Large, decorative Ceramic Tile ... pattern for good living at Makiki Park Place

ARCHITECT: Matsumoto, Takeo & Associates, Inc. AIA
INTERIOR DESIGNER: Charles Heen ASID.
GENERAL CONTRACTOR: Charles Pankow Associates.
SALES: George H. Sakoda Realty

Takeo Matsumoto, architect for this new condominium at 1517 Makiki Street, adopted a Ceramic Tile style in the latest fashion today in Southern California to help glorify the new structure.

The lobby is shown here, its large, patterned Mediterranean style Ceramic Tile setting the tone for luxury at the very entrance as it also does in the foyer of every apartment in the building.

Located on a dead end street across from a park, Makiki Park Place proved a popular choice among condo buyers. Sold out. Here, as in so many other projects in Hawaii, Ceramic Tile, spelling as it does so well quality to buyers, helped speed the sales.

TILE BEAUTY FITS OUR GOOD LIFESTYLE HERE

People who have already chosen Ceramic Tile... or its companion products Genuine Marble and Terrazzo... best know the advantages of these great materials. More and more, too. Ceramic Tile, Marble and Terrazzo are getting major attention from developers of finer buildings of all kinds here as they work with their architects, interior designers and contractors. Helping, too, are the qualified, reliable contractors who take part in their own industry-wide Promotion Program... people ready with ideas, accurate estimates, up to the minute industry developments and on time delivery to fit your schedules.

Contact any of these Promotion Program participants:

As architects work with different cultures and environments, different standards, usages, and concerns take precedence over others. Unique client requirements and community needs must be taken into account in any physical planning program. Planning that is not responsive to community standards is likely to generate dissatisfaction and failure.

This discussion is limited to our experience here in Hawaii with land use planning and the sonic environment. Most of us are familiar with the unique physical aspects of our island state, and the relationships of water, land, and urban areas. We are currently experiencing urbanization of our land areas at a very rapid rate, with the results all around us. We are familiar with the various impacts of both large and small scale urban development.

Because of the rapid transformation of our environment into urban land use, Hawaii has become more sensitive than most areas to the impacts of development.

**IMPACTS OF DEVELOPMENT**

The primary sonic impacts of land development to consider in land use planning are as follows:

- Land clearing, including demolition or removal of structures.
- Site preparation, including construction of infrastructure, such as roadways, water, sewer, and drainage structures.
- Construction of buildings.
- Installation of landscaping elements.
- Operation of construction delivery vehicles.
- Operation of completed facilities, including user activities.
- Operation of vehicles used in servicing completed facilities.

All of these activities increase noise levels both in the development area and in adjacent areas. The sound generation associated with various land uses is so complex and shows so many variations over time, that these impacts have not been modeled with any accuracy.

“Awareness of the relation of land use planning and the sonic environment is an idea whose time has come...”

Konheim and Caccavari (Office of Noise Abatement and Control, U.S. Environmental Protection Agency) have been developing a computer-optimized noise abatement model as part of their technical assistance program to state and local governments. It is interesting to note that the model is based on acoustical and attitudinal surveys performed by a community. It enables the community using the model to achieve the most cost effective noise abatement strategies using local criteria.

When this model is implemented, it will help everyone concerned with land use planning to develop more quantitative means of dealing with the sonic environment.

At present, however, the problem of land use planning in the sonic environment is considered in a very general way. Two noise sources which have historically been areas of significant community concern are construction activities and development-generated vehicular activity. An area not generally addressed is the continuing mitigation of individual noise sources, a technological process.

Construction activities present a variety of sonic impacts with pile drivers, jack hammers, rock drills, and hammers leading the pack in the 95 to 105 dB(A) noise level range measured at 50 feet from the source. Other construction equipment provides relatively lower noise impact levels, but usually continues through the life of the project. On major land development projects, this can range from a few years to a decade. With average construction noise levels around 84 dB(A), this can be a significant long-term impact and affects consideration of development phasing.

Vehicular activities that accompany construction and land use have both relatively short and long-term sonic impacts. Short-term impacts are considered to be those during the construction period. Again, if construction is phased over several years, the sonic impact of construction vehicles, usually in excess of 90 dB(A), can also constitute a relatively long-term impact. Usually during construction trucks can be considered as points sources of noise events.

After construction, when land uses are changed, new vehicular traffic patterns are set. A Highway Research Board model developed in 1971 can serve as a guide to
estimate traffic noise levels. The model considers many factors, including: traffic volume; the percentage split between passenger cars and other vehicles; the average speed; whether or not the traffic flow is interrupted or uninterrupted; the pavement width and number of lanes; the roadway gradient; whether the roadway is at-grade, elevated, or depressed; the relative smoothness of the road surface; the listener's distance from the roadway; and the presence of any shielding effects.

In areas where land use changes add volume to an existing stream of traffic, the noise levels are often not increased, but the period of time over which the noise levels are experienced is lengthened.

