Rain or Shine....

light-weight Concrete Masonry Units
are completely Cured

No longer need you worry about the curing of block used in your jobs. "HORN-CLAVING" removes the guesswork as to the status of cure delivered on the job 365 days of the year.

"HORN-CLAVING" is a process by which our block are cured by high-pressure high-temperature steam. This operation, now being done in our new $500,000 Auto-Claving Plant, imparts valuable properties to light-weight units not resulting from any other curing method.

"HORN-CLAVED" units are completely cured and ready for use within 24 hours after molding. These units have a strength surpassing all requirements of the A.S.T.M., federal specifications, and local building codes—and their shrinkage will be at least 50% less than in moist-cured units.

To ensure completely-cured units in your construction jobs, regardless of outside weather conditions, specify "HORN-CLAVED" Light-Weight Concrete Masonry Units — cured with High-Pressure Steam. Descriptive folder, price and delivery information on request.

Election

Elmer J. Manson, of Lansing, was reelected president of the Michigan Society of Architects at its annual meeting in the Detroit Athletic Club December 14. Eberle M. Smith of Detroit was elected 1st vice-president; Peter Vander Laan of Kalamazoo, 2nd vice-president; Willard E. Fraser of Midland, 3rd vice-president, and Leo I. Perry of Detroit, treasurer.

New directors are Raymond I. Olson of Jackson, Samuel C. Allen and Frederick E. Wigen, both of Saginaw; Ernest J. Dol­lar and Frederick J. Schelloty, both of Detroit, and C. A. O'Bryon of Grand Rapids.

Continuing on the board are Adrian N. Langius of Lansing, Sol King, Amedeo Leone, and Linn Smith, all of Detroit.

James B. Morison and Talmage C. Hughes, both of Detroit, were reelected secretary and executive secretary, respectively.

Dr. Albert E. Giffels, President of Michigan State University, was elected president of the Michigan Society of Architects at its annual meeting in the Detroit Athletic Club December 14. Eberle M. Smith of Detroit was elected 1st vice-president; Peter Vander Laan of Kalamazoo, 2nd vice-president; Willard E. Fraser of Midland, 3rd vice-president, and Leo I. Perry of Detroit, treasurer.

to get behind this worthy movement to restore the venerable house on Mackinac Island.

Manson pointed to the Monthly Bulletin of the Society as a prestige publication, bringing credit to the organization, and comparing favorably with state architectural publications of the country.

An outstanding contribution, he said, was that of Eberle M. Smith, the new vice-president, who is Chairman of the School Building Committee, both locally and nationally.

In the matter of public relations, the president said, there has been good coverage throughout the State. The Society has produced a motion picture, "Designs for Better Living," which has been very well received. There is now a need to see that it is properly distributed. It is available without charge to groups desiring it. TV programs are also in the offing, under the direction of C. H. MacMahon, Chairman of a special publicity committee.

Expansion of the public relations program, the President said, has not been carried out as intended because of the resignation of the public relations director. Employment of his successor is contingent upon the raising of adequate funds. Perry has been named Chairman of a special committee to prepare proposed changes to the Society's by-laws to provide for first membership, with dues based on number of draftsmen. Working with him will be Langius and King.

Other matters of importance dealt with during the past year include leases, by McGraw and Linn Smith, Detroit Building Code, by King, the annual convention in Detroit and the Midsummer Conference at the Grand Hotel on Mackinac Island.

Picture by Besser

On the facing page is a photograph taken at the Michigan Society of Architects Board of Directors Annual Meeting and Election at the Detroit Athletic Club on December 14, 1955.

The Besser Company has generously agreed to send framed copies of the picture to all officers and directors of the Society. Others may obtain copies by writing the Besser Company, Alpena, Michigan. Through the courtesy of our Associate Member, Mr. Clem Mason of Besser Company, there will be no charge.

We wish to take this opportunity to congratulate the Besser Company, its present owners, Mr. Jesse H. Besser and Mr. Andrew Besser, and all of the personnel on the occasion of their 52nd anniversary of service to the building industry and the architectural profession.

The growth of the concrete block industry coincides with the growth of the Besser Company. Fifty-two years ago Besser made the first concrete block machine. Since then the Company has devoted its constant and unflinching efforts to producing better block machinery, pioneering new types and improving production methods. Today the Automatic Vibrapac is the result of more than a half-century of pioneering development.

Over 50 years of Besser progress provide the background for producing the finest concrete block in construction history on Besser Vibrapac.

Left to right are Frederick J. Schoettle, Peter Vander Laan, Willard E. Fraser, Phillip C. Haughney, Talmage C. Hughes, Frederick E. Wigen, Eberle M. Smith, Eimer J. Manson, Charles B. McGrew, Sol King, Adrian N. Langius, Amedeo Leone, James B. Morison, Leo I. Perry and Ernest J. Dellar.

Not present were directors Roger Allen of Grand Rapids, Samuel Allen of Saginaw, Paul A. Brysselboult of Bay City, C. A. O'Bryon of Grand Rapids, Raymond L. Olson of Jackson and Linn Smith of Birmingham.

**KitchenAid**
The World's Most-Wanted AUTOMATIC DISHWASHER

*There's A KitchenAid Model To Fit Any Kitchen*

The nicest kitchen in the world is nicer still when a KitchenAid Automatic Dishwasher is installed. It's the only one whose basic principles have been pioneered, tested and proved unsurpassingly superior in the world's biggest, busiest kitchens. Small wonder, then, that busy housewives want a KitchenAid in their kitchens, too. There are 3 models to choose from, all in sparkling white, gleaming copper or satiny stainless steel, with other colors available.

January '56, Monthly Bulletin
The new Board of Directors of the Michigan Society of Architects has appointed Leo I. Perry, Chairman; Sol King and Adrian N. Langius as a special committee to prepare proposed changes to the Society's by-laws to provide for a new form of membership in the Society to be known as Firm Membership. Upon approval by the Board, the proposed changes will be presented to the Society's Convention in March of 1956.

This is for the purpose of continuing the Society's public relations program which was interrupted when its director of public relations resigned recently. A good beginning had been made on a comprehensive public relations program, but the Board does not believe that a successor to Nell Bertram should be employed until adequate funds can be provided for on a continuing basis.

The plan most favored is the firm membership, with dues approximating ten dollars per draftsman. It is estimated that there are 250 offices in Michigan, with an average of four draftsmen each. This is based on architectural draftsmen only, not engineerings. If this estimate is correct, and the offices will respond, a fund of about $10,000 per year should result.

Mr. G. H. MacMahon, A.I.A., of the office of Architect Linn Smith, of Birmingham, Mich., is Chairman of a special Public Relations Committee for the Society. Serving with him are John W. Jickling and Frederick S. Stickel. Mr. MacMahon has prepared a statement on the scope of a program for the Society as follows:

1. What is a good Public Relations Program and what could it do for the profession?

A. What is Public Relations?

1. The "A.I.A. Handbook on Public Relations" has the following to say on this subject:

The Architect will see a brighter future for himself, his profession and his national organization if he thinks and acts in terms of the public.

The big public consists of over 160 million—but this is broken down into thousands of special groups. These groups develop a public opinion. Around this interest in public opinion has evolved an ever-growing profession—public relations.

As in all new and growing professions, there is no shortage of working definitions of public relations. Public relations counsel prefers this definition, as selected by "Public Relations News":

The function which evaluates public attitudes, ideas, policies and procedures of an individual or an organization with the public interest and executes a program of action to win public understanding and acceptance.

But for the Architect—both as a member of a profession and a community—counsel suggests this simple definition:

Public relations is doing good work and taking credit for it; public relations is not—pressagony or the building or encouraging of "notoriety" for the Architect.

A concentration on selling something to someone or advertising something to someone.

A devotion to keeping certain Architects' names before the public.

Once again, public relations is doing good work and taking credit for it; or in other words, good public relations is good performance, publicly appreciated. Architects come in contact daily with the public and each contact helps create good will or ill will for the profession. The public forms opinions of the Architect, his services, his profession and his national organization as a result of these contacts. Whether the opinions are favorable or unfavorable depends upon attitudes and actions of the individual Architect.

B. What is a good Public Relations Program? (Again, I am quoting from the "A.I.A. Handbook" which states as follows:)

1. Purposes of the Public Relations Program.

A. To do a good public relations job for himself, each Architect should know about The Institute's national public relations program.

A. Each member of The Institute is a part of that program which has these purposes:

1. To make the ever-changing public realize that the Architect—as an individual and as an organized group—can be of great service to the community.

2. To make the public aware of what the architectural profession is and what an Architect is trained to do in order to overcome the general misunderstanding about the scope and cost of architectural services.

In order to accomplish these purposes, Architects must first fulfill their responsibility to the community through projects and activities in the public interest.

C. What could such a Program accomplish?

1. Expanded opportunities for the Architect and his service in all fields.

a. Industrial—in this field particularly package services for design and construction have made substantial inroads.

b. Institutional—Federal, State and Municipal agencies have greatly enlarged the scope of their design and auxiliary services in this ever-increasing field.

c. Housing—we see today contractors and builders dominating this field with the Architect controlling but a minor part.

d. Schools and Churches—our profession controls the great majority of design in this field, but prefabricators and contractors are making progress here.

e. Community Planning—this field has been somewhat neglected by the Architect and is as vital to the health, welfare and economy of our nation as the design of individual buildings themselves.

2. Benefits to the Architectural profession.

a. Increased potential dollar-volume for the architectural practitioner.

b. Greater employment opportunities in the profession and those related fields dependent on it.

c. Increased stature for the Architect in his community.

3. Benefits to the community and our national welfare.

a. Establishing city and community plans for organized and planned growth to eliminate or limit:

(1) Slums and blighted areas.

(2) Excessive traffic congestion.

(3) Local labor shortages.

(4) Ghost towns.

(5) Smog conditions and similar health hazards.

(6) Industrial stagflation.

a. and provide:

(1) Better buildings for all functions and phases of public life.

(2) Green belt areas . . . parks and recreation centers.

(3) Logical growth patterns for all communities.

(4) Groupings and segregations of elements not compatible with healthy living.

b. Provide better buildings . . . because more buildings will be designed by Architects.

D. The Michigan Society of Architects should adopt the A.I.A. Public Relations Program as a guide.

Brown reports that the speaker for the Thursday evening program will be Dr. Walter Sweeney, of the New York office of Skidmore, Owings & Merrill, Architects, who will speak on the Ford Motor Company's Office Building, in Dearborn, Mich., for which SOM were architects.

There will be a conducted tour of the building on Friday morning.

Fleischaker announces that the Architects' Exhibits will consist of the preselected designs from the 1955 Honor Awards programs of the Detroit and Western Michigan Chapters, and similar material from the Saginaw Valley Chapter.

Other details of the Convention program are being worked out by the Committee, and more complete information will be contained in our next issue.

