Renovation with Stucco Good Business for You

MANY a man will "spruce up the old place" when he won't tear down and build over. Sometimes it is sentiment, sometimes economy.

Renovation can do a lot more than improve the looks of the house. Remodeling and overcoating with stucco make the walls fire resistant—lowering insurance premiums and increasing safety. It makes the home easier to heat in winter, cooler in summer. Lowers cost for repairing or repainting.

The new color stucco does wonderful things in color. Toned with exposed aggregates, such as marble and granite screenings, colored sand, gravel, etc., this stucco has a life, character, warmth and individuality not found in ordinary color stucco, and the color lasts.

Use the coupon below for valuable information about this new color stucco, remodeling, etc.

Here's A Portable "Planing Mill"

No matter what kind of work you have for it to do it will do it and do it right. It will save time and labor, too, and utilize all of the lumber—there's no waste where there's an

for odds and ends are turned into profits by its use. Just look over the variety of work it does. It joints, bores, sands, rip-saws, cross-cuts, jig-saws, rabbets, bevels, mitres, tenons and grinds. You can make entire door and window frames with it quicker than you ever made them before—because your “plant” is all in one place. You can take it right out on the “job” with you, too, for it’s light and portable. Substantially made—like all Oshkosh products—and moderately priced—it’s used by contractors from coast to coast.

Write today for “Book of Evidence” and price.

From the Raw Steel to the Finished Saw—

Every step in the manufacture is handled by men skilled in their Art. Each process is handled by experts. Every saw is carefully inspected and tested before being forwarded to the next department. When the final test and inspection has been made, Geo. H. Bishop & Co. place their seal of warranty on the saw and you have the Product of the Greatest Saw-Making Organization in the World.

The Greyhound

A saw that will run fast and cut easy. A saw finely adjusted, tough and flexible.

Good Mechanics appreciate good tools. We offer these Saws, confident that they will please you, recommend them to your fellow builders. They are a superior Saw and will serve you long and well.

We refund money if 30-day trial does not prove our guarantee.

Geo. H. Bishop & Co.
Lawrenceburg, Ind.

For Your Saw Rig

Huther Bros. Dado Head

will cut perfect grooves, any width, with or across grain. It consists of two outside cutters and enough inside cutters to make the desired cut.

The Head comes to you ready to use and guaranteed to do your work satisfactorily. Ten days' free trial at our expense.

This cutter head can be used on the saw table. Knives are adjusted by headless set screws and are held by dovetailed slides and bolts. Run like a solid cutter. Any shape knives made to order.

Packed one in a box.

The Keil Hand Saw Filing Machine is receiving a great deal of attention in the building field now. It is because it is producing such good results. It is sharpening hand-saws so they will cut true and smooth. You can appreciate what this means for work like windows, or door-cases, or any kind of fine trimmings in hard or soft wood.

The Keil will file any hand-saw—stiff or limber back—with teeth numbering from 4 to 12 teeth to the inch. It operates in such a manner as to correct all irregularities—all cutting points are set in perfect line, all teeth are made the same length.

The Keil machine requires no special skill to operate. It is fully guaranteed to do first-class work. Try it out. Return it, get your money refunded if it is not as represented. Our descriptive circular will tell you all about it. Get the details of our “easy payment” terms, too.

A discount will be allowed to the first carpenter in each town who orders one.

Keil-Dedlow Mfg. Co.
Plainview, Nebr.
"AMERICAN" WOOD-WORKER

Simple
Portable
Reliable
Efficient
Profitable

THE decision you make now, on this woodworker question, will affect all your later operations. Don’t be led astray by false ideas of economy. In a woodworker you’re not buying a mere machine but productive capacity, earning power. A few dollars’ saving in first cost may mean hundreds of dollars lost later in limited output, break-downs, delays, repairs. Decide for the “American” and you’ll get a year-after-year woodworker—an outfit that will see you through this season and many seasons, doing high class work all the time. Think of woodworkers in terms of dollars earned instead of dollars spent—and you’ll order an “American.”

Read Bulletin 67—Convince Yourself

American Saw Mill Machinery Co.
1360 Hudson Terminal, New York City

Silver’s New Woodworking Machines
are improved right up to present-day requirements. They include SAW TABLES, JOINTERS, SWING SAWS, BAND SAWS, etc. They are constructed so as to make every operation as easy as can be, and save so much time and labor over other methods, that modern Carpenters and Builders are glad to install them and profit thereby.

Silver’s Machines are high-pressure machines, built extra strong and rigid to withstand the severest service. They are made in a wide range of sizes and patterns. 8, 12, 16, 20, 24-in. Band Saws, 20, 26, 32, 36-in. Swing Saws, 6½, 7, 7½, 8-ft. lengths. Saw Tables, two styles.

WHEN WRITING ADVERTISERS PLEASE MENTION THE AMERICAN BUILDER
The "No Profit" Demon is worry ing a great many builders. Prices have climbed into the aeroplane. Labor is scarce and expensive. Unfortunately some owners are in a peevish frame of mind. And, take it together, life isn't one long sweet dream for the builder!

But the troubles that beset the builder are no greater than those which bite away at other business men. Times are different. Readjustments are absolutely necessary to meet the trend and make good.

*Automatic machines are taking the places left by men—speeding up work—cutting operation costs—and making it possible for builders to make their business pay.*

You simply cannot chase away this demon by hand alone. You've got to get after him with POWER MACHINES. Hundreds of builders are using "FAMOUS" Bullets to drive out that hounding old "No Profit" Devil. Why don't you.

**WHY DON'T YOU?**

Is there a real good reason why? Are you adapting yourself to the times? Have YOU changed your methods to fit changing conditions? Don't you want to make money? WAKE UP! Believe us, there are Opportunities galore RIGHT NOW for the fellow who is prepared for them. But people want better and faster service. They want the man who can take the job at a reasonable price, do a nice piece of work and hustle it through. And FAMOUS machines enable YOU to be that man—and MAKE A PROFIT. Put FAMOUS machines on the job. They'll prove gatling guns that pepper away at the "No Profit" demon and send him hiking. Mail us the coupon or a letter. Write now.

A Mitre Box Bargain

In order to extend the sale of Honeycomb Mitre Boxes we are offering a box at wholesale price to carpenters and builders in communities where we have no dealers.

Consider these points about the Honeycomb Mitre Box:
- Unexcelled design in construction: light weight without loss of strength; greatest range of joints for fitting. Join gauge or joint is made in one piece, through box out of the way; it is not slippery and will not mar the finest work. Easel is dovetailed in such a way as to be free from bindings of guides; the highest grade materials and workmanship used throughout.
- Snap this up! Get this high-grade mitre box at an extremely reasonable figure

Let us send you further information on the Honeycomb Mitre Box.

A SENSIBLE CONTAINER
FOR TRACING CLOTH POWDER

The felt disc on cover
saves time. No cloth or
tuft of cotton needed.

To prepare tracing cloth
so it will take ink readily,
the perforated cover of
the container is turned slightly
to the left, thus permitting
the powder to be shaken on
the cloth.

But little powder is re-
quired, it being rubbed evenly
over the surface with, and
thoroughly removed by, the
felt disc which is securely
fastened to the top of the
cover.

The felt disc is part of the container—always
ready for use. Saves time, as it is not necessary
to hunt for a cloth or tuft of cotton.

15c plus postage is price for can
filled with powder. Weight 10 oz.

Try This Aloe Level
10 DAYS—FREE

Easy Monthly Payments If You Buy
Prove the superior quality of the Aloe Convertible Level by testing it out for 10 days. Use it on your every day work laying out buildings, locating foundation piers, leveling up foundations, walls and floors, aligning shafting walls, piers and walls, for getting angles, or levels anywhere and the hundred and one other things for which you would use a level or transit. Then, if you decide to keep it, you may pay for it in easy monthly payments so small that you will scarcely feel them. Aloe Convertible Level
is more than a mere level. It is a modified transit permitting double the range of work possible with an ordinary architect's level. Its construction is such that sights above or below the horizontal can be taken, making it the finest instrument ever offered at anywhere near the price. For taking vertical sights the instrument is provided with a special convertible bracket rigidly and permanently attached to the crossbar thus eliminating the extra time that other instruments require for changing the telescope in position to take vertical readings. The telescope which is fitted with a permanent axis, rests in the bracket bearings and owing to our special constructed clips the instrument can be used for leveling while in this position if desired, although the bracket clips are easily and quickly released from the telescope axis when levels only are to be taken. The telescope is then set in its normal position in the wyes and you have overcome the old method of attaching and detaching the convertible bracket.

Your Own Time To Pay—No Interest
Remember, you are under no obligation whatever to keep the Aloe Convertible Level. We do not even ask you to promise to buy. But you owe it to yourself to see and try it. If it isn't all you expect you may return it at our expense. If you do keep it, you will find the small monthly payments easier than paying rent for an instrument—and at the end of a few months you will own it—absolutely. There's no red tape about this offer—we ask no embarrassing questions—everything is confidential—we charge no interest. You have practically your own time to pay. Complete details of your easy payment plan. This request in no way obligates me.

Mail Coupon for Descriptive Circular
It explains the Aloe Convertible Level in detail and shows how easily the man without the training of the engineer or surveyor may secure the same accurate results as the expert. Send your name on coupon or postal card for free copy and full particulars of our original, unique and popular selling plan.

A. S. ALOE CO., 621 Olive St., St. Louis, Mo.

The Level For You
when locating lines and levels for streets, buildings, drains, walls or any leveling work where the stations are not more than 300 feet apart use our No. 401 Architects' Level (illustrated).

Only $50.00
for this instrument magnifying 22 diameters, exceptionally fine lens system, horizontal circle reading to five minutes—dust guard, sun shade, dust cap and improved spiral motion for focusing. Write for detailed description.

STANLEY Improved LEVELING STANDS

A Stanley Leveling Stand, used in connection with a wood or iron level and a pair of level sights, will be found in many cases a very satisfactory and inexpensive substitute for the more expensive surveyors' instruments. By its use one can readily determine levels from a given point to one at a distance, such as locating or setting the profiles for foundation work, ascertaining the proper grades for drains, ditches, etc. It can be placed on a stake or crow-bar and adjusted to a horizontal position, even though the stake or crow-bar may not be exactly perpendicular. As now made it can readily be attached to a tripod. A thoroughly practical tool. Price of stand with a 12-inch metal level and a pair of Level Sights $4.50. Price of Stand only—adapted for either wood or metal Level—$2.00 Send for special circular.

STANLEY RULE & LEVEL CO.
NEW BRITAIN, Conn. U.S.A.

It's There WHEN You Want It—

The Bessler Movable Stairway is the only stairs that can be folded up into the ceiling, leaving the lower floor entirely clear. It is designed to do away with the stationary, space-devouring stairway to attics and lofts, as well as to half stories in bungalows. When needed a light tug on a chain brings it down. When not in use they are easily rolled down the panel on to the floor. When not in use it is swung up into the ceiling out of the way.

IT IS THERE WHEN YOU WANT IT OUT OF THE WAY WHEN NOT IN USE

So easy and simple that a child can operate it. It costs less than a stationary stairway—bear that in mind. And just think of the space it saves in the valuable lower rooms. Architects, contractors and home builders are invited to get in touch with

The Bessler Movable Stairway Co.
AKRON, OHIO

Make it easy for the women

"Mother and the girls" in most every automobile-owning family drive the car nowadays—at all times of day and in the evening, to do errands, shop, meet trains or for pleasure purposes.

Make it easy for the women folks to open and shut up the garage by putting in doors equipped with Topping Hangers.

Women like them

Topping Doors open and shut easily—noiselessly—they roll smoothly on the track—automatically lock when open—or closed—they fold back compactly against the garage when open and do not take up needed space inside. The Topping Garage Door Hanger is extremely simple in design—cannot get out of order. It is well made and good for many years of hard service.

**The PITTSBURGH Door Hanger**

The widespread popularity of the Pittsburgh Trolley Hanger and Track among builders is largely due to the satisfactory service this door hanger renders under any and all conditions.

Ease of operation is no way affected by storms, birds’ nests, warping of doors or settling of the building. The hanger is easy to attach and can be adjusted to doors from 1½” to 2½” thick. And what is of interest to every owner — it can’t jump the track.

Better try the Pittsburgh Trolley Hanger and Track on the next barn, granary, garage or warehouse you erect. Write now for your copy of Builders’ Catalog “A-11”.

Get a Jaeger BIG-AN-LITTLE and add units as you need them

WHY spend more money for a larger, more cumbersome machine when, with a smaller investment and operating cost, the Big-an-Little will do your average job in a first class manner?

The Jaeger Units will make it fit to do any big work that might turn up.

The cost of the Big-an-Little amounts to but 45c a day for a year. After that the expense is limited to the slight operating cost. No builder can mix by hand at this price.

The machine is the result of years of experience and the value of every part has been tested by time. It is a Quality machine throughout.

No machine could be more simple or easy to operate. A turn of the handle dups the batch directly into the wheelbarrow without waste.

There is no speedier machine on the market. A mix a minute is our slogan.

Big-an-Little Specifications
Capacity 5 to 6 ft. per batch. Drum 34-inch diameter, 30 inches deep. Discharge controlled by gears. Trucks all steel. Wheel 18 inch diameter—48 inches over all. Standard gauge trucks with 20-inch by 24-inch wheels if desired. Engine 3 H. P.—Jaeger Engine. Best that can be produced. Weight 1700 lbs.

Don’t put off sending for our prices and catalog of Jaeger machinery. Send a postal now.

The Customer's Say-so

Gentlemen:—You will probably think this letter unnecessary after receiving a second order for Blystone mixers, but we wish to express our appreciation of the success in turning out such an excellent mixer as the Blystone.

We have tried several other makes which were unsatisfactory in one way or another, and so far have met with none which does its work as rapidly and well as the Blystone.

You have our best wishes for another successful year and our hearty thanks for your aid in solving our mixing problems.

Yours very truly, (Name on request)

This is the general tone of letters we receive concerning the Blystone. This is the only basis on which we will sell you the Blystone. Our standards of accuracy, and not only the most accurate—but easiest to read, even in the dark. Never rusts—cannot warp, split or crack—and are easily handled. The lightest levels made—strong and durable because the greatest strength is placed where most needed. Ask your dealer to show you these levels, and also write for our new circulars showing full size levels.

The Original End-Discharge Mixer

Any mixer advertised in this paper will mix concrete. The Archer Mixer will do all the work that the most expensive will do—and do it better, too—and besides saves men, because you can do without any wheelers to haul wet concrete to the forms. The end discharge drum permits you to back the mixer right up to the forms and discharge direct.

Saves Time because the two wheeled truck can be moved anywhere on the job in a few minutes by a couple of men. Except where the going is rough one man alone can handle it.

Write today and we will tell you why the ARCHER is worth more to you although it costs you less.

WHEN WRITING ADVERTISERS PLEASE MENTION THE AMERICAN BUILDER
For fourteen years the name STEWART has been identified with the Concrete Machinery business. Throughout our big plant—at the fairs—on the road—at the Cement shows—in the publications—on the job—everywhere, STEWART has always been in evidence.

Thousands of contractors have met STEWART, talked with STEWART, bought from STEWART and used STEWART products and inventions.

Yet—as a name for a firm and as a brand for a line of Concrete Machinery—STEWART is really a new name.

It's a good name, though—because it stands for honesty, integrity, and a policy of building and selling goods strictly "On the Square."

We thank the thousands of customers who have helped make STEWART a success and write this message as a greeting and an invitation to all readers to get acquainted with STEWART and the STEWART way.

The Stewart Mixer

The STEWART Mixer is a new machine, or rather a new model, built along old principles, by an old firm. In fact, it's built by STEWART with fourteen years of Concrete Machinery building and a lifetime of engineering and contracting experience as a foundation.

It has been tried and tested in every possible manner.

It is a mixer you can count on to start a job and finish a job with a perfect score.

In fact, it is "Built On The Square" and "Sold On the Square" and is guaranteed to give satisfaction.

Five sizes and fifteen styles give you a big line to choose from so you are bound to find a STEWART Mixer for your own individual needs.

Write today for prices and information. Let us tell you about this machine and the STEWART way.

Drain Tile is Wanted Quick!

THE demand for drain tile has kept every plant in the country working at full capacity for the last six months. At least three times as many can keep busy for several years to come.

Intensive development of the land is possible only by proper drainage, and drainage demands drain tile. Clay tile is hard to get, besides being inferior in quality to cement tile.

A small investment for a Dunn Cement Tile Equipment will put you in direct position to earn from $14 to $50 per day. Manufacturing is easy, the product is sold just as soon as it is made, and the demand will continue for many years to come. To make cement tile is a profitable business and a patriotic duty.

415 24th Street
Holland, Mich.

Send for This
Complete information on costs, profits, and other angles on the tile business is given in the Dunn Drain Tile Bulletins. This will put you fully on the drain tile business and is sent without expense or obligation. Write for a copy today.

WONDER BUILDERS' EQUIPMENT

Meets War Time needs in Quality, Speed and Efficiency at “Live and help live” price. Nation wide reputation backs your choice of the WONDER and our quantity production and sales make the price a profit-sharing proposition.

THE WONDER JUNIOR
Concrete Mixer

This is the machine, the original model of which displaced the mixing board and opened a new source of profit for the building contractor. It is “The Small Job Money Maker” of the WONDER line, specially adapted to the small jobs every builder can do with great profit—foundations, sidewalks, drives, cisterns, etc. Easily portable, easily operated, easily kept clean. Just the right capacity—3 to 4 Cu. Ft. per batch. Simple, strong, dependable. Can be taken into buildings, handled on elevators and used in cramped quarters. Mixes mortar as well as concrete. 2 H. P. Wonder gas engine—economical—requires little attention—removable for other work. Most value per dollar of investment you've ever seen in a mixer. Get in touch with it.

For Larger Capacity And Larger Profits

Take Model 15 with Folding Track Loader. Output equal to any job you'll meet. Loads at ground level—a real low charging mixer, standardized upon by many leading contractors and engineers for the one big reason that it's the most profitable. It's just as important to you to “Buy Right”. Know WONDER Superiority as these big concerns know it if you want to make money as they make it. Send for the facts before you decide on any mixer. Built in sizes of 5 to 6, 7 to 8 and 10 to 11 Cu. Ft. per batch.

WONDER BUILDERS' HOIST
Single Reversible Drum Reversible Elevator Sheave

Specially adapted for building contractors in handling sundry materials by elevators. Hoisting drum and elevator sheave independent of each other and can be operated in either direction. Chain driven; engine and hoist quickly disconnected and engine can be used as independent power unit. Provided with ample braking facilities and safety guards. Built in sizes 5-7-9 H. P. Easily portable, ruggedly built, efficient, moderate in price. Two driving sprockets furnished, permitting two line speeds and load capacities with same outfit at no added expense. We can furnish complete outfits, including hoist and Single or Double Cage Elevator.

JUST another example of the ability to hold its shape under exposure to trying weather conditions, the long life and the wonderful resistance to decay of **WHITE PINE**

Every carpenter knows that no other wood withstands the wear and tear of weather so successfully as White Pine—that White Pine stays where you put it, without warping, splitting, checking, rotting or opening at the joints.

If your lumber dealers are at any time unable to furnish White Pine, we should appreciate the opportunity of being helpful to you in getting it.

*Address WHITE PINE BUREAU,*
*1835 Merchants Bank Building, St. Paul, Minn.*
A Stucco "Job" That Lasts

Look at the illustration below of Bishopric Board. Note how the Stucco is dovetailed into the lath. The Stucco and Bishopric Board are practically welded together into one solid piece. The Stucco can't let go—it's clinched to the lath. The lath are creosoted, imbedded in Asphalt Mastic on a background of heavy fibre-board. Nails through each and every lath hold the Stucco Board firmly to the frame-work.

Bishopric Board can't sag and crack the stucco. The fibre-board, Asphalt Mastic and creosoted lath give absolute protection against heat and cold, wind and weather. They form a construction that is waterproof, vermin-proof and sound-proof.

Bishopric Board is making Stucco finish more popular. It is providing a background that is dependable—that prevents unsightly cracks and breaks and that gives added life to the entire structure.

That is why Bishopric Board was chosen for the Cincinnati Golf Club House shown above—why architects, contractors, builders and owners all over the country, who take the trouble to investigate its merits, specify and use Bishopric Board.

The Bishopric Manufacturing Co.
903 Este Ave. Cincinnati, O.

Write for our free book, "Built on the Wisdom of Ages," illustrating homes, apartments, factory and public buildings finished in stucco on Bishopric Board. It contains letters from architects, builders and users, and extracts from reports of scientific tests. It also gives full instructions for making a stucco mixture that will last. With this book we send free samples of Bishopric Board.

Write today, investigate for yourself, be convinced.
“Every Season a Busy Season for BUILDERS”
A Short Talk With Our Subscribers About Our 6th Annual Winter Work Number

What Will YOU Do This Winter?

This is close up to the season for looking ahead to bad weather and deciding what you are going to do about it. We will have a number of things to suggest in the next issue of the American Builder—a number of practical ideas for keeping the dollars coming in during the winter months. In fact, we have just about the finest assortment of Good Stuff for October that was ever brought together for one issue of a building journal.

But in addition, we want to hear from YOU, and learn what you are proposing to do this coming season. If you have a shop, rush us a photo of it and tell us how you get in the work and handle it. If you are figuring on a shop, let us help you plan it—(No charge).

Or if you have had good success with side lines in past years, taking orders for specialties pertaining to building, write and tell us about it for the benefit of others. What specialties have you handled, which paid out best, and how do you work the business?

Here is an outline of what we are planning for you in our next issue. If you have anything to suggest on any of these subjects, don’t be bashful. Shoot it in now and help along this big Annual Winter Work Number.

Keep the Job Going

“Examples of Typical Building Jobs, Winter Handled.”

Personal letters from (1) Builders, (2) Supply Men, (3) Building Owners, telling of “Winter Building Benefits.”

We all realize how important it is to “Keep the Job Going.” Building should be a twelve months’ proposition. The rush season and the dull season should be ironed out into good business the year around.

That is the sixth consecutive year that the American Builder has campaigned actively for builders, architects, owners, and material manufacturers and dealers to keep building going, in spite of unfavorable weather. Last winter’s building kept up better than ever before. The prospects are good for a busy season this year right thru the winter months. There must be no let-up this year.

Or Fit Up a Shop

“What Equipment Will I Need?” (For shop of average size.)

“Making Money in the Builder’s Shop.”

“Winter Use for the Portable Power Rig.”

A great many of the American Builder readers have power woodworking shops that they get into during the winter months. More and more are doing this every year. Some have portable woodworkers that they use out on the job, and then bring into the shop as cold weather comes on. Some have portable woodworkers that they use out on the job.

The big problem is what to make that will sell, and how to fit up a shop in a practical way.

Or Take Up a Side Line

“Extra Profits All Around Us.”

“Sales Agency Work That Helps Building.”

The average builder is a natural salesman. He has to be. In his quiet way he has won the confidence of building owners so that about all he has to do is to recommend a building specialty, and the sale is practically made. During the fall and winter months is the time to get out after these agency prospects. There will be a hundred and one practical tested ideas for the carpenter and builder sales agent in this big October issue. Don’t miss it.

“Sales Agency Work That Helps Building.”

The average builder is a natural salesman. He has to be. In his quiet way he has won the confidence of building owners so that about all he has to do is to recommend a building specialty, and the sale is practically made. During the fall and winter months is the time to get out after these agency prospects. There will be a hundred and one practical tested ideas for the carpenter and builder sales agent in this big October issue. Don’t miss it.

Editor American Builder.
Do you specify a spring hinge with distinctive features which will appeal to your client and assure satisfaction to all concerned?

Chicago "Relax" Spring Hinges are in great demand. They are substantial in construction and readily applied. The EXCLUSIVE FEATURE of spring action release, allowing the door to be placed at any desired position and automatically re-engaging when the door is closed, is of recognized merit and utility.

Send for Catalogue C32. It fully illustrates and describes the most complete line of Spring Hinges manufactured.

Chicago Spring Butt Company.

Chicago NEW YORK

BOMMER Floor Surface Spring Hinge
Double or Single Action, Holdback, Ball Bearing. Every moving part of this hinge can be oiled from a single hole on outside of side-plate.

The most durable hinge of its type; holds the door open when swung to 90 degrees at either side

Your Hardware Merchant Can Supply Them
Bommer Bros., Manufacturers, Brooklyn, N.Y.

Worth Much to You

Morrill Saw Set

All master carpenters are using this Saw Set. In one operation it takes out the wrong set and puts in the right one. Write for FREE booklet "Saw Pointe". It tells how to properly joint, set and file hand saws.

CHAS. MORRILL

BOMMER's HARDWARE

No. 546—1 in. Ant. Cop. Fin. Spring Hinge. Per set................. $1.20
Weight per set, 4 lbs.

We do not sell to carpenters or contractors in Cook County, Ill.

Rehm Hardware Company
1501 Blue Island Ave. Chicago, Ill.
NOW, the Best Time for the Farmer to Build

"While there has been some falling off in speculative city building, there is a very large amount of factory construction, and the country trade is good," said John W. Blodgett, Chairman of the Trade Extension Committee of the National Lumber Manufacturers' Association, in a recent interview. "Some spectacular figures have been published as to the quantity of lumber the Government is buying for purposes of national defense, and some of these orders, of course, are very large. But after all the total governmental requirements are not likely to exceed 5 per cent of the yearly lumber production of the country.

"The farmer is the big lumber buyer, and at no time has he been in such a good position to buy the material he needs to build granaries, implement sheds, barns, and all other improvements. Figures just published by the United States Department of Agriculture show that the average price of grain on the farm is exactly double what it was at this time last year, while there has been no such increase in the price of the lumber which the farmer wishes to buy. The manager of a number of retail lumber yards in Minnesota and the Dakotas has recently made some striking comparisons of this sort. The advertisements which he is placing in the country newspapers based upon going prices for farm products and for lumber at those points show while in 1914 it required thirty-three hogs to buy the material for a seven-room house, the same material can be purchased now for the price of eighteen hogs, and that while three years ago it took 703 bushels of wheat..."
A Patriotic Duty of Every American is to PREVENT FIRE.

America at war needs every ounce of her energy and resources. It is criminal to cause hazards; it is unpatriotic to neglect them.

Here are some of the ways in which you can help:

1. Learn the factory safety rules and observe them.
2. If you discover a fire, give the alarm promptly. Do you know how to do this? Ask to be shown.
3. Don't smoke where it is not permitted.
4. Never drop a lighted match, cigar or cigarette; be sure that it has no spark left before throwing it away.
5. Report suspicious strangers seen about the plant.
6. If you notice any unusual smoke, the overheating of any machine, or any other accident, notify the foreman at once.
7. Carry your precautions into your own home; keep your house and yard free from rubbish, and help others to do the same.

Where would your job be if this plant should burn?

Help Uncle Sam BE CAREFUL

Approved by the National Board of Fire Underwriters Endorsed by the Council of National Defense

...in both hands and then dropping one or two every few steps, they put them in the box and conveniently carry them anywhere the foreman assigns them.