**SIGNIFICANCE**

While experts in studies of sonic impact generally agree on types of effects that noises are capable of generating, they do not generally agree on the intensity and duration of the sonic event to produce a given effect. This is due in part, to the subjective perception of noise by various communities and cultures. Noise can be illustrated in terms of comparable sonic events, and we can determine community reaction to historical noise events.

Two other methods of evaluating the impact of sonic events include, (1) comparing predicted noise levels with community standards and determining if they exceed these standards and, (2) making quantitative estimates of sonic impacts on hearing sensitivity, physiological characteristics, and other parameters. While most studies of sound intensity and duration related to hearing loss are conclusive in only a limited sense, they indicate that significant risk of permanent hearing damage occurs on exposure to 90 dB(A) continually over an eight-hour day.

Other significant effects, less permanent than hearing damage, but of increasing social significance, include speech interference, sleep interference, physiological stress, annoyance, and task interference, which occur in the 65 to 80 dB(A) noise range. Generally speaking, these effects become detectable about 15 dB(A) below the range of which they become significant, so that we can say that noise in the range of 50 to 80 dB(A) produces detectable effects.

Practically speaking, permanent hearing loss is not a significant impact of land use decisions. This is a problem largely confined to workers in industrial, construction, and service occupations. Temporary hearing loss is a possible impact of construction that accompanies land development, especially when certain types of pile driving and tractor operations are employed. Other effects, such as degradation of speech communication, are more difficult to quantitatively analyze.

The significance of these effects, however subjective, is nonetheless of community concern and varies with the area of consideration. Often overlooked in consideration of the sonic impacts of land use planning is the ambient, or background, noise level in which this land use planning takes place. Consider a relative pristine, undeveloped beach site. The background noise level of normal surf conditions has been measured at 70 dB(A), high enough to produce some significant physiological effects, and well within the range of detectable effects.

Consider the urban area of Wai'iki. The background noise level of normal conditions has been measured at a low of 57 dB(A) and high of 72 dB(A). Some people accept them as natural, or inevitable, or as a condition of living either in a pristine undeveloped area, or in a high density urbanized area.

In both cases, the background noise level can be significant. The question is: Which is preferred?

**REGULATION AND MITIGATION**

Chapter 44B of the State of Hawaii Community Noise Regulations specifies maximum allowable levels of noise for each use zone contained in the City and County of Honolulu's Comprehensive Zoning Ordinance.

With specific reference to construction (including demolition), the regulations require that no permit be granted for construction activities that would create excessive noise on Sundays or state holidays, or between the hours of 6 p.m. and 7 a.m., or that would emit noise in

excess of 95 dB(A) at or beyond the property line, except between the hours of 9 a.m. and 5:30 p.m., Monday through Friday.

Once a permit is granted, however, noise from construction activities is not limited by the Community Noise Regulations between 9 a.m. and 5:30 p.m. on weekdays. Normal construction activity may occur between the hours of 7 a.m. and 6 p.m.

The State of Hawaii Occupational Safety and Health Law contains standards for occupational exposure to noise. This law requires employers to initiate hearing conservation programs using all feasible administrative or engineering controls to insure that exposures do not exceed levels set in the standards. If noise levels remain excessive after implementation of those controls, employees must be supplied with protective devices that will reduce sound to the level allowed by the law.

Chapter 44A, Vehicular Noise Regulations of the State's Public Health Regulations sets standards for the emission of noise by vehicles. The standards apply to all vehicles except those normally used for emergency work. As was true of the standards for stationary noise sources, permits may be issued allowing noise emissions exceeding levels set in the standards. Unlike permits issued under Chapter 44B, they are valid for only six months, and only two may be issued for any one vehicle within any ten-year period. No official federal limits exist on the level of highway noise, but there are standards for the amount of noise that may be emitted by certain vehicles manufactured after December 3, 1977.

So much for local law. There is a plethora of federal noise standards issued by any number of cognizant agencies, such as the EPA, HUD, FHA, FAA, etc. Many of these standards also serve as design guidelines for control and mitigation of noise sources.

One of the more significant federal efforts in land use planning and the sonic environment has been by the Defense Department. In order to maintain the continued operational viability of their airfield installations, they have commissioned studies to establish Air Installations Compatibility Use Zones (AICUZ) around their facilities. These guidelines are developed in consultation with local land use officials. With wide public dissemination of the documents and continuing dialogue between the base commanding officer and local government officials, the land use recommendations may be useful as inputs to the public planning process.

It will be interesting to see how this guidance is used when considering development in the vicinity of the Naval Air Station at Barber's Point, Hawaii. Will the existing predominantly industrial and agricultural land uses that surround this installation give way to housing and resort uses? You can imagine the difference in noise sensitivities between agricultural-industrial users and resort-residential users.

### SONIC IMPACTS AND THE DESIGN PROCESS

Awareness of the relation of land use planning and the sonic environment is an idea whose time has come and architects and planners are now trying to implement this community concern along with the many other community concerns reflected in our land use laws and standards. We have learned the importance of phased development that takes into account the continuing impact of the inherently noisy construction process. We are also learning to isolate and control the noise sources that we introduce into urban developments.