2. It would be presumptive on my part to attempt to provide a better guide.

E. What is the A.I.A. Program?—The Program is outlined in the publication, "Public Relations for the Architect". This is a folder containing ten separate sections which I have outlined briefly as follows:

1. Policy and public relations.
   a. Relating A.I.A. policy to the problem of public relations.
   b. Defining public relations and purposes.
   2. Community relations.
      a. Responsibility to the community and necessity for leadership.
      b. How best to serve community interests.
      c. How to become active in community life.
   d. Advice on relations with law makers.
   e. How to solve community problems.

3. Client relations.
   a. Reaching new clients.
   b. Explaining your services.
   c. Improving client relations.
   d. Cost estimates.
   e. Supervision.
   f. Salesmanship.
   g. Office appearance.
   h. Need for brochures.
   i. Explaining the firm.
   j. Explaining projects.
   k. Exhibits.
   l. Presentation tips.
   m. Letters.
   n. Relations with community leaders.
   o. Human relations.

4. Publicity.
   a. Outlets for publicity.
   b. What the public should know about the Architect.
   c. Facts about the Architect.
   d. Photos and illustrative material.
   e. Getting credit for published work.
   f. Press conferences.
   g. Press relations.
   h. Press terminology.
   i. Preparing fact sheets.
   j. News contacts.
   k. Magazines.
      a. Brief tips on relationships with:
         (1) Popular magazines.
         (2) Professional publications.
      (3) House organs.
      7. Radio.
         a. Radio speeches, tips.
         b. Radio interviews.
         c. Radio panel shows.
      d. A.I.A. Chapter programs.

8. Television.
   a. Experience of Dallas Chapter with TV.
   b. Opportunities for publicity for the Architect.

   a. Opportunities and types of public speaking.
   b. How advertising can and has benefited the Architect.

F. Recommendations.
1. Formally adopt a program.
2. Establish adequate budget.
3. Retain top-notch public relations consultants or firm (If Ketchum, Inc. is available to help us get started, would we desire to have one of their people consult with us in motivating our program?)
   a. Informal question and answer "shirt sleeve sessions".
   b. Present outstanding examples of work in other areas, brochures, etc.
   c. When possible, get Architects who have performed outstanding Public Relations job to take part.
   d. Conduct a survey in Michigan to establish key issues and outstanding problems before developing Clinic Program.
   e. Use "A.I.A. Public Relations Handbook" as guide.
5. Develop opportunities for TV, radio, newspaper and magazine publicity.
   a. Koy Eyde Program, WKAR-TV, Lansing, immediately.
   b. Establish and maintain clearing house for all Public Relations matters with Public Relations consultant.
   a. Individual Architects and firms keep consultant advised of all newsworthy items.
   b. Public Relations consultant keep in touch with Ketchum, Inc. for possible tie-in.
5. Develop opportunities for TV, radio, newspaper and magazine publicity.
   a. Koy Eyde Program, WKAR-TV, Lansing, immediately.
   b. Establish and maintain clearing house for all Public Relations matters with Public Relations consultant.
   a. Individual Architects and firms keep consultant advised of all newsworthy items.
   b. Public Relations consultant keep in touch with Ketchum, Inc. for possible tie-ins and national publicity of local matters.

6. Establish and maintain a clearing house for all Public Relations matters with Public Relations consultant.
   a. Individual Architects and firms keep consultant advised of all newsworthy items.
   b. Public Relations consultant keep in touch with Ketchum, Inc. for possible tie-ins and national publicity of local matters.

Because the need for a substantial and adequate Public Relations program is so vital to the progress of our profession, it is imperative that the matters of Budget and Public Relations consultant receive immediate attention. It is recognized that the quality of the results will depend upon the adequacy of the budget which will enable our employing competent talent and ability. It is also recognized that special fund-raising measures may also have to be employed, but it is not within the scope of this letter to outline what measures might be necessary or desirable.

Our Public Relations program is absolutely vital to the livelihood and desiring of our best efforts.

EDITOR’S NOTE: Mr. MacMahon reports that his Committee has had excellent response to its request for sponsors on the MSA TV program. Ten companies have agreed to participate, and three others are possible. With this interest shown, the Committee believes the program can be started in January.

From President Manson

Among the many reasons for an expanded Public Relations Program are:
1. The competition from "package deals", and non-registered designers can be minimized by good promotion.
2. The continued high rate of construction activity can be extended by good promotion.
3. The amount of "missionary" activity by the individual practitioner can be reduced by promotion from a state organization.
4. A hedge against adverse legislation will be established by a strong promotional program.
The program as visualized is essentially the same as we have had, but with better material and broader coverage promoted by a full-time public relations director, including:
1. Continued distribution of spot news.
2. Increased distribution of feature stories, with emphasis on heavy construction.
3. Special activity such as the distribution of the MSA movie, the TV Forum, etc.
4. A "protective" legislative program of keeping the legislators informed that our profession is giving a real service to the public.
5. A clearing house on publicity to assist the individual offices publicize their projects.
6. Work to assure that Michigan receives its fair share of the Institute's Public Relations activity.

To adequately carry out such a program requires time and money. A full-time public relations person will cost the Society from $8000 to $12,000 a year. Previously this has been on a voluntary contribution basis. For a more stable organization, it is proposed to establish a new type of membership for individual practitioners or firms. This would be based on:
1. Volume of architectural work done by the office. Dues would be related to the social security payments as a factor which would be easily available to all offices.
2. Architectural work only. This provides an equalizer for those offices which do engineering projects such as power houses, and those offices which have consulting engineers on mechanical and structural portions of architectural projects. The dues for the firms would be based on the architectural staff only.
3. This membership would be voluntary. The billing would be directly from the Society, not through the chapters.

To make this attractive to the members we need some inducement such as free copies of the Bulletin which feature work of the "firm members" and emphasis to the "firm members" in publicity releases.

Will you kindly investigate the reaction of your professional friends to such a membership so that we may have a broad base for consideration at our next board meeting?

Detroit Chapter, A.I.A., will be honored to join with Progressive Architecture for a dinner meeting at Detroit's Whittier Hotel on January 20, at which PA will make Annual Honor Awards in its 1956 "Design Trends" program.

The dinner ($4.00 per person) will be preceded by a social hour at 6:30 P.M., with cocktails provided complimentary by Progressive Architecture, and the program will consist of presentations, slides of the awards, and a lecture by Pietro Belluschi, F.A.I.A., Dean of the School of Architecture and Planning, Massachusetts Institute of Technology, Chairman of the Jury of Awards. His subject will be "Design Trends in the United States.”

We are particularly fortunate this year in that a Detroit firm is top winner in the PA Awards Program. Last year most of the winners were from the East, and the program was held in New York City. In this instance, all winners, from throughout the U.S. will be invited to Detroit to receive their awards. The names of the winners will not be made public until the night of the awards dinner. Laureates are invited to attend, as this will be a gala program that will be of interest to them. Black ties are preferred. Mr. and Mrs. Thomas H. Creighton will be hosts. He is Editor of Progressive Architecture. She is Katherine Morrow, co-author with Mr. Creighton of the book, "The American Home Today," published recently.

PA's Design Awards Program began three years ago, with no awards being given for architecture in the design stage. PA believes this phase of architecture is important, since many brilliant designs are never seen except by the architects and their clients. This is because compromises and changes creep in as working drawings and construction are approached. Many of these good designs might be achieved if the owner, sponsor and community realize how good they are.

The program was planned to allow the jury to choose from submitted designs the ones they thought best in each type of building—to choose one top winner in any category for overall greatest excellence—and to preview the best work ahead for the coming year. The holding of the Presentation Dinner in the home city of the First Award winner is primarily for the purpose of drawing attention of the community to the honor which has been bestowed on it through one of its architect citizens.

This year there were more than 700 entries, and an outstanding jury made some 50 awards and citations. The first year the top winner was the Back Bay Center project in Boston, designed by a group of Boston Architects, and the awards dinner was held in Boston. Last year the First Award was won by Paul Rudolph, for a house in Sarasota, Florida, and the dinner was in New York City.

This will undoubtedly provide a most stimulating meeting for the Chapter.

western michigan chapter

WESTERN MICHIGAN CHAPTER, A.I.A., met at Archie Tarpoff's restaurant in Kalamazoo on Monday, December 12. Chapter member, Edward Jackson was chairman of the committee arranging the meeting.

Chapter Vice-President, George Sprau presided, in the absence of President Ion C. Ironside. Elmer Manson, President of the Michigan Society of Architects, outlined the Society's public relations program and problems in connection therewith.

The dinner was preceded by a social hour and followed by a program, of which Mr. Benjamin C. Taylor, Acting Director of Engineering for the Federal Defense Agency, who described the atomic tests which took place at Down Town, Nevada. He also told about the results obtained and made recommendations regarding the design of buildings to withstand atomic blasts.

Mr. Taylor was director of Program 30 which dealt with structures and shelters. He showed films of buildings inside the blast area, after the blast, and commented upon the findings.

Assisting in the program at the Chapter meeting was Mr. John L. Lynch, structural engineer for the Federal Defense Agency. In its publication, Architectonica, the Chapter calls attention to the A.I.A. National Products Literature Competition and urges members to encourage the submission of useful products and equipment literature. It adds: "We can aid manufacturers in increasing the technical and informative value of descriptive product literature by our recognition of excellence in their printed matter directed to the architects. All entries must be submitted by January 31, 1956. Further information may be obtained from Theodore I. Cee, F.A.I.A., Technical Secretary, The American Institute of Architects, 1735 New York Ave., N. W., Washington 6, D. C."

HOWARD KAMMERAD, who has been an associate of the Chapter, has been elected a corporate member. He is now employed in the office of Louis C. Kinscott & Associates, Architects & Engineers, of Kalamazoo.

BUILDERS & TRADERS EXCHANGE OF LANSING, has moved to its own new Builders & Traders Exchange Building, at 521 N. Washington Ave., Lansing 33.

January '56 Monthly Bulletin
GOOSE-SHOOTING is a strenuous activity engaged in by only the hardiest of individuals. So imagine three leading Michigan Architects taking to the marshes for this sport.

When we have the urge to exercise we lie down until it passes. But not so with Thomas H. Hewlett of Birmingham, Adrian N. Langius of Lansing and J. Robert F. Swanson of Bloomfield Hills. They recently hied themselves to Cairo, Ill., via private plane, as guests of Harry Fruehauf, foot stilts at the confluence of the Mississippi and Ohio Rivers, owned by a gent known as "Red Necktie."

To hear them bragging, they were up at 4:00 A.M. to see the sky gray with sunrise—to go to my office and I will reimburse you."

BANKERS are becoming more conscious of the value of good architecture, because it increases their business. Time was when the two had little truck with each other. The elder J. P. Morgan once received a request for a loan from an architect—on behalf of his client, no doubt, to finance a project. The architect was invited to the House of Morgan, and when he arrived Mr. Morgan put on his hat and the two walked the length of Wall Street, then back again. Upon Mr. Morgan's extending his hand and wishing his guest well, the architect said, "But Mr. Morgan, we haven't discussed the loan." With a wave of his hand down the street, Mr. Morgan replied, "Oh, any of them will lend it to you now. They have seen you with me."

