Do you build stucco garages?

There's good business in building garages.

The auto owner who hasn't a garage wants one and the man who has a garage often wants a bigger and better one. Plenty of demand and you can satisfy it with well-built garages.

Stucco makes the most satisfactory garages, because it is fire-resistant and can be made almost absolutely fire-proof. Its first cost is low—less than brick or stone, nearly as little as wood. The maintenance is almost nothing, for a stucco garage requires little repairs and no painting.

Besides, stucco lends itself easily to almost any design or finish and can be made very attractive—gray, using Atlas Portland Cement; pure white, using Atlas White Non-Staining Portland Cement; or any of a wide range of warm mellow harmonious colors, using Atlas White and exposed colored aggregates—marble and granite screenings, for instance, or colored sand, or gravel.

Ask us about it

We will be glad to send you absolutely free our books on color stucco and stucco garages. Check, sign and mail the coupon below.

A Complete Planing Mill - All In One Machine

Right now when speed is everything—when time means money—you will want the handiest, speediest Saw Rig obtainable.

That will be an

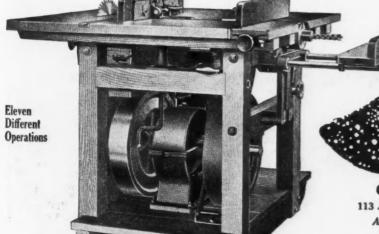

EVEREADY SAW RIG

The Eveready was designed for complete service—to do every ordinary job—and also for those unusual, catchy little tricks that are so annoying and delaying—if you do not have the right tool.

The Eveready does them all. It is light in weight—can be taken right out on the job—and yet is strong and sturdy, built for a life-time of hard usage. Two men can work on opposite sides of the machine at the same time. An efficient, dependable little Saw Rig that will make anything that can be made of wood.

The Men Who Use Are The Men Who Know

You should hear what they say. They Know

That Huther Bros. Patent Groover or Dado Head is the best Dado on the market. They also know that the Dado Head or Groover will be sent on approval to any responsible party, and if not satisfactory in every respect it can be returned to us at our expense.

A Better Buy Cannot Be Had.

They can be used on any Circular Saw Mandrel, for cutting any width groove from $\frac{1}{8}$ to 4 inches or over.

Groover consists of two outside saws, each of which is a groover in itself, and as many inside cutters as required.

Inside cutters are made $\frac{1}{16}$, $\frac{1}{16}$, and $\frac{1}{4}$ inch thick, so that any width groove measurable in sixteenths may be cut.

The outside cutters are made 1/8 inch thick.

It will cut a perfect groove either with or across the grain, and will not leave a rough edge as is the case with ordinary groovers. It is highly recommended.

A Word About The Sleeves.

These sleeves are used for mounting Dados or saws or shafts where it is necessary to change position of same, and are especially useful for cutting grooves for partition boxes, cleats, etc. We manufacture these from steel, and same are tightened to shaft with headless set screws. We also manufacture Regular Circular Saws and Band Saws.

Prices and catalog gladly furnished on application.

OUTSIDE CUTTER

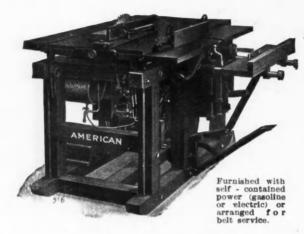

OUTSIDE CUTTER

Distinguish Between "Cheap" and "Inexpensive"

If it is a "cheap" variety wood-worker you're looking for, you have an entirely wrong idea of woodworker values and of what a woodworker should be expected to do and be. Don't let the dollar sign blind you to comparative values.

"AMERICAN" VARIETY **WOOD-WORKERS**

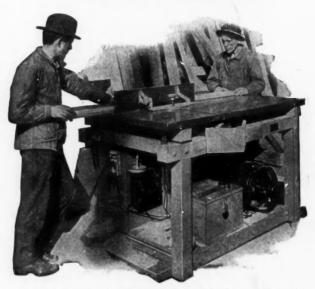

are not "cheap" machines—but they are the most inexpensive woodworkers you can buy. With an "American" the first cost is practically the last cost. You won't be burdened with the endless chain of repair costs that goes with a "cheap" woodworker. You'll get maximum output at minimum cost over a long period of years. And that's what you're looking for, isn't it?

Then send now for bulletin 67

Maybe you think conditions are again conspiring against your making a profit this winter. They are not. You can make progress and bank profits this winter IF YOU PLAN FOR IT RIGHT NOW and don't put it off. You can put one or more "FAMOUS" woodworking machines into your territory and they will route the Winter Slump ranks for you.

It is no small trick to keep profitably busy all winter—depending on hand work—you know that. But a woodworker makes the task very much easier.

You can handle a greater variety of work—you can cut the cost of working up lumber—you can more than double your capacity without extra help—you can put on extra speed when needed, winter or summer. You can use a "Universal" in a shop during the winter or all the year around. You can move it from job to job outside.

An Equipment of "FAMOUS" Woodworking Machines causes your labor problem to fade away

Never was there a time when these machines save more actual cash for their owners —and they cost very little more to buy than when labor was cheaper. The wages of even ONE man represents a neat little profit. Drop us a line—or mail the coupon and let's talk this over and see what FAMOUS machines will save for you and how they will pay you this winter. Don't put it off.

Winter is almost here. If you act right now you can turn these guns on the annual slump and drive it out.

BISHOP'S BEST

We Offer to Carpenters and Builders the final result of years of experimenting and experience in producing good saws. This superior saw is known as our "GREYHOUND." We have satisfied ourselves that a better saw cannot be made. The GREYHOUND is a saw that will hold its sharpness and set longer than any other good saw. This saw should be in the hands of every mechanic who appreciates a good tool. We are proud of this saw and its easy running quality. Its symmetrical lines, toughness and fine adjustment typify its name "GREYHOUND."

30 DAYS' TRIAL---MONEY BACK IF NOT SATISFIED

We are so confident that this saw will meet with your approval that we offer it on trial for 30 days. If it does not come up to your expectations or fails to satisfy you in any way we will refund your money.

Easy Monthly Payments If You Buy
Prove the superior quality of the Aloe Convertible Level by testing it.
out for 10 days. Use it on your every day work laying out buildings, locating foundation piers, leveling up foundations, walls and floors, aligning, shafting walls piers etc. for getting angles or levels anywhere and the shafting walls, piers, etc., for getting angles, or levels anywhere and the hundred and one other things for which you would use a level or transit. Then, if you decide to keep it, you may pay for it in easy monthly payments so small that you will scarcely feel them.

is more than a mere level. It is a modified transit permitting double the range of work possible with an ordinary architect's level. It is construction is such that sights above or below the horizontal can be taken, making it the finest instrument ever offered at anywhere near the price. For taking vertical sights the instrument is provided with a special convertible bracket rigidly and permanently attached to the cross-bar thus eliminating the extra time that other instrument require for changing the telescope in position to take vertical readings. The telescope which is fitted with a permanent axis, rests in the bracket bearings and owing to our special constructed clips the instrument can be used for leveling while in when levels only are to be taken. The telescope is then set in its normal position in the wyes and you have overcome the old method of attaching and detaching the convertible bracket.

Your Own Time To Pay—No Interest

Remember, you are under no obligation whatever to keep the Aloe Convertible Level. We do not even ask you to promise to buy. But you owe it to yourself to see and try it. If it isn't all you expect you may return it at our expense. If you do keep it, you will find the small monthly payments easier than paying rent for an instrument—and at the end of a few months you will own it—absolutely. There's no red tape about this offer—we ask no embarrassing questions—everything is confidential—we charge no interest. You have practically your own time to pay.

Mail Coupon for Descriptive Circular

It explains the Aloe Convertible Level in detail and shows how easily the man without the training of the engineer or surveyor may secure the same accurate results as the expert. Send your name on coupon or postal for free copy and full particulars of our original, unique and popular selling plan.

Most of You Mechanics Use

DISSTON SAWS AND TOOLS

Do You?

Ask any hardware dealer what saw the mechanic prefers and the chances are he'll tell you the DISSTON. Most mechanics DO use the Disston—a recent investigation again proved that fact.

The endorsement of the majority of skilled artisans, men whose livelihood depends on tools, ought to be a pretty safe guide.

The chances are more than even that you use the Disston now; but if you don't, try them next time.

Varying thickness in the same wall

may be troublesome for hanging fixtures or fastening grounds, but never when you use—

ANKOR BOLTS

You do not have to measure the thickness—just put them in and fasten up your fixture. It will stay. It will n-o-t loosen.

Yet the fixture may be taken down and replaced a hundred times and the fastening will still be rivet-tight.

For the work that you want to have reflect credit on you, use ANKYRA ANKOR BOLTS.

Have your dealer show you some, or if he has none, full particulars and sample bolts will be sent by return mail, if you write.

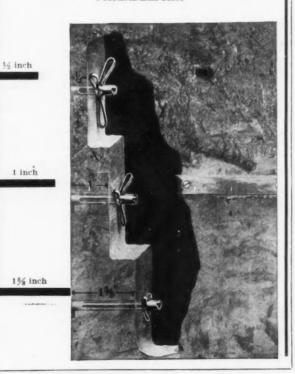

It will be worth your while.

LAST CHANCE To Get These Building Books ABSOLUTELY FREE

We must withdraw all offers we have made on our building books. We want to be fair and square with our friends and give them due notice so they may make any purchases they have in mind. We can no longer afford to be as generous as we have been in the past. We have been the last to make advances in prices.

We find it is necessary for us to protect ourselves by telling of the facts in the case.

Increasing Costs Make it Impossible to Continue Giving These Books Free

The market price of the white paper used in the American Builder has more than doubled since last year. Our increased expenses in paper, postage bills, printing, binding, engraving, labor, etc., will amount to over \$50,000 a year. Owing to these facts, we are compelled to withdraw all previous subscription offers. We tell you frankly that this is in all probability the last opportunity to get your subscription at the old price, and, in addition, one of our building books absolutely free. If you don't take it now you may never be able to get it again at this price.

We Must Withdraw All Offers

We realize it is only right that we should stand back of our past offers as long as we can. To those who have deferred sending their orders we will give a last opportunity as long as our present stock of books last. As soon as they are gone—and they won't last long—we must either discontinue printing them or pay such a high price for having them printed and bound that we cannot give them with a year's subscription to the American Builder. We don't want to do this, but we must.

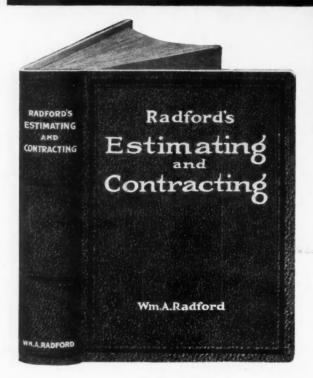

Therefore, if you do not immediately send your order, we cannot guarantee to send you one of these splendid, big books ABSOLUTELY FREE, POSTAGE PREPAID.

Do Not Delay or You Will Be Too Late

Actual conditions confront us. Publishers have been hardest hit of any group of business men in these days of increasing costs and advancing prices. They must charge a good deal more for their products or go out of business. All of the big metropolitan newspapers have raised the price of their papers to take care of a part of their extra expenses.

Before we withdraw our offers to you, we believe it only fair to give you a last chance. Unless we hear from you at once, we cannot guarantee to accept your order. If you know a real bargain you will turn to the last page of this folder now, cut out the coupon and mail it to us at once. This generous offer cannot be made to you again.

NOW OR NEVER-Y

Stop Mistakes in ESTIMATING

By Means of This
Accurate 900-Page Book
Bound in Fabrikoid Leather

Hundreds of Illustrations

A mistake in estimating means the difference between a profit or a loss on a contract. In these days of modern construction it is not safe to guess or go by "rule of thumb." Even experienced contractors who rely upon eyesight or rough calculations make costly errors.

Helps to Easy Figuring

Radford's Portfolio of "Details of Building Construction" is a complete manual of building practice, as applied to carpentry, construction and the use of millwork. It is a remarkable collection of full-page plates, accurately drawn and reproduced to exact scale, showing clearly every detail of modern building construction and finish.

This Book and a Year's Subscription to the American Builder, only . . \$2.00

Our Latest and Best Plan Book

260 Pages—Over 300 Illustrations 150 Residences—50 Farm Buildings

Every builder and lumberman knows how necessary it is to have modern, up-to-date, nicely arranged plans to show prospective customers—to excite their interest and make them want to build. "Guaranteed Building Plans" has been written and illustrated to assist and help, to be a "business booster." It is the most complete collection of House and Farm Building Plans ever published. The designs are all new and have been especially drawn for this book.

In addition to the many perspective views and plans for all kinds of homes and farm buildings, this big book contains a number of details of construction, so that the carpenter and builder will know just how to go about any part of the work that is new or strange to him. A careful selection of interior views is also presented, showing appropriate furnishings and fittings of living rooms, hallways, dining rooms, bedrooms, etc., which give a clear idea of fireplaces, built-in bookcases, plate rails, beam ceilings, etc., making "Guaranteed Building Plans" the most useful book for carpenters and builders, lumbermen, architects and home builders, ever published.

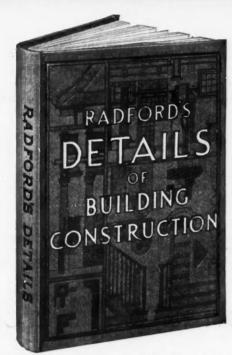

A large part of the builder's work consists in erecting farm buildings and he should have a large selection of designs to work from. This book shows all kinds of barns, from a small horse barn to a complete and well-arranged dairy barn; silos, corn cribs, seed and grain storage houses, wagon and implement sheds, carriage houses, feeding sheds, ice houses, smoke houses, poultry houses, hog houses, round barns, cyclone barns, gearages, balloon barns, plank frame barns; in fact every kind of a farm building. Details of construction accompany the perspective views and floor plans, so there will be no difficulty in undertaking and finishing any of the designs shown.

How to Frame Every Kind of Structure 200 Pages of Illustrations with Descriptive Reading Matter

These plates make plain the framing and construction of residences of every type, frame houses, brick houses, brick-veneer houses, "Stucco" or cement-plaster houses, cement-block houses, etc. Every popular and attractive style of interior trim is fully detailed. Special ideas are presented for the appropriate interior finish for every room or part of the house.

These ideas are worked out complete, the drawings showing both the arrangement of the room and all the interior trim, including built-in features fully detailed.

Radford's Portfolio of "DETAILS of BUILDING CON-STRUCTION" is a regular gold mine of new and attractive designs and practical ideas from which the carpenter or the architect or the builder can draw for all or any of these. In every case complete details are presented all accurately drawn to scale so that the work can be gotten out directly from the Portfolio, if need be, without redrawing.

This Book and a Year's Subscription to the American Builder, only . . \$2.00

An Accurate, Simple Guide for Framing

"FRAMING" is the largest book of its kind ever published. It consists of 356 pages, size 6x9 inches, and printed from large clear type on a high grade book paper. More than 100 pages of illustrated details make it most valuable

"FRAMING" is written so that any reader can understand every page, every term used and every detail shown. It is entirely free from technicalities, and yet its pages are meaty with instruction to all classes of builders, from the youngest apprentice to the journeyman, as well as the practical builder and the largest contractor.

Practical information is the keynote of "FRAMING" By practical, we mean information that can be successfully applied to the everyday work of the average carpenter, builder and contractor, as well as the more intricate forms of framing that come less often, but about which it is necessary to be fully posted. The book presents problems as they have been worked out by well known architects and the man on the job.

Use Coupon Below Don't Delay Make Sure of Getting a Book Free

While our present stock of books last we will stand back of our previous offers to give you one of our big building books with a year's subscription. But they won't last long. You must take quick action.

To make sure of getting one of these books the only thing for you to do is to mail the coupon to us at once.

Your Own Architectural Service

To make your building information complete and up to the minute we have made a temporary arrangement with the Radford Architectural Company to furnish the subscribers who send us their orders at once with a "Radford Special Plan Service" certificate. This admits them to membership in an organization of clean-cut, ambitious men who are anxious to keep posted on the best building methods. Mr. Radford wants our subscribers to have the feeling of mutual good will and helpfulness toward and with each other as exists between the Geographical Society and its members. He wants to create a more intimate relation between the first-class building contractor and our establishment and takes this means of doing it. The certificate entitles the holder to receive information by mail on any question of building, engineering, cement work, etc., and also an opportunity of securing special plans at a figure never before thought possible. This Special Plan Service can be used by you in such a way that it alone will be worth many times the regular subscription price of the American Builder, but we will include it with a subscription without any extra cost whatever, provided your order reaches us at once, in addition to sending you the book you want ABSOLUTELY FREE, POSTAGE PREPAID.

A Complete Building Information Bureau

This generous subscription offer will enable you to have a complete and constantly developing information bureau about building in all of its branches. No matter how well posted you may be, new and better methods are constantly replacing the old ways. The American Builder will tell you from month to month about the latest improvements in building, show working details, plans and perspectives, and be an excellent guide in a multitude of ways. The book you select will completely cover the special subject you are interested in. The Radford Plan Service will help you by furnishing information on any special question that may be bothering you. Taking these three very great and impor-

tant helps is really the duty of every intelligent, energetic, ambitious builder who wants to get the best information and practical assistance in his business and everyday work. We will give you all of them for the price of the American Builder alone, but you must act at once, before it is too late.

AMERICAN BUILDER

1827 Prairie Avenue CHICAGO

"I use 'Trouble Savers' for my scaffolding! 'Trouble Savers' are money savers. They are safe—I don't have hospital expenses to pay for men injured because of poor scaffolding. And the time saved—when the job is ready for scaffolding each of my men takes an armful of 'Trouble Savers' goes around and 'hooks' them in the proper places—no nails to drive—no complicated adjustments. The whole procedure takes, say, about two minutes at the most."

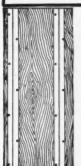

"Yes! I consider the 'Trouble Savers' a big money-saving feature of my business. Wouldn't do without them under any circumstances."

Send for circular illustrating and describing "Trouble Savers."

Make your buildings tight. Chief Galvanized Steel Strips fill the cracks between boards and make strong, neat, weather-proof find joints. Keep out vermin. Store wooden batten. Always fit. Allow for contraction and expansion of boards without loosening nails. Furnished in 6-7-8-9-10 ft. lengths with interlocking joints. Write for full information.

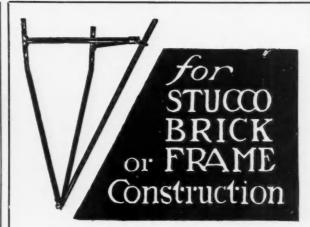

SHRAUGER & JOHNSON
430 Walnut St. :-: Atlantic, Ia.

Shows end view of Chie Batten with joint closed Siding expanded. Not position of the batten is the crack.

Shows end view of Batten with the joint open and siding contracted. Chief Battens automatically accommodate expansion and contraction.

RELIABLE brackets are the only kind of steel brackets on the market that can be used on stucco and brick work as well as frame construction. That's why so many builders find Reliable brackets the most satisfactory for their work.

But there are other important features—

The nail holes are slotted so that the user has but to drive in four nails, when the work is done the bracket is "lifted off" of the nails and folded up, and the nails are driven in without defacing the siding in any way.

And they are compact!

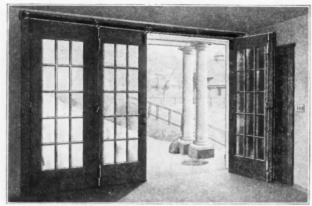

Simply fold them up and stow them away in your trunk. Think of what an advantage they are over wood scaffolding, besides being so much cheaper—and safer. Use them anywhere on the roof—chimney building—on the corners in the gables.

We would like to quote you on Reliable scaffolds. We will give your letter prompt and careful attention.

Send today for further information and prices.

There are no steel scaffolds more reliable than Reliables.

No Ice Needed—in Winter Filled From the Outside in Summer

The Herrick Outside Icing Refrigerators

Most Popular for Modern Homes

Saves more ice, gives more space in the kitchen and does away with the tracking of floors.

This refrigerator requires no ice in the winter. It is cooled by cold air. The Herrick is so constructed that a compartment may be opened from the outside of the house. Cold air thus enters the opening, forces circulation and keeps the contents of the refrigerator cold and pure.

And we furnish FREE PLANS showing how the Herrick saves a great deal of kitchen space by being built into the wall so that only the front is visible. The housewife will appreciate this saving just as much as the ice-saving feature. And here is another point equally important: The Herrick does away with the annoyances of the iceman's visits to the kitchen and the soiling of the floors by his always muddy feet and dripping ice. Any woman who takes pride in a tidy kitchen will not only be interested in—but will demand the Herrick.

No progressive builder can afford to be without information on this modern convenience. Suggest it to your customers before they suggest it to you. It will add to your reputation as a conscientious, up to the minute builder and will get you more jobs. Write for our free plans and our complete catalog.

Contractors' Wheelbarrow

Sterling

Workman's Friend

The Contractor Who Buys STERLING BARROWS Has Three Good Reasons Why He Will Buy No Other Make:

First — He knows that all parts of all Sterling Barrows are interchangeable, which gives him a standard equipment.

Second—He knows that Sterling Handle Clamps, Riveted Channel Legs and Self-Lubricating Wheels mean "longer life," "greater efficiency," thus more for the money invested.

Third-He is sure of a greater tonnage per day, because Sterling Barrows have self-oiling wheels and are properly bal-anced to lighten the work of his men.

MAKE MONEY MAKING TILE

COMBINE DUTY WITH PROFIT

Every building contractor can combine duty with profit by helping to supply the d mand for cement drain tile. Reports from all sources indicate the scarcity of drain tile. Farmers want tile—urgently. Big crops at good prices has brought them the money to pay for it. They want bigger crops next year; they must have drain tile.

Opportunities abound in every farming com-munity for the manufacture of of cement tile.

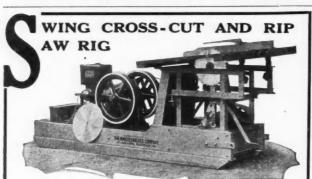

W. E. DUNN MFG. CO.

Not hundreds, but actually thousands more plants are needed. Three times as much tile will be bought next spring as the combined tile plants can produce during the winter.

Only a moderate investment is required to install the necessary Dunn tile making machinery which will put you in position to earn big money. Write for information on the tile business and Dunn machinery.

415 24th St., Holland, Mich.

AFDAWN OFA NEW MANE

"Built on the Square"

"Sold on the Square"

POR fourteen years the name STEWART has been identified with the Concrete Machinery business.

Throughout our big plant—at the fairs—on the road—at the Cement shows—in the publications—on the job—everywhere, STEWART has always been in evidence.

Thousands of contractors have met STEWART, talked with STEWART, bought from STEWART and used STEWART products and inventions.

Yet—as a name for a firm and as a brand for a line of Concrete Machinery—STEWART is really a new name.

It's a good name, though—because it stands for honesty, integrity, and a policy of building and selling goods strictly "On the Square."

We thank the thousands of customers who have helped make STEWART a success and write this message as a greeting and an invitation to all readers to get acquainted with STEWART and the STEWART way.

The Stewart Mixer

The STEWART Mixer is a new machine, or rather a new model, built along old principles, by an old firm. In fact, it's built by STEWART with fourteen years of Concrete Machinery building and a lifetime of engineering and contracting experience as a foundation.

It has been tried and tested in every possible manner.

It is a mixer you can count on to start a job and finish a job with a perfect score.

In fact, it is "Built On The Square" and "Sold On the Square" and is guaranteed to give satisfaction.

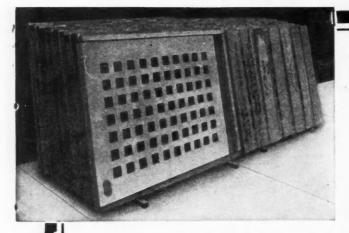

Five sizes and fifteen styles give you a big line to choose from so you are bound to find a STEWART Mixer for your own individual needs.

Write today for prices and information. Let us tell you about this machine and the STEWART way.

"Look Before You Build"

It's Free to See

finish for the artistic home. It is also an economical finish, if properly compounded and rightly applied on a background that will hold it se-

curely—that will not allow it to break away from its fastenings and crack.

Bishopric Board is the one background that, in actual use, has fully met these requirements—and it cuts the cost twenty-five per cent. It's a scientific combination of building principles as old as the pyramids.

Bishopric Board is made of dove-tailed lath that clinches the stucco; the lath are creosoted to preserve them, imbedded in asphaltmastic, which is a perfect protection against vermin and dampness, and backed by heavy fibre-board through which neither sound, heat nor cold can penetrate.

Let us send you free samples and our book "Built on the Wisdom of Ages." It illustrates homes, apartments and buildings of all kinds using Bishopric Board. It contains scientific tests with letters from architects, builders and users; and it gives facts and figures to prove that Bishopric Board is both the best and the most economical background made for the stucco-finished house.

Blue Prints From the Lumber Dealer

A SHORT TALK, NOT ON "ARCHITECTURAL ETHICS" BUT ON SERVING THE PEOPLE, BY THE EDITOR

PERKINS LUMBER CO.

FARMand BUILDING

BOOK

CONNELL-COWAN LBR.CO.

BUILDING GUIDE

TE were considerably worked up the other day when a new book on Farmhouses came to our desk, and we saw that the author has made no mention in it of that handiest and most used source of home-planning information, the local lumber yard office.

It riled us all over to see the Kansas farmer advised (in effect) to journey to New York City and lay his little homebuilding project before a real architect, if he wanted real action on the proposition.

As it happened, we were acquainted with the author of this book, and knew what a level-headed, sensible chap he is, and

how thoroly qualified he is to write on this particular subject of Farmhouses. So we concluded it was merely an oversight that the local sourcees of building plan information were thus ignored - and decided to take our pen in hand and write him about it.

Here are some parts of the letter that are of general interest:

"I am just a little concerned about your several recommendations and illustions thruout this book relative to architectural services. You would have the farmer consult with 'a specialist in this kind of work,' meaning, I presume, a professional architect in the distant city. This is a very high ideal, too high, I am afraid, for one farmer in a thousand to attain. In the first place, this high-grade architect lives too far away-the farmer doesn't know him-doesn't know how to reach him, and when he does reach him finds that he is not interested in 'a little farmhouse job.' The architect's fee is a certain percentage of the cost of the building, and he can't possibly make this percentage high enough to make it worth while bothering with any medium cost dwelling house or farm building.

"It is our observation that the professional architects want the big city work, but don't want to bother with country work, except, of course, the big millionaire estate jobs. They can't afford to bother with the ordinary seven or eight-room dwelling house. There are very few architects in cities of less than 20,000 people.

"What, then, is the proper source of home planning information and assistance for the average farmer and small town man? We maintain that it is the local builder, and also the local retail lumber dealer.

"Next to the local builder, the retail lumber dealer is un-

doubtedly the biggest factor in farm building improvements. It will surprise you to learn how many dealers

J.H.QUEAL & CO. maintain what they call a service department, which furnishes working plans for houses and barns. For the most part, these Four Popular Plan Books Much Use By Lumber Dealers for Promoting designs are taken Building Construction. from plan books and magazines and changed around a little to fit the particular needs of the customer. In your chapter on 'ready-made plans' you don't mention this greatest use and value of the

> simple matter to draw up the revised plans. The lumber dealers are co-operating with the local carpenters and builders in furnishing working plans for a great variety of up-to-date buildings; they are distributing farm building books among the farmers, illustrating good farm homes and barns; they invite the farmer to drop in and talk over any improvements contemplated. In a word, the retail lumber dealer and the local carpenter and builder are right on the job and are doing all they can to promote building improvements."

> stock plan. The lumber dealer uses it as a starting point, the

basis on which to figure with his customer and get a definite

idea of what the customer wants and needs. Then it is a

Chicago "Relax" Spring Hinges

are in great demand. They are substantial in construction and readily applied. The EXCLU-SIVE FEATURE of spring action release, allowing the door to be placed at any desired position and automatically re-engaging when the door is closed,

of recognized merit and utility.

Send for Catalogue C32. It fully illustrates and describes the most complete line of Spring Hinges manufactured

Chicago Spring Butt Company,

CHICAGO

NEW YORK

Rufus D. Wood, Architect, Pittsburgh, Pa. Read what this Architect says about his own house, which is stained with

Cabot's Cresote Stains

"The shingles of the roof and second story are stained with your brown stain and the plaster on the outside columns with your white Waterproof Cement Stain. A number of the shingled houses in my neighborhood have been stained with creosote (?) stains manufactured by local concerns and their colors are very muddy and disagreeable and do not seem to stand the weather, while mine has retained the original nut-brown color which I desire."

Cabot's Stains have been the standard for more than twenty-five years, and are specified by nine-tenths of the architects, who know them from experience. Their colors are soft, rich and beautiful, and guaranteed fast. Their weblies is Crossote, which thoroughly preserves the wool, and they contain no keroseen or other cheapener. Why experiment with unknown stains, when you are sure of Cabot's?

Cabot's Stucco Stains

are the only artistic cement finishes. They give soft, nature coloring effects, without covering the surface with a painty coating. They are also cheaper than coatings and easier to apply, and they cannot crack or peci.

You can get Cabot's goods all over the country. Send for samples and name of nearest apont.

Some Figures on Building

TATISTICS compiled by many leading authorities Indicate that the war has proven a great stimulus to general building operations in the United States. Government construction has attained enormous proportions, and certain factory work is going on in large volume. On the other hand, the erection of dwelling houses and other similar structures has fallen off appreciably.

Discussing the present situation and the building outlook, Roger W. Babson, the well-known statistical authority says:

"Many clients have inquired regarding the effect of the war on building. The following table answers this question more clearly than words. The war will very seriously affect many lines of building, but is stimulating Government and certain factory work. . . Reports from England show a large volume of factory work, both new and remodeling, together with a large amount of Government construction. Builders and dealers in builders' supplies who have adapted themselves to the new conditions, are fairly busy. Residential construction in England has been almost eliminated since the war began, except for the building of workmen's dwellings in certain industrial centers. Work not necessary to the war has been

doubtless will not be as radical as in England, but the tendency will be the same. Clients should plan accord-

Total\$152,266,000 \$149,077,000 \$150,662,000 Note—The above figures represent all building in the northern, central and eastern sections of the country, which constitutes about 45 per cent of our total population. The item "Government War Construction" includes only Government work incidental to the war. Regular Government building is not included in the items.