First Hawaiian Bank's

Checkup

An automatic service that lets your money earn interest until it's needed in your checking account.

Checkup is more than checking. And more than savings. It's an automatic link between the two. The result: your money can earn interest in savings until it's needed in checking.

Let's say your checking account reaches a zero balance. And you write a few checks. With Checkup, First Hawaiian automatically transfers the exact amount of those checks from your savings into checking. So you've got your very own form of overdraft protection.

And here's the big benefit: your money has been hard at work earning interest all this time instead of lying idle in your checking account.

Now Checkup isn't for everybody. But if you're now keeping a fairly substantial combined balance in checking and savings, it may be worth interest for you.

Description and Circular Form

by EMILY ZANTS, Ph.D.
Student member, HS/AIA

Description in the traditional novel is criticized by one of the French avant-garde writers of the 1960s, Alain Robbe-Grillet, as being that of the triumphant Bourgeoisie, as "a reassuring world where things are above all the property of man. Whereas those objects you meet in our novels always seem to belong to no one." Encumbered forms and objects are a result of Naturalism, according to Robbe-Grillet, because it founded a sentimental, social, and functional meaning.

Then "little by little everything disappeared behind an accumulation of supposed psychological mechanisms, familiar motives, and more or less oversimplified social functions. The revolution at hand now is big enough: nothing less than ridding the world of all that crust will suffice." At least this may partially express our uneasiness with encumbered forms.

But you cannot get rid of the "crust" by ignoring it, by simply doing something else, for it is too deeply engrained in our bourgeois heritage. You have to deal with it. Some modern novelists return to an object time and again to attenuate it. Robbe-Grillet observed that his own descriptions consist of "a double movement of construction and destruction;" the method of the description is "to make see and prevent from seeing." This technique has become known as the grillwork technique in literature.

The modern novelist often starts a description over again, but with changes that totally transform the scene with which the reader thought he was familiar. This puts in doubt the first description, forcing the reader to verify, to compare his information and draw his own conclusions. The essential characteristic is not simply repetition, which is present merely to force the reader (user) to mentally juxtapose two parts of the work. In order to be dynamic, the juxtaposition must contain the seed of new relationships that remain unstated.

Michel Butor comments on one technique for dynamic juxtaposition used by Victor Hugo: enumeration. Butor himself translates the technique into architectural terms, if not forms. Enumeration, characteristic of the epic, makes it possible "to set all kinds of curves in motion at the same time. If it is a simple enumeration . . . we will have a totality of parallel curves, but the addition to each of these terms of particular signs will make it possible to modulate all these curves, and consequently to grasp a very complex space." Perhaps he was inspired by the Sydney Opera House.

Elsewhere he describes the technique as "a kind of descriptive machinery . . . set in motion. This descriptive machinery is basically incomplete. It cannot be finished. Consequently one can continue methodically to augment the contents indefinitely . . . One problem [is] to find a way of stopping this machinery. One way of stopping that is by a curved surface that goes off and is severed by another surface." In order that the point of intersection be valid, however, it must come from the internal structure of the work.

Caravaggio, notes Butor, engages the observer "by encroachments of forms on one another. Another literary critic, Ortega y Gasset, finds Caravaggio does it with the use of light: "the visual ray halts at the point where the body begins and light strikes resplendently; from there it seeks another point on another object where the same intensity of illumination is vibrating."

"The painter has achieved a magic solidarity and unification of all the light elements in contrast to the shadow elements. Things of the most disparate form and condition now become equivalent. The individualistic primacy of object is finished."

By this leveling of objects, reality literally appears in a different light.

The grillwork technique as used by Robbe-Grillet and Butor diverges in two different directions. Robbe-Grillet uses an object only to destroy its implications; Butor puts all of history, myth and tradition between the object and the reader, making it equally impossible to draw any conclusions, but providing a much richer resource for interaction. He builds up the implications until the habitual one becomes almost irrelevant and the importance of the object, event, or person has been transformed. His secret is not in the description itself, but in the complexity of the relationships created.

Butor is a true master of circular form and describes one of his novels, Degrees, as turning upon one fact, "which is like a peg holding my text together and keeping it from disintegrating:" this fact has "an existence for me, for you, for us all only because it appears as a focus, in the middle of a whole zone of imaginings and probabilities . . . ."

Similarly, does not a building need a focus point permitting it to integrate all users and their needs? Again modern architecture is like the modern novel: the users and needs tend to be diverse. All the more cause for a focus point to provide a frame of reference.

If effective, a work of architecture would be like a good book, "a mobile awakening the mobility of other books [or architecture] a flame rekindling their fire" (Butor).
‘Oahu’s Neighborhoods: How They Came to Be’

"Oahu’s Neighborhoods: How They Came To Be" is the theme of a series of lecture/slide presentations to be given on five Monday evenings, February 5 through March 5, in the Academy Theatre at the Honolulu Academy of Arts.