C. ALLEN HARLAN, President of Harlan Electric Company, of Detroit was the recipient of this year's Michigan American Democratic Legacy Award from the Michigan Regional Advisory Board of the Anti-Defamation League of B'nai B'rith, whose Chairman is Benjamin M. Rose.

In accepting the Award, Mr. Harlan said, as an aside, to Mr. Rose, "I am highly honored to receive this recognition, but I think you should know that for generations my folks have been in the ham and sausage business."

Replied Mr. Rose: "Well, now, that's quite all right, but I wouldn't recommend that you try to sell any of your products here."

A PANHANDLER approached an architect on the street and asked for a handout "to get something to eat." The architect, feeling charitable, invited the man into a restaurant, saying he would pay for the meals. When finished, the architect discovered he did not have his wallet with him. Business of fumbling and embarrassment, and the poor man said, "You've been a pretty good egg. I have some money, and I'll pay the bill." He did.

When the two strode out to the curb, the architect said, "Now, we'll call a cab, go to my office and I will reimburse you." The beggar said, "Oh, no you don't. I paid for the meal, but you are not going to stick me for a taxi ride."

BACHELOR ARCHITECTS—Dr. George W. Crane, in his syndicated column, says that what this country needs is a scientific dating bureau. He estimates there are 11,000,000 marriageable women in this country without likely prospects, and he adds there are probably 7,000,000 men in the same boat. Many of them, Dr. Crane says, are fine men; physicians, dentists, clergymen, lawyers—and architects.

Herb Shriver reveals how his spinster aunt back in Indiana found herself a husband: "She saw this fellow on a 'wanted' poster in the post office, and offered $500 more for him than the Government did."

SPEED IN BUILDING in this modern age sometimes means that the architect is hard put to it to keep plans abreast of construction.

A general in the last war summoned an American engineer and asked, "How long will it take you to throw a bridge across the river?" "Three days, sir," was the reply. "Good," said the general, "and have your plans made ready this afternoon." In three days the general asked for a report and was told, "It's all ready, sir. You can send your men across now if you don't wait for those dam pictures. They ain't done yet."

CY COX, A.I.A., member of the Detroit Chapter, and his wife Helen moved into a new house, and their maid was bragging about what fine fittings they had. "They're so high class," she said, "they even have their own monogrammed faucets in their bath room. Her's is marked 'H' and his is marked 'C'."

CLAIR W. DITCHY, F.A.I.A., Immediate Past President of The A.I.A., upon being made an Honorary Corresponding Member of the Royal Institute of British Architects recently, saw quite a write-up about it in the Journal of The R.I.B.A. Claire said, "I wish it had been published in the comic books though. I'd kind of like to have my old army sergeant read about me too."

RUBBER
WATERSTOPS

for CONSTRUCTION and EXPANSION JOINTS
Williams Efficiency Waterstops are specially designed to completely seal joints connecting cost-in-place concrete members—wall section to wall section, walls to footings, walls to floor slabs, floor slab to floor slab. The rubber waterstop in the joint permits movement of the individual slabs without breaking the water seal. Williams Efficiency Waterstops are furnished in long lengths, to be field cemented and bolted together for positive seal at end joints. They will bend around corners, will not tear from shear action, and the bulbs are set deep enough in the concrete to insure a positive water seal.

Jefferson Powell, elected president of the Palm Beach Chapter, A.I.A. Other officers elected are Hilliard Smith, vice president; William Kessler, secretary and Paul Kohler, treasurer.

G. Clinton Gamble, was reelected president of the Florida Association of Architects, along with Edgar S. Worman, secretary; Morton T. Ironmonger, treasurer.

Vice presidents named were Frank Bunch, William Harvard and John Stetson.

Charles Kelley, has been elected as the new editor of both Architectural Forum and Architectural Record and for the past three years editor of Florida Living Magazine, Sunday shelter publication of the Miami Daily News. In addition to his regular work with Association officials in coordinating statewide professional activities, representing the F.A.A. in a public relations capacity and publishing the official journal of the organization.

Announcement of the new office, which was formally approved during the F.A.A.'s 41st Annual Convention last November at Daytona Beach, Florida, was made early in December by Clinton Gamble, F.A.A. president, who will start his second term of office in January. The Executive Secretary will be Roger W. Sherman, formerly editor of both Architectural Forum and Architectural Record and for the past three years editor of Florida Living Magazine, Sunday shelter publication of the Miami Daily News. In addition to his regular activities, Sherman, who was originally trained as an architect, has served the F.A.A. during the past two years as editor and publisher of its official journal, The Florida Architect.

His appointment is the result of a growing need in the Florida Association of Architects for a full-time agency that could work with Association officials in coordinating interests and activities of all A.I.A. chapters in the state. Study of the subject began some five years ago. Since then, growth of chapter membership has mushroomed, registering a 25 percent increase in 1954 and another 24 percent in 1955. Last year a re-districting plan for the state was approved; and two new chapters, formed during the latter part of 1955 brought the total number of Florida Chapters with Institute membership at an all-time high and representing over 70 percent of registered architects resident in the state.

In addition to his new duties as F.A.A. Executive Secretary, Sherman will continue to publish The Florida Architect. His office will be 7225 S. W. 82nd Ct., Miami 43, Florida.

New York

George F. Pelham, Jr., A.I.A. has joined the architectural and engineering firm of Kelly & Grzesz as an associate.

Mr. Pelham, the third generation of architects by that name, has been in private practice in New York City for some thirty years and has designed many of the city's largest apartment houses. In 1941, he won the A.I.A.'s "Apartment House Medal" for his design of the Dr. C. V. Paterno's Castle Village development.

Rhode Island

Donald A. Jasinski & John W. Prestley, Jr., have been appointed to the staff of Rhode Island School of Design's division of architecture. Mr. Jasinski has been named instructor in interior architectural design. Mr. Prestley has been appointed visiting architectural critic.

Texas

Baldwin N. Young, has been elected President of the Houston Chapter, A.I.A. Other officers elected include Mace Tungate, Jr., first vice president; Ralph M. Buffington, second vice-president; Abel B. Pierce, Jr., secretary, and Charles S. Chan, treasurer.

Died

Benjamin C. Baker, A.I.A., 72, at his home in Ivy, Albemarle County, Va., on Dec. 3rd. He was a member of the firm of Baker, Heyward and Llorens, of Charlottesville until his retirement last year.

Reine Chambellan, 62, in Jersey City, N. J. on Nov. 26th. Mr. Chambellan was a nationally known architect, sculptor and modeler. His works included sculpture in Rockefeller Center, N. Y., State office buildings in New York City and Buffalo.

William E. S. Dyer, 75, in Buffalo, N. Y. on Dec. 9th. Mr. Dyer was a consulting engineer and architect for many years in Philadelphia, Pa.

George H. Fisher, at his home in Plainfield, N. J. Mr. Fisher was connected for many years with Fisher & Brown, architects and engineers. For the past 20 years he had been associated with the post engineers at Fort Dix.

Julius Gregory, A.I.A., 80, in New Hope, Pa., on Dec. 4th. Mr. Gregory was formerly of New York City where he had his office prior to his retirement. Mr. Gregory was architectural consultant for House & Garden and House Beautiful magazines. He designed the Ideal Home for House & Garden and the Pacesetter House for House Beautiful. His homes won several awards from the A.I.A. and other technical groups.

Carol J. Kluge, 54, at his home in Wauwatosa, Wis., on Nov. 28th. Mr. Kluge had been associated the last 14 years with the Hornschleger Corp. Previously he was district architect for the federal farm security program.

The NATURAL HOUSE

by Frank Lloyd Wright

the magnificent new book on small houses by the great architect

THE NATURAL HOUSE is the book of most practical interest for architects and builders ever written by Frank Lloyd Wright—the first he has done on low cost and moderate cost houses.

In this long-planned contribution towards solving the building problem for people of limited means, he gives a step-by-step description of the construction of the concrete block house, the renowned “Usonian Automatic”—in text, photos and drawings. He also answers such questions as: where to build . . . insulation . . . roof . . . heat, etc.

Many other famed small Wright houses are described and illustrated with photos, drawings, plans and costs.—116 illustrations in all.

Architectural Integration of Lift-Slab Technique

By EBERLE M. SMITH, A.I.A.
From the Journal of The American Concrete Institute

SYNOPSIS
Recognizing a need for greater coordination of the duties of architect and structural engineer, the author explains his experience with lift-slab construction, using as special reference the new Rouge Office Building of the Ford Motor Co., one of the largest structures built using the lift-slab technique. Certain structural characteristics such as the rigid column pattern vertically and the advantage of cantilevers are pointed out. The author discusses footing and slab deflection problems, and explains the advantage of the photo-reflective system of stress analysis in slab design. How a number of other architectural and mechanical features of a building affected by the lift-slab technique must be considered in the architect’s planning is discussed. Concluding the article is a summary of the advantages and disadvantages of lift-slab in modern building and a brief appraisal of the future promise of this new method.

Eberle M. Smith, A.I.A., A.C.I.

INTRODUCTION
In the minds of many there is still the traditional tendency to regard the architect’s responsibilities as those of an “exterior decorator.” Architecture, to these people, is a matter of appearance; whereas the ability of a building to stand is the realm of the structural engineer. There is, of course, a measure of truth in this differentiation of duties. But though most of us have seen the folly of trying to integrate traditional architectural forms with the advancing concepts of structural engineering, there is, even in contemporary architectural design, too often a lack of understanding between the two fields of endeavor. Good architecture, above all, must provide usable space, and this requires a carefully integrated relationship of structure and function to take full advantage of technological advances in materials, mechanical equipment, and construction techniques.

The advantage of cantilevers is always a consideration in flat plate structures. The cantilevered edge of each lift-slab requires its architectural designer an appreciation of this advantage. Because cantilevered edges of slabs lessen positive moment in exterior bays, full advantage should be taken of this fact to provide economy of steel and reduce deflection in bay columns. The cantileverer is almost an integral part of lift-slab construction and at the Rouge Office Building the soaring cantilever of the main entrance canopy is intended to symbolize this structural character (Fig. 3). In this building the typical exterior cantilever is 4 ft. long, and this was incorporated into the architectural design while avoiding undesirable free-standing columns within the offices will be discussed in a succeeding paragraph.