Quick Silo Delivery

KENTUCKY lumber company has provided A farmers in its territory with dozens of silos by delivering them on telephone order quickly by motorsuspended. In the United States the readjustment truck service within a radius of 50 miles. One merit

of the wooden silo is the rapidity with which it can be put together. Two men are sent with the motor truck to help erect the silo, and the service has been of great assistance to farmers where failure of a forage crop made it advisable to put the corn crop into silage instead of letting it ripen. The silo is a great factor in stabilizing the farm yield of live stock and dairy products.

The High Cost of Rats

A NEWS item reports that a Delaware farmer found that rats had eaten more than 100 bushels of corn in his barn, valued at \$190. He organized a rat drive with boys and dogs, and in one day rounded up and killed 800 of the animals.

We can make a pretty good guess at the sort of a barn his was. Let him put in a concrete floor and make the lower side walls snug and tight, as they should be, and he'll not be troubled by rats.

The rat waste of food is serious. It can be stopped by builders. The cure is to make all buildings rat proof.

Carpenters on War Work, Farmers Do Own Building

WHILE up in the northwestern part of Iowa several weeks ago, I found a peculiar condition among the farmers of Emmet County. I visited quite a number of farms and found considerable building going on; but sad to relate carpenters and contractors were not doing the work.

On one farm the owner, with the help of a neighbor or two, was starting an eight-room house. They were pouring concrete for the foundation (using dirty sand and pit run gravel, throwing big stones into the forms ever so often, etc.) and said they expected to do the whole job of building, except inside finishing.

On another place they had just finished a two-story granary built by the owner; had a cup elevator, etc. This job was pretty well done as far as I could see,

except that the bruilding was wrongly located. They had it on the side of a hill and when spring rains come, the water will rush right thru the lower part of the crib.

In this section the contractor does very little buying. The farmer goes to the dealer, contracts for the material and hires a builder and his gang at so much per day and board to do the work.

Talked with a number of lumber dealers, and they report a big business.

I spent considerable time in Emmet County about 10 years ago, and it certainly was a revelation to get back there. New modern barns, houses, silos, etc., have replaced the tumble-down shacks of 10 years ago.

Farmers who 10 years ago were poor and struggling along, now own big buildings, big cars, etc.—L. H. REICH.

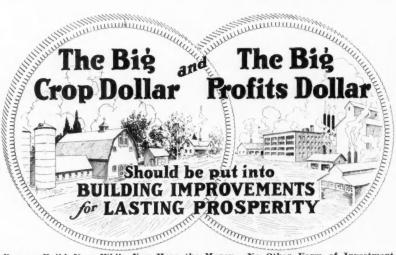

They Couldn't Leave the Old Home, So Moved It

T is not an uncommon sight to encounter a house $oldsymbol{1}$ upon rollers in the middle of a street and in the process of being transported to a new location some distance away, but it is seldom that a house is taken in pieces, the parts transported 1,850 miles, and once more put together again. This is exactly what has happened, however, with the residence of J. E. Storer of Los Angeles. The Storer family recently decided to make its home hereafter in Edmonton, Canada, and for some reason, not generally known to the public, they took their house with them. A corps of workmen was engaged, the house taken down piece by piece, each carefully marked and done up in neat bundles, and loaded upon a steamship for transportation to Vancouver, and thence by rail to Edmonton. It will not be long, therefore, until an American frame house, built of American lumber from floor to shingles, appears in a Canadian city as the residence of the Storer family.

Big Sticks

S HIP masts 136 feet in length and 26 inches in diameter are big sticks of timber, especially when they are to be shipped to Cape Town, South Africa. Four masts of this size are being turned out by Robt. McIntosh, a pioneer shipbuilder of Portland, Ore.;

and they are among the longest ship masts ever built on the Pacific Coast, if not anywhere in the world. They are free from the slightest blemish and constructed of Douglas fir timber, which grew on the Cowlitz river. Six booms and four gaffs are also being built.

IMPORTANT PLANS PRESENTED BEFORE A JOINT MEETING OF INFLUENTIAL LUMBER DEALERS AND THE TRADE EXTENSION COMMITTEE OF THE LUMBER MANUFACTURERS, AT CHICAGO, OCT, 9TH

By J. R. Moorehead

Sec'v Southwestern Lumbermen's Assn

T is in the breast of every well-balanced man to detail as to the form and manner of conducting such own a home. Particularly is this true when he becomes the head of a family. This desire is no greater in the head of the family than in his wife, and their growing children. This has been true in all ages, whether this home has been a tent of grass or skins, a stone house carved in the cliffs, an Indian tepee, or a modern bungalow-the desire has been the same.

In this short discussion we have no time to argue as to whether or not the Building and Loan Association has been a success. We have only to point to the city of Philadelphia, which is known as the city of homes, due to the early development of the Building and Loan Association. Other cities and states such as Ohio, have so progressed in this direction that

organizations.

We take this to be one of the most opportune moments in which to discuss the possibility of the Building and Loan Association, insofar as it will increase the sale of lumber and building material and thus promote our business.

It certainly should be the aim and purpose of the retailer, not only to secure the lumber bill in sight, but to do and perform those things which will bring business in the future. If we have not this foresight and eye to the future, then we have missed one of the principal factors in the success of our business. Only in well-laid plans for the future can we hope to succeed, and it is with this in view that we lay before you under this caption some suggestions which appear to afford a means of co-operation that will result in greater and better business for all branches of the trade in years to come.

In the success of a properly conducted Building and Loan Association, we can see the success of those agencies now being employed to promote the sale of lumber and building materials. Plan books and selling helps will become more valuable and indispensable when we provide the finances.

The great problem in most communities is that of securing funds by those not in possession of sufficient finances to obtain their own homes. Banks do not

and cannot lend money on long time to home-builders. Funds are not obtainable from other sources for such purposes, except occasionally, from private sources. The deposits in the savings banks may reach the millions, but these small earnings are not available for the purposes indicated in this discussion, particularly the obtaining of funds for the building of the small home for the wage earner, the clerk, and the business man in the small community, without sufficient To create sufficient funds. funds, therefore, seems to be the problem and the Building and Loan Association is the only means whereby an accumulation or collection of

hundreds of millions of dollars are loaned largely for the purpose of procuring homes for those who could not otherwise be able to obtain loans and, thru co-

There are many plans. While the fundamentals are much the same, yet there is a wide difference in small earnings can be obtained upon terms equitable and possible to the borrower.

The other difficulty seems to be the lack of anyone in the average community with sufficient knowledge of details to inaugurate and start a Building and Loan Association. We believe it is possible for the two organizations here represented to solve this problem and we shall summarize at the close of this discussion.

Personally, we have always depended more upon experience than theory as to how problems of this

and at least one lumber yard in my community immediately began to get beneficial results from this organization, tho only 30 days old. During the 30 years of the existence of this organization, so far as I recall, the association has suffered but one financial loss, and that an amount of less than \$400.00, which means

town, I was one of the promoters of a Building and Loan Association. For five years previous to my taking up secretarial work, I was the secretary of this association and conducted it in my lumber office. Today that association has assets to the amount of \$490,000. The expense for the past year (the largest business in its history) was, including salaries and for every purpose, \$2,418.00. I do not recall a bank with a like capital and assets which conducts its business for an expense equal to three times this amount. The very first loan made by this association in 1887 was for the purpose of building a home for a blacksmith

Which Shall It B

practically that in the 30 years' business, this associa-

In this connection we may say that in the Building and Loan Association the moral hazard is practically eliminated and the moral security is practically as great as the real estate for the reasons I enumerated at the first, in that it is in the breast and desire of every man to own his home, and thus the security is increased.

When this organization was first started, there was intense opposition on the part of the banks of the community, it being intimated that a scheme was being started to lose a considerable amount of money of working people, who could ill afford to lose it. There was fear, no doubt, that it might interfere with bank deposits. It does not. On the other hand, it increases bank deposits. Small sums come out of socks, tin cans, etc., and thereby get into the banks. The answer to that was that within three years from that time, every bank in the community had a candidate for treasurer of the organization.

We are not prepared to say just the number of homes which have been erected thru the money obtained thru this co-operative effort, but we can safely say that the lumber and material men of the community, where I formerly lived and still own a yard, have had their business increased anywhere from ten

to forty thousand dollars each year by reason of its existence and had not such an organization been formed in my town when it was, the community today would not have reached that stage of development which it has; the mechanics, and laboring people, and business men as well, would not have been living in their own homes and not paying rent, as they are today, and, further, I should not have continued in business there as I have.

The community, if it had improved to any extent at all, would have been one largely controlled by landlords, instead of home-owners. Now, hardly anyone lives in a rented house.

In every state, north, south and west of Ohio. the Building and Loan Association has not developed to any appreciable extent, as compared with some of the eastern states. We, therefore, have the great West as a field for co-operation in promoting these organizations, and thus promoting our own business.

In Missouri alone there are seventy-five towns large enough to maintain a Building and Loan Association. In many of the towns where such organizations are already located, there is room for more. This applies not only to the town of from five to ten, or twenty thousand population, but

even to the larger cities. Supervision by state authorities has practically eliminated wild-catism in the Building and Loan Association. In most of the states the same supervision and inspection that governs the State Bank is provided for the Building and Loan Association. So far as I know there has not been a failure of Building and Loan Association in Missouri in fifteen years, and this will apply possibly to other states. In other words, the possibility of loss has been reduced to a minimum.

My proposition, therefore, to the combined lumber industry of the country, to the manufacturers and the retailers, is this-provide a proper number and finance a sufficient number of men with sufficient knowledge to go into any community and properly guide those interested in the organization and installation of a

Building and Loan Association. I do not mean that the National Lumber Manufacturers' Association should bear all of this expense. Any retail lumberman in any community where an association is established can afford to pay out of his own pocket at once anywhere from \$100.00 to \$500.00 in order to properly start, under proper instruction, such an organization. If by the investment of such an amount, an additional

> business of five, ten, or perhaps twenty thousand dollars in a year can be secured for his yard, what better investment has he, or can he ever make? I have often been requested to go to other states and talk to communities on this subject, which shows there is already interest in the plan.

> My own experience is the warrant for making such a statement and such an appeal. There is everything to gain and nothing to lose. If I were the owner of ten, twenty, fifty or one hundred retail lumber vards, I should employ the best Building and Loan man obtainable and have him make a survev of every community where I owned a yard with a view to establishing a Building and Loan Association therein. would call together my competitors and other business men, including the local newspaper men,

in the community, who are as much interested as is the lumberman, and present the proposition to them in a practical, straightforward, business way. If I could be sure of the co-operation of my competitor, well and good; if not, I should proceed on my own account, and install an association in my lumber office. Any retail lumberman who is looking to the future cannot but see that this would be building a future business.

In such states as Ohio and Pennsylvania, there could be obtained, no doubt, many men who would be more than glad to undertake such work under such guarantee as the National Manufacturers' Association could make, and these men could be sent out and used wherever the retailer showed a disposition to co-operate.

This is the proposition we have to present to you. (Continued to page 138.)

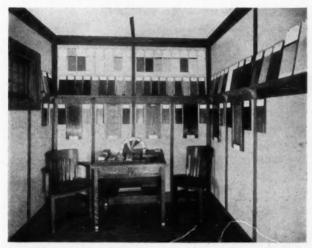

"A Home for Every Family" Should be the Motto of Lumbermen and Builders.

Display Goods to Encourage Business

THIS IS NOT THE TIME TO STAND BACK AND WAIT FOR BUILDING ACTIVITY TO DEVELOP. ADVERTISING IS THE MOST EFFECTIVE AND MOST ECONOMICAL FORCE WHICH DEALERS HAVE TO DIRECT AGAINST ABNORMAL CONDITIONS. THE PROPER DISPLAY OF GOODS IS EFFECTIVE ADVERTISING. STUDY THESE SUGGESTIONS AND APPLY THEM TO YOUR OWN BUSINESS

HE last page of history has been written recording the events of the period during which the dealer in building materials and equipment filled up his shelves, stock rooms, yard or sheds and then settled down in his office to await developments. During the period which has already found a begin-

Dealers in building materials and equipment all over the country are awakening to the necessity of this development. They are realizing that the encouragement of building activity rests almost exclusively in their hands. They are realizing that not only their own welfare, but the welfare of the entire industry is

dependent upon the extent to which they are able to encourage building.

What are some of the things which the dealer can do to encourage building? Perhaps the most logical initial step is to fit out the office, sales room, display room or yard so that the prospective builder may be shown the various materials and articles of equipment to the best advantage. All people are influenced by their surroundings. The man who is thinking of building a home or a barn or a store building should not be discouraged by finding that the dealer from whom he expects to obtain his materials cannot show him what these materials are or what choice he has in their selection. The dealer's place of business must be filled with building ideas.

The exterior appearance of the office or store should, of course, be as attractive as possible. It is an advantage to have a building specially designed so that the appearance may be made novel and suggestive of

step in advance. If his stock includes wall board, this display room is a good place to show prospective builders how it is most effectively used. There should be a table or desk in the room with literature and printed advertising matter nearby. The arrangement of the exhibit should follow a logical scheme; that is, the materials used in the construction of the walls of a building should be grouped together, the roofing materials should make up another group and so on. If display boards are used, they should be placed where the light is good and their elevation should be near eye level. There should be plenty of space

Display Fixture Which "Sells the Goods" in the Store of the Thomas Hardware & Cutlery Company, Chicago, Ill. This Type of Fixture Is Manufactured by the Multiplex Display Fixture Company, St. Louis, Mo. The Prospective Purchaser Would Rather See the Goods Than a Picture and His Examination of Such a Display Will Often Result in the Purchase of More Than the One Article Which He Had in Mind.

An Exhibit of Thirty of the More Important Woods. These Specimens Are Furnished to Lumber Dealers at Less Than Cost by the National Lumber Manufacturers' Association. Each Sample is 2½ by 5 Inches in Size, Shellacked and Labeled with Both the Common and Scientific Names. Everyone Who Wishes to Build Is Interested in Woods and Every Dealer Should be Ready with the Information, which Is Most Easily Given with the help of Samples Such as These.

around working models. A number of clever displays may be worked out by the dealer and made a part of the building. For instance, a section of an interior wall of the display room may be devoted to panels of brick. Another section may be used to show the various types of wall construction for which materials are carried in stock, by stopping the plaster and leav-

ing the wood lath, metal lath, plaster board or other materials exposed for a short distance. A movable rack may be built which will show all of these. In such a rack, only one side of the "studs" are finished so that the manner in which the plaster is keyed to the wall is shown on the reverse side; only a portion of the surface is plastered so that the method of attaching the materials to the stude is shown. Models always attract attention and they provide something definite for the salesman to work with in making a sale. A display may often be arranged so that it will serve a number of purposes. For instance, in displaying a set of garage door hardware, a large case with shelves may be built having a small set of garage doors fitted to it with the hardware installed. The shelves may be used to store the stock of garage door hardware, the wood in the doors is displayed and the finish which they are given is also effectively shown.

It is effective to display small articles which are used for a similar purpose on a group of swinging panels or in some similar manner so that they may all be easily seen and carefully inspected. This type of

display often results in the sale of more than the particular article which the purchaser had in mind when he entered the store. The same principle may be used in the arrangement of shelf stock. Group related articles together; avoid confusion and untidy appear-

A further consideration regarding the display room

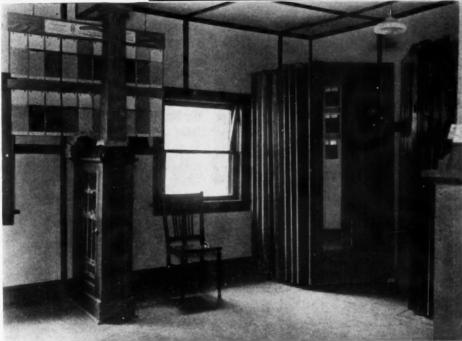

Window Display of Yellow Pine Rough and Finished Lumber, Rustic Siding, Ceiling and Trim in the Natural Color and Finished in Various Ways to Show Its Adaptability to Architectural Treatment. This Display Is Extremely Simple, But It Is Forceful Because There is no Confusion and That Quality of the Wood Which the Majority of People Are Interested in—Figure—Is Very Clearly Shown. The Lighting Arrangement Is Largely Responsible for the Success of the Display. The Strong, Non-Glaring Light From Above Throws the Specimens Out Strongly Against the White Background.

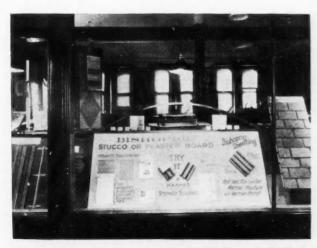

Display Shelving in the Service Room of the R. L. Duniap Lumber & Coal Com-Company, Iowa City, Iowa. The Shelves Serve a Double Purpose in that the Stock of Smaller Articles Is Stored Here at the Same Time That These Goods Are Being Displayed. The Framework and Counter Are Used to Display Small Samples of More Bulky Materials.

Set of Grates Is placed in Foreground.

"The Roof of Actual Service" Applied to the Display of Roofing Materials. The Kork Lumber & Manufacturing Company of Memphis, Tenn., Believes That the Public Is More Interested in the Service Which a Roofing Material Will Give Than It Is in Its Appearance Alone. The Display Shown Above, Which Is Built Near the Office of the Company, Presents Various Designs Which Are Attractive, While at the Same Time the Roofing Materials Are Exposed to the Elements. The Company Reports That the Sales Resulting From This "Silent Salesman" Are Most Gratifying.

sort of window display which the dealer in building materials and equipment ordinarily uses, consists in a central object which catches the eye of the observer, around

Resulting From This "Silent Salesman" Are Most Gratifying.

The Company Reports That the Sales may be used to attract attention.

When the location of the place of is the finish of the walls and ceiling. In most cases business is such that evening display is possible, the

shown off to best advantage against a white background and the entire appearance of the room is improved by this finish.

The utilization of window space is the next method which the dealer may use to display his goods for the encouragement of building. A good window display is an invitation to the observer to come inside and learn more about the goods on display. The window display may be closely merged with the display room, if the window is in one of the walls of this room. Some part of the display room exhibit may then be placed at this window.

Simplicity is the keynote of a successful window display. A confusion of articles thrown together with no logical order cannot carry any force or attention value. The

which additional objects are ar-

ranged to supply the details of the information which the display is intended to give. Striking colors

"Concentration will win where scatteration will lose, especially if concentration be hooked up with keeping everlastingly at it."

THE MAN FROM THE LUMBER YARD

If you are a DEALER we would like you to get this writer's view-point of your duty. If you are a BUILDER, to what extent will you co-operate?

—EDITOR.

I T was some time in September that the "big fellow" took me out to lunch. While we waited for our "beans," he said to me: "Woody, the biggest problem Uncle Sam is going to have as soon as he spanks the Kaiser, is developing man power."

He calls me "Woody," not after our esteemed President, nor because of the density of my head, but because I came from a lumber yard.

The House vs. The Automobile

He went on to say that the world was not going to need men so much in quantity as in quality. He drew attention to the fact that the right man plus a linotype machine was equal to five men; the right man plus a portable saw equaled four men; the right man plus a riveting machine, equaled six men.

In our discussion we touched on the wonderful development brought about by Luther Burbank in the vegetable kingdom. He had only praise for the spending of millions of money by the government in its work in the animal kingdom. You have, perhaps, forgotten the men and money the National Government gave to check the foot and mouth disease that was prevalent within the last twelve months in the central states.

You know that if your hog and your neighbor's hog

developed a peculiar disease, a man from Washington would be on the job quickly.

What if your boy and your neighbor's boy developed the disease of joy-riding; there would be no government action unless the kids killed somebody. He gave it as his belief that HOME building would have to go ahead of AUTO-MOBILE building for the best results in MAN building.

The more I observe, the more I think of HOME influences and the less of automobile influences.

Observation

I have been impressed with the fact that there are at least three new garages built to all other new business houses. I believe this average will hold good in practically every section of town or city.

Of course the thought comes to mind when I look at one of these buildings which generally has, in builders' hardware, three door locks, "there isn't much profit to a supply dealer in that building."

There is a seventeen-year-old boy and two younger girls in the family. I am not home much save Sundays and nights, but I know that the boy has had the machine out in the small hours of the morning when a chap of his age should be in getting ready to get up and go to work. One of the girls ran the machine into a telephone pole.

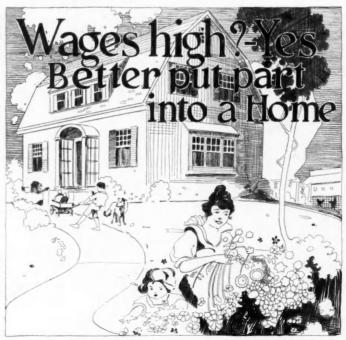

I asked the mother recently if they were going to build next year. "No, indeed, our machine has cost us so much I don't know when we can build," was the

answer.

I would like to tell her that the big cost has not been in gasoline and repair bills, but in making idlers, drifters and dawdlers of her children.

Their rented house is not attractive. They are really ashamed of their so-called home, which is merely a place where they eat and sleep. The shame is that there are thousands just like it.

When I was a youngster there was a small stream near by and I had great fun building dams and changing the channel of the stream.

Rents Are Going Up and "Rainy Days" Are Coming. Protect Yourself from Both by Saving NOW for a Real Home.

It is astonishing how easily the flow of water, the style of dress, the trend of public opinion and whims of people can be changed.

I believe that it is time NOW for the dealer in building materials, with the aid of the builder and banker as well as the printer, the preacher and also the ladies of the Home Missionary Society, to begin to turn the tide toward HOME BUILDING.

I would say to the ladies of the H. M. S., make your homes so attractive that they will not turn out heathen to be converted later on. It is said somewhere in the good book: "Train up a child when he is young and

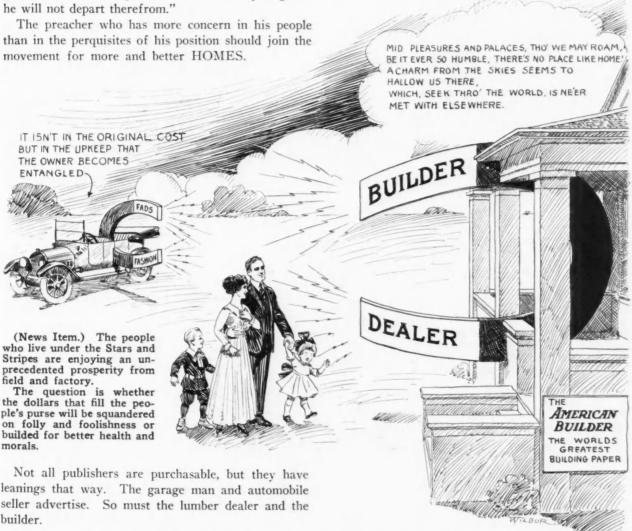

than in the perquisites of his position should join the

people to his place, and then have such attractive books and pictures of homes suitable to his class of people, and such comforts and conveniences shown as would stimulate the desire for homes, its influence would soon be felt.

As I get around the country, I notice a great improvement in the displays of building material.

How much business would a milliner do if the hats and trimmings were not shown?

If the best druggist in your town made no more display than you do, his trade would drop off half in

leanings that way. The garage man and automobile seller advertise. So must the lumber dealer and the builder.

The Influence of News Items

It doesn't require money for all advertising. A few odd moments and a little thoughtfulness in supplying "news items" will have good results.

The alleged purpose of every newspaper is "standing for the welfare of the people and for boosting the town."

You must first make NEWS. You, Mr. Dealer, must originate the campaign.

Things don't just grow like Topsy, nor do they happen. You must concentrate on a plan and push it along.

If every dealer would employ some system to attract

less than six months.

The builder should co-operate. The interests of the dealer and builders are so identical that they should pull together.

Every live builder would be interested in taking prospective, or possible home buyers into the display room of a dealer where the interest in a home would be increased and brought to a focus.

The people who live under the stars and stripes are enjoying an unprecedented prosperity from field and factory. The question is whether the dollars that fill

Dealer-Contractor Good-Will Best for Building

Calling on the Lumber Trade

By Wm. Reuther

For thirteen years Mr. Reuther has been one of the Editors of the American Builder. He has always taken special interest in the dealer side of the building field, and has traveled thousands of miles in his efforts to persuade lumber dealers to distribute

I T has been my good fortune during the past twelve years to have called upon the retail lumber dealers from New York to Montana. I say "good fortune" because the ideas and knowledge I have gained have come largely from my association and talks with them.

Considering the number of men who are engaged in the retail lumber business, they are without doubt the most agreeable and broad minded class of men to call on in this country. I believe this is partly due to the fact that they deal in large quantities; they buy in carload lots and sell in figures running into the hundreds and thousands. This is bound to have its effect on the man; it is hard to have big ideas and broad minded views if you are selling prunes by the pound or sorting over strawberries to make up a good box.

There are a few exceptions still in business and my experience with them stands out like red letter

Bill Reuther, Editor and Salesman.

plan books and posters to promote the building business.

Mr. Reuther's many friends among the lumbermen will be interested to learn that he is now actively associated with the Radford & Wright Co., at Oshkosh, Wis. He is firm in the conviction that every building should have doors and windows—and he proposes now to furnish the same.

Look over his line when he calls.— Editor.

days-or like a very sore thumb!

I remember one beautiful spring morning I got off the train in a small town in the middle west and called on the old lumber dealer in town. The owner had not arrived so I talked crops and general business with the office man, book-

keeper and yard man, all combined in one person.

At eight-thirty the owner came into the office, looked at me from the corner of his eye and without asking my name, business or previous condition of servitude, said: "I suppose you came in on that eight o'clock train."

I admitted it and he said, "Well, I guess we've entertained you long enough, good morning."

This happened a number of years ago and I am still thinking of new things I wanted to call him; but he disappeared into his private office.

I am willing to bet, however, that there are more

mail order catalogs in his community to the square foot than in any other section to the square mile, for a man who will treat a stranger that way is not very liable to get new ideas, new business or new money.

I told other salesmen about this incident and they told me what happened in that town. It seems this lumber dealer met one of his neighbors at the station one morning getting a shipment from a mail order house and criticized him for it.

The neighbor said, "John, I feel guilty about this.

"Well, I guess we have entertained you long enough; good morning."

I feel as if I had been caught kissing a neighbor's wife"

The following week he was buying from two mail order houses.

I am glad to say, however, that the big majority of the dealers today realize that the salesmen who call on them are serious minded men who are specialists in their particular line. Competition has become too strong to allow the manufacturers to risk sending out a low grade man. The large majority of the salesmen who call on retailers have made a thoro study of the line they represent. If it is lumber, they have worked in the woods and in the mill before they were sent out. If it is sash, doors and millwork, they have worked in factory and warehouse and know from actual experience how and of what everything is made.

As a result, the man who comes to you selling roofing,

The man came in to pay a bill-and the dealer kept on reading.

cement, or advertising, has information at his command that you can have. It is information you can use in your business from day to day and the only cost to you is a little consideration.

One of the common failings in a great many retail lumber offices is the lack of prompt attention given to customers. I have seen them come in and stand on one foot and then the other like a stranger in church. It isn't necessary to go as far as the bow-legged clerk in a dry goods store, who went up to a lady and asked her what she wanted, and after being told, said, "Walk this way." Maybe she did, but she wouldn't own up to it, and left the store.

But my point is that if you are busy, let him know

that you see him and ask him to look over some plan books or buying magazines until you are thru.

Would it not be a good idea in this matter to have a table in your front office with a copy of the AMERICAN BUILDER on it, and some plan books? I believe that table would pay for itself the first day.

I don't want you to feel that I only want to criticize; but you know your good points better than I do, and I have never gotten anything but a bigger hat by being told how good I was.

If I don't add the car number into the next invoice or fall over a bundling charge, I may write an article on "Retail Lumber Advertising I Have Met."

Oak Flooring and the Retail Dealer

WHOSE FAULT WAS IT THAT THE FLOOR HAD TO BE RELAID?

By W. L. Claffey

HERE has been a great deal written about the care and handling of oak flooring after it leaves the retail lumber yards, but very little has been said to educate the retail lumber dealer in the proper handling

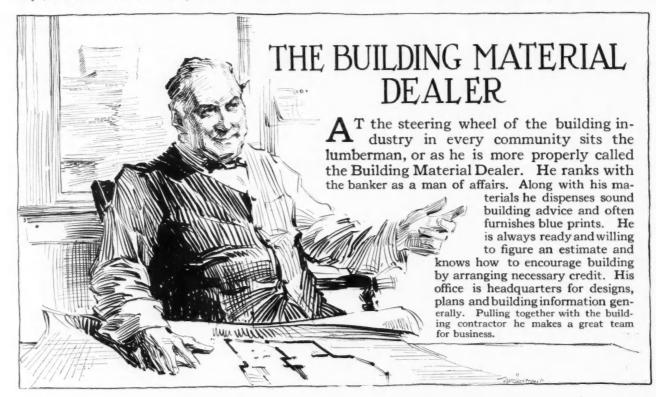

and storing. In a great many yards oak flooring is handled very much like dressed lumber, stored in sheds that are open at both ends, and exposing the oak flooring to such an extent that it absorbs moisture. When oak flooring absorbs moisture it will cause it to swell anywhere from 1/32 to 1/16 inch. When the floor layers receive flooring in this condition it readily can be seen what an imperfect floor it will make. The floor layer and the lumber dealer are always prone to place the blame on the oak flooring manufacturer, in cases arising from the improper care and handling from the retail yards to the job. They seem to overlook the fact that all hardwood flooring will absorb moisture very much like a sponge, and oak flooring is no exception.

