

THE NEXT FIVE YEARS

IN the leading articles entitled "Mussolini and the L.C.C." and "London's Five-Year Plan," published in our issues for November 2 and 9 respectively, we referred to the plan of Rome initiated by Mussolini and gave a brief analysis of the state of planning—or lack of planning—in London. We have also exposed the glaring case of Carlton Gardens, which further demonstrates that the controlling hand of a Master Plan is imperative. The London County Council, the London Society and the Greater London Regional Planning Committee, therefore, should immediately get together and formulate a definite policy, in conjunction with the leading industrial and business interests, and in particular, the Building Industries National Council.

The Greater London Regional Planning Committee, as at present constituted, will be dissolved next March. Its inception was in the nature of an experiment, and its technical advisers have worked under serious limitations, in regard to scope and expenses. Unless the new Committee proposed to succeed it is run on more effective lines, there can be little hope of further progress.

The first essential factor to be considered, that of finance, devolves upon the individual authorities concerned: these number some 140 of varying rateable values (with a total rateable value of about £80,000,000). A very small contribution from each would form a sufficient fund to carry on the preparation of a Plan effectively, apart from Government support, or the possibility of the further support of important industrial and business interests.

This Greater London Region, consisting of the County of London and portions carved out of the adjoining counties into which London has spread, must eventually be administered by executive powers, such as might be conferred upon it as a Joint Executive Body under the new Town and Country Planning Act. Its financial resources should, in principle, be pooled to be applied to general matters concerning the respective and complementary needs of inner and outer London, and adjusted in agreement with the localized planning carried out by the individual authorities concerned.

The next step would be to secure the co-operation of the important landed interests, industrialists and estate developers. The tendency of modern business and industry is to embark upon enterprises on a larger scale than hitherto, and with a greater capacity for organization and co-ordination. So far town and regional planning have been concerned to a far greater extent with restrictions than with constructive planning; in other words, they have exhibited a largely *negative* attitude. This attitude can only be changed into a *positive* one by co-operation in the initial stages with industrial regional planning. Consequently, a more practical basis would be given to the Committee if representatives of industry and land development were co-opted members in the consideration of vital problems of development, as is now provided for under the new Act.

This is the only logical line of development for the new Committee to take: having formulated its preliminary principles and proposals, to co-ordinate these with the active industrial and business interests concerned; and then pass from an advisory to an executive capacity. This is a matter so obvious and so urgent that we need not emphazise that, little as has been done already, to confine its direction to a few officials would be an inadequate continuation. London, by its official inaction in this matter, has focussed the criticism of world opinion. Paris has its Development Plan and Executive; Rome, its Plan now being carried out; New York its comprehensive Regional Survey and proposals—and——*Manchester*, its Joint Regional Planning Committee, which has now been in operation *for over ten years*. For London to leave matters indefinitely at this stage would not be merely a confession of failure, but thoroughly ridiculous.

Further, a wise publicity should not be neglected. In times like these, more than ever, the imagination of the public requires to be stirred, and life and colour given to ideas and ideals which, shrouded in misty generalities or suffocated by reams of statistics, may get no further than the filing room of the Ministry of Circumlocution.

The Town Planning Acts have recently increased in scope with regard to re-planning built up areas and rural districts, but they are still full of ambiguities and perplexities. It would seem to be a waste of time and ingenuity to endeavour to compress such a unique and vital problem as the Plan of London in its initial stages into a too restricted legal framework. In this case it is surely more logical to decide first what to aim at, and then to seek the necessary complementary powers, rather than to produce a half-baked scheme. The initial scheme should be definite in its principles, and concrete in its main lines. Here an agreed policy with the important industrial interests should hasten the carrying out of the Plan in earnest; whilst a Master Plan would ensure that the viewpoint of public amenity is paramount.

Finally, there is the relation of Greater London to the National Plan. The tendency for the excessive concentration of the population towards one centre

is not only a cause of local congestion, but a sign of national dislocation. We cannot ignore the vital fact that the economic problem of the London Region is inseparable from the Regional Planning of the rest of the country. But that it is a definite sphere of influence, dominated by common needs and aspirations, is the main principle we wish to emphasize.

Mere size, after all, is not the criterion of greatness, but also the scale and relation of the parts to the whole. New and greater combinations are before us, as economists, as organizers, as artists; the time to plan ahead is *now*, remembering that no amount of theory can take the place of the *will to plan*.

In our next issue—the New Year Number—we shall expose the disastrous results of false "economy"; and co-ordinate the necessity for building with the necessity for a Plan.

"*England must reorganize or disintegrate.*"

OUR NEW YEAR ISSUE

Various schemes for combating the building depression have been formulated, and the Public Relations Committee of the Building Industries National Council has been formed largely with the object of devising means of setting the industry once again on its feet. THE ARCHITECTS' JOURNAL *conceives it its duty to devote its New Year Number, to be published on Wednesday next, January 11, very largely to the objects which the whole industry must have at heart. This number, therefore, will review the present position of the industry, the effects of unemployment in building on the prosperity of the country as a whole, the urgent need for a reversal of the present policy in relation to municipal expenditure, and the reasons why the present time is essentially the right time for setting building operations on foot.*

NEWS & TOPICS

CARLTON HOUSE TERRACE

I HAVE received a letter from Mr. Gerald McMichael, who asks whether Mr. Dungay, whose letter I printed in my notes last week, has not got somewhat entangled in the cobwebs of his own verbosity. Proceeding, Mr. McMichael says:

> Who said the design was a vandalistic design? The vandalism about the business is that Nash's design has in any way been interfered with; that is the whole point—that a fine *tout ensemble* of a very fine piece of old architecture has been, or rather would be, messed up if Sir Reginald Blomfield's design was carried out.
>
> There are other sites where this design would, of course, add to the amenities of the district, but here it can only help to spoil them.
>
> It is not a question of hot air, but it is a question of a deep-seated instinctive resentment against spoiling what is obviously a very interesting piece of Regency architecture, which most intimately appeals to all those who have a real feeling for architecture.
>
> I think the arguments of the Commissioners of Crown Lands are perfectly unjustifiable.

*

I have also received the following letter from Mr. Phillip J. Turner, F.R.I.B.A., the Vice-President of Quebec Association of Architects and the representative on the R.I.B.A. Council for the Royal Architectural Institute of Canada.

> As one who had his office in the vicinity of Carlton House Terrace for five years and who enjoyed almost every day seeing the dignified appearance of the Terrace and Gardens, I read with a great deal of regret and dismay that there is a prospect of this interesting example of formal architecture in London disappearing before the spread of commercialism.
>
> One fails to understand what the Government officials and the Commissioners of Crown Lands are thinking of, in allowing the architectural unity of the Mall to be ruined in such a way as now contemplated.
>
> In a new country like Canada, we do not lose our interest in anything that concerns the architectural well-being of the Old Land, and for our guidance in helping to build up new cities here, we are inclined to quote what is being done in the Old Land. We admire the care, thought, and efforts given to the preservation of old buildings and the beauty of the countryside in England, but fail to understand now, why, right in the heart of the Empire, such "bad manners" are permitted or contemplated in the particular district referred to, in allowing commercialism to spoil dignity. On a recent visit to London, one could not help regretting that the fine old Quadrant of Regent Street had gone, but there will be still further cause for regret from Londoners in Canada if an old landmark like Carlton Gardens and Terrace is spoilt, for there seems no good reason why such a thing should be allowed to happen.
>
> I trust the attention the JOURNAL has given to the desecration contemplated will result in the old landmark being preserved to the nation in its entirety.

*

ECONOMY IN SCHOOL BUILDING

Mr. Herwald Ramsbotham, the Parliamentary Secretary to the Board of Education, has been considering, in consultation with his officials, the possibility of more economy in the building of schools. There is a general desire on the part of education committees to pull down a number of the old-fashioned schools, where ventilation and illumination are bad.

*

The one-story schools that can be opened to the air in fine weather, such as have been designed by Mr. Topham Forrest, of the L.C.C., are more economical to construct and are, I am sure, much better for the health of the children. Just as there are to be clearances of slum dwellings, so it is hoped before long to embark on a clearance of slum schools.

*

But, first, attention is being given to varying costs. A case has recently been placed before the Board of Education

of an authority which is building a school at the cost of about £40 per place, although two years ago in the same district, a school of the same size was built at a cost of about £26 per place.

*

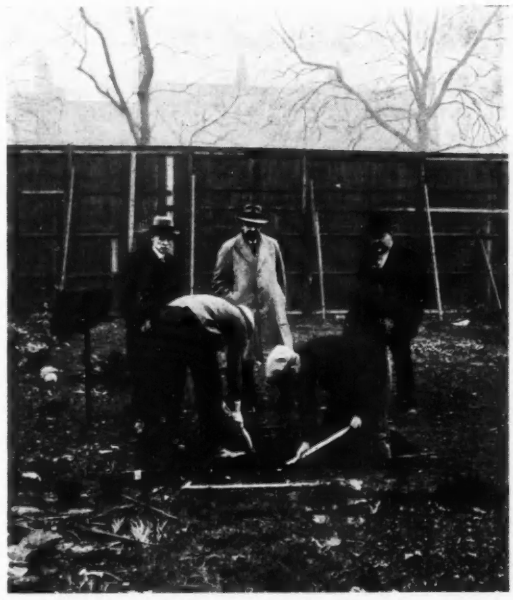
A WASH DOWN AT SOUTHWARK

What sort of an omen is it for the *two* successful competitors of Southwark Town Hall competition to find that the building has been given a thorough wash down? I hear that as the work progressed over the grimy old brick face a scarlet blush suffused the features of the building.

*

LONDON UNIVERSITY NEW BUILDINGS

Last Thursday I visited the vast site in Bloomsbury of the new buildings for the London University and saw the first sod cut of the first section of the work, which comprises the Senate house, the administration block and the great hall. I also witnessed the taking of the first "shots" in the making of a film which eventually will form a complete record of the building of the University. These "shots" were of the small party—which included Dr. E. Deller, Principal of the University; Mr. H. Claughton, clerk to the University Court; Mr. Charles Holden, F.R.I.B.A., from whose designs the buildings will be erected; and Mr. Travers Morgan, consulting engineer for the structural work—who toured the site and saw the digging operations begin.



*

FALLING OFF OF DISTRICT SURVEYORS' FEES

District surveyors are lamenting the reduction of their fees. The latest report shows that the fees received in 1931 were only £89,000 in London as compared with over £103,000 in 1930. The County of London is divided into 43 districts, and in some centres the work is so heavy that there has to be a deputy.

*

The largest fees received were in South Westminster, with over £4,000; in East St. Marylebone, with over £3,900; and, in Camberwell, with £3,300. The three districts where the fees amounted to less than £1,000 were Stoke Newington, Clapham and West Lewisham. It must not be imagined, however, that all these fees go into the pockets of the District Surveyors and their Deputies for their personal use. They have to pay office expenses themselves, and these amount to nearly 30 per cent. of the gross fees received.

Cutting the first sod on the site in Bloomsbury of the new buildings of the London University.

*

RATHER EFFECTIVE

I met a client of mine at his new modernistic house, nearing completion, which he had insisted should be faced externally with *white* cement. "Why the——," said my client, "have you painted it *blue?*" "Your wife told me to," said the builder. "H'm," said my client, turning to me, "I think it's rather effective, don't you?"

Carlton House Terrace

In view of the widespread indignation caused by the action of the Commissioners of Crown Lands in tearing down No. 4 Carlton Gardens, formerly the house of Lord Palmerston and Lord Balfour, and proposing to erect a huge block of offices in Portland stone to tower 30 ft. above the rest of the Terrace, a strong defence committee is being formed (writes Miss M. I. Batten). Mr. J. C. Squire, editor of *The London Mercury*, who played such a leading part in saving the city churches, and in preserving Stonehenge for the nation, is actively concerned in the formation of this committee. As building on the site of No. Four Carlton Gardens is still proceeding, in spite of every effort of Major Elliot, the Minister of Agriculture, to suspend it, the matter is of extreme urgency, and the first meeting of the Committee will be held as soon as possible.

