Whether you're asked to free your creative imagination on a church, office building, school, apartment, factory or home, BELDEN will help with the largest selection of brick in the industry. The versatility of BELDEN is unlimited because of over 200 variations in color, texture and size of brick.

Your nearest BELDEN Dealer will gladly show you the facts in the form of samples and our new 4 color brochure, or write us at
P. O. Box 910, Canton, Ohio 44701.
GAS LIGHT

It runs on electricity produced by a natural gas Total Energy System.

A natural gas Total Energy System is the method of power production based upon on-site generation with gas as the fuel, using gas engine-driven generators to produce low cost electricity.

The economy of natural gas Total Energy Systems is remarkable. In a central electrical power plant, more than 60 percent of the fuel’s potential energy is wasted. But when power is generated at the plant or building site with a Total Energy System, the energy not converted to electricity is captured to meet the plant’s or building’s needs for heat, hot water and steam for absorption cooling.

This highly efficient method of energy production has already been used to supply power for industrial plants, shopping centers, apartment houses, hospitals, hotels and motels.

If you’re designing something that calls for big power economy and efficiency, recommend a natural gas Total Energy System. It makes things work better.

OUR RESPONSIBILITY TO THE PEOPLE WE SERVE

Customers of the MECHANICAL CONTRACTOR range from governments to private property owners... financiers to building promoters... architects to consumers. Wherever you see a new structure rising in the midst of urban renewal or suburban expansion... or a factory building or shopping center being expanded or remodeled... a MECHANICAL CONTRACTOR is taking part in the construction by providing the heating, air-conditioning, plumbing and process piping which make up the nerve center of the structure.

The responsibility of the MECHANICAL CONTRACTOR doesn’t stop with installation, either! Through in-plant maintenance arrangements, the MECHANICAL CONTRACTOR will assume full responsibility (men, materials, tools and insurance) for maintenance of the systems on a continuing basis. Knowing this, the MECHANICAL CONTRACTOR maintains the tools, inventory, skilled craftsmen and heavy equipment necessary to handle any challenge. This always-ready status is evidence of his desire to accept the responsibility he has to the people he serves.
CONCERNING THE COVER

Brilliantly lighted against a dark winter sky, the restored tower of Noblesville’s Hamilton County Courthouse has sparked a “Noblesville 1970” program of study of existing period buildings around the square. Subjected to much discussion and some opposition during the initial planning stages, the rehabilitation, under the direction of Pec Sok, Jelliffe & Randall, Architects, has won overwhelming official and popular acclaim. According to Architect J. Parke Randall AIA (who captured the photograph featured this month), the study of existing buildings will hopefully lead, not to a “Colonial Noblesville,” but will attempt “to honor and respect the fine period buildings of the area. By redesigning facades for architectural harmony, we can omit the existing layer cake, glass front, commercial look. . . . The courthouse square was traditionally the pride of a mid-western community; it was the center of commerce and often the social meeting place for the entire county. We hope we can help re-establish some of this.”

WHY IS AMERLITE® BLOCK

CHosen FOR SO MANY SHOPPING CENTERS?

There are many reasons why AMERLITE BLOCK is first choice . . . the chief reasons being—

STRUCTURAL STRENGTH—AMERLITE Block is a strong, rugged block possessing all the strength necessary for load bearing walls.

BEAUTY—AMERLITE Block gives a clean, modern, pleasing appearance. And each block is manufactured from completely processed cinder aggregates assuring uniformity of texture and size.

ECONOMY—AMERLITE Block is a quality block at an economical price. Also, because it is lightweight, it costs less to handle and erect.

PLUS other important factors as . . . excellent fire-resistance, proven durability, better thermal insulation and compatibility with other building materials.

Why don’t you specify AMERLITE Block on your next project and be rewarded with the finest quality cinder block made? . . . And remember IT COSTS NO MORE!

PARTIAL LIST OF SHOPPING CENTERS USING AMERLITE BLOCK . . .

“Architects and Urban Environment,” the 1968 ISA Annual Convention, opens its three-day stand at Stouffers' Indianapolis Inn Thursday, October 24, with a double-barrel presentation aimed at the principals of architectural firms. The limited-attendance seminar will feature, first, a study on the costs of architectural service presented by Mr. W. R. Evans, vice-president of Case & Company, consultants to the AIA and several state societies. Following this will be a report and recommendation on establishing co-operative computer facilities in Indiana, presented by Professor C. Herb Wheeler AIA, professor at Penn State University, author of “Emergency Techniques,” and consultant to the Indiana Architectural Services Committee.

After lunch Thursday, discussions will turn to “The Schoolhouse in the City,” the first of three theme sessions, with an address by Mr. Johathan King of the Educational Facilities Laboratory. Supporting Mr. King as panelists will be Dr. James MacConnell of Stamford University, Dr. Harold Boles of Western Michigan University, Chicago Architect Larry Perkins AIA, and Mr. Mark W. Gray, member and former president of the Indianapolis School Board.

While the men are so engaged, the ladies will enjoy lunch and a special style show at Hillcrest Country Club.

Thursday evening, entertainment takes over with dinner and “Under the YumYum Tree” at the Black Curtain Dinner-Theater.