A short time ago the writer was in Cleveland during a very rainy day. He went to a small retail lumber yard and found oak flooring being subjected to a very hard, dashing rain. The only protection it had from the elements was an ordinary temporary pine roof. When the dealer was informed that such housing would bring on trouble when laid, he replied that the stock was sold and would be delivered in a few days, and it would then be up to his customer. This

particular dealer. we found out later, did not enjoy a very large trade in hardwood flooring and undeniably the care and housing conditions at his yard were the cause of it. On the same day the writer went to a large apartment house at Cedar Hill, an exclusive residence section of Cleveland, and found the floor layers laying oak flooring in the midst of a very heavy rain storm with the rain blowing in from two sides of the building. Several floors had been finished and pools of water covered the entire oak floors. When the owner and the contractor were asked why they did not put the windows in, or some temporary boards to keep out the rain, they replied that the sash for the windows had not arrived, and that they were too busy to bother with any temporary make-shift for closing the windows. They were also under the impression that a dashing rain would not injure the floors. The owner afterward told me that he intended to sell the building, and that if the floors gave subsequent trouble that he would have no further interest in the matter. I informed him that all the floors that were being rained upon would in a short time, after being dried, buckle up to such an extent that it would be necessary to replace the entire floors.

Some of the large retail lumber dealers have excellent housing conditions for oak flooring. They are usually steam heated and located in a corner of their main shed, properly ventilated, lighted and having ample doors toward the roadway. Proper housing of

Wooden Shingles and "Winter Dollars

HOW THE ONE FETCHES THE OTHER FOR THE BUILDER WHO IS KEEN FOR BUSINESS

By J. S. Williams

Sec'y Shingle Branch, West Coast Lumbermen's Ass'n.

whole building industry to dispel and correct.

It is true that conditions are not nearly so propitious for building in December and January as they December and January building should not be done. on over sheathing in a most simple manner.

One of the most widely used building materials is the wooden shingle, and for all-the-year building, is admirably adapted. It is not a material that will crack in cold weather; no heating of liquid is necessary to apply it to its resting place. It is not a material that a worker must have bare hands to apply, giving the shingler an opportunity to

to wear gloves and be warm and comfortable while working. This means much more efficient and faster work.

And neither rain or snow unfit shingles for laying. In fact the best practice is to lay shingles that have previously been thoroly wet, because they are then in a condition of maximum expansion, and buckling will never occur.

The carpenter or contractor who finds work scarce in the winter season, will do well to cast about his town and see if there are not a number of roofs that need repairing, or re-roofing. A careful survey will disclose many such opportunities, that can very nicely be turned into account.

Another excellent source of winter business is exterior remodeling with wooden shingles. The town

HE time-worn idea that building should cease is an exception which does not have many homes that when the first frost comes, and not start again a new "jacket" of wood shingles would beautify. until the April sunshine appears, is one that Many homes that are awkward in appearance can be merits careful thought and study on the part of the turned into "one of the nicest homes in town" with new shingle siding. Where the old siding is still in good condition the shingles can be laid directly over it at a minimum of cost; or if the old siding is in a are in June, but that is no reason at all why the poor state of repair, can be torn off, and shingles put

The wooden shingle has gained immensely in popularity since the advent of the bungalow; altho its use by no means confined to the bungalow, but because the bungalow demands a siding that is novel, neat and beautiful. There are several reasons for the popa siding material. First, it is simple

ularity of shingles as to put on; has a low initial cost and a low upkeep. Painting is not necessary to the life of a shingle siding, many preferring the natural rustic effect, that softens with age to a rich dark brown. But if color and "life" are preferred, these can easily be had thru the use of creosote stains, in almost any desired color. Moreover, the staining of shingles need not take place nearly so often as the

One doing such work should be very careful to use rust-proof nails (solid copper, pure iron, or zinc-coated nails), or otherwise the life of the nails will be much less than the material that they hold in place. For siding purposes, the thinner shingles are equally as desirable as the thicker shingles, and are cheaper, because on the side of a home, mechanical wear is almost

painting of other forms of painted home exteriors.

The Shingle Sided Cottage Has a Special Grace and Harmony with Its Surroundings.

How Camp Devens Was Built at Ayer

DETAILLS OF THE ORGANIZATION AND OF THE HUMAN SIDE OF THIS HUGE CONTRACT: THE METHODS OF SORTING, STORING, MAKING UP, AND DELIVERING MATERIAL TO THE PROPER BUILDING OR SITE;

THE EQUIPMENT AND ARRANGEMENTS FOR PREPARING AND CO-ORDINATING THE PLUMBING, CEMENT WORK, LUMBER, ETC.

By Peter F. O'Shea
In 3 Parts—Part 2

Completed Section Hospital Unit at Camp Devens. Groups of Hospitals Have Connecting Roofed Walks—All on Same Level, Besides Verandas All Around the Outside.

AVING accounted for the highly important foundation work of hiring many thousand men, purchasing the material and getting it on the ground in time, and arranging for the housing and feeding of the large force of employes, we now come to the actual construction methods which enabled the contractors to accomplish such a gigantic contract in so short a time as ten weeks.

The manufacturers of houses begins right in the railroad switch yard. When a car or a train of dimension lumber stock pulls in, it is shifted by the contractor's job locomotive to the track running along the part of the lumber yard which is devoted to dimension lumber. Beside this track there is a road for trucks, which sometimes back right up to the car and take stock directly from it to the house being built. But this is only in case of special stock specially needed. Ordinarily, gangs of laborers under foremen unload the stock, sorting it as they carry it to the correct piles. "Correct" has a peculiar meaning.

Beside the track, and about fifty feet away from it, is a line of fourteen sawmills and planers. Each mill is run by electricity, wired to it by the contractor's electrical department from a high tension line and transformer, built within a week from the starting of work at the camp. At first each mill also had a gasoline engine attached and ready to work in case the electric power failed, so that there would be no stoppage of work. Later, when the permanent power line of much higher tension was tapped from several miles away and run into the camp for permanent lighting of the cantonment barracks, and so forth, the presence of the two kinds of electric power was considered a sufficient safeguard, and all but four of the gasoline engines were removed to other points in the construction work, like pioneers going West.

Each saw and planer with its table was set up to handle a certain size of work, so that there would be no lost time or confusion from changing. Using a large number of men partly of an unskilled character, it is necessary to form habits and stick to them, and also to make the habits as easy and usual as possible, in order to get fast results, which mean orderly results. The saws were simple circular and ribbon saws, and the planers were only buzz planers, but they did the work.

The unloading gang piled the stock from the cars behind the particular sawmill which worked that size of stock. For instance, one mill would have behind it nothing but two by fours, another two by sixes, and so on. At first all the two by four mills were in a group at one end, then a group of two by six mills, and so on up the planers, which were at the further end of the row. But it was found that when a car came in from a small shipper or even a large one, many kinds of stock shipped together in the same car would necessitate too much walking by the unloaders, including frequent walks the lengths of the mill row. Also, a truck coming after the finished stock for one house also would have to travel the length of the row to pick it all up. Therefore it was found much better to rearrange the grouping of the mills, and break them up into little teams or units, each having within its limits a complete variety of work. Next to a two by four mill was put a two by six, then a two by eight, then a planer, and repeat all the way up the line. Under this arrangement, wherever a car stopped it was near a compact unit of saws which would use up its whole variety. The unloading gang never had to walk very far, and unloading was very much quicker.

Also, this method made it possible to stack the finished product for one building in a compact space, where the truck had nothing to do but back up and go off with it after the shorter period it took the laborers to load it on. The material for each building was stacked separately, and when finished was removed as soon as possible to make room for the next. When moved at all, it went directly to its proper site. Indeed, what went off up the road in a truck was not

Organization for Cantonment Building

spoken of as material or lumber, it was "a building."

The cutting of the proper material for a given building and its despatch to the proper site is secured in the following manner: Every building on the plan of the cantonment as laid out to fit Ayer by the landscape architect of the engineer's force is given a number, roughly, according to its location. For instance, numbers 1 to 76 constitute the first regiment of heavy artillery, the nearest regiment to the railroad. For building purposes, each regiment is called a "unit," and the units are isolated from one another by a distance so large that if an epidemic of disease should unfortunately and in spite of all the efforts of the medical corps start in one unit it would not spread to the next. Therefore, building 77, which is in the Light Artillery, is not by any means adjacent to building 76.

These seventy-six buildings include among them all the varieties of structure needed for a regiment. But a certain number of these will be barracks of the same size and shape, a certain number lavatories, a certain other number also lavatories, but of a slightly different floor plan, and so forth. This is also true for the other regiments. Therefore, the buildings are standardized according to uses and plan, and each type lettered alphabetically, as "Type W," or "Type AA" or "AE." For two or three of these types the same set of plans may suffice, and this the foreman needs to know. And then also there are sheds and stables which are built of a standard width, but of varying lengths.

Therefore, to give the necessary general information about a given building a "Building List" is used. It gives the building numbers, and opposite each number the unit in which that building is, the kind of building or purpose, the over-all dimensions, the type letters, and the plan number by which that type is constructed. Each head of department, superintendent, foreman and engineer has one of these. They are mimeographed on legal size paper, a complete list comprising a score of sheets fastened together. A section

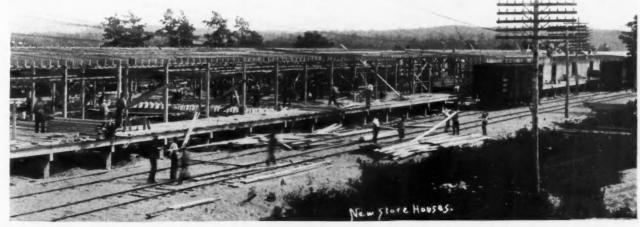

Space Under Buildings Is Filled in if Too Large. If Not, Scarcity and Cost of Labor Were Partly Solved by Leaving Work to be Completed by the Soldiers. Photo Shows Draft Boys Building Wall so That the Winter Winds Will Not Blow Too Cold.

of the list taken at random is as follows:

Bldg.	Unit	Building	Size	Type	Drawing No.
1311	Heavy Artillery	Adminsitration Bldg.	20x 84	AL	28
	Heavy Artillery	Medical Department	20x119	BD	43
	Heavy Artillery Heavy Artillery	Guard House Men's Barracks	20x 49 43x140	BV	29 11
1315	Heavy Artillery	Men's Barracks	43x140	W	11
1316	Heavy Artillery	Lavatory	21x 56	AK	25

Now each foreman of the construction has the necessary outfit of plans to proceed with a given building number. But the sawmill superintendent thought he ought to have a much more succinct thing to work from than a plan, because he was not primarily interested in the exact position each of his sticks would assume after he had them cut. All he wanted to know was how many pieces of a given length of a given dimension he had to cut for each house. He could work much faster and with fewer inevitable mistakes if he did not have to stop to take an abstract of each plan.

So the engineer's department went over the estimator's list of material needed for each building, which had been made out in the first place for the purchasing department, and took off a cutting list for

The Bailroad Tracks Which Are to Serve the Finished Store Houses for the Government Have Been Finished by the Ley Bailroad Construction Department in Time for the Building Construction Department to Use Them for Bringing in Material Right on the Job.

each type, composed of all the lumber which would be needed for that type, in its proper dimensions and proper length. These lists were glued on sheets of cardboard and kept on file by the superintendent of unloading and by the superintendent of the saw mills. A special rack was built for them by each man so that he could reach instantly for the one he wanted. As the cutting list for each type of building occupied somewhat less than a single typewritten page, this was a very compact form. One of the cutting lists is as follows:

Type I	FX		Ва	rracks B		Taken off by A
Size	20'x	133' Res	mount	Station		Checked by B
Item	Size	Finish	Pcs.	Length	Mark	Quant. Remarks
Sills	2x6	Rough	36	14' 0'	2

Under Floor, Etc.	7-8	sq. edge		Random		3059 sq. ft.

When, at the conference which the construction superintendent held with his foreman in his office

being done. When the complete building was cut, he took the memorandum off the board, marked the date of completion on the side, and filed it away, so as to have a record of it in case the truckers or the construction foreman came to the yard looking for it just after some other truck had departed for the site with it. They might accuse the mill superintendent of being mistaken, or stalling them off like the drug store clerk who says, "Willie, here's Mrs. Hightone. You crawl behind the counter. Yes, Mrs. Hightone, the boy left for your house with the package ten minutes ago. It's strange that you didn't meet him on the way down." Men who are very much in earnest about their work are apt to charge even that the superintendent cut the building only in his dreams; whereas the truth possibly was that some other foreman "stole" the building and put it up in place of one of the same type within his own construction territory, to keep his men busy.

On that particular day, Aug. 28, thirteen of these orders for buildings were issued, and by the morning of the 30th all of the thirteen memos. had found their way into the finished file.

Boilers Have Been Erected in Open Complete, and Afterwards Have a Building Built Around Them. One Such Heating Plant Central for Each Unit or Regiment.

every afternoon between 5 and 6 o'clock, the further laying out of the work required preparing the lumber for certain prospective buildings which as yet existed only on the plan or as batter boards, the superintendent's office assistant would forthwith write an order to the superintendent of the saw mill as follows:

Aug. 28.

"Turner:

"Make one bldg, Type AD, mark no. 1116, 3rd Brigade headqrs. Gons."

It saved bookkeeping at the mills, and saved confusion all round, for the superintendent's office assistant to write a separate order for each building, each on a separate memoradum sheet. This memorandum sheet was then used by the mill superintendent, by putting it up into a clamp board, on the wall, not only as an order, but as a file of his work in process of

As soon as he received one of these orders, the superintendent of the saw mills would note the type, reach for the Cutting List of that type, and divide the work among the different mills, according to size, taking off the complete list of each size on a separate sheet. For instance, one of the tickets taken from the partial cutting list shown above would be devoted to 2-by-4's and would read:

Prices Size Cut
162 2 by 4 13 ft. 11 in. Mark 11AA Bldg.
70 2 by 4 6 ft. 11 in. Mark 17AA No.
68 2 by 4 2 ft. 11 in. Mark 17AA 1116
Etc.

For a Type AA building, for example, there would be on the 2-by-4 ticket, 31 different lengths with ten various marks, the whole totalling 868 pieces of 2-by-4.

DUTCH COLONIAL HOUSE WITH SHINGLE FINISH. The walls of this attractive Colonial house, which is built at Union City, Conn., are finished with 24-inch shingles, stained white, the roof being covered with moss green shingles. Shutters are painted to harmonize with the color of the roof. Interesting features of the first floor plan are the large living room with adjoining porch and the pantry, which is fitted out in an elaborate manner. The second floor plan shows an excellence of arrangement which is characteristic of this style of house. The size is 38 feet by 25 feet. F. Alton Clark, Architect.

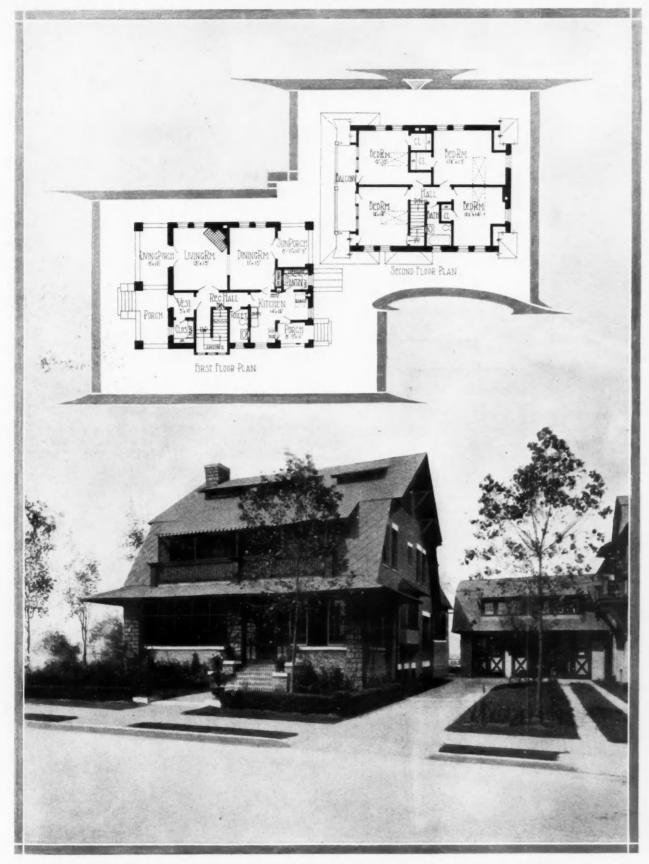

A TTRACTIVE STUCCO HOUSE OF SIX ROOMS. This house follows the story-and-a-half type which has become so popular during recent years. The exterior is finished with stucco in a gray tone with the wood trim painted white. Concrete blocks are used for the foundation walls and the chimney. Details of ornamentation are very effective and well balanced. First floor plan includes screened porch, living room, dining room, kitchen, pantry, rear porch and vestibule. Three bedrooms and bath on second floor. Size, 35 feet by 22 feet, not including porches.

ith rst

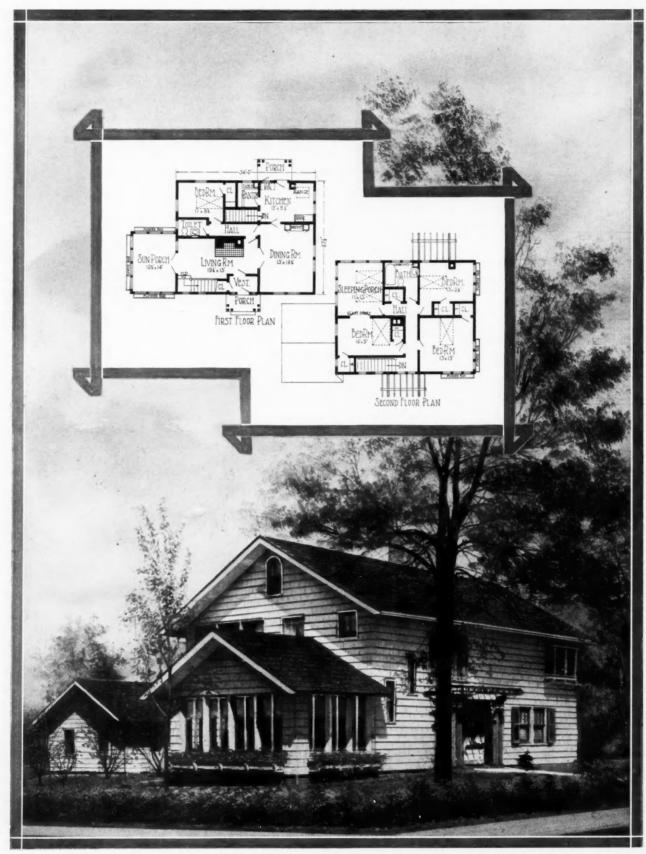

STUCCO HOUSE WITH NOVEL ROOF CONSTRUCTION. One of the noticeable features of the exterior of this house is the roof. It is designed to follow, in a very much modified form, the Japanese style of roof. At each gable end the ridge is given a slight upward curve and considerable overhang is used. The elaborate ornamentation of the Japanese style is eliminated. The first floor plan includes a living room, dining room, kitchen, bed room and toilet. There are two bed rooms, a storage room and the bath on the second floor. The house proper measures 32 feet 6 inches by 25 feet 6 inches on the ground and there is a porch 7 feet wide entirely across the front.

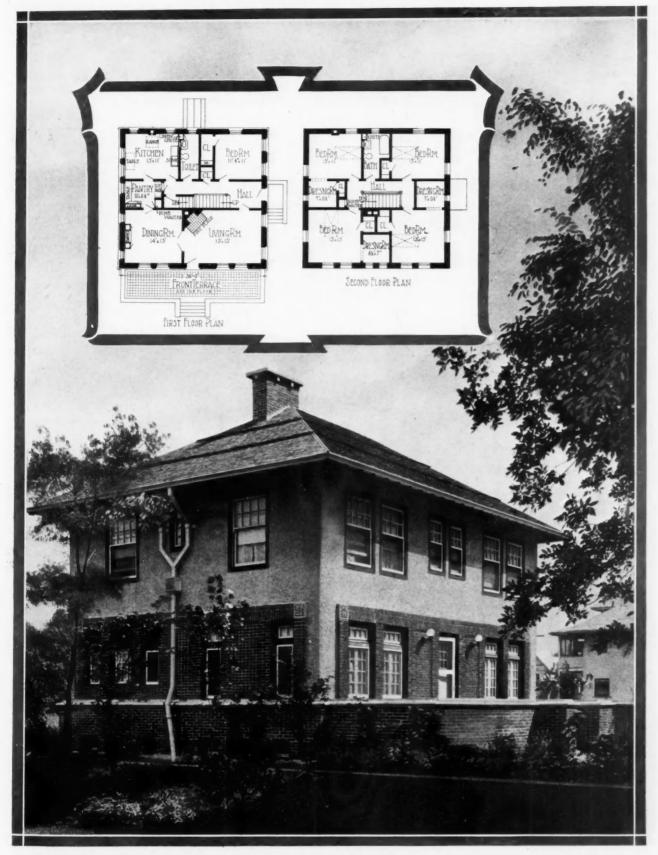

naped per nt.

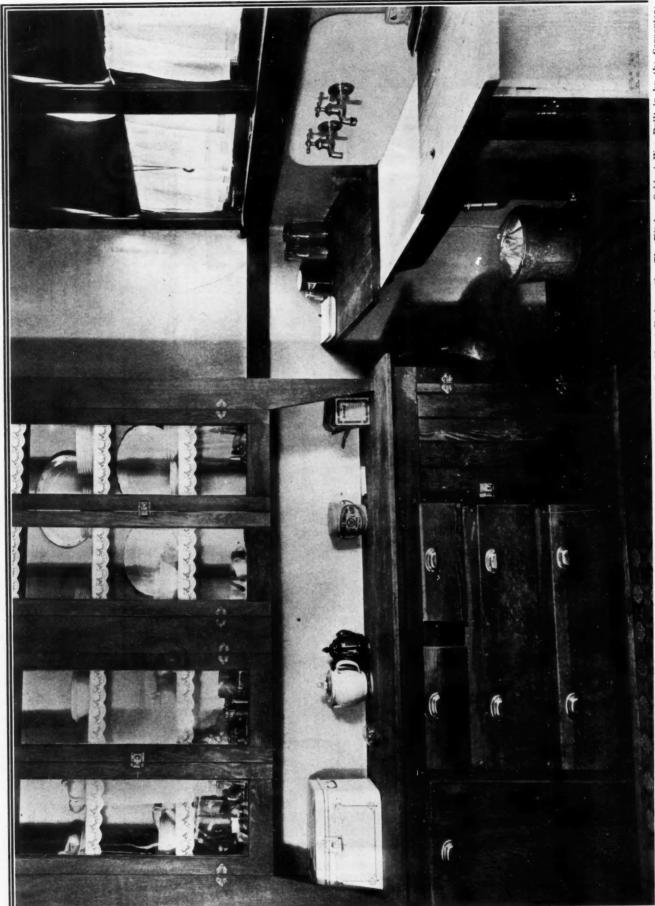

LARGE GAMBREL ROOF HOUSE AND GARAGE. This residence and garage are built at Manhattan Beach, N. Y. Mrs. A. F. Cassidy, Architect and Builder. Walls are of brick, porch columns of cut stone, lintels are of white stone, and asbestos shingles are used on the roof. The type of design used for the house is followed out in the garage. On the first floor, the living room and porch are grouped together and the dining room and sun porch form another group. There is a handy pantry adjoining the kitchen. Four bedrooms and the bath occupy the second floor. The size of house, not including front porches and sun porch, pantry, kitchen wing and rear porch, is 27 feet by 30 feet. The porch widths, front and rear, are each 8 feet, making the over-all dimensions of the house 43 feet by 30 feet.

PLEASANT GABLE ROOF HOUSE WITH STAINED SHINGLE FINISH. The exterior of this house is most attractive, altho its design represents one of the most simple types of construction. The walls are finished with 24-inch shingles treated with a creosoting medium and stained white. The roof is covered with 18-inch shingles treated in a similar manner, with weathered-gray stain. This house is built at Akron, Ohio. Dercum & Beer, Architects. There are nine rooms, including the sun porch, which is one of the attractive features of the first floor. The large sleeping porch on the second floor is a thoroly modern detail. The house measures 34 feet by 27 feet 6 inches on the ground, the sun porch requiring an additional space of 10 feet 6 inches by 14 feet.

A RTISTIC EIGHT-ROOM HOUSE WITH STRUCTURAL TILE WALLS. The walls of this house are of the first floor window sills. The first floor walls are finished mainly with face brick, which is used in the Roman and the standard sizes. Terra cotta plaques, placed at the upper corners of the brick surfaces, add a pleasing artistic touch. A feature of the exterior design is the large front terrace, the walls of which are of face brick with white stone coping, the floor being of red tile. The interior is exceptionally well arranged. Notice particularly the second floor plan. The size is 36 feet by 34 feet.

Possibilities of the Steel Square

ILLUSTRATING THE GROUND WORK OR GOVERNING POINTS IN THE DEVELOPMENT OF CORRESPONDING CURVED RAFTERS.

By A. W. Woods

In the last number of this magazine we talked on the formation of the rafters for an irregular vaulted ceiling, and as we did not say all that we wanted to say, we have thought it would be a good idea to carry the subject a little further by applying the same principle to curved roof rafters, but in this we will go a little further in illustrating how the formation may be determined by the use of the circle and right-angled triangle, the latter being formed by the manipulation of the steel square.

In Fig. 1 is shown the section of a half round mould which we will let represent a semi-circular roof, that is, the curve representing the shape of the common rafters. The next thing is to find or rather develop the corresponding shape for the hip rafter. Now, there are numerous ways of arriving at the required curve, but it is not our purpose to show the

usual diagrams resorted to in finding this curve, but back of it all, no matter what form of diagram is used, they must conform to the universal rule as determined by the divisions of the circle and the square in their relation to one another.

In the plan of this figure are shown the octagon, square and equilateral triangle along with their respective curves for the hip.

Now, if this mould was put in a mitre box and cut on the 0 or 180-degree line the end would represent the curve of the common rafters.

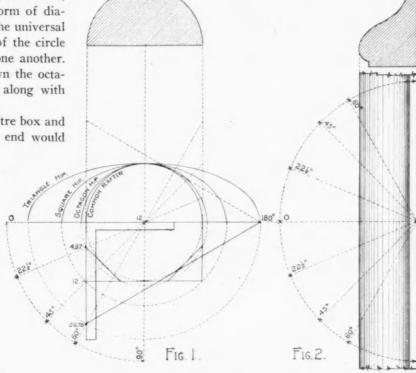

If cut on the 22½-degree line, it would, when looking square at it, represent the required curve for the corresponding octagon hip. If cut on the 45-degree line it would represent the hip for the square corner, and if cut on the 60-degree line would represent the hip for triangle. The elevations of these rafters, in connection with the plan, are shown in comparison with that for the common rafter.

It might be well while we are at

this point to explain what determines the angle that the seat of the hip rests from that of the common rafter. Briefly it is this: As the seat of the common rafter rests on the 180-degree line, the desired angle may be readily found by dividing the 180 by the number of sides representing the polygon. Thus the octagon would rest at $22\frac{1}{2}$, the square at 45, and the triangle at 60 degrees respectively.

In connection with this figure the relation of the steel square is shown to these angles. The intersecting points are given in decimals.

In Fig. 2 is shown a different shape of mould. Suppose we put this mould in a mitre box and cut on the 0 line the end would show as in the section and would represent the curve of the common rafter for any shape the building may have but if cut on the 22½-

degree line and reverse to the other side without moving the mould and make another cut on the 22½-degree

the 22½-degree line and cutting eight such pieces and putting them together we would have a perfect model of an octagon Moorish shaped roof.

The cut having taken care of the required curve of the hip which, of

course, would be true if the mould was cut on any other angle that gives the mitre for the desired corner, but the question is, how to transfer this on a large scale to make the same practical in roof framing. Since we cannot put the full size roof in a mitre box, a workable solution must be arrived at by diagram to obtain the required shape of the hip. As far as the circular roof is concerned this may be obtained by the trammel, as shown in Fig. 3. In connection with this we have shown the steel square, but this need not bother, in case the length of half the avis exceeds the limits of the arms of the square as in that case a couple of straight-edge pieces of any required length set at right angles to each other on a level surface will answer the same purpose. The trammel can also be of wood with pins or brads set at "a" and "b" and with pencil or marker at "c" and by swinging the bar so as to keep the points at "a" and "b" snug up to the straight-edge pieces, the pencil point at "c" will delineate the required curve.

These points are equal to like points, A B and C of the plan. A C represents one-half of the major axis and represents the run of the hip. B C the same for the minor axis and also represents the rise of the roof. A B represents the difference between the two axis, however, in this example the hip resting at 60 degrees from the common rafter. A B and B C are of equal length, or, in other words, the run of the hip for the triangle is just twice that for the corresponding common rafter.

A c' B c c Fig. 4.

Now, by letting the points "a" and "b" move along the tongue and blade of the square the pencil point at "c" will delineate the required curve for the hip to coincide with the curve of the common rafter. But this does not readily apply to any other shape than a true circular roof. In the case of compound curves, as shown in Fig. 2, the trammel could not be used with sufficient accuracy, besides the opera-

tion would be too complicated for practical use.

In Fig. 4 is shown the same problem as in the previous figure, but in connection with the triangle which gives a better idea of the relative shape of the rafters showing intermediate points taken on the rafters, in other words, that part of the hip bounded by A b' c' when set up in proper place will coincide with that part of the common rafter bounded by like letters.

With this we close, but as there are still some points we would like to bring out in connection with compound curves we will take up the subject again in the next number.

