That Detroit has a better way
Save Time and Money with Precast Concrete Structural Units

Precast concrete structural members enable the architect and engineer to effect many construction economies.

1. Forming is simplified because all the work is done on the ground.
2. Forms can be reused many times, thus avoiding duplication and reducing time, labor and materials.
3. Reinforcement can be handled and positioned easily and quickly.
4. If the design calls for ornamentation, molds can be placed conveniently, then stripped and used again.
5. Mixing, placing, vibrating and curing operations can be readily controlled to produce a high-quality concrete, uniform surface textures and attractive appearance.
6. Centering precasting operations in one place and casting several different units simultaneously permits "assembly-line" efficiency and economy.
7. If wide spans are needed, structural elements or assemblies can be prestressed on the site.
8. If tilting operations are needed, small crews can do the job. The precast units can be held in place with simple bracing.

If you desire more information, send for free literature. It is distributed only in the United States and Canada.

Photos are construction scenes at St. Louis Produce Market. The concrete floor of the two 114 x 1235 ft. one-story buildings was a giant casting platform (center). Precast concrete wall panels were tilted into place (bottom). More than 23 miles of precast concrete joists went into the roof (top).

L. Roy Bowen & Associates, of St. Louis, were the architects and engineers. Robinson Construction Company, of St. Louis, was the contractor.

Wood County Hospital...

where Truscon "O-T" Steel Joists
Make Floors Light and Fire-Resistant

Light? Yes. The light weight of Truscon "O-T" Steel Joist construction lessens time and labor required for erection. It saves materials in supporting framework and foundations. Strong, too. Wide, specially-formed top and bottom chord members impart stiffness, and keep joists true to line. Continuous steel web member is electrically welded to the chords. Fire-resistant? Yes. Tests prove that 1/4-inch of cement or gypsum ceiling plaster on metal lath protects Truscon "O-T" Open Truss Steel Joist construction against high temperatures. In fact, the majority of insurance rating bureaus recognize the merits of this construction and give it a first-class fireproof classification.

Investigate this lower-cost-per-square-foot construction that assures adequate strength and safety. See Sweet's for complete specifications on Truscon "O-T" Steel Joists. Write us for literature describing the complete line of Truscon Steel Building Products.
Case Study No. 5

Planned Lighting checks industrial accidents

PROBLEM: To avoid injury from sharp edges and corners of sheet steel, workmen must be able to see quickly. In this area glare from improper lamps and insufficient light required extra effort and strain to avoid accidents.

SOLUTION: Edison lighting engineers recommended the installation of fixtures designed to eliminate glare; fixtures of correct size and spacing to place sufficient light on the steel, and in passage-ways. Workers were then able to recognize potential hazards promptly.

It takes Knowledge and Experience
... about both the quantity and quality of light to make it truly effective. For lighting to fit your special needs, call the nearest Edison office. Skillful advisory service is yours without obligation.

Detroit Edison
Prominent Architect
Follows his own advice

... Specifies Weldwood® Plywood for his own home!

Beautiful, easy-to-install Oak Plankweld®, in the Shelter Island home of Peter Schladermundt, architect.

Peter Schladermundt means what he says to his clients about the enduring beauty and economy of Weldwood Plywood!

He means it so much that he specified Weldwood Plywood throughout his own home on Shelter Island, New York.

He's typical of architects all over the country who are thoroughly sold on Weldwood Plywood.

Weldwood Plywood reflects dignity, charm and good taste ... yet it is so tough and strong that it stands up beautifully.

And when it comes to durability, remember this: Interior grade Weldwood Plywood is guaranteed for the life of the building in which it is installed!

In redecorating, Weldwood panels go up fast and easily right over existing walls ... even over unsightly plaster.

In new construction, Weldwood Plywood saves time and money because it is quickly applied over the studding.

Consider Weldwood Plywood for all of your clients. This wonderful material comes in a wide variety of fine woods ... domestic and imported: genuine Walnut, Knotty Pine, Oak, Korina®, Maple, Birch, Gum, Mahogany.

Therefore, when we build, let us think that we build forever. Let it not be for present delight, nor for present use alone, let it be such work as our descendants will thank us for, and let us think, as we lay stone on stone, that a time is to come when those stones will be held sacred because our hands have touched them, and that men will say as they look upon the labor and the wrought substance of them, 'See! this our fathers did for us.'—JOHN RUSKIN

Our building creed since our beginning, in 1908

GEO. W. AUCH COMPANY
GENERAL CONSTRUCTION

3646 MT. ELLIOTT AVENUE, DETROIT 7, MICHIGAN
You get beauty, economy and faster construction when you build with practical MARIETTA precast concrete wall panels. These insulated sandwich panels have a pre-finished, broomed exterior that closely resembles Indiana Limestone, a pleasing texture that gives a modern, decorative effect.

Build with MARIETTA wall panels and you see your walls go up in days, not weeks... 80 sq. ft. at a time, up to 3,500 sq. ft. a day, with only one crew. And they're complete... pre-finished inside and out with rigid insulation built-in. Slabs are cast with metal inserts that bolt directly to steel framework, eliminate costly, time-consuming masonry work, cut construction costs as much as 30%. Although they are only 5" thick, their U-value of 0.14 surpasses 12" of masonry wall construction. Available in various sizes, cast solid or with insulation.

MARIETTA PRECAST CONCRETE WALL PANELS

Let the MARIETTA engineering staff explain how MARIETTA panels can speed the construction of your next building, cut building costs. Write for details today.

MARIETTA precast concrete wall panels are available by truck if your site is within 300 miles of New York City, 300 miles of Marietta, Ohio, 300 miles of Baltimore, Md. Can also be cast at your building site when advisable.

PENCO TWO-PERSON LOCKER UNIT

Doubles Locker Facilities in the Same
or Less Floor Space!

You can save more than half the floor space usually
required for two large single tier lockers, with this
unique two-person locker unit. Each unit has indi­
vidual, interlocking hat and coat lockers for each of
two occupants. The lower lockers accommodate com­
plete clothing changes, clothes hanging full length on
hangers. The upper lockers are the full width of the
unit—ample size for hats, lunches, pocketbooks, etc.
Provides completely private storage facilities for two
persons in the space usually allotted to a single per­
son. Each upper door is interconnected with the
automatic prelocking device of its corresponding
lower door, thus needing no separate lock.

Engineered Timber Construction

Factual material vital to the designer of modern buildings is contained in this authoritative 12-page booklet. It illustrates the uses of engineered timbers in the construction of buildings which combine the finest appearance with permanence, economy and adaptability.

Included in this booklet is the following:

- Beam and girder applications; recommended sizes and connections.
- Arch applications with recommended connections and tables of section dimensions for various spans and loadings.
- Bowstring and parallel chord applications with detail drawings and tables of truss dimensions for various spans.

To get your copy of the booklet, "Modern Construction," see your nearest Timber Structures office, or fill in and mail the coupon.

COUNTRY CLUB MEMBERS enjoy fine food...cooked with GAS

The Dearborn Country Club, 800 North Military in Dearborn, is one of the many fine clubs in the metropolitan area. In its clubhouse delicious lunches and dinners are served to members and their guests. The excellent food is prepared in the all-Gas kitchen shown in the photograph.

This well equipped kitchen contains two hot-top hotel ranges, one fry-top hotel range, one deep-fat fryer, one hotel broiler and two coffee urns—all gas-fired.

Gas equipment is preferred because of its speed, flexibility and economy.

Crawford Customized Design

for a really distinctive, beautiful and
"front door" price tag.