Back to business Friday morning, the convention will hear transportation authority Ted Aschman of Barton-Aschman Associates, Chicago and Washington, D. C., discuss “Mass Transportation and Community Values.” Panelists appearing with Mr. Aschman will include Dr. Joseph M. Heikoff, director of the University of Illinois' Bureau of Community Planning, Mr. Don Spaid and Dr. Frank P. Lloyd, both members of the Marion County Metropolitan Plan Commission.

The ladies, meanwhile, will enjoy a bus excursion to Nashville and magnificent Brown County.

Noon Friday has been reserved for individual Chapter lunches and meetings, with the afternoon for exhibit viewing, golf, and relaxation. The Stackhouse Reception and dinner Friday night will be followed by the popular Casino Night.

On Saturday morning, the Honorable Birch Bayh, U. S. Senator from Indiana, will lead a dis-
1968 Convention, Indiana Society of Architects
Stouffer's Inn, Indianapolis, October 24-26

Discussion on the "Model Cities Program," with assistance from the Honorable Richard Lugar, Mayor of the City of Indianapolis; Dr. Joseph Maloney, director of the Urban Studies Center at the University of Louisville, and Professor Patrick Horsbrugh, director of Notre Dame's new Graduate School of Environics.

AIA Vice-President Jules Gregory will address the Saturday luncheon, which will be followed by the annual ISA business session.

Wrapping up the convention Saturday night will be the Hugh J. Baker reception at Oldfields (new home of the John Herron Art Museum) and the annual banquet at Stouffers. Announcement of the winners in the 1968 Triennial Honor Awards program and dancing will provide the evenings' entertainment.

As a powerful inducement for architects to attend this convention, the first in Indianapolis in several years, the ISA Board has directed that participants will pay no registration fee, but will pay only for the meals and entertainment.
The title of this presentation might be more accurately called "Hoosier Hysteria in the Nineteenth Century." Of the ninety-two counties in Indiana, all built at least two, and several as many as five, courthouses in a span of less than ninety years.

Thus, keen competition developed between towns in the hope that each would be selected as the county seat, since it was felt that being selected would insure rapid growth and prosperity. (This was, however, not always the case.)

The courthouse quickly became the symbol of the county: Politically, socially, and architecturally. Distances and directions in the county were measured or given with the courthouse as the benchmark or reference point. Rivalry between counties was often equally spirited.

This competition between cities can be readily traced to the rivalry between cities in the late Gothic and Renaissance periods. Numerous comparisons can be made between:

14th and 15th Centuries vs. 19th Century
Secularism (Humanism)
New towns
Increased trade and new trade routes (materialism)
Greater security
Increased wealth

Architectural comparisons between the periods are equally meaningful:
14th and 15th Centuries vs. 19th Century
City Halls Courthouses

Both became tangible architectural symbols of the skills and aspirations of the historic periods for which they were designed.

Sometimes they defined a space:
Siena (Plate 1) Bluffton (Plate 2)
Palazzo Publico Wells County
1297-1310 Courthouse
1888-1890

Sometimes they were defined by a space:
Muncie (Plate 42) La Porte
Delaware County La Porte County
Courthouse Courthouse
1885-1887 1892
Were an important silhouette:
Siena (Plate 3) Decatur (Plate 4)
Palazzo Publico Adams County
1297-1310 Courthouse
1872

Or offered an excellent view of the city:
Venice Muncie

In the Nineteenth Century, architecture became a Battle of Styles: Classical, Romanesque, Gothic, Renaissance, and Eclecticism (Renaissance, Second Empire, Victorian elements).

In the Midwest, the use of other systems was necessary.

Wayne County was organized in 1810 and Salisbury, which is no longer marked on maps of Indiana, was selected as the county seat. It was the first town laid out in the county, which was at the time completely forested. Salisbury was sited south of U.S. 40 about midway between Centerville and Richmond, and the First Courthouse in Wayne County was built in 1811 (Plate 5) at Salisbury. The first trial was held within the partially raised building on October 28, 1811.

The two-story building, 31 feet long and 25 feet wide, was heated by a large fireplace at the first floor. The building was constructed of squared logs, hand-hewn. Spaces, if any, between timbers were chinked with a clay mortar. Corner joints were half dove-tailed and windows were shuttered. The same system of construction had been used during the Seventeenth and Eighteenth Centuries by English colonists to build blockhouses and jails. It proved to be an excellent system but one that required considerable skill and numerous tools. This may well account for the fact that the First Wayne County Courthouse is still standing today. William Commons, who came to the county in 1810, was the builder.

Later a second courthouse of brick construction was built at Salisbury; however, an accurate description and exact date have not yet been uncovered. In 1816 the Indiana legislature passed an act stating that after August 1, 1817, all official business was to be transacted in Centerville. After bitter strife between the citizens of the two communities, the seat of county government was transferred to Centerville.

The town of Salisbury found little use for two vacant courthouses, and the hand-hewn log structure was auctioned off to the highest bidder. The owner dismantled the structure and moved the elements to Richmond where it was reas-
Assembled to function as a residence.Apparently no changes were made in the rebuilding of the original fabric, although later modifications completely concealed the original structure, but the significance of the courthouse-residence was not forgotten.

"In 1952, a contractor dismantled the courthouse-residence in Richmond. Interested citizens came forward to save the original log building and it was again purchased at auction. Since the town of Salisbury had long since disappeared, the owners decided to reconstruct it at Centerville, the county's second seat of justice. The venerable structure now stands on school property in Centerville south of the National Road."  

