ARCHITECT AND ENGINEER

POSED CIVIC CENTER FOR LOS ANGELES
Nothing short of perfection would do in building this modern structure. Scientifically designed to reflect the dignity and character of the profession it represents, it must also meet its exacting demands in every detail of construction.

For the concrete and stucco work, Golden Gate TAN PLASTIC was specified and used, assuring lasting protection against dampness and moisture. In addition, its plasticity and pleasing tan color assure smooth, attractive surfaces...permanently.

No structure is up-to-date that absorbs moisture and lets in dampness. Assure this modern protection for your projects by always specifying TAN PLASTIC, the basically waterproof Portland Cement. Used right it will never fail you.

ENDORSEMENT by the Los Angeles Municipal Art Commission of a report covering a comprehensive scheme for the civic center and related areas in the Angel city, discloses a plan ambitious and imposing that might have materialized but for a change of policy by the Federal Government, which at the last minute has indicated its intention of choosing a different site than the one near the Railroad Terminal for its distributing post office. That Mr. Woollett's unique and not impractical "sunken garden" idea met with the unanimous approval of the city's art commission, is indicated by its endorsement of the survey and passage of a resolution requesting the author to submit a copy of his report to the American Institute of Architects for an opinion.

OUTSTANDING developments in home design this year promise to center around the kitchen and bath room. The use of drawn metal for sinks and drainboards will make for more attractive kitchens and greater permanency of fixtures, while bath rooms may be made more colorful than ever by using two tone colors, streamlined, of drawn metal. Somebody has remarked that the bathroom of tomorrow will be such a pleasant place that "singing in the bathtub" will become a national habit. And this same wag adds: "Should you wish to sing 'The Star Spangled Banner' while bathing you can stand up in safety because some of the new tubs have non-skid bottoms."

COMMENTING on home building progress the past year The Architectural Forum says:

"The greatest advances have been in equipment and appliances, particularly in air conditioning, heating, plumbing and electrical devices, nearly all of which are suitable for houses of conventional construction. Air conditioning has increased in excellence and dropped in cost. Improvement in kitchen equipment has been spectacular. Strangely enough, scientific lighting of rooms is not yet generally practiced. All of this means that building science has not advanced as far as the Sunday supplements like to believe but has made definite and, in some cases, extraordinary progress. The building industry is about at midfield toward the goal of reducing the cost and improving the quality of the house."

REFERRING to present day housing tendencies, Ely Jacques Kahn, A.I.A., has summarized his prognostications as follows:

Flat and sloping roofs will hold their own.
Glass will bulk much larger in construction uses.
In metals, bronze is still the favorite, but it needs much care. Design tends to simpler forms.
We will not fake one material to look like another.

Economic conditions bar tall structures, but capital will be back in the skyscraper field when land values and rents create the right demand.

PRESIDENT ROOSEVELT stands like iron in his belief that we have come to a stage in the country's development when unlimited, unrestricted competition must give way to cooperation, and a planned economy substituted for the haphazard, helter-skelter, dog-eat-dog system under which America has been living. These same friends insist that the President believes that the profit motive can be divorced from greed and brutal disregard of ethics and fair play. Courage, initiative and enterprise are to be preserved as precious heritages, but they must be the real article, and not mere masks for rapacity. On that platform, I believe industry can stand with him. On that platform let us proceed now to pledge ourselves to go on to a new phase of usefulness.—GLYDE G. CONLEY, President American Institute of Steel Construction.

COMPARATIVELY little has been said of the inconsistency between billboards and highway beautification; and in most states the two flit side by side or in annoying sequence past the eye of the motorist.

That billboards are ugly will be denied by no one except those financially interested. That they are a menace to safety has been from time to time asserted but is not easy to prove except where they actually obstruct a view of the road at curves or intersections, and where beyond question, highway authorities should have power to remove them.

The inconsistency between billboards and landscape improvements should be apparent to anyone, observes a writer in Roads and Streets. Of what use is it to develop beautiful perspectives, or graceful slopes, or plantings of green shrubbery in the vicinity of a wood or metal sign which draws the eye by its size, sharp outline, and vivid color? It is silly to say that we need not look at the sign if we don't want to, for it is put there to be looked at, and its every feature is carefully designed to force attention. Every beauty of adjacent landscape is overwhelmed by its presence; while the distant scene too often is broken, marred, or actually obscured by it.

A few far-seeing corporations already have stopped their billboard advertising and others undoubtedly will follow suit, but many will refuse to give up what they consider a good advertising medium. These latter should be restricted by law as far as can be done under the Constitution.

THE Oregon State capitol competition is creating nation-wide interest and details of the program are expected to be made public shortly by the State Capitol Reconstruction Commission. The building is to cost $3,500,000 and prizes of sufficient size to attract the best professional talent in the United States, are to be awarded. Appointment of a technical adviser will be followed by the preparation of a program of procedure. Members of the State Capitol Commission include T. H. Bandfield, H. H. Lake and Dr. H. H. Olinger.
The Public Market Building at Portland, Oregon, illustrates the distinction lent to commercial structures by architectural concrete. Lawrence, Holford, Allyn & Bean, architects

... IT BRINGS NEW FREEDOM TO DESIGN, NEW ECONOMY TO BUILDING

The technique of using concrete as a decorative material is advancing more rapidly today than ever before.

It is noteworthy that during the depression, with building in general at its lowest ebb, concrete has established itself as a foremost combined architectural and structural material.

Whatever the function of the building contemplated, concrete lends freedom in design. Recent concrete exteriors of note run the gamut of architectural types.

Concrete is a practical material—consistently economical in first cost—durable and low in maintenance under the widest range of service and climatic conditions.

To help you design your next building in architectural concrete, let us send monographs covering specifications, construction and design details, and textures. Write us or mail the coupon.

JANUARY, 1936
TERRACES AND GARDENS, ADMINISTRATION CENTER
LOS ANGELES
PROPOSED BY WILLIAM LEE WOOLLETT, ARCHITECT
A FORMER San Francisco architect has proposed a series of competitions, world-wide in scope, covering a period of possibly twenty years, whereby it will be possible to attract artists of reknown from the four corners of the world, to create an adequate plan for a new Administration Center in Los Angeles.

W. L. Woollett, the author, is architect member of the Art Commission of the City of Los Angeles, and also a member of the Mayor's Civic Center Committee, both of which organizations have received the Woollett survey favorably.

The accompanying drawings were made by Mr. Woollett for the purpose of arous-
ing interest in an Administrative Center and
to further the idea of creating an adequate
plan by means of competitions to be held in
the leading capitols here and abroad. Mr.
Woollett describes the features of his sur-
vay as follows:

"The site chosen for the Administrative
Center is at the geographical center of the
metropolitan area, which curiously enough,
corresponds with the center of population
of this area. The physical characteristics of
this site are dramatic. To the West the
shadow of "Old Fort Hill" dominates the
scene as would an Acropolis; to the East
expansion is blocked by the railroads and
the bed of the Los Angeles River. The prin-
cipal buildings for this Administrative Cen-
ter are located on wide thoroughfares which
constitute the vortex of the metropolitan
traffic system. This site is also the site of
the ancient "Pueblo" of Los Angeles.

"The general perspective view is ambi-
tious, but there is not a fictitious feature in
the ensemble. Beginning with the Acropolis,
a prominent feature of the group, it is pro-
posed to terrace the hill, which exists as Old
Fort Hill, for the purpose of an outdoor
Architectural Garden and Museum. The
crowning feature for the terraces would be
the Opera House, which is cast in the form
of a stepped pyramid. On special occasions
the outside, as well as the inside, may be
used as an auditorium. The advent of the
loud-speaker makes this arrangement a
practical means for accommodating occa-
sional large audiences. This exterior seat-
ing capacity also provides a grandstand for
those who wish to view the pageantry of a
great city.

"Just below this group, on North Broad-
way, the city has already provided for a
Police Building, which may be located in
the ensemble drawing by means of a small
tower.

"To the left of the proposed Opera House
group, the Hall of Justice, just completed, is
the first of a series of county buildings
which in time might be expected to reach to
the top of the hill. On the other side of the
sloping garden space, which forms the
background for our present City Hall, we
see the newly finished State Building, first
of a series of structures which should be
necessary for the business of the State of
California.

"In front of the City Hall stretches the
'mall', already dedicated by the mayor's
given word to the purposes of added cir-
culation for traffic and parking. A 'Prado'
for the people begins at the old Plaza, near
the Mission Church, and extends to the
Church of St. Vibiana on Second Street.
This great open space, comprising as it does,
Main and Los Angeles Streets, and the
block between these streets, will serve to
foster the centralizing of business in this
part of the metropolitan area.

"Immediately north of the City Hall, on
the block now occupied by the Post Office,
the Federal Government proposes to erect
a large building, (i.e. some fifteen stories
AIR PLANE VIEW OF PROPOSED CIVIC CENTER, LOS ANGELES
Proposed by William Lee Woollett, Architect
high) which would be about one-half the height of the tower of the City Hall." The studied plan of the Administrative Center, Mr. Woollett thinks, will be useful in estimating the probable effect, aesthetically, of a fifteen story building, in the location proposed, upon the City Hall as the central feature of the Administrative Center; and Mr. Woollett also suggests that the Acropolis upon which is placed so great an emphasis, might be considered as superfluous as background for such a building.

The old Plaza Church near the old Plaza is shown on the fringes of a proposed new "old" Spanish town which is intended to perpetuate the spirit and simplicity of the present Olvera Street.

"The Railroad Station, shown on the plan, as accusing the City Hall, in the form of its "plan" and entourage of fountains, gardens, etc., is proposed as a focal point for one of the secondary axis leading to the City Hall. The plan adopted for the Railroad Station does not make the gesture as suggested here.

The adopted city plan has, unfortunately, no main artery leading directly to the City Hall, the center of the Administrative Center. Hence Mr. Woollett has proposed a series of secondary axis leading to the City Hall. North Broadway is one of these. By means of a very minor change in the street near the proposed Police Building it will be possible to view the North profile of the City Hall as one approaches the city from Pasadena.

"The Los Angeles Chinatown, as shown to the East of the City Hall, already has its foundation partly laid, as the Chinese are now living in this locality. In time we may hope for a skyline similar to the one shown in the lithograph.

"That anything like these sketches will
ever be built is remote but not improbable," Mr. Woollett explains. "The actual form which the improvements will finally assume will be dependent upon the idiosyncrasies of many different minds. The object of these studies is to stimulate interest in this superb architectural problem so that, as time goes on, the citizens of the City of Los Angeles may be moved to place the details of this development in the hands of the great architects, sculptors, and painters of the world.

"During the period of construction of this Administrative Center, a great part of which must necessarily be built during the succeeding ten years, Los Angeles would probably be able to go a long way toward achieving its goal of becoming a recognized art center. However, this would depend very largely on the manner in which these competitions were sponsored. Undoubtedly artists from the four corners of the world would be glad to come to Los Angeles to work if they could be assured, not only of compensation for their labors, but an attitude of reverence and respect for their ability, an attitude which is so often found in foreign capitols, and concerning which we, of a newer and fresher civilization, know so little."

The survey has been indorsed by the Los Angeles Art Commission and a copy has been transmitted to Sumner Spaulding, president of Southern California Chapter, American Institute of Architects; also copies to Admiral Christian Peebles, procurement division, U. S. Treasury Department, Washington; L. O. Whitsell, president of the California State Railroad Commission, San Francisco; M. C. Blanchard, chairman of the Engineering Commission, proposed railroad terminal, Los Angeles; and Lloyd Aldrich, city engineer of Los Angeles.

PLAN FOR DEVELOPMENT OF WATERFRONT, BERKELEY, CALIFORNIA

With Federal aid Berkeley's waterfront is being transformed from muddy tidelands into a beautiful aquatic park and yacht harbor. The Eastshore Highway, which will be Berkeley's major arterial to the San Francisco Bay Bridge, will provide a natural tidal basin for the development of an aquatic park. Total cost of the project is estimated at $1,000,000.
MURAL: "THE FIVE CONTINENTS," BY FRANK BERGMAN
TWO LOW COST MEDICO-DENTAL OFFICE BUILDINGS

By
FREDERICK W. JONES

TWO low-cost office buildings, designed along modern lines to meet individual requirements of professional practice with maximum efficiency, have recently been completed—one at Rodeo, Contra Costa County, California, and the other in Oakland.

Through their simple, practical design the two buildings reflect the dignity and progressiveness of the medical and dental professions. Both undertakings, based on sound business principles, are already paying investments with improved working conditions for their owners. The architects, Wayne S. Hertzka and William Howard Knowles, found that efficiently planned rooms, properly lighted and ventilated, enabled the doctors to better care for more patients at one time than was possible in the usual type of office. Ease of access from the street, the prominence of the building and the combination of medical and dental offices, have been factors contributing to the success of the projects.

Dr. S. N. Weil, in commenting on his new offices, said that by contributing to the improvement of his community he takes greater pride in his practice and his patients, in turn, take greater pride in him.

Dr. Knowles finds that he enjoys working so much more in his new surroundings that he can accomplish better work with less effort than formerly.

A. Lyle Winslow, M. D., who leases from Dr. Knowles, finds that his attractive offices, planned and built specially for him, have brought him many new patients.

In addition to the advantages above mentioned the owners have, in these two buildings, self-supporting investments which, when they retire, can be sold or
OFFICE BUILDING FOR DR. S. N. WEIL, RODEO, CALIFORNIA
Hertzka and Knowles, Architects

Without sacrificing informality, the architects sought to endow this building with the special character of a physician's office in a small town. Dignity without extravagance, and an abrupt departure from customary residential design, were the principal requirements. Cost, including architects' fee, approximately $7,150.

CONSTRUCTION OUTLINE

Foundation: Portland cement.
Frame Construction: No. 1 Common Douglas fir, Redwood sills, Balloon type framing.
Exterior Surface: 3 coat stucco, smooth sand finish, Golden Gate Tan Plastic; white Monterey sand.
Roof: 10-year guaranteed flat roof.
Sheet Metal: Flashings and decorative facias galvanized copper-bearing steel—Forderer Cornice Works.
Doors: Interior—Douglas fir,
Exterior—Philippine mahogany.
Steel Sash: Projecting type with lower vents extended in.
The problem offered here was to meet the needs of a physician and surgeon in a town where there was no hospital. Special electrical equipment, not generally required, had to be provided in a compact plan. In addition, a complete dentist's office was included so that the unit could serve as the town health-center.

OPERATING ROOM

The examination room serves also as a minor surgery and is equipped to handle emergency cases not ordinarily brought to a physician's office. A special operating room type steel window gives maximum natural light.
DETAIL, OFFICE BUILDING FOR DR. S. N. WEIL. RODEO HERTZKA AND KNOWLES, ARCHITECTS
ent for additional income. In striking
contrast to this the money expended for
omparable rented space over a period of
ears would be considerably greater than
these investments without having anything
d to show for it upon retirement.
Both buildings are frame construction
with stucco exteriors. The interiors are
i/ith treated plaster walls, soundproofed
ating rooms and linoleum and tile floors.
The psychological problem of putting pa-
ients at their ease was solved by providing
estful and pleasant waiting rooms, care-
fully planned circulation of traffic and fully
losed treatment rooms. The plans are so
arranged that, after consultation, patients
ay leave the building without re-entering
he waiting rooms.
An analysis of the cost of the two
pective buildings follows:

OFFICE BUILDING FOR DR. C. B. KNOWLES, OAKLAND, CALIFORNIA
Hertzka and Knowles, Architects

As in the Dr. Weil Building, modern design was felt by the architects to be the simplest and truest expression for a medico-dental building. Textural differences between simple materials were used for decorative effect, and a color scheme of cerulean blue, rose and cream, played an important part in the composition. Cost—$5,500 including architect's fee.

CONSTRUCTION OUTLINE

Foundation: Portland cement.
Frame Construction: No. 2 Common Douglas fir, Redwood sills, Balloon type framing.
Exterior Surface: 2 Coat stucco, painted with "Bay State" brick and cement coating; Finished Redwood board and batten.
Roof: 10-year guaranteed flat roof.
Door: Interior—Douglas fir and Philippine mahogany.
       Main Entrance—Philippine mahogany.
Steel Sash: Standard Light Casement without vertical muntins and set in place with fixed lights at bottom.
Wiring: Red Seal certified.
Although built upon a narrow lot, all important rooms have ample outside light. Both examination room and minor surgery have special operating room type steel windows. The plan is arranged so that patients enter a reception room common to both dentist and physician, but may leave by separate exits. The large corner window affords the reception room an outlook toward the street.

OPERATING ROOM
Convenient wall niches in front of the operating chair are provided for technical books and interesting exhibits.

KATHERINE STANLEY BROWN

in The Federal Architect

ARCHITECTURE AT THE NATION'S CAPITOL

The city of Washington, of which the beautiful plan by L'Enfant has been well carried out and added to by the members of the various commissions involved, has, in spite of expert advice and the expenditure of a great deal of money, only achieved to my mind in the last fifty years five or six supremely beautiful and therefore supremely successful structures.

Architecture is a blend of practical necessity and artistic ability, but though one of the two may outstrip the other neither is sufficient, nor are both. There is possible in a building a quality of mind which is extremely difficult to trace or describe, an infusion of spirit, a meaning. Possibly the idea of the building itself—the event it commemorates, if it is a memorial,—is so stirring that not only the architect but the layman regarding the completed structure reads between the stones, as it were, and feels an emotional reaction which the actual mortar and bricks, proportions and details have no power to give. Occasionally the architect of the building or the sculptor of the monument has felt the underlying idea of his problem so powerfully and his technical skill is so great that his creation actually is suffused with the spirit of the idea that prompted it.

Certainly this must be true in the case of the Lincoln Memorial, else why do thousands of people from every walk of life, experts capable of analyzing the source of each fragment of its pure and beautiful Greek details, and laymen unable to do more than feel impressed, stand before it motionless, speechless? It is a good test of a building's worth if before it one has nothing to say. To the expert, counting the twelve columns across the front, possibly daring to criticize the effect of the lift of the parapet across the facade, it becomes a pleasurable exercise of skill, like analyzing symphonic form when listening to a Tschaikowsky symphony. But as he listens the musician is moved, perhaps in an even greater degree than in the days before he was so technically perfect. As he speaks, the archaeologist, the artist, is stirred, but he seldom says those simple things that we all feel, for his mind is accustomed to involved convolutions.
If the emotional experience is great enough, however, he is thrown back into the lay vocabulary. A fine critic of design stood beside me the other night before the Memorial to Lincoln. The moon gave enough light for every detail of the facade to be visible, the majestic flood-lighted monument to Washington shimmered in E. Housman. He says when a "line of poetry strays" into his memory it is accompanied by various symptoms: "... a shiver down the spine; there is another which consists in a constriction of the throat and a precipitation of water to the eyes; and there is a third which I can only describe by borrowing a phrase from one of Keat's last

the long reflecting pool, the statue of Lincoln—which no one could really do, which Daniel Chester French almost did—was bathed in a soft blue light. The idea of Lincoln, the man, his integrity, his work was upon us. "In this temple as in the hearts of the people for whom he saved the union, the memory of Abraham Lincoln is enshrined forever." We stood without speaking. "Knocked cold," as the present generation might say. The man who stood beside me said: "That thing makes me want to cry."

A small boy of my acquaintance when asked to tell how one tells real poetry from mere verse replied: "It's poetry if it makes your stomach feel funny." This is not far from the scholarly analysis of the great A. letters, where he says, speaking of Fanny Brawne, 'everything that reminds me of her goes through me like a spear.' The seat of this sensation is the pit of the stomach." It would almost seem that poetry, as Housman also says, and by that same token, art, architecture, sculpture, were "more physical than intellectual."

Empathy, the act of feeling one's way into a work of art, seeming to be one with it and thus understanding it, is a scientific fact. It is easier to describe the feeling when the work of art is small, whole, as a piece of beautiful sculpture, a picture, or a poem. A building can seldom be grasped in more than one dimension. One may stand in front of it, and admitting that it has a plan, and three or fifty other sides,
forgetting that and judge it from the impact of the idea of its facade upon one's mind.

**Lincoln Memorial First**

It is from this superficial, but certainly not unusual, limited point-of-view that I say there are only five or six supremely beautiful creations in Washington, of pleasing to the eye, and in its stylized animals and unexplained shapes one adds to the pleasure of its symmetry an extra touch of surprise. The rear elevation is not so perfect but we have agreed to gaze in each case upon a single facade. It is a building which subdues one, awes one. The emotional reaction to it is intense, a combination which for sheer inexplicable loveliness I should put the Lincoln Memorial first. And I would follow it by the Temple of the Scottish Rite.

To the architect the Temple of the Scottish Rite is a piece of archaeology. It is an enlarged, a modified Mausoleum of Hallicarnassus: it is a projection of ancient shapes and symbols whose meaning is deep in the rites and traditions of "the ancient and accepted Scottish Rite of Free Masonry." Its carved sphinxes gaze down upon Sixteenth Street with as much aloofness and unexplained calm as their ancient Egyptian prototypes. The whole building towering above us, with each delicate cornice and moulding evenly balanced, each line of the whole duplicated and repeated, is infinitely of awe and curiosity. What does it mean? What do the Freemasons stand for? Even as before the Lincoln Memorial we think not of the building but of Lincoln, here we think of that secret and useful order with its roots, its origins far back in early traditions. The idea dominating the structure!

Prior to the fifty-year limit which I have arbitrarily set myself, there are so many successful and beautiful old buildings in Washington that one would have to deal with them separately. The Washington Monument is a superb example of the embodiment of an idea. George Washington is a legend, a tradition; although much is known about him, much is disputed, and no two Americans admire him for quite the same reasons. Nothing therefore could ex-
press the nation's veneration and admiration for him but just such an abstraction as the monument planned by Mills, a simple and yet majestic shaft, meaning little or everything, depending upon your own knowledge and point-of-view. The Patent Office, the Treasury Building, the old Post Office, all built by Mills, are beautiful and were the beginning of a Greek tradition for Federal buildings which has persisted until this day with, through the years, less successful results.

All Fine Buildings, But—

The White House by Hoban is a splendid building, but to come to our problem, what is American, and recent, and fine in Washington today? The Pan-American building is fine, but it is recapitulated Spanish. It is history. Paul Cret, who with Albert Kelsey designed it would be the first to say so. The Freer Gallery has the distinction of simplicity but it is not an interesting building until one enters the courtyard, despite the fact that a fine architect, Charles Platt, built it. The Archives Building is dramatic, but it has too much applied to it, it is "fussy," to use a dress-making term. It has not that peaceful reserve only possible through great wall spaces, skillful fenestration and restrained use of ornament. As you go by, the Archives Building glitters and flashes at you. I can only call it over-dramatized.

So then, this ideal facade that I am searching for must give me a sense of peace, of power, and of spirit. It must show me what the building is for to some extent, it must dominate my critical faculty, and give me a pleasurable emotion. I submit for this high office the Folger Shakespeare Library of Paul Cret. There the tall windows, the mouldings and cornices which seem to me to be the original conceptions of the architect, the beautifully sculptured panels portraying characters from some of Shakespeare's plays, the tragic and comic muses over the great doors, approach the majesty and power of Shakespeare's mind, reflect the hold that mind has kept through the centuries over humanity. The simple purity of that building, of the conception of that building, puts to shame the grandiose Roman elegance of the Supreme Court across the street.

The integrity of truth in order to administer justice should have been the spirit

ACADEMY OF SCIENCES. WASHINGTON, D.C.
Bertram Goodhue, Architect

actuating the creation of that building. To the lay eye no such honest proposition is visible. Directly across the street from the Folger Library a little Lutheran church from the Church of the Reformation, is almost very good. It is quiet and meaningful but limited in that the impression of a single sculptured panel, which is the church front, is all that is fine. Another noteworthy building is the municipal power plant designed by Paul Cret. There the vertical lines, the condensed simplicity of the whole, make it outstanding among other buildings erected for the same purpose, but the mass of the building in itself has not to my eye sufficient lift and inspiration to rank it among my list of ideal Washington buildings.

And the fourth building that I would have you look at is the Academy of Sciences Building by Bertram Goodhue. Long, restful, simple, the proportions of that facade are exquisite. The most exact
and beautiful Greek detail is used; the color scheme of white marble and bronze turned green is beautiful, and the great wall spaces, in which in the Greek tradition the stone courses are laid in uneven heights, are most interesting. Few of us can translate the Greek inscription that is applied to the frieze. But in our very inability so to do lies another certain symbolic power of the building itself. Who among us dares to say that he understands the wonders of science? And though we invent and discover and pin down on paper, in machines, in power daily more and more the facts of science—the illusive cause, the why these things are so eludes us forever. I feel that this building suggests all that to the lay mind, with the three shallow blue pools of water before it reflecting the changing sky, a poetic reminder that although we catalogue facts stolidly within our buildings, outside the changing water, wind and sky can find no adequate recorder.

Two Small Memorials

These are the buildings, and in a word the interior of each is sufficiently impressive as well. But there are two small memorials which, since I limited this article as I did to what is American, recent and fine in Washington today, must be mentioned. If they are not strictly architecture, at least an architect shared the planning and the design of them both.

The Adams Memorial. Ten feet from it one sits in the small enclosure planned so skillfully by Stanford White, cut off from the depressing stones to the dead, cut off from crowds and heat and traffic by tall holly bushes, tall pine trees. It is strange, mysterious, overwhelming. What does that single figure, fashioned of bronze, seated on granite, everlastingly silent, want us to know? Is the expression that of resignation? The world has failed but we will not let it know that we know? Are we to believe that this life over, there is more to come? The sunlight changes on the sculptured face. A man? A woman? Is that a shrouded or only a cloak to shelter one from the world? The sensitive lips; the brooding eyes, closed as if in death, but closed too only as if in penetrating thought. The flesh is alive. Is it only grief? Or sleep? It is not entirely known if John Adams’ wife died accidentally or by her own forethought. Perhaps that is what St. Gaudens wanted us to know. That life is fluid, uncertain, unsolved, everchanging. To put that into stone, into bronze is a superb achievement.

The Titanic Memorial has no such seclusion and peace to shelter its noble thought nor is it nearly as fine. On the esplanade swinging down from Georgetown to the river, one goes by it quickly, carelessly. But even so, the most casual traveler feels the lift of those outstretched arms. “To the brave men who perished in the wreck of the Titanic. They gave their lives that women and children might be saved.” It is caught forever in stone, that thought, that in honor women and little children, save them first. Call it gratitude, chivalry, what you will. The thought stirs the blood, the thought in stone does likewise. Henry Bacon, the architect of the Lincoln Memorial, designed it. Gertrude Whitney was the sculptor. It is fine as the embodiment of a single idea, even if it in no way approaches the superb abstraction which is the Adams Memorial.

Greek Traditions Praised

Perhaps all that I am saying after all is that Henry Bacon was a great architect; that I greatly admire the work of Paul Cret; that Bertram Goodhue was the most original architect that this country has yet produced; that Lee Lawrie and John Gregory and Brenda Putnam are fine sculptors. That Augustus St. Gaudens and Daniel Chester French were. That may be all, and yet what I have wanted to say is this: We have learned one thing in America about architecture, now that modernism has come

(Please turn to Page 40)
ONE OF THE INTERESTING FEATURES OF THE DESIGN, NOT LEGIBLE ON THE PERSPECTIVE DRAWING, WILL BE A SERIES OF DISKS—REPLICAS OF AMERICAN COINS—TERMINATING THE TOP OF EACH RECESSED PIER. EACH COIN WILL BE THREE FEET IN DIAMETER AND ARRANGED IN CHRONOLOGICAL ORDER TO PORTRAY THE HISTORY OF AMERICAN COINAGE FROM THE FIRST MINTING IN PHILADELPHIA TO THE LAST SIGNIFICANT COIN MADE IN CALIFORNIA.
THE SITE of the proposed new Mint in San Francisco, bounded by Duboce Avenue on the south, Webster Street on the west, Herman Street on the north and Buchanan Street on the east, is a precipice of serpentine rock which rises ninety feet above the lower street level. Forty feet of rock is being removed to create the plateau which will receive the building.

The original proposal for the building provided for a facing of granite with an alternate proposal for using terra cotta. The building at the base is 207' - 9" along the front and 185' - 1" in depth. It is designed in modern classical style, and its walls will enclose four stories in front and three stories at the rear.

Basically the building is a manufacturing plant. It must respond to the need of manufacturing processes, in light, in area, in ventilation and in efficiency. In the architectural design this is expressed in large areas of window space and duo-lateral lighting from both the outside and the inside court around which the building is built.

Across the Duboce front of the second floor are grouped the administrative and related clerical offices and such spaces as are provided for contact with the public.

While essentially a structure for the minting of money, the building is designed in a spirit of dignity. Its facades are symmetrical and regular in repetitive elements of pier and window. Its base slopes into the rocky hill, lending strength to the composition of the building and its relation to the site. Terminating the top of each deeply recessed pier is a replica of an American coin, some three feet in diameter. These disks tell the story of minting in the United States from the first coin struck in Philadelphia to the last significant coin struck in California. Each coin is in its chronological order, so that a numismatist or a layman may read the history of American coinage by walking around the building.

The public spaces are developed in a simple but effective manner in marble and bronze. Surfaces are plain, almost severe. Changes in material are used to obtain emphasis rather than projected or moulded forms. Lighting is indirect without the use of exposed fixtures. All ornament throughout the building is symbolical in nature and has its inspiration from the coins processes of manufacture. The building is fireproof and earthquake-proof throughout. Vibration tests were taken on the site and vibration periods recorded before engineering calculations were started.

The site is to be landscaped with California flora. Its rocky character will be relieved with shrubs, but the natural formation and the varying and interesting color of the native rock will be an important part of the landscaping scheme. A formal hedge will separate the slope of the rocky site from the sidewalk, otherwise the landscaping will be largely informal. A stair rising from the center of the site on Duboce Avenue will unite the base of the site with the building. A continuous drive 20' - 0" wide surrounds the building at the level of the plateau. It is entered from Herman Street at the north which is the main motor entrance to the building. Parking space is provided for sixty-five cars.

Clinton Construction Company, of San Francisco, are the general contractors, and construction is well under way.
IN less than three years cities around San Francisco Bay will celebrate an international exposition to mark completion of the world’s two largest bridges. This will be the first international celebration to be held in San Francisco Bay Region since 1915 when Panama Pacific International Exposition marked the completion of the Panama Canal. Sponsoring the exposition will be the San Francisco Metropolitan area which includes the cities of San Francisco, Oakland, Alameda, Berkeley, Albany, Hayward, San Leandro, Sausalito, San Rafael, Richmond, San Jose, Palo Alto, Redwood City, San Mateo, Burlingame and others.

The inspiration of the International Exposition will be the completion of the Golden Gate Bridge, linking San Francisco with Marin County and the Redwood Empire, and the completion of the San Francisco-Oakland Bay Bridge crossing the 8½ miles of the bay between San Francisco and Oakland.
The Golden Gate Bridge, costing $35,000,000, boasts the longest suspension span in the world. The 4200 foot span between the San Francisco and Marin towers is 700 feet longer than the celebrated George Washington Bridge. The Golden Gate Bridge is also the first large bridge ever to be constructed across open sea. Its 746 foot towers are the tallest structures west of Chicago. Started in 1932, its completion is expected early in 1937.

The San Francisco-Oakland Bay Bridge, costing $77,000,000, is in reality a series of bridges from San Francisco to Yerba Buena Island in the center of the San Francisco Bay and thence to Oakland. A double-deck six lane roadway will take care of both automobiles and interurban train traffic. Towers of the bridge rise 520 feet above water, higher than the city’s skyscrapers. Foundations of some of the piers lie more than 200 feet below the level of the bay, requiring in their construction, engineering methods never before employed. Started early in 1933, the San Francisco-Oakland Bay Bridge will be open for traffic the latter part of this year. The tunnel through Yerba Buena Island, connecting the San Francisco and Oakland units of the bridge, is the world’s largest vehicular bore.

The site of the exposition lies in the center of San Francisco Bay, midway between San Francisco and Oakland, on shoal land located just north of and adjoining Yerba Buena Island. It is in the geographical center of a population area of 1,785,000.

During the current year, an area of 385 acres of this shoal land will be filled in to provide the site of the Exposition, and after the Exposition the land will be used for a modern municipal airport and seaplane base. According to present plans, the exposition area will be 5500 by 3420 feet—more than a mile long and about two-thirds of a mile wide—larger than the site of Chicago’s Century of Progress.

The exposition site will be reached by the bridges and also by ferries from San Francisco. Ample parking space for normal attendance is provided. The exposition site can be reached in approximately 10 minutes time, either from downtown San Francisco or from downtown Oakland.

Ideal weather conditions prevail at the shoals site. Government records show an almost complete absence of fog and rain during the months the exposition will be held, and average wind velocity of only six miles an hour.

The exposition will be in sight of both bridges and directly connected with the San Francisco-Oakland Bay Bridge.

Funds for seawall and fill for the exposition site have been provided through a $3,043,000 Federal WPA grant. The roadways, causeway, trestles, landscaping, and drainage of water systems are provided through an additional WPA grant of $1,296,000. A further PWA grant of $1,711,000 to be matched in part by local funds, will provide paving, ferry slips and some buildings. It is estimated that in addition to this $6,000,000 in Federal funds, another $6,000,000 will be raised through private subscriptions, for building and administrative expenses. A campaign for private subscriptions, through sale of bonds, is now being planned.

An attendance of between 15,000,000 and 20,000,000 is expected, which should enable the exposition to meet all operating expenses and to retire all obligations. The attendance at the Panama Pacific International Exposition in 1915 was 13,000,000. Chicago’s Century of Progress drew 22,000,000 people in 1933 and 17,000,000 in 1934.

Approximately one year will be required to complete the fill and seawall. During that time, architectural plans for the buildings, taking in the requirements of the exhibitors and the needs of the airport to be established after the exposition, will be com-
pleted so that actual construction of the buildings can start in 1937.

It is estimated that the exposition during 1936 and 1937 will provide employment for more than 3,000 people in construction work. An additional 10,000 persons will be employed during the exposition itself.

The exposition will be international in scope. Its theme will be modern developments in transportation and communication as symbolized by the bridges, by the transoceanic air services and the progress in radio and television. Participation of foreign nations, particularly those around the Pacific and Central and South America, already is being arranged. The unique location of the exposition makes it possible to have merchant and naval vessels from every nation in the world actually a part of the exposition, anchoring alongside the exposition or tying up at the piers. Because the exposition grounds will later become one of the most centrally located and busiest airports in the world, aviation activities and developments will also be dominant features of the celebration.

The San Francisco Bay Exposition, Inc., which will operate the exposition, is a private non-profit company of civic, business and financial leaders of the San Francisco Metropolitan area, headed by Leland W. Cutler, former president of the San Francisco Chamber of Commerce. Vice Presidents are Bert B. Meek, executive vice-

The City of San Francisco which owns the shoal lands, has leased the property to the company for exposition purposes, and the company will act as official agent of the City of San Francisco in the administration of Federal funds to be spent on the project.

The architectural commission is headed by George W. Kelham. Members of the commission include: — Lewis P. Hobart, Ernest Weihe, Timothy Pflueger, Arthur Brown, Jr., and William G. Merchant.

Director of Works for the exposition is W. P. Day. Assistant to the president and director of exploitation is Howard Freeman. Executive officer for the Exposition Company is Brigadier General William E. Gillmore, U.S.A., retired.
A FORMAL Colonial type residence won for its designer, H. Roy Kelley, architect of Los Angeles, the 1935 House Beautiful prize. The award was made by a jury consisting of nationally known architects named by the A.I.A. Judgment was based on excellence of design and plan, economy in space subdivisions and convenience; adaptation to lot and orientation and skill in the use of materials. Readers of this magazine are familiar with Mr. Kelley's success as the winner of numerous national competitions during the past several years.

The accompanying illustration and plans, show the prize winning house—a Colonial dwelling owned by the Misses Gail and Marie Houston in Westwood, California. The exterior is of brush coated common brick with shingle roof. The interior partitions are plastered and the floors are of oak and linoleum. The house is equipped with a modern type gas-fired unit furnace, distributing thermostatically controlled warm air. A gas range and automatic gas water heater are also part of the heating equipment.

BUILDING MODERNIZATION

By

CLARK BAKER

The alert architect is realizing that right now he is on the eve of an upswing in building modernization, particularly of commercial building fronts, an upswing which can mean a great deal to him both in income and reputation.

There is a new attitude of commercial establishments toward the maintenance of attractive buildings—an attitude which came out of the experience gained during the depression—a knowledge of the value of the attractive and prosperous appearance of a building-front. In other words, the architect no longer has to "sell" his client on the advantage of modernizing his building front—the client realizes its dollars-and-cents value and is in a receptive mood to consider plans.

While the depression taught the commercial world the importance of attractive buildings, financial stringency prevented the majority from profiting from this knowledge. Now the Federal Housing Act organization is arranging the financing of modernization on very favorable terms, and hundreds of merchants are taking advantage of the opportunity to remodel their stores and business properties.

Not only is the individual merchant eager to improve his building, but there is a growing tendency toward the continuance of the cooperation learned during the past few years, and groups of neighboring merchants are considering modernization plans which are designed to harmonize entire blocks, or business areas.

An experiment of this kind projected by the property owners in a down-town section of Oakland embraced plans for the harmonious modernization of an area of several blocks. Out of this original plan has come the complete modernization of fourteen buildings in the area, and many of the others are planning to follow through within the next year or two.

And such far-reaching development requires a great deal of foundation work and the collective study of all the crafts represented in carrying out such a program. From this necessity has developed an organized group which includes, in addition to property owners, representatives of each craft involved, such as architects, contractors, designers, lighting specialists, and the glass, tile, paint, and decorative metal industries. In addition, practically all of the clubs and associations devoted to civic im-

JANUARY, 1936
improvement have representatives at the meetings, at which different aspects of the problems are presented by a representative member of each craft, and the problems discussed by the entire group. In this way every member is aware of the complete problem and how his particular contribution to the total effect of a building front is affected by the other factors.

As an example, the representative of the window glass industry gains an understanding of how lighting can be planned to eliminate the danger of undesirable reflections in the glass. The representative of the paint company learns what effect different methods, colors, qualities, and intensities of lighting have on pigment colors. The architect and lighting specialist study each others problems too, in order that the carefully planned architectural effect is enhanced, not reduced in effectiveness, by the lighting.

Group study by the crafts involved has been found as highly desirable as group action of property owners in modernizing a business area, as in both cases each profits by the activities of the others. The craftsman has a wider knowledge of his part in the total effect, and the individual store gains by the attractiveness of neighboring buildings.

Whole-hearted support is given these cooperative activities by a varied list of interested groups. Store managements know the selling power of attractive fronts, property owners welcome the increased percentage of revenue on their investments, realtors find modernized buildings easy to lease or sell, citizens want a beautiful city, architects are benefited by the attractive setting for their buildings.

The civic interest groups are particularly interested in programs of modernization of downtown property, especially at the present time when much property is in a run-down condition after several years of business depression, and they are lending their whole-hearted support to this program which promises increased attractiveness for the city.

ARCHITECTURE AT THE NATION’S CAPITOL

(Concluded from Page 31)

and gone its bones, that structuralism, functionalism, whatever you wish to call it, is a necessary fact in the creation of beauty. And then I, tentatively, because of this I am not sure, suggest that where an architect makes use of pure Greek detail, or of original detail based upon Greek traditions, he comes nearest to pleasing our national eye. For no reason perhaps beyond the fact that the Greek brought detail closer to beauty than the architects of any other period. We copied the Georgian architecture of England and made some lovely things, especially in our Colonial period, but now we seem to have lost the knack of doing more copy. But with the Greek revival Federal buildings of Mills we struck a sure and a firm note. . . . There are dozens of beautiful fragments in Washington, certain corners of houses, bridges, columns, fountains; but these five, possibly six creations seem to me in beauty and in meaning to have accomplished their purpose.
ANCIENT structures are generally distinctively different from modern structures in one particular, namely, in the use of materials which take heavy tensile stresses. In all ancient works the major stresses in a structure had to be from necessity compression stresses. Thus were developed to a high degree the arch and the dome heavily buttressed to insure compression under the spreading action of such structions.

With the extensive use of steel, modern structures have developed new forms principally because with the use of steel in tension we no longer need heavy piers and buttresses to span over large areas. This development has occurred in practically all types except in domes. Heavy buttresses in domes have been eliminated by the use of ring steel, but it is still generally felt that the dome structure itself must be spherical or approximately so in shape, and fully symmetrical about a vertical axis to insure the absence of tensile stresses.

With the proper use of steel, however, it is not necessary to be so limited in the shape of dome structures. The accompanying photograph shows a reinforced concrete dome structure of new form recently designed by the writer and built in San Francisco. The dimensions of the room shown are 70' 1" x 44' 6". The side walls are 9" thick; the end walls 6" and there are only 4 columns, one in each corner, and one end is open practically the full width of the building. The rise of the dome is 8 feet. The joist are 4"x8"-24" c-c, and the slab is 2½" increased to 5" at ends where shearing stressed require a thicker slab.

In this type of dome there are, in addition to the direct stresses resulting from the spreading action due to the rise of the center, certain bending moments to be taken care of. The concrete joist shown are designed to span the width of the straight sections of roof, namely, about 16 feet. The spreading action of the roof is resisted by the sloping side sections of the roof acting as approximately horizontal girders and transferring the entire thrust to the end walls where the necessary tensile steel in the form of reinforcing bars is provided. Considerable shearing stresses are developed in the roof slab and the end walls which are, however, readily taken care of by the proper use of steel.

JANUARY, 1936
Upon removal of the shores the center dropped a total of 1/8” and each side wall spread 1/16”. When the sun warmed the roof, the expansion caused the center to rise to its original position but, of course, the lateral spread was not decreased.

In this particular instance, a three part roof was used. This can be varied to suit conditions. A roof may be made of two, three, four, five or more parts, depending on the area to be spanned, and the architectural treatment and other requirements. There is no limit to the spans one may go to except, as in all types of construction, the economic one of increasing costs with increasing spans. Concrete joists are here used; beam and slab or slab construction are equally possible, the choice depending entirely on consideration of cost and appearance.

The many advantages of this type of domed roof are obvious, such as absence of columns which gives a maximum of usable space and utility; absence of trusses which gives a maximum of head room; naturally pleasing appearance; adaptability to architectural treatment; better lighting and ventilation; less subject to fire damage and lesser cost for a similar construction with trusses. In this instance, the only extra cost involved over a similar roof on trusses was about $150 for reinforcing steel. Steel roof trusses, with supporting columns for this building, would cost not less than $600, showing a saving of $450, or about 15c per square foot in this case.

The building was built for the Steel-Form Contracting Co., for the storage of forms. Space utility, head room and economy were the controlling factors.

The various advantages listed above, make this type of roof construction particularly adaptable for use in garages, hangars, dance rooms, large dining rooms, auditoriums and theaters.
THE BONNEVILLE DAM PROJECT

SPANNING two channels—an island and the boundary line between Oregon and Washington—the Bonneville Dam is fast becoming a reality. Eventually this stupendous project will harness the Columbia River and put its waters to work creating electricity for manufacturing and domestic consumption. Completion of the dam is scheduled for July, 1937. A writer in the Standard Oil Bulletin summarizes the project into four units:

One — A main spillway dam between Bradford Island and the Washington shore (the widest channel), with an overall length of 1250 feet and a spillway crest 900 feet long. This will be joined to the power-house dam by a huge L-shaped levee across the island.

Two — Power-house and navigation locks between Bradford Island and the Oregon shore. It is planned to install at first two units of equipment for generating 115,000 horsepower, but the foundation work and substructure will provide for the addition of four more units to double the electric output. The navigation locks will be capable of raising ocean-going vessels from the lower river level to the upper river level, enabling them to penetrate several hundred miles inland.

Three — Relocation of railroads and highways on both sides of the river. This involves raising four miles of Union Pacific System tracks in Oregon a maximum of 34 feet, and relocating most of the Columbia River Highway east of Cascade Locks; on the Washington side, it means relocating about two and one-half miles of the Evergreen Highway, and raising the tracks of the Spokane, Portland & Seattle Railway a maximum of seven feet for a distance of almost five miles.

Four—Incidental work, including such preliminaries as the building of construction camps, social and sanitary facilities for the workers, and homes for the employees who will remain after the project is completed.

Engineers say that the Columbia is the greatest potential power-producer in North America; that it is capable of generating about fifteen times more power than it would be possible to produce by using all of the capacity of Niagara Falls; and that this and the other New Deal project in the Columbia Basin (the Grand Coulee Dam) will be two of the nation's greatest hydroelectric developments. These statements are easy to credit, for the Columbia is second only to the Mississippi in volume of
Looking west, downstream, from the Oregon side of the Columbia River, this view shows the site of the Bonneville project before work was started. The river may seem docile, but its volume of water makes this dam construction one of the most difficult ever attempted.  

(Photograph by Photo-Art Studios)

One view of the navigation locks being built between Bradford Island and the Oregon shore of the river. Above is seen the present Union Pacific Railroad right-of-way. The tracks of this line will be relocated, moved higher up the canon slope so big ships may pass where trains now run.
The power-house dam as seen from the downstream side. Over the roads in the foreground constantly roll Standard Oil trucks with fuel and lubricants used by the contractors. When the project is completed, these roads will be buried beneath water flowing through the power-house above the dam.

A recent photograph of the power-house dam, across the river channel on the Oregon side. The view is of the upstream face; during construction the water of this channel has been diverted. The power-house at this point will generate 115,000 horsepower, or 86,000 kilowatts; later this output may be doubled.

Illustrations Courtesy Standard Oil Bulletin
water. It rises in Canada, follows a devious course through Washington, burrows its way through the Cascade Range, via the famous Columbia River Gorge, flows through a green and fertile region, and finally joins the Pacific beyond Astoria.

Naturally the damming of such a stream involves tremendous physical difficulties. The first problem is to divert part of the water so that construction work can proceed—in itself a task such as is faced by few engineers. If you care for figures, here are a few: At its peak flow, this river carries more than 756,000,000,000 gallons of water a day past a given point. The average flow during each twenty-four hours would supply the City of Portland for thirty-seven and one-half years—one day's supply every four seconds. And finally, the average annual flow is enough to cover Oregon over two feet four inches deep.

It is impossible to work in the river during flood periods, and this means that one-half of the main dam must be completed in the working season of about eight months between floods, although much other work can be carried on the year around. During the winter there are the added difficulties of snow, low temperature, floating ice in the river, and many other conditions not encountered in a more southern clime. Therefore it is necessary to provide better than ordinary housing, complete little cities for the army of workers.

This project is so varied in its aspect, so tremendous in its scope, that it holds interest for the general public as well as for construction men and engineers. Among other things planned on a huge scale is a double radial cableway, now under construction, for use in pouring the concrete for the main dam. It will have a span of 2025 feet, supported by one tail-tower 217 feet high and two head-towers each 90 feet high. The gigantic bucket that travels this cableway will be able to deliver 25 tons of mixed concrete on each trip. This is just one of the sights that will attract visitors when the "pouring" stage of the dam is reached. Right now there are scores of interesting activities, from moving rock and earth in wholesale quantities, to erecting the masonry barrier across one channel.

The aim of the Bonneville Dam project is to bring about development in industry and agriculture of the Pacific Northwest. There is a vision of great transmission lines carrying electrical energy far and near. Since the dam is located on two trans-continental railroads, the suggestion is that industrial plants locate in the shadow of the tree-clad hills. The construction of the navigation locks and the proposed deepening of the channel are to permit the loading of factory and farm products directly into ships for transport to all parts of the world.