Provisions for camber

There is apt to be deflection at the center of spans in plate design and so it was deemed advisable to cast a hinged-type of foundation into each bay of this building. Bay sizes vary from 22 ft 6 in x 22 ft 6 in, with a 3/4-in. camber to 30 ft 8 in x 30 ft 8 in, with a 7/8-in. camber. Because each slab is the form for the slab above, a permanent convex camber is constructed in the ground floor slab of one half the theoretical ultimate deflection of floors above. Thus the noticeable deflection is split half and half in succeeding floors above. The computations for deflections were based on the traditional modulus of elasticity of 3,000,000 psi, but in actuality, deflection will not be as great as expected. Tests by Professor Mayrose, research engineer, University of Detroit, have indicated an actual modulus of elasticity of 3,750,000 psi for the concrete used. This concrete uses a slag aggregate, for the double reason that slag is a Ford Motor Co. by-product and that it is fairly light in weight. This concrete averages 138 lb per

Photo-reflective analysis

After the preliminary scheme of the office building had been determined and such basic characteristics as total area, bay sizes, and slab opening locations had been set, the plans were submitted for a Presan analysis. The solution accomplished by the

Fig. 3—Perspective section through main entrance canopy

Eb Smith (continued)

For many years thoughtful people in the building professions have regretted the slow and expensive method of building a timber structure first, within which a concrete structure is then formed. It was not until 1948 that the first trials with the lift-slab method of construction indicated that the traditional falsework for concrete buildings could be largely eliminated. Not only does the science of lifting slabs realize positive savings in materials and time, but because productivity of men is greater at ground level, labor costs are dramatically reduced.

It was a desire for speed and economy that prompted the Ford Motor Co. to choose lift-slab for its new Rouge Office Building in Dearborn, Mich. Planned to house five major administrative divisions of the largest industrial plant in the world, the building will provide nearly 400,000 sq. ft. on three floors. It was the problem of the author's firm to integrate the functional requirements of this vast area with the structural technique, to the maximum benefit of each (Fig. 1).

DESIGN CONSIDERATIONS

Characteristics of lift-slab method

As we begin to examine a lift-slab building, one important design aspect becomes immediately apparent. That is the rigidity of the column layout. The basic method of concreting the upper floors and roof at ground level and elevating them by hydraulic jacks to their proper height (Fig. 2), determines that the method of erection becomes the system of framing. Because the columns are continuous through the height of the building, their pattern is fixed; but because the slabs have no beam or column cap projections, there is great freedom in the location of walls. The Rouge Office Building utilizes this freedom in its exterior walls, most of which are of lightweight insulated aluminum panels, and in its interior walls, the majority of which are movable metal partitions.

Site conditions

For a backyard the Rouge Office Building has the sprawling industrial complex of Ford's River Rouge plant. On what was once river bottom land Henry Ford the elder elected to locate the hub of his auto-

January '56 monthly bulletin
In certain types of construction, structural strength requirements are met by thickening slabs. Not so with lift-slab. As in other types of flat-plate construction, the floor thickness is consistent throughout. Concrete strength can, however, be varied. In this building, while the superstructure is generally specified to be 3000-psi concrete, certain areas of high positive moment, such as the larger bays and the end bays of the wings, call for concrete mixes up to 4500 psi strength. Here again tests at the job site indicate considerably higher strengths achievable than specified and needed to be largely due to the use of the vacuum process of removing excess water from newly placed concrete.

Framing problems

An important structural problem in lift-slab is that of horizontal loads and eccentric loading. The columns are, in effect, cantilevered beams until the top slab is in place (Fig. 2). Thus it is imperative that the columns be exactly plumb. Even after the slabs are in place there are horizontal wind loads and the consequent "raking" tendency. This can be overcome by planning a wide building. It has sometimes been thought that lift-slab, or for that matter, any flat plate type structure, was not well suited to office building design because interior space in a wide building is less usable and less desirable. Fortunately, the owner desired large windowless interior areas for file space and certain other uses, and so the four-bay width of the two main wings totals 108 ft 4 in. each. This limitation kept the office layout in the perimeter bays to a minimum. In this building the typical column is 33 ft 7½ in. high and rests on a bearing plate secured to the footing with four 1-½ in. round anchor bolts. The vertical distance between slabs is 10 ft. Because in most projects we are more concerned with static load conditions than with moments induced in the column by slabs, it is desirable to use columns whose moments of inertia about the major axes are equal. This explains why lift-slab has usually been done with pipe columns or boxed angle columns. However, the hydraulic jack mechanism is so designed that the threaded tension rods that raise the slab are spaced 15 in. on center. This dimension somewhat restricts the column shape and the Rouge Office Building columns are 10 in. steel H-sections of different several weights, depending on the loads they carry.

Slab lifting pattern

At the present time the controlling "concrete distance" of 42.5 percent of the adjoining span. This leaves a space of 3 ft 6 in. between adjacent slabs, which is called a connecting strip. The edges of the cantilever span are shored up to take out some of the deflection and the connecting strip is cast in place with the result that continuity is developed between the slabs (Fig. 4). Not only must the reinforcing bars that project from each slab be lapped and welded, but electric raceway must be joined. The connecting strip must be of sufficient width for the tying together of reinforcing and raceways before they are encased in concrete.

Interior layout and utilities

It has been pointed out that one of the significant advantages of lift-slab, as with any flat plate construction, is the freedom it provides for wall placement. In this building virtually the only fixed interior walls are around such permanently located areas as the toilets, stairs, escalators, garage, receiving and storage rooms, vaults, and kitchen and canteen areas. Most of the floor area of the building is devoted to office space and can be subdivided as function dictates by the use of movable metal partitions. Like all the walls, column spacing, sash, lighting, etc. in the building, these partitions follow the governing 4 ft 6 in. module. The exterior walls are generally of the "thin-skin" nonstructural type. Only the exterior walls of the wings are masonry (Fig. 5).

It was decided to use a relatively short cantilever, 4 ft. at the perimeter slabs, thereby accomplishing several purposes. The sash runs continuously just outside the columns, which avoids free-standing columns within office areas, and the shelter provided by the overhang greatly reduces the air-conditioning load. The sill height of the windows of 4 ft. 5 in. was selected because it permits file placement beneath the windows. Because it was strongly desirable to limit the building height, the offices generally do not have furred ceilings. This fact limited air duct distribution. Thus the space beneath the windows is utilized fully for heating and air conditioning ducts. An 8 in. girt beam connects the exterior columns and serves the multiple function of supporting the continuous sash, the sloping insulated aluminum spandrel panels, the interior metal wall panels and stools containing air supply grilles, and as a supplementary stiffener against lateral wind loads (Fig. 6).

January '56 monthly bulletin
telephone and intercommunication race- 
ways, and plumbing sleeves are imbedded 
in various locations. Among the spaces required 
for mechanical equipment housing are 
vertical electrical utility cores, and plumbing 
sleeves on the surface. At the same 
time the masonry partition locations can 
be marked. It has been found that after 
the masonry opening dimensions between 
vertical height, there are inevitably slight 
openings and their effect on the structure 
must be carefully thought out. The usual 
rule-of-thumb relegates these openings to 
locations much closer to the columns. In the 
Rouge Office Building nine stairways, two 
escalators, because large boilers beneath the concreted first 
slab comes to rest 2 in. below the top of 
the steel columns. This protruding steel is 
building any overhead construction until the 
first floor is in place could delay progress 
and proved its architects with increased a-
wareness of the potentialities as well as 
ture to play with gravity by floating 
the structure. We said in the introduction, 
Architecture, we said in the introduction, 
dicate that the mechanical equipment in the slab. Twenty 
vertical electrical utility cores rise in various locations. Among the spaces required 
for mechanical equipment housing are three cooling towers for the air-conditioning 
system. These penthouse structures present no special problems. Their supports 
are merely a longer continuation of the standard column height.

The slabs, concreted one atop the other, 
must have a separating compound to pre-
vent bonding between upper and lower slabs during lifting. Various methods have 
been tried, and it has been found that oil 
or wax separators are not satisfactory be-
cause finish materials such as acoustic tile 
or tile toilet room floors, and 2-in. asphalt tile 
are easily handled. Not so simple, 
however, it has been found that, with this 
method of separating, the supporting sur-
face material is of such fragile dimension 
that it becomes damaged by the work that 
takes place on top of it prior to concreting 
the next slab.

Another thought for the architectural de-
signer concerning concrete finishing 
flourishes. Such materials as asphalt, cork, 
or vinyl tile are easily handled. Not so simple, 
since the added depth, is the use of terrazzo, ceramic tile, or quarry tile. In 
the permanent, fixed floor depressions of 
a floor slab is no special problem. A 
type of false work called a "mud sill" can 
be used as a casting deck and then 
removed. However, in a full floor we 
are more reluctant to borrow from the slab 
depth and so we usually elevate the floor 
finish. In the Rouge Office Building 1-in. 
marble step thresholds lead to the ceramic 
tile toilet room floors, and 4-in. asphalt tile 
ramps slope up to the quarry tile kitchen 
floors. A different, and yet related, prob-
lem is that of providing sloping floors to a 
floor drain. When the floor drain is a flat form 
of its ceiling above. In the executive garage, 
for example, it was necessary to use a 
level grout finish for a forming surface. 
This was later removed to expose a floor 
with the necessary pitch to the drains.

Fireproofing
Fireproofing is always a serious considera-
tion in architectural planning. Obviously, 
in a lift-slab structure, it is not the slabs 
but the steel columns that are vulnerable to 
toxic. Usually lift-slab has been done with 
boxed steel columns or pipe columns. When these columns are filled with con-
crete, many communities give them a 2-hr 
fire rating. Since in this building the col-
umns are 10-in. H-sections, fireproofing is 
provided by a 15-in. square metal lath 
and 1-in. perlite plaster enclosure on metal 
furring, which gives a 4-hr rating.

Interior finish
The floor, wall, and ceiling finishes of this 
building are not unlike any similar office 
structure, and yet there are certain archi-
tectural considerations of lift-slab which 
ought to be pointed out. The first aspect of 
this technique that comes to mind is the 
fact that, since the floors provide the cast-
nings for the ceiling above, unusual 
care must be taken to provide a smooth 
finish on the floors. The acoustic problems 
are handled, generally, by applying acous-
tic tile directly to the ceilings with mastic. 
It should be pointed out, that while the
Letters

Bulletin:
Located as I am some 120 miles east of Detroit, the limitations of your mailing permit have no doubt made it difficult to reach me since I have only recently received my second copy of the Bulletin since 1942, although I have been a member of the Society for fifteen years. I mention this only to explain the importance of an occasion which prompts the following comments.

(1) As an effort of a profession whose very essence is design and composition, the organization of the magazine is awesome in its confusion.

(2) The dashing "modern" affectation of omitted capitals in article headings such as "committee on education" with its grotesque a, period, i, period, a, period, I would pass wordlessly were it not excused in article headings such as "committee on education" with its grotesque a, period, i, period, a, period, I would pass wordlessly were it not extended to note the permanent departure of six obviously eminent designers. These gentlemen whose ages are listed in the various eighties would, I suspect, rather have had their passing unnoted than listed under the caption "died" in all lower case letters.

(3) The matter, however, to which as a member I take considerable exception, is the use of the magazine as a means of publishing a brochure of any firm's work when this facility cannot reasonably be extended to every Michigan architect. What I have just examined is in the main of little interest except for that firm's private use, and forgive me for wondering just how they would use it.

(4) Let the National Magazines present the good work there is, reasonably free from local prejudice and critically edited. Consider the possibilities of the A.I.A. format at a local level or even supplementing it. Look over some old copies of "The Federal Architect" that failed, not on its merits but because of bad times. Record some of Michigan's historic buildings and pay thereby a long overdue tribute to the one outstanding figure in architectural education that this state has produced—Emil Lorch.