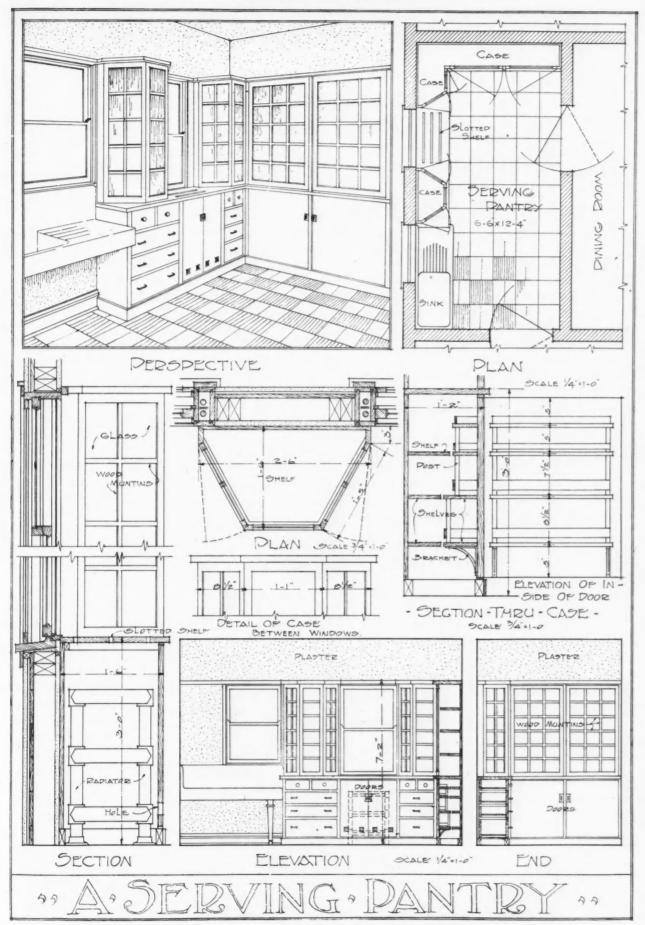

A Serving Pantry Designed by Ralph W. Ermeling, Architect

THIS serving pantry is used for a passageway between the kitchen and dining room, altho there is another door between the two rooms making direct connection. Suggest a serving pantry in some of your new work and see if the owner—or his wife—will not be pleased. Then, too, this pantry is wide enough—6 feet and 6 inches—to move around a bit and to wash the dishes. It is a small work-room as well as a storage space. Double swinging doors make it easy to come and go. Enough space is provided in the cases to keep all of the dishes, and all within reach.

This pantry is especially useful in serving. There is a warming oven under the window to heat dishes. The radiator companies carry these plate warming radiators in stock. The narrow doors in front have small openings at the bottom to admit cool air, and the enclosure is slotted at the top to keep the warm air in circulation. Incidentally this insures a comfortable temperature for the pantry in cold weather. All solid doors—by the way—are flush veneered and the mouldings and muntins of the sash door are of the simplest and plainest type to make them easy to clean and sanitary.

The woodwork is painted white and the walls a very light gray. In this connection, let me say, "Don't try to get along with two or three coats of paint for flat white work." Use three coats of white lead or zinc and two more coats of white enamel. This should insure an evenly covered, unstreaked surface that will wear and that can be kept clean—and look clean.

The cases between the windows and the one at (Continued to page 132.)

Perspective Sketch, Plan and Details of a Well Equipped Serving Pantry. Ralph W. Ermeling, Architect.

The Builder as a Fireguard

CONSTRUCTION METHODS HE SHOULD USE FOR RETARDING FIRE—DETAILS OF FIRE STOPS

By Ralph V. Ermeling. Architect

It would hardly seem necessary to remind builders of the dangers of poor construction in connection with fires, but it is a fact that many a home would be standing unburned today if a little thought had been given to the subject of how to prevent fire spreading thruout a building. Fireproof building does not enter into the question. There may be many good reasons why it is not possible or desirable to build of nonburnable materials, and it is certain that

the great majority of buildings thruout the country are of ordinary construction. In this class buildings are constructed principally of masonry, lumber, stucco over wood framing, with wooden partitions covered with wood lath and plaster or wall board of some kind.

Now, the problem is how to keep a fire confined to the space where it started without passing into any other part of the building. Delaying the spread of fire may save life or terrible suffering from burns, and it will surely save property and the money invested therein. There is no one feature of the house construction which will contribute more to its safety

in case of fire than well placed, efficient firestops. Their use affords a better chance to extinguish the fire before it does much damage.

There is nothing that assists a fire to burn more than a flue of some kind. That is why we have chimneys. Take an ordinary frame wall of a house for instance. The space between the studding and the outer sheathing and the lath and plaster forms a vertical flue. If a fire starts in the basement the flames, smoke and gases can pass straight up into the attic. If the fire starts in the attic the sparks

fall down the dry wooden hollow spaces. And fires have a habit of starting in unexpected places. A fire which starts in rooms which are occupied may, perhaps, be easily extinguished; but if it starts in some unfrequented or inaccessible place the results are disastrous.

Fire-stopping should be arranged to cut off all concealed draft openings, and form an effectual horizontal fire barrier between stories. This also applies

to stopping the passage of fires between floors, and is the principle on which the accompanying illustrations are based. In Figs. 1 and 2 we have a common case, we will say a second-story floor where it joins the frame wall. The 7/8-inch board should be fully as wide as the floor joist is deep. That will prevent fire between the joists from passing upward. The 7/8-inch stop on the ribbon will stop the fire from going up the wall between the studs. These two boards hold the mineral wool or incombustible filling in place.

In the case illustrated by Fig. 3 fire is kept

from passing up from the basement by the 7/8-inch board fitted in between the joists over the sill. This board also acts as a retainer for the filling behind it. If the fire is up higher in the house, Fig. 4 shows how it may be prevented from passing on up into the attic between the roof rafters. This case is where a part of the room under the roof has a sloping ceiling.

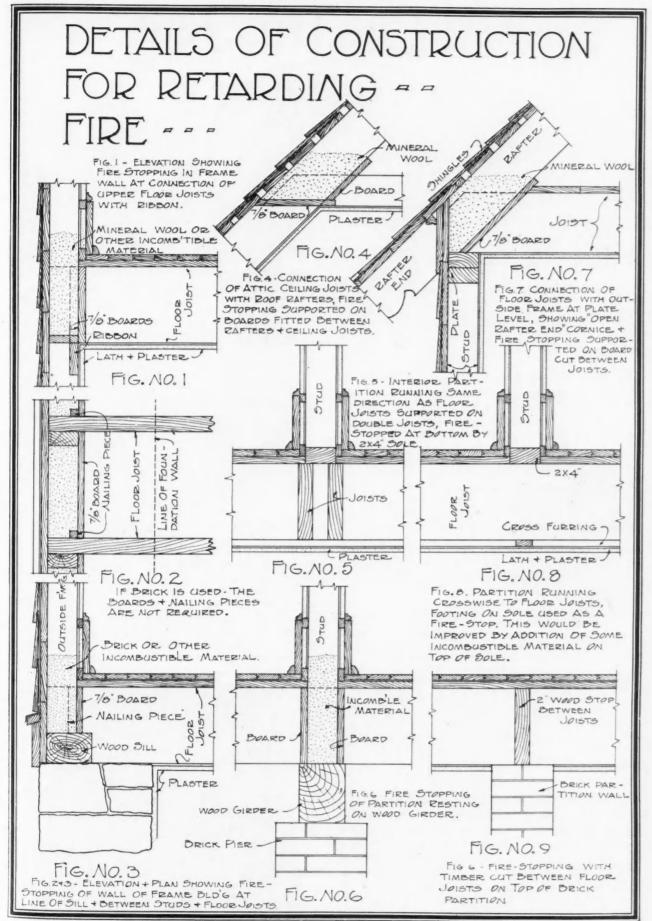

Figure 7 shows a variation in a similar instance where there is a plate at the top of the studs. The reason for giving this illustration is that eaves and cornices are always

Hot Water Circulating Fireplace Heater

The sectional perspective view shows the heating unit of a system which utilizes the fireplace to heat several rooms in addition to the room in which it is placed, by the circulation of hot water thru radiators placed in these rooms. As far

Action of the second of the se

Sectional Perspective View of Fireplace Heater Showing Arrangement of Colls.

as external appearance is concerned, the fireplace is no different than any other fireplace having a cast iron face. Across the back and top of this fireplace, however, there is placed a hot water heating coil of charcoal iron pipe which is capable of furnishing 200 square feet of radiation in addition to the heat radiation from the fireplace into the room.

Piping is carried from the 2-inch flow pipe at the top of the heating coil to the various radiators and a return is installed from each radiator back

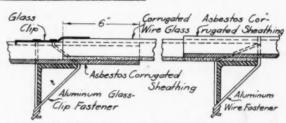

to the bottom of the heating coil. The consumption of water in a properly installed system is about four gallons each season, the same water being used continuously, as it circulates from the heating coil thru the pipe and radiators and back to the coil to be reheated. No water pressure is required and the heater may, therefore, be used in suburban and country homes as well as in the city.

Corrugated Wire Glass Skylight

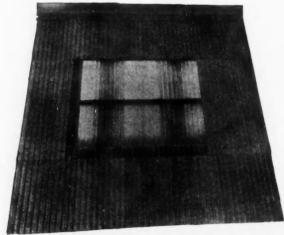

With the development of corrugated asbestos roofing and sheathing there has been brought into use a type of skylight which is notable for its extreme simplicity, easy installation and low cost. This skylight consists of a sheet of corrugated wire glass which nests perfectly with the corrugated asbestos, producing a construction which is non-leakable and fireproof.

It is clearly shown in the illustration that the cost of frames and flashing is eliminated. The glass is placed in the roof

Detail Showing Method of Applying Corrugated Wire Glass Skylight to Asbestos Corrugated Sheathing.

in much the same manner that a sheet of the corrugated asbestos is attached, a metal clip being added to hold the glass from slipping. The roof is usually placed on angle iron purlins, a special aluminum wire fastener being used to hold the sheets in place. These fasteners are placed at the high point of the corrugations and have a soft metal head which closes the hole, making leakage impossible. At the bottom of the skylight sheet the aluminum wire glass clips above mentioned are installed in the same manner as the fasteners. These features are shown clearly in the sectional detail accompanying.

Photographic View of Corrugated Wire Glass Skylight Showing Simplicity of Its Construction.

Humidity Is Important in Heating Problems

Most of us have a general idea of the effect of too little moisture in the air we breathe. We know that dry air has a harmful effect on the skin, the hair, the nose, the tonsils and other glands and tissues and we know that it takes more coal to make us comfortable when the air is dry than is required when proper humidity is maintained. We know that dry air ruins our furniture, warps the woodwork and causes plants to wither and die. We know these things, but what do we do about it?

The illustration shows the details of a combination radi-

Perspective Detail Showing Parts and Indicating Strength of Humidifler, Which Also Serves as Shelf or Seat.

le to he

ad he

ns

he

ial

ator seat and humidifier which effectively eliminates dry air from the room in which it is installed and at the same time furnishes a most attractive piece of furniture. The moisture is supplied to the air by evaporation from a heavy galvanized metal tank which covers the entire top of the radiator and is completely concealed by the art metal top. The back edge of this tank is shaped in such a way that a portion of the upward moving air is caused to pass across the surface of the water in the tank, after which it is caught by the air passing the forward edge of the top and carried into the atmosphere of the room. The air passing over the water takes with it the water vapor resulting from evaporation so that the atmosphere of the room is constantly being supplied with moisture from the humidifier.

The art metal top is constructed of No. 12 gauge pickled steel and the finish, which is furnished in exact imitation of any wood specified, is baked on at 280 degrees Fahrenheit. This finish is durable, elastic and cannot be affected by the heat from the radiator. There is a back piece of galvanized iron which causes the humidifier to act as a shield, protecting the wall decorations and throwing the heated air out into the room.

Some of the most important features of this device are, then, that it supplies moisture to the air, it produces an

even temperature by deflection of the heated air away from the wall, it protects the wall decorations and draperies, it will support 600 pounds as a seat or shelf and it aids in harmonizing the radiator with its surroundings.

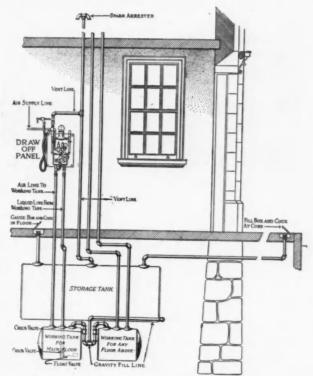

-

Gasoline Delivered by Air Pressure

A system which stores any liquid and distributes it by means of air pressure is shown in the accompanying illustration. Its most common use is in the garage where it is used for the storage and distribution of gasoline or oil. Nearly every public garage has equipment for compressing air used to inflate tires; this equipment may also be used to operate the gasoline delivery system.

The system consists of a large storage tank, smaller working tanks and draw-off panels for each of the working tanks. Gasoline is piped into the storage tank, from the supply wagon, from which it runs by gravity into the working tanks. The working tanks are filled automatically between each discharge and in case the level of the liquid in the working tank becomes too low during the discharge, a float valve closes the discharge line and allows the tank to fill before any more gasoline is taken from the tank.

To operate the panel, exert hand pressure on a finger valve and move the handle to the left; this closes vent line of working tank, opens air pressure and gasoline delivery valves on panel. Liquid will flow thru the meter, where the amount of discharge is indicated, and out thru hose and discharge nozzle. To shut off flow, return handle to original position, which allows air to escape from working tank, which refills

Showing Principal Parts of Air Pressure Liquid Storage and Delivery System.

with liquid. The liquid cannot flow unless hand pressure is exerted on the finger valve, which provides for safe operation. A check valve holds liquid in the system so that discharge begins as soon as panel is adjusted for it.

Contractors and building material and equipment dealers are qualified to make installations of this system. The manufacturers maintain a staff of engineers and designers to assist their agents in making installations.

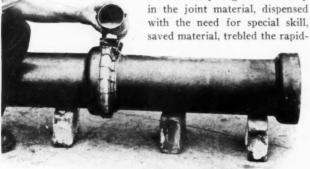

Perfect Tile Joints Made With New Mold

Good results lately achieved in the use of a poured joint of portland cement grout for vitrified sewer pipe indicate that this method of joining pipe may enjoy considerable use from this time forth.

Stringent rules for inspection of building drainage have prompted a large amount of research toward the development of a joint that is less dependent upon the element of special skill for success than is the case with the ordinary hand troweled joint of cement. Previous experiments have been

along the line of discovering a new material and some of them have been appreciably successful, but the latest research has been based upon the idea that a new material was not needed so much as a new method of applying it; one which would obviate the cracking of previously made green joints, when the ensuing joints were being manipulated.

In solving this question the inventors appear to have developed greater density in the joint material, dispensed

The "Fish-Scale" Type of Mold Used to Form Poured Grout Joints Between Vitrified Sewer Pipe.

ity of operation and done away with the need for so much working room in the trench. Against these advantages must be reckoned the expense of equipping with joint molds and also the invariable caulking of the joint with oakum, before the grout is poured.

Several molds to accomplish the purpose have been designed and patented. The one used in a recent series of tests by the Sewer Pipe Manufacturers' Association consisted of a series of galvanized sheet iron sections overlapping like scales and strung on two small steel cables which clamp around the two sections of pipe to be joined during the pouring operation and affording a degree of rigidity for the line of pipe during the time of setting.

The Akron tests were conducted with the twofold object of determining the imperviousness of the joint and testing the comparative merit of various consistencies of grout. It was found that a mixture only slightly less ductile than thick cream was about the right consistency. A one and one mixture of portland cement and sharp sand of medium fineness, such as is used in the final grouting of a brick pavement, made the best showing. Every joint poured with this mixture

was impervious, withstanding a test of 15 pounds per square inch without so much as a seep.

Two joints poured with cement of the consistency of mush had flaws at the lower side of the joint, showing that the thicker mixture of cement had failed to penetrate to the bottom of the mold.

The poured joint is neater in appearance and wastes no cement. It is not uncommon to use three times as much material in a troweled joint as the poured joint requires.

Close View of Poured Grout Joints Indicating Their Neat Appearance and Economy of Materials.

The main point, however, is that the poured joint seems to afford a means by which unskilled labor, with ordinarily careful supervision, can produce a joint that will stand the most exacting tests proposed by sanitary codes and fully satisfying the requirements of building drainage.

HENRY P. BOYNTON.

Self-Regulating Garage Heating System

The man who desires or must have all-year-around service from his automobile is confronted with the problem of garage heating. A freeze-up is costly and the inconvenience and strain on electrical equipment of starting a cold engine is something which must be eliminated. The heating system which meets every requirement must operate economically with little attention and must maintain the required temperature uniformly. This requires automatic regulation.

A simple installation of a system which meets these requirements is shown in the accompanying illustration. For the one-car garage, the equipment consists of a self-regulating heater of cast iron, 30 inches high, a radiator 1 foot 1 inch high by 7 feet 3 inches long, with the necessary pipe connections and radiator supporting brackets. For larger garages, another radiator of the above size is added for each additional car and there are two larger heaters which are used in place of the smallest size in the larger garages. The largest installation from one heater is for a ten-car garage.

The water is placed in the system thru the expansion tank, which is at the high point of the system. This expansion

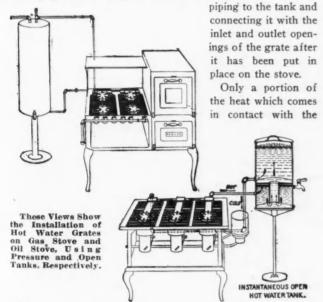

Self-Regulating Garage Heater Which Requires Little Room and Maintains Uniform Temperature with Little Attention.

tank is used in connection with an air-tight float with a lever and connecting rod to actuate a griddle damper in the heater top, which forms the regulating feature—a very important part of the system. In cold weather the water in the lower part of the expansion tank contracts, lowering the float and opening the damper, thru the lever mechanism. As the garage becomes warmer, the reverse operation takes place and the system quickly comes to the point of steady operation as external variations are overcome.

Another important feature is found in the construction of the cast iron parts of the heater. The water jacket completely surrounds the combustion chamber of the heater so that there is no excessive heat on the external surfaces of the heater to injure the car driven close to it. In place of a great amount of heat being concentrated at one point, this system distributes this source of heat across the end of the garage, and radiation gives it to the atmosphere in the building, setting up a circulation of air which carries the heat to all parts of the interior. The heater may be situated in a corner of the garage, in a basement, pit or it may be placed in a separate room or even in a detached small house.

Hot Water Grate for Gas and Oil Stoves

A hollow grate which, when placed on a gas or oil stove in the position of the ordinary grate and properly connected to a tank, will supply hot water for the household by utilizing a portion of the heat which is ordinarily wasted in preparing a meal, is shown in the accompanying illustration. These grates are made to fit the stove so that the installation of the equipment is simply a matter of installing the proper

lower surface of a cooking utensil is absorbed. The remainder is deflected outward and downward and is ordinarily allowed to rise into the air above the stove. With the hot water grate installed, however, a portion of this deflected heat is absorbed by the metal which encircles the burner just below the utensil. This heat is, in turn, absorbed by the water within the metal shell of the grate. Water circulates from the tank around the grate and back to the tank again, constantly absorbing heat from the grate as long as the burner is in operation.

The grate may be for a single burner, such as is commonly the case on an oil stove, where a separate grate is used for each burner; or the grate may be for two burners, the hollow shell being continuous around each of them, as is the case on an ordinary gas stove, where each grate serves a front and a back burner. The tank may be of the pressure type with cold water supply automatically taken care of, or an open tank may be used, which must be filled by hand as often as is required.

Flange Moulding Saves Money on Wall Board Jobs

There are any number of places where wall board might be used to advantage, but where it has not been used because of difficulty in installation. The ordinary installation of wall board requires the driving of many nails and the exact framing of the supporting structure. These items increase the cost of using wall board and the method is fundamentally unsatisfactory in a great many cases because there is no

allowance made for expansion and contraction of the wall board. Working with these things in mind, a Tennessee firm has perfected a patent flange moulding which makes installation of the wall board easy, mechanical and economical. When the moulding is used, headers and nailing pieces are eliminated, the wall board is not nailed along the edges, expansion and contraction is automatically taken care of and exact spacing of studding and ceiling joist is disregarded, obviating much trouble where door and window openings occur and allowing a better panel arrangement.

At the time of installation, this moulding is especially appreciated in finishing the ceiling. For wall board finish over brick walls, old plaster and other uneven surfaces it works to very good advantage, eliminating the use of furring strips. The wall board may be quickly and easily removed at any time from any panel made with this moulding, since there are no nails driven thru the wall board at any point. The illustration shows, in a limited way, the application of the moulding in a few of the many parts of a house interior or other place where wall board has been found readily adaptable. The mechanical features are evident and the appearance is very attractive. The standard forms, which include four mouldings and three stops, are manufactured in clear yellow pine, but special forms can be obtained in oak, gum, birch or mahogany.

Noon Hour Talks by the Boss Carpenter

Talk No. 64.—Farm Series No. 5—Implement Sheds

THE BOSS TELLS ABOUT THE NEED OF HOUSING FARM TOOLS AND SHOWS HOW TO BUILD TWO TYPES OF IMPLEMENT SHEDS

HE other day," said the Boss, "I had a call from a young farmer who lives a few miles out from town. He is a progressive young fellow and tries to run his farm on a business basis, and not on the principle that 'what gave grandfather a living ought to be good enough for me.' As fast as he can get the money together, he is improving his place with new buildings where they are needed, and repairing the old ones to lengthen their time of service.

"This farmer has been interested in our talks on farm buildings and he came to me with a proposition that he thought needed immediate attention.

"'You know, Boss,' he said, 'I saw the statement the other day that over fifty million dollars is lost every year on American farms because implements and machinery are not properly housed. Now, I have invested about one thousand dollars in farm tools and machinery of various kinds, and have no place

I want to drive thru the barn or granary. One of my neighbors thought that he could leave his tractor outside last year, but he found that the damage done by one winter's exposure was enough to pay the cost of some simple structure which would house it, together with other farm implements. What can you do for me in such a case?'

"We went into the matter," said the Boss, "and found that the census figures showed that the average investment per farm in farm machinery was about two hundred dollars. But since these figures are based upon all sorts of farms, it was estimated that a fairer basis for our figures would be about one thousand dollars for the average farm belonging to a progressive farmer. While some instances show that a given machine will last for twenty years with one man, the same machine left out in the field where he quit work the year before, would last another man only five years. A conservative value for the life of a farm

machine or implement might be taken as ten years.

"Owing to the fact that most good farm machinery is well built, it is reasonable to figure that the life of this machinery could be extended to fifteen years if

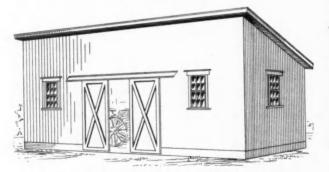

Fig. 5A. Exterior of Shed Type of Implement Shed.

to store this equipment except in driveways of my granary or barn, and in a few little sheds and out-buildings. I find that the larger machines are in the way and that I always want some tool that may be in any one of a dozen different places.

"'I have ordered a small farm tractor for my spring work, and must have some place to put it under cover so that I will not have to run it out doors every time

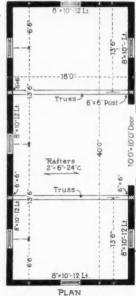

Fig. 5B. Plan View of Shed Type Building.

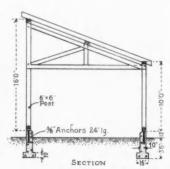

Fig. 5C. Section of Implement Shed Showing Trusses.

it is properly housed and kept in repair. Otherwise, the five-year period of usefulness is nearer correct.

"We finally figured out that he could build a good, serviceable implement shed for two hundred and fifty to three hundred dollars that would meet his needs, and that the saving that would result would really allow him to spend as much as eighteen hundred dollars and still break even over a period of time. But this expenditure was not necessary. He could see that his simple implement shed would pay for itself in two or three years when he considered the losses of some of his neighbors who left their machinery and tools outside or in places where the rain, snow and sun could get at them.

"This man could see that he was adding to his property, and providing a place where all of his equipment could be collected under one roof where he could find it on short notice. He would have a building in which machine repairs could be made easily, and a dry, sheltered space for newly painted or well greased implements which would be ready for the work of the coming season.

n, the

work

y five

farm

ement

years.

et that

hinery

onable

life of

be ex-

ears if

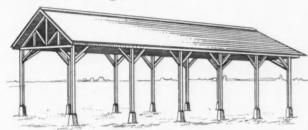

Fig. 5D. Exterior of Open Type Implement Shed.

"The two common kinds of implement sheds which we considered were the 'open shed' type and the 'simple shed' type. The open shed type will do where the exposure to rain and snow is not great, but the closed, simple shed type makes the better building. The open shed is the cheaper building, but the closed shed gives greater protection to the tools and machines and will pay for itself in the end.

"In choosing a design for a shed you must balance low cost with serviceability. In other words, the building must fit the machinery that is to go into it and should allow easy access to the machines. Strength is not the main consideration in such a structure, as the only loads it has to carry are those due to snow and wind pressure. For this reason, the framing may be light, thus allowing a cheap and economical building.

"The general layout of the floor space will depend upon the size and number of machines to be stored. Machines which are to be used frequently should be placed so that they can be taken out of the shed without moving other equipment. Small tools and machines can often be stored under the projecting parts of larger machines. Experience has shown that sheds either 18 feet or 26 feet wide are the most serviceable since they are adapted to the size of various tools and equipment. Interior posts should be avoided if possible, as they are in the way when machines are

to be moved. A simple type of roof truss will accomplish this purpose.

"In order to obtain an idea of the floor space needed in a given case, the following table may be used:

Roofing for Generations to Come

By Frank S. Fogg

OW many appreciate the important part the roofing slate industry plays in the industrial world? When one considers that the roof covering of any building is of the greatest importance, we wonder where all of the material comes from. Upon the roof depends not only the durability and

J. E. Aldred's Gate Lodge, Locust Valley, L. I. This is rather a pretty little bit, showing what can be done with slate on a small roof. The slate is being shipped for the country house now being erected by Mr. Aldred on this estate. Bertram Grosvenor Goodhue, architect.

preservation of the entire structure, but the safety of the contents and the comfort and health of the occupants.

It is necessarily subject to more exposure than any other part of the building, and final economy is lost when cheap and perishable materials are used. No matter how well your house is built, if the roof leaks it causes constant repair and expense, besides damage and annoyance.

There are innumerable forms of roofing materials

made by man, such as tin, corrugated iron and almost endless varieties of composition roofings, such as tar, asphalt, asbestos and felt, all manufactured thru more or less elaborate processes.

There is only one kind of roofing made by nature, and used in its nat-

ural condition, and that is slate. Had you ever thought of that? Slate is taken from the ground, from the quarries, in large blocks, quarried from solid living rock, from 200 to 300 feet below the earth's surface, pure, just as the all-wise Creator planned, and is split into the proper thickness and trimmed to the various

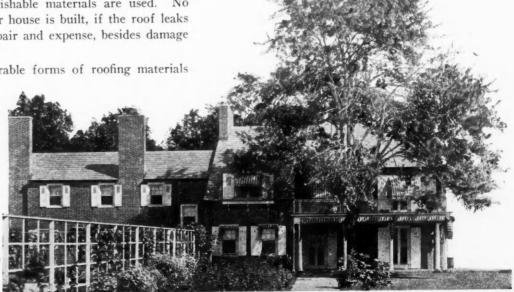

> sizes, but the substance of the rock never changes. It is the same well known slate rock that cannot absorb anything, and therefore cannot decay. Manufactured slate, at the quarries, is left out in the open, subject to the elements. There is no "wear out" to a slate roof.

> As far back as the fourteenth century slate was largely used as a roof covering in England, Wales, Ireland, Scotland, Spain and France. Many of these very same slate are in use today, having been relaid and used a second and third time.

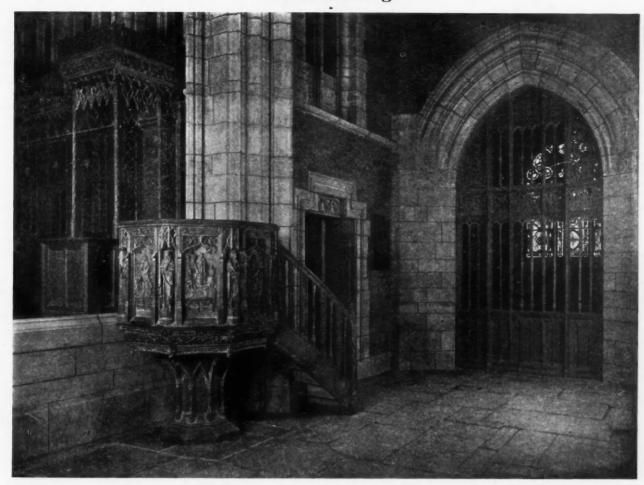

> In our country the three largest producing states of slate are Pennsylvania, Vermont and Maine. Marvin, in his history of Bennington, Vermont, says that slate was quarried in that town in the years 1750-1753.

In 1905 ancient tombs were discovered and opened in England. From the flint implements, pottery, etc., found, some were considered to date back about 1500 years. The tombs in question were composed of

slate rock and undoubtedly came from Wales.

Residence Miss E. A. Watson, White Plains, N. Y. Architects, Delano & Aldrich. Another example of effective roof treatment.

Slate Floor. Chapel of the Intercession. Architect, Bertram Grosvenor Goodhue. Slate is being largely used for these better-class buildings. The charm of the old cathedral lies not alone in its architecture. Time has added a phantom touch of something intangible, inexplainable, fascinating. Our American slate floors are veritable counterparts of those of the cathedrals of the Old World, a remarkable feature being the suggestion of age. These floors are also used for porches, loggias, etc.

This evidently shows that our forefathers built for years of tomorrows. They built "for the generations to come," for their children's children. They built homes, and a home, to be a home, must have a permanency that will endure the buffets of time—that will weather the storms of ages. Beautifully, wisely and economically our forefathers built. The wonderful colonial homes of New England are a heritage of their wisdom. Practically untouched by time's ravages, they stand as a monument to building foresight, to a wise choice of materials, to the permanency and to the beauty of slate roofs. Year after year it stands unaffected by excessive heat or icy cold. Rain cannot mar it. It defies wind and laughs at flying hot sparks. For what fire is hot enough to burn solid rock? Recent tests made show that before slate would begin to discolor they would stand a heat of 1,800 degrees, and before they would crack stood a heat of 2,900 degrees. Very few can comprehend what this means.

at ct to

in in ite

ng ont enar-

red lint

ere ars.