A RAINY DAY IN SAN FRANCISCO, NOT 20 YEARS AGO, AS YOU MIGHT THINK AT FIRST GLANCE, BUT TODAY WHEN HORSE DRAWN VEHICLES ARE AS SCARCE AS HEN'S TEETH

Photo by J.E. Jellick
HOME OF THE MODERN METAL APPLIANCE COMPANY, OAKLAND, CALIFORNIA

MONEL METAL KITCHEN MEETS GROWING FAVOR

The growing popularity of monel metal for domestic uses has brought a new company into the Trans-Bay field. With W. H. Picard, for many years a leader among the contracting plumbers in Northern California, as its president, the Modern Metal Appliance Company has been incorporated and offices and show rooms have been established at 4238 Broadway, Oakland. The location is an excellent one, being part way between Oakland and Berkeley, close to Pied-

ALL FIXTURES, TOP OF SINK, ETC., IN THIS MODERN KITCHEN ARE MONEL METAL

JANUARY, 1936
mont, and with the completion of the Bay Bridge, will be within driving distance of San Francisco. Formal opening of the display rooms was held early in December with a preview for architects and home builders, many of whom were astonished at the remarkable developments that have been made in recent months in monel metal products, together with the greatly reduced prices.

The new company is exclusive California distributors of such nationally known products as the Whitehead monel metal storage heaters, range boilers, tanks and water softeners; Inco standardized "Streamline" kitchen sinks, and "Straitline" cabinet sinks, tops and back splashes; also metal cabinets, flat rim bowls, strainers and faucets.

With reduced prices on monel metal goods architects are specifying them and they find their clients more receptive to their installation, since they not only insure greater durability than other fixtures but are designed with an attractiveness that make for a kitchen ideal in appearance and efficiency. Monel metal is two-thirds nickel and one-third copper—it is corrosion resisting and will not rust. Monel metal is said to be more than twice as strong as the material used in any other range boiler manufactured.

One wing of the Oakland building is devoted to model kitchen exhibits of monel metal equipment while the other portion of the building is arranged with bath room displays for Mr. Picard's separate plumbing business. The upstairs portion is given over to the executive offices and storage room.

BOOK REVIEWS
By Edgar N. Keraulff

This volume will be found to have the utmost interest to architects, engineers, contractors and general building officials. It covers the whole field of specifications referred to under the uniform building code, which are legally a part of the code, and are required to be filed with the city or county clerk.

There are sixty-three standard and tentative specifications and test programs compiled from many sources. The text is amplified by the addition of a number of well executed drawings and illustrations. Nationally recognized engineering and technical societies have assisted in the preparation of this data.

Several years ago there came to the attention of the writer a copy of a book by this same author. At that time mention was made of the beauty and completeness of that volume.

"Color in Sketching and Rendering", is one of the outstanding books of its type to be published in 1935.

The architect who lives again his student days—the days in which he had the time and the full inclination to sketch those things that appealed to his developing sense of perspective and his widening vision—will find in this book a source of pleasure and delight. One can live again in retrospect these sketching journeys and it is a safe bet that many an architect who sees this book will dig out from almost forgotten corners the drawings and the color sketches made long ago for interesting comparison.

BAKERSFIELD SCHOOL BUILDINGS
Kern County Union High School District will hold an election January 17, at which time it is proposed to vote bonds in the sum of $200,000, proceeds to be used to finance high school improvements in Bakersfield. A similar proposal was defeated at an election held on December 6. Chas. H. Biggar, Haberfelde Building, Bakersfield, is the architect.
NEW SCREEN FOR METAL CASEMENTS

A problem which has offered considerable difficulty to architects and builders is that of attaching screens to metal casement windows. The Marvel Casement Screen Company of Brooklyn has recently introduced a new screen, complete with a light frame of its own, which attaches directly to the casement frame by means of a patented clip. Screen and frame are made of rolled steel, and can be obtained in a variety of finishes, such as stainless steel, japanned, or lacquered in various colors to harmonize with the decorative scheme.

As will be seen from the accompanying photographs, the screen is hung on pin hinges to its own frame. The latter remains attached to the casement and need not be removed to detach the screen. Provision is also made for easily replacing the bronze screening in case of damage or corrosion.

Ever since the general introduction of the steel casement window the problem of screening has been one of considerable difficulty. Many types of screens have been tried, such as roll screens, sliding screens, and others which were hinged directly to the sash. However, all of these required special tools for attachment, and were not always satisfactory in operation, since the mechanism was delicately adjusted and easily damaged.

This new screen can be put on in a few minutes by any handy-man without the use of tools. The clip, which is shown in the accompanying photograph, is the secret of the simple installation of this new device. This clip is made of spring steel, securely attached to the screen frame, and when once in place makes a permanent attachment. The method of pivoting the clip is unique and is the important patented feature of the new screen.

The screen is said to be particularly suited for use in large apartment houses, hospitals, offices and public buildings.
A revised Agreement Form "G" governing contracts with architects for preparation of drawings and specifications for new school buildings in Los Angeles has been adopted by the Board of Education in that city. The new form, submitted to the building committee by Secretary H. E. Griffin, was prepared in collaboration with various representatives of the business manager's division, including the board's architect, A. S. Nibecker, the controller and a representative of the county counsel's office. Some of the main features of the revised Form "G" were summarized by the secretary in his communication to the building committee, as follows:

(a) The drawings and specifications shall be prepared so that the ultimate construction cost shall not exceed the preliminary estimate; and in such manner as to conform to all relevant laws of the State and to the Rules and Regulations of the State Division of Architecture:

(b) The fee to the Architect shall be 8% of the original contract cost, plus 8% of the cost of extras to the contract when the Architect is required to perform services in connection therewith; and the fee is to be paid to the Architect, as follows:

20% upon approval of the preliminary work; up to 50% upon the submission of the working drawings and specifications to the State Division of Architecture; up to 60% upon adoption by the Board of the working drawings and specifications; up to 75% upon award of the contract for the construction work; up to 85% upon completion of 50% of the construction work; and up to 100% upon completion of the construction work; it being understood that, if after adopting the working drawings and specifications, the Board does not advertise for bids for the construction work within thirty days, the fee shall be paid up to 75% as full and final payment to the Architect for services to the date of the payment;

(c) The Architect shall furnish structural engineering services; and if a Structural Engineer is retained by him, the Structural Engineer shall be paid (by the Architect) a fee of not less than 2% on wood frame buildings and 2.5% on all other buildings, computed upon the same basis as the Architect's fee, with certain exclusions of work in connection with which the Structural Engineer performs no services;

(d) The Architect shall retain a Mechanical Engineer who shall be paid (by the Architect) a fee of not less than 5% of the contract cost of construction work that is based on drawings and specifications prepared by the Mechanical Engineer;

(e) The Architect shall retain an Acoustical Engineer if necessary;

(f) All employees engaged under the Agreement shall be paid not less than the following hourly wage rates:

Senior Technical Employees, $1.25 per hour. Junior Technical Employees, $0.87½ per hour. Apprentice Technical Employees, $0.50 per hour. Bookkeepers, typists, and other similar non-technical employees, $0.60 per hour;

(g) Every employer of labor shall carry proper compensation insurance;

(h) Provisions for time limits for the completion of the architectural work;

(i) The Board may cancel the Agreement if the Architect fails to provide prompt, efficient and thorough service;

(j) The Board may suspend indefinitely or abandon the construction of the building, in which event the Architect shall be paid in proportion to the work performed by him;

(k) The Architect shall supervise and superintend the construction work and shall approve the contractor's requests for payments; and

(l) All drawings and specifications shall become the property of the District;

Revised Form "G" includes other provisions similar to Agreement Form "G" heretofore used by the Board.

$750,000 PORTLAND BUILDING

Plans are nearing completion by staff architects of Montgomery Ward and Co. for a nine-story and basement wing addition to the Portland store. According to J. D. Bullock, local manager, about $750,000 will be spent on the improvement which will be started in the near future.
ARCHITECTS NEEDED TO "HUMANIZE" SMALL HOUSE

ACTION by architects to aid mass building of small houses is urged by a committee on site planning and grouping of the New York Chapter of the American Institute of Architects headed by Henry Wright, city planner. To "humanize" the small house, architectural studies of community organization are needed, according to the committee.

"The small house field can be reached and improved only to a limited extent if the efforts of architects are confined merely to the reduction of the cost of plans and the improvement of design," the committee says. "This field has been and will continue to be served mainly by the mass builder who has obvious advantages for economies and methods of large scale financing.

"His failure in the past to produce a more creditable output has been because of his limitations in planning ability and in appreciation of the possibilities of group planning inherent in mass methods. It is therefore believed that one of the most important opportunities for the architectural profession lies in making studies of and suggesting the possibilities of better community organization open to the mass producer."

Mass production of small houses can be relieved of monotony by the simplest means, while preserving the inherent economies, the committee declares. "A staggered frontage is possible in group building but unattainable through individual procedure," it is explained. "The private lane or cul-de-sac has further advantages in both economy and living quality but is less appropriate to a gradual building procedure than to a situation in which it can be completely built up in one process.

"The variations are of the simplest nature, variety being obtained by grouping rather than by trite changes in a uniform elevation. A considerable degree of good orientation may be achieved by merely turning a simple plan. Effective group relations and interesting external appearance is also produced more tellingly than by 'doling up' the individual house. A better relation of garden to living area in the house is also arranged.

"More subtle and interesting effects can be secured where the plans can be carefully worked out for the use of two or more standard base plans, with, however, uniform kitchen, bath, and stair features. It is considered imperative that all such proposals be of a simple nature to be readily understood by the average type of builder and sales agency in the field.

"Lot lines should not become too complicated, and spaces requiring common maintenance should be avoided or left optional with the builder. On the other hand, builders must be convinced that they have a valuable selling advantage in featuring permanent qualities and livability in place of possible easy turnover and quick profit.

"The American Institute of Architects can aid morally as well as technically by sponsoring the needed reforms in building laws and city planning so as to encourage desirable departures from the ordinary cut-and-dried but extravagant processes of suburban land expansion. Some of the existing wastefulness could be curtailed by altering street patterns, and safety, interest, and quiet could be introduced into residential neighborhoods.

"As a better understanding on the part of both the architect and the builder is developed, the latter will naturally bring in his problems to the individual architect for solution. Architectural studies with the encouragement of the Federal Housing Administration, should do much to humanize the small house in our midst."

Discussing site costs, the committee states that lots with completely developed improvements will average not less than thirty dollars per foot with the normal street plan and without speculative profit.

"Lower costs may at times be available through sacrifice or where less complete improvements are required or in smaller cities. It is considered desirable to include with even such inexpensive houses more land than is customarily offered by the large builder. A fifty-foot lot of from 5,000 to 6,500 square feet, depending upon depth, is, however, somewhat overgenerous and out of proportion to the house cost proposed.

"Fifty feet for the width of the lot is essential to a good standard of spacious on the basis of a uniform set-back. Certain simple departures from such set-back can, however, be suggested which would add to the appearance of the neighborhood and reduce the average frontage to forty feet, or $1,200 for the lot with complete public and basic lot improvements. A further saving of perhaps $200 might be had through the possibilities of
narrow roadways and less expensive pavements in minor streets and cul-de-sacs."

The committee, in addition to Mr. Wright, was composed of J. Andre Fouilhoux, John Theodore Haneman, and Frederick G. Frost, winners in the New York Chapter's recent low cost house competition, in which first and fourth prizes were awarded to Mr. Fouilhoux for his design of a home aimed to meet the needs of 75 per cent of the nation's population. The committee's report was based upon a study of the forty-one designs submitted by thirty-two architects.

HARDWARE IN MODERNIZATION
As modernization sweeps in expanding volume over the country, it finds a strong base in hardware. Classification of jobs undertaken shows hardware in practically every one. Work listed as redecorating, exterior repairs, outside painting with its inevitable scaffolding, remodeling generally, interior repairs, reconstructing bathrooms and kitchens, addition of rooms, all calls for articles manufactured by the hardware industry. More specifically analyzing this work, which is running into the hundreds of millions of dollars, we find average percentages of total to be: — heating, 17.71; redecorating interiors, 15.30; plumbing, 11.74; exterior repairs, 9.86; painting outside, 9.70; roofing, 9.61; general remodeling, 7.02; interior repairs, 6.61; cementing 3.84; lighting, 2.90; additional rooms, 2.19; bathroom remodeling, 2.15; kitchen remodeling, 1.12; miscellaneous, 0.25. One manufacturer, who has offered credit to property owners, has uncovered a fact of tremendous bearing on the final outcome of the better housing movement. He says only $1 of every $6 spent on home improvements is credit money. This shows home owners are using their savings. As savings bank deposits have increased steadily in the past few years, this tendency to use savings for home investment argues for continued expansion of such operations. And they all call for more hardware.—Condensed from Hardware World by Real Estate Digest.

CITY-COUNTY BUILDING
Richard S. Requa, William Templeton Johnson, Louis Gill and Sam W. Hammill, architects, all of San Diego, are preparing plans for a city-county office building to be built in the new civic center at the foot of Ash Street in San Diego, a WPA project. J. H. Davies, Ocean Center Building, Long Beach, is the structural engineer. The building will be a two-story and part three-story reinforced concrete structure with a steel frame tower. Estimated cost is $1,000,000.

WESTINGHOUSE GOLDEN JUBILEE
Fifty years of progress and usefulness were the key notes of the golden anniversary of the Westinghouse Electric and Manufacturing Company celebrated by its 43,000 employees and friends, January eighth. In all the principal cities where the company maintains executive offices or plants, the employees gathered around the festive board to listen to a nation-wide hook-up of an address by A. W. Robertson, Chairman of the Board of the Westinghouse Electric and Manufacturing Company. Mr. Robertson was introduced by F. A. Merrick, president of the company.

The banquet here was held at the Hotel Oakland, and was attended by approximately five hundred people. W. R. Marshall, vice-president, presided. The program included music and informal talks, concluding with two interesting moving picture reels.

During the fifty years of the company's corporate existence many advanced engineering projects have been successfully achieved. The record starts in 1886 with the development of a transformer which made possible the whole alternating current system and ended in 1935 with the construction, for the Boulder Dam, of two of the largest water wheel generators in the world.

During the past year, the company also equipped the New York, New Haven and Hartford Railroad's stream-lined train "Comet" with Diesel engines and electrical equipment throughout. Continued progress this year may be looked for from Westinghouse engineering and research activities. Highly trained scientists and technicians may be expected to uncover new secrets to be crystallized into epic-making applications of electricity to all complex activities of modern life.

TO MODERNIZE 80 BUILDINGS
Messrs. A. R. Walker and P. A. Eisen, 708 Pacific Commerce Building, Los Angeles, have been retained by the North Vermont Avenue Improvement Association, in an advisory and consulting capacity, to design a general community scheme for proposed improvements to buildings on North Vermont Avenue, between Franklin Avenue and Los Feliz Boulevard. Between 75 and 80 buildings, with a total frontage of 1960 feet, are involved in the project. Estimated cost of the improvements is $2,500,000. The association, headed by Frank H. Partridge, has requested the Los Angeles Planning Commission to rezone the property.
JOHN PARKINSON.

The death of John Parkinson, for many years one of the leading architects of the west, occurred at his home, 1201 San Vicente Boulevard, Los Angeles, December 9, of a heart attack.

In the 46 years he practiced architecture, first in Seattle and later in Los Angeles, Mr. Parkinson designed several hundred buildings, most of them commercial structures. His contribution to the business and industrial development of Los Angeles is familiar to many.

John Parkinson was born in Scorton, Lanca-

shire, England, December 21, 1861. He attended school and received his first training in building construction and design at Bolton. When he reached his majority he came to America spending a short time in Winnipeg, Canada, and Minneapolis, Minnesota.

In 1889 Mr. Parkinson went to Seattle, Wash-

ington, and opened an office, designing many buildings in that city and vicinity. It was there in 1889 he met Weymouth Crowell, who later be-

came a successful Los Angeles contractor and who erected several of the first structures for which Mr. Parkinson was architect. There also was formed the brief partnership of Parkinson & Evers, terminated by Mr. Parkinson buying his partner’s interest in the business. In 1891 Mr. Parkinson was appointed city school architect and in the next few years he designed a score of school buildings for Seattle and surrounding communities.

In 1894 Mr. Parkinson settled in Los Angeles and opened an office for practice of architecture. His first commission was designing the Currier Building on Third Street, between Broadway and Spring, in which he maintained an office for a number of years. Later, in 1896, he designed the Homer Laughlin building on Broadway, just south of Third Street, which was the first steel frame fireproof building in Los Angeles.

From 1905 to 1915 Mr. Parkinson practiced in partnership with Edwin Bergstrom under the firm name, Parkinson & Bergstrom, the latter retiring from the firm on the expiration of their partner-

ship agreement.

During the depression, following the war, Mr. Parkinson was commissioned as architect for the Los Angeles Union Terminal buildings, a group of large reinforced concrete structures which cost around $7,000,000. He was also architect for the original Los Angeles Coliseum, which seated 75,000 and later for the enlarged Coliseum which now seats 105,000.

Mr. Parkinson’s son, Donald B. Parkinson, was taken into the firm in 1920, and in recent years the responsibilities of the business were gradually transferred to him. Among the notable structures designed by John Parkinson & Donald B. Park-

inson are the following: Federal Reserve Bank, Los Angeles Gas & Electric Building, Title Insur-

ance Building, Title Guarantee Building, Bul-

lock’s Wilshire, J. D. Spreckels Building, San Diego; Wilshire Medical Building, Banks-Hunt-

ley Building, Harry Bauer Building, Union Depot, Ogden, Utah; Broadway Department Store; First National Banks of Beverly Hills, Santa Barbara and Long Beach; Elks Club and Security Bank, Santa Barbara; six buildings at University of Southern California—administration, law, science, Students’ Union, Bridge Hall, physical education building.

Mr. Parkinson took an active interest in civic affairs. While in Seattle he assisted in drafting a new building ordinance for that city and was a member of the commission which drafted a new building code for Los Angeles in 1900. He was a former member of the Los Angeles Municipal Art Commission and a life member of the American Institute of Architects.

WILLIAM H. WHARFF

At the age of ninety-nine, William H. Wharff, pioneer architect of Berkeley, passed away at his home in that city, New Year’s Day. Mr. Wharff was the architect of the Berkeley Masonic Temple built nearly fifty years ago. He was a native of Gifford, Maine, and came to California in the seventies. He served in the Civil War and knew Lincoln. He founded the Lincoln Fellowship and was a charter member of Lincoln Post, G.A.R. He was said to have been the oldest living member of the G.A.R. Mr. Wharff had been a Mason since 1870.

AUGUST NORDIN

The death of August Nordin, architect, oc-

curred at the University of California Hospital, San Francisco, January eighth. Mr. Nordin’s death followed a heart attack. He was 67. Dur-

ing his practice in San Francisco, he designed more than 300 structures, the most recent being the Foshay Building on Kearny Street, San Fran-

cisco. Mr. Nordin was a member of Islam Temple Shrine and the Scottish Rite.
WORK RELIEF PROJECTS

A treasury warrant for $3,217,300 has been countersigned to permit the Works Progress Administration to direct work-relief assistance to educational, professional and clerical persons by carrying out the following types of projects:

1. A nation-wide survey of state and local historical records.

3. A survey in 31 states to obtain exact measured drawings and photographic records of important examples of American architecture.

4. A survey in 27 states to obtain and compile historical data pertaining to design, construction and usage of vessels formerly a part of the United States Merchant Marine. Records of drawings and photographs of these vessels will be placed in the National Museum.

In addition, a general inspection will be carried out in all Federal Government-owned buildings in New York City and Detroit. Bacteriological tests of water supplies of these cities will be made and the use of dyes will be employed to trace any suspected pollutions. Of the total allotment, $182,500 will be devoted to this program, of which New York City will receive $163,784 and Detroit, $19,716.

Under the survey of state and local historical records, lists will be made of records now in the hands of state, county and local governments as well as those available from historical societies and accessible individuals. All data will be compiled into a master inventory and will be deposited with appropriate Federal agencies. Allocations to the western states for this survey are as follows: Arizona, $6,000; California, $30,000; Colorado, $12,000; Idaho, $4,600; Montana, $6,000; Nevada, $2,000; New Mexico, $6,000; Oregon, $9,400; Utah, $5,000; Washington, $20,200; Wyoming, $3,000.

The archive survey will be carried forward as distinct from that which can be carried in the budget for the National Archives. The volume and department of origin and the exact location of archives will be ascertained and the relation to the standard archival serials of the affected government departments will be shown. In addition, reports under which archives are kept and the determination whether better provisions can be made for the preservation of records will be studied. Appropriations for the western states are the same as for the historical records survey except that Washington is allotted $16,800.

The third survey, that of American architecture, will be made in only 30 states, California being allotted $22,000, Oregon $7,000, and Washington $7,000.

Under the fourth survey, collection of data and photographs of vessels formerly used in the U. S. Marine, California will receive $9,000, Oregon $3,000 and Washington $9,000.

S. F. ARCHITECTURAL CLUB

Walter C. Clifford is the new president of the San Francisco Architectural Club, with Walter Ruppel, vice-president, and Richard Audsley, secretary.

The following committee chairmen have been named: Walter Ruppel, entertainment; Frank Trabucco, publications, and Richard Audsley, publicity. Otto Hintermann is a new trustee and Chas. Conti, director.

Retiring President Hintermann is recipient of a past president’s charm, bearing the insignia of the San Francisco Architectural Club.

DESires Catalogues

The firm of Herbert & Caulkins, architects of Santa Rosa, announces a dissolution of partnership and C. A. Caulkins, Jr., will continue the practice of the profession with an office at 426 Rosenberg Building, Santa Rosa. Mr. Caulkins would like to receive manufacturers catalogues and building material samples from San Francisco firms.

REVISED BOOK ON STUCCO

"Portland Cement Stucco" in its revised form should serve as a welcome addition to the library of the builder, architect and home owner.

This edition has complete instructions on how to produce a variety of stucco textures, each step illustrated by photographs and the final texture reproduced in full color.

Throughout the book are pictures of attractive houses finished in Portland cement stucco. These range from thirty years of age to the modern style of today—from a cottage to the towering Edgewater Beach Hotel. Modernizing is also discussed and "before and after" pictures are included.

A full set of specifications for the proper application of Portland cement stucco both on new and old buildings completes the story.
BUSY ON RESIDENCE WORK

New work in the office of Edwin L. Snyder, 2101 Addison Street, Berkeley, includes a $12,000 brick veneer dwelling on Alvarado Road, Berkeley; a $7,000 house in Rockridge, Oakland; a brick veneer house in College Park, Sacramento, a Monterey-Colonial dwelling in Berkeley for A. T. Beckett, and three houses on Grizzly Peak Boulevard, Berkeley, for Randolph F. Parks.

MEDICO DENTAL BUILDING

Plans have been completed for a two-story medico-dental building to be built on Bancroft Way, near Telegraph Avenue, Berkeley, and to be leased to a number of physicians and dentists in the University City. The owner of the property is Mrs. E. L. Turner, the architect Julia Morgan, and the builder, H. K. Henderson.

MILLER AND WARNECKE BUSY

Miller and Warnecke, Financial Center Building, Oakland, report activity on several houses in the East Bay; also another Class C store building on Lakeshore Avenue, Oakland. A recent contract to be awarded in this office is a $6,200 house for Carrell Weaver on Ocean View Drive, Oakland.

DUPLEX MUNICIPAL RESIDENCE

The City of Vallejo is the owner of a two-story frame and stucco duplex residence to be constructed on the reservoir site, three miles out of Vallejo for employees of the Water Department. There will also be a garage and laboratory, the total cost being estimated at $12,000.

AWARDED RESIDENCE CONTRACT

William Martin, 666 Mission Street, San Francisco, has been awarded a contract to make alterations to the residence of Dr. Randolph Flood, 3055 Divisadero Street, San Francisco. Farr and Ward, 68 Post Street, San Francisco, are the architects.

CALIFORNIA-COLONIAL RESIDENCE

A two-story and basement California-Colonial residence has been designed by F. L. Confer, architect, 2812 Russell Street, Berkeley, for M. Stracham of the Hotel Harrison, Oakland. The house is to be built in Piedmont Pines, Oakland.

PERSONAL

FRANCIS W. GRANT, who has been construction superintendent for John Graham, Dexter Horton Building, Seattle, for the past 13 years, was recently appointed PWA resident engineer and inspector to supervise work on six construction projects at Medical Lake and Cheney, Washington.

S. LEE HINMAN, architect, who has been affiliated with the Clise interests as building manager for the past several years, is resuming professional practice, becoming associate architect on the staff of Graham and Painter, Ltd., Dexter Horton Building, Seattle.

WILLIAM R. GRANT, architect of commercial buildings, is now occupying a new office at 312 Lloyd Building, Seattle.

WALTER F. FUESLER, has moved his office from 615 Architects' Building to 539 No. Mansfield Avenue, Los Angeles.

EDGAR F. BISSANZT has moved from 1101 Architects' Building, Los Angeles, to larger quarters, suite 912, in the same building.

LOUIS L. DORR has moved his office from 1107 Signal Oil Building to 906 Architects' Building, Los Angeles.

HOWARD H. RILEY, architect, has resumed practice, his office being in the Joseph Vance Building, Seattle. At present he is devoting his attention to small house design.

B. DUDLEY STUART is now occupying an office suite on the sixth floor of the Thompson Building, Seattle. He has several commercial projects under consideration, and has been consistently active in modernizing work.

Messrs. Nordin and Anderson, architects of Los Angeles, have moved from the Transamerica Building to 422-25 Insurance Exchange Building, that city.

GORDON B. KAUFMANN has moved to 627 South Carondalet Street, Los Angeles, where he is occupying attractive new offices.

WILLIAM H. RABE, assistant city engineer at Ventura, has recently been granted a permit to practice as a structural engineer by the California State Board of Registration of Civil Engineers. The City of Ventura has lately accepted the uniform building code.
SOUTHERN CALIFORNIA CHAPTER

Officers for 1936 have been elected by Southern California Chapter, A.I.A., as follows: Ralph C. Flewelling, president; Eugene Weston, Jr., vice-president; George J. Adams, secretary, and Samuel E. Lunden, treasurer. S. B. Marston was elected director of the three-year term. Henry Carlton Newton and Reginald D. Johnson are the hold-over directors.

Delegates to the Institute convention to be held in Williamsburg, Va., next year, were elected as follows: Carleton M. Winslow, J. E. Allison, A. M. Edelman, H. C. Chambers and Robert Orr. Alternates are: Eugene Weston, Jr., A. C. Zimmerman, Roland Coate, Samuel E. Lunden and Reginald D. Johnson.

Sumner Spaulding, who presided at the December meeting, announced that the January meeting would be in the nature of a memorial to the late John Parkinson.

A vote has been taken by letter ballot on the question of issuing a life membership in the Chapter to A. M. Edelman, only surviving charter member. Presentation of the certificate was made at the January meeting, when Mr. Edelman read the minutes of the first Chapter meeting.

Designs or pictures of executed buildings related to sport activities which will be selected for the American section of the international competitive exhibition of the 1936 Olympiad should be directed to Richard J. Neutra, Los Angeles, member of the architectural committee.

NOT SO GOOD

A recent Associated Press dispatch from Washington, D. C., states that “the Federal Home Loan Bank is considering establishing an architectural service for home builders. Officials declare that the service would be available to builders from Savings and Loan Associations, and other members of the bank system.” Does this mean another architectural bureau to compete with individual practitioners?

MERCEDE BUILDING ACTIVITY

The new year started with considerable building activity in Merced, including construction of a new wing to replace a portion of the El Capitan Hotel, damaged by fire; a physicians’ and dentists’ building at 19th and L Streets for Dr. Bruce E. McConnell and associates, and reconstruction of a warehouse and office building for the Yosemite Portland Cement Company, damaged by fire last year.

MARTIN J. RIST BUSY

In addition to a group of houses in San Jose, Martin J. Rist, Phelan Building, San Francisco, is busy on plans for a prospective hospital and has completed drawings for a two-story and basement market and office building on Columbus Avenue and Green Street, San Francisco.

BUSY ON RESIDENCE WORK

Henry H. Gutterson, 526 Powell Street, San Francisco, reports that his office is busy designing several dwellings, one in Ross, Marin County, and the others in the San Mateo Peninsula District.

COUNTY COURT HOUSE

Working drawings have been completed for a Class A Court House at Salinas, estimated to cost $450,000. Charles A. Butner and Robert Stanton, Salinas and Pebble Beach, are the architects.

MODERN PIEDMONT DWELLING

Michael Goodman, 2163 Center Street, Berkeley, has completed plans for a modern style residence to be built in Piedmont, features to include brick glass and air conditioned heat.

HOTEL ON MT. HOOD

Construction of a hotel on the slope of Mt. Hood has received WPA approval. An all-year round hotel to accommodate 300 is planned. The hotel will be 62 miles from Portland via Mt. Hood Loop Highway and Government Camp.

SAN FRANCISCO CONVENT

John J. Foley, 770 Fifth Avenue, San Francisco, has prepared plans for a two-story reinforced concrete convent for Sacred Heart Parish to be built on Oak Street, east of Fillmore, San Francisco, at an estimated cost of $60,000.

PALO ALTO STORE BUILDING

Messrs. Farr and Ward, 68 Post Street, San Francisco, have awarded a contract for construction of a one-story reinforced concrete store building in Palo Alto for the A. B. Morton Company. The building will cost $12,000.

CIVIC AUDITORIUM

Eureka, Humboldt County, is to have a new civic auditorium, costing $120,000. Plans were prepared by Franklyn T. Georgeson, of Eureka, and W. H. Ellison, structural engineer.

PASO ROBLES GYMNASIUM

A $36,000 gymnasium is planned for the Paso Robles High School. Preliminary drawings have been made by Orville L. Clark, 369 North Ridgewood Place, Los Angeles.

THE ARCHITECT AND ENGINEER
Urging the use of "every technical and artistic resource," the American Institute of Architects has pledged its aid to Federal, state and municipal governments in creating a public architecture which will advance the cultural standards of the nation, it is announced by Stephen F. Voorhees of New York, president of the Institute.

The Institute, through its officers, Chapters and committee on public works, is ready to co-operate "in the development of methods and policies for improving and perfecting the planning, design and construction of government buildings," and has so informed President Roosevelt, the appropriate committees of Congress, and the heads of the departments and independent agencies of the government concerned with the planning of government structures, according to Mr. Voorhees.

"The Institute's offer of advice and co-operation is made in a spirit of patriotic service and of intelligent and sympathetic understanding of the difficulties and problems with which they are faced," Mr. Voorhees said. "It is in the interest of the public that all government buildings should represent and embody the highest standard of architectural design, taking into account all aesthetic, all practical, and economic considerations."

Mr. Voorhees made public a report of the Institute's committee on public works, of which Francis P. Sullivan of Washington is chairman, which asserts that "the government is in a unique position to perform a service of education for its citizens of distinct advantage to the intellectual life of the nation."

"No architecture is appropriate for any building in which even the least important of the many activities of our nation's government is housed, except an architecture that is great and noble and inspiring, presenting to the citizen an outward expression of the dignity, the nobility and the greatness of his country in which he takes pride," the report declares.

"Just as the average citizen's blood is stirred by the flag flying over a body of troops or the review of a great fleet of war vessels, he feels inspired by the dome of the Capitol rising over the headquarters of the nation's government and by the refined beauty and historic significance of the White House. He is similarly inspired in a greater or less degree by the government in all its manifestations when these are dignified and worthy, so that there would be a distinct loss to the spiritual and patriotic relation between the citizen and the government if its activities were carried on in bare warehouses without architectural significance or dignity, constructed as cheaply and as shoddily as the average speculative structure.

"The government is also in a unique position to perform a service of education for its citizens of distinct advantage to the intellectual life of the nation. That is to hold up before the people a high standard of excellence both in design and craftsmanship, utilizing for this purpose every aesthetic and technical resource of the nation, so that every citizen may have the opportunity of becoming familiar with good architecture, good painting and good sculpture and so that the cultural standards of the people as a whole may be continually improved.

"There are two great emotions that in the past have inspired artists to accomplish things almost beyond their power; the sentiment of religion and the sentiment of patriotism. Religious fervor has raised great cathedrals the very sight of which stirs the capacity for reverence and awe, and the love of country in past ages has expressed itself in monuments which we cannot see today without feeling the warmth of sentiment that brought them into being. The government owes it to its citizens to guide this depth of feeling into worthy channels."

The report describes the relationship which should exist between the architectural profession as represented by the Institute and the government, saying:

"The government has a right to receive and its citizens have a right to demand that it require and insist upon the highest type of architectural service available. The architecture of the public buildings should represent the best which the highest talent of the country is capable of producing.

"The architects of this country as the professional body of men whose education, whose training and whose whole lives have been devoted to this field are the men best qualified to advise the government as to how this end can be achieved.

"When the appropriate means for accomplishing this end have been determined, these and these alone are what architects should advocate, and if in any instance personal interest should come in conflict with the common good, it is the architects' interest and not the general welfare of the country that must be postponed.

"In order to accomplish any useful and beneficial result, architects must begin and go forward in a spirit of helpful co-operation, with a complete and sympathetic understanding of the point of view of the administrative officers of the government and the many conflicting demands which they are forced to take into account, and of restrictions of law, of procedure and of policy."

JANUARY, 1936
HIGH COST OF IGNORING SAFETY FIRST RULES

By C. G. Chipchase

WHY do some employees trained in "safety" overlook or forget the simple principles of "safety first" when they leave their places of employment for the night or over the week end? There are any number of such cases, trained workers having accidents while off duty, involving members of their families, friends, and others, at home, on the highway, or in their other pastime activities.

Accidents are caused mostly by the failure of some person or machine to perform work in a proper manner. A great many machine failures can be prevented by previous inspection and maintenance, but the ultimate power to prevent machine failure lies with the man himself.

A man must be more than just a good workman to be efficient, for if he is to maintain that efficiency he must be a safe worker. I would not give a cent for a man who worked without regard to safety. Even if he worked without pay and was fortunate in not having an accident, he would still be a liability instead of an asset, for his influence on his fellow employees would destroy the safety morale of the organization.

In modern industry, the habitually unsafe worker is simply not wanted. There is no place for him. To quote the words of a prominent executive: "If we know our job we will not have accidents," so let's get acquainted with our jobs. It, therefore, follows, to be successful with our work or our pastime activities, we must not only work with our hands, but use our heads also. If a thinking man will do his work in his place of employment or at home efficiently and safely, his reward will surely come.

Much has been said about safe practices at the factory or other places of employment and with all the teaching and lessons learned through bitter experiences you would think that the "safety mindedness" of the great majority would be more pronounced, but when one stops to consider the large number of traffic accidents involving automobile, the pedestrian, passenger buses, etc., and home accidents, which are more numerous and just as fatal as industrial accidents, you sometimes wonder if the participant ever heard of "safety."

The old adage "self preservation is the first law of nature" and the foundation of safety seems to have lost all of its old significance, especially when traffic accidents in all parts of the country hold the lime light so constantly, and home and off-duty accidents are running a close second.

The following narrative seems to have a place in this article. It is about an accident in which I had first-hand information; it concerns the non-observance of "safe practices" when off duty or when not under the influence of safety regulations in industry.

The victim in the case, when occupied by his regular employment, was an electrician and lineman employed by a large power company as an artisan. He was first-class, receiving top wages and was constantly employed. I know that he received, with others, good safety instructions from the company's safety engineer and its foreman. This information was verified by the employee to me; he knew all the "safe practices" and "first-aid procedures" that any efficient employee should know. This person had a pastime interest in a small farm which was located about one hour's drive from his permanent town home. He spent many hours working on the place during his spare time. When his crop was ready for harvest he spent a vacation period there to harvest the crop and prepare it for market.

In the process of preparation he used a hulling machine which was driven by a three-horsepower electric motor, belted to the low-down jack shaft of the machine, which he did not provide with a proper guard. There were other hazardous exposures which were not protected, but he felt he knew of their existence and that he would be cautious of them and thus protect himself against accidents.

The vacation period came; he and his family moved out to the farm, here they enjoyed the freedom of country life, all had good health, good appetites and plenty of food, including the wine of the countryside. This man imbibed freely; in fact, excessively of the wine. His wife forbade him against this excessiveness. She was concerned about his automobile driving, fearful he would endanger others on the highway or bring disaster upon himself, which was all good and timely on her part, but no thought was given to the hulling machine.

The safety instructions given him by his employers included directions not to wear loose clothing, shirt sleeves unbuttoned flying in the breeze, etc., but to wear short sleeves or rolled up sleeves, so that they would not catch in moving parts of machinery. Here is where he made his mistake; his neighbors cautioned him to stop his drinking if he intended to work around the huller or he
 Failure to recognize the economic value of light and air has been the greatest single and fundamental error in the production of housing units for sale, according to William Stanley Parker, Fellow of the American Institute of Architects.  

"I am not referring to the aesthetic and social values of light and air but to their cold, hard boiled financial value," Mr. Parker explains. "The real estate expert and businessman of the time, with nothing much but dollars and cents in mind, wholly failed to gauge this underlying economic asset."

"This is not so strange in the real estate broker with current sales primarily in mind, but it is more significant in the loaning agencies presumably interested in long term investment values back of their mortgages."

Progress that has been made toward greater light and air in low-rental housing units Mr. Parker credits to social agencies fighting for improved living conditions, while real estate interests were concerned chiefly with immediate sales.

"During the early portion of the past half century various forces were impelling the development of areas of low-rental housing units with regard solely to their immediate marketability," he points out. "The producers of these housing units were not concerned with problems of city planning and the development of desirable neighborhoods. Neither was the community at large. Social agencies were concerned, and various individuals and groups face to face with the living conditions being created were fighting for more light, air and sanitation."

"Building laws, step by step and slowly, reflected this pressure with improved minimum provisions for courts and coverage which immediately became maximum provisions in the eyes of the speculative builder of low cost housing. In Boston a first enactment of a requirement for a ten foot rear yard to every tenement house illustrates a step that when taken was progressive if not revolutionary but which now is seen to have legalized wholly undesirable conditions."

"This thought should give us pause today, as we now look back on many similar inadequate minimum provisions, when we attempt to determine any new legal minima with which to control future low rental housing."

Crowded tenements resulted from this early shortsightedness and, Mr. Parker adds, "the same failure is visible today in small house developments where the houses are being placed too close together."

In the type of housing selected for a site, as well as in the matter of light and air, he urges that the needs of the families be considered. Eliminating the two-family house which he believes better for investment than for rental, Mr. Parker limits the choice in large scale rental operations to three types—the single free-standing house, the row house and the multi-family dwelling.

"Conferences can continue to debate the relative values of these types," he says, "but housing authorities and their architects and other advisors must make specific decisions on each point in the light of the special conditions connected with a given site. Here they meet the necessity for the various compromises always inherent in a building operation due to special local conditions and differences of opinion."

"A construction program necessitates keeping one's feet on the ground, and on the particular piece of ground that constitutes the site of the project. In doing this, local statistics require careful study and yet cannot be accepted too rapidly as proof of what sort of housing units are needed. The existing units were provided not because they were right and desirable or actually desired, but because they were being built and bought or rented, and others like them could be marketed at a profit."

January, 1936

Lack of Light and Air Blights Housing Values

California Accident Commission Bulletin
This is the fourth article in the series giving derivation of the names of California counties, the first appearing in September:

El Dorado—Created February 18, 1850. One of the original twenty-seven counties of California. Francis Orellana, a companion of the adventurer Pizarro, wrote a fictitious account of a wonderful province in South America, of a fabulous region of delightful climate and never-fading verdure, abounding in gold and precious stones, where wine gushed forth from never-ceasing springs, and wheat fields grew ready-baked loaves of bread, and birds already roasted flew among the trees, and nature was filled with harmony and sweetness. From this description, a gold-bearing belt was called El Dorado, as in later days it has been called Klondike. So, when the discovery of gold by James W. Marshall at Coloma in January, 1848, became known to the world, California, and particularly that part where gold was discovered, was called “El Dorado”, and it was from this fact that the county was given its name upon its creation.

The county embraces 1,111,680 acres, the El Dorado National Forest covering 251,800, while total timber lands have an acreage of 586,645. For approximately 40 miles the topography changes, ascending to 10,020 feet at Pyramid Peak, then sloping to an altitude of 6225 feet at the Nevada line. Picture a beautiful mountainous country carpeted by almost one sweep of pine forest, with shimmering lakes, including the incomparable Lake Tahoe, and sparkling streams, and you have El Dorado.

General John C. Fremont with a party of pioneers, following directions given by Indians, reached Lake Tahoe February 14, 1844. General Fremont gave the lake the name of his companion traveler, Bonpland, a noted botanist. Later Lake Bonpland was changed to Lake Bigler, in honor of California’s third Governor. In 1861 an attempt to change the name to Tula Tulia failed and in 1862 William Henry Knight of Los Angeles, who crossed the plains in 1859, persuaded a group of prominent men to back his efforts to call the lake “Tahoe”, an Indian name meaning “big water”, or “high water”, or “water in a high place”. The land office at Washington and the press approved of the name.

Since the day when James Marshall found gold in the tail-race of Captain John Sutter’s mill at Coloma, in January, 1848, El Dorado has produced millions in gold. Lumbering holds an outstanding position in industry and labor in the county. In addition it is famed for its Bartlett pears and at Placerville, known as Hangtown in early days, is one of the largest packing sheds in the world. Dairying and livestock are important industries. El Dorado is an internationally famous resort county and it is estimated that 250,000 persons annually drive through the county over the Lincoln Highway connecting San Francisco with Nevada. In Placerville are buildings made of brick manufactured in 1852. There are many villages and towns founded in the gold-rush days which still are in existence. Population: 8,325. Area: 1737 square miles.

Imperial County—Created August 15, 1907. It derived its name from the Imperial Valley, situated therein, and was organized from part of San Diego County.

Imperial, “The Winter Garden of America”, has been transformed from a harsh and uninviting desert of cactus and sage brush to a veritable Garden of Eden. Imperial Valley is the largest irrigated district in the world. A great portion of the county, the tenth largest in California, lies below sea level, but in the eastern section are the Chocalate Mountains, and near San Diego county a chain of mountains extends south across the international boundary and are considered among the most picturesque in Southern California.

In ancient times the valley was part of the Gulf of California, later being filled in with deposits and decayed vegetation brought down from the mountains in past ages by the Colorado river, forming a soil to be compared for productiveness with the Nile Valley in Egypt. Salton Sea, covering an area 35 by 14 miles, remained but slowly drying up. More than 515,000 acres are under irrigation in the county and many thousands of additional acres will be cultivated after the completion of Boulder Dam.

Cotton production is an important industry with 22,165 acres now devoted to it. The leading crop is the Imperial Valley cantaloupe with an annual value of approximately $13,000,000 while other melons shipped have an annual valuation of about $9,000,000. Lettuce is in second place as a distinct crop with a valuation of about $11,000,000 a year. Imperial is the tenth cattle-producing county of the state. Dairy products contribute more than $3,000,000 annually. Calexico, the Imperial Valley gateway to Old Mexico, is the port of entry to Lower California. Statistics show that 8,000,000 persons and 2,400,000 automobiles cross the international boundary here annually. El Centro, the county seat, had a population in 1907 of 125; today it boasts 8434. Population: 60,903. Area: 4089 square miles.

THE ARCHITECT AND ENGINEER
Estimator's Guide
Giving Cost of Building Materials, Wage Scale, Etc.

All prices and wages quoted are for San Francisco and the Bay District. There may be slight fluctuation of prices in the interior and southern part of the state. Freight carriage, at least, must be added in figuring country work.

Bond—1/2% amount of contract.

Brickwork—
Common—$35 to $40 per 1000 laid, (according to class of work).
Face, $75 to $90 per 1000 laid, (according to class of work).

Brick Steps, using pressed brick, $1.10 lin. ft.

Brick Walls, using pressed brick on edge, 60 sq. ft. (Foundations extra.

Brick Veneer on frame buildings, $.75 sq. ft.

Common f.o.b. cars, $12.00 job carriage. Face, f.o.b. cars, $45.00 to $50.00 per 1000, carload lots.

HOLLOW TILE FIREPROOFING (f.o.b. job)
3x12x12 in. ... $84.00 per M 4x12x12 in. ... 94.50 per M 5x12x12 in. ... 126.00 per M 6x12x12 in. ... 225.00 per M

HOLLOW BUILDING TILE (f.o.b. job)
carload lots.
8x12x5 1/2 in. ... $94.50 8x12x6 1/2 in. ... 73.50
Discount 5%.

Composition Floors—18c to 35c per sq. ft. In large quantities, 18c per sq. ft. laid.
Mosaic Floors—80c per sq. ft.
Dureflex Floor—23c to 30c per sq. ft.
Rubber Tile—50c per sq. ft.
Terezo Floors—45c to 60c per sq. ft.
Terezo Steps—$1.60 lin. ft.

Concrete Work (material) at San Francisco bunkers—Quotations below 2000 lbs. to the ton, $2.00 delivered.

No. 3 rock at bunkers, $1.75 per ton
No. 4 rock, at bunkers, 1.70 per ton
Elliott top gravel, at bunkers, 2.00 per ton
Washed gravel, at bunkers, 2.00 per ton
Elliott top gravel, at bunkers, 2.00 per ton
City gravel, at bunkers, 1.70 per ton
River sand, at bunkers, 1.80 per ton
Delivered bank sand 1.20 cu. yd.

Note—Above prices are subject to discount of 10c per ton on invoices paid on or before the 15th of month, following delivery.

SAND
Del Monte, $1.75 to $3.00 per ton,
San Francisco (car lots, f.o.b. Lake Ma-jella), $2.75 to $4.00 per ton.

Cement, $2.25 per bbl. in paper sks.
Cement (f.o.b. Job, S. F.) $3.00 per bbl.
Cement (f.o.b. Job, Oak) $3.00 per bbl.
Rebate of 10 cents bbl. cash in 15 days,
Calaveras White $6.00 per bbl.
Medusa White $8.00 per bbl.
Forms, Labors average 25c per M
Average cost of concrete in place,
exclusive of forms, 30c per cu. ft.

4-inch concrete basement floor
1/2 per sq. ft.

2/3 inch concrete Basement floor
1/2 per sq. ft.

2-inch rat-proofing 7/10 per sq. ft.
Concrete Steps $1.25 per lin. ft.

Demoproofing and Waterproofing—
Two-coat work, 15c per yard.
Membrane waterproofing—4 layers of saturated felt, $4.00 per square.
Hot coating work, $1.80 per square.
Medusa Waterproofing, 15c per lb., San Francisco Warehouse.

Electric Wiring—$12.00 to $15.00 per outlet for conduit work (including switches).
Knob and tube average $7.00 per outlet, including switches.

Elevators—
Prices vary according to capacity, speed and type. Consult elevator companies.
Average cost of installing an automatic elevator in four-story building, $2800; direct automatic, about $2700.

Excavation—
Sand, 50 cents; clay or shale, 80c per yard.
Teams, $10.00 per day.
Trucks, $18 to $25 per day.
Above figures are an average without water. Steam shovel work in large quantities, less; hard material, such as rock, will run considerably more.

Fire Escapes—
Ten-foot balcony, with stairs, $75.00 per balcony, average.

Glass [consult with manufacturers]—
Double strength window glass, 15c per square foot.
Quarry Lite, 50c per square foot.
Plate 75c per square foot.
Art. $1.00 up per square foot.
Wire (for skylights), 35c per sq. foot
Obscure glass, 25c square foot.

Note—Add extra for setting

Heating—
Average, $1.90 per sq. ft. of radiation, according to conditions.

Iron—Cost of ornamental iron, cast iron, etc., depends on designs.

Lumber (prices delivered to bldg, site),
No. 1 common $21.00 per M
No. 2 common $27.00 per M
Selection O. P. common $36.00 per M
4x4 No. 3 form lumber $22.00 per M
4x4 No. 2 flooring V.G. $45.00 per M
4x4 No. 3 flooring V.G. $47.00 per M
4x6 No. 2 flooring $54.00 per M
4x6 and No. 2 flooring $60.00 per M

Slash grain—
1x4 No. 2 flooring $40.00 per M
1x4 No. 3 flooring $36.00 per M
No. 1 common run 1 & 2 $32.00 per M
Lath 6x12x12 $6.50 per M

Shingles [add carriage to price quoted]—
Redwood, No. 1 $1.00 per bbl.
Redwood, No. 2 .90 per bbl.
Red Cedar .95 per bbl.