To my knowledge it is the oldest extant courthouse in Indiana and certainly one of the oldest, if not the oldest, in the Northwest Territory. The number of counties in Indiana that built log or hand-hewn courthouses are too numerous to mention, and all have long since disappeared. From the verbal descriptions and drawings that remain, the Wayne County example was one of the largest to employ this system of construction and certainly one of the most sturdy. It is more than a symbol of the frontier spirit. It is expressive of an indigenous concept of construction and design with emphasis on organic simplicity.

The Third Wayne County Courthouse, 1818, the first in Centerville, was built by William Commons, the builder of the first courthouse at Salisbury, and although it was a modest structure, it was the model for the Second Delaware County Courthouse.

"On the third day of June, 1872, a petition was drawn up and signed by 4,937 persons and presented to the Board of Commissioners of Wayne County, asking for the removal of the county seat from Centerville to Richmond." Only after bitter debate and strife was the seat of justice moved to Richmond on August 15, 1873.

The Fourth Wayne County Courthouse, completed August 4, 1873, was the first to be built in Richmond (Plate 6). An expression of the Italianate Style, it was a simple, well-proportioned brick structure with square-headed windows and doors spanned by flat stone arches. Paired brackets defined the continuous eave of a low-pitched, hipped roof which was terminated by an open cupola. The Italianate Style was widely exploited in America from ca. 1850 through the 1870s for both residential and public buildings. Indiana has a large number of well-preserved residences and several existing courthouses built in the Italianate Style. The Jennings
County Courthouse at Vernon, 1859 (Plate 7), and the Morgan County Courthouse at Martinsville, 1857, both by Isaac Hodgson, are quite similar in design. Both are more expressive of the picturesque asymmetrical compositions that became the hallmark of the style than the symmetrical, less ostentatious Wayne County example.

Architects' and builders' handbooks played a most important role in the dissemination of a design vocabulary based upon the Late Gothic and Early Renaissance styles of Italy — a vocabulary that was often referred to by Europeans as an American vernacular or indigenous expression of architecture. The architect of the Fourth Wayne County Courthouse, the first in Richmond, was George Hoover; the builder, Thomas W. Roberts. The cost of the construction was $22,700. The structure was demolished some time after the completion of the present courthouse.

The present or Fifth Wayne County Courthouse, the second at Richmond, 1889-1892, by James W. McLaughlin, architect (Plate 8), is an expression of the Richardsonian Romanesque. Henry Hobson Richardson (1838-1886) has been rightfully referred to as the father of modern architecture in the United States. Indeed, it would be all but impossible to name a contemporary of his who had an equal impact on the development of modern architecture. He was the initial link on the chain: Richardson, Louis Sullivan, and Frank L. Wright.

Richardson's physique was gargantuan; he had architecture in his bones. He was robust, dynamic, virile, and possessed a titanic imagination. These qualities were ever present in his architecture.

As an architect, Richardson placed considerable emphasis on a wall bearing structural system (Plate 9). Thus, the walls were laid up of massive rough-faced masonry units, usually of a local stone which tended to have a rich polychrome or succulent quality.

His design sources were manifold. He exploited low springing arches and grouped openings that expressed interior spatial functions; this was in sharp contrast to the staccato window fenestration of classically inspired academic solutions used by most of his contemporaries. The low springing arches were previously found in Syrian examples of the Fifth and Sixth Centuries.

Silhouettes of towers and details were similar to French and Spanish Romanesque solutions of the Eleventh and Twelfth Centuries.

Richardson was an eclectic, but in a most positive way. He used the history of architecture to formulate a personal and extremely imagina-
positive expression that has been termed a “true American Style.”

It was little wonder that his design solutions made a strong impact on the younger generation of Nineteenth Century architects. An impression of similar significance has been experienced in the Twentieth Century in the influence of Mies van der Rohe, LeCorbusier, and others.

Numerous comparisons can be vividly seen between the courthouses of Indiana and their Richardsonian precedents.

Many of the details of the present Wayne County Courthouse are similar to, or were inspired by, the Albany City Hall, 1880-1882, and the Allegheny County Courthouse in Pittsburgh, 1884-1887, by H. H. Richardson (Plate 3):

Massive bearing walls of rough-faced stone terminated vertically by a hipped roof with a single stone-faced dormer and longitudinally by semicircular tourelles. (Compare Plate 8 and Plate 9.)

Windows of a variety of sizes are grouped to form functional horizontal bands along with small punched rectangular openings at the base.

Low springing arches of local rough-faced stone are used in both solutions.

Let us quickly experience other Hoosier courthouses that reflect similar design characteristics.

The Blackford County Courthouse at Hartford City, 1893-1894, is a massive Richardsonian Romanesque expression (Plate 10) sited on an ample square, the facade being the south elevation. The tower is asymmetrically superimposed on an otherwise symmetrical composition.

Again several comparisons can be made between the Blackford County Courthouse and the Allegheny County Courthouse:

The towers are similar in silhouette (compare Plate 10 and Plate 11), and both exploit blind arcading with slit openings and tourelles to define the corners. Both examples have boldly projecting paired towers running the full height of the massive walls (compare Plate 12 and Plate 9). These paired massive semicircular towers became a hallmark of Indiana County Courthouses.

The Blackford County Courthouse has been well maintained, functions quite well today, and continues to be the architectural symbol of the county.

La Belle and French Architects of Marion,
Indiana, were the designers of the Blackford County Courthouse building which was completed in 1894.

