VERSATILE
Parking Areas  Driveways  Walkways  Canal Sides
Bridge Escarpments  Shopping Malls  Sidewalks  Patios
Drainage Ditches  Airport Runway  Meridians
Highway Shoulders and Medians

IMMEDIATE, ATTRACTIVE AND ECONOMICAL
TUFF TURF is easily installed by semiskilled labor and provides decorative areas of green grass or colored gravel in what could otherwise be large stretches of asphalt or concrete. It is also comparable in cost and as durable as concrete or asphalt.

LESS HEAT ABSORBENT
TUFF TURF absorbs less heat than asphalt and concrete and is therefore a cooler medium for open air malls, plazas and shopping center parking lots.

EASY TO MAKE REPAIRS
Sewer, water, gas, utility and telephone lines are easily accessible and repairs can be made to the blocks themselves inconspicuously and with a minimum of equipment.

ECOLOGICALLY SOUND
TUFF TURF prevents water runoff. It enables a larger percentage of the rainfall to be absorbed and returned to the water table and decreases erosion. It also prevents soil around runways from being wind eroded and burned as badly by jet blast.

SPECIFICATIONS
TUFF TURF blocks are manufactured on a modern, high production concrete block machine with above 6,000 p.s.i. test. The size is 18" by 24" by 3¾" and the concrete is of a dense, low absorption quality.
For all our readers
we wish 1977 to be
rhapsodic, exuberant
and eudaemonic.

vol. 19 no 1.

IN THIS ISSUE:

are reported the recipients of the 1976 New Mexico Arts Commission Awards which are administered by the New Mexico Society of Architects. These annual awards were begun in 1969 and are announced at the annual awards banquet of the Society.

The Society is honored to present these awards. The New Mexico Arts Commission makes them possible. It is a partnership between concerned organizations. The design professions must preserve the past and also must create for the future. These awards recognize outstanding achievements towards these two goals.

NEW MEXICO ARCHITECTURE begins a new year. With that new year we, the "staff," want to know how this magazine can better serve its readers. We would be pleased to receive your comments and suggestions. We do want you to read the magazine. How can we do it better? You tell us.

TOTAL VERSATILITY IN PRECAST CONCRETE

Stanley Structures manufactures a full range of precast concrete products for many types of construction. These products include twin tees, flat slabs, girders, beams, columns, stairs and wall panels. A broad variation of load capacity, surface texture and color is available to satisfy structural requirements and architectural designs.

Another building,
another boost for the
Trus Joist system.

Baker Construction Co. of Albuquerque is no stranger to Trus Joist. When architect John Reed called on us to supply a system for the Geology/Engineering Bldg. for Ranchers Exploration and Development Corp. Les Baker was pleased. Upon completion of the Trus Joist installation he told us:

"... we found the use of TJI units as efficient and economical as ever. As one of the first users of Trus Joist units in this area, we have been, and will continue to be one of their boosters."

If you want to see how easy and economical joist application can be, see us soon. We've got exactly what you're looking for.

1976 NEW MEXICO ARTS COMMISSION AWARDS

For Excellence in the field of Historic Preservation.

The Kit Carson Memorial Foundation

"for its continuing program to preserve the cultural patrimony of Northern New Mexico"

The Foundation was organized in 1949 in Taos, New Mexico. It has grown in stature and scope. In 1952 the Foundation assumed responsibility for the restoration and maintenance of the Kit Carson Home, which was designated a National Historic Landmark in 1963. By 1976, the Foundation had expanded its purposes, goals and collections. In addition to the constantly expanding Historical Research Library and Archives, three additional properties have been acquired: the Blumenschein House, the Fernando Maxwell House and the Hacienda de Don Antonio Severino Martinez, which is currently undergoing an extensive restoration.

But this is only the beginning for this energetic foundation.

The Kit Carson House was built in 1825 by Carson as a wedding gift for his Spanish bride, Joseta Jaramillo. This was their permanent home for the next 25 years; it was their lifetime together as both died in 1868.