Hardwood Flooring (delivered to building)—
13-16x1/2 x 3/4 x G. Maple $12.00 per M
13-16x1/2 x 1 x G. Maple $13.00 per M

Sashes—
1-1/4 x 1-1/2 x 3/4 x G. Maple $12.00 per M
1-1/4 x 1-1/2 x 3/4 x S. Oak $16.00 per M
1-1/4 x 1-1/2 x 3/4 x L. Oak $20.00 per M
1-1/4 x 1-1/2 x 3/4 x S. Pine $10.00 per M
1-1/4 x 1-1/2 x 3/4 x L. Pine $12.00 per M
1-1/4 x 1-1/2 x 3/4 x Clear Maple $17.00 per M

Laying & Finishing 13c ft, 11 ft. 10 ft. Wages—Floor layers, $7.50 per day.

Building Paper—
1 ply per 1000 ft. roll $3.50
2 ply per 1000 ft. roll $5.00
3 ply per 1000 ft. roll $6.25

Brown's, 500 ft. roll 5.00
Brown's Pro-tec-tect-em, 1000 ft. roll 10.00
Sisal Kraft, 500 ft. roll 10.00
Sisl cord com, No. 8 1.00 per 100 ft.
Sisl cord spot No. 8 1.50 per 100 ft.
Sisl cord spot No. 8 2.25 per 100 ft.

Sash weights cast iron, $60.00 ton.
Nails, $1.50 base.
Sash weights, 95c per ton.

Millwork—
O. P. $100.00 per 1000, R. W. $106.00 per 1000 (delivered).

Double hung box window frames, average, with trim, $6.50 and up, each.

Doors, including trim (single panel, 1 x in. Oregon pine) $8.00 and up, each.

Doors, including trim (five panel, 1 x in. Oregon pine) $6.50 each.

Screen doors, $4.50 each.

Plate screen windows, 25c a sq. ft.

Cases for kitchen pantries seven ft. high, per lineal ft., $6.50 each.

Dining room cases, $7.00 per lineal foot.

Labor—Rough carpentry, warehouse heavy framing (average), $12.00 per M.

For smaller work average, $27.50 to $35.00 per 1000.

January, 1936
SAN FRANCISCO BUILDING TRADES WAGE SCALE

Established by The Imperial Wage Board November 9, 1932. In effect on all work January 1, 1933, to remain in effect until June 30, 1933, and for so long thereafter as economic conditions remain substantially unchanged.

This scale is based on an eight-hour day and is to be considered a minimum and employees of skill and craft knowledge may be paid in excess of the sums set forth herewith.

### GENERAL WORKING CONDITIONS

1. Eight hours shall constitute a day's work for all crafts, except as otherwise noted.
2. Where less than eight hours are worked pro rata rates for such shorter period shall be paid.
3. Plumbers' Hodcarriers, Bricklayers' Hodcarriers, Carpenters, Laborers and Engineers, Portable and Hoisting, shall start 15 minutes before other workmen, both at morning and at noon.
4. Five days, consisting of not more than eight hours a day, on Monday to Friday inclusive, shall make up a week's work.
5. The wages set forth herein shall be considered as not wages.
6. Except as noted the above rates of pay apply only to work performed at the job site.
7. Transportation costs in excess of twenty-five cents per day for each worker shall be paid by the contractor.
8. Travelling time in excess of one and one-half hours each way shall be paid for at straight time rates.
9. Overtime shall be paid as follows: For the

### Painting

- Two-coat work ........................................ 29c per yard
- Three-coat work .................................. 30c per yard
- Gold Leaf Painting ................................ 10c per yard
- Whitewashing ........................................ 4c per yard
- Turpentine, 80c per gal., in cans and 75c per gal., in drums.
- Rasin Lined Oil—80c gal. in bbls.
- Boiled Linseed Oil—85c gal. in bbls.
- Meduse Portland Cement Paint, 20c per lb.

### Carpenters

- Carter or Dutch Boy White Lead in Oil (in steel legs)................................. $2.00 per lb.
- 1 ton lots, 100 lbs. net weight ........................................ $1.05 per lb.
- 500 lbs. and less than 1 ton lots ........................................ 1.10c per lb.
- Less than 500 lbs. lots ........................................ 1.15c per lb.

  - 2 coats, hard wall plaster, wood lath ........................................ 80c
  - 3 coats, metal lath and plaster ........................................ 1.35
  - Keepers coats ........................................ 1.35
  - Ceilings with 3 1/2 hot rolls channel metal lath ........................ 75c
  - Ceilings with 4 1/2 hot rolls channel metal lath .................. 1.50
  - Single partition 3 1/2 channel lath .......................... 85c
  - Single partition 4 1/2 channel lath 2 sides ........................ 2,75c
  - 4-inch double partition 3 1/2 channel lath 2 sides ........... 1.30
  - 4-inch double partition 4 1/2 channel lath 2 sides .................. 3.00

### Sheet Metal—

- Windows—Metal, $2.00 a sq. ft.
- Floor doors (various), including hardware, $2.00 per sq. ft.

### Skylights—

- Copper, 90c sq. ft. (not glazed)
- Galvanized iron, 25c sq. ft. (not glazed)

### Steel—Structural

- $100 ton (erected), this quotation is an estimate for complete quantity and tone of materials.
- Light truss work higher. Plain beams and column work in large quantities $80 to $100 per ton cost of steel, average building, $87.00.

### Steel Reinforcing

- $85.00 per ton, set. (average).

### Stone—

- Granite, average, $6.50 cu. ft. in place.
- Sandstone, average, $6.00. Boise, $3.00 sq. ft., in place.
- Indiana Limestone, $2.80 sq. ft. in place.

### Stone Fronts—

- Copper sash bars for stone fronts, corner, center and around sides, will average 75c per linear foot.

### Tile—Floor, Wainscot, Etc.—(See Dealers)

### Redwood Shingles.

- $11.00 per square in place.
- Cedar Shingles, $10 sq. in place.
- Reoat, with Gravel, $3.00 per sq.
- Slate, from $25.00 to $60.00 per sq. paid according to color and thickness.

Ann work performed on such jobs after midnight shall be paid one-half time and one-half an hour for a straight time half hour, no job can be considered an emergency job until it has been registered with the Industrial Association and a determination has been made that the job falls within the terms of this section.

15. Men ordered to report for work, for whom no employment is provided shall be entitled to two hours pay.
16. This award shall be effective in the City and County of San Francisco.

The ARCHITECT AND ENGINEER
YOUR CLIENT WANTS
ADEQUATE ELECTRICAL CONVENIENCE

THAT MEANS just two things to him:

1. Enough light in enough places
2. Enough outlets in enough places

HE DOESN'T KNOW or care how this result is obtained. The number of electrical circuits or the size of wire required are details he knows little about. But he demands electrical convenience when and where he wants it.

PACIFIC COAST ELECTRICAL BUREAU
SAN FRANCISCO • CALIFORNIA • LOS ANGELES
447 Sutter Street

RED SEAL is the nationally recognized mark of quality electrical wiring, and assures your client ELECTRICAL ADEQUACY for his home. RED SEAL is not a material, but a standard of quality.

RED SEAL information, plans, or consultation without cost or obligation.

Inyo County—Created March 22, 1866. This county got its name from a tribe of Indians who inhabited that part of the Sierra Nevada mountains. The meaning of the word "Inyo" never has been determined.

Although Inyo is the second largest county in the state it is fifty-first in population. Fruitful farming lands, towering mountain ranges and huge desert expanse combine to make it a unique county. Here is located the famed Death Valley, which has taken a heavy toll in human lives and yet in the winter time is one of California's greatest scenic attractions. In summer the temperature reaches 140 degrees, but from October to May the climate is delightful. Here it was that Death Valley Scotty became famous and built the great desert mansion that lures tourists. Good highways extend into the Valley from Barstow to the south and Owens Valley on the west. The county is a mecca for hunters, fishermen, mountain climbers and vacationists and its lakes are beyond compare. Los Angeles obtains its water supply from Owens Valley through an aqueduct 250 miles in length. Mt. Whitney, the highest point in the United States, rises majestically to a height of 14,496 feet, and there are nine mountains over 14,000 feet high and several times that many ranging from 12,000 to 14,000 feet. Population 6,555. Area: 9991 square miles.

Kern County—Created April 2, 1866. This county derived its name from the Kern river, which was named for the lieutenant of that name of General John C. Fremont's third expedition in 1845-47.

With an area about the size of Massachusetts, this county is made up of picturesque mountains, productive valleys and arid deserts. Vast underground resources of petroleum, gas and minerals supply the markets of the world, while enough cotton and wool are produced to clothe 100,000 persons. Varied fruits, field crops, vegetables, live stock and dairy products and scores of manufacturing plants add to the prosperity of Kern.

The mountain area comprises more than 3,000,000 acres, including a portion of the Sequoia and Santa Barbara national forest. The Sierra Nevada on the east and Tehachapi Mountains on the south offer excellent hunting, fishing and camping. The Golden State Highway running from north to south. El Centro Sierra, from Mojave up through eastern Kern to the Inyo-Mono playground, an excellent highway leaving Bakersfield, traversing the Sequoia National Forest and a fine road crossing northwestern Kern in its course to the coast route highway at Paso Robles provide splendid means of seeing this extraordinary county.

Live stock raising is an important industry. Cot-
MONEL METAL  
[High Nickel Alloy]

is the accepted material for soda fountains and lunch-room equipment, just as it is the universal metal for food service equipment in leading hotels and restaurants throughout the country.

CORROSIRON  
[Acid Resisting Iron]

is the accepted material for draining waste lines. CORROSIRON meets all State and Municipal specifications for drain lines from school laboratories and chemistry rooms.

We Maintain a Termite Control Department

ton production is increasing annually, 66,000 acres being now devoted to this product. Kern is well adapted to fruit growing. Oil has been produced in the county for forty years and at present more than 50 per cent of the oil producing area in the state is here. Randsburg, a Mojave Desert town, with a population of 443, is the home of the famous Yellow Aster gold mine, which has produced $18,000,000, and the Kelly mine, also one of California's best gold producers. Population: 82,570. Area: 8003 square miles.

ENGINEERING CONFERENCE

The recent election of officers for the Sixth Midwest Power Engineering Conference assures an organization of power specialists well versed in the dissemination of power information covering the fields of generation, distribution and utilization.

The work of carrying on the program for the meeting scheduled for April 20-24 inclusive at Chicago, is in the hands of the newly elected officers. Headquarters at 308 W. Washington Street, Chicago, are busy on the elaborate program being prepared.

The conference will be sponsored by the local sections and regional divisions of the following: American Institution of Electrical Engineers American Society of Civil Engineers American Society of Mechanical Engineers Edison Electrical Institute Western Society of Engineers National Safety Council American Society of Refrigerating Engineers Official hotel meeting headquarters will be at the Palmer House, Chicago, where the entire fourth floor has been reserved for meetings, lunches and receptions. Afternoon sessions will be held at the International Amphitheatre where the Midwest Power Show will be held.

JOHN TREANOR

John Treanor, president of the Riverside Portland Cement Company, Los Angeles, met a tragic death on his ranch, eight miles southeast of Warner's Hot Springs, October 20, when he fell from the roof of a barn while trimming some branches from a tree. He was standing on the peak of the roof when his feet slipped and he was hurled 25 feet to the ground, falling upon the heavy pruning shears in his hands, and sustaining a fracture of the skull.

Mr. Treanor, who was 52, had extensive business interests, investing largely in land and irrigation projects in San Diego county. He was president of the San Diego Water Company, San Diego Water Supply Company, Carneros Ranch and Vineyard Company, a director of the Union Bank & Trust Company, Security Title Insurance Company and other corporations.

THE ARCHITECT AND ENGINEER
OLD MISSION TO BE RESTORED

Popular interest in the architecture of old Spanish missions and churches has been stimulated through recent studies by representatives of the National Park Service, Department of the Interior, of seventeenth and eighteenth century edifices in Sonora, Mexico.

Under the leadership of Schofield De Long, with permission from the Mexican Government, a party of six architects and museum specialists visited Magdalena, San Ignacio, Caborca, Oquiato, Dolores, and other Sonora towns and obtained measured drawings, photographs, and notes of the structures, and will reconstruct the picture of the missions. Their report will guide the museum experts in making exhibits for the Tumacacori Museum and their studies will contribute to the restoration of the courts and buildings of the Tumacacori mission.

Tumacacori, near Tucson, in southern Arizona, is one of the missions originally established by Father Eusebio Francisco Kino, Spanish missionary and explorer.

PITTSBURG HOSPITAL

Financing is under way for a two-story reinforced concrete hospital at Pittsburg, estimated to cost $70,000. Dragon and Schmidts, of Berkeley, are the architects.

DON’T LET THIS HAPPEN
TO YOUR TREES

Improper cutting by unskilled hands caused this “tree tragedy.” And all because its owner thought that he could save on inexperienced service.

Fact is, had he known it, he could have had genuine Davey Tree Surgery Co. do the job for practically the same cost — perhaps even less — and eliminated the possibility of such damage.

Don’t risk this happening to your trees. Insist on genuine Davey Tree Surgery Co. whenever they need attention. Call or write the nearest address below for free inspection and estimate.

ANUARY, 1936
CONSTRUCTION CENSUS

A Nation-wide census of construction, covering 1935 operations, began January 2. The first census of construction was made in 1929 and has been widely used in connection with the problems of the construction industry. Up-to-date information for this important industry will be available from the 1935 census.

Figures will be secured for the number of persons employed by contractors, man-hours of work in 1935, disbursements for salaries and wages, value of contracts and orders received during 1935, value of construction work performed, and expenditures for materials. In addition, information is to be obtained for the location of the business establishments that are regularly maintained by contractors, the legal form of organization (firm or corporation), and the kind of construction business in which they were engaged during 1935.

To augment the value of the construction statistics, some further information will be collected in detail at the request of the industry. Two sets of figures, for example, will be secured for persons employed. One will give an analysis of employees by broad occupational groups for a stated one-week pay period (that ending nearest October 26 has been designated). The other will present the total count of employees on the 15th of each month of 1935. As to work performed, the schedule form is arranged to show five separate types of construction, further classified as new construction or remodeling, repairs and maintenance. Private construction and public construction are also to be reported separately. With these breakdowns, it will be possible to present a statistical picture of construction activities in sufficient detail to be of real value to the industry.

Such questions as: Why is a construction census being taken? —Why have certain questions
been covered in the census?—and
What is to be done with the cen-
sus returns when they are re-
ceived?—are often asked.

The construction census is be-
ing taken because of the need for
fuller information for construction
operations. The industry is of
such great importance, measured
either in terms of the number of
persons that look to it for their
livelihood, or by the expenditures
it makes for materials and equip-
ment, that its progress and what
it is doing concern almost every
other industry's plans for the im-
mediate future.

The construction industry em-
joys, in normal times, a very
substantial proportion of the total
number of American workers. Large
sums are disbursed directly
for wages and salaries. The ex-
penditures for material and equip-
ment affect many related indus-
tries engaged in manufacturing as
well as those engaged in trans-
portation. Active construction also
means more activity in retail and
wholesale trade, transportation
and finance.

Construction is recognized as
an important element in the eco-
nomic welfare of the nation. It
is a measure of the progress made
in providing and maintaining the
physical plant needed for produc-
tion and other commercial pur-
poses, and the structures needed
for housing. The results of the
census will therefore be of wide-
spread interest.

In designing the report form
to be used for the census it would
have been very easy to list a large
number of questions for the con-
tactors to answer. The policy,
however, was to limit the ques-
tions to the ones that are of fun-
damental importance. Valuable
assistance in this was secured
from a number of the leaders of
the construction industry that
were available for consultation. It
is believed that as a result of this
procedure the report form pro-
vides for the essential basic facts
of the industry, yet is not so

lengthy as to require an unduly large amount of work on the part of the contractor.

The census tabulations will be of particular interest to the individual contractor for appraising the operations of his own establishment. Figures for the relative cost of labor and material to be shown by classes of work and by trades, for example, will enable the contractor to compare his own results with those of the branch of the industry in which he is interested.

---

CONTRACTORS’ TAX

State Registrar of Contractors William G. Bonelli has announced the release of a Digest of the laws of all the states of the Union licensing or taxing construction contractors. The Digest, prepared under the direction of Assistant Registrar Glen V. Slater, is expected to be of material value to the construction field and particularly to contractors whose operations extend into states other than California.

The study shows that twenty-nine of the states impose no taxes or regulations. The balance of the states have statutes of varying classes, some of which require the examination of contractors with nominal fees, while others impose high taxes but no form of qualification or examination.

Farthest advanced in the field of regulation, according to this report, are Arizona, California and Utah. Both the Arizona and Utah statutes appear to have been based entirely upon the California Act prior to its amendment this year providing for a directional board of seven members from the construction industry.

“The California Act”, Registrar Bonelli observes, “gives a wider degree of protection to the public and assistance to the industry, without in any sense of the term being a revenue measure.”

THE ARCHITECT AND ENGINEER
ALL SET FOR BOOM

Belief that 1936 will see important revelations in the low-cost home building field was expressed recently by Bennett Chapple, vice-president of The American Rolling Mill Company and chairman of a committee associated with the Purdue Housing Research Foundation.

"The prospective home owner can now get up steam in the boiler for his ride into new environments and new comforts for his home and family," Mr. Chapple said in an interview.

He credited the Federal Housing Administration with working diligently to perfect a reasonable program for government insured borrowing, in order that homes may be purchased on the installment plan. In his opinion, this was the spark needed before any real start could be made.

"With a good reputation for paying his bills, and with a reasonable expectation of steady income, the prospective home owner can borrow eighty per cent of the cost of a new home for $7,43 a thousand per month," Mr. Chapple said.

"One disturbing factor which has held up this opportunity, especially in the lower income racket, is the cost of building houses. The problem resolved itself into one of finding out how to build a house that the working man could afford to own and live in. The challenge went out to architects, building material manufacturers, contractors, real estate men, and home appliance manufacturers.

"One of the most promising of the new ideas," Mr. Chapple said, "is the factory-fabricated steel house. Two different types, the Frameless-Steel house and the Steelox house have emerged from the experimental field and have demonstrated the practicability and economy of their types of construction."

"The year 1935," he said, "represented a time of trial and error,
of hope and despair, of failure and success, in trying to meet the housing problem, but out of it all has come a stronger and more determined group—those who are sure that 1936 will see important revelations in their chosen field."

---

**BUILDERS' CODE**

A code of self-government sponsored by eight employer associations, San Francisco Building Trades Council and the Bay Counties District Council of Carpenters, is still operative in the San Francisco Bay District. The employer associations comprise the master plasterers, sheet metal, heating and piping, tile, mason and electrical contractors, ornamental iron and cabinet manufacturers. None of the general contractor organizations has endorsed the code but individual general contractors will be asked to conform to it in conducting their business, it is stated.

The code is drafted along the lines of the NRA code for the building trades, regulating procedure in bidding and defining unfair trade practices. It will be administered by a board consisting of four employers and four employees. Provision is made for continuance until July 1, 1936, of existing wage agreements.

---

**OIL TERMINAL**

Eleven and one-half acres of land at the foot of Walnut Street, Alameda, have been purchased by the Santa Cruz Oil Company from the Anglo-California National Bank, as a site for terminal facilities. In addition to being used as a terminal site, storage facilities for vegetable oils and fish products will be provided. It is also planned to erect an experimental plant for the processing of various substances of this character.

The head office of the Santa Cruz Oil Company is 311 California Street, San Francisco, and the officers include Stanley Hiller, president; J. J. Coney, vice-president, and L. R. Kerdell, treasurer.

HOME BUILDING
While improvement has marked all divisions of the trade, the most abrupt rise the past year has been in home building. The gradual abatement of the doubling-up of families, the increase in marriages, and the desire for better living conditions, which naturally develops with the general expansion of business, have been the chief contributions to the gain, according to a recent Dun & Bradstreet report.

There has been no important change in building costs, the average being at about the same level as it was a year ago. Lumber prices have been steady, while cement quotations have not risen above the slight advance made at the beginning of the year. Other items, especially plumbing supplies, electrical fixtures, and some hardware items, have been advanced moderately.

The complete insolvency record of builders since 1927, including the eleven months of 1935, as compiled by Dun & Bradstreet, Inc., shows:

ARCHITECT AND ENGINEER
After trying other cements, I finally used Golden Gate TAN PLASTIC to get the crisp, sharp arrises in this precast grill.

{signed} F. JURGESWITZ
Specialist in Plaster and Artificial Stone

Modern design, with its use of shadow lines and masse for expression, also entails the use of grill work and moldings for decorative effects to match the skill of the craftsmen. Golden Gate TAN PLASTIC offers a workable material, ideally adaptable for the purpose...still retaining all the proven merits of true Portland Cement. Further, TAN PLASTIC without adulterants creates pleasing color and smooth, attractive surfaces. Whatever the job, if pourability is a factor, specify and use TAN PLASTIC. Used right it will never disappoint you.

THE ARCHITECT AND ENGINEER—February, 1936—Vol. 124. Number 2. Published Monthly—$4.00 a year. $1.00 a copy. 68 Post Street, San Francisco. Entered as second-class matter, November 2, 1905, at the Post Office at San Francisco, California, under the act of March 3, 1897.
SEVEN eminent American architects have accepted the invitation of Russell F. Whitehead, editor of Pencil Points, to act as judges in the Pencil Points-Portland Cement Association architectural competition.

Cash prizes totaling $7,500 are offered for the best designs of firesafe concrete houses.

Two separate problems are involved. One is the design of a concrete house for a family with two children and without a full-time servant, the house to be suitable for a northern climate. The other is to design a house for the same size family, under similar conditions in a southern climate.

According to Mr. Whitehead, besides architectural merit, the designs will be judged from the standpoint of the practicability and economy of construction, the value of the house as an investment during a twenty-year amortization period, and adaptability to concrete construction.

There are two first prizes of $1,500 each; two second prizes of $750, and two third awards of $500 each. There will also be twenty honorable mention awards of $50 in each of the two classes.

The competition is open to all architects and architectural draftsmen in continental United States. Plans must be in the hands of Mr. Whitehead, professional adviser of the competition by March 9.

The judges will be: Atlee B. Ayres, of San Antonio, Texas, who is an authority on Spanish colonial architecture; William D. Crowell, of St. Louis, member of the architectural firm of Mauran, Russell & Crowell; Robert D. Kohn, of New York, a past president of the American Institute of Architects; Carl F. Gould, of Bebb & Gould, Seattle architects; Edmund B. Gilchrist, Philadelphia, noted as an authority on small house and country estate architecture; C. Herrick Hammond, Chicago, a past president of the American Institute of Architects, and Howard Major, of Palm Beach, Florida, designer of many notable buildings in Florida.

LAST MONTH WE REFERRED to the proposed nation-wide architectural competition for a new state capital at Salem, Oregon. In the meantime several meetings have been held by the Oregon State Capital Reconstruction Commission which has been authorized to arrange all details. The commission has named Carl F. Gould, of Bebb and Gould, architects of Seattle, Washington, technical adviser, and upon Mr. Gould will rest the exacting task of preparing a program and general information to contestants. Mr. Gould is eminently fitted for the position. No member of the profession in the Pacific Northwest ranks higher. He has been honored by the Washington State Chapter, American Institute of Architects, serving as its president, and the National body also has recognized his high ideals and, besides making him a Fellow, has several times named him on important Executive Committees.

The jury of awards will consist of five—two architects, two members of the commission and one citizen.

The architect members will receive $250 each for their services. Following the receipt of a protest from Oregon architects against the holding of a national competition, the commission stipulated that the contest winner, should he be a non-Oregon resident, must affiliate with an Oregon firm in preparing working plans.

J. A. McLean, Eugene, is chairman of the commission. Alton John Bassett, executive secretary, has opened an office at 714 Porter Building, Portland. Other commission members are: T. Harry Banfield, Portland; Robert W. Sawyer, Bend; George R. Lewis, Pendleton; George A. Marshall, Baker; Dr. Ernest C. Dalton, St. Helens; J. H. Lake, Portland; Mrs. Gordon Voorhies, Medford; Dr. H. H. Olinger, Salem.

AT LAST the Institute has taken a stand on advertising. There can no longer be any question about its attitude toward the publication of brochures containing the work of an architect or firm of architects, made possible by a motley array of advertising. Such publications have been open to much criticism and ethical debate in the past.

That they have taken legitimate advertising away from regularly established architectural magazines (this publication, for example), magazines that are dependent upon the support of the building trade, there can be no reason to doubt. As high as $150 per page has been paid by building material houses and manufacturers, not because they expected to get any new customers from prospective clients who happened to read the advertisements, but because they felt obligated to "do something" for the architect. "Just cold-blooded blackmail," one manufacturer said after placing his firm's signature to a substantial advertising contract following a telephone conversation with the architect who said he "would appreciate the firm's cooperation in making the book a success."

Now, after many years, the Institute has declared itself as looking with disapproval on the publication of the work of its members in any publication supported in any way by advertisements, except in regular magazines, and the Committee on Practice must henceforth consider such practice as unprofessional conduct and so report to the Judiciary Committee the cases brought to the attention of the committee.
DETAIL OF ENTRANCE, SUNKIST BUILDING, LOS ANGELES
WALKER AND EISEN, ARCHITECTS
NEW HOME OF THE CALIFORNIA FRUIT GROWERS EXCHANGE, LOS ANGELES

by

Homer M. Hadley

RECENTLY completed and only a few weeks occupied, is the new home of the California Fruit Growers Exchange in Los Angeles. The building West Fifth Street, directly opposite Bertram Goodhue’s great Public Library. Nearby are the Edison Building and the Los Angeles Biltmore.

The building was planned as a permanent home and headquarters for one of the country’s most active and successful cooperatives: that of the citrus fruit growers of California.

In a comparatively brief number of years this organization has justified itself both to its members and to its customers, by its enterprise, fair dealing, and notable development of markets for citrus fruits. Who is there in the land unfamiliar with “Sunkist” products? To whom does not that name immediately suggest large and gloriously golden oranges full of the fresh sweet juice that frees the palate of “past regrets and future fears”? It is this new building which henceforth will be the source and origin of the “Sunkist” message to the nation and to the world.
So long as we human beings retain our preference for sunlight and daylight, so long will the problem of floor arrangements in office buildings in general resolve into the familiar three-span solution of a central corridor space between the living and working spaces which adjoin the exterior walls. Such is the floor plan here in a U-shaped building to the exterior of which modern mass effects and vertical lines have been adapted in the manner shown in the accompanying illustrations.

A special local feature influencing the design of the Sunkist Building is the long and gradually rising retaining wall on the north side of Fifth Street which terminates at Hope Street and which abuts the new building.

It should be stated that the site of the building is at the northwest corner of Fifth and Hope Streets; that Hope Street rises steeply up the hill to the north; that there is about 30 feet difference in grade elevations between the two streets at the intersection and that vehicular connection between them is had by means of a street which parallels and adjoins Fifth Street, descending from Hope Street to a grade connection with Fifth in front of the Edison Building. The retaining wall referred to separates Fifth Street from the connecting street. At its westerly end it has attained a commanding height. Stairs connect the two streets here and the upper flights and landings of the stairs, cantilevered out from the wall, further emphasize and give prominence to it. It is the proximity of this wall and the desirability of avoiding a too abrupt change from its pronounced mass, that led to the treatment adopted for the lower two stories of the Sunkist Building and for the large areas of blank...
wall space which there occur. It is not until the third story is reached that the typical character of the occupancy is manifested.

The high ground of Hope Street and at the rear of the building required heavy retaining walls on those sides of the building so the use of the ground story for garage purposes is

most appropriate. There are two quite widely separated entrances to the garage off of Fifth Street, midway between which is the main entrance.

This entrance, done in marble and aluminum and lintelled by a large decorative panel, opens into a spacious terrazzo-floored lobby having color-decorated concrete ceiling beams and most pleasingly colored and textured walls. It is a surprise akin to a shock to discover that these soft appearing walls are of concrete! The effect results from having lined the forms with and having poured the concrete against Celotex, the fine textures of which were thereby given to the concrete. Wide horizontal bands of these soft textured surfaces encircle the room, each uniformly colored a soft buff-green pastel shade, delicately varying from the adjoining bands from which it is sep-

areted by narrow recessed courses of silver. A most interesting decorative treatment results. At the rear of this lobby are stairs and elevators giving access to the offices above and beyond these entrance is had into the interior of the garage.

In the second story, centrally located on the Fifth Street side of the building, is the large spacious directors' room where official meetings of the organization are held. Its lighting and ventilation are entirely artificial, there being no window space in this room. The
concrete beams of its ceiling are exposed and are decorated in color. Upon its walls are several murals depicting California scenes. Above this room is the open-aired roof garden in the court space created by the U-shape of the upper building. Needless to say particular pains were taken to have a waterproof separation between the garden and the directors.

A most excellent and uniformly high quality of concrete was produced in the Sunkist Building. Not only good intentions but experience, skill, and intelligence are compounded with it. An effort was made to create in every workman an interest in his job and a feeling that his help and cooperation were of real importance in the production of concrete which, when the forms were stripped, would be found sound and without serious blemish. Foremen were charged with responsibility for producing desired results. They had standing orders to...
reject any batch of concrete which in their judgment was unsuitable for the work at hand. They were required to make good—not excuses. With walls eight inches thick, reinforced on both faces with double layers of bars inclined at a 45° angle for most effective earthquake bracing, placement was not a simple, easy matter yet it was successfully performed.

The concrete was mixed on the job. With the aggregates known, technical recommendations were obtained for the proportions in which several sands and gravels should be combined to produce a concrete of desired strength and workability. Minor adjustments of these proportions were made from time to time as job conditions necessitated. The average mix was 1-2'/2-3'/2 with 3/4” maximum size aggregate.

The concrete was tamped and puddled in the forms by hand. After placement was completed, the entire exterior was gone over, any projecting fins were removed, and a colorless surface waterproofing was everywhere applied. The color of the building is simply the natural light grey tone which its concrete possesses.

Wall forms were made of veneer. By using 5-ply thickness, the veneering itself spanned between the vertical studs and carried all construction loads and pressures as well as imparting to the concrete the smooth plane surfaces that were desired. Cut into strips of uniform width, oiled with form oil, carefully wiped off to remove excess oil, these forms were used repeatedly. On each operation the strips were cleaned, oiled and wiped. They were always carefully set in true horizontal position. They produced very pleasing surfaces and the faint lining of the concrete which their edges caused is most successful. There is a suggestion of courses and jointing and an escape from the monotony and sameness with which large plane surfaces of uniform color and texture inevitably are afflicted.

There are several large decorative panels on the exterior of the building. They were cast in waste molds and have details and surfaces which are sharp and clean cut. The large panels, Production and Distribution, wherewith the wings of the upper building terminate, were cast in place. The panel over the main entrance was precast and was set in a recess left to receive it. This particular procedure was due to the building being ready and the concrete poured before the waste mold was made.
There are several exceptionally fine large pre-cast grilles.

When plans were being drawn for this building, thorough economic analyses was made by the mechanical engineer, Franklin R. Winch, of the various types of heating systems available, using electricity, oil and gas for fuel. A report was prepared and presented to the building committee which decided that the heating system should be planned for the use of gas as a fuel and that the boilers should be particularly designed for gas burning.

Plans and specifications were prepared accordingly. A two-pipe up-feed vacuum heating system serves the cabinet type copper finned coiled radiators for the offices of the upper floors. The various spaces on the lower floors, such as the board room, committee rooms, directors' rooms, etc., are heated, air conditioned and cooled from two central units located in the mechanical equipment room. The heating system has approximately 4200 sq. ft. of direct heating surface and about 2500 sq. ft. of equivalent direct radiation in indirect surface. Capacity of the refrigeration units for air cooling is about 30 tons.

The building is of reinforced concrete throughout. Consideration of space needs, of normal structural requirements, of earthquake resistant requirements, of architectural possibilities, of fire resistance—and of the cost thereof—determined the type of construction.
THE Texas Centennial Exposition building program will set a new style which is destined to have a lasting effect upon the future architecture of the world." This was the statement made by Juan B. Larrinaga,* colorist and delineator for the Exposition, at Dallas. And certainly Senor Larrinaga should know, for the Texas Centennial is the third exposition of international importance which has known the sure touch and certain technique of Senor Larrinaga's versatile hands. In 1913 he was assigned to the work of the Panama-Pacific Exposition in San Francisco. In 1934 he was called to San Diego, where he was given the position of designer and art director for the California Pacific International Exposition. Now he is called upon to help the Texans put over their big event.

The Texas Centennial promises to be unlike any other previous exposition in this country. Its background is different — more colorful, more romantic, more splendidly comprehensive, with a wider sweep and scope of time and place. The beginning of Texas antedates any on the North American continent. Texas has had so many sources from which to draw her materials: the ancient Spanish, the early Aztec,
DALLAS SKYLINE FROM WEST CORINTH STREET VIADUCT

ARTIST'S CONCEPTION OF TEXAS CENTENNIAL EXPOSITION, DALLAS
George L. Dahl, Centennial Architect

THE ARCHITECT AND ENGINEER
the Indian, the French, Mexican, Colonial, and modern.

In the Panama-Pacific Exposition at San Francisco, the Spanish motif was used as the theme, and carried out in the architectural design. With this background there was created a colorfully beautiful exposition which dazzled the eye and stirred the senses.

At San Diego, the builders depicted the whole history of Southwestern Architecture with a combination of Pueblo Indian, Aztec, Mayan, Spanish, Colonial Spanish, and ultra-modern. The result was a satisfying, lovely exposition as to beauty of line, form and color.

But the Texas Exposition will be different from both of these, and from all other World’s fairs. San Francisco and San Diego were both riots of color. The Texas Exposition will be more subdued, more in harmony with the ultimate purpose of each structure. For there is this difference about the Centennial Exposition—all major exhibit buildings, the various museums of art, horticulture, natural history, and the $1,200,000 Hall of State will be permanent. Only buildings erected by private exhibitors will be of temporary construction.

For this reason, it has behooved the Exposition management to build well for permanency, to attempt by architectural design and artistic treatment to tell the story of what each building will house, and fit the building to its contents.

The result of this need has evolved a new style of architecture, a new trend for the future builders to follow. Out of the Texas Centennial will come an architecture which reflects the cultural development of an empire and its people; an architecture with the feeling of the Aztec expressed in simple lines; an architecture with the touch of the ancient and the classical in the massive pylons and terraced effects; an architecture with the Latin-American feel of romance and golden sunshine; and withal, an architecture that is as modern as Texas is.

The Hall of State, which will dominate the Exposition grounds, will symbolize this new
architecture. In fact, the Hall of State will, in my belief, become a symbol of Centennial architecture for the world. Builted on a foundation of native red granite, the building proper fashioned of Texas limestone and marble, ornamented with heroic statuary and colorful murals, this structure will typify modern Texas and her progress, at the same time recalling the glorious history of the past four centuries. Texas is building a Centennial for the world, and the architecture of the future will be colored by it for all time.
MAYA ARCHITECTURE
ARCHITECT-EXPLORER REPLIES TO CRITIC

by

Robert B. Stacy-Judd

In the August 1935 number of the Architect and Engineer an announcement appeared stating that "in an early issue we shall publish a paper by Mr. Gerhardt Kramer... on Maya Architecture in Modern Design." Continuing, the announcement informed the reader that Mr. Kramer disagreed with opinions I had expressed in the series of five articles which The ARCHITECT and ENGINEER published during the winter of 1933-4. According to the report, Mr. Kramer said "I do not agree with the opinions of this author. (Referring to myself.) I feel that the architectural profession should be interested in having the correct archeological side of this question presented."

Frankly, I welcome criticism and hope to learn thereby. Although I have devoted approximately fourteen years of my life to a very intensive and almost continuous study of Maya culture, and especially its architecture, I realise that I have yet a great deal to learn on the subject. Anticipating constructive and helpful criticism from Mr. Kramer's articles, or at least an opinion worthy of consideration, my surprise was great when I read in Mr. Kramer's promised article that, with the exception of the somewhat doubtful approval given to the western architects for their "unsuccessful" attempts to adapt Mayan architectural motifs to modern American conditions, the author merely builds up a story in defense of his claim to having solved at least the major problems. His solution is based upon the results of his experiment with a hypothetical project known as a Pan-American Peace Palace.

I shall first consider the portion of Mr. Kramer's article in which he criticises my design for the Aztec Hotel. He says: "On the exterior of the Aztec Hotel in Monrovia, California, an assortment of scrolls have been tossed together and placed on bare wall surfaces where decoration was thought necessary. The designer has failed utterly in interpreting the symbolism or the craftsmanship of the originals." (Boldface are mine.)

En passant, I might mention that I have in my possession a souvenir of the delightful two weeks I spent as a guest of Frans Blom, leader of the Tulanee Expedition, at the Base Camp at Uxmal, Yucatan. The souvenir consists of a photograph of the Casa de las Monjas at Uxmal, on which is inscribed the names of all the expedition members, including that of Gerhardt Kramer, whom I presume is the author of the article I am now replying to. If my surmise is correct, Mr. Kramer may read in my book, THE ANCIENT MAYAS, a recounting...
of considerable happenings at the jungle base camp in which he took part.

The Professor, again if my surmise is correct, will no doubt remember a certain night in March, 1930, when, on top of the Casa de las Monjas in Uxmal, I gave a short talk before the members of the Tulane University Expedition, at which he was present. The Gerhardt Kramer I refer to was at that time an architectural student under Professor J. H. Thompson. On the occasion of which I speak, at the request of Frans Blom, I gave a resume of my practical attempts in adapting Maya art motifs to modern American conditions. At that time I particularly stressed the point that the Aztec Hotel, Monrovia, was purely an experiment, and that at the time I designed the structure I knew practically nothing concerning the symbolic meaning of Maya art motifs. This building, by-the-bye, was designed about thirteen years ago and is credited in every civilized country on earth as the first Maya-motif design to be actually incorporated in a completed structure.

The Aztec Hotel in Southern California

I presume the Professor read my series of articles published in the ARCHITECT and ENGINEER during 1933-4. In which event he could not have failed to note my comments on page 25, of the February 1934 issue of that journal. I wrote, "Not that I considered its (the Aztec Hotel) design indicative of a new style. To me this structure when completed was unintelligible. As a creation it fascinated me. But it lacked reason." This would indicate that Professor Kramer's remarks are not exactly original.

Apparently the article describing my attempt to interpret the Maya art motifs, and the method in which I have endeavored to reconstruct them under modern American conditions, failed utterly to impress the professor. No reference to these items is made in his article, neither does he condescend to comment upon the few later examples of my works.

As the Professor has chosen my first experiment upon which to heap his condematory remarks, I believe it is only fair that I quote a few excerpts from writings concerning the subject in question, penned by, at least, equally qualified but more kindly critics.

Major George Oakley Totten, A.I.A, architect and author of an elaborate work, MAYA ARCHITECTURE, in which illustrations of the Aztec Hotel appear, says: "The so-called Aztec Hotel at Monrovia, California, by Robert B. Stacy-Judd (which is Aztec in name only, but Maya in feeling) is bold and original. The furniture and minor details have received careful study and have been well carried out."

Alfred G. Bossmo, well-known architect, one of the earliest Maya enthusiasts and author of "AN ARCHITECTURAL PILGRIMAGE INTO OLD MEXICO," writes "I noticed those of your very interesting Monrovia Hotel in the June issue of Architecture and Building, and if you could let me have prints . . . etc." Later, Mr. Bossmo wrote me as follows: "I believe now you are the only one in America who is really following on that activity, (referring to the Maya art motif introductions) it has unlimited possibilities . . . . I do wish you the very greatest possible success in the architectural pioneering that you are doing, and it would be a very great delight one day, I am sure, to have the opportunity of meeting you."

Professor Rexford Newcombe, A.I.A., History of Architecture Professor, University of Illinois, author of numerous architectural books, and one of the leading architectural educators in America, says: "This Aztec Hotel I find a most delightful excursion into one of the most fruitful fields of design that the American architect could possibly explore. I congratulate you upon the re-emption of this real American type of architecture." Professor Newcombe was one of those who decided that a review of my Maya adaptations should be given almost the entire issue of "The Western Architect," published in July, 1927. After publication he wrote me as follows: "I am sure that your work merits the attention we have given it, and I confidently look forward to an increasing interest in the thing you are trying to do. Your attack is an original one and you are to have all the credit that comes from.
originating something new and worthwhile."

In my possession are scores of similar favorable comments from architects and editors of leading architectural journals throughout the world, not to mention the hundreds of lengthy illustrated national and international journal, magazine and newspaper articles from every civilized country on earth.

In Professor Kramer's article it is not clear to me in what manner he has given the architectural profession "the correct" and archeological side of this question (boldface are mine). The only apparent effort he makes to give this "correct" information is his statement that "The architecture of this region (Yucatan) theoretically is not pure Maya." The remark, however, should be qualified. On pages 35 and 36 of the December, 1933, issue of The Architect and Engineer, I clearly indicate the fact of foreign invasions into Yucatan and the consequent introduction of Toltec and, later, Aztec cultures.

Old and New Empire Beliefs

Among my many somewhat revolutionary theories concerning the history and architectural remains of the Maya civilization, is one disagreeing with the so-called Old and New Empires belief; the former supposedly confined to the south of the Maya area, the latter to the north, or Yucatan.

Professor Kramer says, "During the sixth and seventh centuries of our Christian era these cities (referring to those of the south) were abandoned and new cities founded and colonized in Yucatan" (boldface are mine). I believe I am the first to point out that this is apparently an error and have offered reasons for so believing. It is my theory that the cities of Yucatan are at least as old as those of the south. Upon their return to Yucatan in the latter part of the tenth century, A.D., after over 300 years desertion, the Mayas "built over," or placed new exteriors over the original structures. There appears sufficient evidence to prove that Chichen-Itza, one, if not the largest, of the northern cities, was deserted circa 642 A.D. It is further evident that this city was founded by Itzamna shortly after the Christian era, therefore it is reasonable to assume considerable changes had taken place in architectural form and decorative design from the period of its founding until deserted by the Itzaes in the middle of the 7th century, A. D. Obviously, after the Itzaes returned to Chichen-Itza, approximately 987 A.D., a considerable building program was undertaken. At the beginning of the 11th century, upon the arrival of Kukulcan, another building revival took place. In my belief similar conditions prevailed in numerous other cities situated in the northern area, or Yucatan. If such was the case then evidence should be forthcoming to substantiate the belief.

On Page 31 of the January issue of The Architect and Engineer, I recite an instance in connection with the Castillo at Chichen-Itza which partially confirms my belief. On Pages 117 and 125 in my book THE ANCIENT MAYAS, I give as my opinion the high probability that the Casa de las Monjas in Uxmal, Yucatan, has been built over; the earlier Maya art is plainly to be seen on an inner face.

In T. A. Willard's book THE LOST EMPIRE OF THE ITZAES AND THE MAYAS, published in 1933, the author recites the incident of the finding of nineteen stones, or stelae, in Uxmal, by Frans Blom, which "afforded him a great thrill." After examination Blom decided they were of the "Old Empire" period. He thereupon set back the age of Uxmal "at least five hundred years earlier." In my book THE ANCIENT MAYAS, I mention this incident as I was present with Blom on that memorable occasion.

Professor Kramer in his article mentions human sacrifice and leaves the reader to infer that the custom is Mayan. Much has been written describing the ancient Mayas as pagans, savages, barbarians, and perpetrators of human sacrifice. All the evidence, however, clearly indicates contrary characteristics. They were a highly advanced race of people and there is no evidence whatever to show that the Mayas performed human sacrifice. The degrading custom was introduced into Yucatan by Kukulcan. The rite was an Aztec innovation.
and formed one of the many "abominations" ascribed to those people and which were forced upon the gentle Mayas. The correctness of this statement is borne out in many ways in addition to the writings of Landa, Santillana, Alonzo de Rojas, and others.

One of the most misleading statements made by the Professor in his concern that the architectural profession be "correctly" informed as to Maya archeological facts and his endeavor to fulfill that worthy obligation, is his unsubstantiated remark that the lower part of Central America—the area of the so-called Maya Old-Empire—is the centre "in which this great culture probably developed." (Boldface are mine.)

This information, right or wrong, is undoubtedly important and belongs to the "archeological side of this question," as the Professor puts it; but, when he says "I do not agree with the opinions of this author (referring to myself) and promptly expresses one of his own (though not original), in all fairness to the reader and himself, he should produce at least some evidence in support of his contention.

It is my strong belief that neither the Professor nor any other Maya student can produce one tittle of evidence to uphold such a statement. To the contrary, all the testimony indicates that the ancient culture arrived hurriedly on the shores of Central America and Yucatan. The earliest works are undoubtedly the best and there is positively no evidence to indicate progress in Maya art at any stage. In fact it has long been my firm opinion (which I have endeavored to back by argument and confirming data, and which is alluded to in my articles and enlarged upon in my books) that, in all probability, the Maya civilization arrived on this continent at a period when its culture was actually on the decline. The theory that the Maya art was born, flourished, and died in Central America, or any part of the Americas, is, in my opinion, without foundation.

Another misleading statement in the Professor's article is that "Comparatively narrow stairways rose at steep angles up the front or four sides of the pyramid." (Boldface are mine.)

Surely the writer is in error. Practically every stairway up the Maya structure is unusually wide. Each of the four stairways up the sides of El Castillo, the great pyramid at Chichen-Itza, for instance, is 44 feet wide. Usually, one of the outstanding features of Maya architecture is a wide stairway.

Thinks Critics Speak too Hastily

When it comes to discoursing upon the merits or otherwise of examples of Maya adaptations to modern American architecture, I feel that Professor Kramer's inexperience in the practical field of architecture has led him to speak too hastily. It will be noted that he has chosen as an example, to illustrate his viewpoint, his own conception of a "Pan-American Peace Palace."

In the average experience of a practising architect such sublime commissions are few and far between, in fact it is the subject of every architect's dream, and as such, in the vast majority of instances, it so remains. If only we of the profession could choose the type of architectural subject nearest our heart's desire, Peace Palaces, and similar monumental structures would probably take first place. Unfortunately, when a hard-headed group of business men desire, for instance, a hotel design comprising an odd assortment of practical requirements in the planning, combined with an outstanding decorative treatment to create unusual public appeal, the handicap is obviously one of deep concern.

If Professor Kramer has carefully digested the contents of my articles to which he refers, he will recall the paragraph describing my self-imposed task, which consisted of endeavoring to create a basis (at no time have I stated the result was final, or even approaching finality) for an essentially Columbian architectural style for all types and classes of structure commonly demanded in North America. In each and every instance the examples are actual commissions, the requirements of which were carried out to the instructions of individual clients.
In common practise the architect seldom has ideal conditions to fulfill, such as environment, site and requirements.

Professor Kramer's article includes, what must be inferred as original thought with him, nothing more nor less than a brief summary of the substance of my five articles, the full contents of which he consistently ignores in his criticisms but never hesitates to turn to for opinions. He says: "Our immediate predecessors in architecture had the same difficulty adapting the Classic to their designs. It was only after they had stripped the ancient buildings to their meagre skeletons and learned the principles of the construction and the relationship of the sculpture to the construction that they were able to make logical modifications." (Boldface are mine.)

These words are precisely the intent and meaning embodied in my articles, and also my books THE ANCIENT MAYAS and ATLANTIS, MOTHER OF EMPIRES. In The Architect and Engineer issue of November 1933, page 39, I say:

"Recalling no parallel case from which to borrow experience I was left to my own devices.

My first act was to reduce the Maya art to 'constructive sentences' and an 'alphabet' as applies to the 'language of architecture.'

After this a 'grammar', or the science of the right use of the 'language,' was employed.

This 'parsing' process reduced the Maya art as a composite whole to fundamental units.