Manchester Exhibition

Arrangements have been made by the Incorporated Association of Architects and Surveyors and Lewis's, Ltd., Manchester, for an exhibition, to be held at the latter's building, from January 19 to 28 inclusive, of the designs submitted in the £1,000 All-British House Competition. Models made by John B. Thorpe, of the three premiated designs will form part of the

display. In addition to the architectural designs, Sir Edwin Lutyens, R.A. (President of the I.A.A.S.) has loaned to the exhibition some of his Royal Academy drawings, which will include the original drawing of the Cenotaph and his plans of the New Liverpool Cathedral. The latter are being publicly exhibited for the first time by permission of the Rt. Rev. Dr. Downey, Archbishop of Liverpool.

The exhibition will be opened by Sir Edwin Lutyens at 11 a.m. on Thursday, January 19. He will be received by the Lord Mayor of Manchester.

Build Now !

Sir Raymond Unwin, P.R.I.B.A., has issued, through the Special Committee for Public Relations of the Building Industries National Council, the following New Year's message :

It is my earnest hope that the citizens of this country, both as individuals and in their various administrative groupings, will see the wisdom throughout the coming twelve months of saving their money by using it for building while prices are low and interest otherwise obtainable small.

In this fashion not only will the money so put to use be truly saved, but for every £1,000,000 of it devoted to new building and constructional work during 1933, the wastage on unemployment benefit and public assistance will be redeemed to the extent, it is estimated, of about £375,000.

Forthcoming Dinners

A dinner will be held by the Town Planning Institute at the Savoy Hotel, W.C.2, on Friday, March 24. The Rt. Hon. Sir Edward Hilton Young, G.B.E., M.P. (Hon. Member) will be the principal guest.

The Leicester and Leicestershire Society of Architects is holding its annual dinner at the Leicestershire Club on Friday, January 27.

International Congress for Modern Architecture

The Fourth of the " Congrès Internationaux d'Architecture Moderne " is to be held in Moscow from June 1–10. The subject chosen will be " The Functional Town."

As a result of the active interest and sympathy shown by the Russian authorities it has been decided to hold the coming Congress on a much larger and more ambitious scale than has hitherto been attempted. For the first time all the work shown and the papers discussed at the previous congresses will be exhibited. In connection with this there will be a very rigorously selected survey of functional modern building in all countries, with a special Swiss section. In addition to these exhibits the Soviet Government has planned a complementary " Exhibition of Contributions to New Forms of Existence."

The Congress, which now represents 20 different countries—though Great Britain is unfortunately still not among them—has been officially invited to Moscow by the Soviet Government. Arrangements have been made by which non-members and nationals of countries that are not officially represented who join the " Circle of Friends of the International Congresses for Modern Architecture " will be able to participate under the most favourable conditions as regards travelling facilities, board and lodging.

All inquiries should be addressed to the General Secretary of the Congress : Dr. Siegfried Giedion, Zürich, 7, Doldertal. 7, Switzerland, who particularly hopes to be able to welcome young English architects.

R.I.B.A.

THE NEXT MEETING

On Monday next, January 9, the Council's award of the R.I.B.A. Prizes and Studentships for the past year will be announced and Mr. H. Chalton Bradshaw, F.R.I.B.A., will deliver his criticism of the work submitted.

The prize drawings will be on exhibition in the R.I.B.A. Galleries from January 10 to 28 during the hours of 10 a.m. and 8 p.m. (Saturdays 10 a.m. to 5 p.m.).

The Council's nomination for the Royal Gold Medal for 1933 will also be announced.

THE ANNUAL DINNER

The annual dinner will be held at Claridges Hotel, Brook Street, W.1, on Friday, March 12. 6.45 for 7.15 p.m.

THE NEW HEADQUARTERS

For the new headquarters for the R.I.B.A., work on which starts in March, Mr. Bainbridge Copnall has been commissioned to prepare sketches for the sculpture and decoration ; Mr. J. A. Woodford and Mr. Maurice Lambert studies for sculpture ; and Mr. Jan Juta studies for decorative work in glass and metal.

THE EXAMINATIONS

The Final Examination

The Final Examination qualifying for candidature as Associate R.I.B.A. was held in London and Edinburgh from December 7 to 15, 1932. Of the 159 candidates examined 70 passed (27 in Part 1 only) and 89 were relegated.

The successful candidates are as follows :—

Bailey, A. ; Bedford, E. ; Blythin, C. F. ; Brown, A. ; Darbyshire, L. ; Davies, E. ; Eley, T. H. ; Elgar, S. ; Exell, K. ; Farnsworth, J. E. ; Firth, E. ; Freeborn, E. E. ; Griffiths, G. D. ; Heathcote, E. R. ; Hewitt, F. A. ; Hutt, H. M. ; Kendrick, A. W. R. ; Marston, W. E. ; Miller, J. ; Overend, A. B. ; Padmore, R. B. ; Page, R. J. ; Pescod, H. G. ; Poltock, J. W. ; Risbridger, H. J. ; Robb, G. ; Robinson, A. ; Rothwell, F. L. ; Segrais, J. J. Le Juge de ; Simpson, R. G. ; Smith, C. B. ; Smith, W. C. B. ; Spivey, C. A. ; Thwaite, T. E. S. ; Tozer, C. R. ; Underwood, W. ; Walmsley, W. G. ; Waters, A. B. ; Watkinson, P. G. ; Woolley, F. E. ; Wright, W. G. ; Wright, F. W. ; Wrinch (Miss) Beris.

Successful candidates in Part 1 only : Bates, B. H. ; Carroll, Miss K. M. ; Chantrey, G. H. B. ; Clarke, E. ; Cookson, R. E. ; Cooper, A. W. ; Cowley, G. J. D. ; Dewing, F. M. ; Doe, H. E. ; Duxbury, L. ; Edleston, R. C. ; Firmin, E. H. ; Greenwood, S. ; Hay, G. S. ; Hersch, R. S. ; Hodgess, I. S. ; Houfe, E. A. S. ; Israel, L. ; Jones, J. R. ; Layfield, A. C. ; Lowe, W. L. ; Nicholson, W. L. ; Peat, J. T. W. ; Simmons, C. H. ; Smeeton, R. A. ; Stallard, E. G. ; Thomas, O. M.

The Special Examination

The Special Examination qualifying for candidature as Associate R.I.B.A. was held in London from December 7 to 13, and in Edinburgh from December 7 to 15. Of the 18 candidates examined 5 passed (1 in Part 2 only) and 13 were relegated.

The successful candidates are as follows :—

Bertram, T. ; Fowler, J. H. ; Pearce, L. (Part 2 only) ; Sutherland, R. O. ; Thacker, E. G.

Professional Practice

The examination in professional practice for students of schools of architecture recognised for exemption from the R.I.B.A. Final Examination was held in London and Edinburgh on December 13 and 15, 1932. Of the 29 candidates examined 20 passed and 9 were relegated.

The successful candidates are as follows :—

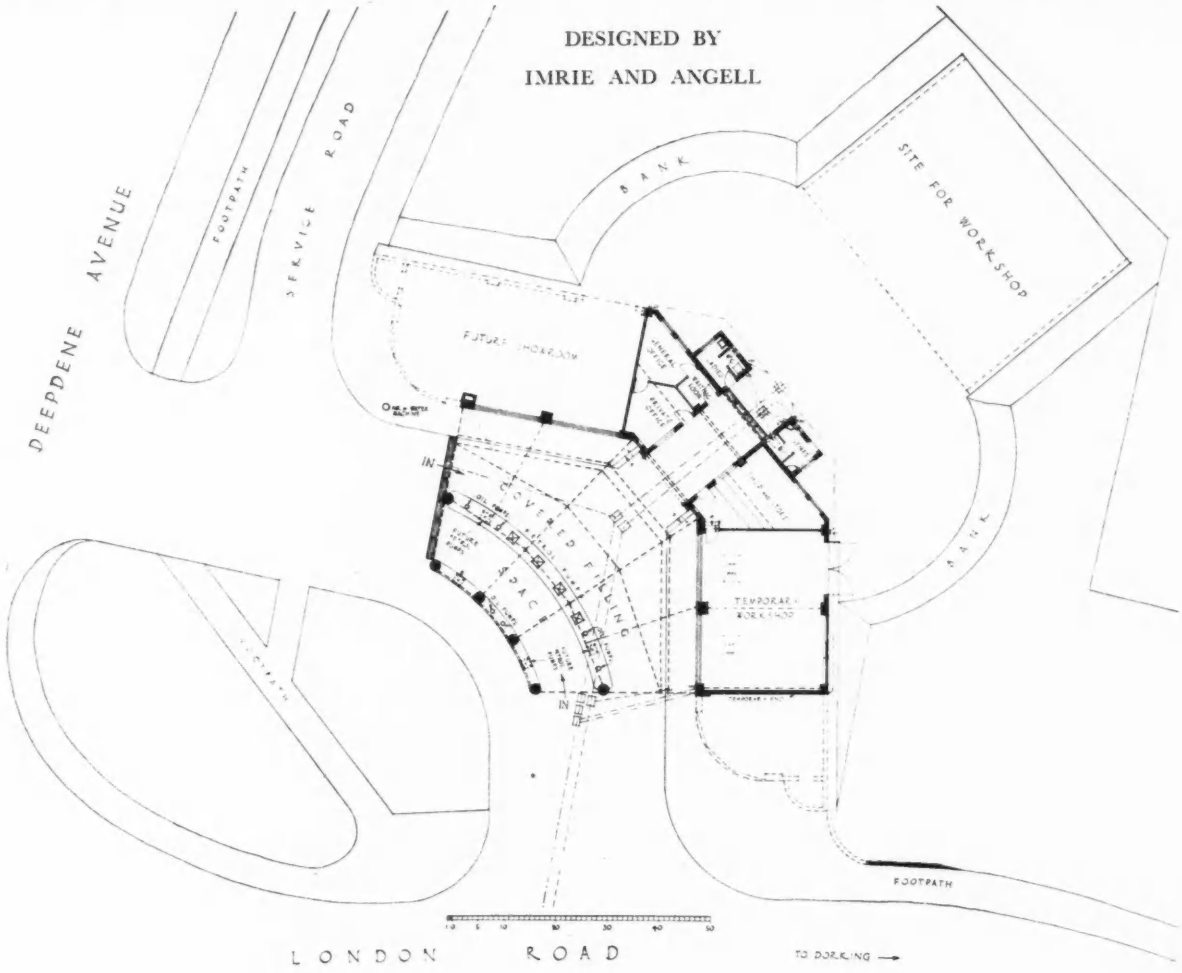
Ambrose, E. S. ; Ashton, R. ; Bannerman, D. G. ; Bennett, H. ; Chatwin, A. B. ; Dillon (Miss), C. J. ; Galletly, J. ; Harvey, D. ; Maclennan (Miss), E. L. ; Miller, A. ; Morrison, A. J. W. ; Saurin, C. P. ; Savill, A. G. ; Scaife, E. F. ; Spence, B. ; Steele, D. R. ; Sutherland, A. C. ; Sutherland, W. T. ; While, G. H. ; Whitwell, F. J.

COMPETITION NEWS

Mental Hospital

The Glasgow Corporation has appointed a sub-committee to arrange the conditions for competitive plans which are to be invited from members of the Glasgow Institute of Architects, for the extension of Hawkhead Mental Hospital.

