DURING a debate on the World Economic Conference, Mr. Boothby, a Unionist member, said that the cause of the world economic crisis was the fall in wholesale prices, and the remedy for that was to raise those prices by increasing expenditure, and particularly loan expenditure. He believed that if the Government would take their courage in their hands, the factor that would be most responsible for hauling this country out of the present depression would be expenditure in capital development on housing construction in the next three or four years. In Europe they were far ahead of us in slum clearance and in housing schemes. In Vienna, in Hamburg, in almost any German city, they would find better working conditions, so far as housing was concerned, than could be shown in any big industrial centre in this country. The irony of the business was that a large part of the money which went to create these new housing schemes came from the City of London. It would have been much better had that money been spent in this country, and the City of London would not have regretted it, because they would have had a safer and surer return on their money if they had lent it in this country.

Use of British Materials

Mr. Robinson asked the Minister of Health whether he was satisfied that local authorities were loyally observing the condition as to the use of British materials laid down in Circular 1060 of December, 1929.

Sir Hilton Young said he had no reason to think that local authorities were not generally acting in accordance with this Circular or that any further Circular was called for. Where a local authority applied for his sanction to a loan and he became aware that they proposed to use foreign materials, he satisfied himself as to the circumstances and conditions of the proposal before the loan was sanctioned. Consent to alterations in a specification had been given in a few cases where a Government grant had been sanctioned and good cause was shown for the use of foreign materials in place of British.

THE BUILDINGS ILLUSTRATED

Following are the names of the specialists, general contractors and some of the sub-contractors for the buildings illustrated in this issue :

St. Helen's Court (for the Anglo-Saxon and Asiatic Petroleum Company), 4-12 Great St. Helens, E.C. (pages 393-395 and Supplement). General contractors, Higgs and Hill, Ltd. Consulting engineer, B. L. Hurst. Quantity surveyor, J. Sprague. Sub-contractors : Greenham Demolition Co., demolition ; Highways Construction, Ltd. (incorporating French Asphalte Co.), asphalt ; London Brick Co. and Forders, Ltd., Fletton bricks ; J. W. Gray and Sons, Ltd., lightning conductors ; Express Lift Co., Ltd., lifts ; Doulton & Co., Ltd., glazed ware ; Rchd. Crittall & Co., Ltd., heating and kitchen equipment ; F. H. Wheeler, electrical work ; Plumbing Guild, Ltd., plumbing ; Henry Hope and Sons, Ltd., windows ; Crittall Mfg. Co., Ltd., windows; South Western Stone Co.. Ltd., Art Pavements and Decorations, Ltd., and Fenning & Co., Ltd., Portland stone ; J. A. King & Co., pavement lights ; Kleine Co., Ltd., flooring ; W. N. Froy and Sons, Ltd., sanitary fittings ; Plastering, Ltd., plaster and grano ; Carter & Co , tiling ; Ragusa Asphalte Co., Ltd., asphalt ; Nicholls and Clarke, Ltd., glazing ; Rippers, Ltd., doors and frames ; Carron Co., Ltd., balustrading ; Marbolith Flooring Co., Ltd., composition flooring ; Wilmer and Sons, Ltd., iron staircase ; Roneo, Ltd., doors ; Braby & Co., Ltd., steel stairs ; Nettlefold and Sons, Ltd., ironmongery ; Parker, Winder and Achurch, Ltd., indicating bolts ; Shaws Glazed Brick Co., Ltd., faience ; J. Starkie Gardner, Ltd., area railings ; J. M. Pirie (London), Ltd., metal grilles ; Mather and Platt, Ltd., sprinkler system ; Carter and Aynsley, Ltd., door furniture ; Inlaid Ruboleum Tile Co., linoleum ; Paint and Cellulose Spraying Co., Ltd., spray painting.

Pilgrim House : First portion of the L.C.C. Tabard Garden Estate (pages 396–397). General contractors, J. E. Billings & Co., Ltd., and Gee, Walker and Slater, Ltd. Sub-contractors : William Smith and Evans, roof tiling ; London Asphalte Co., Ltd., and Ragusa Asphalte Paving Co., asphalt ; Girlings Ferro-Concrete Co., artificial stone ; A. Higginbotham and Sons, plumbing, painting and glazing ; S. W. Farmer and Son, Ltd., wrought iron work ; Dorman Long & Co., Ltd., steelwork ; W. J. Wheeler and Son, plastering ; The Cement Marketing Co., and The Auclaye Brickworks, facing bricks ; The Cement Marketing Co., cement ; The London Brick Co. and Forders, Ltd., flettons.

Animal House at Farm Laboratories, Mill Hill (pages 404-405). General contractors, E. H. Burgess, Ltd. Sub-contractors : Thomas Lawrence and Sons, external bricks ; Grovebury Sandlime Brick Co., Ltd., internal bricks ; British Reinforced Concrete Co., Ltd., reinforced concrete ; J. Jeffreys & Co., Ltd., heating and ventilation ; Tyler and Freeman, Ltd., electric lighting, etc. ; Henry Hope and Sons, Ltd., metal windows ; W. T. Allen & Co., Ltd., metal shelving and pens ; A. C. Golden, asphalt floors ; Lawford Asphalte Co., Ltd., asphalt basement tanking and flat roof ; Adrian Stokes & Co., ironmongery ; F. Braby & Co., Ltd., steamer and channel gratings ; Roberts, Adlard & Co., Ltd., pantiling ; Shanks & Co., Ltd., sanitary fittings ; Merryweather and Sons, Ltd., fire equipment ; Mander Brothers, Ltd., paint ; John Line and Sons, Ltd., distemper ; J. W. Gray and Sons, Ltd., lightning conductors.

House at West Byfleet (page 407). General contractors, Cummins, Ltd.

Other Trade Items

" Spend Wisely for Employment " is the keynote of a leaflet just issued by Messrs. W. H. Gaze and Sons, Ltd. The firm state that to relieve unemployment among skilled men they are offering special rates for any decorations, alterations or repairs put in hand before April 30. Further, they are prepared to defer the account for such work until the end of July. " Prices of materials are," it is stated, " particularly favourable at the moment. Thus by having that job done now you will assist employment and, at the same time, reap the benefit of lower cost."

*

Messrs. Dorman Long & Co., Ltd., request us to state that Mr. Edwin (Eddie) Davies, formerly employed by them in their London offices and previously by Messrs. Bolckow Vaughan & Co., Ltd., is in no way connected with the recent case of alleged forgery at Middlesbrough, in which another employee of the same surname was concerned.

We regret that in the particulars of Messrs. Beale's premises, Bournemouth, illustrated in our issue for March 8, we inadvertently omitted the fact that Mr. H. E. Hawker, of Bournemouth, was the architect for the South block, which was the result of a competition in 1910. Messrs. Hawker, Mountain and Bailey were the architects for the portion added on the West side in 1927. Messrs. Hawker, Mountain and Bailey, and Messrs. North Robin and Wilsdon were associated architects for the additional story over the South block and rebuilding of the North block in 1930.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

Plans passed at FRIERN BARNET: Nine houses, Friars Avenue, for Messrs. H. Ginn and Sons; lay-out of road and sewers, off Friern Park, for Mr. A. J. Spencer; six houses, Queens Avenue, for Mr. C. Haward; 31 houses, Bawtry Road, for Bateman Building Co.

The HAMMERSMITH B.C. has approved revised plans for closing and filling in the Creek at a cost of £13,232.

Plans passed by the LEWISHAM B.C.: Houses, corner of Duncombe Hill and Brockley View, for Messrs. Dunsmore Bros.; 43 houses, Butterfield Street, for New Ideal Homesteads, Ltd.; six houses, Como Road, for Messrs. Montague Holmes and Sons; 228 houses (drainage), Woodstock Road, for Mr. A. J. Butcher; premises, Downham Way, for Messrs. Seth-Smith and Monro.

Plans passed by the POPLAR B.C.: L.C.C. flats, West Ferry Road, for Messrs. Gee, Walker and Slater, Ltd.; L.C.C. flats, High Street, for Messrs. Rowley Bros., Ltd.; warehouse, East Ferry Road, for Mr. H. A. Bower; additions, 37, High Street, for Mr. W. J. Foster.

Plans passed at SANDERSTEAD: Four houses, Addington Road, for Mr. R. V. Tutte; two houses, Old Farleigh Road, for Mr. J. A. Lovell; two houses, Purley Downs Road, for Mr. P. Richardson; two houses, Court Hill, for Messrs. Thomas and Son.

Plans passed by the TOTTENHAM U.D.C.: Factory extension, Union Row, for Messrs. Woolf Bros.; alterations, factory, Vale Road, for Messrs. R. Rosenblatt and Son; bungalow, Commonwealth Road, for Mr. E. W. Allen; reconstruction "Salon Bal," Green Lanes, for Market Estates, Ltd.; three houses, Chandos Road, for Messrs. W. J. Stapleton and Son; alterations, "Plough" public-house, High Road, for Messrs. Truman, Hanbury, Buxton & Co., Ltd.; four houses, Leadale Road, for Messrs. A. and S. Faux; alterations, 165 High Road, for Mr. W. Phelps; factory extensions, Tavistock Road, for Power Flexible Tubing Co., Ltd.; amended scheme, Harringay Market, Green Lanes, for Stephens Amusements, Ltd.; revised plans, 42 houses, Oakdale Road, for Messrs. Walters and Blake, Ltd.; revised scheme, five houses, Northdene Gardens, for Messrs. A. and S. Faux; revised plans, seven houses, Commonwealth Road, for Messrs. C. J. Pilgrim and Sons.

Plans passed by the WESTMINSTER City Council: Frontage line, shops and flats, Marsham Street and Vincent Street, for Mr. G. H. Goldsmith; amended plans for buildings, site of 51-5 Strand, for Messrs. Val Myer and Watson Hart; frontage lines, 10-21 Grosvenor Square, for Mr. G. A. Codd; garages with flats above, Montpelier Terrace, for Messrs. T. P. Bennett and Son; flats, Curzon Street (site of Curzon House), for Mr. J. R. Mactaggart.

SOUTHERN COUNTIES

The BOURNEMOUTH Corporation has received sanction to borrow £13,525 for cliff protection works at Southbourne.

The BRIGHTON Education Committee has approved plans for the erection of extensions at the Whitehawk school, at a cost of £14,550.

Plans passed by the GRAVESEND Corporation: Two houses, Coombe Road, for Messrs. Barton and Burles; two houses, Singlewell Road, for Mr. T. Bennett; six houses, Milton Hall estate, for Mr. S. Bridger; two bungalows, Portland Avenue, for Gravesend Co-operative Society, Ltd.

Plans passed at HERNE BAY: Two houses, Albany Drive, for Messrs. J. Howell and Son; two bungalows, Mayfield Road, for Herne Bay Estates, Ltd.; four houses, Cobblers Bridge Road, and three houses, Greehill Bridge Road, for Messrs. Goodwin and Russell, Ltd.; two houses, Bognor Drive, for Mr. H. E. Puttock; four houses, Westcliff Gardens, for Mr. T. S. Pettman.

The SWANSCOMBE U.D.C. has obtained sanction from the Ministry of Health for the erection of 60 houses.

The WALLINGFORD R.D.C. reports that details have been submitted to it for the development of land at Didcot involving the construction of three new streets.

EASTERN COUNTIES

Plans passed by the CHELMSFORD Corporation: Nine houses, Crompton Street, for Mr. S. W. Stedman; office extensions, Broomfield Road, for Messrs. Christy Bros. and Co., Ltd.; six houses, Swiss Avenue, for Messrs. White and Howard; Catholic school, London Road, for Rev. M. J. Wilson.

The Herts C.C. has approved plans for the enlargement of the HILL END Mental Hospital, so as to provide for 287 extra beds at an estimated cost of £142,500.

The IPSWICH Education Committee proposes to proceed with the erection of the first portion of the new School of Arts and Crafts, at a cost of £11,000.

The Herts Education Committee has approved plans for the erection of a school for 434 children at Parkway, WELWYN GARDEN CITY, at a cost of £12,858.

MIDLAND COUNTIES

Plans passed by the KIDDERMINSTER Corporation: Four houses off Somerleyton Avenue, for Messrs. Towers, Wilson & Co.; alterations, 22, Vicar Street, for Messrs. W. H. Smith and Sons; 13 houses, Highfield Road and Chester Road, for Mr. W. Lindley; two houses, Russell Road, for Mrs. Joseland; four houses, Puxton Lane, for Mrs. R. Hill; two houses, Hurcott Lane, for Messrs. Humphries and Bowdler; alterations and additions, Stour Vale Ironworks, for Messrs. Baldwins, Ltd.

The SMETHWICK Corporation proposes to proceed with the erection of 216 houses on the Warley estate, at a cost of £64,354.

NORTHERN COUNTIES

The BIRKENHEAD Corporation has approved revised plans for the provision of chapels, and a crematorium, at Landican cemetery, at a cost of £20,675.

Plans passed by the BOLTON Corporation: Extensions, weaving shed, Holly Mill, for Messrs. Hill, Davison & Co., Ltd.; two houses off Seymour Road, for Mr. W. E. Yates; laundry, Chorley New Road, for Bolton Nursing Home, Ltd.; works extensions, Windley Street, for Messrs. R. E. Roberts and Son, Ltd.; six houses, Bradford Road, for Mr. R. J. Tyson; four houses, Kingwood Avenue, for Mr. A. S. Woods; four houses, off Green Lane, for Messrs. E. and S. Street, Ltd.; four houses, Old Kiln Lane, for Messrs. Samuel Main & Co.; extensions, Deane Road, for Messrs. E. H. Steele, Ltd.; 30 houses, Devonshire Road estate, for Messrs. A. T. Reynolds & Co.; two houses, Salford Road, for Mr. Maurice Welch; 19 houses, Belmont Road and Thorncliffe Road, for Messrs. F. and H. Douglas.

Plans passed at HYDE: Eight houses, Apethorn Lane, for Mr. H. L. Farrer; lay-out of land, adjoining Apethorn Fold, and the Railway, for Mr. H. L. Farrer; additions, Kingston Mill Yard, for Mr. Ashurst.

Plans passed by the MORECAMBE Corporation: 26 bungalows, Oxcliffe Grove, for Messrs. D. Hunt and Son; shop and petrol station, Lancaster Road, for Mr. J. E. Shaw; four houses, Brook Road, for Messrs. Brook and Kershaw; two houses, Fairfield Road, for Messrs. Swithenbank and Badell; two houses, Brantwood Avenue, for Mr. J. F. Shuttleworth.

The SHEFFIELD Corporation Estates Committee has approved a lay-out plan for the Wybourn Estate extension providing for the erection of 694 houses.

Plans passed by the TYNEMOUTH Corporation: Two houses, Billy Mill Lane, for Mr. J. S. Hurrell; 15 houses, Balkwell Lane, for Mr. W. K. Waite; 11 houses, Balkwell Lane, for Mr. J. F. Charlton; shop and house, Lynn Road, for Mr. W. Moore; 24 houses, Pineapple estate, for Messrs. H. D. Burton, Ltd.; six houses, Mast Lane estate, for Mr. A. E. Brannen; 10 houses, Mast Lane estate, for Mr. J. R. Wallace; alterations, 43-4, Nile Street, for Messrs. Fleming & Co.; 24 tenements, Howden Road, for Mr. A. K. Tasker, on behalf of Square Building Trust; conversion of premises to boxing saloon, Albion Road, for Mr. C. Brannen; 14 houses, Broadway estate, for Messrs. Beautyman and Gray; lay-out of Tynemouth Park estate, for Mr. J. R. Wallace.

The WALLSEND Corporation is seeking permission to complete the development of the Bewicke estate by the erection of a further 96 houses.

Plans passed by the WAKEFIELD Corporation: Alterations and additions, Primrose Tavern, Monk Street, for Messrs. J. Tetley and Son, Ltd.; shop, Stanley Street, shop, Back Mount Pleasant, and house, Balne Lane, for Mr. W. H. Ogden; two houses, Cambridge Street, for Mr. G. Lewes.

FIGURE 1.

FIGURE 2.

Many houses have very ugly "bays" stuck on, and the roof of the bay is continued to form a shelter over the front door, with the result illustrated in Figure 1. There is a complete lack of balance in this. A suggestion that would cost no more and would provide extra room to the first-floor bedroom is given in Figure 2. The only loss is the protection by the roof outside the front door, and this is surely compensated for by the added attractiveness of the house, and the additional floor space in the bedroom. —G. Langley Taylor in THE PENN COUNTRY OF BUCKINGHAM, *reviewed on page 402.*

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

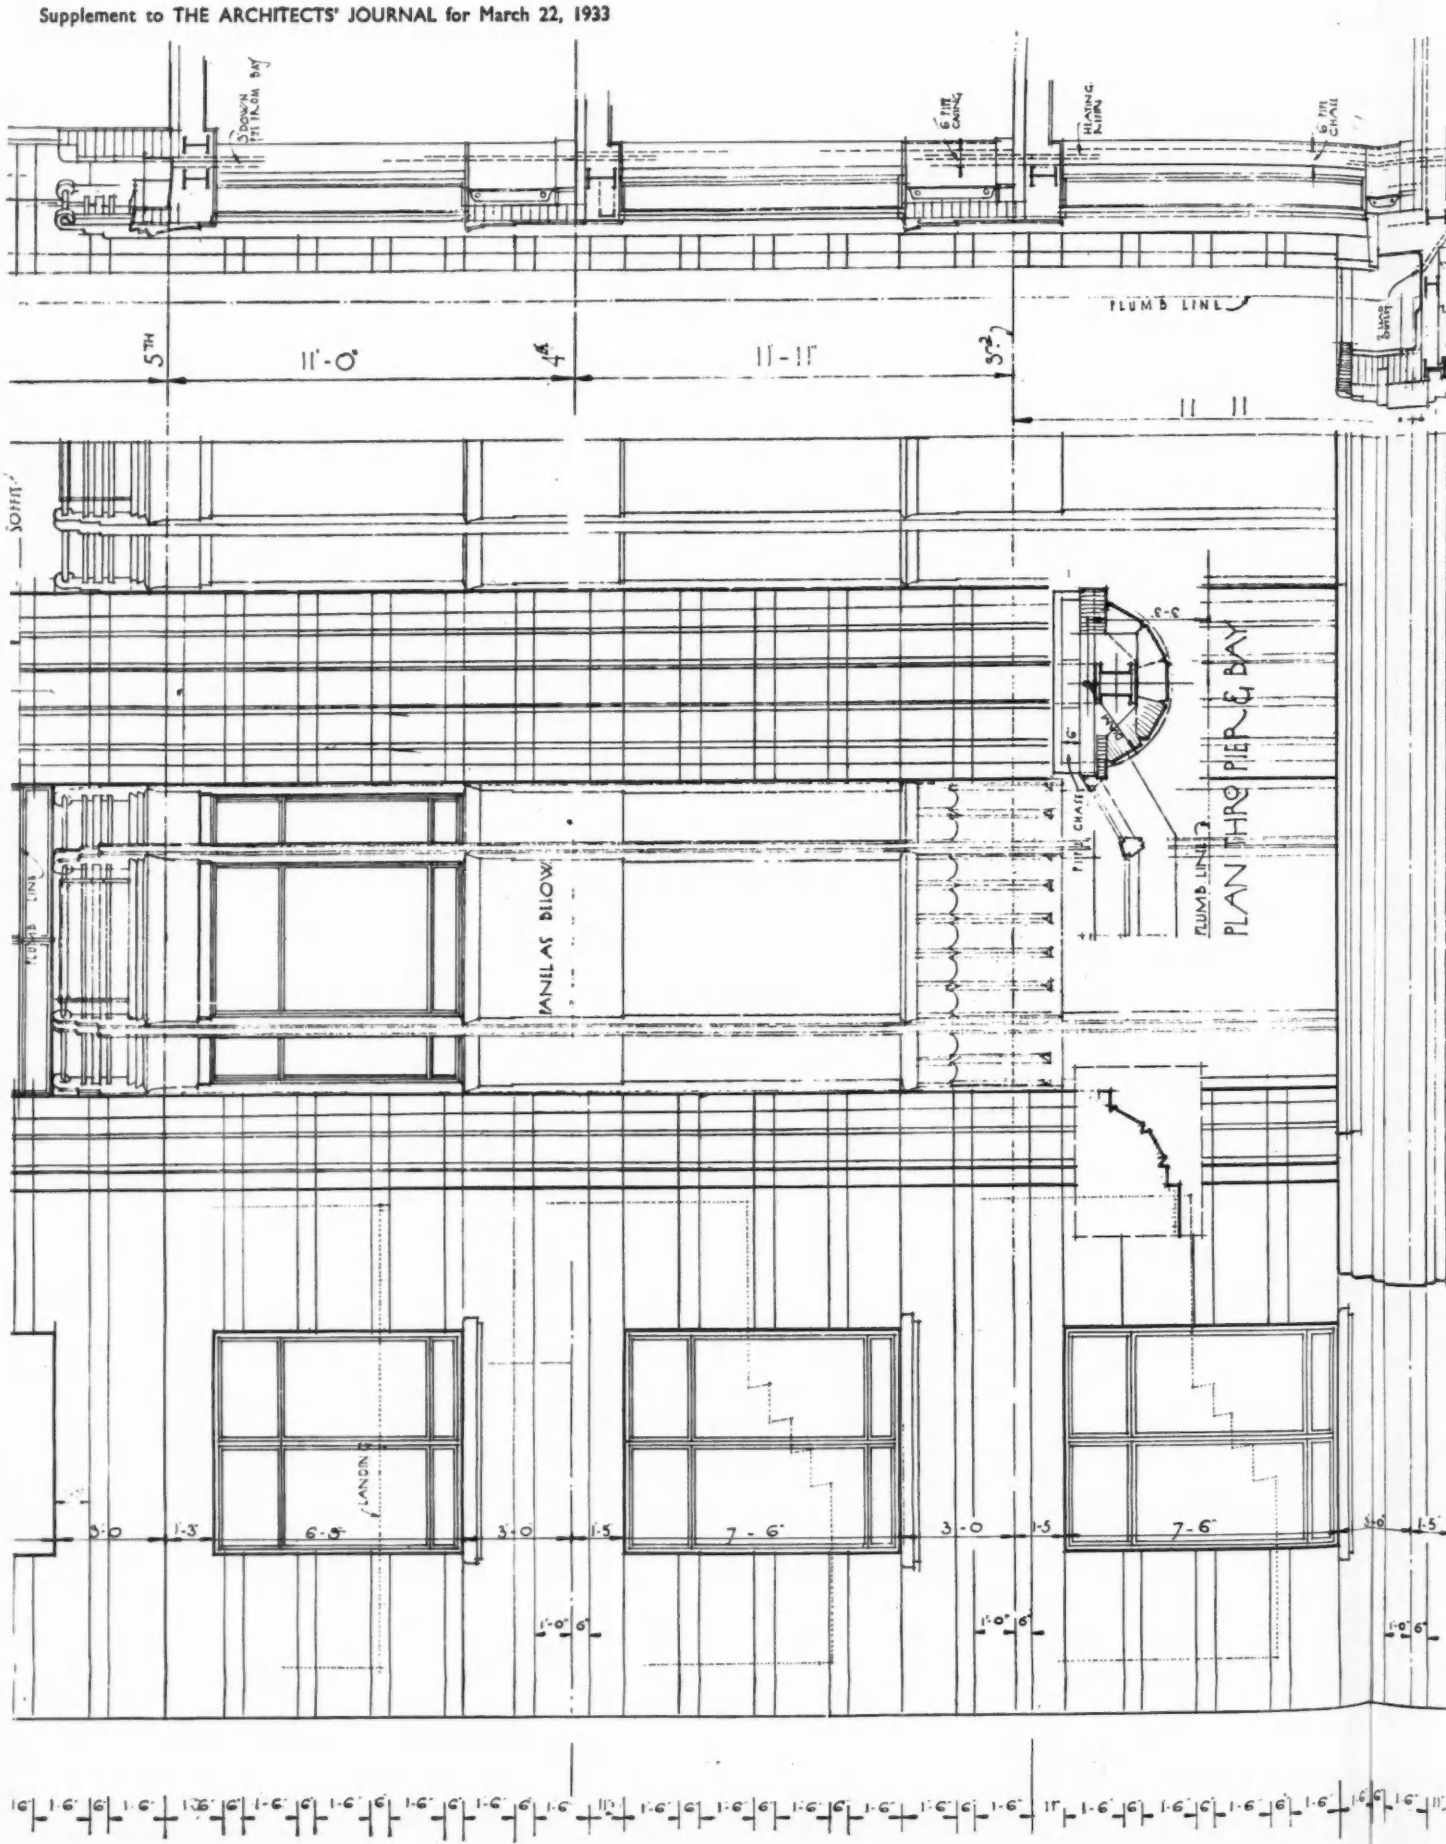
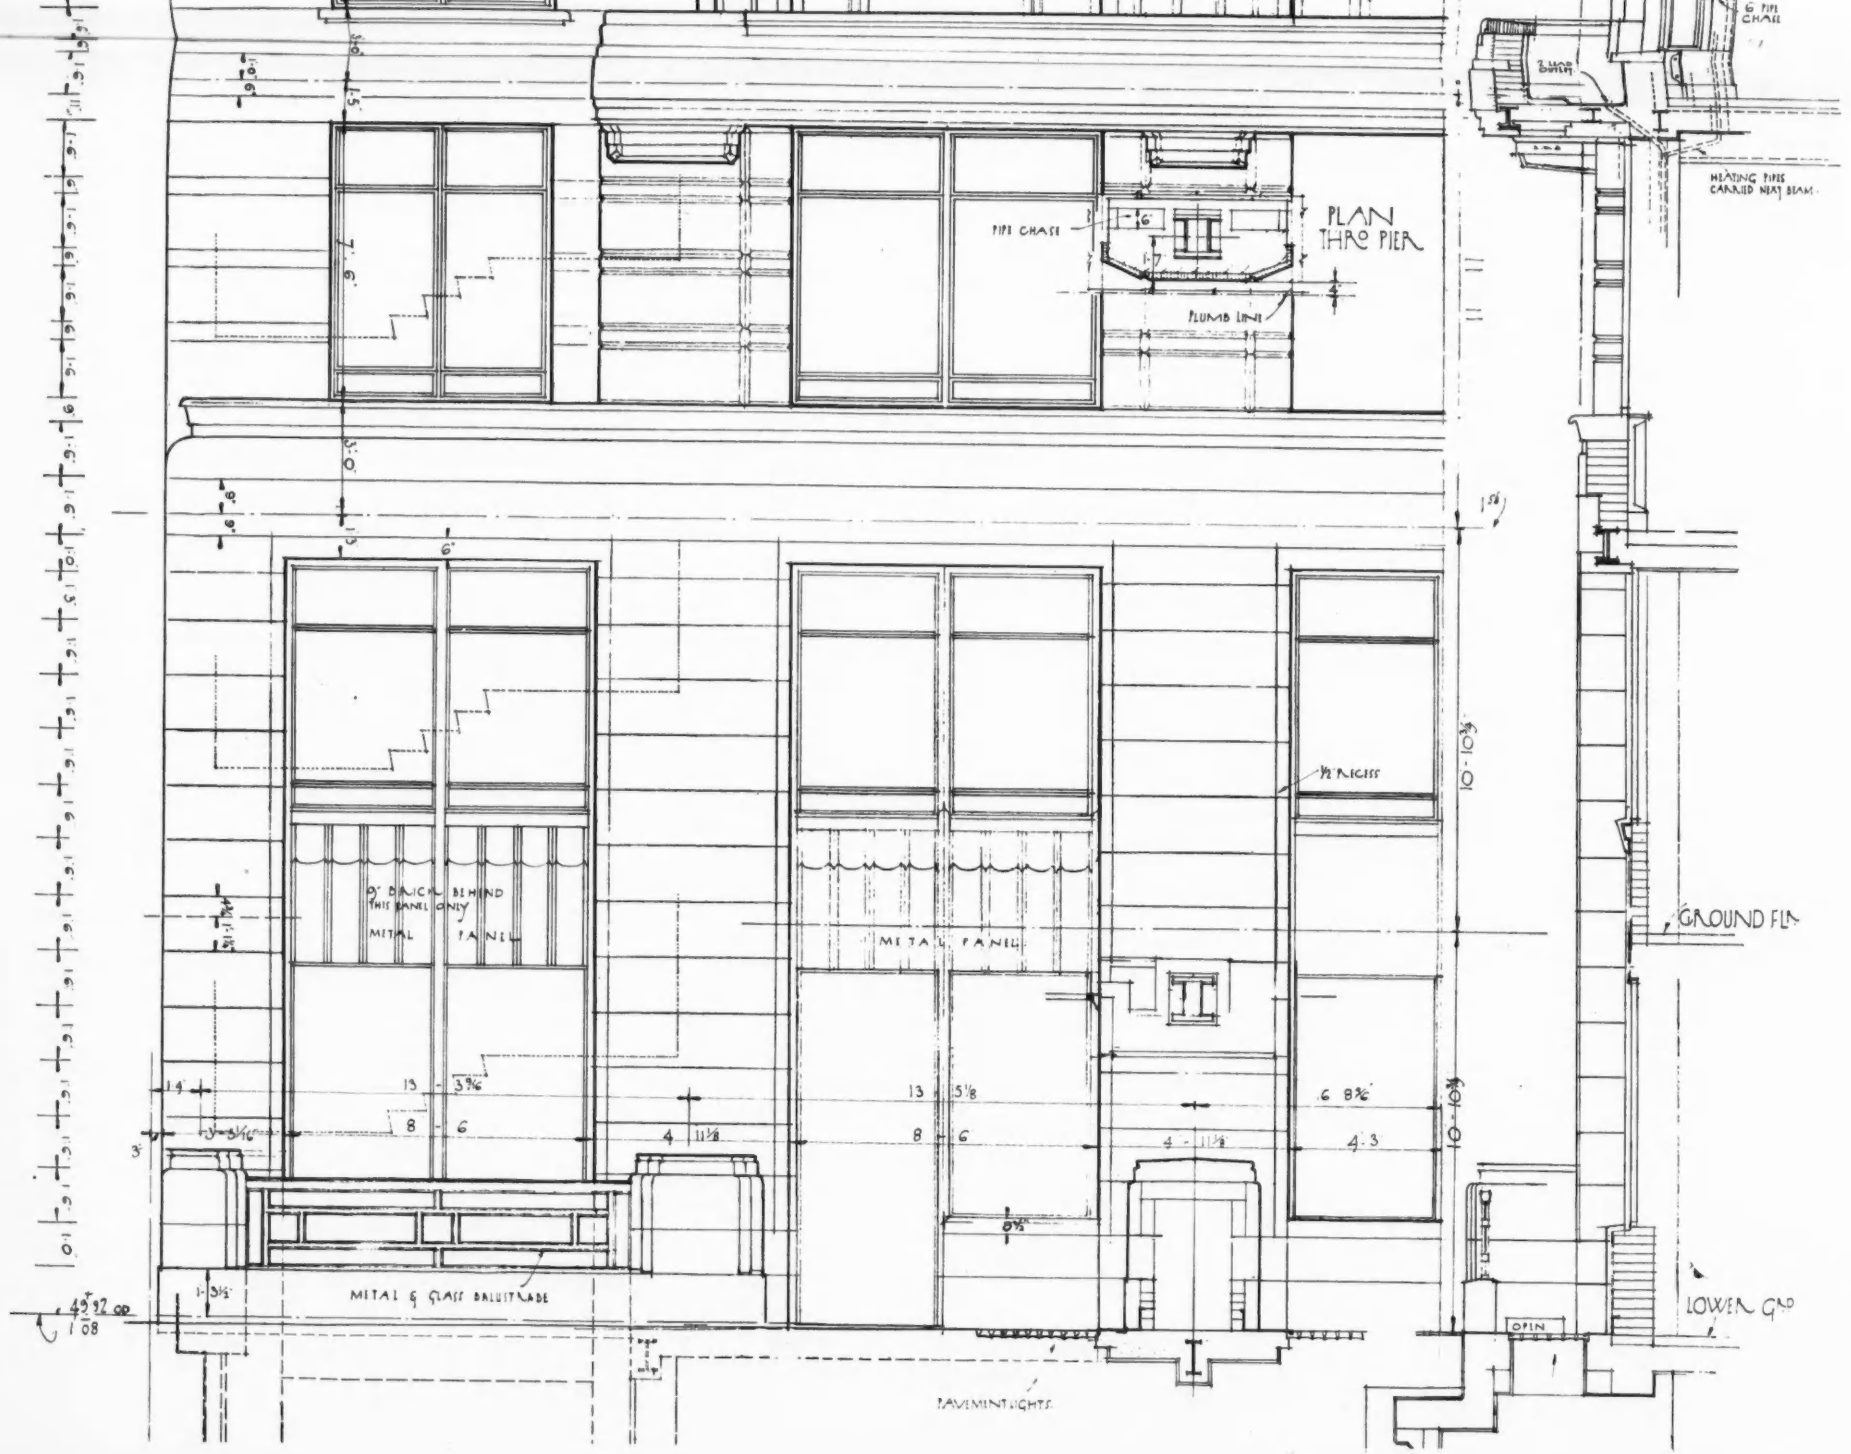
ST. HELEN'S COURT, E.C.

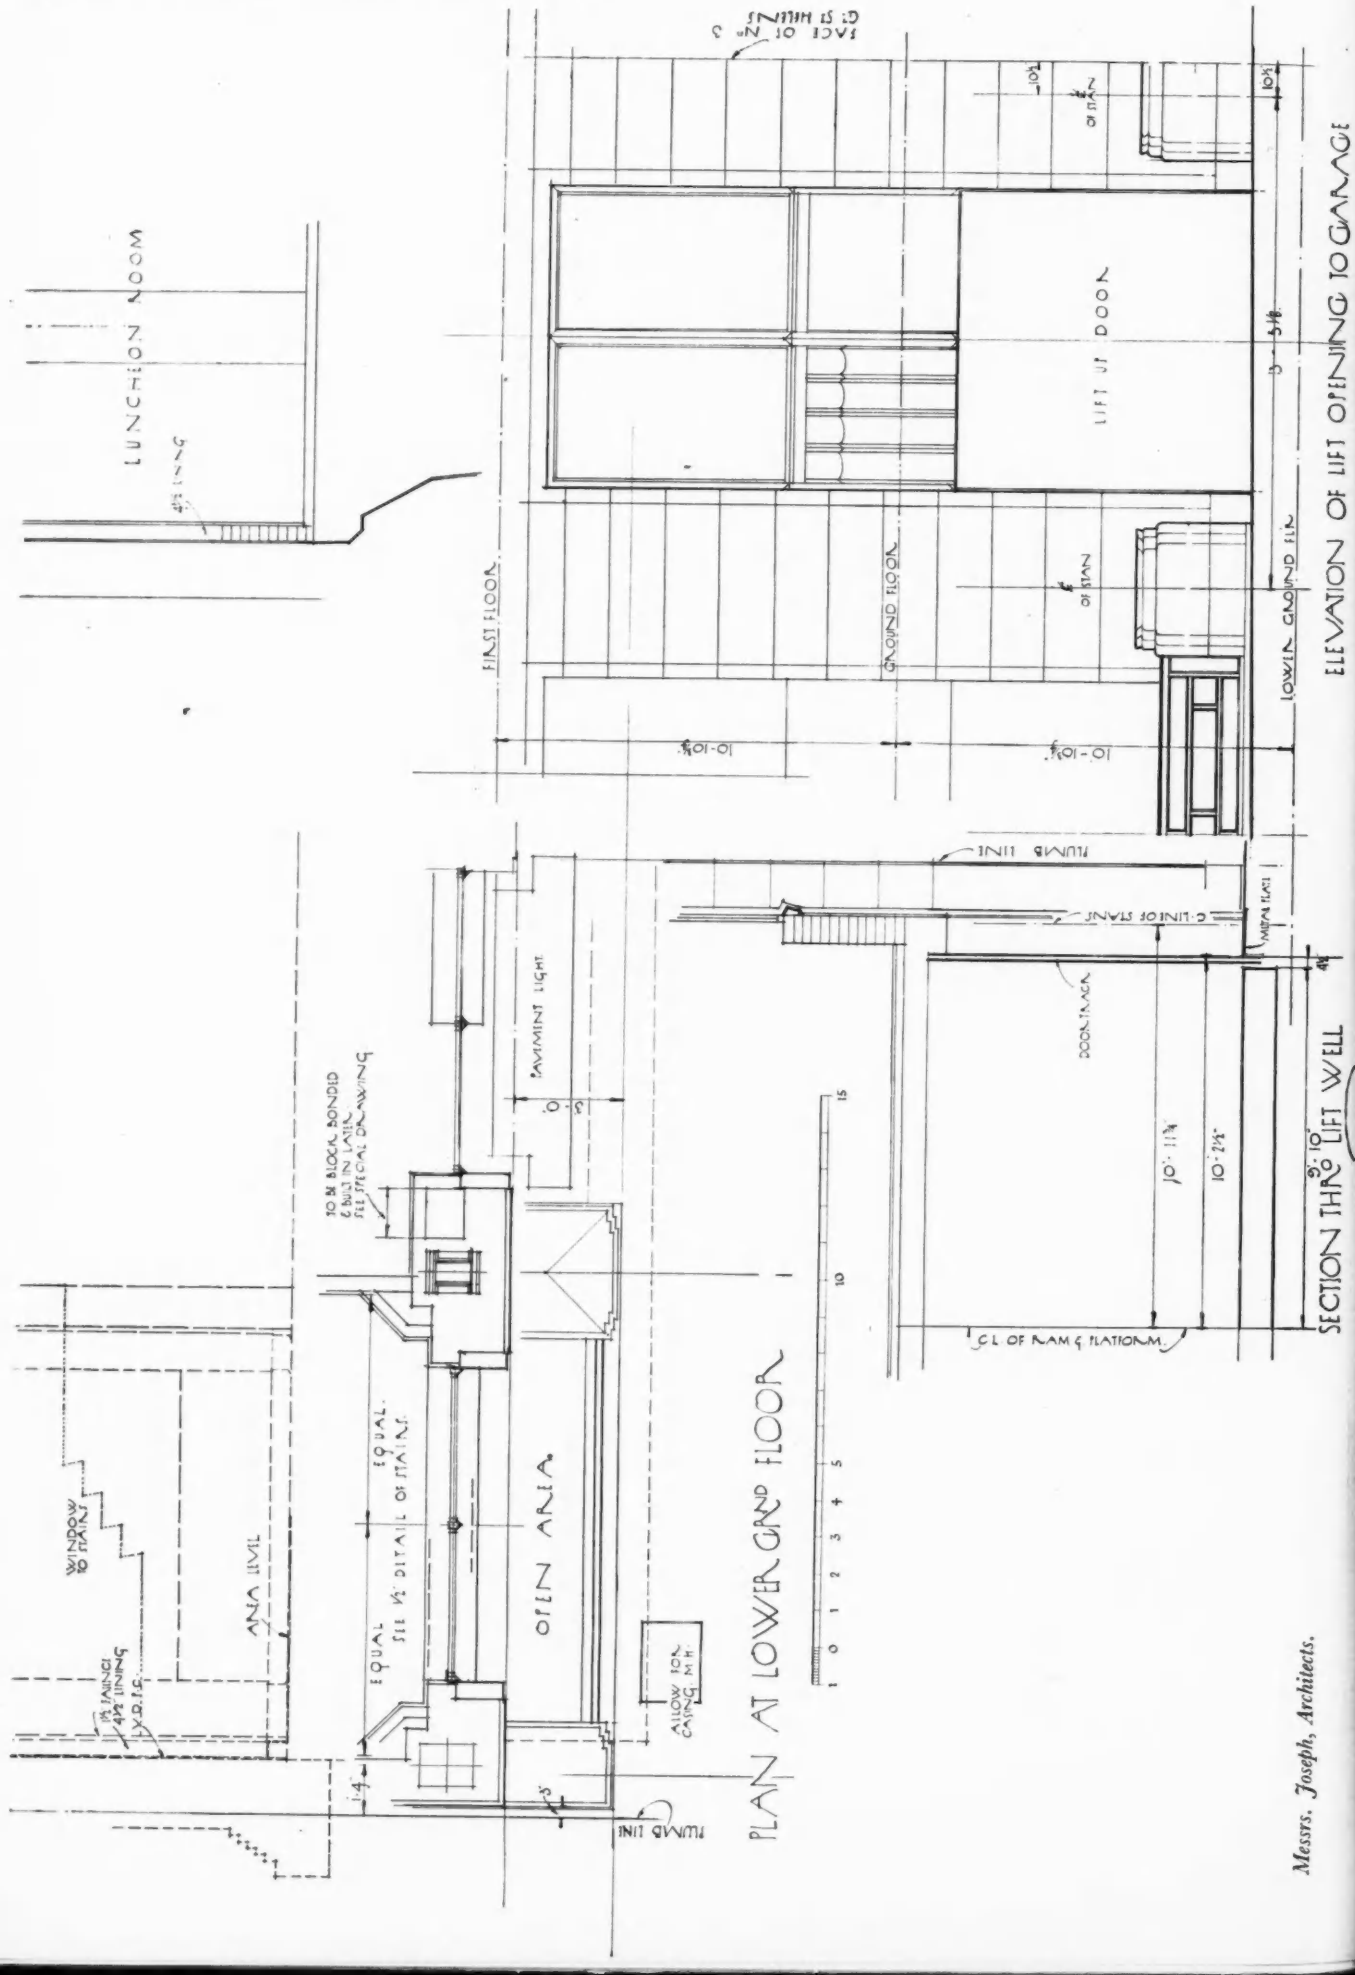
NEW EXTENSION : : BY MESSRS. JOSEPH

THE FRONT TO GREAT ST. HELEN'S





THE building illustrated in this supplement and on pages 393, 394 (plans) and 395 of this issue, is an extension to St. Helen's Court, the headquarters, in the City, of the Anglo-Saxon and Asiatic Petroleum interests. It was designed to accommodate various sections of their staff hitherto housed in separate buildings and to connect up with their adjacent head offices.



Even on its two free sides the new block faces on to narrow thoroughfares—Great St. Helen's and Crosby Square—and the one entrance from the street is in the latter; access is mainly from the older buildings.

The photograph printed above is taken looking along Great St. Helen's. Accompanying it is the uppermost portion of a reproduction of the large-scale detail drawing of a portion of this front; it is continued overleaf and ends on the last page, at foundation level.

The building, which affords nine floors, is of steel-framed construction, with a retaining wall of reinforced concrete. The elevation here illustrated is built of faience tile slab and block.

ELEVATION OF LIFT OPENING TO GARAGE

AREA PER PERSON FOR LIFTS CAGES.

PASSENGER LIFTS :

Allow 2½ - 3½ sq. ft per person in the best type of office building etc.
Allow 2 sq. ft per person in department Stores & where large cages are used.

AVERAGE SIZES OF PASSENGER LIFTS :

Persons carried	Rated load.	Car Switch Control	Push button Control.
4.	6 cwts	4' 0"	3'6"
6.	8 cwts	4' 4"	4'0"
7.	10 cwts	4' 8"	4'4"
8	12 cwts	5' 0"	4'8"
11.	15 cwts	5' 6"	5'0"
14.	20 cwts	6' 0"	5'6"

Sizes given are clear inside dimensions.

MINIMUM SIZE FOR PASSENGER LIFT (for private house) :
2 persons 2'9" x 2'9"

SERVICE LIFTS :

Main service lift to an apartment house block (for furniture etc.) 6'0" x 6'0" inside the cage.
Service lifts to flats (for general household services) from 1'6" x 1'6" to 2'3" x 2'3" inside the cage. Average 2'0" x 1'6" x 2'0" high.

HAND-OPERATED FOOD LIFTS :

1'6" x 1'6" x 2'0" high	wellhole required	2'1" x 1'11"
1'9" x 1'9" x 2'0" high		2'4" x 2'2"
2'3" x 2'3" x 2'0" high.		2'10" x 2'5"

ELECTRICALLY OPERATED FOOD LIFTS :

2'6" x 1'6" x 2'3" high.
1'6" x 1'6" x 2'3" high.

BIN LIFTS :

(dependent on number of bins & size of bin to be used) approx. 3'0" x 3'0" clear inside for one bin.

FOOD TROLLEY LIFTS :

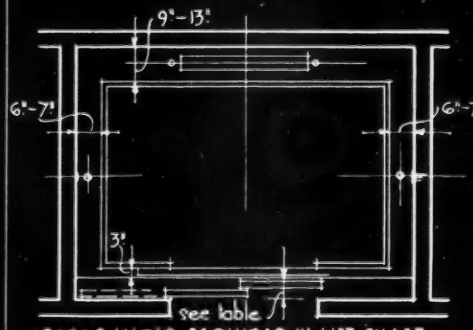
(dependent on number of trolleys & size of trolley to be used) approx. 4'0" x 3'0" clear inside for one trolley.

HOSPITAL BED LIFTS :

for general cases 7'2" x 4'8" well hole required approx : 8'6" x 6'0"
for plaster cases 8'6" x 7'0" well hole required approx : 10'0" x 8'6"

GARAGE LIFTS :

for one car : 20'0" x 10'0" well hole required approx. 21'6" x 11'6"



SPEED OF LIFTS :

Speeds commonly used for various types of lift (London).

	Travel 30'0"	60'0"	above 60'0"
Passenger lifts :			
Car switch control	160 - 200	200-350	300-450 + feet per minute.
Push button control	120 - 150	150-200	
Service lifts :			
½ to 3 cwts.		100 ±	120 - 150
Goods lifts :			
5 to 30 cwts.		100 ±	150 ±
40 cwts		100 ±	100 ±.

Garage car lift :
30 - 40 feet per minute

Hospital bed lifts :
100 - 200 feet per minute.

CLEARANCES REQUIRED IN LIFT SHAFT
Minimum thickness for wood doors 1¾"
Minimum thickness for metal doors 1¼"

HEIGHTS REQUIRED above & below overdriven lifts.
Requirements vary with type of lift, speed, capacity & equipment.
for passenger lifts up to 400 F.P.M. allow 16' to 23' from the topmost landing served to the under side of the Machine room roof ... &
allow 4' to 5' from the lowest landing served to the bottom of the pit.
for passenger lifts above 400 F.P.M. allow up to 27' & up to 10' respectively

for Service lifts allow 11' to 12'
for Goods lifts allow 16' to 18'

SPACE REQUIRED FOR LANDING DOORS (from Messrs Waygood-Otis Ltd)	Wood doors hand opening & closing	Wood doors hand opening Self closing.	Wood doors Pneumatic Operated	Metal doors hand opening self closing	Metal doors Pneumatic Operated
Single sliding door	5"	4'	4'	3½"	3½"
Centre opening sliding door	4½"	4'	4'	3½"	3½"
Two-speed sliding door	.	6'	6'	5"	5"
Three speed sliding door	.	8'	8'	6½"	6½"

N.B. Messrs Waygood-Otis recommend only metal doors for pneumatic operation.

LIFT SIZES, ETC.

•

EIGHT classes of lifts are enumerated in this week's Information Sheet, which sets out in tabular form the dimensions of the cages, etc., in common use. Certain of the data in regard to clearances are reproduced by permission of the manufacturers, Messrs. Waygood-Otis, Ltd.

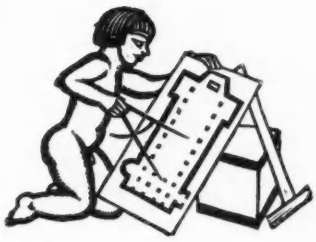
The following is a list of the subjects previously issued :—

1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.
8. Mar. 8—Billiard Table Data.
9. Mar. 15—Roof Pitches and Drainage.

A MODERN AVENUE THROUGH ROME

WITH A MORAL FOR TOWN-PLANNERS

AN alternative title for this photograph might be "Where there is a will there is a way." On the left runs the new through avenue that links the Vittorio Emanuele Monument, seen at its end, with the Colosseum, situated in a direction behind the camera. In the foreground another new road is in progress. Side by side with its construction steps are being taken, in accordance with the comprehensive and far-reaching planning scheme for the whole area of Rome, to demolish obsolete tenements and to open out, reconstruct and isolate buildings of ancient Rome, such as Trajan's Forum, seen on the right, and the Trajan Column, in the centre of the picture. To the left of this Column are two square-towered mansions: the farther one is now the town residence of Mussolini.



In two days' time the Town and Country Planning Act comes into force. What is being done in Rome can and should be done in London and our other large cities. As Mr. Longstreth Thompson said, at the dinner held by the Town Planning Institute, on Friday last: "Whatever the difficulties, London must *have a plan."*

THE ROYAL HOSPITAL SCHOOL, HOLBROOK, SUFFOLK

By Buckland and Haywood

On Wednesday of last week, boys of the Royal Hospital School marched for the last time out of their quarters at Greenwich. When they return from Easter leave they will take possession of the new school premises at Holbrook, Suffolk, illustrated and described on pages 425-9 of this issue. The above view shows the spire above the assembly hall, with the saluting base at its foot, seen through the ratlines of the rigged mast on the parade ground.

NO HAWKERS
NO CIRCULARS

—NO ARCHITECTS

THROUGH consecutive leading articles during the last few months we have dealt as fully as our space would allow with the main problems which face the nation on what the Russians would call its Building Front.

A brief summary would read like this :

State of Unplanning in London.
Necessity of a London Plan.
Argument for a National Planning Board.
Unplanning.
A typical case of unplanning—Carlton Gardens and Carlton House Terrace.
Planning for Housing.
Possibilities of the Housing Corporation and Dangers of the Building Societies.
Results of Unplanning—Unemployment.
Solution to Unemployment through Public Works.

It must be fairly clear to all but the most uncompromising disciples of *laisser faire* that some form of organized planning is called for today if society is to be rebuilt from the ruins of the war. Nor need those who advocate planning on a national scale be afraid of being pointed out rudely as dirty Bolshevists, for was not the Conservative Party the apostle of planning within the Empire long before Lenin or Stalin were heard or thought of?

The fact is planning—on a national scale—is actually going on in England to an extent which few people realize. There is planning in towns, in regions, planning in electricity, planning in wireless, in wheat, in steel, planning even in pigs.

But it is obvious, indeed inevitable, that the fruits of this work will not be apparent for some years, and that a larger conception of planning will only be evoked gradually from the success of a number of minor ventures, converging on one point.

What, then, of the architect? If the modern world is to be planned he must be its key man. Is he the key man of the present world? Certainly not. It may be an exaggeration to say that the architect is encouraged to do nothing more than "play" with thousand-pound houses or stick the Queen Anne into engineers' drawings, but the fact remains his serious function as the planning member of the community is consistently ignored.

We have lately advocated the spending of hundreds of millions of pounds on public works. How much of this work will go through the hands of architects? When the Glasgow Institute of Architects put forward the suggestion that an Advisory Committee on Amenity should work in conjunction with the Corporation in preparing the new Glasgow town planning scheme, the city engineer, Mr. Thomas Somers, objected that co-operation would serve no useful purpose since the replanning of Glasgow *was an engineering job*—and an engineering job no doubt it will be!

Nor are public works the only field in which the architect is consistently ignored. The Government and the Building Societies have recently entered into a conspiracy to promote a vast housing campaign. The results remain to be seen, but the campaign is *calculated* at least to provide housing on an unprecedented scale. Has the architect been consulted? The answer is he hasn't even been considered, and this despite the fact that it is his influence which is responsible for whatever standard there is in houses of the present day.

This situation may or may not be partly the fault of the architect. We do not presume to say. What we do say is that it isn't good enough. It raises the paramount question of what is in the interest of the community.

If the planning mind is needed today, as it is, then it is essential in the public interest that architects should *not* stand by idly watching while borough surveyors and engineers commit crimes in the name of public works. It is essential that architects should not passively endure a vast new jerry building campaign financed by the Building Societies.

Failing a constructive planning policy, we say that one condition at any rate should be observed. To avoid in these new works the worst effects of unplanning, some sort of control by architects should be aimed at. And if the work will not come to the architects then the architects must go to the work.

Later in the year we hope to return to the question of the borough surveyor and public works. The housing campaign is, however, the question of the moment. "The twentieth-century small house," says a well-known architect in *What is to be Done about this?* on page 430, "is a mass-produced product." How to provide a mass-produced product cheaper and better than the speculative builder—this is the architects' immediate problem. We propose, therefore, to review in a series of articles the whole *scena* of the small house.

We believe that many architects will welcome this attempt, humble though it is, to survey a ground that may be ripe for "architectural development."

NOTES & TOPICS

THE FIG-LEAF MIND

IN the House of Commons on Wednesday last Mr. George Gibson Mitcheson, Unionist Member for South West St. Pancras, asked the Home Secretary if he would instruct the police to compel the directorate of the B.B.C. to remove immediately the statue recently placed over the front entrance of Broadcasting House as being objectionable to public morals and decency.

Mr. Eric Gill putting the finishing touches to his statue of "Prospero and Ariel," at Broadcasting House, Portland Place; and Mr. G. G. Mitcheson, M.P. for S. W. St. Pancras, who challenged its decency in a Question in the House last week.

When Sir J. Gilmour said : "No, Sir," Mr. Mitcheson asked if it was the opinion of the right hon. gentleman that there was here no offence against decency. Sir J. Gilmour again said "No," this time in fifty-two words. The House laughed, and Captain Cunningham-Reid said : "Is this not a case of *Honi soit qui mal y pense ?*" The House laughed again, but, unfortunately, there is no official record of what Mr. Mitcheson did.

*

Thinking that I might have missed something, I revived my memory of Mr. Eric Gill's group at Broadcasting House by visiting it again. As morals and decency always seem to mean nakedness to experts in these subjects, I can only suppose that Mr. Mitcheson felt acutely the absence of clothes on the figure of the boy. This raises the sort of prurient conundrum that delights "popular" moralists —Mr. James Douglas, for example.

*

But why should so much attention be given to "statues" when the sex-soaked posters of many cinemas escape comment by observant representatives of this great people ? Because a film-star's figure is police-proofed by a few rags, the puritans pass by satisfied, saying, perhaps, in their pre-war way : "Not in these trousers !"

THE SAGE WAY

This week the public makes its annual conscious contact with architecture. Mr. and Mrs. Everyman visit the Ideal Home Exhibition. Have you ever overheard their comments ? Here's one from last year : "All very well, old man, but *I* like to see what I'm buying, and a builder can always show you something he's run up, and he'll let you change things about a bit—have another sort of front door to make the house *different !*"

*

As P. G. Wodehouse has put it : "Oh death, where is thy jolly old sting ?" To which I add : "Oh, Plan, thy victory ?"

*

ARCHITECT AND ENGINEER

The debate at the A.A. last Monday between architect and engineer—represented respectively by Mr. Goodhart-Rendel and Mr. C. O. Mourant—promised well and drew a considerable number of people ; but, frankly, I was rather disappointed in the form which the discussion took.

*

Mr. Goodhart-Rendel, possibly because he had to stimulate an argument (but with, I thought, far too much genuine conviction), drew a firm line between the functions of the architect and those of the engineer. From the point of view of the architectural profession's reputation, this may be excusable when architects only are gathered together, but it is questionable whether it is desirable to bring up the topic when engineers also are present. Already architects are considered by engineers to be merely "arty," while engineers are considered by themselves to be able "to apply the architecture" to a work of engineering as well as most architects.

*

Mr. Goodhart-Rendel's paper was as witty and well thought out as one has been brought up to expect, but one could have wished that he, too, had chosen to show some slides. In point of fact, the illustrated portion of the lecture fell to Mr. Mourant, and it was interesting to see the reaction of the audience to the slides which he showed. This reaction may be regarded as rather a good indication of the outlook (at any rate of the A.A.) on the subject of "engineering versus architecture."

*

Mr. Mourant showed first of all slides of what might be termed "works of pure engineering," by which I mean that no conscious attempt whatever had been made to produce buildings of beauty. These buildings, however, showed a quite definite quality, and were received with some acclamation by the meeting.

*

It was, however, when Mr. Mourant showed some journeys into architecture by engineers (by way, apparently, of showing that engineers, too, could apply architecture in the form of Doric columns) that his listeners took Mr. Mourant by surprise by appearing to treat these experiments rather as a joke.

*

From this point of view, the meeting may be considered to have been inversely instructive to engineers on the outlook of architects, but little emerged about the outlook of engineers that architects would be likely to find useful. In view of the possibilities of bringing about co-operation between the two groups of designers, this failing was, to my mind, most unfortunate.

THE DESIGNER'S ANONYMITY

In *The Week End Review* for March 11 Mr. John Gloag contributed a letter in which he deplored the manner in which manufacturers insist upon forcing anonymity upon designers. The letter was provocative in nature and it was inevitable that there should be some reply.

*

The Week End Review is to be congratulated on giving space to such a correspondence, and it is to be hoped that manufacturers, as well as designers, will take full notice of what has been written by Mr. Gloag and Mr. Boumphrey.

*

The latter, I am afraid, tackles the problem from a rather wrong angle—he takes a too broad and too knowledgeable view of the whole thing. Unquestionably it is important that the manufacturer and retailer should appreciate the designer's value, but surely one of the best ways of doing this is for the manufacturers who already employ designers to boast about it, however much they may really consider the whole business to be unnecessary. If they will boast about their ventures into good design, the public will soon learn to demand the goods which have been so produced, and enjoy the *cachet* of an individualist origin, even though they may have been mass-produced.

*

It would be interesting to hear what architects have to say on the subject from their own point of view ; and still more it is to be hoped that some manufacturers will take the field and explain what, if any, are their reasons for thrusting anonymity on the designers they employ.

*

THE ARCHITECTS' DIARY

Wednesday, March 29

R.I.B.A., 9 Conduit Street, W.1. Third of a series of lectures on Where Londoners Live. "Where Londoners Play." By P. Morton Shand. 6 *p.m.*

R.I.B.A., 9 Conduit Street, W.1. General Meeting. Presentation of the Royal Gold Medal to Sir Charles Peers. 9 *p.m.*

Tuesday, April 4

ARCHITECTS AND SURVEYORS APPROVED SOCIETY. At the R.I.B.A., 9 Conduit Street, W.1. Annual General Meeting. 6.30 *p.m.*

Model of a "unit house" in all three stages of its expansion : Leopold Ponzen's contribution to the competition sponsored by the Vienna Municipality.

UNIT HOUSES IN VIENNA

The last number of *The Studio* reproduced designs for unit houses entered for a competition sponsored by the Vienna Fair and other bodies, including the Vienna Municipality. No building might cost more than £150, exclusive of furnishings and foundations, and no completed unit might exceed 40 square metres in area.

*

Leading Austrian architects competed, and the results, as I expected, showed that clever planning and simple forms make architecture out of the smallest bungalow.

*

One of the important problems solved was the question of expansion from a very small unit to meet an owner's growing needs and rising income. The accompanying photograph shows how essential unity is preserved throughout three stages of expansion.

*

L.M.S. : A SUGGESTION

A prominent invitation has been widely circulated to the general public to send their suggestions for bettering the service of the L.M.S. to Mr. Ashton Davies, the commercial manager.

*

I have a suggestion. I have a lot of suggestions. Speaking architecturally, I might once have said that I had a grievance. But, answering so polite a request, I would suggest, first of all, that it would be a service to the public if the management would reorganize outdoor advertising, for, as an ordinary traveller, I find it tiresome to be solicited from every wall, staircase, platform, embankment, bridge and every other unoccupied space by tinplate bagmen.

*

I am out to travel and enjoy myself. But only when the train is moving, and then not quite entirely, can I escape this menace. I try to catch the name of a station and see nothing but BOVRIL. On the platform I want the booking office, but can scarcely spot it among the BEERS and INKS, OIL ENGINES, etc.

*

The practice brings in an income, but it is barbarous, quite barbarous. And, moreover, it is not necessary, for it is subject to arrangement, localization. Further, it is inefficient and unworthy of a public utility company. There, that is my suggestion.

ASTRAGAL

NOTES & TOPICS

THE FIG-LEAF MIND

IN the House of Commons on Wednesday last Mr. George Gibson Mitcheson, Unionist Member for South West St. Pancras, asked the Home Secretary if he would instruct the police to compel the directorate of the B.B.C. to remove immediately the statue recently placed over the front entrance of Broadcasting House as being objectionable to public morals and decency.

Mr. Eric Gill putting the finishing touches to his statue of "Prospero and Ariel," at Broadcasting House, Portland Place; and Mr. G. G. Mitcheson, M. P. for S. W. St. Pancras, who challenged its decency in a Question in the House last week.

When Sir J. Gilmour said : "No, Sir," Mr. Mitcheson asked if it was the opinion of the right hon. gentleman that there was here no offence against decency. Sir J. Gilmour again said "No," this time in fifty-two words. The House laughed, and Captain Cunningham-Reid said : "Is this not a case of *Honi soit qui mal y pense ?*" The House laughed again, but, unfortunately, there is no official record of what Mr. Mitcheson did.

*

Thinking that I might have missed something, I revived my memory of Mr. Eric Gill's group at Broadcasting House by visiting it again. As morals and decency always seem to mean nakedness to experts in these subjects, I can only suppose that Mr. Mitcheson felt acutely the absence of clothes on the figure of the boy. This raises the sort of prurient conundrum that delights "popular" moralists —Mr. James Douglas, for example.

*

But why should so much attention be given to "statues" when the sex-soaked posters of many cinemas escape comment by observant representatives of this great people ? Because a film-star's figure is police-proofed by a few rags, the puritans pass by satisfied, saying, perhaps, in their pre-war way : "Not in these trousers !"

THE SAGE WAY

This week the public makes its annual conscious contact with architecture. Mr. and Mrs. Everyman visit the Ideal Home Exhibition. Have you ever overheard their comments ? Here's one from last year : "All very well, old man, but *I* like to see what I'm buying, and a builder can always show you something he's run up, and he'll let you change things about a bit—have another sort of front door to make the house *different !*"

*

As P. G. Wodehouse has put it : "Oh death, where is thy jolly old sting ?" To which I add : "Oh, Plan, thy victory ?"

*

ARCHITECT AND ENGINEER

The debate at the A.A. last Monday between architect and engineer—represented respectively by Mr. Goodhart-Rendel and Mr. C. O. Mourant—promised well and drew a considerable number of people ; but, frankly, I was rather disappointed in the form which the discussion took.

*

Mr. Goodhart-Rendel, possibly because he had to stimulate an argument (but with, I thought, far too much genuine conviction), drew a firm line between the functions of the architect and those of the engineer. From the point of view of the architectural profession's reputation, this may be excusable when architects only are gathered together, but it is questionable whether it is desirable to bring up the topic when engineers also are present. Already architects are considered by engineers to be merely "arty," while engineers are considered by themselves to be able "to apply the architecture" to a work of engineering as well as most architects.

*

Mr. Goodhart-Rendel's paper was as witty and well thought out as one has been brought up to expect, but one could have wished that he, too, had chosen to show some slides. In point of fact, the illustrated portion of the lecture fell to Mr. Mourant, and it was interesting to see the reaction of the audience to the slides which he showed. This reaction may be regarded as rather a good indication of the outlook (at any rate of the A.A.) on the subject of "engineering versus architecture."

*

Mr. Mourant showed first of all slides of what might be termed "works of pure engineering," by which I mean that no conscious attempt whatever had been made to produce buildings of beauty. These buildings, however, showed a quite definite quality, and were received with some acclamation by the meeting.

*

It was, however, when Mr. Mourant showed some journeys into architecture by engineers (by way, apparently, of showing that engineers, too, could apply architecture in the form of Doric columns) that his listeners took Mr. Mourant by surprise by appearing to treat these experiments rather as a joke.

*

From this point of view, the meeting may be considered to have been inversely instructive to engineers on the outlook of architects, but little emerged about the outlook of engineers that architects would be likely to find useful. In view of the possibilities of bringing about co-operation between the two groups of designers, this failing was, to my mind, most unfortunate.

THE DESIGNER'S ANONYMITY

In *The Week End Review* for March 11 Mr. John Gloag contributed a letter in which he deplored the manner in which manufacturers insist upon forcing anonymity upon designers. The letter was provocative in nature and it was inevitable that there should be some reply.

*

The Week End Review is to be congratulated on giving space to such a correspondence, and it is to be hoped that manufacturers, as well as designers, will take full notice of what has been written by Mr. Gloag and Mr. Boumphrey.

*

The latter, I am afraid, tackles the problem from a rather wrong angle—he takes a too broad and too knowledgeable view of the whole thing. Unquestionably it is important that the manufacturer and retailer should appreciate the designer's value, but surely one of the best ways of doing this is for the manufacturers who already employ designers to boast about it, however much they may really consider the whole business to be unnecessary. If they will boast about their ventures into good design, the public will soon learn to demand the goods which have been so produced, and enjoy the *cachet* of an individualist origin, even though they may have been mass-produced.

*

It would be interesting to hear what architects have to say on the subject from their own point of view; and still more it is to be hoped that some manufacturers will take the field and explain what, if any, are their reasons for thrusting anonymity on the designers they employ.

*

THE ARCHITECTS' DIARY

Wednesday, March 29

R.I.B.A., 9 Conduit Street, W.1. Third of a series of lectures on Where Londoners Live. "Where Londoners Play." By P. Morton Shand. 6 *p.m.*

NEW HOMES FOR OLD EXHIBITION. At 24 Grosvenor Place, S.W.1. Exhibition entitled: "Housing: The Present Opportunity." Until April 1. 11 a.m. to 7 p.m. 11 *a.m.*

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Roman Architecture—XI." By Sir Banister Fletcher, PP.R.I.B.A. 6 *p.m.*

LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat *Chambers, School Lane, Liverpool.* "Tradition and Modernism in Architecture." By A. J. Penty, L.R.I.B.A. 6 *p.m.*

IDEAL HOMES EXHIBITION. At Olympia, West Kensington, W. Until April 29. 10 a.m. to 10 p.m.

ST. PAUL'S ECCLESIOLOGICAL SOCIETY. At the R.I.B.A., 9 Conduit Street, W.1. "Ecclesiastical Architecture in the Present Age." By N. F. Cachemaille-Day, M.A., A.R.I.B.A. 8 *p.m.*

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "Colour Harmony." By J. Littlejohns, R.I. 8 *p.m.*

LIGHTING SERVICE BUREAU. At 2 Savoy Hill, W.C.2. "The Lighting of Theatres and Cinemas." By R. Waldo Maitland. Discussion to be opened by G. Grey Wornum, F.R.I.B.A. 7 *p.m.*

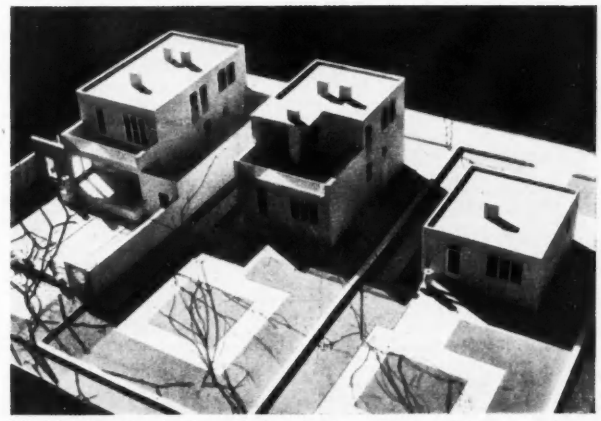
Thursday, March 30

SOCIETY OF ANTIQUARIES, Burlington House, Piccadilly, W. "Report on the Excavations at Hembury, Devon." By Miss Dorothy Liddell, F.S.A. 8.30 *p.m.*

ESSEX, CAMBRIDGE AND HERTS. SOCIETY OF ARCHITECTS. At Anderton's Hotel, Fleet Street, E.C. Joint Meeting with the Eastern Federation of Building Trades Employers. 12.30 *p.m.*

DESIGN AND INDUSTRIES ASSOCIATION. At the London School of Hygiene and Tropical Medicine, Keppel Street, W.C.1. "The Artist and Industrialism." By Eric Gill. 8.15 *p.m.*

Saturday, April 1



Sunrise 5.34 a.m. Sunset 6.34 p.m.

Monday, April 3

R.I.B.A., 9 Conduit Street, W.1. General Meeting. Presentation of the Royal Gold Medal to Sir Charles Peers. 9 *p.m.*

Tuesday, April 4

ART AND INDUSTRY

Mr. Eric Gill, whose sculpture of Prospero and Ariel over the main entrance to Broadcasting House was the subject of a question in the House of Commons last week, is to lecture on "The Artist and Industrialism" at a meeting of the Design and Industries Association, tomorrow, March 30. Mr. Frank Pick will preside.

AN "EXCITING" EXHIBITION

The Exhibition of Industrial Art in Relation to the Home, which is to be held at Dorland Hall, Lower Regent Street, S.W., from June 20 to July 12, was the subject of an article by Professor C. H. Reilly, in *The Manchester Guardian* for Tuesday of last week.

The news [he writes] that there is to be a serious exhibition in London in the summer of manufactured articles of everyday use, chosen by competent people for their fitness for purpose and for the imaginative use of the materials of which they are made, is exciting. It shows that the long Victorian, Edwardian and Georgian sleep with regard to the products of our factories is at last coming to an end.

Our manufacturers should watch everywhere, so it seems to me, what the younger artists are doing in architecture, painting and sculpture so as to get some inkling of the spirit of this great modern movement. Once they get into sympathetic relation with it they will employ the right designers and give them, what is equally important, the right instructions. An exhibition such as is proposed, where the manufacturer is only allowed to show his really good modern things, is not only going to be an exciting event but a necessary one. . . . The Gorell Commission said it was most essential, and that the Government ought to pay for it. The Government, however, will do nothing of the kind, though the Board of Trade offers its blessing. Hence it is especially good to know that private individuals, and those best qualified, have taken on the task.

The list of subscriptions received by the Public Relations Committee of the Building Industries National Council up to Monday last amounted to £2,396/0/10. Among the firms that have recently contributed to the fund are the following: Manchester Brick Mfrs. Assn. Ltd., £105/0/0; Roper, Son and Chapman, £1/1/0; Gross, Sherwood and Heald, Ltd., £3/3/0; Nottingham and District Brick Mfrs. Assn., £25/0/0; and Frederick Braby & Co., Ltd., £5/5/0. Subscriptions should be addressed to the Honorary Treasurer, Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

PROFESSOR REILLY'S SUCCESSOR

At a meeting of the Council of the University of Liverpool held on Tuesday of last week, Associate Professor L. B. Budden, M.A., F.R.I.B.A., Senior Lecturer in Architecture, was appointed to the Roscoe Chair of Architecture as from October 1 next, in succession to Professor C. H. Reilly, who is retiring from the Chair at the end of the current session.

MODERN DECORATION

Mr. Howard M. Robertson, F.R.I.B.A., lecturing to the Incorporated Institute of British Decorators on "The Trend of Modern Decoration" on Thursday last, pointed out that extremists of the modern school are as tyrannical as are the traditionalists. Liberty to express his ideals, either in "Craftsman" design, or in design for mass production, must always remain the right of the designer, and he must fight fearlessly to maintain it. All tendencies are permissible, provided that design is good and the laws of harmony are respected.

Professor Lionel Budden, F.R.I.B.A., who has been appointed Roscoe Professor of Architecture at Liverpool University in succession to Professor C. H. Reilly.

SPOLIATION OF WESTMINSTER

At yesterday's meeting of the L.C.C. the Council's Town Planning Committee expressed its perturbation by proposals to erect tall office buildings on two sites near the Houses of Parliament: that of a terrace of eighteenth-century houses in Abingdon Street, and that opposite the Ministry of Health, facing Parliament Square. They asked the Council to agree to the preparation of a town planning scheme for this area.

IDEAL HOME EXHIBITION

The *Daily Mail* Ideal Home Exhibition, held at Olympia, will be opened to-day at 11.30 a.m. by Mrs. Stanley Baldwin. It will remain open until April 29 between the hours of 10 a.m. and 10 p.m.

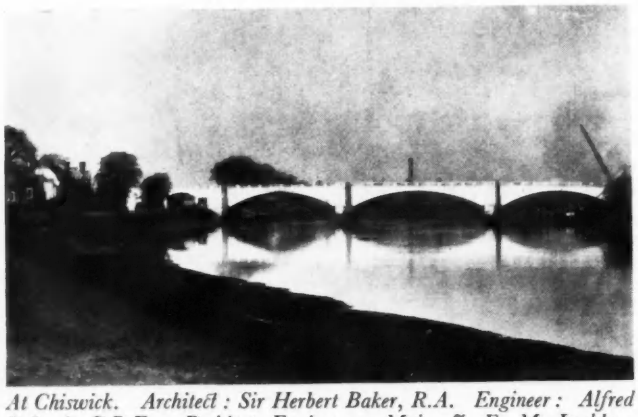
TOWN PLANNERS AT DINNER

A dinner to the Rt. Hon. Sir Hilton Young, G.B.E., D.S.O., M.P. (Minister of Health) was given by the Town Planning Institute at the Savoy Hotel on Friday last. About 100 members and guests were present, with Mr. F. Longstreth Thompson, B.SC., A.M.INST., C.E. (President) in the chair.

Mr. Thompson, proposing the toast of "Town and Country Planning," urged the necessity of embarking with the least possible delay upon the preparation of a planning scheme for London. He said:

With a partner who, for the last ten years, has been engaged, with the help of many experts and a large staff, upon the preparation of a plan for New York, I should be the last to underrate the magnitude of the task or the nature of the difficulties to be surmounted. But of this I am convinced—that, whatever the difficulties, London *must* have a plan. She is already suffering from an acute form of elephantiasis, with the attendant symptoms of the arteries, congestion of the lungs and many other functional disorders. Unless the symptoms are skilfully diagnosed and proper treatment prescribed without delay, the patient's health and activity will inevitably deteriorate and in the end she will suffer the fate of the prehistoric monsters, who perished miserably because their tiny brains proved unequal to the task of controlling their overgrown and ungainly bodies.

On all hands there is a demand for big-scale planning; in the relationship between nations; in finance; in industry; in all human activities.



[*Continued on page 422*]

THE TOWN PLANNERS' DINNER

On the facing page is a report of the dinner to Sir Edward Hilton Young (Minister of Health), given by the Town Planning Institute on Friday last. The above sketches are by Fred May.

NEW THAMES BRIDGES

At Chiswick. Architect: Sir Herbert Baker, R.A. Engineer: Alfred Ryland, C.B.E. Resident Engineer: Major J. F. MacLachlan, M.I.C.E. It is expected that the bridge, which has cost approximately £220,000, will be opened in June.

At Hampton Court. Architect: Sir Edwin Lutyens, R.A. Engineer: W. P. Robinson, M.I.C.E. The bridge is of reinforced concrete, faced with brick and stone, and is estimated to cost just over £200,000. It is expected to be opened some time between the end of April and June.

Indeed, I suppose there has never been a period in the world's history when the need for clear thinking, good organization and close co-operation was so insistent and at the same time so universally recognized.

The Town and Country Planning Act does not give us everything for which we hoped, but we believe it will facilitate both the conservation and the development of our most important asset—the land—and it is the determination of our members who are preparing planning schemes in all parts of the country to do their utmost to further its successful application.

We are met this evening for the double purpose of celebrating the coming into operation of the Act and of expressing our most sincere thanks to Sir Hilton Young for the devotion he has shown to the cause of town and country planning.

The Minister of Health, in response, said he thought the Town and Country Planning Act was the equal of the Bill. "I say—and confidently—don't you be afraid. Wait and see; April the First has not yet come!" Discussing the new idea of national planning, as distinguished from regional planning, he desired to keep an open mind. He continued:

There is still so much work to do which is more appropriate, and can be more adequately covered by regional planning, that we ought to get on with this before we occupy our minds with bigger interests, which may not be of the same practical utility at the present moment. The task of the day is the application of our minds and foresight to the regional and local problem. In the coming year or two we have got to justify this big idea of the utility of planning, embodied in the new Act, to the commonsense of the country. It is going to be a trying time. I am quite confident that there is present in our minds in approaching the task the vast practical importance and significance of enlisting as co-operators the big forces of organized industry in this country.

It is of vital importance to make our country a richer, finer and better land. Without direction it is impossible to contemplate the disorder, ugliness and discomfort that might rule in our towns of the future; and it is impossible to contemplate continued destruction of our countryside. In the new Act we have acquired powers to protect our country from such disfigurement.

The Rt. Hon. Sir Leslie Scott, K.C., proposing the toast of "The Local Authorities of Great Britain," said:

In a recent speech our chief guest of tonight said he thought that "there is nothing more deadening to national life than over-centralization. Local Government gives the fertilizing factor of diversity. By maintaining the healthy difference between town and town and countryside and countryside it maintains vigour in national character."

That sentence happily recognizes the two main divisions into which the whole business of successful planning naturally falls—on the one hand, the adaptation, both in plan and execution, to local conditions, and, on the other, co-ordination at the centre to ensure that the parts shall be so correlated as to produce a coherent whole—a whole which will satisfy the needs of the nation, just as the individual plans satisfy the needs of the locality.

We are not a very logically-minded nation, and in our political advancement we do not start with general principles and work down to the particular, but rather undertake the particular task first and let history gradually elucidate the general principle out of the particular. Such is the history of planning in England. And for the same reason we often confer statutory powers which mean something much better in practice than anyone could suspect from the words of the enabling Act; because our administrators, central and local, do have regard to those general political principles, unmentioned in the Act, which have become our second nature, and which in our more exalted moments we call the British Constitution!

The Act which, with political effrontery, we propose to bring into force on All Fools Day, is essentially one of the kind of Statutes I have in mind. It can be made to work well, if we work it well, bearing in mind its main purposes, taking count of the main conditions of our national life to which we have to apply it, and thinking out for ourselves the main principles which ought to guide us—principles consistent with, but unexpressed in, the Act.

Mr. Ernest M. Dence, J.P. (Chairman of the L.C.C.), responded.

R. I. B. A.

PRESENTATION OF GOLD MEDAL

The eighth general meeting of the Institute will be held on Monday next at 9 p.m., when Sir Charles Reed Peers, C.B.E., F.R.I.B.A., will be presented with the Royal Gold Medal. A collection of photographs, etc., of work carried out by the Department of Ancient Monuments and Historic Buildings under the direction of Sir Charles Peers will be on exhibition in the Meeting Room on the evening of the presentation of the Medal, and will remain open daily between the hours of 10 a.m. to 8 p.m. (Saturday, 10 a.m. to 5 p.m.) until April 12, inc.

WHERE LONDONERS WORK

Mr. Darcy Braddell, F.R.I.B.A., on Wednesday last give the third of a series of public lectures which the R.I.B.A. are sponsoring for the pur-

pose of interesting Londoners in the architecture of their own city.

He began by explaining that, as his time was very limited, he would have to confine the scope of his subject within very strict limitations, so he was going to conduct what he described as an architectural Cook's tour among the great office buildings, banks and such like institutions. He led his audience down Whitehall, showing various Government offices, new and old, then embarked them on one of Mr. A. P. Herbert's proposed new waterbuses, making as he did so a spirited plea for the use of the Thames as London's natural highway, whence the majesty and pageantry of London could be seen to its best advantage. The city was then shown in a series of photographs depicting the headquarters of the great banks, and the enormous change which has taken place in recent years in the neighbourhood of the Royal Exchange was vividly realized. The tour, which is cordially recommended to every lover of London to make for himself, ended with the return via the Strand to Trafalgar Square.

The lecturer laid great insistence on the significance of the plan in all architecture, a significance which is not always appreciated by a lay public, and added much interest to his lantern slides by showing the plans of the buildings they concerned.

THE SOANE MEDALLION AND THE TITE PRIZE

In the United Kingdom 114 students took part in the preliminary competition for the Soane Medallion, and 241 students took part in the preliminary competition for the Tite Prize.

The following students have been selected to take part in the final competitions :

THE SOANE MEDALLION: Messrs. J. C. Clavering, Dudley L. Couves, F. A. C. Maunder, and Wilfred J. Scott (Armstrong College School of Architecture, University of Durham, Newcastle); W. E. Cousins and Glyn Roberts (Liverpool School of Architecture, University of Liverpool); F. Norman James (Architectural Association, London); J. C. B. Price (Bartlett School of Architecture, University of London); C. E. Westmoreland (Royal Academy School of Architecture).

THE TITE PRIZE: Messrs. H. T. Cadbury-Brown, Herbert Tayler, Edward V. Tibbits and (Miss) M. J. Blanco-White (Architectural Association, London); Adam Paton (Glasgow School of Architecture); P. M. Barnes (Department of Architecture, University of Sheffield); John W. Davidson (Department of Architecture, University of Sheffield); Philip B. Dunthorne (School of Architecture, The Polytechnic, Regent Street, London); Harry Gibberd (Birmingham School of Architecture); H. I. Gordon (Liverpool School of Architecture, University of Liverpool); Arthur D. Kirby and Paul K. Pope (Royal West of England Academy School of Architecture, Bristol); David W. Roberts (Welsh School of Architecture, The Technical College, Cardiff); and Bernard G. White (School of Architecture, Municipal School of Arts and Crafts, Southend-on-Sea).

THE TOWN AND COUNTRY PLANNING ACT

THE
PROTECTOR ?

By THOMAS SHARP,
Author of "Town and Countryside"

ON Saturday next, April 1, the Town and Country Planning Act, 1932, comes into being. The vicissitudes which have attended its birth are well known.

Begotten on the Mother of Parliaments by a public grown restive and melancholy in its helpless watching of the ruin of a treasured heritage, the first period of its gestation promised well for the ultimate delivery of a fine upstanding Protector of Amenity. In the darkness of the night of National Crisis, however, the villains of the piece, in the shape of vested interests, got to work to procure an abortion. For a time it seemed as though they would be wholly successful; but happily in the end they failed—and now the Protector is with us.

To greet him with a fanfare of trumpets would, perhaps, be unwise, for it is obvious that though the abortionists did not quite kill the incipient Protector, their hobnailed boots did at least do something towards maiming him. It will almost certainly prove that as a result of their operations he is a little weak in the head and rather dithery at the knees. Exactly how weak and how dithery, time only will prove. So we had better reserve our plaudits for a later date, and, instead of sounding the brassy welcome of "See the Conquering Hero Comes," we should scrape on our doubtful fiddles the more sombre exhortation of "Rescue the Perishing, Care for the Dying."

But, at any rate, this is the only Protector we have got, so we must align ourselves behind his flag.

Exactly what powers have been given to this Protector that were denied his predecessor, The Town Planning Act of 1925?

To begin with, his terms of reference are a complete reorientation of those of the earlier Act. The 1925 Act was a *Town* Planning Act, which related, "for the purpose of securing proper sanitary conditions, convenience and amenity, to land which appears likely to be used for building purposes." Under this Act many hapless planners attempted to preserve Rural England by zoning it for houses. And naturally they didn't succeed. But the Act of 1932 is a *Town and Country* Planning Act which may be applied (by kind permission of the Minister of Health) to any land, whether urban, suburban or rural, for the purpose of regulating or *prohibiting* development. So now perhaps the countryside may be preserved by zoning it *against* housing. And in that there is at least a chance of success.

How extensive the success will be, or how great the failure, will depend in a large part upon the Minister (or should we say Ministry?) of Health, who has had thrust upon him enormous powers of veto which it will require the wisdom of a Solomon to wield properly; for he and he only is to be the judge of whether it will be "expedient" to prepare a scheme for this, that and the other piece of land in every corner of the country.

Success or failure will also depend on the efficiency of the local authorities—but though discretion is no strong point in the make-up of the present writer, the little that he has is sufficient for him to resist any temptation to describe what may be expected from the local authorities.

A further power given by the new Act is that which extends the application of planning to the built-up areas of existing towns, which, like rural areas, have hitherto been excluded from the operation of the Acts. Here again the Ministry has a complete and incontestible power of veto against any proposed scheme.

And what is to be the effect of all this on architectural standards and practice?

One thing at least is obvious. The Act consolidates the sacrosanctity of the garden-city ideal. Semi-detachment, twelve-homes-per-acre and to-blazes-with-civic-design is the principle that is still to apply to suburban areas.

Will it apply even to the centres of existing towns? Will our old towns be re-created in the image of Letchworth?

Perhaps even that: for an example a few yards away from where these words are being written shows how deeply the garden-city ideal of housing has

sunk into the popular mind. Here in the very centre of the ancient clustering compactness of Durham city, under the very shadow of the Cathedral, an old medley of jumbled (and admittedly insanitary) property has been cleared away for—what? For a group of modern town buildings? No: for a fiddling little estate of garden-city houses, where even shops stand in semi-detachment!

That, perhaps, shows the garden-city mentality at its worst: generally speaking, we have not universally sunk so far as that—yet. And if we can keep our heads clear and not indulge too much in romanticism, the powers of the new Act, in such things as zoning for use, the introduction of new street lines, and so on, may serve us very well for town improvements.

But even if large-scale architectural composition in street and square is to continue to be prohibited, will the new Act do anything towards raising our national standards of architecture and assuring that the architectural character of the future English scene will not at any rate be so gross as that of the present, and the immediate past?

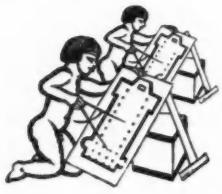
Perhaps it will. Planning schemes under the new Act may contain provisions for "regulating the design and external appearance of buildings," which probably everyone will admit is definitely to the good, though many may be doubtful as to the best procedure for obtaining this regulation.

Are local authorities under the Act to be the final arbiters of taste in their localities? No, they are not. Every scheme containing a provision for the regulation of design must also provide that a person aggrieved by a decision of a local authority may appeal either to a court of summary jurisdiction or to a tribunal constituted for the purpose. Further, as a recent Ministry of Health circular* points out, the powers are not to be used dogmatically, but only "for preventing what may reasonably be regarded as 'outrages,' buildings out of keeping with their surroundings and an offence to the neighbourhood." As such they should be useful, particularly when used in co-ordination with the R.I.B.A. and C.P.R.E. panels that are already fairly widely established. But as to whether they will be used at all or used wisely we shall have to wait and see.

As, indeed, we shall have to wait to see the outcome of the whole Act. In waiting, however, it will be as well to remember the relationship between the scales of expectation and disappointment.

*Circular 1305. There is also a Summary of the Act issued by the Ministry. Both are excellent and valuable documents, and are obtainable from H.M. Stationery Office, price 4d. each.

Changes of Address



Mr. L. Sylvester Sullivan, F.R.I.B.A., has removed his offices to Southern House, Cannon Street, E.C.4. Telephone No.: Mansion House 4964.

Messrs. Adams, Thompson and Fry have removed their offices to 58 Victoria Street (opposite the Army and Navy Stores), S.W.1. Telephone No.: Victoria 7087 (as before).

Mr. H. Douglas Kidd, A.R.I.B.A., has removed his offices to 12 Buckingham Street, W.C.2. Telephone No.: Temple Bar 8522.

Mr. T. Graham Crump, L.R.I.B.A., has removed his offices to 45 High Street, Croydon. Telephone No.: Fairfield 4974 (as before).

COMPETITION NEWS

FLATS FOR STOKE NEWINGTON B.C.

The following architects have been invited by the Stoke Newington B.C. to submit designs for the flats to be erected on the Lordship Road site: Mr. W. R. Davidge; Messrs. Hobden and Porri; Messrs. Howes and Jackson; Mr. E. M. Joseph; Messrs. E. C. P. and H. Monson, and Mr. Granville Streatfield (in conjunction with Mr. Mathew J. Dawson, F.R.I.B.A.) Sir Robert Tasker is to adjudicate; and the premiums are £250, £100 and £50 for first, second, and third places, respectively.

HORNSEY: NEW TOWN HALL

The Borough of Hornsey propose to hold a competition for a new Town Hall, and the President of the R.I.B.A. has appointed Mr. C. Cowles-Voysey, F.R.I.B.A., to act as Assessor. Conditions have not yet been drawn up.

SLOUGH: NEW COUNCIL OFFICES

The Slough Urban District Council have decided to hold an open competition in connection with the new Council Offices which are to be erected at Salt Hill. Premiums of £150, £100 and £50 will be offered, and Mr. H. S. Goodhart-Rendel, F.R.I.B.A., has been appointed by the President of the R.I.B.A. to act as Assessor. Conditions have not yet been drawn up.

COMPETITION FOR A DESIGN IN GRANITE

In connection with the competition for a façade for a newspaper office in granite, organized by the Architectural Association on behalf of the Cornish Quarry Masters' Association, the award of the prize (£50) will be announced and a criticism will be given at 6 p.m. on Tuesday, April 4, at the Architectural Association.

Refreshments will be served from 5.30 p.m.

The competition drawings will be on exhibition at the A.A., 34-36 Bedford Square, from after the announcement of the award until Saturday, April 8, from 10 a.m. to 7 p.m.

LAY-OUT OF PROMENADE

The Council of the Borough of Douglas, Isle of Man, propose to carry out a large widening scheme in connection with the Promenade, and have decided to hold a competition for the lay-out of the front, including ornamental gardens. They propose to offer premiums of £100, £50 and £25. Conditions have not yet been drawn up.

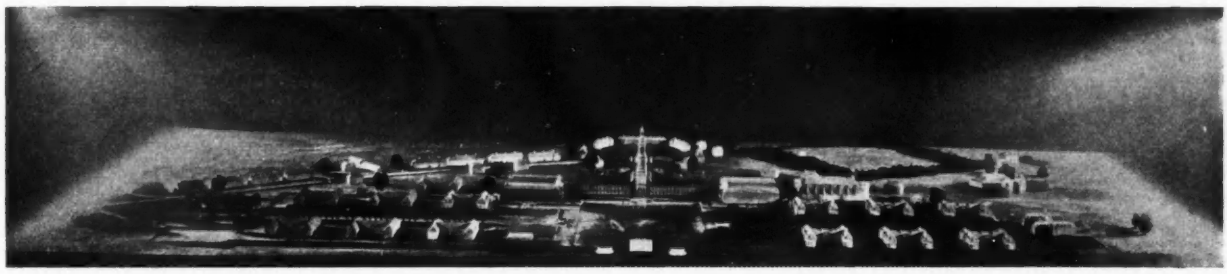
Competitions Open

March 31.—Competitions for Cottages to be built at an economic rent, organized by the Building Centre, 158, New Bond Street, W.1, from whom full conditions are obtainable. Premium: £100.

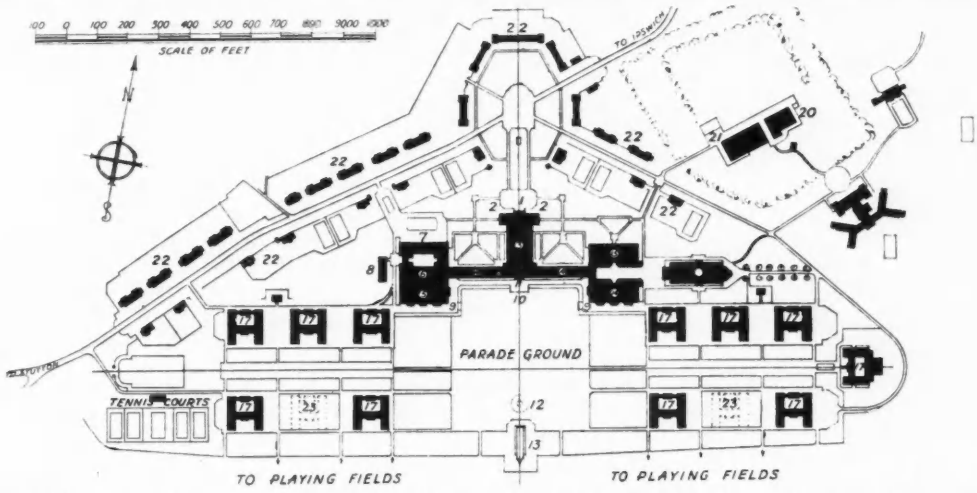
April 13.—Design of a new exhibition hall at Manchester for the Management of the Manchester Building Trades' Exhibition. Premiums: £150, £75 and £25. Full particulars were published in *A.J.* for February 15.

May 8. — Proposed Burgh Chambers, Municipal Offices and Public Baths for the Town Council of the Burgh of Prestwick. Premiums: £200, £100 and £50. Designs to be submitted to the Town Clerk not later than 12 noon on May 8. The period for applications for conditions, etc., has now closed. Full particulars were published in *A.J.* for March 15.

May 31.—Sending-in Day. Layout of a suburb on the river Escaut, Antwerp. £2,400 in prizes (1st, £800). Conditions, etc., were published in *A.J.* for December 7, 1932.



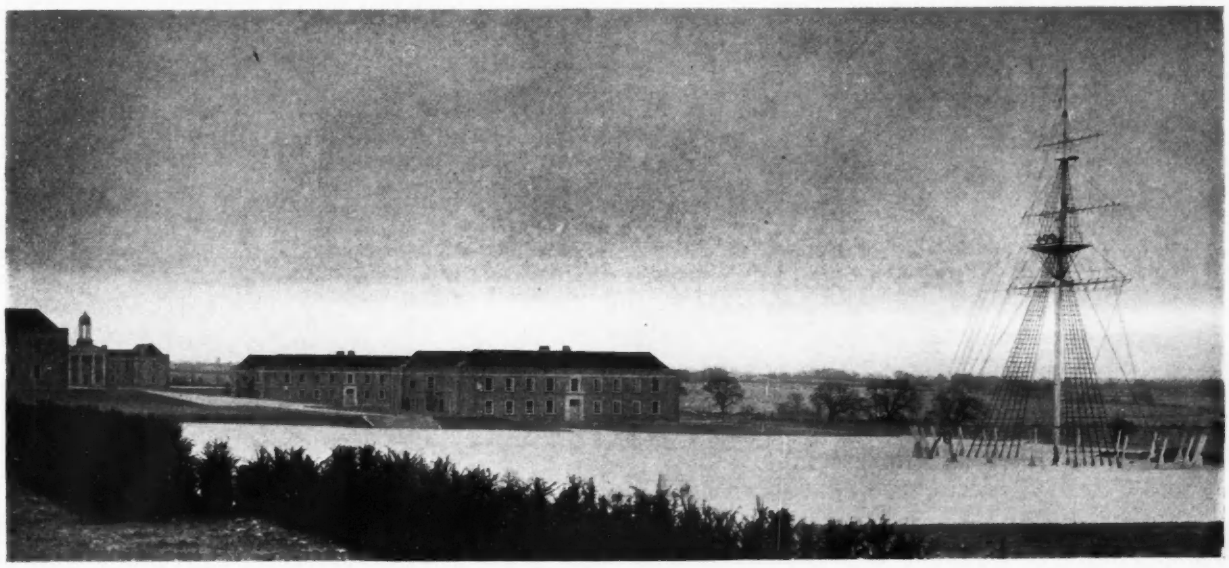
ON THE AIR



A series of broadcast talks is to be given by Commander Stephen King-Hall and Mr. N. F. Hall, Head of the Department of Economics at University College, London. The series will begin on Monday, April 3, and will run until July 3, with the exception of three Mondays: April 24, and May 8 and 15.

The series is in preparation for the expected World Economic Conference, and is intended to answer some of the questions, in part philosophic, in part political and in part economic, which arise following the present world crisis.

Commander King-Hall is taking the attitude of a representative of the man in the street and the woman in the house and will cross-examine Mr. Hall on the various issues which arise. A preliminary talk was given on March 15, when Commander King-Hall invited listeners to send him questions which they would like him to bring up.

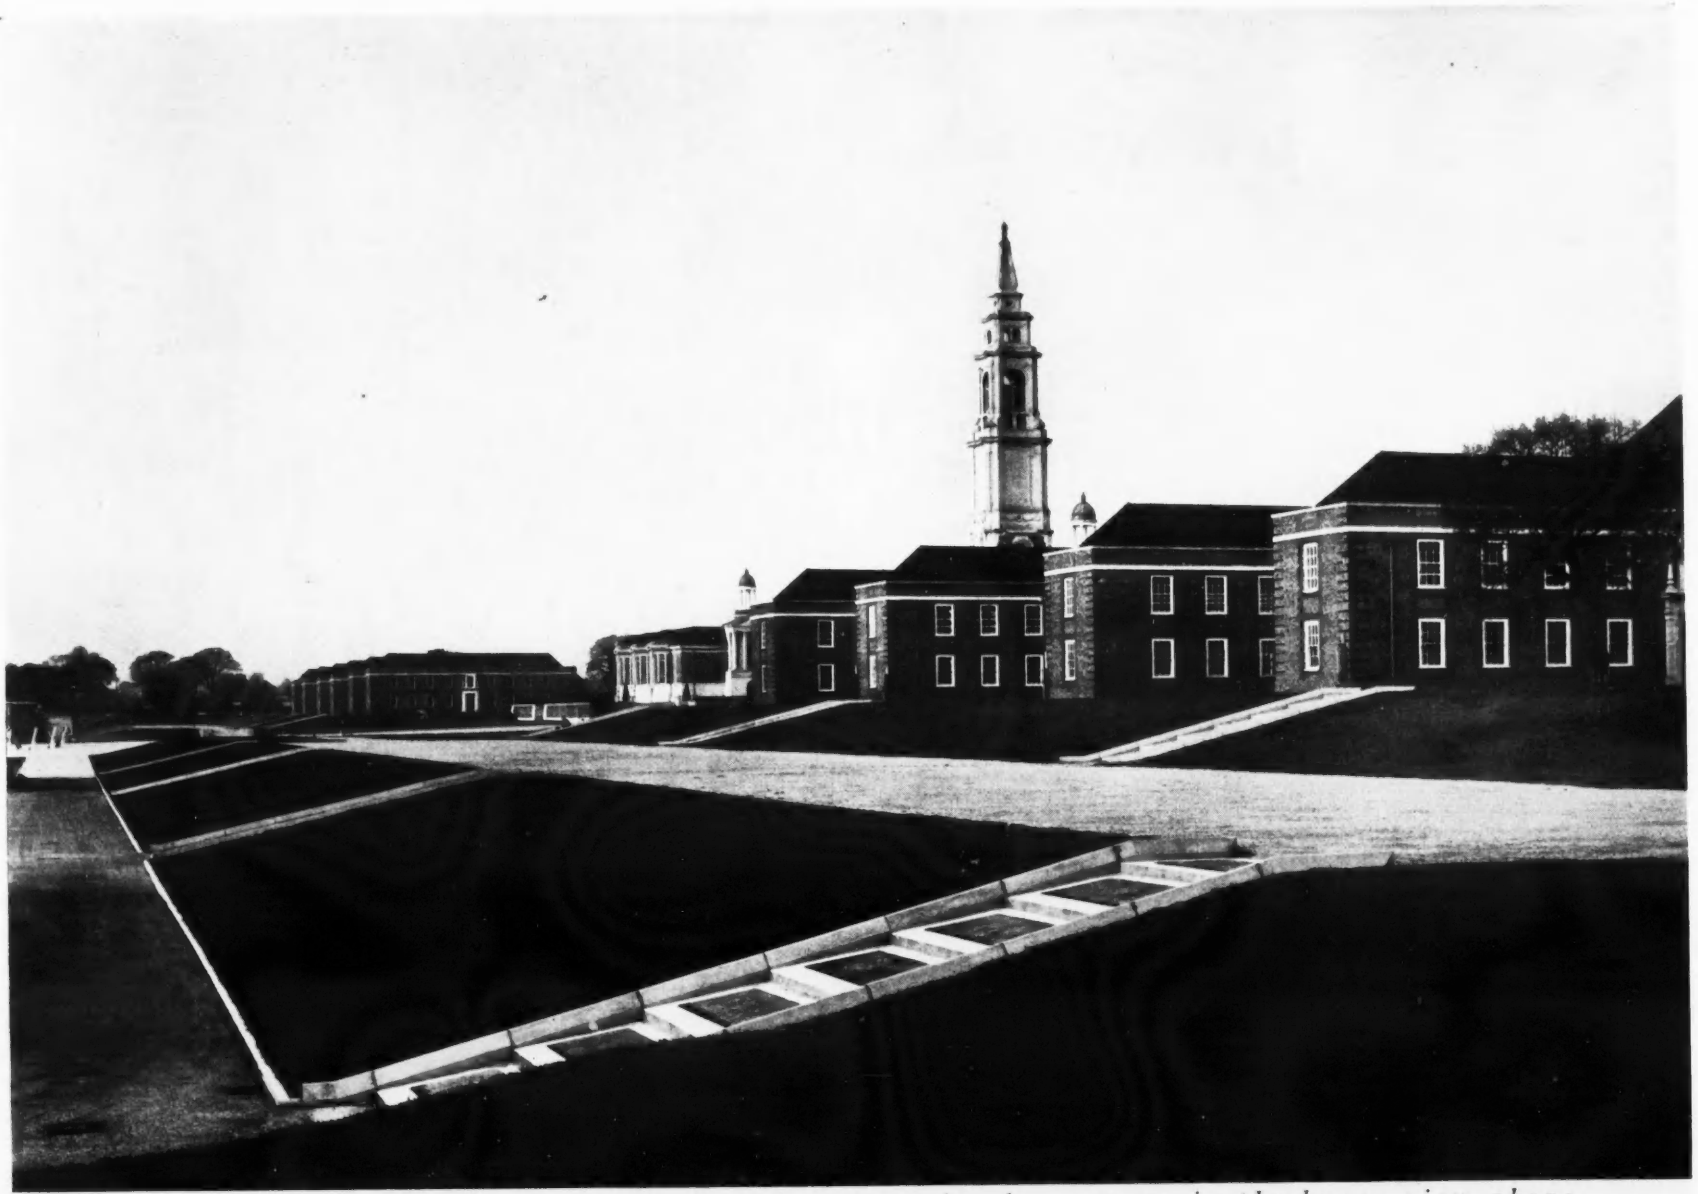


ROYAL HOSPITAL SCHOOL, HOLBROOK

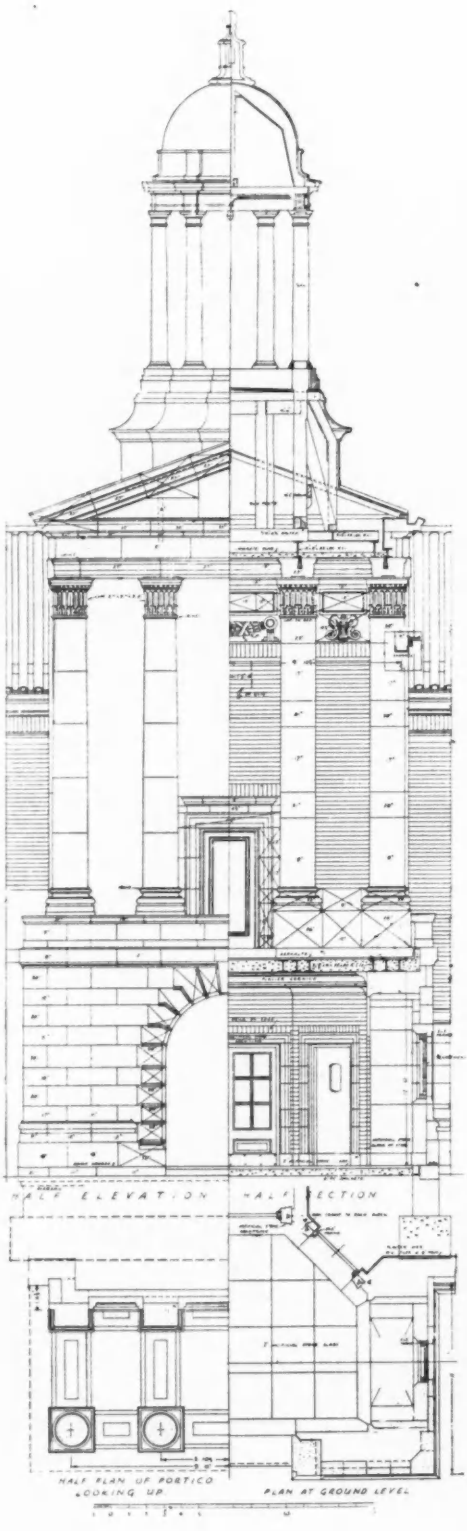
On this page are given general views of the buildings at Holbrook, Suffolk, to which the Royal Hospital School has been removed from Greenwich; more detailed photographs follow. Above are shown the layout model and its key-plan, in which the following are the references:—

1. Entrance.
2. Administration.
3. Assembly Hall.
4. Classrooms.
5. Dining Hall.
6. Kitchens.
7. Stores and Bakery.
8. Manual Instruction.
9. Terrace.
10. Saluting Base.
11. Tower.
12. Rigged Mast.
13. Rifle Range.
14. Gymnasium.
15. Swimming Bath.
16. Chapel.
17. Hostels.
18. Infirmary.
19. Supt.'s House.
20. Laundry.
21. Engineering Block.
22. Residences.
23. Future Hostels.

DESIGNED BY BUCKLAND AND HAYWOOD



ROYAL HOSPITAL SCHOOL, HOLBROOK : BY BUCKLAND AND HAYWOOD

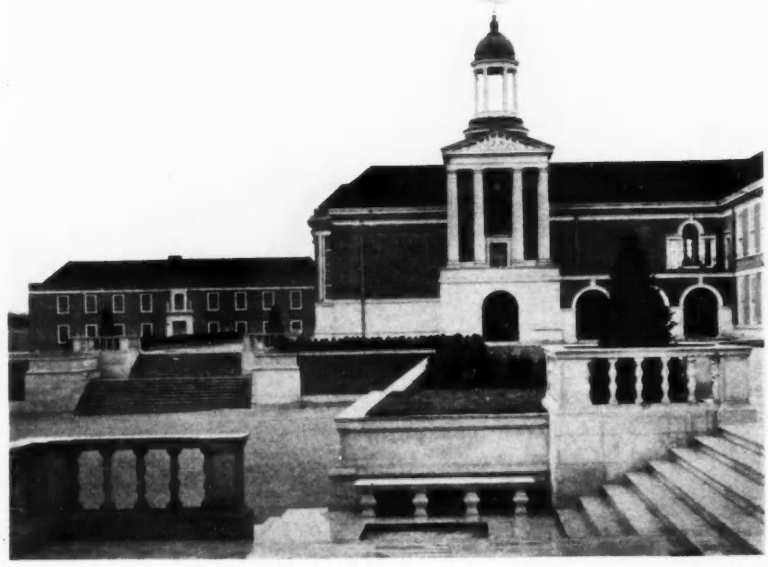


Two views of the central block and the parade ground, looking north-east, and west.

Two views of the central block and the parade ground, looking north-east, and west.

Five of one row of six hostel blocks; the aspect is the same as in the lower view above.

ROYAL HOSPITAL SCHOOL, HOLBROOK,



The site is a very large one, not far short of a mile long from end to end, and the furthest of the hostels, some of which, to accommodate eighty boys apiece, are illustrated on the preceding pages, is nearly half a mile from the assembly hall, which lies behind the spire in in the adjacent view of the classroom blocks, taken from the terrace. The lower photograph, of the dining hall, with, beyond it, one of the hostels, also shows some of the stone-balustraded terracing that has been carried the length of the south front. The drawing is of the cupola of the dining hall block.

The buildings are faced with Blockley bricks, and roofed with Roman tiles; plinths, colonnades, tower and dressings are of Portland stone.

The Royal Hospital School was founded in 1712 for the education of ten boys, sons of inmates of Greenwich Hospital; by 1783 the numbers had increased to 200; today the establishment numbers 860, and accommodation is in view for a future total of 1,120 boys.

SUFFOLK : BY BUCKLAND AND HAYWOOD

The views on this page show the main entrance on the north front, with the assembly hall block, dominated by the Wren-like spire; and a detail of the sculpture in the classical pediment of the portico. To the right of the assembly hall is a range of classrooms on two floors, linking up with the block in which are placed the dining hall and kitchens. To the left a corresponding wing of classrooms terminates in the gymnasium and swimming bath. The spire forms a landmark visible from afar over the level landscape of the estuary of the Stour, and houses water tanks.

WHAT IS TO BE DONE ABOUT

THIS?

[*By 'PENATES'*]

[*As it is almost certain that there will shortly be a revival of building work, especially of small house building, a full inquiry into contemporary speculative small house building practice is of immediate importance.*

The article which follows is the first of a series in which will be outlined the why and wherefore of the present position, the requirements of the middle-class householder, methods of financing building work, and the possibility of further economies through the introduction of new materials and new methods of construction, and a revision of existing bye-laws. We shall also give examples of the achievements of architects who have themselves performed the functions of the speculative builder.

There can be no question of the desirability of architect-control in the large-scale developments that must soon go forward.—ED., "*A.J.*"]

1. The Speculative Builder

WE must have more houses. Though nearly two million have been built since the war ended, the supply has not yet caught up with the demand, and there is an especial need for the three-bedroom, non-parlour type, of 760 sq. ft. area, that sells for £520 or less, and lets at something under 8s. per week, rates excluded.*

Building costs have fallen and low interest rates have brought down the cost of capital: today, for the first time since the war, houses can be built, without subsidy, to let at rents that those who most need houses can afford.

Accordingly, the Government proposes to leave housing to private enterprise. The recent Housing Bill provides for the withdrawal of the subsidy, and suggests as a source of capital the wealth of the Building Societies, hitherto only partly exploited.

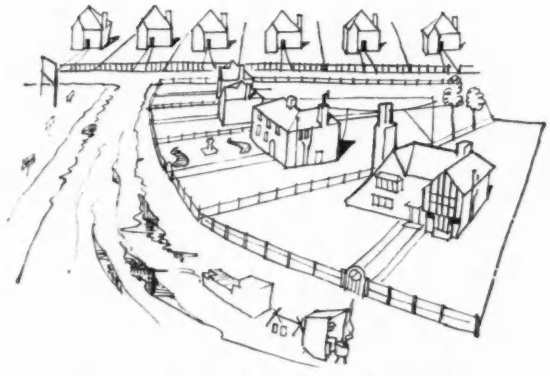
Under the present system the Societies advance 70 per cent. of the value of the completed building to the purchaser, but the new Bill proposes that the Government and the local authority shall each guarantee repayment of the difference between this 70 per cent. and 90 per cent., and in return the Societies shall advance up to 90 per cent. of the building cost to the builder, provided the scheme be approved, lower their customary rate of interest by 1 per cent., which is the equivalent of 1s. 8d. per week in rent, and extend the period of repayment to 30 years. One must anticipate, however, that private enterprise will act only in spheres where a big profit is ensured, and whilst houses for the more well-to-do artisan will doubtless be provided, it is unlikely that much will be done for the poorer of the working classes.

Largely with the object of avoiding this danger, Sir Raymond Unwin has urged the formation of a National Housing Corporation, whose activities would lie in the promotion of the building of houses for renting to the poorest classes, and the ownership and administration of them on completion.

So the present position is this: many more houses are needed, building is cheap, labour plentiful and finance easy. Arrangements may be made whereby even the building of houses to let at low rentals will become an economic proposition, though such housing may be controlled by a National Housing Board.

The speculative builder is thus preparing to get busy; we are familiar with his past achievements, and, as architects, we disapprove of them. But there exists no alternative machine for the performance of this essential work.

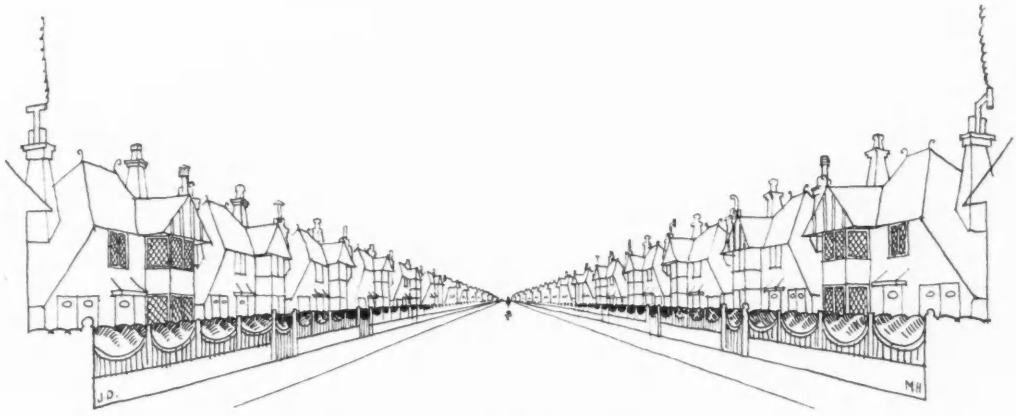
If the man in the street wants a ready-made house—and there is no reason why he should not—there will always be someone waiting to meet the demand. The twentieth-century small house is, in fact, a mass-produced industrial product; in a lesser degree, admittedly, than is desirable, largely because obsolete bye-laws continue to prohibit certain logical and economical methods and forms of building construction.



The problem of immediate concern, therefore, is the provision of well-planned houses that conform to a decent standard of design; "co-ordinated schemes on well laid-out sites."

The speculative builder has shown himself unable to provide these unaided. Why? Because the only person who can provide them is the architect.

We may assume, in fact, that the services of the architect should be, from every point of view, an important factor in speculative building, yet there are, today, hundreds of architects without work, whilst thousands of houses are being built without architects.



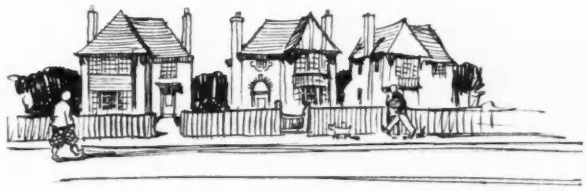
It is obvious that if architects do not make a concerted, active movement in house building there will be no cessation in the littering of nasty, self-conscious little villas all over the country, unco-ordinated groups of unplanned pretentious little villas that conform to no standard of design.

In 1923 the R.I.B.A., after consultation with the National Federation of House Builders, the London House Builders' Association and the National Federation of Building Trades Employers of Great Britain and Ireland, issued a scale of fees for architects for private enterprise housing work; a scale which applies only where the services of the architect are limited to the preparation of drawings. The scale is 4 per cent. for the first unit, 2 per cent. for the second unit, £3 3s. each for the next twenty-five, and £2 2s. each for all others. Above two units the fees include for a lay-out plan and two types for the first twenty houses and one additional type for every additional twenty houses. It has been said, however, that the results of the new scale have been negligible: first, because it

Un-co-ordinated schemes on unplanned sites.

* 9s. 9d. to 10s. per week, inclusive of rates.

A twentieth-century standard in small house design.



may be unknown to builders, financiers and architects, and secondly because, whilst being unremunerative to the architect, it may be too high for the builder. If this is the case we can only assume the employment of an architect in speculative building work to be an economic impossibility; but such an assumption is incompatible with existing cases, admittedly and unfortunately isolated, in which the builder has employed an architect and provided houses of outstanding merit that are good sellers and show a profit.

But if, in general, the promoters of speculative house building will not employ them, and cannot without them improve on the present standard, then architects, in order to re-capture work, improve existing house design and preserve amenities, must evolve other machinery for the performance of this important economic function.

When the architect has capital of his own there is little difficulty in his building speculatively. Several men of repute are working in this way at the present time. Others, whose capital is limited, work with a builder or with a group of sub-contractors. Alternatively, the pooled capital of several architects is employed, but if the movement is to be effective in creating a new standard in house design, it must be immediate and on a large scale,* and steps must be taken to accelerate the revision of restrictive bye-laws.

Some may criticize the practice as unprofessional, but can they really believe etiquette to be of greater importance than architecture, and intelligent land development?

It is only by such constructive steps that architects are able to do the work that can alone be done well by them, and to enforce, by example and the creation of a demand, a better standard of small house building than exists today. But little purpose can be served by appealing to the public through "architecture." What is needed is better accommodation for less money, and this, through economical planning and the intelligent use of new materials, the architect is able to provide.

Pretentious little villas.

* It has been shown that houses erected two at a time cost so much more than those, of a similar type, that are built in hundreds, that they are not an economical proposition.

LETTERS FROM READERS

The Housing Bill

SIR,—Mr. Coppock's letter in your last issue seems to represent the considered view of a large proportion of the enthusiasts for Town Planning and those who wish to improve the general housing conditions of a mass of the population.

In essence it is to go back to the Addison Act of 1919. On general grounds this seems a retrograde step in so far as this Act, while it produced a certain number of relatively decent houses, did not do so either in sufficient numbers or at an economical price. It would appear, therefore, that a new approach must be found.

There is some hope that the Departmental Committee that has now been appointed to enquire into this problem, with terms of reference which should cover a possible Housing Corporation, should show very much greater hopes of a solution. Housing has yet to go through the phase of individual local production. In *The Times* for February 14 it was shown that there were something like 56,000 firms of builders and that only about 8,000 employed ten or more persons at an average turnover of £11,000 and over.

When motor-car production started there was also a very large number of makers each making a few cars a year. Now three-quarters of the British cars made each year are produced by only three firms. It is clear then that before the advantages of modern production can be applied to housing a great deal of rationalization has to be done.

A completely new technique of construction will have to be worked out, and there seems to be greater hope that a National Housing Corporation

J. CRAVEN PRITCHARD
H. B. BRYANT
(Secretary, Building Industries National Council)
W. C. B. SMITH, A.R.I.B.A.
THOMAS PAYNE
F. R. YERBURY, HON. A.R.I.B.A.
OAKELEY SLATE QUARRIES CO., LTD.
E. A. L. MARTYN, A.R.I.B.A.
JOHN SUMMERSON, B. ARCH., A.R.I.B.A.

would be able to do this than a mere reversion to the Addison Act of 1919. Before such a Corporation could be effective, there will have to be very considerable modification of local regulations as applied to sanitation and construction, trades union restrictions and the reconsideration of the permanence of "capital."

If a Corporation could come into being with the ground cleared to this extent, and if it could be given the responsibility of making its structure safe and sanitary, there would be very considerable hope that the mass of the people would be housed in a decent manner and on a very much higher standard than the present artisan dwelling.

J. CRAVEN PRITCHARD

De-Slumming

SIR,—Mr. Maxwell Fry's otherwise most excellent article on "De-Slumming" (issue for March 15) seems to be impaired somewhat by his early statement to the effect that building costs have risen faster than either wages or the common standard of living. It is not clear to what period Mr. Fry refers, but in case an entirely false impression should be conveyed by this statement it is necessary that the facts of the matter, so far as they can be ascertained and applied, should be stated.

While it is true that building costs are higher than in 1914, they have risen (and fallen) with the official cost-of-living figures, to which, as far as labour costs are concerned, they are bound, the standard of construction (quite properly) has continued to rise. The modern standard of the semi-detached non-parlour type of house, together with its amenities of separate scullery, bathroom, sanitary accommodation, etc., and its greatly increased floor area, represents an advance of probably not less than 100 per cent. from the standards involved in the pre-war terrace type of house, with its ghastly tunnel entrance passage and its light-blocking back addition.

The present constructional standards, it must be remembered, are, in effect, legal standards, and the Building Industry merely has to comply with them. Prior to 1914 the narrow type of terrace house (which has become the modern curse of industrial towns), cost on an average approximately £200 to build. Modern cottages, with greater cube and greater amenities, can now be built for something slightly in excess of £300.

The official cost-of-living index is now 41 per cent. above 1914. But this figure shows merely the average increase in the cost of maintaining unchanged the pre-war standard of living of working-class families. It is not a figure which can be compared with all phases of building costs. Neither can the comparison of pre-war wages or other rates with present rates fairly be made, unless the other factors contributing to building costs are taken into consideration.

It is true that the average increase in the cost of building material is greater than the relative increase in the cost-of-living index. But the quality of building materials has improved enormously as a result of modern progress. Further, as was pointed out in the JOURNAL of January 11, there has been an average fall of about 20 per cent. in the cost of building materials in recent years.

On the whole, it is true to say that, with improved organization and increased output, modern cottages, which represent an advance of possibly well over 50 per cent. in super area, and well over 100 per cent. in domestic amenities, are being produced today at an actual constructional cost of very little more than 50 per cent. above pre-war constructional costs of the same type.

So much for the actual building costs; but these do not represent the total cost to the building owner. He has to face the costs of what are in effect the "raw materials" of the Building Industry, namely, land and finance charges. The cost of land adjacent to towns has increased enormously, since pre-war days. The Building Industry has no control over this factor. Interest charges on loans and mortgages generally have also increased, entailing not only an additional charge on first costs, but one that is not in all cases reflected in the rent chargeable, or which the usual type of tenant can afford to pay. The position, therefore, is that on a house costing £300, the building owner, on the basis of 90 per cent., and mortgage at 4½ per cent. advance, has to meet a charge equalling 4s. 8d. per week, which in most cases represents more than 50 per cent. of the weekly rent. Neither the builder nor the building owner has any real control over this charge. The position is rapidly being reached where the financial agencies are getting a higher and more certain return on their money than are the actual builders. Herein lies the core of the problem, as it presents itself today, of providing houses at a rent that the average low wage-earner can afford to pay. The problem, in fact, is not so much a building problem as a financial one.

As a general reference to building costs as such, there would appear to be sound ground for asserting that, where conditions are comparable, modern building costs are, value for value, actually lower than pre-war costs. No one could deny, for instance, that the maintenance cost of modern building is anything like so heavy as in the case of pre-war building.

H. B. BRYANT

[The above letter was submitted to Mr. E. Maxwell Fry, who has sent us the following reply.—ED., *A.J.*]

I stand very willingly corrected by Mr. H. B. Bryant's illuminating analysis of relative building costs so far as they appertain to cottage building outside the peak years of post-war construction—even perhaps for block dwelling building, though in this latter connection my estimate of wages was a very low one, taking into account unemployment, and my estimate of building costs included planning and design as well as construction.

But in the main I accept the criticism in return for more information than one commonly looks for in answer to a rhetorical question.

E. MAXWELL FRY

Information Sheets

SIR,—Please accept my appreciation of the latest feature of THE ARCHITECTS' JOURNAL—the weekly Information Sheets. The gratitude of many members of the profession is due to you and to Messrs. Burnet, Tait and Lorne.

May I mention a small point in connection with one of the sheets? Sheet No. 3, entitled "Seating for Schools," is applicable only to secondary schools. As the Board of Education's recommendations for elementary schools are somewhat different, I wonder if a similar sheet is forthcoming for elementary schools. I have myself, for the time being, attached to my copy of Sheet No. 3 a supplementary sheet, and I venture to enclose a print herewith.

WM. C. B. SMITH

[*This supplementary sheet is illustrated on the opposite page. We applaud our correspondent's zeal and would take this opportunity of saying that we should be glad to receive either new information sheets or suggestions for Information Sheets from other architects.* —ED., *A.J.*]

Standard Cottage Competition

SIR,—The Building Centre invite designs for an improved "Standard" type of cottage, "which has already been carefully worked out." Competitors are obviously expected to expend much care and skill in arriving at a better solution. For this privilege they are required to pay one shilling for a two-page sheet of conditions to provide a premium of £100.

his design will remain the property of the competitor" is useful when a journal devoted to farming is distributing these conditions and plans free with the advice " to wait until the competition is out before building."

A popular contemporary is offering a prize of £300 for a rhyming couplet to the line, " ' Sweetheart, where are you ? ' she called up the stairs," the entrance fee being threepence. I suggest that this is much the better proposition of the two. H. S.

The Winchester Cut

SIR,—With reference to " Student's" enquiry, *re* the pitch at which the Winchester Cut is applicable, I would point out that this can be varied at will by altering the gauge at which the

weather tiling is hung. The angle for various gauges can be found as shown in sketch.

THOMAS PAYNE

Not a Church

SIR,—May I refer to your issue for March 22, and to the illustration on page 387, and may I also quote your caption ?

You would say, would you not, that this is a block of flats or the court of an office building, or, conceivably, a colossal school ? Not so, gentle reader ; it is a sacred edifice, a church. It represents a modern conjugation of the verb to worship, and has recently been erected in Hamburg.

This seems so perfectly to represent the general upside-downness of things in the Fatherland at the present time, that it is a pity the building referred to happens to be not a church, but an office block—the Sprinkenhof—a colossal business centre put up in Hamburg by the architects Höge and Gerson, about six years ago. The view is one of the inner courtyard taken from the ramp which leads down to the underground garages attached to the building.

F. R. YERBURY

[*We suggest that, in future, titles on the backs of photographs submitted by press agencies to the architectural journals should be verified by Mr. Yerbury !* —ED., *A.J.*]

Purple Slates and Red Tiles

SIR,—In your issue for March 15 Astragal asks: "Which is the fouler, a purple slate or a cheap red tile?" We do not presume to offer an opinion, but why does he not mention the grey-blue slate of the Festiniog district in North Wales, which discerning architects specified for the old buildings of our cathedral cities, and now specify for the modern housing schemes in country districts ?

" What," he asks, " are the economics of slate selling ? Are the thin, accurately-squared horrors really the cheapest to produce and market ? " The answer is that the thinner the slate the more it costs, and again, architects in this country, where they can afford the expense, do not hesitate in their choice, and abroad, for buildings like the old Hôtel de Ville, at Brussels, and the more modern Peace Palace, at the Hague, have selected these slates in preference to all others.

As the people responsible for the production of these monstrosities, may we ask what is the alternative proposed to end the " period of debased taste that keeps them hanging on " ? After producing for the best part of a century we are still open to any help your correspondent can give us.

The real value of a decent slate is that until the nails rot it " keeps hanging on."

OAKELEY SLATE QUARRIES CO., LTD.

[We submitted the above letter to Astragal, who has sent us the following reply.]

The reason why I did not mention the grey-blue slate of the Festiniog district is because I was venting my spleen upon the foul purple ones which look so cheap but which cost apparently more than thick rough ones. I am no enemy of slates, for two years ago I used a quantity of blue-grey slates with a dash of green in them, and they came from Festiniog or thereabouts ! They looked uncommon well with cream-washed walls.

What has brought slates into disrepute is the habit of laying thin purple slates with devastating accuracy on rows of ugly houses, capping the performance with a red tile ridge. If slate manufacturers wish to repopularize slate let them educate the builder. He has caused the trouble.—ASTRAGAL.

Technical Paper No. 7

SIR,—In the notice of this publication in your issue for March 15, it is very evident that your reviewer was much upset because no reference was made to the " Daylight Factor Theodolite " and grilles invented by Mr. John Swarbrick.

It is, however, a pity that he should have allowed his annoyance to lead him into numerous misstatements in the course of his review. To start with, the title of the technical paper is not *Easements of Light* but *Penetration of Daylight and Sunlight into Buildings*. The Radial Calculating Sheets published in Mr. Swarbrick's book are for the measurement of daylight on horizontal planes only, while a rectangular diagram for the measurement of light on vertical surfaces was devised by Messrs. P. J. and J. M. Waldram as long ago as 1922. It is, however, not often made use of, as in nearly all " ancient light " cases, the light on the horizontal plane of reference is what matters.

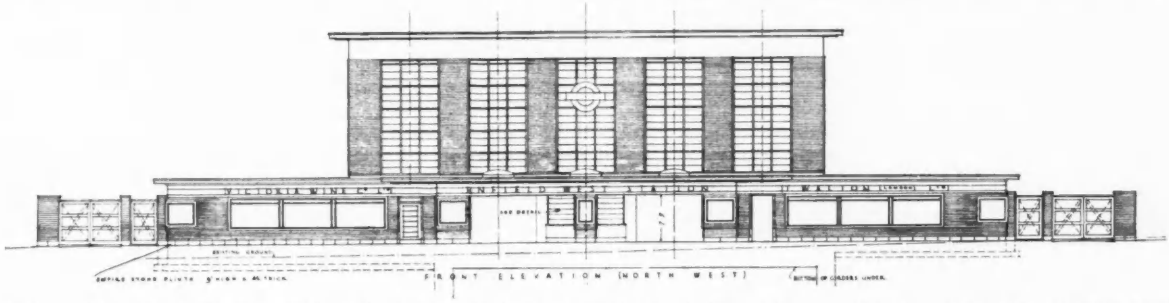
The important point in connection with the 2nd edition of Technical Paper No. 7 has been quite missed by your reviewer. It is that the " Droop Diagrams " (kindly disclosed by Mr. Waldram) are of great assistance to the average architect, who occasionally needs to work out contoured daylight plans, but does not want expensive instruments seldom needed in ordinary practice. And the Daylight Factor Photo-Theodolite cannot photograph buildings before they have been erected.

E. A. L. MARTYN

A Biography of Nash

SIR,—I am engaged upon a biography of John Nash (1752-1835), the architect, and should be very glad to hear of any letters or drawings connected with Nash now in private hands. If any of your readers would inform me of the whereabouts of documents of this nature I should be extremely grateful.

JOHN SUMMERSON



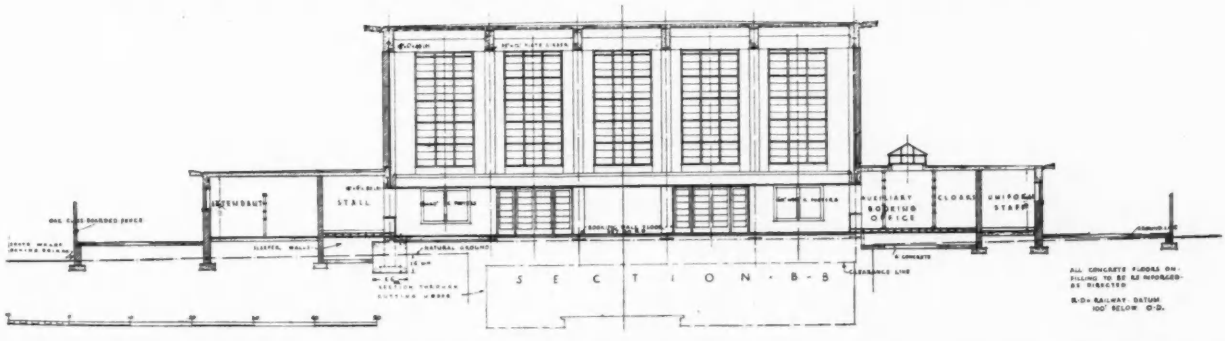
The Slum Drive

Sir Hilton Young, the Minister of Health, in the course of an address to the Chelsea Housing Improvement Society last week, said :

Our common object is to get rid of the slums. We have at present a good opportunity to make better progress with that than we have made for years. We must get to work, and we have now the opportunity. It is provided by the great fall in building costs.

It is right to do so. The slums are our most crying social evil. Their removal is our chief social need. We need to make a plan of campaign against this enemy and to stick to it when made. I shall, within a few days, be entering into conference with the representatives of the local authorities on the matter, preliminary to asking them, in cases in which it has not already been done, to prepare as a matter of urgency surveys of their slums, and programmes for dealing with them within a fixed time. After that will come the hard work of seeing the programmes through. It can be done and it will be done, because public opinion is behind us.

ENFIELD WEST UNDERGROUND STATION

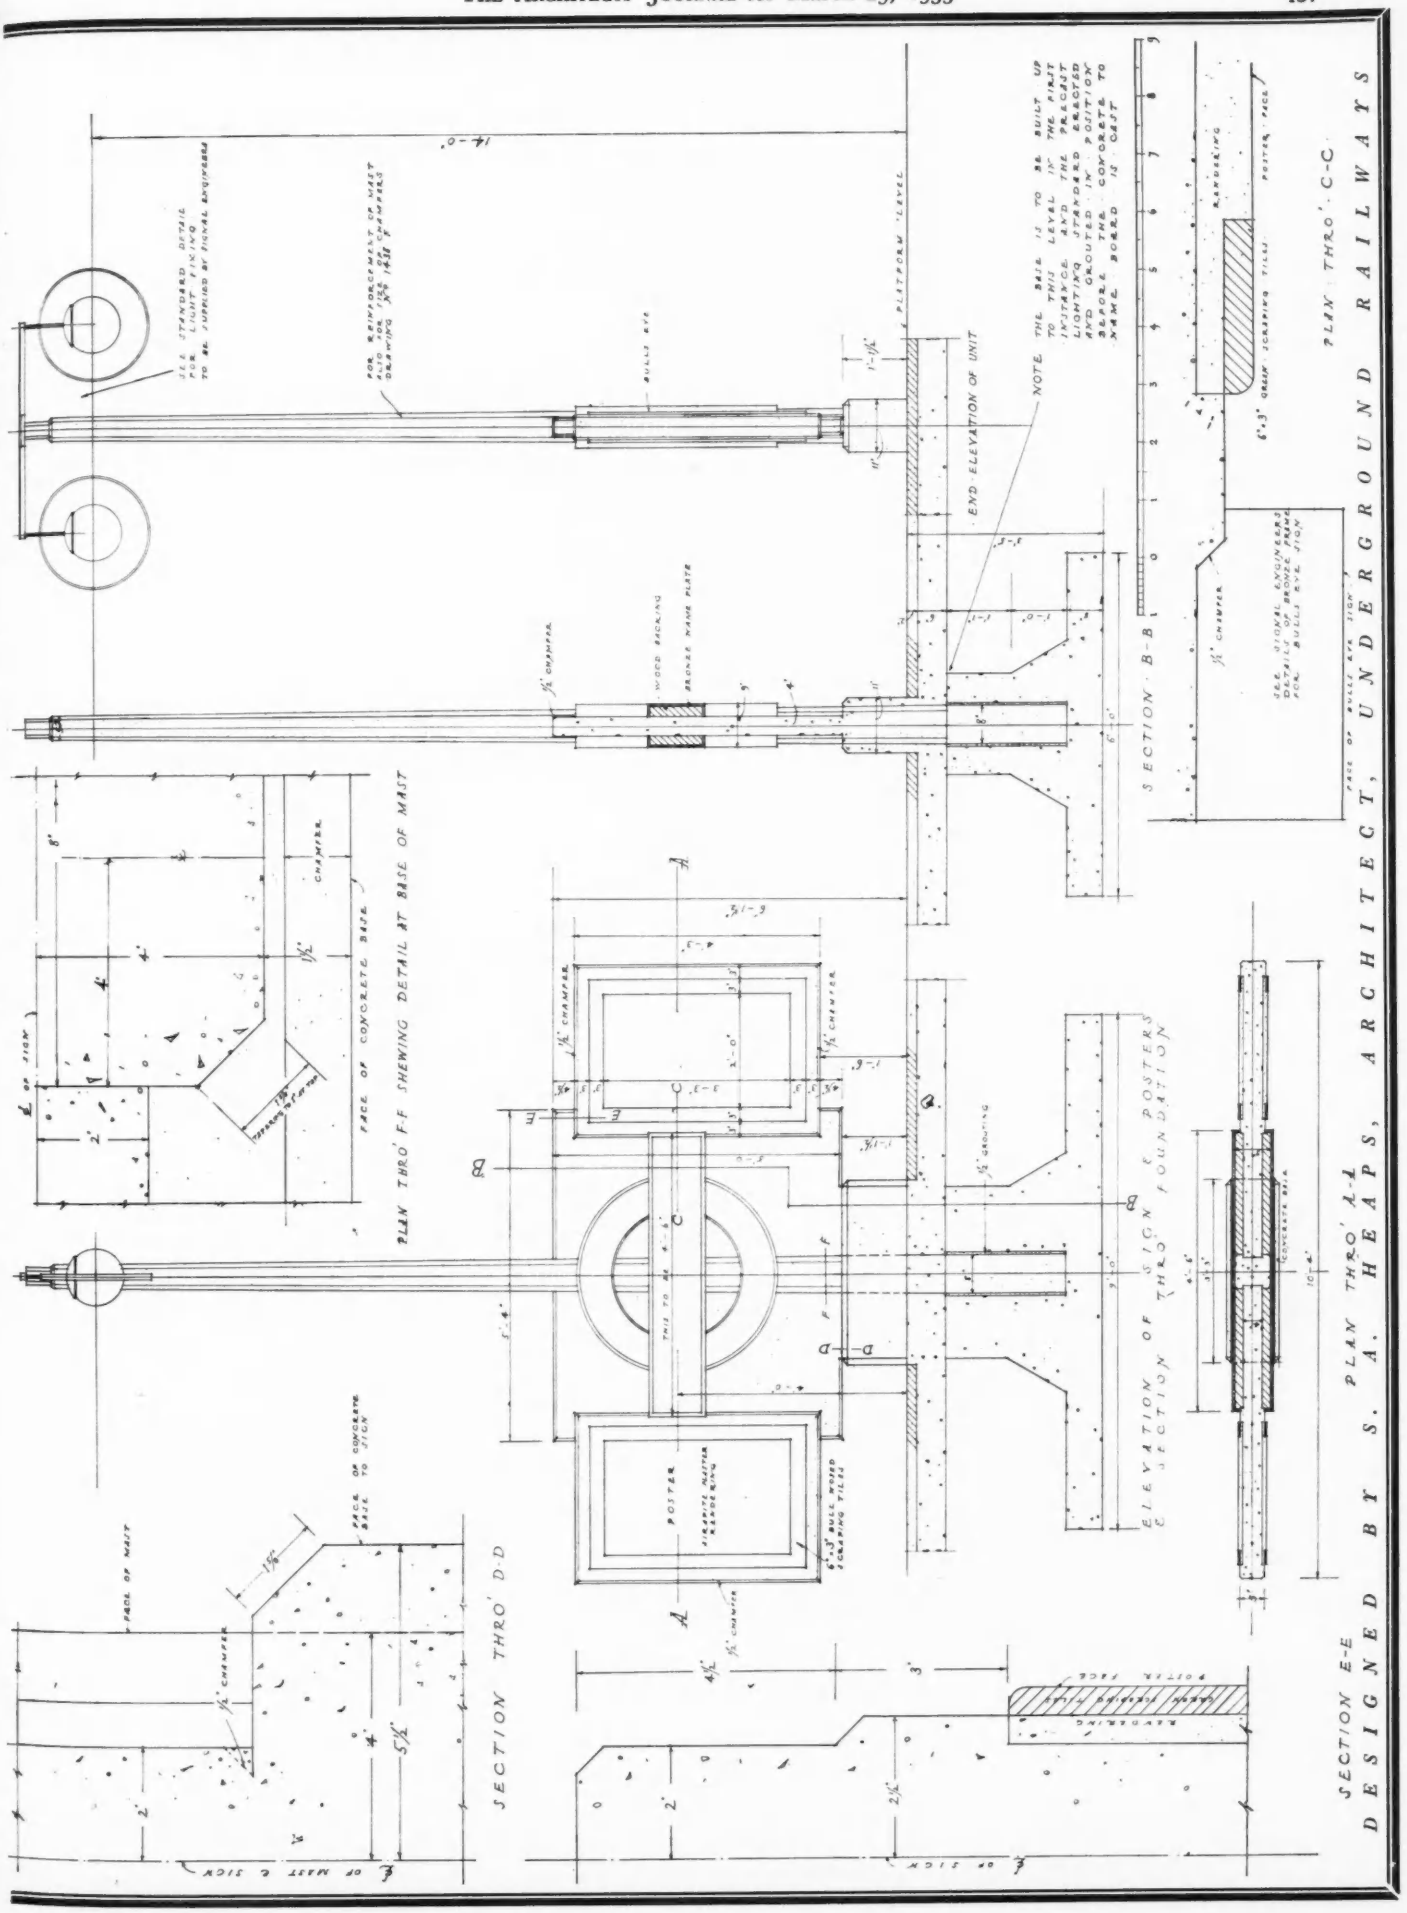


BY C. H. JAMES (ADAMS, HOLDEN AND PEARSON, CONSULTING)

Enfield West Station, one of the two latest on the Southgate tube extension, follows in its main features the type of design for the new country stations at both ends of the line, as at Sudbury Town and Turnpike Lane, for example. The booking hall (see plan overleaf), standing at an angle to East Barnet Road, is controlled, both in size and position, by the lines of beams over the tracks in the cutting beneath. It is lighted by large windows at the front and back and is surrounded by lower service buildings. A double entrance leads through the hall past the booking booth and ticket machines, to the staircase (see pages 438-9) descending to one double-sided platform (see Supplement). The building is faced inside and out with grey South Wales and multi-coloured Buckinghamshire facings, with beams and cornices in grey Portland cement concrete, with Portland stone aggregate on the face, the skin being cleaned off.

The booking-hall has a deep dado, 7 ft. 9 ins. high, of black glazed brick, under a broad concrete ring-beam at fascia level, the bronze and wood shop-fronts being picked out in green. The frieze under the lower cornice at the level of the name fascias outside is in faience tiles similar to those used in similar positions at Arnos Grove and Acton Town Stations, but green instead of blue.

To save time in erection and to preserve the brickwork from staining from cement, the main hall was built as a steel frame and the concrete to stanchions, beams and roof cast and set before the brickwork was started.



(NOTE: For the work below ground level—stairs, platforms, etc.—the architect to the Underground Railways, S. A. Heaps, was responsible.)

TRADE NOTES

BY F. R. S. YORKE, A.R.I.B.A.

¶ *If we are to build well, and with economy, and equip our buildings with fittings and machines that perform their functions in a straightforward manner, it is essential that architects and manufacturers shall keep in close contact with each other's work and aims.*

My main object in these notes will be to bring into closer working relationship the architect and the manufacturer, who are so often inclined to work at loggerheads, to their mutual disadvantage; to select products whose portent may not be appreciated by the architect; and to give the information that the architect requires.

I shall be pleased to answer questions that may arise, and I shall welcome suggestions from architects and manufacturers. I shall be grateful to those who send illustrations and specifications of intelligently-produced materials and fittings, and I particularly want to receive details of new standardized building equipment.—F. R. S. Y.

A new structural steel

A MATERIAL that may have considerable influence on structural problems in the future is Chromador, a new British high-tensile structural steel, marketed by Messrs. Dorman Long, which contains chromium and a small percentage of copper, and has an ultimate strength of 37–43 tons per sq. in., a minimum yield point of 23 tons per sq. in., and an elongation of 17 per cent. on 8 in.

•

It is said that it is suited to all structural purposes for which mild steel is at present employed, and that a member in the new material is at least 50 per cent. stronger than a similar member in mild steel. Subjected to tests, beams 14 ins. by 6 ins. by 50 lb., and 12 ins. by 5 ins. by 30 lb., show the following results :—

Section.	Span.	Load at failure (tons) concentrated at centre of span.		Ratio of ultimate strength Chromador to mild steel.
		Chromador	Mild steel.	
16 in. × 6 in. × 50 lb.	20 ft.	40·1	26·2	1·53
12 in. × 5 in. × 30 lb.	12 ft.	36·9	22·0	1·68

—and full size tests on compound girders and on 10 ins. by 8 ins. by 55 lb. beams, of varying length, in compression, indicate that a 50 per cent. increase in the allowable working stress is justifiable.

•

It is interesting to note that the German State Railways specification for Continental high-tensile structural steel (St. 52) allows a 50 per cent. increase in unit stresses—a maximum permissible stress in tension of 13·32 tons per square inch—though the specified ultimate strength for St. 52 is somewhat less than that of Chromador.

•

Tests show the new material to have nearly twice the resistance to corrosion common to ordinary steel—an important characteristic since, by the employment of a higher unit stress, the thickness of sections in general use may be reduced.

•

It is claimed that rivets of similar composition develop at least 50 per cent. greater strength than mild steel rivets in mild steel plates, so it should be possible to develop the full strength of the new material without increasing the number of rivets or plate sizes.

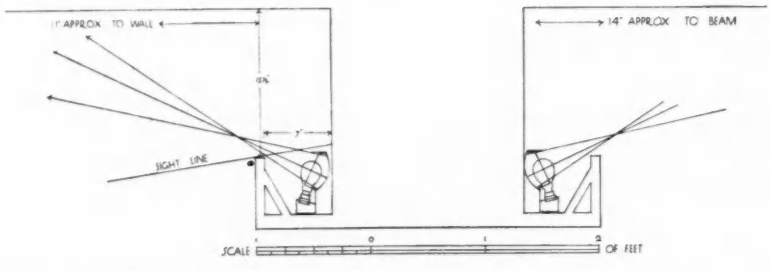
•

Consequently a saving in the weight of steel, up to 35 per cent., should be effected in all those members whose size is directly proportionate to the load they have to carry—members whose sections cannot be reduced remaining in the usual quality of steel—and though the price of Chromador is approximately 20 per cent. higher, it costs less, strength for strength, than mild steel, and in addition, transport, erection and riveting costs are reduced in proportion to the decrease in weight, and in large structures, where the weight of the steelwork forms a large proportion of the total load, the saving in weight by the use of high tension steel will be greater than that represented by the ratio of the unit stresses.

Economy in cornice lighting

At the Monseigneur Restaurant, Piccadilly, W., Allom Brothers, Ltd., have installed, as a medium for general illumination, a new type of three-colour cornice lighting, remarkable for low current consumption and the saving effected in lamp renewals by the employment of ordinary 25-watt bulb type lamps in place of the usual cornice lighting centre filament lamps.

•



The restaurant is 72 ft. long, and the sources of the general lighting are concealed within cornice boxes that run on either side of two beams and along the flank walls, from end to end of the room.

•

The reflectors are not of the usual trough type, but are, in principle, based upon the Allom parabolic indirect lighting reflectors, and fit, cup-like, round the individual lamps.

•

They are mounted in 2 ft. long sections, each of which accommodates

A section through a ceiling beam at the Monseigneur Restaurant, showing the cornice lighting troughs and special reflectors, used in conjunction with ordinary 25-watt bulb-type lamps.

one lamp of each colour, i.e., one 25-watt lamp, on each circuit, spaced 2 ft. centre to centre.

•

The current consumption for the 432 ft. run of cornice lighting is as follows :—

No. 216.—25-watt white vacuum lamps —5,400 watts.
No. 216.—25-watt red vacuum lamps —5,400 watts.
No. 216.—40-watt blue gas-filled lamps —8,400 watts.

•

Each of the colour circuits is controlled on dimmers, which can be manipulated independently or together.

•

The white lighting service alone provides a satisfactory general illumination, and though the top edge of the cornice is only 15½ ins. from the ceiling (see diagram on facing page) and the throw across the central panel, between the two beams, is 14 ft., the distribution of light is quite even.

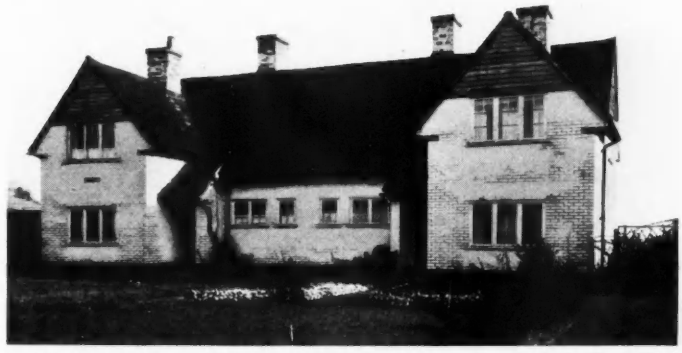
•

Sources of direct light, of low intensity —25-watt—on the secondary service, are introduced to counteract the monotony that results from unrelieved indirect lighting.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

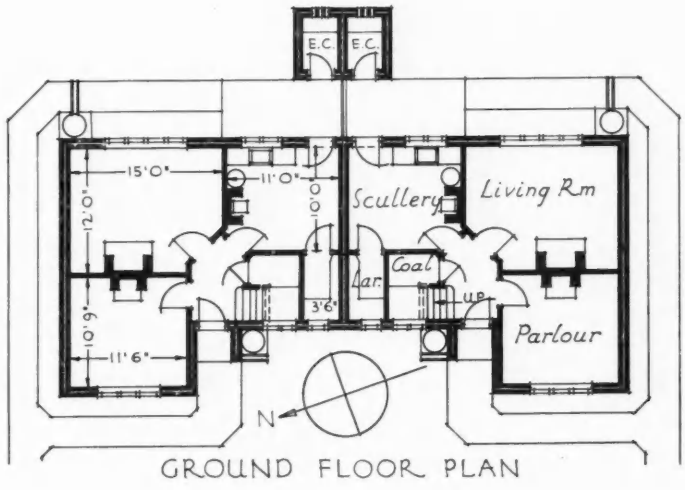
The Housing Bill



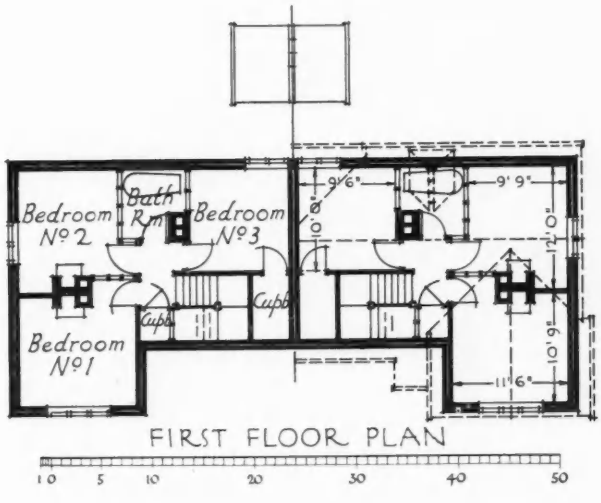
AFTER an interesting debate, the House of Lords last week gave a second reading to the Housing (Financial Provisions) Bill. For the most part, the speeches followed on the lines of those delivered in the Commons but one or two new points were raised. Lord Listowel, for instance, declared that housing throughout the country would be stimulated by the creation of a national housing corporation and if the Government were to give a guarantee for the raising of a substantial loan by such a body.

The Bishop of Winchester feared that the policy of the Government would fail in the provinces because of the high rents that would of necessity be charged for the new houses. The problem could not be dealt with by slum clearance alone ; there must be a large number of houses available at low rents.

Lord Reading said that the country was awaiting some wider vision on the part of the Government, some larger scheme and bolder enterprise to deal with the evils in which they were all agreed. Nothing had been said of the Government's attitude toward the proposal for a national housing corporation or some similar body which could be entrusted with the work of slum clearance and other matters.



Lord Gage, for the Government, pointed out that this was one of the questions which had been submitted, like the questions



COTTAGES IN HANTS.

DESIGNED BY A. LEONARD ROBERTS

The cost of this pair of cottages at Chandler's Ford, designed by the County Architect of Hampshire, was £1,042 0s. 0d., or 10·14d. per foot cube. The brick walls are coloured with a cream slurry ; and the roof is of hand-made tiles.

of the general public utility societies, to the Committee presided over by Lord Moyne.

Lord Salisbury said that he could hardly speak with patience of the provision that there must be a fixed bath in every house. In his recollection there were no fixed baths, or hardly any, in the kind of houses in which their lordships lived. There was one fixed bath, certainly not more than two, in Hatfield House when he first knew it. Were they to believe that Hatfield House was outside the national standard of a civilized home? In another house that he remembered very well there was no fixed bath at all. He recognized that a fixed bath was an amenity of considerable value, but he thought it was ludicrous to make it compulsory.

Lord Gage, in reply to the debate, said that one of the difficulties in dealing with a national housing corporation was that at present there was not very much unanimity as to what form such a body should take. It was understood that its advocates were basing their advocacy on the view that a Government guarantee such as they sought would not involve a charge. Accordingly Lord Moyne's Committee were fully empowered to consider the case which those advocates desired to present. In any case, the Government would be free to act after the Committee's report in any direction they pleased.

Debate on Unemployment

During a debate on unemployment in the House of Commons, many Members urged the Government to finance housing schemes by loan-expenditure. Mr. Chamberlain, the Chancellor of the Exchequer, in his reply, said that where schemes, well thought out and justified on their merits, were presented to the Government, not only would they put no obstacle in their way, but, if help were required, they would be perfectly prepared to consider giving Government assistance in one form or another. There was the possibility of the erection of certain Government buildings. There were unemployment exchanges, for instance, in different parts of the country which were undoubtedly inconvenient and ineffective, and in some cases they held back the efficiency of the work which was being carried on by the Ministry. The Government were reviewing all these cases, and where a good case was made out the work could be carried out. There was a project for a considerable scheme of building new Government offices in Whitehall. He did not think this was a time when it would be appropriate to build new offices in Whitehall, but that was no reason why they should delay the preparation of the schemes so that they might not have to wait when the time came and this could be undertaken properly.

Later, Sir Hilton Young said that the general policy of the Government in regard to housing was well known. It was a definite policy of expansion, because he firmly believed that by getting rid of the competition of subsidized houses they were opening the way to housing forces which would occupy more capital and labour than were ever occupied under the subsidy system. The Government had seized the opportunity to call for a concentrated national effort to get rid of that deep national stain, the stain of the slums. The opportunity was in the Bill which was now before Parliament and which put the housing authorities in a position far more favourable than they had ever been in recent practical politics. The Moyne Committee was now gathering the essential evidence of the housing experts as to what might be done by reconditioning. It was essential that, if they were to succeed, they should do the work within a limited time. The Government programme could not be carried out under five years, but if they could really occupy the full housing activities of the local authorities in a determined effort at slum clearance, it would be 100 times bigger than almost any other effort. It could occupy capital and labour in a degree infinitely greater than many of the other minor things which they had been considering.

Unemployed in the Building Industry

In reply to Mr. Hicks, Sir Henry Betterton, the Minister of Labour, gave the following table showing the insured persons in the building industry classification recorded as unemployed in Great Britain :—

Occupation	Feb. 20, 1933	Feb. 22, 1932	Feb. 23, 1931
Carpenters ..	38,710	37,830	28,414
Bricklayers ..	25,862	22,915	14,617
Masons	6,949	5,300	4,222
Slaters	2,349	1,997	1,605
Plasterers ..	10,425	8,212	6,273
Painters ..	48,347	49,803	40,188
Plumbers ..	9,633	10,124	6,969
Labourers to above.. ..	77,445	72,957	55,659
All other Occupations	67,487	62,977	49,791
Totals ..	297,207	272,115	207,738

Revenue-Producing Schemes

Mr. Peat asked the Minister of Health how many schemes of a revenue-producing character had been brought to his attention by local authorities since January 1, 1933; and which of these schemes had been approved by His Majesty's Government.

Sir Hilton Young said he could not readily give the number of applications, but, including housing, revenue-producing schemes to a total of £3,900,000 submitted by 567 authorities had been sanctioned by him since the beginning of this year.

Working-Class Houses

Mr. Bossom asked the Minister of Health whether he intended making any arrangements to ensure that working-class houses which might be financed largely by building societies, as contemplated in the recent Housing Act, should be required to maintain a higher standard of appearance and design than had frequently characterized many houses so financed in the past.

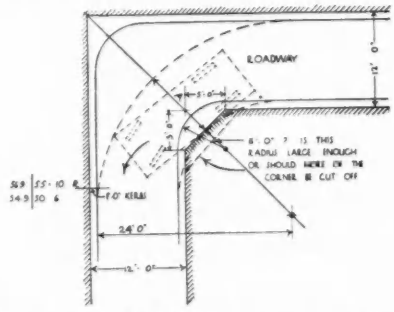
Sir Hilton Young said he understood the building societies and local authorities to be well aware of the importance of maintaining the improvement of the standard of houses for the working classes which had been secured in recent years.

Cost of Houses

Sir Francis Fremantle asked the Minister of Health if he would state what rent, excluding local rates, an investor would have to charge for a house costing £360 on which he had borrowed 90 per cent. from a building society under the arrangements proposed in the new Bill; and what would be the similar rent of a house costing £320.

Mr. Shakespeare said that on a house costing £360 the sum of 8s. a week would enable an investor to repay the 90 per cent. loan in a period of 30 years and provide a return of 6 per cent. on his own share (10 per cent.) of the cost of the house during that time. An addition of 2s. a week would cover maintenance, etc., and leave a margin in the early years. A rent of 10s. a week would, therefore, be sufficient for these purposes, and after 30 years the only charge on the rent would be cost of maintenance. On a house costing £320 the corresponding rent would be about 9s. 2d. a week.

Subsidized Council Houses



Sir Percy Hurd asked if the Ministry was sanctioning the building of further subsidized council houses in rural areas; and, if so, on what conditions as to cost, rent and accommodation.

Mr. Shakespeare said it was. The houses were, of course, subject to the statutory conditions of the Housing (Financial Provisions) Act, 1924, the Housing Act, 1930, or the Housing (Rural Authorities) Act, 1931, as the case might be. The cost was kept as low as possible, and the houses were normally of the three-bedroomed type. The rent of the houses was determined by their cost and the appropriate statutory conditions. In the case of houses erected under the Act of 1931, the rent aimed at is 3s. to 4s. exclusive of rates.

QUESTIONS THAT ARISE

Motor Car Data

¶ "Cornered" writes: "*With reference to your Information Sheet No. 7 in the JOURNAL for March 1, I have a case in point on a job where a 12 ft. roadway goes through the site, with a right-angle bend. A sketch of this bend is enclosed herewith. I shall*

be very grateful if your expert can give me any information which can decide for me the necessary internal radius of this bend, in order to enable a normal car to pass round.

"*The roadway is not intended for commercial vehicles, and a Daimler, measuring 17 ft. long by 6 ft. 6 in. wide, would, I think, be the largest car requiring to use this road and no objection will be taken to the necessity of completely locking the wheel, in order to go round the bend.*"

I have shown, by means of dotted lines on your correspondent's sketch, the position of a car at the corner of

the roadway, which demonstrates exactly what he will have to do with the corner of his building.

F. L.

Waterproofing a Brick Wall

[Following is an enquiry recently submitted to the Building Research Station, together with the Station's reply. This subject was held over from the section "In That Contingency" in our last issue.]

¶ *Driving rain was penetrating the south-west wall of a building in a very exposed position, and the architects were considering the use of a proprietary colourless waterproofer, but first desired the opinion of the Station as to the efficacy of such treatment. The wall was of multi-coloured bricks, with stone dressings, built in mortar composed of 1 part lime, 1 part Portland cement to 6 parts of sand; the pointing was composed of 1 part lime and 1 part cement to 3 parts of sand. It was the opinion of the architects that the joints were responsible for the penetration rather than the bricks.*

It should be mentioned at the outset that the period over which a satisfactory degree of damp-proofing is to be expected from most colourless treatments is limited. The Station is at present engaged in testing a number of representative types of waterproofers, both on a special test wall and in the laboratory, and it has been found that out of eight different colourless proprietary waterproofers, six were fairly effective when first applied, but after 12 months' exposure to the weather only two retained any appreciable quality, and even these showed definite deterioration.

In spite of the apparently discouraging nature of these results, however, it is possible that in practice a colourless waterproofer, in addition to having a temporary damp-proofing effect, may serve some useful purpose by accelerating the formation of the weathered face. The closing up of the pores by the deposition on the surface of solid particles from the atmosphere is likely to be aided by the presence of the waterproofing material, and although the latter may break down in time under exposure, it may not necessarily be entirely valueless on this account. Nevertheless it should be borne in mind that it may be necessary to repeat the treatment at intervals.

It is noted with special interest that from observation on the site the joints are suspected to be more responsible for the dampness than the bricks. In this connection the tests carried out at this Station, as well as those of other investigators, have indicated that in many cases damp penetrates brickwork not so much by reason of the permeability of the bricks or the mortar, as by way of minute cracks which form on account of shrinkage or failure of the mortar to bond closely with the brick. It has been found, for example, that moisture may pass through brickwork in Portland cement mortar more easily than through that in lime mortar, on account of the greater shrinkage of the former.

In this particular case the lime used is not highly plastic or "fat" and this, coupled with the somewhat lean mix used both for the mortar and pointing, may render these somewhat permeable. In addition, it has been found that the "shorter" the mortar mix, the more likely is it that cracks will develop between the mortar and the bricks. This is due partly to the rate of drying of the mortar being accelerated by suction and the absence of "butteriness," which makes for a good bond between mortar and brick.

The only really effective waterproofing treatment in such a case would be one that covers the joint with an impervious film, and in applying any surface treatment, therefore, it is recommended that special attention should be paid to the joints.

It would, of course, be desirable to delay treatment until the summer in order to allow the walls to dry out as much as possible before applying any surface coating. By so doing a greater degree of penetration will be ensured and there will be less risk of internal trouble from imprisoned moisture.

SOCIETIES AND INSTITUTIONS

PLANNING SCHEMES AND ECONOMY

TOWN AND COUNTRY PLANNING ACT. By F. Longstreth Thompson, B.SC., A.M.INST.C.E. Suffolk Preservation Society. March 16.

I would say that far from the planning of town and country being an expense, even in these hard times, I think it is definitely the experience of those who have made planning schemes that it is a very great economy; and far from being an extravagance that we ought to do without. I think it is, on the contrary, an economy we simply cannot afford to omit. In my view, planning is one of the most important factors in the social and economic rehabilitation of this country which we all so ardently desire.

THE SOUTH WALES INSTITUTE OF ARCHITECTS

The annual general meeting of the South Wales Institute of Architects (Central Branch) was held at Cardiff on March 16.

The hon. treasurer's report and balance sheet, showing the healthy financial condition of the Branch, were read and confirmed.

The following officers and members of the Executive Committee were elected for the coming session :

Chairman : Mr. J. Williamson, A.R.I.B.A. ; hon. treasurer : Mr. H. Teather, F.R.I.B.A. ; hon. secretary : Mr. W. S. Purchon, M.A., A.R.I.B.A. ; Executive Committee : Messrs. H. Norman Edwards, Gordon Griffiths, A.M.T.P.I., Ivor Jones, A.R.I.B.A., T. Alwyn Lloyd, F.R.I.B.A., and Percy Thomas, F.R.I.B.A. Representatives of Associates and Students : Messrs. Trevor Hill and F. G. Allen.

J. Williamson, A.R.I.B.A., who has recently been elected chairman of the South Wales Institute of Architects (Central Branch) for the 1933-34 session.

The following were elected as members of the Council of the South Wales Institute of Architects :

Messrs. Percy Thomas, F.R.I.B.A., H. Norman Edwards, T. Alwyn Lloyd, F.R.I.B.A., Gordon Griffiths, A.M.T.P.I., W. S. Purchon, M.A., A.R.I.B.A., T. Edgar Smith, A. J. Hayes, Lewis John, M.A., A.R.I.B.A., J. A. Hallam, H. Fletcher, C. F. Jones, A.R.I.B.A. Representatives of Associates and Students : Messrs. Trevor Hill and F. G. Allen.

BAN ON WOMEN

The Royal Incorporation of Architects in Scotland (Glasgow Chapter), at a meeting held on March 15, decided to hold an annual dinner next winter, and also passed a motion that "no women friends should be present at the dinner."

EDINBURGH ARCHITECTS

At the annual meeting of the Edinburgh Architectural Association Mr. James A. Arnott, F.R.I.B.A., was reappointed president for the ensuing year. Other officers are as follows :

Vice-presidents : Messrs. Balfour Paul and Reginald Fairlie. Messrs. Alfred Greig, J. R. M'Kay, P. R. M'Laren. T. C. Marwick, John F. Matthew, W. T. P. Bryce, G. S. Taylor, and J. D. Carnegie have been added to the Council *vice* members retired, while Messrs. Lorne Campbell, Wilson Paterson, John Wilson, and G. S. Taylor were appointed, along with the office bearers, as Chapter representatives to the Council of the Royal Incorporation of Architects in Scotland.

UNIVERSITY COLLEGE, LONDON

The annual report of the Committee of University College, London, for the year ending in February, 1933, has just been issued.

The number of students on the books

of the College last session was 3,038. The College has for many years taken an active part in promoting adult education by providing public lectures that are open without fee. The aggregate attendance at these lectures during the Session 1931-32 was about 43,500.

The income of the Establishment Account amounted to £225,665, £76,202 being provided by fees, £38,740 by income from endowments, £100,068 by the recurrent grant from the Court of the University, and the balance by sundry grants and donations.

LAW REPORT

LIABILITY FOR DEFECTIVE GUTTERING

Cunard v. *Antifyre, Ltd.—King's Bench Divisional Court. Before Justices Acton and Talbot.*

IN this case the plaintiffs, Mr. and Mrs. Basil Cunard, of 14, Orange Street, Haymarket, appealed against a decision of Judge Tobin, sitting at the Westminster County Court, in favour of Antifyre, Ltd., in an action they brought against the company for damages for personal injuries sustained by Mrs. Cunard in December, 1931, by a heavy piece of guttering falling through a glass roof which covered the plaintiffs' kitchen.

Mr. Mulligan said the defendants were tenants of the house and they let certain of the floors above to a tenant, who in turn sub-let the third floor as a flat to the plaintiffs. Owing to the fall of the gutter Mrs. Cunard sustained head injuries. The County Court Judge gave judgment for the company, holding that there was no duty owing by them to the plaintiffs to take steps to prevent the guttering becoming a nuisance or to take care to see it was reasonably safe.

Counsel said the grounds of appeal were that the learned Judge in the Court below was wrong in law in holding that there was no duty on the company to prevent the guttering becoming a nuisance to his clients, and that he misdirected himself in holding that he need not consider or adjudicate upon evidence given by plaintiffs, that the company, with reasonable care, should have known that the guttering was in such a dangerous condition as to constitute a nuisance.

Mr. G. Howard, for the company, supported the judgment of the County Court Judge.

The Court held that the judgment of Judge Tobin must be set aside, and the case remitted to him to enter judgment for plaintiffs for the amount found due to them, unless the parties could agree on a sum.

Mr. Justice Talbot, in his judgment, said the Court had no doubt that the defendants were lessees of the whole building. With regard to the guttering, there was evidence that it had never been properly supported, and this was obvious to anybody who looked at it. Without repair it could not have been expected to last for a period of ten years. The Court thought that some confusion had arisen in the case owing to the use by the plaintiffs of the word "nuisance." In their opinion the word was incorrect, and the true cause of action was for negligence for failure by the defendants to take reasonable care to see that the property did not get into such a state as to be a danger to persons lawfully in and about it. The appeal as it stood was good, as a nuisance could be caused by negligence. It was well to bear in mind that the two classes of case were different, and that the evidence to support them was also different. In His Lordship's view it would be difficult to call a man prudent or reasonable, who, having heavy guttering over a glass roof, did not take reasonable steps to prevent it from falling. Under those circumstances the appeal would be allowed, with costs.

Mr. Justice Acton concurred.

THE BUILDINGS ILLUSTRATED

Following are the names of the specialists, general contractors, and some of the sub-contractors for the buildings illustrated in this issue :

Royal Hospital School, Holbrook (pages 416, 425-429). General contractors, J. Gerrard and Sons, Ltd., also contractors for roads, excavation, foundations and damp courses, concrete blocks, reinforced concrete, partitions, wood-block flooring, gasfitting, plumbing, joinery, stone work, furniture, school fittings ; William Blaze, Allan Howes, Herman Cawthra, J. A. Stevenson, sculptors ; Henry Lea and Sons, consultant engineers for the heating and lighting; Mr. Vaux Graham, consultant engineer for water supply ; Mr. Hope Bagenal, consultant for acoustics. Sub-contractors : The Birmingham Guild, metal work ; C. Isler & Co., well boring ; Christiani and Nielsen, piling ; Tuke and Bell, Ltd., sewage disposal ; Worthington-Simpson, Ltd., water pumping ; Paterson Engineering Co., Ltd., water aeration and filtration plant to swimming bath ; Barford and Perkins, Ltd., kitchen equipment ; Baker Perkins, Ltd., bakery and laundry equipment ; James Slater & Co. (Engineers), Ltd., hospital equipment ; Constable Hart & Co., Ltd., road surfacing ; Revo Electric Co., Ltd., outside lamp standards and brackets ; Ragusa Asphalt Paving Co., Ltd., asphalt ; British Reinforced Concrete Engineering Co., Ltd., reinforced concrete ; Blockleys, Ltd., facing bricks ; Herbert Alexander & Co., Ltd., sand lime bricks ; Bath and Portland Stone Co., Ltd., stone ; Emerson and Norris, Ltd., artificial stone ; S. Williams and Sons, Ltd., artificial stone margins, steppings and paving ; Rubery Owen & Co., Ltd., structural steel ; Ames and Finnis, roof tiling ; Henry Hope and Sons, Ltd., patent glazing, door furniture, steel casements, window furniture ; Brightside Foundry and Engineering Co., Ltd., central heating and ventilation ; Samuel Smith and Sons, Ltd., stoves ; Griffin Foundry Co., Ltd., Bratt Colbran & Co., Ltd., and Geo. Wright (London), Ltd., grates and mantels ; Aerogen Co., Ltd., gas plant ; Edwin Danks & Co. (Oldbury), Ltd., boilers ; T. Clarke & Co., Ltd., electric light wiring, electric light fixtures, electric bells, telephones ; Synchronome Co., Ltd., electric wiring for clocks ; Smith and Ansell, Ltd., electric light fixtures ; Richard Crittall & Co., Ltd., panel heating ; Shanks & Co., Ltd., Leeds Fireclay Co., Ltd., Dent and Hellyer, Ltd., and Adamsez, Ltd., sanitary fittings ; Gillett and Johnston, Ltd., tower chimes and clocks ; Walter Macfarlane & Co., Ltd., cast iron grilles ; J. and E. Hall, Ltd., refrigerating plant ; Haywards, Ltd., iron staircases ; Doulton & Co., Ltd., drain pipes, etc. ; Adams Brothers (Liverpool), Ltd., plaster and decorative plaster in dining hall ; Gilbert Seale and Sons, Ltd., decorative plaster in assembly and entrance halls ; John Tanner and Son, Ltd., decorative plaster in chapel ; John Stubbs and Sons, marble ; Craven Dunnill & Co., Ltd., wall tiling ; F. Brown and Son, Ltd., plain roof tiling ; The Bennet Furnishing Co., Ltd., school fittings ; Herbert Morris, Ltd., lifts ; United Water Softeners, Ltd., water-softening plant ; London Brick Co. and Forders, Ltd., bricks for structural brickwork.

Enfield West Station (pages 435-439, and supplement). General contractors : Wm. Shurmur and Sons, Ltd. House at Chandler's Ford, Hants. (page 441). General contractor, H. G. Ross.

OBITUARY

J. C. NICHOL

We regret to record the death of Mr. John C. Nichol, F.R.I.B.A., of Birmingham. He was in his eighty-sixth year and was in practice at 117 Colmore Row, Birmingham, under the style of Nichol and Nichol, until the time of his death.

Mr. Nichol spent many years abroad before settling in Birmingham. He was apprenticed in Aberdeen and after practising in Edinburgh went to New Zealand. Later he went to San Francisco, Chicago and New York.

He joined Mr. Oliver Essex in partnership in Birmingham in 1887 and the firm was responsible for the erection of the Municipal Technical School. During the period the firm was known as Essex, Nichol and Goodman. Subsequently the partnership was dissolved and Mr. Nichol and his son practised as Nichol and Nichol.

J. C. POTTER

We regret to record the death of Mr. William Joseph Potter, a Director of Messrs. W. T. Henley's Telegraph Works, Co., Ltd., which occurred on March 14 after a severe attack of pneumonia. The funeral took place at Golders Green Crematorium on March 18. A large assembly of business and personal friends and members of the staff were present.

Mr. Potter joined Henley's as Town Traveller on May 7, 1888; thus he had nearly forty-six years' association with the company. He was Secretary of Henley's Telegraph Works (S. Africa) Co., Ltd., from 1903 to 1914, and he was an original Trustee of the Staff Pension Fund, retiring from that position on April 29, 1932. Mr. Potter was appointed a Director of the company in May, 1913. He retired from his Staff position on March 31, 1932, but continued in his capacity as a Director.

Mr. Potter was one of the most popular personalities associated with Henley's, both in regard to the Staff and the company's many business friends.

A Recent Will

Miss Henrietta May Poynter, of Oxford, daughter of Ambrose Poynter, architect, left estate of the gross value of £4,715, with net personalty £3,790. Her bequests included the following :

£500 to the Royal Academy of Arts, the income to be applied in the purchase of books for a promising student in architecture, selected by the President, the books to be inscribed, "In memory of Ambrose Poynter, Architect, given by his daughter, H. M. Poynter."

Waller ; eight houses, Halesworth Road, for Mr. H. C. Hornbuckle ; two houses, Chesterfield Road, for Mr. C. H. Beardow ; two houses and three shops, Hartley Brook Road, for Mr. J. Maxfield ; two houses, Knowle Lane, for Mr. G. M. Taylor.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

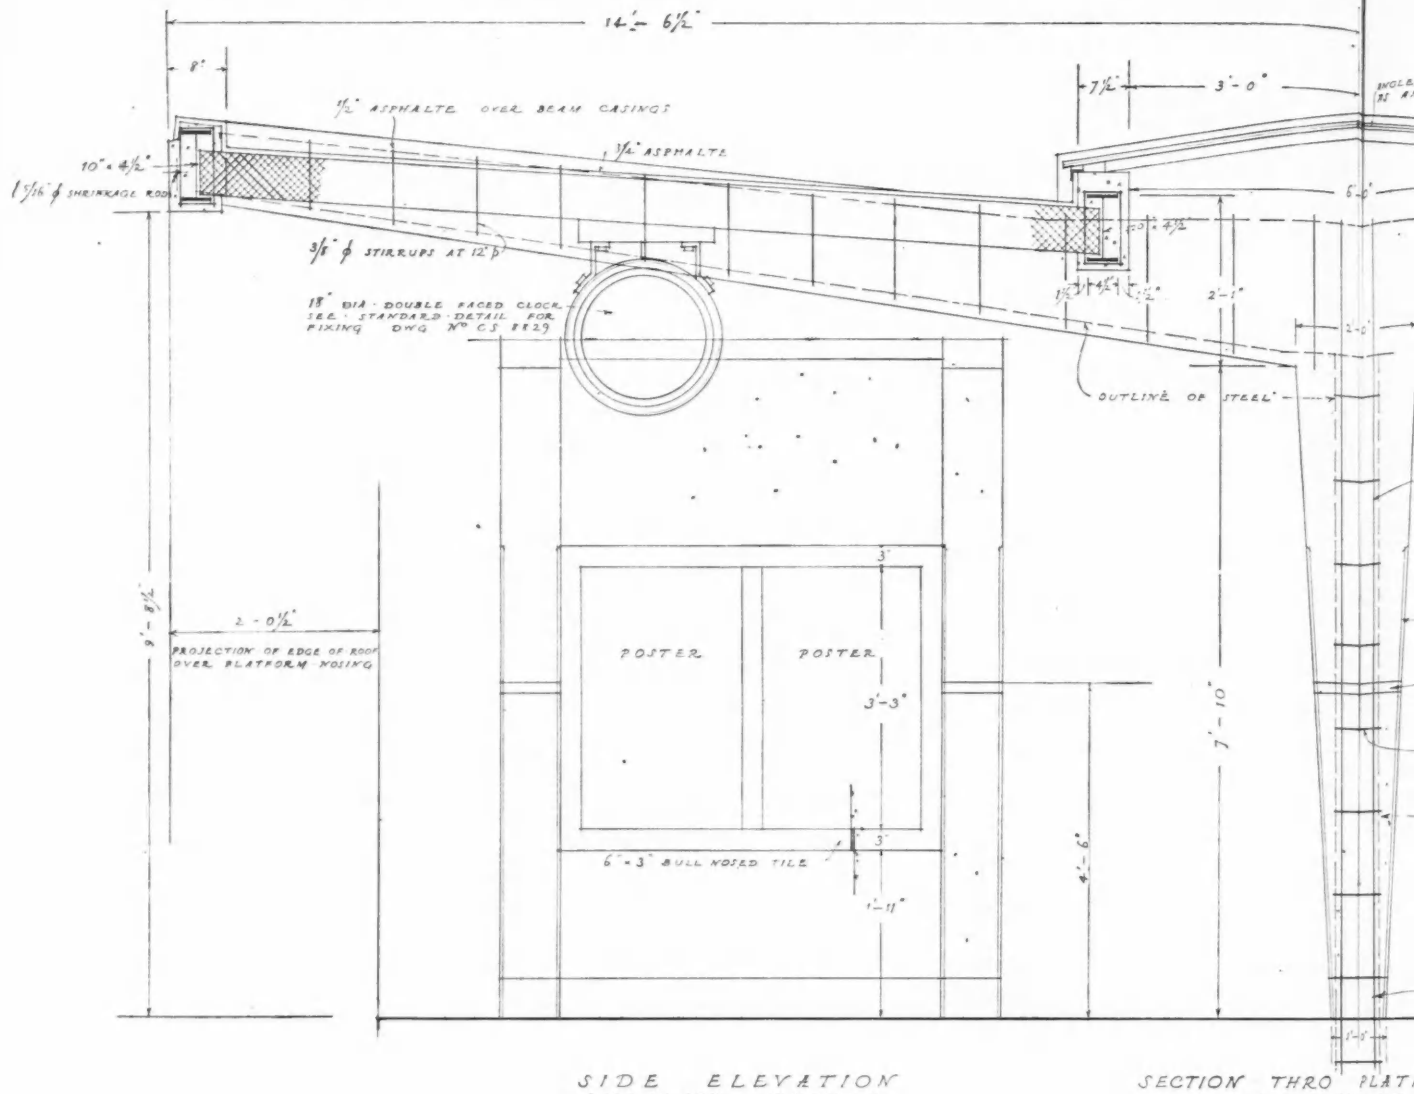
ENFIELD WEST UNDERGROUND STATION

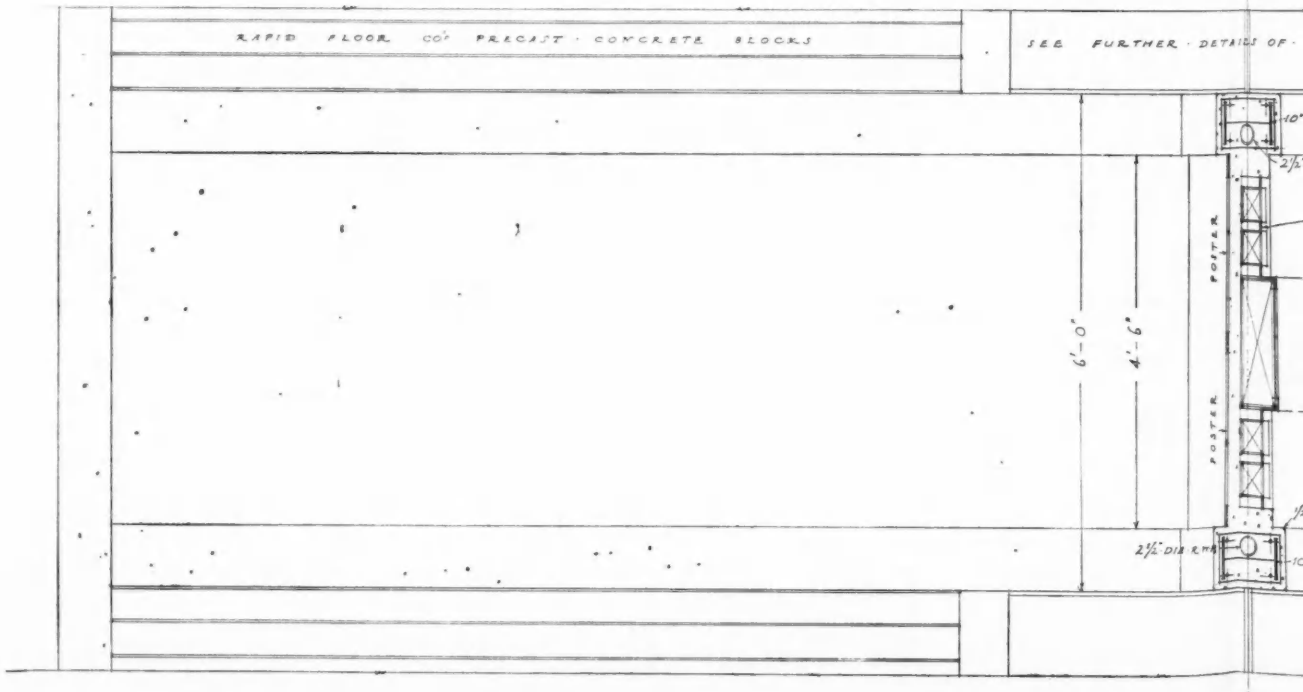
PLATFORM CANOPY: S. A. HEAPS, Architect, UNDERGROUND RAILWAYS



LOOKING ALONG THE STATION PLATFORM

IN this issue some illustrations and drawings are given of Enfield West Station, recently opened on the New Southgate tube, which has been designed by C. H. James (Adams, Holden and Pearson, consulting architects.)

This supplement is confined to large-scale detail drawings of the platform canopy, constructed in reinforced concrete to the design of S. A. Heaps, architect to the Underground group, that has been standardized for open stations. Drawings of the staircases leading down to the platform, also to his designs, are reproduced on pages 438-9.



The drawings of the canopy are fully explanatory, and show how provision is made for automatic machines, nameplate, seats, weather-shelters, etc. The general paintwork in the lower part of the station is green, pale primrose, yellow and elephant grey.

⑤ OCCUPIED BUILDING. (as required by L.C.C.)

minimum provision : 1 W.C. for every 12 persons.

definition : "a house or part of a house let to or occupied by members of more than one family but excluding a common lodging house

⑥ SWIMMING BATHS.

Male : 1 W.C. & 1 urinal for every 60 persons, 1 Lavatory basin for every 60 persons.
Female: 1 W.C. for every 40 persons, 1 Lavatory basin for every 60 persons.

INFORMATION SHEET : SANITARY ACCOMODATION FOR DIFFERENT CLASSES OF BUILDINGS.

SIR JOHN BURNET, TAIT AND LORNE ARCHITECTS ONE MONTAGUE PLACE BEDFORD SQUARE LONDON W.C.1

INFORMATION SHEETS

• 11 •

SANITARY ACCOMMODATION

•

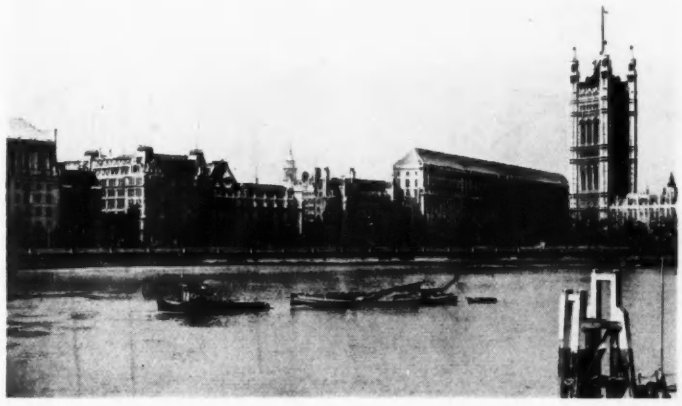
CLASSIFIED under six headings, this week's Information Sheet gives, at a glance, the number of sanitary conveniences that have been found necessary, or are definitely required by the authorities, per head of the occupants of the buildings enumerated.

Two of the Sheets previously published have dealt with the subject of plumbing, and the present one will be immediately followed by others covering this field.

This is not the only Information Sheet in this issue. On page 433, an architect-reader, Mr. William C. B. Smith, has provided in support of No. 3 in this series a sheet dealing with seating data for elementary schools, which were not covered in Sir John Burnet, Tait & Lorne's plate. Yet a third information Sheet (produced by Messrs. J. H. Sankey & Sons) will be found on page xxiii. We make no apology for drawing attention to this particular advertisement which marks a development in advertising which will be universally approved. This page cannot be printed loose, but it can be easily cut out—its authors have taken the trouble to make the plate similar in size and character to the other plates in the Sir John Burnet, Tait & Lorne series, so that, if required, it can be filed away with the others.

The following is a complete list of the subjects previously issued :—

1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.
8. Mar. 8—Billiard Table Data.
9. Mar. 15—Roof Pitches and Drainage.
10. Mar. 22—Lift Sizes, etc.



OTHER INFORMATION SHEETS IN THIS ISSUE

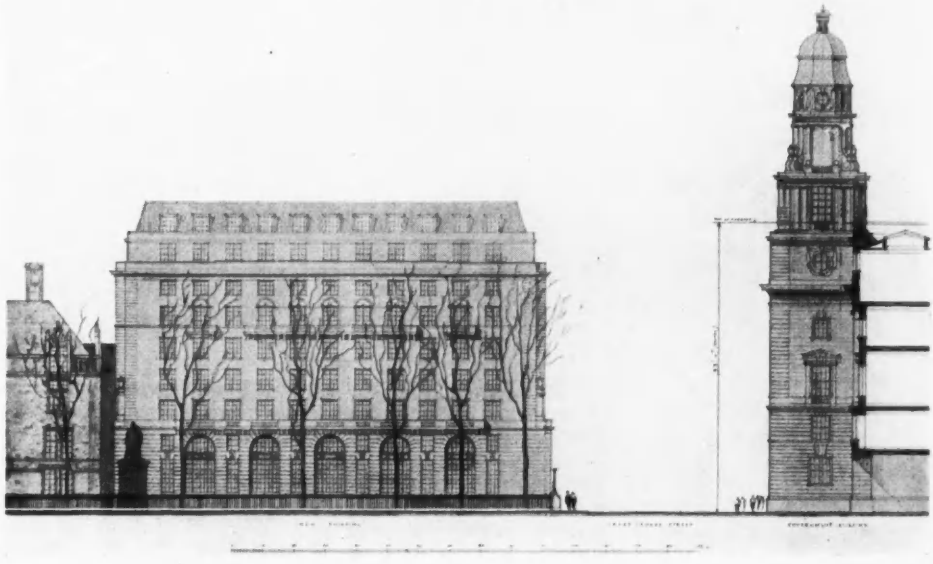
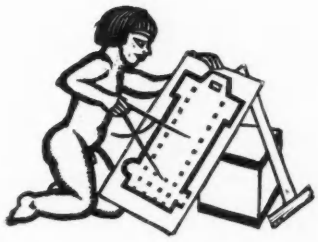
REBUILDING IN WESTMINSTER



THE PROBLEM IN TOWN PLANNING

THE two rebuilding proposals for the vicinity of Parliament Square that have received prominence are here illustrated. The top view shows the Abingdon Street site, with an approximation (superimposed by "The Times") of the block it would carry. The other pictures are a photograph of Gt. George Street, facing the Square itself, and an elevational drawing, to scale, of the new building, designed by Montagu and Tomlins to supersede that at present standing on this site. This has been specially prepared for us by the courtesy of Dr. Crowley, the promoter of the scheme, to show it in its true relations to its surroundings.

Architects have not only no objection to seeing new buildings going up, but ardently desire it. Nevertheless it is being brought home more and more to them that London must have a comprehensive plan, to determine how high new buildings should be, what form they should take, and where they should go. In the meantime the L.C.C. have taken the decision to town-plan an area of 21 acres round Parliament Square.



B

AN EARLY CLOUGH WILLIAMS-ELLIS?

Hardly. But the sensitive observer will appreciate the temperamental likeness between the modern master and his early nineteenth-century predecessors, whose charming fancy plays about these windows in St. Andrew's Gate, York. York is still full of splendid eighteenth-century architecture, though this is due to no "æsthetic sense" on the part of its inhabitants, most of whom have shown a commendable desire to turn what once shared, with Bath, unique distinction among the cities of England into a really up-to-date industrial slum, indistinguishable from Hull or Huddersfield. This particular house, as its sign shows, is inhabited by a chimney sweep—let us hope that he appreciates his luck in having such a charming home.

PUBLIC LIBRARY
DETROIT MICH.

LAST WORDS ON PUBLIC WORKS

MORE than a month has elapsed since the publication of our first leading article dealing with public works,[1] and three weeks since Mr. Keynes's article appeared, and no major criticism has yet been offered of the calculations which formed the basis of the arguments set forth therein. The inference is obvious. The case put forward is unanswerable.

Those who have argued that public works to aid employment have been tried and found wanting, those who have argued that a policy of public works imposes burdens which outweigh its advantages; all who have opposed public works are silent, or, indeed, converted, when it is shown for the first time, in a clear and definite way, that such a policy is essentially an economic proposition. The change of opinion since the publication of our first leading article on the subject is indeed truly remarkable.

It may be taken that, for a given expenditure on public works, every £133 employs a man for a year, and that two-thirds of the original expenditure represents a saving to the Exchequer—four-ninths by way of the saving to the unemployment fund and two-ninths by way of increased yield of taxation.

In addition to its advantages from the national point of view, a policy of public works has considerable advantages from the local point of view.

Public works tend to increase the rateable value of the area concerned. Practically all public works serve property, and thereby tend to increase the value of the property served.

If a new road is built, at once there is an increase in the available number of sites for buildings—an increase in the potential rateable value of the district.

When buildings begin to appear, the value of the site is enhanced by the provision of water, lighting and sewage facilities: or, of course, these services may be provided when the road is built.

Similarly, other public works such as land drainage and reclamation increase the value of the area concerned and tend to increase rateable values. In addition, the development of an area by a policy of public works tends to attract new industries and new population.

By such development the foundations of the future prosperity of the area are established.

In other words, this policy is one of capital development—of investment of a kind which adds to our national wealth. And this is precisely the policy which is appropriate today.

Far from adding to our capital, for the last eighteen months or more we have been living on our capital. *As long as we continue to pay out money to keep men idle, with nothing to show for it, we are living on our capital.*

Far from not being able to afford to undertake public works, we cannot afford *not* to do so. *We cannot afford, as a nation, to live on our capital.*

During the last two years or so, some £30,000,000 has been spent in keeping operatives of the building and public works industries idle. For this expenditure the country has nothing to show except queues at the offices where unemployment benefit and poor law relief is paid out.

Yet under the present system of grants to local authorities[2] the Government—without adding a farthing to the burden of the Budget or making a single extra demand on the Exchequer—could use the same expenditure to promote £45 millions of roads, town halls, public baths and bridges, thereby employing precisely that number of men which it would cost £13 million to keep idle.

---

1. Four leading articles dealing with public works from the economic point of view have appeared in the JOURNAL for March 1, 8, 15 and 22.

2. Grants normally made to local authorities range from 25 per cent. to 75 per cent. of the value of schemes. The argument above assumes that the Government would make grants to the average value of 66 per cent. This would leave only one-third of the cost to be met by loans by the local authorities. If the total expenditure on capital works were £45 millions, the amount to be raised by loan would be £15 millions, and the loan charge would represent about a penny rate.

The better method, however, would be not to leave the burden on the local authorities, but to raise a national loan for reconstruction, as Mr. Keynes apparently proposes.

C. G. Holme, Editor of "The Studio," of which the fortieth birthday is celebrated in a special number, referred to on this page.

NOTES & TOPICS

THE WESTMINSTER PLAN

THE decision of the London County Council to town-plan an area of 21 acres around Westminster Abbey is a direct result of the Carlton House Terrace Campaign. It is a small but an immensely encouraging start though it by no means settles the fate of the proposed new buildings in Abingdon Street and Parliament Square.

*

An essential question now is the length of time during which the officials of the L.C.C. have been aware of this project without warning those responsible of the risk of entering into a building contract.

*

RESPONSIBILITY FOR DESIGN IN INDUSTRY

Speaking last Thursday at an evening meeting of the Design and Industries Association on "The Artist and Industrialism," Mr. Eric Gill withheld his usual mediæval thunderbolts of denunciation, and adopted for his examination of this prickly subject a socratic technique. His seemingly artless questions made this uncertain machine age appear very shiftless and shoddy.

*

He held that we never approach any work of art or industry with a genuine desire to know what the thing is. (For example, on the subject of the Martyr's Memorial at Oxford, he asked "What are Martyrs?" and "Is imitation Gothic their proper memorial?")

*

He reminded us that we were breeding, had indeed already bred, a puppet population, intellectually at a low level, never under the necessity of being critical, save in the matter of physical convenience—an irresponsible herd—while the individual artist was beoming more and more a hot-house plant.

*

Eating, dressing-up and building were the three things that had hitherto given men delight. Standardized food, factory-made clothes, machine-made buildings were changing the nature of men's pleasure. Consequently the artist was almost completely divorced from the production of the things that gave pleasure or were useful.

*

Mr. Gill has a way of provoking all kinds of normally retiring people to unsheathe their prejudices in public, and in the discussion that followed various speakers pursued the point, but never really overtook it.

*

The importation of a few real workmen into these discussions would, as Mr. Carrington aptly suggested, restore the balance of reality. The comments of a bricklayer or two might help many people to understand the comparative indifference of the workman to matters that seem so dear and urgent to Hampstead and Bloomsbury.

*

THE HERD AND THE HOME

But Mr. Gill's strictures on the dying critical powers of the public are supported by many of the things shown at the Ideal Homes Exhibition at Olympia. The architectural quality of the Exhibition lay-out is far ahead of the individual exhibits, and with few exceptions the Village of Ideal Homes represents several headfuls of ideas and a complete inability to understand any of them.

*

Mr. Facing-both-Ways is the presiding genius of the Exhibition, which is an uneasy compromise between moderne (very final "e") and ye olde.

*

"THE STUDIO'S" FORTIETH BIRTHDAY

I have received from Mr. C. G. Holme, editor of *The Studio*, a copy of his magazine's fortieth birthday number. In his covering letter Mr. Holme writes :

> I feel sure you will be interested in the effort it makes, however incompletely, to give a bird's-eye view of the change in progress in art during the period in which our magazine has been in existence.

*

Mr. Holme is very modest in using the words "however incompletely." In the seventy-six pages that comprise the editorial section of *The Studio* he has given us a brilliant review—by means of numerous articles and photographs—showing the progress in the arts in this country and abroad since 1893. Contributors include Sir William Rothenstein, Josef Hoffmann, Philip de Laszlo and Frank Brangwyn.

*

Mr. Holme, it will be recalled, succeeded his father in the active editorship of *The Studio* in 1921-22 ; and is also the general editor of The Studio Publications. He was awarded the M.B.E. for his services during the war, and was also made a Cavaliere by H.E. Signor Mussolini for organizing the British Section of the Exhibition of Decorative Art at Monza in 1930. This year he was elected a Fellow of the British Institute of Industrial Art.

*

THE HOUSING BILL

In the course of the next few days the Government's Housing Bill will pass into law. Although it terminates subsidies offered to local authorities under the Wheatley Act of 1924, its passing does not mean that there will be any reduction in next year's housing grants.

*

According to the official figures of the Ministry of Health, the grants during the year 1933-34 towards housing expenses will be £13,645,000, an increase of a quarter of a million on the present year. The greater part of this vast sum is, of course, to pay for houses already built. The total cost of the technical staff at the Ministry engaged on housing and town-planning is only £13,912.

I hear that the position at the Ministry formerly occupied by Mr. Montagu Harris, a former President of the Town-Planning Institute, is not to be filled.

*

THE ARCHITECT—THE SAVIOUR OF CIVILIZATION

I have seldom known Mr. P. Morton Shand so suavely unprovocative as in his lecture on "Where Londoners Play," at the R.I.B.A. last Wednesday. What surprised me most was his warm praise of Victorian and Edwardian theatres, and his firm belief in the architect as the only possible saviour of civilization.

*

THE ARCHITECTURE OF MIXED DRINKS

According to Mr. Shand the layout of the modern theatre bar—"which provides the British substitute for Continental foyer life"—has considerable affinity with that of the nursery: the high, uncomfortable stools; the solemn discipline of "sitting up" to the counter; the rows of bottles with their reminiscences of the family medicine-chest. How was it, he asked, that some daring young architect had not gone a step further and designed these perches frankly as plattered baby-chairs, in which you could be shut in, and given a "go-cart" cocktail, with a warning spank not to spill it, by a white-aproned barmaid?

*

ADVERTISING ARCHITECTURE

One of Mr. Shand's constructive suggestions was that "a walk-on" by the architect might be billed among a new cinema's "stupendous opening attractions." He insisted that most people had never seen an architect. Never having to consult one, they hardly knew that flesh and blood embodiments of this vague, exalted name existed.

*

It was encouraging to see a lay audience applaud his demand that the instigators of the crudely-daubed Wild-West hoardings that sprawl across West-End cinema façades, and the impresarios whose "amusement parks" have made "the Haymarket spiritually one with Tottenham Court Road," should be imprisoned without the option of a fine. Nor did it demur when threatened with the "mixed blessings of an architectural and a political dictator combined in one," before very long, unless we cultivate purposeful anger instead of indulging in cynical chuckles, in surveying these glaring abuses of individual liberty.

*

PRE-PLANNING

I take the following from Sir Sydney Skinner's speech at the opening of Derry and Toms's New Store Building on 30 March:—

Sir Sydney Skinner said that they saw today the result of a task whose inception dated back 3½ years, when in a room 16 ft. square the vice-chairman and himself drafted the idea of the new store between midnight and 4 a.m. It was planned inch by inch, through a period of fifteen months, and *when the whole scheme was ready, they called into service their own architect, Mr. George. The success of the result was largely due to the skill and intelligence displayed by the firm's employees* . . . The store was laid out to appeal to the younger generation who had thirty or forty years of trading in front of them.

*

Sir William Davidson, M.P., said:

"The new building had been erected by Barker's own building departments and *designed by an architect trained by the firm, and there could be no greater test of the enterprise of this great company.*"

*

THE NEGLECT OF SOANE

Why is Sir John Soane neglected? His practice was limited; he was not easy to understand in his day; he was overshadowed by Nash; but, dash it all, he was a modernist, a hundred years before his time, a constructor if there ever was one, with a sense for and knowledge of materials that has never been equalled. Forget about his classic exuberances and concentrate upon his dome work and you will profit by the experience.

*

One hundred years ago exactly he put £30,000 in 3 per cent. consols as a fund for a museum he wished to found in order to bequeath to posterity his collection of antiquities and drawings. The museum is still there, and Soane is still the most interesting thing in it.

*

THE C. R. MACKINTOSH EXHIBITION

I have just heard that this exhibition will be held in the McLellan Galleries, Glasgow, from May 1-27 inclusive. The organizer is Mr. William Davidson, of Virginia Street, Glasgow, and Tooley Street, London.

ASTRAGAL

THE ARCHITECTS' DIARY

Wednesday, April 5

R.I.B.A., 9 Conduit Street, W.1. "Where Londoners Shop." By F. S. Towndrow, A.R.I.B.A. 6 p.m. Also, exhibition of photographs, etc., of work carried out by the Department of Ancient Monuments and Historic Buildings. 10 a.m. to 8 p.m. (Saturday, 10 a.m. to 5 p.m.) Until April 12 inclusive. 6 *p.m.*

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. At the Home Office Industrial Museum, Horseferry Road, S.W.1. "The Application of Refrigeration to Air Conditioning." By B. C. Oldham. 7 *p.m.*

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "Dublin, Its Arts, Trade and Commerce." By Professor Rudolph M. Butler, F.R.I.B.A. 8 *p.m.*

CARLTON HOUSE TERRACE

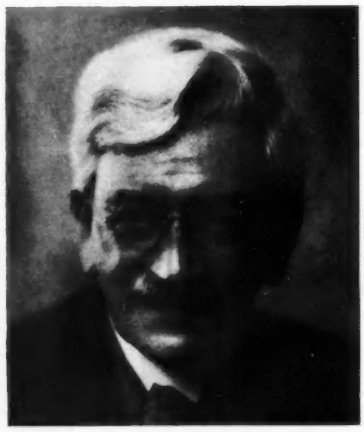
Sir Arthur Steel-Maitland, Chairman of the Carlton House Terrace Defence Committee, issued last week his first report to the 400 members of the Committee.

Sir Arthur begins by admitting that the immediate object has not been attained. In spite of strong representations to the Minister of Agriculture and Fisheries, and a debate in the House of Commons, the Minister has definitely refused to intervene and the new building in Carlton Gardens is to be pushed ahead to its full height. The Government has, however, admitted that the pulling down of No. 4 Carlton Gardens was a mistake, and has given an assurance that no further rebuilding project in Carlton House Terrace will be undertaken without the fullest consideration and the most open discussion with representatives of the public and Members of Parliament. The report continues :

The Government has proposed to take two administrative steps, which, it is suggested, will minimize the likelihood of other mistakes of a similar character. These steps are the appointment of an Advisory Committee to the Commissioners of Crown Lands, and the subordination of the Permanent Commissioner to the Parliamentary Commissioner, who will still be the Minister of Agriculture.

The appointment of an Advisory Committee is to be welcomed, provided that its personnel is suitable, and that its constitution and powers are such that it can exercise an effective check.

Evidence of the successful efforts that are being made by the Public Relations Committee of the Building Industries National Council in its "Build Now" campaign is provided by the fact that during the month of March Messrs. London Brick Co. and Forders Ltd. reached the highest output figure in the whole of their history. The total sale of bricks for that month is well over 111 millions. On Tuesday of last week, March 28, they reached a high water mark for any single day in the whole of their career, the output for that day being 5,300,100. The following day, (Wednesday, March 29), they received orders to the total of 11 millions, which is the highest number of orders received for one day since the year 1902, when a single freight order received caused the total for one day to exceed this figure.



The list of subscriptions received by the Public Relations Committee of the B.I.N.C. up to Monday last amounted to £2,406/0/10. Subscriptions should be addressed to Mr. Oswald Healing, at Duke Street, Adelphi, W.C.2.

The Defence Committee have therefore submitted definite recommendations as regards both these matters to the Minister at an interview which they have had with him.

As regards the constitution of the Crown Lands Commission, the Committee pressed on the Government the view that no change in the administration can be adequate or satisfactory which does not include the transference of the control of the urban Crown Lands from the Minister of Agriculture and Fisheries to the First Commissioner of Works. If the objection is taken that the administration of the Crown Lands should not be divided, the solution is simple. The whole administration should be transferred. The value of the urban lands involved is many times that of the rural, and the disproportion is steadily increasing. Moreover, any mistake made in connection with the rural lands cannot be so permanently disastrous as those affecting urban sites.

Two other matters have also engaged the attention of the Defence Committee. The first is the Adelphi Estate Bill ; the second is a proposal to pull down the houses in Abingdon Street adjoining Westminster Abbey and opposite the Houses of Parliament.

The question arises whether the members of the General Committee wish it to remain in being and the Executive Committee to continue to be active on its behalf. We imagine that this will be their wish, at least for a trial period until the next annual meeting of the General Committee. At the same time, we would be glad to receive any expressions of opinion from members on the subject. The reasons for continuing it, at any rate for the present, appear very strong. The changes proposed by the Government are not settled, and it is most necessary that they should be of a satisfactory nature.

Thomas H. B. Scott, F.R.I.B.A., to whom His Excellency Baron de Cartier de Marchienne, Belgian Ambassador, on behalf of His Majesty the King of the Belgians, recently presented the Knighthood of the Order of Leopold II for his services in designing the Belgian War Memorial erected to the Belgian soldiers who died of wounds in this country and were interred at Kensal Green Cemetery. Mr. P. Lindsey Clarke, D.S.O., the sculptor, has been awarded the Golden Palms of the Order of the Crown.

THE VATICAN INSURED

The Pope has decided to break with tradition and insure some of the more modern buildings of his State against fire.

A PORTENT OF THE FUTURE

Mr. A. J. Penty, L.R.I.B.A., lecturing to the Liverpool Architectural Society on "Tradition and Modernism in Architecture" on Wednesday last, said he foresaw a day, in the course of a generation, when our towns and countryside would be disfigured by derelict concrete buildings, because it would not be worth while to face the difficulties of demolishing them. He urged that tradition did not hamper, but liberated expression, and that architecture depended upon the cross-fertilization of styles, the historical grafting of one upon another from which a new style was born.

A NATIONAL SURVEY

Sir Hilton Young stated on Monday of last week in a broadcast speech that the first step in the coming slum campaign will be a National Survey. It is to be hoped that this will be more effective than the former survey initiated on August 25, 1919. This asked local authorities to send to Whitehall full information about overcrowding, unhealthy areas and insanitary houses. It was said to be a landmark in the history of the country as important as the Doomsday survey. The upshot of the

enquiry was to prove that in many districts there was no adequate record kept either of unfit houses or of unhealthy areas. There was also considerable overlapping in the returns. The new survey must be more reliable.

ECCLESIASTICAL ARCHITECTURE

In a lecture last Wednesday to the St. Paul's Ecclesiastical Society, Mr. Cachemaille-Day, A.R.I.B.A., spoke of modern tendencies in ecclesiastical architecture. He said that a surprisingly large number of churches were being built today, chiefly in the vast housing estates which are growing up outside large towns.

In many of these estates, however, the Church is building centres which not only regard the religious life pure and simple but which also recognize other activities required by a fully-developed human being. No longer is the church alone built on an isolated site, while round the corner may be found an obscure and dreary looking parochial hall, but often a complete group of buildings is being planned right from the beginning, comprising church and vestries, hall and numerous smaller rooms for committees and meetings, kitchen, dressing rooms, lavatory accommodation, also vicarage, and in some cases schools.

He pointed out that church architecture fulfils an emotional need which is not altogether satisfied by " the clean and heroic lines " of modern secular buildings. It is likely, therefore, that the Gothic style will continue to exert its influence on ecclesiastical architecture because of its emotional qualities. Economy, however, is a strongly modifying factor in church building nowadays, and it will shape a style to meet its needs in such a way that there will be no room for the mere repetition of archaic forms. Finally, the Church has a remarkable opportunity for encouraging painting, sculpture and the decorative arts.

PLEA FOR WOMEN ARCHITECTS

Lady Ruth Balfour, M.B., in her presidential address to the Edinburgh branch of the National Council of Great Britain last week, said :—

I would like to see in future every local authority having regard to the necessity of having a woman architect employed in connection with the building of Council houses. I have recently seen a number of Council houses in Fife, and have been impressed by the folly of the men who built them.

ANNOUNCEMENTS

Messrs. Empsall, Clarkson and Clarke, F.R.I.B.A., have removed their offices to 18, North Park Road, Manningham, Bradford. Telephone No. : Bradford 1640 (as before).

The address of Mr. G. Grey Wornum, F.R.I.B.A., as from Friday, April 7, will be 39 Devonshire Street, W.1. Telephone No. : Welbeck 5932.

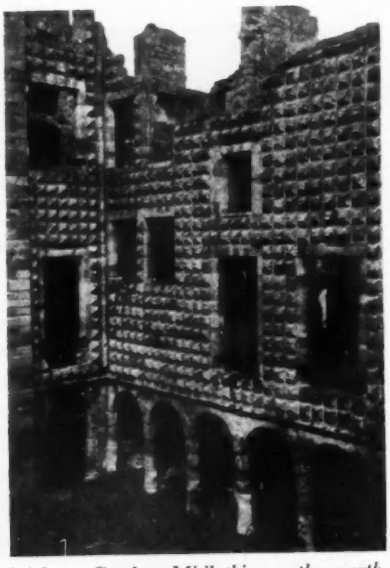
Owing to the renaming of Bentinck Terrace the address of Mr. Cyril Farey, A.R.I.B.A., is now 83, Albert Road, Regent's Park, N.W.8. Telephone No. : Primrose 3071.

The architectural practice of Messrs. Percy Tubbs, Son and Duncan will be carried on under the same title by the remaining partners (Messrs. G. B. Tubbs, A.R.I.B.A., and R. A. Duncan, A.R.I.B.A.). Mr. G. N. Hannam, F.S.I., who has been a member of the staff since 1919, will practise independently as a surveyor and assessor at the same address. He will continue to carry out work of this nature for the firm.

Bekonscot, a model village and railway, now being exhibited to the public in Warwick Road, Beaconsfield. It is the work of the owner (R. R. Callingham) and W. A. Berry. The proceeds of the exhibition, which will be open every Sunday until September, are in aid of the funds of the Railway Benevolent Institution and the Queen's Institute of District Nursing.

The late Sir John Simpson

It is with deep regret we record the death of Sir John William Simpson, K.B.E., F.R.I.B.A., which took place on Thursday last at his home at Highgate in his seventy-fourth year.



The late Sir John Simpson, K.B.E., whose death took place on Thursday last.

Born in 1858, the son of a Brighton architect (the late Thomas Simpson), Sir John was educated at private schools and received his architectural education at the Royal Academy Schools. He became an Associate of the Institute in 1882, a Fellow eighteen years later, and in 1910 entered into partnership with Mr. Maxwell Ayrton, F.R.I.B.A.

The name of Sir John Simpson will always be associated with the British Empire Exhibition at Wembley, held in 1924. In collaboration with Mr. Ayrton (with Sir Owen Williams as engineer), he was responsible for the general layout, the Stadium, and the Palaces of Industry and Engineering. For this work he was made a K.B.E.

For sixteen years he represented the R.I.B.A., of which he was President from 1919–1921, on the Council of the British School at Rome, being one of its original members under the Royal Charter. He resigned from the Institute in 1927 because of the appointment of a new representative of the Institute on this Council. Correspondence subsequently passed between the R.I.B.A. and Sir John, in which the former explained their action, and he withdrew his resignation. Sir John had held several public appointments. He was Secretary-General of the Town Planning Conference, London, in 1910; a member of the Board of Professional Defence ; a corresponding member of the Institut de France, Officier de l'Institution Publique ; President of the Union Franco-Britannique des Architectes (1922-1923) and architect to the Hon. Society of Lincoln's Inn and to the Royal Society of Painters in Water-colours.

Sir John, who was the author of various papers on the planning of cities and public spaces, etc., was responsible for a number of buildings. These included the following : New buildings at Haileybury College and Lancing College ; Roedean School, Brighton ; Art Galleries for the Corporation of Glasgow ; Cartwright Memorial Hall, Bradford ; National Hospital for Paralysed and Epileptic, Queen Square,

Crichton Castle, Midlothian: the north-west corner of the court. From the exhibition of photographs, etc., of work carried out by the Department of Ancient Monuments and Historic Buildings under the direction of Sir Charles Peers, the Royal Gold Medallist, which was opened at the R.I.B.A. on Monday last.

Bloomsbury; Grafton Street Hospital, Liverpool; monuments to Royal Sussex Regiment and Onslow Ford, R.A.; offices for the Crown Agents for the Colonies, Millbank; Victoria Institute, Worcester; Board Schools at Brighton.

The body was cremated at Golders Green yesterday.

R. I. B. A.

THE ROYAL GOLD MEDAL

On Monday last, April 3, at the R.I.B.A., Sir Charles Reed Peers received from Sir Raymond Unwin, the President, the Royal Gold Medal for Architecture which His Majesty the King presents annually to one who has rendered distinguished service to the Art.

The award was first made by Queen Victoria in 1848 and, with two exceptions, has been awarded every year since.

A collection of photographs illustrating some of the work carried out by the Department of Ancient Monuments and Historic Buildings under the direction of Sir Charles Peers was also opened on the evening of the presentation of the Medal and will remain open daily between the hours of 10 a.m. and 8 p.m. (Saturday 10 a.m. to 5 p.m.) until Wednesday, April 12 inclusive.

COUNCIL MEETING

Following are some notes from a recent meeting of the Council of the Institute:

International Architectural Competitions: A letter was submitted from the Foreign Office stating that the proposal for the establishment of a Permanent International Commission of Architects had been put forward by the United Kingdom Delegation to the Council of the League of Nations and that it had been referred by the League Council to the International Organization for Intellectual Co-operation.

The Court of Governors of the University of Liverpool: Mr. E. Bertram Kirby, O.B.E. (F.), was appointed to represent the R.I.B.A. on the Court of Governors of the University of Liverpool for the period January 1, 1933, to December 31, 1935.

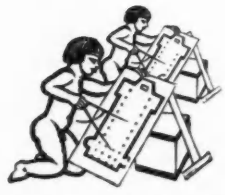
System of Colours for Conduits in Buildings: Mr. L. W. Thornton White (A.) was appointed to represent the R.I.B.A. on a Technical Committee set up by the British Standards Institution to draw up a Standard System of Colours for Conduits in Buildings.

Constitution of the Architects' Registration Council: The following members were appointed to serve on the Registration Council for the year ending March, 1934:—Messrs. W. H. Ansell (F.), Henry V. Ashley (F.), Major Harry Barnes (F.), Henry M. Fletcher (F.), E. Stanley Hall (F.), Sydney Kitson (F.), A. H. Moberly (F.), L. Sylvester Sullivan (F.), J. Alan Slater (F.), Sydney Tatchell (F.), Percy Thomas (F.), John Watson (F.), and Charles Woodward (A.).

Constitution of the Admission Committee of the Architects' Registration Council: The following members were appointed to serve on the Admission Committee for the year ending March, 1934:—Messrs. Edwin Gunn (A.), A. H. Moberly (F.), Thos. E. Scott (F.), and Charles Woodward (A.).

Reinstatement: The following ex-members were reinstated:—As Associate: Mr. James B. Wride. As Licentiate: Captain Owen K. Beattie.

Resignations: The following resignations were accepted with regret:—Messrs. H. Field (F.), G. E. Jones (F.), G. V. Lidbury (A.), R. P. Morris (A.), A. S. Chadwick (L.), R. C. Henderson (L.), W. J. Joynes (L.), E. Rothwell (L.), and E. R. Walker (L.).



Election of Students: The following Probationers were elected as Students of the R.I.B.A.:—Architectural Association: Messrs. A. F. G. Barnard; R. P. Hamlin, (Miss) W. K. Homan, T. C. Page, M. E. Thornely, and (Miss) E. M. Ward. The Polytechnic, Regent Street, London: J. W. L. Forge, A. E. McKenna, F. M. Rutter, (Miss) C. S. G. Smith and H. F. Wilson. Leeds College of Art: H. C. Castle, R. C. Davis, G. Davy, and R. S. Shapley. Edinburgh College of Art: W. Collyer, J. F. Coull, J. F. Donaldson, (Miss) R. H. I. Morrison, (Miss) E. M. Sherwell, and W. Wilson. University of Cambridge: C. S. Beauchamp and C. M. Crichton. Glasgow School of Architecture: J. A. Browning and A. J. Smith. R.W.A., Bristol: C. R. Beecroft. Armstrong College, Newcastle-on-Tyne: M. Hayton and H. B. Thompson. Welsh School of Architecture: S. G. Roberts. Nottingham School of Architecture: G. A. Bethell. Robert Gordon's Colleges, Aberdeen: W. G. Henderson. Auckland University College: G. W. Johnson and R. D. Morgan.

FOREIGN POSTAGE RATES

Members of the R.I.B.A. in foreign countries (particularly those resident in Shanghai) have drawn attention to the inconvenience and expense they are continually caused through correspondence and trade catalogues despatched to them being insufficiently stamped.

Manufacturers and others circularising members of the Institute are requested to draw the attention of their despatch departments to the necessity for observing the postal regulations and the payment of adequate postage rates.

COMPETITION

NEWS

REPLANNING OF STOCKHOLM

Three hundred and fifty designs, together with fifty alternatives, were submitted in the competition for the town planning of Lower Norrmalm, Stockholm, which closed on March 15.

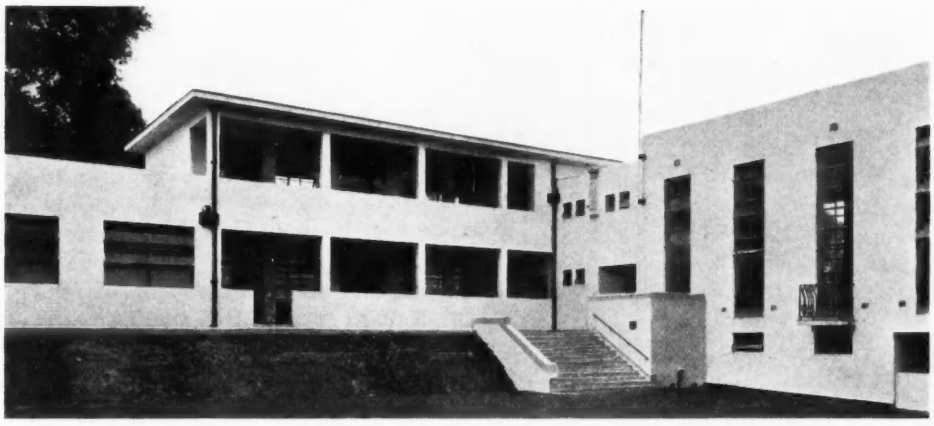
KARL MARX MONUMENT

The Soviet Government has announced a competition for a design for a monument to Karl Marx, to be built on the square of the Palace of Soviets in Moscow. Competitors from all countries may enter. Prizes are offered for the three best designs of 100,000 roubles, 50,000 roubles and 30,000 roubles, respectively.

The monument is to commemorate the fiftieth anniversary of the death of Karl Marx. It is understood that as roubles are only of value in Russia, arrangements may be made for paying foreign competitors in another currency. Full particulars will be announced later.

Competitions Open

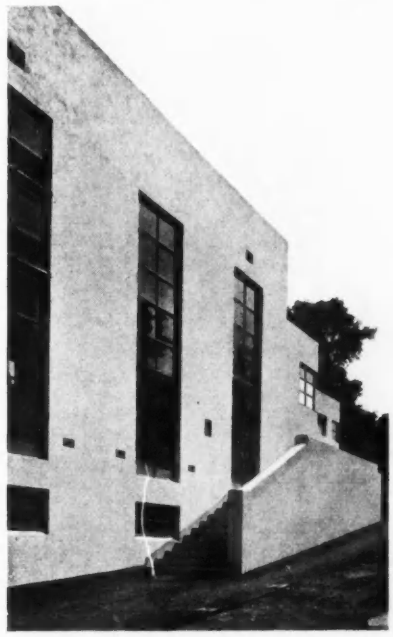
April 13.—Design for a new exhibition hall at Manchester for the Management of the Manchester Building Trades' Exhibition. Premiums: £150, £75 and £25. Full particulars were published in *A.J.* for February 15.



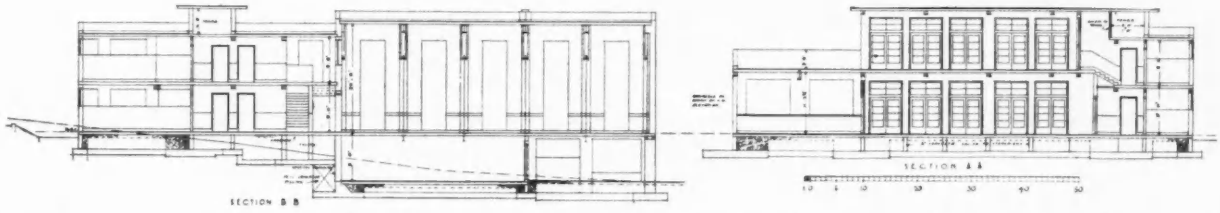
May 8. — Proposed Burgh Chambers, Municipal Offices and Public Baths for the Town Council of the Burgh of Prestwick. Premiums: £200, £100 and £50. Designs to be submitted to the Town Clerk not later than 12 noon on May 8. The period for applications for conditions, etc., has now closed. Full particulars were published in *A.J.* for March 15.

May 31.—Sending-in Day. Layout of a suburb on the river Escaut, Antwerp. £2,400 in prizes (1st, £800). Conditions, etc., were published in *A.J.* for December 7, 1932.

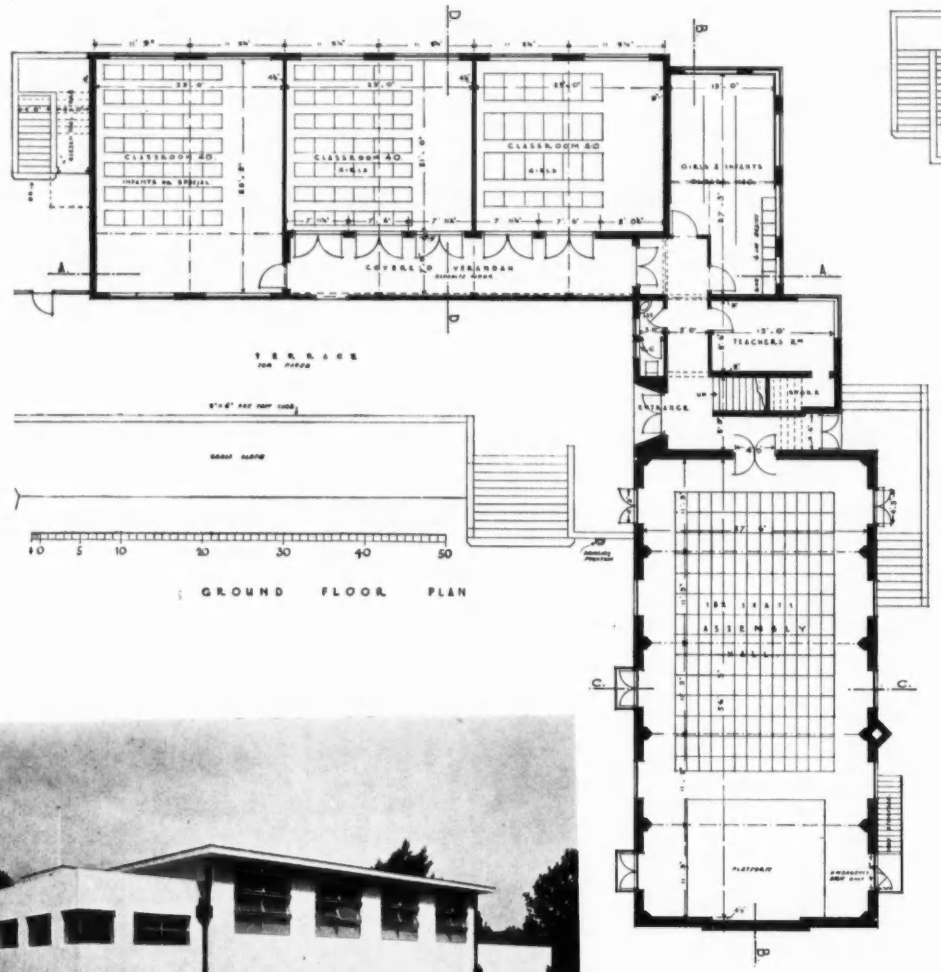
In the description of the Royal Hospital School, Holbrook, on page 428 of our last issue, we inadvertently stated that "the site is not far short of a mile long from end to end . . . and the furthest of the hostels . . . is nearly half a mile from the assembly hall." The architects point out that the extreme length of the site is a quarter of a mile, and the distance from the furthest hostel to the classrooms is one fifth of a mile.



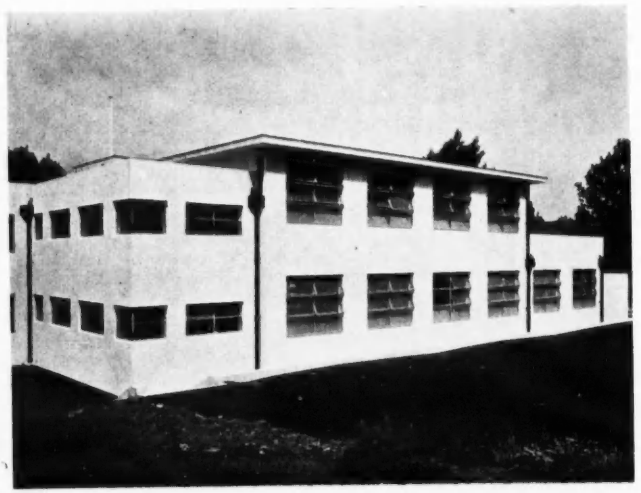
SAINT ANSELM'S R. C. SCHOOL, HARROW



The classroom wing is on the left of this view, the assembly hall on the right. As will be seen from the plans reproduced overleaf, the two-storied portion of the former affords four classrooms, each for 40—girls on the ground floor, boys above—and each entered through glazed walls from covered verandahs. Forty infants occupy the one-storied portion to the left; on its roof is an open-air classroom. The assembly hall wing, built in 14-inch brickwork, with steel beams and concrete floors, is further illustrated and described in a supplement with this issue. The teachers' rooms, etc., are placed at the angle of the wings.



The classroom wing is steel-framed, with panels of brick, and has all its external surfaces plastered with a wood float, and coloured cream buff. Within, each classroom shows variants on a prevailing scheme of cream buff; the steel windows and radiators are painted deep orange, with bright green panels; the skirtings are black.



DESIGNED BY ALLAN D. REID

SAINT ANSELM'S R. C. SCHOOL, HARROW : BY ALLAN D. REID

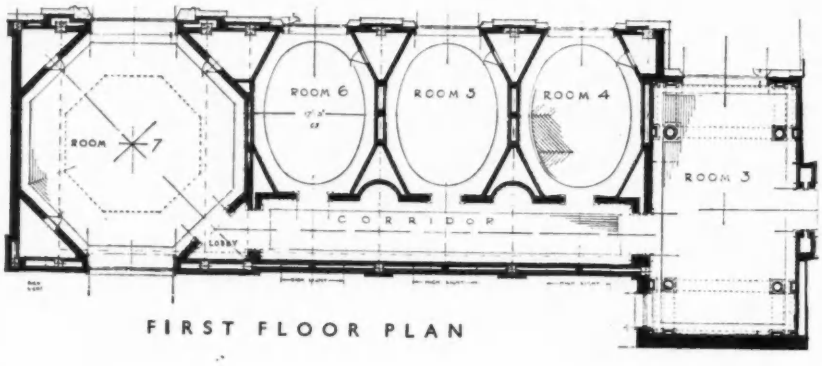
Below: the entrance and assembly hall.



NATIONAL PORTRAIT GALLERY EXTENSION

GROUND FLOOR PLAN

FIRST FLOOR PLAN

Designed for H.M. Office of Works by
JAMES GREY WEST
(Chief Architect:
SIR R. ALLISON)

Last Thursday H.M. the King opened the Extension of the National Portrait Gallery, recommended in the Report of the Royal Commission of 1929-1930, the cost of which has been met by Lord Duveen of Millbank. On the second floor there are four inter-communicating top-lit galleries, one of which is shown above, and on the first floor five side-lighted galleries approached from the existing corridor. The ground floor consists of two rooms for reserve collections, and there is storage space in the basement.

The new structure consists of a steel frame with hollow walls, faced with Portland stone towards the public roadway and with stock bricks at the rear. The floors are of tile construction. Heating is by an accelerated hot-water system supplying pipe coils. The electric lighting has facilities to permit of easy re-arrangement of the fittings. Ventilation is by means of an extract system with high-level ducting and a roof fan-chamber.

These illustrations are supplied by H.M. Office of Works, and are reproduced by permission of the Controller of H.M. Stationery Office.

OLDE-MODERNE IDEALS

A Moralist Visits Olympia

[*By JOHN GLOAG*]

"Yes, sir, and these houses are absolutely modern throughout; central heating and hot water; in fact, ideal super homes."

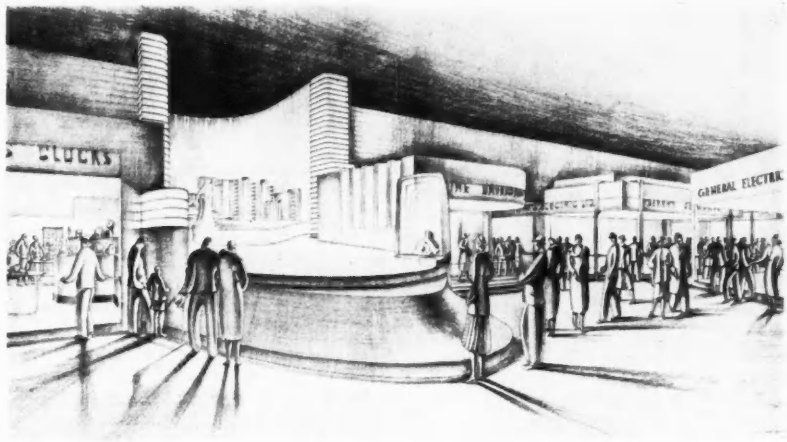
"Modern are they: what about all this half-timbering on the outside?"

"Well, you wouldn't like to live in a house with plain bricks outside, would you now?"

CIVILIZATION begins above the £800 mark; below that figure architectural barbarism has a cosy little triumph in the Village of Ideal Homes at Olympia. There is no need to describe this part for this year's building stunt at Olympia, but a few conversations with the experts in selling who are "putting over" these ramshacklements to the P.B.P* makes one wonder whether what may perhaps be called the Jerriarchy of England has not evolved a scheme of spurious satisfactions for people that is based on actual research work.

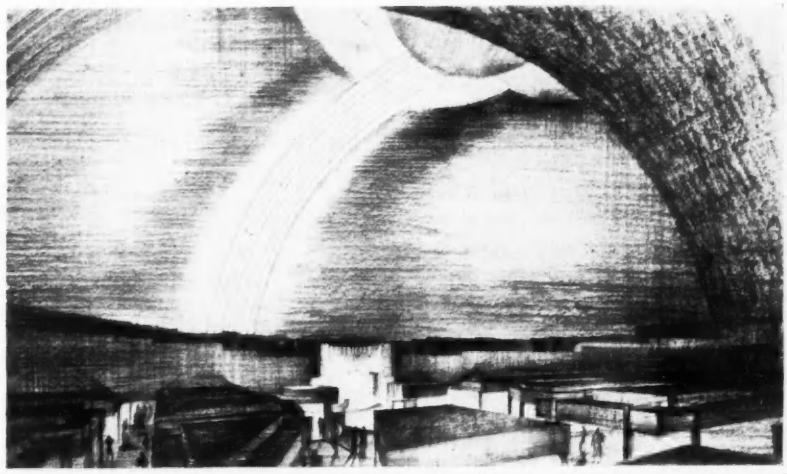
Maybe it is known to a slat how much a semi-detached villa residence has to be Tudored-up in order to get another £50 shoved on to the price. Meanwhile, the Jerriarchy has corrupted words that architects, in their innocence, attach to questions of design. *Modern* means central heating and a working hot-water system; *super-modern* means two water-closets inside the house and a chromium-plated latchkey; *design* means pattern and pattern only; *plan* means "something you don't really want to bother with, but this drawing shows you what the house looks like when it's up."

One visits the Village of Ideal Homes first because it is specifically concerned with building, but its ideals are olde-moderne, and the process of dragging tradition up to date that so many exhibits illustrate is as disturbing and as incongruous as a portrait of Henry VIII in the nude, smoking a cigar in a stainless steel holder.



In the more expensive houses there has been a lot of hearty indulgence in that national pastime, playing for safety. There is more than one piece of inspired compromise, the most notable being an example of Italianate Corbusier. Most of the larger houses in the Village are good-looking in a near-Georgian way, but the whole housing exhibit is deficient in distinction. Inside these houses, the planning seems generally to have been directed for the purpose of obtaining the maximum number of alcoves, niches and odd spaces that can be turned into "decorative features" or used as parking places for the more unnecessary types of furniture.

Many rooms of pleasant proportions have been destroyed by their furnishing. Most of the firms that have undertaken the furnishing of these model houses in the Village evidently employ a discord expert, who, with almost unbelievable skill, leads a host of colours roaring into battle, and the fight goes on in every room above the dead body of furniture design.

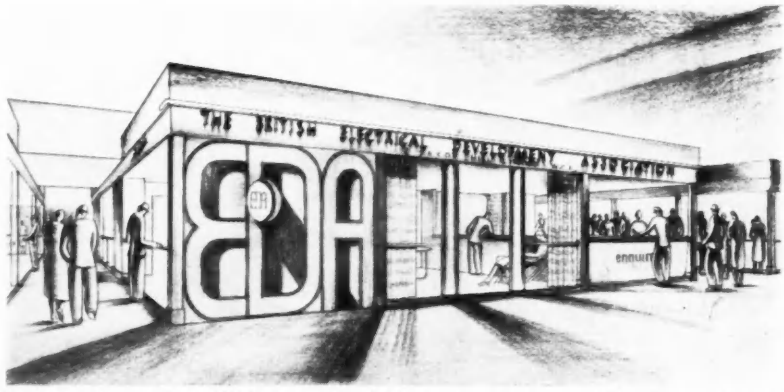


When one comes to a house well-planned in every particular, wherein the furniture, the textiles and the decoration are component parts of a considered scheme, it is like stepping out of a street where pneumatic drills and traffic noises are struggling for the mastery and passing into the restful security of a quiet room. There is such a house where nothing jars upon the eye; where furniture and fittings have been planned with skill; where rooms bear a pleasant and orderly relationship one to another, and where colour is used with lucidity and timber with understanding: it is the "J.P." House, designed by Leslie Mansfield. Externally it has a familiar English air. There is no bright young slang about it, and it wouldn't please the stark-vodka school of modernism; but its calm and reasonable presence must do much to correct the mischievous muddles created by so many other exhibits.

The most impressive thing about the whole exhibition—and this particularly applies to the Grand Hall—is its simple architectural unity as a scheme of display. The stairways to the galleries on each side of the Grand Hall, and the orderly stands, and all the features that form the background of the show, suggest that the arts of display are vastly in advance of the ideas of the exhibitors, and have left the professional stunt-mongers nowhere. There are many stunts. The rooms of the Scientists, on the first floor of the Empire Hall, strangely suggest the Chamber of Horrors at Madame Tussaud's, while the rooms arranged by an assortment of the aristocracy for "Ideal Dinner Parties" resemble the stately homes of Hollywood.

Another stunt is the skyscraper flat. As a skyscraper it is unconvincing; as a flat it is

The central feature in the electrical section of the Ideal Home Exhibition: it shows a tableau of modern industrial and domestic architecture, illuminated and equipped by electricity. (Raymond McGrath, architect.)



A general view of the electrical section, showing the rainbow in neon tubing and the central feature, which is surrounded by the British Electrical Development Association's exhibit (Ian Jeffcott, architect for the exhibition and rainbow.)

*Adapted military initials, signifying "Poor—ahem!—Public."

agreeably spacious and furnished with the brisk and stimulating modernism that Mr. Arundel Clarke practises. It is simple without being savage; practical without being puritanical; and it acts as a restorative after the "Ideal Dinner Parties," making us again optimistically conscious of the gifts of our own century.

The furniture trade, tiring of its uneasy liaison with Miss 1925 Modernism (picked up at the Paris Exhibition), appears to be looking for another foreign mistress. There are some almost-Italian flourishes among the suites on some stands. Nervous liberties are being taken with unfamiliar forms, and although the result is on the whole more palatable than the Shoreditch-Jacobean style, there is no evidence that the furniture trade, dominated as it is by the personal taste of the retail buyer, can think for itself in matters of design. It is not thinking at all, and its tentative experiments are dominated by the sacred words: "Safety First."

It is obvious, from the works of man displayed in the Ideal Home Exhibition, that two systems of civilization are performing a sort of three-legged race in England today, but without any attempt at unison in movement, lacking which, of course, a three-legged race ends in an undignified manner.

The west front of the B.E.D.A. stand. This consists of an enquiries bureau, lounge, dining room, kitchen and laundry, all electrically equipped. (Raymond McGrath, architect.)

WHAT IS TO BE DONE ABOUT

THIS?

[*Last week "Penates" discussed speculative building, and urged "the provision of well-planned houses that conform to a decent standard of design." We pointed out in our foreword that as it is almost certain there will shortly be a revival of building work, especially of small house building, a full inquiry into contemporary speculative small house building practice is of immediate importance. The series of articles, of which the second is printed below, will outline the why and wherefore of the present position, and suggest means of improving it.*—ED., *A.J.*]

2. The Speculative Architect

[*By EDWIN GUNN*]

ARCHITECTURAL opinion—the architectural opinion which we are in the habit of calling "informed"—continually inveighs against the persistent wrongheadedness of most suburban development; but the development continues almost everywhere on the same lines, and the only hopeful experiments, such as "Amenity" clauses in town planning schemes and voluntary panels of architects, appear to misfire or be sidetracked, so that their possible function for good is unavailing.

With the abolition of the Housing Subsidy and probable cessation of Municipal Housing (whatever our views as to the political aspect of it) we must awake to the enlarged possibility of a further degradation of the general standards of seemliness, for though much Municipal housing has been deadly dull (the best of it, of course, is very good) there are worse things than dulness, and a vision of the type of development common in "private enterprise" housing for the middle classes, extended to the new homes of the working classes, will make architects, and any there may be who sympathize with their views, shudder.

Practically everyone who has given thought to such matters at all will agree that the worst manifestation of modern building is the "free" estate, where anyone can buy land by the foot frontage in any sized plot fancied, and erect thereon any type of structure he pleases in any position short of encroachment on a defined frontage line.

Even the most uninspired efforts of the mass-production building speculator fail to descend to the horrid depths of such a scene. From this it should be readily deduced that some measure of uniformity (or possibly regularity is a better word) is a necessary component of success in any close-built scheme. So far, architects are likely to agree, but of the general public one has to feel doubts—otherwise why the present unrelated jumbles? Anyway, let us note the point and pass on to the next.

I have been genuinely surprised to realize on reflection that there should be at this day practically an untouched field for architects. The small house, as seen by the profession, has hitherto been either a cottage or group of cottages, or a version of the small country house—the former for what has come to be known as "housing work," and the latter for such private clients as venture to commission them. Even so, the number of architects having names known to the profession, to whom their fellows would confidently entrust the design of either class, secure in the knowledge that the results would be at once habitable and seemly, makes a less extended list than might be supposed.

Between these two classes of dwelling, however, come the homes of the multitude who do not consider themselves cottagers, and have not the means or aspiration to inhabit country houses, however small. For this class the suburban speculative builder has catered; and apart from banality of design and occasional flimsiness or bumptiousness of structure, he has usually catered well, in the sense of "giving the public what it wants."

The designs for work of this type must be made by somebody, and in the sense that anyone who designs a building is an architect, architects may be said to have had their share in this work, since the deposit of plans with local authorities became obligatory, but, with rare exceptions, as *Architecture*, this is an untouched field. How to capture it for architects, who (did they but try) could assuredly beat the speculative builder at his own game, alike in convenience, seemliness and cost?

First, it must be owned that many architects who have secured entry into the nearest adjacent field (that of cottage design) have sadly failed to restrain themselves and have endeavoured to give too liberal a measure of architecture, which was probably what the late Sir Charles Ruthen meant by his agitating and freely-quoted phrase accusing the profession of spoiling their chances by "profiteering in gables"—a dangerous phrase,

taken up quite wrongly by the public, who are ever ready to criticize architects.

Such criticism as is justly merited may be launched along two divergent lines—on the one hand, lack of interest in the problem, or failure to appreciate that great skill and judgment are necessary, which amounts to the same thing; and, on the other hand, over-enthusiasm. The first-named failing is evinced by a tendency to relegate any such "small work" to the junior draughtsman, or by mere carelessness for practical details, such as the placing of internal doors. A difference, one way or the other, of a few inches in the position of a door may render wall space usable or unusable, but that is only an example. The second failing —over-enthusiasm—shows itself in such ways as too elaborate detail, or in sacrifices to symmetry, either in plan or elevation. A door nicely placed on a centre-line *may* be cursed by occupants for ever after, and a window pushed to one corner of a habitable room to achieve external symmetry, which (at its best) tends to a doll's-housy look in work of the smallest scale, are features which it is desirable to avoid. They cause the public to rail against architects—as, by the way, I seem to be doing now!

Now, how is the attack to be opened? It appears to me that with the main object of setting better standards, it may be advisable for architects to pocket some of their professional dignity—I know, of course, that really *nice* architects never seek work, but wait to be "approached." Alas! in this field they are still waiting! There are evidences that sham half-timber Tudor has reached saturation point, as the Bathstone lintel type of house apparently did some years before the war. The fact that at least one large-scale speculative builder has thought it worth while to embark on "Modernist" houses may show that time is ripe for a change.

The public has apparently two standards (not necessarily shared by the same members of it); they admire what they recognize, or what is novel. Modernism has had a good press, and its tenets as applied to building will at least enable its followers to avoid the pitfalls of symmetry, and to give the public the ample windows which it seems to crave. It is at least possible that a younger generation would respond to the chance of occupying a modern house, if it were available as part of an ordered layout, free from the risk of discordant elements, and at reasonable cost (either for rent or purchase) and clear of eccentricities.

What precise form such a modern house should take may be a difficult point to settle. We know that the small suburban house has settled down to what is practically a standard plan —semi-detached, with space for garage, two reception rooms of practically equal size, a diminutive kitchenette, and either three or four bedrooms, with a bathroom and W.C. How far does this represent the current or best habit of living?

It must be (rather sadly) allowed that the paired type of house-plan offers so many advantages that, despite the fidgetty appearance which it produces in bulk, it will be difficult to oust. Its main advantages, as compared with terraces or groups, are :—

Greater facility in lighting by its extra face.
Ease of access to garden for manure or soil.
Handiness of approach by tradesmen and outlet for dustbins.
Separation of individual drains.
Subjection to possible direct annoyance indoors by one neighbour only.

— a formidable list.

As to accommodation, the only point in the standard plan which seems open to serious question is the twin reception rooms. That two rooms are a virtual necessity for comfortable family life may be taken as certain—adult study or child's homework otherwise becomes needlessly difficult. The problem is whether, in property of this class, the swing might be towards the working-class custom of kitchen-meals-room and parlour, or to the now usual higher-class lounge and dining-room, the former being as large as can be afforded and the latter as small as will permit use for its definite purpose. As in most houses of the type imagined only one fire will normally be kept, and no servant will be employed, the superior convenience of a kitchen-meals-room can only be resisted from sheer snobbery.

The adoption of an arrangement such as is common in American tenement houses, with a kitchen and meals-recess as one apartment, and a good-sized living-room for general use, seems a happy compromise, provided that prejudice does not shun it—kitchen equipment is no longer matter to be ashamed of, as in the days of the greasy stone sink and blackleaded smoky range.

Structural scheme is not so easy to determine. It is clearly necessary to give the public its big windows free from the obstruction of many panes, even though they may discover too late that undue glass area dissipates internal warmth (which can in some measure be overcome by extra heating), and admits unwanted heat—quite uncontrollably. As to the flat roof, which is so constantly said to avoid waste expenditure as unusable space, if that were all there were in it, the answer would be easy. The pitched roof in point of fact need cost no more than the flat, and if from its nature unused space is created, who is the worse for that?

I have previously dwelt upon some of the arguments for an inclined, or water-shedding, roof for rain- and snow-infested latitudes, but in addition to these arguments the failure of flat roofs (without special provision) to furnish space for storage tanks or to insulate against heat and cold or the noise of heavy rain must not be overlooked.

No one keeping his eyes open can have failed to observe, also, the frequency with which parapet walls become saturated after heavy rain, due to their double exposure, and many buildings of which they form a part become much disfigured from this cause even if no worse consequences ensue, such as penetration of this saturation below the upper ceiling line. It is no good shirking these points—they must be faced and overcome.

Whither does all this lead? I suggest that a group of architects might seek out a virgin site, well situated for modern transport; prepare a layout and detailed plans, financial calculations, etc., and proceed in all respects as a building speculator would do —in obtaining capital and building finance.

I am sure that they could beat the speculator at his own game, and could convince the board of any alert building society of their ability to do so—but the site must be carefully chosen, the size of the unit must be capable of rapid absorption, and the individual plan neither humdrum nor extremist, while publicity must be forceful.

Who will set the ball rolling?

Our Industrial Towns

"Modern Architecture and Town Planning" was the subject of an address by Mr. E. Maxwell Fry, A.R.I.B.A., at a meeting of the Design and Industries Association, held in Manchester on Wednesday last.

In its very nature modern architecture, he said, was concerned with towns as organizations, as structures, as the subjects of grand urban designs. Many

of our industrial towns were in the rottenest state, their centres in decay, their road plans confusion perpetuating waste. But surely this would not always be so. If town-planning became infused with the will to create on the basis of structure and social service, and would again confront the problem of urbanism, then Manchester and other cities could be recreated on a new model. Modern architecture would design buildings with efficiency and economy on a plan providing economical services, and would also provide, with light and space, a sense of the grandeur of urban living.

LETTERS FROM READERS

[Owing to the pressure on our space we are compelled to hold over several letters from this issue.—ED., *A.J.*]

Financing Public Works

SIR,—With regard to current suggestions for expending large sums of money on public works, rebuilding slums, etc., accounts which I have read of these proposals pay no attention to the following facts :—

(a) All money raised will be a debt against the public, to be repaid either within a year, or spread over a period of from forty to sixty years.

(b) The money will be created and lent by banks (at no cost to themselves ; vide McKenna, *Post War Banking*), and will be recovered in taxes and destroyed.

(c) These loans will be inflationary and will therefore raise aggregate prices of goods for sale to the amount of the loan.

If loans are to be repaid within the year the public will repay twice over, in prices and in taxation. If the repayment be spread over a term of years, say forty to sixty, the public will pay for the loan once in prices, and will repay capital and interest to an amount about three times the amount of the original loan ; four times in all.

You can't abolish slums that way.

ARTHUR WELFORD

[The above letter was submitted to our leader writer, who has sent us the following reply.—ED., *A.J.*]

(a) : Certainly the money raised will represent a debt. What of it? As the Minister of Health has himself pointed out (Report for 1931-32, p. 150) "It is desirable to refer at the outset to the impression, which may exist in some quarters, that the mere existence of local debt is in itself a symptom of financial ill-health. While that is true of money borrowed to replace a deficiency in the revenue needed for current expenditure, it is not true of money borrowed to finance capital expenditure on permanent works." *In other words, borrowing, e.g., for unemployment benefit, is unhealthy ; borrowing for public works is healthy.*

It should be clear that the loan debt of a local authority balanced by assets in the form of public works is similar to the capital of a company. The capital of a company is a debt "against" the shareholders.

(b) : How and why will money be created? Deposits with the London Clearing Banks amounted on an average during February to £1,956,700,000. Why not use some of this?

(c) : It is not clear what is meant to be conveyed by the term "inflationary," but purchasing power will certainly increase, and of course the aggregate prices of goods sold will rise. The value of an aggregate of goods sold is equal to the money exchanged for them. But that does not *mean that* unit *prices will rise appreciably. Money demand will increase, and the aggregate prices (or value) of goods sold will increase, but chiefly because of an increase in production, not an increase in unit prices. Under present circumstances, wholesale prices would rise somewhat and retail prices be little disturbed. But more would be sold and more produced. That is precisely the benefit which a policy of public works confers on industry in general.*

Far from the increase in the total value of goods sold meaning that the loan will have to be repaid twice—or four times—over, it means that it will partly pay for itself. As I have pointed out in leading articles in former issues of the JOURNAL, *the increase in production—in the value of goods sold—will bring about an increase in employment and an increase in the yield of taxation which, together, will save the Exchequer two-thirds the original expenditure.*

YOUR LEADER WRITER

* We heartily agree with the suggestion of this correspondent. Actually the way has already been shown ; the first of a series of Information Sheets compiled by manufacturers appeared in the advertisement pages of last week's issue.—ED., *A.J.*

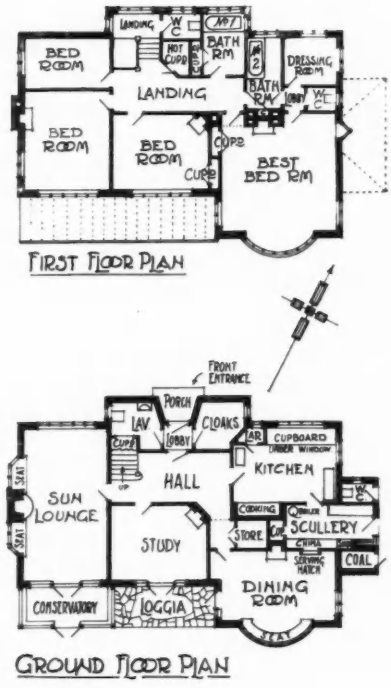
Not a Church

Sir,—Mr. F. R. Yerbury has taken so much trouble to correct the description of a very familiar building ("in the Fatherland") which appeared on page 387 of your issue for March 22, that it seems a pity he should not have taken the trouble to spell its architect's name correctly.



BAIRD DENNISON

A Woman's Ideal Home

SIR,—From the tone of Mr. Redgrave Cripps's letter in your issue for March 15, I had hoped to spend an interesting hour studying his plans and report. I eventually spent part of that time, but it was with amusement that I read his comments on Miss Craig's efforts and his remarks on his own skill as the designer of an "ideal" house.

My amusement was ended more quickly than the report, as I had completely failed to find the point of Mr. Cripps's joke.

I do not know what Mr. Cripps means when he refers to "labour-saving conveniences" in connection with the lavatory and cloaks. Does it save labour to separate the two compartments ; and how does he reconcile his

First and ground floor plans of Mr. Redgrave Cripps's "ideal" house, referred to in a letter on this page.

"idealism and attention to detail" with the very small entrance lobby, having four doors and the obstacle of a single step at each? It must be quite an adventure to use this part of the house.

The conservatory must be very useful as a store for sun rays prior to their use in the "Sun Lounge."

Was the "useful store" tucked away by the dining room door really required, or was it an accident of planning; and how would the scullery have been arranged without the aid of this store? Of course, the north-east window of the kitchen could have been sacrificed and the studied symmetry of this front lost.

I have not yet discovered how the "poor unfortunate maid" reaches the outside w.c. or coal store from under cover. Is there a secret way?

Even the prospect of the best bedroom planned *en suite* fails to attract me.

Mr. Cripps should have confined himself to the singular in the last paragraph of his report.

I believe that Miss Elizabeth Craig is an expert cook.

A. N. GODDARD

Information Sheets

SIR,—The Information Sheets you are publishing contain such valuable data, that I feel sure before long it will become a habit in architects' offices to refer to them whenever definite dimensions are required. It occurs to me that manufacturers would do themselves and the profession a good turn if they would publish Information Sheets of similar size to those you are producing, containing the sizes, methods of fixing and similar particulars of their goods, for which reference has now to be made to a miscellaneous collection of catalogues. I do not mean the full contents of catalogues—that is too much to hope for yet awhile—but such details as a draughtsman requires—standard sizes of steel windows, sizes and methods of fixing laminated wallboards, details of patent roof glazing, and a hundred and one other particulars that would readily occur to the specialists.

The manufacturers' sheets could then be kept in the same or a similar file to your collection and one would usefully supplement the other.

HERBERT KENCHINGTON

External Walls

SIR,—We should be glad to know the experience of any of your readers with 4½ ins. external walls (either reinforced brickwork or concrete) as panels to a steel or reinforced concrete framed building, where the penetration of outside moisture to the inner face must be prevented. We gather from hearsay that such thin walls are in use, but feel nervous of adopting them. We should be glad of information particularly on the following points:—

1. What forms of internal lining are found most satisfactory as regards resistance to outside moisture (mainly driving rain) and also resistance to internal condensation?
2. In the case of thin reinforced concrete panels, are shrinkage cracks an inevitable evil only to be remedied by a suitable internal lining?
3. Is any trouble experienced from penetration of outside moisture attacking the floors (i.e., either the structural part of the floor or the floor finish)?
4. In the case of 4½ ins. reinforced brick walls, what is regarded as the maximum safe span and area of the panels, and what proportion of the number of courses is it necessary to reinforce?

WATSON AND JOHNSON

Technical Paper No. 7

SIR,—Mr. Martyn's letter on p. 434 of the last issue of THE ARCHITECTS' JOURNAL contains an inaccurate reference to "daylight factor grilles," which, although of small importance, should be corrected.

The device of measuring daylight factors by measuring grilles superimposed on photographic or other images of visible sky projected by a lens was first described in *The Illuminating Engineer* of December, 1931. In 1932 they were exhibited at the Physical Society and the Royal Institution, together with an instrument utilizing them, now made by Messrs. Everett, Edgcumbe & Co. An article by Mr. Stevenson, showing how they could be used in the "photo-theodolite" in the *Journal of Scientific Instruments*, March, 1932, acknowledges and quotes the prior publication in *The Illuminating Engineer*.

Their use is fully protected by my patent No. 388,852.

PERCY J. WALDRAM

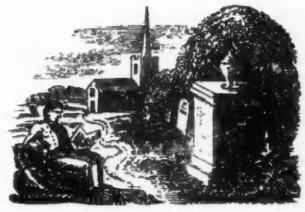
Building—A Sound Investment

SIR,—The question of building is very much in the air at the moment and it occurred to me that your readers might be interested in the experiences of a firm which has just completed a new factory.

Our factory is in the country, facing a golf course, so that we shall never be overlooked. We have adequate playing fields, light and sunshine, first-class rail and road transport and completely satisfactory housing accommodation for our workers.

These considerations did not put 5 per cent. on the total cost of the whole building.

The new factory has paid us. Putting it at the lowest estimate, it has proved good business, a sound investment. We have increased our output, and in addition we have 600 healthier and happier workers. Finally, we have carried out the work when materials and money were cheap.



C. B. COLSTON

The Popularity of Reed Thatch

SIR,—It would be interesting to have a definition of the æsthetic principles which make reed thatch so popular with many architects.

Is it purely tradition or has thatch some inherent beauty which gives distinction to a house? I should like an explanation from your readers.

A. LEDAMUN

Advanced Course in Building Science

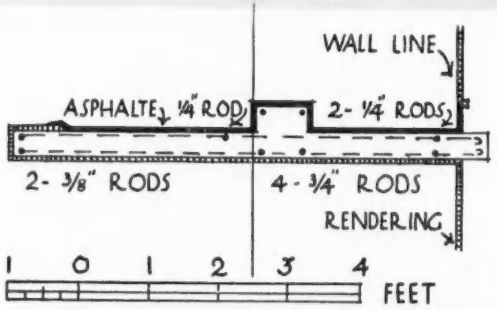
The authorities of the Imperial College of Science and Technology are making arrangements for a one-year full-time course of post-graduate type in Building Science to be held at the Imperial College, South Kensington, during the session 1933-34, commencing in October, 1933.

The object of this course is to disseminate the knowledge of modern scientific research which has been gathered during recent years at the Building Research Station and elsewhere, and the staff of the Building Research Station will collaborate with the staff of the Imperial College in the conduct of the course. The course will comprise lectures and laboratory work in all branches of Building Science, and is intended for suitably qualified persons who are concerned in the scientific aspect of building. The Board of Education are prepared to offer financial assistance in the form of studentships to a limited number of teachers of Building Science in technical schools and colleges recognized by them.

For particulars of this assistance applications should be made to the Secretary, Board of Education, Whitehall, London, S.W.1. Other persons desiring information regarding the course and conditions of admission should apply to the Secretary, Imperial College of Science and Technology, South Kensington, S.W.7.

BEFORE — FROM FACTORY TO OFFICES — AFTER

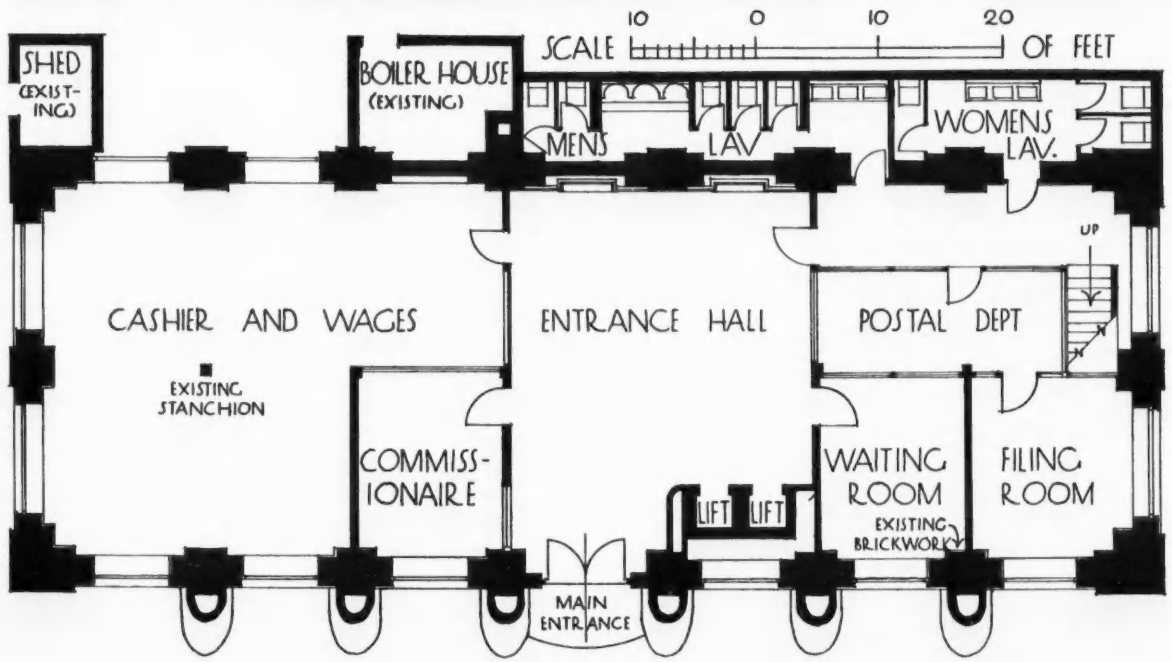
A CONVERSION BY W. WYLTON TODD



In converting this old factory into modern offices the existing walls and foundations were found to be sound, and were used as a basis for the new design.

The curved window arches were straightened, and new cills and lintols installed, the roof was cut back and the walls were carried up to form a parapet. The brick piers between windows were made oval in section, capped with plain stainless steel caps, and a new entrance doorway was formed. The whole of the structure was rendered in cement stucco in three colours—parapet and corner piers and oval piers, cream; wall between, buff; and cills and lintols, plum brown.

The bracket fins overhanging the parapet and supporting the flagstags are of stainless steel. The roof feature, which completes the new design, houses the lift machinery.



To accentuate the horizontality, the horizontals of the sash windows were painted silver, while the verticals were painted buff. The name was carried out in metal with a black enamel finish. The entrance door is finished in ebonized wood, with long, stainless steel handles, having red bakelite grips. The oval piers finish in projections, housing plants. The drawing below gives details of the concrete canopy reinforcement.

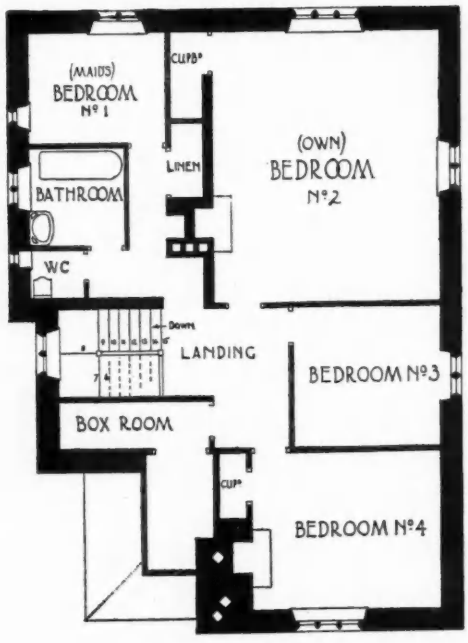
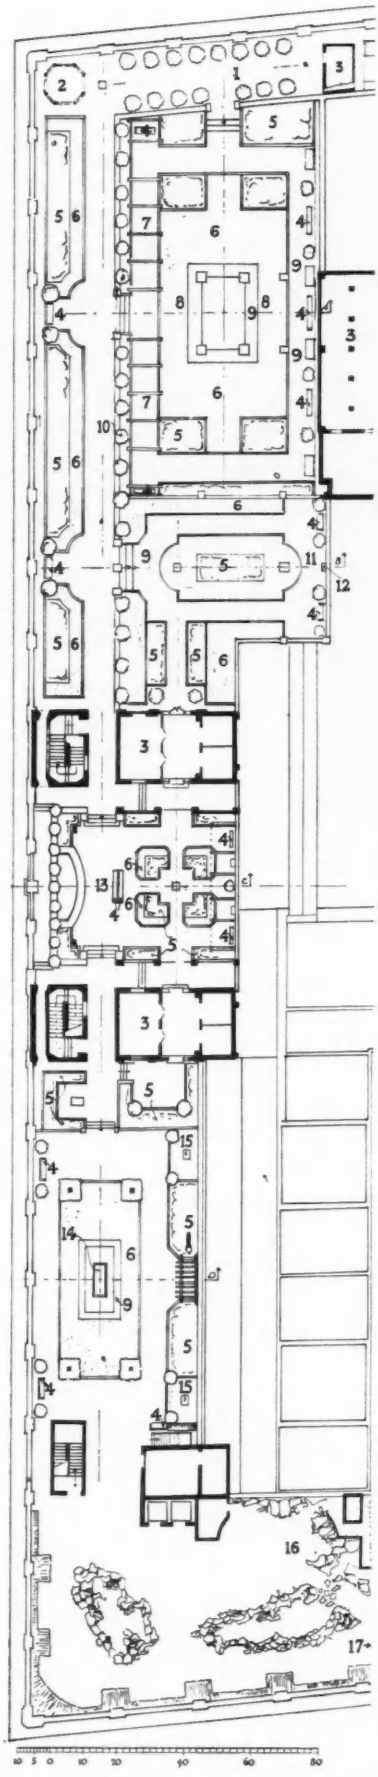
HOUSE AT BURFORD, OXON.