Bert L. French (1868-1940) was born in Urbana, Ohio, and served his architectural apprenticeship in the office of Elah, Terrel and Company in Springfield, Ohio, from 1887 to 1889. In 1891 a partnership was established with Arthur La Belle (1885-?).

Mr. La Belle was born in Plattsburg, New York, and journeyed to Hutchinson, Kansas, in 1884, where he stayed for two years. He arrived in Marion ca. 1888. Arthur La Belle is an enigma similar to the majority of architects who practiced in Indiana during the Nineteenth Century; information on these individuals remains tantalizingly scanty.

The partnership of La Belle and French was very productive. They designed at least two additional courthouses: The White County Courthouse at Monticello, Indiana (1894), and the Trumbull County Courthouse at Warren, Ohio. The firm also designed a large number of schools, churches, and commercial buildings in Indiana.

The Starke County Courthouse at Knox, 1897 (Plate 13), by the architectural firm of Wing and Mahurin of Fort Wayne is sited on a large square with the facade orientated to the south. Originally the major commercial activity of the town defined three sides of the square (W, S, E), but this activity has largely shifted a block south of the courthouse square. The courthouse is basically classical in plan and form; however, the exterior is again Richardsonian Romanesque. It is a well-proportioned and finely detailed structure.

The Hancock County Courthouse at Greenfield, 1896, also by Wing and Mahurin, is another variation of the Richardsonian Romanesque design theme (Plate 14), although the hierarchy or system is less lucid. The massing of the corner units, their gable and mansarded roof elements, and the applied dormers are more reminiscent of French Renaissance and Gothic solutions than Richardsonian Romanesque.

Even the bold, projecting semicircular towers flanking the main entrance (north elevation) have a Renaissance character due to the strong horizontal banding and rectangular headed openings. Note the contrast between the Renaissance inspired arch and strong course versus the Gothic tower.

Indeed, the over-all organization and resulting silhouette of the Hancock County Courthouse (Plate 14) are similar to the Fulton County Courthouse at Rochester, 1895 (Plate 15), by A. W. Rush and Son. The Hancock County example is more monumental due to the elasticized or elongated and chunky vertical axis. However, the Fulton County Courthouse is a clearer, more lucid statement of the Romanesque vocabulary due to the greater emphasis on rusticated planes and simple massing versus applied ornamentation. The incised organic ornament at the main entrance of the Fulton County example is quite rich and most finely carved (Plate 16). The lion is curious. Both examples express considerable imagination and are without question the most significant architectural symbols in their counties.

The Decatur County Courthouse at Greensburg, 1854-1860 (Plate 17), by Edwin May is one of the most unique of all the Indiana County Courthouses and certainly one of the most widely known county courthouses in the United States.

The original or first Decatur County Courthouse, completed in 1827, was a modest 40 by 40 feet two-story brick building terminated by a cupola. By 1854 the building proved inadequate; it was condemned and torn down to make way for the present structure.

Edwin May was employed by the Decatur County Commissioners to design the present structure. He was then only 29 years old, but he had already designed courthouses in Sullivan and Shelby Counties. He later designed at least four additional Hoosier County Courthouses and the present State Capitol Building, although he died almost a decade prior to its completion.

Edwin May (1824-1880), George W. Ruting (1829-1901), and Isaac Hodgson (1826-?) were architects of the generation of the 1820s. The triumvirate had offices in Indianapolis, and all made a significant contribution to the architectural heritage of Indiana.

Mr. May, born in Boston in 1824, journeyed ca. 1838 to Madison, Indiana, a city even then with a large number of finely proportioned and well-detailed Georgian, Federal, and Classical Revival public buildings and residences. Madison was to Indiana in the Nineteenth Century what Columbus is in the Twentieth Century — an architectural oasis. Although his stay in Madison was relatively short, the architecture of the community made an indelible impression on Mr. May.

In 1842 Edwin May went to Indianapolis where he worked as a carpenter and builder for eight years. Although he had no formal architectural training, he must have had a keen mind and considerable knowledge of financing, for he operated a loan office that might well have as-
sisted him in remaining financially solvent as an architect and builder. The operation of a loan office is a most unique and imaginative enterprise for an architect, and I know of no precedent.

Although the present Decatur County Courthouse was started in 1854, it was not completed until 1860. It is an interesting and curious solution, asymmetrical in plan and picturesque and rambling in silhouette, but suggestive of the Gothic idiom. Conversely, the semicircular arches are more indicative of Romanesque expressions, but the Richardsonian idiom was not prevalent until much later (1870 and after). Thus, it is possible that Edwin May was familiar with the then current work of James Renwick and his solution for the Smithsonian Institution in Washington (1847-1855).

In 1903 the exterior brickwork was stuccoed to emulate a more permanent material, stone.

The courthouse has been eulogized on numerous occasions for various reasons. While on a speaking tour in 1908, William Jennings Bryan stated that Decatur County's Courthouse was the finest specimen of Gothic architecture that he had seen in his travels throughout the world.

William Allen White, the eminent Kansas journalist known as the Sage of Emporia, used the Decatur County Courthouse as the subject for one of his editorials (Plate 18). He expressed curiosity as to the "secret of the grove of trees on the high tower between stones whereas on the plains of Kansas one was fortunate to grow a single tree on the ground." White's comments were printed in many papers throughout the country and he even visited the site several years later while on a trip to the East.

