Annie Leibovitz

The High Museum of Art in Atlanta, Georgia, will present an exhibition of photographs by noted American portraitist Annie Leibovitz September 21 through November 28, 1993. This nationally touring retrospective includes 125 color and black-and-white images ranging from early assignments for Rolling Stone through current portrait work. Among the luminaries pictured are Mikhail Baryshnikov, David Byrne, John Lennon, Yoko Ono, and many others.

Options 46: Rachel Whiteread

The first U.S. museum showing of work by British sculptor Rachel Whiteread will be presented at the Museum of Contemporary Art, Chicago, July 9 through September 26, 1993. The exhibition includes a small group of recent work created from domestic objects and is concerned with the evocation of early memories.

Chicago Architecture and Design

As part of its centennial celebration, the Art Institute of Chicago will present Chicago Architecture and Design, 1923-1993: Reconfiguration of an American Metropolis, June 10 through August 29, 1993. On display will be more than four hundred works including architectural artwork, models, furniture, and furnishings that focus on themes of the urban world as it changed after the Great Depression and World War II. The imaginatively designed installation was built by eight Chicago architects in conjunction with architect Stanley Tigerman.

Felix Gonzalez-Torres

Currents 22: Felix Gonzalez-Torres will be on exhibit at the Milwaukee Art Museum May 28 through September 12, 1993. The Art Museum continues its Currents series of contemporary exhibitions with the work of this young, New York-based conceptual artist who challenges the conventions of art production, presentation and audience reception. For Currents 22, Gonzalez-Torres has designed a multiple site installation located in the museum and on billboards throughout Milwaukee.

Josef Paul Kleihues

The Museum of Contemporary Art, Chicago, will present the work of Berlin architect Josef Paul Kleihues July 9 through September 26, 1993. Kleihues was the winner of an international competition for the MCA’s new building to be completed in late 1995. This exhibition includes drawings, models and early sketches by the self-described “poetic rationalist,” and will examine the architect’s response to briefs for “ideal” museums for contemporary art.
Sub-urban House

The Jones residence addition, designed by Iowa State University Professor William Conway, examines the distribution of spaces typical to the sub-urban family house. Located in Corona Del Mar, California, the 1200 square-foot renovation and addition questions the architecture of the single family house and the development-driven architecture of the multi-story monoliths that threaten the fabric of the small beach community. The project is structured through the design of an armature of parallel walls that enframe spaces of storage, passage and study. The architecture of the Jones residence is representative of Professor Conway’s ongoing research into the spatial nature of the wall.

Botany Hall Renovation

Baldwin White Architects PC has completed design development documents for the renovation of historic Botany Hall on the campus of Iowa State University. The five million dollar project, renamed Carrie Chapman Catt Hall, will provide administrative space for the university’s College of Liberal Arts and Sciences, the Department of Philosophy and the newly-instituted Carrie Chapman Catt Center for Women and Politics.

The 1892 building, originally designed by Cedar Rapids’ architects Josselyn and Taylor and listed on the National Register of Historic Buildings, will undergo both extensive exterior restoration and substantial interior remodeling. Construction of the project is slated to begin in the summer of 1994.

Rotary Reserve Lodge

The Cedar Falls, Iowa, Rotary Reserve has begun construction of its new lodge. Thorson Brom Broshar Snyder

Architects sited the building on a crescent-shaped ridge that offers commanding views over a 10-acre nature preserve along the Cedar River. The radial plan is derived from the shape of the existing ridge, with massing of the building to take advantage of natural light, views and prevailing southwest breezes.

Church Expansion

Construction is expected to begin on the addition to the First Reformed Church in Sioux Center, Iowa. Designed by FEH Associates Inc., the project includes a new sanctuary, fellowship hall, chapel and kitchen, along with the remodeling of two existing classroom wings. The new 1300+ seat sanctuary will allow the church to combine into one worship service.

Diagnostic Center

Hanson Lind Meyer has completed schematic design for the first phase of St. Tammany Parrish Hospital, Covington, Louisiana. The first phase consists of an outpatient diagnostic center which is intended to form the basis for future growth into a full service hospital. A semicircular spine contains the business functions with the diagnostic/treatment functions contained in pods radiating from the spine. The parti allows the spine to expand with additional pods to accommodate future growth.

Presenting Flexiframe® windows.
The custom-made commercial window from the company you may have thought didn’t make one: Andersen.

Flexiframe windows are made with a glass-fiber-enhanced polymer. This polymer is so strong and corrosion resistant, it’s actually used along the seacoasts as a substitute for structural steel.

On the inside, warm Ponderosa pine gives office interiors a feeling cold aluminum can’t match.

And Andersen® Flexiframe windows can be custom-made to your specifications in 1/8" size increments.

To learn more, contact your Andersen distributor listed below.

Come home to quality. Come home to Andersen®.
Featured on the cover and leading off this issue of Iowa Architect is the Kruse/Berg Kruse residence. Designed by the owners, the house successfully resolves the conflict of relating to a typical suburban development and also four hundred acres of natural woodlands. Next, the Eskin residence also relates strongly to its Colorado site and combines a wonderful array of local building motifs. A skillfully handled addition to the Victorian Hunter residence seems as though it were part of the original house. Two distinct approaches to modern residential design are illustrated by the Carney/McFarland residence and the Glynn residence. In the latter, as you may notice, the author has taken liberties to present the house in a way very similar to how the house presents itself. Finally, in contrast, the Sargent cabin and a gardener’s shed illustrate two one-room alternatives to our more modern and often conventional provisions for shelter.

William L. Anderson
Editor
The home is a splendid solution to combining the old and the new within a difficult site. The client/architect has superbly designed an environment both in contrast to and embracing nature.

Editor's Note: The Kruse/Berg Kruse residence appeared previously in the Iowa Architect Winter 1992 issue. The residence was recipient of a 1992 Central States Region Honor Award.