DESIGNED BY BAILLIE SCOTT AND BERESFORD



The architects' clients had occupied what had once been one of the old shops in the High Street, Burford, but this did not give them the large room they wished to have for various entertainments and meetings. This house, reproduced from HOUSES AND GARDENS, *reviewed on page 471, shows the plan evolved from their requirements. It is a small house with a large room, and the building is in the local tradition. The photograph was taken looking in a south-easterly direction from the garden.*

The GROUND FLOOR Plan

The FIRST FLOOR Plan

THE ROOF GARDENS AT SELFRIDGE'S

Designed by Allen and Sudell, and Described by
LADY ALLEN OF HURTWOOD

THE thought of making a garden, of any kind, on an arid asphalt roof in the midst of a town, usually fills the heart of the pure gardener with feelings of acute discomfort and distaste. The difficulties are many, as in all gardens, but as the accompanying photograph shows, it is possible to surmount the majority and grow a wealth of flowers that can hold up their heads with pride amongst the company of the country-grown.

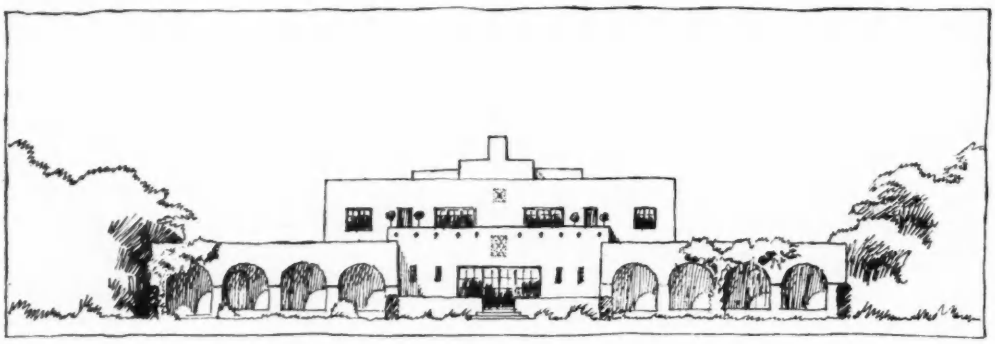
Moreover, there are compensating advantages, the chief amongst them being that the whole area is under complete control. There are no ill-kept neighbouring gardens to breed pests and diseases, no weed seeds blown from the untidy hedgerows, and in addition, each bed being a separate entity, it is practicable to clear it at a moment's notice of all its soil should this become infected in any way.

At no point in the series of gardens on Messrs. Selfridge's roof was there allowed a greater depth of soil than eighteen inches, except in the tubs. Consequently the composition of the soil and the attention to drainage became of the first importance. In addition, it must be remembered that, whereas on terra-firma moisture is always rising from the lower soil by capillary attraction, this great benefit is absent on a roof. All moisture must come from above.

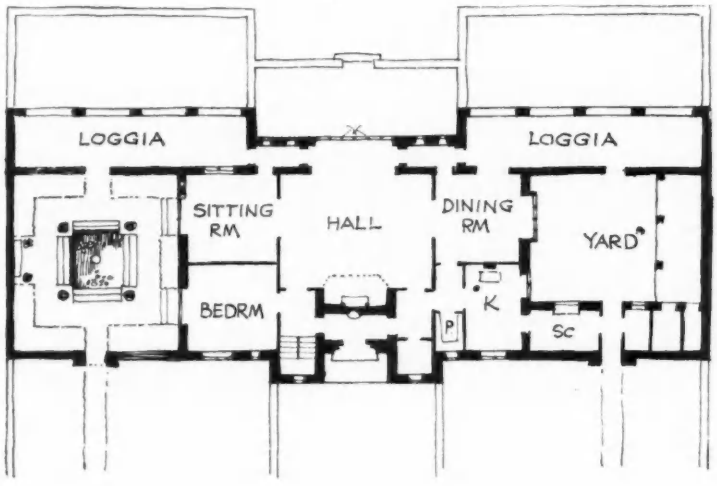
This is a strong additional reason for giving the most experienced attention to the admixture of the soil, by creating a medium that will hold both moisture and nourishment and also be sufficiently stout to provide the necessary anchorage for plants.

The question of drainage is of primary importance, and this must be adjusted in such a way as to prevent unnecessary moisture being lost and at the same time save the beds from becoming sour and waterlogged. The slight fall of a flat roof will provide a certain degree of drainage, and in leading the superimposed drains along this fall, care must be exercised in the arrangement of the outlet tear-holes so as to avoid leaving cul-de-sac pockets of sour soil in the corners and odd angles of beds.

The difficulties and expense of making a roof garden would clearly be diminished considerably if its design and construction could be built up as an integral part of the building. The main problem of drainage would at once be greatly simplified, and the disposition of the beds and the general lay-out could become more flexible, being less hampered by restrictions of weight in certain areas. It is to be presumed that the roof would be formed and strengthened in the course of building in the light of a knowledge of the loads it had to carry. At the moment it is the practice to call in the roof garden architect after the completion of the building. Consequently the garden has to be designed in accordance with the weight-bearing capacity of different parts of the roof.



Judged from a horticultural point of view, the success of the series of gardens made on Messrs. Selfridge's roof, which are believed to be the most extensive in the world, has excelled all expectations. From the four years' experience gained there a comprehensive list of plants that do better than others has been compiled, and this list is an unexpectedly extensive one. In common with all gardens, certain subjects thrive better than others, and obviously the happiest results are obtained by planting freely those which settle down most comfortably.



The most perfect turf can be grown under these constricted conditions: actually the conditions are almost ideal. Twelve inches is the maximum depth of soil allowed, or necessary, under the lawns. During the roasting summer

The photograph reproduced on this page shows the water garden, looking towards one of the lift entrances. The following are references to the figures on the plan:—

1. Morello cherry walk
2. Shelter
3. Lift sheaves
4. Seat
5. Flowers
6. Turf
7. Vine walk
8. Water garden
9. Paving
10. Acacia Trees
11. Winter garden
12. Coloured Italian plaque on wall
13. Rose and bulb garden
14. Island of flowers
15. Dovecot
16. Rock gardens
17. Evergreen recesses for tea tables

THE DOMESTIC ARCHITECTURE OF IN PERU

The design of this house was determined entirely by the special conditions of climate and material and in no sense by any desire to adopt modernistic shibboleths; for the architects' client was an enthusiast for good building in all the classic styles.

From HOUSES AND GARDENS.

of 1930, when the turf in the London parks was brown and scorched, the Selfridge lawns were so velvety and brilliant that a special commissionaire was kept busy dissuading the visitors from pulling up little tufts " to see if it really was grass." The excellence of the turf during that period was not necessarily due to better culture but rather to the fact that the areas were under direct control. It was encouraging to find that the extensive watering that was necessary during that period did not appreciably devitalize the soil.

With a view to reducing the cost of maintenance it is desirable to create in the country a nursery. Here not only can the majority of the perennials and biennials be raised, but it can also become a holiday home for tired plants. Lilies, roses, evergreens and others may be brought down from the roof from time to time to regain their vigour. Immense economies result from this kindly treatment. In addition to the nursery, many annuals, cuttings and seedlings can be raised on the roof itself with the help of a thermostat greenhouse and a series of frames. With the exception of evergreens and a few choicer plants for special displays, the bulk of the plants may be raised by these means.

It is difficult to understand why more roof gardens are not made. They are not necessarily expensive to make or maintain, they are thoroughly practical from a horticultural point of view, and they must render untold health and happiness to the millions of city workers whose lot it is to toil apart from the beauties that nature has to offer. In the summer months as many as thirty-five thousand people pass through the gardens on Messrs. Selfridge's roof during one week. No hospital in a great town should be without its garden of flowers and sun shelters—no block of offices, no factory, no school, no modern hotel, no block of flats built in towns should now be considered adequately equipped without this means of peaceful relaxation.

LITERATURE

DOMESTIC ARCHITECTURE

Houses and Gardens. By M. H. Baillie Scott, F.R.I.B.A., M.R.A.C., and A. Edgar Beresford, F.R.I.B.A. London: "Architecture Illustrated." Price 25s. net.

THE domestic house building of Baillie Scott and Beresford must be known and admired by almost every architect in Great Britain, and, indeed, by a large number of people abroad. Within the covers of this volume, which is not far short of the size of *Webster's Dictionary*, and is published at the remarkably cheap price of twenty-five shillings, are illustrations of nearly a hundred domestic buildings—a selection only—erected from the designs of the firm. It is a pity, however, that scales should have been omitted from any of the plans.

The authors, in their foreword, point out that because they have ventured to criticize somewhat severely the average type of modern house building, they are not necessarily assured of the merits of their own work.

"The modern architect," they contend, "should consider the world of nature with due reverence as a creation essentially divine, a world decorated with miracles of design in trees and flowers."

It is for him to add his contribution to this natural beauty of the world with buildings which are in harmony with it. His highest achievements will not then be the latest mechanical conjunction of glass, steel and concrete, but rather an expression, in terms of human handiwork, of the spirit of the countryside. Instead of that uninspiring and rather tiresome slogan, "Fitness for Purpose," which

BAILLIE SCOTT AND BERESFORD

AT FARNINGHAM, KENT

This modest little house exemplifies the principle of making the building fit its setting rather than designing it as a separate and complete entity and then modifying the site to a suitable form. The architects were first called in to advise their clients if it were economically and practically sound to build at all on this desired site, for they had been assured on all hands that such a steep hillside would entail great extra cost as well as inevitable dampness and other drawbacks compared with the alternative offered, an ordinary uninteresting "building plot" on a flat field. The architects had no hesitation in recommending the hill, and by designing the house with varying floor levels, following to a large extent the natural slopes, they were able to avoid constructional difficulties and serious increase in the cost and to obtain an interesting interior.

any pigsty can fulfil, let him rather inscribe on his banners "England, Home and Beauty." Instead of turning his back on the splendid work of his fathers, let him find his inspiration in the buildings which have given us the precious heritage of rural England. He need not go to Sweden. Let each country preserve its own individuality . . . It is idle to think that the modern ideal of practical scientific efficiency, which rightly dominates the making of machines, can be enough to satisfy us in the creation of homes for human beings. . . . If you wish to realize the prevailing quality of modern building, take a ride on top of a bus in any direction out of London, and try to discover, in all the endless array of houses you may pass, any that are not vulgar or mean. In whatever direction one looks, modern building, almost without exception, is destructive of the natural beauty of the world.

In addition to the various chapters on building, the authors have included a description of each of the houses illustrated. Describing that at Peru, illustrated herewith, they write :

There is something about the name Peru which inevitably suggests the limerick, and we cannot resist the temptation :

There was a young man of Peru,
Declared as his personal view,
If a house may be hatless,
Depends on the atlas :
It seems to be right in Peru.

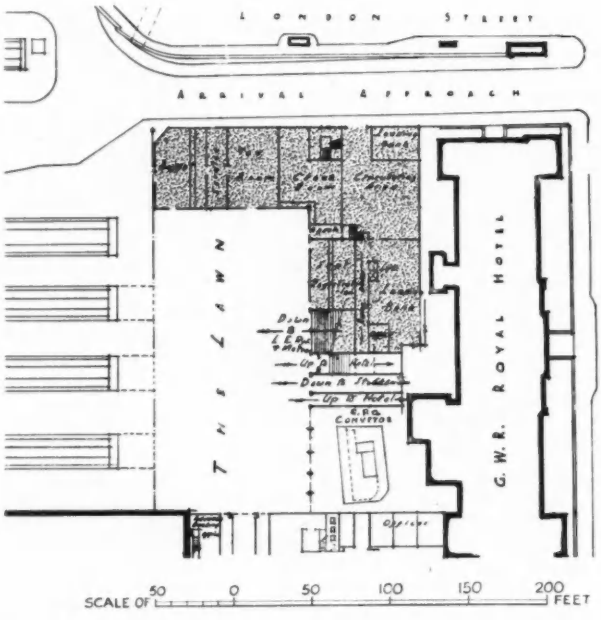
But this singular man of Peru
Was not much unlike me and you :
So his house, although hatless,
Is also quite ratless,
And its angles are solid and true.

TOWN AND COUNTRYSIDE

Town and Countryside. By Thomas Sharp. Oxford University Press and Humphrey Milford. Price 15s. net.

TIME was when architects had to do with town planning, and the time will come again. But it will come with an alteration of our basic outlook upon housing—upon living, nearly ; and this alteration in mental attitude will achieve itself, I believe, in measure as we turn hopefully towards the regeneration of our wasted towns.

Here are the first brave words that have been spoken for urban planning since town planning started. Mr. Sharp has angered the adherents of garden-city planning ; for some reason or other, he has angered even architects, but for all of those who hope to take a hand in replanning the messes the industrial age left behind it this book provides the foundations of a more comprehensive viewpoint than has obtained hitherto.



What, in effect, is Mr. Sharp's main argument ? It is that the garden city movement, offering its little garden houses to those who would leave the town, has produced belts of an amorphous development, neither town nor country. That though it left behind it the winding roads of its first flowering, it has perpetuated a small and insignificant house unit which has successfully belittled all attempts at urbanity and fine design. That, even worse, it has forced this disastrous unit into all town-planning legislation, and, linking it with low densities, has spread development over areas that appear to have no limit in the eyes of practising town planners.

"Urban influences neutralize the country. Rural influences neutralize the town. In a few years all will be neutrality," cries Mr. Sharp. "The strong, masculine virility of the town ; the softer beauty, the richness, the

STATION OFFICES

DESIGNED BY P. E. CULVERHOUSE

These new offices for the Great Western Railway Co. are situated on the arrival side of Paddington Station. The platforms run away to the left of the plan, on which the new block is indicated by a shaded tint. The external walls are built of artificial stone, with a brick backing, and the plinth is of granite. The panels between the metal-framed windows on each floor are bronzed and the brackets in ornamental bowls at the top-floor level are designed to take lamps for floodlighting the main façade. This building is illustrated in the current issue of "The Architectural Review," from which the above photograph and plan are reproduced.

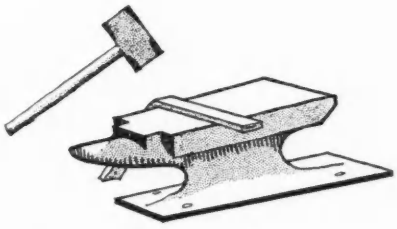
fruitfulness of that mother of men, the countryside, will be debased into one sterile, hermaphroditic beastliness . . . the town is town; the country is country; black and white; male and female."

That is his argument; and are there architects to disagree that it forms the basis of any philosophy seeking to make use of the means at our disposal in a modern world?

We architects hope to use our powers of co-ordination and proportioning to rebuild the rotten centres of urban and industrial population. If we have turned away from the garden city movement, to be instructed of Continental planners, it is because we feel that life has gone from a system that was founded upon false premises. Mr. Sharp is the prophet of a revival of urbanism that we wish most devoutly to bring about in our time.

In writing of the countryside, he has gone to essentials to discover for us, in a chapter of enthralling interest, the origins of English countryside character, so that, if preservation means anything to us, we shall know what it is we preserve and how best we may preserve it. These chapters dealing with landscape and village character give the book dignity enough to withstand the drain of his angry outbursts against what he feels to be the futility of present policy, and against the more obvious sores of a too-rapidly-moving civilization.

The book is divided into chapters on countryside and town, with considerably more stress upon the former, and despite his critics, more of construction there also.



On broad principles, his chapters on the town bring a new and not unconstructive viewpoint to bear on the problem of urbanism as left by the garden city movement rather than as found in the existent centres of populations.

There could be another book added to the second half of *Town and Countryside*, to link Mr. Sharp's arguments with those of the modern movement in architecture, for both lead towards a satisfactory and urbane æsthetic of town planning; the one through the rejuvenation of architectural structure, the other through the destruction of a romantic ideology.

Mr. Sharp has matched his fine prose with good, apt and thoroughly biased photographs, and the Oxford Press have completed a very respectable piece of work. E. M. F.

Hospital Congress

The third international Hospital Congress will be held at Knocke-sur-Mer (Belgium) from June 28 till July 3. From July 4 to 9 there will be a five-days' Study Journey through Holland, which will enable the Congress not only to see the new hospitals, but the classic places, the centres of industry and scenery of Holland. Full particulars are obtainable, free of charge, from Messrs. W. Kohlhammer Verlag, Urbanstrasse 12-16, Stuttgart.

TRADE NOTES

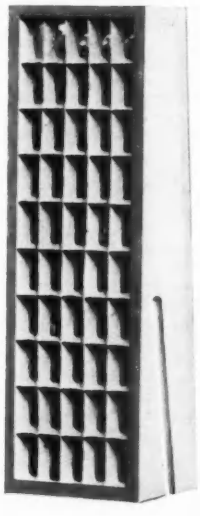
BY F. R. S. YORKE, A.R.I.B.A.

¶ My main object in these notes is to bring into closer working relationship the architect and the manufacturer, and to discuss products that are new, or little known, or whose portent may not be appreciated by the architect; and to give the information that the architect requires.

The response from manufacturers has been gratifying. I am unable in the space at my disposal to deal with every product of which I have received particulars, and I propose therefore to include in my notes a section for manufacturer's literature.

The architect can assist in making these notes of greater practical value by sending information based on his own experience.

I shall be pleased to answer queries, and I shall welcome suggestions from architects and manufacturers. I shall be grateful to those who send illustrations and specifications of intelligently-produced materials and fittings, and I particularly want to receive details of new standardized building equipment.



—F. R. S. Y.

I WENT last week to the Ideal Home Exhibition at Olympia, where, as last year, the utilitarian equipment, refrigerators, cookers, water softeners, and so on, provide the relief in a show of over-decorated fireplaces, electric light fittings and furniture.

A new gas heating radiant

I was especially interested in a new gas heating radiant, evolved in the research laboratories of the Gas, Light and Coke Company, and manufactured by Bratt, Colbran for incorporation in the new Portcullis Fire.

In view of the fact that one such radiant is equal, in terms of radiant heat, to one kilowatt of electricity, the radiant is called a "unit," and, as an approximate guide, it should be useful, when selecting a fire, to remember that each unit is equal, in terms of heat output, to one kilowatt electric fire, or 2½ ordinary gas fire radiants.

A new gas heating radiant burning about 8 cu. ft. per hr.

•

The form of the radiant is unprecedented; a complete departure from the conventional "candle" type. It is constructed with solid back and sides, and has a rigidity and robustness that should permit long life. It is held in position by metal rods that rise from the burner-plate and slide into grooves in its sides. The fire-back is composed of special non-conducting material, and by placing the units close to this back, heat loss is reduced to a minimum. The number of thorns or pips is increased to obtain more efficient "scrubbing" of the flame.

As a result of these improvements a 20 per cent. gain in radiant efficiency, and consequently a 20 per cent. economy, is claimed; and, because a single unit burns no more gas than two incandescent mantles, fumes given off are negligible, and a portable flueless model is sanctioned by the authorities.

Economy in water heating

I was impressed by the Aga water heater, which works in conjunction with the cooker, and, for an extra £1 10s. per annum fuel cost, provides a 20 gallons supply of water, at 200° Fahrenheit morning and evening. This is equivalent to four really hot baths a day, but if hot water for washing-up or other purposes is drawn off, the heating of the water to the maximum temperature will be delayed.

The apparatus consists of a heavily-insulated 20-gallon storage tank, placed above or beside the Aga cooker, and a coil of piping fixed round the barrel of the cooker and connected with a similar coil immersed in the storage tank. These coils constitute a closed circuit within themselves and are filled with distilled water, which eliminates the formation of lime or other deposits. The distilled water in the barrel coil is raised into steam which passes into the upper coil in the storage tank where, in condensing, it gives off its heat to the water surrounding the coil. The distilled water is then returned to the barrel coil for reheating. The system is entirely automatic and contains no moving parts.

Throttling devices prevent the passage of steam through the storage tank coil once the water has reached 200° Fahrenheit. The cold supply to the storage tank can be direct from the mains supply (a great economy) and the hot water can be circulated to any tap in the house.

•

The water heater can easily be fitted to cookers already installed. It costs, if ordered with the cooker, £19 10s., exclusive of any plumbing work that may be required.

•

A special feature of the cooker itself is the insulation, which prevents heat loss, and so effects economy in fuel. It is significant that in one of the model kitchens an Aga Cooker and an Electrolux refrigerator are arranged in juxtaposition.

Rubber wall lining

In another kitchen rubber is employed as a wall lining, in place of tiles. The method of fixing is exactly the same as that employed for rubber floors, and I understand that the material can be supplied at 4s. 6d. to 5s. per yard super.

An electric hand drier

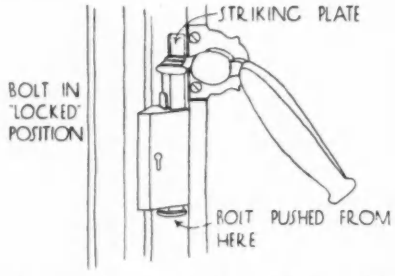
Towels usually remain in the lavatories of factories and schools until they are, at least, slightly soiled, and consequently unhygienic, and I naturally conclude laundering costs, and the time spent in

Pedestal type of "Crypto" electric hand and face drier.

collecting and distributing towels, to be quite considerable. It appears, therefore, that a hot-air hand and face drier, costing £22, that dries sixty pairs of hands for the price of one unit of electricity, should, in the long run, prove an economy.

•

The "Crypto" hand drier, which is obtainable as a wall or pedestal model, is operated by a foot pedal. Cool air is sucked in at a high level, above the motor, circulated about an electric heating element and delivered at high temperature, under pressure, through two opposing outlets, so that the currents meet at a convenient level. The hands are inserted at this meeting point and wrung continuously until they are dry. The manufacturers say that twenty seconds should suffice to complete this operation, but I believe this to be a slight under-estimation.



•

At a higher level is a third aperture, through which hot air is blown towards the face which is dried by rubbing with the hands, with the same motion as that employed in washing. When the foot pedal is released the current is automatically switched off.

•

A locking device for windows

On the Crittall stand I saw a new type of window lock, calculated to defeat the would-be intruder, who, by breaking a single pane

A new window lock that can be attached to standard metal windows.

of glass, can turn the handle and effect an easy entrance.

The lock is fitted to the ordinary type of window, immediately below the catch, and is pushed upwards into a locked position with the fingers, but can be opened only by a master key.

THE SPECIFICATION WRITER

FIRE RISKS AND DESIGN

[*By MAURICE E. WEBB*]

FIRE regulations affect the external design of buildings in many ways, and perhaps the most important is height. Until quite recently our laws in London prescribed a sloping roof with an angle of 75 deg. above the 80 foot limit, but now vertical stories within that angle are not only permitted, but encouraged, except for one stupid rule. The rule is this: that if this construction is adopted the building will be classed as a high one, and adjoining owners and others have to be notified and asked if they wish to object. The height is no greater, and may even be less than the older type, and it is difficult to see the logic or use of such a rule.

Other regulations which affect the external design of buildings are those which limit the window openings to half the area of the wall face. This seems quite unnecessary, and to be a restriction on the liberty of the subject. Another is the casing of all steel with 2 inches of incombustible material, making the designer of a steel building cover it all up with a sham veneer of stone or brick, or forcing the use of reinforced concrete on an unwilling building owner. In this connection, I have found that building in London under L.C.C. regulations costs considerably more than outside their area.

Our present code, as far as London is concerned, is out of date, and takes little, if any, heed of modern building fire-resisting construction; but that we hope the L.C.C. are really seriously trying to remedy now.

Speaking as an architect, I hope that no general increase of height will be permitted. Only two complete streets in London, namely, Regent Street and Kingsway, have hitherto been built up to the present limit, and I believe that the strongest opposition to any big concessions has hitherto come from the London Fire Brigade.

The whole question of increase of heights of buildings is obviously very much wrapped up with fire risks, especially in congested areas of big cities. It is hoped that, if any relaxation is to be permitted in the future, a very careful system of zoning will be adopted, and that any such increase of height should only be permitted in conjunction with proper schemes of street widening, and the use of the most modern type of fire-resisting construction.

Fortunately the London clay will not permit of buildings of gigantic height, but it will permit of buildings very much taller than we have at present. I would remind you that St. Paul's is nearly 400 feet high, and its foundations do not even go down to the London clay. Therefore, there is always a possibility in the future, with land as valuable as it is in London, that a very considerable increase over the present height may be allowed (in fact there are today, as far as I know, no height limits outside London) and in that event the London Fire Brigade will be faced with a different problem in the matter of fire fighting, and the various devices used in America, such as dry mains and pumps, etc., at various points in the building, already used here on a small scale, will have to be resorted to on a big scale to get the water up to the upper stories. This has proved to be possible in America, but they have never, fortunately, had to test it out in the case of a serious fire in their skyscrapers.

The reason is one we ought to note in connection with our modern building regulations, and it is simply this: their buildings are made as fireproof as they can be made, and must be made, before the latitude of great height or great cube is allowed.

Fire rules and regulations have a very intimate connection with the interior planning of buildings. In certain classes of buildings, such as a big store, the Act limits the size of each compartment to 250,000 cubic feet, but under certain conditions this figure can be materially increased.

These compartments may be dealt with, either horizontally or vertically, with openings between each of such compartments, which must be protected by double fire shutters. If the cubic contents are based on vertical divisions, direct access from floor to floor by means of staircases or lifts is a simple matter; but if the division is horizontal, the staircases and lifts must be cut off by means of lobbies, and the openings must be protected by fire doors.

A large number of divisions are involved, and these are not what the modern storekeeper requires. He wants big open uninterrupted floor spaces.

I think most architects will agree that from a fire point of view, as well as every other, these restrictions on cubical contents of a building should be abolished, provided—and this is of vital importance—that the building is made as completely fire-proof as modern building construction will permit, and that it is provided with sprinklers and drenchers throughout; that the staircases are adequate in number and all stairs for escape in case of fire are placed on outside walls with direct access to the street and roof. The entrances to all staircases should be clearly visible to the public for many reasons, the principal ones being that lifts are now largely superseding staircases for public use, and in the case of fire or panic, people invariably try to leave the building by the same means as they came into it. If the electric current fails—as it frequently does—in the case of a fire, the lifts are put out of action, and unless the stairs are clearly visible, a panic may result. For this reason also it is most regrettable that the restrictions on escalators are such that no London Store has, as yet, been able to use them on a big scale.

In dealing with large buildings, I want to stress the importance of sprinklers. As an

Summarized from the Fothergill Lectures, recently delivered before the Royal Society of Arts. The complete set of three lectures are obtainable from the Secretary, John Street, Adelphi, W.C.2, price 2s. 6d.

architect, I dislike them, because of the multiplicity of pipes they cause throughout the building, and the difficulty of fitting the sprinkler heads into the pattern of ornamental ceilings; but if the authorities in London would give them their due value as fire-stoppers and would relax some of their other regulations in regard to cubical contents, fire walls, etc., in all fire-resisting buildings in which sprinklers are fitted, my dislike would be converted to friendship.

The Insurance Companies give rebates of 50—60 per cent. on sprinklered buildings, but, as far as I know, they give little or no rebates to buildings which merely comply with local authorities' bye-laws.

Many fires in old houses have been caused by faulty flues, and by the addition of a heating apparatus, or by a faulty electric light installation. To anyone who buys a house and instals a central heating apparatus, I would ask that he or she makes perfectly certain that the flue through which the boiler has to function is big enough and is safe. Flues can be tested for fire as drains can be tested for escaping gases.

Owing to the increased use of electricity, many houses are now not only wired for electric light, but for heating and cooking also. There are many different systems of wiring on the market, some of them much cheaper than others. From a fire point of view this is not a service which should be economized upon, and it should only be put into the hands of a really responsible engineer, whom one can trust to see that the system is properly installed and earthed and properly tested and fitted with an adequate system of fuses. In the case of a building where both gas and electricity are used, it is of the greatest importance to see that the gas pipes and electric conduits do not in any way cross or touch each other.

Another fairly frequent cause of fires in houses is the faulty setting of fireplaces, and special attention should be paid where the modern type of slow-combustion grate is fitted. Before fitting the grate, care should be exercised to see that there are no wooden blocks or other timbers in the walls, as often occurs with old houses, and that the hearth is properly set on some incombustible base.

SOCIETIES AND INSTITUTIONS

DEVON AND CORNWALL ARCHITECTURAL SOCIETY

THE annual general meeting of the above Society was held at Exeter on March 25, with Mr. A. H. Ough, F.R.I.B.A. (President), in the chair.

Mr. Ough, in the course of his presidential address, made a proposal for widening the scope of the Building Industries National Council. He said: *A small committee might be formed, in every district where an allied society has a branch or chapter, comprising two or three architects appointed by the society and two or three members of the local Building Employers' Federation, which would meet and discuss local problems and link up with the National Council.*

The following officers were elected for the ensuing year:—

President: Mr. B. Priestley Shires, F.R.I.B.A.; *vice-presidents:* Messrs. A. S. Parker, F.R.I.B.A. and W. J. M. Thomasson, A.R.I.B.A.; *Past President:* Mr. A. H. Ough, F.R.I.B.A., M.INST.C.E. *hon. treasurer:* Mr. John Bennett, F.R.I.B.A.; *hon. auditor:* Mr. L. F. Tonar, L.R.I.B.A.; *hon. secretary:* Mr. J. Challice, A.R.I.B.A.

Members of Council: EXETER BRANCH: Messrs. R. M. Challice; E. Kemeys-Jenkin, F.R.I.B.A.; H. Alban Peters, A.R.I.B.A.; J. C. C. Bruce, A.R.I.B.A.; H. M. R. Drury, A.R.I.B.A.; and H. F. Rea, A.R.I.B.A. Associate member: Mr. A. Palfrey, P.A.S.I. PLYMOUTH BRANCH: Messrs. W. A. Vercoe, A.R.I.B.A.; E. G. Catchpole, A.R.I.B.A.; Harold Haughton, L.R.I.B.A.; E. V. Channon: and C. L. Jones, L.R.I.B.A. Associate member: Miss K. I. Maynard.

B. Priestley Shires, F.R.I.B.A., who has recently been elected president of the Devon and Cornwall Architectural Society. He also occupied the same position in 1905 and is a member of the Council of the R.I.B.A.

THE PROCESS OF DEVELOPMENT

Sir Charles Peers, F.R.I.B.A., speaking at the annual dinner of the Berks., Bucks. and Oxon. Architectural Association, held on March 23, said:

Although I have been brought up to revere old work, I feel extraordinarily cheered with what I see going on today. The only mistake is that we are a little inclined to judge every work we see at the present as if it was completed, finished and fully developed. It is nothing of the sort, it is something in the process of development. The newest work we do today is in a somewhat archaic state. One thing leads to another, and the only thing that matters is that you should do what you believe best in your own time.

Mr. T. Lawrence Dale, F.R.I.B.A., presided, and other speakers included Sir Raymond Unwin, P.R.I.B.A., Mr. Eric Gill, Dr. L. H. West and Dr. H. E. Craster.

BERKS. SOCIETY OF ARCHITECTS

At the annual meeting of the Berkshire Society of Architects, held at Reading, the following officers were elected:

Chairman: Mr. E. Steward Smith, A.R.I.B.A.; vice-chairman, Mr. A. Saxon Snell, F.R.I.B.A.; hon. librarian, Mr. H. Whiteman Rising, F.R.I.B.A.; hon. treasurer, Mr. W. R. Morris, F.R.I.B.A.; hon. secretary, Mr. A. B. West. Members of the Executive Committee: Messrs. T. T. Cumming, F.R.I.B.A., W. R. Howell, F.R.I.B.A, J. E. Robson, W. J. Freeman, A.R.I.B.A., A. S. Miller, A.R.I.B.A., and C. B. Willcocks, F.R.I.B.A. Representatives on the Berks., Bucks. and Oxon. Architectural Association Council: Messrs. E. Steward Smith, A. Saxon Snell, W. R. Morris, J. T. Saunders, F. Woods, H. M. Lewis, F. E. Wapshott, A. B. West and S. E. Burrett.

FLOODLIGHTING

THE LIGHTING OF CINEMAS AND THEATRES. By R. Waldo Maitland, A.R.I.B.A. At the Lighting Service Bureau, London, March 29.

The general practice when flooding the front of a cinema or theatre is to use the canopy to house the floodlights but, owing to the L.C.C. regulations in limiting both the depth and projection of the canopy, one invariably sees floodlights projecting above the canopy top. This entirely destroys the illusion of the effect produced on the building face.

To place a shield in front of the floodlights might seriously affect the cross section of the canopy, and I would suggest either a limitation of the area to be lighted should be considered, to enable the use of smaller equipment or the concealment of the floodlights in the itself at various levels.

The application of luminous boxes or troughs has been extensively employed in Germany. In this country little of this application has yet been employed, but something of a similar nature is used in the form of box signs and open letter signs, as illustrated in the new Gaumont Palace, Lewisham.

STIRLING SOCIETY OF ARCHITECTS

At the first meeting of the Stirling Society of Architects (a Chapter of the Royal Incorporation of Architects in Scotland), held on March 20, the following office-bearers were elected:

President, Mr. Eric S. Bell; vice-president, Mr. A. M. McMichael; Council: Messrs. Leonard C. Blakey, Robert Wilson, Alexander Black, John Gray and Henry Wilson. Representative to the Council of the Royal Incorporation: Mr. Alexander Black. Secretaries and treasurers: Messrs. Hill & Whyte, solicitors. Auditor: Mr. Joseph Dickson, C.A.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Spoliation of Westminster

QUESTIONS were put in the House of Commons last week with regard to the alleged threat to the Palace of Westminster and Westminster Abbey.

Sir William Davison asked the First Commissioner of Works what action the Government were taking, in connection with the London County Council or otherwise, to protect the amenities of the Palace of Westminster and Westminster Abbey against the erection of excessively tall buildings in their immediate vicinity?

Sir Assheton Pownall also asked the First Commissioner of Works whether his attention had been called to the Report of the

town planning committee of the London County Council dealing with the danger to the amenities of Parliament Square of certain projected new buildings; and what action he intended to take?

Mr. W. Ormsby Gore said that his attention had been drawn to the recent action of the L.C.C. in passing a resolution authorizing the preparation of a town planning scheme for an area in the City of Westminster, including Parliament Square, Old Palace Yard and Abingdon Street. He understood that this action had arisen out of proposals for the erection of office buildings on sites in Abingdon Street and Great George Street. Under the terms of the Town and Country Planning Act, 1932, any such scheme must be submitted to the Minister of Health, who would take into consideration any representations received from the Commissioners of Works with regard to the proposal.

So far as the Abingdon Street proposal was concerned, the First Commissioner of Works already possessed statutory powers giving him a very considerable measure of control over the elevation and height of any buildings to be erected on that site. He was not aware, however, whether any detailed plans and elevations had yet been prepared, and he was therefore not yet in a position to express any opinion on the proposals. As regarded the Great George Street proposal, the Commissioners of Works had no control except in such matters as rights of light and easements as arise out of the ownership of the land in Parliament Square immediately adjacent to the site in question.

Sir W. Davison: "Then I understand that no application had been made to the Office of Works. Will the right hon. gentleman say, when he said that under the terms of the Act the Minister of Health had certain powers, to what Act he referred?"

Mr. Ormsby-Gore: "I referred to the Town and Country Planning Act of last year. The first step to be taken by any private owners, in connection with rebuilding on these sites, is to go to the County Council: the scheme then goes through them to the Minister of Health, who, before he gives his decision, consults my department."

Sir A. Pownall asked if the First Commissioner could give an assurance that every possible step would be taken to see that there was no repetition of what had happened in Carlton House Terrace?

Lieut.-Comdr. Agnew asked if the First Commissioner had any control over the architectural style of any new buildings erected on the Abingdon Street site?

Mr. Ormsby-Gore: "No. I do not think I have any control over the actual style, but on the general character of the elevation in relation to surrounding buildings; I cannot prohibit all building there altogether."

Mr. Maxton asked if the Great George Street land was not in the ownership of the Ecclesiastical Commissioners, and that being so, had the right hon. gentleman no control over the operations of the Commissioners?

Mr. Ormsby-Gore: "No. I understand that the bulk, but not all, of the Abingdon Street site is in the ultimate ownership of the Ecclesiastical Commissioners. One owner owns three houses privately. The Great George Street site is, I believe, private freehold."

Rent Restrictions Bill

The Committee stage of the Rent and Mortgage Interest Restrictions (Amendment) Bill was begun in the Commons last week. An amendment, moved on behalf of the Government, to provide that the Bill should come into operation on September 29, 1933, was agreed to. It was stated that the measure would come into operation in Scotland on November 28, 1933.

Mr. Greenwood moved an amendment with the object of ensuring that the Rent Restriction Acts, instead of coming to an end in 1938, should continue in force "until Parliament otherwise determined." He said that it was a gamble to suppose that in five years private enterprise would provide sufficient small houses for the working classes to meet the demand.

Sir Hilton Young, the Minister of Health, said there was no reason to suppose that after five years the supply would not equal the demand. Five years would allow free play for the working of those forces which the Government had called into active operation.

The amendment was negatived by 301 votes to 68.

LAW REPORT

LIGHT AND AIR CASE

Smith v. *Evangelization Soc. Incorporated Trust and Another.—Court of Appeal. Before the Master of the Rolls and Lords Justices Romer and Lawrence*

THIS was an appeal by Mrs. Eliza Smith, the owner of No. 8 Mint Walk, Croydon, from a decision of Mr. Justice Maugham, sitting in the Chancery Division, dismissing her action asking for a declaration that the defendant Society and Mr. Denyer, as the owners and superintendent of the adjoining Mission Hall, were not entitled to erect a corrugated iron screen so as to obstruct light and air to her first floor window on the east.

The defendants contended that so much light came to the room through another window that the Court could not say Mrs. Smith's ancient light had been interfered with, and that she had deprived herself of light by blocking up existing skylights in the roof of the room.

Mr. Justice Maugham held that the removal of the skylights was a factor which had to be taken into consideration. Having regard to this circumstance he could not hold that the room was uncomfortable for the ordinary purposes of mankind, it being a small room with a good window light from the west.

Mr. Morton, K.C., for the appellant, submitted that Mr. Justice Maugham ought not to have taken into consideration the skylights at all. They had existed for only 18 years and had ceased to exist before the east window acquired any right to light at all. The Judge was wrong in holding that there was no infringement of the plaintiff's legal rights. The question was whether obstruction was a nuisance and there could be only one answer, because it was a complete obstruction. Even if the skylights had, as the Judge held, to be taken into consideration, it would still be a nuisance to block out the light from the east window. His contention was that the skylights ought not to be taken into consideration at all.

Mr. Gover, K.C., appeared for the respondents.

The Master of the Rolls, in giving judgment, said this appeal raised a point on which it appeared there was no direct authority. Here the Court had to consider what was the effect of the alterations made by the plaintiff in 1924, when the skylights were removed and the east window was enlarged. Owing to the existence of the skylights, starting from 1913, when the period of prescription began, the light from the east window was relatively unimportant. It seemed that consideration must be given o the condition of the premises at the commencement of the period of prescription, because one had to consider what was the access, and what was the use of the light which had been actually enjoyed for the full period of 20 years. It was laid down in the Colls case in the House of Lords that one must consider the surrounding circumstances of light coming from all sources. To his lordship it appeared that Mr. Justice Maugham had followed the reasoning and principles laid down in the House of Lords in that case. In his opinion Mr. Justice Maugham had properly directed himself in accordance with the principles in that case and therefore the appeal would have to be dismissed with costs.

Lords Justices Romer and Lawrence concurred.

THE BUILDINGS ILLUSTRATED

Following are names of the specialists, general contractors, and some of the sub-contractors for the buildings illustrated in this issue:

St. Anselm's Catholic School, Harrow (pages 457-459 and supplement). General contractors, E. H. Burgess, Ltd. Sub-contractors: Self-Sentering Expanded Metal Co., Ltd., reinforced concrete floors, roofs, staircases, etc.; Cook & Co., Ltd., steelwork; Xelite Plaster Co., Ltd., snowcrete rendering and internal plastering; Excel Asphalt Co., Ltd., asphalt; Kingsmill Metal Co., wrought-iron balconies, handrails, etc.; James Gibbons, Ltd., cloak-room fittings, locks and door furniture; H. Pontifex and Son, Ltd., sanitary fittings; G. N. Haden and Sons, Ltd., hot-water system, electric lighting and wireless installation; W. James & Co., Ltd., steel casements and doors.

Extension to the National Portrait Gallery (page 460). General contractors, Leslie & Co., Ltd. Sub-contractors: Edward Wood & Co., Ltd., steelwork; Highways Construction Co. (incorporating French Asphalte Co., Ltd.), asphalt; Harland and Wolff, Ltd., lighting mains; Crittall Manufacturing Co., Ltd., steel sashes; J. Whitehead and Son, Ltd., marble; J. Healey, Ltd., pavement lights; Hill and Smith, Ltd., balustrades and railings; J. and C. Bates, Ltd., fireproof doors; Special: The Kingsmill Metal Co., Ltd., bronze work and window grilles; J. F. Ebner, Ltd., wood block flooring; Diespeker and Co., Ltd., terrazzo paving; Turner, Lord & Co., decorative work; Hampton and Sons, Ltd., handrail; Richard Crittall & Co., Ltd., heating installation.

Conversion of factory for Molin Machines Co., Ltd., Deptford (pages 466-467). General contractors, T. H. Sawyer and Son, Ltd. Sub-contractors: J. E. Pearson (Birmingham), Ltd., metalwork of fence; Henfrey Electrical Co., electrical fittings; Troughton and Young, Ltd., special lighting fixtures in entrance hall; J. and E. Hall, Ltd., lifts and lift cars; Synchronome Co., Ltd., electric clocks; Korkoid Decorative Floors, floor covering; Cement Marketing Co., Ltd., Snowcrete—in three colours.

Other Trade Items

Messrs. W. T. Henley's Telegraph Works Company, Ltd., have appointed Mr. W. Reay, who has been attached to their Contract Office at Lisburn since 1928, as Belfast Branch Manager in succession to the late Mr. C. Magee.

*

Messrs. Commercial Structures, Ltd., have recently secured the contract to erect a modern single-floor factory on the Langhedge Factory Estate at Edmonton, for a boot and shoe company.

*

We regret to record the death of Lt.-Col. F. A. Woodcock, D.S.O., the managing director of Messrs. Diespeker and Co., Ltd.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

Plans passed by the EALING Corporation: Eight houses, Tavistock Avenue, for Mr. E. B. Burge; four houses, Midhurst Road, and seven in Ellesmere Gardens, for Mr. E. Read; six houses, Clauson Avenue, two blocks of flats and 16 houses, Twyford Avenue, and six houses, Rydal Crescent, for Messrs. B. Smith and Sons (Builders), Ltd., of Northolt; 24 flats, Gunnersbury Avenue, for Mr. G. P. Bath; nine houses, Tavistock Avenue, for Messrs. A. Watson, Ltd.; 22 houses, Rydal Crescent, for Messrs. R. Lancaster and Sons; two houses, Downing Drive, for Mr. W. Stokes; hotel, Greenford Road, for Messrs. Clemence & Co.; alterations and additions, King Edward Memorial Hospital, Mattock Lane, for Messrs. Hall-Jones and Partners; warehouse, rear 11 Boston Road, for Messrs. Bostock and Hollins; alterations and additions, 44-5 Broadway, for Lloyds Bank, Ltd.; factory, Wadsworth Road, for Messrs. Perdy, Bilton, Ltd.; nine shops, Ruislip Road, for Mr. W. Hunt; rebuilding 30 Broadway for Mr. H. Braddock. The following estate plans have been passed: Park Royal Estate, for Messrs. P. H. Edwards, Ltd.; Greenford estate, for Ecclesiastical Commissioners; Perivale estate, for Mr. J. M. Wilson.

The L.C.C. is to clear the Northwold Road area, HACKNEY, and build blocks of tenements at a cost of £52,000.

Greenaway Cottage, near Windsor. Designed by M. H. Baillie Scott and A. Edgar Beresford and reproduced from their book, HOUSES AND GARDENS, *reviewed on pages 470-471. The authors state: "Let no one suppose that because a cottage must be cheap and small it is necessarily an inferior kind of dwelling, which can give little scope for the artist in building. On the contrary, there is a quality about the cottage when rightly built which seems of deeper significance than can be conveyed by larger dwellings." The cost of the above cottage would nowadays be about £300-£350.*

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

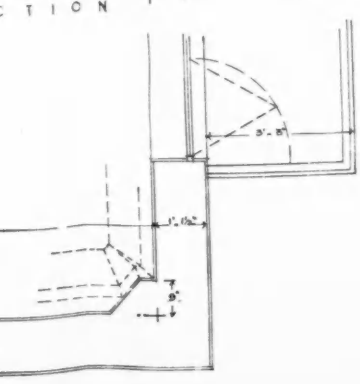
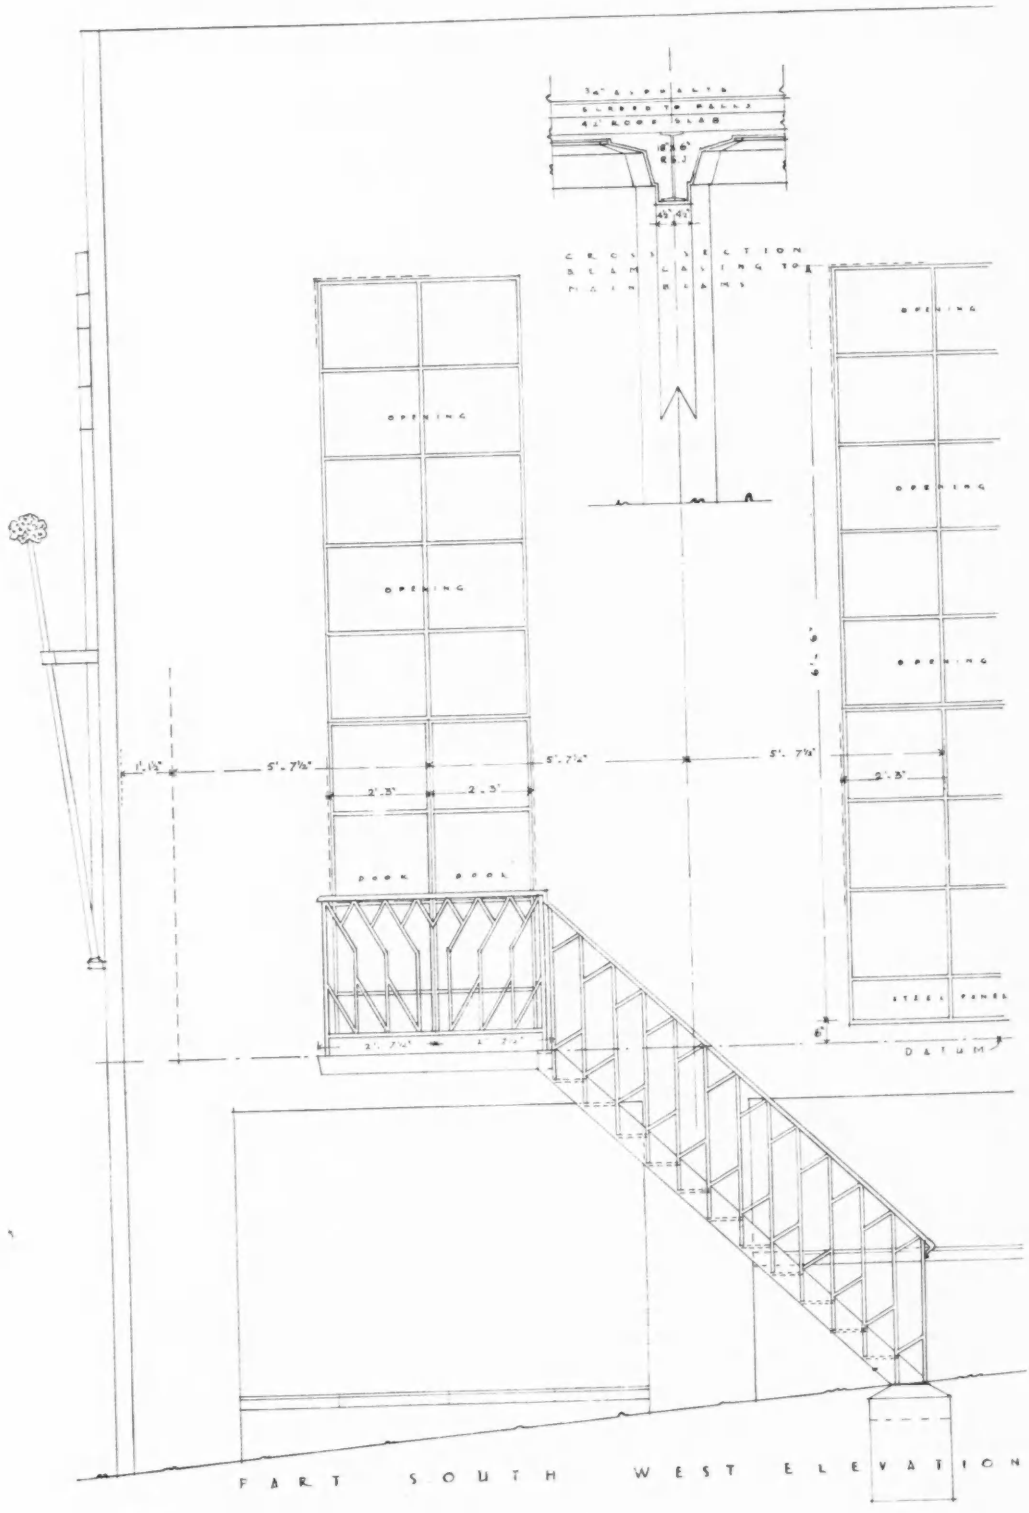
SAINT ANSELM'S
R. C. SCHOOL, HARROW
DESIGNED BY ALLAN D. REID





THE END OF THE ASSEMBLY HALL

THE large-scale drawing in this supplement is devoted to details of the assembly hall, including a deep window and external emergency staircase which occur on the further side of the hall from that in the photograph above, which shows a similar window and balcony. The school, of which other illustrations, plans and a description are given on pages 457-9 of this issue, is planned as an L, the assembly hall occupying most of one wing, and extending its full height except for a basement forming a small covered playground, with store accommodation and boiler house behind. The assembly hall is floored with oak, so as to be suited for dancing when required, and has a footlit stage.

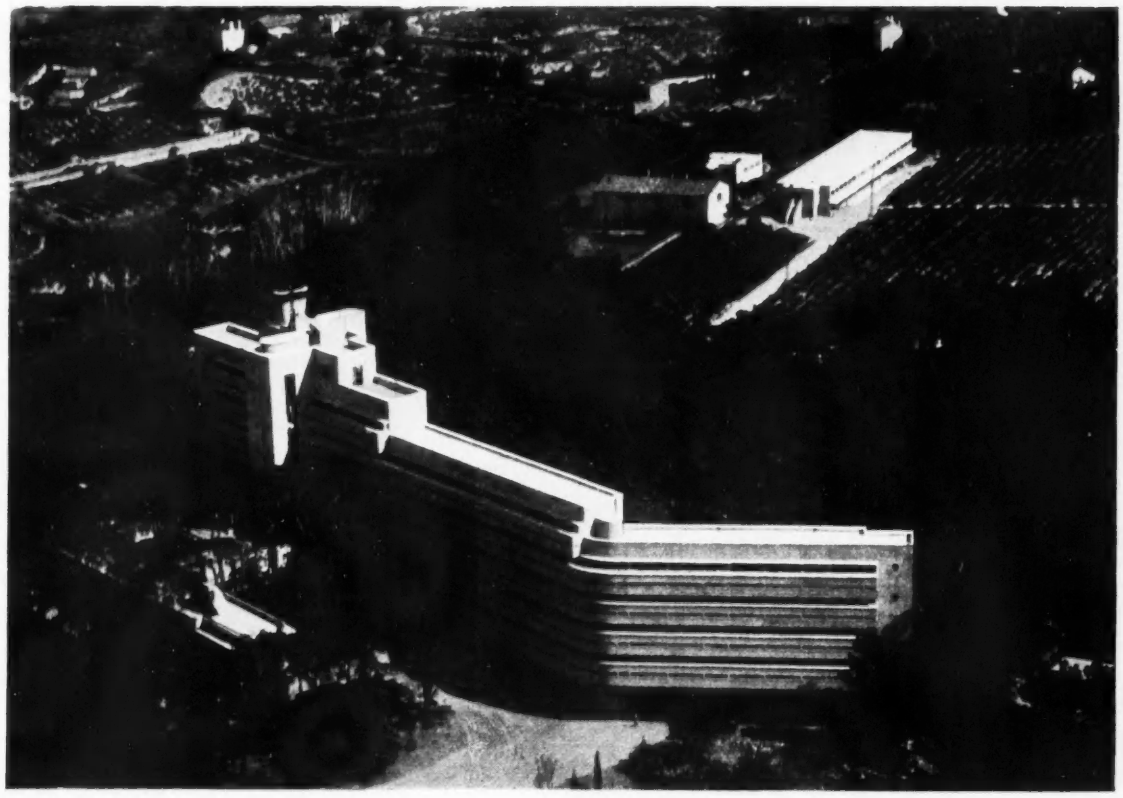
LAVATORY UNITS

•



THIS week's Information Sheet pursues the important subject of lavatory accommodation. It illustrates in plan and section a standard self-contained lavatory, combining the three essential types of fittings in a manner that complies with alternative demands for ventilation. Sheets 1 and 5 should be referred to for subsidiary details.

The following is a complete list of the subjects previously issued :—

1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.
8. Mar. 8—Billiard Table Data.
9. Mar. 15—Roof Pitches and Drainage.
10. Mar. 22—Lift Sizes, etc.
11. Mar. 29—Sanitary accommodation.

LOOKING NORTH IN THE SUNNY SOUTH

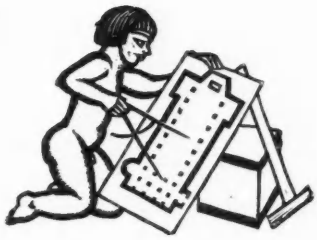
A NEW HOTEL ON THE RIVIERA

"LATITUDE 43," one of the latest additions to the hotels on the Riviera, was completed at St.-Tropez this year. As St.-Tropez is the only part of the French Mediterranean coast which faces north, incidentally possessing a magnificent view across the bay, the plan of the hotel had to be arranged so that the maximum number of rooms should have the advantage of the view, and at the same time receive their full quota of sunshine from the south. The building, therefore, is the shape of a long, high, narrow bar stretching from east to west, with windows on both sides.

The hotel has one hundred and ten rooms, most of them with a bathroom and w.c., a restaurant and patio with accommodation for three hundred, six bungalows, a sports ground, three tennis courts, two sea-water swimming baths, eight shops and a bar-casino-ballroom. There are also annexes, a reservoir, laundry, garage, chauffeurs' accommodation and farm and out-buildings.

The framework of the building is reinforced concrete, the upper parts being filled in with hollow bricks and the basement with rubble. The cellars were hewn out of the rock on which the foundations were built, the stanchions being supported on large square bases, strengthened with girders in the cellar floors.

The characteristics of the ground determined the general lay-out of the estate, which is eight hectares in area. It rises in three terraces from the main coast road to the St. Antoine road and the plateau.



The architect is G. H. Pingusson and an article on the hotel appears in the current (April) issue of "The Architectural Review."

SYMMETRY AS A SYMBOL OF POWER

The boiler-house of the Vereinigte Stahlwerke's Zollverein coal-mine at Gelsenkirchen, in the Ruhr. Instead of the usual exposed piping, writhing in and out of a chaos of unco-ordinated metallic odds and ends, disciplined planning has produced logical symmetry and an all-pervading orderliness. This reinforced concrete, brick-faced structure is dominated by a towering central chimney-stack built up of circular steel sections. The neatness of the lay-out obviates any suggestion of that architectural romanticism which so often mars the monumental grandeur of an industrial complex.

" I suggest that a group of architects might seek out a virgin site, well situated for modern transport ; prepare a lay-out and detailed plans, financial calculations, etc., and proceed—in all respects as a building speculator would do—in obtaining capital and building finance." EDWIN GUNN, *A.J., April 5, 1933.*

LET THE BOY GET OUT TO WORK...

THERE will very soon become law an Act that will bring to an end a period of state control over housing that has lasted since the end of the war.

The Housing (Financial Provisions) Act, 1932, as its title suggests, is concerned with money—with the saving of money. Its author, Sir Hilton Young, the Minister of Health, has described it as being " the second and last instalment of those measures for adjusting housing policy to changed conditions," and the argument for its introduction rests entirely upon the possibility of building cheap houses without the aid of a subsidy.

The Act therefore abolishes all subsidies for house building, and hands over the financial control to private enterprise, with special reference to the building societies. It follows, therefore, that the building societies have got to provide the funds for houses to *rent*, not to *buy*, though how they are to push this class of business and earn safe dividends at the same time is not clear to us, nor, we venture to think, is it clear to the building societies.

Be that as it may local authorities are already allowed to guarantee the repayment of advances and interest made by such societies to their members, and what the Act proposes is to guarantee local authorities against one-half of any loss sustained by them where money was borrowed for small houses built to let. This involves the State in a maximum risk of £20 for a house costing £300, which is tantamount to saying that the Government has handed over complete control.

Sir Hilton Young, during the second reading of the Bill, laid special stress upon " the responsibility of local authorities to carry on " ; for he had no doubt that cheap money and lowered building costs made this possible. He pointed to a growing demand for working-class property as an investment, and, on another occasion, hazarded the opinion that " the tendency of the cost of building would be downwards by reason of the competition that would arise when enterprise was freely at work."

This is the atmosphere of cheerful optimism in which housing is finally cast upon the world to fend for itself. " Let the boy get out to work. I was supporting misself before I was his age." And Why ? Because the Government cannot do more than one thing at a time. There is housing—that is to say, little houses. And there is slum clearance—that is, dirty old houses and new tenements. And there is town planning—which is a different thing altogether.

Over each of these things the Government has some control, and for each has, or had, a policy. But to keep them all separately balanced is too bewildering ; and rather than weld them together into a properly articulated Town Planning Act, it prefers to drop one in order to concentrate upon another : to throw small housing to private enterprise while it manfully and solemnly tackles the slums.

It looks, on the face of it, as though this is what has happened, and it is going to be extremely difficult to estimate the extent to which cheap housing for renting to the poorer people can become the province of private enterprise and speculation. Except for one or two safeguards as to size and density, forced upon the Minister as an amendment, the whole burden of any control over housing is thrown upon local authorities, who are instructed by the terms of an Act that could never be described as an encouragement, and by comparison with the Government's slum clearance manifesto might even be translated as offering a warning to let small house building slide.

Real financial control is vested in the largest lender, which is to be the building societies, and further control over plan, equipment, etc., lies with a Town Planning Act that is by no means in universal operation.

Now, either the building of small houses for letting will or will not be profitable, and houses of the right type will be built if they can show a profit, and otherwise not built, or built at such a lowering of standards as can be brought about in the quite different atmosphere engendered by the new Act. We return, as Mr. Greenwood remarked, to pre-war conditions, which can never be made to prove that private enterprise was capable of solving the problem of working-class housing.

In all this one seeks in vain for any other policy than that of *laisser-faire*, unless Sir Raymond Unwin's plan for a National Housing Corporation, at present being examined, stands any chance of being incorporated into the fabric of small house building, to direct and control a large-scale policy of development.

What the new Act will really do for housing remains to be seen. It may add a number of houses, to let at relatively high rents, to what remains of the landscape ; it cannot, as far as we can see, begin to deal with the house to let at a low rental, since the building societies never lend up to 90 per cent. where the security is not " gilt-edged." In a year's time, we believe, we shall be no nearer a solution to the problem than we are today.

However that may be, one thing is certain ; the

need for small houses is so great that an enormous campaign of building in the near future is inevitable. Surely the architect should be ready for it? An attempt is being made in this JOURNAL, in the articles *What is to be Done About This?* (see page 493), to deal with some of the problems, and some of the possible solutions. We invite those architects who are interested to contribute their views to the common pool.

CORRECTION: By the appearance of a misquoted figure in the last line of last week's leading article, its whole argument was vitiated. The sentence should have read "... employing precisely that number of men which it would cost £30 million (not £13 million) to keep idle."

The clock at Casani's Club, Regent Street, W. The "hands" are of chromium-plated metal, and the dial is black glass; the whole is affixed to a balustrade of silver-bronze.

NOTES & TOPICS

NATIONALISM AND ARCHITECTURE

THE Architecture Club diverted itself last week by discussing whether Architecture should be National or International. Mr. Geoffrey Webb opened the discussion and was trenchantly critical of "romantic people who talk about revolution because it increases their own importance." He warned the modernists that when they are old men they mustn't be as stupid as the old men of today.

*

Nearly all the speakers assumed that scholarship and experience inevitably rot down into stupidity. At least the ideas of the old gentlemen in practice today have weathered; the bright young modernists and their bright young materials may only get tarnished by the years.

*

The danger of a very shoddy future for the modern movement was emphasized by Mr. Towndrow, who reminded the Club of the harm done by erstwhile traditionalists who have been converted to modern architecture because they think it is beginning to pay.

*

Heading the discussion back to its subject, Mr. Towndrow said that all architecture should be "International, Communal, and, incidentally, anonymous."

*

Meanwhile, the nations of Europe seem intent on destroying all traces of internationalism. A style of turbulent romanticism may spring out of the new German nationalism. Bonehead baroque may well be its name.

*

There is, by the way, no truth in the rumour that statues of world-famous anti-semites are to be erected in every German town. There is also no truth in the suggestion that the Nazis were deterred from carrying out such a scheme by the enormous amount of bronze needed for the adequate duplication, even life-size, of Mr. Hilaire Belloc and Mr. G. K. Chesterton.

*

A NATIONAL DEVELOPMENT PLAN IN THE "HOUSE"

I hear that after the Easter Parliamentary recess Dr. W. H. McLean, Conservative M.P. for the Tradeston division of Glasgow, hopes to introduce a motion calling attention to the need for a National Development Plan. Dr. McLean planned the City of Khartoum, under the personal direction of the late Lord Kitchener; the City of Jerusalem, the scheme for which was officially approved by Lord Allenby; and the City of Alexandria.

*

He is, therefore, a man with practical experience in the planning of regions and towns. He tells me that he largely attributes his decision to press for a National Development Plan and Survey in the House of Commons to the "admirable articles published on the subject early this year in THE ARCHITECTS' JOURNAL."

*

The exact words of his motion are: "That, in the opinion of the House, it would be advantageous to prepare a national development plan or survey to assist the Government in estimating the effect of the prevailing social and economic tendencies on the nature and extent of the development for which local authorities should provide in their planning schemes; and also to assist the Government in taking any action in the light of these tendencies which may be necessary to co-ordinate and promote the trade and other developments of the country under private enterprise."

*

A HOMESICK SURVEYOR

Last week, I met a naval friend who has just returned from the West Indies in H.M.S. *Frobisher*. He showed me several interesting photographs taken by one of the petty officers. One of these, reproduced herewith, had the following caption on the back: "A milestone in Somerset, Bermuda (evidently the work of a homesick surveyor!)"

A milestone in Somerset, Bermuda.

B.B.C. TALKS ON " DESIGN IN MODERN LIFE "

Next week, on Tuesday, April 18th, the first of a new series of talks on " Design in Modern Life " will be broadcast in the B.B.C. National Programme, from 8.30 p.m. to 9 p.m.

*

The series has been planned by the B.B.C. in collaboration with the Design and Industries Association. It opens with a discussion on design between Messrs. John Gloag, Geoffrey Boumphrey and Edward Halliday.

*

In the course of the series Mr. Robert Atkinson, F.R.I.B.A., Mr. E. Maxwell Fry, A.R.I.B.A., and Mr. Wells Coates will give talks. Mr. Frank Pick, the President of the D.I.A., discusses the design of the street and also gives the final talk which sums up the series. It sounds stimulating.

*

TOWN PLANNING DISCUSSION

Mr. A. R. Potter, the Secretary of the Town Planning Institute, tells me that Mr. K. S. Dodd will be unable to read his paper on " Town Planning in Russia " at the Institute's meeting on the 28th of this month. It is a pity, for I was looking forward to attending this meeting. However, the evening will be devoted to a discussion on the new powers contained in the Town and Country Planning Act, 1932, for prohibiting or regulating building operations. The meeting will be held at Caxton Hall, Westminster, S.W., at 6 p.m.

*

THE THREAT TO RICHMOND RIVER FRONT

When economic conditions begin to tamper with the settled amenities of a place like Richmond it is time to consider what we mean by town planning.

*

The particular beauty of the Richmond river front is the product of eighteenth- and early nineteenth-century building, a remnant of lordly taste and cultured speculation, for which we lack an equivalent today, and are therefore forced to rush into print about vandalism, spoliation and the rest whenever a builder wishes to use an old site for modern residential purposes.

*

Something has got to be done to bridge the uncomfortable gap. ALL the things we like are in danger because they lie, so many of them, at the centres of population. They fall away in bits and pieces, and we insert new pieces in a new pattern and hope for the best.

*

Can we never PLAN what we will do with all these places, so that when and as they crumble away or cease to be of use, we shall be prepared to substitute something better, that will serve the community directly? A peep into my lord's garden is all very well for the eighteenth century ; we should be able to build towns for people to enjoy.

*

STREET OR PARKWAY AT KINGSTON ?

If we had national planning there might be a right of appeal by the local council for funds to prevent the Kingston by-pass, in its most beautiful stretches, from becoming a street instead of the very lovely parkway it now is.

*

We have succeeded in making a Great West exit road into a conglomeration of factory façades through sheer ineptitude. Our forefathers gave us a clear run south out of London through miles of common. Yet it appears that we are prepared to finish this with a wide suburban street because the local council cannot afford to buy an owner out. It reads like madness, especially when we know that everyone wants to keep that parkway open. O Brave New World !

*

THE I.H.V.E'S. JOURNAL

I would like to offer my congratulations to the Institution of Heating and Ventilating Engineers on the first publication of its monthly journal. It should prove of great value to the industry, and, as Sir Raymond Unwin says, in a letter of appreciation to the Institution : " It is very encouraging to see your Institution occupying the present time of depression in this valuable project for spreading more rapidly any fresh and helpful knowledge." ASTRAGAL

*

THE ARCHITECTS' DIARY

Wednesday, April 12

R.I.B.A., 9 Conduit Street, W.1. " What London Might Be." By A. B. Knapp-Fisher, F.R.I.B.A. 6 p.m. Also exhibition of photographs, etc., of the work carried out by the Department of Ancient Monuments and Historic Buildings. (Last day.) 10 a.m. to 8 p.m.

SCIENCE MUSEUM, South Kensington, S.W. Exhibition of Plaster Materials and Their Products. Until September.

INSTITUTION OF STRUCTURAL ENGINEERS. Lancashire and Cheshire Branch. *At the College of Technology, Manchester.* Annual meeting. *7 p.m.*

Thursday, April 13

INSTITUTION OF STRUCTURAL ENGINEERS. Yorkshire Branch. Annual Meeting. At Leeds. Discussion on " The Sixth Order of Architecture," to be opened by W. T. Lloyd-Jones.

LONDON SOCIETY. Maundy Thursday Service at *Westminster Abbey.* A limited number of tickets are reserved for members. *12 noon.*

Saturday, April 15

Sunrise 6.6 a.m. Sunset 7.56 p.m.

The slums of the future are being built today 497

"We have not yet started the least bit of intelligent planning" 507

CARLTON HOUSE TERRACE

In the House of Commons last week Sir Arthur Steel-Maitland asked the Prime Minister whether he could now announce the terms of reference and composition of the proposed Standing Committee to advise the Commissioners of Crown Lands in connection with the development of the Crown's urban property.

Mr. Ramsay MacDonald said that the terms of reference were :—

To advise the Commissioners of Crown Lands on questions remitted to them by the Commissioners relating to the development of the Crown's urban estates, with particular reference to æsthetic and similar considerations of public interest.

It would be understood that it was open to the Committee, if they so wished, to offer advice on any matters of public interest affecting property administered by the Commissioners of Crown Lands, other than those arising on cases formally remitted to them.

The Committee had been constituted as follows :—

Lord Gorell, C.B.E., M.C. (Chairman) ; Lord Jessel, C.B., C.M.G. ; Mr. Frank Pick ; Sir Raymond Unwin, F.R.I.B.A. ; Sir John Oakley, O.B.E. ; and Mr. E. V. Lucas, C.H.

The appointments were for a period of four years ; members would be eligible for reappointment. The Committee could co-opt *ad hoc* for purposes of consultation, and they were also being asked to co-opt representatives of local government bodies specially concerned with any individual project. Arrangements would be made before action was taken on any question which had been remitted to the Committee to make public their recommendations. The full reports would be regarded as confidential. The appointment of this Committee did not in any way affect the arrangements as regarded the Royal Fine Art Commission, whose advice on questions within their sphere would continue to be sought as heretofore.

Particulars of new building schemes to the value of over £400,000 have been received by the Building Industries National Council from hospitals throughout the country, in answer to an inquiry sent out by them. These include work at Grimsby Hospital (£80,000) ; nurses' home, now in course of construction at Royal Hospital, Leicester (£55,000) ; extensions at Royal Hospital, Gloucester (£40,000) ; Royal Hospital, Worcester (£63,000) ; Paignton Hospital (£20,000) ; medical school, King's College Hospital, London (£40,000), etc. "These figures," states Mr. H. B. Bryant, Secretary of the Public Relations Committee of the B.I.N.C., "refer to schemes either being carried on or being put in hand at once. They are, I think, an indication of the courage and confidence of hospital authorities as compared with the Government, which still seems to see virtue in keeping one-quarter of a million men on the dole rather than in employment, creating national assets."

The list of subscriptions received by the Public Relations Committee of the B.I.N.C. up to Monday last amounted to £2,431 /0 /10.

Subscriptions should be addressed to Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

HOUSING ACT

Following are some extracts from Circular 1331 dealing with the Housing Act 1930, Part I, issued by Mr. W. A. Robinson of the Ministry of Health.

The present rate at which the slums are being dealt with is too slow and His Majesty's Government look for a concerted effort between the central government and the local authorities immediately concerned to ensure a speedier end to the evil. It is necessary to concentrate upon direct action.

For over 20 years, the Local Authority have had the duty of inspecting and recording the condition of all working class property in their area. The records kept in accordance with this duty should now provide a complete picture of the conditions of the Borough or District. I am, accordingly, to request that they will now proceed to prepare and adopt a programme, the components of which should be—

(1) A list of the areas in which clearance is necessary, with information of the number of houses to be demolished in each, and of the number of their inhabitants.

(2) A list of the areas in which improvement by way of reconditioning or otherwise is necessary, with information as in (1) above.

(3) A time-table for the initiation, progress and completion of action to secure clearance or improvement, as the case may be, of all these areas ; and

(4) A time-table of rehousing co-ordinated with the displacements contemplated by the time-table of clearance operations : (*b*) to make an immediate beginning with the programme.

RECONDITIONING OF OLD COTTAGES

The Ministry of Health are pressing local authorities in rural districts to proceed more quickly with the reconditioning of old cottages, suitable for occupation by agricultural labourers. A good deal has been done, especially in the county of Devon, but in some places there have been bad blunders. One of the difficulties is that the drawings of cottages to be repaired are often made by entirely untrained men, and are therefore inaccurate and crude. In such a county as Yorkshire, for example, outlying rural cottages may be 30 or 40 miles away from a chartered architect. Without reliable drawings, it is often difficult to ensure that reconditioning is carried out in the most satisfactory manner.

MR. G. H. JACK

On Saturday, April 1, Mr. G. H. Jack, F.R.I.B.A., retired after twenty-six years' service as county architect and county surveyor of Herefordshire. He has now joined the staff of the C.P.R.E.

NEW RADIO STATION

The B.B.C. announce that a contract has been placed for the erection of the Midland Regional Station on the site acquired at Wychbold, near Droitwich. Work is to be begun immediately.

ROUND HOUSES

Miss Grace Cope, speaking at a dinner of the Lyceum Club last week, suggested that "the wastage of health, both mental and physical, would be practically nil in a circular house." The walls of our homes, she said, should merge into the ceiling. If we could get curves standardized in the architecture of our homes we should

have a much stronger nation. Our houses must inculcate an atmosphere of harmony.

EXHIBITION OF INDUSTRIAL ART

The International Exhibition of Modern Decorative and Industrial Arts is to be held at Milan from May 6 until September 30. There is to be a British section.

M.P.'S SUBWAY FOR PUBLIC

The subway under Bridge Street leading from Big Ben to the corner of the Embankment is (according to *The Daily Telegraph*) to be made available for public use, subject to the existing rights of user and the control enjoyed by the Government not being curtailed. The subway was constructed in 1869 for the convenience of Members of Parliament.

THE BUILDING CENTRE

H.R.H. Prince George paid a surprise visit to the Building Centre on Wednesday last, and spent an afternoon closely inspecting various exhibits, particularly those connected with industrial and factory buildings and houses.

THE WELSH SCHOOL

A party of students and staff of the Welsh School of Architecture, the Technical College, Cardiff, visited, on April 4, the new refectory and extensions for the University College Students' Union, designed by Mr. T. Alwyn Lloyd, F.R.I.B.A., and the Bute Terrace works and showrooms of the Cardiff Gas Light and Coke Co.

GARDEN CITY FOR SUSSEX?

A £1,500,000 garden city to accommodate a population of 10,000 people has been mooted. It is to be developed at Bolney, near Cuckfield, on part of the Garston and Chaites estates. The promoters of the scheme have secured the co-operation of the Abbey Road Building Society. It is intended to erect about 2,000 houses on the most up-to-date lines. All heating and hot water services will be maintained from central oil-fuel furnaces ; there will be no fireplaces, and therefore no chimneys. Electricity will be used. The scheme also provides for the erection of schools, shops, places of amusement, etc. Mr. Maxwell Ayrton is the architect.

Mr. Ayrton, according to *The Daily Herald*, states that he will make a tour of the latest types of architecture abroad, to obtain new ideas for the houses.

" They will be right up to date and will depart a good deal from what is regarded now as modern practice.

" One ideal is to get more comfort for the money than is at present thought possible. Every modern idea of hygiene will be studied, with regard to lighting and windows and admission of sunshine."

EXHIBITION OF PLASTIC PRODUCTS

An exhibition entirely devoted to plastic goods was opened by Mr. H. Ramsbotham, Parliamentary Secretary to the Board of Education, at the Science Museum, South Kensington, S.W., on Wednesday last.

THE POLYTECHNIC SCHOOL

The Polytechnic School of Architecture, Surveying and Building propose to give a dinner to Mr. George A. Mitchell, F.R.I.B.A., who is retiring from the Headship of the School. The dinner will take place on June 1, and it is desired that old members of the School staff, old students and friends who would care to attend will communicate as soon as possible with Mr. J. A. Ray, or other member of the School staff, so that the necessary arrangements can be made.

Mr. Joseph Addison, F.R.I.B.A., has been appointed in succession to Mr. Mitchell. He has been in charge of the Leeds School of Architecture since 1921.

R. I. B. A.

ELECTION OF MEMBERS

At a council meeting of the Institute, held last week, the following members were elected :

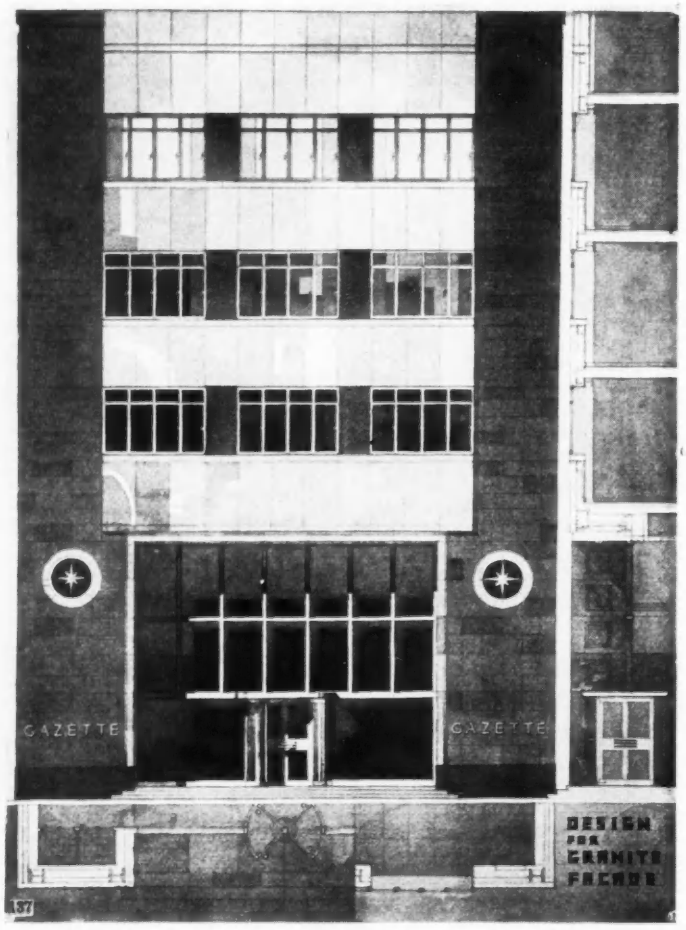
As FELLOWS (4) : Messrs. Joseph Addison, F. L. Charlton, Major R. A. Cooksey, and Mr. S. Evans.

As ASSOCIATES (21) : Messrs. R. M. Archibald, H. Bennett, L. Berger, C. F. Blythin, G. H. Bray, H. A. Burton, A. Crichton, L. Darbyshire, G. L. Greaves, G. F. Hassell, G. H. Mewton, A. Miller, A. A. V. Montagu, J. O. Nelson, R. S. Nickson, W. R. Onions, W. C. Powell, F. R. Pullan, E. C. Scherrer, J. E. Towers, and F. W. Wright.

Joseph Addison, F.R.I.B.A., who has been appointed headmaster of the School of Architecture, Surveying and Building, at the Regent Street Polytechnic, London.

As LICENTIATES (6) : Messrs. G. Dawes, H. W. Ford, C. E. Fox, W. C. Mangan, L. F. Smith, and R. W. Willcocks.

PRIZES AND STUDENTSHIPS



The R.I.B.A. Prizes and Studentships Pamphlet for 1933-1934 has just been issued. The pamphlet contains full information upon the various prizes and studentships, together with, where applicable, the detailed programmes for the competitions.

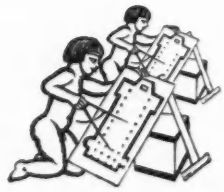
Copies of the pamphlet are obtainable at the R.I.B.A., price 1s., exclusive of postage.

WHERE LONDONERS SHOP

To the English people shopping is more than a mere commercial transaction, it is a pleasure, even a national sport, and because of this London is the greatest shopping centre in the world for sheer variety and comprehensiveness. One can buy anything in London from a cholera germ to a white elephant. And since we are a nation of shopkeepers we are also a nation of inveterate shoppers. Vast businesses have therefore been built up and huge buildings erected either to enhance the pleasures or to mitigate the horrors of shopping, and it was with these buildings that Mr. F. S. Towndrow dealt in his lecture on " Where Londoners Shop " at the R.I.B.A. on Wednesday, April 5.

The architecture of the City Mr. Towndrow described as muddled, citing Gamage's as a typical example of this, and passed on to the Strand, " a dirty, tumble-down bazaar," neither aristocratic nor slummy but a marvellous mixture of both, containing oyster-bars, railways, pubs., churches, theatres and Woolworth's. It did contain, however, what is, in Mr. Towndrow's opinion, the finest modern shop in London, the Civil Service Stores, designed by Messrs. Ellis and Clarke.

The scheme awarded first prize in the competition for a façade for a newspaper office. By Kenneth Peacock and Brian O'Rorke. See Competition News.



He pointed out that three questions should be asked of every building. Is it appropriate? Is it orderly? Does its design show the workings of a gentle and sensitive mind or is it vulgar? These three principles of architectural criticism, Fitness, Orderliness, and Gentleness Mr. Towndrow then applied to that unfortunate thoroughfare, the Tottenham Court Road, one building only, that of Heal's, emerging with credit from the test. Oxford Street was wholeheartedly condemned. "The Strand," said the lecturer, "makes me laugh; Charing Cross Road, beyond doubt the foulest street in Christendom, fills me with misery; but Oxford Street just maddens me." In short, Oxford Street had no dignity. Bond Street, the most expensive and exclusive street in our capital, he described as "a funny little street," a narrow tortuous affair of no architectural significance whatsoever, usually jammed with traffic, but nevertheless possessing one or two excellent buildings, amongst them Atkinson's. Regent Street with all its faults he considered the only dignified and orderly shopping street we have, in spite of the general level of mediocrity maintained throughout its length.

INTERMEDIATE EXAMINATION

The following are the dates on which the forthcoming R.I.B.A. Intermediate Examination will be held :—

May 26, 27, 29, 30 and June 1, 1933. (Last day for receiving applications : April 26, 1933.)

COMPETITION

NEWS

FAÇADE IN GRANITE

The result of the Competition, organized by the Architectural Association on behalf of the Cornish Quarry Masters' Association, for the design of a façade for a newspaper office in granite, was announced last week as follows :

FIRST PRIZE (£50) : Messrs. Kenneth Peacock and Brian O'Rorke, AA.R.I.B.A.

HON. MENTIONS : Messrs. E. C. Kent, A.R.I.B.A. ; H. A. Townsend, Student R.I.B.A. ; G. D. Griffiths, A.R.I.B.A. ; (Mrs.) Hilary Bannatyne Lewis ; and W. Crabtree, A.R.I.B.A.

SELECTED FOR EXHIBITION IN CORNWALL : Messrs. A. G. Lorimer ; C. J. Parker, A.R.I.B.A. ; H. Pittaway ; O. F. Savege, F.R.I.B.A. ; John T. Darch ; R. G. M. Chase ; W. Valder ; T. Snailum, A.R.I.B.A. ; T. W. Sutcliffe, A.R.I.B.A. ; T. A. Collins, A.R.I.B.A. ; Messrs. Hume and Erith, AA.R.I.B.A. ; D. L. Couves ; J. H. Baker ; Aiton and Scott, AA.R.I.B.A ; and S. C. G. Lambert.

164 competitors, including two from South Africa, submitted 172 designs. The assessors were Messrs. A. B. Knapp-Fisher ; G. Grey Wornum ; Howard Robertson ; and two members of the Cornish Quarry Masters' Association.

Competitions Open

April 13.—Design for a new exhibition hall at Manchester for the Management of the Manchester Building Trades' Exhibition. Premiums : £150, £75 and £25. Full particulars were published in *A.J.* for February 15.

May 8. — Proposed Burgh Chambers, Municipal Offices and Public Baths for the Town Council of the Burgh of Prestwick. Premiums : £200, £100 and £50. Designs to be submitted to the Town Clerk not later than 12 noon on May 8. The period for applications for conditions, etc., has now closed. Full particulars were published in *A.J.* for March 15.

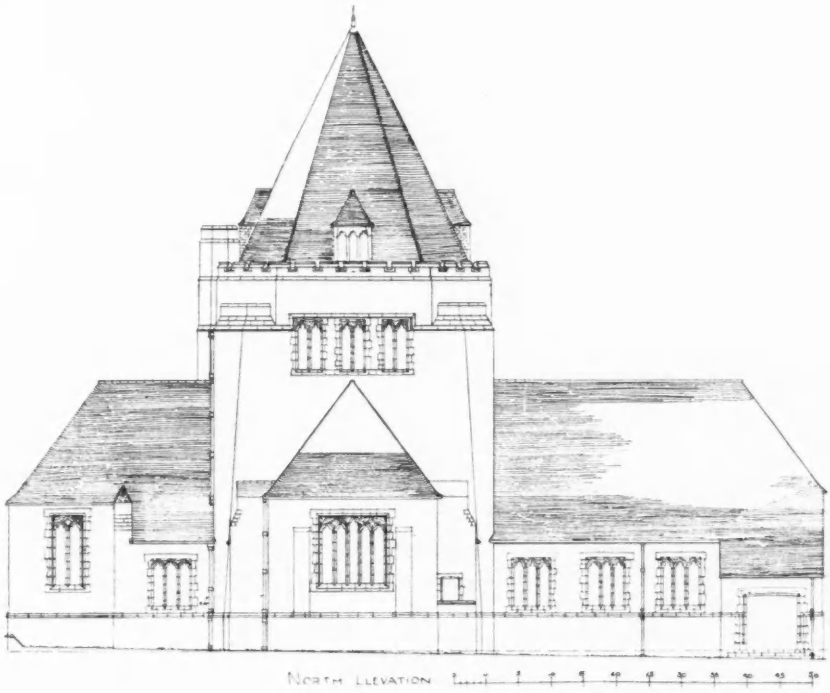
May 31.—Sending-in Day. Layout of a suburb on the river Escaut, Antwerp. £2,400 in prizes (1st, £800). Conditions, etc., were published in *A.J.* for December 7, 1932.

OBITUARY

We regret to record the death of Mr. James F. McMullen, F.R.I.B.A., K.C.S.G., which recently took place at his home in Cork in his seventy-third year. He was the architect of University College Chapel, Cork, and many other public buildings.

We regret to record the the death of Mr. Malcolm Sparkes, the founder of Drytone Ltd., which took place at his home at Beaconsfield on Thursday last in his fifty-first year. He originated the Building Trades Parliament scheme, out of which the Whitley Councils developed.

ON THE AIR

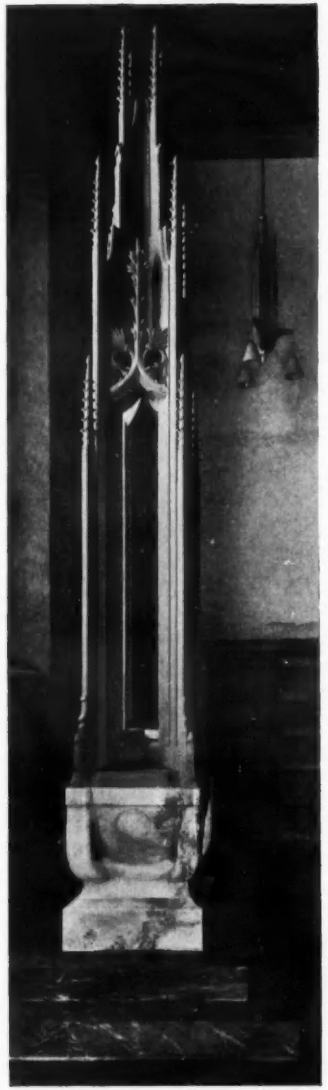


On Tuesday next, April 18, the first of a series of weekly talks on "Design in Modern Life" will be broadcast in the National programme at 8.30 p.m. (until 9 p.m.). Each talk will consist mainly of dialogues between an expert and another speaker representing the listener's point of view. Messrs. Edward Halliday, Geoffrey Boumphrey and John Gloag will introduce the series in a three-cornered discussion. At the end (June 27) the series will be summed up by Mr. Frank Pick, President of the D.I.A., which has co-operated in the arrangement of the series.

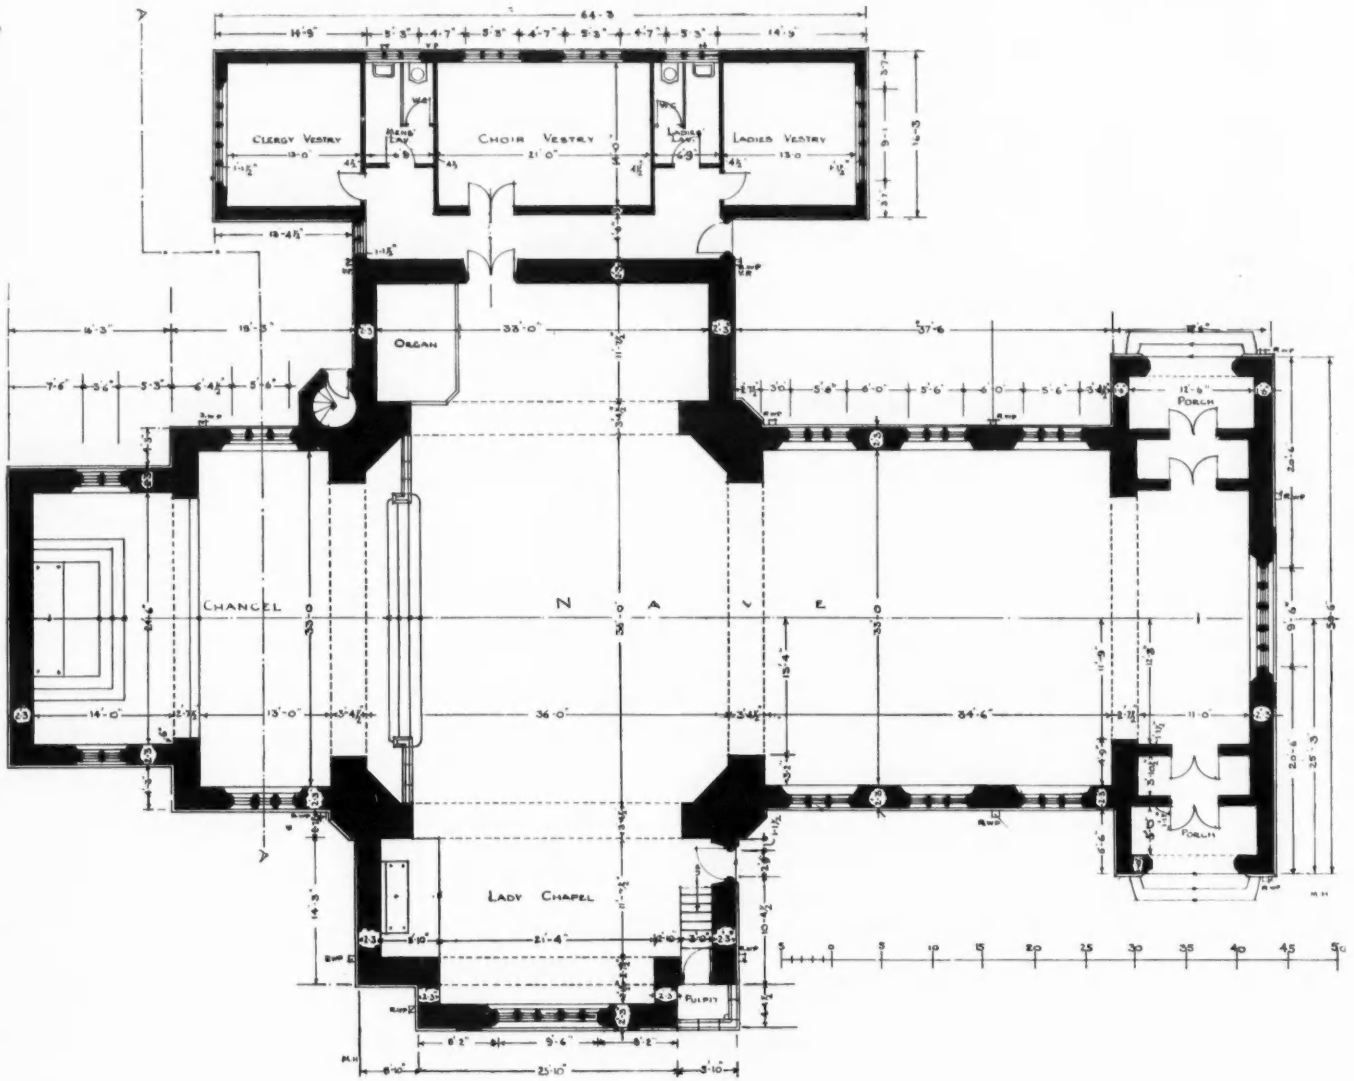
*

The third of the series, "The Economist in the Witness-Box" will be broadcast in the National Programme on Monday next at 9.20 p.m.

The series is in preparation for the expected World Economic Conference.



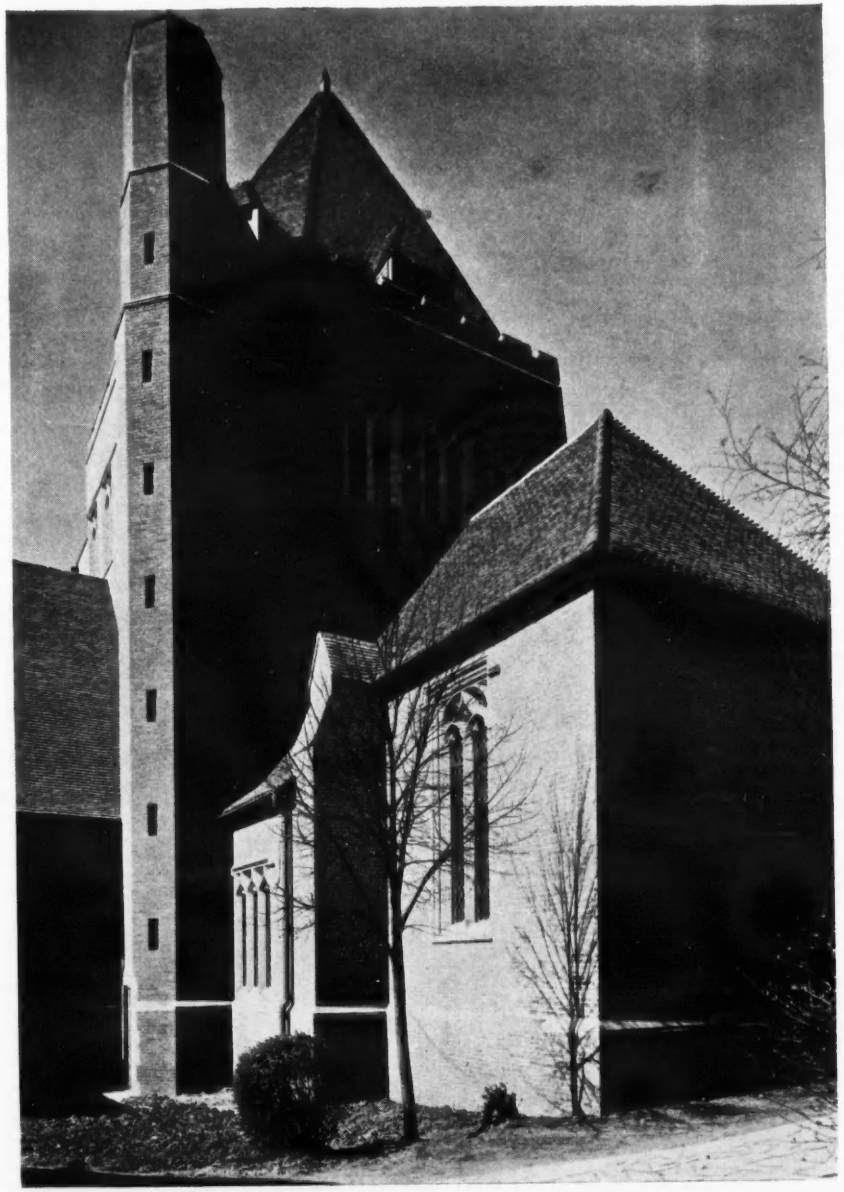
ST. ALBAN'S CHURCH, GOLDERS GREEN, N.W.



DESIGNED BY SIR GILES GILBERT SCOTT, R.A.

ST. ALBAN'S, GOLDERS GREEN : BY SIR G. GILBERT SCOTT, R.A.

St. Alban's Church stands upon a level site at the corner of North End Road and West Heath Drive, Golders Green. The church previously existing at the end of the site has been retained, with some modifications, and is now to be used as a parish hall. Owing to the nature of the soil, it was found necessary to construct the foundations of the new church of reinforced concrete piles of an average length of 30 ft.



The plan is cruciform. There are no aisles and, consequently, no rows of columns, which in so many churches obstruct the view of the altar. The north transept forms the Lady Chapel, while the south transept is used for the accommodation of the organ and for seating. The vestries are approached from this transept and have also, of course, an independent external entrance. The main blocks of seating, in the nave and central space, provide for approximately 450 persons.

The main entrance to the church is by two porches flanking the west end of the nave. There is also an independent entrance to the Lady Chapel. The open-air pulpit is approached by a flight of stone steps inside the building.

The walls are faced externally with narrow bricks of a brownish colour. The stonework employed for the windows, doors and dressings generally is Clipsham. The roofs, including the spire, constructional details of which appear in a supplement with this issue, are covered with tiles.

Internally, the walls are plastered, and there is a dado, about 4 ft. high, composed of Blue Hornton stone. There are open timber roofs.

"MY PROVINCE IS ALL STRUCTURE"

[By E. MAXWELL FRY]

The substance of a lecture delivered, as briefly recorded in our last issue, before the Design and Industries Association at Manchester on March 29.

MODERN architecture has its roots in the past—of the last hundred years. Its growth is not direct. It represents a confluence of maturing forces. I want to present it as the inevitable outcome of cumulating forces, social, economic, scientific and æsthetic, inextricably intertwined but capable of separate examination.

Remembering that they are so entangled, I am going to separate out for analysis :—

(*a*) the movement of revolt against the industrial system which brought about sociology, garden city housing and town planning ;

(*b*) the gradual disintegration of the fabric of English architecture from various causes ;

(*c*) the growth of engineering, structural and mechanical ;

—hoping that at the end it may be shown how all these forces combine, in the one instrument of a structural architecture, which for want of a better name we call " modern," meaning, *of our day, of us*.

In 1833, one hundred years ago, Lord Shaftesbury's first Factory Act was passed to restrict current abuses of adult and child labour.

The application of machinery and power to production, coupled with a limitless world market, had engendered an industrial expansion far too rapid for the mind of man to compass.

The philosophy of the eighteenth century was not available for a movement that had so little to do with the old orders of society, and inevitably it became a blind force of undirected multiplication of wealth, power, population and building, balanced by a dead load of ignorance, brutality, dirt and disease.

Towns evolved through the unplanned accretion of individual enterprise and speculation. Factories and houses grew up together in a solid smoking mass in which no decent life could be lived, but from which there appeared to be no escape.

The movement of revolt which sought first to restrict the worse forms of semi-slavery of the lowest classes, recognized at an early stage that bad and insanitary housing, if not the chief evil, undoubtedly negatived the value of other remedies proposed. Architecture was not considered by the early reformers, who were concerned with the bettering of conditions of sanitation and hygiene, which, left but a little longer, were leading to a really serious spreading of disease.

Various laws aiming at the regulation of communal sanitation and hygiene were consolidated in the Health Act of 1875, which became a charter for the communal control of building in the interests of the working classes. Its provisions were uniformly sanitary, but bore no traces of any thought of architectural planning or design. They were purely restrictive and produced housing that was barrenly hygienic, and killed painlessly through the boredom of endlessly-repeated, negatively-produced houses. We call these places " Bye-law streets" as a term of reproach.

The garden city differed in being the product of an idea, though I believe in essence a mistaken one. To understand it properly one must read it as an idea that gained its strength as it appeared to differ from that lying behind the industrial system. It had what the psychologists call a " release or defence motive," that offered the congested, unhealthy and unhappy town dweller a cottage on a little plot of land, sufficiently removed from contagion. That was and is still the ruling motive of the garden city movement and of town planning as we find it reflected in every Act from 1909 to 1932. Whether it is a wide enough basis for the work which housing and town planning is called upon to do is for us to decide. I agree with Mr. Thomas Sharp, the author of that provocative book *Town and Countryside* that it is not, and that not only does its sociological bias leave out of account human desires for closer congregation, but that upon economical and upon æsthetic grounds the movement is unconstructive and weak.

What it has done on the positive side is to substantiate a poor man's moral right to light, air and space ; and that we will remember to be a great achievement, however costly.

On the negative or destructive side it has offered a model which makes a virtue of space to the extent of allowing towns to spread at a wickedly accelerated pace over miles of good country, settling vast populations evenly and thinly in a hazy and badly co-ordinated organization of crazy roads. Flying from the mess of the industrial disaster it has rejected the whole ennobling idea of urban life in favour of this hand-worker's notion of an earthly paradise at 12 houses to the acre. For this it is prepared to lay extravagant miles of sewers and services, to increase the costs of distribution and collection and send trooping to and from the *vital* centres of population millions of workers.

There will have to be clearance and replanning, for we cannot go on pretending that we can afford to leave a bad thing to look after itself. But what can town planning, with its present garden-city uneconomic bias, offer in solution? There is no effective answer to that question.

There for the moment I will leave this strand of my argument to take up another. I have no cause to enlarge upon the virtues of eighteenth-century classic architecture. Its virtues are known to us, for we have with fair success attempted to revive it as a living style, misnamed tradition. At the beginning of the nineteenth century Late Georgian architecture had reached a point of exquisite refinement. To imagine it capable of unlimited advance is an error which closer investigation of the growing academic control in the early part of the century tends to confirm. But in any case its delicate precision was blurred by the onrush of material expansion, and it dissolved utterly ; nor from that day to this has there flourished another architecture in which the structural and spiritual contents were at peace.

The Gothic revival has been given a variety of explanations, but, broadly speaking, we can regard it as a stop-gap in a period of rapid change. Romanticism and liberation went together. The leaders of the French revolution opposed artificiality by a revival of naturalism. *The noble savage* fitted well with ruins ; and in the same way mediæval architecture, by reason of its communal basis or because of its remoteness from the industrial system, became a vehicle for expression of that sense of frustration and disappointment which animated those who opposed machinery and factories. It was an uncertain stimulus, not calculated to produce a stylish architecture and it seems useless to pretend that the revival was not a disastrous misfortune, that, while it left a few good monuments behind, it wreaked incredible damage in the town and set us on a path away from the grand restraints of urban planning into the meanderings of the garden city.

Even the much saner revival of early English Renaissance architecture, the break-away from Morris mediævalism, organized by Norman Shaw, Reginald Blomfield and others, was doomed to failure, coming as it did much later in the story of mechanical perfection. In any case it was too much the architecture of gentlemanly scholarship to be able to grapple adequately with the overmastering programmes set by a democratized civilization.

It was in the complex programmes offered to architects by commerce, industry and the mass entertainment and recreational business that failure was chiefly noticeable. The great shopkeepers who patronized architects as a form of snobbism declined to make martyrs of their businesses in the name of Christopher Wren. They demanded plate glass windows at pavement level whatever might happen above, and the world was thereby treated to the spectacle of much grand traditional masonry standing on a wall of glass. The man in the street began to laugh at this point, and the pretence became barely supportable.

But still it went on, and in the burst of building activity following the war we have seen masses of costly construction—banks, shops, theatres and offices—erected on the principle of covering a steel framework with Portland stone in the likeness of some dead style—English, Italian, Roman or what not. Light and function are absent from these buildings.

Yet they house highly complex organizations aiming at maximum efficiency. We realize the value of sunlight for clerical work, we use machinery, and we recognize that steel and concrete call for light and rigid construction as essential to their true economy.

One can only assume that architects are guided by the still unexpended force of an æsthetic deeply engrained and as difficult to cast off, and that, helplessly bound by this association, they have watched their province being eaten into by engineers, public officials, shop fitters and decorators. This, I am afraid, is the truth.

How did it happen? To answer this question I must unravel the last thread of the skein, to define the engineers' contribution, and how this leads us towards the final solution we aim at.

Engineering made use of the first factory-produced building material, steel. Steel is manufactured under conditions of scientific accuracy that enable it to be sold with an inflexible guarantee that it will carry stresses for which it is designed.

This element of precision made possible the erection of structures of an entirely new order with every degree of safety. Compared with traditional methods of building its economies were so remarkable that even when used with extreme caution nothing was so cheap in cost or rapid in construction. The Menai Tubular Bridge, designed in 1850 for the carrying of such trains as were within the comprehension of engineers at that time, carries today, without

evident signs of fatigue, the immensely greater weights of the Irish Mail trains that roll daily across it.

But constructional steelwork performed still greater wonders. The Crystal Palace, built for the Exhibition of 1851, was a marvel of structural ingenuity and fine design. In 1889 Eiffel built the tower that bears his name, as the centre piece of another exhibition, to show the possibilities of the material. It stands today. Sir Benjamin Baker built the Forth Bridge on an audacious cantilever system of construction. The list of nineteenth-century structural monuments can be expanded endlessly. Everywhere over the world, British engineers carried out major works in which structural science perfected itself, and was occasionally dignified by fine design.

In the design of steamships and railway engines, by their nature things of balance and models of efficiency, a new art was brought into being. Then finally, with the application of newer sciences to transport, came motor cars and aeroplanes, for the later developments of which our admiration is unbounded, and is for the first time perhaps increased by the realization that an element of conscious design is responsible for a measure of our delight.

These engineers used their materials without reference to anything that had been done before, there being no points of contact between materials built up from the earth heavily, and their own rigidly braced space-defying members. When they provided the framework for an architect's building they did what they were told, and willingly carried whatever loads were demanded of them in any way that might be required. But left to themselves they built as economically as possible, and were, therefore, given all the work involving cheapness, lightness and daring. "Engineers provide the construction, architects the frills," became a catch phrase with a deal of truth in it.

The discovery of reinforced concrete drove the last nail in the coffin of the architecture of conservatism.

François Hennebique erected his first small reinforced building in about 1892, and this date marks a turning point: it was the birthday of a new architecture.

What is modern architecture but the conscious employment of these new materials which industry has given us for their uttermost economy? It is a great deal more than this, for, directed by men like Le Corbusier to find beauty in modern machines and structures, we do indeed find it; and our eyes are opened to a brave new world, the work of our hands, and of this age we live in. To the architect labouring in the hopeless ruck of abortive revivalism, the realization that all structure is architecture comes as a relief from mental servitude. He is free at last to build logically and truthfully, designing the structure of his building instead of adapting structure to fit the needs of style.

It is a freedom conditioned by the absolute necessity for economy and efficiency, but drawing strength from these restrictions rather than regarding them, as in the past, as impediments to fine design.

It requires of architects that they deal fairly with their materials, using steel for its strength under tension and compression: using concrete for its resistance to pressure, its ability to be moulded and its power to combine with steel; using glass as it should be used, in large sheets instead of small; using metal for its various properties, and all materials for what they have in them to offer.

It further requires that if these things are done, the functions of buildings must be closely looked into, for how is it possible to use materials to economy if the plan is not economical, or if the desire for ornamentation or effect is stronger than the wish for efficiency?

Modern architecture is, as Le Corbusier has said, a product of *high selection*; in the words of the German architect, Bruno Taut, it is a high form of ultimate efficiency. The term "function," so often used in architectural discussion, is a sign of health. It shows that architects are recovering a long-lost power to serve the needs of society *exactly*, and with a zest for economy.

More than this, the need for enquiry into the motives of structure and design spreads further than building, or rather it enlarges the sphere of building to include everything that can be built and designed. Architecture is not enough, says the modern architect, my province is all structure.

Here, then, if the truth of the statement will be allowed, is a new creative force, broadly founded on structure, drawing deeply from the ancient sources of design through proportion, and sharing in and eager to serve the community of social service which is our salvation from the perplexities that surround us. How will it serve us?

By leading us first of all to the heart of the greatest problem that now confronts us, the towns. Garden city planning ran away from them; modern architecture by its very nature is concerned with them *wholly*, as organizations, as structures, as the subject matter of grand urban design, as providing the highest means of social service.

Modern architecture will provide buildings designed for ultimate efficiency and economy, whether they be flats or cottages, and these it will erect on a plan that is co-ordinated so as to provide economical services, and designed to offer, with the benefits of light and space, a sense of the grandeur of urban living. I realize that land must be paid for, and that congestion adds to the cost, and defies dislocation. No easy remedy is possible.

Yet if roads are narrow or twisted we shall have to widen and straighten them; and where buildings rot and people sicken, we shall have to rebuild. But, again, where to start and on what plan? What model of a town have we in our minds? What is its structure? How is it organized, served, dignified? Where does it end?

The immediate answer to this is best made in the form of an urban survey, so that we may know that it will be an economy to pull down or blow up this and that obstruction; to replace those areas of obsolete insanitary houses with something better; to guide railway development; segregate industry; allocate open space; and set a limit to the spoliation of the surrounding countryside.

Armed with this knowledge we should be sure of action and as sure of support from a community which we had educated so as to see a town as something worth living in.

The architecture which now forms itself out of the forces at war with each other in the evolution of the last century will be fit to control all building. In Germany it is the creative emotion of factories, houses, offices, even churches, alike. Before ever our trouble started, in the eighteenth century, we had one architecture that served for all purposes. We shall have another again.

Street Improvements

Lord Ashfield, speaking recently at the Royal Institution, made some suggestions for solving London traffic problems. He said:

Drastic improvements involving considerable rebuilding will have to be effected in the lay-out of streets if the true value of the "round-about system" of traffic control is to be obtained.

The ultimate solution of the traffic problem must include improvements in the streets themselves, making them fit for the traffic they have to carry.

Parliament alone can effect the remedy for traffic problems, and I suggest that the problem of street improvement should be considered without delay. There might be an authority taking the form of a Parliament for London to control and finance street improvements.

WHAT IS TO BE DONE ABOUT

THIS?

[*This is the third of a series of articles investigating contemporary speculative small house building practice, which, by virtue of the almost certain revival of building, especially of small house building, is of immediate importance. Briefly, the aim is to explain the why and wherefore of the present position and suggest means of improving it. Its predecessors discussed, respectively, the Speculative Builder and the Speculative Architect.*—Ed. *A. J.*]

3. Building Without Guidance

[*By STANLEY C. RAMSEY*]

I BELIEVE it was Professor Reilly who, some twenty years ago, in a brilliantly unfair phrase, stigmatized Norman Shaw as "the Father of all the Jerry-Builders."

Today, there is no jerry-building worth speaking of; the building inspectors of the local authorities have seen to that. But if I wished to ascribe paternity to the designs of the modern speculative builder, I think I should point a kindly finger at the President for the time being of the Royal Institute of British Architects—in other words the most distinguished architect of his day—and I suggest that Sir Raymond Unwin, as the most distinguished housing architect of our day, is the common source from which architectural ideas, well and badly interpreted, are derived.

At the present time the most popular type of speculative builder's "design," is the semi-detached villa with double bay, under a gable decorated by three pieces of very thin timber. Out of five hundred houses, it would be quite easy to find five hundred bays with five hundred gables decorated with fifteen hundred pieces of sham half-timbering. Now if the genesis of that design is traced, I suggest its origin will be found in the Hampstead Garden Suburb, from whence it has travelled via Golders Green; it is the Golders

Green type getting progressively worse as it gets further from the source.

What was a simple cottage-inspired dwelling in the suburb is the aggressive little pink and white villa, that has crept all over the country.

With a few bright exceptions, the ordinary speculative builder works without any architectural guidance, and it might be instructive to seek out the reason, or rather the reasons for this. The speculative builder may be said to be a by-product of the Industrial Revolution—a revolution that sprang up in the coal-mining countries of north and central England, far away from the centres of traditional English culture.

The modern townsman today has inherited quite a different set of traditions from the dwellers in the countryside or the country town. The cottage-inspired dwelling leaves him cold. He may be able to appreciate the beauties of a group of thatched or half-timbered cottages, but, generally speaking, he does not wish to live in one—that is unless he has attained a certain degree of wealth and culture, when he may acquire one as a week-end toy—but, generally speaking, the shy, modest beauty of the cottage has no message for him, except perhaps :—

> "God bless the Squire and his relations
> And keep us in our proper stations."

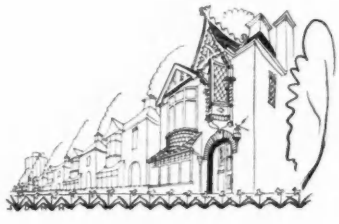
He does not, in the ordinary sense, know the Squire, and if he did, the chances are that he wouldn't like him, and that he would positively detest his relations. His idea of his proper "station" is, more often than not, the little bay-windowed villa I have referred to, or perhaps, if he does live in the country, the little pebble-dashed isolated bungalow, covered with pink asbestos slates.

At present, as I have said, there is a vast field of building activity from which the architect is excluded—and yet a field where he is more urgently needed than in any other that I can think of.

Before the architect and the speculative builder can be brought together, there must be, I suggest, a much clearer and more sympathetic appreciation of the speculative builder's problems and difficulties than the majority of architects possess at present. To them the problem is only one of influencing the builder ; they are forgetful of the fact that the builder's main consideration is the public he has to sell to.

The speculative builder in this country fulfils a most useful and necessary function ; he, in effect, houses that great class which must be designated, for want of a better title, by the name of Middle Class, a class that owes its rise to industry and inhabits the suburbs and outskirts of our towns. It includes the better-paid Working Class, as well as the man who can afford a £1,500 detached or semi-detached villa, complete with garage and hot water system. But, however sympathetically one may view the activities of the speculative builder, one has to admit that, in the main, his standard of design is very poor. I am referring to his design of elevations, which is very much below his attainments as regards interiors. As far as elevations are concerned, he is hopelessly old-fashioned and out of date.

In his interior design there has been something like a revolution, accomplished in the last ten years. This may be due to a variety of causes, but it has been chiefly caused by the demands of the modern housewife, and her desire for a clean, labour-saving, up-to-date house. In the great majority of these ready-made houses there is an absence of fuss, and a clean, straightforward way of doing things, that could teach many an architect a lesson.



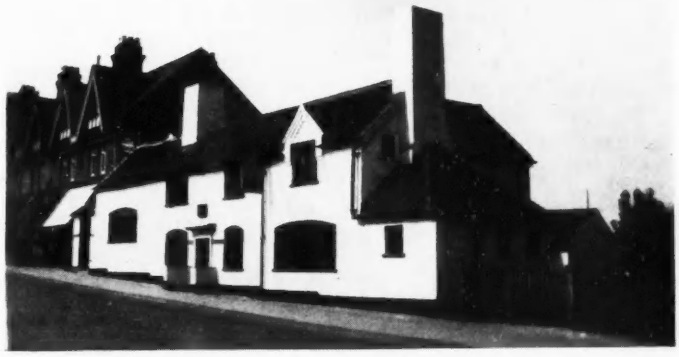
The much moulded cornice to living-rooms has given place to a simple cove. Fireplaces have become simple tile surrounds, easy to clean and pleasant to look upon, doors and door furniture have become much simpler. It is only when we get to the exterior that we revert to all the old-fashioned dodges—sham half-timber that peels off and requires unnecessary painting ; pebble-dashed rough-cast, which is neither so effective as a weather-resister nor so satisfactory to look upon as self-coloured Portland cement put on with a smooth finish ; windows and doors that are a riot of unnecessary mouldings, dirt catching and ineffective ; simple roofs that are spoilt by the intrusion of gables without meaning, the presence of which provides equally unnecessary valley gutters, a further cause of expense and deterioration.

Now, why is there this divergence ? Why should these well-built, conveniently planned, sensibly equipped, and as far as the interiors go, pleasantly devised houses, be covered in these out-of-date exteriors ? I believe the secret is largely in the influence exerted by the writers of the *Home Notes* in the daily press, and the effect that these writers have had on their women readers.

Unfortunately the interest of these talented and well-informed writers never seems to extend beyond the interior and the furnishing. Perhaps they think the proper sphere of woman does not go beyond the interior. If this is so, then one is forced to the unpleasant conclusion that it is woman who is responsible for these pleasant interiors, and man for these repulsive exteriors !

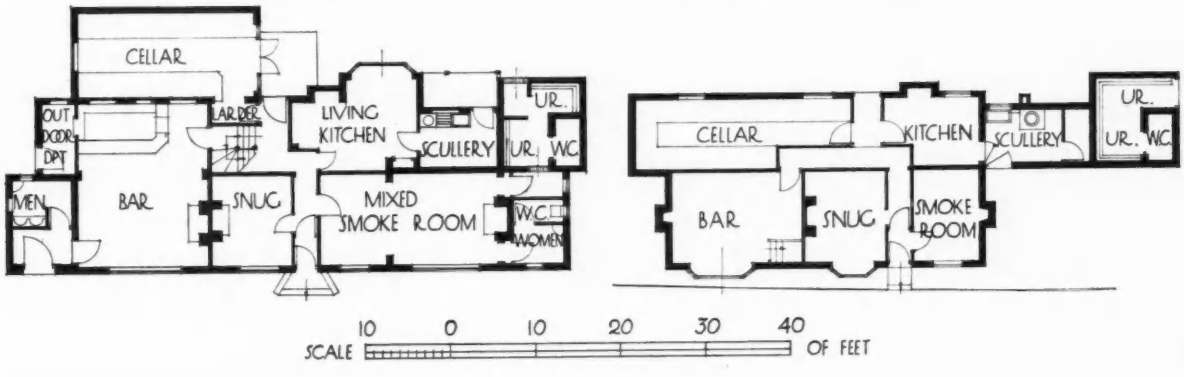
But if woman in her modesty feels that she has no right to offer an opinion as to the public appearance of her house, isn't she interested, and that vitally, in the design of her front door and her windows ? And if these fittings could be standardized on pleasant lines, this would be a most important step in the direction of improved exteriors.

At present we are working in a vicious circle. There is, I feel sure, a large public who would welcome a house of improved design, and there are, on the other hand, a great many speculative builders who would be only too glad to offer the public something better. But, unfortunately, the enlightened public would only appear to meet with the more old-fashioned type of builder and the more advanced builder with the more conservative type of house-purchaser ; so, as the series title at the head of this article puts it, "What is to be done about this ?"



"Plus a little something."

THE WOODLAND COTTAGE INN, REDDITCH



REBUILT FROM DESIGNS

BY FRANCIS W. B. YORKE

This Inn is situated on a Worcester main road, recently widened as part of an extensive road-widening scheme, and in order to gain the maximum road width at this point, where the old building stood in front of the building line, it was necessary to sacrifice the bay windows and the front garden. As certain structural and restoration work had to be undertaken, it was considered opportune to enlarge the Inn and improve the general state of its repair. The plans below show its condition after and before reconstruction.

Financing Public Works

SIR,—I should like to reply to your leader writer.

(*a*) He argues, not from the point of view of the taxpayer and consumer, but from the point of view of the credit financier, which is always directed towards obtaining a mortgage on real things, the more permanent the better. But credit finance has become divorced from reality, that is to say it is not based on the national capacity to produce and to consume goods and services, but it relates only to itself and it controls industry in its own interest. This it does by means of a system of fictitious debt.

(*b*) The money, presumably, will be created by credit finance—i.e., the banks—in the usual way, by giving the borrower a cheque book in exchange for a promise to pay, and by entering the figures of the imaginary loan as an addition on both sides of its ledger.

It will cost the banks nothing but the paper and ink, and it will not come out of deposits; it will add to deposits (*vide* McKenna). The public cannot use the £1,956,700 of deposits of which your leader writer speaks, it is already a debt to banks, whether on their own account for the purchase of Government and other securities or as private or public loans makes no difference. Any fresh loan will create a fresh deposit (*vide* McKenna).

(*c*) The word inflation is generally understood; it is now camouflaged as reflation. Any issue of new money, either as a bank loan or a purchase of securities by a bank, without a simultaneous creation of goods for sale or without a corresponding withdrawal and destruction of previous loans is inflation, and sends up the price of goods. That is not disputed by the most orthodox of economists. In such a case new loans are inflationary; purchasing power is not increased, but debt is.

"The proof of the pudding is in the eating." Can your leader writer explain how the implementing of his quite orthodox proposals is going to develop any differently to all credit-debt schemes which have gone before, and how it will help to rectify a system which has produced, and must mathematically produce, a situation of starvation in the midst of plenty?

ARTHUR WELFORD

[We submitted the above letter to our leader writer, who has sent us the following reply.]

After writing a number of articles in which the chief points stressed were the increase in purchasing power and the relief to the Budget arising from an energetic policy of public works, it is rather surprising to learn that I have not been arguing "from the point of view of the taxpayer and consumer."

The public has hundreds of millions in the banks which are not being used in industry. This is not because the money cannot *be used, but because, under present conditions, the public* will *not use it. If a loan were raised for public works, the response on the part of the public would probably be as great as was the response to the Conversion Loan issue. Thus money now on deposit would find its way into circulation, to the general benefit of industry.*

Money or credit, therefore, need not be created; we have enough already. The deposits in the banks are, overwhelmingly, debts due, not to the banks by the public, but to the public by the banks. Advances are only about 40 per cent. of deposits. Further, the mere fact of raising a loan will not add to deposits. It is the spending of the loan and its beneficial effects in increasing purchasing power which is reflected in increased deposits in so far as individuals and trading companies need to keep more cash on deposit. And, by the way, I know of no bank—and I wonder if anyone else does—which, "in the usual way," makes a loan by giving the borrower "a cheque book in exchange for a promise to pay*" without security.*

In so far as prices would rise, the effects of such a policy would be inflationary. But the whole point of the policy is that the loan is not merely inflationary—its effects are not exhausted in raising prices—but that production and investment will increase. Prices will probably rise somewhat, but it is quite absurd to seek to argue that that would be the sole effect of the loan. No competent economist, orthodox or not, would accept such an argument. And to say that purchasing power would not be increased is just not true.

The effects of a loan will only be exhausted in raising prices if labour and capital are in full employment. In so far, therefore, as unemployment, particularly in building and public works, is greater than it was before when public works were put in hand, a policy of loan expenditure will be more effective than it was then in providing employment and increasing production. Further, as Mr. Keynes has pointed out, the position of the foreign balance was such, in previous years, that the increased employment due to public works programmes was more than counterbalanced by unemployment due to the deterioration of the foreign balance.

Today, that is not the case. The foreign balance is improving.

YOUR LEADER WRITER

"Olde-Moderne Ideals"

SIR,—I read Mr. Gloag's article in your last issue on "Olde-Moderne Ideals" with pleasure and amusement. It is always pleasing to see Mr. Gloag thumping and walloping the uneducated, but I do not feel quite satisfied.

It is no permanent cure for a fungus growth (such as Jerriarchy, to use Mr. Gloag's own expressive word) to whack at the visible growth with a stick; one must look further and endeavour to find out on what the growth feeds, flourishes and grows, and either destroy or alter the character of the soil.

What then does Jerriarchy grow upon? There are two obvious answers, both of them in part true and both of them equally difficult to deal with.

In the first place there is the speculative builder himself; but it is almost impossible to deal with him. Certainly it cannot be done by fulminating in architectural papers. What does he care for architects and their views? He has no use for either.

Secondly, it is said with justice that the public have only themselves to blame, and that this hideous growth is due to their ignorance and apathy, and that the cure is ceaselessly to attack, cudgel and educate them.

But it is well-nigh impossible to attack the public on such a subject; it is far too amorphous a body. You cannot seriously harm a jellyfish by smacking it on top.

The history of the past hundred years has shown that the education of the

public in art and taste is a very slow process, while the expansion and growth of Jerriarchy, by its very nature, is a most rapid process.

It seems to me, however, that there is a third answer to the question—look to the building societies. Without the assistance of the societies ninety per cent. of our Jerriarchy houses and suburbs could be neither built, sold nor let. These societies have grown to be a gigantic power in the State. They are said to have done much good ; they have certainly done, from the æsthetic point of view, almost irreparable harm. They have financed and are daily financing every conceivable kind of architectural horror and absurdity, recking nothing so long as the houses will stand during the odd 15 or 20 years of the mortgage.

They say they are creating a happy home-owning middle class. In fact they are immobilising vast numbers of people, fixing them down in hideous and often badly-built houses, which in twenty years' time may well be unsaleable and will certainly require very heavy repairs. These people will find, and are indeed finding, increasing difficulty in disposing of their rapidly-deteriorating and heavily-mortgaged houses.

Thus we see the creation of the slums of the future. Our present slum houses are appalling enough now, but they were originally reasonably well built, else they would not have lasted the time they have ; but what some of the houses we see going up daily will look like in fifty or a hundred years' time one trembles to think.

If the building societies would rigidly set their faces against financing these horrors, hideously designed and often abominably built, Jerriarchy would cease to grow in a year—and if the societies would act together and let the speculative builder know the line they were going to take they could settle the problem in a year.

Cease, therefore, to waste time and ink on the builder and the public, but impress on the building societies their responsibility in the matter of good taste and good building.

I like Mr. Edwin Gunn's suggestions. Now is his chance. Get together, you group of architects, and go and see the building societies on the whole question, and get them to finance a model building estate.

C. M.

Information Sheets

SIR,—I should like to congratulate you upon the idea of publishing these sheets of technical information. They are most useful, and to my knowledge are being filed for reference in several architects' offices.

I would mention that in sheets Nos. 3 and 3A, by Messrs. Burnet, Tait and Lorne, and by Mr. W. C. B. Smith, the basis of their information appears to be the building regulations of the Board of Education as published in 1914 and reprinted in 1924.

I should like to add that this Authority has now officially approved of a number of deviations from these Regulations. For instance, they permit a classroom with a flat ceiling of 10 ft. in height, provided there is adequate " cross ventilation," thus making a big saving in cube for the whole building. Also the numbers of closets is allowed to be reduced on the tables shown.

It would be an advantage if the plans of classrooms showed the projections of the piers on each side, as this somewhat upsets the careful spacing of the desks, as the gangways next these must be wider than those between.

It is found in practice that the width of classroom should not be more than 20 ft., in order that light may penetrate to the corridor side. Large borrowed lights should also be shown and windows on the external walls next the teaching space.

The Board of Education has, since the reprinting of the 1914 regulations, published several pamphlets suggesting modifications in school buildings, in order to economize in the cost per place, and I suggest that these should always be studied in conjunction with the original regulations if up-to-date information is required for school buildings.

S. D. LOWETH

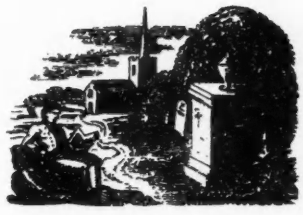
A Woman's Ideal Home

SIR,—I trust that, with your usual fairness, you will allow me a short space to reply to Mr. Goddard's criticism of my plans, especially as most of his statements are incorrect.

It is an old dodge, especially in politics, for " honourable gentlemen " first to misrepresent their opponents and then, on the strength of this misrepresentation, to seek to discredit them. I am surprised, however, that your correspondent, Mr. A. N. Goddard, should have descended to these tactics in order just to " score a point " off me regarding my plans for an ideal home which I submitted as an alternative to those of Miss Elizabeth Craig.

With the exception of Mr. Goddard's assertion that " *Miss Elizabeth Craig is an expert cook* " (which fact I have never questioned) his whole criticism of my alternative plans is a deliberate misrepresentation.

Thus, it is not true that there is a step at each door in the entrance lobby. On the contrary, the lavatory, the lobby, and the cloaks are all on exactly the same floor level.



It is not true that the conservatory materially obstructs the sun's rays from the sun lounge. As shown by my plans, this lounge is a veritable sun lounge and has windows on *three* sides. The conservatory is on the S.E. side, but the *main* windows are on the S.W. side.

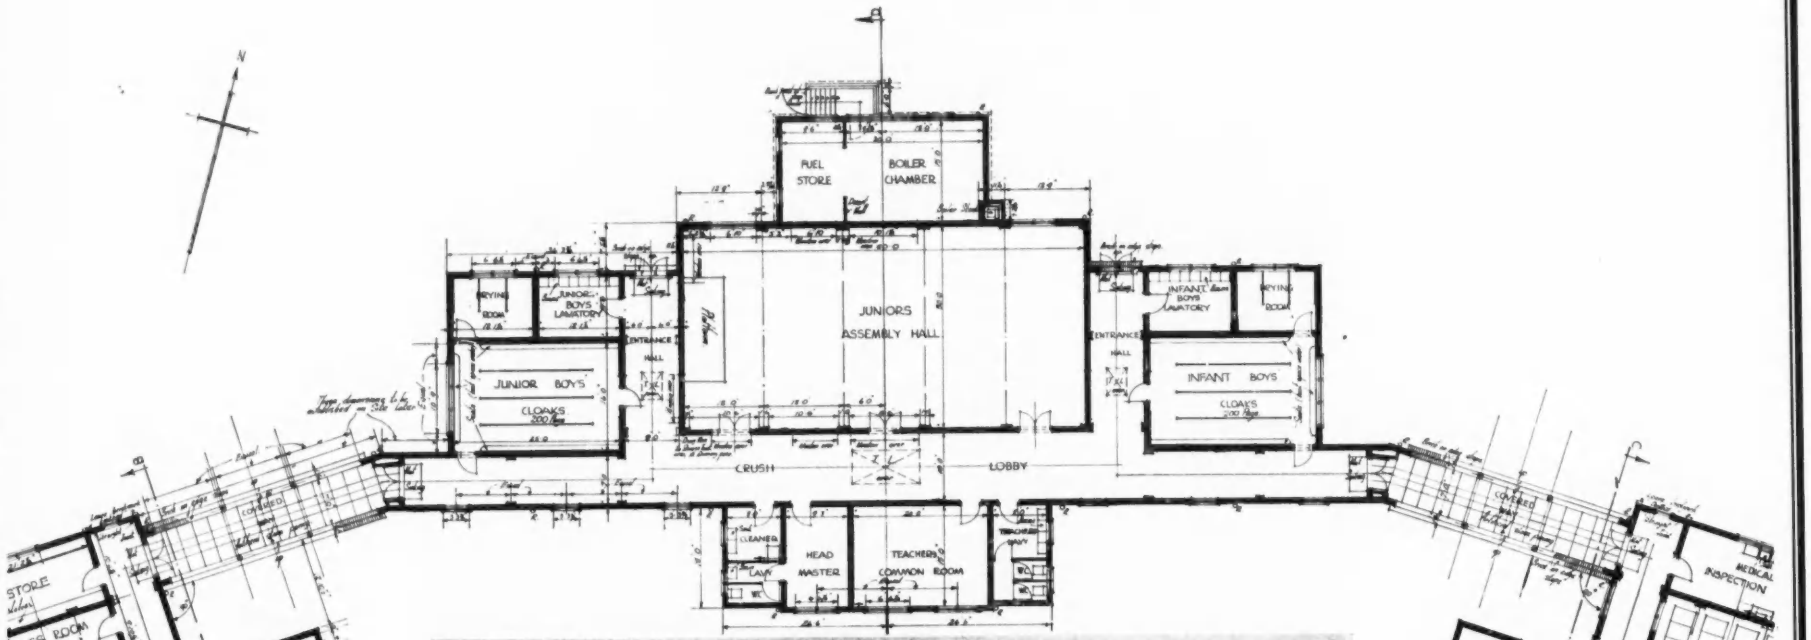
Mr. Goddard quotes me as using the expression " *idealism and attention to detail.*" I have never used this expression.

Neither is it true that the large private store I specially provided adjacent to the dining room is just " *an accident of planning.*" I might as well suggest that it is an " accident " that Mr. Goddard has taken up the cudgels on behalf of a lady " expert cook."

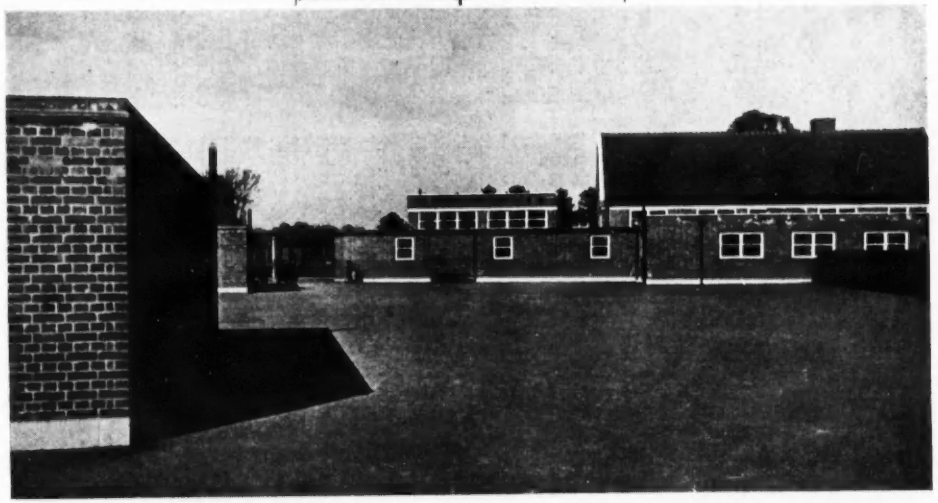
It is interesting to note that in the same issue of THE ARCHITECTS' JOURNAL as contains Mr. Goddard's letter there is an article on " *this year's building stunt at Olympia* " and " *the experts in selling who are 'putting over' these ramshacklements to the P.B.P. (Poor —ahem!—Public.)*" My original letter was in protest against the lady " expert cook " trying to " put over " her ramshacklement to the long suffering P.B.P. I admit I never contemplated that a fellow member of the R.I.B.A. would rush into print on behalf of this lady " expert."

L. J. REDGRAVE CRIPPS

Acoustic Construction



A course of lectures on " Acoustic Construction " will be given by Mr. C. W. Glover, A.M.INST.C.E., L.R.I.B.A., at the Polytechnic, Regent Street, W.1, on Tuesday evenings at 7.30 p.m., beginning on May 9, Full particulars of the course are obtainable from Mr. G. A. Mitchell, F.R.I.B.A., the Head of the School.



Change of Address

Messrs. J. S. Gibson and Gordon have taken into partnership Mr. H. B. Kebel Smith, A.R.I.B.A., and the practice will in future be carried on at 2 Devonshire Terrace, Marylebone Road, W.1, under the name of J. S. Gibson, Gordon and Kebel Smith.

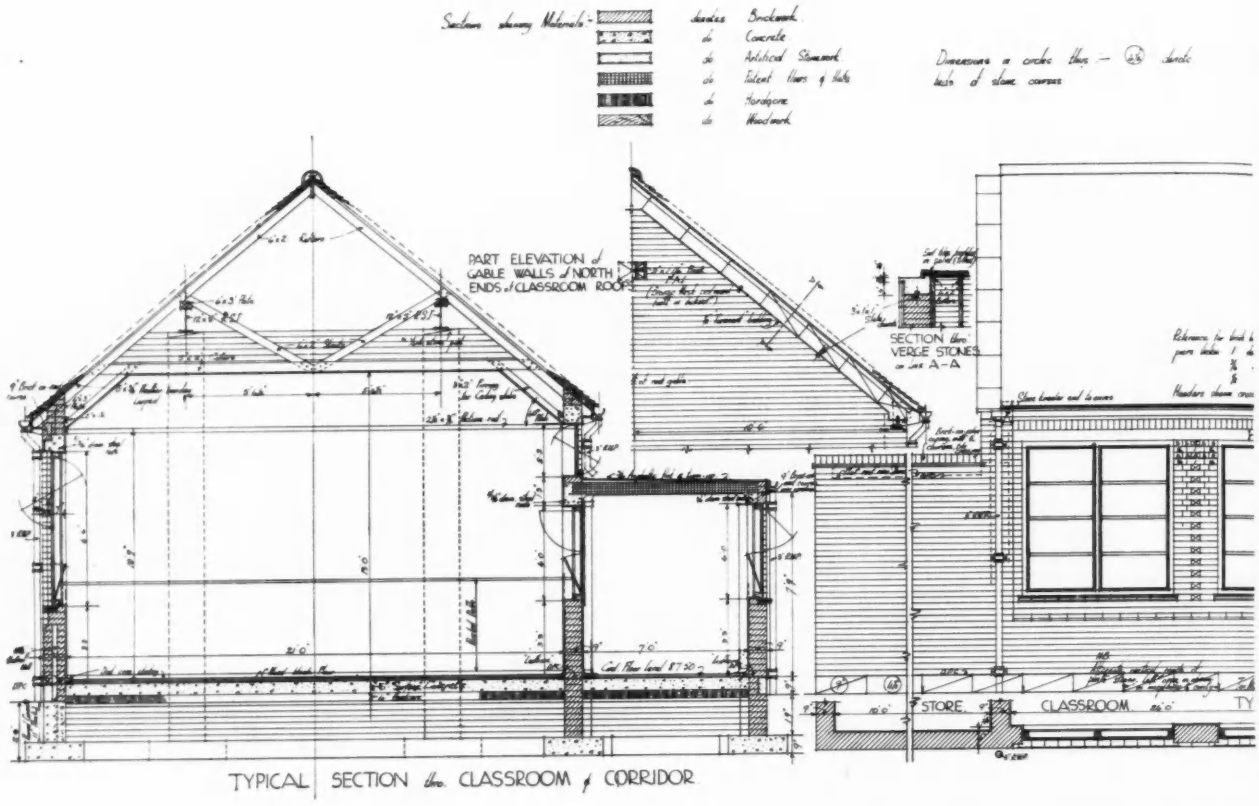
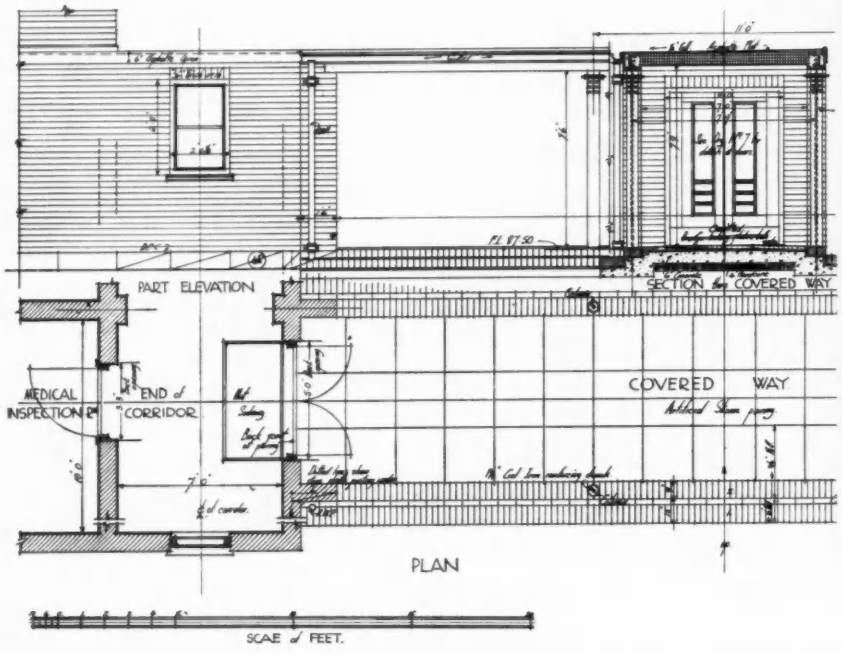
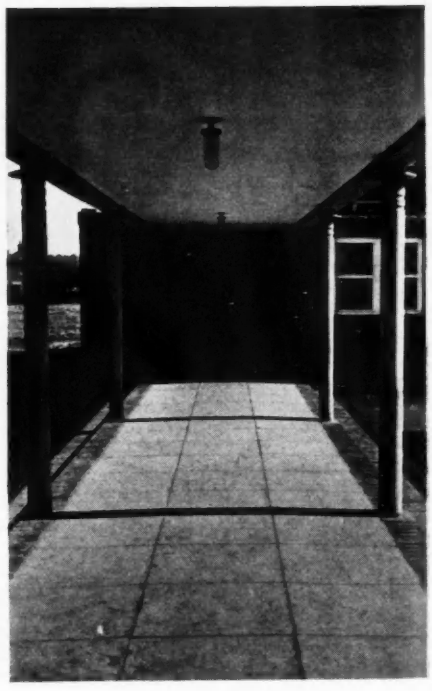
SCHOOL AT MAIDENHEAD : BY LEATHART AND GRANGER



Looking north, from inside the enclosure: the Juniors' Drill Ground and Assembly Hall

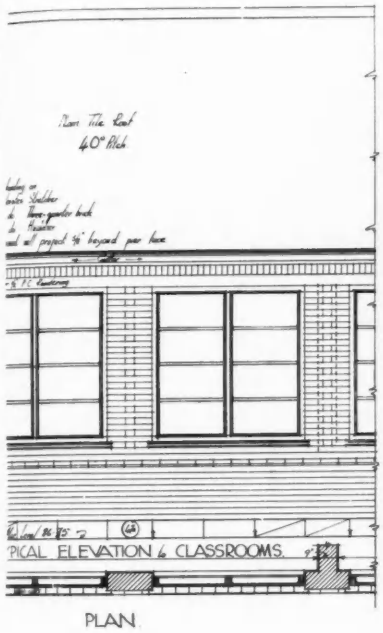


Looking north-west, from outside the enclosure : the Infants' Assembly Hall

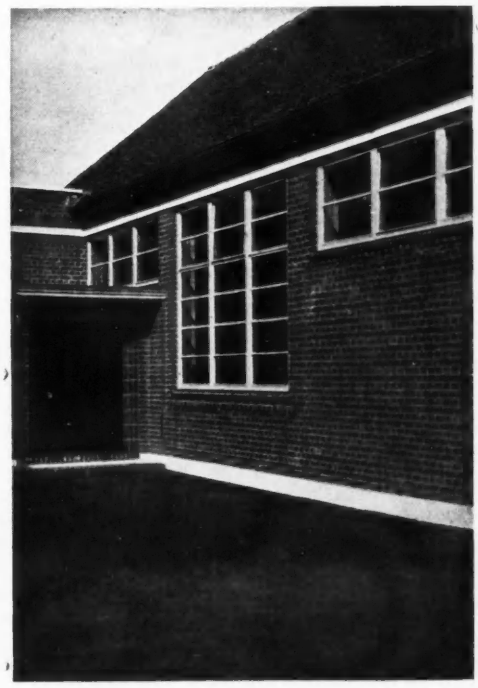


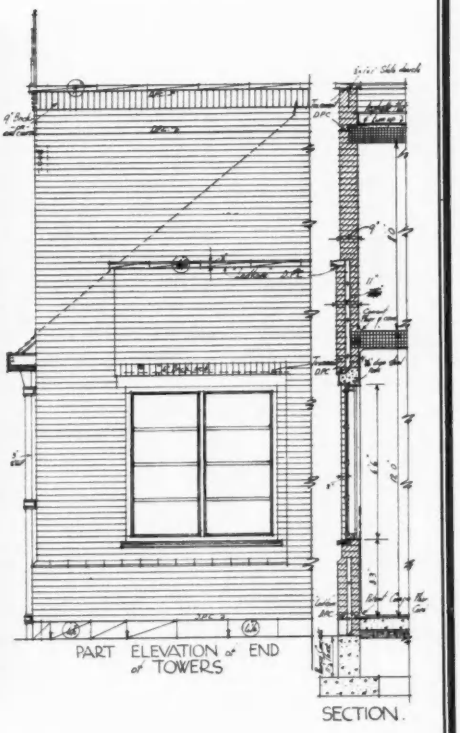
[*For other illustrations, and notes, see overleaf.*

SCHOOL AT MAIDENHEAD: B

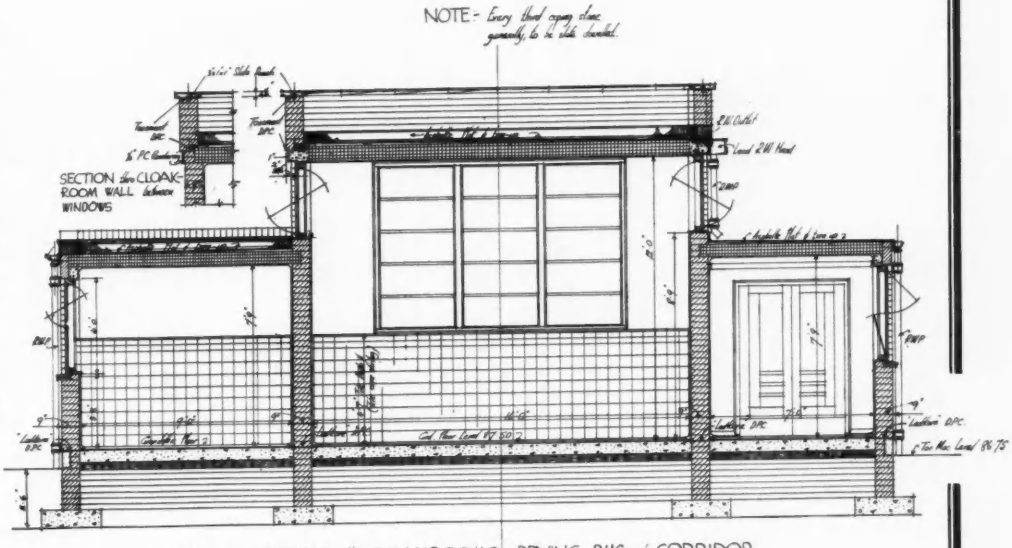


TYPICAL SECTION thro CLASSROOM & CORRIDOR





BY LEATHART AND GRANGER



PLAN

SECTION

The shape of the plan (reproduced in the preceding opening) is dictated by the shape of the site and by the aspects for the classroom ranges, which run somewhat south of east and somewhat south of west. The school is divided into two sections, one for mixed juniors, and the other for mixed infants. The fence that divides the enclosure formed by the buildings into two drill grounds appears in the view on page 498. The entrances, cloakrooms, lavatories and assembly halls are duplicated for each division of the school. Some of these details figure in the drawings reproduced on these two pages; the accompanying photographs show a covered way and a typical entrance doorway. At the north end of the site space has been left for future extension of the classrooms at some future date.

TYPICAL SECTION thro CLOAKROOMS, DRYING RMS & CORRIDOR
(Lavatories similar to Drying Rm but with Glazing to floors)

Lieut.-Col. E. H. Fawckner, the new chairman of the South Wales Institute of Architects. He occupied the same position in 1907-1908.

SOCIETIES AND INSTITUTIONS

SOUTH WALES INSTITUTE OF ARCHITECTS

The following have been elected officers of the above Institute for the forthcoming session :

President : Lieut.-Col. E. H. Fawckner, F.R.I.B.A. ; vice-presidents : Messrs. J. Herbert Jones, F.R.I.B.A., and W. S. Purchon, A.R.I.B.A. ; hon. treasurer : Mr. H. Teather, F.R.I.B.A. ; hon. auditor : Mr. J. A. Hallam ; hon. librarian : Mr. Lewis John, A.R.I.B.A. ; hon. secretary : Mr. Ivor P. Jones, A.R.I.B.A.

CAMBRIDGE ARCHITECTS' MEETING

At the annual meeting of the Cambridge Chapter of the Essex, Cambridge and Hertfordshire Society of Architects the following officers were elected :—

Chairman, Mr. Theodore Fyfe, M.A., F.R.I.B.A.; vice-chairman, Mr. N. T. Myers, F.R.I.B.A. ; hon. secretary, Mr. Norman Hurst, P.A.S.I. ; hon. treasurer, Mr. I. T. Sifton, A.R.I.B.A. ; executive committee, Messrs. Bland, Hughes, H. H. Parker, Tomlinson and Burdett Wood.

A NATIONAL SURVEY

At the last meeting of the Council of the Royal Incorporation of Architects in Scotland, held at Edinburgh, it was decided to co-operate with the Scottish branch of the Town Planning Institute in advocating in Government circles the desirability of having a national development plan and survey prepared for Scotland in the interests of the sound and economic development of the country as regards town and country planning and amenity in addition to transport, industry and agriculture.

The following members were elected : Fellows : Messrs. D. Ross, D. Smith and James M'Nab, Glasgow. Associates : Messrs. D. G. Watson, M. J. H. Cowie, H. K. Macdonald, W. M. Wilson, E. J. Weir, Alfred I. Greig, W. T. Sutherland, G. J. Munro, and H. N. Paterson.

CRUISE-TOUR TO SOUTHERN SPAIN

The Association of Architects, Surveyors and Technical Assistants has arranged a cruise-tour to Gibraltar and Southern Spain from August 25 to September 8, 1933. The party will leave London by the s.s. " Maloja " (21,000 tons), arriving at Gibraltar on August 29, motoring along the Atlantic seaboard to Cadiz, thence to Seville (one day's stay), Cordoba (half day), Granada (one day) and Malaga, i.e., through the Sierra Nevada district, and thence along the Mediterranean seaboard back to Gibraltar, a total of 570 miles' drive. The return journey will be made from Gibraltar in the s.s. " Mooltan."

The itinerary has been selected to include some of the best Roman, Mediæval, Moorish and Renaissance architecture of Spain. If 24 persons join this party the cost will be £20 each inclusive. Further particulars will be sent on application to the Secretary, A.A.S.T.A., 26, Buckingham Gate, S.W.1.

TRADE SOCIETIES

Sir Francis Goodenough has accepted the Presidency of the National Association of Trade Protection Societies in succession to Lord Meston, who is retiring after serving in this capacity for three years.

LAW REPORT

ARCHITECTS' CLAIM

Dollar and Others v. *Harrison.—King and Another* v. *The Same.—King's Bench Division. Before Mr. Justice Swift*

THESE were consolidated actions and arose out of the conversion of some residential property in Gloucester Square into flats and the claims by the plaintiffs were for fees for work done as architects and surveyors.

The plaintiffs were Mr. Peter Dollar, Messrs. Messer and Hamblin (trading as Tubbs and Messer), Mr. H. E. King and Mr. R. W. Thomas (trading as Fleetwood Everson and King). The defendant was Mr. H. Harrison, Australia House, Strand.

Mr. Beyfus, K.C., was leading counsel for the plaintiffs, and Mr. S. Mayer, K.C., for the defendant.

Plaintiffs' case was that by an arrangement made in 1924 between Mr. Dollar and Messrs. Messer and Hamblin, and the defendant, they were to prepare the plans and bills of quantities, etc., for conversion of the property, but that after a great deal of work had been done, it was found that another architect was acting for defendant, and plaintiffs were not paid their fees.

The defence was a denial that any definite arrangement was come to in the matter and in the alternative that any arrangement, if made, was conditional on defendant's acquiring the premises, which he never did. In fact, the property was bought by another person.

Mr. Mayer submitted that there was no evidence before the Court of any contract by his client.

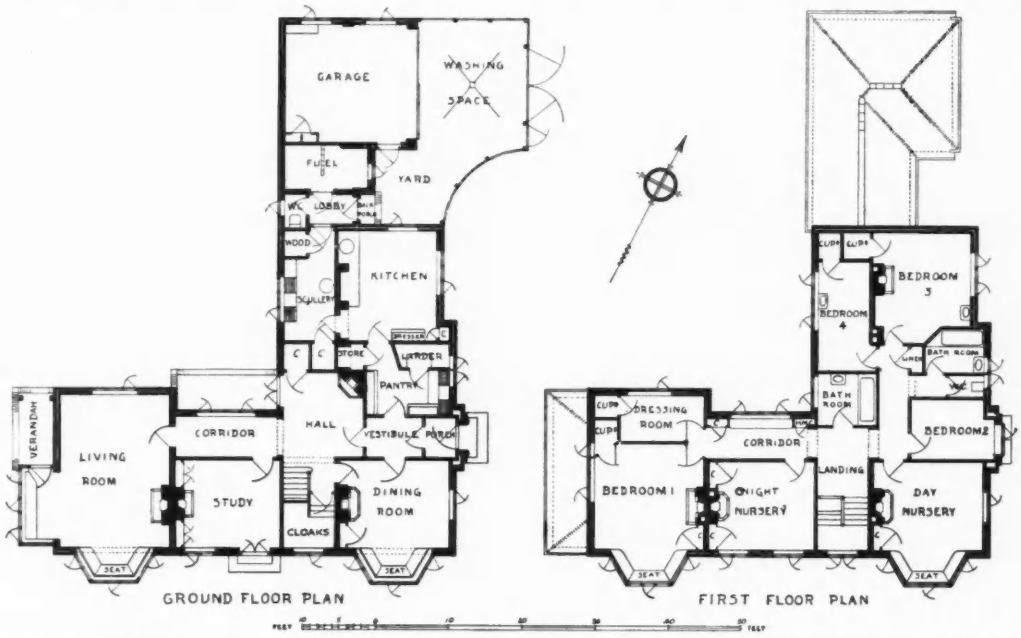
Mr. Llewellyn (who was with Mr. Beyfus) argued that there was ample evidence of a contract by the defendant, supported by the correspondence.

His lordship held that there was no personal contract with the defendant and he gave judgment for the defendant with costs. In his lordship's view the earlier transactions between Mr. Dollar and the defendant were barred by the statute of limitations. At the same time he did not think that the defendant intended to bind himself personally, but that he and Mr. Dollar had in mind the forming of a company in which company he was to be employed as architect and be paid on the basis of 5 per cent. for work done. In July, 1925, however, a company called the Gloucester Square Flats was formed and they acquired 25, 27 and 28 Gloucester Square. In his lordship's view Mr. Dollar knew that Mr. Harrison was not personally responsible, but was only acting as solicitor for clients. Under the circumstances there must be judgment for the defendant with costs.

QUESTIONS THAT ARISE

Dampness in Walls

¶ W. E. A. writes : " *I should be glad if your expert would make any suggestions upon the following problem.*



" *I am designing a church in Wales which is in a very exposed position, and, besides being in strong sunlight, will also have to withstand exceedingly heavy rainfall and strong winds, which will tend to blow the rain through the walls. The walls will be built in local random rubble stone work, set in Aberthaw hydrolic lime mortar composed of one of lime to three of sand, and the pointing will be executed at the completion of the work : all joints being raked out and then pointed. The walls average in thickness from 1 ft. 6 ins. to 2 ft. 9 ins., the majority being 2 ft.*

" *The interior is finished with a special plaster and has for the rendering a coat of cement to two of sand, gauged with an integral waterproofing liquid. The damp course is a double course of slates in waterproof cement, while the concrete bed of the flooring is also similiarly treated.*

" *The problem I am facing is the possibility of wet being driven through these comparatively thin walls and rendering the church damp internally.*

" *I should be glad if you could suggest any further method which would aid in keeping this building perfectly dry, beyond those I have mentioned, particularly any*

A HOUSE AT CAVERSHAM

DESIGNED BY C. BIRDWOOD WILLCOCKS

The external walls of this house at Caversham, Reading, Berks., are faced with hand-made sand-faced deep red multi-coloured bricks; and the roofs are covered with hand-made sand-faced tiles. The floors of the principal ground floor rooms are laid with wood blocks; and the internal woodwork is stained dark brown.

The staircase is an interesting feature of the house, the balustrade being plastered between the string and hand-rail. On the caps of the newels are different animals—a rabbit, owl, squirrel and hawk—carved by Miss Wilson, of Reading University.

materials which could be incorporated in the lime mortar to render it more waterproof, as it seems that this will give the means of ingress of the dampness."

From the question it is assumed that the stone used is known to be non-porous, since attention is being concentrated at the joints. In these circumstances it may happen that internal dampness from condensation may defeat successful efforts to avert penetration of the walls by driven rain. Would it be possible to build the walls with an inner facing 4½ ins. thick of porous brick, built into a cavity grouted in with White's "Hygeian Rock" composition adhering both to brick backing and stone facing? Such a wall, if plastered internally with ordinary porous lime plastic, finished with a grit finish from a wood float, ought to be proof against both external penetration and internal condensation.

It is quite possible that this method, outlined in the question may be successful if the stone is of moderate absorbency so that (*a*) all the water is not confined to the joints, and (*b*) dense, cold stones do not cause blotches of internal condensation when atmospheric conditions favour it. The satisfactory waterproofing of lime mortar (beyond its natural resistance) does not seem possible.

E. G.

A Site Planning Booklet

We have received from the Town Hall, Manchester, an illustrated memorandum, "Site Planning and Roads and Small House Design," prepared on behalf of the Town Planning and Building Committee by the City Architect.

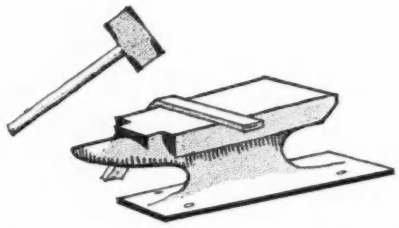
The object of this work is to stimulate an interest in site planning and the design of the small house and to give a lead in good practice in the aspects of estate development that become increasingly important when housing is left entirely to private enterprise.

BY J. N. HATTON Compton Wynyates Pen-and-Ink: 7½" × 10¼"

THE SKETCH CLUB

SIXTY-THIRD SESSION

BY ERIC A. W. IXER



Lissewege Church

Pencil: 9¾" × 12"

Dominating the immense Belgian plain, the tower of the Church of Lissewege rises far above the peaceful village with its white gables and picturesque canals, and is visible from Bruges to the coast.

The building was completed between 1230 and 1260, A.D. which possibly accounts for its remarkable continuity of style. The major portion is built of local bricks of large size, called mouffes, and the sparingly-used dressings are of Tournai stone. The tower is 160 feet high; the total length of the church, 201 ft.; the width of the transept, 97 ft. 6 ins.; the width of the médiane nave, 35 ft. 9 ins.; and of the aisles, 18 ft.; and the height of vaults under keystone, 53 ft. 9 ins.

The thirteenth century was, of course, for Lissewege, as well as for the whole of the district around Bruges, an era of great prosperity, and its population was then much greater than now, which probably explains the magnitude of its Church.

TRADE NOTES

BY F. R. S. YORKE, A.R.I.B.A.

The control of sub-soil water

THE problem of the final sealing of asphalt dampcourses to basements and sub-water-level chambers has always presented difficulties, and normal present-day methods are not only out of date, but involve the asphalt contractor in considerable risk. I believe, however, the recently patented Trinasco asphalt pipe provides a sound method for overcoming this difficulty.

•

The first three stages hitherto employed in the sealing of a basement are shown in the accompanying diagram. The fourth and final stage involved emptying the open sump and filling it with cement concrete ; hasty sealing up with asphalt (a process made more difficult by mud and wet cement over the site) and the final completion of the concrete loading raft. By such methods the testing of the efficacy of the asphalt was a matter of time, and in cases where (through the presence of dirt, defective joints or cracks caused by outside agencies) the sealing was ineffective, the cost of removing the concrete, and once more attempting to seal the sump, was considerable. Again, in cases where the loading raft was found of insufficient weight, the damage caused by the pressure of water lifting the asphalt and loading raft resulted in considerable expense and delay.

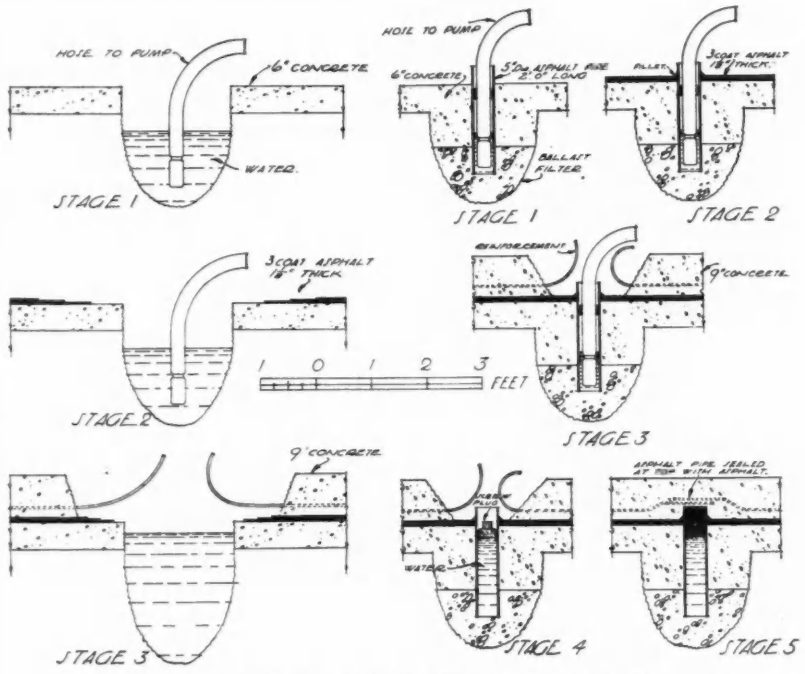
•

The new method of attacking this problem, which is illustrated here by a series of five sketches, includes the fixing of Trinasco asphalt pipes into the lower or bottom layer of concrete *during the course of construction* (Stage 1). Through the concrete, by means of suction, the head of water is kept down during the application of the horizontal asphalt layers (Stage 2). The withdrawal of sub-soil water continues during the application of the final cement concrete loading coat, which is left open for the purpose of access in the vicinity of the pipes as shown in Stage 3. As soon as it is considered that the loading concrete raft has become thoroughly set the suction pumps are withdrawn and the Trinasco pipes are sealed with a metal plug (Stage 4), thus bringing the full pressure of the sub-soil water into action. When it is finally agreed that the asphalt is waterproof and the loading coat of sufficient strength to withstand the water pressure, the pipes are finally sealed (Stage 5).

•

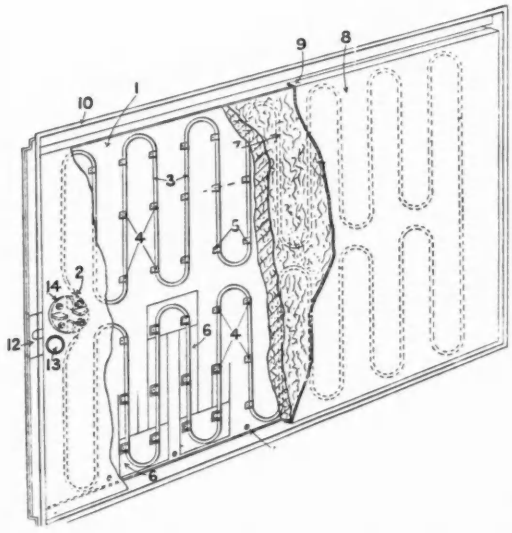
The main advantage of this process is that the sub-soil water pressure is controllable, and should, for instance, the concrete loading coat be found of insufficient weight and strength, the pressure of water can be immediately released by withdrawing the metal plugs, and the head of water kept down while the necessary steps are taken to make good any inefficient construction. Again, if at any later date it is necessary to cut through the concrete and asphalt for the purposes of reconstruction, it is a comparatively simple matter to re-open the pipes for the purpose of relieving water pressure whilst the work is in progress.

Electric panel-heating



The modern tendency in artificial warming is to provide radiant rather than convected heat. In convective heating, air, warmed by contact with "radiators," hot-water pipes, fires and various types of tubular heaters, is used as the medium for transmitting heat. The hot air, being light, rises towards the ceiling and, cooling, is slowly displaced by other warmer currents. Consequently the lowest temperature is at floor level and much heat is wasted.

Radiant heating—by no means new—is, today, generally accepted as the ideal method. Heating is effected by rays which produce warmth when they strike an object, but do not heat the air to any appreciable extent. In an apartment thus heated there is a uniform distribution of radiation and a feeling of equal warmth in all parts of the room. A greater degree of ventilation is permitted because more cool air can be introduced, without consequent chilling, than is possible when convective heating methods are employed.



•

The Braby electric, light steel, heating panel (see illustration on page 507) consists of a rolled steel plate, specially flattened (1), its edges being turned back to retain stiffness, with a heating element of nickel chromium wire (2) encased in a flexible refractory material (3) fastened to it by clips of untarnishable steel (4) by small rivets (5).

Extra insulation between the element and the plate is obtained by means of thin mica strips (6) placed in all positions where contact is made.

The control of sub-soil water and the sealing of sub-water-level basements. On the left: Stages 1-3 of the old method. On the right: Stages 1-5 of the new method.

The rear view of a surface type light steel electric heating panel. The explanation of the reference numbers will be found in the accompanying paragraphs.

To prevent loss of heat from the back of the panel, a mattress (7) of special insulating and particularly non-hygrometric material is laid over the whole of the heated surface and held in position by a galvanized back plate (8) with its edges turned over on to the front plate (1) in box form as shown in (9), thus rendering it water and air tight. These plates are fastened into a moulded steel frame (10).

•

Electrical entry to the panel is made either through the removable moulding (12) in the case of surface fixing and wiring, or by the back entry hole (13) to meet recessed requirements. The points of entry are arranged for a ⅝" conduit. Wire connections are made to a porcelain block of approved pattern (14) by means of porcelain connectors arranged with flexible leads covered with material which is fire and heat proof (not shown).

The standard panels are made 12, 18, 24 and 30 ins. high, and in several lengths. As an indication of the specification and prices of the heater I take the schedule for the 24 ins. high model :

Length		24 inches high. Standard Voltages 100–250.						
		Heating Surface	Wall Mounting		Ceiling or High Level Mounting		Price	
Ft.	in.	Sq. ft.	Watts	B.Th.U.	Watts	B.Th.U.	£ s.	d.
2	0	4·0	320	1090	400	1702	2 18	6
3	0	6·0	480	1670	600	2046	3 10	0
3	6	7·0	560	1920	700	2386	3 17	0
4	0	8·0	640	2180	800	2728	4 4	0
4	6	9·0	720	2450	900	3070	4 12	0
5	0	10·0	800	2730	1000	3410	5 0	0
5	6	11·0	880	3000	1100	3750	5 6	0
6	0	12·0	960	3270	1200	4100	5 12	0
6	6	13·0	1040	3540	1300	4440	5 18	0
7	0	14·0	1120	3820	1400	4770	6 5	0
7	6	15·0	1200	4100	1500	5120	6 12	6
8	0	16·0	1280	4360	1600	5460	7 0	0

The heating element works, at full temperature, under black conditions, and is accommodated in an airtight container to eliminate oxidization. It is claimed that, under these conditions, the element is unbreakable and practically indestructible.

The weight of the panel is approximately 5 lb. per sq. ft.

All standard panels fixed in close proximity to room occupants, fabrics, and so on, are loaded at 80 watts per square foot to give a surface temperature of 155° Fahrenheit. All other types are loaded to 100 watts per square foot, to give a temperature of 195° Fahrenheit. These loadings may, if required, be increased, but in no cases do the temperatures of standard panels rise above the figures quoted.

WHAT IS MODERN ARCHITECTURE?

[*By WILLIAM E. LESCAZE* *]

IN spite of a great number of books, lectures and reviews on the subject of modern architecture, it seems to be still commonly held that flat roofs, large glass areas and tubular furniture are not only the productions of modern architecture, but are actually the whole of modern architecture itself. Is this a case of not being able to see the wood for the trees?

Modern architecture is a plastic expression of a philosophy which rests neither on flat roofs nor on tubular furniture, but if this is to be more generally understood we shall need not merely clearer thinking, but also more actual experiences of human beings living inside modern buildings. At all events, modern architecture is not merely the dogmatic acceptance of certain forms and materials, but springs from an attitude of mind towards human life and human needs.

To ascertain where the British public stands today one might mail a questionnaire somewhat like this :—

(1) Do you believe in health?
(2) Do you believe in cleanliness, in comfort?
(3) Do you believe in economy?
(4) Do you believe in honesty?
(5) Do you believe in happiness?

To those who would answer "Yes, I do," the following notice might then be sent: "Acknowledging yours of January 21, 1933, we wish to inform you that you have been elected a member of the Friends of Modern Architecture. You are for modern architecture and modern architecture is for you."

How did modern architecture come about? I can only guess. I imagine it all started because a few sensible people at first, and now more and more people, became ill at ease with their surroundings. They began to investigate and soon found that the nineteenth-century architects had gone on fondly dressing up their buildings in eighteenth century, or older, garb. A series of patent lies had resulted.

In the meantime life had gone on. Railroads, automobiles, electric lights, telephones appeared. Women's dress and men's suits changed, but the architects would not be disturbed. Their little exercises in "styles" had kept them so happily busy that they forgot altogether about "creation."

I remember that not so long ago a cathedral in New York was heralded as the most beautiful one in the world. On what basis was such a claim made? The architects had gone to Europe and brought back drawings of the most beautiful window in Chartres, the most beautiful spire of some English cathedral, and the most beautiful door of some other. It was demonstrated like a mathematical equation that since part *x* equals beauty, part *y* equals beauty, the total sum of *x* plus *y* equalled the greatest beauty. Really, I am not joking.

By now a few sensible people have realized that architecture is a little more than just a pretty sketch, just a lovely façade with something unrelated to it going on behind. They have realized that what counts is man and his activities, that man is the scale. They have thought of the many postures a man assumes; lying in bed, standing in front of a wash-basin, sitting at the dining-room table, walking, reaching his office, or playing a game. They have thought of what might be the ideal surroundings for these activities: size and location of windows, height of wash-basin, width of street, access to open green spaces. They have seen that as far as our dwellings and streets are concerned we are still barbarians, that we have never considered happiness in our houses, as if grown-ups could not be conditioned as well as children, and that we have not yet started the least bit of intelligent planning.

Now, I don't propose to say that the modern architect is altogether a miracle man. But I do quite emphatically say that he is the only one who has really something to offer to man and society. He is the only one who takes the trouble to *analyse* his problem. He is the only one who dares to build as he has thought, logically and honestly. He is the one who follows the good tradition, who is the tradition. He is the one who fulfils his obligation to his profession, to his fellow men and to society.

* Extracts from an article by the author, reprinted from *The News Letter* for April 1.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Housing Acts

MR. SKELTON, Under-Secretary for Scotland, informed Mr. Kirkwood that at December 31, 1932, the amount of grant paid by local authorities in Scotland in respect of the improvement and reconstruction of houses under the Housing (Rural Workers) Acts, 1926-31, was £951,397. At March 31, 1933, a total of 113 local authorities had received the approval of the Department of Health for Scotland for the erection of houses under the Housing (Scotland) Act, 1930, to accommodate families displaced from unfit houses in their areas, and in addition 43 local authorities were erecting houses definitely intended for this purpose with the aid of the subsidy available under the

Housing (Financial Provisions) Act, 1924. Twenty-one local authorities, who had indicated in the general statements submitted by them under Sub-section 2 of Section 22 of the Act of 1930 that there was a need for houses to replace unfit houses in their areas had not yet submitted proposals specifically intended to meet that need, though some of these authorities were erecting houses under the Act of 1924 which might be used for the accommodation of displaced families. Eight local authorities had not yet submitted any general statement under the sub-section referred to. The Department would continue, where necessary, to press local authorities to provide houses required for rehousing purposes, and, if need be, would put into operation their powers under Section 37 of the Act of 1930 in the case of defaulting local authorities.

Public Works

Sir A. M. Samuel asked the Minister of Health whether he would issue a list of public works involving an individual expenditure of more than £25,000, excluding slum clearance, the building of dwelling houses, schools, and labour exchanges, upon which public authorities, at this date, desired to embark by means of a loan-expansion policy, with or without Government aid; and would he also state the total estimated expenditure and the number of persons likely to be employed upon feasible schemes.

Sir Hilton Young said that this information could be obtained only by means of a return from the local authorities; and the return and deductions based on it would be subject to so many qualifications, as to its inclusive character, practicability of schemes, probable cost and extent of employment and the dates by which employment would be available, as to have no practical value. Local schemes at any given moment were at all stages of preparation, and, before actual loan sanction, required careful examination. The statements already made had removed any doubt as to the ready sanction which awaited proposals for public works of a remunerative or useful character.

Other Trade Items

Readers have probably noticed that this week, in addition to the usual JOURNAL supplements, there is also an additional supplement entitled *The Truscon Review*. This has been issued by the Trussed Concrete Steel Co., Ltd., Reinforced Concrete Engineers, for the special purpose of recording the development and progress of reinforced concrete. This supplement is, as it were, a journal within a journal, and is devoted to research in concrete, for, as the firm rightly point out, "the full possibilities of reinforced concrete are not yet completely realized." The firm, by virtue of their long association with reinforced concrete construction, are well fitted to carry out their object of broadcasting the divers uses for concrete. This number of *The Truscon Review* is the first of a series that will be published from time to time in this JOURNAL. It is an enlightened form of advertising that should, we believe, be much appreciated by architects.

*

A remarkable British trading achievement was celebrated by Electrolux, Ltd. at a dinner held recently at the Park Lane Hotel, London, when it was announced that of the 43 associated companies, the British Organization had won the International Trophy for the highest quota of sales in 1932. Messages of congratulation from Sir Robert Horne, M.P. and Lord Burnham were read by the Chairman of the company, Sir Harold Wernher. Lord Burnham stated that it was remarkable that the company had been able to increase its profits during the period of tragic depression for nearly all trades.

Describing the growth of the company, Sir Harold said: "The Electrolux International Organization consists of 43 companies operating in almost every civilized country in the world; it has many thousands of employees, and four main factories. The company started with a capital of £10,000 and has grown within 20 years to its present capitalization of over three million pounds. This growth came in the post-war period, and largely in countries which had been devastated by war, such as Germany. By prudent working and conservation of finances, the company's position was consolidated in spite of world-wide depression."

The Marquess of Milford Haven, proposing the toast of the factory, traced the growth of the technical side of the British organization from 1921, when the company had a single basement room in Newman Street, London, to the present day, when the most ambitious of all their extensions—a completely new office building, stores and enlarged factory building—were nearing completion.

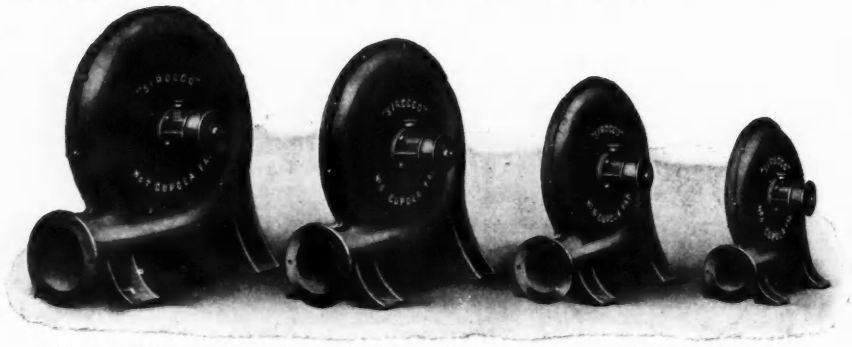
Messrs. Davidson & Co., Ltd., engineers and ironfounders, of the Sirocco Engineering Works, Belfast, Ireland, have sent us a copy of a new brochure (No. S.F.26) illustrating and describing Sirocco high-pressure fans. The fans, which have been designed for comparatively high pressures necessary in the supply of air blast to smiths' hearths, forges, cupolas, or for work of similar character, are marketed in four different types: (1) Cast-iron high-pressure fans, suitable for forges calling for static pressures up to 16 ins. water gauge; (2) single-inlet cupola fans for cupola or other work calling for static pressures up to 30 ins. water gauge; (3) double-inlet cupola fans for similar work to the single-inlet type; (4) narrow pressure fans designed to give a small volume of air at static pressures up to 30 ins. water gauge for general high-pressure work.

Briefly, the brochure includes some interesting examples of recent installations and contains detailed and accurate information concerning duties, weights and dimensions for the wide range of sizes listed. In addition, numerous tables assist in determining the most suitable Sirocco fan equipment for use under diverse operating conditions. Copies are obtainable from the firm at the address given above.



THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:—

St. Alban's Church, Golders Green (pages 489–491 and supplement). General contractors, F. G. Minter, Ltd. Sub-contractors: Ames and Finnis, facing bricks and roof tiling; Ragusa Asphalte Paving Co., asphalt work; G. N. Haden and Sons, Ltd., heating (oil-fired) and electric lighting; Redpath, Brown & Co., Ltd., steelwork; Wilson Lovatt and Sons, pile foundations; Xelite Co., Ltd., plastering; Concrete Ltd., concrete flats; Acme Paving and Flooring Co., wood block flooring; James Gibbons, Ltd., windows and ironmongery; John Compton Organ Co., organ; J. Whitehead and Sons, Ltd., stone steps and paving to chancel and Lady Chapel; Mears and Stainbank, bells; Hornton Quarries, Ltd., stonework of altar and reredos; Green and Vardy, woodwork of reredos, organ-cases, font cover, etc.; Watts & Co., Ltd., decoration of reredos—hangings and canopy forming Lady Chapel reredos and two oak standard candlesticks; F. G. Minter, Ltd. (Furnishing Dept.), communion rails and congregational stairs.

School at Maidenhead (pages 498–501). General contractors, William Creed & Co. Sub-contractors: Dutton & Co., Ltd., heating; C. Harvey & Co., electrical wiring and fittings; Henry Hope and Sons, Ltd., windows; Roberts Adlard & Co., Ltd., roof tiling; Pearson Brothers and Campbell, Ltd., artificial stone; Diespeker & Co., Ltd., terrazzo partitions, etc.; Val de Travers & Co., Ltd., asphalt; Banister, Walton & Co., Ltd., steelwork; Carter (Brockley), Ltd., wall-tiling; Leeds Fireclay Co., Ltd., sanitary fittings; James Gibbons, Ltd., locks; Luxfer, Ltd., patent glazing; F. Jukes, wrought ironwork; Stoner and Saunders, Ltd., lead work; Stevens and Adams, Ltd., wood block floors; E. G. Walters & Co., Ltd., jointless floors; Bratt Colbran & Co., Ltd., fireplaces; Maidenhead Brick & Tile Co., bricks.

House at Caversham, Reading (page 503). General contractors, W. N. and E. Fisher. Sub-contractors: S. and E. Collier, facing bricks; W. W. Hall, tiles; Shanks & Co., sanitary fittings; Bratt Colbran & Co., Ltd. and the Heaped Fire Co., fireplaces; Bell's Poilite and Everite Co., rubber floor tiling; J. T. Spencer and Sons, Ltd., heating installation; Mr. Barnard, electric light installation; Loft Ladders, Ltd., loft ladders.

Range of Sirocco single-inlet cupola fans. Sizes: 35, 30, 25 and 20 ins. diameter.
See note on this page.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

The ISLINGTON B.C. has purchased a site in Sebbon Street, for housing purposes, for £8,000, and propose that a scheme for the erection of 109 dwellings on the site, comprising 78 three-room, and 31 four-room flats, each with scullery, bath and lavatory accommodation, be prepared in due course.

Plans passed by the LEWISHAM B.C. : Three shops, Davenport Road, for Messrs. Walker, Clinging & Co. ; 198 houses, Northbrook Park Estate, for Messrs. Chart, Son and Reading ; eight houses, Brockley View, for Messrs. Dunsmore Bros. ; 116 houses, Brockley Hall estate, for Mr. H. Macintosh.

Plans passed by the NORTHFLEET U.D.C. : Eight houses, St. Mark's Avenue, for Mr. Gillespie ; 16 houses, Plane Avenue, for Mr. C. J. Howard ; four houses, Plane Avenue, for Mr. W. J. Dyke ; induced draught house, Electricity works, for Henley's Telegraph Works, Ltd.

Plans passed at SANDERSTEAD : Two houses, Purley Bury Close, for Messrs. W. J. Frewing and Sons, Ltd. ; four houses, York Road, for Mr. G. Burgess ; six houses, Mitchley Avenue, for Messrs. Harold Williams, Holliday and Partners ; four houses, Limpsfield Road, for Mr. C. Pragnell.

Plans passed by the SOUTHALL-NORWOOD U.D.C.: Three houses, Greenford Avenue, for Mr. H. Gosney ; seven houses, Saxon Road, for Messrs. E. Plaistowe and Sons, Ltd. ; eight houses, Longford Avenue, for Messrs. G. Wimpey & Co., Ltd. ; three shops, North Road, for Mr. E. Hayes ; additions, 65 Broadway, for Messrs. F. W. Woolworth & Co., Ltd. ; workshop and store, Havelock Road, for British Insulating Oil and Varnish Co.

Plans passed by the WEALDSTONE U.D.C. : 11 garages, Kenton Road, for Mr. E. Wright ; 28 houses, D'Arcy Drive, for Mr. John Turner ; 12 flats, off Harrow View, for Messrs. Nethercott and Pepper.

Plans passed by the WOOD GREEN U.D.C. : Public House, Lordship Lane and Roundway, for Mr. A. W. Blomfield ; motor coach station, Lordship Lane, for Messrs. Crickmay and Shenstone.

SOUTHERN COUNTIES

Plans passed by the OXFORD Corporation : Two houses, Windmill estate, for Mr. E. S. Clifford ; additions, Somerville College, for College Council ; two houses, Iffley Road, for Mr. G. Simmons ; two houses, Ramsay Road, for Mr. G. Coppock ; shops and flats, Woodstock Road, for St. John's College Council ; hall and dormitory, Temple Road, Cowley, for Salesian House Council ; addition, Radcliffe Science Library, Parks Road, for trustees ; alterations, 129 High Street, for Messrs. Webbers, Ltd.

The Surrey C.C. has approved a revised scheme for extensions at the REIGATE Institution, at a cost of £120,000.

The West Sussex Education Committee has approved a scheme for the reorganization of the schools in the SHOREHAM and SOUTHWICK area involving a total expenditure estimated at £39,000, and providing for the immediate erection of two senior schools, at an estimated cost for each school of £16,000.

The WEST SUSSEX C.C. is to invite tenders for the foundation work of the new County Offices, at an estimated cost not exceeding £10,000.

The WORTHING Corporation is to undertake part of the scheme for the development of the Beach House site, by the construction of a bathing pool, boating pool, sea wall, etc., at a cost of £60,680.

Plans passed by the WORTHING Corporation : Two dwelling houses, Arundel Road, for Mr. C. Coul ; flats, Wallace Avenue and Pevensey Road, for Cole-Adams, Phillips and Cheriton ; street to join Sea Place (amended) for Mr. G. W. Warr ; seven houses, Rose Walk, for Mr. M. R. Fletcher ; 15 houses, Haynes Road, for Mr. S. C. Phillips ; two houses, Brighton Road, for Mr. A. T. W. Goldsmith ; alterations to Brunswick Hotel, Brunswick Road, for Mr. E. Emerson ; two houses, Hillside Avenue, for Mr. E. J. Love ; seven houses, Manor Road, or Mr. H. M. Potter ; three houses, George V. Avenue, two houses, Ophir Road, and Offington Lane, for Mr. F. W. Payne ; addition to Inkerman Hotel, Shelley Road, for Mr. J. E. Lund.

EASTERN COUNTIES

Plans passed by the YARMOUTH Corporation : Two houses, Hawkins Avenue, for Messrs. H. R. Middleton & Co., Ltd. ; two houses, Middleton Road, Gorleston, for Mr. H. C. Downing ; two houses, Collinwood Road, for Mr. G. W. Woods ; shop, Ordnance Road, for Mr. B. Cole.

The YARMOUTH Corporation has sold six building sites to Mr. H. A. Holmes and eight to Messrs. H. R. Middleton & Co., Ltd.

MIDLAND COUNTIES

The BIRMINGHAM Education Committee is to make structural alterations and additions at Hope Street Council School, at a cost of £11,000.

The LEICESTER Corporation is to reconstruct the Corn Exchange and Market Hall, after fire, at a cost of £12,000.

The NORTHAMPTON Corporation recommends an amended scheme for the erection of baths at a cost of £82,000.

Plans passed by the WOLVERHAMPTON Corporation : Two houses, Oxley Manor, for Mr. A. C. Phillips ; four houses, St. Judes Road, for Messrs. Weaver and Walters ; three houses, Oxbarn Avenue, for Mr. G. E. Lockley ; 10 houses, Victoria Road, Oxbarn, for Messrs. E. Leach & Co. ; six houses, Oxbarn Avenue, for Messrs. Blackburn and Crossland ; two houses, Langley Road, for Mr. R. Carpenter ; 28 houses, Victoria Road, Oxbarn, for Messrs. T. Wellings and Sons ; two houses, Prestwood Road, for Mr. T. A. Ashbury ; covered yard and compressor house, Stewart Street, for Messrs. C. and B. Smith ; three houses, Milton Road, for Mr. H. Grindley ; alterations, Queens Square, for Wolverhampton Building Society ; five shops, Dudley Road, for Messrs. H. and J. N. Patten ; four shops, Dudley Road, for Wolverhampton and Dudley Breweries, Ltd. ; four bungalows, Rowan Crescent, for Messrs. F. Leach & Co. ; steel warehouse, Tower Street, for Messrs. E. Birch and Sons ; additions, offices, Bilston Road and Eagle Street, for Messrs. H. F. Spencer & Co.; business premises, Newbridge, for Mr. E. F. A. Summerfield ; two houses, Coalway Road, for Mr. H. Webberley ; four houses, Plascom Road, for Messrs. Senior and Smith, Ltd. ; two houses, Tudor Crescent, for Mr. W. Winsper ; 12 houses, Stafford Road, Fordhouses, for Bushbury Estate and Building Co. ; 16 houses and one shop, Jones Avenue, for Mr. T. Jones.

NORTHERN COUNTIES

To the HYDE Corporation it was reported that the Ministry of Health would be prepared to entertain the proposals of the Corporation for the 176 houses to be erected at Bradley Green.

The SOUTH SHIELDS Corporation is to proceed with the clearance of the Holborn area, and provide rehousing accommodation by the erection of about 600 houses on the site, and at Simonside.

Plans passed by the STOCKTON-ON-TEES Corporation : Reconstruction, Hippodrome, Dovecot Street, for Messrs. Chadwick, Watson & Co.; two houses, Albany Road, Norton, for Mr. M. C. Robson ; development of Brisbane Garden estate, for Mr. G. P. Stainsby, on behalf of House and Garden Estate Co., Ltd. ; 162 houses, Glebe estate, for Corporation.

Plans passed by the STRETFORD U.D.C. : Eight houses, Skerton Road, for Messrs. Sparke and Stephens ; 20 houses, Derbyshire Lane, for Messrs. E. and J. Slater ; 16 houses, Derbyshire Lane, for Mr. H. Grinshaw ; 18 houses, Manor Road, for Messrs. Freeman, Evans & Co. ; pump house, Saw Mills, Trafford Wharf Road, for Co-operative Wholesale Society, Ltd.

Plans passed by the TYNEMOUTH Corporation : 10 houses and two shops, Heaton Terrace, for Mr. W. Stockdale ; four houses, Station Approach Road, for Messrs. G. O. Park and Son ; alterations, Plaza Winter Garden, for Tynemouth Gala Land, Ltd. ; two shops, Chirton Green, for Mr. F. R. N. Haswell ; eight houses, Brighton Grove, for Messrs. Cackett, Burns-Dick and Mackellar ; two houses, Billy Mill Lane, for Messrs. Williamson Bros.

Plans passed by the WAKEFIELD Corporation : 28 houses, Ashleigh Avenue, for Mr. J. Percy Firth ; six houses, Dewsbury Road, for Messrs. Kay and Lunan ; 10 houses, Duke of York Street, for Mr. M. Arnold ; shop, The Springs, for Messrs. Simpson and Moxon ; six houses, Dewsbury Road, for Mr. J. Caton.

Plans passed by the WALLSEND Corporation : Three houses, Queen's Terrace, for Mr. A. Heron ; offices, etc., King's Road, for Messrs. R. C. Watson and Sons ; three houses, Churchill Street, for Mr. Kirton Smith.

The WARRINGTON Corporation has approved the following plans : Alterations and additions to premises, Winwick Road, for Mr. B. Tyrer ; internal alterations, Town Hall, for Messrs. Burgess Bros. ; houses (revised block plan), Surrey Street, for Mr. A. Wright ; roads off Chester Road, for the Manchester Ship Canal Co. ; eight houses, Chester Road, and roads off, for Mr. A. Cannell.

SCOTLAND

The GLASGOW Corporation has approved a plan showing proposals to build eight single, and two double shops, and 20 houses of flatted type, fronting Boydstone Road, Carnwadric ; two two-story tenements, fronting Bangorshill Street ; 12 houses of flatted type, on the area bounded by Capelrigg Street, Clova Street, and Carnwadric Road.

The GLASGOW Corporation has approved a lay-out plan showing 350 houses to be erected, comprising 74 cottages and terrace cottages, 100 houses in two-story flats, and 176 houses in tenements, at Bellahouston.

WALES

The CARDIFF Corporation is to erect 200 houses on the Tremorfa estate.

To the CARDIFF Corporation it was reported that the Minister of Health has held an inquiry into the application of the Corporation to borrow £12,080, and the Water Engineer was authorized to proceed with the preliminary works in connection with the reconstruction of the Blackweir Depot.

Plans passed by the NEWPORT (Mon.) Corporation : 54 houses, off Somerton Road, for Messrs. J. D. Adey and Sons ; 89 houses, off Somerton Road, for Messrs. F. R. Bates and Son ; two houses and shop, Marshfield Street, for Mr. Pottinger Hodge ; three houses, Liswerry Road, for Mr. S. G. Bland ; new premises for South Wales Argus, Ltd., in Market Street, for Mr. C. E. Tebbs ; three flats, Cromwell Road, for Mr. D. Averbuck ; extensions, Cardiff Road, for Whitehead Iron and Steel Co., Ltd. ; three houses, Friars Road, for Mr. A. E. Sheppard.

Plans passed by the SWANSEA Corporation : Dairy and milk container factory, Station Road, Cockett, for Mr. David George ; two houses, Station Road, Cockett, for Mr. Syd Davies ; four houses, Middle Road, for Mr. David Morgan ; house, Middle Road, for Mr. J. M. Jones ; butter factory, Courtenay Street, for Mr. J. O. Walters ; additions, High Street, King Street, and Orchard Street, for Messrs. Lewis Lewis, Ltd. ; two houses, Mansel Road, for Mr. H. Roser ; 14 houses, Mount Pleasant, for Mr. John Oliver.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

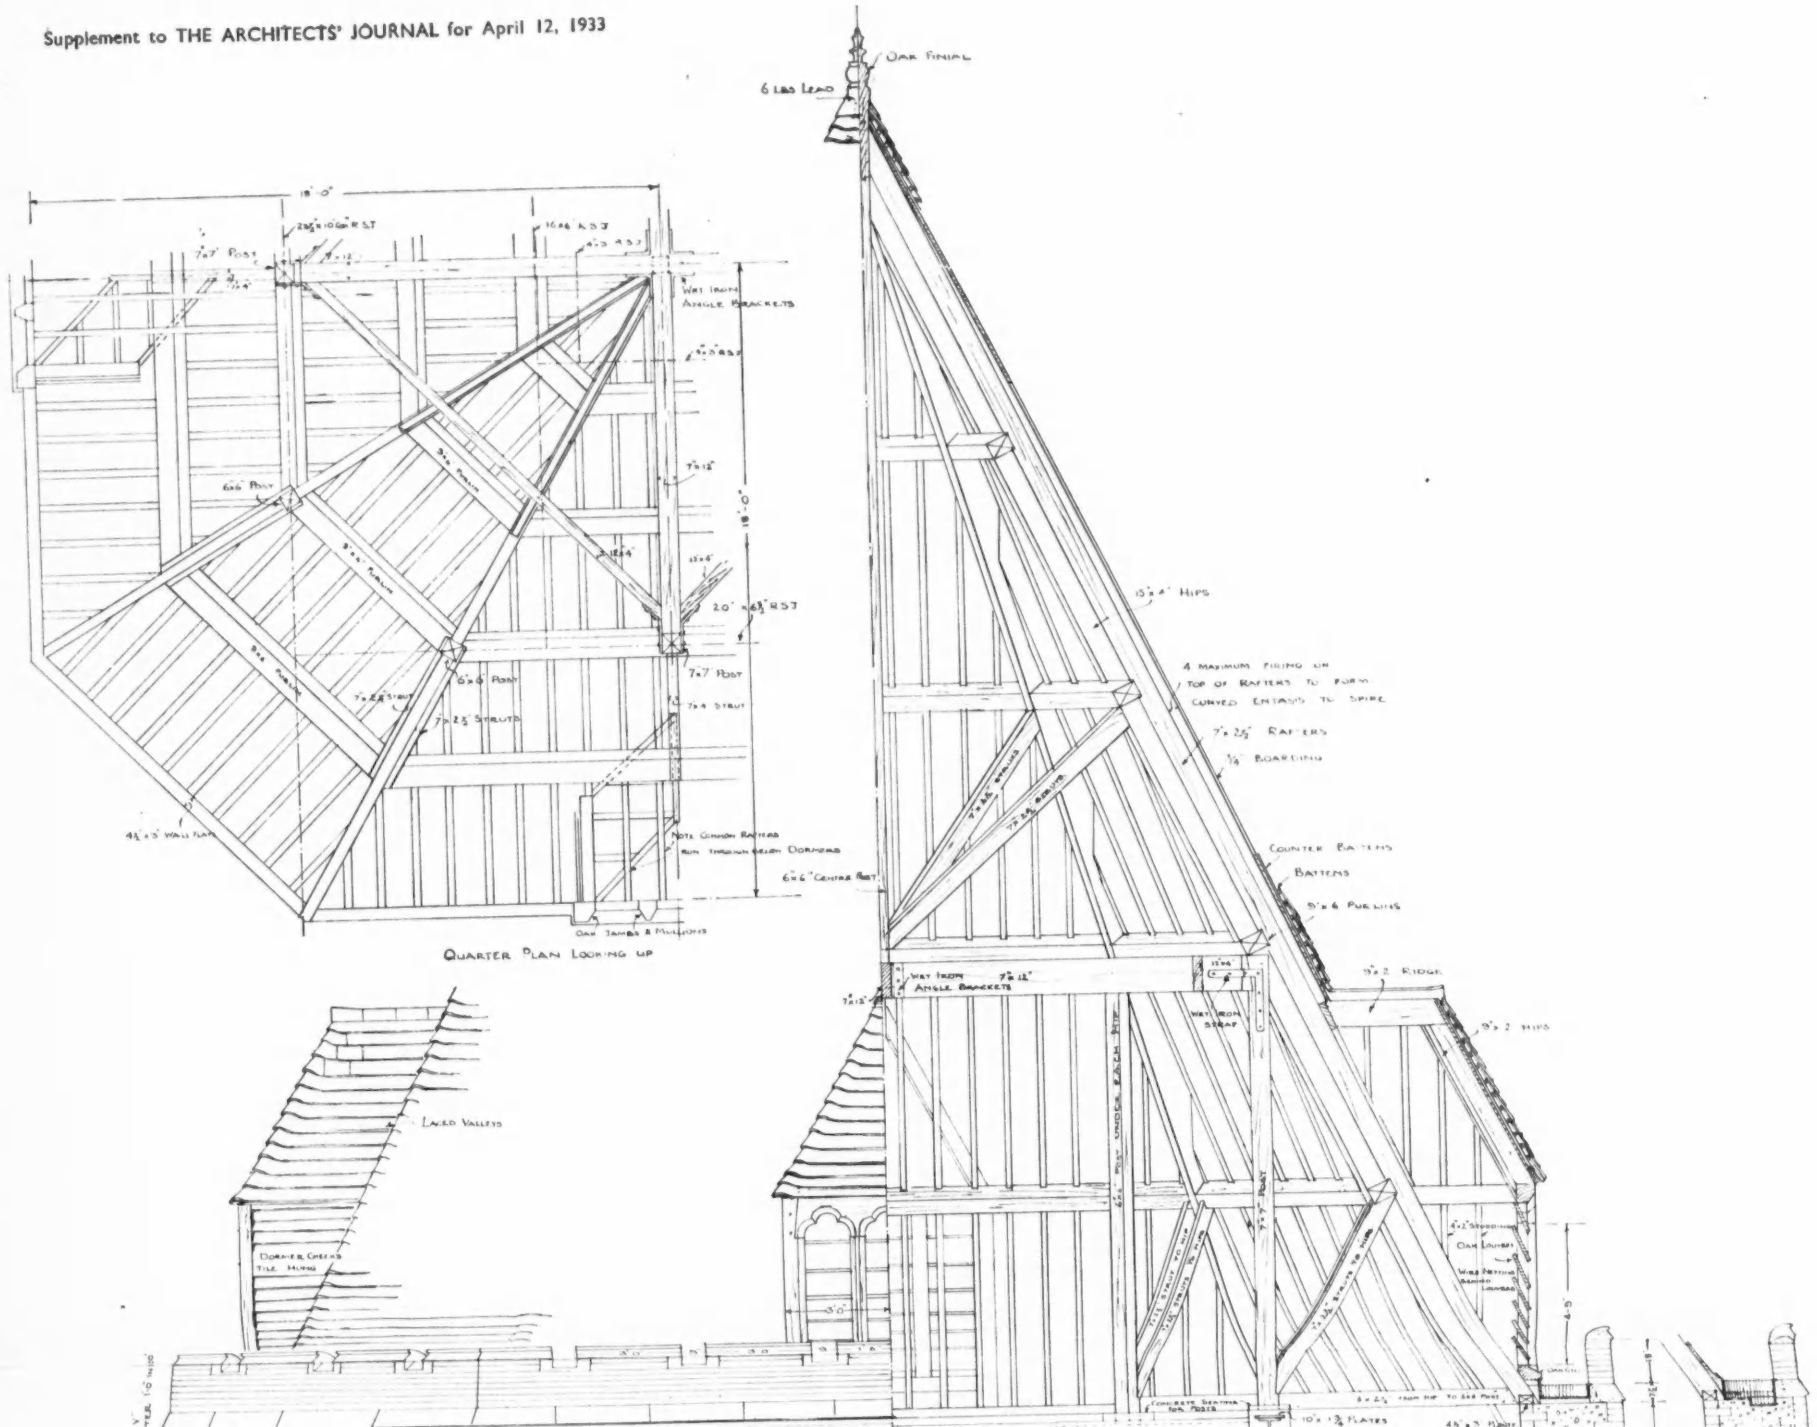
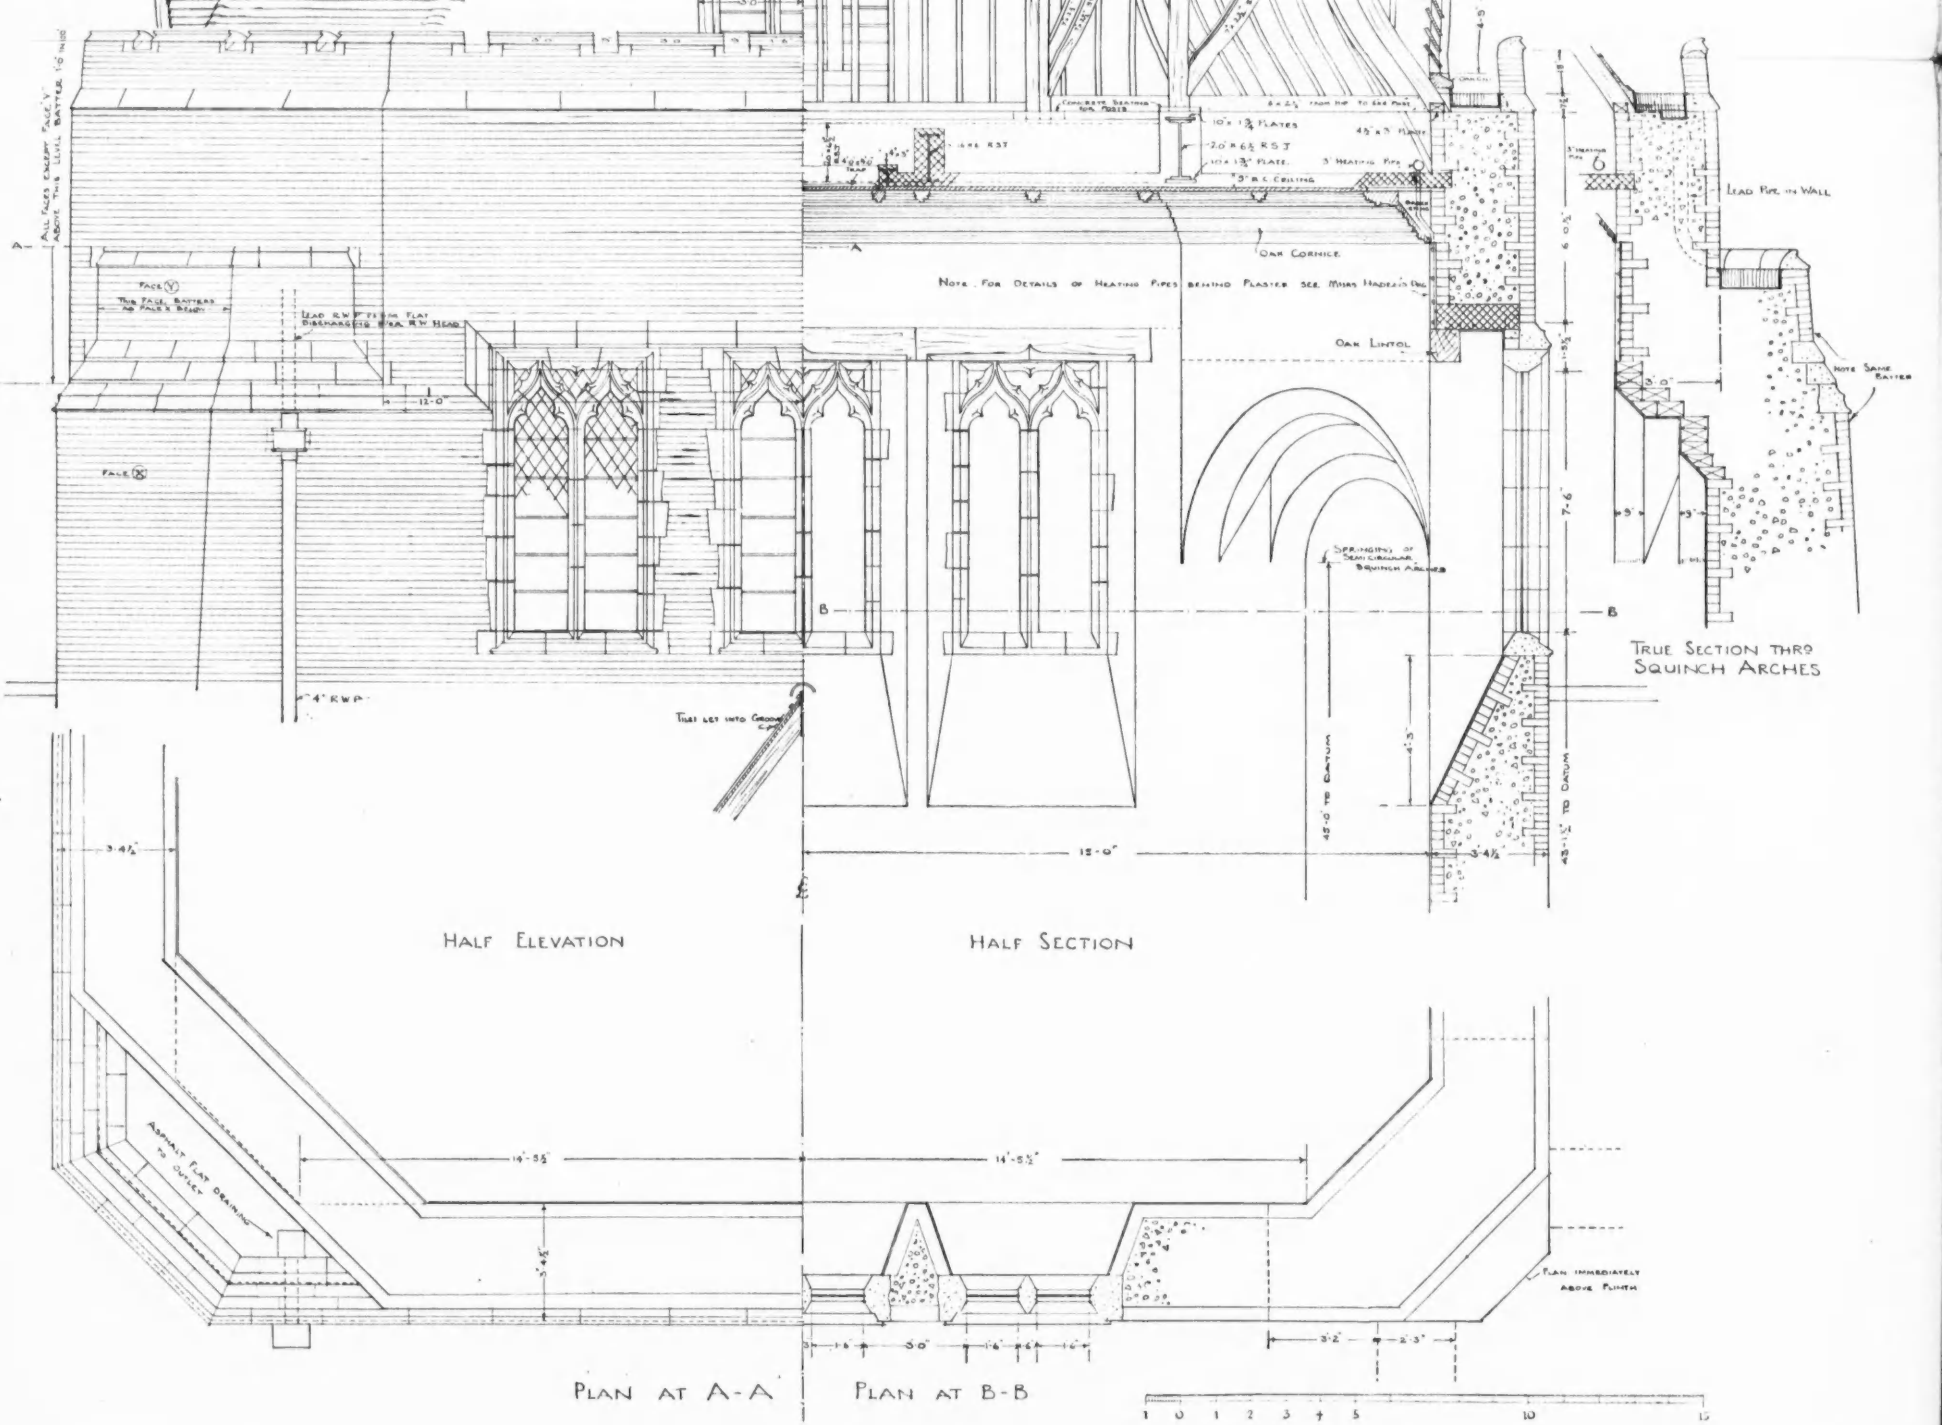
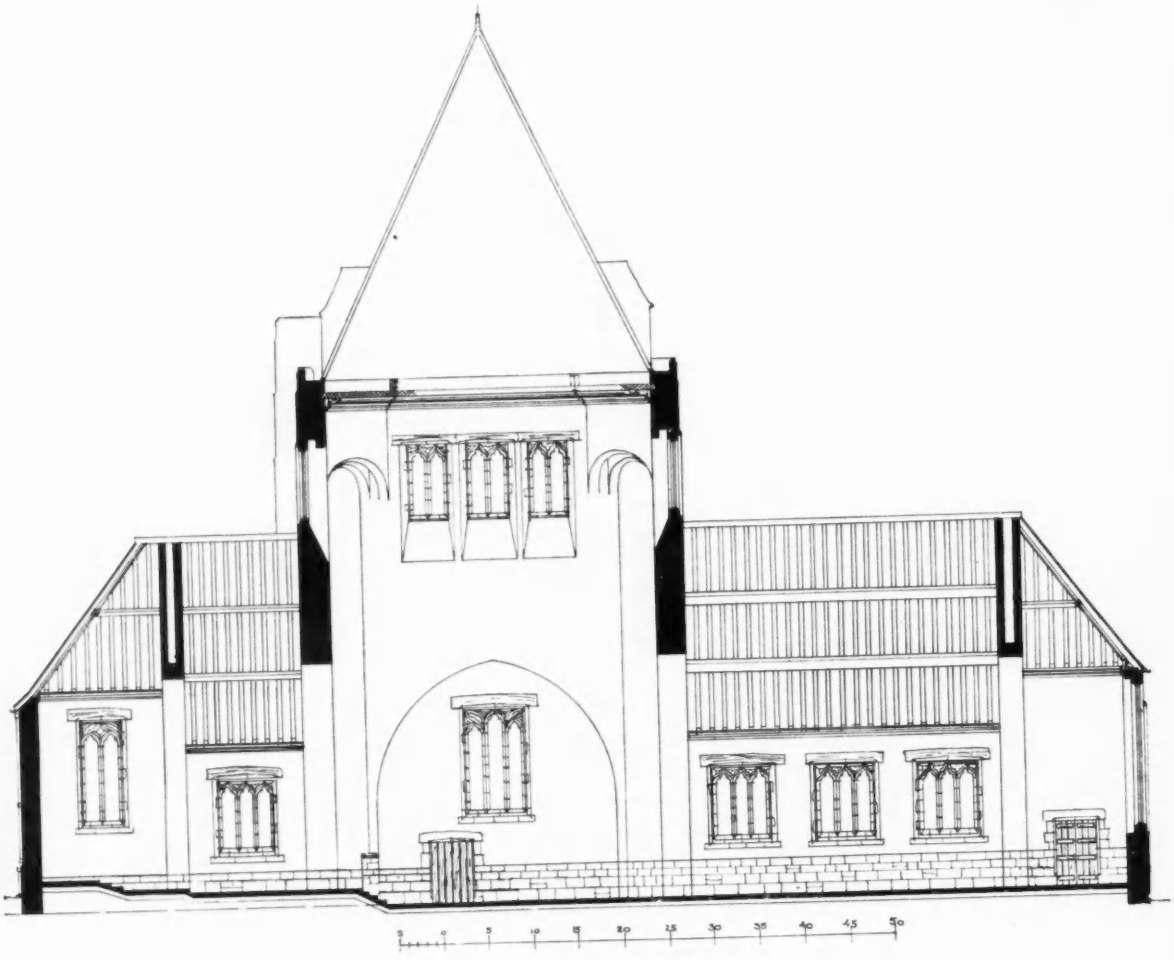
ST. ALBAN'S CHURCH, GOLDERS GREEN

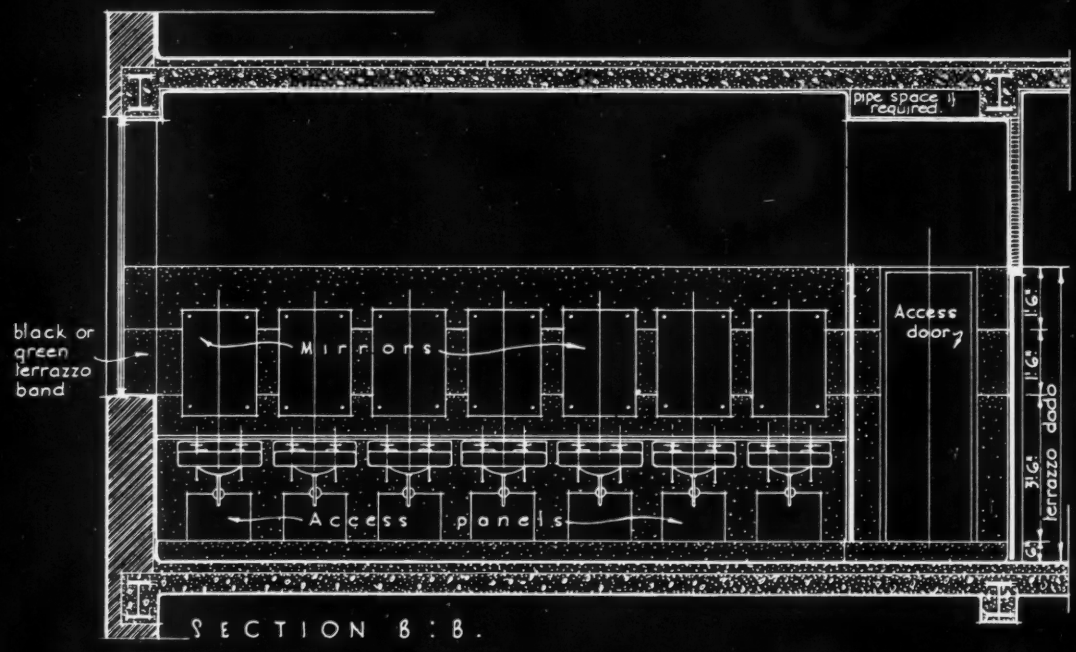


DESIGNED BY SIR GILES GILBERT SCOTT, R.A.

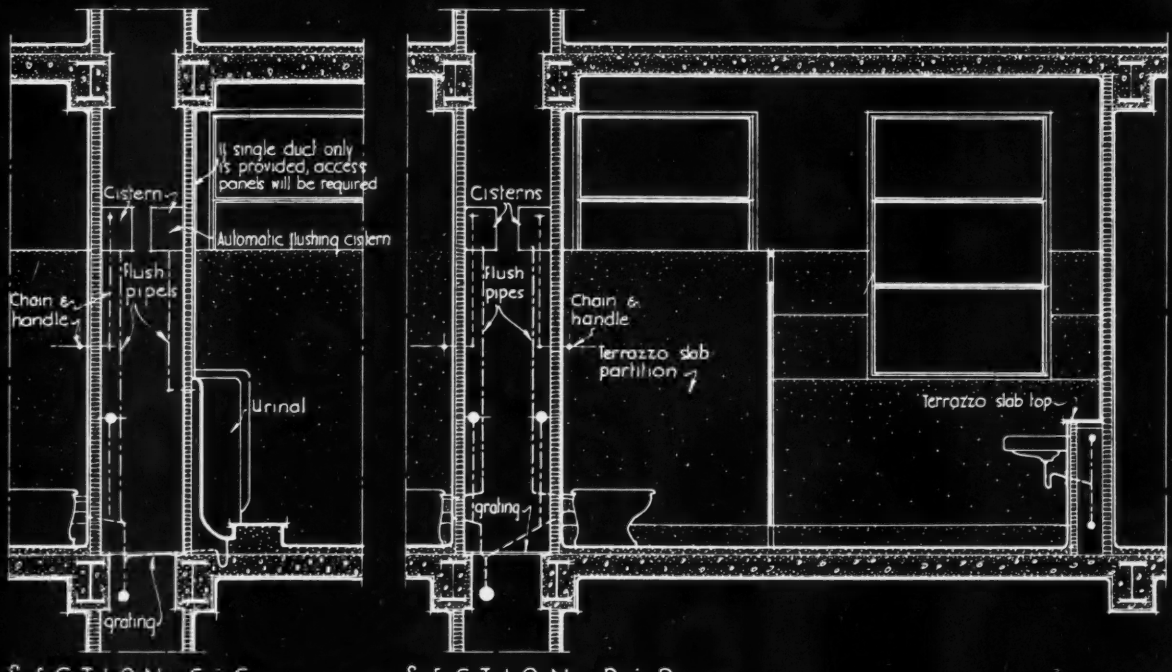




THE TOWER AND WESTERN PORCH



THE central tower of this cruciform church is unusually large on plan; the space beneath it is lit by high-level windows, clear of the roofs of nave, chancel and transepts. The large-scale drawing reproduced within shows constructional details of the upper portion of the tower; that of the section, on the last page, makes clear its relation to the whole structure.



Other illustrations and a description of the building are published on pages 489-491 of this issue. The total cost, including organ and fittings, is £24,000.

DETAILS OF STANDARD TYPE LAVATORIES

SIR JOHN BURNET, TAIT AND LORNE ARCHITECTS ONE MONTAGUE PLACE BEDFORD SQUARE LONDON W.C.1

INFORMATION SHEETS • 13 • LAVATORY UNITS

INFORMATION SHEETS

• 13 •

LAVATORY UNITS

•

LAST week's Information Sheet illustrated, in plan and section, a standard self-contained lavatory, combining the three essential types of fittings. This week's is a companion, giving three more sections of the same design. Sheets 1 and 5 should be referred to for subsidiary details.

The following is a complete list of the subjects previously issued :—

1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.
8. Mar. 8—Billiard Table Data.
9. Mar. 15—Roof Pitches and Drainage.
10. Mar. 22—Lift Sizes, etc.
11. Mar. 29—Sanitary Accommodation.
12. Apr. 5—Lavatory Units.

GUILDFORD CATHEDRAL

THE CROSS TO MARK THE SITE

TODAY, April 19, the Bishop of Guildford will unveil the huge wooden cross, shown above in course of erection, on the site of the proposed new Cathedral at Stag Hill, Guildford, for which Mr. Edward Maufe is the architect. The cross is 35 feet high and is constructed of teak from the old battleship "Ganges."

The design for the Cathedral, won in competition, was illustrated in our issue for July 27, 1932.

THE COTSWOLD TRADITION

Medford House, Mickleton, Gloucestershire, the home of the Medford family, was built in Campden stone to a design in which symmetry was the dominating influence. Certain additions in the classical style, made in 1699 or thereabouts by Samuel Medford, were carried out in brick without detriment to its character. And the principle was regarded even later—no doubt towards the middle of Queen Anne's reign, when powdered wigs became the mode—in forming the two lunettes to give light to powdering closets.

SIR HILTON YOUNG'S EASTER EGG

HAD Sir Hilton Young his tongue in his cheek when he authorized the issue last week of a Ministry of Health circular calling upon local authorities to put an end to the slum evil by 1938? The idea of a Five-Year Plan was borrowed from Russia, and as a method of camouflaging the retreat from the Wheatley subsidy, bellicose phrases about the coming offensive have political value. Following wireless speeches and newspaper articles, which have excited public emotion, the Ministry's circular has been "stunted" in the daily Press. Consequently some may actually anticipate that in five years' time our disgraceful slums will have been swept away.

It should be noted, however, that the official circular makes no attempt to define the word "slums," but suggests that they are a "strictly limited problem." The word can, of course, be used to cover a multitude of buildings. Sir George Duckworth, in the notable address which he gave to the Royal Institute of British Architects in 1926, defined a "slum" as "a street, court or alley which reflects the social conditions of a poor, thriftless, irregularly employed and rough class of inhabitants." If this definition is accepted, Sir Hilton Young hopes by his Five-Year Plan to abolish poverty, casual employment and thriftlessness. But a careful study of the Ministry's circular reveals that the officials are in fact aiming only at the demolition of the miserable dwellings, erected back to back, often below river level, without drains, and scandalously congested, at a time when manufacturers and landlords were inspired by an individualism run mad. The third and fourth generation of today are suffering for the sins and shortsightedness of their forefathers.

Still, anyone who has visited, for example, the basement dwellings of Kensington, the fetid courts in the Midlands, or the airless tenements of Glasgow, will wish "God-speed" to the National Government in their effort to stimulate local authorities to action. Conditions are now exceptionally favourable for a campaign to clear away the relics of the Industrial Revolution, and to provide new accommodation on 1933 standards for the dishoused tenants. The annual subsidy of £2 10s. per person re-housed, together with a grant from local rates, make up a substantial sum. If father, mother and three children are taken from a cellar dwelling and given a new home, the five in the family carry the equivalent of a subsidy from public funds of about 6s. a week. This should enable the rent to be reduced by 6s., so as to be within the means of an unskilled artisan.

All men and women of good will should therefore do their utmost to support their local authorities, if the councils are prepared to take action, and to prod them if they are inactive. Architects especially, who have influence, should point out that low costs, cheap money, big subsidies, and the immense need combine to make this the time for a push.

Granting the opportunity, the realist will nevertheless be a trifle suspicious of the rather bombastic language used by politicians. On a conservative estimate, the number of slum dwellings which are so worn out as to deserve instant demolition is 250,000. During the last 15 years such dwellings have been cleared at the rate of only 1,000 a year. The City of Leeds Improvements Committee, in a Majority Report, recently estimated that it would take 25 years to clear their local slums, while those members, including Labour representatives, who signed a Minority Report, estimated that the minimum period required would be 15 years. In view of these figures, how can Sir Hilton Young, the Minister of Health, imagine that it will be possible to sweep away in five years the derelict homes which cluster by the thousand in the poorer quarters of our industrial cities, especially in the depressed areas of South Wales and North-East England? His officials admit that a longer period will be required in London, and anyone with experience of the provinces knows that, with the best will in the world, the people in 250,000 houses, to the number of over 1,000,000, are unlikely at the present rate of progress to be transferred to new homes from old hovels by 1938, or for that matter by 1958.

A glaring defect of the circular is the absence of reference to the necessity of a plan. Without wise town planning, and the thought-out re-development of districts, piecemeal slum work will be of little avail. This is an important aspect of the whole slum problem, with which we hope to deal in this JOURNAL in the near future. For the present, while we welcome the Government's circular, we would state clearly that it is little more than a bright gesture. The country should not be deceived by words into thinking that this Easter egg will hatch out a noble fowl.

R. A. Duncan, A.R.I.B.A., author of "The Architecture of a New Era," referred to below, is partner in the firm of Percy Tubbs, Son & Duncan.

NOTES & TOPICS

DOGMA AND LIFE IN ARCHITECTURE

WHEN people are noted for holding and expressing advanced or uncommon views it is always interesting to hear from them the reason for their outlook, and the mental process (or accident) which started them off along that particular trail. In many cases the beginnings were so ethereal and indefinite that the individual himself has no clear realization of his own original stimulus.

*

I picked up, the other day, a copy of R. A. Duncan's new book, *The Architecture of a New Era*, but, as generally happens (as a judgment on me for borrowing instead of buying !) I could not read the book before it was reclaimed.

*

But I did read the Foreword, which Mr. Duncan has wisely supplied to "let us in" on his own reactions to modern life. He explains how his entire outlook was altered by having to teach ex-service students at the A.A. immediately after the War. He found that mere recitation of what had been dogmas did not impress men who had had an experience of life, stimulated by the upheaval through which they had passed. They must have reasons for everything.

*

In searching for reasons, Mr. Duncan had to revise or reject much of what he had previously held to be normality ; he had to take an entirely new view of architecture in order to reconcile it with modern conditions.

*

In other words, he formulated a new and metaphysical basic creed. Would that all our so-called "Modernists" could say the same of themselves ! That is what we chiefly lack in our contemporary design in all spheres.

THE HARM THAT ART SCHOOLS DO

A student who had just left a famous art school came to me for advice this week. She wanted to design furniture and/or textiles. She showed me drawings, in the pastel-nursery-rhyme-book style, of furniture designed with bland indifference to the human shape. A house had been casually assembled on paper to accommodate this furniture.

*

Nobody who had been taught to use his eyes with any critical judgment of the form of things could have committed this stuff.

*

But the art-sharp who had *trained* this student had given her strident testimonials to record his satisfaction with her work. (He occasionally exhibited in oils.)

*

Her textile designs indicated a stunted but promising inventiveness. It had never occurred to her that textiles had to be made by a machine. Nobody had ever hinted that the study of textile production might be instructive and stimulating. She had been carefully screened from horrid machinery.

*

That's art, that was !

*

Here was no exceptional case. I am often confronted in this way with the incapability of most art schools to train designers. Art to the English still means pictures, coloured photography, *all 'and done !*

*

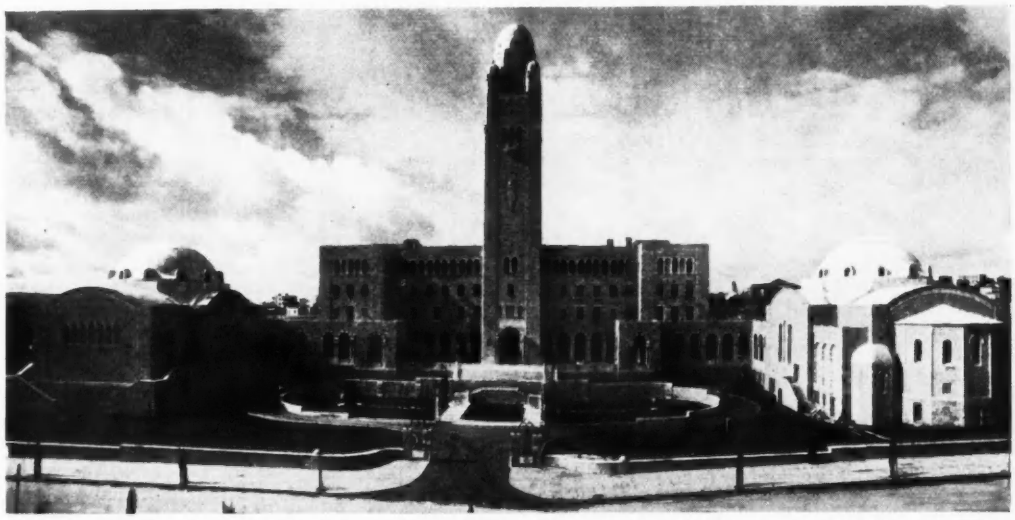
This view of art inspired a recent article in *The Children's Newspaper*, entitled "Poor Prospero." As good a bit of muddle-headedness about Mr. Eric Gill's group, Prospero and Ariel, on Broadcasting House, as ever I read. I could hear the tittering of a decayed gentlewoman running through every sentence.

*

But is the editor of *The Children's Newspaper*, by teaching the young idea how to shoot at what he can't understand, doing more or less harm than art masters who teach the young idea how to highfalute and call it "training in design" ?

*

The provider of juvenile art-fodder said that Mr. Gill's work is "poor sort of humour in stone." What he wants is something light and fairy-like. I suggest that Sir John Reith orders wings and spangles for Ariel. Trousers, too, Mr. G. G. Mitcheson, M.P., would doubtless add.



*

ALL GOD'S CHILLUN IN TROUBLE

Wings can be troublesome things, especially when affixed to angels. I heard that an ecclesiastical committee was floored the other day when they criticized the avian proportions of some angelic adornments for a church. The designer told them that they were "insulting the kingdom of eternal values !"

*

The laboratory view of the comparative anatomy of angels was given some years ago by Professor J. B. S. Haldane in *Possible Worlds*. He said : "An angel whose

To mark the Easter formal opening by Lord Allenby of the new Y.M.C.A. building in Julian's Way, Jerusalem, the carillon of thirty-six bells, cast at Croydon for the 160-foot belfry tower, was brought into use. The building, which has been carried out in limestone at a cost of £400,000, is the gift of American benefactors, and is intended to serve as a centre for students in, and visitors to, the Holy Land. It has been stated that it was the intention of the creator, Dr. Harte, to symbolize the position of Jerusalem as the focus of three faiths—Christian, Judaic and Islamic; hence the combination of architectural styles. On the second floor are classrooms; the two floors above are a hostel. In one wing is a music-room, in the other a gymnasium, with, below it, a swimming pool.

muscles developed no more power, weight for weight than those of an eagle or a pigeon would require a breast projecting for about four feet to house the muscles engaged in working its wings, while, to economise weight, its legs would have to be reduced to mere stilts."

*

I would like to make it compulsory for every student of architecture to read two of the essays in that book. First, *On Being the Right Size*, from which I have just quoted, and secondly, *On Scales*. They would help to make the mind flexible for dealing with concrete problems.

*

Tuesday, April 25

LONDON SOCIETY. Visit to South Africa House, Trafalgar Square, S.W. 3 *p.m.*

WHAT A NOISE!

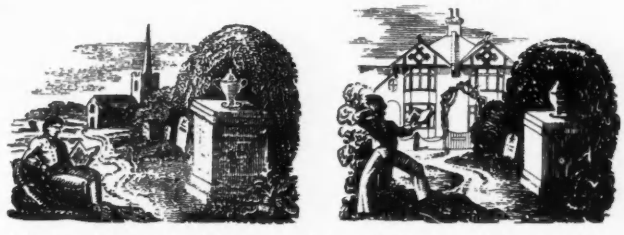
I was sitting on a wall talking to a barrister. He was in plain clothes.

*

"Do you know," he said, "that out of the enormous population of these islands a mere handful, a paltry 6,000, are architects? But the noise they make! Do you realize what a noise you make—relatively speaking?

*

"Why do you make a noise? Have architects always made a noise? Or is something wrong? I would like to know.



*

"I mean, you know, 6,000 to how many millions is it?

*

"I say, it really is very creditable of you to get your word in."

ASTRAGAL

The reverie turned nightmare. A moral phantasy from a reader who pictures a horrific change in the elegiac scene of the tailpiece to our correspondence pages, unless we find an answer—and quickly—to the question, "What is to be done about this?" that we persist in asking. We ask it again on page 529 of this issue, and shall continue to do so.

A LONDON CLUB FOR SALE

The Junior Athenæum Club, one of the most unusual buildings in London, is offered for sale. It was designed in 1849 by a distinguished architect from Paris, M. Dusillon. The building owner insisted that all the workmanship should be French, and in the fashion of the day. The inlays of coloured and polished stone were at that time an absolute novelty in London street architecture.

Recent contributors to the subscription list of the Special Committee for Public Relations of the Building Industries National Council are as follows:

Mosaic & Terrazzo Co., Ltd., £2/2/0; Venesta, Ltd., £10/10/0; Manchester Brick Mfrs. Association, Ltd., £105/0/0; Nottingham and District Brick Mfrs. Association, £25/0/0; Frederick Braby & Co., Ltd., £5/5/0; Henry Williamson & Co., Ltd., £10/0/0; Greystone Lime Sales, Ltd., £25/0/0.

Subscriptions to the fund should be addressed to Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

THE SMOKE PROBLEM

A meeting of local authorities in the Merseyside and South West Lancashire district, held at Liverpool last week, decided to form a regional Advisory Committee for this area to deal with the smoke problem.

It is hoped that as a result of a memorandum addressed by the Society to 130 local authorities, similar committees will be set up for Tyneside, Teesside, North-East Lancashire and the Potteries.

PORTSMOUTH CATHEDRAL EXTENSIONS

Portsmouth Cathedral is to be extended at once. This is in accordance with the wishes of two anonymous donors, who have given £9,000, so that the plans prepared by Sir Charles Nicholson may be proceeded with without delay. The additional land required has already been bought. Sir Charles's plans are to be submitted at once to the Central Council of the Church Assembly for the Care of Churches. It is estimated that the cost of the building will be in the neighbourhood of £70,000.

PROFESSOR REILLY ON SLUMS

Professor C. H. Reilly, F.R.I.B.A., at the annual meeting of Liverpool Improved Houses, Ltd., said he liked some of the older slums of Liverpool and Manchester architecturally.

With whitewashing machines the fronts of the houses could be treated, and the doors and the windows should be painted in brilliant colours. Clipped myrtle trees could be brought back, and if the cobbles were cemented over they would be better for playing and dancing. The slum would then be a comfortable place in which to live.

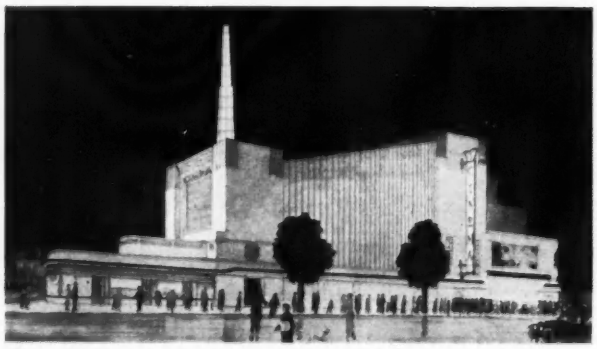
IRISH ARCHITECT'S TOUR

Mr. Vincent Kelly, architect, who is a member of the Committee of Reference set up to advise the Irish Minister for Justice on the allocation of the moneys for voluntary hospitals from the sweeps, has returned to Dublin after a six weeks' tour of Continental hospitals.

In his tour Mr. Kelly visited 52 hospitals in France, Switzerland, Czechoslovakia, Germany and Holland, and concentrated on hospitals which had been built within the last two years.

Mr. Kelly is to deliver a lecture on the subject to the R.I.B.A.

MECHANICAL ENGINEERS



The Institution of Mechanical Engineers is to hold its annual summer meeting this year in Edinburgh during the week beginning May 29.

A GLASS CONVENTION

The British glass industry is holding its Third Convention at Buxton from May 18 to 20. Sir Max Bonn, K.B.E., will preside and there will be addresses and discussions by well-known authorities on such questions as co-operation in industry, hours of work, recent technical developments in the glass industry, education and research.

A brochure giving full details of the programme in preparation and can be obtained very shortly from the Honorary Secretary of the Convention, Mr. Geoffrey Marchand, M.A., Director of

A CAMERA - CINEMA

This cinema has been designed on functional lines in concrete. The effect externally is rather that of a camera; the corrugations, corresponding to the bellows, are required internally for acoustical effect. The architects are Forbes and Tate, associated with Torben Laub.

the Glass Manufacturers' Federation, Norwich House, 13, Southampton Street, High Holborn, London, W.C.1.

WILTON HOUSE LOAN EXHIBITION

At Wilton House, near Salisbury, for four centuries the residence of successive Earls of Pembroke and Montgomery, there will be staged from June 26 to July 1 a loan Exhibition of Historical Treasures from the Counties of Berks., Bucks., Oxon., Dorset, Hants., the Isle of Wight and Wiltshire.

The State Rooms will be on view throughout the week of the Exhibition, so that visitors may enjoy the famous collection of antiques and pictures.

EXHIBITION HALL FOR SALFORD

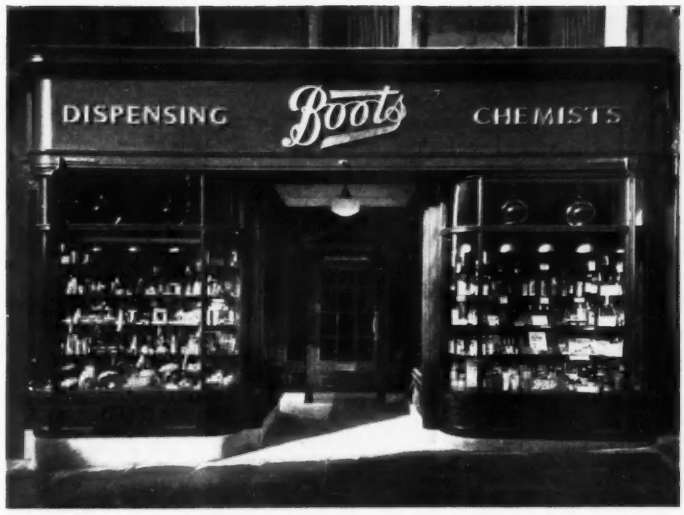
Plans for a large exhibition hall on Salford cattle market site, similar to the London Olympia, will shortly be submitted to the Salford City Council.

ROYAL SANITARY INSTITUTE

The preliminary programme of the 44th Congress of the Royal Sanitary Institute, to be held at Blackpool from June 17 to 24, has just been issued. The officers for the architecture, town planning and engineering section, the meeting of which is arranged for Friday, June 23, in the Winter Gardens, at 10 a.m., are as follows: President: L. P. Abercrombie, M.A., F.R.I.B.A. Recording Secretary: Mr. Percival T. Harrison, M.INST.C.E., Engineer and Surveyor, Finchley U.D.C. Local Secretaries: Messrs. Halstead Best, F.R.I.B.A., F S.I., 20, Clifton Street, Blackpool; and J. C. Robinson, F.R.I.B.A., Borough Surveyor's Office, Blackpool.

INTERNATIONAL BUILDING CONGRESS

The International Congress of Building Societies will meet in London from June 5 to June 9.



Sir Enoch Hill, Chairman of the Council of the National Association of Building Societies, will be the President of the Congress.

The British Government will give a reception to the delegates at Lancaster House on Wednesday, June 7, and on the following evening there will be a reception and dinner at Guildhall.

CHANGE OF ADDRESS

Messrs. Tecton, Architects (A. M. Chitty, L. A. Drake, M. A. S. Dugdale, V. Harding, B. Lubetkin, G. H. Samuel and F. Skinner) have removed to new offices at 57 Haymarket, S.W.1. Telephone No.: Whitehall 5757.

SHOPFRONT IN BATH

A shopfront just completed in Milsom Street, Bath, from the designs of Percy Bartlett, in which the endeavour has been to preserve something of the eighteenth-century feeling for which this street is noted. The front is carried out in medium-polished teak on a Bath stone plinth with bronze vent grates, and a York stone entrance floor.

STEELWORK CONTRACT

Messrs. Dorman Long and Co., Ltd., of Middlesbrough, have secured the contract for the structural steelwork required for the first section of the extensions to the Fulham Generating Station. The contract price is £383,616. Messrs. Dorman Long have agreed to carry out the work within a period of 39 weeks from the date of the Engineer's order to commence the works. The times required by the various tenderers ranged from 24 weeks (also by Messrs. Dorman Long and Co., Ltd., at an extra cost of £23,525) to 208 weeks; whilst the highest tender was for £557,808 5s. for 169 weeks.

THE BATTLEFIELD OF WATERLOO

Sir William Davison, in the House of Commons last week, asked the Secretary of State for Foreign Affairs if he would state what representations had been made to the Belgian government for the continued preservation of the battlefield of Waterloo and the historical buildings thereon, such as the farm of Mont Saint Jean, the farm of La Belle Alliance, Hougoumont, etc., for which a contribution was made by this country in 1914 towards compensation of the owners of the land.

Mr. Eden, the Under Secretary, said that no contribution had been made out of public funds from this country towards compensation of the owners of land on the battlefield of Waterloo, and no representations had been made to the Belgian Government.

Sir W. Davison asked if his hon. friend was aware that contributions were made from this country, even if not from public funds, and as this was a matter in which this country was very much interested, did he not think it desirable, at any rate, to communicate with our Ambassador regarding the proposals which had been mooted in Belgium for building on the field of Waterloo.

Mr. Eden said if Sir W. Davison had any information on this question he would certainly consider it.

R. I. B. A.

THE NEXT MEETING

On Monday next, April 24, papers on "Competitions—Past and Present," will be read at the Institute by Messrs. H. V. Lanchester, F.R.I.B.A., and Percy E. Thomas, F.R.I.B.A. The meeting will begin at 8 p.m.

LONDON OF THE FUTURE

In a lantern lecture at the R.I.B.A., on Wednesday last, on "What London Might Be," Mr. Knapp-Fisher, F.R.I.B.A, pointed out the need for immediate action if London is to be saved before it becomes completely spoiled by

rapacious get-rich-quick merchants, and its "ever-spreading rash of noxious buildings." Further extracts from the paper are printed below:

A brief historical survey showed that even in Queen Elizabeth's day attempts were made to stop the too rapid growth of London by making it illegal to build within three miles of the city. Cromwell increased this distance to ten miles, but nevertheless the city still continued to grow in a haphazard fashion, as the town planning schemes of Wren and Evelyn, etc., were unfortunately never carried out. The eighteenth century, which has left us its heritage of well-ordered squares and charming and neighbourly houses, has given us the most comprehensive scheme for planning London up to the present, and now, after the chaos and squalor left by the Industrial Revolution, is the time to plan once more.

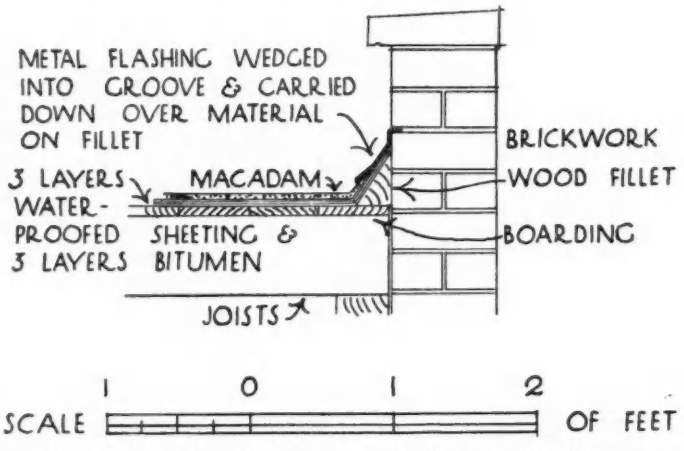
In our eagerness to plan we must not forget London's essential individuality and character, a London on stereotyped lines, dressed in a strait jacket, or ready-made clothes, is not the London at any rate of my desire, or a London which could, I think, continue to dwell in our affections; no! the spirit of London must be retained.

Let us catalogue the improvements we can fight for: A London without Smoke. Less noise (far less noise). Fewer disfiguring advertisements. No slums. Better all round planning, and better buildings. More intelligent lighting. No disfiguring petrol stations.

Again, let us take one or two specific problems. Cannot we put under ground and electrify all routes into the city to Holborn, St. Paul's, Cannon Street, etc., indeed, all railways within a certain radius, and cannot we build over some of the 40 miles of railway tracks and 350 acres of sunken land, that there are in London, utilizing the space for buildings, parkways and open spaces, as is done in parts of New York?

Can we not hope for better traffic facilities, with over- and underground routes for the main traffic arteries, separating these arteries from what we might call traffic veins?

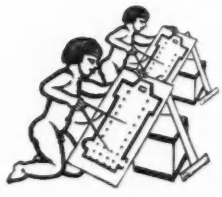
What are we going to do with our squares—the squares of Mayfair and Belgravia, of Bloomsbury, and the West, those that are left to us? I am sure the only possible answer can be that, whether these squares are rebuilt within the next few years or converted for some purpose, they *must* be dealt with as a whole and not in piecemeal fashion—the sort of haphazard building which looks for all the world like the mouth of some semi-toothless hag—and yet the unity and restfulness of a large number of these squares have already been irrevocably destroyed, I consider, to our lasting shame. Oh! the urgency of a plan. Will London buildings be allowed to go higher? Picture what London might be with another 50 ft. on to its buildings; 80 ft. was the limit a short time ago, now 100 ft.—what next? Again, wanted, a plan with areas as to heights properly scheduled.



What of the south of the river? Here is open to us a wonderful opportunity when the time comes, which is of vital national and civic concern; great new buildings on what is known as the Lion brewery site; with a river frontage with a thought for the mystery that such a winding frontage presents, and a care for grass and trees, and no dirty steam trains.

And what of the construction of our buildings? I should be sorry to see no buildings built for posterity, and I think it might be possible in our plan to arrange for certain buildings to be of a more permanent kind, but most to be definitely restricted as to lease and life. Only in this way would we gradually get a synchronization of the many factors which are essential to any comprehensive plan.

On what lines shall we develop air travel? The position and design of airports must be carefully watched and controlled; there is no reason, with proper foresight, why we shouldn't lead the world in this respect. Then we must take advantage of the Grid system of electrical power, which will provide the means for a better distribution and decentralization of industry than is possible with coal.



I believe that we should hold on like grim death to *all* our remaining open spaces near London, and that, in spite of ever-quickening services to and from the metropolis, we should preserve what country is left near in for farms, horticulture and recreation.

THE WHITE HOUSE, C

Details of the coping shown in the drawing on the facing page.

COMPETITION NEWS

SURBITON HOSPITAL

Conditions for the competition for the proposed new hospital buildings to be erected at Hill Manor, Ewell Road, Surbiton, have now been drawn up by the assessor, Mr. C. Ernest Elcock, F.R.I.B.A.

THE BUILDING CENTRE

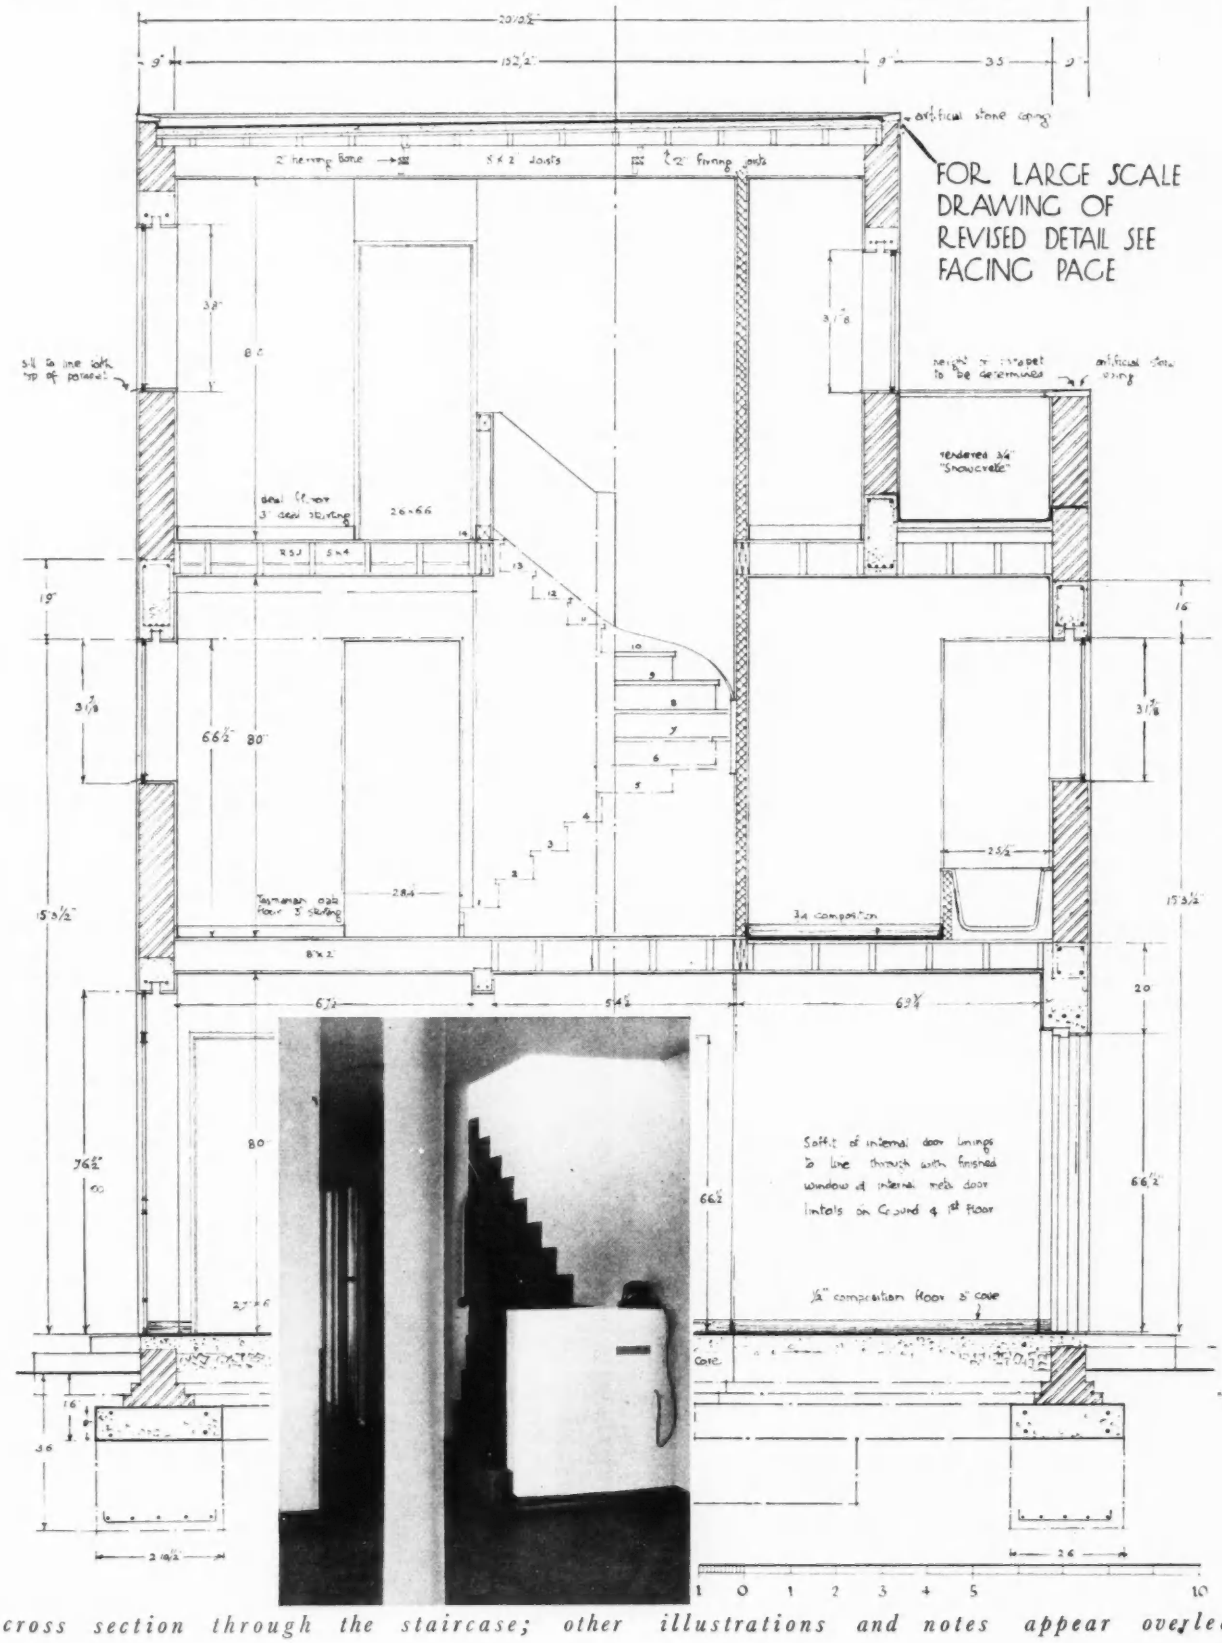
It is understood that the result of the competition for cottages to be erected at an economic rent, organized by the Building Centre, will be announced next week. We also understand that the Building Centre is arranging to erect a pair of sample cottages from the winning design of the above competition on a site in the West End.

ROYAL SOCIETY OF ARTS

By permission of the Board of Governors of the Imperial Institute, the public exhibition of works sent in for this year's open competition of industrial designs, organized by the Royal Society of Arts, will be held in the Exhibition Pavilion of the Imperial Institute, South Kensington, London, S.W. Full particulars of the scholarships and prizes offered by the Society and other bodies can be obtained from the Secretary of the Royal Society of Arts, John Street, Adelphi, London, W.C.2. They include designs for architectural decoration, a cinema vestibule, shopfronts, exhibition stands, inn signs, glass screens, memorials, etc.

Applications for entry forms, labels and instructions must be sent to the Secretary of the Society between May 1 and May 8, the last day for receiving entries being May 20. Designs entered for the competition will be received at the Imperial College of Science and Technology, Imperial Institute Road, South Kensington, London, S.W., between June 7 and June 9. In the case of distant overseas competitors, entry forms, fees and designs will be received up to July 1. After the judging, which takes place in July, the prize and accepted designs will be exhibited to the public in the Exhibition Pavilion at the Imperial Institute from August 5 to August 31 (Sundays included).

Competitions Open

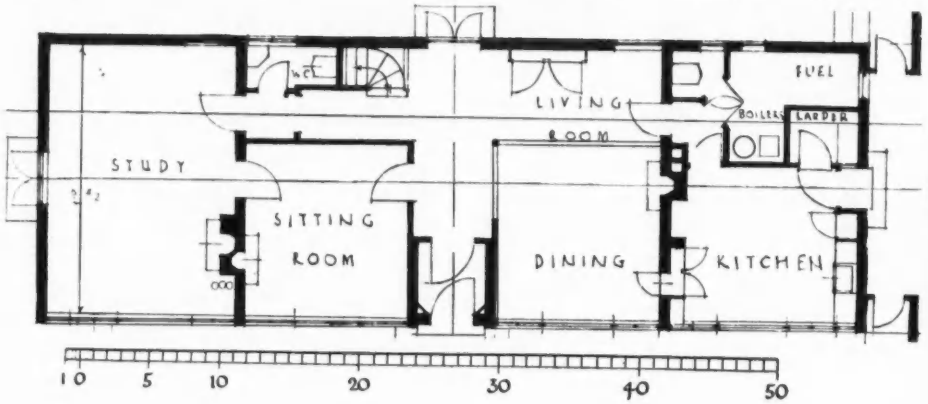


May 8. — Proposed Burgh Chambers, Municipal Offices and Public Baths for the Town Council of the Burgh of Prestwick. Premiums: £200, £100 and £50. Designs to be submitted to the Town Clerk not later than 12 noon on May 8. The period for applications for conditions, etc., has now closed. Full particulars were published in *A.J.* for March 15.

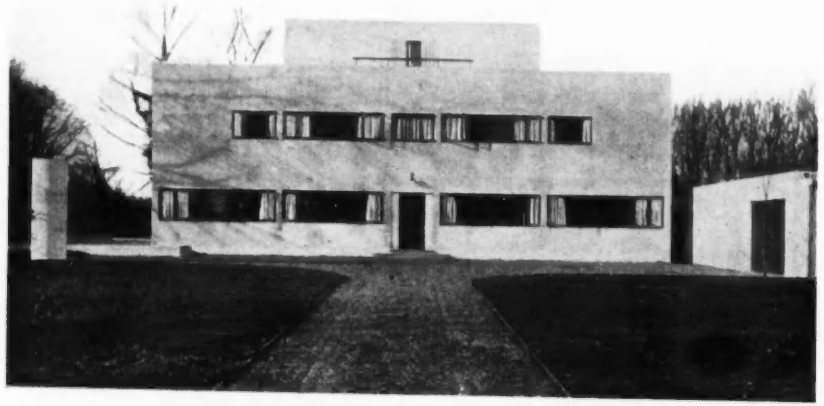
May 31.—Sending-in Day. Layout of a suburb on the river Escaut, Antwerp. £2,400 in prizes (1st, £800). Conditions, etc., were published in *A.J.* for December 7, 1932.

ON THE AIR

On Tuesday next, April 25, the second of the series of talks on "Design in Modern Life" will be broadcast in the National Programme at 8.30 p.m. The subject, "Clothes," will be discussed by Messrs. James Laver and Edward Halliday.



CAMBRIDGE : BY GEORGE CHECKLEY

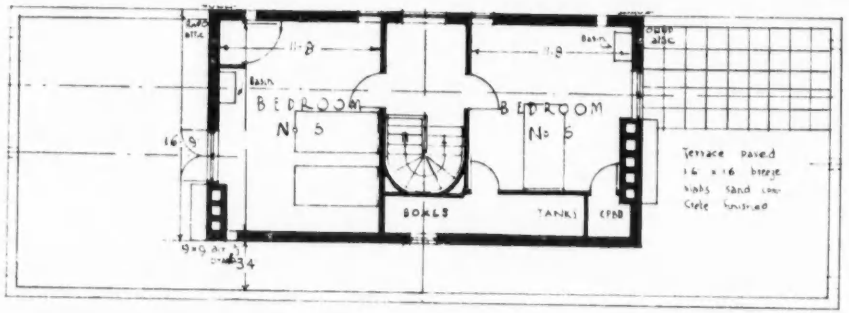


A cross section through the staircase; other illustrations and notes appear overleaf.

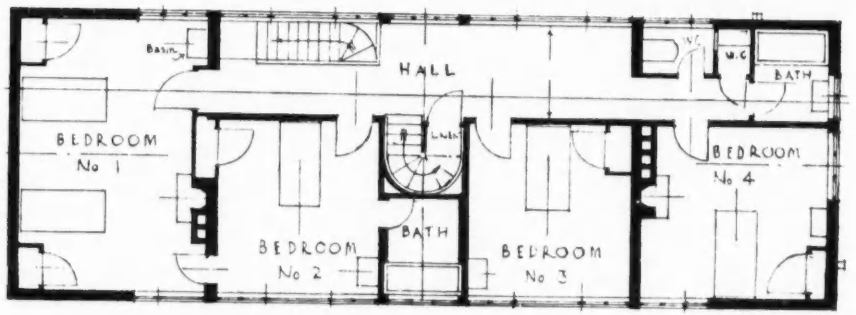
TWO HOUSES AT CAMBRIDGE : DESIGNED BY GEORGE CHECKLEY

NO. 1: THE WHITE HOUSE, CONDUIT HEAD ROAD

More general construction in reinforced concrete would have been preferred, but, on account of cost, the reinforced work was confined mainly to the framing of the elevations. The spans are rather large to be strictly economical, but where all the rooms are small the best practical arrangement was to span from wall to wall. For the first house, where feasible, the use of blue brick piers instead of the reinforced columns was considered, but as the saving was comparatively small and the structure not quite as reliable, the idea was abandoned. For the foundations the ground was very bad in both cases, and a raft would normally have been used.



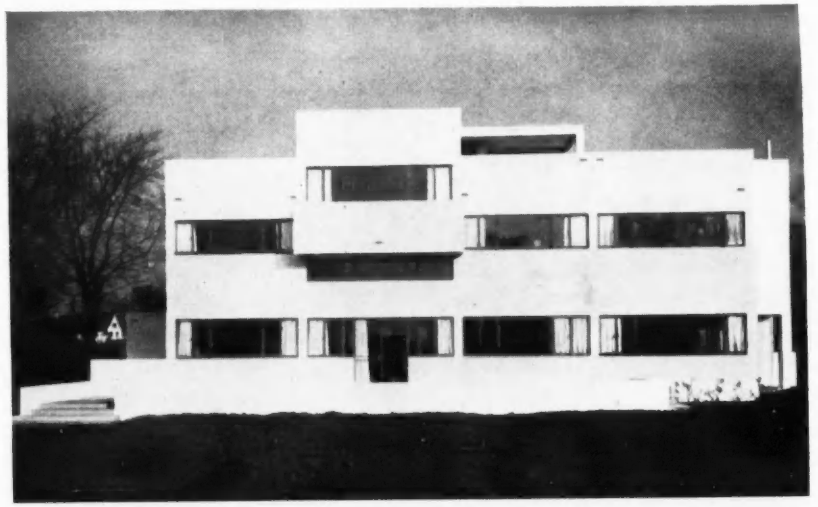
One of the supplements with this issue gives details of the skeleton of No. 2. Nine-inch brick infilling for the frames is employed to agree with reveals in the ordinary unframed walls and to comply with local building requirements.

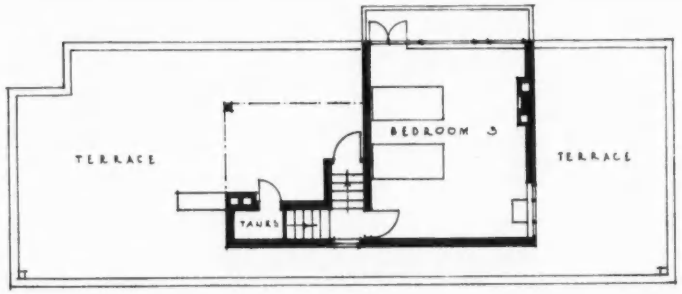


Reinforced concrete first floors and roof flats were originally intended, but were ruled out again on account of cost. Roofs are of 8 ins. by 2 ins. joists, with cross firring joists 2 ins. by 2 ins. to 2 ins. by 5 ins. to falls, boarded and covered with three layers of bituminous felt and half an inch of tarmac. The cross joists give good ventilation, adequate insulation and space for services. The terraces on the first house are as above, but with 1½ in. breeze concrete slabs, brought up in Portland and sand, cast in situ, in place of macadam; the upper roof, not being used as a terrace, is without breeze slabs.