One of the most valuable assets or talking points favorable to slate is the wonderful weathering effect developing into soft, rich and mellow shades of grays, russets, purple and greens.

Artists, students of colorings and chemists have spent considerable time in trying to equal the wonderful combinations of the weathering effect. It emphasizes, more and more effectively, the fact that Nature has planned well for slate. Whether a building is a costly mansion of brick, stone or wood, or an artistic bungalow, or a more modest dwelling, no matter what color of paint is used on the structure, the weathering effect of slate harmonizes beautifully with the color scheme of the structure.

The owners of some of the quaint, artistic, unusual and beautiful homes and chateaus in England, France, Spain, Scotland, Ireland and Wales take much pride in pointing to the age and beauty of their roofs, all made possible by the weathering effect. The producers of slate make it possible for the builders of churches, colleges, public schools, office buildings, railroad stations, factories and residences here in America to have equally as beautiful and everlasting roofs as our friends and neighbors in Europe. We can give you the same "English," "French," "Spanish" or "Welsh" effect.

B UILDING for permanence is a good rule for everybody, whether on the road or off.

L IFE is one chuck hole after another for the farmer on a bad road.

Reinforcing Masonry

THE STRESSES THAT STRUCTURAL MEMBERS HAVE TO WITHSTAND-FACTORS OF SAFETY By M. L. King

ASONRY beams and floor slabs have for years been built with the most economical combination of proportions of masonry and steel. The science of designing has been highly developed; but unfortunately for the building public, walls, especially brick and block walls, have been built in accordance with time honored custom. They have been stiffened by the use of some more brick or blocks.

The logical thing to do is to use masonry thick enough to support the load coming upon it, then any additional stiffness of wall necessary to withstand wind or side pressure of any kind should be provided by means of steel laid in the mortar joints or in rare cases, it may be necessary to place steel within the blocks and fill them with concrete.

In bending any material or substance there exists only three kinds of forces acting upon the material. If these three kinds of forces are thoroly understood and properly resisted, the structure will not fail.

While it is possible to go into the whys and wherefores far enough to befuddle any of us, we can think of them in a simple way, and figure them simply. In this way each man can take care of the problems that come up in the minor buildings and will be in a position to understand and intelligently execute any work on large buildings.

The three forces, or stresses as we often say, are compression, tension and shear. The first is a force tending to crush the material. The tension stress is

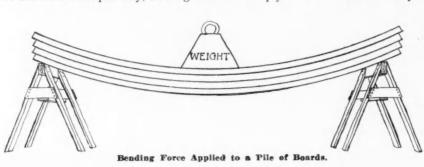

Bending Force Applied to a Green Twig.

a force tending to pull material apart or to elongate it. Shear is the force tending to move one portion of the material sidewise on another portion. For instance, in a floor slab we can see where it would be possible for a portion of the floor to drop thru.

These forces combined in bending are illustrated very nicely in the bending of a green twig. If you are not already acquainted with these forces, take a

green twig as large as you can bend handily and bend it. As shown in the illustration, you will notice on the outer part of the curve there is a tensile force or stress occurring and the bark actually pulls apart. It gives or, technically, it is strained. On the inner side, that is, the side at which you have applied the central force, the bark compresses

or crinkles up. That is, shortens, due to a compressive force.

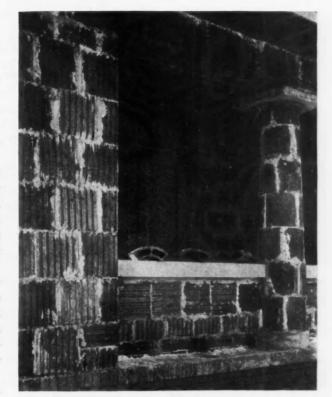

Sometimes, if you will bend a stick near the end, it will split out because the outer part of the curve is pulling and the inner side is pushing, and if the two sides are not knit together rigidly it will split and the portion of the twig on the inner part of the curve will at the end project beyond the portion of the twig, that is, on the outer part of the curve. Thus, the material has failed in shear.

You have undoubtedly seen the same forces at work in handling lumber. We will suppose there are four boards lying on top of a pile, perfectly flush at each end. If a man at each end picks them up, they will sag in the middle and the ends of the top board will stick out past the first one below it and it will stick out past the next one below it.

If they had all been nailed or glued together in order that they could resist shearing forces, they would have bent very much less and the ends would have remained flush. Any bending that would have occurred would have been due to compression which naturally shortened the upper board and tension which actually lengthened the lower boards.

The next question is to know, under various circumstances, how strong are the forces at work on a beam or a floor slab, how strong our material is, that is, what ability it has to withstand these various forces. Naturally we can know this in a general way by testing but we cannot know exactly in every case how strong material is or exactly what the wall or floor slab will be called upon to withstand. All we can do is to deal with averages. Then build several times stronger in order to avoid danger.

The amount by which we increase this strength over and above these requirements is our factor of safety or as it has been very aptly called our "factor of ignorance."

Detail of Round Tile Porch Column.

The convenient way of using the factor of safety is to think of the strength of any building material in two ways. One is its ultimate strength, that is the force which would be required to actually cause that material to fail in a testing machine, and the other figures which we should bear in mind is the safe strength of that material.

In the case of masonry we generally use a factor of safety of 6 to 10, depending upon the material and to what use it is put, also what the result would be in the case of failure. For example, you would

use a high factor of safety (low safe strength), where life would be sacrificed by failure and a comparatively low factor of safety where only a moderate amount of property would be lost by failure.

In any case, it should be borne in mind that a building is built to stand, otherwise it is a loss to the owner and no credit to the builder or the material. But there is no such thing as absolute security against failure.

Elasticity is the property of material which enables it when compressed or stretched or bent to return to its original shape when the force is removed.

If the material is perfectly elastic (Continued to page 128.)

Bungalow with Ashlar Masonry Walls

The bungalow shown in perspective below is the home of B. M. Houchens, of Independence, Missouri. It was designed by Clifton B. Sloan, architect, of Kansas City, Missouri. The exterior walls are finished with stone with the exception of the bays, which are finished with stucco. The massive appearance is very well fitted to the type of design which is used and the details of ornamentation about the porch and roof are all appropriately chosen. There is a balcony above the front porch and the front main wall of the house is carried above this balcony to a gable. The cornice detail of the main roof is carried continuously around the balcony and this detail is repeated for the cornice of the hip roof dormers.

At the rear of the large living room, which is extended entirely across the front of the house, a set of two walls

separate the dining room and kitchen yond these rooms, at the rear, there are lish style. The bedrooms, bath and hall a sleeping porch, breakfast room and rear porch. The space between the two dividing walls is utilized for closets and a small hall near the bathroom.

The living room and dining room from the two bedrooms and bath. Be- are finished in oak, following the Engare finished with white enamel. Floors are of oak. The attic is well lighted and has been finished so that it is useful for a variety of purposes.

Floor Plan of Bungalow Shown Below. Size, 63 Feet by 32 Feet 6 Inches.

Residence of B. M. Houchens, of Independence, Missouri, Having Exterior Walls of Ashlar Masonry. The Building is Well Balanced and Attractive. Clifton B. Sloan, Architect.

ing-

hall

oors

hted

eful

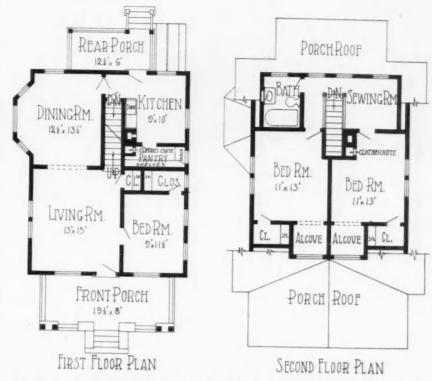

The house shown in the accompanying perspective and floor plan is an inexpensive structure which is well arranged for the comfort and convenience of the occupants. The exterior is simple but attractive. The walls of the building are finished with shingles up to the cornice line and with stucco on the end gables. The porch gable is finished with shingles.

The porch design is simple, consisting of four brick piers with connecting walls carried only up to floor level, balustrades of brick and railings of simple wood frame. The porch roof is supported only by the outside piers, upon which are mounted double square columns with ornamental caps. A generous overhang is provided for the roof, which has a pleasing effect on the appearance of the building.

Entrance from the front porch is into the living room, which is a room 13 feet by 15 feet placed in one of the forward corners of the building. A large cased opening leads back from the living room into the dining room. There is a three-window bay in the dining room which contributes very largely to the pleasant aspect of this room. A double-acting door is placed in the interior wall between dining room and kitchen. The basement stairs, are entered from the short hall between these rooms. A large pantry is provided which is fitted with

shelves and a table. A clothes chute is available from the pantry.

There is one bedroom on the first floor, this room being entered from the living room and terminates in a passage between the sewing room and the bath on the second floor. There are two bedrooms on this floor, arranged in a symmetrical manner about the central wall. Each has a large closet and an alcove having a large window in the forward wall

Floor Plans of House Design Shown Below in Perspective. Size, 23 Feet 6 Inches by 43 Feet.

Seven-Room Bungalow Finished With Shingles. Porch Piers and Walls Are of Brick and Porch Floor is of Concrete. The Gable Roof Has Been Used to Advantage in This Design.

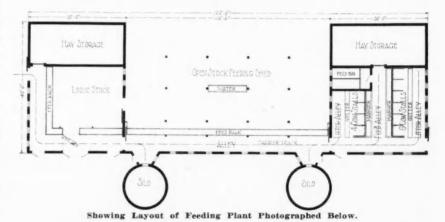

Beef Cattle Feeding Plant

The photographic view below shows a beef cattle feeding plant located near Summitville, Indiana. The plan shows the arrangement of the buildings with the shed between them. One of the barns is arranged as a dairy stable for ten cows, there being a mow space above and to the rear of this stable. The other building is arranged for loose stock and in this building there is also mow space above and to the rear.

It is 62 feet 6 inches between barns and this space is roofed over from the front to within 10 feet of the rear ends of the barns. A feed rack is carried across the forward end of the enclosed space and into the loose stock stable. A water tank is placed in a central position within the feeding shed. There are two tile silos, one at either end

extends the full length of the forward alley from one building to the other. There are switches at the silos and at

of the feeding shed. The carrier track the three alleys in the dairy stable. The track is used for both feed and litter carriers and is a great help in doing the work.

Beef Cattle Feeding Plant Near Summitville, Indiana. The Plant Consists of Two Barns Set 62 Feet 6 Inches Apart With a Roofed Yard Between, Which Is Used as a Feeding Shed. The Equipment of the Plant Is Modern In Every Respect.

Farm Building Plans

High Grade Poultry House

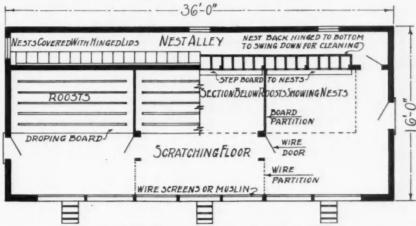

The poultry house shown in the illustrations on this page is a good example of high grade modern poultry house design. It is a building 36 feet by 16 feet of the saw tooth roof type, of frame construction above a concrete foundation. The building is designed to face south which provides plenty of sunlight in the farthest corner of the building on a bright day. The front wall is practically all given over to ventilating screens of either fine wire mesh or muslin.

The interior of the house is divided into three parts, care being taken not to interfere with the ventilation in any way by this division. The arrangement of furniture in these three parts is practically the same. A generous size scratching floor is provided at the front, then the roosts and the nests along the rear next to the alley. The dividing partitions are built of boards from the rear wall to the forward end of the roosts. A wire screen door is placed in each of the partitions at this point and the partition is carried on from the door to the forward wall with wire cloth.

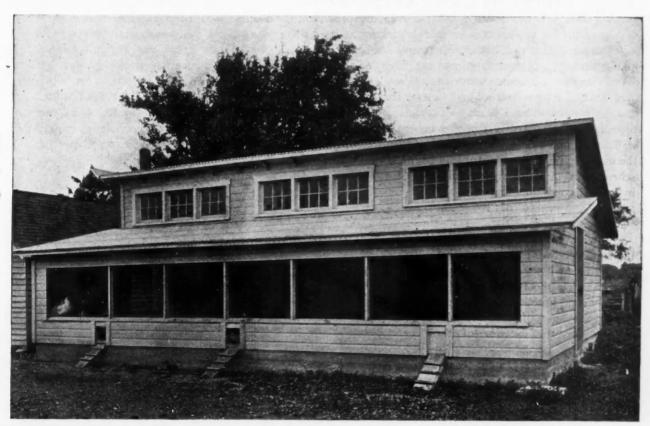

so that the nest will be easily cleaned from the nest alley. The tops of the nests are also fitted with hinged lids. All of the furniture is removable for cleaning. This is a necessity in all poultry houses because if the entire inside of the building is not given a thoro cleaning at frequent intervals there is certain to be trouble from insects and other sources. Some of the old-time poultry houses were allowed to

all natural means of purification-ventilation and sunshine.

Some poultrymen believe that it pays to spend the money to seal up the inside of the poultry house with wall board, closing all of the cracks and finally applying two or three coats of thin paint to fill the pores of the board. This is perhaps more than the average man cares to do in finishing his poultry house, but it is still true that money spent in

Plan of Poultry House Shown in Perspective Below.

Modern High Grade Poultry House of the Saw-Tooth Roof Type. This Building Is Thoroly Built According to the Latest Ideas of Coultry House Design, and Its Interior Arrangement Is Excellent.

The poultry house may be entered from either end, but the nest alley is connected with the front part of the house at one end only. Each nest is built with its back hinged at the bottom get in terrible condition chiefly because they were hard to clean. The modern poultry house is built in such a manner that it is as easy to clean as possible and in addition, advantage is taken of

careful construction to prevent draughts and in making the sanitary conditions up to standard of the modern type, is money well spent. This poultry house presents a particularly good appearance.

WHAT IS PROPER AND BEST IN COLOR SCHEMES AND IN EXTERIOR PAINTING METHODS

By Ralph G. Waring

Specification Engineer

NOTE: This is the fifth of a series of articles by Mr. Waring. The sixth will appear in an early issue.

RECENT motor trip was a source of great pleasure to the writer. Constantly on the alert for new ideas, new practices or improved methods I noticed with increasing satisfaction the immense difference in the choice of exterior color schemes evident on the newly painted houses, over the prevailing colors as applied five or more years ago. It is fortunate indeed that home owners and renters are taking advantage of the educational campaigns of such magazines as the American Builder, House and Garden, Ladies' Home Journal and others, for nowhere are the results of such work so prominent as in the recently constructed or remodeled houses. It speaks well for community interests and improvements when the majority of the houses are well painted, with color

schemes in direct harmony with individual conditions and with the general appearance of the community as a whole.

It is with the intention of furthering this woodwork, therefore, that the writer will try to incorporate in this article the fundamentals of principle and practice which should govern the choice of a suitable color scheme for the exterior of the home.

Above all else, seek a quietly unobtrusive combination of color and
arrangement. For those whose
tastes run to somber shades and
heavy colors, a result achieved thru
the use of lighter tones will be
immensely pleasing. A house built
on an extensive plan, shaded by
heavy trees, or closely crowded by
neighboring houses, does not want
to be painted in heavy, dark red

or green, as are so many of our older types of houses. Their owners adhere to the old color schemes of by-gone days when by the use of a newer, softer, lighter and infinitely more pleasing color scheme, surprisingly better results could be obtained. On the other hand, for those whose ideas tend towards bright colors of the extreme "canary yellow" and vermillion red groups, let me suggest that you adopt a different color combination avoiding such striking colors and use instead some scheme in tones of ivory, tan and brown or silver gray, ivory and white.

The house on a hill in the midst of an extensive lawn should not be an expression of benign opulence, but should appear as a quietly expressive suggestion

(Continued to page 140.)

AN ATTRACTIVE REAL ESTATE OFFICE.

It is naturally desirable that a real estate "tract" office attract attention, that it in some way be made more or less conspicuous. The one here shown meets this requirement at least, and in a most pleasing manner. It is located at Los Angeles, Cal., in a real estate company's subdivision that is restricted to fashionable residences.

As will be evident from the illustration, the office is a rather striking interpretation of Japanese architecture. Its walls are constructed of face brick, vertically timbered in interesting fashion, and the roof, with the true Japanese grace and curves, is covered with red roofing tile, while extending outward from the walls on all sides on line with the top of the windows and door is an enhancing framework of sawed beams. The brick work is of light creamy buff tone, and the exterior work is painted a deep shade of green.—C. A. Byers.

"The man who put up our garage for us did a mighty good job and everything is working perfectly after three years of the hardest kind of service. I'll want that same man to do the work on the new house I'm considering."

That's the way the owner talks when the builder has used

Designed especially for garage construction

When you use STANLEY Garage Hardware

- 1. The hinges are strong and good looking and the doors close snugly and weather tight. They don't sag or warp, and are always easy to operate.
- 2. The bolts lock smoothly and securely.
- 3. The latches and pulls work smoothly and don't get out of order.
- 4. Stanley Garage Door Holder No. 1774 holds the doors open preventing them from being accidentally blown against the car entering or leaving the garage.

Dealers:—Stanley Garage Hardware is now carried in stock by all the leading hardware jobbers. Your wholesaler can supply you. Ask us for valuable selling helps.

You ought to be thoroughly familiar with STANLEY Garage Hardware. Write for latest catalog free on request.

Lasting Newness

Of course you turn every building you construct over to architect and owner spick and span and you want it to remain in that condition. If you see that your painters use Murphy Varnish you can always feel sure that you have given your work a finish that will "stand up" for the longest possible time no matter what treatment it receives after it leaves your supervision.

Murphy Varnish

Architects and owners may sometimes seem indifferent as to what varnish you make your painters use. But no one can be indifferent to the service that Murphy Varnish gives and the beauty of the finish that it produces.

Our country-wide advertising is constantly familiarizing every one with the facts about varnish—the plain *unvarnished* facts. Builders who do high grade work are sure to benefit from it.

Send for further information about our many products.

A Special Call for Skilled Mechanics

WAR DEPARTMENT
Office of the Chief of Ordnance
Washington

Washington, October 15, 1917.

Editor American Builder Magazine,

Chicago, Ill.

Sir: I am directed by the Chief of Ordnance to invite your co-operation in the work of bringing to full strength the necessary quota of men for the Enlisted Ordnance Corps of the National Army. Skilled men in a great many different lines of trade are urgently needed at this time. Speaking, as you do, authoritatively in your position as editor, to the most representative and progressive elements in the trade you represent, you can be of tremendous assistance to the Government in this time of National pulling together. Unless the man in the front line trenches has the help and skilled co-operation of specialists behind him, his work is seriously hampered. Then, too, it is to the best interest of the nation that each man does the work for which he is best fitted, thus saving the Government a long period of instruction, and also greatly increasing his own chances for advancement in rank.

We enclose with this letter a brief resume of the work, and general information about the Enlisted Ordnance Corps of the National Army, with the request that in the earliest available issue of your valued publication you make announcement concerning it, with special reference to the men in the particular line of trade your publication represents.

A great many men who are experts in their lines will wish to make a sacrifice for the Government and take less pay to become non-commissioned officers in the Ordnance Corps of the National Army. The Ordnance Corps has been called "The Army Behind the Army."

By bringing the facts in this letter and the appended circular to the attention of your subscribers, you will be serving the best interests of your subscribers, and at the same time will be of great service to the Government.

Very sincerely yours,

F. A. ROGERS,

Captain Ordnance Department, U. S.

Information to Applicants for Enlisted Ordnance Corps WHAT IT IS

The Enlisted Ordnance Corps, National Army, into which the Ordnance Enlisted Reserve Corps has been merged, is charged with the supply, maintenance and repair of all cannon and artillery vehicles and equipment; all machines for the service and maneuver of artillery; all small arms, ammunition, harness, motor trucks, motorcycles, tractors and railroad cars; in fact, it is the Army behind the Army commonly known as "Service of the Rear."

Type of Men Wanted

There is a place for practically every man who knows a trade in the Enlisted Ordnance Corps. Machinists, mechanics, plumbers, painters, carpenters, canvas workers, (Continued to page 96.)

(Continued from page 94.)

auto mechanics, saddlers, blacksmiths and wheelwrights are especially needed at this time.

Applicants must be between eighteen and forty years, citizens or declarants, and be able to speak, read and write the English language, should have no absolute dependents, and must be able to pass a physical examination conforming to that prescribed for the Regular Army.

Place and Type of Service

If accepted for enlistment, men will ordinarily be sent to an arsenal school for a period of instruction, on completion of which they will be assigned to detachments, units or organizations, with ultimate service abroad. Previous military training, while preferable, is not essential, as men will continue the work which they pursue in civil life.

Pay and Grade

In view of the importance of their work a large number of men will serve as non-commissioned officers. Original enlistment is required as private, but later courses of training or special qualifications quickly lead to higher grades. Pay ranges from \$30 to \$97.20 a month, depending upon demonstrated ability and place of service. Men enlist for duration of war only.

Free quarters, rations, clothing, bedding, medical attendance, etc., are provided.

Relation to the Draft

Men registered under the Selective Service Law may voluntarily enlist prior to the posting of their names by their Local Boards. No man who has been called to appear for physical examination is eligible for enlistment in any branch of the military service. In case such men do enlist the department under which they have enlisted will be requested to discharge them and direct them to report to their local boards.

How to Enlist

Get application blank by writing to Chief of Ordnance, Enlisted Personnel Division, Washington, D. C. Fill it out, return to Chief of Ordnance, and if there is an opening for you at the time, authorization will be sent you to enlist at the nearest recruiting station, and if accepted there, free transportation will be provided to place of service.

Converting a Common Wash Stand Into a Modern Dressing Table

To the Editor:

Bernardsville, N. J.

When one considers the number of old-fashioned wash stands there are stored in attics, basements and other out of the way places serving no other purpose than to hold various odds and ends, commonly known as "junk," it seems imperative that some practical use should bring them back into service again.

The day has passed when "no bedroom is complete without a washstand"—and yet we have them on our hands and they are too good to destroy.

Why not convert them into dressing tables? These have certainly become popular within the last few years. It would be difficult to purchase a dressing table today that would match a bedroom suite bought in the time of washstands; but we are still using these suites.

Now get that washstand out and look it over. They are (Continued to page 98.)

"The principle of fire protection should be first applied to construction." -National Board of Fire Underwriters Committee on Fire Protection.

Why build to burn when both service and absolute security are embodied in fireproof, serviceable and dependable metal roofings? KEYSTONE COPPER STEEL raises the durability standard for metal roofs and all exposed sheet metal work.

Actual time and weather tests have demonstrated the added durability and remarkable resistence to rust of Keystone Copper Steel.

almost all built on the same plan—one long drawer on top, below this two small drawers on the left side, a door on the right. The whole is surmounted by a towel rack.

Remove the door and drawers. Carefully remove the towel rack in one piece (we have a place for that later). Place the washstand on its back and remove all the partitions in the front except the one which supports the top drawer. This is to be done by sawing close to the corner posts.

Next measure from the top of the table to the bottom of the stretcher which was left in front. Measure off on the sides the same distance from the top and draw a line from the front to back. Saw along this line and then saw close

How to Turn an Old Commode or Wash Stand Into a Dressing Table.

to the corner posts from the bottom of the table up close to this line. Do the same thing to the back of the table.

In the case of washstands which have no corner posts to serve as legs for the dressing table, draw a line 2 inches from the corners—from the bottom up to the stretcher in front, and the same on the sides. Then saw along these lines. A better arrangement for a case like this would be to taper the legs, making them $1\frac{1}{2}$ inches at the bottom and two inches at the stretcher.

The towel rack is our next problem. The upright pieces are to support the mirror. Saw off the horizontal rod, saw off the adjoining board 18 inches from the remaining upright which was removed. (If you already have a mirror, make the uprights close enough together to receive it.)

A pair of hinges to hold the mirror can be bought at any hardware store for a small sum. A small can of finish—stain or varnish, as the case may be—will be sufficient to touch up the unpainted surfaces.

R. Heimroth.

To Stormproof a Threshold

To the Editor:

Norwalk, Ohio.

I think I will tell you how I overcome my storm trouble with exposed outside doors. I make the thresholds and fit them and rabbet the outside of them down 3% of an inch back ½ inch from the outside line of door, and then either

The Saving in Modern Home Building

HERE it formerly was deemed necessary to employ the rarest and most expensive woods to obtain richness and variety in the interior finish and trim of homes, the same effects may be had today with the use of the most plentiful and moderate priced wood, and with no sacrifice of permanent satisfaction.

Using modern stains, paints and enamels of standard quality, it is now possible to attain any desired effect of color or tone in home interiors, employing no other wood than

Southern Pine

"The Wood of Service"

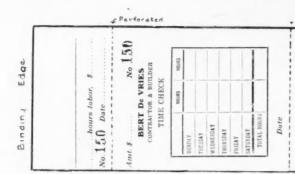

Southern Pine has a wonderfully varied and beautiful grain and a satiny texture, lending itself perfectly to the use of stains. And it takes readily and holds permanently paints and enamels. Southern Pine is extremely durable, yet very workable; it is as perfectly manufactured as any of the expensive hardwoods, is obtainable anywhere east of the Rocky Mountains, and it costs less than any other home building material of anything like

the same high quality.

If you have home building or remodeling in prospect, it will be well worth your while to send for the handsome new booklets, "The Interior of Your Home" and "Beauty Plus Service in Floors." Mailed gratis, on request, if you address Department N-53

Good Business

The following literature, dealing with subjects of interest to builders, is now being distributed:

Ideal Cincinnatus batch mixers in various sizes, ranging between 5 and 14-foot capacity with a complete range of mountings from the little two-wheel mixer to the big traction paver are presented in a very interesting manner in Catalog No. 33, 34 pages, 8 by 11 inches, of the Ideal Concrete Machinery Company of Cincinnati, Ohio.

"Clay Products for Building Construction" is the title of a book of 32 pages, 8 by 11 inches, published by the Sewer Pipe Manufacturers' Association, Second National Building, Akron, Ohio. This book shows graphically why fire clay flue linings are necessary, presents standards for wall copings, sewer pipe and chimney tops and gives a great deal of useful information regarding specifications, building codes and ordinances.

Useful information for the architect, school board and contractor pertaining to natural slate blackboards is contained in a booklet of 20 pages, 3½ by 6 inches, published by the Natural Slate Blackboard Company of Pen Argyl, Pa.

"Creo-Dipt" Dixie White, a successful white shingle stain, is described and the method of its application explained in a folder issued by the Creo-Dipt Company, Inc., North Tonawanda, N. Y.

Tuec stationary cleaner book, architects' and engineers' edition, contains 24 pages 9 by 11 inches, covering the construction details and installation of Tuec stationary cleaners manufactured by the United Electric Company of Canton, Ohio.

"The Straight Road," which is a sound, forceful sales talk that every dealer would be benefited by studying, has been sent out in folder form by E. C. Atkins & Co., Inc., Indianapolis, Ind., to several thousand members of Atkins Silver Steel Saw Club. This club is composed of retail hardware salesmen and "The Straight Road" is one of a series of talks being given by the Atkins Company.

Wood mosaic floors of hardwood, which are beautifying the interiors of buildings ranging in price from the modest home to the structure costing millions, are carefully described and their construction is explained in a 32-page book, 7 by 10 inches, beautifully illustrated in sepia, by the Wood-Mosaic Company, Rochester, N. Y.

"Architectural Drawing," a new book by Ralph F. Windoes and Harvey B. Campbell, B. S., published by the Webb Publishing Company of St. Paul, Minn., while intended for use as a text book for a high school course in this subject, will be found an excellent treatment of the elementary considerations of architectural design by anyone studying it with some previous knowledge of mechanical drawing. The book contains 150 pages and is 11 by 8 inches. Price, \$1.50.

"Practical Structural Design," by Ernest McCullough, C. E., is a text and reference work for engineers, architects, builders, draftsmen and technical schools and is especially adapted to the needs of self-tutored men. It is a book 6 by 9 inches and contains 304 pages. Publishers are the U. P. C. Book Company, Inc., 243 West Thirtyninth Street, New York City. Price, \$2.50.

"Rare Woods," a beautiful and very carefully written treatise on the possibilities of decoration with the woods which are available today, together with brief historical notes regarding them and something of the progress which has been made in finishing them, has just been published by the Murphy Varnish Company of Newark, N. J. There are nine rare woods shown in faithful color reproduction in a very artistic manner on the left-hand pages of the book.

"Practical Concrete Work for the School and Home," by H. Colin Campbell, C. E., E. M. and Walter F. Beyer, C. E., is a well-illustrated shop and school manual of 160 pages, 5½ by 7¾ inches, which discusses, in easily understood language the fundamental principles of concrete construction and presents information of value to the beginner in ornamental and simple structural concrete work. The book may be obtained thru booksellers or from H. Colin Campbell, 824 N. Ridgeland Avenue, Oak Park, Ill., at \$1.50.

THE best way to help your customers pay their bills is to get them to pay while the bills are small.

Time to Build Ice House

An ice house costs little and saves much. This is the pronouncement of the National Lumber Manufacturers' Association in issuing its bulletin upon "Ice Houses and Ice Supply," written by F. M. White and C. I. Griffith, of the University of Wisconsin. In regions where natural ice is obtainable the cost of storing, including hauling and packing, averages about \$1 per ton. At this low cost no Northern farm can afford to be without a good ice house and a summer ice supply for household and dairy use. An ice house, or still better, a combination of ice houses and cold storage room, will enable the farmer to make the best dairy products, keep his fruits and vegetables fresh, get top market prices at all times, and live comfortably himself when hot weather comes next summer.