In this warm section of the universe we use paraffine to grease our saws with. It can be carried in the overalls pocket—always ready to hand—and serves its purpose satisfactorily. And hark!—I saw one of the boys dope up with paraffine the other day a bum joint where he mitered a return on a window stool. It is a poor substitute for good work, but works all right where it is to be painted.

A BRAND new one was sprung on me the other day when a man appeared with teeth filed on the back of his hand saw for about 8 inches from the point. It had us all guessing until he struck a nail. Instead of saying "dammit," he promptly turned his saw upside down, applied the "hacksaw back" and calmly sawed off the offending nail. He had simply filed a little hacksaw along the back of his regular saw!

When you are working around steel much it is a good idea to have a little piece of soapstone to mark it with. Much better than chalk or pencil, and...
"Home Builders should fit Houses to People in place of fitting People to Houses"

The ideas set forth in this letter are like the rat hole Mr. Lincoln told about; worth looking into. Cut out the picture below and show it to every farmer who ought to build this fall.

**The Man From The Lumber Yard**

It is because of difference of opinion that there are horse races. It is because so many people have queer tastes that they read my letters.

If you never did get a worth while thought from one before, you will this time. If you have gotten one thought heretofore, you will get two now.

**Nerve vs. Nerves**

I doubt if many of my friends in the American Builder pay much of the income tax. If they do not accumulate much money, they do develop muscle. And above all, the builder and contractor develops NERVE.

Nerve is the result of good air, good habits, good training. Nerve does things.

It may be unfortunate that the MEN in the building field do not have more NERVES. If they did they would fit their houses to their customers better.

If you did not travel the valley of the MARNE, over three years ago, you will never be able to appreciate its architecture. You can enjoy such of antiqueness as is to be found and always will be found in Yorkshire.

If you want to find, on this side of the pond, full examples of quaintness, visit Cooperstown, N. Y., and take a ride down the Delaware and Hudson, thru Ononta, Bainbridge into Binghamton, New York.

If you want to be oppressed with the flat sameness of residences walk thru the miles and miles of the two-family, two-story residences to be found in Philadelphia and Baltimore. Hundreds of streets and tens of thousands of homes are identical. The only mark of distinction is that your house may have the front door at the left end of the porch.

My door for the eighteen months that I lived in Philadelphia was on the right end of the porch.

With all this sameness of buildings there was as much variety of people as I find on the North Shore drive of Chicago.

I lived in one of these six-room houses that cost, seventeen years ago, fifteen dollars per month rental;

---

Lest ye forget, I repeat that the man who allows one grain of food to waste or one food producing animal to lower its product is not a patriot. Within ninety days the cold wind will blow, the sleet and rain will destroy what might have been a profit for the procrastinator.

He will belong to the class of those who wept and gnashed their teeth because they had not bought oil.

He will apply his boot to his posterior because he did not contract early enough for his silo and barn.
The Man From the Lumber Yard

because I couldn't afford a bigger price.

It would have been impossible, at least unprofitable, to have put any individuality into six-room houses that rented for $15.00 per. But it is not necessary nor would it be profitable, to standardize the houses that the majority of our people build for farmer Brown, Jones the druggist, and banker Smith.

There is one thing that our builders have overlooked. The sooner they learn it with understanding the sooner will both they and their communities profit. Stated in a concrete way, it is this:

There is a psychology of place as well as of people, and of houses as well as of inhabitants.

It is because the builder is a robust biped free from nerves that it would not make any difference to him if the wall paper were red and the carpet a golden yellow. He would not know that there was a clash simply because he has nerve, not nerves.

But the dry goods dealer with an eye sensitive to harmony, would not be able to tolerate it any more than he could enjoy a cold lunch while sitting on the shady side of a pile of manure.

I have seen many of my friends enjoying a hearty lunch, seasoned only with a bottle of cold coffee and a dill pickle, and surroundings that would have upset the stomach of some other of my friends who habitually wear silk shirts.

A Women’s Sense

Some ten years ago my travels took me every few months to a city of about thirty thousand people, and I became real well acquainted with a builder who made a specialty of eight to ten-room residences. He always had one under construction. He was a very ordinary type of man, but there was some way a special charm and distinction about his buildings that I could not account for.

He invited me up to his house one evening and I discovered the reason. He didn’t know the reason of his success. In fact he thought it was his brains and his good luck, whereas it was his wife’s brains and ability to manage him without his knowing it.

She was one of those fine-fibred women, all NERVES, very sensitive to any clash or lack of harmony.

It was she who suggested to him those “little things” which gave a charm to his houses and captured buyers.

His home was furnished very tastily but not expensively. Three times within two years had they sold their home furnished, moving out only their personal effects.

In the course of our chat he told me that some nine months prior to that evening his wife had learned that a well-to-do grocer was expecting to build a home costing about $8,000.00. Mrs. Builder was quite well acquainted with Mrs. Grocer. Mrs. Builder suggested to her husband that he put up a residence on a vacant lot he had that would suit Mrs. Grocer. Mrs. Builder gave her idea of the type of building and certain kinks that would please her friend. The building was put up and lot graded before the grocer was approached. Within a week after the building was shown Mrs. Grocer, the builder had $8,300.00 of the grocer’s money, and Mrs. Grocer was telling her friends of her good fortune in finding a house exactly meeting her ideals.

I really doubt if any one save Mrs. Builder and I know that Mrs. Builder had fitted that house to Mrs. Grocer, just as surely as the milliner would have designed a hat to suit, or a tailor a gown adapted to her figure.

The female of the species is much better equipped than the male for designing a home.

Does It Fit?

I wish each one who has to do with home building would get my thought on this. I wish they would try fitting houses to people in place of fitting people to houses. Did you ever notice how upset you are when you smoke a cigar that doesn’t fit you? Have you ever been disturbed and your temper worn out by an ill-fitting pair of shoes?

Did you ever give more thought to an uncomfortable pew than to the sermon?

These are all little things but it is wise for the

(Continued to page 136.)
Dwellings of modest size, but of surpassing beauty, are available to builders in every community — dwellings complete in their every appointment and so skillfully designed that they please both the eye and the purse.

When building a HOME it is a pleasure to be even a little bit extravagant; for the many years of satisfaction will more than repay.

It is with considerable pleasure that the American Builder presents each month in this special Art Section of the magazine these extraordinarily beautiful examples of modest home designing. If further details are desired regarding any one of them, a letter addressed to the publication office, Chicago, will bring all the information we have regarding it.

Home Planning Editor,
American Builder.
INSIDE A BEAUTIFUL HOME—VIEW NO. 1. With the camera placed as indicated on the floor plan diagram, the home-like warmth and comfort of this fine living room is revealed. This room is 15 by 23 feet in size, and is a convincing argument for the modern style of a few good sized rooms instead of cutting up the space into many small ones. One would scarcely expect such spaciousness in a house measuring 34 by 40 feet.
A VIEW OF HOME—VIEW NO. 1. With the camera placed as indicated on the floor plan diagram, the home-like warmth and comfort of this fine living room is revealed. This room is 15 by 23 feet in size, and is a convincing argument for the modern style of a few good sized rooms instead of cutting up the space into many small ones. One would scarcely expect such spaciousness in a house measuring 34 by 40 feet.

INSIDE A BEAUTIFUL HOME—VIEW NO. 2. Another view of the living room, looking across from the broad entrance door, camera being placed in the doorway. The square bay with built-in seats is the center of light and interest for this end of the room. Notice the simplicity of the wood trim.
INSIDE A BEAUTIFUL HOME—VIEW NO. 3. Looking into the dining room from the hall. This room measures 13 by 17 feet. The trim is finished in white enamel, swinging door mahogany. A dado with textile panels produces the expected dining room effect.
INSIDE A BEAUTIFUL HOME—VIEW NO. 3. Looking into the dining room from the hall. This room measures 13 by 17 feet. The trim is finished in white enamel, swinging door mahogany. A dado with textile panels produces the expected dining room effect.

INSIDE A BEAUTIFUL HOME—VIEW No. 4. Looking across the reception hall into the dining room. Completing a series of photographs of exceptional beauty of the interior of residence planned by the Radford Architectural Company for Mr. Louis Braunhold, the artist who produced our front cover drawing this issue, and erected for him in one of Chicago's North Shore suburbs.
NOVEL FRAME BUNGALOW WITH ESPECIALLY PLEASANT LIVING ROOM. This house has the property of being able to blend itself into an elaborate scenic background. One of the especially interesting details of the room arrangement is the large L-shaped living room. This arrangement is capable of being utilized to advantage in establishing a very cozy living room by the correct selection of furniture. The dining room is well placed with respect to the kitchen and the latter room, with the pantry, form an excellent combination for convenience.
DOUBLE GABLE ROOF RESIDENCE. By a novel treatment of roof details, this house is given a very beautiful exterior appearance. The roof starts at the first floor ceiling level at a very steep pitch and is finally broken up into a double gable. The second floor rooms are full height by the use of dormers extending practically across the entire house. The entire surface of the building above the line of the eaves, is finished with shingles. All of the rooms are well proportioned and well arranged. A special feature is the pleasant screened porch with a balcony above.
STORY-AND-A-HALF HOUSE OF SHINGLES AND STUCCO. This house is at Manhattan Beach, Long Island, and was designed and erected by Mrs. A. F. Cassidy, Architect and Builder. One of the interesting features of this type of house is that a large living room is easily provided. The arrangement which connects the living room with the dining room definitely, and yet retains the privacy of the latter, is clever in this house. The service part of the house is well arranged. The size is 40 feet by 24 feet, exclusive of the porch.
An English Basement House. This house is an interesting study. It is a type of house which would be desirable at a location where basement excavation is inadvisable. The design provides a full basement above ground. The basement is arranged to provide a reception hall of the type used in modern apartment houses, a large room which might be used as a contractor's or doctor's office, the boiler room, coal room and laundry. The upper floors follow modern high grade residence design in the proportion and arrangement of rooms. The porch and balcony are pleasant features.
STUCCO BUNGALOW OF NEAT DESIGN. The trim lines of this little house are pleasing in every detail. The hip roof gives it the bungalow appearance, but second floor rooms are provided by the use of large dormers, which have the added effect of balancing the design. The first floor rooms are arranged in a convenient manner about the central hall. The arrangement is made handy by grouping the kitchen and dining room together. One bedroom is provided on the first floor and three bedrooms and the bath are located on the second floor.
LARGE STUCCO HOUSE HAVING MODEL ROOM ARRANGEMENT. The exterior of this house is finished with stucco above the first floor window sills, up to which point the face brick basement wall is carried. Study the room arrangement; it leaves little undone in the utilization of the floor space. The kitchen with the adjoining pantry and entry include practically every detail of convenience which might be desired. The large sun parlor stands for comfort. This is a residence at Davenport, Iowa, designed by B. W. Gartside, Architect, and built by W. H. Bargman, Contractor. The plan calls for a building 37 feet by 33 feet 6 inches.
AN EXAMPLE OF SUBSTANTIAL BRICK CONSTRUCTION. The clean-cut appearance of the exterior of this house depends upon sharpness of outline, neat white trim and a bright wall surface. The reception hall is given the appearance of depth by the use of two mirror doors at the back. All rooms are accessible from the hall. The sun porch is large and pleasant. The kitchen follows the best modern designing practice and includes many features of interest to the housewife. A sleeping porch is included in the design. This residence is at Audubon Park, Louisville, Kentucky, and was designed by Henry Walter, Architect.
The “American Builder” Information Exchange
Will Help You With Your Contract Requirements

O UR Information Exchange believes it can render service and save our readers time and money on many of their contracts. We can tell you where to get that unusual item, can place before you full information concerning both standard goods you will need and improved specialties you may want, and can help you to secure prompt deliveries and right prices. Fill in coupon below, pin same to your business letterhead, and we will send all information we think would help you.

CONSTRUCTION of said building is as checked below:

EXTERIOR WALLS
- All Frame
- Stud Walls
- Brick Veneer
- Brick Solid
- Structural Tile
- Concrete Blocks
- Monolithic Concrete
- Stone
- Glass: Store Fronts
- Ornamental Terra Cotta

ROOFING
- Wood Shingles
- Asphalt Shingles
- Asbestos Shingles
- Metal Tile
- Clay Tile
- Slate
- Composition Roll
- Built up Tar and Gravel
- Tin Plate
- Canvas

SUPPORTING FRAME
- Stud and Joist
- Heavy Timber Milling
- Structural Steel
- Reinforced Concrete
- Self Supporting Plank
- On Concrete Piles
- Fireproof Floors
- Fireproof Partitions
- Metal Lath

INTERIOR FINISH
- Soft Wood
- Hardwood
- Wallboard
- Marble
- Metal Ceilings and Walls
- Metal Doors
- Metal Windows
- Metal Trim
- Metal Grilles, etc.
- Composition Flooring

SPECIALITIES, FIXTURES AND EQUIPMENT NEEDED

HEATING PLANT
- Warm Air Furnace

Noon Hour Talks by the Boss Carpenter

Talk No. 62—Farm Series No. 3—Figuring a Permanent Hog House

THE BOSS TELLS ABOUT THE CONSTRUCTION OF A MODERN HOG HOUSE AND SHOWS HOW TO FIND THE SIZES OF MATERIAL TO USE

"In designing buildings such as hog houses," said the Boss, "we do not find the difficulty of providing framing to resist pressure as we did in the grain storage building, unless there are parts of the structure that are used for feed storage purposes. The loads to be taken care of are those from the roof only since the floor is constructed directly on the ground and does not require joists in the modern houses. The roof loads will be due to wind and snow only and will vary in different parts of the country. The matter of floor, roof and wall construction, together with interior partitions and similar details, will be considered as a part of our talk.

"A really serviceable hog house is one that can be used to a good advantage every day of the year, and therefore should be built in a rather substantial manner. Small portable houses are simply and easily made but do not fill the purpose of the permanent type such as shown in Fig. 3A. This form of house may be constructed entirely of wood or may be of a combination of wood and concrete. That is, it may have the walls partly or wholly of concrete, as shown in Fig. 3A, with all other parts of the structure except the floor made of ordinary frame construction. A building of frame construction throughout is cheaper and answers all purposes.

"A good hog house should be warm in winter, cool in summer and not subject to

(Continued to page 130.)
Six Well-Planned Farm Buildings

A GROUP OF EXCELLENT FARM BUILDINGS INCLUDING A NOVEL DAIRY BARN, ONE-STORY GRAIN HOUSE, LARGE DAIRY BARN AND HORSE STABLE, CONCRETE BLOCK WINTER HOG HOUSE, SMALL COMBINATION BARN AND CURTAIN FRONT POULTRY HOUSE

The dairy barn shown in the photographic perspective view below is an adaptation of the dairy barn built on one of the large estates in the farming district northwest of Chicago, Illinois. The design furnishes accommodation for 29 cows in single stalls and provides a bull pen and a calf pen in a building 30 feet wide and 66 feet long. The plan is divided into two parts with a cross-alley at the center, at one end of which the silo is built. Distribution of silage to the stalls is accomplished by the use of a feed carrier system, the track of which is suspended across the transverse alley and equipped with a switch at either end which connects it with the tracks along the feed alleys. Litter is removed by means of a litter carrier system, the track of which extends along the entire length of the barn, in the center alley, and out of the barn at one end where it may be loaded directly into the spreader or piled for subsequent use.

Along one side of the transverse alley there are two feed bins opening...
on to the feed alleys. This arrangement, it will be noticed, centers the supply of feed and facilitates the establishing of a feeding plan which will eliminate all wasted energy. The arrangement places the cows facing out. The preference, relative to this point, is divided among different farmers, some preferring the arrangement which faces the cows in and others favoring that used in this design. From the standpoint of sanitation, it certainly seems an advantage to keep all of the litter in one central alley, away from the walls of the building. The gutters flanking the litter alley are sloped toward the center of the barn and a drain is placed at the inner end of each gutter. Where running water under normal pressure is available, it is the work of a few minutes to thoroly clean out the stable.

One of the interesting features of this barn is the roof construction. Altho the plan shows a practically symmetrical arrangement of the two parts of the stable, the superstructure of the building is different in these two parts. Above the right-hand part of the stable, as it is shown in the accompanying plan, there is a hay mow for the storage of timothy or alfalfa hay. This mow is covered with a gambrel roof having its peak at right angles to the length of the barn. Above the other part of the stable there is a smaller storage space for straw covered with an ordinary gable roof having its peak in line with the length of the barn. Such a scheme applies when it is not necessary to have a large mow space.

One-Story Grain House

A farm grain house, 24 by 30 feet in size, is shown in the accompanying design.

This grain house has a foundation of concrete with a solid concrete floor, which is built the same as a sidewalk in blocks about five feet across. The bottom part of the floor is a coarse mixture, but the top is made strong with cement and good clean sand, and surfaced smooth to keep down the dampness.

The plan calls for a driveway thru the center with two large bins on one side of the driveway and four smaller bins on the opposite side. One of these smaller bins is lighted by two windows. Also a hinged door is provided so that the room may be used for the storage of grain sacks or any other commodity in connection with the grain house.

One farmer uses this room to store the fanning mill when not in use. He also has a heavy table with a plank top placed in front of the window, which he uses for a work table for the repair of sacks. He also has a wide shelf over the window, where he keeps sieves and other articles belonging to the fanning mill. When in use the fanning mill is taken out into the driveway.

This driveway extends thru the building from west to east; as the prevailing winds come from the west, the tail of the mill is turned toward the east, so the men are working in an atmosphere free from dust.

The partitions of the bins extend up to within a few feet of the rafters. At threshing time the grain sometimes piles up clear to the top of the bins. It is taken out at the bottom by scoop shovel thru a chute, built on the hopper feeder plan so the grain cannot run out into the main driveway, but it runs down as fast as the shovel lifts it out.

Such a grain house offers facilities for selling clean grain at a higher price. Some farmers go further and separate the grain very carefully into two grades besides the tailings. The best grade is then sold at a higher price for seed.

Grain houses like this one are wanted on the smaller farms where it seems hardly necessary to put in elevating machinery.
Large Dairy Barn and Horse Stable

The building shown below represents an excellent type of construction for the man who has about 50 dairy cows which he wishes to feed principally on silage. The building provides considerable stable space, but the central part, only, is built for the storage of hay. This design provides single stalls for 52 cows in the two wings and extending into the central structure at one end, while one-half of the central part of the barn is arranged as a horse stable, entirely separated from the dairy stable except for the double doors in the passageway.

The wings are 36 feet wide and extend out from the main structure 50 feet. The horse stable is 32 feet wide, which gives the building a dimension, from one end of the wing to the other, of 132 feet. The length of the main structure is 56 feet. The wings are built with a trussed gable roof, each set of rafters forming a truss. The ceiling is flat, supported by the bottom cords of the roof trusses. The main barn is plank frame construction throughout, which gives the largest possible hay mow volume for the material used in the construction of the roof.

The equipment of the barn consists of a system of feed and litter carriers in all parts of the building and an adequate system of ventilation.

Sanitary stalls and stanchions are called for, in keeping with the high grade construction and equipment used throughout.

There are a large number of windows so that plenty of sunlight will be admitted to assist in the maintenance of healthful conditions. Since the floors are of concrete everywhere except directly under the animals, the stables are easily kept clean.

Plan Showing Arrangement of the Above Barn. In accordance with correct design and the rulings of several states, the horse stable is separated from the dairy cow stable. Modern equipment is indicated throughout the plan.
Excellent Winter Hog House Design of Concrete Blocks With Roof Windows and an Efficient System of Ventilation.

Concrete Block Winter Hog House
This winter hog house is an example of high grade modern construction. The walls are of concrete blocks and a concrete floor is used. Large sized roof windows admit an abundance of sunlight into the 20 pens. Two full sized ventilators are mounted on the roof to keep the air pure at all times. The individual pens are equipped with guards to protect the small pigs and concrete troughs are placed in each pen.

Small Combination Barn
The man who wishes a small capacity barn for housing both horses and cows will be interested in the design shown here. There is a good sized mow over the stable. The hay door is of the counter-balanced, vertical sliding type. The roof is framed after the plank frame construction type, each set of rafters being a truss.
Altho the barn is only 26 feet by 32 feet, the structural details are carefully worked out. The sills are set in cement mortar above the foundation walls, which extend above grade 18 inches. The mow floor joists securely tie the
Curtain Front Poultry House

A very popular farm poultry house that offers many advantages is shown in this design. The concrete foundation extends up above the grade line about two feet. Commencing at the top of this concrete wall the sills are embedded into soft cement mortar. There are bolts in the concrete wall which extend up four inches to pass thru a double 2 by 4 sill and leave room to screw on the nuts, so the sills are held firmly to the wall.

Cement mortar is then worked around the sill both inside and outside. This is done to prevent the wind from blowing thru the crack in the wall and the bottom of the wooden sill. This is a weak spot in a good many poultry houses that have concrete foundations. All dimension stuff in such buildings is likely to shrink.

A draught thru a crack in the wall or floor of a poultry house is almost certain to make trouble. Poultry in confinement require plenty of fresh air, but draughts are often fatal. Hence, the necessity of using great care in starting the wooden superstructure on top of a concrete foundation.

The sides and wall and ceiling of this little poultry house are built in the usual way by using building paper and matched narrow ceiling boards, blind nailed to the studding. This finish should extend all around the sides and ceiling except where the openings come for the doors and windows.

A special feature of this poultry house is the large surface given to what is commonly termed "curtain front," which means that the openings are covered with material thin enough to let in plenty of air without a draught.

In this plan ten-cent cotton, called muslin in some parts of the country, is stretched over light frames and tacked to hold it in place. These light frames are rabbeted into large and heavier frames that fit against the jambs in the opening and are fastened in place by stops in such a way as to prevent the wind blowing thru the joint between the curtain frames and the framework around the openings. This double frame arrangement is to facilitate changing the muslin when it gets dirty.

When a poultry house is crowded with laying hens this amount of curtain front often is warm enough in cold weather, because there is no draught and the air changes slowly but steadily. The body heat of the fowls is sufficient to warm the air that comes in thru the muslin and keep the house comfortable.
Testing Paint Materials

MARKET CONDITIONS AT THE PRESENT TIME OFFER SPECIAL TEMPTATIONS TO THE ADULTERATION SWINDLERS—HOW TO BE ON GUARD

By Ralph G. Waring

NOTE: This is the fourth of a series of articles by Mr. Waring. The fifth will appear in an early issue.

WITH the supply market badly demoralized at the present time, many manufacturers are being forced to use inferior and substitute materials in their products in order to satisfy the quantity demanded by the trade. Extreme costs also encourage many dealers to change materials to lower grades when the barrels reach their warehouses. A case this week dealt with a dealer who opened pure boiled linseed oil, extracted five gallons, substituted benzine, and left the manufacturer’s label and guarantee intact.

Being warned of such conditions, therefore, it behooves the careful and conscientious contractor to protect his own name and work. So far as practicable, goods should be bought as pure from recognized reputable firms. I shall be glad to send the list of manufacturers whose goods I have bought on the open market and analyzed within recent months. In case it is hard to get materials from well-known firms, the contractor must then have recourse to such tests as I will incorporate in this article; in case of further doubt samples will be analyzed if sent to this office, remembering, please, that our time is as valuable as your own and that while our complete service is yours, yet do not send samples out of mere curiosity.

Equipment for Simple Testing

For this work of testing by the contractor, the apparatus necessary is neither expensive nor extensive, remembering, however, that the results which occur are merely qualitative and not absolute. A dozen each of test tubes ½ inch and ¾ inch in diameter; test tube brush; 8-ounce bottle of concentrated acetic acid; pound bottle of pure Aniline oil; pound of benzol, 160°; blow pipe; 4 by 8-inch window glass, which should be varnished black on one side; medicine dropper; one-half pound of powdered litharge; one special pencil for marking on glass.

Tests for Pure Linseed Oil

Linseed oil, as used in practically all paint work, should be pure raw oil for reasons explained in the preceding article. Avoid all boiled oil at present time. High grade pure raw linseed oil should be a medium amber color; perfectly clear as indicating that it is well settled and free from foots; have a pleasant, nutty oil taste without any bitter and nauseating taste on the rear portion of the tongue and palate. This acrid taste is the easiest way of testing for rosin oil, or mineral oil adulterant. A positive test is shown by taking one of the small test tubes, pouring in a portion of the linseed oil to be tested and then carefully adding an equal volume of pure aniline oil. The test tube should be corked or covered with the thumb and shaken. If any mineral or rosin oil adulterant is present, this amount will very soon settle out as a separate layer upon letting the test tube stand for an hour and will very closely approximate the adulteration present. Condemn any oil showing so little as 5 per cent adulteration, as it is very apt to be mineral oil, non-drying and very injurious to your paint film. To test for fish oil, now being used, heat a small portion in test tube and smell the vapor given off; either rosin or fish oil will immediately give evidence of its presence by its characteristic odor. By flowing a small stream of the sample oil across the glass side of one of the black 4 by 8-inch pieces the appearance of a bluish bloom or haze near the edges of the oil will indicate the presence of a mineral oil adulterant.

Testing Linseed for Rosin Driers

To test linseed for cheap rosin driers, such as are being added at this time, make up a paste with the oil and moisture free litharge. If the oil is high grade, the paste will not harden inside of twenty-four or forty-eight hours. If such previous hardening

(Continued to page 144.)
EDITOR’S NOTE: The American Builder does not accept payment in any form for what appears in our reading pages. In order to avoid any appearance of doing so, we omit the name of the maker or seller of any article we describe. This information is, however, kept on file and will be mailed to anyone interested; address American Builder Information Exchange, 1827 Prairie Ave., Chicago.

Tractor-Semi-Trailer a Solution to Commercial Traffic Problem

A statement recently prepared by Lieutenant-Colonel Chauncey B. Baker, of the Quartermaster Corps, United States Army, and distributed to the railroads of the country by the Special Committee on National Defense of the American Railway Association, says that to move one field army of 80,000 men requires a total of 6,229 cars—passenger, baggage, box, stock and flat cars—made up in 366 trains, with as many locomotives. When it becomes a matter of moving an army of 500,000 or 1,000,000 men, just imagine the equipment that will be required!

The above figures are for the army alone—the men, animals, vehicles and guns. When you begin also to move the ammunition and food supplies for the army think how much the requirement for railroad equipment mounts up!

Naturally, Government business will have the right of way and commercial traffic will be held up. For some time business has been growling about freight congestion. When the armies begin to move—or better still, before they begin to move—business must find some effectual means to relieve the situation, if business is to continue as nearly normal as possible.

It will not be enough for commercial houses to anticipate their needs and buy their supplies as far in advance as possible; it will not be enough for them to avoid wasting car space by loading all cars to maximum capacity—some new means of transportation, especially for short hauls, must be found.

A most logical method of relieving the situation is the employment of the tractor-semi-trailer system of hauling.

Any motor truck equipped with a rocking fifth wheel can haul on a semi-trailer two or three times its rated carrying capacity without overtaxing the mechanism of the truck. The time saved in transportation and enormously increased efficiency of the truck more than make up for the slightly higher cost. Furthermore, the orders saved thru the ability to make prompt and sure delivery soon pay for the initial cost of any new equipment that is required.

The adoption of this method of transportation will help the Government, help relieve freight congestion and expedite long distance shipments and make business more nearly "as usual."