La Hacienda de Don Antonio Severino Martinez. This placita house is the best surviving example of a Spanish hacienda in the Taos area. In 1824 Don Antonio purchased the site and a three room house which he expanded to the present thirteen room house surrounding a 51 x 65 foot patio.

The March/April issue of NMA will publish the 1977 awards program rules for submission of entries in the two fields for which awards are annually presented. We hope that our readers will submit candidates for these two awards.
YOU DIDN'T PLAN ON AN ENERGY CRISIS, BUT NOW YOU'RE PLANNING YOUR NEXT BUILDING.

Which building material will you use?

You've got energy shortages to think about. Air-conditioning costs. Heat gain through the long, hot summers. Heat loss in the winter months. Heating equipment costs. The whole set of energy-use factors suddenly has become critically important. The building material you use affects all of them.

Compare the energy conserving capability of masonry, for instance, with double-plate glass walls.

At 4:00 P.M. on a hot August day in Washington, D.C., the heat gain through a square foot of west-facing insulated brick and concrete block wall will be 2.2 Btus an hour.

The heat gain through a double-plate glass wall in the same location will be 173 Btus a square foot in an hour. A big difference.

Project this differential over 10,000 square feet of wall. You come up with a heat gain through masonry of 22,000 Btuh, while the heat gain through double-plate glass is 1,730,000 Btuh.

In the case of the masonry wall, cooling equipment with a two-ton capacity can handle the heat gain. But with the double-plate glass wall, about 143 tons of cooling capacity will be needed.

An analysis of a typical 10-story building shows that over its useful life, the air-conditioning cost for a square foot of our masonry wall will be about 23 cents. For the double-plate glass wall, it will be $7.60.

It takes a lot of money to buy, install and create space for all the extra air-conditioning equipment required by the double-plate glass wall. A lot of money and a lot of energy to run that equipment.

Compare the heat loss in winter. It has a dramatic effect on energy consumption and building operation costs.

Our masonry wall, for example, has a "U-value" of .12. The double-plate glass wall has a "U-value" of .55. (U-values are used to determine heat loss through one square foot of wall area in Btuh per degree Fahrenheit differential across the wall.)

This means that the masonry wall is about 450% more efficient, on the average, than the glass wall in reducing heat loss.

Over the useful life of the building, the heating cost per square foot of wall area for masonry will be about 30 cents. For double-plate glass, about $1.38.

In a time of one energy crisis after another, masonry makes eminently good sense as a good citizen.

The masonry industry believes that the thermal insulating qualities of masonry are an important economic consideration to building designers, owners and investors, and all citizens.

Masonry walls save on air-conditioning and heating costs. And just as important, they are less expensive to build. The masonry wall we've described would have a 38% lower initial cost than the double-plate glass wall.

If you'd like to find out more, write to us and we'll send you a booklet comparing the thermal insulating qualities of masonry walls with double-plate glass walls, metal panel walls and pre-cast concrete walls.

International Masonry Institute
823 15th Street, N.W., Washington, D.C. 20005

MASSON CONTRACTORS ASSOCIATION of NEW MEXICO
The International Space Hall of Fame
Alamogordo
New Mexico

Charles E. Nolan, Jr., AIA
Architect

David Sollenberger
Photographer

The 1976 recipient of the New Mexico Arts Commission Award in the Field of New Construction.
1976 NEW MEXICO ARTS COMMISSION AWARD

For Excellence in the field of New Construction.
Mr. Dwight A. Ohlinger, former mayor of Alamogordo and owner of an insurance and realty firm, conceived the idea of a Space Hall of Fame while watching a commercial for the Football Hall of Fame on July 25, 1973. He contacted several community leaders who agreed to back the promotion and establishment of the project. Requests were sent to U. S. Senators Joseph M. Montoya and Pete Domenici to stake the claim of Alamogordo to this project by reading it into the Congressional Record, which they did. A request was made to Dr. Charles Stark Drapper, president of the International Academy of Astronautics, for an endorsement by his organization. He gave his personal endorsement, and later received the endorsement of his organization and their agreement to nominate the candidates to be honored in the Hall of Fame. Bruce King, then governor of New Mexico, issued a proclamation designating Alamogordo as the site of the International Space Hall of Fame. The Alamogordo Motel Owners Association voted unanimously to petition the Alamogordo City Council to turn over $20,000 per year of the lodgers tax to fund promotion and advancement of the project, which the city council did.