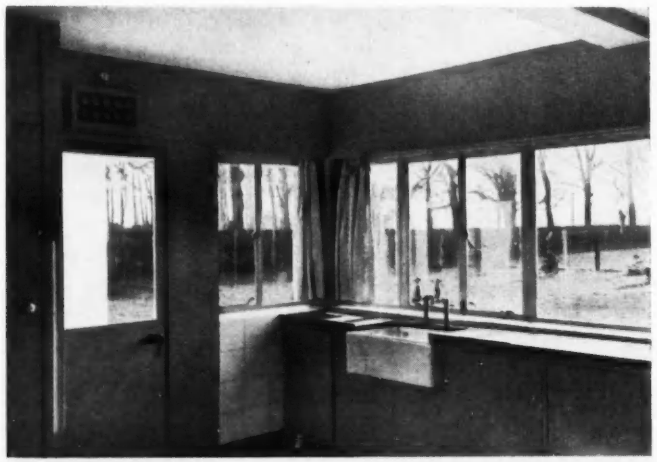
For the windows, ordinary standard metal casements were used, with glazing bars and, in the case of the big panes, mullions, omitted, effecting a saving of about £75 in each house. The metal doors are purpose-made; also the vertical windows on the entrance front of house No. 2.

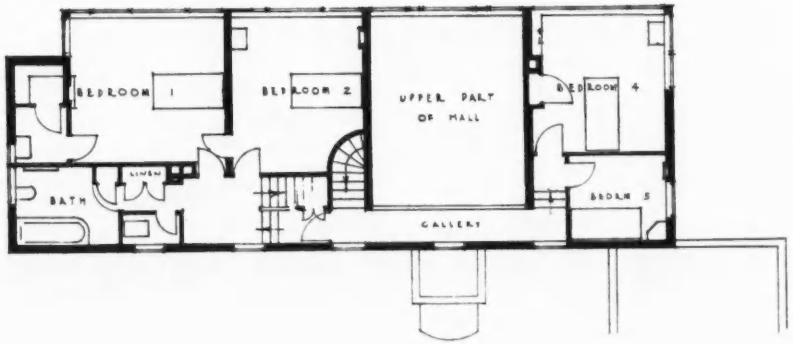
The cost of the houses was, respectively, £2,400 and £2,500; and in the latter case the figure for the oil-burning heating and hot water installation was £300.



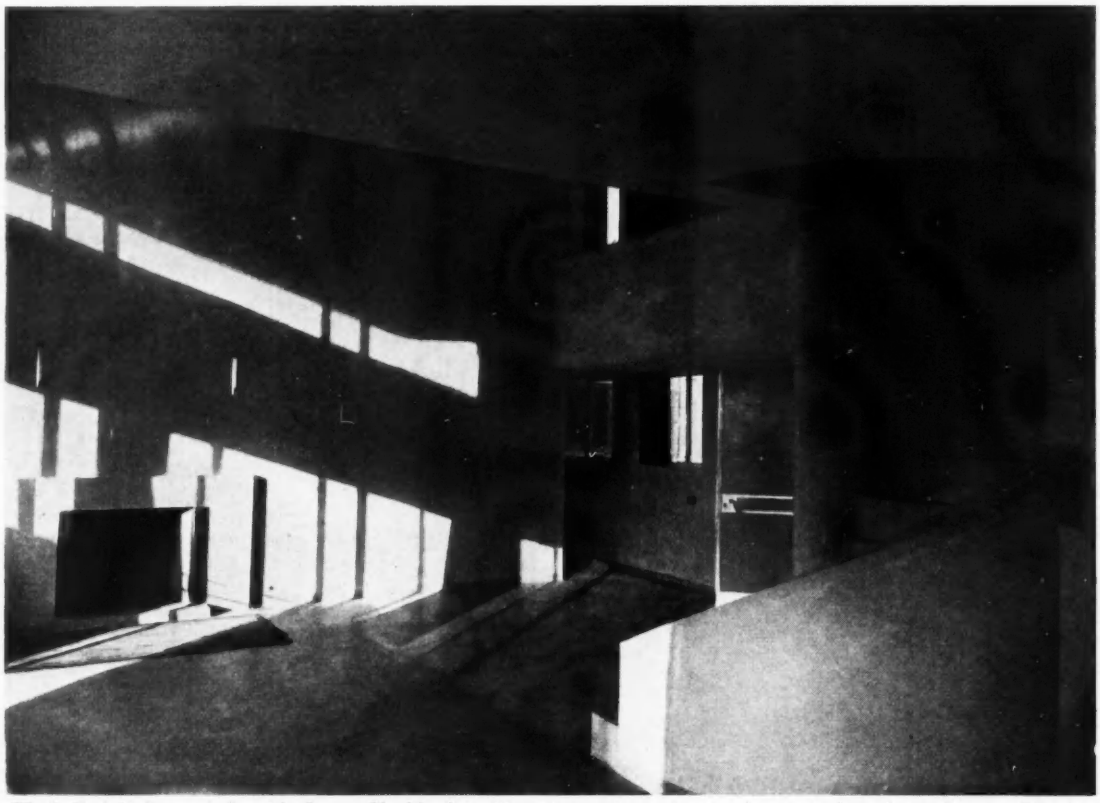


NO. 2: THURSO HOUSE, CONDUIT HEAD ROAD





NO. 2: THURSO HOUSE, CONDUIT HEAD ROAD



THURSO HOUSE, CAMBRIDGE

The hall of this house, designed by George Checkley (also illustrated on the previous page) extends through two floors. The above photograph is taken looking towards the front door, and shows the gallery, overlooking the hall, that spans it at first-floor level.

LETTERS FROM READERS

P. QUENTIN SMARTERLY (Jnr.)
A LAYMAN
J. H.
A. H. OUGH
Past President, Devon and Cornwall Architectural Society

The Speculative Architect

SIR,—I have come to the conclusion that if there is to be an improvement in speculative building work, the architect may have to forgo many personal ideas about etiquette in the old sense of the word. He need lose no dignity in designing buildings to sell, but he must, of course, have absolute control. He must forgo many preconceived ideas of quality in materials and workmanship for houses which are to be sold *really cheaply*.

Capital is easy to obtain ; the question is the method of procedure. The architect may (1) employ labour, buy materials and see the whole thing through, or (2) do the designing, and employ a builder ; thereby having less responsibility but netting less profit. (Smarterly's method.)

It seems to me that the biggest chances are around the big cities, where there are many more people of all classes, or of one class, to draw from. There are, I think, the following people who need a different type of house :—

(*a*) The artisan, clerks, "respectable people," lower middle class.

(*b*) Professional newly-married people, who are making a start, but have little money.

(*c*) Retired people of all grades, from grocers to colonels.

The tastes of these people vary, but in some cases overlap. Your retired colonel, doctor, etc., or even widows of gentry, would not buy a house which says "retired grocer" or "quite successful commercial traveller," but would buy a house that is quiet and seemly, *although it may have exactly the same area as the grocer's house.*

I happen to know of cases of this sort, and there is no doubt that the English social system has great force in matters of this kind. I have asked people why they settled in the unpleasant speculative house, and they say always : "There was nothing else to be found of the size we could afford."

If I were going in for building houses I would try to make it economically possible to put a refrigerator in the kitchen, gas to every fire-place, and to paint the bathroom walls. In matters like that there would be a pull over the other fellow. But I know I should not have to be scrupulous about the "fourths" timbers in the roof, or the bricks composing the inner walls.

The architect has too long been exploited by the builder. I have prepared plans *and* elevations for builders, and in two cases only have my elevations been carried out with a few variations to suit the builder's fancy. The roof in every case spoils the design. I have given details for chimney caps and windows, although it does not pay me to do so. But the devils *will* ignore them: put gables where I put hips, and decorate these gables with enormous barge boards.

There is a queer human psychology that makes people like these nasty villas. You will notice that the rooms are always 9 ft. 6 ins. or 9 ft. ground floor, and 8 ft. 6 ins. first floor, which seems extravagant at first sight, but people like to feel they are having lofty rooms, and if the architect built houses with 8 ft. high rooms to econo-

mize, and the choice of a prospective buyer fell between the architect's house and the speculative builder's, he would, I think, plump for the builder's house because of the nice lofty rooms and the nice curved bay window.

I have not mentioned the house for the poorly-paid labourer or dole-paid man. That is another matter which is now about to turn from the hands of the architect into those of the speculative builder, since the Government propose to stop financing housing work. Of course it will probably be a question of profits on rents, and not on sale, but it may be the architect's opportunity, for, if the Government *do* decide on this course, the results will be worse than ever they have been.

P. QUENTIN SMARTERLY, JNR.

Circular 1331

SIR —The publication of the Ministry of Health Circular No. 1331 on the subject of Slum Clearance will be welcomed by all, and not least by your influential paper.

This Five Years' Plan, however, offers opportunities for abuse as well as for blessings. If we are not to spend this time in preparing plans for what will be the slums of 1953 the architects of this country must here and now make their influence felt throughout the country in order to ensure that both plans and construction shall be of the best.

Your companion illustrations on p. 31 of THE ARCHITECTS' JOURNAL for January 11, 1933, entitled "Washing: A Tale of Two Cities," should be republished and broadcast to every local authority in order to set the pace and standard of ideas for new construction.

A LAYMAN

Technical Paper No. 7

SIR,—My attention has been called to Mr. Martyn's comments on my review of Technical Paper No. 7. He is entirely mistaken in assuming that what I wrote in the review was influenced in any way by annoyance. Why should I be annoyed when I am perfectly disinterested, and every word that I wrote was the result of sincere conviction, and of very careful consideration? Moreover, I believe that every word was fully justified in the public interest. In my opinion, the inadequacy of Technical Paper No. 7 is too obvious to warrant any difference of opinion, and I observe that the writer does not claim that it is other than I have stated.

Mr. Martyn states that I made numerous misstatements in my brief review. As I am familiar with the subject, I am in a position to prove that that is not the case. In apparent support of this statement, he adds that Mr. Swarbrick's book does not illustrate the Radial Calculating Sheet for measuring light on the vertical plane. If he will read my review again he will see that he is endeavouring to correct a statement that I never made.

Mr. Swarbrick's Calculating Sheets for measuring light on the vertical plane have been published elsewhere, as I know very well. He will find illustrations of them in the technical press, and in the paper by Mr. A. C. Stevenson, read at the International Congress on Illumination in 1931, to which I referred. A copy of this paper he will find in the R.I.B.A. Library, and, I believe, in the principal scientific libraries both in this country and abroad. Mr. Martyn gives no other evidence of my alleged misstatements.

From his letter, one would imagine that he is not aware that the photographic method of measuring daylight was recommended in the *R.I.B.A. Journal* of August 8, 1931, at the request of the Practice Standing Committee of the Royal Institute. He seems to think that I inadvertently overlooked the Droop Diagrams, illustrated in the second edition of Technical Paper No. 7. That was not the case. The fact is that the Droop Lines are distortions of lines that can be represented by simple ellipses on the Radial Diagrams for measuring light on the horizontal plane to which I referred. If ellipses are used, the accuracy of points upon the lines can be rapidly checked. The writer will find that Mr. Swarbrick called attention to this advantage on page 100 of his book on *Easements of Light*.

It seems so apparent that it is more advantageous to obtain all the data required for plotting on calculating sheets by means of photography, in one or two seconds, instead of in a matter of weeks by the old geometrical method, that it is difficult to imagine that anyone would seriously contend that a method of so much importance should not be included in a Government publication intended to assist practitioners who deal with Right of Light cases.

Mr. Martyn states that the Daylight Factor Photo-Theodolite cannot photograph buildings before they are erected, but he must not forget that, even when a building does not exist, it is possible to photograph the windows in the dominant tenement, and, by superimposing co-ordinate grilles of angles, to plot the portion of the non-existent building that could either originally or eventually be seen through the opening.

In this way, much time can be saved, and the possibility of many serious errors avoided, even when the building in question is not actually in existence. This is a very important matter, when the window openings are of irregular form, and not simple rectangles. J. H.

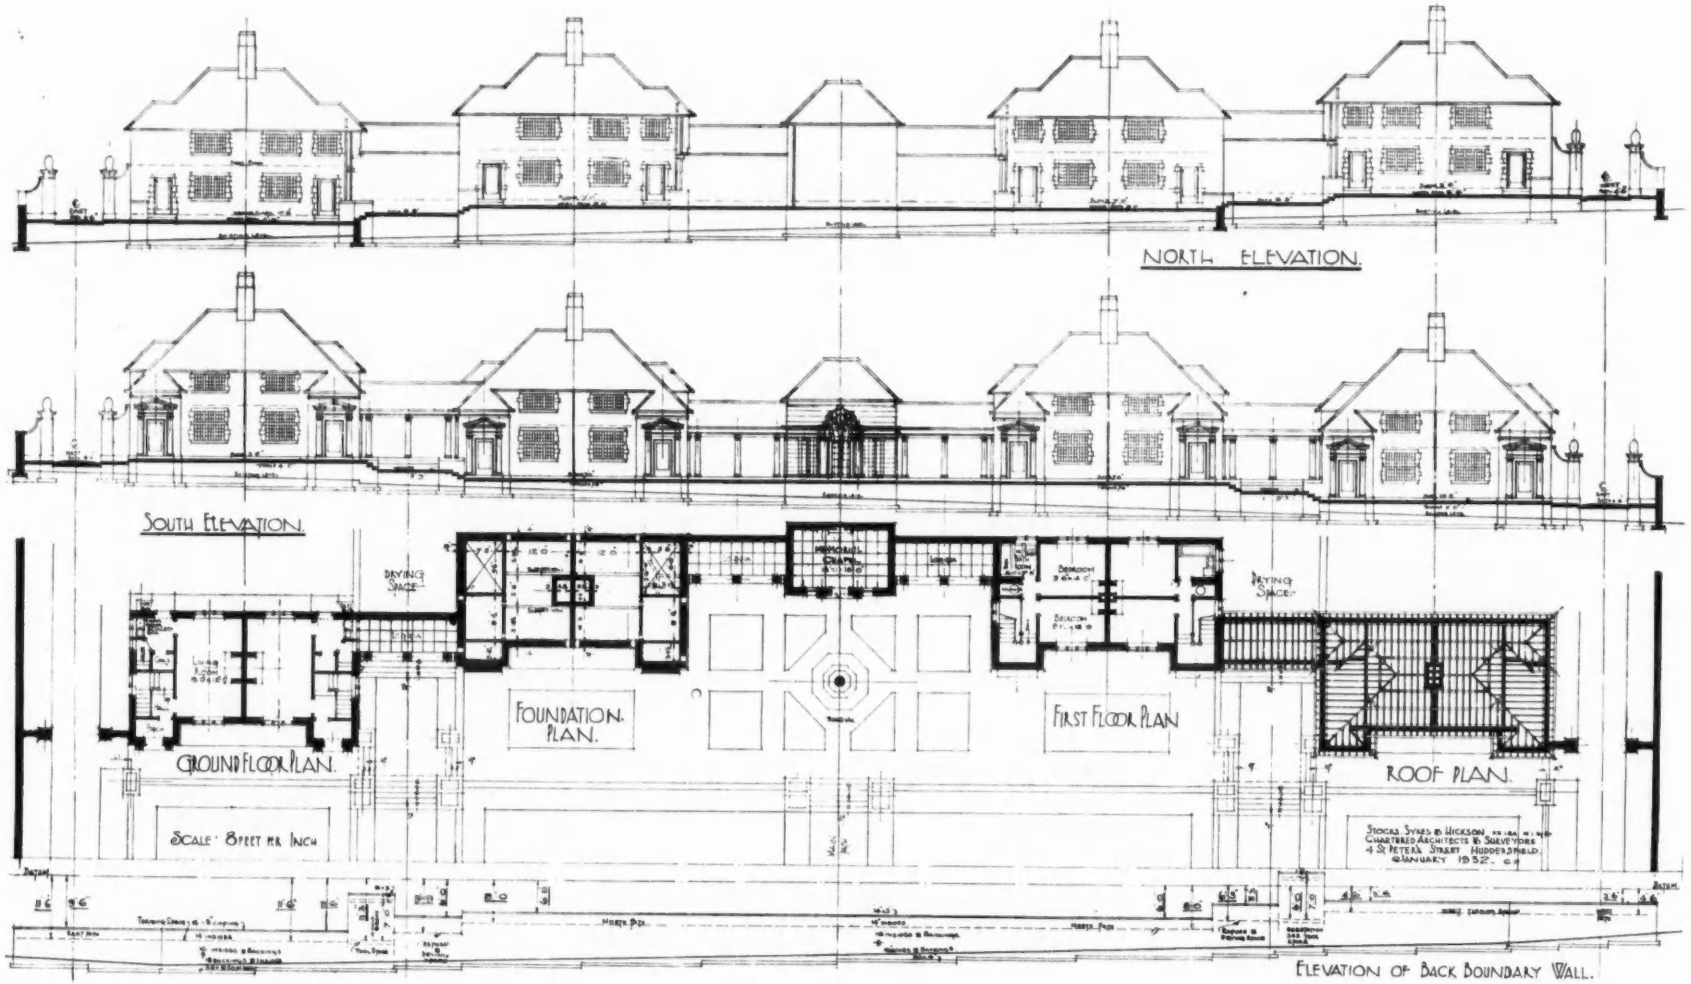
The Scope of the B.I.N.C.

SIR,—The Building Industries' National Council, for which Sir Raymond Unwin, P.R.I.B.A., is parentally responsible, appears at a time when the national effort to deal with the problem of unemployment should proceed from the general to the particular.

The two million men engaged in the industry, of whom two hundred thousand are without work, have now a central body prepared to devote skill and energy to the improvement of their condition.

This central body should be supported by local committees in every part of the country, and the organization already exists for their creation. The non-Metropolitan Societies of the R.I.B.A. are 49 in number, 30 being within Great Britain and Ireland; each is the accredited agent of the Institute in its district.

It only remains for these societies to appoint three members to sit with the representatives of the organizations of the builders, manufacturers and operatives, to discuss any questions arising locally and forward information and recommendations to the central body.



The decisions of the central body could be quickly and effectively communicated to the districts and passed to the authorities concerned with the support of the whole industry behind them. In my own Society we already have such a committee, which meets the Master Builders' Federation on purely local matters and is ready to extend its scope. The Society has recently adjudicated a very successful competition for prizes offered by a manufacturer for designs of the entrance fronts of semi-detached houses costing £850.

These examples are given as indicating the way to co-operation between architects, surveyors, contractors, manufacturers and operatives for a united Building Industry aiming at the efficient production of well-designed work, from the smallest cottage to the largest public building, and the guidance of those entrusted with the administration of public funds from the morass of blind economy to the firm ground of wise remunerative expenditure.

ARTHUR H. OUGH

THE ROEBUCK MEMORIAL HOMES, HUDDERSFIELD

Other views of the Memorial Chapel, about which the Homes centre, appear on page 528.

DESIGNED BY STOCKS, SYKES AND HICKSON

ROEBUCK MEMORIAL HOMES

BY STOCKS, SYKES AND HICKSON

The two views on this page show the Memorial Chapel, the central feature of the scheme, with its loggia connections to the houses on either hand, as seen from within and without the central gateway, from which a paved pathway rises to a terrace, with formal garden and sundial.

WHAT IS TO BE DONE ABOUT

THIS?

[*If, through the Housing Bill, there is to be a revival of small house building, a full inquiry into contemporary small-house building practice is of immediate importance to architects, since there can be no question of the desirability of architect-control in the large-scale developments that must soon go forward.*

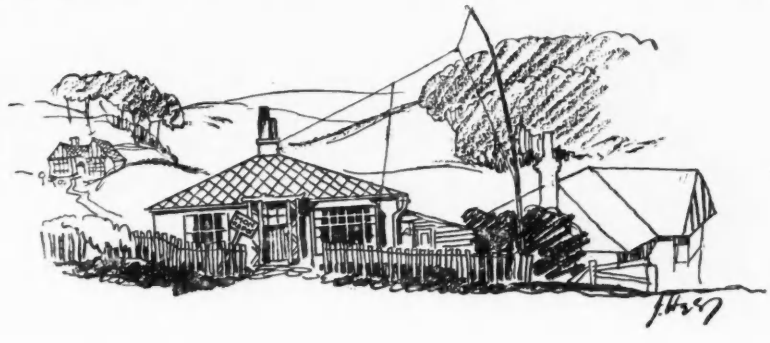
The twentieth-century small house is a mass-produced industrial product in a new field of architecture. How to capture it for architects who could beat the speculative builder at his own game, alike in convenience, seemliness and cost?

It has been suggested that a group of architects might seek out a virgin site, well situated for modern transport, prepare a layout and detailed plans, financial calculations and so on, and proceed—in all respects as a building speculator would do—in obtaining capital and building finance.—ED., *A.J.*]

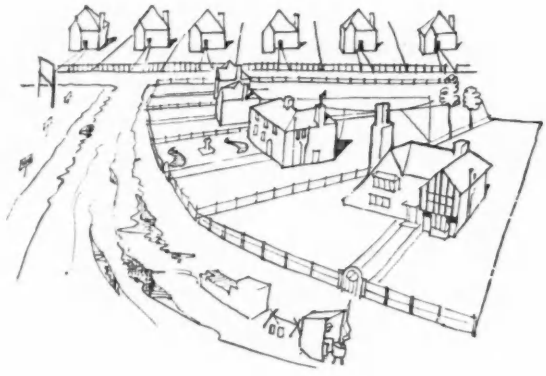
4. What the Public Want

[*By EDWIN GUNN*]

THE attitude of the architectural profession to the small house owner or would-be owner has for many years past been in the main either one of complete indifference (" these wicked things are beneath our notice") or of somewhat dictatorial endeavour to persuade the poor fellow that he couldn't really want what he thought he wanted, or if he did, he ought not to. It is no doubt highly desirable that he should in fact be dissuaded from some of his fancies, and a certain measure of success has actually attended efforts in this direction, as for instance the slight decline in the perverse preference for parti-colours in the painting of window and door frames, and the gradual disappearance of the transome from the window that is too small to carry it gracefully.



On the other hand, when architects saw plate glass used badly, it did not occur to them that it might be used well, and they launched an anti-plate-glass campaign, and tried to establish the supremacy of the leaded light. Now, when, at last, the diamond pane enjoys popularity and has a selling value, they begin to design intelligently in plate glass and agitate for its wider use. No wonder the layman is confused.



Apart from mere whimsicalities, there are features and items (what the Sales Expert calls " selling points ") which seem to constitute legitimate demands on the part of the average householder, and these it is quite useless to evade. The Friday " Houseseekers' page " of almost any popular newspaper will afford a reliable guide to these points, and casual conversation with young people just becoming house-conscious will fortify the knowledge gained. I should put the main requirements of a practical nature (omitting passing whims such as " Tudor character ") in the following order of importance :—

(1) Space for garage.
(2) Large windows.
(3) No sloping ceilings.
(4) Bays—the more the merrier.
(5) Tiled bathroom, with w.c. separate.
(6) Enamelled coke boiler, with radiators and hot towel rail.
(7) Compact kitchen with up-to-date fittings—tiled dado if possible.
(8) Plenty of electric plug points.
(9) Important-looking door-furniture (chromium at present in fashion).

It may be observed that none of these items relates particularly to the size, form, or aspect of principal living rooms or bedrooms. It seems to be the fact that the " labour-saving " character of the kitchen, and the sanitary glossiness of the bathroom are the matters of accommodation which now constitute the pride of their owners, and are exhibited to friends and acquaintances. However, some *rooms* are also required, and as little lead is gained from the actual demands made, it is necessary for designers to form their own conclusions. Personally, I have found that where the device of putting every possible foot of floor space into the main living room has been followed it has always proved popular, provided an alternative room—however small—is contrived for the quiet job or casual visitor. I am convinced that the front and back rooms about equal in size which the speculating builder so often provides are no more than the survival of an obsolete convention, and are no longer seriously regarded as a hall mark of respectability. The number of bedrooms cannot be standardized—the need of course fluctuates with the size of the family—even two is not necessarily the minimum when young married couples or elderly folk are considered, but in the intermediate stage between the first arrival of children and their departure from home, five bedrooms is not an unreasonable provision in a proportion of cases and as the home is not regarded today as a permanent institution, people move to a house that provides accommodation to suit their immediate requirements.

On the important question of cost, it is gall and wormwood to architects that the modern householder views cheerfully the expenditure of three or four hundred pounds on a car, which must be written off in (at most) a few years, whilst towards his house, which might last him a lifetime, he is relatively niggardly in his outlook. It is necessary to realize that today the car and not the home is the central figure in the lives of many and in the ideals of more. As I have implied, people no longer settle for life, their homes are apt to be changed nearly as freely as their cars, though with less ease. The difference, of course, is that, whereas an out-of-date car is discarded, a house, from the mere fact that it lumbers the ground and cannot be wheeled away like an out-moded vehicle, is expected to make its cost from a succeeding occupant—this is where the gall and wormwood comes in. A building costing between £450 and £1700 seems the present limit of the suburban average, with cost of land in addition, and the latest attraction—" No road charges, survey fees, or legal expenses." With these figures it should be quite possible to compete on sound lines. What are

the advantages which the Estate Developer-Builder enjoys, which enable him to sell his houses "like hot cakes"?

Apart from a willingness to supply the needs chronicled above—and a few more or less unquestionable—I believe they are :—

(*a*) A shameless publicity and use of slogans ;

(*b*) Ability to exhibit the specimen article and not merely plans on a seductive picture ;

(*c*) The facilities for building in quantities, and consequently with economy.

As to (*a*) it is noticeable that there is an increasing tendency for speculative builders of no more than ordinary merit to attach to their efforts quite boldly such names as imply that superior character or quality belongs thereto—as for instance "Boodle's houses are different," "Bunkum's houses—built to last," or with more subtle inference "Blogg Built Homes." Modesty and a sense of the ridiculous are clearly prejudicial to full commercial success. Extravagant fun has been poked at such terms as "The little palaces of Colindale," and "The H with the Baronial Hall," but these slogans seem almost a necessity to capture the fancy of the multitude. Perhaps architects will be able to invent and use better ones.

(*b*) The actual presentation of show houses is the trump card. Despite sixty years of compulsory education the number of ordinary folks who can understand plans and visualize sizes is still very low, while added to this a measure of distrust as to the reliability or even the bona-fides of architects is deep-seated in the mind of the average business man. To compete with the type of house now available, any alternative effort must be in the concrete and not merely on paper, and it will be as well for its sponsors to remember that in translating designs into fact they must not make the pace too hot. If, as well as aiming at improved design incorporating the 9 points, they endeavour to raise the structural scheme too much above that considered adequate and practised by the speculator, the price may soar so that no true parallel will exist. The aim should be the provision of houses strictly comparable with their model in all but planning and design and it is here that the architect may score, for there has been little progress in the planning, construction or design of the speculative house since the war. But it is only by entering into active competition and showing the man in the street exactly what his money will buy that the architects can hope to recapture small house work, and improve upon the existing standard of house design.

Liverpool Cathedral

The foundation stone of the new Liverpool Cathedral, designed by Sir Edwin Lutyens, R.A., P.I.A.A.S., will be laid at noon on Monday, June 5. The stone will be a block of solid white Italian marble weighing about 140 lb.

Two Art Treasures

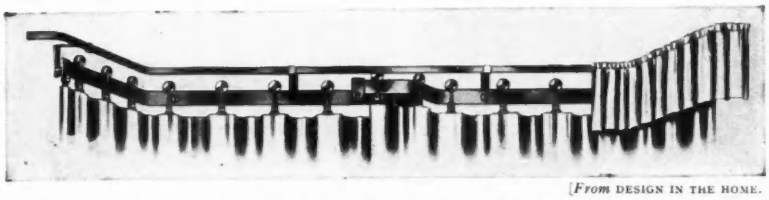
The gold and silver altar-piece and a font, which could not be brought from the goldsmith's in Germany in time for the consecration of Buckfast Abbey in August last, have now been delivered. The delay in the installation, it will be recalled, was due to the death of the donors before they were fully paid for, and the heavy Customs duty liable on the two gifts. The altar-piece, which has cost several thousands of pounds and took over two and a half years to complete, is a reproduction of the famous altar of Coblenz. It was designed by the architect of the Abbey, the late Frederick Walters, F.R.I.B.A.

Manchester Housing Problem

The Manchester City Council has rejected a scheme for making certain smaller houses on the Wythenshawe Estate all-electric.

Northern Polytechnic

The annual speech night of the Department of Architecture, Surveying and Building of the Northern Polytechnic, held on April 6, was attended by distinguished representatives of the architectural profession, including Sir Raymond Unwin, P.R.I.B.A. The prizes were distributed by the Right Hon. The Earl of Crawford and Balcarres, F.R.S. ; Mr. R. L. Roberts, M.A., Chairman of the Governing Body of the Polytechnic, presided.



Mr. T. E. Scott, F.R.I.B.A., in presenting his report, stated that they had passed through a most satisfactory year. Although it was unfortunate that the number of students available for training in the Junior School of Building was small compared with those entering the industry, the official attitude towards technical education was at least encouraging for the future ; all the boys who had left the school had been placed. He reported that the Day School of Architecture had completed a satisfactory but uneventful year. In the Evening School of Architecture, however, considerable progress was being made.

Mr. W. H. Ansell, F.R.I.B.A., Chairman of the Board of Architectural Education, and Mr. G. Harding, President of the National Federation of Building Trade Employers, then addressed the students.

Following the addresses, the Prizes and Diplomas were distributed by the Earl of Crawford and Balcarres.

Other speakers included Dr. T. J. Drakeley, Principal of the Polytechnic, Sir Raymond Unwin, Mr. C. Eaton, of the Board of Education, Mr. L. Sylvester Sullivan, F.R.I.B.A., Mr. J. Murrey, Secretary of the National Federation of Building Trade Operatives, Mr. A. B. Knapp-Fisher, F.R.I.B.A., President of the A.A., and Mr. H. G. Dowling, President of the Incorporated Institute of British Decorators.

Combined curtain runner and valance rail. The overlapping rails are designed to prevent a gap when curtains are closed.

IN THE ENGLISH HOME

Design in the Home. Edited by Noel Carrington. London: Country Life, Ltd. Price 15s. net.

AS this book is written and compiled from a "fitness for purpose" point of view one cannot avoid the impression that fitness for purpose, as exemplified by the telephone and the knife in the introduction, is somewhat lacking in the illustrations that follow. The majority of the interiors, the furniture and the fittings are "over-designed," but, as Mr. Noel Carrington has courageously confined himself to British work his field is, of course, very limited. It is significant that the same names appear again and again, and discouraging to note that so much of the better work comes from one building —Broadcasting House.

It is pleasing, however, to find a general improvement in the design of standardized fittings, kitchen equipment, household gadgets, electric fires and electric light fittings.

In his introduction Mr. Carrington reminds us "that the house is becoming a more and more complex organism, even though simpler in appearance, and the designer needs to have knowledge of *both* more trades and more materials than in the past." He continues :—

I am tempted to suggest that the architect of the future will be the designing member of a building firm and no longer professionally divorced from his craft. It is common knowledge that architects are regarded as extravagant luxuries, and largely because of their lack of practical training. Builders, on the other hand, show no sense of planning or form, from lack of culture and education. The divorce is unnatural and it is the public which suffers. It is significant that both in England and on the Continent the profession of interior designing is attracting young men and women of ability, and the firms which employ them have been conspicuously successful at the expense equally of the more conservative type of builder and architect. . . .

It is undeniable that the contemporary designer is faced with a serious problem, whether he recognizes it or not, and this applies as much to individual trades as to the architect. On the one hand an embarrassing richness of materials and methods, on the other hand an absence of that vital tradition which has always served as the basis of every style. In most trades we have to go back a century for any vital tradition. The gulf is too wide. Craftsmanship has been displaced by machines. I think this is the reason why many designers, obsessed with "fitness," and without a traditional style to guide their hands, fail to rise above the commonplace, and why others, in quest of modernity, present us with nothing but novelty. Nevertheless life goes on: men and women must make their homes. As it appears to the writer, the less we concern ourselves with style the better. A mind trained to appreciate the best work of the past, and also trained to apply itself to modern needs with modern methods, will find itself sooner or later.

The book contains over five hundred illustrations and is divided into ten sections. They are as follows: interior design; furniture; artificial lighting; daylight lighting; heating; baths and lavatories; the kitchen; pottery and glass; silver and plate; and curtains, rugs and wall coverings. Each section is preceded by a short description of the subject treated.

Discussing the "modern style" in the foreword to the photographs of interior design, Mr. Carrington says :—

Perhaps the self-conscious interiors which followed the Paris Exhibition of 1925 justify the label of "modernist" because one sees the obvious determination to be novel at all costs. Working along such lines, it is always possible to produce a style of sorts, compounded largely of studied unconventionalism, flavoured in this instance with a dash of Cubism. Such interiors are as unrelated to function and construction as the Tudor reproductions of the big shops. They will prove tiresome and boring, all the quicker because of their loud emphasis, and they are indeed a bad joke in which only the rich can indulge.

Mr. Carrington sums up the important question of heating in the following words :—

The householder must decide how much heat he requires, in what form and for what periods, not only now but in the future. He must reckon how much labour he will have available, and how intelligent that labour will be. He must balance the claims of convenience and comfort against the ultimate claims of economy. Let him consult an architect friend who has a home of his own, and let him keep away from showrooms until he has a clear idea in his

LIVING ROOM IN A CHELSEA FLAT

The living room being in fact something of a conversation piece, it is only logical that the couch and easy chair should become the principal features. In this living room in a Chelsea flat, designed by Brian O'Rorke, the couch or day-bed also acts as a writing table or a cocktail cabinet. The walls are partly panelled with sycamore and partly painted pink. The rugs are of sheepskin, the curtains grey and the settee cushions in grey-brown plaid. Wireless is brought through a grille from below. It is interesting to note how shelves, chairs and cushions all carry through the same lines.

[From DESIGN IN THE HOME.

head of his needs and the best instrument for meeting them. If few homes are effectively heated today it is not so much the fault of the apparatus as because it has been wrongly chosen for its purpose.

The book is essentially one for British architects: for, by it, they are afforded an admirable survey of the trend in modern design in this country.

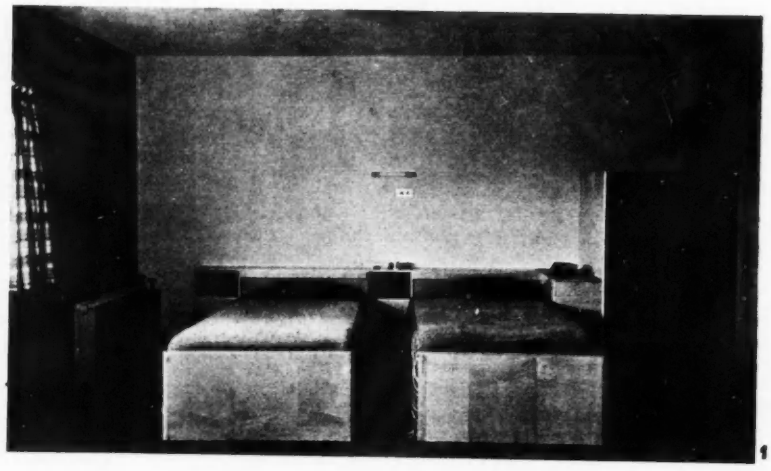
NOTES ON THE ILLUSTRATIONS

1. A distinguishing feature of the modern bedroom is the way in which the bed is made the decorative centre of the room. Here is shown a double bedhead fitment in a country house. The furniture is in sycamore and the joinery in oak. Walls and ceilings are painted ivory; the carpet is blue, curtains are brown and white. Architect: R. D. Russell.

2. Washing-up remains the worst of household drudgeries. It deserves an efficient apparatus which can appreciably shorten the task. Here is a simple and sensible arrangement in a London flat, where the hot water pipes are utilized for drying.

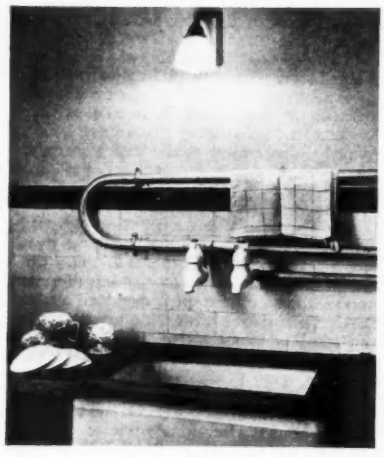
3. The portable electric fire is still popular, partly from its cheapness, its usefulness for warming plates and for moving from room to room. This three-unit electric fire has chromium plates and cellulosed guards. Designer: A. Murray Easton.

4. In bedroom furniture of a more expensive nature the designer has more opportunity to provide beautiful surfaces and patterns, but the same absence of carving and the same simplicity of outline will be found as in the mass-produced article. This photograph shows bedroom furniture, veneered with figured birch and stained oatmeal colour, designed by David Pleydell-Bouverie.



5. Living room in a country house. Here we see a fine disregard for symmetry, though the composition of the room is restful because of its spaciousness. The walls are jade-green cellulosed and the fittings of chromium steel. Architect: A. Connell.

6 & 7. Ceiling lights of obscured glass for the working rooms and passages of a house are the most practical and efficient. They require less cleaning and distribute the light evenly, especially with painted wall surfaces. These two photographs show ceiling lights suitable for lavatories or low passages.



8. The fitted-in electric fire is certainly the neatest of all in appearance. This is an example of a modern chimney-piece with fitted-in fire. Architect: Edward Maufe.

The above notes, also the illustrations, are reproduced from DESIGN IN THE HOME.

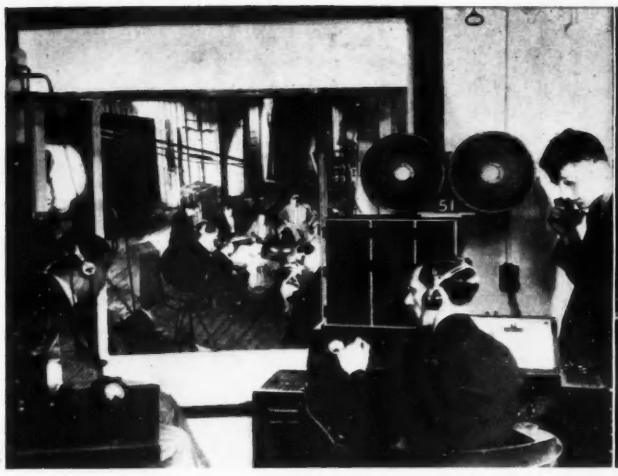
S. B. PRITLOVE, ARCHITECT

(1) *The main centre block, on the left, designed by S. B. Pritlove, was completed in September, 1931, and later altered and extended to meet the new demands created by rapid technical development and the wider activities of the Gaumont Corporation. The block includes studios, dressing rooms to accommodate 600 artists, and technical and administrative offices. The largest studio (No. 4) is 135 ft. long and 85 ft. wide. Above the block is a flat roof equipped for the "shooting" of outdoor scenes.*

In the foreground is the latest extension, designed by Nicholas and Dixon-Spain, and recently completed, with offices on the ground floor, a studio on the first floor, and orchestration and viewing theatres, film-cutting rooms, and film stores on the top floor.

The studios are ventilated by a plenum type conditioning plant, the intake being equipped with specially designed filters, and the air is cleared to give, at all times, a fog-free atmosphere.

(2) *No. 4 studio, or sound stage, on the second floor of the centre block, cleared for a new production. The ceiling and walls are acoustically treated for sound "damping." The visible facing is of linen, covered by wire mesh, stretched over rockwool between wood battens. The floor is laid with pine blocks.*



Runways to take pulleys that facilitate the handling of scenery and lighting apparatus are arranged immediately below the ceiling.

A sunk water tank, 48 ft. long by 18 ft. wide by 10 ft. deep, formed in reinforced concrete and asphalted, holding 270 tons of water that can be heated by steam ejectors, is provided for water scenes. In the sides are portholes through which underwater scenes can be filmed and lighted. When not in use the tank is covered by sections of removable flooring.

Each studio is fed independently from all workshops and dressing rooms, so that there shall be no interference with work on adjoining stages, and is provided with full service accommodation: green room, floor property, camera store, paint shop and so on, and each has its own monitoring and recording rooms, positive and negative loading rooms, etc., and suites of drawing offices and art departments.

(3) *A representative battery of studio lights. Great changes in electric equipment are illustrated by the fact that whereas in the*

(NICHOLAS AND DIXON-SPAIN, CONSULTING)

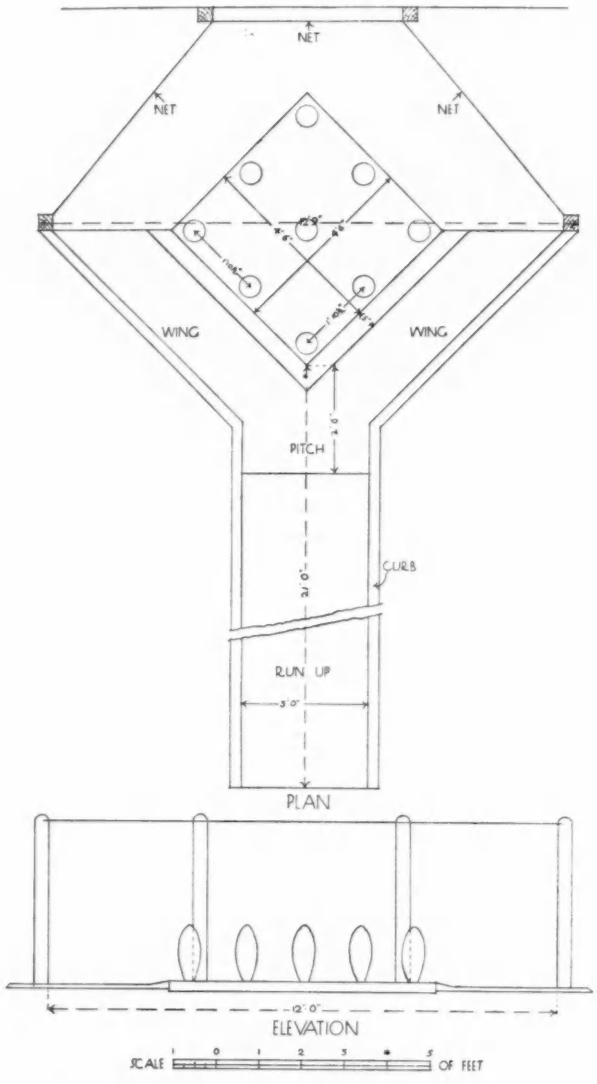
early days of production six lamps were in use on the floor, now over 600 are needed. These vary from 500 to 5,000 watts for incandescent lighting, and from 25 to 150 ampères for arc lighting.

Galleries at two heights around the studio, and two transverse gangways at ceiling level, are provided for the accommodation and direction of the lighting.

The overhead lighting equipment is suspended from trollies, on the ceiling runway system, enabling lamps to be concentrated and banked as required. All electrical apparatus for lighting and power is controlled from switchboards on the floor and galleries. The upper gallery is served by a lift in order that the large sun-arcs, which weigh nearly half a ton each, may be easily transported. The lower gallery has a trolley system that enables lamps to be manipulated rapidly.

Two 1,500 K.V.A. transformers, four 125-kilowatt and two 250-kilowatt output motor generators have been installed. These supply D.C. current for the stage floors' lighting equipment, giving, at 110 volts, nearly 10,000 ampères at normal rating, but capable of supplying, if necessary, 15,000 ampères for short periods.

(**4**) *A section of the sub-generating station. The existing single-phase supply has been converted to a three-phase supply, capable of giving three times the old output. For this purpose two new transformers and complementary switchgear, were installed, and a considerable length of cable was laid from the Hammersmith Electricity Works to the Corporation's sub-generating station.*



(**5**) *A sound recordist's booth—where sound is recorded and controlled—located on the studio floor.*

(**6**) *Engineers, in the sound camera room, on a mezzanine adjacent to the studio and separated from it by a soundproof window, recording the sound from a scene enacted on the stage below them. The "mike," which collects the sound, is visible, at the end of its lever-arm, through the observation window.*

In the laboratory: (**7**) *A developing room.* (**8**) *A battery of film drying cabinets in the negative drying room.* (**9**) *The mass film printing department.* (**10**) *The cutting and examination of films.*

(**11**) *A carpenters' workshop, located, with the plasterers' shop, near the stage. Here the sets are made and prepared for quick assembly before being taken to the stage.*

QUESTIONS THAT ARISE

Plan and elevation of a skittle alley. See note below.

Skittle Alleys

¶ J. A. L. writes: "*I should be grateful if your expert would supply me with some information with regard to skittle alleys. I particularly wish to know the usual dimensions of these rooms, the arrangement of windows, the general construction of floors, walls, etc., and any other information that is essential to the proper working of such places.*"

Following is a general specification for, and description of, a skittle alley to conform to the rules of the Amateur Skittle Association, which, I think, will answer your correspondent's queries:—

Court 30 ft. 0 ins. long by 13 ft. 0 ins. wide.

Floor to be of dry deal, covered with cocoa fibre mats, fixed to bearers and joists laid on concrete which must be on a thoroughly sound bottom.

Curb to run-up and wings to be constructed of deal with top front edge chamfered. At the junctions of run-up and pitching pieces of cocoa fibre mats to be supplied and laid in position. Run-up formed of deal boards securely spiked to bearers. These to be thoroughly seasoned.

The wings are usually of prime dry hardwood.

The whole depth of the pit at the back to be protected with a proper shaped and stuffed buffer, made of best stout canvas, filled coir, and provided with lashing eyes and lacing rope for hanging in position.

The pitching piece and bevel pieces to be of red oak.

Under-frame to be in English elm laid on a concrete bed.

The top-frame to be of red oak spiked to under-frame with iron or gun-metal pin plates let in at proper distances and securely screwed down.

The pit surrounds to be fitted with chamfered posts let into iron sockets, with a rail of deal, to which is attached a hemp rope net fastened to the curb at the bottom.

All screws on pitching pieces and wings, etc., to be sunk and the whole carefully filled in.

The success of the floor is wholly dependent on good sound and secure concrete foundations.

Red oak is usually preferred for the frame, but other hardwoods can be employed if required.

With regard to the lighting, a good light at the end of the alley is all that is generally required.

The cost is from £65 to £75 delivered and fixed within the London area.

E. B. M.

LAW REPORT

STRUCTURAL ALTERATIONS TO PREMISES

Kettle v. *Smith.—Court of Appeal. Before Lords Justices Scrutton, Greer and Slesser.*

THIS was an appeal by the defendant, Mr. George David Smith, of Finsbury Pavement, E.C., from a judgment of Mr. Justice Swift, sitting in the King's Bench Division, in favour of the plaintiff on the defendant's counter-claim in the action brought by Mr. George William Kettle, of Dorland House, Regent Street, W., in a claim for £6,033 for rent and other expenses under a tenancy agreement of November, 1931, under which the defendant became the tenant of certain parts of Dorland House.

In the Court below the claim was not deposited, but execution had been stayed pending the trial of a counter-claim by the defendant. By that counter-claim defendant sought a declaration that the plaintiff, as the landlord, was liable to carry out all such structural alterations to the demised premises as might be required by the London County Council as a condition to the grant of a music licence in respect of the part of the premises he held. Defendant also put in a claim for damages, alleging breach of obligations. The defendant was described in the agreement as an exhibition organizer, and it stated that he desired to occupy the premises for the purpose of organizing and running exhibitions. The agreement was for two years from January, 1932, at a yearly rent of £12,000, and in the event of the defendant organizing more than three exhibitions in a year the landlord was to be entitled to 50 per cent. of the net profits from the additional exhibitions.

Defendant was bound not to make any structural alterations or additions without the consent of the landlord, and undertook that the exhibitions should not become a nuisance or annoyance to the landlord or tenants of Dorland House and adjoining owners or occupiers.

Under the tenancy agreement, the landlord by clause 4, sub-clause 3, agreed to carry out all the necessary structural alterations to the building to comply with the London County Council requirements for the user of the premises for the exhibition purposes contemplated. Certain alterations were made, but

defendant alleged that plaintiff had not carried out his obligations.

Mr. Justice Swift, however, dismissed the counter-claim and removed the stay on the plaintiff's judgment for rent.

It was from this judgment that the defendant now appealed.

Mr. Croom Johnson, K.C., argued the case for the appellant. Mr. Malcolm Hilbery for the respondent, was not called upon to argue.

The Court dismissed the appeal with costs.

Lord Justice Scrutton, in his judgment, said whoever had drafted sub-section 3 of clause 4 had been asking for trouble. The question that arose in the case was whether the parties when they entered into the agreement contemplated anything about music. There had been three exhibitions without music and no suggestion was made by the defendant with regard to music till March, 1932. The learned judge who tried the case found that music was not in the contemplation of the parties at the time the agreement was entered into, and that therefore there was no obligation on the landlord to make any further structural alterations. On these facts the Court could not interfere.

Lords Justices Greer and Slesser concurred.

Electrical Engineers

The Summer Meeting of the Institution of Electrical Engineers is to be held at Bath from May 29 to June 2.

New Derry Bridge

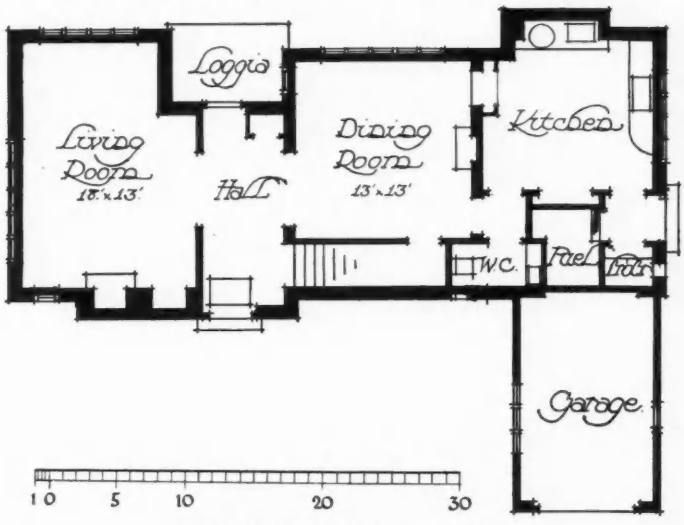
The Derry Corporation has invited the Lord Mayor of London (Sir Percy Greenaway) to open their new £250,000 bridge, which is to be named after Lord Craigavon. The ceremony will take place about the middle of July.

Offices at Chichester

A special meeting of the West Sussex County Council was held recently at Horsham to discuss matters relating to the proposed new County Offices at Chichester. The debate was held in Committee, and the Press were asked to withdraw. Later, the Council issued a statement, extracts from which (as printed in *The Sussex Daily News*) are given below :—

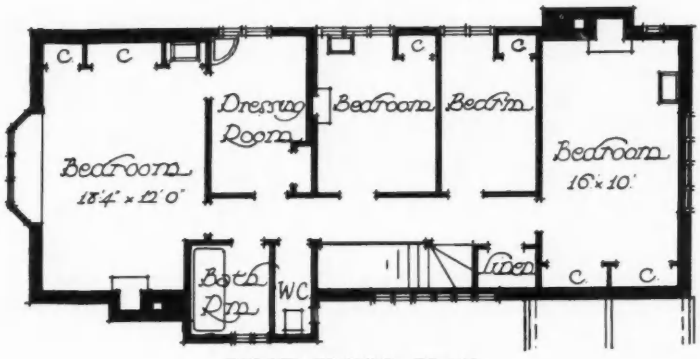
"That Mr. Vincent Harris be informed that the Council do *not* propose to proceed with the erection of the new County Offices in accordance with the lay-out plans submitted *by him*, and that the Accounts and Estimates Sub-Committee be authorized to effect a settlement of the fees payable to Mr. Vincent Harris under the terms of his contract.

It was resolved also:

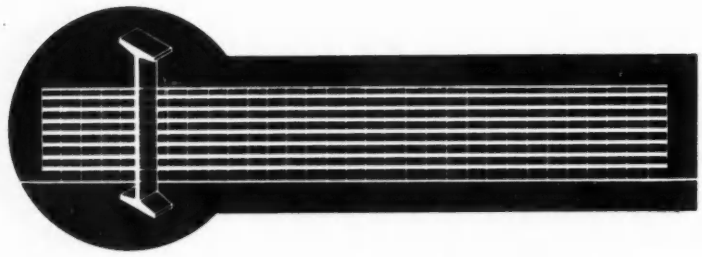


"That the lay-out plans for the erection of the new County Offices as *prepared by the County Architect* be adopted, and that the Accounts and Estimates Sub-Committee be authorized to approve the detailed plans and drawings and to invite and accept tenders for the erection of the building in accordance therewith, at a total estimated cost not exceeding £79,650, and that the Common Seal of the Council be affixed to any necessary documents in connection therewith.

A HOUSE AT ESHER



DESIGNED BY IMRIE AND ANGELL



The external walls of this house are 11 ins. hollow, part of the first floor external walls being 9 ins. solid brick, covered with weather tiling. The half timbering on the front is in adzed oak, and the roof is covered with tiles. The oak window frames are filled in with steel casements and leaded lights.

GROUND FLOOR PLAN

FIRST FLOOR PLAN

TRADE NOTES

BY F. R. S. YORKE, A.R.I.B.A.

Cement glaze

IN order to provide, on an internal wall, a permanently glazed surface, it is usual, in this country, to fix glazed tiles or similar built-up slabs, but on the Continent, for several years, cement glaze has been employed with considerable success.

•

This material is now made in England by Hoyle, Dobson, Barnett, as Glazement. It has a Portland cement base that sets with a hard glazed surface which, when sealed, cannot be stained by oil, grease, or ink. It can be applied in any colour and finished in a variety of textures. It is applied *in situ*, and the surface, unbroken by joints, can be easily washed.

•

It is applied, as a rule, to a Portland cement rendering, for which the manufacturers suggest an ideal specification :—

Rendering to be ¾ in. thick, and to be finished smooth with a steel trowel.

The proportions to be three parts of an equal mixture of fine and coarse sand and one part of cement, to consist of 95 per cent. Cement Marketing Co.'s Ferrocrete quick-setting cement, and 5 per cent. Pudlo waterproofing.

Ferrocrete is not absolutely essential, but if ordinary cement be used, twenty-eight days must be allowed for setting. Pudlo is not essential either, but it helps the glaze people to give a good job, especially where suction happens to be considerable.

The object of the steel trowel is to obtain a surface on which the cement glaze can be brought to an even finish.

•

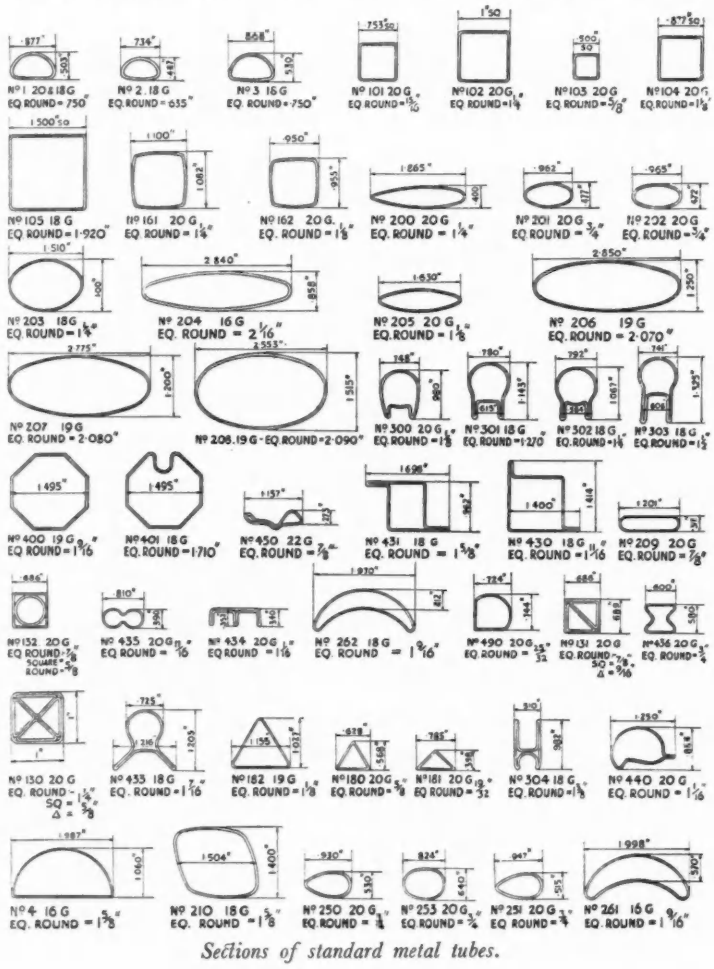
Application of Glazement is not sublet, but is undertaken by the manufacturers, who consider that best results are obtained by men who work constantly with the material.

•

If, as is claimed, the material is immune from crazing, it should be invaluable as a finish to external concrete or rendered surfaces, but I know of no instance of such usage in this country. I understand, however, that the manufacturers have carried out successful experiments in this direction ; the only difficulties being imposed by weather conditions. It has been found that whilst a damp day with a little wind is ideal, heavy rain, frost, and high winds prove detrimental.

•

Cost must, of course, vary in accordance with the size of the job, number of coats, nature of the backing material, and so on, but, as a guide, I give two examples of work recently executed.



At the Hoover Factory, where five coats with a smooth finish were applied direct on brickwork and rough concrete, over an area of some 5,000 yards, the price was about 4s. per yard super. At the Southern Railway Stations, Balham and others, where five coats with a stippled decorative surface were applied to Portland cement rendering, over an area of 1,500 yards, the price per yard super was about 6s.

Steel Tubes

So seldom does one find a manufacturer exercising foresight by discouraging the abuse of his material that it is with mixed feelings of surprise and gratification that I read, of metal tubes, in a brochure produced by Tube Products : "The facility with which they may be employed has probably encouraged some mishandling of their possibilities through misguided ideas of novelty and sensation," and I recall a window-background exhibition, held recently at Selfridge's, where "fanlight effects," in curly tubes, dominating the lower and more intelligently designed part of the background, destroyed, for me, all sense of the modern, in an exhibition that was supposed to illustrate the window dressing tendencies of today.

•

Thanks to scientific processes of fabrication, the tube need no longer be unsightly and

Sections of standard metal tubes.

hidden away. New and various methods of mass production, manipulation, welding (by electricity) and finishing tubes, to any degree of accuracy desired, have opened out such agreeable advantages of application that they have become a medium of infinite capacity.

•

They are used today as a means of scaffolding buildings, for radiators, ventilating screens, hand rails and balustrades, electric fittings, furniture, show cases and general shop fittings.

•

Tube Products, Ltd., manufacture, as a standard, the sections shown in the diagram on page 538, and round tubes in the following sizes and gauges :

Outside Diameter. Inches	Gauge	Outside Diameter. Inches	Gauge	Outside Diameter. Inches.	Gauge
⅜	20	1	20	1¼	20

Galvanizing

In notes on the protection of iron and steel from rust and corrosion, sent to me by Messrs. G. A. Harvey, I read that rusting is a special case of corrosion depending upon the combined influences of moisture, oxygen and carbon dioxide, the process being accelerated by the presence of acidic substances in the atmosphere. The rate of corrosion or rusting of an iron or steel surface depends upon the conditions to which it is subjected and may vary very widely.

•

The term "Galvanizing" is usually understood to apply to the "hot" galvanizing process, in which the articles to be treated are immersed in a bath of molten zinc, and this is the process with which we are immediately concerned. It is totally distinct from the electro-galvanic method, in which a thin coating of zinc is deposited by the action of an electric current.

•

Hot galvanizing is recommended. It results, when correctly carried out, in the production of an even, substantial and homogeneous coating, which is corrosion-resisting, pliable, and firmly adherent to the iron or steel base.

The anti-corrosive action of galvanized coatings depends entirely on their weather-resisting properties. When properly deposited, these coatings hermetically seal the surface and completely prevent the access of air to the underlying iron or steel. The practice of coating iron with zinc has, therefore, nothing to do with the relative electrolytic properties of zinc and iron, but is based on the fact that zinc itself is a highly weatherproof metal. After a short exposure to the atmosphere, zinc becomes coated with an extremely dense and insoluble coating of zinc oxide and basic zinc carbonate, which itself protects the underlying zinc from the further action of atmospheric agencies.

•

The zinc coating becomes alloyed with the surface of the iron, and it is interesting to note that this coating is composite in character and really consists of several layers merging one into the other, so that there is no really sharp boundary between the iron surface underneath and the pure zinc above.

BUILDING FACTS AND FIGURES

Unemployment

[*By L. J. GOLLOP*]

B.Sc. (Econ.) F.S.S. Economist to the Special Relation Committee of the Building Industries National Council

PROVISIONAL figures issued by the Ministry of Labour on April 4 indicate that on March 20 the number of unemployed in the building industry had declined by 52,000 as compared with the previous month, and in public works by 4,000.

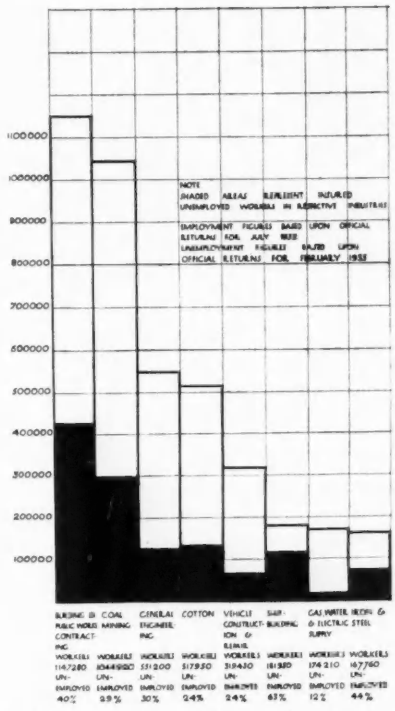
The relevant figures required to place this information in its proper setting are as follows :

Insured Persons Unemployed

End of 1931	Building	Public Works	Total
January	225,012	63,040	288,052
February	212,261	62,341	274,602
March	187,029	60,059	247,088
1932			
January	281,291	103,199	384,490
February	279,261	102,178	381,439
March	248,642	101,408	350,050
1933			
January	323,212	133,997	457,209
February	295,285	131,135	426,420
March	243,000*	127,000*	370,000*

* Provisional figures.

This table indicates, *inter alia*, the



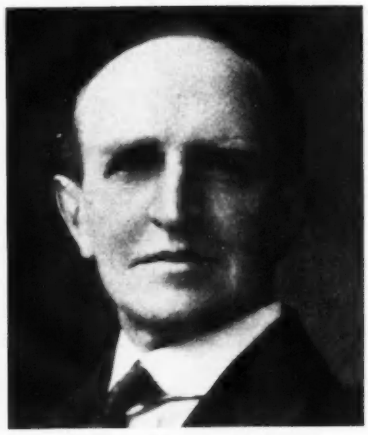


Chart showing unemployment figures in key industries in February, 1933.

extent to which the building and public works industries have been hit by the economy campaign. As compared with the January before that campaign, an increase of 96,000 was recorded in the total for the group in January, 1932. The seasonal decline in the early part of 1932 was considerably less than usual, and the seasonal increases in the autumn and winter were greater. The increase of 54,000 between December, 1932, and January, 1933, to the phenomenal total of 457,000, was distinctly abnormal. The causes of this abnormal increase were, however, apparently temporary, as the decline in February was greater than the normal seasonal movement. February, however, still showed an increase of 23,000 as compared with December, which is not normal.

The decline of 56,000 in the total between February and March is much greater than the normal seasonal decline, and the movement as compared with December, 1932, is about normal. The figure for March for the building industry is some 5,000 below that for 1932, though still 66,000 above 1931. The public works industry shows an increase of 26,000 as compared with 1932 and of 67,000 as compared with 1931.

The figures would appear to indicate some expansion in building work, probably undertaken by private enterprise, and some further decline in the public works activity of local authorities as compared with 1932.

The late Malcolm Sparkes.

OBITUARY

MALCOLM SPARKES

As briefly recorded in our last issue, the death of Mr. Malcolm Sparkes, of Drytone, Ltd., occurred on Thursday, April 6.

Born at Rochdale on October 14, 1881, Mr. Sparkes was educated at Ackworth and Bootham School, York. After leaving school he came to London and for 16 years worked with Mr. Howard C. Cleaver, designer and manufacturer of architectural woodwork. He was a Quaker, and as such was always active in all movements making for international, industrial and social peace. The "peace" he had in mind was not merely that of a mediator, just touching up quarrels, but his definition of a peacemaker was one who unites for a great constructive purpose the very forces now wasting themselves in opposition, and that faith led him to the idea of an industrial parliament. It was he who originally drafted the scheme for the Building Trades Parliament, which formed the model—with some alterations which were not improvements—for the so-called Whitley Councils, and arising out of that he founded the London Guild of Builders. They did some of the large contracts for direct labour with Housing Schemes for Councils.

In 1924 he founded Drytone, Ltd., specialists in high-class joinery and architectural metalwork. He was not only the founder of it, but the active directing head. His genius as a creative artist as well as a practical craftsman stood him in good stead. The fact that Drytone has through the recent crisis held its own and made progress shows how well and truly the foundations were laid. Everyone who knew him was impressed by his unquenchable optimism and his faith in human nature. The human side of industry always interested him as much as the technical and business side.

Mr. Sparkes, in a letter to this JOURNAL for February 15 last on the subject of National Planning, said the Building Industries National Council, "together with the Central Electricity Board, marks the beginning of a British Plan which, rightly understood, will effect great changes in our standards of living and also in the whole tone of our industrial relations, with incalculable benefit to both. This may sound extravagant, but I think it will bear examination. It is the proposed National Planning Board that is so far-reaching."

ARTHUR E. SALMON

We regret to record the death of Mr. Arthur Edward Salmon, Chairman of W. T. Henley's Telegraph Works Co., Ltd., which took place suddenly on April 6, at his residence at Bourne End, Bucks.

Mr. Salmon was born on March 5, 1865. He joined Henley's as secretary in April, 1894, was appointed a director on July 9, 1926, acting especially in the capacity of Financial Adviser to the Board. He was elected Chairman of the Company on April 1, 1932.

Mr. Salmon was also on the Board of several other companies, principally electrical.

The funeral was at Little Marlow Church, on Saturday, April 8; and a memorial service was held at the Church of St. Sepulchre, Holborn Viaduct, on Tuesday, April 11.

Trade Items

Messrs. W. T. Henley's Telegraph Works Co., Ltd., have appointed Mr. W. Kells as Liverpool Branch Manager in succession to Mr. J. B. Snell, who has resigned his position in order to take up an appointment with a large supply undertaking. Mr. Kells has been with the firm for the past 22 years and has for many years acted as Chief Assistant at the Liverpool Branch.

*

The British Aluminium Co. Ltd., Adelaide House, King William Street, London, E.C.4, have removed from their Birmingham Office and Warehouse at 21 Barwick Street, to Lawley and Landor Streets. The new telephone number is Aston Cross 5865-6.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors, and some of the sub-contractors for the buildings illustrated in this issue:

Houses at Cambridge (pages 521–524 and supplement). Thurso House. General contractors, Manning and Bullman. Christiani and Nielsen, consulting engineers. Sub-contractors: T. R. Freeman, heating and hot water; Electric Wiring and Repair Co., Ltd., electrical installation; Williams and Williams, Ltd., metal windows and doors; British Magnesite Co., Ltd., jointless flooring; Horsley Smith & Co., Ltd., hardwood floors; Standard Flat Roofing Co., Ltd., roofs; Venesta, Ltd., flush doors; Davis Gas Stove Co., Ltd., gas fires; Cement Marketing Co., Ltd., "Snowcrete"; Manu Marble Co., Ltd., reconstituted marble; Parker Winder and Achurch, Ltd., Parwinac oil burner; National Radiator Co., Ltd., Rayrad panels. The White House, Conduit Head, Cambridge. In addition to the general and sub-contractors given above, the following firms also executed work on this house: Joseph F. Ebner, Ltd., composition floors; Merchant Trading Co., Ltd., Laminex flush doors; Bratt Colbran & Co., Ltd., fireplaces. Black flooring tiles, manufactured by Minton Hollins & Co., Ltd., were used.

Roebuck Memorial Homes, Huddersfield (pages 526–528). Sub-contractors: Graham and Jessop, Ltd., excavators, bricklayers and stonemasons; H. Hollingworth and Son, carpenters and joiners; H. C. Stringer, plumber and glazier; W. E. Jowitt, plasterer and roof tiler; Williamson, Cliff & Co., Ltd., tiles (supply); J. W. Hamilton, painter and decorator; Keneth Levell, Ltd., electrical engineers; Precast Concrete, Ltd. (now Roxana, Ltd.), reinforced concrete engineers; Walter Fisher and Son, wall and floor tilers; Millward and Son, steel casements and leaded glazing; Henry Platts, landscape gardeners and paved paths; John Addy and Sons, Ltd., wrot-iron gates and grilles; John Mollet & Co., Ltd., fireplaces, etc.; Hygienic Stove Co., Ltd., gas cookers and boilers; W. and R. Leggott, Ltd., hardware, etc.; Edgar Lockwood, stone carver.

Gaumont British Film Studios, Lime Grove, Shepherd's Bush, W.12 (pages 534–535). Main Centre Block: General contractors, Bovis Ltd. sub-contractors: H. Young & Co., steelwork; Dorman Long & Co., Ltd., steelwork (alterations); Southern Block (latest extension): General contractors, Thomas and Edge, Ltd., sub-contractors: Archibald D. Dawnay and Sons, Ltd., steelwork; Engineers', Carpenters' and Plasterers' Shops, etc.: General contractors, L. and W. Whitehead; sub-contractors, Kelvin Construction Co., steelwork. The consultants for soundproofing and insulating for the whole of the above were Absorbit Ltd. Sub-contractors: The Trussed Concrete Steel Co., Ltd., Reinforced Concrete Engineers, and Siegwart Fireproof Floor Co., reinforced concrete stairs and floors; Absorbit, Ltd., and H. W. Cullum & Co., soundproofing and insulation; Hall and Kay, Ltd., and Young, Austen and Young, heating and ventilating; Mather and Platt, Ltd., and Independent Sprinklers, Ltd., sprinklers and hydrants; J. Briggs (Electrical Contractors, Ltd.), electrical work; Gardiner, Sons and Co., Ltd., W. James & Co., and Crittall Manufacturing Co., Ltd., metal windows; Mellowes & Co. Ltd., and British Challenge Glazing Co., lantern lights and patent glazing; Stevens and Adams, Ltd., and Jos. F. Ebner & Co., wood block flooring; Diespeker & Co., Ltd., terrazzo work; Marbolith Flooring Co., composition flooring; J. Chater and Sons, Ltd., and John R. Venning & Co., sanitary fittings; Shutter Contractors, Dreadnought Fireproof Doors (1930), Ltd., and John Booth and Sons, fireproof shutters; W. Salter Edwards & Co., Ltd., and Limmer and Trinidad Lake Asphalte Co., Ltd., asphalte; Robert Adams, A. E. Davis & Co., and Walter Cassey, Ltd., ironmongery; Midhurst Brick Co., Ltd., Sussex Brick Co., Ltd., and Ames and Finnis, bricks; R. C. Cutting & Co., and J. W. Gray and Sons, lightning conductors; Garton and Thorne, Ltd., Potter Rax Gate Co., A. R. H. Maxted, J. Starkie Gardner, Ltd., and Caslon & Co., metal work; Anselm Odling and Sons, Ltd., marble work; Cork Insulation Co., cork tiling; Benham and Sons, Ltd., kitchen equipment; F. Bradford & Co., and Girlings Ferro Concrete Co., artificial stone; Venesta, Ltd., and Hitchins Flush Woodwork, Ltd., flush doors, etc.; Estler Bros., Ltd., steel shelving; London Sand Blast Glass Co., embossed glass; Carter & Co. (London), Ltd., and Cope & Co., tiling; Asbestos Cement Building Products, Trafford tiling; Ten-Test Fibre Board Co., and the Patent Impermeable Millboard Co., insulating board.

House at Esher (page 537). General contractors, Cummins Ltd.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

The BERMONDSEY B.C. has approved plans for the erection of 15 four-room non-parlour type cottages (one with shop), on the Crosby Row site at a cost of £7,900.

Plans passed by the CATERHAM U.D.C. : Four houses, Kingswood Lane, for Mr. W. Bex ; two houses, St. Michael's Road, for Mr. W. R. Quested ; two houses, Salmon's Estate, for Messrs. Thomas and Sutcliffe ; four houses, Harestone Valley Road, for Messrs. Rodec, Ltd. ; squash rackets court, Overhill, Warlingham, for Mr. L. S. Crossbie ; two houses, Alexandra Road, Warlingham, for Mr. M. Wright.

Plans passed by the EAST HAM Corporation : 12 houses, Gainsborough Avenue, and shop and three houses, Dore Avenue, for Messrs. W. Goodchild & Co. ; 20 houses, Grantham Road, for Mr. G. Siegerts ; four houses, Church Road, for Mr. S. Newlyn ; three houses, Katherine Road, for Mr. J. Broadbent ; house, High Street South, for Mr. H. Joseph ; three houses, Langdon Road, for Mr. J. Franckeiss ; 102 houses, Millais Avenue, etc., for Mr. R. J. Slater ; 48 houses, Walton Road, for Mr. J. H. Lohden ; reconstruction, Empire Cinema, Barking Road, for Mr. W. E. Trent.

Plans passed by the ENFIELD U.D.C. : Factory, Green Street, Brimsdown, for Mr. W. M. Brand ; extensions, Summerfield chemical works, Ponders End, for Messrs. Thomas Morson and Son, Ltd. ; two houses, St. Stephen's Road, for Mr. A. E. Guy ; four houses, Holmwood Road, for Messrs. French and Buchanan ; four bungalows, Oaklands Avenue, for Mr. Charles Cable ; 286 houses, Aylands estate, for Messrs. W. Goodchild & Co. ; alterations, bioscope room, Rialto Cinema, for Mr. C. Masey ; extension, Sangamo works, Great Cambridge Road, for Messrs. Wimperis, Simpson and Guthrie ; two houses, Bazille Road, for Mr. S. E. Hopton ; two houses, Churchbury Lane, for Messrs. Bowyer and Bowyer ; four houses, Uvedale Road, for Mr. E. Yates.

The L.C.C. is to erect 25 dwellings, containing 80 rooms, at the Northwold Road area, HACKNEY, at a cost of £11,350.

SOUTHERN COUNTIES

Plans passed by the BEXHILL Corporation : Two houses, Wickham Avenue, for Mr. J. E. Maynard ; four houses, St. Andrew's Road, for Mr. J. H. Lye ; two bungalows, Knebworth Road, for Mr. A. E. Lewis ; two houses, Helmesdale Road, for Mr. G. Cash.

Plans passed by the BOURNEMOUTH Corporation : Additions, Castle Laundry, Castle Road, for Mr. R. Bevington ; alterations and additions, 626-8 Christchurch Road, for Messrs. Wilsons ; additions, Studland Dene Hotel, Alumhurst Road, for Mrs. Youngson ; additions, St. Mary's Church, Holdenhurst Road, for Churchwardens ; two houses, Priory View Road, for Messrs. F. Hoare and Sons ; flats, Gervis Road, for Mr. D. A. Wood ; hotel, Pine Grange site, Bath Road, for Modern Service Flats, Ltd. ; two flats, Kimberley Road, for Mr. S. Warde ; three houses, Warnford Road, for Mr. T. Kermode ; two houses, Harwood Avenue, for Mr. A. Laughton ; three houses, The Grove, for Mr. T. Fry ; two houses, West Way, for Mr. E. B. Little ; six shops, Christchurch Road, for Mr. H. G. V. Wallis ; four houses, Malvern Road, for Mr. W. H. Peaty ; flats, Dalkeith Lane, for Messrs. Jones and Seaward ; hall, Demmead Road, for churchwardens ; two houses, Southville Road, for Mr. A. Aston ; two houses, Iford Lane, for Mr. G. B. Ive ; six shops, Wimborne Road, for Mr. Boulton.

The Ministry of Health is to hold an inquiry into the scheme for the BRIGHTON Corporation to provide sea water swimming baths at West Street, at a cost of £50,000.

Plans passed by the EASTBOURNE Corporation : Stores and offices, Chamberlain Road, for Mr. C. M. Wood ; alterations, Blackwater Hotel, Grand Parade, for Messrs. G. Bainbridge and Son ; additions, St. Winifred's School, Meads Road, for Mr. F. G. Cooke ; six houses, Seaside, alterations, Central Cinema, Seaside Road, 56 houses, Seaside, for Mr. A Ford ; two houses, King's Drive, for Mr. S. G. Scales ; six shops, The Avenue, for Messrs. P. D. Stonham and Son.

SOUTH-WESTERN COUNTIES

Mr. H. E. Bettington, is to erect, on behalf of the Hereford Dwellings Co., Ltd., 28 flats in Bath Street, HEREFORD.

Plans passed by PLYMOUTH Corporation : Shop and two houses, Green Park Avenue, for Mr. J. Neal ; two houses, Vine Estate, Swilly, for Messrs. Williams and Gray ; 11 houses, Ganges Road, for City Estate Office ; three houses, Green Park Avenue, for Messrs. Brown and Sleeman ; alterations, Bank of England Place, for Governors ; factory, Water Lane, Stonehouse, for Plymouth Co-operative Society, Ltd. ; Roman Catholic Church and two houses, Barne Estate, for Rev. Father Symons ; four houses, Elms Estate, for Mr. W. H. Webb ; workshop, 16 garages and clubroom, Pounds Building Estate, for Mr. J. Hender.

EASTERN COUNTIES

Plans passed by the CHELMSFORD Corporation : Showrooms and office, London Road, for Messrs. Wenley, Ltd. ; four houses, off Mildmay Road, for Messrs. Choat and Son ; alterations and additions, 36, High Street, for Mr. H. J. Boon ; three houses, Galleywood Road, for Mr. R. H. Currie ; two houses, Lynmouth Avenue, for Mr. H. G. Gard ; flats, off New Writtle Street, for Dr. K. S. Storrs ; shop, High Street, for Messrs. Marks and Spencer ; works extensions, Writtle Road, for Messrs. Crompton Parkinson, Ltd.

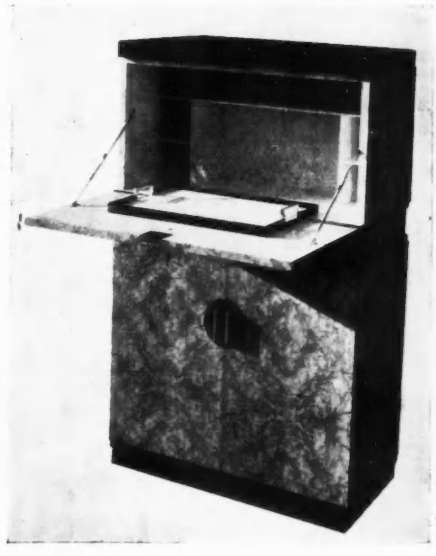
Plans passed by the COLCHESTER Corporation : Four houses, Old Heath Road, for Messrs. H. G. Pryke and Son ; two bungalows, Mersea Road, for Mr. C. H. Pegg ; four houses, Shrub End Road, for Mr. C. Brown ; two houses, Dunthorne Road, for Mr. T. J. Smith ; four houses, Ipswich Road, for Mr. J. S. White ; two almshouses, Military Road, for Mr. F. S. Daniel ; two houses, Sheepen Road, for Messrs. H. Everett and Son ; two houses, St. John's Road, for Mr. E. W. Pentney ; alterations and additions, Myland Hall, for Messrs. Duncan Clark and Beckett ; alterations, Kendal Road, for Colchester Industrial Society, Ltd.

MIDLAND COUNTIES

Plans passed at BURSLEM : 18 houses, Bank Hall Road, for Messrs. J. H. Broadhurst and Son ; pump house, off Waterloo Road, for Messrs. Shell-Mex, Ltd. ; reconstruction, 1-5, Back Elder Road, for Mr. J. O. Smith ; two houses, off Eastwood Avenue, for Mr. J. W. Walton.

Plans passed by the CHELTENHAM Corporation : Development, Treelands Estate, Leckhampton Road, for Mr. H. St. Clair Hall ; development, Newlands Estate, Evesham Road, for Mr. G. S. Stannard ; amended plans, telephone exchange, Presbury, for Office of Works ; laundry, Croft Road, Charlton Kings, for Mr. H. H. Peacey ; 12 houses, Naunton Way, for Naunton Estates, Ltd. ; new women' wards, and additions to nurses' home, Poor Law Institution, Swindon Road, for Gloucestershire County Architect ; two shops, High Street, for Corpus Christi College trustees, Oxford ; alterations, 42-5, Winchcomb Street, for Victory Motor Co. ; four houses, Naunton Terrace, for Mr. C. H. Reason ; additions, 340, High Street, for International Tea Co., Ltd. ; 15 houses and shops, Tennyson Road, for Mr. A. L. Baynes ; nine houses, Whaddon Road, for Naunton Estates, Ltd. ; six houses, Evesham Road, for Messrs. A. C. Billings and Sons.

Plans passed by the GLOSSOP Corporation : Two houses, North Road, for Messrs. Hall and Bowden ; alterations, Norfolk Arms Hotel, for Gartsides Brewery Co., Ltd. ; alterations, Station Road, for Hadfield Co-operative Society, Ltd. ; two bungalows, Hadfield Road, for Messrs. Holden and Miles.



Plans passed at HANLEY : Alterations and additions, Eastwood Works, Lichfield Street, for Messrs. J. and G. Meakin, Ltd. ; 12 houses, Boulton Street, for Messrs. E. Harris & Co. ; five houses, Hanley Road, for Mr. J. Jackson ; two houses, Warrington Road, for Messrs. Cummings & Co. ; shop premises, March Street, for Messrs. E. R. Dawson & Co., Ltd. ; shop and house, Abbots Road, for Mr. W. H. Hodgkinson ; four houses, Abbey Road, for Mr. A. Perry ; six houses, Aynsley Road, for Mr. J. Dimbleby.

Plans passed by the KIDDERMINSTER Corporation : Two houses, Stourbridge Road, for Mr. W. Lindley ; four houses, Highfield Road, for Mr. J. H. Smith ; four houses, Highfield Road, for Mr. W. Lindley ; two houses, Park Lane, for Mr. G. Clarke ; two houses, Sutton Road, for Messrs. T. W. Edwards and Son ; four houses, Batham Street, for Messrs. F. Highes & Sons ; four houses, Larches Road, for Messrs. H. and H. Bridges.

NORTHERN COUNTIES

Plans passed by the BOLTON Corporation ; 11 houses, Thorncliffe Road, for Messrs. F. &. H. Douglas ; service garage and petrol station, New Hall Lane, for Lady Beaumont ; 20 houses, Salford Road, for Mr. Maurice Welch ; two houses, Oakebottom Road, for Mr. John Markland ; junior school, St. Ethelbert's, Melbourne Road, for Rev. T. McGrath ; four houses, Morris Green Street, for Mr. Charles Booth ; two houses, Turton Street, for Mr. F. Cheetham ; 16 houses, Plodder Lane, for Mr. John S. Highes ; out-patients and massage block, Chorley Street, for Bolton Royal Infirmary Governors ; 10 houses, Wheatfield Estate, for Mr. Wilfred Andrew ; four houses, Abingdon Road, for Messrs. Leigh Bros., Ltd. ; club house, Moisant Street, for Messrs. Tootall, Broadhurst, Lee and Co., Ltd.

The WARRINGTON Corporation has obtained sanction to borrow £13,137 for the erection of 42 houses on the Reynolds Street site.

Cocktail cabinet, veneered with olive wood and coromandel. Designer : Edward Maufe. From DESIGN IN THE HOME, *reviewed on pages 531-2.*

E

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

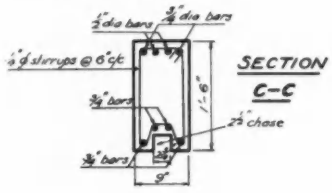
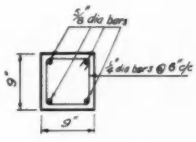
THURSO HOUSE, CAMBRIDGE



DESIGNED BY : : GEORGE CHECKLEY



ABOVE is reproduced an isometric drawing, and, within, a set of elevational and sectional drawings of the steelwork at Thurso House, one of the two at Cambridge illustrated on pages 521-4 of this issue. The consulting engineers were Christiani and Nielsen. Notes on the construction appear on the last page of this supplement.

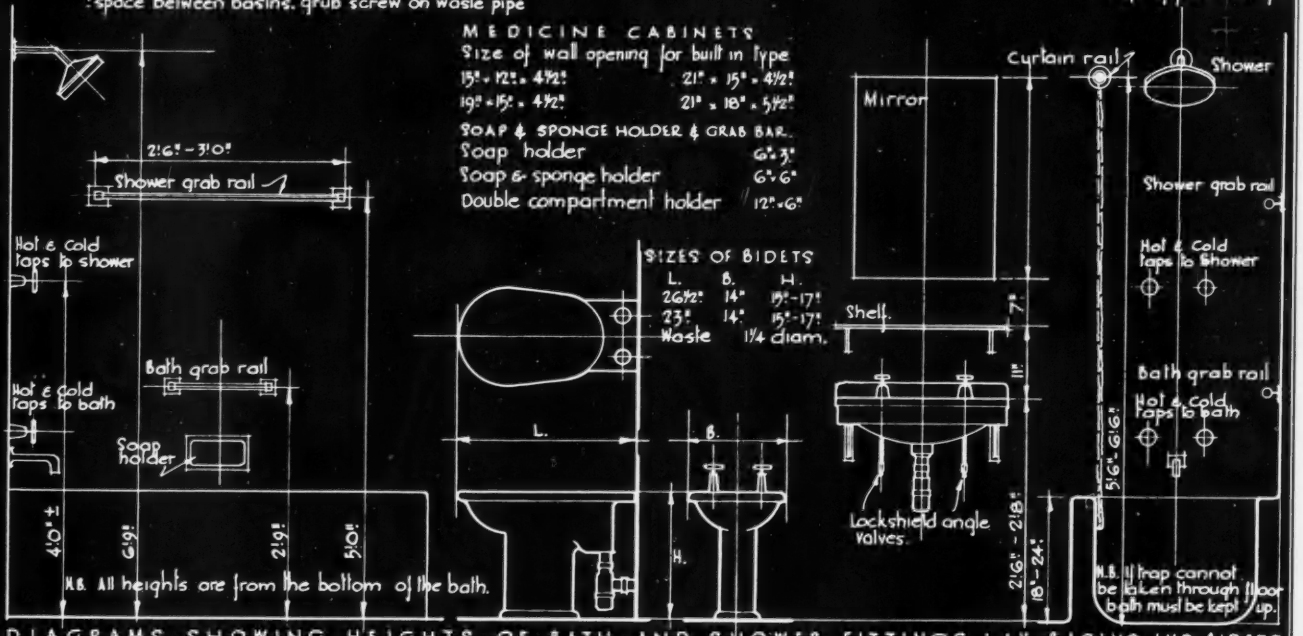
SECTION OF BALCONY

CONSTRUCTION	The reinforced concrete work is chiefly confined to the external walls, which are formed of concrete frames with 9ins. brick infilling, finished externally with cream cement rendering. Reinforced concrete is also used for the staircase and gallery in the hall, the external balcony, the shelter on the roof, and for internal lintels and ties.
PARTITION WALLS	Brick or breeze blocks.
FIRST FLOOR AND ROOFS	Of wood joist construction on account of cost.
ROOFS	Finished with standard flat roofing (bituminous felt) and macadam.
FLOORING (GROUND FLOOR)	Whole of ground floor with exception of boilers, larder, maids' w.c., tradesmen's vestibule, store and garage, finished in jointless flooring on concrete sub-floor. Boilers, larder, etc., in granolithic concrete.
FLOORING (FIRST FLOOR)	Bedroom No. 1 in jarrah; all other rooms in Japanese oak. Stairs and steps from gallery level in American oak.
HALL FIREPLACE	Reconstituted marble.
HEATING AND HOT WATER, ETC.	Boiler with indirect cylinder for domestic supply; it runs eleven flush heating panels placed beneath windows.
FUEL	Oil, burnt in automatic oil burner, under aquastatic control; also fitted with clock attachment for automatic starting at any time dialled. Oil from supply lorry is pumped to fuel storage tank through stand-pipe in hedge on roadside. No coal or coke used—wood fire in hall.
SECONDARY HEATING	Gas fires in all bedrooms and in study, dining recess and kitchen.

NOTE: *For plans of this house, see page 523 of this issue*



LAVATORY BASIN WITH: pipes enclosed; traps exposed; space between basins.

Inspection panels dowelled at the bottom edge and held at the top by metal collar and grub screw on waste pipe

Inspection panels screwed top and bottom.

LAVATORY BASIN WITH: overlapping sides; all pipes & traps enclosed; sloping front casing.

INFORMATION SHEET: PLUMBING AND SIZES OF LAVATORY BASINS, BIDETS AND BATHS.

SIR JOHN BURNET, TAIT AND LORNE ARCHITECTS ONE MONTAGUE PLACE BEDFORD SQUARE LONDON W.C.1.

INFORMATION SHEETS

• 14 •

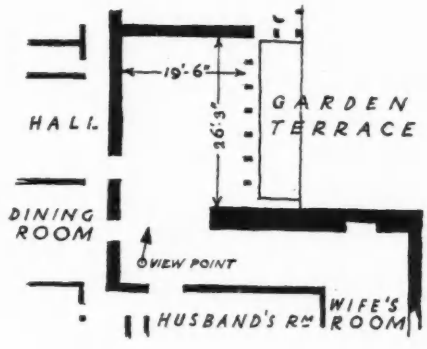
PLUMBING TO BASINS, BATHS, ETC.

•

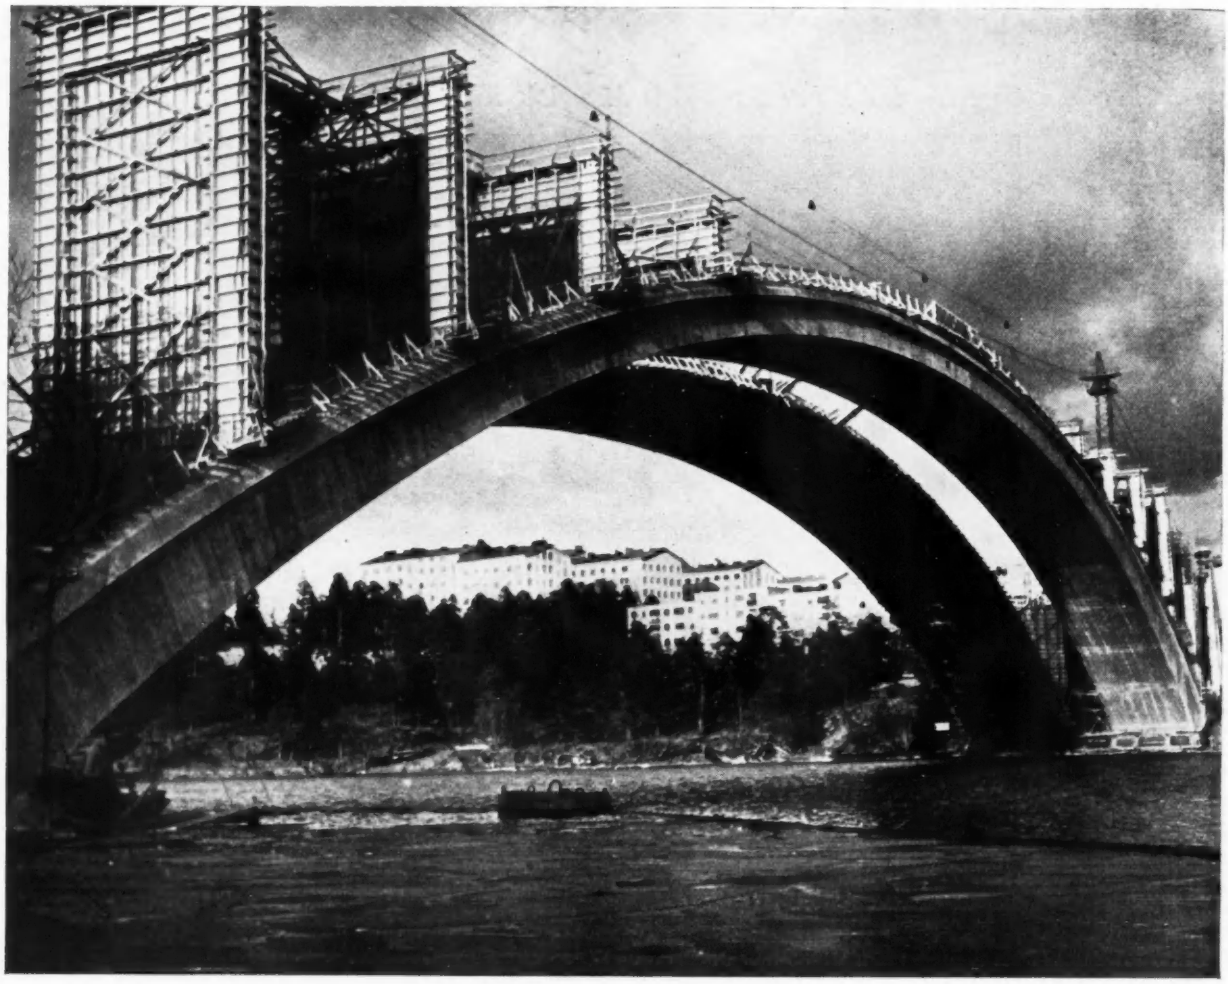
THIS week's Information Sheet again extends the data in regard to plumbing. With Nos. 1 and 5, already published, urinals, w.c.'s, lavatory basins, baths and bidets have now been covered, while the two immediately preceding issues have been concerned with a typical lavatory. There are still to appear Sheets relating to pipes and drainage.

Again, in this week's issue, an Information Sheet figures amongst the advertisements; on pp. xxiii-xxiv will be found details and data concerning hollow building blocks, prepared by the manufacturers (Messrs. J. H. Sankey & Sons) for the information of their architectural clients. This is perforated, so that it can be torn out and filed for reference.

The following is a full list of the subjects previously issued :—

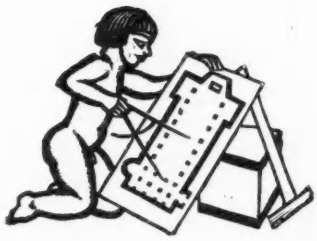


1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.
8. Mar. 8—Billiard Table Data.
9. Mar. 15—Roof Pitches and Drainage.
10. Mar. 22—Lift Sizes, etc.
11. Mar. 29—Sanitary accommodation.
12. April 5—Lavatory Units.
13. April 12—Lavatory Units.



A HOUSE AT INNSBRÜCK

THE LIVING ROOM ABROAD TODAY



THE vast window of this house at Innsbrück, Austria, forming one side of the room, can be lowered into the ground by operating a small electric motor. The plan shows how the living room is related to the other principal rooms of the house, including the separate sitting rooms of husband and wife. The architect is Lois Welzenbacher. The illustrations are reproduced from the first number (for May) of Design for Today, *just published.* *See also Astragal's notes on pages 548–9.*

A NEW CONCRETE BRIDGE IN SWEDEN

A view of the new Tranebergs Bridge now nearing completion at Stockholm, Sweden. The arches are claimed to be the largest yet built of concrete, having a span of 180 metres and a navigation height of 26 metres. The length of the bridge is 580 metres.

A PLANNING BOARD FOR LONDON

THE *Architectural Review* in a recent issue has made a suggestion with regard to the future planning of London which we think worthy of closer examination.

We have already indicated in the pages of this JOURNAL the attempts so far made by official and unofficial bodies in this connection, and the lack of municipal co-ordination. We await the next report of the Greater London Regional Planning Committee as to *definite* proposals for the development of outer London. Meanwhile, the activities of this body do not, as we understand, include any scheme for the re-planning of the central core, beyond the general proposition of the "decentralization of industries," etc.

Monday's discussion by the L.C.C. on slum clearance, arising out of Ministry of Health Circular No. 1331, revealed the magnitude of the problem and showed that it cannot be dealt with as an isolated section of the general plan.

This important central work, involving monumental civic planning and slum clearances on a vast scale, devolves, under the Town and Country Planning Act, upon the London County Council. We are unaware what attitude the L.C.C. intends to take in respect of its augmented powers under the above Act, but we surmise that the difficulties attendant upon a drastic application of it will probably induce them to confine their activities to certain particular areas where development is likely to take place, and which can be more easily dealt with under its powers. This appears to be the view of such an authority as Dr. Adams in a recent lecture when he also advocated a "guiding plan in broad outline for the whole metropolis."

Who is to prepare this plan, and how far is it to be translated into action?

Whatever may be the attitude of the authorities concerned, it is evident that there are considerable limitations, both to the powers and scope of these bodies, as at present constituted. The reaction of economic forces has more than ever made the re-planning, efficient functioning and development of the London region a national concern. Pending the formation of a body which can deal with these matters on a nation-wide scale, which was strongly advocated by economic experts in our New Year issue for January 11, the formation of a London Planning Board seems to be both wise and desirable.

The London Transport Board, which emerges as a consequence of recent transport legislation, is a step in this direction. The extension of traffic regulations cannot in themselves, however, solve a problem which requires a drastic reconsideration of the main lines of communication and the general street plan.

A London Planning Board would include much more than municipal and governmental representation. It would include representatives of the railways, road transport, Port of London, industrial and property-owning interests, electrical power, banking and finance. It would be in a position not only to lay down the lines of a plan, but to initiate development on a large scale by combining State loans, private enterprise and public finance, either by direct action following its planning proposals, or by guaranteed subsidiary companies developing along the lines indicated and approved by the Board.

It would be further essential that all proposals of a certain magnitude or involving drastic change of usage of a district should come before the Board for approval. We have in mind such propositions as the Adelphi scheme, King's Cross airport, etc. The preservation and scheduling of certain areas and buildings from demolition further requires a plan of demarcation which will render nugatory such violations of civic planning and æsthetic sense as the recent Carlton Gardens affair.

In advocating the formation of such a Planning Board for London we do not wish to minimize the present activities or potential activities of the London County Council and its adjoining authorities. At the same time it appears to us quite evident that these bodies in themselves, under the present circumstances, cannot cope with, or carry the whole burden of, a civic re-organization of national urgency which is without parallel in any municipal planning so far attempted.

It is a task for the chief citizens of this Grand Babylon to get together with the authorities and envisage, and carry out an organic and fundamental development worthy of the problem.

Persistent failure to co-operate must lead first of all to further confusion, and then to the inevitable reaction therefrom, namely, the stricter dictatorial State control, plainly visible in the world around us today—a development that few business interests can wish to see in England.

NOTES & TOPICS

DESIGN ON AND IN THE AIR

LAST week the first of the broadcast talks on "Design in Modern Life" enabled Messrs. John Gloag, Geoffrey Boumphrey and Edward Halliday to address themselves to the congenial task of pointing out what was wrong with contemporary design. It would have been simpler, and maybe a trifle more hilarious, had they used a few more concrete examples of design going wrong (and right).

*

As it was, the song sung by the Weston Brothers summed up their views: "Oh, it *has* gone down!"

*

But this introductory talk must have stirred innumerable listeners into unusual ways of thought about the subject of design, and it was an indisputable appetizer for the rest of the series. Many a household will be vaguely troubled from now on regarding what Mr. Halliday called "ye olde flickeringe yule-logge electric radiator."

*

FAKE'S PROGRESS

Meanwhile more and more traders and citizens embellish their shops and their homes according to these ancient lights. I saw the other day in the Strand a notice with "Ye Olde Chemyst's Shoppe" swinging above the latest thing in hygienically-packed super-modern toothbrushes.

*

"GIVE TASTE IN OUR TIME"

If only there could be an answer to that additional prayer that John Galsworthy once suggested: "Give taste in our time, oh Lord!" Still, a comforting idea of the excellent taste that is occasionally controlling design was provided by a small, well-selected exhibition of photographs, arranged recently by the Design and Industries Association in the hall of Charing Cross Underground Station.

*

An ampler and most promising record of good modern work is in the first number of *Design For To-Day*, a new monthly magazine which incorporates *Design in Industry*, the D.I.A. quarterly. The abundant illustrations show that the improvement of design is being taken seriously not only by designers and publicists, but by manufacturers.

*

Mr. Gordon Russell contributes an article (the first of a series under the title "The Designer and His Problem"), on the designing of the cabinet for the Murphy radio set, and it is to be hoped that others uphold the value of this first one.

*

Mr. Russell was lucky in his association with an industrialist of vision and enthusiasm; but that chance in itself could not by any means solve the problem, which was an entirely new one—that of enclosing a mechanical unit in a box neither "mock Queen Anne nor woolly American."

*

After the trials and tribulations through which this magazine has passed, I hope to see it flourish and wax exceeding influential; it has it in its power to do much for the cause of good design by exposing the bad.

*

Incidentally, I think the editor ought to have a pillory in each issue, for the adequate mocking of stupid things, and of the people who perpetrate them.

*

Design For To-Day reveals what a varied number of things *are* well designed. It stands for good sense rather than newness for its own sake.

*

Mr. Joseph Emberton, in an article in *The Evening Standard* last week, did likewise. He upheld good sense rather than newness in discussing the rebuilding of London. He described Le Corbusier's *City of To-Morrow* (which Mr. Trystan Edwards once named "The Dead City") and packed two columns full of sense in support of residential towers for slum-cleared areas.

*

"FUMIFUGIUM"

I referred some weeks ago to the intention of the National Smoke Abatement Society to reprint John Evelyn's *Fumifugium*. A copy of the sixpenny new edition is now before me. It has as frontispiece this portrait of Evelyn.

John Evelyn, author of "Fumifugium."

The dedication of these "remedies humbly proposed" is "to his Sacred Majestie (Charles II) and to the Parliament now assembled" (1661). And their nature is, briefly, that all "works be removed five or six miles distant from London"—in the direction of Greenwich.

*

Evelyn was a town planner before his time: he includes a plea for open spaces and plantations in the town of London. He was not to foresee the time when the manufacturing quarter would extend down-river to Dagenham and beyond, nor the ameliorations due to the introduction of anthracite and electricity, of coke and gas.

*

All that has happened since his day has done little or nothing to mitigate what Miss Rose Macaulay terms, in her introduction, "the hellish and dismal cloud of sea-coal which broods over cities and which is a nuisance of all time." Sooner or later this evil must be met, and Evelyn's doctrine of zoning holds as good as ever. London and other areas *must* be organized.

A hansom cab outside the Carlton Club.

HANDSOME IS AS HANSOM DOES

Joseph Aloysius Hansom, inventor of the cab, was by profession an architect with what we should consider today to be a very useful practice—mainly ecclesiastical. He was born at York in 1803 and lived (as it was only proper that the inventor of such an astonishing contraption should live) to the ripe age of 79.

*

It is just upon one hundred years since he introduced his famous "safety carriage" to a wondering world. He sold his patent for £10,000 to a firm which promptly got into financial difficulties, and he never saw a penny of his money. No doubt his experience as an architect softened for him the shock of not receiving his fees.

*

Anyway, nothing daunted, he invented *The Builder* the next year and our contemporary shows no signs of following the cab into oblivion.

*

It was this same Hansom who was architect of Birmingham Town Hall—which nearly ruined him financially because he had been unwise enough to become bond for the builder.

*

"BUILD NOW!"

I was glad to note at the Ideal Home Exhibition last Saturday that Mr. H. B. Bryant had been busy distributing "Build Now!" cards to the owners of the stands. They were prominently displayed by the various exhibitors, and I hope their slogan will be taken up by the general public.

*

Mr. Bryant further tells me that a number of two-colour posters on the same lines have been prepared. They are in two sizes: 30 in. by 40 in. for display on building jobs, hoardings, etc., and a smaller size, reproduced herewith (10 in. by 14 in.), for display in offices, in windows, on lorries, etc. A small gummed stamp has also been printed, to be used by supporters on their correspondence.

*

PEACEHAVEN PUTS TO SEA

The Cunard liner *Berengaria*, in which the Prime Minister sailed for America on April 15, has just been "reconditioned"—*and* redecorated—as though to make it worthy of the Nation's Envoy Extraordinary. The following details are culled from *The Times*:

*

In pursuance of the Cunard's policy of keeping its ships abreast of the times . . . Tourist-Class passengers will find an innovation which is sure to please: a long Tudor gallery on the port side, two hundred yards in length, with an attractive old-world atmosphere. Trees from the New Forest were used in the cleft-oak, half-timbered treatment of the gallery's plaster walls, and the iron grilles and brackets were made and wrought in smithies. . . . The general impression received on a tour of the ship was of comfort and quiet elegance.

*

Footnote to the above.—The Cunard's deficit on last year's operations was £400,000. The Norddeutscher Lloyd, the owners of the *Bremen* and *Europa*—which are, shall we say, *rather differently*, anyhow *less luxuriously* decorated—made a profit.

ASTRAGAL

BUILD NOW

Building will relieve unemployment. Great Britain can build her way back to prosperity. Proceed with your plans; build now!

IDEAL HOME EXHIBITION. At Olympia, Kensington, S.W. 10 a.m. to 10 p.m. Until April 29. 10 *a.m.*

INSTITUTE OF LANDSCAPE ARCHITECTS. At the Royal Horticultural Hall, Westminster, S.W. "Preservation of Rural England." By A. B. Knapp-Fisher, F.R.I.B.A. 3.30 *p.m.*

INSTITUTION OF STRUCTURAL ENGINEERS. Scottish Branch. *At 129 Bath Street, Glasgow.* "Some Problems in Steelwork Design." By W. Basil Scott (Junr.). 7.30 *p.m.*

LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. Annual General Meeting. 6 *p.m.*

NATIONAL HOUSING AND TOWN PLANNING COUNCIL. Annual Conference of local authorities in Lancashire and Cheshire. *At the Town Hall, Manchester.* 11 a.m. to 1 p.m. and 2.30 p.m. to 5 p.m. 11 *a.m.*

Thursday, April 27

ARCHITECTURE CLUB. At the A.A., 34 Bedford Square, W.C.1. Supper and Discussion: "Should Buildings have an Age Limit?" Supper 7.30 p.m. Discussion 8.30 p.m.

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "Reinforced Concrete Staircases." By A. B. Dailey, A.R.I.B.A. 6.30 *p.m.*

Friday, April 28

TOWN PLANNING INSTITUTE. At Caxton Hall, Caxton Street, Westminster, S.W. General discussion on the new powers contained in the Town and Country Planning Act, 1932, for prohibiting or regulating building operations. 6 *p.m.*

DESIGN AND INDUSTRIES ASSOCIATION. At the London School of Hygiene and Tropical Medicine, Keppel Street, W.C.1. "Revolutions in Civilization." By R. A. Duncan, A.R.I.B.A. Discussion to be opened by Darcy Braddell, F.R.I.B.A. 8.15 *p.m.*

Saturday, April 29

Sunrise 5.37 a.m. Sunset 8.19 p.m.

ASSOCIATION OF ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS. Annual Dinner and Dance, to be held at the *Florence Restaurant, Rupert Street, W.* 6.45 for 7 p.m. 6.45 *p.m.*

Monday, May 1

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. "Aerodrome Design." By Nigel Norman. 8 p.m. Also, exhibition of photographs, etc., depicting the progress of air travel. Until May 25. (10 a.m. to 10 p.m.) 8 *p.m.*

MODERN ARCHITECTURAL RESEARCH

Some years ago a number of well-known Continental architects formed what is known as "The International Congresses for Modern Architecture"—an association of various national groups of architects united by a common realization of the necessity for a new conception of architecture and its relation to the structure of society today.

Many solutions of contemporary architectural problems—such as, for instance, the problem of the "Minimum Dwelling"—have been discussed and formulated at the Congresses, which have been held at La Sarraz, Switzerland (1928), Frankfort (1929), and at Brussels (1930) when official delegations from 19 national groups—not, however, including Great Britain—attended.

At the invitation of the President and Secretariat of the international association, Mr. Wells Coates has now formed the nucleus of a British group of architects, engineers and town planners, whose work will be officially associated with the research programme of the International Congresses.

The new group will be known as the "Modern Architectural Research Group." Programmes and procedure for immediate research are now being prepared, and further details will shortly be published in the leading architectural journals.

The hon. secretary is Mr. F. R. S. Yorke, A.R.I.B.A.

The first annual meeting of the Building Industries National Council was held at the R.I.B.A. on April 13. Sir Raymond Unwin presided.

The reports of the General Purposes Committee and the Special Committee for Public Relations were presented by the chairmen, Messrs. Sydney Tatchell, V.-P.R.I.B.A., and Howard Robertson, F.R.I.B.A., respectively. The latter said there could be no doubt that the educative campaign conducted by the Committee has played a major part, and certainly an essential part, in influencing, if not converting, public opinion with regard to wise spending. It was felt that a further impetus might be given to the work of the Committee by the formulation of a definite plan showing the types of work which in the wide sense would best satisfy the conditions of being remunerative and of meeting real needs, while at the same time absorbing the maximum number of unemployed.

Mr. Kenneth Thomas, of Messrs. Kenneth Brown, Baker and Baker, was appointed honorary solicitor.

Subscriptions to the Fund, which has now reached the sum of £2,571-15-10 should be sent to Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

A NATIONAL HOUSING PLAN

Sir Raymond Unwin, P.R.I.B.A., will speak on "A National Housing Plan" at the next monthly luncheon of the Thirty-Two Club, to be held at the Northumberland Rooms, Northumberland Avenue, Trafalgar Square, on May 3.

MANCHESTER EXHIBITION

The Manchester Building Trades Exhibition was officially opened at the City Hall, Deansgate, Manchester, yesterday, April 25. It will remain open until Saturday, May 6.

THE ARCHITECTURE CLUB

"Should buildings have an age limit?" This question is to be discussed at the supper-discussion of the Architecture Club to be held at the Architectural Association tomorrow night. The discussion (preceded by supper at 7.30 p.m.) will be opened by Mr. J. R. Leathart, F.R.I.B.A., at 8.30 p.m.

IDEAL HOMES EXHIBITION

A special meeting of the Design and Industries Association, presided over by Mr. E. Maxwell Fry, A.R.I.B.A., was held at Olympia on Monday last. The subject debated was the architectural lay-out of the Ideal Homes Exhibition, and the new ways in which building materials have been used therein. Mr. Ian Jeffcott, F.F.A.S., the architect for the Exhibition, was the principal speaker, and Mr. Serge Chermayeff, F.R.I.B.A., opened the discussion.

LECTURES ON ARCHITECTURE

A course of three lectures on "L'Architecture: Cadre de la Vie" will be given by Monsieur Louis Madeline (Architect-in-Chief of French Civil Buildings and National Palaces) at University College, Gower Street, W.C.1, at 5.30 p.m. on May 4, 5 and 8. The lectures will be delivered in French and illustrated with lantern slides. Admission is free.

HANTS. AND ISLE OF WIGHT ARCHITECTS

At a recent meeting of the Hants. and Isle of Wight Architectural Association, held at Portsmouth, it was stated by the Secretary, Mr. A. L. Roberts, that the Association had been approached by various town planning authorities to devise a scheme to help them in the criticism of the elevations of buildings submitted under the Town and Country Planning Act which came into force on April 1. Four meetings had been held jointly with representatives of town planning authorities together with builders and contractors in the various areas of the county, and as a result it had been suggested that the most workable scheme would be for the Association to set up a local panel of architects, consisting of three members, to give voluntary assistance in criticizing schemes.

To avoid the delay which would occur when schemes were completed before being submitted to a local authority for approval, it was suggested that schemes should be submitted to the panel in the preliminary stages while still in pencil, so that any alterations required might be made before the

schemes were officially submitted to the authorities for approval.

The meeting were unanimously in favour of this line of action.

FORTHCOMING DINNER

The annual dinner of the Auctioneers' and Estate Agents' Institute will be held at the Connaught Rooms, London, on Thursday, May 11, 6.30 for 7 p.m.

L.C.C. AND SLUMS

A special meeting of the London County Council was held on Monday last to consider a motion by Mr. Herbert Morrison " that the Housing Committee be instructed to prepare forthwith a programme of slum clearance schemes in accordance with Circular 1331 of the Ministry of Health, dated April 6, 1933," which calls upon local authorities to prepare and adopt forthwith plans for the clearance of slums within five years.

Mr. Selley moved an amendment to the effect that " inasmuch as the receipt of Circular 1331 of the Ministry of Health, dated April 6, 1933, was followed by action with a view to the proposals in the circular being dealt with at the first meeting of the appropriate sub-committee of the Housing Committee on April 26, 1933, a special instruction to the committee on the subject is unnecessary."

After much discussion, Mr. Selley's amendment was adopted by 65 votes to 36.

EDINBURGH ARCHITECTS

The third of the visits arranged by the Edinburgh Architectural Association was made to St. Ninian's Church, Restalrig, on Thursday last. The architect of the new church is Sir Giles Gilbert Scott, R.A.

HULME SLUM CLEARANCE

It is expected that at the meeting of the Manchester City Council, to be held today, a decision will be reached on the Hulme Slum Clearance Scheme.

CONFERENCE OF LOCAL AUTHORITIES

Today, April 26, the annual conference of local authorities in Lancashire and Cheshire will be held at the Lord Mayor's Parlour, Town Hall, Manchester, from 11 a.m. to 1 p.m.

Arthur J. Davis, F.R.I.B.A., who, at a general assembly of the Royal Academy last Friday, was elected an Associate of that Body.

and 2.30 p.m. to 5 p.m. The conference will consider the following subjects :

1 : The General Housing Situation and the Effects of the Housing (Financial Provisions) Act. 1933.
2 : The Problem of the Slum, and the Administration of the Housing Acts, 1925 and 1930.
3 : The Rural Housing Problem, including the Administration of the Housing (Rural Workers) Acts, 1926 and 1931.
4 : The Town and Country Planning Act, 1932.

WEST YORKSHIRE SOCIETY OF ARCHITECTS

At the annual meeting of the above Society, held at its Leeds headquarters on Thursday last, the following officers for the ensuing session were elected :

President (second year) Mr. B. R. Gribbon, F.R.I.B.A. ; vice-presidents, Mr. Victor Bain, F.R.I.B.A., and Col. H. W. Barker ; hon. secretaries, Messrs. Norval R. Paxton, A.R.I.B.A., and Harold Conolly, A.R.I.B.A. ; hon. treasurer, Mr. Douglas Bowman, L.R.I.B.A.

B. R. Gribbon, F.R.I.B.A., who has just been re-elected President of the West Yorkshire Society of Architects.

In the report of the Council for the year 1932-33 it was stated that the membership of the Society at the close of the session stood at 419, a net increase of 23 members over the number for the previous year. It was also pointed out that one of the most important events of the year was the bequest to the Society by the late Mrs. Ellen Brown Bedford, widow of James Edward Bedford, former Lord Mayor of the City of Leeds, and brother of the late Frank Bedford, member of the Council of the Society in 1903 and 1904, of her residuary estate for the purpose of founding one or more travelling Studentships. These are to be known as " The J. E. Bedford Studentships." The Council understands that certain funds will be available for the Studentships in the coming session, and further conditions for the holding of the Studentships will be drawn up and circulated in due course.

SHEFFIELD AND SOUTH YORKS. ARCHITECTS

The forty-fifth annual report of the Sheffield, South Yorkshire and District Society of Architects and Surveyors, presented at the annual meeting held in Sheffield on April 20, showed that the membership of the Society is now 148 compared with 152 last year.

The officials and council were re-elected.

200,000 DWELLINGS NEEDED

Sir E. Owen Williams, K.B.E., in the first of three articles on housing in the current issue of *The Week-End Review*, writes :

> It is abundantly clear that the present housing accommodation in London and, generally, all over England, does not serve in any way the needs of the population either in quantity or kind. Its deficiency in quantity leads not only to overcrowding, but the discomfort, to say the least of it, of overcrowding is still further accentuated by the disproportion of kind or type.
>
> The immediate need in London is for about 200,000 new dwellings belonging in about equal numbers to types having two, three and four rooms each.

IMPORTANCE OF HARMONY

The Manchester and District Joint Town-planning Committee (states *The Manchester Guardian*) is about to publish a memorandum appealing for the co-operation of landlords and other interested in land development in an attempt to preserve and, as far as may be practicable, improve the amenities

in the extensive area with which the Committee is concerned.

The Committee feels that much disfigurement, resulting from insufficient attention to the design of buildings, their siting in relation to their surroundings, and the use of unsuitable material, is caused through thoughtlessness, and that it is only necessary to draw the attention of those concerned to a few matters of detail to secure the improvement desired.

R. I. B. A.

COMPETITIONS

The papers on "Competitions: Past and Present," delivered by Messrs. H. V. Lanchester, F.R.I.B.A., and Percy E. Thomas, O.B.E., F.R.I.B.A., at Monday's meeting of the R.I.B.A., are summarized on pages 561-562 of this issue.

COUNCIL MEETING

Following are some notes from a recent meeting of the Council of the Institute:

Officers of the Board of Architectural Education: The Officers of the Board for the Session 1933-1934 were appointed as follows: Chairman: Mr. W. H. Ansell (F.); Vice-chairman: Mr. A. H. Moberly (F.) (Chairman of the Examinations Committee); Professor A. C. Dickie (F.) (Chairman of the Schools Committee); Mr. G. D. Gordon Hake (F.) (Chairman of the Prizes and Scholarships Committee); Mr. T. A. Darcy Braddell (F.) Hon. Secretary.

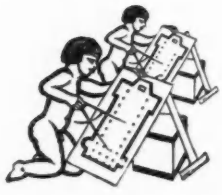
Fees for Housing Work, Re-conditioning, etc.: The following Special Committee was appointed to consider and report with the least possible delay on the question of fees for housing work, re-conditioning, etc: Messrs. E. G. Allen (F.); A. W. Kenyon (F.); T. Alwyn Lloyd (F.); Charles Woodward (A.); R. N. Mackellar (A.), and John Laing (Builder).

The Hertfordshire Society: Messrs. R. Barry Parker (F.) and Louis de Soissons (F.), were re-appointed to represent the R.I.B.A. on the Hertfordshire Branch of the C.P.R.E.

Dissolution of the Maritime Association of Architects (Canada): The formal approval of the Council was given to the dissolution of the Maritime Association of Architects in its present form and to the formation of the Nova Scotia Architects' Association and the Architects' Association of New Brunswick.

British Architects' Conference, 1934: It was decided not to hold a provincial Conference in 1934 in view of the R.I.B.A. Centenary Celebrations which will be held in that year.

W. H. Ansell, M.C., F.R.I.B.A., who has just been re-elected chairman of the Board of Architectural Education. This is his third year of office.



Whole-time Officials and Private Work: It was decided to add a clause to the report of the Salaried Members Committee approved by the Council in March, 1932, to the effect that architects whose main occupation is teaching in Architectural Schools are not intended to be included in the term "Whole-time Official" within the meaning of the Committee's report on Whole-time Officials and Private Work.

Amendment of Bye-Laws: The approval of the Privy Council to the amendment of Bye-Laws 28 and 34 was formally reported.

Transfer to the Retired Members Class: The following members were transferred to the Retired Members Class: As Retired Fellow: Mr. J. C. Hall. As Retired Associate: Mr. A. B. Wilson. As Retired Licentiate: Mr. J. Arthur.

Resignations: The following resignations were accepted with regret: Messrs. W. Brown (A.); J. E. Marchinton (A.); F. A. Allen (L.); A. E. Anderson (L.); T. M. Forrest (L.), and A. J. Penty (L.).

COMPETITION NEWS

BUILDING CENTRE COTTAGE COMPETITION

The following awards, announced on Monday night, have been made in connection with the above competition:

First Prize £100

Mr. N. E. Leeson, of Messrs. Oliver & Leeson (Newcastle-on-Tyne). Mr. Leeson's design was accompanied by a Tender from: Messrs. Adam Carse, of Amble, Northumberland, undertaking to erect four cottages for the sum of £900.

A Special Prize of £10 10s.: Mr. S. W. T. Blythe, of New Barnet, Herts. Mr. Blythe's design was accompanied by a Tender from: E. G. Campion, of Victoria Road, New Barnet, Herts., undertaking to erect four cottages for the sum of £900.

A Special Prize of £5 5s.: Mr. H. U. Diplock, of Sterret, Glover & Diplock, A. and L.R.I.B.A., of 27 Buckingham Gate, S.W.1. Mr. Diplock's design was accompanied by a Tender from: Messrs. Walter Gale & Co., of 22 Milverton Crescent, Leamington Spa, undertaking to erect four cottages for the sum of £900.

Fifty designs have been selected from those submitted in connection with the competition, for an exhibition which will be held in June at the Building Centre, when a special housing month is being arranged.

It is proposed to erect a pair of cottages from the winning designs for exhibition purposes on a site in the Strand, and these will be on view to the public for a month or six weeks. Full details of the housing month and the special Housing Exhibition will be issued later.

Three hundred designs were received, each accompanied by a Builder's tender definitely undertaking to erect cottages at prices varying between £850 and £1,000 for two pairs.

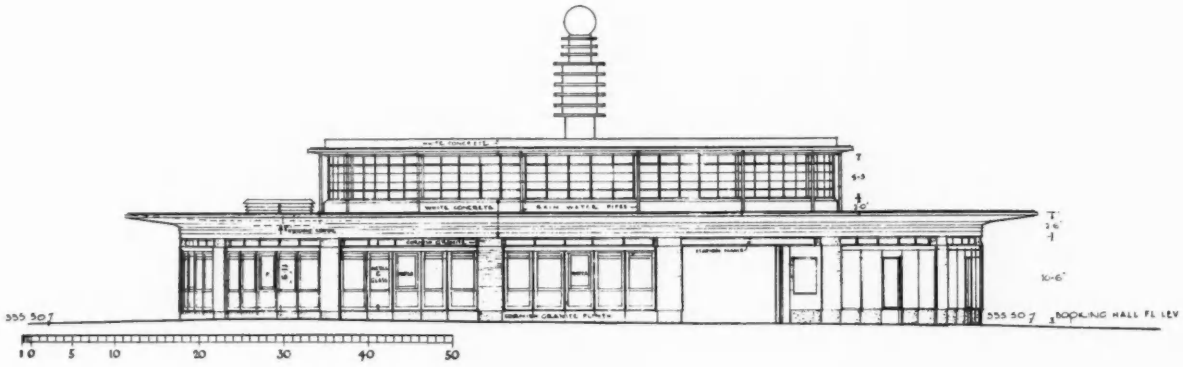
SURBITON HOSPITAL

The conditions for the new hospital buildings to be erected at Hill Manor, Ewell Road, Surbiton, which were recently drawn up by Mr. C. Ernest Elcock, F.R.I.B.A., have now been approved and will be issued shortly.

Competitions Open

May 8. — Proposed Burgh Chambers, Municipal Offices and Public Baths for the Town Council of the Burgh of Prestwick. Premiums: £200, £100 and £50. Designs to be submitted to the Town Clerk not later than 12 noon on May 8. The period for applications for conditions, etc., has now closed. Full particulars were published in *A.J.* for March 15.

May 30.—Sending-in Day. Royal Society of Arts Competitions for Industrial Designs. Applications for entry forms, instructions, etc., must be sent to the Secretary of the Society, at John Street, Adelphi, W.C., between May 1 and May 8.



May 31.—Sending-in Day. Layout of a suburb on the river Escaut, Antwerp. £2,400 in prizes (1st, £800). Conditions, etc., were published in *A.J.* for December 7, 1932.

June 3:—Sending-in Day. Limited competition for flats to be erected in Lordship Road for the Stoke Newington B.C. Premiums: £250, £100 and £50. Full particulars, etc., published in *A.J.* for March 29.

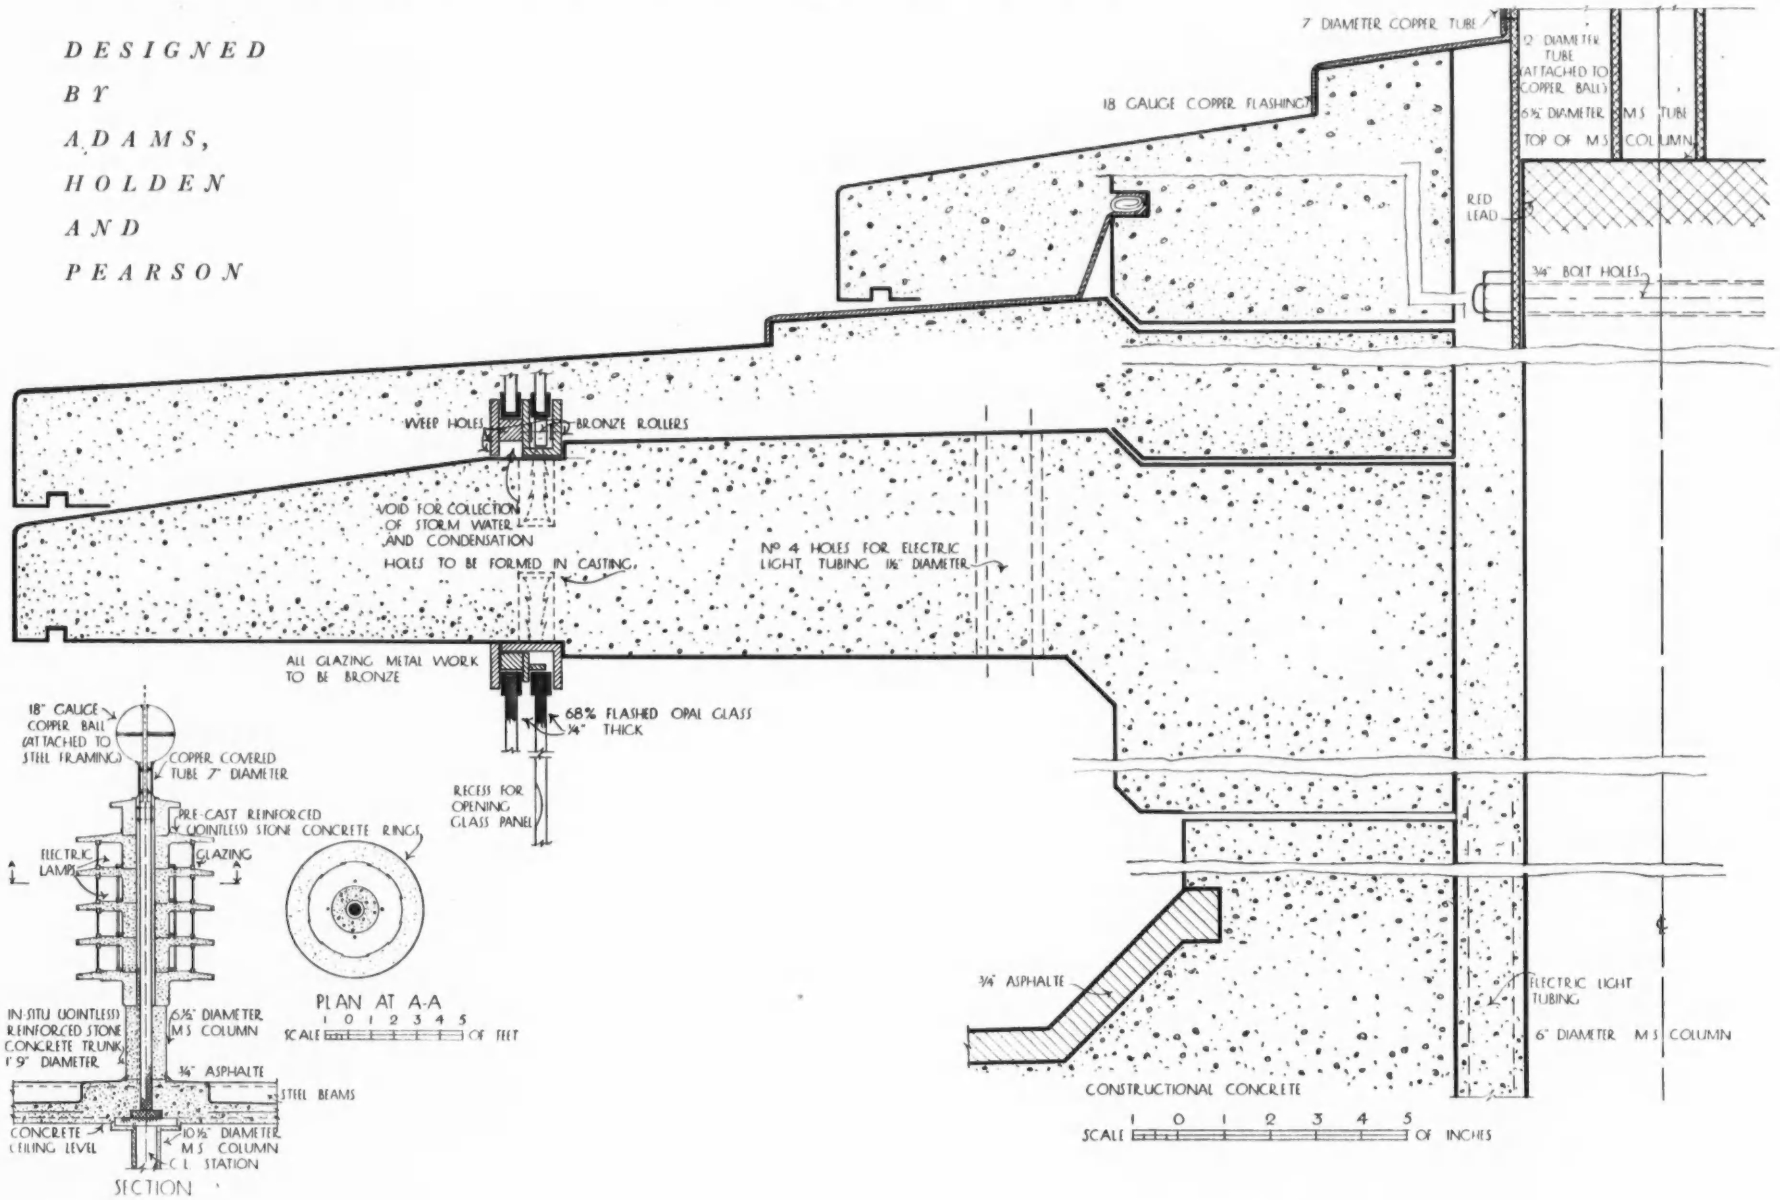
ON THE AIR

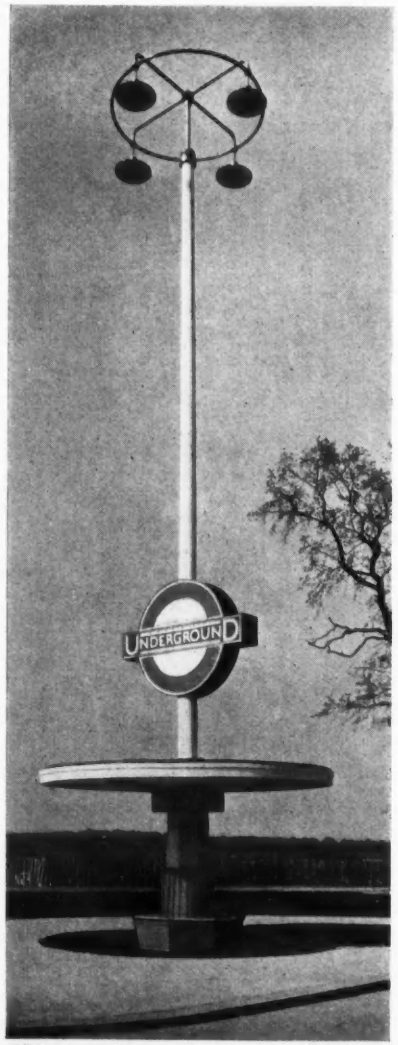
On Tuesday next, May 2, the third of the series of talks on "Design in Modern Life" will be broadcast in the National Programme at 8.30 p.m. by Mr. Gordon Russell, who will discuss "The Living-Room and Furniture."

SOUTHGATE UNDERGROUND STATION

The booking hall block at Southgate Station has been treated as a circular building in two stages, the lower covering the stalls, staff rooms, etc., with a wide projecting canopy, lighted from a box-light carried right round the building at the level of the station name fascias. The upper part consists of a continuous ring of metal-framed clerestory windows, the concrete roof being supported at the outside on small steel columns behind the window framing, and at the centre by a steel column. There are three entrances, arranged at intervals, so that the passengers are distributed, two streams in the directions of the existing High Street and Chase Side and the third towards the new bus draw-in road between the station and block of shops.

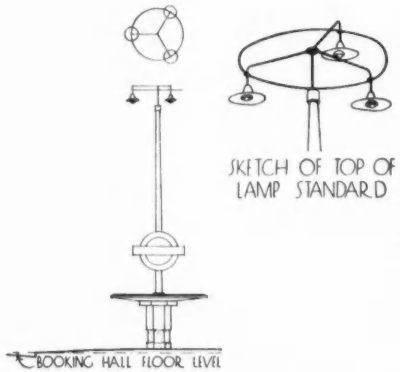
The internal finishings include bronze metal stall fronts with black and white tiling between and above them, the fascia line being further emphasized by a moulded bronze band and the stall boards providing colour in their painted cast iron panels. The central passimeter booking booth gives direct access to the escalators, shown in the adjoining view, leading down to the two tunnel platforms; these are finished with cream and orange wall tiling.





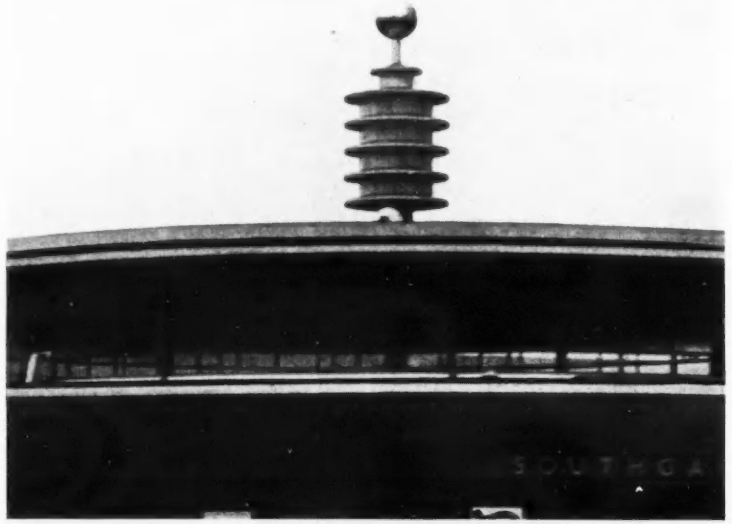
This photograph was taken last week; the scaffolding on the extreme left is for the lamp standard, of which drawings appear on page 555.

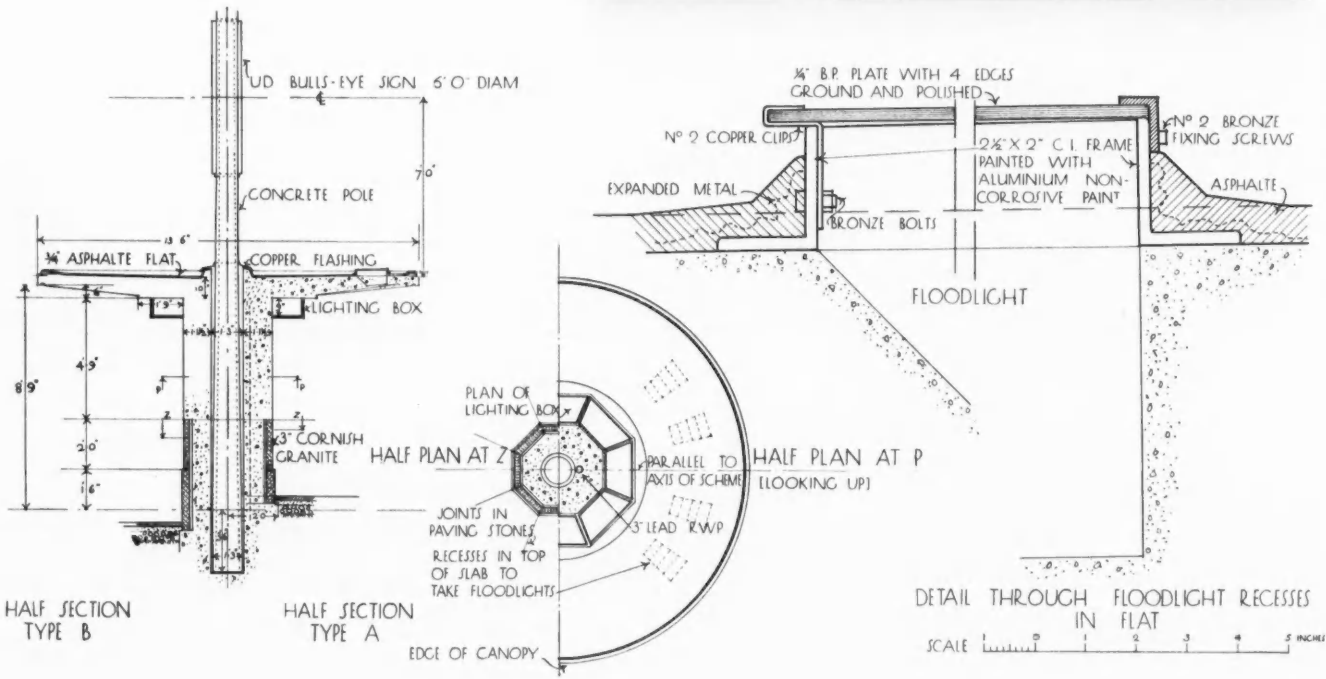
DESIGNED BY ADAMS, HOLDEN AND PEARSON



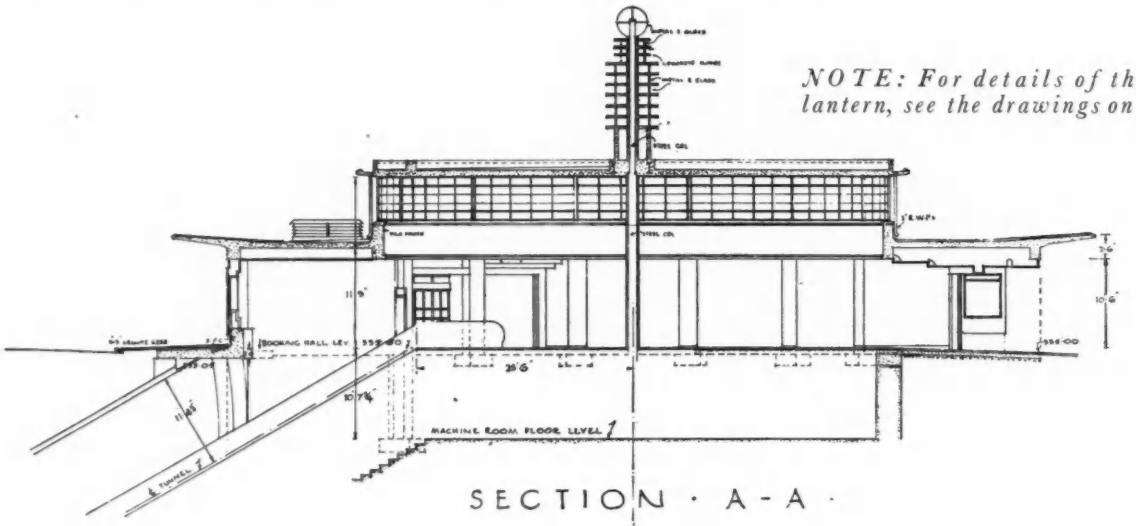
SOUTHGATE UNDERGROUND RAILWAY STATION

DESIGNED BY ADAMS, HOLDEN AND PEARSON

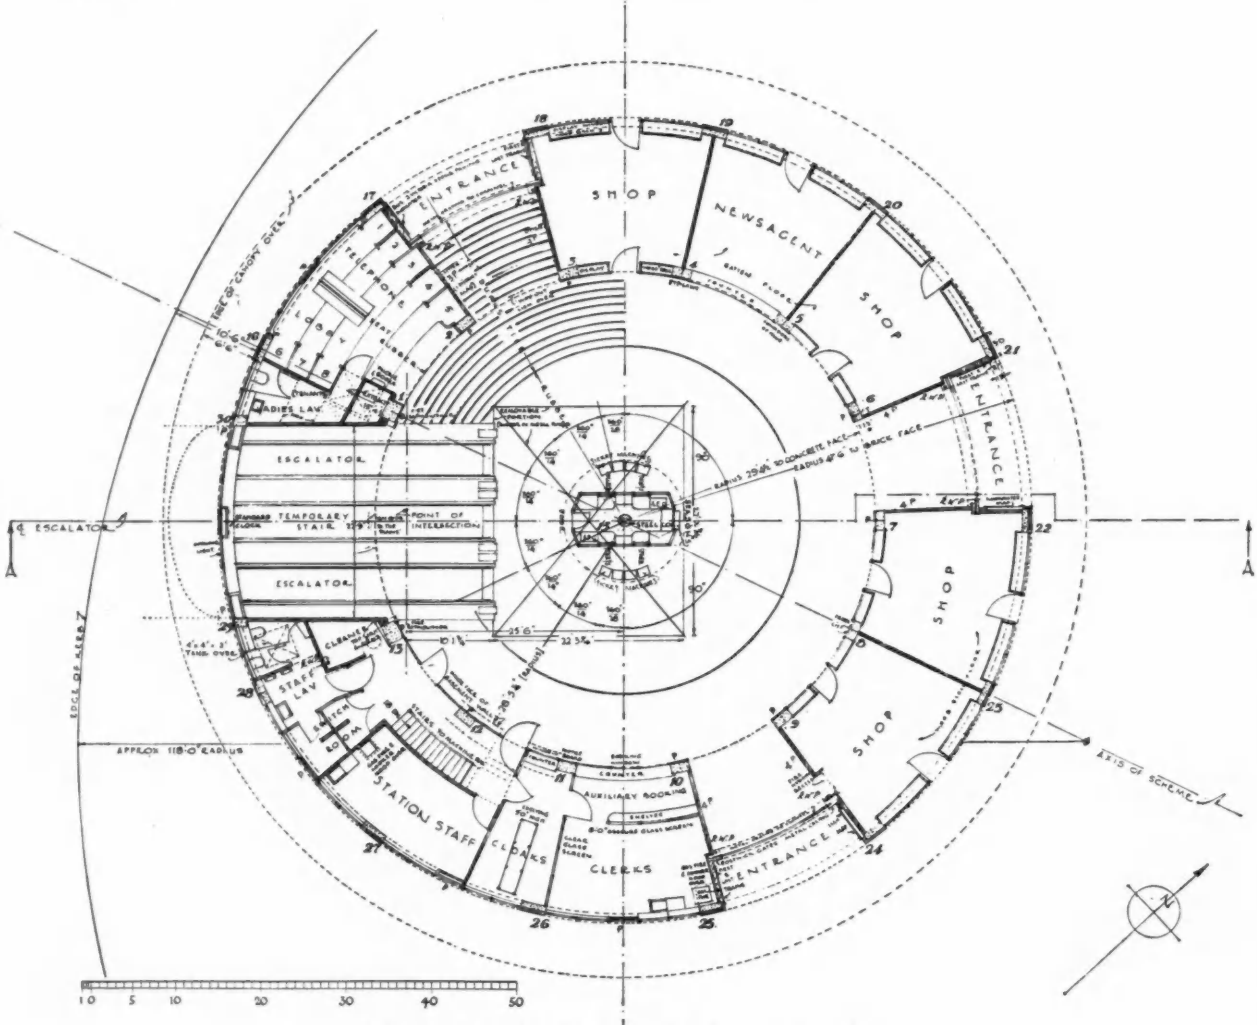




This is a photograph of a shelter-bullseye sign-lamp standard at Enfield West Station, designed by C. H. James. The design of that at Southgate, by S. A. Heaps, architect to the London Underground Railways, to which the detail drawings on this page refer, is on similar lines, but has three lamps instead of four.



The drawings on the facing page give constructional details of the chessman-like central lantern on the roof of the booking hall, of which an elevation appears on page 553 and a section with plan on page 556. The lantern consists of pre-cast concrete rings, with glazed bronze frames between them, in front of the lights, surmounted by a spun copper ball. The publicity service it supplies is supplemented by two concrete masts, on either side of the building, carrying the usual bullseye sign.



SOUTHGATE UNDERGROUND STATION

NOTE: For details of the central lantern, see the drawings on page 554.

Financing Public Works

SIR,—May I make some comments on the remarks of your leader writer in the issue for April 12?

It is the inadequate bank credit debt system which has been a main cause of slumdom. To continue financing the building of houses for the slum dweller on the same lines will succeed only in creating further slums. The financial blunder goes further back than the question of the foreign balance.

Your leader writer agrees that the proposed new loans will create debt, and I gather that he contends that the loans will come out of deposits. They will not; and it is necessary to any understanding of the present rules of credit finance to realize that bank loans do the opposite, that every bank loan creates an equivalent deposit—it comes out of nowhere. The same applies to money created by banks for purchases of Government stocks, debentures, etc., on their own account. Banks have a way of calling these created sums liabilities; the general public might look upon this power of creating money at will as an asset!

Cheques written against bank loans are mere scraps of paper until they are accepted by private creditors; it is industry in general which gives them any monetary value, and yet by doing so industry fastens a killing debt upon itself.

These hundreds of millions in the banks which are not being used in industry? *The Times* for April 12 gives total deposits as being nearly two thousand million pounds. Does your leader writer contend that this is all idle and available for loans for public works? Mr. Hore-Belisha, M.P., Financial Secretary to the Treasury, is reported in *The Times* for April 8 as saying, "There was no actually idle money outside the normal reserves kept for purposes of safety in good years as in bad." He was right; deposits are debt to banks. To say that "money need not be created; we have enough already," implies that power must be taken by Government to sequestrate private reserves. Does your leader writer propose this?

Banks have the power, by charter, to create and to destroy money at will, beginning with "the private company called the Bank of England."

All money other than coin (about ·7 of 1 per cent. of all money) exists as debt to banks, and could be destroyed by them at will by calling in loans and selling securities.

Bank loans are only figures, added to each side of the ledger, until passed on and accepted as money by industry. If accepted, it functions as real money, but is nevertheless debt to banks and liable at any moment to be recalled and destroyed.

The powers thus possessed by banks gives them hidden control over the whole of Industry. It is for the banks to put things right, and they cannot do that on their old system, which is mathematically certain to put them wrong (see *Social Credit* by C. H. Douglas), as we see at the present day.

Although I am not in the habit of advocating copyism of the U.S.A., especially at the present time, I would like to draw the attention of your leader writer to an article in *The Times* for April 10, "A Lead From America." In it Mr. Cordell Hull, the Secretary of State, lets the cat out of the bag. "He was ready to believe that all nations, the United States among them, had been 'starved down' sufficiently to incline them to listen to new proposals for application to a new world."

I think the chief of these proposals will be the establishment of that perfect credit rationing and utterly inhuman thing, an international bank!

ARTHUR WELFORD

A Reader's "Ideal" House

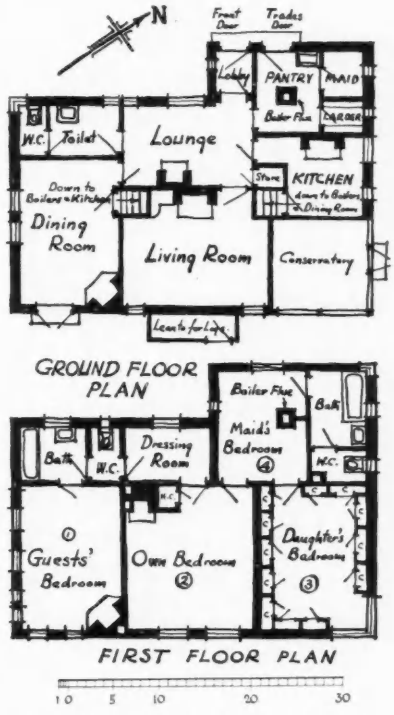
SIR,—I am venturing to send you the plans of my ideal house so that your readers may compare them with their own and possibly derive some benefit from them.

This house was designed and built primarily for our own use, and I would particularly call your attention to the ingenious and labour-saving arrangement of the kitchen and scullery, in the planning of which I was actively aided by Mrs. Blower. The extremely intelligent connection of the dining-room and kitchen by a staircase passing beneath the living-room, also giving access to the boiler house in the basement, commends itself to those who wish to place this "somewhere at the back."

There is, of course, the special provision of a rest room for our one servant, which I think I may be permitted to describe as a gracious affair.

Being a friendly family by nature, we decided to forgo the customary landing, and enter one bedroom from another.

I have omitted to give the elevations, but I need hardly add that these fell into place quite naturally as the work proceeded.



I might mention that at the conclusion of the job, owing to a slight oversight in preparing the plans, we were compelled to append a staircase outside the building, entering upon the first floor through the guest's bedroom. This freshness of treatment has provoked much appreciation from the various friends who have stayed with us since we moved in.

JOHN J. BLOWER

Dampness in Walls

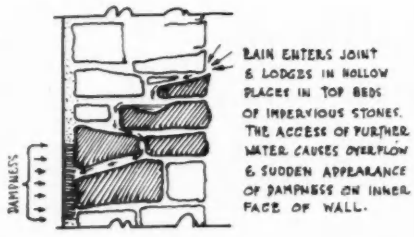
SIR,—We think that your correspondent W. E. A. (issue for April 12) might like to know the results of actual experience in the remedy of dampness in the outer walls in very exposed positions.

We were asked to inspect and advise a treatment for the dampness that showed on the inner surfaces of the external walls to several churches in

Plans of an "ideal" house designed by John J. Blower and described by him in a letter on this page.

Ireland. These walls were over 2 feet in thickness, and were built of a dense impervious whinstone, which was known locally as "weeping stone." The stone had apparently acquired this name because, owing to its impervious nature, condensation readily occurred upon it.

The dampness showed in roughly circular patches, scattered over the surface of the internal plastering, which was of ordinary porous lime and sand mortar, and it was difficult to connect these patches of dampness with any obvious defects in the pointing to the outer surfaces of the walls, which had been done with a very rich mixture of cement and sand, apparently applied in a rather soft condition, which had resulted in its cracking. The pointing was of the weather-joint type, but, in places, the bottom edges of the joints had been cut off above the top edges of the stones and many of these stones had their top beds sloping down from the face of the wall towards its heart.



This is, of course, contrary to the traditional practice of old masons, who were careful to bed the stones so that their top surfaces sloped outwards, thus shedding any water that found its way into the joints, instead of leading this water into the substance of the wall.

After a very patient investigation, the conclusion arrived at was that, owing to the almost complete imperviousness of the stones, any water that was driven through the outer joints was not absorbed, but travelled over the surfaces of the stones, and possibly lodged in depressions that existed in the upper beds of large stones, thus forming small interior reservoirs. The entry of a little more water would displace some of the water thus "cupped" and this displaced water would then escape over the edge of that particular stone to fall upon another, and so travel, in what might be termed a cascade, to the inner face of the wall.

Confirmation of this presumption was found in the fact that a recrudescence of the dampness upon the interior faces occurred almost immediately after the incidence of heavy rain which could not possibly have passed through the thickness of the walls by absorption in such a short interval.

The application of a two-coat rendering of waterproofed cement and sand to the internal surfaces of the walls proved entirely successful in these and many other cases. The face of the waterproofed cement rendering was skimmed with ordinary plasterer's lime putty and sand setting stuff, gauged with a little plaster of Paris, and left from the wood float, in order to prevent condensation.

In the case of a church which is not regularly heated, it would be desirable to apply an additional undercoat of porous lime and sand, gauged with a little plaster of Paris, as the outer walls are liable to become thoroughly cold, and when the church is occupied by a congregation, the sudden raising of the temperature and moisture content of the atmosphere would establish conditions that are very likely to result in condensation.

Section of rubble wall built with hard impervious stone, showing how penetration by rain may occur. See accompanying letter by L. E. Walker.

If your correspondent or any other reader would like to have a copy of the specification which provided a remedy in these cases, we should be glad to supply this, together with further details of the various jobs where a similar specification has proved satisfactory.

Such a treatment, of course, is equally suitable for any external wall which is damp, either through the penetration of rain, or through the absence of an effective horizontal damp-proof course, and indeed, in such latter cases, it provides the only quick and permanent remedy, short of cutting out and inserting a new horizontal damp-proof course, the cost of which is often prohibitive and hardly ever immediate in its results.

L. E. WALKER

Technical Paper No. 7

SIR,—My attention has been called to the letter of Mr. P. J. Waldram, in your issue for April 5, relative to the measurement of daylight factors by measuring grilles, and to the second edition of Technical Paper No. 7 and its review in your columns.

The paper (B) of mine to which Mr. Waldram refers (see *Journal of Scientific Instruments*, March, 1932) was not an account of how Mr. Waldram's measuring devices "could be used in the photo-theodolite," but is an account of my own independent work on the geometrical problem of dividing the image screen of any camera device systematically into elements of area representing *constant* amounts of percentage daylight factor at the station-point of the instrument, as an advance on previous image screens whose elements represented known but not constant amounts of daylight factor, so that simple counting of the elements takes the place of comparison with tables of appropriate daylight factors or the transference to a calculating diagram.

I share your reviewer's surprise that Mr. Swarbrick's work finds no mention in Technical Paper No. 7, since he has been directly and indirectly responsible for developments labelled (1), (2) and (3) in the prefatory note of that publication, but this results from the method adopted of references to the text; the addition of a bibliography would have been a useful feature, removing that anomaly.

In any case, the daylight factor grilles used by Mr. Swarbrick, so named by him and constructed in his office from instructions supplied by me, owe their origin to my acquaintance with the work of his unique Daylight Factor Photo-Theodolite, as will be evident to anybody consulting (A), (B) or (C), and are not due in any way to Mr. Waldram.

A. C. STEVENSON

We have recently received several extremely interesting letters in which the name and the address of the sender has not been included. We would like to remind correspondents that their letters may be published under pseudonyms, but that unless the name and address of the writer is made known to the Editor letters cannot be published.

SIR,—Your reviewer has apparently failed to notice that both the first and second editions of Technical Paper No. 7 give the published information as to the application of photographic surveying to daylight calculation.

On p. 17 of the first edition and p. 21 of the second edition the reader is referred to *The Illuminating Engineer*, Vol. 16, May, 1923, of which 2,000 reprints have been sold, mainly by Messrs. Batsford.

On p. 102 of that reprint will be found a complete description of the use of co-ordinate angle grilles in connection with photography, as a labour-saving device in daylight calculations.

The 1923 paper quoted above also mentions on p. 107 that flat projections of co-ordinate grilles constitute measuring diagrams for illumination on verti-

cal walls, but that a rectangular form given in the same paper was more convenient.

PERCY WALDRAM

[*This correspondence is now closed.*—ED., *A.J.*]

"*Economania*"

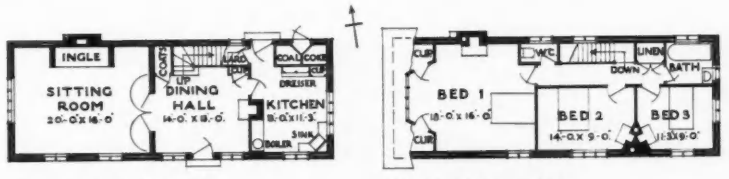
SIR,—The enterprise of British holiday resorts in their efforts to attract visitors during the season now begun is a graphic commentary upon the action of the Ministry of Health in banning certain public works on the vague ground that these are not "remunerative."

Among different plans undertaken around the British coast I note the following :—

	£	
Aberystwyth	21,000	New pavilion and palm court.
Blackpool ..	150,000	Indoor baths.
Bridlington	150,000	Concert hall, bathing pool, and gardens on site of old buildings.
Douglas (I.O.M.)	75,000	Promenade extension.
Felixstowe	30,000	Park, zoo, ballroom, etc.
Hastings ..	65,000	New bathing pool with terraces, a sun parlour, and cafés.
Scarborough	30,000	Extension of sea wall.
	7,000	Bathing pool.
Southend ..	56,500	Illuminations, new shelters, and park for 1,000 cars.
Southport	30,500	Bathing centre with beach bungalows.
Southsea ..	100,000	Winter gardens and a hall.

What I should like to know is whether even the most stubborn of advocates of economy would veto such work as "unremunerative." Before doing so, let him ask the people of Blackpool and Scarborough and Aberystwyth and Southsea what they think about it. He will find them unanimous (especially nowadays when faced with the competition of cruising holidays) in declaring for this form of spending money to attract the visitor. Indeed, I think I am correct in saying that Blackpool and Southsea at least have made themselves as holiday resorts in their differing respects by wise spending financed by their own rates. It is quite obvious that only by well-planned and far-sighted development can our own health and holiday resorts meet the competition of Continental holiday facilities.

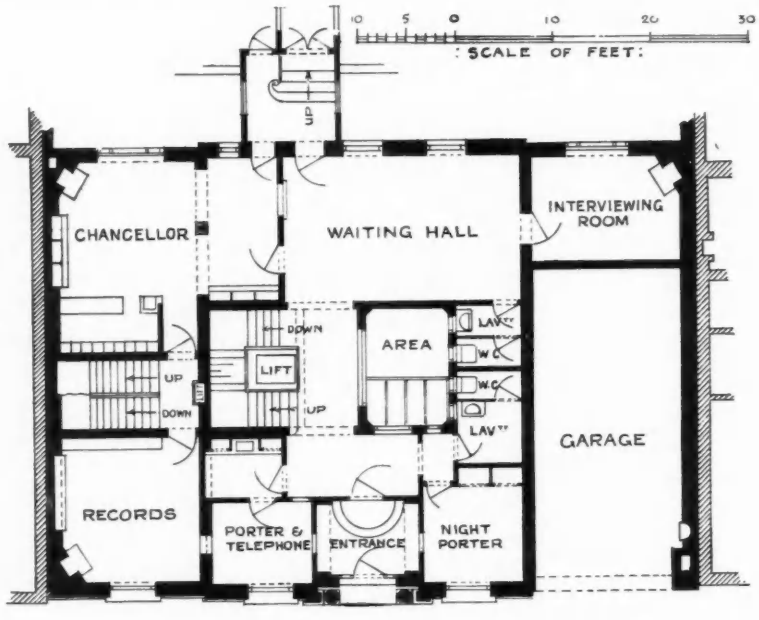
HOLFORD KNIGHT



A NEW THATCHED COTTAGE

DESIGNED BY KENNETH DALGLEISH

In planning this cottage for a Warwickshire site an endeavour was made to give maximum floor-space with minimum passage-room. The front door opens into a dining or lounge hall, separated from the sitting room (shown below), by large double doors, which can be opened wide. The external walls are eleven-inch cavity brick above an uneven plinth of warm red facing bricks, similar to those used for the chimneys; they are covered with a cream slurry of cement and sand. The casements are steel with lead lights, and the roof is covered with Norfolk reed thatch. An article on thatching appears on page 563. The plans of this house, as all plans published in the JOURNAL, *are the copyright of the architect, and may not be "borrowed" by speculative builders.*



CHANCERY AT THE ITALIAN EMBASSY

This building is situated in a small close, leading off Three Kings Yard, London, and was erected on the site of stable buildings belonging to and at the rear of No. 4, Grosvenor Square, the new home of the Italian Embassy. It is the Chancery to the Embassy, accommodating the Councillor, Secretaries, the various Attachés, the Chancellor and the rest of the Official Staff of the Embassy, and is connected to the mansion (the home of the Ambassador) by means of a communicating corridor at the ground floor level.

Extensive alterations have been made to the interior of the mansion, including reorganizing and decorating rooms on the ground and first floors, to make them suitable for the holding of State functions.

The work to the Chancery and mansion, both internally and externally, has been designed to give an Italian character to the buildings and, by special request, Italian workmanship has been employed wherever possible. The elevations of the Chancery have been carried out in reconstructed Portland stone and multi-coloured bricks, with bright red arches and quoins. The grilles to the windows, and the balustrades, are in wrought iron; the whole of the building is roofed with an asphalt flat.

THREE KINGS YARD

DESIGNED BY A. BURNETT BROWN AND ERNEST R. BARROW

COMPETITIONS
PAST AND PRESENT

Below are printed summaries of the two papers dealing with the above subject, read on Monday before the R.I.B.A. by H. V. Lanchester, F.R.I.B.A. and Percy E. Thomas, O.B.E., F.R.I.B.A.

1. The Past

By H. V. LANCHESTER

IN 1839 it was thought admissible for the promoters of competitions to decide on the merits of the designs submitted, and though even then technical advice was sometimes secured, it took another 44 years before professional adjudications became a regulation of our Institute. During that period various experiments were made in the direction of associating professional advisers with the promoters or their nominees, but rarely did these prove satisfactory.

As I have mentioned, it was only in April, 1883, that the R.I.B.A. made it a definite regulation that the promoters of a competition should as their first step appoint one or more professional assessors, further strengthening this procedure by deciding in November, 1910, that members should only compete in cases where the regulations, including professional adjudication, were complied with.

Experience tells us the advance in practice does not keep pace with our standard of knowledge as to the ideal conduct of a competition, owing to the promoters not understanding the purpose of our rules, and therefore not co-operating with the assessor in his efforts to secure the most equitable result.

To be quite fair to promoters, I must say that when recommendations are put lucidly to them from a clear and logical standpoint, it is my belief that in most cases they accept advice so supported. The responsibility for giving such advice in an appropriate form rests with the architect, and important competitions have sometimes fallen short of the standard they might have reached, more by our own default than by reason of any intentional malpractice on the part of the promoters.

THE NEED IN COMPETITIVE PRACTICE

Continuity from start to finish, such as we find in non-competitive work, is the great need in competition practice. At present there is a tendency to cut it up into three distinct stages, greatly to the detriment of the result: the first stage, before the appointment of the assessor or jury, the second during this appointment, and the third after the selection of the design.

To put competitive practice on a sound basis, the breaks between these stages should be bridged over, and I have ventured to suggest a procedure by means of which this may be achieved. I do not say that there may not be better ways: the one put forward is merely a suggestion as to the type of procedure that might be appropriate.

Let us assume that some public body is promoting a competition and has appointed a building committee. After some preliminary discussion they would ask for the appointment of an architectural adviser and depute two well-qualified members to confer with him, possibly the chairman and city engineer, or chairman and medical officer, according to the class of building. These three would draw up the programme. Before issuing this, two other independent architects would be added to form a jury of five, and on the programme having been agreed by them, it would be issued to competitors. The usual stages of questions, replies, and receipt of designs having been passed through under the supervision of this jury, its members would jointly make their award, dealing very fully with all the considerations necessary to inform the successful competitor as to any fresh aspect that has occurred to them during the adjudication. Their award might be in two parts, one for publication, and the other more in the nature of a confidential communication to the selected architect, in order to make him conversant with problems and difficulties affecting the further development of his design.

THE ARCHITECT AS ASSESSOR

I have often heard it said that a good architect is necessarily a good assessor, but to my mind this is not the case. It may be admitted that the same intuition that enables an architect devoid of the analytical faculty to produce a brilliant design may empower him to select the ablest one submitted in a competition. That is not the weak spot in his equipment as an assessor. This will be discovered in the earlier stages, such as discussions with the promoters and the preparation of the programme. To place the issues properly before a clear-headed business or professional man, whose experience is outside the technique of art, demands a faculty of logical exposition and an experience of the difficulties involved which are not essential concomitants of imaginative force.

I introduced one of the architects a stage earlier than his two professional brethren, in order to take advantage of employing one, specially qualified by his attitude of mind and his experience, to thrash out with laymen those points of detail and method that are so often misunderstood. He is thus "the forerunner" who paves the way for his association on the jury with one or more whose artistic qualifications may perhaps rank higher, but whose limitations in other respects might preclude their being entrusted with the conduct of a competition.

As a general rule, experience as a competitor is almost essential as a qualification for the single assessor, but in the case of a jury this experience may be dispensed with in some of its members if it is in other respects advantageous to have a wider field for selection.

To use César Daly's phrase, "The direction of architectural ideas" is subject to gradual change, and the pioneers of one generation become the exponents of the academic school in the next. In order, therefore, that vital fluctuations in our art shall receive due appreciation it is desirable that the adjudication of competitive designs shall not be entirely in the hands of the older and more experienced men, whose sympathies are liable to incline towards the earlier as against the newer methods. At the same time experience and mature judgment are invaluable, so that one of the chief recommendations of the jury system is the facility it affords for securing both the experience of the older and the fresher point of view of the younger men.

Finally, we come to the competitor, who, when he has decided to compete, sits down to master the conditions and programme. If the latter is well drawn up it should at once give the competitor a good general impression as to what the promoters have in their mind; if it is not, the competitor, by much reading and re-reading, will gradually obtain, from accidents of phrasing here and there, some idea of the points to which importance is attached. With a good programme no further questions should be needed, but with a bad one the competitor can help to patch it up by means of questions on salient points.

THE BEST PROGRAMME

From the competitor's point of view the best programme is one that states clearly what is wanted but makes no attempt to indicate how these wants are to be provided for. As a rule, the allocation of the relative positions for the accommodation asked for is a mistake, tending to hamper freedom in the conception of the design. If special requirements have to be met, it is far better that these should be thoroughly explained than an attempt made to anticipate the competitor's work by specifying some definite arrangement.

Holding the views I do with regard to the basis on which a competition should be decided, I must point out how rarely is the competition in two stages advantageous. Almost its sole use is in placing before promoters a series of definite solutions from which they can realize how they have failed to grasp and express all that they had in mind. They are then able to supplement the programme and secure a design more closely approximating to their requirements. If this is clearly recognized it disposes of any argument for or against double competitions. The promoters are obviously entitled to claim that the problem is so complex that only by means of a double competition can the best result be secured, but solely on the ground that only after seeing sketch solutions can all the difficulties be realized. After all, one's private client has often to see two or three sets of sketches before he can fully explain himself. The main difference is that the assessor should be able to clear up difficulties of this kind, and where he can the double competition becomes unnecessary.

2. The Present

By PERCY E. THOMAS

LIMITED competitions are usually restricted to architects who receive direct invitation from the promoters, or who are selected by means of the submission of names and records of previous work. There have been a good number of limited competitions in recent years, and there are many people, architects and laymen, who strongly advocate the principle. I believe the reason in many cases is that it gives them a sort of "Safety-First" feeling. They feel satisfied that at least they know the worst that can happen.

Another argument used in favour of the limited competition is that for special buildings the competition should be limited to architects who

specialize in that particular class of work. I have already stated what I consider are the objections to this argument, and they apply equally in this case.*

It should also be borne in mind that the planning and equipment of special buildings are constantly changing with the progress of science and invention.

Personally, I feel that if the competition system itself is right, then the open competition is the simplest and fairest to the profession, and as it is undoubtedly the one which has produced our best men, it must also be the best from the promoters' point of view.

THE OPEN COMPETITION

The open competition, held in two stages, can only be justified in very exceptional circumstances. It has, I know, many supporters who would have practically all major competitions held in this way, but it is significant that few experienced competitors believe in it. They know that as far as the labour involved is concerned, the same amount of research work and thought must be put into the problem in the first stage. The elaboration of drawings, and even the working out of parts of the design, are minor matters which take comparatively little time, and which, in my opinion, do not justify the delay and additional expense involved by a further stage. It can be safely stated that practically every competition of this character is won in the initial stage, and that the other competitors in the second stage are merely elaborating designs which have already lost, for it would take a bold man to depart fundamentally from a scheme which has already secured him a place in the second stage.

To overcome this difficulty one of the technical journals recently made the suggestion that before the second stage, the original sketches should be exhibited for all competitors to see, but that the sketches should be retained by the promoters for comparison with the final drawings, and would be binding upon competitors just as original esquisses are binding in student competitions, the idea being that any competitor selected for the second stage could retire if an inspection of the designs convinced him that it was useless for him to proceed further. But architects are all optimists, and as the suggestion was also made that the competitors in the second stage should be paid a fee, I am afraid most of them would be tempted to take an optimistic view of their chances.

THE ASSESSOR

Under this heading I propose also to deal with the question of juries.

The question of the assessor is probably the most controversial and difficult in the competition system. Many hold the view that the jury system ought to be generally adopted, their argument being that errors of judgment would be fewer, that there would be less chance of the result resting upon the idiosyncrasy of the assessors, and that there would be no playing up to the assessor's known opinion or prejudice, but the principal argument advanced in recent years is that with the jury system the promoters could, if they desired (and they would desire), have representation on the jury.

This suggestion that the promoters should have a voice in the award has been advocated recently by quite a number of architects who seem to forget the continuous scandals throughout the nineteenth century and the beginning of this century which made it necessary to insist upon the absolute acceptance of the assessor's award.

I do not like the argument that you should include a representative of the promoters on the jury to make them feel that they are having some share in making the award. It does not seem quite honest, and if it is only their views that are wanted, surely these are obtainable before the designs are received, and the question as to how these views have been met in the designs can only be decided by men whose training and experience renders them competent to judge.

Take a recent case, familiar to all of you, where the assessor, quite wrongly in my opinion, agreed to consult the promoters before making his award. What happened? The promoters insisted upon the design which they favoured being selected. The designs have all been published, and I leave you to judge what help these promoters could have given the assessor in making his award.

To the jury system, i.e., a jury of architects, it is difficult to make objection, although it is extraordinary how many architects, experienced in competitions, will prefer to leave the decision to one good man.

There is the question of expense to consider for all except very large or important competitions, for even if the assessors agree to share or reduce the recognized fee, the expenses of a jury, if the assessing has to be done at any distance, and they all conscientiously do their duty, must be a considerable item.

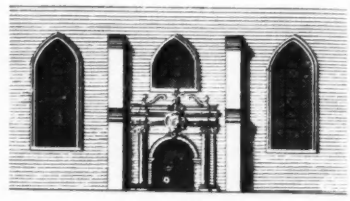
I believe that with most juries one of its members does the bulk of the work, especially in the preliminary stages, and that the other members may not, in consequence, have that thorough grasp of the difficulties of the problem which renders them competent to have a voice in the award.

I consider that for most competitions, the single assessor, providing always he is competent, is the most satisfactory method.

The Competitions Committee at the present time are giving careful consideration to this matter of the promoters having a voice in the award, but as their views have not yet been laid before the Council, I cannot say anything further about that this evening.

THE APPOINTMENT OF THE ASSESSOR

As most of you are aware, the appointment of the assessor is entirely in the hands of the President, except in cases where the promoters have appointed the assessor before approaching the Institute.



It can be realized that this does not always work out satisfactorily, and many suggestions have been put forward for an alternative method. The two most frequently advocated are (1) that the competitors themselves should select the assessor or jury, and (2) that the selection should be left to a body such as the Competitions Committee.

In support of the first, it is claimed that if competitors are to give of their best, they must have confidence in the men who are going to assess their work, and that this would best be achieved by the competitors themselves making the selection from a panel nominated by the President or the Competitions Committee.

One objection to this proposal is that the competitors as a body do not exist until they have studied the conditions and decided to compete, so the whole of the preliminary work of the consultation with promoters and drafting of conditions and requirements would have to be done before the assessor was appointed and might convey ideas totally at variance with his own.

With regard to the appointment by the Competitions Committee, the objection to this is that the Committee is bound to include many of the men most suited to act as assessors. Are they to appoint themselves in turn, or are we to lose their services in this direction altogether?

I confess that at the moment I see no better way than the present, and although mistakes may occur, we have no guarantee that they would not also occur under a different system of selection.

Empire Timber Resources

The timber resources of the British Empire were reviewed by Major J. R. Cosgrove, of the Forest Products Research Laboratory, Princes Risborough, in a recent lecture to the Planters' Group of the Royal Empire Society.

At present about 90 per cent. of the timber imported into the United Kingdom comes from foreign countries. During recent years, however, there has been an increasing demand for Empire produce, largely as the result of the work being done by Princes Risborough, the Imperial Institute and other bodies which have been aided financially and generally by the Empire Marketing Board. With the aid of lantern slides and the Board's films, Major Cosgrove illustrated how some of the chief timbers are obtained and the uses to which they are put.

British Foundation in Paris

Work has now been started at the University City of Paris on the much-needed British Foundation. By next year a hostel of 150 rooms will be ready for British students wishing to study there.

New Orphanage at Wavertree

Work is now well advanced on the foundations of the new Liverpool Orphanage at Wavertree, which it is hoped to finish in fifteen months, at an approximate cost of £50,000. The architects are Messrs. Barnish, Silcock and Thearle, whose design was awarded first place in the competition limited to Liverpool architects.

A Recent Will

Mr. T. Haines, architect, of Kew, left £12,163 (net personalty £11,121).

* Mr. Thomas, in the first part of his paper, said: "The architectural specialist, unlike the specialist in other professions, obtains his position largely as the result of opportunity or accident, rather than deliberate intention. The main principles of planning and design are common to all classes of building, and while greater experience may bring perfection in detailed planning and equipment, it is more than counterbalanced by the freshness of mind and variety of solutions which are obtained by means of a competition."

REED THATCHING IN NORFOLK

[BY HUMPHREY C. BOARDMAN]

NORFOLK reed thatching suffers more wrongs through mistaken identity than from any other cause, and it is more often unfairly condemned for false reasons than praised for its own singular merits.

Many would include the commonest straws, such as wheat, barley, oats, etc., in the category of reed thatching, yet barley straw is too short, oat straw is cut up for feeding cattle and horses, leaving wheat straw as the most convenient and cheap covering for all types of farm stacks. Since the introduction of thrashing machines straw suffers ruination as a thatching material of any merit because it invariably leaves the machine rolled and bent about to such an extent that it is quite impossible for any thatcher to make it into a neat, tight or particularly lasting job.

Most reed-beds are cut every alternate year, and from that fact a fair comparison can be drawn between its straw rival and its obvious advantage as a weather-resisting material. What crop of arable corn could survive two years' exposure to the climate of East Anglia? Falls of snow would break it down, while the variations of wind, rain, frost, sunshine and the inevitable "unsettled" weather would soon turn it into pulp. Reed-beds suffer in time of drought, since, no doubt, the submerged roots must gain a certain amount of their nourishment from the rain and dews passing over the leaves and down the stems.

Only two types of reed are used by Norfolk thatchers, the most important being *Arundo Phragmites*—true or Best Reed. One occasionally sees various kinds of farm shelters and boathouses entirely covered with *Typha Angustifolia*—the Lesser Reedmace—but it is considered cheap and untidy and not up to the standard of *Arundo Phragmites*. Where one has a combination of the two types of reed it is known as Mixed, and in many circumstances this is to be preferred to Best Reed by itself, but it is far from popular among architects, probably more on account of its unfortunate title of Mixed than from a true consideration of its merits. Reed-bed owners who obtain a harvest of Mixed stuff off their marshes are rightly indignant with the profession when they find that they can only obtain a price for their crops of £3 per hundred less than those with the Best Reed beds, and it has been said with some truth that, in this case at least, architects are biased when they ought not to be.

The addition of about 10 per cent. to 20 per cent. of Reedmace among the Best Reed gives a slightly more mottled appearance to the finished roof than the use of Best Reed alone. A matter of opinion and æsthetics sometimes arises here as to what advice one would give one's clients, but for strength and durability the addition is an asset. Reed is brittle, while Reedmace is softer and, therefore, more pliable. The latter will resist the pecks of birds and puffs of wind because it can be bent without breaking. It weathers even better than reed, and if used as a type of reinforcement against such attacks its use is to be recommended, but too much Reedmace prevents the thatcher from tapping the thatch tight, in the same way that straw fails to make a good job.

Both types of reed mentioned are perennials growing freely in the Broads districts of Norfolk and Suffolk. The reed beds vary from entire crops of one to entire crops of the other. The best crops are obtained from marshes covered with about 6 ins. of water, the reed growing to a height of about 5 ft. to 6 ft. In the southern districts of the Broads the reed tends to be taller, often being 7 or 8 ft. long, but reed of this length should be laid on the roof to a thickness of about 16 ins. or more, while the shorter reed gives satisfactory results if only 12 ins. thick. For valleys, verges, etc., the longer reed is an asset, but the majority of the work should be carried out with the shorter stuff.

Reed harvests commence in December, after frosts and winds have cleared the stems of leaf, leaving the reeds bare except for the feathery flowers on the top. It is

The thatched church at Salhouse, Norfolk. The thatch on the ridge and south side of the roof is completely covered with wire netting as a protection against wind.

This group of thatched cottages at Catfield, Norfolk, exhibits several examples of patterns of ridging—the crowning features of the thatcher's art. The article describes the process by which they are formed.

then ready for thatching, or can be stacked until required, the harvest continuing until early spring, when the young shoots of the new crop, locally known as colts, begin to appear. April 6 is the recognized day to stop reed-cutting, and it is surprising how very near that date the scything ceases year by year throughout the Broads. If the reed were to be cut when in full flower, during the months of July or August, the plant would probably be killed, and, to save undue strain on the roots, two years' growth before cutting is universally considered the most satisfactory.

Some thatchers prefer to work the single wale (one year's crop), and it might make a slightly better job than the double wale (two years' crop), but they wisely bear in mind that it is in their own interests to preserve the reed-beds or, as far as possible, to postpone the cycle of growth which inevitably seems to turn a reed-bed into a marsh of sedge. Where there are signs of a sedge-marsh turning into a reed-bed care and knowledge can promote the alteration. Sedge (*Cladium Mariscus*) is used for all the best thatch-ridging, and it is so common that there need, as yet, be no anxiety that it might be difficult to obtain.

For a thatched roof the timbers can be of a lighter construction than is necessary for pantiling, but they must be able to bear the weight of the workmen upon them and heavy loads of snow. If the spars or rafters are not battened or boarded in any way the thatcher will have to flake the roof to prevent the main bulk of the reed, which is laid parallel to the rafters, from falling down between them. Before squared timbers could be obtained easily and cheaply, flaking was the only satisfactory method levelling up the irregularities that the various shaped spars of an assortment of trees gave the roof, but nowadays ordinary tile battens, used as splining, can be substituted for the flaking if desired.

To commence flaking, wisps of reeds, which the thatcher can comfortably hold in his hand, are each tied up with a piece of string and are placed parallel and midway between the rafters. While held in this position, thin layers of loose reed, which work from 4 ins. to 6 ins. wide, are then interlaced at right angles to the wisps, forming a woven bed for the reed until a

sufficient area of the roof is covered ready to commence the thatching proper. The flaking is often so thin that one can see daylight through it until the main thickness of reed covers it and makes it perfectly weatherproof. Work commences at the corners of eaves and verges to enable the thatcher to place the reed at a convenient angle, so as to form all exposed surfaces with stub ends ; and the finishing of a thatched roof, irrespective of ridging, should never be arranged to take place at overhanging gables or eaves, etc.

Sufficient reed is placed upon the flaking to form the required thickness of 12 ins. for all normal work, with the flower of the reed near the flaking and the stub ends forming the exposed roof-surface. It will be noticed that the angle of the reed is less than the pitch of the roof. With the required amount of reed in position along a part of the eaves, it is securely held to the rafters by placing sways horizontally along the roof and tying them to the rafters to hold the reed tightly between sways and rafters. The first sway is placed about 15 ins. from the eaves, the second 6 ins. higher up and then at 24 ins. intervals. Nut, common sallow or, best of all, black sallow, roughly trimmed to about $\frac{3}{4}$ in. diameter and averaging 8 ft. and 9 ft. in length, make the best sways. These are tough yet pliable, and can be bent to take up any desired curves that one may require.

On a thatched roof of varying pitches, valleys and hips are swept round almost as easily as if they were flat, and the resulting avoidance of unsightly gutters and ridging is an asset and a saving worthy of consideration. In many old cottages brambles were used to tie down the sways and, with them, the thatch to the rafters, but nowadays three-thread jute spun-yarn, or iron hooks of selected length, nailed to the rafters, are generally used. The tarred spun-yarn is tied to a sway and is threaded through the thatch and flaking. Inside the roof it is drawn round the rafters and threaded back to the thatcher, who pulls it tight and ties it again round the sway so that the two knots are made the width of the rafter apart. A boy is usually employed to thread the needle within the roof and to keep the thatcher supplied with reed while thatching.

Sways should either be tied or nailed to all

5. *Further up the roof. Tapping up a pattern in the reed, still utilizing a temporary sway of reed, pegged loosely on to the thatching reed.*

6. *Ridging. Hammering into the thatch one of the broaches used to secure the liggers. Note, on the left, the broaches ready for twisting.*

7. *Ridging. The liggers already follow the desired pattern, and the thatcher is trimming away the ends of the reeds.*

8. *Ridging. Cutting out the ridge pattern. The photograph of a group of cottages, reproduced on page 563, shows some of the traditional ridging patterns.*

rafters, which are fixed at approximately 15 ins. centres, though much laxity in placing them further apart or nearer each other gives the same results in the exterior appearance of the roof. If the roof has been boarded in any way, threading round the rafters is quite impracticable, so binding hooks must be used instead. These are simply bent-headed pieces of iron which fasten over the sway and can be nailed to the rafters wherever required. If one wishes to thatch a boarded, corrugated iron, asbestos sheeting or any bituminous type of roof, it is a simple matter to find the rafters and nail the hooks through the original roofing material into them.

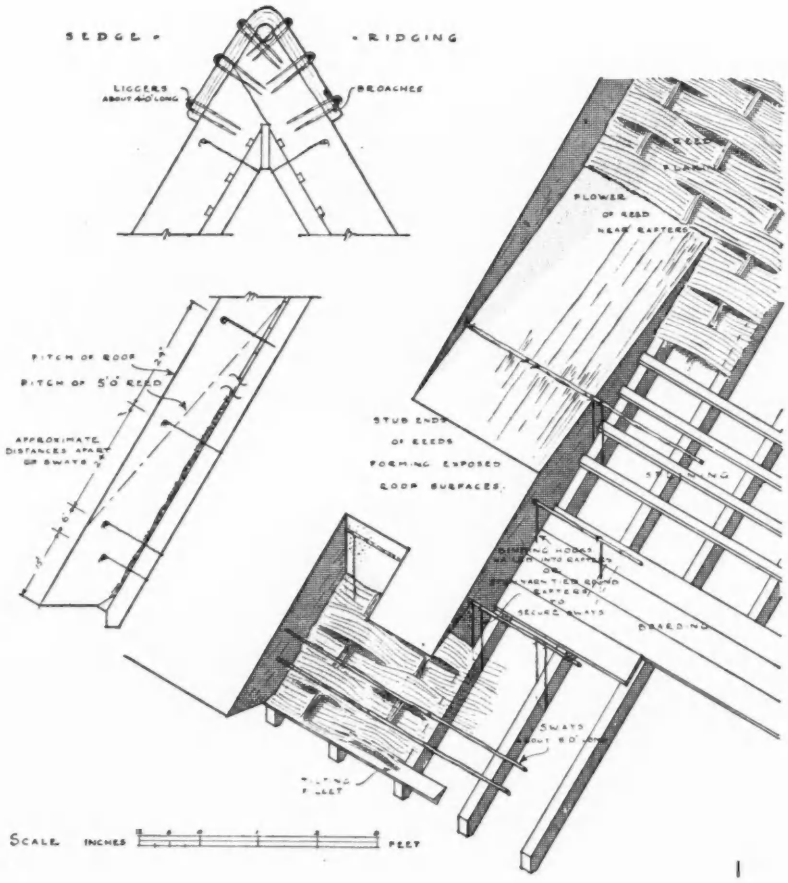
To continue thatching, sufficient reed is placed to cover each sway as it is fixed and to provide convenient layers between sways for secure fixing, the amount rather depending on the quality and length of the reed and the conscientiousness of the thatcher. Sways should not be more than 2 ft. apart for the best type of work. In this way thatching takes its form, the stubs being tapped up into position with nailed elm leggetts until the ridge is reached.

The finishing of the reed can be completed in various ways. Some thatchers cut off the reeds almost level with the ridge on the north or east sides of the roof, the reeds on the south or west being carried up and bent down to butt against the reeds on the north or east to a height of about 10 ins. above the wood ridge. The principle of the idea is to give added protection from the prevailing south-west winds and rain. Other thatchers run the thatch up on one side so that they can cut it off in a line with the pitch of the rafters on the opposite side. The thatching is then completed on the remaining side, giving a greater height above the wood ridge. At the apex is worked a bundle of reeds about 10 ins. in circumference, parallel to the ridge and for its entire length.

As already mentioned, sedge forms the ridge covering. This grass or rush grows in close proximity to the red-beds and, like reed, the best crops grow on the marshes which are saturated with water. The harvest can take place at any season of the year, and the largest quantity is bought by farmers for the feeding of live stock, only a small percentage being utilized for thatch-ridging. Sedge is sold tied up in bundles, 200 bundles equalling a truck, and five bundles would be required for 1 ft. run of ridging. The thatcher prices the work at so much per foot run, according to the elaboration of the design required.

Before being used on a roof, sedge should be thoroughly soaked either by complete immersion or by pouring buckets of water upon the lump. This is done to assist the thatcher in laying the sedge tight. It must be drawn from the lump by hand and placed over the ridge hanging over the reed on each side of the ridge and not along it. The sedge is securely held in position by means of liggers laid to any desired pattern upon the sedge, and they are themselves secured by broaches pegged into the reed thatch.

Liggers, which are semi-circular, and broaches, which are triangular, are both made from split nut or sallow and are cut into the required lengths. Liggers are about 5 ft. long and the small broaches, which are twisted by hand through 180°, forming springy pegs, are 2 ft. long, passing over the liggers and into the thatch about 12 ins. to secure the ridging. The sedge ridge varies in thickness, but should not be less than 3 ins. When the sedge is secured into position the thatcher trims it up and cuts out the various patterns required. Some of the liggers, all of which remain exposed to view, should have previously been fixed following near the edge of the proposed design. For added security and to prevent vermin and tempests from playing havoc with the ridge, the first part likely to wear away, many are now covered with ¾ in. mesh galvanized wire netting, which becomes hardly noticeable and quite inoffensive after weathering for a few months. The netting should be secured by the use of galvanized wire pins thrust into the thatch 9 ins. to 10 ins.



Wheat straw has been used in a few instances in the place of sedge for the ridging, but it is despised in Norfolk because it fails in every respect to compete with the latter. It is too light in colour to harmonize with the reed, nearly three times as expensive, and very much more inflammable.

All reed is cut and sold by the hundred fathoms, a method of calculation common throughout the Broads. Local districts vary, some providing five and some six shoves or bundles to the fathom, but in either case one fathom must measure 6 ft. in circumference at the binding of the shoves. One hundred and twenty fathoms make one hundred, i.e., Hd., or Long Hundred, while 100 fathoms would constitute a Short Hundred.

The thatcher calculates the number of Hd. required for a job by measuring all exposed surfaces of stub ends of reed, including the main roof surfaces, all eaves, verges, etc. One square (100 square feet) of 12 ins. thatch would require about 17 fathoms, while 15 ins. work would need 22 fathoms, two fathoms of which are in either case utilized for the flaking. Thatchers naturally prefer to flake their roofs, but this process is, of course, dispensed with if the roof is splined or boarded by the contractor. The interior of the roof is made very much more attractive by leaving the interlacing pattern of the flaking exposed to view, but, if necessary, the surface between the rafters can be lime-mortared, with the flaking acting as an excellent key. For domestic work this is advisable, but for buildings of the summerhouse type, boathouses, barns, etc., it is quite unnecessary.

A recent price quoted for Norfolk reed thatching was £4 per square, to include

REED THATCHING IN

I

THEORY AND PRACTICE

2

3

4

best reed, flaking and fancy ridging. This surely compares most favourably with the prices of various other types of roofing, and the benefits to be derived from living or working under thatch and the happier harmony it provides with rural England should secure for it all the encouragement it can get.

Hand-made plain tiles, laid to 3½ ins. gauge, at 800 to a square, would cost about £3 per square ; add 10 per cent. profit—6s., fixing 17s. 6d. and some type of bedding for good work to give it a chance to compete with thatch—felt 10s. per square—total £4 13s. 6d. Reed thatch, well laid, will last for some 80 years or more without repair, while the ridge can be expected to survive for 15 years. In the same way as a tile which has fallen off a roof can be replaced, so can thatching be repaired where it shows signs of wear. If a roof does get beyond local repair it is a comparatively simple matter to half-coat the entire surface, using the existing thatch undisturbed as the foundation for the new work. The new work of half-coating works about 9 ins. thick and binding hooks would be used to secure the sways if the rafters have been boarded or a ceiling must not be disturbed.

Some of the best-looking thatch on old cottages has been half-coated, and it looks both neat and new to the expert, yet old and beautiful to the layman from the day it is done. It is surprising that reed thatchers have such little repair work to do, and it is conclusive evidence that either roofs are being neglected or they do not need attention. If it is the latter it is a pity that more new work is not being carried out. Modern country houses are often built in most prominent positions, and council houses are some of our worst offenders, their red, green or black tiled roofs spoiling many picturesque views. As the roof is so often the most conspicuous part of any house it deserves the sympathetic treatment that only thatch can give.

Norfolk thatchers often receive requests from the more distant counties and abroad to this effect : " We propose to thatch a roof —please send us some reed and tell us how to do it." To the expert there is very much more in it than meets the eye. One looks at a thatch roof and one is struck by its simplicity, but, as in anything else done really well, it needs an expert to do it.

WHAT IS TO BE DONE ABOUT

THIS?

[*The article printed below, by the architect to the Wakefield Corporation, West Riding of Yorkshire, represents an interesting response to our invitation to readers to express their independent views on the pertinent question that forms the running title of the present series. We have, of course, mapped out our programme of future articles, but think it advantageous to break its sequence in favour of important contributions such as this.*

The following have already appeared:—(March 29) 1. The Speculative Builder, by Penates; (April 5) 2. The Speculative Architect, by Edwin Gunn; (April 12) 3. Building Without Guidance, by Stanley C. Ramsey; (April 19) 4. What the Public Want, by Edwin Gunn.—ED., *A.J.*]

5. The Housing Problem

[*By PERCY MORRIS*]

IN your issue for March 29 appeared an article under the heading of "The Speculative Builder," wherein it was stated that "there is an especial need for the three-bedroom non-parlour type, of 760 square feet floor area, that sells for £520 or less, and lets at something under 8s. per week."

If there existed a demand and this price of £520 was forthcoming, or even a hundred pounds less, I think every builder in the country would be busy selling houses and buying motor cars. A house of this size could be built in a satisfactory manner, and sold at a good profit, for £320. But is any evidence available in any part of the country to justify a statement that there is "an especial demand" to buy a house of this size and character? There may be a great need for housing accommodation "to let" at rents "something under 8s. per week," but not for selling purposes, at any rate for houses of the size of 760 square feet floor area.

This size of house was only fixed upon by so-called housing reformers because it was the "rock bottom" in accommodation and came nearest in rent (after taking into consideration the subsidy and rates contribution) to the house for which the majority of the homeless working-class citizens of this country could, with their small wages, afford to pay. Even then, in a large number of cases, it was only found possible to pay the rent by existing on an insufficient supply of food and clothing.

With the subsidy at £7 10s. and a contribution from the rates of £3 15s. per house, the weekly rent worked out at 4s. 9d. on a house costing £340 "all-in." Without either subsidy or rate contribution, the economic rent, according to the local authorities' method of calculation (with loan charges on the 60 years' annuity basis at 4¾ per cent.) is 8s. 6d. The net rent commonly charged by many local authorities for this type of house is 7s. per week.

In the same issue of your JOURNAL is given a reply by the Parliamentary Secretary to the Minister of Health to the effect that, on a house costing £320, to be erected under the new regime of co-operation between the building societies and the Minister of Health to provide houses to let for the poor and long-suffering working classes, it would take a rent of 9s. 2d. to meet the building societies' charges and provide 6 per cent. on the 10 per cent. of the capital provided by the builder. With an all-in cost of £340, the rent required would be about 9s. 9d. per week.

Assuming that rates, water, gas and electricity amount to 3s. per week, then the gross rents under the different methods of house erection would be :—

	At £340 "all-in" cost. Per week s. d.	At £300 "all-in" cost. Per week s. d.
Housing Act, 1924, with subsidy	7 9	7 2¼
If erected by Local Authorities without any subsidy	11 6	10 6
If erected in 1933 and financed by a Building Society	12 9	11 7¼

These figures are sufficient to show that, even with money at 4¾ per cent., from the prospective tenant's point of view, the erection of the houses by a local authority without subsidy is cheaper than provision by a building society on the terms of the figures given in the reply of the Ministry to a question put by Sir Francis Fremantle.

Touch-line criticism is futile; we must either get into the "scrimmage" or keep away from the "field." Talking or writing is not much good without constructive ideas or deeds; therefore, may I state the problem of housing very briefly, and my briefer suggestions for the solution?

The housing problem is how to give sufficient and satisfactory housing accommodation at a rental which the working man can afford to pay. What can he pay? What can a satisfactory house sufficient for his needs be built at? These are the two most important questions to be faced. It is dependent upon the answers to these two queries whether the problem can be solved or not.

Let me try and answer the last question first. If land is purchased and developed by the acre it may be secured for £100 to £150 per acre; assuming the latter figure and 15 houses to the acre, the cost would be £10 per house for land. The charges for roads and sewers will amount to, say, £35 per house. A house of 760 square feet floor area will cost £255 at the present time. The total "all-in" cost is, therefore, brought down to £300.

Can this figure be cheapened in any way? If standards are to be maintained, frankly, I do not think it can, for it is only by mass-production methods, where the number of houses to be erected is 100 or more, that such figures may be secured.

If the responsibility for housing the numberless people who definitely require accommodation, but who do not actually now live in slum areas, is to be left to the energies of private enterprise, some other method of financing and production will have to be found to take the place of the local authority. The methods of the small builder with the aid of the building societies will not suffice, unless there is evidence to show that the cost of money is very much lower than 4¾ per cent. as the cost of loan charges.

Assuming that this cost of money can be reduced to 4 per cent. on the annuity system for sixty years on an "all-in" cost of a house at £300, the rent and rates will be approximately 8s. 2d. per week.

Can a working man afford to pay this amount of rent and rates? Take a working-class family as consisting of man, wife and two children. In a pamphlet published by Miss Rathbone, M.P., the minimum cost of living needs (excluding rent), of such a family, is 42s. 1d. If the man is in work and earning 1s. per hour for a 44-hour week, there is only 2s. for rent; if the wages are 48s., there is 6s. for rent; if 50s., 8s. is left for rent. To be able to live in a house with rent and rates amounting to 8s. 2d. per week, the wage must be 50s. per week.

It would appear that, unless some method is conceived of lowering rents, a man with a less wage than 50s. (unless he lives in a slum area) will have to remain without a house.

What about the men with less wages? If houses are to be provided for this section of the community by private enterprise, then it would appear obvious

that, even with careful organization and the use of cheap money (which term I should like to see explained), in order to bring down building costs, still further drastic reductions in accommodation and the costs of erection will have to be made.

If this is allowed, then it will be possible to secure a house at a cost of £250 which will allow of a rent of 4s. 4d. and with rates of 3s., a total of 7s. 4d. per week, which will go some way to meet the position ; but it does not appear that the building societies, plus the small builder, can do very much in this field. The real endeavour, if one is to be made, will have to come from an entirely new organization with the co-operation of the building societies.

IN THAT CONTINGENCY

The following abstracts of inquiries represent a number of those recently submitted to the Building Research Station. The information given in the replies quoted is based on available knowledge. It has to be borne in mind that further scientific investigations may in the course of time indicate directions in which the replies might be supplemented or modified. Moreover, the replies relate to the specific subject of each inquiry, and are not necessarily suitable for application to all similar problems. Crown Copyright Reserved.

Failure of Setting Coat

¶ *FAILURE of a plaster ceiling on expanded metal lathing was reported. On inspection it was observed that the setting coat, stated to be a "Keene's" cement, had come away from the undercoat. Moreover, on the samples of the setting coat brought away for examination, an appreciable film of white salt was adhering to the part where the coat had been in contact with the backing. Little information could be elicited regarding the composition of the undercoat, but from a visual inspection it appeared to be Portland cement probably lightly gauged with lime. Both a pink and white Keene's had been used. It was interesting to note that the failure was solely confined to the pink type.*

The examples of the setting coat brought away have been superficially examined, and the following observations on the failure are offered.

The plaster is a pink-coloured, hard-burnt calcium sulphate plaster containing lime, apparently well carbonated. The considerable amount of white efflorescence is the result of crystallization of soluble salts on the back of the finishing coat. This is often found in cases of failure of adhesion of calcium sulphate plasters, in particular when over a Portland cement backing, the white powdery layer generally including both salts derived from the backing or plaster and fine particles of the plaster which may have failed to set in a coherent form.

The type of plaster employed in this case is sometimes slow in setting and, under unfavourable circumstances, the material in contact with the backing may dry out in a crumbling layer before it has a chance to hydrate properly. If subsequently the plaster becomes moist through condensation on the front or percolation of water from the backing, further hydration will occur, and may result in uneven expansion, buckling, and total loss of adhesion in certain areas. Once a gap forms, efflorescent salts will tend to accumulate here and complete the damage.

It should be noted that a plaster of this kind is not a true Keene's cement of the traditional type. The failure exemplifies one of the major difficulties which exists at the present time. In the absence of any formal specifications, reliance has to be placed on a very ill-defined nomenclature, and the user has to guarantee that the plaster has suitable properties for the work in hand.

The remedy would appear to be, first, the thorough cleansing of the exposed cement surfaces from efflorescent salts ; secondly, the use of a Keene's cement which is well accelerated in order to gain strength rapidly, rather than a cement which may have a fast initial stiffening and which has consequently to be " killed " to get it on, but has a slow subsequent rate of hardening. The backing should be well wetted before application, though not sufficiently to cause the material to slide off. Some effort should be made to decrease the rate of drying after application.

Preventing Efflorescence on Bricks

¶ *AN architect was concerned with possible methods of preventing the appearance of efflorescence on the facing bricks of a garden retaining wall. It was the intention to construct the wall in reinforced concrete with a $4\frac{1}{2}$ inch brick facing bonded to the backing with metal ties, and he required the views of the Station on the following alternative methods of treatment :—*

(1) *To execute the concrete wall in high alumina cement and to bed the facing bricks in the same type of cement.*

(2) *To build the brick facing in lime mortar and to paint the back with a proprietary bitumastic paint.*

(3) *To employ a bitumastic paper between the facing wall and the concrete backing.*

The architect added that the extra cost involved in carrying out the first scheme would be considerable, while the second scheme would, of course, fail if the impermeable coat was not continuous.

At the outset it should be mentioned that the problem of preventing efflorescence is one of considerable difficulty, but the following points would probably merit consideration in relation to the various alternatives.

(1) High alumina cement would in itself certainly be less likely than Portland cements to give rise to efflorescence, but it must be borne in mind in either case that salts from the soil will be liable to pass through the concrete.

It seems doubtful, therefore, whether the additional expense involved would be justified.

(2) A really continuous film of bitumen on the back of the bricks should be effective.

This, however, has the disadvantage referred to, and if it is to be reliable, the bitumen must be very carefully applied and care must be taken not to injure the film when the concrete is poured. There is on record at this Station one case where a retaining wall erected in this way on a very wet site was quite successful and no serious efflorescence occurred.

(3) A bituminous paper or felt would probably be very difficult to apply in such a manner as to provide a continuous membrane. Moreover, the ties would undoubtedly be a source of trouble and the laps of the paper would have to be satisfactorily water-proofed.

Unless the cost is prohibitive it is strongly urged that the most satisfactory method of construction from the point of view of

freedom from efflorescence would be to keep the concrete and brick facing separate with a cavity between them. There would be no difficulty in tying the brickwork to the concrete backing and there would be reasonable certainty of avoiding efflorescence due to salts in the concrete or in the soil. It will obviously be desirable if this form of construction is adopted to provide efficient damp-proof courses at the top and bottom of the brickwork.

In order to avoid efflorescence due to salts derived from the jointing and pointing, a dense cement mortar should be avoided. A greystone dry hydrated lime, with a moderated gauging of Portland cement, should be satisfactory. The lime should be obtained under guarantee that it will pass the soundness test developed at this Station.

Decay of a Solid Wood Floor

¶ *A SOMEWHAT unusual case of decay of a solid wood floor was brought to the notice of the Station. The construction was a common type, consisting of dovetailed wood fixing battens laid on a concrete base and covered with deal flooring; hot tar-pitch was poured over the surface of the concrete before laying the boards.*

The surrounds of the floor had been stained and the decay was confined solely to this area. The unstained portion appeared to be perfectly sound, although one batten beneath this area was reported to be affected.

A sample of the decayed wood was forwarded for inspection.

No case of an identical nature has been previously reported to the Station.

From a superficial examination of the sample forwarded it seems that the stain was a fairly thick varnish stain and actually this seems to be the most probable cause of the trouble. The thick covering of the stain has provided a virtually impermeable membrane, almost equivalent to linoleum or rubber covering. Impermeable coverings of this kind are a very prolific cause of dry-rot in floors, since any moisture which finds its way to the timber is retained.

The decay of the batten can probably be attributed to normal causes. The embedment of timber in solid floors is very liable to lead to decay unless the preservative treatment is very thorough, and actually in the light of present knowledge this particular type of construction is to be deprecated. It is noted that the sample of decayed board appeared to have been affected by *Merulius Lacrymans*, a rather aggressive type of dry-rot fungus, and one which demands very thorough measures in eradication, since once the growth has commenced it is capable of finding sufficient moisture from the air to flourish without any other source of water.

It is suggested, therefore, that any timber showing signs of infection, however slight, should be taken up and burnt, and that it would be very desirable to treat the boards with preservative before relaying the floor. It would also be preferable in staining the surrounds to avoid the varnish stain of the type previously used; a preservative stain such as Solignum is quite suitable, and there are also a number of spirit stains which should not give an impermeable finish.

It is assumed, of course, that any possible source of moisture access will be dealt with. It might also be as well to make good the tar-pitch covering before relaying, since it may well have been broken in taking up the boards.

The new edition of "The Adventure of Building" has just been published. A few minor revisions have been made in the text, but the chief difference from the old edition lies in the illustrations, which are now all of cheaper houses, most of them costing about £1,000. Moreover, there is now not more than one house in any one county.

The Berks., Bucks., and Oxon. Architectural Society have bought 30,000 copies of the new edition and are distributing these copies among residents in the three counties which they represent. It is very much hoped that other societies will follow their example. Copies may be obtained from The Architectural Press, 9 Queen Anne's Gate, S.W.1.

Fire-Resistance of Sand-Lime Bricks

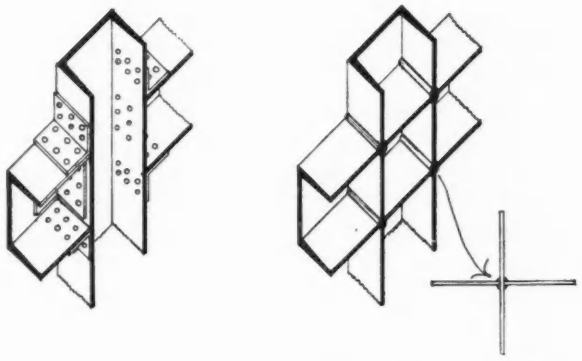
¶ *AN architect wished to know at which temperatures sand-lime bricks, both in a dry and wet state, would be damaged by fire. He also desired information as to the temperatures which may be reached in buildings such as flats in the case of a serious fire.*

Tests have been carried out at the Station on sand-lime bricks fired for periods of one hour at 600° C. No appreciable cracking or disintegration was noticeable at this temperature, though there was a loss of strength of the brick up to 35 per cent. of the original unfired values.

Further, tests have been carried out by the United States Bureau of Standards, Washington, on walls 8 ins. and 12 ins. thick built of sand-lime bricks, laid in a cement-lime mortar. These tests were carried out on sections of wall both unloaded and under a working load, the furnace temperatures on one side being raised from 927° C. after one hour to 1,370° C. after ten hours forty minutes. None of the 8 in. walls failed either as the result of deflection or applied load. One 12 in. wall, however, failed shortly before ten hours due to weakening of the bricks on the furnace side. Cracks up to $\frac{5}{8}$ in. wide showed on the outside of unloaded walls, but cracks were very slight on the heated side. Headers were seldom found cracked in the central portion of the wall, so that the integrity of the wall as a building member was maintained.

Tests were also carried out wherein the walls were exposed to fire for one hour, then withdrawn from the furnace and subjected to a stream of water on the hot side. These fire and water tests developed nothing that would change the conclusions based on the fire endurance tests. The report includes the following table:

Ultimate Fire Resistance Periods of Solid Walls Built of Sand-lime Bricks



Nominal Thickness of Wall.	Building Members Projecting into Wall.	Fire Resistance Period.
8ins. unplastered	None or incombustible	8 hours.
8ins. ,,	Combustible	3½hours.
12ins. ,,	None or incombustible	10 hours.
12ins. ,,	Combustible	10 hours.

"For periods not exceeding six hours either Portland cement, cement-lime or lime mortar not leaner than 1.3 can be used. For walls having periods above six hours, Portland cement or cement-lime mortar should be used."

Tests have also been carried out in Stockholm on sand-lime brick walls 27 cms. thick, built in cement-lime mortar and plastered both sides with lime and sand-plaster. These testing temperatures were raised from 900° C. after one hour to 1,165° C. after eight hours. At the end of the eight-hour fire and water test the wall appeared to be in good condition, the actual wall units having retained relatively sharp edges and corners, though the mortar had been destroyed to a depth of about 5 to 10 cms., and had been washed away in parts by the water. On closer examination, however, it was found that the bricks had been damaged on the exposed side and showed cracks extending right through individual bricks as well as destruction of the actual brick material to a certain depth. The report states that both mortar and bricks were damaged to a depth of 5 to 10 cms., which measurements may also be taken to indicate the reduction in the effective cross-section which was caused in the wall (in its entirety) by the combined action of fire and water.

To summarize, sand-lime bricks, although likely to undergo rather more deterioration in a fire than ordinary clay bricks, may yet be stated to show quite satisfactory resistance for ordinary use; in construction of buildings of the "flat" type there appears to be no objection to them on account of fire hazard.

With regard to temperatures actually reached in building fires it is regretted that no precise information is available for temperatures likely to be attained in a domestic building. A report of the United States Bureau of Standards, however, states that in burning down a building of the office type stocked with records to resemble normal office occupancy, temperatures of 1,350 to 1,650° F. were attained in 40 minutes to 1½ hours, and 1,500 to 1,780° F. in 1 hour 40 minutes to 5 hours.

TRADE NOTES

BY F. R. S. YORKE, A.R.I.B.A.

Structural welding

I WENT last week to see the "all welded" factory at North Acton, where, although the job is a small single-story one, with no heavy members, the elimination of rivets, and a reduction in the size and number of gusset plates and cleats produces a clean and simplified finish and makes a considerable difference to the general appearance.

The steelwork is by the Aston Construction Co. and the welding work carried out, as a demonstration, by Agile, Ltd., who consider the saving in weight over a fabricated riveted job approximately 9 per cent., although a small one-story job of this type is not particularly favourable to comparisons, since it is in a heavier, multiple-story structure that welding, and the consequent elimination of rivet holes, enables lighter sections to be used, and a saving up to 20 per cent. made.

•

I understand the Leipzig Municipal Authorities in 1931* built, as an experiment, two blocks of workmen's dwellings, alike in size, both steel-framed; one in the orthodox manner and the other welded, and claimed a 24 per cent. saving on the price of steelwork and frame erection for the welded job.

•

The welding process has been employed in America and on the Continent for steel-framed structures for ten years or more, and during the last five years progress has been rapid. The library at Yale University, which is one of the largest welded structures in the world, is 150 feet by 220 feet and 18 stories high. In England the obsolete bye-laws still enforced have prevented the welding of structures of more than one story, though a revision of restrictions is anticipated; and it is with this revision in view that the demonstration work at Acton has been done.

Messrs. Agile have supplied me with the following figures for the Acton job:

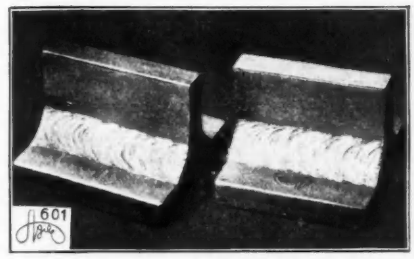
Total net cost of welding: 60 hours of labour at 1s. 5d. = £4 5s., plus cost of electrodes (708 feet No. 8 and 609 feet No. 10) = £3 6s. 8d., plus current 10s., equals total net welding cost, £8 3s. 8d.

Saving in cost of steel work approximately 15 per cent.

Saving in cost on complete erected steel structure over riveted structure approximately 10 per cent.

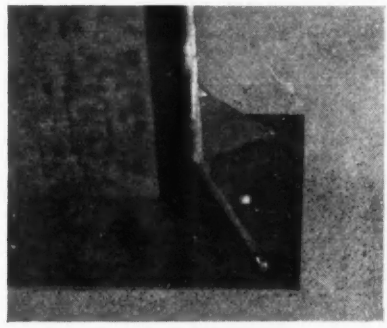
The electrode used was the Agile "buff" which deposits metal having a tensile strength of 28/30 tons. The steel electrode is comparable to solder in that it melts and is deposited to form the joint: it must completely unite two pieces of metal, and the analysis of the weld must approximate to that of the parent metal. Under the Agile process the electrode consists of metallurgically coated wire, and, by regulation of the ingredients of the coating material, the characteristics in the deposited metal can be determined.

•



It seems the designer of the welded structure must forget the methods and principles that apply to riveting, and think in terms of the new process. There are changes

*The German constructional welding code became effective in 1931.



[*Architects, Henry Butcher & Co.*

A general view of the all welded factory shop at Victoria Road, North Acton. The photograph was taken eight days after the site was cleared for erection to commence.

Detail of a fillet weld.

A stanchion base assembled and ready for welding.

A welded joint at the centre of a truss. White paint, applied to the welded edges in order that they might show clearly in the photograph, gives the illusion of a rough finish.

in the fabrication and the design of joints. Cleats and gusset plates can often be eliminated, and continuity of the lines of the girders obtained through the welded connections.

•

Arc-welded structures, through their rigidity, permit a reduction in wind bracing.

•

Welding has a further advantage over riveting, in that the process is noiseless.

Cement glaze

I hear from Hoyle, Robson, Barnett & Co., the manufacturers of Glazement, that architects and builders have sometimes criticized the ideal specification for rendering to take cement glaze (given in these notes on April 19) on grounds of cost, and as a consequence an alternative specification has been prepared, and is found to be satisfactory in practice. This is :—

Scratch coat of Portland cement and sharp plastering sand 1 : 3, followed by ¼ in. Cement Marketing Company's waterproofed cement and sand 2:5, finished to a smooth even surface with a steel trowel.

Where such a rendering is employed, twenty-one days, at least, should elapse before the glaze is applied.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Sky Writing

BEFORE Parliament adjourned for the Easter recess, Mr. Lewellyn-Jones asked the Secretary of State for the Home Department if he proposed to introduce at an early date legislation to give effect to the recommendations of the Select Committee on Sky Writing.

Sir J. Gilmour said it was not proposed to consider the question of introducing legislation until some experience had been gained of the effectiveness of the voluntary control which was being exercised by a body representative of advertisers, advertising agents, firms engaged in sky-writing, and other interests, which had been set up in accordance with the recommendation contained in paragraph 44 of the Report of the Select Committee. Should legislation ultimately prove to be necessary, the experience of the working of the voluntary system would provide useful knowledge of the practical difficulties for which provision had to be made.

School Building Schemes

Mr. Hicks asked the Parliamentary Secretary to the Board of Education if he would state the number of school building schemes throughout Great Britain prepared at the 1st August, 1931, and since that date, the estimated total cost thereof, and the number suspended or abandoned, together with the estimated cost.

The Great Hall at the old Trades House, Glasgow, which has been installed with new lighting fittings. See note on this page.

Mr. Ramsbotham said that the total number of schemes for the building of new schools or the improvement of existing schools in England and Wales, which were under consideration by the Board of Education on 1st August, 1931, or received since that date, was 1,223, involving an estimated expenditure of £5,257,000. Of these schemes 93, involving an estimated expenditure of £313,000, had been rejected by the Board.

Trade Item

The lighting problem of the Great Hall at the old Trades House, Glasgow, was to give a sufficient illumination on the floor area, and to also arrange the light distribution so that the frieze and ceiling should receive a special intensity, and that the painted figures on the frieze should be visible ; not an easy problem, as the colours, figures and background were not in contrast.

The previous lighting fittings were cluster electroliers, already converted, with a large number of small bulbs and shades.

The fittings ultimately chosen are polyhedron in section, having seven main Holophane Pagoda panels with seven inset glass panels between, fourteen panels in all. In the lower section of the fitting is arranged a Holophane Filterlite semi-indirect bowl, designed to redirect the main light upward. In the interior of the fitting is a Holophane band type refractor which gives a very wide light distribution in a narrow zone, this being particularly required for lighting the frieze, as can be seen in the photograph on this page. The metalwork is of heavy cast cathedral brass finish, the corona finishing with the " Trades House " crest of fourteen arrows. This description is in reference to the four side fittings. For the centre dome fitting one of a much larger construction was necessary. Here the same general design was adopted, but the fitting was made in two tiers. The top tier is similar to the side fittings, but the bottom tier consists of fourteen Holophane Pagoda panels, with an 18 in. Holophane Filterlite bowl for the bottom member. A cluster of seven lamps and reflectors are fitted inside the lower tier, with also a 500-watt lamp in position for the semi-indirect Filterlite bowl. The upper tier is arranged with one 500-watt lamp.

Allen; shop and house, and two houses, Heysham Road, for Mr. F. Wyton.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

Supplement to THE ARCHITECTS' JOURNAL for April 26, 1933

AT MANOR HOUSE STATION

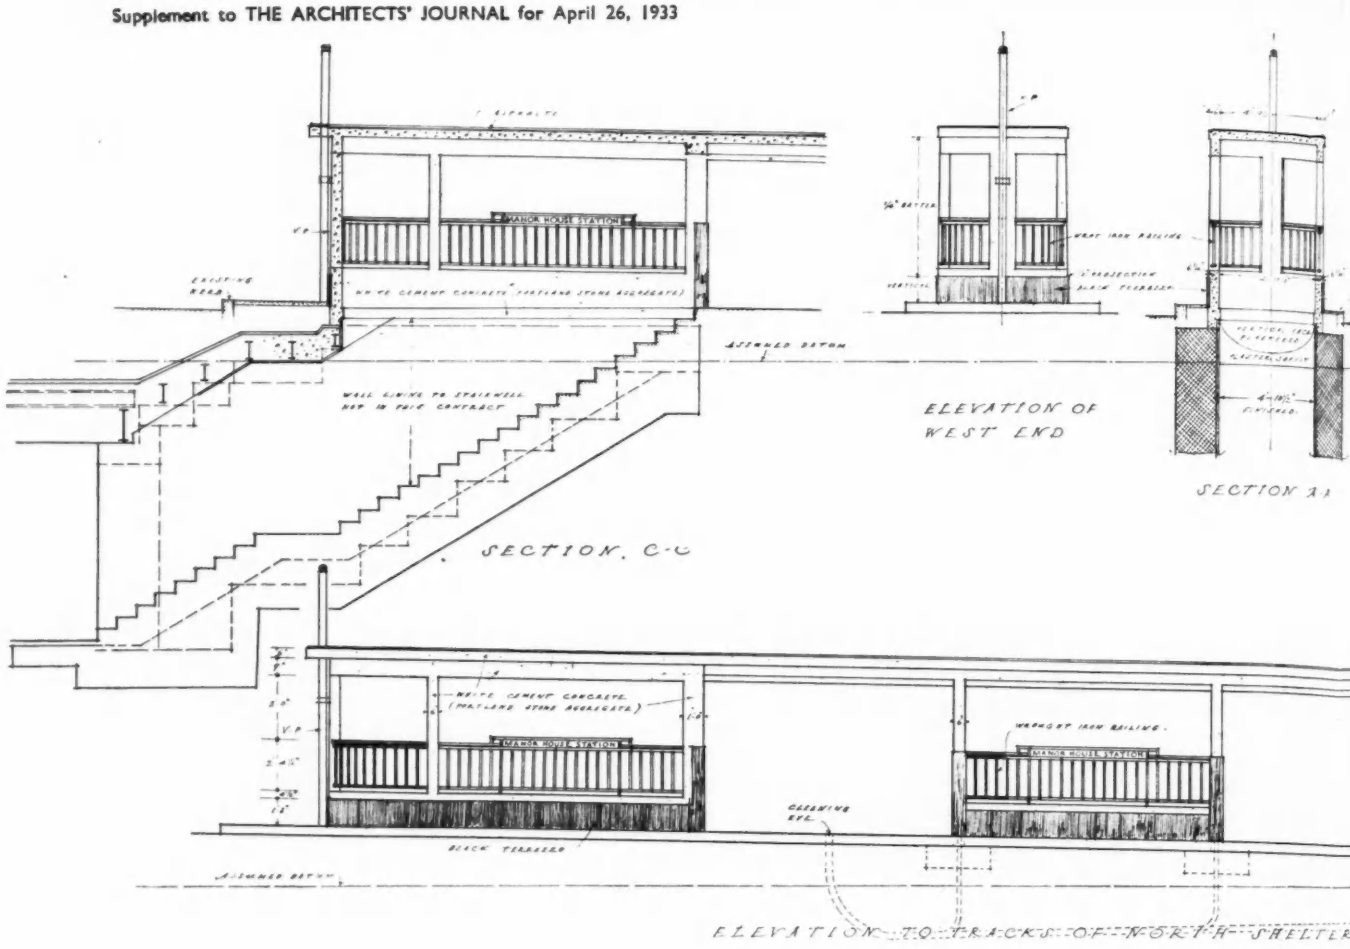
TRAMWAY SHELTER : UNDERGROUND : DIRECTION SIGN

: ADAMS, HOLDEN AND PEARSON, ARCHITECTS :

THE TRAMWAY SHELTER, SHOWING MANOR HOUSE

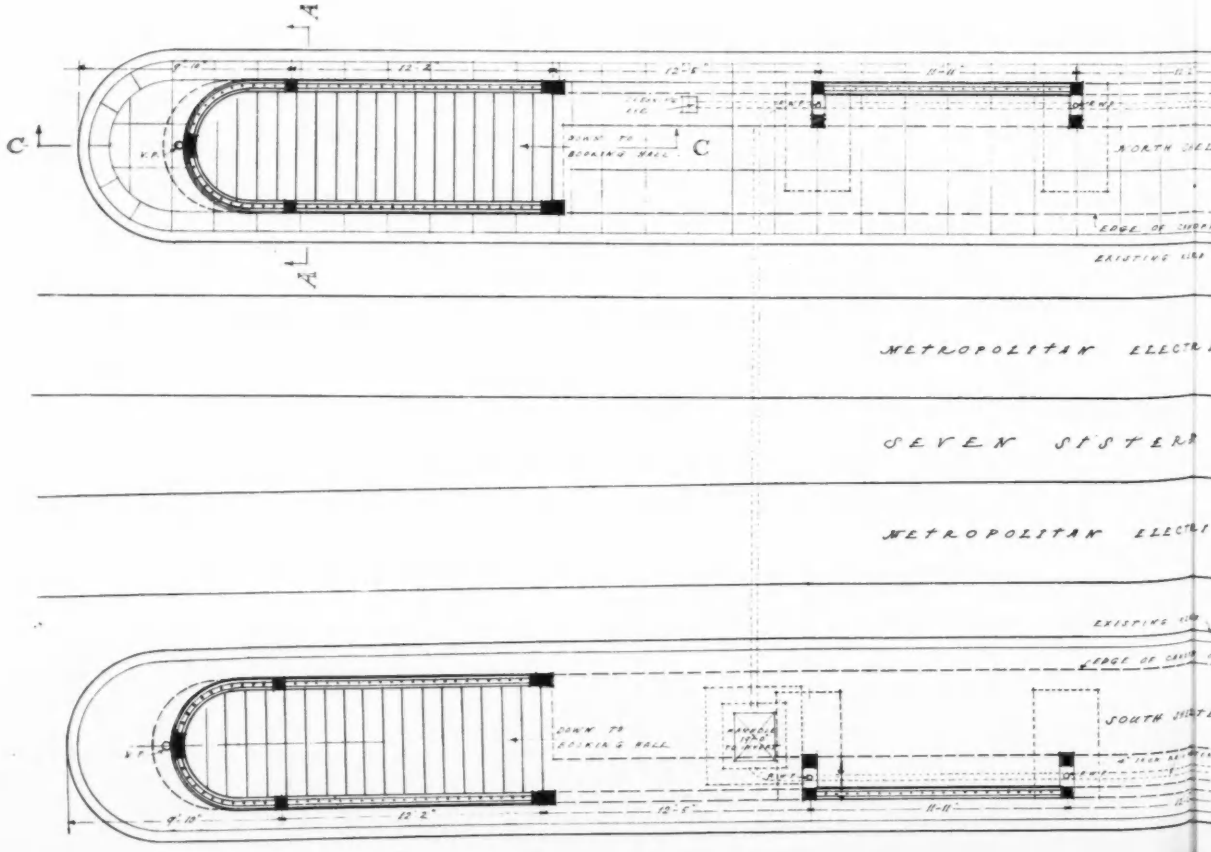
IN this issue illustrations and drawings are given of Southgate Station, on the latest London Underground Tube Railway. This supplement is devoted to incidental structures at Manor House Station on the same line. [Illustrations of this Station appeared in the issue for December 28, 1932, which also contained drawings and pictures of five other new Underground Stations. That at Enfield West was dealt with in the issue for March 29, 1933.]

The tramway shelters (see within) are constructed in reinforced concrete, with a Portland stone aggregate rubbed down with a carborundum wheel, the skirtings being finished in black biancola.

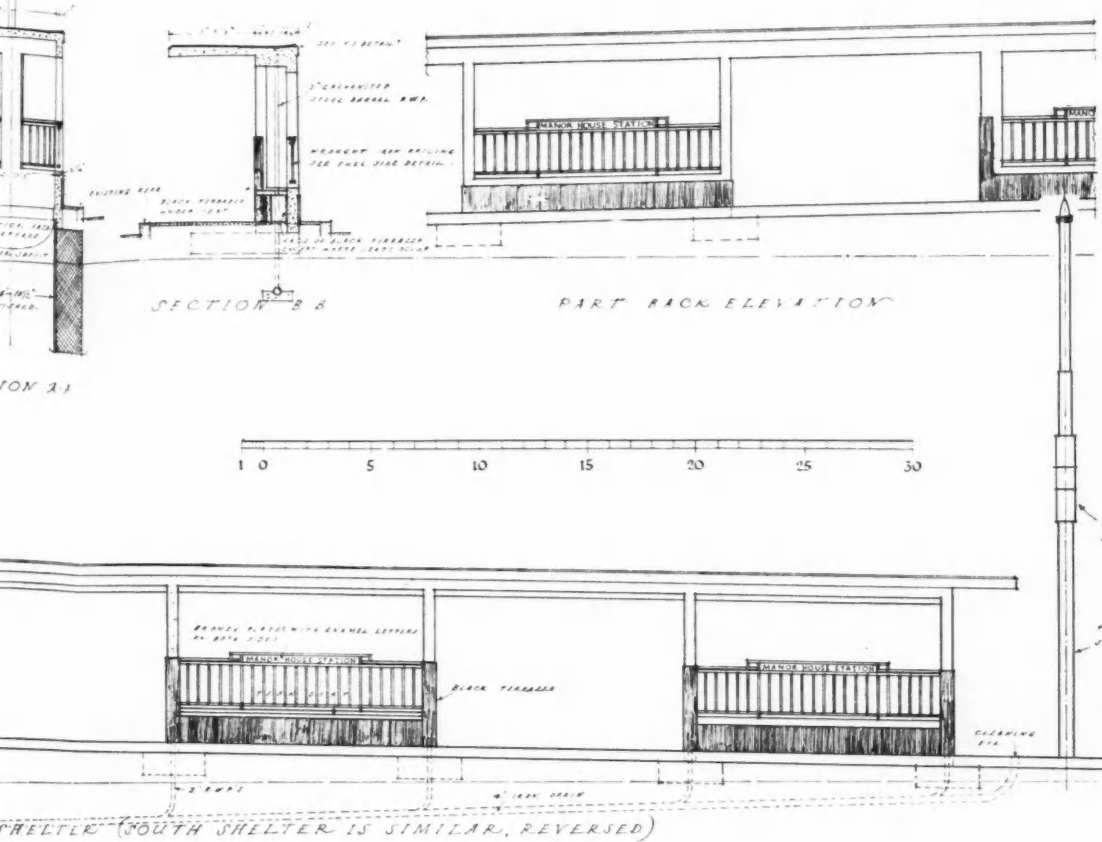


The roofs are cantilevered out from the twin stanchions, except at the one end where the staircases lead down to the railway booking hall below ground. The railings are in wrot iron with bronze name panels.

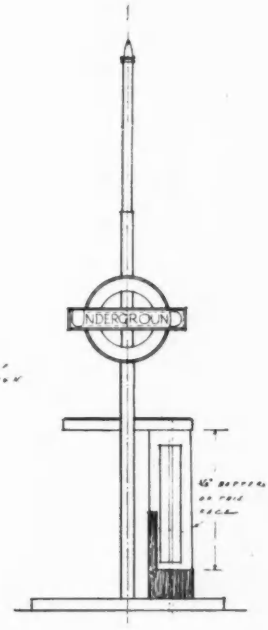
The direction sign (see last page of this supplement) is in concrete, faced in black marble mosaic in the lower part and in Portland stone concrete pre-cast blocks in the upper, built around the tramway span pole with a 3-inch clearance to allow for the vibration caused in the latter by the movement of the trams.



The sign boxes themselves are of bronze, with illuminated panels showing white in daylight and orange at night. The projecting canopy at the top serves as a boxing for the street lighting, which also illuminates the enamelled iron bulls-eye signs on each face.



THE NEW SIGN POST



NOTE: NORTH SHELTER TO BE PARALLEL TO NORTH TRAMWAY TRACK. SHELTERS ARE TO FOLLOW GENERAL SLOPE OF ROAD. WEST END OF ROOF AT WEST END OF ROOF OF NORTH SHELTER. EAST END OF ROOF OF SOUTH END OF ROOF OF NORTH SHELTER. ROOFS TO HAVE A UNIFORM SLOPE AND PLATES ARE TO BE PARALLEL THERETO. SEE ENGINEERS DRAWING

PIPE CHASES, ETC.

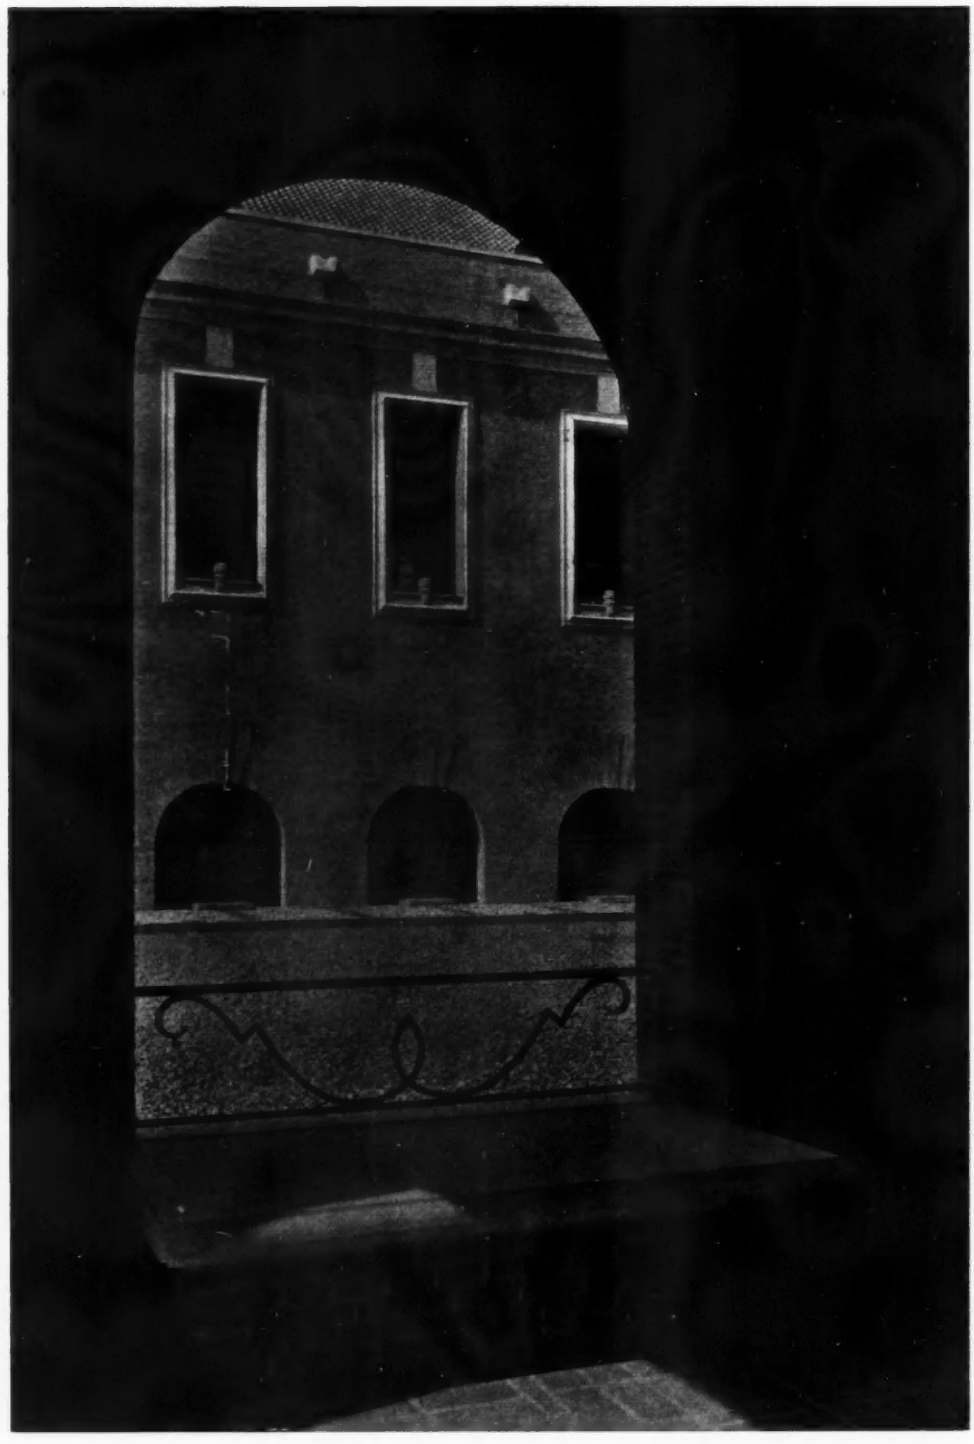
•

THE publication, this week, of tabulated data regarding pipes and pipe chases, together with minimum dimensions of typical bathrooms, leaves only the subject of drain pipes, manholes, etc., to be dealt with to complete the set of Information Sheets covering lavatories and sanitation; the Sheet in question will appear next week.

The present one contains extracts from the Ministry of Health Model Specification of Water Pipes and Fittings, and these are quoted by the permission of the Controller of H.M. Stationery Office.

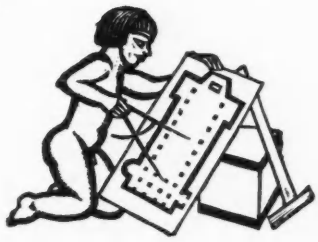
The following is a full list of the subjects previously issued :—

1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.
8. Mar. 8—Billiard Table Data.
9. Mar. 15—Roof Pitches and Drainage.
10. Mar. 22—Lift Sizes, etc.
11. Mar. 29—Sanitary Accommodation.
12. Apr. 5—Lavatory Units.
13. Apr. 12—Lavatory Units.
14. Apr. 19—Plumbing to Basins, Baths, etc.



AT THE ROYAL ACADEMY

A CHURCH AT KENNINGTON



[*R. A. Ex. No.* 1497.

ON pages 585-8 of this issue will be found an illustrated article, "The Royal Academy: First Impressions," by Mr. H. S. Goodhart-Rendel. In the course of it, after touching upon the examples of ecclesiastical architecture hung this year, our contributor writes: "Most of the other designs for churches are in some form of Romanesque style, and vary in merit from one at Cairo, which is easily the worst, to one at Kennington, which is easily the best. The architects of the latter are Messrs. Adshead and Ramsey." This is the subject reproduced above. Its official title is "Church of St. Anselm, Kennington."

THE NEW MERCHANT TAYLORS' SCHOOL

A portion of the east elevation of the assembly hall, seen from the gatehouse of the new school buildings at Northwood, Middlesex. A detail drawing of this elevation appears in the centre pages of one of the supplements, and other illustrations, with notes, are given on pages 591 to 596 of this issue. The architects were Messrs. William G. Newton and Partners.

PLANNED TRANSPORT IN UNPLANNED LONDON

AFTER protracted parliamentary wrangling, the London Passenger Transport Bill has at length received the Royal Assent. On July 1 all forms of public conveyance within Greater London will be made over to the new Board set up by the Act to own, operate *and co-ordinate* them.

Apart from taxicabs, which ply on no fixed routes, the suburban services of the four main-line railways are the only exception to its monopoly. These, however, will be indirectly, but effectively, controlled by the Board through a Joint Standing Committee and the pooling of earnings. A long era of that "healthy competition" between vested interests, for which both shareholders and the travelling public paid the piper, is brought to a close. With it disappears the last pretext for further delay in the scandalously overdue electrification of those local lines (75 per cent. of them notoriously belong to the L.N.E.R.) on which steam traction is still suffered to pollute the atmosphere.

The creation of the L.P.T.B. should be welcomed as a belated step in the right direction. It is a beginning of planning, if of planning the wrong way round. Since there cannot be any isolated aspects or spheres of urban co-ordination, a London Planning Board ought clearly to have been established simultaneously with the L.P.T.B. Housing and transport are interdependent. It is as impossible to consider them separately as it is to consider the former divorced from those "laid on" essentials of modern life, water, sewerage, gas, electricity and telephones.

Hitherto, population and transport facilities have been allowed to outstrip one another alternately with results disastrous to the community. Thus the co-related and synchronized redistribution of each in accordance with a single master-plan has now become inevitable. *London must reorganize or disintegrate.*

The L.P.T.B. will possess no powers of autonomous initiative except on paper. It will have to waste the nation's time and its own money in seeking the authority of Parliament for every furlong of tube it may wish to build, though, paradoxically enough, it will be the only body on earth competent to judge what extensions are required. If the Board is to fulfil its function of co-ordination it must start by drawing up a comprehensive scheme for the connection and prolongation of existing routes, and the construction of supplementary ones. In the absence of a master-plan, governing both the rebuilding of London's built-up central areas and the development of its outer fringes, how can the Board hope to do more than superimpose a new, but purely provisional, railway map on the old?

The only answer to this question is to refuse to believe that the wholesale replanning of London is imperiously necessary, which no one qualified to express an opinion any longer denies. Yet the master-plan, when we get it—and we *shall* get it, and comparatively soon, because otherwise London will perish from self-congestion and auto-intoxication—is bound to provide for many new main thoroughfares and nodal traffic centres to relieve the obstruction of the derisively few we have. As a result, some of the Board's new tube lines will have to be scrapped, partly rebuilt, or reduplicated along different alignments, almost as soon as they are begun or opened.

Nor will the L.P.T.B., though owning every bus and tram, have any direct control over street widenings and improvements, for the necessity of which the L.C.C. and various other sovereignly independent county, borough and urban councils, to the number of over two hundred, severally remain the sole arbiters. The London and Home Counties Traffic Advisory Committee can, it is true, advise them as to what roads to build or widen for the common good, but even the Minister of Transport is powerless to compel them to act on its advice. Lord Ashfield has pointed out that there are two ways of dealing with surface transport; making the traffic fit the streets, and making the streets fit the traffic. Unplanned, opulent London makes shift heroically with the former; impoverished Berlin, which, being under a single administration, is fully planned for twice its existing population and ten times its present area, has been able to adopt the latter.

In the offices of the "B.V.G." the Berlin Traffic Authority on which our L.P.T.B. was largely modelled, hangs an enormous map of the small province that constitutes the municipal district of "Gross-Berlin." On it is indicated the position of every future building-site, street transport service, and open space in the immense circumference surrounding the already built-up central core. There is nothing sporadic or individualistically happy-go-lucky about the growth of this progressively expanding ring. It is controlled by disciplinarian time-schedules "according to plan." An official points to a particular segment, and explains that it is among the next to be taken in hand. In four years' time it will house 40,000 inhabitants. Half that number will be living on its now empty inner edge within eighteen months. By then the terminus of the nearest underground line is due to be carried forward into their midst; in another two-and-a-half years it will be extended a couple of stations farther afield, and so on.

The radiating underground lines and the housing zones they intersect are marked in correspondingly shaded gradations of different colours to represent the various stages of a 10–15 years' plan of mutually co-ordinated development which can be accelerated or slowed down in ratio with the actual increase of population.

Intelligent—or at all events intelligible—rumours are current that Lord Ashfield will be the L.P.T.B.'s first chairman. We earnestly hope they may prove true, for, in an address to the Royal Institution on March 24, Lord Ashfield clearly gave it as his opinion—and it is undoubtedly the most authoritative of any man living—that a Planning Board for London is as essential as a Transport Board :—

As a result of all this division of responsibility, the carrying out of street improvements based upon a co-ordinated and considered plan is rendered extremely difficult. . . . Co-ordination in this respect is just as important as co-ordination of transport facilities ; and the conclusion that seems irresistibly forced upon us is that any adequate measures will be impossible without some central co-ordinating authority. If the establishment of such an authority is the right solution for the problem of London passenger transport, then there seems no reason why it should not also be the solution of the problem of street improvements. . . . It may be said that the cost of such a programme will be so vast as to render its execution impossible, but I fancy we are apt to take too narrow a view of the problem of costs.

President of the new "MARS" Group : Wells Coates.

NOTES & TOPICS

THE "MARS" GROUP

HOW it has happened that England should for so long have been unrepresented in the International Congresses for Modern Architecture is hard to understand. Whether this is another example of massive insularity, or of that flair for compromise which jibs at cool logic, or——

*

Well, it doesn't much matter now that we have overcome the disability.

*

We have become the Twentieth National Member of the Congresses, and I am glad that brave Mr. Wells Coates has undertaken the job of forming the English group, for, as I see it, there is a crying need for some very strong intellectual direction in this so difficult matter. Propaganda is not an end in itself without a steady pressure of disinterested research into practice and theory.

At Merchant Taylors' School. Shakespeare, carved in Clipsham stone over the centre window of the library, by Alan Durst.

*

I understand that, as the name implies, the Modern Architecture Research Group will act in this capacity, independently of official bodies, and gathering round it technicians and experts as they may contribute to the solution of contemporary architectural problems.

*

Groups have come and gone, but I feel quite certain that upon such a foundation, and drawing from the wider international sphere, the Modern Architecture Research Group should be of untold value to architecture in this country.

*

STATE HOTELS AND STATELY HOMES

I was talking this week to a man who had for some years organized industrial and educational schemes in prisons. He had loved his work, and he described it with the humbleness and sympathy and profound understanding of men that marked him as one of the salt of the earth.

*

He regretted that the conditions under which such work was carried on did not always make prisoners contented with industrial life when they were released. He said—and surely this is the bitterest comment ever made upon our casual and needless squalor—"It's so easy to make any prison superior to the slum conditions of England!"

*

THE HERITAGE OF JUNK

Many of our worst slums are due to the social degeneration of permanent buildings. And this inflammable subject of permanence in architecture was discussed with acrimonious vigour at an Architecture Club meeting, last Thursday.

*

The debate on "Should buildings have an age limit?" was opened by Mr. Julian Leathart, F.R.I.B.A. He referred to the heritage of permanent junk bequeathed to us by past generations who were so pleased with themselves that they imagined their ideas were valid for all time.

*

A short life and a stark one for buildings seemed to be the desire of the modernists who spoke.

I thought that the suggestion of Mr. H. G. Strauss was wholly admirable: he thought that the laws relating to obscenity should be transferred from literature to building.

*

"But building," said Sir Christopher Wren, "certainly ought to have the Attribute of the Eternal. . . ."

*

To a stable society, controlled by an educated aristocracy, that applies. To a world covered with the unhealed sores of barbarous industrialism, the evils of permanence in building are miserably obvious.

*

THE REVOLUTIONARIES

Last Friday evening Mr. R. A. Duncan delivered to an audience composed of people who nearly all agreed with him, namely, the members of the Design and Industries Association, a passionate denunciation of the congested futility of modern civilization.

*

Mr. Darcy Braddell, who opened the discussion after the lecture by putting the case for an intellectual aristocracy, said that Mr. Duncan was preaching a crusade and was a hot gospeller. I found it difficult myself to discover (1) what was the crusade's objective, and (2) what the gospel was.

*

Maybe the earnest vigour of the gospeller overcrowded the great design he was trying to convey. I was frankly bewildered by the proliferation of ideas he exposed to view. The slides he showed represented a really lucid interlude: he told the story of that great book by Lisle March Phillipps, *The Works of Man*, in a brilliant selection of examples.

*

Nobody can complain today that the D.I.A. is dull when it arranges discussions like "Revolutions in Civilization." Dull is quite the wrong word.

*

POSTS AND THINGS

I was talking the other day to a member of a firm which makes and instals traffic signals, which are every day becoming more and more common objects in our streets.

*

As it is the recognized thing in this country that the manufacturer is always to blame, I made some suggestions about the general appearance of the signals. I asked what mental process brought it about that the light-boxes themselves should be, though by no means perfect in design, at least straightforward solutions of the problem and reasonably harmless in appearance; while the standards to which they are generally fixed should be throw-backs to a half-caste culture—fruit and that.

*

The reply I got was illuminating and disappointing. It appears that it is the local authority in most cases which insists that the standards shall "harmonize" with the existing lamp-posts of the neighbourhood! I was unable to find out how much extra is paid for this perpetuation of bestiality over the cost of a plain, well-proportioned post.

*

It is, incidentally, interesting to see that the Trafalgar Square signals are very much better in design than many. The fact is, I suppose, that as there are to my knowledge in that square five different types of lamp-post, in varying degrees of vileness, an attempt at "harmony" by the local authority would be like putting a chameleon on a piece of tartan.

*

"THE ADVENTURE OF BUILDING"

Of the making of houses there is no end. Hence the new edition of *The Adventure of Building* (of which 50,000 copies have already been sold) in which, although only slight revisions have been made in the text, almost all the illustrations are new. The houses now illustrated are of a smaller size, ranging in cost from £350 upwards, the object, of course, being to demonstrate that architects should be employed for the very smallest type of domestic work.

*

The publisher has told me of his hope—which, in view of his past experience, is practically a certainty—that the various architectural societies, as well as individual architects, will continue to buy the booklet for widespread distribution. The charge made per copy is the almost nominal one of 2s. a dozen, post free. Enquiries should be addressed to the Manager, Architectural Press, 9 Queen Anne's Gate, Westminster, S.W.1.

THE MACKINTOSH EXHIBITION

Today, May 3, the C. R. Mackintosh Exhibition will be opened by Sir Robert Horne, Principal of the University of Glasgow, in the McLellan Galleries, Glasgow. A short inaugural address will be delivered by J. Jeffrey Waddell, I.A., F.S.A. (Scotland).

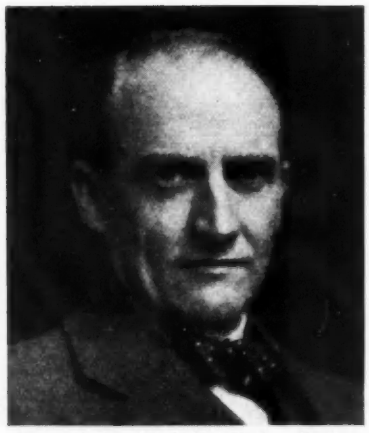
EXHIBITION OF BRITISH INDUSTRIAL ART

In the course of a letter dealing with the forthcoming Exhibition of British Industrial Art in Relation to the Home, Mr. Christopher Hussey, Chairman of the Executive Committee, writes :

The forthcoming exhibition is the first attempt in this country to reply to the modern industrial art exhibitions of Continental nations, one of which, the Swedish, made a profound impression when shown in London in 1931.

The exhibition is to be held at Dorland Hall, Regent Street, from June 20 to July 12. It is to represent the best and most progressive work of manufacturers and designers, selected by committees conversant with each particular trade. Exhibitors are responsible firms, designers, and federations of manufacturers and retailers, and exhibition is according to class of goods. Sales will be facilitated, but direct retail transactions are of course impossible. Great care is being taken to include exhibits at various prices so that a public of varied requirements may be attracted.

The exhibition aims at providing the public with the means for acquiring a contemporary standard of judgment in regard to the furnishing and equipment of their homes. It is believed that in the last two years very great progress has been made in bringing output up to date, but that, for lack of an exhibition of this nature, the public both at home and abroad is largely unaware of the excellence of modern British industrial art. It is the first exhibition in the history of British industry based on the selective principle.



Recent contributors to the subscription list of the Special Committee for Public Relations of the Building Industries National Council are as follows : British Challenge Glazing Co., £5/5/0 ; Cement Marketing Co., Ltd., (2nd instalment of £500) £125/0/0 ; Midland Brick Association, £10/10/0 ; Leicestershire Brick Mfrs. Association, £10/10/0 ; South Eastern Federation of the Building and Engineering Brick Trade of England and Wales, £50/0/0. Subscriptions to the fund, which has now reached £2,632/5/10, should be addressed to Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

LIVERPOOL ARCHITECTURAL SOCIETY

Mr. Leonard Barnish, F.R.I.B.A., was elected president of the Liverpool Architectural Society and its representative on the R.I.B.A., for the second successive year at the Society's annual meeting on Wednesday last. Mr. Duncan Campbell, F.R.I.B.A., a former president, was elected vice-president. The other officers were elected as follows :—

Vice-president, Mr. H. A. Dod, F.R.I.B.A.; hon. secretary, Mr. J. S. Allen, A.R.I.B.A. ; hon. treasurer, Mr. E. J. Dod, A.R.I.B.A.; hon. librarian, Mr. E. H. Honeyburne, A.R.I.B.A. ; hon. auditors, Messrs. E. E. D. Smith, L.R.I.B.A., and James Grieve, A.R.I.B.A. Unofficial members of the Council : Professors Patrick Abercrombie, F.R.I.B.A., and L. B. Budden, F.R.I.B.A., and Messrs. G. W. Fraser, F.R.I.B.A., Ernest Gee, F.R.I.B.A., W. P. Horsburgh, F.R.I.B.A., L. H. Keay, F.R.I.B.A., D. G. McIntosh, W. Dougill, A.R.I.B.A., and H. S. Silcock, A.R.I.B.A.

The Society's membership now includes 75 fellows, 55 associates and 37 students.

Leonard Barnish, F.R.I.B.A., who has just been re-elected President of the Liverpool Architectural Society.

BRIGHTON EXHIBITION

Brighton's third annual Home and Building Exhibition was opened by the Mayor of Brighton (Councillor F. G. Beal, J.P.) at the Dome and Corn Exchange, yesterday.

TWO ARCHITECTURAL DISEASES

Mr. Robert Wilson, speaking at a dinner held last week to mark the inauguration of the Stirling Chapter of the Royal Incorporation of Architects in Scotland, said the architectural profession was suffering from two diseases, "speculative building bungalitis" and "official organisms." He singled out these two because he thought they in their official capacity could effect, if not a complete remedy, at least a substantial partial remedy. He did not cast any reflection on the official architect, but the amount of work that was placed in his hands was such that he could not give it the personal attention that all such work must have.

Mr. John Begg, F.R.I.B.A. (President of the R.I.A.S.), occupied the chair.

GANDHI PLAQUE REMOVED

Following a local controversy, a plaque depicting Mr. Gandhi in Finchley (N.) Parish Church, has been removed by the Rector, the Rev. Stuart F. L. Bernays, and is now in his study. The plaque was illustrated on page 747 of our issue for December 7, 1932.

TOWN PLANNING IN THE U.S.S.R.

At a meeting held under the auspices of the Society for Cultural Relations between Great Britain and the U.S.S.R. at the Royal Society of Arts last week, Lord Marley gave an address on "Town Planning in the U.S.S.R."

The U.S.S.R., he said, had not yet developed its own form of architecture. What it had so far achieved was a great harmony of relation between the height of the houses and the width of the street. The building materials that had been used in most of the new towns he had visited were of a cheap variety. This was explained partly on the grounds of cost, and partly because planners were anxious not

Bridge over the River Thames at Hampton Court: east elevation. By Sir Edwin L. Lutyens, R.A., P.I.A.A.S.

to put up too durable structures before the U.S.S.R. had evolved its own type of architecture to correspond with the new forms of life. The material used was calculated to last about thirty years or so.

THE PASSING OF THE ALHAMBRA THEATRE

Negotiations are almost completed for a scheme to demolish the Alhambra Theatre, Leicester Square, and to build in its place a gigantic Palace of Entertainment, at a cost of £700,000.

Sir Oswald Stoll, in a statement to *The Daily Mail*, said: There is every likelihood that the negotiations will be completed, and if the new building is erected according to the plans I have seen there is no doubt it will be the sensation of London.

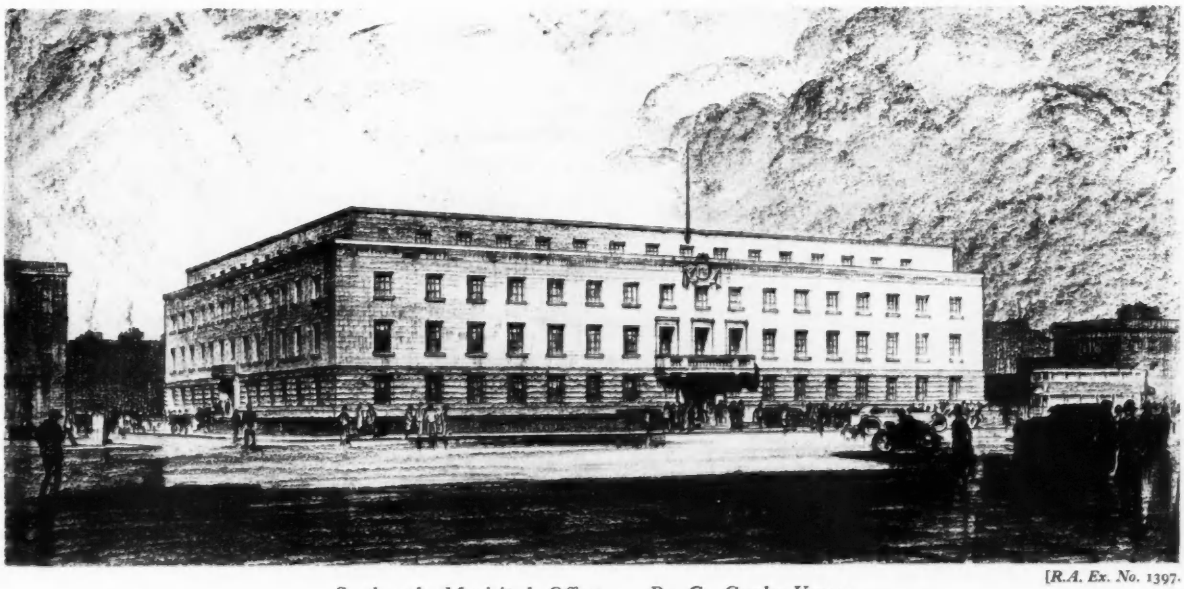
Mr. E. A. Stone has prepared the plans for the new building, which, it is understood, will be called "The New Century." The basement of the new building, states Mr. Stone, is to be a stadium for boxing; the ground floor will be constructed as a Beer Garden, and decorated as a Tyrolean village; on the first floor a Flower Garden and Restaurant will be laid out; on the second floor will be the Restaurant of Nations; and half the roof will be taken up by the kitchens, and the other half will be constructed as a solarium where artificial sun-bathing will be available the whole year through.

ROYAL ACADEMY BANQUET

Sir William Llewellyn (P.R.A.) presided at the annual dinner of the Royal Academy, held on Saturday last at Burlington House.

The Duke of Gloucester, replying to the loyal toast, proposed by the President, said:—

You cannot have failed to notice, when travelling throughout England, that there is writ over the countryside a greater movement in the life of the people, an impulse to have a light, airy home and pleasant surroundings, something pleasant to look upon from the exterior. The interior must be made to match, for we have long, dark winter evenings, and I suggest that art, in whatever form we can afford it, is what we really want to make our home life attractive.



Sir William Llewellyn, responding to the toast of "The Royal Academy," said:—

At the present time, it is true that, in regard to the design and appearance of our products, our reputation with other countries does not stand as high as it should do. What is needed is closer co-operation between the artist, the manufacturer and the public.

A good deal can be done by exhibitions of the best work, and specially prepared work, to train the taste of the public, the trade-buyers and the manufacturers.

It is perhaps in the field of architecture and kindred matters that great public interest has recently displayed itself. This, I think, began with the campaign for the saving of Waterloo Bridge, a matter in which public opinion was particularly stirred. Happily the bridge is now safe from destruction, and is to be reconditioned and preserved for future generations.

With increasing public interest in the development of London, and increasing knowledge among the general public, endeavours are now being made to safeguard the future of our cities, so that interesting buildings of the past shall be preserved, and that new plannings and new buildings shall be worthy records of our time.

EXHIBITION OF ARCHITECTS' WORK

An exhibition of sketches, etchings, oil and water-colour paintings executed by architects, will be held at the Institute from Friday next, May 5, until Monday, May 22. Many of the works exhibited will be for sale, and 25 per cent. of the proceeds will be given to the Architects' Unemployment Fund.

The exhibition will be open free to the public between the hours of 10 a.m. and 8 p.m. (Saturdays, 5 p.m.).

ELECTION OF STUDENTS

The following Probationers have been elected Students of the R.I.B.A. :

The Polytechnic, Regent Street, London : Messrs. J. G. Le Jeune and G. R. Penrose ; Auckland University College : D. J. Bedford, G. A. Rix-Trott and C. Sanderson ; Birmingham School of Architecture : F. H. Marvan and C. G. Percy ; Architectural Association : H. S. Smith ; Edinburgh College of Art : Alan Reiach ; University College, London : F. A. Howard ; Robert Gordon's Colleges, Aberdeen : A. Duncan ; Armstrong College, Durham University : D. W. Dickenson ; University of Cambridge : F. J. Cornell ; Secured Approved Qualification in the Dominions : M. Poole and W. I. Willies.

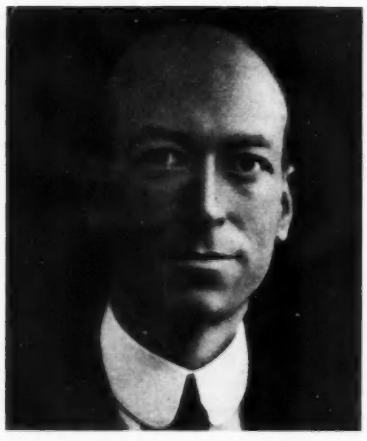
COMPETITION NEWS

THE BUILDING CENTRE COTTAGE COMPETITION

The result of this competition was announced in our last issue. A critique, together with the premiated and some of the other designs, will be found on pages 600-602.

MANCHESTER EXHIBITION HALL

The three premiated designs in the above competition are illustrated on pages 598-599.



ALUMINIUM FURNITURE

A competition for the design of seating furniture employing aluminium or aluminium alloys has been arranged by the International Aluminium Bureau. It is open to architects, craftsmen, designers, manufacturers or others interested, from all countries, and will be divided into two sections. The competitors in the first section must submit a finished specimen of one or more types of seating furniture. In addition, these competitors must furnish working drawings showing the exact details of construction, particularly emphasizing the methods of assembly. They must also give full particulars of the weight of the finished article, the weight of aluminium employed and the estimated selling price, basing the latter figure on an output of both 100 and 1,000 articles at a time.

Competitors in the second section will not be required to submit finished articles but only drawings and specimens. They must, however, submit the same information as competitors in the first section. Prizes totalling 6,000 Swiss francs will be awarded. Full particulars of the competition are obtainable from the British Aluminium Co., Ltd., Adelaide House, King William Street, E.C.4.

Reginald H. Uren, A.N.Z.I.A. (qualified and awaiting election as A R.I.B.A.) the author of the winning design in the competition for an exhibition hall, organized by the promoters of the Manchester Building Trades Exhibition.

N. E. Leeson, the author of the design awarded first place in the Building Centre Cottage Competition. *See page 600*

EXTENSIONS TO BELFAST SANATORIUM

The Belfast Corporation Tuberculosis Committee, subject to the approval of the City Council, are to invite designs from architects resident in Northern Ireland for the Extension to the Municipal Sanatorium and Municipal Hospital for Tubercular Children.

Competitions Open

May 8. — Proposed Burgh Chambers, Municipal Offices and Public Baths for the Town Council of the Burgh of Prestwick. Premiums : £200, £100 and £50. Designs to be submitted to the Town Clerk not later than 12 noon on May 8. The period for applications for conditions, etc., has now closed. Full particulars were published in *A.J.* for March 15.

May 30.—Sending-in Day. Royal Society of Arts Competitions for Industrial Designs. Applications for entry forms, instructions, etc., must be sent to the Secretary of the Society, at John Street, Adelphi, W.C., before May 8.

May 31.—Sending-in Day. **Layout of a suburb on the river Escaut, Antwerp. £2,400 in prizes (1st, £800). Conditions, etc., were published in *A.J.* for December 7, 1932.**

June 3.—Sending-in Day. Limited competition for flats to be erected in Lordship Road for the Stoke Newington B.C. Premiums : £250, £100 and £50. Full particulars, etc., published in *A.J.* for March 29.

September 21.—Proposed Town Hall for the Borough of Hornsey. Open to architects of British nationality. Assessor : C. Cowles-Voysey, F.R.I.B.A. Premiums : £350, £250 and £150, for the designs placed first, second and third, respectively. Applications for conditions, etc., should be made to E. B. Croasdell, Town Clerk, Town Hall, Highgate, N.16. Deposit £1 1s., returnable on receipt of a bona-fide design or return of the conditions within four weeks before the date for submitting designs.