This demand arises from the fact that the
home's garage door is, in effect, their "front door" because it is the first thing they drive up in the driveway.

All of these designs—and many others—can be applied to any standard model Crawford garage door in sizes to fit any garage, old or new, in colors and design effects can be applied by us, or, if you prefer, you can apply them yourself. It isn't difficult, it will cost you a fraction of the price of a designed, custom-built door at a fraction of the price.

We'll be glad to offer suggestions and information.
been introduced to meet the demand for a garage door—without the "custom look".

owners realize that today their garage doors are the first thing that people see when they arrive at a residence. If you let your imagination suggest—can be a reality with Stylist Door. These doors are available in single or two-car widths. The decorative panels can be enhanced with a little handy-man skill, you can apply finish paint; you'll have the effect of a decorator's touch to your garage door that such a door would otherwise cost. Get free estimates.

Two-Car Door with accent moldings No. 1 and rosettes in white on white panels. Contrasting color in alternating panels.

Single-Car Stylist Door with accent moldings No. 3 applied in diamond design with rosettes inset.

Single-Car Muntin Door with false louvers in harmonizing colors in side panels.
Decorative Units for Crawford Customized Designs

No. 1 molding is a half-round accent molding, 3/4" wide.
No. 2 molding is a beveled accent molding and is 1 1/2" wide. It can be applied in six different positions, as shown.
No. 3 molding is triangular with two rounded edges. It is 1 1/4" x 3/4" wide and is used to produce the effect of false louvers, as shown. It can also be used as an accent molding.

Rosettes are designed to give interesting shadow effects and various units can be combined on the same door. For example, rosette No. 1 could be used on alternate panels with rosette No. 3. And, rosette No. 2 could be used with rosette No. 3, the latter being positioned as a diamond rather than a square. Any of the accent moldings can be used with any of the rosettes. Rosettes are five inches in diameter.

10,000# Zero Slump Concrete

YES—The installation of heavy-duty concrete floors with a zero-slump mix is possible by the NARDONI process, producing a 1" top finish denser and more impervious to wear than any other.

Only 4 gallons of water maximum is used to each bag of cement. So dry, special mixing equipment with rotating blades instead of the usual revolving drum are necessary to facilitate handling. To level, mechanical rodding machines on steel screeds are used. Next the Vibro-Roller and the mechanical steel floats, followed by motor-driven trowelling machines. This superb floor will not dust; will withstand heavier loads; will stand abrasion longer than any other type of floor; will not craze; will decrease the overhead and operating expense of any institution or factory; contains aggregates that will not crush or roll out under the most severe traffic conditions; is laid by our own skilled mechanics; will show floor profits with years of quality service, and yet the cost eventually is less than an ordinary concrete floor topping.

Supported by years of experience and millions of feet of all types of floor installations

A—"Roller"—Compacts material after it has been spread approximately 1/2" above finish grade.

B—"Mechanical Rodding Machine"—Rodding and Compacting.

C—Manual filling up and striking after screeds are removed.

D—"Vibro-Roller"—Will further compact and produce density.

E—"Rotary Floating Machine"—Will also further compact and close all voids.

F—"Motor Driven Trowelling Machine"—Will further seal the finish surface.

G—Hand Trowelling for final smooth hard finish.

'redesign hughes' urges allen, as thousands cheer

The new format unveiled by the January issue of the Bulletin of the M.S.A. is brilliantly successful, and reflects great credit on the taste and talents of Alexander Girard, Morris Jackson, and Editor Talmage C. Hughes,' said Roger Allen today in a press conference attended by a fellow who stopped in to see did we work on ourepaper shingles. We didn't. Mr. Allen, I need hardly tell you, is the eminent architect, columnist and public speaker, also wet wash called for and delivered.

"But the very perfection of the job done on the Bulletin raises a complex question — what about redesigning Tal Hughes?"

'The Bulletin is now very contemporary and Hughes ain't. We must proceed instantly to give Hughes a new facade. No doubt you will point out that Hughes is better looking than I am. This is silly. Everybody is better looking than I am. When I pass along the street, small children clutch their parents and demand, 'Mommy, why is the man looking like that, huh, Mommy? Is it Halloween again already, Mommy?' I laugh as naturally as the little toddlers and kick their feet out from under them.

'Talmage, to be blunt about it, is not so as pretty as his wife Margaret. By an odd coincidence, I have a wife named Margaret, too, and she is prettier than I am. I hope so.

'First I thought we should redesign Hughes to look like a non-representational design by Piet Mondrian. And then I thought not. Next I thought perhaps we could make him look like one of the primitives by

March '53 Bulletin
Minoru Yamasaki, A.I.A., of the Detroit and St. Louis firm of Leinweber, Yamasaki & Hellmuth, Architects, was the speaker before a meeting of the Detroit Chapter, A.I.A. in Detroit's Rackham Memorial Building on the evening of February 19. His subject was, "Is Architecture a Business or a Profession?" The speaker divided his program into three parts; slides of contemporary architecture, done recently by his firm, a paper on his subject, and a question-and-answer period. President Amedeo Leone presided.

In pointing out that the architect has economic, social and esthetic responsibilities to his client, Yamasaki lamented the fact that Detroit is far from the city beautiful. In fact, he said, "It is downright ugly."

The discussion which followed the talk was one of the most spirited we have had for a long time, and altogether this was one of the Chapter's best programs.

**Chapter March Meeting**

Frederick A. Gutheim, A.I.A., of Washington, D.C., will be the speaker at a meeting of the Detroit Chapter, American Institute of Architects in the Rackham Memorial Building on March 25. His subject will be "What's happening to American Architectural Design?" His address in the auditorium will follow a Chapter dinner in the same building.

Marcus R. Burrowes, fellow and member emeritus of The American Institute of Architects, formerly of 24300 Locust St., Farmington, Mich., is now located at 226 University Crescent, London, Ontario, Canada. Burrowes, who until recently practiced in the Architects Building, 415 Brainard St., Detroit, is a past president of the Detroit Chapter, A.I.A. and of the Michigan Society of Architects. For many years he and the late Richard H. Marr, architect shared offices at the Brainard St. address. The practice is now being carried on by Richard Marr's son, Carl B. Marr, A.I.A.

Daniel C. Bryant, A.I.A., formerly of Port Huron, has transferred his membership from the Detroit Chapter to the Chicago Chapter.
convention will have many features

Linn Smith, President of the Michigan Society of Architects, announces that the program of the Society's Thirty-ninth Annual Convention to be held at Detroit's Hotel Statler, March 11-13, 1953, will be outstanding in many respects.

General Chairman, James B. Morison, A.I.A., has had the support of committee members, headed by some of the most able workers. Featured will be an exhibition of architects' own homes, or what the architect does when he has himself for a client. There will also be a showing of winning designs in the Kirlin lighting competition and a comprehensive display of building materials and products.

The show will open Wednesday afternoon, March 11, and the ladies committee will be on hand to serve as hostesses during registration and the social evening to follow. At this complimentary function there is to be a practical demonstration of architects as craftsmen, and a jury of tradesmen will award prizes for the best brick-laying, carpentry, etc.

Committee Chairmen for the various events are Suren Pilafian, Advisory; Leo M. Bauer, Past President; Talmage C. Gabler, Entertainment; Lyall H. Redstone, Architect's Own House Committee; Sol King, Leo M. Bauer, Talmage C. Hughes, Advisory.

Complimentary breakfast meetings for the Society's Board of Directors and for delegates from the three chapters will be held Thursday morning. At the business meeting Thursday morning Leo M. Bauer, past president of the Society, will be the keynote speaker. At the two luncheons, Thursday and Friday, and at dinner Thursday evening Society vice-presidents will preside.