An ad hoc committee was formed to carry out the development of the project. They approached Charles E. Nolan, Jr., A.I.A., local architect, for assistance in developing preliminary concepts, cost estimates, and preparation of a promotional brochure to use in raising funds. The committee also made initial contacts with various land owners for availability of land for the project.

The project was presented to the New Mexico Legislature in January, 1974, with the recommendation of Bruce King, governor, for preliminary funding of $1.8 million. After presentations by the architects and community leaders to House and Senate committees, the legislation was unanimously pass-
ing. Mr. Tatsch has established a good reputation as a quality contractor in the southern New Mexico area.

The Program

As there are few Space Halls of Fame around for development of program information and background, the architects were faced with the requirement of totally researching the concept and preparing a program which would have to remain flexible to allow for future space achievements, which would have impact on those being honored and on the display and housing of space artifacts.

A visit was made by Charles Nolan and Kent Roberts, member of the ad hoc committee, to Huntsville, Alabama, to view and examine the Alabama Space Museum and NASA Visitor Center. This excellent museum pioneered several methods and variations for display of space items. One major concept was the use of dynamic and static displays. Visitors liked the dynamic displays which allowed them to operate small experiments and games which demonstrated space and physics principles. It was decided at this time to separate exhibits of this type from the Hall of Fame honorees in order to retain the honor and dignity of those being enshrined. Also, it would allow the exhibits to be developed with greater variety for maximum visitor interest.

A prime requirement of the ad hoc committee at this time was for the project to be financially self-sustaining if possible, like the Alabama Museum.

NASA and the Smithsonian Institute, as the repository of space artifacts, has a wealth of movie film taken in space and it was decided to include an auditorium which could be divided into four small theaters for continuous showing of a variety of space films.

A planetarium was requested to be included by the Space Hall of Fame Commission, in order to provide educational opportunities for learning more of space accomplishments in relation to all of our solar system and near space.
As the selection of artifacts for display would be made in the future and as the artifact displays would be ever changing with future space achievements, flexibility became the major design concept requirement. All spaces in the main exhibit building were to be able to accommodate a variety of sizes and types of items. An interplay of static and dynamic displays would be required for maximum interest and to subdivide the larger spaces into smaller spaces with better relation to human size viewers.

The major thrust of the exhibits within the facility is on man, his theories and discoveries which led to space exploration, and his
achievements in space. With man the major focus, the goal will be for spaces and exhibits which relate to the viewers of these displays in this facility.

The Design

The first problem of such a project was to select a site that would provide access to visitors and be of some prominence. The city of Alamogordo is located at the base of the west side of the Sacramento Mountains in south central New Mexico. The mountains rise about 5,000 feet above the valley floor and provide a dramatic backdrop for the city. The decision was made to locate as high on the foothills as possible. A site was selected above the Alamogordo branch of New Mexico State University, northeast of the city and higher than any other building in the city. This site is on a planned major arterial which will allow adequate traffic access. It also poses a few problems. The foothills are full of arroyos which carry the heavy mountain rainfall in the summertime, but otherwise remain dry most of the year. There were no city utility services at the site. This meant negotiating with the city for extension of these services. Also the site has a slope of from 5% to 10% which is covered with sagebrush and low desert brush growth. The site was also discovered to be the home of a sizeable colony of rattlesnakes when construction began.