Building Work at Weymouth

The Prince of Wales will open the new pier and harbour scheme, constructed at Weymouth at a cost of £150,000, on July 13.

Architect and Engineer

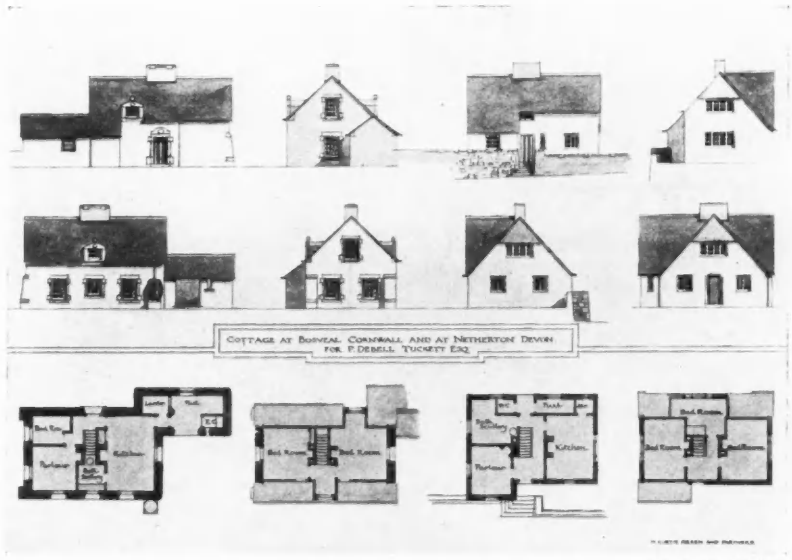
At a recent meeting of the Junior Institution of Engineers a paper was read by Mr. J. R. Leathart, F.R.I.B.A., on "The Foundations of Architectural Design." Discussing the work of the architect and the engineer, he said that it was an almost invariable paradox that the work of a trained architect tends towards a simple and orderly arrangement of engineering units in decorative treatment, whereas an engineer almost inevitably produces a riotous architectural veneer to the structure if left with a free hand.

ON THE AIR

On Tuesday next, May 9, the fourth of the series of talks on "Design in Modern Life" will be broadcast in the National Programme at 8.30 p.m. by Mr. Francis Meynell, whose subject will be "The Printed Word."

THE ROYAL ACADEMY

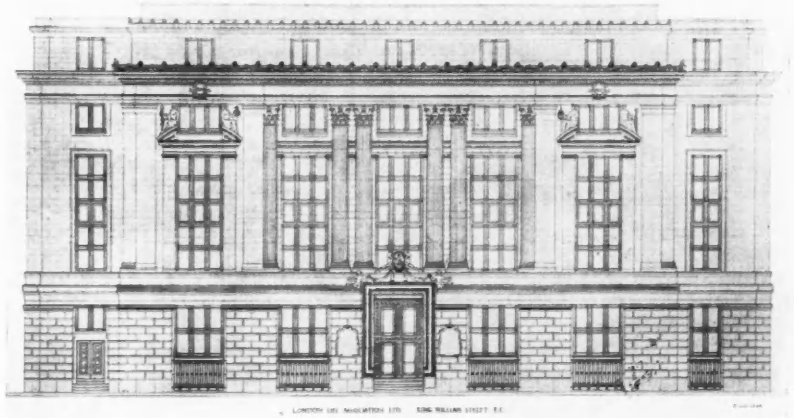
FIRST IMPRESSIONS



[BY H. S. GOODHART-RENDEL]

IT is impossible to imagine a more thankless task than must be that of selecting and hanging the architectural drawings exhibited annually at the Royal Academy. Various obstacles, apparently insuperable, prevent any proper exhibition of architecture at that institution, in spite of honest attempts at reform that, from time to time, have been made by its authorities. In consequence, the unfortunate hanging committee must cover the walls, as agreeably as it can, with a mosaic of those sketchy and uninformative drawings that experience has encouraged architects to submit; drawings from which the quality of the design represented can seldom be gauged and still more seldom seems to be taken into account.

Raking over the scrap-heap which is the show this year, it is not hard to discover jewels. Mr. Curtis Green's diploma work, a beautiful elevation in outline of his London Life Association building (1447) is an ideal exhibit, and no better method of presenting domestic architecture can be imagined than the plans and elevations he shews of a Surrey house (1418) and some charming cottages in the West Country (1419). Sir Edwin Lutyens, also, has sent complete and straightforward drawings (1382, 1387, 1399) of his bridge at Hampton Court, a structure far from straightforward in itself, but, as a piece of make-believe, very skilful and pretty. Had Waterloo Bridge been rebuilt by Messrs. Rendel, Palmer, and Tritton, it would have been charmingly trimmed by Sir Giles Scott as three drawings (1388, 1393, 1394) here testify. No decorative elegance, however, could have reconciled any thinking critic to the discord between the arches over the water and the flat girder over the roadway. Wall-space has most unaccountably been granted to another proposal for this rebuilding in which Rennie's columns reappear in groups of three, making an architectural curiosity of the first order (1411). Mr. Maxwell Ayrton's bridge at Twickenham (1410) is not easy to visualize from the one elevation shewn, in which some curious shapes lack whatever significance they perhaps may have when seen "in the round."



Among the designs for municipal buildings no elevation is better than that with which Mr. Cowles-Voysey won the Southwark competition (1397) and none is worse than an unsuccessful design submitted for Norwich, shewn in two superfluous drawings (1360, 1361) occupying space to which their quality gives them no shadow of a claim. Messrs. James and Pierce's design selected for this town has an air perhaps unduly Swedish, but is agreeably sane and homogeneous (1402). Mr. Hepworth's Municipal Offices at Walthamstow (1403) are rather coyly presented, exciting a desire to know more of what promises to be an interesting composition. Sir Herbert Baker's Government buildings at Pretoria reappear, as his diploma work, in a romantic drawing (1457), that well conveys the emotional effect attempted in the architecture.

Of public buildings not municipal none in the room can rival the proposed completion of Mr. Greenslade's National Welsh Library by Messrs. Adams, Holden, and Pearson (1513). Old and new are here combined into a harmonious and magnificent group. The library of the new Geological Museum (1405) by Mr. Markham of the Office of Works looks a more agreeable room than was to be expected in so very routineer a building. Sir Edwin Cooper shews his usual competence in the splendiferous boardroom for the Port of London Authority (1363). Sir Edwin Cooper's other two exhibits are the medical school of St. Mary's Hospital (1370) and the National Provincial Bank (1439). In the latter he triumphs in the rôle of *ultimus Romanorum*, for, surely, never again will commercial pride demand so much architecture and so little window space. In its pompous kind this design is excellently and consistently worked out; so consistently that

Cottages: Bosveal, Cornwall, and Netherton, Devon. By W. Curtis Green, R.A., and Partners.

[R. A. EX. No. 1417.

London Life Assn. in King William St., E.C. (Diploma). By W. Curtis Green, R.A., and Partners.

we are even beguiled from laughing at female figures personifying the higher and the lower mathematics. St. Mary's Medical School is simpler and no less capably handled.

Other hospital buildings of importance are shewn by Messrs. Burnet, Tait, and Lorne (1359); Messrs. Hall, Easton, and Robertson (1369), and Mr. John Denman. Mr. Denman's model (1563) of the Sussex Eye Hospital at Brighton admirably shews an admirable design; Messrs. Burnet, Tait, and Lorne's small bird's-eye view tells very little about the Fever Hospital at Paisley.

A small elevation of Mr. Emberton's new exhibition hall at Olympia (1414) is hung so as to be decipherable only by the long-sighted. It really sometimes appears as though inconveniently stimulating designs were inevitably, if unconsciously, relegated to inconspicuous positions. The cleverest drawing in the present show, for instance, has been hung upon the pedestal of one of the models. It is a pencil sketch by Mr. Walcot of the charming new front he is putting upon No. 61 St. James's Street (1568). Again, no small house in the room shews such sensitive characterization as Messrs. Adshead and Ramsey's (1421), a tiny drawing of which can just be described below the cornice on the long wall. Upon the pedestal of another model is misplaced a delightful church interior (1552), designed by Messrs. Travers and Grant for Streatham. This clever compromise between mediævalism and protestantism is infinitely more intelligent and interesting than most of the ecclesiastical architecture exhibited.

Mr. Palmer Jones's design for Guildford cathedral (1502-4), for example, wastes a great deal of wall-space to no purpose except, perhaps, that of serving as a foil to the skilful and delicate design of Mr. Maufe, accepted for execution (1488, 1494, 1495). If the present generation believes that mediæval forms of violently different scales can be jumbled together as Mr. Palmer Jones has done, it is not surprising that the Gothic Revival has come to be undervalued. Mr. Harold Gibbons's sketch design for Guildford (1533) is the work of one who knows what Gothic is.

Most of the other designs for churches are in some form of Romanesque style, and vary in merit from one at Cairo (1477), which is easily the worst, to one at Kennington (1497), which is easily the best. The architects of the latter are Messrs. Adshead and Ramsey. A sketch for a cathedral by Mr J. H. Sellers (1471) secures all the essential qualities in Byzantine composition that are generally missed by less experienced artists.

What is now commonly and loosely described as "Housing" is extremely well represented in blocks by Mr. de Soissons (1365, 1448), and by Messrs. Mitchell and Bridgwater (1416).

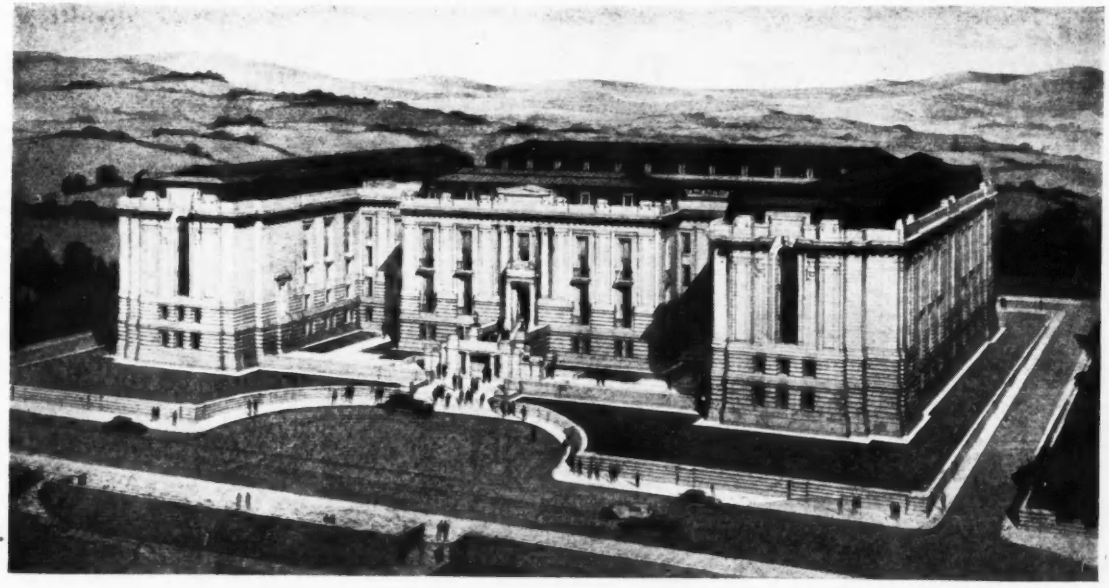
ARCHITECTURE AT

1.

[R.A. Ex. No. 1375.

2.

[R.A. Ex. No. 1552.



A higher type of collective dwelling is typified by Messrs. Maurice Webb and Dawson's excellent flats (1375) in St. John's Wood. The Lady Hardinge Serai (1528), by Mr. A. Shoosmith, may be mentioned as well in this category as in any other; it is of agreeable and characteristic design.

It is to be feared that it is in no cautionary spirit that the Hanging Committee has presented to us much "Tudor" litter of the kind that accumulates round suburban golf courses. Of cottage design at its best, Mr. Keen

sends an example from Oxted (1456), and in a house near Esher (1354) Messrs. Baillie Scott and Beresford tell an oft-told fairy tale with charm as great as ever. Models such as these, however, are not nearly *poivré* enough for the dwarf-and-goblin homelet of the tired business man, in which every rural characteristic must be exaggerated into violent oddity. From many disagreeable examples of this kind we may turn with infinite relief to the pleasant drawings of Mr. Hamp's Headington Manor Farm (1404), Mr. Rea's house at Brixham (1467), and Mr. Hyam's house at Looe (1538). In a more sedate style there is an excellent house in Sussex by Mr. Guy Dawber (1482), and another at Totteridge (1463), very sensibly presented by Mr. Hepworth.

It would obviously be unfair to regard this motley exhibition as representative of British architecture today, since the inducements to submit designs for inclusion in it are not sufficient to elicit more than a small proportion of the best work done in the country. It is, however, nearly typical enough of our too prevalent weaknesses for Mr. Wornum's design for the new R.I.B.A. headquarters (1378) to shine forth as a beacon of hope for a future very different from the present. In its revised form this design is entirely adequate to its noble purpose, and must surely be regarded with great satisfaction, even by those whose first approval was qualified by doubts.

Architects and Unemployment

SIR,—May I make use of your columns to call the attention of architects, particularly those who are in salaried positions, to the fact that there is a scheme in the architectural profession for insuring against periods of unemployment. This scheme was started by the Association of Architects, Surveyors and Technical Assistants in 1925, and the benefits are available for their members for a subscription of 12s. a year.

Those of us who have been working on the Unemployment Committee for the past year, and have seen the hardship caused to so many members of our profession through sudden loss of work, feel very strongly that if a similar emergency were to arise we should be prepared for it in some way. As the A.A.S.T.A. Unemployment Fund offers a certain measure of protection against unemployment, we consider it advisable that all salaried men who are eligible to join this scheme should know of it. An additional advantage of membership is that contributors to the Fund who have been insured under the National Insurance Acts can draw State unemployment pay at the offices of the A.A.S.T.A. instead of at a Labour Exchange.

Full particulars with regard to membership of the Association and of their Unemployment Fund may be obtained from the Secretary, A.A.S.T.A., 26, Buckingham Gate, London, S.W.1.

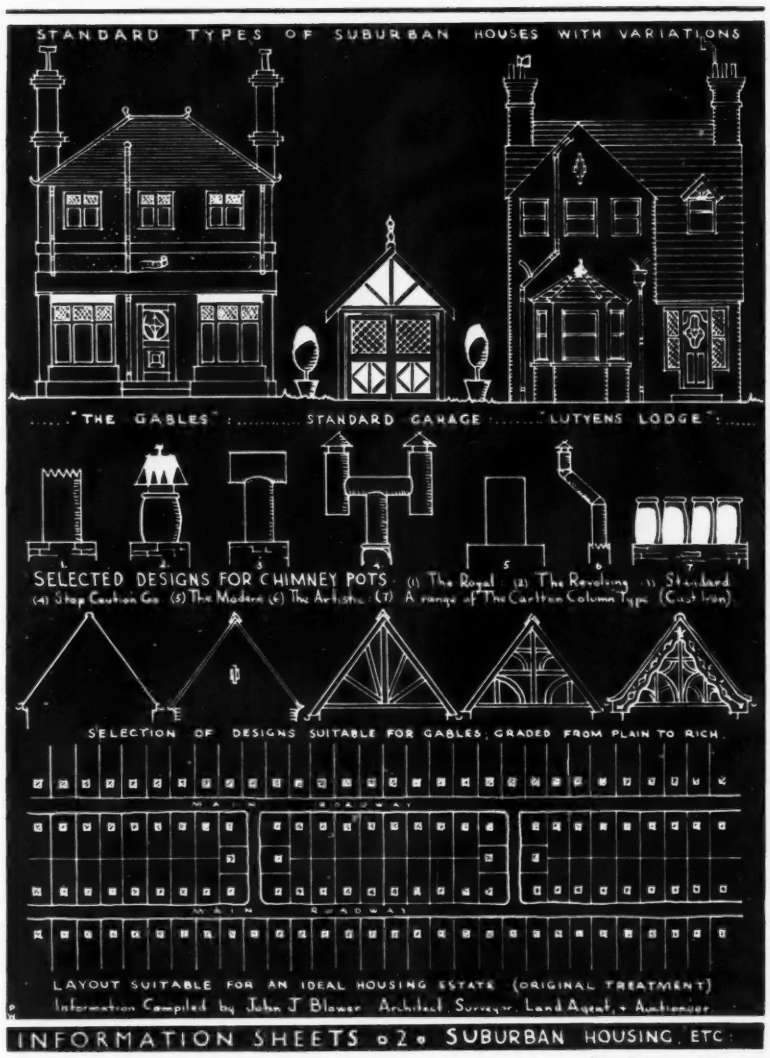
MAURICE E. WEBB

Suburban Housing

SIR,—I should like to take this opportunity of thanking you for the useful Information Sheets presented with the recent numbers of THE ARCHITECTS' JOURNAL.

I am venturing to send you a copy of one from my own files dealing with the variety of effects that may be obtained by varying small details in suburban domestic work, always bearing in mind the fact that I have deliberately planned these details in accord with the characteristics of the neighbourhoods for which the houses are designed.

I would like to point out that this style of house is favoured throughout the length and breadth of our island, and that it seems to me to be desirable to cater for everybody's likes and dislikes nowadays as it is a democratic age, which is what I always say, so perhaps if you published my Information Sheet it might help your readers to a broader outlook.



JOHN J. BLOWER

What is to be Done About This?

SIR,—The correspondence which has appeared in your JOURNAL recently regarding the thousands of houses which have sprung up in the suburbs since the war seems rather unfair to me. I hold no brief for the builders of these houses, but in justice to them, one must admit that they have provided thousands of people of moderate means with decent living accommodation. Since the majority of these builders have not had an architectural education, it is too much to expect them to appreciate the niceties of architecture, and, therefore, unjust to pour forth vitriolic comments on their work. They have at least satisfied a national want, and for that reason alone they are entitled to appreciation.

In Mr. Smarterly's letter he states that capital is easy to obtain. In that case, why haven't the architects taken advantage of it and constructed attractive houses themselves? No man is justified in belittling the efforts of another if he cannot, or will not, do better.

Again, it is not a "queer human psychology that makes people like these nasty villas," as Mr. Smarterly maintains, but the result of having nothing better to choose from within their means.

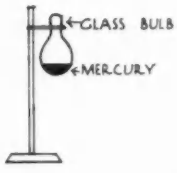
[*See letter on this page.*

Let architects build something better, that can be purchased on the same moderate terms. Then I, for one, will forsake my flat and give thanks unto them.

ALFD. J. SMITH

SIR,—Concerning "What is to be done about This?" May I make an unobtrusive suggestion? I feel that your most excellent JOURNAL preaches too much to the converted. Could any scheme be devised by means of which it could at least be in the hands of members of building committees of town, county and district councils? I am sure that it would have an educative effect upon them, and they would, possibly rather gradually, become interested and more critical.

I feel convinced that some good could be done in this way. Having taken to architecture late in life, I realize the complete change that has come over my own outlook, and I know that my own relations have become quite "educated," largely by means of your JOURNAL.



H. M.

[*It is often felt by readers that this* JOURNAL *is read exclusively by architects. We are glad of the opportunity of stating that this is far from being the case. In point of fact it is seen by a wide circle of lay readers. The scheme suggested by H. M. for circularizing the building committees of town councils, etc., has already been carried out.*—ED., *A.J.*]

A Novel Water Softener

SIR,—I was shown yesterday in a domestic water storage tank, in a hard-water district, what appeared to be a novel water softener.

It consisted of a glass bulb, about the size of the ordinary electric light bulb, containing a small quantity of mercury. This bulb floated in the water and was kept in position by a small vertical brass rod set in a glass base about 4 ins. square, somewhat as sketch :—

There was no name cast on the base, only the words "Scale buoy." Do any of your readers know anything of this apparatus and of its efficiency?

HAROLD A. DOD

The R.I.B.A. Conference

SIR,—It is proposed to hold a camp for men members of the Conference, should they prefer this method of spending the few days in Cambridge to that of staying at a hotel or in rooms.

Apart from the fact that a considerable saving would be incurred by this method, it is also pointed out that by mingling in camp an excellent opportunity is given for forming acquaintances and friendships.

The arrangements for the camp, which will last from Wednesday, June 21, till Saturday, June 24, are very attractive, full particulars being obtainable by writing to Peter Burton, c/o H. C. Hughes, M.A., F.R.I.B.A., Tunwells Court, Trumpington Street, Cambridge.

PETER BURTON

Architecture and the Public

SIR,—It is a commonplace that no art can really flourish without public recognition and patronage, but it is most notoriously true of architecture.

The allied societies should do a great deal more towards the spreading of architectural propaganda among the laity.

On how many newspaper staffs are found, besides the musical, literary and dramatic critics, an architectural critic?

It is essential that we stimulate among the laity an intelligent interest in criticism of architecture.

R. V. R. SMITH

Welsh Architects' Visit

A large party of architects and students visited the new buildings which are being erected for Messrs. Spillers, Ltd., Roath Dock, Cardiff, on Thursday last. The visit was arranged under the auspices of the South Wales Institute of Architects (Central Branch) and the Welsh School of Architecture, Technical College, Cardiff.

The visitors were met on the site by Mr. J. Bradshaw, Messrs. Spillers' clerk of works, Mr. F. Goddard, the representative of Messrs. John Clarke and Son, of Liverpool (the architects), and Mr. H. R. Evans, the representative of Dr. Oscar Faber, the consulting engineer.

Apart from the question of financial economy, many interesting methods of construction were examined, especially that adopted in the building of the reinforced concrete silo, in which a system of continuously moving shuttering was used, the workmen keeping pace with this in placing the concrete with its steel reinforcement. By means of this system a height of 100 ft. was carried out in 16½ days.

At the close of the visit Mr. Percy Thomas, O.B.E., F.R.I.B.A., chairman of the Central Branch of the South Wales Institute of Architects, expressed the thanks of the party to all who had contributed to its success.

The Housing Bill

The Minister of Health conferred last week with representatives of the National Federation of House Builders, who were introduced by Messrs. R. W. Jennings, the President of the Federation, F. Williams, Vice-President, F. Lord, and N. McKellen (Secretary).

The object of the conference was to enable the Minister to discuss with the Federation the steps to be taken to give effect to the proposals for the building of houses to let, contained in the Housing Bill now before Parliament, as soon as the Bill is passed into law.

The Minister suggested that it would be helpful if the Federation would arrange to hold local conferences throughout the country with the object of making the proposals widely known to builders.

The representatives of the Federation assured the Minister of their confidence that they would be able, in the absence of subsidised competition, to provide houses on a large scale.

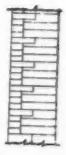
Reconstruction of Soviet Towns

An All-Union Conference on the reconstruction of Soviet towns has recently been held in Moscow. After the plenary session on the first day the work of the Conference split up into sections—namely, planning, road and transport, sanitation, housing, power, and administration and finance.

At the plenary session the question was discussed of the lack of co-ordination between the relative allocations for housing and municipal construction, and the insufficient attention paid by industry to the production of equipment for municipal services. The question of finance for the Second Five-Year Plan was raised, also that of local building materials, what and how much each locality could supply, and the weak spots to which State industry would have to turn its attention. Some of the speakers emphasized the need for more scientific research work in municipal construction.

An exhibition was opened in connection with this Conference showing the achievements made in housing, municipal enterprises, replanning of the bigger towns in the Union, and the work done in the planning of new towns.

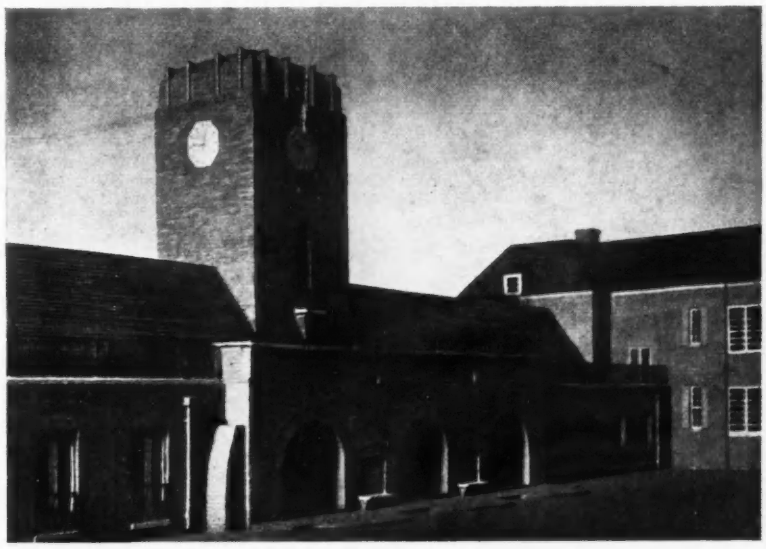
MERCHANT TAYLORS' SCHOOL, NORTHWOOD



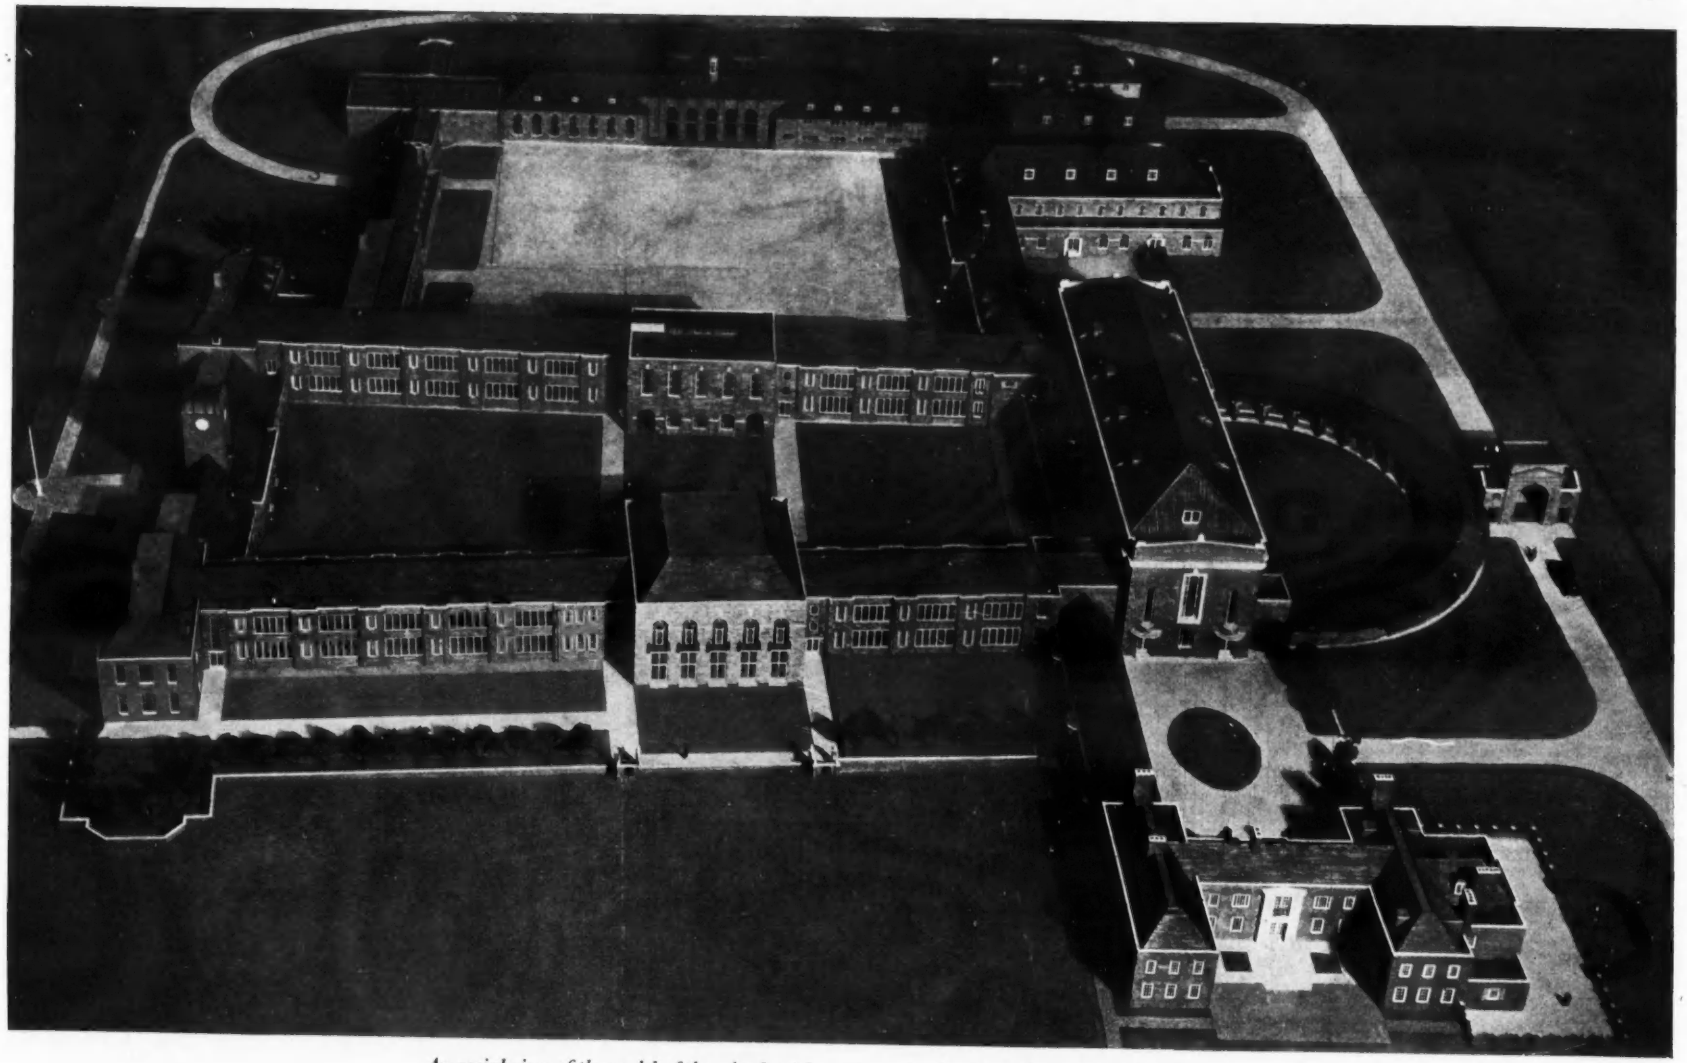
The building is carried out in mottled Amersham bricks, with a tiled roof and dressings of real and artificial stone, the whole being in varying tones of brown. The metal grilles, and the wooden shutters in the classrooms, are painted green on silver.

On the right is given a view of the tower at the west end of the main quad, as erected, while below it is a photograph of a model of the building. It will be noted that the tower was built finally with a batter, not shown in the model, a refinement which adds greatly to its appearance. The upper part of the tower is built of purpose-made bricks, with projecting ribs, and, below, a pattern is formed by means of projecting headers.

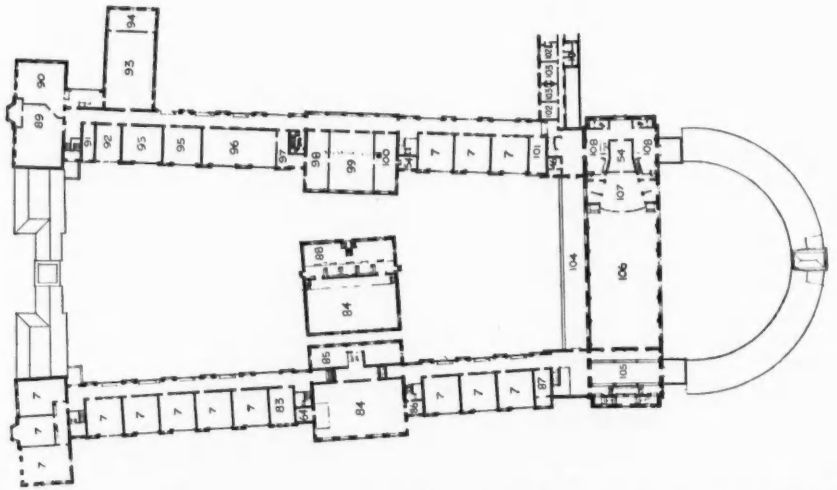
The clock faces are of stone, with circles of glass to mark the hours.

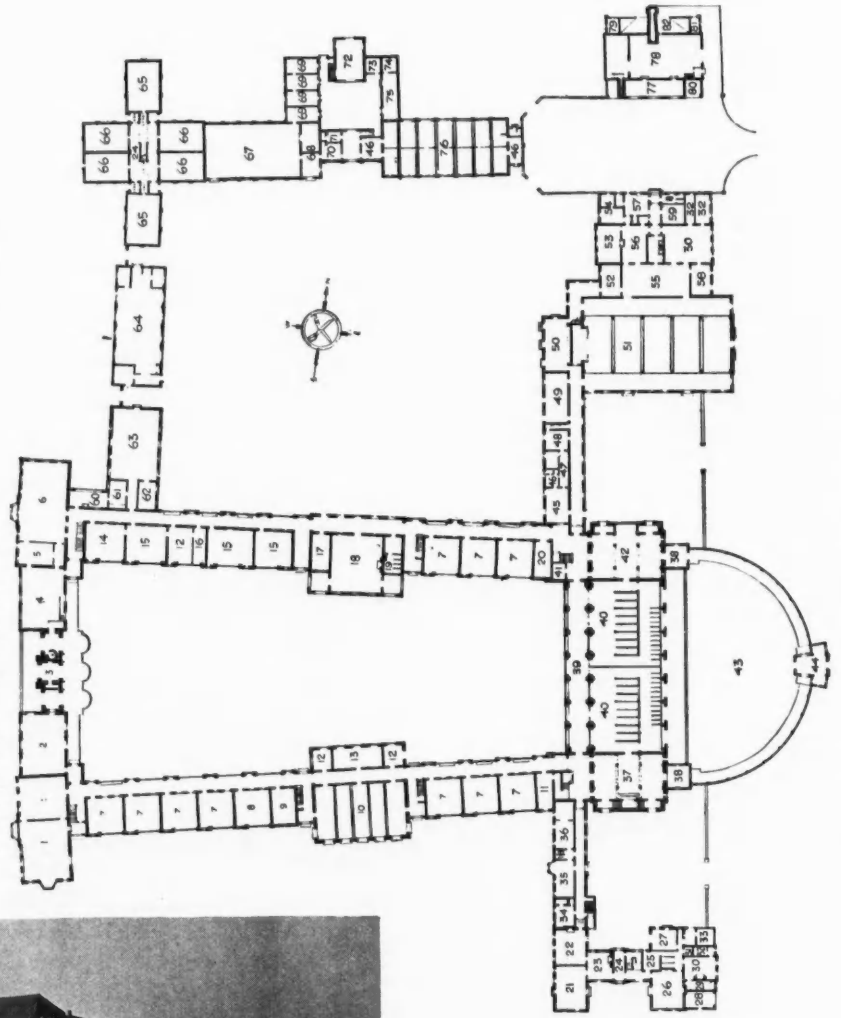


Newton, one of the seven stones, carved by Alan Durst, above the library window-arches. The reference is to Isaac, an earlier bearer of the present architect's distinguished patronymic.



This sketch section through one of the main walls of the building shows the method, generally adopted, of binding the facing bricks, which work out at four courses to nine inches, with the ordinary constructional bricks (four courses to the foot). There are three stretcher courses of facing bricks to one of headers, the header course binding in with the brickwork behind.



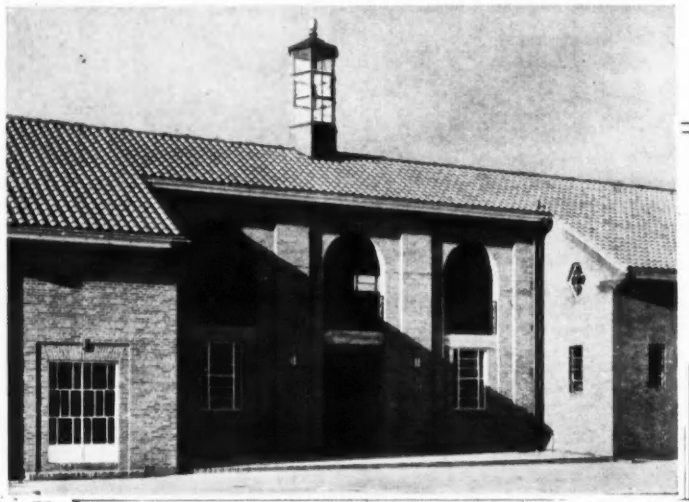


DESIGNED BY WILLIAM G. NEWTON AND PARTNERS

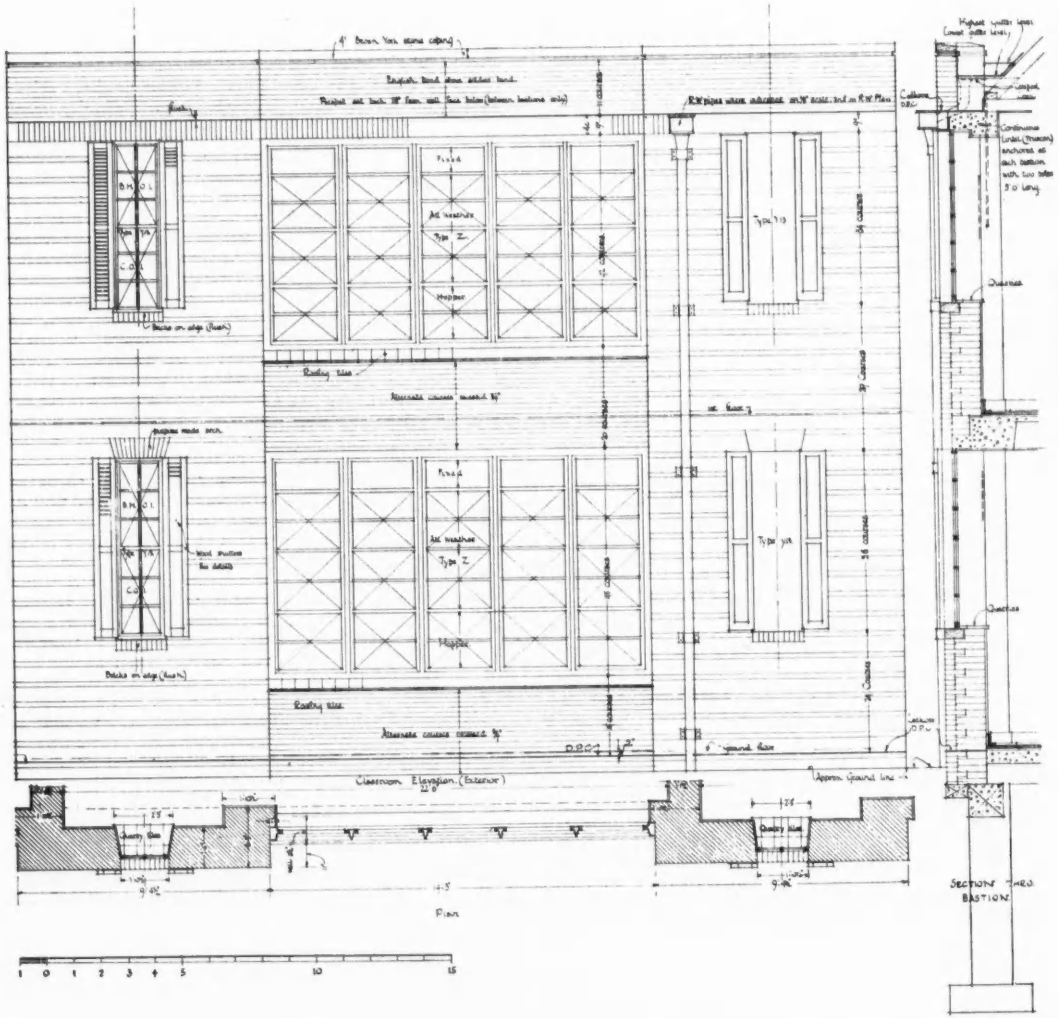
MERCHANT TAYLORS' SCHOOL, NORTHWOOD, MIDDX.

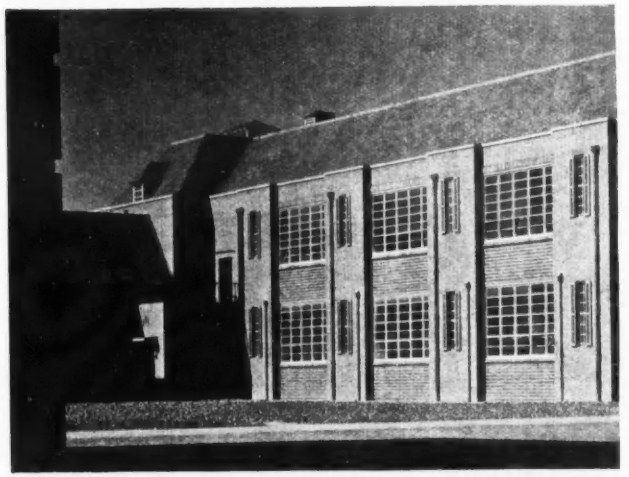
An aerial view of the model of the school, with the headmaster's house in the foreground. Further back, the dominating mass of the assembly hall can be seen, with the semicircular covered way leading to it from the gatehouse, and to the left, on either side of the main quad, the library and museum blocks rise above the horizontal lines of the wings containing classrooms.

On this page is given a general view of the building from the south-west, showing the headmaster's house at the south-east corner. The plans are of part of the first floor, and of the ground floor. The key to the accommodation is as follows :—

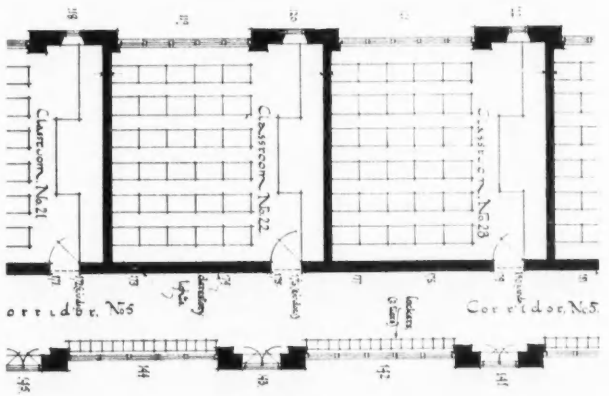


1—Geography rooms. 2—Temporary chapel. 3—Tower. 4—Lecture theatre. 5—Prep. room. 6—Elementary physics. 7—Classrooms. 8—Classroom (now monitors and prompters). 9—Committee room. 10—Lecture and examination hall. 11—Committee room. 12—Department head. 13—Masters' library. 14—Advanced physics. 15—Science classroom. 16—Special laboratory. 17—Locker room. 18—Masters' common room. 19—W.c.'s. 20—Electric sub-station. 21—Headmaster's drawing room. 22—Study. 23—Sitting hall. 24—Hall. 25—Pantry. 26—Dining room. 27—Servants' sitting room. 28—Garage. 29—Scullery. 30—Kitchen. 31—Store. 32—Larder. 33—Coal. 34—Secretary. 35—Reception room. 36—Medical inspection room. 37—South hall. 38—Vestibule. 39—Cloisters. 40—Cloak rooms. 41—Waiting room. 42—North hall. 43—East garth. 44—Gate house. 45—Clerks. 46—Lavatories. 47—Stationery. 48—School secretary. 49—Tuck shop. 50—Staff room. 51—Dining hall. 52—Wash-up. 53—Mess room. 54—Stores. 55—Servery. 56—Still room. 57—Superintendent. 58—Vegetables. 59—Receiving room. 60—Laboratory workshop. 61—Switch room. 62—Dark room. 63—Electrical and optical laboratory. 64—Workshop. 65—Squash courts. 66—Fives courts. 67—Gymnasium. 68—Remedial store. 69—Visitors' changing rooms. 70—Instructor's room. 72—O.T.C. store. 73—C.O. 74—R.S.M. 75—Armoury. 76—School changing room. 77—Fuel. 78—Boiler room. 79—Sewage pump room. 80—Bin shed. 81—Engineers' office. 82—Ashpit. 83—Committee room. 84—Library. 85—Art rooms. 86—Librarian. 87—Ladies' cloak room. 88—Junior reading room. 89—Advanced chemical. 90—Chemical lecture room. 91—Chemistry store. 92—Physical chemistry laboratory. 93—Elementary chemical laboratory. 94—Balance room. 95—Form room. 96—Biology. 97—Biological prep. room. 98—Biological museum. 99—General science museum. 100—Archæology museum. 101—Committee room. 102, 103—Bachelors' quarters. 104—Paved terrace. 105—Ante hall. 106—Assembly hall. 107—Stage. 108—Green room.





SCALE OF FEET



DESIGNED BY WILLIAM G. NEWTON AND PARTNERS

MERCHANT TAYLORS' SCHOOL, NORTHWOOD, MIDDX.

On the facing page are shown details of the south elevation of the gymnasium, changing rooms and O.T.C. quarters. The central arcade in the photograph leads to the O.T.C. quarters; on the left is a corner of the gymnasium; and part of the changing room block is seen on the right. Note the metal grilles to the arches on the first floor, and the interesting design of the window panes.

The elevations of the classroom wings, details of which are shown on this page, are a straightforward and effective expression of the plan. The long steel windows stretch across the pupils' part of each classroom, while solid piers, with narrow green shuttered windows, mark the end of the room occupied by the master (see portion of plan above). The horizontal feeling of the long windows is further stressed by the brickwork above and below them, where every alternate course is recessed ¾ of an inch. The vertical piers, where all the courses are laid flush, emphasize and punctuate the long, unbroken, horizontal lines of these façades.

DESIGNED BY WILLIAM G. NEWTON AND PARTNERS

MERCHANT TAYLORS' SCHOOL, NORTHWOOD

DESIGNED BY WM. G. NEWTON AND PARTNERS

The dining hall is constructed with columns, beams and ceiling trusses of reinforced concrete. The roof has a span of 36 feet and is supported by great beams, a continuation of the piers which divide the hall into a wide central nave flanked by narrow aisles.

The plaster is left from the flannel float and the dado is painted grey to harmonize with the concrete. The chair rail is gold, and the radiators are green, echoing the painted window. The floor is of dark Granwood, with a scatter of green.

THE ONE-PIPE SYSTEM

Some Further Notes

[*By D. BETHUNE WILLIAMS*]

SOME months have now elapsed since the first discussions took place which brought to general notice in England the question of using a type of plumbing which at first sight appeared to be a radical departure from the sanitary practice to which we are accustomed, and no doubt within the next few months we shall have in our hands the bye-laws as amended to permit the use of the "one-pipe system."

The majority of those connected with the building trade have grown familiar with the name but there are probably still some who are not so conversant with its application in practice, and regard it as a foreign invention.

This it is not; it is merely the scientific development of the original system that was used here, to be discarded later as being unsafe on account of the doubtful quality of materials, workmanship and experimental data. Therefore, though it has been stated before, it may not be out of place to mention again the outstanding point in which our present system differs from the proposed alternative.

Under our present bye-laws in London certain fixtures, now to be known as soil fitments, i.e., urinals, slop sinks, etc., are permitted to be connected to a sewage drain without the intervention of any trap other than that at the fitting itself; this was considered quite sound practice even though in some cases as small a seal as 1¾ ins. was permitted. The point at which our drainage changes into a one-pipe system is that now the remaining fixtures, known as waste water fitments, are also to be permitted to have connections to a soil pipe or sewage drain similar to those of soil fitments.

The objection to the waste water fitment being connected by an untrapped pipe to the sewage drain is, of course, that fixtures, like basins and sinks, are frequently placed in habitable rooms, and the air in these rooms is then only protected against pollution with sewer gas by a single trap.

It is argued rightly that this trap might have its seal broken by evaporation, aspiration, pressure, or self siphonage, and it is therefore particularly necessary in one-pipe work to protect the trap seal from these risks.

The first danger of evaporation, and also that of diffusion of gases through the seal, is met by using traps with deep seals of from 3 ins. to 4 ins. Deeper seals are unnecessary and tend to collect sediment, which may give off unpleasant odours.

The next dangers of the liability of the trap seal being broken by self siphonage after the rapid discharge of its contents, or being broken by alternate pressure and suction due to a discharge from another fixture, are overcome by the use of the weight of the water column in the deep seal trap and also adequate venting; this latter piping in addition tends to prevent the accumulation of gases which would destroy the metal pipework.

In a one-pipe system of any size the vent pipes or vent arrangements are of the utmost importance for the correct functioning of the plumbing, also the closing of the vent pipes may well cause the unsealing of all fittings on that line, and so it is in their design that the quality of the plumbing layout will largely lie.

Closing of the vent pipes may occur due to a variety of reasons; one reason might be the accumulation of rusting or debris in the pipe. This can generally be overcome by the use of the more durable materials, such as cast iron, for the pipe, and the design of connections for the vent which tend to clear themselves, such as by-passing the vent pipe and taking one fixture into the base of the stack, which will automatically remove any accumulations.

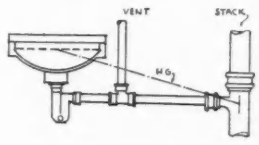


Figure 1

The vent might also be closed by being placed in such a position that during discharge of the fitting the waste matters rise up and deposit sediment in the vent, as illustrated (Fig. 1). This can be prevented by placing the vent above the hydraulic gradient. In certain cases such as baths, this is impossible, in which case use may be made of part of the vent as a waste pipe for another fixture from which a vent is taken above the hydraulic gradient (see Fig. 2 herewith from *A.J.*, Nov. 23, 1932). The level of the

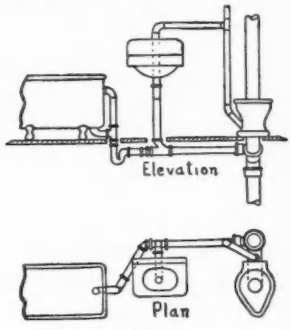

Figure 2

vent in relation to the fixture should also be checked to see that it is not possible for it to act as an overflow should the branch be blocked.

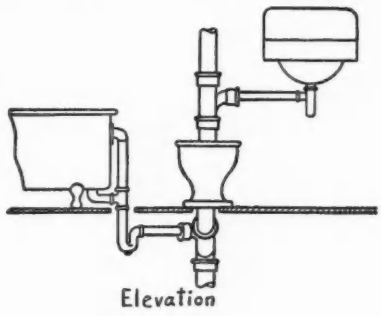

Figure 3

For smaller domestic work it has been found by experiment in the U.S.A. that venting in certain cases by separate pipes was unnecessary, and a sketch of such work is given (Fig. 3). It is

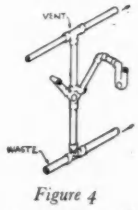

Figure 4

unlikely, however, that this will be adopted in London though probably duplex venting as illustrated will be permitted (Fig. 4).

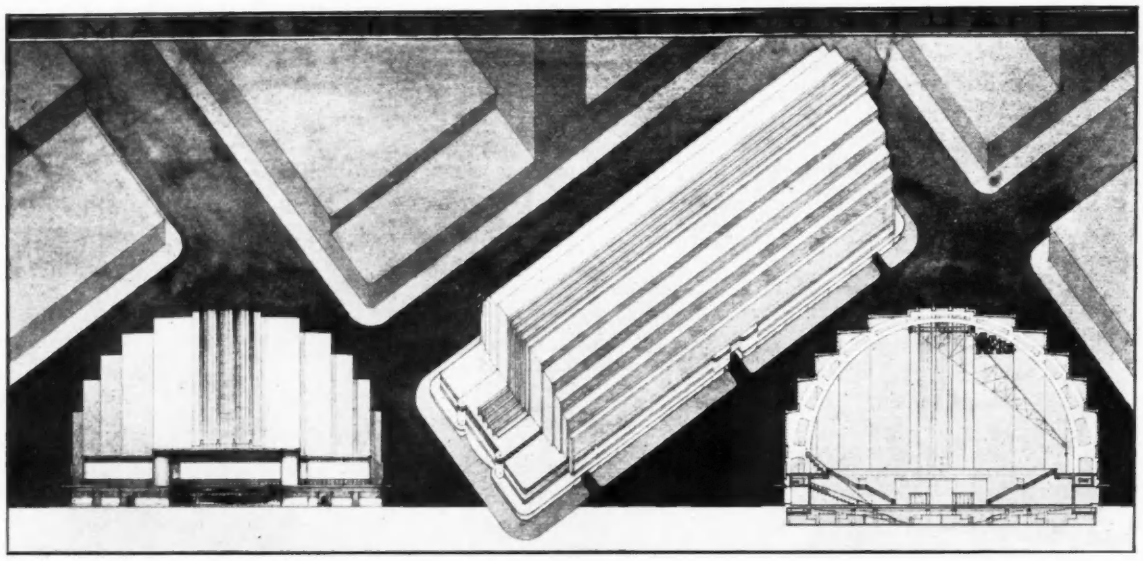
In London at present an example of large-size work on this system is the experimental layout at the Cumberland Hotel: abroad, however, there are innumerable examples, the best being found in North America, where the one-pipe system is used to an extent hardly realized, entirely refuting the idea which seems to be held that it is only for buildings of great size that the system is applicable.

In domestic work, inside plumbing with one-pipe work will reduce the sizes of pipe ducts and in many buildings of 4 and 5 stories, carefully planned to suit the ductwork, the system will be found satisfactory either as the general scheme or as part of it, but it must be remembered first that rainwater may not connect into a soil pipe; and, secondly, that, with fittings connecting to a horizontal run of drain with an adjoining stack, there is the risk that their seals may be forced unless special provision is made.

Finally, during the earlier discussion, much was made of the dangers of the one-pipe system and demands were advanced for heavy safeguards to prevent unpleasant odours arising from the fittings. Such odours were not noticed by the writer in any of the North American buildings that were visited but every day there are still noticeable in London slipshod methods of dust removal and possibly now that one-pipe plumbing is on the way those who were so particular about dangers arising from the disposal of one form of waste might turn their attention to the disposal of that other form of waste.

Slum Clearance

Speaking at the Bonar Law College at Ashridge on Wednesday last, the Minister of Health said that the Government's circular to the local authorities, calling for a five years' programme of slum clearance, had been described by some critics as a mere gesture. It was a gesture to kick a ball into the net, but without the gesture there would be no goal. It was the fixed purpose of the Government to put an end to the slums as soon as humanly possible, and in that purpose they would be supported by the country and by the local authorities. The local authorities must be the van of the advance, because they alone had the local knowledge necessary to show the way; but by hook or by crook the Government intended to see the matter through.



Wakefield Cathedral

The architect has given such a serious report on the condition of the beams of Wakefield Cathedral nave roof that an order has been given to construct internal scaffolding in order to avert possible disaster. This will be done immediately. It will be necessary to proceed with the work of repair as soon as funds permit.

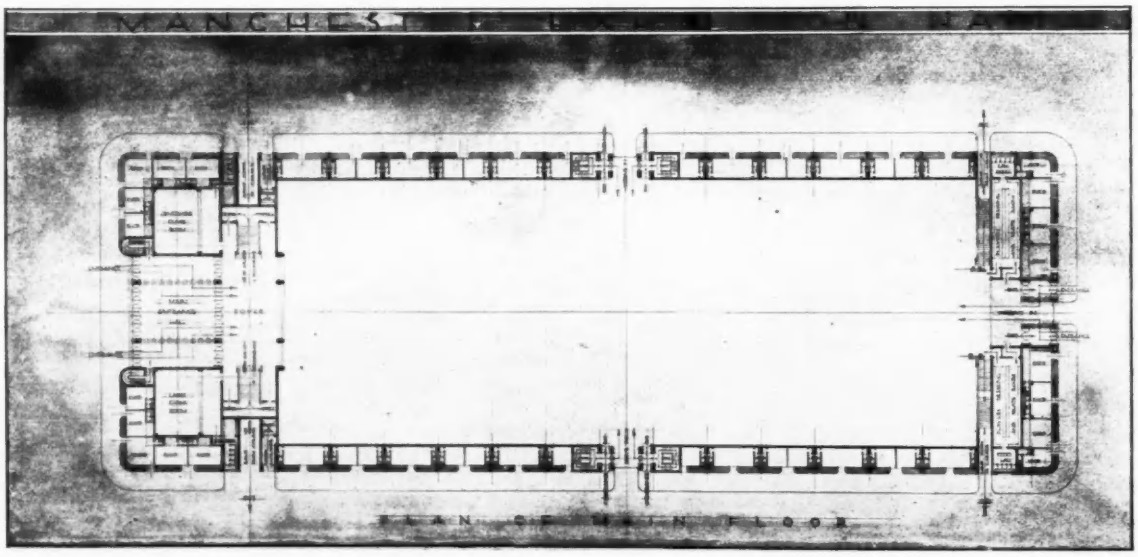
Change of Address

Messrs. E. H. Stodart & Co., architects and surveyors, have removed their offices to 21, Bedford Row, Gray's Inn, W.C.1. Telephone No.: Chancery 8147.

COMPETITION FOR AN EXHIBITION

MESSRS. H. S. Fairhurst, A. J. Hope and J. Hubert Worthington, the assessors in the competition for the design of a new exhibition hall for Manchester, organized by the Management of the Manchester Building Trades Exhibition, have made their award as follows :—

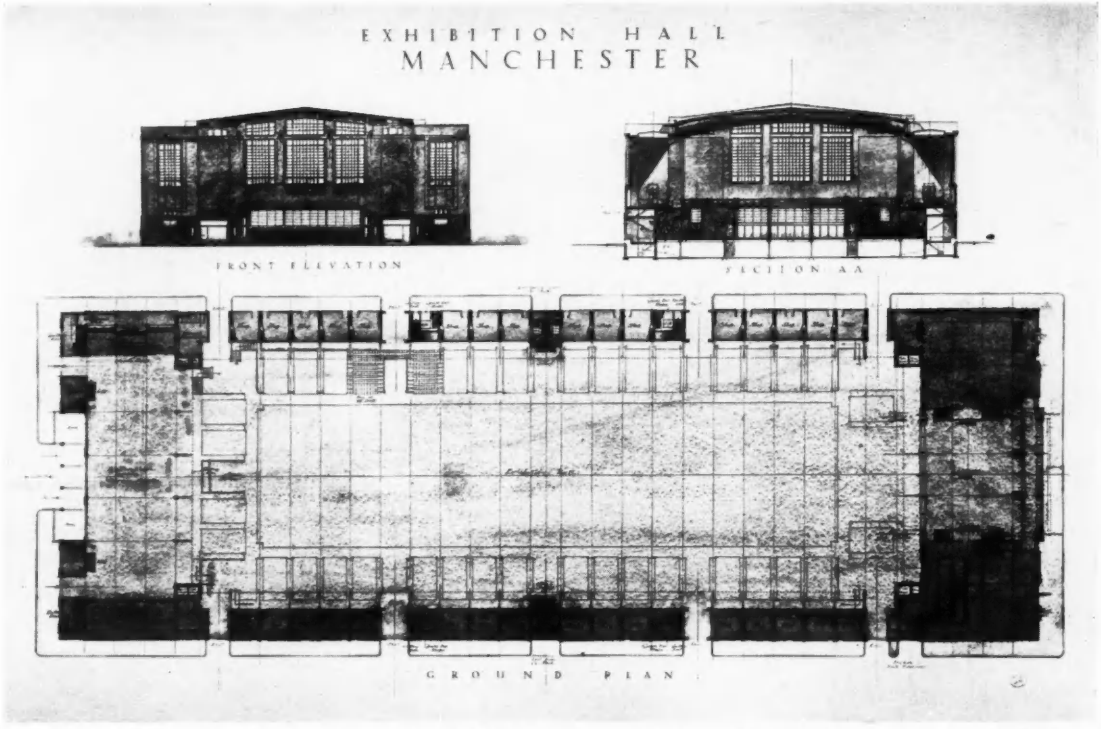
FIRST PRIZE (£150) : R. H. Uren, A.N.Z.I.A. (qualified and awaiting election as A.R.I.B.A.), of Belsize Park Gardens, Hampstead, N.W.3.



SECOND PRIZE (£75) : H. H. Jewell, F.R.I.B.A., of 12 Gt. James Street, Bedford Row, London, W.C.

THIRD PRIZE (£25) : T. Harold Hughes, F.R.I.B.A., F.S.I., of 121 Douglas Street, Glasgow.

HIGHLY COMMENDED : Charles E. Pearson, A.R.I.B.A., of 18 Dalton Square, Lancaster.



The assessors, in their report, stated : "The competition produced an excellent response, 93 designs being submitted for adjudication, with more than 500 sheets of drawings. The problem was one of exceptional complexity, calling for resource and skill in planning and design, the main points being to provide a distinctive and arresting Exhibition Hall of dimensions which created a very unusual structural problem. The question of awarding the prizes was a difficult one, as we feel that none of the competitors met the whole of the conditions in an entirely satisfactory manner."

In highly commending the design submitted by Mr. Pearson, the assessors further stated that they "were unable to award it a prize owing to the infringement of the gallery condition."

THIS?

[Again, this week, we postpone resumption of our pre-arranged sequence of articles under this heading. A current event gives us good reason to do so.

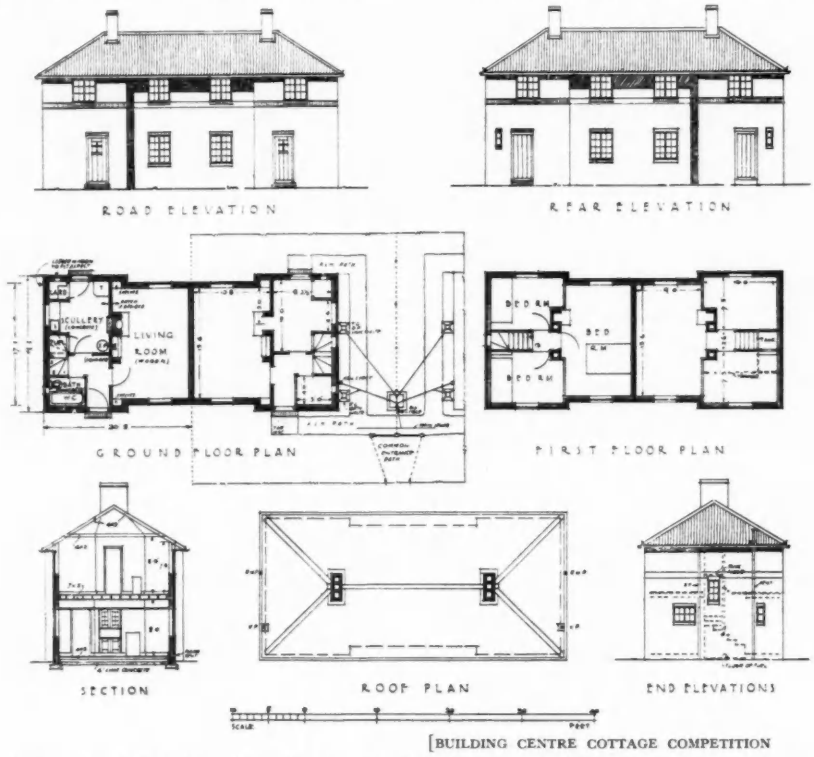
It will not escape the reader that, on this occasion, the dread familiar mock-Tudor villa head-piece has given place to a design of utilitarian simplicity, which he will recognize as representing drawings of a type of cottage that has become standardized. It was about this that the Building Centre virtually propounded the question "What is to be done?" to intending competitors in their competition, of which the result was announced in full in our issue of a week ago.

To consider to what extent and how the premiated designs suggest answers is the concern of the following critique of the competition.—ED., *A.J.*]

6. The Building Centre Competition

[*BY E. MAXWELL FRY*]

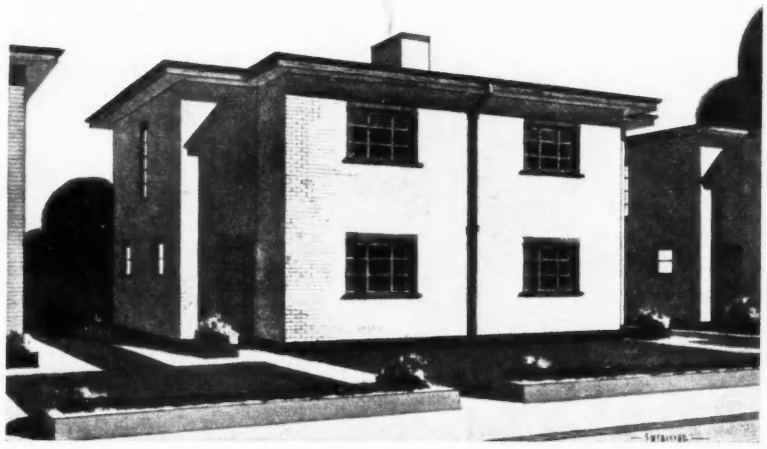
THIS is, I think, the first competition instituted by the Building Centre, which, it will be remembered, is to use part of its funds for the purpose of furthering the cause of architecture and building. This competition definitely aims at finding means to lower the cost of the smallest house unit, in the hope of achieving an economic rent.



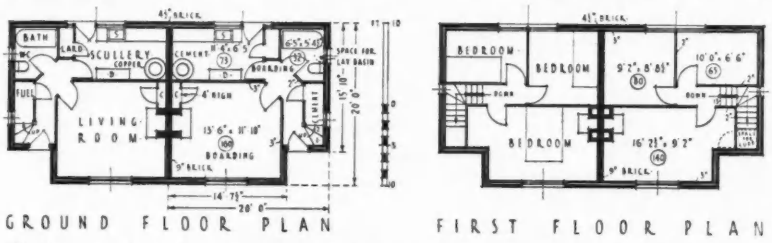
The Government, having removed the subsidy from cottage housing, have provoked a situation which has to be tackled by private enterprise, if at all, and this problem, already closely-studied, is once again to be subjected to enquiry.

Rightly or wrongly, this competition uses as a basis the smallest unit of cottage construction. One might imagine that the answer to the question of housing the lowest paid workers would lie in the direction of very much larger units than are commonly found in any form of housing development today, for, if the provision of communal services is to be used to the greatest advantage a larger scale of grouping seems to be called for, to say nothing of the saving brought about by terrace building as opposed to erection in small blocks. And further, the opportunity which connected frontages offer for a fine design is lost entirely when site planning becomes a matter of dotting about tiny boxes in a pattern which is only realizable from the air.

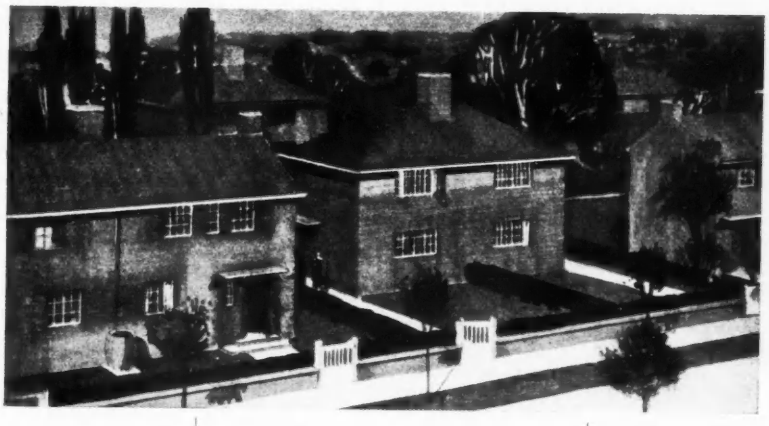
AN AVENUE EXPLORED



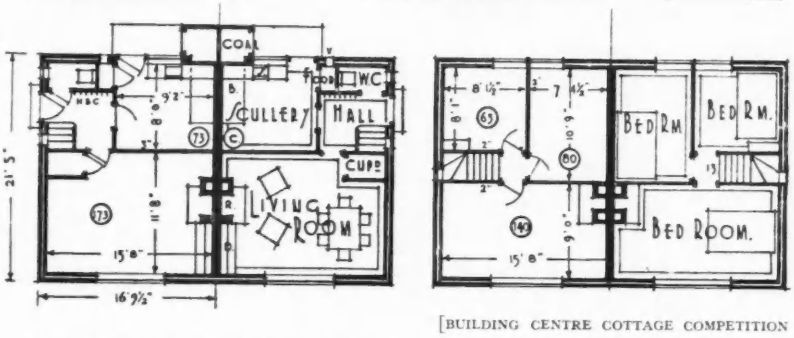
The methods adopted by the Building Centre, therefore, appear to explore only one avenue and to base their premises upon the accepted formula of today, leaving a further field for what we may take to be a different type of exploration, requiring a larger organization fit for the control of a National Housing Corporation and beyond the scope of the common unit of the building trade. This is, in fact, a competition to provide a stimulus to the small builder. There is no suggestion that it will lead to a revival of sound estate planning.



Within the limited field thus defined the programme is drawn up with considerable efficiency, not unmixed with guile. A standard cottage design (reproduced as preamble to this article) together with a specification, was prepared and issued to all competitors as a jumping-off point for their contributions. To quote from the conditions, "The Directors of the Building Centre are informed that substantial cottages of the standard type (drawing and specification accompany these conditions) may be, with certain immaterial differences, erected in numbers of four at one time for the approximate sum of £225 per cottage. . . Competitors



[BUILDING CENTRE COTTAGE COMPETITION



Design placed first (Premium £100): By N. E. Leeson, of Messrs. Oliver and Leeson (Newcastle-on-Tyne). Mr. Leeson's design was accompanied by a tender from: Messrs. Adam Carse, of Amble, Northumberland, undertaking to erect four cottages for the sum of £900.

Design awarded a Special Prize of £10 10s. By S. W. T. Blythe. The design was accompanied by a tender from E. G. Campion, New Barnet, Herts., undertaking to erect four cottages for the sum of £900.

[BUILDING CENTRE COTTAGE COMPETITION

Design awarded a Special Prize of £5 5s. By H. U. Diplock, of Sterret, Glover & Diplock. The design was accompanied by a tender from Walter Gale & Co., Leamington Spa, undertaking to erect four cottages for the sum of £900.

must give the same accommodation as shown on this diagram, provided the total cost is not increased; and if any lesser cost is possible full details as to how this can be effected must be given."

The fittings and accommodation shown on the standard plan were to be adhered to, but any materials which would be approved by local authorities could be used and other variations were allowed so long as the material accommodation was not reduced. It was further laid down that buildings were not to be *in larger units than two dwellings*.

THE RESULT

Some three hundred designs were received, and in the process of elimination those showing a w.c. approached from outside, and several which made use of a freak construction which the jury felt it was impossible to erect with economy, were thrown out in the first round. In reviewing the fifty or more entries, which will be exhibited in June, it must constantly be borne in mind that the conditions very narrowly define the nature of solutions. Generally the jury have favoured designs which maintain a reasonably high level of accommodation. Through ventilation has been regarded as desirable, while the separation of bath and w.c., and the accessibility of bathrooms from the latter are points which have weighed heavily with them. The question of the reasonableness of the estimates is in all cases vouched for by a form of tender from a builder to erect two pairs of the cottages.

FIRST PRIZE DESIGN

N. E. Leeson, the first prize winner, has managed to fulfil the conditions without sacrificing the external appearance. A small break on the front and the rear elevations gives him an addition in depth very helpful to the accommodation of scullery and bathroom fitments. The bathroom is entered from a passage hall, from which winding stairs lead over a fuel cupboard to the first floor. The scullery is well planned, with a larder window adaptable to changing aspects, and there is provision for a hatch if desired. If the house is reasonably well built there should be no trouble with cross draughts. The living room runs through the depth of the house and that ingenious gadget, the back-to-back fire, is used with considerable effect. The bedroom accommodation occupies all but a very small portion of the first floor area, there being a landing only 2 ft. 6 ins. by 5 ft., giving two bedrooms 7 ft. 3 ins. by 10 ft. and the principal bedroom, with fireplace, 9 ft. by 15 ft. 6 ins. The flues which rise on each side of the stair landing form one stack within the roof space. No bedroom cupboards are provided and the tank occupies a position over the stairs, leaving bare headroom. The plan provides very economical frontage, and there is some little reason to doubt that this design could be built for the price. In appearance it adheres to normal practice, being neither distinguished nor yet unsightly. The economies are economies of plan and cheap building that are relatively unconcerned with the larger issues to be associated with large-scale housing.

SPECIAL PRIZE DESIGN
(£10 10s.)

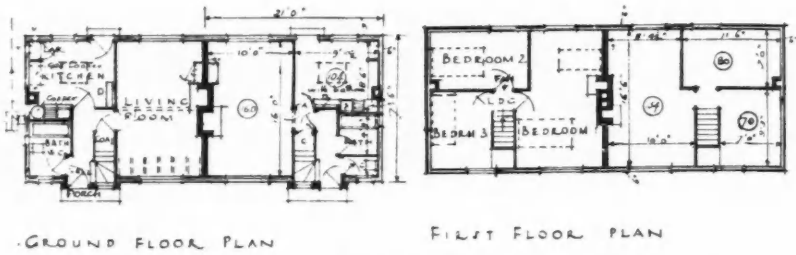
The design of S. W. T. Blythe (special prize of ten guineas) employs hollow brick walls and a flat roof, the use of which frees his plan from the financial restrictions imposed by the complications of cheap roofing on any but the simplest rectangle. His living room occupies a position in the front. The front door opens on to a cramped passage from which the stairs rise awkwardly, the access to them being temporarily closed when the door is three-quarters open. The bathroom and scullery are separate and the scullery appears to be workmanlike and not subject to draughts, but in-

adequately lit. Not very much can be said for the diagonal passage cut into above by the soffit of the stairs. The principal bedroom is adequate and a second bedroom, 8 ft. 8½ ins. by 9 ft. 2 ins., is balanced against a very much smaller third bedroom. Externally the appearance inclines to dullness, though there is every opportunity of relieving this by careful study of the window openings. If we are to build in small units this flat-roof type would conform with its neighbours the more easily for being rid of a heaving roof line.

SPECIAL PRIZE DESIGN
(£5 5s.)

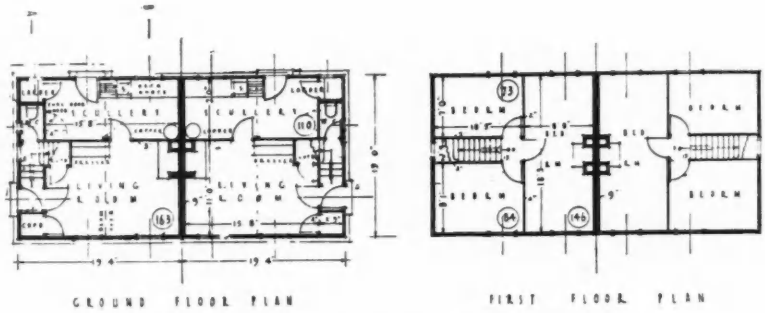
The design of H. U. Diplock (awarded a special prize of five guineas) is extremely pleasing and straightforward upon conventional lines. The living room is of interesting shape, with a dining recess suggested at one end. The bath is placed in the scullery, which is, however, roomier than most. The hall, again, is pleasantly commodious. Upstairs a principal bedroom, 9 ft. by 15 ft. 8 ins., and a second bedroom, 7 ft. 4½ ins. by 10 ft. 9 ins., are provided with sufficient economy to allow of the smallest bedroom being quite adequate for its purpose. A coal bin is placed outside the house. A feature of this plan is the possibility it offers to alternative design by changing the party wall. The depth of 21 ft. 5 in. is reduced to the length of the living room, 15 ft. 8 in., with the effect reproduced in the perspective sketch.

A RUNNING COMMENTARY



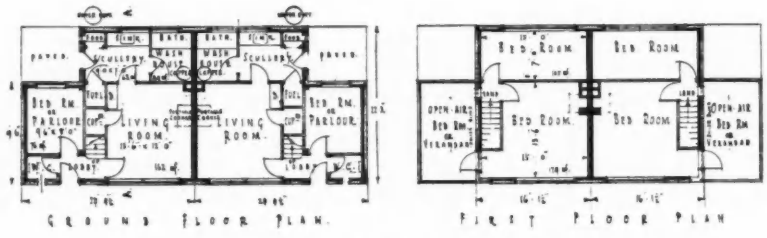
Experimental construction does not seem to have produced designs capable of competing, within the limits of this competition, with standard practice. The flat roof may perhaps be held to have proved a case for itself, but the assessors have not looked kindly at the attempts of No. 250, who use Poilite sheets and Ruberoid, or at several other unusual methods of construction, such as No. 195, using tubular steel framework and thatchboard covering, or No. 217, a charming but too costly design employing cellular concrete cased in a heavier concrete in a wall of a thickness of 2 ins. No. 114, an interesting design by Manning-Robertson and J. H. de Waller, uses the Nofrango system, employing a steel framework upon which hessian is stretched as the reinforcement for fine concrete. It is interesting to see that No. 231, by David Booth, of Broadway, Worc., by providing a horizontal division, produces two flats instead of two cottages, whereby considerably larger and more spacious living room is available. Against this must be set the disadvantages of one family living over another, and it is likely that a soundproof and fireproof floor would have to be provided between the two.

No. 203, by T. Schaerer, takes advantage of the market price of copper to use this material as a sheet facing over a frame with slagwool and with the inside surface plastered over board. His roof is also in copper or, as an alternative, an alloy of copper, by name Tecuta, which is not in general use as yet. Another interesting design is that of W. Naseby Adams, which the assessors felt could hardly be built for the money, but included because of the very generous accommodation provided in a design of this type. The third bedroom is offered as an alternative to a parlour on the ground floor with an open-air bedroom or veranda at first floor level, entered from the large best bedroom. The scullery and combined bath and wash houses are separated at some expense to the scullery itself.



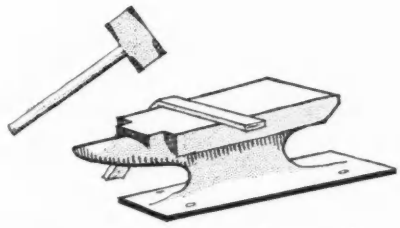
CONCLUSIONS

In all, the three hundred entries offer a fairly wide range of constructional possibilities and very limited plan variations, as one might expect. A minor battle of methods has been staged, without, it would appear, any very decisive result. The competition appears to have proved that the price level of the small house built in pairs is capable of a reduction below the figures upon which the last Housing Act was based and for this reason and because this effect will undoubtedly stimulate the small builder to enter a field of enterprise from which he has hitherto backed in alarm, it is of value, especially when one realizes that the results are to be widely advertised to the general public.



I understand that the winning pair of cottages will be erected on a site in the Strand some time in June, and one could not hope for a more concrete form of publicity than this. If, in addition, the furnishing and equipment of the specimen pair is undertaken by a body such as the Design and Industries Association the usefulness of the competition will be carried still further and it will no longer be said that architects are leaving uneducated a vast population of lower-paid workers which private enterprise somehow or other has got to house. The exhibition which will take place at the same time at the Building Centre is to include models of many of the designs, and at a later date a book is to be prepared on the lines of similar books of model plans which the Ministry of Health and other bodies issue for the guidance of local authorities and others controlling the design of housing schemes.

Design by G. E. Clare. Builders: Thornton Hall, Ltd., of Harrow.



Design by T. Schaerer. No tender was submitted.

Design by W. Naseby Adams. Builder: W. J. Nichols, of Gloucester.

[BUILDING CENTRE COTTAGE COMPETITION

TRADE NOTES

BY F. R. S. YORKE, A.R.I.B.A.

The Manchester Building Trades Exhibition

THE Building Exhibition at the City Hall, (open until May 6) is a quite practical little show, surprising in its simplicity of lay-out and freedom from overcrowding. No attempt, however, appears to have been made to group the exhibits in their several categories, and the design of exhibitors' stands is disappointing.

•

Because I visited this bi-annual event for the first time this year I cannot tell whether the coloured celluloid lamp shades and brilliant cut mirrors are beginning to creep in, or whether they have been almost entirely cleared out ; but there is happily very little jazz shoddy outside the display houses.

•

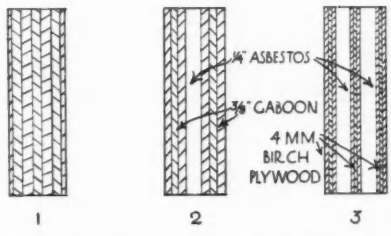
When will the manufacturers of standard windows and doors give us a well-designed standard lever handle in place of the curly b.m.a. levers and ornamental synthetic resin knobs that we must buy at present if we cannot afford the specially made ? The lack of such a simple device is evident at every exhibition.

An Asbestos Building Board

The building board exhibited by Asbestos Cement Building Products is, I understand, the only board manufactured at present in this country from asbestos mineral fibre. The raw fibres, when crushed, become fine silk-like threads, which, under pressure, provide an intricate and closely interwoven structure of high insulating capacity.

•

But it seems the great value of the board lies in its effective resistance to fire. Some months ago an interesting fire test was carried out at Trafford Park, where two timber-framed structures were erected ; the first lined internally with seven-ply gaboon plywood, $\frac{7}{8}$ in. thick, and the second with 1 in. thick composite panels of plywood and asbestos. Each structure was charged with fuel—shavings and dry timber saturated with paraffin oil—and fired.



•

The $\frac{7}{8}$ in. gaboon plywood panel burned through completely.

In the case of the composite panel, No. 2 in the accompanying diagram, the exposed surface of the three-ply wood burnt away entirely. The asbestos layer, to the depth of $\frac{1}{16}$ in., was black in colour but the outer face was unaffected by the fire and retained its natural texture. The three-ply wood on the outer surface was completely protected by the asbestos layer and unaffected by the heat or the water played upon it during the process.

•

No 3 composite panel behaved in a similar manner. The exposed surface of the three-ply wood was completely burnt

Three types of board used in a fire test on asbestos board. 1 : 7-ply gaboon, $\frac{7}{8}$ in. thick, 2 : composite plywood and asbestos panel approximately 1 in. thick, 3 : composite plywood and asbestos panel approximately 1 in. thick.

away, and a similar effect to that described above was produced on the first layer of the asbestos lining. An attempt was made to break away the inner section of three-ply wood, but it was found that perfect adhesion with the second layer of asbestos had been maintained. The second layer of asbestos, and the outer layer of three-ply wood, were quite intact.

•

The asbestos wallboard weighs 1 lb. per sq. ft. It is $\frac{1}{4}$ in. thick, and the standard size for sheets is 8 ft. by 4 ft.

A New Waterproofer

The Powell Duffryn Steam Coal Company are demonstrating Synthaprufe, a new liquid by-product of Welsh coal, with a milk-like consistency, that seems equally efficient for jointing and waterproofing. Minute cracks in cement and concrete surfaces are apt to make waterproofing a difficult business, but it appears the new material will enter even the finest hair crack and form within it a waterproof and adhesive deposit, resembling rubber in its elasticity and responding to any reasonable movement in the surface treated.

•

The material is recommended for reservoirs, swimming baths, horizontal and vertical damp courses, and for making waterproof joints in concrete, glass and similar materials. It should be particularly useful for flat roofs.

•

It is applied by brush, in two or three coats. For the first coat one gallon will cover 10 yards, and in subsequent coats a gallon will cover approximately twice that area.

•

The price varies with the quantity bought, 10 gallon to 40 gallon drums costing 6s. per gallon.

Wood Block Floors

J. Gerrard and Sons, the building contractors who have recently completed the Royal Hospital School, Holbrook, are, I imagine, well known as manufacturers of wood block flooring. At Manchester, on a stand designed by Buckland and Haywood, they have a special display of wood block flooring in Empire timbers.

•

The blocks are cut to standard 1 in. and $1\frac{1}{4}$ ins. thicknesses, either tongued and grooved or dove-tailed. The tongued and grooved are slightly more expensive, costing, in 1 in. thickness, approximately the same as dove-tailed blocks in $1\frac{1}{4}$ ins. thickness.

•

Among the wood block floors exhibited are those in jarrah, matai, gurjun, Douglas fir or Columbian pine, Canadian rock maple, Canadian birch, Moulmein teak, New Zealand silver beech, and British Borneo white serayah.

•

Columbian pine is cheap, costing, including laying, 7s. per yard, 1 in. thick, dovetailed, or 7s. 6d. per yard, 1 in. thick, tongued and grooved.

Jarrah is 8s. and 8s. 6d., matai, a light yellowish wood, 10s., gurjun 10s. 6d. and Moulmein teak 11s. 6d. and 12s.

A New Wall Colouring Medium

Among the Cementone products is *Exelaero*, a wall colouring material for immediate use on inside plaster, sirapite, Keene's and Parian cement renderings, or for application to external cement walls which do not need waterproofing, but which do need a tight gripping colouring material that will resist the action of both cement and weather.

•

The material should be applied in two coats and a period of 24 hours allowed to elapse between the two applications. One gallon will cover up to 50 yards super in one coat, and the material costs from 8s. 6d. to 10s. per gallon, according to quantity.

A Glazed Hollow Tile

The Attoc block is a new type of hard burnt clay hollow tile for partition and floor construction. It is, I believe unique, being glazed (on one or both sides) and so requiring no applied surface finish.

•

It should be particularly valuable in cases where speed of erection is an important factor, for by its use walls and ceilings are erected, complete with surface treatment, in one operation.

For single story buildings the tile can be used, alone, for the wall construction.

•

The wall tile is made in 2, 2½, 3, 3½ and 4½ in. thicknesses, and in the following standard sizes :—12 ins. by 8 ins., 12 ins. by 9 ins., 12 ins. by 10 ins., and 15 ins. by 9 ins.

•

The floor tile is made with a glazed soffit and has, on either side, ribs projecting 1½ ins., which, when butted, leave a space of 3 ins. between the vertical faces of adjacent tiles to take reinforcing rods and poured concrete. When the centering is struck the ceiling is complete.

The bay window in one of the geography rooms at the Merchant Taylors' school. The ceiling is decorated with a map of England.

THE HOUSING BILL

[BY OUR SPECIAL REPRESENTATIVE]

DURING the report stage of the Housing (Financial Provisions) Bill in the House of Lords, Lord Salisbury moved to omit the paragraph which provides that any proposals made to the Minister of Health under Clause 2 shall make provision for securing that, except in so far as the Minister may in any particular case dispense with the requirements of this paragraph, the number of such houses in relation to the area occupied or intended to be occupied by and in connection with them will not exceed the rate of 12 to the acre. The paragraph also provided that, except where otherwise approved by the Minister on the recommendation of the local authority, every house to which this section applied should be provided with a fixed bath. He said that the Government were not well advised to insert a provision which would make working-class houses dearer instead of cheaper. He did not say that houses should be built more than 12 to the acre, but he argued that the building societies, who knew the needs of their customers, should be left with a free hand to build the houses which they found to be required.

Lord Buckmaster said that the paragraph would not interfere with the building societies, and all that would be done would be to secure that the facilities under the clause should only be provided for the erection of a particular class of house, subject to the overriding power of the Minister of Health. The provision of a bath in the house of a working-class tenant was essential wherever possible.

Lord Gage, replying for the Government, said that the clause was the result of an agreement between the Government and the building societies. He would oppose the amendment. The provision of fixed baths and the restriction as to density per acre originated in the Wheatley Act of 1924, and since that time no subsidy had been given to houses unless they conformed to those requirements. In the view of the Ministry the provisions about the density per acre would not appreciably affect the cost of the houses on the sites to be selected. The primary object was to continue the construction of Wheatley houses for the working-classes.

The amendment was negatived by 38 votes to 15 and the report stage concluded.

MERCHANT TAYLORS' SCHOOL

Following are the names of the general contractors, and some of the sub-contractors, for Merchant Taylors' School, Sandy Lodge, Northwood, Middlesex (pages 578, 591-596 and supplement). General contractors, Holland and Hannen and Cubitts, Ltd., who were also responsible for the plumbing, gasfitting, joinery and water supply. Specialists: Alan Durst (external stone carving); Esmond Burton (internal wood carving); C. J. Dring (special tiles); Eric Ravilions (painted ceiling panels); J. Spear (painted glass). Sub-contractors: Trussed Concrete Steel Co., Ltd., Reinforced Concrete Engineers, excavation, foundations, mantels and reinforced concrete; Ragusa Asphalte Paving Co., Ltd., asphalt; G. M. Callender & Co., "Ledkore" dampcourses; Hall & Co., Ltd., and Ames and Finnis, bricks; Ames and Finnis, roofing tiles; Holland and Hannen and Cubitts, Ltd., and Wm. Knight & Co., Ltd., stone and stonework; Stuart's Granolithic Co., Ltd., artificial stone and stairtreads; Aston Construction Co., Ltd., and Haywards, Ltd., structural steel; Haywards, Ltd., fireproof doors, iron staircases and patent glazing; D. Anderson and Son, Ltd., roofing felt; Joseph Chater and Sons, Ltd., glass; Wenham and Fowler, cast lead; Hollis Brothers & Co., Ltd., wood block flooring; Granwood Flooring Co., Ltd., patent flooring; J. H. Nicholson & Co., Ltd., central heating, boilers and ventilation and cloakroom fittings; John Wright & Co., Ltd., stoves; G. Matthews, Ltd., grates and mantels; Davis Gas Stove Company, gas fixtures; Electrical Installations, Ltd., electric light fixtures, electric heating and electric wiring; Dent and Hellyer, Ltd., sanitary fittings; Brookes, Ltd., terrazzo staircases and wall lining; A. E. Davis, door furniture; Crittall Manufacturing Co., Ltd., and John Gibbs, Ltd., casements and window furniture; General Post Office, telephones; G. J. Green and Sons, plaster; G. and A. Brown, Ltd., decorative plaster; Galsworthy, Ltd., ornamental grilles and special electric light fittings for assembly hall, balustrading to staircases and balconies throughout, etc.; Cashmore Art Workers, wrought iron entrance gates; Morris-Singer Co., metalwork; Art Pavements and Decorations, Ltd., marble; Conway & Co., tiling; Waring and Gillow, curtains; Gordon Stark, furniture; Cutbush and Sons, Ltd., shrubs and trees; Bennet Furnishing Co., Ltd., school fittings; Warham Guild, church fittings; Aldous and Campbell, Ltd., lifts; Synchronome Co., Ltd., clocks.

Trade Item

The twenty-third annual general meeting of Messrs. W. H. Gaze & Sons, Ltd., of Kingston and London, was held on Wednesday, March 22, 1933. Mr. W. H. Gaze, who is 80 this year, and founded the business in 1885, was in the chair, and in the course of his remarks he said: "Our trading and work carried out during the past year amounts to £312,503, which is less than the previous year, when the amount was £550,964, showing a decrease of £238,461. This was brought about by the general depression in trade. I am able to report that the balance sheet for 1932 is in our favour, and that the directors are now in a position to recommend a dividend of 10 per cent. be paid on the Ordinary shares, in which are included the Employees' shares, less income tax."

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

Plans passed by the SOUTHGATE U.D.C. : Eight shops and flats, Winchmore Hill Road, for Mr. C. W. Dennis ; five houses, Wades Hill, for Messrs. Martyn (Builders), Ltd. ; 34 houses (amended), Broadfields Avenue, for Mr. O. R. Davies ; 54 houses, Wentworth Gardens, for Mr. J. Neilson ; bus garage, Enfield West station, and shops, Bowes Road, for London Electric Railway Co. ; cinema and seven shops, and eight shops with flats, Bowes Road, for Mr. W. J. King ; 62 houses, Greenway, for Mr. C. E. Hartshorne ; six houses, Firs Lane, for Mr. G. W. Newman ; two houses, Eversley Crescent, for Mr. C. V. Longland ; eight houses, Wades Hill, for Messrs. Reader Bros.

Plans passed by the WATFORD Corporation : Additions, 58-61 Bushey Mill Gardens, for Hillingdon Estate Co. ; additions, Rickmansworth Road, for Messrs. Novobax, Ltd. ; five houses, Copeswood Road, for Mr. W. McKibbin ; two houses, Malden Road, for Messrs. Stimpson, Lock and Vince ; eight houses, Hibbert Avenue, for Messrs. W. Judge and Sons ; factory extension, High Street, for Grosvenor Electric Batteries, Ltd. ; 24 houses, Stanborough Estate, for Messrs. W. Farren and Sons ; additions, The Parade, for Messrs. Clements ; four houses, Westfield Avenue, for Mr. S. Ruff ; two houses, Liverpool Road, for Mr. C. Foster ; factory extension, St. Albans Road, for Granose Food Co ; three shops and flats, Chalk Hill, for Mr. L. G. Hartley ; additions, transformer house, Tolpits Lane, for Messrs. Scammells ; five cottages, Cardiff Road, for Messrs. W. J. Weller and Sons ; four houses, Westfield Avenue, for Mr. J. F. Sleight.

SOUTHERN COUNTIES

Plans passed by the NEWBURY Corporation : Six houses, Greenham Road, for Messrs. F. and A. Cooke ; two houses, Monks Lane, for Messrs. Allen and Roberts ; two houses, Kingsbridge Road, for Mr. W. Samuels ; two houses, St. Nicholas Road, for Mr. T. C. Pembroke ; alterations, shop fronts, The Market Place, for Messrs. Daniel & Co.

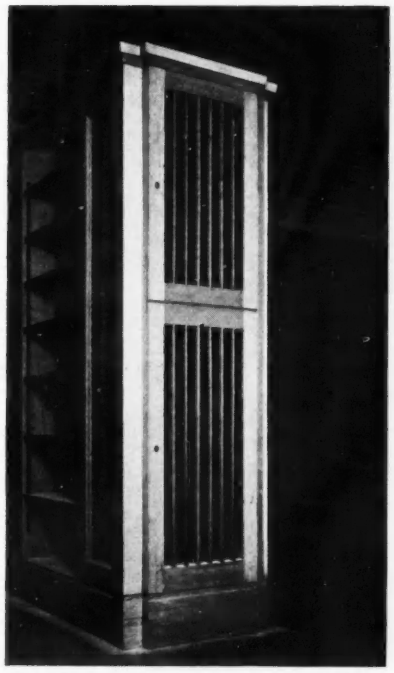
Plans passed by the OXFORD Corporation : Two shops, 131-3 Oxford Road, Cowley, for Mr. J. Rush ; eight houses, Oliver Road, Cowley, for Messrs. R. Gardner and Sons ; two houses, Stapleton Road, Headington, for Mr. R. Ryman ; two houses, Portland Road, for Mr. D. Mealing ; alterations and additions, Parish Hall, Victoria Court, for St. Mary Magdalen trustees ; two houses, Five Mile Drive, for Messrs. Hinkins and Frewin ; development, Brasenose Estate, Cowley, for Mr. G. T. Gardner, on behalf of Isis Properties, Ltd. ; two houses, Iffley Road, for Mr. G. H. Simmons ; oil stores and offices, Rewley Road, for Shell-Mex, Ltd. ; additions and operating box, Ice Skating Rink, Botley Road, for Oxford Ice Rink Co. ; 92 houses, Brasenose Estates, for Isis Properties, Ltd.

Plans passed by the WORTHING Corporation : Six flats, Christ Church Road, two houses, Balcombe Avenue, three houses, Loxworth Avenue, house, Ashacre Avenue, seven houses, St. Andrew's Road, and three houses, Chesswood Road, for Mr. H. M. Potter ; six houses, Brougham Road, and house, Warren Road, for Mr. A. T. W. Goldsmith ; eight houses, Broadwater Road, two houses, Victoria Road, and 48 flats, George V Avenue, for Mr. M. R. Fletcher ; alterations, Brunswick Hotel, Thorn Road, for Mr. E. Emerson ; two houses, Hillside Avenue, house, Woodside Road, 12 houses, Broomfield Avenue, and house, Seldens Way, for Mr. E. J. Love ; alterations, Queen Alexandra's Hospital Home, Boundary Road, for Mr. Clyde Young ; two houses, Pembroke Avenue, for Mr. C. Parsons ; two houses, Sea Place, for Mr. J. A. Lauchlan ; three houses, Hailsham Road, for Mr. J. E. Lund ; 14 houses, Ethelwulf Road, for Mr. R. G. Pierce ; seven houses, Lavington Road, for Mr. H. Baker ; 52 flats, Ardheal Road, for Messrs. J. A. Terry, Ltd.

EASTERN COUNTIES

The Herts. C.C. Public Assistance Committee has submitted revised plans to the Ministry of Health for alterations and improvements at Oster House Institution, ST. ALBANS, estimated to cost £21,945.

MIDLAND COUNTIES



The SMETHWICK Education Committee has approved plans for alterations at Brasshouse Lane and Crocketts Lane schools, at an estimated cost of £11,000.

Plans passed by the STOKE-ON-TRENT Corporation : Ten houses, Bedford Street, Basford, for Messrs. Baddeley Bros. ; two houses, Jubilee Road, for Mr. B. Garton ; four houses, Penkull New Road, for Mr. F. Gibson ; four houses, Oxford Street, for Burslem Co-operative Society, Ltd. ; two houses, Drubbery Lane, for Mr. S. Simpson ; 23 houses, Meir Residential Estate, for Mr. A. Perry ; 36 houses, Shelton New Road, Hartshill, for Messrs. Holloway & Co ; two houses, Out Lane, for Mr. N. Marsden ; 40 houses, Victoria Square, for Col. H. Clive.

Plans passed by the SUTTON COLDFIELD Corporation : Ten bungalows, Boldmere Glebe Estate, for Corporation ; 21 houses, Kineton Road, for Mr. John White ; two houses, off Monkseaton Road, for Mrs. Hart ; 12 houses, South Parade, for Mrs. S. E. Wright ; two houses, Upper Clifton Road, for Mr. J. Salt.

NORTHERN COUNTIES

Plans passed by the MANCHESTER Corporation : Alterations, Frascati's Restaurant, Oxford Road ; alterations, Clarendon Inn, Church Street ; alterations and additions, Commercial Inn, Ogden Lane ; alterations and additions, Corner Inn, Bradford Street ; alterations, Wellington Hotel, Barlow Moor Road ; alterations, Royal Exchange, Market Street.

A radiator casing terminating a projecting bookcase in the library at the Merchant Taylors' School, Northwood, Middlesex. The little balusters of the casing are oval in section. Other views of the building are given on pages 591-596 of this issue.

Plans passed by the SHEFFIELD Corporation : Four houses, Warminster Road, for Mr. D. Richerby ; two houses, Arran Road, for Messrs. E. and W. Booler ; two houses, Herries Road, for Mr. L. J. Garner ; six houses, Hutcliffe Wood Road, for Mr. W. Bingham ; six houses, Rotland Road, and two houses, Montgomery Road, for Mr. C. W. Alflat ; two houses, Eccleshall Road, for Mr. H. E. Mottram ; two houses, Chantrey Road, for Messrs. F. B. Skinner and Sons ; three houses, Parsons Cross Road, for Mr. W. H. Rowan ; three houses, Pingle Road, for Mr. J. Bailey ; three houses, Cliffefield Road, for Mr. Hammett; four houses, Malton Street, for Mr. E. Gardham; two houses, Warminster Road, for Mr. C. G. Robinson ; two houses, Louth Road, for Mr. Riley Watson; four houses, Wath Road, for Mr. E. C. Horton ; 14 houses, Hutcliffe Wood Road, for Mr. W. Bingham ; 20 houses, City Road, for Messrs. A. and E. Tate ; 16 houses, Forres Street, for Mr. D. Topliss ; two houses, Harley Road, for Mr. J. A. Wragg ; four houses, Sheldon Road, for Mr. S. Martin ; 24 houses, Addison Road, for Mr. C. S. Smith ; house and shop, Hartley Brook Road, for Mr. H. Cook ; 7 houses, Bellhag Road, for Mrs. D. Williams ; four houses, Cawthorne Grove, for Mr. W. A. Wright ; two houses, Rundle Road, for Mr. J. L. Conway; two houses, Lismore Road, for Mr. W. H. Kilner ; 16 houses, Rivelin Valley Road, for Mr. J. Barker ; two houses, Glossop Road, for Mr. J. A. Suckley ; 30 houses, Bawtry Road, for Mr. A. Ramsay ; four houses, Heeley Bank Road, for Mr. G. R. Parkin ; six houses, Crawford Road, for Mr. H. Hammett.

The SHEFFIELD Corporation has passed the following development plans : New streets, off Gleadless Common, for Mr. A. Tate ; Stone Delf extension, Fulwood, for Mr. J. W. Sivil ; sewer extension, Meadow View Road, for Mr. F. Tinker ; culvert, Bocking Lane, for Messrs. Wright and Walton and Mr. J. T. Redmile ; new street off Hutcliffe Wood Road, for Mr. F. Crawshaw ; Anns Road extension, for Duke of Norfolk.

Plans passed by the SOUTHPORT Corporation : 12 houses, Cromer Road, for Messrs. A. H. and E. W. Jackson ; rebuilding, 26-8, Roe Lane, for Messsrs. Cook and Talbot ; land development in Southbank Road, for Mr. W. J. Wright; eight houses, Waterloo Road, for Mr. W. Wright ; shops, 36-8, Station Road, Ainsdale, for Mr. F. Whitehead ; development in Park Street, for Mr. Gerald Rowe ; house and shop, and two houses, Lytham Road, for Mr. A. James ; workshops, Tulketh Street, for Mrs. E. Hague ; club house extension, Hillside Golf Club, for Club Committee ; alterations, Tudor Restaurant, Kingsway, for Restaurant Co. ; land development, St. Luke's Road, for Mr. H. Buckey.

SCOTLAND

The GLASGOW Corporation has approved plans for internal alterations at the Nicholson Street Barracks, and Southern Police Buildings, to provide accommodation for at least 50 recruits, at a cost of £25,000.

Plans passed by the GLASGOW Corporation : Workshop, Crow Road, for Messrs, Thomas Stewart and Son ; hall, Clydeview, Whiteinch, for Y.W.C.A. Committee ; office and workshop, Muirend Road, for Messrs. A. & J. Clark ; shop, Thornliebank Road, for Mr. John Keenan ; 180 houses, Nether Auldhouse, for Messrs. Alexander M'Lellan and Co. ; shops, Paisley Road West, and at Cardonald Estate, for Glasgow Estates Development Co., Ltd. ; shop, Carntyne Road, for the Shettleston Co-operative Society.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

Stripping off old paper	Piece 2 0
Hanging ordinary paper	from " 2 9

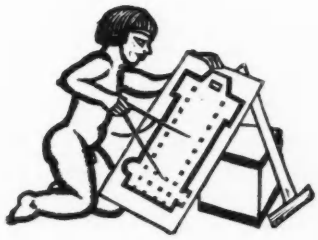
FARADAY HOUSE, LONDON

THE NEW NEIGHBOUR OF ST. PAUL'S

A VIEW from the south bank of the Thames of the International Telephone Exchange building, designed by A. R. Myers (H.M. Office of Works), and opened a few days ago by the Prince of Wales. In this week's leading article it is pointed out that, though in itself a notable contribution to modern London, it becomes, from the proximity of its site to St. Paul's Cathedral, one of those cases where wise planning would have intervened—this time on the vertical plane—to avoid the risk of eclipsing that "ancient landmark." But London remains unplanned, and Bureaucracy —in Carlton House Terrace and now in Queen Victoria Street—is a partner to its unplanning.

"This is the greatest blow to the good looks of the capital that has been struck for generations," writes James Bone in "The Manchester Guardian."

The public has a right to know :—



(1) why the L.C.C. height limit of 100 ft. was waived in favour of this building (130 ft.)?

(2) whether it is proposed to allow all buildings in this neighbourhood to go to the height of the Telephone Exchange?

AT THE R.I.B.A. EXHIBITION

Mr. J. D. M. Harvey, in his review of the current R.I.B.A. Exhibition of Architects' Sketches and Paintings, on page 629 of this issue, writes of the above watercolour: "'Syracuse,' by E. C. Bewlay, shows us that picturesque jumbles of Southern Italy present a clean gay face to the clean gay sea."

(SIGHT) LINE OUT OF ORDER

FARADAY HOUSE, the new telephone building in Victoria Street, was opened last week by the Prince of Wales, and the last clear view of St. Paul's Cathedral that had been left unobstructed by the March of Progress was closed. The building, which has been put up by the Office of Works for the Post Office, is in itself a notable contribution to modern London, with its four low towers and its slate roof between them. The architect is A. R. Myers, H.M. Office of Works.

By the erection of Faraday House London has gained a building and lost a view. How does it stand on the profit and loss account? It stands a loser to an incalculable extent. There are a thousand sites on which beautiful buildings might be, and ought to be, built. There is only one St. Paul's, and it is the greatest site of all. On the hill above the river the greatest of English architects made his greatest church, and the Office of Works has planted its box of electrical contrivances so that Englishmen will not be able to see their church. Wren built St. Martin's, Ludgate, to reveal the perspective of the Dome. The Office of Works has built Faraday House and destroyed it.

We are not, and never have been, fanatical about the preservation of ancient buildings simply because they are ancient. Architecture is a living art, and every generation must have its modernity. To cling, for example, to the pediment for ever because Pheidias made the Parthenon would be silly, and on all sides we can see today the proof that our modern architects are keeping architecture as alive as it ever was; and in ninety-nine cases out of a hundred the twentieth century is right to tear down what has gone before. But the hundredth case is always there, and when we reach it, then we take an immovable stand. Not for all the modernity in the world, not for all the architectural profession, not for all the creation of employment, should the hundredth case be destroyed, and if ever there was a hundredth case it is the Cathedral of Paul. Westminster Abbey is another, and so is the Forum in Rome, and Stonehenge, and the Acropolis. Who would hang a sheet over a Velasquez simply because Manet and Picasso were more modern?

Faraday House is all the more alarming as it is the fruit of official, governmental action. This is no case of a private landlord, against whose "rapacity" and "Philistinism" there would be a strong and legitimate outburst of rage. It is the Office of Works, the custodian of Fountain's Abbey, of the Mint, of the Tower, of the National Gallery, and of all the treasures of the nation, that has done this thing. And it has done it without even consulting the Royal Fine Art Commission. Last year the Commissioners of Crown Lands secretly and swiftly destroyed the skyline of the Mall, but at least they went "through the motions," as the Army says, of consulting the Fine Art Commission. The Office of Works did not even do that. It worked as secretly and as swiftly as the Commissioners of Crown Lands, and paid as little heed to protests. The Carlton House Terrace Defence Committee, that amazing articulation of public indignation, was in favour of getting the Urban Crown Lands transferred to the control of the Office of Works. Would anyone today, who has vainly tried to peer at Wren's Cathedral round the edge of Faraday House, be in favour of transferring the Pot's responsibilities to the Kettle?

There is an L.C.C. regulation which limits the height of buildings in London to a hundred feet, unless some special case can be put forward for an increase of thirty feet. Whether the Office of Works can compel the L.C.C. to grant an increase, we do not know. The fact remains that for Faraday House it obtained an increase. The precedent has thus been set, by the custodians of the nation's treasures, by which private landlords can complete the work and make a ring of extra tall buildings round a site where extra tall buildings are out of place.

More than ever is it necessary for London to have its Vigilance Committee, to watch for the germs of vandalism before they grow, overnight, into a Vested Interest. The Carlton House Terrace Defence Committee must either remain in being as such a Vigilance Committee, or the Prime Minister's new Crown Lands Committee will have to take its place. The Fine Art Commission has proved a failure, not through any fault of its own distinguished members, but partly from its ineffective constitution and partly from the ingenious technique which the Bureaucracy has evolved of either using it as a camouflage for iniquity or paying no attention to it at all.

Town Planning is one of the most vigorous and hopeful children of the age, and today there is more effort being made by architects and local councils towards an establishment of sanity as a principle in the making of modern cities; and yet, in London, greatest of cities, twice within a year we have seen two separate departments of the Bureaucracy deliberately, utterly and wilfully ignoring Town Planning and Sanity.

C. Lovett Gill, F.R.I.B.A., who has been nominated as the next President of the Architectural Association.

NOTES & TOPICS

COLOUR IN THE—FACTORY

WHEN Lord Rochdale, Lord Lieutenant of Middlesex, opened the new Hoover factory at Perivale last week, he said that in the North of England it wouldn't be recognized as a factory at all. He described it as being more like a child's dream of a fairy palace, in white, red and gold.

*

It is nine years since Professor J. B. S. Haldane wrote (in *Daedalus, or Science and the Future*) : "Before long someone may discover that frescoes inside a factory increase the average efficiency of the workers by 1.03 per cent. and art will become a commercial proposition once more."

*

It is nine years since I heard a grand old man of industry truculently defending the barbarian outlook on factory amenities. He was speaking at one of those self-conscious public luncheons organized by people who believe that unplanning is an Englishman's birthright. "Sloppy humanitarianism has ruined British industry," he said.

*

He wasn't going to make his factory like a confounded drawing room, he wasn't. Work was something that had to be done. It wasn't something to be enjoyed.

*

This archaic obstructionist had always regarded industry as a state of conflict. Fighting labour. Fighting social legislation. Fighting competition.

*

Ah well, Nature in the raw is seldom mild !

*

"Prosperity in war," writes H. J. Massingham, "means penury in art ; they do not breathe the same air. . . ." Is our backwardness in industrial art due partly to the bleak atmosphere of conflict that still haunts industry ?

*

I was talking a few days ago to a manufacturer whose products are a felicitous example of design in partnership with industry. I went through his factory afterwards. It was not one of those old family factories where everybody calls the managing director "Alf," but it was pervaded by friendliness and technical enthusiasm, as opposed to mere privileged mateyness or disciplined hostility.

*

Incidentally this factory provided a civilized background for work. It was an agreeable background, not because its owner thought it paid to make it so, but because he possessed the spirit that has given England its leaders in the past—the spirit that does not permit a man to ask other men to do what he is not prepared to do himself.

*

A COAT WITHOUT ARCHITECTURE

Poor Sir Raymond Unwin ! *The Tailor and Cutter* doesn't like the picture of him in the Academy. "The coat is formless and without any signs of architecture. Lapel is badly moulded, while collar and tie expose too much of a columnar neck." Well, well, well !

*

And yet if the President of the R.I.B.A. cannot have a "columnar neck" (and show it too) who can ? Were we not brought up on columns ? Had the complaint been of the unfamiliar design of capital and abacus I could have understood it.

*

I am offering a prize for a design for a suiting appropriate to the P.R.I.B.A. It must, of course, be architectural in character, and although the widest freedom is allowed, the ensemble should be modernistic in idea, but must not offend the traditionalists. Neck ruffles are barred (in case of acanthus), but special attention will be paid to softening down the unduly functional necking.

Charles Rennie Mackintosh, from a painting by Fra H. Newbery, now on exhibition at the M'Lellan Galleries, Glasgow. The exhibition, in memory of the late Mr. and Mrs. Mackintosh, will remain open until May 31.

A correspondent sends us a cutting from an estate advertisement, with the caption "this orchard setting . . . . for these houses . . . . " in which these two pictures appear. His comment is: "A new puzzle for architects—find the orchard." (No prize is offered for solutions; for other valuable prize competitions see below.)

Designs must be submitted by June 1. The jury will consist of myself and the editor of *The Tailor and Cutter*, but I shall decide by myself. Prize: a spinning jenny.

*

I GIVE MY READERS ANOTHER BIG CHANCE

I have another big chance for readers up my sleeve. Last week I went to one of the most surprising estates in England—Smethwick Old Hall.

*

It lies near the village, and my host took me over the old inn in whose basement a store of ancient cutlasses was found not so long ago, one of which remains in his possession.

*

It wasn't the cutlasses that surprised me, nor the size and extent of the Old Hall buildings, nor the school my host's forbear built for the children of his tenants, nor the stables—but the cows.

*

Why did the cows surprise me? I will offer a prize of half a corona to any reader who can tell me where I have been.

*

THE INSOLATION OF HOSPITALS

The report of the Joint Committee on the Orientation of Buildings was published last year in the R.I.B.A. *Journal* (see also *A.J.*, September 21, 1932). I am glad to find this important piece of research work into almost unexplored country is now, together with the appendices, to be had in book form at the reasonable price of five shillings.

*

While acoustics are recognized as a vital branch of architecture, the science of insolation has been until now without any established technique, and the co-ordination of the scattered data here reduced to diagrams and tables will be of great value.

*

Of the various instruments used by the Committee to predetermine the measurement of sunshine, the heliodon will probably be used most by the ordinary architect on account of its simplicity. Its form and use were described in the issue of the JOURNAL for February 8 last, p. 214.

*

Section III deals with the practical problems of hospital, school and general design. The remarks with regard to hospital ward planning have already been subjected to criticism and, as there emerge two schools of thought with definite and divergent views, further research on hospital insolation seems necessary before any final recommendation can be made. On the other hand, the Town Planning Section, with its appendix on the insolation of street façades, is very clear and complete.

AT BRIGHTON BY THE SEA

Economy has its curious manifestations. The provision of schools and housing is not considered sufficiently vital to open national purse strings. We can economize on children and the houseless. But nothing stands in the way of our seaside resorts' determination to make England fit for holiday makers. I am not opposed; far from it, but it has its humours, has it not?

*

Brighton, having built an Aquarium underground, rising now with greater boldness to the surface, proposes to roof in a portion of the windswept terraces that cover the Aquarium, to make a concert hall and indoor lounging place as still another attraction for the leisured visitor.

*

They propose to adopt certain ideas from Dutch practice, notably a system of sliding glass roofs. I hope to goodness they will adopt a measure of good Dutch designing. So many of our seaside schemes are all ideas and no design.

ASTRAGAL

THE ARCHITECTS' DIARY

Wednesday, May 10

R.I.B.A., 9 Conduit Street, W.1. Exhibition of architects' sketches, etchings, oil and water-colour paintings. Until May 22. 10 a.m. to 8 p.m. (Saturdays 5 p.m.). 10 *a.m.*

ROYAL ACADEMY, Burlington House, Piccadilly, W.1. Summer Exhibition. Until August 7. 9 a.m. to 7 p.m.

ARCHITECTURAL ASSOCIATION, 34, Bedford Square, W.C.1. Exhibition of photographs, etc., depicting the progress of air travel. Until May 25. 10 a.m. to 10 p.m. 10 *a.m.*

MUNICIPAL SCHOOLS OF ARTS AND CRAFTS, Birmingham. At the Museum and Art Gallery. Exhibition of students' work. Until May 24. 10 a.m. to 5 p.m. (8 p.m. on Wednesdays). 10 *a.m.*

Thursday, May 11

SOCIETY OF ANTIQUARIES, Burlington House, Piccadilly, W.1. "The Excavations at Ur." By C. Leonard Woolley. 8.30 *p.m.*

INSTITUTION OF ELECTRICAL ENGINEERS, Savoy Place, W.C.2. Annual General Meeting. 6 *p.m.*

INSTITUTION OF STRUCTURAL ENGINEERS, 10, Upper Belgrave Street, S.W.1. Discussion on "A Structural Steel Review," to be opened by H. V. Crabtree. 6.30 *p.m.*

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.2. Annual Reception by the President, Mr. A. B. Knapp-Fisher, F.R.I.B.A., and Mrs. Knapp-Fisher. 8.30 *p.m.*

Saturday, May 13

Sunrise 5.12 a.m. Sunset 8.41 p.m.

ST. PAUL'S ECCLESIOLOGICAL SOCIETY. Visit to Chingford Old Church and the New Parish Church. Conductor: C. C. Windmill, F.R.I.B.A. Meet at Old Church. 2.30 *p.m.*

LONDON SOCIETY. Visit to Old Parish Church of St. Mary, St. Marychurch Street, Rotherhithe, S.E.16. 3 *p.m.*

At tonight's meeting of the Southwark Borough Council the proposed new Town Hall will come up for consideration 616
Messrs. Howard Robertson and Wells Coates engage in correspondence on the question of English participation in the International Congresses for Modern Architecture 623
New buildings which are not in conformity with the Town and Country Planning Act may have to be pulled down 625
Architects ought to have legal right of action against anyone disfiguring their handiwork by poster or sign erection 634
Working-class tenements of from three to five stories cost ordinarily from 12s. to 15s. per square foot of floor area 636

BUILDING PRICES

There has been a curious hardening of building prices, especially in connection with timber, during the past three weeks. Some attribute this to the embargo on Russian timber, but a more probable explanation is that there has been a very distinct improvement in building work generally, not, of course, sufficient to reduce substantially the number of unemployed, but enough to increase the immediate demand for Scandinavian timber. But as soon as the ice is fully broken round the Scandinavian countries, it is thought that the cost will again drop.

PLANNER-ECONOMIST

The Town and Country Planning Act, 1932, was the subject of a paper read by Mr. I. G. Gibbon, C.B., C.B.E., at a meeting of the Chartered Surveyors' Institution on Monday night. Mr. Gibbon emphasized that the groundwork of a sound plan must be economic. "It must minister to the prosperity of the district. The planner must be more than a little of an economist—and thus rank himself, if not among the major prophets of our modern Press, at least among the minor."

The Special Committee for Public Relations of the Building Industries National Council point out that their "Build Now" campaign will not be really complete until everyone connected with the Building Industry takes it up as a personal matter.

The Committee suggest the following lines of personal action. 1: Urge the resumption of postponed building schemes in the Press. 2: Ask your Local Authority to proceed with its postponed schemes. 3: Approach your local Member of Parliament on the question of public works and postponed schemes. 4: Urge on every possible occasion that now is the time to build. *5: Urge your Local Authority to prepare plans for new works which are needed in its area. 6: Support the "Build Now" campaign of the Special Committee for Public Relations.*

In this way, supporters of the work of the Committee can give the "Build Now" campaign the benefit of their special knowledge of local affairs and conditions, and commence a cumulative movement all over the country.

Subscriptions to the fund should be addressed to Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

MR. KNAPP-FISHER

Mr. A. B. Knapp-Fisher, F.R.I.B.A., has been appointed to the Professorship of Architecture at the Royal College of Art, South Kensington.

PRESERVING STEEL-WORK

Sir Edwin Lutyens, R.A., discussing functional architecture at a meeting of the Oxford Architectural Club last week, said "it may be that there will soon be discovered some method of preserving steel-work without burying it deep in concrete—a spray of some preserving material, so that we may use steel as the men of old used their timber, and with a 'half-ironed' house we may again express our architecture through the medium of its construction."

The modern car and iron ship now seem to be the inspiration of originality, and our buildings sometimes appear as top-hampered lids of liners superimposed on concrete boxes, punctured with the streamline windows of a moving car and the use of hard materials that, in reflecting light, destroy all unity of the landscape wherein they are placed. Even the old English trees are callously let go, and quick-growing varieties from foreign soils are planted. I believe we shall retract our ways before it is too late.

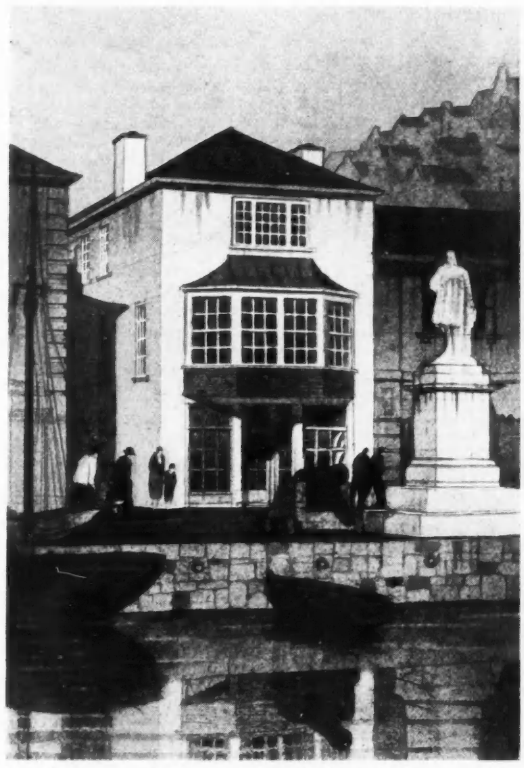
F. Morrall Maddox, F.R.I.B.A., who has just been re-elected president of the North Staffordshire Architectural Association.

THE HOUSING BILL

The Minister of Health conferred last Friday with representatives of the National Association of Building Societies, who were introduced by Sir Enoch Hill, J.P., Sir Harold Bellman and Mr. Walter Harvey.

The object of the conference was to enable the Minister to discuss with the Association the steps to be taken to give effect to the proposals for the building of houses to let, with the assistance, where needed, of loans from the building societies under the guarantee scheme contained in the Housing Bill now before Parliament.

The Minister suggested that the Association should take steps to bring the exact nature and possibilities of the proposals in the Bill to the notice of all their constituent Societies and to stimulate their co-operation with the local authorities and the building trade in using the new provisions to the maximum advantage, and discussed with the representatives of the Association present the best ways in which those objects could be secured.



The representatives of the Association assured the Minister that they would bring to the notice of all the individual societies the scope of the new proposals and the importance of operating them actively.

NOTTS., DERBY AND LINCOLN ARCHITECTS' MEETING

At the seventieth annual general meeting of the Nottingham, Derby and Lincoln Architectural Society last week, Mr. Charles H. Calvert, F.R.I.B.A., was elected president in succession to Mr. T. Cecil Howitt, F.R.I.B.A. Mr. Claude Howitt, A.R.I.B.A., whose father was president of the Society from 1894-6, was elected vice-president. The other officers were appointed as follows:—

Hon. secretary: Mr. H. H. Goodall, L.R.I.B.A.; hon. librarian: Mr. R. Spencer, L.R.I.B.A.; Council: Messrs. C. H. Ashlin, A.R.I.B.A.; B. E. Hughes, L.R.I.B.A.; T. C. Howitt, F.R.I.B.A.; A. E. Eberlin, A.R.I.B.A.; J. Wollatt; B. Jessop, A.R.I.B.A.; W. G. Watkins, F.R.I.B.A.; W. H. Golightly, and P. Gerard.

The retiring president (Mr. Howitt), in his address, said the "reason our small designs have not been accepted may be that people do not like architects' houses; we must design houses people will like."

Beach House, Brixham. By Herbert F. Rea. From The Royal Academy Exhibition (No. 1467).

LORD MOYNE'S HOUSING COMMITTEE

The Departmental Committee that has been set up under the Chairmanship of Lord Moyne to consider what further steps are necessary or desirable in connection with housing, has already received evidence from Lord Eustace Percy, M.P., and Sir Raymond Unwin. Lord Moyne is endeavouring to receive all the evidence this month with a view to issuing an early report. The Committee finds itself, however, limited by the terms of reference, for it can only recommend steps to be taken that are possible "without public charge." How any action can be taken, either through local authorities or through the Ministry of Health itself, without entailing some kind of expense, is a conundrum which members of the Committee are trying to solve. This, of course, applies to the National Housing Corporation. The Committee is busy considering, not how the Housing Corporation would work, but whether the terms of reference of the Committee allow the Committee to consider how the Housing Corporation would work.

MANCHESTER SCHOLARSHIPS

The Manchester City Council is again offering a number of scholarships tenable in the Faculty of Technology of the University of Manchester. Successful candidates are required to follow a full-time course leading to the degree of Bachelor of Technical Science in the College of Technology; and Matriculation or its equivalent is an essential qualification.

For students who have been engaged in industry, and who have attended part-time day or evening classes, the scholarships are of the value of £100 per annum, while for students leaving Secondary or Central Schools the value is £60. Both classes of scholarships are tenable for three years.

SLUM CLEARANCE AT CARDIFF

The Cardiff City Council decided last week upon a scheme for the clearance of slums in the centre of the city and the construction of a bus centre to cost £250,000.

IRISH ARCHITECTURAL ASSOCIATION

Mr. H. V. Millar, M.R.I.A.I., has been elected president of the Architectural Association of Ireland, in succession to Mr. Manning Robertson. Other officers are as follows:—

Vice-President, Mr. E. A. Barrett, M.R.I.A.I.; Committee, Messrs. E. D. Buckley, W. H. H. Cooke, C. J. Clarke, J. A. Doyle, V. Kelly, D. M. O'Dwyer, F. J. O'Neill, E. R. Sheridan and Miss S. M. Tisdal; hon. librarian, J. J. O'Gorman; hon. treasurer, Mr. T. F. Inglis; and hon. secs., Messrs. H. T. Coleman and G. C. Henry.

SOUTH WALES ARCHITECTS' VISIT

The second evening visit arranged jointly by the South Wales Institute of Architects, Central Branch, and the Welsh School of Architecture, took place on Wednesday, May 3, when a large party of architects and students of architecture visited the Llandough Hospital.

The visitors were first shown the working drawings of the kitchen and were then conducted round the various buildings by Mr. E. C. Morgan Willmott, F.R.I.B.A., the architect for the hospital. The complete scheme, it was pointed out, is intended to provide for 1,000 patients, but the present buildings accommodate 340 patients in five two-story blocks. At the conclusion of the visit, Mr. Willmott was thanked by Mr. Percy Thomas, O.B.E., F.R.I.B.A., and Mr. W. S. Purchon, M.A., A.R.I.B.A.

TEESSIDE ARCHITECTS' MEETING

At the tenth annual meeting of the Teesside Branch of the Northern Architectural Association, held at Stockton, the following officials were elected: Chairman, Mr. George P. Stainsby, F.R.I.B.A.; vice-chairman, Mr. J. R. Weatherill; hon. secretary, Mr. Arthur Harrison; assistant hon. secretary, Mr. Matt Trotter.

EMPIRE STATE BUILDING

On Wednesday last, at the Architectural Association, Mr. W. Smith Rollo, A.M.I.MECH.E., A.M.I.E. (India), of Messrs. Waygood-Otis, exhibited and explained an interesting film showing the manufacture of steel, and the construction and lift equipment of the 1,252-foot Empire State Building, New York.

CHANGES OF ADDRESS, ETC.

Messrs. Le Maitre and William and Segar Owen, Architects and Surveyors, have removed their offices to 3, Pump Court, Middle Temple, E.C.4. Telephone No.: Central 1716.

Mr. Harold Greenwood, A.I.A.A., has removed his offices to 39 St. James's Street, S.W.1. Telephone No.: Regent 1045.

The partnership of Cayley and Jarvis, architects, of 34, High Row, Darlington, has been dissolved by mutual consent, and the practice will be continued at the same address by Mr. H. E. Jarvis, A.R.I.B.A.

STRUCTURAL ENGINEERS

The first summer meeting of the Institution of Structural Engineers is to be held in Birmingham from June 14 to 16. On the first day Mr. A. H. S. Waters, M.INST.C.E., will be installed as president in succession to Mr. F. C. P. Monson, F.R.I.B.A.

R. I. B. A.

THE ANNUAL CONFERENCE

Particulars of the annual conference of the R.I.B.A. and Allied and Associated Societies, to be held at Cambridge from June 21 to 24, have just been issued by the Institute.

Following is a summary of the proceedings :—

WEDNESDAY, JUNE 21, 8 p.m. to 11 p.m.—Annual Reception in the Hall of Peterhouse, Cambridge.

THURSDAY, JUNE 22, 10.30 a.m.—Inaugural Meeting at the Guildhall. Inaugural address by the President of the R.I.B.A., to be followed by short addresses by Messrs. A. Beresford Pite, M.A.(HON.)CANTAB., F.R.I.B.A., and Geoffrey Webb, M.A.CANTAB. 2 p.m.—Conference Photograph. 2.30 p.m.—Four alternative visits. 5.15 p.m. to 7.15 p.m.—Reception by the Rt. Worshipful the Vice-Chancellor of the University of Cambridge, at the Fitzwilliam Museum.

FRIDAY, JUNE 23, 9 a.m. to 5.45 p.m.—Six alternative charabanc tours. 7 p.m. for 7.30 p.m.—Conference in the Hall of Trinity College.

SATURDAY, JUNE 24.—Informal visits.

FINAL AND SPECIAL EXAMINATIONS

The following are the dates on which the forthcoming R.I.B.A. Examinations will be held :—

Final Examination : July 5, 6, 7, 8, 10, 11 and 13, 1933 (last day for applications : June 7).

Special Examination : July 5, 6, 7, 8, 10 and 11, 1933 (last day for receiving applications : June 7).

R.I.B.A. STATUTORY EXAMINATION

The R.I.B.A. Statutory Examination for the office of District Surveyor under the London Building Act, and the Examination for the office of Building Surveyor under Local Authorities, will be held at the R.I.B.A., London, on October 11, 12 and 13, 1933.

The closing date for receiving applications for admission to the Examinations, accompanied by a fee of £3 3s., is September 20. Full particulars of the examinations and application forms can be obtained from the Secretary, R.I.B.A.

The Unemployed Man, by Gordon Herickx, recently exhibited at an exhibition organized by the Birmingham Craftsmen's Club.

COMPETITION NEWS

SOUTHWARK TOWN HALL

I understand (writes our special correspondent) that the proposed Town Hall for Southwark is to be discussed at a meeting of the Borough Council tonight (Wednesday). It will be recalled that Mr. C. Cowles-Voysey's design was awarded first place in a limited competition, but the Borough Council favoured the scheme submitted by Messrs. Yates, Cook and Darbyshire.

STOKE NEWINGTON : MUNICIPAL BUILDINGS

The Council of the Metropolitan Borough of Stoke Newington have authorized the holding of a competition for Municipal Offices and extensions to the Library and Electricity Offices. Conditions have not yet been drawn up.

Competitions Open

May 30.—Sending-in Day. Royal Society of Arts Competitions for Industrial Designs. The Secretary of the Society, John Street, Adelphi, W.C.

May 31.—Sending-in Day. Layout of a suburb on the river Escaut, Antwerp. £2,400 in prizes (1st, £800). Conditions, etc., were published in *A.J.* for December 7, 1932.

June 3.—Sending-in Day. Limited competition for flats to be erected in Lordship Road for the Stoke Newington B.C. Premiums : £250, £100 and £50. Full particulars, etc., published in *A.J.* for March 29.

September 21.—Proposed Town Hall for the Borough of Hornsey. Open to architects of British nationality. Assessor : C. Cowles-Voysey, F.R.I.B.A. Premiums : £350, £250 and £150, for the designs placed first, second and third, respectively. Applications for conditions, etc., should be made to E. B. Croasdell, Town Clerk, Town Hall, Highgate, N.16. Deposit £1 1s., returnable on receipt of a bona-fide design or return of the conditions within four weeks before the date for submitting designs.

No Date.—Proposed Town Hall for the Portstewart U.D.C., Co. Londonderry. Open to architects practising in Northern Ireland. Assessor : R. H. Gibson, F.R.I.B.A., President of the Royal Society of Ulster Architects. Premium 50 guineas. Conditions of the competition may be obtained on application to Mr. F. Martin, Town Clerk, Portstewart. Deposit £1 1s.

Competition Pending

Proposed New Council Offices to be erected at Salt Hill for the Slough U.D.C. Assessor : H. S. Goodhart-Rendel, F.R.I.B.A. Premiums : £150, £100 and £50. Conditions have not yet been drawn up.

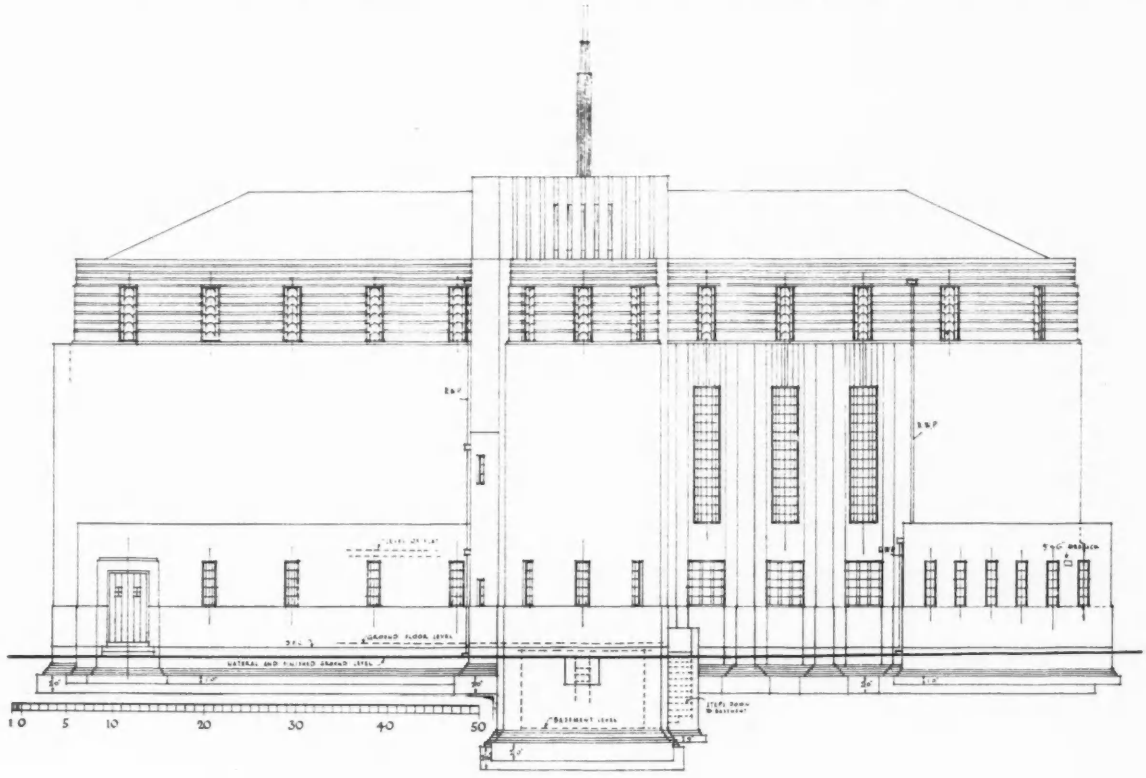
The late A. M. Mackenzie

We regret to record the death of Mr. Alexander Marshall Mackenzie, R.S.A., F.R.I.B.A., LL.D., which took place on Thursday last at Culter House, Aberdeenshire, in his eighty-sixth year.

Mr. Mackenzie was articled to James Mathews, of Aberdeen, and was assistant to David Bruce, R.S.A., of Edinburgh. His chief work was the extension of Marischal College, which was opened in 1906 on the occasion of the quatercentenary of Aberdeen University, and was erected at a cost of £30,000.

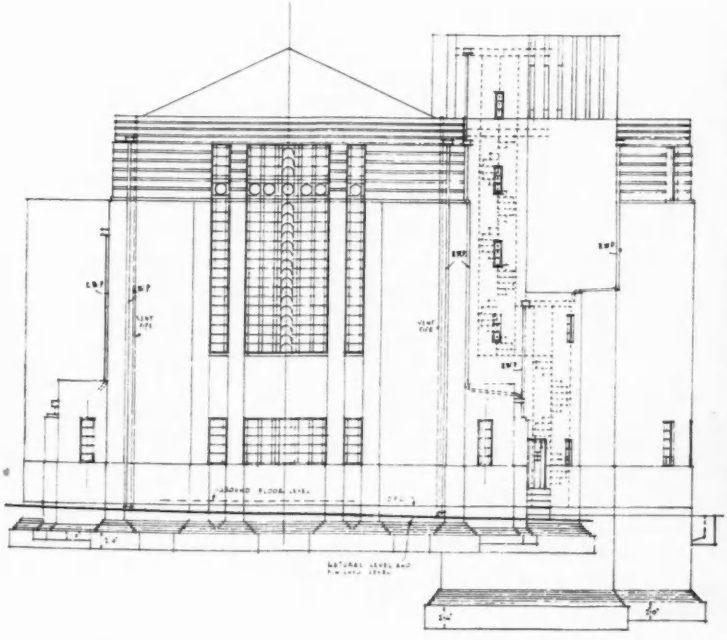
He was also responsible (in conjunction with his son, A. G. R. Mackenzie, F.R.I.B.A.) for Australia House and the Waldorf Hotel, London ; Hursley Park, Hants. ; Aberdeen War Memorial ; and Cowdray Hall, at Aberdeen Art Gallery.

Recent Wills

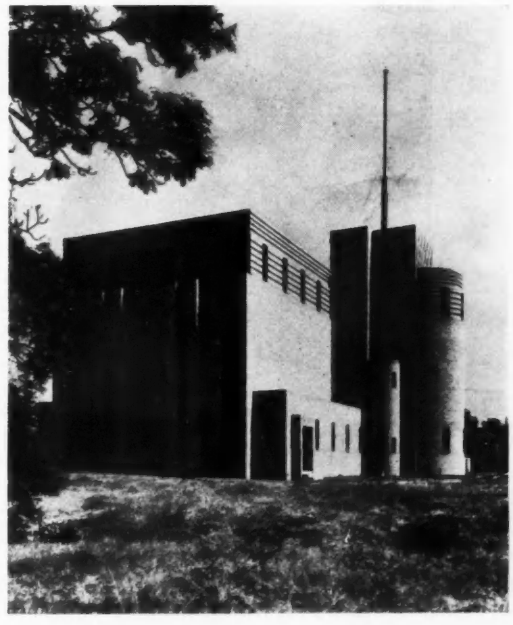


Sir Thomas Manly Deane, R.H.A., of Penmaenmawr, formerly of Dublin, architect, left £4,647 (net personalty £3,737).

Mr. Percy B. Tubbs, F.R.I.B.A., of Eaton Mansions, Sloane Square, left £81,080 (net personalty £22,802). His legacies included £200 to the Architects' Benevolent Fund ; and £100 to the Artists' General Benevolent Fund.

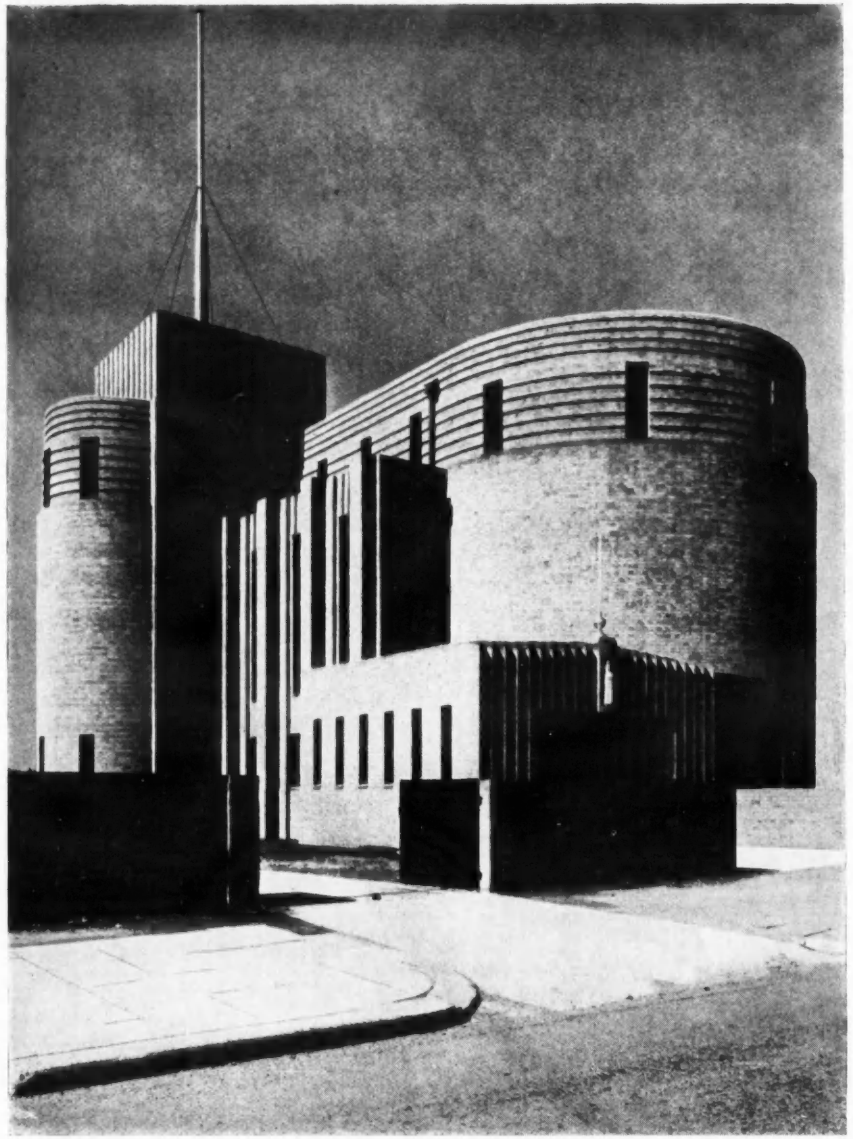


ON THE AIR

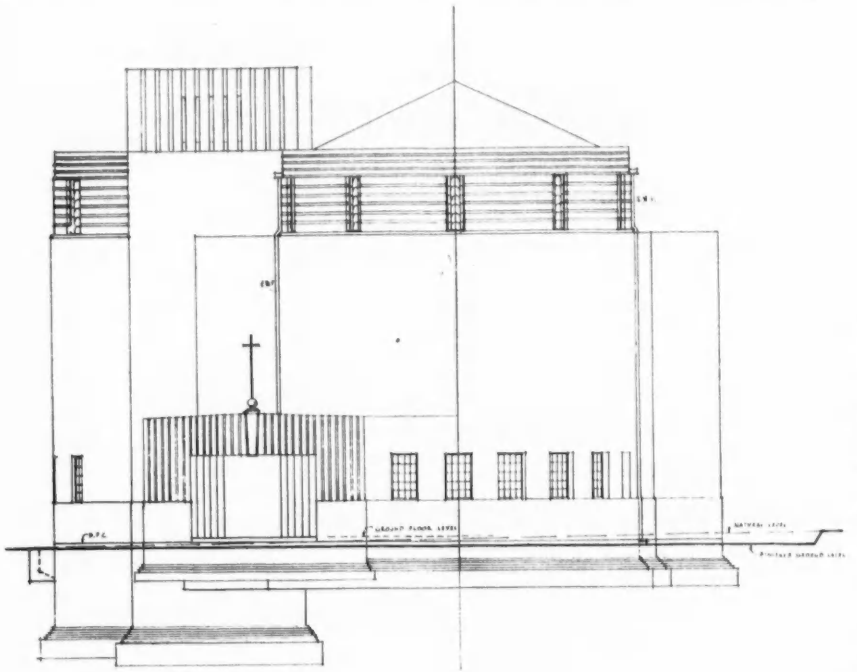


On Tuesday next, May 16, the fifth of the series of talks on "Design in Modern Life" will be broadcast in the National Programme at 8.30 p.m. by Miss Elizabeth M. Denby and Mr. Geoffrey, who will discuss " The Kitchen."

SAINT NICHOLAS CHURCH, BURNAGE

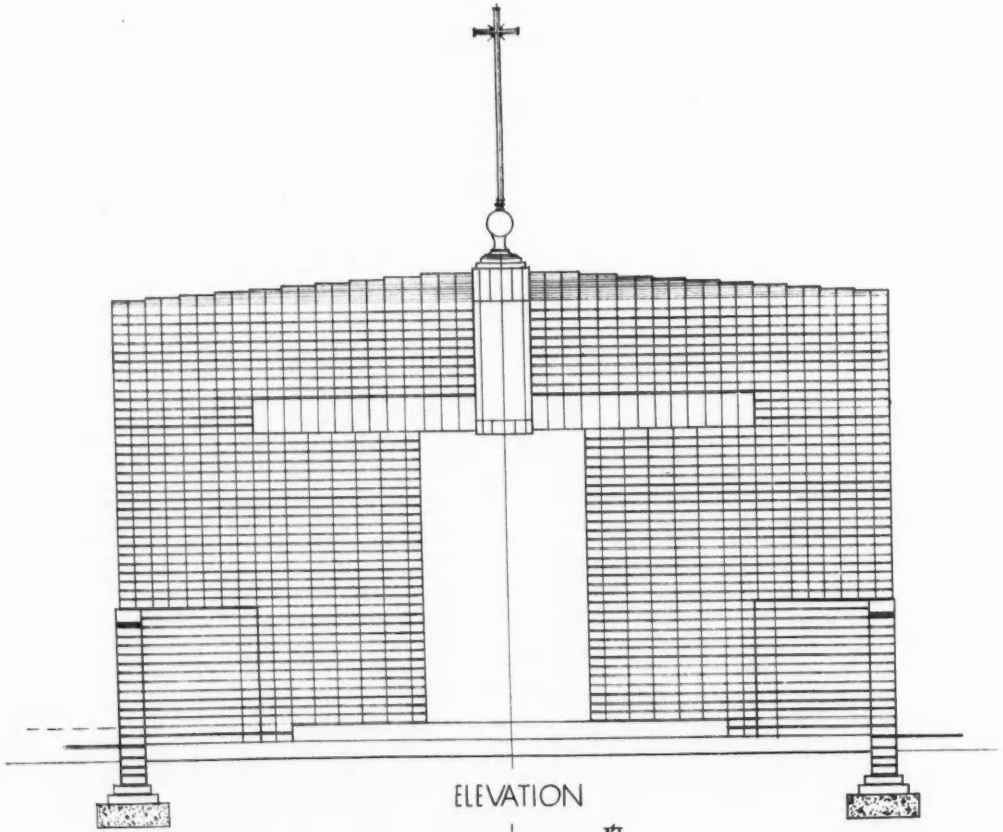


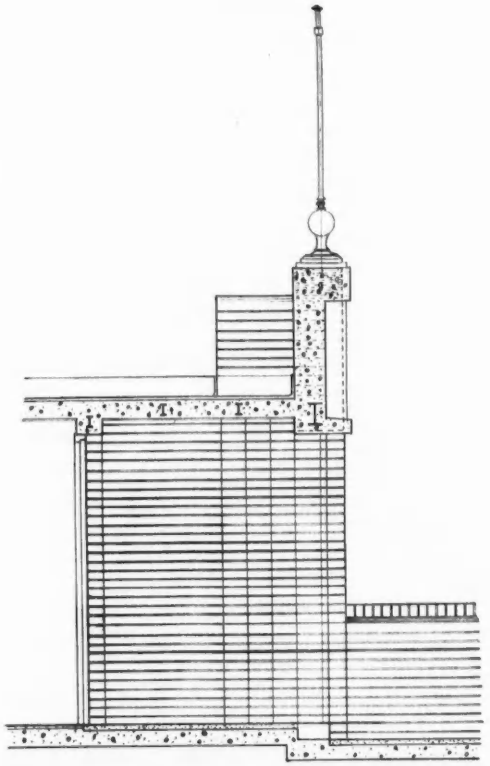
The drawings reproduced on this page are of the south elevation, in which the tower occurs, and of the west end. Both are to the same scale, and so is that of the east end, appearing overleaf.

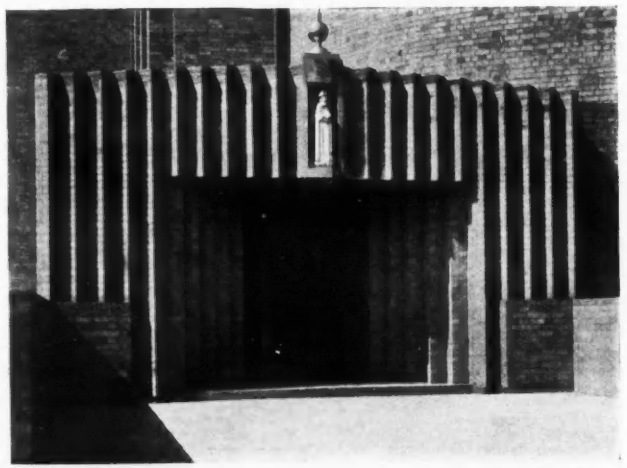


BY WELCH, CACHEMAILLE-DAY AND LANDER

ST. NICHOLAS CHURCH, BURNAGE, NEAR MANCHESTER



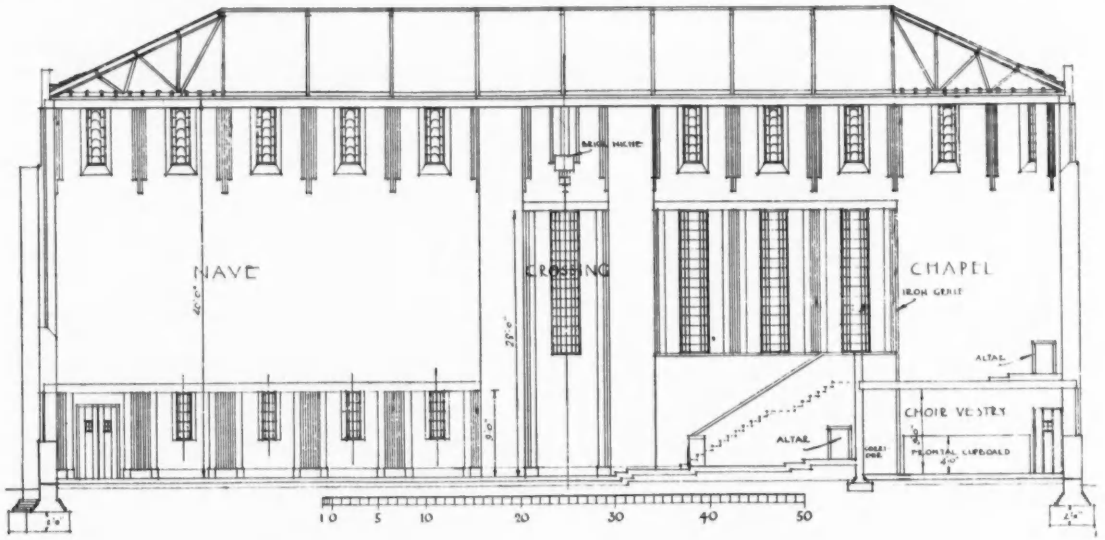


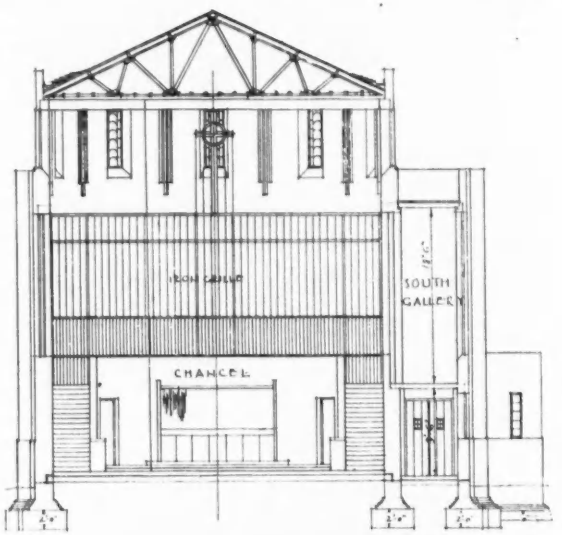


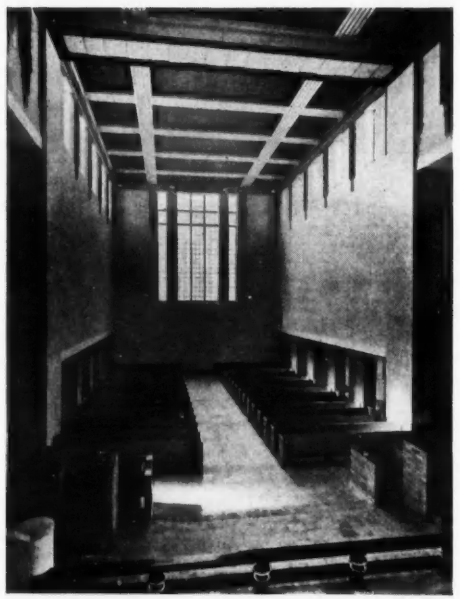
The illustrations on these two pages show the eastern end in general, and its main entrance in detail. The walling of the church is in Lincolnshire yellow-grey bricks, 3 ins. on the exterior, 2⅝ ins. on the interior; most of the internal surface is finished with hydrated lime plaster, untinted.

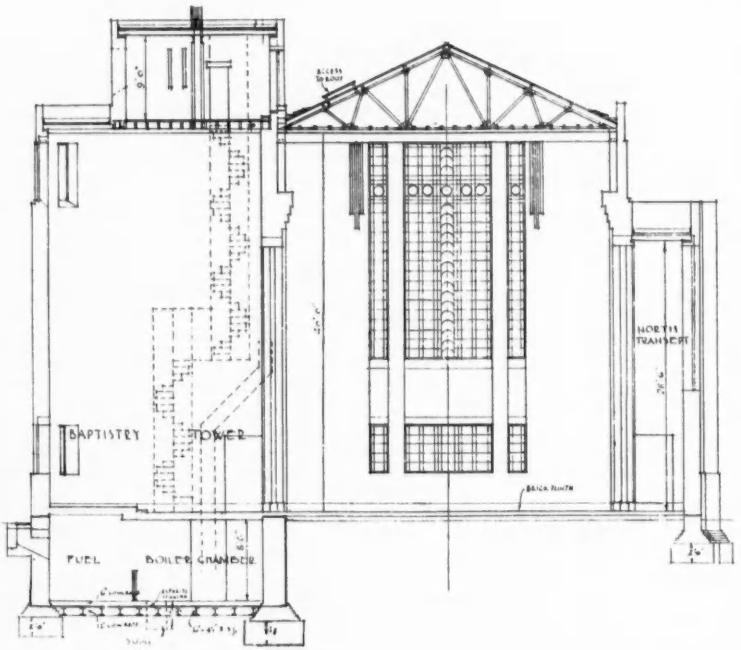
The site extends westward at right angles from Kingsway, a new arterial road running south out of Manchester; the axis of the plan (see page 621) is, of course, east and west. The two conditions thus arising are satisfied in a way that makes interesting planning of the east end. Porch and semi-cylindrical apse adjoin and are of similar depth. The former is one story in height, and from it access is given to the church by a corridor alongside the chancel. Over the corridor is the organ and choir gallery, and over the vestries that occupy the apse at ground level is the Lady Chapel, which thus appears directly above and behind the altar as seen from the nave. The photographs on pages 620-1 show the effect.

All the seating is in the nave; the aisles are merely passages one story high. Steel trusses support the roof over the comparatively wide span; the ceiling is of wood beams and wall-board, roofed with small grey slates. The nave is floored with wood blocks, the chancel with tiles to match the brickwork.



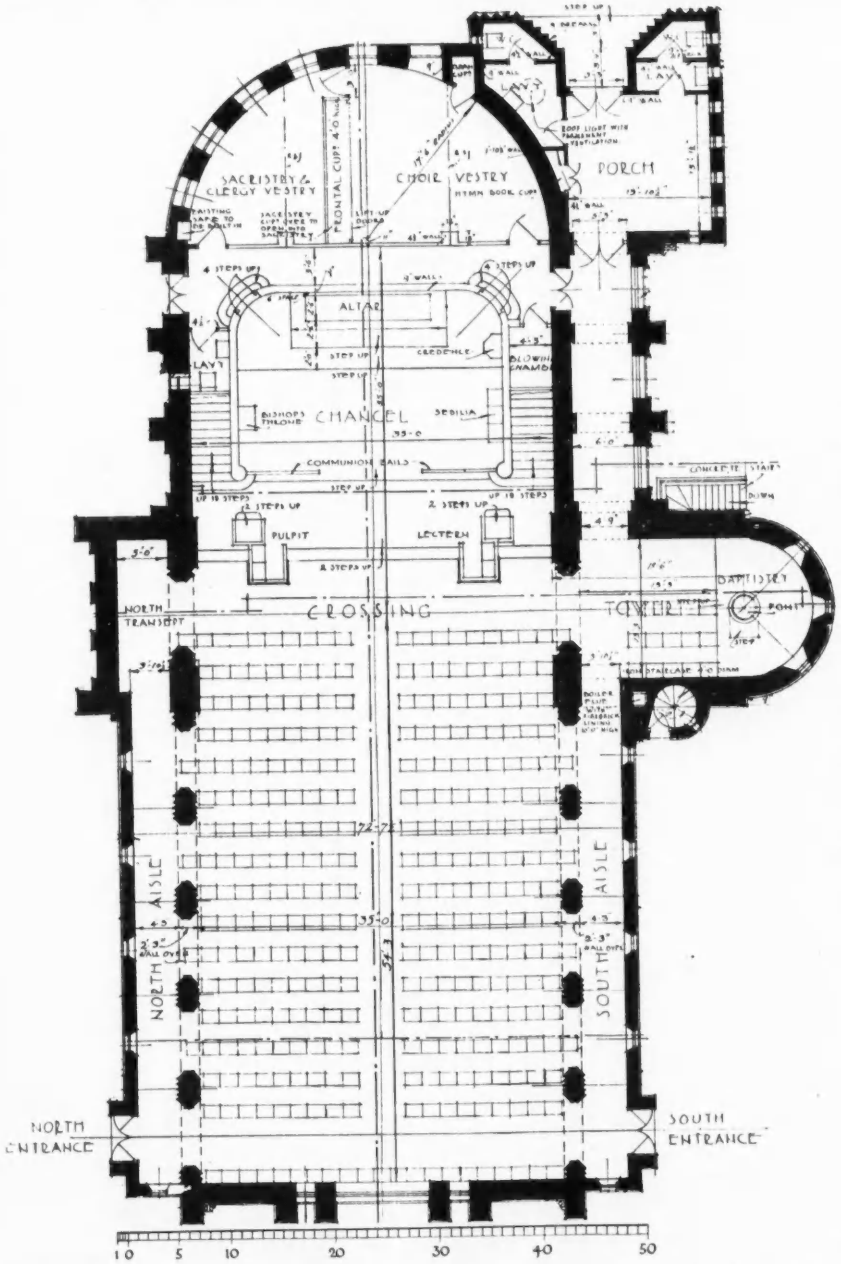


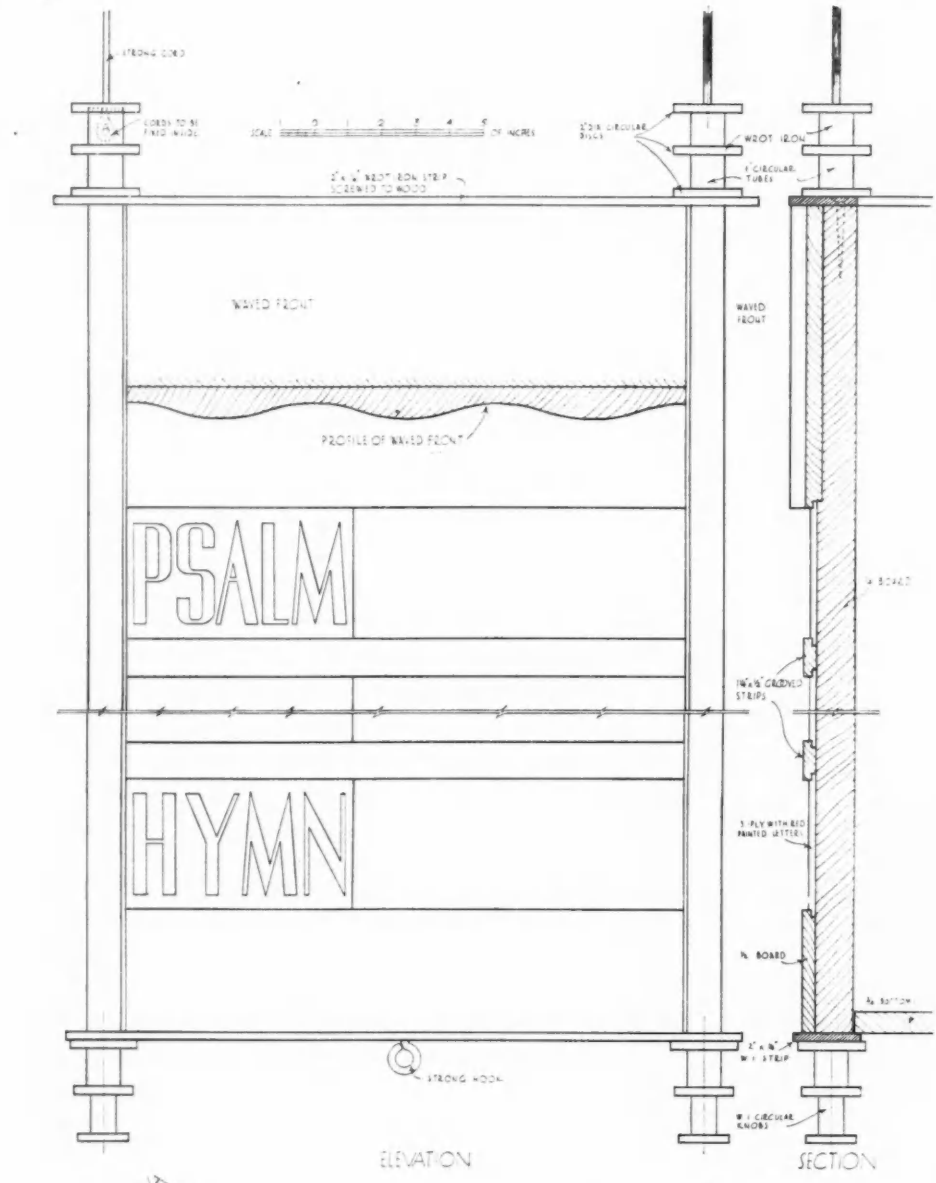




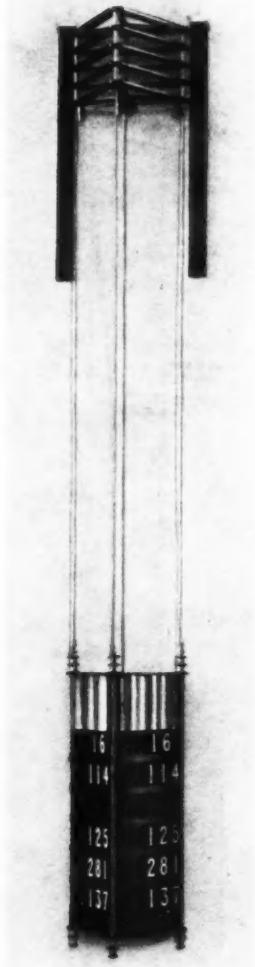
DESIGNED BY WELCH, CACHEMAILLE-DAY AND LANDER

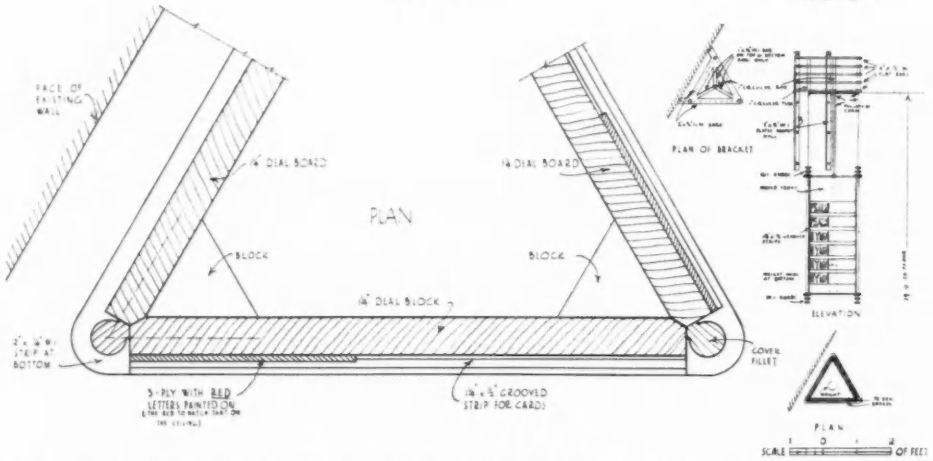
ST. NICHOLAS CHURCH, BURNAGE, NEAR MANCHESTER





The ceiling panels are of acoustic wallboard, stained royal blue, framed in red, gold and black bands. The iron grille to the Lady Chapel is black, picked out with gold, the altar frontal red and gold, the altar rail ebonized wood and gold. Pew cushions and sanctuary carpet are royal blue. The walls generally are of neutral grey-blue.





DESIGNED BY WELCH, CACHEMAILLE-DAY AND LANDER

IN ST. NICHOLAS CHURCH, BURNAGE

The hymn board, suspended, counterbalanced, on the north wall of the Sanctuary, is triangular in plan, and can be seen from every part of the church. It is constructed from ordinary soft white wood, painted black and gold. The wide waved strip at the top is in gold, the figures are white on a black ground, and the lettering repeats the shade of red used on the church ceiling. The cost was £21 10s. For a photograph of the font, together with description, see page 637.

"PRACTICAL POLITICIAN"
CHARLES L. HILL (*Chairman, Urquhart's* [1926] *Ltd.*)
C. G. MARTIN, F.R.I.B.A. (*Retired*)

The Mars Group

May 3, 1933

SIR,—I have read the remarks under Notes and Topics in the JOURNAL for today regarding the formation of the Mars Group, and in this connection I send you a copy of a letter which I have written to Mr. Yorke. I understand from him he is referring my letter to Mr. Wells Coates.

My object in writing to you is to remove any misconception which quite clearly exists that English architects have paid no attention to the International Congresses. Mr. Rowland Pierce, Mr. P. Cutbush and myself are only three amongst several other members of the Architectural Association who have gone fairly closely into the work of the Congresses. We have also furnished the Congresses with data on English practice.

As there seems to be quite frequently an idea abroad that English architects and architecture are behind the times in every circumstance, I think it only right that you should correct the impression conveyed by the first paragraph of your notes on the Mars Group.

You are, of course, at liberty to publish my letter to Mr. Yorke should you desire to do so.

HOWARD ROBERTSON

April 28, 1933

F. R. S. YORKE, ESQ., A.R.I.B.A.

DEAR SIR,—My attention has been called to your letter appearing in the technical papers regarding the International Congress of Modern Architecture.

In your letter you state that at the various Congresses there were no official delegates from England. I would like to point out that at the 1930 Congress England was represented by Mr. S. Rowland Pierce, Mr. Patrick Cutbush and myself, and that I have been a member of the Congress since 1929.

I should also like to point out I have been approached at various times to form an English group and that about two years ago a meeting was held at the Architectural Association to discuss the advisability of so doing. After full consideration of all the circumstances it was decided to leave the question of adherence to those individual architects who might be interested.

I think that the suggestion in your letter is that no attention has been paid to this movement by any architects in England and as this is not quite correct, I would be much obliged if you could arrange to put the matter right.—Yours very truly,

(Signed) HOWARD ROBERTSON,
Director and Principal, A.A.

(*This letter has been submitted to Mr. Wells Coates, who has sent the following reply*) :—

SIR,—I am surprised that Mr. Howard Robertson should have sent you his letter to the Hon. Secretary of the Mars Group before he had received an official reply to it. In the circumstances I am bound to send you a copy of my reply, as follows :

May 4, 1933

HOWARD ROBERTSON, ESQ., F.R.I.B.A.,
54, Bedford Square, W.C.1

DEAR HOWARD ROBERTSON,—Your letter of April 28 on the subject of the International Congresses for Modern Architecture was received by the Hon. Secretary of the British Group only yesterday, and has now been passed on to me.

Before accepting the responsibility of forming a British Group I made very careful enquiries regarding the attempts that have been made in the past by the International Secretariat to interest English architects in the programme of work of the Congresses.

I am, of course, aware that you and two other English architects attended the Brussels Congress. But the position is that an invitation to attend a Congress is one thing, official association with a programme of work, another. Dr. Giedion's report left no room for doubt on that matter.

I should very much like to know the names of those who attended the meeting at the Architectural Association about two years ago. Our Group is organized on the basis of a programme of work, with specific items of research for every contributing participant, and I am, of course, anxious to know of all those whose interests and whose capacities lie in the direction in which our Group proposes to move.

If you wish me to carry out the suggestion contained in the last paragraph of your letter, I shall be glad to do so, but I should in that case be bound to state the official position in regard to the Congresses with greater detail than I do here. Perhaps you would like to have a chat with me about the whole thing.—Yours sincerely,

WELLS COATES

In order that there should be no further doubt as to what constitutes "attention" to the aims and programme of the International Congresses, I shall quote from a letter in my possession, from Dr. Giedion, the International Secretary :

"To our great regret no English group of the Congresses has been formed. Mr. Robertson and some of his friends attended our Brussels Congress, but they afterwards informed us that no interest in our movement existed in England. ('Dass in England kein Interesse für unsere Bewegnung zu finden sei.')

"We regretted this all the more because our Congress is more actively organized for work today than ever. . . Please let us know if interest in the new architecture is still so lukewarm in England, and whether there are really no young men to be found there who have the courage, and feel it their duty, to form a collective organization, and establish contact with us?"

WELLS COATES

What is to be Done About This?

SIR,—The present conditions under which speculative housing is being produced are truly damnable. We have on the one hand the financial octopus of the building societies, who have developed from quite good and proper thrift societies into huge financial usury agencies. They have decided, for very obvious reasons, to throw in their lot with the speculative builder, the person which the history of housing (through our industrial period) shows to have been, in effect, our greatest social bane, and the producer of our most costly social ill—slums.

We have, as the result of the Housing Bill, the marriage of the two worst elements associated with the building industry, or with the architectural profession. This unlovely pair are exercising their conjugal rights to say to the architect, "You shall not come in, because *we* can do without you"; they say to the well-organized building contractor: "We will have no truck with you, because we can undercut your methods and your production." Thus the two pre-eminent members and most stable influences in the industry are in practice debarred from a field of activity which, through the next two or three years, is likely to be responsible for spending anything up to £100,000,000 of public money in one shape or form on house construction of all kinds. In other words, we are likely to see in the near future the largest expenditure of money on housing of the century without the slightest control by, or influence of, the architectural or organized building mind.

I am satisfied that no amount of voluntary organization will stop the ghastly progeny of the union referred to above. The advantages of a free and unfettered field of activity will be protected and defended by them at all costs. There are ways, however, of counteracting this brood, which, if taken up with vigour, would, I think, be successful. Action to this end appears to fall under three heads, namely :—

1. To amend the Acts governing the activities of building societies which, as you know, are given certain legal privileges under what might be termed their enabling acts (particularly with regard to the compounding of income tax), to the effect that while they enjoy these privileges, which are almost monopolistic in nature, they should be confined to making advances on houses erected to the designs and under the supervision of a registered architect. There would be no hardship whatever in this move, and it would add immensely to the value of the property upon which the advances are made; moreover, it is just common business sense.

2. To bring pressure to bear upon the Government to pass an amending Bill to their last Housing Act, to the effect of confining the advances of building societies to schemes under architectural supervision. As one of the major intentions of the Act was said to be to increase employment in the building industry, it is only right that the immense advances for housing purposes by the building societies should be confined to schemes being executed under the supervision of registered architects. Unless some such move as this is made the £100,000,000 which is likely to be spent during the next year or so on housing will be

of comparatively little advantage to the unemployed architect, but withal to the distinct disadvantage of the community.

3. This can be contemporary with action under 1 and 2 above, namely, for architects themselves to form a building society for the purpose of advancing money and taking advantage of the Housing Acts by loaning money only on houses constructed under the supervision of registered architects.

Without going very much into detail under these three heads, there does appear to be real ground for constructive action along some or all of these lines.

If, for example, in truth and effect, the architecturally-built house has marketable and social advantages over the speculatively-planned house, then the architectural building society should be in a position to grant considerably more by way of a mortgage than could the building societies dependent upon the more promiscuous market of the speculative house.

You will realize that I have only touched very briefly on the more important aspects of this matter, as I see it, and, of course, I regard them all as subservient to the national plan of dealing with housing, of which Sir Raymond Unwin's suggestion of a National Housing Board is such a constructive part.

I firmly believe that the creation of such a Board as is envisaged by Sir Raymond would deal with many of the difficulties which now arise from the ridiculous freedom extended to the speculative builder, from which we all suffer.

I do certainly hope that you will get every support for your movement, as it appears to be nothing less than a scandal that the most important work functionally of the architect, and the great influence for good which the architect can bring to bear upon the lives of the lower-paid population of this country through houses designed and planned for beauty and utility, should be withheld from them because it has been felt fit to throw the production of working-class houses to the ruthless wolves of speculation and monopolistic usury.

Just one final thought, namely, that while I think this problem is capable of being tackled upon the lines I have indicated, such efforts, if they are made, will, I fear, be largely wasted unless, concomitant with such, equal efforts are made to bring into being a cheaper and more efficient system of financing house building of all kinds.

As a constructive counter to the monopolistic position into which the building societies generally have developed, I think it is essential that the problem of building finance should be examined and dealt with by the industry as one of its major problems.

"PRACTICAL POLITICIAN"

Scale Buoys

With reference to Mr. H. A. Dod's letter in your issue for May 3 in connection with the above, we act as wholesale and retail distributors for this apparatus.

There are some thousands in use throughout the country, and they prove most efficient in removing scale from pipes and boilers, and for domestic purposes give the water the effect of having been softened, thus showing a considerable saving in the use of soap, soda and tea.

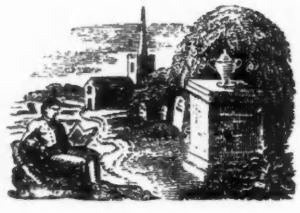
CHARLES L. HILL,
URQUHART'S (1926) LIMITED

The Speculative Builder

SIR,—Upon the first casual perusal of my JOURNAL this morning I feared you had made a change in the very excellent series of Information Sheets (we have now reached "Manholes," to my great pleasure), but upon closer scrutiny and with the aid of my glass I was disgusted and amazed to discover that the sheet was by another hand, and, what is worse, was actually the work of a *speculative builder's architect*—no more, no less.

Now, Sir, your chance has come to strike a blow for England.

No longer must this pest, this aptly named Blower,* be allowed to disfigure the face of the land. Surely one of your readers has sufficient love for this fair heritage of ours to suggest the means.



I have searched my *Kalendar*, but the fellow is not a member of our Institute—*not even a Licentiate*—so I am afraid that no help can be expected from that quarter.

Cannot the C.P.R.E. be prevailed upon to take some action?

Having at last found the culprit, some means of preventing his further depredations simply *must* be found.

CHARLES GREGORY MARTIN,
F.R.I.B.A. (RETIRED)

* Blow. To puff up. To taint by depositing eggs upon.

WHAT IS TO BE DONE ABOUT

THIS?

[The architect does not, as a rule, make use of the Building Societies; in fact, generally speaking, he knows curiously little about them. The article printed below, with a sequel to follow next week, shows how the small builder uses them. There is every reason why the architect should use them on behalf of his clients. It is hoped that the information now conveyed by an experienced estate developer may help architects, who have had no experience of Building Society procedure, to consider its possible applications in relation to their clients. A letter on building societies concludes on this page.

The following have already appeared:—(March 29) 1. The Speculative Builder, by Penates; (April 5) 2. The Speculative Architect, by Edwin Gunn; (April 12) 3. Building Without Guidance, by Stanley C. Ramsey; (April 19) 4. What the Public Want, by Edwin Gunn; (April 26) 5. The Housing Problem, by Percy Morris; (May 3) 6. The Building Centre Competition, by E. Maxwell Fry.—ED., *A.J.*]

7. How the Architect can use the Building Societies

[*By H. C. BURDETT*]

Owner Occupiers

AT the present time, most of the building societies lend 80 per cent. of the purchase price or valuation, whichever is the less, to people wishing to buy houses for their own occupation. They will nearly all lend a further 10 per cent., making a total of 90 per cent., if this excess is insured. They have their own arrangements with one or other of the leading insurance companies for this purpose, and the risk is covered by the payment by the borrower of a single premium of approximately 10 per cent. of the extra advance. For example, on a house valued at £1,000 the building society would lend £800 normally and an

extra £100 if this is insured, and the single premium for this extra loan would be £10. As will be explained next week, arrangements can be made in conjunction with some builders to borrow even more than 90 per cent.

Building Owners

It frequently happens that architects have clients who wish to build and take advantage of building society funds. Most of the societies are willing to lend on the security of the land as the building work proceeds. Assume a suitable site has been acquired and appropriate plans and specifications prepared : these should be submitted to the society with the request for finance during construction. The society will, if they approve the scheme, instruct their surveyor to inspect the site and value the proposed building, and the borrower will have to pay the nominal survey fee in advance.

If the society approves of the proposal it will agree to lend approximately 70 per cent. of the completed freehold value as the work proceeds. The advances will be made on the certificate of the society's surveyor at the stages agreed. As a rule the first certificate is issued when the building is roofed in, and the value of this certificate is usually about 45 per cent. of the total agreed. Most building contractors are willing to carry the work to this stage without payment on the assurance that the fund is available. The society requires a mortgage on the site when the first advance is made. If the site is already encumbered, a simple calculation will show whether there will be sufficient margin from the proceeds of the first certificate to clear the charge on the land and pay the builder his due. If not, it will be necessary to arrange with the builder to take less at this stage. When the house is completed the society will be willing to bring its loan up to the normal percentage of value already explained and any payments to the builder that may have been delayed can then be made.

Estate Development

It should be added that, in approved cases (that is, where the borrower is sound and the site is satisfactory), most societies are willing to help in the development of an estate by assisting with building finance. They will not assist in the purchase of the land, but will lend on the work in progress, and even if the land is mortgaged it is possible for it to be released plot by plot by using the first advance from the fund to pay out the original mortgage. Each society has its own methods, and will explain the details to any bona-fide enquirer.

(To be concluded)

HOW THE PLANNING ACT AFFECTS DEVELOPMENT

[*By T. J. SOPHIAN*]

ONCE a resolution to prepare or adopt a planning scheme has been passed by a planning authority, the development of land within the area to which the proposed scheme applies will be attended with appreciable risks unless the provisions of the Town and Country Planning Act, 1932, and the General Interim Development Order, 1933, are carefully observed.

Consent to the development of land cannot, of course, be absolutely prohibited if the proposed development complies with the ordinary bye-laws and regulations dealing with buildings, building operations and the like. But the risk run, in failure to observe the additional requirements of the Town and Country Planning Act, 1932, is that if the development ultimately offends the scheme on the scheme coming into force, then buildings which may have been erected may have to be pulled down or altered, or the use to which buildings have been put may have to be entirely stopped, and in each case without any compensation.

On the other hand, if permission to develop has been obtained in accordance with the Act and the Order, and it should subsequently happen that the development is not in conformity with the scheme, then conformity can only be required subject to the payment of compensation.

There are, however, only certain forms of development affected by the Act. It will be observed that S. 53 of the Act defines " development " as including " any *building operations* or *rebuilding operations*, and any use of the land or any building thereon for a purpose which is different from the purpose for which the land or building was last used " ; and " building operations " will include any road works preliminary or incidental to the erection of buildings.

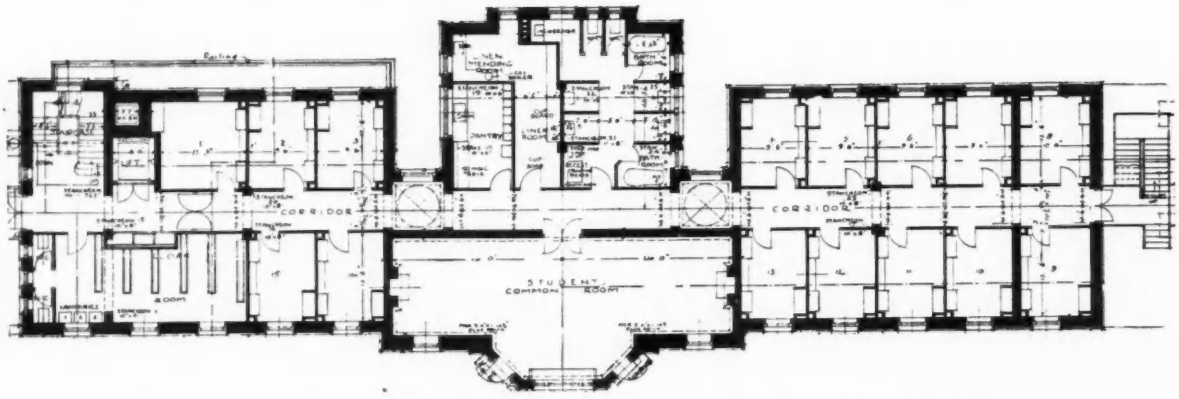
The following forms of " development," however, are expressly excluded by S. 53, viz. :—

(1) The use of land for the purpose of agriculture, whether as arable meadow pasture ground or orchard, or for the purposes of a plantation or wood, or for the growth of saleable underwood, and the use for any of those purposes of any building occupied together with land so used.

(2) The use of land within the curtilage of a dwelling house for any fresh purpose other than building operations, if the purpose is incidental to the enjoyment of the dwelling-house as such.

Furthermore, by virtue of S. 12 (3) of the Act, permission during the interim development period cannot be refused for the erection of a building to be occupied with land which is used mainly or exclusively for agriculture (whether as arable meadow pasture ground or orchard) or for the purpose of a plantation or a wood, or for the growth of saleable underwood, though such permission may be refused if the site of the building is reserved by the scheme for any purpose, the carrying out of which in the future would necessitate the removal or the alteration of the building.

Except in the cases, therefore, in which the particular development is not affected by the Act, it will be advisable to make the necessary application to the interim development authority for permission to develop. The power vested in interim development authorities with regard to the granting or refusing of permission are as follows. In some cases, however, the authority must grant the application ; in others, however, it has an absolute discretion.



APPLICATIONS WHICH MUST BE GRANTED, UNCONDITIONALLY

An application for permission to *erect* a new building *must* be granted unconditionally if the following conditions are fulfilled :—

(1) The new building must be erected on the site of an " existing building " (as defined in S. 53 of the Act) or on the site of a building which was standing within two years before the date on which the resolution took effect (which would usually happen on receipt of the Minister's approval).

(2) The application must be made before or within two years after the destruction or demolition of the previous building *or* within twelve months after the date on which the

STUDENTS' BLOCK, ST. KATHERINE'S

The scheme, of which the above is the ground-floor plan, consisted of a separate wing in the College grounds for seventy-five study bedrooms, together with the necessary sitting rooms and sanitary accommodation. The point to note is the arrangement of the individual study bedrooms, typically shown in the plan of the first floor on the opposite page. They have built-in furniture, and the sanitary accommodation is concentrated in the centre of the block, with washing cubicles for the students.

The boiler plant was made the centre boiler house for the whole College, and therefore is relatively large; the boilers are oil-fired.

Externally, the elevation is in keeping with the existing College buildings. A good stock facing brick was used with red dressings, stone sills, and tiled mansard roof.

resolution took effect, whichever period last expires.

(3) The effect of refusal or of the imposition of any conditions must be such as to render it impossible for the applicant to erect a building having a cubic content, above the level of the ground, as great as that of the previous building, or having, in the case of a previous building used for business or industry, as great a cubic content, above the level of the ground, and as great a superficial area on the ground floor, as those of the previous building.

Notwithstanding, however, that all these conditions may be fulfilled, the interim development authority will have a discretion in the following cases, viz. :—

(1) Where the new building would not conform with a provision as to a building line, proposed in the scheme.

(2) Where it is proposed to include the site of the new building or part thereof in an area to be reserved by the scheme for a purpose the carrying out of which in the future would necessitate the removal or alteration of the new building.

APPLICATIONS WHICH MUST BE GRANTED, THOUGH CONDITIONS MAY BE IMPOSED

A. Permission to use a building erected in substitution for an "existing building" (as defined in S. 53 of the Act) or for a building which was standing within two years before the date on which the resolution took effect, *must* not be refused—though conditions may be attached—if the following conditions are fulfilled :—

(1) The new building must have been commenced within two years after the destruction or demolition of the previous building.

(2) The use must be the same as, or similar to, that for which the previous building was last used before the destruction or demolition.

(3) The use must not be of a noxious or otherwise offensive character.

B. Permission to *carry out works of alteration* to an "existing building" (as defined in the General Interim Development Order, 1933, hereafter referred to as "the 1933 Order"), other than works of alteration proposed in connection with a different use of the building, must not be refused—though conditions may be attached—if the following conditions are fulfilled:—

(1) The work must not involve the pulling down of the building to the extent of more than half of the superficial area of the main containing walls of the building, account being taken of any previous works of alteration subsequent to the date on which the resolution took effect.

(2) The works must not materially affect the design or external appearance of the building.

C. Permission to *extend* an "existing building" (as defined in the 1933 Order) *and to use* the extended building for a purpose the same as, or similar to, the purpose for which the building was used before the date on which the resolution took effect, or, if there was more than one purpose, for the same or similar purposes in the same relative proportions, or in the case of a newly-erected building, which has not been used before the date on which the resolution took effect, to use the building as extended for any purpose for which it was designed, must not be refused—though conditions may be attached—if the following conditions are fulfilled :—

(1) Neither the total nor the ground-floor space of the extended building must exceed by more than one-eighth the total or ground-floor space of the existing building.

(2) The extension must not seriously injure the amenity of the neighbourhood by reason of its design or external appearance.

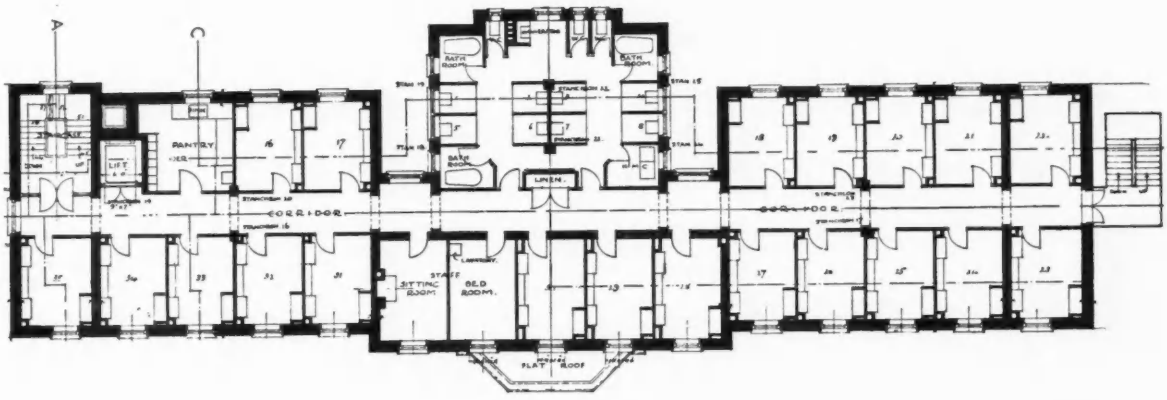
(3) The extension must conform with provisions as to building lines in the proposed scheme.

(4) No part of the extension must occupy land proposed to be reserved by the scheme for a purpose the carrying out of which would necessitate the removal or alteration of the extension.

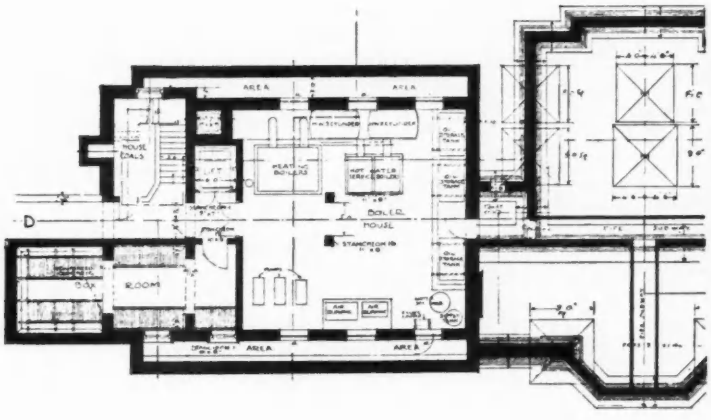
(5) The proposed use of the extension or of any part thereof must not be of a noxious or otherwise offensive character.

(6) In the case of the extension of a wall, fence or paling at or near the corner or bend of a road, the extension must not be contrary to the interests of safety.

D. Permission to develop land for the purpose of a *sports or recreation ground* (not for profit and if public, free of charge) or to *erect within the curtilage of a dwelling house* buildings ordinarily incidental to the enjoyment of the dwelling house as such, must not be refused—though conditions may be attached—if the following conditions are fulfilled :—



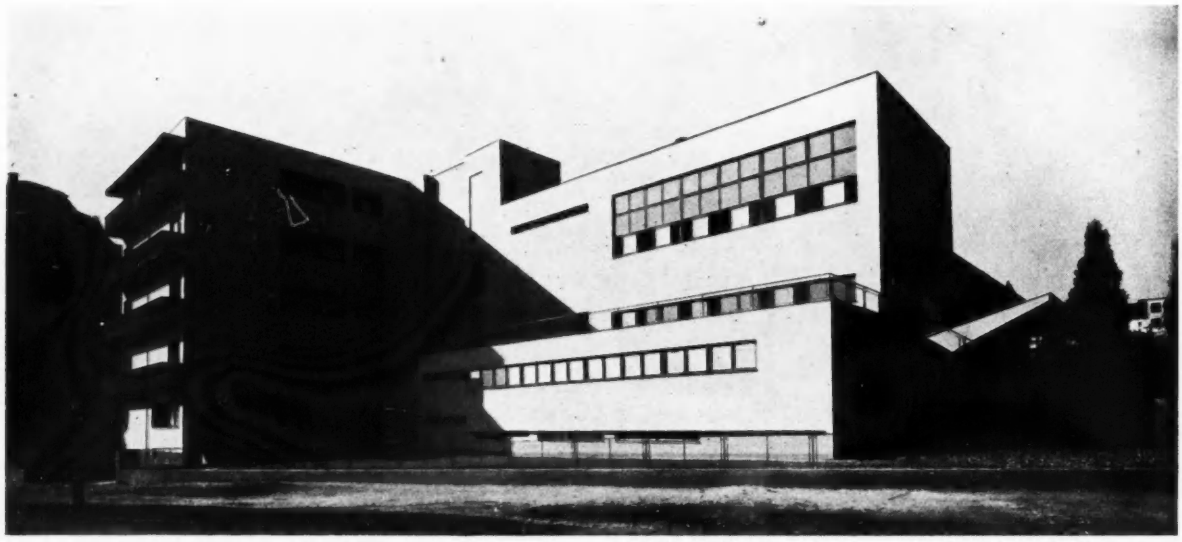
(1) No part of any proposed building must :—
  (*a*) infringe any building lines proposed in the scheme.
  (*b*) Occupy land proposed to be reserved by the scheme for a purpose the carrying out of which would necessitate the removal or alteration of the building.
  (*c*) Seriously injure the amenity of the neighbourhood.

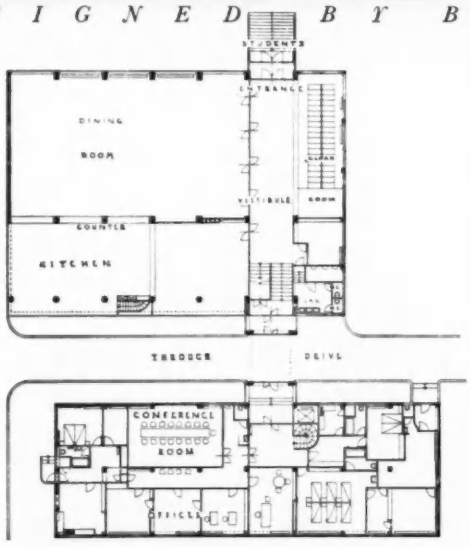


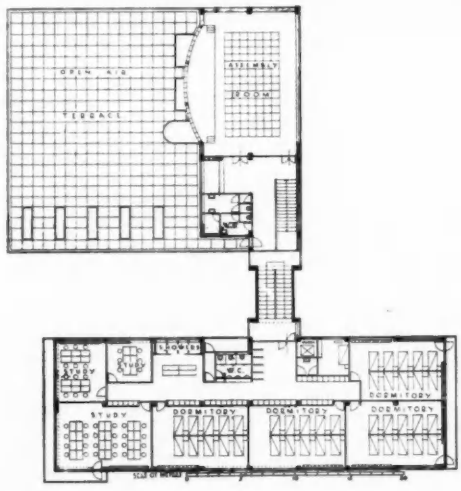
(2) Walls, fences or palings at or near the corner or bend of a road must not be contrary to the interests of safety.

In all other cases, the interim development authority will have an absolute discretion as to granting or refusing permission, and as to the imposition of conditions.

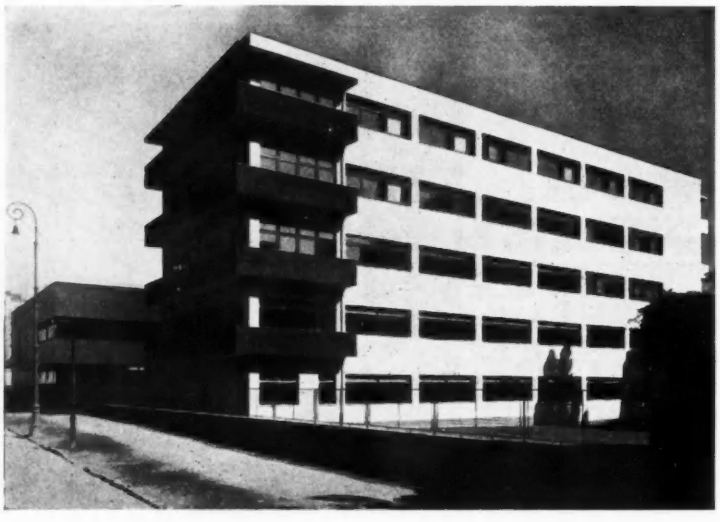
TRAINING COLLEGE, TOTTENHAM







DESIGNED BY YOUNG AND HALL



STUDENTS' HOSTEL AT BRÜNN

DESIGNED BY BOHUSLAV FUCHS

The group comprises a hostel and club, with full amenities for work and leisure. It is planned on a corner site. The structure is in reinforced concrete. A series of regularly-spaced reinforced concrete piers carry thin filling walls of mass concrete and partitions of plastered hollow tile. There are two main sections, separated on the ground floor, but linked above. One block comprises administrative and living quarters and is divided into small space units. Access to it, on the ground floor, is from the drive, but students enter direct from the street, passing between cloakroom and dining hall and up the connecting stairway.

The second block has one main floor. The dining hall, for about 200 persons, is separated from the kitchen by a long counter from which students collect their own food. Roll shutters completely close the opening. The flat roof is paved with square concrete slabs and used as an open-air exercise terrace. The adjacent assembly room, with small stage, seats 100.

R.I.B.A. EXHIBITION

THE ARCHITECT AT LEISURE

[*By J. D. M. HARVEY*]

WITH relief the architect lays down his T-square, consigns specifications to the waste-paper basket and clients to more interesting places, but his hold on the pencil is prehensile. It is only given up to be replaced by the brush, the etching-needle. The urge to express, to record, to paint the lily and add to the beauties of clean paper is insistent. There are gathered together at the R.I.B.A. galleries some two hundred odd pictures—paintings, drawings, etchings—the work of members. The architect may betray in his more leisure and perhaps unguarded moments, traits hidden in his work which, in the very nature of things, must generally assume a more constrained and conventional attitude. Let us look around.

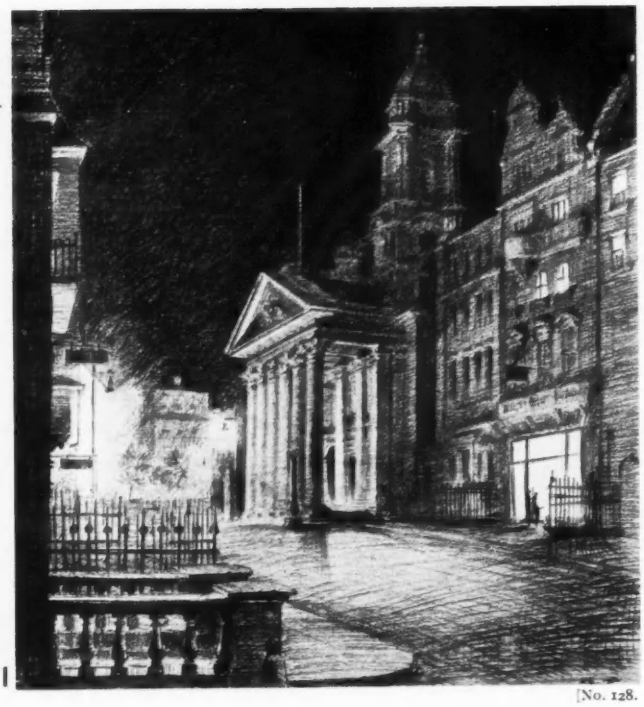
We may search for some well-known signatures in vain, but the collection is very representative and attains a high level of excellence. The mannered technique is refreshingly rare. Water colours and drawings predominate enormously. Pencils and water colour are familiar, easy to hand and to carry, but this also shows that the nineteenth-century tradition which sent the architect on to the Continent to study, to measure, but, above all, to sketch, dies hard. There are but a meagre four or five lino-cuts. In a Continental show of like scope and circumstance the proportions would have been different. The decorative instincts of English architects seem, as yet, to lie dormant.

It is immediately apparent that, for the architect, interest lies in the object as an object; in the thing built up, completed, created. This is shown not so much by choice of subject, which may be due to circumstance, association, or even lighter reasons, as by treatment. The painter's interest is not bounded by what has gone into the making of a thing, but extends to what he himself can get out of it. The two attitudes are distinct and the dividing line in this exhibition is interesting and easy to trace.

Sir Reginald Blomfield, Professor Adshead, H. T. Brock Griggs, Mr. Maxwell Ayrton, to mention only a few, attain this painters' freedom. So does Mr. Vinycomb in his "Chessington Brickworks" (No. 98), where the reds and oranges, subtly disposed, glow with true native warmth. There are several old favourites here, notably H. T. Brock Griggs's etching of the Empire Hall at Olympia (No. 12), proudly bearing on its frame records of past appreciation. With but the slightest reference to architectural detail, this etching exactly conveys that quality of sturdy mass allied to workmanlike efficiency which is inherent in the building, and the means by which this is achieved repay study. Mr. Farey sends four water colours, of which the best is certainly "Lisseweghe" (No. 19) and that of "Banff Village" the least satisfactory. The clear light of the foothills seems to have unaccountably eluded Mr. Farey's accomplished technique. Three paintings by S. D. Adshead, small but lovely, are proof that here is one of the finest living water-colourists in the English—and best—tradition. His "Harbour, Polperro" (No. 107) is a lesson in the value of blacks as an aid to the painting of light. Mr. Musman's art suffers nothing by proximity or comparison, and his "Hampstead Heath" (No. 23) and "Farmhouse, Devon" (No. 24) are models of what water colours should be. By a somewhat different approach H. Lewis Curtis interests with three very charming water colours. In "View of St. Peter's and the Vatican" (No. 72) A. N. Prentice superimposes with disarming ease a pattern of blue shadows on Rome, the Golden. Mr. Maxwell Ayrton's "L'Aigle d'Or, Nice," and "Richmond" (Nos. 117 and 116), effortless and unaffected, combine pencil and light colour washes to perfection, but might have shown to better advantage in silver frames. Nearby, "Syracuse," by E. C. Bewlay (No. 121), shows us that the picturesque jumbles of Southern Italy present a clean gay face to the clean gay sea.

Let us turn for a moment to the pencil and crayon drawings. These range from the robust gaiety of Mr. Beswick's "Venetian Scene" (No. 129), in which a drop of the gaiety within, detached by the arrival of a gondola, illumines a stately façade with its flickering torch, to the intimate and unaffected charm of Mr. Arthur Keen's drawings. But the palm must surely go to Sir Reginald Blomfield's drawings (Nos. 6, 7 and 8). Three in number, they are probably the best pictures in the galleries. They show a complete mastery of technique and a sensitive appreciation of the limitations as well as of the capabilities of the medium. As you leave, you visit them for a last look. Mr. P. D. Hepworth, in three crayon drawings (Nos. 152, 153 and 154), exploits cleverly the cloudy but hectic romanticism of the—not quite so—Sunny Spanish Shore. For the sake of contrasts compare Mr. H. M. Fletcher's "New Bridge at Ronda" (No. 5), in which the scene, cleverly bereft of figures, is left to architecture and sunlight, with Mr. Ayrton's "Sunday Reflections" (No. 114), where it is left to Towzer and the rain. Mr. Walter Brand contributes some pencil drawings on that most exacting of surfaces—a chalk-surfaced paper—delicate, calling to mind the careful notations of a Regency artist's sketch-book. The best is the "Tower of the Palazzo Vecchio, Florence" (No. 51), in which the framing arch is declared only where needful and where the only overstatement is concerned with the projecting cornice on the left. In "Harbour Office and Customs House, Poole" (No. 90), by Gordon Sutcliffe, mannerism fights a losing battle with sympathy in the pencil work, and the handling of the black washes is accomplished deftly. This form of technique is a salutary discipline.

To mention all the good things is to catalogue the exhibition, but lest it be overlooked, let us here praise Mr. Keith Murray's "Conventions de Agustinas, Avila" (No. 56), in carbon pencil, with a wash which is not quite monotone: an assured drawing. Of the etchings, Mr. J. M. Clarke's "Whitby" (No. 36) is good. So also is Mr. Lawrence Wright's "Thames House" (No. 149). This artist's view under a steel bridge upholds with Mr. Cyril Power's three excellent prints the honour of the lino-cut and Mr. Richard's three oils are refreshingly unarchitectural.



Many of the works exhibited are for sale, and 25 per cent. of the proceeds will be given to the Architects' Unemployment Fund. Here surely is an opportunity to kill not one but a whole flock of birds with one stone.

LITERATURE

ACOUSTICS

Introduction to the Acoustics of Buildings. By E. G. Richardson, B.A., PH.D., D.SC., with a foreword by Professor A. E. Richardson, F.R.I.B.A. London: Edward Arnold and Co. Price 3s. 6d. net.

THIS little book, published in a handy pocket size, and on sale at the small sum of three and sixpence, should prove of great value to the practising architect and the student. The author, a lecturer in acoustics to students of architecture at University College, University of London, and Armstrong College, University of Durham, touches upon almost every aspect of the subject touching architecture.

Professor A. E. Richardson, in his foreword, rightly states that "the data provided in this work should enable the architect to design auditoria that will be efficient places in which to hear both the human voice and music. The merit of this book inheres in its brevity no less than in explicit statement. I can say that a work of this type has long been needed, and that in so far as the University of London Bartlett School of Architecture is concerned, this book admirably fills a gap."

The book is divided into five sections, namely, 1: Reverberation; 2: Distribution of Sound; 3: Absorbent Materials; 4: Insulation of Sound; 5: Hints on Acoustic Design.

Discussing the distribution of sound, the author says:

There are certain places in a concert hall where a curved reflecting surface is advantageous. The surface of revolution whose section is a parabola has the property that if the source is placed at one particular point, the focus, all the rays after reflection are parallel (Figure 1). Consequently, if such a shape be placed behind the speaker or soloist at the focus, a plane beam of sound will be sent down the hall, and good distribution as well as reinforcement of the direct sound will be secured. This is the function of a sound-board over a pulpit, but it must be large to be effective. Such a device

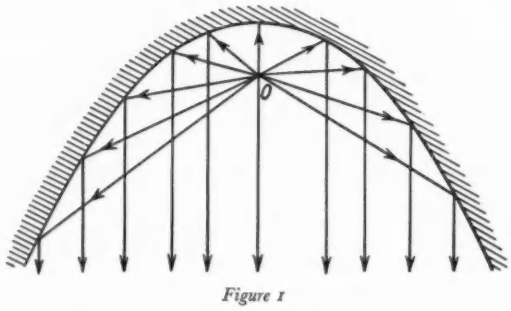

Figure 1

cannot be used with an orchestra, but a shell-shaped cavity or even a plane wall close behind the orchestra will ensure reinforcement of the direct sound. The surface of such reinforcing walls must be *hard* and non-absorbent, marble, say, or plaster on stone. This principle has been carried even farther in a bold experiment by M. Lyon at the Pleyel Hall in Paris, where the whole ceiling has been given a parabolic section, in the hope that the rays will pass along the arena and to the balconies in a parallel beam (cf. dotted lines on Figure 2). Another

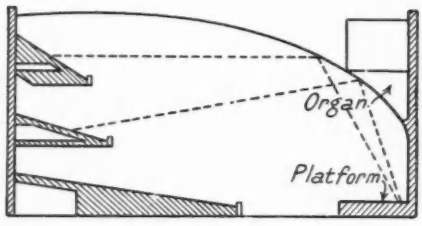

Figure 2

place where a hard surface is advantageous is on the sloping ceiling above a gallery, where the sound reflected from the ceiling following hard on the heels of the direct sound improves hearing for the auditors at the back of the gallery (Figure 3).

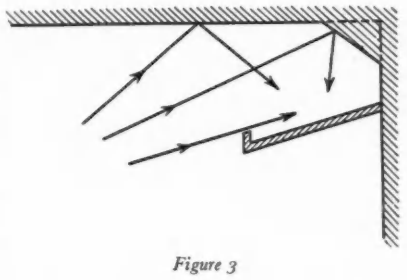

Figure 3

The following extracts are taken from the chapter on "Hints on Acoustic Design."

THEATRE.—As this is essentially a type of auditorium which is planned vertically rather than horizontally, it will usually have a high ceiling, which must be broken up in some way, either by a canopy, a large chandelier or a turret. As the surfaces in a theatre are usually good absorbers, there is no danger of excessive reverberation in the auditorium; rather is it liable to be too dead for music. It is best to keep the stage as reverberant as possible. This can be done only if large quantities of canvas are not allowed to remain on the flies.

CINEMA.—The general acoustic design will be similar to that of the theatre. Loud-speakers should be grouped so that they direct their sound into absorbent material, i.e., blocks of seats and sections of the audience. The seating accommodation should be such as can be covered by an angle of 90 deg. horizontally, and 30 deg. vertically. This will lead to a comparatively low ceiling. The organ should be above the screen, rather than divided into two halves on either side of it. If a small stage is provided behind the screen, it should be made reverberant.

GEORGIAN BATH

Sketches of Georgian Bath. By J. Raymond Little. With a preface by T. Sturge Cotterell. Bristol: J. W. Arrowsmith, Ltd. Price 10s. net.

THE author, in his short introduction, explains that this book is not an illustrated guide; nor does it pretend to be an exhaustive catalogue of the interesting buildings of Bath or an outline history of Bath architecture. He disclaims any design of insinuating into the reader's unsuspecting hands a commercial puff of the attractions of the Spa. All these things, he states, have been done already. Why then has he made and published these drawings?

First, I have made them for the fun of drawing things that one is interested in and admires. Secondly, it is my way of saying: "Look, how beautiful, how interesting this is; admire it with me!" Thirdly, because I am sure it is a fact, odd though it may seem, that people often look at things without seeing them. Lastly, because Father Time, who can invest ancient buildings with such a charm, has a nasty way of snatching them from us if we do not enough value them. Several of the scenes I have drawn are even now threatened with destruction. Some such changes are inevitable; but they are none the less deplored by such as happen to be drawn to Bath by æsthetic rather than by medical reasons.

The twenty-eight pencil sketches are extremely well executed and have been supplemented with brief particulars of the subjects depicted, such as Beaufort Square, Trim Bridge, Bath Street, the Circus, the Royal Crescent, etc.

LAW REPORTS

TOWN PLANNING ACT

Barnes v. *Hett.—King's Bench Division. Before Mr. Justice Swift.*

This was an action by Mrs. R. G. Barnes, of Kingsgate-on-Sea, Kent, against Mr. H. F. Hett, of Pembroke Avenue, Margate, claiming £250 damages for breach of covenant and, in the alternative, a like sum for breach of warranty.

Mr. Van den Berg, K.C., for plaintiff, said his client was a widow, and she claimed to recover damages arising out of the sale by the defendant to her of a plot of land in Pembroke Avenue. The parties had been on friendly terms, and in August, 1928, a conveyance was executed between the parties, pursuant to a contract made just before, under which the plaintiff agreed to pay £300 for this plot of land, and the land was conveyed to her. Plaintiff did not know that this plot of land, which was of considerable value if it could be used for building purposes and of little value if it were not available for building land, had been registered under the Town

Planning Act and the Land Charges Act, 1925, and that there was a Town Planning Scheme, the effect of which was that the land, having a shortage in frontage of 2 ft., prevented it being built upon. After the purchase plaintiff was offered £300 for the land, and then it was discovered that there was this restriction and that the land could not be built upon. The land could now only be used for a garden and was not worth more than £50. Plaintiff now sought to recover the difference between the £50 and the £300. The plot of land had only a 30 ft. frontage, whereas the Town Planning Scheme stipulated for a 32 ft. frontage. When plaintiff asked for an additional 2 ft. from the defendant, he refused to sell, saying it would spoil his tennis court and make it useless for the game of tennis. Counsel's contention was that as the land was sold as building land his client was entitled to recover.

Mr. Evershed, K.C., for the defendant, said at the time the land was purchased the plaintiff's husband was alive, and they lived in a house adjoining defendant's. Defendant understood that Mr. Barnes had no intention of building on the land, and that he desired to acquire it solely for the purpose of extending his property and providing a back entrance. His client denied the plaintiff's allegations, and said that plaintiff's husband knew that the land could not be used for building purposes. The Town Planning Scheme had been duly registered, and that must be deemed to be notice to the plaintiff of the scheme. Counsel pointed out that the plaintiff could have added the 2 ft. she wanted to the land from her own property before she sold it.

On the law, counsel submitted that there was no implied warranty of title expressed and no warranty had been established. He pointed out that the plaintiff made no complaint to the defendant till March, 1932, when the Margate Corporation refused to allow a house to be built on the land. He submitted that the plaintiff had neither the law nor the merits on her side.

His lordship, after hearing the evidence and legal arguments, said the strip of land in question was 30 ft. wide and 118 ft. long. Neither party at the time of the conveyance knew that there was then in operation in that neighbourhood a town planning scheme, and that that scheme of 1927 would have the effect of rendering that piece of land, which defendant had sold plaintiff, unavailable for building purposes, being too narrow by 2 ft. Defendant had stood on his legal rights. His lordship could see no evidence at all of any warranty here. Plaintiff had given no evidence to prove warranty or, in fact, to show anything collateral to the deed by which this land was purchased. He was quite satisfied that there was no warranty given in this case. With regard to the question of an implied covenant, he did not think that in the circumstances of this case there was an implied covenant that the plaintiff should be entitled to build. The defendant had no control over the covenant restricting building. The trouble arose when the solicitor who acted for both of them in the sale and purchase of the land failed to search the register and find out that there was a scheme, and how it affected this property. He could not say that there was an implied covenant here as alleged. The action failed, and he dismissed it with costs.

SUBSIDENCE

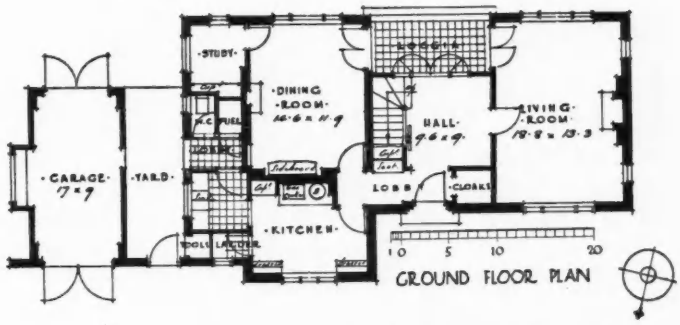
Whittle and Cook v. *Russ and Murphy.—Chancery Division. Before Mr. Justice Farwell.*

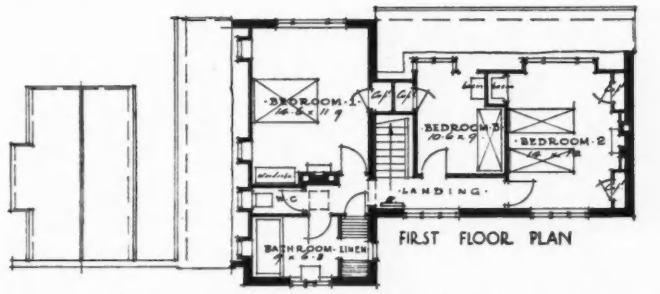
IN this case the freeholder of Nos. 22 and 24 Highfield Road, Northwood, Middlesex, Mr. J. Whittle, and the second plaintiff, Mr. R. G. Cook, his tenant, of No. 24, brought an action against the defendants, Mr. and Mrs. Emil Russ and Mr. E. M. Murphy, for an injunction restraining them from excavating or digging on their property, The Chalet, adjoining plaintiff's property, so as to cause subsidence of plaintiff's land.

It appeared that the plaintiff's houses stood at the top of a bank which sloped down some 22 ft. to the defendants' premises. The defendants' land was formerly on the site of a sand and gravel pit, and plaintiff alleged that in order to level the ground for a lawn the defendants had cut away the toe of the slope. The result was that a portion of the top of the bank, including some of the garden of Mr. Cook, had subsided, and plaintiff alleged that any further subsidences would be a danger to the foundations of his houses, which were not far distant.

For the defence it was contended

HOUSE AT KINGSWOOD





DESIGNED BY BERTRAM LAST

This house at Kingswood, Surrey, was planned to be on the south side of the road on a site of ample frontage. The walls are built of 11-inch cavity and limewhited; and the roof is covered with apple green glazed pantiles. Green shutters are used as a decorative feature and the whole effect is enhanced by a woodland setting.

The chief feature of the plan is a central loggia leading off the hall, which gives an air of spaciousness and light directly the house is entered, and an excellent view of the garden and woods beyond.

The interior is executed in as simple a manner as possible, walls and ceilings being finished with a rough plaster face and distempered to match.

that the bank was an artificial one, and that owing to the heavy rains it became waterlogged and subsided.

Mr. Topham, K.C., and Mr. J. B. Nesbitt appeared for the plaintiffs and Mr. W. Hart for the defendants.

His lordship, after hearing the evidence, said he came to the conclusion that the subsidence was the result of cutting by the defendant, Mr. Murphy, at the bottom of the slope. As far as he could see, there was no evidence that the other defendants, Mr. and Mrs. Russ, took any part in what was done, and he dismissed the action as against them, with costs. In the case of Mr. Murphy, he granted an injunction against him, with an inquiry as to damage, and ordered him to pay the plaintiffs' costs.

BUILDING FACTS AND FIGURES

2. *Building Plans Approved*

[*By L. J. GOLLOP*]
B.Sc. (Econ.) F.S.S.

THE Ministry of Labour collects regularly from 146 towns in Great Britain particulars of the estimated cost of buildings for which plans submitted under the local building regulations were passed. Detailed figures are published every quarter in *The Ministry of Labour Gazette*. These figures are thus not comprehensive, and are not a measure of the absolute quantity of building work for which plans were passed at any particular time, since they do not cover the whole country and, in particular, exclude the London (L.C.C.) area. Nevertheless, covering 146 towns with a population at the 1931 census of 17,570,000 persons, they form a useful indication of the relative movement of proposed building activity.

The figures form no exact basis for an estimate of the amount of building work actually going on at any particular time. In the first place, there is a varying time-lag between the date of passing the plans and the date of the commencement of the work. Even if this time-lag were known or could be estimated, some of the schemes require more preparatory work than others, and there is no way of estimating this factor.

Secondly, the fact that plans are passed is no guarantee that the works will be put in hand. This is particularly the case with regard to the figures of the Local Authorities' own schemes, which are included in the figures. These are subject to the strict scrutiny of the Ministry of Health, and further sanction is also necessary in the case of works to be financed by loan. As experience has shown, much work may be held up at this stage.

These figures, however, are the only indication of building activity we have, except the unemployment figures and the Census of Production. They may, therefore, be used, *faute de mieux*, but their limitations should be kept in mind—in particular the limitation of scope and the fact that the schemes of the Local Authorities themselves are not given separately—a blemish, by the way, which the Ministry of Labour could remove.

In *The Gazette* for April, figures for 1932 are given, as well as figures for the first quarter of 1933, and the former are even more interesting than the latter. The figures for 1932 compared with the two previous years are given in the following table.

Building Plans Approved in 146 Towns of Great Britain (including London).

	1930	1931	1932
	£	£	£
Dwelling houses ..	46,764,000	40,492,000	46,888,000
Factories and workshops	4,581,000	2,734,000	3,072,000
Shops, offices, warehouses and other business premises	5,475,000	5,214,000	4,748,000
Churches, schools and public buildings ..	8,402,000	7,198,000	4,668,000
Other buildings; and additions and alterations to existing buildings ..	9,383,000	7,372,000	6,878,000
Total	74,605,000	63,010,000	66,254,000

The total value of work for which plans were approved thus suffered a considerable decline in 1931 and recovered somewhat in 1932. The figure for 1931 is 84, and 88 for 1932 compared with 100 for 1930. But the most interesting feature of the table is the increase under the heading "dwelling houses," which rather more than recovered the 1930 level after a moderate decline in 1931. It is to be regretted that the housing schemes of Local Authorities are not shown separately, but it is probably safe to say that the increase in this item between 1931 and 1932 was chiefly due to an increase in plans prepared by private enterprise. The stimulus of low interest rates and low costs would appear to be taking effect.

The table also gives an indication of the changes in demand from various sections of the community. In the following table, the previous table is recast, and figures are inserted comparing the items with 1930 as 100.

Plans Approved	1930	1931	1932
Total ..	£74,605,000	63,010,000	66,254,000
1930=100 ..	100	84	88
Total excl. houses	£27,841,000	22,518,000	19,366,000
1930=100 ..	100	81	70
Business premises (*a*)	£10,056,000	7,948,000	7,820,000
1930=100 ..	100	79	78
Public buildings (*b*)	£8,402,000	7,198,000	4,668,000
1930=100 ..	100	86	55
Dwelling houses	£46,764,000	40,492,000	46,888,000
1930=100 ..	100	86	100

(a) Factories and workshops; shops, offices, warehouses and other business premises.
(b) Churches, schools and public buildings.

The relative movement of the items is now apparent. The value of plans approved for dwelling houses contracted sharply in 1931, but recovered their former level in 1932. The value of public buildings contracted sharply in 1931 and even more sharply in 1932, falling almost to half the 1930 level. This clearly shows the effect of the economy campaign. The demand for buildings from the business community suffered a very sharp decline in 1931—the sharpest recorded—but remained stable at its depressed level in 1932.

The table would appear to indicate that housing, under the stimulus of low costs and interest rates, may be expected to go ahead during 1933. With regard to the industrial community it would appear that their demand has been cut to the lowest possible figure, and that there is an increasing amount of "slack" which will be taken up when industrial and commercial prospects improve. We may, therefore, expect a continuance of the present low figures in this category with no further substantial reductions, and a considerable spurt when conditions for industry generally become more favourable, and perhaps some extension before then on necessary work postponed. With regard to public buildings, it is impossible to forecast. If, however, a "normal" building programme is envisaged for the year, it would appear that, in addition to the "normal" 1933 programme, half the 1932 programme remains to be completed. The future of this item depends very largely on the view taken in Whitehall with regard to the "economies" in building work, which have proved so uneconomical.

The figures for the first quarter of 1933 are relatively less interesting owing to their limitations. It is the policy of the Ministry of Labour to publish the quarterly figures as soon as possible, without waiting for returns from all the 146 authorities. The returns received, usually numbering between 140 and 146, are compared with the returns from the same authorities for the same quarter of the year before. These figures are thus even more incomplete than the annual figures, and can only be compared with the same quarter of the year before.

The following table shows particulars for 141 towns from which returns had been received.

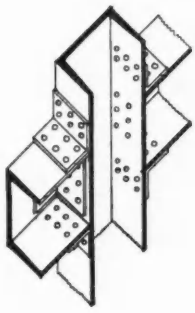
Building Plans Approved in 141 Towns of Great Britain (excluding London).

	First Quarter of 1932	First Quarter of 1933
	£	£
Dwelling houses	9,585,400	13,346,200
Factories and workshops ..	543,000	917,300
Shops, offices, warehouses and other business premises	1,019,900	1,022,800
Churches, schools and public buildings ..	1,236,500	2,232,100
Other buildings; and additions and alterations to existing buildings ..	1,656,000	1,499,400
Total	14,040,800	19,017,800

It will be seen that the chief feature of 1932—the increase under the heading "dwelling houses"—continued into 1933. It would appear, however, that the movement of the figures in the category "churches, schools and public buildings" between 1931 and 1932 is now being reversed in 1933. Local Authorities, after the intensive economy campaign and its disastrous results, are clearly "thinking twice" about economy and are submitting plans. Whether this will result in an increase in activity on public buildings and schools remains to be seen. It is possible, of course, for the Ministry of Health to continue the economy campaign after it has ceased to be acceptable to the Local Authorities. There was also an increase in plans passed for the business community, probably indicating that some of the "slack" mentioned above is being taken up.

The total result of these movements is an increase in the estimated cost of buildings, of which plans were approved in the 141 towns, of £4,927,000 or 35 per cent. over the first quarter of 1932. Whether this will result in a corresponding increase in building activity remains to be seen. It would, however, seem probable that the unemployment figures for the building (not public works) industry will this year show at least their normal seasonal decline.

Architects and Posters



Mr. George Mansell, addressing the Publicity Club of Glasgow last month, said:

Architects ought to have the legal right of action against anyone disfiguring their handiwork by sign or poster erection, and a perpetual injunction granted them against such disfigurement in the future.

Scottish Architects

At the last meeting of the Council of the Royal Incorporation of Architects in Scotland, Mr. John Begg, F.R.I.B.A., president, in the chair, it was decided to institute a Lorimer Memorial Prize of £10 per annum in books for sketch-book work. The following were elected members:

As Associates: Messrs. D. D. S. Stokes, Basil Spence and A. F. Wallace. As Students: Messrs. H. E. Scott, J. R. Beaton, James Brown, I. F. Cameron, W. J. C. Irvine, J. R. Findlay, F. R. Stevenson, John Ogilvie, Alex. Graham, jun., W. P. Johnstone and George Annand.

The photograph shows an Eclipse pressed metal stair and landing with sheet steel balustrading, assembled at works prior to dismantling for despatch to the job.

TRADE NOTES

BY F. R. S. YORKE, A.R.I.B.A.

Pressed Steel Stairs

PRESSED steel stairs are becoming more widely used in this country, but I believe their advantages are not as fully appreciated here as they are abroad.

•

Tread and riser are usually pressed as a single unit, and it is quite likely that in the near future complete flights in standard heights and widths will be made in a single pressing. Such stairs are cheap, strong and rigid.

•

A steel stair, constructed in light pressed metal that can be erected with the structural frame and does not rely for support upon the walls, has been made for several years by Frederick Braby. Where such a stair is incorporated in a building scheme temporary ladders and gangways are eliminated, the finished filling of treads and landings, which may be cement, terrazzo, marble or wood, being laid only when the building is nearing completion.

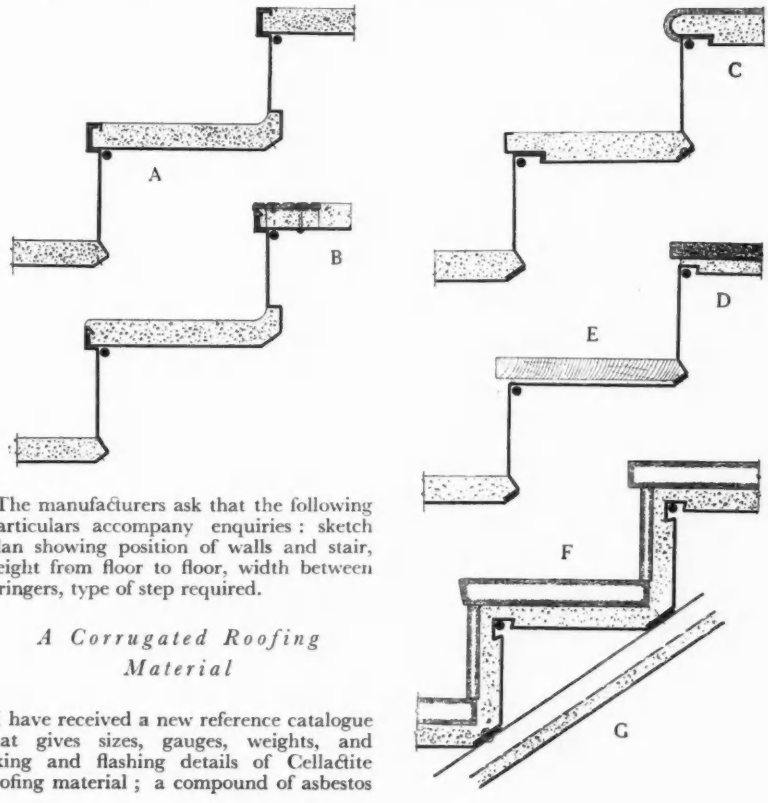
•

Because the stair is independent of the walls non-supporting partitions may be more freely employed.

•

The stair can be made to any width between stringers and with any size of tread and riser. The landings are formed from dovetail steel sheets, which provide a rigid platform and a good key for any composition filling.

•



Each flight is assembled at the works, dismantled, and the members marked to facilitate easy erection on the site. The underside of the stair is fitted with steel clips to take expanded metal or dovetailed sheet for plastering.

•

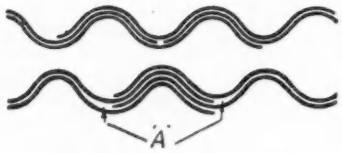
Balustrades in sheet steel, or of dovetail sheeting designed to take a cement backing for tiles, marble, terrazzo and so on, are supplied as an integral part of the stair.

The diagrams illustrate the manufacturers' standard sectional details for the treads of pressed steel stairs.

(*A*) *Right-angled and coved corners.*
(*B*) *Safety nosing*
(*C*) *Rubber covering.*
(*D*) *Stone tread.*
(*E*) *Wood tread on felt.*
(*F*) *Marble and terrazzo tread.*
(*G*) *Dovetail metal sheeting fixed to the underside of the stair and plastered.*

The manufacturers ask that the following particulars accompany enquiries: sketch plan showing position of walls and stair, height from floor to floor, width between stringers, type of step required.

A Corrugated Roofing Material



I have received a new reference catalogue that gives sizes, gauges, weights, and fixing and flashing details of Cellactite roofing material; a compound of asbestos

and asphalt, consolidated and sealed by pressure over a steel core, and die-pressed in the form of standard corrugated sheets.

•

In the process of manufacture the steel core is cleaned and dried and immersed in a bath of chemically inert molten bitumen which is acid- and weather-resistant, and, having a very high melting point, is unaffected by sun heat.

A covering of asbestos asphalt felt is then applied under a pressure of 3,000 tons, and is held firmly to the sheet by the adhesive bitumen.

The upper illustration shows the close and solid nesting afforded by Cellactite corrugated roofing, with no opening to the weather; the lower, unsatisfactory openings at A left by other methods, without mitreing.

Initial water-tightness in a corrugated roof depends chiefly on the weathering of the laps. With materials of any appreciable thickness the junction at the end and side laps presents difficulties which appear to have been overcome by the Cellactite method (see diagram).

•

The material is made with 28, 24, 22 and 20 gauge cores; the four types being made to suit varying purlin spacings. For normal slopes the following spacing is recommended as a maximum :

28 gauge, 5 ft. 6 ins. centre to centre.
24 ,, 6 ft. 6 ins. ,, ,,
22 ,, 7 ft. 0 ins. ,, ,,
20 ,, 7 ft. 6 ins. ,, ,,

Sheets are 2 ft. 3 ins. wide overall, having nine 3 ins. corrugations and covering 2 ft. if laid with a single corrugation side lap, or 1 ft. 9 ins. if laid with a side lap of two corrugations.

Lengths are ordinarily available from 1 ft., increasing by increments of 6 ins. up to 10 ft. Sheets between 10 ft. and 12 ft. long are made to special order in all but 28 gauge core. The average thickness of Cellactite is $\frac{5}{32}$ in. and the depth of the corrugations $\frac{3}{4}$ in.

•

The natural black sheeting, 28 gauge, laid with a 6-ins. end and side lap, and including necessary fastenings for normal work, weighs 270 lb. per 100 square ft. The 20 gauge sheeting, laid in a similar manner, weighs 375 lb. per 100 square ft.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Tenements

SIR Francis Fremantle asked the Minister of Health whether, and to what extent, tenements of equally good design were dearer than cottages per square foot of floor area; what was the reason for the difference; and whether he would issue model plans and specifications to local authorities of urban areas.

Sir Hilton Young said that working-class tenements of from three to five stories cost ordinarily from 12s. to 15s. per square foot of floor area. The comparable figures for cottages of one or two stories were from 7s. 6d. to 9s. The difference was due largely to the greater cost of foundations and heavier construction of buildings of more than two stories, and also to the comparatively small demand for tenements, resulting in less specialization in this class of work. Many model plans of cottages and tenement buildings and a model specification for cottages had been issued, and further plans were at present under consideration.

Working-class Houses

Commander Cochrane asked the Secretary of State for Scotland whether he was in a position to announce the terms of reference and composition of the departmental committee which he proposed to set up regarding the reconditioning of working-class houses and other matters.

Sir Godfrey Collins said that the terms of reference to the Committee which had now been appointed were as follows :—

"To consider and report :

(*a*) What, if any, further steps are necessary or desirable to secure the maintenance of a proper standard of fitness for human habitation in working-class houses which are neither situate in an area suitable for clearance under Part I of the Housing (Scotland) Act, 1930, nor suitable for demolition under Section 16 of that Act ; and

(*b*) What, if any, further steps are necessary or desirable to promote the supply of houses for the working-classes, without public charge, through the agency of public utility societies or other bodies subject to similar limitations, operating in particular areas or otherwise."

Sir Thomas Whitson, ex-Lord Provost of the City of Edinburgh, had consented to act as chairman of the committee and the other members would be : Mr. J. G. Burnett, M.P., Mr. L. Foot, M.P., Col. Kerr, M.P., Mr. Maclay, M.P., Mr. J. S. C. Reid, M.P., Councillor A. S. McKinlay, Mrs. Shaw, M.P., Baillie Mrs. Somerville, and Mr. Train, M.P.

THE BUILDINGS ILLUSTRATED

Following are names of the specialists, general contractors, and some of the sub-contractors and suppliers for the buildings illustrated in this issue :

St. Nicholas Church, Burnage, Manchester (pages 617–622). General contractors, G. Macfarlane and Sons, Ltd. Sub-contractors : Ragusa Asphalte Paving Co., Ltd., asphalt ; Stuart's Granolithic Co., Ltd., granolithic ; Williamson Cliff, Ltd., bricks ; Roberts Adlard, Ltd., slating ; Eric Munday, Ltd., iron screens and electric light fittings ; Hollis Bros. & Co, Ltd., wood block flooring ; Williams, Gamon & Co. (Kaleyards), Ltd., metal casements ; Pilkington Bros., Ltd., glass ; F. A. Norris & Co., Ltd., iron staircases ; Callow Rock Lime Co., Ltd., Calime for all plastering work ; A. and S. Wallace, Ltd., plastering ; London Pipeless Heating, Ltd., heating ; Pharaohs (Wallboards) Ltd., ceiling ; Gillett and Johnston, Ltd., bells ; Henry Willis and Sons and Lewis & Co., Ltd., organ ; Cecil Cooper & Co. (London), Ltd., electrical installation ; John Faulkner and Sons, Ltd., lightning conductor.

St. Katherine's Training College, Tottenham, N. (pages 626-627). General contractors, Y. J. Lovell and Son. Consulting engineer : Dr. Oscar Faber, O.B.E. Quantity surveyor : H. H. Connybeare. Sub-contractors : Jas. Slater and Co., (Engineers) Ltd , heating, hot water and boiler plant ; Dent and Hellyer Ld., plumbing, drainage and sanitary fittings ; Girdlestone & Co., electric light and fittings ; J. P. White and Son, doors ; Matthew Pollock, Ltd., furniture ; Carter & Co., internal tiling ; Acme Flooring and Paving Co. (1904), Ltd., oak flooring in common room and other wood block floors ; Ames and Finnis, roof tiles ; General Asphalte Co., Ltd., asphalt ; George Wright, (London) Ltd., external staircase and rainwater heads ; Stuart's Granolithic Co., Ltd., staircase ; Aldous and Campbell, Ltd., passenger lift ; Nettlefold and Sons, Ltd., door furniture ; Aspinall Enamel, Ltd., paint.

House at Kingswood, Surrey (page 633). General contractors : Head Bros. Sub-contractors : Louis Dernier and Hamlyn, Neolux fittings.

Trade Items

Messrs. Bryce, White and Co., Ltd., are again exhibiting at Brighton's third Modern House and Building Exhibition, which is now open at the Dome and Corn Exchange, Brighton, until May 13. The firm are showing their well-known Brycite products, which include doors and gates of all kinds, an enormous range of mouldings, dressers, kitchen cabinets, joinery and turnery. The central feature of the exhibition is the Model House, which is fitted with a Brycite dresser. The doors on the ground floor and the whole of the mouldings used throughout this house are also supplied by Bryce White.

•

The stand of Messrs. London Brick Co., and Forders, Ltd., at the Brighton Exhibition shows examples of the company's products, which are now being used to the extent of 1,200,000,000 every year. The well known Phorpres (four times pressed) common brick, which is now the standard building brick, does not lend itself, of course, to elaborate display upon an exhibition stand ; nevertheless, samples of the very many standard special shapes that are always stocked are exhibited. There are also shown Phorpres rustic bricks, and Phorpres white facing bricks. An interesting example of the results of the application of scientific research to an age-old industry is seen in the small sections of wall built with the patent Phorpres cellular brick. These sections are cut away in order to show the honeycomb form of construction given to a wall by the use of these bricks, which were produced, first, to remedy a defect of most building materials—excessive weight in relation to their strength—and, secondly, to provide improved insulation against heat and cold, sound and moisture. Some photographs are also displayed which give some conception of the machinery and resources required to produce over four million bricks per working day.

Obituary

We regret to record the death of Mr. William Stewart Morton, managing director of Scott Morton and Tynecastle Co., Ltd., Edinburgh, in his 65th year. He was the eldest son of the late William Scott Morton, founder of the business, and became managing director on the death of his father in 1903. Mr. Morton, who was a J.P. for Edinburgh, was also on the boards of The College of Art, Edinburgh Savings Bank, Chamber of Commerce, Fettes College and St. George's School for Girls.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

The BERMONDSEY B.C. is to erect 36 flats on the Amos estate at a cost of £17,573, and 49 flats on the Bethel Place estate, at a cost of £26,110.

Plans passed by the ENFIELD U.D.C.: Two houses, Bazile Road, for Mr. S. E. Hooton; four houses, Churchbury Lane, for Messrs. Bowyer and Bowyer; nine houses, Halifax Road, for Mr. Albert Tracey; two houses, The Chine, for Mr. W. E. Silk.

Plans passed by the FINCHLEY U.D.C.: Four houses, Bancroft Avenue, for Messrs. Smerdon Bros.; two houses, Ingram Avenue, for Messrs. R. Hart and Sons; alterations and additions, 4 Broadway, for Messrs. J. Salmon and Sons, Ltd.; eight houses, Widecombe Way, for Mr. A. Reast. Plans submitted: 12 flats, Chandos Road, for Mr. E. Sage.

Plans passed by the SOUTHGATE U.D.C.: Workshop, Highfield Road, for Mr. W. G. Kearsey; eight shops, flats and hall, rear Winchmore Hill Road, for Mr. C. W. Dennis; six houses, Waterfall Road, for Mr. F. Bate; workroom, rear 12 The Parade, Green Lanes, for Mr. J. A. C. Foster; 26 houses, Tewkesbury Terrace, Lower Maidstone Road, for Mr. A. L. Farman; shop, Tottenhall Road, for Mr. W. F. Harris; 12 houses, Firs Lane, for Messrs. George Reed and Sons, Ltd.; new road, Chase Way, for Messrs. Swannell and Sly; four houses, Myddleton Gardens, for New River Co., Ltd.; alterations, building, Russell Road, for Mr. C. S. Brown.

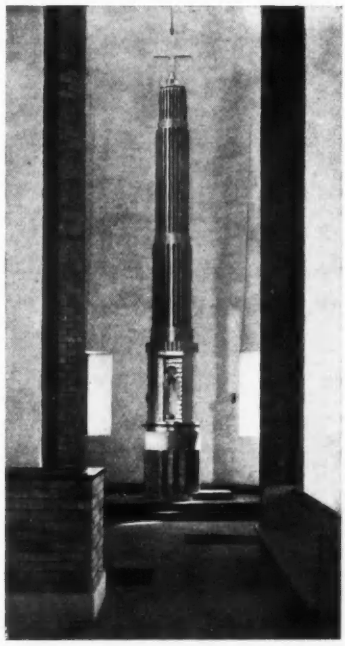
SOUTHERN COUNTIES

The Ministry of Health is to hold an enquiry into the scheme of the BEXHILL Corporation for new sewerage works, at a cost of £27,300.

Plans passed by the BEXHILL Corporation: House and shop, Buckhurst Drive, additions, Golf Club House, Brookfield Road, additions, Cooden Beach Hotel, and eight houses, West Down Road, for Mr. E. Bunce; six bungalows, Turkey Road, and four bungalows, Peartree Lane, for Mr. J. E. Maynard; five houses, Lessingham Gardens, for Messrs. Tubbs and Messer; house and shop, Turkey Road, and six houses off Cranston Avenue, for Messrs. Jeffery and Bowcock; two houses, Cranston Avenue, for Mr. R. W. Moore; seven shops, Marina, for Mr. O. H. Collins; four houses, St. Andrews Road, for Mr. J. H. Lye; 28 houses, St. George's Road, for Messrs. Thorpe & Co.; flats, Brookfield Road, for Messrs. W. R. Hindmarsh & Co.

The Aquarium Committee of the BRIGHTON Corporation has considered a report with regard to the construction of a Concert Hall and an indoor bowling green on the front, and reports in favour of the scheme, at an estimated cost of £9,000.

Plans passed by the BRIGHTON Corporation: Shopfront, 154-5 Edward Street, for Messrs. G. Virgo and Sons; alterations, 34-5 Western Road, and 42-3 Clarence Square, for Messrs. Halford, Ltd.; nursery school, Sussex Street, for Brighton and Hove Nursery Schools' Association; conversion into flats, 154 and 108 Coombe Road, for Mr. A. T. Arnett; alterations, 17 York Place, for Mr. H. Ogden; hospital, Eastern Road, for the Governors of the Sussex Eye Hospital; six bungalows, Warren Rise, for Mr. R. C. Spendlove; street, Sandyhils Avenue, Patcham, for Messrs. G. Ferguson and Son; four houses, Graham Avenue, Patcham, for Mr. E. H. Rowe; three houses, Sea View Road, Rottingdean, for Mr. J. Bassett; 42 houses, Graham Avenue, Patcham, for Mr. T. G. Thompson; two houses, Crescent Drive, Rottingdean, for Mr. F. A. Coats; house, four semi-bungalows, two bungalows, Braeside Avenue and Barrhill Avenue, Patcham, for Messrs. G. Ferguson and Son; eight houses, Valley Close, Patcham, for Mr. T. R. Braybon; streets, Carden Avenue, Patcham, for Messrs. Braybons, Ltd.; alterations, 3-4 Regency Mews, for Mr. H. A. Kimberley; alterations, rear 31 Loder Road, for Mr. T. A. Poole; conversion to store, 11-12 Ivory Buildings, for Mr. J. Ashdown; alterations, 135 Preston Road, for Mr. G. F. Poole; conversion into three flats, 42 Preston Park Avenue, for Mrs. L. Brooker; shop, 3 Rose Hill Terrace, for Mr. J. Cutts; two houses, Hollingdean Terrace, for Mr. J. Morley; shop, 138 Beaconsfield Villas, for Mr. G. H. Simpson; shop-front, 5 Camelford Street, for Mr. W. Morgan; 16 bungalows, Farm Hill, Rottingdean, for Coastal Estates, Ltd.



EASTERN COUNTIES

Plans passed by the YARMOUTH Corporation: Six houses, Anson Road, for Mr. L. Flaxman; four houses, Burgh Road, for Messrs. H. Bedwell and Son; five shops, Lowestoft Road, for Mr. D. C. Thomas.

MIDLAND COUNTIES

Plans passed by the KIDDERMINSTER Corporation: Three houses, Batham Street, for Mr. W. Lindley; eight houses, Franche Road, for Mr. P. Hall; two houses, Park Street, for Mr. E. W. Perks; eight houses, Highfield Road, for Miss A. Spilsbury.

Plans passed by the MANSFIELD Corporation: Two houses, Century Avenue, for Mr. A. Mason;

In St. Nicholas Church, Burnage, Manchester. By Welch, Cachemaille-Day and Lander. The font is built of the same silver-grey Stamford bricks as the rest of the church, and the bowl is of stone. The life-sized figure of the Child Christ, carved in wood by Donald Hastings, is painted in natural colours, and stands inside the cover, which is made up of oak slats, gilded on the outside and painted vermilion on the inside. For the gilding, white metal leaf, lacquered, was used. The cost of the font was about £25, and the cover, including the figure, cost about a hundred pounds.

stores, Rosemary Street, for Mansfield Co-operative Society, Ltd.; three houses, Beckett Avenue, for Mr. J. Jeffery; 13 houses, Bedford Avenue, for Mr. J. P. Smith; operating and X-ray rooms, Mansfield Hospital, West Hill Drive, for Governors; 12 houses, Balmoral Drive, for Messrs. T. Smith and Son; four houses, Kate Moody Lane, for Messrs. H. Blythe and Son; six houses, Nottingham Road, for Messrs. H. Baggaley, Ltd. Plans submitted: 44 houses, Chesterfield Road, for Mr. A. Farnsworth.

Plans passed at SUTTON COLDFIELD: Conversion of Vesey houses, High Street, for Mr. J. Cohen; additions to cottage, Holland Street, for the City of Birmingham Gas Department; shop, King's Road, for Mr. F. H. Wheelock; 10 houses, Kingstanding Road, for Mr. D. James; two houses, Oakwood Road, for Mr. G. Foster; 24 houses, Whitehouse Common Road, for Mrs. E. E. Wright; billiard hall, Highbridge Road, for Mr. E. Pickard.

NORTHERN COUNTIES

Plans passed by the BOLTON Corporation: Two houses, Albert Road, for Messrs. G. H. Pearse and Son; two houses, New Church Road, for Mr. H. Latham; 40 houses, off Crompton Road, for Messrs. Leigh Bros., Ltd.; 28 houses, Lever Hall Road, for Mr. J. Markland; six houses, Almond Street, and four houses, Carisbrooke Drive, for Mr. W. E. Yates; six houses, Southgrove Avenue, for Messrs. Price and Groves; tennis pavilion, Chorley New Road, for Independent Methodist Church trustees; alterations, 400-402 Derby Street, for Bolton Savings Bank; extensions, Sunnyside Mills, for Messrs. Tootal Broadhurst, Lee & Co., Ltd.; 43 houses, Gibbon Street, for Corporation Housing Committee; two houses, Green Lane, for Messrs. R. G. Hirst and Son; two houses, Lakeside Avenue, for Mr. A. Bottomley; two houses, Lakeside Avenue, for Mr. Wm. H. Jones; 20 houses, Salford Road, for Mr. Maurice Welch; three houses, Morris Green Street, for Mr. James Marsden.

The SHEFFIELD Corporation is to erect 45 houses on the Woodthorpe estate, for rehousing persons to be displaced by slum clearances.

The SHEFFIELD Corporation Tramways Committee has approved plans for extensions at the Queen's Road depôt, at an estimated cost of £26,500, and tenders for the work are to be obtained.

Plans passed by the YORK Corporation; Three houses, and house and shop, Albemarle Road, for Mr. J. Hetherton; eight houses, Swinnerton Avenue, for Messrs. W. West, Ltd.; development, Mount Vale and White House Estate, for Messrs. R. J. Pulleyn and Sons; institute extensions, Bootham Crescent, for Burton Lane Club Committee; two shops and houses, Haleys Terrace, for Mr. Oglesby; six houses, Huntington Road, for Messrs. Culliford and Tindall; two houses, Millfield Lane, for Mr. J. N. Dunn; 16 houses, Irwin Avenue, and eight houses, Lilac Avenue, for Mr. H. Williamson; six houses, Burton Stone Lane, for Mr. A. Temple; two houses, Hempland Lane, for Mr. H. C. De Burgh; two houses, Millfield Lane, for Messrs. Eyeington and Dunkley; two houses, Abbey Street, for Mr. D. Thorpe; additions, Esplanade Boat House, for St. Peter's School Governors; six houses, Holgate Lodge Estate, for Mr. F. Shepherd; house and dairy, Main Avenue, for Mr. W. Scoby; additions, The Crescent, for Church of English Martyrs; two houses, Green Dykes Lane, for Mr. H. Fisher; 20 houses, Burnholme Estate, for Mr. J. N. Dunn; new brewery premises and two houses, Huntington New Lane, for York and District Club's Brewery, Ltd.; two houses, Copmanthorpe, for Mr. L. Birch; estate development, Tang Hall Lane, for Messrs. Cowling and Swift.

D

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

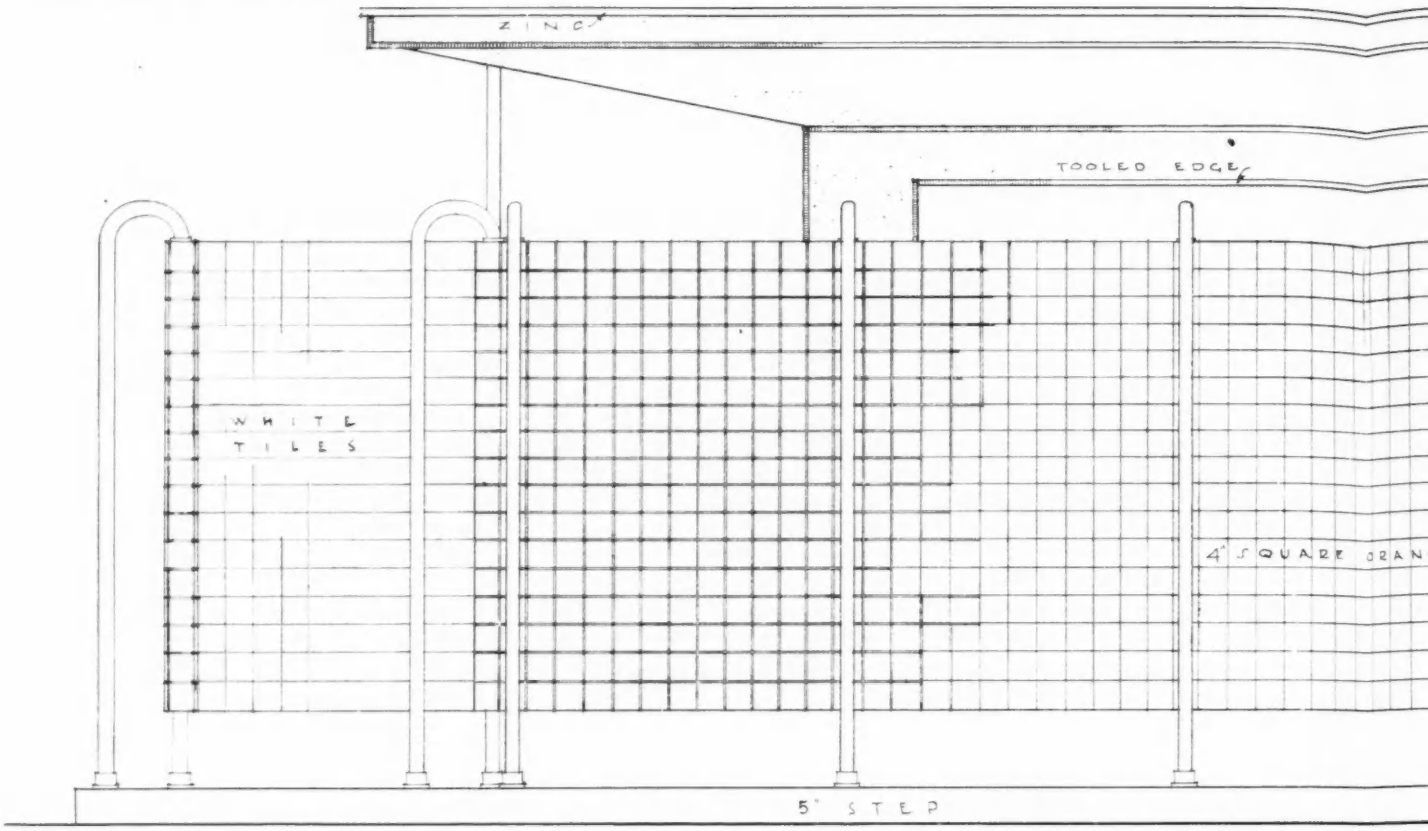
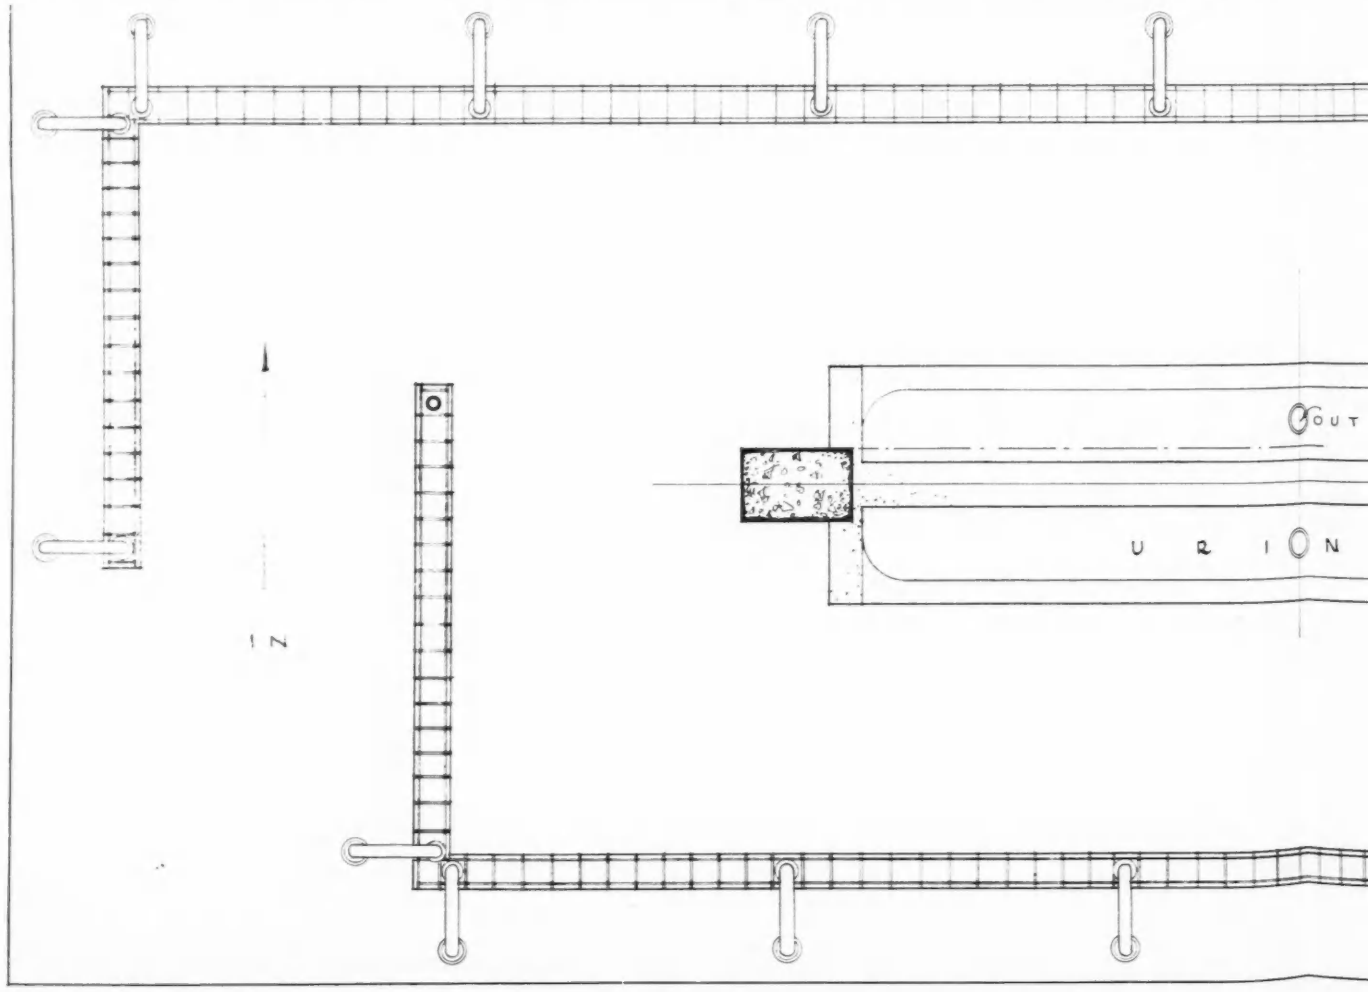
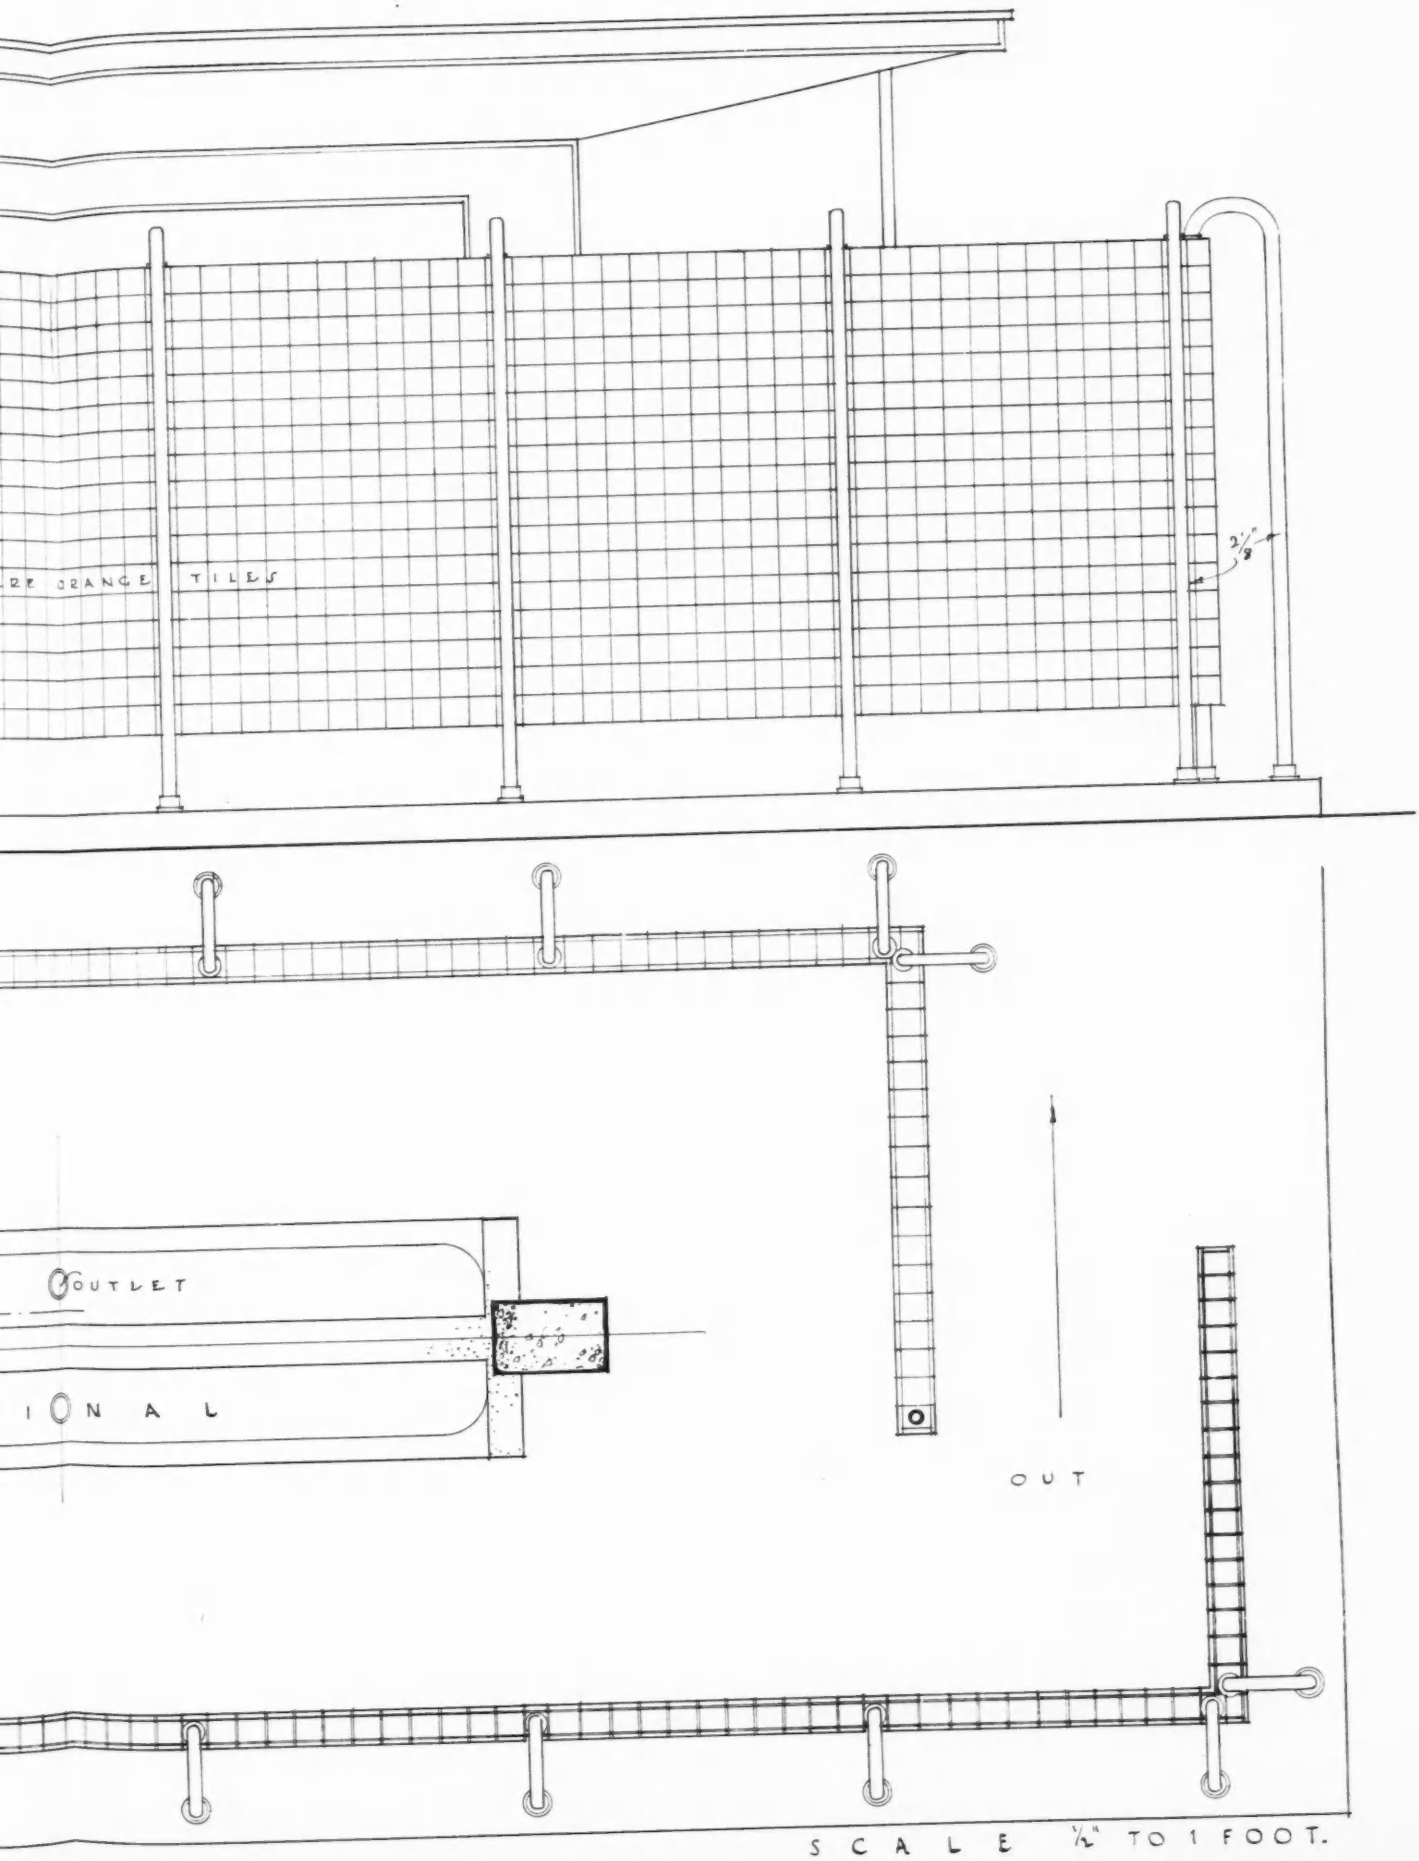
A URINAL IN PRAGUE

DESIGNED IN REINFORCED CONCRETE AND TILES





AN END VIEW, SHOWING THE SCREENED ENTRANCE



THE urinal, of which large-scale drawings appear within, reproduced to a scale of 1 foot = ½ in., is situated in public gardens near the Wilson Station in Prague.