The Eleventh Annual Michigan Building Industry Banquet, concluding event, Friday evening, will, as usual, tax the facilities of the hotel. At this event the Society's medal will be awarded to an architect who has made an outstanding contribution to the profession. Also an honorary membership will be awarded, and there will be announcements of awards in the competitions at the convention. President Linn Smith will preside and Adrian N. Langius will be toastmaster. Cal Tinney will be the speaker.

Cards for reservations for the various events are being mailed to all members, and should be returned promptly in order that committee tags may be arranged. Banquet tickets are to be obtained through the Banquet Committee, care of Builders & Traders Exchange, 2210 Park Avenue, Detroit 1, Mich. Room reservations should be made direct with the Hotel Statler.

During Convention the exhibit, "Italy at Work," will be at The Detroit Institute of Arts. This is an outstanding show and should be of interest to architects and guests.

The map of Michigan with cartoon calling attention to the Convention is the second done by Maximilian Jaeger, of the Albert Kahn organization. It was secured through the cooperation of our director Sol King of that office. This year Max Jaeger has been active in the field of art, having exhibited at the Kirk of the Hills and at the Scarab Club. He feels there is much to be gained by closer coordination of architecture and the allied arts. He is following in the footsteps of the late beloved Albert Kahn who was an active member of the Scarab Club.

2:00 P.M.—Address, Ballroom
Second Vice-President, A. N. Langius, presiding
Speaker: Ben John Small, A.I.A.
Subject: "Specifications, Servant or Master:"
Discussion following address
4:30 P.M.—Viewing of Exhibits
5:30 P.M.—Cocktail Hour, Bagley Room
Host—Producers' Council
Speaker: Philip N. Youtz, A.I.A.
Subject: "Architecture with a Lift"
Discussion following address
4:30 P.M.—Address, Ball Room
Speaker: William Lescaze, F.A.I.A.
Subject: "Famous People I have Third-degreed"
4:30 P.M.—Viewing of Exhibits
7:00 P.M.—Michigan Building Industry Banquet ($7.00)
President Linn Smith, Presiding
Adrian N. Langius, Toastmaster
Speaker: Cal Tinney
Subject: "Famous People I have Third-degreed"

Note: Reservations for Banquet should be with the Banquet Committee, c/o Builders & Traders Exchange, 2210 Park Ave., Detroit 1, W.O. (3-5000)

FRIDAY, MARCH 13, 1953
8:30 A.M.—Tour, General Motors Technical Center (by ticket only)
Ladies invited
11:30 A.M.—Ladies Cocktails, President's Suite
Host—Michigan Society of Architects
12:30 P.M.—Luncheon, Bagley Room ($3.25)
Cocktails—Host to be announced
Third Vice-President, Paul B. Brysselbout, presiding
12:30 P.M.—Ladies Luncheon and Fashion Show, Terrace Room ($3.25)
2:30 P.M.—Address, Bagley Room
Speaker: Philip N. Youtz, A.I.A.
Subject: "Architecture with a Lift"
4:30 P.M.—Address, Ball Room
Speaker: William Lescaze, F.A.I.A.
Subject: "Famous People I have Third-degreed"
4:30 P.M.—Viewing of Exhibits
7:00 P.M.—Michigan Building Industry Banquet ($7.00)
President Linn Smith, Presiding
Adrian N. Langius, Toastmaster
Speaker: Cal Tinney
Subject: "Famous People I have Third-degreed"
Ben John Small, A.I.A., a partner in the New York firm of Alfred Hopkins and Associates, Architects, will be a speaker at the Society's 39th convention at the Statler the afternoon of March 12.

Architect Small, an authority on specifications, and author of "Streamlined Specifications Standards," published last year, will speak on that subject, "Specifications - Servant or Master?"

A specialist in specifications for 24 years, Mr. Small is co-author of "Architectural Practice," a lecturer at Columbia, Princeton and V.P.I. He currently conducts a feature in Progressive Architecture entitled "Spec Small Talk."

In view of the widespread concern over this subject, it is obvious that all members of the building industry can gain much by attending Mr. Small's lecture, and all those interested are invited to attend.

Following the lecture, a question-and-answer period will enable attendants to express their views.

William Lescaze, F.A.I.A., of New York, designed the world-famous "glass skyscraper" in Philadelphia which is still reaping architectural honors. The Philadelphia Saving Fund Society Building, though built 21 years ago, belies its age with its two acres of plate glass exterior, giving the effect of a gigantic tower of glass overlooking the heart of Philadelphia's shopping district.

Lescaze has crusaded for contemporary architecture through his own outstanding work and in his many books and articles. "On Being An Architect" was published in 1942 and "The Intent of the Artist" in 1941. He has lectured extensively at universities, museums and to professional groups, and was visiting critic at Columbia University for two years.

Born in Geneva, Switzerland in 1896, he graduated from the College de Geneve in 1914 and the Federal Polytechnic Institute of Switzerland in 1919. He worked in devastated areas of France for a year prior to his arrival in the United States in 1920. He became an American citizen in 1929.

He was awarded the silver medal at the Paris International Exposition, 1937; medal of the Philadelphia Chapter, A.I.A., 1940; silver medal by Pan American Congress of Architects, and an honor award by the Southern California Chapter, A.I.A. for the Columbia Broadcasting System building in Los Angeles. He will speak Thursday evening.

William Lescaze

Philip N. Youtz, A.I.A., a practicing architect, author and teacher, of New York, will be the speaker at the afternoon session, Friday, March 13.

Youtz is a most versatile person, having designed schools in Canton, China, as well as many other structures in this country.

The speaker was graduated from Amherst College in 1918, and he received his M.A. degree from Oberlin College in 1919. He has taught architecture at Columbia University and at Peoples Institute in New York City. In the field of art, he has been curator and director of museums in architects, and an honor award by the Southern California Chapter, A.I.A. for the Columbia Broadcasting System building in Los Angeles. He will speak Thursday evening.

William Lescaze

Cal Tinney

Philadelphia and in Brooklyn. He served as president of the American Federation of Arts from 1936 to 1938.

Mr. Youtz was Director of Pacific Area, Golden Gate Exposition, San Francisco, 1938-39. He engaged in travel and exploration in South America, 1939-41, and was consultant for the government, on research and development, during World War II.

While Mr. Youtz is also editor and author of many important works, he is perhaps best known for his recent invention of "skyhook" for construction of monolithic concrete floor slabs without forms.

World Travel and a residence on millionaire row in Tulsa hasn't changed him. The fact that he's written for AMERICAN, READER'S DIGEST and LIFE and that his syndicated newspaper column has been read by millions doesn't impress him. It's true he's been heard on three radio networks and a television network — but the homespun humor and whimsical philosophies that have been heard on the air are as much a part of the real Cal Tinney as the large hat he wears.

"The hat is 'Oklahoman'," according to Tinney, "In Oklahoma they're big enough to shade us but not big enough to shade us and the horse."

Cal Tinney looks something like Will Rogers but his lecture bureau doesn't allude to the classic Oklahoman humorist in Tinney promotion.

The colorful Oklahoman gathers material for his platform appearances and newspaper columns by traveling everywhere and talking to everyone. He goes on the theory that every man, woman or child he meets may be the leading character in a story that is worth repeating.