If you think your advertisers won't support such a change, make a survey of your mailing list reaction, and you all may be greatly surprised. I for one would read and consider every advertisement in an issue that included a feature such as "The Architect Looks at the Shoe Repair Business". 

Bulletin: It has been my pleasure to receive for twelve months your Monthly Bulletin. I have enjoyed it immensely. The selection of material for publication, the quality of paper, the format and composition, the brilliance of the photography, the splendid cover designs, and the all around high level of advertising copy has produced something of which you should be very proud. It is thought the Bulletin is the finest architectural magazine now published in the United States. It makes one feel glad he is an architect. Best wishes for an even greater 1956.—J. Robert Harris, A.I.A., John Robert Harris & Associates, Architects & Engineers, Studio City, Calif.

Bulletin: The City of our love has shown the world that it takes more than words to tie together the infinite variety and diversity of our society with the golden sentiment of Brotherly Love.

In the midst of our Torch Drive I had a dream one night of an incident of my youth that I can never forget. My father died and left my mother with a large family. One day the barn burned. A week or so later hundreds of people of all ages appeared at daybreak. The axes began to ring—the barn went up like magic. The women took over the house. I never saw such workers—I never saw such happiness. Before night the barn was finished, then the big dinner and after that out came the fiddles, with music and dancing until morning. I remember this so well because I never saw so many happy people. I never saw people working so hard—that is until I became a member of the Torch Drive Team. All of a sudden, I knew why I loved being a part of this effort—for right here in our own beloved City this same spirit prevailed upon us, and by doing our bit we captured the kind of happiness that is rare and precious.

At this festive season, when we have so much to be thankful for, may I say to you how much I enjoyed being a part of this great drive, which because of your efforts, has attained a degree of success never before witnessed on earth. Love is not an abstract. Love is action. Love is work. Love is sacrifice. Love is keeping faith—it is setting one's sights high and attaining one's goal, and in these things you were wonderful.—C. Allen Harlan

Gardiner C. Vose, A.I.A, a member of the Detroit Chapter, The American Institute of Architects, is a member of the Zoning Board of Bloomfield Township, Mich. Other architectural personnel in the area of the Detroit Chapter who have been appointed on planning groups are Ray C. Eastman, Ann Arbor; Richard B. Fernbach (director), Highland Park; J. Robert F. Swanson (chairman) and George J. Bery, Oakland County; Harold S. Ellington, Detroit Metropolitan Area Planning Commission, and Grosse Pointe Park Planning Commission (Chairman); Charles A. Blessing (Director), Eero Saarinen (Consultant), Frances P. Bennett and Frank Barcus (Architects), Edward J. Hustoles Associates, Detroit City Plan Commission; Miss Helen L. Fasset, Detroit Board of Zoning Appeals.

Advisory to the Detroit City Plan Commission is the Chapter's Committee on Civic Design: Louis Rossetti, Chairman; Malcolm R. Sturton, Vice-Chairman; James H. Barr, Eugene T. Cleland, Clair W. Ditchy, Amedeo Leone, Thomas H. Hewlett, Eberle M. Smith, Minoru Yamasaki, Edward H. Laird and Lawrence G. Linnard.

CHARLES W. BABCOCK, a registered professional engineer, of Detroit, was found guilty of violating Michigan's State Registration Act for Architects, Professional Engineers and Land Surveyors, by holding himself out to be an "Architectural Engineer and Builder." Appeal was made and the constitutionality of the Act was attacked.

On December 1, 1955, the Michigan Supreme Court affirmed the conviction and upheld the constitutionality of the Act. The Supreme Court's opinion, among other statements, said:

"While it is a fact that the definitions of architects and engineers are somewhat similar, yet there is a distinction. The services of an architect require the application of the principles of architecture or architectural design, while services of an engineer require the application of engineering principles."

EDGAR R. KIMBALL, A.I.A. (Detroit Chapter) who, since his separation from the Service as Major in the U. S. Army Corps of Engineers during World War II, has been Chief Architect for Severup & Parcel, Inc., Engineers and Architects, 915 Olive St., St. Louis, Mo., has been made Vice-President in Charge of Buildings for the firm.

The organization has been changed from a purely consulting basis to one of engineering and architectural practice. The parent firm has a staff of about 500, and the two wholly owned subsidiaries employ some 1,800 more, making a total of about 2,300, with operations throughout the world.

DAVID C. BOLDIA, JOHN C. HARO AND HAROLD J. ZIGMANTH have been elected associate members of the Detroit Chapter, A.I.A.

Boldia is a draftsman with Twins Cabinet & Millwork Co., while continuing his architectural studies. Haro, a graduate of the College of Architecture & Design, University of Michigan, with a master's degree from Harvard, is now with Albert Kahn Associates Architects & Engineers, Inc., Ziganth, also a U. of M. graduate, is now with John-Anderson Associates, Inc. Architects & Engineers, of Dearborn, Mich.

WILLIAM E. BRADLEY is our official photographer, but you wouldn't always know it—we sometimes forget to credit him, as in the case of the Detroit Chapter Honor Awards presentation ceremonies, published in our last issue.

Any way, Bill is a first-rate architectural photographer, as evidenced by his having served many architects in this area. His studio telephone number is TEMple 1-7152; at home, KEnwood 2-4450.
Correction

MICHIGAN STATE BOARD OF REGISTRATION FOR ARCHITECTS, PROFESSIONAL ENGINEERS AND LAND SURVEYORS will hold its examinations for Architects-in-Training and Engineers-in-Training on Feb. 4, 1956 at the RACKHAM BUILDING IN DETROIT, Michigan College of Mines & Technology in Houghton, College of Architecture & Design University of Michigan in Ann Arbor, and Michigan State College in East Lansing.

This is as announced in our last issue, except that the place in Detroit was announced, incorrectly, as the Board offices.

A STANDARD FORM OF AGREEMENT BETWEEN ARCHITECT AND ENGINEER has been prepared by a joint committee of the New York Chapter, A.I.A. and the New York Association of Consulting Engineers. Copies are available from the Association at 220 E. 42nd St., New York 17, N. Y., at twenty-five cents each.

SAMPLE copies may be seen at the office of the A.I.A. Monthly Bulletin, 120 Madison Ave., Detroit.

EINO O. KAINLAVI, A.I.A. is an assistant teacher in the School Plant Planning, College of Education, University of Michigan. Students of the class recently visited the transportable school buildings in Dearborn, Michigan designed by the firm of Eberle M. Smith Associates, Inc., Architects. The buildings won an award in the Detroit Chapter, A.I.A. honor award program held recently.

MICHIGAN SOCIETY OF ARCHITECTS BOARD OF DIRECTORS will meet at Butler Inn, 28000 Grand River Ave., in Farmington on January 18. The afternoon and evening business meeting will be preceded by a meeting of the directors of the Monthly Bulletin, Inc., the Society's publication.

The next best sound deadener to STANDARD COTTON INSULATION

Snow is an efficient sound deadener but nowhere near as efficient as Standard Cotton insulation.

Sound must be controlled in two ways. The first of these is to reduce sound at its source by absorption. Cotton insulation behind perforated board or perforated metal pans has a noise reduction factor as high as .75.

The second method of sound control reduces the transmission of sound from one room to another. Here a Standard Cotton blanket 2 inches thick will reduce 36.7 decibels of sound. 50 to 60 decibels is about the loudness of sound in a fairly busy office. This means that two inches of cotton insulation, installed in a wall, will effectively bar the passage of sound in the average office.

So whenever soundproofing is a factor in a building, soundproof it with Standard Cotton insulation.

WASHTENAW COUNTY SOCIETY OF ARCHITECTS has been formed, with headquarters in Ann Arbor, Mich. Walter T. Antics is President; Charles Wesley Lane, Secretary, and Ward G. Swarts, Treasurer. Three meetings were held—In October, November and December — and three standing committees will be appointed—Practice, Public Relations, and Registration.

Present membership numbers 28, but there are about 40 architects in the area, most of whom are members of the Detroit Chapter, A.I.A.

BARTON D. WOOD, A.I.A. has been made a member emeritus of The American Institute of Architects, its Detroit Chapter and the Michigan Society of Architects. Mr. Wood, formerly secretary of the Society, is now confined to Veterans Hospital in Dearborn, Mich.

ALOYS FRANK HERMAN AND HOWARD THOMAS SIMONE, Architects, of Detroit, announce the removal of their offices from the David Stott Building to Suite 632, the Lafayette Building, 144 W. Lafayette Ave. The telephone number remains the same: WWoodward 2-8788.

WILLIAM G. FRANKENFIELD has become a partner in the firm of William G. Zimmerman Associates, Architects, of 831 W. Huron St., Pontiac, Mich., it is announced by Maurice B. Kimmings, A.I.A., head of the firm.

Harvey C. ALLISON, the new secretary of the Saginaw Valley Chapter, A.I.A., and Mrs. Allison, are the proud parents of their first offspring—a fine baby boy, born on November 3 in Midland, named Harvey Cleland Allison, Jr. An assistant secretary in charge of sales resistance.

CLAIR W. DITCHY, F.A.I.A., immediate past president of The American Institute of Architects, has been made an Honorary Corresponding Member of the Royal Institute of British Architects. Ditchy was President of the national A.I.A. during 1953 and 1954.

RICHARD P. RASEMAN, A.I.A., of Harrisonville, Mich. is Chairman of the School Board in his community, that recently approved vending on an $800,000 school building proposal.

CARL D. JOHNSON, Associate of Edward A. Eichstedt, Landscape Architect, announces that their office has facilities for making perspective drawings and color renderings of architectural subjects, for architects, from now on through the winter months. Call them at VAlley 2-8834.

Southern California Chapter
How It Operates
By Rita Miller and William Quinn • From the Chapter Bulletin

At the request of THE BULLETIN editor, I started to list the duties involved in being Executive Secretary of the Southern California Chapter. Remembering the many details involved within a group such as yours took longer than even I could imagine. My general duty as Executive Secretary is to act as the Chapter's representative in carrying out the work and managing the activities of the Chapter office. This entails attending and writing minutes for the 52 Executive Committee meetings every year and getting the minutes into the hands of the Board before the next week's meeting. This also means attending and writing minutes for all special or joint meetings of the Executive Committee.

It is my duty to attend 12 Chapter meetings in the year, and, if the Secretary cannot attend, I write the minutes for these meetings. During these 12 meetings I must first help with the reservations, sell the tickets before the dinner and pay the bill before the meeting adjourns. It is also my task to handle details and seating of the guests at the head table each month.

The Executive Secretary prepares the membership certificates for all new members and has them ready for presentation at Chapter meetings. The Executive Secretary handles all applications for new members; and notifies the membership chairman when to call a meeting.