The reinforced concrete canopy is supported by a pair of reinforced concrete piers, between which are arranged the stalls of a two-sided urinal. The concrete has a fine surface aggregate of hard grey stone, hammered generally, and tooled at the edges.

The 4¾ ins. thick screen, which has a core of concrete, suspended on inverted U-shape tubular metal rods, spaced at about 4 ft. centres, is tiled externally with 4 ins. square orange-red tiles, and internally with 4 ins. square white glazed tiles. The bottom of the screen is raised 11 ins. above the tiled floor of the urinal.

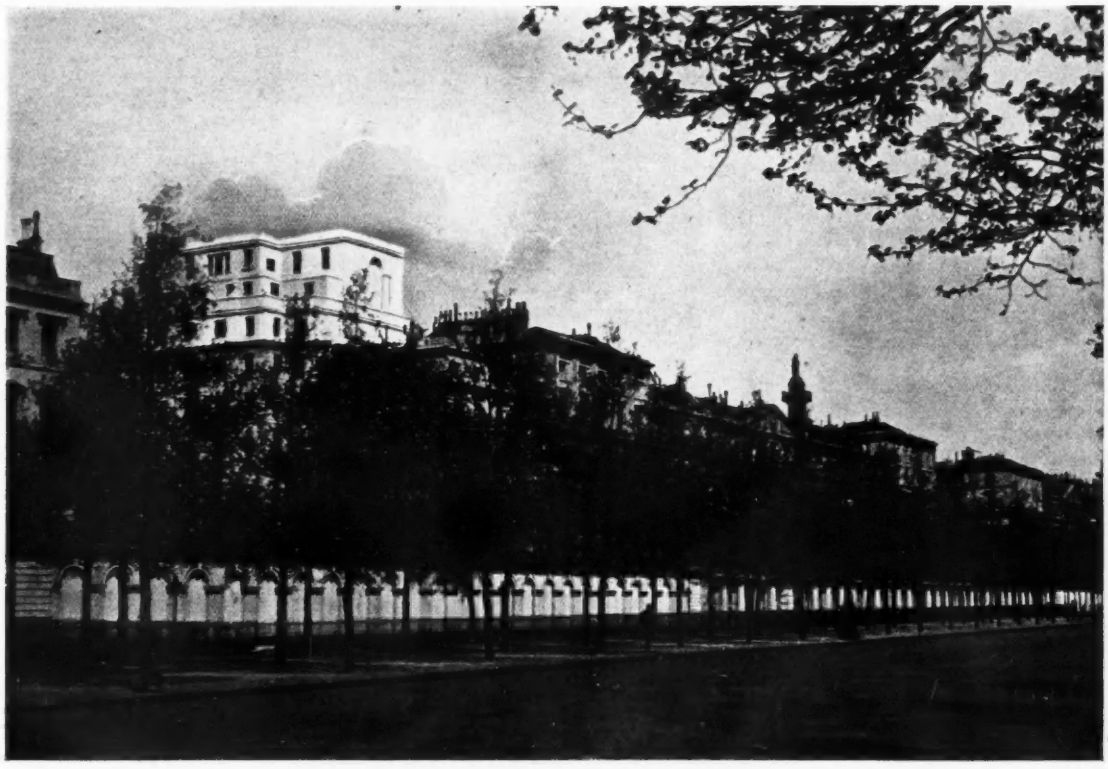
INFORMATION SHEETS

• 17 •

STAIRWAY DIAGRAMS

•

THIS week's Sheet, which gives general information essential to the economical planning of ladders, stairs and ramps, is the first of a series of nine dealing in detail with the layout and construction of staircases.

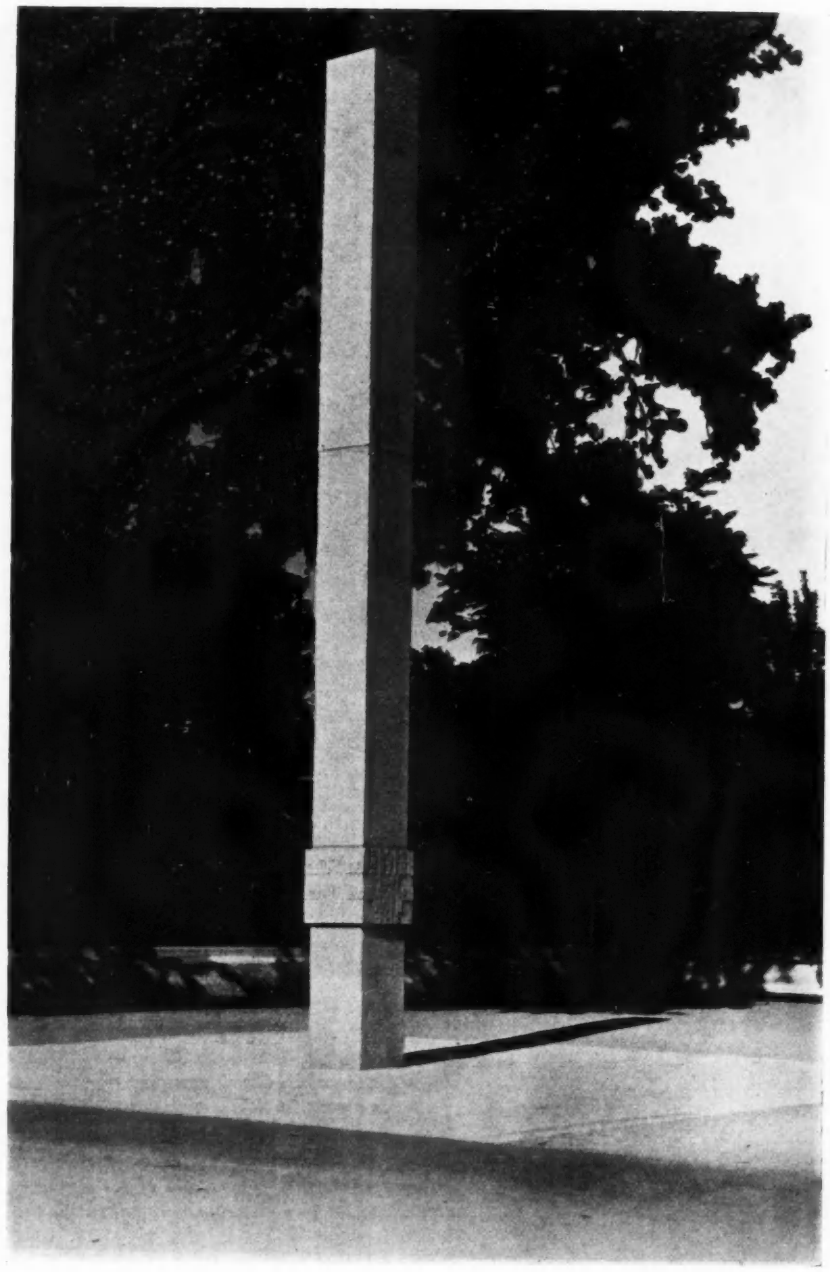


A table of risers that will appear next week will be followed by details dealing with stairs for places of public entertainment, with roughing in dimensions for stairs of general buildings, with reinforced concrete stair construction and with interlocking pressed steel stair construction. A note on the last subject appears on page 635 of this issue.

The following is a full list of the subjects Previously issued :—

1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.
8. Mar. 8—Billiard Table Data.
9. Mar. 15—Roof Pitches and Drainage
10. Mar. 22—Lift Sizes, etc.
11. Mar. 29—Sanitary Accommodation.
12. Apr. 5—Lavatory Units.
13. Apr. 12—Lavatory Units.
14. Apr. 19—Plumbing to Basins, Baths, etc.
15. Apr. 26—Pipe Chases, etc.
16. May 3—Drains and Manholes

THE EXCRESCENCE ON CARLTON HOUSE TERRACE

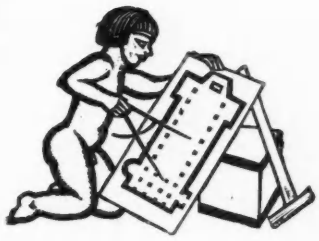


THE NEW BUILDING SEEN FROM THE MALL

CARLTON HOUSE TERRACE as it is today, showing the new building for No. 4 Carlton Gardens, nearing completion. It would need a dozen photographs, taken from various positions in St. James's Park, to show pictorially the full extent to which this building breaks the skyline of the Mall. But for the intervention of the Carlton House Terrace Defence Committee other parts of the Terrace would now no doubt be receiving the attentions of the house-breaker.

No reasonable person objects to tall buildings qua *tall buildings; indeed, by American standards, No. 4 is little more than a mole heap; what is objectionable, and what we, in common with most of the Press, the public, and the architectural profession, have protested strongly against is the lack of a sense of town-planning which is revealed in our Government departments.*

Within recent months, the Government—which is simply a national planning board—has twice shown the most cynical contempt for its own principles of ordered planning—once in Carlton House Terrace and once again in the telephone exchange, Faraday House. The latter (illustrated last week) succeeds in obstructing St. Paul's Cathedral by the simple expedient of ignoring the regulations as to the height of buildings laid down by the Government of London.



MEMORIAL TO AN ARCHITECT

" With unbiased consistency, he magnificently re-established the profession of the architect. Wagner's greatest achievement was that he has given us a firm, clear and new conception of architecture; a conception that was, and still remains as inspiring as imposing. His teaching embraced the entire field of architecture, including simple, yet boldly conceived, bases for the laying out of whole towns and groups of buildings."
—BRUNO TAUT, IN "MODERN ARCHITECTURE."

This austerely simple grey granite stele, which stands in one of the principal public squares of Vienna, is unique among memorials. In it one great architect's genius is the vehicle by which a nation's homage is paid to another—and all the more fittingly since the still living commemorator, Josef Hoffmann, was first pupil and then partner of Otto Wagner, the commemorated dead. The moral would seem to be that in those small countries ignorant and vulgar-minded politicians dismiss as "living on their past," famous architects are duly honoured—and honoured, not by the moribund convention of a servile reproduction, but by giving the freest scope to the creative spirit of the national tradition of which they have become a living part. Like the sovereign, architecture never dies; but styles, having their mortal span, succeed each other as do kings and dynasties upon the same throne. Had another great creative architect—a Scot, not an Austrian: Charles Rennie Mackintosh—been accorded a little honour in his lifetime he might have become a greater than Wagner. Where has Glasgow or Britain raised the meanest stone to witness they were aware he ever lived?

Otto Wagner (1841-1918) may be called the real Precursor of Modern Structural Architecture, just as Josef Hoffmann was the most notable of its earliest pioneers. His best-known buildings, which were built in the last decade of the nineteenth century, are all in Vienna; the Post Office Savings-Bank Headquarters, the huge complex of the Steinhof Asylum, a very "functional" block of flats in the Neustiftgasse, and the pressed-steel stations of the "Stadtbahn." It would be hard to overestimate Wagner's influence on men of the (then) younger generation like Peter Behrens, Josef Olbrich, Adolf Loos, Hans Poelzig, Van de Velde, Berlage and even Mackintosh.

If the decorative art nouveau *side of this logical planner's work is "of no importance to architectural history," it cannot invalidate the epoch-making place he occupies in it by virtue of his "flat, neat treatment of material, and pure, unshrouded presentation of construction."*

A PUBLIC RELATIONS COMMITTEE FOR THE R.I.B.A.

ARCHITECTS have consistently modelled their guild on the doctors'. Resolutions of the B.M.A. are the R.I.B.A.'s precedents for doing this or not doing that—a pertinent example being its code of professional conduct, which refuses to tolerate any form of individual or collective advertising.

A hundred years ago, though architects were largely gentlemen's gentlemen, surgeons still ranked as barbers, and the status of doctors was almost menial. As a result they were only sent for by those *in extremis*, or driven frantic with gout. Yet today the medical profession commands universal respect. Its corporate pronouncements are assured of the gravest attention, and its recommendations are carried out by private individuals and public authorities alike.

We have grown accustomed to seeking the advice of doctors for prophylactic reasons—quite as much to prevent disease as to cure it. This profoundly significant sociological change is not due to accidental causes; it has been brought about by persevering, and very intelligently directed, enlightenment of the public in regard to the practical value of medical science and its triumphant progress. But it has undoubtedly been accelerated by popular appreciation of the self-sacrificing spirit of eminent specialists in giving their services gratis in the big hospitals. Though its public services cannot be estimated in terms of money, the medical profession has a very "good press."

Doctors have been called "the guardians of the uprising generation, and of those as yet unborn," a title of honour which can be claimed by architects with equal justice. For, in so far as their much more limited opportunities allow, they constitute *the nation's one and only planning board*. Great as are the public services of doctors, they are not unparalleled. Architects, *qua* architects, render inestimable, though largely unrecognized, social and economic services, the beneficial effects of which would be infinitely greater and more far-reaching if (as in most civilized countries) the State allotted them wider instead of jealously restricted planning powers. In England (once again unlike most civilized countries) the architectural profession does not enjoy anything like the esteem, authority or influence of the medical. The result is an England still "minus a little (but very necessary) something" many other nations have already got. Ordinary citizens do not consult qualified architects in regard to houses, either prospectively or prophylactically. Because their homes are run up by self-architecting speculators, eked out by borough surveyors and engineers, few of the great public have ever met one. To the man in the street the architect is either an unpractical sort of fellow, with the same extravagant "arty" ideas as other "artists" or else one of a select little band of titled academicians who sit on vaguely official committees in virtue of the fact that they design (much as painters "compose") the façades of those buildings "which have to be impressive looking." He does not believe that the architect is useful, far less necessary, to himself, and so the nation.

Where the medical profession has succeeded in doing what it deliberately sets out to do—to impress the public with its value to the community—the architectural profession has so far signally failed. True, in the immediate sense of sickness *v.* health, architects are not actually as "indispensable" as doctors. But there are higher necessities for a nation than vaccines to fight epidemics; preventive medicine begins when the architect draws a plan.

The R.I.B.A. has shown a full sense of its responsibilities and commendable initiative in spreading the Gospel of the Necessity of Architecture. So, too, have various societies; though they are mostly preaching to the already converted. But all these efforts have been entirely unco-ordinated. If the mass of the population is to be reached and persuaded, co-ordination of all educative activities is a prerequisite of success. The economic crisis has brought British architects to the parting of the ways. As Theodore Roosevelt said of the British Empire, our profession must "get on or get out." *It must reorganize* its propaganda resources—and on the broadest possible basis—*or disintegrate*. Architects need a common rallying-point, or what Soviet ideology would call "a front," from which to launch an "offensive defensive" on the several octopuses of disorder, squalor, ugliness, reactionary obstructionism and that *laissez-faire* individualism we have allowed to run riot. Though only just set up, the Public Relations Committee of the Building Industry is already rendering that industry a great service. The R.I.B.A. is a cultural, not a commercial, body. We do not want an R.I.B.A. Publicity Committee to advertise architects, but we do need one to co-ordinate, and give direction to, every agency within and without the profession that is striving to make Mr. and Mrs. Everyman understand what sort of an England would be theirs without the architect to save her from herself.

Stanley Hamp, F.R.I.B.A., the new president of the Berks., Bucks. and Oxon Architectural Association. (*See page 666.*)

NOTES & TOPICS

BRIGHTER POST OFFICES

HOWEVER well entitled we are to jest about the anomalies and absurdities which distinguish our Telephone Service, there is no doubt that, from the point of view of design, we owe much to H.M. Post Office.

*

It is some years since Birmingham (through the efforts of its Civic Society) was allowed to have a really good cover for its telephone directory. Pillar boxes and Sir Gilbert Scott's telephone kiosk (as distinct from the other standardized atrocity) must command our respect and admiration. The lettering on mail vans is good ; so is the new design of telephone instrument.

*

I attended last week the official opening of Dagenham Post Office, designed by the Office of Works, under Mr. F. A. Llewellyn's special care, to be district office for the Becontree L.C.C. Estate. Anyone who has seen the inside of an old type of sorting office would do well to have a look at this one—bright and airy and cheerful, and entirely unlike the dungeons which make one wonder how the addresses are read at all.

*

From the point of view of external design the building is an admirable combination of traditional Essex vernacular with an intelligent solution of the planning problem and expression of the present day. Every detail has been well thought out, even down to combining lightness with coolness and care of the employees' eyes, which has been achieved by the use of a special glass for roofing.

*

The Post Office, like other institutions, must go carefully if not slowly. Now that Dagenham has proved a success we can hope that it will be regarded as a model for future occasions.

FOUR-INCH WALLS—AND SEVENTEEN FEET

How refreshing it is to read about the crypt of Westminster Abbey. Because I like Abbeys? Partly; but when I think of how much of my time is given up to talking of 4-inch walls and plate-glass windows, then the thought of the seventeen or more feet of masonry that surround the little crypt is as a pillow to my tossing brain.

*

Once upon a time the walls were a fragile 12 feet or more. Then another 5 feet were added for security. The London Building Act came somewhat later, but was built on the same sturdy lines.

*

OLD SMETHWICK HALL—LAST WEEK'S BIG CHANCE

Last week I gave my readers a big chance. Half a corona had to be won in an easy competition with no entrance fee and no annoying conditions. Competitors simply had to write down on a piece of paper the whereabouts of Smethwick Old Hall.

*

Well, the prize has been won—by a competitor entering under the pseudonym of *Arthur*.

*

"Smethwick Old Hall (writes *Arthur*) and the stables, and the village pub., and also, I believe, the village, are none other than the works of Chance Bros., the glass kings of Birmingham."

*

Arthur is right. What was once a tiny hamlet outside Birmingham is now a centre of the glass industry, vast, impressive and rather terrifying ! I went down to it in one of those select little architectural "cricket parties" which Mr. M. L. Anderson arranges with the discretion of a manager of the M.C.C.

*

If you, reader, get such a chance, I advise you to take it. You will spend one of the most dramatic—and dangerous—afternoons of your life.

*

My memory is of a tongue—the most articulate and mobile tongue I ever remember to have seen. It belonged to the enormous artist who spun the Crown glass, and it darted and shone in the light of the furnace like the head of an angry snake, while the sweat poured down the artist's face. A vivid commentary on the miracle that was being worked.

*

Arthur, by the way, accuses me of being disingenuous. My method of describing the site, he says, was legitimate, until I got to the cows. "Cows in Smethwick !" cries *Arthur* ; "Really, Astragal, that *is* going a bit too far."

THE ARCHITECTS' JOURNAL THURSDAY

TO BE PUBLISHING DAY

AS from the beginning of June THE ARCHITECTS' JOURNAL *will be published on the Thursday of each week instead of on the Wednesday, as at present. Next week's issue will appear on Wednesday as usual ; but the issue of the following week, which would normally be published on Wednesday, May 31, will be dated Thursday, June 1.*

I'm sorry to disillusion *Arthur*, but it's only going as far as the Recreation Ground.

*

YET ANOTHER BIG CHANCE

And here is yet another big chance. For the midland reader.

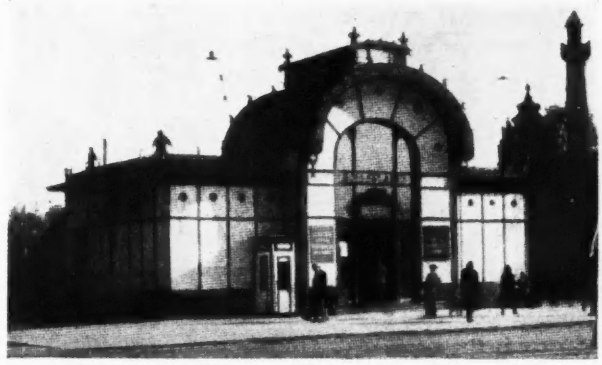
THE A.A. RECEPTION

Passing to and fro in the Library of the A.A.—where, on Thursday, the President and Mrs. Knapp-Fisher shook hands with more than a thousand guests—in the Members' Rooms, anon in the Dining Rooms ; penetrating, not without effort, into the very Ching's Head itself, I received a sort of composite mental photograph of architectural physiognomy.



*

You tell a sailor by his eyes. An architect, too, I fancy. The men in whose minds lies the plastic future of England have eyes not so very different—less keen, perhaps, but more introspective, and with a touch of the visionary, looking out on other worlds than this with some amazement. But mouths and chins are for the most part severely practical. And, if lines go for anything, not devoid of humour.

*

There was reason for amazement when Vanda and Vladimir at last appeared to entertain the serried ranks of visitors in the Lecture Hall with their exhibition dances. The factor of safety must have been perilously low. After which, one was lost in the thronged mazes of the dance. A night, in fact, of A.A.-maze-ment (O, Ching !).

ASTRAGAL

Designed in pressed steel by Otto Wagner in 1898 : Karlplatz, one of the Stations on Vienna's "Stadtbahn" (see also frontispiece of this issue).

Nominated for the R.I.B.A. London Architecture Medal : Lloyds Bank, Lombard Street elevation, by Sir John Burnet and Partners, with Campbell Jones, Sons and Smithers (see note on page 646).

THE ARCHITECTS' DIARY

Wednesday, May 17

R.I.B.A., 9 *Conduit Street, W.1.* Exhibition of architects' sketches, etchings, oil and water-colour paintings. Until May 22. 10 a.m. to 8 p.m. (Saturday, May 20, 5 p.m.). 10 *a.m.*

ROYAL ACADEMY, Burlington House, Piccadilly, W.1. Summer Exhibition. Until August 7. 9 a.m. to 7 p.m. 9 *a.m.*

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Exhibition of photographs, etc., depicting the progress of air travel. Until May 25. 10 a.m. to 10 p.m. 10 *a.m.*

MUNICIPAL SCHOOLS OF ARTS AND CRAFTS, Birmingham. At the Museum and Art Gallery. Exhibition of students' work. Until May 24. 10 a.m. to 5 p.m. (8 p.m. on Wednesdays). 10 *a.m.*

SOCIETY OF CHEMICAL INDUSTRY. At the Science Museum, South Kensington, S.W. "Plastics—Their Use in the Paint Industry." By Dr. L. A. Jordan. 4.30 *p.m.*

Thursday, May 18

INSTITUTE OF BRITISH DECORATORS, Painters' Hall, E.C. "The Brangwyn Panels." By Frank Rutter. 8 *p.m.*

Glass Convention. At Buxton. Until Saturday, May 20.

Saturday, May 20

Sunrise 5.2 a.m. Sunset 8.52 p.m.

HANTS. AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION. In the Isle of Wight. Annual General Meeting. Also, excursion to the works of the Cement Marketing Co., Ltd.

LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY. Visit to Leyton Parish Church. *Meet at the Church* at 3 p.m. 3 *p.m.*

Monday, May 22

R.I.B.A., 9 *Conduit Street, W.1.* "The Architectural Antecedents of Sir Christopher Wren." By Geoffrey Webb, M.A., Cantab. 8 *p.m.*

Tuesday, May 23

LONDON SOCIETY. Visit to the works of the *Gas Light and Coke Co., Sands End, Fulham, S.W.* (Including the old Sandford Manor.) 2.45 *p.m.*

SOUTH-EASTERN SOCIETY OF ARCHITECTS. (Croydon and District Chapter.) *At the Public Halls, Croydon.* Annual General Meeting : 7 p.m. Presentation of prizes won by students during the past session : 7.30 p.m. "When Building, Behave Yourself." By T. Graham Crump, L.R.I.B.A. : 7.45 p.m. 7 *p.m.*

COUNCIL OFFICES FOR BRISTOL

The Bristol City Council decided last week to prepare a town planning scheme which will provide for the erection of new municipal buildings on the College Green site. The scheme, when prepared, will be submitted to the Council for approval.

WOLVERHAMPTON'S SECOND OLDEST CHURCH

Wolverhampton is in danger of losing its second oldest ecclesiastical building.

Parts of St. John's Church, which has been surveyed by Mr. Bertram Butler, are said to be in an extremely dangerous condition, and must, if it is to be saved, be repaired at once.

When the church, which is in the Italian style, was built in 1758, the architect used freestone from the Wrottesley estate at Perton. This proved too soft to withstand the joint action of rain and acid fumes from neighbouring galvanizing works—since removed—and has for long shown signs of decay.

In some places the stone has been worn away to such an extent that rain has carried fragments down in solution and stalactites have been formed.

Now, nearly 170 years after it was built, the structure shows urgent need of repair. The vicar is appealing for financial support to save the building. Here, citizens of Wolverhampton, is an opportunity to preserve the finest church you have. *It must be saved.*

Recent statistics indicate an increase in building activity which might well be somewhat more than seasonal. This small but welcome improvement, undoubtedly due in part to the efforts of the Special Committee for Public Relations of the Building Industries National Council, must be fostered. The greatest improvement has taken place in the smaller types of dwelling-houses. The lesson of low costs and low interest rates must be placed before those responsible for larger projects. In the interests of the industry this Committee must continue to be fully supported.

Subscriptions to the fund should be addressed to Mr. Oswald Healing, at 5, Duke Street, Adelphi, W.C.2.

AUCTIONEERS AND ESTATE AGENTS AT DINNER

The annual dinner of the Auctioneers' and Estate Agents' Institute was held in London on Thursday last. Those present included Sir Raymond Unwin, P.R.I.B.A., and Sir Edwin Lutyens, R.A., P.I.A.A.S. Mr. Stewart Bevan, M.P., said that the home of the Institute in Lincoln's Inn Fields was, in his opinion, one of the most beautiful buildings that had been erected in London during the past few years.

THE UNEMPLOYMENT FIGURES

The seasonal improvement in employment, it is pointed out in the *New Statesman* for May 13, is a good deal more marked this spring than it was last year, thanks mainly to a substantial revival of activity in the building trades.

There is, unfortunately, no corresponding sign of revival in other industries. There the improvement is no more than the expected seasonal rise. We may, of course, rejoice that we are not going downhill so fast as a good many other countries, and that the mere check to the decline is having some stimulating effect. But we must not rejoice too much. We have to bear in mind that the new factor of world currency instability arising from the depreciation of the dollar has not yet had time to produce any effect; and accordingly we cannot afford to place too much reliance on a relatively small upward turn in employment which is mainly seasonal, concentrated largely on one industry, and may prove to be merely temporary. All we can say is that building is beginning to rally from the knock-down blow it received after the crisis of 1931, and that this is a good sign of the readiness of industry to respond if the right stimulus can be supplied. It remains as true as ever that this stimulus can come from only two sources—a recovery in world conditions and an active policy of expansion through public expenditure on capital services.

Percival C. Blow, A.R.I.B.A., the new president of the Essex, Cambridge and Herts. Society of Architects. He will be a vice-president of the R.I.B.A. Conference, to be held at Cambridge from June 21-24.

NEW BUILDINGS IN PARLIAMENT SQUARE

The Town Planning Committee of the L.C.C. referred last Saturday to their recent report on a proposal to erect a block of offices on a site facing Parliament Square. The committee, in their report, which was discussed at a meeting of the L.C.C. last night, stated :—

> We have informed the applicants that the Council are not prepared to approve the proposals submitted, but would give consideration to a further application, accompanied by plans, for permission to erect a building conforming to the spirit of the requirements as to height intimated during the discussions.

R. I. B. A.

THE NEXT MEETING

A paper entitled "The Architectural Antecedents of Sir Christopher Wren" will be read by Mr. Geoffrey Webb, F.R.I.B.A., M.A., Cantab., at the Institute on Monday next at 8 p.m.

LONDON ARCHITECTURE MEDAL 1932

The Jury entrusted by the R.I.B.A. with the Award of the London Architecture Medal have announced their award for the year 1932.

After careful examination of drawings and photographs of all the buildings which were nominated for the honour, the Jury have given their Award in favour of Lloyds Bank Headquarters, Lombard Street Elevation, designed by

AT THE ANNUAL DINNER OF THE A.E.A.I.

Some of the personalities present at the annual dinner of the Auctioneers' and Estate Agents' Institute, held at the Connaught Rooms, London, on Thursday of last week. The sketches are by Fred May. *See note on facing page.*

Sir John Burnet and Partners, with Messrs. Campbell Jones, Sons and Smithers.

The R.I.B.A. London Architecture Medal is awarded annually to the architect who has designed a building of merit completed during the three preceding years within the County of London.

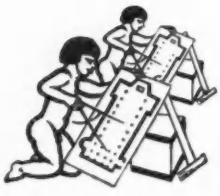
EXAMINATIONS

At the R.I.B.A. Statutory Examination for the Office of District Surveyor in London, held on May 3, 4 and 5, six candidates presented themselves, and the following were successful in the examination: Messrs. Ernest P. Featherstone and Ian D. Walker.

At the R.I.B.A. Examination for the Office of Building Surveyor under Local Authorities, also held on May 3, 4 and 5, four candidates presented themselves, and the following were successful in the examination: Messrs. Thomas P. Chester and Regent Robson.

ELECTION OF MEMBERS

At a recent meeting of the Council of the Institute, the following members were elected:—



As HON. CORRESPONDING MEMBER (1): Mr. M. Lalewicz.

As FELLOWS (11): Messrs. J. C. C. Bruce, G. W. Knight, B. A. Miller, C. R. Pinsent, D. C. Rae, A. L. Iredale, R. M. Mauchlen, J. Morris, W. J. Davis, T. H. Johnson, C. Saunders.

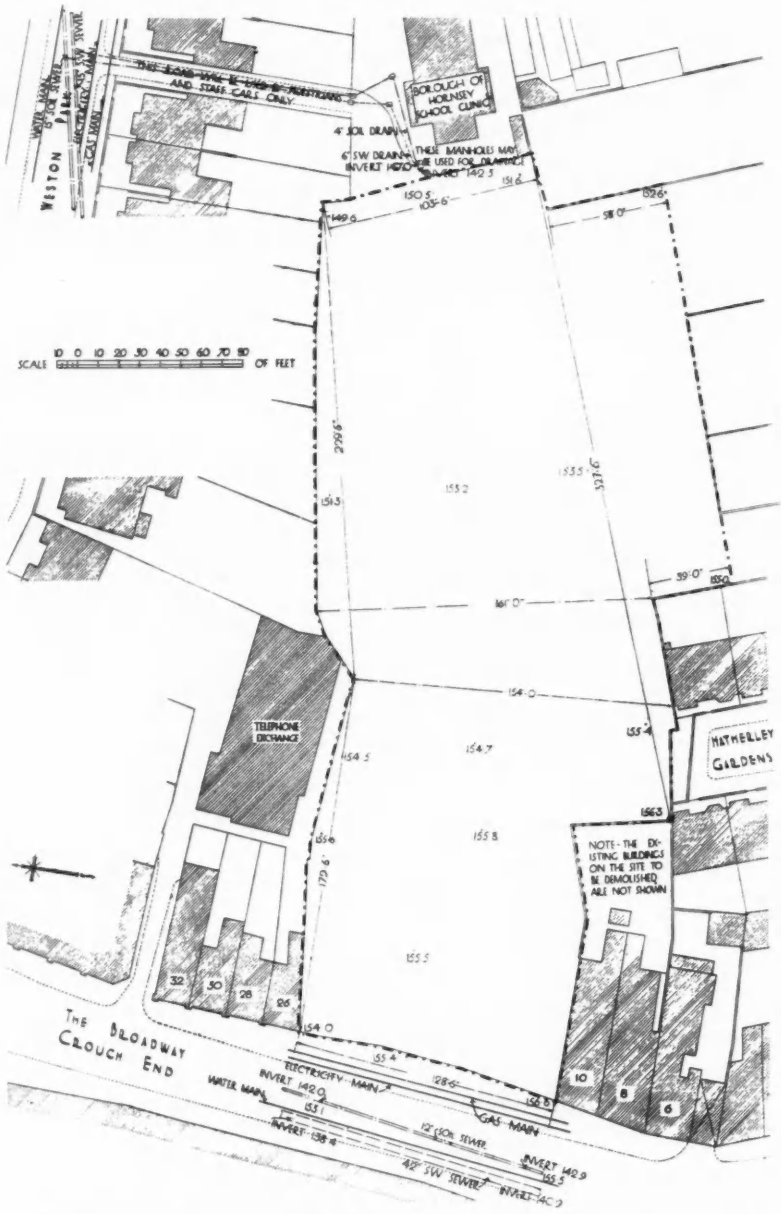
As ASSOCIATES (17): Messrs. C. W. Brown, G. B. Drury, E. R. Horsburgh, G. Kenyon, P. Lingwood, (Miss) L. M. McLay, (Miss) M. I. Mayo, A. V. Montague, D. W. Naylor, H. T. Rees, E. M. Rice, L. F. Richards, L. V. Sathe, C. P. Saurin, R. G. Simpson, (Miss) C. S. Stammers and A. F. Wallace.

As LICENTIATES (11): Messrs. R. J. Begley, J. B. S. Comper, J. W. Corney, S. Gregson, J. McNab, J. W. Mayhew, L. Pugh, C. E. Thomas-Medhurst, G. Tuxford, Lt.-Col. G. Westcott, and A. W. Wheatley.

COMPETITION

NEWS

THE HORNSEY COMPETITION



Borough of Hornsey; Competition for new Municipal Buildings. Assessor: C. Cowles-Voysey, F.R.I.B.A. Premiums: £350, £250 and £150. Last day for questions: May 30, 1933. Sending-in day: September 23, 1933. Conditions from Town Clerk, Town Hall, Highgate, N.6. Deposit one guinea.

I. A visit to the Site and First Analysis

By "Iodos"

THE Hornsey Corporation are to be congratulated on being the first, after a considerable interval, to announce a major competition for municipal buildings, and thus giving a lead to revived activity in an increasingly important sphere of constructional work. They are further to be congratulated on obtaining as their assessor Mr. Cowles-Voysey, whose post-war record in this field is outstanding. It is doubtful, however, whether they should be congratulated on their choice of a site, which at a first inspection seems to give little chance of a really successful civic centre from the point of view of either convenience or dignity and beauty: but this is only to congratulate them somewhat grimly on setting the many scores of architects who may be expected to compete an unusually difficult set of problems. Difficulties and limitations of site are the stuff that have made concrete many fine architectural dreams and given them edge and individuality: they may here again stimulate a daring and vigorous solution: but it is hard to see how the merits of any building could

BOROUGH OF HORNSEY

Plan of site, which comprises the whole of the area contained in the chain lines. Existing buildings to be removed are not shown. The scale has been added so that competitors may use this plan for preliminary small-scale sketches.

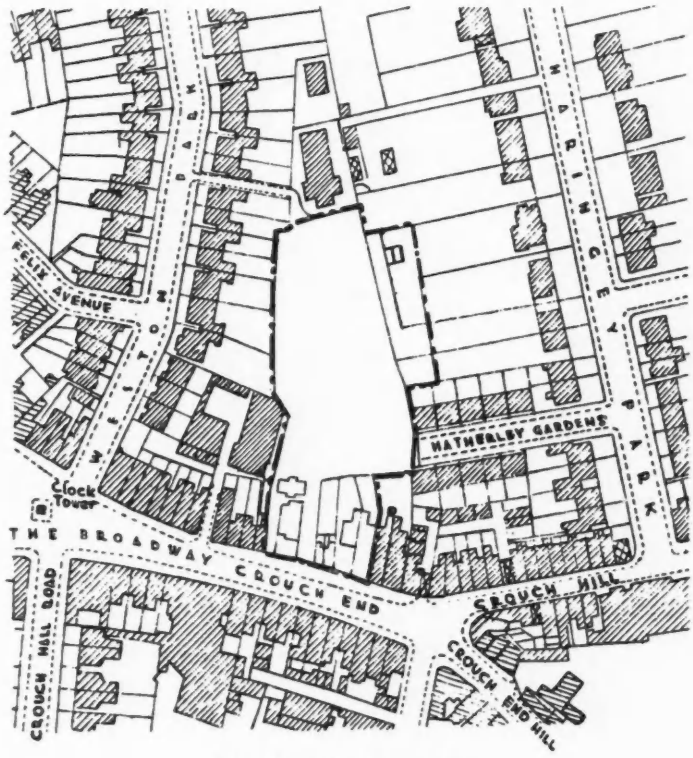
TOWN HALL COMPETITION REVIEWED

The curvature produced photographically is false, the frontage being approximately straight, as shown on the plan of the site. The limits of the frontage are indicated by chain-dotted lines; the buildings between them are to be pulled down.

FRONTAGE OF SITE TO BROADWAY, CROUCH END

show themselves on so enclosed a site unless its uniformly mean and disorderly neighbours were swept away.

A VISIT TO THE SITE



The conditions recommend that competitors should visit the site. The clause might well have been supplemented by a suggestion that the visit should be made as early as possible, so that any depressing effects should have time to wear off before designing work had to be started. Such information as is given in the conditions is a colourless understatement. The following notes from a personal visit may help to complete the picture :—

APPROACHES : "The Broadway is the main approach. It is congested and cannot be used for parking cars." The Broadway (which opposite the site is far from broad) is in fact a *very* congested bottle-neck from which main traffic routes radiate in all directions ; it is also a busy shopping centre and has no buildings of any architectural merit (which at least gives the competitor a completely free hand in elevational treatment). The Broadway is too short and irregular to have any marked street frontage and the conditions wisely insist that the buildings, however arranged, "must be set back so as to form a forecourt that can be used for parking cars, and so as to leave a through way for vehicles from the Broadway into Hatherley Gardens." But Hatherley Gardens is a narrow cul-de-sac of small and mediocre terrace-houses, quite unsuitable for more than a convenient reserve exit.

THE SITE : The conditions leave the site plan (which is conveniently provided to the same scale as the required drawings, 16 feet to 1 inch) to speak for itself, noting only that "the Corporation have no rights of light over adjoining properties." The main mass of ground available is an open space, at present used—and heavily used—as a children's playground : it is to be hoped that a new playground will be provided in its place, though it could scarcely be so conveniently related to the clinic. Though the schedule of accommodation includes a car park "as large as can be provided on the site," competitors may perhaps be able to retain a portion of the playground at the clinic end. The site is level and seems satisfactorily served with electricity, gas, water and sewers, but the conditions do not mention that almost the whole area, except the parts occupied by buildings to be pulled down, is fairly thickly covered by trees, some large, some small, but all in good condition. The majority of these will inevitably have to go to provide space and light for the new building ; but the retention of others as a setting and to screen the ugly back sides of adjoining property will be a nice problem

View of school clinic from east end of site. Trees of this frequency and type cover most of the site.

The site and its surroundings.

for the successful architect, to which competitors might well give some preliminary thought.

ADJOINING BUILDINGS: There is no question that the site—an irregular rectangle about 400 ft. east to west by 150 feet average north to south—is sufficient for the required accommodation. But any close approximation to the general arrangement that has become increasingly standardized in recent years, to a considerable extent through Mr. Cowles-Voysey's influence, would seem to be ruled out through the long narrow shape and the compulsory setting-back from the very restricted frontage. Of adjoining buildings only the Telephone Exchange would appear likely to interfere materially through rights of light; it occurs unfortunately opposite a re-entrant angle at the other side of the site, and the two restrictions may together force the main blocks of new building still further back from the main road. The Telephone Exchange—dating from before the days when the Office of Works took such matters properly in hand—is a very ugly red-brick building, with which no self-respecting scheme could attempt to harmonize. The School Clinic at the eastern end is a much more respectable affair in symmetrical pseudo-Georgian style—a heavy single-story treatment in red brick with artificial stone dressings and sash windows. The pros and cons of some attempt to harmonize with the clinic would seem closely balanced; but to follow its marked axis very far is likely to lead the designer into further difficulties, and the independent-minded may be glad to leave the clinic alone behind a screen of preserved trees.

THE ACCOMMODATION REQUIRED

Compared with the restrictions imposed by the abnormalities of the site, experienced competitors will find the limits set by the very normal schedule of accommodation relatively easy. Not the make-up of the several units, but their piecing together in the available space, constitutes the main problem. Realizing this, the assessor has given more freedom than usual in the disposition of the various departments on the several floors. The requirements may be summarized as follows (areas are round-figure approximations, exclusive of corridors, etc.):—

(*A*) *Council Suite:* about 6,000 sq. ft. (including Council Chamber, 1,750), "suitably on the First Floor."

(*B*) *Town Clerk's Department:* about 1,600 sq. ft., "on Ground or First Floor."

(*C*) *Borough Engineer's Department:* about 4,000 sq. ft. "on Ground or First Floor or both."

(*D*) *Borough Treasurer's Department:* about 4,000 sq. ft. (including public Rates Office, 720), "on Ground Floor."

(*E*) *Medical Officer's Department:* about 1,600 sq. ft., no floor suggested, but "should be easily accessible from Clinic" and from Enquiry Office at Main Entrance.

(*F*) *Education Department:* about 2,300 sq. ft., no floor suggested.

(*G*) *Miscellaneous:* the various staff, plant and store rooms, etc.; it seems to be indicated that the greater part of such accommodation might suitably be placed in a Basement, which would be not less than 6,000 sq. ft. (including a Garage of 1,500).

(*H*) *Caretaker's Quarters:* probably about 800 sq. ft., no floor suggested.

(*J*) *Public Assembly Hall:* for an audience of 800—1,000 "and a gallery" of unspecified size "in addition." The hall is of the multi-purpose type requiring suitable arrangement and ancillary accommodation for public meetings, lectures, concerts, amateur theatricals, cinema performances, dancing and banquets.

Competitors will probably find that the accommodation settles down into two blocks—Municipal Offices (*A* to *F*) and Assembly Hall (*J*), with *G* and *H* allocated between them as convenient. But, though there should be "a car approach to the principal entrance" of the Hall, there should also be a "direct and dignified approach from the Council Suite for use when the Hall is used for municipal functions"—presumably under cover. The Corporation, rather optimistically "have in mind the expenditure of approximately £100,000" for the whole of the work, exclusive only of furniture, movable fittings and fees.

SOME QUESTIONS

Having got his conditions and studied them, and having visited the site, the wise competitor will frame such questions as he wishes to ask, and then allow himself a breathing space for general reflection and the collection of any relevant examples, including especially the assessor's own works (a short list of references to back numbers of THE ARCHITECTS' JOURNAL is added below). There will be time enough for the working-out of schemes after the answers to questions have been received.

My own list of questions would include the following:—

(1) Is it desired to retain any portion of the site as a children's playground in connection with the clinic?

(2) Is it desired to retain the trees wherever possible, provided light and traffic circulation are not interfered with?

(3) For what number of people (above the 800—1,000 mentioned) is the gallery in the Hall to be designed?

(4) Should the approach from the Council Suite to the Hall be fully enclosed, or merely under cover?

(5) Will banquets take place in the Hall itself or should a separate refreshment room be provided?

(6) The conditions provide that the Borough Engineer will "act as a consultant with the successful architect in the carrrying out of the work." Does this mean that he will perform in full the functions of a consulting engineer? if so, for what—the structure? heating? ventilating? lighting? what responsibility will he take? and is he to be paid by the Corporation or by the architect out of his fees?

Worthing: competition (C. Cowles-Voysey, winner), August 6, 1930.

["*Iodos*" *will continue his review of the above competition in our next issue, which will also contain photographs and plans of Worthing Town Hall, to be opened on Monday next, May 22.*—ED., *A.J.*]

SOUTHWARK TOWN HALL

The scheme to erect a new Town Hall and Central Library in Walworth Road, Southwark, the outcome of a limited competition, has been postponed indefinitely. Modified proposals are now suggested.

Two years ago (states the *South London Press*) a proposal to scrap the existing buildings was postponed until April. Conferences have since taken place and it has been found that local public opinion is against a large expenditure on the project.

The special Town Hall Improvements Committee has resumed consideration of the scheme and has paid attention to the possibility of carrying out part of the original proposal. The Chairman of the Committee explained the new suggestions at a meeting of the Borough Council on Wednesday last.

The Town Clerk, he said, had been directed to inquire of both the architect (C. Cowles-Voysey), whose design for a new Town Hall was placed first by the Assessor, and the architects whose scheme was more favourably received by the Council, whether they were prepared to give their views on the proposed partial development.

It had been made clear that the committee had no authority to offer them any reward for their advice.

"Our sole object is to secure further information upon which we may report to the Council," said the Chairman. The report was received without comment.

Competitions Open

May 30.—Sending-in Day. Royal Society of Arts Competitions for Industrial Designs. The Secretary of the Society, John Street, Adelphi, W.C.

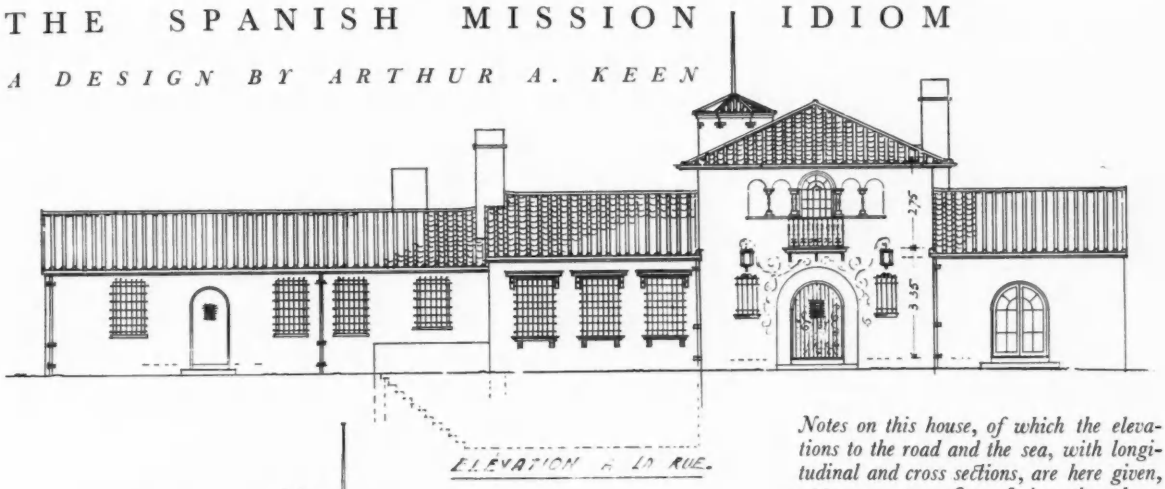
May 31.—Sending-in Day. Layout of a suburb on the river Escaut, Antwerp. £2,400 in prizes (1st, £800). Conditions, etc., were published in *A.J.* for December 7, 1932.

June 3.—Sending-in Day. Limited competition for flats to be erected in Lordship Road for the Stoke Newington B.C. Premiums: £250, £100 and £50. Full particulars, etc., published in *A.J.* for March 29.

September 21.—Proposed Town Hall for the Borough of Hornsey. See page 648.

No Date.—Proposed Town Hall for the Portstewart U.D.C., Co. Londonderry. Open to architects practising in Northern Ireland. Assessor: R. H. Gibson, F.R.I.B.A., President of the Royal Society of Ulster Architects. Premium 50 guineas. Conditions of the competition may be obtained on application to Mr. F. Martin, Town Clerk, Portstewart. Deposit £1 1s.

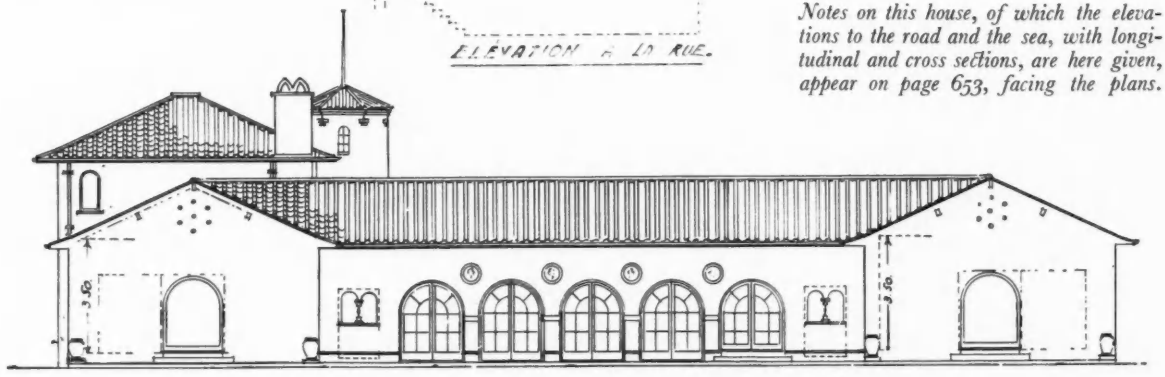
THIS ARSHETECTURE



(*With acknowledgments to the* Week-end Review)

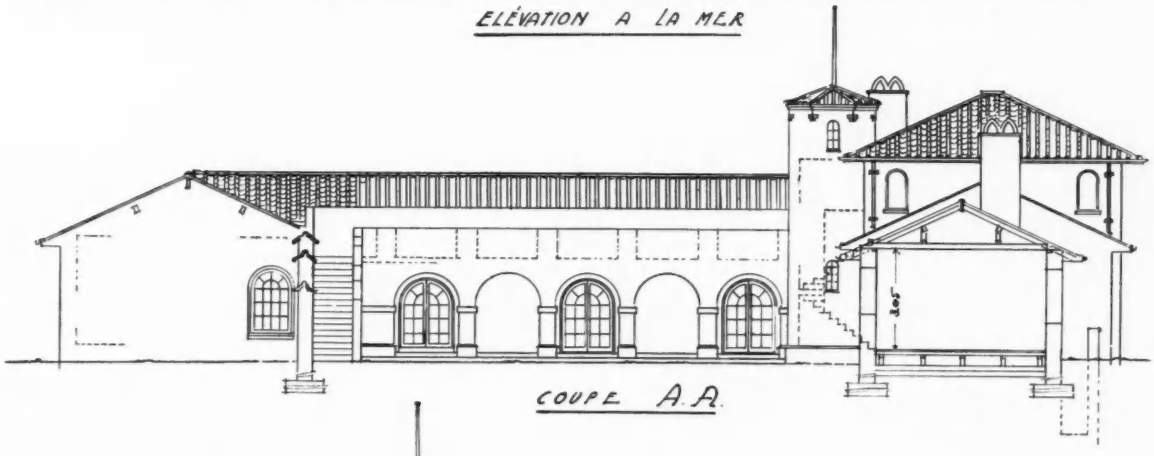
Mr. J. W. Green, City Surveyor of Durham, granted honorarium of £150, for work in connection with the new baths. Councillor J. W. Pattinson (deputy Mayor and Chairman of Baths Committee) stated that the actual saving to the council, so far as architect's fees were concerned, was £1,890. *This particular work was of a specialist type and had been done by the C.S. outside office hours.*—

THE NATIONAL BUILDER

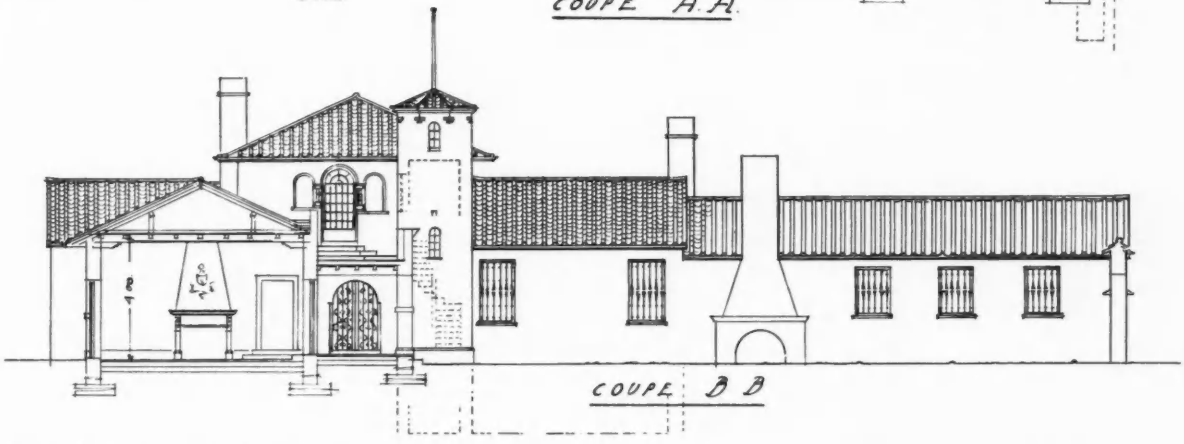


THE SPANISH MISSION IDIOM

A DESIGN BY ARTHUR A. KEEN



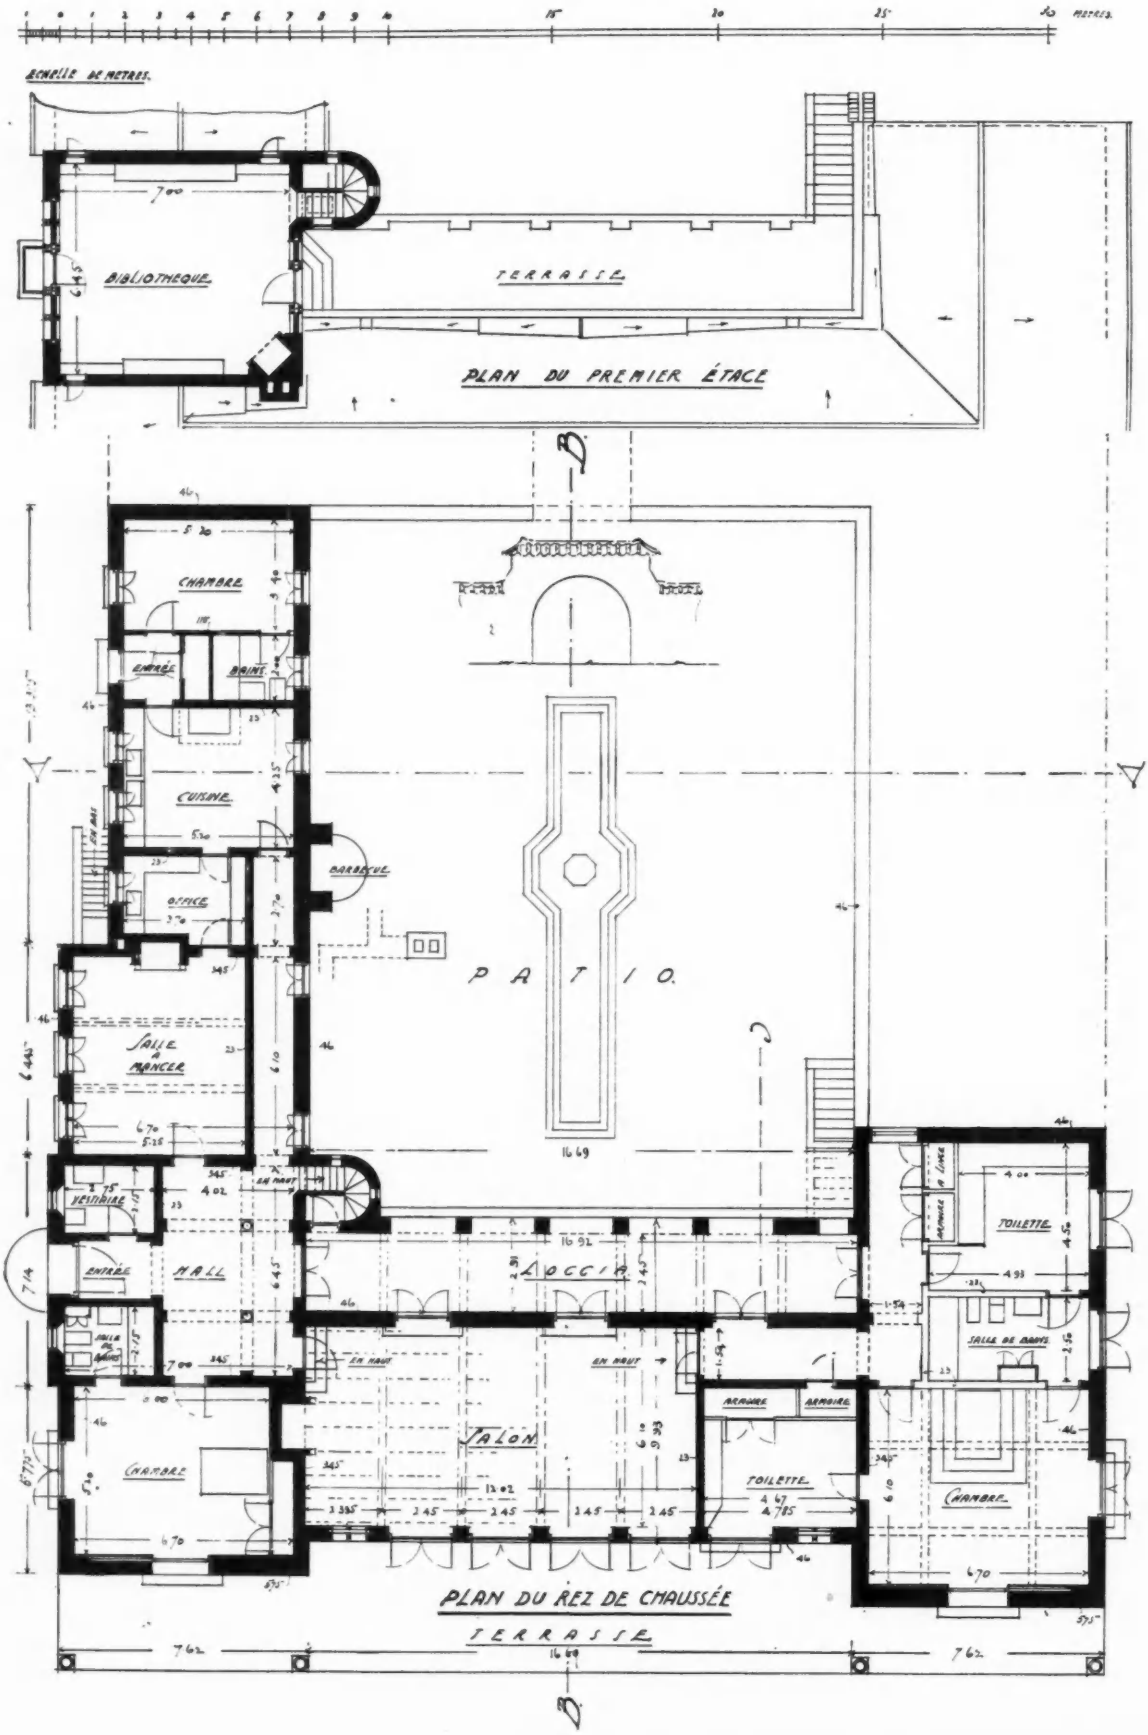
ELÉVATION A LA RUE.



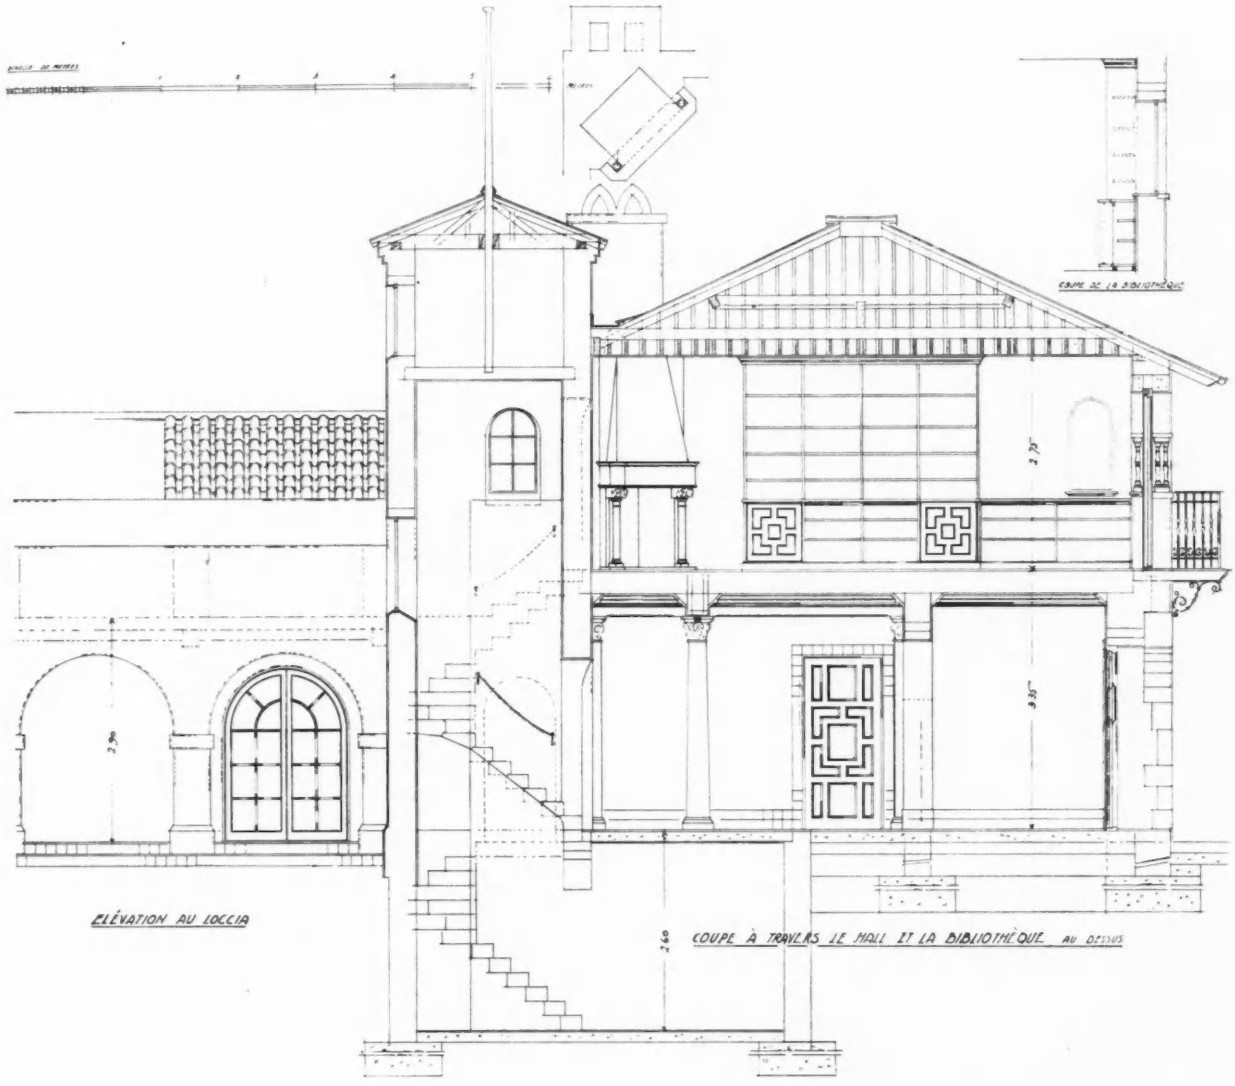
Notes on this house, of which the elevations to the road and the sea, with longitudinal and cross sections, are here given, appear on page 653, facing the plans.

ELÉVATION A LA MER

COUPE A.A.



COUPE B B



ECHELLE DE METRES.

THE SPANISH MISSION IDIOM:

A DESIGN BY ARTHUR A. KEEN

This house, for an estate of over 300 acres, including a private racecourse and polo field, near Mandelieu, Alpes-Maritimes, France, was expressly designed, by the owner's wishes, in the old Spanish mission type of architecture common in certain districts of California. Stone for the rubble walls was found on the site, and these were finished, externally and internally, with white cement, with specially selected sand for colour. A very rough, but not fantastic, finish to the plaster was enjoined to aid the casting of shadows by their uneven surfaces. For the roofs, deeply eaved, again to cast shadows, Spanish tiles of a warm colour were chosen.

All the rooms are on one floor except the library, which has a door opening on to a roof terrace. Every bedroom has its own bath and dressing-room, and the two bedroom windows opening on to the terrace each has one large pane, not to obstruct the view, and slide into the thickness of the wall, while fine-mesh fly-screens can be slid into their places. The two Moorish windows overlooking the terrace also slide, this time downwards, into the wall. The front door is designed in oak slabs, fixed vertically on the outer face and horizontally on the inner face, set in an architrave of red local stone. In the patio, paved with large rough stone slabs, is a barbecue for the roasting of whole hogs. The builders' estimate for the work shown was about £4,000.

British Steelwork Association

A deputation of members of the British Steelwork Association and others interested in bridge-building was introduced to the Minister of Transport last week by Mr. C. U. Peat, M.P.

Their memorandum stated that "money spent on bridge building as opposed to pure 'amenity' development, would satisfy any criterion of economic benefit and would be immediately reflected in a large number of skilled trades with considerable relief to national and local funds in the way of unemployment relief." The Minister of Transport said that he was now in a position to assist certain approved schemes.

While due weight would be attached to their employment value the Department's duty was to regard all schemes from the standpoint of traffic value.

LETTERS FROM READERS

LAY-READER
SURVEYOR
SUBURBAN
R. P. VERREY
GEOFFREY L. PRICE, A.R.I.B.A.
R. GARDNER MEDWIN

The Poor Architect

SIR,—It is with pleasure I read Astragal's brighter notes for architects every week. I am not a member of the architectural profession, but unluckily for me, a member of my household is; thus, in these days of economic stress, it is impossible for me to obtain any more frivolous or expensive periodicals. My reading is therefore confined to the somewhat gloomy architectural press. However, I am writing to point out that I find great joy in Astragal's notes and criticisms.

I am constantly meeting architects, and I do feel very sorry for them. In fact they arouse great pathos, as their hopes are more blighted than those of any other professionals. Their skill, in my opinion, is very seldom recognized, and by all clients they are *very* grudgingly employed.

The architect is a nice man—but the general public thinks he is a villain.

I suggest a remedy:

The architects are showing courage—rather late in the day—in forming themselves into a protected body. This alone will not cut much ice with the uneducated general public, for I have met people, capable of buying a £1,000 house, who do not even know how to pronounce the designation—and have been told—"No! Of course we couldn't possibly afford an arshetekt!"

Well, why do not the R.I.B.A.'s have a competition, not among themselves, but for the benefit of the public?

I suggest that the A.R.I.B.A.'s should produce 12 sheets of drawings and plans of, say, a £1,000 house, with the slogan *a £1,000 house for 6d.* Judge them in the correct order!

The designs should be the work of competent architects and each should be accompanied by a brief specification giving the materials used, so that the public are induced to take an interest and become knowledgeable about bricks and tiles, etc. Also, a given sum should be set aside for purchase of a site.

I do not quite know how these competitions are run, but I think the procedure is fairly simple.

To induce people to enter would not be difficult, if the competition were on sale at such an exhibition as *The Ideal Homes*, or every architect were given the sale of copies.

Perhaps a competition on the lines suggested above is not feasible. But, in my opinion, it would be of value in bringing the architect to the fore and introducing him as a necessary adjunct to the house-buying or building purchaser.

My personal opinion is that the new R.I.B.A. building will look like a huge and stately sarcophagus and should have the letters R.I.P.–A. over the door.

May this not come true! England is a fair country, marred by vulgarity, and I should hate to live in it if I had to attend the funeral of the whole architectural profession—which, unfortunately, does at the moment seem almost possible.

LAY-READER

[*Astragal writes:* I suspect that this letter is the work of a lady. Anyhow, a reader who isn't an architect but who finds my notes bright has my sincere sympathy. I return the compliment by saying that her suggestions for architectural competitions are in my opinion brilliant, and shall be placed before all the editors of daily papers I can command. As for the new R.I.B.A. building, its architect has a noble and patient nature, but let critics beware! There are times when even a Wornum will tornum.]

What Is To Be Done About This?

SIR,—The letter signed "Practical Politician" is as ill-advised as the writer is ill-informed, and is calculated to do an infinite amount of harm, not to the building societies, who are well capable of looking after themselves, or to the speculative builder, who is fulfilling a practical requirement, but to the architect, whose cause he apparently desires to further.

Your correspondent is so confused and contradictory in his statements that it is a little difficult to know quite where to start, but I presume, with your permission, to deal with him point by point.

He begins by saying: *We have on the one hand the financial octopus of the building societies, who have developed from quite good and proper thrift societies into huge financial usury agencies.* The building society rates have always been a shade higher than those obtainable in the open market, for the reason that anybody who goes to a building society is protected for a long term: in other words, the mortgage cannot be called in unless it is paid off, and for this protection he pays a little more than if he went to a bank or a solicitor. Is that what "Practical Politician" means by usury?

Again, the relative rates are the same now as they have always been, therefore what is it that has made them develop from "good and proper thrift societies" into "huge financial usury agencies"—except possibly their success!

He goes on to say that *they have decided for very obvious reasons to throw in their lot with the speculative builder, the person which the history of housing (through our industrial period) shows to have been, in effect, our greatest social bane, and the producer of our most costly social ill—slums:* but surely some of the worst slums are the best buildings, as far as both structure and architecture goes. To quote two instances: There was the Royal Mile at Edinburgh, consisting of some of the most splendid houses of the old nobility, which for years was the plague spot in Edinburgh; and are not some of the worst slums in London beautiful old Georgian buildings?

Is not the worst form of slum the building that is not adapted to its purpose? If "Practical Politician" means the pre-bye-law type of house, then I am prepared to agree with him that some of these have developed into very bad slums, but was not this rather a result of the social condition of the times than the particular vice of the speculative builder? Does "Practical Politician" condemn, in his sweeping assertion of speculative builders who are responsible for slums, such people as the late Mr. Willett and the late Mr. Hart of Hampstead, who have produced some excellently-designed and well-built houses? Does not "Practical Politician" require to be a little more clear in his definitions? Is not he confusing building society practice, as it was and has been since the war, with what he imagines it will be under the Housing Bill?

It is a little difficult to follow what it is he exactly objects to on the part of the speculative builder. If it is the kind of construction, surely there are the bye-laws and the building inspectors of the local authorities! If it is simply a question of æsthetics, why should the building societies demand a higher standard of æsthetics than the local authorities, who are the proper guardians of the public weal?

Nevertheless, when he comes to æsthetics, I think he is on sounder ground and I am inclined to agree with him. Undoubtedly many of the speculative builders' houses are of a deplorably low standard of taste, but is not this the standard of taste of their purchasers? "Practical Politician" says that *if, for example, in truth and effect, the*

architecturally-built house has marketable and social advantages over the speculatively-planned house, then the Architectural Building Society (sic!) *should be in a position to grant considerably more by way of mortgage than could the building societies dependent upon the more promiscuous market of the speculative house.* But is not that a very big "if"? Where there is a public demanding an architect-built house, as, for instance, in Hampstead Garden Suburb, and in Welwyn, or in any of the better-class residential areas, then any of the building societies who did not take architectural character into consideration would be very foolish, and certainly the more reputable building societies would take the architectural character into consideration; but can they, where there is no demand for such a house, insist that this is the only type of house that they will lend money on? Have the directors of any building society any mandate from their subscribers to make adventurous essays in æsthetics; and if they did, would not they have a very short shift?

I have been up to now referring to the ordinary building society practice, in which advances have been made to speculative builders to provide middle-class houses. If "Practical Politician" is talking about working-class houses, then I suggest that very few working-class houses have been built by the speculative builder since the war—in fact, was not this the whole gravamen of Sir Raymond Unwin's argument, that houses for the working classes have not been provided in anything like sufficient quantities by any agency?

I think that "Practical Politician" is on much safer ground when he attacks the situation created by the present Housing Bill. Here it is true that the building societies approached the Government with an offer to help them: i.e., the Government to provide finance for working-class houses to let.

Without going into the merits of whether an organization such as a building society, which has been formed and grown to prosperity through its main purpose of financing the man who wishes to purchase his own house, can be successfully used for an entirely different purpose, I do agree that if the building societies and the Government, together with the local council and the speculative builder, are to provide houses for working classes to rent, the building societies cannot escape the implication that they have a responsibility to the community for the houses so provided, the case, as I see it, being entirely different to that of the middle-class man, who is a free agent and who could certainly have an architect-designed house provided by the speculative builder, if he demanded it. The remedy is in his own hands, and it is not for the building society, or any other agency, to dictate to him. But the working-class man has no choice, and, moreover, the scheme is being launched under the ægis of the Government and the local authorities, so that people can point and say, "This is the class of houses the Government guarantees": "This is the sort of building the Government pleads for: and "This is the sort of architecture the Government blesses."

Here I am heart and soul with "Practical Politician"; but here, surely, the remedy is obvious, and is outlined in number two of his proposals.

SURVEYOR

Competition for Small Houses

SIR,—It is probably not overstating the case to say that the whole architectural profession deplores, and has for years past derided the multitudes of mean little houses which arise yearly in the neighbourhood of every live town. The amount of useful help which the profession has offered to the improvement of standards within the legitimate requirements of intending house owners is, however, negligible. The leaders of the profession no doubt move in a rarified atmosphere where the existence of the needs which are now only adequately met by the speculative builder can be ignored, while at the other end of the scale the enthusiastic aspirant nourishes his spirit on visions of new legislative buildings for the Republic of Eldorado and similar heartening subjects. Meanwhile the horrid work goes on, and seems likely to go on.

I suggest that you, Sir, should initiate an open competition for the design of houses for people of humble means who are not "cottagers," incorporating in the conditions the following requirements, which are those usually met with in suburbia:—

Site (in 40 ft. road, building line 20 ft. back), a plot of 30 ft. frontage with adequate depth upon which must stand the house, leaving space for a garage and for access to back gardens with a wheelbarrow.

Accommodation.—Two reception rooms, say, 13 ft. by 10 ft., with bow windows, and 14 ft. by 11 ft. Kitchenette about 8 ft. sq., containing coke boiler, gas cooker, sink, dresser, with side or back entrance.

Hall, with stairs, larder, fuel store, etc.

Three bedrooms, the smallest not under 65 sq. ft. Bath, linen closet, and separate w.c.

Special requirements.—All rooms to have flat ceilings at a height not less than 8 ft. All windows to have plain sheets of glass in their lower portions up to eye height.

Big bow windows (additional to given dimensions of rooms) should be provided in front room and bedroom over.

These are the conditions (usually quite inflexible) with which designers of such

houses have to cope. Though they contain nothing contrary to commonsense or legitimate desire, they constitute what appears to be æsthetically a wearily insoluble problem, and the man (whether student or leader) who produces a solution which may be acceptable to the intending builder will have made an offering entitling him to the congratulations of the architectural profession and the goodwill of all lovers of England.

SUBURBAN

Suburban Housing

SIR,—Congratulations on your Information Sheets, and especially on the one by Mr. John J. Blower in the May 3 issue. Land developers like me, who are trying to further housing as pressed by by the Ministry of Health, have to put up with a good deal of criticism. Instead of obstructing progress it would be better if all papers like yourself would try to help builders by telling us what to do.

When you have completed the series you should have them bound up for builders, and so further good design, which is just what we want.

R. P. VERREY

Registration

SIR,—With regard to the question of Architects' Registration, I have been wondering why it should not be possible for the R.I.B.A. to register its own members who are eligible *en bloc*. As it is, each member has to fill up forms, and tear his final Certificate from its honoured frame, tie up with red tape and pack them off to London. Surely the Institute knows that an Associate is an Associate without each individual member having to prove it to them. One would think that with such an apparently overpowering representation on the Registration Council, the R.I.B.A. would be able to do the necessary for its members whom they know to be qualified.

GEOFFREY L. PRICE

A Novel Water Softener

SIR,—In a recent issue Mr. Harold Dod enquired about an unconventional water-softening device known as a "Scale Buoy."

The floating flask he described contains, as well as mercury, an invisible gas. The slightest vibration of the water in the storage tank causes a faint glow to emanate from the flask, and this glow has the power of penetrating the water, causing particles of lime to disintegrate and settle at the bottom of the tank in the form of a soft sludge which can easily be removed every few months.

I know of about twenty houses in North Wales and the Wirral in which this ingenious device has been tested. It has proved thoroughly efficient in all but one, where, owing to perpetual baby-washing, the water apparently flowed too rapidly through the unusually small tank to allow time for the mysterious glow to work its magic.

I do not know the name of the makers, but can put anyone interested in touch with an agent.

R. GARDNER MEDWIN

THE GAUMONT PALACE,

This modern picture palace, with all its apparatus of pleasure, stands where had stood, for 84 years, the Congregational church known as Highbury Chapel, in Winchcombe Street, Cheltenham. The structure is steel-framed and fire-resisting throughout, includes a fully-equipped stage and provides seats for 1,009 on the ground floor and 762 in the balcony (1,771 in all).

In the street front a brightly-coloured sign and canopy are conspicuous features, intended to present a striking appearance after dark. The architect has also given special attention to the design of the interior light fittings, some of which are illustrated on pages 660-1.

In the plans reproduced (all to the same scale) on the following three pages old walls appear in black. Sections appear in the Supplement.

Gas Engineers

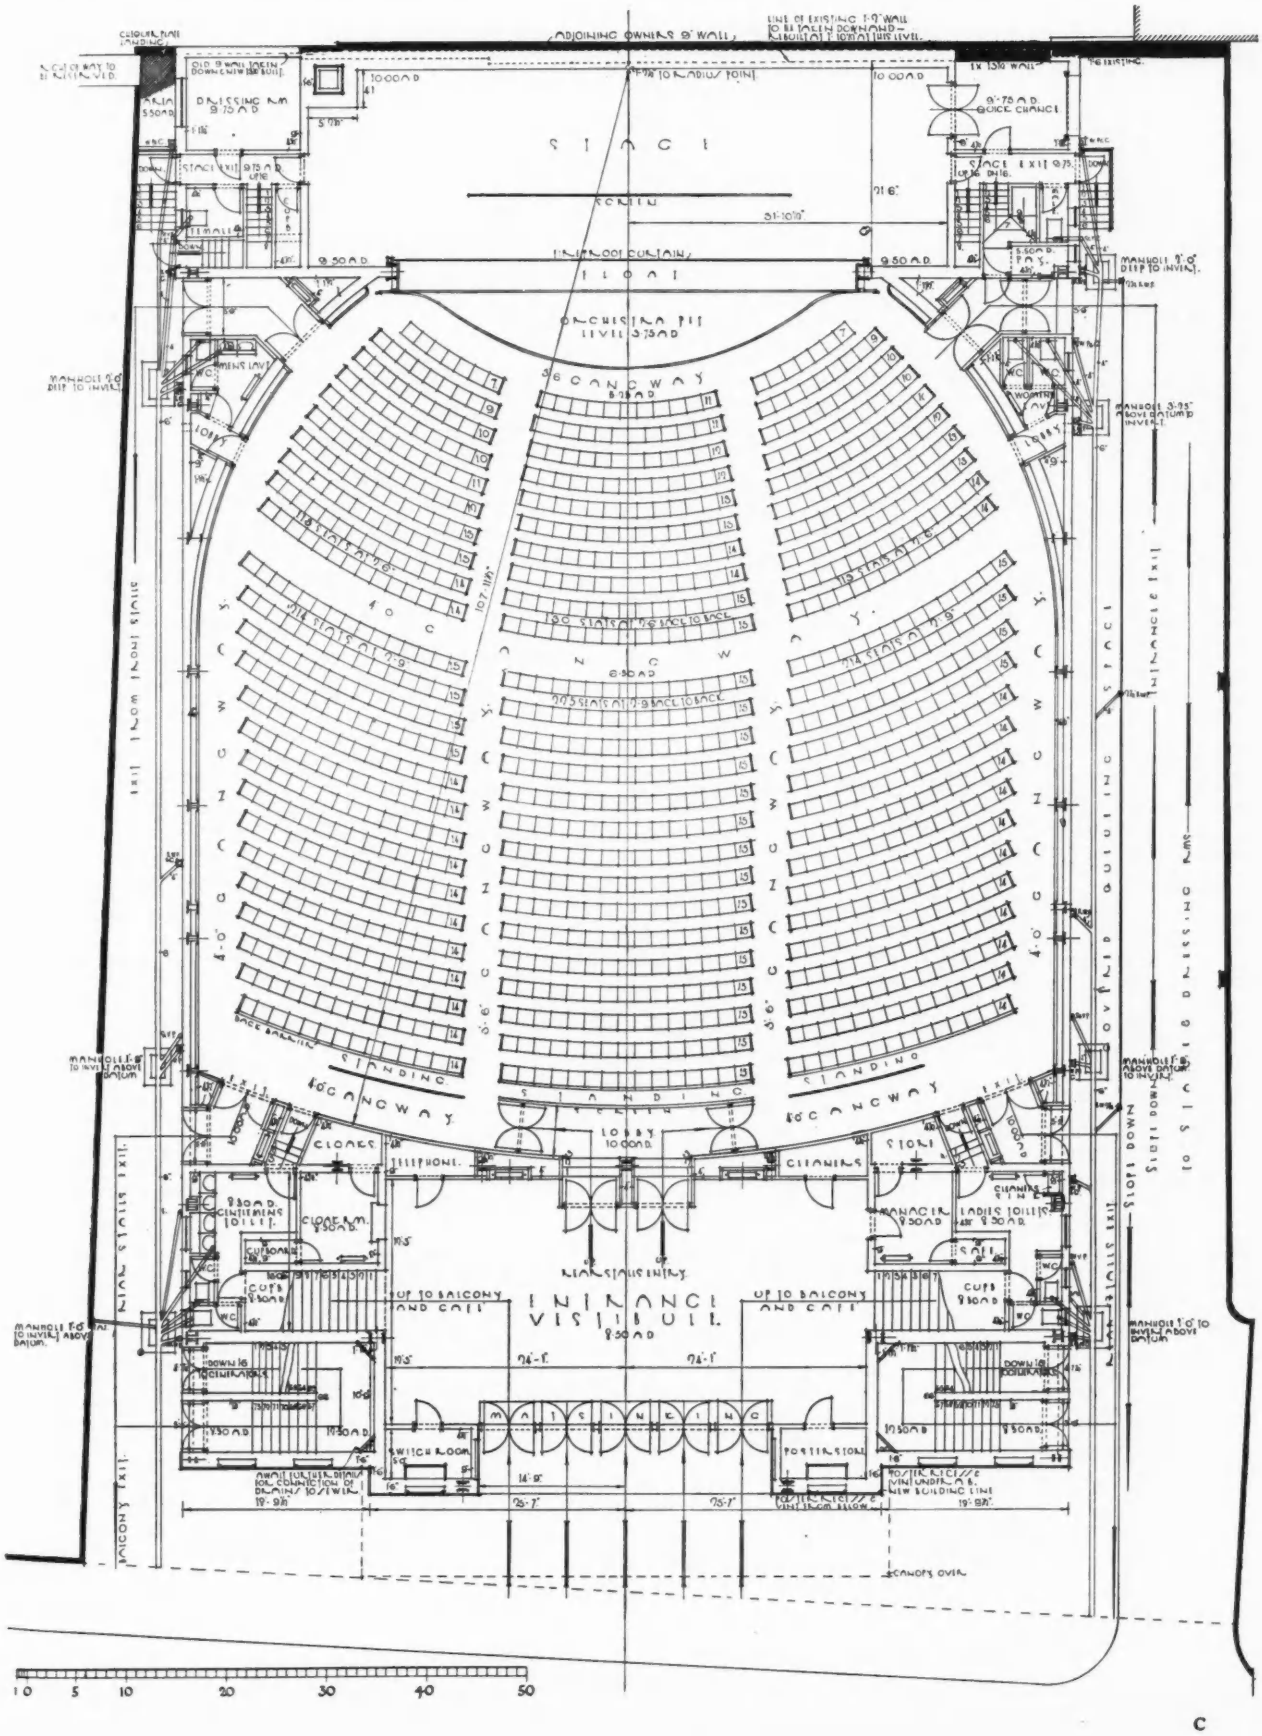
The seventieth annual general meeting of the Institution of Gas Engineers will be held at Liverpool from May 30 to June 2 inclusive.

U.S.S.R. Lecture

"Ancient Church Architecture from the White Sea to the Caucasus" is the title of a lecture to be given by Mr. David Roden Buxton at a meeting of the Society for Cultural Relations between the Peoples of the British Commonwealth and the U.S.S.R., to be held at the London School of Hygiene and Tropical Medicine on Thursday, May 25, at 8 p.m. Mr. Buxton will describe little known wooden churches in the North Russian Forests, churches in brick architecture in Central Russia and the Armenian architecture in Transcaucasia.

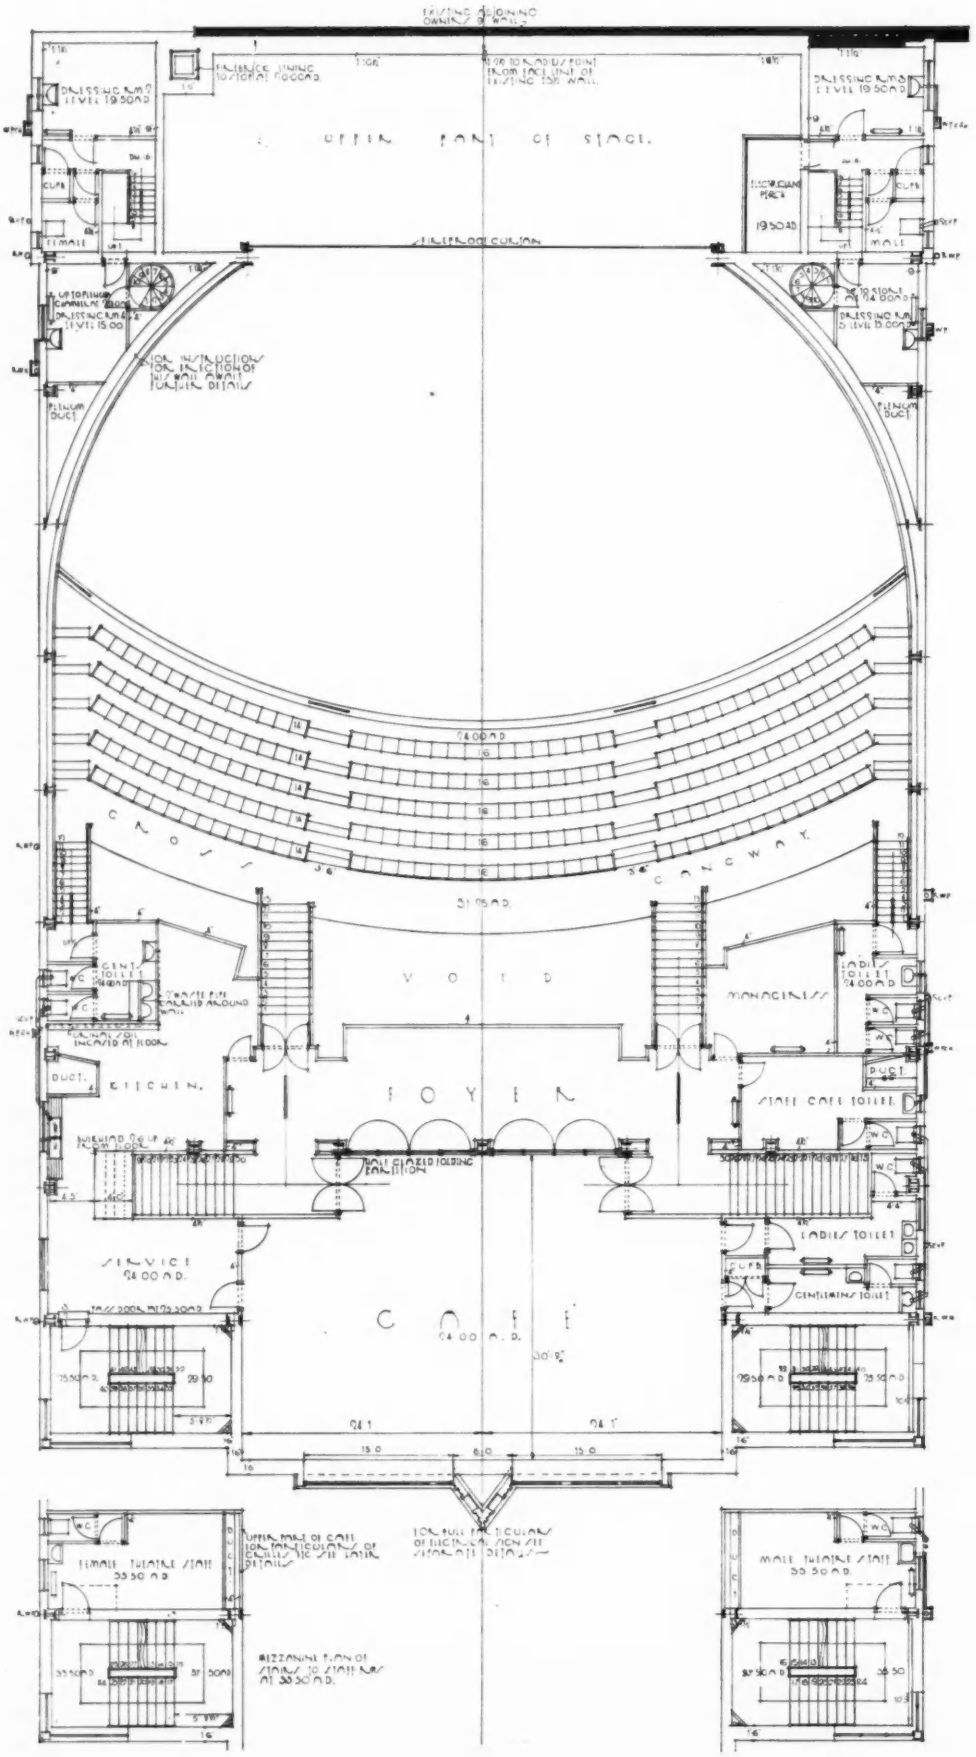
Royal Society of Arts

The Council of the Royal Society of Arts state that Professor Maiuri is unavoidably detained in Naples, and consequently the lecture on "The Recent Excavations at Herculaneum and Pompeii," which he was to have delivered before the Society today, is indefinitely postponed.



Town Planning in America

"Recent American Town Planning developments and their Bearing on the English Problem under the New Act" is the title of a paper to be read by Mr. C. R. Ashbee, M.A., at a meeting of the Town Planning Institute, to be held at Caxton Hall, Caxton Street, Westminster, S.W., on Friday, May 26, at 6 p.m.



ON THE AIR

On Tuesday next, May 23, the sixth of the series of talks on "Design in Modern Life" will be broadcast in the National Programme at 8.30 p.m. by Messrs. Wells Coates and Geoffrey Boumphrey, who will discuss "dwellings."

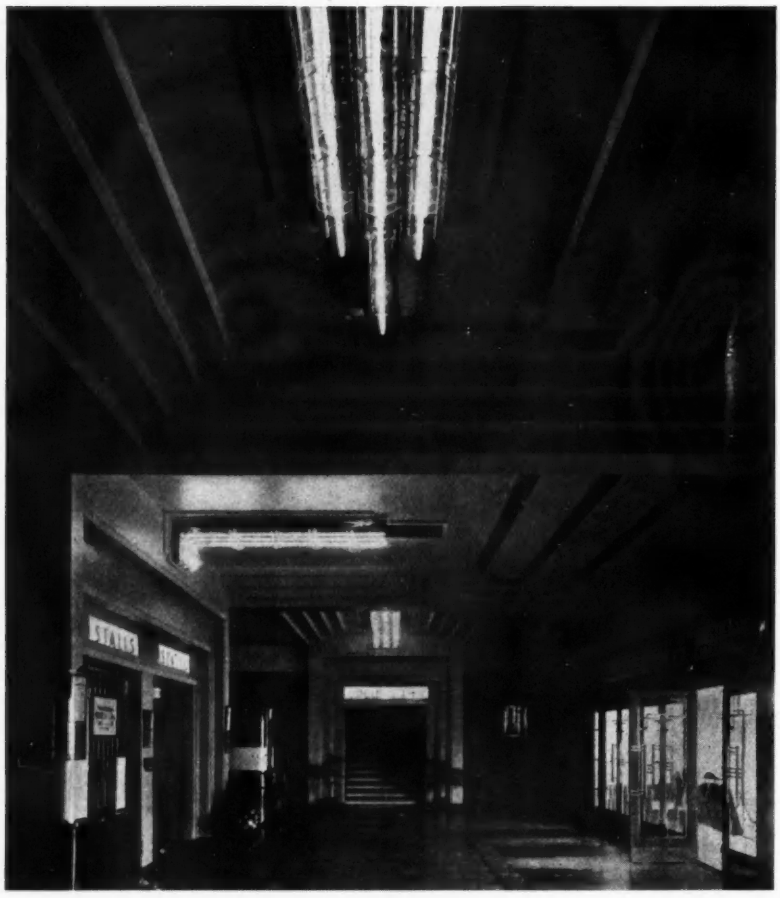
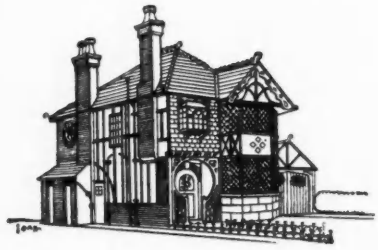
The Balcony Plan

GAUMONT PALACE, CHELTENHAM: BY W. E. TRENT (E. TULLEY, Assistant)



The photographs on this page show some of the light fittings of which large-scale drawings appear on the opposite one ; others appear elsewhere in this issue. The fittings are of chromium-plated metal, with the edges coloured green and vermilion ; the glass everywhere is white flash opal, with the exception of the café, where it is tinted pink. The colour-scheme of the auditorium itself is carried out in shades of warm orange and beige, relieved by bands of pale green touched with silver.

GAUMONT, CHELTENHAM



W. E. TRENT, Architect
E. TULLEY, Assistant

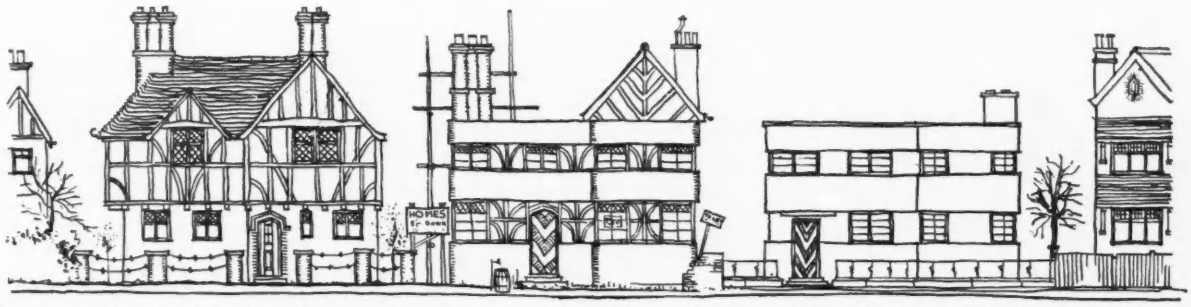
The doorways to the stalls, pictured on the preceding page, reappear on the left of the above general view of the entrance vestibule, looking towards one of the staircases to the circle and café, which is reproduced in order to show the variants of the ceiling light fittings. The walls of the vestibule, which contains pay-boxes, telephones, cloak-room and chocolate kiosk, are panelled in walnut.

The lower photograph on this page is of a mirror, with light above, on one of the landings of a circle staircase.

WHAT IS TO BE DONE ABOUT

THIS?

[*The architect does not, as a rule, make use of the Building Societies; in fact, generally speaking, he knows curiously little about them. The article concluded below shows how the small builder uses them. There is every reason why the architect should use them on behalf of his clients. It is hoped that the information now conveyed by an experienced estate developer may help architects, who have had no experience of Building Society procedure, to consider its possible applications in relation to their clients.*



The following have already appeared:—(March 29) 1. The Speculative Builder, by Penates; (April 5) 2. The Speculative Architect, by Edwin Gunn; (April 12) 3. Building Without Guidance, by Stanley C. Ramsey; (April 19) 4. What the Public Want, by Edwin Gunn; (April 26) 5. The Housing Problem, by Percy Morris; (May 3) 6. The Building Centre Competition, by E. Maxwell Fry; (May 10) 7. How the Architect can use the Building Societies, by H. C. Burdett.—ED., *A.J.*]

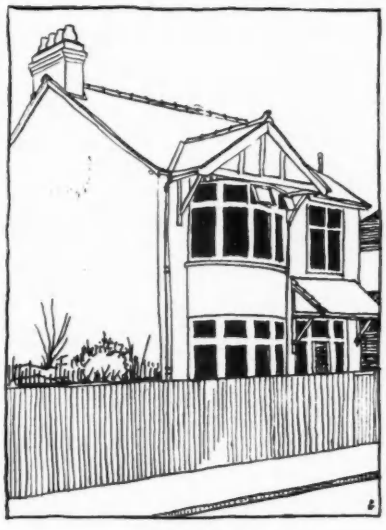
8. How the Architect can use the Building Societies: ii.

[*By H. C. BURDETT*]

Pool Systems

IT can be arranged for a building society to advance more than 90 per cent. This is done by the builder agreeing to protect the society against loss by the deposit of collateral security. This collateral takes the form of an investment with the society of an amount equal to the excess advanced. This investment bears interest at the rate obtaining for the time being, and need not remain attached after the period of risk has passed. For example, suppose a builder wishes to sell his houses on the basis of a total deposit of £25 out of a purchase price of £600. The normal 80 per cent. loan would be

What we expect to see when a conscientious builder decides to respect "local amenities" by building in keeping with his immediate neighbours—



£480. This can be increased to £540 by insuring the excess. The margin of £60 is provided as to £25 from the purchaser and the society will be willing to advance the balance of £35 to the borrower and consolidate this with the mortgage if the builder invests £35 with the society.

This investment is released by the society when the repayments by the purchaser have reduced the loan to normal.

When a number of houses are being sold in this way the collateral investments are "pooled," by which is meant that the "pool" can be attached up to an agreed amount against any specific default. The risk of default can be calculated with reasonable accuracy from past experience, and when the size of the "pool" adequately covers the risk it need not be increased.

Small Speculation: Typical Procedure

Suppose a small builder has a hundred pounds with which to speculate. He finds a suitable site where he believes houses of the type he contemplates will sell readily. Say it costs £3 per foot. He would like to buy enough for

—and when he doesn't.

twelve houses on 20-ft. frontages: 240 ft. will cost him £720. He should arrange a contract to purchase this parcel, paying 10 per cent. deposit (£72) and providing for him to have possession for building purposes and for the balance of the purchase money to be paid plot by plot as he builds and sells. The time the vendor will allow for this delayed completion will vary with the individual, and the builder must bargain for as long as possible. He can always complete earlier if things go better than anticipated.

He must now prepare his plans and specifications and submit them to the local authority for approval and to the building society for building finance. The building society will make enquiries as to his stability from his solicitor and from trade references. They will want to survey the site. If everything is satisfactory they will advise him that he has been granted a loan of so much (about 70 per cent. of their surveyor's valuation) to be advanced on certificate as work proceeds on the security of particular plots.

Suppose he proposes to build houses to sell at £500 freehold, and suppose the building society has agreed to advance on four houses at a time. They have offered him the use of a fund of £1,400 as the work proceeds. This will be paid on certificates issued by their surveyors at approximately the following stages:—

House roofed in, 45 per cent., equals £157 10s. per house.

Plaster finish, 25 per cent., equals £87 10s. per house.

Completed, 30 per cent., equals £105 per house.

Now the builder knows what he has to budget for. The selling price of the house is £500, and he should have allowed for £150 gross profit. The site value of the house is £60, of which £54 is owing. Out of the first certificate advance of £157 he has to pay this to free the land, and is left with £100 for his labour and materials. He should have reached this stage in four weeks—if he has been able to arrange a month's credit for his materials he has only had his wages to provide. This sum might be £200 for the four houses and may be too much for him. His bank might assist if they had a call on the building society's certificates. Alternatively, he must proceed more slowly or get sub-contractors to take over the trades and wait for the payments.

LAW REPORTS

DAMAGES FOR BREACH OF COVENANT

Dickinson v. *Brocklesby.—King's Bench Division. Before Mr. Justice Roche*

THIS was an action by Mr. J. A. Dickinson, of Cromwell Road, South Kensington, S.W., to recover the sum of £42 odd from Mr. J. S. Brocklesby, being rent and charges alleged to be due in respect of a flat at Cromwell Road. As judgment had been refused for the amount claimed, the matter now came before the Court on a counter-claim set up by the defendant against the plaintiff for damages for alleged breach of covenant.

Mr. Bathurst, for Mr. Brocklesby, said his client held the flat with a lease which ran from January, 1931, and his case was that his landlord had failed to carry out his covenants to keep the flat in good repair. The roof was found to be defective and his client had also to complain that damp had penetrated a bedroom wall near the window sill. There was also a lack of electric lighting on the stairs and a stair broken. The rain had penetrated the roof, with the result that his client had had to remove his furniture. He could not sub-let the flat for a long period.

Defendant gave evidence in support of his counter-claim.

Cross-examined, defendant took the view that the flat was uninhabitable when he vacated it. He did not agree that the broken stair was repaired within a week.

Evidence was given for the defendant,

that he placed the flat in the hands of estate agents to let furnished and that they had shown it to many clients, but all had refused to take it because there were signs of damp on the ceiling. It became noticeable in the roof.

Mr. Morle, for the plaintiff, said his client repaired the stair a few days after complaint, and attended to the roof as soon as he could get into defendant's flat, as it was the only way to get access to the roof. The trouble with the roof was due to someone going on to the roof to fix a wireless aerial.

Plaintiff stated that he repaired the stair a few days after the complaint.

His lordship observed that repairs of this kind needed doing in the first five minutes, not the first few days.

Plaintiff explained that the switching off of electric light was only while repairs were being done.

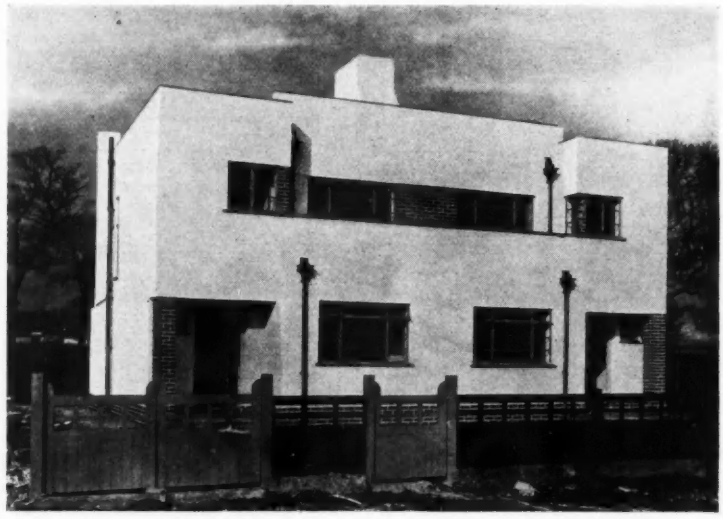
His lordship, after hearing the evidence, said he came to the conclusion that if the plaintiff had wanted to get into the defendant's flat to do repairs he could have done it long before he did. In his opinion the plaintiff treated the matter of the broken stair far too lightly. He had had ample evidence to show that for about a fortnight the condition of the stair gave the defendant a great deal of anxiety. With regard to the roof his view was that it ought to have been repaired long before it was. In the circumstances, he gave judgment for defendant, in the counter-claim, and awarded him £50 damages with costs.

ANCIENT LIGHTS

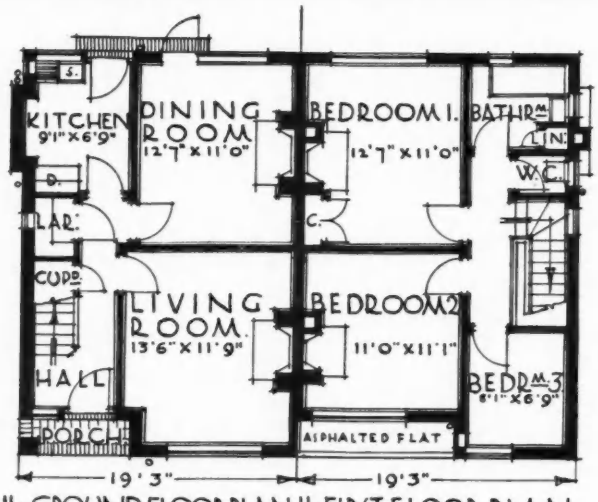
Robertson v. Shears.—Chancery Division. Before Mr. Justice Bennett

THIS case related to obstruction of light to a scullery about 8 ft. by 10 ft. forming the ground floor of a back addition of one of a row of terrace houses, No. 17 New King's Road, Fulham, by the raising and extension of the back addition of the adjoining house. The scullery had been converted into a kitchen and the original kitchen utilized as an additional living room. The property was controlled. Evidence was given as to the disposition of adequate and inadequate light in the room before and after the obstruction, and as to the impossibility of detecting defects, dirt, etc. on various articles of food outside the restricted area of adequate light close to the window.

The obstruction being completed before action was brought, damages only were claimed. Damages were claimed on the whole house, on the ground that adequate light in the kitchen governed the rental value and lettability of the house even though other rooms remained well lit.



The defence was based on the contention that town kitchens were necessarily dark, that the room was too small to be material, and that, the property being controlled, damage to rental was negligible.



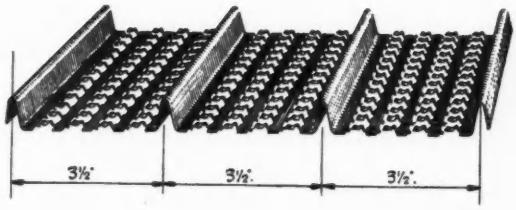
Mr. Vaisey, K.C. appeared for the plaintiff and Mr. Cleveland-Stevens, K.C. for the defendant. Evidence was given for the plaintiff by Mr. P. J. Waldram, F.S.I. and Mr. Culliford, F.R.I.B.A. and by Mr. Doddington, F.R.I.B.A., for the defendants. The learned Judge held that the alleged nuisance affecting the value of the reversion to the property as a whole had been proved, rejecting the contention that dark kitchens were customary in town houses and expressing the opinion that if the action had been brought in time the plaintiff would have had little or no difficulty in obtaining an injunction. He assessed the damages at £150. An application to disallow the costs of expert witnesses was refused.

Battle Abbey

Battle Abbey is to be reopened on May 27. Two years ago it was badly damaged by fire, and has been restored under the direction of Sir Harold Brakspear, F.R.I.B.A. Princess Alice, Countess of Athlone, and the Earl of Athlone will be the guests of honour at the reopening ceremony, and the Bishop of Chichester will conduct a special service in the Abbot's Hall.

HOUSES AT KENTON

½ GROUND FLOOR PLAN ½ FIRST FLOOR PLAN.



DESIGNED BY WALKER AND WESTENDARP

This pair of houses at Kenton, Middlesex, represents an attempt on the part of a firm of estate developers to provide a seemly and up-to-date dwelling for the man with less than £1,000 to spend. Each house is intended to be sold at £850, or 24s. 6d. weekly, including land and space for garage. The actual frontage of each plot is 24 ft. It was stipulated that the planning, accommodation and equipment should be exactly similar to their normal type of house selling at the same price, any saving caused by the omission of external excrescences to be used in obtaining a better finish. Thus no alteration was made in the plans except that the bay windows have been shorn off and the rooms slightly enlarged.

The construction is of 9 ins. brick walls, rendered externally in white cement concrete, with a certain amount of facing bricks, and wooden floors. The flat roof, however, is of patent reinforced hollow blocks, covered with two layers of asphalt. Sills, external and internal, are of black quarry tiles, and a course of similar tiles is set on top of parapet walls. The windows are standard metal frames built direct into the brickwork, but with vertical bars omitted; they are painted bright green. The kitchens are fitted with a gas cooker, small heating boiler and built-in dresser.

London University

Last week the first pile for the foundations of the extension of London University was driven home. Above this pile will be placed the foundation-stone, which the King will lay on June 25.

TRADE NOTES

BY F. R. S. YORKE, A.R.I.B.A.

Flexwood

I HAVE received a letter from a reader asking: "What is flexwood, in what varieties of wood, in what sizes, and at what price is it obtainable?"

•

Flexwood is in essentials a wallpaper with a wood face that can be waxed and polished. It is not meant for the inexpensive reproduction of traditional wood panelling, but can be applied to almost any type of wall surface—with as much ease as any ordinary heavy quality wallpaper—and the edges butted to form joints that are practically invisible and need no cover strip to define them.

•

By a special process a very fine wood veneer—almost any wood can be used, but only prima vera, oak, mahogany and walnut are obtainable in this country—about $\frac{1}{50}$ in. thick, I believe, and normally impossible to handle, has been made flexible and mounted on canvas. It can be applied to an evenly finished wall with the certainty that it will neither warp, shrink nor crack. It is so fine that if carried over an intricate shape or minutely moulded projection, it will take upon itself the exact profile and reproduce quite sharp angles.

•

Flexwood is sold in lengths of 8, 9 and 10 feet; its width varies in accordance with the size of the log from which the veneer is cut, and no particular dimensions are promised, but as a rule all the sheets in one delivery are of approximately the same width.

•

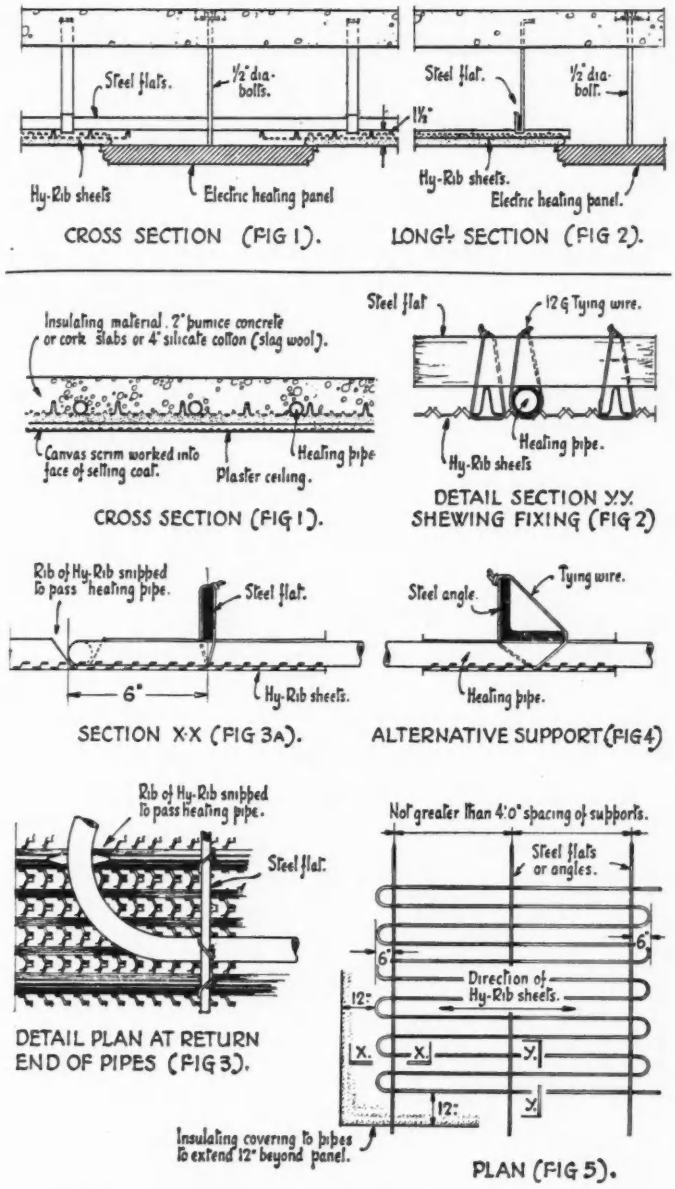
The prices and approximate widths are as follows:—

	Price per sq. ft. s.	d.	Widths
Prima Vera (Obechi)	1	2	10–18 ins.
Quartered Oak	1	2	6–12 ,,
Mahogany	1	2	12–36 ,,
Walnut	1	2	10–36 ,,

Steel Lath Ceilings and Panel Heating

I have received from the Trussed Concrete Steel Co. a copy of the Hy-Rib Handbook. Hy-Rib is a well-known steel lathing, stiffened by rigid high ribs. The ribs and lath are fabricated from a single sheet of metal to produce a one-piece unit of lath and studding.

•



The incorporation of hidden-pipe panel heating systems, or exposed electric panel units, is simplified by the use of Hy-Rib. The standard methods of suspending the lathing lend themselves to the economic arrangement of the latter. The supporting members for the lathing may be relied upon to give adequate fixing for pipes or panels, and the hangers, being few in number, can be placed in position with an accuracy that assures the correct alignment and level of the individual heating units.

•

It will be seen from the accompanying diagrams that the sectional outline of the Hy-Rib sheet lends itself well to the formation of suspended ceilings in which heating pipe panels are embedded. The ribs, serving as spacers, keep the mesh away from the supporting rails, and the pipes may be conveniently nested. The steel rail supports are spaced at intervals to suit both pipes and lathing.

•

The lathing facilitates construction by retaining the insulating material that covers the pipes without further provision. This is

Panel heating in ceilings: (above) method of fixing electric heating panels; (below) details of warming panels in suspended ceilings.

particularly the case when pumice concrete is used and the centering quality of Hy-Rib fully developed. Other insulating material —silicate cotton (slag wool), slab or granulated cork, and so on—may be used, the selection being made, as a rule, by the heating specialist.

Joints in Fibrous Plaster

A reader asks how joints in fibrous plasterwork can be prevented from opening and showing dark cracks.

•

I am told by Messrs. H. E. Gaze that if, when making a joint in fibrous plasterwork, a gap of ¼ in. is allowed, and this is filled with a wad of canvas dipped in plaster, and the gap made good with plaster of Paris, the joint will only open under very exceptional circumstances.

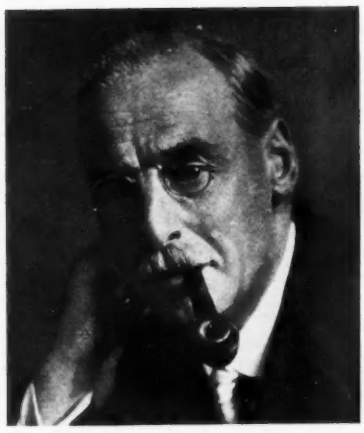
QUESTIONS THAT ARISE



Substitute for Lead

¶ M. G. A-K. writes: "*Would you please let me have your expert's opinion on the following query? : I am living in a Georgian house, square and slate roofed, containing 12 rooms. Rain has penetrated the roof in places and the local builder assures me that it is not a matter of the* slates *but of the* lead *work ; this, despite patching and repair, is now wearing out. He tells me that it would cost about £120 to insert new lead. As I cannot afford this sum, I asked him if it was possible to employ a modern and less expensive method. He then informed me that on several council houses in the county a new material had been used. Also, the firm who manufactured the material had sent their own experts to carry out the work, which, he thought, could have been undertaken by any builder. At my request he wrote to the firm, but they declined the job as being 'too small.' So, sir, I apply to you for further assistance and information on the subject, for I feel quite sure that there* is *something which could be used for the purpose, to replace the original lead, which involves much costly labour.*"

From the description, it seems likely that the alternative material is asphalt, the reason for refusal of the work being that its execution entails the transport of large coppers and furnaces for heating the mastic, which would be out of proportion to the amount of work to be done.

Asphalt is cheap only in fair quantities, when these costs can be spread over a large superficial area. If it is certain that the cause of leakage is defective leadwork it may be possible to replace the lead by a plastic material such as Farotex, applied in two layers with an intermediate reinforcing layer of coarse fabric such as hessian. The suggested cost of £120 for renewal of lead seems unduly high. I have recently had such a case relating to a house (also Georgian) of about the size named and the total cost of taking off and relaying slates, renewing any which were defective, replacing all leadwork (including hips), refixing gutters and repairs to skylights, was £133. Your querist should consult an architect.

E. G.

R. Wynn Owen, F.R.I.B.A., the new president of the Association of Architects, Surveyors and Technical Assistants.

Colour-washed Brick

¶ T. L. C. writes: "*Our house is exposed to great onslaughts of storm and rain driven almost horizontally against it. It is of brick, colour-washed with cream, the shape of brick showing through (washed brick is characteristic of this part of Somerset). The east and west walls are in excellent condition. The exposed south front needs re-washing for the third time in six years. Is there any known preparation that can be mixed with the colour or underlay it to enable it to withstand the weather and not peel off, giving an effect of measles?*"

I have found that a brush-applied slurry of Supercement as a preliminary to colour-washing results in greatly increased permanence of the colouring when applied on bare brickwork, but this treatment is only applicable to work not already colour-washed. It is the *only* treatment which I have found successful on common Flettons or similar machine-made smooth-faced bricks, on which moreover it confers a less harshly mechanical appearance by softening the sharp arris-lines ; looking in the end rather akin to many-times distempered stocks.

For work already treated I should suggest washing and brushing off loose or flaky distemper and painting with such a finish as "Stic-B" in place of redistempering. Generally the measly patches seem to be produced by crystals of salts exuding from particular bricks to which moisture has reached.

E. G.

SOCIETIES AND INSTITUTIONS

A.A.S.T.A.'S ANNUAL MEETING

The annual general meeting of the Association of Architects, Surveyors and Technical Assistants was held recently at the R.I.B.A. The Report of the Council and the balance sheet were adopted unanimously, and the following were elected as officers and members of Council for the year 1933-34 :—

President : Mr. R. Wynn Owen, F.R.I.B.A. Vice-Presidents : Messrs. E. Bond ; A. N. Cathcart ; F. J. Maynard, A.R.I.B.A. ; and Ivor D. Newton. Hon. Editor, *The Keystone*, Mr. P. S. Hudson, A.R.I.B.A. Council :— Messrs. E. S. Brown ; G. A. Ensor ; R. G. Forbes, A.R.I.B.A. ; F. P. Harrison ; C. H. Holden ; L. A. F. Ireland, L.R.I.B.A. ; J. H. Kirkby ; G. G. J. Lacy, L.R.I.B.A. ; C. L. Langshaw ; C. G. Manly ; C. McLachlan, A.R.I.B.A. ; H. A. Mealand, A.R.I.B.A. ; W. C. Morgan, A.M.I.STRUCT.E. ; V. L. Nash, A.R.I.B.A. ; C. B. Pope ; C. H. Rattenberry ; L. H. B. Roberts, A.R.I.B.A. ; S. Sanders, P.A.S.I. ; E. A. D. Tanner, A.R.I.B.A. ; W. E. Woolley, L.R.I.B.A. ; A. H. Wood and J. Rosenfield.

BERKS. ARCHITECTS' MEETING

At the annual meeting of the Berks., Bucks. and Oxon Architectural Association, held at High Wycombe, the officers and members of the Council were elected as follows :

President : Mr. Stanley Hamp, F.R.I.B.A. : vice-presidents : Messrs. W. Austin Daft, A.R.I.B.A., E. Steward Smith, A.R.I.B.A., and G. Langley Taylor, F.R.I.B.A. ; hon. secretary : E. A. L. Martyn, A.R.I.B.A. ; hon. treasurer : T. T. Cumming, F.R.I.B.A. ; hon. auditor : C. B. Willcocks, F.R.I.B.A. Council : Messrs. Steward Smith ; Saxon Snell, F.R.I.B.A. ; W. R. Morris, F.R.I.B.A. ; J. T. Saunders, F.R.I.B.A. ; F. Woods, F.R.I.B.A. ; H. M. Lewis, A.R.I.B.A. ; F. E. Wapshott, L.R.I.B.A. ; A. B. West, F.R.I.B.A. ; S. E. Burrett ; A. Foxley, F.R.I.B.A. ; G. L. Taylor ; H. J. Stribling, A.R.I.B.A. ; C. S. Kimpton, A.R.I.B.A. ; W. D. Hartley, A.R.I.B.A. ; A. R. Barrett ; W. A. Daft ; R. F. Dodd, F.R.I.B.A. ; G. H. Grayson ; N. W. Harrison, F.R.I.B.A. ; and T. Rayson, F.R.I.B.A.

TUNBRIDGE WELLS CHAPTER OF ARCHITECTS

At the annual general meeting of the Tunbridge Wells Chapter of the South-Eastern Society of Architects, the following officers were elected :

Chairman : Major W. H. Robinson, F.R.I.B.A.; treasurer, Mr. C. J. Cable, F.R.I.B.A. ; auditor : Mr. H. C. Scotto ; Secretary : Mr. G. Gregor Grant. Committee : Messrs. L. S. Hatchard, A. S. Killby, F.R.I.B.A. ; W. G. Lovell, L.R.I.B.A. ; Stanley Philpot, F.R.I.B.A. ; C. H. Strange, F.R.I.B.A. ; L. Mason Apps ; R. C. Ball, L.R.I.B.A. ; H. J. Benians, A.R.I.B.A. ; R. A. Cooksey, A.R.I.B.A. ; and S. H. Loweth, F.R.I.B.A.

LITERATURE

EARLY GREEK SCULPTURE

The Technique of Early Greek Sculpture. By Stanley Casson. Oxford University Press. Price 25s. net.

THE purpose of Mr. Stanley Casson's extremely able book is to put forward the results of a systematic investigation of the precise methods and tools used for the creation of Greek sculpture as far back as the middle of the fifth century B.C.

This required from the author a precursory examination of Minoan and Mycenean work in stone and bronze, leading to several conditional deductions, which he has amplified in the second part of the volume. These concern the actual character of the implements used during the periods under consideration, together with an exhaustive examination of contemporaneous sculpture.

In several instances, the testimonies of modern stone and bronze workmanship are examined, step by step, in comparison with the methods employed by the ancient sculptors. The writer takes into consideration throughout the book the interworking of technique and style in Greek sculpture, and presents his opinions with a lucidity which renders them equally comprehensible to the student of archæology, and to the less knowledgeable ordinary reader.

In these enlightened days we are no longer content to regard passively the great works produced in bygone civilizations. We like to know by what methods they were achieved. Hence, it is obvious that Mr. Stanley Casson's book makes a timely appearance, for it appears to be the first publication dealing with an aspect of Greek sculpture hitherto almost entirely ignored. Of the ninety-six photographic illustrations accompanying the letterpress, the greater proportion are either entirely new, or represent unfamiliar details of their subjects. These are augmented by reproductions of a great number of drawings of sculptor's tools, both ancient and modern, including examples of chisels, rasps, gouges, burnishers and hammers.

The graceful ensemble of the figure of the Cycladic harpist (reproduced on this page), presents a beauty of line which might well be emulated today. How much pleasanter it would be to recline in a modern tubular steel chair, modelled upon the type shown in the illustration, than distrustfully to seat oneself on one of these now fashionable crudities wrought on such inherently illogical principles of construction !

JULIA CHATTERTON

In the review of THE TECHNIQUE OF EARLY GREEK SCULPTURE *on this page it is suggested that the chair on which the Cycladic harpist is seated offers a* motif *in design to the modern tubular furniture manufacturers. The illustration is reproduced from the book ; and the original work is on exhibition in Athens National Museum.*

B.B.C. PAMPHLET

Design in Modern Life. Pamphlet No. 667. Published by the British Broadcasting Corporation. Price 6d. net.

THIS little book, with its 32 pages of provocative illustrations and 16 pages of text, is one of the best sixpennyworths that has appeared for years. It expands by means of carefully selected examples of good, bad, ornate and functional design, the theme of the broadcast talks that began recently and are continued each Tuesday evening in the National Programme.

The text of the book consists of a compact summary of these talks, following a brief explanatory introduction by Mr. Noel Carrington ; but it is from the illustrations and their informative captions that the real stimulation is derived. The educational value of these illustrations is immense: the almost bruising shock of the contrast provided in the sections devoted to clothes and furnishing is unforgettable ; and the impartial record of the queer blind spots that afflict our civic consciousness must surely bring thousands of people to a healthy condition of dissatisfaction with poor, unplanned England. How deeply these broadcast talks cut into the nature of England's civic degeneration is suggested in the summary of Mr. Robert Atkinson's contribution (to be given on June 13), which concerns design in public buildings. " Can the modern hospital be called efficient or even economic ? " is one of the disrupting questions in this summary, and " Why does a hospital cost so much more per bed than an hotel ? Why are central sites, worth millions of pounds and

surrounded by the roar of traffic, retained for hospitals? Why not small casualty clearing stations in the city to serve larger units outside?"

The illustrations collected by Mr. Maxwell Fry to demonstrate how towns can be planned or just muddled together begin, rightly, with Wren's urbane statement of London's possibilities, and the grand order of Bath, and they also include views of the residential and industrial ulceration that now spreads its leprous crust upon the face of the land. The book concludes with a practical guide for people who want to see examples of good design in buildings, cities and exhibitions, and there is an admirable list of books.

As a piece of propaganda for good design and intelligent thinking about the whole subject of design, this book is wholly successful. Casually introduced to a difficult client, the architect might well discover in this sixpennyworth of interesting common sense an instrument of persuasive potency. Nobody could resist the illustrations, and once they have fallen for their well-told story the most opinionated obstructionists may become malleable and even understand that design is not a matter of personal whim.

SLUM CLEARANCE AND RE-HOUSING

The Public v. *The Slums*. London: The Rotary International Association for Great Britain and Ireland. Price 6d. (post free 8d.)

THIS illustrated pamphlet has just been issued by the Rotary International Association for Great Britain and Ireland, Tavistock House, Tavistock Square, W.C.

It contains a foreword by Sir E. Hilton Young, Minister of Health, and a special message from Mr. J. M. Keynes describes the scheme for slum clearance which the Rotary Association is now putting forward to follow its "Spend for Employment" campaign.

The aim of the scheme is to assist the national work of slum clearance and rehousing by means of the formation of Public Utility Housing Societies in towns in all parts of the British Isles. It is claimed that this scheme will provide not only considerable employment, but also a sound outlet for money at present lying idle.

Books reviewed in these columns may be ordered through The Architectural Press, 9 Queen Anne's Gate, S.W.1.

Publications Received

The Arts in American Life. By Frederick P. Kettel and R. L. Duffus. New York: McGraw Hill Publishing Co. Price 15s. net.

Arc-Welded Steel Framed Structures. By Gilbert D. Fish. New York: McGraw Hill Publishing Co. Price 30s. net.

Reinforced Concrete Bridge Design. By C. S. Chettoe. London: Chapman and Hall. Price £2 2s. net.

The Disappearing City. By Frank Lloyd Wright. New York: Farquhar Payson. Price $2.50.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

The Battlefield of Waterloo

SIR WM. DAVISON inquired of the Secretary of State for Foreign Affairs if he had now received a report from His Majesty's Ambassador at Brussels with regard to the proposal to erect houses on the Field of Waterloo: and what was the purport of the same?

Sir John Simon replied that His Majesty's Ambassador at Brussels had reported that a Private Bill had been laid before the Chamber of Representatives for the purpose of abrogating the law of March 26, 1914, preserving the battlefield of Waterloo from building operations. The matter was under the consideration of the Belgian Government, and His Majesty's Ambassador would keep him informed of developments.

Sir Wm. Davison then asked if it was not a fact that on Thursday, May 4, that Bill was rejected by the Belgian Parliament.

Sir J. Simon said that he had no official knowledge of it, but, in that case, he hoped the hon. member was satisfied.

Government Buildings in Edinburgh

Mr. Scrymgeour-Wedderburn asked the First Commissioner of Works whether there was any probability that any scheme for the construction of new Government buildings in Edinburgh might be approved in the near future; and whether he saw any prospect of agreement among the various persons or bodies in Edinburgh whose opinions were being consulted.

Mr. Ormsby-Gore, the First Commissioner of Works, said he was not in a position to give any definite answer to the first part of the question. All he could say was that he had sought the best advice possible, and was now hopeful of some agreement being reached.

Mr. Scrymgeour-Wedderburn asked whether it was the case that things were being held up by the inability of the people in Edinburgh to agree, and, if their differences could not be composed, would the Government produce a scheme of their own, in view of the urgency of the matter.

Mr. Ormsby-Gore said it was not exactly a question of urgency, but it would take some time to work out a new plan and new designs. Until the questions of siting and accommodation and the nature of the buildings had been agreed on with the various people in Edinburgh, there was no real hurry.

Trade Items

Messrs. J. and H. Patteson, Ltd., of 96, Oxford Road, Manchester, whose most recent London contract comprises the whole of the marble work for the control room and the main entrance hall to the new Battersea Power Station, have appointed Mr. F. W. Holloway as resident representative for London and the Southern Counties. His address is 7, Bridgeman Road, Teddington, Middlesex (Telephone No.: Kingston 4710).

Messrs. Pattesons have carried out many contracts throughout the country in marble, granite, stone, mosaic, terrazzo, and bronze, and also ecclesiastical work in oak.

*

Competing at the London Music Festival Competition held at the Westminster Central Hall on March 22, the Truscon Singers were successful in winning the first prize for Quartets, gaining a Certificate of Merit and cheque; also the privilege of performing at the Final Prize-winners' Concert which was held on Monday, April 10.

The Truscon Singers' entry into the Musical Competition world began in June last year. In five competitions they have gained four first prizes (medal and certificates) and one second, being beaten by only two per cent. in the latter instance.

The Truscon Singers comprise Messrs. J. Orr, H. W. Rose, T. Hawkins and D. Munro and the musical director is F. G. Windsor, all of whom are members of the London Staff of the Trussed Concrete Steel Co., Ltd.

*

Messrs. Sal-Ferricite Constructions, Ltd., have removed their offices to 119 Victoria Street, S.W.1. Telephone Nos.: Victoria 3224-3225.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue:

Gaumont Cinema, Cheltenham (pages 656–662 and supplement). General contractors, McLaughlin and Harvey, Ltd. Sub-contractors: Archibald D. Dawnay and Sons, Ltd., steelwork; Clark and Fenn, Ltd., plaster and decorations; A. Anderson and Son, electric wiring; Siegwart Flooring Co., Ltd., flooring; Garton and Thorne, Ltd., outside sign and canopy; Bulman Jupiter Screen Co., Ltd., perforated screen; G. N. Haden and Sons, Ltd., heating and ventilation; A. E. Davis, ironmongery; John Compton Organ Co., Ltd., organ; Frank Burkitt, Ltd., projection room shutters; Knight & Co. (Engineers), Ltd., fireproof curtain; Turners, seating and carpets; Lawford Asphalte Co., asphalting; Marble Mosaic Co., Ltd., terrazzo floor; Arthur Scull and Sons, Ltd., plumbing; Bath and Portland Stone Firms, Ltd., figures on front; E. G. Walters & Co., Ltd., floors in manager's flat, etc.; British Acoustic Films, Ltd., talking installation; Martin Van Straaten, tilers; Claude-General Neon Lights, Ltd., lights to sign; The Automatic Sprinkler Co., Ltd., sprinklers; Korkoid Decorative Floors, entrance hall floor; Potter-Rax Gate Co., hand rails; Geo. Bence and Sons, glazing and drainage, etc.; Sharp and Fisher, Ltd., cement, etc.; H. Packer and Co., Ltd., bricks, haulage, sand, etc.; Farquharson Bros. & Co., timber; Moler Products, Ltd., partition blocks; Crittall Manufacturing Co., Ltd., window frames; J. Wright & Co. (New Malden), Ltd., floor fillets; Hitchens Flush Woodwork, Ltd., entrance hall panelling; F. H. Pride, lighting fittings; Haskins, Ltd., steel shutters; Kingsmill Metal Co., poster frames and grilles; Fortilite, Ltd., cold glaze to walls; Benham & Sons, Ltd., kitchen equipment; Bostwick Gate Co., collapsible gates; Laminated Wood Products, flush doors.

Houses at Kenton (page 664). General contractors, H. R. and P. (London) Ltd. Sub-contractors: London Brick Co. and Forders, Ltd., Flettons; Askham Brick and Tile Co., facing bricks; Cement Marketing Co., Ltd., Snowcrete; Kleine Patent Fire Resisting Flooring Syndicate, roofs; Limmer and Trinidad Lake Asphalt Co., Ltd., asphalt; Crittall Manufacturing Co., Ltd., metal windows; R. May and Son and the Wealdstone Joinery Works, timber and joinery; Standard Wallpaper Co., Ltd., grates, mantels and door furniture.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

The CAMBERWELL B.C. has adopted a scheme, prepared by Messrs. Culpin and Bowers, for extensions at the Town Hall, at an estimated cost of £50,000.

Plans passed by the CAMBERWELL B.C. : Blocks of flats, site of 40-2 Shard Road, for Messrs. W. H. Woodruffe and Son ; building extensions, adjacent to Herne Hill Congregational Church, for Messrs. Rees and Partners ; extension, premises of Messrs. Samuel Jones & Co., Peckham Grove, for Messrs. Bishop and Etherington Smith.

The Surrey Education Committee has approved plans for the erection of a central school for 360 pupils and a junior school for 384 pupils at CHEAM.

The Surrey Education Committee has purchased school sites at CUDDINGTON, where 4,500 houses are to be erected. A junior school is to be built as soon as possible.

The EAST HAM Corporation is to erect 98 dwellings on the Goosleley Lane estate, at an estimated cost of £32,500.

Plans passed by the EAST HAM Corporation : Factory extensions, High Street South, for Messrs. Burgoyne, Burbridges & Co. ; factory extensions, Factory Road, Silvertown, for Messrs. Bateman, Loders and Nucholine, Ltd. ; shop, Johnstone Road, for Mr. E. C. Winter ; 15 houses, Grantham Road, for Messrs. A. W. Jaggers and Sons.

Plans passed by the LEWISHAM B.C. : Rebuilding, 20 Upwood Road, for Messrs. Thomas Allen (Lee), Ltd. ; rebuilding pavilion, Rutland Road, for Messrs. Rogers and Rogers ; two shops, Downham Way, for Mr. C. Durbin ; four houses, Westwood Park, for Mr. Newton Anderson ; two houses, Ewhurst Road, for Mr. L. A. Denham ; 33 houses and four shops, Brockley Road, for Mr. Hugh Macintosh ; additions, 164-6 Rushey Green, for Messrs. Thompson and Walford ; rebuilding, 32-4 Brockley Park, for Mr. A. Casse ; 144 houses, Manor Lane estate, for Manor Estates, Ltd. ; houses, Manor Lane estate, for Messrs. Hugh F. Thoburn, Ltd. ; streets, Peak Hill Lodge estate, Sydenham, for Messrs. Brett and Son ; houses, Perry Rise estate, Forest Hill, for Mr. R. B. Rowell ; houses, Woodcombe Crescent, Forest Hill, for Mr. A. G. Cole.

Plans passed by the SOUTHALL-NORWOOD U.D.C. : 28 houses, Delamere Road, for Hayes Bridge Estate, Ltd. ; 30 houses, Longford Avenue, for Messrs. G. Wimpey & Co., Ltd. ; three shops, North Road, for Mr. W. Etheringham ; four houses, Dorset Avenue, for Messrs. Warren and Woods ; roads and sewers, Butterfly estate, for Property Development and Construction Co., Ltd. ; lock-up shops, North Road, for Mr. E. Hayes.

SOUTHERN COUNTIES

The BRIGHTON Corporation Pavilion Committee recommends the scheme for re-modelling the Dome and Corn Exchange, at an estimated cost of £60,000, and an architect is to be appointed to prepare drawings and specifications and to superintend the work.

Plans passed by the WORTHING Corporation : 12 houses, Sunny Close, for Mr. C. W. Fielder ; three houses, West Parade, for Mr. M. R. Fletcher ; flats, Lansdowne Close, for Mr. F. W. Payne ; six flats, Christ Church Road, for Mr. H. M. Potter ; two houses, Offington Drive, for Mr. L. Daynes Wood ; two houses, Westland Avenue, for Mr. E. G. West ; three houses, Pembroke Avenue, for Mr. S. C. Kirby ; two houses, Loxwood Avenue, for Mr. H. M. Potter ; six houses, Cottenham Road, for Mr. H. M. Wallace ; 24 houses, Tynemouth Park estate, for Mr. W. Moore ; six houses, Billy Mill estate, for Mr. J. H. Rogers ; two shops, Chirton Green, for Messrs. F. R. N. Haswell and Son ; 4 houses, West Allotments, for Mr. W. R. Spedding.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

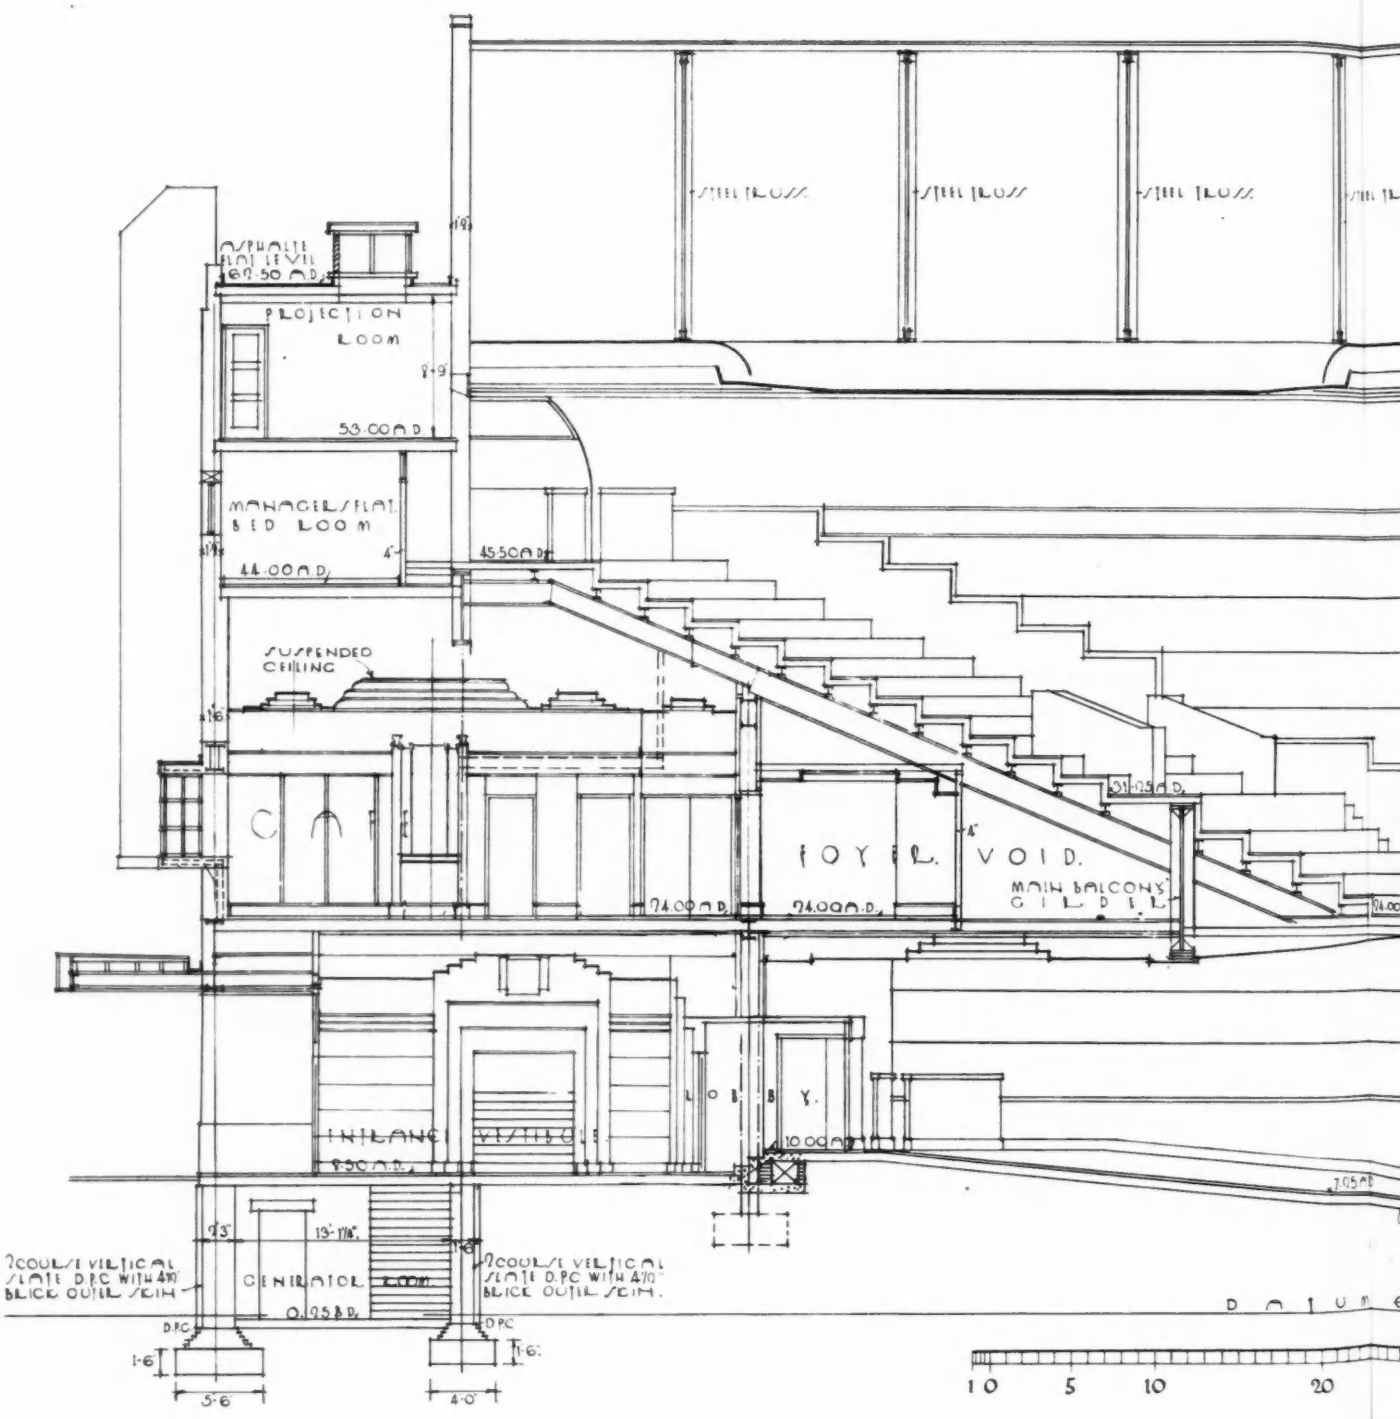
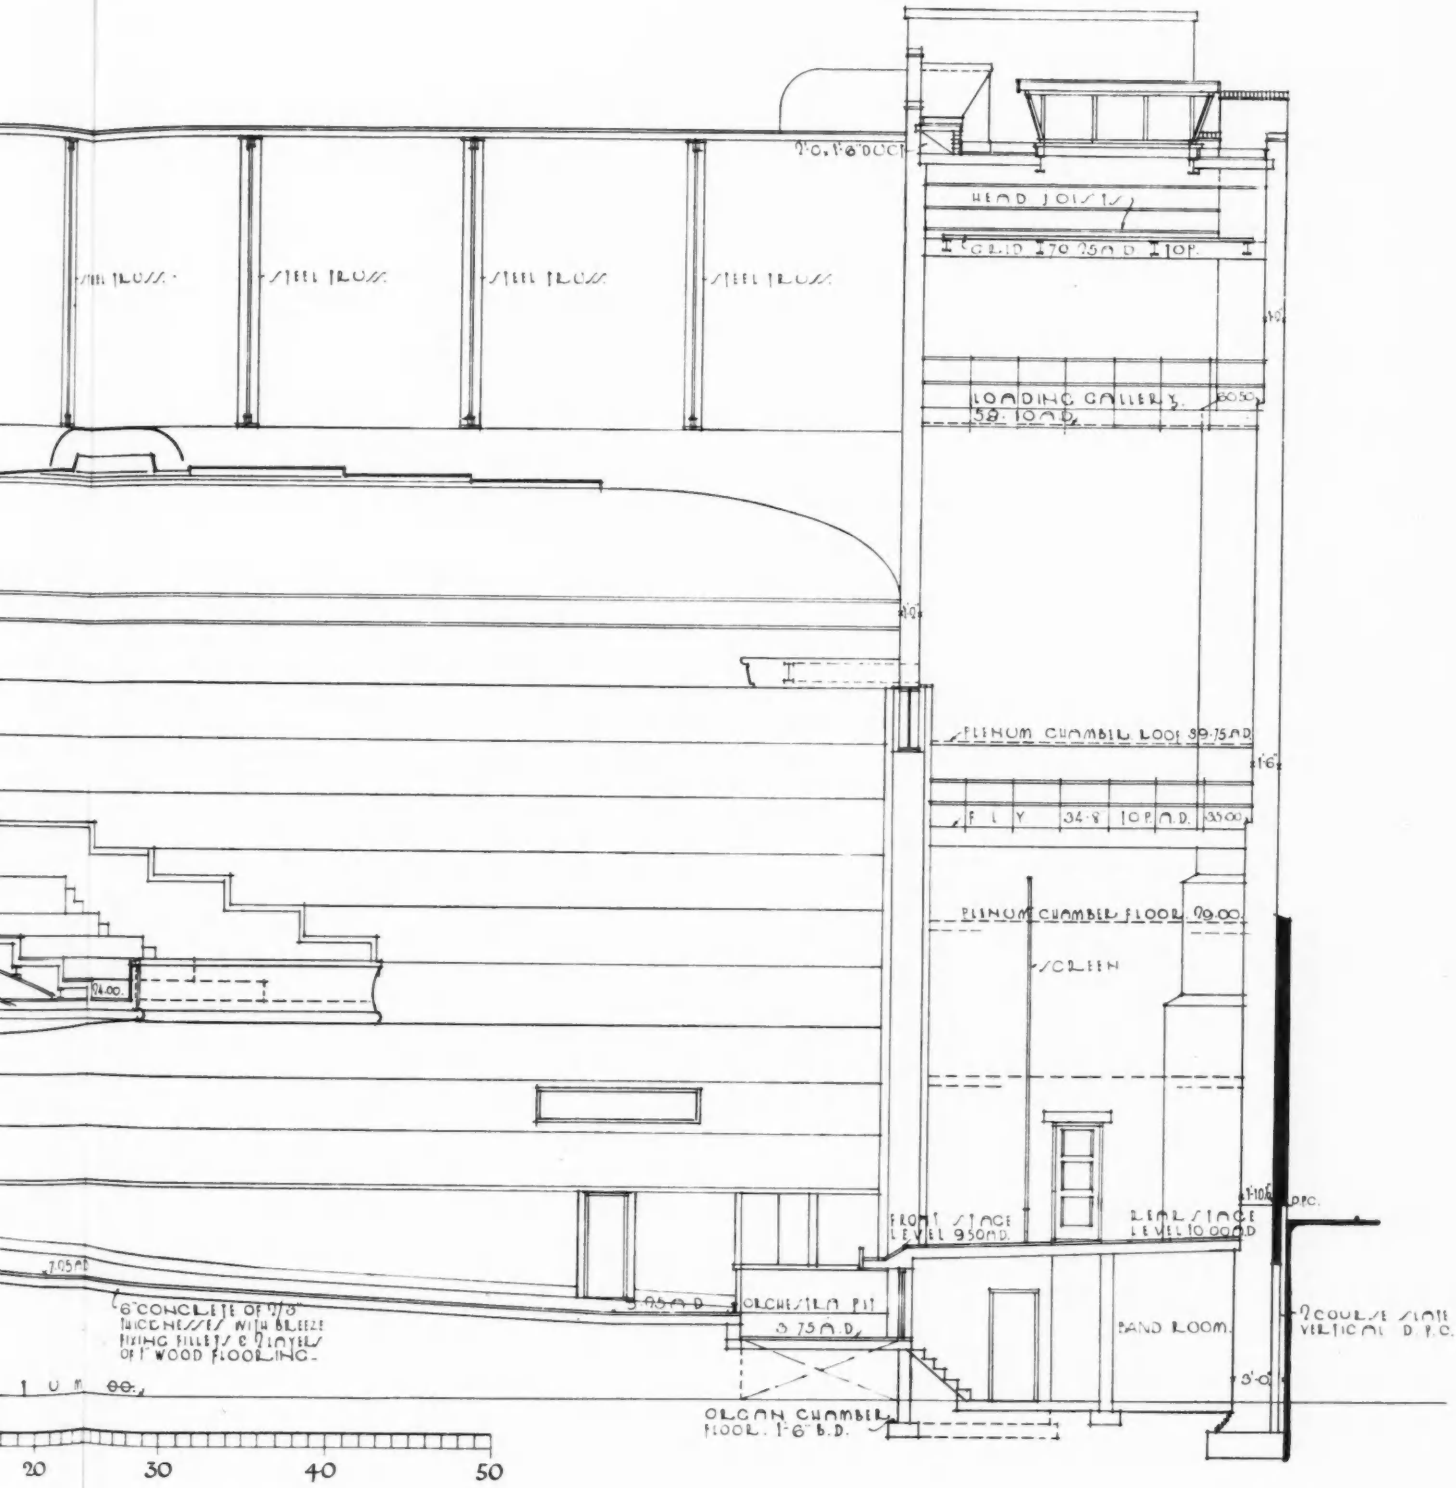
GAUMONT PALACE, CHELTENHAM

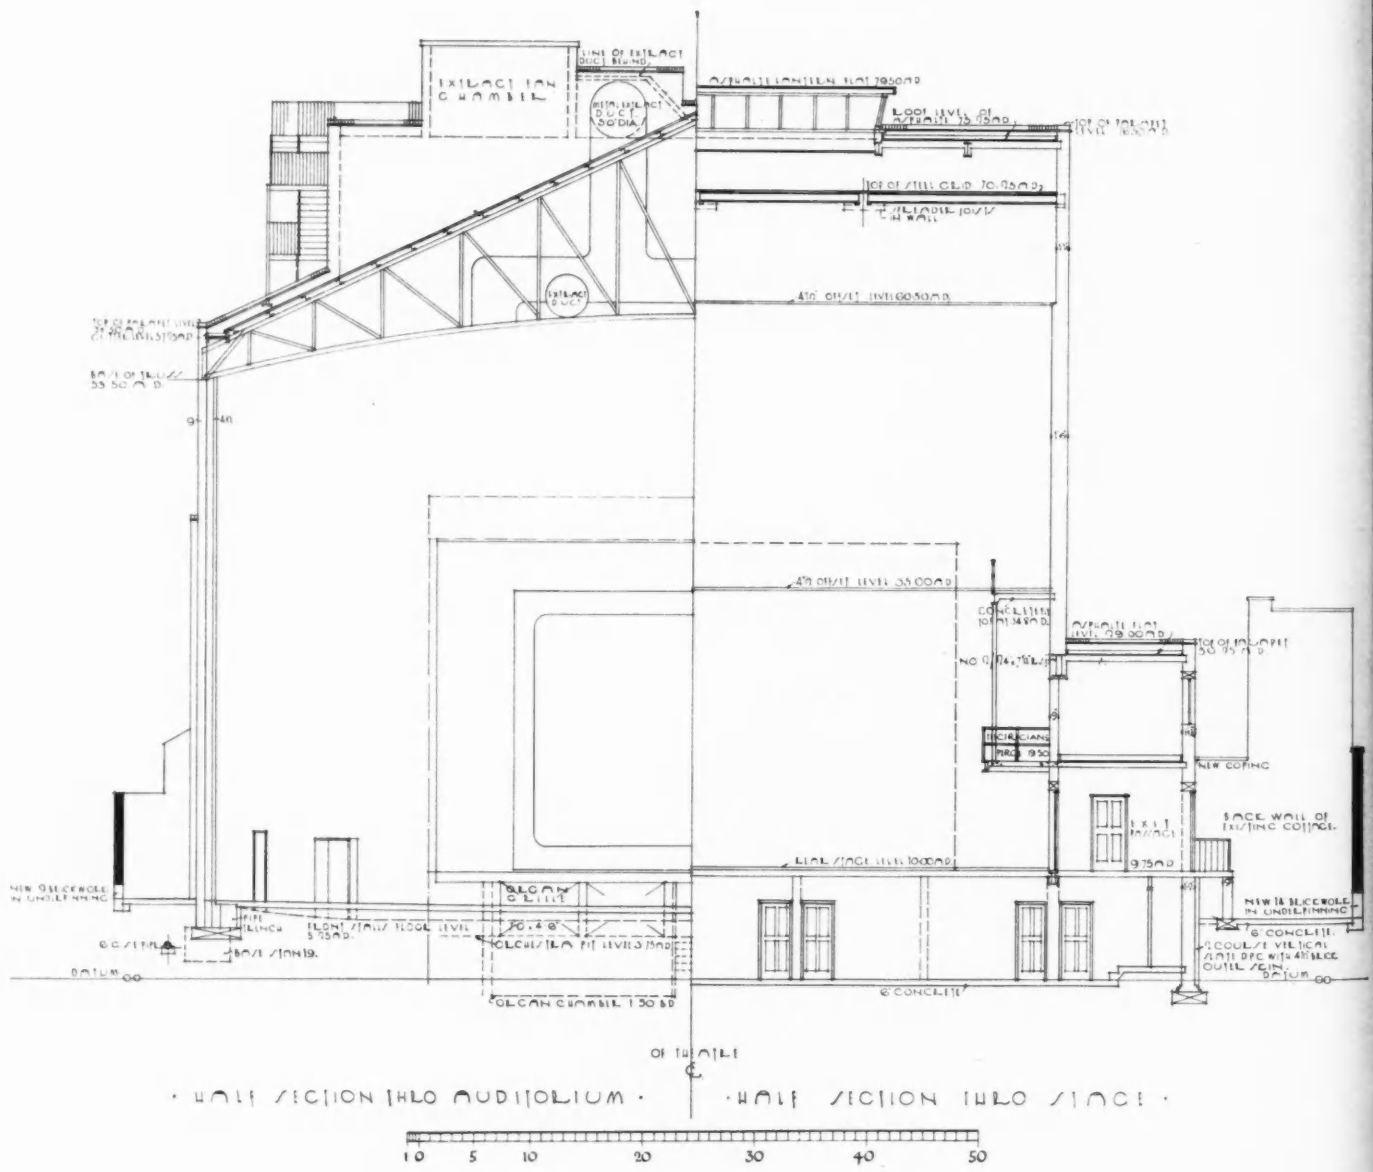
W. E. TRENT, ARCHITECT; ERNEST TULLEY, ASSISTANT



LIGHTS UNDER THE BALCONY SOFFIT



ON the centre and back pages of this supplement are reproduced drawings of longitudinal and cross sections of the picture theatre of which plans, photos and a description appear in the body of this issue.



Both give interesting details of the constructional materials and units. In the former, on the right, the ample nature of the stage facilities is suggested, and on the left is shown the flat for the manager, which is fitted in at the rear of the balcony, on the main façade, below the projection chamber and above the café, which has a suspended ceiling.

The cross section, halved vertically, shows very clearly the manner in which the construction varies and tallies as between the two portions of the building lying in front of and behind the proscenium.

The forward portion of the soffit of the balcony is sloped upwards towards the screen, to give uninterrupted sight lines, as suggested in the view above. Drawings of its light fittings, and of others in the house, appear on page 660.

INFORMATION SHEET: TABLE OF RISERS FOR STAIRS.
SIR JOHN BURNET, TAIT AND LORNE ARCHITECTS ONE MONTAGUE PLACE BEDFORD SQUARE LONDON W.C.I.

INFORMATION SHEETS

• 18 •

RISERS FOR STAIRS

•

THIS week's Sheet is the second of a series of nine dealing in detail with the layout and construction of staircases.

Probably no other in the series conveys more information in so little space. From the table, the heights of individual risers in any number of steps desired in a flight between floor and floor, varying by inches from 6 feet to 13 feet 11 inches, can be read off at a glance. The limiting heights of the risers themselves are 5 inches minimum and 9 inches maximum.

The following is a full list of the subjects previously issued :—

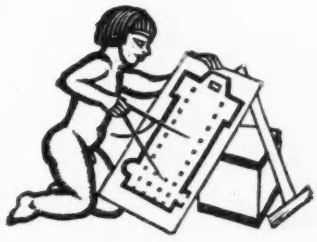
1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.
8. Mar. 8—Billiard Table Data.
9. Mar. 15—Roof Pitches and Drainage
10. Mar. 22—Lift Sizes, etc.
11. Mar. 29—Sanitary Accommodation.
12. Apr. 5—Lavatory Units.
13. Apr. 12—Lavatory Units.
14. Apr. 19—Plumbing to Basins, Baths, etc.
15. Apr. 26—Pipe Chases, etc.
16. May 3—Drains and Manholes
17. May 10—Stairway Diagrams.

LARGER THAN THE SPHINX

HEADS OF FOUR U.S.A. PRESIDENTS

THIS view shows the memorial to four famous American Presidents which is being carved from the granite face of Mount Rushmore in South Dakota. It is an actual "cut" from a British Paramount News Film which was shown for the first time in London last week.

It is not often that a sculptor has a complete mountain from which to carve his statue, but the American tendency towards megalomania is given full scope here, for, when completed, the monument will be seven-and-a half times larger than the Sphinx, and the nose of George Washington, whose face is one of the most complete at present and is shown in the above photograph, is 24 feet long. The other Presidents whose greatness is thus literally commemorated are "Teddy" Roosevelt, Abraham Lincoln and Thomas Jefferson.



The memorial stands 6,000 feet above sea level, and was designed by an American sculptor, Gutzon Borglum, and dedicated by President Coolidge. It was begun five years ago, and is expected to be finished in another five years' time.

WORTHING TOWN HALL

Designed by C. Cowles-Voysey

On Monday, Prince George opened the new Town Hall, of which the above is a general view of the main east front to Chapel Road; Stoke Abbot Road runs up the side nearest the camera. A portion of the architect's drawing of the main elevation appears on the first page of a Supplement with this issue; on its inner pages are reproduced the ground and first floor plans. Other illustrations are given in the body of this number.

REGISTRATION: DO IT NOW

REGISTRATION is a *fait accompli* after years of struggle. Just before the beginning of the year the Register was opened for enrolment, leaving a period of twelve months before it closes finally and irrevocably on December 31, 1933.

After this date no architect who is not already on the Register will be able to get on, or to call himself "Registered Architect," unless he passes an examination approved by the Statutory Board of Architectural Education, an examination the terms of which, as so far approved, were announced recently in this JOURNAL.

The business of enrolling architects now practising, or going through the motions of practising, their profession, is proceeding, and up to date some 4,000 out of a possible total of 12,000 have applied for registration, 3,000 being members of the R.I.B.A. and its Allied Societies.

Now, although enrolment is going forward steadily, there is a definite danger that many of the 7,000 or 8,000 architects who have made no definite move in the matter will wake up to find themselves left outside in January, 1934, and raise a shocking hullabaloo about the way things go on and are managed.

Because Time quite remorselessly "goes on," not even yielding his pace for the last day or hour, this reminder comes NOW, while there yet remain well over half the months of the year in which to take action.

Note also that Acts of Parliament are like Time in this quality of remorselessness.

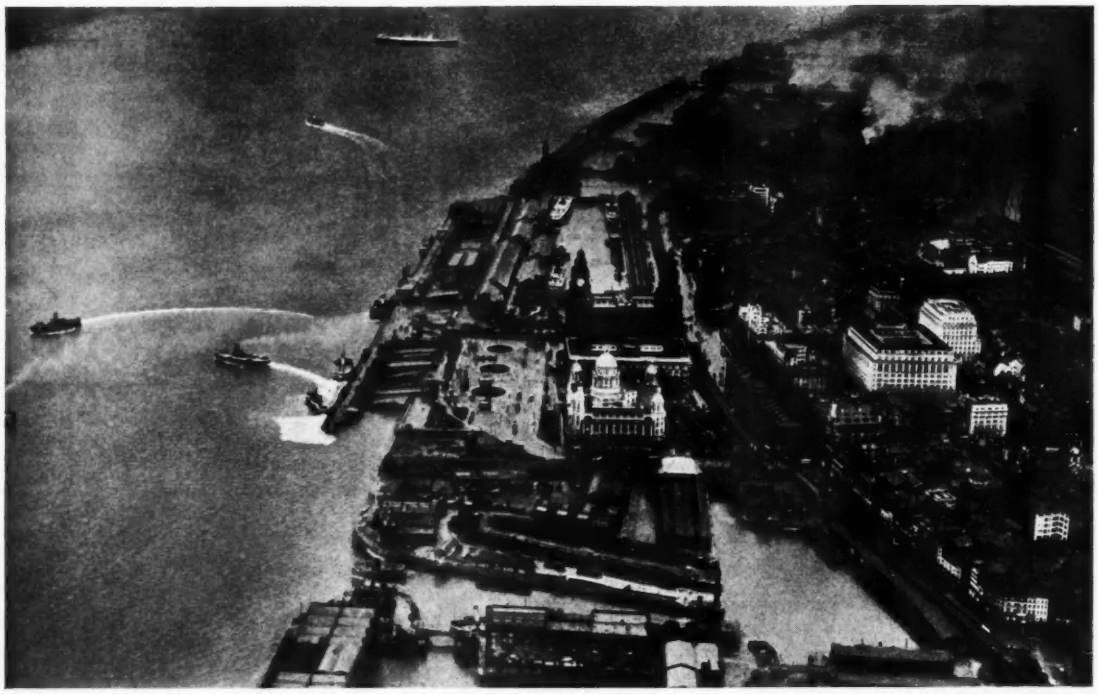
On the 31st of December, 1933, the Register closes.

After that date no amount of clamour will open it again, for an Act cannot be stretched or varied to suit the convenience of the apathetic, and those who delay too long will have to suffer the pains of examination if they are to overcome the disappointment of being left outside the place where so many of their fellows sit ensconced.

All this we say on a note of warning and in the name of urgency and practical expediency. But enrolment on the Register serves more than personal interest.

It is not a trade union. No one really expects that by calling oneself Chartered and Registered Architect instead of Chartered Architect, or simply, Architect, one will attract a queue of smiling clients. There is, of course, the expectation that the establishment of registration will give a clearer indication than formerly of where are to be found men capable of architectural trust; but of far greater importance to us all is the knowledge that, as time goes on, the practice of architecture will be almost entirely in the hands of properly trained men, and that in measure as the idea of registration penetrates the common intelligence, the increasing supply of trained men will find a widening sphere of practice.

We are all agreed that at the bottom of most of our difficulties today lies ignorance, shared, but not equally, between the public and architects themselves. In the name of architecture a vast, nearly criminal traffic in bad building is carried on by a host of people lying well outside the sphere of registration, damaging the value of what is well done through ignorance of the importance of doing anything well, or of what constitutes well-doing.



That we should continue to lay out our towns and build the greater proportion of building, lacking the elementary capacities for planning or the desire for beauty, is a waste which no country can stand indefinitely. Look about the world and you will see how many nations have recognized this need for regulating and controlling the character of building; England lagging behind her overseas territories many of which have better machinery in operation. The best intentions of town planning are frustrated, and regulations from the centre seem to be in vain so long as the mass of building that lines the streets is undisciplined and ignorant, the work of men who are architects for profit only, and obey no higher laws.

Registration, therefore, if it is to be an instrument for raising the level of architectural practice over the whole sphere of building, must carry the names of every reputable and competent architect working today, and those of every member of the Institute as a matter of course. Practically all members of the Council and Standing Committees are now on the register, and an exceedingly good lead has been given from the centre; but even so there are still two-thirds of the profession who have taken no steps to get on, and half the time has passed.

It should be noted that application can be addressed to the Secretary, E. J. Haynes, at 18 Abingdon Street, S.W1, and that the fee for Registration is 6s. 8d.

For this there remains what is left of the year, with the dog-days of summer intervening; and on the last day the door closes and registration as a completed system is put into operation.

The 31st of December, 1933.

An aerial view of Merseyside, Liverpool, "one of the gateways of England."

NOTES & TOPICS

ENGLAND FROM THE GANGWAY

WITHIN a week I have been to Southampton and Liverpool: two ports that are responsible for a large number of foreigners' first impressions of England.

*

Southampton made me wonder whether that responsibility was recognized and whether it was accepted as a civic responsibility. There are spectacular engineering works in progress at Southampton: the draining of vast areas of waste and water-logged land, the building of great docks.

*

But the order and the spacious dignity that come from planning stop at the docks. Southampton itself only gives an impression of huddled squalor.

*

This is one of the gateways of England, approached by a noble road of water. So is Liverpool.

*

Seen across the Mersey from Seacombe or Woodside Ferry, Liverpool is growing a fine skyline. Already the Cathedral is uprising to a splendid dominance, and when its tower is finished, and its exotic neighbour, the Metropolitan Cathedral, has a dome, Liverpool will have more architectural interest belonging to the twentieth century than perhaps any other city in the country.

When the Mersey tunnel is opened, there will be an opportunity for some imposing planning. The main Liverpool end comes above ground opposite St. George's Hall. If only the city fathers will have the courage to slash right and left into the mean buildings that flank the tunnel mouth, and create a great open space below St. George's Hall, and abolish the chaotic traffic tangle that is now woven about a clutter of refuge islands, Liverpool's core of fine public buildings will acquire an unforgettable majesty.

*

The main tunnel mouth in Birkenhead is behind Hamilton Square, beside that dismal structure, the Birkenhead Market. Hamilton Square is a fine piece of planning. The emergence of the tunnel behind it suggests that something more than the casual demolition of buildings that "happen to be in the way" is indicated. Is there a plan for making the tunnel approach worthy of Hamilton Square?

THE ARCHITECTS' JOURNAL THURSDAY

TO BE PUBLISHING DAY

AS announced in our last issue, THE ARCHITECTS' JOURNAL *will in future be published on the Thursday of each week instead of on the Wednesday, as heretofore. Next week's issue will therefore not be on sale at the bookstalls until Thursday, June 1, and subscribers' copies will not reach them until the first post on that day.*

I have a fear (not wholly fantastic) that near one of the tunnel mouths somebody will open a café and call it: Ye Olde Tunnelle Gate-house.

*

This week's super-pseudo antique is: *Ye Olde Soda Fountaine.*

*

GAS—INSIDE AND OUT

A suggestion has been made (in Scotland) for using the outside of a gasometer for advertising. Years ago Clough Williams-Ellis, writing about gasometers, urged us to "think what might be done . . . if the strange fat shape were accepted and enjoyed and taken as the basis of a design."

*

I hope that somebody will do some pretty quick thinking (followed by preventive action) about the possibilities of a gasometer as the basis of an advertisement. The shape would doubtless be seized on for boosting appropriate products: reducing belts, for instance, or abnormally nutritive buns.

*

A BIG CHANCE FOR THE COWS

I make no apology for returning to this enthralling subject. Chance's cows mean as much to me as Pilkington's elephants. Here is some hot news about them.

A member of the firm, who signs himself *Austin*, sends me a letter in which he says the cows "become quite excited when they hear a Chance diaphone with a note based on a bull moose's call" being tested at works.

*

Poor brutes! And *Arthur* denied their existence.

*

SEPOC ENIW EGDOL

The same correspondent dead heats with *Envious* and *V. L.* in last week's easy competition. All three ingeniously read the words at the head of this note as *Cope's Wine Lodge*, and the "operative word" *nainurfluw* as *Wulfrunian.* It looks as though the prize, half a bottle of yksihw, will have to be divided between them.

*

WULFRUNIAN

Wulfrunian means of or pertaining to Wolverhampton. It is a word that seems to me to have possibilities, and I shall try to get it taken up. "Charming but just the teeniest, teeniest bit wulfrunian," or "Oh, absolutely wulfrunian!" will shortly (I hope) be on the tongue of every bright young person.

*

Not that Wolverhampton should be made fun of—let me urge those who don't know it to go to Cope's Wine Lodge (early nineteenth century) and then tour the city. I say no more now. I shall return to Wolverhampton and to St. John's Church next week.

*

FURTHER COMPETITIONS

There are no further competitions.

*

SUCCESS OF THE FIRST *F.T.O.* CARPET COMPETITION

Nothing to speak of; at least, not above a whisper. For sheer badness, lack of style, coherence, reticence of anything, in fact, but compromise, dullness and jazz vulgarity, the winning designs in this very praiseworthy competition could not be matched outside the carpet departments of the cheap retail stores.

*

I take it that the idea of *The Furnishing Trades Organiser* was to discover new designers of merit. Why, then, set up a jury mainly composed of retailers who are not artists to judge the work of designers? So long as such competitions are to be judged from the point of view of the man-in-the-street, so long may we expect them to provide us with the worst designs, since no self-respecting designer could possibly design on the basis of what he thought a carpet salesman would like.

*

THE NEXT R.I.B.A. PRESIDENT

As there is no other nomination for Presidency of the R.I.B.A., I think it may be taken for granted that Sir Giles Gilbert Scott will follow, in a few weeks' time, Sir Raymond Unwin, who has laboured unceasingly and unselfishly for the good of the profession.

*

Sir Giles will be an admirable President for the Centenary Year. His dignity, his high reputation as an architect, his happy manner, his power of quiet speech—all are valuable qualities for the head of the architectural profession.

ASTRAGAL

THE ARCHITECTS' DIARY

Wednesday, May 24

ROYAL ACADEMY, Burlington House, Piccadilly, W.1. Summer Exhibition. Until August 7. 9 a.m. to 7 p.m. 9 *a.m.*

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. Exhibition of photographs, etc., depicting the progress of air travel. Until May 25. 10 a.m. to 10 p.m. 10 *a.m.*

MUNICIPAL SCHOOLS OF ARTS AND CRAFTS, Birmingham. At the Museum and Art Gallery. Exhibition of students' work. Last day. 10 a.m. to 5 p.m. 10 *a.m.*

ARCHITECTURE CLUB. Twenty-second annual dinner. *At the Savoy Hotel, W.C.2.* 7.15 for 7.30 p.m. 7.15 *p.m.*

C.P.R.E. Annual General Meeting. *At the R.I.B.A., 9 Conduit Street, W.1.* The Rt. Hon. W. G. A. Ormsby-Gore, M.P., will be the principal speaker. 3 *p.m.*

Thursday, May 25

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. Annual General Meeting. 6.30 *p.m.*

SOCIETY FOR CULTURAL RELATIONS BETWEEN THE PEOPLES OF THE BRITISH COMMONWEALTH AND THE U.S.S.R. At the London School of Hygiene and Tropical Medicine, W.C. "Ancient Church Architecture from the White Sea to the Caucasus." By David R. Buxton. 8 *p.m.*

Friday, May 26

TOWN PLANNING INSTITUTE. At Caxton Hall, Caxton Street, S.W.1. "Recent American Town Planning Developments and their Bearing on the English Problem under the new Act." By C. R. Ashbee, M.A. 6 *p.m.*

Saturday, May 27

Sunrise 4.53 a.m. Sunset 9.1 p.m.

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. Annual Exhibition. Until Saturday June 24. 10 a.m. to 8 p.m. (Saturdays: 10 a.m. to 12 noon.) 10 *a.m.*

Monday, May 29

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. "The Modern Architecture of Hilversum, Holland." By W. M. Dudok. Also, exhibition of views of new buildings in Hilversum. Until June 24. 10 a.m. to 10 p.m. 10 *a.m.*

INSTITUTION OF ELECTRICAL ENGINEERS. At Bath. Summer meeting. Until June 2.

Tuesday, May 30

LONDON SOCIETY, Lancaster House, St. James's, S.W.1. Evening Assembly to celebrate twenty-first anniversary of the founding of the Society. 8.45 *p.m.*

INSTITUTION OF GAS ENGINEERS. At Liverpool. Annual General Meeting. Until June 2.

THE MAGNET OF LONDON

Greater London is a magnet drawing to itself industries and population. Sir Raymond Unwin, in the second report of the Greater London Regional Planning Committee, just issued, insists on the need for more control. Haphazard development wastefully permitting residential areas to be spoiled by the invasion of industry must be stopped.

Sir Raymond envisaged the wise planning in the future of a London of nearly 2,000 square miles, the allocation of suitable sites to industry, the formation of a green belt, the classification of new roads, the laying out of self-contained satellite communities. In short, the development of the 14,000 square miles of Greater London, which still remained unbuilt on, would not be sporadic and speculative.

THE UGLY FACTS

With Sir Raymond's advice most readers of the JOURNAL will be in agreement, but the facts cannot be overlooked. The Committee, of which Sir Banister Fletcher is Chairman, is still only advisory. Its financial resources have recently been cut down. It is regarded with suspicion by most of the 135 local authorities. Commercial men so far are untouched by the appeal of the regional planners, in this respect differing from their American counterparts. In theory, everyone wants a way out of the present muddle, but, in practice, architects and builders are already finding how town planning is stopping many a building project. The unfortunate discrepancy in the figures produced with regard to the proposed new building in Parliament Square, which the L.C.C. Town Planning Committee has refused to sanction, and the silence of Lord Haddo, are doing considerable harm to the cause of planning. As Dr. I. G. Gibbon, of the Ministry of Health, recently said, the economic aspect of planning needs to be more studied.

The present advance in building activity is undoubtedly due, at least in part, to the efforts of the Special Committee for Public Relations of the Building Industries National Council:—(1) The Committee are doing all in their power to forward the policy of slum clearance. They are in touch with the chief local authorities, offering co-operation in case of difficulty in preparing a programme. (2) The Committee is also in touch with the building societies with a view to pressing the "Build Now" scheme. (3) The Committee continues to urge that public works should be undertaken as a means of national rehabilitation.

These efforts, made by the body constituted to speak for the building industry, must continue to be fully supported.

Subscriptions to the fund should be addressed to Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

SLUMS

The Prince of Wales's speech to the Association of Municipal Corporations on Wednesday last was a timely supplement to the appeal issued by the Archbishops earlier in the week for an active campaign for the abolition of the slums. The Prince said:

Let public opinion awaken. Great risks require great energy, vision and determination. Let us put forward a great national effort irrespective of party or of politics. Let our age, our generation, be remembered as the one in which we swept away this blot that disgraces our national life. Let us build a new Britain and provide houses worthy of the dignity and greatness of our race.

THE EARL OF RADNOR

The Earl of Radnor, who has just been appointed by the Prince of Wales Lord Warden of the Stanneries in Cornwall and Devon, and Rider and Master Forester of Dartmoor, is one of the most energetic of our younger peers. In addition to this work for the Duchy of Cornwall, he is a Director of the Southern Railway, and a regular attendant at the House of Commons. He is particularly interested in architecture in relation to working-class houses. He has studied with much care the plans prepared by Mr. De Soissons for houses on the Prince of Wales's estate in South London. As Lord Warden he is the head of the Prince of Wales's Council, which administers not only the London property, but the tin mines in Cornwall and Devon, and also Dartmoor.

WAKEFIELD'S NEW BRIDGE

Wakefield's new £65,000 bridge over the River Calder is to be officially opened by the Mayor of Wakefield (Alderman W. Emmett) on Friday next, May 26.

TWO NEW ACTS

The Housing (Financial Provisions) Bill, and the Housing (Financial Provisions) (Scotland) Bill, have received the Royal Assent.

ADELPHI ESTATES BILL

The Select Committee of the House of Lords concluded, last week, their consideration of the Adelphi Estate Bill. They have decided to let the Bill proceed, stipulating that any building which might be built on the estate should not exceed the height of the Savoy Hotel.

UNEMPLOYMENT IN THE BUILDING TRADES

In the House of Commons last week Sir Henry Betterton, the Minister of Labour, referring to the unemployment figures, said that there had been a marked improvement in the building trades. During the last four months there had been a diminution of unemployed persons in those trades by no fewer than 124,000. Other parliamentary news appears on page 701.

A GOVERNMENT REPORT

The Building Industries National Council is working quietly and steadily on a number of problems, but according to the Preliminary Reports recently published by the Government as a result of the Census of Production taken in 1930, there is good reason for closer cross-examination. For the facts as revealed in these Reports are not too complimentary to the Building Industry. In the majority of instances there has been a steady increase in the introduction of labour-saving machinery, but in building, between the years 1924 and 1930, there has been an actual decrease of 2 per cent. in horse-power used to save the muscles and the brawn of the building trade operatives. Further, the output in the associated industries, such as the manufacture of bricks, pottery and glass, has also decreased during the period between the taking of the Census in 1924 and six years later in 1930. The decrease of net output per head was from £190 to £170.

The report also states the facts in another way. In 1930, 175,000 workers employed in the chemical industries produced £70,000,000 worth of chemicals, whereas 175,000 workers in the same year only produced £31,000,000 worth of bricks, pottery and glass. There are, of course, various reasons to account for these discrepancies, and it is hoped that the Building Industry Council of Review and kindred organizations will look into the whole question. At present, however, students of the Census of Production are of the opinion that the Building Industry has no reason to be unduly complacent.

ARCHITECTS' BENEVOLENT SOCIETY

At the annual general meeting of the above Society, the election of Council for the year of office 1933–34 resulted as follows :

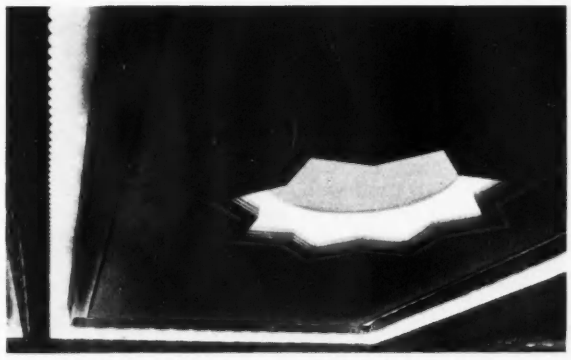
President : The President of the R.I.B.A. ; Vice-Presidents: Messrs. Walter Tapper, A.R.A., F.S.A., F.R.I.B.A., H. S. E. Vanderpant, Hon. A.R.I.B.A. ; Ordinary Members : Messrs. Charles Woodward (A.) ; L. S. Sullivan (F.) ; C. E. Elcock (F.) ; S. Phillips Dales (F.) ; R. Dircks (Hon. A.R.I.B.A.); Maxwell Ayrton (F.); C. McArthur Butler (L.) ; J. Alan Slater, M.A.CANTAB. (F.) ; A. Saxon Snell (F.) ; E. Stanley Hall, M.A.OXON. (F.) ; A. H. Moberly, M.A.CANTAB. (F.) ; Sydney D. Kitson, M.A.CANTAB., F.S.A. (F.) ; Michael Tapper, M.C. (A). ; R. E. Enthoven (F.), Arthur Keen (F.) ; Francis Jones (F.) (representing the Manchester Society) ; C. M. Hadfield (F.) (representing the Sheffield, South Yorkshire and District Society) ; Ingalton Sanders (F.) (representing the Hampshire Society) ; C. Lovett Gill (F.) (representing the Architectural Association) ; Arthur Crow (F.) (representing the London Society) ; C. McLachlan (A.) (representing the Association of Architects, Surveyors, and Technical Assistants) ; and E. Hadden Parkes (F.) (representing the Mount Pleasant Artists' Rest Home).

Honorary Treasurer : Mr. Maurice E. Webb, D.S.O., M.C. (F.). Hon. Secretary : Sir Charles Nicholson, Bart., M.A.OXON. (F.). Honorary Auditors : Messrs. Charles Woodward (A.) and H. S. E. Vanderpant (Hon. A.R.I.B.A.).

A NEW JOURNAL

Today, May 24, the first number of a new weekly illustrated paper, *New Britain*, will appear under the editorship of C. B. Purdom. Its aim, programme and policy are disclosed in its title—the building of a New Britain.

New Britain will be concerned not only with current politics and economics and world affairs, but also with the arts and entertainments, and with books and travel. It will deal with them all from a central sociological standpoint.



Following are some extracts from a leaflet announcing the publication of the new paper :—

When man's inventive genius is employed for constructive purposes only, he will become more and more free not only from the necessity of manual labour, but from the monotonous work of guiding the machines he has invented. This opens out a prospect of leisure such as has hardly been conceived of, and those energies which have hitherto been directed towards the struggle for existence must be employed and directed by sound education and wise guidance.

Then man will know the joy of extending knowledge for its own sake. He will no longer need to study science solely for the purpose of improving his conditions, and will then recognize that those who devote themselves to pure science are enlarging the common understanding of life.

The arts will then become socialized not only in their application as crafts, but as interpretations of man's common experience.

When housing, health, education, in its widest sense, and true religion, have supplied standards of thought and conduct, recreation and entertainment will no longer be a frenzied attempt to escape from uncongenial conditions.

A ceiling lighting fitting in the entrance hall of the Co-operative Wholesale Society's London Branch. *See also pages 691–697.*

NORTHERN ARCHITECTURAL ASSOCIATION

Mr. W. Milburn (Jnr.), F.R.I.B.A., B.SC., T.D., has been elected president of the Northern Architectural Association in succession to Mr. H. L. Hicks, F.R.I.B.A. Mr. F. A. Child, A.R.I.B.A., has also been elected hon. secretary in place of Mr. R. Norman MacKellar, A.R.I.B.A., who has retired from this office, which he had held for six years.

Other elections included the following: Vice-presidents : Messrs. H. Oswald, J.P., L.R.I.B.A., G. H. Gray, F.R.I.B.A., and H. E. Ayris, L.R.I.B.A. ; hon. treasurer, Mr. R. Burns Dick, F.R.I.B.A. ; hon. librarian, Mr. G. E. Charlewood, F.R.I.B.A. ; Members of Council : Messrs. G. Talbot Brown, A.R.I.B.A., C. A. Harding, F.R.I.B.A., DIP. ARCH. (Glasgow), S. W. Milburn, M.C., F.R.I.B.A., W. W. Tasker, F.R.I.B.A., R. N. MacKellar, DIP. ARCH. (Glasgow), A.R.I.B.A., and R. Mauchlen, M.C., F.R.I.B.A. ; Associate Members of Council : Messrs. T. J. Cahill, B.A., J. Logan, A.R.I.B.A. ; and S. Brinton, L.R.I.B.A.

PUTNEY BRIDGE WIDENING

The result of the L.C.C.'s application for a portion of All Saints' Churchyard, Fulham, to complete the scheme of street and bridge widening at Putney Bridge will be announced by the Chancellor of the Consistory Court (which has been sitting in the Chapel of St. Michael and St. George in St. Paul's Cathedral) on Saturday next.

LONDON SOCIETY

At the annual meeting of the London Society, held last week, the officers and council were re-elected.

WOLVERHAMPTON'S SECOND OLDEST CHURCH

Last week we referred to the fact that St. John's Church, Wolverhampton, is in an extremely dangerous condition, and must, if it is to be saved, be repaired at once. Mr. Bertram Butler has stated that the restoration scheme would entail an expenditure of £2,000 within the next two years, and a total of £5,000 in ten years.

£10,000,000 FOR HOUSES TO LET

It is announced that the directors of the Halifax Building Society have decided to co-operate with the Government in the Housing (Financial Provisions) Act, 1933, by granting loans under the Act to the extent of £10,000,000 during the next two years.

R. I. B. A.

MONDAY'S LECTURE

At the R.I.B.A. on Monday night, Mr. Geoffrey Webb read a paper on " The Architectural Antecedents of Sir Christopher Wren." He pointed out that " Wren was not born in an architectural vacuum "; that "there existed in the earlier years both a monumental

and an established domestic manner," and, beginning with Inigo Jones, he discussed the work and style of the important architects of the Renaissance in England who preceded Wren. He also spoke of the work of the Commission on London Buildings of 1618 and 1620, which concerned itself with "the energetic promotion of brick as a building material instead of timber, and an endeavour to improve the quality of brickwork by standardizing sizes." It had, therefore, "a very considerable influence on English architecture and certainly contributed to the improvement in the qualities of brickwork, so marked as to amount almost to a technical revolution, that came about during the first half of the seventeenth century."

FINAL EXAMINATION

Under the terms of the Scheme agreed upon between the R.I.B.A. and the Royal Australian Institute of Architects, whereby the latter acts as the authority for Architectural Education and Examinations in Australia, with the exception of Western Australia, the School of Architecture of the Sydney Technical College has been recognized for exemption from the R.I.B.A. Final Examination.

REGISTRATION

Now that the Registration Act is in force, the Council of the Institute have been asked to give advice with regard to the best way to use the title "Registered Architect" by members of the R.I.B.A., who have been placed on the R gister, and who already have the right to use the designation "Chartered Architect."

The Council recommend that members of the R.I.B.A. who have been registered should use the designation "Chartered and Registered Architect."

THE ARTHUR CATES PRIZE

The Board of Architectural Education wish to draw special attention to the Arthur Cates Prize, a Certificate and the sum of £50.

This year the Prize is offered for the promotion of Architecture more especially in relation to the application of geometry to vaulting, stability of edifice and design, coupled with actual measurement and delineation, both geometrical and pictorial, of appropriate examples in Great Britain or foreign countries.

A person is eligible to compete for the Prize who has either passed the Final Examination of the R.I.B.A. in one examination only or who has obtained, by attendance at one of the Schools of Architecture approved by the Institute, a Diploma exempting him from the said examination.

It is hoped that there will be a keen competition for the Prize this year.

Full particulars are given in the R.I.B.A. Prizes and Studentships Pamphlet, which may be obtained from the R.I.B.A., price 1s. 2d., inclusive of postage. The closing date for the submission of works in the competition is November 30, 1933.

COMPETITION

NEWS

HORNSEY TOWN HALL

The second part of "Iodos's" review of the Hornsey Town Hall competition has been postponed until after the assessor has supplied answers to competitors' questions.

Surbiton Hospital Competition

Proposed Hospital at Surbiton. Assessor: C. E. Elcock, F.R.I.B.A. Premiums: £120, £75, £50 and £25. Sending-in day: September 21, 1933. Conditions from A. C. C. Dunn, Hon. Secretary, Surbiton Hospital, St. James's Road, Surbiton.

Hospital planning probably represents the architect's most important contribution to contemporary construction. During the last few years, hospitals of gigantic dimensions have been the subject of competitions, those at Cardiff and Birmingham ranking as very important additions to hospital practice.

This competition, the conditions of which have been recently announced, is on a much smaller scale, serving rather a locality than a city, but inasmuch as it is to contain within it accommodation and equipment for dealing with every case, it is not incomparable to one of the greater London hospitals. The solution of the problem presented will require as great an exercise of skill as would a larger type of scheme.

The site, plan of which is reproduced, is irregular on its northern boundaries and faces directly south-west. It has a small eastern frontage to a roadway, and access from the north. It is practically level, and unobstructed over the greater part of it. To the north-east there stands Hill Manor, of which the site was originally the gardens, a small section of which, lying to the north-west of the house, is to be retained in the scheme. A small lodge gate on the eastern boundary is also to remain as the lodge to the hospital. The Assessor suggests that the main public approach to the hospital should be from the east end of the site, with a back entrance for goods on the north-western corner. He further suggests that in order to keep the patients' side of the hospital undisturbed by traffic, the approach road should pass along the north to the main entrance for administrative purposes. The possibility of future extension of wards and nurses' home should not be forgotten, although at present no proposals for extension are being considered.

Turning to the hospital itself, the first important note concerns the general design, which it is suggested should be of a single story, with accommodation for the matron and domestic staff. The conditions suggest a grouping of the hospital units into four main sections :—

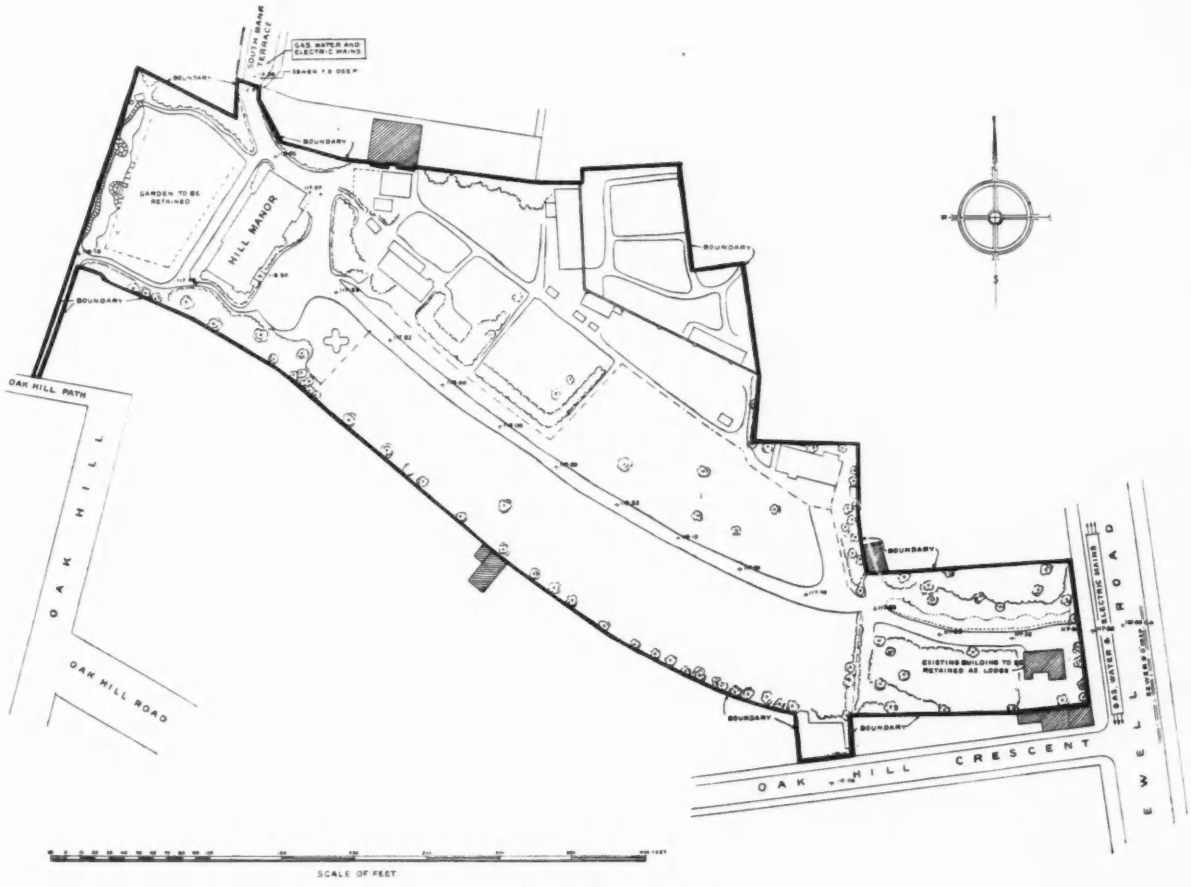
(*a*) The Wards themselves—Male and Female, Surgical, Children's and Maternity.
(*b*) The Operating, X-Ray and Casualty Departments.
(*c*) The Administrative Offices.
(*d*) The Nurses' Home.

This latter is to be detached from the main circulation. The maternity ward is to be in some way semi-detached, so that, if necessary, it could be omitted without damaging the administration, and, finally, the children's unit is to be administered from the female wards, though requiring some separate accommodation.

The very important Clause 31, *Construction and Materials*, should be quoted in full :—

"So far as possible, consistent with due economy of initial cost and maintenance, the buildings should be of fire-resisting materials, and competitors are left entirely free as to design, the main idea being to provide a scientific 'Health House' which will rely for its artistic effect on its good scale and proportion."

This is qualified by a note which is printed in heavy type, and is as follows :—



"Competitors should note that great importance would be attached to economy in capital outlay, combined with economy in administration costs."

Thank goodness these two admonitions to competitors are no longer incompatible one with another! They are indeed indications which will be only too eagerly seized by competitors, no longer left in any manner of doubt as to what is required of them.

Turning to the competition problem, one notes with peculiar satisfaction that the attention of competitors is particularly drawn to the "veranda" type of ward, illustrated in the Report of the Orientation Sub-Committee of the R.I.B.A. This ward type employs a skeleton framework of large folding windows on either side, so that when windows are fully opened a ward only 20 ft. wide and unobstructed on the south by any sanitary block or staircase tower, is in effect a veranda with controlled lighting and circulation.

The R.I.B.A. Report shows beds grouped in sets of four and lined along the long axis of the ward, though this is not insisted upon by the conditions of this competition, nor is there complete unanimity on the point. As though the Report were not enough, the Assessor has still further underlined the necessity of the avoidance of heavy brick piers between the windows, and nobody can say they have not been warned. What with this, the stress upon economy in capital and administration costs, and the use of that very good term "Health House," this competition opens under the best of auspices. The usual note to competitors to avoid

SURBITON HOSPITAL COMPETITION

The Site Plan.

wasting their time on elaborate drawings and boring reports is given again with greater emphasis, even to the extent of suggesting four headings under which the Report should fall, and detailing the nature of the estimate required, in a thoroughly sensible manner. There appears to be an error in the amount of the cube foot rate.

It is not unusually a matter of doubtful value, and in any case of extraordinary difficulty, to analyse in any hopeful way the terms of the programme for a scheme of any complication. It will be obvious from the first perusal of the conditions that various sections group themselves into functional units; that the entrances are fairly clearly defined, that the power house will be placed certainly on the south west border, and that the main Hospital itself will occupy the space between Hill Manor and the final closing in of the site towards the east. Further than this no commentator should go, except in such a general way as will not encourage competitors to one line of thought.

From inspection of earlier competitions, it is obvious that more than in any other problem presented, the functional, the machinery side, dictates the main lines; this, and the all-important question of ward-orientation. It is as though the architect were a member of the General Staff, directing a firing line towards the enemy, while at the same time responsible for the intricate machinery, for supplying the front line with all the necessities of life, and its opposite—warfare. The siting of wards within the limitations of these boundaries is the matter for first consideration, allowing of no compromise. But following from this it is the exact planning of the circulation of administration which converts the wards into such a hospital as will fulfil the conditions of economy so strongly imposed. And one realizes that the circulation is complex to a degree that involves the passage, not only of all sorts of people, staff, patients and public, but of food, laundry and a host of other things. At the centre of these is the administration, gathering to itself the life of the hospital.

Turning back once again to Clause 31, one is tempted to enlarge upon the æsthetic outcome of designing a "Health House," yet in fact there is little really helpful to be said where so much is experimental within rigorous conditions of cost. It is enough today to mention a good scale proportion, meaning that we no longer rely to any extent at all upon decoration, the last Georgian hospital depriving us of even the last hold upon our resources of emotion evoked by earlier styles of building. We are in fact up against it here. and will have to take our chances of using a trained sense of order and proportion in the arrangement of new forms and a novel system of lines.

So far as recent competitions and one or two completed hospitals can serve to reassure us, the risks that æsthetic hospitals are going to be the architect's blind alley are entirely negligible. In actual fact the arrangement in pure design, untrammelled by values of mixed association, are our most important hostages to fortune.

Competitions Open

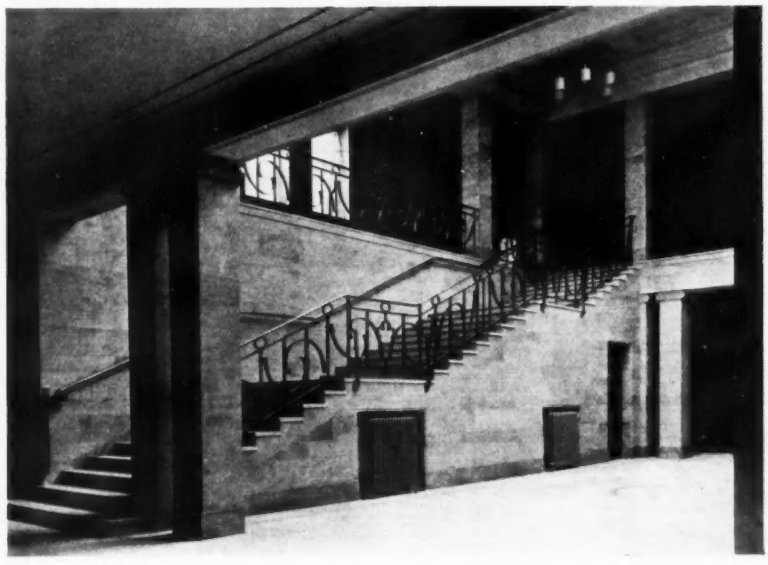
May 30.—Sending-in Day. Royal Society of Arts Competitions for Industrial Designs. The Secretary of the Society, John Street, Adelphi, W.C.
May 31.—Sending-in Day. **Layout of a suburb on the river Escaut, Antwerp. £2,400 in prizes (1st, £800). Conditions, etc., were published in *A.J.* for December 7, 1932.**
June 3.—Sending-in Day. Limited competition for flats to be erected in Lordship Road for the Stoke Newington B.C. Premiums: £250, £100 and £50. Full particulars, etc., published in *A.J.* for March 29.
September 21.—Sending-in Day. Proposed Town Hall for the Borough of Hornsey. Premiums: £350, £250 and £150. Full conditions, etc., were published in our last issue.
September 21.—Sending-in Day. Proposed Hospital at Surbiton. See page 680.
No Date.—Proposed Town Hall for the Portstewart U.D.C., Co. Londonderry. Open to architects practising in Northern Ireland. Assessor: R. H. Gibson, F.R.I.B.A., President of the Royal Society of Ulster Architects. Premium 50 guineas. Conditions of the competition may be obtained on application to Mr. F. Martin, Town Clerk, Portstewart. Deposit £1 1s.

Competition Pending

Proposed New Council Offices to be erected at Salt Hill for the Slough U.D.C. Assessor: H. S. Goodhart-Rendel, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions have not yet been drawn up.

THIS ARSHETECTURE

500,000 People and Forty Bishops to see Start of New Cathedral



Dr. Richard Downey, Archbishop of Liverpool, first planned this cathedral in his own mind, and then set out to find a man to interpret his ideals.

"Lutyens used eight tons of paper for his drawings, and the result is a masterpiece."

—*The Sunday Express, 14/5/33.*

WORTHING TOWN

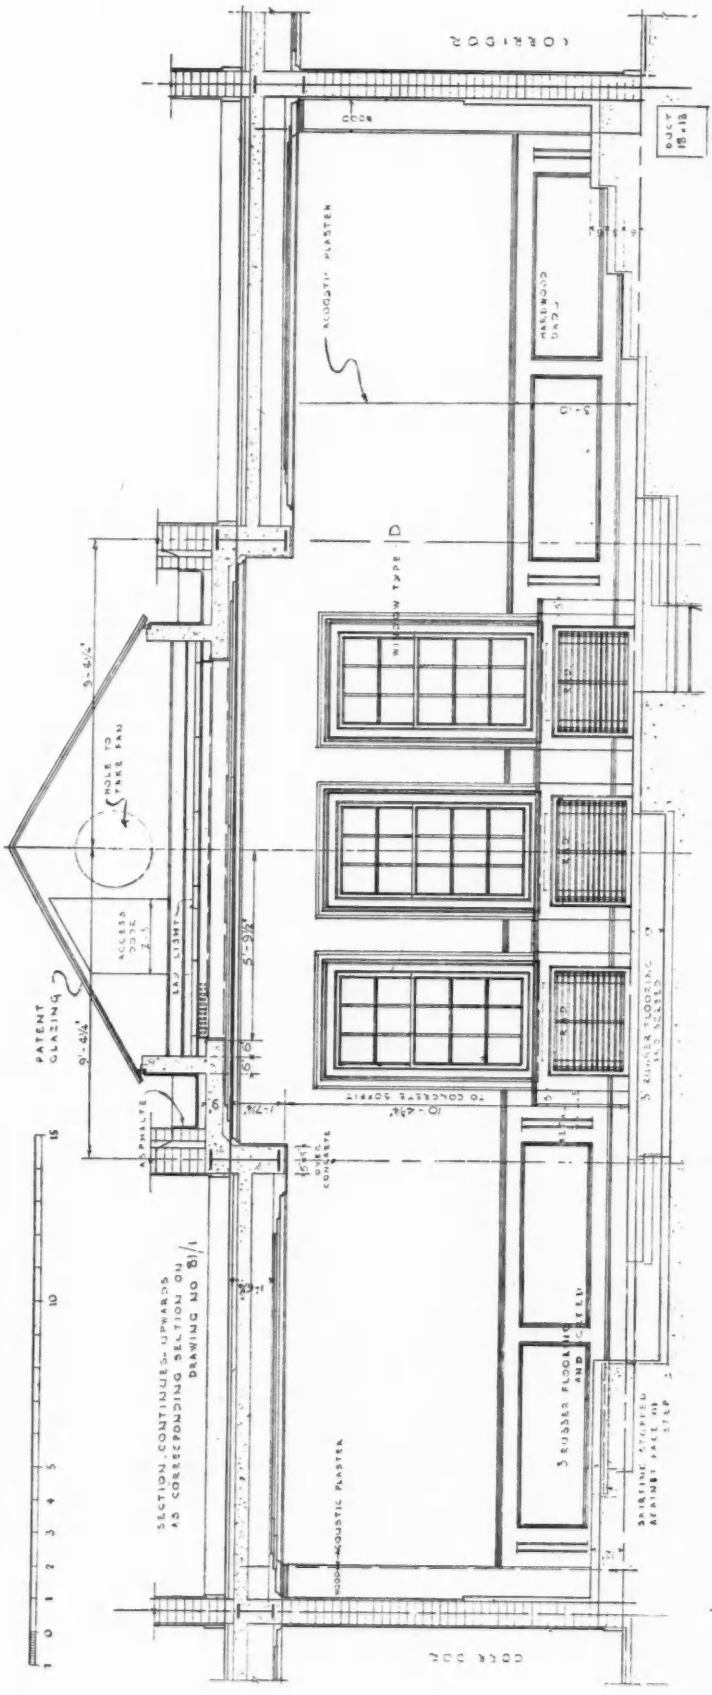
The building here illustrated is the result of a competition originated in 1930. Designs were invited for municipal offices, court house, assembly hall and maternity and child welfare clinic; 43 entries were received. Later, it was decided to defer erection of the assembly hall, but the remainder of the work has now been completed. The clinic (see pages 686-7) is a separate building.

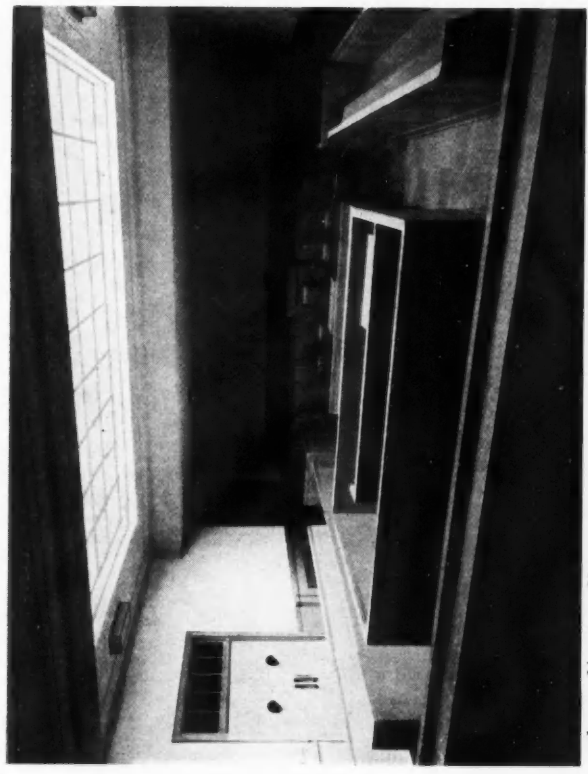
The upper view on this page shows part of the suite of committee rooms, panelled in Australian walnut. By means of folding doors, it may be made available for use by one, two or three committees simultaneously. In the lower view is seen the main entrance hall, whence two staircases lead up to the principal accommodation, which is placed at first-floor level. Walls and floor are of Ancaster stone; in the centre of the latter is the Worthing crest, carried out in marble and mosaic by the sculptor, Gilbert Bayes.

The Council Chamber, illustrated on page 684, has had special acoustic treatment, the walls being faced with damask over felt; blue predominates in the colour scheme.

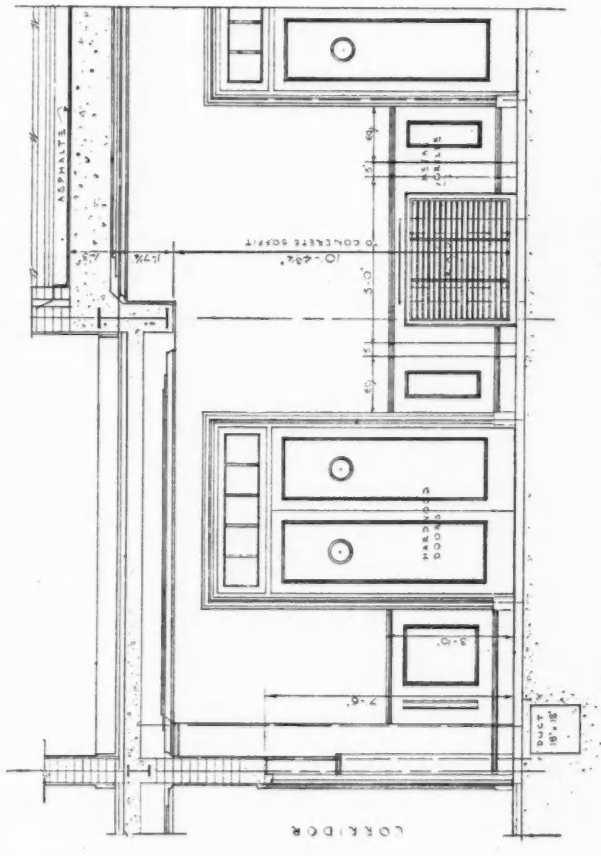
The heating is by low-pressure hot water through the medium of radiators, with a plenum plant for the Council Chamber, Court Room and the larger rooms. The building is wired for auxiliary electric heating and inter-communicating telephones.

HALL: BY C. COWLES-VOYSEY



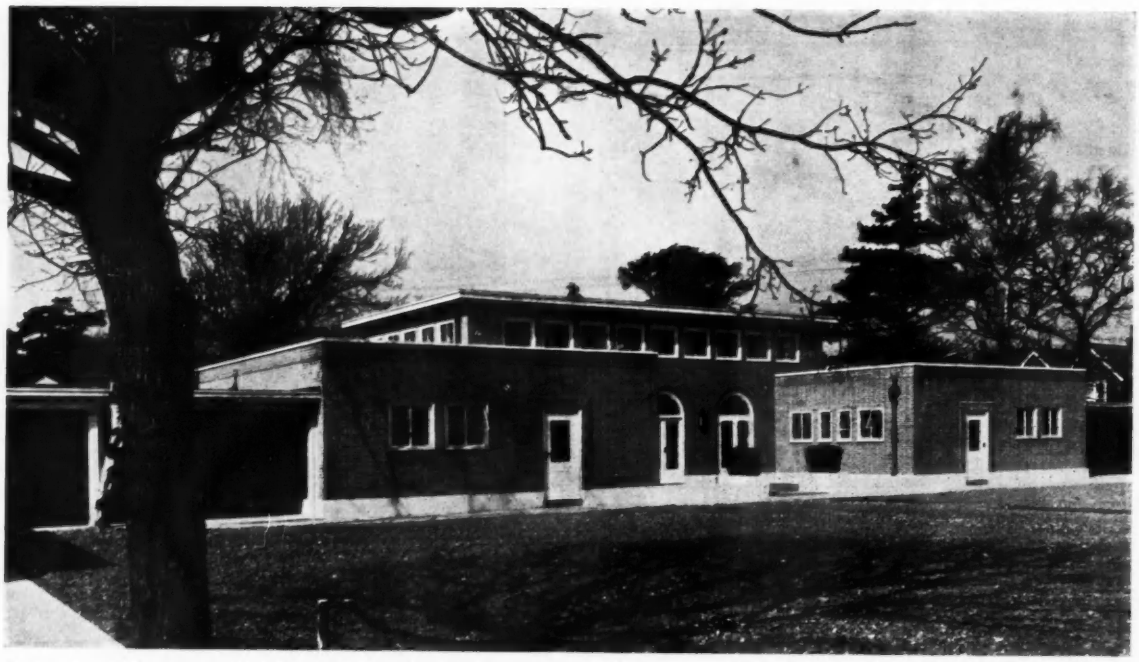


The Ionic portico to the main entrance in the centre of the Chapel Road front. The building is faced with hand-made, sand-faced, multi-colour bricks, with dressings of stone; it is roofed with green Westmorland slates.

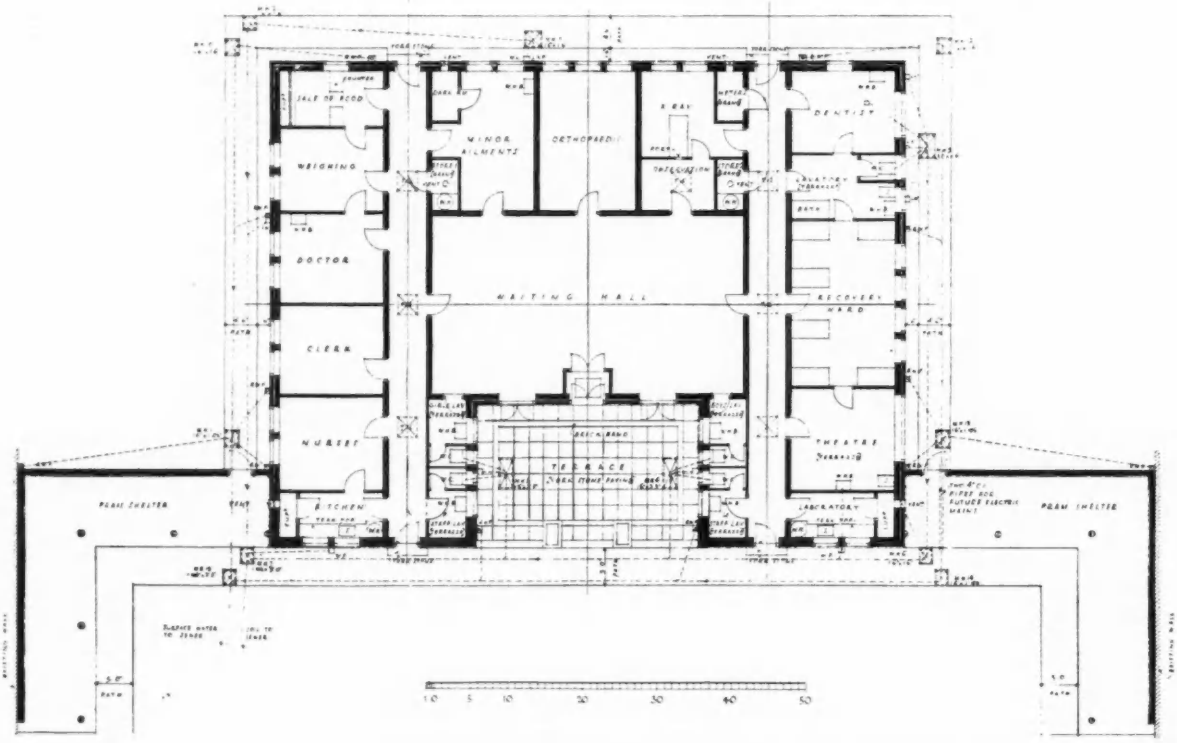


WORTHING TOWN HALL : BY C. COWLES-VOYSEY

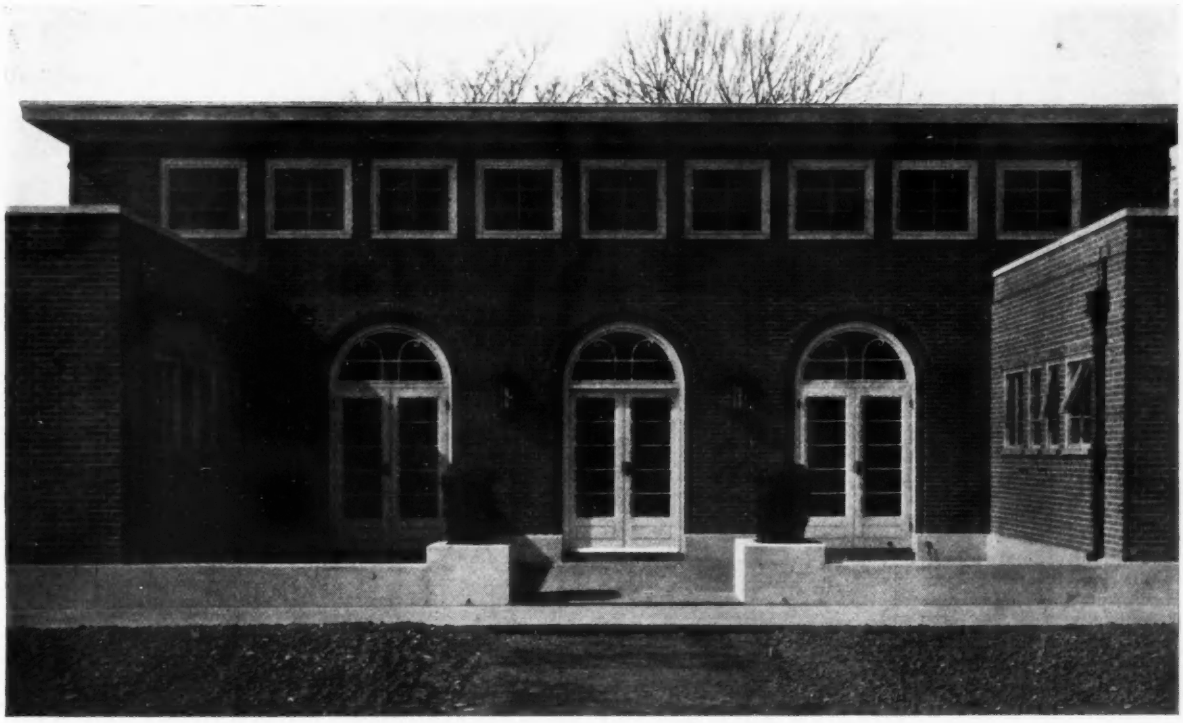
The Council Chamber on the first floor.



The Police Court on the first floor.



WORTHING TOWN HALL: THE CLINIC:



The plan of the new municipal clinic is similar in its general arrangement to that of the usual out-patients' department of a hospital. There is a central waiting hall, with a direct entrance for all patients, surrounded on three sides by the various administrative and treatment rooms. This is lighted and ventilated by clerestory windows on all sides, placed above the lower surrounding rooms. The external wall contains the entrance (see facing page) and a series of French windows.

In the north wing there is a small operating theatre, with a recovery ward adjacent; a dental operating theatre, with rinsing room and lavatory; and a small laboratory. These rooms are disconnected from the waiting hall by a corridor. In a similar wing on the south side are the doctor's consulting room, nurses' room and office for the clerical staff. The building, which will face on to a grass quadrangle, is provided with ample perambulator shelters.

The construction is of a fire-resisting nature, having cavity brick walls and reinforced concrete roofs, which are insulated with cork and covered with asphalt. Internally, the finish is consistent with modern practice in hospital design.

DESIGNED BY C. COWLES-VOYSEY

ARCHITECTURAL CONTROL

ON A LIVERPOOL ESTATE

THERE is evidence in Liverpool that the sense of responsibility for true planning which the great ground landlords of the eighteenth century had, has not entirely vanished from England. The Marquess of Salisbury owns large tracts of agricultural land on the outskirts of Liverpool, which are being taken up rapidly by speculative builders. The builders' taste in that city reaches as low a level as can be found anywhere in the country, and it was the deplorable results of speculative enterprise on the first part of his estate to be developed that led Lord Salisbury to adopt a proper system of control of layout and elevations.

This important task has been given to a town planner, Professor Patrick Abercrombie, and an architect, Mr. Hinchcliffe Davies, and all layouts and designs are now submitted to them for approval. By the terms of the agreements between Lord Salisbury and the builders, the estate architects' powers are, theoretically, absolute, but in practice their veto cannot possibly be exercised to its fullest extent.

The builders on the Salisbury estate are surrounded by rival firms whose land is subjected to no control whatsoever, and too aggressive interference by the architects would make Salisbury land so unpopular among builders that they would avoid it, so that the whole object of control would be defeated. Moreover, the builders have to sell their houses, and purchasers habitually demand variations of their own, regardless of whether or not these variations will upset schemes of grouping and layout imposed by the estate architects. If they cannot get what they want from builders on the Salisbury estate, purchasers will naturally go elsewhere. This means a reduction of sales, and hence the same result as before : the unpopularity of Salisbury land. Estate control, therefore, has become a matter not of veto but of negotiation, in which the third party, the purchaser, is very often involved.

It has been found, too, that the business of speculative building is hedged about by various fetishes and conventions. For instance, in the suburbs, it is considered a sign of social inferiority to live in one of a block of three or four houses instead of in a semi-detached house. Again, the architects are hindered by the extreme conventionality of the lower-middle-class people who are coming into the new houses and who are terribly afraid of being different from their neighbours.

Then there is the two-story-bay fetish. Every purchaser wants one, although the constant repetition of this motive leads to an insufferable monotony. The plan itself is an unvarying convention. Practically every house selling at about £850 is designed on the same principle, whether its aspect is north or south. There are two entertaining rooms, the drawing-room at the front and the dining-room at the back, and both about the same size. Not one speculative builder in a hundred is speculative enough to risk building a house with one large living-room running through the house or along the full length of the front.

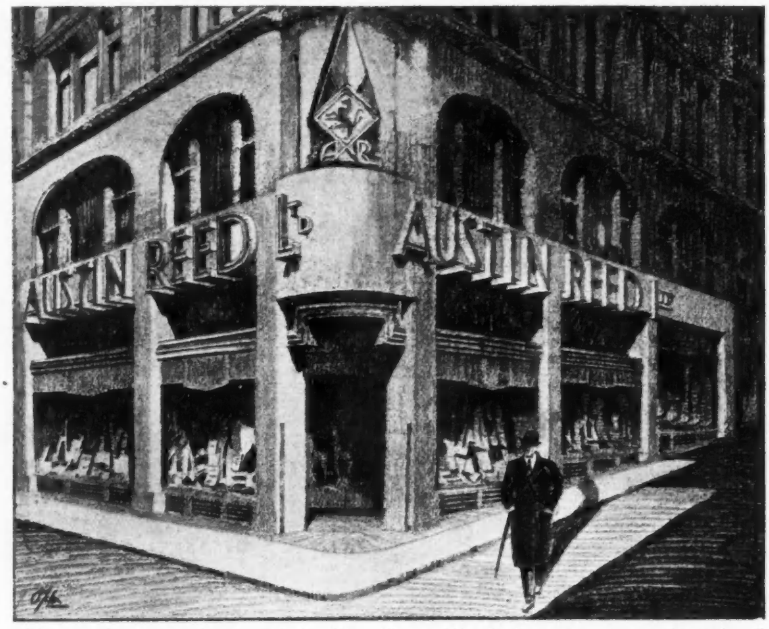
Windows are another source of difficulty. Some purchasers want lead lights and some want plain glass, and all unite in a desire for a transom with ill-proportioned fanlights above it. Against glazing bars there is a general prejudice which might have the support of the modernists did not the large sheets of glass go ill with the tiled roofs and gables of the orthodox elevation the average purchaser wants.

Inquiry leaves little doubt that the prejudice against small panes and glazing bars is due not so much to a desire for easy-cleaning surfaces and unobstructed vision

as to a feeling that they result in a "Corporation house" appearance. Honest brickwork is objected to for the same reason. The middle-class suburbanite prefers pebble-dash, in order to make the distinction between the Corporation house and his own as wide as possible. Indeed, the charming work done in Liverpool by Mr. L. H. Keay, the Housing Director, has ironically created a general objection to Georgian architecture by the suburban house purchaser. In Liverpool, as in many other cities, the working class lives in houses of infinitely better design than do the middle class. But the middle class prefers it so.

Before supervision of the Salisbury estate began, the builders used to put in pressed roofing tiles, pebble-dash, with dressings of red pressed brick, having black-mortared joints, and sham half-timbering. The architects have had some success in persuading the builders to use tiles with a sanded face, and white cement concrete and rustic bricks with cream-mortared joints. Where the pitch of a roof is steep enough, which is very rarely, the architects try to persuade the builders to use bonnet tiles for the hips, and when this is impossible, a compromise is made with an ordinary mitred tile. Sham half-timbering is discouraged, and the practice of placing blue ridges on red-tiled roofs, and *vice versa*, is no longer put forward.

With paint-work, progress is slow. The purchaser wants to be the arbiter of colour schemes, and he sees nothing wrong in chocolate-and-orange on one of a pair of houses and blue-and-green on the other. Nor can the architects' control prevent a purchaser from repainting his house a different colour.



The architects would like to insist on grass verges, small open spaces and trees, but the Liverpool Corporation will not undertake to maintain them, and who else can?

It will be seen that, starting as they have done with speculative building at its worst, Professor Abercrombie and Mr. Hinchcliffe Davies have a task beset with innumerable difficulties. If all the speculative work in the city were subject to the same control, the matter would be easy, and the middle-class purchaser with bad taste would find it as impossible to buy an ugly house from a builder as it is for the artisan to rent an ugly house from the Corporation.

Some of the builders on the Salisbury estate are genuinely anxious to fall in with the architects' wishes, but their public spirit is impotent against the competition of indifferent builders. The moral is that, while control of elevations is essential, there will be no achievement comparable with the best work on Corporation housing schemes or at such self-contained places as Port Sunlight and Welwyn until the standard of the purchasing public's taste is raised. On the Salisbury estate, the architects do not expect that control will lead at once to positive beauty. But if it achieves the elimination of ugliness, an extraordinary advance will have been made.

The public must be educated by frequent exhibitions, by incessant propaganda, by advertising, by letters to the Press and by public speeches. The lesson of the Salisbury scheme is the uselessness of forcing the builder to build what the public doesn't want.

A NEW SHOPFRONT AT

Messrs. Austin Reed's branch in New Street, Birmingham, has been enlarged and reconditioned by taking in the adjacent shop and by the removal of the party walls. Entirely new fronts have been designed in brown travertine marble and bronze, and a feature was made of stainless steel lettering, which takes its place as part of the design and is not merely applied.

These two drawings show the entrance and part elevation. The interior is refitted with walnut panelling and fixturing and stainless steel handrail to the staircase to the basement and first floor departments.

LETTERS FROM READERS

JOHN J. BLOWER

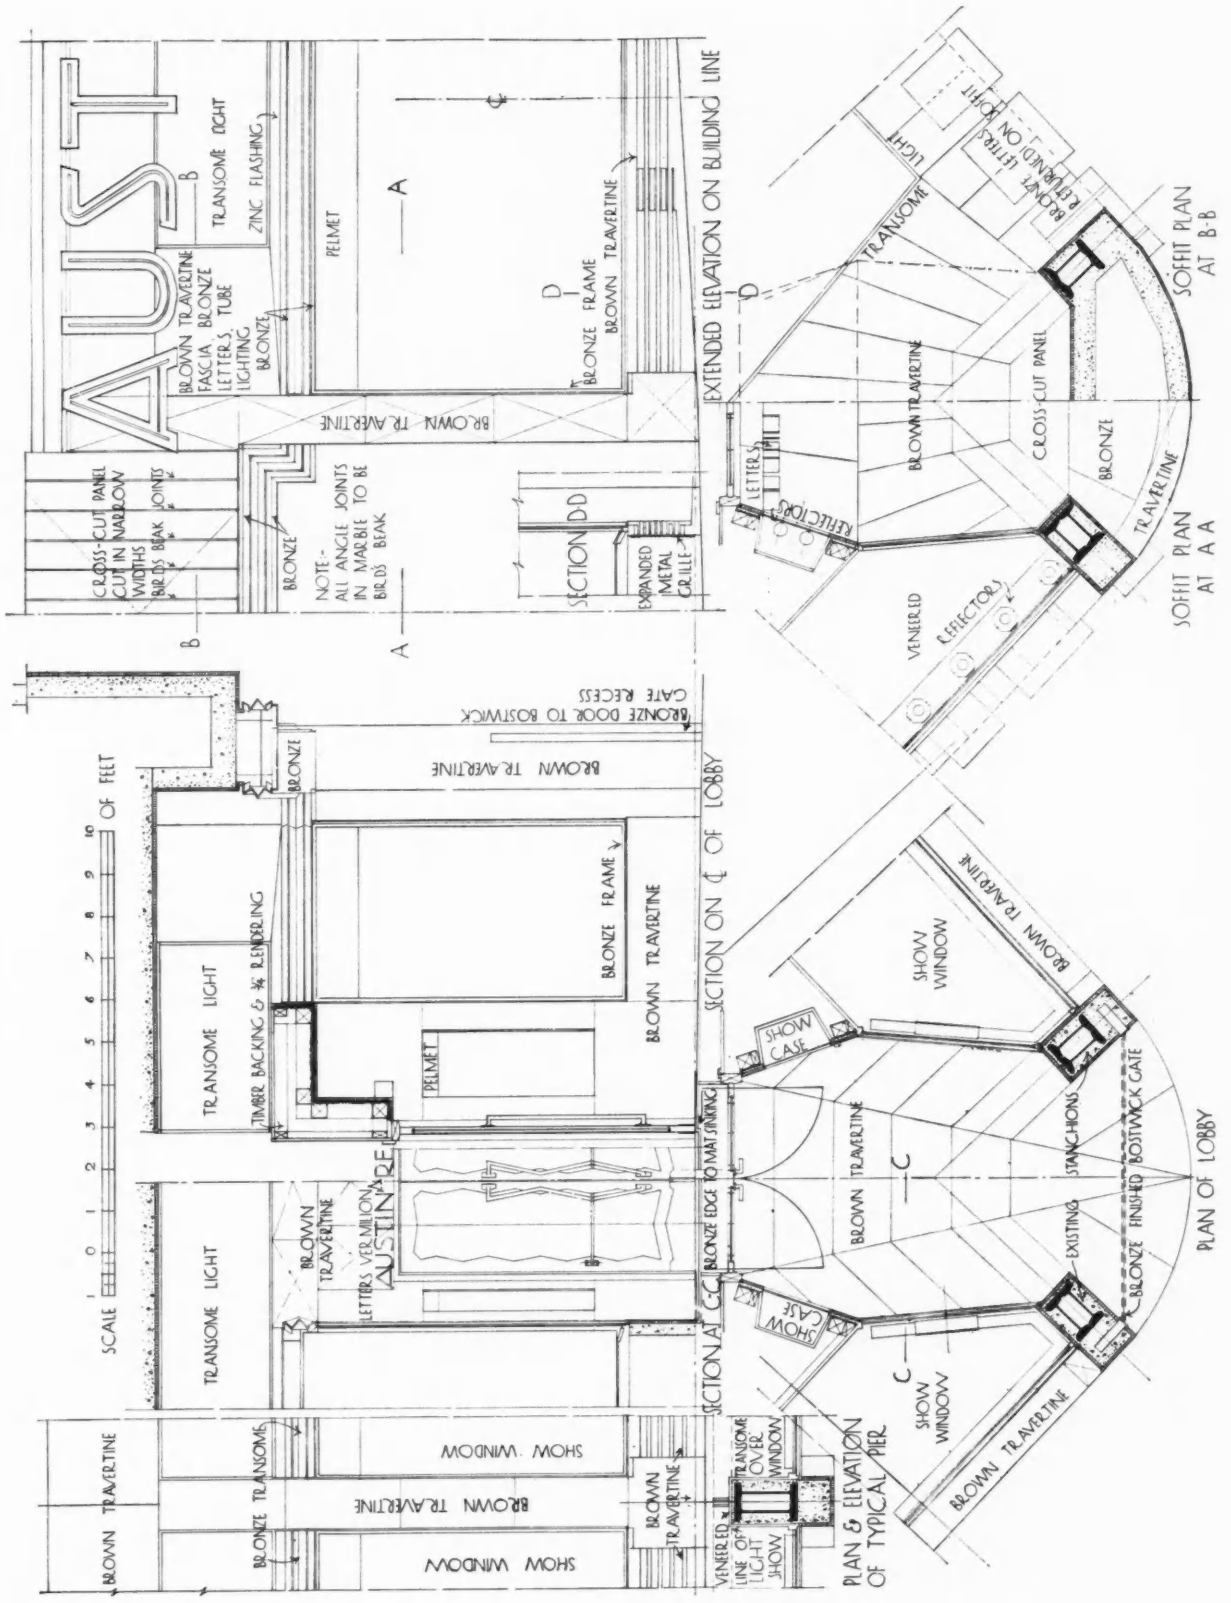
NOEL CARRINGTON

SUBURBAN

JULIAN R. ELSLEY, Thomas Elsley, Ltd.

E. C. INSTON

The Speculative Builder



SIR,—It was with great gratification that I perceived Mr. J. Wardle's request for plans in accordance with my designs published in your JOURNAL for May 3. I shall be very pleased to supply him with any type of plan or elevation that he may require for the sum of seventeen and sixpence per copy. ("Worth a guinea a copy." *Vide* Press.)

I do feel, however, that the malicious and totally undeserved attack made not only upon my work, but upon my person by Mr. Charles Gregory Martin (see JOURNAL for May 10), can only be described, if I may be permitted to express the view, as abusive and totally unworthy of an F.R.I.B.A., however retired.

I should like here and now, Sir, to vindicate my positions as Architect, Engineer, Estate Agent, Surveyor and Auctioneer, before the whole world. I have a responsible backing in my work of supplying suburban builders with plans and layouts of housing estates (e.g., my famous Larkholme Ideal Cosy Corners, Ltd., West Finstead Park). My backing, Sir, is the Government. If I am a pest, and am disfiguring the face of our glorious hermitage, as Mr. Martin suggests, WHY AM I NOT PROSECUTED? Your case is legally unsound. I am encouraged in my work of providing domiciles for the workers of our metropolocies, and it gives me a great and permanent satisfaction that I should be supported in this great cause by the House of Lords and the House of Commons (for "Those that are not against us. . .").

I am not at all sure that your JOURNAL is not liable under the law, for pub-

BIRMINGHAM : BY P. J. WESTWOOD

lishing such slanders, but I am postponing proceedings indefinitely.

Honos Alit Artes, my dear Sir, as my work will testify.

JOHN J. BLOWER

[*We here and now, in order to avoid all possibility of legal proceedings, apologize to Mr. John J. Blower and withdraw unreservedly any imputations that may have been made in this* JOURNAL *on his fair name. It is clear that Mr. Blower represents a type that has been aptly called the backbone of the nation.*—ED., *A.J.*]

SIR,—Really you and your architect correspondents have the most astonishing effrontery in ridiculing the speculative builder for his bad taste in house design. In your last issue you show some imaginary villas in the Tudoresque and other picturesque styles, and really our arterial roads are enough to make one go by train.

But, Sir, what are these silly elevations if not caricatures of what all the leading architects were putting up until a few years ago, when most of them went Georgian? It is true that the architects built them for £5,000 apiece and used genuine old oak and called them "Strangeways," "Garth," and the like, and it is true that you and your contemporaries illustrated them and wrote very learned comments on their scholarship, skill in siting and the rest of it. But the sin of the architectural profession was infinitely more gross than that of the builder who now satisfies the taste which has spread downwards to humbler classes of society. Come, Sir, don't let's be so superior.

NOEL CARRINGTON

Competition for Small Houses

SIR,—A plaint and its satisfaction seldom come so close together as in your last issue, where my letter under the above heading appeared on page 655, while plans and a photograph of a pair of houses at Kenton which substantially fill the programme are illustrated on page 664.

As I am writing, I should like to have one doubt resolved. The houses occupy a frontage of 19 ft. 3 ins. each, and we are told that each plot is 24 ft. wide, which includes "space for garage." Unless this is a misprint, either the garage is for a motor cycle, or the Baby Austin will want some skilful driving!

SUBURBAN

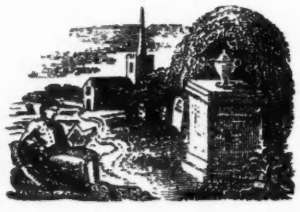
[*The architects for these houses point out that they have garages behind them, with a single 9-ft. passage between; at the rear this widens out to serve both garages.*—ED., *A.J.*]

Inigo Jones's Headpiece

SIR,—I hope you will excuse this letter on a matter which may be of small moment; but I for one of your many regular readers should appreciate a more cheerful gentleman on the outside cover of THE ARCHITECTS' JOURNAL, the pages of which are so often, and so rightly, devoted to the "anti-depression campaign." He may have been a very clever man, but somehow he does not seem to be in keeping with the rest of the JOURNAL—perhaps, however, I am wrong! It certainly proves that they had troubles in the mediæval times.

JULIAN R. ELSLEY

Acoustics in a Theatre



SIR,—On page 632 of your issue for May 10, in a review of a book on Acoustics, I find the following quotation:—

> It is best to keep the stage as reverberant as possible. This can only be done if a large quantity of canvas were not allowed to remain in the flies.

I think it might be of interest to know that this should not be accepted as a hard and fast rule. In a theatre also used for talking pictures, where the acoustical correction of the auditorium had been carried to the finest possible pitch, reverberation on the stage, owing to the lack of canvas in the flies, so affected matters (and the artists on the stage) that it was found essential to hang 8 or 9 full-sized blank back cloths in order to assist the acoustics.

I had considerable difficulty with the case, but the action taken effected a definite cure.

E. C. INSTON

Commonwealth Fellowships

The Commonwealth Fellowships—America's reply to the Rhodes Scholarships—are the most valuable awards of the kind in the academic world. Nominally they are of the value of £600 a year for two years but with the fall of the £ they stand today at something nearer £750 a year. They are given for the purpose of research in America to selected graduates of the English Universities who have obtained First Class Honours Degrees. In these times of economic depression there is naturally great competition for these Fellowships. This year's awards have been made as follows:—

Cambridge, 5½ (one shared with London); Liverpool, 3; Oxford, 3; London, 1½ (one shared with Cambridge); and the following have obtained one each: Glasgow, Birmingham, Leeds, Edinburgh, St. Andrews, Durham, Swansea.

The names of the Liverpool men are R. J. Gardner-Medwin, B.ARCH., whose Fellowship is to Harvard in architecture; J. H. Lamble, B.ENG., PH.D., whose Fellowship is to the University of Michigan in engineering; J. C. E. Simpson, B.SC., PH.D., whose Fellowship is to the Rockefeller Institute in chemistry.

R. J. Gardner-Medwin is the only man to whom a Commonwealth Fellowship has been awarded for research in architecture and he proposes to use this opportunity to make a special study of American methods of town-planning.

Maidstone Arts and Crafts Society

The third annual exhibition of the Maidstone Arts and Crafts Society was held at Maidstone last week. The exhibits comprised architectural drawings, etchings, wood engravings, oil and water colours, sculpture and craft work.

I.A.A.S. £1,000 House Competition

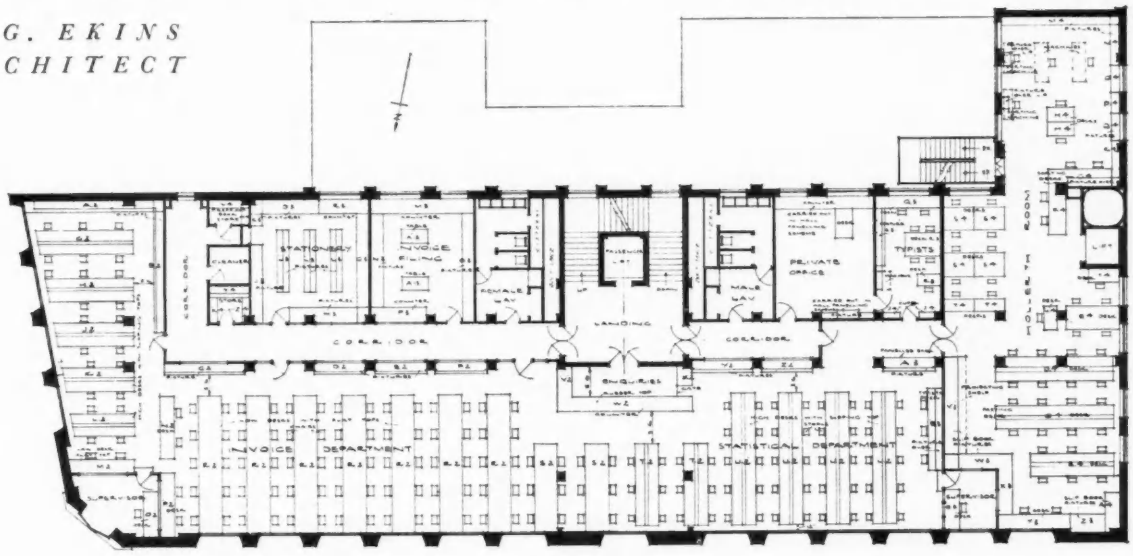
On May 17 an exhibition of models and drawings of the winning designs and drawings of the other entries in the I.A.A.S. £1,000 House Competition was opened by Sir Edwin Lutyens, R.A., P.I.A.A.S. at the premises of Messrs. Cole Bros. Ltd., Church Street, Sheffield. The exhibition will remain open until May 27.

The late J. G. Burgess

We regret to record the death of Mr. Julian G. Burgess, F.R.I.B.A., which occurred in his fifty-sixth year at his home at Beaconsfield.

He was a member of the firm of Messrs. Burgess, Holden and Watson, architects and surveyors, of Bank Chambers, Beaconsfield.

Recent Will



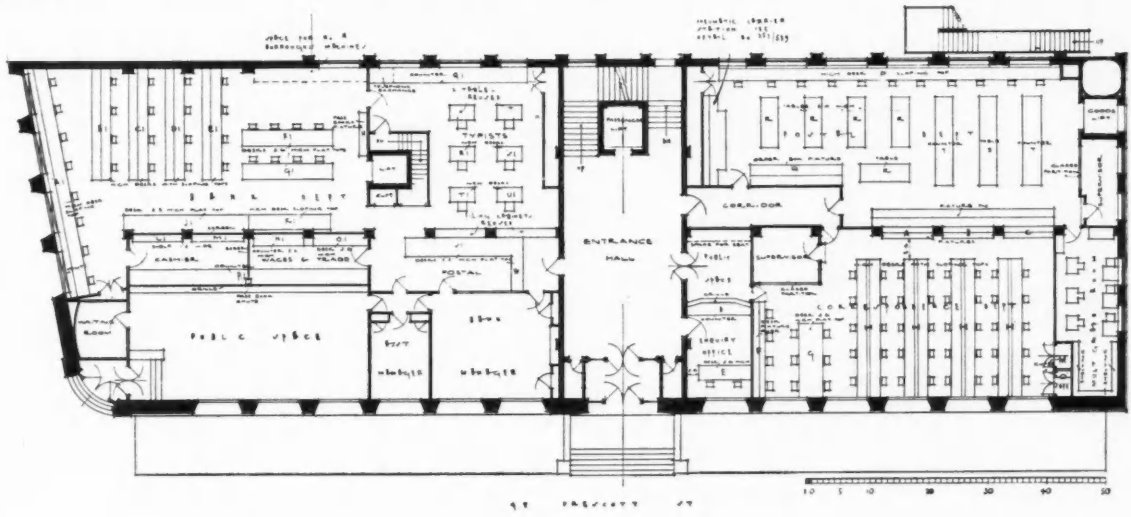
Mr. E. W. Coldwell, Architect and Surveyor, of Pall Mall, left £12,762 (net personalty £12,692).

ON THE AIR

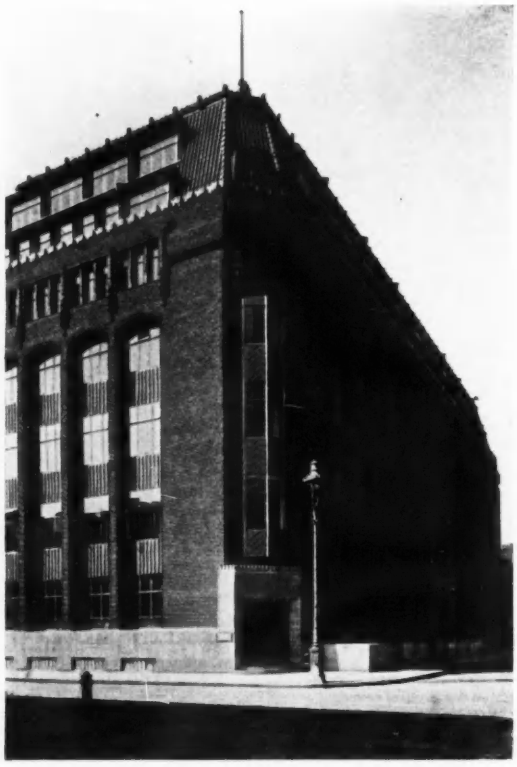
On Tuesday next, May 30, the seventh of the series of talks on "Design in Modern Life" will be broadcast in the National Programme at 8.30 p.m. by Messrs. A. B. Read and Geoffrey Boumphrey, who will discuss "Light."

CO-OPERATIVE SOCIETY'S LONDON BRANCH

L. G. EKINS
ARCHITECT

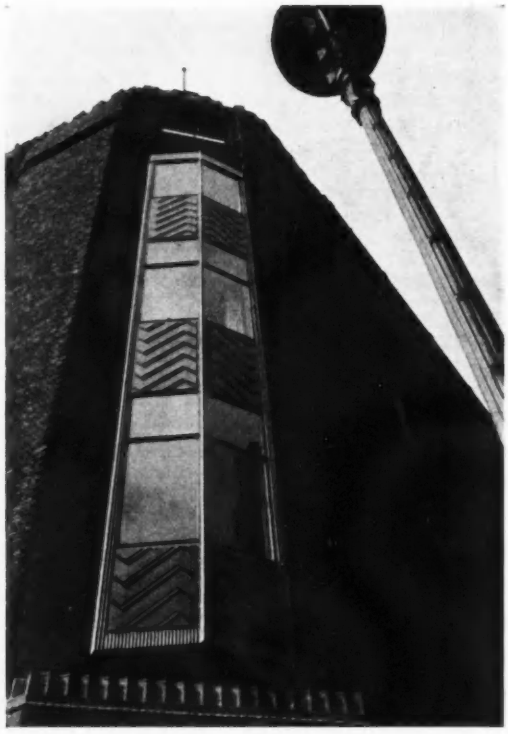


FIRST FLOOR PLAN



This new building, of which the plans show the present extent, while the adjoining perspective drawing represents the scheme as it will be on completion, stands at the corner of Leman (left) and Great Prescot Streets, E.1, and is to house the Society's banking, administrative and other offices.

The external walling is in brickwork, used in forms and patterns the nature of which is indicated overleaf. It rises from a base, extended to embrace the entrance architraves, of artificial granite. A close range photograph of the entrance in Great Prescot Street appears on page 694. Above the line of the set-back is a two-story mansard faced with green glazed tiles.



On the second and third floors are a board room, committee and reception rooms, panelled and with special built-in fittings : illustrations of these appear on pages 695-6.

WHAT IS TO BE DONE ABOUT

THIS?

[*That the Housing Act, which has just received the Royal assent, will remove the subsidy for small houses, is well known. But, as the author of the following article points out, the arrangements made by the Government with the Building Societies are not so well known. He therefore explains the full meaning of Section 2 of the Act, and suggests that it provides little, if any, incentive to the building societies to advance money needed for the construction of small working-class dwellings to let, with the result that this type of work will, unless some remedy is provided, come to a complete standstill. Thus, the Government will have to replace the subsidy, or develop rapidly the establishment of a National Housing Corporation.*

The following have already appeared:—(March 29) 1. The Speculative Builder, by Penates; (April 5) 2. The Speculative Architect, by Edwin Gunn; (April 12) 3. Building Without Guidance, by Stanley Cc Ramsey; (April 19) 4. What the Publie Want, by Edwin Gunn; (April 26) 5. Th) Housing Problem, by Percy Morris; (May 3. 6. The Building Centre Competition, by E. Maxwell Fry; (May 10 and 17) 7 and 8. How the Architect can use the Building Societies, by H. C. Burdett.—ED., *A.J.*]

9. The Housing Act

[*By our Parliamentary Correspondent*]

EVERYONE, of course, knows that the main purpose of the Housing Financial Provisions Act, which passed through its various stages in both Houses of Parliament after somewhat protracted debates, is to withdraw the State subsidy (including the subsidy given under the 1930 Act for rural housing) for all purposes except the purpose of slum clearance.

But what everyone does not know is the full meaning of Section 2 of the Act, which embodies the arrangements made by the Government with the building societies.

It was stated, during the second reading debate in the House of Lords, that, of all forms of private enterprise which concerned themselves with housing, building societies had by far the

greatest resources and experience in financing the building of houses. Out of 2,000,000 houses constructed since the war, no fewer than 1,000,000 had been constructed through the agency of these societies. The Government, therefore, had decided to call to their aid the large reserve funds possessed by these societies.

Normally, building societies lend 70 per cent. of the cost of the houses required. Under the scheme of the Act they are to lend 90 per cent. The 20 per cent. gap thus left will be bridged over as regards one-third by the State, one-third by the local authority, and one-third by the building society.

As a concrete instance of the procedure to be followed under the Act, let us suppose that a private builder desires to erect a group of small houses to let. He will apply to a building society—any one he chooses—for an advance up to 90 per cent. of the cost. The building society, if it approves the scheme, makes this advance and charges a rate of interest which today would be only 3 per cent. If the local authority also approves the scheme, it guarantees about 6 per cent. of the cost. If the Ministry of Health approves as well, it also guarantees a further 6 per cent. of the cost. Thus the building societies undertake to finance, on terms quite favourable to the builders, the construction of small houses to let, provided they receive a guarantee from public authorities of the money advanced.

During the discussions in the House of Commons a good deal of cold water was poured on the scheme, and many members declared that the building societies, as a whole, were reluctant to work it. To this allegation Sir Hilton Young, the Minister of Health, retorted that the plan had been put forward voluntarily by the building societies. It was their own suggestion. It had been framed, quite frankly, by them to meet their own particular needs, which they believed

were in accordance with the needs of the country. He had been in touch with nine societies which were prepared to operate the scheme, and those nine societies had capital assets of the value of £150,000,000. The House would therefore see that the Government had "enlisted powerful forces."

Apprehension has also been expressed lest the new scheme should mean a lowering of the national standard of housing. On this point, too, the Minister has given assurances. There is, he states, no danger of a reduction in the national standard. Although he admits that the conditions imposed when the subsidy was in force will go under the new Act, yet it will still be the duty of local authorities to maintain the standard of housing. They can do this, first, because their assent is necessary to the guarantee for building-society money; and, secondly, under the general powers they now possess through the Town Planning Act of last Session.

To sum up, while one has no desire to condemn the scheme before it has been properly tried out, there is a very general feeling, particularly pronounced in building-society circles, that the Act is a peculiarly hopeless piece of legislation. It provides little, if any, incentive, to the building societies to advance the money needed for the construction of small working-class dwellings to let, and the probability is that the construction of this type of house will, in a short time, be almost at a standstill.

In that event, the Government will be compelled, by the force of public opinion, either to replace the subsidy or to develop rapidly the scheme for the establishment of a National Housing Corporation.

The Moyne Committee is "exploring" the suggestion of the setting up of such a Corporation, and it is to be hoped, for the sake of the future of working-class housing, that this exploration will not be unduly prolonged.

IN THAT CONTINGENCY

The following abstracts of inquiries represent a number of those recently submitted to the Building Research Station. The information given in the replies quoted is based on available knowledge. It has to be borne in mind that further scientific investigations may in the course of time indicate directions in which the replies might be supplemented or modified. Moreover, the replies relate to the specific subject of each inquiry, and are not necessarily suitable for application to all similar problems. Crown Copyright Reserved.

Plaster Setting Coat Failures

¶ *THE proprietors of an hotel reported the failure of a large number of setting coats to plaster ceilings. The floors on which the ceilings had been placed were constructed of hollow clay tiles and concrete; some ten months had elapsed between the completion of the concreting and application of the plaster. The original finishing coats had come away over large areas in various rooms of the hotel, and it was stated that they were composed of 1 part sand (by volume) to 2 parts white hydrated lime, gauged with a coarse gauging plaster. The composition specified for the undercoats was in every case as follows:—render coat: 1 part Portland cement (by volume) to 3 parts sand; floating coat: 1 part grey hydrated lime to 3 parts sand with an addition of about 10 per cent. Portland cement.*

In an attempt to arrive at the most suitable mixing proportions and type of material to use for the final coats, the plasterers had tried a number of experimental ceilings, and in every case they, too, had come away from the undercoats with surprising regularity. The mixes of these final coats had been varied, using different porportions of coarse gauging plaster and a Keene's cement. Certain chemical investigations had also been carried out.

The work was inspected and the sample of failed plaster brought away for examination was stated to be composed of 1 part sand (by volume) to 1 part

hydrated lime, gauged with about 10 per cent. of a Keene's cement.

It was understood that, from an acoustical point of view, the architect to the building deprecated the use of any type of plaster other than a lime plaster.

(NOTE.—*This failure is similar to one recently included in these notes, but in view of the somewhat unusual circumstances of the case it appears to be a problem of especial interest.*)

The undercoats (floating coat and rendering) seem to be sound and hard, and should provide a satisfactory base for the application of a finishing coat. The floating coats on the two ceilings inspected seem to be considerably harder and stronger than would be expected of plaster conforming to the specification.

It is a matter of considerable difficulty to determine the cause of the failures with absolute certainty; it has been frequently found in cases of this kind that manipulative errors are not indicated by any chemical or physical tests which can be carried out on the set plaster. From the account given of the chemical investigations it would appear unlikely that the lime or cement were in any way defective and the excellent condition of the floating coat supports this view.

It appears most probable that the failure of the original setting coat may be ascribed to a combination of two circumstances:

1: Overworking of the gauged plaster, so that the early set of the coarse plaster was "killed."

2: Extraction of the moisture from the finishing coat due to the dry condition of the background. The powdery condition at the back of the setting coat where failures occurred is typical of this kind of failure. The long period which elapsed between the completion of the floor concreting and the application of the plaster may well be a contributory factor. It is often found that the hollow tiles used in floor construction exhibit a high capillary suction.

The failure of the second batch of setting coats with the Keene's cement gauging may well be due to the second of the causes indicated above. It would be difficult to ensure that the background was sufficiently wetted to take advantage of the comparatively slow development of strength of the Keene's cement addition. In any case it should be noted that in the absence of any formal specification, cements marketed as Keene's may vary widely in composition and properties, and there is no guarantee that the user will obtain the traditional hard-burnt, acid accelerated type of plaster.

It seems, therefore, that in replacing the setting coats it would be desirable first to reduce the suction of the background by vigorous use of the water brush, supplemented in areas of particularly high suction by a coat of size; then to apply a plaster having a definite controlled period of setting, such that it can be applied within reasonable time for working, and yet develop adequate strength before the moisture is lost to the dry background. A calcium sulphate plaster of the retarded hemihydrate type, of which there are a number of reputable brands available on the market, would be the most suitable. Care should be taken to ensure that the material delivered to the job is of the type actually specified, since plasters of different types demand different handling. It will, of course, be necessary to clean off all loose powdery material adhering to the floating coat.

In view of the fact that the conditions on this job are evidently difficult, it is suggested that a neat or lightly sanded finish, without any lime addition, is to be preferred. This should give a reasonably porous surface which will provide an excellent background for decoration where, in view of the delays which have already happened, no doubt some haste will be desirable. The plaster can be worked for a period of about 1½ hours, but all material must be used up within 2 hours of the addition of water. Rigorous supervision on this point is absolutely essential to the success of the work.

It may be mentioned that any advantage which a lime plaster finish may possess in respect of sound absorption will be completely lost when the absorbent surface is decorated. Moreover, there is no reason to suppose that a lime plaster on a solid background will have any advantage over a hard plaster in respect of sound transmission. The only case where it is likely that a lime plaster may possess some advantage is for ceilings on lathing; it is possible then that the harder plaster may act as a resonant membrane.

Disintegration of Facing Bricks

¶ *AT the request of a housing company an inspection was made of the brick facings of a large block of flats. The flats had been built about 35 years and something like four years ago it was first noticed that the facings, of red sand-faced bricks, pointed in cement mortar, were weathering badly. The deterioration has progressed steadily and reached such serious proportions that recently it became necessary to adopt remedial measures at once, since damp penetration was occurring in the affected areas, which were of considerable extent. The surveyor to the company proposed to render the walls in a cement and sand mortar but first desired the opinion of the Station as to the suitability of this remedy.*

It is most likely that disintegration of the brickwork has been caused by the soluble salts contained in the bricks. These salts are conveyed to the outer face of the brickwork, and on the evaporation of moisture at this face crystallization takes place, leading to flaking of the face of the brick; this action will have been greatly aggravated by the cement mortar with which the brickwork has been pointed. If a cement rendering is to be used it must be accepted that there is some risk of failure, since the brickwork in this case is by no means an ideal background.

Unfortunately there is no simple alternative which we can suggest; any form of surface treatment of the nature of a paint, or similar waterproof film, would probably flake rapidly, due to crystallization of the salts which are causing the bricks to decay. In certain other cases where repeated attempts to apply cement renderings have proved unsuccessful, it was finally found necessary to adopt a more elaborate treatment, in order to keep the rendering out of contact with brickwork containing considerable amounts of salts and to prevent the penetration of moisture. One method, which has proved satisfactory on a large factory office block, consisted in the following:—

A coating of a bituminous preparation was first applied to the brickwork to serve as a waterproofer. Expanded metal, or similar lathing, was then secured to plugs in the brickwork, so that it was just clear of the surface. Cement rendering was then applied to the lathing, using a carefully graded sand and keeping the mix as lean as possible; the new rendering was kept damp for a period of about two weeks after completion. The latter precautions were intended to minimize the formation of shrinkage cracks.

To summarize, in the present case the following methods may be adopted for the main block of buildings:—

1. To cut out and replace the worst of the defective bricks from time to time. Any repointing to be carried out in a lime mortar lightly gauged with cement. Moisture penetration to be dealt with locally according to the nature of each specific case.

2. To apply cement rendering as suggested, accepting that there is a definite risk of further trouble. A well-graded sand should be used and the mix should be kept as lean as possible. Damp curing for ten days is very desirable.

The effect of a cement slurry, brushed on to the brickwork at cream consistence as a base for cement rendering, is being tried out at the Building Research Station. The results so far are very promising and it seems that much better adhesion of the rendering may be secured. The slurry should be applied about twelve hours, and not more than forty-eight hours at most, before applying the undercoat of the rendering.

3. To apply cement rendering on lathing over a waterproof film as indicated above. This should be effective but the cost will be considerable.

BUILDING FACTS AND FIGURES

3. Housing Costs

[*By L. J. GOLLOP*]

B.Sc. (Econ.) F.S.S.

THE average building cost of houses, excluding charges for land, roads, sewers and fees, in respect of which tenders were let or direct labour schemes approved during the first quarter of 1933, was £295 for non-

parlour and £366 for parlour houses.

The more important figure is that for non-parlour houses, as dwellings built under subsidy are predominantly of this type. Similar figures for the last four years are as follows :—

Average building cost of non-parlour houses

Year	1st Quarter	2nd Quarter	3rd Quarter	4th Quarter
	£	£	£	£
1929 ..	339	349	343	349
1930	335	335	337	351
1931 ..	345	321	333	327
1932 ..	321	310	304	298
1933 ..	295	—	—	—

This table admirably indicates the progressive decline of building costs in recent years, broken only by minor and seasonal movements, and a somewhat more than seasonal increase in the fourth quarter of 1930.

The figure of £295 for the first quarter of 1933 is the lowest ever recorded in this series of figures—which goes back to 1924—and is no less than £153, or 34 per cent., below the figure for the fourth quarter of 1926 (£448), the highest recorded.

The movement of these figures since 1924 may be indicated by comparing the first quarter of each year.

Average building cost of non-parlour houses

First quarter of :	£	First quarter of :	£
1924	398	1929	339
1925	435	1930	335
1926	442	1931	345
1927	425	1932	321
1928	368	1933	295

This progressive tendency to lower costs gives an important clue to the movements of the statistics of building plans discussed in my previous article (May 10). It also provides additional support to the conclusion then reached that housing, under the stimulus of low costs and interest rates, may be expected to go ahead during 1933. This is also reflected in the fact that unemployment in the building industry on April 24th had been reduced to 198,017—the lowest figure since September, 1931—while the number unemployed in public works was 122,057—21,000 above the figure for April, 1932, and 64,000 above the corresponding figure for 1931.

As *The Economist* of May 20th remarks, "throughout the 'economic crisis' the demand for dwelling houses, chiefly of the smaller types, has been a mainstay of the building trades."

The Mackintosh Frieze

The Quarterly Illustrated of the Royal Incorporation of Architects in Scotland asks the question : "Should architecture be taught in our schools?" It would certainly give laymen, it states, an architectural vocabulary and make them conversant with our terminology. Quite recently an architect entered a certain restaurant and asked to be shown the Mackintosh frieze. Great was his surprise when he was handed the cold menu, and was told that the ices were "off" today.

TRADE NOTES

BY F. R. S. YORKE, A.R.I.B.A.

Scale Buoys

FOLLOWING the appearance of letters dealing with "Scale Buoys" in our issues for May 3, 10 and 17, I have been asked to give the method of application and cost of this unconventional device for which is claimed power to remove scale deposits from boilers and pipes of domestic hot water systems, and to prevent further accumulation.

•

That scale in a boiler is a very expensive nuisance is evident from the fact that a $\frac{1}{8}$ in. thick deposit means a 15 per cent. increase in fuel cost, whilst a $\frac{1}{2}$ in. deposit may entail an increase of anything up to 150 per cent.