The program is sponsored by the University of Hawaii College of Continuing Education and Community Service, in cooperation with the Honolulu Academy of Arts and will cost $15 on a subscription basis or $3.50 by individual admission at the door.

The lecture/slide series has been planned as a sequel to the "Honolulu: The Story of a City" course given a year ago and the programs will cover the history of various Honolulu and Rural Oahu districts and what archeological and historic landmarks remain. All sessions will begin at 7:30 p.m. and run two hours. Here is the schedule:

February 5—WAIKIKI: The Resort Area Before Statehood, by sociologist Richard Coller, instructor of social science, Kauai Community College.

February 12—KAIMUKI and KAPAHULU: Their Character Has Persisted into the 1970s, by Richard Bordner, coordinator for Historic Hawaii Foundation’s Kaimuki-Kapahulu Survey.

February 19—MANOA: The Early History, by Beatrice Krauss, research affiliate, Harold L. Lyon Arboretum, University of Hawaii at Manoa.

Old Houses Still Standing, by members of the Junior League of Honolulu.

Continued on Page 22

Development Plan Survey Results:

by RORY HAHN

The three most pressing problems facing the people of Oahu are the lack of affordable housing, the uncertainty of an adequate water supply, and the growing congestion on our highways. These are some of the findings of a survey commissioned this summer by the city’s Department of General Planning.

The survey was carried out by the consulting firm of Survey & Marketing Services, involving 4,000 house-to-house interviews designed to find out about the views of the community concerning a wide range of development topics.

Since the early 1970s, the lack of affordable housing has been a serious problem facing residents. They consider housing the single most important problem facing the city. They want more low- and moderate-income housing and more single-family housing they can afford. However, there is very little agreement as to where on this Island this housing should be built.

Another strongly supported objective is the preservation of agricultural land. This is especially true in rural areas such as Windward Oahu, the North Shore, and Waianae. In contrast, the people in Ewa and Central Oahu are not as strongly against urbanization, due perhaps to the on-going developments occurring in these two areas.

Residents of two key areas on the Island are particularly concerned about transportation. East Honolulu (Kalaniauaoalear Highway) and Windward Oahu (TH-3) residents definitely want improved facilities; however, they are not in agreement as to the type and extent of the improvements. Doubts are primarily generated by the potential impacts the improvements may have on population growth in their area.

Another high priority item is the preservation of specific buildings and sites of significance. Although this is a high priority item, people do not want areas to be stagnant. There is strong Islandwide support for the improvement and/or redevelopment of Waikiki, Chinatown, Kakaako, and the waterfront and downtown areas. Again, the specific manner and extent each area is
Not just another pretty place...

Hawaii is unique in many ways—including its business and government environment.

Get the full story of Hawaii in a tightly written publication that covers its economy, culture, taxes, geography, people, and more—colorfully illustrated in a magazine-style 64 pages.

All About Business in Hawaii for 1979 brings you up-to-date on Hawaii's growth and diversification, puts you ahead with inside information, provides fresh perspectives on the why, what and where of an Island State.

At $2.50, it's one of Hawaii's biggest bargains.

On most newsstands, or direct from the publisher.

Enclosed is $_________ for ________ copies of the 1979 edition of All About Business in Hawaii at $2.50 each postpaid.

to be improved remains unresolved; however, the community now appears to be in favor of the city taking action to improve these areas.

What do these results mean? One interpretation might be that the people of Oahu are in favor of lower density development, and might perhaps accept zero lot-line detached housing in Central Oahu and Ewa as a realistic substitute for traditional single-family housing. One could also interpret the results to indicate a desire to have more low-rise apartment development in Central Honolulu with high-rise development concentrated in only specific neighborhoods.

Although there is a strong desire to keep existing single-family neighborhoods in Central Honolulu free of apartments, the survey indicates the community might accept somewhat higher densities through smaller lot sizes and duplexes.

Finally, there is a strong indication that the community now recognizes the need to improve Waikiki, downtown, Chinatown, Kakaako, and the waterfront areas. These areas, if properly developed, may take away the pressure for higher density development in more mauka, stable neighborhoods and at the same time meet the demand for higher density housing.

The points of view just expressed barely touch the surface of possible insights which the survey could provide. If further information is desired, copies of the report are available at the Department of General Planning.

NEW ZEALAND METAL TILES AT MAUNALANI HOSPITAL WERE INSTALLED BY PEERLESS ROOFING BECAUSE...

* Unlike clay and concrete tiles, steel tiles are light (1/3 the weight) and not brittle;
* Unlike wood shakes, steel tiles are both long-lasting and fire-resistant;
* Unlike asphalt shingles, steel tiles are rigid and self-supporting;
* Unlike slates, steel tiles are secure against wind and have integral weather-proofing.

CASTICO'S NEW PROFILE has been designed because early forms of pressed steel tile were felt to be too weak where they should have been strong, and too rigid where they should have been flexible. Some could dent when walked on in the past.