Ben John Small
construction is everyone's business

This evening it will be my privilege, with your indulgence, to talk with you about certain phases of the construction industry, to develop a part of the historic background of that industry, to show how construction is predominant in determining the destiny of nations, and to develop certain thoughts which may perhaps have occurred to many of you, and which are of vital importance not only to the segment of our people who are directly engaged in construction, but of local importance to our national welfare. In this discussion, we shall recognize the age and dignity of our industry, because the construction industry is the oldest known to man. It began when man began, because when the first eviction case came before the supreme court, and judgment was rendered, it became necessary for Adam to bestire himself to provide shelter and food for himself, his wife and the children who came from that union. Food and shelter have been basic elements of survival ever since, and construction has been essential to their maintenance and development.

We shall recognize also that the construction industry, although an old and important industry and only one segment of our overall economic structure, is nevertheless a very important cornerstone in that economic structure. What we in the construction industry do, how well we occupy ourselves, how efficiently we do our job, has an effect over an ever-widening sphere.

What is our industry composed of — what makes it run — what makes it virile — wherein lies its strength or its weakness? The industry could not function at all if it were not comprised of three integrated branches — all having their root firmly secure in the earth from which the industry derives its basic elements — iron ore, tin, asphalt, cement, aluminum, coal, oil and the thousands of elements which are used in the industry or whose processing is dependent upon the industry. Three main branches, all working in coordinated harmony, lend stature and dignity to the industry: Management — inventive management, imaginative management, with adequate financial and technical resources; Material — adequate material, not limited by artificially created scarcities, and with the virility and confidence of performance instilled by constant research; and Labor — that vast group of people who, by the skill of their hands, their minds and their hearts fashion into physical being the facility that Architects and Engineers design and which the Owner wants and is willing to pay for. The Owner is, of course, an indispensable part of this business. Without him we should not have a construction industry. He is the fellow with the money and when we consider that under present tax laws, he needs to earn from $2.00 to $3.00 before he can lay aside the next dollar for building purposes, we note that the building dollar which he entrusts to you and to me to spend for him is an expensive dollar indeed. It behooves us to spend it wisely.

Another part of the team — the Architect-Engineer — is not entirely indispensable; he can be gotten along without. But the good Architect-Engineer can make it worth on Owner's while to engage him because he more than pays his way; if he doesn't do at least that, he has no business on the team. Too many Architects and Engineers give an Owner only what he initially wants. That is wrong. The true Architect-Engineer shows an Owner what he needs — and makes him want it.

But this evening we are not going to talk at length about the Owner nor about the Architect-Engineer. Nor are we going to discuss at too great length another collective individual who had an idea that he owned the ball and bat and insisted on getting on the team. Government as it was intended to be constituted
in this nation was the agent of the people. It was designed to receive only such powers as are delegated to it by the people. During times of great stress and emergency, it becomes essential that the people temporarily give up some of the rights and privileges inherent in the individual and permit them to be administered in the interest of the common good. The trouble arises that once these individual rights and privileges have been delegated, they are not easily reclaimed. The result of recurrent and continuing stress and emergency has been a stifling of individual enterprise, because you cannot have individual enterprise in its highest form unless the incentive to it is kept alive. How do we maintain that incentive? By recognizing the true meaning of profits in business; by assuring the people of a sound dollar; by recognizing the force of the law of supply and demand; by a moderation of the tax laws such that the goose which lays the golden egg may not die to lay no more; by recognizing that only such powers as are delegated to the people. It was designed to receive die to lay no more; by recognizing which lays the golden egg may not be produced and why they died. Much of this is buried in the unknown, but many of their structures have endured over many centuries. This era in which we are privileged to live will be known in future centuries not by the physical monuments we leave behind, but by the productive imagination of industry and commerce which blazoned a cycle of build, alter, tear-down and rebuild, and a profound faith in the destiny of America and the American people. And the construction industry has been a proud partner.

You and I have a stake in this — a big stake. And make no mistake, what affects the building industry affects the nation adversely — because the building industry is basic. We are all allied to it in some form or other, even though we do not build bridges or roads, or dams or buildings — each individual is dependent upon the building industry, because the basic elements of survival — food and shelter. You cannot have them without construction; you cannot have them in a better form or supply unless construction is unhindered by artificial roadblocks in its quality, its quantity and its diversification. Nowhere in history of nations has this been more forcibly exemplified than it has here in America. Upon a virile construction industry depends the welfare of peoples and their standard of living.

If ever there was an American Period of Architecture, I believe that it will be reflective of the constant change with which American Industry and Commerce have imbued it; it will be reflective of the cycle of build, alter, tear-down and rebuild — as exemplified by industry and commerce, particularly over the past half century. Progress and change are nurtured on discontent. America was founded on that premise. The American people were comprised initially of the discontented elements of many nations — men with ambition, men with a desire for liberty, men who were willing to carve out of the wilderness a place for themselves and their homes by the work of their hands and their hearts. I hope that we shall never lose that discontent, because upon it we make progress, we build commerce, we interchange ideas and products and ownership. It is this incessant and insatiable desire for change and improvement that has given American industry and commerce their stature and has required construction methods to keep pace.

The dead civilizations of past centuries intrigue us, and archaeologists have delved into their histories as depicted by their writings, their art, their structures, to determine, if possible, how they lived, what they produced and why they died. Much of this is buried in the unknown, but many of their structures have endured over many centuries. This era in which we are privileged to live will be known in future centuries not by the physical monuments we leave behind, but by the productive imagination of industry and commerce which blazoned a cycle of build, alter, tear-down and rebuild, and a profound faith in the destiny of America and the American people. And the construction industry has been a proud partner.

History will probably also record this era as one of discard and waste. Certainly there is waste in the commonly accepted definition of the word. But the commonly accepted definition is not entirely correct. To denude our forests without reforestation and permit the fertile soils of our fields to be eroded into the rivers and oceans — that is waste. To take crops from farms with the effect to maintain the fertility of the soil — that is not waste. To squander time in useless pursuits — that is waste. To discard the individual know-how and experience accumulated over many years by arbitrary forced retirement from active productive effort — that too, in my opinion, is waste. But waste the commonly accepted definition is not an evil when it is instrumental in providing something better than what has been discarded. If a better engine can be built which uses one-third less fuel than the old one, thereby in fact increasing our fuel reserves, then, by all means, we are justified in throwing the old one away. If a locomotive can be constructed which converts an inexpensive fuel into electric energy, thereby permitting that locomotive to require less weight and greater pulling power — then we are certainly justified in discarding the coal fired steam locomotive. That kind of waste is not actually waste at all; it is conservation of energy. That is the kind of waste by means of which we have in our homes the automatic washer, the dryer, the electric stove; through that kind of waste we have on our farms the tractor, the gang plow, the combined reaper. That is the American way wherein man's labor is taken over by the machine, wherein we have been able to produce more and are able to enjoy more of the comforts and conveniences with less manual effort. That is why we have more in America than in any other land under the sun.

The United States with 6% of the earth's land and 7% of its population nevertheless produces food sufficient not only for itself, but for many millions outside its limits. It has 70% of the world's telephones; more than 70% of the world's automobiles. How is this possible? Certainly not through communal, collective farms or enforced labor as in Russia; certainly not through Socialism and nationalization of industry as in England. No, it came about because men of vision, men of imagination, men of inventive genius were able to work unhampered by artificial controls, in an atmosphere of free enterprise — and were able to enjoy not only the satisfaction of accomplishment, but also a goodly portion of the profit derived therefrom. That has been the American way and, in general, that way has been good. We must never lose sight of the fundamentals upon which it rests and sell that birthright for a mess of potage.