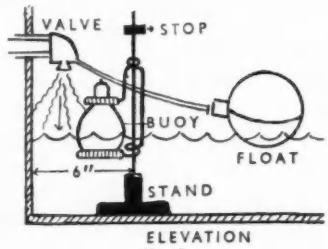
•

I understand that when Scale Buoys are used installation cost is negligible, and there are no charges for chemicals or electricity. The existing water system is not altered and there is no need for affected pipes to be replaced. The buoys are hermetically sealed and should last indefinitely. Once installed they are supposed to function automatically.

•

When shaken in a clear light they give evidence of an electrical discharge. No chemical change is shown in the analysis of the water, but, in spite of that, Scale Buoys so alter the salts or scale-forming matter in solution in the water that when the water is heated, instead of crystals forming hard scale they precipitate in the form of sludge, which can be dealt with easily.

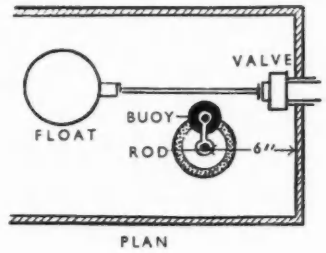
•



The buoys cost 50s. each. One is sufficient for a 50-gallon supply tank if the water does not exceed 20 degrees of hardness. Two should be used in a 100-gallon tank and one buoy added for every additional hundred gallons capacity.

•

The best results are obtained if the buoy is placed in the part of the cold water cistern in which water is most likely to circulate freely. Where a single buoy is installed, the rod should be placed as near the arm of the ball-cock float as possible, but with sufficient space to allow it to swing around without touching either the arm or the side of the tank. The rod should be about 6 ins. from the side of the tank (Fig. 1).



•

Where two buoys are installed, the positions indicated in Fig. 2 are recommended. If more than two are used, the stop should

ELEVATION

Fig. 1.

PLAN

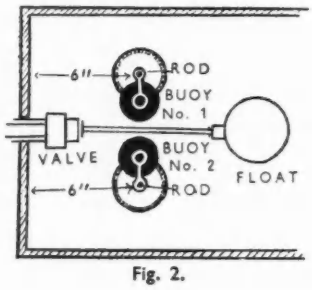


Fig. 2.

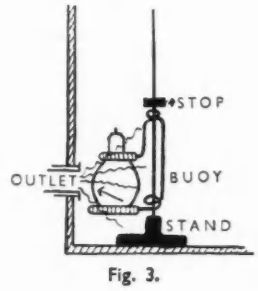

Fig. 3.

be allowed to slide down the rod until the buoy is held at the level of the outlet pipe supplying the hot water system (Fig. 3) and placed about 1 in. away from it. Additional buoys should be placed symmetrically about the tank, with the rods from 6 ins. to 9 ins. from the side. Where intercommunicating tanks are installed, buoys should be placed near each tank-to-tank connection (Fig. 3).

Synthetic Resin Plastics

I went last week to the Plastics Industry Exhibition at the Science Museum, South Kensington, which has been arranged to demonstrate the production methods and "modern" applications of plastic materials. As the Exhibition will remain open to the public for several months it may not be too much to hope that those responsible for the modern application section will replace some of the exhibits by others of more intelligent design, if only to do justice to the technical side.

•

Here is a manifestation of the muddled outlook of the age we live in: intensive scientific research, years of patient experiment, fortunes spent in the development of an industry and machinery, and, at an exhibition organized to demonstrate progress, held in the Science Museum, we find a host of "arty" imitations of tortoiseshell, wood and marble, and scarcely any sign of exploitation of the inherent qualities of the new material.

•

Anything more puerile than the lamp shades, wireless cabinets, clock cases and door knobs it is difficult to imagine, and I should have left the Museum with a poor opinion of the material itself had it not been for the exhibit of telephone instruments, designed for service, with no elaboration to interfere with utility; and a small room, in a central position, for which furnishings and fittings were designed to demonstrate the architectural use of plastics. The walls were lined with squares of orange Beatl and the doors faced with brown and black Bakelite.

•

Plastics have been described as materials that take shape or form by the application of heat, with or without pressure, and retain shape on cooling: the basic materials are

Natural resins.
Cellulose (nitro-cellulose and cellulose acetate).
Casein (from milk).
Synthetic resins (derivatives of coal).

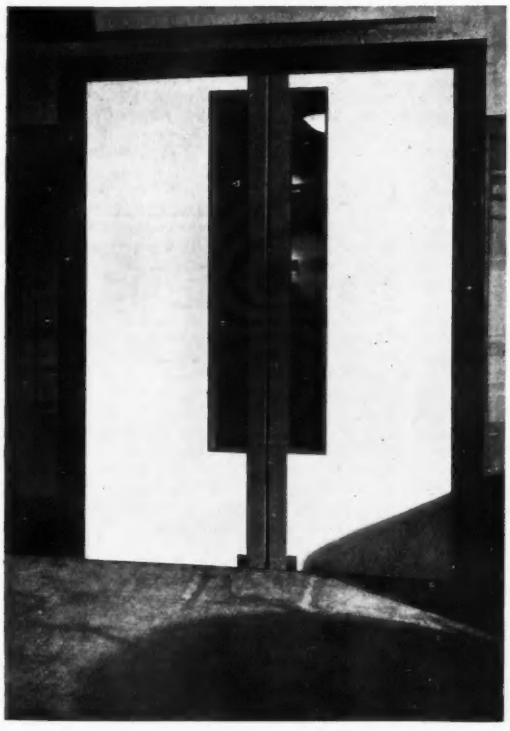
•

In the synthetic resin group are the plastics most likely to be of interest to architects. The principal members of this group are the phenol-formaldehyde resins (phenol from coal tar) and the urea-formaldehyde resins (urea is a product of carbon dioxide and ammonia). From the phenol we get Bakelite and from the urea Beatl.

•

Both are produced in the form of moulding powders, which harden permanently under heat in hydraulic presses. Wood flour or wood meal (triturated sawdust) is added to the powder to counteract brittleness.

•



In the course of a lecture, delivered at the opening of the Exhibition, Mr. H. V. Potter, Chairman of the Plastics Group of the Society of Chemical Industries, speaking of synthetic resin plastics, said the first of these to be developed commercially was Bakelite, named after its inventor, Dr. Baekeland. This class of plastic was dependent on two common natural materials, coal and wood. From coal came carbolic acid or phenol, and from wood, wood spirit and finally formaldehyde. Today there were many other methods of obtaining formaldehyde, and wood spirit was little used.

•

These materials chemically reacted together to give a hard transparent amber-like body which was inert in many solvents, chemicals and conditions and was a relatively good insulator. Another member of this class was "amino resin" in which urea or thiourea was used instead of phenol. This produced a water-white or opaque product. It was the introduction of the synthetic resin plastic products that had brought the industry to the forefront in recent years. These synthetic resinoid plastics readily flux under heat and pressure and are introduced into a steel mould in which the design of the final article is cut or engraved on the opposite or negative form; when subjected to heat and pressure the material rapidly fuses and takes the shape of the containing mould, chemically hardens, and can be ejected from the mould in the solid finished form. "The phenolic type is used to form black and brown switches, lamp-holders and other electrical equipment, in dark warm colours, while the amino class is no doubt well recognized in the moulded beakers and cups for picnic sets, etc., with very artistic and attractive colour effects," said Mr. Potter.

•

Although comparatively new, the plastics industry represented a turnover of £20,000,000 and employed many thousands of persons. The lecturer was sure that it would play a very important part in the industries of the country, and the artist, the architect, and the engineer had available for their use a new material offering almost unlimited possibilities. Finishes could be produced during manufacture and the costly process of subsequent application eliminated; flat colour surfaces, previously only obtainable by a long process of painting and polishing, became an integral part of the plastic product, and it was now possible to produce sheets of plastics which were fire-and water-resistant, relatively flexible, machineable and in some cases chemically resistant.

Double doors to a studio at Broadcasting House, veneered with a yellow composition resin board. The metal frame and meeting stiles are cellulosed.

Architect: Raymond McGrath.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Rent Restrictions Bill

THE Rent and Mortgage Interest (Restrictions) Amendment Bill, which is the second step in the Government's housing policy, has been read the third time in the House of Commons by 301 votes to 6.

Sir Hilton Young, Minister of Health, speaking during the third reading debate, said that the Bill directly affected 7,000,000 houses. The interests of both owners and occupiers had been considered in a spirit of fair play. Already they had seen some improvement in the building activity of the country, and it was reasonable to think that the new direction which the Government had given to housing

policy had been in part responsible for the improvement in employment in the building trade. Since last January unemployment in that trade had decreased by some 100,000 persons. That improvement was partly seasonal, but it was precisely double this year what it was last year and the year before.

The principal object of the Bill, which was part of the housing policy of the Government, was to maintain a pool of small houses available for the lower-paid wage-earners during the remainder of the period when it might be anticipated that the supply of these houses would not equal the demand. The Act would operate for a fixed period of five years—a reasonable period to allow for those forces which were at work in increasing the supply of the smaller type of houses to such a point as would make it safe to decontrol the "C" class of houses. The measure secured a most important condition for the future, namely, that control should not continue in an automatic manner year after year. For the first time a wage-earner who was looking for a house would be able to be quite certain whether the house to which he was going was controlled or decontrolled. This information would be provided by a register of houses. Sub-tenants were protected against the profiteering of the direct tenant by the provision which enabled the owner to turn out the profiteering tenant by recovering the full possession of the house. Powers were given to local authorities to supply information and advice to tenants as to their rights. From the point of view of the owners the Bill established the principle that the owner was entitled to the possession of a house where he could prove that there was alternative accommodation, or a house of the same kind, available for the tenant. Society as a whole was benefited by the provisions against the overcrowding of houses by tenants and the sweeping away of unnecessary restrictions on investments in house property; thus, by making such investments more attractive, leading to a greater supply of houses and consequent reductions in rents. Encouragement was given to the reconditioning of houses by enabling the owner to charge a fair return on the money he spent for that purpose. Dispossessed owners of shops and business premises were given the right to compensation.

Price of Bricks

At question-time Mr. Soper asked the Minister of Health whether his attention had been called to the increase in the price of bricks; and whether any steps could be taken to prevent it.

Mr. Shakespeare said that the Minister's attention had been called to some increases in the price of certain sorts. He understood that a recent increase of demand had interfered in places with the ordinary adjustment of supply to demand.

Trade Items

Many architects are probably unaware that Messrs. W. H. Gaze and Sons, Ltd., of London and Kingston, are one of the few firms in this country that can undertake—with their own men—the whole of the work entailed in the erection of a building, right down to the last detail of its equipment. This complete service to the architect—possibly unique in its scope—is only possible by the excellent organization of the various departments of the firm. These departments, each under the direction of a specialist, include the following: Building, decoration, furnishing, heating, lighting, wrought iron work, landscape gardening and hard tennis courts.

Gaze's tennis courts are well known for their cheapness and efficiency. They have been

Philip J. Turner, F.R.I.B.A., F.R.A.I.C., the newly-elected President of the Quebec Architectural Association.

chosen three consecutive years for the British Hard Courts Championships; selected year after year for Davis Cup contests; and purchased by numerous private clients, hotels, firms, councils, boroughs, hospitals, sports and tennis clubs, etc. As an example of their quality we may point out that the London General Omnibus Company and associated Electric Railways, after every test, are now standardizing Gaze's "Grass-Green" hard courts in all their sports and recreation grounds.

To appreciate the craftsmanship displayed by the firm's staff in the execution of gardens and garden ornaments, one has only to visit the Gazeway. Here, on the main Portsmouth Road at Surbiton, are acres of model gardens of all types and sizes, any of which Gaze's will re-create on your own land. Here, also, is a large selection of ornaments. The firm, as usual, are exhibiting at the Chelsea Flower Show, which opens tomorrow, May 25. Thus, those unable to visit Gazeway, are afforded an opportunity of appreciating the high standard of work reached by Gaze's.

The main feature of their exhibit consists of a summer house of unique design overlooking a garden with simple undulating lawn and massed flowers arranged in shades of blue complemented with bright green and grey foliage. The summer house, of Surrey sandstone, stands in one corner of the site with a mass of evergreens as a background, and on each side a bank with grassy slopes and occasional outcrops of rock on which are growing masses of alpines, semi-aquatics and ferns. The approach to the summer house is by a flight of stone steps leading to the floor level. Projecting from the summer house is an old oak balcony adorned with trailing flowers, and this leads to a winding path with occasional rock steps. The water starts on one side of the summer house and feeds a small lake beneath. The firm's object has been to obtain the effect of a restful and quiet retreat with a still, clear pool reflecting the overhanging balcony and summer house.

*

Messrs. G.V.D. Illuminators announce that they have secured a contract for lighting the whole of the shop windows at British Industries House, Marble Arch [lately Gamages (West End), Ltd.], which is being adapted to form a permanent centre for overseas buyers.

The same firm recently completed the installation of a lay light illuminated on the G.V.D. system at the Tate Gallery, to the instructions of H.M. Office of Works. This system is also being incorporated in the lighting arrangements for the World Economic Conference, which is to be held in the New Geological Museum, S. Kensington.

Kidman; church, Dyfed Avenue, Townhill, for the Trustees of the English Congregational Church; two houses, Gower Road, for Mr. A. J. Bevan; two houses, Mumbles Road, West Cross, for Mr. T. H. Harris; two houses, Goitre-fawr Road, for Messrs. M. Davies and Co.; two houses, Maple Grove, for Mr. C. H. Wastell.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

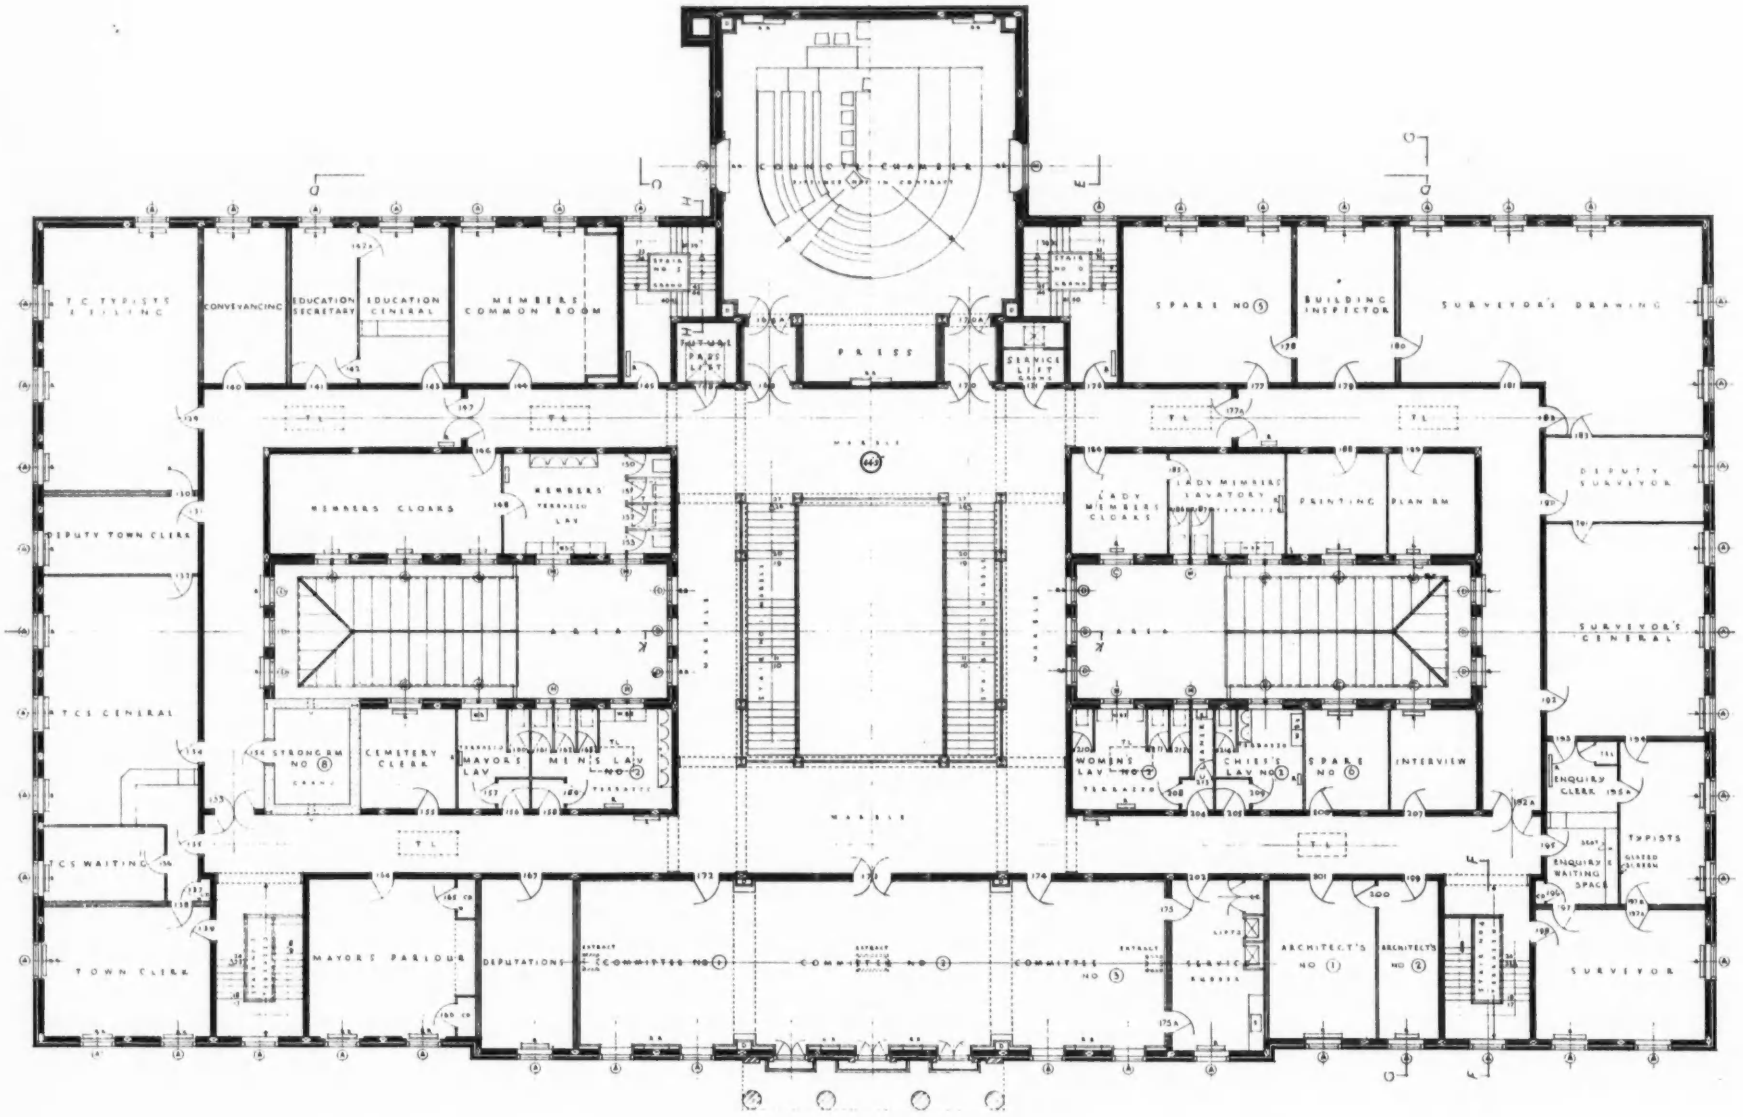
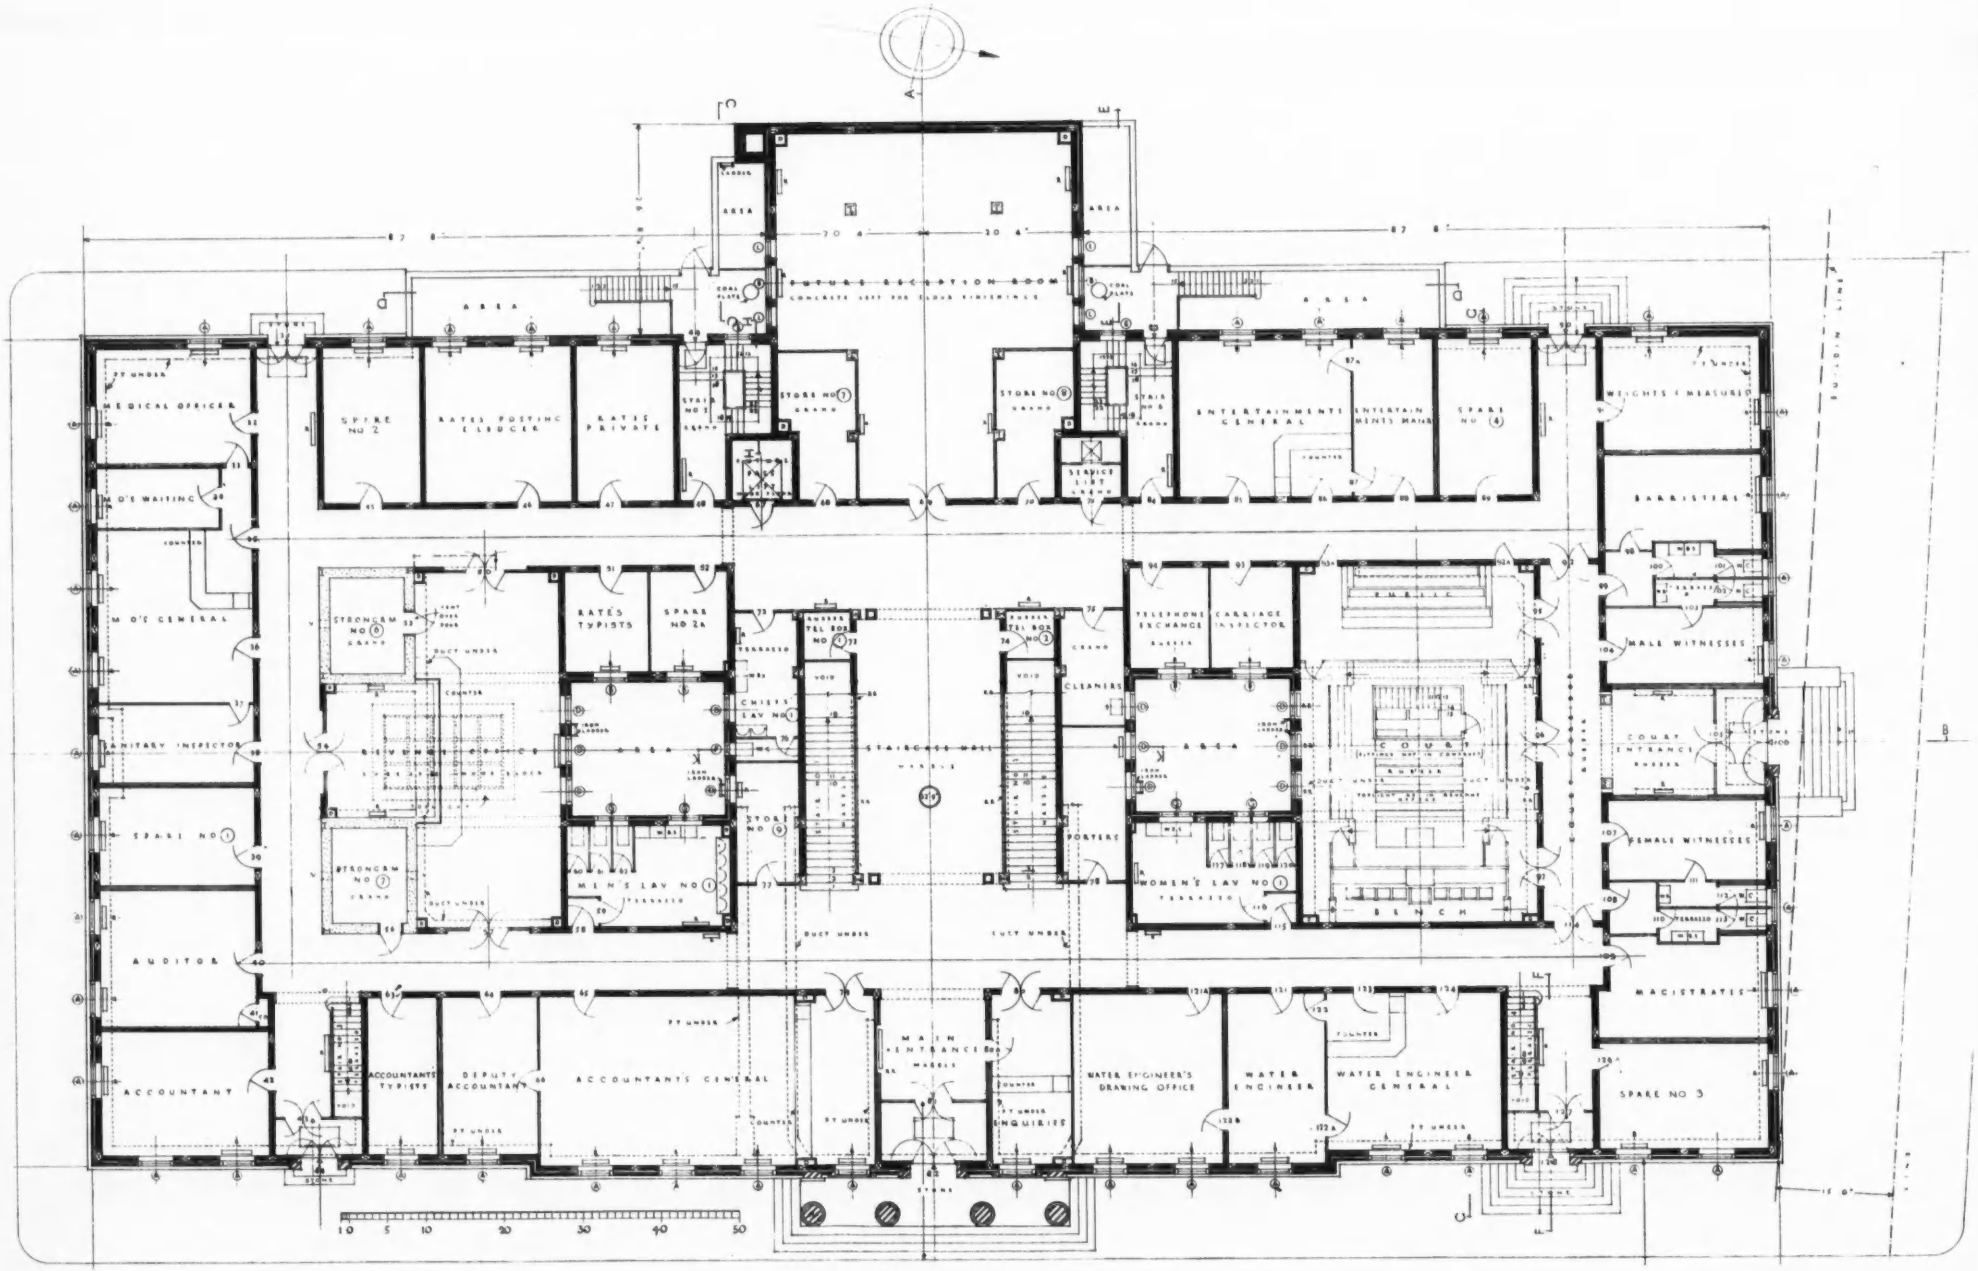
Supplement to THE ARCHITECTS' JOURNAL for May 24, 1933

WORTHING TOWN HALL

ELEVATION AND PLANS: : BY C. COWLES-VOYSEY





PART OF THE MAIN EAST ELEVATION: THE WHOLE IS SYMMETRICAL

THE form of the Town Hall building, of which plans are reproduced overleaf and photographs and some detail drawings elsewhere in this issue, is a simple rectangle with two light wells in the centre. On the first floor there are the Council Chamber, committee rooms and member's room and also the offices of the Town Clerk, Borough Engineer and Surveyor. The ground floor is occupied by the accountant's department, rates and revenue office, medical officer of health's department and the Police and County Court, with the necessary subsidiary rooms. There is a second floor over the centre portion of the building containing kitchens, caretaker's quarters and the public gallery of the Council Chamber.

The construction throughout is of a fire-resisting nature with the exception of the roof. The walls are of brickwork combined with steel framework and the floors are of reinforced concrete.

The site is bounded by Chapel Road (main front) and Stoke Abbot Road. Space has been left at the back of the present building for an assembly hall, accommodating 1,000 people, to be built at a later date if required. This latter would have a public approach from Stoke Abbot Road, and a ceremonial approach from the main entrance. The estimated cost of the building now completed, including furnishing, is £120,000; and of the assembly hall annexe, £42,000.

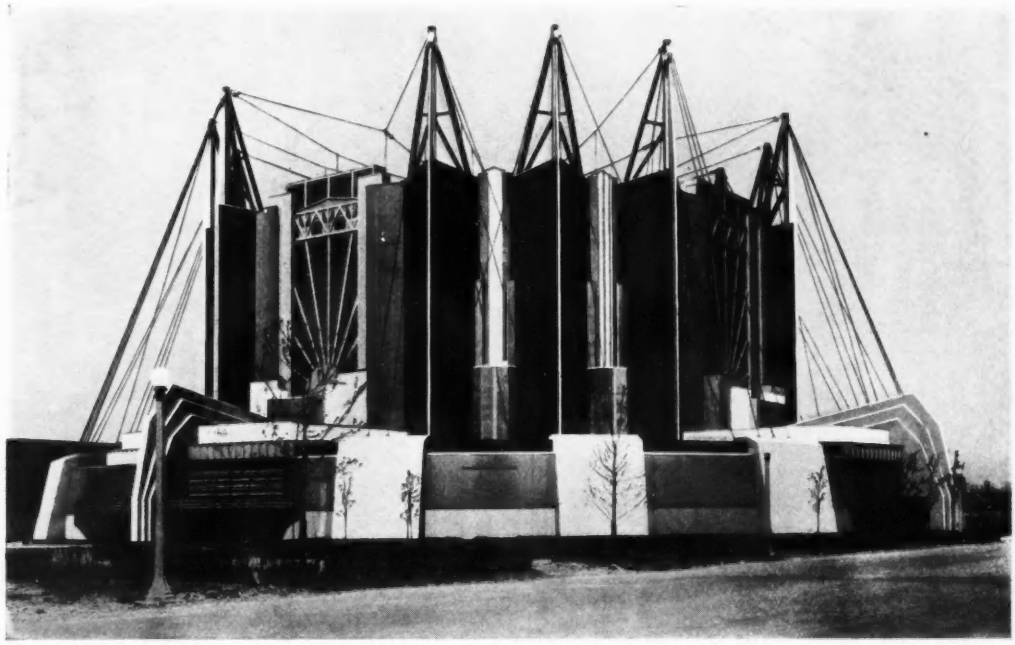
STAIR RISERS AND FLIGHTS

•

THIS week's Sheet, the third of a series of nine dealing in detail with the layout and construction of staircases, continues the table given last week for floor-to-floor flights increasing by single inches up to 17 feet 11 inches.

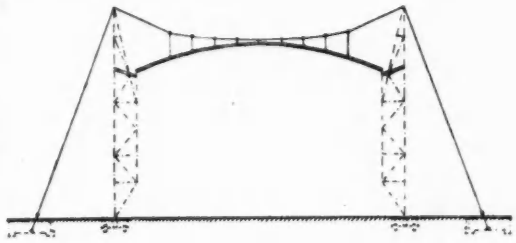
From the complete table, the heights of individual risers in any desired number of steps necessary in the flight can be read off at a glance. The limiting heights of the risers themselves are 5 inches minimum and 9 inches maximum.



The lower table gives the going in inches per step by increments of half-an-inch.

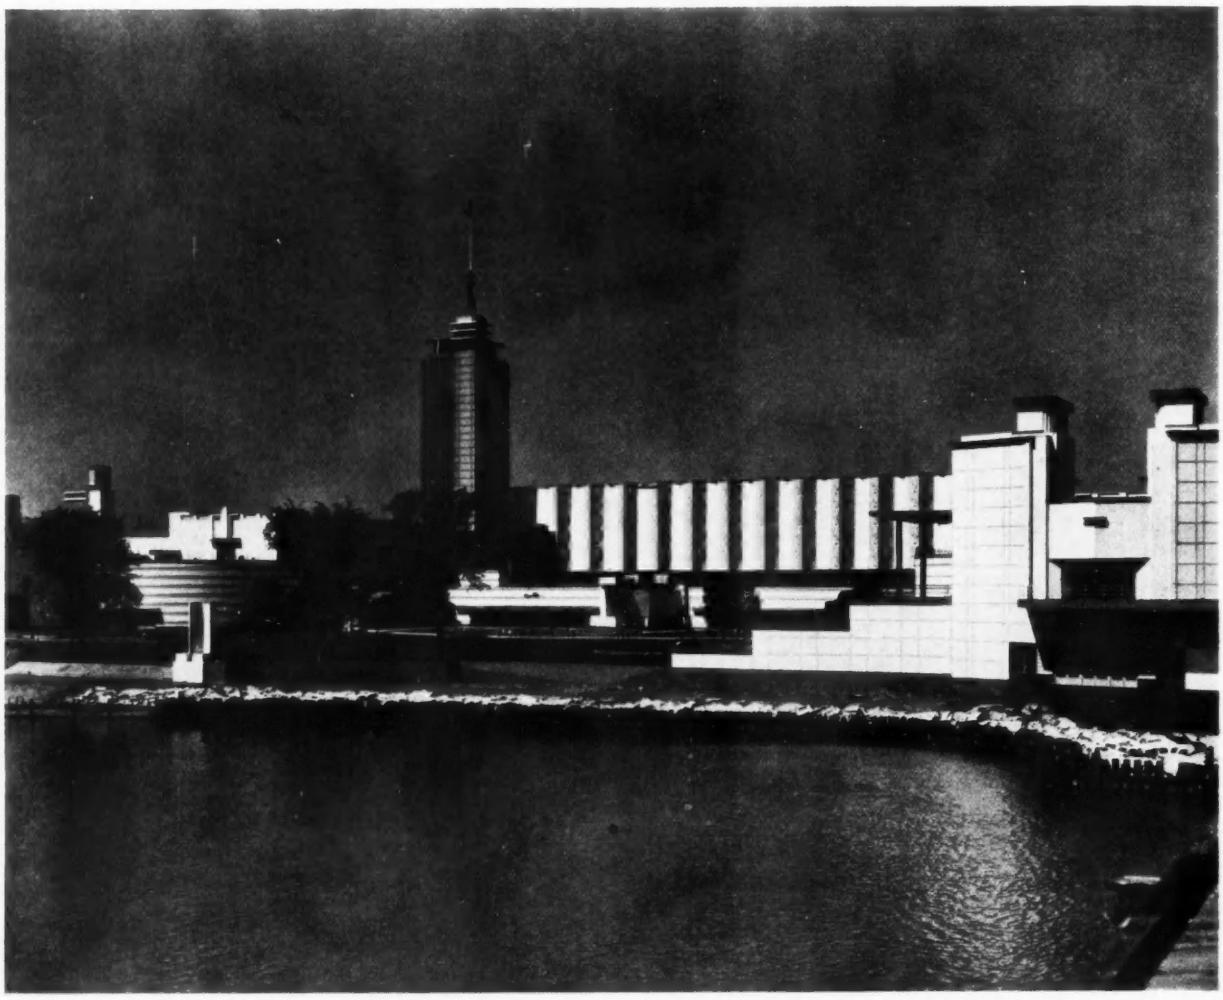
The following is a full list of the subjects previously issued :—

1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.
8. Mar. 8—Billiard Table Data.
9. Mar. 15—Roof Pitches and Drainage.
10. Mar. 22—Lift Sizes, etc.
11. Mar. 29—Sanitary Accommodation.
12. Apr. 5—Lavatory Units.
13. Apr. 12—Lavatory Units.
14. Apr. 19—Plumbing to Basins, Baths, etc.
15. Apr. 26—Pipe Chases, etc.
16. May 3—Drains and Manholes
17. May 10—Stairway Diagrams.
18. May 17—Risers for Stairs.



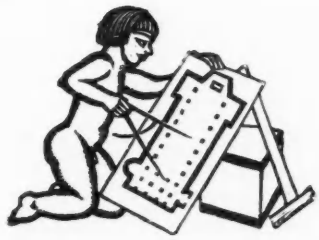
AT THE CHICAGO WORLD FAIR

A DOME SUSPENDED FROM STEEL CABLES



THE vast size of this Travel and Transport building, designed by Bennet, Burnham and Holabird, may be gauged from the height of the surrounding wall in the foreground, which is over 23 ft. The dome is upwards of 200 ft. across and 125 ft. high, and the novel application to its design of the principle of the suspension bridge is in keeping with the object of the exhibition, which is to depict "a century of progress."

The roof, formed of I-section steel members and plates, is hung from twelve lattice stanchions, 150 ft. high, by 2-in. steel cables, anchored to the blocks of concrete, some 39 ft. by 20 ft. by 10 ft. of which several are visible. The interior thus presents a clear span devoid of arches, pillars, beams or any other supports. By means of



expansion joints, sections of the roof are left free to slide one over another under the influences of changes of temperature, wind pressure and the load of rain or snow. The lateral movement, in a surface so large, may be a matter of feet.

THE HALL OF SCIENCE, CHICAGO

Designed by Paul Philippe Cret

On Saturday the Chicago World Fair was opened. It occupies a narrow site, nearly four miles long, from north to south, and over half a mile across, on the westerly shore of Lake Michigan. Near the centre of its length is an island enclosing a lagoon spanned by bridges. From one of these is taken the above view of the Hall of Science, a structure occupying a space of 700 ft. by 400 ft., and planned like a U, with the opening facing east; the court thus enclosed on three sides is capable of accommodating 80,000 persons. The tower is 176 ft. high, and is equipped with a carillon. The taller portions of the building are steel-framed, the lower, timber-framed. At night it has the appearance of a brilliantly illuminated metal and glass creation, rising from coloured terraces.

ADVISORY PANELS: SIR HILTON YOUNG'S GESTURE

FROM the moment when it was announced that the Government was prepared to concentrate upon slum clearance and let private enterprise look after small house building, it seemed to many people that State responsibility for the dwellings of the poorest classes of the community was being thrown aside at the first opportunity. The Act was called the "Anti-Housing Act." It seemed as though we had reverted to the bad old pre-war days which saw the jerry-builder at his highest activity, turning miles of pleasant fields into wildernesses of bricks and mortar.

We have yet to find it otherwise. Most certainly the Government has removed its control from small house building. It accepts the building societies as the chief financial agent, and anticipates, in the words of a recent circular on the question, that "with the present re-establishment of more normal conditions, economic forces, operating in a free field, will secure a large volume and variety of production at competitive rents, and that a great number and diversity of persons and organizations will play their part; private builders, housing companies, public utility societies, finance societies and private investors will, it is hoped, all take a share in the ownership of working-class houses."

That would read to us very like a free fight if it could be proved that there was enough in cheap houses for letting purposes to cause such a concentration of eager participants. We doubt it.

The same circular goes on to suggest that local authorities may ease up their regulations for road construction and generally modify their ideas about development, having regard to the nature of the gentlemen about to take over, there being after all a Town and Country Planning Act, regulations governing the size of houses, their density to the acre, and other matters.

Whether some of these regulations are not in conflict with the successful solution of the problem, the very difficult problem, of building very cheap houses *to let* at a profit, for persons who are quite used to making a profit, has yet to be made clear. All we see at this moment is the dwindling responsibility of local authorities, the express admonition to start private enterprise going before turning away to slum clearance, and "this great number and diversity of persons and organizations *playing their part*." It is not a pretty, nor yet a hopeful picture.

As though conscious of some hardly-to-be-defined failure in an otherwise irreproachable measure, this circular goes on to make suggestions of a very different nature. "It is important," it says, "that local authorities should endeavour to secure, so far as possible, that the houses to be provided are well laid out and of good design, and attention is called to the duty . . . to have regard to the beauty of the landscape or countryside and other amenities of the locality. Local authorities who do not themselves employ an architect should bear in mind that it is open to them to seek the advice of the advisory panels which have been set up by the Council for the Preservation of Rural England with the help of the Royal Institute of British Architects; and all local authorities are advised to draw the attention of builders and investors to the advantages to be derived from the employment of qualified architects to design the houses."

Now this is a pious admonition to be acted upon according to local circumstances and personal fancy. It follows a policy of peaceful persuasion, operating in a sphere which our current series of enquiries, under the title, *What is to be done about this?* prove to be bristling with difficulties and moved almost entirely by considerations of finance.*

Obviously the desire for beauty and amenity (a murrain upon that pale-faced word!) will not suffice to open up the field for architects, for we are discussing a type of house which we are far from certain can be made to show any profit at all. But if it can, it will more surely do so where large schemes are undertaken, under unified control, and employing terrace formations; and it is exactly in the handling of such units that architects alone can produce economies and find scope for fine design.

The more one looks into it, the better case there appears to be for a national organization on the lines suggested by Sir Raymond Unwin. Outside this is only the "great number and diversity of persons and organizations," playing their unspecified parts in a confusion easy to imagine; involving only too certain a waste of land, money and effort.

That appears to us to be the position created by Parliament, and to find some sense of order out of

* See article on *Building Society Finance*, page 729.

chaos, enough at least to provide a safeguard against the building of new slums under the wing of the Town and Country Planning Act, seems to be our mission to the lower-paid workers.

We think it doubtful that the Government can permanently avoid a responsibility for the housing of the lower classses, assumed with some show of feeling ; nor can we do less than seize with spirit the little opportunity offered us to enter the field of cheap housing TO LET.

R. Mervyn Noad, A.R.I.B.A., winner of the Prestwick competition. See pages 716-722.

NOTES & TOPICS

PURE TEXTURE

DURING the general strike, when traffic was scarce, London, most of us remember, looked *blanched*. That scarlet flow of buses through its streets was dried up, and we could appreciate the opulent variety of white and grey in the buildings.

*

London, dirt-streaked though it is, is essentially a white city ; but we do not discover it until the blinding colour of its traffic is withdrawn, or we look down from some high place and see its cool-coloured towers and spires.

*

" Colour in the West does not enter into life," wrote Lisle March Phillipps ; but since the war we have had a surfeit of colour in rooms, in textiles and furniture. I suspect it was partly a reaction from Government tones, khaki and the dispirited hue employed for official tape.

*

How enjoyably we can take a holiday from vivid colour, or even from innocuous pastel shades, is now being illustrated by a most ingenious exhibition arranged by Heal's in their Mansard Gallery.

Everything white, and just off white, that could be collected, in glass, pottery, fabrics and furniture, has been assembled as only Heal's can assemble an exhibition. Here and there some ebony bulk gives a tropic richness of shadow, while silver and the hard brilliance of chromium plate provide high lights.

*

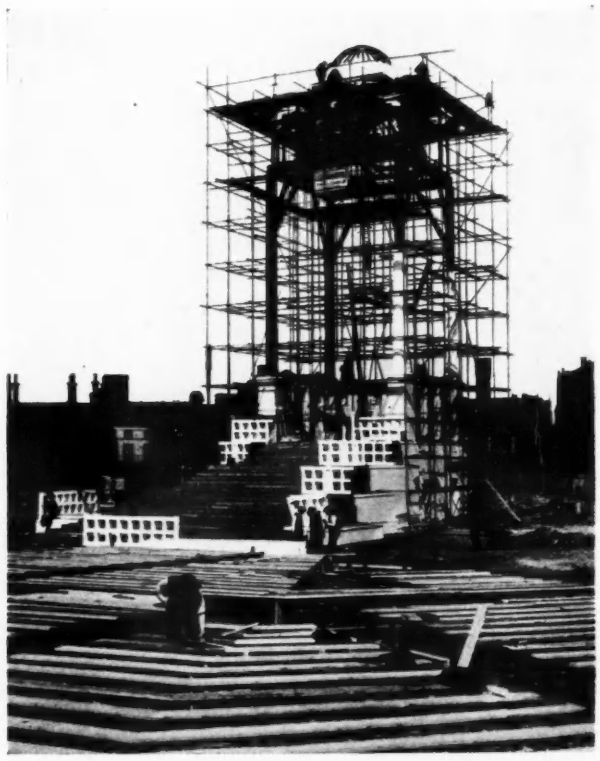
This is a show to see, if only for the experience of seeing steel furniture enjoying its first phase of mellowness in design.

*

THE SHOP OF 1950

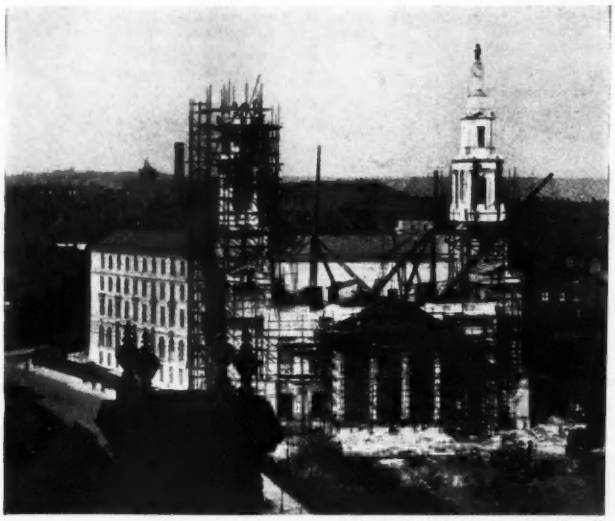
Shopping of the baser kind, which concerns itself not with things that delight the eye but which hearten the stomach and increase the housekeeping bills generally, is going to get special attention in July at the Advertising Exhibition at Olympia.

*



A shop of 1950 is being designed, based on the " help yourself " principle of the Cafeteria. As everything (or nearly everything) will be sold in packets seventeen years hence, this shop is to be a sort of speedway for quick shopping, and will be called a *Packeteria*.

*



THE MONTH OF THE CENTURY

When future historians pick up their pens to write of the architectural events of the twentieth century, this month may well stand out in their chronicles. Why ? Let me hasten to give only two grounds for the prognostication.

*

The temporary high altar of the new Roman Catholic Cathedral at Liverpool, the foundation stone of which is to be laid by Archbishop Downey, after being blessed by Cardinal Bourne, on Monday next. The stone-laying ceremony, including the Cardinal's address, is to be broadcast.

[Photo: "Yorkshire Evening News"

The new Civic Hall, Leeds, now nearing completion, from the design of E. Vincent Harris. It is to be opened by the King on August 23.

First: on Monday next, Archbishop Downey is to lay the foundation stone of the R.C. Cathedral at Liverpool, which, I believe, will be the second largest ecclesiastical building in the world. Sir Edwin Lutyens, with £3,000,000 at his command, has designed a building that will do much to maintain the standard of architecture of this century.

*

Then, on June 26, the King is to lay the foundation stone of what Lord MacMillan, at the Architecture Club Dinner last week, described as "a university of a new era."

*

Mr. Holden's design for the new headquarters of London University is one that has been acclaimed on all sides as an excellent piece of planning, and, as the King has likened it to a battleship, I am loyal in expressing the hope that it will sail proudly down the seas of time.

*

It was a happy idea of the Architecture Club to devote its 22nd Dinner to a discussion of this building, and those present were further indebted to the Club for prevailing upon the retiring Mr. Charles Holden to describe his masterpiece.

*

ST. JOHN'S CHURCH, WOLVERHAMPTON

Last week I made an oath to write about St. John's Church, Wolverhampton.

*

It is a superb church, standing on a superb site. You approach it up an eighteenth-century terrace which debouches into an eighteenth-century square. What would be the garden of the square is the graveyard, which is unique in that it is sunk each side of a raised triumphal way which leads from the terrace to the church, carrying on the street line of the terrace.

*

The church itself is 1758 and Gibbs-ish. Behind it is another square and yet another terrace. I don't think I'm exaggerating in saying that it is as good a piece of monumental planning as is to be found anywhere in England.

If you are in need of a fresh experience and haven't seen it, catch the next train to Wolverhampton. Incidentally, if any Wulfrunian has a drawing or a photograph which shows the layout, I should like the chance of publishing it in this column.

*

I need hardly add that the church is falling down. Yet it is far more beautiful than the dubious olde worlde St. Peter's which Wulfrunians are so proud of.

*

If Wulfrunians have any civic pride they will save St. John's and preserve it as the finest possession of their city.

*

YOUTH MUST BE SERVED

In order "to make room for young intelligence and ambitious youth" all officials who have passed the age limit in Czecho-Slovakia are to be retired. In other less fortunate countries "ambitious youth" has to make himself such a nuisance to everybody that someone takes notice at last. He is then ready to be an old man.

*

THE WICKED CITIES

It seems likely that Sodom and Gomorrah, the wicked cities of the plain, have been located at last. I hope so. We can register the fact, and get on with our own urban problems, which are only not interesting because the facts are too disturbing for nicely-balanced minds.

*

PITY THE POOR SEASIDE TOWN

Seaside towns are complaining of the difficulty of finding that little something other places have not got. They are all so apt to develop in two directions—there and back along the promenade.

*

What most of them lack, if the truth were known, is any decent character to call their own, and that is not a relic from the past or an accident of fortune. Pity the poor seaside town.

ASTRAGAL

THE ARCHITECTS' DIARY

Thursday, June 1

ROYAL ACADEMY, Burlington House, Piccadilly, W.1. Summer Exhibition. Until August 7. 9 a.m. to 7 p.m. 9 *a.m.*

L.C.C. CENTRAL SCHOOL OF ART AND CRAFTS, Southampton Row, W.C.1. Annual Exhibition. Until Saturday, June 24. 10 a.m. to 8 p.m. (Saturdays: 10 a.m. to 12 noon.) 10 *a.m.*

INSTITUTION OF ELECTRICAL ENGINEERS. At Bath. Summer meeting. Until June 2.

INSTITUTION OF GAS ENGINEERS. At Liverpool. Annual General Meeting. Until June 2.

CONGRES INTERNATIONAUX D'ARCHITECTURE MODERNE. At Moscow. Until June 10. Subject "The Functional Town."

Friday, June 2

FRANCO-BRITISH UNION OF ARCHITECTS. At Caen, France. Thirteenth Annual Meeting. Until June 5.

Saturday, June 3

Sunrise 4.48 a.m. Sunset 9.9 p.m.

Tuesday, June 6

INTERNATIONAL CONGRESS OF BUILDING SOCIETIES. Annual Meeting in *London.* Until June 9.

Wednesday, June 7

INTERNATIONAL CONGRESS OF BUILDING SOCIETIES. Annual Meeting in *London.* Reception at Lancaster House, S.W.1.

SOCIETY OF CHEMICAL INDUSTRY, At the Science Museum, South Kensington, S.W. "Plastics—the Phenolic Types and their Uses." By George Dring, B.Sc. 4.30 *p.m.*

INDUSTRIAL ART EXHIBITION

A reception in connection with the Exhibition of British Industrial Art in Relation to the Home was held at the house of Mr. and Mrs. Hudson, Wood Street, W.1, last week. Guests were invited to meet Lord Gorell, Sir Philip Sassoon and the Chairman and Executive Committee of the Exhibition, which is to be held at Dorland House from June 20 to July 12.

Lord Gorell, C.B.E., M.C. (President of the Exhibition and Chairman of the Government Committee on "Art and Industry"), said that we could afford to lose no time before the chief recommendation of the Government Committee was put into effect, namely, the holding of selected exhibitions of the most progressively designed productions of British industry. The Exhibition at Dorland House in June would show what remarkable progress had already been made in this country. There would be little copying of foreign designs in the Exhibition, for English designers had plenty of imagination and a great inherited tradition.

Sir Philip Sassoon, Bt., G.B.E., C.M.G., said there was no real reason why the industrial art of a mechanised age should not be every whit as fine, in its own way, as was the art of the ages of handicrafts.

CONGRESS OF BUILDING SOCIETIES

The meetings of the International Congress of Building Societies and the annual meeting of the National Association of Building Societies will be held in the Wharncliffe Rooms, Hotel Great Central, London, N.W. from Tuesday, June 6, to Friday, June 9. On the morning of June 9 Sir Raymond Unwin is to speak on "The Value of Good Design in Dwellings."

Recent contributors to the subscription list of the Special Committee for Public Relations of the Building Industries National Council, are as follows:—The Cement Marketing Co., Ltd., (2nd instalment of £500) £125; the Midland Brick Association, £10 10s.; Leicestershire Brick Manufacturers' Association, £10 10s.; South Eastern Federation of the Building and Engineering Brick Trade of England and Wales, £50; the National Fed. of Building Trades Employers, £250; Prior Burners, Ltd., £1 1s.

Subscriptions to the fund, which has now reached £2,283 6s. 10d., should be addressed to Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

ARCHITECTURAL ASSOCIATION

Following is the list of Officers and Council of the Architectural Association elected for the session 1933-1934:—

President: Mr. C. Lovett Gill, F.R.I.B.A. Vice-Presidents: Messrs. L. H. Bucknell, F.R.I.B.A., and C. H. Holden, F.R.I.B.A. Hon. Treasurer: Mr. G. Grey Wornum, F.R.I.B.A. Hon. Secretary: Mr. J. R. Leathart, F.R.I.B.A. Hon. Librarian: Hon. H. A. Pakington, F.R.I.B.A. Hon. Editor *A.A. Journal*: Mr. Lionel G. Pearson, F.R.I.B.A. Past President: Mr. A. B. Knapp-Fisher, F.R.I.B.A. Ordinary Members of the Council: Messrs. E. W. Armstrong, A.R.I.B.A., H. Chalton Bradshaw, F.R.I.B.A., G. R. Dawbarn, F.R.I.B.A., R. E. Enthoven, F.R.I.B.A., W. R. F. Fisher, M.A., A.R.I.B.A., P. D. Hepworth, F.R.I.B.A., W. M. Keesey, M.C., F.R.I.B.A., T. A. Lodge, F.R.I.B.A., E. B. O'Rorke, A.R.I.B.A., and J. C. Shepherd, A.R.I.B.A.

PUTNEY BRIDGE WIDENING

The Chancellor of the Diocese of London has granted a faculty applied for in a Consistory Court by the L.C.C. to throw into the public highway a small portion of the churchyard of All Saints, Fulham, in connection with a scheme for widening the approach to Putney Bridge.

INDUSTRIAL DEVELOPMENT

Mr. C. R. Ashbee, M.A., in a paper on "Recent American Town Planning Developments and their bearing on the English Problem Under the New Act," read at a meeting of the Town Planning Institute last week, pointed out that "in America they have, during the last 25 years, saved from industrial destruction many thousands of acres of lovely landscape. What we in England have to do—it is the next step in the process of industrial development—is to link up our 200 decentralizing towns, somewhat on the lines of the American parkway, but to a unified system, and that with more far-sighted protective legislation indicated in the Government Parks Report of 1928."

NEW WORK AT HASTINGS

On May 28 Sir Humphrey Rolleston opened the new bathing pool at West St. Leonards and the new medical baths at White Rock, Hastings. A boating and paddling lake for children at the eastern end of the front was also opened. Over £150,000 has been spent on these improvements.

LIVERPOOL CATHEDRAL

An exhibition of the architect's plans of the R.C. Cathedral will be held at Rushworth and Dreaper's, Liverpool, from Saturday, June 3 to June 10.

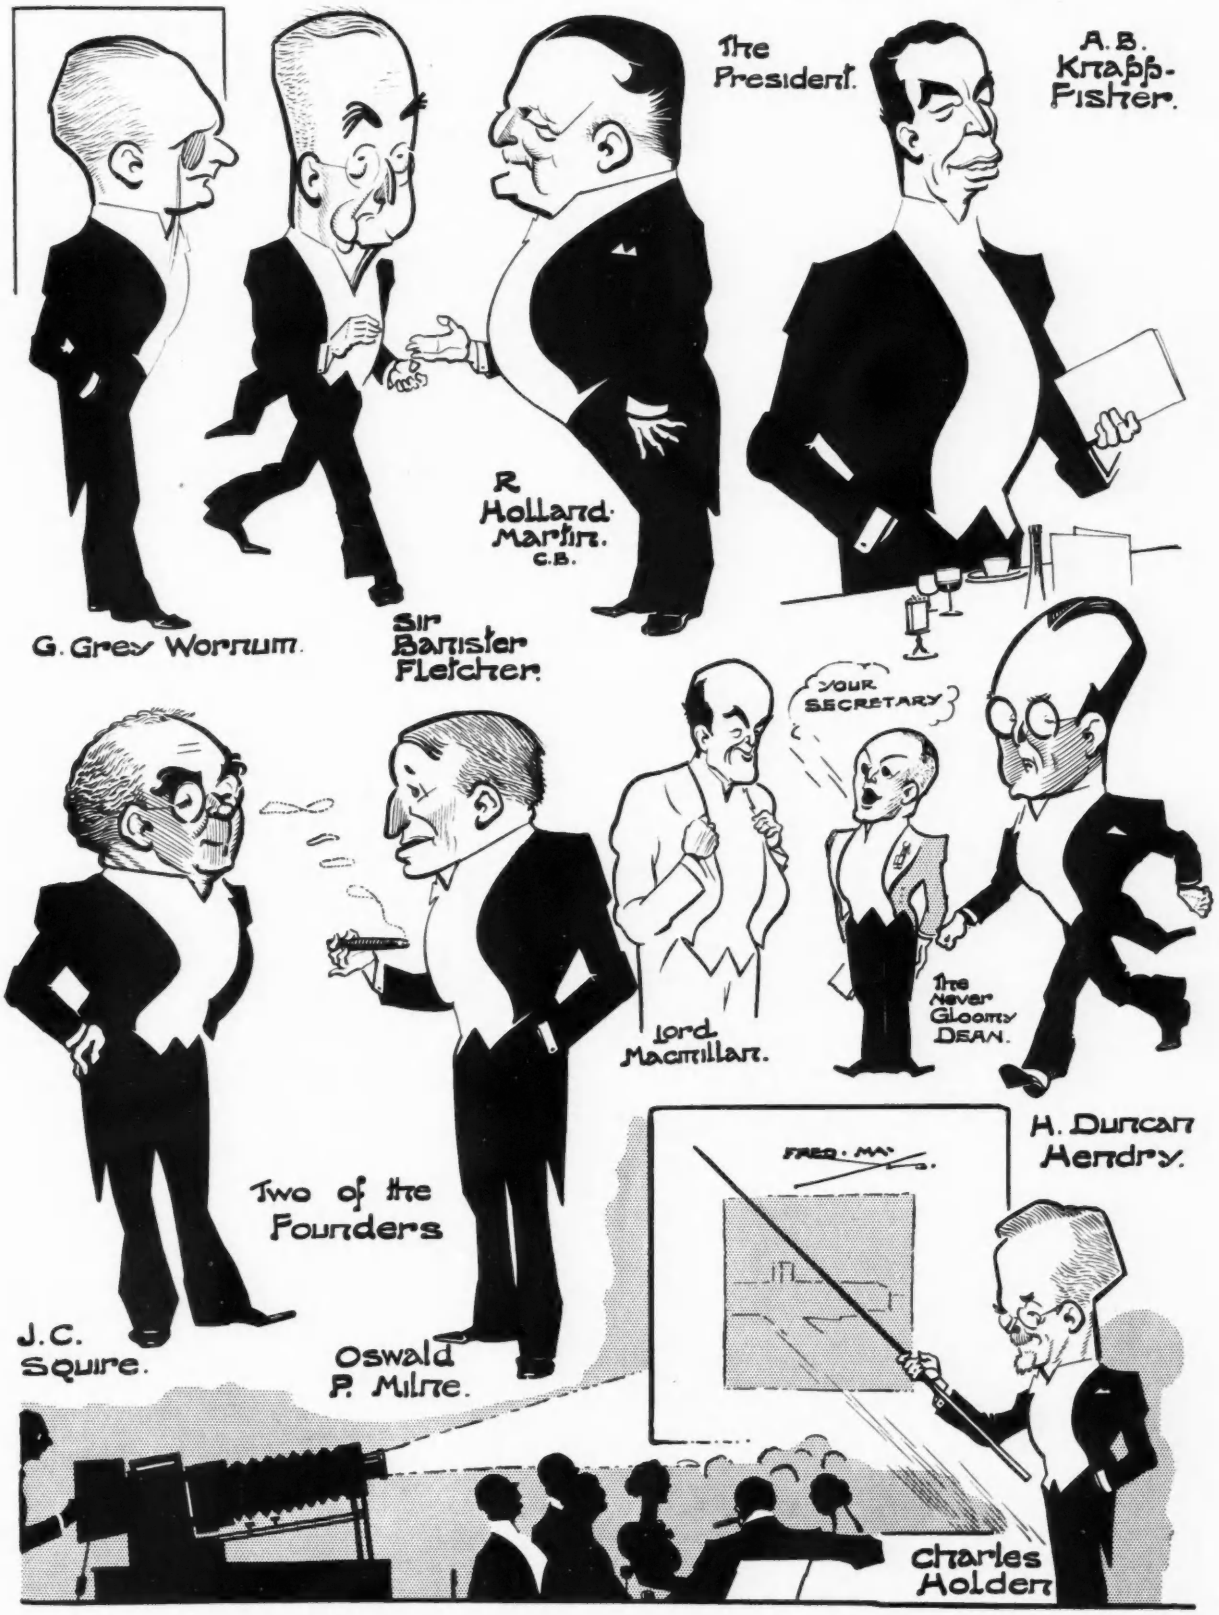
ELECTRICAL ENGINEERS

A conversazione is to be held by the Institution of Electrical Engineers at the Natural History Museum, Cromwell Road, S.W., on Thursday, June 22, from 8.30 to 11 p.m.

£1,000,000 COLLEGE FOR BIRMINGHAM

The Birmingham Education Committee has decided to recommend to the City Council the purchase of a central site with the object of proceeding with the provision of a new college for technical, commercial and art studies. It was stated in the discussion that the complete scheme would involve an expenditure of approximately £1,000,000. The first instalment, including the cost of the site, is estimated at £600,000.

EXTENSIONS TO THE B.I.F., BIRMINGHAM



Extensions and re-arrangements of the British Industries Fair grounds and buildings at Castle Bromwich, which will increase the size of the Fair by two-and-a-half acres to fourteen acres, have been authorized by the Council of the Birmingham Chamber of Commerce.

An official announcement issued by the committee states that provisional bookings of space by exhibitors for the Birmingham Section of the 1934 Fair are 37 per cent. greater than corresponding bookings last year for the 1933 Fair. Of a total available indoor space of 244,362 sq. ft., 177,907 sq. ft. have been provisionally booked already for 1934, in comparison with 129,926 sq. ft. provisionally booked at a corresponding date last year.

Plans have now been approved having as an ultimate objective a permanent exhibition building with a total indoor area of 1,000,000 sq. ft., of which 500,000 sq. ft. will be available for exhibits. A 99 years' lease of the site has been negotiated.

Immediately extensions are to be put in

THE ARCHITECTURE CLUB DINNER

Some of the personalities present at the twenty-second dinner of the Architecture Club, held in London on Wednesday of last week. The sketches are by Fred May. *A report of the dinner appears on page 733.*

hand to add 55,000 sq. ft. of indoor area, of which 30,000 sq. ft. will be let to exhibitors, in time for the 1934 Fair. This immediate addition is part of the larger plan. The additional space to be provided for the 1934 Fair will be set aside for the gas, electricity, building and engineering groups in which congestion has become especially marked.

TEES BRIDGE

Such good progress is being made with the construction of the new £600,000 Tees bridge at Newport, Middlesbrough, that it is expected that it will be ready within a few months. The bridge was scheduled to be completed in 1934.

SLUM CLEARANCE

Slum clearance schemes, estimated to cost £90,000, were approved by the L.C.C. last week.

CHARTERED SURVEYORS' INSTITUTION

The sixty-fifth annual general meeting of the Chartered Surveyors' Institution was held on Monday last. In the report of the Council it was stated that the Institution now comprised 8,213 members, representing an increase of 419 over the membership for the previous year. The Council also announced that preparations are in progress for the next quinquennial International Congress of Surveyors, which, by invitation of the Council, will be held in London in 1934. It is expected that the surveying profession in the majority of European countries will be represented at the Conference, and the co-operation of the Foreign Office has already been secured.

YORKSHIRE ARCHITECTS AND THE SLUMS

A meeting to consider what further action they could take in support of the Prince of Wales' slum clearance appeal was held by the Council of the West Yorkshire Society of Architects in Leeds last week.

It was pointed out that though the necessary committee of the Society had been appointed, the local authorities appeared to be reluctant to carry out the Ministry of Health recommendations which advised local co-operation with architects and others.

After discussion, it was decided to approach the Minister of Health with a view to ascertaining any course which might enable the Society to render more effective support to the Prince's appeal.

A.A. APPOINTMENT

The Council of the Architectural Association have appointed Mr. E. A. A. Rowse to the position of Assistant Director of the A.A. School. He takes up his appointment under Mr. Howard Robertson, Director of Education, on September 1 next.

PRESENTATION TO THE SHAKESPEARE THEATRE

Mr. G. Topham Forrest, F.R.I.B.A., has presented models of the Globe and Blackfriars Theatres to the Shakespeare Memorial Theatre, Stratford-on-Avon.

ARCHITECTURE AS A TRADE

[*By ICONOCLAST*]

1. Introduction

[*Architects do, in point of fact, work primarily for a living. We should not blush to admit the fact; it is sometimes not unsalutary to take things on the lowest plane. That is what a well-known architect, who has chosen the pen-name of Iconoclast, frankly proposes to do in the series of articles of which the first is printed below. We do not necessarily agree with every point Iconoclast makes; nor may every reader. But all should find his arguments stimulating.*—ED., *A.J.*]

THE discussion as to whether architecture is an art or a profession has been carried on for many years and generally boils down to the question whether an architect should prize most the fees he receives in payment for his services, and which it is utterly improper for any layman (*sic*) to dispute: or whether the privilege of practising a fine art is the chief reward, the fees being merely a sordid necessity so long as the lay public (also *sic*) neglects to provide for the living of artists out of public funds.

We may be lacking in the dignity either of an artist or a professional man if we consider the practice of architecture as a trade, i.e., the selling of something which society needs at a fair profit to the salesman. If this aspect of the question seems crude, we have only to ask ourselves why it should be more dignified to eat sausages than to sell them.

The trades and the professions have undoubtedly approached one another during recent years, and are less distinctly different categories than was once the case; though there still seems to be a certain pretence that the one has little in common with the other. Yet both have always had the one thing in common, that they are alternative means whereby an individual may earn a living.

There has been perhaps some unspoken suggestion that of the two the professions offer the more honourable livelihood: and though this may be despicably snobbish, there is no doubt that with a great many people it is imagined that the standard of honour in the professions must be higher than in the trades. Whether this has ever been true or not, it has long ceased to be a mark of difference between the two, for it is a generally accepted thing that high ideals and strict integrity are applicable to any means of living which is not in itself dishonest or mean.

The Rotary principle perhaps crystallizes this idea in as happy a way as possible, and if this ideal is respected, there can be no essential difference between a trade and a profession so far as it is regarded as a means of livelihood.

In thus treating the architectural profession, then, as a career for profit, we need not mount the high professional horse and speak of money with bated breath, because the earnings of honest work need no concealment or apology.

Let us, on the contrary, discuss architecture frankly as a trade, in which the wares offered are the skill and services of trained competence, and their prices the scale of charges; and let us then consider whether, as a trade, it offers its fair measure of success: or, if not, whether there is anything we, as organized tradesmen, can do to better our lot.

It is proposed in this series of articles to discuss just this, and by dealing with the subject frankly, to strip it of some of the problems which are of our own making and largely humbug. The subject, as so treated, falls under a number of natural headings, each of which has been discussed elsewhere at some length, but possibly not from just this particular point of view. A few preliminary notes upon these may define the terms of reference, and assist to place each as an integral part of the whole picture.

A natural starting point is the subject of pay. In this our deliberations must be freed from the bounds of the R.I.B.A. scale, viewed as a sacrosanct document; but at the same time directed towards some more orderly scheme than an undignified scramble

for the best terms. The subject must be treated less as a likely basis for easy recovery of fees in court, and more as an assessment of fair value for services rendered in the simplest way consistent with efficiency.

Next comes the question of professional organization, with special bearing upon the R.I.B.A., and this leads on to registration, as a measure designed to improve the chances of architectural practice. I shall discuss its present form and its future possibilities, and the nettle will be grasped in no half-hearted manner.

The next heading will be the question of competition as between one architect and another, dealing with the professional code in its bearing upon fair trade. The question, reduced to its elements, will be: "How should architects compete with one another?" frankly admitting the fact that some form of competition is the essence of architectural practice. May this be upon the basis of price, or of ability, or of business energy? There is much food for thought in this question, which has rarely been frankly faced or discussed with all the cards on the table.

We then naturally follow on with the question of advertisement. How should, or how may, the architect make his presence known to the public at large? What sort of fair publicity, if any, is desirable, or likely to improve the practice of architecture as a means of profit? And in dealing with this thorny question it is not proposed to consider dignity as an abstract and self-sufficient quality unless in its relation to fair trade, which in itself is a dignified thing.

It will be seen that the field to be covered is a wide one, and that it is possible that some will be shocked at what they may consider to be an irreverent way of dealing with something almost holy in its mystery. But it is hoped that, whereas the vast majority of architects during the last two years have suffered a most difficult spell of practice, in which money, or its lack, has loomed large, the same majority will realize that our task is much as that of other trades, where efficient training, honest charges, fair competition, adequate publicity and trade organization combine to offer favourable results in a favourable economic atmosphere. In other words, we may as well spend our enforced leisure in tidying up the shop in time for the first customer of the new economic day.

R. I. B. A.

CODE OF PROFESSIONAL PRACTICE

On the recommendation of the Practice Standing Committee the Council have amended the preamble to the Code of Professional Practice to read as follows:—

A member of the R.I.B.A. is governed by the Charter and Bye-laws of the Royal Institute. The following clauses indicate in a general way the standard of conduct which members of the R.I.B.A. must adhere to, failing which the Council may judge a member guilty of unprofessional conduct, and either reprimand, suspend or expel him or her.

Cases of unprofessional conduct not specifically covered by these clauses are dealt with by the Council, having regard to the particular circumstances of the case.

The Code of Professional Practice is printed on pages 23–25 of the current *R.I.B.A. Kalendar.*

MAINTENANCE SCHOLARSHIP

The R.I.B.A. offer, for award in July, 1933, the Ralph Knott Memorial Maintenance Scholarship, tenable at the School of Architecture of the Architectural Association, London. It is of a value of about £45 per annum, and is available for applicants in England, Scotland and Wales.

The scholarship will be available in the first instance for one year, and will be renewable for two further periods of one year each. It is intended to enable a student who has not the necessary means, to attend an approved course at the Architectural Association School of Architecture. Students who are already taking such a course are also eligible to apply for the scholarship.

The value of the scholarship, up to the limit stated, will depend upon the financial circumstances of the parents or guardians of the candidates. The parents or guardians will be required to furnish particulars, on the proper form, of their financial position.

Particulars and forms of application may be obtained, free, on application to the Secretary to the Board of Architectural Education, R.I.B.A.

The closing date for the receipt of applications, duly completed, is July 1, 1933.

T. Trevor Sawday, A.R.I.B.A., who has just been elected president of the Leicester and Leicestershire Society of Architects.

NEW BUILDING

The Rt. Hon. Lord Howard de Walden (Hon. F.R.I.B.A.) is to lay the foundation stone of the new R.I.B.A. building, and the ceremony will take place at 3 p.m. on Wednesday, June 28.

The accommodation for those wishing to attend the ceremony will be limited to 500, and admission will be by ticket only. Tickets will be allotted to members in order of application, and those who wish to attend the ceremony are therefore requested to apply to the Secretary of the R.I.B.A. at an early date.

COMPETITION

NEWS

SURBITON HOSPITAL COMPETITION

The attention of readers, and particularly of intending competitors, is drawn to three errors which regrettably crept into the analysis of the conditions of this competition appearing on pages 680-2 of last week's issue:—

(1) The sending-in date is September 1, NOT September 21.

(2) There is no error in the rate per foot cube. It is pointed out that on the last page of the Conditions, under *Estimate of Cost*, the last paragraph clearly defines what is intended. While the price is to be stated at 1d. per cubic foot, the competitor is also to state his price per cubic foot in making up his estimate.

(3) The sentence on the placing of the power house should have read: "the power house will certainly *not* be placed on the south-west border." On this point the Assessor, Mr. C. Ernest Elcock, writes in a letter to the Editor that the S.W. border "is the very last place in the world to place a power house and if the writer had stated 'on the north-east border' his remark would have been understood."

"It may interest you to know," he further continues, "that over 300 applications have been received for Conditions; and, so far, very few questions have been asked consequent upon their perusal."

TOWN HALL FOR HACKNEY?

It is probable that the Hackney Borough Council will erect a new town hall, which will be the subject of an architectural competition. The planning of Hackney's chief municipal building (states *The Hackney Gazette*) ought undoubtedly to be competitive, and should not be left to the creative brains of one man or one firm.

BEXHILL ENTERTAINMENTS HALL

The Bexhill Town Council propose to erect an Entertainments Hall on what is known as the Coastguard site, at an approximate cost of £50,000. No further step has been taken by the Council in the matter, so far, except to decide that a competition in accordance with the rules of the R.I.B.A. will be conducted with respect to designs and an Assessor appointed.

Prestwick Competition

Mr. A. Graham Henderson, F.R.I.B.A., the assessor in the competition for municipal offices and public baths at Prestwick, Ayrshire, has made his award as follows :—

DESIGN PLACED FIRST (£200) : *Mr. R. Mervyn Noad, A.R.I.B.A., of 261 West George Street, Glasgow.*

DESIGN PLACED SECOND (£100) : *Messrs. Wylie, Wright and Wylie, FF.R.I.B.A., of 204 West Regent Street, Glasgow.*

DESIGN PLACED THIRD (£50) : *Kininmonth and Spence, AA.R.I.B.A., of 16 Rutland Square, Edinburgh.*

The designs submitted by the following were commended by the assessor : Messrs. T. Harold Hughes and A. G. Bryett, 121 Douglas Street, Glasgow ; Mr. James Carruthers, 209 St. Vincent Street, Glasgow ; and Messrs. John Burnet, Son & Dick, 16 Blythswood Square, Glasgow.

The first and second premiated designs are illustrated on pages 717-722.

The Designs Reviewed

We must surely congratulate the Town Council of Prestwick upon the enterprise they show in having decided to hold an open competition, and upon the very interesting problem that the programme outlines.

The schedule of accommodation provides that there shall be two buildings. The first is to consist of the Council Chamber suite, the Municipal Offices and the Public Library ; the second of a range of curative and medicinal baths, while the competitor is asked to submit proposals for the development of the remainder of the ground so that the scheme may provide a convenient social centre for the town. The latter proposals do not in the meantime feature within the terms of the competition. Though the conditions do not allow for any very extravagant development of the scheme, since the total " all-in " cost of £25,000 is aimed at by the promoters, the solution has not been punished and the promoters have not been unduly surprised.

Ninety-seven designs were submitted by architects practising in all parts of the country, but there is only one " die-hard " Scot to be recognized. National sentiment, however, must be dismissed in considering the problem of satisfying the elevational demands of this problem where a building with fitting municipal dignity must be so intimately associated with lighter social functions. Nothing short of unaffected and straightforward grouping of shapes will achieve this.

This conclusion brings me to consider the winning design prepared by Mr. R. Mervyn Noad, of Glasgow, which is developed throughout with easy grace. Little need be said about the elevational design of Mr. Noad's scheme, which is so well massed and tidily conceived that it speaks for itself, but it is a little distressing to note so many weaknesses in the planning of the Council and Municipal Block, most of which, however, appear to be surmountable without harming in any way the design. The Council Chamber, Provost's Suite, Reception Room and service accommodation are not happily related, and the Public Gallery has not been provided with separate access apart from the main and only approach by way of the grand staircase. The lavatory accommodation might be better placed on the plan and a certain practical advantage would be gained by placing the kitchen quarters on the other side of the block. The circulation of this group is not handy and it is safe to say that many better solutions have been presented.

In the design placed second, prepared by Messrs. Wylie, Wright and Wylie, of Glasgow, the planning of the Municipal Block fails to display any sense of dignity. The entrance hall and main staircase should have been given more space, and it is very difficult to understand why such prominence should be given to the lavatory blocks, which have axial approach from the entrance hall. In the Council Suite, the Provost's Room and servery are inconveniently planned, and on the whole there is an absence of straightforwardness in the circulation. The medicinal baths block does not achieve any tidiness and the elevational treatment is in some parts laboured and a little restless.

The design placed third, prepared by Messrs. Kininmonth and Spence, of Edinburgh, has some very good planning features. The Council Suite is admirably arranged and all the difficulties encountered by the first two designs are made to appear as though wilfully created. The baths group is good, though not so tidy and compact as that of the winning design. The elevational treatment is sound and well massed, being maybe a little disturbed in some places.

The design of Mr. T. Harold Hughes, F.R.I.B.A., F.S.I., and Mr. A. G. Bryett, which has been commended, leaves me with very little to say ; while that of Mr. James Carruthers, F.R.I.B.A., also commended, has some very unhappy features. Another commended design by Messrs. John Burnet, Son and Dick, FF.R.I.B.A., displays some slickness in its elevational forms but falls far short of being a satisfactory solution.

One cannot leave this exhibition without noting the very good solutions that have been submitted by Mr. W. F. Valentine, of Kilmarnock, where planning and elevational work is excellent ; the ground layout round the buildings, only, leaves something to be desired. The solution of Messrs. Bradshaw, Gass and Hope, FF.R.I.B.A., of Bolton, is competent and clean, well planned throughout and elevationally good. The ground about the buildings is well laid out and approach to the various departments of the scheme is convenient.

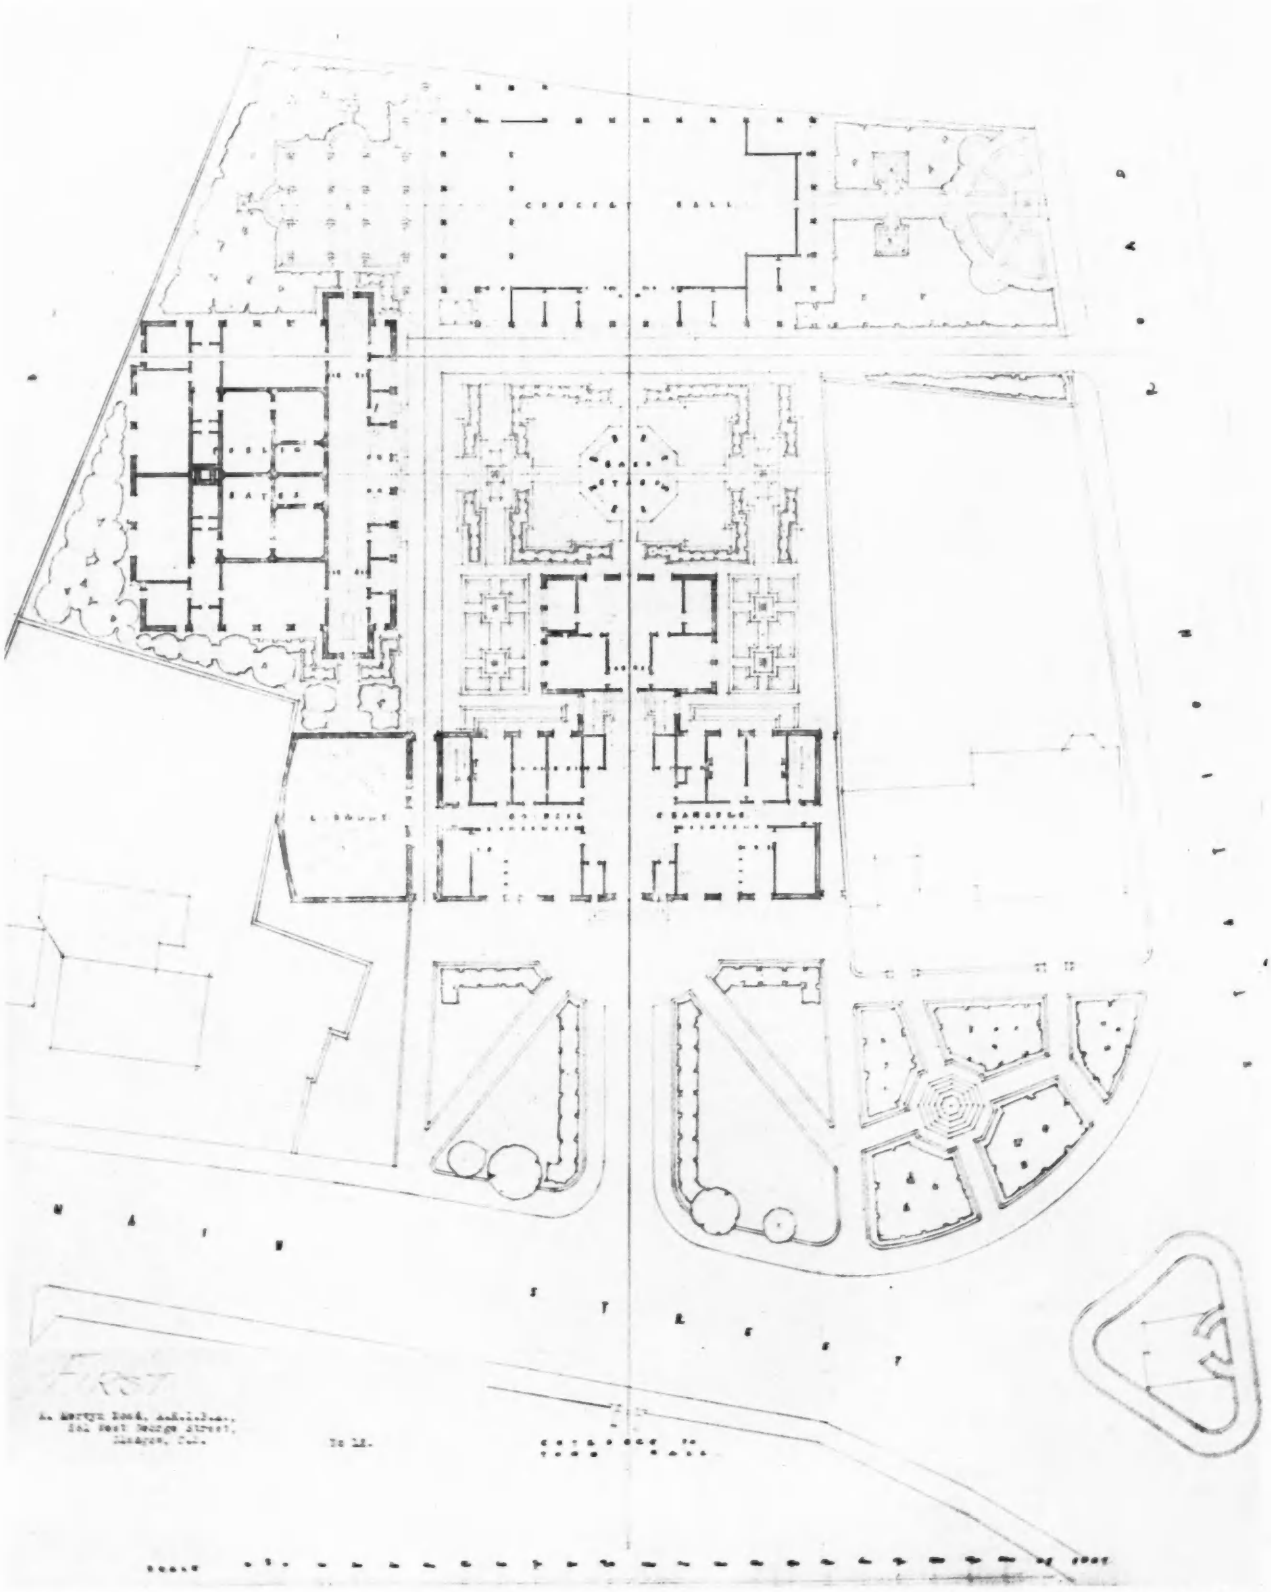
It is difficult to understand why these two very sound designs should have been lost among the " also rans," but maybe the inefficiency of Messrs. Bradshaw, Gass and Hope's fire-escape facilities to the concert-hall will explain just a little.

In conclusion I might observe that the designs and drawings are of a fairly high standard and many very interesting solutions were presented. The development of the ground forming the forecourt to the Municipal Block seems to have been the least satisfactory feature of most of the designs.

G. F.

Competitions Open

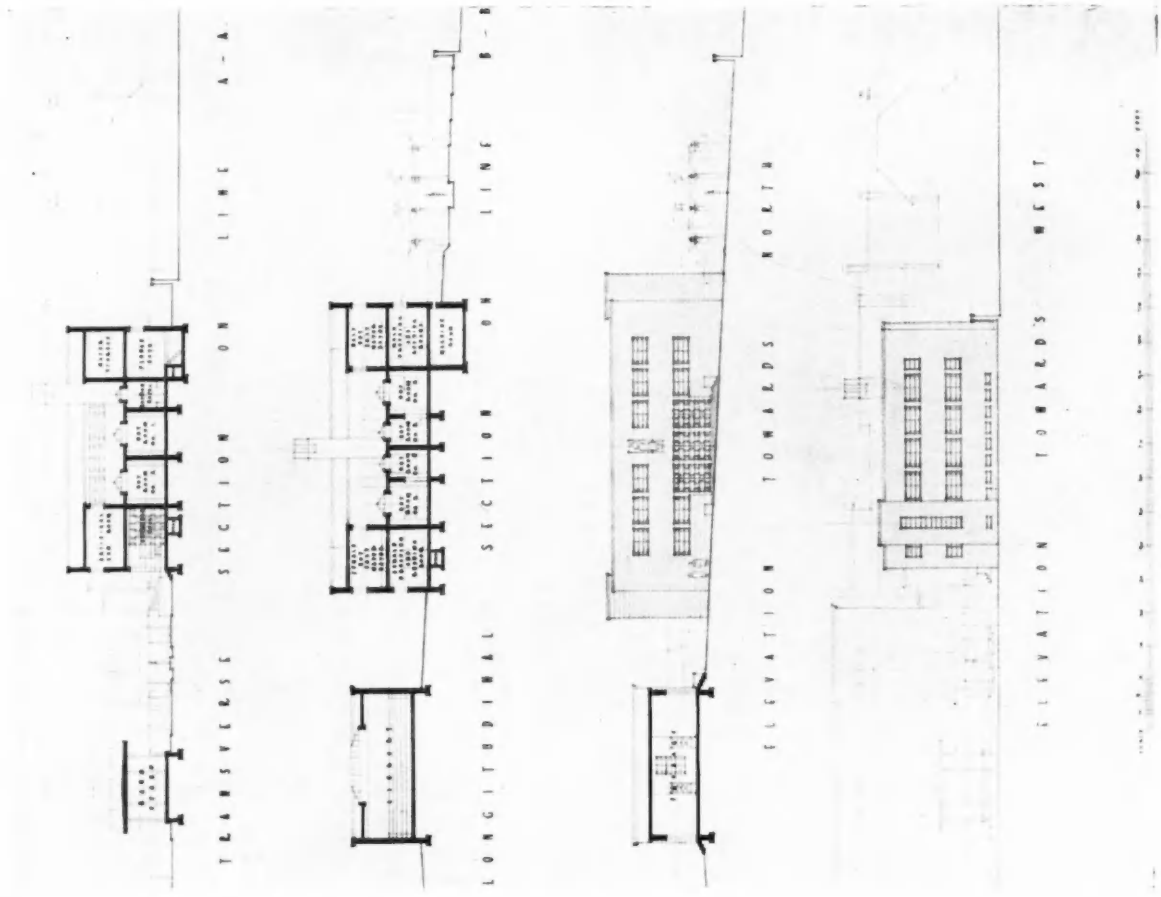
June 3.—Sending-in Day. Limited competition for flats to be erected in Lordship Road for the Stoke Newington B.C. Premiums : £250, £100 and £50. Full particulars, etc., published in *A.J.* for March 29.



September 1.—Sending-in Day. Proposed Hospital at Surbiton. Assessor : C. E. Elcock, F.R.I.B.A. Premiums : £120, £75, £50 and £25. The conditions, obtainable from A. C. C. Dunn, Hon. Secretary, Surbiton Hospital, St. James's Road, Surbiton, were reviewed in our last issue. See also note on previous page.

September 21.—Sending-in Day. Proposed Town Hall for the Borough of Hornsey. Assessor : C. Cowles-Voysey, F.R.I.B.A. Premiums : £350, £250 and £150. Full conditions, etc., were published in our issue for May 17.

Competition Pending



Proposed New Council Offices to be erected at Salt Hill for the Slough U.D.C. Assessor : H. S. Goodhart-Rendel, F.R.I.B.A. Premiums : £150, £100 and £50. Conditions have not yet been drawn up.

The Housing Act 1933

SIR,—Your Parliamentary Correspondent is in error in stating that money is available from the building societies at 3 per cent. only. The actual terms as reported in the Press last week are that the rate of interest should be 1 per cent. below the usual rate and the period 30 years.

The interest now charged is 5 per cent. in the north and 5½ per cent. in the home counties, so we in the London area cannot expect better terms than 4½ per cent. for 30 years, which, according to *Whittaker*, is £6 2s. 9½d. per cent. This alters matters considerably.

I agree with your correspondent that the Act is unlikely to produce many houses, the weak point being that the rents must be high in order to produce a very moderate return to the investor considering the risk undertaken.

Let us assume that cottages can be built and sold at an all-in cost of £400 each. This includes land, roads, sewers, building, architect, interest during construction, and both the builder's and the purchaser's legal expenses.

A calculation for rent might be made on these lines :—

1. Mortgage interest and sinking fund, £360 at £6 2s. 9d. per cent. ..	£22	2	0
2. Interest on £40 balance at 10 per cent. ..	4	0	0
3. Bad debts, might be anything, but say ..	1	0	0
4. Management 5 per cent.	1	15	6
5. Insurance (fire) ..	0	5	0
6. Repairs and empties (an actual figure on an estate of 350 cottages)	6	10	0
	£35	12	6

—or say 13s. 9d. a week, plus rates, which may bring up the inclusive rent to 17s. or 18s. a week.

An investor would want to be satisfied that this rent can be maintained and that the allowance for bad debts was sufficient, as it is obvious that if the first had to be reduced or the latter was insufficient, the £4 allowed for interest on his own investment would soon disappear or be turned into a minus quantity.

Most councils can now borrow at 3½ per cent. for a 60-year period, making a total of 4 per cent. for interest and sinking fund. If similar terms were available to private enterprise, then cottages would be produced at reasonable rents, but under present conditions the Act looks to be largely "eyewash"!

JOHN C. TICKLE

[Our Parliamentary Correspondent writes :

I should have pointed out that 3 per cent. is the minimum *rate of interest. The Ministry of Health Circular No. 1334 of May 22 states : "Societies belonging to the National Association of Building Societies have undertaken to make advances . . . . at rates of interest which are 1 per cent. below their prevailing rates, subject to a minimum rate of 3 per cent. For the present, therefore, the rates applicable to such advances will be 4½ per cent. in London and the Southern Counties, and 4 per cent. elsewhere."*

I do not gather, however, either from the circular or from the debates in Parliament, that 4½ per cent. and 4 per cent. will be fixed for the whole 30-year period of an advance. The rates will surely vary up or down, according as prevailing rates vary. No one can say with certainty, therefore, that 3 per cent. may not become the rate of interest at some time in the future.]

R.I.B.A. Elections and Official Architects

SIR,—My attention has been drawn to a circular (which has been received by some official architects) with reference to the above subject. It contains no address, so I do not know from whence it is issued, but it ends with the names of four candidates for election to the Council of the R.I.B.A.

The circular appeals for the support of these candidates and it states that official architects have no representation on the R.I.B.A. Council or under the Registration Act.

The authors of this circular are misinformed.

The Association of Architects, Surveyors and Technical Assistants (a body associated with the R.I.B.A.) has direct representation on the Council of the R.I.B.A. and also on the Architects' Registration Council. The latter involves statutory recognition of the A.A.S.T.A. as the body representing all salaried architects, whether in official positions or otherwise.

The membership of the A.A.S.T.A. includes official architects and the Association has always given due attention to their interests on the R.I.B.A. Council and elsewhere.

Among other things, the A.A.S.T.A. was the direct cause of the appointment of a Salaried Members' Committee of the R.I.B.A. This Committee contains a number of official architects.

A. SEYMOUR REEVES

Inigo Jones's Headpiece

SIR,—May I publicly disagree with Mr. Julian R. Elsley regarding the drawing of Inigo Jones on the outside cover of THE ARCHITECTS' JOURNAL?

Apart from the wisdom and nobility apparent in that face, the preoccupied air, the far-away hint of worry, are surely appropriate to the great profession which Inigo Jones practised. In his day he was a modernist : that is to say, even with the backing of Royal patronage he had to endure the futile criticism of the architecturally uneducated, the opposition of the common mind, and the abuse of jealous and stupid people who feared what they could not understand.

The historic row with Ben Jonson arose from Jonson's inability to see that Jones was more than a sort of superior scene-shifter for the court masques, and in that prolonged quarrel Ben Jonson, genius though he was, proved that he was before all other things a narrow, professional literary man.

When Jones gathered up all the tangled odds and ends of Italianate fashions, and wove with perfect scholarship and masterly imagination the most majestic forms. When he burst upon a world that was fumbling architecturally the lucid harmonies of the Banqueting Hall, that tiny section of the great Palace of Whitehall that was never built, he roused and shocked and stimulated and excited the world he lived in.

His later professional life was addressed to that great battle for good design against the dread English Trinity : Ignorance, Indolence and Individualism. What architect today is absolved from that unending warfare?

Architects, who are about the only class of people who are really trained to think and plan and to be conscious of their civic responsibilities, must meet continually the opposition of the good plain stoopid. Jones began the fight for intelligent design, which is still carried on, and carried on vigorously, by the paper that bears his image on the cover.

If I may make two suggestions : why not, on those occasions when the

JOURNAL has a special number, obtain permission (if it is possible) to reproduce on the cover the fine drawing of Inigo Jones by Vandyke in the Chatsworth Collection. My other suggestion (academic, perhaps) is that as Jones was born in 1573 his troubles were hardly "mediæval." Troubles he certainly had: his chief clients were the Stuarts!

JOHN GLOAG

The Mackintosh Frieze

SIR,—Your reference to the "Mackintosh Frieze" in your last issue reminds me of Theodore Hook's comments on John Croker, the first secretary of the Athenæum Club.

Croker had decided against the Ice House desired by certain members, and in favour of Henning's Sculptures.

Hook wrote as follows:—

"My name is John Croker
I do as I please,
You ask for an ice-house
I give you a frieze."

This little jest seems to have reached Scotland at last.

W. S. PURCHON

What is a Man to Do?

SIR,—In the leader for the issue dated May 24, 1933, mention is made of "the work of men who are architects for profit only, and obey no higher laws." Well, what *is* a man to do, when, by force of circumstances, he has either to disobey the "higher laws" or starve? He may draw architecturally perfect elevations but that is no guarantee that he will be able to persuade the speculative builder (?) to erect in accordance with his drawings.

While on the subject of elevations, it appears to me that most local town planning authorities are satisfied with a rather low standard of architecture. Even where these authorities have had power to approve all elevations for some years, John Blower's adherents seem to have done just what they pleased, irrespective of any drawings submitted for approval. Why should we expect anything different under the new Housing Act?

J. ROGER HALE

Acoustics in the Theatre

SIR,—I was interested to read Mr. E. C. Inston's letter on the above subject, published in your JOURNAL for May 24, and as I had the privilege of reviewing Mr. Richardson's book, *An Introduction to the Acoustics of Building*, in another journal, I can state with confidence that the author merely stated a general fundamental principle in the paragraph referred to.

It is undoubtedly safe as a general rule to group the reflecting surfaces around the origin of sound and dispose of absorbents over surfaces remote from the source.

Whilst it is readily admitted that in cinemas, where the reproduced sound is often much too loud, excessive reverberation in the stage house does introduce difficulties, on the other hand I am able to cite a case in my own experience in which the construction of the stage house in hard glazed bricks gave exactly the required acoustical conditions for direct music and speech.

Generalizing on this matter is difficult, as each individual problem must be dealt with on its own merits, and Mr. Richardson's book does not pretend to be more than an introduction to the subject, the author referring interested students to more serious works for further information.

C. W. GLOVER

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Housing Act, 1924

MR. WILLIAMS asked how many local authorities whose applications to erect houses under the terms of the 1924 Housing Act were out of date had, on consideration, been permitted to complete their schemes; and how many houses were involved.

Sir Hilton Young said that the hon. member would see from the circular which was issued to local authorities on May 22 that local authorities who considered that their proposals were entitled to consideration under the proviso to Section 1 of the Housing (Financial Provisions) Act, 1933, which only became law the previous week, had been invited to submit their applications, supported by full particulars of the grounds on which they were based, before June 30 next, and that he proposed, immediately after that date, in consultation with the Treasury, to proceed to the approval of such applications as were found to fall within the limits of the Act.

Prices of Bricks

Mr. Attlee asked the Minister whether he could state the percentage increase in the price of Fletton bricks and cement at the present time over 1913; and whether he would inquire into the reasons for the increase.

Mr. Shakespeare said that the percentage increase in the price of Fletton bricks since 1913 was 55, and in the price of best British Portland cement 28, but there had been decreases since 1924 of 4 and 23 per cent. respectively. The Minister had already means of information as to the course of the prices in question.

Mr. Attlee asked the Minister whether he was aware of the shortage of Fletton bricks in London, which was seriously hampering building operations; that 80 per cent. of the output of such bricks was controlled by one firm; and what action he proposed to take in the matter.

Mr. Shakespeare said that the Minister understood that the increased activity of the building trade had resulted in a temporary shortage of the sort. He was informed that the firm in question was working at its full capacity to overtake the increase in demand; and that there was no evidence of any likelihood of building operations being seriously hampered. A lag of the sort not unusually accompanied a revival of building activity.

Mr. Attlee also inquired of the Minister whether, in view of the inconvenience and cost caused to builders in London by the insistence on delivery only at one station by the firm which controlled the greater part of the production of bricks, he would take steps to prevent this restriction in the case of all building schemes under the control of his department.

Mr. Shakespeare said that the Minister was not aware of the existence of any such restriction, but he would be glad to consider any particulars submitted to him.

Preservation of Cannock Chase

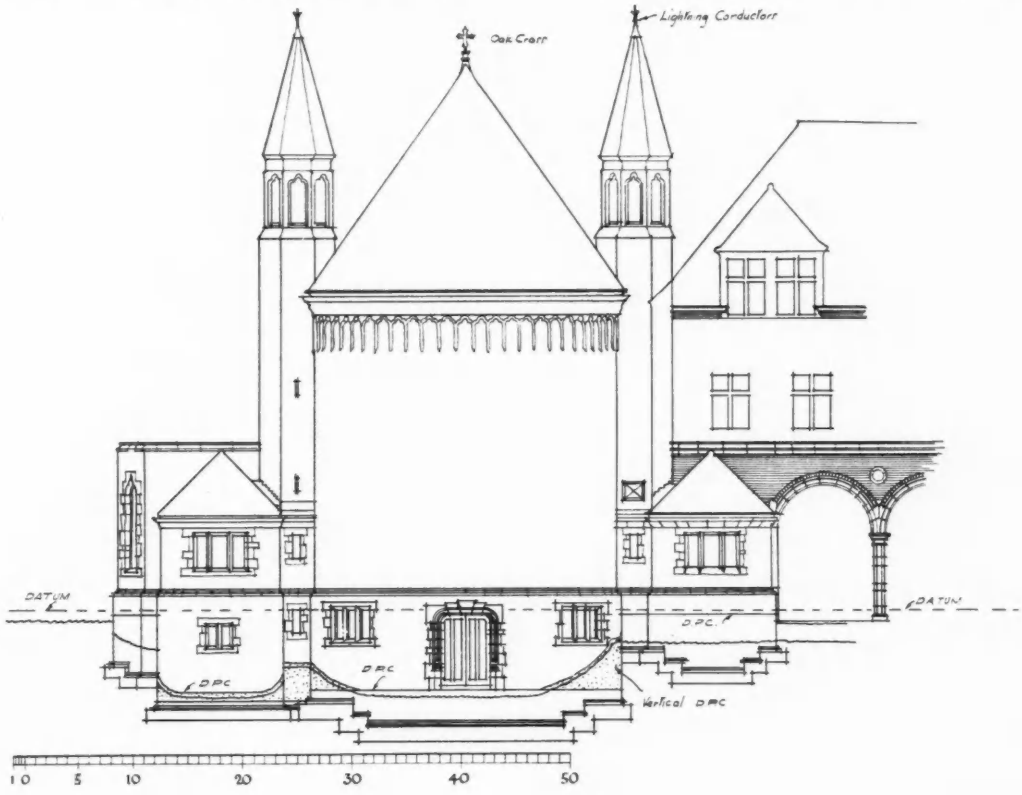
Mr. Mander asked the Minister of Health if he would state the present position with regard to the preservation of Cannock Chase as a national park, and to what extent the matter was being dealt with by the local authorities interested as part of a joint planning scheme.

Mr. Shakespeare said that the Minister understood that the South Staffordshire and North Worcestershire Joint Town Planning Committee were considering the question of the preservation of Cannock Chase and had approached the local authorities who were not constituent members and whose districts included any part of Cannock Chase. It appeared that four local authorities were concerned, of whom two were already members of the Joint Committee, and a third had, it was understood, agreed to become a member. The fourth, the Stafford Rural District Council, had not yet agreed to join the Committee.

Covent Garden Opera House

Captain Cazalet asked the First Commissioner of Works whether he could give the House any information about the representations which he had received as regarded the future of Covent Garden Opera House and its preservation or demolition.

Mr. Ormsby-Gore replied that he had received no representations such as was suggested, and he therefore regretted that he was not able to give any information in regard to them.



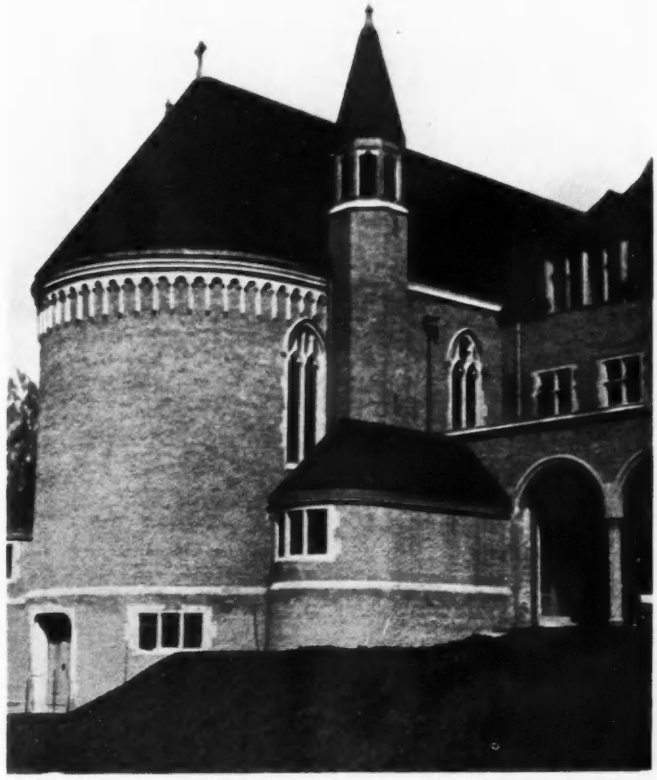
Captain Cazalet then asked if the First Commissioner was aware that, unless some steps were taken in the next few weeks, Covent Garden Opera House was likely to be pulled down, and there would be no opportunity of having opera in this country for many years to come.

Mr. Ormsby-Gore replied that he did not think that concerned his Department.

ON THE AIR

On Tuesday next, June 6, the eighth of the series of talks on "Design in Modern Life" will be broadcast in the National Programme at 8.30 p.m. by Messrs. Frank Pick and John Gloag, who will discuss "The Street."

NEW CHAPEL AT FARNBOROUGH

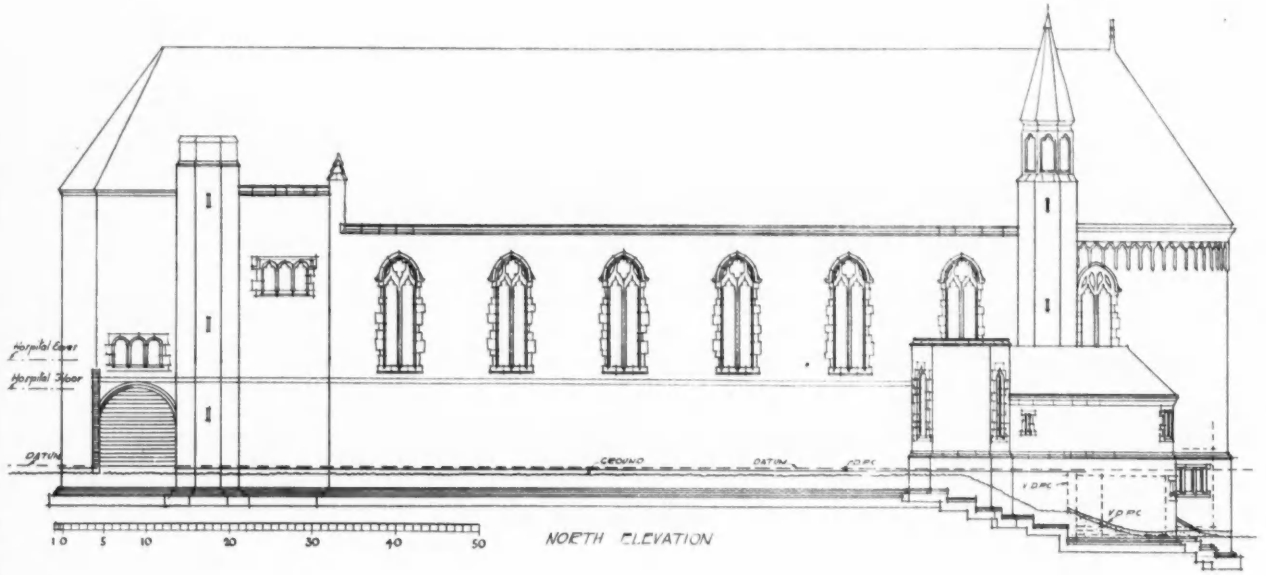


Farnborough Hill, Hampshire, formerly the residence of the Empress Eugenie, has been converted by the nuns of the adjoining Hillside Convent into living quarters, on the lines of a public school, for the girls, whose classrooms have been retained in the old school building.

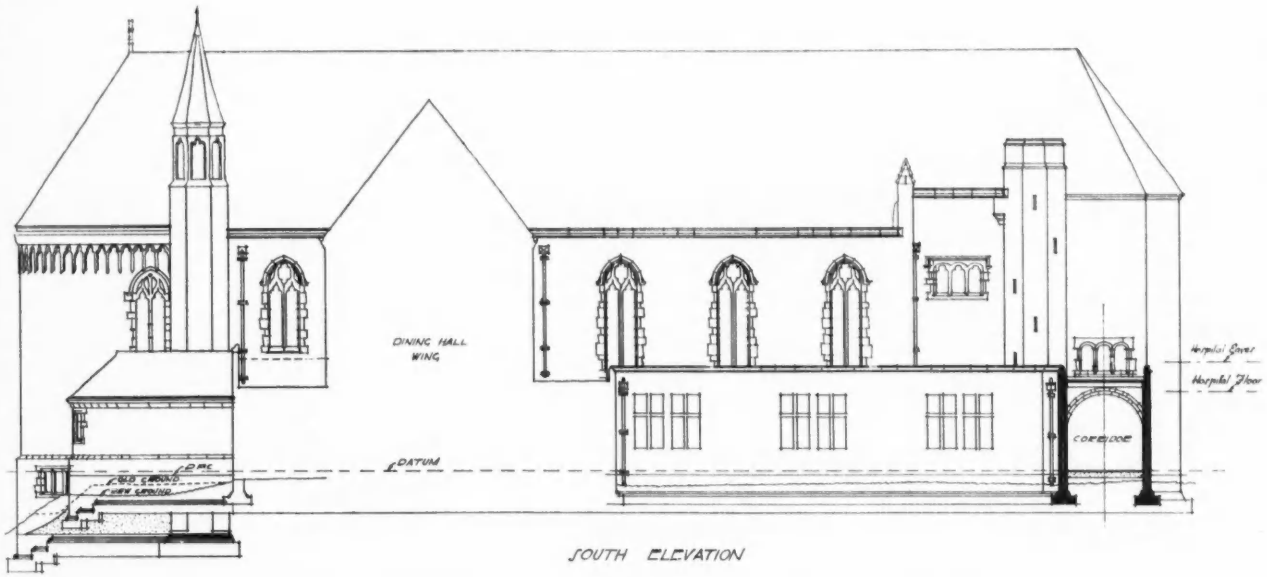
The present addition provides a new chapel, to seat 400, of which the east elevation is illustrated on this page, and a dining hall.

The group of buildings occupies a prominent site, commanding magnificent views. Where the ground falls away steeply, at the eastern end of the chapel, low two-storied vestries are placed to give proportion to the old and new work. The original structure is an ornate version of early French Renaissance; the quieter extension is designed to harmonize with it in colour.

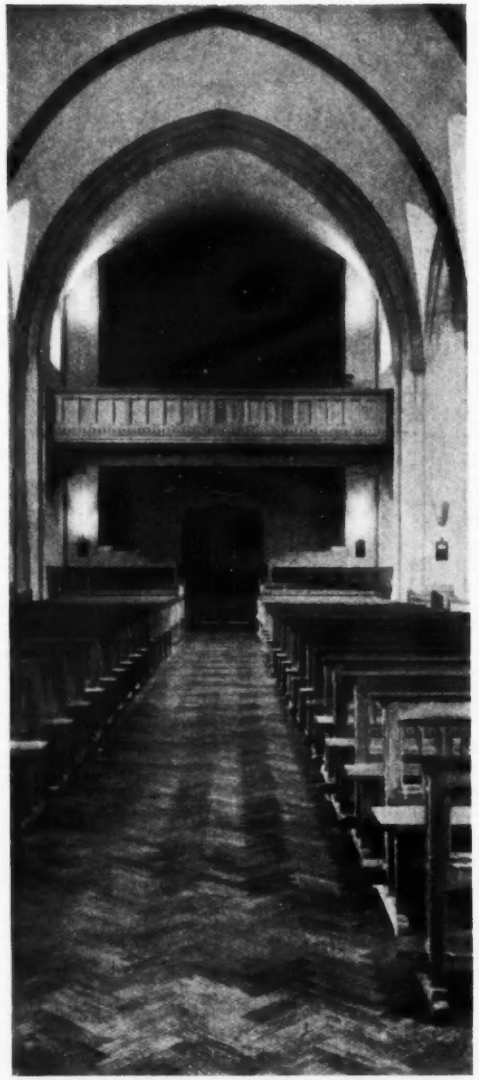
The chapel, which stands fifty feet high, is planned (see page 728) without aisles, but with a cloister on three sides—one yet to be built. The exterior is faced with 1¾ ins. Dutch yellow bricks, with dressings in Clipsham stone, of the same colour. The roofs are covered with plain brown tiles to match the adjoining weathered roofs of the old building.



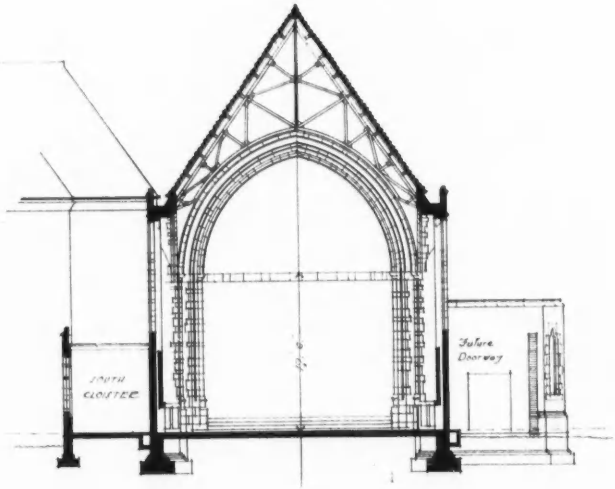
DESIGNED BY A. GILBERT SCOTT



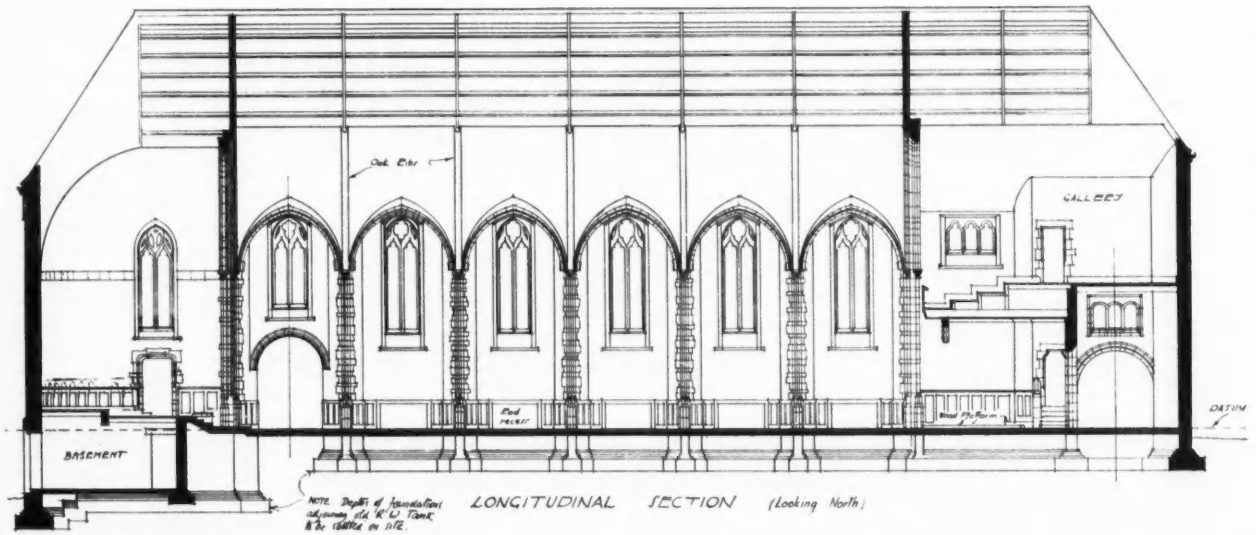
NEW CHAPEL AT FARNBOROUGH



NORTH ELEVATION



SOUTH ELEVATION



The dining hall, measuring 70 feet by 33 feet, has two stories above it, containing twenty-eight individual girls' rooms, each fitted with hot and cold water. In the upper view on the facing page its arcaded front is seen between the chapel and a bay of the old residence ; the lower is of the arcade itself. This arcaded front, being a continuation of the existing Royal Gallery, forms a vista some 215 feet long, from end to end of the buildings, and affords the main traffic artery. A new girls' entrance has been formed, with additional lavatory accommodation, so as to give direct access from the playing fields to the new buildings. Provision is also made for future extensions beyond the chapel.

The chapel, to which are devoted the other illustration in this opening and also those in a supplement with this issue, has, at the west end, as here indicated, a spacious organ and choir gallery ; it has separate access from the infirmary for convalescent patients. Heating is by low pressure hot water from existing boilers, enlarged, converted to oil fuel and placed under thermostatic control. The electric lighting in the chapel is so arranged that no lights whatever are visible from its west end.

CHAPEL, FARNBOROUGH: BY A. GILBERT SCOTT

WHAT IS TO BE DONE ABOUT

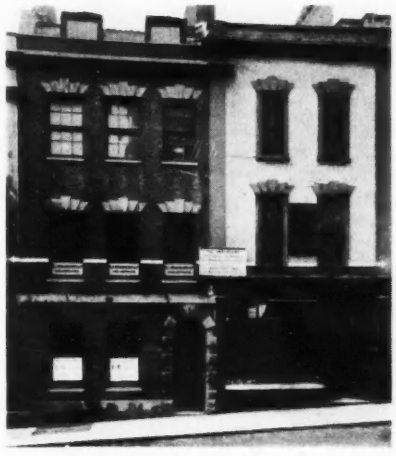
THIS?

[This week, Penates, who opened this series of articles, again takes up his pen to discuss the potential activities of the Building Societies. What was then a Bill is now an Act. And the Act assumes the co-operation of the Societies in financing houses to be built to rent. *Last week's contribution cast doubts on the validity of that assumption. Evidence in rebuttal is now adduced.* —ED., *A.J.*]

10. Building Society Finance

[*By PENATES*]

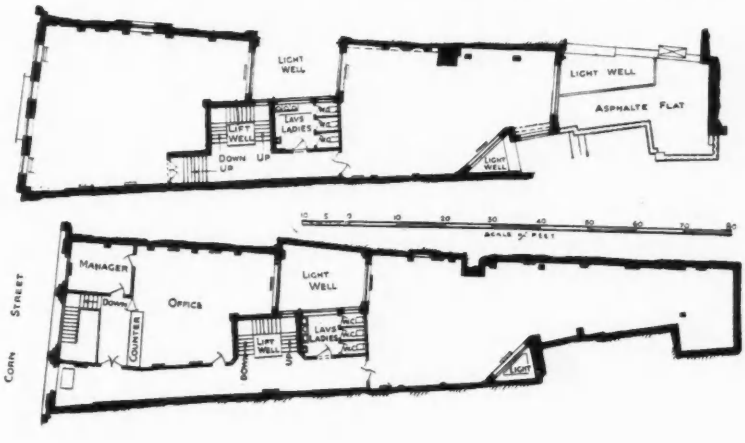
IMPLICIT in the new Housing (Financial Provisions) Act is the intention that the Building Societies, who control a large proportion of the building finance in this country, but have up to the present time advanced money only for the building of houses to be *purchased* by the individual, shall provide cheap money for the building of houses to be built *to let* at low rentals to those who have not sufficiently large incomes to become house owners under the ordinary building society procedure, and the belief that sufficient houses will be built under its provisions to obviate the necessity for further housing activities by local authorities.



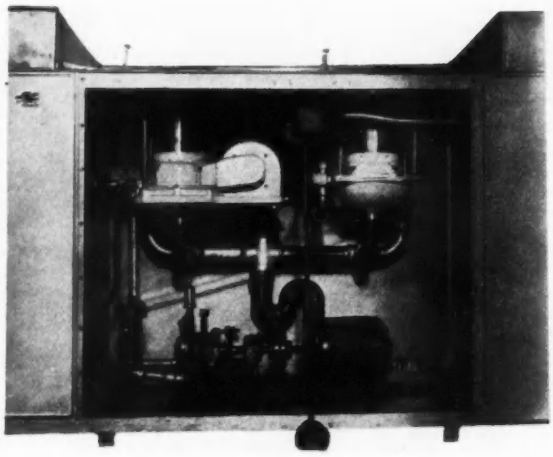
Whether cheap houses can be built, and the local authorities relieved of what has been, up to the present time, public work, for the performance of which no alternative machine has existed, will depend for the moment, and until such time as a National Housing Corporation or similar financial institution becomes effective, upon the attitude of the Building Societies.

The Parliamentary Correspondent of this JOURNAL wrote last week, "there is a general feeling, particularly pronounced in building society circles, that the Act is a peculiarly hopeless piece of legislation. It provides little, if any, incentive to the building societies to advance the money needed for the construction of small working-class dwellings to let," but surely there is proof that the societies do

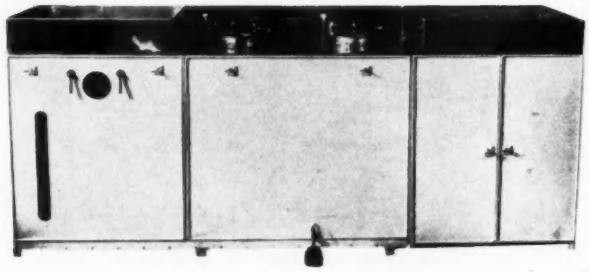
INSURANCE OFFICES



SIR G. GILBERT SCOTT, R.A., Architect for the Elevation



The Friends' Provident and Century Life Office, Corn Street, Bristol, is fireproof throughout. It is of steel construction, faced with Portland stone, and fitted with windows of white anodium metal. The roof is of pantiles.



The illustrations show the new frontage, which is embellished with sculptures by Hermon Cawthra; the structures that formerly occupied the site; and plans of the ground and a typical upper floor. The whole of the building will be used as offices, part of the ground and the whole of the upper floors being available for letting.

A. W. ROQUES, Architect for the Plans

MIDDLESEX COUNTY HOSPITAL:

This machine, installed at the hospital illustrated opposite, scours and rinses babies' feeding bottles by means of two specially designed units, with fluid mixing tank and circulating pump, the latter being foot-controlled by the pedal shown. The work table, scouring and stacking tanks are of polished stainless steel; and the body is white enamelled. Special attention has been paid to easy and cheap maintenance. Wearing parts are easily replaceable by unskilled labour.

intend to act, and to act immediately, in the announcement that the directors of the Halifax Building Society have decided to co-operate with the Government in putting the ideas behind the Act into practice by granting loans, under the Act, to the extent of £10,000,000, during the next two years.

Loans up to 90 per cent. of the valuations of the houses, subject to Government and local authorities' guarantees, will be granted at 4 per cent. interest in the North and Midlands, and 4½ per cent. in London and the Southern Counties, on a 30 years' repayment period.

Definite proposals for the erection of houses under the scheme may now be submitted to the Society.

The provisions of the Act do not, admitted, coincide with the inherent principles of the building societies, which were founded to enable people with limited capital to buy their own houses; but the societies have large surplus funds that are not likely to be absorbed immediately in financing houses built for sale and, since there is an urgent need for more houses to let to the poorer of the working classes and for cheap finance to enable them to be built by private enterprise, the societies who regard the scheme with favour will employ a part of their surplus in the provision of building finance at lower interest rates. But a distinct division will be made between the new proposals and normal business, and in order that there may be no unfair competition through speculators obtaining money from the same source at different rates of interest, cheap money will be available only for houses built to let; the builder will not be permitted to sell a house financed under the new scheme to the individual for his own occupation.

The builder may retain the houses himself or sell them, and investors will deal with them on a rental basis. For several years there has been a steadily increasing demand for good-class property for investment, and since cheap money is now available, building cost considerably reduced, and municipal competition eliminated by the withdrawal of the subsidy, the position of the investor is, at the moment, decidedly favourable.

In order to obtain finance the potential borrower first lays his proposals before the building society, giving plans and layout scheme, and stating the number of houses he intends to erect. The directors of the society consider applications at an early stage, and no undue expense need be incurred.

If the scheme appears favourable it is forwarded to the society's surveyors, who make their report and valuation. If it is then approved, a provisional offer is made to the builder.

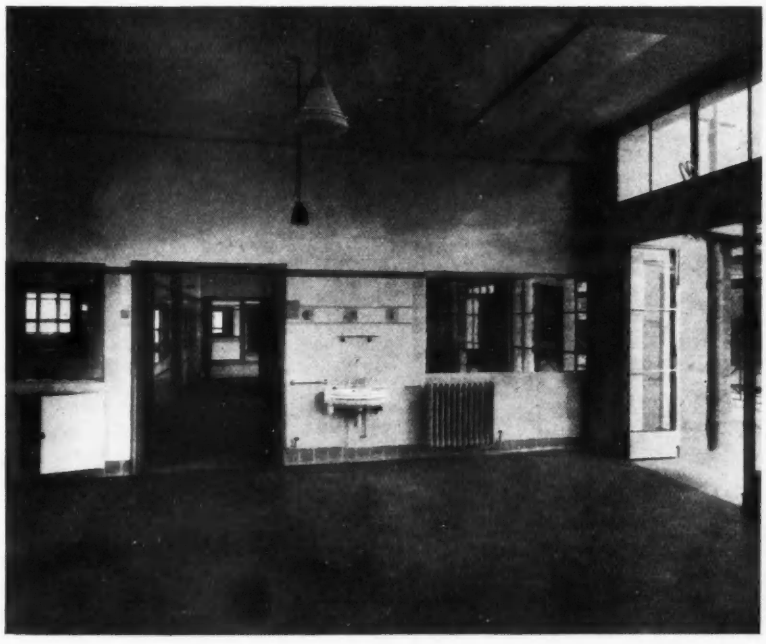
The scheme must next receive the approval of the local authority that will act as guarantor and, having the authority's consent, must go to the Ministry of Health. This is the final stage; so soon as the scheme is sanctioned by the Ministry building work may go forward on a 90 per cent. loan basis on total valuation of house and land, these being regarded as an entity, with a 30-years' repayment period.

These articles were started, primarily because this JOURNAL anticipated a wave of speculation in small house building, following the withdrawal of the subsidy, and foresaw the deadly danger of allowing the speculative builder to produce, uncontrolled, the £250 to £300 house.

The danger has now been brought home to many people, including the Government, and the Minister of Health has himself moved in the matter.

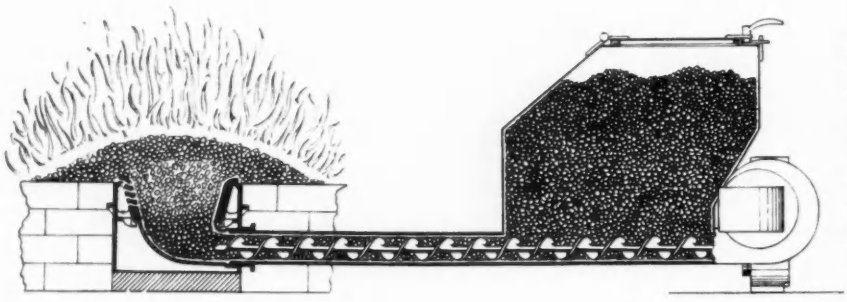
Since the Halifax Building Society's scheme for a £10,000,000 loan for housing was made public, the Minister has issued to the local authorities and county councils of England and Wales a special Circular (No. 1334), Section 14 of which amounts, since the Government itself will act as a guarantor for money advanced under the provisions of the Act, to an order to local authorities to ensure that the houses provided are well laid out and of good design; and attention is drawn to the duty which is laid on local authorities by section 38 of the Housing Act, 1930, to have regard to the beauty of the landscape and the other amenities of the locality.

There is an implication that houses must not only give proper accommodation, but must conform to an architectural standard of design, which is tantamount to a demand that qualified architects be employed. Failing the employment of architects, the Minister insists that proposed schemes be put before the architectural advisory panels set up by the C.P.R.E. with the help of the R.I.B.A. and its allied societies.



Here is a definite rule of procedure, the significance of which can hardly be exaggerated. Uncontrolled development has gone unchecked since the war ended, and feverish speculation in house building began. Houses were needed at any price, and amenities were forfeited. But the Minister of Health has now definitely laid on the local authorities the onus of responsibility for preserving an architectural standard in small house building, and further, he has indicated the means (architectural advisory panels) by which this proposal may be implemented. What is now essential, and what every responsible person should do, is to back up the lead given by the Minister. Kindly pressure brought to bear on the local authorities will stimulate them to exercise the powers granted to them under the Town Planning Acts.

NEW CHILDREN'S WARD BLOCK



DESIGNED BY SAXON-SNELL AND PHILLIPS

This new three-floor block at the hospital at Willesden provides for 102 sick children. It is steel-framed, with brick walls and reinforced concrete floors. Partitions, which are of pumice blocks, are generally glazed in the middle third with plate glass. External southerly windows and veranda are glazed with Vita glass. On the left, below, is seen a typical glazed-tiled ward, with day room beyond; on the right, a corridor, with separation wards, leading to a day room.

TRADE NOTES

BY F. R. S. YORKE, A.R.I.B.A.

Automatic Coal Stokers

SINCE the price of oil has increased by approximately £1 per ton, following a tax of one penny per gallon levied under the 1933 Budget, attention has turned again to bituminous coal as an economical fuel, and consequently to underfeed firing and automatic coal stokers.

•

The underfeed firing system was first developed in this country a hundred years ago, but has only recently, through the perfection of thermostatic control and the increased reliability of small motors, been applied to boilers consuming 10 lb. to 400 lb. of coal per hour.

•

By this system raw coal is forced upwards, and the fire burns constantly with a glowing surface. The maximum radiant heat is therefore transmitted to the boiler heating surface, and the formation of smoke is prevented because the volatile matter, distilled from the "green" coal, is burned in passing through the incandescent zone above.

•

The diagrammatic section shows the essential features of a typical automatic underfeed stoker.

•

The Prior Mastoker, an automatic stoker designed for use with boilers rated at 150,000 to 3,000,000 B.T.U.'s per hour, consists of a coal hopper of convenient size connected to a burner by a worm conveyor. Air, to aid combustion, is supplied by a fan, driven, with the conveyor, by a small electric motor of ¼ to 2 h.p., according to the size of the Mastoker.

•

Paper and wood are laid in the usual way and fired. Fuel is fed by the worm conveyor from the hopper to the burner, and, becoming preheated, liberates combustible gases that pass through the fire bed and are consumed. All that remains in the fuel of heating value is the carbon matter, which is burned as it is forced upwards towards the glowing surface of the fire bed.

•

The combustion should be smokeless, and the soot nuisance eliminated. The ash fuses into clinker, which is easily removed through the fire door, and amounts to only one-tenth of that normally produced by hand firing.

A No. 6 Mastoker automatic coal stoker installed at Salisbury Road School, Willesden.

Remote room control and thermostats prevent fuel waste, and a mercury pilot control automatically starts the motor for short periods at predetermined intervals in the event of the thermostat being held out of action for a prolonged period, owing to exceptionally warm weather or other cause.

The makers state that the Mastoker shows an economy, after making allowance for current consumption by the motor, of 25 per cent. to 50 per cent. when compared with ordinary hand firing, and it is obvious that there is a considerable saving in labour.

•

The prices of the Mastoker in its several sizes, complete with motor, kindling control, boiler thermostat and clinker tongs, are :—

Stoker.	B.T.U's Rating Hot Water Radiation.	Retail Price.

Lamp Spacing for even Diffusion

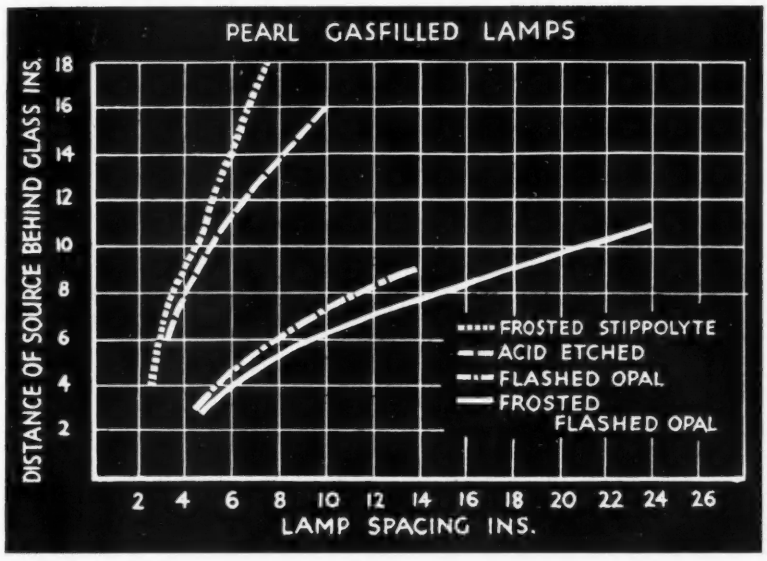
I read in the Electric Illumination Handbook No. 8* (Architectural Lighting) that in an investigation recently undertaken tests were made on acid-etched ; flashed opal ; flashed opal, acid-etched on clear glass surface ; and stippolyte, acid-etched on the flat surface, in order to obtain empirical rules for the effective installation of electric lamps with diffusing glass, and to ascertain the maximum lamp spacing and the minimum distance of the source of light from the glass surface to provide approximately even illumination.

•

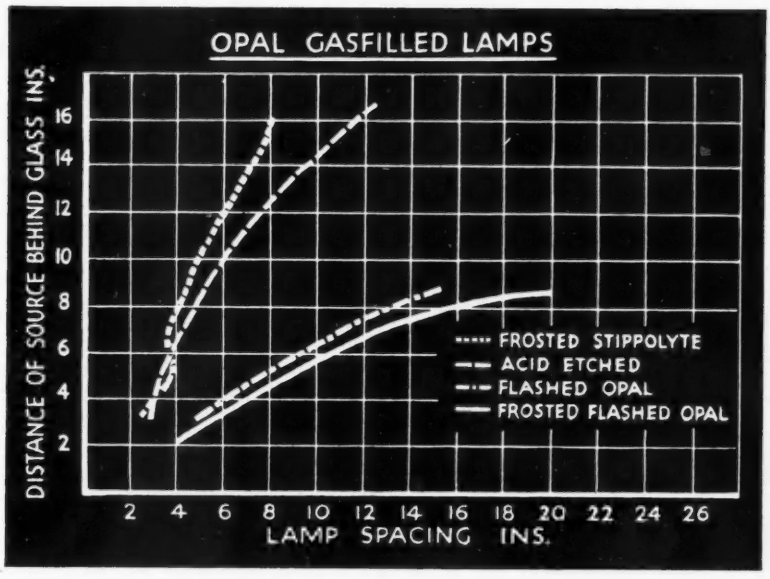
It is impossible to obtain with acid-etched glass a degree of even brightness as high as that obtainable with other specimens.

•

Preliminary tests indicated that similar results were obtained from lamps of 15 W to 100 W, and it was, therefore, concluded that lamp size was not an important factor governing spacing and position of lamps, and consequently that the results obtained from further investigation could be approximately applied independently of lamp wattage.



•



Some variation was found between the results obtained with Pearl and Opal lamps, and the curves in the diagrams overleaf indicate this variation. The spacing of the lamps is indicated on these curves and represents the maximum permissible spacing with the particular glass at a given distance of the lamp from the glass itself.

•

If, for instance, flashed opal glass and Pearl lamps are used, and the space available behind the glass permits the lamp to be installed at a maximum distance of only

* Copies of this handbook are obtainable, free of charge, from The Electric Lamp Manufacturers' Association.

Above: Spacing curve for Pearl lamps. Below: Spacing curve for Opal lamps.

6 ins. behind the glass, then the lamps should not be spaced at a greater distance apart than 8½ ins.

•

If, on the other hand, the distance between the lamps and the glass is unreasonably great, the efficiency of the system is impaired. For example, in a test with opal glass, in a flush panel, the minimum distance from lamp centre to glass to avoid spottiness was found to be 7 ins. When this distance was increased to 10 ins., by way of experiment, the resultant reduction of luminous efficiency was found to be 5·7 per cent.

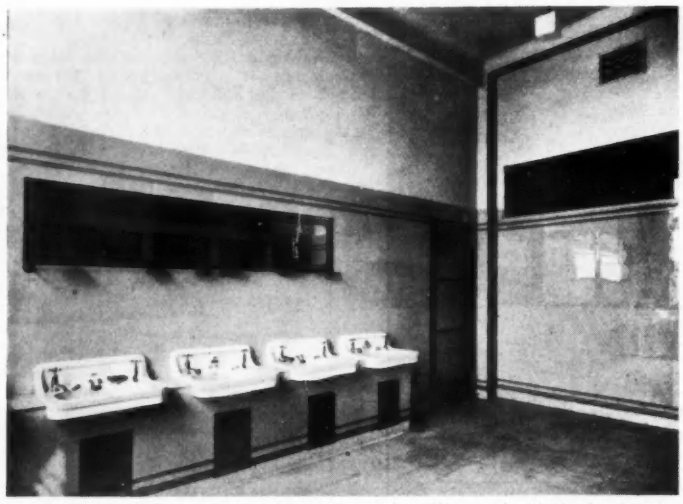
SOCIETIES AND INSTITUTIONS

THE ARCHITECTURE CLUB

The twenty-second dinner of the Architecture Club was held at the Savoy Hotel on Wednesday of last week. Mr. R. Holland Martin, G.B., F.S.A., HON. A.R.I.B.A. (President) presided over about 140 members and guests. The topic of the evening was "The New Headquarters of London University."

After the Royal toasts had been proposed by the President, a set of lantern slides were shown of some incidents and events since the last dinner.

The first slide was of Messrs. J. C. Squire and Oswald P. Milne, the founders of the Club, "having a little talk in connection with the defence of Carlton House Terrace." The slides that followed showed Joseph Emberton and the Royal Corinthian Yacht Club, for which he was awarded the Essex, Cambs. and Herts. Architecture Medal; E. Berry Webber and the Southampton Municipal Buildings; C. H. James and the Norwich Municipal Buildings; Guy Wornum and the R.I.B.A. Building; Edward Maufe and Guildford Cathedral; W. Curtis Green, the new Royal Academician and A. J. Davis, who was recently elected an Associate of the R.A.; A. B. Knapp-Fisher, the new Professor of Architecture at the Royal College of Art, South Kensington; Sir John Burnet and Lloyds Bank, E.C., the London Street Architecture Medal Building for 1933; Sir Giles Gilbert Scott (nominated for the Presidency of the R.I.B.A.) and a view of the extrados of the great vault over the main crossing of Liverpool Cathedral; Sir Edwin Lutyens and the temporary high altar for the new R.C. Cathedral at Liverpool.



The Rt. Hon. Lord Macmillan, P.C., K.C., proposing the toast of "The New Headquarters of the University," described the building as a "university of a new era," which would stand on a magnificent site of 10½ acres of land in Bloomsbury, placed at their disposal through the munificence of the Rockefeller Trust and friends. London, he said, had now awakened to the desirability of having within its midst a home of learning worthy of itself and the University, and one which would win its repute throughout the world. The problem presented to the architect was to obtain such a group of buildings as would produce one general harmony of scheme with the diversity of interest served by each unit, and they were wisely guided when their choice fell on Mr. Holden. He first met him at the dinner at which Mr. Holden was presented with the Architecture Medal for the Underground Building, and immediately realized that he was a man of vision; a man who would not be—as he was told some architects were—a dictator. When he first saw the design it seemed to convey an impression of power like that of a battleship, which was exactly the view expressed by His Majesty.

Lord Macmillan stated that Mr. Holden had arranged to preserve as many open spaces as when the trustees entered upon the site, and, for once in the history of London, a great building had been launched without questions either in the Press or Parliament. Most of our present-day buildings had been born in sin and conceived in iniquity. Mr. Holden's design had been shown to all the commissions and institutions, etc., and all had expressed approval.

At this stage Mr. Holden described, with the aid of lantern slides, the planning of the building.

Professor L. N. G. Filon, M.A. (Vice-Chancellor of the University) congratulated Mr. Holden on the way he had arrived at a solution of a difficult problem, and expressed the hope that the new building would be the intellectual centre of London. The University had not altogether neglected architecture and building in the past, as they had the Bartlett School of Architecture, under the leadership of Professor A. E. Richardson.

Mr. Edwin Deller, LL.D. (Principal of the University), said he had seen new buildings—not skyscrapers—in the U.S.A. which he

The directors' lavatory in the Co-operative Wholesale Society's London Branch, Leman Street, E.C. Vitrolite, a strong opaque glass with a hard and brilliant fire-polished surface, was used for the walls. See note on this page.

disliked, such as Collegiate Gothic. He particularly disliked all shams in architecture. Mr. Holden had relied upon mass and proportion and avoidance of decoration that decorated nothing. Art, like architecture, was long, and life was short. The new University building was as notable a contribution to London as St. Paul's. It was up to them to see that it was brought to fruition.

Messrs. J. C. Squire, A. B. Knapp-Fisher and H. L. Eason also spoke. Mr. Knapp-Fisher said that the new building would rank among the best of the century.

SCOTTISH ARCHITECTURAL PRIZES

The jury of assessors, consisting of Messrs. James A. Arnott, A. G. Henderson, John Stewart, A. F. Balfour Paul, and A. H. L. Mackinnon, have issued their award of the prizes annually given by the Royal Incorporation of Architects in Scotland. There were 81 competitors for session 1932-1933, the prizewinners being as follows :—

David G. MacConville, Glasgow School of Art, who gained the Rowand Anderson Studentship (silver medal and £100) for the best design for a "pavilion or palace of arts for the British Empire at a foreign centenary exhibition." Second place (certificate and £20) : James A. Carrick, Glasgow School of Art. P. H. D. Ronaldson, Edinburgh College of Art, who gained "honourable mention."

Philip M'Manus, Edinburgh College of Art, who gained the Rutland Prize (certificate and £50) for the best selection of practical working drawings for a "riverside restaurant with a sun roof." Hon. mention : Wm. G. Dey, Edinburgh College of Art.

William Archibald Jack, Glasgow School of Art, who gained the Incorporation Prize (£15) available to third-year students producing the best design for an "open-air theatre in a garden of a great musician." Second prize (£5) : T. Warnett Kennedy, Glasgow School of Art. Miss Mary Drysdale, Edinburgh College of Art, received "honourable mention" with a special prize of £2.

N. R. J. Johnston, Glasgow School of Art, who gained first prize (£15) in the *Quarterly* essay competition.

The Maintenance Scholarship, £50 per annum for two to three years, was awarded to an Edinburgh student.

Trade Item

Vitrolite is a strong opaque glass with a hard and brilliant fire polished surface. This material was used for the walls of the directors' lavatory at the Co-operative Society's Building, illustrated above. It is claimed to be hygienic, non-absorbent and unstainable and to retain its lustre indefinitely ; and cannot warp, swell or pull apart and will never become marred by surface cracks or crazing. Vitrolite is supplied in white, black and a variety of other colours. It can be fixed to a Portland cement screeding or to a hard plaster wall, this being done by the application of a special Gripon Mastic in blobs about 2 ins. in diameter placed approximately 6 ins. apart on the back of the panels.

Vitrolite can be drilled for screwing to woodwork and shaped to meet nearly every requirement ; and is obtainable in ashlar sizes, namely, 15 ins. by 10 ins., 18 ins. by 12 ins., 15 ins. by 15 ins., and 21 ins. by 14 ins., but larger panels can be supplied if required.

Vitrolite, manufactured by the British Vitrolite Co., Ltd., of 7, Albemarle Street, W.1, is a British product and is said to be suitable for installing in bathrooms, kitchens, dairies, cafés, hairdressing saloons, operating theatres, shops, lavatories and for counter and table tops, and is obtainable through all glass dealers.

Obituary

We regret to record the death of Mr. R. J. Hatton, M.I.MECH.E., M.I.E.E., a director of Messrs. W. T. Henley's Telegraph Works Co., Ltd., which took place on May 17.

Mr. Hatton, who was born in 1854, served the company for over fifty years. He was appointed manager of the North Woolwich Works on January 1, 1884, and retained that position until January, 1920, when he was appointed Consulting Engineer to the company, in which capacity he was acting until the time of his death. Mr. Hatton was appointed a director of the company in 1912.

*

We regret to record the death of Mr. Thomas Sanderson, aged eighty-eight years, who was associated with Messrs. Sidney Flavel & Co., Ltd., for a period of sixty-five years, and was active up to three days before his death, which was caused through a fractured thigh.

Over this long period of activity he was, in turn, works clerk, traveller, general manager, secretary and director, during four generations of the Flavel family.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

New Chapel, Farnborough Hill Convent, Farnborough (pages 725–728 and Supplement). General contractors, Mussellwhite and Son, who were also responsible for the joinery and plasterwork. Sub-contractors : James Slater & Co. (Engineers), Ltd., hot water heating ; G. N. Hays and Gray; congregational church extensions, Stephenson Street, for Mr. F. A. Child; two houses, Percy Park, for Messrs. H. D. Burton, Ltd.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

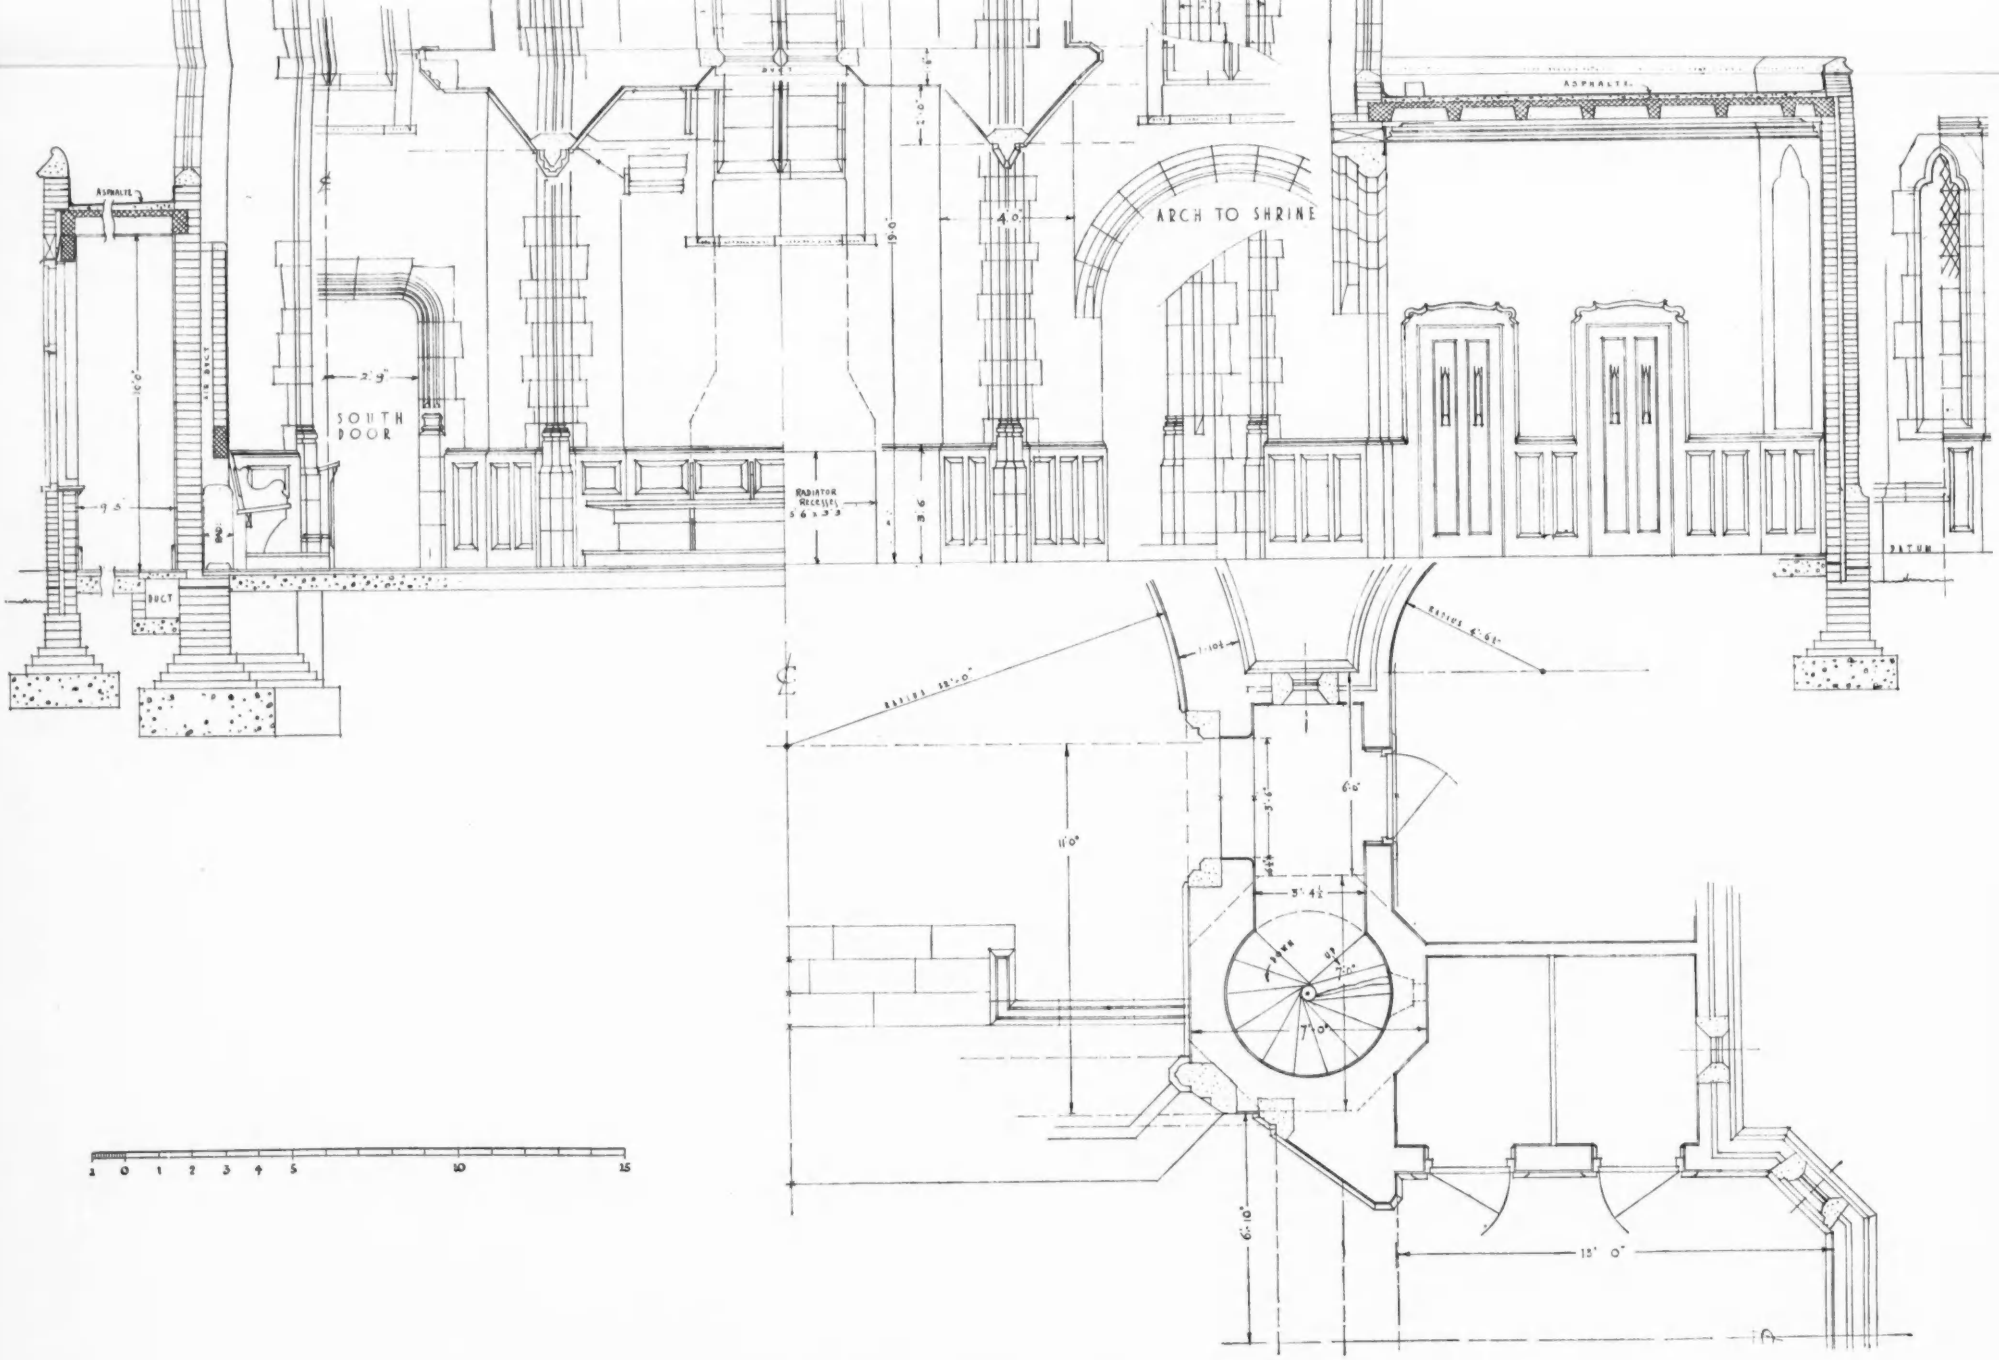
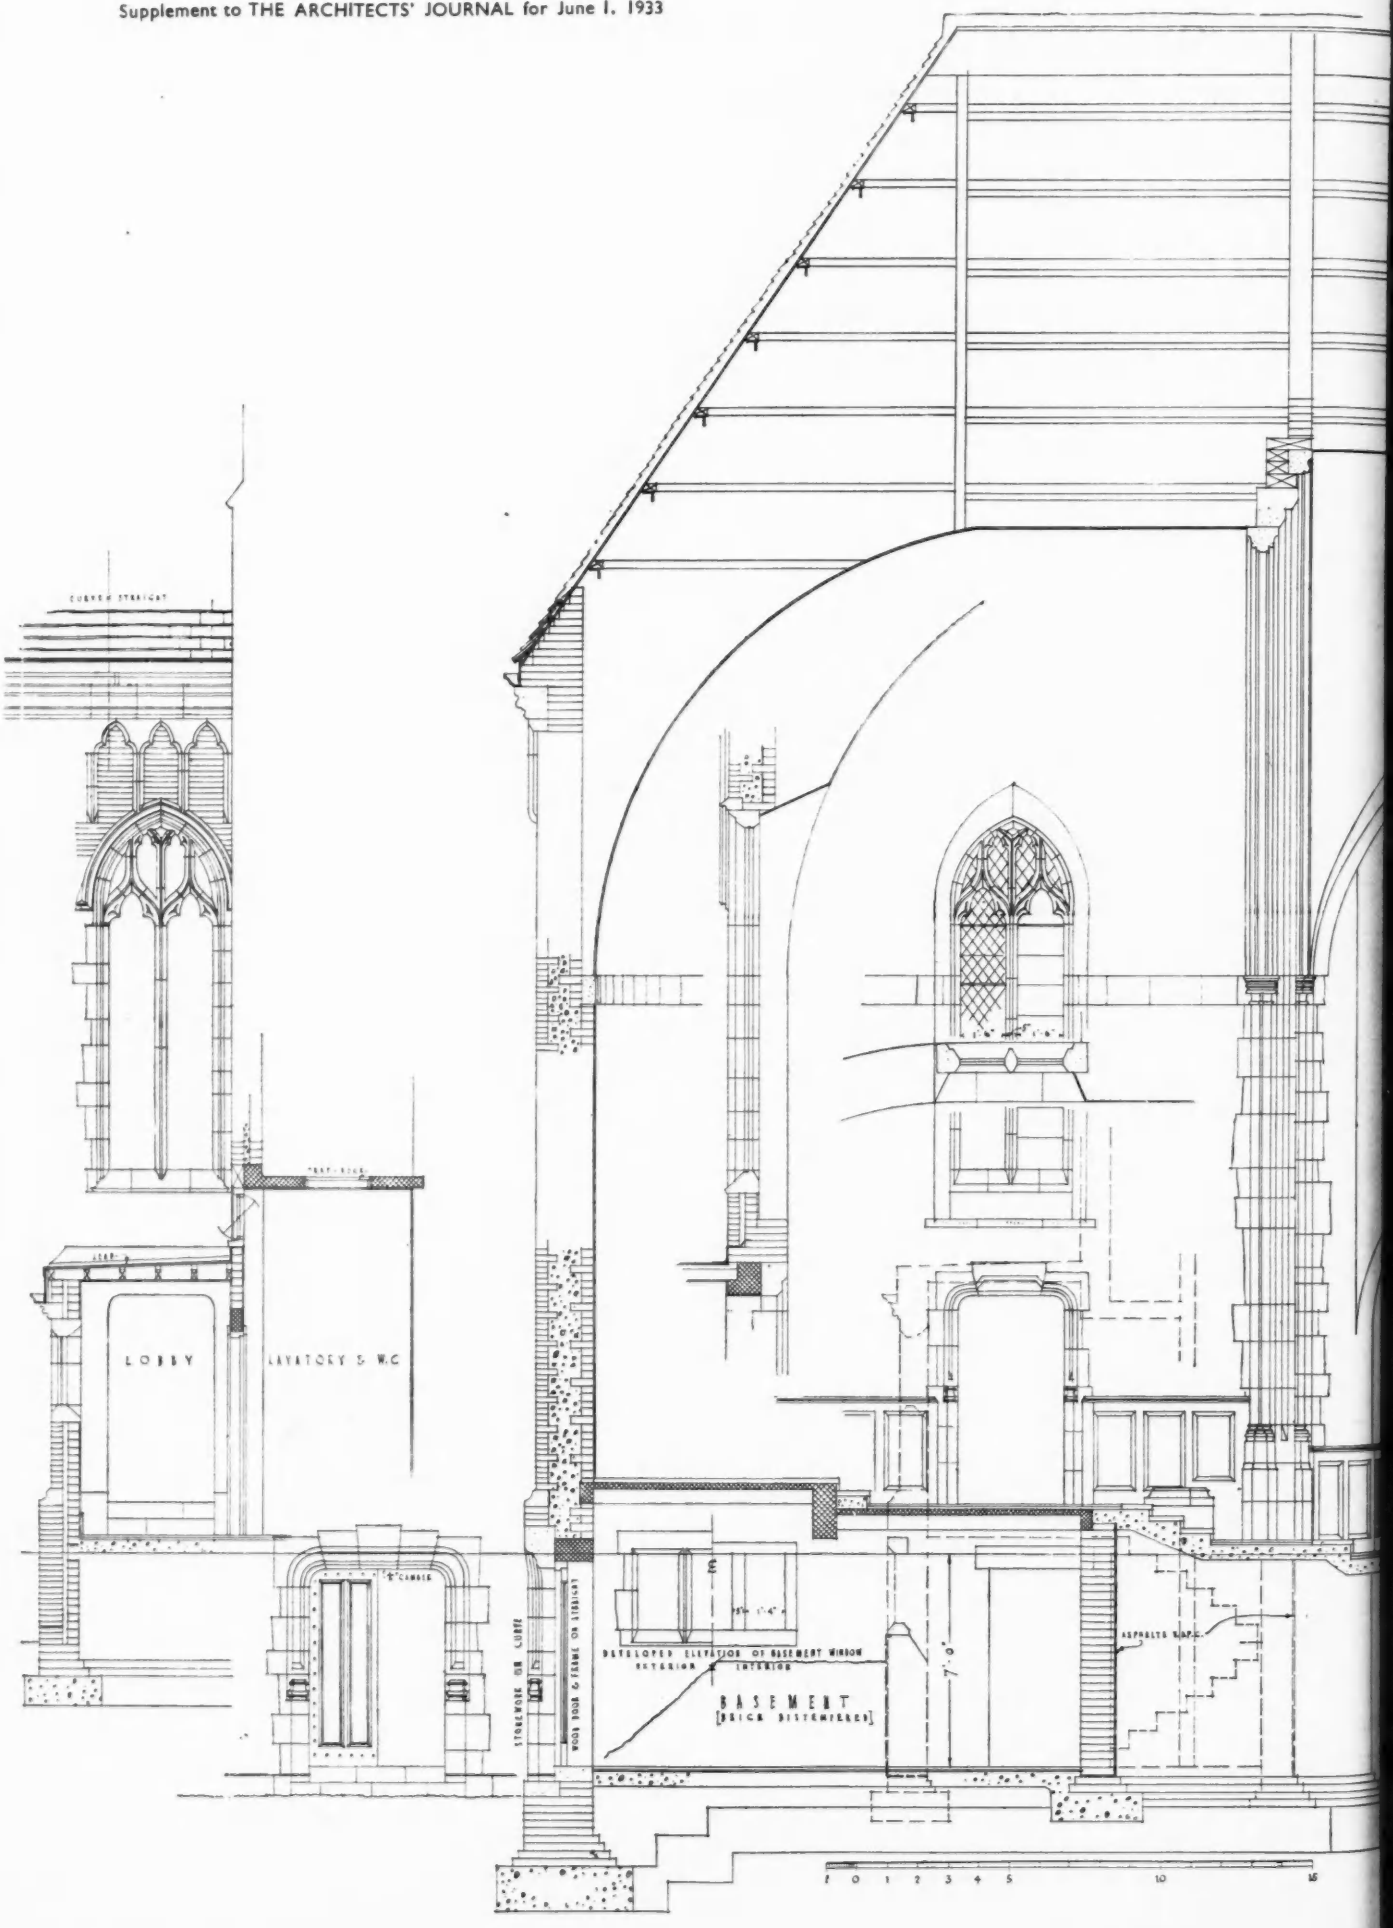
NEW CHAPEL,
FARNBOROUGH HILL CONVENT
DESIGNED BY A. GILBERT SCOTT

THE NAVE, LOOKING TOWARDS THE ALTAR



THE plans and sections of this building appear, along with other views, in the body of this issue; advantage is taken of the large spread of paper overleaf to reproduce a large-scale section through the nave, looking in the direction illustrated above, together with an elevation of a typical bay.



The other drawing, appearing on the last page of this Supplement, is a section through the sanctuary and adjoining lobby.

The present altar and reredos are temporary and are shortly to be replaced by permanent fittings, in keeping with the main design. A somewhat novel feature is a continuous row of stalls against the side walls, which converts the whole chapel into one large choir for the community.

The interior is finished in rough cream plaster, with Weldon stone dressings. The benches and joinery are of limed oak.

STAIR LAYOUTS CLASSED AS ONE EXIT.

PROJECTIONS:
IN STAIRS.. No projections are permitted below 6'9" except handrails having a maximum projection of 3".
IN CORRIDORS.. No projections which exceed 2" are permitted below 6'9" except handrails having a maximum projection of 3".
RECESSES: all recesses to be defended.
HANDRAILS: to be continuous around landings and steps and where stairs turn to be chased flush into newel walls.

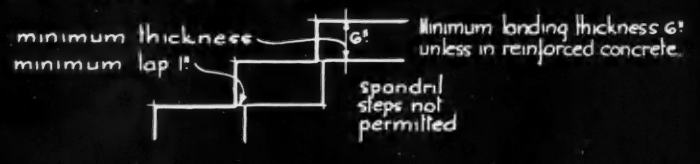
EXITS: STAIRS AND CORRIDORS (as required by L.C.C.).

NUMBERS AND WIDTHS:

a. 2 separate exits shall be provided from every tier or floor which accomodates not more than 500 persons; and, where more than 500 persons, an additional exit must be provided for every 250 persons or part of 250 above 500.

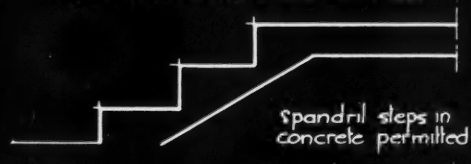
b. 2 of the exits from each floor or tier to deliver into different thoroughfares.

c. if a floor accomodates not more than 300, the width of each exit to be not less than 4'0" measured between the finished walls or between leaves of doors when open, whichever is the smaller.
if a floor accomodates more than 300 persons the width, as measured above, to be not less than 5'0".



d. in the case of premises (or portion of) being 40'0" or more above pavement level the total width of exits provided to be 25% in excess of widths required by paragraph c.

the aggregate unobstructed width of all exits from a vestibule to a thoroughfare to be at least 33⅓% greater than the aggregate width of all exits that lead into such vestibule.



CONSTRUCTION

exits to be of fire resisting materials, enclosed and supported to the satisfaction of the Council. (i.e. 9" walls, F.R. self closing doors, and F.R. roof and glazing are required).

STONE STEPS AND LANDINGS

REINFORCED CONCRETE STEPS AND LANDINGS.

POPULATION: all standing and waiting space must be included in estimating the population. Tea rooms, lounges, restaurants and foyers shall be regarded as waiting space.

INFORMATION SHEET: STAIRS: FOR PLACES OF PUBLIC ENTERTAINMENT, ETC.
SIR JOHN BURNET, TAIT AND LORNE ARCHITECTS ONE MONTAGUE PLACE BEDFORD SQUARE LONDON W.C.1.

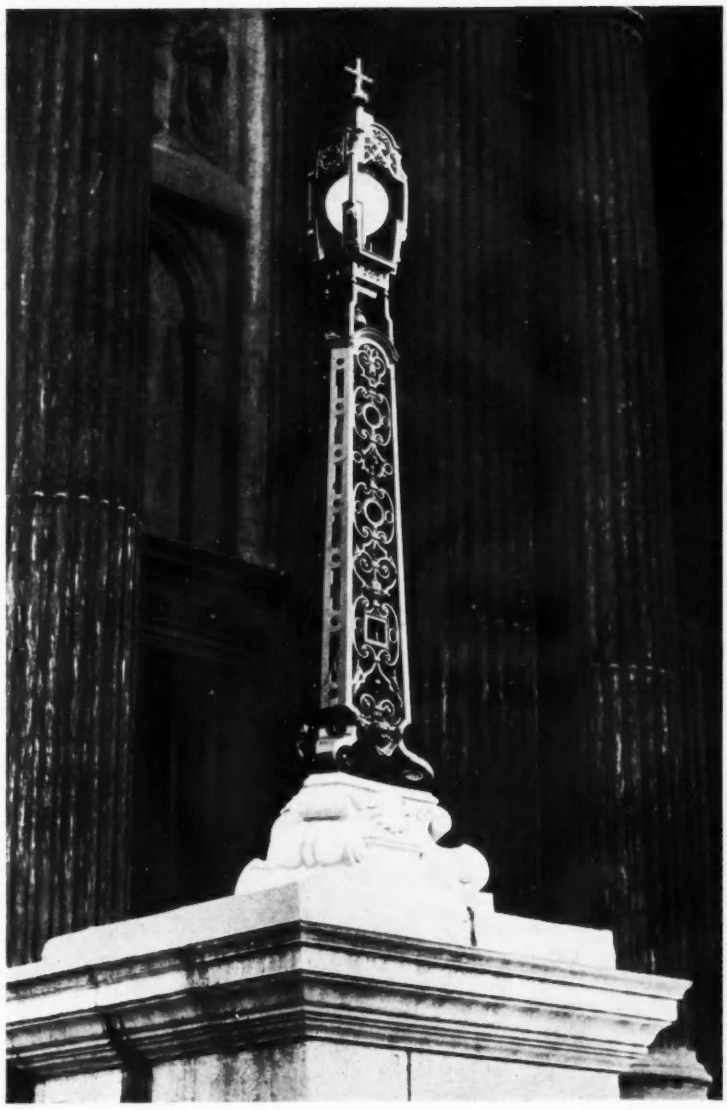
INFORMATION SHEETS

• 20 •

PUBLIC EXIT STAIRS

•

THIS week's Sheet is the fourth of a series of nine dealing in detail with the layout and construction of staircases. It summarizes the requirements in structure and capacity laid down under the Building Acts and L.C.C. regulations for exit stairs in places of public entertainment.



An additional Information Sheet again appears among the advertisements in the present issue. On pages xxvii—xxviii will be found drawings and data, prepared by the manufacturers, to illustrate three methods of constructing walling with proprietary hollow bricks.

The following is a full list of the subjects previously issued :—

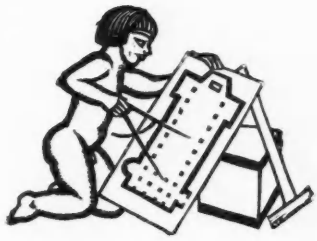
1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.
8. Mar. 8—Billiard Table Data.
9. Mar. 15—Roof Pitches and Drainage
10. Mar. 22—Lift Sizes, etc.
11. Mar. 29—Sanitary Accommodation.
12. Apr. 5—Lavatory Units.
13. Apr. 12—Lavatory Units.
14. Apr. 19—Plumbing to Basins, Baths, etc.
15. Apr. 26—Pipe Chases, etc.
16. May 3—Drains and Manholes
17. May 10—Stairway Diagrams.
18. May 17—Risers for Stairs.
19. May 24—Stair Risers and Flights.

THE LAMPS AT ST. PAUL'S

FROM SIR EDWIN LUTYENS'S DESIGN

ONE of the pair of lamps outside the main west front of St. Paul's Cathedral, unveiled without formal ceremony at the end of last week. The standards, which are the gift of the President and Council of the Royal Academy, and were designed by Sir Edwin Lutyens, R.A., P.I.A.A.S., with the collaboration of Reid Dick as sculptor, represent the fruition of an idea of Canon Alexander's dating back more than twenty years, but delayed in execution first by the war and then by the reconstructive measures taken to preserve the fabric of the Cathedral.

The pedestals are of open wrought iron, triangular on plan, and rise from winged-cherub-head bases to support the lamps, glazed with milk-white glass, which are surmounted, in turn, by the Chapter arms—gilded crossed swords—and crosses. The whole reach a height of fifteen feet.



AT THE MILAN TRIENNIAL EXHIBITION

For the triennial exhibition of modern applied art and architecture at Milan, which was opened last month and closes at the end of September, a special large building has been erected from the designs of G. Muzio. In it is the room of which one end appears in the above view. This was organized and decorated by Gustavo Pulitzer Finali to illustrate "Æsthetics in the means of conveyance."

The figure of Icarus, sculptured by Marcello Mascherini, suggests the Spirit of Beauty rising from the world of mechanics. The decoration of the walls takes its inspiration from technical drawings. Down one side of the room are models and photographs of the most modern ships, aeroplanes, locomotives and motor cars, showing their evolution from an artistic point of view; down the other run bays exhibiting the interiors designed by architects for the various vehicles of travel displayed.

The intention underlying the exhibition is twofold: to demonstrate to laymen the opportunities and advantages of inviting the collaboration of trained designers; and to reveal to designers on their part, the forms, tendencies and signification of modern mechanism and the possibilities they offer for seemly exterior treatment.

THE FOURTH INTERNATIONAL CONGRESS OF BUILDING SOCIETIES

THIS week the Fourth International Congress of Building Societies is taking place in London. The portraits of the directors of these societies are featured in the daily press, and the originals of the pictures announce in somewhat grandiloquent language how much they contribute to the nation's progress and economic well-being.

No one will, of course, deny that these societies have met a very real need in human nature. For over a hundred years they have helped the wage-earner to save money and to become the owner of his own home. Their success is best proved by the latest report of the Chief Registrar of Friendly Societies, in which it is stated that there are now over 1,000 societies in Great Britain, 1,692,167 share investors, 868,794 borrowers, and total assets of over £469,000,000. The rapid increase which has taken place since 1919 is illustrated by the fact that the two largest building societies have now between them about twice the assets of the whole of the societies put together before the war.

According to the speeches made by the leaders this week, the societies are now to take the leading rôle in a brilliant new act in the national drama, called "New Homes for Old." This is their reward for their persistence last year, when the Housing Committee of the National Association of Building Societies pressed upon Sir Hilton Young their views that the time had come when it was no longer necessary for the State to give housing subsidies. They declared that costs had fallen so far that the subsidy was no longer justified, if private builders were to be given a chance. In view of the Treasury's desire to save public funds, they were pushing, of course, at an open door. It was almost a foregone conclusion that subsidies would either be terminated or reduced, if the Government could find a good excuse and defence for such an action.

Today the Minister of Health and his colleagues cling to the building societies in the hope that they will find an outlet for their accumulated funds and go ahead with a large building programme. But recently there have been signs of hesitation, and the Ministry have made it very clear that they are not relying solely upon the societies to secure the universal building of small houses to meet the present demand, especially in relation to re-housing persons displaced by slum clearance.

From the architectural point of view, as we have pointed out from the first, there are grave dangers in allowing speculative builders to construct what Lord Riddell, the President of the Metropolitan Building Societies' Association, recently called "monstrosities." It is therefore encouraging that Sir Raymond Unwin is to address the Congress tomorrow on the subject of the design of the new houses to be built with the money advanced by the societies. All must hope that his words will not fall on deaf ears.

The Ministry of Health, fortunately, have been warned of these rocks ahead. In the Memorandum on the new Act, which is now in the hands of local authorities, special emphasis is given to the necessity of the houses being designed by qualified architects or else of the plans being submitted to architectural panels. This warning is all to the good, provided it is heeded by the societies. It is, however, somewhat disconcerting to study articles written by some of the outstanding men of the movement, and to find in them no hint whatsoever that they recognize the value of skilled planning and design.

For the question of the control of the lay-out and of the design of such houses as may be financed by building societies is obviously a vital one. Yet the more the present Town and Country Planning Act is studied, the more formidable the procedure appears to be. A Town-Planning Scheme has to pass through 28 different stages, and property owners, if advised by skilful counsel, will find plenty of ways of holding up most schemes.

We cannot, therefore, rely on legislation alone to protect this country in the future from the execrable types of houses which have sprung up like mushrooms during the last ten years. The education of the public to appreciate good architecture proceeds slowly, and private interests are strong.

It is significant of the present outlook on the subject that in an admirable supplement published a few days ago by *The Daily Telegraph* on the subject of building societies and their work, although members of the House of Lords and House of Commons, Railway Directors, a Major-General, and an American Senator contributed informative articles, there was no architect-contributor. Lord Riddell said that houses should be "more beautiful" and pleaded for "tastefulness in new designs." Viscountess Dunedin wrote on "Women and the Domestic Architect," and declared that the architect of today will be forced to give more consideration to the woman's point of view in the planning of the house. But in this comprehensive survey, no member of the Royal Institute of British Architects and no recognized Town-Planner were allowed to suggest that this much-boosted housing campaign should be guided by experienced and qualified men.

Lord Howard de Walden, who is to lay the foundation stone of the new R.I.B.A. building in Portland Place, on June 28.

NOTES & TOPICS

PICKING HOLES IN THE MODERN STREET

ON Tuesday, the eighth talk of the "Design in Modern Life" series was broadcast in the National Programme by Mr. Frank Pick, managing director of the London Underground, and President of the Design and Industries Association, and Mr. John Gloag. Their subject was the Design of the Street. and the discussion oozed with dissatisfaction concerning things as they are.

*

Mr. Pick released an enormous flood of facts about the needs of traffic, and Mr. Gloag, who appeared to be posing as an aggrieved pedestrian during part of the talk, was compelled to admit that the chief matter that emerged from the discussion was that traffic was controlling the whole plan and character of the modern city.

*

"The city itself," he said, "you pass through quickly or slowly as the case may be, but you pass through it on wheels."

*

This comment stimulated Mr. Pick to produce a vision of the Street of the Future. As traffic congestion gets worse (and it's depressing that one of the greatest living experts in traffic seems to think that it's going to get worse) it will be necessary to lift the centre of London up into the air about 15 or 20 feet, and double-deck all streets.

*

I liked the description of Trafalgar Square as "civic authority and commercial irresponsibility shaking hands in the centre of the Empire."

*

One of the complaints Messrs. Pick and Gloag underlined with their restrained but bruising indignation was that the street in the city of today has too many jobs to do. Mr. Pick was particularly severe on statuary cluttering up the roadway.

Frankly I don't think he was severe enough. Think of those ridiculous Victorian politicians in bronze frock coats; but I see the sculptor's difficulty. You couldn't have given Gladstone a Roman toga or a loin cloth; not in the nineteenth century; not now, even.

*

The other day I heard the comment of a country gentleman of the old school on the figures that adorn the façade of the Bank of England extension. After regarding them coldly for some minutes, the fine, blunt old squire said: "I suppose it's all right for men's figures, but I don't think they ought to take those sort of liberties with women."

*

MORE ABOUT DESIGN

While I am on the subject of design, let me say that, in my opinion, the second number of *Design for Today* is an even more remarkable affair than the first one. One expects the first issue of a paper to contain some good material because, after all, it is largely the first issue which is to fix the public idea. One often finds, however, that the second issue is rather a lame affair when set side by side with its predecessor. *Design* is a very notable exception.

*

Mr. Clough Williams-Ellis contributes a most interesting article on "The Road House," and nobody (if I may be allowed to offend by regarding Portmeirion as in any sense a *road* house!) should know more about the subject. Reference is also made to that most interesting and stimulating experiment, "Knights on the Road."

*

When the last issue appeared, I extolled the admirable notes by Mr. Gordon Russell under the heading of "The Designer and His Problem," and only innate delicacy prevented me from betting heavily that the others of the series would fall short of the high standard set in the first

C. Sargeant Jagger, the sculptor, in his Chelsea studio, putting the finishing touches to his model for the colossal figure of Christ for Liverpool's new Roman Catholic Cathedral.

The frontispiece to this issue shows a room at the Milan Exhibition. Here is another: a private dining room for the Cosulich motor liner, "Oceania." It is constructed of incombustible materials: ceiling, stainless steel; walls, engraved glass; furniture, steel and green leather; floor, green linoleum.

one. I am glad that I did nothing so rash, because the second happens to be by Mr. Keith Murray, and deals with the designing of his now famous table glass, which is made by Stevens and Williams.

*

I am not quite sure about "Printing for our Time." I may be personally prejudiced, but it smacks rather of printing for personal amusement.

*

By far the most brilliantly clever thing in the whole issue lies in three pages under the heading "Sport and its Trophies," which are hitched on to the Shell-Mex House exhibition of sporting trophies. Riding, golf, chess, horse racing, yachting and sporting dogs are all illustrated by photographs, and alongside each is a picture of the trophy with which the unsuspecting winner cannot avoid being presented. ("Oh look, Ellen! Isn't that one lurvly!")

*

SIR EDWIN LUTYENS IN THE NEWS

Sir Edwin Lutyens is much in the news this week. When I picked up my morning paper on Monday, I saw his name in longish articles on three of his works.

*

First, there was Liverpool Cathedral; secondly, the new lamp standards for St. Paul's Cathedral; and, finally, his appointment as architect for the memorial to Lady Cynthia Mosley.

*

I am not quite certain whether some of my readers have heard Sir Edwin's story of his first meeting with Dr. Downey, his Liverpool Cathedral "client." In case not, here it is.

*

When Sir Edwin travelled up to Liverpool for his first meeting with the Archbishop, he pondered whether to bow or kneel when shown into his presence.

*

Dr. Downey's first words were: "Will you have a cocktail?"

*

Sir Edwin replied . . . . . .

STONE-LAYING UP-TO-DATE

At the opening of the new Plymouth Head Post Office recently, Sir Kingsley Wood, Postmaster-General, laid, by electric contact, the foundation stones of the Telephone Exchanges in Exeter, Torquay and Plymouth.

*

In this case pressing the button really did the whole trick, for the stones had been counterbalanced up to few pounds' weight capable of being supported by a thin wire. The current fused the wire, allowing the stone to drop, and automatically, as it touched its bed, another contact lit a green lamp on the table before the P.M.G.

*

When we have television screens I foresee exciting little ceremonies taking place half-way round the world.

*

THE NEW BELGIUM

I spent a part of last week in Belgium and was impressed by the exuberance of the new architecture. Especially in post-war seaside resorts like Le Zoute Belgian architects show what gaiety can be added by skilful use of colour.

*

In some of the hotels they have also proved the value of economical planning. Belgium has always catered for a class of visitor who expects reasonable prices. Special attention has been given to the planning of rooms so that not an inch is wasted.

*

In the western part of Belgium, near the French frontier, many vestiges of the war still remain in the shape of concrete emplacements, and some shelled houses have not yet been repaired.

The Building Industries National Council is stimulating interest in the slum clearance problem among local authorities. The replies received by the Council to a letter circulated among these authorities urging them to commence operations at once are encouraging. It is obvious that a number of these bodies really intend to tackle the problem in a serious manner. This will help the Building Industry and all members of the Building Industry should do what they can to stimulate their own local councils to activity in this matter.

Subscriptions to the fund of the Special Relations Committee of the B.I.N.C. should be addressed to Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

INTERNATIONAL CONGRESS OF BUILDING SOCIETIES

The fourth meeting of the International Congress of Building Societies and the sixty-fourth annual meeting of the National Association of Building Societies was begun in London on Monday last, when a reception to the Overseas delegates was held by Sir Harold and Lady Bellman at their home at Finchley.

On Tuesday, the opening session of the Congress was held in the Wharncliffe Rooms, Hotel Gt. Central, N.W. Following the address of welcome by the President (Sir Enoch Hill, J.P.), papers reviewing the position and progress and special features of the movement in the following countries were read: Austria (by Herr Wilhelm Flatz); British Guiana (by Mr. W. Seivewright Stoby); Bulgaria (by Mr. D. A. Ivanoff); Commonwealth of Australia (papers by Messrs. C. W. Pitt, T. Waites and V. Dumas); Denmark (by F. C. Boldsen); France (by M. Georges Risler); Germany (by Dr. H. Schuon); Great Britain (by Sir Harold Bellman); New Zealand (by Mr. E. G. Cowell); Northern Ireland (by Mr. W. D. Scott); South Africa (by Mr. J. R. Booth, J.P.); Switzerland (by Dr. J. Grogg); United States of America (by Mr. H. F. Cellarius). Sweden (a statistical summary only was read.)

Sir Harold Bellman, in his paper, pointed out that the movement had throughout its history in Great Britain provided assistance for the purchase of at least 2,000,000 houses, affording accommodation for approximately 10,000,000 persons.

At the afternoon session, H.R.H. the Prince of Wales expressed a welcome to the delegates. The Prince, in his address, said:

"The achievements of building societies are to be read in our contemporary history, and the rapidity of your progress in the post-war years in particular is one of the most stimulating features in our social and economic life. During these years Great Britain has slowly but surely overcome the most acute phase of housing shortage in its history. Approximately 2,000,000 houses have been erected in England and Wales since the year 1919, and to the various forms of State and local government assistance must be added your own practical contribution in helping to finance this gigantic housing effort.

"But in spite of the achievements of the post-war years we must remember the fact that there are not yet enough homes of the right type in this country.

"While as building societies you may not be directly concerned with slum clearance, nevertheless you can render invaluable assistance by giving your support to those schemes which have for their objective the provision of alternative and better accommodation for the lower paid workers. It is fairly obvious that until adequate alternative accommodation has been provided the problem of demolishing unsatisfactory and insanitary dwellings will be a grievous one."

Lord Gorell, C.B.E., M.C., president of the Exhibition of Industrial Art in Relation to the Home, which is to be held at Dorland House from June 20 to July 12.

After a vote of thanks to the Prince had been made by Mr. J. R. Booth, of South Africa, the delegates adjourned to the various sectional meetings.

In the evening, the Congress reception and dinner were held in the Wharncliffe Rooms. Apart from the loyal toasts, no speeches were made.

Yesterday, the morning session was devoted to discussions on the "Economic Significance of the International Thrift and Home Ownership Movement," opened by Professor J. H. Jones, M.A., and "Home Ownership and International Relationships," opened by Herr Wilhelm Flatz.

The afternoon was devoted to excursions to Hatfield House and Welwyn and Letchworth Garden Cities. In the evening, the British Government reception to Overseas and British delegates took place at the London Museum, Lancaster House, S.W.

ADVERTISING EXHIBITION

The Hall of Success is to be one of the principal features of the Advertising and Marketing Exhibition, to be held at Olympia from July 17-22.

It will contain a display of certain products of manufacturers who can be regarded as the most successful in the trades in which they are engaged. It is proposed to include in the displays data which will demonstrate the evolution of these products and the methods by which they have been made pre-eminent.

MUNICIPAL OFFICES FOR LEICESTER

Leicester's application to borrow £126,479, for the building of municipal offices and electricity showrooms, has been sanctioned by the Ministry of Health. It is hoped to commence building at an early date.

£95,000 BOATING LAKE

A new boating lake, constructed at a cost of £95,000, was opened at New Brighton last week. The lake is part of Wallasey's £1,000,000 scheme to improve the eight-mile sea-front.

HOUSING CONFERENCE AT NOTTINGHAM

The East Midlands Housing and Town Planning Conference was held at Nottingham last week. Mr. G. A. Goodall (vice-chairman of the Nottingham Corporation Housing Committee) presided.

The chairman, in his opening address, pointed out that since the last conference a year ago the Government had shown a changed outlook regarding slum clearance, but there was still an immediate need for

vigorous and sustained action. Another problem, almost as acute as slum clearance, was that of normal housing. Married people were still living in rooms, although building costs were at the lowest level since the war, and private enterprise had been unable to do very much towards building houses at rents within the reach of the artisan classes. He hoped, therefore, that the Government would restore some of the facilities which would enable local authorities to deal with the situation.

Mr. Frank Elgood, F.R.I.B.A., opening a discussion on the Town and Country Planning Act, appealed for a general speed-up in town planning on the part of local authorities. At the present rate of progress, if the whole country was to be covered by town planning schemes, they would have to live four hundred years.

After a discussion on the Housing (Financial Provisions) Act it was decided to forward a resolution to the Ministry of Health calling for an amendment in the financial provisions of the Act, whereby local authorities would be entitled to the subsidy for providing disposed tenants with other accommodation.

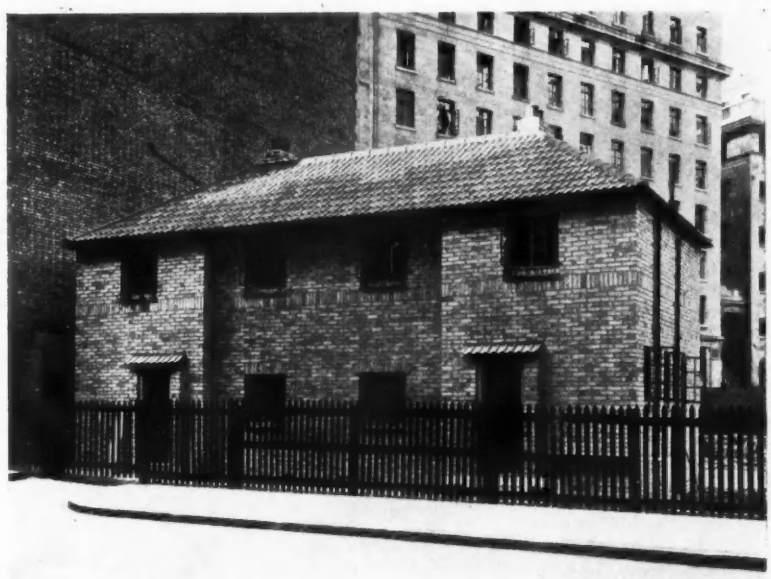
MANCHESTER REFERENCE LIBRARY

At a recent meeting of the Manchester City Council a suggestion that, as a matter of economy, someone already in the city's employ could advise as to the interior furnishing of the new Reference Library, was rejected. The Council unanimously agreed that Mr. E. Vincent Harris, F.R.I.B.A., the architect, should be allowed to direct this work. The architect has, however, renounced some of the fees he is entitled to draw for his advice in this matter.

NEW TOWN HALL FOR OLDHAM?

At a joint meeting of the Oldham Corporation committees, held last week, it was decided to recommend the Town Council to formulate a scheme immediately for a town hall and civic buildings on the Smethurst Street site, which is a slum clearance area. It is estimated that the scheme would cost at least £250,000.

MANCHESTER SOCIETY OF ARCHITECTS



At the annual general meeting of the Manchester Society of Architects, held in Manchester last week, Mr. J. R. Adamson, F.R.I.B.A., was elected president. Mr. Adamson is a member of the firm of Messrs. Bradshaw, Gass and Hope, of Bolton, and is the third member of that firm to be elected to this office.

In the annual report of the Council for 1932-1933 it is pointed out that the Council has supported a scheme for co-operation with house builders in the hope that an improvement might be made in the design of suburban houses. With this object a conference with representatives of the Builders' Association and the House Builders' Association was held in the Society's Rooms on February 24, 1933. As a result a committee has been appointed to arrange for a Competition for the purpose of obtaining panel designs suitable for use by speculative builders and others. Since the R.I.B.A. Conference the City Architect has published a pamphlet, which the Council trust may have the effect of producing economies and securing the erection of more suitable domestic buildings by private enterprise.

The Council also state that their representatives on the Civic Advisory Committee, of which Dr. Percy Worthington is Chairman, continues to do a considerable amount of valuable, if unostentatious, work for the amenities of the city.

The Society now comprises three hundred and eighty members.

COTTAGES IN THE STRAND

This pair of cottages, which won for their architect, N. E. Leeson, the first place in the Building Centre Competition, have now been erected on a site in front of Bush House, Strand, W.C. The opening ceremony is scheduled for Thursday next, June 15.

ARCHITECTURE IN NEW ZEALAND

The New Zealand Institute of Architects has under consideration certain activity in the direction of bringing before the general public the essential services which the architect has to render. The preparation of a booklet is now in the hands of a committee. It is to be hoped, states *The N.Z.I.A. Journal*, that the efforts so far made will bear fruit in some definite activity during the rest of the year. The Wellington Branch of the N.Z.I.A. suggest that one of the main objects of a public educative programme is that "every registered architect should associate himself with his work by placing his name on a sign on each of his buildings—small and large."

CHARTERED SURVEYORS' INSTITUTION

The Council of the Chartered Surveyors' Institution have awarded a Travelling Scholarship of £125 for one year to Mr. Alan Charles Golding, B.SC., P.A.S.I. Mr. Golding proposes, pursuant to the conditions of the scholarship, to travel in the British Isles, Denmark, Sweden, France, Italy and Germany for the purpose of investigating agricultural buildings and the capital equipment of farms and small holdings, and of preparing an ordered exposition of, and if possible of making an original contribution to, the existing knowledge on that subject.

COLWYN BAY PIER

The work of clearing the Colwyn Bay Pier of the mass of ironwork, which is all that remains of the pavilion after the fire, was begun last week. It is expected that the work will be completed within a month. A letter on this subject appears on page 753.

NATIONAL PHYSICAL LABORATORY

The annual reception at the National Physical Laboratory, Teddington, will be held on Tuesday, June 27, from 3 to 6 p.m.

CHANGES OF ADDRESS

Messrs. Wallis, Gilbert and Partners, Chartered Architects, Surveyors and Engineers, have removed their offices to Coastal Chambers, 15 Elizabeth Street, Buckingham Palace Road, S.W.1. Telephone Nos. 2257 (3 lines).

Messrs. W. G. Wilson and Son, F. and A.R.I.B.A., have removed to new offices at 14 Dean's Yard, Westminster, S.W.1. Telephone No. : Victoria 4120 (as before).

ARCHITECT'S WILL

Sir John William Simpson, K.B.E., P.-P.R.I.B.A., whose death took place last March, left £9,564 (net personalty £7,720).

R. I. B. A.

THE NEXT MEETING

On Monday, June 12, 1933, at 8 p.m., a general meeting will be held for the purpose of receiving the Scrutineers' Report on the annual elections of the Council and Standing Committees.

At the close of the general meeting a special general meeting will be held to confirm the resolutions passed at the special general meeting held on May 22, amending Bye-law 28(j).

This will be followed by an informal and private discussion on matters of current professional interest or concern.

A DANCE

A dance arranged by the R.I.B.A. Social Committee will be held in the R.I.B.A. Galleries, 9, Conduit Street, W.1, on Monday, June 26, from 9 p.m. to 1 a.m. Tickets, price 6s. each, can be obtained from the Secretary, the R.I.B.A., or through any member of the Institute. The price of the tickets includes light refreshments.

COUNCIL MEETING

Following are some notes from a recent meeting of the Council of the Institute :

The Old Ashmolean Museum : Mr. Sydney Kitson, Hon. Secretary, R.I.B.A., was appointed to represent the Institute at the 250th Anniversary of the opening of the Old Ashmolean Museum.

The Scottish Architecture Medal : Mr. T. R. Milburn (F.) was appointed as the R.I.B.A. representative on the Jury for the award of the Scottish Architecture Medal, 1927–1932.

Nineteenth Annual Conference of the National Association for the Prevention of Tuberculosis, Cardiff, July 13 to 15, 1933 : Mr. W. A. Pite (F.), was appointed as the R.I.B.A. delegate at the above Conference.

Forty-fourth Congress and Exhibition at Blackpool of the Royal Sanitary Institute : Mr. F. M. Wilding (L.) was appointed as the R.I.B.A. delegate at this Congress.

Board of Architectural Education of the Royal Victorian Institute of Architects : Mr. Leighton F. Irwin (F.) was appointed as the R.I.B.A. representative on the Board of Architectural Education of the Royal Victorian Institute of Architects in the place of the late Mr. Rodney H. Alsop.

Standardization of Water Closets and Lavatory Basins : Mr. F. R. Taylor (L.) was appointed to represent the R.I.B.A. at a conference called by the British Standards Institution to consider the question of the standardization of water closets and lavatory basins.

The Social Committee : Miss G. M. Leverkus (F.) was appointed as an additional member to serve on the Social Committee as a representative of the Women Members Committee.

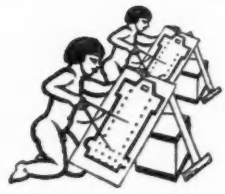
Legal Advice for Members of the R.I.B.A. : The Council approved a scheme submitted by the Practice Standing Committee for the provision of legal advice at moderate fees for members in regard to matters arising in their practice.

Nomination of Honorary Auditors for 1933–1934 : Mr. E. J. W. Hider (F.) and Mr. J. Maclaren Ross (A.) were nominated as Honorary Auditors for the Session 1933–1934.

The Fellowship : The Council, by a unanimous vote, elected the following architect to the Fellowship under the powers defined in the Supplemental Charter of 1925 : Mr. Vincent Kelly, B.ARCH., F.R.I.A.I. (Dublin).

Reinstatements : The following ex-members were reinstated : As Licentiates : Captain Charles Thomas Morris Evans, R.E., and Messrs. Sydney Rhys Crocker, and George Holmes.

Transfer to the Retired Members Class : The following members were transferred to the Retired Members Class : As Retired Fellows : Messrs. Edwin Thomas Johns and Samuel Hurst Seager. As Retired Associate : Mr. John Reginald Best.



Resignations : The following resignations were accepted with regret : Frank Stephen Reynolds (F.), Milton Botting (A.), Doris Silcock (*née* Musker) (A.), John Rowland Fairbairn (L.), John Frank Johnson Goodacre (L.), Edward A. B. Hay (L.).

Election of Students : The following Probationers were elected as Students of the R.I.B.A. : Nathaniel Gordon Abercrombie (University of Cambridge) ; Walter Warne Atkinson (Northern Polytechnic) ; Hugh Maxwell Casson (University of Cambridge); William Halkerston (Robert Gordon's Colleges, Aberdeen) ; Ernest Dennis Jordan (Leicester College of Arts and Crafts) ; Samuel McHarg (Glasgow School of Architecture) ; Victor James Sargison (Special Exemption) ; Roderic Walter Voller (Special Exemption) ; Alexander Abercrombie Wilkie (Glasgow School of Architecture) ; David Marshall Millwood Wilson (University of London) ; John Pearson Worrow (Architectural Association).

Vincent Kelly, B.Arch.(N.U.I.), F.R.I.A.I., the architect member of the Committee of Reference set up to advise the Irish Minister for Justice on the allocation of the moneys for voluntary hospitals from the sweeps. He has just been elected a Fellow of the R.I.B.A., at a meeting of which he is to lecture on hospitals.

COMPETITION NEWS

COMPETITION RESULT

Mr. R. H. Gibson, P.R.U.S.A. has made his award in the competition for a town hall at Portstewart, Co. Londonderry, Ireland, as follows : First prize (£52 10 0) Mr. Benjamin Cowser, A.R.I.B.A., of Belfast. The competition was limited to architects practising in Northern Ireland.

SURBITON HOSPITAL

Mr. C. Ernest Elcock, F.R.I.B.A., the assessor in the Surbiton Hospital competition, has now issued his replies to competitors' questions. These, about a dozen in all, have been circulated to the competitors. The assessor points out that the replies now form an integral part of the conditions of the competition, and no further questions will be answered.

STOCKHOLM COMPETITION

Owing to the large number of schemes submitted in the competition for a town-plan for the part of Stockholm called Lower Norrmalm, it is understood that the result will not be announced until August. Each scheme is being carefully analyzed by the authorities concerned.

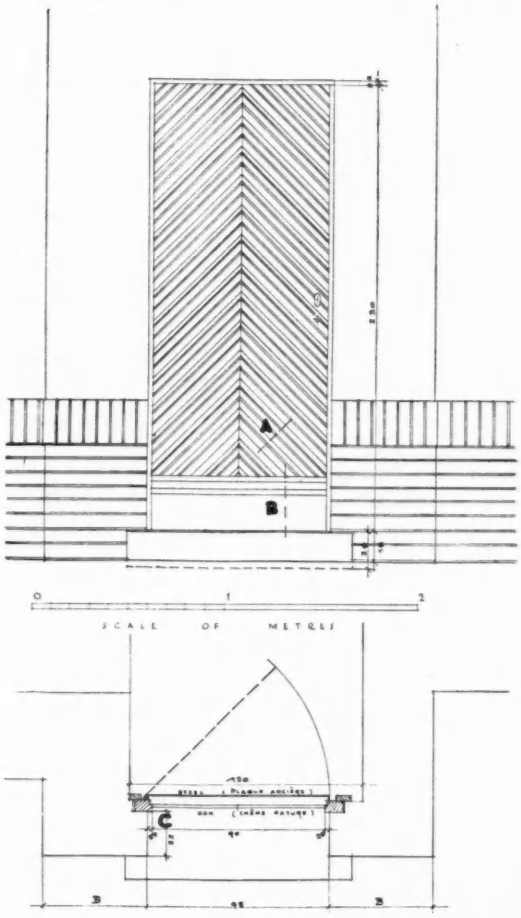
Competitions Open

September 1.—Sending-in Day. Proposed Hospital at Surbiton. Assessor : C. E. Elcock, F.R.I.B.A. Premiums : £120, £75, £50 and £25. The conditions, obtainable from A. C. C. Dunn, Hon. Secretary, Surbiton Hospital, St. James's Road, Surbiton, were reviewed in *A.J.* for May 24.

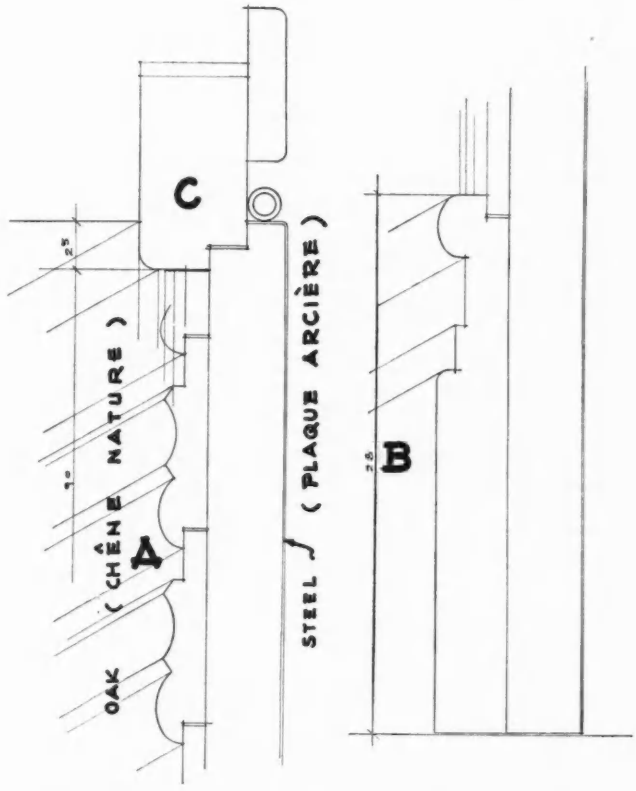
September 21.—Sending-in Day. Proposed Town Hall for the Borough of Hornsey. Assessor : C. Cowles-Voysey, F.R.I.B.A. Premiums : £350, £250 and £150. Full conditions, etc., were published in our issue for May 17.

Competition Pending

Proposed New Council Offices to be erected at Salt Hill for the Slough U.D.C. Assessor : H. S. Goodhart-Rendel, F.R.I.B.A. Premiums : £150, £100 and £50. Conditions have not yet been drawn up.



Proposed Municipal Sanatorium and Craymount Children's Hospital, Belfast. Limited to architects practising in Northern Ireland. Assessor : R. S. Wilshere, A.R.I.B.A. Conditions are now being drawn up by the assessor.



Proposed Municipal Offices and Extension to the Library and Electricity offices for the Metropolitan Borough of Stoke Newington. Conditions have not yet been drawn up.

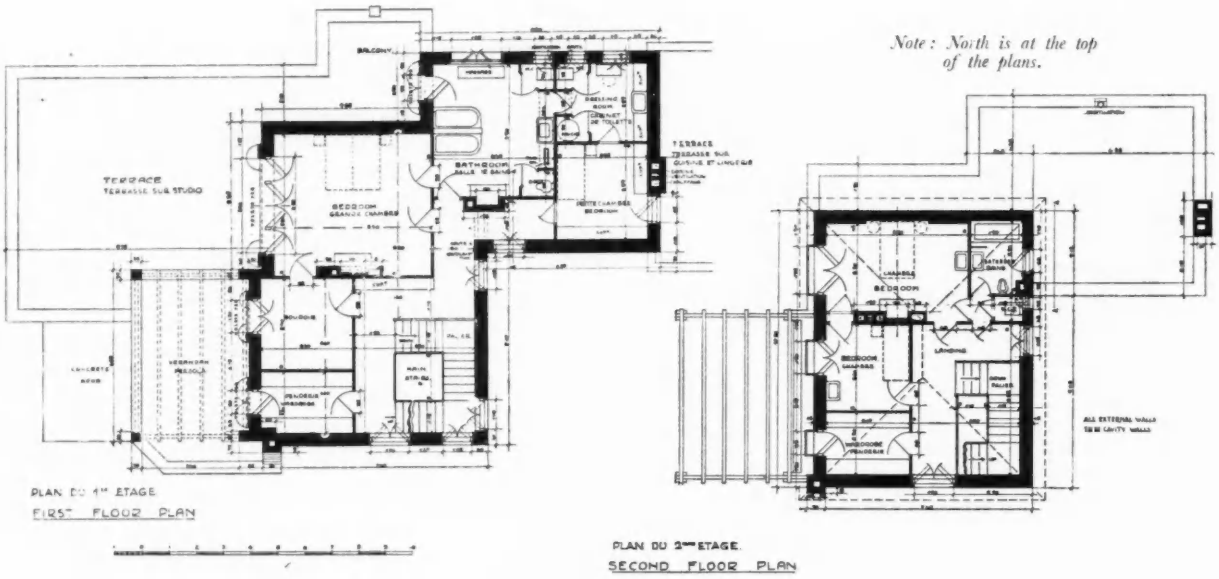
ON THE AIR

On Tuesday next, June 13, the ninth of the series of talks on "Design in Modern Life" will be broadcast in the National Programme at 8.30 p.m. by Messrs. Robert Atkinson, F.R.I.B.A., and John Gloag, who will discuss "Public Buildings."

COUNTRY HOUSE AT ST. CLOUD

DESIGNED BY

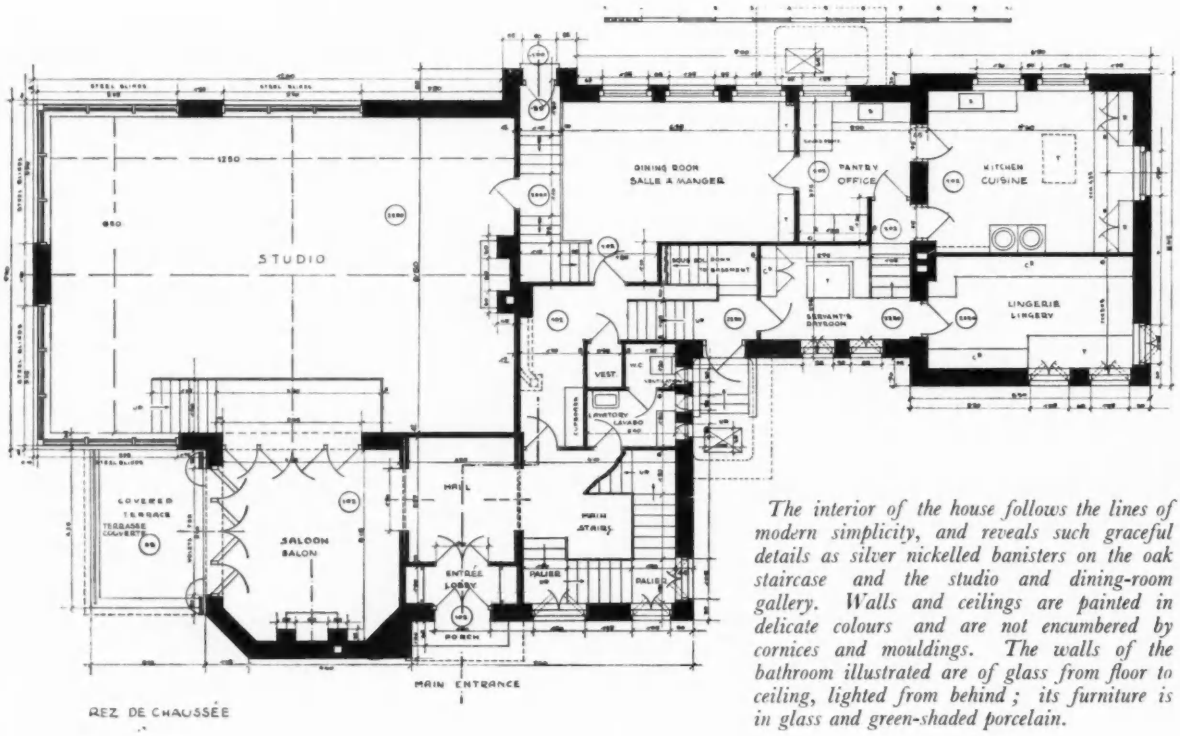
The villa of which plans appear overleaf was built for Count Paul de Vallombrosa on a hill which rises from the Seine at St. Cloud to the links of the Golf de St. Cloud, offering a wide view over the Bois de Boulogne and the whole of Paris. The slope has been put to advantage in the planning of the ground floor, by bringing the level of the large studio, its main feature, on to a lower level than the rest, thus achieving a height proportional to the dimensions of this room, of which the landing and staircase from the little salon form an attractive feature. Consequently, the entrance-hall, with the adjoining salon, and the staircase-hall, are on the same level as the right wing of the building, which contains dining-room and kitchen quarters, giving the servants' rooms in the basement the character of a ground floor in relation to the lower point of the slope.



Large terraces are placed to the north of the studio; these again have a full view over Paris. The large windows, which almost form the walls on three sides of the studio, can be sunk into the basement by means of electric motors, thus transforming the studio into a covered terrace.

All technical details have been carefully considered in the light of the character and possibilities of the materials employed. The outside doors, details of one of which, opening from the north terrace, are shown above, are of oak, and their lively design presents an effective contrast with the smoothness of the walls, which are of light facing bricks, and white cement rendering over reinforced concrete.

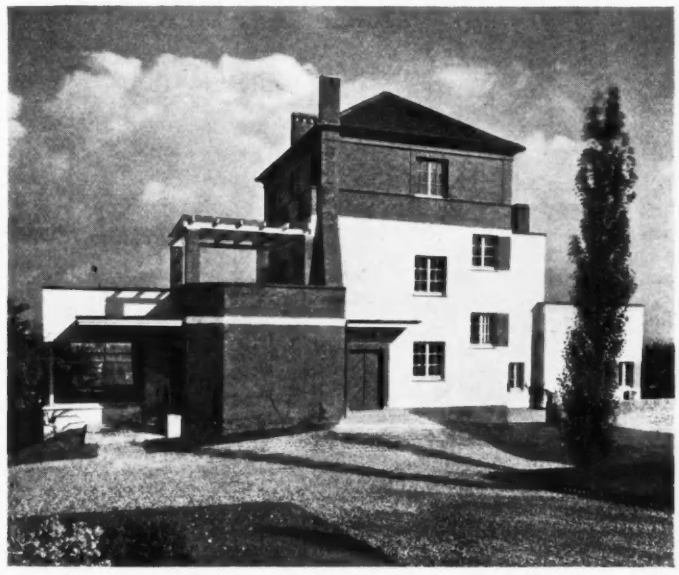
MICHAEL ROSENAUER



COUNTRY HOUSE AT ST. CLOUD

Note: North is at the top of the plans.

All the first-floor rooms lead out to large terraces, built over parts of the studio on one wing and over the kitchen quarters on the other. The parapets of the terraces are arranged with flower beds, from which flowers and creepers hang over the outside walls. The main terrace is partly covered by a flower pergola.



The second floor contains two guest-rooms with bathroom. Only this portion of the building is covered with a tiled roof; all other parts are finished with terraces. The composition of the building masses is in harmony with the rhythm of the hilly surroundings, and the treatment of the elevations aims at avoiding any sign of heaviness. Extremely modern constructions, as, for instance, the large windows which avoid even corner pillars, and have only the steel frames for the sliding panes, are reconciled with the use of materials, like bricks, not new in the construction of domestic buildings.

The interior of the house follows the lines of modern simplicity, and reveals such graceful details as silver nickelled banisters on the oak staircase and the studio and dining-room gallery. Walls and ceilings are painted in delicate colours and are not encumbered by cornices and mouldings. The walls of the bathroom illustrated are of glass from floor to ceiling, lighted from behind; its furniture is in glass and green-shaded porcelain.

DESIGNED BY MICHAEL ROSENAUER

LIVERPOOL'S TWO CATHEDRALS

[*By Our Special Correspondent*]

UNIQUELY favoured among cities, Liverpool now has two great cathedrals building. To the Anglican, designed by Sir Giles Gilbert Scott, a Roman Catholic, the Roman Catholic, designed by Sir Edwin Lutyens, a Protestant, was added on Monday last, when the foundation stone was laid by the Archbishop of Liverpool, Dr. Richard Downey, in the presence of two cardinals, forty bishops, over a thousand clergy, the Lord Mayor of Liverpool, the Mayors of seven towns, and a crowd of 30,000.

Sir Edwin, who attended in the red robes of an honorary LL.D. of the University of Liverpool, designed and presented to Dr. Downey the diamond-fitted *culter* with which the latter marked the sign of the cross on the foundation stone's six sides, and stood at his side as the stone was placed within a three-ton block of granite and lowered into the earth.

The two cathedrals will crown the summits of steep hills within a mile of each other. The Anglican already dominates the town and the river. The Catholic will do the same, upon a site claimed to be the best cathedral site in the world. Sir Giles Scott's building rises out of a tree-filled cemetery and is flanked for the most part by terraces of fine houses. Sir Edwin's adjoins the University. Liver-

pool's Bloomsbury is behind it and the city's Jewish quarter below, down Brownlow Hill. In this neighbourhood also are some good streets—somewhat disfigured by decay.

When the Catholic Cathedral will be finished none can say. Sir Edwin estimates that it could be completed in 20 years if the necessary £3,000,000 were in hand. Its area will be four times as great as St. Paul's, and it will have the biggest dome in the world. It will be easily the largest cathedral in England, and though it will be 24 feet shorter than St. Peter's, Rome, with a nave only just over half as wide, it will exceed St. Peter's in the height of both the nave and the surmounting cross.

Building will begin with the West side and the four crypt churches, the Lady Chapel and the Chapel of the Blessed Sacrament. On the exterior, brick, mostly hand-made in England, and granite will be used, and on the inside travertine. The raised portions of the interior will be of marble and the nave will be floored in cast iron. The lighting will probably be by candles.

Sir Edwin has described his design as "Roman Wrenaissance," with a modern use of rectangular masses. Dr. Downey—who, by the way, has several times been the guest of the Liverpool Architectural Society at their meetings and a speaker at their annual dinner—speaks of the Cathedral as "expressive of the spirit of our own age, yet comparable in design and execution with the great Gothic masterpieces of the twelfth and thirteenth centuries."

Monday's ceremonies mostly took place at the temporary high altar (illustrated in the JOURNAL last week), which is temporary only in the sense that it will, after many years, be superseded by the high altar of the growing Cathedral. On its columns are emblazoned the arms of the bishops of the Suffragan Sees of Hexham and Newcastle, Lancaster, Leeds, Middlesbrough and Salford, in recognition that the cathedral is not for the Archdiocese of Liverpool alone, but for them also and for the whole Northern Province and the Metropolis of Liverpool.

The altar contains 60 tons of steel, and is 90 feet high to the crowning figure of Christ the King. At the four corners, above the columns, are life-size plaster figures of the four Evangelists. The baldachino the columns support is in the form of conventionalized hanging curtains of hemlock wood, painted in a diaper damask pattern, with plated aluminium lining soffits and emblematical medallions and symbolic painted panels at the sides. The altar is protected on three sides by glass screens.

ARCHITECTURE AS A TRADE

[*By ICONOCLAST*]

2. Charges

[*In the introduction to this series of articles, printed in last week's issue, Iconoclast—the chosen pen-name of a well-known architect—defined his standpoint. It is that architects do, in point of fact, work primarily for a living. He frankly reduces architecture to the common business denominator and applies to it the common commercial creed. His object is, of course, to suggest reforms which, in his view, would tend to make the practice of architecture a paying concern. Below he grasps the thorny question of fees. We do not necessarily agree with every point Iconoclast makes; nor may the reader. But all should find his arguments stimulating.*—ED., *A.J.*]

THE climax in an orgy of professional vulgarity is the question of money, and the inevitable starting post the scale of charges. During recent months the profession has considered this matter in some detail, and the decision seems to be that the scale should stand. The reason generally put forward for this manifestation of inertia is that although it is admittedly imperfect, it is better than most alternatives; which is really no reason at all.

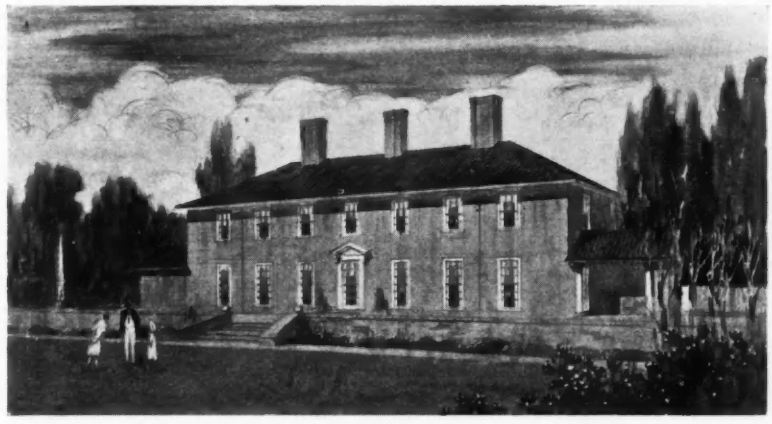
Let us deal first with the basic fee of 6 per cent., which was raised from the 5 per cent. mark shortly after the war. There was never any real justification for this increased rate, because, at the time it was altered, the cost of building had increased well beyond the cost of living increase, as compared with pre-war levels, and architects were thus receiving an automatic increase of remuneration with no increase in the basic rate.

But, as business men, we are naturally entitled to charge what the public will pay for our wares, so long as we are sensible enough to fix our price list within the limit beyond which our trade is checked on account of price. It seems obvious that in raising the level to 6 per cent. this limit was passed, for there is no doubt that since that time there has been a vast increase in the amount of domestic work of the £1,000 and upwards size carried out without the assistance of an architect, which was almost invariably sought in similar circumstances before the war. Also there has been an equally marked increase in permanent architectural establishments run by estates, commercial firms, and banks, etc., which suggests that in some minds the architect's office is too dear a shop; while other firms, with a more or less continuous flow of jobs, frankly refuse to pay the practising architect more than 5 per cent., a fee which he generally accepts quite profitably.

But, lest this may seem to be quibbling over a paltry 1 per cent., let us admit that the nice round figure of 5 per cent. has a prettier appearance than the unusual 6 per cent. Six per cent. is a vague proportion which seems to be well on the way to one-tenth of the cost, and at the threshold of substantial proportions. Five per cent., on the other hand, is an easily assessed value which the man in the street can reckon at one shilling in the pound. Thought of in such terms, it is not a formidable figure, taking more the flavour of an incidental expense than the addition of a capital outlay. The psychology of this datum is well worth consideration, and architects would be more likely to gain in turnover than lose job by job if this simple reversion to an old-established custom were officially blessed.

Another material for irritation as between client and architect is the question of expenses, an indeterminate item which varies widely between the customs of one architect and another upon identical tasks. The recoverable expenses, faithfully recorded down to the last penny postcard, may be much or little, but as an addition to a percentage charge, understood or agreed, they open the door to a sense of grievance with very little reason in the average case. It would be far better if architects would agree to let their percentage charge cover all incidental and out-of-

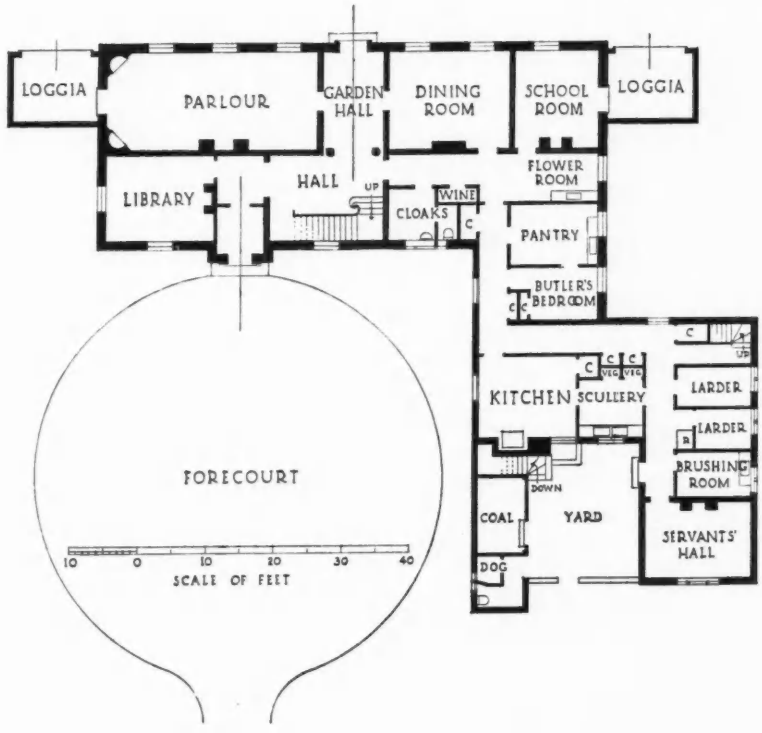
pocket expenses other than unusually heavy items which any reasonable client would accept. A man could then be definitely told what his inclusive commitment was to be at the outset.



We now turn to the matter of variations and extras. It is surely a defect of the scale system that an architect should stand to profit by an inflated builder's account, or be penalized for economies he may be able to make during the course of the job; yet this is exactly the effect of the operation of the scale of charges on a percentage basis. Give the average architect his due, and admit that these considerations do not affect his outlook upon the deal; there is yet material for an undercurrent in the mind of his client, which may to some extent, great or small, colour his reception of his architect's advice. If it were possible to remove this defect the system of charging would be much improved, and it is not so formidable a task as it may appear. A reasonable suggestion would be that, having explored the scope of a contract, an architect would not be buying too big a pig in a poke if he consented to base his fees on the contract price as a lump sum figure which should not be adjusted on settlement figures unless variations exceeding, say, 15 per cent. of the contract had occurred. In this way we should be free to advise convincingly a limited extra outlay or a limited value of economies without appearing to grind any axe but our clients'.

The opponent to change in any old-established custom will probably cite a hypothetical case to show how this will ruin the architect. He will suggest, say, a £10,000 job, upon which there has been a further £1,500 worth of authorized extras. He will say that, under the existing scale, the architect would receive £690 in fees, plus probably £50 in expenses, making a total of £740. Under our present suggestions he would receive £500, or nearly a third less, and our critic will say, not without reason, that the architect of today cannot afford to forgo one-third of his income.

We are, of course, discussing the matter as tradesmen, and it is obvious we are not going to sell our goods for £500 if we can get £740 for them, *unless* our trade is likely to increase under the stimulus. The submission in these notes is that it is likely so to increase. These simple reforms and substantial concessions are just the sort of things that are likely to appeal to business men if carried out and made known, and there are few architects who would not prefer to build two jobs for a £500 fee each than one similar job for a £750 fee. There would be a certain decrease in the number of architectural salaried establishments if the cost of architecture were thus reduced to moderate and simple terms.



Here, at any rate, is a good trading move, suggested not without considerable thought, which is calculated to give a fresh impetus to a more general use of the architect's shop.

A HOUSE AT WILLINGDON

DESIGNED BY E. GUY DAWBER

"Ratton Wood," Willingdon, Sussex, of which a perspective drawing by P. D. Hepworth is reproduced above, is now in course of construction. The walls are carried out in old Sussex stocks from Turner's Hill; and the roof is covered with Italian pipe tiles. The principal rooms occur on the garden front, the three windows seen to the right of the central door lighting the parlour; they are balanced by those of a dining room and a schoolroom. The main entrance, with staircase hall and library, is on the other front of the house; the service quarters are isolated in a wing of their own.

RISHWORTH SCHOOL, HALIFAX, YORKS. :

Rishworth School was founded in 1724. It is situated upon the eastern slope of the Pennine Range, at the foot of the moorland. The old buildings, dating from 1828, have accommodation for 84 boys, and the recent additions increase this to 140. The new building is detached from the old, the space between giving access to the old and new quadrangles on the westerly side.

The external walls are treated similarly to the old walls and are faced with local delph-dressed sandstone, with dressings of white ashlar from the Clock Face Quarry nearby; the roofs are covered with blue Welsh slates and the woodwork generally is of red deal. The floors are of hollow block reinforced concrete, finished with composition to the dining rooms and dormitories, granite to the corridors and offices, and wooden blocks to the classrooms, laboratory, etc.

The necessary extra height of the gymnasium is obtained by the falling site, and the larger windows thereby obtained are fitted with steel casements opening the whole area, thus forming an open-air gymnasium for summer time. The floor is of narrow maple boards upon wooden joists. All other windows are sliding sashes of wood. The assembly hall is panelled to a height of 7 ft. with Japanese oak, a gift from the old boys in memory of a former head master.

The work was carried out by separate tradesmen at a cost of £14,550, exclusive of furnishing; the total cost is about £20,000.

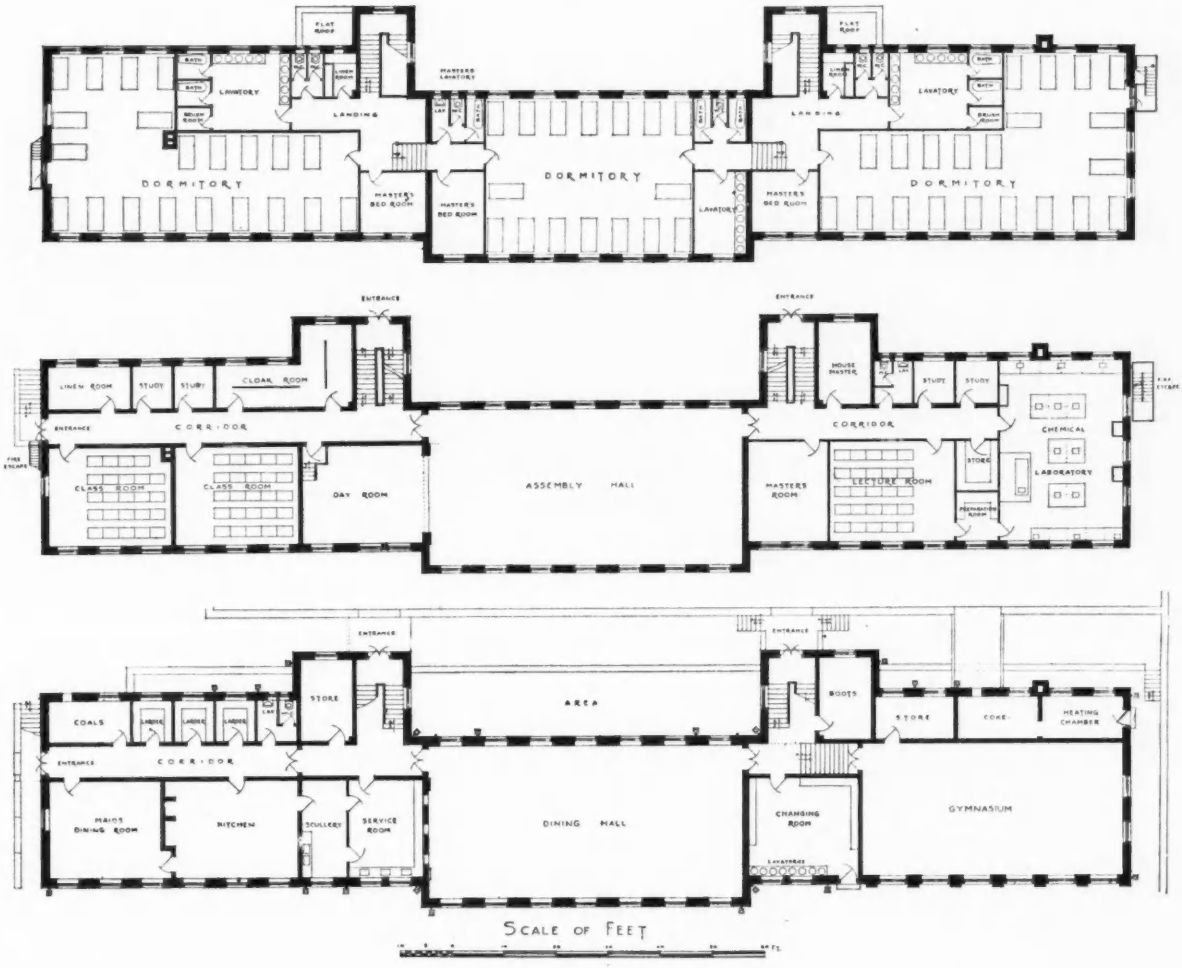
LETTERS FROM READERS

R. S. REDWOOD, A.R.I.B.A. (Hon. Secretary, Bristol Society of Architects)
W. H. ANSELL, F.R.I.B.A. (Chairman, Statutory Board of Architectural Education)
J. B. D. (F.R.I.B.A. Retired)
T. RUELEIGH MODERN
JULIUS P. HARDACRE

Architects' (Registration) Act, 1931

SIR,—The leading article in the JOURNAL for May 24, entitled, "Registration: Do it now," urges upon architects the advisibility of making application for Registration before the end of this year. One argument advanced is that after December 31 applicants will be obliged to pass an examination approved by the Statutory Board of Architectural Education.

May I direct your readers' attention to a statement upon the Act made by the Secretary of the R.I.B.A. Registration Committee published in *The R.I.B.A. Journal* for August 8 1931, and previously in *The Times* for August 4, 1931? This statement contains the following paragraph:—



"The nature of the Act is permissive, and no one need seek registration unless he desires to do so, as the title 'Architect' may continue to be used by any person. The Act restricts the title 'Registered Architect' to registered persons, but its use by them is not compulsory." These words are correct in their suggestion that there is no connection between the voluntary Register set up by the Act and the legal status of a qualified architect.

Moreover, in a recent statement by the Statutory Board of Architectural Education, it is made clear that the recognition of Fellows, Associates and Licentiates of the R.I.B.A. will be retrospective. Thus, if a now qualified member of the Institute chooses to delay his application for registration until 1934 his Institute status will still gain his admission to the Register.

Your article proceeds to urge the wider claims of Registration and states that "as time goes on, the practice of architecture will be almost entirely in the hands of properly trained men, and that in measure as the idea of registration penetrates the common intelligence the increasing supply of trained men will find a widening sphere of practice." But the suggestion that registration will increase professional prestige is erroneous, since Section 17 of the Act provides that commercial bodies, corporate firms and partnerships may carry on the business of architecture under the style or title of "registered architect" by the simple expedient of employing the managing services of a registered person (of either sex).

So far, therefore, from enhancing the status of a professional architect, registration and its corollary, the use of the title "registered architect," is likely to be misleading and derogatory, unless

NEW WING: BY WALSH AND MADDOCK

accompanied by a necessary but undignified disclaimer of commercial connection.

R. S. REDWOOD

Mr. W. H. Ansell, Chairman of the Statutory Board of Architectural Education, writes:

SIR,—The statement in the fourth paragraph of the letter from the Hon. Secretary of the Bristol Society of Architects, which, by your courtesy, I have been allowed to see before publication, is incorrect. The only statement ever issued by the Statutory Board of Architectural Education on the subject of approved examinations gave a list of the examinations recognized as a qualification for registration under Section 6 (1) (c) of the Act and announced that the recognition of these examinations would be retrospective.

The R.I.B.A. Final and Special Final Examinations and certain examinations at the Schools of Architecture recognized for exemption from the R.I.B.A. Final Examination are included in the list, but Fellows, Associates and Licentiates of the R.I.B.A. will not, after December 31, 1933, be eligible for registration unless they have passed or do pass one of the approved examinations. Under the provisions of the Act R.I.B.A. status alone does not and will not gain anyone admission to the Register.

W. H. ANSELL

Concert Hall at Colwyn Bay

SIR,—You may have heard that, about a week or two ago, the concert hall at the end of the pier at Colwyn Bay was destroyed by fire.

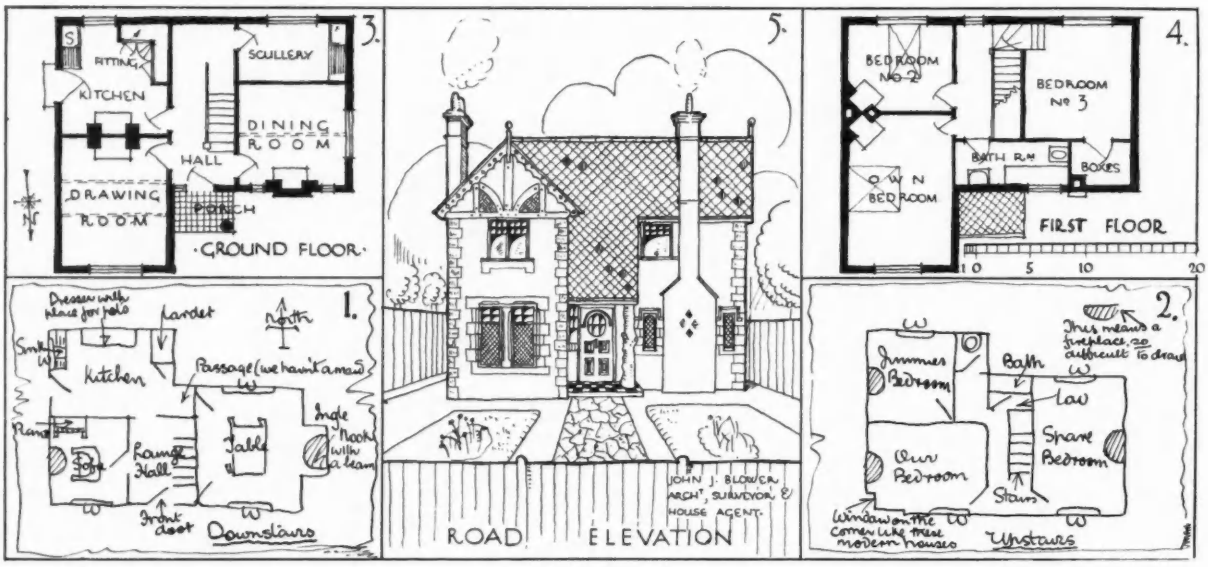
It is reported that messages of sympathy from many quarters have been received by the Urban District Council, but to my mind (except for the Insurance Company) this is not an occasion for sympathy but for congratulation.

For about 35 years this vulgar erection has been a blatant eyesore in the quondam beautiful bay.

It was destroyed by fire in 1922, and at once rebuilt, so this is the second fire they have had.

Evidently the thing was abhorrent to nature.

I hear that steps are being taken again to rebuild it, but I hope that wiser counsels may prevail, and if they want a concert hall in Colwyn they will build one in its proper place on the shore and not on grimcrack stilts in the midst of the sea.



I should be interested to know what you think about it.

J. B. D.

Inigo Jones's Headpiece

SIR,—It has been suggested that Inigo Jones is out of date. I agree. And what is more, I have gone to the trouble of offering up for general approval alternatives more in keeping,

A HOUSE BY JOHN J. BLOWER

A correspondent, in a letter on this page, suggests that this house is one of the architect's "greater triumphs." Figs. 1 and 2 show the client's sketches of her requirements; and Figs. 3, 4 and 5 are the architect's ground and first floor plans, and the main elevation of the house as built.

as Mr. Elsley remarks, with the dynamic cheerfulness of your JOURNAL which I feel sure, Sir, must be its own reward.

The first is intended to portray a very

keen modernist in the act of thinking very functionally, but on looking at it again it reminds me of Jack Hulbert, and I didn't intend it to be modern in that way.

I have therefore in the second roundel tried to concentrate upon the

note of cheerfulness, only to find, as you will possibly agree, that this quality seems to typify a less distinguished type of man than I had originally in mind.

I fear, Sir, that I have failed in what I set out to do, but, remembering this to have been the lot of men more brilliant than myself, I submit my honest effort for the approval of yourself and posterity, that will idly turn these pages in a more aluminium age than this.

T. RUELEIGH MODERN

The Work of John J. Blower

SIR,—I have noted with increasingly great interest the appearance in your JOURNAL of examples of the work of John J. Blower.

As an intimate friend and erstwhile colleague of this eminent architect, may I bring to the notice of your readers one of his greater triumphs?

I enclose with this letter copies of various drawings which will, I am sure, amply illustrate the ease and skill with which this genius overcame an enormous problem in domestic house design. I have numbered the plans for greater clarity.

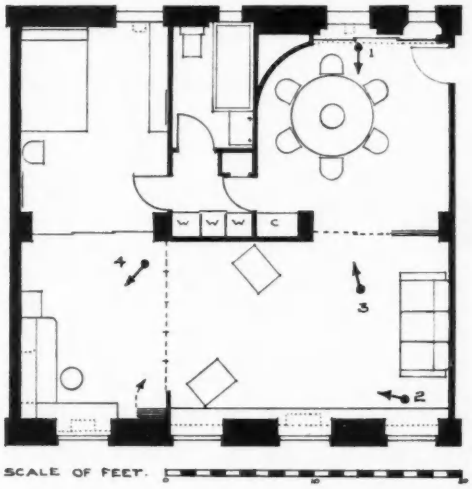
The drawings 1 and 2 are copies of sketches sent to Mr. Blower by a lady of wealth and position who instructed him to draw out the plans of her proposed villa for the builders. Mr. Blower, having scrutinized these, found them lacking in taste and refinement and proceeded to redesign the house on a labour-saving basis, at the same time producing an elevation in the neo-Tudor style.

The fire of his genius and unremitting labour resulted in the truly noble design shown on drawings 3, 4 and 5 which will speak for themselves and need no praise from me, except to draw attention to the masterly way in which the Rustic order of the porch has been combined with the modern decorative feature on the chimney stack.

At one time I feared that the publication of this design might tempt unscrupulous members of the profession. I now know that no right-minded architect would ever copy a design which so definitely bears the hall-mark of that master, John J. Blower.

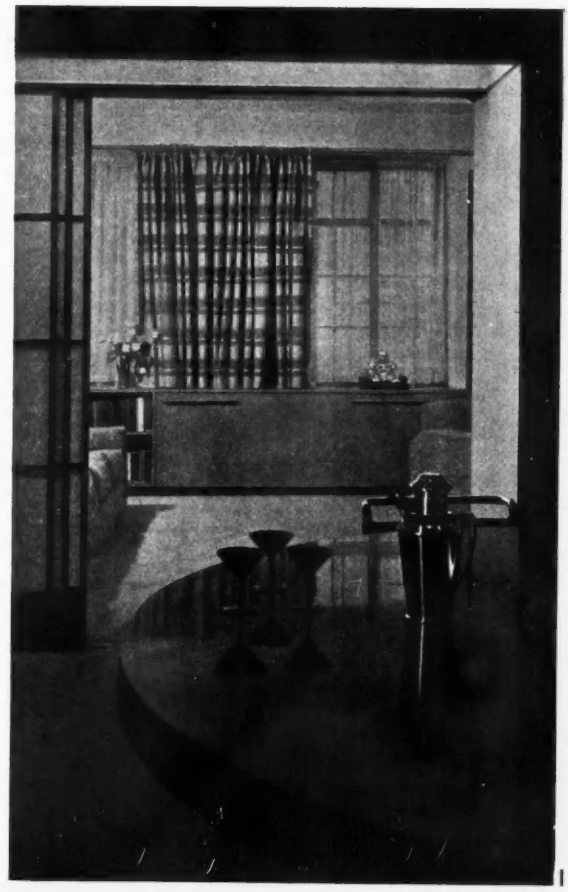
JULIUS P. HARDACRE

IN PARLIAMENT



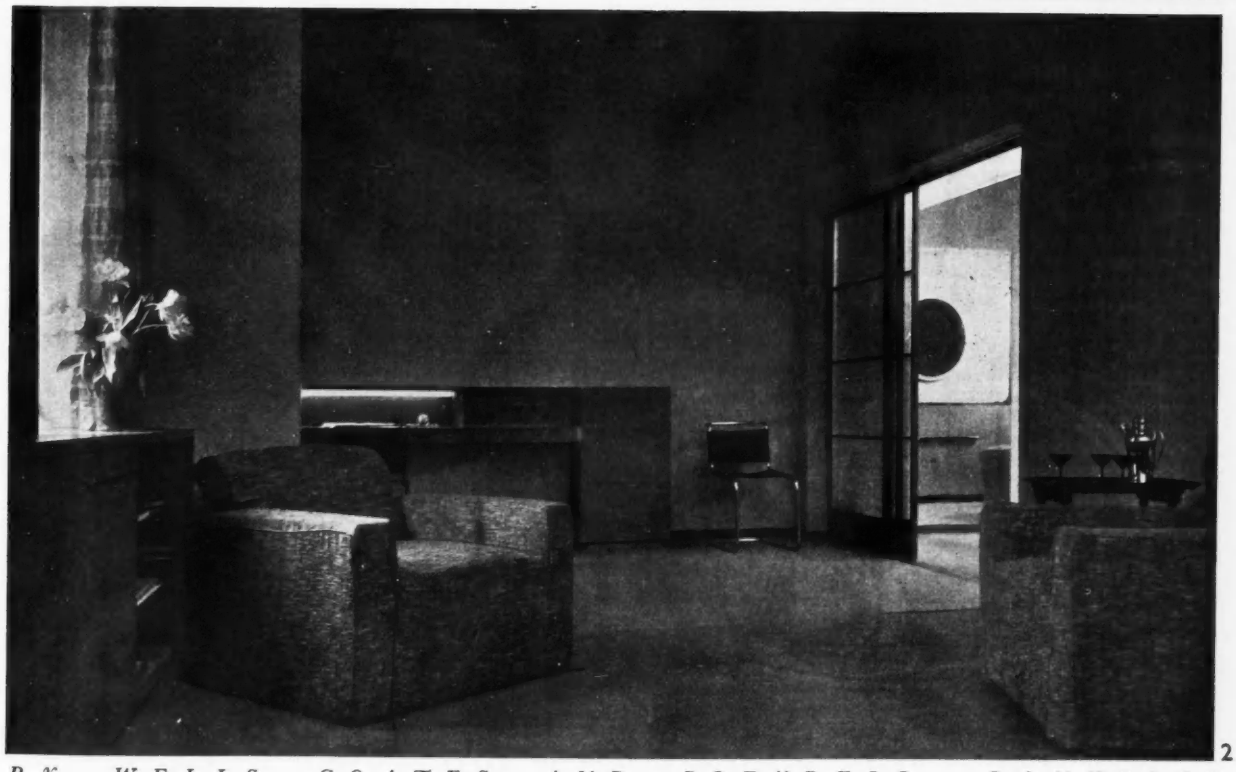
[BY OUR SPECIAL REPRESENTATIVE]

Prices of Building Materials



MR. Hicks asked the Minister of Health whether, having regard to the increased activity in the erection of working-class dwellings which he expected to ensue from the passing of recent legislation, he had conferred, or would confer, with the President of the Board of Trade, with a view to having an inquiry made, by means of the existing inter-departmental committee on the supply and prices of building materials or by other appropriate means, as to the adequacy of supplies available of materials likely to be required in the near future, to the end that there might be no undue delay in any schemes which might provide employment for the building trade operatives now unemployed.

Sir Hilton Young said at present he had no reason to suppose that such a special inquiry as was suggested would be useful. He had already arranged that the Committee on Prices of Building Materials should keep him closely informed of any changes in the conditions in the building trade.



A RECONSTRUCTED SERVICE FLAT

The whole area of the four rooms has been treated as one, divisible at will by movable screens. The view-points of the photographs are indicated by arrows on the plan. View (1) is taken looking from the dining room, through sliding screens of cedar-wood and shantung silk, to the living room proper; the mahogany panel under the window drops to reveal a model electric railway. View (3), overleaf, is of the dining room table; it is veneered with English burr walnut, has a central illuminated panel of green rough-cast glass, and a bronze-faced pedestal. The room has tubular steel chairs, finished in polished and lacquered copper, with green hide seats and backs. The screen behind is illuminated. View (2) shows the study, with the sliding screens to the bedroom visible on the right. Fitted wardrobes (W on the plan) are built into the reconstructed central wall.

ENGLAND'S SMALLEST CHURCH?

Culbone, near Porlock, Somerset. This little church, claimed by Mr. Philip J. Turner to be the smallest in England, is situated near the bottom of a lovely wooded combe running down to the Bristol Channel. In the centre of the churchyard are the remains of the old cross. St. Culbone crossed over the Channel from Wales in the sixth century and the walls of the church are undoubtedly of early Saxon times.

LITERATURE

PARISH CHURCHES

Parish Churches of Rural England. By Philip J. Turner, F.R.I.B.A., F.R.A.I.C. McGill University Publications (Series XIII, Art and Architecture.) Reprinted from *The Canadian Geographical Journal*, December, 1931.

MR. PHILIP J. TURNER strikes a welcome note on the first page of his brochure *Parish Churches of Rural England*. While in no way minimizing the claims of the great churches, where "the craftsman was given every opportunity to rise to the heights of his genius," he stresses the loss of those who overlook the many beautiful village churches, which have a story all their own, and tell of the lives and customs of the people who created them.

It is just this appreciation of architecture in its relation to human life that makes the charm of what Mr. Turner has written. At the same time his technical knowledge is evident, and the success of his work is enhanced by excellent photographs well selected, and by his clear and readable style.

Selection is difficult, but special interest attaches to the church of Culbone, Dorset, said to be the smallest in England; Lavenham, with the finest—but not necessarily, to all, the most attractive—tower in the country; St. Mary Magdalene's, Launceston, impressive, and a "good example" of several features, desirable and otherwise; Beaminster, typical of the parish church dominating the mediæval village; and Sandon, Essex, showing how effectively bricks could be used where stone was not to be had.

Mr. Turner rightly calls attention to the importance of roofs as an unrivalled feature of English churches, and his lament concerning the depredations of the death watch beetle on the old oak of which these roofs are frequently made should help to enlist practical help for parishes whose poverty prevents them from dealing with this matter themselves. The author has much that is interesting to say about bells, and records the astounding feat accomplished at Hetonstall, near Halifax, in 1927, when the "Oxford Treble Bob Major" was made without a break in ten hours and fifty-one minutes by ringers standing in one position throughout without food or drink of any kind.

Perhaps the author assumes rather too readily that the usual explanation of the term "squint" is always the right one; and here and there—although rarely—his references to history seem too generalized as to fact and not presented in the clearest way. Such is the statement that French villagers loved to worship at "the various chapels that lined their Cathedrals," or, again, the reference to the respective parts played in church building by bishops, abbots, the common people and manorial lords.

But these are small points, scarcely touching the main purpose of the author, to whom we are indebted, if only for a fresh interest in native beauties that we are often apt to overlook.

FRANCIS DAY

THE MUNICIPAL DIRECTORY

The Empire Municipal Directory and Year Book, 1933-1934. London: The Sanitary Publishing Co., Ltd. Price 12s. 6d. net.

THIS directory—the fifty-first—although published at a time when many Councils are in a state of flux, awaiting absorption, reformation or absolute dissolution, maintains the high standard set by its predecessors.

The editorial section is as full and complete as hitherto, with articles dealing with progress and developments in connection with highway construction, housing and town planning, swimming baths, concrete and cement, and public lighting.

EMPIRE FORESTRY HANDBOOK

The Empire Forestry Handbook for 1933. Edited by W. A. Robertson, F.R.G.S. London: The Empire Forestry Association. Price 5s. net. (Free to members.)

THIS handbook aims at presenting in a condensed form essential information on the forests of the Empire. Under the head of general information the section dealing with the forest statistics of the Empire, in area, volume of standing timber, ownership, production, consumption, imports and exports, has been brought up to date from official returns. These statistics are of necessity only approximate, but they provide the most complete statement available anywhere, and furnish a balance sheet of the Empire's forest resources.

Of special interest to the timber trade, the architect and the contractor is the revised list of Trade Names of Empire Timbers. In this, formidable confusion of local trade and vernacular names has been reduced to order by sorting out and tying these local names to

the actual botanical species to which they belong. At the same time, with the approval of some of the leading timber traders, a definite trade name has been allotted to the botanical species, so that if used by the trade there should be little chance of wrong species being shipped against an order. As an appendix to the list a reference is given to the various public and other buildings where various particular Empire timbers can be seen in use.

PRICING AND COSTING

Pricing and Costing for Buildings and Public Works. By B. Price Davies. Second Edition. Cardiff Western Mail and Echo, Ltd. Price 21s. net.

THE second edition of this volume, by the City Engineer and Surveyor, Bangor, North Wales, has just been issued. It is similar to its predecessor, with the exception of a few minor alterations, which means that the information, covering a very wide field, is convincingly set out in comparatively small space.

The book comprises three main sections, namely: pricing; costing; and cost results of buildings and public works. There are also the author's general introduction, explaining his objects and system, an index, and a "buyers' directory."

It should be noted that an earlier companion work by the same author dealt with estimating, and of that the present work is a continuation in idea.

PUNCH SUMMER NUMBER

MR. Punch's Summer Number seems to be unusually funny, perhaps because the pictures by his troupe of gifted artists, plain and coloured (the pictures that is), show little trace of their having bothered about architecture. A blow is, however, struck in the cause of rural preservation. A tramp, dining in a bosky retreat by the side of a main road, is made to say to his pal: "Ain't it the limit, Ginger? As though they couldn't find another place to put that bloomin' ugly 'oarding. . . ." The said hoarding advertises British sausages, and the tramp is pig-faced.

WHAT IS TO BE DONE ABOUT

THIS?

[In this week's article statistics of building costs are closely scrutinized. The factors that are open to variation are identified. Cheaper building is shown largely to depend on two: lower rates of interest; and more economical construction. The second is pre-eminently the province of the architect, and it is to solutions of this pressing problem that the profession must bend all its energies. To explore available means to this end will be the object of forthcoming contributions to this discussion.

The following have already appeared:—(March 29) 1. The Speculative Builder, by Penates; (April 5) 2. The Speculative Architect, by Edwin Gunn; (April 12) 3. Building Without Guidance, by Stanley C. Ramsey; (April 19) 4. What the Public Want, by Edwin Gunn; (April 26) 5. The Housing Problem, by Percy Morris; (May 3) 6. The Building Centre Competition, by E. Maxwell Fry; (May 10 and 17) 7 and 8. How the Architect can use the Building Societies, by H. C. Burdett; (May 24) 9. The Housing Act, by our Parliamentary Correspondent; (June 1) 10. Building Society Finance, by Penates.—ED., *A.J.*]

11. Factors in Cost

[*By L. J. GOLLOP*]
B.Sc. (Econ.) F.S.S.

ANY housing policy, any pronouncement on housing, turns ultimately on the question of cost. That is the fundamental problem—and a most difficult one to tackle. The chief difficulty arises from the diversified nature of house building.

In the first place, there is very considerable variation in the accommodation provided, which has obvious reactions on cost. This does not merely mean that the total cost varies with the accommodation, but that the proportion of labour cost, material cost, etc., to total cost also alters.

In the second place, there is considerable variation in the amenities provided. This goes far beyond the question of the cost of fittings. Whether there is a bathroom or not, or whether it is separate or not; whether the houses are built twelve or twenty to the acre—these and many other questions mean variations in cost.

Thirdly, methods of construction vary. Thus a house on one side of a road may require foundations quite different from those on the other side.

All this is very obvious, but it means that the question of housing costs must be approached with caution, and that it can only be tackled by means of averages. The costs involved in building roughly the same type of house in different parts of the country will vary so much that it is impossible to take any particular example as typical of the whole. All that can be done is to take rough averages for the building of a certain type of house. These averages should not be interpreted too literally, and will not fit any given case. They are indications rather than measurements of the magnitudes concerned.

The costs involved in the building and maintenance of a given type of house may be divided into four parts—building costs, land costs, interest charges and loan redemption, and repairs and maintenance charges.

With regard to building costs, for non-parlour houses, it may be taken that, on the average and with the qualifications mentioned above, they are made up as follows:—

Labour	35%
Materials	55%
Overhead charges, professional fees, etc.	10%

In a recent leading article in this JOURNAL, it was laid down that building and construction costs in general are made up of:—

Labour	40%
Materials	50%
Overheads, etc.	10%

Housing, of course, employs less labour on the site, and uses more materials, than the average building or construction work, so that the figures here given fit in with those for building and construction in general.

For a house the building cost of which is £300, that is to say, £105 is spent on labour employed on the site, £165 on materials, and £30 goes in overhead charges. This last item is probably put rather too high, and must be taken to include some element of profit.

With regard to the further analysis of the various elements of cost, little can be done, having regard to the very considerable variations of the various items. Mr. Coppock, General Secretary of the National Federation of Building Trades Operatives, has, however, put forward the following figures

as being the typical allocation of a "labour unit" of £100 :—

	£
Excavator, concretor and drainer ..	9
Bricklayer and his labourer	30
Carpenter and joiner	27
Slater and his labourer	3
Plasterer and his labourer	14
Plumber and his mate	8
Painter and glazier	9
	£100

With regard to land costs, little can be said. Houses with a building cost of about £300 are probably built overwhelmingly at between sixteen and twenty to the acre, on the average, but the price of the land itself varies enormously. The Ministry of Health, however, adds to the contract price for building houses of this type £70 for land, roads and sewers. If we take this figure, it brings the total cost of our house up to £370.

In order to deduce the price at which such a house will be sold in the market, it is necessary to add an amount for the profit of the builder. To assess the actual amount of profit received by builders is virtually impossible. There are no data to go on, and the amount varies greatly according to circumstances. On an arbitrary assumption, however, we may assume that a profit of £30 is made and that the selling value of our house is £400. This allowance for profit is probably somewhat extreme, particularly since the allowance for overhead costs included an element of profit. We may therefore state the selling price of a house the building cost of which is £300 as about £380-£400.

We now come to interest and loan charges and allowances for repairs. Here we may leave our assumptions and deal with actual figures, since the Committee on Local Expenditure has examined this problem on the basis of a house costing £380. The total amount of loan charges on a sixty-year basis for a house costing £380 would be £17 per annum at 4 per cent., £16 at 3¾ per cent., and £15 at 3½ per cent. The weekly equivalent for the purpose of arriving at the rent is, to the nearest penny, 6s. 6d. at 4 per cent., 6s. 3d. at 3¾ per cent., and 5s. 9d. at 3½ per cent. To this must be added an allowance for repairs, maintenance, etc. The figure taken by the Committee for this allowance is £5 10s. per annum.

We therefore get the following table :

All-in cost of house ..	£380		
Rate of interest	4%	3¾%	3½%
Total amount of loan charges	£17	£16	£15
Weekly equivalent ..	6/6	6/2	5/9
Add for repairs, etc. ..	2/1	2/1	2/1
Economic rent	8/7	8/3	7/10

Thus, as the Committee points out, the difference in rent caused by a fall in the rate of interest from 4 per cent. to 3½ per cent. is nearly the same as the difference that would follow a reduction of £30 in the capital cost of the house. This conclusion is obviously extremely important when it is a question of the reduction of costs.

The average building cost of non-parlour houses built under subsidy fell to the record low level of £295 in the first quarter of 1933. There seems little likelihood of any very substantial reduction in this cost without far-reaching changes in construction and the materials used. The rate of interest on local loans for housing, however, has been 4 per cent. since October, 1932, when it was reduced from 4¼ per cent. A reduction of this rate of interest to 3½ per cent. would mean that the economic rent could be reduced from 8s. 7d. to 7s. 10d. per week.

A Housing Corporation of the kind which has been proposed would probably be able to lend at yet a lower rate for housing purposes.

It would thus appear that it is chiefly to a reduction in the rate of interest that the country must look for the provision of houses at an economic rent which the worker can afford to pay, without radical alterations in the method of construction.

HENDON PARK MANSIONS:

This building consists of twenty flats upon a corner site with frontages looking south-east and south-west, one of which faces a park. Fourteen of the flats have one sitting-room and two bedrooms, and six have two sitting-rooms and two bedrooms ; all have kitchen, bathroom, and w.c. in addition.

External walls are faced with multi-coloured bricks of rough texture, and the roof is covered with interlocking double Roman tiles with battens, felt and insulating board under. Floors are of normal timber construction, sound-deadened with insulating board. Living rooms are fitted with coal fireplaces, but have points for gas or electricity if desired, and the principal bedrooms have built-in electric fires. Hot-water circulation is by gas water circulators of 30-gallon capacity per flat. Staircases are of reinforced concrete, cast in situ, *covered with coloured granolithic, and have wrought-iron balustrades and limed-oak handrails. There is a garden at the back for the use of the tenants.*

A.A. Excursion

The Architectural Association has decided to organize the annual excursion this year to take place in July, and to be to Italy. The party will visit Milan for the purpose of seeing the Exhibition of Modern Decorative Art and Architecture, and will then proceed to Florence and Rome. Apart from the visits paid to old buildings, a special programme is being officially arranged for the party to see modern architecture and town planning, particularly in Rome. The party will leave London on Saturday, July 15, and the duration of the tour will be two weeks. The cost, which will include travel, hotels, breakfast and dinner, with all tips, etc., will be approximately £24. Full details are being prepared, and members desirous of joining the party should send in their names as early as possible to the Secretary, A.A., 34 Bedford Square, W.C.

D.I.A. Annual Tour

The Design and Industries Association have arranged a tour to Northern Italy and the Dalmatian Coast from August 18 to September 2. It has been organized to enable members to visit the Milan Exhibition and also to see something of Dalmatia, a country at present comparatively little known to the tourist from England.

Three days will be spent in Milan, two in Venice, one in Verona, and the party will then go by Yugoslavian steamer to Dubrovnik and back. Full particulars are obtainable from Miss M. E. Pheysey, Secretary, 6 Queen Square, W.C.1.

TRADE NOTES

BY F. R. S. YORKE, A.R.I.B.A.

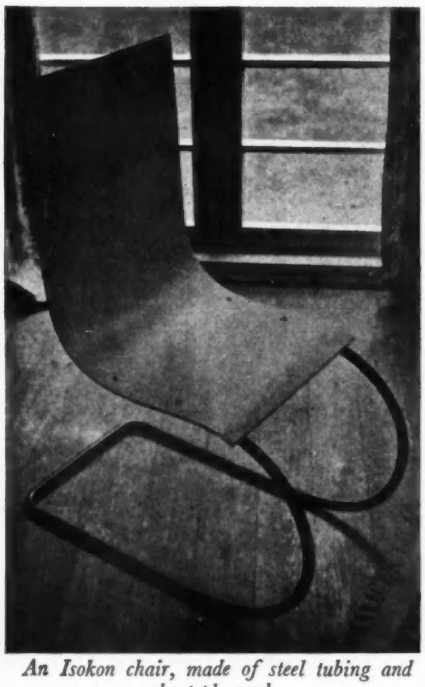
Unit Furniture

ISOKON units, cupboards and book-shelves are made in standard and outside dimensions of 24 ins. by 20¾ ins. by 9 ins. or 12 ins. deep.

•

The units are built in five-ply wood, with dovetailed joints, and may be obtained in ordinary birch, or finished with Australian silky oak, plain oak, figured oak, Australian walnut or sapele veneers.

•



The cheapest unit, extreme right- and left-hand, in groups in the accompanying diagram, costs 9s. 10d. in birch, 19s. 6d. in oak, and 24s. 9d. in Australian walnut and sapele.

•

Matalose, a brushing, transparent cellulose, is recommended as a medium that provides a protective coating without interfering with the natural colour of the wood.

•

Isokon also make chairs and tables. The experimental chair No. 2, illustrated here, is quite functional. It is made with a minimum of tubing, and is designed to give maximum strength with minimum weight by the most economical methods of production. The bent plywood is used structurally and no tubes are required to support the back. The price of the chair is 37s. 6d.

An Isokon chair, made of steel tubing and bent plywood.

An Acoustic Consulting Service

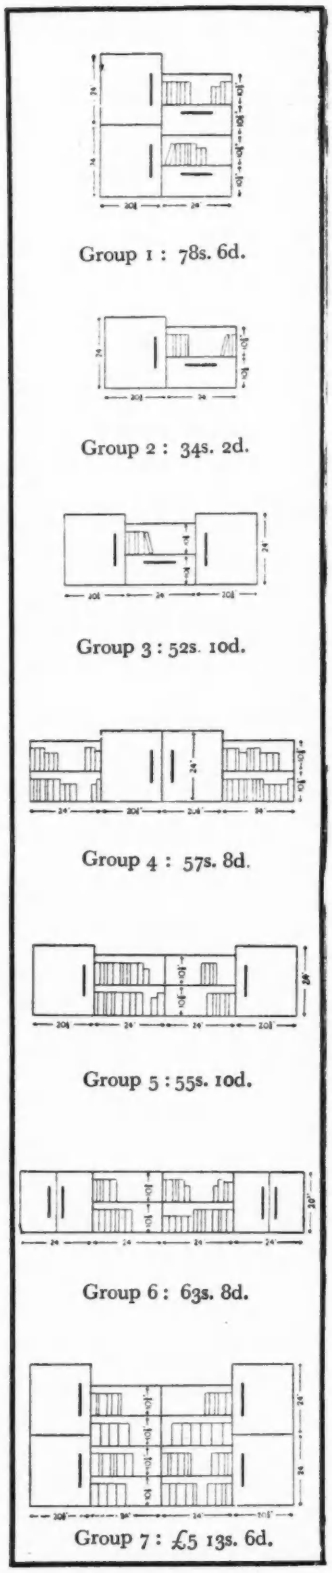
When sound forms a part of a public entertainment, whether a play, a film, a broadcast or lecture, the listener does not get the maximum enjoyment from the performance unless the sound is heard under the best possible conditions. On the other hand, unwanted sound—noise—often interferes with the comfort and efficiency of those at work or travelling, and architects are today expected to design buildings in such a manner that noise has no adverse effect upon their clients' business.