Clinton Briggs Ripley—Architect
The Middle Years

by CHARLES O. UHLMANN, AIA
Illustrations by author

Comments by the Author
I'm a rank amateur historian. This sketch of Ripley's life and times is spotty and is drawn from a larger study in progress. I've entitled it "The Middle Years..." because I don't know much about his early California years or much after he departed for the Philippines. In addition to the specific sources cited, I found a lot of general background information in the Honolulu and San Francisco newspapers of the period. The illustrations were drawn directly over the microfilm reader.

C.B. Ripley is probably most familiar to us through his association with C.W. Dickey. But the Ripley & Dickey partnership was actually a brief, albeit prolific, interlude in Ripley's long and varied architectural career. Following high school, he began in apprenticeship to an uncle. William K. Ripley in Chattanooga in 1871. There he married Loda M. Rose in 1873 and moved to Nashville. In 1875, looking toward the new frontier, they moved to San Francisco and then, in 1890, they looked for a new frontier.

Ripley was 38 years old when he and his family (including seven children) left San Francisco on the S.S. Alameda. They steamed into Honolulu just before Christmas 1890. Immediately Ripley established himself as an architect and building construction superintendent with Peter High's Enterprise Mill, and as a "visiting brethren" at the local Masonic lodge. While Ripley was living in California, what little he may have known of economic conditions in the Hawaiian kingdom probably revolved around newspaper accounts of King Kalakaua, Walter Gibson and Claus Spreckels. There were reports that the civilizing effect of American commerce had influenced Hawaiian politics. Within the framework of constitutional monarchy, the reform movement of the late 1880s reflected the greatly increased political power of haole (especially Americans) within the cabinet and Parliament.

Although native Hawaiians still far outnumbered haoleos (and foreign-born Orientals were disenfranchised), the king's authority was under incessant attack and his status was soon restricted to that of a figurehead. The revised reciprocity treaty of 1888 with the United States (which gave the U.S. exclusive rights to the use of Pearl Harbor for military purposes) opened the door to American development of Hawaiian resources.

Prosperity of the sugar plantations (owing largely to favored treatment in American markets) caused a general sense of economic well-being among Hawaii's political and business leaders. For Americans looking for new frontiers, the news from the Hawaiian Islands must have been encouraging.

This is not unrelated to the subject of architectural history at hand. It was Kalakaua who sent abroad for architects to design his imperial residence. The resulting arrogant, Victorian robber baron's house he proudly held forth as a sign of his status in a rapidly changing world seemed to invite the careless introduction of foreign influence. His political role uncertain in December 1890, Kalakaua went to San Francisco for treatment of a lingering illness and recklessly plunged into a hectic schedule of social activities.

While Ripley was attempting to establish himself anew in Honolulu, the Hawaiian king was celebrating the New Year at the fabulous Hotel del Coronado at Monterey. In Los Angeles, Kalakaua was also royally received, but there he caught cold and his entourage returned immediately to San Francisco where he died quite unexpectedly. When his body arrived in Honolulu there was an elaborate funeral, including full Masonic rites—the King having proudly been a first Order Mason.

For Ripley it must have been an unusual and alien experience, being unaccustomed to the purpose and pageantry of the monarchy. Nevertheless, it was architect Ripley (of the Enterprise Mill, who designed the "exceedingly tasteful" mourning dress for the front of the Government Building 'Ali'i'olani Hale). Also, Ripley's timely arrival resulted in a fortuitous opportunity. The building committee for the new Sailors' Home design competition had just moved back the deadline for submission of plans from December 15 to February 1. Ripley won first prize (George L. Dall, second, and Harry Mills, third). His association with the Enterprise...
Charles O. Uhlmann holds a master's degree in architecture from Washington University in St. Louis. He worked in New York City and San Francisco, and began his career in Honolulu nine years ago working for Onodera, Kinder & Zane. He is currently project architect with Anderson/Reinhardt, Ltd.

Planning Mill was terminated that same spring and he apparently practiced on his own until the arrival of Arthur Reynolds in the fall of 1891.

Reynolds was 30, single, and had worked in Chicago on building designs for the Columbian Exposition to be held in 1893. He was probably in San Francisco in 1890 and it seems possible that Ripley and Reynolds first met there. In any case, they quickly joined together in partnership in Honolulu.

Charles Peterson has observed that it was not until after the end of the monarchy that architects could support themselves by plying that profession alone. However, even during Kalakaua's reign there was considerable demand for services of persons knowledgeable in construction, although architects and clients knowledgeable in architecture were conspicuously few. An exception was Charles Reed Bishop. After 1886, Bishop spent more and more time in San Francisco, but he maintained an active role in many civic and business interests in the Islands.