Sink with Built-in Dishpan

A new kitchen convenience that will appeal to every woman is a sink with a built-in dishpan, which makes entirely unnecessary a dishpan for washing dishes. The sink is made in
What Builders Are Finding Good

two forms; one has the dishpan at the middle and the other at one end. In either case the sides slope so that the water drains off thoroughly when dishes or other materials are placed on the sloping surface. The water is drained from the sink thru an outlet at the bottom of the dishpan portion; the valve control for controlling the flow is placed at the top so the hands need not be placed in the water to open the outlet. The sink is made of the very best material and is handsomely finished. FRED TELFORD.

**Hollow Chisel Electric Mortiser**

Every woodworking shop must have facilities for mortising and boring. Whether this is done by hand or by machine is determined by how much of it there is to do. If speed and accuracy are essential, a hollow-chisel electric mortiser and multiple speed boring machine of the type shown in the accompanying illustration will serve an urgent need.

The bit shaft of this machine is driven by a friction pulley from the disk, which is directly connected to a heavy-duty, constant-service horizontal motor. Any speed of the bit shaft may be obtained up to 3750 R.P.M. The machine will successfully handle hollow chisels up to 1/2-inch and regular boring augers up to 1 1/2 inches. By the use of special boring machine cutters, the machine may be used for a multiplicity of operations, such as routing, gaining, milling and cutting out core-boxes. The motor may be quickly detached from the machine and used to operate grinders, small lathes and any other machines requiring power within its capacity. Table adjustments are quickly, easily and accurately made. The table may be tilted to an angle of 45 degrees and has a vertical adjustment of over 15 inches. The stops may be adjusted to hold regular or irregular pieces, making the machine adaptable to a wide variety of work, including furniture and cabinet making, pattern making and manual training school work in addition to the regular sash and door shop work. The head casting may be blocked out to give the bit more overhang if special requirements make it necessary.

**Paint Applied With Compressed Air**

The accompanying illustration shows how paint is applied to the walls of a building with a portable compressed air painting outfit. The compressed air supply is taken from the tank on the truck in the foreground, the gasoline engine and air compressor being mounted on this truck. The paint is supplied from the 5-gallon tank standing near the center of the picture. The spray at the nozzle is under control of the operator by means of a trigger under his index finger. Adjustment of the spray may be quickly made by means of a knurled screw which regulates the density of the spray from nothing to the full capacity of the nozzle. The trigger actuated valve is very sensitive and can be opened to any desired degree.

The type of equipment shown in the illustration is one of several types included in a system of finishing which embodies equipment for finishing of all kinds of surfaces in which stains, primers, surfacers, shellacs, varnishes, undercoats and enamels are applied on wood, and lacquers, primers, fillers, paints, surfacers, japans, varnishes, enamels, asphaltums, bronzes and celluloid materials are applied on metal. The system includes a number of accessory appliances which are used to adapt the various types of equipment to any special conditions under which they might be placed in service.
What Builders Are Finding Good

The Thermostat Heat Regulator Saves Fuel

The thermostat heat regulator shown in the illustrations offers three prominent advantages: first, low popular price; second, extreme sensitiveness to any temperature change and third, mechanical simplicity.

The thermostat, which is usually placed in the main living room, is connected by wires with the weight motor hanging from the ceiling of the basement. Two dry cell batteries supply the electric current which operates the motor, causing the check and draft dampers on the furnace or heating boiler, which are connected to the motor by chains, to alternately open and close.

Extreme sensitiveness is obtained in the thermostat by using a peculiar style of coil spring made from an alloyed metal. This coil is so sensitive to heat and cold that gloves are worn when adjusting the thermostat so the heat from the hands will not cause inaccuracy.

The motor has no springs or other delicate moving parts to get clogged or rust in a damp or dusty basement. It is built like an old-fashioned weight clock, is practically fool proof and should last indefinitely.

The thermostat is also made with a clock attachment so a low temperature may be maintained over night and then at an early hour in the morning the clock will operate and set the thermostat for a higher temperature thru the day.

Convenience is the main consideration for installing a heat regulator, altho they often save a shovel or more of coal a day, which, if estimated at 10 pounds, means more than a ton of coal saved in a season.

Sturdy Electric Lighting Plant

The gasoline engine is of the two-cycle type, which means the accompanying illustration is substantially constructed and as simple as good designing can make it. The plant is mounted on a solid cast iron base which permanently holds the magneto, engine and generator in perfect alignment and prevents discordant vibration between the parts. The batteries are mounted on a rack at some convenient point near the generating plant.

The gasoline engine is of the two-cycle type which means that there is a power impulse every revolution. The individual impulses may, therefore, be lighter than would be required if the four-cycle type of engine (giving a power impulse every other revolution) were used at the same speed, and the power is more uniform with the larger number of power impulses. The heavy flywheel shown between the engine and the generator effectively smooths out the application of power to the generator and results in the maintenance of a reasonably constant voltage at the generator terminals. The oiling system of the engine requires no attention, since the oil and gasoline are mixed together and as long as the engine will run, it is sure to be properly oiled.

A high tension magneto is used for the ignition, which eliminates the coil and dry cells. The thermosyphon cooling system is used with a simple water tank. Ball bearings are used throughout the crankshaft. By the use of a centrifugal governor, fluctuation of voltage is prevented when the load is thrown off or on. The plant is started with a switch and a simple means is provided for automatically stopping the engine when the batteries are fully charged. The output of the generator may be used direct, if desired, precluding the necessity of operating thru the batteries.

Water Jacketed Magazine Water Heater

Most hot water heaters have to be watched carefully or they will run out of coal, but the one shown here is equipped with a magazine feed which keeps a good supply of coal on hand.

Trouble has often been encountered in this type of heater by the magazine becoming overheated and causing gases to form which escape into the basement or the room or cause explosions. This trouble is prevented in the heater shown here by a water jacket which is placed around the magazine. This jacket keeps the magazine cool and prevents the formation of gases and the resulting inconvenience. The water jacket and the closed magazine keep the fire from burning anywhere except right on the grate where it is wanted.

The heater can be used with a surface feed if this is desired, as it may be if a small amount of hot water is wanted.

The accompanying cross-section shows the construction of the heater with the magazine filled.
Portable Electric Rubbing Machine

The accompanying illustration shows the modern, efficient method of rubbing surfaces in the finishing process. This man is rubbing the varnish on a counter top with a portable electric rubbing machine. He can guide the machine over the surface with a single finger—its weight produces just the right rubbing pressure and the reciprocating motion of its two rubbing blocks is so accurately balanced that there is no tendency to "creep." His work at four in the afternoon will be just as thorough as it was at eight in the morning. Hand rubbing is very tiresome work and cannot be carried on continuously without loss of either quality or speed. Work done with the machine is, at all times, more uniform than can be accomplished by the hand rubbing process.

The machine is very carefully constructed of high grade materials and it is so designed that the mechanism is fully protected against grit and other harmful substances. The entire machine above the rubbing blocks is encased in aluminum and a patent sliding shoe arrangement seals the aluminum case below the bearing surfaces of the block guides. All wearing parts are made of specially treated steel and bronze. Ball bearings are used to reduce the friction wherever possible.

The machine is ready for work when it has been connected with a lamp socket and the current has been turned on. A regulator is provided to vary the speed to suit the work in hand. Varnish that is comparatively green will not stand as high speed as when it is thoroughly dry. The length of the machine is 13 inches and it can be used for rubbing surfaces having a length of 15 inches or more, any width. It will rub into corners on any surface larger than the machine itself. For instance, the sunken panels in the front of the counter shown in the illustration could be easily rubbed with this machine. The rubbing blocks carry felt pads and sanding pads may also be attached. The blocks are interchangeable and several sets may be kept at hand, fitted with pads for different classes of rubbing.

Wrought Steel Thumb Latch

The accompanying illustration shows a new full surface thumb latch which has recently been placed on the market. Its parts are few and simple and easily applied, as will be seen in the illustration. It is altered from the ordinary latch of the same class and character in that both the strike and guide plate are made to be applied on the surface rather than to be mortised, as is the practice ordinarily, saving much trouble and expense in labor and application. It is reversible for either hand and is packed one set in a box with screws to match.

Combined Kitchen Table and Ironing Board

Convenience and economy of space are both secured in a new ironing board which occupies the lower part of a kitchen table. The table top is hinged, and when it is lifted up the ironing board is ready for use. One end of the board may be raised so that skirts may be slipped over it. The bag suspended from the frame protects the skirts and other clothing from dirt on the floor. The ironing board may be swung completely over and supported at the free end by an extra leg easily attached. There is space enough between the board and the table top to store the irons when the board is not in use. The table is solidly built so as to give a firm foundation for ironing. There are four different sizes to meet various needs, and at slightly greater expense the table may be provided with a porcelain enameled top.

Industrial Truck Hauls Building Material

One ordinarily thinks of three-yard dump wagons or big five-ton motor trucks when the subject of hauling bulky, loose materials is considered. However, the illustration shows a rig recently placed on the market which, because of
its extremely small size and simplicity and speed of operation, has made a decided hit with many industrial concerns and contractors.

The motive unit is an electric driven industrial truck of two-ton capacity similar to those commonly used in warehouses and railroad stations for handling trunks, boxes and miscellaneous supplies and heavy materials. Upon this truck is mounted a side-dumping hopper of 1½-yard capacity. One of the features of this patented machine, which differentiates it from the ordinary Koppel car, is that the load is thrown out several feet away from the truck as shown in the illustration.

Overall dimensions of the complete machine are, length, width and height 8 feet, 4 feet, 4 feet respectively. Hoppers dumping in a similar manner off the end of the truck are also manufactured.

**Concealed Casement Window Adjuster**

The popularity of the casement window has been steadily growing. The necessity for high grade casement window hardware has consequently developed action on the part of the hardware manufacturers to the extent that some very clever devices are now on the market. The casement window requires a device to hold it in any given position. Very often it is desirable that this device be as nearly invisible as it is possible to make it.

The casement window adjuster shown in the accompanying illustration handles in a clever way the matter of a practically concealed device of this kind. The device is simple in construction and easily installed. It permits the window to swing 180 degrees, operates sash swinging in or out and is reversible. The standard size adjuster of this type will control sash having a minimum thickness of 1½ inches and will control sash hung on butts as large as 4 by 4 inches.

The sash is held in any desired position, but severe strain upon the butts is avoided because the lock acts as a brake.

**Collapsible Canvas Houses**

For those who wish to spend the summer months outdoors as fully as possible, or sleep in the open air at other times of the year, canvas houses that collapse so as to be easily portable meet every requirement. The material is so light that it can be taken on a camping trip, and the operation of putting up and taking down the house is so simple that if desired it may be put up on the lawn in the evening and taken down in the morning. No tools of any kind are required, and it is not necessary even to remove a bolt. The house is provided with screens so that troublesome insects may be kept out. The house may be left almost completely open in pleasant weather so the occupants may have the benefit of any slight breeze; for rainy weather it may be ventilated in any manner desired, with the weather side...
Solid Out-Door Comfort in a Two-Tent Group Near Colfax, Iowa.

closed; and for severe weather it may be made tight. The canvas house meets every requirement for living purposes for summer weather and sleeping purposes for winter.

FRED TELFORD.

New Lever Flush Bolt

The accompanying illustration shows a new burglar-proof lever flush bolt which has recently been placed on the market. This bolt is made of wrought steel except the extra long bronze lever which operates so easily. It locks on a dead center and the action is positive so that the bolt, which has a 3/4-in. throw, cannot be jimmed. It is designed for use on double doors and is mortised into the astragal or joint edge of the inactive leaf of a pair of doors, or applied on the inside face.

With the mechanism occupying such a small space and the plate extending the full length of the bolt, it is easy to make a snug mortise and a neat looking job.

The strike plate is self-centering and wide enough to allow for any reasonable shrinkage of the door; the springs are piano wire, durable and strong, and liberal screw holding power is provided, ample for heavy doors. The bolt is made in 9, 12, 18 and 24-in. sizes, and is furnished in several different finishes.

Cement and Brick Surface Covering Compound

A compound has recently been placed on the market which waterproofs, protects and beautifies building exteriors of brick, concrete, stucco and other such materials. The compound is manufactured in several attractive and permanent color shades and is useful for all classes of ornamental concrete work such as bridge railings, balustrades, columns and posts and for structures of monolithic concrete, stucco, brick, concrete blocks and manufactured stone. It has the quality of penetrating and sealing the surface pores, thus permanently preventing water penetration, making the surface proof against driving rains.

The treatment consists of two coats of the compound. The surface to be treated should be perfectly dry. A flowing coat is applied first so that the surface pores will be thoroly saturated. The second coat follows the first in 24 hours. Application is made with an ordinary wide brush. For two coat work, approximately 150 square feet of surface can be treated per gallon of the compound, but this will vary according to the porosity of the material on which it is applied.

The American Builder Information Exchange will be pleased to furnish on request the name and address of the parties responsible for any of the interesting novelties or improvements described in these columns.
Lumber Is Not High

COMPARATIVE FIGURES, LUMBER WITH FARM PRODUCE, SHOW THAT NOW IS THE BEST BUILDING TIME IN YEARS

CONTRACTORS and dealers who have to meet the arguments of farmers against building at this time on account of the advance cost of lumber will be interested in the following extracts from a circular letter which the Thompson Yards (Inc.), of Minneapolis, has recently sent its line yard managers:

"The comparisons appearing herewith are based upon average prices paid during 1914 and the first six months of 1917 in Minnesota, North and South Dakota and Montana, taken from official records:

<table>
<thead>
<tr>
<th>Item</th>
<th>1914</th>
<th>1917</th>
</tr>
</thead>
<tbody>
<tr>
<td>No. 1 Nor. wheat</td>
<td>$0.95 to $1.05</td>
<td>$2.70 to $2.90</td>
</tr>
<tr>
<td>Barley</td>
<td>.40 to .50</td>
<td>1.28 to 1.38</td>
</tr>
<tr>
<td>Flax</td>
<td>1.30 to 1.50</td>
<td>3.10 to 3.50</td>

"In 1914 our cash prices on the lumber items named were:
Shiplap, boards and dimensions, on 40-cent fir rate, a thousand.................................................................................. $22.50
Shingles, a thousand........................................................................... 3.15
"In 1917 our cash prices for same items, No. 2 quantity classification, were:
Shiplap, boards and dimensions, on 40-cent fir rate, a thousand.................................................................................. $34.50
Shingles, a thousand........................................................................... 4.35

"A few facts of this kind will boost your sales. There is a mistaken impression that lumber is 'high.' These figures prove that it isn't true. The farmer will never find a better time to build than right now. His purchasing power is represented by what he produces. What brought him $1.00 in 1914 now brings him $2.00 or $2.50. In other words, the same products now buy from two to two and one-half times as much.
Dealers and Contractors Work Together to Show Farmers That Lumber is Not High

as they did then. 'Dollar wheat' was hailed as a godsend; what of $2.50 wheat?

"If lumber had advanced in proportion to farm products the farmer would now be paying from $55.00 to $70.00 a thousand for common and could afford it. As it is, prices are only about $4.00 above list,

"There never was a better time to buy lumber than at the present! Compare the difference in your favor in the following table of what was required to purchase this barn then and now:

<table>
<thead>
<tr>
<th></th>
<th>In 1914</th>
<th>In 1917</th>
</tr>
</thead>
<tbody>
<tr>
<td>705 Bu. Wheat</td>
<td>705</td>
<td>351</td>
</tr>
</tbody>
</table>

and list represents the average normal value of lumber. To put it in another way, lumber is really only about 15 per cent above normal at the present time.

"Therefore, the dealer who imagines for a single moment that lumber is too high for the farmer to buy, or that it is not a good time for the farmer to build, can hardly maintain that position in the face of these facts. If you have any good farmer friends to whom you are anxious to 'tip off' something good, get them to build now. They will thank you many times in the future."

One of the newspaper advertisements of the Thompson Yards features a gambrel roof barn 32 by 56 feet with 14-inch shed along one side. Above this barn appears the slogan, "The Time To Build Is Right Now." Below appears the following:

"In 1914 it took forty hogs to pay for this barn, while at the present time it only requires twenty-four!

"Explanation: In 1914 Thompson Yards' cash price on this barn design was $705.00. The average hog

How to Do Work Right
APPROVED PRACTICE FOR PLACING WINDOW FRAMES AND FITTING SASH
By Aug. C. Schnake
Master Carpenter, Centralia, Ill.

In several of the previous numbers of this magazine we have read articles on "How to Do Work Fast." These treatises were very interesting and also instructive, showing where time could be saved and at the same time not affecting the quality of the work. While it is laudable to take advantage of the work, it isn't policy to try to do all work the quickest way possible. In the greater part of our work quality must be the first consideration, while quantity is a poor second. The object of this article is to explain how to do work right.

Anyone experienced in any line knows that to be able to finish a job right it is important that it be commenced right and carried thru that way. To get sash to work right it is imperative that the frames be made correctly, otherwise even the best mechanic works in vain. The first requirement is that the frames be exactly the same width top and bottom. Next in order is that the jambs be straight edgewise, then sidewise. If the frames are not the same width top and bottom the sash will either stick or rattle, depending on whether the fault is at the wide or narrow end. The practice of taking stock from the lumber yards and using for jambs without jointing it is hazardous business as the greater part of the lumber is crooked. This might sound exaggerated, but I've (Continued to page 148.)

Details of a Stairway
Designed by Ralph W. Ermeling, Architect

There is something stately and rich about the stairway of a house which opens from the living room. Some people prefer the main stairway in connection with the entrance hall, but there are often reasons why the stairway connecting the second floor directly with the living room is to be preferred. This is, perhaps, best illustrated in very cold weather. When the house has a rear stairway it is not necessary to have the stairs in the hallway for reasons of privacy.

The stairway shown here is at one end of the living room directly across from the entrance vestibule. The sun parlor opens off the front of the living room and the ends of the opening are partially screened by pylons and a simple grille-work over them. The pylons are hollow, made of 7/8-inch stock and surmounted by the grilles which are 7/8-inch square spindles. If the pylons are made of finely grained stock they should be mitred at the corners, or if gum wood— or other more expensive finish—is used, it would be better to use veneer. A small cabinet is built back of the pylon. It has any number of uses, and it furnishes a useful shelf top.

The stairway itself goes up three risers to a landing from which one may continue on up or enter the kitchen. The vertical members which form the side of the stair are 3 by 4 inches and they are housed into the beam of the ceiling above. They might be made of 2 by 4 stock, altho they look rather light in this size. The upper part of these uprights are simply ornamented by cutting a slot and finials out of the stock. The plaster is then brought out almost flush with the face of these uprights and the moulding at the top of plaster panels is also very flat. The balustrade is constructed of 7/8-inch stock with a comparatively light top rail, and with 7/8-inch square spindles set in the openings.

The wainscot and rail which takes place of the usual newel at the foot of the staircase are alternately 5½ and 3 inches in width, the 3-inch strips being set out 3/8 of an inch further than the wider strips. These wider panels have ornaments at the top, or rather two alternate ornaments. These are ½ inch in thickness and are sawed and bored out to shape and then bradded or glued in place. These ornaments, while simple and inexpensive, are very effective.

At the base of the stairway a music cabinet is built in and fitted for Victrola records. These are kept best in books according to the size of the records—10 and 12 inches, respectively. The height to allow for the books to be fitted into the case is 10½ and 13 inches, respectively. They are 2 inches in width and may be laid on their sides on the bottom shelf. The space within the cabinet may also be subdivided for piano player rolls or for sheet music.
Novel Construction Methods Used in Community Auditorium

A village or town which has no building with a sufficient seating capacity to serve as the meeting place for the people of the community when they are gathered together is, indeed, lacking in its provision for the fullest enjoyment of community life. There are any number of occasions when such a building may be used advantageously in the ordinary course of events in the community, and when it is once provided, a committee may be appointed to arrange special meetings which are more effective in the enlightenment and entertainment of the people than any other course which might be pursued to attain this end.

Communities which are lacking in this respect may learn much from the example set by Frederick, Okla. The community auditorium shown in the illustrations on this and the following page, was built at Frederick by popular subscription, the highest amount given by any one person being $100, the amounts varying from this down to $1.00. No profit was taken by anyone connected with the erection of the building and materials were supplied by the local yards at the lowest possible cost. The building cost approximately $4600.

The building is especially interesting to builders because of its novel construction. All foundations and truss footings were made of concrete. The laminated truss members were laid out on the ground by striking off the radius and driving 2 by 4-inch stakes in the ground and bracing them in place. The inner board was placed against the stakes first, after which ply after ply of the 1 by 12-inch No. 1 yellow pine lumber was nailed in place. The first nailing was done with 8-penny nails, three-ply being placed in this way; the remainder was nailed with 16-penny nails. Joints in the inside and outside boards were made opposite each other and clamps were installed as shown on the
Unique Timber Construction

building section illustrated. The tension rods were put into place after the wood member had been assembled. The trusses were hoisted into place with a derrick; one of the illustrations shows the beginning of this operation.

When the truss footings were placed, two iron straps 1/2 by 2 inches in size were set into the concrete in each footing, the truss being bolted to these straps when in place. The ends of the truss members were secured to the straps with chains while the truss was being raised. A wire stay was used across the bottom of the arch to prevent spreading during the hoisting operation. The footing straps bear on the outside of the truss and prevent spreading as the truss is placed in the building. The arches had to be slung in three places, since they were very limber. As each one was bolted, it was plumbed with a level and braced. After all of the arches were in place it was necessary to loosen the tension rods on one side or the other and align the arches.

The outside of the entire building is covered with 6-inch drop siding. Between the windows on each side of the building, the sides are hinged at the top and made to swing out at the bottom for ventilation.
Roofing a Hollow-Tile Residence

DETAILS OF TWO METHODS OF STRICTLY FIREPROOF CONSTRUCTION—HOW TO ATTACH A TIMBER ROOF TO TILE WALLS

By J. J. Cosgrove

"SPEAKING of roofs," remarked my friend, the old building superintendent, "there is much to be learned by the average builder about roofs for buildings. There are roofs for fireproof buildings, and fireproof roofs for buildings; and the one must not be confused with the other. A roof for a building may be either of wood or hollow tile. A fireproof roof for a building must be of hollow-tile, slate, concrete or other fireproof materials, altho the building itself might be of combustible material.

"A glance at some of these blueprints will show the difference, and incidentally the different methods of roofing buildings of hollow tile. Take this print of interlocking tile, for instance (Fig. 1). Any of three methods can be used with this type of block. In the first method the lugs are broken from the face of the tile, and a roof plate is secured to the wall by means of toggle bolts. These toggle joints are secured to the top course of tile.

"In the second method a 2 by 8-inch plate is spiked to the 2 by 4-inch plate to form a rest for the rafters and ceiling beams. In the third method a 2 by 4-inch plate is bedded in mortar to bring it flush with the top of the outside course of tile, and the ceiling beams, or attic floor joists and rafters may rest equally on this plate and the tile blocks.

"After the roof rafters are in place and ready for the sheathing, the spaces between the rafters may be filled to the top level of the rafters with hollow tile to keep out the cold.

"When a frame roof is put over hollow-tile walls of usual construction, the roof plate is anchored to the wall by means of anchor bolts about 30 inches

Fig. 1. Three Methods of Roof Plate Construction.

Fig. 2. Detail of Book Tile Steel Roof.
How to Use Structural Tile

long and spaced about 5 feet apart. The joists and rafters are well spiked together and also to the roof plate. When this is done the anchor bolts resist the lifting tendency due to the wind when blowing a gale, and make for a more stable construction.

“These two prints,” and he unrolled a couple more blueprints (Fig. 2 and Fig. 3), “show two vastly different types of roofs, but both of them are strictly fireproof. One of the problems which had to be worked out in the design of fireproof residences was
A Good Example of Tile Roofing on Tile Houses Faced with Stucco and with Brick; Location, Darlington Road, Pittsburgh, Pa.; Harry S. Bair, Architect.

A hollow-tile roof that could be constructed at moderate cost. To do so a pitch or gable roof had to be built without the use of structural steel members. A flat fireproof roof could be readily designed which would require no structural steel, but a flat roof would not lend itself to the architectural treatment of residence buildings, and a pitched roof using structural steel would increase considerably the cost of the building.

"This plan solves the problem satisfactorily. The roof is of reinforced hollow-tile construction, similar to reinforced hollow tile floor construction, and is carried on the walls and bearing partitions of hollow tile built up from the attic floor, so that the entire roof load is supported like a floor, thereby relieving it of all thrust.

"For buildings having wide spans without cross-partitions for support, this truss roof of steel with book tile is an ideal construction. The book tile are supported on tee irons laid between purlins; and the book tile are of porous material so that slate shingles or roofing tile can be nailed directly to them."

Two Examples of Hollow Tile Farm Buildings
PERMANENT COMBINATION STRUCTURES THAT ARE O. K.

By C. A. Willson

WITH the increased demand for better methods of farming has come the increased demand for permanent, substantial farm buildings. In this article two examples are given showing how several small buildings, which were not permanent, have been combined into one larger building which is permanent.

The accompanying photograph illustrates a combination of a smoke house, a store room and an ice house with cooling space underneath.

The ice house, which is the largest of the rooms, is 12 by 14 feet. The cooling room below is 5 by 6 feet. Contrary to ordinary practice, the ice was stored in the south end of the building. The apparent disadvantage of this arrangement was overcome by means of shade trees.

A passage, 4 feet wide, leading from the north end to the ice storage room, separates the smoke house from the store room. Each of these rooms is 5 feet wide and 6 feet long. This makes the entire building 14 feet wide and 18 feet long. The walls are of hollow tile 8 inches thick. The floor is 5 inches thick, also of hollow tile, but covered with a very thin coating of cement.

The drawing shows another arrangement, but embodies the same general idea of combination. Ample space is provided in the garage for an automobile and...
buggy or wagon, with space for a small shop situated at the rear. The garage measures 12 by 24 feet, so there is plenty of room for the shop.

Adjoining the shop is the ice house, which is 12 feet by 12 feet in size, outside measurement. By making the opening toward the north an ideal location is secured, for, with the other rooms arranged as they are, the walls of the ice house are never exposed to the heat of the sun.

Next in order comes the milk house, which is 12 feet wide and 12 feet long. It is lighted by windows in both outside walls, and since it is entered only from the outside it is entirely separated from the shop and garage, much the same as if it were an individual building. At the same time it is in direct connection with the ice storage room.

In another similar building part of the garage space was partitioned off for a laundry. Located in this way it is well lighted and well ventilated, and it also is entered only from the outside. Between wash days this will be the proper place for the storage of washing machine, boilers, tubs, etc., and on wash days it will be found a decided improvement over a corner of the back porch. If the building is not near the house it would be advisable to construct a flue in one corner of the room, set up a small laundry stove and heat the water for washing in this room also.

The outside walls of the building, and also the inside walls of the ice storage room, are 8 inches thick, constructed of 5 by 8 by 12-inch hollow clay building blocks. The floor and other inside walls are 5 inches thick, also of hollow blocks. The floor may be made of hollow tile seconds. Most clay products manufacturers will be glad to sell these at a price less than that of first quality blocks. The roof can be made of rafters and sheathing covered with prepared roofing, or, better still, a fireproof roof can be made of tile.