An architect's private residence is the ultimate symbol of personal aesthetic preferences. Designing one's own home is an arduous task for the individual who has been exposed to numerous theories and styles throughout his or her educational and professional career. Assimilating and sorting through a multitude of images to create a coherent plan is a challenge for the designer. For Rod and Jan Kruse this endeavor was intensified by the location of their home in a newly developed suburb.

While Richard Meier has designed homes for clients with few neighbors and therefore no concern with contextualism, the Kruses' did not enjoy this situation. Rod's desire to live in the woods was vetoed by the children. The site has a two-faced nature as the home separates opposing environments: a treeless streetside and 400 acres of park.

Composed of three shifted rectangles, the two gabled forms present a conventional pattern to the street. The overall shape resembles surrounding homes but the visual play results from a ten degree shift between the two dramatic gables. The power of ten is also employed in the siting of the Modernist house concealed behind a limestone wall. This single-story form is shifted ten degrees from the large gable and runs parallel to the park boundary. Dynamic tension results as elements interact with one another and simultaneously react to streetside and the park.

The simple elongated 15'x66' section employs a gridded window wall gazing upon the vast wooded area. By utilizing this grid the architects have established a visual connection with nature and the mullions illustrate the serene quality of Japanese architecture. The limestone wall disguising this Modern section is similar to several of Richard Neutra's residential designs.

The exterior is an intricate composition of elements meshing together into a unified entity. If separated these forms would have minimal impact. To further express the individuality of this home Kruse has clad the exterior in white. Every element from walls, window frames, doors and shingles is pure white, which enables the house to present itself as an unadulterated shape upon the landscape.

The home is internally organized with all bedrooms and baths in the large gabled section. The top floor contains a study area overlooking the park through large windows, in contrast to the minimal fenestration in the street elevation. A
(Left) Architectural elements are pure white to present the house's composition as object on the landscape.

(Below) The modern box appears as a jewel with the gable windows facing the park. The grid is a frame and visual connection to the park.
centrally located staircase between the second and third levels opens and unifies the space and demonstrates the architect’s penchant for simplicity. Constructed of sandblasted steel with a clear finish, the staircase represents the paramount importance of form and texture in design.

The kitchen and dining areas are located in the large gable plan but actually protrude into and occupy space within the Modern structure. Uncommon residential angles are formed by this intrusion and one is reminded that the entire plan is slightly askew.

Inside the graceful small entry gable is a staircase providing access to the second level. Perfect square windows facing the park offer another interesting vantage point as one ascends the house.

The residence achieves its strength from the use of elements in contrast to one another. This important aesthetic consideration is exemplified in the meticulous juxtaposition of form and color throughout the interior. Architects constantly strive to establish details-Mies-and connections-Eames-between building elements to stress the intricate use of material. Form and texture combined with color and construction clearly indicates a high degree of craftsmanship not usually associated with residential construction.

Kruse has extended the purity of white from the exterior to the interior providing a pristine backdrop for shapes and colors. Throughout all levels of the house black pipe railings delineate circulation paths and provide an absolute contrast with the white color scheme. The use of maple wood flooring, lighter than traditional oak, in the kitchen and dining area allows the mahogany cabinetry and black granite countertops and appliances to play off the light wood. Gray commercial carpeting in the Modern section sets off the black chairs and piano, producing an interesting counterpoint to the adjacent park environment.

The Kruse/Berg Kruse Residence combines the Modernist aesthetic with accepted residential forms. By utilizing a white scheme along with stone, and the assemblage of color and texture for the interior, Rod and Jan Kruse have produced an extraordinary home satisfying their personal requirements.

As the Third Millennium approaches architects will respond to the built environment with new ideas. This impressive home has its foot in the Twentieth Century and presents a possible example for residential design in the Twenty-First Century.

Mark E. Blauke lives in Oakland, California and plans to write the great American novel.
Maple floors and mahogany cabinetry contrast with white and black illustrating minimalist form and texture.

Articulation of bathroom functions were handled with a simplicity of detailing.

The Modernist structure looks out onto 400 acres of park. The dining/kitchen area thrusts into this section, creating a path between the traditional and Modern.
More often than not, residential designers find their creative instincts limited by a laundry list of external forces. Covenants and community design restrictions, code and regulation details, site and budget limitations, and client indecision are just the tip of the project iceberg that residential designers deal with routinely. Though all projects carry like baggage, it is the degree to which designers are able to turn these obstacles to assets that distinguishes good from average work.

Occasionally, a residential design project affords the opportunity to go beyond good and approach greatness. Over the last decade, Bill Nowysz has been able to attract a string of great clients and good sites, and has made the most of every obstacle. For his efforts, Nowysz has become one of Iowa’s premier residential designers, and with the Eskin residence in Aspen, Colorado, he is showing signs of expanding his circle of influence.

Like many of Nowysz’s clients, he and the Eskins are friends. The family owns a profitable marketing research company and has had homes designed by Nowysz in Iowa City and Chicago. The Eskins’ requests for this “home-away-from-home” were simple: a cabin with private spaces for visitors, a pottery studio, and “something regional.” Working with the Eskins and a “great site,” Nowysz set about to analyze the setting and develop a suitable concept.

To control housing density, Aspen has a 10-acre minimum code limitation for residential construction. The remote Eskin site is in the heavily forested Castle Creek Valley and backed up against steep, grassy mountains. “From the beginning,” said Nowysz, “we were blessed. The site was incredible and passed every environmental study and water table analysis.”

In addition to posing no environmental problem, which is virtually unheard of in mountain sites, the design passed through Aspen’s strict review board in less than eight months. “I took all the plans and delivered them in person, and attended all the meetings,” said Nowysz. “They’re very strict about heights and footings because of the water tables and underground springs. But we didn’t have any problem with the requirements. I guess it was beginners luck; most plans take at least two years.”