The bulletin shows simple designs of easily constructed but amply efficient ice houses and cold storage rooms, adapted to all ordinary farms. From three to five tons of ice are usually sufficient for household use, while on a dairy farm it is customary to allow 1,000 pounds of ice per year per cow, where only the cream is cooled, and two or three times this amount where the whole milk is cooled. A very small ice house will, therefore, afford sufficient storage to meet the wants of an ordinary farm. For thirty cows, where only the cream is cooled and allowing five tons additional for household use, a total of only twenty tons of ice per season is required, which can easily be stored in a house 10 feet square and 10 feet high inside. The main thing is to have the ice house well built with walls thoroly insulated, with solid foundation and floor, and proper ventilation.

A DEAD fish will drift with the tide, but it takes a live one to swim against the current.

Plastering Rib Lath
Note heavy scratch coat, due entirely to stiffness of Rib Lath

No More Cracked and Streaked Plaster

Contractors everywhere are finding that the use of Hy-Rib and Rib Lath products prevents cracked and streaked plaster. Wood lath absorbs moisture, expands and causes the plaster to crack and streak. Our metal lath does away with this

Use Hy-Rib and Rib Lath-and you save forms, stiffening channels and labor. Two coats of plaster can be used instead of three. This metal lath is so stiff and rigid that supports may be placed a greater distance apart, saving in the cost of supports and labor in installation. Moreover, it provides a permanent, fire-proof construction.

Hy-Rib furnished in four depths of ribs and various gauges

HY-RIB

A steel sheathing, stiffened by rigid deep ribs. Manufactured from a single sheet of steel its use is decidedly simple. The easily handled sheets are fastened to the supports and the plaster or concrete applied. No forms, stiffening channels nor wiring required. A superior metal lath with beaded ribs that span between the studs, making it exception-ally stiff and rigid and permit-ting the wider spacing of studs. Provides a perfect clinch for plaster and prevents cracking or streaking of plaster. Saves time, labor and material in erection.

RIB LATH

time, lab Begin now to build with Hy-Rib and Rib Lath. The line is complete, including Diamond Lath, Channels, Studs, Corner Beads, Base Screeds, etc.

Representatives in Principal Cities

Sixth National Conference on Housing

The sixth national conference on housing in America was held in Chicago, beginning October 15. The conference, which lasted three days, was held under the auspices of the National Housing Association in co-operation with the City of Chicago and various business, civic and social service organizations. The membership of the National Housing Association is made up of more than 700 organizations and persons interested in housing problems. It acts as a clearing house for organizations engaged in the solution of these problems, in all parts of the country. The work of the National Housing Association is supported by the Russell Sage Foundation. Officers of the association are Robert W. DeForest, president; John M. Glenn, treasurer, and Lawrence Veiler, secretary. Headquarters are at 105 East Twenty-second Street, New York City.

The conference at Chicago had, as one of its vital subjects for discussion, the relation of present abnormal conditions to the housing of the employes of large industrial organizations. This subject was considered with respect to conditions existent in various parts of this country and abroad. The possibility of reducing the cost of the workingman's home, without sacrificing those things which experience has found to be essential, was discussed at some length. The morning sessions of the second and third days of the conference were divided into two sections, the one considering housing from a constructional standpoint and the other dealing with the matter of health. Municipal as well as industrial housing problems were given careful consideration.

The afternoon program of the second day of the conference consisted of a first-hand study of conditions in various parts of Chicago, automobiles being provided for this purpose. The evening session was given over to an excellent paper on United States National Army cantonments and a study into the problems of the construction gang on large building projects. The afternoon of the third day was devoted to the question of proper methods of handling community housing work and the effective application of a housing law.

Too much cannot be said in favor of the study by every architect, contractor, real estate man and materials man of the questions brought up in these conferences. A thoro knowledge of the various phases of the broad subject of housing will place in their hands the means of providing better homes for the workingman. It will show them how to make it possible for the workingman to obtain a home which he can be justly proud of. It will give him a broader knowledge of the entire subject of home building and will make him a more capable man in his chosen field.

Grand Rapids to Have Better Homes Show

From Nov. 28 to Dec. 8, 1917, the Klingman Exhibition Building in Grand Rapids, Mich., will be the scene of the First Annual Grand Rapids National Better Homes Show. Space plans are open and the demand on the part of manufacturers of house furnishings for exhibit space predicts a wonderful interest and the success of the show.

No; not a New Roof, but an Old Roof Made New

THIS is a good time to get roofing repair business. Winter and heavy weather are almost at hand. Lots of people don't want to have an entire roofing job done—they don't want to go to the expense of laying a new roof. Yet they really don't realize that with the new FLEX-A-TILE Roll Shingles, old roofs can be made new at little expense. For FLEX-A-TILE Roll Shingles lie right over old shingle roofing jobs just as firm and tight and weather-proof as if it were a brand new roof on a brand new house.

FLEX-A-TILE

Roll Shingles

In the new style FLEX-A-TILE Roll Shingle the shingles face endways instead of across the roll. It actually gives the same effect as a roof of real FLEX-A-TILE Asphalt Shingles with butts exposed, size 5×10 inches. We don't get the shingle effect by using paint or imitation patterns of any kind. It is an actual FLEX-A-TILE Asphalt Shingle roof in every way—with this exception: You get the wearing quality and the good looks of the FLEX-A-TILE Asphalt Shingle roof with the economy and saving in laying time of roll roofing.

Send for Prices and Samples

Let us supply you with samples of this new style FLEX-A-TILE Roll Roofing. Let us quote you prices. Let us give you suggestions as to how to get new roofing business.

Trailer Factory Constructed in Twentyfour Days

The completion of the new factory of the King Trailer Company at Ann Arbor, Mich., in twenty-four days marks a new record in factory construction.

Interior of New Factory for King Trailer Co.

"Business was coming so fast that we simply couldn't handle production in the old quarters," said Mr. McCloughton, sales manager of the company, "so it was a case of move fast to keep up with orders.

"The contract was let to the Austin Company of Jackson, Mich., on June 25th and five days later construction work commenced. By July 25th the factory was occupied and the company mechanics were hard at work turning out trailers."

60 by 160 Feet King Trailer Co. Factory, Built in 30 Days.

The new building occupies 9,600 square feet—60 by 160—and is brick, steel and concrete construction thruout. Daylight lighting and proper ventilation are assured.

Altho the construction speed is phenomenal and sets a building record, the construction is anything but flimsy. Foundations are concrete and the walls are brick below sills laid in cement mortar. Columns are structural steel. Roof structure is also structural steel with I-beams set horizontally. Floor is concrete. Ventilation is provided by the four light ventilators located in each section of the sash.

Largest Slate Sales Agency Established

Builders and architects will be interested to learn of the service that is now available thru the Vendor Slate Company, Inc., Easton, Pa. This is a selling agency for some thirty-six of the prominent slate producers—probably the largest shippers of roofing slate in the world. It is a convenience to be able to obtain from the same concern a considerable choice or range of varieties in roofing slate. From their numerous quarries, the Vendor Slate Company furnish any of the following well-known slates: Genuine Bangor, Albion Bangor, Jackson Bangor, No. 1 Penn Argyl, Slatington Big Bed, Washington Big Bed, Through Creek Big Bed, and Franklin Big Bed.

Drop us a line and tell us what you are figuring on building this Spring

ITUNDREDS of progressive contractors are finding that brick in sometruction is as easily handled as frame; and it has many advantages—the principal one is, that it gives your client a more permanent home and relieves him of the continual expense of painting and upkeep.

Then we will tell you how "Artfashioned" Brick can be used to advantage

Artfashloned Brick are made in a wide range of colors and textures. There is a Nuvogue Brick for every style of architecture — from the modest bungalow to the best building in town.

You can get "Artfashioned" Brick from your Local Dealer

We have hundreds of lumber dealers in the Middle West now handling "Artiashloned" Brick. If your local dealer does not earry our line set him to write us. We prefer to furnish it through his yard.

Ransome Company Holds Annual Meeting

The annual meeting of the Ransome Concrete Machinery Company was held at the Dunellen plant, Dunellen, N. J., and the Queen City Hotel, Plainfield, N. J., October 12, 13 and 14.

Tribute was paid Ernest L. Rasome, founder of the company and builder of the first reinforced concrete building and the first reinforced concrete bridge in the United States. Mr. Ransome died on March 5, 1917, at his home in Plainfield, N. J. His name will always be intimately associated with the early development of concrete construction.

Beaver Board Dealer Advertising Helps

The Beaver Board companies have recently launched upon a campaign to assist their dealers, in a large way, to develop the market for this wall board, as well as to extend their entire business by local advertising. The service which they have worked out consists in a large amount of forceful circular matter, window displays, letter enclosures and electrotype advertising plates, which material is supplied the dealer for use in the local field. At the same time, a national advertising campaign is being carried on by the Beaver Board Companies and the local advertising is cleverly tied up to the national advertising in some cases by furnishing the dealers with plates which are smaller reproductions of the advertisements run in the journals of national circulation. This sort of service is appreciated by the progressive dealers, who have come to know that business comes to those who make special effort to get it.

Here's an Original Work on Farmhouses

"Farm Houses—How to Build the New and Improve the Old," is the title of an attractive booklet just published by the National Lumber Manufacturers' Association as one of its series upon Better Buildings. The farm house bulletin is written by Wm. A. Etherton, Professor of Rural Architecture in the Kansas State Agricultural College and member of the American Institute of Architects. Prof. Etherton was born and brought up on a farm and when it comes to the planning of the farm home he is upon familiar ground. The bulletin just published goes into a large number of practical details upon the planning and arrangement of the

Hendrick's Commercial Register for **Buyers and Sellers**

The twenty-sixth annual edition of Hendricks' Commercial Register of the United States for Buyers and Sellers, has just been issued. This standard publication is especially devoted to the interests of the architectural, contracting, electrical, engineering, hardware, iron, mechanical, mill, mining, quarrying, railroad, steel and kindred industries. Full lists are included of producers, manufacturers, dealers and consumers, listing all products, from the raw material to the finished article, together with the concerns handling these products, from the producer to the consumer. There are 2209 pages of text matter and the index to trade classifications numbers 151 pages, covering over 50,000 trade references. The list of trade names, brands, titles of identification, etc., numbering 1212 pages, furnishes ready reference to distinctive products manufactured by concerns listed in the work. The alphabetical section is included for the first time and contains in one alphabetical list the name, trade description and address of every concern appearing in the book. S. E. HENDRICKS COMPANY, INC., 2 W. 13th Street, New York City. Price, \$10.00. (Advertisement).

An Electric Motor On The Job

is as good as an extra man, for it's the odd jobs and the special work that takes the time.

Put a portable electrically driven saw or buzz planer on your next construction job.

The cost for power is only a few cents an hour.

With motor driven outfits your men can rush work through with the same speed and sureness as in your own shop.

Tell your power needs to your electric company or our nearest motor agency.

You Can't Afford to Be Without

"Nice" Liquid Filler

BECAUSE it means an economy of both time and material to dries hard in 8 to 12 hours, allowing one-coat-a-day work to be done with safety.—It will enable you to make first-class jobs on close grained woods with one coat of filler and one coat of varnish.—It will hold out varnish better than sheliac and will cover 800 sq. ft. to the gallon.—It will make the very best Flat Stain by simply shading with colors in oil or a varnish stain by adding a little good mixing varnish. It is very valuable as a first coat for floors to bring them up to an even surface.—It helps the user over many a difficult place and adds to the quality of his work.

Be sure you get the genuine "Nice" Filler. Ask your dealer to show you Nice or write for our prices and catalog of varnishes, paints, coatings, fillers, enamels, etc.

Eugene E. Nice

Philadelphia, Pa.

How Camp Devens Was Built

(Continued from page 62.)

Similar tickets would be written separately for 2-by-6's, 2-by-8's, etc. Rough and finished stock of the same dimension would also have separate tickets. These tickets would then be distributed to the group of mills which had the least work ahead, with an eye also to the amount of stock on hand in the piles back of it.

Each stick was marked "11" or "17" as it went over the table. This table was narrow, being nothing but a plank at the outer end supported by a leg. But it was planed smooth and marked off in feet from the saw. When a batch of work was started, the foreman set a block of wood at the proper distance and clamped it firmly into place as a guage. As the piece came off the table it was received by a laborer, with another laborer at the other end if the pieces were long, and placed on the ground between two stakes. All the pieces of one kind and length and mark were thus placed in the same "bin," and the top ones marked with the number of the building they were for. Also, all material for the same building, having been cut in this and the closely neighboring mills, was stacked in adjacent bins, so that the complete building frame lay in a compact space.

As fast as the different lengths were cut, the foreman would check them off on the cutting ticket, when completed. The cuttings would then be signed and returned to the superintendent of the mills. He would then notify the unloading superintendent's distributing clerk. His work was done, except for the duty of keeping the mills supplied with new work in an always steady flow. The work was sometimes very fast. For instance, an order was received one morning at 9 o'clock: "Make one bldg, mark 1421, Type EL. Rush." It was all cut at 10 o'clock and delivered on the job to the ready carpenters a few minutes later. Still better results could be had if necessary, by splitting up the 2-by-4 tickets among all the 2-by-4 mills.

The fourteen small saw and planer mills were not the only sawing equipment. To clip or square the ends of boards and of dimension lumber which was to be used in even feet, another much more ambitious piece of equipment was put in. It happened that a saw mill was being torn down at Mt. Tom, Mass., whence the Connecticut River Lumber Company had been forced to move by the expense of getting logs down the river from an ever-receding wood supply. The contractor bought from this mill its large "clipper" or battery of saws, with its conveyor system and table, apron and sorting table, and moved the whole down to Ayer. This gang of saws is spaced 2 feet apart beneath slots in the table, except for the left end saw, which is always in place. Positive feed conveyors brought the boards or lumber squarely up to the sawslots. A man standing at a series of levers beside

(Continued to page 116.)

No Sagging or Buckling, no Falling Plaster, if You Buy Herringbone Lath

Exceptional rigidity is the leading characteristic of Herringbone Rigid Metal Lath. This is due to the heavy longitudinal ribs set on edge at an angle of 45 degrees. If the material was expanded in any other way, the characteristic rigidity of Herringbone, the unequaled strength and stamina that go with it, would not be possible.

Herringbone in 24 gage, weighs 3.4 lb. per sq. yd. weight endorsed by the Concrete Institute, Associated Metal Lath Manufacturers, the Building codes of New York and other metropolitan cities—the lowest weight that is safe and ultimately economical for modern stucco and plaster construction. Herringbone Lath is not only exceptionally rigid; it is also self-furring. Thus it eliminates the need of costly furring.

Herringbone Rigid Metal Lath

Because of the perfect "key" between the plaster and the lath, the exterior stucco walls and interior plaster walls, ceilings and partitions, held together and strongly reinforced by Herringbone Rigid Metal Lath, cannot crack or fall in pieces. They bar out fire, mice, rats, vermin, weather and decay. For plaster and stucco work in damp climates, on the seashore, in industrial centers, and wherever moisture is excessive; rust-resisting, non-corrosive Herringbone "Armco" (American Ingot) Iron Lath should be used.

To make sure that you get the full weight metal lath—so necessary from the standpoint of safety, economy, and permanence—buy metal lath by weight per square yard as well as by gage. To make sure that you get exceptionally rigid, economical and durable metal lath, buy Herringbone Rigid Metal Lath, and see that it is brought on every plaster job.

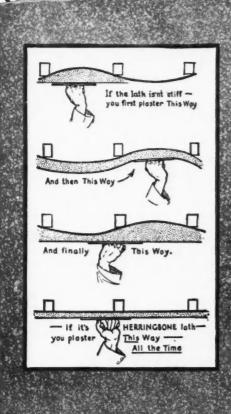

Send for the Herringbone Catalog, if you would like complete information about this superior type of metal lath construction.

How Camp Devens Was Built

(Continued from page 114.)

the table could judge the largest possible even length of the piece, elevated the proper saw, and both ends were clipped square as the piece went thru the clipper. This arrangement ate up the boards and lumber wholesale.

However, when boards were not to be sawed in the clipper, but on the job by the carpenters, there was no need to store them at the yard at all, if proper facilities for moving them immediately to the site could be had. The traffic man in the purchasing department tried to keep a steady flow of the material coming in on cars, so as not to have any lean days or peak loads, and he succeeded very well. The rest was up to the unloading department. The superintendent of this is really superintendent of both unloading and distributing. He divided the yard into three parts, one for dimension lumber, back of the saw mills, one for boards, roofing paper, posts, and other material in which there was little subdivision; and one for piping, metal supplies, etc. Over each of the first two he had a foreman for unloading, each of whom had as many sub-foremen and gangs as he needed. These moved

So as to move things out in an orderly fashion, the superintendent had a foreman-clerk stationed in a booth which commanded the outlet of the road running in front of the saw mills and past the board

yard. A truck coming after a load stopped at the booth and the chauffeur was given a ticket telling him that his next load was Building No. 1116, stacked in front of mill No. 10. He got the building, and on his way back signed for it at the booth.

He did the same for boards, signing for them by the estimated number of feet in his load, and its destination. Each truckman generally worked for the same construction foreman for days at a time, and would ask the booth clerk for assignment to material for that foreman if possible. Thus he was a connecting link between the individual foreman and the distributing yard, tho he was not responsible to that construction foreman except as one gentleman to another. The chauffeur was responsible to the special superintendent of trucks, Martin Keany.

Keany had charge in all of 140 trucks. If a foreman of sewer construction wanted ten trucks, for the next day's work, he would send in a requisition to Keany for them. Likewise, the other superintendents and foremen. The trucks gathered at one place in the camp before starting work in the morning, and again at the same point at night. This was the time when the truckmaster issued assignments for the day's work. If he had trucks enough to fill all requisitions, they would be filled. If not, it was up to him to apportion those on hand as best he could, and then if the demand showed signs of keeping up, to scurry

(Continued to page 118.)

A Serviceable Ornament

The demand for a strong, serviceable door stop that will stand up under the bumps and jams, abuses such as it gets and yet ornament the base board is not overlooked in the

Griffin Pressed Steel Door Stop

a beautiful, plain and ornamental door stop.

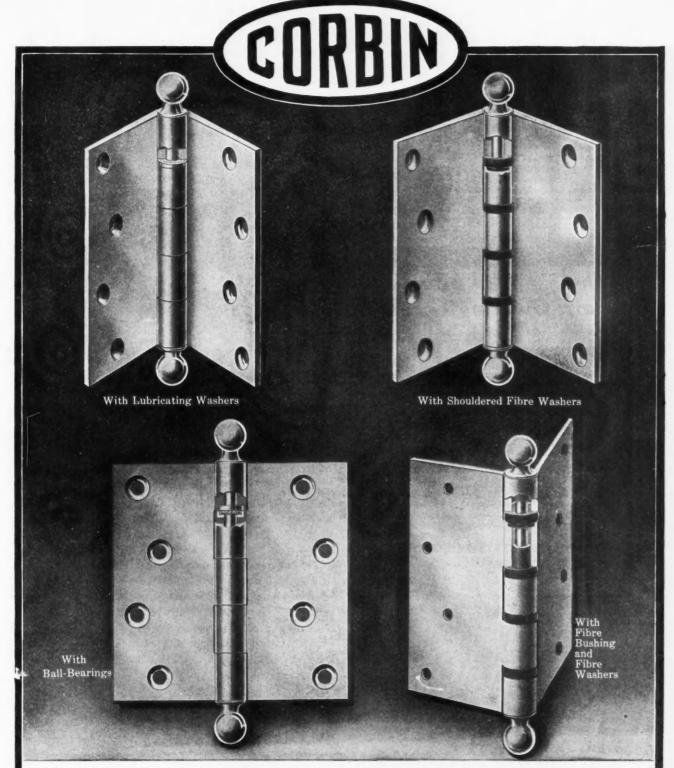

This Door Stop is made from the highest quality cold rolled strip steel, drawn into shape from one piece of material. The rubber bumper is so fastened that it absolutely cannot work out. It is the strongest Door Stop ever placed on the market and we guarantee it to be indestructible. When fastened in place with three round head screws will hold a weight of 250 pounds hung on the end.

Finished in any of the Griffin hardware finishes; wrapped and packed with screws.

There's Real Money in Barn Building For You

Think of the barn jobs in your community that you could get with the help of James service. Farmers are today awake to the needs of better built barns and are findling exactly what they want in James Barns and James equipment. They are reading our advertisements in their leading farm papers—and they know through years of service the matchless quality of anything in barn equipment bearing the James trademark.

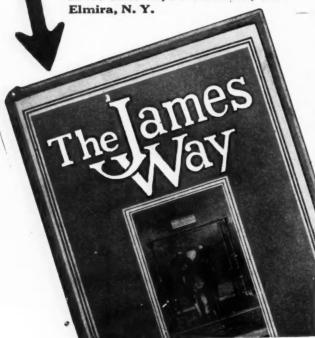

Send us the names of farmers you know who wish to build or remodel their barns, and mention the size of their herds. We will circularize the farmers whose names you send us, and will send you our book

The James Way-FREE

Our book should enable you to suggest to your customers the most practical way to handle their barn problem—how they can save time and work about the barn—get the right plans—avoid mistakes in building—best ways to arrange equipment—provide lighting, ventilation, make good use of floor space, etc.

Take advantage of our service and get more and better barn contracts

James Manufacturing Co. EP-76 Cane St., Ft. Atkinson, Wis.

How Camp Devens Was Built

(Continued from page 116.)

around and get more trucks, from Boston, Fitchburg, or anywhere so long as the lack of them did not delay the work. The truckmaster had a small machine for his own use, and kept tab on the movements of the trucks, so as to get full efficiency out of them. He also kept the time of all trucks.

This yard so divided, with a foreman of unloading at the dimension lumber end and another at the board end, a superintendent of saw mills, and a distributing clerk, all under a superintendent of unloading and distributing, who was a regular Ley superintendent of construction, handled 3,000,000 feet of lumber a week. The various grades of foremen and sub-foremen totalled 35, with 450 men, mostly laborers.

Just as the wooden frame of a building went up the road all together in a truck, so the plumbing is dispatched in a similar way. That is, the entire rough plumbing for each building, not only cut but assembled in sections so far as possible, is loaded into a truck and dispatched to its site, sometimes before the wooden part of the building is there. In fact, the plumber looks upon the load of piping as "Building" No. so-and-so.

The plumbing superintendent has his raw material delivered along a special side track. Forty benches are ranged in order along beside the track. Each kind of stock is unloaded at a point selected for it, nearest where it is to be worked up.

The plumbing superintendent made from the plan of each type of building a skeleton sketch of the plumbing. Each sketch he divided again into three main parts, rough plumbing, supplies, and fixtures. The rough plumbing was again sub-divided into sections. Each of these sections, tho composed of several fittings and pipe pieces which would have to be cut, was made up with tight joints ready to be put in as it stood, except for making the joints with the next preceding and following sections. These schedules of sections correspond with the cutting lists of the saw mills, except that the material was partly made up into assembled form.

In doing this, the work progressed from one group of benches to another, each group also being subdivided to handle always the same kind of work. There were benches and men who did nothing but cut cast-iron pipe to the length of a stick furnished by the foreman. This stick was a check on the gage which might slip. Some of the benches were fitted with special structure to hold more securely the irregular shapes of the sections being made up on them. None of these sections were designed to be too long or too heavy for quick handling by a man and helper, but even then, the work was made at once easier and faster by these special brackets to hold awkward forms.

How Camp Devens Was Built

(Continued from page 118.)

As fast as caulked the section was marked with its number according to the skeleton plumbing sketch for the type of building, as, "AA 9." All similar sections as fast as cut were deposited in the same imaginary bin between two stakes driven in the ground. The bins were arranged in order of building types and section numbers, all bins for sections of the same type buildings being placed in a row. When the truck driver wanted a type G building, he drove up to the G row, picked one section out of each of fifteen bins, all plainly marked, checked them up with his "G" material list, and drove off.

At one time the shops had 120 "buildings" all finished in bins on the ground.

The trucking was always done by the same chaufteurs, who had a standing assignment to the plumbing department and who knew something about plumbing. These men were selected for this because they could not only talk the vocabulary of the plumber, which is large and takes as long to learn as French, but had the plumbing sense, which is essential for the correct transfer of messages and avoidance of mistakes in sending requisitioned orders.

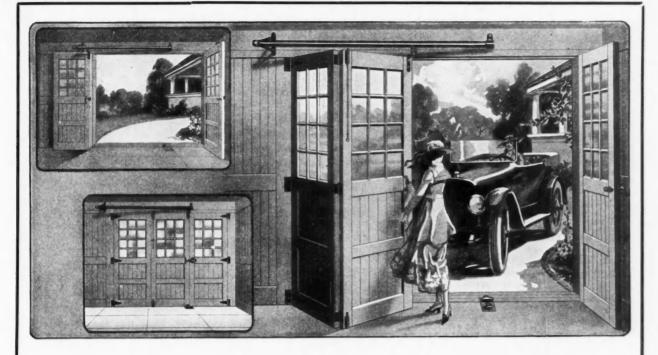

This manner of making up sections at the switch yard not only got work done in a swift and efficient way that would have to be done anyway, but did away with a vast number of mistakes in delivery to sites. For instance, in the fifteen sections of a type G building, there are two or three hundred pieces of pipe and fittings. If the chauffeur had to pick these up from boxes and bins, he would inevitably make a multitude of mistakes which would at the building cause men to stand around waiting for them to be rectified. Moreover, while he was gathering this assortment, even in prepared boxes, his waiting truck would be idle.

The work of putting the pipe in was divided into three parts, for each of which there was a general foreman in charge and responsible—roughing, supplies and fixtures. Much of the roughing was done where the only other trace of a building at the time was a building number, stake and batter boards, perhaps with saplings, stumps and scrub still in the area included between the batter boards. There the plumbing erector had nothing to align with except the horizon, and there isn't even very much horizon at Ayer—not of the horizontal variety, at least—because the place is mostly hills. But when the carpenter foreman would arrive, he would find a stack of pipe sticking up all by its lonesome as far as the prospective second story.

The greatest discrepancy from the height of the building as compared with the plumbing thus put in was 1½ inches, but this was an exceptional case. Usually the work was about right.

(Continued to page 122.)

Gannon Ball Combination (Folding-Sliding) Garage Door Sets

The makers of the best known barn door hangers in America—the Cannon Ball—have added to this line a new garage door hanging which is unquestionably the most practical set for this purpose yet evolved.

Briefly the Cannon Ball Combination (Folding-Sliding) Garage Door Set fits any door opening up to $8\frac{1}{2}$ ft. and takes care of any thickness of door—makes them absolutely weather tight and secure against sagging. The doors fold inside requiring minimum space and are automatically held open by the heavy spring attached to the supporting track bracket. It is easy to install—neat in appearance—easy working and strong and substantial in use.

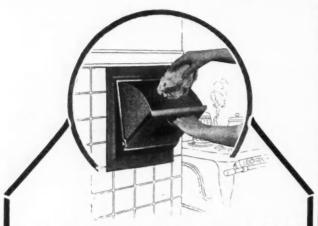

Comes packed in complete sets including Hangers, Track, Hinges, Floor and Ceiling Stops, Door Latch, Bolts, Screws, etc.

And the selling-helps put back of this new Cannon Ball item absolutely insure its rapid sale.

Can the Garbage Can!!!

Can the garbage can ever be a desirable feature in a residence or apartment?

THE

KERNERATOR

The Built-In-the-Chimney

INCINERATOR SYSTEM

IS THE

CLEANEST, QUICKEST and CHEAPEST

equipment for the complete and instantaneous elimination of garbage and waste.

Cleanest—because the garbage is burned to cinders by a method that also renders the wastage odorless. Garbage cans and rubbish piles with their flies, vermin and the like are eliminated. All waste including tin cans, garbage, broken crockery—everything that is not wanted, disappears forever through the little door in the kitchen (shown in cut above).

Quickest—because as soon as waste accumulates it is placed in the hopper door shown above and falls down the flue to the incinerator in the basement.

Cheapest—because its first cost is its last. No commercial fuel is required. The garbage "consumes itself" when ignited, as there is plenty of paper, rags and other dry combustible material to burn and to dry out moisture in garbage, which, when dried, is readily combustible and burns to harmless ashes. Garbage haulage is eliminated.

Consider This, Mr. Contractor

Satisfied clients are your greatest asset. If you show them a way of eliminating all garbage and waste, without a penny of expense other than the nominal first cost, you will have solved for them one of their most disagreeable and annoying problems. No one wants garbage cans and waste piles around their homes. Here is a simple, efficient and economical method of eliminating these intolerable and unhealthful nuisances.

Your buildings will be more desirable than any others in your community. Your clients will be grateful.

Send for our two big books which describe the Kernerator completely and state what users have to say about them.

Address Dept. A

How Camp Devens Was Built

(Continued from page 120.)

The trench work on the water pipe was also subdivided. Of course, the digging of the trench fell not to the plumbing superintendent, but to the general superintendent of outside construction, or rather to his digging superintendent and foremen. Likewise, the work of closing in the trench later. But given the trench, three gangs of water supply pipers got busy. One gang laid long stretches of pipe line where everything was straight ahead, wholesale work by the hundred linear feet. If they ran into any difficulties, they would leave off work there and begin again beyond the difficult point. This gap would then be filled in by a second gang, who did nothing but this kind of work, which required a little finer technique. Anything which would interfere with the steady fast pace of the line layers was left to these rough trouble gangs. But even these did not touch the propositions requiring the finest work and judgment, as for instance at a difficult branch point. For this there was still a third group of the most expert workmen. Thus the best workmen did not waste their skill on "horse" work, nor did the poorer mechanics waste everybody else's time attempting things they could not do well.

In this manner it was possible oftentimes to lay a mile of pipe a day.