What can the construction industry do to maintain the strength of the American way? By the vitality of true construction service. The most important theme is service. You may be an Architect and Engineer, and you embrace within your organization all the know-how of design of a church or a school or a hospital or a factory — but what you really sell to an Owner is service, personal service. The other attributes modify that, too, in my opinion, is service. But waste the commonly accepted definition is not an evil when it is instrumental in providing something better than what has been discarded. If a better engine can be built which uses one-third less fuel than the old one, thereby in fact increasing our fuel reserves, then, by all means, we are justified in throwing the old one away. If a locomotive can be constructed which converts an inexpensive fuel into electric energy, thereby permitting that locomotive to require less weight and greater pulling power — then we are certainly justified in discarding the coal fired steam locomotive. That kind of waste is not actually waste at all; it is conservation of energy. That is the kind of waste by means of which we have in our homes the automatic washer, the dryer, the electric stove; through that kind of waste we have on our farms the tractor, the gang plow, the combined reaper. That is the American way wherein man's labor is taken over by the machine, wherein we have been able to produce more and are able to enjoy more of the comforts and conveniences with less manual effort. That is why we have more in America than in any other land under the sun.
important item of personal service. And labor, skilled and unskilled, whose talents and abilities are so indispensable to manufacture and who install the many items required for a building — be they brick or mortar, or finished wood work, or the menial task of moving earth — all such labor is soul satisfying only if done with the motto "I, too, serve."

Some time ago I was invited by Leo Bauer, the then very energetic President of the Michigan Society of Architects, to discuss with a panel of persons engaged in architectural practice, the practices within the large architectural and engineering organization. Other speakers handled the operations in the small and medium sized organizations. I should like to quote one excerpt from my discussion at that time, because it has a bearing on this theme:

"Whether the organization is large or medium or small — the primary function of the organization is service. It is the only commodity we have to sell. If an organization becomes so large in numbers and in operations that the immediate official family cannot have a fairly intimate concept of all projects and be in a position to discuss them intelligently with an Owner, then, I am convinced the organization is too large. If the head of such an organization is too busy to have his door open for discussion with individual members of the organization of their intimate problems, their ambitions and to take a personal interest in their progress, then I am equally convinced the organization is too large. The aim must first be for quality of service. It is that and not numbers alone which makes an organization big."

If that is true of the Architect-Engineer organization (and I believe with all my heart that it is), it is equally true of the Contractor who manages construction, of the Supplier who furnishes the materials of construction, and of Labor which furnishes the skills for the integrated whole. Some of us have been prone to forget this all-important element, in a period when our products and our abilities have been in great demand and it has done us no good. Just as the manufacturer who had the foresight to move from an obsolete plant into one with modern up to date appointments will be in a preferred position in the competitive days ahead — so, too, will those in the building industry who have never lost sight of the present service be in a preferred position in the days that will test its calibre. Prosperity is something which is not artificial, something which is not handed to a nation as its constant diet, but something which needs to be cultivated and learned for. How prosperous are we? How the is the prosperity which we have been told we enjoy? How hard have we worked to achieve it or more important — how hard are we working to maintain and improve it? Let us see.

First, nearly every one in this nation is handling more dollars than at any time in his career. But if a foot were arbitrarily decreased to six inches instead of twelve, would you thereby become physically taller? No, and neither are we any richer. If we recogize more of the current dollars. So, in our prosperity, we must discount the inflationary phase as an unreal measure.

Are we more prosperous because a varying percentage of the production capacity of men and machines and of raw materials is being expended in the making of munitions and implements of defense and of war? We are, but only insular as we thereby lay aside and accrue, in our treasury of knowledge, methods or machines, or know-how that may be applied to the advancement of man's stature. The actual production of tanks and guns and atomic bombs — though virtually essential for our defense — nevertheless is useless in improving the standard of living. Such production may even temporarily depress our standard of living because of its impact on our economic structure. We must therefore place some percentage of discount upon war production or defense production in our measure of real prosperity.

Real prosperity can be measured only in terms of national goods and services which are available to the civilian population and to all sections of that civilian population. It is the total of such goods and services available and within the reach of each individual which determines whether the individual may have them in increasing amount, whether he may have them in constant amount, or whether they are available in decreased amount. Immediately subsequent to World War II, there was a measurable increase in goods and services available. The improved technique of production developed during the war years, the inventions of the war years, modified for civilian use, gave great impetus to real prosperity. There has been further improvement since then in national production, but it has been slow, so slow in fact, that when the increase in national population is considered, the actual real value of goods and services available to each individual today is no more than was available to each individual in the first year following World War II. This is not the progress of which America is capable.

There is no finer sympathy depicting the story of success and prosperity than that of machines at work; and the world is in need of more work, not less. The higher we progress in what we choose to call our standard of living, the more work necessary to maintain that progress. You can have more leisure only through more intensive work. We get nothing for nothing. To make a washing machine or a tractor or an automobile or a television set requires just so much labor. You either provide that labor with hand and back, or combine these with more efficient tools, or your brain thinks up more efficient ways of performing that labor through a combination of hand and mind and machine.

There is no more energy in the universe today than there was when the world was created. We do not create energy; we do not increase energy, but, by application, we have found and will continue to find — if we are diligent and aggressive — better and more efficient means of using the energy that surrounds us — in the air, in the sea, from the earth — and we have only scratched the surface of some of these sources. But none of the energy which we obtain from the sun, or from the reservoir of energy stored in the air, in the sea and in the earth — none of this energy is automatically good — it must be controlled. It must be developed by man and controlled by man. If we lose the energy of mind and hand and heart, all the energy from the sun, in the sea, the air and the earth will be useless to the improvement of man's stature. The sun's rays falling on a field will not produce wheat unless we first till the soil, sow the wheat and maintain the soil's fertility. Coal will burn, but not usefully, unless its heat is directed to alleviating suffering from cold, or to the cooking of food, or to the making of steam. It will not do these things automatically — man must direct them. Men must work — the basis of our individual economy is work and too many of us have lost the will. Why? I can see many reasons for it. Ever since World War I, the nations of the earth have been threatened with war. Some of the nations, cultivated that threat through blind following of their ambitious leaders. Man has not attempted to counteract this threat by collective methods of security and in both processes the individual delegated or permitted to be delegated certain
of his inherent rights to a state which became more and more socialist and paternal; and the state relished the role. The expenditures for collective destruction through the medium of war; the expenditures for collective defense against the threat of destruction; and the taxation which is corollary thereto in an ever rising spiral has increased the dependency of peoples upon their centralized government. The result has been, or, if continued, will be, the destruction of individual initiative because individual initiative thrives only on incentives.

Be as idealistic as you wish, but in the final analysis, incentive thrives only on profit — profit in property, in money, in enhanced living standards, in credit, in renown, in satisfaction for serving fellow man — either singly or in combination. Profit is essential to incentive. Money may be the root of all evil — but it is the root of incentive for material advancement too, and, when honestly accumulated and wisely administered, it is not the root of evil at all — it is the life blood of free economy which recognizes individual initiative, individual enterprise, and the rights of all to life, liberty and the pursuit of happiness.

Every individual is entitled to acquire property, to use it and to hold it, safe against seizure as long as he administers that property in keeping with the moral and legal principles of private ownership. And every individual has the right and the duty to work and to produce — and thereby he is entitled to the fruits of his labor to the degree that economic factors permit; and he is entitled to these fruits to the extent to which he applies his talents. Every man has that responsibility and that right, be he salesman, or engineer, or architect, or carpenter, or bricklayer, or laborer. There is no other way to foster incentive in peacetime than to recognize those individual responsibilities and those individual rights.