**Plastering and Furring**

It is very seldom in a residence or other moderate sized tile buildings that we have occasion to use furring of any kind. Plaster or stucco is applied directly on the tile. This is in general the most permanent and satisfactory material to which stucco and plaster can be applied. In case furring of any kind is necessary, it should be tile furring. Otherwise there may be a question of permanence or fire risk involved.

**Yepsen Now Sales Manager**

V. L. Yepsen, advertising manager of the National Fire Proofing Company, Pittsburgh, has been elected second vice-president and manager of sales.
Striking Brick Porch Improvement

As a matter of protection, the money invested in keeping a place up to date indicates sound, good judgment on the part of the owner. No person can be so sure of his future that it is unnecessary to prepare for unexpected circumstances. It is the well kept up place that is most quickly sold.

Face brick, as a material for the improvement of old houses, is most effective. A new face brick porch on the old house is a protective investment as well as a means of providing increased comfort for those who occupy the house. The effect which may be obtained in altering the appearance of a house is shown by a comparison of the two views below. This is the result of replacing the old porch with a new one of face brick, with a frame sleeping porch above a portion of it. The remodeling plan has been prepared at the request of Mr. C. C. Fenwick, of St. Joseph, Ill.

These Views Bring Out a Striking Comparison Between the Appearance of the House as It Is and as It Might Be.
How to Build of Brick

How to Build of Brick

FACE BRICK POSTS FOR ORNAMENTAL IRON FENCES. When it conforms with the style of the residence and there is sufficient lawn surrounding the buildings, an ornamental iron fence with trim face brick posts is a most effective means of ornamentation. The design of the metal work should be as simple as possible. The face brick posts should be capped with white stone or terra cotta, preferably, but it is sometimes possible to work out a cap from brick laid on edge which is very artistic. The principal objection to capping the posts with brick is that the contrast between the body of the post and the cap is lost. The face brick should be of the same pattern as those used in the house. The size of the post should be proportioned to that of the porch pillars or to some other conspicuous part of the house. The design should also bring out a definite relation between the post and this part of the house. A fence which is too conspicuous is more of a detriment than it is an aid in making the grounds attractive. The fence must not detract the attention of the passer-by from the house. For this reason it must not be too elaborate. The evident purpose of the fence should be to ornament the premises and a repellant aspect should be carefully guarded against. If the fence is to be used, however, it should be designed in such a manner that small animals are prevented from roaming over the lawn.

What Will An Outside Brick Chimney Do?
The answer to this title question is the answer to the question, "How may an inexpensive frame cottage most easily be given the appearance of a building of much higher cost?" In the hands of an experienced designer, even the most inexpensive cottage may be given a rich appearance by the use of an outside chimney of face brick. There is such a wide range of color and texture effects possible and such a diversity of designs which may be worked into the surface for ornamentation, that the possibilities of this method of building are almost unlimited.

The fireplace elevation and chimney section shown here will indicate the structural details with which the builder should be acquainted. Fundamentally, a good foundation or footing is required. Its size should be carefully figured so that the bearing on the subsoil will be as nearly that on the subsoil beneath the remainder of the house foundation as possible, and then if any settling occurs it will be equal in all parts and cracks will not develop. Common brick are used up to grade and within the walls of the building to the roof. When the heater is served by this chimney, a double flue is used, each part lined with flue lining. Cast iron cleannout doors are placed at the bottom of the fireplace ash pit and the heater flue. The section shows the hearth supported by a brick trimmer arch. A concrete slab, reinforced, may be substituted if desired. Fire brick are used to line the fireplace and a modern damper is installed.

The chimney should not be used to support any part of the building. Never set joists or other inflammable members into the brickwork.
"GOODS well displayed are half sold." This is the keynote of modern merchandising, and goes far toward accounting for the marvelous successes built up in many lines of trade during the past ten years. Go into any up-to-date store during a good volume of business, and one of the most striking features for the man on the lookout for selling ideas is the fact that practically the entire stock of goods is on display. Materials are out where they can be looked at and examined, and are exhibited so attractively that they actually sell themselves.

In dry goods and furnishing stores this idea has been worked up most elaborately; the city "department stores" owe their huge success almost entirely to this one principle; and general stores have increased their sales wonderfully by it.

The shopper comes into a store with a single purchase in mind; an attractive display of some line catches the eye—perhaps the price is a little bit special—and, unless said shopper is of a very stubborn character, two purchases are made instead of the one intended.

This is the goods-display that increases sales. There is also the type of display, much in use among wide-awake merchants, that helps them sell the customer the goods he is in search of by making it easy for him to examine the entire line and so make an intelligent selection. This is the kind of display most vitally interesting to dealers in building materials and it is this that we want to call particular attention to.

The man who is going to build, or his agent, the architect or building contractor, comes to the building material dealer to select the materials to be used in the work. For instance, in regard to the brick—the face brick for the front and trimmings of the building and the special artistic brick for the fireplaces; the owner knows in a vague sort of way that there are a number of different face brick on the market that might well be used on his job—all varying in color, texture and cost; he wants to see all of them, or at least enough to be able to make up his mind with some degree of satisfaction that he is choosing wisely and is getting the best the market has to offer in line with his particular job. Such a man, naturally and rightly, expects the building material dealer to help him in making this choice; and nine times out of ten he is going to give the business to the dealer who can do this satisfactorily.

In this connection brick display enters as an im-

(Continued to page 128.)
Brick Bungalow of Fine Proportions

An unusually well arranged, well divided residence is that illustrated here. It was built for Mr. F. L. Pease, Hastings, Neb., by Mr. E. M. Gilbreth, of Hastings, who also designed it.

A full-width porch, 11 feet deep, railed around solid from the foundation, is built in front. A broad arch, from two corner pillars, adds to the charm of this porch.

Entrance is into a reception hall, from which a wide cased opening leads into the large living room. Along the back wall are book cases and a fireplace.

Behind this living room is a square dining room, lighted by a very large window. Thru a swinging door is the kitchen, where a built-in counter of shelves does service as pantry. A vestibule from the kitchen gives rear entrance.

Between kitchen and downstairs bedroom is a lavatory and toilet. Taking up the width of the lavatory is the closet for this bedroom. Separating bedroom and reception hall is the stairway.

Upstairs is a large bedroom, 13 by 25 feet; a bathroom, 10 by 10 feet; a closet, a dressing room, and a sewing room—each about 10 by 10 feet.
Pleasant Frame Cottage

The exterior details of this pleasant little cottage are worked out with wood in the form of shingles for the main walls, ornamental battens and boards under the gables, a massive chimney of face brick and concrete for the porch steps. The pergola porch roof and exposed rafters add a decorative touch which is pleasing. To relieve the possibility of excessive dark tones, the window and door trim is finished in white.

The arrangement provides for entrance thru a reception hall having a colonnade opening into the living room. The bedrooms and bath extend back on one side of the house and the dining room and kitchen, with its pantry, occupy the other side of the house. There is a rear stoop with entrance, thru a small entry, into the kitchen.

Perspective View of Frame Cottage Having a Well Balanced Gable Roof. The Appearance Is Pleasing and the Interior Is Arranged to Provide the Utmost in Comfort and Convenience.
Fireproof Duplex House of Neat Design

The two-flat building shown on this page is of fireproof concrete construction, designed and built by Nels Quam of Willmar, Minn. The outside walls from the basement floor up are double, each wall being 4 inches thick with a 3-inch air space between. The moulds used in the construction of the walls were made by the builder. The first floor is of reinforced concrete, heaved from 4 to 7 feet on centers. The second floor is of combined concrete and hollow tile construction, using 5 by 12 by 12-inch tile, 4½ inches apart, for the concrete beams and having a 2-inch top layer of concrete, which gives the floor a thickness of 7 inches.

The roof is constructed in the same way as the second floor, except that tile from 4 to 8 inches thick were used in order to get slope to drain the roof to the center of the building, from which point it is conducted to the cistern. All partitions are solid concrete, 5½ inches thick in the basement, 4½ inches thick between floors, and 4 inches thick above the second floor.

Porch and roof railings and balustrades are of monolithic reinforced concrete, using wood forms. The outside wall and ceilings under the roof were furred and lathed. Mr. Quam states that he has built houses without the furring and lathing, but that in the cold climate where this building is located, he finds it advisable to use them.

The living room, dining room and hall are finished in white oak and the rear rooms are in birch with maple floors. The cost of the building is approximately $10,000. There is a garage to the rear of the building which is built in the same way. The flat building is 33 feet by 60 feet and the garage is 24 feet by 26 feet. The stucco used on the body of the house is made of white cement with red sand, and that on the trim is made of white cement with white sand.

This is a most excellent type of construction for a building of this style. It is certainly true that the average tenant is less careful of the house which he lives in than the owner would be. Fire is one of the principal sources of destruction which must be guarded against. Furthermore, most people are willing to pay more for the rental of a fireproof building.

Arrangement of the Duplex Flat Building Shown Below.
Size 33 by 60 Feet.
Comparative Figures Prove Cement is Not High

These arguments will help convince your customers—now is the time to build

By Blaine S. Smith

General Sales Manager, Universal Portland Cement Co.

Is the price of cement high? Some people think so, but as a matter of fact, cement has not kept pace with the recent general advance in price of raw materials and finished products. The fact can be proved.

The farmer's case is plain. What he produces shows a much greater price advance than what he buys. An acre of potatoes or wheat has greater purchasing power than before, and in terms of rural products, cement actually costs the farmer less than formerly.

Other Commodities Have Advanced More Rapidly in Price than Cement

The same general situation is found in the city. Labor earns more and spends more. Manufacturing concerns sell their products for more and pay more for raw materials. Extensions to a factory are made at higher cost for building materials, but in the case of cement, the advance is not so great as the advance in selling price of articles produced in the enlarged plant.

Bradstreet's, the financial agency that rates all business concerns, for years has made a careful study of the "ups and downs" of prices. No one commodity can show the general trend, so the following 107 articles are used:

The 107 Commodities on Which Bradstreet's Bases Its Index Prices

6 Breadstuffs—Wheat, corn, oats, barley, rye, flour.
4 Livestock—Beef, sheep, hogs, horses.
24 Provisions and Groceries—Bread (carcasses), hogs, mutton, milk, eggs, beef, pork, bacon, hams, lard, butter, cheese, mackerel, codfish, coffee, sugar, tea, molasses, salt, rice, beans, peas, potatoes.
6 Fresh and Dried Fruits—Apples, cranberries, peanuts, lemons, raisins, currants.
4 Hides and Leather—Native steer hides, hemlock packer, union, oak.
11 Textiles—Cotton, wool (two grades), hemp, jute, silk, flax, print cloths, sheetings, gingham, cotton sheetings.
13 Metals—Iron ore, pig iron (three grades), steel billets, steel rails, tin plates, steel beams, silver, copper, lead, tin, quicksilver.
4 Coal and Coke—Anthracite, bituminous, Connellsville coke, Southern coke.
6 Oils—Petroleum (crude and refined), linseed, cottonseed, castor, olive.
3 Naval Stores—Rosin, turpentine, tar.
11 Chemicals—Alum, bicarbonate soda, borax, carbolic acid, caustic soda, nitric acid, sulphuric acid, phosphate rock, alcohol, opium, quinine.
7 Miscellaneous—Hops, rubber, tobacco, paper, ground bone, hay, cottonseed.

The following table of index figures for July of several years past and for May, June and July of this year shows the July, 1917, index to be 90 per cent over the July figure in 1909:

Bradstreet's Index Figures Show Trend of Prices

</table>

Note particularly that Bradstreet's Index Number, based on prices of a great many commodities including cement, shows a substantial increase from May to July, 1917, during which time there has been no change in the price of cement. This means that there have been recent price advances in most important commodities except cement.

Concrete Beams for Spanning Large Porch Openings

By Albert M. Wolf
Assoc. M. Am. Soc. C. E.

The appearance of many a fine residence has been marred by the sagging or deflection of long span lintels over porch openings caused by improper design or consideration of the deflection thereof under load. Any apparent sag in a beam lintel (one with level under surface) gives an appearance of instability and weakness even to persons having no knowledge of the mechanics of materials and is, therefore, doubly objectionable. In stucco work it is quite common practice to frame false arches under horizontal lintels and if the latter are not stiff enough the deflection will crack and render unsightly the stucco.

For long span porch openings, wooden trussed beams are quite often used. These are generally “just built,” rather than designed, and they are usually entirely too strong or not strong enough. If the latter is the case, a sag will be noticed soon after completion, which becomes more pronounced as the timber dries out. In bungalow construction, especially where the porch lintels generally support the main roof construction sufficient depth is not provided to give a stiff trussed lintel. In first-class construction, then, a wood beam lintel or modification thereof in trussed form is not to be recommended for long span lintels where any small sag will be readily apparent.

Lintels made up of structural shapes are used more frequently on large residence work, but to give good results they must be designed for a very limited deflection rather than simply for strength. In frame construction some difficulty is presented in boxing in such lintels while for a stucco house they must be wrapped with wire mesh and plastered or entirely encased in concrete to give the desired outline to the beam. With the present high cost of structural steel (five to seven cents a pound erected, for small work) the most logical material to use for porch lintels where permanency is sought, is reinforced concrete.

If the facing material used on the structure is brick, the brick can be anchored to the concrete so as to mask the beam entirely on any such part as it may be desired to cover. In general, however, this process will be found difficult of execution, since each individual brick must be anchored. In many cases, however, a steel angle anchored to the outside face of the lintel beam will meet the requirements of supporting the brick facing; the angle with a 4-inch leg projecting being set flush with the bottom of the lintel and the under surface plastered and painted if desired.

For buildings of hollow clay tile, concrete block, or reinforced concrete walls to be finished with stucco, the concrete lintel beam can be used to the best advantage, for it can be formed to any desired contour; that is, as a plain lintel beam, one with brackets or any shape of arch, the concrete poured and the stucco applied directly thereto to obtain the desired finish.

Advises Stronger Ties in Crib
To the Editor: Spencer, So. Dak.
I was noticing in your August number the cross section of crib Fig. 2A, page 85; and wish to say that the 2x6 cross ties which are at the center of crib part will never hold the weight of ear corn which comes upon it. I formerly used 2x6 and had to go back and fix every one over. I use a rough 1 in.x12 in. which I find holds up in most cases. This may help some one out of trouble some time to know this. I have been a subscriber to your paper for several years and like to read it very much.
Max Samp,
Contractor and Builder.

Well-Framed Lumber Shed
To the Editor: Rosholt, Wis.
Here is a big lumber shed frame built of hemlock all thru. All posts were built up or membered of 2 by 6, and gave best service. Building is now used as lumber shed for the Wisconsin Building Material Co., whose general offices are at Schofield, Wis.
We used 85,000 white cedar standard "A" shingles for the roof.
Wisconsin Building Material Co.,
Paul J. Brehmer, Local Mgr.

Something for the Typewriter Men to Think About
To the Editor: Carbondale, Ill.
I have been wondering why some manufacturer of typewriters does not get up a machine for the small contractor to get out material bills on. To get out a material bill on the standard keyboard is a puzzling proposition for most stenographers, let alone an amateur like me, who, like numerous others, cannot afford to employ one anyway.
My idea of the machine would be to build it on the same principle as the adding machine, at least as to the keyboard, getting as many numerals on a key as possible, such as "2x4," "2x6," which require two changes to write, besides having to strike three keys. Also #2, S-4-S, "CLR," CY., YP., etc., could be put on one key and printed with one motion, instead of three or more. The machine should run a roll of paper, the same as an adding machine does, having the paper wide enough to carry the ordinary lumber bill. The paper should be rolled double, with a strip of carbon between, so that a copy could be kept for filing, then a fellow could sit down and knock out a lumber bill that the yard man could read and it wouldn't take all day to do it. With the thousand and one changes that you have to make on the ordinary machine,

For Years of Continuous Satisfactory Service

The reason so many contractors and builders are using Stanley Garage Hardware is, that it is a complete line of ALL the builders’ hardware needed for all kinds of garages. It is decidedly good looking, harmonizing with the lines of the garage; it is well made; and it does its work perfectly day in and day out. For the next garage you build be sure that you order

STANLEY GARAGE HARDWARE

It is correct in every detail and can be relied on with absolute confidence.

Stanley Garage Door Holder No. 1774 locks the door open, preventing injury to car and occupants while entering or leaving the garage.

Get Stanley Bolts, Stanley Butts and Hinges, Stanley Door Pulls, Stanley Latches, and you will have the best and most modern garage hardware equipment.

Write today for valuable illustrated booklet on Stanley Garage Hardware. It is sent free on request.

THE STANLEY WORKS
NEW BRITAIN, CONN., U.S.A.
Your faithful ally

When you finish a job with Murphy Varnish or Murphy White Enamel, you feel safe. You know you’ve left a strong and trusty friend on guard who will protect your work from injury and keep it looking like new.

Murphy Varnish

"the varnish that lasts longest"

is not a luxury. Compared with ordinary varnishes the Murphy house-finishing products cover so much more area that they cost less to use than finishes that have less staying qualities.

it is so much quicker and easier to use a pencil, that I hardly ever use the typewriter for that purpose.

Now, I may be a back number and there may be such a machine on the market, but if such is the case I have not seen it advertised and I would like to be put in touch with the makers, and if there is not, then I wish you would bump some of them up and let's have one made before lumber bills go out of fashion.

Yours for efficiency.

F. E. KLINE, "Home Builder."

A Kin to the Shaving Horse

To the Editor: Pomeroy, Ohio.

As I am an old timer and a charter member of the AMERICAN BUILDER family, I will try to answer the question asked by W. R. B., Yates City, Ill.

We used to take a post or any timber that had a mortise cut clear thru and lay it across some other timbers or on a stump or anything to raise it up off the ground to form something like the old shaving horse as illustrated in the July number.

Then take a 2x4 and put it thru the mortise and put a pin thru the pin hole in the timber to let the 2x4 swing back and forward same as the head in the shaving horse, and put a pin in the bottom for a foot rest to work the head piece. Then put a piece of 2x3 or any shape the length of the pins you wish to make back from the 2x4 in the mortise; then cut a notch in the top of the 2x4 the size of a pin you wish to make at the big end, say 1½ in.; then cut a notch in the other upright, say ¾ in. or 5/8 in., whatever you wish to make the small end of the pin. With this kind of a pin horse you can make the pins the exact thickness you wish to make them for the notch in the top that holds. The pin acts as a gauge for thickness and the other notch acts as gauge for the small end and also the taper. We always made the pins octagon.

NOTE: Mr. James Selby at Claysville, Pa., and Mr. R. Nail at Shelbyville, Ind., submitted practically the same thing in the way of a shaving horse, as the above.—EDITOR.

To Cut the Planceer for an Octagon Roof

To the Editor: Laconia, N. Y.

What figures must I use on the square to cut the planceer for an octagan roof with a 4/12 pitch? BENTON S. PORTER.

ANSWER—Use the same figures that you would for the top cut of the jack but the cut is reversed on the square, that is, in this case 5 in. and 15 5-12 in. will give the cut for either the top cut of the jack or the cut across the face of the board for the planceer. In the former the cut will be on the side of the square on which the latter number is taken and the reverse for the latter. But there is still another cut that should be considered and that is the edge cut of the board which

(Continued to page 90.)
Economy in Interior Trim

It is no longer necessary to expend large sums for rare and costly woods for the interior finish of your home.

Modern improvements in materials and methods now make it possible for you to obtain any desired effect of tone or color in interior trim with the use of the least expensive woods. This substantial saving does not necessitate any sacrifice of beauty or utility when the wood used is *Southern Pine*.

Southern Pine not only is exceptionally workable and durable, but it has a wonderfully varied and pleasing grain; and it takes and holds stains perfectly, making possible a wide range of color and tone effects in floors, standing trim and all interior woodwork. Furthermore, it costs less than any other high-class building wood, and it may be had anywhere east of the Rocky Mountains.

*It will pay you to send for the new booklets, "The Interior of Your Home" and "Beauty Plus Service In Floors." They are Free. Please address Department N-52.*

WHEN WRITING ADVERTISERS PLEASE MENTION THE AMERICAN BUILDER
Practically Every Roof is a Prospect for You

The roofing dealer who can meet every roofing demand with a suitable and serviceable roof is the dealer who lands the big business. In the Johns-Manville Roofing Line there's a roof for practically every requirement—and each has distinct service and sales features.

Johns-Manville Asbestos Ready Roofing. A combination of Asbestos (Rock) Fibre and natural asphalts, this roofing is literally a sheet of flexible stone. Fire-resistant, time-defying, weatherproof—giving long years of service with minimum upkeep expense.

Johns-Manville Roofing Clamps, supplied with Ready Roofing, are strips of special alloy galvanized metal that exert continuous pressure all along the seams of the roofing. These clamps make leak-tight joints and secure the roofing sheets against wind-lifting.

Johns-Manville Asbestos Shingles—made of selected Asbestos Fibre and Portland Cement—an armor for all time against the most severe action of the elements. Severe temperature changes, rain, sleet or snow have little or no effect on these shingles. And they cannot burn.

A Genuine Dealer Opportunity. The market for the Johns-Manville Line of Roofings lies at your very door. The farmer whose stock and equipment comprise his working capital needs the protection of a safe and durable roof for his big new barn. The new bank building, the business block, the hotel, church, school, warehouse or factory, each of these has a distinct need for just such a safe and economical roofing as Johns-Manville offers. And on each job there's both a dealer's and contractor's profit—why not make it yours?

We want a few builders in various parts of the country to handle Johns-Manville Roofings. We want men of good standing, able to make full use of the help we will give—men who measure up to the big possibilities of this profitable business.

If you're the right man, ask for further details, for our proposition will prove interesting.

How to Cut Hen House Rafters
To the Editor: Freeport, Me.
Inclosed find a sketch of a hen house with posts in front 5 ft-0 in. back 6 ft-0 in. and at one-third of width of building back from the front is 7 ft-0 in.

Under your method of cutting rafters how should the square be applied to get the lengths and cuts of the rafters?
J. B. SYPDEMAN.

Answer—The run and the rise will give the seat and plumb cuts just the same as in the even pitched roof, but each side must be treated separately. In this example, the front posts are 5 ft-0 in. and at the comb it is 7 ft-0 in., a difference of 2 ft-0 in., which represents the rise given the roof for the front side for whatever the run may be. The rear posts

(Continued to page 94.)

Here's a big, profitable opportunity for contractors and builders everywhere. Don't worry about a building slump in your locality on account of the high cost of materials. Get busy on remodeling work. Rebuild frame houses into stucco. There are any number of people in your town that want to bring their old houses up to date and it's mighty profitable business for you.

Kno-Burn Corrugated Metal Lath goes right on over the clapboards or sheathing and requires no studding. You simply put on the conveniently sized strips and apply the stucco—easy and certain to give a fine, smooth, permanent job.

We'll gladly post you fully. Send for booklet 32 at once.

Big Lumber Shed Roofing Job

To the Editor: Iola, Kan.

I am sending a picture of a roof covered with "Vulcanite" roofing of "Jumbo" type. There is a little less than one-half acre of roofing or 195 rolls of paper.

A. W. Woods.

Plank Truss for Barns

To the Editor: LaFargeville, N. Y.

In answer to question of C. Kolkind in July issue: In regard to plank truss for barns, the illustration he gives shows how to build the truss. The braces which run up to the purlins are double, one each side of the 2x12 principal rafter which goes from plate to peak. The posts are double as are also the short struts from purlin to principal rafter.

E. R. Gerry.

"Why Black Rock Wallboard makes money for me"

"There is never any 'come back' when I use Black Rock Wallboard on a job. It not only looks well, but stands up well; and I can trace many new customers to the satisfactory Black Rock jobs I have built."

A builder's profits in the long run, depend not merely on how the job looks when it is finished, but how it "stands up." Black Rock is veneer built of the stuff that lasts. It is so well sized that no priming coat of paint is necessary.

You will find Black Rock Wallboard not only as easy to handle and as enduring as lumber, but surprisingly economical as well. Let us send you a sample for your careful examination.

Black Rock Wallboard Co.
1510 Ontario Place
Black Rock, N. Y.
Steady Work
Without a Break

When Beaver Boarding fills the gap you have steady work from frame work to finishing. No need to carry tools to another job or lose time waiting for lathing to be done and plaster to dry.

You have steady work without a break.

More than that the job is right. There is no chance of cracking and falling. The walls and ceilings are just as permanent as the woodwork and hardwood floors. This knotless, crackless, manufactured lumber is a staple among building materials.

Just because some people think all wall board is Beaver Board don't expect Beaver Board results from anything but the genuine.

Send the plans of your next job to our Department of Design and Decoration and let us help you with suggestions and estimates. This service is free to carpenters and contractors.

BEAVER BOARD
FOR BETTER WALLS & CEILINGS

WHEN WRITING ADVERTISERS PLEASE MENTION THE AMERICAN BUILDER
The space for the purlin is left vacant. I think that the brace from peak to purlin should be lower at the low end so that it will pass between the long braces and also between the struts, thus tying these together, and being below the purlin it will serve to support this; see illustration.

If one will examine a few designs of trusses he will see that this brace is not an important member as it is sometimes left out and one stick put in horizontally to take the place of it and of the strut as well, and so we conclude that it is more important that a design be workable than it conforms to some theoretical drawing.

The purlin may be two 2x10 planks with blocks between, making 6x10-inch sections.

After the joists are laid a floor is laid on them to make a place for building the trusses.

When the first truss is completed the other trusses are to be built exactly like it, one on top of the other, and when all have been finished the first is placed in position at one end of the barn. Place the feet of the truss where they are to rest in position with the top of the truss toward the center of the barn. Blocks are then spiked to the joints at the upper points, so as to keep the feet of the truss in place while being raised, said feet resting against these blocks and pivoting on them.

A pair of shears is erected at the end of the barn in the center, leaning at an angle of 45 degrees toward the center of the barn; the black and tackle is rigged, the rope passing over the shears and attached to the upper part of the truss.

A gang of men can do the work but horse power is cheaper. A few men with guy ropes are necessary to steady the truss while being raised and to keep it from going too far. It may be found best to use a team to start the truss and lift it part way up, then men may pull it the rest of the way easily and safely. As soon as the first truss is up it is braced in position. The second is then raised in like manner and as soon as it is up the girts are added. Then one after another the trusses are put in place, spiking the girts as you (Continued to page 98.)
Now I'm Reroofing My Town

My first NEPONSET roof was the envy of the neighborhood. It added tone to the building. Many thought it slate. They asked me about it. Found out it was spark-proof, a wonder in wear and economical in laying. They saw samples in soft green and red colors.

NEPONSET
TWIN
SHINGLES
Asphalt, Slate-Surfaced, Fire-Resisting

(Patent Applied for)

Large national advertising kept the subject in their minds. Page advertisements explained the beauty, wear, safety, and saving in Neponset.

Orders came in fast. They have kept on coming, for every Neponset roof has given real satisfaction. Those Neponset Twin Shingles are impregnated with everlasting asphalt and coated with crushed slate jammed right into the fibre.

Send for full information on Neponset Building Products and the free booklet, "Repairing and Building"

New York  Chicago  Washington  Canadian Office and Plant: Hamilton, Ontario
go along. No scaffold is needed to put on the plates as you can climb the truss.