The Eskins and Nowysz spent several weeks in and around Aspen and surrounding mountain looking for a concept to drive the design. It had been decided that rather than imitate the precious Victorians of Aspen, the site was more suited to an old mountain vernacular. Inspiration for the home eventually came from the rugged countryside. “The imagery from Colorado’s rustic mountains vernacular includes voluminous barns, tattered mining sheds, stolid log cabins, and historic military forts. Combining as many influences into any single structure is at best a risky proposition. A mannered composite of such details almost always ends up an unrecognizable mess. Rather than blending form and style, the Eskin residence bluntly juxtaposes: The result is a striking composition of mass, structure, rhythm and integrity.

Robert Tibbetts
Skilled craftsmen were largely responsible for the success of the Eskin residence. Here, mitered corners of the log cabin, a flagstone patio, and landscaping details highlight the quality of the craftsmanship throughout.

Situated on a narrow bluff 60 feet above the quick water of Castle Creek, the Eskin residence is a loose collection of these mountain and Southwestern building types. Rather than selecting one motif or blending all five, Nowysz chose to use each distinctly. The axis of the design is the barn. It's a simple, timber-frame great room with a massive hearth. “The hearth is enormous; goes up to my shoulders and Ms. Eskin can walk right inside. ‘They burn six-foot logs in it that take two people to toss in,” said Nowysz. It is also one of the last homes in the area granted a permit for an open, wood-burning fireplace.

Because of the hearth’s large dimension, Nowysz hired an iron worker to build a screen and a pair of andirons. An aspen branch motif was chosen, some sketches were traced, and the artist left to interpret. The result is a splendid wrought-iron screen, patterned with an intricate network of branches, twigs and leaves, and a pair of andirons in old buildings up there are just terrific. Broad, low barns with shallow roofs; rusted tin sheds and abandoned mine shafts with tailings pouring out of them; and there was an old timber, military fort with ramparts and slotted rifle windows. We were looking at basic structures like log cabins and adobe, said Nowysz.
form of massive iron trout. When back-lit by fire, the screen's pattern casts mesmerizing shadows throughout the great room, and its iron leaves appear to shudder against the flames. The impression one gets is almost medieval.

According to Nowysz, the craftsmanship of the arth and chimney as well as the rest of the home's tiles are exquisite. Ostensibly due to its relative size, the area draws some of the nation's finest artists. "The stone masons' joints on the stonework are flawless. But all the trades were amazing — the landscape people, the timber framers they were real artists. The woodcutter who built the log cabin showed up on site in an old beat-up pickup with a dog and a satchel of tools. He worked like mad, worked overtime, and just loved what he did. It was fascinating to watch this guy miter the joints of those huge logs," said Nowysz.

Each of the concept's other four elements are hung off the barn's corners like later additions. Core-ten steel and corrugated sheet metal were used for the pottery shed and kitchen area. A log cabin fashioned out of beetle-kill-pine serves as the master bedroom and a library and guest suite fill out an adobe-like stucco structure. There is a mother-in-law suite above the garage; both are clad in the boards of a classic cavalry fort, complete with ramparts, tall narrow windows and an imposing wooden door.

In elevation, all five parts are skillfully woven together through careful massing. Each type remains distinct and does not compete with any others. Moreover, each retains the simple integrity of its original form. In plan, extensive use of flagstone flooring eliminates any implied space separation. The most unifying element, however, is Nowysz' detailing, his use of materials, and his ability to recognize talent and exploit it. While probably not great, this home goes way beyond good.

Combining five distinct styles in one structure can be risky. But, done skilfully as in Des Moines' Art Center, the effect can be one of compounding rhythm and intrigue. Nowysz has done some of his best work to date in folding these parts together to create a fluid, yet complex whole. The integrity of the home's imagery exudes character, its rough, burnished materials lend depth, and an uneven cadence make the home as random and unpredictable as October in the Rockies.

Robert Tibbetts is a frequent writer on art, architecture and film, and is former editor of the ACA Journal. He is currently the marketing coordinator at Gensler and Associates/Architecture in San Francisco, Calif.
This vintage residence has been vastly improved by a renovation/addition program respectful of the late 19th Century design. Both function and form principles have been successfully executed and resolved.

(Right) A family room gazebo appears original to the house by employing proper materials. It serves as a junction for the new porch areas and overlooks a sprawling yard.

As this century draws to a close it is important to acknowledge the residential work of architects in the last century. During the last decades of the 1800s, several Victorian styles were prevalent throughout the country. One of the more restrained variants was the Queen Anne, which often avoided the excessive ornamentation commonly associated with the gingerbread Victorian aesthetic. New construction techniques such as balloon framing replaced heavy timber methods, thereby greatly simplifying the building of wall projections, overhangs, and irregular floor plans. The cost of these homes was mitigated by the mass production of complex components such as doors, windows, and siding. Elegant houses were no longer restricted to the wealthy class as complex shapes and detailing became available to a wider clientele.

In 1895, Christopher Huttenlocher, the personal secretary to Frederick M. Hubbell, adapted a Queen Anne design from a mail order pattern book by Tennessee architect George F. Barber. The classic elegance of the home originates in the various steep angled roofs, multiple layering, and the state procession of porch columns. This original concept has been accentuated in a respect remodel/renovation by architect and Des Moines native Nate McBride of New York.

The exterior work involved two significant aspects with each solution enhancing the other. The original porch on the east elevation had only been extended approximately halfway across the southern facade creating an uninviting asymmetry and awkward approach. The architect lengthened the porch structure to the southwest corner where it abuts the new single story family room. An entry porch has also been added along the west elevation adjacent to the kitchen successfully integrating exterior spaces.

The most significant design aspect, however, is the expressive octagonal indoor gazebo tying the porch areas together. This element is precisely incorporated into the original design and serves both a multipurpose recreation room and a view onto the gardens and landscape. The perfectly scaled room replaces the original back porch and
try vestibule is accessible from it and the two porch areas.
The gazebo accomplishes functional purposes and adds visual stability as the mass ever so slightly unbalances the elongated porch area. Shallow angles rise only slightly above the porch ceiling and are a fitting contrast to the extreme configuration of the large gables.