The local chamber of commerce refers to the tree as the "Eighth Wonder of the World." Some have accused the chamber of commerce of "planting" the tree which caused a local wit to say, "and it's watered by the springs of the clock." Indeed, the fire department has watered the trees during severe period of drought. It is uncertain how the tree got to the apex of the 115-foot high tower or when the tree was first soon; possibly a bird or even the wind carried a seed to the tower. Various dates have been given for the sighting of the first tree, ranging from ca. 1864 to 1870.

The present tree is the twelfth in the series of large-tooth aspen which have brought considerable publicity to the Decatur County Courthouse, but the trees seem to have clouded the architectural significance of the building.

The Hamilton County Courthouse at Noblesville, 1878, also by Edwin May (Plate 19), is in
sharp contrast to the Decatur County example. It is one of the most lucid expressions of the Classical French Renaissance mode to have been constructed in the Midwest during the Nineteenth Century and is reminiscent of French examples of the Seventeenth and Eighteenth Centuries in form, materials, and details. The banded columns are an expression of the "French Order" devised and exploited by Philibert de l'Orme in the Sixteenth Century.

One of the most interesting series of Indiana courthouses was the classically inspired solutions which began to appear in the southern part of the state ca. 1845. The Classical Revival was to have a longer life in the United States than any other country in the world, with the possible exception of Russia.

The Greek Revival became an American architectural ideal because of our romantic association with ancient Greek arts, politics, and cultural perfection. Indeed, the modern Greeks gained the sympathy of a new nation, the United States, with their struggle for freedom against the Turks in the War of 1821-1827.

The style which became a fashion was used for the design and/or remodeling of all building types except factories, barns, and privies.

Temple-front wooden porticoes in standard heights could be purchased from local mills; however, some needed additional sections to reach an already established cornice height, and the results were not always successful.

Similar fortuitous systems have occurred in the Twentieth Century:

Dutch doors of aluminum for residences designed in any style.
Portholes Kits (Buicks) for Chevrolets.
Cadillac tail fins for Chevrolets.
Edward Stone sun screens for the N elevation.
Asbestos siding to simulate stone.

One of the earliest and now the oldest Greek Revival Courthouse in Indiana to be continuously occupied is the Ohio County Courthouse at Rising Sun, 1845 (Plate 20). The architect is uncertain. It was probably inspired by the Greek Revival portico which was added to the George Washington Custis House (later Robert E. Lee) at Arlington, Virginia, ca. 1820-1826 by George Hadfield. The columns were copied from an unfinished Greek Classical Temple where the volutes had not been cut into the column shafts. It was archaeologically inaccurate, but the result was a new expression and one that was to be widely emulated.

This archaeological inaccuracy is the key to the significance of the Greek Revival Period in America. It was rarely an exact copy of Greek Classical examples, but rather an imaginative assimilation of forms for the solution of new building types. Great emphasis was placed on developing new structural systems that would result in fire-resistant construction and hence greater permanency.

The solutions expressed restraint, simplicity, and monumentality even if the building was modest in size, such as the courthouse at Rising Sun.

A strong similarity can be seen between the Jefferson County Courthouse at Madison, ca. 1848 by David Dubach (Plate 21), and the Switzerland County Courthouse at near-by Vevay (Plate 22).

The Jefferson County example was the precedent. The porticoes of both examples are similar: High bases with pierced arches supporting four slender columns. The orders and the proportions of the pediments are dissimilar. The Ionic order was employed on the Jefferson County example and the Corinthian was used on the Switzerland County solution. The angle of the raking cornice of the Switzerland County solution is a more accurate use of the classical element.

It is possible that the facade of the State House at Boston (Plate 28), 1795-1808, by Charles Bulfinch was the precedent for both solutions.

Other similarities between the Hoosier solutions are quite obvious: Bay system, window fenestration, and scale. Indeed, the domes are identical except for minute details in the proportions of the cupolas (Plate 23 and Plate 24).

One of the most finely proportioned and detailed Greek Revival examples in Indiana is the Orange County Courthouse at Paoli, 1847-1850 (Plate 25). The architect is unknown. It is grandly sited on a gently sloping square defined by low commercial facilities at the periphery.

Behind the Greek Doric hexastyle portico, two open iron stairways rise from the main floor to the courtroom at the second floor. A similar stair system is employed to gain access from the finished grade to the first or main floor. Both stairways are defined by ornamental cast iron panels. The Paoli example is a very restrained, sophisticated, and monumental solution.

Another interesting example in the classical vocabulary is the St. Joseph County Courthouse at South Bend, 1854, by John Mills Van Osdel (1811-1891), the first architect to practice in Chicago and one of the first to practice in the Midwest. Fortunately, when a new courthouse was built in 1897, the old structure was moved to
a new site and is now used as the headquarters of the Northern Indiana Historical Society (Plate 26).

Numerous other Indiana County Court-houses were built in the Classical Revival Style, several by the eminent Hoosier architect, John Elder. However, most, if not all, have been replaced by more recent constructions.

The Marshall County Courthouse at Plymouth, 1870, by Gurdon P. Randall (1815-1884), (Plate 27), is unique in that it is not located in the business district but is sited on an ample square defined on all sides by a fine group of residences.

Mr. Randall was born in Vermont and studied under the eminent eastern architect, Asher Benjamin (1773-1845). Although Benjamin designed numerous buildings, his publications were of far greater importance since they established a high standard of design "that had a strong influence down to the Civil War."