To put the purlins in place raise to a position with block and tackle. For this a 2x4 can be spiked to the brace and principal rafter and later sawed off.

Siding is nailed on before rafter and roof boards are in place there being nothing to interfere with nailing on the boards under the cornice.

If desired the purlins can be made in parts several feet long and raised by pulley up over the main plate.

Proportion for Heavy Timber Gambrel

To the Editor: North Cohocton, N. Y.

In a recent issue of the AMERICAN BUILDER, a brother asks if there is a rule to frame a gambrel roof. I am sending a sketch showing the method that has been used in this section for years. The rule is to set the purlin in 1/6 the width of the building and with a rise of 12" to 6 in. run or 6 and 12 reverse and with upper 7 in. to 12 in. This will make the upper rafters a little longer than the lower ones but it gives a good shaped roof.

Have also shown the usual method of finishing at eaves by running up from top of facia 3 ft.-0 in. to 3 ft.-6 in. of rafter with a 10 ft.-0 in. radius. These pieces are cut out of inch stuff and nailed on to the side of the rafter. Some times we use straight lookouts instead of the curved.

W. T. MILLER,
Contractor and Builder.

How to Read Essex Board Measure

To the Editor: Rockwood, Pa.

I would like to have an explanation to the “Essex Board Measure Rule” found on the body of some steel squares.

SIMPSON S. SHAFFER.

Answer—The Essex board measure has been stamped on most all of the steel squares for these many years. The fact that it has not become generally known by the men for whom it was intended shows it to be of but little importance. In fact, we cannot now after more than thirty years’ experience among builders, recall a single instance where we saw this board measure referred to.

Yet it is simple and easy to learn and is as follows: Always look under 12 on the blade for the length of the board and move to a point under the desired width and the figures recorded there represent the contents of the board in feet and inches in linear board measure. Thus, a board nine feet long and nine inches wide contains six feet and nine inches or six and three-quarters board feet.

A. W. WOODS.
The ENDORSEMENT of RED CEDAR SHINGLES IS ON THE HOUSETOPS of the NATION

There they stand, Beautiful Homes, years and years they live, their Beauty Unfading, their durability unquestioned, lasting for generations.

DURABILITY—UNCHANGING ARCHITECTURAL BEAUTY

These are the outstanding qualities of the structures built of Red Cedar Shingles. A workmanlike building and a building architecturally beautiful at the beginning AND ALWAYS. Do them justice in the laying—with good workmanship, good old-fashioned cut nails or zinc-coated nails (never wire nails) you have a Roof or Siding that WILL LAST FORTY YEARS AND MORE.

A Guarantee of Grade and Quality

The Rite-Grade Inspection Mark appears on only such shingles as in every way conform to the rigid specifications of the West Coast Lumbermen's Association. When you buy INSPECT on the Mark being on each bundle.

Below (in the left-hand corner) is the identification mark of all Red Cedar Shingles that pass inspection.

FREE—Write for the following literature, for one or all, address below:

(3) Bungalow Book—Twelve pretty designs with floor plans. (4) Distinctive Homes—Twelve fine residences with floor plans. (5) Report of the University of Washington giving results of tests on the comparative fire resistance of roofing materials.

Shingle Branch, West Coast Lumbermen's Association

SEATTLE 426 Henry Building WASHINGTON
To set big plates for a Store Front is a difficult matter. The operation in itself requires skill and every precaution must be taken to prevent breakage.

Yet—the most important thing, by far, is to set the glass in a construction that will at all times adequately protect the glass from injurious jars, shocks and vibrations which, in many instances, may prove disastrous and result in cracked plates.

Kawneer Store Front Construction affords the most ideal metal setting for large plate glass. The glass is securely held by means of a spring friction grip, being resilient on both sides of the glass thus protecting the glass from undue strain.

Just take a look at the above illustration, which plainly shows the advantage of our resilient grip; then imagine glass held in an unyielding, vice-like grip of iron, for instance, or perhaps of wood, which will always warp or swell.

Kawneer Store Front Construction is designed for one purpose only, that of holding glass efficiently, but above everything—safely.

Our Catalog "H" contains details of our storefront construction. Perhaps you would like a copy, if so, just mail us the coupon and it will cheerfully be sent you.

KAWNEER MANUFACTURING COMPANY
NILES, MICHIGAN

Please send me a copy of Catalog 'H'

Striking Out an Ellipse

To the Editor: Norwich, Conn.

How many mechanics are there who can strike out a perfect ellipse if given the desired diameters? Very few. Those who could do it, very likely would make a complicated job out of it. In a certain Connecticut wood-working shop many elliptical window frames were made. Some of the men had a very unique method for striking out the correct shape and size without using any special tools.

Suppose for example an ellipse having diameters of 72 inches and 24 inches is required. Refer to Fig. 1. On the top of the bench and at right angles to the front edge, nail a strip of 3/4-inch board. This board must have a straight edge to work from. Cut a thin strip of wood 1/4 inch thick and shape as in Fig. 2. The end at O, have about 1 inch deep; the end at P, about 1 inch deep. The longest diameter of the ellipse is to be 72 inches, so the distance from O to N must be half of 72, or 36 inches. The shortest diameter is to be 24 inches,

![Diagram](image_url)

so length from N to P must be half of 24, or 12 inches. Stick O-P therefore is 48 inches over all. At end of P, cut a notch for a pencil or marker.

To operate, refer to Fig 1. Stock O-P is pressed against the 3/4-inch board with the notch at N fitting up tight to outer edge of bench. Keeping end O against 3/4-inch board, swing end P to right but always have notch N in contact with edge of bench. This will cause end O to slide up along edge of 3/4-inch board. The stick O-P will assume positions such as shown in dotted lines, and the pencil will travel through points P1, P2, P3, etc. When the pencil reaches P5, the path traveled is a perfect quarter of an ellipse.

With a quarter of the ellipse for a pattern, it is an easy matter to mark out the remaining three quarters.

---

Wants to Make Band Saw Sharpener

To the Editor: Calgary, Alta., Canada.

I would like a sketch of a homemade, or easily made bandsaw sharpening machine that I could run off on our little motor in the shop. I would like it practical and simple so that I could make nearly every part myself with the machinery we have. You could publish this question and I will probably have a few answers from some of my brother carpenters.

WILLIAM DEANS.
We have combined the two into shingles which not only defy fire but are practically indestructible. They do away with paint and repairs—the first cost is the only roof cost as long as the home stands.

**Nature Made Asbestos and Cement Unburnable**

AMBLER
Asbestos Shingles

Nothing To Burn

can be laid in several patterns and come in three colors: Newport Gray, Slate and Indian Red. They are artistic—architects endorse them.

Exposure to the weather in any climate does not change their texture. Should the snow cover them in winter, thaw in the midday sun and freeze again at night, it would in no way impair a roof of Asbestos Shingles. They are sufficiently elastic to prevent any cracking or splitting, as happens with ordinary roofing slate.

Write for more facts, prices and pictures. Estimates gladly furnished free on request.

Manufacturers of Asbestos Shingles, Building Lumber, Corrugated Sheathing, Pipe and Boiler Coverings
To Join Boards Together

To the Editor: Montrose, Pa.

I am enclosing sketch that I thought might help some brother "wood butcher." This I find is a good way to put two pieces of wood together, as for moulding boards, drawing boards, etc. Joint the two edges that are to go together, then mark off two places on the edges so that they will be square with each other (see sketch at lines A A). In one edge at center of lines set screws, leaving the heads projecting about ¼-inch. In the edge of the other board, bore holes 1/16-inch larger than the screw heads and ½-inch deep. Cut slots a trifle larger than the neck of the screw. Place the piece with the screws in, in the vise, glue both edges, and place the slotted piece down on the heads with the holes covering same and drive end ways so as to bring the screw heads in the slot cut for same. Lee C. Brown.

Help on Some Finishing Problems

To the Editor: Mayaguez, P. R.

Having seen in the last number of the American Builder your offer of the service of a consulting chemist, and having great difficulties in the preparation and application of varnishes, I take the liberty of consulting with you on some of the main points.

I have been using varnish made by dissolving shellac in denatured alcohol, and find that mainly when I use bleached shellac, most of it does not dissolve. When I apply this varnish with the brush, instead of leaving a smooth surface it makes corrugations.

Since my business is furniture, and since hand labor is rising rapidly, I have been thinking to substitute the method of varnishing by hand for a more rapid and efficient one.

I would be glad to hear from you on this matter.

Jose Berrocal.

Answer—Your letter to the American Builder has been referred to me for reply. My work in factory engineering has brought me into contact with the identical problems now troubling you, so that I am glad to be able to offer you first-hand information.

It is a peculiarity of bleached shellac, after storage, that it becomes partially insoluble in denatured alcohol. To overcome this difficulty I have found that it is necessary to treat the shellac with ether, such as is used in the hospitals. Obtain a large, wide-mouthed glass jar or bottle which can close securely. Since shellac should be cut at the rate of three pounds to the gallon of alcohol, place this amount of gum in the jar, add one-half cup of ether and quickly seal the bottle. Shake the jar occasionally until the shellac swells into a thick jelly. When it has reached this state, it can be readily dissolved in the alcohol. If you cut any great amount

The Best Bench Stop
To the Editor: Denver, Colo.

Enclosed find the best bench stop that I have ever seen, and I have had men under me from all parts of the U. S. It should be made of oak of 7/8-in. material and of the proportions shown. If carefully made, well dressed up, and with the dovetailed edge beeswaxed

(Continued from page 102.)

of shellac, it will be an economy to make or buy some form of barrel churn which can be rotated. With this you can bring shellac into solution much quicker than otherwise.

As regards your trouble with the shellac piling up under the brush and causing corrugations, I will say that you do not use sufficient alcohol to reduce or thin your shellac before brushing out. In order to obtain smooth shellac work the material should be as thin as skim milk, and each coat should not be rushed any more than absolutely necessary. Never go over a piece of freshly shellaced work to touch up any spots that the brush may have missed. The only way to do is to let the first dry and afterwards give a second sanding with 00 sandpaper between coats. Three hours is sufficient time between coats. Personally, I do not like to get a good body to the finish with shellac, but prefer to use a thin coat merely as size; sandpaper; fill where necessary; and give enough coats of the proper varnish to allow rubbing down to a perfect surface. Another mistake many finishers make in the use of shellac, lies in the method of brushing. This brush must be well filled with the material and brought in a clean, smooth sweep over the work, moving with the grain of the wood and not across it. For turned or carved work the brush should be quite dry and moved in short, quick strokes in such a manner as to prevent drips or sags, and bubbles. If the room is warmer than 75 degrees F. bubbles will form easily under the brush. Work at about 70 degrees F.

Since my business calls for the constant study of new machinery and new methods of work, I am sending you two letters which I have had on file for the past year. I am fully acquainted with the Aerom System for finishing with shellac, varnish or lacquer. This machine has reduced our finishing force from forty men to nine, with a product much improved; put thru the factory in less time; and has enabled us to practice shading and other effects quite impossible with brush work. I cannot emphasize too strongly the value of this apparatus. It can be easily installed, and any man of average finishing room intelligence can be taught to use it. The manufacturer will make any arrangement of apparatus to suit your requirements.

The rubbing machine at first thought will seem rather expensive, but when you consider that it will replace four or more men at hand rubbing, and do better work in far less time, I think you will readily appreciate that it can be made to pay for itself in a short time, depending on the amount of use it will have.

I shall be pleased to hear from you after you have had an opportunity to try these ideas.

RALPH G. WARING.
Proof against
sparks and fumes

Any roof should be *waterproof*
RU-BER-OID is more: It is

**SPARKPROOF**  **ROTPROOF**
**WATERPROOF**  **HEATPROOF**
**RUSTPROOF**  **COLDPROOF**

The Wheeling Iron and Steel Company, Wheeling, W. Va., states:

"On our new tinning department, warehouse and machine shop build-
ings, having more than 60,000 square feet of roof area, we used RU-BER-
OID Roofing exclusively. Experience has proved to us that RU-BER-OID
is not injured by fumes, gases or smoke, that it resists fire, and ex-
tremes of heat and cold, and that it gives longer service without repairs."

Though RU-BER-OID costs a trifle more than other prepared roofing, it
will save you money in the end.

Made in Slate Gray, Tile Red and Copper Green. Your dealer will show
you samples and quote you prices.

when first put in operation, you will find that it will hold anything from an O.G. window stop to a 2x4 and hold it rigidly on edge. Simply push your piece in place, and the wedge will automatically grip and hold. To loosen, merely pull the piece to you, and it will automatically release and leave the stop set for the next piece. The piece that is ripped out should not be over 5/16 in. wide for as thin material as window stop.

Chas. M. Gates, Architect.

Which Way Should He Lay the Grain?

To the Editor: Salina, Kan.

I would like to ask the following question, which has come up in our bunch several times: Is it best to lay valley shingles with grain of shingle parallel with valley, or with common shingle and why? I contend with the common shingle, to avoid nailing edge in valley and to avoid weather checks crossways from the valley.

Would like to see answer in the Builder from some of the carpenter folks.

A. F. Aimes.

The Facts on Hydrated Lime

Have you a definite knowledge as to the history, manufacture and uses of hydrated lime? Probably not unless you have very recently been so fortunate as to come into contact with a copy of Dr. E. W. Lazell’s work on Hydrated Lime. This book fills an urgent need which has been stimulated by the rapid advances made in the industry during recent years. Especially is this work to be commended on its treatment of the use of hydrated lime in concrete, which has only very recently come to be a subject of serious consideration.

Thru the pages of well arranged and very clearly worded reading matter are distributed a generous number of photographic illustrations, diagrams and tables. Not only is a fund of valuable information offered, but it is compiled in such a comprehensible manner that the interest of the reader is at no time forced.

An interesting bit of history relative to the early uses of mortar for plastering and binding the joints in stone structures is included in the opening pages. The second chapter deals with the chemistry involved in the entire “lime cycle” which is forcefully explained in a diagram showing the sequence of the changes produced by burning, slaking and hardening, which carries the material thru a complete cycle leaving it in its original carbonate form.

A chapter is devoted to the classification of lime, including a discussion of its origin; classes of limestone; composition of limestone; definition of lime; types of lime; building trades classification of lime, and the classification of limes as fat, lean or hydraulic.

Chapter IV traces the history of the lime kiln down to the modern producer gas kiln, the steps being clearly marked by the use of diagrams. Following this chapter is a discussion of the slaking of lime, the process being explained carefully, and the need of a lime which has been slaked some time before using is shown to exist if a good, sound, smooth working lime paste is desired.

Readers of the American Builder who are interested in construction work involving the possible use of hydrated lime will be satisfied with the very small investment required to obtain a copy of this work. The book is being distributed by the Hydrated Lime Bureau of the National Lime Manufacturers’ Association, Arrott Building, Pittsburgh, Pa., at thirty cents per copy.
Fire and Water Cannot Harm

The walls of the First Congregational Church of Newton, Iowa, on February 19, 1917, survived one of the worst fires in the history of that city—**because its walls were covered with genuine Kellastone** (Imperishable Stucco).

Cold water from the fireman’s hose turned full force on the baking hot building failed to crack the surface. For Kellastone is composed of the most fire-resistant, waterproof elastic material known.

And furthermore—Kellastone is not mixed with water, but combined with a special mixing compound which itself renders fireproof all wood it saturates. Is there any wonder that the fire-resisting properties of economical Kellastone are not surpassed by brick, cement, stone or tile?

**Let Us Send You the Story of Kellastone**

This book also tells of Kellastone Composition Flooring, which resists abrasion, deadens noise and is without seam or joint.

**The National Kellastone Co.**

Build with Beaver Brick

Beauty and permanence of construction can be obtained with this brick at a cost but slightly greater than for frame.

Well-burned face brick is universally recognized as the most beautiful and durable building material in existence, and the advantages of brick construction are many.

- Brick homes are practically indestructible. Insurance rates are low and the cost of upkeep such as painting and repairs are reduced to a minimum.
- Houses of brick maintain an even temperature at all times. Cool in summer and warm in winter.

Beaver Brick is made in a variety of colors and textures. Beaver Clay, Turkestan Vertex and Volcanic Extreme Rough Texture represent the best in facing brick. Our catalog shows them in their natural colors.

SALES OFFICES IN ALL CITIES

The following literature, dealing with subjects of interest to builders, has recently been sent in.

"Store Fronts by the Brasco Man" is the title of an attractive booklet of 16 pages, 5 by 9 inches, which presents in an interesting manner the essential features of the Hester and Brasco Systems of store fronts of the Brasco Manufacturing Company, 1451 Michigan Avenue, Chicago, Ill.

A collection of Denison Interlocking Tile Details is contained in a very handy booklet 5½ by 7¼ inches, containing 32 detail plates, prepared for the guidance of contractors by The Interstate Clay Products Company, Guardian Building, Cleveland, Ohio.

An Architectural Monograph on a White Pine House, competitive drawings with the report of the jury architects is Number 4, Volume III, of the interesting and instructive series of architectural monographs being published by the White Pine Bureau, St. Paul, Minn.

Cem-Bric Covering Compound, the new floor covering compound of the Ceresit Waterproofing Company, Chicago, Ill., is described in an 8-page leaflet, 3½ by 7¼ inches.

Grinding and polishing machinery manufactured by The Webster and Perks Tool Company, Springfield, Ohio, is carefully illustrated and described in their loose-leaf catalog, 9 by 11 inches.

The characteristics of California Redwood which determine its usefulness as a material for the construction of homes, engineering structures and for special uses are noted in three booklets 6 by 9 inches, by the California Redwood Association, San Francisco, Cal.

The solution of hoisting problems is greatly facilitated by the use of the Handbook of Hoisting Machinery for Industrial Works issued by the Shepard Electric Crane and Hoist Company, Montour Falls, New York. This is a loose-leaf book, 8 by 5 inches.

The Grinnell Automatic Sprinkler Bulletin for July, 1917, is a food conservation number which points out in a graphical manner the danger of insufficient protection from fire of foodstuffs. The bulletin contains 20 pages, 7¼ by 10½ inches, published by General Fire Extinguisher Company, 277 West Exchange St., Providence, R. I.
Have You the Data

on this approved modern method for saving much of the cost of structural steel and foundations?

Long Span Floor Construction

with

NATCO HOLLOW TILE

In the use of NATCO Hollow Tile, you are offered a sure and safe way to lessen the dead load, the requirements for support in structural steel and foundations and at the same time conserve the maximum strength. Girders or pipes may be concealed in this form of floor construction by a very slight increase in thickness and dead load.

You have opportunity also to provide a floor of unusual sound deadening properties, of quick erection and the very desirable flat ceiling with its scored surface for plastering and better reflection of light.

NATCO's structural strength withstands better than similar types of construction, the knocks and shocks incident to building operations both before and while it is being placed in floor.

All the data needed with enlightening figures on comparative tests are in our new book, which we will gladly send to any Architect or Engineer upon request. Write today for our Bulletin No. 171.

Possibilities of the Steel Square
SHOWING HOW TO FORM A BRACE TO REST AT ANY POSITION FROM A POST—RELATIVE TREATMENT OF BRACE AND HIP

By A. W. Woods

To cut a brace with the aid of the steel square to fit against the side of a vertical post or wall is a very simple matter; but suppose the brace is set off to one side so as to intersect the post or wall at an oblique angle, then that presents a different problem and one that will tax the ingenuity of most men to know just how to place the square to get the required length and cuts for the brace.

In the case of the straight brace it requires but one placing of the square to get the cut across the side of the brace and the proportion to use on the square is the run and rise given the brace, which is just the same as for common rafter; that is, while one arm of the square gives the angle for the seat cut, the other arm will give the angle for the plumb cut to fit against the post or wall; and the distance between the figures taken from one arm to the other will represent by scale the required length of the brace.

But when the brace is set obliquely to the post it is not so simple as additional calculations must be made before a correct solution can be arrived at, as will be seen by referring to the illustration. In this case AC represents the run of the brace and AB its rise; but in order to arrive at the former it is necessary to take into consideration what the run of the (Continued to page 114.)

Build With Belden Brick
—On the basis that brick houses make for a higher standard of construction and therefore more good work and more profit to you.
—With the knowledge that once you are familiar with brick construction you can make more money building brick houses than any other kind.
—With the absolute conviction that "Belden Brick" represent the biggest value you can buy and that we are prepared to give you the kind of service you want.

We appeal to you to investigate carefully brick house construction.

Direct from the Manufacturer
We have dealers in hundreds of cities and towns in the United States and Canada at the present time. We ask you to write for samples and prices and the name of our nearest dealer. Belden Brick are made in five modern factories and come in all colors, shapes and sizes, and in all textures rough and smooth. We have the very brick you are looking for, be it house, bungalow, garage, theater, store, bank, church, school, library or office building.

(Continued from page 112.)

cuts for the brace, but there is still another cut to get and is the real sticker in the case. This requires some more planning and to get it we must once more go off into the seemingly unseen proportions, so here we go off at right angle from A C to E, which is on a line with the side of the post. Now, then, C E taken on one arm of the square and C B on the other will give the required top cut of the brace to fit against the side of the post, the side on which the latter is taken will give the cut.

In case of the straight brace set square out from the post only one triangle is required to obtain the cuts; but in case of the brace set off to one side it is necessary to use this angle as a starting point to form the other angles required, of which there are four; in arriving at the proper angle for the top cut of the brace, which is found in the angle bounded by B C E, the side of the square on which B C is taken will give the cut.

Of course in actual practice it is not necessary to lay out all of these angles to arrive at what is wanted, but it is necessary that their relation to one another should be understood in order to readily solve problems of this kind.

In Fig. 2 is shown the layout of these angles and by making a half fold on the lines A C, A D and B D we will have a perfect model in the solid of all the parts that enter into the problem. Like letters are used in both illustrations for like parts and by a comparison of the two we trust one will have no trouble in understanding the relative position of one to the other.

To some this may seem like a nonsensical problem and not likely to ever come up in actual practice,
More and more people are demanding brick houses because of their beauty, comfort, safety against fire and economy against depreciation. Permanent building is a vital part of national thrift.

You can easily become an expert in building with brick and increase your profits by reading the brick section of the American Builder. Furthermore, every Hy-tex office is at your service.

but if the reader will stop to think a minute he will discover that the brace we have been talking about is the same as for a hip in a roof of unequal pitch.

If $AD$ and $ED$ were of the same length then the brace would be the same as for a hip in an equal pitched roof and should be treated as such. This seems simple enough, but how many are there that would think of associating the brace in connection with the treatment of a hip?

**Swiss Factory Duplicated in America**

Desiring to establish in America a replica of its plant in Switzerland, a Swiss watch company has by landscape gardening and reproducing the plans of its Alpine factory succeeded in duplicating the entire scene in Switzerland, even to the minutest detail of importing the beloved edelweiss and more than 200 other plants and shrubs from the Alpine mountains.

This rare bit of architecture and Swiss gardening is located in Cincinnati and $8,000 was spent in transforming an unsightly rocky hillside into this fascinating bit of scenery in Switzerland.

In duplicating the original factory and its surroundings, over a hundred detail photographs of the plant in Switzerland were studied and worked out. The building plans were those used in building the original building.

J. R. SCHMIDT.
Herringbone lath saves time—saves labor, lath and money

For Herringbone Lath is exceptionally rigid. Its rigidity is due to the heavy longitudinal ribs set at an angle of 45 degrees to the plane of the lath. This rigidity means quick, easy handling and erection. It means that the lather and plasterer require less time to do their work. Thus a good part of the money, which ordinarily would be paid out to them, stays in the contractor's bank.

Herringbone—rigid metal lath made

Herringbone Rigidity also prevents buckling and sagging. It insures a uniform thickness of plaster. No depressions to be filled out, no elevations with which the wall must be leveled, and which often require as much as 10% additional plaster.

Herringbone also saves in the lath itself. For the selvedge form of the Herringbone edges interlock, making it unnecessary to lap the lath, saving that waste as well as reducing materially the cost of lacing the sheets together.

The slanting ribs and flat strands prevent plaster from dropping down behind the lath. Just enough plaster passes through to curl around and completely cover the lath, thus forming a perfect "key." The plaster clinches the lath and the lath clinches the plaster in an unbreakable grip.

In a word, Herringbone Rigid Metal Lath saves you money at every turn. You give the customer an economical, long-lasting, fireproof, moisture-proof, vermin-proof, sanitary plaster job. If you wish more complete information about Herringbone Rigid Metal Lath write us for the Herringbone Catalog.

NEWS OF THE FIELD

Whipperman Called to Serve Uncle Sam

Having accepted a commission as captain in the United States Army and having been assigned to the command of Company C Sixth Nebraska Infantry, which is a part of one of the regiments ordered south at an early date, Frank Whipperman has handed in his resignation as president of the Mid-West Cement Users' Association.

Mr. Whipperman has established an enviable record with the association both as its secretary-treasurer and later as its president. He has built a wide circle of friends among his business associates, the members of the association and everywhere that his influence has been felt, who all will be interested in following his military career. They join him in his wish that when his services are no longer needed by his country, he will again take up the activities of the association.

Safety and Sanitation Congress

In view of the changed conditions that are being brought about in numerous factories by the National draft, the matter of safety of employes, especially novices who are to take the places of those who enlist, has become a national problem of considerable importance, and with this idea foremost in mind, a huge Safety and Sanitation Congress has been called to take place in New York City, Sept. 10-15. It will be the largest congress of this nature ever held, and delegates from all over the world will attend to discuss matters pertaining to the promotion and standardization of safety methods in factories, railroads, and the various industries in which hazardous occupations are found.

Coincident with the Congress there will be staged the largest Safety and Sanitation Exposition in history, three large floors of the Grand Central Palace being used for this. The National Safety Council and the American Museum of Safety will co-operate in staging this. Thousands of safety devices and demonstrations of accident prevention will be on view. The exposition will be open to the public for one week, and it is expected that it will result in at least a thousand new members being enrolled who will promise to conform to standards urged by the Council.

Speed in Army Camp Work

When the rush is over and the men have a minute to talk there will be many stories of wonderful record breaking accomplishments in the greatest building program ever undertaken by any person or government in the history of the world—that is the building of the new army camps or cantonments.

The Archer Iron Works told our representative a story of a little side issue speed the other day that is interesting in showing how every one is trying to do his part in getting the country prepared for war.

As Mr. Scannell tells the story, "At 11:40 a.m. July 31, we received the following telegram from Henry Monk of Pensacola, Fla.: 'How soon can you supply and deliver one (Continued to page 120.)
"A Man and a Half"

is the man provided with a G-E motor driven machine. Close the switch and in an instant the machine is up to speed. The turn of a controller handle gives varying speed where required.

For heavy work nothing equals the steady, willing power of the electric motor.

G-E motors never hesitate—they operate for years with only an occasional oiling.

Ask your electric power company or our nearest motor agency about G-E motors for your shop.

bag Archer concrete mixer?" Mr. Monk had owned and used an Archer for over a year, so he knew what the machine would save him in time.

"We wired back: 'Can ship immediately if necessary.'

"At 3:38 p.m. we received his answer: 'Ship immediately fast freight one bag Archer Mixer for government camp work.'