Competitions Open



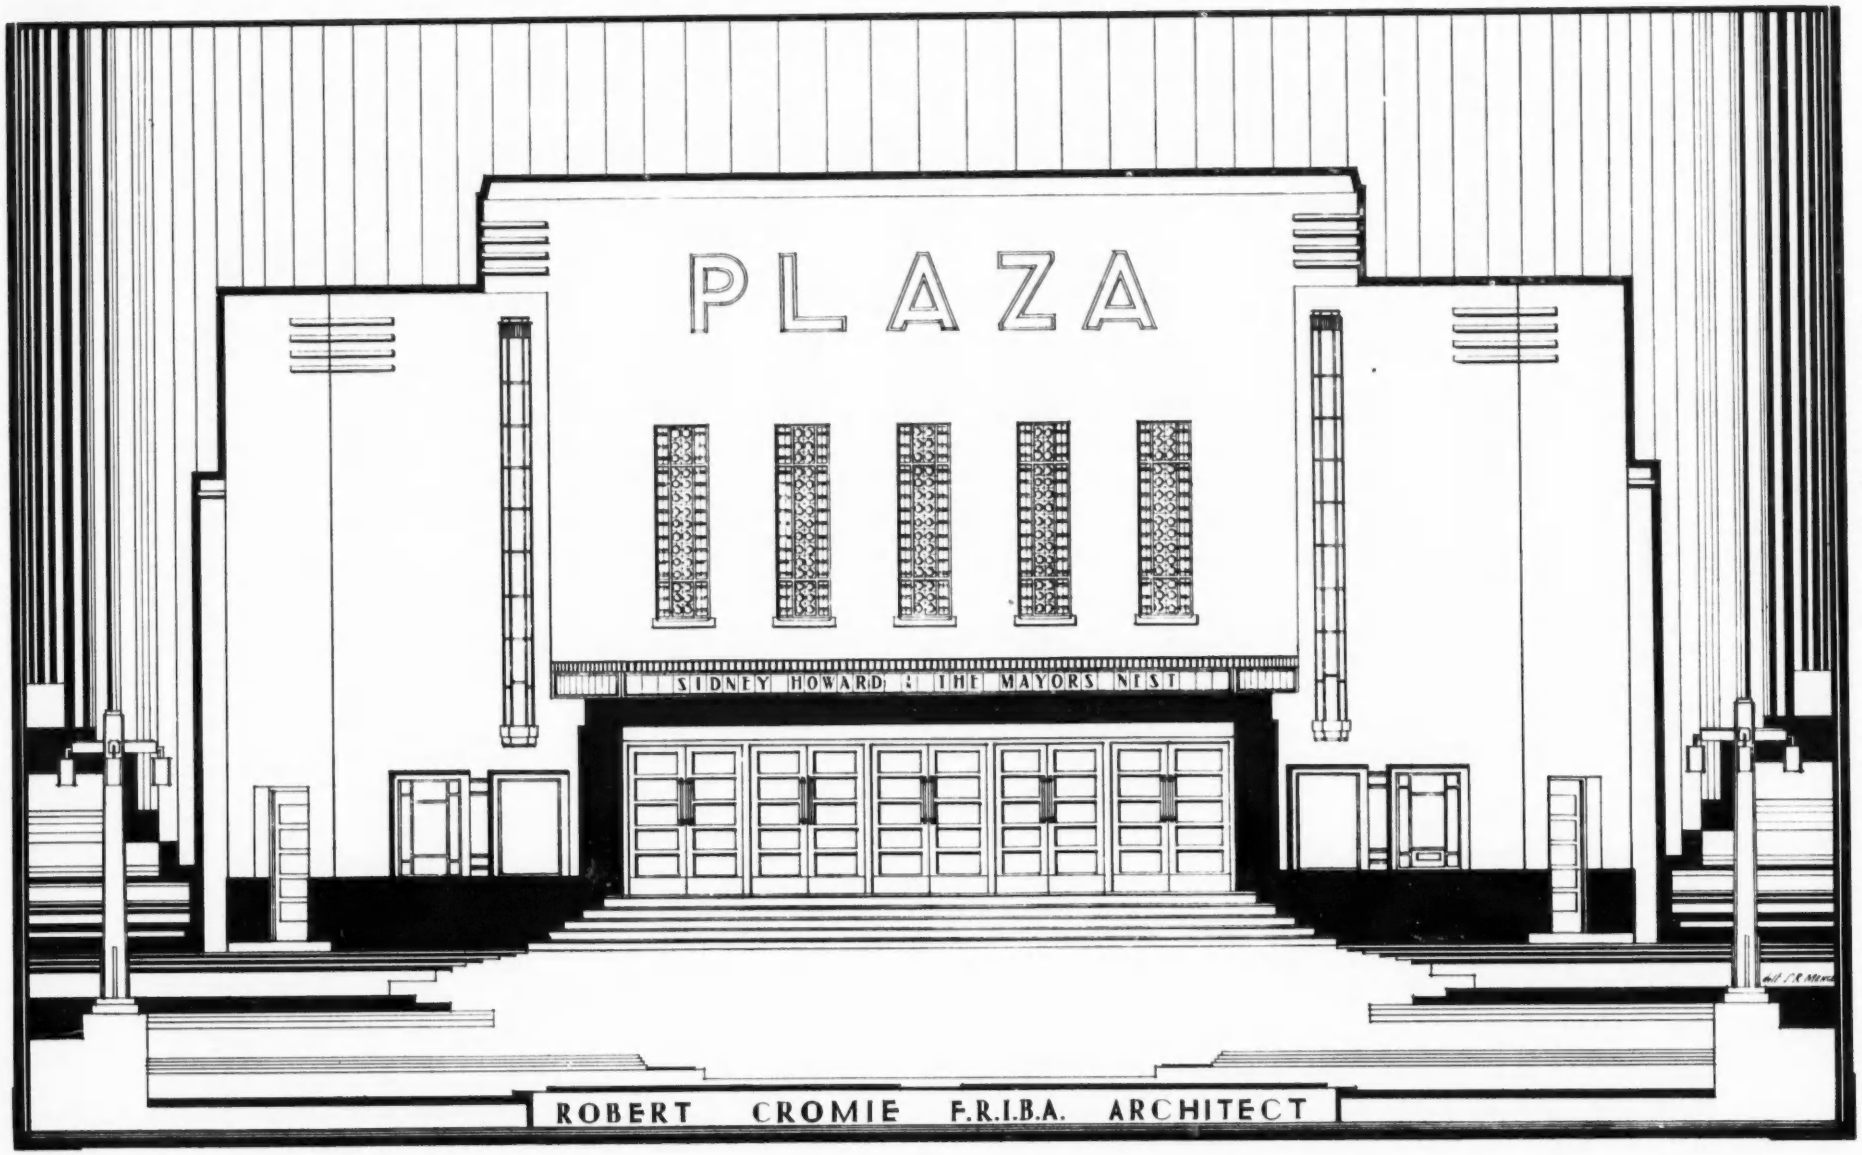
February 1.—The city of Stockholm invites designs for a town plan for the part of the town called Lower Norrmalm. 60,000 kronors (£3,077) in prizes, 1st premium, 20,000 kronors (£1,025).

May 31.—Sending-in Day. Layout of a suburb on the River Escaut, Antwerp. £2,400 in prizes (1st, £800).

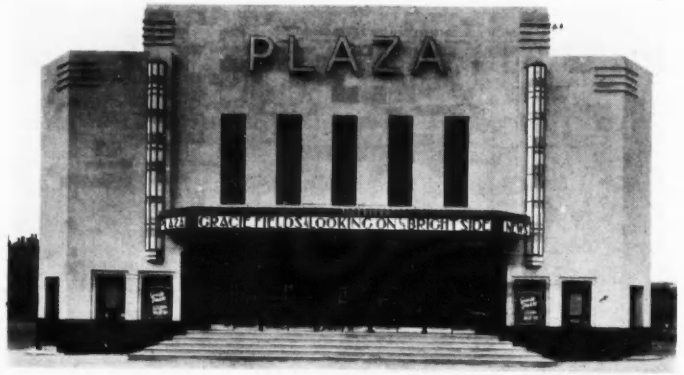
Full Particulars of the above competitions were published in our issue for December 7.

PIPPBROOK FILLING STATION, DORKING, SURREY

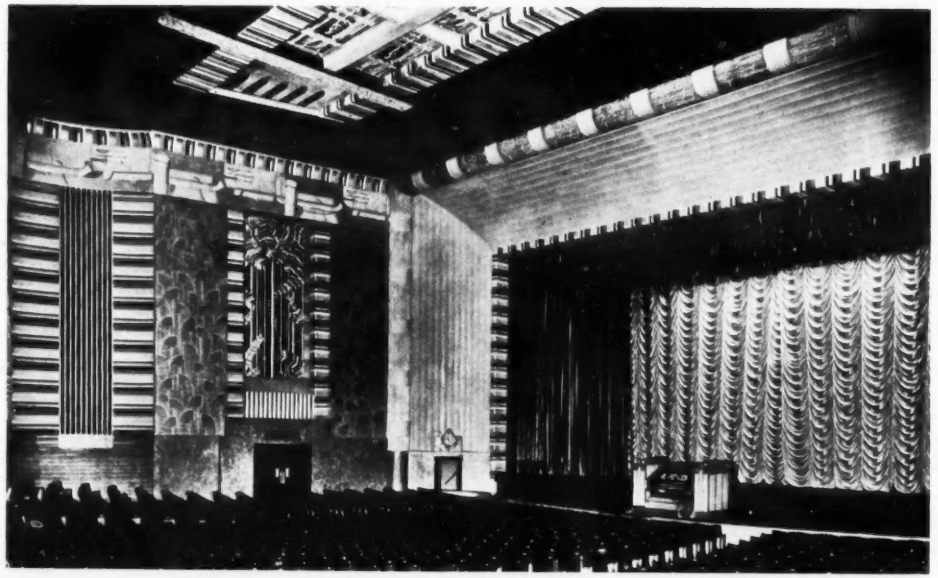
DESIGNED BY
IMRIE AND ANGELL



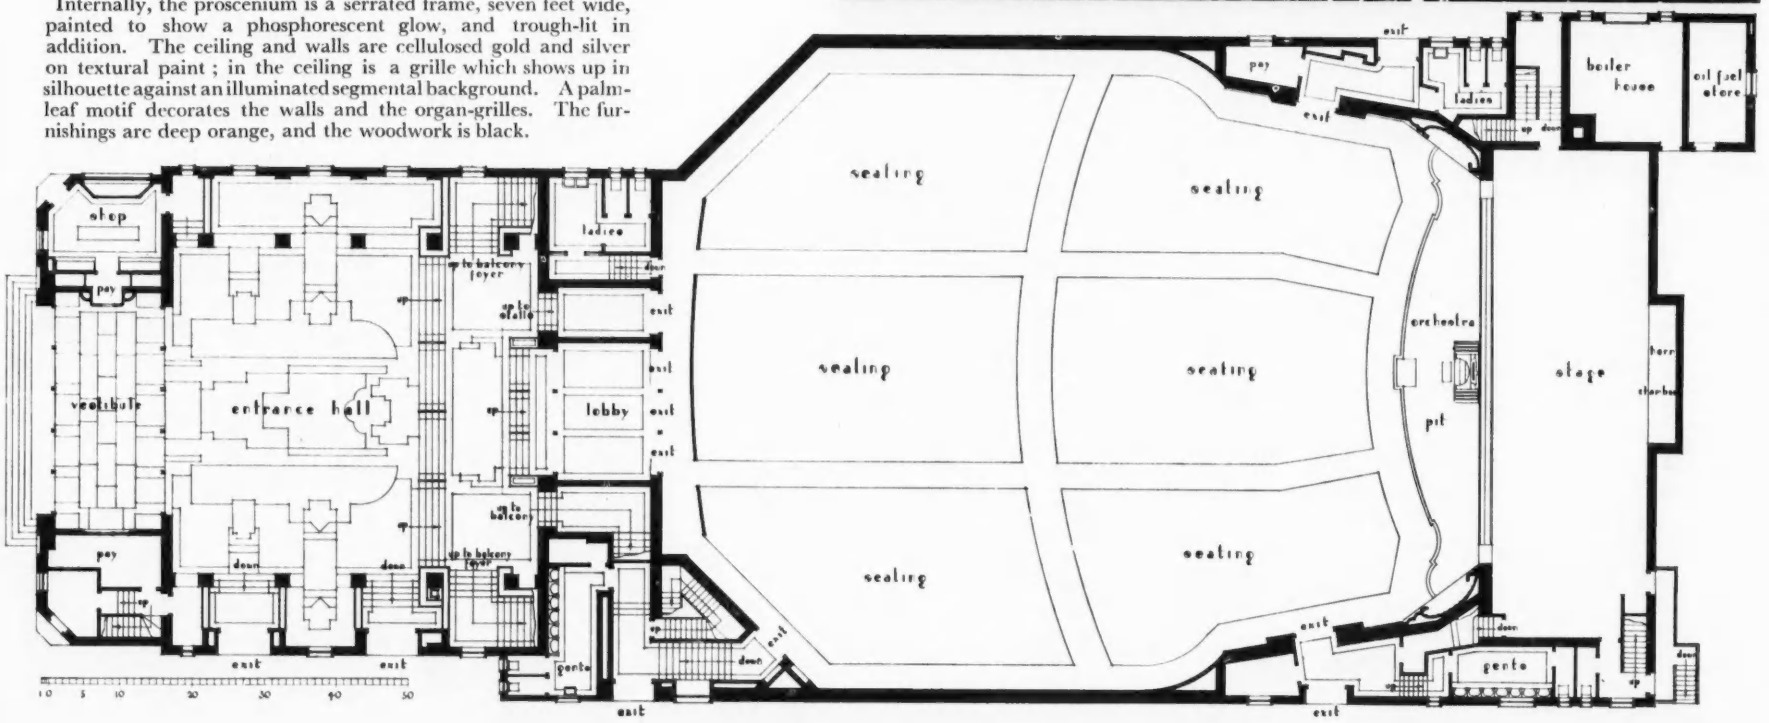
The photograph below shows the building so far completed as a covered filling and general service station. The present building is part of a larger scheme, as shown by the dotted lines on the plan, and the perspective drawing gives some indication of its ultimate appearance. The temporary workshop will form part of a showroom.