Mr. Randall lived in Chicago for thirty-four years, where he became a well-known architect. He designed a number of courthouses, several located in distant states.

The Marshall County Courthouse is an imaginative emulation of the works of James Gibbs and Robert Adam, two of the most distinguished architects of the Eighteenth Century. Randall used a raised portico defined by a series of arches in a manner not dissimilar to the system employed by Charles Bulfinch in the design of the State House in Boston (Plate 28), an example that Randall had often experienced while residing in Boston.

George W. Bunting (1829-1901) was without question the most prolific designer of county courthouses to reside in Indiana. He designed a minimum of seven Hoosier examples and others in Kansas (Sedgwick County), Michigan (Wash-tenaw County), West Virginia (Harrison County), and Tennessee (Montgomery County). The latter group is a testament to his ability to seek out commissioners at a great distance from the geographic area of his architectural practice.

Bunting was born in Pennsylvania, the son of a sea captain. He later attended Girard College, a most extraordinary institution. The will of Stephen Girard stated the entire moral and architectural program of the school. It stated that a 20'-0" high wall must be constructed around the site and that no member of the clergy be allowed on the grounds. The main building (Plate 29) was designed by Thomas Ustick Walter in 1833 and completed four year later at a cost of $2,000,000, an enormous sum for the time.
The structural system is fire resistive, the detailing is impeccable, and it is one of the finest monuments of the Greek Revival Style to have been built in the Western world.

As a youth Bunting was also apprenticed to the shipbuilder's trade. His exposure to both architectural excellence and shipbuilding did much to prepare him for a career in architecture. He journeyed south and served as a colonel in the First Mississippi Cavalry during the Civil War. He then spent five years in Bloomington, Illinois, where he was engaged in the practice of architecture, prior to establishing an office in Indianapolis.

His son, George W. (the younger), later joined him in the practice of architecture and the firm of George W. Bunting and Son was established ca. 1886. At least two examples by George W. Bunting and Son were executed in the Richardsonian idiom. Both are virile and somewhat brutalistic.

The Wells County Courthouse at Bluffton, 1889 (Plate 2), is a brute of a building, with a massive outline and an asymmetrical cantilevered tower that has a polychromed checkerboard band of stone defining the clock faces, a device often used by Richardson. The rear and side elevations are massive and well scaled. The courtroom is a fine space and has required only minor modifications over the years (Plate 30).

The Union County Courthouse at Liberty was built a year later, 1890, and although the facade is more symmetrical than the Bluffton example (Plate 31), the side elevations are bolder in scale and more brutal (Plate 32). The walls are expressed as a skeleton of stone more open in form than the Bluffton solution with great emphasis on the wall plane juxtaposed to the recessed plane of the windows. The result is a bold three-dimensional expression.

In sharp contrast to the Richardsonian solutions that we have just experienced, George W. Bunting designed several examples in the Eclectic mode that recalled Renaissance, Mannerism, Baroque, and the then current Second Empire Style.

The Johnson County Courthouse at Franklin, 1881-1882 (Plate 33), largely of red brick, is vigorously striped with contrasting white limestone. Other details — dentil blocks, columns, etc. — are picked out in the same light color. Numerous manneristic elements are employed in the solution (Plate 34).

The Clinton County Courthouse at Frankfort (Plate 35) and the Madison County Courthouse at Anderson (Plate 36), are more than similar. Both were designed by the same architect, George W. Bunting, and were under construction in the same year, 1882.

The only major difference is in the use of materials, stone at Frankfort and red brick with stone trim at Anderson, and that the broad flight of steps is absent in the Frankfort example (Plate 37 and Plate 38). A further similarity can be seen between the window details of the Franklin County and the Madison County examples. Indeed, it is somewhat unique that an architect would use the same set of plans in the same year for two courthouses of identical scale less than seventy miles apart.

The works of two additional architects are of more than passing interest.

Thomas J. Tolan (1831-1883), was from Carrollton, Ohio, and designed numerous buildings in the northwestern part of Ohio. In 1874, he moved with his family to Fort Wayne. With his son, he established the firm of Thomas J. Tolan & Son, Architects, and they specialized in the design of courthouses and jails. At the time of his death in 1883, the elder Tolan was the architect and building supervisor of the Hamilton County Courthouse at Chattanooga, Tenn.

His son, Brentwood S. Tolan (1855-1923), came from Delphos, Ohio. Upon the death of his father (1883), the name of the firm was changed to B. S. Tolan, Architect.

The LaGrange County Courthouse at LaGrange, 1878-1879 (Plate 39), was designed by Thomas J. Tolan; of that we can be almost certain. The building is nobly sited on a forested square with a hitching rail running almost the entire length of the west side of the site for the even now familiar Amish horse-drawn carriages. The courthouse is symmetrical in plan and form with corner pavilions capped by mansard roofs. A domed unit rises from the center of the composition. The town has changed only slightly over the years; hence, the courthouse dominates the city now as it did almost ninety years ago.

The Parke County Courthouse at Rockville, 1879-1880 (Plate 40), by T. J. Tolan & Son, laid the foundation for the design of both the Kosciusko and Delaware County courthouses. Similarities can be seen in all three solutions.