In the architects' renovation projects, an emphasis has always been placed on the importance of employing building materials sympathetic to the original structure. This project involved obtaining elements such as the balustrade, molding, and urns for the porch and gazebo that precisely matched the existing components. Additional materials including hardware, fittings, and fixtures were purchased from Midwest architectural salvage resources, illustrating the architect's concern for originality.

With this attention to detail the addition appears in complete harmony with the 1895 design. The home is repainted to a Victorian color scheme that reinforces the unique character of the property. Beige columns are appropriately juxtaposed against red shingles and forest green clapboard siding and balusters.

Interior renovation involved the aforementioned vestibule and the removal of a wall between the kitchen and pantry, creating a more usable space. A half-bath was wisely installed near the kitchen providing facilities where none existed before on the first floor plan. A second floor bath has been restored to near original condition by utilizing a combination of new and reused fixtures and hardware from other bathrooms.

The Hunter Residence is nearly a century old and its gracious charm has been discreetly completed by a clever plan that respects the specific compositions that characterized the original. The home now appears complete and balanced; may it survive another 100 years.

Mark E. Blunck lives in Oakland, California, and freelances for Iowa Architect.
The architects have adapted the site into the program of both the exterior and interior. Powerful shapes enclose an interior replete with elements of the Modern aesthetic.

The residential ouvre of Architects Wells Woodburn O’Neil has encompassed several unusual projects during recent years. The Butler House Addition and Restoration resurrected a Streamlined Modern tour de force to its rightful status as a landmark building. An extraordinary and widely acclaimed home of brick, wood, steel, and glass was designed as an extension of the environment and is a superb blend of elements. Unusual form is the feature of the Rosenberg Residence as an inverted triangle of glass is adjacent to a curvilinear roof element. A Garden Pavilion created in the spirit of Frank Lloyd Wright is a study in the flawless execution of scale and proportion.

These diverse projects illustrate a firm’s ability to envision notable solutions for a private residence. The Carney/McFarland Residence continues this reputation as the home interprets the sloping site into the exterior configuration and interior spaces.

The three-story, 4600 square-foot home is formed into an L-shape with the open elevation facing a city park. Arranging the home in this method allowed generous east-facing fenestration to admit light filtering through the trees to penetrate main living spaces. The plan also shields these areas from the neighbors, providing privacy requested by the clients.

The compelling feature in terms of a site influencing design is the use of multi-levels to integrate elements of the natural environment into the plan. This is initially evidenced at the entry which is pulled from streetside and consists of three short flights of stairs. The vertical ascent establishes a pattern employed throughout the house as both exterior and interior order reiterates the site.

Internally this concept is expressed on the main floor. Reinterpreting the multi-level entry as elevation differences between living areas. Step from the kitchen and casual dining area lead down to the larger formal dining room and appear again in the living room and library. This artistic treatment both acknowledges the site and satisfies aesthetic criteria as a large open plan is divided in human-scale balance.

Facing the park are two decks that complete the unifying of the house to the site. A deck off the living room and library leads to a lower section adjacent to the casual dining and sun rooms. The interpretation has been realized on both exterior elevations and main floor as the house is secured to the environment in both visual and metaphysical aspects.

The forms employed in the exterior design are sizable monolithic shapes rectilinear in profile appearing in procession. The only convention residential motif are the two black hip roofs the small dining and sun rooms that embrace corner of a much more prominent section. The entry is marked by a circular roof form providing a geometric foil to the forceful thrust of angularity.

While the majority of glazing is presented on the east elevation fronting the park, wind patterning on all facades is at first unsettling. Further examination reveals a sense of playfulness by the architects as windows are positioned in corners or in the middle of a vast facade randomness is the operative word.

The interior is the most striking feature in the home. The main floor of various levels is enlivened by sumptuous oak with its color enriched by white walls and ceilings. Color contrast is vital since there is a minimal amount of furniture competing for attention, producing a Zen-like quality. Spacious openings between rooms intensifies the multi-level aspect and the open plan is further illustrated. The upper floor master bedroom overlooks the two-story living room in the manner the house relates to the park, formulating another interpretation of connecting architecture to the site.

Immediately inside the entry is a superlative assemblage of walls in contrast to each other, half-height section extended just short of the opposite wall forces a circulation path into the living room. Another similar height section is truncated and juxtaposed against a full-height wall and this study culminates with a serpentine enclosing a staircase to the top level.

This open interior of several levels an multitude of shapes is somewhat belied by...
terior geometry as the separate sections initially
ify small enclosed spaces of traditional box-like
ns. The architects have adeptly manipulated a
atomy between exterior and interior space
ucing a work that successfully interprets
ite.
ark E. Blunck is a writer living in Oakland,
ioria.
At precisely the prescribed moment, the designer arrives. The incessant rain of the past few days has broken briefly, though the streets and driveway remain wet. It is still early spring, chilly, and I worry that I have left my coat back at the office.

It is, seemingly, a normal weekday morning in a normal suburban neighborhood. The kids are away at school; their parents have commuted to jobs in the city. What remains is both quiet and perfectly expected: rows of somber but upscale spec houses, varied only in the faces they have chosen to wear, one Tudor, one Colonial, most undistinguishable, abutting their trimmed, edged, groomed, and chemically enhanced lawns hard against the winding street.

The designer parks his car just beyond the cul de sac on which the home we have come to visit is sited. My ear sits in the front driveway and I fear, momentarily, I have broken some plain but unspoken code of suburban conduct: isitors' cars stay in the street.

The designer approaches and, as I have come to expect, smiles broadly. We shake hands. I apologize for the location of my car. He suggests that, as usual, I worry too much.

To begin, we must dogleg around the home's imposing two-car garage. Like its neighbors on either side, the garage is the house's most predominant street-side element. In fact, it is the home's only publicly-facing element; the entry is tucked to the side, midway back on a very narrow lot. The designer explains:

"This was the last property on the block to sell. No one could figure out how to place a conventional house on so little street frontage.

"The covenants for the subdivision are extremely restrictive: no flat roofs, no unconventional materials, and so on. We basically had to hide everything else we did behind this garage as a contextual link to its neighbors."