"We instantly took all the men available and put them to work completing a one bag machine that was nearly done on another order. At 3:45 this was loaded on our truck and at 4:10—just one hour and 32 minutes after we received the order the mixer was on the car and as the freight was scheduled to leave at 5:00 it is certain that we broke some records in getting this machine to Mr. Monk.

Big Organization to Promote Use of Building Tile

E. R. Sturtevant, Secretary of the Hollow Building Tile Association, has recently opened offices in the Conway Building, Chicago, and is rapidly maturing plans for standardizing building practice with respect to structural tile, and for popularizing this worthy material still further among builders.

The Hollow Building Tile Association at the present time has as members sixty-five manufacturers, representing an annual output of 2,200,000 tons of material—in percentage about 90 per cent of the output of building tile. The membership extends from the Atlantic Coast to Texas. It is thoroly representative in its character and is organized along broad lines.

The manufacturers of tile united in the organization of this association because they realized the very great need for a central body which would do for the industry the things that needed to be done and which could not be done by the individual manufacturer.

Since the use of all materials in the larger cities is controlled by law, one of the most important problems confronting this association is building codes. They have established a building code department with John A. Ferguson, a trained engineer, in charge. He will work with and cooperate with building committees and building inspectors in all cities and states which are revising their codes.

The engineer in charge will also make investigations covering the fire-resistant qualities of tile to see that it is properly recognized by the fire underwriters.

Disston Issues Internal House Organ

Henry Disston & Sons, Inc., of Philadelphia, have inaugurated a monthly house organ for employees of the company. The title of the publication is "Disston Bits."

Paint Foundations

WHERE is the contractor who would for one instant consider a 1:8:12 concrete mix for foundations and footings? First principles require that enough first quality cement be mixed in to carry the load of other materials subsequently used to make up a building. Firm foundations and footings are obvious requirements. No one is going to build on top of drift sand. Neither will the careful contractor permit his buildings to be decorated inside or out until a substantial paint foundation of pure lead and linseed oil has been laid down. Paint failures are due nine times out of ten to having used hard, inelastic or inert pigments next to the wood or plaster. The first coat is always responsible for the success or failure of painting jobs. Seldom will any but pure lead and oil paint support the weight and pull of canvas, burp or muslin on walls. Seldom will any other paint form the elastic coating necessary to expand and contract with the wood when the temperature changes. See that your paint foundation is right and you have gone along way toward securing really serviceable painting. Pure white lead, linseed oil and a good painter have never been quite equalled for producing dependable, beautiful jobs. You should specify Carter Lead because it is conceded first place among many brands of pure white lead, because it is enough whiter to be a distinct advantage. It makes White jobs and clear, delicate tints. Real whiteness in white lead indicates purity.

"Ah, Here's the Real Thing at Last—and Low in Price!"

$2.75
Per Gal.

Takes the place of Shellac, Varnish and Lacquer for every purpose. Dries in three hours. Hardens overnight.

**Degrah** Cuts Down Your Carrying Costs

Pore-filling and Non-penetrating like SHELLAC. Tough, Glossy and Neutral like LACQUER. More Durable and Rubs Quicker than VARNISH. The most remarkable wood finish ever offered regardless of price—the result of 22 years of scientific thought and chemical experimentation. Made of degras (pronounced Degrah), the animal oil taken from sheep's wool combined with other high-class ingredients. The result is an entirely new and different product. Has longer life and greater elasticity than mineral or vegetable oil products.

Takes the place of Shellac, Lacquer and the following varnishes: Hard Oil Finish, Cabinet Rubbing, Finishing, Floor, Spar, Automobile and Carriage Varnish. Perfectly neutral for Brass or Copper. Makes a Bronze Liquid. Can be used directly over Hardwood Stains. Prevents penetrating stains from bleeding. Equally good for both interior and exterior use. Transparent and smooths out like glass. Two coats do the work of a coat of shellac or filler and three of any varnish selling at the same price.

Apply it one day. Sandpaper it and apply more—or Rub or Polish it the next morning. Also comes in DEGRAH Enamel Varnish, and DEGRAH White Enamel.

You Can Take Hills On High Without A Knock

If you will keep your motor free from carbon. That knocking in your engine—the difficulty you have climbing hills—poor pick-up—lack of power—noisy motor—pre-ignition—in fact 80% of engine trouble is caused by carbon. Clean it out with

JOHNSON'S

CARBON REMOVER

and your engine will run like it did the first 500 miles, quietly and full of “pep”. And your gasoline consumption will drop from 12% to 20%.

You Can Do It Yourself

For 25c—five minutes’ time—and with no labor you, yourself, can remove all carbon deposits. Simply pour an ounce of Johnson’s Carbon Remover into each cylinder—allow it to remain from two to twelve hours and then drive your car 10 or 15 miles. You will be surprised at the wonderful improvement.

How It Works

Johnson’s Carbon Remover does not eat the carbon, but releases it from the metal and softens it into a jelly-like, inflammable mass. Then, as the engine is operated, the mass burns, pulverizes and is blown out with the exhaust in powder form.

Use It Every 1,000 Miles

If you will use Johnson’s Carbon Remover at regular intervals, giving carbon no chance to accumulate, you will automatically eliminate most valve trouble and your engine will always be at its highest efficiency.

If your dealer cannot supply you with Johnson’s Carbon Remover use attached coupon.

Advertising Is Not a Waste

Figures Given Out by the Association of National Advertisers Show Low Percentages of Advertising Costs when Compared with Gross Receipts

The favorite plaint of the business man who has fallen asleep by the wayside is that advertising is a huge economic waste; that millions of dollars are spent and wasted in artificial attempts to stimulate selling to the ultimate injury of both buyer and seller. At first glance, and to the man who has not really studied the subject, this argument may appear logical. The only trouble with the logic is that it does not square with the facts. Most people know more things that are not so about this subject than any other under the sun.

"Let us see how much the big advertisers spend," says Alan C. Reiley, president of the Association of National Advertisers, in discussing this matter. "The average man hears talk every day about the millions and millions spent for advertising, and he finally gets the notion that somehow or other the buyer has got to pay for it.

"I wonder if Mr. Average Man ever stops to realize that those millions spent in advertising sell hundreds of millions worth of goods—goods that could never be sold so cheaply in any other way. And it is this immense saving in selling cost that helps to make lower-priced goods.

"Millions spent for advertising" sounds big, but ‘hundreds of millions worth of goods sold by advertising’ makes the actual amount spent for advertising look small.

"What is the exact ratio of advertising to sales anyhow? This is something that every buyer would like to know.

"I am glad to be able to tell the public. The Association of National Advertisers has collected some valuable facts and figures on this subject. Listen to a few of them:

"The advertising of one of the leading paint manufacturers of the country averages 3½ per cent of their total sales. In other words, for every dollar’s worth of paint they sell, they spend 3½ cents in advertising. This is about equivalent to the price of a postage stamp and a cent’s worth of paper for every dollar’s worth of goods sold. Another big paint and varnish manufacturer spends from 3% to 4% per cent.

"Next, take clothing. We have obtained figures concerning two of the biggest clothing manufacturers in the country. One spends 1½ per cent, the other 2 per cent. An equally prominent shoe manufacturer spends 1½ per cent.

"But shoes and clothing are necessities, you may say. "How about the luxuries?"

"All right! Take one of the most popular luxuries in the world—candy. One of the best known candy makers in the country and one of the biggest advertisers, spends 5 per cent.

"Then take the big automobile and tire manufacturers with their full page and double page spreads. Surely now the percentage figures will begin to jump. Will they?

"You will be surprised when I give you the figures for two of the most famous automobile builders in the country. One is 2 per cent, the other is 3 per cent. Also two of the leading tire manufacturers: one spends 2 per cent, the other 2 per cent. And all four rank among the biggest advertisers in the country.

"These figures are authentic, and when you consider the enormous volume of the automobile and tire business you will see that the small percentages are ample to provide for the wonderful publicity.

"The fact is that the great majority of all nationally-advertised articles—articles which are familiarly known in every home in the country, which are famous for their quality as well as their immense distribution, belong in the 5 per cent or under class.

*Ck-continued to page 124.*
The Devoe Formula tells the whole story and guarantees the Purity and your Satisfaction:

PURE WHITE LEAD
PURE WHITE ZINC
PURE LINSEED OIL
PURE TURPENTINE

—AND NOTHING ELSE

Nothing else? Just pure paint—100% paint—paint to the last drop in the can. No barytes, no whiting, no silica, no clay or other worthless "extenders" that add weight without worth.

These "extenders" may look like lead and zinc but they only make "half-paint" paint. DEVOE is all paint.

Builders know

that even the moderate priced home needs more than one bathroom. The guest room, with its private bath, has become almost a necessity.

Then there should be an extra bathroom for the children. Because of its beauty and hygienic construction, builders are choosing

**KOHLER WARE**

*always one quality—the highest*

Our manufacturing economies enable us to make KOHLER WARE available for homes of all classes, from the modest cottage up.

KOHLER WARE is first choice for the finest residences, apartments and hotels. All modern patterns.

"It's in the Kohler Enamel"

The "Viceroy," our special one-piece built-in bath, is the most popular tub of its type ever constructed. Be sure to see it.

Every KOHLER product has our permanent trade-mark in the enamel. It is a guarantee of first quality.

Write for free copy of our interesting book, "KOHLER OF KOHLER." It contains much useful information for builders.

KOHLER CO., Kohler, Wis.

* The star indicates the location of the KOHLER permanent trade-mark in this blue.

(Continued to page 126.)

"And let this final point be remembered. Even if this advertising represented a direct advance on what the buyer would otherwise have to pay, this would make little difference in the price of the goods. But it does not. And why not? Because advertising is the most efficient method of marketing ever developed by business enterprise—therefore its effect is to decrease and not to increase the sum total of selling cost. This is a simple fact about advertising that every buyer of advertised goods ought to know."

**Stewart Now Firm Name in Concrete Machinery Field**

In the announcement of the organization of the Stewart Manufacturing Company as successors to The Cement Tile Machinery Company at 46 Rath Street, Waterloo, Iowa, is found the entrance, as a brand for a line of concrete machinery, of a name which has been intimately associated with the concrete machinery business for fourteen years. The new firm name is, then, really new only as a name, since it designates a firm of established reputation and long experience in this field.

The Stewart mixer is a new model built along old principles which have been tried and proved correct. In addition to the mixers, the firm will build block machines, block tampers, sand screens, sand elevators, tile cars, block cars, brick cars, dump cars and transfer cars.

**New Redwood Books Issued**

The California Redwood Association has started the development of a "builder's library" of publications to show the advantages of redwood for various types of buildings. Among the first of the publications, which are all being illustrated with actual buildings of the types described, is one on the redwood homes. The redwoods were, many of them, sturdy saplings at the time of the birth of Christ, and grow nowhere else than on the Pacific California coast. They are said by scientists to be a relic of the prehistoric vegetation, which flourished with the mammoths, and the five-toed horses. Another volume is on specialty uses, such as refrigerator insulation, coffins, incubators, pipe organs and the like. Another volume is on finishes of redwood, and still another on the use of redwood on the farm.

**Re-inforced Concrete Ships—Why Not?**

Concrete Barges in Successful Use for Years Show That Similar Methods Might be Used for Ship Building

The problem that confronts our country of increasing the merchant marine requires the consideration of every possible method or material of construction. Several prominent engineers have suggested reinforced concrete.

A San Francisco paper mentioned in a recent issue the interesting fact that a local firm of engineers was designing a ship with a length of 330 feet, a beam 44 feet and a depth of 31 feet, with a capacity of 4500 tons—to be built of reinforced concrete. This is not something new—a concrete schooner was employed for some years in the north Atlantic coasting trade, having been constructed in about 1898. The London Times mentions a small boat of reinforced concrete built by a Frenchman in 1849 and still in service after a test of 68 years.

The concrete ship is only a further development of the concrete barge and such craft have been in successful use for years. Concrete lighters have been used for the past six years on Chesapeake Bay, supplying coal and water to dredges, carrying loads of sand and gravel, etc., and the ac-
Garage Door Hangers

Porter Swiveled Door Hangers with Ball Bearings
Insure Easiest Operation and Give Most Space for Automobiles in Opening or Closing

The modern garage requires door fixtures differing from those used in other buildings. Porter Garage Door fixtures make practical application of sliding doors to any garage. Ordinary sliding doors are impractical. Porter fixtures allow opening the full width of the garage without support post.

Reinforced Concrete Barge of the Type Expected to Solve Our Shipping Problems.

(Continued from page 124.)

companying illustration of a 500-ton lighter on the ways just before launching is typical of their appearance. With such a craft there is no necessity for caulking or painting, the upkeep is small and there is no danger of decay. Barnacles will not collect on a concrete hull.

A concrete barge has been in service on the Welland Canal since 1910 and has seen very hard usage. It has a length of 80 feet, a beam of 24 feet and is 7 feet deep. It is interesting that the walls which were constructed between forms are 2½ inches thick, reinforced with steel rods, yet the barge is used for carrying loads of stone, etc., with conspicuous success.

Since 1910 reinforced concrete barges have been built for use on the various sections of the Panama Canal and their experience has enabled the engineers to develop a very efficient type of vessel. Recently concrete pontoons were constructed for service as landing stages for boats up to 65 feet in length. These pontoons have a length of 120 feet, a beam of 28 feet and are 8 feet deep. They are very thoroly reinforced.

Vessels which are more like ships than barges have been built of reinforced concrete in Norway. A report from the American Consul General at Christiana describes a plant at Moss, Norway, where vessels of 3000 tons displacement are being constructed. The following quotations from the report indicate the extent of the work under way at that time:

"The inventor of this new style of vessel is said to be M. Nicolai Fougner, an engineer, who claims to be able to construct a ship of any size demanded. He is now building a lighter for a mining company at Sydvaranger for the overseas export of iron ore and the import of coal. The vessel, having

Get LOUDEN Plans

Louden service enables you carpenters and builders to outstrip your competitors by giving you practical, expert, authoritative plans, costs and advice on modern barn building. We plan better barns because of our fifty years experience as agricultural architects.

LOUDEN Service Lands Contracts

Every farmer knows Louden. For fifty years Louden has led the world in barn building and equipping. He has assembled a staff of America’s best farm-agricultural talent. The services of this Agricultural Department are at your command. Lay your barn problems before it. We make no charge for advice or preliminary sketches. Complete working plans and material specifications are supplied at a very modest fee.

Send us the names of farmers in your locality who need new or bigger barns. We will co-operate with you in getting them started.

"LOUDEN BARN PLANS"—Write for It—No Charge

This 112-page book is free to carpenters and builders. Contains 74 representative plans for cow and horse barns, hog houses and farm buildings, with full description and estimated costs. Also expert advice on grading, drainage, concrete work, framing, strength of materials, lighting, ventilating and all other barn problems. Write for it today.

Specify LOUDEN Barn Equipment

To insure satisfied customers and more firmly establish your reputation as a barn builder, suggest Louden equipment throughout every barn you build.

Louden equipment is the recognized standard equipment, in use in over a million barns, including many U. S. and State Government barns. 224-page Catalog showing full Louden line sent on request.

WHEN WRITING ADVERTISERS PLEASE MENTION THE AMERICAN BUILDER
There Is Only One System of Garbage and Waste Disposal

IT IS THE
KERNERATOR
The Built-In-the-Chimney INCINERATOR SYSTEM

This equipment is designed for the builder who wants to install the cleanest, quickest and cheapest equipment for the complete instantaneous elimination of garbage and waste.

Cleanest—because the garbage is burned to cinders by a method that also renders the wastage odorless. Garbage cans and rubbish piles with their flies, vermin and the like are eliminated (as the incinerator is located out of the way in the cellar). All waste including tin cans, garbage, broken crockery—everything that is not wanted, disappears forever through the little door in the kitchen.

Quickest—because as soon as waste accumulates it is placed in the hopper door shown above and falls down the flue to the incinerator in the basement.

Cheapest—because its first cost is its last. No commercial fuel is required. The garbage “consumes itself” when ignited, as there is plenty of paper, rags and other dry combustible material to burn and to dry out moisture in garbage, which, when dried, is readily combustible and burns to harmless ashes. Garbage haulage is eliminated.

Consider This, Mr. Contractor

Satisfied clients are your greatest asset. If you show them a way of eliminating all garbage and waste, without a penny of expense other than the nominal first cost, you will have solved for them one of their most disagreeable and annoying problems. No one wants garbage cans and waste piles around their homes. Here is a simple, efficient and economical method of eliminating these intolerable and unhealthful nuisances.

Your buildings will be more desirable than any others in your community. Your clients will be grateful.

Send for our two big books which describe the Kernerator completely and state what users have to say about them.

a displacement of 3,000 tons, is to be ready before the end of the current year. It is stated that these concrete ships can be sailed or engined like other vessels, and experts consider that a new epoch in shipbuilding has arrived.

“The ship, which arrived in Christiana last month, resembles a large barge, and is constructed entirely of concrete with the exception of the ribs, which are of steel. This new method of constructing ships has attracted much attention. The Swedish Minister of Marine, M. Brostrom, one of Sweden's largest shipowners, immediately ordered a lighter of some thousand tons displacement, and he was present when the craft was launched at Moss. He was accompanied by four experts, all of whom expressed much satisfaction at the result.

“Two other lighters are now on the stocks, and a large ship for a 4,000-ton craft is nearly completed. More than 200 men are now working in the new yards, and five lighters have been contracted for in addition to the one completed and the two on the slips.”

In view of such examples proving the usefulness of concrete vessels of this character, it would seem wise to consider concrete in the construction of ships which are to increase our merchant marine to the proportions demanded by the present requirements. If sea-going barges were to be constructed, or smaller craft suitable for lake traffic, this would release for other purposes many ships now in use in this capacity. The presence of the necessary materials for a concrete vessel at so many convenient locations would make it possible to provide a large tonnage, and progress in construction would be faster than with ships of steel or even wood.

The subject is certainly one worthy of serious consideration on the part of the Shipping Board in connection with their present program of ship construction.

Pushing Sale of Brick by Proper Display

(Continued from page 80.)
important factor. The American Builder staff has had occasion to note, in frequent journeyings up and down the land, that the dealers who do a nice business in building bricks invariably have gone to the trouble and expense of fitting up their rooms with a nice display; a display showing the bricks all laid in real mortar, a neat panel for each style of brick, so that the customer could easily see just exactly how any particular brick would look when laid in the wall.

We have collected photographs of a number of these displays, showing how these are arranged and the problem handled in the offices of some of the prominent dealers. The photo presented here shows the display of the Cleveland dealers at the Complete Building Show. It is rich in ideas for the firm wanting an elaborate display.

Lumber and building material dealers who have never gone into the brick line very extensively, but who want to get in and take advantage of the strong tide of popularity that is now setting brickward, will do themselves a good turn by acting on this suggestion. It is not enough to have just a few sample bricks tucked away somewhere in a corner to be dragged out and dusted off. Get into the game and go after the business and be ready for it with a winning display when you get your prospect into your office.
The Sultan Saw Rig Outfit HELPED TO BUILD FORT RILEY. When the big rush came the Sultan Saw rig was first on the job. The first order came “SHIP BY EXPRESS SIX NINE HORSE POWER SULTAN SAW RIGS WITH SIXTEEN INCH RIP SAWS. GIVE US THE MOST POWERFUL SAW RIGS MADE.” so we shipped the Big 3-B rigs with Special Heavy mountings and 9 H. P. Sultan Engines. Second order followed for same kind of rigs by express and so has the Sultan proved useful when millions of feet of lumber must be cut to hurry construction.

great changes in temperature during the day and night. It should be located in sandy soil if possible and on rolling ground so as to fit in the general plan of farm routine. An open, sunny space is advisable so as to have the direct sunlight reach all parts of the building. A southern slope has the advantage of warmth, dryness and natural air drainage. Convenient pasture and shade should be provided for, but the heavy shade of trees or buildings should be avoided in locating the house.

"In Fig. 3A, as shown, the foundations are of concrete with footings extending below danger from heaving by frost. The footings in this case are 18 inches wide and 12 inches deep. The foundation wall is 12 inches thick and 2 feet 6 inches from the bottom of the floor to the top of the footing. This same foundation would be advisable if the walls were entirely of frame construction instead of concrete and frame.

"The concrete for the footings and foundation walls should be of a mixture of at least 1 part Portland cement, 2½ parts clean sand and 5 parts of crushed stone or screened gravel.

"The side and end walls may be of 1:2:4 concrete 8 inches in thickness, or of 2-inch by 4-inch stock or heavier if of frame. Frame walls should be substantial, close and warm. They may be single in the smaller buildings, but in larger buildings such as shown should be made double, either by siding up both the inside and outside of the studs, or by putting on a double outside layer with building paper or felt between the layers. Good results in a double wall may be obtained by using shiplap for the inner boards and drop-siding for the outer surface.

"If the south or pen-side wall is of frame construction in the building shown, the sills and plates should be of 2-inch by 6-inch stock; if it is of concrete, 2-inch by 8-inch material will be needed. A 2-inch by 8-inch ribbon is used to receive the rafters of the low part, while two plates made of 4-inch by 6-inch stock support the rafters of the higher part of the building, and two pieces of 2-inch by 8-inch are used for the plate on the concrete wall. The middle wall containing windows over the low roof consists of 4-inch by 4-inch posts spaced 6 feet apart, and sheeted between the windows.

"The roof consists of 2-inch by 4-inch or 2-inch by 6-inch rafters, spaced from 18 to 24 inches apart, depending upon the load to be carried and length of span between supports. In Fig. 3A the rafters are 2 inches by 4 inches in size, spaced 24 inches on centers, and are supported at the wall plates and by an interior girder held at the top of a row of 4-inch by 4-inch posts spaced 6 feet apart, as in the wall just at the right hand.

"The roof covering may be wood shingles or pre-

(Continued to page 132.)

How about FALL business?

Milwaukee, Wis.

Consult, free, our expert service bureau on all your heating installations.

pared roofing, as was the case in Fig. 3A. The underside of the roof may be sheathed with wood or covered with wall board. Calculations for the size of rafters will be shown later.

"Earth floors, which were commonly used in the old type of hog house, have been replaced by wood or concrete, or a combination of both for sanitary reasons. In a permanent building the earth floor is decidedly insanitary and its use should be avoided. Brick and concrete have been used, but in many cases have been found to be so cold that young pigs could not live upon them.

"Wood floors in the form of creosoted wood blocks, or planks joined together in sections so that they can be removed for cleaning, have been found to give good service when laid on a concrete base. Creosoted flooring, or the creosote brush treatment of both floors and walls, is a sanitary measure and adds to the durability of the wood. The floor of the central passage between pens, or the driveway if the building is large enough to allow one, should be made of concrete or concrete covered with creosoted wood blocks. This central passage should be provided with drain tile beneath the floor to carry the drainage away from the pens. The floors of the pens in Fig. 3A slope to the edges of the central passage, where shallow water drains are provided.

"If a plain concrete floor is used it should be about 4 inches thick and composed of a mixture of 1 part Portland cement, 2½ parts clean sand, and 5 parts crushed stone or screened gravel, as in the case of the foundations. If a wearing surface of concrete is desired, it should be about 1 inch in thickness and composed of 1 part of Portland cement and 2 parts clean sand. This should be laid as soon as possible after the base is placed and before the base has had a chance to become thoroughly dried out or dirty.

"If a wearing surface of creosoted wood blocks is to be used, the thickness of the concrete base need be only 3 inches. The 2½-inch size of wood blocks is sufficient for this type of floor.

"Houses should have an abundance of light and good ventilation. In Fig. 3A the windows in the upper part of the central wall and also in the pen-side wall at the right are placed very close together so as to obtain both light and air. The upper line of windows are of the swinging type and aid in the ventilation of the building.

"Two roof ventilators are used in addition to the windows. One of these is located near each end of the building, with the lower ends about 2 feet above the floor and the upper ends just above the comb of the roof. These ventilators may be either round or square, but should be of at least 36 square inches inside area. This might be obtained by using a 6-inch by 6-inch square passage, or about an 8-inch diameter pipe.
HOLLAND FURNACES
Make Warm Friends
Ask Any Owner

Yes—ask any owner of a Holland Furnace.

Hear what he has to say about how warm it keeps his whole house—how warm it keeps the floors—what perfect ventilation it provides—how much it saves in fuel. You will then readily understand why Holland Furnaces make warm friends everywhere. The lucky owner of a Holland Furnace regards it literally as the heart of his home. It insures a warm, healthful, cozy home—the kind of home that keeps the family circle together. Investigate the merits of the Holland Furnace and you will understand why more than thirty thousand owners declare it to be the best and most economical heating plant that can be installed in a home.

Holland "Boosters"
Also Make Warm Friends

Your recommendation, Mr. Contractor, goes a long way in the final selection of any special kind of material, appliance or fixture for the home. And your reputation and success depend very largely upon the degree of satisfaction the home owner derives from your recommendations.

You can conscientiously recommend the Holland Warm Air Furnace. You know, because you have given the subject of heating plants close study, and also because scientists have proved it, that warm, moist air, such as the Holland Furnace supplies, is the most healthful heat that can be had. You know that it costs less to install a warm air furnace than any other kind of a heating plant and that it is the most economical to operate. Your recommendation of Holland Furnaces will make you friends. Not only does a Holland Furnace insure an abundant supply of heat in even the coldest weather at the smallest cost, but it invariably enhances the value of the house in which it is installed. Our Holland Service Home Comfort Bond is the strongest guarantee ever given with any heating plant. Free heating plans. Send your floor plan.

Special Proposition to Contractors and Builders

Holland Furnaces are not installed by dealers. We have our own special representatives who have made a study of the Holland Furnace and who make a regular business of installing it. We have a very special proposition which we would like to submit to you. It is a proposition which means increased prestige and more business for you. Let us submit this proposition in detail to you. Mail the coupon for full particulars. This places you under no obligation of any kind whatsoever. Just sign and mail coupon today.

WHEN WRITING ADVERTISERS PLEASE MENTION THE AMERICAN BUILDER
(Continued from page 134.)

The interior arrangement shows a line of pens on each side of the center passage. These are divided by movable wooden partitions spaced 6 feet apart in this building and held in place by the 4-inch by 4-inch posts shown at each side of the passage. Pens 6 feet by 8 feet are a good size unless feeding is to be done inside, when they should be made a little longer. Small sows do not require so much room as large ones and it may be advisable to make a part of the pens 5 feet by 8 feet.

Partitions should be tight at the floor and for 10 or 12 inches above to keep young pigs from crawling thru and to protect them from sows in neighboring pens. Above the first 10 or 12 inches the partitions should be open enough so that the hogs can see out. All partitions should be 30 to 36 inches high. Alley gates should be removable by lifting out.

The hog doors opening into the pen or yard should be 22 or 23 inches wide and 30 to 31 inches high in the clear.

Pig rails or guard rails for the protection of young pigs should be placed on the inside of the pen from 6 inches to 10 inches from the floor, and should stand out 6 or 8 inches from the wall.

If we assume that the dead load, snow load and wind load on a roof of the type shown in Fig. 3A is approximately 30 pounds per square foot of roof surface for a building in a temperate climate having average snowfall, and that yellow pine timber is to be used with an allowable working strength in bending of 1,000 pounds per square inch, we can find the size of the material needed for the rafters, knowing their length of clear span. We will use our ordinary beam formula which we used in the last talk.