By rearranging these fundamentals on new lines, from a standpoint of architectural 'grammar,' it seemed reasonable to anticipate an ultimate distinct style acceptable to American demands."

The Mayas took the form of the lowly serpent and progressed the simple motifs through conventionalism to abstract design of great beauty. My humble efforts aspire to a similar formula, but with no exalted expectation of emulating similar results. Obviously, such a task is not to be accomplished alone through the experiments of a single individual, neither can it be completed in a single lifetime.

"Atlantis, Mother of Empires"

When it comes to the question of interpreting Maya symbolism, of which the Professor infers I am ignorant, I must ask his indulgence until my "Atlantis, Mother of Empires" is off the press. This work is the result of over twelve years intensive study and research in the Maya and many other fields of thought. Therein I submit my theories, not only those to which Professor Kramer objects, but numerous other far more radical opinions concerning Maya history and art. Therein, too, I deal with Maya symbolism and symbolism in general, ancient religions, ethnology, legends, mythology, architecture, root languages, customs, the origin of art motifs, astrology, racial migrations and distribution of early cultures throughout the world, etc.

It must be admitted that the origin and early history of the Maya civilization has roused a world of speculation, and that it is a subject upon which no two authorities agree. Therefore, it is unwise at this time to take a too definite stand on any one point. The student of Maya culture, however, has a virgin field of thought before him. He is free to speculate at will, but if his theories are accompanied by logic, sound reasoning, and corroborative data, they are at least worthy of serious consideration.

After having carefully read Professor Kramer's article I fail to find any corroboration of his objections, or fulfillment of his promise to give the "correct archeological side of this question", in fact I find no item mentioned which is not more fully described in my own articles and still further expressed in my book. It is far from my intention to be intolerant when considering the opinion of others, but, in view of the general lack of knowledge on the subject, the reader should have been supplied with sufficient convincing and corroborative data in support of the Professor's objections to my beliefs.

ARCHITECTURAL EXPRESSION

DESIGN INFLUENCED BY ENVIRONMENT AND TRADITION

Reginald D. Johnson

in The Federal Architect

SINCE the Columbian Exposition in Chicago in 1892, it is possible to trace four more or less distinct philosophies of design at work in this country in the solution of architectural problems.

First: We have that great school which is conscientiously and religiously following precedent in its effort to clothe our modern structures with stone, brick or wood. The argument of this school of thought is of course that while they recognize that evolution in design is bound to take place, they nevertheless believe the only safe and sane course is to proceed with the greatest of caution and the minimum amount of experimentation. Such delightful buildings as the Boston Public Library and the Freer Gallery of Art are excellent examples of this philosophy showing, at the same time, strong indications of the individuality of their respective designers.

Second: We come to that school of thought which still holds very closely to the past for its inspiration, but shows a breaking away from exact traditionalism. The architects who represent this school were educated as a rule along strictly traditional lines, but it is evident that in the minds of these men there is a revolt against the inconsistency of trying to solve modern problems with the definite limitations laid down by precedent; and, while they struggle to free themselves from the shackles of tradition, they are only able to do so to a very limited extent, due to the fact that in their youth they had been so thoroughly grounded in the philosophy of the older school of thought. Their whole approach to a problem in design is automatically based upon precedent.

Bertram Goodhue, during the period of his association with Ralph Adams Cram, is an excellent example of what I have in mind.
Third. We now come to that school of philosophy in architectural design which is the direct result of the restraint placed upon the honest expression of materials and construction. Almost in desperation, we see a school giving birth to a new concept of architectural thought. Many of our great "skyscrapers" and the Nebraska State Capitol illustrate this point-of-view.

Fourth: As in all schools of philosophy, whether relating to architecture, economics or politics, we have an extreme left wing. We hear much of "Functionalism" in architecture, and we are surfeited with designs which express nothing else, and thereby are supposed to merit our approval. This ultra-modern school has, however, taught us some very valuable lessons. As a result of its experiments, we are beginning to think in terms of filler walls and cantilever construction in our designs, rather than simply in the terms of bearing walls, as in the past.

Let us now, as it were, try to stand back and see these four philosophies of design in their true relationship to modern conditions.

The first school of thought, as ably interpreted by that great firm of architects—McKim, Meade and White—had unquestionably one basic inconsistency, namely, the impossibility of adapting in a logical manner the designs of the past to modern materials, modern workmanship and modern construction. I, for one, nevertheless feel that in certain instances environment and tradition in certain communities in this country warrant, to a great degree, this approach toward the subject. For example, there are many delightful towns in New England and in the South, and a few in the Southwestern section, where precedent in the past has been so well established that we are more than justified in carrying forward our newer buildings in at least the spirit of what has gone before, no matter what the Modernist may say to the contrary. These instances need the skill of the traditionalist in their solution, but they are comparatively few and far between. By and large, we need in this country much more of the so-called "modern" point-of-view.
Personally, I do not feel, however, that the extremist in Modernistic design has any chance of permanently satisfying the aesthetic needs of our country. The pure Functionalist soon finds that if he carries his philosophy to its logical conclusion there is nothing left but wall surfaces and openings, and he is already trying to camouflage this by all sorts of clever tricks which are in themselves mere subterfuges. Over a period of many years, man's aesthetic expression has always been logical, and with this assumption I think we can see evolving from the four philosophies mentioned above a type of design which will—first, be functional in plan, section and elevation; second, will express the materials used; and third, be based on pleasing forms derived and evolved from past centuries of endeavor, and adapted when necessary to new materials. Really worth while new forms in both detail and mass will only evolve slowly.

In making this statement, I am also taking for granted that with the introduction of the machine age and with the streamline, which we admire in the aeroplane and the automobile, we are unconsciously developing a somewhat different aesthetic reaction from the past. For some reason, we seem to demand expressions in positive vertical or horizontal motifs plus great simplicity. The desire for simplicity unquestionably is largely due to the fact that the tempo of our lives today is far faster than in former ages, and as a result we are, gen-

DESIGN FOR A POST OFFICE BUILDING
Reginald D. Johnson, Architect

erally speaking, a somewhat tired people, and therefore demand simplicity rather than elaboration and stimulation in aesthetics, whether it be in architecture, painting or sculpture.

The mere copying of the past has gone for good and ever. The future of architectural expression, with the exception of a few locations where tradition has a very strong foothold, unquestionably will be some honest, straightforward form of the structure with the minimum amount of ornament and detail.

In brief, the architects of today are discarding plagiarism and returning to honesty—an honesty which, previous to the machine age, was characteristic of all good architecture, and not something newly discovered by the Extreme Modernist.
House for

Pasadena Cal
CHIMNEY DETAIL, RESIDENCE OF THEODORE OFF, HOMBLY HILLS
H. ROY KELLEY, ARCHITECT
RESIDENCE OF MR. AND MRS. THEODORE OFF

This early American type residence has an excellent outlook upon a broad expanse of the surrounding mountains of Holmby Hills and Bel-Air. It is located within a few minutes drive of the University of California at Los Angeles.

The exterior half timber work is of weathered oak. The exterior plaster is an old weathered natural stone color which blends with the natural stone of the chimneys. The roof is of weathered hand split shakes.

The walls of the principal rooms are of a slightly textured cream-colored plaster with oak beams and wood ceilings. The floors are oak planks of random widths.

CAMBODIAN PAGEANT
Artists Ball Colorful and Resplendent

SAN FRANCISCO has again shown to the world that it "knows how." The latest exemplification of this now famous saying of the late President Taft, was the Cambodian Ball and Pageant, depicting the Fall of Angkor Vat, at the Municipal Auditorium, the night of January 17th, under the auspices of the San Francisco Art Association.

With Timothy L. Pflueger, architect, as its versatile general director, the Parilia proved one of the most successful affairs of its kind ever undertaken in these parts, and this in the face of the fact that it was the fourth event of similar nature to be given by the Art Association.

Lucien Labaudt, well-known San Francisco artist was art director.

The story of the Pageant was compiled from various Cambodian myths by William H. Smith, Jr., who acted as production director.

An outstanding pageant entitled to international recognition, was the verdict of such distinguished critics at Maurice Sterne, internationally famous painter and sculptor, Col. W. de Basil and S. Hurok of the Monte Carlo Ballet, who were present, as well as Lady Mendl, (the former Elsie De Wolfe), and Prince Valdemar of Denmark.

It was to introduce the pageant that the Teller of Tales spoke (in the person of Edgar Walter, sculptor), and when he had done, the nine thousand spectators saw towering before them a temple-like structure of colossal proportions. It rose upwards into shadowed space in broad tiers which were designed eventually to hold the 881 participants in the pageant. Its central feature was an enor-

“Java” (East Bay Artists Unit) presenting two colossal Javanese marionettes, 18 feet high and painted in blue, magenta and gold.
mous green Buddha, sculptured by Robert Howard.

To give some idea of the proportions of the pageant, it were best to explain that the hall in which it was held occupies a city block. The setting, with a stage in front of it, stretched the width of one end. The pageant entered the opposite side of the stage, and moved the length of the hall to it. As each of the 12 units of which it was composed finished its performance, the participants took assigned places on the tiers above the stage. The entire action was accompanied by an orchestra of 30 pieces.

The units are described, with an outstanding feature of each, as follows, in the order of their appearance: "The Frieze of the Lotus," Alumni Association, California School of Fine Arts, 100 participants; costumes green and silver. On a litter carried on the shoulders of 12 men, a large silver lotus flower on which sat Siva and Parvati, performing a ritualistic dance.

"Court of Kambu," San Francisco Art Association, 100, orange-red and gold. King Kambu (Victor Arnautoff, artist) and Princess Naga (Esther Bruton, artist) entered on life-sized elephants, attended by symbol-bearers. They dismounted and ascended their throne, at the feet of the Buddha. Then a most effective Cambodian dance was performed on the main floor by a large group (Anne Mundstock, choreographer), with Marcelle Chesse and Patrick Bradfield as the principals, in silver.

"Burma," Betty Horst Dancers, 10 girls, gold and green, in a finished Burmese dance, on the stage. "Java," East Bay Artists, 35, blue; two colossal, articulated Javanese marionettes, 18 feet high, operated with sticks, and painted in blue, magenta and gold, accompanied by a devil dance, in masks. "Tonkin," San Francisco Architectural Club, 110, yellow-green; a group of effective banners, some 30 feet high; Indo-Chinese dance.

"Siam," California School of Fine Arts, first group, 150, red-orange and gold; flame dance on floor. "Ceylon," Rudolph Schaeffer School of Design, 25, red-violet. "India," George Pring dancers, 55, blue-violet; Nautch dance on stage. "Siam," California School of Fine Arts, second group, 150 orange-red, white and silver; a life-sized white elephant, followed by a baby white elephant, bearing a prince and a princess, respectively.

Lastly, Naga, the Seven-Headed Cobra, attended by 30 Indriyas in green and gold, appeared, to wreak vengeance. Her snake body, 30 feet in length, uncoiled as she approached the stage. Angkor-Vat became enveloped in smoke and flame, which had its destruction from the profaning eyes of Man.

Summing up Junius Cravens writes:

"Thus ended what was probably one of the most resplendent pageants that has been staged anywhere in our time. It was so colorful in pattern, so colossal in scale, that adjectives seem inadequate in attempting to describe it. It was artistically conceived and executed, expertly directed and beautifully performed."
JOE B. LARRINAGA OF HOLLYWOOD, CALIFORNIA, colorist and delineator for the Texas Centennial Exposition, shown in his studio with a model of one of the buildings for the Fair. The Californian predicts that architecture of the Texas Centennial Exposition will set a new fashion for construction.
WHEN the Riley Act was enacted by the California Legislature in 1933, the Building Inspector was confronted with two problems, neither of which had been very seriously considered in connection with the usual small frame dwelling, store, warehouse, or multiple garage, unless some special provision existed in the local code.

The first problem was: Shall the lateral force law be applied to minor structures, such as those mentioned above?

The second: What allowances shall be made for the ordinary traditional types of wall construction, such as horizontally and diagonally sheathed walls, wood lath and plastered partitions, stucco, and fire-blocking or herringbone bridging?

In some localities, the first problem was dismissed as being unimportant for frame structures of the conventional type not over three stories in height. This action, of course, eliminated consideration of the second problem. However, in this connection, at that time there was already in existence a considerable literature dealing with the relative stiffness and rigidity of various types of frame walls and special bracing designs.

If, on the other hand, the Building Inspector interpreted the Act in such a manner that all new buildings were subject to investigation, the second problem became a very real one, and was further expanded by the natural question: How detailed and complete an analysis is justified in the above type and class of structure?

It is thought by the writer that possibly the way this problem was handled in Berkeley might be of general interest, and below is given a brief outline of our present procedure, dating from May 1, 1933.

First of all, it was assumed that all new structures must be properly braced to comply with the law. Next, the bracing system was optional with the designer, and certain values of bracing elements were assigned, such as 65 lbs. per linear foot for horizontal sheathing (net wall length) but no credit was allowed for instance, for wood lath and plaster or for fibre boards.

Then, certain mandatory requirements were
set up, such as: "balanced" footings (inverted T sections, double-battered, or combinations), two 3/8-inch deformed bars in the lower half of all footings, bolted mud-sills (usually 3/4-inch bolts, 10 inches long, at 6 foot intervals).

Gable ends were required to be braced, and open fronts of garages were strengthened by horizontal diagonal bracing or by diagonally sheathed floors overhead.

In the case of small stores, a reinforced concrete U frame was built on the front, the upright legs acting as cantilevers in resisting forces parallel to the plane of the open front. These U frames are useful in one story reinforced concrete or brick structures, being adaptable as longitudinal and transverse stiffening bents.

Finally, some designers would say, "Well, I have never had to analyze or specially brace such a structure, and I don't want to take the time or incur the expense of hiring an engineer —so what is a simple method of bracing the ordinary frame dwelling?"

This put us on the spot: should we insist that a man who was building a $3,000 one-story, five-room dwelling, pay an engineer to go over the plan and design a bracing system? (Remember, the majority of such plans are not designed by either an architect or engineer.)

As a result, it was decided to publish a small table of values of what we called the "Berkley Compression Brace"—a very simple brace for which we claim no credit as to its originality.

It consists of the usual diagonal integral blocking, reversed in direction from customary
fashion, in order to "pick up" a maximum dead load vertical resisting couple, and having the head and foot cut off horizontally to meet vertical cripples which extend from head to plate and foot to sill, and arranging a special dapped-end design at plate and sill (see sketch).

We also encourage the use of diagonal sheathing, both single and double, allowing double values when walls are diagonally sheathed in opposite directions on opposite sides of a wall.

The compression brace was well received, as the final test was the carpenters, and they had absolutely no trouble in accommodating their traditional methods to this brace. The retention of the integral blocking also served as fire blocking, the only "extra" being the few cripples, which were usually scrap lumber anyhow.

Thus, if the designer furnished us a strain sheet showing the forces assumed, and reasonably expected, to be acting on bracing walls, and the "type" of brace taken from our table, we accepted the plans and felt that a reasonable compliance with the Act had been achieved.

The consideration of torsion, "center of rigidity," "center of mass" and rotation in these minor structures, was dispensed with in all but the most exceptional cases.

The tables reproduced in this article are based on nominal sizes, and ordinary workmanship, using No. 1 Common Dimension O. P. or equal lumber.

A STUDY IN ROOF LINES

THE ARCHITECT AND ENGINEER
THE TERMITE SITUATION

PUBLIC INTEREST INCREASES AS NATIONAL MAGAZINES DIRECT ATTENTION TO ALARMING CONDITIONS

by

A. A. Brown, C. E.

The incidence of termite damage in the United States is assuming genuine importance on the part of the public as evidenced by leading magazine articles appearing in the Saturday Evening Post, Time, and Readers Digest. All of these publications are of national circulation, and such articles are intended to direct the attention of the public to important developments which would be of interest to the reader. Other popular magazines in recent months have also carried articles on this same subject. The interest thus shown should prove helpful in directing attention to the need for local investigations, and the preparation of standard specifications to deal with the problem in major communities. Conditions which retard or accelerate the destructive activities of these pests vary greatly from community to community. With more than fifty species native to our country, and the conditions surrounding the activities of these various species differing one from another, it should be apparent that no stereotyped formula for their control can be used without reference to the specific conditions to be met.

It has often been said that a sure way to gain a man's interest is through his pocketbook. While this may not be true of all individuals, its appears to be true with most of us. Termites are touching the pocketbook of American home owners. According to the Bureau of Census Reports of 1930 there are more than twenty-five million buildings (houses and apartments) in the United States. For a number of years past these buildings have suffered an annual average fire loss of $250,000,000, or about $10 per dwelling. Many guesses have been made as to annual damage by termites to wooden structures. The Bureau of Entomology of Washington has used the figure of $40,000,000 to represent this annual damage. The National Committee on Wood Utilization places the figure at $45,000,000.

Of the wood frame buildings inspected in the San Francisco Termite Survey, more than 82 per cent were found to be infested by one or more species of termites. The estimated damage to these structures varies from $25 to several thousand dollars, and in a few instances caused the condemnation and subsequent demolition of the buildings. In approximately 10 per cent of those structures found to be infested, structural weaknesses were discovered requiring immediate repairs to safeguard public safety. A number of buildings of two or more stories were found with columns so heavily damaged as to destroy their structural value and require their replacement. One of the most serious cases of this kind to come to my attention was a two story and basement building where fourteen of the wooden columns in the basement were removed and replaced with steel. In a six story apartment building it was necessary to replace a 10x10 wooden column in the basement.

Termites Infest Industrial Buildings

The buildings in seventy-five contiguous blocks within the fire limits of the 1906 con-
flagration were inspected, and provide a yard-
stick for estimating the approximate damage
done to structures by wood-destroying organ-
isms. Within this area, one corporation owns
some twenty-seven buildings. At its request
these structures were inspected in company
with two of its maintenance engineers. At the
closure of the inspection these engineers
estimated that it would require the expendi-
ture of $100,000 to repair the damage un-
covered. These, of course, were industrial
type structures, and the average unit of ter-
mite destruction was higher than is normally
found in a dwelling. Assuming that all the
buildings within the fire limits have been con-
structed subsequent to the fire of 1906 with
an average of approximately 25 years, the
annual damage by these insects is far greater
than is commonly estimated. Indeed, it may
exceed the loss caused by fire.

To support any building on shoring and re-
place main columns is, at best, a costly pro-
cEDURE, and as noted above this has been done
in a number of instances. An apartment house
built in 1907, repaired in 1914, the lobby of
which was reconstructed in 1928 due to Zoo-
termopsis infestation, was again reconstructed
in 1935 due to the destructive work of these
insects. The repairs to this building on each
occasion merely provided the termites with a
fresh new food supply. It is well known that
termites prefer new, freshly-cut lumber to old,
dry, and thoroughly seasoned material. In
making such repairs, chemically treated wood
that has been rendered unpalatable to termites
should be used.

In San Francisco we are dealing with two
major types of termites, namely the Rhino-
termitidæ, which make their home either in
whole or in part in the soil, and the Kaloter-
miteidæ, which make their home in the wood.
In the latter classification we have two major
types: Zootermopsis, the so-called damp-wood
termite, and Kaloterme, commonly known as
the dry-wood termite. This latter group was
not reported as being present in San Francisco,
in the report of the Termite Investigations
Committee. Both major groupings of ter-
mites have a number of things in common:
they depend upon cellulose for food; they al-
ways have fungi present in their burrows as
an aid to provide a balanced diet. This
material supplies the proteins. They live a
hidden life protected from their natural en-
emies, the ants; they are blind and shun light
except at the swarming season when the re-
productives have eyes and are attracted to
light. There is a wide variation, however, in
their tolerance to the percentage of moisture
present and in the ability to produce moisture
from the wood. We found from laboratory
determinations that Zootermopsis can success-
fully colonize in wood containing as little as
13.35 per cent moisture, and they are also
found nesting in wood with 220 per cent
moisture by dry weight of the wood. The
formula for cellulose is C6-H10-O5. Breaking
down this formula into two parts, and by tak-
ing oxygen from the air, termites are able to
obtain six parts of carbon dioxide (CO2) and
five parts of water (H20). Thus, by controlling
the circulation of air in their colony, and pro-
ducing water by chemical processes from
otherwise dry wood, once established the Zoo-
termopsis can create sufficient moisture to
live in dry wood. This ability on the part of
wood-dwelling termites to create their own
moisture supply, makes the problem of pre-
vention, eradication and control more complex
than in the case with the ground-dwelling
termites.

Wood Dwelling Termites Active

Subterranean termites depend primarily for
their moisture supply upon ground connec-
tions. They seem unable to create moisture
from the wood to the same extent as the wood-
dwelling termites. Consequently it is not so
important in making repairs where subterrane-
an termites are involved to eliminate all
members of the colony, since the remaining
members will in all likelihood dry up and die.
Not so with the Zootermopsis. Members of
such a colony which remain after repairs have
been completed will, within six to seven weeks, develop supplementary reproductives which are more prolific egg-layers than the original queen.

Wood dwelling termites have been found in 44 per cent of the buildings infested, and in 56 per cent of the structures, subterranean (ground dwelling) termites were present. San Francisco is a city that is very compactly built. Residential lots are small, usually 25 feet wide, and in most instances buildings are constructed to within an inch of the property line. Subterranean termites are known to build runways in the ground traversing great distances, as well as reaching considerable depth. In one instance subterranean termites entered a Class A structure through joints in the concrete of the basement floor some 25 feet below the street level and constructed covered runways to the furnishings on the main floor. The ability of these subterranean termites to travel under the ground surface from one place to another, probably accounts in a measure for the very heavy percentage of infestations in wooden structures in San Francisco where buildings are constructed in contact one with the other. Termites under these conditions become not only the problem of the individual property owner, but a neighborhood problem as well. As an example of the situation created by these conditions, the owner of a home constructed within the last three years became interested in the termite problem and requested that his property be inspected. It was built on a 25 foot lot and within less than one inch of the adjoining structures. His property was found to be infested to a minor degree, but the older adjoining buildings were heavily infested. The owner in this case was interested in eradicating the termites on his own property. On the other hand, his neighbors were not at all interested. In a block containing fifty to sixty homes, where the space between such buildings is less than one inch, and where more than eight out of ten houses are infested with termites or beetles, the individual attempting to protect his property against the ravages of these pests finds himself often surrounded by properties harboring large nests of termites, to which he has neither access nor jurisdiction. Such conditions indicate the interdependence of neighbors in the control of these pests.

While the number of infestations by wood-dwelling termites are not quite as numerous as those of the subterranean variety, the cost of making repairs is usually much greater. The ability of these insects to create their own moisture and not depend upon moisture from the ground, greatly extends the range of their destructive activity. They are frequently found in the second, third, and fourth floors of buildings. Some two years ago, the engineers of one of our railway companies termite-proofed one of their large train sheds infested by Zootermopsis, on the assumption that by cutting off the supply of moisture from the ground the termite colonies would die out. In their treatment they bored holes in the top of the underpinning some distance above the ground, and inserted a quantity of paris green; and at the base, a number of holes were filled with the crystals of paradichlorobenzene. These latter evaporate slowly and the heavy poisonous fumes, being heavier than air, are supposedly distributed in the wood. Due to the grooming habit of termites, the use of paris green has in many instances proved effective in poisoning a colony of dry-wood termites when introduced into their runways; but sufficient moisture appears to be present in the galleries of the Zootermopsis to cause this poison dust to cake and render it more or less ineffective. A recent inspection of this same train shed disclosed that the termites had moved up, and that many of the main building columns above the first floor are now heavily infested.

Should Study Habits of Insects

In another building infested by Zootermopsis, the underpinning was entirely renewed in July 1935. During the fall months, the tenant was annoyed by frequent swarms of winged reproductives appearing in the building. A
recent inspection showed these termites to be colonizing at and above the first floor, indicat-
ing that the work of eradication in the first place was incomplete, or fully developed alates 
would not now be present.

These incidents illustrate the importance of 
knowing the habits of the insects encountered 
before any attempt is made to prescribe a 
remedy. In every instance where inspections 
have been made following attempts to eradi-
cate Zootermopsis, we have found these ter-
mites still present.

To locate and destroy all members of a 
colony of wood-dwelling termites the use of a 
high gain audio amplifier in conjunction with 
an oscilloscope should be encouraged to de-
tect their presence by sound. The oscilloscope 
is far more sensitive to sound vibrations than 
the equipment commonly used for the magni-
fication of sound. It is a large bell-shaped 
tube, the end of which is phosphor coated and 
acts as a projecting screen when energized by 
the sound waves. The characteristic sound 
waves are reflected on this screen in the form 
of curves visible in daylight. Only by the use 
of such apparatus, or other scientific equip-
ment, can one be reasonably certain that all 
hidden sources of infestation have been de-
stroyed. It is difficult, if not impossible, to 
establish general rules for control and eradia-
tion that would apply equally in all communi-
ties. The existence of a large percentage of 
buildings on 25 foot lots, together with the 
prevalence of Zootermopsis in San Francisco, 
presents a combination of conditions that are 
peculiar to this city. To successfully cope with 
the problem created by termites in any com-
munity, it would seem necessary that one 
should be familiar with the physical property 
relationship, as well as the biological problem 
presented.

SKETCH BY ERNEST PETERSON
UNUSUAL FEATURES OF A LOS ANGELES AIR CONDITIONING INSTALLATION

INTEREST in air conditioning is being centered on actual installations in use, rather than on equipment alone. A particularly interesting and recent installation, incorporating novel features, is a one-story reinforced concrete building at 1138 So. Broadway, Los Angeles. The building is approximately 50 ft. wide, 80 ft. deep, with a 20 ft. ceiling. It is divided into a large front room, with a mezzanine extending to the rear wall above three rear private offices, vault and toilet rooms. The main floor is cement on dirt and is covered with linoleum. Occupied by a finance company, the building is used throughout for office purposes.

The air conditioning system consists of seven standard Conditionair room units, a newly perfected appliance recently introduced to the field, served by a central gas-fired hot water generator and a central refrigeration unit. Four of the room units are located in the main office and one in each of the three rear private offices. The hot water generator is located in one of the toilet rooms near the center of the building, the ceiling of which is the full height of the building and is provided with a skylight ventilator. The refrigeration unit is located under the stairs that lead to the mezzanine.

The Conditionair room units contain a propeller type fan driven by a 1/20th horsepower motor, a spray type, atomizing humidifier, a finned copper tube heating element, a finned copper tube cooling element, and a wool felt pocket type air filter. The cabinets are of furniture steel finished in walnut, the castings are of aluminum, the heating and cooling coils are copper tubing, cadmium plated, and the steel parts are cadmium plated to prevent corrosion. The heating and cooling elements are combined in a single physical unit having common fins, two banks deep, but with entirely separate tubing, the heating coils occupying the position of the first bank, the cooling units that of the second.

A duct through the wall back of each unit allows 100 percent outdoor air to be drawn through the unit, or a circled louvre in the front of the unit may be opened to allow re-circulation of inside air. Opening this front louvre for re-circulation also turns a damper that cuts off about half the area of the outdoor air inlet. This arrangement is intended to permit introduction of 100 percent outdoor air or a minimum of 50 percent outdoor air even when the re-circulation inlet is used. Incorporated in each unit is a storage chamber for disinfecting, perfuming or medicating the air. Aromatic material from the chamber is drawn in by the fan and mixed with the air discharged by the unit. This function may be operated regardless of whether air is being entirely drawn from outdoors or partly re-circulated.

Hot water for the heating element and chilled water for the cooling element is supplied to each room unit through copper tubing insulated with wrapped felt and laid on the ground under the cement floor. Water for
the humidifier nozzles is taken from the hot water lines. A copper tubing waste line from each room unit runs under the floor to a covered sump in the floor of a toilet room.

Electric energy for the fan motors is supplied by a convenience outlet located in the wall back of each unit. A rheostat permits fan operation at 450 r.p.m., 900 r.p.m., and 1250 r.p.m., at which speeds the fan is rated to handle respectively 100, 200 and 300 cu. ft. of air per minute. An unusual provision is that of water cooling for the rheostat and motor by means of encircling coils of 1 3-inch cadmium plated copper tubing around each, through which water from the chilled water line passes.

The most unusual feature of this installation, perhaps, is the scheme by which city water pressure is used to convey the hot and chilled water to the room units where it is wasted to the drain after passing through the unit. For the hot water source a gas-fired automatic instantaneous water heater of 4.1 gallons per minute, 60 deg., rise capacity, is used. Located in the corner of one of the toilet rooms, this heater is connected to city water supply just as it would be for domestic hot water, and in fact, it does furnish hot water to two lavatories. However, the heater's main function is to supply the finned heating elements of the air conditioning room units with hot water, and from the heater outlet a 3 8-inch copper tube runs to each unit. Opening a valve at the inlet of the heating element of any room unit operates the automatic instantaneous heater in exactly the same way as turning on a hot water faucet. Hot water, forced by city pressure, passes through the unit's heating element after which it is wasted to the drain connection through a metered orifice. This orifice is sized to allow a maximum average consumption of 16 gal. of water per hour.

For cooling purposes, city water supply is connected to and passes through a pair of twin heat exchangers in series. The primary side of these heat exchangers is chilled by direct expansion of a refrigeration unit, which is located in a insulated compartment under the mezzanine stairway. The unit is set to reduce the temperature of the water passing through the heat exchangers to 40 deg. F. Three-eighth inch copper tubing from the heat exchanger outlet to each unit conveys the chilled water, which, forced by city water pressure passes through the unit's cooling element and is wasted to the drain connection. The amount of chilled water passed through the cooling element is controlled by a valved inlet and a metered orifice outlet. The average maximum water consumption for cooling is rated at 16 gal. per hour. Water condensed from the air in the cooling process and excess water from the humidifier nozzles is collected in a drip pan connected to the drain lines that serves the heating and cooling elements.

The installation provides extreme flexibility, each room unit operating independently. Moreover, the output of each unit may be varied independently by changing the fan speed, reducing or increasing the quantity of hot or chilled water passing through the elements, or changing the setting of the re-circulating damper. The use of city water pressure to control the gas fuel used for heating, by selecting an instantaneous automatic water heater in place of a heating boiler, while not new in principle, is unusual for a heating installation.
TRAFFIC STARTS OVER BAY BRIDGE IN LESS THAN TEN MONTHS

IN LESS than ten months, completion of the world's largest bridge will be California history.

Despite the pace of the 30-hour week and the obstacles which nature places in the way when man seeks to set new engineering frontiers in defiance to the hazards of deep water and dizzy heights, the world's largest bridge from San Francisco to Oakland may finish ahead of schedule. By November, 1936, Chief Engineer C. H. Purcell expects to have finished the paved decks so that the bridge may be opened to traffic for the Stanford-California big game which will be played at Berkeley this year.

Thus far approximately $40,000,000 has been expended on bridge and approaches. The railway portion will not be completed until after the highway decks have been opened to the traveling public. Referring to the importance of both the Bay and Golden Gate Bridge projects, Earl Lee Kelley, Director of Public Works, is quoted, in the last issue of California Highways and Public Works as follows:

"The building of this world's greatest $77,600,000 bridge between San Francisco and Oakland, and its sister bridge, the $35,000,000 Golden Gate structure, sets in motion the tidal wave of public interest in California which is to produce a tremendous exposition on a specially made island in San Francisco Bay in 1938. The entire west is tributary to these great bridges and California is the special beneficiary.

"The engineering wonders of these two record-breaking structures have turned the eyes of the world on America, on California, and on San Francisco Bay—just as Boulder Dam has turned the spotlight on Los Angeles.

"During its first year we expect the bridge to carry 6,000,000 vehicles, and full prosperity only needs to return to give the bridge an annual passenger traffic of 50,000,000 persons."

A report to Governor Merriam sets forth the following schedules for completion of units of the San Francisco-Oakland Bay Bridge this year:

BERKELEY UNDERPASS—now complete.

EAST BAY DISTRIBUTION VIADUCTS—complete April 1.

MAINTENANCE BUILDINGS IN OAKLAND TIDELANDS—complete July 1.

EAST BAY BRIDGE—cantilever closed March 7.

PAVING EAST BAY—complete May 7.

YERBA BUENA ISLAND—upper deck of tunnel and all island work, including the tunnel—complete June 1.
BUILDING THE WORLD'S GREATEST BRIDGE. SHOWING WORKMEN TIEING HUGE TRUSSES TO CABLES
WEST BAY BRIDGE—(The twin suspension bridges, East Bridge and West Bridge, over the West Bay Channel, between San Francisco and Yerba Buena Island)—The west bridge will be completed first, with all of its spans hung from the cables by March 15, and the steel floor in by April 15. The East Bridge, between the concrete center anchorage and the island, 283/4-inch cables for which are now being spun, will have its decks hung by June 15 and its steel floor in by July 15; all paving in the West Bay will be complete by September 15.

SAN FRANCISCO APPROACHES—complete by July 1.

ENTIRE BRIDGE—(exclusive of railways)—paved by September 15 and cleaned up ready for traffic by November, 1936.

Work completed in 1935 is listed as follows:

EAST BAY—Five 504-foot through truss spans, east and west cantilever anchor arms, west cantilever arm, completed in 1935.

YERBA BUENA ISLAND—Three 300-foot deck truss spans over the east side of the island completed in 1935 together with towers supporting them. The vehicular tunnel through Yerba Buena Island was fully excavated and lined with concrete by the end of 1935 and construction of the upper deck started. At the beginning of 1935 the vehicular tunnel was in the stage where three small excavations (two at the bottom and one at the crown) had been bored through the wall and the concrete footings for part of the side walls poured.

Therefore, during 1935 it may be said that save for three pilot tunnels, entire excavation of the Yerba Buena Island tunnel was accomplished. In the category of concrete work, all but the footings for the side walls were poured during the year 1935—the footings having been laid in the fall of 1934. Similarly, all the concrete viaduct at the east portal of the tunnel, a section of the bridge approximately 800-feet long, was built during 1935.

WEST BAY—At the start of 1935, the last of the foundation work was being done; some concrete was still being poured at Pier A near Beale Street, San Francisco; and the concrete center anchorage, a mile off the San Francisco shore, was being raised by the superstructure contractor to the height where it was to be taken over by the Columbia Steel Company for cable spinning. The superstructure
EASTERLY TOWER OF SUSPENSION SECTION OF SAN FRANCISCO BAY BRIDGE, 1110 FEET WEST OF YERBA BUENA ISLAND, SHOWING ENTRANCE TO TUNNEL.

Etching by Chesley Bonestell.
The landscaped plaza, shown above, is between Harrison and Bryant Streets, San Francisco, and marks the western end of the San Francisco-Oakland Bay Bridge at Fifth Street, San Francisco.

Here the main traffic will flow on to the upper deck of the bridge, which begins its gradual ascent on an easy grade, rising from 11.57 feet at Fifth Street level, to 260.76 feet at the high point of the bridge on the concrete center anchorage, a mile east of San Francisco.

The roadway of the upper deck of the bridge at this entrance way at Fifth Street will be 58 feet wide.

The design of this plaza was created by the Board of Consulting Architects, consisting of Timothy L. Pflueger, Arthur Brown, Jr. and John J. Donovan.
COMPETENT ARCHITECTURAL SERVICE
IMPROVES SMALL HOUSE DESIGN

STEPHEN F. VOORHEES, A. I. A. PRESIDENT,
REVIEWS 1935 ACCOMPLISHMENTS

IMPROVED conditions in the construction industry are reported from all sections of the United States by the Regional Directors of the American Institute of Architects, according to a survey of progress in architecture and building during 1935 by Stephen F. Voorhees, President of the Institute.

A marked increase in architectural employment, amounting in some localities to an actual scarcity of draftsmen, is a significant feature of the recovery in this industry, Mr. Voorhees declares.

The Institute Directors, Mr. Voorhees reports, urge that governmental participation in the field of low rental housing be limited to procuring and disseminating necessary general information and to furnishing financial aid for such projects, leaving to local agencies such functions as location, design, construction, and administration.

The Directors, he explains, recognize the importance of town planning and other local considerations in the formation and operation of a national program for the development of low rental housing.

"Non-residential building has maintained a steady increase over 1934 totals and continued to increase during the closing months of the year, which normally show a reduction in volume of new construction," Mr. Voorhees says. "Federal assistance by loans and grants of money to finance the building of schools and other public structures is contributing to the improvement in this class of construction.

"Residential building continues to lead the field in volume of new construction. It is not necessary to quote statistics to show the obvious need of this activity. The cessation of building during the past four years; losses resulting from fires; depreciation; the increase in number of families; all are factors in the impending housing shortage.

"Federal housing agencies, by their promotional activities, have directed public attention toward home building and financing on a sound basis. Present building prices and rising rentals are factors favorable to residential building at this time and indicate continued activity in 1936.

"That the architects of the country have devoted much time during the recent years of inactivity in building to a study of the problems of their many sided profession is indicated in the reports of committee chairmen made at the meeting of the Board of Directors of the Institute.

"New materials and methods of construction have been studied and experiments conducted looking toward an improved technique in building that would parallel the improvements made in other lines of production. The new year will see many of these experiments put to the test of practical application to building.

"How to improve the poor quality of design so evident in the average American small house has been the concern of the American Institute of Architects for many years. Efforts to find
a way to apply the architect's talents in this field have met with little success. Lending agencies have been slow to see the advantages of architectural service as a protection to their loans.

"One of the most encouraging experiences of the past year has been the higher rating attained by plans prepared by architects when submitted for government insured mortgages as compared with plans prepared without benefit of architectural service.

"To further this work the Directors of the American Institute of Architects endorsed a plan to establish local groups of architects prepared to furnish architectural service in the small house field in a manner to meet local opportunities and demands for such professional service.

"The Directors also tendered to Government agencies promoting better small house building the assistance of the Institute in raising the standards of value by means of the employment of competent architectural service."

In the field of architectural design, there has developed during the economic depression a greater consciousness of the social aspect of the architect's practice, Mr. Voorhees points out.

"Town and regional planning is receiving greater recognition by the architectural schools in preparing architects to broaden their horizons and to participate to a greater extent in social and civic activities. The value of planned communities and garden suburbs as opposed to the haphazard placing of dwellings so prevalent in our cities is receiving increased attention.

"In view of the prevalent preoccupation of many architects with functional planning, and with full recognition of the research and reasoning so logically expressed in plan and structure, the Institute's Committee on Education believes that the time has come for the expression in our architecture of something beyond the purely utilitarian that might be called either charm or beauty, but without which our creations fail to realize their full possibilities.

"The Committee believes that this quality is more likely to be embodied in our architecture when we recognize our debt to the past and the value of its lessons in meeting the problem of today."
With the Architects

NEW COUNTY BUILDINGS
The Charities Commission of Alameda County has been authorized by the Board of Supervisors to enter into an agreement with Will G. Corlett, architect, Bank of America building, Oakland, to prepare plans for several additional county hospital buildings in Highland Hospital grounds, the Fairmont Hospital, and the Arroyo Sanitarium, to be erected as WPA projects.

The proposed buildings include a central clinic at the Highland Hospital, central heating plant and dormitory building for the help in the Arroyo Sanitarium, and a ward building at Fairmont. The Federal government has already earmarked upward of $410,000 for part of the work.

WATSONVILLE RESIDENCE
A two-story modern style house is planned at Watsonville for Dr. F. E. Blaisdell, from drawings by W. W. Werster, 260 California Street, San Francisco, who has also completed plans for a frame apartment building to be built on the south side of Bay Street, east of Hyde, San Francisco, for Nora Kenyon, at a cost of $20,000. G. P. W. Jensen is the contractor.

MARKET BUILDING
Martin J. Rist, Phelan Building, San Francisco, has awarded a contract for a two-story and basement market building for Joseph Capurro to be built at Columbus Avenue and Green Street, San Francisco. Mr. Rist is working on plans for several additional dwellings in El Camino Park, San Jose, for the Pasetta Estate. The same office is also busy on sketches for a hospital.

MILLER AND WARNECKE ACTIVE
New work in the office of Miller & Warnecke, architects, Financial Center Building, Oakland, includes a $10,000 steel and brick store building on Lakeshore Boulevard, Oakland, a two-story Colonial house in Walnut Creek for W. J. Chapman, and a Spanish style dwelling in Hayward.

DESIGNING MANY RESIDENCES
Chester H. Treichel, 696 Cleveland Street, Oakland, has completed drawings for a Colonial dwelling in Oakmore Highlands, Oakland, for A. E. Fifield; a six-room dwelling on Chelton Drive, Oakland, for E. Longfellow and an Early California residence in Redwood City for F. W. Freechtle.

BAKERSFIELD ARCHITECT BUSY
Charles H. Biggar, Haberfeldle Building, Bakersfield, has a considerable amount of school work in his office, including an extension to the high school library building, a three-story structure with tile roof, estimated to cost $90,000; an athletic field with grandstand, etc., for the Kern County high school and a new auditorium for the Standard School, the latter a $120,000 project.

SACRAMENTO JUNIOR COLLEGE
Bids are being taken for the second unit, consisting of an 18-classroom structure, to the Junior College in Sacramento. The first unit costing $125,000 is under construction. The architect, Harry J. De Vine, has drawings fifty percent completed for two more units—an assembly hall and wings for the arts, engineering and music departments.

GARDNER A. DAILEY BUSY
The office of Gardner A. Dailey is busy on several new residence projects, besides alterations to the home of Reed Funston at 2672 Vallejo Street, San Francisco, and additions to the residence of Mr. and Mrs. George Oppen at 3665 Washington Street, San Francisco.

HILLSBOROUGH APARTMENTS
J. S. Gould, 251 Kearny Street, San Francisco, is preparing preliminary drawings for a residence apartment building to be built on the Spreckels Estate at Hillsborough, San Mateo County. Howard Spreckels is the owner. The improvements will cost in the neighborhood of $50,000.

PALO ALTO RESIDENCES
John K. Branner, Shreve Building, San Francisco, has completed drawings for a $16,000 brick residence for Dr. Eph Weiss, 1412 Tasso Street, Palo Alto.
Mr. Branner has also completed drawings for a $10,000 Colonial home in Crescent Park, Palo Alto, for James Wallace.

SANTA ROSA HOSPITAL
A contract has been awarded to the P. J. Walker Company, San Francisco, to build a two story steel frame hospital at Santa Rosa for Sonoma County for $223,000. John I. Easterley, Exchange Building, Santa Rosa, is the architect.
BERKELEY RESIDENCE

R. G. De Chene, 364 14th Street, Oakland, has prepared drawings for a $7500 residence to be built in Peralta Park, Berkeley, for Mr. and Mrs. Higbee Williams.

The same architect has completed plans for a residence on Brann Street, near 65th Avenue, Oakland, for Edward Henninger, and a $6000 Spanish dwelling at Ward and Milvia Streets, Berkeley, for Leland S. Hawkins.

COLUSA BANK BUILDING

Plans are being completed by the engineering department of the Bank of America, San Francisco, for a one-story steel and concrete bank building at Colusa. L. H. Nishkian, San Francisco, is the structural engineer.

MERCED HOTEL

Plans have been completed by Messrs. Kent & Hass, San Francisco, for additions and alterations to the El Capitan Hotel at Merced. Construction is expected to go forward within thirty days.

PACKING HOUSE FOR WINTERS

The Winters Dried Fruit Company will erect a new packing house from plans by Dragon & Schmidt, architects, of Berkeley. The building will be part one and part two stories, of reinforced concrete and will cover ground area 60x230'.

$8000 DWELLING

Plans have been completed and a contract awarded for the construction of a two-story stucco dwelling near the Berkeley line in Contra Costa County for V. A. Kimberley. The architect is Warren C. Perry, 260 California Street, San Francisco.

LIVE STOCK PAVILION

New bids are being taken for a reinforced concrete live stock pavilion and race track in Visitacion Valley, San Mateo County. The plans were prepared by W. D. Peugh, 333 Montgomery Street, San Francisco. Bids are scheduled to be opened Tuesday, March 17th.

ALAMEDA COUNTY BUILDINGS

Several new buildings are planned this year for Alameda County. W. G. Corlett has been commissioned to prepare drawings for new units and additions to the Arroyo Saniterium and Fairmont Hospital.

WILLIAMS & WASTELL BUSY

New work in the office of Williams & Wastell of Oakland, include a $12,000 California Colonial brick veneer residence in Piedmont, a store building on Lakeshore Boulevard, Oakland, and a Mediterranean style residence in Piedmont for Andrew Christ.

PERSONAL

GEO. WELLINGTON STODDARD, architect of Seattle, and Mrs. Stoddard, spent the Christmas holidays at Palm Springs.

HARRY E. HUDSON, of Seattle, attended the Rose Bowl game at Pasadena on New Year's Day.

WILLIAM H. WEEKS and HAROLD H. WEEKS, architects, announce the removal of their offices from the Underwood Building to the Balboa Building, 593 Market Street, San Francisco.

SAN FRANCISCO APARTMENTS

R. R. Irvine, architect, of San Francisco, is preparing plans for a three-story stucco apartment building in Marina District, San Francisco, having 18, two and three-room apartments. The same architect has completed working drawings for a three-story frame apartment building to be erected on the north side of Taraval Street, west of 24th Avenue, San Francisco, at a cost of $16,000.

FURNITURE AND DESIGN OF THE HOME

The second part of R. M. Schindler's article on “Furniture and the Modern House,” the opening chapter of which appeared in this magazine in December, will be published in the March number. The subject of special furniture design to fit the type of construction of private dwellings (particularly the modern home) is discussed at length.

ATHLETIC FIELD

Plans are being prepared by Charles H. Biggar, architect, Heberfelde building, Bakersfield, for an athletic field, including reinforced concrete bleachers, etc., to be erected on the Lincoln High School campus at a cost of about $100,000. An application for a Federal grant for financing has been filed.

THREE RESIDENCES

F. L. Confer, 2812 Russell Street, Berkeley, reports completion of plans for a California Colonial house in Piedmont for C. G. Morse; a two-story residence in Piedmont Estates for Mr. Boebe and a $7000 residence in Lakeshore Highlands, Oakland, for Mr. Prost.

GRAMMAR SCHOOL BUILDING

Plans have been completed by William Mooser, architect, Monadnock Building, San Francisco, for a reinforced concrete grammar school to be erected in Nevada City for the Nevada City Grammar School District. The cost is estimated at $97,000.

ELK HORN SCHOOL

A $16,000 frame school building is being designed by Joseph Losekann of Stockton for the Elk Horn School District.

THE ARCHITECT AND ENGINEER
DR. ELWOOD MEAD

Dr. Elwood Mead, Commissioner U. S. Bureau of Reclamation, since 1924, died at his home in Washington, D. C., January 26, following soon after the celebration of his 78th birthday. His death was attributed to thrombosis.

Dr. Mead was closely identified with the development of the west for more than half a century as a recognized expert on reclamation problems and rendered distinguished service as chief of the Reclamation Bureau.

He was born at Patriot, Indiana, in 1858, and was graduated from Purdue University in 1882 with the degree of bachelor of science and again in 1884 with the degree of master of science. He was later recipient of a degree in civil engineering from Iowa State College in 1904 and in 1925 was made a doctor of laws by University of Michigan.

After his graduation at Purdue he spent a year with the U. S. Engineers as assistant and for several years held a professorship in Colorado Agricultural School. From 1888 to 1899 Dr. Mead was territorial and state engineer of Wyoming. For the next ten years he was chief of irrigation and drainage investigation, U. S. Department of Agriculture and at the same time professor of irrigation practices at University of California, Berkeley.

In 1907 Dr. Mead was called to Australia as chairman of the Rivers and Waters Systems Commission of Victoria. Returning to America in 1915 he resumed his connection with University of California as professor of rural institutions. His appointment as commissioner, Bureau of Reclamation, was made by President Coolidge April 24, 1924, and he held the position continuously until his death. In that period he supervised a long list of outstanding federal reclamation projects, most important of which was the Boulder Dam project.

EDWARD J. SCHNEIDER

Edward John Schneider, 60, contracting manager of the bridge and structural department of the Columbia Steel Company, subsidiary of the United States Steel Corporation, died January 25 in Berkeley, following a week's illness with heart disease.