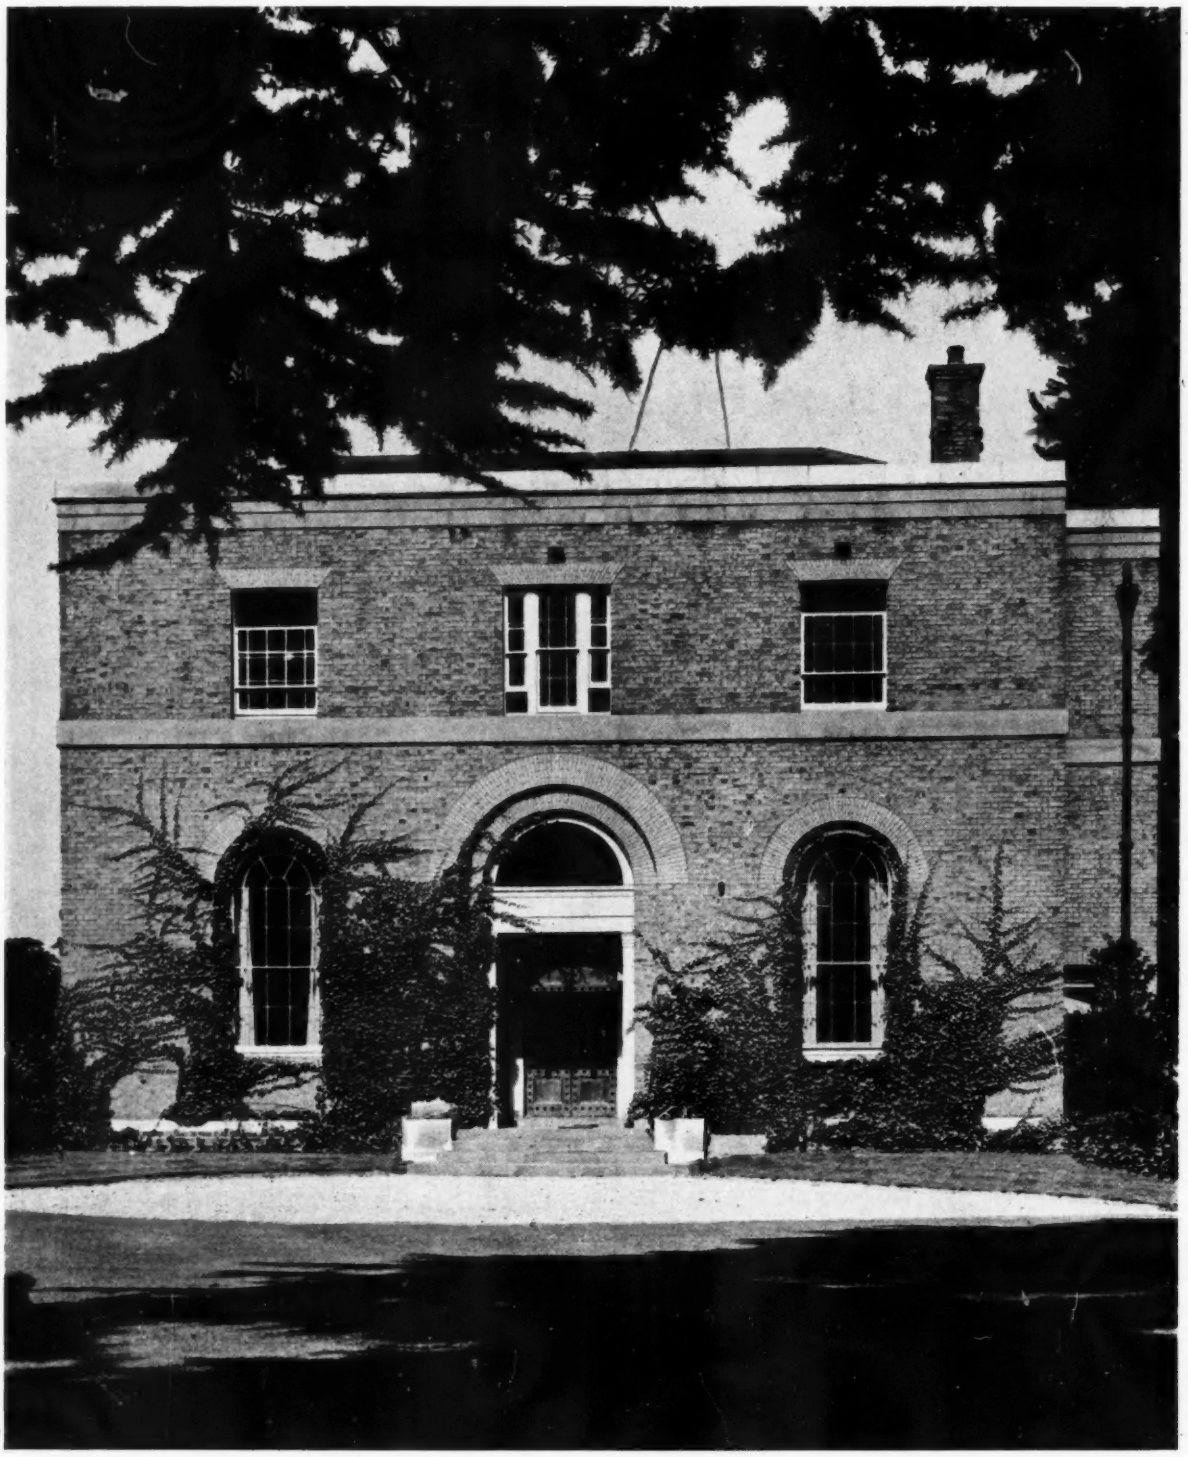


The walls are built of brick, and the covered filling space is constructed with steel girders and wood joists and is floored with asphalt. The stanchions are covered with cast concrete columns, and they, as well as the remainder of the external facework, are rendered with white cement, the whole being finished off with a black cement plinth. The caps of the columns and the decorated band to the parapet were cast in cement, the ornament being picked out in brilliant colours with cellulose paint.



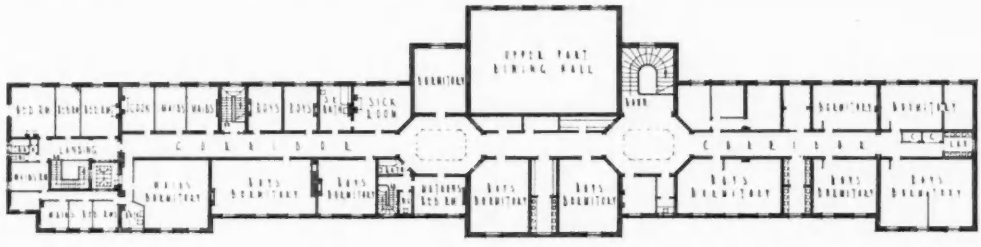
THE PLAZA CINEMA, SOUTHAMPTON : DESIGNED BY ROBERT CROMIE



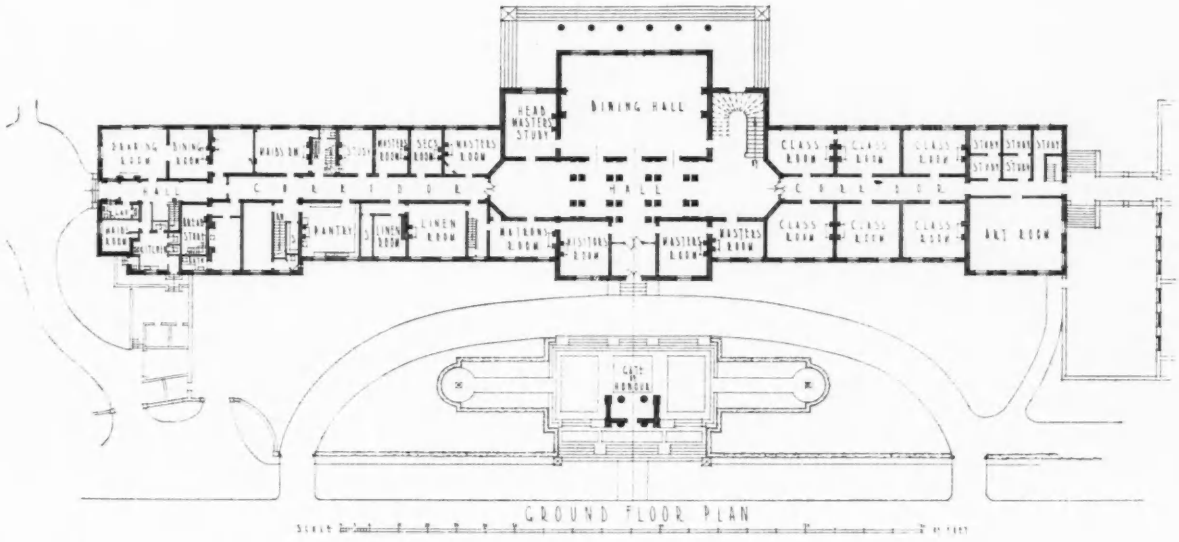


The exterior of this new cinema, at Northam, Southamptor, seating an audience of 2,000 and with a large car park in front, is carried out in white stone, black faience and gilded metal. Provision has been made for flood-lighting it with changing colours ; neon signs are also incorporated in the design. The building stands only a few yards from the sea-wall and, owing to foundation difficulties, the body of the theatre is elevated some seven feet, but this level is reached in easy stages, as shown on plan.

Internally, the proscenium is a serrated frame, seven feet wide, painted to show a phosphorescent glow, and trough-lit in addition. The ceiling and walls are cellulosed gold and silver on textural paint ; in the ceiling is a grille which shows up in silhouette against an illuminated segmental background. A palm-leaf motif decorates the walls and the organ-grilles. The furnishings are deep orange, and the woodwork is black.