Measuring up the section shown in Fig. 3A, we find that the greatest length of projection of rafter down onto a horizontal line at the floor is about 8 feet. We will use this for the value of \( l \) in \( M = \frac{1}{2} W l \), where \( W \) will be the total load carried by the span of rafter which we are considering. If the length of rafter on the left from plate to girder is 10 feet, and the rafters are spaced 2 feet apart and loaded with 30 pounds per square foot of roof, this total load will be \( 10 \times 2 \times 30 = 600 \) pounds.

Then filling in our formula, \[ p = \frac{1}{e} M \], we have for a 2-inch thickness of stock,

\[
1,000 \times \frac{1}{12} \times 2 \times h^2 \quad \frac{h}{h+2} = \frac{1}{8} \times 600 \times 8 \times 12
\]

Solving,

\[
h^2 = 21 + \frac{h}{h+4} \text{ inches.}
\]

This would indicate that 2-inch by 4-inch yellow pine rafters spaced 2 feet on centers may be used if there is no danger of heavy snowfall.

THE GREAT BELL PIPELESS FURNACE

Father of Them All

We have thousands in use. Sizes, styles and prices to suit all. $38.00 to $94.00.

Made for the building where a furnace is needed, but where the cost has been prohibited.

The GREAT BELL PIPELESS FURNACE will heat any one or two-story building in the most efficient manner with the least effort and the lowest relative cost. While Cost is secondary to Service in this furnace, our methods of production and sales have reduced the cost so low that no builder can afford to overlook our proposition.

And we guarantee our furnaces to be and do all we claim for them in both catalog and correspondence. Write for our catalogs, describing the various styles, prices and specifications of the Great Bell Furnaces.

American Bell & Foundry Co.

27 Cody Street, Northville, Mich.
Big money in furnaces

Here is your chance to make good money in furnace installations. Installing Hero Pipeless Furnace means less work and more money. Less work because you have but one register to put in instead of some six or seven of them. More money because the first cost of the furnace is the lowest, consistent with heating efficiency and because of the labor and materials saved on installing.

Here is the BIG point—

You don't have to hire a furnace expert to put in the job for you. You can handle the whole proposition yourself. Just keep the furnace expert's share right in your own pocket and install the Hero yourself in a perfectly satisfactory manner.

We Have a Good Substantial Organization

Charles Smith Company has been manufacturing Hero Pipeless Furnaces for the past twenty-five years. We maintain a steadily growing business and have every facility for giving you first class service. Our engineers will aid you in choosing the most efficient type of furnace for each particular job. They will send you blue prints and advise you on the best installation method. All absolutely free.

We Give Liberal Commissions to Contractors

If you install one Hero Pipeless furnace you will be an enthusiastic Hero booster. If you want to work up a good healthy business in Hero Furnaces in connection with your regular work you will find us ready to give you every assistance to that end. We will appoint you our agent with a generous size territory—and a generous gratifying commission on each job installed.

Get a complete description of Hero Pipeless Furnaces by sending for our Catalog No. 1.

CHARLES SMITH COMPANY

57 West Lake Street :: :: CHICAGO, ILLINOIS
Figures Show That Now Is a Good Time to Build

(Continued from page 84.)

With these figures you can prove conclusively that cement and probably other building materials you handle have not shared equally in the general advance and that now is a good time to build.

Explain that first cost alone means little. If a factory or hog house produces returns 90 per cent greater today than in 1909, the wise investor will not hesitate at greater first cost; for his income from that investment will increase in greater proportion. The advance in prices of other commodities has made improvements all the more desirable.

If anybody tells you that he can’t afford to buy cement now and that the high price of cement is holding up work, use this information to convince him that the cost of cement is relatively not high.

The Man From the Lumber Yard

(Continued from page 40.)

The builder who is ambitious to do big things, not to overlook the little.

The plea I am making is for you to fit the house to the inhabitant.

The reason people, women especially, are often better suited in buying an old house than a new, is because they get a better fit in the old.

The builder should forget some things and remember when he is putting up a house for Mrs. Jones, that Mrs. Jones should be taken into account just as much as if she were having a bonnet made for her.

Place as Well as People

Even at the risk of your patience, I want to emphasize the fact that “place” must be taken into account as well as people.

This is illustrated quite well by two houses out in the suburb where I now live. One is a sprawling, spread-out building on a small lot that is entirely covered.

The adjacent buildings are two and two and a half stories which emphasizes the squattiness of the building.

In marked contrast is a tall spindling building in the center of large grounds. If the two buildings would swap locations, each would benefit.

It was not a matter of money. It was simply because these two jobs happened to be placed in the hands of two men who made a specialty, one of the low rambling type, and the other of the spindling type.

The house in the valley should not be built on the same lines as the one on the hill top.

Smile, You Crab, Smile!

Some may remember the bicycle face that was acquired some years since. All have read of the

(Continued to page 138.)

ON construction work of all kinds there is need for reliable power to speed up work.

Wherever there is material to hoist, water to pump or any other work requiring power, the Ideal Engines will deliver dividend paying service. They are designed essentially for this class of work.

Light weight for their power—therefore easy to move about. Vertical type, requiring small floor space. The enclosed crank case keeps the cylinder, piston and rings free from dust, dirt and grit.

Frost-proof, dirt-proof and fool-proof. Run with minimum care and attention. Need no engineer. Well balanced so that when mounted they run with practically no vibration. Equipped with a special carburetor, so arranged as to use warm air, which insures greater efficiency even in the coldest weather.

For complete details of the Ideal Engine, together with all information and special equipment for carpenters and builders, address

IDEAL ENGINE CO.

Chicago face—a face typical of hurry, possibly worry. An acquaintance recently spoke of the Methodist face as being solemn and forbidding. Being a Methodist, I resented the slur.

I fear that I have discovered the WAR face. I see it everywhere. In Chicago offices, among workmen on skyscrapers; in the smaller cities with employer and employe there is a knowing seriousness of expression. Men talk less in the cars and at the noon hour. They seem to think more, to meditate and ponder. There is much less of frivolity—less of haste—less of froth and more of substance. That is all right. We want thinkers in the building game, in driving nails, operating hoisting engines, wording specifications; but we must not forget how to smile.

An expansive smile lubricates greatly, bridges many an unpleasant chasm, aids digestion and will put meat on the bones.

Especially to the man who has to provide the payroll, supply the material and carry the load of details, to him whose face gets fixed in set lines, say, “smile, old top, smile.” Look for the humor that is to be found in every predicament. Anyone can smile when everything goes his way. Be superior to that. Smile when everything goes dead wrong.

Sand in the Soul or Sand in the Gear Box
I don’t embrace the opportunity of seeing many plays. My days are full, evenings also, and I see so much of real tragedy, real comedy and real life every day as I rub shoulder with my fellows that I don’t crave the “playing” to be seen on the stage.

Whether it is a wooden ham or a painted bunch of bananas or the best of acting, the unreal never equals the real.

However, many lessons can be learned from a good play. You probably have heard or heard of “The Man From Home,” played by Hodge.

His sayings were full of pith, but I remember only one: “don’t throw sand in the gear box.” There is a disposition on the part of so many when their nerves get a little on edge to be cantankerous and they throw into the machinery, gritty substance in place of oiling it.

Today the great majority of people who do big things and many who attempt only small things are under stress.

Old conditions and old precedents are badly upset. Builders of certain types of structures have nothing to do. Builders of other types are rushed to the breaking point.

When a stream is muddy at its source, it is quite likely to be cloudy all the way. If the head of an institution doesn’t keep sweet there is apt to be friction in every cog.

An employee does himself a gross injustice when
If Every Reader of The American Builder Who Builds of Frame Would Fill in This Coupon

We would know just what information to send you to enable you to build (any kind of building) of permanent, fire-resisting materials at the same cost as good frame construction. We believe every reader of the American Builder would prefer to use permanent, fire-resistive materials instead of frame, if he knew how and could do so profitably at the same cost. Hundreds of contractors are now doing it. So can you when you know how to use them as well as you know how to use the frame. We will show you how. Tell us in the coupon below why you do not use these modern materials. Is it because you do not know how to figure them? Because you do not know where to get them? Because you cannot get masons to do the work? Because the public does not want buildings so built? Or because you do not believe in such construction? Whatever your reasons are, please tell us in the coupon below, for we want you to help us reduce America's annual FIVE HUNDRED MILLION DOLLAR fire and depreciation loss.

BACK your building skill with the scientific knowledge of our barn experts.

“The James Way” Book gives the practical, helpful suggestions for better barns and barn equipment. It advises as to the best location. Basing its advice on drainage, ventilation and best distance from other buildings.

Complete Dairy Barn Information

From cover to cover “The James Way” is filled with the best, most modern dairy barn facts. Including blue print plans for complete barns, floors, windows, ventilation, etc. Showing James Barn Equipment the equipment used by thousands of dairymen and installed by leading builders everywhere.

Write for This Book TODAY!

Just send us the names of farmers who intend to build or remodel, and for how many cows. James's reputation added to your skill will do more to increase your income. Dairymen everywhere know the name “James” to stand for the best in barn equipment. Get in touch with us as quickly as possible. We have some barn information that will help you land jobs and beat competition. Write us now.

James Manufacturing Company
EB75 Cane Street, Ft. Atkinson, Wis. Elmira, N. Y.

he throws a monkey wrench into his employer's machinery.

A sneer, a suggestion that the boss is not on the square, urging a brother workman to make a kick on a fancied grievance, all these things clog the works and react.

The man that lays the material doesn't know the troubles of the man that pays the money.

The Kick Back

In northern Indiana a building was being put up under a bonus penalty contract, and a good workman from Cincinnati went onto the job.

He was one of the sort of fellows who thought it sport to turpentine a dog, who would go out of his way to step on a worm and lost no opportunity to stir up trouble. He made trouble on this job and got so many men at loggerheads that the contractor was shut off by his banker and pay was held up.

This man had a sickly wife and when the pay stopped for a while she was made quite ill. Mr. Trouble Maker's expenses at home were doubled.

Try as you may you can't get away from the proposition that as you sow so shall ye reap.

Sand in the Soul

But these are times when every ounce of grit a man has must be at his command. It doesn't take any more grit to go over the top of the trench and bomb Boches out of their trench than to pull some of our big building enterprises thru.

The country is on wonderfully solid financial foundation, but there is a conservatism with many banks, and lines of credit of many are being curtailed.

This is possibly because of over speculation and wild cat gambling in stocks by others. Whatever the cause one must have sand in his soul to keep a brave front and cool head in the face of danger.

I saw some verses in the Claxton Magazine, one of which was especially worth while:

"If your track is steep and hilly, and you have a heavy grade, And if those who've gone before you have the rails quite slippery made; If you ever reach the summit of the upper tableland, You'll find you'll have to do it with a liberal use of sand."

Rat Poison Would Be Cheaper

Some place themselves on the toboggan first physically and then financially thru worry.

There is nothing in the world like worry to wilt a man's prospects. There is nothing like worry to disorganize a man's internal equipment and external affairs. The man who starts from somewhere for Successville must lay his trip over the hilly road that goes thru the town of Hope and Faith also the hamlet of Plugville. The chap who permits his car to turn down the sandy road to Worrytown will probably be led thru Sickton and then into the town of Disaster.
Ventilation by the ROYAL SYSTEM is the only true scientific and economical ventilating system in use. So why use inferior ventilators. ROYALS draw the impure air upward and outward from all parts of the building. They are designed to do this. The process of exhausting foul air and substituting pure air goes on without interruption day and night. No wind, rain, sleet or snow can enter the building through the ROYAL. A constant circulation is maintained. Our catalog gives all details. Write for it.

ROYAL VENTILATOR COMPANY

Large Profit in Air and Light
The certainty with which More Sun Windows decrease disease and losses and increase quality, production and profit deserves the attention of progressive dealers and contractors, as every stock raising farmer should have them. This is an opportunity for all to be benefited financially. Make money and help your customers prosper. Now, dealers and contractors ask for our co-operative plan.

Cork your worry when it first calls because no good can come from it.

**Painted Buttons for Eyes.**

One of the marvels of my home town when I was a youngster was a blind man who was able to get around quite well in spite of his affliction. He would be guided to the curb by his cane and listen carefully for approaching vehicles. When the way was free he would easily cross.

I have often wondered what he would do in this day and generation when the vehicles sweep by at five times the speed they formerly did and are gumshoed and noiseless. Painted buttons would not answer for eyes to any man today.

People must not only see things but they must be aware.

A builder cannot be a good builder unless he sees everything to be seen.

Observation is the basis of true education. It always has been and always will be that people don’t use their eyes until they begin to be dim. It is one of the ironies of life that we don’t appreciate our blessings until we begin to lose them. I see more now than I did when I was twenty years younger.

Why can’t YOU, Mr. Young Reader, get the benefit of your eyes from now on. See the thing to be done and see how to do it.

Learn to Be a Draftsman
and Draw Your Own Plans

By means of these two books the contractor, builder or carpen-
ter can advance by easy steps from the first principles of drafting
room practice to the complete work of an architect’s office, includ-
ing drawing to scale, tracing, detailing, lettering, rendering, design-
ing, etc. He can combine the work of the architect and builder.
He will learn not only how to plan the structure, but how to lay
out the work, specify the materials and finish, make the contracts,
and take complete charge. A complete set of plans with every
dimension, all sizes of windows, doors, etc., is shown in these books.
This serves as a guide as it shows the process from the preliminary
sketch to the finished plan.

Radford’s “Mechanical Drawing” is a book of 272 pages,
with 165 illustrations, and a supplement showing perspective views
and floor plans of 41 brick, cement and frame residences.

Radford’s “Architectural Drawing” is a book of 304 pages,
with 147 illustrations and a supplement showing perspective views
and floor plans of 41 brick, cement and frame residences.

Each book is printed on high-grade paper, bound in cloth, is
6x9 inches and has a beautiful illuminated cover.

Don’t Depend on Another Man’s Brains

Develop your own ideas. Be in a position where you can
work a customer’s hazy suggestions into a tastefully arranged,
complete plan, showing all dimensions.

One of these books and a year’s subscription to the
American Builder for only $2.00, the regular price of
the magazine alone. Both volumes and a year’s sub-
scription for $3.00.
“Looks well”
Canton Coal Chutes will please your clients because they look well. A man has a justifiable pride in the appearance of his home. That is why we have taken pains to make “outside appearance” one of the strong features of the Canton Chutes.

Durable and Efficient
Canton Chutes are extremely practical in design—are easy to install. There is an automatic locking device and also an independent outside lock.

The use of only the best materials, and its all metal construction insure the best service through years of hard usage.

Get our catalog B-4 for prices and complete information.

Canton Foundry & Machine Co.

 WHEN WRITING ADVERTISERS PLEASE MENTION THE AMERICAN BUILDER
"No more of that for my truck drivers"

"My new Kissel Truck with the ALL-YEAR Cab gives them full protection in wet and stormy weather and keeps them warm and comfortable in the winter."

New Kissel All-Year Cab

Insures All-Year Comfort for Drivers and Increased Results for Owners

The new ALL-YEAR Cab is revolutionizing truck driving in the carpentering and building trade. It protects drivers in winter weather — increases their efficiency — discourages speeding — diminishes accidents — keeps trucks in operation the year round regardless of weather.

In its summer form it is a cool open housing. In winter the ALL-YEAR Cab is quickly changed into a warm, dry, closed weather-proof cab — by adding the winter attachments.

KISSEL TRUCKS

A Truck for Every Purpose

Unusual strength, power and durability are some of the characteristics of the new Kissel Trucks designed and built to meet economically and efficiently the present day demands in the carpentering and building trade.

See our Kissel dealer or write us for literature on the new Kissel Trucks and the ALL-YEAR Cab.

Kissel Motor Car Company
Hartford, Wis., U. S. A.

Lumber Is Not High

(Continued from page 69.)

was worth from $10.00 to $20.00 so that it required forty hogs at $18.00 to buy the barn since—

40 Hogs at $18.00 = $720.00.

"In 1917 our price had increased to $1000.00 cash, but hogs had advanced to from $40.00 to $45.00 each so that it only required twenty-four to buy the barn since—

24 Hogs at $42.00 = $1008.00.

Another ad with the same illustration has the slogan, "The Best Building Time in Years," and below the following is presented:

"In 1914 it took 705 bushels of wheat to buy this barn, while at the present time it only requires 351 bushels to buy it!"

"Values have readjusted themselves during the past twelve months. Your products have very nearly tripled in value, while lumber is ONLY SLIGHTLY ABOVE NORMAL. NOW IS THE TIME TO BUILD."

Now is the Time for the Farmer to Build

"Explanation: In 1914 Thompson Yards' price on Barn Design No. 404 was $705.00 cash, while the average price of wheat was $1.00 per bushel. It, therefore, required 705 bushels to buy the barn since—

705 Bushels at $1.00 = $705.00.

"In 1917 our cash price on the same barn had advanced to $1000.00 cash, but wheat had advanced to an average of $2.85 per bushel (first six months), so that it now requires but 351 bushels to buy the barn, since—

351 Bushels at $2.85 = $1000.35."

This seems like the right approach for selling all building materials and farm building equipment this year.

Testing Paint Materials

(Continued from page 61.)

occurs, condemn the oil. Flow a sample on one of the clear glass pieces, note the time of application and amount of time required to harden. The oil should be free from all feeling of tackiness in three days or less.

Testing Turpentine

Turpentine should be tested for oil adulteration by letting a drop fall on a piece of pure white paper.

No Ice Needed—in Winter
Filled From the Outside in Summer
The Herrick Outside Icing Refrigerators
Most Popular for Modern Homes
Saves more ice, gives more space in the kitchen and does away with the
tracking of floors.
This refrigerator requires no ice in the winter. It is cooled by cold air. The
Herrick is so constructed that a compartment may be opened from the out-
side of the house. Cold air thus enters the opening, forces circulation and
keeps the contents of the refrigerator cold and pure.
And we furnish FREE PLANS showing how the Herrick saves a great deal of
kitchen space by being built into the wall so that only the front is visible. The
housewife will appreciate this saving just as much as the ice-saving feature.
And here is another point equally important: The Herrick does away with
the annoyance of the ice-man's visits to the kitchen and the spilling of the ice.
by his always muddy feet and dripping ice. Any woman who takes pride in
a tidy kitchen will not only be interested in—but will demand the Herrick.
No progressive builder can afford to be without information on this modern conven-
ience. Suggest it to your customers before they suggest it to you. It will add to your
reputation as a conscientious, up to the minute builder and will get you more jobs.
Write for our free plans and our complete catalog.

Herrick Refrigerator Company, Waterloo, Iowa
If not contaminated by a mineral oil the spot will dry free from greasiness and clean. Test with aniline oil as for mineral adulteration of linseed oil.

**Testing White Lead**

White lead and white zinc can only be accurately tested by a chemist, as such work is complicated. If the contractor is careful, however, he can make a fairly accurate test of white lead by washing a small sample with benzol to remove the oil and letting dry on a piece of white blotting paper. When the oil and benzol have all evaporated, place a small quantity of the dried powder in the hole made by twisting a nickel edgeways on a block of charcoal. This lead should now be reduced with a flame from an alcohol lamp and blow pipe or that from a blow torch. If pure, nothing but a small globule of metallic lead will be left in the hole in the charcoal. If a white residue or scum forms over the lead, do not use that brand of material from which the test sample is taken.

**Testing Zinc White**

Zinc white should be washed with benzol and the latter poured off several times to remove all traces of oil. Warm the test tubes carefully to remove all benzol remaining and then treat the sample of zinc oxide with concentrated acetic acid. If pure, the oxide should be completely soluble in the acid. If an insoluble portion remains, even after boiling when the tube is heated, condemn the brand of zinc as unsafe to use or else send the sample for analysis to determine how serious is the adulteration. Zinc oxide is high priced at the present time, but very essential in a paint formula.

**Testing Japan Driers**

In testing japan driers recourse can be had to the use of the paste made from drier and moisture free litharge. High class driers will not thicken or harden under three or four days; cheap rosin driers will harden in twenty-four hours or less in direct proportion to theircheapness. Choose a turpentine drier which produces a good drying action in three days.

**Testing Color Pigments**

Pigments for coloring or tinting should be tested very carefully. A one-gram sample should be very accurately weighed out and reduced with nine grams pure zinc oxide, well mixed with a muller or spatula and carefully spread as a ribbon on glass. Two different brands should be tested simultaneously and the two ribbons placed side by side for comparison. By backing up the glass with pure white blotting paper, a good idea of the comparative value of the tinting strength can be secured of the two samples. That sample which will stand the greatest reduction to produce a desired tint should be chosen as the finest ground and purest material.
When Barns Are Full It's Easy to Install

MYERS HAY TOOLS

Contractors and Builders: Remember the name Myers on a Hay Unloading Outfit is a guarantee of Quality, and whether installed during the summer or winter months, a Myers will give excellent service in the unloading of hay or grain from the rack into the mow or into the stack—we merely recommend the fall and winter months for installation because mows are filled to the roof and the work can be accomplished easier and quicker.

When you build new barns or remodel old ones be sure they are equipped with a complete Myers Outfit, Unloader, Forks or Sling, Tracks, Pulleys and Fixtures, for the Myers Line has a background of friends in every hay making community that have been gained and retained year after year through their excellent unloading service—capacity, ease of operation and uniform performance. Catalog gladly mailed.

Shutters Have Come Back!

The old style controlling devices were exceedingly cumbersome, they rattled and banged in windy weather; there was much tugging and lifting to close the shutters, and in stormy weather one had to lean way out of the window to work the shutters and consequently got drenched.

Superior Shutter Fasteners bring shutters back to their own. They make the opening and closing of the shutters a simple task, quickly accomplished. Shutters can be bowed at any angle without danger of being torn off the hinges by the wind.

There is an arrangement for locking the shutters back against the house. Shutters lock from outside if necessary.

Builders, carpenters, contractors. Let your clients have shutters again. Show them how easy shutters are to handle when they are "Superior equipped." Write us for full information and prices.

THE G. F. S. ZIMMERMAN CO., Inc., Frederick, Maryland

You Can't Afford to Be Without "Nice" Liquid Filler

BECAUSE it means an economy of both time and material to you. It requires little, if any, sand-papering and dries hard in 8 to 12 hours, allowing concrete-only work to be done with safety. It will go into close grained woods with one coat of filler and one coat of varnish—it will hold out varnish better than shellac and will cover 800 sq. ft. to the gallon. It is very valuable as a first coat for floors to bring them up to an even surface—it helps the user over many a difficult place and adds to the quality of his work.

LINOFELT

"Between You and the Weather"

(Designed. 1914. Union Fibre Co., Winona, Minn.)

Perfect building quilt for all buildings. Keeps out cold in winter and heat in summer. Wears longer—saves 40% on fuel expense.

How to Do Work Right
(Continued from page 70.)
seen it done time and again, and the results were, of course, accordingly.

Jointing the Jambs Necessary
The jambs should be jointed perfectly straight before plowing or sizing, as the small margin that is generally allowed for play, is not ample enough to take care of any curvature in either sash or jamb. The jambs should also be straightened sidewise. This is usually done by nailing on the casings except in box frames as for brick or concrete work, when all parts should be jointed perfectly before assembling. The frames should also be made the proper length and width, as any great variations in this part will affect the proper actions and service of the window sash.

For standard two-light windows the mill books prescribe 4 1/2 inches allowance in width over the glass size, but I find during my 14 years of experience that it is safe to allow an extra 3/8 inch, as the sash always run full and otherwise require considerable trimming, which tends to weaken the sash; and they are frail enough at the best. If made much wider there is chance for the sash to slip the stop. For length the good book recommends 6 inches over entire glass size. This is proper and allows a fair margin for fitting. This length must be taken along the inside edge of the parting stop. The distance between the blind stop and parting stop should be 1 1/16 inch over the thickness of the sash. Less than that might cause them to bind; more allows them to rattle.

Pulleys and Pockets
The pulleys should be put in the center of the channels for the sash, otherwise they will not enter the grooves which are made in the upper ends of the sash for that purpose. The question of whether or not to put in subsills is debatable, as strong arguments can be brought forward for either side; but either way, the sills or sub, as the case may be, should be nailed between the jambs instead of under them, as some mills do. This practice is a mighty poor way of doing an important part of the work, and the only argument in favor of it is cheapness, and there are many important ones against it.

Architects and owners of buildings should insist that window frames be provided with pockets, as in this day of keen competition and cheap construction there prevails a tendency to omit this part of it; but after the ropes break and the carpenter has to either take off a casing or cut in a pocket, the owner is a lot poorer but wiser. And ropes do break.

The level of the ends of the pocket should be towards the top from the face of the jambs, otherwise there is a chance for the sash to catch on the ends if they project in the least. The drop or pitch of the sills in most windows is not enough, as they generally have about

ARTISTIC HOMES
A book of 280 (8 x 11 inch) pages showing perspective views and floor plans of 250 artistic modern homes. A large variety of designs are given so as to meet the taste of the majority of home builders. There are artistic houses for people of moderate means and others for the more wealthy, but in every case the design is made with reference to comfort and economy.

Every design shown has been made by best architects in the world, who have made a study of home architecture and that alone.

"Simonds"

"Sure!"
"I have never used any other kind since I first had this one in my hand, thirty years ago."
"There are two very good reasons why I have never used any other saw—because I have never seen one better than a Simonds and because I can't afford to use one that is not as good."

That's the Truth About Simonds Saws

The manufacturers have used every means to keep Simonds Saws the finest on the market—steel is made in their own factories and is tempered by their own special process—high class workmanship on every saw. You can depend upon a Simonds for accurate cutting—for "wearability." They will stay sharp.

Ask your dealer to show you the Simonds Saws. The price is reasonable—the quality unquestionably the finest.

Have you got our Carpenter's Guide Book? If not let us send it to you.

SIMONDS MFG. COMPANY
FITCHBURG, MASS.

External Adjustable Butts

The Fenestra Butt is guarded against loosening by being double riveted through sash bar and weathering. The mere turning of a nut allows ventilators to be adjusted or removed from the sash at will. Early types of butts were clamped on or riveted only to the weathering and allowed no adjustment.

1 inch fall in 10 inches, when they should have at least 1 inch in 6. The advantage in this is that it will drain the water better and consequently not rot so easily. There is also not so much danger of rain beating in under the sash and stool and running down the inside of the room.

Squaring frames with the steel square or a stick and then sawing the casing to fit is an uncertain process, as the jambs usually cannot be depended upon to be straight before the casing is nailed on, and consequently do not true up. A better way is to cut the casing square, and if cut to proper length, this will square the frame. Then, when setting the frames the sills are leveled, and the casing plumbed, and the cut will fit perfectly.

**Fitting the Sash**

Commencing with the top sash the lugs should be cut off flush, then try for width at both ends, laying the sash flat on the sills. Pay no attention whatever to center, as the casings will straighten the jambs. There should be a strong ¼ inch play. If necessary, dress both ends to width, working equally from both sides. Then straighten the sides, leaving them the least bit hollow. Many carpenters size the ends and leave the middle high, and then wonder why the sash drag. Now, notch the check rail for the parting stop. This should be just a little less than the projection of the parting stop from the jamb. This work must be done just right and not any old way, as some do, regardless of whether they get a quarter or a half inch more than necessary, for here is where the cold comes in.