It is also my duty to see that all applications are forwarded in the proper manner to the Institute headquarters in Washington and take care of all correspondence with references to membership between the Institute and the Chapter. Also, membership records are kept up to date with our mailing company and at the office. Each member, junior associate and associate member has a ledger sheet at the office on which records of payments of dues and assessments are kept. This number over 500 individual record sheets. Each month a budget report is made up by the Executive Secretary which shows the amount of money used in each budgeted article and the money left in the budget for that activity. The Public Relations office has a separate budget with its income derived from THE BULLETIN, and every expenditure and budgeted item is listed much the same as the Chapter budget is prepared. Each month I balance the books, and once a year the books are audited by a Certified Public Accountant. It is also my job to handle all the commercial and savings account banking, and to purchase supplies and office equipment.

Each year I bill every member of the Chapter, and thereafter on a quarterly basis until all dues are paid. Payroll of Chapter personnel and quarterly reports of the government are my responsibility as well as paying all bills. A list of bills to be paid is made up each month, or at times semi-monthly, for approval by the Board. Following approval, the checks are made out for signature by the treasurer and president of the Chapter.

The Executive Secretary answers all correspondence coming into the office that does not require official Executive Com-

mittee action, and sends memos and instructions of the Executive Committee to all Chapter committee chairmen.

Telephone calls answered by the Executive Secretary number over 30 per day, with some days bringing as many as 75 calls.

The Executive Secretary handles the sale of A.I.A. documents to architects, contractors, and anyone wishing to purchase same. Sales this year for the first 10 months have exceeded all previous years. City and Sales tax returns must be made up on these sales at the end of each year. My duties include interviewing all draughtsmen, or personnel seeking employment in architects' offices, and a file is kept on these people so that architects needing draughtsmen will find them available.

The job also includes recommending architectural and sales consultants to the public to assist them in their building problems. Recommendations have gone out from the office for such work as hospitals, sanitariums, motels, restaurants, apartments, industrial, commercial and residential as well as remodeling jobs.

The Executive secretary also assists the public with information and help relative to the profession; such as, architects' services, fees, ethics and practice problems, arbitration procedures, and recommending members to serve as expert witnesses in legal cases involving architects. This includes working with the American Arbitration Board in selecting architects to serve when called upon.

The job also includes the scheduling of committee meetings (22 active committees and the W.A.L.; Women in Architecture also have meetings at Chapter office). Inquiries concern the California Council of Architects' policies, such as those regarding school contracts, exhibit space at state conventions and recommended schedules of compensation. Also, since the State Board of Architectural Examiner's
Office has moved to Sacramento, we find ourselves answering more and more questions and inquiries relating to that office, i.e., requirements for examinations, etc. My duties also include assisting the members and furnishing them with information, as to proper documents, files, and other pertinent matters when setting up their own offices.

A little-known job is that of conferences with visiting architects; outlining libraries of particular work they are interested in seeing, and contacting offices for them. This is also true with those architects visiting on exchange scholarships from other countries. Duties include conferences with general public, members, representatives of other organizations within the construction industries, and conferences with manufacturers of new materials they wish to bring to the attention of the architects. My job also includes supervision of one part-time girl and public relations director.

This is a brief resume of the daily activities of your Chapter office. It would be impossible for me to try to put into a report all the problems, questions, information, contacts and duties that are handled by the Executive Secretary. In order to keep pace it is necessary to devote much time to study of new A.I.A. policies, document changes, State Board rulings and California Council of Architects' matters.

Because of the size of our Chapter we are able to carry on an office that is open to members and the general public from 8-30 a.m. to 5 p.m. Monday thru Friday. This is the only Chapter with a full time public relations director working strictly on a Chapter level. Bill Quinn gives all of his time to handling the public relations activities and Nancy Cope is our Assistant secretary. We invite the members to stop in and visit our new offices and get acquainted with the Chapter personnel.

By William Quinn

For the past three years this writer has served the Southern California Chapter as its public relations editor and editor, as well as advertising manager of THE BULLETIN, monthly Chapter publication.

From the very first, because of the lack of public relations funds, it was apparent that if the Chapter were to ever have an effective public relations program, THE BULLETIN must be a publication that would not only attract advertisers, but interest the Chapter members as well. This has been the first goal over the years, because to do otherwise would be putting the cart before the horse, and no real public relations effort would be feasible or practicable without the available funds with which to operate it.

Complete renovation of THE BULLETIN has taken place, gradually, slowly, but emphatically. Unless the members looked at those early issues we doubt that they could imagine the complete change that has taken place.

With this change and promotion have come new advertisers—some highly touted national accounts—and long term advertisers. We now have so many contract advertisers that it is no longer a month to month operation.

We know that many of our members have been impatient, but impatience cannot only be unprofitable, but can kill every-thing that has taken place before.

Public Relations, we are often told (those of us in the field), is a matter of publicity—How many column inches can be obtained in the newspaper or how many television shows can be obtained free of charge? To those of us who have spent every waking moment in this field, it is almost inconceivable that people take this attitude toward our profession. It is just as wrong as to say that “architects draw pretty pictures and blueprints”. Our work has as many facets as there are kinds of people. Our job is to look at our client and find out what he has to offer—Duties include publicizing the general public needs and wants (whether they know they need it or want it!) and then say, “how can we get this message over?”. There are many ways to do this—through the press, other publications, television, radio, films, lectures, brochures and just plain talking. In my case, I want to show people that hiring an architect is not only a “good” thing, but a real necessity. How I do this must depend on how much money I have to spend. In other words I can be asked to handle a client with $500.00 as well as one with $500,000, but the result must be the same if that client is to be satisfied. As you can see, if you are doing a job of $500.00, it necessarily limits the kinds of things you can do within your field—the kind of communications you can use to get the message over to the general public.

To those critics who think we have gone very slow, let me say this—the public relations program over the past three years has been a paying proposition. My salary and program expenses come out of a budget clearly marked “public relations,” and the income from this budget has come only from the advertising receipts derived from THE BULLETIN. This, in itself, puts me in the most unique position my profession has ever encountered. I find myself an editor and advertising manager (and a good public relations man should be qualified to handle both of these jobs because he is NOT a promoter as so often misquoted). This, without exaggeration, takes seeing advertisers, checking on copy, plates, advertising agencies, lunch-sons with manufacturers and attending cocktail parties that otherwise would be of little value to the ordinary public relations man. I find myself seeking editorial material continuously, for any editor of any publication will tell you that a magazine is like a giant animal that seems to devour material as fast as it can be obtained. I find myself writing stories every month that require research, and those types of stories that are only a matter of information. I have seen issues where not one word appeared that didn’t come from this typewriter—a state of affairs which I obviously wouldn’t want to encourage since I think it hurts the magazine. I have found myself in the position of being the production man on this publication every issue—a production man for your information is one who does the lay-out and paste-up, who knows where the cuts are, the sizes, and if they will fit. This is a specialized job that often on most magazines is done by skilled men. Art Director? Well your public relations man must serve in this capacity as well. The covers—whether good or not—have been his responsibility. Designing one requires a knowledge of costs of printing, use of colors, and the main dictator of the design is that old friend called MONEY!
Now, we hear some say, this could be easily solved by using the manpower within the Chapter. Is there a man in the Chapter that can spare some 75 hours away from his own office every month? Is there any architect that can take over another going, thriving business as well as the one he already has? Your answer will be "no," of course, and then we continue to search for the answer.

The answer is plainly simple, yet so complex that we must make THE BULLETIN an even bigger and better magazine, with more advertising and even better editorial material. We are now in the economic state of diminishing returns. We are at a point where we are making money, but aren’t big enough to handle extra costs. But that day will come, and it isn’t going to be as far away as you might think.

What are the other duties of a public relations counsel for your Chapter? He must attend some 30 to 40 committee meetings per year, 35 luncheons, 40 dinners, and numerous cocktail parties. Some of these in the interest of the magazine and some in the interest of promoting architecture. He must arrange television shows, work on exhibits, arrange radio broadcasts, and at times even write the scripts for these. He must represent his job at numerous meetings and functions that to the layman would seem a far cry from the client he serves. He must work with and know newspaper reporters, magazine editors, magazine bureau personnel, television production workers, television writers (so his client will be written into a script occasionally), radio broadcasters, news columnists. He must be a member of press clubs, publicity clubs, public relations societies.

A public relations counsel must have the ability to interpret the meaning of "reinforced concrete" and at the same time tell the layman in simplest of terms just what it means. For if he doesn’t know about the field he represents, then immediately he is looked upon as a "fake." When someone discusses a home he just spotted in a little known publication, the person in front of him looks to see if he has this at his fingertips—Which architect really does. He must let it be known that he is available for conferences with the general public. If a "hot" columnist finds it good reading to pick on his client, he must find some way to show that man how wrong he is.

He must take a positive approach—Find time to talk to the architects about the work he is doing in his offices so that when an editor helps and calls, he has this at his fingertips—Which architect to call about a mortuary, a hospital, a residence with a hi-fi set built in, a circular staircase, an unusual entrance. If this all sounds overwhelming—it is—at times, but most of all the public relations counsel must enjoy his job, believe in his client. I enjoy mine and I certainly wish he could play an even more important role in civic affairs, in the Southern California area and the country. If we keep on plugging, working, without discouragement, this goal will be accomplished.

Education

EBERLE M. SMITH, A.I.A., vice-president of the Michigan Society of Architects, was a delegate to the White House Conference on Education held in Washington, D. C. recently. Smith is active on The American Institute of Architects School Building Committee, at the local, State, regional and national levels. He announces that a meeting of the State School Committee will be held in Ann Arbor next April.

1. The following recommendations are made in regard to State and Federal Control:

States should pursue research, and provide leadership through consulting services, for school districts on building construction, with special emphasis on new building materials and techniques.

The Federal government should have no control whatsoever over school building plans and specifications.

2. Basic and Advisory Facilities:

Basic facilities for an elementary school: Adequate site, classrooms including kindergarten, office facilities, space for assembly and cafeteria activities or multi-purpose room, physical education, and playground facilities, equipment health unit, teachers' room, service and sanitary facilities, toilet rooms, custodial and storage rooms. Desirable, but not mandatory, facilities should include special service rooms, library and visual aid facilities.

Basic facilities for secondary schools: Adequate site, general classrooms, special classrooms for art, home-making, music, industrial arts, and for vocational education, boys' and girls' physical education, offices, library and textbook rooms, cafeteria, auditorium, health unit, teachers' lounge, locker facilities for students. Desirable, but not mandatory: swimming pool, visual aid facilities.

3. Federal Aid for Schools:

The participants approved by a ratio of more than two to one the proposition that the Federal Government should increase its financial participation in public education. Of those favoring such increase, the overwhelming majority approved an increase in Federal funds for school building construction. A very small minority opposed the Federal aid for education in any form.

The administration of Federal funds should be through the appropriate state agency for education. This state agency should determine the relative needs of local school districts. There was some opposition that Federal administration of financial grants for education should be vested in the U. S. Office of Education.

The delegates almost unanimously opposed any Federal control over educational use of funds in local school districts.

4. Non-Public School Support:

While the participants recognized the right of parents to educate their children in non-public schools in accordance with American tradition, a large majority of the participants did not favor the use of tax funds for the support of non-public education institutions.