Mr. Schneider was born in Pontiac, Illinois, where he received his early education, later graduating from the University of Illinois, College of Sanitary Engineering.

He spent his entire business life in the design, contracting, and erection of fabricated steel structures, including many of the most important steel buildings and highway and railroad bridges in the West.

In May, 1907, he moved to San Francisco to become contracting manager, first for the American Bridge Company, then for the United States Steel Products Company, and finally, with the Columbia Steel Company, in full charge of office and all engineering, contracting and erection in the Pacific Coast territory. Among the bridges to come under his charge were the Carquinez Straits Bridge, the Southern Pacific Railway Bridge at Suisun, California, and the new $70,000,000 State Highway Bridge across San Francisco Bay between San Francisco and Oakland, now being completed.

Mr. Schneider was past president of the Engineer's Club of San Francisco and past president of the San Francisco Section, American Society of Civil Engineers. His social affiliations included membership in the Bohemian Club, Commonwealth Club of California, Commercial Club of San Francisco, the Masonic bodies, including the Shrine, and the Claremont Country Club.

WM. E. HIGGINS

Death came to William E. Higgins, one of San Jose's best-known architects, January 26, following a somewhat protracted illness of acute lung congestion and heart trouble. Mr. Higgins succeeded to the business of Wolfe and Higgins upon the death of Mr. Wolfe some years ago. He designed many buildings in Santa Clara county, including public and commercial structures and several hundred dwellings. The deceased was a member of Golden Rule Lodge, F. & A. M. A widow and four children survive.

CHINESE ARCHITECTURE

How Chinese architecture may be adapted to modern-day American needs was discussed by Henry K. Murphy before members of the Oakland Forum at the City Club Theater recently.

Mr. Murphy was formerly architectural adviser to the National Government of China when the City of Nanking was laid out. Later he was architect for the Nanking Revolutionists' Memorial group.

His methods of combining Oriental and Occidental modes of architecture have been employed in the construction of many commercial buildings in China. The lecture was illustrated with pictures and lantern slides.

Mr. Murphy's lecture was the first in a series dealing with art and architecture, to be held under the club's auspices.

NEUTRA AGAIN HONORED

Announcement that Richard J. Neutra, internationally known architect, has been appointed a member of the summer session staff of the University of California at Los Angeles, has been made by Dr. J. Harold Williams, dean of the session.

The U. C. L. A. summer session begins June 27 and closes August 7. Most of the classes are to be open to everyone interested, regardless of previous college training.
HOME BUILDING COSTS VARY IN DIFFERENT SECTIONS OF THE COUNTRY

IT COSTS the buyer of a home nearly half again as much in one section of the country as it does in another to build the same identical one-family house, according to the Federal Home Loan Bank Review. The same home that can be erected in Columbia, South Carolina, for only $4,337, would cost as much as $6,442, in Providence, Rhode Island. Exactly the same dwelling can be constructed in Baltimore for $5,028, but costs $6,033 in Cumberland, Maryland, only 125 miles away. In Chicago, the same home can be bought for $6,361, in Hartford, Connecticut for $5,846, in Oklahoma City for $5,756, in Pensacola for $5,095 and in Colorado Springs for $5,972.

These comparisons are revealed by preliminary reports of the construction cost of an identical dwelling, received from 27 cities in all parts of the United States, which points out that labor supply, transportation facilities and accessibility of materials play the most important parts in determining the local cost of building the average small home. The figures cover only the actual construction outlays and do not include home-mortgage financing costs, which vary widely in different sections.

Recognizing the vital influence of construction costs on the volume of home building and the activity of mortgage lending operations, the Board is developing the first exact index ever attempted to cover the local trend of cost of small home construction in every part of the country, represented by actual data in some 70 cities. Current costs of materials and labor will be included, and the rising or falling trend thus disclosed at three-month intervals for the guidance of prospective home owners and the executives of home-financing institutions.

"The possible uses of accurate local indexes of small-house construction costs are many," the Review says. "The movement of building costs, in relation to rentals, contracts or expands the volume of home construction. It is, therefore, a factor that must be known to all agencies concerned in the building or financing of homes—home-financing institutions, builders, material dealers, and real estate operators. This is particularly true if the home is being built to sell. In addition, current costs of construction determine the replacement cost of any existing building, and so must be included in the making of any appraisal."

The typical home specified as the standard of comparison is a detached house of 24,000 cubic feet volume of sound design and workmanship, containing a living room, dining room, lavatory and kitchen on the first floor, three bedrooms on the second floor and an attic. The exterior is of wide-board siding with brick and stucco trim. A one-car, attached garage is included. Unusual materials and construction features are avoided. The design meets the requirements of the average municipal building code. This home might be placed generally in the $6,000 price class, excluding land value.

The basic data consists of prevailing unit prices of materials and labor, compiled throughout the country by the personnel of the Reconditioning Division of the Home Owners' Loan Corporation, which includes architects and builders familiar with local construction practices. Items for overhead expense and contractor's profit are added.

HEAR EARTHQUAKE TALKS

The Structural Engineers' Association of Northern California, held their first regular meeting for 1936 at the Engineers' Club, January 14. Following an excellent dinner the members and a number of invited guests, listened to a highly interesting and instructive discussion of the Helena earthquakes.

The speakers were F. P. Ulrich, U. S. Coast and Geodetic Survey; H. M. Engles of the Board of Fire Underwriters and H. J. Brunner. All three spoke from first hand information, having visited Helena during the progress of the quakes. Mr. Brunner is supervising some rehabilitation work in the area for the Helena Board of Education. Mr. Engles seemed thoroughly conversant with conditions in Montana. Among other things he made it very emphatic that much of the damage to schools and other public buildings was due not so much to faulty materials and poor construction as to inferior design. Many of the older buildings seemed to stand up under the upheavals better than the newer ones.

The Association has reelected John B. Leonard president for 1936.

K. E. PARKER NAMED PRESIDENT

The directors of Central California Chapter, Associated General Contractors, have elected K. E. Parker, San Francisco building contractor, president of the Chapter for 1936. Mr. Parker succeeds Geo. Greenwood of the P. J. Walker Co., who has been president since the Chapter was organized in 1934.

Other new officers are: John Cahill, vice-president, and R. Walberg of Lindgren and Swinerton, treasurer. W. E. Hague is secretary-manager.

The Chapter board of directors for 1936 is composed of John Cahill, George Greenwood, H. H. Hilp, K. E. Parker and R. Walberg.
ARCHITECTS CONVENE THIS YEAR IN HISTORIC CITY OF WILLIAMSBURG, VA.

The A.I.A. Board of Directors have adopted the recommendation of the convention committee that the 68th convention be held at Williamsburg, Va., May 5 to 8.

Hotel accommodations in Williamsburg are inadequate for an Institute convention; but at Old Point Comfort, 38 miles distant over good roads, the modern Hotel Chamberlin has adequate accommodations. It is proposed to establish headquarters at Old Point Comfort and hold sessions there and at Williamsburg using automobiles busses for transportation between the two points.

The significance of Williamsburg as a center of historical and architectural interest may be recalled by the following brief description:

In 1699, following the burning of Jamestown, the General Assembly passed an Act directing the building of a Capitol and the City of Williamsburg at what was then known as Middle Plantation. Previously, the main building of the College of William and Mary, designed by Sir Christopher Wren, had been built at Middle Plantation. This building became the western terminus of the main axis of the city plan, the new Capitol building forming the eastern terminus. A cross axis is terminated at the north by the Palace of the Royal Governors. The plan is notable for its openness and for the effective placing of its public buildings.

The city thus founded grew rapidly and soon became the center of the political, educational and social life of the Virginia colony and held this preeminence until 1780, when the seat of government was removed to Richmond. Virginia during this period was the most wealthy and influential of the colonies and its Capitol City reflected in its architecture and its gardens the culture and refinement of the best element of the colonists.

The Civil War and a period of prolonged depression thereafter contributed largely to the decline of this once distinguished city and many of its precious buildings and gardens disappeared.

The story of the restoration of Williamsburg is too well known to require retelling.

The Institute Directors believe that the holding of the convention in this environment will make a strong appeal to the membership. The cooperation of Williamsburg Restoration, Inc., and the College of William and Mary is assured. The latter has reserved Phi Beta Kappa Hall for the convention meetings and has invited the Institute to be their guests at luncheon on one of the convention days.

TACOMA BUILDING PROGRAM

The Tacoma Society of Architects is lending enthusiastic support to a $5,000,000 residential building program backed by the Pacific First Federal Savings and Loan Association of Tacoma.

Architects participating in the program are: Roland E. Borhek; Heath, Grove and Bell; A. Gordon Lumm; Mock and Morrison; Silas E. Nelsen; Russell, Lance and Muri; Stanley T. Shaw; and Sutton, Whitney and Dugan.

NEW BOOKLET

Richards-Wilcox Manufacturing Company of Aurora, Illinois, have recently issued a very interesting and well arranged brochure, "DOORWAYS."

It fittingly illustrates several of the doors and doorway hardware manufactured by this company. The wide-awake architect and builder, as well as the general contractor, will find it worth their while to write for a copy of the brochure which will be mailed promptly upon receipt of request.

SAN DIEGO CHAPTER

San Diego Chapter, The American Institute of Architects, held its annual meeting January 16, and elected the following officers: President, Frank L. Hope, Jr.; Vice-President, Ray Alderson; Secretary, Sam W. Hamill, and Treasurer, Richard S. Requa.

William Templeton Johnson and William P. Lodge were elected to the Board of Directors.

PROVISIONAL CERTIFICATES

At the last meeting of the California State Board of Architectural Examiners (Northern Division) Provisional Certificates were granted to the following: Chester O. Root, Hotel Del Monte, Del Monte; Robert E. Riggs, Route 80, Berkeley; Irving F. Brown, 1408 Burlingame Avenue, Burlingame.

SKETCH COMPETITION

Preparations for holding the annual Summer Sketching Competition for Washington architectural students and draftsmen are being made by George Gove of Tacoma, chairman of the educational subcommittee of the Washington State Chapter, A.I.A. Prizes will be offered in the several different classes.

MUSIC HALL

Working drawings have been prepared by Wm. H. and Harold Weeks, architects, Balboa Building, San Francisco, for a reinforced concrete and brick veneer music hall in Santa Rosa.
NORTHERN CALIFORNIA CHAPTER

The regular monthly meeting of Northern California Chapter, the American Institute of Architects, was held at the St. Germain Restaurant, San Francisco, Tuesday evening, January 28; President Will G. Corlett, presiding.

Guests included Henry Killam Murphy, A.I.A., Prof. Knight and Messrs. Funk and Graybar.

Prof. Cyril Knight of the University of New Zealand at Auckland, was introduced by Mr. Hays. Mr. Graybar of Wisconsin, was introduced by Mr. Evers.

The Committee on Practice through its chairman, Mr. Gutterson, presented a tentative report on the proposed schedule of minimum fees which had been assigned to it for study. It was stated that the schedule had been approved by Southern California Chapter, and conditionally by the State Association, subject to the approval of Northern California Chapter.

The report favored the principle of higher fees without commitment to definite percentages and suggested 6% as the minimum basis with reasonable higher fees for types of buildings offering greater difficulty in performance of service.

The members were asked to express their re-action to the schedule so that reply could be made to the other organizations. Mr. Evers felt that the recommendation of the Chapter should be more specific and stated his approval of the schedule in toto. Messrs. Johnson, Hays, Gerren and others offered pertinent observations.

Mr. Evers moved that the recommended Schedule of Fees as proposed by Southern California Chapter be approved as a reasonable charge for architectural services. The motion was carried and the committee was thanked for its efforts in the matter.

The death of Harris Osborn, Associate, was announced as having occurred October 22, 1935. It was instructed that a committee be appointed to draft a fitting resolution of respect.

The motion of Mr. Michelsen was unanimously approved that the State Department of Public Works be requested to establish a district office in San Francisco for the convenience of the profession and construction industry in checking plans for schools and other public works.

Mr. Bakewell recommended that the Competition Committee consider the advisability of listing the names of jurors in competition programs. This knowledge, he thought, might have weight with an architect in deciding whether to enter or not. The committee was instructed accordingly.

Business was brought to a close at this point and Henry Killam Murphy, A.I.A., was introduced as the guest speaker. Mr. Murphy has spent many years in China in private practice and publicly as architectural advisor to the Chinese Government.

Current Chinese architecture was the theme of his talk. The audience was taken back a few centuries by lantern slide illustrations of the old Chinese work, while the salient features embodied in that era were pointed out. The current work which was next shown was referred to as the Renaissance of Chinese Architecture. In this, it was observed, the dominant Chinese characteristics prevailed, with modification suited to modern form of construction and modern requirements.

J.H.M.

MODERNIZATION BRINGS PROFIT

Norman J. Rodder, in Hotel Management, writes: Income of a Chicago hotel was jumped from $150 to $1,000 a month by modernization. It is a four-story building. Designed as a bachelor hotel, with 15 rooms and one bath on each floor, the owner complained she couldn’t even give the rooms away. An architect advised her to cut its 60 rooms to 40, using the lost 20 to make a bathroom and closet for each new unit. He did this by splitting in half the center one of every three adjoining rooms, thus putting the new bathrooms back to back, saving labor and piping. They got white fixtures against walls of rose ceramic tile, bordered in black, every tub with shower. Bedrooms were redecorated and refurnished in latest style. Work started on the fourth floor, which was fully rented before the third could be completed. Entire modernization, including improvement of heating plant, cost $7,500, which was financed by the plumbing contractors, who agreed to take $300 a month in payment, with interest, thus making the changes pay for themselves out of increased rentals in less than three years.

MODERNIZING FARMHOUSES

Ways of bringing farmhouses up-to-date are described in a new Farmers’ Bulletin No. 1749, Modernizing Farmhouses, issued by the U.S. Department of Agriculture. It contains comprehensive information on costs and details on remodeling to meet a variety of needs.

In it are floor plans, photographs or sketches of 13 typical farmhouses which have been remodeled by their owners, with descriptions and costs of the work. There are also floor plans, worked out by state agricultural colleges, for remodeling five common types of houses. Alternate plans for most of the houses suggested by the Bureau of Agricultural Engineering are also shown as well as floor plans of the original homes.

The plans are of typical farmhouses in various sections of the country and are for one- and two-storied structures. Sizes of houses range from 3 rooms to 10, the latter allowing separate apartments for two families.
Estimator's Guide
Giving Cost of Building Materials, Wage Scale, Etc.

Amounts given are figuring prices and are made up from average quotations furnished by material houses to San Francisco contractors.

NOTE—Add 2½% Sales Tax on all materials but not labor.

Bond—1½% amount of contract.

Brickwork—Com. $35 to $40 per 1000 lb., (according to class of work).
Face, $75 to $90 per 1000 lb., (according to class of work).

Brick Steps, using pressed brick, $1.10 per lin. ft.

Brick Walls, using pressed brick on edge, 60 sq. ft. (Foundations extra).

Brick veneer on frame buildings, $.75 sq. ft.
Common f.o.b. cars, $12.00 job cartage.
Face, f.o.b. cars, $45.00 to $50.00 per 1000, carload lots.

ollow Tile Fireproofing (f.o.b. job) 3x12x2 in., 8x4.00 per M 4x12x2 in., 9.50 per M 6x12x2 in., 12.00 per M 8x12x2 in., 25.00 per M

ollow Building Tile (f.o.b. job) carload lots.

Concrete Work (material at San Francisco bunkers)—Quotations below 2000 lbs. to the ton, $2.00 delivered.

No. 1 rock, at bunkers $1.80 per ton No. 4 rock, at bunkers 1.75 per ton Elliott top gravel, at bunkers 2.10 per ton Washed gravel, at bunkers 2.10 per ton Elliott top gravel, at bunkers 2.10 per ton City gravel, at bunkers 1.75 per ton River sand, at bunkers 1.80 per ton Delivered bank sand 1.20 c.o.y.

Note—Above prices are subject to discount of 10c per ton or invoices paid on or before the 15th of month, following delivery.

SAND

Del Monte $1.75 to $3.00 per ton.
Pan Shell Beach (car lots, f.o.b. Lake Ma-tella), 2.75 to $4.00 per ton.

Cement, 2.50 per bbl. in paper sks.
Cement (f.o.b. Job, S. F.) $3.00 per bbl.
Cement (f.o.b. Job, Oak.) $3.00 per bbl.

Rebate of 10 cents bbl. cash in 15 days.
Calaveras White $6.00 per bbl.
Medusa White $6.00 per bbl.
Forms, Labors average $30.00 per M.
Average cost of concrete in place, exclusive of forms, $35 per cu. ft.

4-inch concrete basement floor
1/2c to 14c per sq. ft.
4/5-inch concrete Basement floor
1/4c to 16c per sq. ft.
2-inch rat-proothing
7/8c per sq. ft.
Concrete Steps $1.40 per lin. ft.

Dampproofing and Waterproofing—
Two-coat work, 15c per yard.
Membrane waterproofing—4 layers of saturated felt, $4.00 per square.
Hot coating work, $1.80 per square.
Medusa Waterproofing, 15c per lb., San Francisco Warehouse.

Electric Wiring—$12.00 to $15.00 per outlet for conduit work (including switches). Knob and tube average $7.00 per outlet, including switches.

Elevators—
Prices vary according to capacity, speed and type. Consult elevator companies. Average cost of installing an automatic elevator in four-story building, $2800; direct automatic, about $2700.

Exhaustion—
Sand, 50 cents; clay or shale, 80c per yard.
Teams, $1.00 per day.

Trucks, $18 to $25 per day.

Above figures are an average without water. Steam shovel work in large quantities; last hard material, such as rock, will run considerably more.

Fire Escapes—
Ten-foot balcony, with stairs, $75.00 per balcony, average.

Glass (consult with manufacturers)—
Double strength window glass, 15c per square foot.
Quartz Lite, 50c per square foot.
Plate 75c per square foot.
Art. $1.00 up per square foot.
Wire (for skylights), 35c per sq. foot.
Obscure glass, 26c square foot.

Note—Add extra for setting.

Heating—
Average, $1.90 per sq. ft. of radiation, according to conditions.

Iron—Cost of ornamental iron, cast iron, etc., depends on designs.

Lumber (prices delivered to bldg. site),

FEBRUARY, 1936
### General Working Conditions

1. Eight hours shall constitute a day's work for all crafts, except as otherwise noted.

2. Where less than eight hours are worked pro rate rules for such shorter periods shall be paid.

3. Plasterers' Hodcarriers, Bricklayers' Hodcarriers, Roofers' Laborers and Engineers, Portable Cork Holding, shall start 15 minutes before other workman, both at morning and at noon.

4. Five days, consisting of not more than eight hours a day, on Monday to Friday inclusive, shall constitute a week's work.

5. The wages set forth herein shall be considered as net wages.

6. Except as noted the above rates of pay apply only to work performed at the job site.

7. Transportation costs in excess of twenty-five cents each way shall be paid by the contractor.

8. Travelling time in excess of one and one-half hours each way shall be paid for at straight time rates.

9. Overtime shall be paid as follows: For the first four hours after the first eight hours, time and one-half. All time thereafter shall be paid double time. Saturday (except laborers), Sundays and Holidays from 12 midnight of the preceding day, shall be paid double time. Irrespective of the day and time for Craft Finishers shall not commence until after eight hours work.

10. On Saturday Laborers shall be paid straight time for an eight-hour day.

11. Where two shifts are worked in any twenty-four hour period, the second shift shall be straight time.

12. All work, except as noted in paragraph 13, shall be performed between the hours of 8 A.M. and 5 P.M.

13. In emergencies, or where premises cannot be vacated until the close of business, men reporting for work shall work at straight time.

15. Men ordered to report for work, for whom employment is provided shall be entitled two hours' pay.

16. This award shall be effective in the City of San Francisco.
FIREPROOFING OF STRUCTURAL STEEL

by S. H. Ingberg

The need for some form of fire protection for metal members became evident in the early days of metal-framed construction following fires producing general collapse of unprotected structures. This yielding under load at elevated temperatures should be expected for structural steel, considering that rolling is done at temperatures well below those to which it may be heated if exposed unprotected in building fires.

The strength of structural steel under short-time tests in tension, and in compression for relatively stable sections, is higher in the temperature range 300 to 600°F than at ordinary temperatures, the increase being as much as 25 percent at temperatures near 450 to 500°F. This, however, has no decided significance as far as fire resistance of unprotected members is concerned, since exposed in any fire of consequential import, they would attain higher temperatures in a comparatively short time. However, this property gives in effect an added factor of safety for members that are protected so that they will not attain temperatures exceeding these limits.

The main object of structural protections is to prevent the occurrence of temperatures in the metal that induce failure under the supported loads. For recognized design working stresses, this means that average temperatures over the stressed sections of structural steel members must be maintained below about 1000°F. This has been confirmed by tension and compression tests of steel specimens and also by fire tests of building members.

It was formerly usual in public regulations such as building codes, to require a minimum uniform thickness of protection irrespective of type of material. As knowledge increased on the value of the materials applied, as judged by performance in representative fire tests, the more effective insulations were required to be applied in less thickness than the others. Of late years, thickness requirements except as backed by results of tests, have been superseded in part by performance requirements in terms of fire resistance developed in prescribed tests. While this places the materials on a fairer basis with respect to each other, unless care is taken in setting performance limits, protections may be prescribed not commensurate with the fire severities to be expected in given locations.

While much remains to be done on development of basis for estimating fire severity, judicious application of available data will enable the desired results to be attained with the use of the least bulk, weight, and cost of protecting materials. The methods of application as well as the properties of the materials are important in this respect. Thus, depending on choice of aggregates, identical columns protected with a 2-inch thickness of Portland cement concrete will

The man who whispers down a well
About the goods he has to sell
Won't reap the gleaning, golden dollars
Like one who climbs a tree and hollers.

TRUE today as in April, 1905 when this homely bit of wisdom was printed in Volume One, Number One of THE ARCHITECT AND ENGINEER. It is quite probable, too, that the very first advertisement was delivered "from the tree tops" . . . Picture caveman Ig with his stock of selected rocks, the sharpest for use as axe heads, the heavier ones for cave walls, rude fireplaces and such. There were no newspapers, radios (lucky Ig), nor magazines in those days. The only way in which Mr. Ig could make known his wares and attract cave-dwellers from surrounding hills to come and trade meat, skins and maybe wives, for supplies from the Ig Materials Co. (the original building supply house) was to climb a tree and holler.

So down through history . . . Paul Revere with his horse, the town crier with his bell, the redskin with his smoke-signal broadcast (first blanket coverage) . . . the evolution of the advertising medium continued.

It was not until the year 1905, that the then adolescent Western building industry was given a much needed monthly architectural journal, in the format of THE ARCHITECT AND ENGINEER. Since then building in the West has steadily advanced (excepting the recent respite while prosperity was "on strike") and this publication has grown with it, faithfully mirrored development and achievement, during the more than thirty intervening years. The resultant widely recognized medium . . . reaching all factors (architects, engineers, contractors, owners) in the specification and purchase of building materials . . . is available to those firms planning aggressive sales promotion during the coming months.

Incidentally, your advertisement in THE ARCHITECT AND ENGINEER, far from a mere "whisper," will be a good healthy "holler" heard by (or rather, read by) a substantial proportion of all your prospects in the allied building interests.

68 POST STREET . . . . . . . SAN FRANCISCO
832 W. 5TH STREET . . . . . LOS ANGELES
OF SPECIAL appeal to those whose interests lie in the planning or construction of homes is an exhibit demonstrating the development of the detached dwelling, at the New York Museum of Science and Industry in the R. C. A. Building, 30 Rockefeller Plaza, New York City.

A series of eleven models, built to the scale of one-quarter inch to the foot by Helen and Hugh Perrin, of Boston, shows the progression of the housing idea from the perched-on-stilts dwellings of river and jungle life thousands of years before Christ, to the home of the well-to-do 1936 suburbanite. Each model represents a sharply distinctive step in the history of home-building.

A typical Neolithic Lake village of about 12,000 B.C. begins the series. Roughly constructed of plaited twigs, straw, reed or leaves, this primitive home stands on a high platform well out from the shore of lake or river so that a bridge connecting with the land could be pulled up when necessary for defense. A single large platform accommodates several houses, a number of families occupying each house. The tiny figure of a man outside one of the houses, bent over one of the coils of fish line scattered about the platform, illustrates the main occupation of the community—fishing through holes in the platform. Occasionally, as indicated by a man putting out to sea in a rough boat in a corner of the model, the fishing was carried on in the open water. Traces of ancient villages of this type are still to be found along the Congo, the Amazon and other large rivers, and primitive tribes of Java, Sumatra and Borneo still use this plan of building construction.

**Egyptian House**

Moving up some 8,000 years, the second unit in the exhibit shows an Egyptian house of about 4,000 B.C. The home of a wealthy Egyptian has been chosen for this illustration, a structure equivalent to what might be a $50,000 house today. Set in the desert, against a background of pyramids and sand hills, this flat-roofed, three-sided building is surprisingly surrounded by green shrubbery and gay flowers, the latter as characteristic of a home of this era as the stone or sundried mud which built the house itself. The ancient Egyptians, it is reported, were so fond of flowers and growing things that they transported earth for long distances in order to make their gardens in the midst of the desert. The interior court, enclosed on three sides by the body of the house and its two wings, testifies to the outdoor life led by the people of that land and time. In the midst of the court stands the family hearth for cooking, off to one side is a religious niche, while a shaded loggia afforded opportunity for rest and relaxation. A bed on the flat roof, reached by an outside staircase, shows where most of the sleeping was done.

Also built around a court, but far more sheltered from the weather and definitely designed for indoor living rather than the Egyptian opposite, is the Roman house of about 400 A.D., which is the third model in the display. A special feature to be noted is the construction of the roofs, sloping toward a central opening, so that rain might be diverted into the pool in the center of the courtyard.

The fourth model is that of two Saxon houses, three hundred years later. One is little more than a lean-to shelter, built of forked sticks with a roof of reeds covered with sod. Grass, growing freely on the sod of the roof, offered good grazing to the family pig and goats, and the tiny figure of one of the latter perched on the roof above the head of the householder sitting outside the door, shows that they availed themselves readily of the privilege. The second house in this unit was evidently constructed by the owner at a later and more prosperous period of his life. A long, low building, designed with a special eye to the accommodation of an increasing number of oxen, its door had a high threshold and low head so that the visitor must stoop to enter and, in this highly unstrategic position, could be dispatched easily with a blow.
from a club if the home-owner was not attracted by
the looks of his cellar. A small third building, built
on a high platform, stands at one side, and was used
partly as a storehouse and partly as a retreat for the
ladies of the household during the day.

An armored knight, riding on horseback with his
lance upright in his hand, adds a picturesque touch to
the fifth model, that of a Norman manor house of the
13th century. The building is of the semi-castle type
and combined a thatched roof with stone walls. Tall
and narrow arched windows were scarcely more than
slits in the thick walls, the upper ones with wooden
shutters and the lower ones protected by iron gratings.

15th Century Home

In the sixth unit of the display, a substantial, half-
timbered English house of the middle 15th century
exhibits a lavish use of glass in its windows, mute
evidence of a more peaceful spirit in the countryside.
Slate roofing, elaborate chimneys and pleasant orna-
mentation in brick and wood likewise attest to an
architectural mood changing slowly from the defensive
to the cultural.

Model 7, a Georgian house of the middle 17th
century, introduces the typical brick structure of the
period, characterized by much emphasis on balance
and symmetry. The main body of the house, with the
doorway approached by a double stair flanked by a
delicate iron railing, is supported on each side by a
wing, probably a library on one side and the kitchen
on the other.

By way of abrupt contrast, the eighth model is that
of a 17th century Iroquois Long House, a thing of
forked poles, lashed rafters and bark shingles, standing
in the center of a strong stockade. These Long Houses
of the Iroquois Indians were in reality an early type
of apartment house, the model shown representing
living accommodations for eight families.

Still in the 17th century, but well on to its end, is
the adapted Early American house shown in the
ninth model. The wide boards, small windows and
front overhang are familiar features, while the wagon
wheel leaning against the barn, the pump in the middle
of the backyard, and the woodpile at the kitchen door
provide a homely authentic atmosphere.

American Victorian House

The advent of the jigsaw, making it possible to cut
out of wood quickly and cheaply all sorts of ornaments
formerly carved with great labor out of stone, is
conspicuously celebrated in the American Victorian
house which constitutes the tenth model. All dressed
up with fancy trimmings, the comfortable, if somewhat
fussy-looking residence is a counterpart in miniature of
numerous dwellings still bearing witness to past
elegance in the American scene. An "old-fashioned"
house, the observer says of it today, passing it by for
architectural types closer to his own generation. A
bird house high on a pole, and a square summer house,
dominate the front lawn, with a bird bath occupying
the center of the side lawn. A lady driving smartly
up to the door with her tandem of horses and her
spotted coach dog running behind, adds the final
touch of local color.

A contemporary American suburban home com-
pletes the series. The model-makers chose to depict
an adapted English-type house, with the familiar
ground-level entrance, built-in garage, driveway and
flower-beds—what might be described as a good
house in a good suburb. The figure of the home-owner,
inspecting with apparent dismay a rear tire of his
coupe, just emerging from the garage, supplies the
last necessary touch of reality to this picture of life in
Suburbia.

The building of the models for the exhibit was done
under the supervision of Albert Farwell Bemis and
John Burchard, Ill., author of "The Evolving House—
A History of the Home."

CONTRACTOR BENEFITS BY RULING

According to a recent ruling of Judge W. D. Held,
of Sonoma county, equity should afford relief to a
contractor making a bona fide error in compiling a
bid, against forfeiture of a check submitted with the
bid guaranteeing the bidder would enter into a con-
tract if awarded the job. The ruling restrained the
Healdsburg High School District from confiscating a
certified check given by George Petersen, building
contractor of San Leandro, guaranteeing a proposal
for erection of an addition to a high school building.
The court found that Petersen had made an honest
mistake in his bid and that the school district had
suffered no damage by the contractor's refusal to
accept the job.

NEW KAWNEER PRODUCT

Recently published manufacturer's literature includes
folders on two new products of The Kawneer Company,
Niles, Michigan.

The Kawneer Medium Sealair Window is intended
primarily for commercial use and is of slightly heavier
construction than the Kawneer Light Sealair Window,
which is for residential use.

The new Kawneer extruded store front construction,
with continuous spring grip, supplements the well-
known Kawneer rolled store front construction. Thus
Kawneer offers the architect and builder a choice of
either extruded or rolled construction with ample
resiliency and glass protection in either case. Full
sized architect's details are available in addition to
the six-page file size folder.

METAL CRIBBING PROVIDES EXCELLENT RETAINING WALL FOR COUNTY HIGHWAY NEAR MORAGA, CALIFORNIA

1—Preliminary excavation for the wall. 2—Placing the first course of cribbing units on correct line and batter. 3—Assembling or erecting the cribbing courses. 4—Cribwall complete, ready for the remainder of the backfill. 5—Completed job. The roadway above at the right can be visualized.
LOS ANGELES CHAPTER ADDRESSED BY SCHOOL ARCHITECT

At the February 11th meeting of Southern California Chapter, A.I.A., A. S. Nibecker, Jr., architect for the Los Angeles Board of Education, gave an address on "The Use of Permanent Materials and Simpler Plans, Rather Than the Construction of Architectural Monuments, in Modern School House Design."

Commenting on plans that are prepared for Los Angeles school buildings, Mr. Nibecker said that one thing most architects forget when submitting preliminary drawings is a plot plan, which must be provided. The proper location of the building on the site is of importance, as is the position of the structure in order to take best advantage of natural light.

Other points stressed in school house design were the provision of toilet facilities on the ground floors of elementary schools, stairways at extreme ends of the buildings (high school stairs to be twice the width of those in elementary schools), and equal toilet facilities on all floors of high schools.

Since the earthquake of 1933, according to Mr. Nibecker, a lot of useless ornamentation and projections have been eliminated. Windows are provided for light and not architectural effect, and the building must stand without a lot of maintenance and must be what he termed "kid proof."

The width of the walls, he said, must be kept within reason and the corridors kept at the proper width. The school board expects at least 50 per cent of instructional area in all buildings and considers this an economical plan.

The board looks to the architect for complete professional services and for actual inspection of the work in return for the fee paid, which is considered ample for good service and a satisfactory profit to the architect.

(Continued on Page 71)

ORIGIN OF NAMES OF CALIFORNIA COUNTIES

This is the fifth article in the series giving derivation of the names of California counties, the first appearing in September:

KINGS COUNTY—Created March 22, 1893. This county was created out of the western part of Tulare county, and took its name from Kings river, which, according to history and tradition, was discovered in 1805 by an exploring expedition and named Rio de los Santos Reyes (the "river of the holy kings"), from which it obtained its present name.

In the lower center of the great San Joaquin valley lies one of the smallest, one of the youngest, but one of the richest and most resourceful counties of the state. Kings county is known as "The Little Kingdom of Kings" because of the wealth and diversification of the products of this area. In 1852 there were only 100 settlers in the region now known as Kings and Tulare counties, and this area was a part of Mariposa county. In 1852 Tulare was formed, but it was not until 1893 that Kings came into existence by divorcing itself from Tulare. In 1908 about 100 square miles were taken from Fresno county and added to Kings.

Tulare Lake, at one time covering thousands of acres, a paradise for game and waterfowl, gradually has been drying up and as early as 1881 settlers began to take up land in the lake bed. After years of tremendous reclamation work, practically the entire lake bed now is under cultivation, producing abundant crops of wheat, barley, corn, alfalfa and cotton. Peaches are the most important of a large variety of fruit crops. Poultry raising is a rapidly growing industry and Kings ranks second in butter manufacturing in California. Kings has one of the greatest oil fields in the world. Kettleman Hills being mostly within its territory. The assessed valuation of Kings has nearly doubled since 1928. Population: 25,385. Area: 1159 square miles.

LAKE COUNTY—Created May 20, 1861. This county derived its name because of the many charming lakes within its borders.

This county presents enchanting scenery, offers opportunities in all lines of agricultural endeavor, proximity to the leading markets, is known as a land of highways and is one of the leading playgrounds in Northern California.

The high mountains surrounding the county probably acted as a barrier to the white man until the early forties, at which time a few Russians came from Fort Ross and Bodega, in what now is known as Sonoma county, to establish parts of this region for their czar. General Vallejo and his brother claimed title to a large grant of land in 1847. Soon a few other white pioneers settled and raised thousands of head of cattle, undisturbed by the 6,000 peaceful Indians who called this land home. However, the influx of people began to crowd the docile Indians and a few endeavored to establish rule over them, finally leading to much bloodshed.

Indian folklore and early California history do not reveal when this region experienced a gigantic volcanic upheaval. There are high mountains and peaks, numerous streams, scores of mineral springs, a dozen valleys and the largest lake of fresh water in the state. There are more mineral springs in Lake than in the countries of Europe, visited annually by 75,000 persons. Clear Lake, the Indian name for which is "Lu-poyoma," is one of the prettiest bodies of water in the world and covers an area of 84 square miles. Mount Konocti, known locally as 'Uncle Sam,' rises to a height of 3000 feet and almost divides the lake. Hunting and fishing lure the sportsman.

Lake has famous quicksilver mines which have yielded more than $4,000,000. Lake’s leading crops in order of their importance are pears, walnuts, hay, grapes, barley and wheat. Live stock and lumber industries

are prosperous. Population: 7,166; area: 1238 square miles.

LASSEN COUNTY—Created April 1, 1864. The name of this county was taken from Mount Lassen, the only active volcanic peak in the United States, which was named for Peter Lassen, a native of Switzerland, one of General Fremont’s guides and a famous trapper, frontiersman and Indian fighter, who was killed by the Piutes at the base of this mountain in 1859.

This county has an unusual history. Barely over the stage of pioneering, compared with other counties, rail lines and highways now serve various districts, the lumbering industry is one of the greatest of its kind in the west, cattle and sheep raising are very important, and Lassen is a popular vacation land. The minimum elevation of the county is 3949 feet.

Peter Lassen, rugged adventurer, Isaac Roop, first territorial governor of Nevada, and Lieutenant John C. Fremont, youthful army officer, were the early pioneers. Lassen crossed the plains from Missouri in 1839 en route to Oregon. In 1844 he settled on his grant on Deer Creek. Three years later he brought another party out from Missouri and settled in Indian Valley, Plumas county. In 1855 he went to Honey Lake Valley where he lived until he was killed by Indians in 1859. Historic Lassen records relate:

“Believing themselves to be out of California, the settlers of Honey Lake Valley fought off Plumas county officials who claimed jurisdiction over them. As a consequence Honey Lake Valley became a sort of “No Man’s Land,” harassed by savages on all sides and infested by outlaws. In 1856 the settlers, in the belief they were in western Utah, organized a territory about the size of Nevada and called it “Nataqua.” Peter Lassen was elected surveyor and Isaac Roop recorder. Later the settlers joined those of the Carson Valley country in their efforts to organize a territory and call it Nevada. The government was slow in acting and they organized a provisional territorial government and elected a legislature and a full set of officials. Roop was named governor. Before long, however, the government organized the territory and in 1861 James W. Nye was appointed governor. Honey Lake Valley was put into Lake county, Nevada. After repeated clashes with Plumas county officials, a joint survey was made by California and Nevada and Honey Lake was found to be in Plumas county. The people of the valley asked to be set off into a new county and in 1864 the California legislature granted their request. The new county was named Lassen.” Population: 12,589. Area: 4531 square miles.

LOS ANGELES COUNTY—Created February 18, 1850. This is one of the original twenty-seven counties of California. The words “Los Angeles” in Spanish literally mean “the angels” and are a contraction of the original name “Pueblo del Rio de Nuestra Señora
La Reina de Los Angeles de Porciuncula' ("the town of the river of Our Lady, Queen of the Angels"). It will therefore be observed that Los Angeles really was named for the Virgin Mary, commonly called "Our Lady of the Angels" by the Spanish. On September 7, 1781, Governor Felipe de Neve issued orders from the San Gabriel Mission for the establishment of a pueblo on El Río Nuestra Senora de Los Angeles and under the protection of Nuestra Senora La Reina de Los Angeles [Our Lady, Queen of the Angels], the mission by this name having been dedicated three days before, having practically the same title. This pueblo in time became known as the Ciudad de Los Angeles, "the City of the Angels," and it is from this that the county derived its patronymic.

This county has almost half the population of California. Its growth in the last decade has been one of the wonders of America. It is nearly four times the size of Rhode Island. In 1910, the population was 504,131, or 124 per square mile. The 1930 census revealed a population of 2,208,492, or 536 per square mile. Los Angeles is the greatest agricultural county in the state and the 1920 Federal census ranked it first among all the counties in the nation.

Los Angeles harbor was built at a cost of many millions, $10,000,000 of which was contributed by the national government. It is the world's leading oil exporting and lumber importing port. The county, due to its vast oil and natural gas production, ranks first in mineral production. Nearly every commercial product known to California is produced on its 12,653 farms. Citrus fruits head the list of these products.

The county's motion picture industry stands as a gigantic structure spoken of only in terms of millions of dollars. The greatest electric interurban system in the world is here with over 1200 miles of tracks serving fifty-four incorporated cities in four counties and transporting annually 125,000,000 passengers. Population: 2,208,492; Area: 4115 square miles.

MADERA COUNTY—Created March 11, 1893. "Madera" in Spanish signifies "timber," and the county got its name from the town of Madera, situated within its limits, which town originally was surrounded by groves of trees.

Fertile plains and valleys, rich foothills carpeted by vast stretches of orchards, a wealth of mineral deposits and scenic mountain regions with dense forests of pine and fir, are Nature's gifts to Madera. Within the county lies a part of Yosemite National Park and a large portion of the Sierra National Forest. In northeastern Madera is one of California's national monuments, a strange formation of rock called the Devil's Postpile composed of tall posts of hard rock, six-sided and fitting closely together, resembling the Giant's Causeway in Ireland.

An attraction to motorists is the Madera-Mariposa Big Tree Route known as "Discovery Road," traversing much of the territory over which Major Savage and

HOW MUCH for your tree, MISTER?

Of course you wouldn't sell your trees, even if you could. Like any other asset however, you should appraise and preserve their value.

Each year Davey Tree Surgery Co. is instrumental in saving millions of dollars in tree values for California home owners. Why not let us check up on your trees?

A complete inspection might reveal conditions which, nipped in the bud, at small expense now, might cost a great deal more to remedy later on. For truly, in tree surgery, if in anything, "a stitch in time saves nine."

PRECAUTION! To avoid disappointment, make sure you get genuine Davey Tree Surgery Co., Ltd. You'll find the cost no higher—besides your trees are too precious to entrust to unknown hands.

The luxury of efficiency at the price of economy!

JOHNSON Oil Burners . . . all of them . . . are famed for efficiency, for economical operation. Here, for smaller homes, is the Johnson Type B, low in first cost as well as in cost of operation. Available in various models according to radiation required up to 1360 square feet and for either gravity or pump feed.

It represents a recommendation that can be made with the same confidence felt in commending any Johnson burner to the home-owner.

S. T. JOHNSON CO.
940 Arlington Street Oakland, California
the Mariposa Battalion, in early days, chased a band of marauding Indians who had hiding places in unknown canyons in the higher mountains. While on the heels of a fleeing band of redskins, Major Savage and his men reached the rim of the "Valley of Valleys." Ahead was such a gorgeous view that they reined in their horses, forgetting the objects of their chase, and gazed with startled wonder. They had discovered Yosemite.

Madera soils are those of the rich San Joaquin Valley and the county's agricultural products cover a wide range. Population: 17,164; Area: 2112 square miles.

MORIN COUNTY—Created February 18, 1950. One of the original twenty-seven counties of the state, it derived its name from Chief Marin, of the Licatiut tribe of Indians. In 1815, a military expedition of the Spanish proceeded to explore the country north of the bay of San Francisco. This action aroused the ire of the Licatiut tribe and a desperate engagement was fought in the valley now known as Petaluma Valley. Chief Marin led the forces of the Indians with wonderful strategy and bravery. At the same time, his sub-chief Quentin gave battle to a second division of the Spanish army at the point which still bears his name, Punta de la Quentin. In 1824 the chief was captured, but escaped, locating on a small island in San Francisco bay. Later he again was captured and sentenced to death. Priests of San Rafael Mission saved him and converted him to their faith. He died in the mission in 1834.

This county, known as "Marvelous Marin," is a lovely portion of the Redwood Empire and one of the most picturesque counties in California. With its woods and hills, gardens and trees, surrounded on three sides by the Pacific ocean and San Francisco and San Pedro bays, Marin is a land of beautiful homes. Almost in its center stands Mount Tamalpais at the base of which are the world-famous Muir Woods, named in honor of John Muir, the naturalist. In this great grove of redwoods are trees ranging in age from 500 to 3000 years. The tribe naming Mount Tamalpais is a matter of controversy. Some insist it was the Lacatuits, while the Smithsonian Institute has given its choice to the name "Hookoekos." Some believe the name came from the Nicasio tribe, but whatever the tribal name, it generally is conceded that the Indians called their land "Tamal"—the word from which is derived Mount Tamalpais and Tomales Bay.

In 1579, Sir Francis Drake entered the harbor now known as Drake's Bay, visible from Tamalpais, where he made repairs to his Ya Golden Hinde and obtained provisions.

Marin is one of the counties leading in the production of farm and dairy products. General farming and cultivation of orchards are carried on although the agricultural area is limited. Population: 41,648; Area: 527 square miles.

Next: Mariposa, Mendocino and Merced—Editor.
More care should be exercised by the architect in estimating the cost of his job, Mr. Nibeker stated, and a special effort made to keep the cost within the estimate, thereby simplifying matters for all concerned.

Donald Cunliff, construction superintendent of the Los Angeles Board of Education, advised architects to watch costs, avoid change orders and sign their PWA documents. Construction costs are 10 to 15 per cent higher than they were six months ago, he said, and may go higher.

 Specification work was discussed by A. C. Zimmerman, until recently employed by the school board. Many specifications turned in by architects could have been greatly improved, he said, principally because they did not follow requirements and were not properly edited.

Myron Hunt, chairman of the Chapter's county courthouse committee, gave an interesting account of the work his committee has done in endeavoring to arrive at a satisfactory solution of the location of the proposed Los Angeles county courthouse.

This committee, composed of Mr. Hunt, Reginald D. Johnson and Donald B. Parkinson, together with three civic leaders and three county department heads, have been instructed by the supervisors to figure out a way of building a suitable building on property now owned by the county.

It is the opinion of these men that an office-type building with high ceilings, a portion of it adapted to courtroom purposes, erected on county-owned property north of the Hall of Justice, between Broadway and Spring Street, would be the economical plan for the present. The cost at this time, as reported to the committee by authority of privately-held property on the west side of Broadway, between First and Temple Streets, precludes the use of that site.

Should the next generation decide to acquire this or some other courthouse site the recommendation is that the present courthouse be so designed, engineered and constructed as to make it convertible into a county office building.

In the meantime the recommendation is that the courts be as amply provided for that if the next generation decides to continue to use this building, enlarged, as a permanent courthouse, it will be adequate and dignified.

CITIES WILL CHANGE

Transformation of the nation's cities will be the major task of architecture for the next generation. Louis La Beaume, vice president of the American Institute of Architects, declares in an optimistic forecast of progress in the construction and allied industries for 1935.

Not only architects but manufacturers of building materials, quarries, mills and mines, labor and transportation will share in a sustained upswing after five or six years of distress, due to the curtailment of investment building on a large scale, Mr. La Beaume predicts.

This revival, avoiding the speculative excesses of the 1920's and shaped by sound principle of city planning, will, he foresees, embrace vast modernization and rehabilitation operations as well as the erection of new homes and Federal, state, municipal, commercial, and institutional structures.

"Our cities have grown like weeds, and we cannot begin remaking them too soon," he says. "They are symptoms of anarchy, and of a disregard for the decencies and amenities of life. They must be remade in the interest of sound economics, hygiene, traffic simplification, convenience and beauty. This metamorphosis will constitute the principle field of architectural endeavor for years to come."

"Many signs indicate the dawn of a new era for the architectural profession. As general business recovery proceeds, the demand for new structures will grow. In the domestic field we may confidently expect increased and healthy activity for these reasons:

"First, homes do deteriorate, and repairs too long deferred contribute to further deterioration. The time is at hand when conditions are ripe for a vast volume of modernization and rehabilitation if the nation's investment in existing structures is to be salvaged.

"Second, due both to the normal expansion of population and to better business conditions, a great number of new dwellings are needed. Especially is this true in the field of moder-

FEBRUARY, 1936

ately priced homes. That the movement to supply this need is well under way no one can doubt.

This movement offers both a challenge and an opportunity to the architectural profession. The demand for individual, well-planned, well-designed, and well-constructed homes at moderate cost is becoming more insistent day by day. Also the demand for the modernization and improvement of existing structures calls for skill, ingenuity, and common sense on the part of the architect.

Federal Public Works involving architectural elements such as post offices, court houses, custom houses, and departmental structures have always constituted a source of inspiration and interest to the architectural profession, but the volume of such building has always been small in comparison with the nation's normal building budget.

"Today states and municipalities, as well as the national government, are undertaking programs of considerable importance in this field. We may also expect some activity in other public building, such as state and municipal eleemosynary institutions. The building of schools is being encouraged by grants from the PWA, and the profession of architecture is benefiting by the stimulation of this activity."

"We have heard much talk of low cost housing on a large scale, and some noteworthy projects have been undertaken under the sponsorship of the Federal Government. However, the Government's program in this field has encountered many obstacles which have retarded its development. Some of these obstacles have been legal, some economic, but as the social necessity for slum clearance and better housing for our working people becomes more generally understood, it cannot be doubted that ways and means will be found to eradicate the blighted areas in great cities. In this field the services of the architectural profession are of paramount importance."