In the interest of a healthy and virile building industry, it is essential that incentive be fostered in all its branches. I do not believe that individual incentive can be maintained unless there is recognition that individual skills are proportionate not alone to years of experience, but also, and to a greater degree, to innate ability and a will to apply that ability. The roadblocks to that recognition must be removed in all branches of our industry if it is to continue as the bellwether of real prosperity. It cannot maintain that position if individual incentive is stifled by lack of recognition of a basic fact — that even though all men are created equal, they are not all equally able, equally ambitious, equally willing to apply their abilities — and should therefore be not equally rewarded.

In all of our discussions of the economic side of our existence, the acquisition of material goods; the owning of property, and the enjoyment of that ownership; the invention of new and better ways of doing things; the ability to perform our tasks more rapidly and more efficiently, thus permitting more leisure — all of these must be founded not alone on the rock of sound economics; they must be based on the moral principles of right and wrong. Our founding fathers recognized these principles in the Declaration of Independence and in the Bill of Rights. It would be well for all of us to read and to re-read these historic documents.

Because an economy delegates all authority to the state and makes man a chattel of the state does not change the moral principle that such a state is not right — but morally wrong. You cannot legislate wrong into right. If a principle is wrong, it remains wrong forever, inalterably, because Truth is eternal and unchangeable. Sin cannot become a virtue because more and more of us commit sin. And laziness and sloth will never become virtues because more and more we lose the will to work.

Any economy which is not founded on the moral principles of right and wrong will not thrive. That is why the communistic state will definitely fail to survive because it disclaims all the moral virtues and bases its existence only on what appears to be immediately of benefit to its materialistic economy. If the state based on the principles of private enterprise and the dignity of the individual, as our founding fathers conceived it, ever fails, it will be because we have failed to reiterate and to reinforce our basic economic structure with moral reinforcement, — respect for the dignity of man, respect for law, nay — respect for the basis of all law, the Ten Commandments of God. Until and unless such moral armament—which must be the fundamental basis of any capitalistic economy — until and unless that moral armament is in good repair, then I say to you that we have no right to go to the far corners of the earth to preach the gospel of our way of life.

A panel discussion featured the meeting of Western Michigan Chapter, A.I.A. in Grand Rapids, Monday, Feb. 16th. George Sprau, chairman of the program, had invited Dr. Jay Pyleman, Asst. Supt. of Schools; I. J. Van Kammen, Supt. of Buildings, and Frederick C. See, Supt. of the City Park Dept. to present their views on the school plant expansion plan under way in Grand Rapids.

Dr. Pyleman told of the effective collaboration of the architectural committee, community-citizens advisory group, administrative staff of the Board of Education, and the City Park Department. He praised the Citizens' Advisory Committee in obtaining the additional tax millage to make the school building program possible.

Mr. See outlined the concerted efforts of his department to utilize present properties surrounding the schools for greatest community advantage. The areas around the schools are being prepared to accommodate recreation, physical education, and inter-school demands. This has been especially successful in Montreal, Canada and other park-school communities.

Mr. Van Kammen pointed out that 1929 was the year in which the last school building had been built in Grand Rapids. He stressed that the new schools would be easier to operate and more economical to maintain. The architects have provided storage spaces that permit easy access to cusodians.

Prior to the discussion, President Vander Loon brought the business meeting to order.

The annual Lake Macatawa Sum-
Summer Conclave will be held on Saturday, June 27th.

Elmer Manson reported on the latest developments coming from the A.I.A.-A.G.C. meetings. He announced the next Chapter meeting to be at the Skyway Cafe, Lansing City Airport on Monday, March 23rd. The Chairmen from the two State legislative houses will speak to the audience.

Home-towners: Robert Klawieter, Philip Haughey, and Chase Black. From Grand Rapids, the Chapter's Third Annual Honor Awards program was presented.

The Grand Rapids meeting was held on February 19th. Copies of the Grand Rapids meeting will be sent to A.G.C. members. Western Michigan Chapter and Saginaw Valley Chapter members. This is a joint effort on the part of the two groups and the committees will continue to meet.

Many valuable points have been brought out by the committee members; these points will be further discussed. Following the discussions, the Monthly Bulletin will publish articles on the specifications and general bidding procedure.

The Board of Directors, Michigan Society of Architects, will hold its April meeting concurrently with that of the Western Michigan Chapter in Grand Rapids, the Chapter's Third Annual Honor Awards program, tentatively set for April 20th. The purpose of the Honor Awards program is to give professional and public recognition to meritorious architectural achievement in the Chapter area to the end that an appreciation of excellence in architecture may be encouraged both within the profession and by the public.

The Awards Committee is now accepting entries for the best buildings of 1948-52. Any building constructed and completed during these years is eligible provided: it is located within the Chapter area or the architect is a Chapter member. Selected work of the exhibit will be published in the Monthly Bulletin for June, 1953. Entries will be judged in the following general classifications:

1. RESIDENTIAL (single and multi-dwelling) 2. COMMERCIAL AND INDUSTRIAL (Any building used for a profit-making enterprise) 3. INSTITUTIONAL (Any building used for a non-profit enterprise)

April 15th is the deadline for mailing entries to:
Western Michigan Chapter, A.I.A. 158 Bostwick Ave., N.E. Grand Rapids, Michigan

Welcome to Institute membership is extended to Henry Chase Black, Jr., 149 Redner Drive, Battle Creek and Gordon A. Belson, 247 Winter, Battle Creek, who are assigned to Western Michigan Chapter.

Century Brick Company has appointed Lewis Bliss as sales manager. Bliss, formerly with Belden-Stark Brick Co. and the Mason Brick Company, will renew old friendships at the Century display in Parlor A at the Statler during the Society's 39th Convention, March 11-13.

C. Allen Harlan, President of Harlan Electric Company, has been appointed by Mayor Cobo to serve as a Trustee of the Detroit Educational Television Foundation, to plan financing, construction and operation of the non-commercial station recently allotted to Detroit by the Federal Communications Commission.

Edward F. Ebbert, A.I.A., formerly of Jackson, now of 23108 St. Clair Shores, has transferred his membership from the Western Michigan Chapter to the Detroit Chapter.

Forrest W. West, A.I.A., 230 W. Washington, South Bend 1, Ind., has become a non-resident member of the Michigan Society of Architects.

Alwin S. Kolm, A.I.A., of Holland, has joined the staff of Adrian N. Langius, Director of the Building Division, State Administrative Department, Lansing.

O'Dell, Hewlett & Luckenbach held open house at their own new office building recently, at 950 Hunter Blvd., Birmingham, Mich. Two hundred fifty attended.
N.C.A.R.B. Met in Chicago

The Board of N.C.A.R.B. met in Chicago on February 13 and 14. President Charles E. Firestone, F.A.I.A., presided during the two-day session, which was devoted to Council business and planning for the Council’s 32nd Annual Meeting to be held in Seattle just prior to the A.I.A. Convention in Seattle.

Besides members of the Board, there were present members of the Syllabus Committee headed by A. Reinhold Melander. Also present was Talmage C. Hughes, editor of National Architect, the Council’s official publication.

As indicated above, members of the Board are from many states, some far distant from Chicago. These architects deserve much credit for making valuable contributions to the profession.

It is hoped that at the Convention one session will be devoted to reports from the various state boards of registration, for the exchange of ideas that might be of value to all concerned.

architects in the news this month

Architect Lloyd W. Larimore has been reappointed to a four-year term as a member of Fort Wayne-Allen County (P.a.) Humane Commission. Mr. Larimore was one of the founders of the Society for the Prevention of Cruelty to Animals and served as chairman of its board of directors. He has practiced architecture in Fort Wayne for the past 33 years. First appointed by Fort Wayne mayor Harry W. Baals a year ago, Mr. Larimore succeeded his wife who resigned.