Don't Overpay Your Taxes

This article is based on information supplied by the American Institute of Accountants, the national professional organization of certified public accountants.

Whether the federal income tax rates are cut or not, you may be able to cut your own tax bill—honestly!

To do this you need to know the tax effect of various choices. Your choice of a method of handling a particular transaction can raise or lower your taxes, and sometimes you can save money by a legitimate shift of taxable income or deductions from one year to another. You are also allowed choices in your treatment of certain items in your tax return, such as depreciation and research costs.

Many businesses could reduce their tax burden if they were aware of the tax considerations affecting a variety of transactions. The most feasible means for many businesses to keep alert to tax saving opportunities is frequent consultation with a properly qualified advisor. If the firm retains a certified public accountant or a firm of CPAs, there should be tax consultations not just once a year when the filing date approaches, but throughout the year as decisions are made which will affect the tax.

Choice of Depreciation Method

Certain tax-saving steps are still possible at tax-filing time. One of them is the proper choice of depreciation method. The first step is to determine the estimated useful life of any asset acquired during the tax year. Every businessman should have a copy of "Bulletin F," which contains tables of "average" useful lives. It is available from the Superintendent of Documents, Government Printing Office, Washington 25, D. C., for 30 cents. The tables provide a guide, but it is not necessary to follow them exactly.

The simplest method is straight-line depreciation. It may also be the best in your particular case. Just divide the cost (less what you expect to sell it or trade it in for when it is replaced) by the number of years of estimated useful life, and this is the amount to be deducted each year. In arriving at the original cost, don't forget to include freight and installation charges in addition to the price paid for the equipment.

The law now specifically permits several other methods of depreciation for new assets having a useful life of three years or more. One of them is known as the declining balance method. In the first year the depreciation rate is twice what it would be under the straight-line method. The next year the same rate is applied to the amount remaining to be depreciated. This process is repeated each year.

The result is that a greater proportion of the cost is depreciated during the early years of the life of the asset. Another new method, known as "sum of the years' digits," has a similar effect. You should figure depreciation on a new asset in all possible ways so that you can decide which is best for you and make the proper choice.

These methods of rapid depreciation may be particularly helpful to a company which is currently making large outlays for new equipment, but the depreciation left for the later years of the asset's life will be less than under the straight-line method. The best method depends upon the circumstances of the individual company, and is also affected by such imponderables as estimates of future earnings and tax rates during the life of the asset.

Research and Development

Another choice confronting the taxpayer is whether to treat research and development costs as immediately deductible expenses or to amortize them over a period of years. The immediate deduction is certainly a "bird in the hand" and may be very attractive to a company which needs this tax benefit to help finance the undertaking.

The company which can afford to spread the cost over the estimated useful life (or at least sixty months if the useful life cannot be determined) may find it best to do so. This is especially likely to be advantageous for companies whose income is expected to increase.

Being Taxed as a Corporation

There is a provision in the 1954 Internal Revenue Code which allows some proprietorships and partnerships to be taxed as if they were corporations. This choice should not be made lightly, as there is considerable uncertainty about the provision and the proprietorship or partnership desiring corporate tax treatment might find it better actually to incorporate.

Choice of Fiscal Year

Regulations now permit changes of fiscal year in some cases without permission of the Treasury Department. Generally it is wise to use the fiscal year which corresponds most nearly with the annual cycle of business operation. For asset and liability purposes, a new fiscal year is started at the point of receivables, inventories and loans, instead of a calendar year. This reduces the area of possible dispute over such matters as value of inventories, and has many advantages apart from tax considerations. The change should be carefully timed, though, to avoid possible adverse tax effects during the changeover period.

Sickness and Accident Benefits

Under the present tax law, payments from your company to employees for treatment of sickness or injury are not taxed as income of the employees. If the company has a plan for continuing all or part of an employee's pay while he is absent for sickness or injury limited amounts of this "sick pay" are also tax exempt.

This applies whether the payments are made by the company or by an insurance company. In the case of a sickness requiring hospitalization even for one day during the course of the illness, or in the case of any injury, the first $100 per week of payments are tax free. In the case of sickness which does not require such treatment or hospitalization, the exemption only begins after the first week of absence.

No great formality is required concerning the "plan" but it should be explained to employees, and appropriate records kept of the amounts paid. Proposed regulations governing tax withholding in 1956 from payments to ill employees were still under discussion when this article was prepared.

Repairs and Improvements

If you contract for repairs and improvements to your business property, be sure that these two types of work are billed separately. Should you lump them together, you may find that the entire cost has to be capitalized for future depreciation. By listing the cost of repairs as a separate item you are allowed to deduct it as an expense of the current year.

For example, you might have a furnace repaired and new radiators added. By separating the charges you can deduct the cost of the repairs in the current year, although the new radiators would be improvements subject to depreciation during their useful life.

Keeping Good Records

Many deductions are lost through failure to keep adequate business records. Be sure that you have good records to show you what deductible expenses you have had, and to back up your deductions in case they are questioned by the Government. This applies particularly to your out-of-pocket business expenses, such as travel and entertainment of customers, and to items which are deductible on your personal income tax return.

Good records and properly qualified professional tax assistance—at tax-filing time and throughout the year—are the keys to income tax savings.

January '56 monthly bulletin
The new unit is exceptionally strong and only 60" by 21" by 64" high and is a part of the assembly. It occupies an area channel type carrier which is an integral benches fold up compactly into an open Transi-Fold, when unfolded, seats up to 4 persons, but may be detached; Mobil-Fold which is portable and may be detached from its carrier and now Transi-Fold of which the carrier is a part of the unit.

The educators, designers and architects throughout the country were consulted as to their opinions during designing. All have accepted the final product.

Schieber classroom furniture, folding chairs and tables for institutional use are distributed in the Michigan area by the C. A. Finsterwald Company, of Detroit, Michigan.

Samsonite classroom seating—classroom seating that is comfortable, mobile and durable. The chairs are designed with a cantilever action to insure additional comfort. All metal parts are bonderized to prevent rusting. Durability is incorporated in the design by the use of aluminum "spats" that protect the legs of the furniture during maintenance operations. Swivel glides on chairs, desks and tables insure surface contact at all times.

The new Samsonite classroom furniture construction is the most advanced method that is used and here, again, Samsonite pioneered the development. They have also incorporated polyester styren—fiberglass plastic backs molded to fit the shape of the growing child. This back pivots to add additional comfort.

In designing this new furniture they have kept in mind the demands of the time and the relationship between furniture and classrooms as a whole. There have been many changes that have taken place in the schools in their teaching methods but the classroom will remain the same.

In furnishing the new classroom, manufacturers of the new Samsonite classroom furniture, are pioneers in the field of manufacturing ingenuity. For almost a half century, Samsonite has been the leading name in luggage. Today, Samsonite has designed a contemporary line of classroom seating—classroom seating that is comfortable, mobile and durable.

In designing this new furniture they have kept in mind the demands of the time and the relationship between furniture and classrooms as a whole. There have been many changes that have taken place in the schools in their teaching methods but the classroom will remain the same.

Samsonite, in this new line of basically proven designs, has introduced, for the first time, color to the furniture. It is available in turquoise, terra cotta, brown and grey. All work spaces are available in three types of finishes, plywood, hardwood and melamine plastic.

Resistance type welding in Samsonite classroom furniture construction is the most advanced method that is used and here, again, Samsonite pioneered the development. They have also incorporated polyester styren—fiberglass plastic backs molded to fit the shape of the growing child. This back pivots to add additional comfort.

The educators, designers and architects throughout the country were consulted as to their opinions during designing. All have accepted the final product.

Schieber classroom furniture, folding chairs and tables for institutional use are distributed in the Michigan area by the C. A. Finsterwald Company, of Detroit, Michigan.

where enrollment has grown, etc.

Schieber now offers four types of folding units. In-Wall which installs permanently in wall pockets; Port-A-Fold which installs in wall pockets but may be detached; Mobil-Fold which is portable and may be detached from its carrier and now Transi-Fold of which the carrier is a part of the unit.
**How to plan and do expert MASONRY work**

Practical "how-to" manual gives facts and step-by-step directions for concrete work of all types.

**Simplified Masonry Planning and Building**

By J. Ralph Dalzell

362 pages, 6 x 9, 179 illustrations. $5.00

Here is an easy-to-understand manual on the planning and construction of all common types of concrete, concrete block, stucco, and similar structures. Explanations and clear pictures and diagrams reveal details of footings, foundations, walls, floors reinforcing, and many other masonry features. Every operation has been tried in the field to make sure it meets building code requirements.

This book is ideally suited for building mechanics, cost-minded homeowners, and as a first-class practical reference book for architects and builders.

**Now! For better design of secure prestressed concrete structures**

This practical aid offers methods for improved design and application of prestressed concrete. Tests of prestressed concrete are discussed, including studies of creep of steel and concrete, behavior of beams tested to breaking point, and problem of buckling during prestressing. More than 50 applications of prestressed concrete, drawn from the author's own experience, are described in detail, and illustrated by photographs, diagrams, and plans.

**PRESTRESSED CONCRETE**

By Gustave MagneL

Professor of Reinforced Concrete at the

University of Ghent, Belgium, and Director of the Laboratory

Third Edition. 352 pages, 6 x 9, 330 illus. $8.00

- Gives dead weight and acceptable working load for varying spans and depths of beams.
- Presents numerical applications of great help to designers.

Termites don’t like the lumber in these pictures because it will poison them if they take a bite. The wood has been treated with the Wolman Salt solution which makes the wood termite-proof, rot-proof, and fungi-proof, thereby extending its life 3 to 5 times beyond untreated lumber.

HANSEN WHOLESALE LUMBER CORPORATION of Detroit has been appointed Michigan representative for Olin-Mathieson Chemical Corporation of Shreveport, Louisiana, and is carrying a complete stock of Wolmanized Yellow Pine in all construction sizes. Olin-Mathieson Chemical Corporation, one of the big timberland holders in the United States and the biggest in the South, will treat the lumber in their processing facilities in Shreveport, Louisiana, against rot, termites and fungus. Then they will ship the lumber either directly to the job or into Hansen’s Detroit yard for distribution of less than carload quantities for the Michigan area.

The way they make ordinary lumber into Wolmanized treated lumber is to place it into a 70 ft. long pressure cylinder (picture above). The cylinder is closed tight and most of the air is pulled out of it. When air is sucked out of the cylinder it also comes out of the pores in the wood, so the lumber can more easily soak up the salt solution.

The salt solution—or Wolman Wood Preservative Salts—is heated to 140 F and admitted to the cylinder. When the cylinder is full of solution, the vacuum is broken and a pressure of 175 lbs. per square inch is applied until the solution has worked its way into the lumber.

The lumber is dried in automatic kilns, and after that it’s Wolmanized treated wood, ready for the market.

The process itself is not new—the Germans developed it 50 years ago to treat railroad ties—however, Hansen feels there is a big future for it for these four reasons: 1) It is odorless, 2) It can be painted, just as untreated lumber can, 3) It can be handled without gloves because it is non-toxic and 4) It can be glued.