If the holes in the sash are not deep enough to receive the knot on the rop, take a ¾-inch bit and bore them deeper, as a projecting knot will make a sash work hard; also, if the groove is not deep enough, dig it out. Give the sash a fair chance. If it is possible to avoid it, and it generally is, never nail a sash cord into a sash, for it is the most aggravating thing to take out. If the rope is put in properly it doesn't require nailing.

After the top sash is in, size the lower one for width, set in place and find the distance the tops of the check rails are apart. Better measure both sides and if there is any difference measure in the center, as here is where the sash lock sits and the check rail should be flush. The measurement taken here gives you the amount to be trimmed off at the bottom. If possible, scribe the sash to the sill with a scriber or a pair of dividers and bevel the sash the least bit more than the pitch of the sill. It is important that the sash fit tight on the outside to exclude rain and cold. This can't be done if the frames are made too long. Many carpenters size the sash bottom with a plane, but if I can scribe the sash on the outside I wouldn't give loc for all the planes in the country for this work, as I could do a better job with my rip saw. If the sash can't be got-

Builders' Course

A Practical Course for CARPENTERS, BRICKLAYERS, PLASTERERS, FOREMEN, SUPERINTENDENTS, CONTRACTORS and all other men in Building Lines

Plan Reading, Estimating Architectural Drawing Specifications, Contracting

Any man in the building lines can save many times the cost of this course on one job alone.

This elegant $15 outfit and all blue print plans furnished FREE, with instructions in Plan Reading, Estimating and Drawing.

To Succeed in any branch of the building business you must have a complete knowledge of plans and specifications. You must be able to estimate closely the cost of material and labor. Guessing won't do—you must know. This knowledge is what makes successful foremen, superintendents and general contractors. You can master these subjects by our new easy "Study-at-Home" method.

Your Spare Time is Enough

The same expert instructors who are so successful with hundreds of men in our Day and Evening Classes will guide you to a larger success. These instructors are among Chicago's leading Architects, Engineers, Estimators and Contractors. They prepare your instruction matter; they examine and approve your work. They are themselves in charge of real work—big work—and know exactly the training you need.

IF you are a CARPENTER, BUILDER, BRICKLAYER or MASON, you need this course—it will bring you higher wages.

IF you are a FOREMAN or SUPERINTENDENT, you need this course—it will enable you to become a successful contractor.

IF you are a CONTRACTOR, you need this course—it will help you to figure closer. It will eliminate mistakes and increase your profits.

WHEN WRITING ADVERTISERS PLEASE MENTION THE AMERICAN BUILDER
ten at to scribe on the outside, the next best thing is to set the dividers as before and mark on the inside. Then set the bevel square to the pitch of the sill and mark across the edges. Then take a straight stick and mark across.

**Fitting the Stool**

After the sash are in, the next thing is to fit the stool. This should be fitted so there is 1/16 inch space when the sash is back tight against the parting stop. If less room is given, the sash will stick; if more, it will rattle and not be a good job. After fitting the stool I always put the apron on next and nail the two together solid. Then I scribe and fit the casing onto the stool. When I get a fit I know it will stay. Some mechanics leave the apron till the last and nail the stool to the casing from below, but I have noticed when casing up twin or triple windows in this fashion that it required a 2 by 4 pry to bring it up in the center, and after all the nailing was done the casings didn’t fit a little bit.

When nailing on stops it is important that both sash be closed tight, as the check rail is generally a little thicker than the parting stop, and if not together when stop is nailed on it will bind when closing window. On the other hand, the stop can be nailed up close and then when sash is raised it will have ample room. Some recommend dressing the check rail, but for various reasons this is not the proper thing to do.

**Concrete Beams for Supporting Long Porch Spans**

These lintel beams should be designed as ordinary reinforced concrete beams for the floor or roof live and dead load they support in addition to their own weight. For a single span the moment in foot pounds will be equal to \( \frac{1}{8} \omega l^2 \), where \( \omega \) is the total load (both live and dead) per foot of beam and \( l \) is the clear span length in feet between supports plus 1 foot. Where lintel beams are built continuous over one or more supports the moment at the center is decreased, but a negative moment is developed at the supports which must be taken care of by providing reinforcing bars in the top of beams at those points. These bars should extend at least one-fourth the span length each side of the support over which the beam is continuous. In ordinary residence work, however, where there are seldom more than two spans continuous, it will be found good practice not to figure on the decreased moments due to continuity, but to assume that a moment of \( \frac{1}{8} \omega l^2 \) will be provided for at the center of beam in bottom and over the center support in top of beam. This will give an excess of steel over theoretical requirements at the center between supports, but in such work where men are not always the most experienced kind, in reinforced concrete, at least, it is best to have a little excess of resisting moment. Before the total bending moment can be computed it is necessary to assume a tentative size of beam and this can be done by taking the end shear due to superimposed loads and dividing it by a low value of unit shear (as later explained) and finding the necessary cross-section. If on computing the moments and stresses the latter are too high a new section must
No matter how well proportioned a building—no matter how well built—if the roof of that building does not insure absolute protection as well as perfect conformation to type—you would not want to know as the builder.

BAYONNE
Roof and Deck Cloth

lends itself equally to protection and perfection. Being laid on dry boards, it offers unusual possibilities of painting and finishing afterwards, to obtain any desired effect. Being waterproof, weather-proof and wear-proof, it will resist the ravages of the elements longer than any other roofing material.

Bayonne does not buckle or rust. Fits smoothly into corners like canvas, yet cannot shrink. Can be kept clean by sluicing with water, like cement, yet is the most economical roofing material on the market.

Bayonne is recommended for roofs, sleeping porches, conservatories, piazzas and all places receiving constant wear.

JOHN BOYLE & CO., Inc.
112-114 Duane St., New York City
Branch House: 202-204 Market St., St. Louis, Mo.

BAYONNE ROOF AND DECK CLOTH

The Impervite Stucco work is the best job in the County, not a hair-crack in the whole building.

To The Standard Paint Co., Chicago.
We tried everything to overcome water seeping through the cellar wall. Are now using the room for pianos and there is no sign of dampness.

The pit goes twenty-five feet below water level. It was originally waterproofed with ten layers of tar and felt, which failed. The Impervite system was decided on and a 2” inside facing was applied in 1912 and has been absolutely successful.

To The Standard Paint Co., Boston.
We ordered 5000 lbs. of Impervite for plastering several reservoirs. We have had no leaks, we have had no cracks and it has held on a stone wall where we very often had trouble in being able to hold the cement plaster.

There’s Roofing and Roofing

The labor cost on all prepared roofings is practically the same. The difference in price is in the materials.

There fore, the cheaper the price the cheaper the materials used.

Laying a cheap roofing means laying another cheap roofing a few years later—with the additional labor cost.

Labor costs from 25% to 50% of cost of materials.

So—it’s very probable that roof ing—then re-roofing with a cheap brand represents a cost far surpassing the original cost of a high grade, last-the-life-of-building brand such as

Monarch Roofing abolishes roof troubles.

Monarch Roofing is chosen by the careful buyer—the painstaking workman.

Monarch Roofing is made in 4 plies and, while it is a smooth roofing, it is surfaced with crushed mica slate. This layer of Natural Red or Green Crushed Slate is rolled into the asphalt coating while it is hot, affording an excellent wearing surface—proof against flying embers. Being natural slate the red or green cannot fade out and holds its pleasing color the life of the building.

Used on any kind of roof. In rolls of 108 square feet—with Special Large Head Nails and Liquid Asphalt Cement packed with each roll.

be assumed and the beam recomputed. In small work
the facilities for bending steel are inadequate or en-
tirely lacking and for this reason the concrete sec-
tions of lintel beams should be sufficient to provide
adequate shearing strength without stirrups—in other
words, the unit shear on the effective depth should
be kept below 40 pounds per square inch in the final
design. In ascertaining the size of beam required
preliminary to designing same it will be convenient to
take the end shear due to superimposed load and
divide it by a lower value of unit shear, say, 30 pounds
per square inch, this lower value to take care of
neglecting the weight of the beam. The section so
found should be rechecked for unit shear after the
shear due to the dead load of the beam has been added
to the shear due to superimposed loads. The bending
moment can now be found and the steel area required
and the stress in the concrete ascertained as explained
in the following example:

For purpose of illustration we will design a porch
lintel on the basis just set forth.
Let span of beam 20 feet = clear span plus 1 foot.
Roof live load per square foot = 30 pounds.
Dead load of roof per square foot = 20 pounds.
Dead weight of concrete per cubic foot 150
pounds.
b = limiting width of beam due to architectural
design = 12 inches.

h = total required depth of beam.
Lintel to carry roof area equal to its length by
10 feet wide.
v = unit shear allowable = 40 pounds per square
inch on effective section.
d = depth to center of steel.
Total load carried by lintel W = 20 × 10 (50
pounds) + dead load of beam.
The size of beam not being known, the dead load
is unknown, so that the live and dead load of roof
only can be used to determine a tentative beam size
for computation, and to make some allowance therefor
a shearing stress of only 30 pounds per square inch
will be used for the preliminary calculations.
Thus:
Total roof load on beam = 10,000 lbs.
End shear due to roof load = 5,000 pounds.
d = ——— = 14 inches. Now assume that a
5,000
12 × 30
beam 12 by 18 inches overall will be needed, if the
shear is to govern (it does not, as we find later).
The beam weighs 225 pounds per foot, so that the
additional end shear due to its weight = 225 × 10 =
2,250 pounds.
Total end shear = 5,000 + 2,250 = 7,250 pounds.
Unit shear on effective section, assuming 2 inches
as distance from bottom of beam to center of steel, =

(Continued to page 156.)

(Continued from page 154.)

$$V = \frac{7,250}{b} = 43 \text{ pounds per square inch}$$

This is so little over the allowable that the size will not here be revised.

The bending moment must now be found, this equals

$$M = \frac{(10,000 + 4,500) \times 20 \times 12}{8} = 435,000 \text{ in. lbs.}$$

The allowable unit stresses used will be:

$$f_t = \text{tension in steel} = 16,000 \text{ pounds per square inch}$$

$$f_c = \text{compression in concrete} = 650 \text{ pounds per square inch}$$

The amount of steel required can be found by the approximate formula:

$$M = \frac{435,000}{f_t \times \frac{1}{6} \times 12} = 1.94 \text{ sq. in.}$$

Four \( \frac{3}{4} \)-inch square bars = 2.24 square inches.

The stress in the concrete can be found by the formula (approx.):

$$f_c = \frac{850 \text{ lbs. per square inch}}{1.6 \times 6} = 512$$

This indicates that the concrete is overstressed and that the matter of shear does not govern the design; however, on short spans and heavy loads it will govern.

A new depth of beam will, therefore, have to be chosen and the bending moment recomputed.

A new total depth of 21 inches will be assumed.

New dead weight of beam = 5,240 pounds.

Bending moment = $M = \frac{(10,000 + 5,240) \times 20 \times 12}{8} = 457,200 \text{ inch pounds.}$

$$A_s = \frac{457,200}{f_t \times \frac{1}{6} \times 12} = 1.73 \text{ square inches of steel required.}$$

Three \( \frac{3}{4} \)-inch square bars = 1.68 square inches, which is close enough.

$$A_s = \frac{457,200}{1.6 \times 6} = 635 \text{ pounds per square inch,}$$

which is within the allowable.

It will be well for practical reasons to place at least two small bars in the top of the beam, in this case two \( \frac{3}{8} \)-inch square bars will do (see Fig. 1).

If a double span lintel continues over the center support is used, practically the same steel should be used in the top of the beam over the center support and extending at least one-fourth of the span on each side of support, as is used in the bottom.

In Fig. 2 this is accomplished by adding two \( \frac{3}{4} \)-inch square bars over the center support in addition to the \( \frac{3}{8} \)-inch square bars which lap at the center to make them continuous.

The bottom bars should rest on support for a distance of at least 6 inches.
The Sorlien Ceiling Bed takes up no ceiling room, wall or floor space. It is perfectly practical for old buildings as well as new. Any good carpenter can install it, for from 50% to 90% less than any other disappearing bed. The Sorlien sells for $40.00 F. O. B. Minneapolis.

"RELIABLE" FOLDING SCAFFOLD BRACKETS

play an important part in putting through the greatest building program the world has ever seen. At each of the sixteen great cantonments which Uncle Sam is building for the training of our new National Army thousands of "RELIABLE" Brackets are in daily use. The photograph above shows "RELIABLE" in use at one of these camps, "somewhere in America." Not less than four gross (276) and in most cases from 900 to 1000 "RELIABLE" Brackets are in use at each camp. At one camp the cost of lumber for staging was figured at $5,500.00 alone $2,860.00, or more than their cost. Figuring time saved at the rate carpenters are paid on these jobs, you can get a good idea of the amount saved by the wise buyers on this job. DON'T FORGET THIS—"RELIABLE" Brackets were purchased for this work by the shrewdest buyers in the country ONLY after they had successfully proved in COMPETITION their great superiority in strength, safety and speed over all other equipment of this kind. "RELIABLES WILL SAVE YOU MONEY AS WELL AS UNCLE SAM. See your dealer today or write us direct for prices.

Beautiful Oak Floors — Everywhere

BECAUSE

— Oak Flooring by right of superior merit and conquest is "America's Best Flooring".
— Women prefer Oak Flooring for the reason it is rich and cheerful in color, and offers unlimited possibilities to give the home that coveted touch of elegance.
— Oak Flooring is Distinctive, Beautiful and Substantial, three very vital reasons why so much Oak Flooring is in use today.
— Service and satisfaction are assured if Oak Floors are used.
— Of all the hardwood flooring in use today, Oak stands pre-eminent for color, texture and durability.
— Keeps the "For Rent" and "For Sale" signs off of the property. Landlords know what is best in flooring.

See our Page 279—1917 Sweet's Catalog. Write for Booklet—"America's Best Flooring."

The buildings you erect will be proof against fire, rodents, sound and decay—cracks in walls and ceilings will be prevented—maintenance expense reduced to minimum—and insurance cost lowered by using Berger's Metal Sambre.

Use of this pressed steel construction assures safety, economy and permanency. Depreciation in value can be forgotten. Easy and simple to erect, resulting in rapid construction. Each member is cut at the factory, in accordance with plans, and reaches the building ready for placing.

The illustration shows a group of the Detroit River Tunnel Company's Towers, erected with Berger's Metal Lumber.

The Majestic Duplex Heating System
It will be well worth while for you to investigate thoroughly the Majestic Duplex Heating System before you decide what heating system to put in that new house or store.
The Duplex draws the cold air from the floor through the cold air ducts while pure warm air is discharged from the main face of the register. And the register itself makes an excellent bench or table.
The Majestic Duplex furnishes more heat, uniformly distributed and at two-thirds the cost of the old-fashioned methods. Easily installed in new or old house. Write today and get the facts about this modern, efficient heating system.
The Majestic Co., 702 Erie St., Huntington, Ind.

I want, through this advertisement, to establish as friendly business relations with you as I possibly can. I want you to realize also, that it is my earnest effort and intention to give you full honest value for every dollar that you spend with me. This is the only way I can succeed. My advertisement has appeared in the leading magazines continuously for more than four years.

I am building up my business on the foundation of good value and square dealings. I am saving thousands of satisfied customers thousands of dollars, by supplying perfect plate style—visible writing—typewriters, at remarkably low prices.

All my transactions are handled through by personal correspondence. I assure you that it will be worth your while to investigate the Tabulator Stops Adjustable Paper Guide Forced Alignment For R Platen Release Line Space Adjustment
Marginal Stops Carriage Release
Carriage Return and Automatic Spacer
Ribbon Reverse Ribbon Shift & Stencil Cutter Tabulator Bar

This is absolutely the most generous typewriter offer ever made. Do not rent when you can pay $2.50 a month and own one. Think of it—Buying a $100.00 machine for $48.80. Cash price, $45.45.

Perfect machine: standard size, standard keyboard, standard universal arrangement—universally used in teaching the touch system. The enti line of writing completely visible at all times. Has the built-in calculator, with hinged drover, the two color ribbon—with automatic reverse and key controlled shift, automatic double shift, automatic paper feed, automatic paper stop, the latest style—palatable style—and modern operating convenience. Comes to you with everything complete, tools, cover, operating book and instructions, ribbon, practice paper—nothing extra to buy. You cannot imagine the perfection of this beautiful reconstructed typewriter until you have seen it. I have sold several thousand of these perfect, latest style L. C. Smith machines at bargain prices, and every one of these thousands of satisfied customers has this beautiful, strictly up-to-date machine on five days' free trial before deciding to buy it. I will send it to you F.O.B. Chicago for five days' free trial. It will sell itself, but if you are not satisfied that this is the greatest typewriter you ever saw, you can return it at my expense. You want to try it before you buy it.

YOU TAKE NO RISK—PUT IN YOUR ORDER NOW

Send me only $2.50 a month until the low total price of $48.80 is paid, and the machine is yours.

H. A. SMITH
231 N. Fifth Avenue
CHICAGO

I will pay you the $40.00 balance of the SPECIAL $40.00 purchase price, at the same time that you return the machine to me in you fully paid for it. It is standard. Over one hundred thousand people own and use these typewriters and think them the best manufactured. The supply at this price is very limited, the price will probably be raised when my next advertisement appears, so don't delay. Fill in the coupon today—mail to me—the typewriter will be shipped promptly. There is no red tape. I employ no solicitors—no collectibles—no prospecting—no transmission. If you simply understand that I retain title to the machine until the full $48.80 is paid, you cannot go wrong. It is the greatest typewriter opportunity you will ever have.

Get This Man, Mr. Builder
He needs a good lighting system.
He has been wanting good light but does not know of a dependable system. He is tired of fussing with his old-fashioned lamp, which requires frequent attention—cleaning, trimming, filling, etc.
You can show him how he can have a brilliantly illuminated home and abundant cooking fuel at moderate expense.

SELL HIM A VICTOR
Acetylene Lighting System
It is an easy system for you to install. It is an easy system for the user to operate, as there are absolutely no adjustments to make. Simple, fool proof—nothing that can get out of order.
You can show your client—of the smoky kerosene lamp—how he and his family can get some real enjoyment out of life by having the evening hours pleasantly lighted by a modern, efficient, dependable lighting system. You can explain the cooking fuel economy to his wife.

The Victor Lighting System is simply constructed; safe, extremely durable. It works automatically making gas only when lights are turned on. It is outdoors, away from the house and is protected against temperature changes by an outer jacket.
Detailed explanation is contained in our catalog, Victor Out-door Above-ground Acetylene Generators. Send for it and the testimonial circular.

Moore Bros. Lightning Rod Company
Maryville, Missouri

Sell Protection from Lightning
with every building you build, and make that extra profit.

Property owners are awake to the terrible Lightning hazard, and most buildings are now protected—sooner or later—from Lightning. Even the Government has at last taken up the subject and warned the farmers of the country especially to protect their property from the Lightning stroke.
The best time to apply Lightning Conductors is when the building is built, and the Contractor or Builder is the logical man to handle the job.
The Shinn System is the only one Banded to Protect. Ask us how we cooperate with you.

Shinn Mfg. Company

NEW OLIVER NINE FOR HALF PRICE

The Oliver Typewriter Company created a nationwide revolution on March 3rd when it announced its new plans. No more expensive sales force of 15,000 men! No high office rents in 50 cities! No idle stocks!
But dealing direct with the people—cutting out all middlemen. The old plan cost the buyer a needless $51 per machine. We now save that and give it to you. So the new price for standard $100 Olivers is $49.
The Oliver Nine—our latest model—direct from the factory to you. It is the finest, the costliest, the greatest typewriter ever built. Used by the leading concerns.
Who would ever pay over $49 again for a new typewriter? Especially when we not only make a new low price, but also give the lowest terms—about 10 cents per day—over a year to pay.

Contractors' Special!

For contractors, our Special Oliver Nine is unbeatable. Besides being the best for ordinary correspondence, none can equal it for figure work. It has the characters you need, as shown on the keyboard herewith.
Over 600,000 Sold
And remember, carbon copies of everything written, for your records.
Our new price and terms ought to sell an Oliver to every contractor. Longhand writing will be out of date among progressive men.

Free Trial—No Money Down
Just send for our amazing disclosure entitled "The High Cost of Typewriters—The Reason and the Remedy." Then ask for a trial. You are not put under the slightest obligation. It is our new-day way of selling. It saves money for both of us. You act as your own salesman—the Oliver itself must convince you. You pocket the $51.
Send in the coupon below today for one copy of this sensational book that exposes the secrets of the typewriter world.

Give Proper Attention to Your Ceilings

PROBABLY nothing adds to or detracts from the appearance of a room so much as the ceiling.

A streaked, cracked and dirty ceiling is an "eye-sore" not only to the building owner, but visitors and customers as well. On the other hand, the clean, attractive, substantial appearance of Berger's "Classik" Steel Ceilings lends character and distinction to any interior.

Now, which type of ceiling are you giving your clients? One stands for ultimate dissatisfaction and maintenance expense; the other stands for permanent beauty, sanitation, safety and durability—all at reasonable cost.

You'll find Berger's "Classik" Steel Ceilings easy to erect—the improved bead and construction eliminating tamping and calking, saving 25% to 40% in erection costs.

Install them in your next building. Hundreds of artistic designs from which a selection may be made.

Ask for "Classik" Book D. A.

HERE are so many shapes of Asphalt Shingles and so many different styles of laying that we have decided to make FLEX-A-TILES in a new slab designed to fit the ideas of any home builder. Now all you need do is order FLEX-A-TILE Reversible Slabs as soon as necessary to secure prompt delivery — then, if the builder later decides he would like the shingles laid American Shingle Style—or American Diamond Style—or American Block Style—you will be ready with Reversible Slabs. Or, many unique effects can be obtained by alternating the positions of the slabs.

FLEX-A-TILE Reversible Slab Asphalt Shingles

These Reversible Slabs are genuine FLEX-A-TILE Asphalt Shingles through and through — made with the same scrupulous care and by the same scientific methods of manufacture as the famous FLEX-A-TILE Asphalt Shingles you have known in other styles for so many years. But they are made in this new slab form for your convenience. Each slab is four FLEX-A-TILES in one. This alone means a saving of 38 per cent in nails. And this great saving in nails, together with the ease of laying FLEX-A-TILE Slabs as compared with old-style single shingles, means a saving to you of 50 per cent in time and labor of laying. FLEX-A-TILE Slabs can be used equally well on new work or over old shingles, and the rich red or fadeless green natural-stone surfacing adds a wealth of beauty to any building.

THE HEPPE-S-NELSON ROOFING CO.

FLEX-A-TILE Roll Shingle — No-Tar Asphalt Paint — Other Guaranteed Heppes Products

WHEN WRITING ADVERTISERS PLEASE MENTION THE AMERICAN BUILDER
Here's a Portable "Planing Mill" which will do any work you have to do and do it right. It joints, bores, sands, rip saws, cross cuts, jig saws, rabble, bevels, mitres, tenons and grinds. It's a whole "plant" and it is portable, too. Can be taken right out on the "job." Substantially made and moderately priced.

One user wrote us that this machine would do the work of thirty men. We know that it will cut the cost of back-filling 75%. It works, too, where teams can’t work. It’s a self-tractor and moves forward as the "fill" is completed and has plenty of reserve power furnished by a 6 H. P. Gasoline Engine. Requires but one man to operate machine and two men to work the scoop.

This pump will run a full ten-hour day without attention after starting for less than thirty-five cents. The pump is of the rubber diaphragm type and power is furnished by a 2 H. P. gasoline engine. Guaranteed to have sufficient power and to be dependable. Furnished on skids or trucks as desired.

THE Oshkosh Low-Loading Mixer is a top-notch quality product—that’s been proven—and it renders uninterrupted service—that’s been proven, too. But a time comes in the life of every machine when it requires adjustment, some little part becomes worn or accidentally broken. That’s the time Oshkosh Service proves its worth. Every Oshkosh dealer can be depended upon to render the owner of an

just the service he requires and at the time he requires it. That’s the big broad meaning of Oshkosh Service.

To mix and deliver two batches a minute is quite a stunt with any other than an Oshkosh Low-Loading Mixer. But this big little mixer does it often, for its “four-motion” mix is very rapid and exceedingly smooth and thorough. Its easy loading, direct from wheelbarrow, and its low discharge, directly into the wheelbarrow, insures a remarkable saving in time and labor.

There’s an Oshkosh Mixer for your particular needs. Write today for catalog and book “Facts and Figures.” There are other Oshkosh products of equal worth of the same Oshkosh quality. Mention any other described on this page that you are interested in and we will include descriptive literature.

Liberty Bonds Accepted in Payment at Face Value

Oshkosh Mfg. Co., 92 Amber St., Oshkosh, Wis.
The Trailer Idea is not new. The Indian understood that his pony could pull more than it could carry. The paleface is not above copying the trailer idea--developing it with careful ingenuity to its present excellent expression—The King Trailer and Semi-Trailer.

The King Trailer Company builds Trailers and Semi-Trailers for every business need: Light trailers carrying 1000, 1200 and 1500 lbs.; Big trailers, known to the trade as Semi-Trailers, with carrying capacities of 1 1/2, 3, and 5 tons. Good honest material put together by competent workmen makes the King Trailer the superb vehicle that it is. Quality from tire to top—solid rubber tires guaranteed 7000 miles—artillery wheels with second-growth hickory spokes—ball bearing axles—bodies of best hardwood, in all designs. Dump Semi-Trailers for road work—Stake Semi-Trailers for draying and hauling farm and dairy products—Box Semi-Trailers for loose grain and builders' supplies—Van Semi-Trailers for moving and storage business—Light trailers for every imaginable use—Trailers for the outdoor man, for the plumber, painter, and plasterer. It's the famous King Line.

Investigate it.

SOMETHING NEW!
our latest accomplishment in garage door sets!

Here is the last word in garage door equipment that will give you the greatest efficiency at the lowest cost—the cheapest possible combination and the easiest to operate. This new National Garage Door Set will make garage doors slide—swing—and fold with the least possible effort. A light push and the doors open quickly—easily. A light pull and they close compactly without binding or friction.

Doors are absolutely weathertight. Single door on one side can be opened without interference with double doors. Notice the small illustration at the left. Notice how the absence of structural iron work on the outside gives the front of the garage a neat compact and pleasing appearance.

Adjustable feature prevents sagging of doors. Doors are hung inside and lie flat against the wall when opened, thus requiring a minimum of space in the garage. Doors are adjustable in case of swelling or raising of cement floor. The Code Number of this set is 805. Set No. 805 includes:

No. 29 Latch; 1 only Swivel Hanger; 6-foot Braced Rail; 4½ pair 4x4 inch Jap. No. 505 T. P. Butts; 1 only No. 820 Chain Bolt; 1 only No. 830 Foot Bolt; 1 only No. 5 Pull; 1 only 4½-inch No. 30 Safety Hasp.

No. 806 Set includes the same except that No. 27 Latch is used instead of 29. Both sets furnished in Japan finish. Let us mail you our circular describing this set in full.