I find the designer's depiction of the modest garage amusing, for its design is anything but normal. Granted, at first glance it does appear to be everything expected of a typical two-car garage, but anticipated conventions of "normal" begin, quite literally, to fly apart.

Each half of what should be an orthodox gabled roof is misaligned by eighteen inches. To insure this disjuncture by casual observer, an immensely over-scaled and structural redundant wood bracket is precariously positioned beneath this peculiarity intersection.

As though all this were not yet enough, the garage itself mediates between street and residence and anticipates something of the experience to follow.

Project: The Glynn Residence
Location: West Des Moines, Iowa
Owners: Russell and Mary Glynn
Architect: VDV Architecture
Design Principal: Phillip Vlieger
General Contractor: Kron Construction, Waukee, Iowa
Area: 4,241 Square Feet
Cost/S.F.: $79.90
Photographer: Studio Au, King Au

"Conventionally" rendered, the garage both mediates between street and residence and anticipates something of the experience to follow.

If this house is to be understood in any terms whatsoever, it is through an examination of its formal language. Despite its unorthodox appearance the Glynn Residence is, in fact, a conventional, though admittedly inspired derivation of ideas that have intrigued architects for many generations. It is an architecture which is predominantly about itself, couched in an obscure vocabulary of spatial and geometric concepts generally understood among architects and virtually no one else. Most architects, to their credit, are well aware of the disparity between the formal imperatives of this sort of architecture and their clients' relative indifference to similar themes. Good designers, for the most part, keep such matters to themselves. When asked, for example, to describe the formal attributes of his work, the late British architect James Sterling declined: "I never speak to my clients about aesthetics, only budget and function."

An architecture of formalism, that is to say, an architecture concerned with, or constituted by, its form as distinguished from its content, has throughout contemporary history, assumed many different labels: Modernism, Structural Determinism, De Stijl, and even (one suspects) despite protests to the contrary, Decostructivism. Each markedly different "ism" remains caught up in one fundamental premise of formalist thinking: the meaning and content of an architecture may be derived solely by manipulations of abstract, two- and three-dimensional geometries. Practitioners of this genre approach conceptual design almost as though it were an elaborate adult board game on which geometric game pieces engage in heated competition.

Representations of form assume animate characteristics and even, at times, personality. Forms are said to "move" or "rest," "advance," "recede," "pose," or "posture." They "penetrate" one another if necessary, or "disengage" when it becomes appropriate. They may be either "pure" (Platonic) or "profane" and their proportions depicted as "svelte," "lithe," "brutal," or "jaunty."
The precarious cant of the garage's gable, supported by a giant order bracket, frames the arcing paths of the home's entry.

The convergent geometry of competing geometries: the ellipse, the wedge and rectangle.

Russell's loft and balcony, framed by rafters through which the stars may be counted.

The wedge's inaccessible balcony.

garage's stucco-clad gable end is canted perilously inward, giving the structure the distinct reading of a child's tenously assembled house of cards.

The designer, oblivious to my growing perplexity, continues his explanation of the house's siting:

"The narrowness of the property compelled us to locate the living areas to the rear of the site. Initially, they were set back from the street after a wooded glen, across the lazy Skunk River Valley, and outward to a minute patchwork of unplowed fields and rolling pastures. The designer explains:

"The owners came to us with a set of builder's plans and a builder, who, was, interestingly enough, the developer of the subdivision. Initially, they wanted just to modify the floor plan, adding a second floor for their third daughter, but after four or five meetings, their ideas about the house and architecture began to evolve. We didn't refer to their original set of plans much after that."

The front door is opened by a petite, unassuming woman, a second generation Japanese American and owner of the home. To her side is the okonoma, a small, ceremonial shrine found in traditional Japanese homes. It is a contemporary, though as yet, complete construction assisted by the designer to intercede between a wall of water and the formal realms of the home. It is also, the designer's meditation, a reconciliation of the two distinctly different cultures which she dwells.

The owner, introduced as Mary Glynn, and the designer confer briefly. She describes the purpose of our visit and offers to peek with her later regarding some uncompleted work for the newly constructed home. Satisfied, she resumes her daily business about the house.

As the designer and I peered through the row entry hall intentionally narrow to

"gaunt," "stout," or even "ungainly."

Such buildings are said to "speak" to themselves, to one another, and most specifically, in response to their designer's own manner of inquiry. Louis Kahn would often "ask" a building "what it wanted to be," presumably expecting a fully intelligible answer from an inconspicuously mute entity.

This personification of what are, in reality, only abstract lines and symbols occasionally gets out of hand. One noted designer has uncharacteristically hired a secretary solely on the basis of her legs. He wanted to use her profile as a proportional model for his next skyscraper.

content that an architecture's meaning might more properly derive from purely programmatic concerns, or attributes of human psychology and perception, historical precedent or culture and even literature. They suggest that formal languages are, at best, circumstantial if not entirely arbitrary. Moreover, the content presumably elicited by geometric manipulation remains arcane and imponderable to the average observer of architecture.

Still, the penchant for formal architectural constructs persists, frequently with admirable, if somewhat illegible, results. Richard Meier's Athenaeum comes to mind, as does much of the work of I. M. Pei. Closer to home, Charles Herbert and Associates' Des Moines Civic Center remains a deft demonstration of the subtle elegance of undulated geometric manipulation.

What distinguishes these works is not the specific choice of their formal language, but the finesse with which that language is spoken. Designers instinctively understand the "rules" of this abstract geometry and its success is judged on the merits of their intuitive and analytical agility in "playing" the game of formal manipulation.
The Glynn Residence from the South: a quirky assemblage of common and uncommon elements.

As such manipulations go, the Glynn Residence proves itself to be remarkably adept. The house is a composed dialogue between five explicit geometric figures: the ellipse, the square, the rectangle, the wedge (an acute triangle), and the arc. Each is ordained with a specific symbolic content and a relative hierarchy of importance within the overall work.