This speed was fostered by rivalry between the departments and gangs. Of course, they were all on the Ley payroll, and the great majority of the men in each group had never worked together before, but such was the spirit of the job, probably aided by its patriotic purpose, that each gang immediately developed an *esprit de corps*. For instance, in one place, Crowley's trench foreman had two days' start on the trenches. He therefore announced to the plumbers that he "had them tied to a post." The plumbers then broke away from said post, and were soon on the heels of the diggers. As soon as they left the post, Crowley's other gang of trench closers occupied it, and were soon on the heels of the plumbers. Then the three gangs went across the field like a local mixed train.

The speed maintained as a matter of routine both in laying mains and in roughing and other work, can be best illustrated in its practical effects and possibilities by a couple of instances. The cement foreman's reports were collected and delivered to him thru his office in such a way that at one time of the day they were four hours late. After one glance at the report, for he was an energetic man who believed that people worked better when there was pepper in the air, he would bawl the plumbing department out for not having the plumbing in certain buildings so that he could lay the cement floors of the lavatories. "The cement forms are all ready to be thrown into place," he might add. Then the plumbing superintendent would have the extreme pleasure of replying,

How Camp Devens was Built

(Continued from page 122.)

"Wake up, wake up, man! You're in the twentieth century. The plumbing in those buildings was all done

On another nearby building for an outside concern, not the Government, but contributing to the Government work at the camp, the architect one evening wanted the plumbing in as quickly as possible. This involved sixteen toilets, baths, and washbowls in proportion. From 7 p.m. to 7 a.m. the work was completed.

The plumbing work was, of course, kept co-ordinate with the carpenter and cement work. It was up to the plumbers to put in the underground work so as not to hold back the cement men. On the other hand, the plumbers were always ready to put in the supply pipes as soon as there were joists for the hangers.

In order to assign the work intelligently, foremen did two hours scout duty every evening, ahead of the work the men already had laid out for them. They then gave each man a list of the numbers of the buildings he was to work upon. They kept the men assigned to work enough for two days. In that way no man ever had to lose time hunting up the foreman, or waiting for him to come and assign the next job. This does not mean that a single man piped a whole house. Indeed, one man did nothing but drive screws, another put in grease traps, etc.

Daily reports of progress were sent in to General Manager Rogers and the home office of the Ley Company. These reports were divided into two partsthe number of buildings in which the rough plumbing had been installed, and the number in which all plumbing was complete to date. After laying preparations, in the first eight days of work, three hundred buildings were roughed in. Similarly in the first eight days of finish work two hundred and sixty buildings were completed. The roughing work normally had a lead on the finish work of about forty buildings. This lead was swiftly narrowed toward the completion date of the contract, and on the last day there was very little slack to take up either way.

The superintendent of plumbing, Mr. John J. Downey, with his assistants, was borrowed from the W. G. Cornell Co., plumbing contractors, of Boston. While the individual men were members of the Ley force and on the Lev payroll during the camp construction, and were always required to work in with the other departments for the common progress of the whole job rather than any one part of it, they still had a separate unit spirit and knew that the credit or responsibility for the plumbing part of the contract would leave the job with them when they rejoined the Cornell company. Thus it was to the Cornell men's permanent interest to have their organization get the fine results which they, in common with all the

WANTED—a man like Washburn

He made 200% profit in his second year!

WASHBURN LIVES in a little town alongside the Hudson. Three years ago he first heard of the Norwalk Vault. He lost no time scraping together \$450 and securing the agency for his county. Keeping his regular position, he worked his vault business nights and odd times.

WITHIN A YEAR his profits paid back his \$450 investment with a hundred dollars or so to spare. In his second year, he tells us, he cleared more than 200% profit. Since then he has been giving up his other work and putting his profits back into securing all the adjoining territory he can obtain. In a very few years he will have a big paying business of his own, and be independent for life.

Washburn started working outside his regular hours, without help, in a dark, low cellar. Now he has a fine new shop and plenty of help. While we are looking for men of his type—and believe his success shows what can be done under severe handleap—we would rather not have men that have to start as Washburn did. If he had had a going building business, for example, his profits would have been not only much quicker, but much bigger,

A MAN out in Michigan—for example—piled up in six years nearly 2000% profit. The Georgia Paving and Construction Company, down in Columbus, reports a 2000% increase in business in less than 10 years. The Los Angeles agent writes us that he finds from 200% to 300% greater profit in Norwalk Vaults than in any other sort of cement work.

DON'T GET the idea that the Norwalk Vault proposition is any "sure thing" or a get-rich-quick game. It is simply a thoroughly proven and tremendously profitable manufacturing line—preferably a side-line to begin with—for a practical man with energy and enterprise. For the man willing to work hard enough and able to put in a few hundred dollars, to get a fair start, the Norwalk Vault will give bigger and more certain returns than any other legitimate business we have ever heard of. This we know! It is no experiment.

FOR TEN years the Norwalk Vault Company has been doing business at the same place. Any bank or business house in Huron County can vouch for it. It has four vault factories of its own—one in Norwalk, one in Detroit, one in Plainfield, N. J., and one in New York City. As fast as more factories can be developed, the company will extend its own retail vault business. In the meantime, the company is assigning the manufacturing rights wherever it can find good men to represent it. More than 300 different agents are now building up the business, and more than half the United States has already been assigned to local manufacturing.

Who is making the Norwalk Vault in your territory? It would be interesting to find out how much more he would charge you now than he paid us a few years ago. The man who gets hold of a good plee of territory at present prices is lucky—for when it's once taken by somebody else, it's gone forever. Only one man can have it

THE AVERAGE gain reported by local manufacturers of Norwalk Vaults throughout the United States equals 222% in about four years—a jump of around 50% for each year in business

Undertakers everywhere are waking up to the fearful crudeness of the old way of burying without waterproof protection in the muddy bottom of a six foot cistern. In New York, especially, a change of sentiment has taken place; the leading undertakers are unanimous in praising the Norwalk. (We will be glad to send you a book of their letters.) And the same feeling is spreading rapidly all over the country. Part of the Norwalk's selling plan is thoroughly to make known the vault to the undertakers in your vicinity.

AS SOON as the public begins to realize the difference between the antiquated wooden box and the air-tight, moisture-proof, steel-and-cement Norwalk—the holders of the Norwalk Vault

franchise for any given district will find he has a mighty valuable possession. Only the other day the Philadelphia holders refused to sell for ten times what they originally paid.

OUR IDEA is to write several thousand local manufacturers all over the United States—each the best man in his own territory—and to develop a dozen or more districts of our own. Then we propose to make the idea of the cement burial case as thoroughly understood as the idea of a Pullman sleeping car, and the name "Norwalk Vault" as familiar as "Uneeda Biscuit." A long start—10 years of hard work—has already been made in this direction. The man who gets in now cashes in on both the past and the future.

READ THROUGH the advertisements in this or any other magazine and see if you can find any other proposition—PROVED BY TEN YEARS' GROWTH—that offers you half the opportunity this does. See if you can find any other article patented and trade-marked, with a sale based on as unchanging a thing as the human death rate, that you can develop exclusively in your own territory and cash in on as fast as the article becomes known to the public.

TWENTY LOCAL manufacturers selected at random from all over the United States, reported an average manufacturing cost of \$9.31 a vault, as against an average selling price of \$31.90—indicating a gross profit of \$22.59 per vault, or about 242%. THIS, HOWEVER, is a greater gross profit than we would care to predict in all cases these present days. Even so, being made chiefly of cement and sand, the Norwalk is affected less than most propositions.

ON THE other hand, the Norwalk proposition has an EXTRAOR-DINARY VALUE just now as a side line for any business that has been affected in any way by the War, either by slowing down of sales or by the rising costs of material, or difficulties of transportation, etc. And as an additional line for BUILDERS it is absolutely ideal; takes up comparatively little space, requires only spare time labor, no new sales or delivery expenses, and gives a wonderful straight lead to customers who may later buy monuments!

IF THE general idea appeals to you—write us about it. Tell us just exactly how you are situated; ask any questions you like—our sales and office force are paid to tell you just what you want no obligation on your part whatever.

So much of the United States has already been taken up that we are placing the remainder on one single, simple sales plan: The cost to you varies only with the size of the territory and amount of equipment desired, a small payment will be accepted and payments may be spread out over a whole year if desired. No more territory will be allowed any man than he has capital and energy to develop fully—your success is essential to ours.

MOREOVER, IF, after six months' fair trial, you find for any reason you do not care to continue, we will agree to allow you to cancel your contract and return your molds on what you will agree are fair and liberal terms. Could anything better illustrate our entire faith in the Norwalk proposition?

YOUR TERRITORY may not be taken yet—there are a lot of excellent districts still untouched. If you are interested and are really able to handle a proposition of this kind, don't hesitate because it is new to you. Somebody else may write while you are thinking about it. Put your name and address on the bottom margin of this page and mail at once. Or, if you prefer, write us what you want particularly to find out, and save time.

The "Bevo" Built-in Lavatory

The New Product in

KOHLER WARE

Always of one quality—the highest

Here is a new pattern that you have been waiting for — a built-in lavatory that is a companion piece to the "Viceroy," America's foremost built-in-bath.

This new design builds into the wall of the bathroom and is of unsurpassed quality and beauty. The unbroken artistic lines please the eye. The KOHLER pure white enamel makes it easily cleaned. With the widely known KOHLER "Viceroy" bath, the original *one-piece* built-in bath, it offers an ideal bathroom combination.

"Bevo" Lavatories may be had with or without the pedestal.

Your customers will appreciate the "Bevo."

Our new book, "KOHLER OF KOHLER," illustrates and describes this new fixture. A postal will bring it to you.

How Camp Devens Was Built

(Continued from page 124.)

other organizations at the camp, did get.

The heating was handled in the same way, by the contractor directly, but using F. A. Merrill, heating contractor, of Boston, as the general superintendent of heating, and having him bring along his usual executives.

The moment Assistant Superintendent Gay, of the pipe-cutting department got on the ground he requisitioned from his new co-employes in the carpenter department one pipe shop beside the railroad track, 30 to 60 feet. While it was going up he took a look around at the scope of the other work already in full swing at the camp, and immediately had the shop size increased to 60 by 70. That was one instance of the way in which the camp job made people expand. No matter how much a man had tried to magnify the size of the job in his own mind and multiply by factors of safety so that he would not be caught short or small in his preparations for the work he had to do there, his imagination always had to be multiplied again in the actual work.

It was soon found that since a car full of mixed sizes of pipe could be opposite only one stock pile at once, unloading involved either much carrying of heavy material from the car door to the proper pile, or tedious levering of the car along the track by hand. So the superintendent had his pipe piles moved back a few yards. Then in the cleared space he asked the construction department to lay an additional railroad track -not a regular one, such as the rest of the yard had, level and true to line, with good ballast-but just ties thrown on the ground and rails laid along them to look like a track and have no humps quite as bad as a camel's back. The construction superintendent obliged. The pipe shop man then obtained from the purchasing department an ordinary railroad hand car truck, which he deposited on his rails. These rails do not join the regular switch tracks, but like the rivers of India, arise in the sand and end in the sand. But they parallel the railroad track on one hand and the stock piles on the other, so the truck, which is, of course, heavy enough to take a good load at a time, can be pushed from opposite the car door to the proper unloading point for the particular kinds of material

The piping is piled at right angles to the track. The piles are located near the proper sizes of machines. The roof of the shop is built out over the inner ends of the stock piles, being held up by posts. The shop has no wall on the side toward the railroad and storage piles. The men can therefore reach out a few feet, and draw the pipe lengths in wherever wanted. The extended roof half way over the piles enables them to keep dry in wet weather. The pipe shop proper is distinguished by a wooden floor, which is much better to work on and is therefore a tool of production.

(To be Concluded in the December American Builder.)

Reinforcing Masonry

(Continued from page 87.)

the amount of give will depend directly upon and be in proportion to the force applied. Many materials are quite elastic up to certain pressures, which is spoken of as their elastic limits, and theny they either change their shape permanently or break or crush as the case may be. For instance, in bending a piece of mild steel it will bend a certain amount and spring back if permitted to do so, but if bent too far it takes a permanent set.

With concrete or brick or blocks the material when compressed in a testing machine will give an appreciable amount, and if permitted will come right back to its original size; but it will not change its shape permanently without breaking. That is when it gets past the elastic limit it breaks, generally making a loud noise.

It is often said that lumber will bend so as to give warning as to whether or not it is going to break and that masonry or fireproof structure will not. The facts are that masonry does bend enough to tell the story. It is considered safe for a slab to bend one fifteen-hundredth part of the span. This is easily measured, as it would be one one-hundredth of a foot on a 15-foot span or, roughly, 1/8 of an inch.

ENIUS is an infinite capacity for taking pains; and the world has an infinite capacity for giving

Alcohol From Sawdust

PROCESS for producing alcohol from sawdust is A offered by the Forest Products Laboratory, Madison, Wis. One ton of dry sawdust worth not more than 50 cents a ton will product 15 to 25 gallons of 190-proof spirit. A plant large enough to distill 2,500 to 3,000 gallons daily can make alcohol at a cost of 14 to 20 cents a gallon, according to this laboratory's estimate.

Implement Sheds

(Continued from page 83.)

"The sizes of lumber needed for an ordinary implement shed will vary from 2 by 4 inches or 2 by 6 inches for the studs, rafters and truss work up to 6 by 6 inches for the posts supporting the roof trusses, and 6 by 8 inches for purlins between trusses.

"A floor may be put in it if is desired, altho it is not necessary. If a concrete floor is used, the construction and the proportions of the materials used for concrete may be the same described in our talks on swine houses and poultry houses.

"The foundations should be of concrete mixed in the proportion of one part portland cement, 2½ parts sand, and 5 parts crushed stone, or screened gravel. They need not be large, as no heavy loads are to be carried. Ordinarily a footing 12 to 16 inches wide and 10 inches thick will be sufficient. It should extend

WHEN WRITING ADVERTISES PLEASE MENTION THE AMERICAN BUILDER

Here is a Field Nobody

Controls Big money made easily by installing Majestic Coal Chutes. One order brings another. Their orders lead to other repair jobs, so this is a live proposition for any man.

These are facts—proven by the best men. And you, what are you going to do about it? Are you to make your share of this money now? Of **course** you are.

The winter coal is being put in now and the coal bin window is brought again to attention. The coal bin window is usually the most neglected portion of the home. The window may be broken, the paint around scratched and dirty from coal—the frame "out of square." The owner probably knows of this condition and may be thinking of having it repaired.

But suppose you get on the job and sell him the Majestic Coal Chute, and thus bring profit to yourself during the dull winter months.

These, with other metal specialties as Built-in Garbage Receivers, Milk and Package Receivers, Rubbish Burners, Duplex One-Register Store Heat-

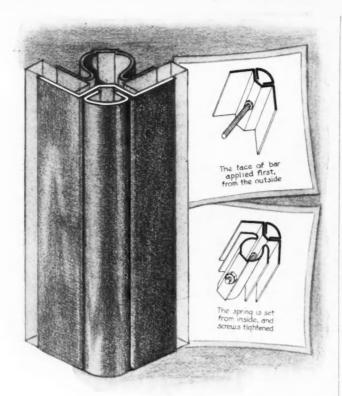

ing Systems, Pipe and Pipeless Furnaces, etc., offers big, profitable activity for you this winter. Write us today. Cut out the coupon.

MAJESTIC CO.

702 Erie Street Huntington, Ind.

Use the Majestic Duplex Heating System. Gives more heat and costs one-third less than old-fashioned methods. It takes up very small space in the cellar and does not heat up cellar. All heat goes to rooms upstairs.

Are You Interested in Store Fronts

YOU no doubt are. In selecting a certain Store Front Construction, be sure that you select one that will prove satisfactory—a construction that will finish up well, and which affords the greatest possible safety for the glass; a construction that will be easy to install, saving you time and labor, besides being permanent and of a lasting, good appearance. All these merits are embodied in

Kawneer RONTS

Make one good Store Front Job sell another. Merit will tell. Two good jobs will sell the third one, and you will soon find yourself firmly established in your community, doing a profitable Store Front Business.

You have been looking for short, clean and well paying jobs. Here's your chance. Write for our Catalog "H," containing half size details of our Store Front Construction. It is yours for the asking.

from one foot to 3 feet down into the solid earth, depending on the depth of the frost line in a given locality. The foundation wall above the footing may be 10 or 12 inches in thickness and should extend upwards about 18 inches above grade, except at the doorway.

"The studding may be set in metal studding sockets or supported by sills bolted to the concrete foundations. These sills may be made of two 2 by 6-inch pieces placed flat on the wall.

"The side walls may be made of 2 by 4 or 2 by 6-inch studs placed not over 3 feet apart and doubled around openings and at corners. These are covered with drop siding, novelty siding, or ordinary weather boarding laid horizontally. If vertical siding is desired, either 10 or 12-inch boards are used with the cracks covered by battens. In such a case it is advisable to use one or more lines of horizontal framing along the building to strengthen the siding and provide nailing strips.

"The roof may be of either the shed or gable type. If shingles are used as a roof covering, the slope of

the roof should not be less than one-quarter pitch. The rafters for a shed 18 feet wide should be at least 2 by 6-inch, and 2 by 8-inch will give a better roof. The spacing of these rafters should be about 2 feet on centers.

"The door in a building of this kind should be at least 8 feet wide, and may need to be from 12 to 14 feet wide in case large or wide machinery is to be stored. The table given above will indicate the width of a machine by the floor space needed for its storage.

Implement Sheds

(Continued from page 130.)

"The plate or support over the door must be strong enough to hold the load which comes from the roof to that part of the wall without allowing any appreciable sag. A sagging plate will make trouble in handling the doors. Often a small truss is used, consisting of a 4 by 6-inch horizontal plate over the door and strengthened by two slanting 4 by 6-inch pieces meeting over the center of the doorway. A 5/8-inch diameter iron tie rod passes from the junction of the two slanting pieces downward to the center of the horizontal member. This rod is fitted with nuts and washers where it passes thru the wood. The slant of the top pieces should not be less than $2\frac{1}{2}$ inches to the foot.

"A simple shed type of building is shown in Figs. 5A, B and C. The framing of this building consists of 6 by 6-inch posts placed 8 feet on centers. The plates and sills are 2 by 6-inch stock doubled. The studding is 2 by 4-inch stock and the rafters are 2 by 6-inch. Other dimensions of the building are shown in the illustrations.

"Figures 5D, E and F show an open type of shed. The framing consists of 6 by 6-inch posts resting on concrete piers spaced about 9 feet apart. These piers are 1 foot 4 inches square in section below the ground and extend down to a depth of 3 feet 6 inches. The top part of the pier tapers from the ground upwards to a width of about 10 inches. The roof is supported by 2 by 6-inch rafters spaced 2 feet apart on centers."

(Continued from page 74.)

the end in the corner are splayed to place their contents within easy reach and to admit more light into the room. The doors to the upper part of the cases are provided with muntins for small lights of glass, making a stiff door with glass of a size inexpensive to replace in case of breakage. A generous supply of drawers of varied sizes furnishes a stow-away for all kinds of supplies and kitchen utensils.

At the end of the pantry the lower part of the case is provided with two large doors the backs of which are fitted with retaining trays or shelves. They are simply made, with trays of two different depths for cans and boxes of several sizes. The bottom tray is supported at the ends with metal brackets and the others are held in position above with small corner supports. Narrow horizontal strips across front of each tray prevent things from falling out. Some housekeepers prefer one deep tray at the top with two slats across the front instead of the two as shown. The shelves which fit in the back of the door are useful for supplies and canned goods which do not need to be reached so frequently.

The Builder as a Fireguard

(Continued from page 76.)

troublesome in case of fire. It is a common occurrence for a fire in a row of buildings to communicate to other buildings thru cornices and eaves. They are usually dry on the under side. The wood has shrunk and cracks or small open joints exist. Go up in your attic sometimes and see the narrow white streaks of light thru the cracks. Eaves and cornices form a natural place for the fire and heat to collect. They burn freely and a fire travels thru them rapidly. The incombustible filler where shown between the joists prevents the fire from passing upward. The 7%-inch board holds the filler in place.

Figures 5 and 8 are instances of how a fire in a partition may be prevented from passing up from the floor below. In wooden construction there are places where a floor is laid over a brick partition. Two cases

within, although the storm rages without

within, although the storm rages without CON-SER-TEX is a specially treated high grade cotton fabric particularly well adapted for roofing and porch covering. It will not, stretch, crack nor blister. No more noise and rattle when the elements let loose. No more leaky spots nor repair bills after the storm has passed. CON-SER-TEX preserves the coziness and safety of the home during the storm.

Every carpenter, builder and owner should send for our new illustrated booklet, "Roofing Facts and Figures." It proves the many advantages of "CON-SER-TEX" Canvas Roofing.

The Builder as a Fireguard

(Continued from page 132.)

of this kind are shown in Figures 6 and 9. If a course of brickwork resting on the foundation wall is built up between the joists and fitted snugly against the underside of the floor-and at the ends of the joists as might be done in Fig. 3-it is likely to deform the floor when the timber shrinks. Wooden fire-stopping, or a compressible material such as mineral wool should be used to prevent the floor from bulging in the course

If it seems that these suggestions are merely an unnecessary expense ask your insurance agent what he thinks of them.

Wooden Shingles and "Winter Dollars"

(Continued from page 59.)

negligible. Winter shingling need in no way disturb the warmth, convenience or comfort of the occupants of the home.

To assist a contractor, carpenter, or lumber dealer in "landing" such jobs, some "close-up" views of beautiful homes having shingle sides should be obtained, and as a forceful contrast, pictures showing homes that are badly in need of paint, or that are not aesthetically appealing.

In the smaller towns that do not have the convenience of modern water supply, and where the course of "aqua pura" is still the garden well, artistic well shelters of wooden shingles will be found to be quite a salable feature, and one that can be put up at a neat margin of profit to the carpenter-contractor-

There are a great many "Winter Dollars" waiting for the man who will take the trouble to put these ideas before the residents of his town, especially at a time when major building is not being done. The aggregate of such opportunities will be found quite surprising, and one will find the wooden shingle a valuable partner in his pursuit of these "Winter Dollars.'

Oak Flooring and Retail Dealer

(Continued from page 58.)

this kind keep the stock fresh and bright, and in the proper condition for delivery to the jobs. A retail lumber dealer who keeps the stock properly housed in all kinds of weather generally enjoys a far better trade than his brother dealer who is careless about the housing of oak flooring.

Not very long ago in Chicago an owner of a large apartment building made complaint on account of large crevices appearing. They were so numerous and large that they were indeed very unsightly. The flooring, from all appearance, had been properly laid, filled and finished, but after examination at the retail lumber vard where the stock came from, it was found that the oak flooring was exposed on both ends to the weather, and upon measuring same it was found that

(Continued to page 136.)

Just the Thing for **Emergency Jobs**

PARTITIONS are needed quick—an attic or basement must be lined in a dayshelving put up over night—a store or window display background or booth completed in a few hours—a theatre remodeled or a whole house lined in a few days.

"Hurry-up" jobs like these usually pay good profits. You can "deliver" by using

It's the only wall board with the wood core worked quick and easy. It saws straight and smooth, is light in weight, but very strong and durable. not affected by dampness or other weather conditions -does not warp or shrink.

Be sure you get the genuine-with the wood coresold by dealers in strips 4 feet wide by one to 18 feet long.

WALL BOARD

Assures Steady Work and Big Profits

That's what every contractor, carpenter and builder is looking for—and that's just where Plastergon Wall Board comes in.

There isn't a home that can't be improved by the use of Plastergon and the opportunity of securing contracts is unlimited. Our free service department will gladly furnish plans, literature and other matter that will create a demand for Plastergon every time—and every finished Plastergon job is a boost for new business.

You save from \$4 to \$6 per thousand feet, because we size Plastergon before it leaves the factory. Plastergon Wall Board is water-proof, warp-proof and twist-proof and gives absolute satisfaction.

Write for particulars.

PLASTERGON WALL BOARD CO. 201 Philadelphia Ave., Buffalo, N. Y.

Oak Flooring and Retail Dealer

(Continued from page 134.)

practically all pieces measured fully 1/16 inch on the face over the standard measurement. This condition ran from the end in about two feet. When all the facts were brought out the owner compelled the contractor, as well as the dealer, to compensate him for the abused condition of the floor.

There are many retail lumber dealers that are offering splendid service to the contractors along the line of the proper handling and caring for it after it leaves the retail yards. A good plan, if the period is in winter, is to have the oak flooring stock kept in a dry room in the building, with steam heat, for about ten days before starting to lay. This treatment will keep the stock in normal condition, and the result will be less complaints from the architect or the owner.

Another case in St. Louis, Mo., last spring was where about 3,000 feet of oak flooring was laid in a beautiful home in Forest Park. The owner made complaint to the architect on account of the number of unsightly cracks appearing mostly toward the ends. The architect took the matter up with the contractor, and they placed the matter before the dealer, and the dealer contended that it was the fault of the manufacturer of the stock at the mill where it was made. An expert was called in upon the case, and in a very short time the fact was brought out that the retail lumber dealer was housing the oak flooring in a build-

ing entirely unsuitable for the storage of oak flooring. The building had three sides open, allowing the rain to wet both ends, swelling the flooring about 1/6 inch from the original manufacture. The contractor, instead of keeping the oak flooring in a dry place in the house for at least ten days before it was laid, laid the stock as soon as he received it from the dealer. In this case the architect and the owner agreed that the direct trouble with the floor was in the abuse of the oak flooring by the improper housing given it by the retailer. They also reprimanded the contractor for laying the floor in the condition in which it was received.

Atmospheric conditions peculiarly affect oak flooring thruout the entire season, and with this in mind it surely would pay the retail lumber dealer to give it more care so that when his customer calls for it for laying it will be in the proper condition for immediate use.

When you consider that oak flooring after being laid is supposed to last a lifetime, it would appear very unreasonable on the part of some retail lumber dealers and contractors to abuse the flooring by improper housing, handling, as well as laying. The general tendency today is too much toward quantity and too little regard for high-class workmanship.

It would be well for all dealers and contractors to remember that oak flooring is like a sponge, in that it has been thoroly kiln dried and all the dampness

(Continued to page 138.)

Beautiful Oak Floors

Oak Floors are the only floors that combine beauty, durability and distinctiveness, three very vital reasons why so much Oak Flooring is in use today.

Oak Floors are always the source of unlimited satisfaction and pride. Nothing is prettier, or more artistic than floors of Oak and a few choice rugs.

Oak Floors mean better selling and renting values, and it attracts a better class of tenants.

More Winter Work for the Carpenters

Three-eighths inch Oak Flooring offers an excellent side-line for carpenters or contractors during the winter season. It can be laid over old pine floors in old houses at a very low cost. All that is necessary to secure jobs is some soliciting. Every woman wants Oak Floors as beautiful Oak Floors and rugs simplify housekeeping and house-cleaning.

Three-eighths inch Oak Flooring can be laid successfully by any carpenter or handy man. The work is very agreeable and very profitable.

Write for folders that tell all that is worth knowing about Oak Flooring.

Oak Flooring and Retail Dealer

(Continued from page 136.)
extracted. It will absorb moisture if exposed to any dampness for any length of time. A little extra attention in caring for the flooring before it is laid means years of satisfactory service. Carelessness in handling oak flooring means extra work for the floor layer, and permanent dissatisfaction for the home owner.

The manufacturers of oak flooring have been doing some excellent educational work during the last ten years, and have distributed millions of booklets and folders over the entire United States. This literature tells all that is worth knowing about oak flooring, from the mill where it is made, to the finished floor after being laid, filled and finished. This national advertising campaign is of direct assistance to the retail lumber dealers. The manufacturers of oak flooring have standardized the grades, thicknesses, as well as the size of the tongue and groove. These are very distinct advantages to the retail dealers who keep on hand different brands of oak flooring.

Building and Loan Proposition

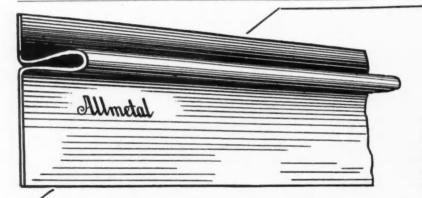

(Continued from page 46.)
It would cost very little to try it out. There is no limit to the possibility of such co-operation. There is no limit to the possible increase in the use of lumber.

In promoting the building of homes by mechanics, clerks, laboring people, and others in the smaller communities, we would be opening a field for the consumption of our product. In every community where there is a single or several lines of business engaged in manufacturing, employing laborers and mechanics to the extent of 1000 men, the owners and operators of such plants could afford to established in their own offices, or if not practical there, to maintain at their own expense all of the clerical help necessary to conduct a Building and Loan Association without \$1.00 charge to the members whatsoever. They could build homes and sell them to their employes on the Building and Loan plan.

It is of very little importance what the rate of interest Building and Loan Association members pay. It may be very large, but if all pay the same there is no burden. The larger the interest, the quicker the maturity of the stock and the sooner does the homeowner come into entire possession of his property.

The principle upon which the average Building and Loan Association is conducted, that of weekly and monthly dues, loans compounded monthly, at a minimum expense of doing business, is the best and quickest and safest method of obtaining homes for those not in possession of sufficient funds. It is for the retail lumberman and the manufacturer here assembled to work out a plan whereby the Building and Loan Association plans, purposes and benefits may be extended to every community possible, thereby develop-

ing not only the community, but bringing greater returns to that particular industry in which we are interested-the lumber business.

The National Lumber Manufacturers' Association employs men who are experts in mill construction, wood preservation and general trade extension. Why not employ at least an expert Building and Loan Association man and I pledge you the co-operation and support of the retail associations and their members in an honest trial to make the effort a success.

Why not adopt now and here the slogan:

"A HOME FOR EVERY FAMILY!"

Painting the Exterior

(Continued from page 92.)

of good taste in order that its less fortunate neighbors may be enabled to enter into harmony with its color scheme because of the good example which it has set.

The modern house with its use of stucco, shingles, wide and narrow sidings, belt courses, lends itself readily to a restful and happy color combination. The older type of house, however, with its excess of scroll saw and turned work, should so balance its colors to leave these features as unobtrusive portions rather than accent their presence as has so often been done.