The Kosciusko County Courthouse at Warsaw (Plate 41), 1882, by Thomas J. Tolan and the Delaware County Courthouse at Muncie (Plate 42), 1885-1887, by Brentwood S. Tolan are similar in outline, form, and detail. It is quite probable that the younger Tolan designed both examples, although thus far this has been impossible to prove. In both examples a central cross axis is expressed as a massive projecting
frontispiece which defines the main entrance. The orientation is the same in both solutions.

Through a closer inspection it is obvious that dissimilarities can be experienced (Plate 43 and Plate 44). The Delaware County Courthouse was elasticized vertically; thus, the main entrance (on the south elevation) was at grade level versus the broad flight of stairs used to gain access to the main floor at the Kosciusko County example. Thus, the higher base in the Delaware County Courthouse resulted in a more monumental solution and provided an additional floor of office space above the finished grade level compared to the sunken or basement sequence of spaces in the earlier Kosciusko County Courthouse.

The frontispiece of the Kosciusko County Courthouse is an emulation of the frontispiece of the Chateau Maison, nr. Paris, 1642-1646, by Francois Mansart. A similarity also is evident in the upper area of the frontispiece of both Indiana examples and the French solution.

Indeed, the upper mansarded element of the Delaware County Courthouse is reminiscent of the south front of the State War and Navy Building (Executive Offices) often referred to as Grant's Pile in Washington, D.C., 1871-1875, by Alfred Mullett, one of the most significant examples of the Second Empire Style in America.

The entrance of the Delaware County Courthouse was of greater girth, it is more positive, it states that this is the main entrance.

The window treatment in both Indiana examples is more than similar. In both examples the domes are similar in that they are both underscaled for their massive blocky bases. The dome of the Delaware County Courthouse is more plastic, is more finely detailed and less stilted.

Numerous other comparisons could be made between these Indiana examples, and there can be little doubt that the Kosciusko solution was the pilot study for the later and now no longer extant Delaware County solution.

Until its demolition in December of 1966, one of the most delightful ways to experience the Delaware County Courthouse was to walk north through the alley (Plate 44), a tight, narrow space, toward the south or main elevation. This same method of approach can be used in experiencing many of the Indiana courthouses. The element of surprise is dramatized, since only a narrow vertical segment of the structure can be experienced until one reaches the courthouse square. Then and only then can the entire structure be experienced. It is a space sequence system that has been often exploited in the history of architecture and one that even now has great importance.

The Delaware County Courthouse was finely detailed, and a monument of more than local significance. Indeed, it is difficult to experience an equally well-detailed and monumental public building in this part of the state. The views or vistas from the dome revealed the grain of the city and offered the finest panorama of the immediate area.

Fortunately, we have the predecessor of the Delaware County Courthouse. The example in Warsaw has been well preserved and continues to function quite well.

Indiana still has one of the finest assemblages of Nineteenth Century courthouses in the Midwest, and they vividly express a variety of architectural concepts. They express the architectural skills and aspirations of America in the Nineteenth Century. Unfortunately, several examples have very recently been demolished, and an ever-greater number will crumble under the repeated blows of the wrecker's ball in the future. Indeed, it would be fortuitous to suggest that all of these examples should be preserved and restored. One can only recommend that a more careful analysis of the Nineteenth Century courthouses must be made if we are to retain one of the most significant phases of our heritage. They are tangible and can continue to afford us a rich architectural stimulus and experience for many decades.

Indianapolis Architect John C. Parrish AIA, died August 13 in the Grissom Air Force Base Hospital near Peru, after suffering a stroke while on a trip to Rochester.

A charter member of the Indianapolis Architectural Club in 1913, Mr. Parrish has been a Corporate Member of the Indianapolis Chapter AIA since 1954. He was 76 years old.

Mr. Parrish started in architecture as an apprentice draftsman with Vonnegut & Bohn, Indianapolis, in 1910, was with George, Mac-Lucas & Fitton from 1914 to 1916, and with Frank B. Hunter from 1916 to 1920 prior to opening his own practice in 1920. He served in the U.S. Army Corps of Engineers from 1942 to 1952, and was the Architect for Military Air Transport Service, U.S. Air Force, Andrews Air Force Base, until 1960. His architectural projects included John Strange Elementary School, Calvin Prather Masonic Lodge, Stout Field Administration Building and hangar, and he was consulting architect for Culver Military Academy.

A record ninety-three entries were received for judging in this year's Triennial Honor Awards competition, twice as many as ever received previously.

The distinguished jury was composed of Jan Rowan, editor of PROGRESSIVE ARCHITECTURE magazine, New Canaan Architect John M. Johansen and Romaldo Giurgola, chairman of Columbia University's School of Architecture. Fifteen entries (also a record) received awards from the jury, including four Honor Awards, six Merit Awards and five Citations. The judging was held in New York on Sept. 6.

The results of the competition will be kept confidential until announcement of the winners is made at the annual banquet October 26, concluding the ISA Annual Convention. Recognition of the winners will be made then, and certificates will be presented to the architect, owner and contractor of each winning entry at ceremonies in each locale early in December.