"All of these activities, whether they involve the rehabilitation of existing buildings, the construction of small homes, large scale housing
operations, commercial or institutional buildings, should be solved in the light of modern and common sense city planning."

The past five or six years of comparative inaction have been not altogether fruitless, according to Mr. La Beaume. "Architects," he continues, "have had ample opportunity to analyze the factors which brought about the stoppage of building on a large scale after the debacle of 1929. For ten years or more previous to the crash, we had witnessed an orgy of speculative building, perhaps unparalleled in history.

"The field of the speculative builder, previously restricted to the erection of jerry-built houses in urban and suburban subdivisions, had been enormously enlarged. Every city in the country succumbed to the speculative craze. Office buildings, hotels, and apartment houses multiplied as if by magic, to supply the needs of a supposedly inexhaustible stream of tenants.

"Land values and building costs rose with the height of the scaffolding, but almost as soon as the scaffolding was removed these values suffered a precipitous decline. The past five years have been years of liquidation, deflation, and readjustment. Losses have been largely written off and tenants are returning to make use of the facilities provided for them in such prodigal measure."

FIRST FOREIGN EXHIBITOR

THE Commonwealth of the Philippines has accepted San Francisco's invitation to participate in the 1938-9 World's Fair.

In a letter to Mayor Angelo J. Rossi and Leland W. Cutler, president of the San Francisco Bay Exposition, Inc., Jorge B. Vargas, secretary to President Manuel Quezon, announced that the Commonwealth Secretary of Agriculture and Commerce has been instructed by the President to begin immediate studies looking toward Philippine participation.

The Philippine government thus becomes the first foreign Nation to signify its intention of taking part in the San Francisco World's Fair.
BEAUTY IN ARCHITECTURE

AN APPEAL for beauty in architecture is made by the Committee on Education of the American Institute of Architects, of which Dean William Emerson of the School of Architecture of Massachusetts Institute of Technology is chairman.

"In view of the prevalent preoccupation with function rather than design, and the tendency to regard composition as little more than the assembling of pre-fabricated units, the committee believes that the time has come to make an appeal for beauty in our architecture—for the expression of something more in the exterior of a building than the mere portrayal in diagrammatic form of the structure as shown in plan.

"With full recognition of the research and reasoning so logically expressed in plan and structure, we believe that something more is needed; something beyond the purely utilitarian, that might be called either charm or beauty, but without which our creations fail to realize their full possibilities. Our appeal is that this is worth striving for, and that it is more likely to be embodied in our architecture when we recognize our debt to the past and the value of its lessons in meeting the problem of today."

Ellis F. Lawrence, of Portland, Oregon, is a member of this committee.

HOT SPRINGS

Twenty years ago an oil prospector working in the White Sands region of Otero County, New Mexico, was astonished when he tapped a subterranean cauldron of hot water at a depth of 988 feet.

The water reached 94 degrees F., and flowed 1000 gallons a minute.

While this freak of nature brought no joy to the luckless prospector, it is certain to bring pleasure to thousands of vacationists in the near future.

Development of a recreational park and wild game refuge in what is now the White Sands National Monument extension recreational
project, today is being carried on by the National Park Service.

The hot water, gushing upward through an eight-inch casing, has formed a lake of 200 acres. Wild fowl have claimed the lake as their own. Thousands of sightseers visit the place annually, many coming from Lincoln National Forest 20 miles east.

The vast expanse of pure white gypsum, called the "Alabaster Sand Dunes," for which the National Monument was created, is said to be the only phenomenon of its kind in the world. Plans call for pipe-lines from the hot water gusher to the National Monument recreational center.

The Park Service will maintain and administer the area—one of 46 similar developments in progress throughout the United States.

DOUGLAS FIR HANDBOOK

The "Douglas Fir Use Book," a new and enlarged handbook for architects and engineers, giving load tables for Douglas fir lumber, formulas for various kinds of loading, and other structural and design data, has been issued recently by the West Coast Lumbermen's Association, 364 Stuart Building, Seattle, Washington. The book has been designed to supply all the data about Douglas fir that a designer would need in using this lumber for grades and notes on their use: properties, their construction purpose. It includes information on: basic laws for stress of factors related to longitudinal shear, compression and tension stresses, deflection; effect of duration of time of load, and factors of safety; an exposition of timber connectors—split rings, toothed rings and shear plates; grade marking; a grade-use guide that describes grades and makes grade-use recommendations; formulas for various kinds of loading—bending, shear, deflection and deflection loads; properties related to weight, areas, section moduli, moment of inertia, and moments of resistance; inch-width loads; span load tables for joists and beams; maximum spans for joists and beams; loads for plank and laminated floors and roofs; loads for posts and struts, and loads for studding.

OREGON STATE CHAPTER
Fred Aandahl, member of Sutton, Whitney and Aandahl, Lewis Building, Portland, was elected president of the Oregon Chapter, A.I.A., for the 1936 term at the annual meeting, January 28, at the Congress Hotel, Portland. Other officers chosen were: Vice-president, Roi Morin; secretary, John T. Schneider; treasurer, Harold D. Marsh; trustee, Hollis Johnston. All reside in Portland.

Oregon architects were urged by Carl F. Gould, Seattle architect and technical advisor to the capital commission, to lend support to the Oregon State Capitol Reconstruction Commission in its efforts to provide an adequate and thoroughly modern new state capitol building.

Following the serious business, the architects and their guests were entertained by a hi-jinks program under the direction of the inimitable Harold W. Doty, toastmaster.

WASHINGTON STATE CHAPTER
Lance E. Gowen, Seattle architect and faculty member of the University of Washington, has been elected president of the Washington State Chapter, A.I.A.. Other officers are: First vice-president, Floyd A. Naramore, Seattle; second vice-president, Nelson J. Morrison, Mock and Morrison, Tacoma; third vice-president, Harold C. Whitehouse, Whitehouse and Price, Spokane; secretary, William J. Bain, Seattle; treasurer, Albert M. Allen, Seattle.

Following the election of officers Judge Roger J. Meakim, King County Superior Court, delivered an address. The program, arranged by Donald Thomas, entertainment committee chairman, included specialties by the Sallie Sue White Dancers, accompanied by Bernice Campbell.

ELECTRIC HEATERS
"Find a cold spot and you'll find modernizing work," says Heating and Ventilating. Unit heaters are hailed as among the best remedies. They may be put almost anywhere and shifted readily. The electric kinds are especially convenient.

THE ARCHITECT AND ENGINEER
ARCHITECT AND ENGINEER

OREGON STATE CAPITOL COMPETITION
Golden Gate TAN PLASTIC was used throughout the construction of the new rectory...a wing of San Juan Bautista Mission, founded in 1797.

The walls required no subsequent treatment after the forms were stripped. TAN PLASTIC pourability was a factor in producing the desired architectural effects.

{Signed} IRVING F. MORROW
Morrow & Morrow, Architects
San Francisco

Exposed concrete is meeting today's demands for economy without sacrificing structural strength or appearance. TAN PLASTIC is a "natural" for this purpose.

First, it makes it possible to produce water-proof concrete with greater ease and certainty. Its pourability makes it easy to puddle into a solid mass, free of pockets, voids and bumbs. Last but not least, its basic color...a pleasing tan, makes it unnecessary to add agents which might affect porosity and uniformity.

Next time you have a water-proof job, try TAN PLASTIC...used right, it will never fail you.

NOTES AND COMMENTS

TEXAS ARCHITECT SCORES MODERN STYLE

What one architect thinks of the modern trend in architecture is reflected in the following letter penned by H. S. Sanderson, architect, of Laredo, Texas, soon after he had read the December Modern number of THE ARCHITECT AND ENGINEER. The Texan cannot see any logic or good common sense in substituting the so-called moderne for a style that his countrymen have learned to love and which suits their needs and climatic conditions.

To ease his anxiety and assure him there is nothing to worry about we would like to have him read Reginald Johnson’s article in the February ARCHITECT AND ENGINEER on “Architectural Expression.” Let us quote a paragraph which seems particularly applicable to Mr. Sanderson’s perturbation:

“‘Modern design’ must of necessity be influenced by environment and tradition. For example, there are many delightful towns in New England and in the South, and a few in the Southwestern section, where precedent in the past has been so well established that we are more than justified in carrying forward our newer buildings in at least the spirit of what has gone before, no matter what the Modernist may say to the contrary.”

So if Mr. Sanderson wishes to design homes possessed of the Spanish or Mexican or Mission feeling he may very properly do so and still be “within the law.”

Let us go on with Mr. Sanderson’s interesting letter:

“Your December, 1935 issue on MODERN ARCHITECTURE has left me in a quandary. I read it with an open mind. My mind is still open and empty. Nothing entered it upon my reading. I seek information. Was my failure to understand due to my inability or because there was nothing to understand? . . .

I am giving my clients the best architecture that the market could give. At least I give them the best according to my lights. After I make the plans I get out here in these hills and help break up the rock, staying right with it until we get the last piece of cow-hide stretched over the last chair. (You see design furniture as the new architect must; to this extent at least I am modern).

“In the States this would be unethic. But I am not in the States. This is the ancient kingdom of Laredo with descendants of the same families on the throne that came from the Conquerors via Vera Cruz 150 years ago to settle this frontier for the King of Spain. Spanish is the only language in which a brick has ever been laid. We are different in other ways too. For one thing, there is not a ‘for sale’ or ‘for trade’ sign in the whole kingdom.

My work shows up over that of my Spanish wife’s great grandfather because my buildings represent a college education. They have dynamic symmetry, hot and cold water with built-in douche basins. All very modern to be so harmonious at the same time with the old buildings. Or that is thought they were modern until December when I received this special modern issue. Now I don’t know. Maybe I cannot see well any more or have gone loco trying to make the Indians understand the same things the first Spanish settlers tried to get them to understand.

* * *

“For years I have thought that my work built in the Spanish manner, with thick walls of stone and heavy coved beams, was mighty fine, especially those having glazed tiles and carved furniture from Spain and Mexico. But now I don’t know. It looks like it is all over for me. Why only last week I told a banker if he built his bank in the good old tried and century—tested Spanish manner, with all these new things listed in the books of ‘Sweet for Banks’ he just couldn’t go wrong. For the Spanish style, like the Spanish language, would be the only one our people here would ever understand. It has to our minds a timeless, classic quality. Are we wrong?

“They all believe me for, by hard, honest work. I have built up a reputation for doing things that will never go out of style as long as women sing songs and men drink wine and both make love.

“But now I guess I am ruined and will be beheaded or exiled. It is awful. I would rather die than be driven away from the palm trees, the oranges, the cattle, the vineyards, the cactus and all that these represent. Yet exiled I must be if your December number is right. What will become of my wife, my daughter Margareta, and my dear old mother who worked so hard that I could go to Spain and learn how to build for gentlemen whose pleasure it is to live in hot countries. . . .

“Mr. Jones, you who have been a Californian for so many years, you who know the history of California so well, you who have helped paint the picture of California as a land of an all-consuming romance, how could you ever permit this terrible thing to come down on the heads of so many of your friends?

* * *

“How much the architectural magazines I receive, yours is the only one my good friends like to see. California the romantic—California the beautiful! What will become of the Golden State? What is to become of the artists, the carvers, the sculptors, the poets?

“Will they redesign the Missions, Ramona’s marriage place and Santa Barbara? Will there be a revolution? I hope so, I hope they give the punishment of the horses to these imos that are trying to change the sound of children’s dancing feet to the buzz of a machine.

“What has changed the functions of eating, sleeping, loving, fighting, drinking, smoking or dying to require new forms for their exercises? What is a new form? Have Wright, Corbusier, Neutra or Weatherhead, individually or collectively, ever produced a single damn thing that tops or equals the work of Reginald Johnson, Gordon Kaufmann or John Austin? If they have I say peccavi—. I did not know it. I will pull them over the face of the United States in an ox cart; so they can lash my share with a cow-hide whip every step of the way for my impudence. They show themselves off to the students of America as the greatest artists that ever lived, but they will never earn that ride and the world knows why.

“‘I am out of my mind or you are. But it must be me. It’s hot here. Time is of no consequence. Maybe I am Cortez awakened from a dream or the soul of Montaguone crying out to his branded brave not to give up. Anything may be possible when you are crocked or slipping. . . .

“They may see in me a potential worker in space. God knows I have more space to work with than any other architect on the North American continent. It is 150 miles to the nearest architect’s office. So if space, instead of geography, is going to be the big thing for architecture in the future I am the Kingfish right now and will share the wealth with anybody that will get behind me in this new superheated, high speed, easy riding, streamlined, architectural vitamin. . . .

“So here is what I want to know Mr. Jones, or Mr. Corbusier, or Mr. Wright, or Mr. Neutra, or Mr. and Mrs. S. Schindler, or Mr. Weatherhead and the seniors of the Class of ’36, et al, or all of you—tell me, please. If you were in a hot cattle country, sans factories, sans discontent, where good building rock is to be found everywhere, breaks up in such a way that it is cheaper to build a wall two feet thick than it is one foot thick or 6” thick, would you send away for material of vegetable or synthetic composition in order to be able to poo-poo the ancient order of interior decorating and time period temperaments? Would you?

“If every ranch, and that is the trade of this kingdom, not psychology, has more than enough mesquite trees on it to pro-

ENEAN THEATER, PITTSBURG, CALIFORNIA
F. FREDERIC AMANDES, ARCHITECT
TWO THEATERS AND SOME RECENT HOUSES
BY F. FREDERIC AMANDES

ARCHITECTURE is finally emerging from a period of unrest and despite the teachings of a few modern extremists, the traditionalists are moving ahead. To attempt to overthrow precedents that have weathered the test of centuries is folly, many architects opined when the movement was young, and now they are boastfully crying: “We told you so.” The modernists are retreating and extreme is giving way to conservatism and common sense.

This does not mean that modern design is passe. On the contrary, the movement has accomplished some good. For one thing it has brought the architect to a point where he realizes the necessity of a fresher and less traditional approach to his problems. So if the functionalists have overstepped they have at least performed a useful service in calling attention to the need of simplification and for a clean, outright architectural treatment.

Certain types of buildings are being successfully handled along modern lines with the chances favorable for a continuation of this

MARCH, 1936
practice for some time. The motion picture house, for example, offers an opportunity for the use of materials not heretofore assembled. We find sheet metal and glass replacing heavy gold ornamentation while concealed lights have been substituted for the once popular crystal chandeliers. Theater owners have discovered that besides good entertainment they must offer their patrons interiors both unique and colorful, together with comfortable seats, good pure air and smoking conveniences for both men and women.

Such is the type of theaters designed by F. Frederic Amandes of San Francisco and exemplified in the new Pittsburg Theater and the remodeled Fox-California in Richmond.

PITTSBURG THEATER—In spite of a shallow lot and building code restrictions, a spacious lobby has been provided and throughout the entire building there is a noticeable absence of cubical waste space. By using an inverted truss overhang for the balcony, it was possible to increase the height of the lobby ceiling, thereby giving the foyer a more imposing appearance. A unique feature of the lighting equipment is the center ceiling fixture in the auditorium which is in the form of a sun-burst and designed so that it may be illuminated in colors to blend with the action of the picture. For example, if there is a moon scene, the lights are dimmed to a soft silver glow. If the scene is a storm the lights change from green to amber. The fixture is made of sheet metal and glass. Aside from this ceiling light there is no other fixture visible in the house, so cleverly have they been made a part of the architecture of the interior. The color tones of the auditorium are henna, buff, cream, gold and silver.

RICHMOND THEATER—One need only to look at the two exterior pictures, the old and the new, of the Fox-California Theater in Richmond, to appreciate the improvements that have been made in the appearance of this building. The feeling is decidedly modern. In providing additional seating accommodations the architect, Mr. Amandes, and the structural engineer, W. Adrian, adopted a plan of economy that has worked out with even greater success than anticipated. The

AUDITORIUM, REMODELED FOX THEATER, RICHMOND, CALIFORNIA
F. FREDERIC AMANDES, ARCHITECT
problem was to reduce the steepness of the balcony, dispense with the protruding steel girders, and at the same time preserve sight lines. This has been accomplished by anchor ing the steel joists to the main plate girder in such a way that they form one continuous joist.

Mr. Amandes does not advocate extreme modern design for domestic architecture. He does not consider this style adaptable to the needs and comforts of the average American family. He prefers to stay with the old schools in house design. Simplicity, neatness, convenience, comfort, these are all essential details for a livable American home. If his client has no preference for style, Mr. Amandes is partial to the French Provincial. His own studio home, which is illustrated here, is an example of his ideas in residence architecture.

Mr. Amandes' rise to prominence as an architect has been rapid. In less than ten years he has moved along from a draftsman and art student to association with leading members of the profession, and today he maintains his own office. A native of London, he comes from Swiss-French parentage. During his student career, Mr. Amandes was awarded two Beaux Arts medals for creditable architectural designs. When not engaged in the practice of his profession he finds enjoyment and relaxation as an operatic baritone and builder of water craft.—F. W. J.

California Spring Garden Show

While rare and beautiful flowers and plants are being "forced" into early maturity for exhibition in the California Spring Garden show in Oakland next month, experienced craftsmen in architecture, landscaping and interior decorating are concentrating on the details of the show requiring their expert attention. The landscape director of the affair, Butler S. Sturtevant, has asked the foremost craftsmen in these fields to cooperate and they are enthusiastic. The theme of the show will be the "Chateau Gardens of France," embodying the creation of three small home-units representing Modern French, French Provincial and Louis XIV types of architecture, and each one complete with its individual type of landscaping and interior decoration.
of the side wall will be a typical French Catholic Shrine, with market baskets placed at the foot of the wall. A sidewalk cafe under brightly colored awnings will be found in this area also. In the center of the market place will be a panel made of colored stone and blossoms, typical of street decorations in Mediterranean countries on fete days. Sponsoring this unusual display is the Business Men’s Garden Club of Oakland. Steps leading upward to the top of the wall command a view of the Chateau gardens, parterre, French lattice houses, neatly trimmed lawn panels, garden statuary and fountain and pool in the manner of the one at Versailles.

Priceless orchids of many varieties will be seen through a series of arches in the vicinity of the Versailles pool.

So that patrons may remain for many hours in the Chateau Gardens, members of the board of directors of the show, headed by Abe P. Leach, president, have arranged for many rest benches near the wall terrace and around the fountain. In addition to the big beds of brilliant and large blooms, there will also be a collection of wild-flowers arranged in one of the several lattice houses.

The modern French home unit designed by William W. Wurster will show a French morning room with modern textiles, furniture and color scheme arranged by Armstrong, Carter and Kenyon, interior decorators. Landscaping for this unit will be done by Thomas D. Church of San Francisco.

The French Provincial home-unit has been designed by Henry H. Gutterton of San Francisco, who last year designed the beautiful Georgian manor house which formed the entrance to the garden show. Helen Van Pelt, landscape artist and Arthur Baken, interior decorator, both of San Francisco, are collaborating with Mr. Gutterton.

The Louis XIV home unit is the work of Clarence A. Tautau of San Francisco. Leslie Kiler of Palo Alto will do the landscaping and Winifred Wise of Oakland, the interior decoration.

In addition there will be a garden unit designed by a student at the University of California in the Division of Landscape Architecture, and whose plan was chosen in competition with other students in this department.
TOWER OF INTERNATIONAL HOUSE, UNIVERSITY OF CALIFORNIA, BERKELEY, CALIFORNIA

GEO. W. KELHAM, ARCHITECT
THE architect of the past conceived the house as a group of separate rooms, carved out of his structural mass, like the holes in a piece of cheese. Each room was complete in itself with only a slight relation to the next one. It was possible to decorate each room in a different "style", and finally, in our times, to add an American bathroom without any shock to the sensibilities of the occupant.

The Space Architect sees the house (or the whole town) as an articulation of the one cosmic space. The house becomes an organism in which all rooms are related to each other, representing variations of one basic theme. The house becomes a weave of a few basic materials used to define his space forms. The furniture which is stationary (beds, etc.), becomes part of this weave, until it is impossible to tell where the house ends and the furniture begins. The few places which are necessarily movable (chairs, etc.), become so in an accentuated degree. Moving, they are unfit to define the space conception and must therefore be eliminated architecturally for the sake of clarity. They are either folded up and stored away or made transparent to become inconspicuous. This is the real meaning of the metal chair. Its essence is its transparency—the lack of which immediately delegates to the realm of idle phantasies all the "fashionable" designs in which bulging upholstery masses are suspended on snaky metal braces.

The folding chair is the more radical solution of the space architect's problem—it avoids blurring of the space scheme by leaving the realm of furniture altogether; it becomes part of the occupant like his shoes and clothes and will develop his final shape out of this new constellation.

COMPOSITION AND SCALE

The social structure of the past was based on a pyramidal conception of the universe. The world was seen as built up from a wide common level to the authorative position of king and God. And all the detail groups of the social building—family, monastery, etc.—

EDITOR'S NOTE—This article is a continuation of a paper, the first installment of which was published in the ARCHITECT AND ENGINEER for December, 1935.
were again built on the same form scheme. This pyramidal conception of the world seems to have blinded the feudal artist to the beauty of any other scheme of composition. Houses, furniture, including their details throughout, fit themselves into the outlines of an upright triangle—each piece in shape and meaning an altar to the idea of centralized authority.

The stereotyped form-sentence of the conventional designer: base, body, cornice, crown, has now lost its meaning. The contemporary form-sentence may move horizontally, around the corner, or even downwards.

The social position of each member of the pyramid of feudal society had to be expressed outwardly. Representation became one of the important functions of any individual. Life lost its fluidity, and separated itself into alternating periods—front stage for representative action and backstage for private life. The house expressed and furthered this scheme. The front-elevation with the main entrance, and the other sides with the backdoor, belonged to two different worlds.

Our time, with a more democratic scheme, has discovered the meaning of the neighbor and allows us to stretch our hands out horizontally. It has accorded to any individual the privilege of the king to consider himself and his action sacred at all times. Our houses lose their forbidding faces and become three-dimensional beings in a three-dimensional world.

One of the most primitive tricks for impressive representation was accentuation by size. The king with cloak and crown became a giant and his palace reflected his grandeur. It was natural that social prestige attached itself to dimension and the architect of the last centuries used a scale which was social rather than human.

Only lately have we again discovered the real height and breadth of a human being. Ceilings shelter us instead of crowning our position. Doors are to walk through rather than to form an impressive frame for one who carefully pauses on the threshold. The chair supports the back rather than to produce an aura for our head.

POSTURE

The postures we assume in our unconscious daily life are rigidly predefined in our culture.
This means that they not only express this culture, but that through them the imagination of the architect may profoundly influence our spirit. Our furniture in compelling certain positions is directly molding physical traits, manners and culture.

The high straight-backed mediaeval chair reproduces an epoch, and requires a position impossible for us. Grandmother’s wing-chair of a more recent period, around which her grandchildren gathered and in which she ailed and died sitting, represents a different world, contrasting with our low clubchair and our supine position for rest and death. It seems that our nervous intensity in action requires in turn a more relaxed rest position. Even sitting at our work we are apt to seek the horizontal by putting our feet on the desk.

This tendency, together with our changing attitude toward the floor, lowers and spreads our furniture. The stationary furniture, especially, stops leaning against the wall and tries to merge with the floor. The imaginary horizon in the room has dropped from door to elbow height. This divides the room at a lower level and increases its spaciousness. The height of the window-sill of yesterday is confiningly high today, the coming window will extend its pane to the floor. Not, as the mechanist claims, because we are able to make larger panes, but on the contrary, it is because our inner urge requires it, that such larger panes are made. The conventional picture above the fireplace is high above our horizon, and if we really want to study a painting we set it on the floor.

The ceiling has completely disappeared above our line of vision and we no longer lavish our decorative talent on its surface. Our intensity of action has increased the necessity for elbow room. The accepted standing and walking position of the conventional ballet (heels together, toes apart) which children were trained to assume fifty years ago, has given way to the more active one of the toes pointing straight ahead. Our wardrobes recede into the wall. The concentric grouping of furniture gives way to a linear one. The mobile piece must be small and light enough to respond quickly to our intentions. It is impossible to hurry in a Roman toga, or to sit down quickly if it requires a servant to move our chair. A highly polished parquet floor can only be the stage for a circumspect execution of representative postures. Our house should give us ease and freedom of action—a request which “period furnishing” is unable to satisfy.

**ORGANIZATION**

The preservation of fluidity and continuity of space in the house eliminates all features which are too self-centered. Conventional design invariably breaks up all flow by a repeated use of symmetrically arranged and therefore self-centered groups. This holds good for rooms as well as furniture. Therefore, contemporary work will usually shun the circular room, the cupola, a furniture arrangement which faces a center point (cut-a-corner position) and symmetrical pyramidal pieces—even if they masquerade under a modernistique formskin. It ends the work of the conventional decorator whose scattered groupings of odd pieces have lost all artistic meaning.

The space architect organizes the room according to his purpose and still maintains an unobstructed natural motion through the house. This does not interfere with the tendency of most rooms to face a fireplace, a view, or some other feature of special interest. The furniture will be arranged in such a way as to facilitate the contemplation of the center of interest from all points of the room where this can add to the charm of living.

The room will clearly separate areas for the different postures of its users. Open spaces for communication should be well-connected and allow short traffic lanes. Areas for sitting, and low places for horizontal rest will relate themselves in proper sequence to the lanes of communication. They will succeed each other in definite sequence towards the center of interest, so that the standing person will be behind the sitting one and that the latter with table and chair will not obstruct the view from the couch. This means that instead of pointing at the center of interest in the conventional way...
by some axis of symmetry, it will be featured by 
the downward slope of the plane which con 
nects the tops of the furniture. This will further 
emphasize such a center by means of a large 
open floorspace in the foreground, replacing 
the conventional emphasis by means of a frame 
and a supraport; it will allow the introduction 
of an accent in the room without stopping the 
desired flow of the space toward the next one. 
Together with the natural interlacing of the 
areas of communication, the house will achieve 
an organic unity impossible in the "period 
house" and its present rehash.

FLEXIBILITY

Intimacy of connection between the house 
and its furniture does not imply that all rooms 
must forever retain their original design. For 
the large group of people, especially, who live 
in apartments and move from place to place, 
a static room is not practical. It should be 
possible on the one hand to move the furni 
ture into rooms of different shapes without 
difficulty, or on the other to rearrange the 
same room to fit a new occupant. The implied 
urge towards individualization grows con 
stantly, and contemporary furniture must satis 
fy it in order to be successful. One solution 
for this problem is shown in the author's 
"Schindler Units", composed of a few simple 
units they allow rearrangement, addition, and 
subtraction with ease.

The basic idea for such a unit scheme is 
theroughly modern and could not have been 
conceived in a period without machine pro 
duction. It illustrates at the same time that 
most of the sloganists advocating machine pro 
duction do not yet understand its essential 
features. The machine which is used to fabri 
cate whole objects: houses, desks, etc., takes 
its production scheme from the craftsman. 
The latter, however, maintains a certain alive 
lessness in his product by his inability for exact 
repetition. The machine, for which exact re 
petition is the very essence, when misused in 
such a way will cause a deadly standardization 
of our lives.

Only by confining the machine to making 
parts (units) which, through the very fact of 
their precision, may be joined freely, can we 
subdue its mechanical ferocity to individual 
human expression. The machine, contrary to 
common opinion, can develop such individual 
sation to a degree of which the handicrafter 
could never have dreamed.

The "Schindler Units" permit the assemb 
ling and rearranging of their parts into furni 
ture, which will respond to the particular 
conditions of any room, according to the individ 
ual character of the occupant. They consist of 
a number of top-units which are assembled 
first. They form a skeleton which receives 
shelves and doors for cupboards or drawers of 
sizes.

The following considerations governed their 
design, which separates them definitely from 
the conventional sectional book case etc.

They are square, low and wide. They do 
not produce furniture forms standing up 
against the wall. Placed one above the other 
they establish several horizontal planes through 
out the room, giving the furniture the charac 
ter of floor terraces.

They have no definite front, but may be 
used turned in all four directions. The resulting 
furniture has no representative face, but is 
three-dimensional.

No unit is symmetrical in itself. It therefore 
permits the establishment of form relationships 
with its neighbors. The result is consequently 
not the formless pile of self-centered elements 
which the usual type of unit furniture produces, 
but a form organization with definite character 
and variable individuality.

The scheme further includes large floor pil 
lows, which may be changed into armchairs by 
simply adding an adjustable back and arms. 
Several such seats and backs joined together 
form the couch, which may be of any length, 
or a corner seat.

Further individualization may be achieved 
by the addition of a few specially made parts, 
which may be of sufficient emphasis to alter 
the character of the whole assembly.
THE FOUR ELEMENTS:
Earth, Water, Fire, Air.

The mainspring of primitive life was fear. "My house is my castle" shows how that emotion adhered to man throughout his development up to the immediate past. The most "comfortable" house was the one which faintly reminded him of the feeling of relief felt by the animal, and by his ancestor, upon entering a secluded cave.

Only the contemporary architect has realized that this period of fear has passed. The elements are no more our masters and enemies: they are our friends and servants, and the out-of-doors is our playground. The house opens wide towards the garden, and if it is to be comfortable, it must be able to furnish us artificially a suitable climate without losing the feeling of openness. Our newly-acquired ability to manufacture our own climate must not separate us from our natural contact with the elements. They serve us admirably in their domesticated form, flowing through pipes, ducts, and wires, but life would become unbearable if we were to surround ourselves only with servants. To insist that ventilating windows, light windows, fire places and pools are rendered obsolete by our ducts and pipes, is merely to repeat another half-truth of the modernistic sloganist. The open window, the furtive sunray, the natural breeze, lightning and thunder, the crackling flame, the bed under the stars, are thrilling experiences not to be surrendered from our daily life. Our houses must admit the elements as friends. The functionalist who preaches that the canned life of our top-story city apartments is the ideal of the future, forgets that the revolt against the confining features of such city life is ready to kill the city altogether.

LIGHT

The effort of man to multiply the hours of the day by artificial suns has discovered for him one of the most potent and subtle materials for room building. This is possible only since we have been able to disassociate the light from a concentrated source and understand it as an attribute of space.

The harnessing of electricity has freed our artificial light from the candelabrum and the light fixture. It is able to filter into the room space without emphasizing its source, in a way similar to daylight when it is not confined to a small windowpane. Light and darkness and colored lights are building materials as effective for the defining of rooms as are steel and concrete.

This use of light in contemporary work is completely contradicted by any emphasis of the source: the "light fixture." No effort of any fashionable designers can create a "light fixture" — the favorite stamping ground of half-baked imaginations—which is in truth contemporary or modern.

The space architect uses the illumination of the room to shape it richly without necessity for cumbersome material divisions. He uses it to connect rooms in spite of a partition between them for practical reasons. The light of the room matched in the garden will join the two and effectively suppress a glass wall between them.

And his power will be complete when the present primitive glass wall develops into the translucent light screen. The character and color of the light issuing from it will permeate space, give it body and make it as palpably plastic as is the clay of the sculptor. Only after the space architect has mastered the translucent house will his work achieve its ripe form.
A MODERN BEACH HOUSE BY GORDON B. KAUFMANN

BEACH HOUSES in the modern design are becoming increasingly popular. In December The Architect and Engineer published pictures and plans of an interesting beach house in Richmond by W. W. Wurster. In this issue is shown an eight-room moderne beach dwelling, with strong nautical treatment, at Alamitos Bay, Gordon B. Kaufmann, architect. Mr. and Mrs. Norman Chandler are the owners of the house which is constructed of wood frame with exterior of flush redwood boards and horizontal flush redwood mouldings for architectural effect.

The exterior walls are finished with a patent hardboard, etc., laid in symmetrical horizontal panels and finished with semi-gloss enamel. The floors throughout are covered with linoleum. Provisions for heating the residence has been made by installation of gas radiant fire wall heaters. The kitchen is equipped with a modern gas range, and an automatic storage type water heater.

MARCH, 1936
ONE of the outstanding school buildings to be designed and erected in California since the state's "lateral force" law became effective, is the Polytechnic High School group at Long Beach, Hugh R. Davis, architect. The new structures, with one exception, replace buildings that were badly damaged in the 1933 earthquake. The single building to survive the disaster is the auditorium which has been redesigned and practically rebuilt to conform to the requirements of the California state lateral force law. The other buildings, all new, form a splendid group, structurally well designed and architecturally pleasing.

When the new plant is entirely completed the Board of Education anticipates an enrollment of 4000 students, greater than that of most universities. In replanning the group to meet the requirements of this large student body, two limitations placed upon the architect, Hugh R. Davis of Long Beach, were the location of the auditorium and a strip of privately owned land on the Fifteenth Street frontage of the site, which extends for two blocks along Atlantic Avenue to Seventeenth Street. It is expected this strip will be later acquired by the city in which event the gymnasium will be moved from its present temporary location to the south line of this property, making a large quadrangle for physical education activities.

For planning, the high school plant was divided into three general departments, Academic, Manual and Physical education. As the last mentioned is compulsory in California, it was necessary to place the academic building as near the street as practicable to obtain the necessary open play area, the manual arts building being placed on Seventeenth Street facing the play area.
Redesigned and Rebuilt to Resist Earthquakes

General requirements of the plant originally outlined included 73 classrooms, 7 laboratories, a music hall, 10 shops, 2 gymnasium floors, a swimming pool, a cafeteria and orthopaedic rooms. Provision was made for financing the project on this basis in an application approved by the Public Works Administration, the total estimated cost being $939,495, of which amount $225,738 was to be a Federal grant.

Largest in the group of new buildings are the Commercial and Science Units and the Administration building. The former extend along Atlantic Avenue, with a total frontage of 520 ft. These structures are two stories, the Commercial building being 203 ft. long and the Science building 318 ft., with only a one-inch open joint to interrupt lateral forces separating them. The former is 60 ft. wide and the latter the same width with an ell 36 ft. wide extending out 100 ft. toward the street. The Administration building, also a 2-story structure 250 ft. long and 60 ft. wide, is immediately back of the buildings on Atlantic Avenue, facing on a court.

All the buildings are connected by a covered way, the roof being designed as an outdoor corridor.

The structural design of the buildings to resist lateral force equal to 1.10 gravity was simplified to some extent by elimination of weight and lowering the center of gravity. The latter was accomplished by laying the first floor slab of reinforced concrete directly on the ground and tying it to all the major footings. This plan also eliminates all stairs to the first floor. By the type of construction adopted and the structural design followed it is estimated that the usual dead load of pre-earthquake structures was reduced by 60 per cent.
The structural design of the buildings to safely resist both gravity and earthquake, or lateral loads was influenced by the desire to reduce dead weight of the structure to a minimum, insistence of the architect on practically continuous window areas on outside classroom walls, necessity for continuous transoms and locker space in corridor walls, and the method of heating rooms which required individual heating units between the ceiling and the floor or roof above.

A structural steel frame with rigid column connections and a light weight floor and wall construction were considered the best solution of these problems. Requirements of a two-hour fire-resisting rating for exterior walls of this type of building, imposed by both the state and local codes, was fulfilled by metal studs with one inch of cement plaster on both sides. Such a wall weighs less than 30 lbs. per sq. ft. Code requirements of one-hour fire protection for the structural steel frame were met by wrapping the columns with metal lath and covering them with one inch of cement plaster while the floor, or ceiling and roof construction provided the necessary protection to beams and saved the weight and cost of two-inch concrete fireproofing for these members.

Floor and roof construction consisted of specially designed steel joists, or light trusses, supporting Robertson Keystone beam steel floors with a span of 4 ft. on the second floor and 8 ft. for the roof.

Cost of the reconstruction work, including fees, was $.085 per cu. ft., according to a writer in Southwest Builder and Contractor.

C. Gordon DeSwarte of Los Angeles, is structural engineer for the academic buildings and Laurance J. Waller, of Los Angeles, structural engineer for the auditorium. Homer Fisher of Los Angeles, is the mechanical engineer.
"MANUFACTURED WEATHER"

by

John J. Davey, Architect

O THE general public "Air Conditioning" is a comparatively recent development and the layman has not as yet been educated to appreciate the exacting requirements of the term. He is generally unaware of its limitations, although he recognizes that it should lead to greater physical comfort.

The innumerable types of equipment now offered indicate that the term is being indiscriminately applied to installations and devices of almost every description. This, together with the contradictory and, in many instances, misleading claims presented in behalf of the manufacturer relative to the performance, initial and maintenance costs of his particular equipment, have created much confusion in the public mind and naturally prompt the oft repeated inquiry "What is Air Conditioning?"

Air conditioning, or as one prominent organization aptly terms it "manufactured weather," is the process by which the temperature, moisture content, movement and cleanliness of the air in enclosed spaces intended for human occupancy, are simultaneously controlled and maintained within definite specified limits at all seasons of the year regardless of weather conditions.

The equipment controls the temperature by summer cooling and winter heating, regulates humidity by addition or elimination of moisture, and creates movement by the even distribution and circulation of both tempered and humidified air. It provides enough ventilation to produce a mild distribution and sufficient fresh or revitalized air to eliminate smoke and objectionable odors.

An installation that does not perform all of these functions is not a complete air conditioning system. The type of equipment and control naturally varies with the specific requirements, character of space, and number of persons accommodated within the enclosed area.

Equipment or apparatus that but partially fulfills the above requirements should, for the protection of both the industry and the public, be so designated as to clearly set forth the specific purpose for which it is intended, viz: Cooling, Humidification, Air Movement or Air Filtration.

Air at any given temperature will absorb only a specific amount of moisture. The cooler the air the less moisture it is capable of holding, and vice versa.

When introduced by infiltration into a heated area, cold outside air with its low moisture content mixes with warmer air of greater humidity and as it becomes heated absorbs all possible moisture from persons or objects which it surrounds, creating a dry condition of relative low humidity. This imparts a feeling of chilliness to the occupants even though the thermometer shows no change in temperature. To overcome this condition, it is necessary to increase the moisture content of the air within the enclosed area.

In warm weather the opposite condition prevails. Warm or humid outside air with its high moisture content, upon becoming mixed with the cooler, dryer inside air, results in a feeling
of discomfort to the occupants due to the excess heat and high humidity. To remedy this situation the excess moisture must be removed.

This is usually accomplished by passing the air through a spray chamber or over a surface evaporator. The temperature of the warm or humid outside air coming in contact with the cooling medium is immediately lowered to the required dew point or to where a portion of its moisture content is condensed. The cooled, de-humidified air, when circulated through the conditioned area, absorbs heat and moisture and the process is repeated.

The inside air, plus a certain percentage of fresh outside air, may be recirculated and the excess air is forced out by means of an exhaust fan or by leakage through cracks around doors and windows.

A proper comfort zone, or condition acceptable to at least 50% of the occupants, has been definitely established. In winter a temperature of 68° to 70° F and a relative humidity or moisture content of 20 to 50%; in summer 70° to 85° F and 50% humidity, depending on outside conditions, has proved generally satisfactory.

Experience and extensive research on the part of both engineer and manufacturer have produced many types of conditioning equipment adaptable to almost any need. These range from the large commercial systems to the popular small units and apparatus especially adapted to home use. The latter give practically the same results as do the larger installations and also provide a greater degree of health, comfort and resistance to disease than is possible with the simple heating system.

For new homes a central system is preferable. This consists of a basement unit which houses the fan, filter, humidifier and heating coil. The latter is connected to the hot water or steam boiler and the air conveyed to and from the various rooms by a system of ducts. Primarily intended for "winter conditioning" only, in combination with a refrigerating machine or a supply of sufficiently cold water, it constitutes an "all-year-round" installation.

Another efficient and popular device is the "fan furnace type," consisting of an enclosed coal, gas or oil burning unit from which the conditioned air is distributed. If provided with air filter and humidifier, it becomes a winter system and by the further addition of summer cooling equipment, meets "all season" requirements.

A simple installation, particularly adapted to individual rooms in existing buildings which perform all functions of summer conditioning, viz: cooling, dehumidification and air circulation, consists usually of a cooling coil and fan enclosed in a small portable cabinet which can be placed in any desired location.

The refrigerating medium may also be housed in the cabinet, thus forming a complete self-contained unit, or it can be installed in another location and connected to the cabinet by small refrigerant lines. Where more than one room is to be cooled, several of these cabinets can, under certain conditions, be operated from a single refrigerating machine.

For "year round" service, room cabinets similar in appearance to the simple cooling units, but containing in addition a heating coil, an air filter and humidifier, are available. These, when connected to the radiator system and in combination with a suitable refrigerating unit, meet all conditioning requirements.

The basic principles of air conditioning have been definitely established. However, as with all mechanical installations, the results obtained depend largely upon the ability and experience of the designing engineer.
FUTURE OF THE STEEL HOUSE

by
Edward L. Soule

IT IS rather difficult to attempt to tear an industry, even though it be an infant, into small technical parts and make them understandable in so short a time as that allotted for this discussion. Rather, it becomes a necessity to define the existing requirements for a successful steel home; one that will find favor with the home building public.

It is possible there is a bit of misconception on the part of the general public as to what constitutes a steel home. I find in my contacts with persons more or less interested in the subject, that their first conception seems to be something of a pre-fabricated nature, a house that can be screwed or bolted together in some magical way and present an interior and exterior of smooth, polished chromium, in very modernistic design and for which the cost will be something far below that of any other type of construction.

It is true that what has been done toward the perfecting of steel home construction has been, too often, a method of adaptation of existing patented units regardless of their adaptability to a sane method of steel construction.

It has been several years since steel was first used as a frame for home construction. During these elapsed years many different methods have come on the market. It is only necessary for you to peruse your technical magazines and trade papers to become acquainted with how many organizations are deep in the development of methods and in technical research of various materials in their attempt to solve the problem. And it is only from this concentration of thought and effort that the eventual leaders of the steel home will evolve.

There is, without doubt, a very generous potential market for the steel home. Those of the more advanced type of design are, or should be, flexible enough to definitely fit in with the more modern, as well as the standard architectural treatment of any locality. It should also be adaptable enough so that interior arrangement may be handled without sacri-
lice of comfort or space. There should be no limitation to the exterior or interior finish. Costs, when compared with the old type of construction, should be favorable, when it is considered that the steel home is a product of excellence and longevity; that homes ranging in cost from $5,000 upward, fall into the natural market for steel construction.

Many Types of Steel Houses

There are many types of steel homes on the market at the present time. First, we find that type of construction that adapts already existing units, and with practically no change, utilizes them as framing units for homes. As a rule these units will be found to do only an approximate job. They have limitations, because in the first place they were not made for the purpose of a light weight rigid steel frame for home construction.

Into this category fall those types that have been fabricated by the builders of heavy steel construction. They have applied their basic method of building to the construction of homes, and we find their construction methods to be unwieldy, their frame too heavy and without the flexibility that permits the function of other necessary trades and appurtenances that must be incorporated in a finished building. As a rule the time of erection is too great because the heaviness of the construction material precludes shop unit pre-fabrication.

Any home that can be built of wood can be built of steel, but because of the non-flexibility of the majority of the steel framing systems it will be found that the efforts of the marketers are concentrated on the "box" type of home. In some types the different members are bolted into position; in others the uprights are set in the concrete of the foundation. In most cases the exterior walls are thin, not exceeding four inches in thickness, and the standing members, being of solid steel, afford practically no accessibility for interior wall installations of the plumber and the electrician.

There is a second type that has a tendency to defeat the first principles of steel construction. It is true that a steel frame is used, but that is practically all that is used that will safeguard the home from its natural enemies—fire, dry rot, termites and the endless number of things that cause home deterioration.

These two types of steel frame construction are detrimental to the successful marketing of the steel frame as a method of home building that will render a service far in advance of anything that has been available to the home owner in the past.

For a successful steel home, it is necessary to have in mind the necessities of the eventual owner of the structure. It must be borne in mind that there are many different geographical areas and as many different types of architectural treatment in vogue in the United States. Each of these must be made a part of any plan to market a steel home, if success is going to crown the efforts of the marketer. In each of these areas definite care should be given to the ordinances governing load carrying capacities and stress analysis in all its details.

Should Fabricators Do Actual Designing?

In the past most construction has been predominantly of wood. With the steel home it is expeditious to use wood for decorative purposes only; otherwise the steel is defeated in its first importance. It must be so flexible that it will be easily adaptable to any type of construction and with any materials in vogue within any building area. It must be adaptable to any type of design and so engineered as to give maximum load carrying ability with a minimum of dead weight.

I believe it is going to be necessary for the fabricators of the steel home to do the actual designing of the homes to be marketed. While, as a rule, he is interested only in the frame of the house, he is, at the same time, going to have to produce a home with all the little refinements included, that have become so necessary to the housewife in her daily home management.

To be able to market a steel home, in which the steel frame is only a small fraction of the total cost, and to gain his livelihood from the
sales of this steel frame, without unduly burdening the balance of the construction with carrying-charges, is going to require a merchandiser of rare ability.

Standardization is another thing that must be considered. Up to and including a certain point there must be standardization, but to exceed this point will defeat any program that adheres to it. Production is of much more importance than Standardization. To temper standardization with flexibility, both in design and construction method, should be the aim of every fabricator of the steel home.

To successfully produce a marketable steel home, it is going to be necessary to have outstanding design. Both floor plan and elevation must be of merit. This constitutes the eye and mind appeal to the home builder. Carrying on from this point, the engineering detail must be so accomplished as to allow for no mistaken theories to enter into the actual fabrication and construction. It is, beyond a doubt, going to be necessary to pre-fabricate in the shop and erect in the field. The methods of doing this must be worked out by each fabricator so there will be little lost time and no lost effort.

‘Show Window’ for the Steel Home

Erection in the field will be found to be the "show window" for the steel home. It is only at that point that the general public will be able to gain an intimate acquaintance with the various types of construction and the methods used in placing the units. It is more than could be expected, to hope that the public will be able to gain more than a cursory knowledge, or idea, of the merit of any steel home from a hasty inspection of one in the course of erection; but they will be greatly impressed with the skill and the time element in the construction. The compactness and the portability of the various units will be found to have a great bearing on the public mind.

I believe that from a sound engineering standpoint it will be found impractical to exceed three stories in height with this type of construction. I think, however, this will allow the fabricator to include in his marketing oper-

ations the sale and fabrication of small industrial buildings, schools, hospitals, and small commercial and apartment buildings. There is, at the present time, in various sections of the country, a very definite trend to the lighter types of construction on some of these.

Of primary importance, after the steel frame has been fabricated and is in place, is the interior and exterior finishes and the method employed in their application. The first prerequisite of a steel home is its fireproofness. Unless this can be maintained over a period of several hours the prime feature of the frame is defeated. It then becomes a great necessity to know that the steel frame is adequately protected from without and within by some method of insulation that will allow it to retain its original shape and carrying capacity through an ordinary period of conflagration. There are many methods available, but it will remain for the individual fabricator to select and market, along with his steel home, the necessary protection to make it all that such a home should be.

A secondary, but almost as important a consideration in some sections of the country, is the ability of the frame to withstand seismic shock. Various theories have been worked out for this, but it is not my intention to go into them today. I only want to remark in passing that a steel frame, to outlive the present day long term mortgage, must be so engineered as to incorporate these two essentials in a greater degree than any other items in the entire construction program.

Should all of the essentials to the construction of a steel home, thus far discussed, be incorporated in the structure, it is only natural that it will be of such soundness that the lesser destructive forces will have no opportunity to attack its parts. It will be rat and vermin proof. Termites and the various wood boring insects will have nothing upon which to feed. Adequately damp-proofed, it will outlast the mortgage period and be a sound and healthy habitation for many years exceeding the period in which it is being paid for.
Desirability of Steel Frame Houses

The ideally constructed steel home, with structurally correct units, has two major outstanding features of desirability. First: The walls between the exterior and the interior finish, and all interior partition walls, should be continuously open for the circulation of air. Second: The size of the openings in each member should be such as to admit all conduits, pipes and conductors, as well as the necessary cross ties to insure structural stability, in this way assisting the installation of electrical, heating and plumbing systems, as well as the newer air conditioning now becoming so popular.