Shortly preceding Ripley's arrival in 1887, architect William F. Smith of San Francisco (then 32) was commissioned by Bishop to design the main building for Kamehameha Boys' School. This was Honolulu's first taste of the Romanesque revival style, artfully rendered in rustic local lava rock from quarries on The Kamehameha School grounds. In 1889, Smith was commissioned to design Museum Hall for Bernice Pauahi Bishop Museum. In the same year, Bishop was instrumental in the selection of George A. Bordwell of Oakland (then 39) for the design of Central Union Church. This design was a somewhat orthodox example of Romanesque revival and reportedly an adaptation of a commission already executed by Bordwell in East Oakland.

Other than brief visits to the Islands, neither Smith nor Bordwell practiced in Honolulu. In fact, they probably had only scanty knowledge of the settings into which their building designs would fit. While neither Ripley nor Reynolds had anything like even the modest notoriety of Smith or Bordwell, they were permanently established in Honolulu or, at least, they tried to create that impression.

Ripley & Reynolds were engaged in a lively practice and their partnership, rather than that of Ripley & Reynolds, deserves the distinction of being called the “first modern architectural partnership” in Honolulu.8

The first Ripley & Reynolds partnership lasted until the fall of 1895, and thus bracketed one of the most tumultuous periods of Hawaiian history, including the forced resignation of Queen Liliuokalani (January 1893) and the attempted counter-revolution (January 1895). Prior to the revolution the partners had been busy with such projects as the Pearl City Hotel and the new Masonic temple.

After the revolution they were even busier. Generally speaking, Americans in Hawaii who supported the overthrow of the monarchy were rewarded for their efforts by the provisional government and, in the private sector economic opportunities were plentiful for the willing and able among them.

Ripley (who held the rank of captain in the Citizens' Guard) and Reynolds designed a variety of building types including a classroom building at Oahu College (Pauahi Hall, Punahou), Kamehameha School for Girls, the Healani Boat Club, the Methodist Church, and the von Holt commercial block. They were surprisingly strong in architectural competitions, winning first place for the Pearl City Hotel and Pauahi Hall. In the case of the latter, they won second prize as well, in limited competition with Smith & Freeman and George A. Bordwell.

Reynolds, having worked on...
designs for the “Great White City” of the Chicago World’s Fair, would have been strong in the neo-Classical style and previous experience would have certainly included Romanesque revival. Ripley, on the other hand, had 20 years of experience when he arrived in Honolulu and his career would have bridged Victorian (Gothic and Italianate), Eastlake, Queen Anne, and Romanesque revival. However, one can't help feeling that their use of varied and sometimes seemingly inappropriate styles indicates a lack of strength in conceptual design as well as a degree of naivety among their clients.

It is clear that as senior partner Ripley was the coordinator and driving force behind the business success of the firm. Ripley understood how to bring in work. He carefully and deliberately insinuated himself into community activities such as free and accepted Masons, the YMCA, and the Methodist church. To provide complete architectural services it seems probable that Ripley came quickly to depend upon Reynolds as the firm’s designer.

But Arthur Reynolds was not so settled as Ripley. Perhaps to Reynolds, success was defined in other ways—after all, he didn’t have a wife and seven children to support. There are indications that the partnership was beginning to dissolve in the fall of 1895. When the opportunity presented itself just after Christmas, Reynolds tucked his sketchbook under his arm and set off to tour the world with the Music Concert Company.

Ripley apparently labored alone through the spring of 1896, and among other projects, completed the final design of the opera house reconstruction for its patrons, Mr. and Mrs. William G. Irwin. The following June, Reynolds returned to Honolulu having toured Japan, parts of China, Burma, the Philippines, and Java. He said “business” had necessitated his return, which may have been a reference to unfinished design work in Ripley’s office he had hoped to complete.

But while Reynolds was traveling, Honolulu’s architectural community had changed in a very significant way—in February Will Dickey had come home to stay.

Dickey was a kama‘aina who had the best academic credentials and the best social connections (see W.D. Merrill’s article in Jan. ’79 H.A.). After a few months’ apprenticeship in the office of the Reid Brothers in San Francisco (they designed the Hotel del Coronado, Continued on Page 16)
TAXES OF HAWAII

16th EDITION

INCLUDES:

• 1978 changes to Hawaii tax laws, including excise, inheritance, real property,
• All Federal tax changes, including Revenue Act of 1978
• Recent court decisions, tax department information releases, Attorney General opinions
• Directory of State and Federal tax offices in Hawaii
• Specimen tax forms

Authored by Russell S. Bock and Elliott H. Brilliant
The only authoritative book on Hawaii taxes.
$11.95 per copy, postpaid.

1888, and during the winter of 1895 the Spreckels office tower and Claus Spreckels' mansion were being designed), at age 24, he returned to the Islands and entered the employ of C.B. Ripley. He was put to work at once refining the design of Ripley's Gothic-style memorial chapel for The Kamehameha Schools. Dickey apparently improved the design to Charles R. Bishop's eventual satisfaction.9

About the same time the Bishop Estate building was designed in Ripley's office, but it is not clear whether Dickey was involved. It was a period of transition for Ripley's office and it is possible that the design of the Bishop Estate building and the Irwin block, which was designed later that summer, represent the hand of another designer. They are highly stylized examples of American Romanesque which was popularly borrowed from books in the late 1880s.