**Floor 'em...with Kuramic Seamless**

Kurfees KURAMIC Seamless Floor Coating is a proven, durable epoxy base and urethane-finish that looks expensive, but installs and maintains for less than most floorings. Kuramic Seamless goes over practically all subfloorings; is available in a wide choice of colors. Kuramic film builds 35 mils minimum in three coats. Wears like tile. Cleans easily by simply mopping. No waxing. For kitchens, shower rooms, hallways, auditoriums, recreational areas, surgical rooms and most everywhere. Inside or out. Makes exciting dados. For more information, write J. B. Tabler, Kurfees Paint Company, 201 E. Market Street, Louisville.
Indianapolis Architect Fran E. Schroeder AIA, has been named a member of the Nominating Committee for the national Construction Specifications’ Institute. Mr. Schroeder is a charter member of the local CSI Chapter and served as its first director. ... Another Indianapolis architect, John C. Fleck AIA, currently is regional director of CSI from this region. Mr. Fleck also currently is vice-president of the ISA. ... Indianapolis Architect Paul Brandt AIA, has taken a leave of absence from his firm, Brandt & DeLap, Inc., to become department head of Building Technology at Auburn University’s School of Architecture. ... Ewing Miller Associates of Terre Haute, has moved into its new offices at 788 South Third Street. The firm occupies the upper level of the new two-story building, with the first floor area leased. The phone number (235-6275) remains the same. ... Ball State architectural student Terrence J. Minor of Muncie has been awarded the first annual housing research grant sponsored by the Muncie Federal Savings and Loan Association. The $750.00 grant will be used to travel and study row housing on the east coast and in Canada this summer. ... Anatoli Boschenko, a 1965 graduate of the University of Cincinnati’s School of Architecture recently returned from Vietnam and presently employed with Henry G. Meier AIA, Indianapolis, received the Bronze Star for his service with the 4th Engineer Batallion, 4th Infantry Division, U.S. Army. Mr. Boschenko was instrumental in designing protective bunkers which could be prefabricated and transported by helicopter. ... Purdue University’s School of Civil Engineering is sponsoring a two-day educational conference on high-rise steel building design November 14-15. Subjects to be discussed include the co-ordination necessary among architect, engineer, contractor and fabricator, roof and flooring systems, fire-proofing, and stress and stability analysis for vertical and lateral loads on medium-height steel frame buildings. Registration fee is $15.00.

**A CEILING OUGHT TO EARN ITS KEEP**

The ceiling in the new State Life Building will work because it is an Armstrong Luminaire integrated ceiling system. ... Distributed and Installed by the Most Distinguished Name in Electrical Construction and Ceiling Systems. ... Sanborn Electric Co.

A ceiling ought to do more than just look good. The Luminaire ceiling is an integrated system of functions delivering light, conditioned air and comfortable sound levels—each a benefit that maintains an investment in buildings and people.

Another Presidency

Former ISA President James M. Turner AIA has just assumed the third presidency of a major organization in about as many years, this time with the Calumet Council, Boy Scouts of America. He served as first president of the reorganized Indiana Society of Architects in 1965, and moved directly from that task to the presidency of the Hammond Chamber of Commerce in 1966.

More than 22,000 boys from Lake, Porter, Will and South Cook Counties participate in the Council's program, assisted by 8,000 volunteer leaders. As president, Architect Turner heads a ninety-man executive board composed of representatives of 68 communities involved in the Council's area.

Speaking of his new duties, Mr. Turner stated: "Scouting in our area is a predominant factor; about one out of every four boys is in the scouting movement, and we hope to increase this to one out of every three by 1972. Scouting involves our boys and young men in a manner that will shape the judgment of our future society."

Executives expect a little more from BFC...and they get it

Busiess Furniture Corporation

Several years ago, I&M Power Engineers observed a strange situation. While offices, stores, schools and industrial buildings were installing fluorescent lighting fixtures everywhere, no effort was being made to capture and use the heat that came from these fixtures as a by-product of light.

Today, heat recovered from fluorescent luminaires is a practical, working reality in hundreds of installations in the I&M area. During the times when modern, well-lighted buildings are occupied, Heat-With-Light delivers free comfort heating energy at savings of thousands of dollars!

A fluorescent fixture uses only about 20% of its electricity to produce light. The other 80% is released in the form of heat. Knowing this, it became a simple matter to design a duct-fan system, to move air through luminaires, picking up surplus heat and moving it out to warm the room. In Summer, the same system moves the heat outdoors, taking an enormous load off air conditioning equipment.

Your own I&M Power Engineer, based at your nearest I&M office, will be glad to supply all the information and direct assistance you need to plan and install a Heat-With-Light system to fit your particular requirements. He'll provide equipment information and specifications, work with your architect and contractor, and offer a wealth of experience. And there's never a charge or obligation! Call him today.
Modern masonry is reaching new heights with loadbearing concrete block

*The high rise — Newest concept in concrete masonry construction.*

Concrete block is coming up in the world — and fast. The Hanalei Hotel is another recent example of the far—and high — reaching structural advantages of innovative concrete block. The loadbearing walls of scored 8"x8"x16" block were completed at a rate of one story per week over a four month period, enabling the owner to open for the summer season.

Today concrete block possesses more comprehensive strength than ever before, yet still provides more wall area for less material and labor costs. This, combined with the wide variety of shapes, sizes, colors and textures, helps to elevate the most creative design; the most demanding loadbearing requirements to new highs. And with these structural advantages go the many traditional qualities of block always held in high regard; complete fire-safety, extremely high sound isolation (perfect for party walls) and impressive self-insulation head the list. Little wonder, concrete block is the building material more people are looking up to in high rises of every nature: hotels, condos and apartment buildings, college dorms, hospitals and office buildings.