HOUSEMASTER'S NEW QUARTERS, MILL HILL



The addition shown on the left of the plans (new work in black) was erected to provide new accommodation for the Housemaster, in materials similar to the old work, and similarly treated. Yellow stocks have been employed for the general walling, with yellow rubbers for the arches and other

SCHOOL, N.W.: BY STANLEY HAMP (Collcutt and Hamp)

FIRST FLOOR PLAN

GROUND FLOOR PLAN

dressings. The general dressings are in Portland stone, and the windows throughout are in wood. Flat roofs are used, covered with asphalt. The accommodation provided is clearly indicated on the plans, reproduced on this page, which show its relation to the original structure.

VANDALISM AND HIGH RENTS

LESSONS FROM REGENT STREET AND CARLTON HOUSE TERRACE

On Monday next, Mr. A. S. Gaye, C.B., O.B.E., the Commissioner for Crown Lands, will read a paper entitled "Crown Lands," at the Chartered Surveyors' Institution. It will be interesting to see how his views compare with those given in the following article.

THE destruction of Number Four Carlton Gardens, the home of Lord Palmerston and Lord Balfour, by the Commissioners of Crown Lands, has not only caused the fiercest and most violent indignation. It has focussed general attention upon these mysterious Commissioners, their mysterious methods, and their mysterious absence of any apparent feeling of public responsibility. To understand what these Commissioners are up to it is necessary to trace briefly the story of the Crown Lands.

The story begins in Saxon times, but it only comes into real history with the Norman kings. The Norman kings owned land. That is the real historical beginning of Carlton House Terrace. But it is of immense importance to realize that even in those days of autocracy the king only held the lands as the king. He could own nothing as a private citizen. In consequence, as Sir William Anson says in his classic work on the Constitution, from the earliest times the Crown Lands have been indissoluble from "the public duty." Later, in Plantagenet and Tudor and Stuart days, Parliament, as the watch-dog of the "public duty," frequently interfered in the administration of the Lands.

In particular, Parliament came to the conclusion, after Charles II had exchanged some of the Crown Lands for a good deal of deliciousness, that the power to alienate the Lands should be extracted from the hands of the Monarch, however Merry. When George III came to the throne therefore, in 1760, it was pointed out by some sensible person that though the Crown Lands could never fluctuate in size, they always fluctuated in value, and George III, prudent and thrifty German, at once agreed to surrender them in exchange for a fixed income. The position was subsequently consolidated by the Crown Lands Act of 1829, which governs the administration of the Lands to-day.

The department of bureaucracy, to which was allotted the administration, used to be called His Majesty's Commissioners of Woods and Forests, but not many years ago the name was changed to the Commissioners of Crown Lands. There are two Commissioners. One is, *ex officio*, the Minister of Agriculture and Fisheries, and the other is the Permanent Commissioner, at present Mr. A. S. Gaye, C.B., O.B.E. There is some confusion about their respective powers *vis-à-vis* each other, and questions a fortnight ago in the House of Commons, elicited from the Minister of Agriculture and Fisheries, Major Elliot, no clearer statement than that no recorded clash had ever taken place between the two Commissioners, and that he did not know what would happen if a clash did occur.

Another question in the House, by Sir William Davison, contained the definitely challenging statement that "the two Commissioners have equal powers," and was not contradicted.

So much for the history of the Commissioners.

Now for their record.

The Crown Lands consist of 251,000 acres (exclusive of fisheries), and on these 251,000 acres lie the one great bit of town-planning that London, the world's greatest city, possesses, Nash's mighty sweep from St. James's Park, past the Duke of York's column, up his curved Regent Street and into Regent's Park. This belongs to the nation, just as the Koh-i-Nor, and Shakespeare, and the Elgin Marbles, and Velazquez's Philip IV, and Winchester Cathedral, and the making of Devonshire cider and the flowery hedgerows of Buckinghamshire belong to the nation.

Nash's work was in the charge of the nation's paid servants.

What did they do, and what are they doing?

In 1919 the 100-year leases of Regent Street fell in, and the Commissioners announced the rebuilding of Regent Street. But they had no comprehensive uniform plan as poor despised John Nash had. How could they have? As early as 1894 they had allowed a shop to rebuild itself in a style of its own. Half a dozen new buildings were allowed to crop up before the leases fell in, including the Piccadilly Hotel, designed by Norman Shaw and completed in 1908. Sir Reginald Blomfield, to whose designs the Quadrant was rebuilt, describes in his *Memoirs of an Architect* the difficulties which he had to grapple with because of the existence of the Piccadilly Hotel. The Quadrant and part of Piccadilly Circus was rebuilt as much as possible to a comprehensive scheme, but the rest of Regent Street suffers from a huge, haphazard, piecemeal rebuilding, in which architects, builders, contractors, and, one might think from a glance at the street as it is today, enthusiastic and semi-inspired amateurs, were given a free run. Sir Reginald rightly deplores that it was "a very great pity that the Crown did not have the courage of its convictions and deal with the whole of Regent Street as it had dealt with the Quadrant instead of leaving it open to miscellaneous design."

Regent Street was rebuilt when prices were at their highest, and consequently all rents went up. The new "economic" ground rents which the Commissioners have demanded are so high that the Town Clerk of the Westminster City Council wrote to *The Times* on July 26, 1932, as follows: "I am directed to state that, at the valuation of 1930, all premises in Regent Street were assessed on the basis of the estimated value of the floor area and not on the actual rents paid, which the Assessment Committee considered were generally higher than the true value of the premises and not likely to be maintained. It may be added that the Assessment Committee are most anxious to do all that is possible to encourage the letting of the vacant premises in Regent Street, but they cannot take a course which would be a flagrant non-compliance with the law and result in gross unfairness to other ratepayers in the city." These exorbitantly high rents have been maintained by the Commissioners in spite of the efforts of the lessees to have them reduced, and the result is that the new street, besides being a jumble of hideousness, has the beginnings of a derelict economically.

A detailed tour of every building in Regent Street reveals the fact that there are no fewer than 90 vacant office premises in addition to 30 completely vacant floors. It would be taking a reasonable average to say that each floor would accommodate four separate offices (some, of course, would hold a great many more), and this would bring the number of vacant premises to over 200. There are also nine empty shops, three of which include the entire building. Of course times are bad, and every street has its empty houses and floors. Bad times and the Commissioners' high rents make it impossible to fill Regent Street. Why on earth should anyone suppose that bad times and similar rents will fill a commercialized Carlton House Terrace?

So much for the Commissioners' treatment of Regent Street, the centre

of Nash's great town-planning scheme. What about the two ends, Regent's Park and the Mall? For the moment Regent's Park seems safe, especially as last year the leases of two houses for 32 years were sold in York Terrace. But then so, just over a year ago, was the 16-year "strictly residential" lease of No. Three Carlton Gardens sold. And now Carlton House Terrace and the Mall are in deadly danger. No. Four Carlton Gardens is down, and Messrs. Pinchin Johnson are in process of building their new offices on the site. Sir Reginald, in his letters to *The Times*, would try to pretend that the building is invisible from the Mall. Actually it is 40 ft. higher than No. Three Carlton Gardens, which stands between it and the Mall, and it juts out over the area on the Garden side, so that the three top stories and the west side of this Portland stone building do directly overlook the Mall. And by reason of the space made by the Gardens the whole of the west side of the building will be perfectly visible from the Mall, and anyone who goes down that avenue now can see the red iron girders of the lower floors as plain as plain can be.

In *Memoirs of an Architect* Sir Reginald writes that "the responsibility of settling what was to be done with the Quadrant seemed to me a very serious matter. Evidence was taken from various witnesses, both architects and tradesmen, and we sent in our report with recommendations as to general treatment. The problem was to alter Shaw's design without destroying it."

This seems very applicable to the Carlton Gardens case. The responsibility of what was going to happen to Carlton House Terrace does not seem to have been considered very seriously by anybody until No. Four Carlton Gardens had been pulled down and a 99-years' lease granted to Messrs. Pinchin Johnson, and only then because there was a public outcry. It is true that Sir Reginald, finding himself architect for the one new building, prepared a design for the whole site, but this design has not been officially authorized by the Commissioners, who have gone so far as to disclaim it by saying that there is no project at present for the rebuilding of the whole Terrace. If evidence had been taken from architects and residents, the latter presumably taking the place of the tradesmen, the present abominable muddle would not have arisen. And presumably some future architect will find himself confronted with the problem of Sir Reginald's design, and when Carlton House Terrace is rebuilt will have to wrestle with an equally impossible conundrum as that which Sir Reginald deplores in the Quadrant —that is, one building which has to be incorporated in a design for a whole layout. Such is the policy of the Commissioners of Crown Lands.

It is 103 years since the Crown Lands Act was passed. During this period patchwork and muddle have been the methods of the Commission, vandalism and small money-grubbing its policy. The nation's property has been torn down for the sake of a few extra thousands a year, and æsthetic values have been totally sacrificed to economic values. Regent Street has gone. Public opinion must see to it that the next piece of Crown property to go shall be the Crown Lands Commission itself.

M. I. BATTEN

A Tribute to Wren

A Commemorative Service for Sir Christopher Wren was held in the Chapel of the College of William and Mary in Williamsburg, Virginia, on October 20, simultaneous with that at St. Paul's Cathedral. The collection, mainly contributed by students of the College, has just been received by the Wren Society with great appreciation of this indication of the sympathy of many on that side of the water for the purposes of the Society.

The College claims to be the only American building from the designs of Sir Christopher Wren. It was so attributed in 1721 by Hugh Jones, Professor of Mathematics. In view of Queen Mary II's interest in the foundation, the support of the Archbishop of Canterbury, and a semi-official character it seems likely that a Key-design may have been made by Wren and sent out, though no actual drawing has so far been traced.

The College was burnt but has been restored on the original lines after the most painstaking study, Messrs. Perry, Shaw and Hepbourn, of Boston and Williamsburg, being the architects.

R.A. Exhibition

The Winter Exhibition, 1933, of the Royal Academy of Arts, Burlington House, W.1, will remain open from Saturday next, January 7, until Saturday, March 11, between the hours of 10 a.m. to 6 p.m.

British Industries Fair

The nineteenth British Industries Fair, which opens at Olympia and White City in London and Castle Bromwich, Birmingham, on February 20, will be larger and more varied than any of its predecessors. According to Lt.-Col. D. J. Colville, M.P., the space required by exhibitors is twenty per cent. larger than that engaged at the last Fair. Such has been the demand for space, both in London and Birmingham, that additional buildings have been necessary.

Change of Address

Mr. David Evelyn Nye, A.I.A.A., architect, has removed his offices to Pereira House, Tufton Street, Westminster, S.W.1. Telephone No.: Victoria 6145.

OBITUARY

A. W. S. Cross

It is with deep regret that we record the death of Mr. Alfred William Stephens Cross, M.A. (CANTAB.), which occurred last week in his 73rd year.