A house in the city, located on a dusty street closely crowded by its neighbors, can be painted in much lighter shades of grays, tans or browns than is commonly supposed with often increased wearing qualities in the paint and added cheerfulness in the lives of the tenants thru the increased amount of light brought into the rooms.

I am suggesting for color schemes suitable to many locations and types of houses such combinations as the following named in order of body, trim and window point.

Medium ivory or light cream; silver gray; light greenstone.

Cream; light brown; black or moss green.

Pure gray; light cream or ivory; black or green-

Dark brown; cream; silver gray.

Silver gray; ivory; white.

Silver gray; white; black.

Light buff; warm gray; moss green.

In mixing these paints follow the formulas given in the August issue of the American Builder. It will be necessary that all loose, scaly, or blistered paint be removed by burning or scraping and afterwards sandpapered, followed by the priming coat as mentioned in the August issue. See that all knots and sap streaks are cleaned and shellacked with good orange shellac. If the house has been exposed to

Painting the Exterior

(Continued from page 140.)

excessive fumes from smoke stacks or manufacturing plants it is often an economy to have the entire exterior wall surface of the house scrubbed with brush and Gold Dust, afterwards rinsing down thoroly with the hose. When dry, follow with sandpapering and the first coat of paint. Allow three to five days between coats, ascertaining that the work is done when the surface is warm and free from moisture from dew or rain.

For new work on a new house, if possible have a fire in the furnace for a week before doing the second and third coats of outside painting. This is necessary in order that the plaster may be thoroly dried and to prevent the moisture, driven out of the plaster by the furnace heat, from blistering and peeling the second coat and finish coat. Do not paint until the plaster is thoroly dry.

Too much thinning of the under coats, whether with linseed oil, turpentine or any other thinner and too free use of japan drier will injure the durability. Carelessness in brushing out paint is responsible for lots of trouble. Paint must be rubbed and brushed into and onto the surface, not flowed on like varnish. Three well brushed, thin coats will outwear two thick coats. Two coats are not enough on new work to give good results. Use a priming and two coats of finish. The under coats should not dry too fast nor too

glossy, if so, the last coat will not adhere. A porous surface needs more oil than an old or hard surface. The last coat should be full bodied and almost no turpentine used at all.

All paint stocks should be mixed at least twentyfour hours ahead to allow thoro absorption of the

After the first coat and before the second, all putty work should be done and three days allowed for hardening before the second or third coats are applied.

Employ a good painter who hires sober men; has good equipment and who is willing to do the right thing at the right time. When the job is done, be satisfied to pay a good and reasonable price for work well done. The job will speak for itself.

The Man from the Lumber Yard

The Man from the Lumber Yard

(Continued from page 142.)

one plan is operated on, it is continued for too short a period.

Concentration of purpose will win where scatteration will lose, especially if concentration be hooked up with continuation.

I have learned a lesson from an industrious timepiece at home.

It has to tick off eighty-six thousand four hundred (86,400) separate and distinct ticks in one day and keep it up seven days in the week.

It can give only one tick at a time, but it concentrates on its job and continues on the job and delivers.

Learning Concentration

It was Wednesday, Sept. 17, about 7:30 a.m., that part of the Honor Draft Army began assembling in the narrow street adjacent to the Illinois Central train shed. It was a new experience for American mothers of this generation to send their boys to war.

An observer could see the strain under which they were to keep a brave smile until the boys had marched by to the train. A young man who had worked with me for the last seven years, was of the number.

When I had bidden him Godspeed, I was attacked by a leaking of the eye and pretended to have hay fever, as I used my handkerchief.

They were not tears of sorrow, nor yet of joy. It was that same tightening at the throat felt when

you hear great music or see a great tragedy or your favorite ball player makes a fine strike, bringing himself and two others home when the score is even.

I knew that all over Uncle Sam's domain young men just like my man were entraining to learn the war game. You have read of the earnest work done. Ninety per cent is to learn how to concentrate on the job in hand.

If my own boy or this young man to whom I feel like a father returns short an arm, an eye and an ear, he will be more of a MAN than he would have been without the training, even if he were whole in body.

Good fellows who had been drifters who couldn't concentrate on any special work will secure the training that will make real men of them.

Can't Begin Yesterday

They don't take bald headed chaps who are grand-dads into the army. I must get my training in CON-CENTRATION some other way. When I woke up to my need I didn't bewail the fact that I couldn't begin yesterday to get strong in will power, nor did I wait until tomorrow; but I began at once on the today.

Organize

There has been a concerted movement for creating public opinion on and desire for other things than homes. If those interested in home building do not have enough interest to organize and enough of purpose to push a campaign, the dealer in building mate-

"You Get The Job"

"We've been watching you, young man. We know you're made of the stuff that wins. The man that cares enough about his future to study an I. C. S. course in his spare time is the kind we want in this firm's responsible positions. You're getting your promotion on what you know, and I wish we had more like you."

The boss can't take chances. When he has a responsible job to fill he picks a man trained to hold it. He's watching **you** now, hoping you'll be ready when the opportunity comes.

The thing for you to do is to start today and train yourself to do some one thing better than others. You can do it in spare time through the International Correspondence Schools. Over 5000 men reported advancement last year as a result of their I. C. S. training.

The first step these men took was to mark and mail this coupon. Make your start the same way—and make it right now.

I. C. S., Box 8148 Scranton, Pa.

rial and the builders will have lean times until the pendulum swings back of its own accord. But why should the building interests simply drift.

The Worthwhileness

There will be held before this goes to print, the sixth session of the National Conference on Housing.

Men of public spirit and vision are working on this problem of home building. Any dealer or builder that is interested enough to write to our editor will receive concentrated information on this subject that will be of interest in a broad way and of vital importance to every community. Every one that reads this is directly or indirectly interested in knowing how to provide decent and healthful dwellings for the family that has only a \$15.00-per-week wage, as well as the proper ventilation and convenience for the family that enjoys a larger income.

The solution of this problem means the lengthening of the span of the infant's life to carry it into the period where it is strong enough to fight its own battle for existence. It means the giving of a proper spirit to the worker so he can fight off poverty.

You have possibly thought that the reason people lived in poor houses was because they were poor.

I say to you that living in a squalid home with bad air, bad toilet and bath facilities begets poor specimens of humanity that naturally gravitate to wretchedness.

Not Because of But in Spite of

You draw attention to the fact that President Lincoln came from a log cabin and some of the boys born in the "Gold Coast" in Chicago went to the scrap heap.

Lincoln had ideals in his home and an ancestry on his mother's side that were dynamic. You will find where a lad takes the toboggan that a parent has failed in duty regardless of the money owned.

Trace this failure of duty to its source and you will find it had its origin in unwholesome living conditions.

Graham Taylor says: "While shiftless people wreck

You Can Take Hills On High Without A Knock

IF you will keep your motor free from carbon. That knocking in your engine—the difficulty you have climbing hills—poor pick-up—lack of power—noisy motor—pre-ignition—in fact 80% of engine trouble is caused by carbon. Clean it out

with

JOHNSON'S CARBON REMOVER

and your engine will run like it did the first 500 miles, quietly and full of "pep". And your gasoline consumption will drop from 12% to 20%.

You Can Do It Yourself

For 25c—five minutes' time—and with no labor you, yourself, can remove all carbon deposits. Simply pour an ounce of Johnson's Carbon Remover into each cylinder—allow it to remain from two to twelve hours and then drive your car 10 or 15 miles. You will be surprised at the wonderful improvement.

How It Works

Johnson's Carbon Remover does not eat the carbon, but releases it from the metal and softens it into a jelly-like, inflammable mass. Then, as the engine is operated, the mass burns, pulverizes and is blown out with the exhaust in powder form.

Use It Every 1,000 Miles

If you will use Johnson's Carbon Remover at regular intervals, giving carbon no chance to accumulate, you will automatically eliminate most valve trouble and your engine will always be at its highest efficiency.

If your dealer cannot supply you with Johnson's Carbon Remover use attached coupon.

The Man from the Lumber Yard

(Continued from page 146.)

the house, the house starts or finishes the wrecking of meek and shiftless people."

Your Brother's Keeper

Every day I am more and more impressed with the smallness of the world. Don't think that because you don't patronize the saloon, John Barleycorn will have no grip on you.

Don't think that the tenement problem in New York doesn't mean anything to the Iowa dealer in supplies or the Wisconsin builder.

Don't think that the Chicago contractor is not interested in the best being had in homes for the people who grow fruit in Michigan or wheat in Minnesota. The house has to do with the determining of the happiness or misery, the health or sickness of all, especially the child. If you are not your brother's keeper, you are vitally interested in the kind of children your neighbor has, and he in your children, if both are interested in the grandchildren.

Believe me, I can testify to the value of a grandchild. My grandchild couldn't be what it is if some one had not been interested in the proper raising of its mother.

An Utopian Dream

Some day Uncle Sam will take a paternal interest in his children, poor and rich, the same as he now takes interest in his hogs and cattle. In that day he will say that all ugliness must also disappear. Ugliness is badness and it begets badness.

The only reason we tolerate unsightly houses, the uncomely rows of houses, each the counterpart of the other, and the ramshackle tenements, is because we are bad.

If we all followed the teachings of the Great Teacher we would have beauty and loveliness in every structure, farm house or granary, city office building or apartment. The country roads and city streets would be adorned. Vacant lots would produce other than weeds, and untilled fields would blossom with beauty while resting. This would beget so much good that we would not have to wait until some indefinite period in the future to enjoy heaven because we would have heaven here on earth.

You and You

But what has this to do with you. The answer is that the American Builder is committed to the gospel of more and better building. I want YOU to think of this subject in a big way. YOU may be on the lowest round of the building ladder and concerned only with how to meet today's high cost of living.

If I can get only YOU to see the potential results of the right kind of buildings and only YOU thinking on the Ideal, this space will not have been wasted.

ARTISTIC HOMES

A book of 280 (8 x 11 inch) pages showing perspective views and floor plans of 250 artistic modern homes. A large variety of designs are given so as to meet the taste of the majority of home builders. There are artistic houses for people of moderate means and others for the more wealthy, but in every case the design is made with reference to comfort and economy.

Every design shown has been made by best architects in the world, who have made a study of home architecture and that alone.

Partial Table of Contents

Value of Being Able to Read Plans. What is meant by Floor Plans, Elevations, Sections, Interior and Exterior Details.

How Different Materials are Shown in Sections.
Illustrating wood, stone, concrete, brick, glass, slate, cast-iron, etc.

Reading and Checking Sizes and Dimensions.
Showing how to use ¼-inch, ½-inch, %-inch scale on a plan.

pian.

Plan of kitchen, showing chimney, hearth with range, boiler, washtubs, drainboards, sink, prap, dumbwaiter, pantry with shelves. Plan of bathroom, showing bathtub, washbasin, water closet, medicine cabinet and soil pipe. Plan of bedroom, showing bed, radiator or register Showing how single-swing and double-swing doors are indicated.

doors are indicated.

Illustrating Difference Between Frame and Masonry Wall.
Plan of a cellar, showing how footings, columns, joists and girders are indicated on a plan.

Giving Complete List of Symbols.

or abbreviations commonly used on plans. For example:
O. C., meaning on centre; D. S., meaning double strength; W. I., meaning wrought iron. Illustrations showing how stairs, bookcases, colonnades, cased openings, fireplaces and hearth, buffets, seats, ice boxes, doors, windows, beamed cellings, single and double sliding doors, floor drains, etc., are indicated on plans.

Chapter on Reading Barn and Outbuilding Plans.

sliding doors, floor drains, etc., are indicated on plans.

Chapter on Reading Barn and Outbuilding Plans.

Illustrations showing how horse stalls, cow stalls, box stalls, mangers, gutters, carrier tracks, foul-air shaft, fresh-air inlets, floor drains, dutch doors, sliding doors, feed troughs and guard rail for hog houses, roosts, nests and dropping boards for poultry house are shown on plans.

Taking off a Bill of Materials.

Concrete Work:

Method of figuring number of cubic yards of concrete in footings, foundations, piers, floors, etc. Method of figuring amount of cement, sand, and aggregate in each cubic yard.

Stone Work.
Figured by cubic yards. Amount of mortar required for each cubic yard. Amount of cement and sand in cubic yard of mortar.

Brick Work.

Methods of figuring number of brick in walls, chimneys, fireplaces, cisterns, etc. Amount of sand, cement or lime necessary to lay 1,000 bricks with different thicknesses of joints.

Framing.
Residences.
Rough Lumber. Nough Lumber.
Methods of figuring number of pieces, sizes and lengths of wall plates, girders, posts, joists, rafters, studs and collar beams. Illustrations showing exact location of each, also safe spacing and sizes of joists for various common spans. How to figure number of feet of roof and box sheathing.

Overline.

Roof Covering.

Methods of figuring number of shingles required, whether wood, slate, asbestos, asphalt, cement. Also number of sheets of tin roofing. Also number of square feet of tar and gravel roofing. Also figuring tile roofing, prepared roofing, galvanized iron roofing, metal shingles, etc.

Exterior Finish and Millwork.

Method of figuring number of lineal feet of facia, frieze and porch box, water table, plancier, ceiling, lattice frame, lattice. Also figuring door frames, window frames, crown mould, bed mould, drip cap, cove mould, top and bottom rail, baluster stock, columns, newels, etc.

nterior Trim. erlor Trim. How to figure number and size of door frames, door jambs, window frames. Also number and size of all doors and windows, number of feet of wainscot, base, picture mould, mouldings, chair rail, plate rail, celing beam. Also how to figure flooring, stairwork, mantels, fireplaces, window seats, ideboards, book cases, colonnades, medicine closets, wardrobes, shelving, etc.

Plastering.

How to figure number of feet of grounds, furring, number of wood lath or square yards of metal lath.

Amount of plaster necessary, whether cement or lime, figuring amount of wall board or plaster board.

'ainting.

How to arrive at the amount of material necessary for priming and finishing both exterior and interior. Also wood filling, hardwood finishing, varnishing, waxing, staining, bronzing, shellacing, enameling, calcimining, etc.

TECTURAL TERMS

A big, practical, up-to-the-minute book for the Lumberman, Carmenter, Builder, Contractor, Construction Man, Architect, Draftsman, and Estimator.

This book contains the latest and most reliable, practical information on original drawings, tracings, blue prints, and rough sketches. shows how to figure inside and outside dimensions, heights, opengs, take off quantities, and a vast amount of other data that is dispensable to the man who has to do in any way with construction the use or estimating of materials.

In This Big New Book rati

A Dictionary of Architectural Terms

Included in this book is a Dictionary of Architectural Terms. This appendix is one of most necessary additions to a builder's or lumberman's knowledge. Many terms are used architects which are unfamiliar or not in common use, and when one is met with that is mown to the man who is erecting a building or taking off a bill of materials he wonders it it means. By the use of this part of "How to Read Plans" he is able to master any used, any question that may arise, and by getting and keeping posted he has a very at advantage over the man who has to guess at the hidden meaning. It is surprising how by words and terms are used in architecture and building that the average builder and berman does not know. The purpose of this Dictionary of Architectural Terms is to round and make complete everything relating to any set of plans, no matter how simple or orate they may be.

orate they may be.

"HOW TO READ PLANS," with its many pages of descriptions, its many illustrations ouse plans and details of construction, its practical examples of how to take off a bill of trial correctly, its Dictionary of Architectural Terms, and its hundreds of simple moneying and labor-saving suggestions is a volume that every man in any way engaged in the can buy

that need he can buy.

"The World's Greatest Building Paper"

AMERICAN BUILDER

Circulation Larger Than Any Other Building Paper

We want to advertise "How to Read Plans" in the most effective way, and we believe that we can do this best by letting our old friends know about it in advance and giving them the opportunity to secure a copy for themselves FREE. We have therefore decided to send it to our subscribers with our compliments.

FREE TO OUR SUBSCRIBERS

We are doing this because we are sure that the subscribers of the American Builder will want a book covering this important subject—we have published it because it will fill a vital need in the building industry. It has been our custom to tell our old friends first of all the good things we have to offer—and this is one of the best we have ever had. Our experience has been that our subscribers will advertise the book for us in the most effective manner—that they will recommend it to their friends if they find it as good as we say it is. We are willing to give away the first ten thousand books simply for the sake of our subscribers' good-will and future help.

ORDER YOUR COPY WITHOUT DELAY

We are positive that there will be an overwhelming demand for this book. Make sure of getting a copy of

How to Read Plans

by signing the coupon below and getting it in the mail at once, together with \$2.00 to pay for a subscription or renewal for one year to the American Builder. Renewals will be credited from the time present subscription expires.

SAVE \$51

The Oliver Typewriter Now \$49—Was \$100

The Oliver Typewriter Company created a nation-wide revolution on March 1st when it announced its new plans. No more expensive sales force of 15,000 men! No high office rents in 50 cities! No idle stocks!

But dealing direct with the people—cutting out all middlemen. The old plan cost the buyer a needless \$51 per machine. We now save that and give it to you. So the new price for standard \$100 Olivers is \$49.

The Oliver Nine—our latest model—direct from the factory to you. It is the finest, the costliest, the greatest typewriter ever built. Used by the leading concerns.

Who would ever pay over \$49 again for a new typewriter? Especially when we not only make a low price, but also give the lowest terms—about 10 cents per day—over a year to pay.

Over 600,000 Sold

Contractor's Special

For contractors, our Special Oliver Nine is unbeatable. Besides being the best for ordinary correspondence, none can equal it for figure work. It has the characters you need, as shown on the keyboard herewith. Special features on the contractor's model enable one to handle bills of materials, estimates, etc., as easily as correspondence. And remember, carbon copies of everything written, for your records.

Our new price and terms ought to sell an Oliver to every contractor. Longhand writing is out of date among progressive men.

FREE TRIAL-No Money Down

This Book FREE

Just send for our amazing disclosure entitled "The High Cost of Typewriters—The Reason and the Remedy." Then ask for a trial. You are not put under the slightest obligation. It is our newday way of selling. It saves money for both of us. You act as your own salesman—the Oliver itself must convince you. You pocket the \$51.

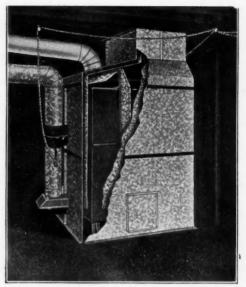

Send the coupon below today for one copy of this sensational book that exposes the secrets of the typewriter world.

Asphalt Shingles 1413 Y. M. C. A. Bldg., CHICAGO, ILL.

Save At Both Ends

——DEALERS who sell and builders who use Rex Strip Shingles save

in many ways.

These shingles cost less than individual shingles, and weigh only 185 pounds. Thus the dealer saves, even in freight, and passes his saving along to the builder—who in turn requires less nails and less labor of nailing than with individual shingles.

This combined saving and our broad guarantee makes it easier to sell the roof to the house owner.

Our Big Catalog No. 20 that tells all about Rex Strip Shingles—and other Rex Products—will be mailed (samples included) on request.

A Few Things We Teach

PLAN READING How to read a building plan. Floor plans and elevations. Use and meaning of different lines on the plan. Sections and section lines. Cross Sections. How different materials are shown on the plan. How to read dimensions, Detail drawings. How to lay out work from the plans. Tractice in reading complete plans from basement to roof, etc., etc., etc.

CONSTRUCTION

Brickwork: Footings and foundation walls of brick, concrete and stone. Brick laying, joints in brick work, pointing, differentiation of stone. Carpentry: Kinds and uses of woods, confice, interior details, framing, roof construction, bridging, miter joints, butt joints, etc. How plansare made. Complete instructions illustrated by working blue prints. Plans and specifications. Residences, apartment buildings, factory buildings, school houses, hospitals, store and office buildings, bank buildings.

ESTIMATING

Practical rules. Problems worked out from the plans. Brickwork and carpentry. Excavations. Labor and material for footings in brick, concrete and rubble stone. Methods of practical builders. Re-inforced con-rete-full plans and specifications for re-inforced concrete buildings. Estimates of labor and material required. Labor and material for brick work; figuring common and pressed brick walls of different thicknesses, etc. Chimneys, fire places and cisterns. Fire proofing, tileflooring, arches, partitions, furring, terra cotta, etc. Lumber and timber; figuring board feet. Estimating poats, girders, silla, joints, studs, bridging, rafters, etc. Estimating all kinds of roofs, floors, siding, cornices, etc. Labor for rough and finished carpentry.

Estimating mill work. Labor and material for window and door frames, sash, blinds, base board, wainacoating and all kinds of closets, cupboards, etc. Lathing and plastering, sheet metal work, exterior and interior marble jointing and decorating, glazing, plumbing, heating, wiring, etc.

ARITHMETIC

mplete but condensed course in arithmetic sly arranged for contractors and builders. as all a man in this business needs to know.

ARCHITECTURE COURSES IN DRAFTING

Accept this offer while it lasts. Send for this FREE Lesson which will show you how quickly you can learn Plan Reading by our new easy method. Not a penny to pay for it—and no obligation upon you for asking.

This knowledge is what you must have to become a foreman or superintendent in charge of building work or to go into the contracting business on your own account. Without a good knowledge of plans your opportunities are limited. The man at work doesn't get the chance to study the blue prints himself or to have their meaning explained. We make the chance for you. We place in your hands plans used in actual building work by contractors in Chicago and other cities. We explain every detail. We make it as easy for you to read a plan as it is for you to read this advertisement. Your lessons will be given by practical contractors—men in charge of building work in Chicago. be given by practical contractors—men in charge of building work in Chicago and they will show you how to get the knowledge that brings advancement and more money. To get full information sign and mail the coupon below.

Builders' Course on Easy Payments

Read at the left the partial list of subjects we will teach you in this Builders' Course. This is a course that gets right down to the things you need to know. Every lesson gives you information that

will make you worth more in the building business. And you can get all this on easy payments. We don't ask you to pay all down when you enroll. A small first payment—then payments monthly -so small you will never feel the cost. Don't put off enrolling. At least send for the Free Lesson and see for yourself what this Course really gives you and how easily you can learn.

Learn By Mail

Keep your present job while studying this Course. Use your spare time at home to learn how to be a better workman, a better foreman or a better contractor. In only a few months you can complete the Course under the direction of our experts and then be ready to make a larger income. Once enrolled you have the privilege of consulting us at any time even after you have completed your studies. Our experts will always be ready to help you.

end the Coupon

Get this information now. Learn how to make more out of your work or out of your business by knowing more about it. All this information is free. Send while the offer lasts. Whether you decide to take the course or not you ought to get this Lesson and see what it teaches in Plan Reading. Just sign and mail the coupon.

The Only Solution

Inside Bead, Patented June 18, 1912

"SUPERIOR" Metal Corner Bead

Damaged plastered corners, unsightly cracking where wall meets wall or ceiling-imperfect corner lines-"Skinning" of mortar coat from jambs to inner corners, and many other troublesome plaster features disappear when you use "Superior" Metal Corner Bead.

Outside Bead

Both inside and outside bead are made from open hearth galvaniz d sheets in 5, 6, 7, 8, 9, 10 and 12 foot lengths.

Ask for samples.

MILWAUKEE CORRUGATING CO.

Blackboard Talks by the Professor

No.

THE designer and builder who sees to it that the unseen parts of the structure are right is giving building insurance that is worth while. Owners should have

Protection from falling plaster.
 Protection from fire.
 Protection of walls from rats and mice.
 Protection from frequent repairs.
 Protection of decorations through prevention of cracks in the walls.

Berger's Expanded Metal

gives all this and more. It adds strength to the building as the lath reinforces the plaster and stiffens the walls. For stucco work, Metal Lath gives most satisfactory results as proven by practical tests made by the U.S. Bureau of Standards, so you are recommending reliable construction when you advise your clients to use Metal Lath. The small diamond mesh of Berger's Metal Lath save plaster and provide a grip clinch which holds the plaster securely for the life of a building.

Send for Metal Lath Booklet F. A. B.

NOTICE TO ADVERTISERS

Forms for the December number of the American Builder will close promptly on November 15. New copy, changes and orders for omissions of advertisements must reach our business office, 1827 Prairie Ave., Chicago, not later than the above date. If new copy is not received by the 15th of the month preceding date of publication the publishers reserve the right to repeat last risement on all unexpired contracts.

AMERICAN BUILDER

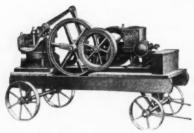

Eveready Saw Rig

A strong and handy portable mill. It joints, bores, sands, rip-saws, cross cuts, jig saws, rabbets, bevels, mitres, tenons, and grinds. A quality rig at a moderate price.

Oshkosh Back Filler

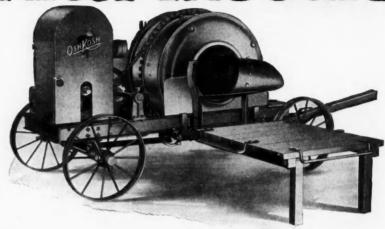

A practical back filler that does the work of from 20 to 30 men and only requires three men for operation. A self-tractor—moving forward as the fill is made. It will work where a team can't work.

Oshkosh Trench Pump

A rubber diaphragm pump operated by a 2 H. P. gasoline engine. Will run a tenhour day without attention and guaranteed to have sufficient power. Furnished on skids, or trucks, as desired.

Service WHEN SERVICE IS NEEDED — After The Sale

THE man who gets the next big contract is the man who finished his last job on time.

But accidents are bound to happen—and a broken sprocket may mean having your men idle for days—a faulty job—a paralyzed contract—unless you can get immediate repairs. You will want a new part—and want it quick. You can get it quick if you own an

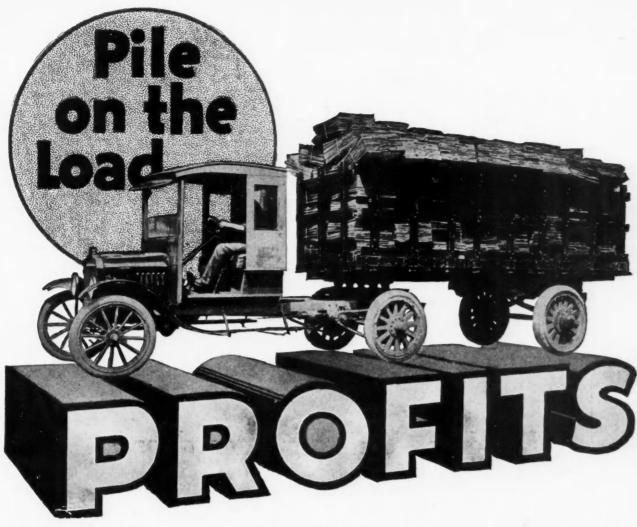

LOW LOADING MIXER

Oshkosh service—sure, speedy, obliging—stands firmly behind every Oshkosh sale. Phone your dealer if you need repairs.

The OSHKOSH Low Loading Mixer is built for long service—sturdy, efficient, rapid—it will deliver two batches per minute—and do it ten hours per day—or more. It loads easily, direct from a wheelbarrow and discharges directly into a wheelbarrow—a real saving of time and labor.

A letter will bring descriptive catalog on this or any of the other Oshkosh products shown on this page. There is an Oshkosh quality machine for every need.

Oshkosh Mfg. Co., 112 Main St., Oshkosh, Wis. Liberty Bonds Accepted in Payment at Full Face Value

ERE'S the King Semi-Trailer carrying a three ton load hauled by a one ton truck. The truck itself could not safely handle more than its rated capacity, but its tremendous reserve pulling power enables it to handle the three ton load with ease.

By using this King Semi-Trailer, the owners—the C. A. Sauer Lumber Company of Ann Arbor, Michigan—have tripled their hauling efficiency. At practically the same operating cost they are carrying a payload three times as large. That's why you need a King Trailer or small Semi-Trailer—because, attached to any auto, truck or tractor, you triple your hauling efficiency without increasing your hauling expense.

The King Semi-Trailer is connected to the tractor unit by the wonderful King-Irwin Universal Motion Shock Absorbing Fifth Wheel—lengthens the life of tractor, trailer and load.

One driver, one truck and a King Trailer will do the work of four trucks and four drivers.

You Building Supply men will find that the King way is the most profitable, satisfactory and economical way to haul shingles, sash, doors, mill work, wallboard, bricks, lime, cement or plaster. You can serve customers more promptly, profitably and efficiently. In one delivery trip you will accomplish as much as you formerly did in three. You can build up an enormous country building trade and get orders on the strength of your ability to perform.

Let the King help you get more business. King Trailers and Semi-Trailers are built for strength, speed and service. There's a size to suit your immediate hauling requirements. Write for our illustrated booklet—"Cutting the Cost of Hauling"—and get all the facts. It's FREE. Fill out the coupon and mail it to us direct.

DEALERS—there's a big opportunity for the dealer who sells King Trailers.

THE Control of the Angel And Angel State Bearings

Builders—a new garage door set

See how the doors lie back flat against the wall, giving maximum space in the garage. Notice how the door to the right opens without interfering with the double doors, thus providing easy access to the garage.

You won't find an easier working combination sliding and swinging garage door equipment on the market—a light push and the doors swing, slide and fold against the opposite wall—a light pull and they close—compactly without binding or

The adjustable feature prevents sagging of the doors. The doors are also ad. justable in case of swelling or raising of cement floor.

Low Priced.

We have simplified the construction of the No. 805 Combination Garage Door Set in such a way as to be able to offer you equipment that is most efficient and also low in cost. You can give your client the very best kind of combination garage door equipment at a very reasonable cost.

No. 805 includes:

- No. 29 Latch; 1 only Swivel Hanger; 6-foot Braced Bail; 4½ pair 4x4 inch Jap. No. 505 T. P. Butts; 1 only No. 820 Chain Bolt; 1 only No. 830 Foot Bolt; 1 only

- No. 5 Pull; 1 only $4\frac{1}{2}$ inch No. 30 Safety Hasp. No. 806 Set includes the same, except that No. 27 Latch is used instead of No.
- 29. Both sets furnished in japan finish.

We have just issued a circular illustrating and describing the No. 805 Combination Garage Door Set. If you haven't received a copy, drop us a line and we will mail you one promptly.