In June 1896 plans for reconstruction of Baldwin Memorial Chapel at Wainee, Lahaina, were announced and the architects named were Ripley & Dickey. Ripley had found an able and well-connected new partner or, perhaps, Dickey had found him. As in his previous partnership, Ripley was the senior partner and assumed the role of coordinator while to Dickey fell the responsibility for design. From 1896 until the end of their partnership in the summer of 1900 the commissions fairly rolled in.

With particular regard to Dickey's work, Meredith Neil has compiled a nearly comprehensive list of Ripley & Dickey's projects during this period including many commercial and public buildings, and dozens of residences.10 In the context of their work it is difficult to define Ripley's role precisely, but it is clear that he possessed different talents than those of a great design architect. His skill lay in organization and coordination (today we would say in the domain of construction management) and, therefore, he could operate fruitfully in symbiotic relationship with an able designer.

Perhaps Ripley was aware of his dependence and how it reflected on his image as an architect in the business community. When he traveled to the States in the fall of 1898, he took care to write to the Honolulu press that in Chicago (which was then becoming an architect's Mecca) he was "taken up by the leading architects and
shown through all of the principal buildings."

But he was also confident of his strengths, which included being flexible in the application of his talents. Partly this may have been Ripley's response to changing demands of clients and increasing competition with other architects such as Howard & Train, Beardslee & Page, H.L. Kerr and O.G. Traphagen—a man of formidable talents. And partly, Ripley instinctively sought to make opportunities where others might not have looked for architectural commissions.

For example, during the construction of the Honolulu Brewery building (1899-1901) Ripley & Dickey provided local supervisory services for the New York architect, H. Steinmann. Then, when the bubonic plague threatened Honolulu in the winter of 1899, Ripley immediately volunteered his services. He was appointed by the Board of Health to a special citizens' committee on Chinatown problems.

To expedite construction of the Detention Camp, "on motion of Mr. (L.A.) Thurston, Architect Ripley was given full charge of all the buildings ordered and the delivery of material. He has secured a sufficient number of contractors who are pledged to begin work immediately." Clearly this is an early example of fast tracking. Ripley & Dickey were also called upon to design the fumigation station to be erected on the Executive Building (Iolani Palace) grounds.

Under Board of Health direction, the Fire Department was systematically burning wooden buildings in infected blocks. On January 20, a sanitizing fire swept out of control and left most of Chinatown in smouldering ruins. This must have made an indelible impression in Ripley's mind but, moreover, it probably sparked his imagination with the enormous potential in advocating fireproof construction.

Fireproof construction per se was nothing new. In fact Traphagen had brought with him from Duluth the reputation of having been associated with the foremost expert in fireproof construction in America, Francis W. Fitzpatrick. The Judd Building (1898-99) and the Boston Building (1899-1900). Ripley & Dickey had the Stang-
Continued from Page 17

enwald Building on their drawing boards when the plague quarantine was lifted from Honolulu. Ripley went immediately to California and spent two months researching new methods of fireproof construction and interviewing experts in the field. His return was preceded by the cryptic message that he would bring with him details of a revolutionary new method of construction. He was scarcely down the gangplank when it was announced that he would take charge of construction superintendence of the Stangenwald Building and would forthwith organize the Concrete Construction Co.14

All did not go well. First, the Stangenwald Building was beset with financial problems. Although Ripley's new system may have been more fireproof and it had the capability of supporting greater loads on thinner walls (six stories was a high-rise in Honolulu), it was not cheaper. Eventually the building was completed with bearing walls of cheap, Japanese brick (the first in the Islands). The Merchant Street facade was of California pressed brick and hollow granite trimmings, consistent with architect Dickey's design. In retrospect it is easy to see how the Stangenwald Building was a watershed in Ripley's architectural career. He turned his attention almost completely to the technical aspects of architecture. He spent about a year trying to promote Concrete Construction Company's building system, and they did, in fact, win contracts for several buildings including a couple of other Dickey designs. But, there was a general downturn in construction. In January 1902, Concrete Construction Co. was reorganized and Ripley sailed for the Philippines, which was to be his next frontier.

Following the 1898 takeover, Americans had great expectations for economic development in the Philippines. In order to sustain a colonial outpost in Asia, massive government expenditures for military and civilian support facilities were required. Millions were being spent for construction and it must have seemed to Ripley that the Philippines held an untold promise for the future. When he left Honolulu, the Hawaiian Star reported that Mr. Ripley "goes to design and construct a handsome new Methodist church there and to engage in general architectural and building operations."