The square, the garage as mediator between suburb and home, suggests all things conventional. It sits, predictably, tangential to the cul-de-sac it fronts, and is, in all but its most minute details, perfectly expected.

The arc, slashing from the front of the property to the rear of the house, demarcates transition. It marks the passage from the outer suburban environment to the inner sanctum of the house. Manifested in the form of a massive masonry wall, it further demises the house into two distinct realms: one formal, containing the living room and library; the other informal, accommodating the family room, kitchen and eating area.

Most notably, the concave face of the arc reassuringly cradles more intimate spaces of the house. From various positions and viewpoints, through openings in the wall, the two readings of the arc intertwine. Like M. C. Escher’s cleverly penned optical illusions, the wall is at first one thing, and then almost as quickly, something entirely different.

The ellipse is the great container which lies at the soul of the house’s geometry. Its egg-like form is not accidental. The ovoid shape evokes the warm caress of motherhood and the security of a sheltering embrace, a suitably feminine gesture. It is both tangible in its suggestion of enclosure, but implicitly elusive in the enclosure’s exact definition. A circle, by contrast, would have been far too exactly explicit.

The rectangle, employed for the library, family room and the bedroom wing below, is far more resolute. Its boundaries are exact and immune to alternative interpretation. It is, in its own way, a very masculine stroke artfully played against the ellipse’s softer contour.

The curving profile of the arc’s convex face constantly retreats from view, anticipating forthcoming events in the act of passage through the home. Conversely, the concave face of the fireplace below is equally outspoken, a wistfully composed compendium of oak, mahogany, metal, and drywall, which glanceingly foreshadows a number of succeeding architectural inventions lying scattered throughout the house. A massive grand piano is the sole furnishing of the otherwise completely spare room.

Almost unnoticed in this composition of at once recurrent, but simultaneously fragmented gestures, is the subtile curvature of the room’s elliptical outer wall. The ellipse, I am told, is the principle conditioning element of the home’s geometry. It contains both the living spaces of the house and directs carefully prescribed views into the landscape beyond. Decisions regarding the evolution of the house were made either in congruence with, or in contradiction to this prevailing geometric pattern. I touch the enveloping wall gingerly as it leads us more deeply into the home’s conceptual core.

Early on, I recognize this is not the sort of house you walk through casually. Instead, you (seemingly) orbit its eccentric universe of planes, volumes, and skewed geometries, attempting to vainly scan an with no small effort, ultimately comprehend its aberrant logic.

Beyond the living room lies the library, “Russel library,” as the designer puts it:

“Russel Glynn is an intensely private, profound intelligent individual. When we first met, I introduced myself, shook his hand, and said he never expected to see me again.

“He wasn’t being rude, merely disinterested. I couldn’t, at least initially, see any intellectual chal...
in the making of a house. He felt he had better things to do with his time and left the whole issue of 'home making' up to his wife.

"Mary and I were left to fashion the substance of the house on our own. She was keenly interested in knitting together the diverse threads of her family's life: the contradictions of her mixed cultural heritage, Russell's need for solitary contemplation, her crafts and handiwork, and their children's own personal interests. We talked at length about an architecture which could make the integration of these elements not just feasible, but evident.

"It was only later, after Mary and I had worked out much of the conceptual development of the house, that Russell came around, persuaded, at last, of the cerebral content of the architecture."

The library, surprisingly, is the most conventional room yet encountered on our tour. Though the osynctatic geometries of the house persist, they have toned down to a far more comprehensible level. The room is quiet, almost dark in mood. A single, narrow window, seated in the outer elliptical wall, mes a perfectly composed view of a distant, agrarian landscape.

You (seemingly) orbit its eccentric universe to scan and, with no small effort, ultimately comprehend its aberrant logic.
The kitchen, bisected by the piercing figure of the wedge overhead.

The staircase to the lower level, shoehorned between the arc (left) and the wedge (right and above). In the distance, the wedge penetrates the ellipse through a narrow sliver of glass.

We spend only a moment or two in Mary’s loft. It is, at least this morning, in some disarray, evidenced by a stages of mid-completion. The designer explains: “Mary needed a workplace that could be as more accessible to the life of the family. From her, she can observe much of the house, even the girls’ playroom on the lower level.”

I glance over the loft’s wire mesh-clad guardrail and identify, through a joist opening in the dining room floor, the gay chaos of children’s toys and game strewn on the floor of a room two stories below. The designer says: “The screen on the guardrail allows the loft to appear open while obscuring direct views of whatever she happens to be working on.”

For the moment however, I am less intent on the view below as the view beyond. Each window of Mary’s loft frames a consciously composed vignette of the surrounding environment: to my left, a distant grove of trees; to one side, a winking glance at the peak of Russell’s loft, rising above the roof line; ahead, the sweeping arc of the home.

We spend only a moment or two in Mary’s loft. It is, at least this morning, in some disarray, evidenced by a stages of mid-completion. The designer explains: “Mary needed a workplace that could be as more accessible to the life of the family. From her, she can observe much of the house, even the girls’ playroom on the lower level.”

For the moment however, I am less intent on the view below as the view beyond. Each window of Mary’s loft frames a consciously composed vignette of the surrounding environment: to my left, a distant grove of trees; to one side, a winking glance at the peak of Russell’s loft, rising above the roof line; ahead, the sweeping arc of the home.
The living room, which frames a spectacular view through a broad penetration in the elliptical enclosure.

The result is equally powerful, but metaphysical in nature. What, then, is the yield of all this feverish posturing of form and figure? What content and utility might possibly come from all of it? The designer would suggest that the house neatly accommodates the needs of its occupants, that it skillfully addresses the constraints of a very difficult site, and frames a number of nicely composed views into the surrounding landscape. This explanation, though, is insufficient. Any number of far less derivative architectures might have accomplished comparable ends. Clearly, the ambitions of the Glynn Residence are aimed at something more formidable than mere formalistic conformity. It is, instead, a compelling delineation of the virtues and vagaries of contemporary existence. This thought is well expressed (though intentionally overstated) by Peter Eisenman in his 1987 monograph, House of Cards: "the house may once have been a true locus and symbol of nurturing shelter, but in a world of irresolvable anxiety, the meaning of shelter must be different."