•

The Western Electric Company have recently established an Acoustic Consulting department to assist architects and engineers in solving noise and acoustic problems. Its scope is wide, and covers acoustic design in auditoriums, acoustic design and pick-up technique in broadcasting and recording studios, noise reduction, noise survey, and sound analysis. The department* is an outgrowth of the firm's researches in the recording and reproduction of sound for talking pictures.

Stic B

I have been asked by a reader for particulars of a material known as Stic B.



•

I understand that Stic B is not a patent material but a secret process, and all I can say concerning its composition is that it is an emulsion with a gum as one of its principal ingredients.

•

It is a decorative, protective, damp-proof and fire-resisting material, made for application to almost any type of surface, including concrete, cement, plaster and brick, and obtainable in a range of colours. Its damp-proof qualities and suitability for application to new Portland cement surfaces are reported upon favourably by the Department

* Details of the service are outlined in a booklet, "Acoustic Service," that can be obtained, free, from the Western Electric Company.

Cupboard and book-shelf groups built up in Isokon units. Prices are for birch. Designed by Wells Coates.

of Scientific and Industrial Research, and the Building Research Station.

•

The object of the tests made by the latter was to determine the effectiveness of the treatment in the waterproofing of brick walls, to examine its applicability to fresh Portland cement rendering and to gain information concerning the durability of the treatment under exposure to weathering. The treatment consisted in the application of one coat of the "Primer" and two coats of "Stone Covering." These materials were in the form of a thin white liquid and a thicker stone-coloured cream, respectively.

•

The general conclusions reached were summarized as follows :—

1. That Stic B "Primer" and "Stone Covering," of the composition supplied for the tests, could be applied easily to porous surfaces of brick and cement.
2. That such treatment rendered brickwork rainproof when freshly applied.
3. That such treatment, when applied to brickwork, showed good resistance to the action of weathering, and was likely to remain effective and of good appearance for a reasonably long period under natural conditions of exposure in comparison with other types of waterproofer tested at the Building Research Station.
4. That such treatment could be applied to fresh Portland cement with little risk of failure and that in this respect it was superior to ordinary linseed oil paint.

Stic B was used at the new Battersea Power Station as a covering to the shuttered reinforced concrete of the chimneys.

QUESTIONS THAT ARISE

The Editor invites readers' enquiries on all matters connected directly or indirectly with architectural practice. Readers must enclose name and address and should send their enquiries to the Editor at 9 Queen Anne's Gate, S.W.1.

Preservation of Elm Boarding

¶ H.M. writes: "*Some months ago I had placed on the external faces of a building weathered elm boarding which has now bleached to a silver grey colour. This colour I wish to retain, but at the same time I am desirous of treating the wood for the purpose of preserving it. Would you kindly let me know what method should be taken to obtain this effect?*"

I have used considerable quantities of elm boarding in gables and cladding, always allowing it to bleach to the natural silver grey colour, but never using any means at all for its preservation. I find that it stands quite well; the only trouble experienced being borings by ordinary wood-worm confined entirely to the sappy edges of boards used with the natural wany edges.

Elm does not take creosote preparations easily—they are apt to make the surface blotchy and to bleach out irregularly, as may be seen where this treatment has been applied. There is, however, a colourless Solignum now made which should be applicable without disclosing this defect, and if for any reason a preservative is thought essential, this appears the most suitable application.

E. G.

External Walls

¶ F. W. N. writes: "*The external walls of a house are specified to be rendered in cement and sand and finished with rough cast, which is usually taken to mean cement and shingle. The effect of this when dry is to give a greyish white colour to the wall and my client insists that the resultant colour shall be 'pinky cream.'*

"*Could your expert supply me with a recipe for a rough-cast mixture which will give the desired effect when dry? I have suggested to the plasterer that the rough-cast might consist of lime and shingle, gauged with cement, with a pigment incorporated, but we cannot agree on the proportions of lime and cement, or on the pigment to be used.*"

Two reliable alternatives seem to be open to your correspondent: (1) The matrix of the roughcast coat might be made up with Cullamix of the desired tint, this being a mixture of white cement, pigment and white sand supplied in bags by the Portland Cement Co.; or (2) the roughcast might be carried out by ordinary methods and distempered the desired tint at completion. The second method would probably prove cheaper, and, in the case of a particular client, more likely to give the exact result desired. Any mixture of lime, cement, shingle, and pigment such as proposed is liable to dry out to a different colour with patchy results.

E. G.

Efflorescence on Plaster

¶ B. L. M. writes: "*In a small house on the sea-side two years ago alterations and repairs were done; since then there has been a continuous deposit of salt on the walls, which has been swept off at intervals only to recur. The walls were redistempered last year with a view to curing the condition, but they are again as bad as ever. The builder now informs us that sea sand was used for the plaster and he advises complete replastering. I should be obliged if your expert can tell me of any less expensive remedy for this condition, and if in his opinion it is likely to be the sea sand used in the plastering.*"

It is presumably the internal plastering of rooms which is affected in the way described. If the cause is definitely established, the effects are likely to continue almost in perpetuity as long as moisture can reach the work which contains the salts, and evaporate by the exposed surface. The necessary moisture may be derived from the atmosphere, or may be driven into external walls from outside.

Before embarking on this troublesome and costly job of removing the plaster and re-executing it, it might be worth experimenting with a dressing of bitumastic paint on the surface, followed by distempering. If the moisture which causes the crystallization is absorbed by the face of the plastering in contact with the air it is quite possible that painting in this way might effect a cure. Several replies to queries relating to efflorescence were among the problems dealt with in the first published volume of the B.R.S. "Questions and Answers," and querist might like to consult these before taking action.

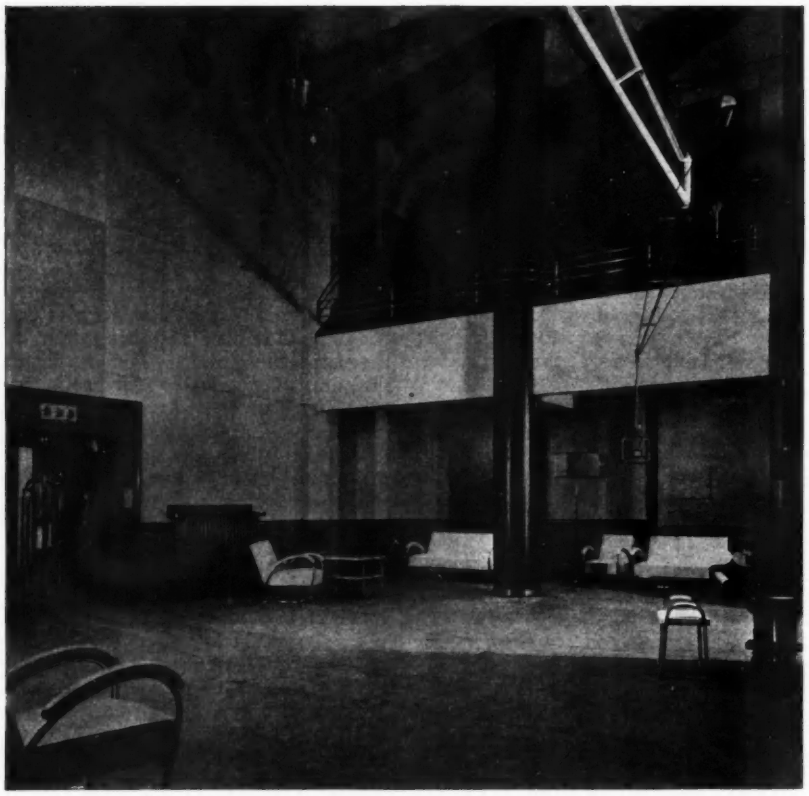
E. G.

LAW REPORT

LIGHTS AND AIR DISPUTE

Goffe v. Cox and Martin, Ltd.—King's Bench Division. Before Lord Wright.

THIS was an action by Dr. E. G. L. Goffe, of Red House, Kingston Hill, Surrey, against the defendants, Cox and Martin, Ltd., of Kings Store House, Kingston-on-Thames, claiming damages for the alleged obstruction of the ancient lights to his premises, No. 10 High Street, Kingston-on-Thames, by reason of the erection of a building of a permanent character by the defendants, known as No. 12, High Street, Kingston-on-Thames.



The plaintiff, who was the owner of premises, No. 10 High Street, complained that, in consequence of the defendants' building, the light to his surgery, consulting room and inner consulting room windows had been so materially diminished as to amount to a nuisance and also that the light to the landing, bathroom, and cellar windows had been materially obstructed. Dr. Goffe alleged that the result of the obstruction was that the value of his house and surgery had been greatly reduced.

The defence was a denial that the light to the plaintiff's windows had been so materially diminished by the defendants' building as to amount to a legal nuisance.

Mr. Porter, K.C., and Mr. Blanco White appeared for the plaintiff and Mr. Cyril Atkinson, K.C., and Mr. A. Watson for the defendants.

His Lordship, after hearing the expert evidence, and in giving judgment, said that the building of which Mr. Goffe complained was a high building and his main complaint was as

IN BROADCASTING HOUSE, LEEDS

Broadcasting House, Leeds, is constructed in what was the old Quaker Meeting House, and the main studio, illustrated above, is a portion of the large Meeting Room. As this studio is used for many totally different types of broadcast, the general colour scheme is low in tone, black, greys, browns and the oatmeal colour of the wallboard being relieved with the sparkle of chromium plate. Note the microphone on the right of the illustration. The studios are fully illustrated and described in the current issue of "The Architectural Review," from which the above photograph is reproduced.

to the obstruction of light to his ground-floor windows, which he alleged had deprived him of sufficient daylight to enable him efficiently to carry on his professional work. The premises, No. 10, went for some distance by the side of a stream called the Hoggs Mill stream. Previous to the erection of the defendants' building there existed a comparatively low building. Dr. Goffe's premises were, it was stated, between 200 and 250 years old. They had been originally used as a private residence, but about 50 years ago the front of the building was converted into a shop. The doctor's consulting rooms, of which the main complaint was made, were on the ground floor, the other windows, the lights of which were said to be diminished by the defendants' building, being on the first floor. When the plaintiff's premises were used as a private dwelling house, the ground floor was partitioned off into various rooms. The premises were used as a shop until 1913 and then the plaintiff put in partitions, which made his consulting rooms. The plaintiff also altered the front.

Having referred in detail to structural alterations which the plaintiff had made, his Lordship said that the windows of which plaintiff complained were beyond any doubt ancient lights, and the question he had to decide was whether in the events which had happened the plaintiff had made out a case for relief. Having regard to the evidence he came to the conclusion that the plaintiff's light was so interfered with, that an actionable wrong ensued, and that the plaintiff was entitled to damages, which he assessed at £150.

He accordingly gave judgment for Dr. Goffe for £150 with costs.

THE BUILDINGS ILLUSTRATED

Following are the names of the specialists, general contractors and some of the sub-contractors for the buildings illustrated in this issue :

House at Willingdon, Sussex (page 751). General contractors, G. E. Wallis and Sons. Sub-contractors : Dent and Hellyer, heating, hot water, plumbing, and sanitation ; Waring, Withers and Chadwick, electrical installation ; Roberts Adlard & Co., Ltd., tiles.

Rishworth School, Halifax (pages 752-753). Sub-contractors : E. and T. Bower, Ltd., masonry ; C. and W. Whiteley, joinery ; John Holdsworth, plumbing ; H. Castle and Son, Ltd., slates ; George H. Hoyle, plaster ; B. Mallinson and Son, painting ; Rosser and Russell, Ltd., heating ; John Cooke and Son, Ltd., reinforced concrete and compo floors ; T. K. Yeates & Co., wood blocks ; Hamer & Co., electricians ; Val de Travers Asphalte Co., rock asphalt ; North of England School Furnishing Co., laboratory ; Niels Larsen and Sons, gymnasium ; Williams and Turpie, ironmongery.

Hendon Park Mansions (pages 760-761). General contractors, Higgs and Hill. Sub-contractors : G. Tucker and Sons, Ltd., bricks ; Matthew T. Shaw & Co., Ltd., structural steel ; H. J. and C. Major, Ltd., tiles ; Alfred Goslett & Co., Ltd., grates and door furniture ; North Middlesex Gas Co., gasfitting ; Sunhot, boilers ; F. Wadman, electric wiring and bells and clocks ; Crittall Manufacturing Co., Ltd., casements and window furniture ; Gifco, iron staircases and metal work ; Plastering, Ltd., plaster ; Hall & Co., tiling ; Hampstead Garden Suburb Trust Nursery, garden, shrubs and trees ; General Constructional and Engineering Co., iron staircases and balustrades ; Arden Hill & Co., gas circulators ; Boulton and Paul, Ltd., joinery ; Gliksten Doors, Ltd., B.P. Insulating Board ; Jenson and Nicholson, Ltd., paints and distempers ; J. Wormell, coal and dust bins.

A Country Architect's Week

BY R. JACKSON

Sunday
One week behind, another week to go.
Between ? A moment's halt, but could I know
What lies before me, don't you somehow think
I'd take to drink ?

Monday
Eccles, the lawyer, wandered in to say
That, Did I know the firm of Knight and Day
Who're building now my house for farmer Butt
Had just gone phut ?

Tuesday
On languidly examining my mail,
I find the usual twenty pages' wail,
Boiled down, it means that Lady Griggs believes
Builders are thieves.

Wednesday
Excited ; Jones rang up to say that Brown
Had left, quite unexpectedly, the town.
Yet one more repetition of that ill,
The unpaid bill.

Thursday
While absent, and inspecting Upton Rawl,
The Vicar called *re* sketch plans for his Hall.
Finding my draftsman impudent and tight,
Went off to White.

Friday
The Town Surveyor made me view a drain,
A thing I never do without great pain ;
And while the foreman droned about the sump,
I had the hump.

Saturday
To-day I feel that things are much more bright
At half-past six I know, with Bobbie White
I'll celebrate (the friendly cheerful soul)
The nineteenth hole.

* * *

And yet ! the fascination of it all,
The victims are for ever held in thrall.
I must away. That crack in Simkin's house !
Stupid to grouse.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

Plans passed at BARKING: Alterations and additions, "Britannia" public-house, for Messrs. Mann, Crossman and Paulin, Ltd.; two houses, King Edward's Road, for Mr. Samuel Rogers; two houses, Upney Lane, for Mr. C. J. Dawson; alterations, 93 and 95 Movers Lane, for Mr. Watling; alterations, 48 Ripple Road, for Messrs. J. H. Dewhurst, Ltd.; transformer house, Abbey Road, for Messrs. Austins; new factory, River Road, for Messrs. Orrock.

Plans passed by the ENFIELD U.D.C.: Development, Orchardleigh estate, for 14 shops, and 54 houses, for Estate Co.; nine houses, Oatlands estate, Brimsdown, for Oatlands Estate, Ltd.; 34 houses, Parsonage Gardens estate, for Messrs. G. Reed and Sons, Ltd.; four houses, Gilbert Street, for Messrs. Bethell and Swannell; four houses, Uvedale Road, for Mr. Ernest E. Yates; extensions, Sangamo Works, Gt. Cambridge Road, for Messrs. Wimperis, Simpson and Guthrie; two houses, Brodie Road, for Mr. T. Towers; alterations and additions, "Rose and Crown" public-house, Clay Hill, for Messrs. C. S. Foster and Son; three shops, Chase Side, for Mr. C. E. Q. Ward; six houses, Carterhatch Road, for Messrs. Lewis, Veronique and Day; four houses, Catherine Road, for Messrs. Hamilton, Son and Campion; five houses, Carterhatch Road, for Mr. W. H. Jefferies; two houses, Malvern Road, for Messrs. French and Buchanan; 40 houses, Cheyne Walk, for Mr. G. W. Newman; extensions, London Plywood Factory, Ponders End, for Messrs. Dunsmore Bros.; 240 houses, Orchard estate, Enfield Wash, for Messrs. Hilbery Chaplin, Ltd.; 170 houses, Greenwood Avenue, etc., for Homemakers, Ltd.; 12 houses, Ladysmith Road, for Messrs. Rowley Bros., Ltd.; seven houses, Ashurst Road, for Mr. C. Winkley. Plans submitted: eight houses, Green Street, for Mr. C. H. Knight; two factory buildings, Ponders End, for Churchbury Investment Co. Ltd.

Plans passed by the FINCHLEY U.D.C.: Five houses, Bancroft Avenue, for Mr. W. Quennell; two houses, Westbury Road, for Mr. A. A. Park; six houses, Bancroft Avenue, for Messrs. Smerdon Bros.; two houses, Kingsley Way, for Mr. L. C. Gibson; alterations, Methodist Church, Ballards Lane, for trustees; 14 houses and one shop, Woodhouse Road, for Messrs. Lawes and Son, Ltd.; two houses, Brim Hill, for Mr. S. G. Liversedge; factory, East Finchley High Road, for Messrs. W. Luck and Sons. Plans submitted: six shops and flats, corner Creighton Avenue, for Mr. J. Brown; shop extensions, Hill Rise, for Greater London Properties, Ltd.

Plans passed at ILFORD: Alterations and additions, 792 Green Lane, for Messrs. Sanders Bros.; nine houses, Birkbeck Road, for Mr. H. V. Meekcoms; 12 houses, Beattyville Gardens, for Mr. J. Aldridge; eight houses, Vaughan Gardens, for Mr. T. Anders; 16 houses, Royston Parade, Wanstead Lane, for Mr. J. Aldridge; two houses, Barley Lane, for Mr. G. F. Siegerts; 245 houses, Ashburton Avenue, Dawlish Drive and Capel Gardens, for Ilford Building Co.; two houses, Bealla Gardens, for Mr. J. Giles; milk store, 327 Green Lane, for Mr. J. Looker; two houses, Hastings Road, for Messrs. Vernon Gordon & Co.; eight houses, Trescoe Gardens, for Messrs. W. Moore and Son; estate office, Eastern Avenue, for Mr. J. W. Lohden; 28 houses, Stapleford Avenue, for Mr. J. W. Lohden; two houses, Abury Gardens, Aldborough Road, for Mr. T. Colgate; four houses, Donington Avenue, for Messrs. B. Bailey; alterations, 157 High Road, for Messrs. J. Curtis and Son.

The ILFORD Corporation has approved a scheme for extensions at the isolation hospital at a cost of £51,000.

Plans passed by the MARYLEBONE B.C.: Two houses, Grove End Road, for Mr. R. Atkinson; buildings, site of 506-540 Oxford Street, for Sir John Burnet, Tait and Lorne; rebuilding, 54 Hamilton Terrace, for Mr. Guy Dawber; block of flats, 70 Grove End Road, and Abbey Road, for Mr. J. A. Mactaggart.

Plans passed by the POPLAR B.C.: Alterations, "Cubitt Arms" public-house, Wellington Road, for Mr. A. E. Sewell; additions, Metropolitan Transport Garage, Tredegar Road, for Messrs. Kearley and Tonge, Ltd.; additions, City of London Institution, Bow Road, for Messrs. J. C. Mather and Son; additions, St. Katherine's College, Brunswick Road, for Messrs. Mason's (Poplar), Ltd.

SOUTHERN COUNTIES

Plans passed by the FARNHAM U.D.C.: Two bungalows, Fox Yard, for Mr. A. Butt; two houses, Upper Bourne, for Mr. H. J. Smith; two bungalows, Wings Road, for Mr. J. Chuter; two houses, Beavers Hill estate, for Mr. R. W. Hards; alterations, Bourne Mills, for Mr. G. W. Grace.

The KENT C.C. has obtained sanction to borrow £66,000 for extensions at the Leybourne Grange mental colony, and the works have accordingly been commenced.

Plans passed at NORTHFLEET: Nine houses, Napier Road, for Mr. W. J. Rattery; additions, 36, Mitchell Avenue, for Messrs. R. Hopkins and Sons; four bungalows, Newman's Road, for Messrs. Bevan Bros.; extension of shop, Waterdales, for Mr. S. T. Toulson; two houses, Perry Street Road, for Mr. A. E. Wells.

Plans passed by the OXFORD Corporation: Four shops. Hollow Way, Cowley, for Mr. J. E. Cammell: additions to bakery, George Street, Summertown, for Messrs. Oliver and Gurden; additions to bakery, Bullingdon Road, for Mr. J. H. Warland; conversion of house into four flats, 96 Banbury Road, for Mr. H. Hinkins; two houses, Highfield Avenue, Headington, for Messrs. Ponton & Co.; factory, Carsington Road, for The British Paint and Lacquer Co., Ltd.; two houses, Ramsay Road, for Mr. G. Coppock; additions, adjoining Rawlingson Buildings, St. Giles' Street, for The President of St. John Baptist College; workshop and store, rear of Oxford Road, Cowley, for Messrs. E. Organ and Son; eight houses, Five Mile Drive, for Mr. D. Mealing; five houses, Banbury Road, for Mr. A. J. Colborne; 78 houses (amended plan), Westbury Crescent, for Messrs. N. Moss and Son, Ltd.; 11 houses (amended plan), Oliver Road, Cowley, for The Artisan Building Co.; 16 houses, White Road, Cowley, for Mr. A. E. Harris; additions, Cowley Working Men's Club, Oxford Road, for Messrs. Ushers' Wiltshire Brewery, Ltd.; 132 houses, Cowley Road, for Messrs. N. Moss and Son, Ltd.; two houses, Sandfield Road, Headington, for Mr. A. W. Lee; shop, Cowley Road, for Messrs. N. Moss and Son, Ltd.; additions to workshop, Garsington Road, for The Pressed Steel Co., Ltd.; alterations and additions, 2-4, Brewer Street, for Christ Church; two houses, Five Mile Drive, for Messrs. Hinkins and Frewin, Ltd.; porter's lodge, South Parks Road, for University Chest.

SOUTH-WESTERN COUNTIES

The EXETER Corporation is to obtain tenders for the erection of 300 houses on the St. Loyes estate.

Plans passed at PAIGNTON: Two houses, Barcombe Road, for Mr. F. A. Maunder; shops and stores, Winner Street, for Paignton Co-operative Society, Ltd.; two houses, Sparkes Barn Road, for Mr. F. G. Stockman; showroom, Torquay Road, for Torquay and Paignton Gas Co.; conversion of Cliff Park House, Dartmouth Road, into six flats, for the Staverton Builders, Ltd.; sixteen houses, Saltern Road, for Mr. R. H. Peeke and Son; two houses, Dunstone Park, for Mr. J. Maunder; 28 houses, Preston Down Road, for the Great Western Building Corporation, Ltd.; six houses, Redburn Road, for Mr. Chippendale; two houses, Knapp Park Road, for Mr. A. B. Soul; seven bungalows, off Horseshoe Bend, for The Coasts Estates, Ltd.

MIDLAND COUNTIES

Plans passed by the STOKE-ON-TRENT Corporation: Four houses, Lancaster Road, Harpfields, for Messrs. Hollins and Jones; two houses, Stone Road, Hanford, for Messrs. Holloway & Co.; two houses, St. George's Avenue, for Mr. H. Bratt; two houses, Chorley Avenue, Chell Green, for Mr. H. Sale; three houses, Bradeley Lane, Bradeley, for Mr. W. G. Hollins; 24 houses, off Little Chell Lane, Tunstall, for Mr. L. J. Cope; 11 houses, Chell Street, Hanley, for Messrs. L. Ray and Son; 10 houses, Cromwell Road, Sneyd Green, for Mr. B. Stubbs; two houses, Blurton Road, Fenton, for Messrs. Bowman and Woodfield; four houses, Blurton Road, Fenton, for Messrs. Prestwood Bros.; two houses, Star and Garter Road, Longton, for Messrs. Holloway & Co.; four houses, Stone Road, Lightwood, for Mr. G. Titley; four houses, Barber Road, Chell, for Messrs. Ray and Son; two houses, Sandon Road, Meir, for Mr. C. Underhill; six houses, New Inn Lane, Trentham, for Mr. H. J. Emery; two houses, London Road, Oakhill, for Messrs. W. Ball and Son; two houses, High Street, Cornhill, for Mr. J. Gregory; two houses, Norman Avenue, Tunstall, for Mr. C. Whalley; two houses, Greasley Road, Bucknall, for Mr. W. Withington; two houses, Weston Coyney Road, Longton, for Mr. W. Simcock; five houses, Vivian Road, Fenton, for Mr. S. Mason; 50 houses, Whieldon Road, Fenton, for Messrs. Bates and Hughes; two bungalows, Longton Lane, for Mr. G. Witham; six houses, Kingston Avenue, Sneyd Green, for Mr. B. S. Phillips; shop, Marsh Street, for Messrs. E. R. Dawson; alterations to four houses, Oxford Street, Penkhull, for the Burslem and District Co-op. Society, Ltd.; two houses, Blurton Road, for Messrs. Bowman and Woodfield; 24 houses, Chell Lodge estate, for Mr. L. J. Cope; additions, Swan Street, for the Winkhill Mill Co.

NORTHERN COUNTIES

The Durham County Council Assistance Committee recommends the provision of a surgical unit for BISHOP AUCKLAND, and a medical unit at Chester-le-Street at a cost of £29,200.

The BLYTH Corporation has received sanction to borrow £46,775 for the erection of 200 houses on the South Farm Estate, £5,700 for the construction of roads, and £2,325 for the construction of sewers.

Plans passed at BLYTH: Two houses, Cowpen Road, for Messrs. J. and W. Simpson; four houses, Newcastle Road, for Mr. A. Best; alterations, Wellesley Nautical School, Links Road, for the trustees; six flats, Princess Louise Road, for Mr. J. E. Dover; two bungalows, Barras Avenue, for Mr. J. E. Dover; eight flats, Salisbury Street, for Messrs. Bird, Ltd.; four flats, Beaumont Street, for Mr. H. Berg.

The ECCLES Corporation is to obtain tenders for the erection of 100 houses on the Haddon Road estate.

The TODMORDEN Corporation is to undertake a rehousing scheme at a cost of £18,854.

The TYNEMOUTH Corporation has decided to proceed with the second section of the slum rehousing scheme, provision being made for the erection of 216 houses.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

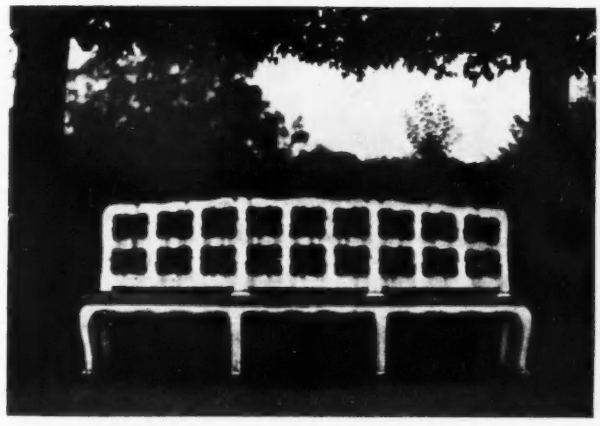
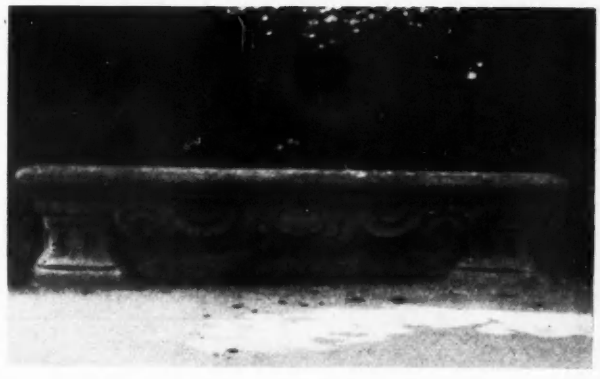
Supplement to THE ARCHITECTS' JOURNAL for June 8, 1933

BAROQUE DETAILS FROM S. GERMANY



MEASURED AND DRAWN BY R. BANKS AND C. Y. KOH

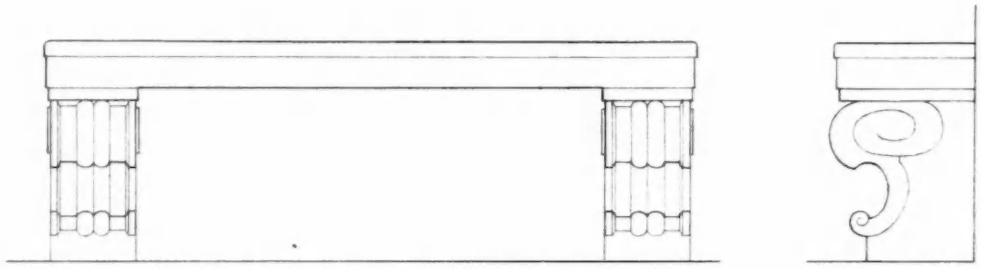
SEAT OUTSIDE THE RESIDENZ, SALZBURG



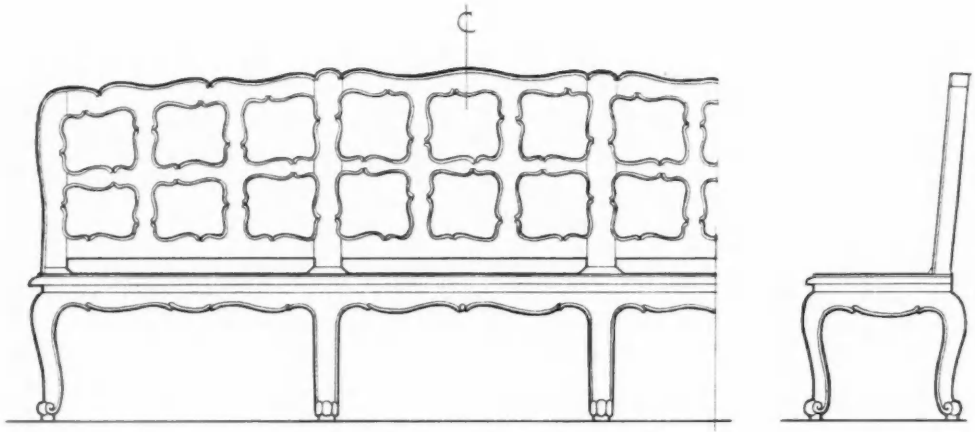
This is one of a pair attached to the bases of the columns which flank the entrance archway of the main façade of the Residenz completed in 1710. The seat is composed of two consoles which hold up a solid piece of marble. The lower portions of the supports have not been very kindly treated, and show the results of having been chipped by passing pedestrians.

WOODEN SEAT, VEITSHÖCHHEIM, LOWER FRANCONIA

Wooden seats were evidently designed in conjunction with the circular arbours, one of which is also illustrated in this Supplement, as the curvature is the same, and they fit the positions that would have been allotted to them. Their design is similar to that here shown, which is of one of those placed at regular intervals along the main avenue, formed of clipped lime trees, with a low clipped hedge, making a continuous background behind them. They are painted white with green beads, which accentuate the curves of the members.



STONE SEAT, VEITSHÖCHHEIM



The stone seats are typical of the period, and compare favourably with those at Schloss Seehof, which reach a high level in design. They are placed in the grottos with the statuary, and were carved by the following sculptors: J. P. Wagner, J. W. van der Auvera, and F. Dietz.

WOOD STRUCTURE WITH COPPER ROOF AND PLASTER CEILING

Plans

ARBOUR AT VEITSHOCHHEIM

The house was built as a country residence for the Prince-bishops of Würzburg by Antonio Petrini about 1680; rococo wings were added later by Johann Balthasar Neumann in 1753. The formal gardens, immediately round the house and the outer gardens, including the lakes, grottos and "ruins," were designed in the Franco-Italian style and built during 1763-1775.

The arbour is situated amongst a group of silver birch trees which form a square block in part of the outer gardens, and are surrounded by clipped hedges. It is octagonal on plan, with entrances on two opposite sides, the supports being at each angle with a light trellis filling. The roof is curved and covered with copper, being surmounted by a vase of the same material. The ceiling, which is plastered, partially follows the line of the roof, the curved portions being divided up into bays, which are decorated in relief plaster and coloured.

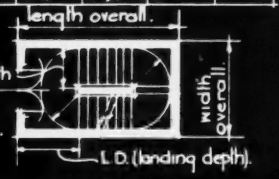
Originally the woodwork was probably painted, as are the two other arbours and wooden garden seats.

Notes based on the London Building Acts (Amendment) Act 1925.

STAIRS FOR GENERAL BUILDINGS. (excluding theatres, cinemas, schools, etc).

NOTES AND TABLES OF LENGHTS AND WIDTHS OF STAIRS.

1. Stairs having a clear width of 6'0" or more must have a central handrail.
2. above 700 persons : 1 stair, clear width to be 6'6" or 2 stairs, clear width each to be 4'4".
   - " 800 . . . . . 7' 0" . . . . . 4'8".
   - " 900 . . . . . 7' 6" . . . . . 5'0".
   - " 1000 . . . . . 8' 0" . . . . . 5'4".
   - " 1100 . . . . . 8' 6" . . . . . 5'8".
   - " 1200 . . . . . 9' 0" . . . . . 6'0".
3. If 2 stairs are provided where only 1. is *required*, the clear width of each must be equal to 2/3 of the clear width *required* for one stair.
4. "clear width" is measured between finished walls.
5. maximum riser . . 7½". minimum tread . . 10". minimum clear width . . 3'6".



TABLES OF LENGTH AND WIDTH.

In the following tables walls have been taken at 9". finish at ¾" and newel walls at 6". If 4½" walls are permitted deduct 4½" from the overall length and 9" from overall width.

TYPE A. front entry.

If doors are not central increase the overall length by 1" for every foot of clear width of stair. If the risers on the landing are omitted add 10" to the length.

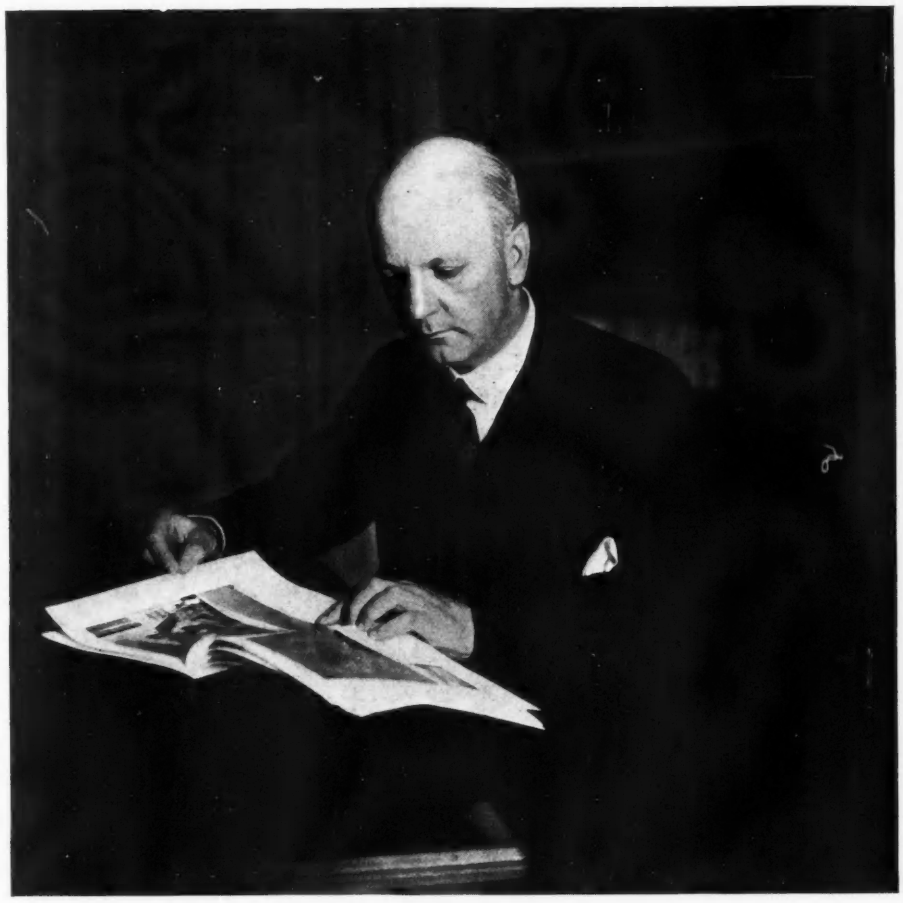
GENERAL BUILDINGS STAIRS

•



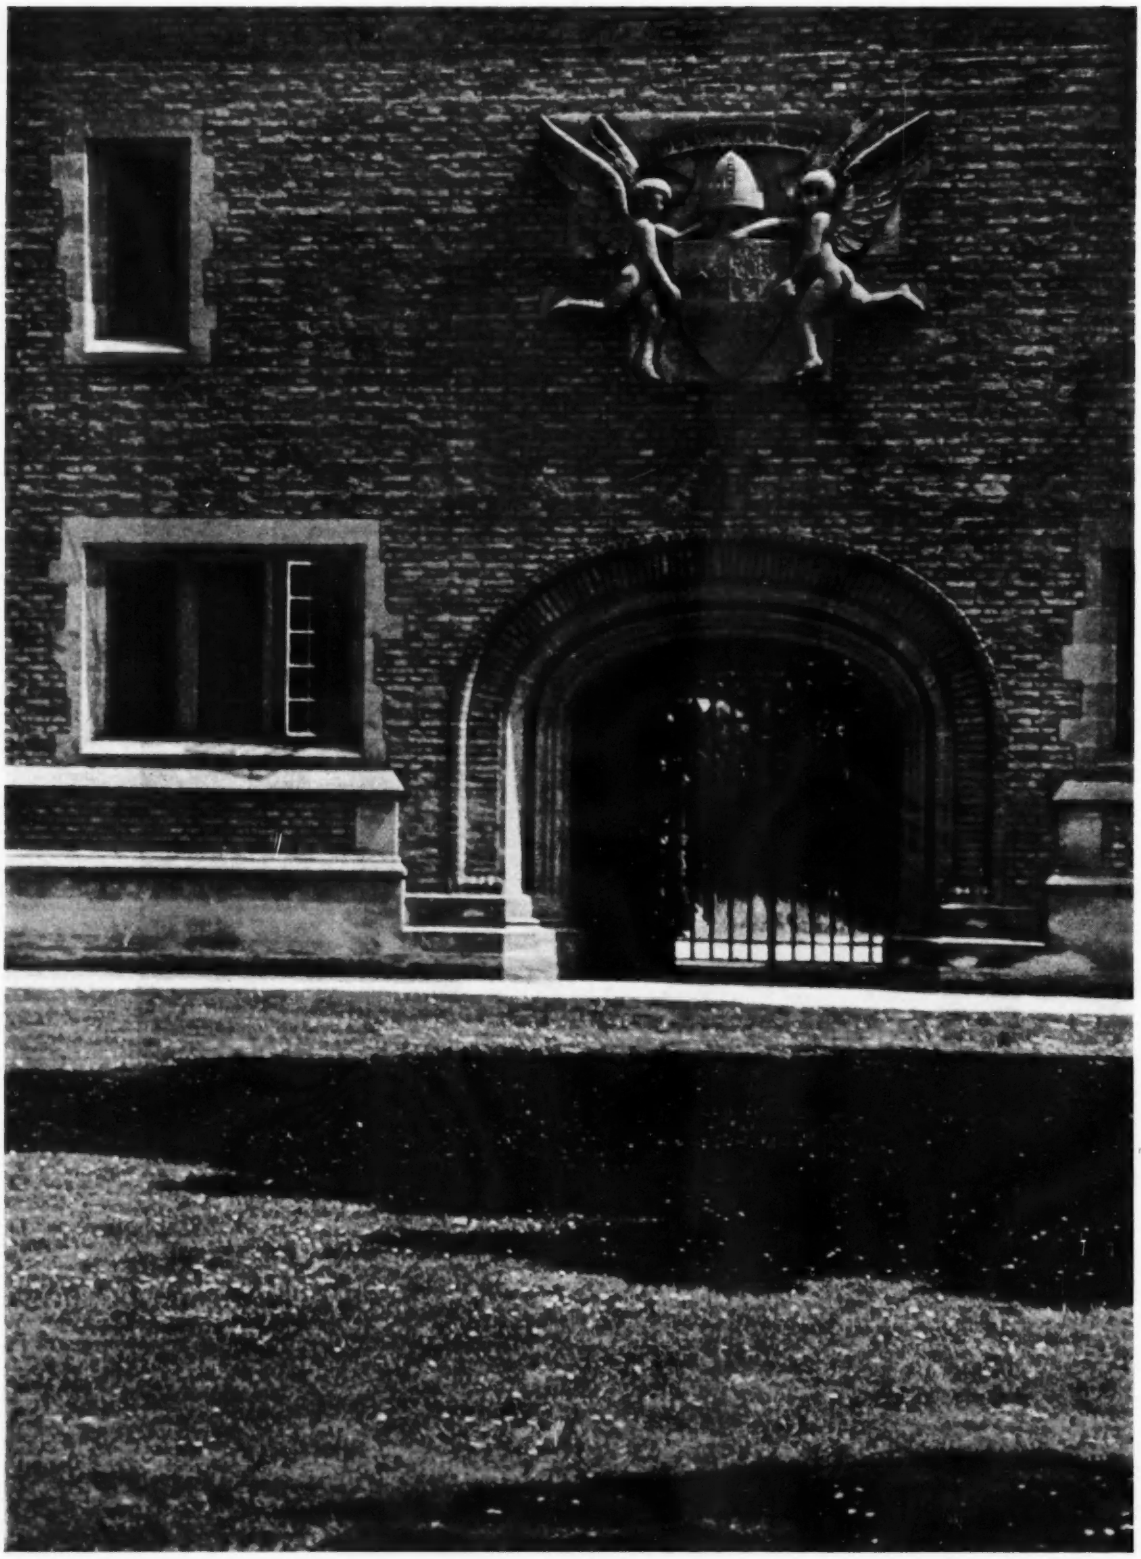
THIS week's Sheet is the fifth of a series of nine dealing in detail with the layout and construction of staircases. It summarizes the requirements in structure and capacity laid down under the Building Acts for stairs in general buildings, other than places of public entertainment.

The following is a full list of the subjects previously issued :—

1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.
8. Mar. 8—Billiard Table Data.
9. Mar. 15—Roof Pitches and Drainage.
10. Mar. 22—Lift Sizes, etc.
11. Mar. 29—Sanitary Accommodation.
12. Apr. 5—Lavatory Units.
13. Apr. 12—Lavatory Units.
14. Apr. 19—Plumbing to Basins, Baths, etc.
15. Apr. 26—Pipe Chases, etc.
16. May 3—Drains and Manholes.
17. May 10—Stairway Diagrams.
18. May 17—Risers for Stairs.
19. May 24—Stair Risers and Flights.
20. June 1—Public Exit Stairs.

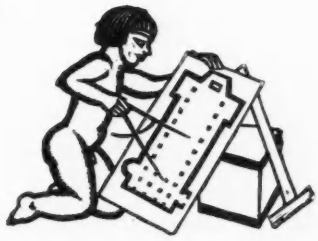
THE NEW R.I.B.A. PRESIDENT

SIR GILES GILBERT SCOTT, R.A.



ON Monday last, at a general meeting of the R.I.B.A., it was officially announced that Sir Giles Gilbert Scott, R.A., had been elected President of the Institute for the ensuing session, in succession to Sir Raymond Unwin. His name was the only one nominated for the office.

Sir Giles was articled to the late Temple Moore, F.R.I.B.A., and commenced private practice in 1902. And in the same year he won the competition out of which his life work and Liverpool's Anglican Cathedral is still growing.



He may have the happy fortune to see the last stone of his design placed in position. He is now 53, and his Cathedral, begun some 30 years ago, may be finished in another 25. Of the £300,000 appealed for in 1924 to pay for the portion now building—the lower part of the tower to the height of the belfry floor, and the nave transepts—all has been obtained with the exception of some £60,400. In five or six years this work should be finished, and then it will remain to add the nave, the belfry and the great tower.

What a sound in the ears the Nunc dimittis *would have for the architect who saw the consummation of such a scheme, begun in youth and ended in old age!*

ARCHWAY AT JESUS COLLEGE, CAMBRIDGE

This archway, with sculpture by Eric Gill, is the centre feature of the new addition By P. Morley Horder; an addition imbued as faithfully as any collegiate building in Cambridge with the æsthetic and social traditions of the University, though breathing an individual atmosphere. Harold Tomlinson, in the article which begins on page 785, shows how, in this addition, a satisfactory new use of brickwork has been made in the linking up of two buildings of different colours.

ROCKS AHEAD FOR BUILDING SOCIETIES

THE International Congress of Building Societies has concluded its deliberations, and it is now possible to consider the future of the British Societies. Sir Hilton Young, the Minister of Health, last week announced that the tide is at the full, with a favouring breeze; that the conjunction of cheap money, cheap materials, and augmented Building Society advances is not like to recur. He concluded his nautical metaphor by wishing the Societies and the private builders, whose building of working-class houses is to be financed with joint guarantees from both the Government and the local authorities, "a successful and prosperous voyage."

In his message there was no warning of any rocks ahead. But no one studying the illuminating criticisms made during the course of the Congress can fail to descry on the horizon the menace of perilous reefs, hidden for the time by a haze of political optimisms.

We have indeed heard so much during the last few days of the influence for good exercised by not less than one million home-owners, created mainly by Building Society facilities, and have been so overwhelmed by the stupendous figures of the assets of the Societies, that it is little wonder that the public generally expect a prosperous voyage and no wrecks.

Nevertheless there are the rocks ahead. Sir Enoch Hill, who presided with so much dignity over the Congress, and who for a dozen years has been Chairman of the National Association of Building Societies, showed his statesmanship by offering a warning. He is a wise pilot, and it will be well if the captains of the various craft, 367 Societies in all, pay due regard to his words. He acknowledged that there had been "a lamentable breakdown in the co-operative spirit during the last two years," and boldly confessed that "in his long experience he had not previously seen anything approaching the degree of competition, almost regardless of courtesy, as between one Society and another, which had been experienced during the past year." Sir Enoch was not extravagant in his expressions of admiration for the Government's latest Housing Act, and, in fact, spoke of it in rather half-hearted terms.

Sir Herbert Samuel, speaking at the Annual Dinner of the National Association of Building Societies at the Guildhall last Thursday, also gave a hint that all was not smooth sailing. He emphasized the necessity for maintaining high standards of "honest administration and financial prudence." Evidently Sir Herbert realizes the peril of a badly-managed Society crashing upon the rocks of bankruptcy.

Professor J. H. Jones, of Leeds University, one of the sanest economists of the day, pointed out another rock ahead. In his speech to the International Congress, he made no secret of the danger to which the Building Societies may shortly be exposed, for he said, "it is certainly possible that the nation will soon be faced with a big demand for industrial capital and an appreciable rise in the rate of interest." Those Societies which have attracted the capital of the relatively wealthy may be faced with the danger of large-scale withdrawals, and in that case advances to fresh borrowers would need to be seriously curtailed.

The rock of cut-throat competition is a matter for the Societies themselves to avoid. The rock of financial disaster has already been marked on the chart by the Chief Registrar of Friendly Societies. There is still a third rock ahead in which architects are particularly interested. Of the peril of disregarding the standards of layout and design, Sir Raymond Unwin discoursed with verve and pungency last Friday. It remains to be seen whether the captains of the Building Societies will take to heart his advice. It was not welcomed by those who wish to build with the minimum of restrictions, and regardless of good taste.

It must be remembered that local authorities, before they decide to join in giving any guarantee, are held responsible, under the 1933 Act, for safeguarding local amenities and watching over the design of new houses built to be let. Building Societies, from the very nature of their constitution, cannot ensure the necessary control over questions of layout and planning, internal and external; yet these are matters of vital importance to everyone concerned.

Public taste is changing, and we hope improving. Already the half-timber style of suburban villa has reached saturation point. If the new houses are designed in the worst style of the ignorant and speculative builder, it is probable that by 1953 they will become empties. If their construction is shoddy, they will be a bad investment. Under the period of repayment at present proposed, the liabilities on the new houses will extend for at least 30 years, and before that they may be out of date and unpopular. This is indeed a rock ahead on which those Societies which drive their vessels forward, regardless of the signs of the times, may founder.

The opportunities presented to the Building Societies under the current favourable conditions are without precedent. But in housing, as with a ship setting out on a voyage, the launch is the only time when self-congratulatory speeches are permissible. After that the captain of the ship is responsible. During the voyage, with all its dangers, known and unknown, to encounter, he alone is accountable for keeping a continuous look-out so that he may bring his vessel safely into harbour. We wish the Building Society movement *bon voyage*, and trust that it will escape the three rocks ahead, which are now marked clearly on the chart by men of experience and foresight.

H.R.H. Prince George, K.G., G.C.V.O., Patron of the Exhibition of Industrial Art in Relation to the Home, which he is to open at Dorland House on Tuesday next, June 20.

NOTES & TOPICS

THE ARCHITECTURE OF PAIN AND PLEASURE

THE broadcast talks on "Design in Modern Life" are getting a more architectural flavour. On Tuesday the ninth talk of the series was between Mr. Robert Atkinson, F.R.I.B.A., and Mr. John Gloag on the design of public buildings.

*

Schools, theatres, cinemas and hospitals were scrutinized in turn, and most listeners must have been left with a feeling of mild wonder that it was possible for the majority of such places to exist at all in view of the shortcomings Messrs. Atkinson and Gloag exposed with such zest. Having agreed, with regard to schools, that the whole architectural character was dominated by the teaching system, Mr. Gloag suggested that "the happy-go-lucky-go-as-you-please-no-repression school would be as well off in a tent or a tin hut."

*

Mr. Atkinson yearned for the lost gaiety of the theatre, when the audience had some spirit of fun, and corrected, somewhat sharply, his questioner's suggestion that the old-fashioned spirit of fun in the audience had necessitated the employment of professional chuckers-out. Mr. Atkinson's sketch of the changes that have occurred in theatre design since the beginning of the century was penetrating and lucid.

*

The matter of advertisements outside theatres was discussed vigorously, and this situation was revealed. A theatre is built to look like a near-Roman temple because the site regulations insist on a classic façade; but this façade disappears behind posters and electric signs because no regulations are made about the display of such things.

*

Of such is the kingdom of commerce.

*

Hospitals suffer from what Mr. Gloag described as "the top hat and frock coat and dickey tradition that used to haunt the medical profession." Doctors, whose training fits them for observation and deduction, are rather ill-equipped for the consideration of creative design.

*

Medical technique changes rapidly, but the old conventional and wasteful hospital forms are often perpetuated, while, in Mr. Atkinson's words, "what is required is permanent floors and structural bones, and movable partitions which can keep pace with changes. . . ."

*

"THE OLD LADY SHOWS HER MUDDLES"

A correspondent, describing to me the Milan Exhibition, illustrated in last week's JOURNAL, writes of the British Exhibit:—". . . our section simply made one blush with shame. It was just like a window of [*here the names of two big London stores*] and included Scotch plaids, golf clubs (!) and leather bags (!!). I should think the Overseas Trade Department could never have noticed the words *Decorative Arts* in the title of the Exhibition. It seems most pathetic. . . ."

*

Somebody else who has been there tells me that the objects shown are as inappropriate to Italy as anything could be. "Squash" racquets! (There are, I understand, two courts in the whole of Italy.)

*

Another "feature" is some very fine silk work—in Milanese silk.

*

But it is not really fair to blame the Department of Overseas Trade—not wholly, at least. Because it is a Government department, and has no power to tell this or that manufacturer that his goods are not suitable to be shown as representing either Britain or its Decorative Art. The D.O.T. has to get the British section together; under our feckless system nobody has the authority *and* discrimination *and* freedom from ultimate responsibility, to be able to whip up the laggard manufacturer of good things and persuade him to show, any more than to be able to cast out the footler.

*

A SPECIAL ISSUE ON SLUMS

THOUGH much that is picturesque or otherwise has been written about the SLUMS, no attempt has yet been made to carry out a national slum survey.

This, with such figures and material as are available, THE ARCHITECTS' JOURNAL *is now attempting to do, in the belief that the onus of providing the nation with actual data regarding slum conditions and housing needs lies with the architectural profession.*

The first results of the survey, dealing with the six biggest towns of Great Britain (excluding London, which needs an issue to itself) will be published on Thursday, June 22, the opening day of the R.I.B.A. Conference, in a special issue on the SLUM PROBLEM—thus developing one of the main suggestions put forward in the New Year issue on National Planning.

A perspective drawing, by J. D. M. Harvey, of a block of shops, with flats above, which is to be erected by Messrs. Holland and Hannen and Cubitts, Ltd., on a site of 81,000 sq. ft., bounded by Oxford Street, Old Quebec Street, Bryanston Street, and Portman Street, W.1. The architects are Sir John Burnet, Tait and Lorne. On the ground floor, fronting Oxford Street, Old Quebec Street and Portman Street, there will be spacious shops with basements. Above, the building will rise to eight stories, devoted to small service flats. The entrance to the flats will be in Bryanston Street; along this front there will also be a garage for private cars. Demolition of the existing buildings has been commenced. It is expected that the new structure will be completed at the end of next year.

Let us watch Dorland House. Between the "unofficialness" of this and the "authoritativeness" of the B.I.F. may lie the ideal solution to the problem.

*

A GIANT STRIDE IN EXHIBITIONS

For the answer, of course, to criticism of English exhibition policy is that up to the opening of the new Dorland House Exhibition we cannot be said ever to have had a policy at all.

*

And it depends to some extent upon how well this show is done whether the policy we are about to have is well founded or not. To some extent only, because, good or indifferent, the next exhibition after this will be better still, and so on, until we really *know* how to do it.

*

The great point about this exhibition is that it is the first attempt at a *selective* exhibition, and that, my masters, is a giant's step in the right direction. I can't say how eagerly I await the opening. It will—it *must* be a great day for British industry.

*

WANTED: A TELLING CONFERENCE PROGRAMME

I wish that the R.I.B.A., when it meets in yearly conference, would make great announcement of the subjects about which it is to confer—and then in sober earnest set about its conference.

*

Slum clearance and speculative building might be two fairly engrossing headings for hot discussion, but in the invitations I missed the urgent note that might have sent me hurtling to Cambridge, and marked all too keenly the price of dining with my elders and betters.

*

One ray of hope: the camp, a new institution of a type most encouraging and, I hope, permanently to be adopted wherever pleasant circumstances permit.

THE B.I.F., BIRMINGHAM

The extensions to the British Industries Fair grounds and buildings at Castle Bromwich, Birmingham, which will increase the size of the Fair by two-and-a-half acres to fifteen acres, have been designed by and will be carried out under the supervision of Mr. C. Elliott, B.SC., of Birmingham.

THE PROBLEM OF THE SLUMS

The annual meeting of the Mansion House Council on Health and Housing was held at the Mansion House on Monday last. The Lord Mayor (Sir Percy Greenaway) presided.

The Bishop of Winchester, chairman of the Council, in his annual address, said housing schemes had failed too often because the new houses were built too far from the wage-earner's place of work, and the rents were in many cases too high. He urged the encouragement of public utility societies and private enterprise. Although the erection of new houses on expensive land often raised the local rates, it was preferable to the appalling scandal of slums

TOWN HALL FOR BRIGHTON?

A plan for a new £250,000 town hall, facing the sea-front between the two piers, is now being considered by the Improvements Committee of the Brighton Town Council.

NATIONAL ASSOCIATION OF BUILDING SOCIETIES

Sir Enoch Hill, at the annual meeting of the National Association of Building Societies, held last week, announced his retirement from the chairmanship of the Association, which he has held for twelve years.

Extracts from Sir Raymond Unwin's paper on "The Value of Good Design in Dwellings," read at the same meeting, are given on page 797 of this issue.

The circulars recently issued by the Ministry of Health, calling upon local authorities to demolish the slums in urban areas, and to provide adequate and safe water supplies in rural areas, present an opportunity for a great local effort on the part of supporters of the Building Industries National Council. Both these circulars call attention to national problems which depend for their solution very largely on local opinion. All those with the interests of the nation and of the building and public works industry at heart should support the Special Committee for Public Relations by building up an irresistible mass of local public opinion in favour of these essential works.

Subscriptions to the fund of the Special Committee for Public Relations of the Building Industries National Council should be addressed to Mr. Oswald Healing, F.S.I., at 5 Duke Street, Adelphi, W.C.2.

ROME SCHOLARSHIP IN ARCHITECTURE

The designs submitted in the Final Competition for the Rome Scholarship in Architecture will be on exhibition in the Galleries of the R.I.B.A., 9 Conduit Street, W.1, between the hours of 10 a.m. and 8 p.m. (Saturdays 10 a.m. and 5 p.m.) from June 21 to July 1, 1933.

This year the subject of the competition was "A Road House." Eleven students, drawn from the following schools, took part: Bartlett School of Architecture, University of London; School of Architecture, The Architectural Association, London; Armstrong College School of Architecture, University of Durham; Liverpool School of Architecture, University of Liverpool; School of Architecture, University of Manchester; and School of Architecture, Edinburgh College of Art.

J. R. Adamson, F.R.I.B.A., the new president of the Manchester Society of Architects.

WALCOT EXHIBITION

An exhibition of the work of William Walcot is being held at 5 Grafton Street, W.1, by courtesy of Mr. Longden, of Messrs. Martyn, during the next few weeks. The exhibition was opened unofficially or Monday, and the brilliant versatility of the artist is seen in his work, for he shows paintings, etchings and town planning schemes. His plan for the development of London is of particular interest to architects.

EXHIBITION OF PORTRAITS

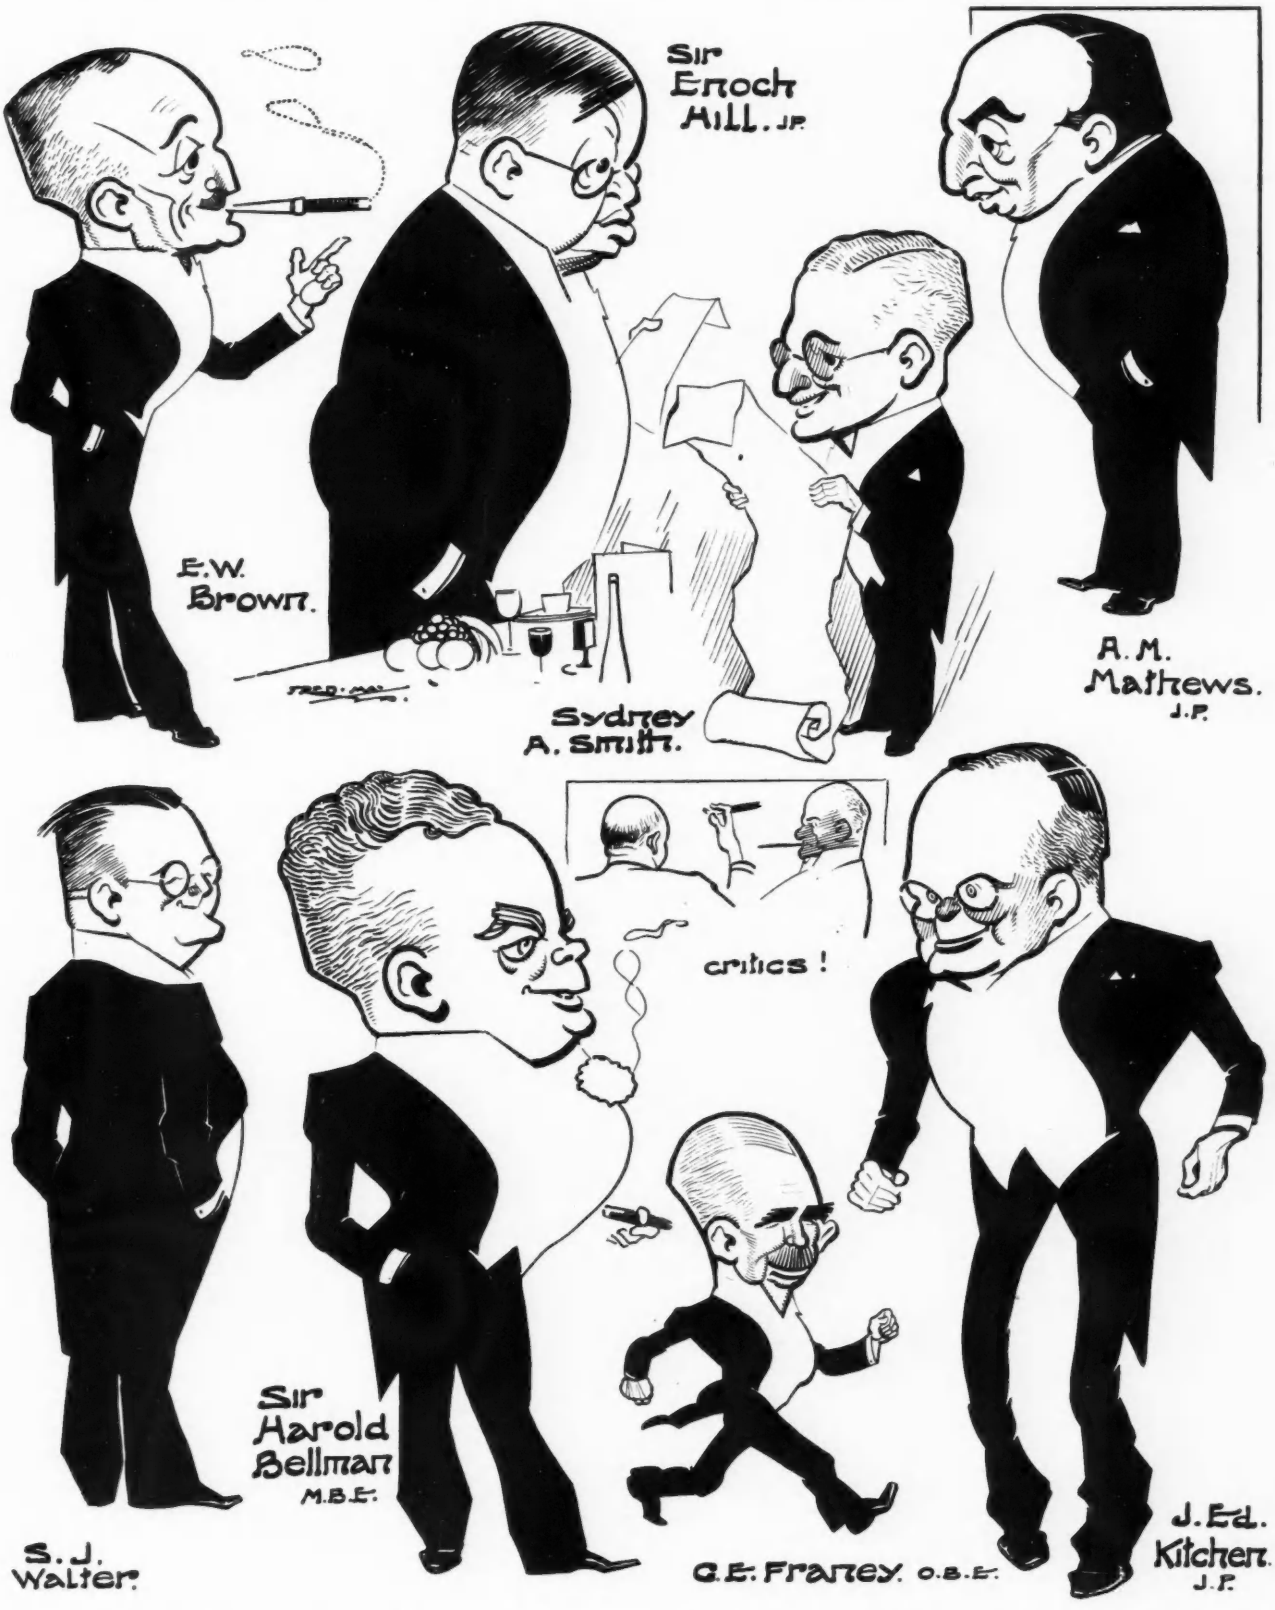
A loan exhibition of portraits by Philip A. de László, M.V.O., (in aid of the Artists' General Benevolent Institution) will be held at Messrs. M. Knoedler and Co. Inc., 15, Old Bond Street, W.1. from June 20 until July 22 (10 a.m. until 6 p.m. Sats. 10-1).

THE BUILDING CENTRE

The pair of cottages, which won for their architect, Mr. N. E. Leeson, the first place in the Building Centre Competition, have been erected on a site in front of Bush House, Strand, W.C. The opening ceremony is to take place today. A housing exhibition is also to be held at the Building Centre from Friday next.

REGIONAL PLANNING FOR BLACKBURN AREA

A conference of the various authorities in the Blackburn district of the region which originally comprised the North-east Lancashire Joint Town-planning Area has recommended the establishment of a joint committee to prepare a town-planning scheme for the Blackburn area. This (states *The Manchester Guardian*) embraces the county borough of Blackburn, the boroughs of Accrington, Clitheroe and Darwen, the urban districts of Church, Clayton-le-Moors, Great Harwood, Longridge, Oswaldtwistle and Rishton, and the rural districts of Blackburn, Preston, Clitheroe and part of Bowland.



STREET ARCHITECTURE

Mr. B. A. Millar, A.R.I.B.A., presided at a discussion held at the Ancient Chapel of Toxeth, Liverpool, last week, following the broadcast talk by Messrs. Frank Pick and John Gloag on "The Design of the Street."

Mr. Millar said the reason why the great movement towards design of streets is here is to counteract all the bad taste which is the direct result of that awful period which we associate with the industrial revolution of the last century, when street design was at its worst.

To-day, he continued, we had got away from the parochial outlook of the last century, and we thought design was

THE BUILDING SOCIETIES CONGRESS

A few well-known members, as seen by Fred May during the banquet of the International Congress of Building Societies, held at the Guildhall last week.

absolutely necessary to every part of human life, and of the utmost importance in street architecture. We now recognized what a great deal we owed in design to the Continent, and we ought to organize design in industry in such a way that the designer had a hold on everything.

DUTTON HALL

Dutton Hall, the remains of a Cheshire mediæval mansion near Northwich, is being dismantled for re-erection two hundred miles away in Sussex. It has been bought by Mr. J. A. Dewar, and the work of removal is being supervized by Mr. Guy Dawber, A.R.A.

GATESHEAD'S FIRST METHODIST CHURCH

Remains of what is believed to be one of the oldest Primitive Methodist Chapels in Gateshead have been revealed during the demolition of property in Mulgrave Terrace under a slum clearance scheme. It is understood that the building was started in 1790 and finished in 1838.

£150,000 SCHEME

The Cheltenham Town Council have approved plans for the erection, by private enterprise, of a new building on the site of the present Winter Garden. The scheme is estimated to cost £150,000.

PUTNEY HOSPITAL

The governors of Putney Hospital, S.W., have sanctioned an extension scheme, to be begun in about two months' time, which will cost nearly £25,000.

MARBLE COMPARISONS

A firm quarrying marble in Penang has approached the Imperial Institute to ascertain how the local product of the Federated Malay States compares with Italian marble. Practical trials have been carried out by London marble experts, who have reported that the marble, when used for flooring, withstood wear satisfactorily, and would also be suitable for tablets or memorials for erection indoors. It was said to be hard, but coarser grained and more open than statuary marble, and therefore liable to be more easily soiled.

GLASGOW HOUSING EXHIBITION

The Glasgow Corporation are again promoting a housing and health exhibition, which will take place in the Kelvin Hall from October 4 to 28. It will constitute the eleventh of the series run by the civic authority.

LIVERPOOL MAN'S APPOINTMENT

Mr. S. L. G. Beaufoy, chief town planning assistant to the City Engineer of Liverpool, has been appointed a Ministry of Health Inspector of Housing and Town Planning.

BRADFORD'S NEW CITY ARCHITECT

Mr. J. A. Fletcher, F.R.I.B.A., who has been Deputy City Architect for the Bradford Corporation for 23 years, has been recommended for appointment as City Architect in succession to Mr. W. Williamson, F.R.I.B.A., who retired some eighteen months ago.

ARCHITECTURE AS A TRADE

[*By ICONOCLAST*]

3. Organization and the Institute

[*In last week's article Iconoclast aimed some shrewd blows at the scale of charges. Briefly, he considered that a reduction from the customary six to five per cent.—to be inclusive, moreover, of incidental and out-of-pocket expenses—would make for better business. Now he turns to an examination of weak points in the organization of the profession. Once more, our agreement with everything our contributor says should not be taken for granted, refreshingly frank as we believe all will find it.*—ED., *A.J.*]

IT is both fashionable and popular to cast stones at the Institute; but the fact remains that, with all its faults, it is the obvious heart and core of any possible organization within the profession. Membership of it may not count for so much as in years gone by, but still remains the highest qualification an architect can hold unless he can secure one of the rare places upon the Academy.

We cannot, therefore, cast aside our consideration of the Institute as we may have to do of the Registration Act. Its faults may not be past mending, and it is certainly worth while seeing what can be done to make this fine nucleus of a trade union more effective in the benefits it can gain for its members.

The essence of an effective trade union must be that membership in itself is a mark of competence, and protection is given to its members against inefficient non-members. To a point, membership after qualification by examination was as good a rough-and-ready test of competence as human ingenuity could devise, but qualification has been to some extent depreciated from two causes.

The first is the concession to schools whereby a five-year student may qualify after passing certain internal examinations in which the examiners are the familiar masters who have trained him, subject to a nominal and generally perfunctory period of office experience, six short months in length. The degree of Associate thus ceases to be a mark of experienced competence and becomes a purely academic diploma. The other source of weakness is the admission without examination of numbers of practising architects, the work of many of whom does not justify by its quality the mark of professional distinction.

It is naturally not practical politics to cast out those who have been already admitted, but it is well worth consideration whether existing members should not be given an opportunity of qualifying either by superlative executed work, or by the passing of a further severe examination for a higher distinction than ordinary membership, and one which would declare itself as such. Whether the Royal Charter would provide an instrument in instituting a Doctorship of Architecture is a matter for the lawyers to investigate; but there is no doubt that such a degree, carefully distributed, with its title, would fulfil a discriminating purpose which would do much to remove the evils and injustices which a levelling down of qualification has brought about.

Turning to the organization of the Institute itself, it is admitted on most hands that it fails signally to reflect the mass opinions of the profession, and the admission is one of faulty organization whereby the rank and file of the distant provinces find difficulty in gaining a full dispassionate hearing. There is some excuse for the Institute being primarily a club of London architects, bearing in mind that such was actually its origin. But the excuse becomes weaker when the professed policy of the Institute of today, with the development of Allied Society work, is taken into account, though some advance in favour of the provincial architect must be conceded. But the machinery whereby the provincial architect can influence the high counsels at headquarters is still remote and less favourable than is the case with the London man. The latter has without doubt prior access to the fountain head, since his first and legitimate contact is at the General Meetings of the Institute, and his first office upon its Council and Committees. The provincial, on the other hand, must reach the same objectives by service on an Allied Society Council, possibly in some cases

preceded by Chapter Committee work, from which he may attain representative work upon the Institute Council as one of a small provincial minority.

The approach to a Federal system just falls short of attainment within the present system and an inconsistency must be apparent to all who have studied the question.

The final move to restore unity to the scheme would be to form a new Allied Society to cover the only remaining area of the country still uncoloured by Allied Society jurisdiction, viz., the London area.

A Society of London Architects would have a defined and yet wide field of activity before it, which it could pursue without the distractions of provincial interests. Treated, then, as an Allied Society, its chosen would represent it upon the central federal Council, which would be a smaller and more compact body of men, each instructed by the area it represented.

Such a reform would have a number of benefits to offer. It would in the first place give the provincial majority a fair representation on the Council and remove a reproach which is generally present in the minds of this majority. It would also establish machinery whereby policy and ideas could travel up and down from member to President, ensuring that vast comprehensive schemes, the merits of which there is no time to investigate, should not be sprung upon district membership in a mature state. The usefulness of the Institute must be more complete if its policy is initiated from below rather than dictated from above, and there is no doubt that, if this principle had been established ten years ago, we should not have been landed in so many embarrassing situations as those in which we have since found ourselves on many occasions.

So far as finance is concerned it will be generally agreed that whereas the Allied Society has been generally crippled for lack of funds with which to prosecute effective work, the Institute has had far too much money to play with, a fact which accounts for many adventures of doubtful wisdom.

In the Federated system there would not be a grant from the R.I.B.A. to the Allied Societies, but the latter would be the natural collecting-box for annual subscriptions, and each would make its grant to Headquarters for Federal administration. The systematic and fair nature of such a reform must surely be apparent.

This section dealing with the reorganization of our trade union is of very great importance in the discussion, because it must be understood that the deficiences of architectural practice as a living have arisen mainly from our disorganized state. We can neither bargain nor promise so long as matters are settled for us by a few men who, though in the letter elected by a full membership, are actually chosen by a comparatively few members drawn from a few square miles of England.

Our chief task in the way of breaking ground for a more fruitful crop is, therefore, to reorganize in a business-like way, after which we can control the machinery in an equally business-like way, to serve our own interests first, and out of that healthy state give the best service possible to the public upon whom we must live.

R. I. B. A.

ANNUAL ELECTIONS

At a general meeting of the Institute, held on Monday last, the results of the annual elections to the Council and the Standing Committees were announced as follows :

PRESIDENT : Sir Giles Gilbert Scott, HON. LL.D. Liverpool, R.A.

VICE-PRESIDENTS : Messrs. William Henry Ansell, M.C. ; John Begg (Edinburgh) ; Harry Stuart Goodhart-Rendel and Maurice Everett Webb, D.S.O., M.C., M.A. Cantab.

HONORARY SECRETARY : Mr. Sydney Decimus Kitson, M.A. Cantab., F.S.A.

MEMBERS OF COUNCIL : Professors Leslie Patrick Abercrombie, M.A. Lvpl. (Liverpool) ; Stanley Davenport Adshead, M.A. Lvpl ; Charles Herbert Reilly, O.B.E., M.A. Cantab. (Liverpool) ; Albert Edward Richardson, F.S.A., and Messrs. Henry V. Ashley ; Ernest Chawner Bewlay (Birmingham) ; Herbert Tudor Buckland (Birmingham) ; Joseph Emberton ; William Curtis Green, R.A. ; Edwin Stanley Hall, M.A. Oxon. ; Philip Dalton Hepworth; Charles Henry Holden ; Henry Vaughan Lanchester ; Oswald Partridge Milne ; Howard Morley Robertson ; Leo Sylvester Sullivan ; Sydney Tatchell ; and Percy Edward Thomas, O.B.E. (Cardiff).

ASSOCIATE MEMBERS OF COUNCIL : Messrs. Cyril Arthur Farey ; Edwin Maxwell Fry; Edwin Gunn ; Richard Goulburn Lovell (Eastbourne) ; Robert Norman Mackellar (Newcastle-on-Tyne) ; John Douglas Scott; Michael John Tapper, M.C. ; Ernest Berry Webber ; and Charles Woodward.

LICENTIATE MEMBERS OF COUNCIL : Major Frederick William Rees ; Captain Angustus Seymour Reeves ; and Messrs. Howard Leslie Baker (Romford) ; George Nathaniel Kent, F.S.I. ; Francis Robert Taylor ; and Percy John Waldram. F.S.I.

PAST PRESIDENTS : Sir Banister (Flight) Fletcher, M.ARCH., F.S.A. ; and Sir Raymond Unwin.

Representatives of Allied Societies in the United Kingdom or the Irish Free State

1 : *Six Representatives from the Northern Province of England :* Messrs. James Robertson Adamson (Manchester Society of Architects) ; Leonard Barnish (Liverpool Architectural Society) ; Blakeley Rinder Gribbon (West Yorkshire Society of Architects) ; Frederick John Horth (York and East Yorkshire Architectural Society) ; John Lancashire (Sheffield, South Yorkshire and District Society of Architects and Surveyors) ; William Milburn, Junr., B.SC., F.S.I. (Northern Architectural Association).

(2) : *Five Representatives from the Midland Province of England :* Major Charles Henry Calvert (Nottingham, Derby and Lincoln Architectural Society) : and Messrs. William Thomas Benslyn, A.R.C.A. (Birmingham Architectural Association) ; Sidney Frank Harris (Northamptonshire, Bedfordshire and Huntingdonshire Association of Architects) ; Cecil Upcher (East Anglian Society of Architects) ; and one representative to be nominated by the Council of the Leicester and Leicestershire Society of Architects.

3 : *Six Representatives from the Southern Province of England :* Lieut.-Col. Reginald Fowler Gutteridge, T.D. (Hampshire and Isle of Wight Architectural Association) ; and Messrs. Hugo Ritchie Bird (Essex, Cambridge and Hertfordshire Society of Architects) ; Stanley Hinge Hamp (Berks., Bucks. and Oxon. Architectural Association;) Benjamin Priestley Shires (Devon and Cornwall Architectural Society) ; one representative to be nominated by the Council of the South Eastern Society of Architects : and one representative to be nominated by the Council of the Wessex Society of Architects.

4 : *Four Representatives of Allied Societies in Scotland, nominated by the Council of the Royal Incorporation of Architects in Scotland :* Messrs. James Alexander Arnott, F.S.A. Scot. (Edinburgh) ; Andrew Graham Henderson (Glasgow) ; Arthur Hay Livingston Mackinnon (Aberdeen) ; and William Erskine Thomson (Dundee).

5 : *One Representative of Allied Societies in Wales, nominated by the Council of the South Wales Institute of Architects :* Lieut.-Colonel Edgar Hinton Fawckner, R.E., T.D. (Newport).

6 : *Two Representatives of Allied Societies in Ireland :* Professor Rudolph Maximilian Butler, A.R.H.A. (Royal Institute of the Architects of Ireland) ; and one representative to be nominated by the Council of the Royal Society of Ulster Architects.

REPRESENTATIVES OF ALLIED SOCIETIES IN THE BRITISH DOMINIONS OVERSEAS : (nominated by the Council of each of the following) : Royal Architectural Institute of Canada (Representative to be nominated); Royal Australian Institute of Architects : Professor Alfred Samuel Hook, A.R.C.A. ; (Representative in the United Kingdom : Mr. Maurice E. Webb, D.S.O., M.C., M.A.) : New Zealand Institute of Architects : Mr. William Henry Gummer ; (Representative in the United Kingdom : Mr. Howard Robertson) ; Institute of South African Architects : Representative to be nominated ; Indian Institute of Architects : Representative to be nominated.

REPRESENTATIVE OF THE ARCHITECTURAL ASSOCIATION (LONDON) : Mr. Charles Lovett Gill.

REPRESENTATIVE OF THE ASSOCIATION OF

ARCHITECTS, SURVEYORS AND TECHNICAL ASSISTANTS: Mr. Leonard Archibald Frederic Ireland.

CHAIRMAN OF THE BOARD OF ARCHITECTURAL EDUCATION: Mr. William Henry Ansell, M.C.

Also, the Chairmen of the Art, Literature, Practice and Science Standing Committees; Chairman of the Allied Societies' Conference; Mr. John Begg (Edinburgh); and Chairman of the R.I.B.A. Registration Committee.

ART STANDING COMMITTEE: *Fellows:* Professor Stanley Davenport Adshead, M.A. (Lvpl.); and Messrs. Leonard Holcombe Bucknell; Charles Frederick William Dening, R.W.A. (Bristol); Joseph Emberton; Arthur Bedford Knapp-Fisher; Henry Vaughan Lanchester; Edward Maufe, M.A. Oxon; Francis Winton Newman; M. H. Baillie Scott; and George Grey Wornum. *Associates:* Messrs. Edwin Maxwell Fry, B.ARCH. Lvpl.; Walter Monckton Keesey, M.C.; Raymond McGrath, B.ARCH. Sydney; Harold Tomlinson, M.A. Cantab. (Cambridge); Frederic Edward Towndrow; and Ernest Berry Webber. *Licentiates:* Messrs. Samuel George Short; Archibald Stuart Soutar; and Sidney Lunn Whitehouse (Birmingham).

LITERATURE STANDING COMMITTEE: *Fellows:* Professors Leslie Patrick Abercrombie, M.A. Lvpl. (Liverpool); Lionel Bailey Budden, M.A. Lvpl. (Liverpool); and Messrs. Louis Ambler, F.S.A.; Robert Atkinson, HON. M.ARCH. Lvpl; Martin Shaw Briggs; Frederick Chatterton; David Theodore Fyfe, M.A. Cantab. (Cambridge); Harry Stuart Goodhart-Rendel; Philip Dalton Hepworth; and Andrew Laurence Noel Russell. *Associates:* Miss Elisabeth Whitworth Scott; and Messrs. Hope Bagenal, D.C.M.; Stephen Ernest Dykes Bower, M.A. Oxon.; Harold William Chester; Eric Rowlstone Jarrett; and Grahame Burnell Tubbs. *Licentiates:* Miss Jocelyn Frere Abram and Messrs. William Walter Begley and Norman Jewson, M.A. Cantab. (Cirencester).

PRACTICE STANDING COMMITTEE: *Fellows:* Major Charles Frederick Skipper (Cambridge); and Messrs. Alexander Burnett Brown, F.S.I.; Herbert Tudor Buckland (Birmingham); William Thomas Curtis; Harry Smith Fairhurst (Manchester); Arthur Keen (Limpsfield); George Churchus Lawrence, R.W.A. (Bristol); Leo Sylvester Sullivan; John Swarbrick (Manchester); and Herbert Arthur Welch. *Associates:* John Batty; Robert Norman Mackellar (Newcastle-upon Tyne); Christopher James Fawcett Martindale (Deal); John Douglas Scott; Edward Unwin; and Charles Woodward. *Licentiates:* Messrs. Louis Blanc; Arthur Baldwin Hayward; and Malcolm Waverley Matts.

SCIENCE STANDING COMMITTEE. *Fellows:* Lieut.-Col. Percy Alfred Hopkins, O.B.E.; and Messrs. Alfred Henry Barnes; William Edward Vernon Crompton (Southport); Arthur John Hope (Bolton); Alan Edward Munby, M.A. Cantab.; Thomas Edward Scott; Herbert Duncan Searles-Wood (Sutton); Reginald Minton Taylor; Samuel Pointon Taylor; and Thomas Wallis. *Associates:* Messrs. Eric Leslie Bird; Arthur Edwin Cameron; Edwin Gunn; Alister Gladstone MacDonald; Charles Stanley White; and L. W. Thornton White. *Licentiates:* Messrs. Oliver Percy Bernard, O.B.E., M.C. (Godalming); Francis Robert Taylor; and Percy John Waldram, F S.I.

LETTERS FROM READERS

R. S. REDWOOD, A.R.I.B.A. (*Secretary, Bristol Society of Architects*)

JOHN J. BLOWER

C. W. PERRY

Ll. E. WILLIAMS, A.R.I.B.A.

The Architects' (Registration) Act

SIR,—With your readers, I am indebted to Mr. Ansell for his clear statement of the position of chartered architects in relation to the statutory register—unless gained by recognized examination, their chartered status will not serve to gain them admission after December 31, 1933. Delay, therefore, is dangerous, alike to the unexamined members of the R.I.B.A. and to others to whom the acquisition of any sort of status by examination now presents an obstacle.

That Mr. Ansell does not suggest danger to the "legal" status of qualified, non-registered architects is all to the good; he obviously realizes that no danger to such will exist. But he is scarcely fair to the Registration Council in omitting reference to the danger to that body's financial stability if there be continued delay in the influx of subscriptions of 6s. 8d., only 3s. 4d. of which is available for the maintenance of the register. The situation of the Council's "scholarship fund" which obtains the remaining 3s. 4d. gives no cause for pressing anxiety.

There are, in fact, dangers galore upon which the considered opinion of Mr. Ansell would be of the utmost advantage to the architectural profession: the danger, either to the Registration Council or to the interests of the R.I.B.A., involved in his holdership of the chairmanship of the Boards of Architectural Education of the two bodies; the danger to the prestige of the R.I.B.A. from the possible magnification of a three-and-fourpenny (but "statutory") Registration Council in the eyes of an undiscerning public—a Council representative not of one but of three "statutory" bodies; and the appalling dangers of Section 17 of the Act in its effects upon private, professional practice.

The opposite opinion to that of Mr. Ansell is that, to the genuine architectural aspirant, there is no danger commensurate with that of dallying with the idea of seeking admission to the purely voluntary and permissive register set up under the Architects' (Registration) Act, 1931.

R. S. REDWOOD

The authentic elevational drawing of John J. Blower's house, illustrated in our last issue. See letter on this page.

John J. Blower's Ex-Office-Boy

SIR,—I see poor Hardacre is trying to make a name for himself by adapting my designs for his own ends. I protest against being termed his "intimate friend" and "erstwhile colleague." It is a total misrepresentation. How my office-boy ever came to be possessed of such a high sounding name I know not, but Office Boy he was. He has stolen my plans and perverted my good name.

Of course all right-thinking readers of your JOURNAL must have realized immediately that the house he served up was most certainly not a genuine Blower. I enclose, as a proof of his nefariousness, the original elevation which he has so abused. A Blower house is well known all over the country. No trimmings; Filling a need; Functional; these are the points which go to make up a good design, and a hasty glance at the drawing herewith should be sufficient.

Kindly be so good as to see that no trumped-up trickery appears under my name again.

JOHN J. BLOWER

The Village Wren

SIR,—The art of Mr. John J. Blower is emerging from obscurity into the limelight it so richly deserves.

In view of the great interest taken by your readers in the work of this village (or shall I say suburban?) Wren, would it not be possible to have a special John J. Blower number of the JOURNAL, illustrating some of his masterpieces, and with articles describing the materials he uses, and his methods of construction; many of these, I feel sure, are unknown to the average F.R.I.B.A. and their employment (except were hindered by obsolete bye-laws) would not only reduce building

costs, but also give buildings in a few years that appearance of age that is so much admired.

Finally, to meet the wishes of those readers who have wearied of the Inigo Jones frontispiece, could not a portrait of the great man himself appear on the cover of his special number?

C. W. PERRY

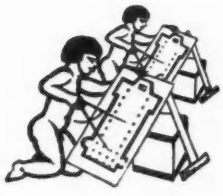
Unfinished Parts of London Buildings

SIR,—The completion of the lamp standards at St. Paul's Cathedral, illustrated in your last issue, leads one to hope that the unfinished parts of other London buildings may soon be taken in hand.

The following list gathered in a short walk through the main streets can no doubt be added to by other readers irritated at these "loose ends" of architecture on our public buildings:—

Southwark Bridge.—Completion of the approach parapets at each end.

Admiralty Arch.—Carving the boasted stonework over the inner arches.



County Hall.—Bronze ornaments on the new portion of Embankment wall.

Central Hall, Westminster.—Statue of Wesley on the unfinished pedestal on Tothill Street front.

Possibly Wellington has sat his horse too long outside the Royal Exchange without his stirrups to miss them, but the unfinished arch at the end of Downing Street can hardly yet be claimed as an Ancient Monument.

LL. E. WILLIAMS

COMPETITION

NEWS

PORTSTEWART MUNICIPAL BUILDINGS

Mr. R. H. Gibson, F.R.I.B.A., the assessor in the competition for the proposed municipal buildings at Portstewart, Co. Londonderry, has made his award as follows:

Design placed first (£50): Mr. Benjamin Cowser, A.R.I.B.A., of Belfast.

Design placed second: Mr. V. Smith, of Belfast.

Design placed third: Mr. John M'Geagh, of Belfast.

The competition was limited to architects practising in Northern Ireland. The winning design is illustrated on the following pages.

The assessor, in his report, stated that twenty designs were submitted, a number of which showed interesting and clever solutions of the programme. On the three designs placed in order of merit, he had the greatest difficulty in making a final decision, and it was only after very careful study of each that he finally placed Mr. Cowser's design first. The other two were designs of very great merit. In assessing the competition he had borne in mind the fact that the Council required a compact and homogeneous building of simple structure and refined expression, and one which would lend itself to a readjustment of the rooms as the Council might afterwards decide. The competitors had, in most cases, utilized the levels of the site for access to the two floors in a clever and logical manner.

The winning design, he continued, was a very direct and compact scheme, well presented, with many excellent points in plan. The plan showed a good Council and Town Clerk's suite, a fine public hall, with well-placed caretaker's and servery apartment, and a stage or platform which was perhaps the most generous and ample of any submitted. Altogether the plan possessed on the average a greater number of good points than any other, and it had sufficient elasticity for modification should such be desired by the Council. The elevations were restrained and refined in detail, and adequately expressed the function of the building. The Crescent elevation in particular was outstanding as a piece of fine design.

The buildings are estimated to cost £7,000.

St. Martin's Church, Wareham, from the exhibition of paintings in tempera by Maxwell Armfield, which opened at the Leicester Galleries on June 8. This exhibition is entitled "Beauty Preserved" and the pictures are records by the artist of some of the buildings and places of interest and beauty which are being preserved for the Nation by the activities of such bodies as the Councils for the Preservation of Rural England, Scotland and Wales.

NEW BELFAST COMPETITION

Belfast architects are to have a further opportunity of testing their competitive skill. At a meeting of the Corporation's Baths and Lodging House Committee the City Surveyor (Mr. R. B. Donald) reported on the proposed £40,000 extension to Peter's Hill Baths and, in view of the amount of work which his department had in hand, suggested the placing of the work with an architect in private practice.

The Committee decided to invite designs from qualified architects, the terms and conditions of the competition to be left in the hands of a sub-committee.

LAY-OUT OF A SUBURB

About ninety schemes have been submitted in the competition for the lay-out of a suburb on the River Escaut, Antwerp, which closed on May 31. It is expected that the result will be announced at the end of July.

Competitions Open

September 1.—Sending-in Day. Proposed Hospital at Surbiton. Assessor: C. E. Elcock, F.R.I.B.A. Premiums: £120, £75, £50 and £25. The conditions, obtainable from A. C. C. Dunn, Hon. Secretary, Surbiton Hospital, St. James's Road, Surbiton, were reviewed in *A.J.* for May 24.

September 21.—Sending-in Day. Proposed Town Hall for the Borough of Hornsey. Assessor: C. Cowles-Voysey, F.R.I.B.A. Premiums: £350, £250 and £150. Full conditions, etc., were published in our issue for May 17.

Competitions Pending

Proposed New Council Offices to be erected at Salt Hill for the Slough U.D.C. Assessor: H. S. Goodhart-Rendel, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions have not yet been drawn up.

Proposed Municipal Sanatorium and Craymount Children's Hospital, Belfast. Limited to architects practising in Northern Ireland. Assessor: R. S. Wilshere, A.R.I.B.A. Conditions are now being drawn up by the assessor.

Proposed Municipal Offices and Extension to the Library and Electricity Offices for the Metropolitan Borough of Stoke Newington. Conditions have not yet been drawn up.

ON THE AIR

On Tuesday next, June 20, the tenth of the series of talks on "Design in Modern Life" will be broadcast in the National Programme at 8.30 p.m. by Messrs. E. Maxwell Fry, A.R.I.B.A., and John Gloag, who will discuss "The Countryside and the Town."

MAP OF CAMBRIDGE TO ILLUSTRATE THE FOLLOWING ARTICLE

BUILDINGS AT CAMBRIDGE

REVIEWED

By

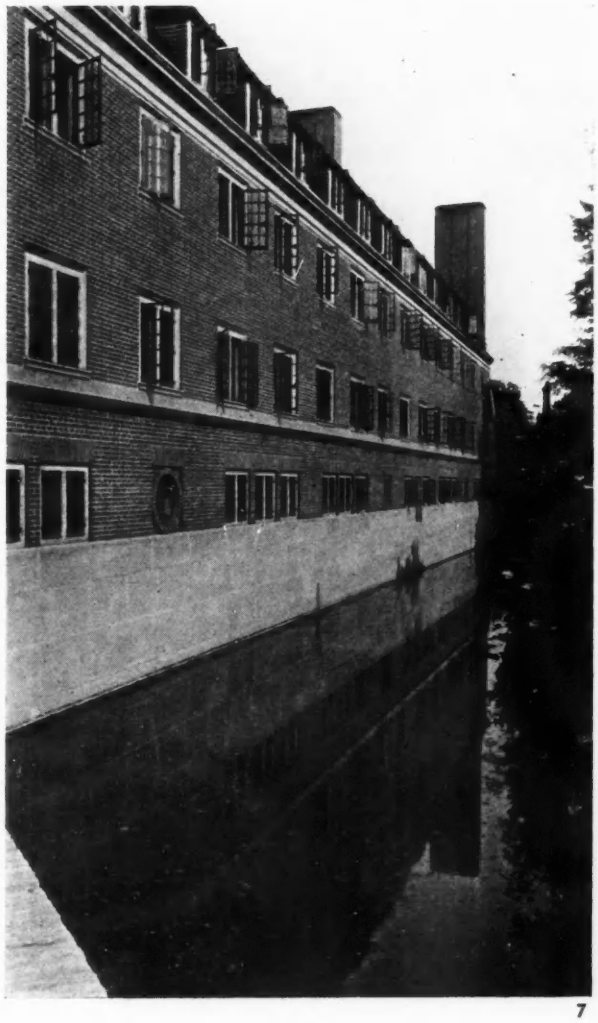
HAROLD TOMLINSON

[NOTE : *Throughout this article the figures in bold type* • 8 • *refer to the map of Cambridge on the facing page.*]

TO attempt to make a selection from the post-war buildings of Cambridge is a difficult task, and in the list which follows each item has been chosen because it seemed to possess sufficient individual interest to warrant its inclusion. Cambridge has many new commercial buildings of great merit ; but these will lie in the way of the visitor, and the limitations of a brief article have prevented their inclusion here. At the same time, it is interesting to notice how much the town has suffered from the well-meaning endeavours of firms who have tried conscientiously to preserve the amenities of the place. These firms have played to that small but influential gallery of University and Town folk who believe that Tudor is still the only suitable style.

Cambridge and its surroundings have so many houses of outstanding merit that to make a selection from these would be impertinent, and the writer has contented himself in mentioning the works of Mr. Checkley and Mr. Sisson because they are the only completed buildings which are in tune with the modern movement. It may be out of place to speculate on the propriety of attempting to marry the "moderne" to the older aristocracy ; but a certain laboratory now in process of building leads one to suspect that the new style may be better suited to the old than are the intermediate buildings of vaster proportions.

Most of the buildings that are of really large scale are devoted to commerce. Cambridge, unlike the sister University town, has not yet become a large manufacturing centre ; but in some quarters there is a growing desire to make it so, and to anticipate this state of affairs by an urban dignity to which more palladian façades are



8

JESUS COLLEGE

· 8 ·

By P. Morley Horder

The block here illustrated, of which a study of the central archway, with its sculpture above, has been selected as frontispiece to this issue, is a link between two older blocks. The bricks of these two being of different colours, its mixed facings have been gradually varied from one tone to the other to effect a transition.

7

MAGDALENE COLLEGE

· 7 ·

By Sir Edwin Lutyens, R.A.

This building is the first section of the new Benson Court, and forms one wing of a projected three-sided court open to the River Cam. The north front, illustrated overleaf, will eventually face this new court ; the south side, here shown, rises from waters of the Binn Brook, a little tributary of the Cam. To obtain a firm foundation, concrete piles were driven to a depth of about forty feet through the river mud to the underlying clay.

MAGDALENE COLLEGE

. 7 .

By
Sir Edwin Lutyens, R.A.

A near view of one of the five entrances on the north front; and a view from the north-east. The east end of the new wing faces the river Cam. The walls are of hand-made, sand-faced, multi-coloured bricks; the base and dressings are of Weldon stone, and the roofs are of red hand-made tiles. On one of the shields over the staircases are the arms of the late master, Arthur Benson, impaled with those of the College. On the keystone of one of the doorways are carved the Harvard badge and motto. A photograph of the south side of the College appears on the previous page.

7

7

considered to be proper. It may be that in course of time University buildings will have to be content with that kind of dignity which is evident in the few low buildings of metropolitan New York—buildings which acquire a kind of inverted prominence by the contrast which their lowness makes with the height of their sky-scraping neighbours.

For the present such prophecies are gratefully forgotten.

NATIONAL INSTITUTE OF AGRICULTURAL BOTANY

P. Morley Horder

1

This large block is partly devoted to the purpose from which it takes its name, and partly to flats. Both the main building and the adjacent small dwelling houses (by the same architect) form a very pleasant layout, and are in sharp contrast with the unpleasantness of the general disorder of that intervening part of the Huntingdon Road which lies nearer Cambridge. Cambridge, like Oxford, has lost nearly every chance of providing a pleasant first impression to visitors arriving by road, and here the pity is greater because so good a start had been made. As in all his other work in Cambridge, Mr. Horder has used freely the local traditional modes and materials. None of his buildings is in any way ostentatious; but sensitive residents have learned to appreciate their subtle qualities by a gradual growth of affection, and the town of Cambridge owes to this architect a debt for good instruction which only Mr. Baillie Scott can claim to share in equal measure.

ENTOMOLOGICAL FIELD LABORATORY

H. C. Marshall

2

A small building of great interest. The windows are designed to give the best possible light for the use of microscopes. The entrance is worthy of study as a charming composition achieved without affectation and in the simplest materials, namely sand-lime and black bricks.

THE COUNTY HALL

H. H. Dunn

3

This building is admirably suited to the needs of County Offices. The rooms are well lit and of pleasing proportion, and the planning is efficient. A particularly noteworthy detail of the layout is the circulation which has been arranged for vehicular traffic—a necessity in view of the increased volume of personal applications for

motor licences. The character of the work has all the admirable qualities which the same architect infused into the Village College at Sawston, near Cambridge, and a visit to this, too, is well worth while.

HOUSES

George Checkley

4

These have been too widely illustrated to need further introduction ; but it is interesting to note that in the later example (*b*) the architect has emancipated himself from a prejudice for symmetry, and in doing so has produced the freedom of planning which is one of the best features of advanced modernistic design.

HOUSE

Marshall Sisson

5

This house, also, is well known. It combines a feeling for modernistic tendencies with conventional construction and materials. The excellent plan is on traditional lines, save that it is set out in standard units of 5 ft. 3 ins., as is evident in the fenestration.

HOSTELS: CLARE COLLEGE

Harold Tomlinson

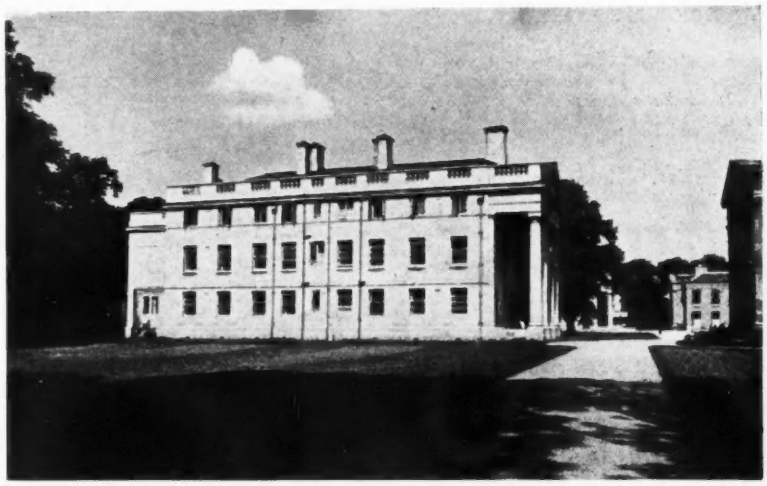
6

The two small buildings designed by the present writer are included because they were the first of their kind. They are houses designed in suites of undergraduate rooms and rented by the College to a housekeeper.

MAGDALENE COLLEGE

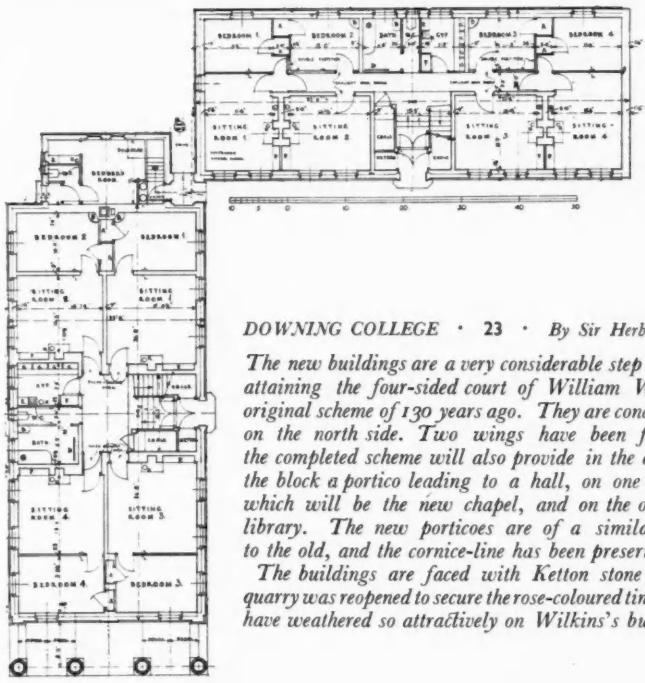
Sir Edwin Lutyens, R.A., P.I.A.A.S.

7



The completed block represents a small portion of a vast scheme. The details show Sir Edwin Lutyens's familiar but ever-astonishing versatility in the use of traditional forms. The doorways are particularly pleasing, and the staircases have all the richness which this architect usually gives to this feature. On the south front the lavatory windows of the ground floor are ingeniously masked by a small arched opening behind which is a minute internal area flanked by windows. The charm of this elevation owes much to light ingeniously borrowed at high premium for lavatorial purposes.

JESUS COLLEGE



P. Morley Horder

8

A very satisfactory new use of brickwork is seen here in the linking of two buildings of different colour by a block in which mixed facings are gradually varied from one tone to the other.

23

23

DOWNING COLLEGE · **23** · *By Sir Herbert Baker*

The new buildings are a very considerable step towards attaining the four-sided court of William Wilkins's original scheme of 130 years ago. They are concentrated on the north side. Two wings have been finished ; the completed scheme will also provide in the centre of the block a portico leading to a hall, on one side of which will be the new chapel, and on the other the library. The new porticoes are of a similar order to the old, and the cornice-line has been preserved.

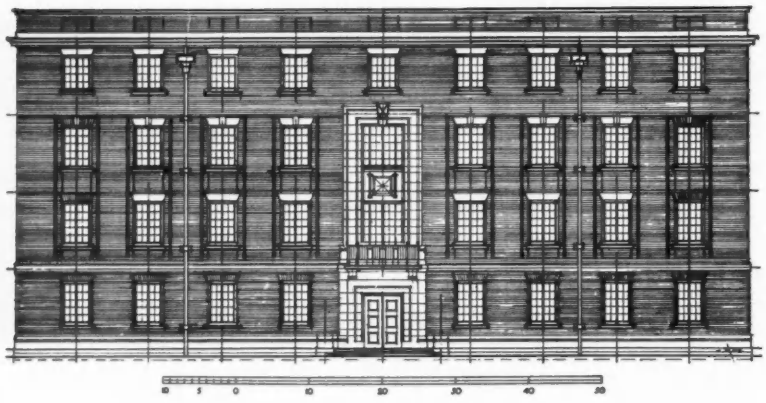
The buildings are faced with Ketton stone ; an old quarry was reopened to secure the rose-coloured tints which have weathered so attractively on Wilkins's buildings.

20

SCHOOL OF AGRICULTURE · **20** · *By Lanchester, Lucas and Lodge* (*see overleaf*)

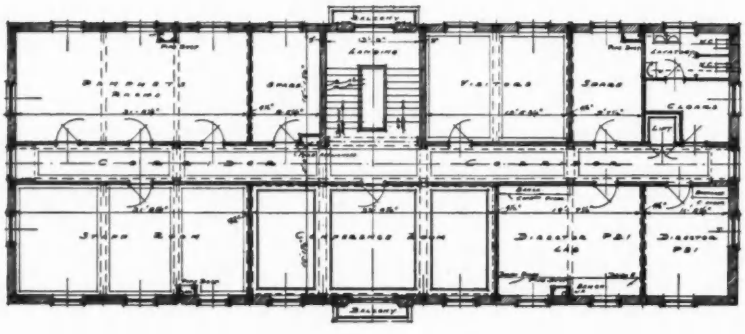
SCHOOL OF AGRICULTURE

· 20 ·

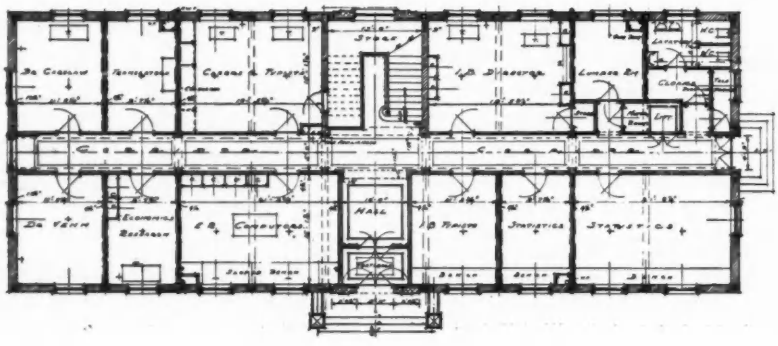


By Lanchester, Lucas and Lodge

The extension to the School of Agriculture, of which a general view appears on the preceding page, is situated at right angles to the present School and is a separate and distinct building. It forms a third side to a court of which the present School and the School of Biochemistry form the other two sides.



The accommodation on ground and first floors is shown; above are two floors of laboratories.



20

20

20

20

The older work is wisely allowed to determine the character of the new, so that a unity is preserved which a less scrupulous designer would have broken. The sculpture is by Eric Gill.

THE NEW UNIVERSITY LIBRARY

Sir Giles Gilbert Scott, R.A.

9

This is at an interesting stage. It is possible to analyse the relation of the steelwork to the skin which encases it. Evidently, the architect has been at pains to investigate new materials, and new methods of construction. Over the book-stack positions may be seen concrete cast with a smooth finish from forms which were faced with fibrous wall board, to give a surface which requires but little treatment after the moulds are struck. It will not be appreciated at first sight that the eaves are complete. The gutter is concealed behind the fascia, and the rain-water is led away through perforations in the valley members of the Roman tiles. The inner courts are now vast in scale, as are the principal rooms, and one realizes with regret that some of this largeness will be lost by transverse communications not yet completed. The mouldings of the stonework should be noted. They have a freshness of a quite different order from that of the Clare Buildings. In one of the inner courts an aluminium window frame is in position to give a clue to the appearance of the completed building.

CLARE COLLEGE MEMORIAL BUILDING

Sir Giles Gilbert Scott, R.A.

10

Work is now in progress on the completion (with revision) of the scheme originally planned by the architect. The central feature of the earlier portion is axial on the New University Library, while one of the flanking pavilions provides, through its axiality with the work of Grumbold, a slender link with the College beyond the river. The facing bricks are Ruabons treated with a slip after the first firing in order to obtain the grey colour. It will be seen that the task of allying new work greater in height by an additional story has not been without its difficulties, particularly so far as the nether circumference is concerned, and a secondary cornice in partial competition has been introduced. The slightness of the carving of the Portland stone is interesting, and the progress of larger and larger windows during successive stages is not an insignificant comment on the tendencies of the last ten years.

SIDNEY SUSSEX CHAPEL AND NEW BUILDING
T. H. Lyon
11

The chapel was completed after the war, though building operations were started earlier. A necessary change in ceiling level has been skilfully achieved, and the detailing of the woodwork is typical of this architect. The new building was built with great economy, and in its day was unique in Cambridge in having a corridor plan in place of the usual staircase system.

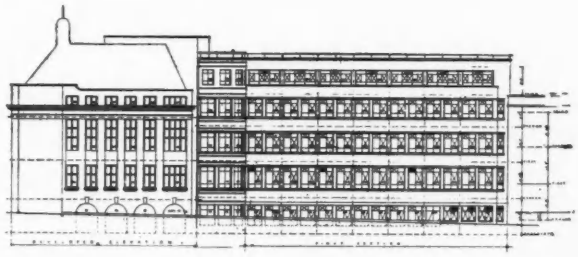
FLATS AND SHOPS, SUSSEX STREET
E. R. Barrow
12

These buildings occupy an awkward triangular site on what used to be a very narrow street. The plan has been worked out with ingenuity to give light and air by inward bowing of the frontage. Private access to the flats has been achieved by the uncovered stone staircases leading to the terrace above the colonnade. The equipment is complete and includes oil-fired central heating.

KING'S COLLEGE
Kennedy and Nightingale
13

The effect of the architects' as yet uncompleted scheme is not apparent without reference to their plans. The work has proceeded in fragments ; but it is intended to continue the range next to the Bodley building for a considerable distance by the demolition of Wilkins's work.

ST. CATHARINE'S COLLEGE
Kennedy and Nightingale
14



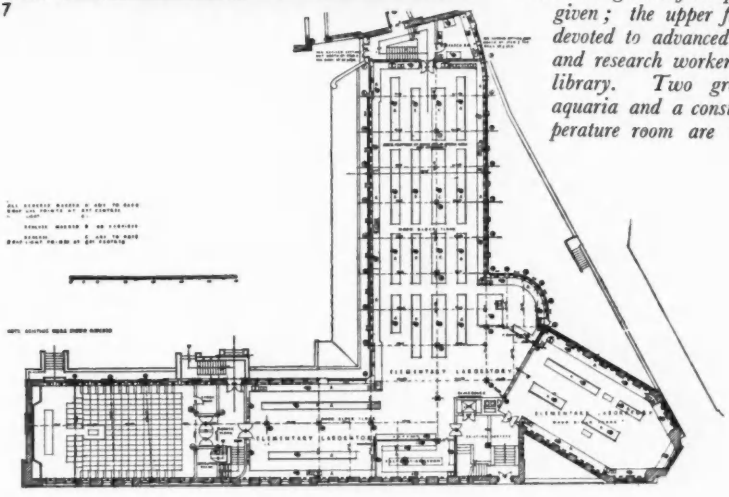
The new work here, too, is incomplete ; but what has been carried out bears some relationship in form to the earliest plans for the larger College.

CORPUS CHRISTI COLLEGE
G. R. Dawbarn
15

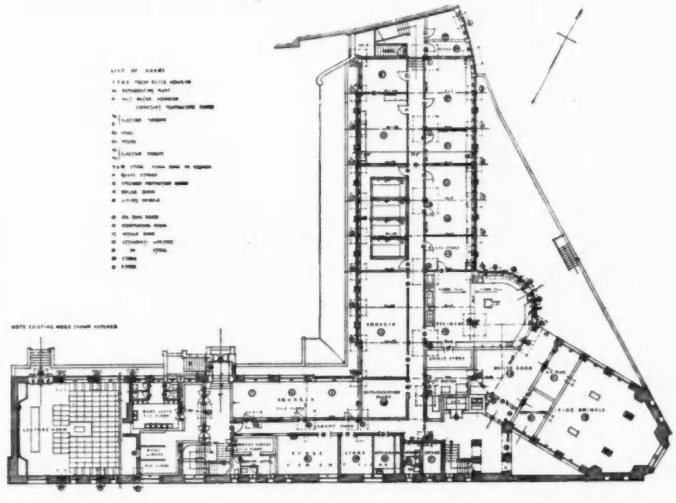
An interesting attempt to break away from the neo-Gothic work which flanks it on either side. The building includes a new Combination room of unusual shape.

THE MOND LABORATORY
H. C. Hughes
16

This laboratory forms part of a larger scheme which could not be completed



17



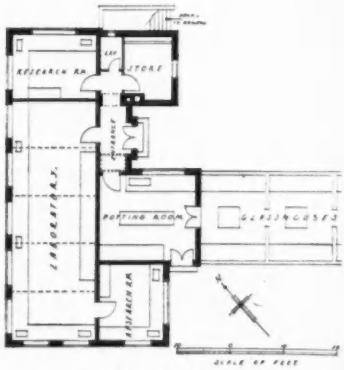
17

ZOOLOGICAL LABORATORIES
· 17 ·
By J. Murray Easton

The new group will constitute the largest and most fully-equipped institution of its kind in this country. The old Medical School building in Downing Street (by the late Professor Prior) will be remodelled as soon as the new block in Corn Exchange Street, here shown in course of construction, is completed, and floor space of some 63,000 square feet will be available. Basement and ground floor plans are given ; the upper floors are devoted to advanced students and research workers, and a library. Two groups of aquaria and a constant-temperature room are included.

17

17



26

MILL LANE LECTURE ROOMS

· 26 ·

By Dunbar Smith and Brewer

In the accompanying article, attention is drawn to the freshness which the designers have found in traditional forms, and in particular to the quality of the brickwork and the restraint of the dressings in stone. The interior decoration and equipment has been the subject of the most detailed care. Modern materials and appliances have been utilized in the interests of acoustics, heating and ventilation; and one of the lecture rooms can be darkened by a mechanically-operated blind beneath its lantern-lit laylight.

2

ENTOMOLOGICAL FIELD LABORATORY

· 2 ·

By H. C. Marshall

The principal building is of one story with a flat roof, faced in white sand-lime bricks with a plinth of local yellow bricks and a course of blue Staffordshires. The remainder of the site is occupied by special insectaries, glasshouses, and field sheds, the last being of similar materials to the Laboratory.

26

2

because the whole site was not available. It has been built with great economy, even the steelwork being exposed and painted, and the walls devoid of plaster. The facings are sand-lime bricks, with blue bricks at points subject to wear. The crocodile was carved by Eric Gill.

ZOOLOGICAL LABORATORY

J. Murray Easton (Messrs. Stanley Hall and Easton and Robertson)

17

A steel-framed building which follows the new building line without affectation of frontage. The fenestration is in standard units so that the light internal partitions may be changed at future dates to meet the exigencies of research. The windows are admirably arranged for laboratory work, and the whole building gives promise of being the first laboratory in the University to be wholly admirable both in appearance and in utility.

TRINITY COLLEGE

Edward Maufe

18

The additions which this architect has made to the Essex Building show a sensitive appreciation of their surroundings. Their external manifestations in Nevile's Court can receive no higher praise than that they are worthy of their position.

PEMBROKE COLLEGE HALL AND MASTER'S LODGE

Maurice Webb

19

The architect has succeeded in the difficult task of adding an extra story to a Waterhouse building. The improvement to the interior of the ground story will be a revelation to all who were familiar with its old form.

AGRICULTURE AND MINERALOGY BUILDINGS

Lanchester, Lucas and Lodge

20

Further ranges of laboratories in which a standard unit has been used. A joint cinematograph projector room between the lecture theatres of different departments is an ingenious device here used for the first time.

BIOCHEMISTRY LABORATORY

Sir Edwin Cooper, A.R.A.

21

A typical work of its author, reminiscent of The Star and Garter at Richmond.

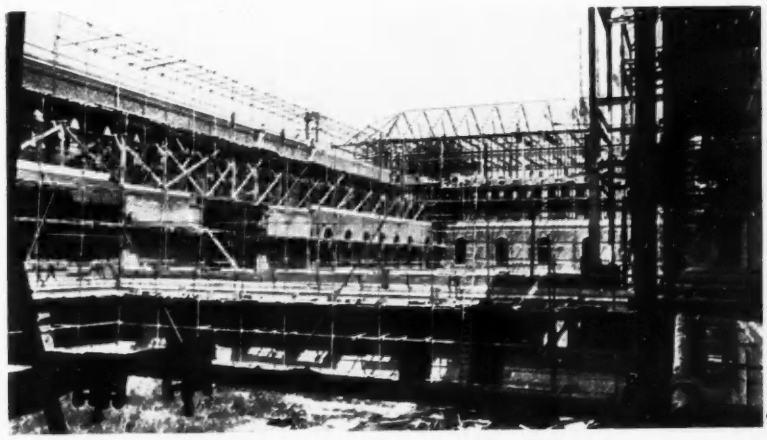
PATHOLOGY LABORATORY
Edward Warren
22

It is interesting to compare this with a laboratory for the same purpose by the same architect at Oxford. The two buildings have much in common; but the presence of stone dressings at Cambridge has completely altered the character of the work.

DOWNING COLLEGE
Sir Herbert Baker, R.A.
23

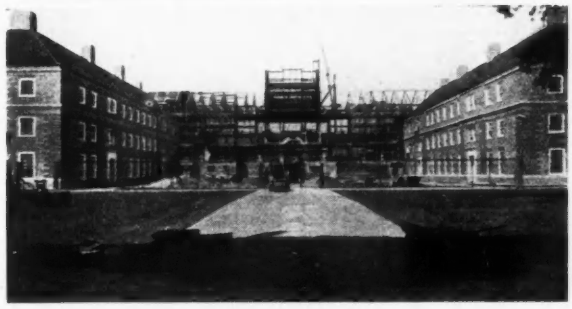
The first instalments of a large group which will be completed by a central portion with a dome. The work is in strong contrast with the modest charm of Wilkins's neo-grec work of a century earlier, but a wise union has been created by the use of Ketton stone, which was not employed after Wilkins's time until the present century.

SCOTT POLAR RESEARCH INSTITUTE
Sir Herbert Baker, R.A.
24



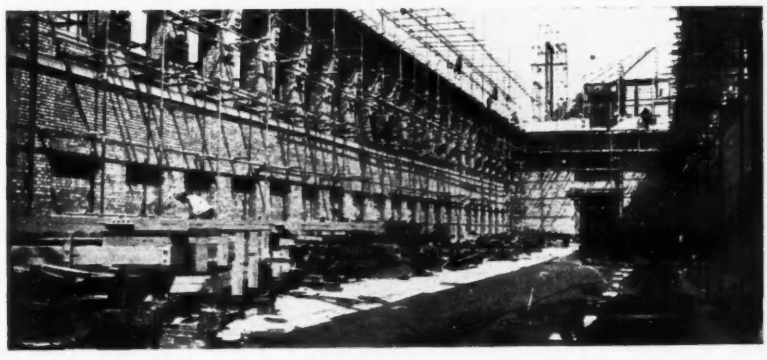
This is but recently begun; but it will be attractive to those who are interested in the early stages of building operations.

FITZWILLIAM MUSEUM EXTENSIONS
A. Dunbar Smith
25



The new gallery and the rooms beyond show how great has been the improvement within recent years of the lighting of rooms devoted to the exhibition of works of art. The illumination everywhere is admirable, and even in the lower rooms there is no object which does not seem to be unusually well displayed; but it is the pictures which give the greatest indication of the architect's competence. Particular note should be made of the provision for storage of pictures which are not permanently exhibited. The new gallery in Basevi's building is an important and highly successful experiment. The admirable methods of display are due to Dr. Cockerell, and are heightened by the beauty of the lettering. The Fitzwilliam Museum makes manifest the great architectural importance of this craft, which was sadly neglected until the recent revival—a revival to whose genesis nobody has contributed more than has the Director of the Museum.

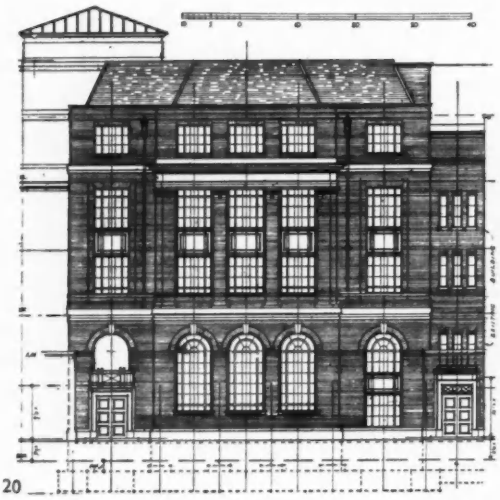
MILL LANE LECTURE ROOMS
Dunbar Smith and Brewer
26



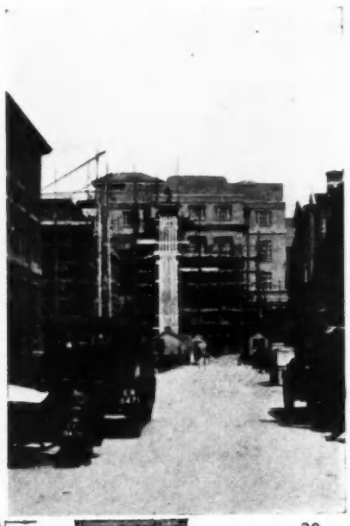
One of the most notable of recent buildings in Cambridge, and a startling reminder of the liveliness which may

9

UNIVERSITY LIBRARY
· 9 ·
By Sir G. Gilbert Scott
Plans and elevations are the subject of one of this week's Supplements, which includes a description of this huge building, here seen under construction.



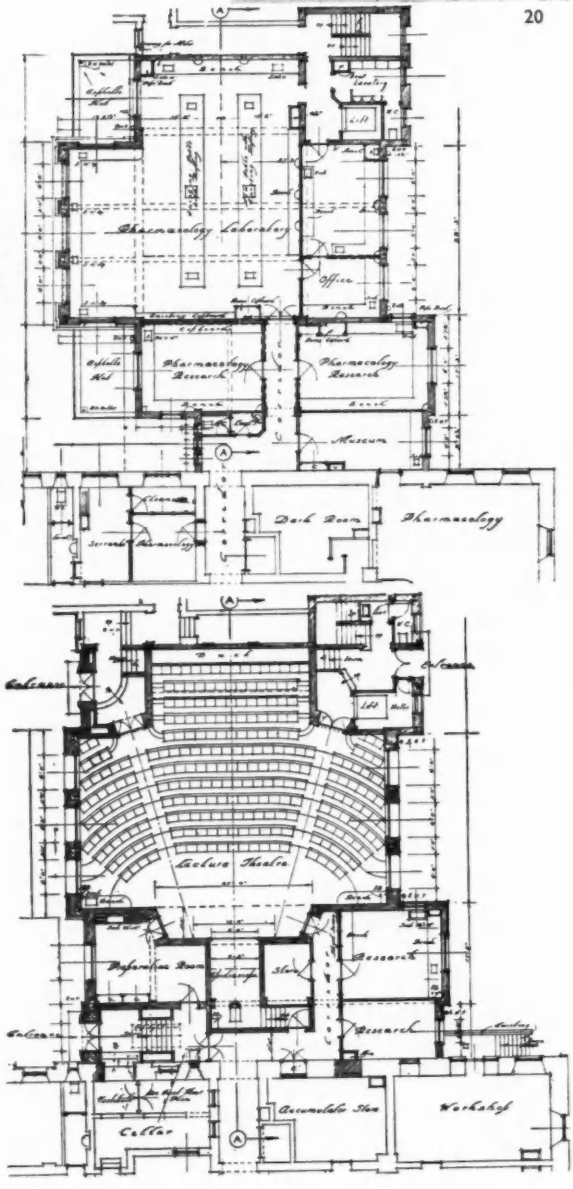
9



28

ENGINEERING LABORATORIES
· 28 ·
By F. W. Troup
The building here shown to the right supplements earlier work by the same architect. A feature of the design is the lighting of the uppermost story, which has a north light running from end to end of the building.

20



20

SCHOOL OF PHYSIOLOGY

· 20 ·

By Lanchester, Lucas and Lodge

The new building is an extension to the existing School of Physiology, and provides a lecture theatre, with seating for 250 students and additional laboratories on six floors. The photograph shows the present stage of advancement of the front, of which the elevational drawing is also reproduced. The plans are of the ground and second floors.

20

20

still be found in traditional forms. Externally admirable for the quality of its brickwork, and reticent stone details. Internally outstanding in the care which has been lavished on every detail. One lecture room has a mechanical horizontal blind to a lantern-lit laylight; and many modern materials and devices have been incorporated to ensure that both acoustics and temperature shall be perfect.

ADDENBROOKE'S HOSPITAL

Pick, Everard, Keay and Gimson

27

The Nurses' Block was designed by Mr. T. H. Lyon several years ago, and is now being enlarged by the addition of an extra story. The extensions to Trumpington Street by Pick, Everard, Keay and Gimson, already well known, are worthy of study as modern hospital practice. Planning, admission of sunlight, and general efficiency are in no way sacrificed to the elevations, yet these are of great distinction.

ENGINEERING LABORATORIES

F. W. Troup

28

A building to supplement the architect's earlier work was completed last year. The equipment both in laboratories and in lecture rooms has been very carefully thought out, and the top floor is north lit from end to end.

"HORSE AND GROOM" PUBLIC HOUSE

Basil Oliver

29

This building was awarded the R.I.B.A. Medal, and is typical of the great benefits which its architect has brought to the houses of the company which employs him—a benefit which has been extended over a large area of East Anglia.

"FINELLA"

Raymond McGrath

30

"Finella" is too well known to require any description here. It is of particular interest as the first executed work of Raymond McGrath, and shows his success in transforming the interior of a nondescript Victorian house. Glass, his favourite medium, is seen in its earliest experimental stages.

PERSE SCHOOL FOR GIRLS

T. H. Lyon

31

A highly successful addition to existing work which presented numerous problems. The asymmetrical eleva-

tions are particularly noteworthy, as is also the employment of the cheapest and simplest materials.

PETERHOUSE COLLEGE

T. H. Lyon

32

A building of individual form, which was built with great economy. The second college block to have the corridor plan.

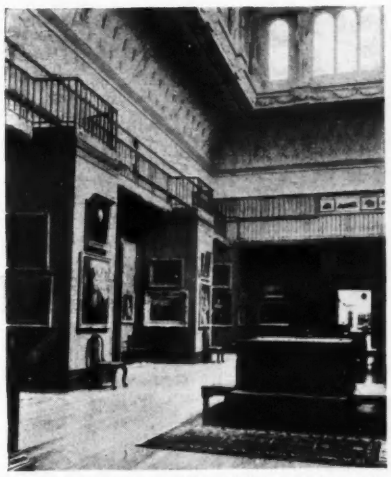
GIRTON COLLEGE

Michael Waterhouse (Sir G. G. Scott, Consultant)

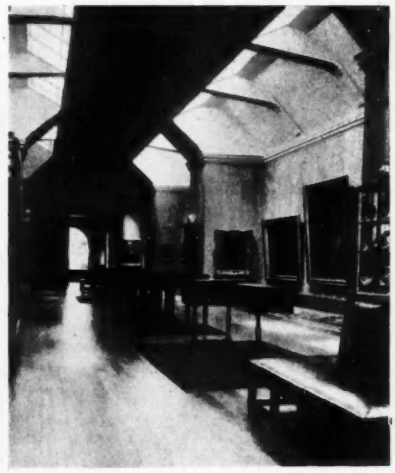
33

Additions which manage to harmonize with the unattractive buildings of the last century, and yet to preserve a charm of their own. Great care has been taken in the detailing of the internal fittings and furnishings.

Programme of the R.I.B.A. Conference



THE headquarters of the Conference will be at the Arts School, Bene't Street, Cambridge. Members should call there as early as possible to obtain conference badges, information, etc. The programme of arrangements for the four days, June 21–24, inclusive, is as follows :—

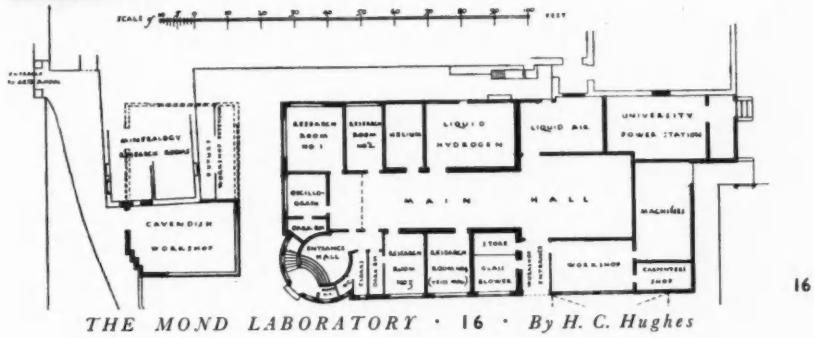


WEDNESDAY, JUNE 21—8 p.m. to 11 p.m.: An informal reception will be held in the Hall of Peterhouse, Cambridge.

THURSDAY, JUNE 22—10.30 a.m. The Conference will assemble at the Guildhall for the Inaugural Meeting, and will be welcomed by the Mayor of Cambridge (Alderman Mrs. Keynes). The Inaugural Address will be delivered by the President of the R.I.B.A., to be followed by short addresses by Mr. A. Beresford Pite, M.A. (HON.)CANTAB. (F.), and Mr. Geoffrey Webb, M.A.(CANTAB.).

Lunch : Members and their guests will make their own arrangements for lunch. 2 p.m.—Assemble at King's College, where the Conference photograph will be taken. 2.30 p.m.—Alternative visits. *A :* Old University Library; King's College, New Combination Room, Chapel ; Clare College ; over the river to New Clare Building ; New University Library now building ; bus to Headquarters. Cost per head 1s. 0d. *B :* Trinity College ; St. John's College ; Magdalene College and New Buildings ; new County Hall ; Castle Mound ; bus to Headquarters. Cost per head 1s. 0d. *C :* Mill Lane, New Lecture Rooms ; Corpus Christi College, Old and New Courts, Combination Rooms ; Free School Lane ; Mond Laboratory ; other new laboratories ; Downing College, old and new buildings ; Emmanuel College. Cost, nil. *D :* Through King's College to the Backs ; bus to Jesus College, old and new buildings, Chapel ; Westcott House, Chapel and Library ; bus to 12th century Stourbridge Chapel ; then to Pembroke College, Wren Chapel, etc. Cost per head 1s. 0d.

5.15 p.m. to 7 p.m.—Reception by the Rt. Worshipful The Vice-Chancellor of the University of Cambridge at the Fitzwilliam Museum. Refreshments. Members will dine privately.



25

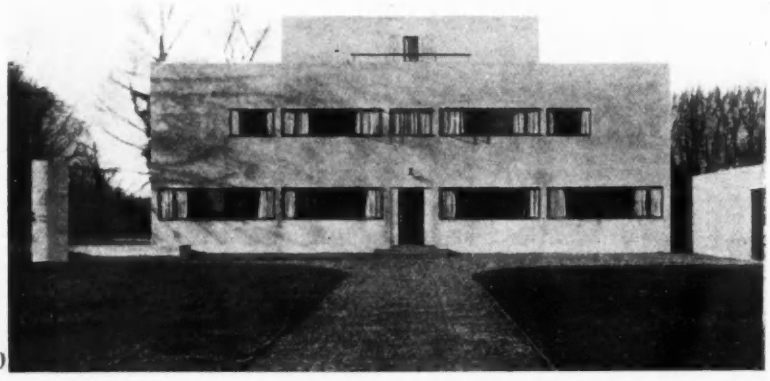
FITZWILLIAM MUSEUM EXTENSIONS · 25 · By A. Dunbar Smith

The new gallery and the rooms beyond show how great has been the improvement within recent years of the lighting of rooms devoted to the exhibition of works of art.

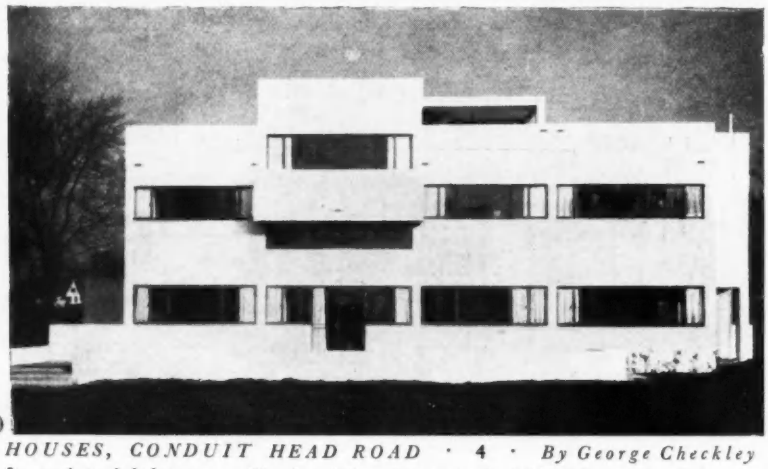
16

16

THE MOND LABORATORY · 16 · By H. C. Hughes



The laboratory is the gift of the Royal Society through a legacy of the late Dr. Ludwig Mond ; the nature of the research work into the behaviour of materials in intense magnetic fields demands darkness, quiet, electric power and low temperature installations. The walls are mainly of sand lime bricks. The bronze chromium-plated doors are set in a black faience surround. Part of the Cavendish Laboratory is seen in the foreground ; both buildings have flat roofs and metal windows.



27

ADDENBROOKE'S HOSPITAL · 27 · By Pick, Everard, Keay & Gimson

In this new wing, children are accommodated on the ground floor, with its southward-facing balcony and lawn in front, and private patients on two floors above. It is built in the main of local cream-coloured bricks, and is connected to the other hospital buildings by a corridor.

HOUSES, CONDUIT HEAD ROAD · 4 · By George Checkley

It was intended that construction in reinforced concrete should have been general, but, on account of cost, it was confined mainly to the framing of the elevations. Nine-inch brick infilling is employed. The roofs are of timber, laid to falls, boarded and covered with three layers of bituminous felt and half-an-inch of tarmac, in one case, and where used as terraces, with 1½ ins. breeze concrete slabs, brought up in Portland cement and sand, in the other. Standard metal windows, without glazing bars or mullions, and metal doors are used.

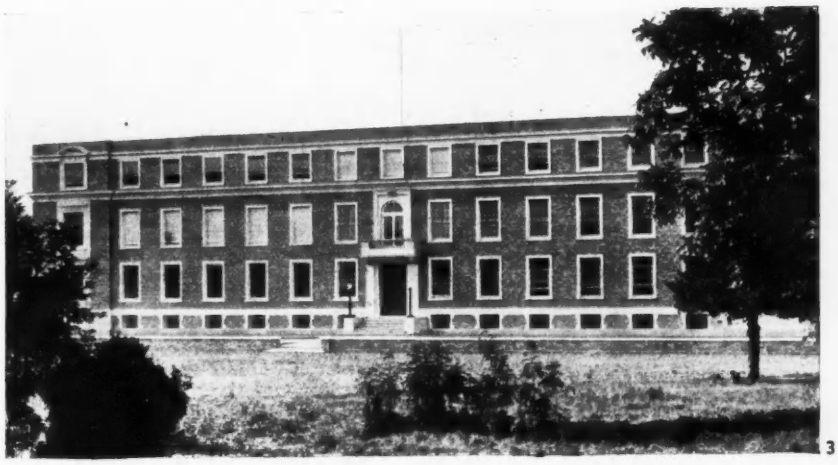
FRIDAY, JUNE 23—Alternative whole-day motor coach tours. Inclusive cost of each tour, as shown. Accommodation for certain visits is strictly limited and members are requested to state their second choice when applying. All coaches will start from Market Hill.

TOUR No. 1, 9 a.m. to 5.45 p.m.—Milton—Stretham—Ely (no stop made here on this tour)—Upwell, church—Walsoken, church—Wisbech, "Capital of the Fens," possesses a tidal river and is some nine miles from the sea. In this district King John with his army was overtaken by the tide and lost his crown and regalia. A company, "Fen Research, Ltd.," is at present engaged in attempting to locate and recover these valuables. At Wisbech will be seen Messrs. English Bros. Timber Yard—ships importing Swedish timber—creosoting process—manufacture of "chip" baskets. (Lunch.) Visits will then be made to the Parish Church, one of the five double-naved churches in England—Museum—National Canning Co.'s Pea Factory. March—largest railway marshalling yard in Europe. St. Wendreda's Church. (Tea.) Between March and Chatteris the road passes over Turf Fen, where the ancient method of cutting peat or turf for domestic fuel is still carried on and where gipsies have for many centuries exercised "squatting rights." Continue journey via Sutton—Haddenham—Stretham to Cambridge. Leader: Mr. F. Burdett Ward (L.). Cost, including lunch and tea, 9s. 6d. per head.

TOUR No. 2, 9 a.m. to 5.30 p.m.—The road along which this excursion is taken lies across the fens, which in Hereward's time were almost impenetrable, and rises on to the Isle of Ely at Stretham—inspect brick tower windmill. Only a short time can be allowed at Ely Cathedral, as time presses, and no halt will be made in the fens (where often the road is lower than the river) till King's Lynn is reached. (Lunch.) Here the party will be met by Mr. H. L. Bradfer-Lawrence, F.S.A., who will act as guide for Lynn and Castle Rising. After lunch the remarkably well-preserved Norman Castle at Castle Rising will be visited, the Norman Church and seventeenth-century almshouses. The return journey will be northwards for a short distance, then down past Houghton Hall, Castle Acre and Swaffham, to Mundford, near Grimes Graves, the great flint implement factory of the Stone Age. (Tea.) Continue the journey through Brandon, over Lakenheath, passing through plantations of the Forestry Commission, Barton Mills, Newmarket to Cambridge. Leader: Mr. H. C. Hughes, M.A. (F.). Cost, including lunch and tea, 10s. 6d. per head.

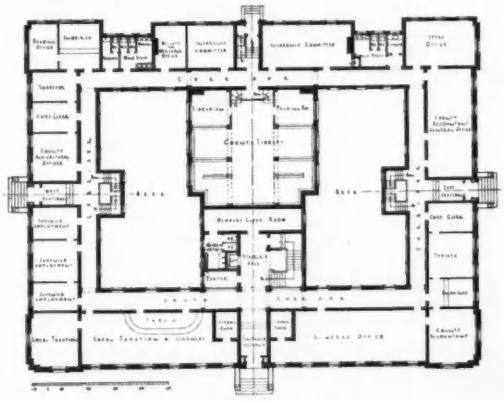
TOUR No. 3, 9.30 a.m. to 5.30 p.m.—Proceed along the London Road out of Cambridge by the Botanical Gardens and through Trumpington village with thatched roof cottages; then bear to the right and over the railway bridges, skirting the Shelfords and on to Sawston, where alight at the first Village College in England, under the directorship of Mr. Henry Morris, County Education Officer for Cambridgeshire; then to Sawston Hall. Continue past Hinxton and Littlebury to Newport, where there are houses with very good external plaster work. Between Littlebury and Newport a good view of Audley End can be obtained from the road. Proceed via Widdington to Thaxted, where there is one of the finest churches in Essex, a moot hall, and—about two and a half miles to the south—Horham Hall, a good example of sixteenth-century brickwork. From Thaxted proceed to Saffron Walden, which has a fine perpendicular church, an interesting museum, castle ruins, and many quaint houses with examples of old parge or plaster work. (Lunch at the Rose and Crown Hotel.) Drive through the park to Audley End House, the most notable residence in Essex and the site of the Benedictine Abbey of Walden. The house will be visited by kind permission of Lord Braybrooke. (Tea.) Return to Cambridge through Ashdon, Linton and the Abingtons, passing Babraham Hall on the left.

Then over the Gog Magog hills and by the golf course to Cambridge. This tour will give visitors the opportunity of seeing some good domestic architecture, together with interesting churches in some delightful country. Leader: Mr. N. T. Myers (F.). Cost, including lunch and tea, 8s. per head.



TOUR No. 4, 9.30 a.m. to 5.30 p.m.—From Cambridge to Wimpole; north along Ermine Street, past Longstowe, to Bourne (church and windmill), to Caxton Gibbet and west through Eltisley to St. Neots. From St. Neots via Eaton Socon to Buckden. (Lunch.) From Buckden to Huntingdon and Godmanchester. Through the Offords to Great Paxton; then via Toseland, Graveley and Hilton to Hemingford Grey and Fen Stanton. (Tea.) This tour will be mainly in Hunts. Its interest will centre in a number of fine parish churches (notably St. Neots and Great Paxton; the one perpendicular, the other late Saxon—a very fine example) and charming examples of vernacular eighteenth-century work. Points of especial interest are the fifteenth-century Palace of the Bishops of Lincoln at Buckden and the Bridge at Huntingdon. Leader: Mr. Geoffrey Webb, M.A. Cost, including lunch and tea, 8s. 6d. per head.

TOUR No. 5, 9.30 a.m. to 5.30 p.m.—Drive to Ely, where the Cathedral will be visited. (Lunch.) The route will be by the old road, through characteristic villages of the Fen country—Bottisham and the Swaffhams, with three interesting churches; Burwell, with a particularly fine perpendicular church; Soham, also with a fine church, near Wicken Fen, preserved as a wild-life sanctuary by the National Trust. The return journey will be on another roundabout route, by Sutton, with its noble church tower, to Haddenham on its hill, and down to Earith Bridge, at the south end of the unique Old and New Bedford Rivers, crossing from the Isle of Ely near a spot made famous by the resistance of Hereward the Wake. Thence by some of the most interesting churches in Cambridgeshire—Willingham, with a splendid timber roof and painting; Over, with remarkable local carving and sculpture. (Tea at the delightful Ferry Inn on the Ouse at Overcote.) Swavesey, with fine Early English lancets. Thence via Devana to Cambridge. This tour offers the best opportunity of seeing at close quarters the real character of the Fenland countryside and the Minster of Ely. Leader: Mr. Theodore Fyfe, M.A. (F.). Cost, including lunch and tea, 9s. per head.



TOUR No. 6, 9.30 a.m. to 5.30 p.m.—Leave Cambridge by the Barton Road, passing across the long avenue of Wimpole Hall. Join London Road, left, but leave it immediately, right, for Ashwell, via Wendy, Shingay and Guilden Morden. Alight at Ashwell to see the Church. Proceed to Baldock, where there is a fine church and some interesting eighteenth-century houses. The new factory for the manufacture of full-fashioned hosiery can also be visited. (Lunch.) Proceed from Baldock to Letchworth. After seeing the old village, the party will be shown over the Garden City under the guidance of Mr. Barry Parker, J.P. (F.) Proceed to Hitchin, where some good houses can be seen, and the fine parish church visited. (Tea.) Return to Cambridge by the direct road via Baldock, Royston, Melbourn and Trumpington. This tour will enable visitors to have expert guidance over the first and most completely developed Garden City in England; in addition, to see some very pretty country in the neighbourhood of Cambridge, and, in Hitchin and Baldock, two Hertfordshire towns which are full of character. Leader: Mr. P. C. Blow (A.). Cost, including lunch and tea, 9s. per head.

BANQUET: 7 p.m. for 7.30 p.m.—Conference Banquet in the Hall of Trinity College.

SATURDAY, JUNE 24: Informal Visits.—Private parties to other places of interest. Members to make their own arrangements. Information will be available at the Conference Office.

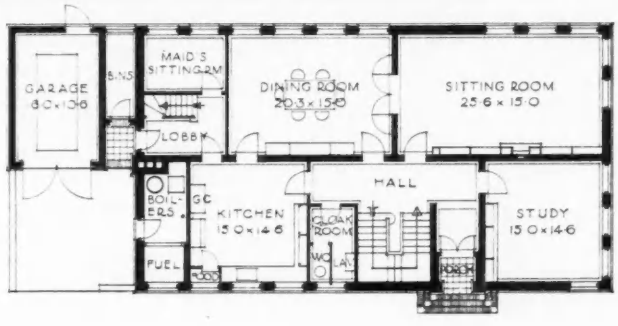
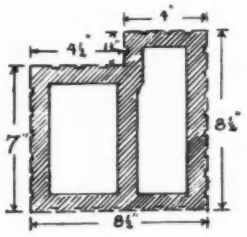
COUNTY HALL · 3 · *By H. H. Dunn (County Architect).*



The view is taken from the grounds. The bricks used were salved from the gaol previously standing on the site; dressings are of reconstructed Portland stone. The Council Chamber is over the library, which accommodates some 20,000 volumes. The buildings cover rather more than half an acre, and house all the County administrative services except police and public assistance.



5

HOUSE · 5 · *By Marshall Sisson.*

Designed for a family of three and one maid, this modernistic building is constructed of traditional materials: 14 ins. brick walls with ½ in. flat joints, lintels, sills and copings of reinforced cast stone, and wooden casements, glazed with crown glass. The flat roof has a garden with pergola and screened sun-bathing area. All the kitchen services are in one room. There is only one chimney, containing flues from central-heating boilers and the gas range. (See the ground plan below.)

TRADE NOTES

BY F. R. S. YORKE, A.R.I.B.A.

Hollow Tiles in Domestic House Construction

I HAVE often wondered why hollow tiles are used so rarely in the construction of domestic houses; they have been on the market for years, and have been proved reliable and economical and are used for walling with steel-framed structures.

•

Seeking enlightenment I called on J. H. Sankey and Son, who manufacture *Holbric* and I was informed that the neglect of this important material persists mainly because many local authorities still work to obsolete byelaws, i.e., the regulations that govern building work in the areas in which they have authority have not been revised to meet the requirements laid down in the Model Byelaws (1930), and, whilst the Code of Practice and British Standards Specification govern the use of hollow tile with steel-framed structures, the local council surveyor has jurisdiction over domestic house building, and may turn down a scheme if the type of construction proposed is not permitted by the byelaws in force in his own district, although such construction meets with approval under the Model Byelaws issued and recommended by the Ministry of Health.

•

An architect cannot, of course, compel a surveyor to accept a form of construction that is not approved under the byelaws existing in his district, for it is the duty of the surveyor to enforce these byelaws, even though they be hopelessly out of date. But *he can press for an amendment*, and to get byelaws amended is, I am informed, a comparatively simple procedure, though a month may elapse before an amendment takes effect. He will, in doing this, have the sympathy and co-operation of the Ministry of Health, who are anxious to see all local authorities' byelaws brought up to date, i.e., based on the Model Byelaws (1932).

•

Paragraph 5 of the Memorandum of the Model Byelaws says: "Local Authorities proposing to make byelaws are asked to base their proposals on the model series where there is one, and to follow it as closely as they can. The object of Parliament in leaving certain matters to byelaws is that the responsibility for meeting local needs shall rest upon the byelaw-making authority, but obviously differences between districts in the law of building should be confined to points where there is a substantial difference in local needs or circumstances. The law is unavoidably technical and sometimes controversial, and the people most concerned with these byelaws, architects and builders (who may have building activities in several districts) have found the continual differences which formerly existed (often in details where differences could not be justified) to be probably the most irksome feature of their control by Local Authorities.

"This irksomeness cannot be avoided except by following the settled forms of clause embodied in the model series."

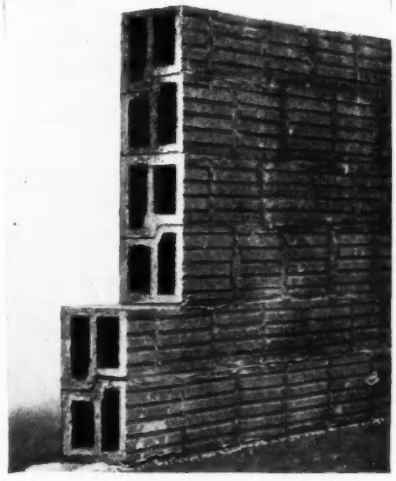
•

Paragraph 5* of the Byelaws says: The byelaws with respect to the structure of walls except those numbered 22 and 30† shall not apply to a domestic building if:

(1) the building comprises not more than *two* stories;

(2) the capacity of the building does not exceed *eighteen thousand cubic feet*;

(3) each external wall of the building is constructed of good and suitable material so as to be of sufficient stability and reasonably weatherproof and either:



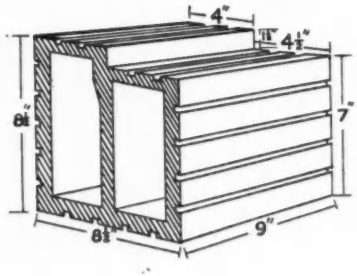
a. to a height of not less than *six inches* above the surface of the adjoining ground is constructed of:

(i) good whole bricks or stone not less than *eight-and-a-half* inches thick and properly bonded and solidly put together, with good mortar compounded of good lime and clean sand or other suitable material, or with good cement, or with good cement mixed with clean sand, or

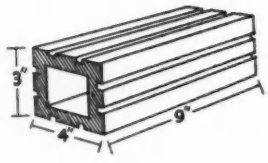
(ii) other good, hard and suitable incombustible material of sufficient thickness, properly and solidly put together, or

b. at a height not less than six inches above the surface of the adjoining ground is carried upon sufficient piers so constructed as to comply with the byelaws with respect to a pier forming part of a wall.

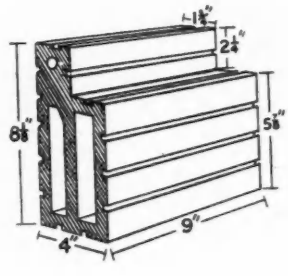
Paragraph 17 anticipates the use of hollow blocks in the construction of external and party walls in saying, under section (b) (1): "where any wall or part of a wall of a building is constructed of hollow blocks, every block shall be constructed of good material not inferior in strength, impermeability and fire-resisting capacity to good whole bricks used in the same position."



An 8½ ins. interlocking hollow tile wall.



•



Messrs. Sankey have employed their ordinary 9 ins. x 6 ins. x 9 ins. hollow building

** A footnote to this paragraph says: "wherever byelaws of an urban type are in force a provision on these lines should be adopted. It has been found extremely valuable not only for wooden buildings, but for buildings in various patented materials."*

† Dealing mainly with damp-proof courses and copings.

Left: 8½×8½×9 ins. long block.
Above: 4×3×9 ins. long block (closer).
Right: 4×8½×9 ins. long block.

blocks for the construction of 9 ins. walls, but find them less satisfactory than their 8½ ins. *Holbric* interlocking blocks, which have rather thicker " walls," and a crushing strength of about 923 lb. per sq. inch. (It is interesting to note that the Code of Practice requires a crushing strength of 450 lb. per sq. inch of a hollow burnt clay block used in a steel-framed structure.)

•

It is customary to render the blocks externally and to plaster them in the usual way on the inner face. Both faces are keyed to secure good adhesion.

•

The wall below the dampcourse is best built in brickwork or concrete, but the whole of the wall above may be in hollow tile, and the manufacturers will supply details of finishes at reveals, angles, around door frames, and so on.

•

I have been supplied with the following figures showing the comparative price of 8½ ins. rendered *Holbric* walling against 9 ins. pointed brick walling. Weather pointed 9 ins. brickwork with picked facings costs approximately 15s. per superficial yard. Rendered *Holbric* walling costs approximately 11s. per superficial yard. It seems, therefore, that the external walling of a house 24 ft. by 20 ft., having approximately 196 yards of 9 ins. brick wall at 15s. per yard would cost £147, whereas the same amount of walling in *Holbric* at 11s. per yard would cost £107 16s., indicating a *saving*, effected by the use of hollow tile, of £39 4s., which represents a considerable economy on such a house.

Automatic Coal Stokers

I am told by the manufacturers of the *Mastoker* that the price of the No. 4 model is £168, not £160, as shown in the price list that appeared in these notes on June 1.

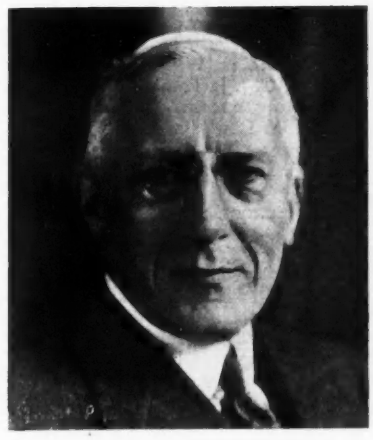
SOCIETIES AND INSTITUTIONS

NATIONAL ASSOCIATION OF BUILDING SOCIETIES

Sir Raymond Unwin, P.R.I.B.A., in a paper on " The Value of Good Design in Dwellings " at the annual meeting of the National Association of Building Societies, compared the cost of speculative and architect-designed houses. He said :—

You may be thinking that houses built by speculative builders are much cheaper than those designed by architects and built under their supervision. To meet this probable question I have collected from quite independent sources and from equally varied parts of the country particulars of cost relating to a number of such houses. To secure as fair a basis of comparison as possible, the total floor area of accommodation in all cases was taken out, the cost reduced to a price per square foot, a much more valuable standard, I believe, than the price per cube foot, which in these days of high pitch, low pitch, flat roofs and bungalows tells very little. The numbers taken, about 30 separate examples of each, are clearly not sufficient for basing any general conclusions upon, but, for what they are worth as an indication fairly arrived at, I will give them. The architect-designed houses show an average cost of house and site costs of 14s. 5½d. per square foot ; the speculative houses show an average selling price of 14s. 11d. per square foot. When reasonable allowance is made for the number of cases in which the architect was building a single house, and those in which the quality of the building may have been higher, there is, I think, sufficient ground here to suggest that more skilled planning and design, so far from being a costly luxury, probably saves more in cost than the modest fees with which it is recompensed. I do suggest seriously to all concerned with speculative building that this matter of employing well-trained and skilled designers is worth their impartial investigation. In this connection they may be reminded that the R.I.B.A. sanctions a specially low scale of fees for the design of houses for builders where the architect's responsibilities end with design, and a scale providing generously for repetitions. To meet the urgent need for improving design at the present time, this scale has been examined by a special committee and further adjusted to the special conditions.



There can hardly be surprise that these ill-planned houses with cramped rooms are in appearance too often further spoiled by a hotch-potch of ill-assorted samples of windows, doors, gables, flats and still less purposeful features, showing a complete absence of the most ele-

IAN MacALISTER

ROYAL INSTITUTE OF BRITISH ARCHITECTS

MR. IAN MACALISTER, M.A. (Oxon.), F.C.I.S., was born at Liverpool in 1878. His father was the late Sir John MacAlister, Secretary of the Royal Society of Medicine, and his grandfather the late Donald MacAlister of Tarbert, Loch Fyne.

Coming to London in 1887, he was educated at St. Paul's School, of which he was a Foundation Scholar, in the reign of the great High Master, F. W. Walker. He went up to Merton College, Oxford, in 1897, as an open Exhibitioner in Modern History. Persuaded to desert his own subject, he obtained Second Classes in the Honours Schools of Classical Moderations and Literæ Humaniores. Taking his degree at the end of 1901, he went to Canada early in 1902, with local rank of Captain, as Secretary and Aide-de-Camp to Major-General the Earl of Dundonald, General Officer Commanding the Canadian Army. Two very strenuous years of staff and organization work took him from end to end of the Great Dominion and in 1904 a political crisis brought the appointment to an end. A short period of work as a journalist was followed by his appointment, in February 1908, as Secretary of the R.I.B.A., in succession to the late W. J. Locke. He has therefore spent just over a quarter of a century at 9 Conduit Street.

That period has been one of growth and development in the R.I.B.A. and its Allied Societies. Subscribing membership of the Institute has risen from 2,200 to 7,000, income from £10,500 to £40,000, assets from £25,000 to £155,000, Trust Funds from £12,800 to £42,300.

In 1908 there were 19 Allied Societies. Now there are 100 Allied and Associated Societies, Branches and Chapters.

mentary appreciation of the need for relationship which is the essence of design.

The plainness of the usual Council housing scheme is sometimes made an excuse for this riot of unrelated features. It is however an excuse only ; and in no sense a reason. The plainness and simplicity of Housing Schemes are rightly the outcome of an economy which is appropriate to building aided by public funds. Much of it is restful and pleasing enough, and in general effect often puts to shame the more elaborate jumble of undigested features to be found on the speculative site across the road.

THE INSTITUTION OF STRUCTURAL ENGINEERS

The result of the elections of Officers and Council of the Institution of Structural Engineers for the session 1933–1934 is as follows :—

President : Major A. H. S. Waters, V.C., D.S.O., M.C., M.INST.C.E., M.I.MECH.E., etc. ; vice-presidents : Mr. Ewart S. Andrews, B.SC., M.INST.C.E. ; Mr. J. T. Saunders, F.R.I.B.A. ; Lt.-Col. C. H. Fox, O.B.E., B.SC., F.S.I. ; and Professor J. Husband, M.ENG., M.INST.C.E. ; hon. secretary : Dr. Oscar Faber, O.B.E., M.INST.C.E. ; hon. treasurer : Mr. W. Muirhead, M.INST.C.E. ; hon. editor : Mr. H. R. Cox ; hon. librarian : Mr. A. J. Taylor, F.R.I.B.A. ; hon. curator : Lt.-Col. H. S. Rogers, C.M.G., D.S.O., etc.

Ordinary members of Council : Captain M. Buxton, M.C., M.A., M.INST., C.E. ; Professor C. E. Inglis, M.A., M.INST.C.E., A.M.I.MECH.E. ; and Messrs. J. Stuart Lewis ; J. F. Butler, A.M.INST.C.E. ; G. McLean Gibson, O.B.E., M.I.MECH.E., A.M.INST.C.E. ; H. J. Collins, M.SC., A.M.INST.C.E., A.M.I.MECH.E. ; A. Kirkwood Dodds, M.C., L.R.I.B.A. ; P. J. Black, L.R.I.B.A. ; W. F. Hutchinson ; S. Bylander ; C. J. Jackaman, A.M.INST.C.E. ; R. Travers Morgan, M.INST.C.E., A.M.I.MECH.E. ; J. D. Stitt ; W. Douglass-May ; E. Granter, B.SC., A.M.INST.C.E. ; F. M. Easton ; and A. S. Lowe, M.C., A.M.INST.C.E., A.M.I.MECH.E.

WELSH SCHOOL OF ARCHITECTURE

The students of the Welsh School of Architecture played a prominent part in the annual sports of the Technical College, Cardiff, held on Friday, June 1, taking seven firsts out of 11 events.

The two departmental events, the tug-of war and the one mile relay race, were both won by the Welsh School of Architecture, while important events were won by D. K. G. Cumming and D. J. Armstrong, both students in the Architecture School, D. K. G. Cumming winning the 120 yards hurdles, 880 yards flat, and one mile flat, while D. J. Armstrong won both the long jump and the high jump.

LITERATURE

THE LANDSCAPE OF ENGLAND

The Landscape of England. By Charles Bradley Ford. London : Messrs. B. T. Batsford. Price 12s. 6d. net.

IF one had been asked to write a comprehensive book on the landscape of England, to cost not more than 12s. 6d., and to be profusely illustrated, one would have said it was an impossibility. It has, however, been done ; the apparently impossible has become an accomplished fact.

This book is the eighth of the series on England to be published by this firm, and, as previously, the photographs are not only excellent in themselves but most comprehensive in their range, and the text interspersed with delightful pen sketches by Mr. Brian Cook. In a land where the works of man are so much a part of the landscape it is impossible to ignore these works, and so amongst the superb panoramas over the plain of Worcestershire, the Vale of Evesham, the moors and the Weald, among the pictures of intimate little places such as Boscastle, Lulworth Cove, St. Cross, etc., we find illustrations of many of our famous cathedrals, views of the industrial areas, shipping and so forth.

The text itself obviously provided the most difficult task for the author, for he had to include an enormous amount of matter in a small space, and make it interesting. This was a tremendous task, and in so far as it could ever succeed, it has succeeded admirably ; but obviously only a small portion can be read and assimilated at a time. It is, indeed, a book to pick up and gloat over, a book in which one can renew one's acquaintance of places one knew well or discover more about places one did not.

The book is divided into five areas, and although repeated reference is rightly made to the geological formations, it is not treated in this way. Starting in the north of the country, the first area is bounded on the south by Cheshire, Derby, Nottingham and Lincoln ; the Midlands by Gloucester and Northampton ; the east by Huntingdonshire, Cambridgeshire and Essex ; and the south-east and west both by the sea. Each section is provided with a map on which is marked the chief ranges of hills and the important towns and villages.

L. F. R. COOTE

Major A. H. S. Waters, V.C., M.I.Mech.E., the new President of the Institution of Structural Engineers. See note on this page.

The late F. W. Simon

We regret to record the death of Mr. Frank Worthington Simon, F.R.I.B.A., which took place at his home at Mentone in his seventieth year.

Mr. Simon (writes J. B.) was elected to the Fellowship of the Institute in 1902.

He received his early training in Birmingham and later at the Ecole des Beaux Arts in Paris. He was Tite Prizeman of the R.I.B.A. in 1887. From the earlier 'nineties till about 1902 he practised in Edinburgh, having been latterly for some years in partnership with the late Sir Rowand Anderson (Anderson, Simon and Crawford). On the dissolution of this partnership he won the competition for the Liverpool Cotton Exchange in association with Mr. Matear of Liverpool.

Latterly he had devoted himself principally to competition work, in which his chief success consisted of the competition for the new Parliament House at Winnipeg, Canada, the erection of which building he himself saw through on the spot.

Mr. Simon was a man of great personal charm. He had an unusually facile pencil and was no mean executant in water-colour painting. He had more than "a streak of genius" in design, and would assuredly have risen to the highest eminence in his profession had it not been for a certain wandering instinct that seemed to be deeply ingrained in his nature, and that kept him from allowing himself to take root in any one spot.

Trade Items

Resulting from the death of Mr. Sanderson, who was associated with Messrs. Sidney Flavel & Co., Ltd., stove makers, Leamington, for sixty-five years, we understand that the following appointments have been made—Additional directors : Miss I. Lane and Mr. S. W. B. Flavel, B.SC. ; Mr. G. Westley to be secretary and accountant ; Mr. Burton-Smith to be assistant secretary and cashier. Miss I. Lane has been associated with the company for fourteen years, and has been private secretary and chief of office administration. Mr. S. W. B. Flavel is the sixth generation of this old private family business—his uncle, Mr. Percival Flavel, J.P., being the present proprietor.

*

The new Khedive Ismail Bridge at Cairo was opened by H.M. King Fuad I on June 6.

In the absence of Mr. Charles Mitchell, Chairman of Dorman Long & Co., Ltd., designers and builders of the bridge, who was unavoidably prevented from attending, the Company was represented at the Opening Ceremony by Major F. W. Stephen. Major Stephen carried with him a lapis lazuli and gold fountain pen stand suitably inscribed for presentation by the contractors to H.M. King Fuad I.

*

The ballroom walls and ceiling of the Ace of Spades Club, Kingston, are carried out wholly in black—except for a ceiling panel of silver above the maple floor. Even the floor, surrounding the maple centre for dancing, is black, Dunlop rubber flooring being used both on account of its purely jet-black colour and for quietness. The furniture is a brilliant red.

The combined effect is striking but is only to be appreciated when the room is in use. This, in fact, was the architect's (E. C. Musman) intention, his view being that the colour and decorative schemes of ballrooms should not be complete in themselves but should rather provide backgrounds for the people using them—and in particular for the dresses of the women. The ballroom stairs and the Club entrance hall are also carried out in black with green Dunlop rubber flooring.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

The Surrey C.C. has authorized the preparation of plans for the provision of a centralized laundry at the FARNHAM Institution, the cost being estimated at £11,500.

Plans passed by the SOUTHGATE U.D.C. : Eight shops and flats, Winchmore Hill Road, for Mr. C. W. Dennis ; extensions to premises, Green Lanes, for The London Co-operative Society, Ltd. ; four maisonettes, Myddelton Gardens, for the New River Co., Ltd. ; depot, Reservoir Road, for United Dairies, Ltd. ; sub-station, Vicars Moor Lane, for The N.M.E.P.S. Co. ; eight shops, The Broadway, for Mr. T. Woolnough ; extension to bakehouse, The Broadway, for Mr. C. D. Walden ; 16 flats, Station Road, for Mr. C. E. Ward ; layout of 16 houses, Waterfall Road, for Mr. F. Bate ; alterations, 27 The Broadway, for Messrs. Ruddock & Co. ; layout of nine houses, Bourne Hill, for Mr. C. E. Ward ; two houses, Vicars Moor Lane, for Mr. W. Drinkwater ; six houses, Brookdale, for James Estates, Ltd. Plans submitted : alterations to building, Russell Road, for The Hoffman Le-Roche Chemical Works, Ltd. ; three shops, Bowes Road, for Mr. P. M. Fraser ; public-house, Enfield Road, for Messrs. Dudley Newman, Elliott and Archer ; additions to Holy Trinity Church, Green Lanes, for Messrs. Alder, Turrill and Danvers ; two houses, Oakthorpe Road, for Mr. H. C. Keene, Jnr.

Plans passed by the TEDDINGTON U.D.C. : Four shops, Stanley Road, for Miss I. A. Dunton ; two houses, Munster Road, for Mr. F. J. P. Disney ; shop, Stanley Road, for Mr. B. H. Parker ; two houses, Connaught Road, for Mr. A. Gray.

SOUTHERN COUNTIES

Plans passed by the BRIGHTON Corporation : Four bungalows, Vernon Avenue, for Mr. H. King-Jones ; two blocks of 33 flats, Crescent Park Road, and Brewer Street, for Mr. T. J. Braybon ; four houses, Ditchling Road, for Sussex Property and Building Co. ; two houses, Rosebery Avenue, for Mr. W. Rason ; shop and six houses, Whitehawk Road, for Mr. F. J. Wellman ; Guildroom, Whitehawk Road, for Brighton Co-operative Society ; five houses, Stanmer Park Road, for Mr. W. A. Fuller ; 24 houses, Carden Avenue estate, and flats, Widdicombe Way, for Messrs. Braybons, Ltd. ; 65 houses, Ladies Mile estate, Patcham, for Messrs. G. Ferguson and Son.

Plans passed by the GUILDFORD Corporation : Three houses, Downs estate, for Messrs. R. Holford & Co. ; two houses, Downs estate, for Mrs. L. Cook ; two houses, Mount Farm estate, for Mr. H. L. Clarke ; two houses, Beckenham Road, for Mr. C. T. Corps ; two houses, Wendy Crescent, for Mr. R. C. Whitemore ; two houses, Shepherds Lane, for Messrs. W. A. Harding, Ltd. ; new premises, North Street, for Messrs. J. Perring, Ltd. ; shops and flats, corner London Road and Epsom Road, for Greater London Estates Development Co., Ltd. ; two houses, Downs estate, for Mrs. A. M. Walton.

Plans passed at HASTINGS : Additions, "The Red Lion" public-house, Stone Street, for Mr. John H. Howard ; two bungalows, Keppel Road, for Messrs. Jeffery and Bowcock ; alterations, 50 Queen's Road, for Messrs. Oxley and Burleigh ; extensions, Robertson Hotel, for Messrs. Ward, Son and Wray ; two houses, Morningside, Elphinstone Road, for Mr. J. Hunt ; alterations and additions, 19 Russell Street, and 19 Queen's Road, for Messrs. J. H. Procter ; garage and showroom, Marine Road West, for Messrs. Fahys, Ltd. ; two houses, Twemlow Parade, for Mr. H. Pinder ; two houses, Royds Avenue, for Messrs. Swithenbank and Ladell ; 62 houses, Tranmere Park estate, for Messrs. F. and H. Obank ; bungalows, Heysham Road, for Mr. H. Fairbank ; two houses, Regent's Park Avenue, for Mr. H. Marsden.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

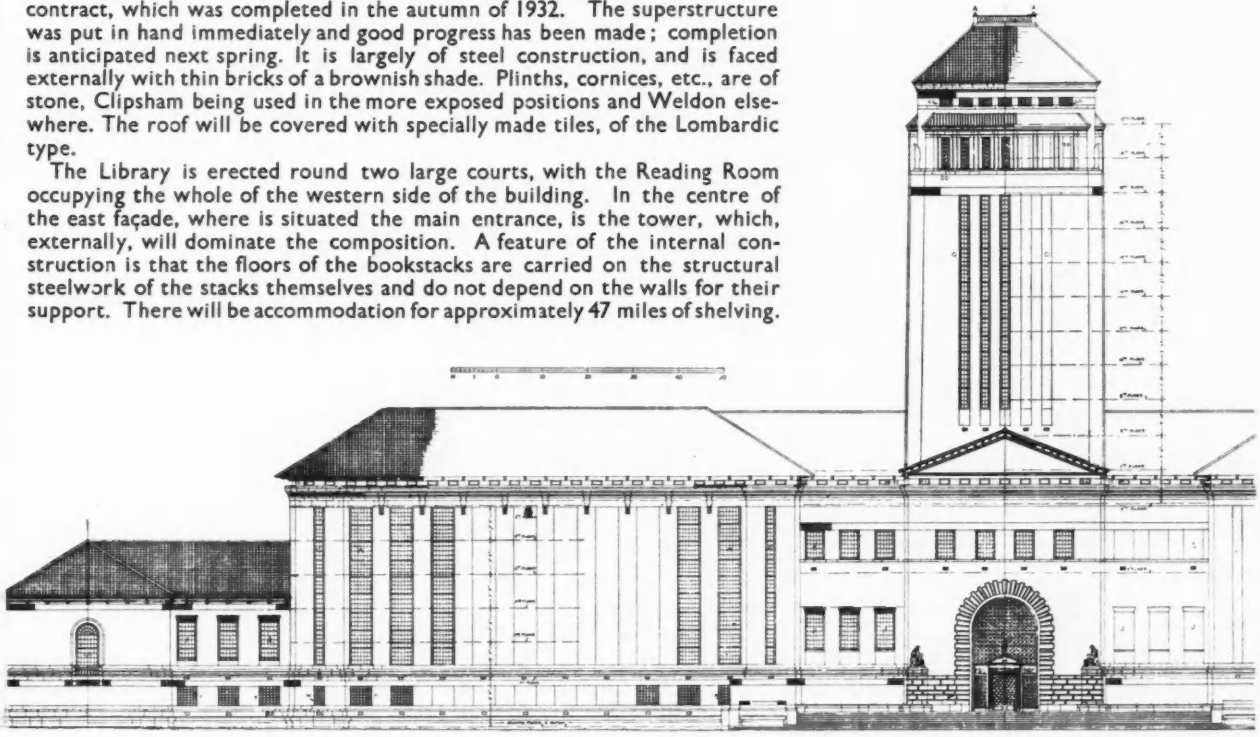
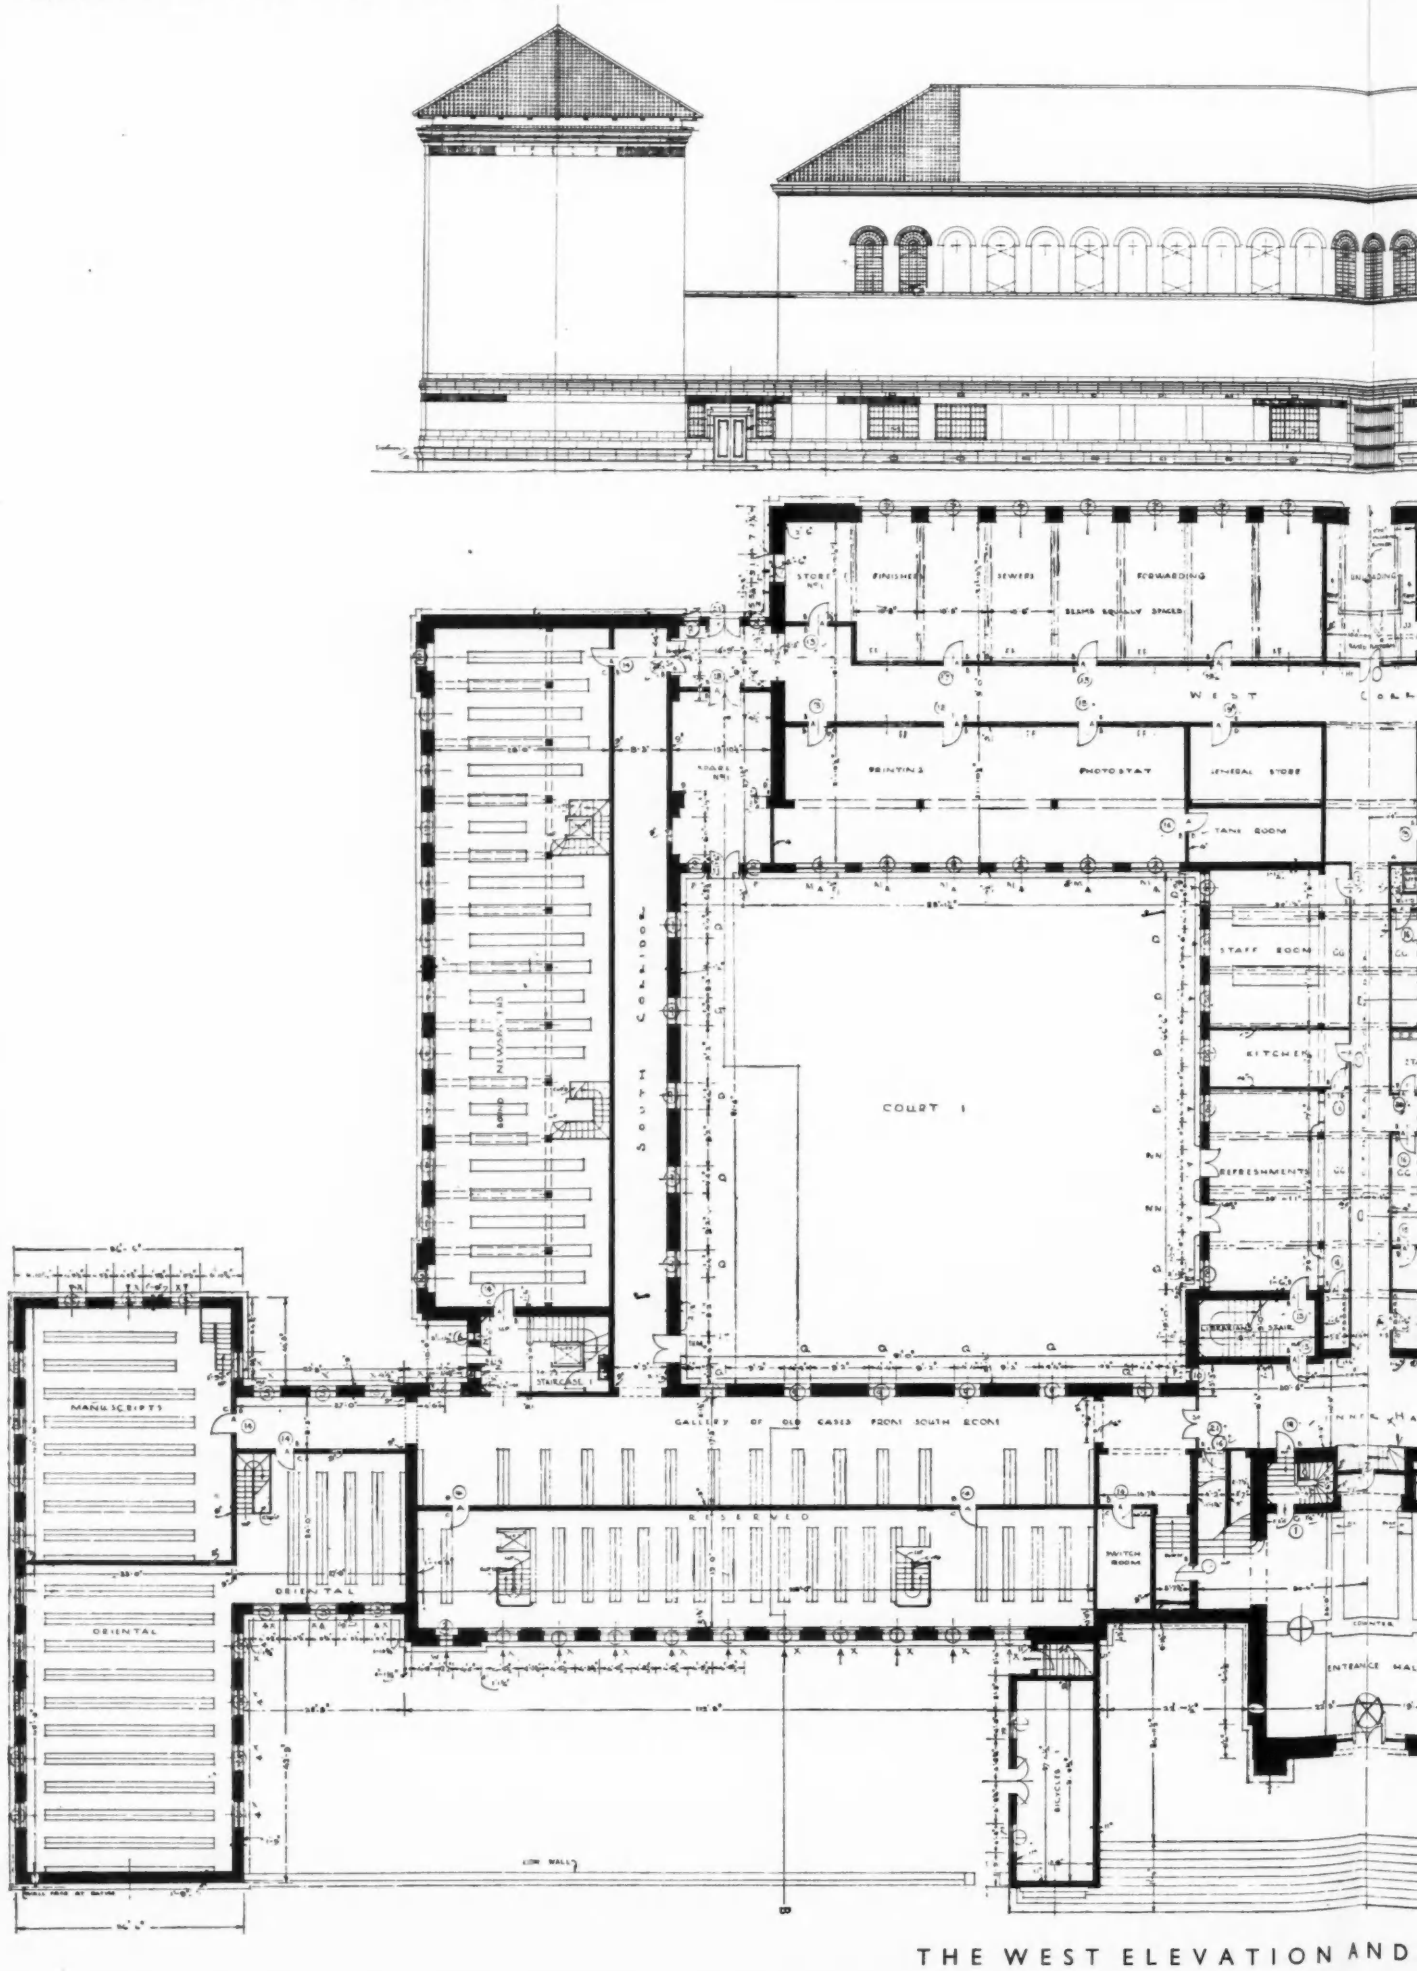
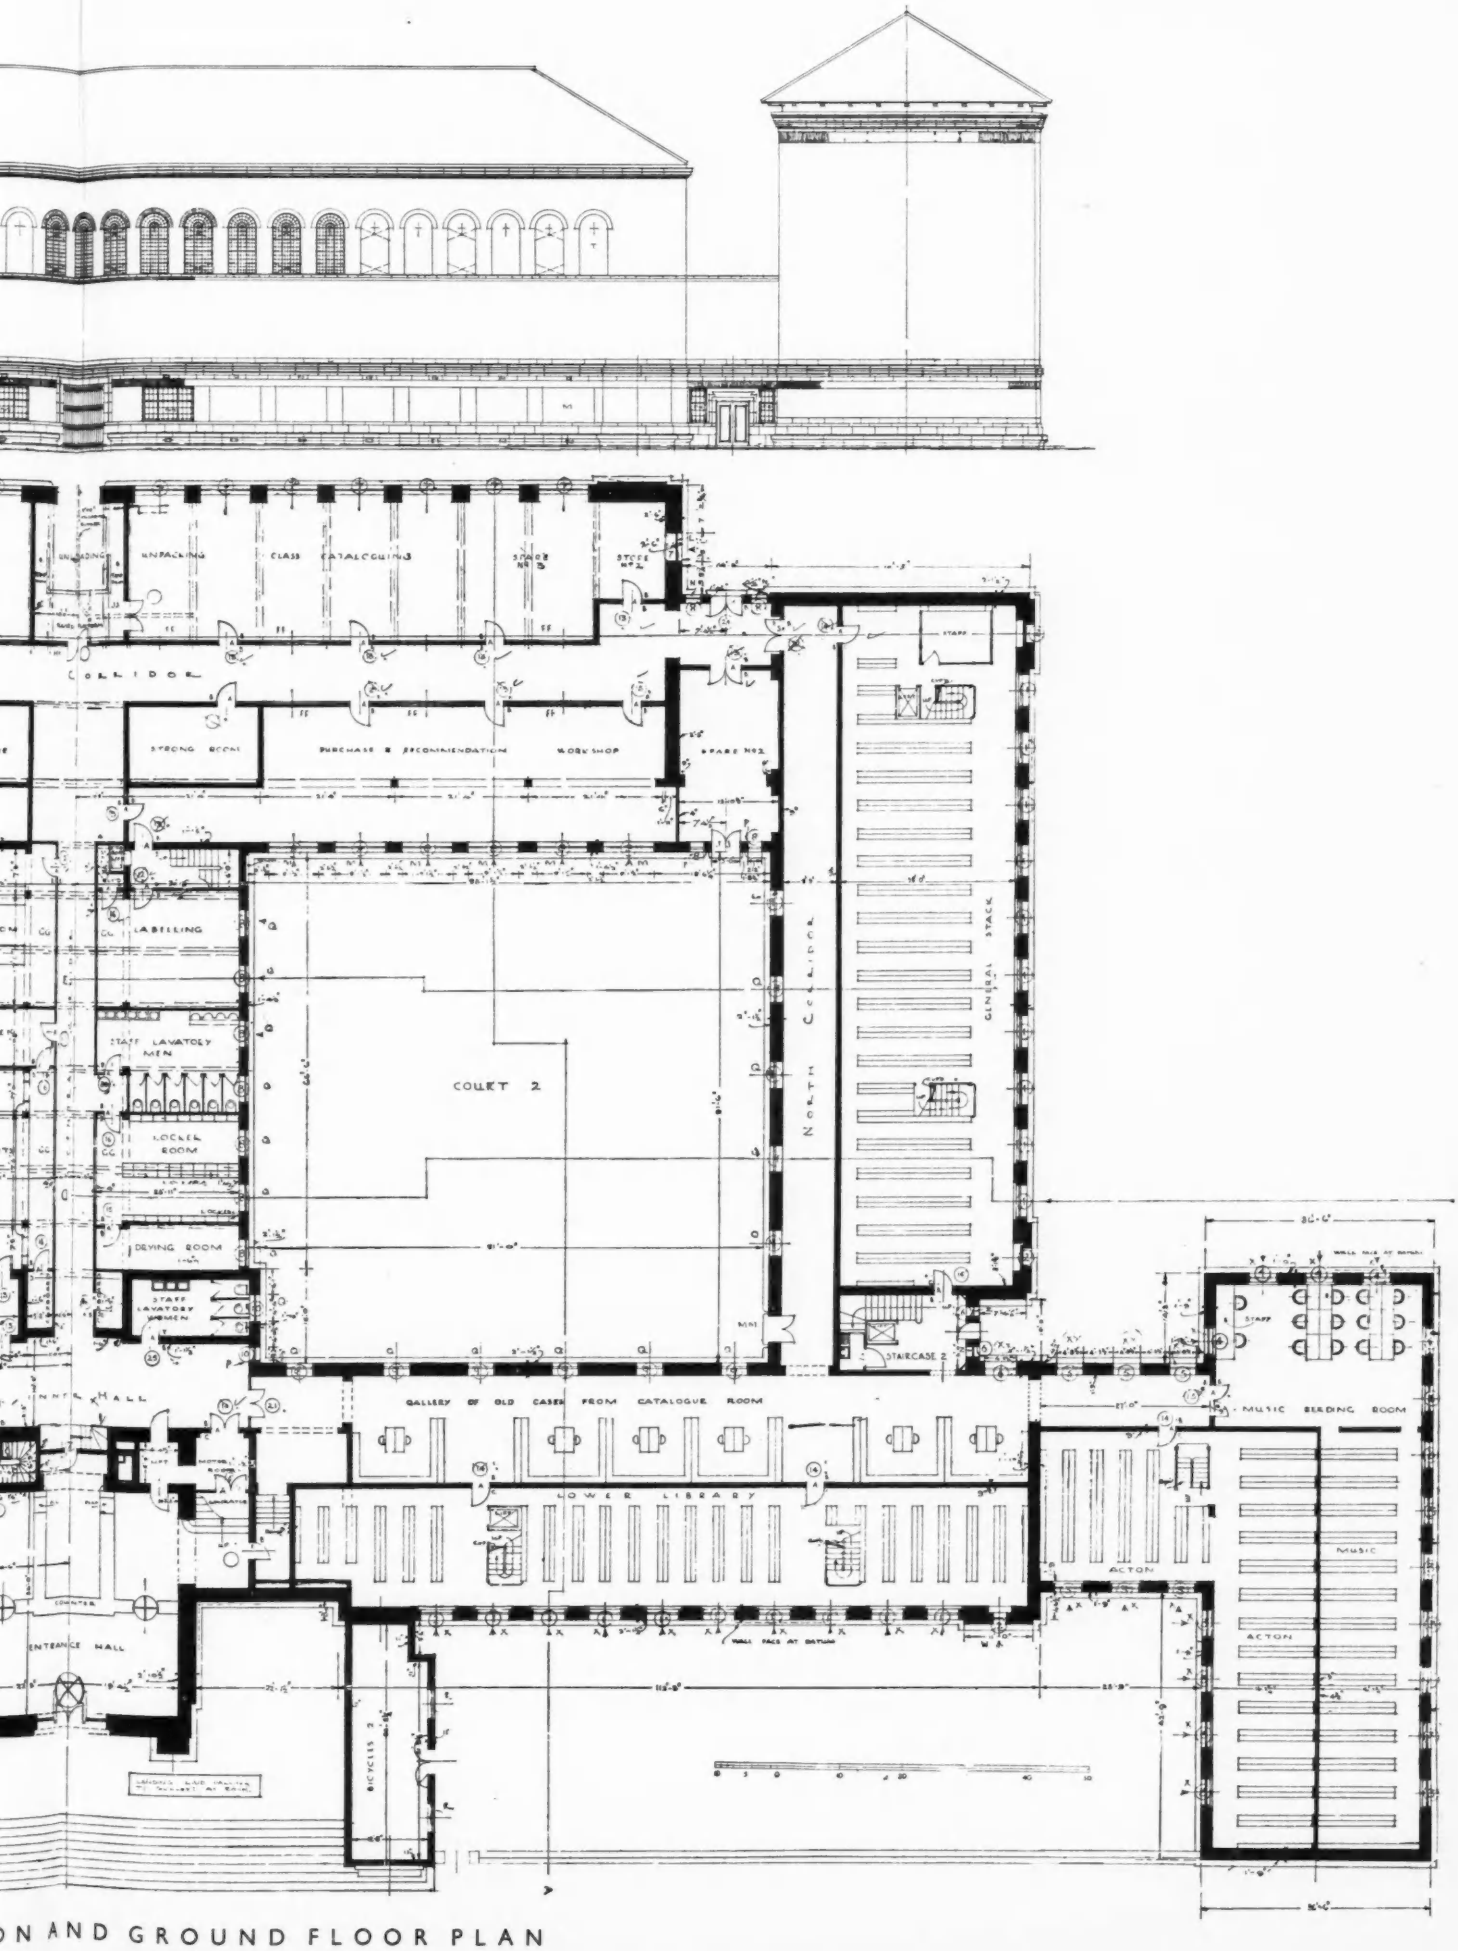
CAMBRIDGE UNIVERSITY: NEW LIBRARY



DESIGNED BY SIR GILES GILBERT SCOTT, R.A.



THE EASTERN FRONT, WITH THE TOWER, UNDER CONSTRUCTION



THIS building stands on a comparatively level site, approached from Burrell's Walk (which branches off Queen's Road), and faces the western boundary of the new Clare College Memorial Buildings. The foundations are of reinforced concrete pile construction and were dealt with as a separate contract, which was completed in the autumn of 1932. The superstructure was put in hand immediately and good progress has been made; completion is anticipated next spring. It is largely of steel construction, and is faced externally with thin bricks of a brownish shade. Plinths, cornices, etc., are of stone, Clipsham being used in the more exposed positions and Weldon elsewhere. The roof will be covered with specially made tiles, of the Lombardic type.

The Library is erected round two large courts, with the Reading Room occupying the whole of the western side of the building. In the centre of the east façade, where is situated the main entrance, is the tower, which, externally, will dominate the composition. A feature of the internal construction is that the floors of the bookstacks are carried on the structural steelwork of the stacks themselves and do not depend on the walls for their support. There will be accommodation for approximately 47 miles of shelving.

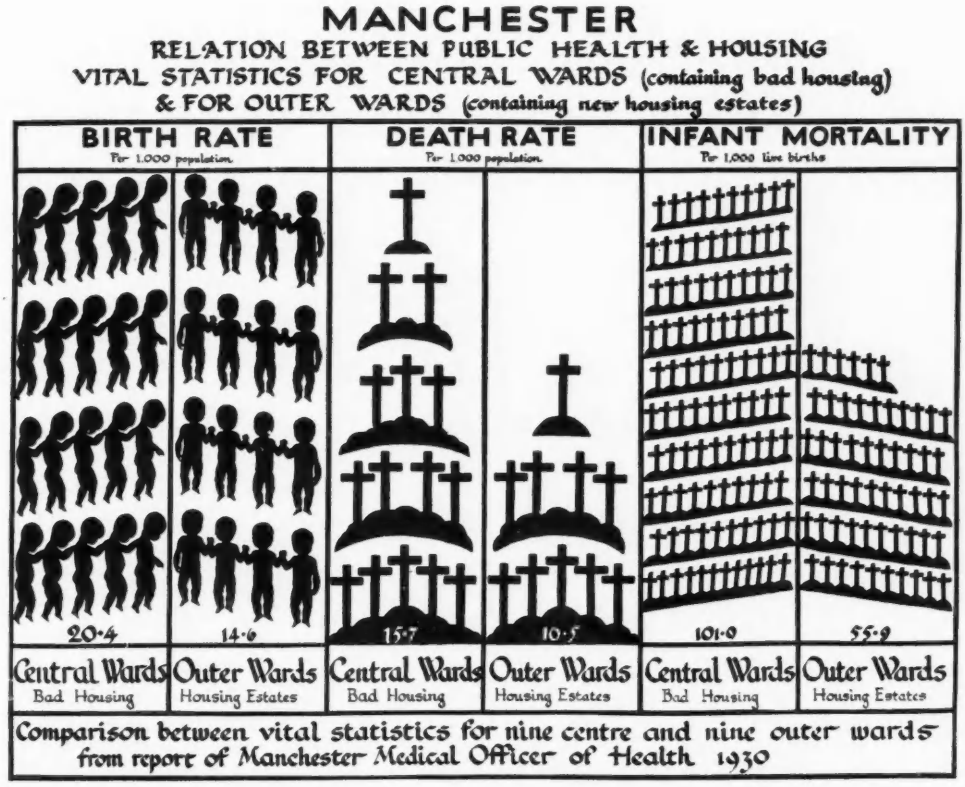
CONCRETE STAIRS: I

•



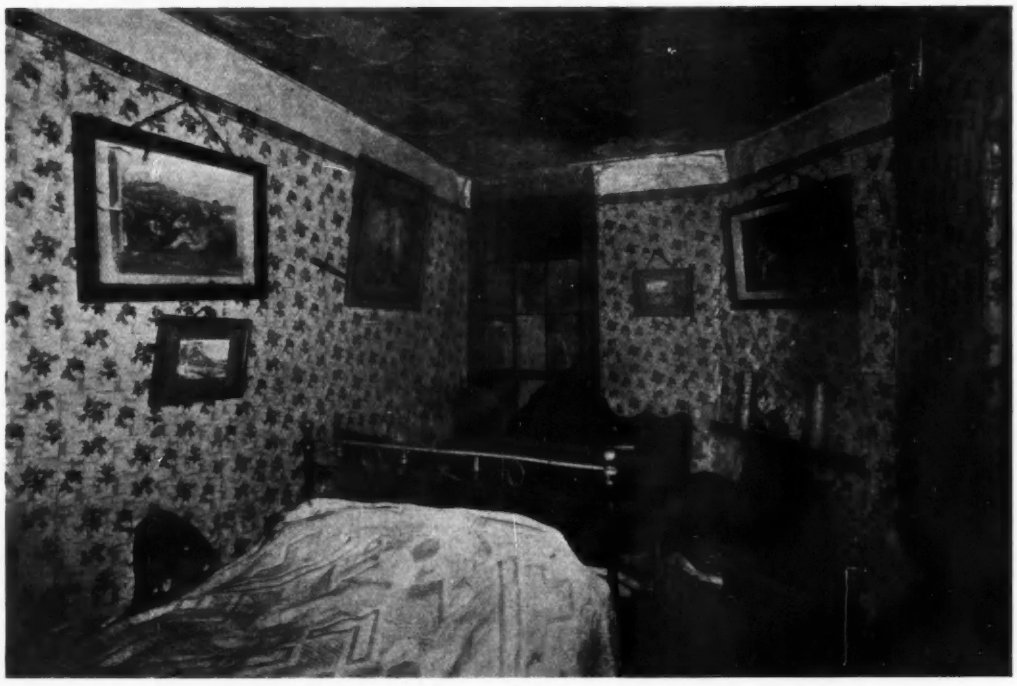
OF the set of nine Sheets now in progress, devoted to staircases, this, the sixth, is one of a pair illustrating various lay-outs and methods of construction in reinforced concrete; its fellow will be published next week. Thereafter, another pair will follow on similar lines, but dealing with pressed steel construction.

The following is a full list of the subjects previously issued:—

1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.
8. Mar. 8—Billiard Table Data.
9. Mar. 15—Roof Pitches and Drainage.
10. Mar. 22—Lift Sizes, etc.
11. Mar. 29—Sanitary Accommodation.
12. Apr. 5—Lavatory Units.
13. Apr. 12—Lavatory Units.
14. Apr. 19—Plumbing to Basins, Baths, etc.
15. Apr. 26—Pipe Chases, etc.
16. May 3—Drains and Manholes.
17. May 10—Stairway Diagrams.
18. May 17—Risers for Stairs.
19. May 24—Stair Risers and Flights.
20. June 1—Public Exit Stairs.
21. June 8—General Buildings Stairs.

"— GIVING PLACE TO NEW"

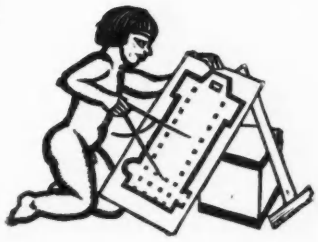
SMALL BEGINNINGS WITH GREAT AIMS



THE object of this special issue is to set forth data about living conditions in our great cities. They indicate the magnitude and ramifications of the problem.

The Manchester chart shows what is happening as a result of improved housing : while deaths (and births) fall by a third in better conditions, the infant mortality is halved.

This Liverpool photograph shows the new Corporation dwellings and, in the foreground, a sample of the old dismal tenements they are displacing.



TEN IN A BEDROOM AT LIVERPOOL

This two-roomed apartment is typical of those to be found in every slum area in the country. It is by no means one of the worst examples, and, as the photographs show, bears striking evidence of the struggle made by the family to keep the home respectable, clean and tidy.

The living room (above) is connected by a passage to the bedroom (below) and lavatory. These two rooms are inhabited by a man, his wife and eight children. The décor *of the living room includes mistletoe, clothes-lines, mangle and perambulator. The bedroom where, according to official information, the whole family of ten sleep, shows one bed and two empty shell cases. Note the state of the ceiling. The rooms are so dark that artificial light is necessary during the day.*

THE CONSCIENCE OF THE NATION HAS BEEN ROUSED

CHARLES JOHN HUFFAM DICKENS—to give him his full name—wrote *Hard Times* just about eighty years ago. It is hardly necessary to say that it roused the Conscience of the Nation. Enlightened self-interest found it upsetting to think of human beings living and dying in the iron slum of Coketown.

Since that day the Conscience of the Nation has been very busy. If it has flagged it has been quickly whipped back to work. Quite recently the Prince of Wales, the Archbishops, Sir Hilton Young, Mr. Howard Marshall, Mr. H. V. Morton, the B.B.C., *The Times*, *The Daily Telegraph*, *The Manchester Guardian*, *The Daily Herald*, *The Daily Express* and *The Listener*, have each in their own way roused the Conscience of the Nation to fresh heights.

In the meantime Coketown has not altered. To-day, after eighty years of Roused Conscience, its children may be a little better treated, its machinery a little less elephantine, but its houses and slums are the same houses and slums—bathless, w.c.-less, often waterless—that Dickens described with picturesque detail in 1854. Of the 125,000 houses in Leeds, a typical Coketown, 75,000 are back-to-backs and 61,000 of these have no water-closet; 350,000 out of a population of 480,000 live in them. The main difference between Dickens's day and ours is that the houses are now eighty or seventy or fifty years more decayed, and harbour a more concentrated animal, if not human, life.

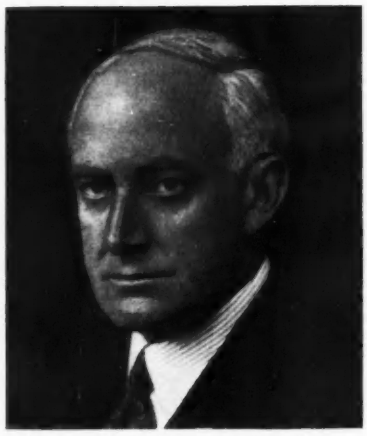
Clearly the Roused Conscience, regarded as a weapon of offence against *slum*, though a busy, is hardly an active organ. Yet laymen and the lay press have done their part in creating a public opinion. The trouble is, public opinion has no knowledge of the real issue, since the technical data which give the real facts of housing conditions, where they exist at all, exist only in fragments which are not readily available to the public. A general technical survey has not yet been made. This omission it is our object to rectify. We hope to continue our investigations in succeeding issues, with the aim of compiling, eventually, something like a national survey of housing conditions.

It is an ambitious project from which prudence shrinks. It involves a formula and some bold assumptions. It involves a formidable amount of research. But the need is obvious. To paraphrase Trelawny, on the North-West Passage: it might be done, and an architectural paper should do it. We therefore ask for what goodwill is available, and plead that at least we are trying to live up to a pious New Year resolution made in the issue on National Planning.

What, then, is *slum?* The question is far from rhetorical, as the reply of the City Clerk of Cardiff, to enquiries made on behalf of this JOURNAL, clearly shows: "There are no slums in Cardiff." Coming from so authoritative a source, this statement will, no doubt, agreeably surprise the Prince of Wales. If we understand slum to mean simply an area officially scheduled for clearance by a Medical Officer of Health, then there are only a few acres of slum in England. If, on the other hand, we feel that the M.O.H. is an unduly optimistic creature, another standard will have to be chosen than the official one.

Slum is manufactured in great quantities from the raw materials of bad housing and overcrowding. Overcrowding can be measured statistically, bad housing cannot. Hence, in this survey, we use overcrowding as the yardstick by which to measure slum. At the same time provision for bad housing is made in the formula explained by Mr. Massey on page 818. The use of this formula makes comparison possible between town and town. It fills the gap where information is missing. Where information is available the formula is superseded; by its use something in the nature of a bird's-eye view can be obtained.

The next question is, what is overcrowding? Again there are various standards and again it is a matter of choice. We have chosen our standard and described it on pages 816–817.



Conceivably some may object that to allow four rooms to six people is unnecessarily generous, even though it means one member of the family sleeping in the parlour. In our view "housing" starts with housing, not with rat-holes. It starts *after* the demand for houses made in the Summary on pages 842–844 is satisfied—*after* every family has got a house*—*after* one room has been provided for every one-and-a-half persons. The one-and-a-half-to-a-room standard is, in fact, the *lowest possible standard.* We can talk about housing when we start to improve on that. Today it is a standard of perfection below which live over a million of the four million odd persons dealt with in the survey presented in this issue.

This survey will, we hope, serve at least one useful end. It will show that, widespread as the manufacture of slum is, its extermination presents no such insuperable problem as timid Governments and authorities are inclined to fear—except in the case of Glasgow, where the conditions are fantastic. Housing and slum clearance are, of course, complementary.

* See Definitions, page 814.

The solution depends on initiative and determination rather than on the power to perform miracles. By September the Government's ambitious Five-Year Slum Clearance Plan will be hatched, and we shall know what the local authorities mean to do, and how far the Ministry of Health means to support them.

Whatever comes of this and of the Building Society compromise, one thing is certain. Ultimately the responsibility for diagnosing the real housing needs of the country, and prescribing treatment, must lie with the architectural profession. And to the architectural profession, as Mr. Maxwell Fry indicates, in the last article in this issue, will come, at the appointed time, the opportunity for action.

The Rt. Hon. Sir E. Hilton Young, M.P., who, as Minister of Health, promulgated the Government's Five-Year Plan for the clearance of the slums.

NOTES & TOPICS

THE ENGLISHMAN'S MODERN HOME

THE Exhibition of British Industrial Art in Relation to the Home, at Dorland Hall, has brought into focus all the ideas and theories and gallant individual experiments created since the war in the name of modern design. There has been so much *talk* about design, seasoned with almost theological ardours or critical intolerance, that one felt that something might some day emerge.

*

A little bit of something for everybody has emerged. Expensive glories in glass for stunt-loving millionaires; interiors which display a stimulating concurrence of unusual materials and of familiar materials unusually treated; and compressed functionalism, intended to make the Englishman adopt beautifully tidy cells as his castle.

*

What this exhibition does prove is that we have got some ideas of our own, and that we aren't merely editing Continental notions, and thickening them up to square with our national love of comfort.

*

I don't think the art of display has ever touched the standard this show reaches. The illumination and arrangement of the different sections are in themselves masterly.

*

Yes, this "dear, dear land," for all its slums, is beginning to stand on its own feet in design (though, of course, these exhibits represent exceptions as yet to the rule of industrial production), and credit for helping to lug industry out of its nap in a traditional arm-chair must be given to the activating designers of the show: Messrs. Oliver Hill, Oswald Milne, Serge Chermayeff, Raymond McGrath and Wells Coates.

*

But, oh, those standard lights in the entrance hall! Who on earth was responsible for them?

*

ADVERTISING THE WORLD ECONOMIC CONFERENCE

There is a World Economic Conference on in London; but official attempts to inform London of the great honour that has been done to it are confined to the A.A. notices to direct traffic: "To the Geological Museum."

*

A NEW METHOD OF HOUSEBREAKING

The Evening Standard was sympathizing last week with the village of Markyate, Herts., which has been bombarded with lorries. Markyate is a bottle-neck for heavy traffic, and the sides of the neck are getting damaged. At least twenty houses and shops are reported as bearing marks caused by lorries hitting them.

*

As Messrs. Maxwell Fry and John Gloag said in the tenth broadcast discussion in the "Design in Modern Life" series on town-planning, we are the great unplanned. The Markyate incident is only one of many hints that the heady wine of the scientific commercial age is bad for the dear old bottles we will go on using.

*

'TIS POVERTY THAT MAKES A SLUM

To be killed by improved housing conditions is an ironic fate, but that it has happened we have the considered report of Dr. G. C. M. M'Gonigle, the M.O.H. of Stockton-on-Tees, as evidence.

*

Dr. M'Gonigle has had under close observation the two communities, one living in slum conditions and the other in a housing scheme, having been removed thither from the same slum.

*

Over a period of years he found that the slum death rate decreased slightly. The death rate of the transferred *increased by fifty per cent.* He also proved beyond a doubt that an increase of sickness and diseases leading to a high

A. J. SUPPLEMENTS

In view of the enlarged size of the present issue the usual loose supplements are unavoidably omitted; the publication of both series will be resumed next week.

death rate was due to lack of proper food consequent upon an increase in rent of 4s. 6d. per week.

*

No better example than this is needed to prove the case for a scientific attack on slum clearance building such as alone will suffice to lower costs and enable flats to be let at rentals fit for those people condemned to live so perilously near the poverty line.

*

A LONG-TERM VIEW OF HOUSING

Nothing pleased me more than to hear, at the meeting last week of the Mansion House Council on Health and Housing, Mr. H. R. Selley, M.P., confessing that the only permanent method of clearing the slums was to build houses and block dwellings in a large way by means of town planning, building to plan, whether or not the land used could be considered slum property or not.

*

He gave it as a pious hope for a distant future ; and *The Times* did not report this singular utterance, the only *really* constructive contribution in an hour of good speeches.

*

In sober truth, legislation for slum clearance is a one-sided affair that sooner or later *must* be amended if the Five-Year Plan is not to turn into a complete farce that will leave us with a disjointed hotch-potch of expensive dwellings scattered in holes and corners.

*

Mr. Selley is Chairman of the L.C.C. Housing Committee. I wish he could convert that body to a long-term view of their planning responsibilities.

*

THE PLAN OF THE STEELWORK ASSOCIATION

The British Steelwork Association plan, or partial plan, for the rebuilding of London should be looked at very carefully. In essence it forms a sort of negotiating formula for the introduction of higher buildings on a system of give and take.

*

First, it assumes with some logic that the present eighty-foot height restrictions represent a volume control over building, and that, with larger units of planning, the needs of building would be better served by central towers and an increase in height, rather after the New York model. The Underground Building is cited.

*

But, under cover of this, they proceed to put up the general cornice level and very considerably increase the total volume of building, and it is here that I grow nervous of too great a stress upon height, and not enough upon an increase in site areas and a widening in road widths.

*

Frankly, I would press first for street replanning, before I introduced the difficulties of skyscrapers and inflated land values, for, after all, the Underground Building is the result of a bad site, and assumes the form it does to some extent because it grows from an enclosed pit of buildings rising from narrow and badly-planned streets.

*

BUILDING NEW ABOVE THE OLD

When reinforced concrete engineers get ideas they sometimes do things. One of them, at least, is interested in slum clearance. He tells me of a scheme which, though applicable in only isolated cases, may be the deciding factor where it is impossible to disturb tenants, and so clear a site for re-building.

*

In such a case, and where the site is favourable, he suggests the erection of a frame, with piers in back and front yards, and any other available spaces, to carry second, third and fourth floors, which may be roofed, walled, and completed above the heads of those who continue to live sheltered, though a little inconvenienced, in the old houses.

*

When the upper floors are complete the tenants climb to their new abodes ; their old ones are demolished, and work on ground and first floors is finished.

*

THIS ENGLAND

What a spate of books on England there is just now ! They make me feel absolutely self-conscious, with their flow of sentimental balderdash about the English countryside, and the wayward English character.

*

Is this the publishers' attempt to squeeze the last profit out of the thing before it and the visiting foreigner disappears ? Or is it the genuine idiocy of the voluntarily blind, who will not see a bungalow for fear of shattering a day-dream ?

*

Never was such a time to make day-dreams come true. But architects require a strong dose of logic and economics to shake them out of *their* day-dream into a consciousness of the problems of their own times and *this England.*

COMPETITION FOR

INDUSTRIAL ART EXHIBITION

The Exhibition of Industrial Art in Relation to the Home was opened by H.R.H. Prince George at Dorland House on Tuesday afternoon. The Exhibition will remain open until July 20.

SOUTH AFRICA HOUSE

Today, June 22, H.M. the King is to officially open South Africa House, Trafalgar Square, W.C., designed by Sir Herbert Baker, R.A.

HOUSING EXHIBITION AT THE BUILDING CENTRE

Last Thursday an Exhibition of Housing was opened at the Building Centre. A typical slum living and sleeping room is exhibited in the Bond Street window, and through vivid statistical diagrams showing unemployment figures, overcrowding percentages, etc., one passes to the first floor. Here a series of small rooms are furnished with simple, well-designed fittings and furniture, and the price of each article is clearly marked on it. It is intended that this exhibition, and the Building Centre Cottages, which are now on view in the Strand, shall be complementary to each other.

HIGHER BUILDINGS

In a memorandum submitted to the Advisory Committee of the L.C.C., the British Steelwork Association, with the co-operation of Sir John Burnet, Tait and Lorne, has submitted a plea for more liberal site development in London. It is pointed out that " the restrictions on earning space of buildings are too apparent in London to require emphasis and are such that every cubic foot of space has to be squeezed into service, and buildings have to be driven three and four stories underground in order to secure usable and suitable accommodation on a given site. Not only is subterranean construction of this sort unduly expensive, but it brings about greater difficulties in fire-protection and much less hygienic conditions in respect to light and air than would result from a relaxation in respect of height.

" An economic urge is necessary for the re-planning of London. A vast expenditure of capital is necessary if the Metropolis is to be rebuilt on the lines of wider arteries and open spaces, with more efficient working accommodation. But this capital will only be attracted to new building enterprise if the economics of rebuilding are firmly established. Building regulations should, therefore, be framed to encourage the replacement of inefficient and out-of-date areas by modern constructions."

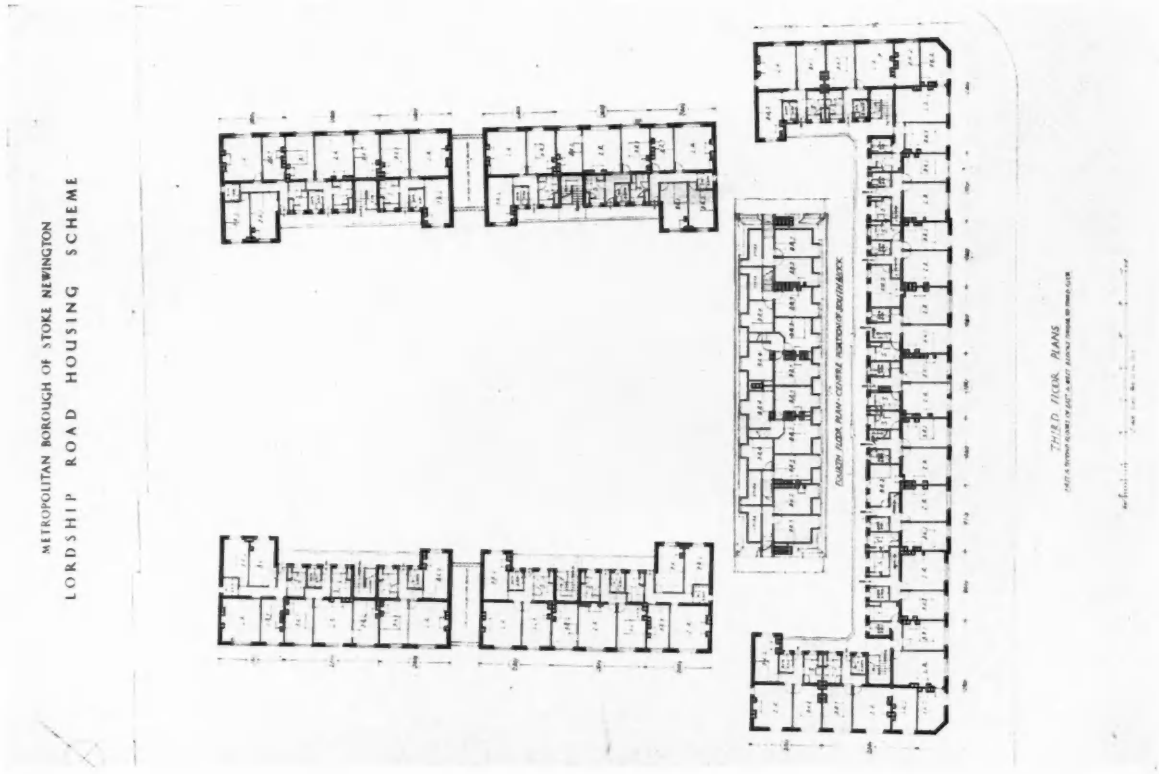
It is suggested (1) that " new buildings be allowed to go to a height of 85 feet on the building line, plus an extra height of 40 ft. set back within an angle of 75°." (2) " New buildings be set back at pavement level in order to provide a minimum of 30 ft. to the centre of the street. The area given up to the public multiplied by a height of 125 ft. plus one-half of this volume may be added to the building above the 125-ft. level, provided the added height is set back within the 75° angle. This revision would obtain a minimum width of street of 60 ft., and thereby help to solve one of the most urgent problems, that of street traffic congestion due to narrow streets. The added height and cube to the buildings would be an inducement to rebuild on more modern and economic lines."

WALCOT EXHIBITION

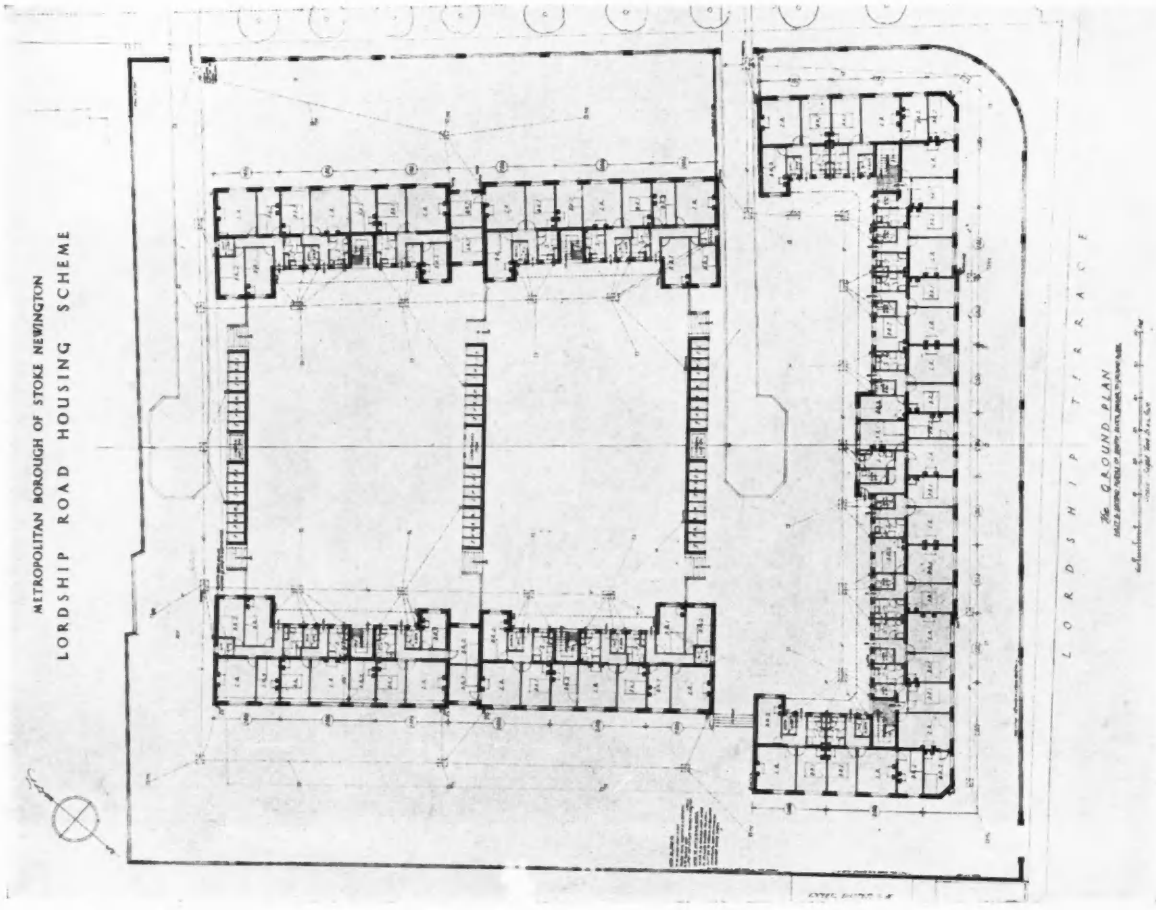
On Tuesday last, Sir Raymond Unwin, P.R.I.B.A., opened an exhibition of architectural drawings, etchings, watercolours, etc., by Mr. William Walcot, F.R.I.B.A., at 5, Grafton Street, Old Bond Street, W.1. The exhibition will be open daily from 2 to 6 p.m., until July 20.

SLADE PROFESSORSHIP AT OXFORD

The Board of Electors to the Slade Professorship at Oxford University have elected Mr. H. S. Goodhart-Rendel, F.R.I.B.A., as Slade Professor of Fine Art from October 3 next, for a period of three years.



THE HOUSING PROBLEM



At a meeting held at the offices of the Chartered Surveyors' Institute it was agreed to form a Council for Research on Housing Construction, under the chairmanship of the Earl of Dudley, to undertake research in housing and to bring together industrial, professional and other interests for the study of this problem.

The following were elected as first members of the Council: Lord Melchett; Dr. W.

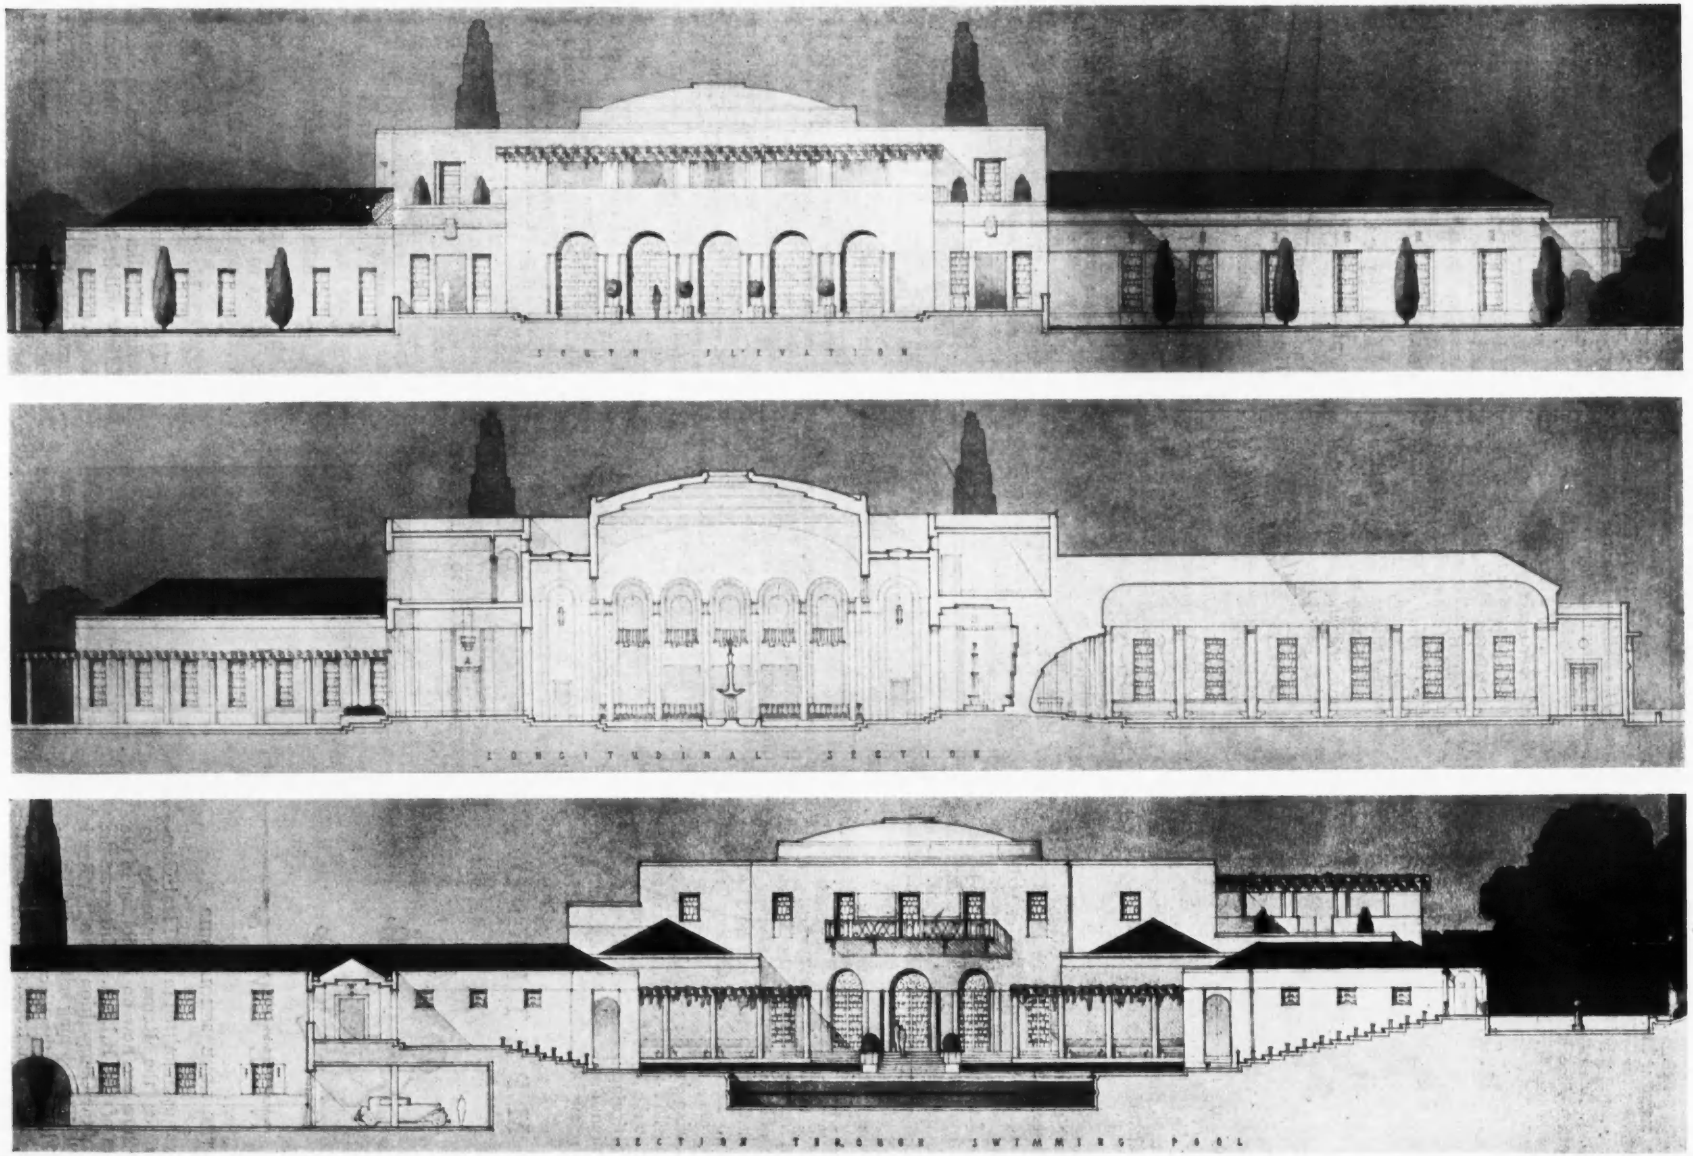
FLATS AT STOKE NEWINGTON



WINNING DESIGN: BY HOWES AND JACKMAN

[See note on page 812.

THE WINNING DESIGN : BY A. G. S. FIDLER (LIVERPOOL SCHOOL OF ARCHITECTURE)

H. Coates; Mr. E. J. George; Mr. M. Claude Leigh; Mr. Francis Lorne; Sir John Mann; Sir William Ray; Mr. J. B. Stevenson, and Mr. Ben Walmsley.

Mr. C. J. Kavanagh (Sec. of the British Steelwork Association) was appointed Director of the activities of the Council.

R. I. B. A.

THE CONFERENCE

Today, at 10.30 a.m., the inaugural meeting of the R.I.B.A. Conference will be held in the Guildhall, Cambridge. Particulars of the other arrangements are given in the Architects' Diary on page 807.

A DANCE

A dance arranged by the R.I.B.A. Social Committee will be held in the R.I.B.A. Galleries, 9, Conduit Street, W.1, on Monday next, June 26, from 9 p.m. to 1 a.m. Tickets, price 6s. each, can be obtained from the Secretary, the R.I.B.A., or through any member of the Institute. The price of the tickets includes light refreshments.

STATUTORY EXAMINATION

The R.I.B.A. Statutory Examination for the office of District Surveyor under the London Building Act, and the Examination for the office of Building Surveyor under Local Authorities, will be held at the R.I.B.A., London, on October 11, 12 and 13.

The closing date for receiving applications for admission to the examinations, accompanied by the fee of £3 3s., is September 20. Full particulars of the examinations and application forms can be obtained from the Secretary of the R.I.B.A.

COMPETITION NEWS

THE ROME SCHOLARSHIP

The designs submitted in the Final Competition for the Rome Scholarship in Architecture are now on exhibition in the Galleries of the R.I.B.A. This year the subject of the Competition was a "A Road House." The winning scheme, by Mr. A. G. S. Fidler (of the Liverpool School of Architecture) is illustrated on pages 810-811.

The Special Committee for Public Relations of the Building Industries' National Council continues actively to pursue its work of educating the public on the economic virtues of a consistent policy of planned public works of national utility.

All those interested in the work of the Committee should apply for a copy of the latest publication on this matter entitled "The Case against Economy." This is a reprint of the two Memoranda issued last autumn, which have had such great influence on public opinion with regard to economy, brought up to date and incorporating further statistical information. Mr. Howard Robertson, F.R.I.B.A., Chairman of the Committee, contributes a preface dealing with the change of opinion on economy since the Committee commenced its "Build Now" campaign. The latest figures show the extent to which the work of the Committee on behalf of the Building Industry have been successful. This work merits the wholehearted support of every member of the Industry.

Subscriptions to the Fund of the Special Committee for Public Relations of the B.I.N.C. should be addressed to Mr. Oswald Healing, F.S.I., at 7, Duke Street, Adelphi, W.C.2.

Other competitors were as follows: Messrs. D. McIntyre, (Armstrong College, Newcastle-upon-Tyne), J. R. Baxter, (Liverpool University), J. A. Pinckheard (Architectural Association, London), A. Reiach (School of Architecture, Edinburgh College of Art), P. B. Dunham (London University), E. Farrar (Liverpool University), P. H. D. Ronaldson (School of Architecture, Edinburgh College of Art), G. H. Lawrence (School of Architecture, Edinburgh College of Art), T. J. Cahill (Manchester University), J. C. Clavering (Armstrong College, Newcastle-upon-Tyne).

FLATS FOR STOKE NEWINGTON

Sir Robert Tasker, the assessor of the limited competition for flats to be erected in Lordship Road, Stoke Newington, has made his award as follows:—

Design placed first (£250): Messrs. Howes and Jackman, of 10 Gray's Inn Place, W.C.1.

A. G. S. Fidler, the winner of the Rome Scholarship in Architecture.

Design placed second (£100): Mr. E. M. Joseph, A.R.I.B.A., of 2 Paul's Bakehouse Court, E.C.4.

Design placed third (£50): Mr. Granville Streatfeild, F.R.I.B.A. (in conjunction with Mr. Matthew J. Dawson, F.R.I.B.A.), 13 New Square, W.C.

The other competitors were Messrs. Hobden and Porri, F.R.I.B.A.; E. C. P. and H. Mawson, FF.R.I.B.A.; and W. R. Davidge, F.R.I.B.A.

The winning design is illustrated on pages 808-809.

Competitions Open

September 1.—Sending-in Day. Proposed Hospital at Surbiton. Assessor: C. E. Elcock, F.R.I.B.A. Premiums: £120, £75, £50 and £25. The conditions, obtainable from A. C. C. Dunn, Hon. Secretary, Surbiton Hospital, St. James's Road, Surbiton, were reviewed in *A.J.* for May 24.

September 1.—Sending-in Day. Proposed bathing pool for the Llandudno U.D.C. Open to architects and civil engineers. Three sites are under consideration and three premiums of 50 guineas are offered for the best design for each site. Site plan and particulars obtainable from W. T. Ward, Engineer and Surveyor, Town Hall, Llandudno. (Deposit, 10s. 6d.)

September 11.—Sending-in Day. The Directors of Gidea Park, Ltd., invite designs for five different types of houses (ranging from £400 to £900). Open to members or students of the R.I.B.A. Assessors: Prof. S. D. Adshead, F.R.I.B.A., A. E. Beresford, F.R.I.B.A., Ald. Ewart G. Culpin, F.R.I.B.A., E. Maxwell Fry, A.R.I.B.A., Howard Robertson, F.R.I.B.A., and W. Harding Thompson, F.R.I.B.A. In addition to being paid a fee according to the scale of charges of the R.I.B.A., the authors of the first five selected designs in each class will be paid a premium of £10. Particulars obtainable from Gidea Park, Ltd., The Estate Office, Hare Street, Gidea Park, Romford, Essex.

September 21.—Sending-in Day. Proposed Town Hall for the Borough of Hornsey. Assessor: C. Cowles-Voysey, F.R.I.B.A. Premiums: £350, £250 and £150. Full conditions, etc., were published in our issue for May 17.

Competitions Pending

Proposed New Council Offices to be erected at Salt Hill for the Slough U.D.C. Assessor: H. S. Goodhart-Rendel, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions have not yet been drawn up.

Proposed Municipal Sanatorium and Craymount Children's Hospital, Belfast. Limited to architects practising in Northern Ireland. Assessor: R. S. Wilshere, A.R.I.B.A. Conditions are now being drawn up by the assessor.

Proposed Municipal Offices and Extension to the Library and Electricity Offices for the Metropolitan Borough of Stoke Newington. Conditions have not yet been drawn up.

Change of Address

Mr. W. H. Ansell, F.R.I.B.A., has removed his offices to No. 12, Gray's Inn Square, W.C.1. Telephone No.: Chancery 8169.

ON THE AIR

The last—and the eleventh—of the series of talks on "Design in Modern Life" will be broadcast in the National Programme at 8.30 p.m. on Tuesday next, by Mr. Frank Pick, who will discuss "the Meaning and Importance of Design."

FOREWORD

[BY THE EDITOR]

In the pages which follow an attempt is made to carry out a survey of working-class living conditions in the six largest towns of Great Britain, London excluded.

The investigations, which have been specially carried out for THE ARCHITECTS' JOURNAL by Mr. Philip H. Massey, are related in every case, except that of Glasgow, to the standard which is described and illustrated on pages 816-817.

The use of a single standard makes it possible for the reader to compare one city with another and to arrive at a general conception (1) of overcrowding, (2) of housing needs. No figures as to the number of houses that ought to be pulled down are available, since officially no area is supposed to be unfit to live in unless scheduled for clearance by a medical officer of health. A summary of results for the six towns, with final conclusions, is given on pages 842-844.

The illustrations and quotations which accompany this survey are by way of being merely a commentary on the text. It is not the aim of this JOURNAL to emphasize the horrors of slum life. Anti-slum propaganda has been, and is being, carried on very adequately in the lay press. Our object is to give, as far as the available information permits, the facts and figures from which can be made a proper diagnosis—one might almost say a proper *architectural* diagnosis—of the slum problem. At the same time figures need a context, and the illustrations seek to ensure that they shall be read in the right atmosphere.

To talk, for instance, of the one-and-a-half-to-a-room standard means little unless one realizes that this, for a normal family, involves a bed in the parlour. For a normal family? No; for a luxuriously accommodated family. Overcrowding in Great Britain is such that this standard has to be taken as an ideal. The figures of new houses required which we give on pages 842-844 show merely the amount of housing necessary to enable people to live round about this standard. The real housing problem—how to provide living conditions at less than one-and-a-half—*starts when all these houses have been built.*

We propose, in succeeding issues, to continue our survey of the larger towns. The slum problem and the overcrowding or housing problem are treated officially as though they were separate questions. They are not. It is true that as long as slum buildings stand, so long will people live in them, and so long will slums go on. But the slum will not disappear when every slum building is in the hands of the house-breaker. Overcrowding automatically produces slum conditions, and until the increase in the number of houses overtakes the increase in the number of families, new slums will spring up as fast as the old ones are pulled down.

[THE ARCHBISHOPS TO THE CHURCH]

Before the war the housing problem was acute; but the cessation of building during the four years of the war, and the difficulties attending building enterprise after it, resulted in a disastrous shortage of houses and a consequent overcrowding calamitous both in its intensity and in its extent.

Great efforts have been made by both municipal and private enterprise to overtake the lost ground. We have now reached a stage when, by the action of a united, vigilant, and decisive public opinion, it should be possible altogether to abolish bad and insanitary houses and that continuing blot on our national life which we call the slums.

With this great object in view the Minister of Health has issued a programme for the next five years. But it will not and cannot be carried through unless it is steadily and vigorously supported in every part of the country. We regard this situation as offering a direct challenge and call to the Church.

This year multitudes of Church people are celebrating with thankfulness the centenary of the Oxford Movement, one of whose main principles was the restoration of the corporate character and life of the Church. Where could we find, apart from worship itself, a better and clearer opportunity for the Church's corporate activity than in a campaign for the abolition of slums and for the decent housing of the people?

There is need not only of proper housing, but of this at rents which are within the means of those who have been or now are living in slums. Here is an opportunity for the exercise of that "charity" in its true sense, that love of our neighbours.

Bad housing and overcrowding are damaging to health of body and even more, perhaps, to health of mind and soul. We cannot and dare not as Christians acquiesce in the subjection of our fellow countrymen to conditions so injurious. A time has come when we can, if we will, remove this scandal from our social life.—THE ARCHBISHOPS OF CANTERBURY AND YORK. (May 16.)

DEFINITIONS

To avoid misapprehension of the terms used throughout the survey in the pages that follow, these definitions, used in the Census, are given :—

"*PRIVATE FAMILY.*—Any person or group of persons included in a separate return as being in separate occupation of any premises or part of premises is treated as a separate family for Census purposes, lodgers being so treated only when returned as boarding separately and not otherwise. Private families comprise all such families with the exception of those enumerated in (i) Institutions or (ii) business establishments or boarding-houses in which the number of resident trade assistants or resident boarders exceeds the number of members of the employer's or householder's family (including private domestic servants).

"*STRUCTURALLY SEPARATE DWELLINGS.*—A structurally separate dwelling has been defined for the Census as any room or set of rooms, intended or used for habitation, having separate access either to the street or to a common landing or staircase. Thus each flat in a block of flats is a separate unit ; a private house which has not been structurally subdivided is similarly a single unit, whether occupied by one family or by several families. But where a private house has been subdivided into maisonettes or portions, each having its front door opening on to the street or on to a common landing or staircase to which visitors have access, then each such portion is treated as a separate unit.

"*ROOMS.*—For the purposes of the Census, the rooms enumerated are the usual living rooms, including bedrooms and kitchens, but excluding sculleries, landings, lobbies, closets, bathrooms, or any warehouse, office, or shop rooms."

The term "structurally separate dwelling" is used in the Census to avoid the ambiguities of such words as "house" or "tenement."

"Tenement" is normally used for parts of a house inhabited by the working class, but is sometimes used (not here) to give the meaning of "dwelling."

The parts of this survey which are derived from the Census follow the use of the term "structurally separate dwelling"—in other parts, e.g., in all the conclusions, "house" is used. The expression "so many *houses*" wanted is not to be taken to exclude the idea of flats or tenements.

It is necessary in many cases to rely on the context, and there does not appear to be any place where ambiguity could be alleged. For example, where an enquiry "from house to house" is being described and a house is found containing three or four families, it may safely be assumed that "house" is being used in the everyday sense of the word.

Author's Note.—Besides making my acknowledgments to the authors of the studies of the slum problem enumerated in the biography on page 843, I should like to place on record my appreciation of the kindness shown me by officials of the various City Councils in replying to my written enquiries, and by several experts who have spared me their valuable time and given me the benefit of their knowledge.—P.H.M.

INTRODUCTION

SCOPE AND METHOD OF ENQUIRIES

IT appears now to be fairly generally appreciated that the building of a million houses in this country since the war has scarcely touched the slum problem.

Recently there have been a large number of articles written, and speeches made, on the problem of the slums. No previous attempt appears to have been made to gather information and to present it in a comprehensive form.

The following survey seeks to discover the housing needs of the six greatest British cities. From the experience of these it should be practicable to assess the total number of houses which this country requires.

A mass of information has been gathered and worked up for the purpose of this enquiry. In view of the fact that this information had to be gathered from diverse sources, it was found quite impracticable to present the features of each town under similar heads. A selection of figures given in, or calculated from, the Census volumes is, however, quoted for each city, and this is used as a background. The picture of the city as a whole, its worst wards, the proportion overcrowded, etc., are presented in statistical terms, as briefly as possible.

The description of the slums of each city, and of rents paid, etc., follows. At the conclusion an attempt is made to calculate the housing needs on the basis of the information, both as to overcrowding and as to existence of unfit dwellings.

One thing which many people have not realized is that the problem of the slums is different in one city from another. Neither "wholesale clearance," nor "workers' flats," nor "reconditioning," nor any other generalization is applicable to every town. Nor, indeed, to all the slums in any one town.

This analysis of the great British cities is designed, among many other things, to emphasize that there is no uniformity between slums.

Where possible, lines of advance have been suggested. In the case of most of the cities there can be said to be some dominant characteristic which gives one, if not a positive answer to the question of how to solve the problem, at least an indication of the things that do *not* require doing or ought not to be done. Manchester and Birmingham have reconditioned and built houses on outlying estates. Their problem is one of rehousing in the central areas. The centre of Glasgow, quite definitely, demands the clearance of square miles rather than acres, and the provision of workers' flats. And so on.

But in general this enquiry has been confined to estimating, so far as possible, how many houses are wanted.

To do this it is necessary to decide how far down the scale of horror we are to go. Various Acts of Parliament exist under which houses can be dealt

with, and one is thus presented with a series of definitions. The word "slum" does not occur.

The definition of a clearance area is given in the 1930 Act. In practice a slum is any dwelling which the Medical Officer of Health, acting within the law and the opinions of the Council on housing matters, manages to get certified as a slum.

This enquiry is intended to show total *housing needs*. It is, therefore, necessary to start with overcrowding. To use the overcrowding figures in order to arrive at a figure of housing needs it is necessary to establish a standard.

OVERCROWDING STANDARDS

A number of overcrowding standards exist :—

1. The Registrar General's—under which people living over 2 per room are overcrowded.* All rooms are counted except bathrooms, sculleries, etc.
2. The National Bedroom Standard —a 2-bedroom house to be regarded as providing accommodation for 4, 3 for 5, and 4 for 7.
3. The Sex Separation Standard regards a house as overcrowded if it does not afford sex separation in respect of all persons over 10, except for people living as man and wife.
4. The Manchester Standard requires bedroom accommodation for man and wife, and as necessitated by the Sex Separation Standard, and also prescribes a maximum of 2½ persons per bedroom, children under 10 counting as half.
5. The Merseyside Survey Standard —differing slightly from the Manchester—is explained in a footnote to the section on Liverpool.
6. Standards based on cubic space per person.

There are disadvantages attaching to all these standards. The Registrar General's is inadequate. A family of 4 adults—man and wife, grown-up son and daughter—inhabiting two rooms would not be deemed overcrowded. Presumably it is agreed that such a

* Practically all the authorities define the Registrar General's Standard wrongly by saying that children under 10 count as halves. They do not. (See County Volumes of the Census of England and Wales, Table 11.) The National Housing and Town Planning Council have published writings in which this mistake is made.

OVERCROWDING

SOME TYPICAL EXAMPLES

"Flat" of four rooms over two shops ; one room is really a scullery. Rent 14s. Occupied by a husband who is blind, wife, daughters 20 and 17, sons 12, 8, 6, 4, 3, 1. There are two bedrooms (one with partition and no door), and a scullery containing coal, "bit bucket," etc., but also used for sleeping. The girl aged 17 has been certified as tuberculous, and should have a bedroom to herself. No water-tap in house, and all water has to be carried from the yard ; no sink and no wash-boiler.

Two-roomed house, one up and one down ; rent 6s. 2d. No water in house ; bugs and mice and at one time rats in bedrooms. Occupants : widow (husband died early this year in a Sanatorium, T.B.), boy, 10 ; girls 8 and 3. Elder girl away in Sanatorium, expected home shortly. All sleeping in one room. Boy threatened with T.B.

House : one boxroom up, and one room down ; rent 6s. 7d. ; 5 persons. The entire family sleep in one room, as the boxroom is unfit for habitation owing to crumbling walls and falling plaster. Rain penetrates bedroom roof and soaks beds in wet weather ; leaking lavatory roof. House overrun by mice and beetles.

Very old house, two up and two down ; rent 8s. 2d. ; eight persons. The entire family live in back-room kitchen. The whole house is dilapidated, and both walls and floors are bad. The lavatory door was off its hinges and leaning against yard wall. The house was literally "running alive with vermin." Occupants declare that they have to get up during the night and come downstairs to "shake" themselves, in order to get any sleep at all.

—*From* SURVEY UNDERTAKEN IN PART OF MANCHESTER BY ST. CHRYSOSTOM'S HOUSING SURVEY GROUP.

Husband, wife, adult son and daughter-in-law, nephews, ages 15, 14, 7 and 1 ; nieces, ages 12, 10 and 3, in a two-bedroomed house.

Mother, son-in-law, adult daughter and son, grandsons aged 20, 14 and 8 ; grand-daughters aged 7, 4 and 2, in a two-bedroomed house.

—*From* HOUSING IN HULME.

At No. 54, X—— Street, a man, wife and six children occupy one room.

—*From* SOCIAL STUDIES OF A MANCHESTER CITY WARD.

Coal carter (49) with wife and five children, daughter of 9 and four sons (13, 8, 5 and 1), two bedrooms. Rent 8s. 1d. Parlour used as general shop by wife, who also sells vegetables ; cellar-kitchen let at 2s. 6d. as hairdressing saloon.

Marine fireman (58) with wife and two sons (20 and 13), one bedroom (which is also used as a living room). Rent 7s. 6d.

—*From* HOUSING CONDITIONS IN LIVERPOOL.

Four families in house . . . (b) Father, mother and six children in two upstairs rooms. Rent 7s. 6d. All sleep in one room when it rains. Other room lets in rain.

Six families in house.—(a) Family of five on ground floor. One room. Rent 4s. Rats as big as kittens reported ?

—*From* HOUSING PROBLEMS IN LIVERPOOL.

Family of six, consisting of a mother, two adult sons and three adult daughters. These are living in a house with two bedrooms, a parlour and a living-room. The parlour has been let to a family of seven lodgers ; a man, wife and five children under 10, two of whom sleep out. The rent of the whole house is 8s. 4d. and the parlour is sub-let for 6s.

Two families living in same house using same living-room. 1. Family of four, consisting of husband, wife and two adult daughters sleeping in one bedroom. 2. Family of nine, consisting of husband, wife, one adult son, one adult daughter and five children sleeping in two bedrooms. The house has a living-room, parlour and three bedrooms. Rent 8s.

—*From* A REPORT ON THE HOUSING PROBLEM IN SHEFFIELD.

In the attic (second floor) is a man, wife and four children, boys aged 4 and 14 months and girls aged 5 and 3. The room is large, but the ceiling is low ; the roof is leaking, and the plaster is bulging. The walls are damp, and have been papered by the tenant. When the visit was made the floor boards were defective in places, and gave way as they were trodden on . . . The ground-floor back room is rented by a man, his wife and two children, a boy 3 years old and a girl 13 months. The room opens directly into the wash-house. The walls are appallingly damp, partly due to the vicinity of the wash-house, and also because a length of rain water pipe on the outside wall has broken off, so that the water is soaking into the room at the head of the bed. The tenant complains of snails, black beetles and mice.

—*From* FIVE HUNDRED HOUSES IN BIRMINGHAM.

This nation cannot afford, first from an economic point of view, the perpetuation of the slums. Nor can the nation afford the moral and mental degradation which slum conditions create in those who inhabit them. Let public opinion awaken. Great tasks require great energy, vision and determination. Let us put forward a great national effort, irrespective of party or of politics. Every generation has a dominating social task and so let our age, our generation, be remembered as the one in which we swept away this blot that disgraces our national life.

THE PRINCE OF WALES

Slum clearance is primarily the responsibility of the local authorities. . . . But very little progress was made in the matter before the War, and in spite of intensified efforts, which have included the grant of large subsidies, only just over 1,000 slum houses a year have been dealt with since the War. The slow rate of progress in the past has been due partly to imperfections in legislation, partly to technical difficulties such as the rehousing of the displaced population, and partly to the enormous cost involved. All these obstacles have been very greatly decreased of recent years. Building costs have fallen to a remarkable extent, and this fact—in conjunction with the subsidy of £15 a year for a house to accommodate five persons under the Act of 1930—means, according to the Minister of Health, that houses built under a slum-clearance scheme "can be let at rents well within the capacity of the poorest of the working classes."—THE TIMES

family should have three bedrooms. In practice they cannot have more than two, and they may prefer, or be practically forced, to use one only. The National Bedroom Standard is intended to be used in connection with *rehousing* schemes, and is inapplicable as a standard for measuring overcrowding in existent dwellings. The Sex Separation Standard obviously makes no provision for large families—it only insists on *sex separation*. When this standard is incorporated into the Manchester Standard one is arriving at something fairly satisfactory.

The disadvantages of the Manchester Standard are twofold. First, its applicability largely depends on the habits, or necessities, of the people. If a family has to, or chooses to, use all its rooms as bedrooms there is less chance of it being considered overcrowded on this standard. The second disadvantage attaching to the Manchester Standard, which also applies to that used in the Merseyside Survey and to other complex standards, is that it is impossible to apply them to an area unless a special investigation is made.

Over any area of magnitude the use of the Manchester Standard will give a far greater percentage of overcrowding than the Registrar General's, but there are cases which would be overcrowded under the latter but not the former. A man, wife and child under 10 in one room are not overcrowded on the Manchester Standard—they are on the Registrar General's. In general, however, the Manchester Standard gives a figure about three times as high as the Registrar General's.

METHOD USED FOR ESTIMATING HOUSING NEEDS

In the case of many of the towns, the information at present existing makes no pretence at completeness. London cannot say how many slums it has; Naturally, towns that cannot or will not clear their slums do not always schedule them, though some do.

We are thrown back on the overcrowding figures of the Census as a basis. From the County volumes of the Census we can obtain the number of persons in each town living over 3, 2, 1½ and 1 per room. (Children of all ages count as full persons.)

Age and sex composition of the family, and the size and character of rooms, play a great part in the decision which any individual would make as to the existence or absence of overcrowding. But the Census information cannot take us far in this direction, and it can only take us a little way on the road by means of laborious calculations. Since we should still have to make assumptions to go any further, it would not be profitable to go through such calculations.

The Census gives the number of persons living at various overcrowding levels. In order to see at a glance what sort of a family would be considered overcrowded on these standards, the following table has been prepared specially :

OVERCROWDING ON VARIOUS STANDARDS AVAILABLE FROM THE CENSUS

Persons.	Persons per Room. 1 room	2 rooms	3 rooms	4 rooms	5 rooms
1	1	½	⅓	¼	⅕
2	2	1	⅔	½	⅖
3	3	1½	1	¾	⅗
4	4	2	1⅓	1	⅘
5	5	2½	1⅔	1¼	1
6	6	3	2	1½	1⅕
7	7	3½	2⅓	1¾	1⅖
8	8	4	2⅔	2	1⅗
9	9	4½	3	2¼	1⅘
10	10	5	3⅓	2½	2
11	11	5½	3⅔	2¾	2⅕
12	12	6	4	3	2⅖
13	13	6½	4⅓	3¼	2⅗
14	14	7	4⅔	3½	2⅘
15	15	7½	5	3¾	3
16	16	8	5⅓	4	3⅕

Living over 1 per room

Living over 1½ per room

Living over 2 per room

Living over 3 per room

It has been decided to use a standard which considers as overcrowded all families living at over 1½ per room. It is a perfectly just criticism of the adoption of such a standard to say that it makes no provision for individual differences in the age and sex composition of families or in their use of living rooms as bedrooms. But it is necessary to use a standard which can be applied to every town. This one can.

Now let us examine the table above, in relation to the use of this standard :

1 person must have 1 room.

2 persons must have 2. If they are man and wife they will therefore have a bedroom and a living room. Otherwise they may have two bed-living

OUR STANDARD

One-and-a-half to a room. This is the standard to which we work in the Survey which follows of the six largest cities in Great Britain—excluding London, which will demand an issue to itself later on. As will be seen from the drawing, we have been generous. We have given the inhabitants of this house larger and higher rooms than such inhabitants usually get.

Even so, at one-and-a-half to a room—kitchens counting as rooms—there are six people in this house, divided for sleeping purposes thus: main bedroom, husband, wife and child; second bedroom, two girls; parlour, son.

Accommodation which necessitates five people sleeping in two small bedrooms, and one person in the parlour, is by every civilized standard odious. Nevertheless, today in England it is a standard of perfection. Of the four million odd persons dealt with in this issue 25 per cent. live in conditions of overcrowding beside which this is luxury.

If one adds the presence of vermin—the bug, the beetle, the rat—the all-pervasive slum smell, and the absence—in thousands of cases—of bathrooms and w.c.'s, and even of water taps, one arrives at some idea of the living conditions for a quarter of the population as dealt with here.

This state of affairs has been brought about in spite of the organized opposition of the architectural profession. In many places—London, for instance (the percentage of persons living more than three-to-a-room actually increased between 1921 and 1931)—or Lancashire (see chart, p. 830)—"new" overcrowding is easily beating "new" housing.

rooms. If one of the rooms is very much a kitchen, they will probably have to sleep in the same room, whatever their relationship may be. Our standard is not too generous.

3 persons, also, only have 2. *A fortiori*, we are not being too generous.

4 persons must have 3. Where a family of 4 consists of man and wife and two small children, three would be demanded on the Manchester Standard if one room were not used for sleeping. Where the children are older and of the same sex, again it would be reasonable to use two rooms as bedrooms. If the children were of opposite sexes, decency would require the use of 3 rooms. This would mean no room empty at night. Again, we are not too generous.

5 persons in 4 might be said to be comfortably as well as decently housed, but in many cases 4 rooms would really be necessary.

6 must be got into 4. Where the family is as big as 6, there should be two free rooms at night if possible. It will be hard to manage this in many cases.

On the whole it seems probable that in many ways the use of this standard would happen to accord with the results which would be arrived at by using the Manchester Standard—the most satisfactory of those in common use. Where their application differed, it is likely that the use of the 1½ standard would lead to fewer rooms being considered necessary. This contention would seem to be supported by statistics, so far as information can be obtained, for in the case of most of the cities considered the use of the 1½ standard involves us in classifying as overcrowded about 2½ times as many persons as would the Registrar General's Standard. The Manchester Standard gives a proportion of overcrowded about three times as high, except where a great proportion of families use all rooms for sleeping.

Overcrowding, therefore, is based on the principle that no family ought to live at more than 1½ per room. This standard is accepted as a *pis aller*, but has been shown to be reasonable. It must be emphasized that all persons are counted as 1 on our standard, while on the Manchester (bedroom) Standard the young children only count as halves.

The Census figures give overcrowding

at various levels. Use of the table, and a careful analysis of one particular town, show that it is safe to say that those living at *over* 3 are on average living at 4, those at 3 and over 2 at $2\frac{1}{2}$, and those at 2 and over $1\frac{1}{2}$ at $1\frac{3}{4}$.

The method of determining needs in each case may be represented thus :—

A people living at over 3 per room (assume average 4), have $\frac{1}{4}$ A rooms. They should have $\frac{3}{3}$ A, and therefore need another $\frac{5}{12}$ A to prevent overcrowding at over $1\frac{1}{2}$ per room.

B people living at 3 and over 2 (assume average $2\frac{1}{2}$), have $\frac{2}{5}$ B rooms. They should have $\frac{2}{3}$ B, and therefore need $\frac{4}{15}$ B.

C people living at 2 and over $1\frac{1}{2}$ (assume average $1\frac{3}{4}$), have $\frac{4}{7}$ C rooms. They should have $\frac{2}{3}$ C, and therefore need $\frac{2}{21}$ C.

No symbols are used in the actual determinations, so that the total of rooms required at each stage can be seen.

We thus get a figure for rooms which all the people living in the different classes should have in order that none shall live at over $1\frac{1}{2}$ per room, and a figure showing the deficiency.

The latter shows the number wanted if all the houses lived in were fit for habitation. The former would indicate the number required if every overcrowded house were unfit for habitation.

Experience shows that it is safe to take the geometric mean of these two as an indication of total needs. In the case of the majority of towns, the "maximum" figure is about four times the "minimum," so that this is the same as assuming that about as many rooms are required to replace insanitary dwellings as to prevent overcrowding at over $1\frac{1}{2}$. The use of this mathematical method is not chosen, but dictated by necessity, since many towns have no idea how many insanitary houses they have. The geometric mean formula is abandoned where exact information is available, or the result modified where the evidence appears adequate.

One further adjustment remains. All families cannot be housed at precisely $1\frac{1}{2}$ per room. Some of those that are put into the old houses which are too small for their present occupants, and some of those given new houses, will have to be housed at 1, $1\frac{1}{4}$ or $1\frac{1}{3}$, in order not to be housed at over $1\frac{1}{2}$. Only families consisting of multiples of three can be housed exactly at the standard. We push all our figures up 25% to allow for thi

Construction of Houses since the War

Houses erected 1919 to June 30, 1932	31,964
by private enterprise	7,586
by Council	24,378
(none sold or being sold)	
Houses demolished for specific slum clearance purposes over same period	1,586

The Courts and the Cellars

Liverpool slums are probably the worst in England, built when Liverpool was becoming one of the great ports of the world. The practice was to put up six or eight houses at a time round a court.

In 1841 half the population of Liverpool was living either in courts or cellars.

In 1854 the Corporation prohibited the building of more court houses. There were then 22,000. Their demolition has been proceeding ever since. By 1914 only 2,900 remained. There were in 1931 still 1,832 dwelling-houses in courts "found to be in a state so dangerous or injurious as to be unfit for human habitation." This, of course, had been implied 80 years before.

Most of these houses are in Exchange district.

In this district, the average number of families per house is 1·8, and the average number of persons per family 4·4.

There are, therefore, at least 13,000 people living in these court houses—regarded as unfit 80 years ago.

There are also 6,000 insanitary houses, most of which could be put in order by structural improvements.

There are 99 cellars still occupied as separate dwellings and 598 cellars used as kitchens.

Overcrowding

On the Survey* standard 11 per cent. of the families investigated in the whole city (a random sample) are overcrowded. Therefore about 16,000 families are overcrowded.

In St. Anne's Ward 37% are overcrowded.

Many of these overcrowded houses are not unfit—but movement is hampered by shortage of cheap houses and the Rent Restriction Acts.

Table showing Relation between Infantile Mortality, Death Rate and Overcrowding, 1931

The infantile mortality rate for the city increased from 81 in 1930 to 93 in 1931. (This increase is common to all the big Lancashire towns. Warrington shows an increase from 65 to 100, Oldham from 67 to 106, Bootle from 57 to 95. Those three are the worst.)

District	Percentage of working class families overcrowded	Infantile Mortality Rate	Death Rate

Slum Clearance — Particular Area

Slum clearance has had to wait for building.

But progress has been very slow, despite this, in great part owing to the obstructive attitude of property owners.

The Queen Anne Street area, one of the worst, contains about 434 houses, and a clearance order was made and confirmed in 1928. Legal action held this up until March, 1931—but even then the scarcity of land proved such a bar that by November only 85 tenements had been put up for rehousing purposes consequent on the contemplated clearance.

The Queen Anne Street area had, over the period 1921–1927, a death rate of 22·5, an infantile mortality rate of 158·9.

Detailed information is available in respect of six areas of bad housing, from a survey by the Liverpool University Settlement.

SIX BAD AREAS

Area in St. Anne's Ward, 343 houses

"Most of the houses are old and dilapidated. Defective roofs, cracking brickwork, decayed woodwork are common features . . . in some of the rooms the plaster is decayed and falls away at the slightest touch; the ceilings present a sodden appearance and in places are stuffed with rags. Such furniture as there is is often cumbersome and completely unfit for the small rooms. The bed usually dominates and the flock mattress serves as a general dumping ground by day, and a very uncomfortable resting place by night. In the absence of facilities for cleaning and airing, the beds are often harbouring places for dirt and vermin."

"The cellars are seldom used: in some cases they are boarded up, and in others they have been used for a long time for dumping refuse, with the result that they smell very bad."

Though they have to live near their work, "it seems that there is no real occupational necessity for the people to live in this area rather than in many other areas lying within a mile of the riverside."

Area in St. George's Ward, 98 houses (10 superior ones not included)

Information was obtained from 71 houses, holding 76 families.

"The courts are gloomy in the extreme; in places they are only 10 feet wide and the houses in them are of the back to back type, with 3 rooms on separate floors."

Similar information is available about four other areas. The information has been added to the above to get a general summary of these six bad areas.

Rents are generally 6s. 6d.–7s. 6d. for 3 or 4 rooms (much the same as in the first area).

* The "Survey Standard" referred to is that which was used in connection with the recent survey of Merseyside. It was devised by Caradoc Jones, and takes into account living-room as well as sleeping-room accommodation. Counting children under 10 as half, the following standards are used:—2½ to have 1 room, 3-3½ to have 2, 4-5 to have 3, 5½-7½ to have 4, 8-10 to have 5, etc. The cases not deemed overcrowded under this test are subject to certain conditions as regards sex segregation, the age selected being 7 in place of the 10 of the Manchester Standard. Also it is assumed that families consisting of four adults, or the equivalent, require at least one sitting-room not used as a bedroom.

A ONE-ROOMED HOME FOR FIVE

A living-bedroom in Liverpool. In this single room a man, his wife and three children live and sleep. The plaster on the walls and ceiling is decayed and falls away at the slightest touch, and such furniture as there is is completely unfit for the room. In such rooms the bed, often harbouring vermin, usually dominates, and the flock mattress serves as a general dumping-ground by day and a very uncomfortable resting place by night.

Fewer 1- and 2-room dwellings exist, in 2 there are no 1-room dwellings, and in 1 no 2-room dwellings.

Summary of the Six Bad Areas

In the six areas 765 houses, containing 1,206 families (5,089 persons) were visited.

32% of the families were overcrowded.
44% of all persons were living in overcrowded families.
57% of all children under 14 were living in overcrowded families.
53% of all male workers were unemployed in the particular week taken (counting a docker unemployed if he worked less than 3 days).
87% of the families lived in 4 rooms or less.
68% paid under 7s. rent.
84% per cent. of the families are willing to leave their houses for better accommodation.
38% are prepared to leave the neighbourhood.

None of the houses had a garden or a bathroom.

"Sanitary arrangements were generally very unsatisfactory. In many cases they were revolting. Some of the houses were kept in a fair state of repair, but the majority were unfit for habitation. All the property is old and adequate repairs expensive."

"The desire to be near their work was the commonest reason . . ."

". . . no general antipathy towards tenements was expressed . . ."

Special Summary of Rents paid in these Six areas

Rent Paid	Number of Families Living in 1 Room	2 Rooms	3 Rooms	4 Rooms	5 Rooms and over
Up to 2s. 11d. ..	32	1	2	0	0
3s. to 3s. 11d. ..	102	10	22	1	0
4s. to 4s. 11d. ..	127	25	16	5	1
5s. to 5s. 11d. ..	60	63	56	17	3
6s. to 6s. 11d. ..	37	35	125	82	16
7s. to 7s. 11d. ..	14	31	65	54	19
8s. to 8s. 11d. ..	1	13	22	12	10
9s. to 11s. 11d. ..	0	4	9	13	38
12s. to 15s. 11d.	0	0	0	0	37
16s. to 21s. ..	0	0	0	0	4

Analysis of Rents paid in these Six Areas

One Room

The largest class are those for which 4s. to 4s. 11d. is charged, numbering 127.
There are 134 cheaper than 4s., and 112 more than 4s. 11d.
It is probable that the median is about 4s. 5d.
Average higher, owing to dispersion in upper classes.