After five years in Manila, things turned out to be "too slow" and he relocated to Oakland. There he was rejoined by Arthur Reynolds and they formed the partnership of Ripley & Reynolds for the second time. The firm moved back to Honolulu in 1910, when they won the commission to design the new Central YMCA. Ripley told the Star that in California his family "were unable to endure the climate in comfort. . . so we have decided to come back to the Paradise of the Pacific to remain. I will re-open an office and resume business much where I left off (10) years ago."15

In addition to the YMCA, which still survives as the Honolulu Merchandise Mart, Ripley & Reynolds designed Hawaii Hall at the University of Hawaii. In 1913, Reynolds went out on his own and Ripley made a new partnership with Louis E. Davis. That firm evolved into Ripley, Davis & Fishbourne just before Ripley died in 1922.16

7. "Hawaiian Gazette" 1/30/94, p. 1. It is also interesting to note that both Neil and Gaylord Wilcox have credited C.W. Dickey with the design of Pauahi Hall, but when the design drawings must have been done in the winter of 1894 and spring of 1895, Dickey was completing his senior year at MIT. And, while the building was being erected during 1895, Dickey was otherwise occupied on Maui. During the spring of 1896 he may have had a hand in the construction supervision. But, in spite of the relatively sophisticated use of so-called Moorish elements (for which Dickey was later recognized in his design of William G. Irwin's mansion in Waikiki) the original Pauahi Hall design must have been Reynolds' and Ripley's, believe it or not.

**That's a Butler building?**

Yes, that is a Butler building. In fact, you probably see beautiful Butler buildings all the time and don't know it.

Because Butler buildings offer total design flexibility and can be as tasteful and dramatic as any building.

Yet, they also give you all the important time and money savings of systems construction.

To learn more about Butler buildings, give us a call.

MENG HOCK PANG, Student Affiliate; Sophomore, University of Hawaii. Hobbies: photography, slide programming, reading.
Professional development for practicing architects, student aid, visiting critics and speakers, library acquisitions, conferences and seminars—all are included in the objectives of the second annual appeal of the University of Hawaii Department of Architecture.

Edward Aotani and Francis Haines head the fund-raising effort, assisted by Elmer Botsai, Donald Goo, Ernest Hara, E. Alan Holl, Clarence Miyamoto, Vladimir Ossipoff, James Sugawa, and Howard Wong.

Flexibility and creativeness result from the gifts which donors make available to the department, as the use of funds from last year's appeal clearly indicate. These monies were used to complete the department's jury room and graphics studio, constructed with student help; to purchase special light type fluorescent tubes to insure proper color control for that studio; and to purchase materials to allow student competition graphics to be applied to portions of the building.

Funds were also earmarked for the printing, binding, and distribution of the graduate urban design studies of Kakaako, which will be distributed to neighborhood boards and city and state planning agencies. It is anticipated that this will be followed up with a senior design studio study of the Moiliili district.

Funds have been used to assist in the development of the Hawaii Society AIA convention, including funds for travel expenses of Harry Weese, guest speaker for the convention. In addition, continuing education programs in fire protection and life safety, a student Beaux Arts Ball, and sending a student delegation to the Association of Student Chapters, AIA, Convention at Sun Valley were and will be underwritten.

As the fund grows and develops, greater assistance in the continuing education area, as well as finding additional ways to involve architectural students with the professional practitioner will be offered.

**KO A FLOORING**

By GenuWood™ II

Real Koa. Bonded in durable vinyl.

Elegant Koa flooring, lustrous and warm yet as easy to maintain as a kitchen floor. An invisible shield of tough, easy to clean vinyl protects from scuffs, scratching and spills. GenuWood™ II vinyl bonded Koa flooring is more resistant to abrasion than vinyl tile and vinyl asbestos, and will not show wear or traffic patterns. GenuWood™ II sandwiches carefully selected Koa veneers between a thick surface layer of permanently bonded, invisible, moisture resistant vinyl and core layers of fiberglass and vinyl.

Available in 4"x48 planks, random planks, and squares, 9" and 12".

Happiness is pushbutton elevator service that's both reliable and affordable.

Elevators that are activated by hundreds of hands every day, perhaps every hour, need expert professional preventive maintenance service. And, as a user, you want fast emergency service whenever you need it.

Amelco Elevator maintenance service includes all of this, and also helps to balance your condominium budget. Nowadays, that's a very happy thought. Call for a comparison estimate with what you are paying now.

Ready for that Happy Number? It's 845-3291.

Keeping Hawaii Plastered

ADVANTAGES OF USING LATH & PLASTER CURTAIN WALLS

Design Versatility
- System is adaptable to steel frame, concrete structures, masonry bearing walls, or any combination of types.
- Portland cement stucco offers a broad range of finishes, and cavity walls provide ample chase and insulation space.

Light Weight
- Average weight (finish to finish) of 14 to 20 lbs. per sq. ft. reduces dead load effect on structure and footings. High strength factor means the greatest load capacity to weight ratio of any building materials available today.

Durability
- Permanent construction. Long established components of cement plaster, metal lath, and steel studs have been developed into proven systems with use of new techniques.

Insulation Values
- This is an important consideration because of the energy crisis. Lath and plaster curtain walls not only reduce operating expense, but also mechanical installation cost.