The Glynn Residence is about, more than anything else, a different "meaning of shelter," in all its expected and unexpected convolutions. Life, it seems, is complicated. Several lives contained in a single home is more complicated still. The edges and boundaries of these lives, like those of this house, overlap and intertwine, yet retain their own discrete personalities. Their interactions are at once, defined by the traditional structures which constitute a family, but remain equally clouded by the disorder of modern existence.

The Glynn Residence attempts not to reconcile the seemingly contradictory terms of the family, but to express those terms in a frankly explicit formal language. The house, in many ways, is an interpretation of life: of expectations granted and expectations denied, and it succeeds or fails to the same extent the family itself succeeds or fails.

And that struggle, to both distance and yet embrace the contradictions of our existence is, as the designer notes, "why we call it architecture."
Two small houses in Iowa share a philosophical debt to one built over one hundred fifty years before. Together, they suggest compelling alternatives to our more conventional sense of modern habitation.

We already know something of these houses. We have been to them at least in our minds: places with no phones, no electricity, no alarm clocks or maddening scramble through rush hour traffic to the work contemporary existence obliges us to perform.

In our minds, these are places of complete repose, quiet, humble retreats, composed in the wilderness of the simplest materials, intent on providing only what is absolutely necessary for life: shelter.

If you dwell on this image of shelter for long, you may find yourself opening the pages of a book written by a man who, at least in spirit, built these houses: Henry David Thoreau.

Thoreau completed his own house at Walden Pond on Independence Day in 1845. His intentions were plainly spoken: “to live deliberately... to drive life into a corner, and reduce it to its lowest terms.”

“I have thus a tight shingled and plastered house, ten feet wide by fifteen long, and eight-feet posts, with a garret and a closet, a large window on each side, two trap doors, one door at the end, and a brick fireplace opposite.” He furnished his home with equal simplicity: “a slant-top writing desk, a low cot, a table, and three chairs—one for solitude, two for friendship and three for society.”

To some, Thoreau must seem the supreme escapist, and his Walden, less home than hermitage. Yet, through his writing and correspondence, in his political activism and “civil disobedience,” we know he remained, throughout his life, vigorously engaged in the intellectual life of nineteenth century America.

Thoreau cherished his solitude, but recognized it more as a state of mind than any particular place: “A man thinking or working is always alone, let him be where he will.”

Thoreau came to Walden with a different purpose in mind: to take stock of the value of living in concert with nature. “I was rich, if not in money, in sunny hours and summer days, and spent them lavishly,” he wrote. His house was a simple lens which drew into focus nature’s insights regarding human existence. Thoreau observes of Walden Pond: “it is earth’s eye; looking into which the beholder measures the depth of his own nature.”

We, despite the glories of our technologically-driven age, have no less need for similar moments and spaces of quiet contemplation. Like Thoreau, we yearn to “live deliberately.”

On these pages are two very small houses which, if not inspired by Thoreau, share a kindred spirit with his Walden home. They too, are lenses which direct our attention to the simple, profound lessons nature has to offer.

Tom and Mary Lou Sargent’s Clarke court cabin was built by themselves, their family and various friends over the course of many a summer weekend. Tom Sargent, a graphic designer and founder of DesignGroup in Des Moines, created the home as a place to “kick back, relax, a retreat” from the day-to-day pressures of urban life.

Sargent did most of the design work himself, though he admits to soliciting occasional technical advice from Des Moines architect Thomas Baldwin AIA of Baldwin White Architects. The simple one-room structure measures twelve by twenty-four feet, ten feet in height, surmounted by steeply pitching, shingle-clad roof. Aside from a small sleeping loft to the east, all of the house accommodations, food preparation, dining, living, reading, and relaxation, occur within the confines of the ground floor.

The house has no running water or electric Kerosene lanterns provide what light may needed, a wood burning stove warms the cabin winter, and a few dozen steps west of the door, a rustic privy serves nature’s occasional call.
Though the house sits in a pastured clearing, it may not be approached directly by car. Visitors can initially only glimpse the structure across a small creek through a veil of trees before abandoning their vehicles. The creek must be forded recariously by foot, over a narrow bridge constructed of felled tree limbs. A roughly-hewn wood fence and gate mark entry to the cabin's grounds and if the day is warm, the Sargents will have left a cooler on the front porch, offering their guests chilled sodas and beer.

It is from this porch, in the shade of its low, steeping roof, that the elegant economy of the house becomes most apparent. The porch is raised only a few feet above the pasture floor "to keep out the critters," says Sargent, but the gesture lends the house an almost classical sense of proportion. A lonnaede supporting the porch roof is fashioned from small, undressed tree trunks, each selected and placed with evident care and sensitivity. Rough-sawn, cedar shingles dress the main structure's enclosure and small, double hung windows (one of the home's few concessions to modern manufacturing processes) are arranged to bathe the cabin's interior with clear southern sunlight.

In addition to the simple furnishings necessary for comfortable country living, Sargent punctuates the house's interior with a lifetime's collection of eclectic curiosities: mounted game heads, woven baskets, Forties-era knickknacks and antique-framed, turn-of-the-century photographs. The room and its effects possess a casual, effortlessly unpretentious atmosphere that beckons its occupants to sit back and breathe in the sweet aroma of freshly cut alfalfa which drifts in through an open window.
The simply conceived massing of the pavilion is drawn from geometries and materials found in the main house.

The second house is, in reality, a gardener’s tool shed, though its utility extends far beyond mere storage. The owners of a 1930’s stucco cottage in Des Moines, avid horticulturalists, enveloped their home with an expansive series of both formal and meandering gardens. They required a simple enclosure for their equipment as well as a place to transplant and pot plant materials.

Yet, as designed by Patrick A. Ulron AIA of Architects Wells Woodburn O’Neil, this simple pavilion assumes a much more central role in the composition and perception of the surrounding gardens.