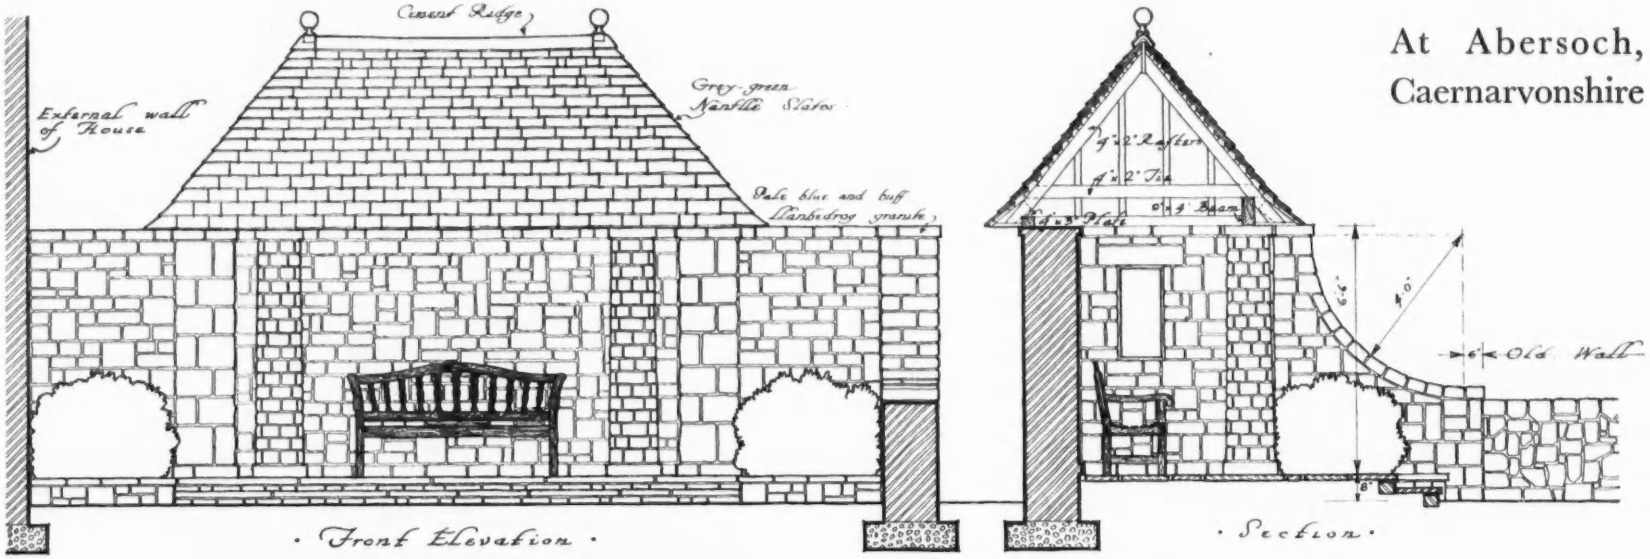
Born in 1860, he received his architectural education at King's College, London, and the National Art Training School, now the Royal College of Arts, South Kensington, and was articled to Alfred Cross, of Hastings and London. He commenced private practice in the seaside town in 1885.

Mr. Cross acted as professional adviser and assessor in many competitions, and served on the Council and various committees of the R.I.B.A. Among the large number of buildings for which he was responsible were the following:

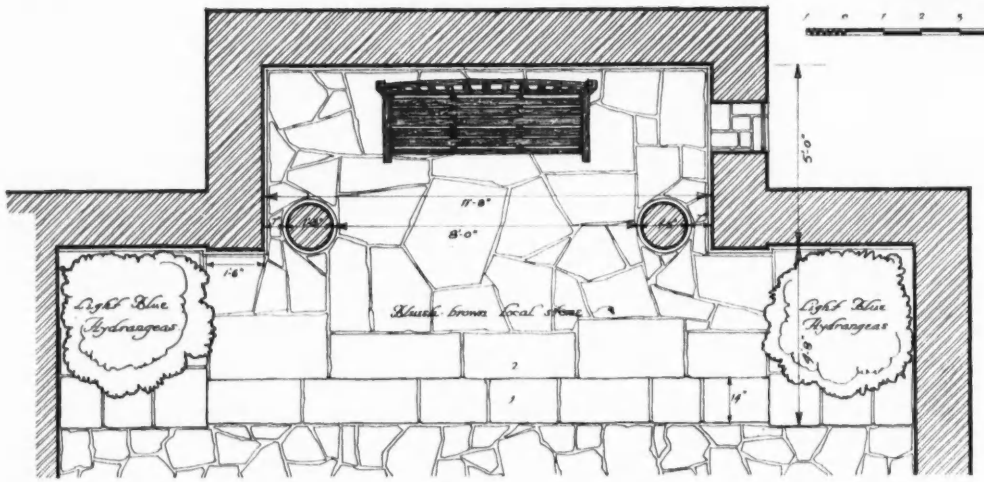
Municipal School of Technology, Manchester; the Town Hall, Shoreditch; additions to St. John's College, Cambridge; Memorial Laboratories, Aberystwyth University College; Merchants Venturers' Technical College, Bristol; public baths at Dulwich, Camberwell, Hampstead, Wandsworth, Walthamstow, Lincoln, Newcastle-on-Tyne; schools at Finchley, Poplar, Hampstead, Cricklewood, Kentish Town, Hendon, and New Barnet; Congregational Churches and schools at Harlesden and West Hampstead; and working men's clubs and houses in London and the provinces. Some of the above-mentioned work was carried out in collaboration with his son, K. M. B. Cross, M.A., F.R.I.B.A.

His publications included *A History of Architecture; Rome in the Augustan Age; The Crowning Quality of Architecture;* and *Practical Notes for Architectural Draughtsmen* (series I in collaboration with Alan E. Munby, F.R.I.B.A.; series II and III with K. M. B. Cross).

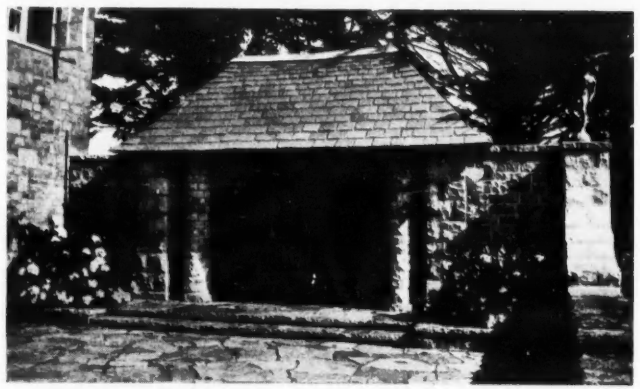
Charles Girault



M. Charles Girault, the French architect, has died at the age of 82. He designed the Petit Palais in Paris, and many other buildings throughout France.

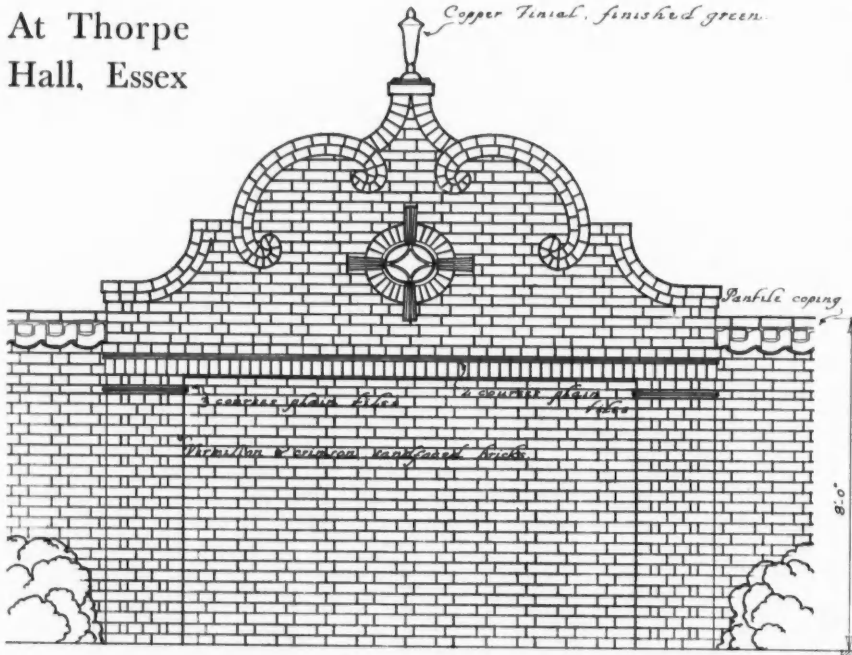


Architect's Will

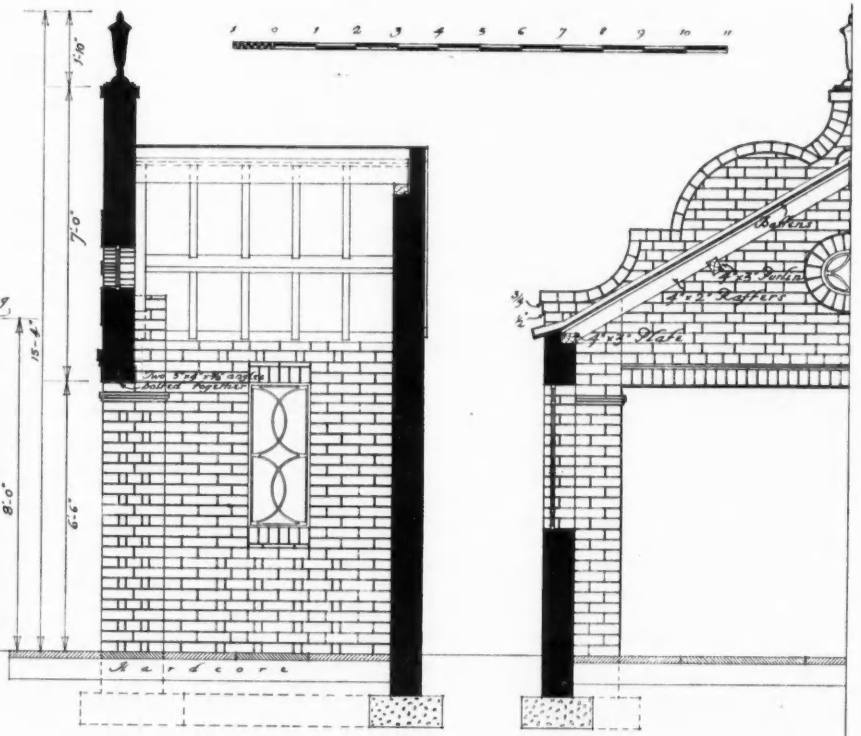


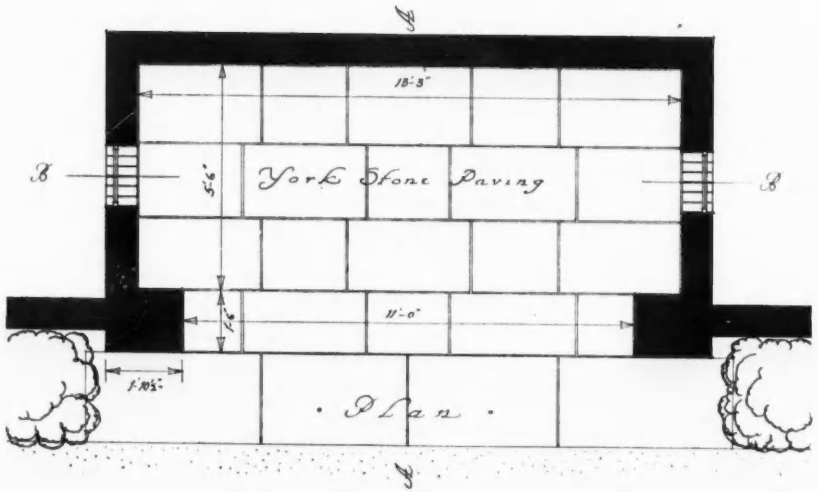
Alderman Thomas A. E. Buttery, of High Street, Morley, retired architect and surveyor, who died on October 16, left £27,432 12s. 1d. (net personalty £24,141 9s.).