A major consideration in designing the visitor traffic flow through the Hall of Fame cube was the high altitude of Alamogordo. At 4,300 feet elevation, visitors coming from locations lower in elevation suffer from a lack of oxygen when climbing stairs or walking long distances. It was determined that the flow of traffic through the project would be from the top floor down and would have to be by ramps as the budget was too limited to permit the inclusion of escalators. The ramps are located on the diagonal of the cube and along two faces of the cube leaving two other faces free for exhibits. The triangular halves of floors created by the ramps on the diagonal were offset vertically to aid in reducing the length of ramp required from each floor to the next. Also, this provided for elevated viewing of certain artifacts of a dramatic nature.

The design was approached from the idea of creating a visual attraction that would contrast with the mountain backdrop. There is little in space that does not create a contrast when man enters that environment, thus there was a basis for this project to be a contrast with its surroundings.

Early in discussions, the concept of using a sphere for the Hall of Fame was considered but discarded for reasons of technical difficulties. The concept then changed to the possibility of using a cube which could have a gold glass exterior as being a suitable form for the Hall of Fame. In the original design the cube was placed on one point to create an impression of space, both interior and exterior. Discussions with glass and curtain wall manufacturers revealed this bordered on technology pioneering as there would be sloped surfaces on all cube faces with the bottom sloped surfaces being critical as to retention of glass for safety purposes. The upper surfaces also became airfoils with strong lifting forces due to the southwest winds which prevail in the valley. The extreme cost of developing adequate curtain fall members and insistence of the glass manufacturers on wire screens to restrain the under slope glass led to the decision to place the cube in a conventional vertical/horizontal position for exhibit and ancillary buildings, a forty foot module was established as an economical spacing for prestressed concrete members, and
the design developed on this forty foot module. Also, this space provides the necessary large interior volumes for display of the various sizes and types of space artifacts. This module would allow the design to be stepped down the ground slope to provide additional vertical space for large artifacts.

Footing excavation presented the initial construction problem which the contractor had anticipated. Although soil boring tests in seven locations on the site indicated mostly alluvial fill and gravel, excavations for drilled casion footings encountered very large rock formations too large for economical removal. Frank Tatsch had suspected this and was ready to assist in the change. John Fulgenzi, structural engineer consultant from Amarillo, was called to re-design the footings for the encountered conditions. The footings were redesigned using large spread footings.

Interior colors were kept toward earth tones in order to provide contrast with the bright colors used on the exhibits. C. N. Jr.
You save with new Spectra-Glaze II glazed block walls

**CONSTRUCTION** — Build and finish in one operation... walls go up faster — one trade, large units lay up fast... thru-wall load bearing units eliminate expense of back up wall.

**MAINTENANCE** — No refurbishing ever, permanent, sanitary, factory finish — cannot peel or blister... easy to clean and keep clean.

**ENERGY** — Excellent U-factors with lightweight block and insulating granular fill.

**INSURANCE** — Maximum security and protection at lowest cost, with fire-rated walls.

**GOVT REQUIREMENTS** — Meet USDA and OSHA specifications for health, sanitation and safety.

Steelcase Movable Walls

A wall that's only a wall is an obstacle. But a Steelcase Movable Wall System can form an office today or a conference room tomorrow or two or three work-stations the day after. In other words, it gives you unlimited flexibility in planning your office interiors. And that's a boon to any business.

PROVEN CEMENTITIOUS COATINGS

- MODIFIED COATINGS
- CONVENTIONAL STUCCO
- MASONRY PAINTS

MANUFACTURED IN ALBUQUERQUE, N.M.

SUPER-FLEX I, an acrylic base modified cementitious coating that may be trowel applied and textured as with stucco.

SUPER-FLEX II, a superior thin coat finish developed as a spray material for a flexible finish for masonry, metal, and other non-porous surfaces. Ideal for coating asbestos board, foam board, woodrock and as a bed coat for marble crete.

BRAVO MASONRY PAINT, a waterproof filler and color coat for concrete block, slump block, precast concrete or any masonry cement substrate. Just add water - six standard plus custom colors.