I believe, insofar as the marketing of these steel homes is concerned, that it is going to be necessary for every fabricator to enter a program of education. It is in this effort that the larger steel producers can be of great assistance. For each individual fabricator to try and make an individual effort to publicize the steel home would lead to a slow and biased program of education conducted through advertising designed to sell ONE particular type of construction. This would be confusing, more than instructive, and would, without doubt, slow up the public acceptance. I suggest that the effort directed to sell the public on the idea—the desirability of a steel home—should be a communal undertaking of those vitally interested.

Let me summarize a bit in conclusion. Throughout the length and breadth of these United States there is a very definite trend toward the building of homes. This trend is being subsidized by the Government, and it is generally expected within the next year that it will grow to such proportions that it will become one of the major operations of the country. To be ready to take advantage of this natural condition the fabricator of steel homes is going to have to perfect an organization of sufficient strength to cope with a flood of interest if he is expectant of receiving a just share of the natural business that will fall within the limitation of excellence of construction and price standard. He is going to have to iron the "bugs" out of his type of construction and make it as universally correct as is possible and still remain within the dictates of sound engineering principles. He is going to have to meet the advanced trend in building design and construction that is now expected of the master builder by the general public. He is going to have to conform to the dictates of the speculative builder so that he in turn may offer something of an advanced nature to the buying public, thereby netting the fabricator increased volume. He is going to have to watch the trends of the increased commercial, school, hospital and small apartment buildings. He is going to have to increase, as rapidly as is demanded by consumption, his production and distribution methods. But first, he is going to have to build a steel home that will do all the things claimed for it, and above all, one that will sell.
NATION WIDE BUILDING CENSUS
GIVES EMPLOYMENT TO 3,000 PEOPLE

The building industry is about to have its first complete census in many years. A force of 3000 persons is being employed to gather and compile information, and returns are already pouring into the Census of Business headquarters in Philadelphia. How this data is being assembled, analyzed and converted into composite statistics is most interesting.

From the moment the census report is obtained from a contracting firm, the information is carefully handled in a systematic and expeditious manner. Its confidential nature is guarded as carefully as money in a bank.

A more far-flung field organization could hardly be formed than is required for a nationwide census. Each state is divided into supervisor districts, further sub-divided into many enumeration districts, based on the probable number of business firms as well as territorial extent.

There are more than 400 supervisor offices, from which the thousands of enumerators work. Yet the whole canvass is planned to the last detail. It moves with precision.

As the canvass of an enumeration district proceeds, the reports are assembled in folios at the supervisor's office and sent by registered mail to the Philadelphia headquarters. All checking in the field offices is restricted to features pertaining to the canvass—whether a report is complete and whether the canvass of an enumeration district is complete. That is the field job. As soon as all reports from a given district are obtained, that office is closed and the working papers follow the individual reports to headquarters.

As rapidly as the postoffice delivers the incoming reports, they are checked again to assure completeness of the canvass. Each enumeration district has an identification number, indicative of the State and County, as well as having definitely circumscribed territorial limits. Previous census records afford a means of checking on coverage and other phases of the canvass.

Released for editing and analysis, the reports are sorted by branches of business—construction, retail trade, wholesale trade, transportation, communication, business services, amusements, hotels, and the other branches covered by the census which is indicated by the form on which each report is made. After being sorted by major business classifications, the reports are sent to these business divisions in the Bureau, which are headed and supervised by division chiefs who are specialists in their respective fields.

Within the construction division the reports are further sorted by kinds of construction—building, highway, heavy construction, and so forth. Then groups of clerks trained in each of these fields examine and test the reports, code them and prepare them for statistical tabulations.

The kind-of-business classification is established by the answer to a specific question, and further verified by other information on the
schedule received. This classification is usually
the popular designation by which the concern
is known, such as "air conditioning", or in
accordance with the principal kind of construc-
tion performed.

Each individual report is carefully edited to
eliminate errors in preparation—misplaced
entries and inconsistencies. Code symbols are
entered on the report for use in mechanical
tabulation. A certain code number may mean
that the contracting firm is independent and
individually operated, or a unit of a branch
system, or whatever may be the form under
which it is operated. In other fields of business,
such as wholesale, or banking, or real estate,
similar subdivisions of the business are design-
nated by code numbers.

Entries under each main inquiry on the
schedule-report are handled separately, and
carefully studied for consistency. Operating
revenues, operating expenses, and employ-
ment data are scanned and scrutinized by dif-
f erent individuals for inaccuracies—assayed to
prevent distortion of the composite statistics.
In this respect, the work is particularly anal-
gous to that in a factory where each piece is
calibrated and tested before assembly.

Each part of the report is also edited and
coded by different persons—and subsequently
is reviewed and critically analyzed. The whole
set-up for this work is a system of checks and
balances, in which the element of error ap-
proaches the irreducible minimum. Then the
individual figures are consolidated with others
of similar classification and lose their individ-
ual identity. No figures for a classification
(whether a business, area or type of operation)
are published unless enough individual reports
are included to make it impossible to distin-
guish the facts about any particular individual
firm or corporation.

Every step in the work makes for accuracy
in the final results. All changes and adjustments
are made in accordance with approved statis-
tical methods, usually after reference to the
business involved, and only by persons pro-
perly trained for that work.

Each detail on a report is prepared carefully
for the composite statistical arrays—to be
shown by kinds of business and by area sub-
divisions, by types of operation and by legal
forms of organization, and under the various
other headings.

When finally released by the editing and
coding groups, the reports are consecutively
numbered and assembled in folios by states,
counties and cities. The folios are then ready
to be sent to the machines where the data will
be transformed to punch-cards, preparatory to
subsequent machine tabulation. It is from the
mass totals produced by these machines that
the many statistical tables are prepared which
finally become the formal printed census re-
ports.

A force of nearly 3,000 workers, under the
direction of Fred A. Gosnell, Chief Statistician
in charge, is required at the Philadelphia office
of the Bureau of the Census for this work.
The building provides a waiting room 135 feet wide by 220 feet long.
OVER RIVER, RAILROADS, AND BOULEVARDS, a wide 1100-foot viaduct will carry the highway extension link of Figueroa Street from Tunnel No. 1 of the chain of three tunnels built through Elysian Park in Los Angeles to join North Figueroa Street on the other side of the river valley. The main river span will be 200 feet long. This sketch by Charles Owens is reproduced by courtesy of the Los Angeles Times.

TUNNEL VISTA SHOWING THREE COMPLETED FIGUEROA STREET BORES THROUGH PARK
Los Angeles, California
END BARRIER TO LOS ANGELES TRAFFIC

by Chas. W. Jones

For years the mountains and the Los Angeles River have been a barrier to through traffic on Figueroa Street, one of the main north and south traffic arteries in the City of Los Angeles. This traffic in the past has been forced to take a long circuitous path around the mountain, through the congested business section of the city.

At last, due to the combined efforts of the city, the state, and the Federal government, the engineering dream of breaking through the barrier to secure a direct route for Figueroa Street traffic is about to be realized. The complete program includes a chain of four tunnels,
three of which have already been bored through the mountain, and the fourth is under construction.

As part of this program, the state has recently awarded a half million dollar contract for the construction of a 1000-foot viaduct link starting at the northerly tunnel portal in Elysian Park.

The viaduct will cross above the various tracks of the Southern Pacific Railroad, the tracks of the Los Angeles Railway, the Los Angeles River, and San Fernando Road to join North Figueroa Street, and will also make direct connection with the proposed Arroyo Seco Parkway to South Pasadena and Pasadena, a new route added to the State Highway System by act of the legislature of 1935.

The engineering forces of the state of California and the city of Los Angeles cooperated in designing the viaduct. It will be an imposing structure with a main river span 200 feet long crossing the river at an elevation of some 70 feet above the stream bed. Long spans will cross the railroad tracks on each side of the river. The vehicular roadway will be 44 feet in width and, in addition, there will be sidewalks on each side of the roadway.

This project, which will give employment to many persons, will be financed from Federal funds made available under the 1935 apportionment of Emergency Relief funds. The work will be done under the direct supervision of the state.

Viewing the project from a construction standpoint, some of the major problems will be the building of deep river piers adjacent to the railroad tracks without endangering or interfering with railroad service and the spanning of San Fernando Road without interrupting street car and vehicular traffic. It is proposed to construct the main river pier on the north bank of the Los Angeles River around and over the large Glendale outfall sewer without injuring that structure.

The erection of the unusually long steel plate girder spans, which will arch the tracks and the Los Angeles River will also be an interesting construction problem.

The contract for the viaduct has been awarded to the low bidder on a bid price of $578,420. However, supplemental work to be accomplished by the Southern Pacific Company, in addition to a contingency item, will bring the cost of this project to approximately $678,000. The contract provides for 300 working days in which to complete the viaduct.

The North Figueroa Street road, tunnel and viaduct projects will provide a continuous through artery for traffic to and from the rapidly developing areas across the river at the north, northwest, and northeast of Los Angeles.
THE Oregon State Capitol Reconstruction Commission proposes to hold a competition for the selection of an architect to design and supervise the construction of a Capitol building at Salem, Oregon.

There are to be no specially invited competitors.

The Commission has retained the services of Carl F. Gould, F.A.I.A., of Seattle, Washington, as its technical adviser in the preparation of the program given below.

The attention of competitors is called to the following sections of the Oregon Code, 1930, and Amendments thereto relating to the practice of the profession of architecture in Oregon:

OREGON CODE, 1930

68-306. EXAMINATION—CERTIFICATE OF REGISTRATION—NONRESIDENTS.

(c) Any person who is a registered or certified architect in another state, where the qualifications are equal to those required in this state shall, in the discretion of the board, be entitled to a certificate of registration without examination.

OREGON CODE, 1935, SUPPLEMENT

68-304. UNLAWFUL TO PRACTICE PROFESSION OF ARCHITECTURE WITHOUT OBTAINING CERTIFICATE—CORPORATIONS AND PARTNERSHIPS. In order to safeguard life, health and property, and, to eliminate unnecessary loss and waste in this state, it shall be unlawful for any person to practice the profession of architecture or to assume or use the title of architect, or any title, sign, cards, or device indicating, or tending to indicate, that such person is practicing architecture or is an architect, or to represent in any manner that he is an architect, without first qualifying before the board or obtaining a certificate of registration as provided by this act.

This act shall not be construed to affect or prevent the practice . . . of engineering by a professional engineer duly licensed under the laws of the state, nor apply to any person engaged in architecture or engineering work as an employee of an architect or registered engineer, nor shall it prevent draftsmen, clerks of the work, superintendents and other employees of registered architects and registered professional engineers under provisions of this act, acting under instructions, control or supervision of their employers. Provided that such engineer, person, or persons, designated shall not use the designation architect, architectural or architecture unless licensed under the provisions of this act. . . .

No corporation or stock company shall be entitled to a certificate to practice architecture. . . .

A partnership may engage in the practice of architecture provided a firm name or title is used containing only the name or names of the registered architect or architects of such firm.

All such partnerships when organized or formed and when any change in the personnel of said partnership occurs, whether by withdrawal, addition, resignation or death, shall make and file with the secretary of the board of architectural examiners, a sworn statement giving the names and addresses of all such members.
68-308. REFUSAL TO GRANT AND REVOCATION OF CERTIFICATES—CHARGES—HEARING. 

The state board of architect examiners may refuse to grant or may revoke a certificate of registration to practice architecture in this state upon the following grounds, to wit:

1. The employment of fraud or deception in applying for a certificate of registration or in passing an examination as provided in this act.

2. Upon proof that the holder of such certificate of registration is falsely impersonating a practitioner or former practitioner.

3. That the holder of a certificate is practicing under an assumed, fictitious, or a corporate name contrary to the provisions of this act.

4. Upon proof that the holder of such certificate of registration is guilty of fraud or deceit, or of gross negligence, incompetency or misconduct in the practice of architecture.

5. For the conviction of a crime involving moral turpitude or proof of habitual intemperance, the using of morphine, opium, cocaine or other drugs having similar effect, by the holder of such certificate of registration.

6. Upon proof that the holder of such certificate of registration did willfully evade or try to evade any or all laws, ordinances, codes, regulations governing construction and/or buildings, of the state or counties and cities of this state.

7. Upon proof that the holder of such certificate of registration permitted his seal to be affixed to any plans, specifications or drawings that were not prepared by him, or under his personal supervision, by his regularly employed subordinate or subordinates.

8. Upon proof that the holder of such certificate of registration did receive, unbeknown to the party or parties for whom he is doing work, such rebates, commissions, grants of moneys and/or favors, to which he is not entitled or justified in receiving.

9. Upon proof that the holder of such certificate is practicing contrary to the provisions and requirements of this act.

The state board of architect examiners shall have power to revoke, suspend, or annul the certificate of registration to practice architecture in this state, or an architect, or reprimand, censure or otherwise discipline an architect in accordance with the following provisions and procedure:

Any person may prefer charges against a holder of such certificate of registration to practice architecture. Such charges shall be in writing and sworn to by the complainant and shall be forwarded to the board of architect examiners, which shall act on such charge or charges at their next regular meeting. Any person who is a holder of a certificate of registration, or who is an applicant for a certificate of registration against whom any of the foregoing grounds for revokeing or refusing a certificate of registration is presented to said board with a view of having the board revoke or refuse to grant a certificate of registration, shall be furnished with a copy of the complaint, and shall have a hearing before said board in person, or by attorney, and witnesses may be examined by said board respecting the guilt or innocence of the accused. Said board may prescribe rules and regulations under which applicants for certificates of registration, or persons whose certificates of registration have been revoked may apply.

For assistance in the construction of the Capitol, a Federal public works grant in the sum of $1,125,000 is being made. The grant is made on terms embodied in PWA regulations. A detailed statement regarding these regulations may be obtained from the Oregon PWA authorities, or Alton John Bassett, Secretary of the Capitol Commission, 714 Porter Building, Portland, Oregon.

Definition of Words and Terms

The words "The Act" as used in this program, unless otherwise stated, shall refer to Chapter 74, Oregon Laws, Special Session 1935.

The word "Owner" as used in this program, shall mean the State Capitol Reconstruction Commission, which is the duly authorized body to reconstruct the Oregon State Capitol Building.

Winner: Author of winning design.

Associate: The associate is the Oregon architect or firm of architects with whom the winning architect will be required to associate, if the winner is not an Oregon man.

Architect: Whenever the word "Architect" is used in this program, unless otherwise indicated, it shall include the words "or architects", and the words "or firm or firms of architects," and it shall mean, and include the winning architect, and associate architect, and any and all architects collaborating with any of them.

Conditions of Contract Between 
Architect and Owner

Duties of the Architect

The Winner agrees to make such revision of his competitive scheme as may be necessary to complete the preliminary studies and to provide the drawings and specifications necessary for the conduct of the
work and to obtain the approval of the Owner and the State Director for the P. W. A. These drawings and specifications must be delivered to the State Director of the P. W. A. by September 15, 1936. All such drawings are instruments of service, except the drawings entered for the competition, and remain the property of the architect.

For the purpose of taking bids, the winning architect will be required to furnish 12 complete sets of prints and specifications.

The Winner agrees to prepare the design of the entire building or buildings, and the design of its constructive, its engineering requirements, special or otherwise, decorative work, and fixed equipment, and if further retained by the Owner, its movable furniture, the treatment of its grounds, and to direct the design of the sculptural features and/or mural paintings.

The associate agrees to prepare or advise as to all forms connected with the making of proposals and contracts, to issue all certificates of payment, to keep proper records and generally to discharge the necessary administrative duties connected with the work.

The associate agrees to supervise the execution of all work committed to his control.

The associate agrees to furnish the Owner progress reports from time to time during construction, and a comprehensive report upon the building when complete. Included in this report shall be all guarantees, names of all contractors and sub-contractors, names of all men or firms furnishing materials and their addresses for reference and as might be of value in maintenance of the building.

In consideration of the submission of drawings in this competition, and the mutual promises enumerated in the subjoined "Conditions of Contract between Architect and Owner," the Owner agrees, and each competitor agrees if the award be made in his favor, immediately to enter into a contract containing all the conditions herein following; including the conditions in the agreement between the Winner and the Associate, and until such contract is executed, to be bound by the said conditions.

The duties of the Winner include all of the customary duties of an architect except those specific duties contracted for by the associate.

The Agreement

The agreement into which the winning and associate architect shall be required to enter is substantially as follows:

The adjudged winner of the competition, if not a resident of Oregon, will be required to associate himself with a registered architect residing in the State of Oregon. The associate architect will be selected by the Owner in consultation with the technical adviser from those judged competent and acceptable to the winner and the Public Works Administration State Director.

Article 1. That said winner shall make all sketches, working drawings, details, specifications, etc., called for or required by the contract with the Owner, and shall conduct such conferences and make such inspections of the work as shall be required by said contract, the Owner or by the exigencies of the work, and shall at all times maintain in fact his position as architect under the terms of said contract with the Owner.

Article 2. That said associate shall represent the Winner during his absence from Salem and shall perform for him all the services required in the proper supervision of the work provided for in the contract between the Winner and the Owner.

Article 3. That said associate shall at no time have authority to issue orders to prepare or change drawings or specifications, which shall materially modify those prepared by the Winner, nor shall they in any way supplant said Winner as the architects in any work connected herewith except as otherwise provided in this agreement, or with the consent of the Winner.

Article 4. That the said associate shall at all times keep in close contact with the work, by such personal inspection at least once each week, and within three days of the day on which certificates are issued, as hereafter provided; shall be subject at all times to calls from the Owner for conferences as representing the Winner, and shall keep the Winner advised as to the progress of the work by a written report at least once every two weeks.

Article 5. That said associate shall pay at his own expense for all telephone and telegraph charges, stationery, postage, clerical and other office expense, in Salem or elsewhere in Oregon, incidental to the proper performance of this agreement, and said winner shall pay at his own expense all similar expenses from his own office.

Article 6. That said associate shall, in the absence of the winner have full authority in the direction of the work as representative of the winner to the degree herein provided, and all orders or directions issued by said winner shall be issued through the said associate.
Article 7. That said associate shall direct the taking of bids and make his report and recommendations to the owner, and shall receive all applications for payments from the contractors, shall properly check same and shall issue certificates for payments to the contractors on behalf of the winner as provided for by the contracts.

Article 8. That, in consideration of and conditioned upon the faithful performance by the said associate of the duties provided for in this agreement, the said winner agrees to pay to the said associate two percent of the cost of the work, which sum shall be computed by deducting one-third of the architectural fees that are paid to the winner, except that the winner and associate shall share the cost of the mechanical engineering work, in the proportion of two to one, which work shall be based on 11/2% of its cost.

Article 9. That all payments to both the winner and to the associate shall be made at the same time as provided elsewhere in this program conditioned only upon the progress of the work, but not conditioned upon the work of the other; and that these payments shall be made directly from the Owner to each of the parties hereto.

Article 10. This agreement shall at all times be subject to cancellation upon direction of the Owner, and upon reasonable notice. Upon such cancellation the complete records and files of the party or parties whose services are to be terminated shall be turned over to the Owner. Such cancellation shall take place only should the architect in the judgment of the Owner prove incompetent, and after his having received equitable compensation for all work performed up to time of removal.

Article 11. This agreement pertains to the work connected with the construction of the Capitol building at Salem, and to no other work whatsoever.

Article 12. It is understood and agreed by the parties hereto that the work forming the subject matter of this contract is being financed in part by the Federal Emergency Administration of Public Works of the United States of America, and is subject to all of the rules and regulations issued by it, governing construction work and the matter and method of keeping thereof. And the parties hereto agree to assume that part of this expense, which by its nature attaches itself to that share of the work undertaken by each of the parties hereto.

Duties of Owner

Payment

The Owner agrees to pay the architect for his services, which include the necessary engineering services for heating, ventilating, and electric work, a sum equal to six (6) per cent of the cost of the completed work that comes under his supervision, as evidenced by the contractor's certificates issued, to be divided between the winner and associate in accordance with articles 8 and 9 of their agreement.

The owner further agrees to reimburse the architect the cost of transportation and living incurred by him while in the discharge of duties connected with the work, an amount not to exceed $5000.00. Such traveling expenses shall be incurred only as authorized by the Owner.

The times and amounts of payments to the architect shall be as follows:

- Upon the announcement of the award by the Owner, the Winner will receive 1/10 of the total commission.
- Upon the Owner's approval of preliminary sketches, 1/10 additional.
- Upon completion of the working drawings, 2/10 additional.
- Upon P. W. A. approval of working drawings, 2/10 additional.

The remainder of the fee as determined by the amounts of the certificates of payment for work performed issued to the contractor.

All sets of prints and specifications that may be necessary over and above the 12 sets furnished by the Winner will be paid for by the Owner at actual cost.

The Owner reserves the right to require the Winner to furnish a plaster model of the proposed building; the actual cost of which will be paid for by the Owner.

Information, Clerk of the Works

The Owner agrees to furnish all information as to requirements; to pay for all necessary surveys, borings and tests, and, after the building contracts have been awarded, for the continuous service of a clerk of the works of approved competence whose selection shall be agreed upon mutually by Owner and Architect and whose duties are subject to the direction of the Architect.

Reports made by the clerk of the works shall be made in duplicate, one copy to be furnished to the Owner and one copy to the Architect.

Awards

The Owner has authorized, and agrees to make the following awards:

First Award: To the author of the winning design, the architectural commission.

THE ARCHITECT AND ENGINEER
Five additional awards: To the authors of the next five most meritorious designs, the sum of $1500.00 each.

The order for payment of the awards will be made by the Owner within 20 days after the decision of the judges has been announced.

After the award is made to the winner, a complete list of competitors will be sent to each competitor, together with the report of the jury.

Communications

Provision for Anonymity During Progress of the Competition

Mandatory

Questions must be made anonymously to the technical adviser, who will answer by simultaneous bulletins to all competitors, and these bulletins shall become part of the program. It is left to the discretion of the technical adviser to determine the pertinence of questions, and the necessity for a reply.

No competitor shall communicate — orally or in writing — with the Owner, the executive committee, or the jury, nor with the technical adviser except by question submitted anonymously through the Owner’s secretary.

Provision for Date After Which No Questions Will be Answered

Mandatory

No communications will be answered that are received after April 10, 1936.

Anonymity of Drawings

Mandatory

The drawings to be submitted shall bear no name or mark which could serve as a means of identification, nor shall any such name or mark appear upon the wrappings of the drawings, nor shall any competitor directly or indirectly reveal the identity of his design, or hold communication regarding the competition with the owner, nor with the jury, nor with the technical adviser, except as provided for under “COMMUNICATIONS,” above.

It is understood that in submitting a design, each competitor thereby affirms that he has complied with the foregoing provisions in regard to anonymity and agrees that any violation of them renders null and void this agreement and any agreement arising from it.

Method of Submitting Drawings

Mandatory

Accompanying each set of drawings shall be a sealed, opaque, white envelope, 4”x9½”, without name or marking, enclosed within the package, containing the name and address of the competing architect.

The technical adviser will open the package of drawings in the presence of the Chief Justice of the Oregon Supreme Court, and will place a number upon each of the drawings and a similar number upon the blank envelope. The envelope will be deposited in safekeeping until opened by the technical adviser in the presence of the jury and the Owner, after the selection for the award has been made by the jury.

Credentials of Competitors

Mandatory

There shall be contained in each set of drawings a sealed package wrapped in white, opaque paper with no marking of any kind upon it, which will be marked for identification by the technical adviser, and will not be opened until the envelope containing the author’s name is opened. This package must contain the following:

1. The competitor’s name and address.
2. A statement that he is a citizen of the United States.
3. A statement that he is an architect registered in his own state or by the National Council of Architects Registration Board.
4. A statement that the drawings were made in his office and that he affirms the authorship is his.
5. A statement concerning his education, offices he has worked in, and how many years he has been in practice.
6. List of three projects of some magnitude executed under his direction, to show capabilities for preparing working drawings.
7. Photostatic copies of two (2) sheets from signed contract plans of buildings executed under his direction and two (2) photos of executed buildings.
8. A statement that in submitting drawings for this competition the competitor agrees to abide by all the provisions and rulings that are made or implied in this program and as may be interpreted by the technical adviser.

Should an architect, wishing to enter this competition, realize he may not qualify under the above “Credentials of Competition,” he may, provided he
is a registered architect, associate himself with one who does so qualify.

The competitor must declare his intention of entering the competition before April 10th, 1936, and any association made at that time must remain in force as to the winner until completion of building.

Examination of Design and Award

After the competition has closed, the technical adviser will open the packages as provided, and will examine the designs to ascertain whether they comply with the mandatory requirements of the program, and will report to the jury any instance of failure to comply with these mandatory requirements, but shall convey no information to the jury that might prejudice its independent judgment.

The Owner agrees that the jury will satisfy itself of the accuracy of the report of the technical adviser, and will place out of competition and make no award to any design which does not comply with these mandatory requirements. The jury will carefully study the program and any modifications thereof, which may have been made through communications, and will then consider the remaining designs, holding at least two sessions on separate days, and considering at each session all the drawings in competition, and will make the awards, by secret ballot, and by majority vote.

In making the award the jury will thereby affirm that it has made no effort to learn the identity of the various competitors, and that it has remained in ignorance of such identity until after the award was made.

Date and Place of Receiving
and Time Allowed

Mandatory

All packages containing drawings entered in this competition must be received at the office of, and be addressed to Arthur S. Benson, Clerk of the Supreme Court of Oregon, Salem, Oregon, on or before the 22nd day of May, 1936. These packages shall be secured in ordinary detail paper, sealed with plain wax, and shall bear no marks, save the above address, and shall be delivered by an express company, and in no other way. All drawings except those receiving awards will be returned to their authors within ten days after the date of the award, the Owner assuming no responsibility in case of loss or damage in transit or otherwise. Those designs receiving awards will be returned in similar manner after the close of the public exhibition. The drawings of the winner shall be retained. The awards are to be made on or before May 28, 1936. In making the awards the jury shall indicate an order of choice from first to sixth but shall not make this decision public unless a condition arises as suggested in second paragraph of Authority of Jury below, and then only to the technical adviser.

Jury

The Jury shall consist of two architects, neither of whom shall be a resident of Oregon, two members of the commission, and one outstanding layman from Oregon. The professional members of the Jury shall be men of recognized standing. The names of the jurors will not be announced prior to the award.

Method of Selection

The Jury is to be selected by the owner. The technical adviser is not a member of the Jury. The architectural members of the Jury are to be selected by the Owner from a list of names submitted by the technical adviser. The Jury, two members of which will come from states other than Oregon, will convene on the 25th day of May, 1936, at 9:00 a.m.

Authority of Jury

The Jury after viewing the drawings, and having satisfied itself after advice by the technical adviser that they conform to the mandatory provisions of the competition, will deliberate until a conclusion is reached by a majority. It will then prepare a written report containing the verdict. The report of the Jury shall be made public and the decision will be announced by the owner.

If upon examination of the competitor's credentials by the technical adviser, it is his opinion that the author of the design selected by the Jury has not shown that he has the requisite experience, the matter shall be referred to the Owner for decision, and the competitor's plan in question, will be designated as "qualified" or "not qualified," according to the decision of the Capitol Building Commission.

If the decision of the owner is that the competitor is not qualified, the credentials of the competitor placed second shall be examined and the award made to him if qualified. This procedure shall be followed in order of award until a qualified architect is named.

The opening of the envelope containing the name of the author of the selected design will automatically close the contract between him and the Owner, subject to his qualifications and to the correctness of the representations made by the competitor.

The Site

The site available for the Capitol building is the property owned by the state, as described in section 6 of the act, and as shown upon the site plan which is inserted in the official program. Under the present law the commission can only consider this particular
property as available for the construction of the Capitol building.

The power plant shown on the site plan is built underground and will remain in use to serve the Capitol building. The Capitol building shall be designed to make use of this heating plant.

The State Office building, the Supreme Court building, and the Agriculture building shown upon the site plan are owned by the state and located on state property. However, these buildings need not influence the architectural style or treatment of the site of the main Capitol building.

In developing the plan lay-out, it is suggested that Summer Street be considered as the axial approach to the Capitol building. It is possible that the state will ultimately acquire the half-blocks or full blocks on each side of Summer Street, extending a block or more to the north of Court Street. Competitors may assume that this additional property will be acquired, and at their discretion may include other state buildings in the group lay-out. At least one other building must be shown, namely, a State Library building with approximately 20,000 square feet ground floor area. Other possible future structures include an additional State Office building, a building for storage of archives, and a state museum.

The trees which are apparent from the air-view of the site in the official program, are of mature growth, giving character and adding to the beauty of the Capitol grounds and Willson park. As many of these trees should be preserved as possible.

In preparing and submitting drawings, the entire site including Willson park may be assumed as level.

Cost

Mandatory

For the purpose of this Competition the cost of the building is to be figured at 80c per cubic foot, and the total thereof, figured on this basis, shall not exceed $2,200,000. This sum shall include architect's fees, but shall not include the cost of furniture and furnishings.

Material

The building shall be of fire-resisting material and constructed according to the best practice. All materials are to be of the best quality, with preference given to the use of materials that are manufactured or can be procured in the state of Oregon. Material to be used for the facing of the exterior of the building shall be left to the discretion of the competitors.

Cubage

Mandatory

Cubage shall be so computed as to show as exactly as possible the actual volume of the building, calculated from the finished level or levels of the lowest floor to the highest point of the roofs, and contained within the outside surface of the walls.

The actual volume of all architectural features adding to the bulk of the building, shall be included in computing the cubage. Light walls of an area of less than 400 square feet shall not be deducted. One-half of the volume of porticos with free-standing supports, if any, and other similar projections, shall be taken. Minor extraneous projections constituting features of exterior design shall not be included.

In calculating cubage, account shall be taken of variations in the exterior wall surface, as, for example, the projection of a basement story beyond the general line of the building.

A cube diagram on tracing cloth, showing method adopted in cubing shall accompany each set of drawings. This diagram shall show in plan the wall face at the main story, and shall scale accurately, with principal dimensions figured. A tabulation showing how the cube was obtained shall appear on the cube diagram.

Design

There shall be no descriptive matter accompanying the design.

The competitor may accent the traditional, the more functional or modern, or he may combine their influence in his design. An outstanding solution is desired and one that will be looked upon now, and hereafter, with an ever awakening interest by the people of the State of Oregon.

Drawings to be Furnished

Mandatory

A. Block plan showing the location and relationship of the described buildings and their surroundings as shown on the city plan, at scale of 1/64” equals one (1) foot.

B. Plans of all floors, including basement, at scale of 1/16” equals one (1) foot.

C. Front elevation, scale at 1/16” equals one (1) foot.

D. Side elevation 1/16”.

E. One longitudinal section, scale at 1/16” equals one (1) foot.

The elevation shall be rendered in monochrome. The floor plans shall show where the solids are cut filled in full black. Fixed furniture only shall be shown, and no elaboration of corridors or hall floors permitted. The section will not be rendered except a wash where the solids are cut.

The names of the various parts of the plans shall be lettered in a single-line block letter and each room
shall have its total floor area and dimensions marked in figures.

Each drawing shall have the inscription, "Oregon State Capitol Competition" and subtitile specifying the subject of the drawing and the scale to which it is drawn. There shall be no other notes or descriptive matter shown on the drawings.

All lettering shall be a single line. All drawings shall be upon white mounting board. Sheets of any one competitor shall be of a uniform size. Each sheet shall have a plain border of a single line only—this border to show a uniform margin of one-half (1/2") inch.

Accommodations Required

The various departments of the State Government will require rooms and space in the locations and of the approximate sizes indicated on the schedule following. The size requirements stated in the schedule may be varied to the extent of not more than ten per cent above or below the figures given.

The setting aside of extra space, marked "unassigned" for the use of minor departments, will not be prejudicial in the judgment of the drawings, provided that the total cubage limit is not exceeded.

The size and arrangement of toilet facilities, cloak rooms, storage rooms, etc., are left to the discretion of the designer, unless specifically scheduled.

The amount of space devoted to non-essential uses shall be reduced to a minimum, consistent with the monumental character of the building, and the necessity for providing adequate circulation.

Wherever storage space is located on a different level from the office space it serves, a private connecting stairway is desirable.

- Two Vaults (total): 250
- Storage (may be in basement): 850
- **Total Office Space**: 1,100
- **Toilets, etc. Location**: Near Governor, Secretary of State and State Treasurer

(F) Board of Control:
- Reception Lobby: 520
- Secretary's office: 4,500
- Meeting room (see requirements for Governor): 1,500
- **Total Office Space**: 5,440
- Storage (may be in basement): 1,040
- **Total Office Space**: 6,480
- **Toilets, etc. Location**: Near Governor, Secretary of State and State Treasurer

(G) State Land Board:
- Lobby: 300
- Main Work room: 1,200
- Private office: 200
- Conference rooms (2 6' x 200): 1,000
- **Total Office Space**: 2,100
- File Room (may be in basement): 500
- **Total Office Space**: 2,600
- **Toilets, etc. Location**: Near Governor, Secretary of State and State Treasurer

3. Miscellaneous:
- Cafeteria and Kitchen: 3,000
- Barber Shop: 500
- Press room: Building Superintendent and storage: 500
- **Ample provision for ventilating equipment and elevator service is required**.
LEADERS of the building industry who recently participated in a nation-wide radio forum all agreed that the biggest job confronting the building industry is stimulating the desire for home ownership.

Selling the idea of home ownership to the American people has been the biggest job of the industry for the past few years. The drop in home construction to one-tenth the average yearly building program of the years before the depression, made the solving of the problem essential. Until residence construction again approaches the volume of the pre-depression era, it is asserted, the building and heavy goods industries will lay dormant and general business recovery remain uncertain.

It was vitally necessary for the American people to begin that long deferred residence building program. Attempts were made during the past few years by various groups of the building industry to persuade the prospective home owner to take action. But not until 1935 was much headway made in this up-stream fight to revive residence building.

In 1935 the efforts of the building industry, in the discouraging struggle up-stream against the current of apathy brought on by the depression, received strong assistance from the Government, which made the going easier. The Federal Housing Administration’s program for increased residence building was put in operation in the closing month of 1934.

By March 1935 the leading institutions had analyzed the plan and the necessary machinery for its operation had been set up, with the result that $4,772,728 of mortgages were accepted for insurance that month by the Housing Administration. From then on the amount of insured mortgages written by the lending institutions steadily increased until in the latter months of 1935 insured mortgages were being written at the rate of a million dollars a day. During the off season building month of January this year, $21,337,926 worth of mortgages were insured by the Federal Housing Administration.

Since the start of the Mutual Mortgage Insurance Plan the proportion of new residential building financed under the plan has steadily risen until it has reached 37.2 per cent of the estimated residential construction in the United States.

Since all of this new residence construction is being paid for out of private funds, there is no good reason why every man in the building industry should not get back of this movement to assure the continuance of sound, constructive stimulation of residence building. Building authorities agree that home construction will not assume its rightful place of leadership in the rehabilitation of the building industry until all branches of that industry act as a co-ordinating force to sell more and better homes.

The recognition of that fact by the industry may be a long forward step towards the realization of the purpose. But unless every person connected with the building industry regards himself as a working part of that co-ordinating force and puts all his energy back of the movement, complete success will be delayed.

To make this co-ordinating force effective, each individual connected with the building industry should approach his acquaintances, and look up others, who are or should be potential home owners. They should educate these prospects to the value of a home investment, and also clear up any doubts in their minds as to the manner of financing the construction of a new residence.

Progress in construction and improvements in methods of financing home construction have provided the industry with sound arguments to prove that any reputable man with a decent job can buy or build a home, if he has saved 20 per cent of its cost and has an income that warrants him to support a family according to American standards of living.

Those reasons are:

1—The general improvement of business conditions has made his job more certain.

2—The improvement of the mortgage market has made funds available for home building at rates lower than formerly obtained.

3—The establishment of the Mutual Mortgage Insurance Plan of the Federal Housing Administration corrects the faults of the old short term mortgage system with its first and second mortgages and their expensive renewal charges. It is based upon a single mortgage system which gives full security to the borrower as well as to the lender. Eighty per cent of the appraised value of the home (including house and lot) may be loaned on one mortgage up to a limit of $16,000. The amount of the down payment is reduced to a minimum of 20 per cent of the appraised value.

4—Under this Single Mortgage System, the borrower can pay off the mortgage in monthly installments which include that month’s interest on the money borrowed, a portion of the principal, and installments on each year’s taxes and each year’s insurance premium. Thus over a given period—anywhere up to 20 years—the entire amount of the mortgage is paid off and the home is free of all debt.

5—At no time during the repayment of this type of insured mortgage will the owner be faced with the necessity of renewing the mortgage. No longer will lump-sum payments for taxes, premiums or interest come as an unpleasant shock to the budget.
6—There is a degree of safety in building a home financed under the Single Mortgage System that was lacking under the old system. The property standards laid down by the Federal Housing Administration assure the home builder of a secure deal. In its insuring offices competent men, trained in the technique of architectural design, construction methods, valuation procedure and subdivision analysis, will protect the home builder's interests in regard to the design of his house, the quality of material, the workmanship, the price and the location.

Those reasons are fundamental arguments in favor of home ownership upon which the industry can well base its sales efforts.

---

**ORIGIN OF NAMES OF CALIFORNIA COUNTIES**

This is the sixth article in the series giving derivation of the names of California counties:

**MARIPOSA COUNTY**—Created February 18, 1850. One of the original twenty-seven counties of the state. The county took its name from the Mariposa river. The meaning of 'Mariposa' in Spanish is 'butterfly.' There is some doubt as to how this stream derived its name. According to one story, in June, 1807, a party of Californians from the San Joaquin Valley made one of their annual excursions into the Sierra Nevada mountains for the purpose of hunting elk. Camping upon the banks of a river, they were charmed and delighted with the butterflies of most variegated and gorgeous colors that hovered around them in countless numbers, and because of this they gave to the stream the name "Mariposa." Another beautiful story, and probably more authentic, is that the first explorers in the mountains of that region beheld for the first time a pretty lily growing everywhere, gay-colored and spotted and in some respects resembling the wings of a butterfly. In their admiration, they gave to this dainty flower, the Calochortus, the name of Mariposa [butterfly] lily.

Mariposa is known as the "Mother of Counties" because it once comprised one-seventh of California's area. Here is the world-famous Yosemite Valley. The county embraces magnificent mountains, extensive forests, flower-strewn mountain meadows, cool canyons and sparkling streams. It is host to a greater number of tourists than any other county.

Not only is the scenery unsurpassed, but large ranches produce fine strains of hogs, sheep and cattle, grain and hay, mountain vegetables and fruits, and mining plays an important part in the industrial life and wealth of Mariposa. The old Mariposa mine has produced more than $7,000,000 in gold and the Princeton mine, $5,000,000. Ore in the Spread Eagle runs about $10,000 to the ton. Here is the great Esquecher Dam, 350 feet high, 960 feet long, with a carrying capacity of 75,000 second-feet and backing the waters of Merced River up for 12 miles. Population: 3233. Area: 1463 square miles.

**MENDOCINO COUNTY**—One of the original twenty-seven counties of California. The county derived its name from Cape Mendocino, which was discovered and named by Juan Rodriguez Cabrillo in 1542, and named for Don Antonio de Mendoza, the first Vicerey of New Spain, or Mexico, appointed by the King of Spain in 1535.

Magnificent Mendocino, in the Redwood Empire, is noted as a paradise for the tourist, vacationist and sportsman. In the empire as a whole are nearly 2000 miles of trout streams, many miles of ocean and surf fishing and game in abundance. Approximately 97 per cent of the world's redwoods are here, and the Redwood Highway through the county has the company of these giant trees for 100 miles. Salmon caught in the coast waters are shipped to all parts of the world.

Lumbering and commercial fisheries are Mendocino's principal industries. Ukiah, Potter, Round and Little Lake valleys are among the most productive agricultural areas in the state. Mendocino ranks fifth in the production of apples, sixth in pears, thirteenth in plums and prunes and tenth in juice grapes. Principal industries on the coast are lumbering, stock-raising, dairying, fruit raising, general farming and fishing. The Union Lumber Company at Fort Bragg is the third largest manufacturer of redwood lumber in the world. Population: 23,505. Area: 3539 square miles. (Next month—Merced, Modoc, etc.)

---

**BOOK REVIEWS**

**THE ENGLISH COUNTRY HOUSE**—by Ralph Dutton; Foreword by Osbert Sitwell; Charles Scribner's Sons, New York; Price:—$2.75.

A very attractive book, containing some historical facts concerning its subject matter, and several superlative illustrations.

To the architect whose interests are particularly in connection with residence work, and to whom house architecture is paramount, this book will be a more than welcome addition to his library.

The end-papers are of special interest and are of a type not usually seen in the general run of books of this type.

**ARCHITECTURAL DRAWING AND DETAILING**—by J. Ralph Dabezil; and James McKinney; Published by the American Technical Society, Chicago; Price:—$2.00.

A nicely arranged little manual, devoted to reference, general practice and technique. The chapters are grouped under such headings as Architectural Drawing: Architectural Detailing; Rendering In Pen and Ink; Landscaping.

THE ARCHITECT AND ENGINEER
With the Architects

ROOS BROS. IMPROVEMENTS
A. R. Williams, architect, Mercedes Building, San Francisco, has recently returned from the East where he went to gather information and ideas to be used in connection with extensive interior improvements to Roos Brothers' stores in California. The largest project will be extensions to the Market Street store of the firm in San Francisco. A portion of the first, second and third floors of the Phelan Building have been leased and the ground floor will be arranged for merchandise display while the second and third floors will be used by the executive and service departments. Plans for the exterior treatment of the building are being prepared by Bliss & Fairweather.

SAN FRANCISCO THEATER
The first new theater to be constructed in San Francisco for some time is being designed by John H. Ahnden, architect, 822-39th Avenue, San Francisco, for Messrs. Sbarboro & H. L. Tefjen. The new playhouse will be located on Chestnut Street, near Scott, San Francisco, and will cost between $75,000 and $100,000. L. H. Niskian is the structural engineer. Mr. Niskian is also the structural engineer for extensive alterations to the Capital Theater in Sacramento.

CHICO HOSPITAL
Messrs. Cole & Brouchard, of Chico, have completed working drawings for a $75,000 frame hospital building in Chico for the Enloe Hospital Association. W. Adrian is the structural engineer. Mr. Adrian is also doing the engineering work for a Class C store building on Grand Avenue, Oakland, Noble & Archie T. Newsom, architects, and a reinforced concrete gymnasium in Nevada City, William Mooser, architect.

MARIO CORBETT BUSY
New work in the office of Mario Corbett, Benjamin Franklin Hotel, San Mateo, includes a two-story duplex residence in San Francisco for Mr. and Mrs. A. V. Graefls; a Colonial house in Hillsborough to cost $10,000 and some remodeling of the ground floor of the Mercantile Building, Market Street, San Francisco, for the Sterling Furniture Company.

APARTMENT BUILDING
R. R. Irvine, 3431 Market Street, San Francisco, has completed plans for a 3-story frame and stucco apartment house on Divisadero Street, south of Marina Boulevard, San Francisco; also a three-story frame apartment building at Broderick and Francisco Streets, San Francisco, both for Ben Liebman. The total cost of the improvements is estimated at $110,000.

EL CAPITAN HOTEL ADDITION
Scheduled to be completed by July 15, reconstruction of El Capitan Hotel and the erection of a new store building at the corner of 17th and M Streets in Merced, will begin within a month.

The new hotel will be four stories in height, will contain 33 rooms with baths and showers. It has been leased for ten years to John A. Robinson, Jr., operator of the Maze Hotel, who will operate both properties.

The lobby will be floored in tile, and in an inside patio will be a fountain. Air conditioning will be a feature of the hotel. Kent and Hass are the architects.

MILLER AND WARNECKE BUSY
Miller and Warnecke, architects in the Financial Center Building, Oakland, have been exceptionally busy since the first of the year. Scarcely a week has passed that they have not sent out plans for one or more new projects. During the present month plans have been completed and bids taken for a $20,000 frame apartment house in Oakmore Highlands for Dr. Leon R. Dupuitch and a California Colonial brick veneer residence in Claremont Pines, Oakland, for Mr. and Mrs. George Harlow.

TO PREPARE SCHOOL PLANS
George Klinkhardt, formerly with Henry H. Meyers and now in the drafting department of the Oakland Board of Education, has been commissioned to prepare plans for a new unit to the Roosevelt School at San Leandro, estimated to cost $60,000. There will be eight classrooms and an auditorium. H. J. Brunner is the structural engineer.

SAN FRANCISCO RESIDENCE
Plans have been completed by W. W. Wurster and a contract has been let to Lindgren & Swinerton, Inc., for a splendid new home for Mortimer Fleishhacker at Pacific Avenue and Pierce Street, San Francisco. It is estimated the improvements will cost in the neighborhood of $40,000.

ARCHITECT IN NEW OFFICES
Frederick H. Meyer has moved his offices from the Underwood Building to a roof studio in the Kohl Building, San Francisco. The new quarters of Mr. Meyer are not only conveniently located but afford splendid light and a fine view of the city and bay. Plenty of inspiration for the drafting force.

MARCH, 1936
EXPOSITION BUILDING

Architectural drawings and specifications of the $150,000 Administration Building for the 1939 World's Fair have been completed and a construction contract has been awarded to Lindgren & Swinerton. The three story building will occupy the southeast corner of Bush and Stockton Streets, San Francisco, and will serve as the headquarters of the Exposition Company, now located in the Financial Center Building.

Architecture of the building, designed by William P. Day, Director of Works for the Exposition, is neo-classic with a modern influence. The general color of the building will be a light tan beige with the sash tinted a light emerald green. Modern illuminating effects will be provided to bring out the beauty of the Bush Street facade which includes a colonnade of cast stone.

NEW MEMBERS OF STATE BOARD

Governor Merriam has made a number of long deferred appointments on the California State Board of Architectural Examiners, Northern and Southern Divisions. The appointments are as follows:

Northern District: C. J. Ryland, Monterey, incumbent, term ending 1939; Harry J. Devine, Sacramento, incumbent, term ending 1939; Arthur H. Memmler, Berkeley, succeeding Chas. F. Roeth, Oakland, term ending 1940; W. C. Perry, Berkeley, incumbent, term ending 1940.

Southern District: Harold Burket, Ventura, incumbent, term ending 1939; Harold C. Chambers, Los Angeles, incumbent, term ending 1939; G. Stanley Wilson, Riverside, incumbent, term ending 1940.

Board of Registration for Civil Engineers: Henry R. Dewell, San Francisco, incumbent for term ending 1939.

NEW ARCHITECTURAL FIRM

Under the firm name of Smith, Carroll and Johanson, a partnership for the performance of architectural service was recently formed by Frank M. Smith Jr., Theodore B. Carroll and Perry Johanson with office at 4512 University Way, Seattle. Mr. Carroll graduated from the School of Architecture, University of Washington, several years ago, and recently passed the Washington state professional examination, and was issued a license to practice.

OAKLAND STORE BUILDING

A contract has been awarded by Williams and Wastell, of Oakland, for the construction of a Class C reinforced concrete store building on Grand Avenue, Oakland, for J. W. & L. E. Dinsmore. Contract price was $12,000.

PIEDMONT RESIDENCE

Frederick H. Reimers, 233 Post Street, San Francisco, has completed plans and awarded contract for a $35,000 California Colonial residence in Piedmont for Mr. Captoin.

PORTLAND CHAPTER COMMITTEES

Committees to handle Chapter activities for the 1936 season are announced by President Aandahl of the Oregon Chapter as follows:

City and Regional Planning: Harrison A. Whitney, chairman; Pietro Belluschi, Hollis Johnston and Folger Johnson.

Public Information: Roi Morin, chairman; Harold D. Marsh, George H. Jones and Glen Stanton.

Education: Glenn Stanton, chairman; Roscoe Hemenway, Ernest Tucker and W. R. B. Willcox.

Legislation: Walter E. Church, chairman; Leslie D. Howell, Francis Jacobberger and Clifford Claussen.