Two Rooms

Largest class 5s. to 5s. 11d., numbering 63.
36 below, 83 above.
Median about 5s. 9d.
Average rather higher.

Three Rooms

Largest class 6s. to 6s. 11d., numbering 125.
96 below, 96 above.
Median about 6s. 6d.
Average a little lower.

Four Rooms

Largest class 6s. to 6s. 11d., numbering 82.
23 below, 79 above.
Median about 6s. 9d.
Average much the same.

Five Rooms and Over

Largest class 9s. to 11s. 11d., numbering 38.
49 below, 41 above.
Median more difficult to determine, owing to wider limits of the rental margins in the largest class, and to dispersion below this class, and concentration above it—perhaps 10s. 9d. or even more, owing to the second of these factors.
Average considerably lower, owing to great dispersion below.

These figures show the impossibility of moving many of the inhabitants of these bad areas into Council houses or even tenements suitable to their needs, unless the rents of such municipal dwellings are to be greatly reduced.

The following sections summarize the work of the Corporation.

What is Being Done

Houses erected by Corporation since the war, or in course of erection at March 31, 1932.

Under 1919 Act	5,808
1923	1,035
1924	16,897
1930	203
	23,943

The Corporation also built 2,895 houses before the war.
Its tenants now number 118,000, i.e., 1 in 7 of the City's population.
About 15 per cent. of the houses are tenements in the centre of the City.
The great majority are in outlying estates.
The Council's big mistake has been to lease land on estates for shops, etc.

This great building performance has not been enough to satisfy demand.
The Council has built 72 per cent. of the total houses built since the war.

Council's Five-Year Programme under 1930 Act

10,000 houses.
3,000 tenement dwellings.

(This programme will be more than enough to relieve present shortage, accommodate natural increase and rehouse those displaced from the worst of the insanitary and overcrowded dwellings, *provided that:*

1. Emigration continues at its present level;
2. "Filtering up" takes places to the requisite degree.

LIVERPOOL

Rents of Corporation Buildings

Pre-war tenements (controlled) : 1 room, 2s. 8d. to 3s. 8½d. ; 2, 4s. 1½d. to 5s. 3½d. 3, 4s. 1½d. to 6s. 9d. ; 4, 7s. 1d. to 8s. 1½d.

Self-contained four-room cottages (controlled), 8s. 10d. to 13s. 7½d.

Tenements under 1923 Act : (bathroom and scullery each besides), 1 room, 3s.3d. ; 2, 4s. 9d. to 5s. 3d. ; 3, 7s. 3d. to 8s. 3d. ; 4, 8s. 3d. to 9s. 3d.

Houses under 1919 Act :
Non-Parlour, 12s. to 13s. 10d.
Parlour, 16s. 1d. to 18s.
Terrace type, 14s. 6d.

Houses under 1924 Act :
Non-Parlour, 2 bed., 8s. 8d.
Non-Parlour, 3 bed., 9s. 4d. to 13s. 1d.
Non-Parlour, 4 bed., 11s. 6d.
Parlour, 3 bed., 16s. 1d. (special ones up to 19s. 10d.).
Flats, 2 bed., 15s.

Three-bedroom tenements are therefore 7s. 1d. upwards, inclusive.

Houses are therefore 8s. 8d. to £1 inclusive.

The average is about 14s.

Average for all working-class houses 9s. to 10s., and, for the slum areas considered, far lower. Moreover cost of living is higher in suburbs.

•

CONCLUSION

We have seen that there are 20,515 people in Liverpool living at over 3 per room, 68,821 living at 3 and over 2, and 126,629 living at 2 and over 1½. By assuming that these people are living on an average at 4, 2½ and 1¾ per room respectively (see Introduction), we can proceed to ascertain their wants, on a basis of giving them houses in which the overcrowding cannot exceed 1½ per room.

1. 20,515 people are living on an average of 4 per room, i.e., in about 5,000 rooms.
They should have 13,500 rooms.
If all their present rooms are fit, another 8,500 will suffice —if they are all unfit, 13,500 are needed.

2. 68,821 people are living on an average of 2½ per room, i.e., in about 27,500 rooms.
They should have 46,000 rooms.
If all their present rooms are fit, another 18,500 will suffice —if they are all unfit, 46,000 are needed.

3. 126,629 people are living on an average of 1¾ per room, i.e., in about 72,000 rooms.
They should have 84,000 rooms.
If all their present rooms are fit, another 12,000 will suffice —if they are all unfit, 84,000 will be needed.

The minimum requirements to abate the overcrowding would therefore be 39,000 rooms. And this figure, besides taking no account of houses or whole areas unfit for habitation, assumes implicitly that it is possible for each family to establish itself in a house at exactly 1½ per room. Manifestly this is impossible. To allow for the necessity of some people living rather less than 1½ per room (2 people would have to have 2, 4 people 3, 5 people 4, and so on), we may, conservatively, increase our minimum figure to 50,000 rooms.

Our maximum—necessary if all overcrowded houses were unfit—would be over 140,000 rooms. Allowing for the above factor, this might be increased to 175,000 at least.

Pure statistical deductions from Census figures therefore give us a minimum of 50,000 rooms to abate overcrowding, and a maximum of 175,000 required if all the overcrowded houses were unfit. In fact we know three things :—

1. All the overcrowded houses will not be unfit ;
2. Neither are they all fit ;
3. There are some not overcrowded houses which are quite definitely unfit.

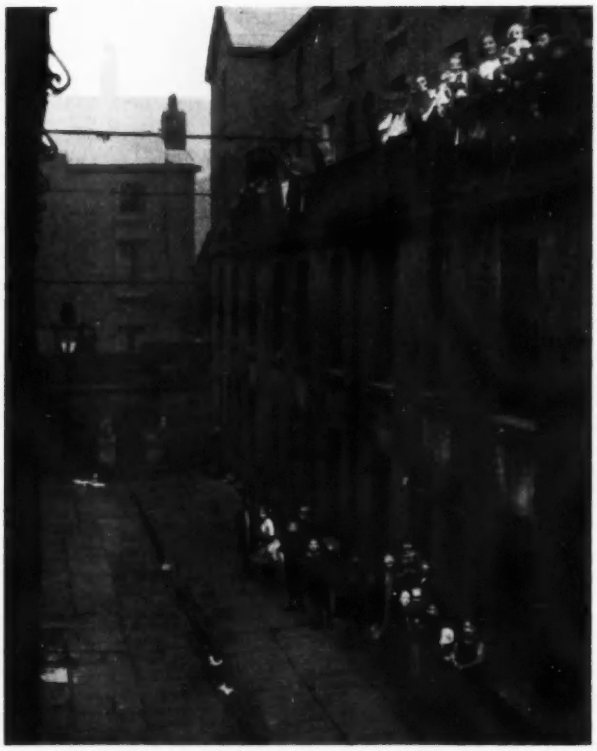
Further, the examination of the slums proper has shown that :—

1. 13,000 people at least live in the 1,800 odd court houses—all of which are definitely insanitary.
2. The provision of 13,000 houses by 1935 will be adequate for relieving the present shortage, accommodating the natural increase and rehousing those displaced from the worst of the insanitary areas, provided emigration continues as at present and the requisite filtering-up goes on.

The indications are that emigration will slow down, that filtering-up has gone nearly as far as it will (the correlation between overcrowding, poverty and foul conditions in the areas considered is very great). It would not be unjustifiable, on this basis, to hazard a figure of 20,000 houses, *of the right types, in the right place and very cheap* as the minimum requirements. Many of these would have to be fairly large—overcrowding being chiefly associated with large families. The average would be perhaps 4½ rooms. The figure of rooms required would then be 90,000. This figure roughly represents the geometric mean of our minimum and maximum above—and would seem to represent a rough working rule to be applied in most cases.

LIVERPOOL

Mother, father and six children (one a very young baby). Two-roomed dwelling. Wall in sitting-room crumbling. Impossible to paper it. The floor was a stone one, all broken and uneven. Bedroom in which the whole family slept was practically pitch dark even in the day time. Place was infested with rats and cockroaches. Family in bad health—suffered with chests. Two children had died of diphtheria. Mother thought rats brought sickness.



A three-storied house, with one room on each floor and cellar used for storage, was occupied by father, mother and nine children under 18 years of age. Rent 5s. 2d. Tap in cellar. Cooking done on gas ring in a covered utensil in the cellar. The cover was needed to keep bits of falling plaster out of food. Cellar drain stopped up. Parlour could not be used because chimney was out of order and the room filled with smoke when a fire was lit. No dust-bin. Rubbish tipped on entry. Trough closet. Walls old and crumbling. Mother in ill-health. Seven slept in one room.

—*From* HOUSING PROBLEMS IN LIVERPOOL

BALCONIES NEAR—And Not Quite So Near—HEAVEN

The designers of these appalling Liverpool "dwellings" were at least humane enough to provide them with balconies, in default of anything green to look out upon, or any view except of your neighbour's involuntary disregard of most of what the sanctimoniously well-housed call "the decencies of life." A balcony can become a sort of make-believe piazza. Even so there is an overflow of social life into the guttered alley where water has to be drawn from a pump. To look from these crowded culs-de-sac to the immense German tenement-buildings on the right, is to feel they must be uninhabited. Actually they house more inhabitants per square yard than their Liverpool counterparts. Only there is privacy and room for all—even room for grass, flowers and sunshine. The view above shows the long sweep of concrete access balconies by which each flat is reached, that below the rows of separate sitting-out balconies, of which each flat has one. Yet it costs less to build flats like these than it would to rebuild the Liverpool ones to their original design.

Construction of Houses since the War

Houses erected 1919 to December, 31 1932	23,074
by private enterprise	13,113
by Council	9,961
(357 sold or being sold)	
Houses demolished for specific slum clearance purposes over same period	281

The Census observes that :—

"The large increase in these wards (Crossgates and Templenewsam, North and Roundhay) is attributed mainly to the construction of new houses made necessary by the demolition of other houses in the City of Leeds, consequent upon new road-making improvements."

*Some more overcrowding figures**

Overcrowding shows a remarkable improvement compared with 10 years ago. This improvement is mainly due to the decrease in the size of families. It can

* The greater part of the figures and ideas on Leeds have been taken by me from a pamphlet entitled "Housing Policy in Leeds." The pamphlet is in reality a Minority Report of a City Council Sub-committee, but was published by the *Leeds Weekly Citizen*, from whom it can be obtained, price 1s., post free.

be seen that the Council has built less than 10,000 houses since the war.

Even now :—

3,528	persons in	1,883	families occupy	1	room
48,150	,, ,,	15,596	,, ,,	2	rooms
104,662	,, ,,	30,148	,, ,,	3	,,
135,436	,, ,,	36,919	,, ,,	4	,,

885 of the 1-room dwellings were occupied by persons living alone.

Without these the above figures show 2,643 persons in 998 rooms.

Recent investigations into particular areas show about 10% of all working-class houses overcrowded on the standard of more than 2 persons per sleeping room.

The Back-to-Backs

There are 74.805 back-to-back houses in the city.

Of these back-to-backs (33,632 built before 1872.
28,154 built between 1872 and 1890.
13,019 built since 1890.

Altogether it is estimated that Leeds contains nearly 35,000 houses built before 1844 and a further 19,000 built between 1844 and 1872.

Over 32,000 of the older back-to-backs are 70 to 80 per acre, consisting of kitchen and one bedroom (sometimes a very small boxroom-bedroom as well) ; they have no scullery, no food storage facilities, no hot water facilities ; w.c.'s are shared between large numbers. The average 2-room back-to-back has a superficial area of 350 ft.

The Medical Officer of Health for the City, in his Special Report, said :—

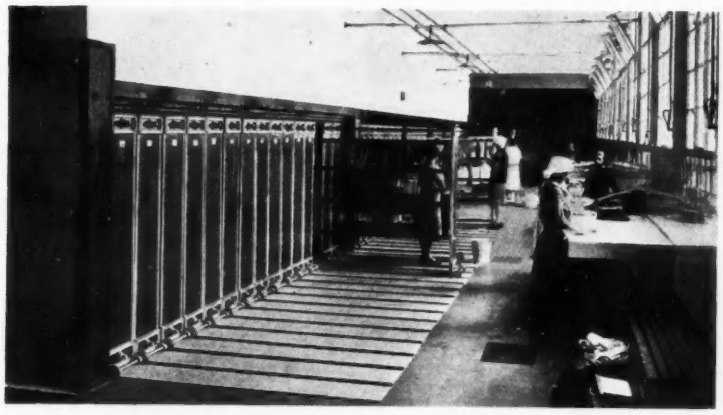
" The modern type, generally speaking, is a good type of working-class house, to which little exception can be taken from the point of view of health. The design is, of course, open to the objection of being back-to-back, but generally speaking the structure and accommodation is satisfactory. The houses are built in rows, have a fifteen foot forecourt in front, abutting on to a street 36 feet wide, giving a total distance between the houses of 66 feet. The houses are provided with separate sanitary accommodation, and have their own ashbins. Bathing facilities are supplied in the sculleries, with hot and cold water laid on. The houses number 40 to the acre, which, it will be observed, is still much in excess of the number allowed by law today.

" The oldest type, those built prior to 1872, and now numbering about 33,632, is built in long, unbroken rows, and abuts on to streets few of which exceed 22 feet in width. They consist of two rooms—a living room opening directly upon the street, and a bedroom. There is also under the living room a cellar—usually unlighted—used for storing coal. Owing to the design, ventilation is bad in both living room and bedroom, whilst not infrequently the lighting is likewise inadequate. The only provision for the storage of food is a cupboard in the living room, or, alternatively, shelves fixed on the stairs leading to the cellar. Personal and domestic washing must be done in the living room, where as a rule there is an earthenware sink with cold water laid on, and a set-pot for boiling the clothes.

" There is no water closet in the house, and no accommodation for the storage of household refuse. Water closets are provided outside, usually in blocks of 2, 4 or 6, either sandwiched in between two houses—often under bedrooms—or built at one or other end of the row. The entrance to these conveniences is usually narrow and dark, and the conveniences themselves are of the old trough type situated on an inside wall. Generally speaking, the ratio of conveniences to houses is one to three—not infrequently one to four—which, judged by modern sanitary standards, is totally inadequate. Domestic refuse is deposited in an ashpit adjoining the sanitary conveniences, access to which is obtained through a small door from the dark and narrow passage referred to. In many cases the ashpit is situated under the pavement, in which case the entrance is through a trap door flush with the foot-path.

" With the passage of time the walls, roofs, and woodwork of the houses show unmistakable signs of decay. In some cases the walls are bulging, and have to be tied, whilst in others it is only by constant repair that the structure can be

W A S H I N G — A T



There is nowhere to hang the washing in the industrial areas of Great Britain. In the frontispiece to this issue clothes-lines are shown strung at ceiling level, from corner to corner across the living-room. Here washing is seen hung along balconies, across the streets, or even, for lack of any other place, in front-entrance doorways and passages. In the illustrations on the opposite page tenants in Vienna are enjoying the advantages of a central laundry. The upper photograph shows a gallery of drying closets in the central laundry of the Jedleseerstrasse building, and the lower the electric ironing room in that of the group of buildings at Wienerbergstrasse. The drying closets are fitted with a series of clothes-horses, running on rollers, and are heated by waste steam. The horses are pulled out, the washing is hung upon them, and they are then pushed back into the closets, where drying takes place.

HOME AND ABROAD

held together and kept weathertight. Owing to the deterioration of the structure and the absence of damp-proof courses, evidence of dampness on the inside walls and bedroom ceilings is general. A house of this type, as will be readily appreciated, lends itself to congestion, and in many parts of the city the number of these houses to the acre is as many as 70 or 80. One might also mention that in certain districts of the city—particularly Hunslet and Holbeck—there still remains a number of enlosed courts and yards—some of them extremely narrow, and most of them unpaved, on which houses of this type abut.

"The conditions as regards size, structure and layout are somewhat better in the intermediate type—those built between 1872 and 1890, numbering 28,154. Instead of in long rows, the houses are built in blocks of eight, with the sanitary conveniences situated in the gaps between the blocks. The streets are wider, averaging from 36 feet to 42 feet, but the objectionable feature still remains of the living room opening directly on to the street.

"The houses consist of living room, scullery, and two bedrooms, with occasionally an attic in addition. There is also a cellar under the living room for the storage of coal. In this type of house the domestic and personal washing is done in the scullery, and not in the living room, whilst food is stored either in a cupboard in the living room or in the scullery. The houses, generally speaking, are in a better state of repair, and signs of weathering and dampness are not so obvious. Domestic refuse is deposited either in an ashpit of the overground type, or in ashbins placed in the space between adjoining blocks. The sanitary conveniences were until recently of the old trough type, but most of them have now been converted into modern pedestal w.c.'s. The ratio of w.c.'s to houses in this type of houses is one to two. As regards congestion, whilst this is not so marked as in the case of the old type, nevertheless, the number per acre is still from 50 to 60."

The Churches in the City have made their feelings heard to the City Council.

"In many houses of this City the birth of a child must take place in the living room downstairs, for there is no spare bedroom where the mother may lie for her confinement. When death enters the house the body must frequently be laid out in the same living room downstairs, and the clergy who have to visit such houses are accustomed to the sight of the family sitting down to meals, and entertaining the numerous visitors who arrive at such times, in the room where the corpse is laid out . . . . Lack of sufficient washing accommodation means that the whole family must wash at the sink in the living room. . . . Opportunities for taking a bath are difficult to secure. The younger members may be encouraged to go to the public baths: but it is a fact that the parents get very few baths, and as they get older tend to drop the practice altogether. Lavatory accommodation is in many areas woefully inadequate. Families have to share a closet with others, usually placed in a passage nearby. They may have to walk down the street past 6 or 8 houses before arriving at the lavatory provided, usually surrounded by the dustbins. Not infrequently they arrive to find the place 'engaged' by one of the neighbours, and children, and not merely tiny ones, get into the habit of using the street instead . . . the people learn to acquiesce in these sad conditions. Something in the nature of a campaign will have to be undertaken in Leeds on this question of Housing, for the vast mass of our people are ignorant about this vital matter . . . curiously enough there seems to be an entire lack of enthusiasm for this question. . . . The reason may well prove to be that so many of our citizens—I believe about one-third—are themselves living in such inadequate housing conditions that they are unaware of the seriousness of their situation."

"For the past 31 years I have lived and worked in one of the 'slum' areas of Leeds. What exactly may be the definition of the word 'slum' I am not prepared to say . . . my definition of the 'slum' area is one in which the houses are totally unsuitable to shelter human families. . . . I can vouch for it that 9 out of 10 houses in the districts above mentioned (10 streets are given) are of this type."

"I have seen boys and girls, grown-up men and women, shouldering one another to get in or out of the w.c.'s."

"By their crowded conditions they foster diseases and immorality. That w.c.'s should be crowded together in blocks, that one such w.c. has to be used by members of more than one household, and that all have to be approached under the public eye is a scandal that should be abolished at once. . . ."

Details of 3,000 of the Oldest Houses

In 1930 the Medical Officer of Health prepared a list of 3,029 houses as a suggested demolition programme (5 years) under the Act of that year.

The programme was regarded as too large, and rejected(!) The one Housing Inspector(!) employed by the City took a door-to-door canvass of the houses.

It is to be noted that these 3,029 houses comprise several areas of some hundreds of houses, a number of smaller areas of 20—100 houses and about 200 in groups of threes and fours. The larger areas are portions of much greater districts of substantially similar character.

Twenty-five of these are single-room houses,

69 people live in them (i.e. about 2¾ per room), 5 each in 3 of them, and 6 in 1.

1,874 are two-room houses.

About 6,700 people live in them (i.e. about 3½ per dwelling or 1¾ per room), 156 of them contain 7 or more, 18 contain 9 or 10.

1,053 have 2 bedrooms—one very small always.

Over 4,000 people live in them (i.e., about 4 per dwelling, or 1¼ per room), 116 contain 7 or more, 21 contain 9 or more, 2 contain 11.

Only 77 contain 3 bedrooms or more.

Overcrowding in these Houses

385 of these are overcrowded on the more than 2 per room standard, but with children under 10 counted as half an adult. (The Report mistakenly calls this the Registrar-General's Standard.)

On the National Standard of Bedroom Accommodation (which is far superior, but may yet be seriously deficient in that, for example, a family of mother, father, grown-up son and grown-up daughter is not deemed overcrowded in 2 bedrooms) 2,430 more bedrooms are required in these 3,029 houses.

This figure was arrived at by a detailed analysis of the houses in grades. These grades showed the inhabitants of each dwelling differentiated according to age and sex; without going into this detail, no analysis would be possible.*

Taking the figures for the above classes of dwelling for the whole City and assuming in each case that the shortage will be half what it is in these 3,000 odd houses, it may be estimated that 13,000 more bedrooms are required. This is a very low estimate, and in any case refers only to the pre-1872 back-to-backs.

Vital Statistics of Bad Areas. Ten-Year Averages

	Birth Rate.	Death Rate.	Infantile Mortality Rate.	T.B. Death Rate.	Other Respiratory Diseases Death Rate.
1. West Street (202 houses. 694 persons)	35·3	23·6	176	3·31	4·90
2. Meadow Lane (283 houses. 1,150 persons)	26·2	22·7	154	1·55	4·56
3. Newtown (246 houses. 864 persons)	32·2	17·1	137	1·85	2·89
4. Isles Lane (231 houses. 894 persons)	30·2	22·9	141	2·91	5·59
5. . . . (689 houses. 2,904 persons) ..	27·7	19·1	118	2·24	4·34
City	17·6	13·5	91	1·28	2·30
Normal healthy area .. . (This is not a special area. It is a compact area of 470 "modern" back-to-backs; population 1,753.)	9·4	9·5	73	0·63	1·54

* I have previously pointed out that the absence of such details, unless they are specially collected, as in this case—which is only possible for a small area—makes it impossible to use, say, the Manchester Standard or the National Bedroom Standard for estimating the number of houses needed by the different cities.

LEEDS

THE BUG

THE bug is a common insect pest, an unclean fellow who lives on human blood, and likes dark, unventilated, stuffy apartments. He makes himself snug in warm and dirty corners, and emerges at night to take his nourishment.

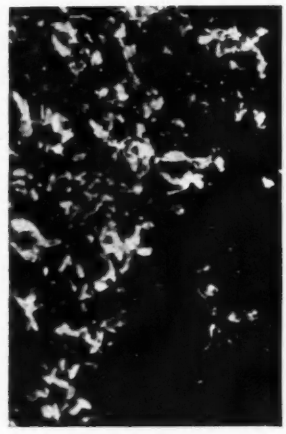
The fully-grown adult is readily recognized as a flat, mahogany-brown coloured, six-legged, wingless, blood-sucking insect of nocturnal habits. He is about a quarter of an inch long and an eighth of an inch wide. He can live for several months without food, and when unfed his body is as thin as paper, so that he can retire into the narrowest of chinks in woodwork, furniture, picture frames and even the joints of iron bedsteads.

Bugs in captivity fed on human blood at intervals of approximately six weeks, do not arrive at maturity for about two years, and breeding then progresses only from March to September, the progeny often numbering over 200 in a single season.

The bug feeds by inserting its sharp proboscis, usually into human beings, and rapidly sucking blood until it is full. The insect is fragile and easily squashed. It omits a heavy, offensive odour which, in addition to being disgusting to human beings, protects it from being preyed upon by its natural enemies.

In order to prevent infestation, it is essential to know the creature's habits and the stages of life from egg to adult.

The eggs are secured by a thin cement to the material upon which they are laid—wood, stone, metal or any fabric, such as the edges of a mattress. They are elongated, ovoid, pearly-looking structures visible to the naked eye.



Normally the young bug emerges within ten days of the egg being laid, but eggs may lie unhatched throughout the winter months, tiding the young insect over a very difficult period.

The egg case affords the embryo a strong protection against noxious gases, and the young bug must be hatched before it can be gassed with certainty.

From the time of its birth the bug is capable of sucking blood, which it does most greedily. Its bite at this stage is practically painless, but a small red spot indicates the site of the puncture.

The bug is often introduced into new houses in the personal belongings of those who have come from an old one.

It constitutes one of the major horrors of slum life, and the only way to deal with bug-infested houses is to pull them down. Thousands of houses in England are bug-infested.

A Stronghold of the Bug.

Pillow in a bug-infested house, with copious stains of human blood, some spilt by the insects in the act of biting, some extruded from the bodies of bugs crushed by restless movements of the sleeper.

The Medical Officer of Health commented :

"That bad housing conditions favour the incidence of such diseases as tuberculosis and pneumonia is universally recognized. . . . At the present time the city, through municipal and voluntary agencies, is expending huge sums of money every year in the upkeep of hospitals and sanatoria, to say nothing of home treatment of the sick under the National Health Insurance scheme and the Public Assistance Committee. Then there is the loss to the employers and workers alike, amounting to thousands of weeks in the year, resulting from "broken time," caused by illness. Not all of this immense loss is due to bad housing, but a substantial proportion undoubtedly is. I, for one, am convinced that with the slums swept out of existence we could reduce the bill by at least 50 per cent."

The Special Report of the Medical Officer of Health contained the following :—

"The final test of the health of a population is its vital statistics. . . . On the other side of the picture we have the squalor and unhealthiness of the slum, where life is on a low plane, and in consequence ideals of domestic and communal hygiene are unappreciated and absent. Children are born in large numbers and die at a correspondingly high rate. Sickness and ill-health are occurrences which are common in every home, and have become practically a constant feature of the life of the people. They have become immured to physical suffering and fail to realize the significance of disease—either from the point of view of the individual or of the community. I am afraid the citizens in general do not appreciate what the unfavourable health statistics of a slum in their midst mean, to their own and to the well-being of the population as a whole."

Tuberculosis

December 31, 1931—4,109 registered cases. Cost to the city—£55,986, i.e. 4·71d. per £ on rates.

The Annual Report of the Medical Officer of Health says :—

"The stream of (tuberculosis) notifications has been falling in volume since 1925, the total decrease for the whole period 1925—1931 being 54·9 per cent. . . . It is too much to expect, however, that the curve will continue to descend at the same rate in succeeding years as it has done in the past decade ; indeed there is every likelihood that it will tend to flatten out and become more or less stationary, because as long as the housing conditions in the city are such as they are, it is obviously impossible completely to overcome a disease which is social in character and closely bound up with such things as overcrowding, lack of hygiene and poverty."

The following table shows some Ward figures for non-pulmonary tuberculosis. It will be observed that the three "leading" Wards are those with the highest average of persons per room.

Richmond Hill ..	2·17
Holbeck North ..	1·85
Burmantofts ..	1·34
Mill Hill ..	1·33
South	1·33
Crossgates ..	0·21
Templenewsam ..	0·21
Roundhay ..	0·26
Far Headingley	0·27
North	0·32

(The City spent 4·71d. per £ rateable value on tuberculosis, and 5·922d. on all aspects of housing—2·458d. on *all* schemes connected with slum clearance and improvements.)

The Five-Year Programme under the 1930 Act was—

Houses to be demolished. 2,000 (excluding West Street area).
Houses to be erected to replace them, 1,800.
Houses to be built (Wheatley Act), 3,200.

LEEDS

What has been done under the Five-Year Programme in the first two years, 1931 and 1932

Houses "represented" for demolition, 25
Houses built or contracted for to November, 1932 942

Present Position

7 Clearance Areas have just been declared. These comprise 1,049 buildings, of which 863 are back-to-backs and involve 3,831 people.

The West Street area (involving 198 houses, of which 194 are back-to-backs, and house 694 people) will also be demolished. The clearance of this area was decided on in 1927, but was held up by the adverse decision in the Derby case (like the John Street, Longton, Stoke scheme).

This totals 1,200 demolitions likely by the end of this year.

A Note on "Subsidization"

It has frequently been maintained that houses provided by local authorities, by bearing rates, pay for themselves so far as the municipal subsidy is concerned. The following figures are of interest. They refer to Leeds in 1930-1.

Number of municipal houses completed at 31st March, 1931 6,888
Rateable value £94,296
Rate income £56,617
Charge of same houses on rates .. £26,539

These figures show that about one-half of the rate income derived from municipally-built houses goes to pay the municipal subsidy on them.

The point must not be pressed too far. For :—

1. The national subsidy is still necessary,
2. The local authority may well maintain that their tenants therefore pay only at half-rate for all the other services which they enjoy, and this contention is quite obviously true.

●

CONCLUSION

We have seen from the above that Leeds may truly be called a "city of back-to-backs." It contains some 75,000 houses of this type out of about 125,000 houses. Three-fifths of the houses are of this revolting architecture. Nearly three-quarters of the working class population must live in them—350,000 people.

The Medical Officer of Health says that 16,000 of the oldest back-to-backs require immediate treatment. The Council's plan is to demolish 2,000 in 5 years, and to build *altogether* 5,000 in 5 years. If the Medical Officer of Health's ideas are a minimum, the Council's are appalling in their inadequacy.

There appears to be no doubt that all the "old" and "intermediate" back-to-backs are blots upon a civilized world. The modern type, though comparatively good, are still of the same culpable design. It would not be straining too far to say that all the old and intermediate ones should be demolished as rapidly as possible. But this means over 60,000 houses, and the provision of these in any space of time that can be envisaged would appear Utopian.

Perhaps it may be as well to work out the requirements of Leeds on the "formula :"

7,498 people living over 3 per room (assume average of 4) have rather less than 2,000 rooms.
They should have 5,000.
The shortage is thus over 3,000.

30,649 people living 3 and over 2 per room (assume average $2\frac{1}{2}$) have 12,250 rooms.
They should have 20,500.
The shortage is thus 8,250.

59,360 people living 2 and over $1\frac{1}{2}$ per room (assume average $1\frac{3}{4}$) have 34,000 rooms.
They should have nearly 40,000.
The shortage is nearly 6,000.

The minimum shortage is thus over 17,000, the maximum requirements (if all the overcrowded houses at present lived in are unfit) are 65,000.

We increase these figures by about one-quarter because of the impossibility of housing everyone at exactly one-and-a-half per room—i.e., to 22,000 and 81,000.

The geometric mean is about 41,000 (rooms required).

So that to reduce the overcrowding in Leeds to a level such that no family would be living over one-and-a-half per room would require perhaps only 5,000 houses.

Leeds is not very overcrowded. The general average for the city is 0·87 persons per room, and though eight Wards show over one person per room average, the worst are 1·30, 1·21 and 1·20. The important point is the low size of the family (3·6 persons). The importance of this is shown by the fact that in all the "one up and one down" back-to-backs there are only 272 containing eight or more persons. It must be emphasized that if reconditioning were resorted to, rents would be likely to increase from, say, 8s. to 12s. Then overcrowding would be caused.

So that our figure of 5,000 houses as representing the needs of the population as regards overcrowding is very low, just as our figure of 60,000 as the houses required in order to demolish all the pre-1890 back-to-backs may appear fantastically high—especially to those who have not seen the houses in question. It is to be noted, however, that the Unhealthy Areas Committee of 1920 "condemned" all the 60,000 and stated that "it is difficult to suggest any method of dealing with (the 33,500 worst of them) satisfactorily short of complete clearance."

A de-licensed public-house, containing twelve rooms, each let at 11s. to 15s. a week, furnished, to a separate family. It is inhabited by 46 persons, of whom 24 are children. There are two water-taps and two w.c's., no cooking facilities except open grates, and no food storage facilities.

The present plan of the Council is to demolish 400 back-to-backs a year.
This programme will get rid of the :
Medical Officer of Health's 16,000 in 40 years.
33,500 oldest in 84 years.
60,000 (oldest plus intermediate) in 150 years.
Whole 75,000 in 190 years.

By then the population increase will presumably have had some effect, and the houses put up to day will have fallen down.

It is to be recalled that 33,500 is the number of back-to-backs built before 1872. But there are nearly 35,000 houses still existing which were built before 1844, before the first Health of Town Act.

In the face of these figures it is almost impossible to find a minimum. The real requirements are certainly as high as 70,000—i.e. all the pre-1890 back-to-backs and 10,000 of the other pre-1872 houses (these would in fact be pre-1844).

Perhaps we had better follow the Unhealthy Areas Committee of 1920 and say that 33,000 must be replaced immediately. This must not blind us to the fact that the number represents only about one-half of the real wants of the inhabitants.

Owing to the fact that back-to-backs are 50-70 per acre, some flats will be essential, but estates are a practical solution in many cases because of industrial diversity. The area of the city is very large, indeed, half that of the administrative County of London. So the estates need not be outside the city—a phenomenon common in the Metropolis !

Overcrowding and Insanitation as revealed by Medical Officer of Health's House-to-House Inspections in 1931

There are 36 wards in the city.

In four of these—Exchange, Oxford, St. Andrew's and St. John's, no houses were inspected.

The following is a summary of the results of these inspections :—

Houses inspected	8,878
Rooms per house :—	
One room	5
Two rooms	141
Three rooms	1,333

The increase in the number of families is far outstripping the building of homes. This means an increase in slums.

Four rooms	4,058	
Five rooms	2,142	
Six rooms or more	1,199	
Business Premises :—		
Partial	646	
Total	71	
Overcrowded Houses :—		
Registrar General's Standard	263	
Manchester Standard	1,359	
Social Standard	1,187	
Want of cleanliness	532	
Inadequate light	2,730	
Inadequate ventilation	3,617	
Dampness	3,582	
No proper food storage	8,204	
No proper facilities for domestic washing	1,055	
Disrepair	6,041	
Bad arrangement	3,359	
Classification :—		
Good		870
Minor defects		1,969
Serious defects, remediable without reconstruction		2,501
Serious defects, irremediable without reconstruction		1,191
Unfit		2,347

Some of the wards show no houses classified as " good," so far as the houses inspected are concerned.

MANCHESTER

Beswick. 444 houses inspected.

10 good, 209 with minor defects, 38 serious defects remediable without reconstruction, 73 only remediable by reconstruction, 114 unfit.

231 damp, food storage facilities satisfactory in only 39.

88 of the houses overcrowded on the Manchester Standard and 15 on the Registrar General's Standard.

All Saints. 266 houses inspected.

None were good, 38 had minor defects or serious defects remediable without reconstruction, 98 were irremediable without reconstruction, and 130, just under 50%, were unfit.

205 of the houses were inadequate as regards light, 225 had inadequate ventilation, 59 were damp. In only 11 were food storage facilities adequate.

58 of the houses were overcrowded on the Manchester Standard and 8 on the Registrar General's.

Collyhurst. 297 houses inspected.

None good, 1 with minor defects, 2 remediable without reconstruction, 244 only remediable by reconstruction, 50 unfit.

182 damp, food storage satisfactory in only 1, adequate light in only 15, adequate ventilation in only 41.

78 of the houses overcrowded on the Manchester Standard and 16 on the Registrar General's.

Medlock Street. 310 houses inspected.

273 houses unfit, none either " good " or " minor defects."

153 damp, only 1 with adequate food storage, about 85% with inadequate light and/or ventilation.

36 houses overcrowded on Manchester Standard and 13 on Registrar General's.

Miles Platting. 312 houses inspected.

5 good, 61 with minor defects, 63 with serious defects remediable without reconstruction, 29 irremediable without reconstruction, 154 unfit.

86 damp, and about half suffering from inadequate lighting and/or ventilation, food storage satisfactory in only 5.

95 houses overcrowded on Manchester Standard and 21 on Registrar General's.

New Cross (Ancoats). 373 houses inspected.

None good, minor defects in 3, serious defects remediable without reconstruction in 43, 162 irremediable without reconstruction, 165 unfit.

228 damp, 328 inadequately ventilated, 227 with inadequate light.

99 houses overcrowded on Manchester Standard, 31 on Registrar General's.

St. George's. 491 houses inspected.

487 unfit (!)

St. Clement's. 274 houses inspected.

119 unfit, and 155 irremediable without reconstruction. None classified as good, or suffering from minor defects or remediable without reconstruction.

154 damp, rather more with inadequate light and/or ventilation, food storage satisfactory in 4.

82 houses overcrowded on Manchester Standard and 13 on Registrar General's.

St. Michael's. 296 houses inspected.

None good, 11 with minor defects, 27 with serious defects remediable without reconstruction, 3 irremediable without reconstruction, 255 unfit.

61 damp, 234 with inadequate light, 249 with inadequate ventilation, food storage satisfactory in only 6.

70 houses overcrowded on Manchester Standard and 15 on Registrar General's.

Six of the 9 Wards whose figures are quoted above correspond with the 6 for which figures were taken from the Census.

A great deal of further information on many of these areas is obtainable from the pamphlets issued by the Manchester and Salford Better Housing Council and the Manchester and District Regional Survey Society.

It is stated that in St. Clement's Ward "Under the Arches (behind London Road Station)" there is much property dating to 1740. Some has been "reconditioned" in various ways.

595 houses were inspected in this area, 3 have baths, 52 have no wash-boiler, 17 no inside tap, 10 have pail or ash-closets. 173 are overcrowded on the Manchester Standard, 37 on the Registrar General's.

This is worth quoting :

> "1 boxroom up, and 1 down : rent 6s. 7d. ; 5 persons. The entire family sleep in one bedroom, as the boxroom is unfit for habitation owing to crumbling walls and falling plaster. Rain penetrates bedroom roof and soaks beds in wet weather ; leaking lavatory roof. The cupboard is unfit for food owing to vermin ; house overrun by mice and beetles."

Masses of information similar to the above can be obtained from official statistics and reports of private investigations.

Manchester knows all about its slums.

But what does it do ?

Work of the Council

Manchester does very little, by comparison with Liverpool, or Sheffield, or Bristol.

Since the war one slum clearance scheme has been carried out, in Medlock Street Ward. 199 houses were demolished. This was part of a much larger area, the Hulme Clearance area, condemned 12 years ago but still standing.

A Picture of the Hulme Clearance Area

Houses	1,076
Population	4,767
Persons per house ..	4·43
Houses containing lodgers	27·9%
Houses required to rehouse	1,256

Death Rate 21·8 (Ward 15·3, City 13·9).
Infantile Mortality Rate, 135 (Ward 101, City 91).
Phthisis Death Rate, 2.39 (Ward 1·74, City 1·41).
(Death Rates are 1925-29 averages.)

The Council's Five-Year Plan

5,400 houses to be demolished.

6,000 to be built to rehouse those displaced and abate overcrowding in Improvement Areas.

1,000 in 1931.
1,100 in 1932.
1,200 in 1933.
1,300 in 1934.
1,400 in 1935.

The Council will have to hurry to catch up with this. So far, the figure for those built should be about 2,500. It stands at—nil (!)

"Many cases of overcrowding have been found during the year, but the shortness of houses at rents which the affected persons can afford to pay renders the service of notices practically futile." (Annual Report of Medical Officer of Health.)

Waiting list for Council houses 10,000.

No. 8, L—— Street, Salford, has two rooms up and one down and scullery. The back bedroom is very small. The family consists of husband, wife, daughters, aged 23 and 19, and sons, aged 18, 13, 9, 5 and 2—nine people in all. The girls sleep in the back bedroom, the two eldest sons sleep in a single bed in their parents' room, and in a double bed in the same room the parents sleep with the child of 2, and at the foot of the bed the other three small boys—that is six people in one bed. The house is alive with bugs. No skirting boards to bedrooms, roof leaks, floor broken in one bedroom. Roof so weak slaters afraid to go up to repair.

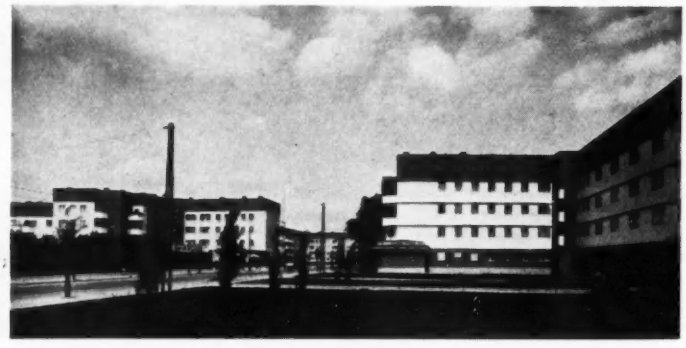
No. 5, C——Street, is a one-up-and-one-down back-to-back house ; water closet is shared with six other houses. The tenant has concreted a large part of the cellar, but this is still very damp. He also pays 1/- a week for disinfectant to put down the drains. The only tap is in the cellar down a deep, dark stair. No sink—waste water has to be tipped in the street. The family consists of husband, wife, sons, aged 17, 16, 11 and 9, and daughters, 6 and 2—eight people in all ; another baby is expected.

—*From* HOUSING CONDITIONS IN THE ST. MATTHIAS WARD, SALFORD

What can be done?

In the 30 years preceding the war, 27,000 houses were dealt with by the authorities. 7,000 were demolished. 3,000 back-to-backs were converted.

Reconditioning has gone as far as is practicable in the worst areas. The Medical Officer of Health has said :



"There are many thousands of houses which are on the list for the consideration of the Unhealthy Dwellings Sub-Committee, and some upon which closing orders have been made but not enforced owing to housing shortage. Whilst it is not practicable to repair these houses thoroughly, urgent defects, such as choked drains, leaky roofs, broken floors, and yard surfaces, etc., are frequently reported and receive immediate attention."

Filtering-up

Manchester does not lag behind as far as the provision of houses, *qua* houses, is concerned. Over 20,000 have been put up since the war. Overcrowding is now 3·75 per cent. of all families and 6·72 per cent. of all persons, on the Registrar General's Standard. Though this involves 50,000 people living over 2 per room, it seems that the time has come to cease or at any rate diminish the speed at which expensive Council houses are put up. The 10,000 applicants for Council houses will include a large number of relatively well-to-do families, seeking suburban Wythenshawe cheapness. (The total number of applicants for Wythenshawe houses is over 2,000.) It will also include a large number of people who are living in

A CONTRAST IN HOUSING

The Manchester sky-line (when visible at all) discloses itself fitfully between mercifully frequent wisps of fog as a devil's cauldron of chimneys, belching soot over long funereal slabs of black-slated roof. So chaotic are all outlines in this sulphurous twilight that a telegraph pole stands up as the one embodiment of definite form. Here free Britons live, are begotten, born and die. The gleaming white and red tenements at Lichtensberg house an identical type of population—not huddled together literally in stall-like hutches, but in spacious, balconied flats, with abundant light and air, a clear sky overhead, and grass to look out upon.

insanitary as well as overcrowded houses. Many of these will have to go hungry if they are "fortunate" enough to obtain a Council house.

But there is some chance of filtering-up taking place. The explanation of why this is so in the case of Manchester is that the proposed filtering-up could take place *through municipal houses*. In cities where the idea is for the slum-dweller to move into better privately-owned dwellings, the factor of decontrol makes filtering-up unlikely. The decontrolled rents of the intermediate houses may well be higher than those of the Council houses.

Manchester may be said to have two classes of Council house. And, therefore, it is possible that there will be some shift from the lower range to Wythenshawe, freeing houses on the nearer estates for slum dwellers. The number that can be rehoused in this way cannot, however, be very large, for the nearer estates are fairly full up.

Apart from this there is the question of the public morality of housing a considerable number of people with respectable incomes in Council houses bearing rents of 15s. and £1 a week at the public expense, while leaving the slum dweller to chance.

●

CONCLUSION

The Manchester slum dwellers cannot be housed outside the City proper. Wythenshawe is five miles out, and the houses there are too expensive.

The Wheatley subsidy has been brought to an end. Flats are necessary on a large scale, as in Somers Town, St. Pancras, though perhaps the occupants of a thousand or so houses might filter to near-in Council estates.

8,864 people living over 3 per room (assume average 4), have less than 2,250 rooms. They should have over 5,900, and therefore need nearly 3,750 more.

39,968 people living 3 and over 2 per room (assume average 2½) have 16,000 rooms. They should have over 26,500, and therefore need over 10,500 more.

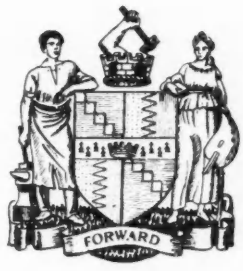
89,330 people living 2 and over 1½ per room (assume average 1¾) have 51,000 rooms. They should have nearly 60,000, and therefore lack nearly 9,000.

The minimum requirements to abate overcrowding are therefore 23,000 and the maximum, if all the houses were unfit, 92,500.

Raising these by 25 per cent. gives 30,000 and 115,000. Using the geometric mean would give about 60,000 rooms, say 14,000 houses, required.

The use of the geometric mean principle in the case of Manchester produces a figure which we know to be far too low. Manchester is not overcrowded by comparison with most towns. The proportion of people in Manchester living over 2 per room is less than it is in Birmingham, despite the 40,000 houses built by the latter.

If we use the mathematical approach we should deduce that the requirements of the City are about 7,000 to abate overcrowding, and 7,000 to replace insanitary dwellings.



But the true requirements of Manchester are well known, so we can desert our "conservative" analysis. We know that 8,000 houses have been condemned, and that the Medical Officer of Health for the City has estimated the total number of insanitary dwellings at 30,000.

Many of these houses might be suitable for reconditioning if they were to be dealt with as units. But where most of the houses in an area are unfit, those which could themselves be reconditioned ought to come down too, to make large-scale re-housing possible. Taking this into consideration, it seems likely that to take 23,000 as the number of unfit houses unsuitable for reconditioning would not be to exaggerate. This would give 30,000 as the total needs of the City.

(An analysis by the M.O.H. gives a 15-year plan. Net requirements for period are 42,100. 11,550 of this is to accommodate natural increase.)

Clearance Work, etc.

There are three schemes of clearance and improvement formulated at present, one sanctioned clearance scheme which will be followed by rehousing on the site; one clearance scheme awaiting confirmation by the Ministry of Health; a large improvement area reaching the stage where families will be displaced. Three small schemes are under consideration.

General Notes

Over 40,000 municipal houses have been built in the city since the war.

It will be noticed that Birmingham is the only one of the five largest provincial cities where building has more than kept pace with the increased number of *families*. Birmingham is, in fact, complacent on matters of housing. But the slums and the back-to-backs live on. The provision of

THE DESCENT OF MAN

In a home fit for gorillas to live in the country possesses an asset which may be regarded as a standard of comparison for future building—for human beings as well as animals. The paragraphs in italics refer to the Gorilla House, and those in Roman type are quotations from slum reports.

The new Gorilla House in the Zoological Gardens, London, shows the thoughtful care devoted to this housing problem. Gorillas are liable to the diseases of man, and are, therefore, protected in winter by movable glass screens.

Here the place is infested by rats and cockroaches, family in bad health—suffering with chests. Two children have died of diphtheria.

The windows are provided with blinds which can darken the cage, so that the tropical conditions, natural to gorillas, of twelve hours darkness and twelve hours light may be reproduced.

Bedroom in which the family sleep is practically pitch dark even in the daytime.

In the centre of the floor of the winter cage there is a small basin and fountain, operated by a brass knob in the floor, manipulated by the gorillas.

A very bad feature of this property is the water and lavatory accommodation—one tap between six houses and one w.c. between three.

Inside, the colour scheme was chosen to eliminate the oppressive sense of prison that is apparent in many animal cages.

The walls of the room are covered with a pink distemper, the distemper flaking off with the damp.

Council houses at 10s. a week, built on estates outside the city, and therefore necessitating probably another 3s. in fares, does not solve the problems of the slum dweller.

The position in Birmingham is that there are enormous numbers of houses which are not "legal" slums, but which are definitely unfit to live in. This description applies particularly to court houses and back-to-backs, which were "reconditioned" by removing one or two per block in the period immediately preceding the war.

•

CONCLUSION

11,455 persons living over 3 per room (assume average 4) have under 3,000 rooms. They should have over 7,500, and therefore require well over 4,500 more.

56,656 persons living 3 and over 2 (assume average $2\frac{1}{2}$) have 22,600 rooms. They should have 37,750, and therefore require well over 15,000 more.

112,635 persons living 2 and over $1\frac{1}{2}$ (assume average $1\frac{3}{4}$) have 64,500 rooms. They should have 75,000, and therefore require 10,500 more.

Minimum requirements on this basis are, therefore, 30,000, and maximum requirements, if all the overcrowded houses were unfit, would be 120,000. Raising these by 25 per cent. to allow for the fact that people cannot be housed at precisely $1\frac{1}{2}$ per room, we get 37,500 and 150,000. The geometric mean of these is 75,000.

So that another 18,000 houses are required on our overcrowding formula analysis.

But there are about 40,000 back-to-backs in Birmingham. Some have no light, water or lavatory, and the rents of these may be 8s. a week (as are some single rooms in the larger houses). Any real plan ought to include the demolition of all these and the satisfactory re-housing of their inhabitants.

In the case of Leeds it has been decided that all the pre-1890 back-to-backs should be demolished. Assuming that Birmingham has no post-1890 back-to-backs, which is, I think, true (most of them are pre-1844), then the needs of the city are probably about 50,000 houses. The choice of that figure makes allowance for the fact that a considerable number of the back-to-backs will have already been decided as unfit by the operation of the "formula"—perhaps as many as 8,000.

To decide on such a figure is not to belittle the work of the City Council. Far from it. But it is certain that the

time has come for a little more attention to be focussed upon the real slum dwellings, and those most overcrowded.

Let us not forget 68,111 people (7·08% of the population) living over 2 per room. This figure compares with 38,147 (8·21%) for Leeds, 89,336 (10·94%) for Liverpool, and 48,832 (6·72%) for Manchester. On the "Registrar General's" Standard, Birmingham therefore compares a little unfavourably with Manchester, while Liverpool is only 50% worse.

Or take the overcrowding at *more than three*. Birmingham has 11,455 people living at over 3 per room (1·14%). This compares with 1·55% for Leeds, 2·40% for Liverpool and 1·16% for Manchester. On this basis Birmingham is less than half as bad as Liverpool, and rather better than Leeds—the same as Manchester.

There does not appear to be any ground for complacency here.

Let us have a look at the expressed wants of the inhabitants.

There are over 25,000 applicants for Council houses now on the waiting list. This must represent 60,000 persons at least.

The housing activities of Birmingham, while far in advance of those of most cities, have solved neither overcrowding of the worst type nor the slum problem. The cynic might observe that they have, however, been an admirable solution, in many cases, to the problem of the middle-class salary-earner wishing to live cheaply in the suburbs on an income of, say, £200 to £350 a year.

Sir Austen Chamberlain on the Birmingham Slums

Speech made in the House of Commons :—

". . . house after house, court after court, where the houses as they stand are not fit for any human being to live in . . . a door which he has to prop to and fasten with a chair at night because it is hanging loose upon its hinges . . . paper peeling off the walls . . . a bed propped on the tops of packing cases, because if the castors of the bedstead were left upon the planking of the floor they would go through, so rotten are the planks."

Latest Information

"Birmingham Corporation has sounded the Ministry of Health on its chances of getting Government sanction for a loan to build 1,000 houses a year. It has received a strong hint that no such permission will be forthcoming."—*Daily Herald*, 16th May, 1933.

Slum Clearance Work

Between 1919 and the adoption of the Five-Year Plan under the 1930 Act, 6 slum clearance schemes, involving 5 acres of the worst slums in England, containing 485 houses, have been brought to completion. The density of houses in one area was 94 per acre.

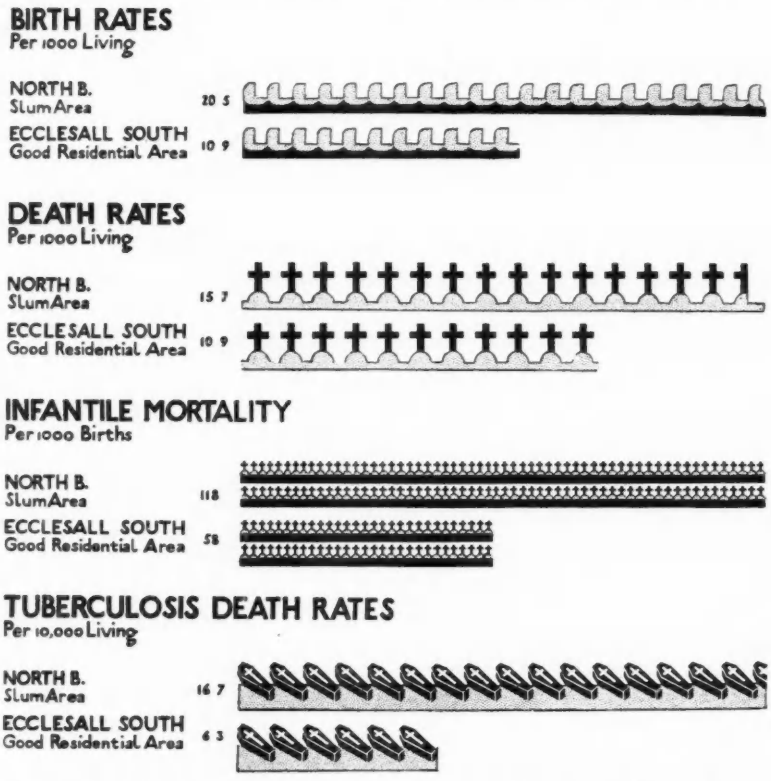
The mean rental of houses in these areas was a little under 7s.

Sheffield still needs 500 to 1,000 houses to rehouse those living in one-room tenements of the foulest type, and in huts and caravans.

The Wyburn Estate

All slum dwellers are rehoused on the Wyburn Estate.

The rents are 9s. 1d. for a two-bedroomed house and 10s. 6d. for a three-bedroomed house.



Investigation by the Sheffield Social Survey Committee shows many tenants unable to afford these rents. They either return to an area slightly less slum-like than the one in which they formerly lived, or they are unable to have enough food. Wages in the cutlery trade are very poor.

Reaction of Tenants to new Environment

Only 16 per cent. unfavourable.

Back-to-Backs

Sheffield has about 15,000 back-to-backs. They are all 70 years old. The town forbade the building of any more in 1864. There are more than 4,000 courts. How many houses this represents there is no

Like the chart referring to Manchester, reproduced on the fly-sheet of this issue, returns of Sheffield's public health, taken over the five years, 1926-1930, show a one-third reduction in general mortality in good residential areas as against slums; and, again, the infantile mortality is halved. The birth-rate is halved, and there is a striking drop in deaths from tuberculosis—to little more than one-third.

The following particulars of a house let in lodgings in Sheffield are characteristic of many houses of this type in the city :—

An old public-house converted, now in a very dilapidated state ; doors, windows and stairs broken or defective ; whole house bug-infested ; oil lamps throughout ; stairs dangerous and unlighted.

Sanitary conveniences : three water-closets in backyard, ash-pit under living-room at the back.

A typical room : first floor, front, fairly large room overlooking the street. No floor covering ; large hole in floor ; stove. Furniture : two bug-ridden beds, a baby's cot, rough table, broken sofa and chest of drawers. The family (husband, wife and five children) have also the use of a scullery-kitchen on the ground floor in which there is a kitchen range, boiler and sink, couch (with no bottom), old table and three chairs (without bottoms). Rent ("furnished") 10s. 6d. a week.

—*From* A REPORT ON THE HOUSING PROBLEM IN SHEFFIELD

evidence to show. Many of the court houses have as their floor either earth or large stone squares.

General Notes

A characteristic of Sheffield is the number of workshops mixed up with residential dwellings. Often the two are to be found in the same courtyard.

There are a good number of houses built back on to factories and workshops.

Five-Year Programme under 1930 Act

Houses to be erected, per year	500
Individual demolitions, per year	60
Clearance area houses to be demolished, per year	440

(No provision for making Improvement Orders under this Act.)

During 1931 the Five-Year Programme was kept up, so far as recommendations for clearance were made.

The City has been greatly handicapped by the slowness of obtaining departmental confirmations.

Sheffield has been working by means of small clearances. All over the central parts of the city are areas of 4 to 20 houses condemned.

Besides this the Corporation makes considerable use of the other powers given it by the 1930 Act. In 1931 nearly 21,000 defective dwelling houses were made fit by their owners after informal action, and over 2,000 more after notices had been served. 206 individual demolition orders were made.

CONCLUSION

7,679 people living over 3 per room (assume average 4) have less than 2,000 rooms. They should have over 5,000, and therefore require well over 3,000 more.

33,229 people living 3 and over 2 per room (assume average 2½) have 13,300 rooms. They should have 22,150, and therefore require nearly 9,000 more.

65,406 people living 2 and over 1½ per room (assume average 1¾) have 37,500 rooms. They should have 43,500, and therefore require 6,000 more.

The minimum and maximum figures, following the usual rule, are, then, 18,000+25 per cent., i.e., 22,500, and 71,000+25 per cent., i.e., 90,000.

If the geometric mean rule was followed, we should conclude that Sheffield required something like 12,000 houses.

This figure takes no account of the fact that 15,000 back-to-backs still exist.

In fact it only allows some 6,000 as the total number of unfit houses, since 6,000 would be required to abate overcrowding. 6,000 is perhaps about the correct figure of unfit property other than back-to-backs.

Every back-to-back in Sheffield may be taken to be unfit to live in.

On this perfectly safe assumption we can say that Sheffield needs about 27,000 houses.

SHEFFIELD

GLASGOW

GENERAL POSITION

Area	28,694 acres	
Population 1921	1,034,174	
1931	1,088,461	(130,000 unemployed)

Decennial increase in population 54,287
(1921 population of areas added in intercensal decade 17,353)
Decennial increase in occupied dwellings 28,242

1931	Persons per acre	37·9
	Population in private families	1,053,258
	Structurally separate dwellings occupied	256,171
	Average size of occupied dwellings	2·68 rooms
	Persons per room	1·54
1921	Population in private families	1,012,955
	Structurally separate dwellings occupied	227,929
	Persons per room	1·76
	Average size of occupied dwellings	2·52 rooms

1931	Persons living more than 4 per room	79,267	or	7·5%
	Persons living 4 and over 3 per room	120,347	or	11·4%
	Persons living 3 and over 2 per room	246,205	or	23·4%
	Total over 2 therefore	445,819	or	42·3%

The One- and Two-Roomed Houses

115,490 people (11·0%) live in one-roomed houses which number 37,230 (14·5% of all houses)

467,725 people (44·4%) live in two-roomed houses which number 111,727 (43·6% of all houses)

3,498 families living 6 or more in one room
685 with 8 or more in 1
83 with 10 or more in 1

7,947 families living 8 or more in two rooms
1,621 with 10 or more in 2
186 with 12 or more in 2

The charts show the conditions of overcrowding and infant mortality in Glasgow in 1931.

The Wards

Number of wards in city	37
Number of wards containing over all average of over 1 person per room	31
Number of wards containing over all average of over 1½ persons per room	23
Number of wards containing over all average of over 2 persons per room	7

(i.e., there are only 6 wards with an over-all average less than 1 person per room, viz., Park, Kelvinside, Pollokshields, Camphill, Langside and Cathcart.)

Seven wards rejoice in an over-all average of over 2 persons per room.

Details of these Seven

	Dalmarnock	Mile End	Hutchesontown

Persons per room ..	2·09	2·07	2·04	2·01

Over 1½ per room seems a reasonable standard of overcrowding to take, though any arbitrary arithmetical standard is unsatisfactory.

Over 2 is in general use in England.

In Glasgow over 3 is the standard, and on this dreadful standard 200,000 people are overcrowded.

On the Registrar General's Standard 450,000 are overcrowded.

On the standard which has been taken for the English towns in this enquiry, over 1½, it would appear likely that about 700,000 (70%) of the people, were overcrowded.

Scotland's contribution to civilization: the single-room back-to-back house. There are over fifty of such dwellings in this street alone.

Slums at Florence St., Glasgow, showing conveniences and wash-houses in the yard.

Details of overcrowding are given in the Census for Scotland as shown above, so that this figure could not be obtained without some labour, and would still be inexact owing to families of 15 and more, and houses of 10 or more rooms not being separately shown.

Number of Unfit Houses

At the end of 1930 approximately 13,500 houses, i.e., separate dwellings, in Glasgow, were officially regarded as unfit for human habitation, and in the great majority of these it is considered that no reasonable expense could make them fit in all respects for habitation.

Council Programme

To build 7,500 in the three-year period 1931-33 in respect of houses unfit for habitation, and also, 9,000 to abate overcrowding, and 3,000 to meet growth of population.

General Conditions

Worse than anything in England, the worst slum city in Great Britain. Many dwellings are simply a kitchen—the adults sleep on a bed placed in a hole in the wall and the children sleep on the floor. Average number of persons per house in the whole city, 4.11, compared with 4.44 in 1921, 600,000 living either in one room or two. Some do their best, but many others are "stabled in filth and degradation . . . bogged in a morass of filth and foul living— . . . perhaps their reason tells them there is no good in trying to do anything about it."—H. V. Morton in *The Daily Herald.*

Corporation Active

Howard Marshall remarks:

"I saw many clearance areas and rehousing schemes, and there is no doubt that the Glasgow Corporation are uncommonly active. It is, however, in no

sense a criticism of their endeavours to say that at the present rate of progress the solution of their difficulties is by no means yet in sight."

This view is generally supported.

The Corporation takes care to build houses before clearing areas elsewhere.

In 1921 19% of the houses consisted of 3 rooms, in 1931 24%.

Since 1919 the Corporation of Glasgow has had 30,000 houses built.

This is not enough—they now want 100,000 —no municipality can hope to undertake such a task.

The Annual Report of the Medical Officer of Health for the City contains the following significant sentences :—

> " The whole question thus crystalizes down into the provision of alternative accommodation for tenants of insanitary houses. The declared policy of the Committee to undertake the building of 7,500 houses for this purpose would, when completed, bring the problem into manageable proportions. The standard of what constitutes a house unfit for human habitation is rising, and a considerable number of houses become unfit by the process of time in each year. It will therefore be necessary for a fresh survey to be made when the Corporation's three-year programme is completed to enable the Committee on Housing to consider its policy again."

Number of Individual Houses condemned

From 1924 to the end of 1932 1,640 individual houses were represented for closure and demolition.

Number of Improvement Areas and Clearance Areas

Since 1923 the Corporation and the Department of Health for Scotland have approved of 7 slum clearance schemes, involving 6,575 houses.

Number of Houses built in connection with Slum Clearances

At February 28, 6,258 houses were occupied by families dispossessed from Slum Clearance schemes, and 2,534 additional houses are being built.

Rent of New Houses

2 apartments	28s.–34s. month	= 6s. 6d.–7s. 10d	per week
3 ,,	32s.–38s. ,,	= 7s. 5d.–8s. 9d.	,, ,,
4 ,,	38s. ,,	= 8s. 9d.	,, ,,

Rents of demolished Houses

The detailed print of the Calton Improvement Scheme was made available to me for the purposes of this investigation. It shows that the scheme embraces 1,311 dwellings.

611 one-apartment dwellings
636 two-apartment ,,
61 three-apartment ,,
3 four-apartment ,,

HUMAN WASTE *V.*

HUMAN SPACE

The difference in latitude between Glasgow and Berlin is not considerable, the one being wetter and the other colder in winter. Still that does not seem quite a good enough explanation of the difference between the " courts " of their respective " working-class quarters " ; or of the fact that the terrible " backlands " of Glasgow contain not lawns, trees, paddling-pools and rock-gardens, but only so-called " privvies " and a carpet of stinking slag-like earth. Yet thousands of children have no other playground.

The total annual rents paid amount to just under £15,600, of which over £4,000 is for business premises.

The business premises are not included in the total of " houses," which is 1,311 (127 of which are habitable and 1,184 uninhabitable).

Total amount of rent paid for " houses " is £11,443 5s. p.a.

Average rent paid for a " house " is therefore £8 14s. 7d. per year, or 3s. 4¼d. per week.

Total number of separate apartments is 2,078. Average rent per room is therefore £5 10s. 1½d. per year or 2s. 1½d. per week.

Average number of rooms per dwelling is 1·58.

Since the number of two-room dwellings is slightly greater than the number of one-room dwellings, (the number of dwellings of more than two rooms being about 10% of the number in either of the former categories), and since the rent paid per dwelling is only a little more than 1½ times the rent per room, we can see that neither of the figures arrived at enable us to determine exactly the average rent paid either by people living in two rooms or one.

A 5% random sample was therefore taken.

The following table shows the results :—

	Lower Quartile	Median	Upper Quartile
One-room dwellings	2s. 5d.	2s. 8d.	3s. 7d.
Two-room dwellings	3s. 4d.	3s. 8d.	4s. 3d.

The sample enquiry is adequate for the purposes to which it is to be put. In both

It is obvious that, although operations under slum clearance schemes are removing many of the worst examples, there exists a very large number of dwelling-houses in the city provided with water-closets in common. This is illustrated in the following table :—

	No. of Water-closets	No. of Houses involved	Estimated No. of persons involved (taking four persons per house)
Water-closets serving 2 tenants* ..	5,971	11,942	47,768
,, ,, 3 ,, ..	18,502	55,506	222,024
,, ,, 4 ,, ..	7,673	30,692	122,768
,, ,, 5 ,, ..	1,820	10,000	40,000

* Household.

From REPORT OF MEDICAL OFFICER OF HEALTH, GLASGOW, 1930

(*This information is not given in the report of the M.O.H. for 1931, the last issued.*)

Door after door as we knocked was opened by a shirted man, suddenly and softly, as if impelled forward by the overpowering slum smell behind him. It is this smell which is the most oppressive symbol of such lives : choking, nauseating ; the smell of corrupt sweat, and unnamed filthiness of body. The universal " jaw box " is the only defence of these people, deserted by the sun, against such miseries ; it is never more than a couple of feet square, and its use must be unhandy and uncomfortable. Everywhere unimaginable beds, dirty floors, with dark heaped shadows in the corners that the broom had left, scraps of polished brass ; and that smell. Sometimes it crept out at us past the legs of the householder, insinuatingly, as if ashamed ; sometimes it brazened it out, full and pestiferous ; once, in a woman's shilling boarding-house, it leapt out and took us by the throat like an evil beast : the smell of the slums, the unforgettable abominable smell. Henceforth when asked, " What deepest misery may overcrowding such as this mean ? What ultimate torment is reserved for humanity deprived of air, light, food, money, space ? " I must answer—" The slum smell."

From THE CANCER OF EMPIRE, BY WILLIAM BOLITHO

cases the difference between the median and the lower quartile is much less than between the median and the upper quartile, i.e., there are a great number of rents just below the median, while above it the rents vary more. The highest rent paid for one room was 4s. ; for two 5s. The average in each case will be somewhat above the median.

Overcrowding (Calton area)

For the Calton improvement area the following are the figures :

Acreage	Population to be displaced	No. of houses to be demolished
12.32	3,677 adults + 1,474 children = 5,151 total.	611 one-apartment houses, 636 two-,61 three-; 3 four- = 1,311 total. Total no. of rooms : 2,078.

The population is therefore living, on average, a fraction less than 2½ persons to the room, nearly 4 persons to the dwelling, over 400 per acre. 55 " houses " are occupied by more than one family—it is not stated how many of these are one-room dwellings, but examination of the separate figures given for each dwelling shows a small number of cases of this—probably less than ten in all.

Examination of one-family one-room dwellings shows one case of 10 to a room, 4 of 8 ; and examination of one-family two-room dwellings shows one of 12 to two rooms, 3 of 11, 13 of 10. 6 to one room and 8 to two rooms are very common.

There is not much variation in the figures of *average* density per room as between the different sub-areas in the scheme. In the areas in which the density per dwelling is highest, it must be noted that the proportion of one-room dwellings is lowest.

Reaction of Re-housed Tenants to New Conditions

It appears from the Annual Report of the Medical Officer of Health for the City that a full inspection system of houses in re-housing schemes is carried out—every three months for the clean houses and every month for the others. The Report states that of the 5,556 houses of the type in occupation at the end of 1931 71·1% were clean, 26·5% fair and 2·4% dirty, and concludes—" The high standard of house occupancy which these figures indicate is very satisfactory, having regard to the conditions under which the families had been living previously."

Effect of Re-housing on Children

Reports from headmasters in the schools situated in areas containing a large number of children born in slums and now re-housed :—

" The pupils from the re-housing schemes are becoming less easily distinguishable from those outside the schemes . . . what little difference exists mainly among the older pupils."

" In cleanliness, nutrition and clothing these children compare very favourably with the others."

Infantile Mortality

In 12 wards in Glasgow over 50 per cent. of the population is overcrowded on the over-two-per-room standard. The average infantile mortality rate for these was 116 per thousand in 1931.

In 5 wards less than 10 per cent. are overcrowded on this standard. In these the average infantile mortality rate was 54 per thousand.

The following table shows examples of these wards, infantile mortality figures having been put side-by-side with overcrowding figures.

	Rooms per house	Percentage of population overcrowded (over 2 per room)	Infantile Mortality Rate
Dalmarnock ..	1·71	69·3	127
Calton ..	2·07	58·4	140
Anderston ..	2·26	51·6	126
Kelvinside ..	6·01	1·8	34
Pollokshields	4·83	7·0	34
Cathcart ..	4·20	9·0	46

Other working class wards infantile mortality rates are :—

Exchange	..	150
Townhead	..	129
Govan ..	..	127

Pneumonia

Death rate, 2,494 per million in Exchange (many lodging houses).

Phthisis

Death rate 865 per million in City.

1,497 in Exchange.
1,389 in Calton.
1,184 in Hutchesontown.
1,129 in Parkhead.
1,107 in Shettleston.
1,107 in Tollcross.
135 in Kelvinside.
331 in Pollokshields.
344 in Cathcart.

Bronchitis

Death rate 926 per million in Exchange.

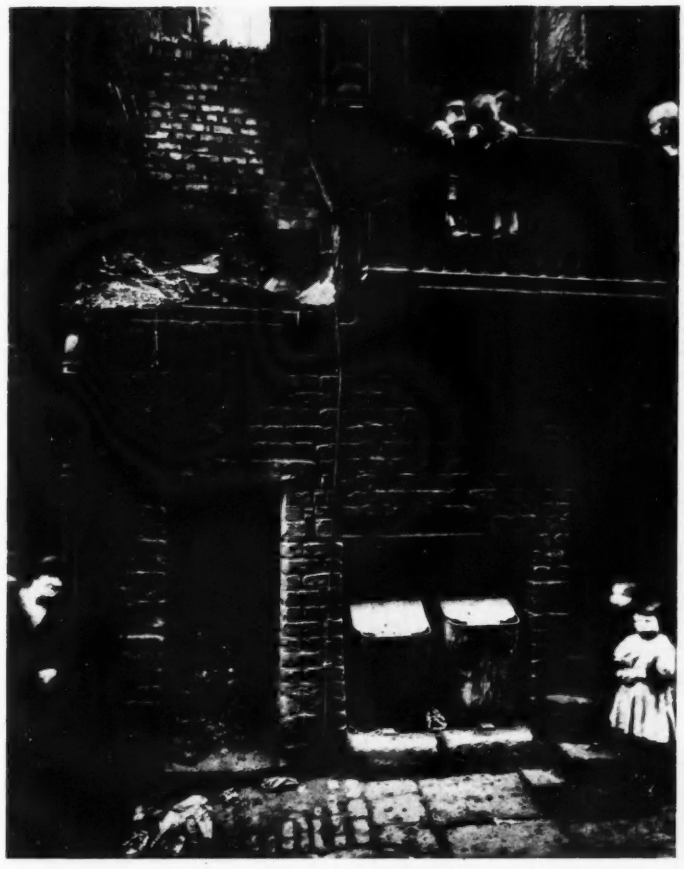
All Respiratory Diseases

Death rate round 2,000 per million in Mile End, Dalmarnock, Cowcaddens, Hutchesontown, Gorbals, etc.; 400-600 in good residential areas such as Pollokshields, Camphill and Cathcart.

●

CONCLUSION

The picture presented by Glasgow, in terms of overcrowding, is four times as bad as that of Liverpool, England's "high spot" for slums.



In the face of these figures, the plan for Glasgow, and for the two other Scottish cities, is based on a "not more than 2 per room" basis, in place of a "not more than 1½." The cases of acute discomfort left untouched by such a plan will be legion, but the plan involved is yet greater than that for any of the provincial cities of England.

There are 79,267 people living over 4 per room. Assuming an average of 5, they have 16,000 rooms; they should have 40,000. They therefore need another 24,000.

There are 120,347 people living at 4 and over 3 (assume average 3½). They have less than 35,000 rooms, in place of 60,000. They need another 25,000.

INGENUITY IN RUBBISH DISPOSAL

Methods of refuse disposal often become grotesqueries in horror. The upper photograph was taken in Glasgow just after old newspapers, dish-water and contents of bed-pans had been swept down the staircase of a house and left in the yard. The lower shows Liverpool dust-bins, standing in open recesses, where second-, first- and ground-floor tenants tip their refuse.

There are 246,205 people living at 3 and over 2 (assume average 2½). They have less than 100,000 rooms, and should have 123,000. They need nearly 25,000 more.

Our minimum and maximum figures are therefore, say, 73,000 and 223,000 Raised by 25 per cent. to allow for the impossibility of housing all these people at precisely 2 per room—90,000 and 280,000.

We reach, therefore, a conclusion that

25,000 houses are required merely in order to house Glasgow so that no one shall have to live at over 2 per room. This would still leave every filthy dwelling untouched, and 13,500 have been *officially* declared unfit.

In the case of the English towns, the method has been followed of taking the geometric mean of these figures as a rough basis of measuring the real needs of the respective cities. The difference between the geometric mean and the minimum is thus taken as an index to the number of houses unfit for habitation, whether the houses concerned are overcrowded or not. This rough guide has then been adjusted, where possible, on the basis of evidence as to the degree of "insanitariness" in each particular town, where the evidence for this is adequate.

In the case of the Scottish towns we cannot use the geometric mean and the minimum when these are based on a two-per-room basis. We should, for comparability so far as replacement of insanitary dwellings is concerned, add to the figure of 25,000 the number of unfit houses deduced from using the formula on a 1½-per-room basis. This cannot be given exactly, but may be estimated at 30,000. So the needs of Glasgow, to abate overcrowding at over 2 per room and to replace the 30,000 insanitary dwellings arrived at by using the method of the "formula," amount to 55,000 houses.

If a "1½" standard were adopted for the relief of overcrowding, we should get a figure of about 85,000. And at the same time our houses would have to be bigger—many would have to be about double the size of the City average of 2¾ rooms per house. (The figure of 100,000 has been arrived at by others as a rough measure of the real needs of the City.)

Three figures have then been achieved—the first is fairly exact, the others are not exaggerated.

1. 38,500 houses are required to abate overcrowding at over 2 per room and replace the 13,000 officially condemned houses.

2. Some 55,000 houses are required to abate overcrowding at over 2 per room and replace all uninhabitable houses.

3. About 85,000 houses would be required to abate overcrowding at over 1½ per room and replace all uninhabitable houses—the basis used for English cities.

GLASGOW

SUMMARY

(NOTE.—Exact figures are still shown, to facilitate referring back.)

The foregoing analysis of the largest six of the provincial cities may now be summarized briefly.

LIVERPOOL has a population of 855,688.
- 20,515 people live at over 3 per room.
- 215,965 people live at over 1½ per room.
- 50,000 rooms are required merely to abate overcrowding at over 1½ per room.
- *20,000 houses* may be taken as the immediate and urgent requirements of the City. This figure makes no provision for the demolition of back-to-backs, about which information is lacking, and is based on overcrowding figures as adjusted by the general rule described in the Introduction. *The "conservative" results obtained by the use of the formula are well illustrated by the far higher figures obtained for total housing needs in the case of the cities about which we know more.*

LEEDS has a population of 482,809.
- 7,498 people live at over 3 per room.
- 97,507 people live at over 1½ per room.
- 22,000 rooms are required merely to abate overcrowding at over 1½ per room.
- *70,000 houses* would be required to replace all the pre-1890 back-to-backs and 10,000 of the pre-1872 non-back-to-backs.

MANCHESTER has a population of 766,378.
- 8,864 people live at over 3 per room.
- 138,162 people live at over 1½ per room.
- 30,000 rooms are required merely to abate overcrowding at over 1½ per room.
- *30,000 houses* would be required to abate this overcrowding and to replace 23,000 of the insanitary dwellings in the City—it having been assumed that 7,000 of them could be "reconditioned" or otherwise rendered habitable.

BIRMINGHAM has a population of 1,002,603.
- 11,455 people live at over 3 per room.
- 180,746 people live at over 1½ per room.
- 37,500 rooms are required merely to abate overcrowding at over 1½ per room.
- *50,000 houses* would be required in order to abate this overcrowding and replace the 40,000 back-to-backs. This does not allow for the existence of insanitary houses other than back-to-backs.

SHEFFIELD has a population of 511,757.
- 7,679 people live at over 3 per room.
- 106,314 people live at over 1½ per room.
- 22,500 rooms are required merely to abate overcrowding at over 1½ per room.

27,000 houses are required to abate this overcrowding, and to replace the 15,000 back-to-backs still existing, which are all over 70 years old, on the assumption that there are 6,000 insanitary houses other than back-to-backs. (Since there are 4,000 courts in Sheffield this assumption cannot be too high.)

The figures for Leeds, Manchester, Birmingham and Sheffield show conclusively that the estimate for the housing needs of Liverpool was utterly inadequate. The figure of 20,000 is that produced by the operation of the "formula."

In the case of the other four cities the number of houses needed altogether is in no case less than the number of rooms needed to abate overcrowding. It would not appear dangerous to estimate that Liverpool needs as many houses altogether as she needs rooms to abate overcrowding. If this assumption were made, the figure of 20,000 given above would become 50,000.

GLASGOW has a population of 1,088,461.
199,614 people live over 3 per room.
455,819 people live over 2 per room.
90,000 rooms are needed to abate overcrowding at over 2 per room.
38,500 houses are needed to abate this overcrowding and replace the 13,500 officially-condemned houses.

This figure has been shown to be far too low, both as regards overcrowding (because a "2" standard is taken in place of a "1½") and because the number officially condemned quite obviously represents only what the City now regards as a practical plan and bears no relation to the real number of insanitary dwellings. To build 55,000 houses may not, under present conditions, seem to be a practical plan—it undoubtedly represents much less than the true housing needs of the City. It provides for the abatement of overcrowding on the not-more-than-2-per-room basis, instead of the not-more-than-1½ adopted as a basis for the English towns. On the English basis the figure would be about 85,000. There are, after all, 55,000 dwellings in the seven selected Wards, about three-quarters being of one or two rooms, and these house a quarter of a million people. They require wholesale clearance. This shows that our figure is still inadequate.

Even taking figures which we know to be less than half the correct ones for the worst two cities—Liverpool and Glasgow—we arrive at the following totals:

4,707,696 people
255,625 living over 3 per room.
1,184,513 living over 1½ per room (over 2 in the case of Glasgow).
252,000 rooms required to abate overcrowding at over 1½ per room (over 2 in the case of Glasgow).
235,500 houses required (overcrowding only reduced to 2 in the case of Glasgow).

If we increase the final figure for Liverpool to 50,000, by assuming that, like the other great English cities, she needs altogether as many houses as she needs rooms on the overcrowding basis, and increase the final figure for Glasgow to 55,000 (to make an allowance for insanitary houses on the principles of the "formula"), we arrive at

282,000 houses

as the total needs of the six cities,

and our figures for Glasgow and Liverpool are certainly many thousands below the true ones even now.

This figure represents immediate requirements.

If it is to be envisaged as a building plan to be spread over a period of

years, adjustment must be made for population increase—or rather for the increase in the number of families.

In the intercensal decade 1921-31 the number of families in Liverpool, Birmingham and Manchester increased by 100,000. Comparable figures for the other cities are not available. It is probable that the rate of increase was less. Ignoring it altogether, 10,000 houses a year are wanted for new families if the present tendency continues—merely in the three cities named above—in order that each new family shall have a "structurally separate dwelling."

It is not proposed, however, to calculate on such a basis in the case of the other cities, but only to show minimum housing needs *at present*. We may, therefore, conclude that

the largest six provincial cities, which have a total population of
over 4,700,000,
require
over 280,000 houses
NOW.

THE ARCHITECT'S PROBLEM

[BY E. MAXWELL FRY]

I would advocate where it is possible the treatment of sites or slum clearances rather as big units than as small ones. Instead of demolishing one side of the street and building new houses, demolish four or five streets and build a huge block.—THE PRINCE OF WALES.

Dwellings for the Very Poor

THE approach to slum clearance is by way of sociology, conditioned by poverty. The literature on the subject abounds with references to "slum areas," "slum houses," and so on, as though the act of rebuilding was in itself a cure. *But slum dwellings are merely the houses of the very poor, in which is waged an unending struggle between difficult ways and too little means.* Slum clearance is a sociological problem, but only as housing of any kind is a sociological problem, slum clearance work being more narrowly conditioned by questions of finance. Inherently the design of block dwellings must engage exactly the same faculties as are called to the planning of a normal house but in a degree of concentration which has hitherto been lacking. Poverty is relative. A family earning a given number of shillings per week can live in what are known as "slum conditions" without feeling the sharp edge of poverty. Removed to model dwellings, this same family income is insufficient to prevent starvation among the members of that family, and Dr. G. C. M. M'Gonigle's (M.O.H., Stockton-on-Tees) report on two communities, one of which, when his observations commenced, had been taken from slum conditions and lodged in model dwellings removed from the centre of the town, proved conclusively that an increase of 4s. 6d. in rent *was enough to raise the death rate 50 per cent.* and bring with it starvation, disease and suffering. The situation is as desperate as that. Slum clearance is not enough: dwellings are not "model" unless *the rent is within the means of the tenant.*

The Terms of the Problem

The problem of building dwellings for the very lowest stratas of society is nearly limitless in extent, and its solution is bound up with the course of town planning, and the organization of the building industry, vertically and horizontally, including the practice of architecture. It is three-headed: RENT, CONSTRUCTION, LAND: and of these three, rent alone is fixed; the solution must lie in terms of construction and land. Construction is the architects' problem, and one says *construction* advisedly because the lowering of the costs of slum clearance lies first in the cost of building, which is too high. And secondly, since, as it appears that reduction in the cost of building will flow from the engagement of larger units of lay-out, then it is the architect, and the architect alone, who has the power to point the way to economy, stating his case in terms of construction, but carrying it very quickly into terms of land and the operation of Acts and legal procedure created in order to facilitate the purchase of land for the purpose of slum clearance.

Blind Standardization

We have to turn to industry for the means of cheapening the cost of building. Industry replies with mass-production, standardization and skilled management. These are three powerful means to an end. None of them is new, and the efficiency of all three depends upon our power to vitalize their energies towards good ends. If we examine block dwellings put up by the L.C.C. and by other bodies within recent years, we find that what is known as the "normal character" of block-dwelling design is in fact a standardization of *external* features, cast usually in a Georgian mould. These features, which have become the standardized units, are expensive ones: sash-framed windows, high pitched tiled roofs, monumental chimneys, purely decorative wrought-iron railings, stone pediments, cornices and so on. The arrangement of these external features obey dead laws of a stylistic architecture *but they fix window openings*, and they add to every block not only the resulting difficulties of internal planning, but a heavy and needless expense, *every penny of which is charged to the rent of tenants.* Each block is put up in a blind faith that the only decency is Georgian, and in a block erected quite recently the only answer to this cry for cheaper accommodation was to lower the standard of internal finishes. Surely, slum clearance is not enough.

Standardization from the Inside—Outwards

The nineteenth century presented us with two out of many materials, the very nature of which calls for a fine order of planning. These are steel and concrete. The inherent economy of these materials lies in the regular disposition of the structural members; and granted this regularity, economies result automatically. But the way to economy is by the standardization of units, a standardization proceeding from within outwards. Few problems are more susceptible to a process of fine standardization than the design of block dwellings. The family units are small and of nearly equal size.

Bathrooms and kitchens can be standardized completely over a wide range of building. A repetition of standard parts is the material of grand design, and not the deterrent so much feared by architects fettered to what is called "tradition," where irregularities of planning, and a pre-conceived notion of window-spacing, condition internal planning.

The study of kitchen lay-out from the housewives' point of view as a place in which to work with economy of effort and money cannot, in buildings designed to a fixed Georgian pattern, or to the even more rigid and less logical patterning of recent Westminster housing, be given the care and skill required to make a small room efficient, so that all too frequently one finds sinks jammed up into corners, baths in kitchens, gas cookers placed away from the light, the light itself wrongly disposed and inadequate, dressers too small and badly conceived, and so on. Even the speculative builder realizes that the kitchen is the workshop of the house, and the bathroom its pride and joy. It is nearly true to say that without standardization, the "minimum" kitchen* and the "minimum" bathroom are impossible. But with standardization as the basis of design, the architect is forced to bestow upon the one kitchen plan which he is going to repeat 100 times at least twenty times the amount of care which he can afford for any one of his 100 incidental kitchens. And similarly with the other rooms of the house.

The Economies of Standardization

But, arising out of the same problem, through the standardization of rooms and parts of buildings, flow other and hardly less important economies. For once the qualities peculiar to these materials are rigorously observed; fenestration, chimney design and many other vital and expensive elements of construction assume new forms and become larger and different units, which, constructional in the first place, are very quickly transferred to the plane of design and æsthetics.

The largest single item in building is labour; and labour can take place on or about the building in course of erection, when its motions are loosely directed in surroundings unfitted to accurate work; or in a factory where every action is studied, performed in large measure by machinery, and costed to the penny. The factory-produced article is always cheaper, and, as the Americans proved in the tool-making industry, incredibly more accurate.

Therefore, two things spring from this. First, that the more labours that can be performed under conditions of factory organization, the cheaper will the work become; and secondly, that it is not possible to make use of the economies of factory production until design itself adopts a high measure of standardization.

The Organization of a Time and Progress Schedule

From this a new difficulty: namely, that neither standardization nor mass production can be successfully pursued without a fitting organization in the conduct of the work, both upon the architect's and upon the builder's side. The direction of organization must naturally flow from the architect, and if he is to control much more than he does now it is not at all impossible to conceive of a new form of contract under which the architect is not only responsible directly for the work of sub-contractors, but himself engages them under contract for the work, and uses the building contractor for organization and that part of the construction not performed by trade specialists. It is likely again that the normal form of specification, with bricklayer, carpenter, joiner, ironfounder, etc., will give place to a series of accurate specifications on the spot-item principle, dovetailed into a Time and Progress schedule directed by the architect, but engaging the active co-operation of everybody connected with the work. It is possible by such methods, as may later be shown, to lower the cost of slum clearance construction well below the accepted minima, and to arrive thereby at a new low level of rent.

Slum Clearance and Town Planning

This brings us back to the consideration of the three main headings of Rent, Construction and Land. If now it can be said that the rent which the poorest can afford to pay is 8s. per week, and construction costs, based upon large standardized units of lay-out, can account for a certain proportion, at the moment not specified, of the 8s., *then the remainder is in land*, and we are driven to see the whole problem of slum clearance—the most desperate problem which this country has had to face—in terms of town planning, land planning.

Glance through the published reports on slum clearance work in London and the large cities, and the vital nature of this last consideration springs to the eye. It is obvious at once that slum clearance has been so far an act of local surgery upon a diseased body; piecemeal; unconnected; bearing no relation to the regeneration of the road plan, the park plan or any part of the organization or *function* of the cities in which they take place. Nor is it possible for the Government to announce, like an American police chief crying out that he will rid the city of vice overnight, that it will clear the slums in five years; for without the operations of town planning, freeing vastly larger units for the erection of *really cheap dwellings* with sufficient open space, the slum problem is not solved, but aggravated. We are but setting out to build still more dwellings above the income of their occupants. So that perhaps here at last is the answer in terms of finance to those who claim that town planning is a burden of extravagance, and that we cannot rebuild our rotten cities.

One day, passing an L.C.C. estate, I remarked upon the beauty of the buildings to my friend, a German town-planner, with some degree of pride. "Yes, guvnor," said the busman, popping his head inside, "there's only one thing wrong with that place. All the people as lives there can't afford to!" There is no effective answer to the busman that does not throw overboard most of our pre-conceived ideas of housing in favour of standardized unit design, and *slum clearance through town planning*.

Slum Clearance in London

In every London borough people are thinking about slum clearance. If you could see a map in which new block dwellings were shown in red you would find them everywhere, filling in corners, filling up holes, expanding into largish schemes, but seldom, nearly never, clearing a way through the muddle of streets, and never achieving a new way of life for the poor. This problem of the land of London is the last, but the greatest, of the three elements of Rent, Construction and Land, and there is as yet no great *desire* to replan, perhaps because land has not been sufficiently recognized in its relation to the cost of living and *in terms of town planning*.

Design

In the methods outlined here, design is conceived in terms of ideal minima related to rent.

It seems hardly worth while indulging oneself in a fanciful chequer-board of solid and void if blocks are so closely

* A "minimum" kitchen is not a term of reproach. It represents the smallest size for absolutely efficient working: the elimination of waste rather than a concentration of traditional planning.

spaced that they must be separated by arid and anti-social strips of hard tar paving.

If the entrance of light through windows is a vital consideration for healthy living, that light must get past the great blocks to the windows in the fixed directions of the sun's movement. Any other arrangement is not slum clearance but barrack building that neglects to use such knowledge as is contained, for instance, in the R.I.B.A. report on the orientation of buildings. It is not design to good ends.

Nor is design good that places *style* before *use*, fearing the outcome of a complete and brave solution of the programme; for the purpose of slum clearance is to provide cheap dwellings for poor but otherwise normal people. Anything less than this is an indulgence of private taste at someone else's expense.

But what, after all, is there to fear but a new thing, strangeness, a new unit and a new proportion? Sir Christopher Wren helped to standardize a new unit after the disaster of fire. It was the brick that vitalized domestic architecture for close upon two hundred years.

THE GOVERNMENT'S FIVE-YEAR SLUM CLEARANCE PLAN

The only conclusion to be drawn from the announcement of the Government's five-year plan to rid the country of slums is that the Government intends to break the back of the problem in England by the end of the year 1938.

Preliminary work is to commence at once, and local authorities are expected to submit programmes and plans for slum clearance and re-housing by September of this year.

We intend to publish these programmes when they are announced, and to follow closely the development of the schemes in every area affected. In the meantime, between now and September, we propose to survey a number of the larger towns, and, by showing the full requirements in each, to give a basis upon which the value of local authority proposals may be judged.

In this issue we have dealt with :—

Birmingham
Glasgow
Leeds
Liverpool
Manchester
Sheffield

The following are in hand :

Bradford
Bristol
Cardiff
Edinburgh
Dundee
Hull
Newcastle
Stoke-on-Trent
London

—*Ed., A.J.*

THE END

TRADE ITEMS

Marble. A handbook. By Ian Cater. London : Art Pavements and Decorations, Ltd. Price: free.

The architect who is constantly seeking information and whose work covers so wide a field that his knowledge can never be quite complete, must often visualize a series of reference books, instructive works, compiled by specialists, dealing with methods and materials and giving concisely and completely the information that he requires.

Manufacturers are usually in the best position to produce such works. No one can be more familiar with a particular material and all the little snags of fabrication and construction it involves, yet they usually content themselves by telling the world how well they do their job, leaving the architect to find his own information by the laborious process of research.

A handbook on marble is a welcome addition to the few such books that do exist. In *Marble*, issued by Messrs. Art Pavements and Decorations, Ltd., Mr. Cater has taken about thirty of the more important varieties of the material, describing the uses, limitations, sources of origin and so on of each, illustrating his remarks by a coloured photographic reproduction of the material in every case.

Of Swedish green, for instance, he says :—

"The quarries, which are located at Kolmarden, have been known and worked in a small way since 1650, but it was only in 1902 that the installation of modern machinery enabled this marble to be extracted in sufficient quantity to be available for general use.

"The geological changes which have produced this marble have partially changed it into serpentine, and it is the varying distribution of this serpentine which gives rise to the different types.

"There are two principal varieties : Swedish green G.3, which is the lighter ; and NYT.2, which is more mottled and contains dark markings. G.3 may be sawn either with the bed or cross-cut. Sawing with the bed gives a green surface, mottled with splashes of white, while cross-cutting produces ribbon markings. NYT.2 is invariably cross-cut to develop the characteristic markings. Really large slabs are, unfortunately, unobtainable on account of the narrowness of the bed, which is of an average depth of 18 ins. only. In addition to extensive use in Sweden, the country of its origin, Swedish green is freely used in England and on the Continent.

Practical notes, fixing and maintenance details, common to all varieties, are contained in a loose supplement.

F. R. S. Y.

*

Messrs. Hill and McFarlane have sent us particulars of their Ardanbrite jointless floor covering, which they state can keep an even wearing surface, and not peat up through constant wear. It is also claimed to have the advantage of a self-polishing surface, no artificial polish being required ; and is also said to be damp-proof, fireproof, germproof, noiseless, non-slip, homogeneous and hard-wearing. This floor, the price of which is extremely reasonable, can be laid on concrete or timber and is guaranteed against cracks.

Full particulars, samples and prices are obtainable from the manufacturers, Messrs. Hill and McFarlane, 66A, Chatterton Road, Finsbury Park, N.4.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

Plans passed at EALING: Twenty houses, Cavendish Avenue, for Messrs. G. K. Metcalfe, Ltd.; five houses, Bideford Avenue, for Mr. A. E. Murdoch; 18 houses, Oakwood Crescent and Woodcroft, for Messrs. John Laing and Son, Ltd.; 12 houses, Abbey Terrace, for Messrs. P. H. Edwards, Ltd.; nine houses, Dawlish Road, for Messrs. A. Watson, Ltd.; four shops and flats, The Broadway, Ruislip Road, for Mr. E. R. Taylor; 14 houses, Mayfield Gardens, for the Great Western Land Co., Ltd.; six bungalows, Church Road, for Mr. E. De la Rue; four houses, Bideford Avenue, for Mr. F. Roberts; two houses, Cleveland Road, for the Oaklands Estates, Ltd.; 248 houses, Empire Road, Jordan Road and Launceston Gardens, for Messrs. Swannell and Sly; six houses, Wellmeadow Road, for Mr. W. Gardner; 20 houses, Church Road, for Messrs. Grainger Bros.; 14 houses, Ealing Road, Northolt, for Messrs. J. and J. H. Boothman; five houses, Horsenden Lane, for Mr. A. J. Marshall; nine shops and 18 flats, Hanger Lane and Western Avenue, for Messrs. T. P. Bennett and Son; 29 houses, Beaufort Road, for Messrs. Haymills, Ltd.; alterations to flats, Gunnersbury Avenue, for Mr. G. P. Bath; factory, Aintree Road, for Messrs. Percy Bilton, Ltd.; oil fuel tank store, St. Benedict's Church, Charlbury Grove, for Messrs. F. A. Walters and Son; alterations, 7, The Green, for Messrs. Hall-Jones and Partners; additions to factory, Cambridge Yard, for Mr. R. A. C. Churchward; conversion of garages into factory, Uxbridge Road, for Messrs. W. H. Read & Co., Ltd.; conversion into three shops, 158 and 160 The Broadway, for Messrs. Hall-Jones and Partners; conversion into flats, 3 Leopold Road, for Messrs. Strange and Stengelhofen; alterations to shop, Ealing Road, for Mr. J. E. Watts; block of flats, Hastings Road, for The Housing Corporation of Great Britain, Ltd.; additions to shop, Bilton Road, for Mr. G. L. Russell.

Plans passed by the FRIERN BARNET U.D.C.: Six houses, Gresham Avenue, for Messrs. Frampton and Palmer; nine houses, Church Crescent, for Mr. G. Elphick; flats, Oakleigh Road, for London Co-operative Society, Ltd.; layout of Halliwick estate, for Halliwick Estates Co.; three houses, Oakleigh Road, for Mr. E. Roberts.

SOUTHERN COUNTIES

Plans passed by the GILLINGHAM Corporation: Three houses, Gillingham Avenue, for Mr. H. Holden; 53 houses, Third Avenue, for Mr. W. G. Wilson; 22 houses, Beaconsfield Avenue, for Mr. F. T. Mattocks; two shops, High Street, Rainham, for Mr. J. Clark; lock-up shops, 151-5, High Street, for Mr. A. T. Batzer, on behalf of Messrs. Marks and Spencer, Ltd.; two houses, Edwin Road, for Mr. A. Jarvis; two houses, Carlton Avenue, for Mr. A. E. Neenham; alterations, Co-operative Stores, King Street, for Mr. L. G. Ekins; development, Rainham Mark estate, for Mr. G. H. Ward; development, Upper Darland estate, for Messrs. A. E. Clifford & Co.

Messrs. Piper have lodged plans with the WORTHING Corporation for the erection of 135 houses, in the vicinity of Meadow Road.

The WORTHING Corporation recommends the acquisition of property in Chapel Road, and the erection of electricity offices and showrooms, at a total estimated cost of £18,000.

Plans passed by the WORTHING Corporation: Alterations, 17 and 19 The Broadway, Brighton Road, for Mr. W. T. Bagnall; 10 houses and shops, Upper Brighton Road, for Mr. R. Hodgson; two houses, Lime Tree Avenue, for Mr. G. W. Warr; three houses, Sea Place, for Mr. R. J. Tinniswood; alterations and additions to bakery, rear 62 Chapel Road, for Mr. J. E. Lund; two houses, Livesay Crescent, for Worthing Estates Building Co., Ltd.; new streets, adjoining Meadow Road, eight houses, St. Andrews Road, and 134 houses, Meadow Road, for Mr. H. M. Potter; 36 houses, Sheridan Road, for Mr. S. C. Phillips; three houses, Rugby Road, for Mr. A. T. W. Goldsmith; three houses, Ophir Road and Offington Lane, for Mr. F. W. Payne; 10 houses, Offington Avenue, for Mr. M. R. Fletcher; new street, east of Findon Road, for Messrs. Jordan and Cook, Ltd.; workshop and store, South Street, Tarring, for Messrs. Sparks and Son; alterations, 29 South Street, for Messrs. Treacher and Farmer; 34 houses, George V Avenue, for Mr. C. A. Jarvis; four houses, Hailsham Road, for Mr. M. R. Fletcher.

SOUTH-WESTERN COUNTIES

The BRISTOL Corporation is to construct further roads and sewers on the Bedminster and Knowle estates, at a cost of £21,000, so that houses can be provided under slum clearance schemes.

The TORQUAY Corporation is to construct a concrete wall at Oddicombe, at an estimated cost of £32,000.

EASTERN COUNTIES

Plans passed by the COLCHESTER Corporation: Two houses, Ipswich Road, and house, Lexden Road, for Mr. C. Brown; two houses, Clairmont Road, for Mr. R. T. Clarke; four houses, Mile End Road, for Messrs. E. A. Cook and Sons; two houses, Gladwin Avenue, for Messrs. Grimsey Bros.; two houses, Ipswich Road, for Messrs. H. G. Pryke and Sons; extensions, stores, Church Street, for Messrs. J. Moss and Son; two houses, Shrub End Road, for Mr. George Hearsum.

MIDLAND COUNTIES

Plans passed by the SUTTON COLDFIELD Corporation: Showroom and garage, Kings Road, for Mr. L. King; four houses, Maple Road, for Excelda Housing Society; three houses, Tamworth Road, for Messrs. Davis and Son; shop and house, Boldmere Road, for Mr. G. E. Clarke; 33 houses, Boldmere Road, for Messrs. T. P. Smith, Ltd.; two houses, Chester Road, for Morris Estates.

The WEST BROMWICH Corporation is to construct roads on the Hambletts estate, to provide for the erection of a further 300 houses.

NORTHERN COUNTIES

Plans passed by the BOLTON Corporation: 18 houses, Montserrat estate, Chorley Old Road, for Messrs. A. T. Reynolds & Co.; two houses, Stapleton Avenue, for Messrs. R. Paiton and Sons; 60 houses, Ferns estate, Tudor Avenue, for Mr. George Le Maire Barnes; six houses, Brook Hey Road, for Mr. J. Latham; service garages, New Hall Lane, for Mr. Norman Rowbottam; alterations, vicarage, Stowell Street, for St. Matthew's Church Council; vicarage, Bridgeman Street, for St. Phillip's Church Council; two houses, Wigan Road, for Messrs. Dobson and Tierney; 18 houses, Hulton Lane estate, for Mr. F. Holmes; two houses, Old Kiln Lane, for Messrs. S. Main & Co.; four houses, Bradford Road, for Mr. R. J. Tyson; seven houses, Gregory Avenue, for Mr. G. Grisdale; 16 houses, off Bradford Road, for Mr. W. Astley; two houses, East grove Avenue, for Messrs. Price and Groves.

The BOLTON Corporation has obtained sanction to borrow £14,907, for the purchase of land, erection of 43 houses, and road and sewer works in connection with the Gibbon Street site; and £2,719 for the erection of 12 bungalows on the Moorfield housing site.

Plans passed by the DEWSBURY Corporation: New streets, off Canterbury Road, for Savile Estate Co.; two houses, South Street, for Mr. J. Tierney; two houses, Henley Road, for Mr. H. T. Dawson; two houses, Slaithwaite Road, for Mr. W. Marshall; four houses, Bendigo Road, for Mr. R. Laycock; four houses, Falcon Road, for Miss Gladys E. Turner; two houses, Warren Street, for Mr. R. Dean; two houses, Frank Lane, for Mr. S. Knowles; six houses, Leeds Road, for Mr. G. Milner.

Plans passed by the SHEFFIELD Corporation: Two houses, Abbeyfield Road, for Messrs. Naylor and Barker; six houses, Knowle Lane, for Mr. G. M. Taylor; four houses, Greystones Grange Road, for Messrs. W. Malthouse, Ltd.; four houses, Forres Avenue, for Messrs. Broomhead and Sons; three houses, Pitsmoor Road, for Mr. C. H. Hoyland; four houses, Brooklands Avenue, for Mr. G. M. Taylor; 32 houses, High Storrs Drive, for Mr. A. Shaw; 118 houses, Thorpe House estate, for Messrs. W. and J. Laver; six houses, Derbyshire Lane, for the City and Suburban Estates, Ltd.; four houses, Carlby Road, for Mr. H. Haywood; 320 houses, Hollinshill Estate, for Hallewell Estates, Ltd.; 52 houses, Firth Park, Addison, Bolsover and Cammell Roads, for Mr. C. S. Smith; 449 houses, Hall Road, for Miss I. M. Helliwell; two houses, Montrose Road, for Mr. J. W. Bailey; two houses, Ecclesall Road, for Mr. H. E. Mottram; 14 houses, Greystones Grange Road, for Messrs. W. Malthouse, Ltd.; 30 houses, Hollinsend Road, for Messrs. Maxfield Bros.; four houses, Mulden Road, for Mr. P. H. Slater; four houses, Herries Road, for Mr. J. C. Mason; five houses, Sharrow Lane, for Mr. H. A. Longbotham; two houses, Tinsley Wharf, for the Sheffield and South Yorkshire Navigation Co.; six houses, Carterknowel and Bannerdale Roads, for Messrs. A. Waddington and Son; 178 houses, Thorpe House Estate, for Messrs. W. and J. Laver; six houses, Toftwood Road, for Mr. M. Silman; 120 houses, Woodthorpe estate, for the Estates Committee; four houses, Wisewood Road, for Mr. P. H. Slater; four houses, Forres Street, for Mr. F. Ridal; four houses, Barnsley Road, for Mr. C. B. Malam-Wilson.

Plans passed by the SHIPLEY U.D.C.; 24 houses, Taunton Street, for Messrs. Wm. Pitts and Sons; three houses, Bargrange Avenue, for Mr. S. Rawson; two houses, Wrose Road, for Mr. F. Dalby; amended lay-out for 80 houses, Claremont estate, for Mr. F. Dalby; lay-out of land, Wrose Road, for Messrs. Walton Bros.; four houses, Nab Lane, for Nab Wood Estates Co.; two houses, Westfield Lane, for Mr. A. Greenwood; two bungalows, Wrose Road, for Messrs. A. and F. Mellor; extension of works, Wrose Brow Road, for Messrs. J. E. Briggs and Sons, Ltd.

Plans passed at SOUTHPORT: Two houses, Fleetwood Road, for Mr. Charles Green; shop and house, Station Road, Ainsdale, for Mrs. A. Tood; three houses, Burnley Road, Ainsdale, for Mr. T. Swarbrick; conversion into two flats, 16, Grange Road, for Mr. J. Cottam; alterations to lodges, 1 and 2 Botanic Gardens, Botanic Road, for the Botanic Gardens Development Co.; three shops and six flats, Lord Street, for Mr. James Rimmer; conversion into flats, 30, Wennington Road, for Messrs. Wagstaffe and Fletcher; conveniences, Holy Trinity C. of E. School, for the managers; additions, 8 Church Street, for Dr. Campbell; alterations and additions, 6 Melling Road, for Messrs. Graham and Caddick; three houes, Fleetwood Road, for Mr. C. Green.

Plans passed by the STOCKTON-ON-TEES Corporation: 52 houses, Craigwell estate, for Mr. W. C. Cummings; six houses, Green Lane, for Mr. J. C. Watson; reconstruction, six houses, Crosby Terrace, for Mr. A. E. Hobbs; two houses, Darlington Road, for Mr. G. F. Walker; 16 houses, Whitfield Road, Norton, for Mr. T. F. Whitear; four houses, Greens Lane, for Messrs. R. W. Russell and Son; 24 houses, Eynesham Grove, for Mr. G. P. Stainsby; estate development, off Hallifield Street, Norton, for Messrs. Lane and Fox; two houses, Hartburn Avenue, for Mr. G. Hope.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

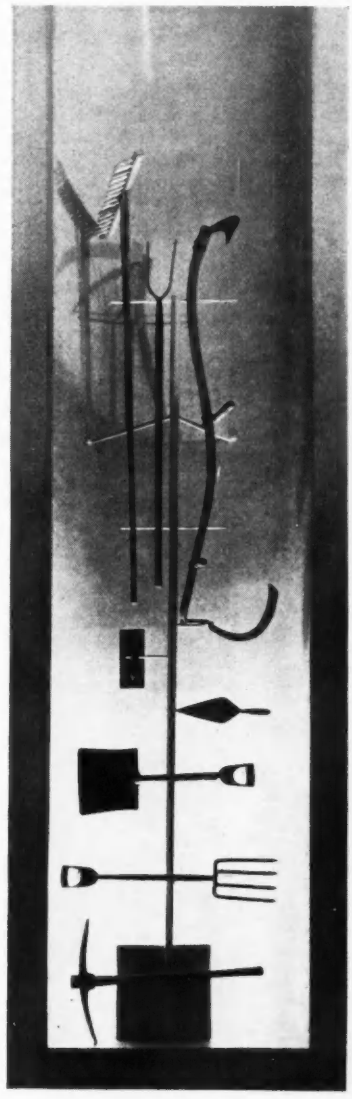
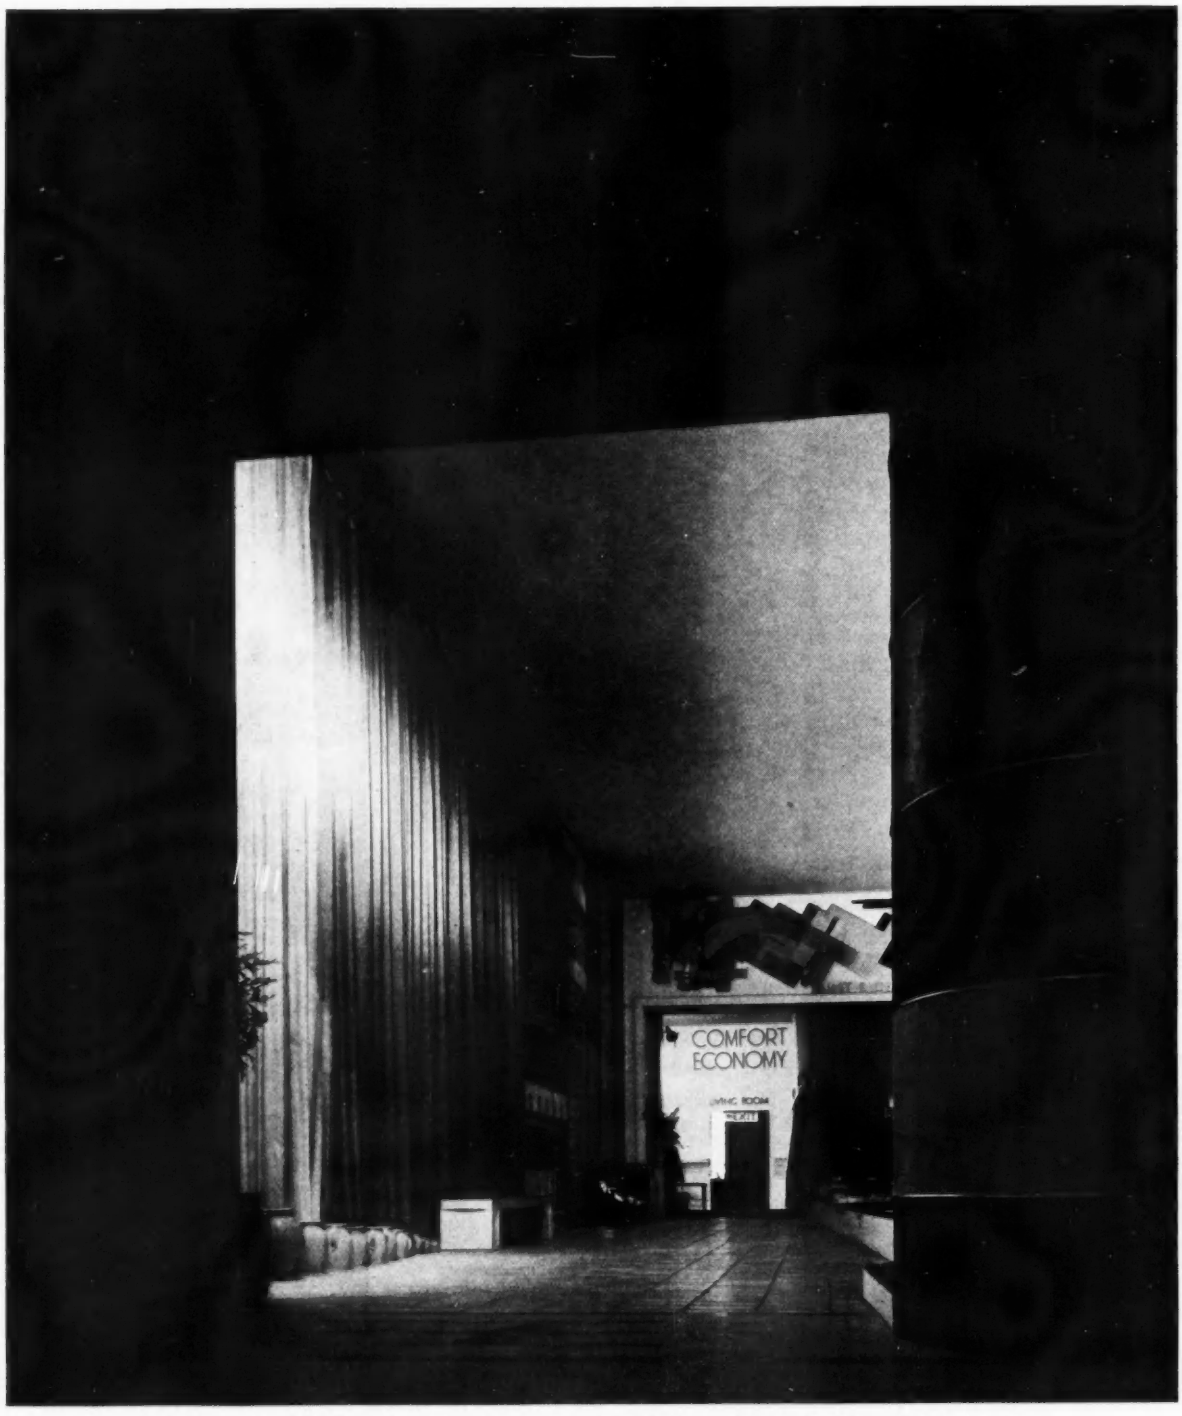
THE KEYNOTE OF THE B.I.A. EXHIBITION





THE BEAUTY OF EVERYDAY IMPLEMENTS

THE Entrance Hall of the Dorland Hall Exhibition starts on a felicitous note, showing us real industrial art—implements of use closely connected with every home which are not usually regarded æsthetically.

This exhibit demonstrates how beautiful these simple things of everyday use actually are, and puts one in the frame of mind to judge the rest of the Exhibition from the same standpoint.

"The Intelligent Woman's Guide to the Exhibition" appears on pages 865-72; it will be followed, subsequently, by a technical survey.

AT THE B.I.A.: THE MAIN HALL

DESIGNED BY OLIVER HILL

The words "Comfort" and "Economy" salute the visitor entering Dorland Hall to view the B.I.A. Exhibition. What is displayed within acknowledges these desiderata of modern life. The exhibits show the advances already made in superseding the old call for "artistic," uncomfortable, expensive furniture and fittings, and point the way to the fuller utilization of modern manufacturing resources.

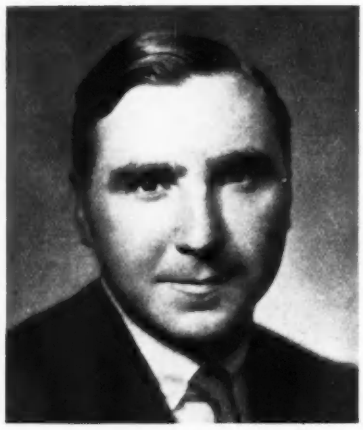
Nothing in the Exhibition is finer than this ante-room to new experience, conceived with a splendid sense of proportion. And the materials open one's eyes to a whole fresh world of possibilities. To take only two instances conspicuous in the above view, the flooring is of dull white Vitrolite tiles, and the panelling, with its ends curved by a special process, is of Empire timber veneers.

THE GREAT LITTLE EXHIBITION OF 1933

"This Exhibition must not be thought the isolated endeavour of some enthusiasts: it does not stand alone, but is the forerunner of a concerted national movement . . . *I have every hope that it will pave the way to a regular series* based on a coherent plan."—LORD GORELL.

THOSE whose faith in the vitality of English design had worn thin in hoping against hope for the revolution in taste which the Exhibition of British Industrial Art that opened on June 20 proclaims, prophesied that either it would never materialize, or else only as "one more blush for Britain." They were doubly wrong. For the Exhibition is the sort of wholly unexpected triumph of rightness over wrongness and direction over drift which makes one throw one's hat in the air. As the French would say, its organizers, selectors, planners and guarantors "have deserved well of their country."

And, largely, thanks to them, their country takes its place once more—not quite so self-confidently as in the past, but conscious of its former prowess—among the creative nations of the modern world, after a century's interregnum. The splendid sobriety of the English tradition, so long servilely reproduced or prostituted instead of being reinvigorated and renewed, is now resumed. We can lift up our heads again as a *Kulturvolk*, for the days of living backwards in splendid isolation are numbered. A definite, because collective, British contribution to the æsthetic canons of our age has made its appearance and is "on view." Here we are confronted not only with one of the most momentous events in our cultural development, but with the presage of an imminent resurgence of the national genius in design. It is something more than chance—for the history of art, like history in general, rarely admits coincidences—that this year, too, Great Britain has at last entered that eminently unacademic federation, the International Congresses of Modern Architecture; and that the Englishman invited by it to form a British unit should be one of the architects whose work is most in evidence at Dorland Hall.



For the first time, all that is best in English design has been deliberately winnowed away from all that is not, and then grouped together apart. The result, which surpasses all expectations, has been a revelation —not merely to "the right sort" of English visitors, but to foreigners as well.

Lord Gorell points out in his Foreword to the Catalogue that the work of the selection committees reveals not only "what has already come into being," but what is "in process of fruition." The paramount importance of showing the latter is made clear by a very necessary reminder in Mr. Christopher Hussey's admirable "Introduction" that this is "the first opportunity for public and producer to come into direct contact." We trust both will avail themselves of it to the full. And it must not be forgotten—for this is one of the most encouraging aspects of all—that the exhibition is an "official" one in every respect except that of direct Government subvention. If "the world's economic crisis" was responsible for this tangible endorsement of the now famous Gorell Report being withheld, it has also caused the Exhibition to be more than ever a crucial turning-point in the evolution of British design. People (including, we hope, plenty of "the wrong sort") are going to the Exhibition not to learn how to spend their money, but to see ways in which they can save it. Most of the great movements in architecture and decorative art have had an economic basis.

Window-dressing is an art which has never become acclimatized in this country. English shopkeepers believe in quantity before quality, and crowd their windows so that the confusion of articles defeats the possibility of separate inspection. Their displays are representative of the wide range of their wares, not selective of the newest or best among them. Until yesterday the same fatal blemish applied to all British exhibitions. At Dorland Hall there are no "to-day's best selling lines," though plenty of the exhibits may well be the prototypes of tomorrow's. Quite apart from what is shown—and where else in the whole world can more adventurous glass, or better and better-looking textiles be seen?—the Exhibition is magnificent as expert showmanship. It should do much to educate the shopkeeper's ideas not only of what to stock, but of how to set it out for sale. The stands, the actual displays and the lighting (except in the book section, where the desire to have each title-page fully lit has somewhat militated against the *ensemble*) are all examplars of perfectly co-ordinated *ad hoc* planning.

There is one significant omission in the list of guarantors which needs a lot of explaining: the F.B.I.

If the Dorland Hall Exhibition accomplishes nothing else—and it is going to move mountains of inertia and complacency—it is at least showing the public that the annual British Industries Fair at the White City and Birmingham is neither enough, nor good enough.

J. S. Allen, B.Arch., A.R.I.B.A., who has just been appointed head of the Leeds School of Architecture. *See note on page 856.*

NOTES & TOPICS

CONFERENCE REFLECTIONS

SINCE my return from Cambridge and the R.I.B.A. Conference of last week, I have received the following letter from a correspondent :

DEAR ASTRAGAL,—I read with interest your suggestion that the Cambridge Conference ought to devote its time to the discussion of serious subjects.

In one way I quite agree with you, but I expect you would be amused to discover that the vast majority who attend these Conferences entirely disagree. There is nothing they hate more on such occasions than to be asked to consider and discuss a really important subject.

When the present series first began two whole mornings were devoted to serious papers and what was meant for serious discussion on burning professional topics, but there was the greatest difficulty in making and keeping audiences of any size, and the attendance on the second day was deplorable. What they all wanted to do was to get to work at once on what really attracts them, the visits to buildings, the tours, the luncheons and dinners and the long friendly talks in the hotels, which the old hands say are the most important and pleasant features of these annual events.

In the second year of the Conference, at the urgent request of the organizers, the serious discussion was cut down from two days to one, again with the same result. The subject was attractive and interesting enough, the people simply did not want to discuss it on a fine summer's day.

The next year the organizers tried to cut out serious discussion altogether, but after all it is a " Conference " and there must be at least one morning of a serious character, though even so it is difficult enough to get anything like a decent number of members to come into the meeting. I remember one year we had an admirable lecturer, a burning subject of the utmost importance to discuss, and the situation was only saved by a violent shower of rain which drove a sufficient audience into the Conference Hall to make us look like a serious body. When the rain stopped they began to sneak out and rejoin their wives and daughters.

It may be possible, of course, to change all this, but lots of people have tried for many years past and they have completely failed. What you are up against is the ordinary human nature of normal members.

Research at this year's Conference convinces me of the truth of my correspondent's observations. Human nature is weak but nice. If I probe into my own activities at Cambridge I find that I spent the major part of the Conference's time learning from an Australian architect how to throw a boomerang. I hit a horse and finally lost the boomerang in a tributary of the Cam.

*

The rest of the time seemed to be spent on the slum problem. There is no doubt that the profession is taking this particular question seriously. Sir Raymond Unwin, in referring to the slum number of THE ARCHITECTS' JOURNAL, drew a pointed comparison between over-production in commodities and under-production in housing.

*

The success of the Conference was marred by one thing —the absence of a famous Cambridge figure, Mr. Mansfield Forbes, of Clare and Finella.

*

That an architects' conference should be held at Cambridge without Mr. Forbes seems inconceivable. Nevertheless Mr. Forbes was not there. Nor was his name down amongst those of the guests at the banquet. I should think I overheard fifty enquiries for him.

*

This is all the more extraordinary in that as far as architecture is concerned Mr. Forbes *is* Cambridge. Obviously he must have been asked to the Conference. It was most disappointing that he could not see his way to be there.

*

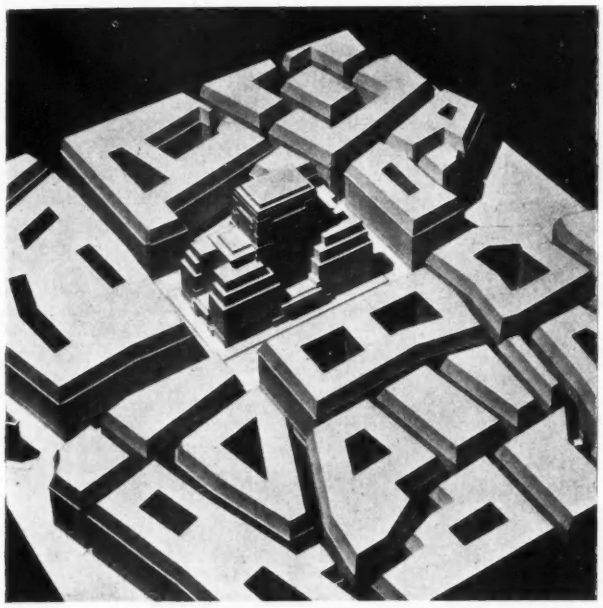
The other surprise—this time a pleasant one—was the exhibition of students' work at the School of Architecture. There is a disposition in certain quarters, I find, to regard the Cambridge school as " not serious." Those who went there in the hope of finding evidence to support this theory must have got rather a shock.

*

GHASTLY GOOD TASTE

The sensation of the week is *Ghastly Good Taste, or a Depressing Story of the Rise and Fall of English Architecture,* (*Chapman and Hall, 5s.*). The author is Mr. John Betjeman, who is described by William Hickey, in *The Daily Express,* as slight, dark and untidy, with projecting teeth and a pale green face.

*



I know Mr. Betjeman, and can vouch for the pale green face. " It is not because I have such a rooted dislike for English architects [he writes], but because I have such a rooted love for English architecture that I write so malevolently of the majority of its present practisers in this country."

*

" Malevolently " is the right word. Mr. Betjeman is a good hater. If his book doesn't make somebody angry it ought to. I suppose Mr. Betjeman is to be numbered amongst the Bright Young Men. Before the war they wrote poetry and criticized obscure mediæval literature. Now they write about architecture. This, to my mind, is a significant development to which only very stupid architects will find objections.

*

Nor, I fancy, will their objections in any way deter the Bright Young Men.

A photograph of a model, made from the designs of Sir John Burnet, Tait and Lorne, to illustrate the British Steelwork Association's suggested amendment to the London Building Act, 1930. *See page 872.*

LUXURIOUS EFFICIENCY

I was recently in the office of a magnate in the Midlands, a bland, expansive pundit, who honoured me with an appointment at 10 a.m. We conferred, and as I listened I observed a metal-lipped plate of frosted glass standing upright on his desk, whereon something of the great man's greatness was dramatically indicated.

*

In illuminated letters, under the general heading of "Awaiting Interview," a list of names gradually grew longer. "Mr. Jones" and "Mr. Brown" had established themselves on the indicator when I arrived. Presently they were joined by "Mr. Robinson, Mr. Smith, Mr. Goop and Mr. Slug."

*

At 12.45 the magnate said: "You will lunch with me: I should like you to meet one or two of our executives." I glanced at the indicator, now occupied by eleven names "awaiting interview." The magnate smiled, turned a switch in the frame, and all the illuminated names went out. "They must wait," he said.

*

After lunch I went to the office shared by Mr. Brown and Mr. Jones. "Have you switched in, Brown?" asked Jones, and the latter nodded. I couldn't resist a question, and Mr. Jones, pointing to a red switch marked "Chairman," said: "That tells the chief we're waiting for an interview; we always put it on when we're in—it looks well, you know."

*

DORLAND HALL ECHO

I overheard two dear old ladies exchanging views after inspecting one of the British Industrial Art exhibits, at Dorland Hall, where they had been talking to one of our leading experts in compressed furnishing. He had been explaining the design of the exhibit with the lucidity of a functionalist. "My dear," said one as they left the stand: "what a nice young shopman. Well educated, too!"

*

Problem: should an architect sell?

*

PLAN LOOKS LIVERPOOL IN THE FACE

Across the Mersey, facing Liverpool and its slums, is a piece of intelligent good order. The ferry approach and tram terminus at Seacombe have been tidied up, and tidied up to some purpose.

*

Sheltered ways lead to the booking hall, a tall clock tower without trimmings uprises from the building, and something of the comfortable efficiency of the new London Underground stations is suggested by the whole lay-out.

*

If only the trams that decant passengers for the ferry were painted a less sickly shade of green, the warm hue of the brickwork in the new buildings might be seen to better advantage.

*

THE PRICE OF PROPERTY FOR RECONDITIONING

Auction sales in order to raise money for housing societies have become fashionable today. Leaders of Society serve on housing committees. This shows the increased interest taken in the slum problem, and therefore is all to the good.

*

Unfortunately there is another aspect which has been brought to the notice of the committee of which Lord Moyne is Chairman. The increased number of enquiries for the purchase of old property that may be reconditioned has led to a distinct hardening of price. A leading estate agent tells me that, from his own experience, he estimates that the price of buying unsatisfactory property has increased by at least 25 per cent. in the last two years.

*

The moral, of course, is that societies which wish to spend subscribers' money to the best advantage would do better to engage an experienced architect than to send up property values by embarking injudiciously upon reconditioning programmes.

ASTRAGAL

THE ARCHITECTS' DIARY

Thursday, June 29

EXHIBITION OF INDUSTRIAL ART IN RELATION TO THE HOME. At Dorland Hall, Lower Regent Street, S.W. Until July 12. 9.30 a.m. to 7.30 p.m. (Wednesdays 9.30 a.m. to 10 p.m.) 9.30 *a.m.*

ROME SCHOLARSHIP IN ARCHITECTURE, EXHIBITION: (at the R.I.B.A.) of the designs submitted in the competition. Until July 1. 10 a.m. to 8 p.m. (Sats. 10 a.m. to 5 p.m.) 10 *a.m.*

ARCHITECTURAL ASSOCIATION, 34, Bedford Square, W.C.1. Exhibition of recent work of the Egypt Exploration Society. Until July 15. 10 a.m. to 10 p.m. 10 *a.m.*

ROYAL ACADEMY, Burlington House, Piccadilly, W.1. Summer Exhibition. Until August 7. 9 a.m. to 7 p.m. 9 *a.m.*

HOSPITAL CONGRESS. At Knocke-sur-Mer, Belgium. Until July 3.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS. At Eastbourne. Sixtieth Annual General Meeting and Conference. Until July 1.

LONDON SOCIETY. Visit to the Fulham Dust Destructor, Townmead Road, S.W.6. 3 *p.m.*

BUILDING CENTRE, 158, New Bond Street, W.1. Housing Exhibition. 11 a.m. to 7 p.m. (Sats. 1 p.m.) 11 *a.m.*

Saturday, July 1

Sunrise 4.46 a.m. Sunset 9.21 p.m.

IS YOUR NAME on THE LIST?

No diminution in intensity of the "Build Now" campaign of the Special Committee for Public Relations of the Building Industries National Council must be permitted by members of the building industries. The time when unemployment normally increases is drawing near; every effort must therefore be made to stimulate employment in these industries during the coming winter months.

Recent additions to the subscription list of the Special Committee for Public Relations are as follows: The National Federation of Building Trades Employers, £250; Prior Burners, Ltd., £1 1s.; George Shaw (Mansfield), Ltd., £1 1s.; South Western Counties of England District Federation of Clay Industries, £10 10s.; Yorkshire Amalgamated Products, Ltd. (2nd instalment of £100), £25; The Ruberoid Co., Ltd. (final instalment of £100), £50.

Subscriptions to the fund, which has now reached £2,969 17s. 10d., should be made payable to the Special Committee for Public Relations, and be addressed to Mr. Oswald Healing, F.S.I., at 5, Duke Street, Adelphi, W.C.2.

LONDON UNIVERSITY

On Monday last the foundation stone of the new home for the University of London, in Bloomsbury, of which Mr. C. H. Holden is the architect, was laid by H.M. the King. The ceremony marked the birth of a new centre of university life in London, and when the scheme is finished some ten and a half acres in the heart of London will have been completely rebuilt.

The work of developing the site (which cost £525,000) will be carried out in stages. Those stages will probably spread over many years. The first unit to be erected will be the Senate House and official headquarters of the University. This is to occupy the south-west corner of the site and will face the north front of the British Museum.

The exterior of the buildings will be faced to a height of about 15 ft. with granite and above with Portland stone. The core of the main structure will be of brick.

THE NEW HEAD OF THE LEEDS SCHOOL

Mr. J. S. Allen, B.Arch., A.R.I.B.A., lecturer in architecture at the University of Liverpool, was on Tuesday appointed head of the Leeds School of Architecture, in succession to Mr. Joseph Addison, F.R.I.B.A.

Mr. Allen, who is 35, has been at Liverpool University since 1929. He is hon. secretary of the Liverpool Architectural Society and a member of the advisory panel of architects for Cheshire under the auspices of the C.P.R.E. After extensive travel in Europe and the Near East, he spent two years in the United States, being engaged on several buildings in New York. On his return from America he became senior assistant to Sir Arnold Thornely and Mr. H. J. Rowse on India Buildings, Liverpool, one of the largest office blocks in Europe.

Mr. Allen will take up his Leeds post in September.

A LIVERPOOL ARCHITECT'S APPOINTMENT

Mr. W. G. Holford, B.ARCH., A.R.I.B.A., has been appointed to the vacant post of Senior Lecturer in Architecture at the Liverpool University, the appointment to date from October of this year.

Mr. Holford, who is twenty-six years of age, is an old student of the Liverpool School of Architecture with a distinguished record.

TOWN HALL FOR BRIGHTON

A proposal for a new town hall for Brighton has been approved by the Brighton General Purposes Committee. The hall is estimated to cost £250,000. Mr. John L. Denham, F.R.I.B.A., is the architect.

THE HOUSING PROBLEM

Sir Ernest Simon, addressing the members of the Rotary Club of Manchester on housing, with special reference to the problems of Manchester, said the housing campaign must be tackled in two stages. The first was to go ahead with building as hard as possible until there were enough houses for all families to have at least the minimum accommodation of two-up-and-two-down, so that every family had a chance to get out of those houses let as lodgings. Once there were enough houses for all and some empty ones, then let the City Council start pulling down bad houses as fast as they could go on building new ones. That would be the second stage.

BUILDING SOCIETIES

Sir Harold Bellman has been appointed Chairman of the Council of the National Association of Building Societies, in succession to Sir Enoch Hill, who has occupied the position for the past twelve years.

ROYAL SOCIETY OF ULSTER ARCHITECTS

Mr. Thomas Houston, L.R.I.B.A., has been elected president of the Royal Society of Ulster Architects in succession to Mr. R. H. Gibson, F.R.I.B.A., who has held the office for two years.

LEVERHULME SCHOLARSHIP

The first Leverhulme Scholarship in architecture, value £200 a year for five years, tenable at the Architectural Association School of Architecture, has been awarded to Mr. David Duncan, of Brechin, Scotland.

AN ARCHITECTURAL EXHIBITION AT READING

An exhibition of works by members of the Berkshire Society of Architects and the R.I.B.A. Students' Prize Drawings was opened by the Mayor of Reading at the Corporation Art Gallery, Reading, on Tuesday last.

THE LATE MRS. BENNETT

We much regret to record the death, during the Conference Banquet in Trinity College, Cambridge, on Friday last, of Mrs. John Bennett, wife of the city architect of Exeter.

R. I. B. A.

THE NEW BUILDING

Yesterday, at 3 p.m., the Rt. Hon. Lord Howard de Walden and Seaford, HON. A.R.I.B.A., laid the foundation stone of the new headquarters of the R.I.B.A. at the corner of Portland Place and Weymouth Street, W., designed by Mr. G. Grey Wornum, F.R.I.B.A.

The Council of the R.I.B.A., some time ago, approved the sum of £106,250 to be expended on the erection of the new building. We understand that the architect has recommended Messrs. Ashley and Horner's tender of £106,377.

THE CONFERENCE

About four hundred persons attended the inaugural meeting of the R.I.B.A. Conference at Cambridge on Thursday last. The welcome of the town of Cambridge was extended to the conference by the Mayor (Alderman Mrs. Keynes).

MRS. KEYNES said: The waves of academic buildings are encroaching ever more and more upon the territory of daily business life, and I know that you, Mr. President, will sympathize with our problems of town-planning in such a congested area.

Cambridge as a town, so far as its public buildings are concerned, has to take a modest place architecturally. The future I hope will see us in more dignified surroundings, but the function of Cambridge has been, and probably will always be, to provide a home for the University, and not to rival it architecturally.

SIR RAYMOND UNWIN, before delivering his presidential address, thanked the Mayor for all she had done to make the Conference a success. He also congratulated Mr. P. C. Blow, A.R.I.B.A., and the local secretary (Mr. Norman Hurst), on the very successful arrangements made for the Conference, and coupled with the congratulations the name of Mr. Theodore Fyfe, F.R.I.B.A., the Chairman of the Cambridge Chapter.

Sir Raymond then dealt with the question of housing. He said: We have been receiving some of the data of the very valuable returns from the Census authorities as to conditions, and I find from the 1931 census, taking the separate families in England and Wales, we are half a million, in round figures, worse off. The deficiency in dwellings is half a million more than it was in 1911. That represents something like the deficiency of the War years, and after all our struggling we have failed to make any impression on the War deficiency. The deficiency in houses in 1911 was a quarter of a million, and therefore today we are three-quarters of a million short. That has nothing to do with slums or bad housing. In addition to the three-quarters of a million houses required to make up the deficiency I estimate there are half-a-million of houses not fit to live in, and another half-a-million that fall far below any decent standard of accommodation that any of us would set up.

Many of you will have seen that *The Architects' Journal* this week has dealt with six great cities, and they have come to the conclusion that on a moderate basis there should be one-and-a-half persons per room. I would look at it in this way—take your own dwelling and assume your family grows until there is one-and-a-half persons per room, and see what you would think of it. The total population of the six cities is 4,707,000 people, and of these *The Architects' Journal* says 1,194,513 are overcrowded, that is over 25 per cent., and they estimate to get rid of that overcrowding 280,000 houses are necessary.

The point I want to put to this Conference and to the architectural profession most seriously is how are these people to be housed. This is the most vast architectural problem of our time. We hear of over-production in commodities, we hear that in Canada and other countries they have wheat stored up to last one-and-a-half years. We hear of all sorts of over-production. Why is it we have this under-production of dwellings, which are quite as important for our welfare as wheat and other products? Not only is this the biggest architectural problem of our time, but a task vital for the architect as it represents the most important town-planning problem of our time.

We have had, sitting under the chairmanship of Major Barnes, a committee dealing with slum clearance and overcrowding. They have not found the problem of slum clearance an easy one, and we are awaiting with interest their report, but they have given me one or two fruitful suggestions. They say there is very useful work for citizens to do in surveying conditions and putting them before borough councils. Information was required that they might see where the difficulties lie, and suggestions were useful in the determination of what land there is. And there is still more to do in preventing the reaction of intrusive industrial and other buildings which are crowding out people in places where people ought to live, and where industries ought not to be needed.

The Mayor of Cambridge (Alderman Mrs. Keynes) who extended the welcome of the town of Cambridge at the inaugural meeting of the R.I.B.A. Conference last week.

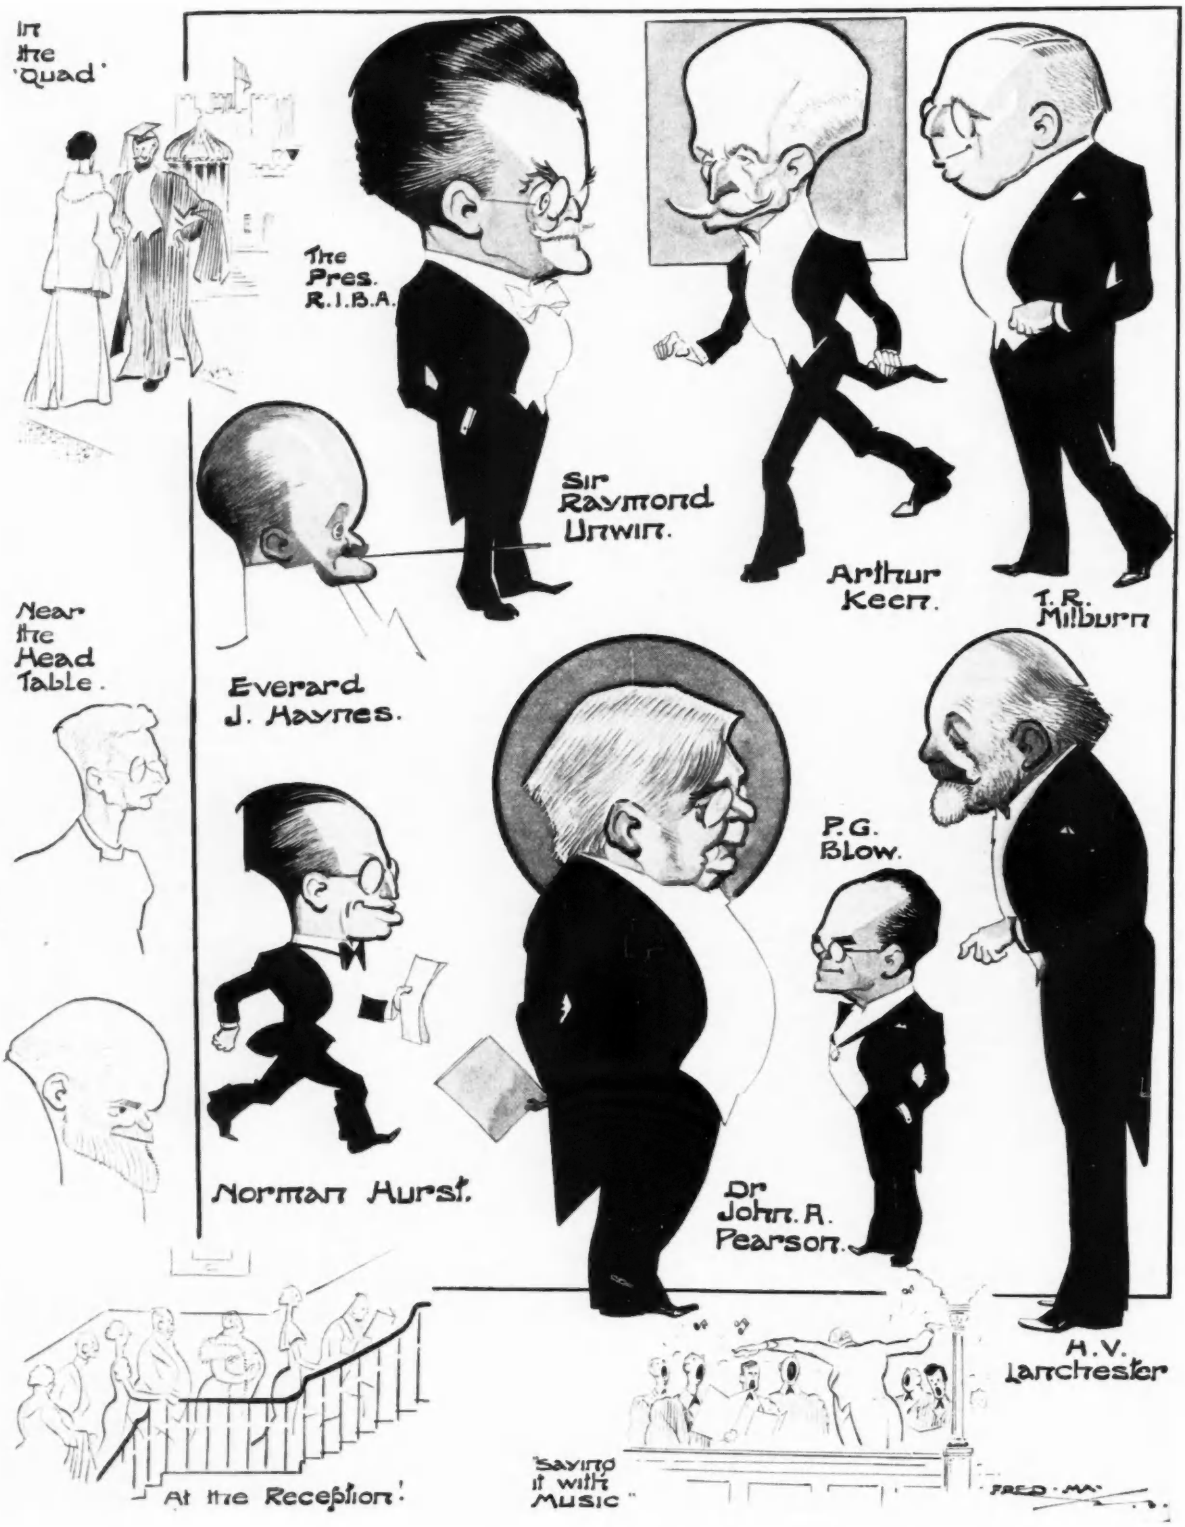
How are these families to be dealt with, and how are they to be housed—in homes or in warehouses? Some of the modernists in construction and other things are not less prone than the more traditional to make use of false statements in putting forward their ideas of what is required, and that is not the right way to go to work. If it is wrong for the traditionalist, it is equally wrong for the modernist to go to work in that way. There is a great deal of talk of housing families in vast steel and concrete warehouses, and of the great economy and urban benefits, whatever they were, in so doing. It may be that the modern man and the modern family will like living in a few cells in a vast pile of biscuit boxes. I don't know. But that has never appealed to me as my idea of a home. Perhaps I am prejudiced.

Let us examine what are the arguments for the new method of warehousing families. I think there may be many alternative ways of housing families in houses that are homes. For years and years I have hankered after the opportunity of seeing whether it is possible to copy some of the beautiful features of colleges, grouping houses round courts and quadrangles after the example of colleges. I don't want to dogmatize. I don't want to persuade people to be housed in my particular way of housing. If people do want to be housed in big masses in the centre of a town by all means let them be so housed, and I do not want to interfere with the game of bricks on a large scale which many of our designers are enjoying playing at at the present time, but I want us to be serious and careful about it, because it is easier to put up these places than to remove them.

The reasons given for warehousing are that we can't afford the cost of cottage homes, we can't afford the space occupied by them, and we can't afford the journeys to and from the places of employment. Let us examine these things and see whether there is any substance in them. I am going to be more generous than to take 12 houses to the acre. I am going to take ten because it simplifies my arithmetic. According to the last Census report the whole of the families of England and Wales living in houses built ten to the acre would require 1,599 square miles. The County of Somerset contains rather more, so you can house the whole of the population of England and Wales in the County of Somerset. Let us see how the London region stands. First of all we have 1,846 square miles. I will give the County of London, for public buildings, shops, warehouses, all the land, and that would require 117 square miles. We will add 1,599 square miles for the population outside, and I find I have 130 square miles left. I have housed the whole of the population of England and Wales in an area outside London, and have given them a belt of 130 square miles over to play in, and yet we have plenty of room.

Is it not ridiculous to talk about shortage of sites when you have this vast acreage? People who put up these concrete warehouses always think they are short of sites. But the fact is we scatter our houses all over the place, we string them out along roads and make ribbon development. It is not the land we occupy, it is the land we spoil in scattering our houses and straggling over the country. We have had to house in London in the last 20 years 647,000 families. If you take a circle of eight-mile radius to include parts of London pretty well built up, I find it is possible to house all the people at ten houses to the acre within a belt one-and-seven-eighths of a mile wide, and that would add one mile to the average journey to the centre of London. If we take 40 houses to the acre it would still require a belt half-a-mile wide. The fact is again we spilt these people over a belt ten miles wide, all over London, because we have not had proper planning or control.

I think fairly we can afford the space, and the cost of homes was not more than the cost of warehouses. It costs us in London £300 per family more for every family we house in a tenement block in the centre than for every family we house in a little cottage on the outskirts of London. And if these enthusiasts for concrete tell us, as they do, that they are going to house these people for less money, I do not say it cannot be done, and if done it seems to be extremely useful, but there is a great deal to be found out. We know nothing yet of the conductivity of sound in buildings of that type when used as dwellings. I am wondering if I lived in one of these cells how many gramophones and loud-speakers I should have to hear at once.



This problem of the growth of towns is a problem of planning and design, and we have to look at it as we do at other problems of planning and design. We have to think of the purpose, and if we architects are worthy of the name we know something of the problem of having to think in terms of cubic space, and here we are thinking of families that have got to grow up and cultivate pure relations. We are thinking of homes that will not only give them elbow room but something that will entwine itself around their hearts' affections when they come home, associations that they will carry with them all their days of life. That in my view is what the architect can and should give to the generations.

The Other Speakers

Other speeches were made by Messrs. Geoffrey Webb, M.A. and A. Beresford Pite, F.R.I.B.A. MR. WEBB said: In recent years there has been a revolution against Oxford and Cambridge Gothic. The bright young men who on going down take to journalism are apt to sneer at domestic Gothic. One of them more witty than the rest remarked, "I think the atmosphere of domestic Gothic in Oxford and Cambridge is a bad smell." They call it squalid, and in a sense they are right. It is only the eighteenth and nineteenth centuries that have made us look less squalid. The tradition of Cambridge was one don and four students to one room. The princely scale of King's was to end our squalor, for the great architect felt that it was unwise of King Henry VI to spend his money on building another slum. When the one don and four undergraduates standard was applied to the richest foundations they felt that they must blow their money on some feature, and the feature was the chapel of King's. Rich men lived in squalor, and at King's they decided to build what we may call a tenement house. It was a mediæval skyscraper, with undergraduates crowded on top of one another, and without the benefit of balconies. When the presiding genius decided to spend money you find a document

[*Continued on page 860.*

AT THE R. I. B. A. ANNUAL

Some of the personalities present at the

CONFERENCE, HELD AT CAMBRIDGE

Conference, as seen by Fred May.

which enjoins "Let there be no rich carvings or busy mouldings." They were thought unsuitable for poor men and to men devoted to learning and religion. The most ornamented building in Europe was the chapel of King's, and, starting to build for poor men, they finished up by building a palace, because the architect always found that the work took charge of him, even when he was unable to persuade clients to spend more money. That happened at King's and it went on all through history.

Most of our buildings are not mediæval, but Corpus has a few rooms left built on the plan to which I have referred, and in those rooms there are alcoves for beds. The undergraduates slept on the floor, and the don in the bunk. You find the gardens planted with rosemary and lavender for practical reasons in enclosed courts. The first three-sided court in Cambridge was due to Dr. Caius, and Oxford never had one until much later it was forced on them.

New Buildings at Cambridge

MR. BERESFORD PITE said: To the two generations of Gilbert Scott to whom Cambridge owes so much, is added a third in Sir Giles Gilbert Scott, whose new building for Clare sums up the progress of the era with a delicious grace. The great Library building must perforce make its own standard when its time comes. Emmanuel provides a conspicuous effort to make late Gothic revival effective in the detached building by Leonard Stokes, and Jesus has carried the same ideal further with freedom by Mr. Morley Horder. Sir Aston Webb's buildings at Caius, Magdalene and the Leys School all belong to the same school of resultant revivalism, and Sir Edward Lutyens's new building of Magdalene still abides.

It may be said that the new wonder of modernism, with its fever and baldness, may yet invade the University, but of this it is useless to prophesy. The search for the new expression in art will need to be reinforced by a studious discernment of the spirit which evoked and accomplished the great buildings of the past. Without this serious analysis of motive and simplicity of aim the modern movement may become that which it most deprecates: the simulation of an unreal innocence of heart.

There is a relation of scholarship to art which is not inimical to genius; for this the University can stand witness. For there is at the root of all great architecture a sincerity of purpose evinced in the science and art of all noble building; this has to be drawn out of the study of the past to provide the stimulus, breadth of judgment, and the motive power in design for which modern architecture looks, and for the lack of which she faints.

THE BANQUET

The banquet was held at Trinity College on Friday night.

MR. THEODORE FYFE, proposing the toast of "The University of Cambridge," said: Ever since 1921, except in one year, the R.I.B.A. has had a similar conference to this in one of its local centres. This year Cambridge was selected because of its incomparable attractions as a University town, and, some of you may think, for the attractions of its surroundings also. I have little time to enlarge on the University, but I should like to dwell on two aspects of it which must have struck many who are here as visitors. One of them is the astonishing recent development of the University—apart from its colleges—in many humanistic and scientific ways. The magnificent donations of the Rockefeller Trust and the enlightened generosity of the Courtauld family have, in particular, made possible the splendidly equipped scientific and lecture room buildings; the new University Library, and the extension to the Fitzwilliam Museum, where the Vice-Chancellor held his reception.

The other but less obvious thing that may have struck some of you is the way that Cambridge has wakened up to its dangers from unwise and over-hasty development and spoliation. Most of us at any rate know that the Cambridge Preservation Society exists and what it means, and some fewer may know what it actually has done.

Mr. Will Spens (Vice-Chancellor of the University) responded.

Sir Raymond Unwin, replying to the toast of "The R.I.B.A. and its Allied Societies," proposed by Professor Edward Bullough (Chairman of the Faculty Board of Fine Arts), said: We owe a great debt of gratitude to the University, and I want to congratulate the University and Mr. Fyfe on the abundant progress of the School of Architecture. In thanking the University I am going to take the usual course of saying that the measure of our gratitude is a foretaste of the good things to come.

"The Town and County of Cambridge" was proposed by Mr. P. C. Blow (President of the Essex, Cambridge and Hertfordshire Society of Architects). Alderman Raynes responded.

"Our Guests" was proposed by Mr. H. M. Fletcher, F.R.I.B.A., and responded to by Sir Donald MacAlister.

ELECTION OF MEMBERS

At a recent meeting of the Council of the Institute the following members were elected:

As FELLOWS (4): Messrs. L. M. Chitale, W. F. Dawson, C. J. F. Martindale and F. R. Freeman.

As ASSOCIATES (14): Messrs. A. Bailey, A. G. Bazeley, F. E. Bromilow, (Miss) E. M. Comber, J. T. Darch, T. N. Duncan, R. D. Hunt, (Miss) J. G. Ledeboer, J. Lewis, N. S. Lunn, (Miss) Z. T. Maw, E. F. Scaife, A. Smethurst and B. Spence.

As LICENTIATES (13): Messrs. J. C. T. Cole, R. Dann, H. L. Fox, G. H. Griffiths, A. Hay, G. H. Herring, R. E. Hulse, A. B. Mendis, W. Peter (Junior), H. Pover, D. Y. Rossiter, J. L. Webb and G. C. Young.

COMPETITION

NEWS

PROPOSED BATHING POOL AT LLANDUDNO

The Competition Committee of the R.I.B.A. desire to call the attention of members to the fact that the conditions of the above competition are not in accordance with the regulations of the R.I.B.A.

The Competition Committee are in negotiation with the promoters in the hope of securing an amendment.

In the meantime members should not take part in the competition.

FLATS FOR STOKE NEWINGTON

The address of Messrs. Howes and Jackson, A.A.R.I.B.A., winners of the limited competition for flats at Stoke Newington, is 10, Gray's Inn Square, W.C., *not* Gray's Inn Place, as stated in the assessor's report published in our issue.

A NEW COMPETITION?

It is probable that the proposed new town hall for Hackney will be the subject of an architectural competition.

Competitions Open

September 1.—Sending-in Day. Proposed Hospital at Surbiton. Assessor: C. E. Elcock, F.R.I.B.A. Premiums: £120, £75, £50 and £25. The conditions, obtainable from A. C. C. Dunn, Hon. Secretary, Surbiton Hospital, St. James's Road, Surbiton, were reviewed in *A.J.* for May 24.

September 11.—Sending-in Day. The Directors of Gidea Park, Ltd., invite designs for five different types of houses (ranging from £400 to £900). Open to members or students of the R.I.B.A. Assessors: Prof. S. D. Adshead, F.R.I.B.A., A. E. Beresford, F.R.I.B.A., Ald. Ewart G. Culpin, F.R.I.B.A., E. Maxwell Fry, A.R.I.B.A., Howard Robertson, F.R.I.B.A., and W. Harding Thompson, F.R.I.B.A. In addition to being paid a fee according to the scale of charges of the R.I.B.A., the authors of the first five selected designs in each class will be paid a premium of £10. Particulars obtainable from Gidea Park, Ltd., The Estate Office, Hare Street, Gidea Park, Romford, Essex. Deposit 5s.

[We much regret that the deposit was inadvertantly omitted from the particulars published in our last issue.—ED., *A.J.*]

September 21.—Sending-in Day. Proposed Town Hall for the Borough of Hornsey. Assessor: C. Cowles-Voysey, F.R.I.B.A. Premiums: £350, £250 and £150. Full conditions, etc., were published in our issue for May 17.

Competitions Pending

Proposed New Council Offices to be erected at Salt Hill for the Slough U.D.C. Assessor: H. S. Goodhart-Rendel, F.R.I.B.A. Premiums: £150, £100 and £50. Conditions have not yet been drawn up.

Proposed Municipal Sanatorium and Craymount Children's Hospital, Belfast. Limited to architects practising in Northern Ireland. Assessor: R. S. Wilshere, A.R.I.B.A. Conditions are now being drawn up by the assessor.

Proposed Municipal Offices and Extension to the Library and Electricity Offices for the Metropolitan Borough of Stoke Newington. Conditions have not yet been drawn up.

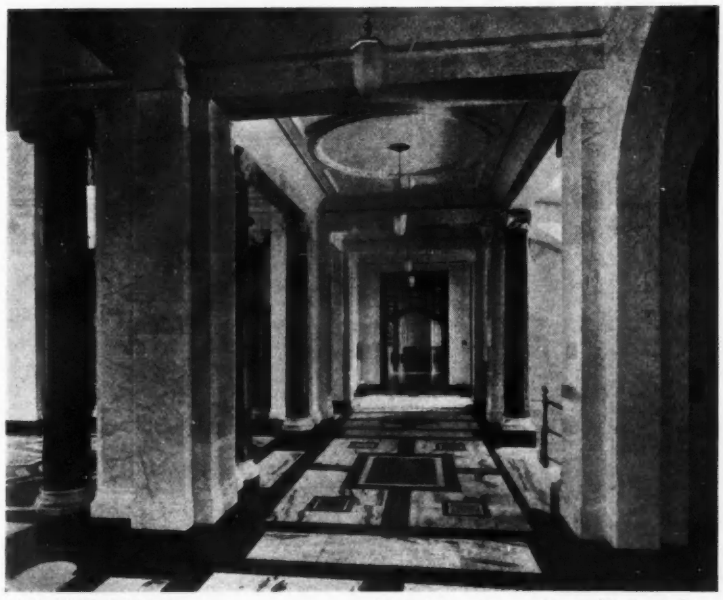
THIS ARSHETECTURE

Architectural history will record that one of the outstanding features of post-war building is the number of well-constructed and strikingly designed hotels erected in city suburbs. . . .

Hotels of this kind are not erected with the utility side as the only consideration, and the Princess Hotel, Withington, has been designed . . . to harmonize with Hough End Hall, its neighbour, which is one of Manchester's architectural treasures. . . . The style . . . is, therefore, reminiscent of the old Tudor houses found in the south of England.

Part of the building is half-timbered in oak, and the gables are faced with elm weatherboarding. The roof is covered with heavy sage-green slates of various sizes. . . .

At night the hotel will be floodlit, and special attention has been paid to external lamps. These electric lamps are of Tudor design. . . .



All the rooms and the staircase are treated in old English traditional manner with oak beams in the ceilings and wainscoted walls. . . .

—*From* THE MANCHESTER EVENING NEWS

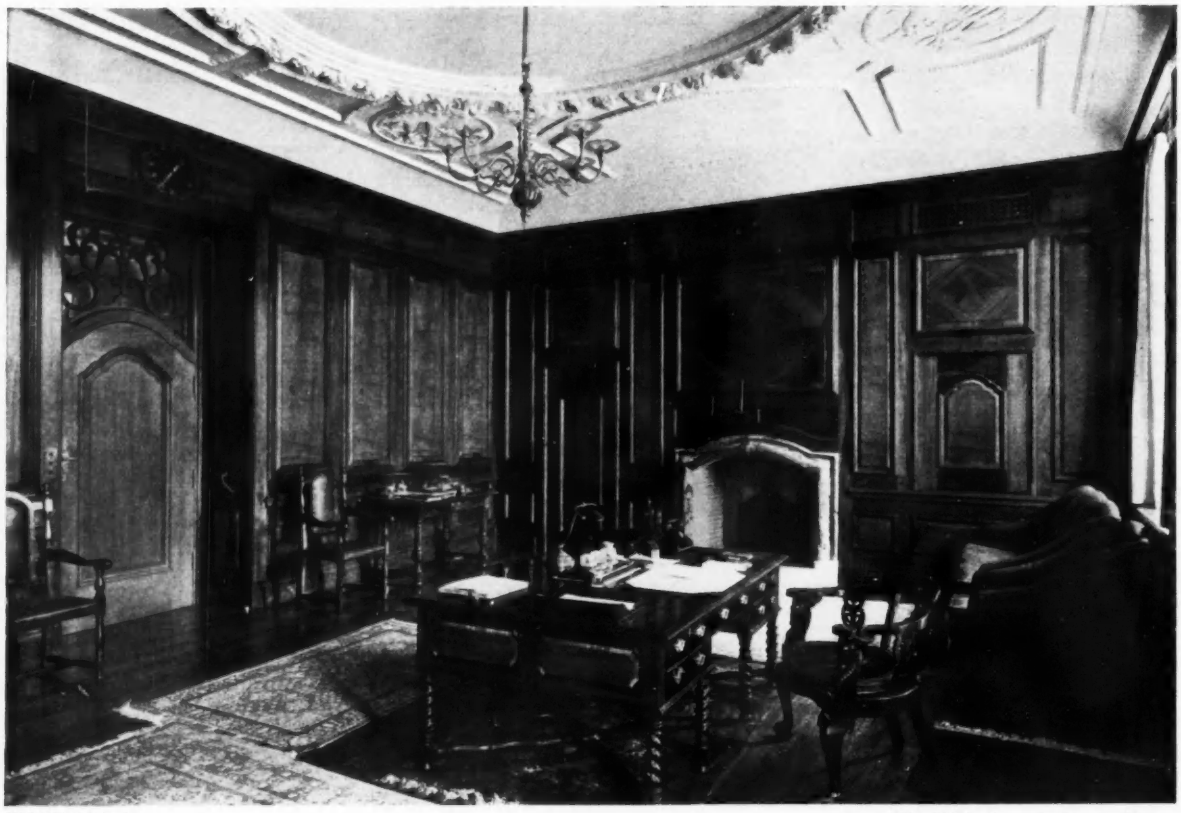
SOUTH AFRICA HOUSE, LONDON

The west front is illustrated, along with plans, in a supplement with this issue. The main entrance from Trafalgar Square, shown above, is under the central portico, which gives emphasis to the High Commissioner's suite on the first floor, just as does the other colonnade, at the Strand corner, to the Conference Room Library on the same floor. Within are a few steps leading downwards to the lower ground floor, and upwards, between columns of green Transvaal marble, to the central hall, around which are grouped stairs, lifts, enquiry office, etc. The walls are of plain grey-white marble, also from S. Africa. From this vestibule runs the longitudinal corridor, shown in the lower view, leading to the Travel Bureau, and to the Visitors' Reading Room, illustrated overleaf, which is provided for use as a common room by South African travellers.

GROUND FLOOR. *Vestibule and corridor to Visitors' Room*

DESIGNED BY SIR HERBERT BAKER, R. A.

SOUTH AFRICA HOUSE, LONDON:



GROUND FLOOR. *Visitors' Reading Room.*

The Visitors' Reading Room is panelled in teak, and, for the greater part of its length, has a high vaulted ceiling, with a frieze bearing modelled and coloured escutcheons representing the early romance of S. Africa. Elsewhere the Reference Library, Conference Room, illustrated on the facing page, breaks in from the floor above, and reduces the ceiling height; it has an arched gallery looking down on the Visitors' Room, which can be closed by sliding doors.

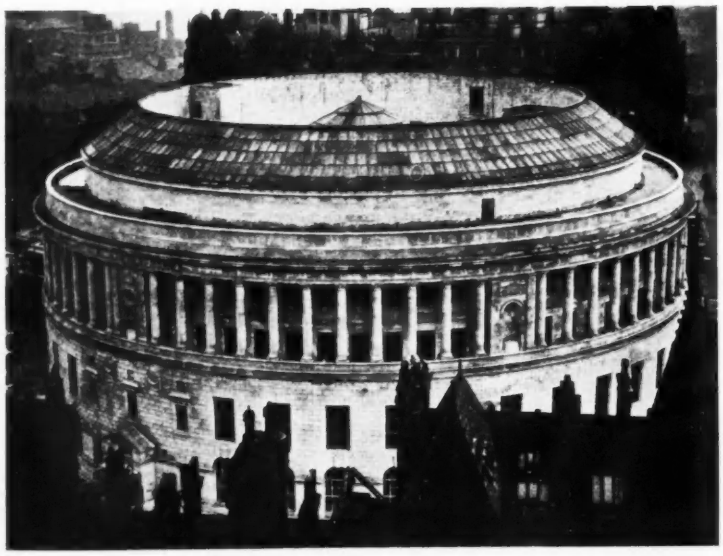
The High Commissioner's room occupies the point of vantage on the first floor, facing the setting sun across Trafalgar Square. It is panelled in stinkwood, and has a ceiling of decorative plaster, and flooring of kejaat. On the fourth floor, and with the same aspect, are the private rooms for the accommodation of visiting Ministers of State; and here the set-back provides a loggia or stoep for the use of these distinguished visitors.

Quantities of marble, tiles and timber were imported from South Africa for incorporation in and decoration of the building. For the principal rooms furniture has been specially designed and made in South Africa; but, from the wood left over from panelling and flooring, ordinary office equipment has been made in London. The building is warmed throughout by radiant ceiling panels, heated by hot water; while the ventilating air, besides being washed, can also be heated or cooled.

FIRST FLOOR. *The High Commissioner's Room.*

DESIGNED BY SIR HERBERT BAKER, R.A.

FIRST FLOOR. *The Reference Library-Conference Room.*



FIRST FLOOR. *Library Corridor.*

FOURTH FLOOR. *Vestibule to visiting Ministers' suite.*

MANCHESTER LIBRARY

The new Reference Library at Manchester, which is now nearing completion, from the design of E. Vincent Harris.

Our Slum Issue

SIR,—It has been left for Mr. Maxwell Fry, writing in your issue for June 22, to point out that the cost of land has something to do with slum clearance.

Presumably the owners of the foul pens referred to in your slum articles receive rent money from the miserable occupants. If Government has the right to regulate new building development with regard to density and sanitation, there can be no objection to a very simple scheme that would do much to solve the problem of our slums, i.e., confiscation of rent money for insanitary property by the Local Authority.

With the low rents received it is impossible for slum landlords to get a "fair" return on the sums they claim their properties to be worth, and at the same time provide for proper maintenance and repair, let alone any attempts at modernization. Such ownership has already cost the nation much trouble and anxiety; could not your paper lead the way by at least stating the names of the owners of the slum property illustrated? Surely such action would not be construed as libellous? Is there any legal reason why a man should be ashamed of owning slums?

I would suggest that this nation is in greater peril through our slum kings than America has ever been through gangster rule; but idle sentimentality can deal with neither problem. Let the country know who owns the slums; what revenue the slums produce for their excellent landlords; add some reasonably sound statistics of the cost of the slums as a breeding-ground for disease, and state how great is the cost of regulating the criminal activity that is directly traceable to filthy living.

Let the people know and appreciate the fact that slum dwellers can become legislators: that is the reason for the much-vaunted Continental housing development. Make the slum dwellers understand that each has a vote as strong as the next man's. There is a difference between sentiment and sentimentality; there is little difference between the idealist and the ineffectual idler, who at this very moment may be living on slum rents.

Unless the National Government and the Royal Institute of British Architects, together with the host of well-meaning amateurs they have collected round a futile policy, get down to the real cause of slum life in double quick time, it will be left for others somewhat more realistic to heal the country of this foul complaint.

Of course, the architects and the town planners must do the work, but it is only accountants who can set the wheels in motion that will one day carry an effectual Land Bill through Parliament.

Slums are a matter of finance; it is part of the great question of the rights of individual owners, and if, indeed, they have any right, what liabilities to the community do they accept by exercising it?

I must confess to a feeling of pity for the slum owner; it must be dreadful to become more and more fearful of the future by each advancing day. I wonder if they do?

May I conclude by thanking Mr. Maxwell Fry for an article on slum clearance that was at least common sense. He is gentleman enough not to patronize the victim of the slums.

RAYMOND WALKER

SIR,—I congratulate you very heartily on the Slum issue of the JOURNAL.

The information which your special correspondent, Mr. Massey, has compiled and set out so graphically, about the overcrowding and the grave shortage of houses in the six large cities is most striking. When reduced to terms of family misery and human distress, this tale, reinforced as it can be from countless examples from other towns and even villages, is surely the greatest stain on our national record. Thanks to the lead given by the Prince of Wales, the Minister of Health and others, the public conscience is now thoroughly aroused and there is a better chance than we have seen for a long time of drastic remedies being applied. But it is essential that the facts and figures of the slum problem should be constantly before the public, and it is for this reason that one welcomes so cordially the fine service which you are rendering.

T. ALWYN LLOYD

SIR,—Congratulations on your Slum number. It is magnificent in spirit, purpose and technical production. The profession as a whole should support the lead you give and begin to study the housing conditions of the working classes. I do not mean from an architectural point of view (for they have been messing about with that quite long enough), but from the point of view of the social reformer and student of affairs.

There should be at least one architect on every municipal or county council in the country, and at least a dozen

in Parliament. There is not an earthly chance of our replanning even bits of our cities or of abolishing the slums under our existing system.

To talk of abolishing the slums in five years is merely eyewash. In five years' time we shall be exactly where we are now. Land is the crux of the whole problem. Mr. Maxwell Fry touches on it in his splendid article.

FREDERIC TOWNDROW

Architecture as a Trade

SIR,—I was very much interested in "Iconoclast's" third article on the R.I.B.A., but I do wish he would consult his facts—the statement about the Associateship, for example. He says that "the degree of Associateship thus ceases to be a mark of experienced competence and becomes a purely academic diploma."

The Associateship has never been a mark of "experienced competence" any more than in the case of the Barrister called to the Bar after passing the Bar examination, or the Medical Student's admission to the register after passing the professional examination.

The paragraphs about the representation of the provinces in London are curiously out of date. They would have had some truth in them twenty years ago. He says that "the machinery whereby the provincial architect can influence the high counsels at headquarters is still remote," and he speaks of work upon the Institute Council as one of "a small provincial minority." I suppose he cannot have noticed that at this moment the provincial members of the Council are in an actual majority and not in a minority at all; that of the six leaders of the Council, the President, Vice-Presidents and Hon. Secretary, three are provincial and that the conditions of which he complains ceased to exist many years ago.

I am not, of course, arguing with regard to his concrete suggestions. He may or may not be right in regard to them, but they give me the impression of curiously inadequate knowledge of the facts. When, for example, has "a vast comprehensive scheme, the merit of which there is no time to investigate," ever been "sprung upon district membership in a matured state?"

ORTHODOX

[*We regret being compelled again to hold over Iconoclast's fourth article in the series, "Architecture as a Trade," owing to pressure upon our space.*—ED., *A.J.*]

THE INTELLIGENT WOMAN'S GUIDE

To the Exhibition of British Industrial Art in Relation to the Home (until July 12)

Lights in the Main Hall.

Patron:
H.R.H. Prince George

President:
Lord Gorell

Chairman:
Christopher Hussey

Vice-chairman:
Frank Pick

Executive Committee:
Noel Carrington
Gordon Forsyth
V. H. Goldsmith
Miss Muriel Harris
H. de C. Hastings
Oliver Hill, F.R.I.B.A.
G. R. Hughes
Major A. A. Longden
Charles Marriott
Oswald P. Milne, F.R.I.B.A.
Paul Nash
Howard Robertson, F.R.I.B.A.
Miss Dorothy Todd

[*The fact that women of an almost sub-human intellectual status are encouraged to air their views on architecture in the lay press, often blinds architects to the value of the feminine contribution. Actually, the normal woman, when unpolluted by the sentimentalisms of man, is an astute critic and a wise buyer, and is almost automatically an apostle of fitness for purpose. Not without consideration of the foregoing matters, we print an intelligent woman's views on the B.I.A. This is probably a feat unique in contemporary journalism. A technical survey of the Exhibition will be published next week.*
—ED., *A.J.*]

COMING in from Regent Street to Dorland Hall you must leave behind you on the doorstep all your ideas about design. Then you will be ready to make an intelligent estimate of new ideas.

From the moment you enter, there is a stimulating atmosphere of pure inventiveness, and all this inventiveness is about homes, furniture and the things women use and care for. Women know very well that we are living under new conditions that call for new ideas. We want twentieth-century ideas, twentieth-century methods, from architects, designers and manufacturers, and we want to support them. Let designers only have good ideas and women will readily appreciate them, and will make their critical estimate from the point of view of efficiency and economy.

Machinery is creating a new world for us. The cheap, mass-produced article is typical of these days, and we are progressing towards a time when everyone can afford an efficient home—if only artists make it their business to work hand-in-hand with machinery. It is important to call attention to this fact about the twentieth-century style—that by sheer majority the mass-produced articles are our style today, and therefore what women will look for in this and in subsequent Exhibitions is a preoccupation of designers with mass-produced things. It is not enough for an artist, having made a millionaire's suite, to be satisfied that his ideas will eventually filter through to the design of commercial furniture. The cheaper furniture must be deliberately designed in very close relation to the cheaper and smaller home.

It will now be clear, I hope, what my point of view as a woman is.

Beginning at the Main Hall, there are important details that must not be missed.

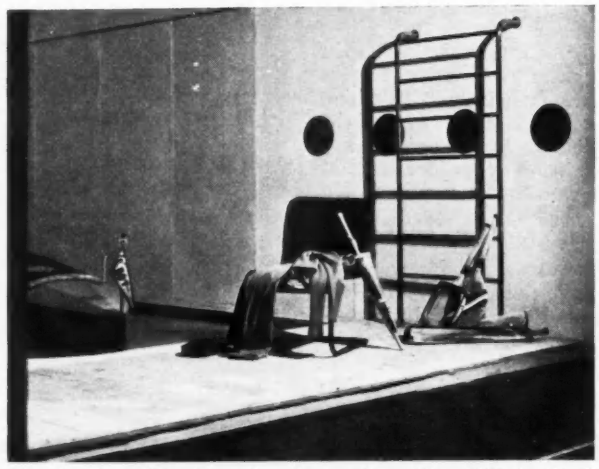
The Dryad Metal Works have a number of beautifully simple door handles, below two shocking light standards. *Pilkington Brothers* have dull white Vitrolite tiles on the floor of the Hall, which, though slippery, is very lovely.

The Dining Room, designed by Sir Ambrose Heal, exhibited by Heal's, is the first ensemble, and glitters with the announcement of steel furniture in the modern home. Women like metal tubes, because they make no dust traps. But these table and chair legs do not seem to me to be designed with neatness and cleanliness in mind. The steel frames are heavy and far too elaborate, in a way which defeats the whole purpose of steel.

The Bedroom, designed by Raymond McGrath, exhibited by Trollope's, is inviting, but, for obscure reasons, the room is crowded ; the scale of the furniture in relation to the room accounts for this, perhaps.

The Living Room, designed by R. W. Symonds, exhibited by Frederick Tibbenham, makes an interesting attempt to solve the problem of the fireplace. Its electric fire is out in the room, and circular, so that the number of people who can sit round it is doubled. This obvious advantage loses some of its practicability from the fact that the fire is fixed. Being fixed, it has to be put in a corner so as not to block up the room. As a result the flexible quality of a movable fire is lost, while the increased " fire-room " is interfered with by the corner.

The Study, designed by D. R. Russell, exhibited by Gordon Russell, is a large room containing excellent steel filing cupboards and shelves by Messrs. Sankey Sheldon. They are painted, washable, well-proportioned, and they encourage keeping papers and finding them again. But they are very expensive.

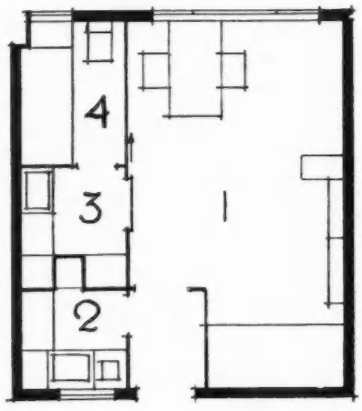


The Minimum Flat, designed by Wells Coates, exhibited by Isokon, is not large. It is the work of an architect who accepts with admirable realism the fact that we have a large population : a population that has to live in small spaces, but wants to live in them hygienically, comfortably, cheaply and pleasantly. This is, in my opinion, the most intelligent design in the Exhibition. It has compact fittings in the kitchen of 5 ft. by 4 ft., where everything, including the refrigerator, is at hand. It has also an electric radiant fire, designed in a unit with a radio and a cocktail cupboard ; a dining table veneered, but not highly polished, so that you need no cloth ; and sliding doors. There is nothing superfluous. The apparently impossible task of planning a flat in 17 ft. 8 ins. by 15 ft. 6 ins. manages to look effortlessly done. These flats are to let in Hampstead for £96 a year each, which includes service, heating, hot water and fittings.

Bathroom, designed by Oliver Hill, exhibited by Twyford's. It is sensible to reform the shape of a bath like this, by fixing the water supplies and waste fittings on the wall at the side.

Week-end House, designed by Serge Chermayeff, exhibited by Whiteley's. This bungalow house is luminous, with an effect of being hardly materialized. It is, however, composed of a light steel frame and a great deal of glass and will not really melt away in

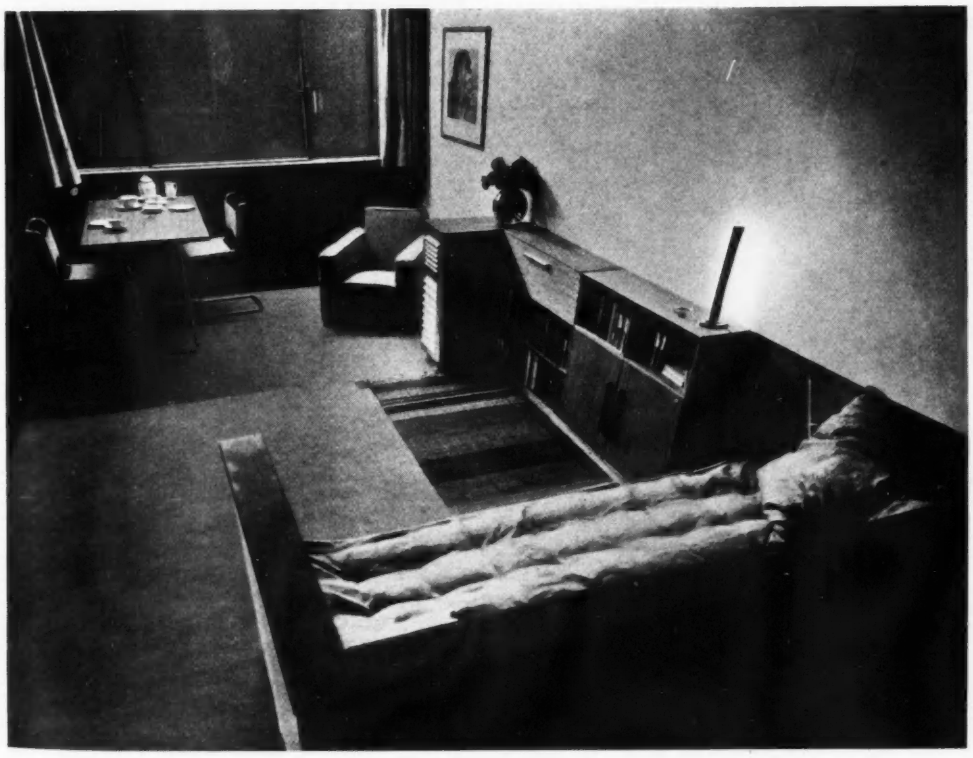
(*Continued on page 870*)



AT THE B.I.A.

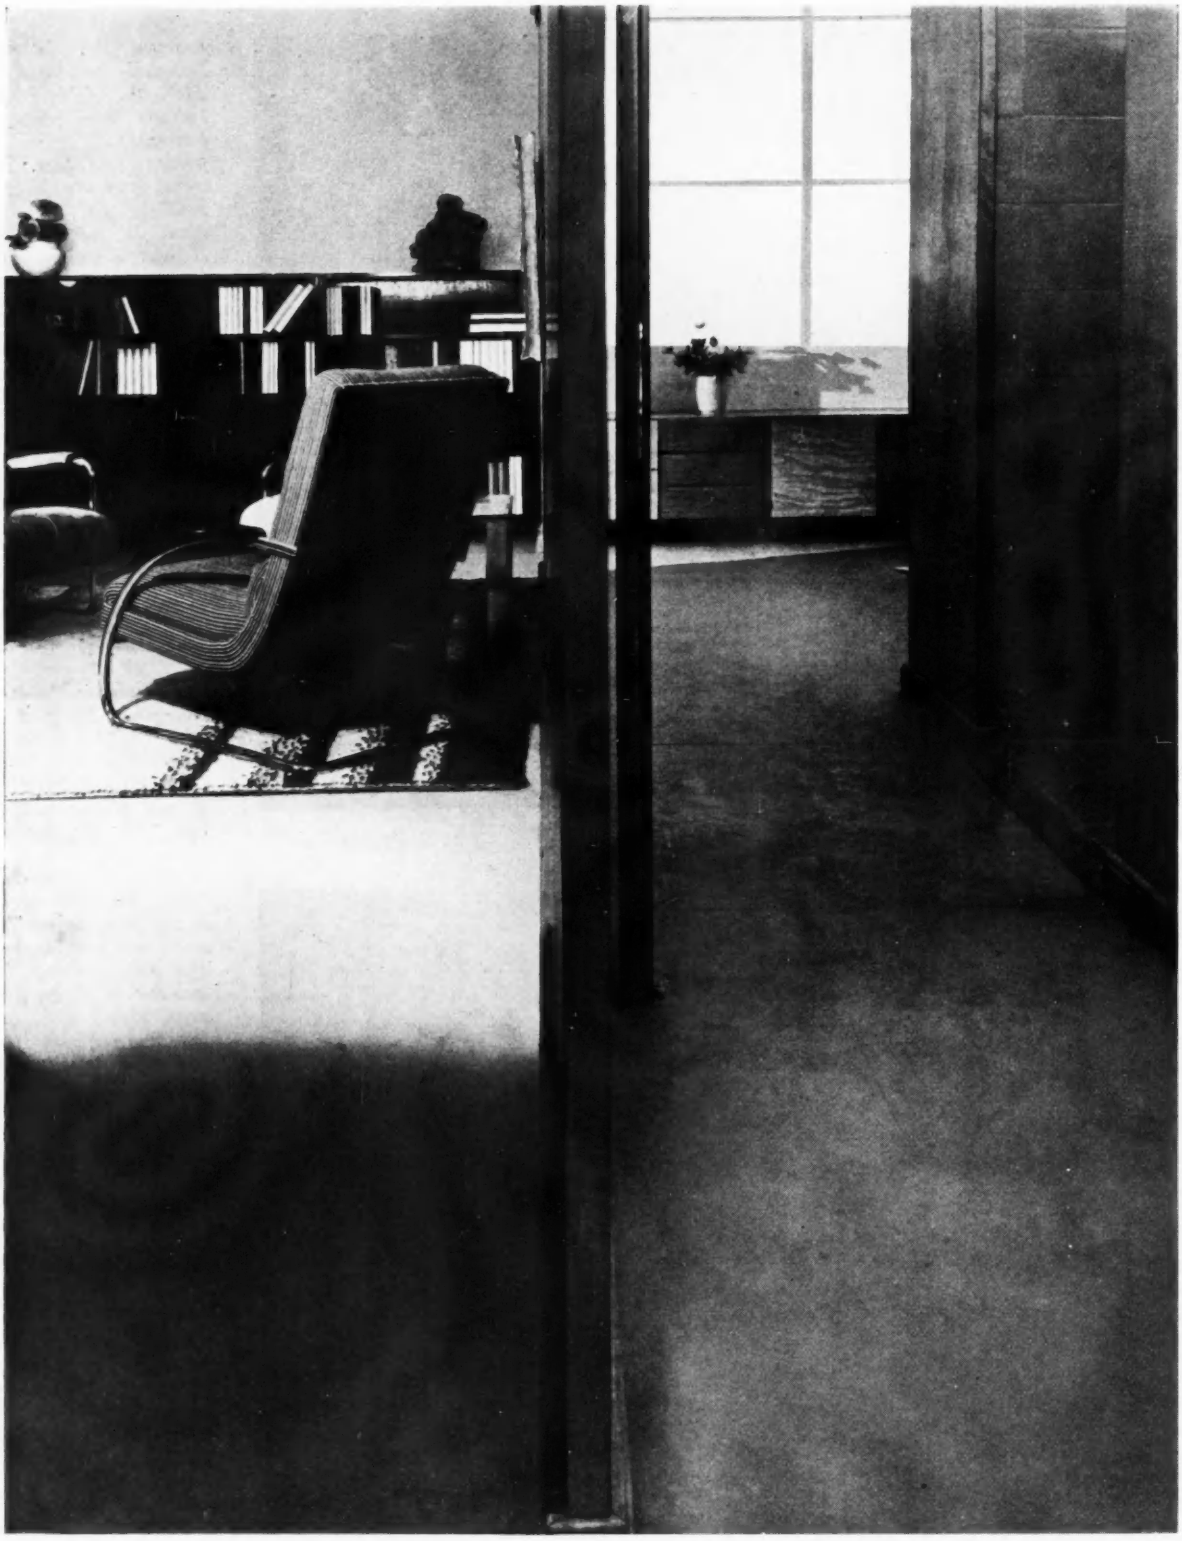
Exercise Court (Ex. No. 55). Designed by Oliver Hill (architect for the Exhibition) and Serge Chermayeff. In the foreground is the end of a grass-green hard lawn-tennis court ; in the background a swimming pool.

Dining Room (Ex. No. 46). Designed by Sir Ambrose Heal. The furniture includes certain needs of a sitting-room as well. The dining furniture is in Australian walnut, white sycamore and chromium-plated steel. " Self " colours predominate in hangings and carpets.



The Minimum Flat (Ex. No. 50). Designed by Wells Coates. The following are the references on the plan : 1, living room ; 2, kitchen ; 3, dressing room ; 4, bathroom. The living room is illustrated on the facing page.

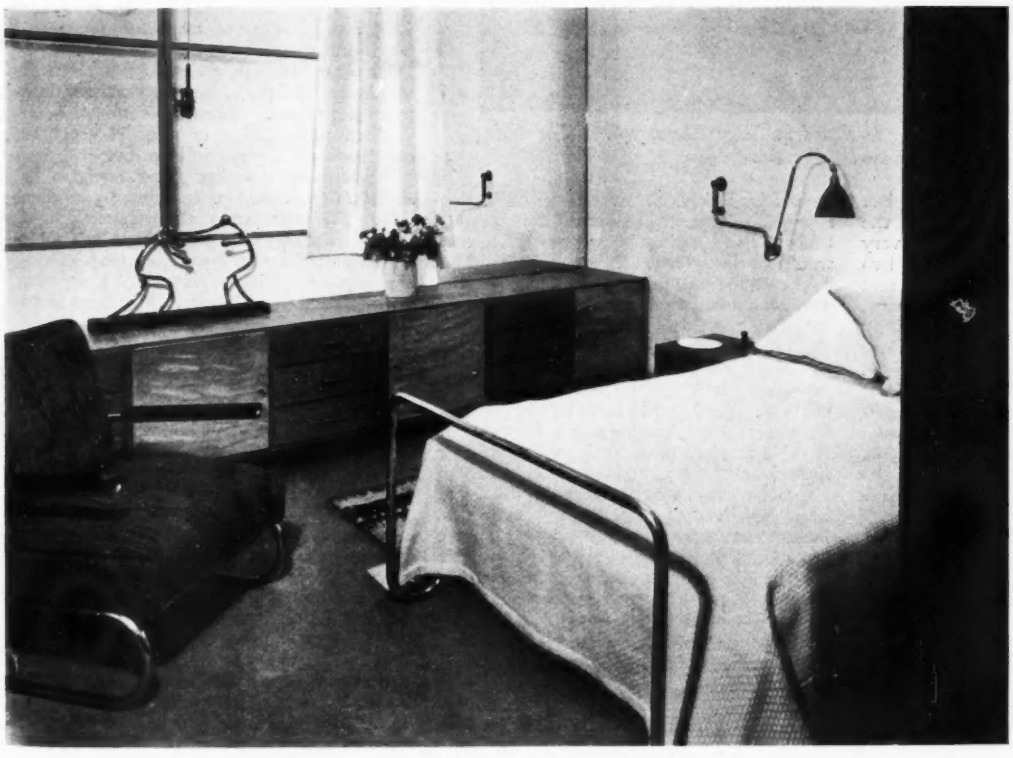
THE MINIMUM FLAT AND OTHER EXHIBITS



Bedroom (Ex. No. 47). Designed by Raymond McGrath. Gone is the bedroom suite, with its permanent encroachments on floor space. The room is in a modern building and the furniture is built in; it includes a writing-desk. The windows are metal casements, the wall covering and the upholstery fabric are designed by the architect, the joinery is in ash. The carpet is black and vermilion, and the general colour scheme, lemon-yellow and chartreuse.

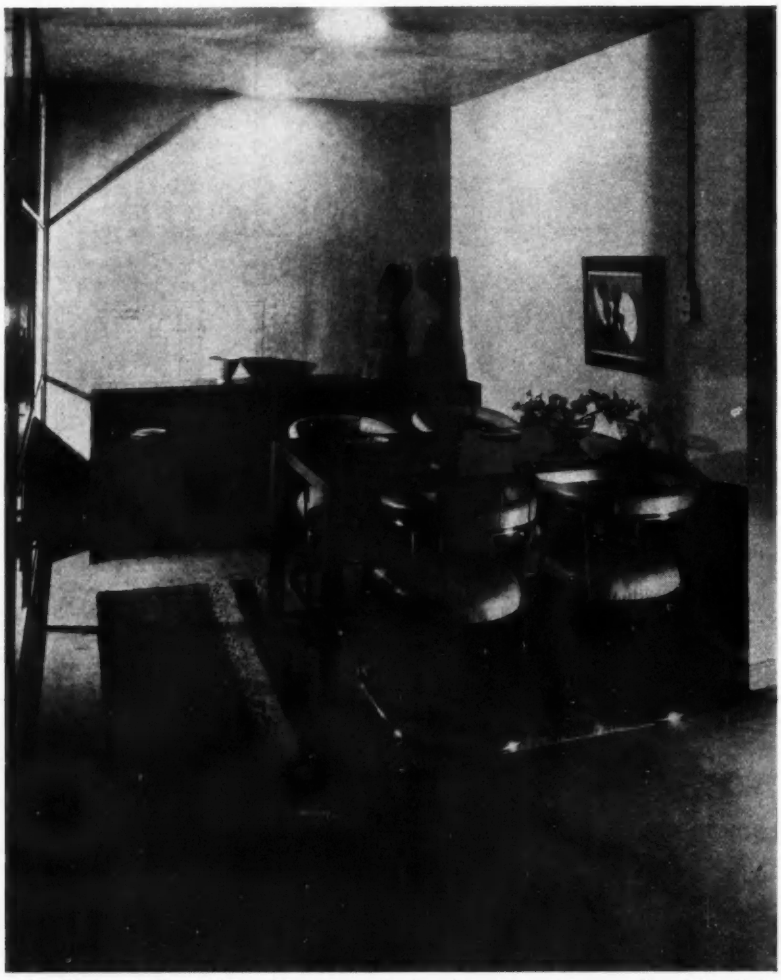
The Minimum Flat (Ex. No. 50). Designed by Wells Coates: the living room. This exhibit comprises a complete replica of one of the smallest type, for use by one person, in a block about to be erected at Hampstead. The plan appears on the fac ng page. The rental has been fixed at £96 p.a., furnished, but exclusive of chairs, book units, electric fires, curtains and furnishing fabrics. This total is made up thus: rent, £52; rates and taxes, £18; central heating and constant hot water, £6; service, £20 (including cleaning and washing; there is a central kitchen with trollies, service lifts, etc.) The living room has a bed-settee in an alcove, a mahogany dining-table which slides into the corner, four stacking chairs and two plywood book units and electric fire-cum-radio, forming a "hearth scene." These Isokon units were described in "Trade Notes" (A.J. June 8, 1933); both the two top units are among others since standardized.

AT THE B.I.A.: THE WEEK-END HOUSE:

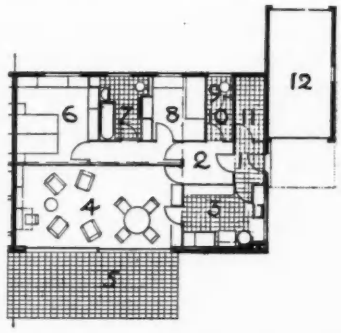


The Week-end House (Ex. No. 52) has an ingenious plan, reproduced on page 870. To take this view the photographer stood at the front door. On the left of the partition is seen the living room; on the right, the main bedroom, with the bathroom adjoining. There is another bedroom in this branch, and, in the house as built, the kitchen leads out of the sitting room, alongside the camera.

DESIGNED BY SERGE CHERMAYEFF



The Week-End House (Ex. No. 52 : steel-tube furniture, 54) : the living room. The large terrace window, through which this photograph was taken, slides away, in two sections, into a cavity in the kitchen wall. The dimensions throughout the house are designed for a uniform, economical constructional unit, capable of accommodating the furniture units. Light steel framing is used, with hollow tile floors ; the outer walls are of hollow building blocks, plastered internally on building board, and rendered externally. Interior partitions are of two thicknesses of plywood-faced building board ; stanchions are painted or enclosed in light chromium-plated casings.



The Week-End House (Ex. No. 52 : furniture, 53) : the main bedroom. This is a square apartment, the standardized furniture fitting along two walls, as indicated on the plan. This "Plan" furniture is designed on five basic units, of trestle, drawer, box, shelf and link type, with additional wardrobe, single, double and treble units. The standard finishes are light and dark oak, with birch veneered doors at request, and five standard colours, intended to harmonize with textile and other products of the same firm. The Week-End House can be constructed of identical structural units in five different types : single bungalow, semi-detached bungalows, superimposed two-family flats, two-floor house, block of four flats.

AT THE B.I.A.: THE WEEK-END HOUSE;

The Week-end House (Ex. No. 52). Designed by Serge Chermayeff. The dining recess in the living room.

The Week-end House (Ex. No. 52). The following are the references on the plan:

(1) *Entrance Lobby*; (2) *Hall*; (3) *Kitchen*; (4) *Living Room*; (5) *Terrace*; (6) *Large Bedroom*; (7) *Bathroom*; (8) *Small Bedroom*; (9) *W.C.*; (10) *Cloaks*; (11) *Fuel Store*; (12) *Garage*.

the wind after the week-end as the last fragile conversations wreak up on the terrace and the people go. It is very simply and effectively planned, in two halves, one half long dining-room and kitchen, and, behind a partition and passage, two bedrooms and a bathroom, the partition facing the centre of the side entrance door and dividing the traffic to back and front. There is much space and light.

Plan Furniture, designed by Serge Chermayeff, and Isokon Furniture, designed by Wells Coates. This is the sort of ably-designed, cheap furniture that is welcome. Both Plan and Isokon furniture are made on the unit principle, the units being combined at will as cupboards, bookcases, desks, etc., for various settings. It is a good way of making the standard article adaptable to personal needs.

Ascog show glass lighting fittings of simple shapes. There are few of the dismal jazz-modernistic pink and yellow glass fittings of two years or so ago.

The Dining-room, designed by Oliver Hill, is a demonstration of the use of polished Perry-cot Portland stone of great beauty, the walls etched by Eric Gill. But a floor of stone is bound to be noisy, and to be waited on at table in this room by heavy-footed footmen would be disturbing. The chairs would be cold comfort without cushions. It is all a lovely colour and quality, but the idea of stone furniture and floors seems to me dubious.

Silver and Clocks. This section is far below the standard set by the Exhibition. It exposes the lack of new ideas in this particular field. And yet, to have silver, particularly table silver, women will endure much. If table services were made of celluloid or malachite, there would be no cleaning to do, but women would scorn the idea. It must be silver or plate, and perhaps the lack of competition accounts for the failure to produce new designs in silver. If we are asked what is our grievance with the old designs, it must be plainly admitted that, if they are old enough, they are sometimes enchanting, but if they are not they are bad, fussy, and out of place in the contemporary home. Clocks suffer from indefatigable personality. The mania for distinctiveness is not always limited by the need to read the clock easily.

Table Pottery is unimaginative, avoiding vulgarity. *T. G. Green and Co.* show honest kitchen ware. The solid square cups are not at all ungraceful, though not aiming at grace. On the whole, it is disappointing that designers produce so much peasant pottery. The saturation point has surely been reached. In a Minimum Flat or a Week-end House, peasant pottery is the last type of design to choose.

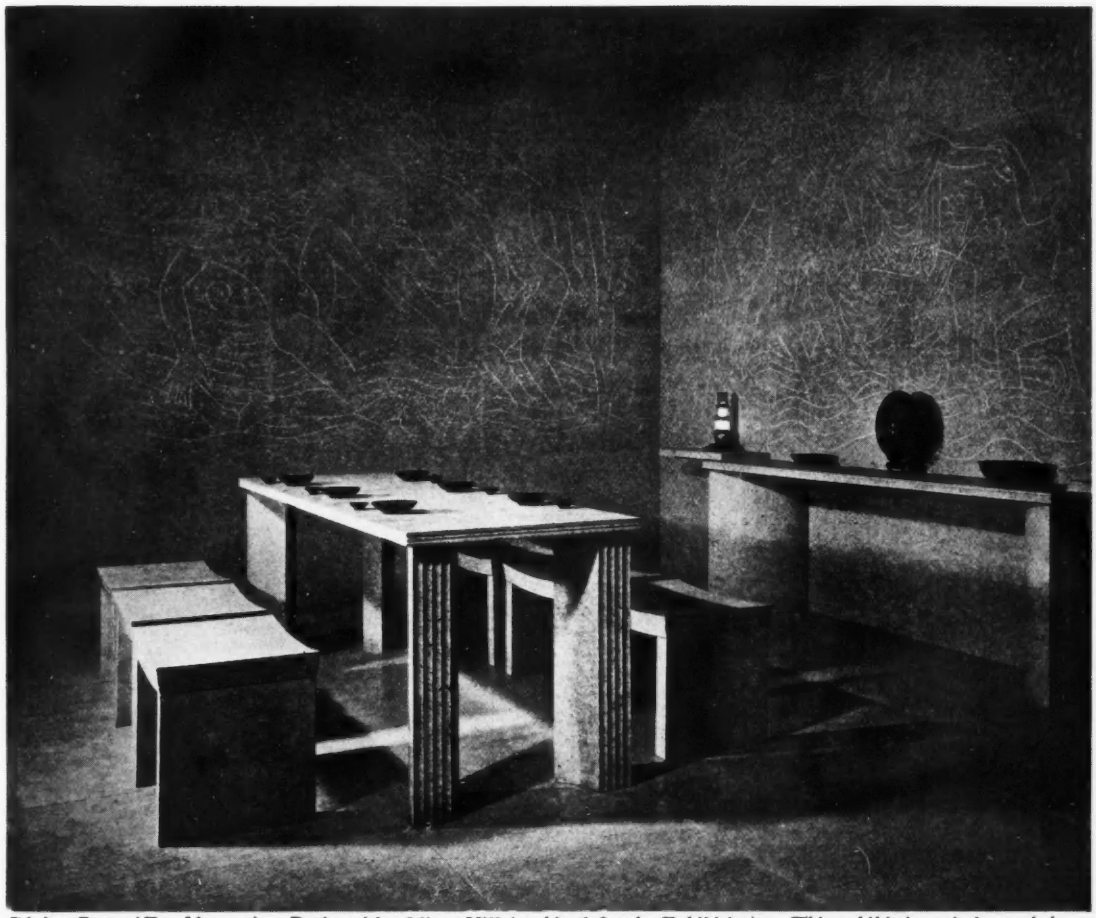
The Panel of Carter Tiles proves that tiled walls need not be associated only with lavatories.

Cellulin Flooring has a range of good, plain colours.

The Wall Glass Exhibits do not seem to show that coloured mirror glass compositions are a happy invention.

James Powell and Sons, Whitefriars Glass Works, show some of the best glass jugs, bowls and vases.

The Glass Furniture, designed by Oliver Hill, executed by Pilkington's, is a stunt appropriate to an exhibition. The gun-metal coloured wall in plain strips of glass shows how effective a plain glass wall can be.



The Study of a Ruling Prince, designed by Arundell Clarke, disarms criticism by its nice title. The settee and chair are excellent.

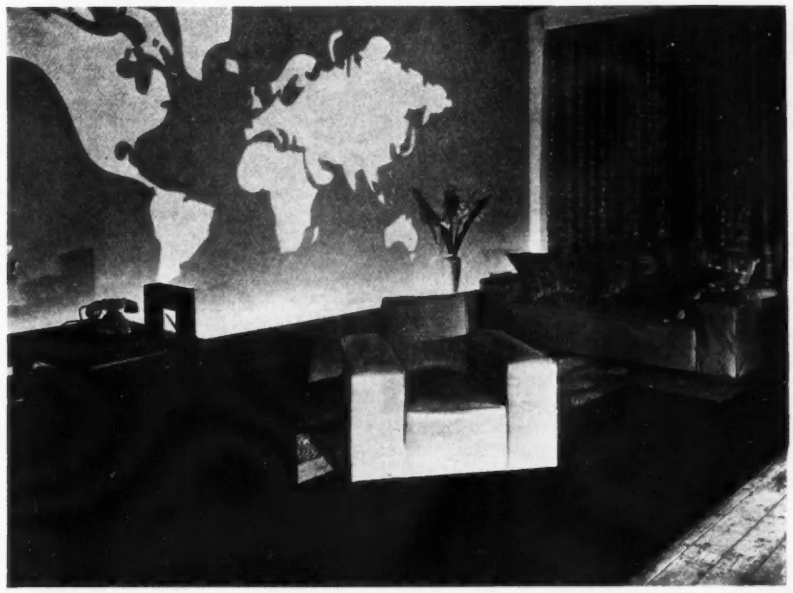
The Wilton Royal Carpet Factory show their very successful rugs by their group of designers, and *Marion Dorn* has four new curtain and chair fabrics. Her rugs from the Wilton factory are some of the loveliest things in the Exhibition.

The Nursery Ensemble, designed by Oliver Hill, reminds me of the colourful paint phase of decoration, here revived for children. There is enough colour in the pictures, samplers and toys. The furniture and walls should be plain, as a background for the goings-on. Presumably children are expected to grow up to like the sort of room we like. The green blackboard—essential toy!—is fixed in the bed alcove, where a child can get out of the way of others to draw. It is one of the really excellent toys by Mr. and Mrs. Abbott.

Textiles have made so much advance in the last decade that we are no longer surprised to see good printed and plain fabrics at the shops. Nightmarish cretonnes and upholstery fabrics still exist, but there is an encouraging number of firms served by

STONE DINING ROOM; PRINCE'S STUDY

Dining Room (Ex. No. 135). Designed by Oliver Hill (architect for the Exhibition). This exhibit is entirely carried out, including furniture, in polished Perrycot Portland stone in the form of thin slabs. The walls bear incised drawings by Eric Gill.



modern designers. This is due, I believe, to women. Women have demanded modern fabrics for their clothes, and have dictated their terms to the manufacturer.

Alan Walton has fine designs by Frank Dobson and Duncan Grant.

Raymond McGrath's Finella Wallpaper, exhibited by John Line, is simple but subtle, and suitable for many purposes.

National Gas Exhibit. It is an excellent thing to be able to see the new gas equipment offered to the modern house. Unfortunately, there is no similar electrical section. The gas-fire today is a vastly improved affair. Flat inset fires with metal surrounds please me, but the spiral burners do not change, and this seems a pity. There is an *Improved Bowl Boiling Burner (Parkinson)* that everyone will want to buy. It catches water that boils over in a bowl beneath, and it is perfectly good-looking. A new *Ewart* geyser, a plain cylinder, painted cream colour, is notable.

The Kitchen and Equipment Stand, designed by Mrs. Darcy Braddell, exhibited by Smith and Wellstood, is admirable. The kitchen is definitely too large for a modern private house. However, the furniture might be compressed into less space. *The Aga Kitchen, designed by Mrs. Darcy Braddell,*

"Study of a Ruling Prince" (Ex. No. 1165). Designed by Arundell Clarke. Settee and chair upholstered in washable hide; the desk is veneered in Macassar ebony.

AT THE B.I.A.: LIGHTING; TEXTILES

Light-fittings section (Ex. Nos. 110—132). Exhibition architect: Oliver Hill. Herein are displayed selected modern designs of ceiling lights, wall brackets, pendants, standard and portable lamps for every purpose.

Textiles section (Ex. Nos. 1180—1191). Exhibition architect: Oliver Hill. Here are shown damasks, tweeds, linens, printed cottons, repps, chintzes and art silks, many of them bearing the names of well-known designers.

exhibited by Bell's Heat Appliances contains the Aga Cooker, which is expensive, but uses the minimum of fuel, and cooks on the right principle. The *Monometal* sink and draining tray in one piece is obviously a good arrangement.

The Gas Kitchen, designed by Wells Coates, has a sink with long, extended, sideways-moving taps. They are queerly attractive, and are certainly useful. The long window is excellent. Kitchens need large windows.

In the kitchen, above all, women are everywhere demanding the maximum of efficiency and cleanliness, and it is extraordinary how the modern kitchen is becoming a pleasant workshop. We mean to have it so, and what we mean to have must be supplied.

HIGHER BUILDINGS FOR LONDON

The British Steelwork Association's Proposals

Following are some extracts from the British Steelwork Association's Memorandum to the Advisory Committee of the L.C.C. calling for higher buildings for London.

IT is suggested that this section of the Act should be replaced by a bye-law or regulation giving the right to construct higher buildings provided that they are of fire-resisting construction throughout and equipped with modern fire-fighting appliances, and provided that the upper stories are set back to give light and air to surrounding streets, and that due attention is paid to the flow of potential traffic to and from such buildings.

Section 51 (1) of the London Building Act, 1930, which it is proposed to alter, reads as follows: "A building shall not be erected of or be subsequently increased to a greater height than 80 ft. (exclusive of two stories in the roof and/or ornamental towers, turrets or other architectural features or decorations) without the consent of the Council."

The advantages that would accrue from the rebuilding of selected sites under such improved conditions may be considered under the following heads:—

TOWN PLANNING AND ARCHITECTURE

To quote the Report of the Royal Commission on Transport (page 205), "in many parts of London there are areas honeycombed with small streets and lanes, useless for traffic purposes. Wholesale redistribution of the area covered respectively by streets and buildings would, in such cases, replace small, narrow, and useless streets and the type of building that alone is possible in them, by fewer but broader roadways and buildings of a kind that would increase and not diminish the accommodation."

The stimulus for the rebuilding of areas such as these may come from a public authority, which could at great cost purchase large areas of land and demolish buildings already in existence, thus securing the power to "town-plan" an area and rebuild that area in reasonable architectural taste, or it could be brought about by private enterprise where the permission to erect a reasonably high building would provide the incentive for the acquisition of large and adequate sites and the surrender to public use of such amount of frontage as would safeguard the necessary traffic facilities.

Rebuilding on these lines would mean the replacement of old, probably insanitary, and certainly fire-hazardous property by modern, fire-resisting structures.

Fortunately, to bring into focus the development we have in mind is not a difficult matter. There is in our midst at least one building of the type which satisfies all reasonable claims which a public authority may demand. Such a building is the Underground Railway building in Westminster, built to a total height of 180 ft.

How does this building satisfy the essentials of social amenities, town-planning, fire-resistance and traffic?

On the score of social improvement one must admit that for light and air it is excellent. For hygiene and fire-resistance one need only compare it with the buildings it has displaced. Its construction is of steel and stone-faced brickwork and its combustibility (having no timber partitions and no timber window frames) is negligible.

Of its architecture there is little need to speak, except to remind oneself that it was awarded by the R.I.B.A. the London Architecture Medal in 1929.

Where it fails to develop its full value is on the economic side.

Despite considerable sacrifices of space to the common good and to every consideration of its tenants, the occupation of the top stories is not permitted within the existing terms of the London Building Act.

The Underground building, as an example of town-planning, points the way to the rational

reconstruction of London ; it throws into vivid emphasis the advances in modern architectural layout which the authorities might well seek to see established for the whole of London.

It will be recognized that the impulse to all commercial building is economic and that economic methods of construction and a freedom to develop earning space must not be unreasonably thwarted.

The restrictions on earning space of buildings are too apparent in London to require emphasis and are such that every cubic foot of space has to be squeezed into service, and buildings have to be driven three and four stories underground in order to secure usable and suitable accommodation on a given site.

TRAFFIC

Just as in the case of fire, so in the question of traffic : uninstructed criticism is apt to attribute traffic congestion to the higher building. In point of fact, however, the high building is the one factor which if properly pressed into service can free us from the mistakes of the past.

SOCIAL AMENITIES—LIGHT, AIR AND SMOKE NUISANCE

In respect of the provision of light and air, there have been advanced against the high building arguments which will quickly be rectified by an inspection of the Underground building. A great deal has been written about the incidence of the "angle of the sun" and far too little about the bad conditions of light in the narrow streets, which conditions only progressive city planning can remove. How does the high building affect light and air ? With a high building properly stepped back, as shown in the illustration, the effective light reaching the roadway and adjacent buildings is much greater.

But to these advantages of better light and air must also be added the great advantages of the modern centrally-heated building in eliminating smoke and soot. One of London's worst problems is the smoke nuisance, and the most promising solution to this lies in the great contribution which the modern large building can make towards obtaining a pure atmosphere.

FIRE PREVENTION

The question of fire prevention is far too often regarded merely from the angle of the alleged difficulty in dealing with fire in rooms over 100 ft. above ground level.

But the proper manner in which the fire hazard should be regarded is rather in comparison with the much greater hazard which a modern building displaces by the demolition of its part-timber Victorian predecessor.

London rebuilt on the lines of modern blocks such as Bush House is surely much safer than the London of narrow part-timber buildings, often very difficult of access.

In a modern fireproof office or apartment building the contingency of fire is itself very remote, and even small as it is, can be met by permitting only incombustible furnishings above a height of, say, 100 ft. Buildings must, after all, represent an insurable asset, and the ordinary commercial safeguards of insurance as a factor operating to reduce fire risks will play an important part in securing their safety.

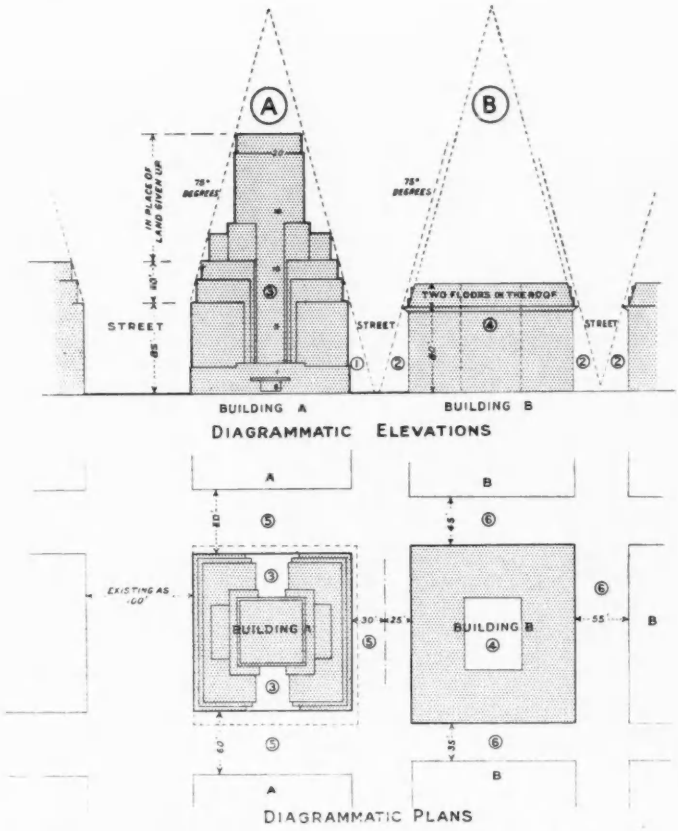
Admitting the limitations of the London water mains, there is nothing whatever to prevent architects and hydraulic engineers from designing and equipping a building so that fire prevention is fully catered for by :—

(1) Fireproof construction, with fire towers. (2) Incombustible materials and fittings above a height of 100 ft. (3) Set-back upper stories, to give fire steps. (4) Rising mains, booster pumps and tank system ; and (5) Sprinkler installation if required.

An economic urge is necessary for the replanning of London. A vast expenditure of capital is necessary if the Metropolis is to be rebuilt on the lines of wider arteries and open spaces, with more efficient working accommodation. But this capital will only be attracted to new building enterprise if the economics of rebuilding are firmly established. Building regulations should, therefore, be framed to encourage the replacement of inefficient and out-of-date areas by modern constructions.

The time for this change has arrived. On the one hand, the advances in building technique, the progress in fireproof construction and fire-fighting equipment, and the new conceptions in architectural design, represent great new forces waiting to be harnessed to the large-scale reconstruction of London. And, on the other hand, hundreds of thousands of workers whose livelihood is dependent upon the building industry, either in the manufacture of component parts or as builders, are seeking employment.

We would respectfully suggest for the consideration of the Advisory Committee, as a basis for the carrying into effect of the improved building methods above outlined, that :—



(1) New buildings be allowed to go to a height of 85 ft. on the building line, plus an extra height of 40 ft. set back within an angle of 75°.

This revision would give better light and air to the streets than under the existing conditions, where architectural features and cornices project beyond the main envelope of the building and considerably diminish the angle of light from that theoretically required.

(2) New buildings be set back at pavement level in order to provide a minimum of 30 ft. to the centre of the street. The area given up to the public multiplied by a "height" of 125 ft. plus one half of this volume may be added to the building above the 125 ft. level, provided the added height is set back within the 75° angle.

This revision would obtain a minimum width of street of 60 ft., and thereby help to solve one of the most urgent problems, that of street traffic congestion due to narrow streets.

The added height and cube to the buildings would be an inducement to rebuild on more modern and economic lines. Interior light wells, which are dark and unhygienic, would become impracticable, being replaced by light wells facing the streets, giving better light and air not only to the tenants in the building, but also to the people in the street and buildings opposite.

One of the two diagrams reproduced in the British Steelwork Association's Memorandum to illustrate their proposals for the amendment of the London Building Act to permit of the erection of higher buildings in London. It bears the following title : Building A (new)—(1) Higher buildings will not reduce light and air to streets (all set-backs within angle of 75°). (3) Light wells open to street give better light and air to all. (5) Wider streets for increased traffic. (7) Larger and more compact buildings. Available cube (this example) increased to 2,970,000 cubic feet. Building B (existing)—(2) Existing cornices, dormers, etc., darken the streets. (4) Interior light wells are dark and unhygienic. (6) Retention of narrow congested streets. (8) Cube at present (this example) 2,270,000 cubic feet.

THE ADELPHI BILL

[*By our Parliamentary Correspondent*]

AN interesting debate took place in the House of Lords last week, when Lord Stonehaven moved the third reading of the Adelphi Estate Bill. He said that there was a good deal of misconception in regard to the Adam buildings which stood on part of the estate. In 1872 £72,000 was spent in alterations to Adelphi Terrace, and those alterations

had changed the aspect of the Terrace to such an extent that he believed it would be impossible for the brothers Adam to recognize the present façade of their work. It was, therefore, impossible to claim that there was again ground for opposing the Bill because it would result in the demolition of the work of the Adam Brothers. There was nothing to prevent the owners of the property pulling it down and building up anything that would satisfy the London building bye-laws, and anyone who was acquainted with the buildings must be aware that what satisfied the ideas prevailing in 1771 was not adequate in regard to one of the finest sites in London today. Another objection was that the promoters were seizing property which had belonged to the public since 1771. The Select Committee was satisfied that this was also a misconception. The space of 80 feet in front of the present façade of Adelphi Terrace had a restriction imposed on it by the Act of 1771, which prevented any buildings higher than 20 feet being erected on it. The same restriction applied to the property lying further east, and immediately adjoining the Adelphi Terrace property, on which the Shell-Mex building now stood, and the Savoy Hotel. Since Parliament had thought fit to release the owners of that property from a similar restriction, it was essential to ascertain what valid objection there could be to the owners of the Adelphi Terrace property enjoying the same benefits today. If buildings were erected of a greater height than 20 feet that would not only interfere with the amenities of the occupants of the houses in the Terrace, but would also enormously reduce the value of the property in Adelphi Terrace, whose owners would be cutting off their nose to spite their face if they put up a large block of buildings. So the Committee did not think that was a valid objection. The Committee did not consider that the Bill would interfere with the amenities of the Embankment Gardens, and the objections of the London County Council, the Westminster City Council, and the Royal Society of Art had been met.

Lord Conway moved the rejection of the Bill. He said that the preservation of the beauties of London required ceaseless vigilance. They were scattered, and each had to be protected when the attack came. Adelphi Terrace was one of the great beauties of London, and if they handed it over to the builder and the road maker they would diminish by so much the amenities of London. There had been many attempts to build over quiet sites in London. The last attempt was in connection with St. James's, Piccadilly, and at the time a resolution was passed by the House of Commons "declining to sanction a private Bill in contravention of the general public statute concerning open spaces for the express purpose of enhancing the value of a private estate." That pretty accurately described what the present Bill was intended to do. The Terrace itself was one of the great amenities of London. In return for the loss of it they were to get buildings like Shell-Mex. He was not a critic of that building, but he would not exchange for it a terrace commanding a beautiful view over the Thames. The House was asked to allow the Terrace to be pulled down in order to improve the financial position of the estate. There was no demand now for great office accommodation and London was already too full of it. The problem of site value in London would not be over until the square mile to the south of the Thames had been tackled. If that could be done, the pressure on the Adelphi site would be diminished, and there would be no need to sacrifice the Terrace. He asked their lordships to vote for the maintenance of the amenities of London. Open spaces were becoming fewer, and new ones should be created rather than the existing ones be diminished.

LORD CONWAY'S motion was, however, rejected by 90 votes to 26, and the Bill was read a third time.

WHAT IS TO BE DONE ABOUT

THIS?

[The preceding article in this series appeared in our issue of June 8, the special Cambridge and Slum numbers having intervened. In it, Mr. L. J. Gollop analysed factors in building costs: and it was shown that the architect's contribution to cheaper housing depended upon the exploitation of economical means of construction. Penates once more engages in the discussion, this week, to point out the advantages, in this connexion, of the modern developments of standardization and pre-fabrication due to American enterprise.

The following have already appeared:—(March 29) 1. The Speculative Builder, by Penates; (April 5) 2. The Speculative Architect, by Edwin Gunn; (April 12) 3. Building without Guidance, by Stanley C. Ramsey; (April 19) 4. What the Public Want, by Edwin Gunn; (April 26) 5. The Housing Problem, by Percy Morris; (May 3) 6. The Building Centre Competition, by E. Maxwell Fry; (May 10 and 17) 7 and 8. How the Architect can use the Building Societies, by H. C. Burdett; (May 24) 9. The Housing Act, by our Parliamentary Correspondent; (June 1) 10. Building Society Finance, by Penates; (June 8) 11. Factors in Cost, by L. J. Gollop.—ED., *A.J.*]

12. The Pre-fabricated House

[By PENATES]

THE individual-architect-designed house is a luxury product; it is not possible, or even desirable, in an age of big population that many such houses should be built. The houses of the people are mass-produced industrial products of the machine.

Because architects refuse to regard the house as a machine for living in, and cannot get rid of preconceptions and prejudices, but approach the problem of design from the æsthetic rather than the fitness side, and manufacturers are so intent upon selling that they neglect to experiment and demonstrate the proper and economical use of new materials, and because there is no one to finance the building of experimental houses or housing exhibitions, there has been no real movement forward towards the production of a low-cost dwelling.

The small house is, today, a mass-produced industrial product; the individual rarely builds a house to suit his own requirements. He buys one from the stock of the speculator—who considers he has arrived at a standard that suits everyone—and he buys it, as he buys his furniture and his car, on the instalment system.

He is buying accommodation; the question is whether he is getting his money's worth; and when we are told that in 1924 six cars were produced for the same amount of labour and capital required to produce one car in 1904, we can only wonder that there is no other machine for the performance of the important social work that is at present controlled entirely by the speculative builder.

He claims, of course, that he provides the maximum accommodation, for the money, that is permitted by the methods and materials he employs; but is he employing the most rational methods and the most economical materials? It is obvious from the little home-made wood and pink-asbestos-roofed bungalows that continue to appear along every road in the country that no one can yet produce—well, the house that is needed, at a price that those who need it are able to pay.

The builder uses natural materials adapted to structural use, small units to fit the workman's hand, larger units that are cut and fitted on the job, and composite materials, mixed and applied on the job. The parts are built up by a laborious process on the site, few parts are standardized and pre-fabricated, and most of the work is done by hand. The specialization of hand work has led to the sub-contractor system. Co-ordination between the several trades during the construction period is temporary and inefficient; time, labour, materials, and consequently money, are wasted, and progress is slow.

It seems that the provision of the economical house of good quality can only be made possible through rigid standardization and pre-fabrication. When floor heights, spans and beam spacing are of fixed dimensions, wall, partition and floor panels, doors, windows, built-in furniture and equipment units can be standardized and "submitted to a process of industrial fabrication."

The low-cost house will be manufactured as a whole, or in parts, in central factories and assembled on the

site. Production will be similar to that of the automobile. Design will be dictated not only by convenience and efficiency, but by economical machine production, handling and distribution of parts, and speedy erection by unskilled labour.

In America several companies have formulated schemes, and though none have yet commenced production, experimental houses have been built, and working programmes prepared.

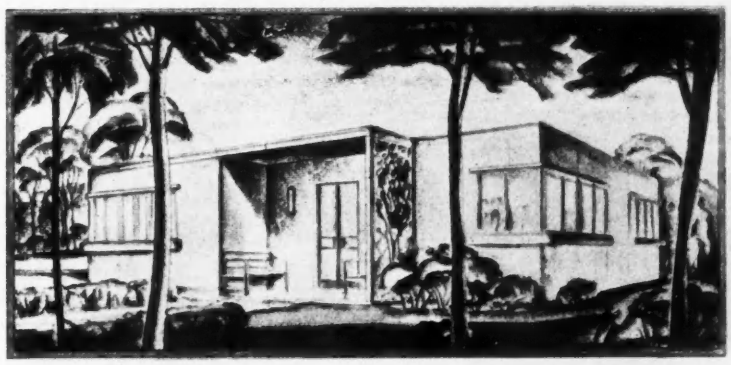
In some cases, companies, already equipped with modern plant capable of conversion to housing manufacture, will undertake mass-production and distribution, or a group of associated manufacturers of building materials and equipment will work through some central organization, which will arrange distribution and mass assembly.

General Houses, Inc., is in the latter category. It proposes, for immediate production, a pressed steel house, in several models, based on standard parts designed by Howard Fisher, the architect and engineer to the group.

The walls are of pressed steel and insulation panels, and the roof of insulation panels carried by steel beams. Partitions are sound-deadening throughout. The superstructure is supported on regularly spaced concrete piers, and a small cellar provides access to house meters and service connections. The exterior finish is painted steel, and the internal finish painted insulation board.

Equipment includes heating, lighting, plumbing, refrigeration and air-conditioning. Erection takes two weeks or less. It is possible to buy at first a minimum dwelling and add a room from time to time.

House types will change with experience and experiment, and the Corporation proposes to develop not only low-cost individual houses, but terrace houses and villas of the luxury type, " the Lincolns and Cadillacs," in which details of mechanism and construction will compare with those of the most expensive motor-cars, whilst economical use of pre-fabricated units and speed of erection will make for a relatively low selling price.

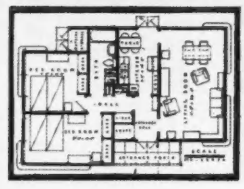


The Columbian Steel Tank Co. supply, for 600 dollars, a house with three rooms and a porch, and for 900 dollars a four-roomed house with two terraces. Each type is frameless. Walls and roof are of channel-steel sections, bolted together. The interior is finished with insulation board and the outside painted. The house is fire-resistant and weather-proof. The price is exclusive of plumbing, flooring and foundation costs.

The price of National Steel Homes ranges from 495 to 1,200 dollars. The walls and roof are of interlocking steel panels and insulation board, with rock wool filling. The exterior is painted steel and the interior painted wall-board. The equipment includes heating, lighting, plumbing and air conditioning.

The architect can hardly complain at a time when almost all small house building is in the hands of the speculative builder that the manufacture of small houses by the thousand will deprive him of his work. It seems more likely that if he associates himself actively with such a project in its initial stages, and is instrumental in bringing about standardization, he may recapture work in a field he has lost, and, having readjusted his ideas of planning, continue to practice as he would at present, designing in terms of standardized pre-fabricated panels instead of 9 ins. by 4½ ins. by 3 ins. bricks.

There is no reason why design should deteriorate. Rather the new material should stimulate initiative, and bring to an end the period of stagnation that results from the obsolescence of available materials.



We will deliver this five-room house to you this very week!

THIS ANNOUNCES a revolution in the marketing of houses! Now you can come to our showroom and pick out your house just as you do your automobile. In a surprisingly short time you move into it. Everything is in place . . . lighting, plumbing, heating, refrigeration. Not one thing must you add!

The cost to you . . . that is even more amazing! Volume production makes it possible to sell these modern, pre-fabricated houses in a variety of designs and sizes for about one-half of what it would cost you, or anyone, to build. All financing, even to furniture and landscaping if you wish, is handled by a single company. You know to the penny how much your home will cost per month or year—complete.

Thank engineering skill and mass production for this revolutionary achievement. General Houses, Inc., with the cooperation of leading manufacturing companies, now follows the volume production methods of the automobile industry to save you money on the designing, production, erection, equipping and financing of houses. These houses, delivered and erected on your lot, are the first efficient, pre-fabricated, low cost houses ever perfected. General Houses, Inc., Chicago, Illinois.

Above are plans of one of many modern, pre-fabricated houses we have designed to sell at a price never before possible. This particular model is a favorite for small families. You have your choice of a wide variety of designs and sizes to accommodate from two to eight people. For further information call at our nearest showroom or write for free booklet which illustrates and describes the many models available, their construction, equipment, cost and our complete financing plan.

GENERAL HOUSES

Advertisements such as the above may well crowd automobile sales-talks out of the preferred magazine pages of the next decade. Instead of floating power and synchro-mesh gear shifts, the public of the later 'thirties will be dazzled with the claims of co-ordinated kitchens, thermostatic control, and cooled and conditioned air. The trade-marked house will compete for space with the trade-marked radio or the trade-marked soup. The above is actual copy prepared by the great new building group as part of its impending campaign to sell mass-produced houses—From HOUSING AMERICA.

Regional Planning in Wales

Mr. B. S. Townroe, speaking at the opening of the " Beautiful Britain and Scenery of Wales " Exhibition in the Lesser City Hall, Cardiff, said that the Welsh County Councils were in many cases quite unaware of the value of wise regional planning, and that they could do much more to safeguard the rural parts of Wales.

TRADE NOTES

BY F. R. S. YORKE, A.R.I.B.A.

Steel Door Frames

I FEEL that Messrs. Crittall are to be congratulated on having introduced steel door frames to this country. Such frames have been manufactured for several years on the Continent, but it has been almost impossible to obtain them in England, and, where a metal frame has been essential, it has been necessary to build it up from available flats and angles.

•

Metal frames were, I believe, first used in Continental hospitals, but they are now fitted regularly in offices, flats, domestic houses, and many other types of building, and, although they are more expensive than the wooden variety, they have several advantages over the older material. They lend themselves to mass-production, are durable, stable and clean.

•

The quality of durability, though desirable in all types of building, is of especial importance in hospitals, where wheeled traffic is liable to damage edges formed in a soft material.

•

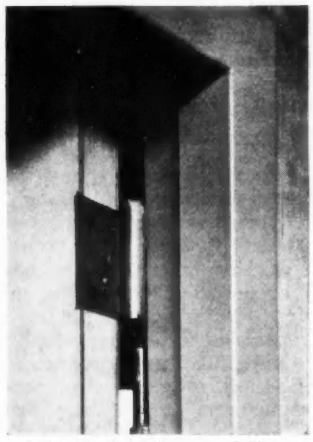
Since shrinkage is eliminated, there is no likelihood of frame and plaster parting company in varying temperatures to cause cracks that collect dust and encourage vermin. The frames are easily cleaned, since projections are reduced to a minimum, and there are no mouldings or planted-on architraves to form awkward impenetrable angles.

•

In the present stage of development Messrs. Crittall have standardized the frame sections to accommodate wood doors in 2 ins. partitions, and $4\frac{1}{2}$ ins. and 9 ins. walls, and heights and widths are governed by the standard sizes of flush wood doors—a type to which the frame is particularly suited. Standardization naturally bears an important relation to the cost of production and is therefore most desirable.

•

The frames are rolled from 14 gauge plate, electrically welded at corners, and are complete with lugs, welded to the frames for building in.



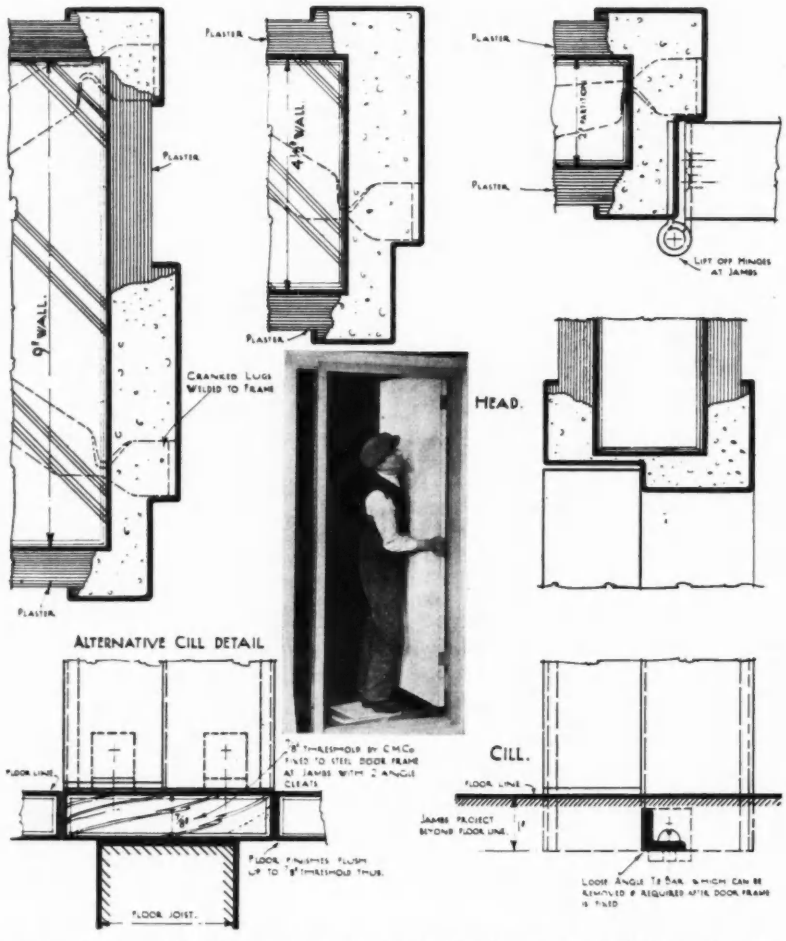
Hinges are of the lift-off type, one leaf being welded to the door frame and the other loose for application to the wood door; provision is made in the frame for the lock shoot.

The frame consists of head and jambs only, the sill having an angle distance-piece which can be removed after fixing if desired, or alternatively this distance-piece can be supplied in $\frac{7}{8}$ in. hardwood to rest on the floor joists as shown in the accompanying diagram, to facilitate finishing the floor boards on either side of the door.

The prices for the three types of frame, exclusive of door and lock, but including delivery to site, are :—

For 2 ins. partitions, door opening size 6 ft. 6 in. by 2 ft. 6 in., 16s. 6d. each.

For $4\frac{1}{2}$ ins. walls, door opening size 6 ft. 6 in. by 2 ft. 6 in., 18s. each.



A detail of the frame and hinge.

For 9 ins. walls (door frame and corner fillet), door opening size 6 ft. 6 in. by 2 ft. 6 in., 26s. each.

An Architects' Camera

I imagine most of us have, in the past, associated the whole-plate or half-plate camera, a tripod and a valise of impedi-

Steel door frames. The diagram shows the standard sections made by Messrs. Crittall to accommodate wood doors in 2 ins. partitions and $4\frac{1}{2}$ ins. and 9 ins. walls.

menta, with any serious attempt at architectural photography. But we can today obtain a pocket camera that combines the handiness of the well-known snapshot type with the qualities of more expensive and more bulky equipment.

•

The "Leica" camera is an interesting example of this development. Its overall measurements are only $5\frac{3}{8}$ ins. by $2\frac{5}{8}$ ins. by $1\frac{3}{4}$ ins., and its weight 18 oz. The film used is standard small-sized cinematograph film, giving a negative 1 in. by $1\frac{1}{2}$ ins. The equipment of the camera throughout is of the quality associated with the best press cameras, and only its small size, I imagine, permits production at the relatively low price of £22 10s. The shutter is of the focal plane type, giving instantaneous exposures ranging from 1/20th to 1/500th of a second, and, of course, time exposures. The setting of the shutter automatically winds a new length of film into position, making double exposure an impossibility.

•

The standard lens is F3.5, with a 5 centimetre focus, but six immediately interchangeable lenses are available and include wide angle, telephoto and specially fast lenses. An ingenious range-finder is automatically coupled to the focussing, and works on the principle of the coincidence of two images. By its use sharp focussing is achieved in a few seconds. Incidentally, since the standard lens is of short focal length, comparatively deep focus can be obtained at full aperture. A depth of focus scale is engraved on the focussing ring, enabling one to see at a glance how much of one's picture will be needle sharp at any given aperture. This seems to me a very valuable provision.

•

Ordinary contact prints are in most cases too small to be of value, but the negatives are so sharp that enlargements can readily be made up to 10 ins. by 8 ins. or more without loss of definition. The cost of each negative works out at about 1d., and enlargements vary in price from 6d. for a postcard size to 1s. 6d. for a full plate. The low cost of the negatives makes it possible to take a large number of views of any particular subject and to choose the most successful for enlargement.

•

The speed is such that "snaps" can be taken out-of-doors in practically any light, whilst, with panchromatic films, interiors require only six or seven seconds—even in poor artificial light—at full aperture. Indeed, with the specially fast lenses (such as the Herakles F1.9) it is often possible to "snap" in strong artificial light. There is no rising front to the camera, but distortion in perspective (which is particularly likely to occur in architectural photography) is easily corrected in enlarging, provided the enlarging is done by a competent firm of photographic specialists. The camera is so light that it can be carried in the overcoat pocket with little inconvenience, and, since there are 36 exposures on each film, it is very convenient for use on holidays and other journeys as an architectural notebook.

A strip of three contact prints from a portion of a film exposed in a Leica camera, reproduced actual size. See note on this page.

IN THAT CONTINGENCY

The following abstracts of inquiries represent a number of those recently submitted to the Building Research Station. The information given in the replies quoted is based on available knowledge. It has to be borne in mind that further scientific investigations may in the course of time indicate directions in which the replies might be supplemented or modified. Moreover, the replies relate to the specific subject of each inquiry, and are not necessarily suitable for application to all similar problems. Crown Copyright Reserved.

Decay of Old Brickwork

¶ *AN interesting case of the decay of external brickwork in a church tower, built entirely of thin Roman bricks some eight or nine centuries ago, was recently brought to the notice of the Station. An inspection was made at the request of the architect who had been called in to make a survey of the failure. The decay took the form of deep erosion of the face of certain individual bricks, while the faces of others were crumbling and powdering badly. The worst cases of erosion occurred at the corners of the tower.*

The architect mentioned that something like sixty or seventy years ago a restorer of the fabric had repointed the whole of the external faces of the tower in a Portland cement mortar. The apparent hardness and density of the mortar joints corroborated this statement.

Many instances have been reported to the Station of the disintegration and flaking of brickwork when set in mortar which is too dense and impermeable. This decay may be due to (1) the action of soluble salts present in the bricks, or (2) the action of soluble salts derived from the mortar, or (3) frost. The controlling factor is the outlet for moisture. If the solutions can find their way out through the joint, the water evaporates (or freezes) at the surface of the mortar, and either leads to efflorescence there or to destruction of the mortar. But if the solutions can only pass out through the brick, and if the brick is of a type susceptible to this form of action, the face of the brick suffers. Thus bricks set in permeable lime mortar have been known to weather well, whilst the lime mortar has perished; but when they have been repointed in dense Portland cement mortar, the mortar has survived at the expense of the bricks.

The present instance is interesting in view of the fact that the bricks have lasted well for so many centuries. There can be no doubt that the decay now being experienced started after the repointing with Portland cement mortar. The joints project beyond the face of the eroded bricks, and it is unlikely that they would have been left in this condition had the bricks been eroded at the time of repointing. Also, it can be assumed that the bricks themselves cannot have contained much soluble salts after the lapse of centuries. The decay seems therefore due either to soluble salts leached out from the mortar through the bricks, or to frost action. The latter may have been predominant in the case of the bricks at the corners of the tower. The sporadic nature of the failures is of course due to the variability in density of materials and in workmanship.

If it is desired to retain the original architectural character of the brickwork, the only treatment to be adopted is to rake out the whole of the Portland cement mortar joints and to repoint in a less dense and more permeable mortar. A suitable mortar would be one of hydrated lime gauged with a small proportion of Portland cement.

Thermal Movements of Concrete Promenade covered with Asphalt

¶ *A LOCAL authority had recently completed the construction of a covered promenade 400 ft. long, consisting of reinforced concrete beams and slabs, carried on reinforced concrete columns. An expansion joint was provided in the centre and the deck was finished with $1\frac{1}{4}$ ins. of asphalt. The movements at the expansion joint had been carefully observed and were found to amount to as much as $\frac{3}{8}$ in. on certain days. The engineer considered that the structure would benefit if this movement could be reduced, and that this might be effected by spraying the asphalt with some material to give a light coloured surface, so that less heat would be absorbed than by the black asphalt. The advice of the Station was asked as to a suitable covering that could be applied.*

The question of the heat attained under asphalt mastics, due to their low reflective power for solar radiation, has been occupying the attention of the Building Research Station for some time, and accounts of the work done and the measurements which have been made will be found in recent Reports of the Building Research Board. The Station investigated last year a considerable number of failures due to thermal movements of asphalt-covered concrete roofing slabs, where neglect to provide any form of expansion joint had resulted in displacement and fracture of the supporting structures.

In view of the importance of these effects, endeavours have been made to find a suitable white surface treatment which could be brushed or sprayed on to asphalt. Experiments have shown that a white surface finish such as a simple whitewash does, in fact, reduce the temperature attained by the asphalt very considerably, but unfortunately it has not been possible up to the present to find any treatment which is reasonably durable and yet at the same time will not have any adverse effect on the weathering of the asphalt. The use of paints or distempers containing oils or oil emulsions is inadvisable, since they may tend to soften the surface of the asphalt, and it has been found in trials on a roof here that inorganic treatments, which at first sight would seem quite unobjectionable, have induced crazing of the asphalt on exposure. Up to the present the only treatments that can be suggested, which are not in any way open to objection, are the following :—

(1) A layer of about 1 to 2 ins. of light coloured stone chippings or gravel.

(2) A special form of light concrete decking which has been produced by a firm of reinforced concrete engineers.

(3) A special form of asbestos-cement tile which is being marketed for use with a bitumen felt type of roofing, but which could probably be used quite satisfactorily over asphalt.

OUR SECRETARIES

D. N. MARTIN-KAYE

ESSEX, CAMBRIDGE AND HERTS. SOCIETY OF ARCHITECTS

MR. D. N. MARTIN-KAYE, F.R I.B.A., A.A.DIPL., was born in London in 1891 and educated at Colet Court and St. Paul's School, West Kensington. After leaving school he proceeded abroad and studied first at the Ecole de Commerce, Neuchatel, Switzerland, and the Berliner Handelschule, Germany, breaking his studies by travelling in Germany and Italy. He began his architectural training in the office of Herr Alfred Sasse, a prominent architect in Hanover.

Returning to England, he entered the A.A. Schools. During the war he served in the Royal Engineers. After demobilization he served as assistant to many prominent architects. Later, he entered into private practice.

In 1922 he was appointed specialist teacher in Architecture at the School of Arts and Crafts, Southend. This school was placed on the recognized list of the R.I.B.A. for exemption from the Intermediate Examination, R.I.B.A., in 1927, and re-organized with a separate department of architecture of which he is the responsible head.

In 1927 Mr. Martin-Kaye was Founder and Hon. Secretary of the Southend-on-Sea District Society of Architects.

At the suggestion of the R.I.B.A., Mr. Martin-Kaye organized the formation of Chapters in Chelmsford, Colchester and West Essex and embodied the same into the Essex Society of Architects.

In 1930 the counties of Cambridge and Hertfordshire were incorporated and the title changed to the Essex, Cambridge and Hertfordshire Society of Architects. Mr. Martin-Kaye has acted as Hon. Secretary since its inception. He is also responsible for domestic work in London, Essex, Suffolk and Sussex.

Announcements

Mr. Arthur A. Stewart, A.R.I.B.A., is joining the firm of Messrs. Burgess, Holden and Watson, practising at Lloyds Bank Chambers, Beaconsfield, Bucks., and 12, Grays Inn Square, as a partner.

Mr. J. G. Burgess, F.R.I.B.A., lately of the firm, has recently died at his Beaconsfield home.

The firm will continue to practise under the old title, the partners being Mr. C. H. Watson, F.S.I., L.R.I.B.A., Mr. Arthur A. Stewart, A.R.I.B.A., with Mr. W. F. C. Holden, F.R.I.B.A., as consultant.

*

Messrs. William and Edward Hunt, FF.R.I.B.A., have removed to new offices in Brettenham House, Lancaster Place, Strand, W.C.2. Telephone Nos. Temple Bar 1843 and 7801 (as before).

Trade Item

Motor Coach Stations is the title of a brochure just issued by the British Steelwork Association. The coach stations illustrated are diverse in type and have each been built to suit particular requirements. One feature, however, common to all is that they are built on the steel-frame principle of construction. No other structural medium, it is emphasized, is competitive where large unobstructed areas, involving long uninterrupted spans, are necessary. For these conditions, the claim of structural steelwork is paramount, but it is also significant that even in the design of administration blocks, steelwork has been used : its economic advantages in adaptability to future requirements, its speed of erection and light construction, combined with its flexibility to meet any particular requirements of design, placing it in the forefront of all materials in the construction of modern buildings.

South Africa House

The following is a list of the general and sub-contractors for South Africa House, illustrated on pages 861-3 and supplement to this issue.

General contractors, Holland and Hannen and Cubitts, Ltd. Sub-contractors, Diespeker & Co., Ltd., biancola and terrazzo ; Drake and Gorham, electrical distribution system ; Fenning & Co., Ltd., marble and Crestown granite ; G. N. Haden and Sons, Ltd., heating, hot water supply, ventilation and refrigerator plant ; Matthew Hall & Co., Ltd., plumbing and drainage ; Le Grand, Sutcliff and Gell, Ltd., artesian wells and plunger pumps ; Limmer and Trinidad Lake Asphalte Co., asphalt ; Redpath, Brown & Co., Ltd., constructional steelwork ; Scaffolding (G.B.), Ltd., scaffolding ; Waygood-Otis, Ltd., electric lifts ; Willment Bros., excavation ; The Acme Flooring and Paving Co., Ltd., wood block paving ; Laurence A. Turner, plaster decoration, coats-of-arms, enrichments and wood carving, etc. ; The Pulsometer Engineering Co., Ltd., sewage pumping plant ; The Croft Granite Brick and Concrete Co., reconstructed "Hydroment" Portland stone ; Complete Plasterers, Ltd., plasterwork ; Stuart's Granolithic Co., Ltd., granolithic work ; The Synchronome Co., Ltd., electric clock installation; Standard Telephones and Cables, Ltd., paternoster type conveyor ; Milners' Safe Co., Ltd., strong room door and gate ; Henry Hope and Sons, Ltd., metal sashes ; Joseph Armitage, stone carving ; W. Finch, expanded metal lathing ; T. W. Palmer & Co., light ceiling steelwork ; Ericsson Telephones, Ltd., automatic switchboard ; W. B. Simpson and Sons, wall and floor tiling ; Brown and Tawse, Ltd., light ceiling steelwork ; Fredk. Sage & Co., Ltd., bronze doors and frames to conveyor ; James B. Robertson & Co., polishing acoustic plaster ; A. B. Young, Ltd., acoustic plaster.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

Plans passed at SANDERSTEAD: Two houses, North Down, for Mr. H. P. Hawkes; three shops, Addington Road, for Mr. C. H. Ridge; four streets, Sanderstead Court estate, for Mr. C. H. G. Taylor; 47 houses, Braemar Avenue, for Mr. F. H. Willcocks; two streets, Selsdon Park Farm estate, and 10 houses, Sundale Road, Selsdon, for Industrial Builders, Ltd.; two houses, Limpsfield Road, for Mr. Duncan Wylson; two bungalows, York Road, Selsdon, for Mr. G. Burgess.

The STEPNEY B.C. is to erect another block of tenements on the Limehouse Fields site at a cost of £8,237.

Plans passed by the WATFORD Corporation: Alterations and additions, 140, St. Albans Road, for Watford Co-operative Society, Ltd.; roads, Leavesden Green estate, for Messrs. Kempster and Williams; four bungalows, Bradshaw estate, for Mr. F. Pearce; six houses, Orchard Drive, for Messrs. W. J. Rice and Son; 12 houses, Bradshaw estate, for Mr. R. Burton; four houses, North Western Avenue, for Messrs. Kempster and Williams; mortuary, Harwoods Road, for Messrs. C. H. Hempsall and Son; alterations and additions, Clarendon Hotel, Station Road, for Benskins Brewery, Ltd.; two houses, Woodland Drive, for Messrs. A. J. and R. Eldridge.

Plans passed by the WOODFORD U.D.C.: Ten houses, Seaforth Gardens; six houses, Dale Gardens; seven houses, Beverley Crescent; five houses, Knighton Drive.

SOUTHERN COUNTIES

Plans passed by the LITTLEHAMPTON U.D.C.: Eight houses, Clun Road, for Mr. G. E. Hayward; three shops and houses, Wick Street, for Mr. C. W. Alliston; alterations, 10, Surrey Street, for Messrs. Boots; six houses, Horsham Road, for South Coast Trading Co.; 16 houses, Cornwall Road, for Messrs. W. Charman and Son.

EASTERN COUNTIES

The COLCHESTER Corporation is to obtain tenders for the erection of 46 houses on the Ipswich Road estate.

SOUTH-WESTERN COUNTIES

The BRISTOL Corporation is considering proposals for the erection of premises, at a cost of £20,000, on a site in the Prince Street area.

MIDLAND COUNTIES

The BURTON-ON-TRENT Corporation has approved a scheme submitted by the borough surveyor for extending casual wards, at an estimated cost of £7,000, together with furnishing at a cost of £323, and tenders are to be invited for the work and furnishing.

Plans passed by the DUDLEY Corporation: Four houses, Priory Road, for Mr. C. Coulson; eight houses, Buffery Road, for Messrs. Poole Bros.; two houses, Aston Road, for Mr. T. H. Bate; eight houses, Buffery Road, for Messrs. Lloyd Bros.; two houses, Priory estate, for Mr. S. Brookes; shop, Wood Road, for Mr. W. B. Homer; two houses, Paganel Drive, for Mr. W. Lindley; two houses, Cole Street, for Mr. A. Scriven; workshop extension, Scotts Green, for Messrs. F. Flanagan and Sons; boiler house and laundry, Guest Hospital, Tipton Road, for governors.

Plans passed at ILKESTON: Thirty-one houses, new street, off Norman Street, for Mr. R. M. Tickle; shop and house, Nottingham Road, for Mr. Wm. Goodchild; bakery, Derby Road, for Ilkeston Co-operative Society; two houses, Heanor Road, for Mr. W. H. Dawson.

The NORTHAMPTON Corporation is to proceed with the clearance of the Bath Street and Scarletwell areas, and obtain tenders for the erection of 76 houses, for displaced tenants, on the St. David's estate. It is expected that tenders for a further 220 houses will be invited in the autumn.

The NORTHAMPTON Corporation is to obtain tenders for the erection of another 100 houses on the Abington estate.

Plans passed by the NORTHAMPTON Corporation: Two houses, Brookland Road, for Messrs. Lack and Revett; 12 houses, Freehold Street, for Mr. J. A. House; land development, Ridgeway, for Messrs. A. P. Hawtin and Sons, Ltd.; nine houses, Balmoral Road, for Messrs. H. Holloway and Sons; two houses, Briar Hill Road, for Messrs. H. Martin, Ltd.; 84 houses, Ennerdale Road, etc., for Messrs. Chowns, Ltd.; two houses, Hawthorn Road, for Messrs. Jordans; four houses, Pinewood Road, for Northampton Co-operative Society, Ltd.; four houses, Greenfield Road, for Messrs. S. G. Sale & Co.; four houses, Edinburgh Road, for Mr. S. A. Barber; two houses, Cranmere Avenue, for Messrs. A. Glenn and Sons, Ltd.; two houses, Weston Way, for Henry Green's exors; 14 houses, Euston Road, for Messrs. T. Wilson and Son, Ltd.; alterations, 43 Bridge Street, for Messrs. Rawlins, Hawtin & Co.; institute, Church Lane, for St. Sepulchre's Church Council; two houses, Monks Park Road, for Mr. W. B. Chattell; workshop and offices, 7, Spencer Road, for Messrs. Matthews Bros.

Plans passed by the WOLVERHAMPTON Corporation: Forty-six houses, Elston Hall Lane, for Mr. A. J. Fieldhouse; estate development, Goldthorn Court, for Messrs. Instone and Instone; estate development, off Rooker Avenue, for Messrs. T. and B. Butler; eight houses, Jones Avenue, for Mr. Thomas Jones; three houses, Watery Lane, for Mr. C. B. Jones; additions, Church Hall, Owen Road, for St. Chad's Church Council; four houses, Pinfold Lane, for Messrs. H. Gough and Son, Ltd.; six houses, Pinfold Lane, for Mr. W. Sharratt; eight houses, Finchfield Lane, for Mr. R. Carpenter; two shops, Thorneycroft Lane, for Mr. W. J. Leading; four houses, Oxley Moor Road, for Messrs. Brookes & Co.; Church, Cannock Road, for Messrs. Sandy and Norris; estate development off Warstones Road, for Messrs. A. M. Griffiths and Son, Ltd.; 11 houses, Penn House Avenue, for Messrs. E. Leach & Co.; two houses, York Gardens, for Mr. J. H. Appleby; two houses, Bhylls Lane, for Messrs. W. and A. Dalton; Roman Catholic Church, Cannock Road, for Rev. Maurice Woulfe; two houses, Park Road West, for Mr. W. G. Corfield; 58 houses, Rooker Road, for Wolverhampton and Dudley Breweries, Ltd.

NORTHERN COUNTIES

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

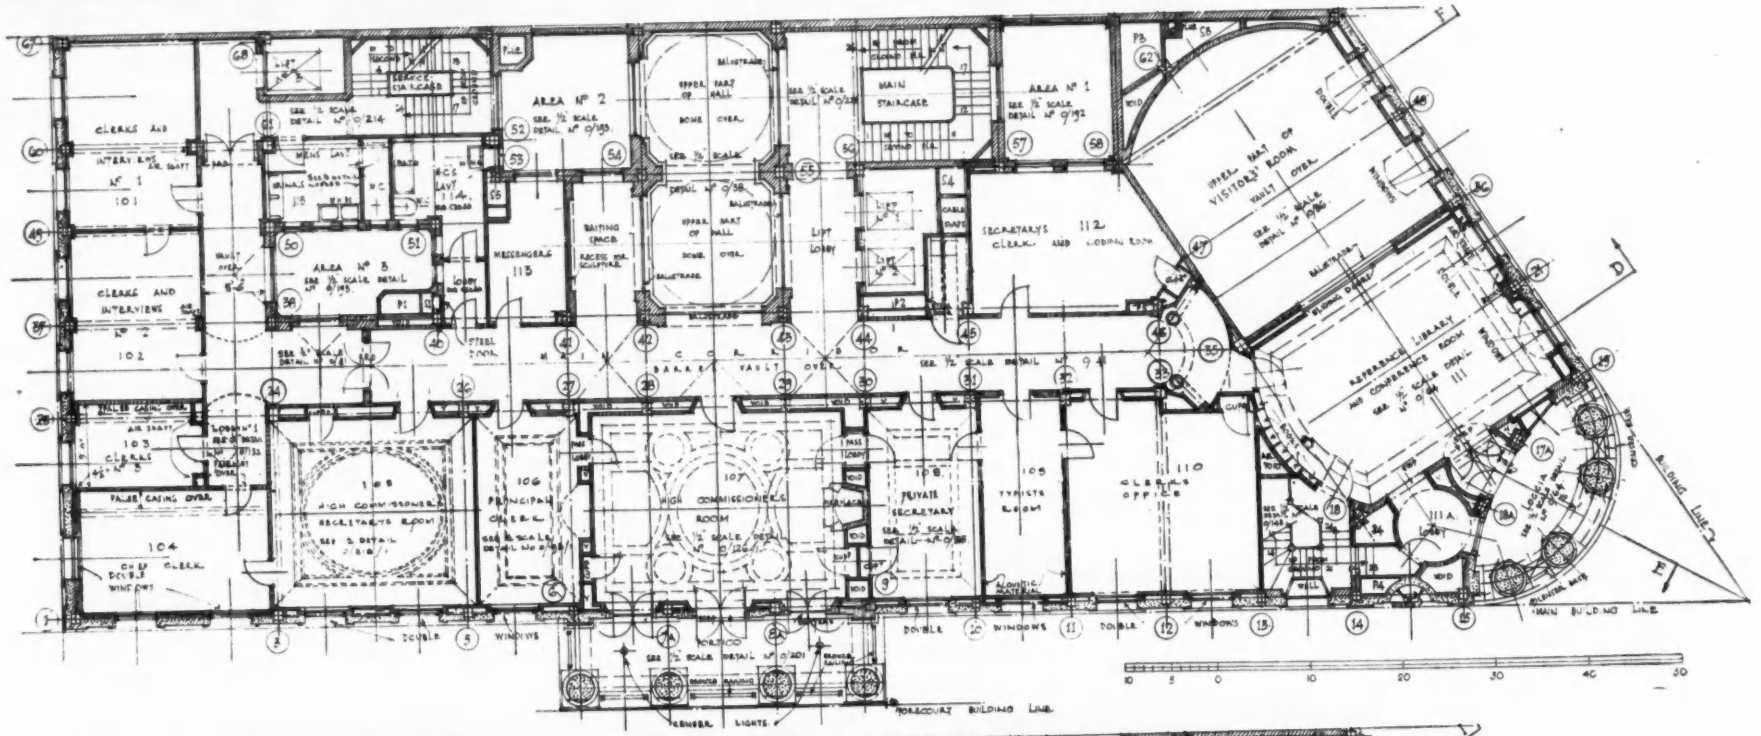
Hanging ordinary paper . . . . . from "	2 9

Supplement to THE ARCHITECTS' JOURNAL for June 29, 1933

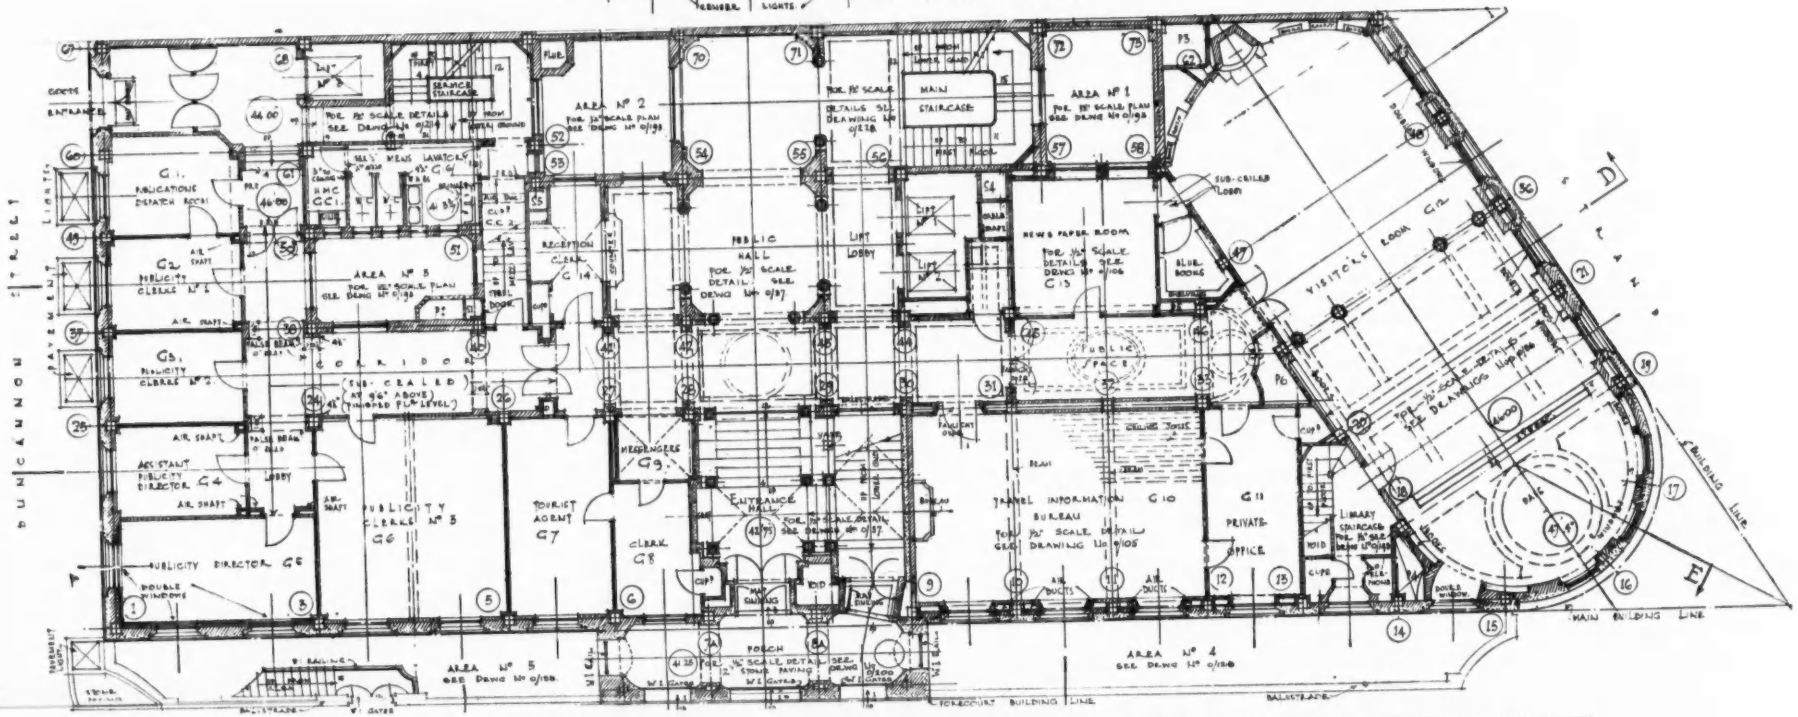
SOUTH AFRICA HOUSE, LONDON

SIR HERBERT BAKER, R.A., : : ARCHITECT



THE MAIN WEST ELEVATION, FACING TRAFALGAR SQUARE

OWING to the slope of the site there are two basement and two ground floors, with five above, of which the two highest are set back. Plans are reproduced overleaf, counting upwards, of the sub-basement, lower ground, ground and first floors, these having been selected as indicating the nature and purpose of the principal accommodation. The upper floors are mainly devoted to administrative accommodation. North is to the left of the drawings.



The colonnade of the main front, to Trafalgar Square, ranges with that of the National Gallery, and its cornice with those of that building and of St. Martin's Church. The adjoining photographic view of this front, taken during the winter, is given because the leafless trees mask as little as possible of the details of the structure. The building, which was formally declared open by H.M. the King on Thursday of last week, is further illustrated and described in the body of this issue.

DIAGRAMMATIC LAYOUT OF REINFORCED CONCRETE STAIR CONSTRUCTION.

SIR JOHN BURNET, TAIT AND LORNE ARCHITECTS ONE MONTAGUE PLACE BEDFORD SQUARE LONDON W.C.1.

Supplement to THE ARCHITECTS' JOURNAL for June 29, 1933

INFORMATION SHEETS

• 23 •

CONCRETE STAIRS: 2

•

THIS week we continue the weekly series of Information Sheets, interrupted owing to the publication of last week's special Slum Issue. Of the set of nine Sheets, now in progress, devoted to staircases, this, the seventh, is the second of a pair illustrating various lay-outs and methods of construction in reinforced concrete; its fellow was published in the Journal for June 15. Next week's Sheet will be the first of a pair on similar lines, but dealing with pressed steel construction.

The following is a full list of the subjects previously issued:—

1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.
8. Mar. 8—Billiard Table Data.
9. Mar. 15—Roof Pitches and Drainage.
10. Mar. 22—Lift Sizes, etc.
11. Mar. 29—Sanitary Accommodation.
12. Apr. 5—Lavatory Units.
13. Apr. 12—Lavatory Units.
14. Apr. 19—Plumbing to Basins, Baths, etc.
15. Apr. 26—Pipe Chases, etc.
16. May 3—Drains and Manholes.
17. May 10—Stairway Diagrams.
18. May 17—Risers for Stairs.
19. May 24—Stair Risers and Flights.
20. June 1—Public Exit Stairs.
21. June 8—General Buildings Stairs
22. June 15—Concrete Stairs: 1.