Jose Louis Sert, distinguished Spanish architect and painter, more recently practicing architect and city planner of New York, has been appointed professor of architecture and dean of the Graduate School of Design at Harvard University. He succeeds Joseph Hudnut who is retiring. Mr. Sert is president of the Congress International d’Architecture Moderne (CIAM), and in 1944-45 he served as professor of City Planning at Yale University.

Wells I. Bennett, F.A.I.A., dean of the College of Architecture and Design, University of Michigan, has been reappointed a member of Michigan’s Board of Registration for Architects, Professional Engineers and Land Surveyors. The appointment by Michigan’s governor G. Mennen Williams is for seven years.

O’Dell, Hewlett & Luckenbach, Architects held open house at their own new office building, 950 N. Hunter Boulevard, Birmingham, Mich., on January 24. Two hundred and fifty were present.

George J. Haas, A.I.A., has been confined to Jackson Memorial Hospital in Miami, Fla., where it is reported that he is “responding favorably to treatment.”

Louis G. Redstone, A.I.A. has moved into his own new office building at 10811 Puritan Ave., Detroit 26.
By heralding the important happenings, volumes bound and preserved constitute a running history for easy reference in the years to come.

The publication should be of interest first to members, but also to other professions and the public, in so far as possible. To accomplish this the editor should conform somewhat to newspaper style; that is, find the news value and feature it, while at the same time bringing out details that are also important but not always so interesting. A safe procedure is to follow the newspaperman's creed of who, what, where, when, and why. Most every newspaper article follows this in the opening paragraph, so that if one doesn't read more he has, at a glance, the gist of what the article is about.

Example:

"Before and after the last war, our country became the world's architectural center of gravity," according to world-famous architect Eric Mendelsohn of San Francisco, California, who addressed the annual convention of the Michigan Society of Architects at Hotel Statler on Thursday evening.

State or chapter activities, while local in nature, have their national aspects, providing reason for intercommunication with other sections of the country. Every effort should be made to extend circulation as much as possible to non-members, for herein lies the opportunity of expansion. Then, in addition to exchanges, the publication should reach libraries, schools, colleges, newspapers and consumer magazines, our friends the producers and keepers throughout the building industry. It would be good if all officers, directors and committee chairmen of the Institute, its chapters and state societies could be kept informed of what is being done and the trend of thought in every other group of architects in the nation. Such material should be considered required reading for students in our architectural schools. Such wide-spread exchange of ideas would greatly increase the interest and activity of various local groups. A few copies will fall on barren ground but this is to be expected. I know of only one such case. An architect in Brooklyn wrote on a postcard, "Dear Sir: Please discontinue sending your pamphlet, as it is of no interest to me. It takes up room in my apartment house mail box so that more important mail cannot be inserted." And to this Roger Allen cracked, "No doubt he means large pictures of the Brooklyn Dodgers."
air conditioned home contest

A nation-wide architectural competition to obtain designs for homes planned around air conditioning and providing prizes totalling $27,800 has been announced by Carrier Corporation, of Syracuse, N. Y., residential air conditioning leader.

The contest — the Carrier Weathermaker Home Competition — will offer 31 prizes, including a national grand prize of $5,000, plus six prizes of $2,000 each distributed in three geographic regions, and eight additional prizes for each region.

The competition opens February 2 and closes April 10. Its purpose is to stimulate practical, economical, well-planned designs for homes using year round air conditioning.

The regional grand prizes will be offered in two size categories — houses of 1,000 square feet in area and under, and of 1,800 square feet in area and under. Awards will also be made for both pitched roof and flat roof houses in both size categories.

Awards will be based on esthetic considerations and on suitability and adaptability for use in a home by a builder's development. Functional stress will be given to good planning for house and site, taking advantage of year-round air conditioning. Another important consideration will be skill in achieving economies in plan, design and equipment due to the inclusion of air conditioning.

The contest is expected to stimulate the best thinking of the nation's architects and result in drawings showing how this goal may be reached.

Although prizes will be awarded in the two size classes, no limitation will be placed on number of rooms or floors or the type, period, or style of the house. It is expected that submissions will represent all sections of the country, reflecting local taste and individual idioms and styles as they may be applied to the design of better homes through air conditioning.

The contest has been approved by the Committee on Secondary Competitions of The American Institute of Architects. It is open to registered architects, architectural draftsmen, and architectural students.

Professional Advisor is Harold R. Sleeper, a Fellow of The American Institute of Architects. The board of judges will consist of three prominent architects, a builder, and a housewife.

Carrier officials said they believed the contest would be a long step forward in developing the Weathermaker Home concept, which the company pioneered as a means of freeing home design from the arbitrary restrictions of ventilation problems and providing added conveniences and livability.

The Weathermaker Home visualizes a new way of living with complete year-round comfort provided by air conditioning. It provides new possibilities in the arrangement of walls, windows, and other design features for better light and view, greater convenience, and more privacy and flexibility.

died

James R. Edmunds, Jr., F.A.I.A., 62, past president of The American Institute of Architects, at his home in Baltimore, Md., on February 4. Distinguished practice in Baltimore since 1915. Honorary Corresponding Member of Royal Institute of British Architects.

Edward M. MacMillin, A.I.A., 51, on Dec. 2, at St. Luke's Hospital in Cleveland. He was a past president of the Architects Society of Ohio. From 1946 to 1948, he was architect-engineer for the National Air Races.

Hugh Tallant, 82, retired, at his home in Savannah, Ga. He had belonged to the New York Society of Architects and The Architectural League of New York. Among his works are the Brooklyn Academy of Music and several of the leading Broadway theatres.

Boyd Phelps, 51, on Dec. 8, at his home in Michigan City, Ind. He was founder and president of Boyd Phelps, Architects and Engineers, who designed the Norman Beatty Memorial Hospital plant in Westville, Ind.

Henry P. Merrick, 73, in Maplewood, N. J. He was a former secretary of the Merrick Scale Mfg. Co. and a member of The Architectural League of New York.

William H. Hayes, 61, professor of architecture at Columbia University. He had been a member of the faculty since 1934 and lived at 106 Morningside Drive.

William D. Sherman, 72, retired, in Overlook Hospital, Summit, N. J. He was a member of the New Jersey Society of Architects.

Charles R. Beltz & Company

11029 Whittier Avenue, Detroit 24, Michigan

Builders of Detroit Artificial Ice Rink

CHRYSLER AIRTEMP Products

The first unit of the Pierce Elementary School was constructed in 1912 and was only a two-story four-class room semi-fireproof structure. At that time the building was not within the city limits of Detroit but was a township school. In 1921 a wall bearing reinforced concrete slab addition was added.

The original school was of the type popular at the turn of the century. Class rooms were placed in the basement as the first floor level was more than five feet above the finish grade. This presented a problem regarding floor elevations, ceiling...
heights, window size and spacing, and exterior wall treatment. The architects collaborated with the Detroit Board of Education's Architectural Planning Division and finally decided to place the first floor of the new school near grade level. A fire-wall separates the new building from the old structure. Concrete stairs connect the first and second floor corridors of the two buildings and they can be completely shut off and protected by fire doors.