Entertainment: Harold W. Doty, chairman; Francis Jacobberger, Roi Morin, Clarence Wicks and Thayne Logan.

Public Works: Jamieson Parker, chairman; Ormond R. Bean, Hollis Johnston and David L. Foulkes.

Exhibition: Herman Brookman, chairman; Margaret Fritsch, John R. Dukehart, Abbott Lawrence and Wyman K. Bear.

Special Committee on Honor Award: Roi Morin, chairman; Fred Aandahl, Herman Brookman, Harold W. Doty and Jamieson Parker.

OREGON CAPITOL COMPETITION

An architectural competition to select plans for the new Oregon State Capitol will close May 22 under a schedule adopted tentatively by the State Commission in charge of rebuilding the Capitol. The jury will make the award on or before May 29. Final plans are to be submitted by Sept. 15.

Two architects, not residents of Oregon, two capital commissioners and one layman will compose the jury. Their identity will not be disclosed prior to the award.

Cost of the capital has been set at $2,200,000, and architects will be instructed to give preference to Oregon materials and products.

A fee of 4 percent will be paid the architect who designs the $2,200,000 building, if he resides outside the state. If a non-resident architect is selected he must have an associate in Oregon, who will be paid an additional fee of 2 percent. The non-resident architect will be allowed $5,000 for traveling expenses in addition to his fee. Architect Carl F. Gould of Seattle is the technical advisor.

THE ARCHITECT AND ENGINEER
STRUCTURAL ENGINEERS ACTIVE
The Structural Engineers Association of Northern California has recently held two meetings of exceptional interest to the members and invited guests, with large attendances at both affairs.

The Golden Gate Bridge was the subject of an interesting talk by A. F. McLaner, at the February 11th meeting of the Association in the Engineers’ Club, 206 Sansome Street, San Francisco. The speaker exhibited a number of views of the bridge and answered questions in regard to the progress work.

On March 17 the Association met in Oakland, joining with the East Bay structural engineers in a day of sight seeing and good things to eat. After a visit to the East Bay terminals of the San Francisco-Oakland Bay Bridge the members and guests viewed some elaborate tests of steel sections of the Bay Bridge at the University of California laboratory. Later in the day a general meeting was held at which short addresses were made by Oakland city officials and officers of the Engineers’ Association.

At 6:30 o’clock dinner was enjoyed at the Hotel Oakland. The committee in charge of the affair consisted of B. J. Osborne, Prof. C. F. Wiskocil, Prof. R. E. Davis, W. Adrian, A. W. Anderson, M. P. Kitchel, E. H. F. Frisell, W. G. Corlett, H. A. Cox and V. R. Sander. Wm. H. Popert was chairman of the publicity committee.

John B. Leonard has been named president and W. Adrian vice-president of the Association for 1936. The directors are Wm. H. Popert, Jesse Rosenwald and John J. Gould.

ENGINEERS RECEIVE PERMITS
The California State Board of Registration for Civil Engineers, at its meeting held in Los Angeles, March 4, issued certificates of registration to

Authority to use the title “structural engineer” was granted to Hunley Abbot, New York City; Ernest Hillman, Los Angeles; Peter A. Horn, Los Angeles.

The Board approved for examination in Civil Engineering Design and Construction, the following applicants:

Spencer W. Lowden, Bishop; J. E. Griffiths, Whittier; Bruce M. Dack, Los Angeles; C. K. Wells, Long Beach; Richard N. Thomas, Arcadia; S. A. Soderstrand, Oakland.

The following applicants for land surveyor’s licenses were approved for examination:

Russell W. Cummins, Mina; Norman B. Bailiff, San Francisco; D. D. Hillyard, Santa Ana; Takeo Shikamura, Mountain View.

SAN FRANCISCO ARCHITECTURAL CLUB
The February meeting of the San Francisco Architectural Club was unusually well attended. President Walter Clifford presided. The following committees were appointed for the ensuing year: Class, Albert W. Kahl; Entertainment, Walter Ruppell; House and Refreshments, Walter Kuhn; Finance, Waldon B. Rue; Membership and Reception, Otto G. Hintermann; Library, Leo S. Daly; Exhibitions, Leland Hyde and Harold Wagner; Constitution and By-Laws, Ira Springer. The feature of the February meeting was an interesting lecture by Clifford Nelson of the San Francisco Recreation Commission, illustrated with technicolor movies.

The club participated in the Cambodian Ball, given by the San Francisco Art Association on January 17. The club group, 180 strong, represented “Tonkin China.” Walter Ruppell and his able assistants, who worked hard for several weeks prior to the ball making “props” and scenic effects, are to be complimented on the success of the club’s participation.

The new Atelier season opened auspiciously with ten members taking the esquisse for the “Sierra Nevada Club” project. This season, the Atelier is collaborating with the School of Architecture at the University of California in the problems of that school. Judges will be chosen for each problem from members of the Northern California Chapter, A.I.A. Messers. Mario J. Ciampi and Preston Ames are the Atelier patrons.

A new class, under the direction of Irving F. Morrow, architect, has been formed to thoroughly imbue the new Atelier students in the rudiments of Architectural Design, History and Composition.

Officers and directors of the club are as follows: President, Walter C. Clifford; Vice-President, H. Walter Ruppell; Secretary, Richard E. Audsley; Treasurer, A. N. Granish; Directors, A. L. Kahl, Charles Conti, Ira Springer; Trustees, Harry C. Nye, Waldon B. Rue, Otto G. Hintermann.—R. E. A.

VALLEJO ELKS BUILDING
Construction of a new building to replace the one burned some time ago will be commenced this year by the Elks’ Hall Association of Vallejo. The new structure will occupy the site of the old structure at Georgia and Sonoma Streets, Vallejo.

IN NEW LOCATION
The Association For Advancement of Home Building has moved from the Architects’ Building to the Exhibition Hall of the Los Angeles Chamber of Commerce, where it will maintain an Architects’ Exhibit and complete building information center.

TEMPERATURE CONTROL
COCKTAIL LOUNGE IN HOTEL PORTAGE, AKRON, OHIO, SHOWING RUBBER MURALS, TIRE CHANDELERS, RUBBERIZED UPHOLSTERING, ETC.

RUBBER MURAL DEPICTING THE SCIENCE AND RESEARCH OF THE RUBBER INDUSTRY, HOTEL PORTAGE, AKRON, OHIO
UNIQUE COCKTAIL LOUNGE
Murals and Fittings all of Rubber

RUBBER, long recognized as one of the basic commodities contributing to the advancement of civilization, has made its entrance into the field of fine arts, as a result of its use in a group of historic and classic murals which decorate the walls of the rubber room in the Hotel Portage, Akron, Ohio.

The idea of producing murals in various colors of compounded rubber is believed to be original with S. R. Real, proprietor of the Portage.

Mr. Real employed the facilities of the Goodyear Tire & Rubber Co., to produce the rubber which was made in large sheets of the same compound used in high grade rubber flooring. The murals, depicting the rubber industry from plantation through factory operations, are the creation of Ivor Johns, Cleveland artist.

The rubber room and its fittings were designed especially to accommodate and harmonize with the murals by Kenneth C. Welch, architect, of Grand Rapids, Michigan.

MARCH, 1936
Originals of the murals were produced by Mr. Johns on a greatly reduced scale, in the colors desired for the finished work. Each mural then was projected to exact size in charcoal outline on heavy wrapping paper and the colors to be used indicated by number-code. Each expanse of color then was cut out to serve as a template or pattern.

Pieces of the rubber flooring material in the desired colors, then were cut out carefully to the exact shape represented in the original paintings by aid of the templates and mounted in their proper places on fibreboard with the aid of rubber cement. The finished murals then were erected into place on the walls.

In all, there are seven murals, four of which are approximately life-size and three about one-quarter life-size.

A research laboratory scene; two factory scenes and a cotton plantation scene are on the side walls. Above the three sides of the bar or counter, are as many rubber plantation scenes.

While the idea of interpreting murals in rubber is the outstanding feature of the rubber room, rubber is also used for floor covering, bar-counter and fac-  
ing, table tops, wainscoting, etc.

RICHARDSON v. RICHARDSONIAN  
(From Time)

Henry Hobson Richardson died of Bright's disease on April 27, 1886, two years after the first steel frame building had been erected in Chicago. Unlike his admirer, the late Louis Sullivan, Richardson had nothing to do with the development of the skyscraper, but because he was the most important U. S. architect of the 19th Century, Manhattan's Museum of Modern Art last week hung a gigantic portrait of him in its lobby, published a scholarly critique of his work and displayed photographs and plans of his most important buildings all over the ground floor.

Few U. S. schoolboys have ever heard of H. H. Richardson. If they have eyes to see, though, they cannot help being aware of the type of architecture he popularized; if they are schoolboys of taste they view it with alarm. No man was ever more betrayed by his imitators. What the trade knew as "Richard-  
sionian Romanesque" are the banks, schools, churches, libraries, jails which still dot the land, built of the knobbliest of rough-cut masonry, with livid tile roofs, arched windows and a profusion of useless squat towers. What his admirers have never ceased to point out is that Richardson himself was very seldom Rich-  
ardsonian. His best buildings: the Marshall Field Wholesale Store in Chicago, Harvard's Sever Hall, the  
Albany City Hall, Boston's Brattle Square Church ('The Church of the Holy Bean Blowers'). These were heavy-  
set, impressive buildings befitting a stolid age, but all were well-planned, magnificently proportioned and still serve as an inspiration to young architects.

H. H. Richardson really knew very little about Romanesque architecture. His ornament was original, more often Syrian than Romanesque. In all his churches the object most admired by the public-at-large, the tower of Boston's Trinity Church, was not designed by Richardson at all. It was an adaptation by the slickest of exterior decorators, the late Stanford White, then a draftsman in the Richardson office, of the lantern of Salamanca Cathedral, added when Trinity's builders announced that they were unable to execute Richard-  
son's more original first design.

Born in St. John's Parish, La., in 1838, Henry Hob-  
son Richardson went to Harvard when his stuttering kept him from a West Point appointment. He was the second famed U. S. architect to study his profes- 
  
sion in Paris. Once back in his native country his  
success as an architect was rapid. Rebellng against  
the General Grant era of architecture, he won com-  
  
petition rights and left while his prize-winning designs  
were in other commissions. One of his least suc-  
  
sessful, most "Richardsonian" buildings, the New York  
State Capitol, was the cause of a great scandal. He was called in as architect after graft and mismanage-  
  
ment had used $7,000,000 of public funds and only carried the original design of Architects Arthur D. Gilman and Thomas Fuller through the first floor. The  
graft continued. The handsome metal ceiling that Richardson designed for the Senate Chamber was  
secretly executed in papier-mache by a political con-  
  
tractor.

Romantically slim and handsome in his youth, Henry Hobson Richardson grew to a great bearded man, proud of his wife and six children, his combined home and office, his vast capacity for champange and the bright yellow vests he wore with evening clothes. Though he built several churches he was by no means a religious man. In fact at dinner one evening his good friend Phillips Brooks, rector of Boston's Trinity, was abashed to learn that Architect Rich-  
ardson had never read the Bible. Architect Richard-  
son promised to do so, started at Genesis, read straight through the night. At breakfast next morning he lustily hailed his family:

"I have been reading the Bible, and it's the damn-  
  
Oddest most interesting book I ever read in my life."

ENTERS CONTRACTING BUSINESS  
W. C. Tate, Jr., who has been identified with the McNear Brick Company for some time and who years ago built the first steel frame house in the Bay District, has re-entered the general contracting business with offices at 883 Market St., San Francisco. Mr. Tate will figure all types of building construction.

PERSONAL  
A. F. Rosenheim announces the removal of his offices to suite 518 Chamber of Commerce Building, Los Angeles.

THE ARCHITECT AND ENGINEER
Estimator's Guide

Giving Cost of Building Materials, Wage Scale, Etc.

Amounts given are figuring prices and are made up from average quotations furnished by material houses to San Francisco contractors.

NOTE—3% Sales Tax on all materials but not labor.

All prices and wages quoted are for San Francisco and the Bay District. There may be slight fluctuations of prices in the interior and southern part of the state. Freight charges, at least, must be added in figuring country work.

---

Bond—1½% amount of contract.

---

Brickwork—
Common, $35 to $40 per 1000 laid, (according to class of work).
Face, $75 to $90 per 1000 laid, (according to class of work).
Brick Steps, using pressed brick, $1.10 lin. ft.
Brick Walls, using pressed brick on edge, 60 sq. ft. (Foundations extra.)
Brick Veneer on frame buildings, $0.75 sq. ft.
Common f.o.b. cars, $12.00 job carage. Face, f.o.b. cars, $45.00 to $50.00 per 1000, carload lots.

HOLLOW TILE FIREPROOFING (f.o.b. job)
3x12x12 in. $64.00 per M
4x12x12 in. $44.50 per M
5x12x12 in. $126.00 per M
8x12x12 in. $225.00 per M

HOLLOW BUILDING TILE (f.o.b. job) carload lots.
8x1x2½ in. $44.50
8x1x5/2 in. $73.50

Discount 5%.

Composition Floors—18c to 35c per sq. ft. In large quantities, 16c per sq. ft. laid.
Mosaic Floors—80c per sq. ft.
Duraflex Floors—23c to 30c per sq. ft.
Rubber Tile—50c to 60c per sq. ft.
Terazo Floors—45c to 60c per sq. ft.
Terazo Steps—$1.60 lin. ft.

Concrete Work [material at San Francisco bunkers]—Quotations below 1500 to the ton. $2.00 delivered.
No. 3 rock, at bunkers... $1.80 per ton
No. 4 rock, at bunkers... $1.75 per ton
Elliott top gravel, at bunkers... $2.10 per ton
Washed gravel, at bunkers... $2.10 per ton
Elliott top gravel, at bunkers... $2.10 per ton
City gravel, at bunkers... $1.75 per ton
River sand, at bunkers... $1.80 per ton
Delivered bank sand... $1.20 cu. yd.

Note—Above prices are subject to discount of 10c per ton on invoices paid on or before the 15th of month, following delivery.

SAND
Del Monte, $1.75 to $3.00 per ton.
Fan Shell Beach [car lots, f.o.b. Lake Ma-

MARCH, 1936

Cement, 2.50 per bbl, in paper sacks.
Cement (f.o.b. Job, S. F.) $3.00 per bbl.
Cement (f.o.b. Job, Oakland) $3.00 per bbl.
Rebate of 10 cents bbl, cash in 15 days.
Calaveras White $6.00 per bbl.
Medusa White $8.00 per bbl.
Forms, Labors average $30.00 per M.
Average cost of concrete in place, exclusive of forms, 35c per cu. ft.
4-inch concrete basement floor......$1.25 to 14c per sq. ft.
4½-inch concrete basement floor......$1.50 to 16c per sq. ft.
2-inch rat-proofing......$9.50 per sq. ft.
Concrete Steps......$1.40 per lin. ft.

Demifacing and Waterproofing—
Two-coat work, 15c per yard.
Membrane waterproofing—4 layers of saturated felt, $4.00 per square.
Hot coating work, $1.80 per square.
Medusa Waterproofing, 15c per lb., San Francisco Warehouse.

Electric Wiring—$12.00 to $15.00 per outlet for conduit work (including switches).
Knob and tube average $7.00 per outlet, including switches.

Elevators—
Prices vary according to capacity, speed and type. Consult elevator companies.
Average cost of installing an automatic elevator in four-story building, $2000; direct automatic, about $7000.

Excavation—
Sand, 50 cents: clay or shale, 80c per yard.
Teams, $10.00 per day.
Trucks, $18 to $25 per day.
Above figures are an average without water. Steam shovel work in large quantities, less; hard material, such as rock, will run considerably more.

Fire Escapes—
Ten-foot balcony, with stairs, $75.00 per balcony, average.

Glass [consult with manufacturers]—
Double strength window glass, 15c per square foot.
Quartz Lite, 50c per square foot.
Plate 75c per square foot.
Art. $1.00 per square foot.
Wire (for skylights), 35c per sq. ft.
Obscure glass, 26c square foot.

Note—Add extra for setting

Heating—
Average, $1.90 per sq. ft. of radiation, according to conditions.

Iron—Cost of ornamental iron, cast iron, etc., depends on design.

Lumber [prices delivered to bldg. site].
No. 1 common......$17.00 per M
No. 2 common......$20.00 per M
Selection O. P. common......$28.00 per M
2x4 No. 2 flooring......$2.40 per M
1x4 No. 2 flooring......$2.00 per M
1x2 No. 3 flooring......$1.80 per M
1x2 No. 4 flooring......$1.40 per M
1½x4 and 6. No. 2 flooring......$6.00 per M

Sash grain—
1x4 No. 2 flooring......$45.00 per M

**SAN FRANCISCO BUILDING TRADES WAGE SCALE**

Established by The Impartial Wage Board November 9, 1932. Effective on all work January 1, 1933, to remain in effect until June 30, 1933, and for so long thereafter as economic conditions remain substantially unchanged.

This scale is based on an eight-hour day and is to be considered as a minimum for employees of superior skill and craftsmanship and may be paid in excess of the amounts set forth herein.

---

### GENERAL WORKING CONDITIONS

1. Eight hours shall constitute a day's work for whom all crafts, except as otherwise noted.
2. Where less than eight hours are worked, all time at one-half rate for such shorter period shall be paid.
4. Except as noted the above rates of pay apply only to work performed at the job site.
5. Whosoever is employed on work actually required to be paid double time, Saturday (except laborers), Sundays and Holidays from 12 midnight of the preceding day to 8 am of the day following, shall be paid double time, irrespective of starting time, overtime for any work performed above and beyond the limit of this scale, shall be paid at the respective rates.(See Laborers).
6. Where less than eight hours are worked, all time at one-half rate shall be paid for such straight time.
7. Where time at one-half rate is worked, eight hours pay shall be paid for seven hours on the sec-ond and third days of work, respectively.
8. All work, except as noted in paragraph 13, shall be performed between the hours of 8 A.M. and 6 P.M.
9. In emergencies, or where permits cannot be issued until the close of business, men reported for work shall be paid at straight time.
10. Any work performed on such jobs after midnight on any day shall be paid at the rate of time and one-half, or at the rate of time and one-half, for all hours worked from midnight of the preceding day to 8 am on the day following.
12. Men ordered to report for work, for whom no employment work is provided shall be entitled to two hours pay.

---

### CRAFTS

**CRAFT**

- Iron Workers (Bridge and Structural)
- Bricklayers
- Laborers (6-day week)
- Painters
- Lathers, All Other
- Marble Workers
- Sprinkler Workers
- Mosaic and Terrazzo Workers (Outside)
- Mosaic and Terrazzo Workers (Inside)
- Painters, Varnishers, and Polishers (Outside)
- Pipe Fitters
- Pile Drivers
- Plumbers and Terrazzo Workers (Inside)
- Plumbers
- Roofers (All classifications)
- Sheet Metal Workers
- Sprinkler Fitters
- Steam Fitters

**MECHANICS**

- Sheet Metal Workers
- Electricians
- Plumbers
- Sprinkler Fitters
- Steam Fitters

---

**STONE**

- Granite, average, $6.00 cu. ft. in place.
- Sandstone, average, Blue, Boise, $7.00 cu. ft. in place.
- Indiana Limestone, $8.00 cu. ft. in place.

---

**WASHING**

- Copper wash bars for bars of corn, center and around sides, will average 75c per lineal foot.

---

**TILE**

- Floor, Wainscot, Etc.—(See Dealers).
STATE ASSOCIATION MEETING AT LONG BEACH

The Directors and District Advisors of the State Association of California Architects met at the Lafeff Hotel, Long Beach, Friday evening, January 24. E. W. Mayberry, president of the Long Beach Architectural Club presided. Robert H. Orr’s report of the meeting is given herewith in part:

The discussion for the evening revolved about the theme that is most near to each one’s heart. The formula for a beam may be worked out with precision but the formula for the practice of architecture is as varied as there are individuals. To think that an association can solve the difficulties of each District and each individual seems quite absurd and yet to listen to conversation one would think that that is its purpose? To answer: Is it of any use to the public? Does it maintain ethics of practice? Does it create special privileges for a few? Why does it not solve local problems? Can it produce direct and tangible benefits to the individual or is it a mere organization for good fellowship?

Perhaps it will be well to begin by reciting from the Constitution and By-Laws: “This Association is established to advance the science and art of architecture; to insure to the public efficient architectural service; to encourage architectural education; to maintain the honor and dignity of the profession of architecture:

OFFICE BUILDINGS have in the last five years increased use of electrical office equipment many hundreds of times. STORES find more electrical equipment necessary to modern merchandising. HOMES are continuously adding appliances.

WHAT DO YOUR CLIENTS SAY
TO PROSPECTIVE BUILDERS WHO ASK THEM ABOUT YOUR PLANNING?

Are they saying the things that will build your reputation? Are they enthusiastic about the building after occupying it for a time?

Electrical adequacy is imperative if a building is to be satisfactory—adequacy not only for the present, but for many years to come—because the electrical age is in its infancy. New applications are being evolved daily.

If the architect has not made provision for this increasing use of electricity, wiring is inadequate to carry increased load, and convenience outlets are not available for added equipment. The building owner’s only recourse is to rewire. This is often very expensive whereas it would have been simple and inexpensive to insure adequacy while building.

Be sure your clients are telling inquirers that your plans provide electrical adequacy.

to enlighten the public in relation to the province of architecture in the body politic; to advocate proper legislation and to oppose improper legislation affecting architectural practice; to support the State Board of Architectural Examiners; to co-operate with other professional associations and to cultivate social intercourse among its members."

If all of these things were done how happy we would be. The public has a vital interest in architecture and the science of architecture is dependent upon the public at all times. The science of architecture is not individualistic. It is a rare individual who can shape the destiny of any science. Without the Guilds perhaps the great architectural monuments of the Old World would never have been builded. Without organization, of some kind, the public would be at the mercy of individuals of every degree and temperament, without recourse from any of the attending ills. Ethics of practice is to place restraint and inflict punishment. For a child this is often daily practice because it does not know better, it has to be brought up and taught that there is a right and a wrong which sooner or later becomes a part of its being.

So it is with the beginner in architecture. It might be unethical for the beginner to cut the price a bit for the first job. Considering he does, what can be the value of service of one's first building compared with the practitioner of long standing? Step by step he learns that his services are worth more and he begins to take on the standards that organized society establishes. Because the State Association includes all architects, from the beginner to the finished product, if there be such a being; and further, by reason of the progressive steps in architecture whereby after years of practice, when one should know better than to be unethical, he can affiliate himself with the American Institute of Architects, which provides these requirements. the State Association deliberately and advisedly excludes ethics as within its province, except to frown upon unethical practice and advise that it is not a part of honor.

Special privileges for the few seem to imply that some are placed in position without due course of reason. To achieve and acquire is a privilege open to all. Why do not young men find a seat upon the State Board of Architectural Examiners and what would be the thought if a Provisional Licensed one should? Perhaps the implication would be unqualified. From this view point let us proceed to find how old a person should be to be eligible to hold office in The State Association. From the By-Laws: "Executive Board:" "Two members of the State Board of Architectural Examiners chosen or appointed by the members thereof . . . shall ipso facto become members of the Executive Board." And, "Two members of the Chapter of The American Institute chosen by the members or appointed . . . shall ipso facto become members of the Executive Board." There is no choice here to include men who do not have professional standing growing
out of years of practice. Aside from the Director of
The American Institute of Architects for the Sierra
Nevada Division, for the other four members there are
no limitations. These four are selected from and by
the District Advisors, regardless of years of service. This
system should be democratic enough to bring in young
men and have them advance step by step to the various
offices. If it does not work out that way then something
must be wrong and that may be attributed to a lack of
interest, which is altogether too prevalent.

Within the past few years, not a few architects have
established themselves in interurban communities where
heretofore no architect existed or could exist. From this
may be drawn the inference that more and more small
work is being committed into the hands of architects.
The little fellow,” as he is pleased to call himself, feels
that the territory is his by right of domain and resents
the intrusion of the city gentry coming in and taking
the plums. He feels, at least some do, that it is the
Association’s duty to protect him. How this may be
done is beyond comprehension. To undertake such a
task would be to set up a dictatorship and a dictator-
ship can only lead to discord, dissension and ill feeling
of such a magnitude as to cause its undoing. Instead,
if it were possible, would it not stifle “the science and
art of architecture,” “efficient architectural service,”
“architectural education,” “honor and dignity of the
profession,” all of which the Association is duty bound
to uphold and promulgate.

To provide direct and tangible benefits cannot be
measured as a matter of days, months or even years.
Those who have practiced their profession for years
and years can reflect back and say quite positively that
in their lifetime the profession has made considerable
progress, and ranks upon a higher plane today than
ever before. Back of this achievement stands some-
ting above, beyond and over individual effort, and
that something is nothing more than the benefits
accruing from many years of organized work.

Good-fellowship is an adjunct worthy of our high-
est esteem. It is that affection that can be found in
no other way than by social contact with one’s fellow
man. To stand aloof, shun one’s competitor, if that is
what he should be called, finding no pleasure or profit
in sharing the views of others of like kind, is not good-
fellowship; it is not even good understanding of one’s
responsibility in the task he has set his hand and heart
to do.

Mr. Natt Piper, chief building inspector, of the City
of Long Beach, paid a deserving compliment to the
Long Beach Architects.

PASO TIEMPO CLUBHOUSE

Plans are being prepared by Clarence A. Tantau,
210 Post Street, San Francisco, for a new clubhouse
at Paso Tiempo, Santa Cruz, for Miss Marion Hollins.
The design will be Spanish.

OAKLAND OIL BURNER MANUFACTURER
REVIEWS RECENT HEATING EXPOSITION

FEATURED by an unusual amount of interest on the part of 44,695 visitors who came to see products displayed by over 300 exhibitors, the Fourth International Heating and Ventilating Exposition — "The Air Conditioning Show"—held in the International Amphitheater, Chicago, January 27-31, was voted "the best ever" by the industry and the public alike. Despite the elaborate displays, some exhibitors were inclined to regret that they had not contracted for even more space, and had not featured their equipment even more strikingly. In most of the exhibits display technique reached a high point with the dynamic treatment predominant. The audience could see how things worked by watching them in operation.

The Exposition was held during the same week as was the annual meeting of the American Society of Heating and Ventilating Engineers—where attendance records were broken with a registration of over 1200 engineers and technical men from all parts of the United States and from abroad—and the mid-winter meeting of the National Warm Air Heating and Air Conditioning Association, also a mecca for enthusiastic attendance.

J. C. Johnson, President of the S. T. Johnson Oil Burner Company of Oakland, was among the Californians to attend the exposition and he says he was particularly impressed with the business-like desire to learn on the part of those who visited the show. Displays were designed to answer this demand for knowledge. Many new products were shown for the first time, and many models of equipment and complete installations were in operation. The displays included almost every type of device used in heating, cooling and ventilating, including the residential, the industrial and the commercial air conditioning fields. Featured also were steam and hot water boilers, furnaces, boiler-burner and furnace-burner units, central and unit air conditioners, controls, valves, pumps, traps, oil burners, stokers, gas burners, heating surfaces, refrigerating machines and accessories, fans and blowers, air filters, instruments, tools, welding apparatus, motors, drives, registers and grilles, to name but a few. Little was neglected, either in the range of the exhibits or in attention given them by those who attended.

Conditioning the air in winter by heating it is an age old custom which has created industries, fashioned domestic habits and engendered a long line of specific apparatus burning wood, coal, gas, oil and electricity. Yet all this served merely to provide higher temperatures in enclosed spaces during the cold portions of
the year. The more recent efforts to do something the same in summer, but in the reverse direction, has led to a broad new development known as "air conditioning." The Fourth International Heating and Ventilating Exposition marked another stage in the transition between old time equipment for specific purpose and new type systems which serve all of the weather requirements throughout the year. Whereas formerly some exhibitors showed furnaces, boilers, ventilating fans, or air conditioning equipment, the trend now is to consolidation. This year's Exposition proved that whether originally the manufacturer had been making oil burners, coal furnaces, or ventilating fans, he was now offering whatever equipment was necessary properly to condition a given space, winter or summer, with respect to temperature, humidity, and air circulation.

In the oil burner field, Mr. Johnson said, the tendency was completely to enclose the operating unit within a steel jacket which would make it more attractive in appearance without increasing the maximum dimensions. Sometimes the oil burners were furnished with domestic hot water coils to provide hot water service without the use of a storage tank. Thus heating, source of heating, and hot water supply were all made available within a single unit.

Quick heating with respect to water supply was offered as an auxiliary feature to several types of boiler and furnace equipment. For heating large buildings there were new steam heating systems which provided for direct-by-the-weather control. It is claimed that these keep the building supplied with just sufficient steam to maintain comfortable temperatures without waste.

Accessory equipment in the oil burner field included strainers, pumps, motors and the necessary conduits and insulation. One of the innumerable special devices was a fan unit which could be slipped into a gas range oven to provide, with the door open, early morning kitchen comfort through warm air circulation. Radiators continued to disappear in the wall, and a wide assortment of cabinets were used to assist them. The use of pulverized coal for domestic heating was promoted by equipment especially designed for handling this fuel. One design for mechanical heating units offered a patented arrangement whereby the air to be heated is returned at the top of the furnace casing and is preheated before entering the filter and blower compartment. The arrangement is said to increase the overall heating efficiency of the compartment. There were many devices for putting the hot water heating unit inside the central heating system.

Heating systems included the circulation and control of subatmospheric steam. This development was said to represent a valuable scientific achievement in steam heating. Not only the amount but the temperature of steam is varied, depending on the weather for differential operation. There are no limitations on the source of steam. Steam may be supplied by high pres-
sure boilers, low pressure boilers, central heating plants or from the exhaust from turbines or power plants.

A combined vapor turbine and electric vacuum heating pump handled the condensation and air from heating systems continuously as long as steam was on the boiler, using no electric current until steam was below one pound. Then the electric motor cut in until adequate steam was again available.

Some of the exhibits featured model houses by means of which the Exposition visitors could themselves operate little valves and see where the heat went round and up, and where it came out. In one instance neon tubing was used to denote the pipe lines. In one model the visitors could operate a system of temperature regulation to observe the manner by which ordinarily the control operates in response to outside weather conditions. Oil burners, and fuel oil pumping and preheating equipment were well represented by operating displays.

JURY FOR BRIDGE COMPETITION

The following jury of nationally known architects and engineers has consented to serve as judges in the eighth student bridge design competition held annually by the American Institute of Steel Construction:

H. H. Allen, Vice President, J. E. Greiner Company, consulting engineers of Baltimore.

Arthur G. Hayden, designing engineer, Westchester County Park Commission, White Plains, N. Y.

Theodore E. Blake, architect, New York.

Archibald Manning Brown, President Architectural League of New York.

H. H. Saylor, Editor of Architecture.

Students of engineering and of architecture in the colleges and technical schools of the United States are eligible to participate in this competition. The problem is a design for a grade elimination over-pass. The students are now invited to submit their preliminary designs which the jury will review on April 15, and select therefrom the ten best. The students who designed those will be requested to make finished drawings which the jury will judge on May 13. The best of the final drawings will receive a cash prize of $100. The second best will be awarded $50 in cash. The prize winners and those receiving honorable mention will receive certificates of award signed by the jury.

STATE REGISTRAR OF CONTRACTORS

Earl S. Anderson of Los Angeles has been named State Registrar of Contractors by the California State Contractors’ License Board, which is a division of the Department of Professional and Vocational Standards. Mr. Anderson succeeds W. G. Bonelli, who has been acting as Registrar for the Board in addition to his regular office as Director of the State Department, and member of the Governor’s cabinet.

THE ARCHITECT AND ENGINEER
PRESENTATION OF GIFT

Present at the February 18 meeting at the Ainsworth Coffee Shop, Portland, were Messrs. Aandahl, Morin, Marsh, Johnston, Herzog, Jacobberger, Clau sen, Stanton Parker, Foulkes, Wardner, A. Lawrence, Brookman, Sundeleaf, Bear, Wicks, Dukehart, Turner, Belluschi, Crowell, Doty and Schneider.

President Aandahl presided.

Mr. Morin was instructed by the President to write a letter of appreciation to the Gas Company for loan of broadcasting equipment.

Mr. Morin referred briefly to the data being gathered by relief workers for preparing "The American Guide," a WPA project. This collection of volumes is the first comprehensive attempt to publish an American Baedeker. One of the important sections of this Guide is concerned with architecture and every important building in each locality is to be listed, with the name of the architect, date, styles, use, size, cost and other interesting facts.

The data for Multnomah County is being collected by a Miss LaFrance, and Mr. Morin urged that each Chapter member give her every assistance possible when she calls, or to list his own buildings with complete information and mail same to Mr. Roi L. Morin, 1601 Public Service Bldg.

Through previous arrangement with the WPA, all architectural data for this locality is to be revised and edited by the Public Information Committee of the Oregon Chapter.

Draft of circular letter to all political subdivisions of Oregon was read and discussed.

Mr. Stanton reported on letter received from National Committee on Education, urging greater activity along lines of education by the "Mentor" system. It was moved and seconded that Mr. Stanton's recommendations be accepted and that Mr. Stanton be informed Mr. Zantzinger.

A report was submitted by A. Lawrence on travels and sketches of H. E. Hudson, third holder of the Ion Lewis Traveling Scholarship. Some of Mr. Hudson's sketches were exhibited at the meeting.

A report was made by Mr. Clausen on the "Buffalo Plan" of The Small House Bureau. Motion amended that report be accepted and that Mr. Shreve be informed that the Chapter consider the plan against the best practices of Architecture and should be rejected.

Mr. Herzog moved that the report be accepted; seconded by Mr. Parker. Motion as amended carried. Mr. Brookman was instructed to report on holding an exhibition for spring.

Mr. Herzog moved that Exhibition Committee arrange to hold the exhibit early in April. Motion seconded and carried.—J. T. S.

ADDITION TO CHURCH

Charles F. Maury, Monadnock Building, San Francisco, is preparing plans for alterations and additions to the First Presbyterian Church at Richmond.
S. F. FAIR NOT TILL 1939

San Francisco's World's Fair will open Saturday, February 18, 1939, and run for 288 days to Saturday, December 2, 1939.

The decision to stage the Fair in 1939, rather than 1938, was reached immediately after the ceremony at Yerba Buena Shoal celebrating the actual beginning of physical work on the project.

"We regret the necessity of waiting an additional year," said Leland W. Cutler, president of the Exposition. "However, circumstances beyond the control of the Exposition Company, resulting in various delays, dating back more than a year to the protracted controversy over the Fair site, have made it advisable, in our opinion, to choose the year 1939.

"Our directors have consistently asserted that our forthcoming Fair must eclipse all previous expositions. During the past several weeks it has become apparent that in order to open it in 1938, we should be compelled to sacrifice careful planning and promotion of the enterprise.

"Rather than attempt to rush this great project through at the cost of its ultimate beauty and success, we prefer to wait one more year, confident that the people of California will endorse the wisdom of our decision."

With the date definitely fixed, Mr. Cutler declared that the Exposition will begin immediate efforts to bring more than 1,500 national conventions to San Francisco and the Bay area in 1939.

Exposition leaders pointed out that the extension will enable them to secure more representative participation from foreign nations, will give architects an opportunity to devote more time to the design of buildings, and enable the company to "sell more exhibit and concessions space, with a consequent increase of potential revenue."

BEETRER HOMES GUIDEBOOK

With the printing of the 1936 Campaign Guidebook for Better Homes in America, Miss Isabel Hodgkins, assistant administrator in charge of the campaign, states that the fifteenth annual drive for community improvement is actively underway. The Guidebook is being mailed to some 5000 Better Homes chairmen throughout the United States from the Better Homes in America headquarters at Purdue University. The booklet forms the basis of organized effort throughout the country to help people improve their homes and their communities. The campaign culminates in Better Homes Week, April 26 to May 2.

The campaign for 1936 stresses the idea of improving and modernizing the entire residential block rather than isolated houses. An effort will be made to interest home owners and renters in entire blocks to improve their dooryards and gardens. In some localities demonstration houses will be used to stimulate new ideas, better homes and to show localities examples of modern trend in small dwellings. As in the past, there will be essay contests, local tours, special Sunday sermons in churches, lectures before women's clubs, schools and business organizations.
CONTRACTOR'S LICENSE LAW UPHOLD

Another victory for the Contractors' License Law in California is reported by State Registrar William G. Bonelli, who states that the Appellate Division of the State Supreme Court has upheld a departmental decision handed down over two years ago, suspending the license of Philip Karz of Los Angeles.

The decision of the Registrar was set aside in the Superior Court of Los Angeles County by Judge Emmet H. Wilson in February of 1934. The reversal was carried to the higher court with Eugene M. Elson, Deputy Attorney General, representing the Department. After more than two years the Appellate Court has reversed the judgment of the Superior Court in a decision which is a complete victory for the State Department.

"I am highly gratified," states Registrar Bonelli. "Our record as to reversals is, in my opinion, rather remarkable, due to the fact that the Contractors' License Bureau probably takes punitive action against more licentiates than any other similar body in the State of California. Our reversals to date can be numbered upon the fingers of one hand, with space left over. I believe this case and our general record prove conclusively that our method of procedure in complaint cases is soundly conceived and carried out by a well qualified personnel. In view of the Karz decision, the Department feels very confident that it may expect splendid support from the higher courts as long as we continue to proceed in our established manner."

CONFERENCE ON LOW COST HOUSING

The lively interest manifested during recent months in cheap and effective housing for urban and rural communities has encouraged the Pennsylvania State College to arrange a conference on low cost housing April 16th and 17th. The preliminary report of the Pennsylvania State Planning Board, issued last year, pointed out that in the last fifteen years relatively few dwellings have been constructed in the Commonwealth within the price range of the majority of the people. The possibility of expansion in this hitherto neglected field is one which is being vigorously explored by architects, engineers, planning boards, realtors, bankers, industrialists, State and Federal Agencies. The time seems ripe for the College to provide in Pennsylvania an opportunity for the consideration of various elements from which a practical program of low cost housing would evolve. Attractive costs are essential, taking into consideration materials, labor and financing.

Papers will be presented by H. E. Buttenheim, editor American City, on the subject of "Taxation as a Factor in Housing for Low Income Groups"; H. H. Engle, Assistant Director Department of Commerce, Washington, on "Interrelation of Industrial Decentralization and Housing"; Arthur C. Holden, Consulting

WESIX Automotive Electric Heater

Every bathroom needs heat that is independent of any other room or heating system. The entire nation exulted the WESIX portable electric heater as ideal and safe for bathroom comfort. Now WESIX has built an AUTOMATIC electric heater for the bathroom—built in and out of the way—and with fully automatic temperature control—two features that very definitely result in utmost safety and comfort. This new WESIX BATH-A-MATIC produces healthful warmth without sudden or abrupt—quickly and economically—quicker than any furnace or other auxiliary equipment. Employs some proven double-action principle used in famous WESIX portable heater—circulates the heat and distributes a cozy glow just like sunshine! NO MOVING PARTS—No fans to grow rusty and drift—nothing to get out of order. Standard finish: beautiful rust-proof chromium. Standard size: 1500 watts. Uses regular 110 volt current. Also made in other finishes and sizes for heating any size room or entire house. Enjoy this safe, healthful, dependable and economical WESIX electric heater, easy to install and quickly and easily made available by your own electrician. $29.50.

Other papers will be presented by Ernest M. Fisher, Director Division of Economics and Statistics, Federal Housing Administration, on "The Role of Government in Housing," and by H. N. Peaslee, Chief Economic Analyst in the Housing Division, P. W. A., on "The Economics of Low Cost Housing." Pope Barney, architect of Philadelphia, will be chairman of one of the sessions. The College is arranging a Housing Exhibition to coincide with the Conference.

ARCHITECTS NEED ADVICE

INSECT damage to structures containing wood and its products is coming to be recognized as a building problem of major importance. In designing wood frame buildings, it is just as important that the architect should have expert advice as to the prevention of damage by wood-destroying insects, as it is that the architect should require the services of a structural engineer, an electrical engineer, or a heating and ventilating engineer.

A case in point is that of a fraternity house in the Bay Region. Some five or six years ago this building was reconstructed at a cost of about $40,000, and, while the exterior of the structure presents a very pleasing appearance and is generally considered to be an architectural gem, the understructure has already been seriously damaged by termites, and is in urgent need of repairs.

By the expenditure of a very small sum of money at the time the reconstruction was undertaken, advice could have been had and the present difficulties avoided. There is such expert advice available to architects. This editor would urgently recommend that architects avail themselves of it to avoid future embarrassment.

THE ARCHITECT AND ENGINEER
STEEL FOR AQUEDUCT

Over 1,000,000 pounds of steel per month is being consumed on the Metropolitan Water District Aqueduct from the Colorado River.

At present the principal use of steel on the aqueduct is for reinforcement of concrete canal and siphon sections. Other important uses include steel for supporting tunnel sections and for the construction of towers on the Water District’s 237-mile long power transmission line from Boulder Dam.

In the near future, large quantities of plate steel will be used for delivery pipes to the aqueduct pumping stations and for steel pipe sections of the aqueduct distribution system.

Building of the aqueduct has required 20,035 freight carloads of materials during the past three years—or enough cars to form a 170-mile freight train—according to a carloading report made by General Manager F. E. Waymouth.

The report showed that the manufacture of the 3,052,260 tons of materials represented by the carloading figures is giving employment to approximately 30,000 men in Southern California and throughout the nation, in addition to the 8,000 men directly employed on aqueduct construction.

It is estimated that by the time the aqueduct project is completed its construction will have consumed sufficient materials, supplies and equipment to form a solid train of freight cars somewhat longer than the 390-mile aqueduct itself.

TERMITE CONTROL

A total of 42 termite control operators qualified at the first examination for state license held by the Structural Pest Control Board, bringing the total number of licensed operators up to 231. The state law provided that licenses would be issued without examination to all operators who were engaged in business at the time the law went into effect. Glen V. Slater, deputy registrar of contractors, is registrar of termite control operators.

LOCAL PLANNING IN THE PACIFIC NORTHWEST

LOCAL planning in the Pacific Northwest might be said to be about half constructive and half preventive, and only in small measure corrective. It contrasts with the Atlantic Northeast, for example, a region more than two centuries older, where the corrective proportion has become very high. In this region, a rather virgin field for planning as indicated by the following brief summary, we should profit by the experience of the older regions and avoid the necessity for much of the corrective type of planning effort.

City Planning. Up to two years ago city planning was the major objective. There was at least a foundation for such activity. Oregon had a state enabling act—Washington had home-rule authority.

Although the majority of the present city planning commissions was organized during the closing days of CWA in 1934, a number of cities at that time secured suitable help and began the preparation of a municipal inventory along the lines adopted by the Portland Planning Commission.

It was found that in the smaller cities a suitable base map for planning work was the first requirement. A number of cities began such a map, showing surface conditions, as well as the location, type and condition of underground utilities.

Although only a start toward planning had been made, the value of even that little was reflected in the type and character of work relief projects selected in those cities where planning had been considered.

The interest in city planning during 1934 brought about the enactment of enabling acts in Idaho and Washington during the 1935 legislative meetings, putting city planning on a firm basis in those states also.

White-collar projects under WPA are reviving city planning interest. Some cities are continuing work, with such help, on municipal inventories...
and base maps. Several are undertaking street, park, and recreational plans.

County Planning. A number of county planning boards was organized in 1934 on an interim basis, pending legislative enactment for official boards. In such counties, although little basic planning was undertaken, considerable useful work was done in the study of immediate needs and the selection of suitable works projects for immediate development.

In 1935, legislative enactment enabled counties in Idaho and Washington to legally establish planning boards and allocate funds for their use.

County planning, although a newer endeavor than city planning, is making rapid progress. In the Pacific Northwest, an area of great distances, with some counties larger than eastern states, the county appears to be a logical unit for planning. Some counties have within their area entire drainage basins—others have large special interests such as mining, lumbering, farming or stock raising. The coastal counties have important problems of lumbering, commercial fishing, and recreation. In all counties there are the problems of transportation and use and conservation of water and land. Such problems are being studied on a local basis, on a joint basis by neighboring counties in many cases, by the state planning boards, and finally, on a regional basis, by the Regional Planning Commission.

SAN FRANCISCO ARCHITECTS MEET

The regular meeting of Northern California Chapter, A.I.A., was held at the St. Germain Restaurant, San Francisco, Tuesday evening, February 25. Will G. Corlett presiding.

The following were present:

Harris C. Allen, Clement Ambrose, John Knox Ballantine, Jr., Morris M. Bruce, Will G. Corlett, John J. Donovan, Albert J. Evers, Albert Farr, Edward L. Frick, Wm. I. Garren, Wayne S. Hertzka, Henry T. Howard, Samuel Lightner Hyman, Ray-

The minutes of the January meeting were approved as published.

The discussion of the evening centered upon small housing.

Harris Allen, Chapter representative on the A.I.A. Committee on Housing, presented bulletins issued on the subject by the Institute. He urged that the Chapter cooperate with the movement to provide better planning and supervision of construction of small houses.

House bureaus in Buffalo and Baltimore were mentioned and it was instructed that the Chapters in these cities be asked for information on their operation.

The Architects Home Service Bureau in San Francisco was referred to as an organization which brings the benefit of full Architectural Services to those who wish to build a small home. P. J. McGuire who heads the bureau was present and spoke briefly on the problems confronted in bringing the public to an understanding of the value of an architect's guidance.

Mr. Evers approached the subject from the viewpoint of the F.H.A., whose granting of Certificates of Quality on executed work coming under its jurisdiction, he stated, is recognition that the quality standard which it requires has been met. Others felt that the Certificates of Quality should be restricted to houses having Class A rating.

Mr. Garren told of studies on housing made by the State Association.

A Federal Building and Loan Company now operates in San Francisco and is directed by a Board comprised, mainly, of architects. This interesting fact was brought out by Mr. Masten who stated that better knowledge of the structural and aesthetic values of the property to be financed is afforded because of this architect directorship.

Comments by others included statements that architects by accepting small commissions, have brought about a condition making it difficult to obtain regular fees; that the only answer to the problem is public information; that the architect should look upon small house planning as a community betterment and a public service from which adequate financial return should not be expected.

TEXAS ARCHITECT SCORES MODERN STYLE
(Concluded from Page 7)

duce good 4 inch average round rafters 9 feet long, would you send off for other rafters to make rooms wider than 17 feet?

"When summer [90 degrees temperature] begins in April and ends in November, with a steady cool breeze blowing from the south east, would you plan a house in any other manner than to expose as many rooms as possible to that afore-said breeze? Or without consideration of the breeze? It being understood that if you owned less than 3000 acres of ranch you would be considered as having too little space to have any to work with.

"If the brush was full of coyotes and there were plenty of bandits, both home grown and in transit, to where experience had taught you that it is cheaper to cover the openings with iron bars than contribute to the opium dreams of thieves, would you, for the sake of one of these modern glass wells you show here in this December number, omit the iron bars?"

"If half barrel clay roofing tile was cheaper over a ten year period then any other roofing available would you build a flat roof if you were not building to sell to suckers? If whitewash lasts longer, looks better and costs one-tenth as much as anything else, would you undertake any other exterior painting?"

"If your answers to the above questions are yes, and I fear they will be for things have been going too good for me lately—
I knew there was something wrong and before I got to be the wide open space Kingfish some dam thing would throw me —I am prepared. I am all prepared, sir, modern, to do the modern thing in the modern way if it is the thing to do down here. I am letting you be the judge. I don't want people driving through here on their way to Mexico from New York or Hollywood to say 'This architect around here must be nuts, look at that.' One of my friends who has invested a lot of money in what we thought was all very modern right up until now might hear of it and get to feel mighty bad. I don't want anything like that to happen. If I have been wrong in my thinking I want to know it so I can square myself somehow with my clients and go on working."

"Please let me know as soon as you can as I have plenty of additional work to do here on this ranch."

If you, dear reader, would like to answer Mr. Sanderson's many questions let us hear from you—this fellow is sincere!