C. ALLEN HARLAN, Detroit electrical tycoon, has been appointed by Gov. G. Mennen Williams to head the Michigan Care Committee—the organization which has done such a splendid job in providing food for the starved people in foreign lands.

During the past Christmas season, when Gov. Williams proclaimed Dec. 18 to 25 as Care Week, Harlan, as chairman, gave a great deal of his personal time and effort to promoting the Care cause over radio and television.

It is men of Harlan’s stature that this country needs more and more to carry on the gigantic tasks that confront the heads of government in carrying out their duties.

In addition to his work on the Care Christmas Food Crusade, Harlan is on the Great Lakes Seaway Commission and president of the Detroit Educational Television Foundation. He recently gave to the State of Michigan a $10,000 portrait of the famous French explorer La Salle which had been smuggled out of Europe after having been hidden from the world in a private collection for centuries.

4. ARCHITECTURAL SPEAKING by R. Raskin. Amusing book exploring architectural abstract terms, bringing them down to earth and explaining their connotative and specific meaning. 145 pages, illustrated by R. Osborn. Single copy $5.00

5. ARCHITECTURAL AND ENGINEERING LAW by B. Tomson. Excellent reference book on over 365 court cases. Deals with every type of legal problem in its field that has come before the courts. 370 pages, profusely illustrated. Single copy $7.00

6. ARCHITECTURAL DETAILING by C. Hornostel and E. A. Bennett. Complete details of various building types. 176 photos and line drawings of sections, elevations and blow-ups. 230 pages, profusely illustrated. Single copy $12.00

7. ART IN MODERN ARCHITECTURE by E. Bitter. The use of art in recent architecture, stressing the practical, usable aspects of murals, architectural sculpture and glass. 178 pages with many pages of pencil drawings. Single copy $8.50

8. THE BOMB. SURVIVAL AND YOU by F. N. Severud. Full explanation of how to protect people, buildings and equipment in the event of a nuclear explosion. 256 pages, profusely illustrated. Single copy $5.95

9. BUILDING CHECK LIST by B. J. Small. Complete check list of building procedure. Bails down entire checking and planning process, with charts, checking and organization and final specifications. 158 pages. Single copy $1.00

10. BUILDING INVESTMENT by C. H. Cowgill. Covers all investment problems in connection with buildings, such as building management, modernization and appraisal, etc. 482 pages, illustrated. Single copy $7.00

11. BUILDING PRACTICE MANUAL by R. W. White. Complete information for estimating accurately building materials used in houses, small commercial buildings and other buildings of similar types. 256 pages, profusely illustrated. Single copy $4.95

12. CHURCHES AND TEMPLES by P. Thiry, R. M. Bennett and H. L. Kirschnhofer. Beautiful, pictorial presentation of religious architecture. Gives complete background and points out the requirements of present-day planning. Over 600 striking illustrations. Single copy $18.00

15. CLIMATE AND ARCHITECTURE by J. E. Aronin. Valuable information on how to design for various climatic conditions: describes the influences of sun, temperature, wind and humidity on architectural structures. Profusely illustrated. Single copy $12.95

16. CONTEMPORARY STRUCTURE IN ARCHITECTURE by L. Michaels. Deals with all structural aspects, from skeleton frame to exterior shell. Describe how they are used and critical analyzes their effects on architectural design, etc. 256 pages, profusely illustrated. Single copy $10.00

17. DON GREA'S DATA SHEETS by D. Gres. A superb handbook of simplified information about materials, structural design, mathematics, plans, equipment and structural details, drafting, furniture, 634 pages, profusely illustrated. Single copy $9.00

19. FUNDAMENTALS OF PERSPECTIVE by T. DePortes. A simple and easily understandable method of showing the order in which lines of perspective is drawn. 30 plates. Single copy $6.00

20. FURNITURE FOR MODERN INTERIORS by M. D. Fabro. Describes and depicts over 200 selected examples of modern furniture created by famous designers. 230 photos and 63 scale drawings. Single copy $7.50

21. WALTER GROPius: WORK AND TEAMWORK by R. Giedion. Outstanding book on one of the greatest living architects. Includes the description of contemporary architecture, with Gropius as the central figure, 250 pages, profusely illustrated. Single copy $10.00

22. HOSPITALS-INTEGRATED DESIGN, 2nd Edition by I. Rosenfield. Complete study of plans and services which require housing; facilities for educational, research, etc. Profusely illustrated. Single copy $9.00

23. THE HOUSE AND THE ART OF ITS DESIGN by E. Saarinen. Complete study of plans and services in the educational program of a school; and how to use the school. 128 pages, illustrated. Single copy $10.00

24. HOW TO BUILD A CHAPEL by E. Saarinen. Complete study of plans and services in the educational program of a school; and how to use the school. 128 pages, illustrated. Single copy $10.00

26. LETTERING ART IN MODERN USE by L. Marfo. A stimulating study of design and construction of T.V. planning for everyone, from architects to TV professionals. Shows the economic and comfort advantages of thermal insulating materials. Describes the various types of insulation used in building. 100 pages, illustrated. Single copy $3.00

27. LETTERING ART IN MODERN USE by P. D. Close. Explains the economic and comfort advantages of thermal insulating materials. Describes the various types of insulation used in building. 100 pages, illustrated. Single copy $3.00

28. MOTELS by G. Baker and B. Funaro. The all-time best motel book available in this field. All information needed by the architect and builder is explained with over 630 illustrations. Single copy $10.00

29. THE NEW ARCHITECTURE IN GREAT BRITAIN by E. D. Mills. Excellent introduction to recent trend in architecture. Written in straightforward technical and aesthetic aspect involved, 210 pages, profusely illustrated. Single copy $10.00

30. PENCIL TECHNIQUES IN MODERN DESIGN by W. W. Atkin. Complete study of modern pen and ink techniques. Includes the outermost limits of technical and aesthetic aspect involved, 210 pages, profusely illustrated. Single copy $10.00

31. THE PERSPECTOR by T. DePortes. Valuable new device for accurate and rapid construction of perspective. Guaranteed to mathematically correct perspective. Single copy $5.00

34. QUALITY BUDGET HOUSES by K. M. Ford and J. L. Creighton. Combining 100 architect designed houses from $5,000 to $20,000. Each house is accompanied by full information needed by the home buyer wants to know. 224 pages, profusely illustrated. Single copy $14.00

35. SCHOOLS by L. B. Perkins and W. D. Cocking. Deals with the educational program of a school and its design, in a contemporary viewpoint. Deals with all design problems of each unit in the school, classroom, administrative offices, shops, etc. 252 pages, profusely illustrated. Single copy $12.00

36. SEARCH FOR FORM by E. Saarinen. An excellent fundamental approach to art and a lifetime study of form in architecture. 254 pages, profusely illustrated. Single copy $5.00

37. SHOPPING CENTERS-DESIGN AND OPERATIONS by M. D. Fabro. Over 470 photographs and illustrations, plus detailed specifications. 630 pages, profusely illustrated. Single copy $12.00

38. STATIONS by J. E. Atkin. Complete coverage of modern pen techniques; composition, perspective, etc. Profusely illustrated. Single copy $9.00

39. THEATRES AND AUDITORIUMS by F. Gibberd. Outstanding book on modern theater design. Show latest developments in theater design based on architectural and modern design. Shows latest applications of lettering to architecture, advertising, etc. Profusely illustrated. Single copy $12.00

40. THERMAL INSULATION OF BUILDINGS by E. C. Cole. How to determine the educational program of a school; and how to use the school. 128 pages, illustrated. Single copy $10.00

41. TOWN DESIGN by F. Gibberd. Outstanding book on how to treat architecture, landscape and road design as an integral part of the urban environment. Describes the design problems of town centers, industry and housing, 300 pages, profusely illustrated. Single copy $12.00

43. WOOD FURNITURE TREASURES by L. Marfo. An inspiring book of furniture created by famous architects, innovative designs of world furniture masterpieces from early 1500's to the present. 200 pages, profusely illustrated. Single copy $10.00

44. YOU WANT TO BUILD A SCHOOL? by W. Bursch and J. L. Reid. How to determine the educational program of a school, and how to use the school. 128 pages, profusely illustrated. Single copy $6.00
PUT POWER IN YOUR PLANNING
with the help of Edison’s CBR

Planning’s more complete with greater power for success when it includes wise and wide use of electricity . . . for light, for heat, for power.

Your Edison man (Customer Business Representative) will be happy to counsel with you on the best and most effective uses of electricity. Whenever your business, production or processes are altered to meet today’s change and growth, electricity can help with more power, greater efficiency.

Ask the CBR to come and talk with you.

Edison advisory services are available without charge.
In Detroit, call WOodward 2-2100, Ext. 9387— elsewhere telephone your nearest Edison office.

Detroit Edison
MAHON M-FLOOR
Cellular Steel Structural Sub-Floor constructed with Mahon M-Floor Cel-Beam Section M2. When energized with an electrical distribution system, Cel-Beams are utilized as continuous electrical raceways. In addition, M-Floors have an unusually high strength to weight ratio which, coupled with rapid erection, produces many cumulative and far-reaching economies in both construction time and cost.

MAHON STEEL DECK and LONG SPAN M-DECK SECTIONS
- STANDARD DOUBLE RIB
- WIDE-FLANGE DOUBLE RIB
- LONG SPAN M-DECK SECTION M1-G
- LONG SPAN M-DECK SECTION M2-A
- LONG SPAN M-DECK SECTION M3-A

New Structural Sections Make Cellular Sub-Floor, Roof, or Combination Roof and Acoustical Ceiling!

Mahon M-Floor Sections and Long Span M-Deck Sections provide designers with a wide range of structural units which have literally dozens of uses in modern construction. In addition to their use in cellular steel structural sub-floors, known as M-Floors, in which the Cel-Beams provide continuous electrical raceways under every square foot of floor surface, these versatile Cel-Beam Sections are used extensively as decking in roof construction. Mahon Long Span M-Deck Sections can be produced with deep Cel-Beam Members to span from truss to truss... they can be produced with bottom metal perforated and sound absorbing material inside the Cel-Beams to provide a highly effective acoustical ceiling—in which case, the M-Deck Section serves as the structural unit, the interior finish material and the acoustical treatment all wrapped up in one package. This is the ultimate in economical construction of combination roofs and acoustical ceilings... it is permanent, incombustible, indestructible construction which will require no maintenance other than normal decorative painting. For complete information, including engineering data and specifications, see Sweet's 1956 Files, or write for Catalog M-56.

THE R. C. MAHON COMPANY • DETROIT 34, MICHIGAN
Sales Engineering Offices in Detroit, New York and Chicago • Representatives in Principal Cities
Manufacturers of M-Floors and Long Span M-Decks; Steel Deck for Roofs, Partitions and Walls; Permanent Concrete Floor Forms; Insulated Metal Walls and Wall Panels; Rolling Steel Doors, Grilles and Underwriters' Listed Automatic Rolling Steel Fire Doors and Fire Shutters.