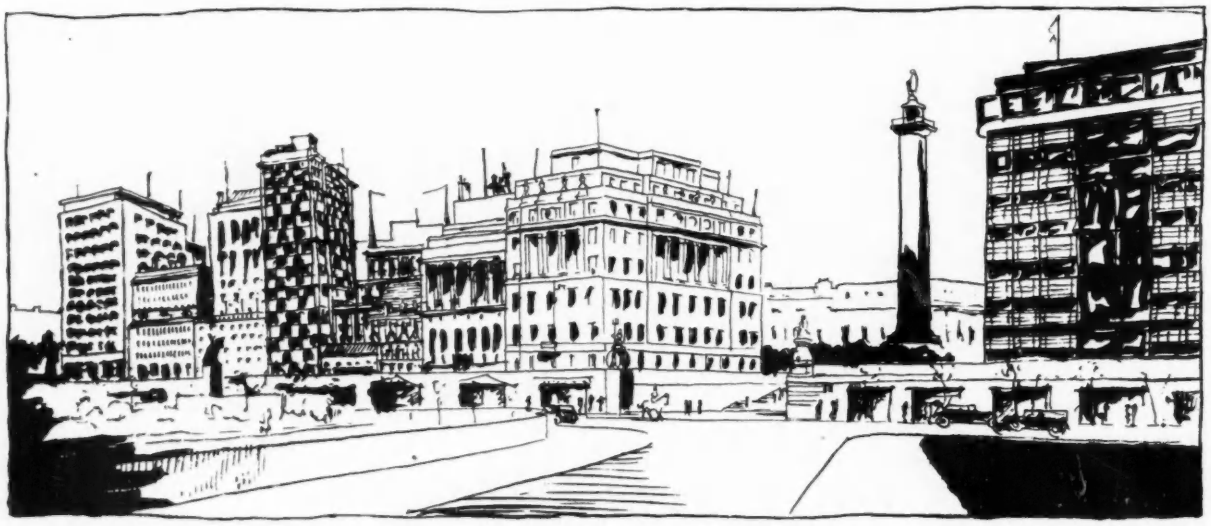
TWO GARDEN PAVILIONS: DESIGNED BY MINOPRIO AND SPENCELY



At Abersoch, Caernarvonshire







At Thorpe Hall, Essex

John J. Blower, in a letter on this page, suggests that a scheme for Carlton House Terrace something after the lines of the above sketch would be more likely to satisfy people. It has, he says, what one might call a more "general" appearance and is more in keeping with our London streets and our own city style.

LETTERS FROM READERS

Carlton House Terrace

SIR,—I am so sorry that nobody likes the alterations and additions to Carlton House Terrace that Sir Reginald Blomfield has so kindly designed for the Commissioners of Crown Lands. I think it would be very beautiful only perhaps too regular. Don't you think something after the lines of the enclosed sketch would be more likely to satisfy people. It has what you might call a more "general" appearance and is more in keeping with the rest of our London streets and our own city style. After all we have to cater for everybody's likes and dislikes nowadays as it is a democratic age and there is no accounting for tastes anyway, which is what I always say, so perhaps if you published the enclosed sketch of my scheme for Carlton House Terrace, they might stop writing letters.

JOHN J. BLOWER

SIR,—It would appear that your views and most of your correspondents' views on Carlton House Terrace are biased, and I consider this matter should be treated in an absolutely unbiased manner.

Are you really serious in the matter, especially when one of your titled correspondents blames the inferior paint as one of the reasons for the deterioration of the property? The best paint in the world will not hold a building together, nor prevent inferior stucco from cracking or crumbling. This complaint, if taken seriously, shows up the poorness of the construction and design.

It seems farcical to stand up for a horrible stucco-faced building which has to be patched up from time to time, and painted periodically to uphold it, and yet to decry the introduction of the well-designed buildings proposed to be faced with Portland stone.

Another of your titled correspondents, who is interested in the Protection of Ancient Buildings, mentions old Regent Street buildings as eighteenth-century construction. These were built in the nineteenth century. You also have the Secretary for the Protection of Ancient Buildings giving his views.

Why these buildings should come under the category of ancient buildings is beyond the average man's comprehension, as these and the buildings under discussion have no historical or antiquarian value.

Why do you presume that the Commissioners of Crown Lands and their advisers have not arranged a scheme for the ultimate rebuilding of Carlton House Terrace and Carlton Gardens in one proportionate block?

Although I do not know Sir Reginald Blomfield, I know the buildings he has designed have not only the merits of good lines, but have also, what is more important in these days, the merits of good workmanship and suitable materials, and I am glad at least that no freak architect or designer has been let loose on the designs for the proposed new buildings.

W. H. DARK

SIR,—On page 804 of your issue for December 21, your special representative for Parliamentary affairs says, with reference to Number 4 Carlton Gardens and the Commissioners of Crown Lands:—

"The Office of Works has never been consulted about Number 4 Carlton Gardens, and Members of Parliament take the view that there should be an authoritative statement from Mr. Ormsby-Gore, the First Commissioner."

To the purist in style and expression this statement is not misleading; Mr. Ormsby-Gore is the First Commissioner of Works. To the layman, the statement implies that he is First Commissioner of Crown Lands. The essence of the present widespread agitation against the administration of the Crown Lands is that they should be transferred from the existing office to the enlightened control of men like Mr. Ormsby-Gore and Sir Lionel Earle, the Permanent Secretary of the Office of Works.

It is a grotesque anomaly that Nash's supreme example of town-planning should be administered by the gentlemen of the Woods and Forests, answered for in the House of Commons by the gentleman of Agriculture and Fisheries, and in the Lords by the gentleman of the Air. It can happen only rarely that aeronauts find the occasion to equip themselves with rakes and turf-cutters in order to pursue the nimble trout through the hazel-groves and oak-forests of Regent Street.

A. G. MACDONELL

Jerry-building

SIR,—It is a well-known fact that it is far easier to criticize another man's work than to do the job better oneself, and when Mr. Richard J. Jenkins asked me, in your issue for December 21,

to give three designs for small houses (suitable for speculative building), both architecturally correct and attractive to the man in the street, his admission that the problem is enormous was only too true.

The subject of speculative house building may be viewed from three standpoints. In the first place there is that of the builders, whose only consideration, not unnaturally, is pounds, shillings and pence. Knowing that they readily can sell a certain type of house, they supply that type by the thousand. Secondly, there is the general public, provided for so long with houses of the type I illustrated in my previous letter, and who have become insensible to their ugliness because they have no standards by which to judge architecture. Lastly, there is the viewpoint of the architectural profession, presumably qualified to design the perfect house, but lying largely idle owing to its inability to persuade either the builders to supply anything better or the general public to demand it.

I feel confident that if simple, well-designed houses were built on a large scale, the general public would learn to appreciate their undoubted advantages, and that is why I welcome the work of "The Master Builders, Ltd.," described in your issue for November 23, as a good step in the right direction.

The design and production of the small house as a marketable commodity is a subject so vast that many entire numbers of THE ARCHITECTS' JOURNAL would be required to deal with it exhaustively, but possibly a few brief remarks here would not be out of place.

By considering where modern speculative building fails, perhaps it will be easier to see how Mr. Everyman's home might be improved.

Houses are strung out along roads, each plot being as narrow as possible, necessitating the adoption of a more or less stock plan. This plan is repeated indiscriminately for any site, without consideration of aspect, nature of site, possible views to be obtained, or any other circumstances that should be taken into account when planning a building. Every house is designed solely for the "front elevation," which is usually decked with a few facing bricks, ¾ in. boards (to the Olde English formula), and a dab of roughcasting in a manner calculated to attract—and which *does* attract—the prospective purchaser. These embellishments end abruptly on the front angles, and sides and backs of houses merely "come as they will," and are executed, in most cases, in inferior materials.

The improvement of this state of affairs is not to be achieved merely by designing a number of types of houses, no matter how pleasant, for so long as the practice of cutting up land into long strips with small road frontages continues, there is little likelihood that it will be possible to use the more suitable plans.

The problems of planning should be tackled immediately it is decided to develop a district for residential purposes, when roads, plots and the houses themselves should all be set out in proper relation to one another. The houses, especially in the case of smaller properties, should be designed with a view to the harmony of the general effect, rather than they should each shriek their own individuality. This is not news, I know, but it will bear repetition.

In answer to Mr. Jenkins, I enclose a sketch of a pair of small houses which I think, in these days of conflicting views, might be considered by some to be architecturally correct, and also attractive to the man in the street.

KENNETH W. BLAND

A sketch of a pair of small houses by Kenneth W. Bland. In a letter on this page he suggests that in these days of conflicting views these houses might be considered by some to be architecturally correct, as well as attractive to the man in the street. Approximate cost at 1/- per cubic foot = £1,330. Materials: Ground floor walls and chimneys, hand-made sand-faced stocks, 11¼" hollow; first floor walls, 9" thick, of brick-on-edge in "rat trap" bond, covered with feather-edge boarding, painted creamy-white or stained dark. Roof: Dark hand-made, sand-faced tiles. Windows: Wood frames, with either wood or standard steel sashes.

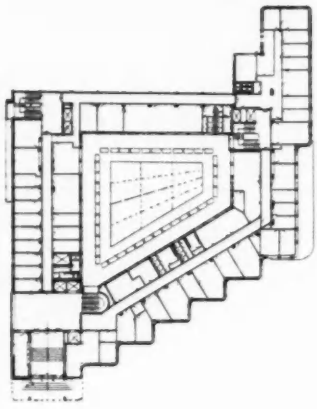
A House at Sanderstead

SIR,—I take strong exception to your note following the letter of Mr. Oliver Law, in THE ARCHITECTS' JOURNAL for December 21, relating to a house at Sanderstead designed by me.

The photograph, plans and note which you published, and for which you now apologise to Mr. Law, were furnished at your request.

Not knowing why this modest piece of building should receive notice in your paper, and not being a candidate for the honour, I wrote asking whether you were "pulling my leg."

On being asked a second time, I sent you the material, which you published with the addition of my name under your editorial style, as I now learn, with "an ironical intention." To hold up to ridicule a private person who received public notice through your own action, is, as I submit, in bad taste.



H. CARTER

[*We agree, and must therefore express our apologies to Mr. Carter. Actually, it was not the building which evoked the "ironical intention," but a passage in Mr. Carter's notes, which read: "The adventure of building without an architect might have been disastrous, and would have been less enjoyable, without the sympathetic co-operation and scrupulous dealing of the builder." For an architectural paper to receive such sentiments seemed to us too good a joke not to be shared with other architects, and it was in that spirit we printed them.*—ED., *A.J.*]

[Owing to the pressure on our space we are compelled to hold over several letters from this issue.—ED., *A.J.*]

THE SHELL-MEX BUILDING, BERLIN:

The plan of this building is dictated by the shape of the site, roughly a right-angled triangle, with a block of offices on each of its sides, and a single central area. The hypotenuse is treated as a series of receding planes, or set-backs, in order to provide a maximum amount of daylight in the offices, and incidentally an interesting external form. The walls are faced with thin slabs of Cannstadt travertine, laid like tiles without visible bond and swept round the curved angles of the receding bays on the principal façade. The elevational treatment is vigorous, and interest is derived from proportion and the intelligent use of material. There is no sign of the indulgence of personal decorative fancies.

Mr. Raymond Mortimer, in an article on the Shell buildings in London, Berlin and Hamburg in the current issue of *The Architectural Review*, from which the accompanying photographs and plan are reproduced, says: "The Shell House in Berlin is, in my opinion, the finest office building in the world. It is modern without being merely utilitarian, imaginative without being fanciful. Its only grave fault is the cut-away entrance."

DESIGNED BY PROFESSOR EMIL FAHRENKAMP

LAW REPORTS

QUESTION OF SINGLE PRIVATE DRAIN

Hills and another v. *Mayor, etc., of Aldershot.—Court of Appeal. Before Lords Justices Scrutton, Lawrence and Greer.*

THIS was an appeal by the applicants, who were the executors of W. T. Hills, deceased, the owners of three houses in Edward Street, Aldershot, from a decision of the Aldershot magistrates, who held that the applicants were liable to pay a sum of £73 to the Corporation of Aldershot in respect of their share of the cost of repairing certain drainage pipes.

A single conduit or pipe took the drainage of 15 houses, and of these the applicants owned three. The Corporation carried out certain repairs to pipes and sought to recover from the applicants the amount apportioned to them. The Aldershot magistrates held that the applicants were liable, and this decision a King's Bench Divisional Court affirmed.

Mr. Glen, for the applicants, argued that the pipe was a sewer vested in the local authority and not a single private drain within the meaning of Section 19 of the Public Health Act, 1890.

Mr. Moresby represented the Corporation, and argued that the decision arrived at was right in law.

The court allowed the appeal with costs.