Situated to the south and downhill from the main residence, the gardener’s shed lends the gardens a keen sense of scale and focus, as well as privacy from the public street. The structure articulates a view of the gardens from the home’s entry drive and extends that vista south, over densely wooded river valley. A small terrace sheltered in front of the pavilion shares the same vista and becomes the setting for casual seating and relaxed contemplation of the landscape.

The pavilion’s geometries, which at first appear eccentric in plan and profile, are drawn in direct reference to the original house, as are its coarsely textured stucco walls. Coupled with an asymetrically-placed eyebrow dormer and rustic weather vane, the shed suggests the image of a quaint though enigmatic peasant’s hut, poised along a rutted cart path in the French countryside.

The instinctively primitive and agrarian character of the shed infuses each detail of its construction. The formality of a traditional fascia supplanted by exposed cedar beams and rafters. Lintel above window openings are rough
The shed's materials, though finely assembled, are consciously left in their natural, unelaborated finish.

And how might Thoreau access the merits of these particular houses, viewed from a distance of one hundred-fifty years:

“What of architectural beauty I now see, I know has gradually grown from within outward, out of the necessities and character of the indweller who is the only builder — out of some unconscious truthfulness, and nobleness, without ever a thought for the appearance; and whatever additional beauty of this kind is destined to be produced will be preceded by a like unconscious beauty of life.”

Bang & Olufsen
708.299.9300

Rich in natural resources such as inventiveness, logic and an innate sense of quality, Bang & Olufsen products are not only beautiful but unsurpassed in technology. The Beosystem 2500 features an AM/FM receiver, CD player, cassette recorder and smoked glass doors that slide open with a wave of the hand. Bang & Olufsen is represented in the permanent collection at The Museum of Modern Art in New York City.

Wave Goodbye Table
Thomas W. Stender
Furniture Design
716.941.6388

"I draw inspiration from human form, gesture and clothing. My ideas are instinctively three dimensional and formed in wood. I find it a comfort to take both function and material as given; the difficulty comes in helping it assume plastic forms apparently without effort," says designer Thomas Stender. The "Wave Goodbye" table, which is constructed of curly maple and cherry, measures 12'/" w x 61" l x 31'/" h.

Principal Office Building

Touted as one of the “10 most influential living American architects” by the AIA, Helmut Jahn and the firm of Murphy/Jahn have been awarded the commission for Principal Financial Group’s expansion in Des Moines. On March 24, the Chicago-based architect unveiled the design for the project, which includes a new 450,000 square-foot building north of Principal’s home office, and a public plaza linking the company’s corporate campus.

The design incorporates floor-to-ceiling glass on the north and south facades, while the east and west sides are clad in stone. A giant gateway through the building links the areas to the north with the plaza to the south. Preliminary designs of the plaza include informal seating, a shade garden, an orchard, and a fountain.

Jahn’s design excellence has been recognized for a number of buildings, most notably the United Airlines Terminal and State of Illinois Center, both in Chicago. His buildings exemplify the aesthetic use of structure and a close attention to detail.

The new Principal building will be located between 7th and 8th Streets, and between Keosauqua Way and Park Street. The project is scheduled for completion in 1995.

In Remembrance

Lawton Mikell Patten AIA, 87, Ames, Iowa, died of pneumonia on December 3, 1992. He was a member of the architecture department at Iowa State University from 1946 - 1975, teaching history and painting. He was also a member of Architectural Historians, the National Trust for the Preservation of Historic Landmarks, the Society for the Preservation of New England Antiquities and the Iowa Archeological Society.

Frederick D. Schwengel, Hon. AIA, an eight-term Republican Congressman and the founder of the United States Capitol Historic Society, died April 1, 1993. This native Iowan has made not only his home state proud, but also historians and architects all over the country by his accomplishments in preserving the heritage of the United States Capitol.

Thomas R. Clause — FAIA Announcement

The American Institute of Architects has announced that Thomas R. Clause has been elevated to the prestigious College of Fellows for his contributions to the profession. Clause was awarded the honor June 19 during the AIA’s annual National Convention in Chicago.

Among his accomplishments, Clause has demonstrated leadership in the AIA on the state and regional levels, including the positions of State Chapter President and Regional Director. His leadership has also made an impact on local legislation. By rewriting local design review ordinances and reshaping the City of Des Moines’ Architectural Advisory Panel, Clause has made significant improvements to the environment of architectural practice. Clause has been active in increasing public awareness of art and architecture by serving on the Iowa Arts Council and leading committees that initiated the Art in Public Architecture and Iowa Town Squares programs.

Though dedicated to furthering the profession, Clause has proven excellence in design throughout his career, amassing 18 design awards. Clause is president and principal of Clause Architects, based in Des Moines.

Through his leadership, public advocacy for design issues, and personal quest for design excellence, Thomas Clause has continually demonstrated his value to the profession.

Remembering

What’s Wright

The Frank Lloyd Wright Building Conservancy has decided to hold its National 1993 meeting in Mason City in September 8 - 12. The collection of Wright homes in Rock Blen will be open for ours exclusively for this meeting, as well as the art museum on the same block. The meeting correlates with September’s designation as Architecture Month.

The company that invented laminate introduces a revolutionary new surfacing...

NUVEL

Some earth shaking news

Nuvel™ surfacing material is a revolutionary new product that works and preforms far better than conventional surfacing materials. It has the look of solid surfacing at less than half the price. Use Nuvel with Surell™ solid surfacing sinks and bowls to create a one-piece look.

seamless

And that's just the beginning. Nuvel is formable, taking shapes you could only dream of with high pressure laminate. It post forms to a tighter radius and works more easily at a wider range of temperatures without the worry of cracking and blistering.

workable

Unlike laminate, it can be vacuum formed and thermo-formed. Nuvel is durable, resilient enough to minimize damage during fabrication, and heat and chip-resistant. Nuvel is renewable, colored all the way through so that stains, cigarette burns, even deep scratches can be removed.