The new addition consists of class rooms, auditorium, multi-purpose room, library, art room and administrative service areas. The auditorium and multi-purpose room are located on the west end of the new building, each having a separate lobby opening into the two exterior entrances. As a result the public does not wander through the remainder of the building in using these as community facilities. The auditorium seats 254 pupils. It contains a stage, proper storage space, dark curtains for the large exterior windows and is connected with the activities room. The multi-purpose room is 40 feet by 60 feet. This is an appropriate name for this area as it is used as a gymnasium, play room and lunch room. Metal folding tables
and benches concealed flush in recessed wall pockets convert this into a large efficient lunch room. Adjacent to the south end of the room is a well equipped kitchen having ample cupboards and food storage rooms. The finish floor is constructed of hard maple laid on one inch thick cork insulation. The class rooms and art room have floors of continuous pattern hard maple laid in mastic. These rooms have glass chalkboards with aluminum chalk rails. All chalkboard, corkboards, bulletin boards, display cabinets and fixtures in these rooms and corridors have extruded aluminum trim of satin finish.

The new building was recently completed and all areas are in continuous operation. The children and teachers alike are enjoying the new addition with its light spacious well equipped rooms after spending many years in the old units.

Residence of Mr. & Mrs. Magnus
Mallory Burgess, Bloomfield Hills, Michigan
Architect: Carl B. Marr, A.I.A.

The site secured for this residence in Bloomfield Hills was approximately 450 x 250 feet. The southerly half of the property is on high ground with fine views in three directions, which suggested the location of the principal rooms. The client's requirements were for a comfortable home of traditional character, but incorporating the various useful and attractive devices which have been developed in the past twenty years. Also, to provide a home which would be in scale for a single family needs, as well as a background for entertaining.

The living room, dining room and entrance hall have been designed with an eye to traditional forms, while the all-purpose room was developed with a harmonizing contemporary treatment of limed oak paneling, acoustical ceiling, cork...
floor and window wall. This room with its southern exposure is a spacious area, which can be used for informal dining and other family activities. Bar space has been provided at one end of this room, which can be opened to the room at will for convenience in entertaining.

The client wished the master bedroom suite to be on the first floor and this is oriented to two principal views and the southern exposure. A large bath and dressing room with numerous built-in features is adjacent. This suite is entirely separate from the other first floor rooms and yet has been laid out to be convenient to them. Two other bedrooms and baths are on the second floor, together with upstairs sitting room for use of guests and members of the family. Two maids' rooms and bath are located over the garage area.

The owner's fine traditional furnishings enhance the formal living room and dining room, which were designed as backgrounds for these furnishings. Three paintings for the living room were prelocated and are softly illuminated by recessed concealed spots.

A large kitchen, complete with double Thermidor ovens, Mix-mast er cabinet, stainless steel sinks, etc. is the focal point for service facilities and is flanked by pantry and utility room. The latter is complete with planning desk, space for deep freeze and washing and ironing equipment. The cabinets in these rooms are Coppes Napanee in a soft shade of dusty pink with Formica countertops and full backsplash.

The entire house was glazed with Thermopane sash in either fixed units or Pella casements. The house is completely summer air conditioned with three Chrysler Airtemp units. The blowers on these units circulate warm air during the winter months. The principal source of heat to these units being a hot water boiler. Inasmuch as the various portions of the house are rather spread out an intercommunication system has been provided.

The exterior of the house was developed with a brick having a soft rose tone, gray trim and blue-green heavy asphalt shingle roof. The wall treatment has been broken by the introduction of Tennessee ledge stone. The south garden area in front of the all-purpose room incorporates a large screened porch enclosed with jalousies and a terrace paved with New York blue stone.
The successful completion of this building was due in no small way to the cooperation of Neil K. Barber, and to the various sub-contractors, and decorators, who worked closely with this office on furnishings and fabrics, etc., and to Mr. H. F. Klein on lawns and gardens.

Adas Shalom Synagogue
Detroit, Michigan
Architects: Vogel & Fortney, A.I.A.

The Adas Shalom Synagogue plans and pictures of which are shown herewith, was erected upon the existing basement which temporarily housed the congregation's activities.

The form of the building was largely dictated by the outline of the structure previously built under another contract.
The design is in a contemporary manner modified in part by problems of the budget.

The interior is finished with striped African mahogany. The imitation marble grille at Bimma and columns in entrance lobby are Verde Antique Scagliola (simulated marble).

The scagliola at the Ark is of Red Numidian color.

The symbolism of the Jewish religion has been drawn upon for developing various features, such as the grille at rear wall of Bimma.

The lighting fixtures on main ceiling are developed from the Star of David motif.

The entrance doors are further embellished with etched glass panels of traditional symbols.

The building seats approximately 1600.

The architects were especially indebted to Mr. Charles Charlip of Allied Painting & Decorating Co. for his fine cooperation in the decorating of the Synagogue.

Residence of Dr. & Mrs. Harry Cook  
Ann Arbor, Michigan  
Architect: Thomas S. Tanner, A.I.A.

The principal problem in designing this residence was to get a spacious house with double garage on a comparatively narrow lot. The architect was forced to put the garage entrance on the street but recessed the garage door to give it less prominence.

The activity room has proved to be a very interesting and popular room with the owners. This is also used as a breakfast room. The finish in this room is rift-sawed white oak plywood which contrasts with the green Brick-Crete used on one wall. The fireplace end of the living room and cabinets between living and dining space are rift-sawed white oak plywood also, with Roman travertine fireplace mantel and hearth. The ceilings of the living room, dining room and activity room are all flush without doors between the rooms to give an open spacious feeling and flow of space.

All windows are Andersen gliding windows. Exterior walls are Roman brick; plant box walls are crab orchard stone.

The partial basement contains utility room and laundry, playroom with fireplace, and maid’s room with bath.

STREAMLINED SPECIFICATIONS STANDARDS

Volume I (Architectural) by BEN JOHN SMALL, A. I. A.

Here is the most valuable time-saver ever published for the architectural specifying team! Uniquely designed in three handy, easy-to-detach pads, this volume contains all the specifications necessary for the contract, site work, carpentry and other structural work, masonry, weather protection, metal work and finishing of a building. All are grouped into 63 alphabetically arranged sections, are numbered for quick reference or separate filing, and are printed on only one side of a page in double-spaced elite typewriter type. Nowhere else will you find these amazing streamlined specifications in such easy-to-use form!

A bright new building at 888 W. Baltimore, Detroit, is the nerve center for the Hall Engineering Company, electrical contractors. In this center, trained, energetic administrators and engineer estimators analyze every task and synchronize every movement of craftsmen in the field to assure a high level of efficiency in every Hall installation.

The Hall record of accomplishment, which includes some of the largest and most complex installations in the Detroit region, is the testimony of this efficiency.
Rolling Metal Doors

Provide Removable Dividing Wall in School Gymnasium!

The six aluminum rolling doors illustrated here, which form a dividing wall in a school gymnasium, are electrically controlled by push-buttons on a single panel. When the doors are fully opened, the mullions between doors on the main floor are moved out of the way by means of an overhead track and nested at either side, leaving the entire gymnasium floor clear.

Rolling Metal Doors with movable mullions prove to be ideal for a removable dividing wall in the gymnasium of a modern high school. In this particular installation, four power operated rolling doors are employed in the main floor area... two more power operated rolling doors are employed to divide the balcony on either side of the gymnasium floor, thus dividing the gymnasium into two entirely separate parts—which is desirable on many occasions in present-day usage. All visible parts of the six rolling doors, were manufactured in aluminum. Similar installations can be made in stainless steel, or in enamel coated galvanized steel which may be painted after erection to harmonize with a general decorative scheme. For high quality Rolling Metal Doors, and Underwriters' Labeled Rolling Steel Fire Doors and window Shutters, see Mahon's Insert in Sweet's Files, or write for Catalog G-53. Inquiries relative to special purpose doors, and installations such as the one illustrated here, should be addressed to the home office in Detroit for prompt attention.