Lord Justice Scrutton, in giving judgment, said this was a difficult case, and raised points of law which depended on the effect of numerous and contradictory decisions on the meaning of the Public Health Acts of 1875 and 1890. The question was when a pipe which conveyed sewage was a drain repairable by the owner, and when it was a sewer repairable by the local authority. If he had had a free hand to construe the statutes without reference to decided cases, he would probably have arrived at a different conclusion from that which he had with some difficulty reached. In that case the court was dealing with a length of pipe which had been held to be repairable by its owners as a private drain under the 1890 Act. But by the Act of 1875, once they got the drainage of two buildings into a drain it became a sewer repairable by the local authority. The Act of 1890 made an attempt to deal with the difficulties which arose in Section 19, and provided that the expression "drain" included a drain used for drainage of more than one building, though it appeared to be a sewer under the 1875 Act.

A decision of the House of Lords in the case of the Wood Green Urban District Council v. Joseph, appeared to decide that Section 19 did not prevent pipes carrying only sewage from different houses in the same ownership from being sewers, and that a line composed partly of a sewer under the 1875 Act and partly of a private drain under the 1890 Act could not, as a whole, be a private drain. That appeared to give an absurd result—viz., that a pipe on private land draining six houses in different ownership was a single private drain repairable by the owners, but that if the owner of number six, the house furthermost from the public sewer, also owned number five, the whole pipe would be a sewer repairable by the local authority. That absurdity might be either in the statutes, or if they were ambiguous, in the decisions on their meaning. It was, therefore, with regret that he took the view that the appeal must be allowed and the question in the special case answered by saying that the particular pipe in question was not a single private drain. The result was that the Corporation failed, except in so far as it had been admitted.

His lordship added that he regretted the result, as he thought the consequences of the decision were ridiculous, the thing recorded was the House of Lords' interpretations of the Act of Parliament. He was afraid it was hopeless to ask Parliament to deal with the matter, though the present legislation and the attempts at interpretation appeared to him to be a disgrace to the English Legislature.

Lords Justices Lawrence and Greer agreed.

BUILDING CONTRACT : ADJUDICATION BY ARCHITECT

H. M. Nowell, Ltd. v. *Kingston-upon-Hull Corporation, King's Bench Divisional Court. Before Justices Acton and Talbot.*

THIS case came before the Court on an appeal by Messrs. H. M. Nowell, Ltd., builders and contractors, of Bank Chambers, Stockton-on-Tees, from a judgment of Mr. S. R. C. Bosanquet, K.C., one of the Official Referees of the High Court, in an action they brought against the Kingston-upon-Hull Corporation to recover the sum of £4,896 in respect of extra work entailed in building for the Corporation 374 houses up to the level of the roadways.

The Corporation refused to pay on the ground that acting under the contract their architect had adjudicated upon the question and decided that the work charged for was covered by the contract.

The Contractors contended that there had been no valid adjudication, but when the matter came before the Official Referee he decided in favour of the Corporation and from that decision the Contractors now appealed.

Mr. W. T. Creswell appeared for the appellants, and Mr. W. H. Owen for the Corporation.

Mr. Creswell said the grounds of the appeal were that the Referee was wrong in limiting the inquiry to the question whether there had been an adjudication : in refusing to hear certain evidence by the Contractors, and in holding that there had been an adjudication. The contracts in question were entered into in 1929 and were lump sum contracts, and the sums involved were £81,470 for the Inglemire Lane and £55,224 for the Derringbank Farm Estates, and the sums now claimed were in respect of having to raise the houses to the levels of the roads made by the Corporation. The Contractors regarded this work as extras, but the Corporation alleged that the contracts being lump sum contracts, included this work. In some cases the houses had to be raised as much as 5 ft. 6 ins.

The Corporation alleged that the work had been done without a written order and that the claims were adjudicated upon by the architect and disallowed. He (Mr. Creswell) contended that there had never been a valid adjudication.

Without calling upon Counsel for the Corporation the Court dismissed the appeal.

Mr. Justice Acton in giving judgment said that the only question before the Official Referee was whether there had been a proper adjudication by the architect, Mr. Harvey. The contract provided that in all questions arising between the Corporation and the Contractors the decision of the architect should be final. It was true that a year before when the work was not complete Mr. Harvey had expressed the opinion that the extra digging was not outside the contract. When the work was completed the plaintiffs laid the whole matter before Mr. Harvey, who then decided that the plaintiffs were not entitled to any extra payment. The inquiry was one to which no exception could be taken, and seeing that the plaintiffs submitted their case to Mr. Harvey they could not say that he was not a fit and proper person to hold it. The Official Referee's decision on the matter was perfectly correct and the appeal failed and would be dismissed with costs.

Mr. Justice Talbot concurred.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

PARLIAMENT adjourned for the Christmas Recess on December 22, and will meet again on February 7.

Slum-clearance and Housing

Mr. Buchanan asked the Minister of Health if he would state the number of slum-clearance and re-housing schemes approved under the Housing and Slum Clearance Act, 1930, up to the most recent date at which such information was available ; the number of houses and tenements, respectively, completed, together with the number of persons removed from houses condemned ; and the number of persons for whom new houses or tenements had been provided under the 1930 Act up to the same date.

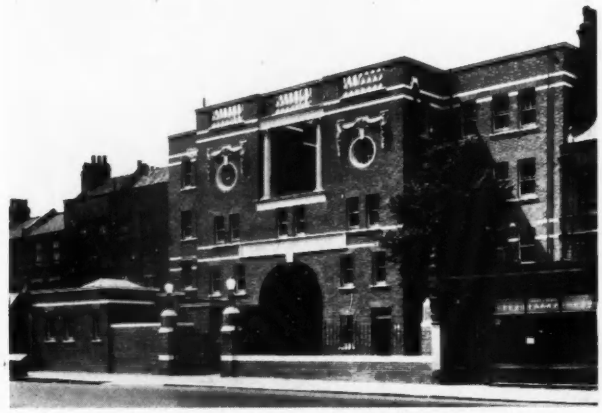
Sir Hilton Young said that up to November 30 last he had received resolutions declaring 580 areas in England and Wales to be clearance areas. 6,451 dwellings had then been completed. He was not able to say how many of these dwellings were houses, flats or tenements respectively. Up to September 30 last 23,829 persons had been removed from houses demolished or closed. The houses completed provide, according to the standard laid down by Section 37 of the Act, accommodation for 30,928 persons.

In reply to a question by Mr. Buchanan as to Scottish housing progress, Mr. Skelton, Under Secretary for Scotland, said that up to December 20 proposals had been approved by the Department of Health for Scotland for the provision of 13,765 houses with assistance under the Housing (Scotland) Act, 1930. At November 30, the latest date for which information was available, 3,950 houses, including 604 in tenements, had been completed and 6,983 houses, including 2,698 in tenements, were under construction. At September 30 24,329 persons had, in consequence of action taken under the Act, been removed from condemned houses.

Earl Haig Memorial Statue

Lt.-Col. Moore asked the First Commissioner of Works what was the present position with regard to the memorial statue to the late Field-Marshal Earl Haig, and at what date it was expected that the statue in question would be erected in public.

Mr. W. Ormsby-Gore said that the sculptor was now at work on the full-size clay figure. Under the terms of the contract, the memorial should be ready for erection in the summer of 1934.

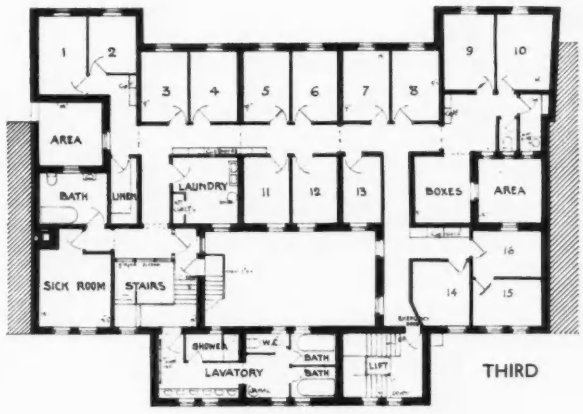


Subsidy for Cottages

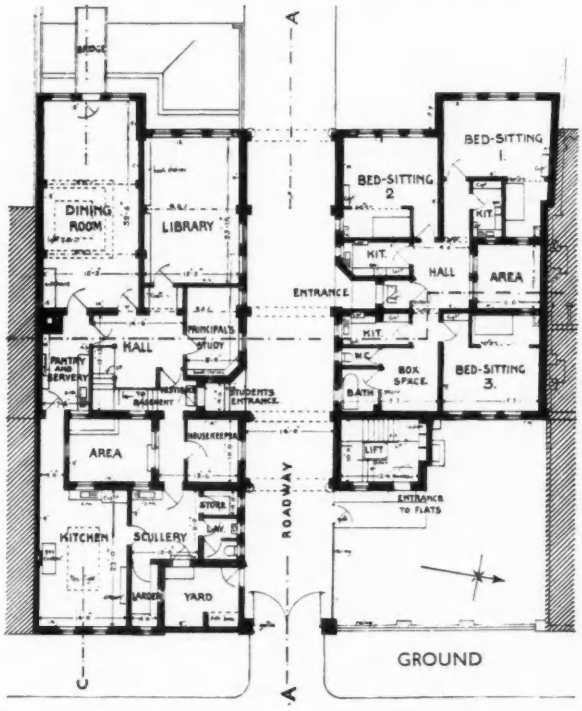
R. N. writes : "*Is there any subsidy still available which would assist my client, a private person, to build cottages and, if so, under what conditions ?*"

There is no direct subsidy at present to private enterprise, but your reader would be well advised to communicate with the clerk of his local authority in case help in the form of a loan might be forthcoming under the Small Dwellings Acquisition Act. B. S. T.

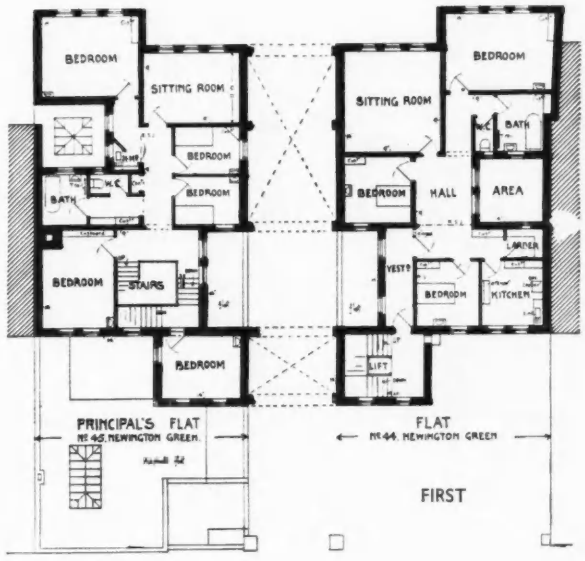
Messrs. A. S. R. Ley and Son, chartered architects, of 214, Bishopsgate, E.C.2, and Messrs. J. R. Moore-Smith and Colbeck, chartered architects, of 14 Union Court, Old Broad Street, having amalgamated now carry on their combined practices under the style of Ley, Colbeck and Partners, at 214 Bishopsgate, E.C.2. Telephone numbers : Bishopsgate 2041-2.



MISSIONARY TRAINING HOME : BY PERCY K. ALLEN



This building for the China Inland Mission occupies the site of Inglesby House, Newington Green, London. On its north side was a much smaller house, with a roadway between. In planning for the new building, the purpose of which is a missionary training home for men and a residence for retired missionaries, there was need for the roadway, in order to reach the mission offices and home, which are in the rear, and at the same time provide separate access for a series of flats. The training home has been placed on the south side of the roadway, and the flats on the north.



In the basement is the men's gymnasium (under the dining room and library), with their lavatory; and the oil-heating plant. The north side basement is occupied by storerooms, etc. The accommodation shown on the ground, first and second floor plans are self explanatory. The third floor is divided into a number of bed-sitting rooms, each with its own kitchenette, for retired lady missionaries.

Externally, rubber brick arches and artificial stone dressings have been relied upon for decoration. Internally, the patent fireproof floors are covered with compressed cork, and the stairs are in Hopton wood marble-stuc.

LITERATURE

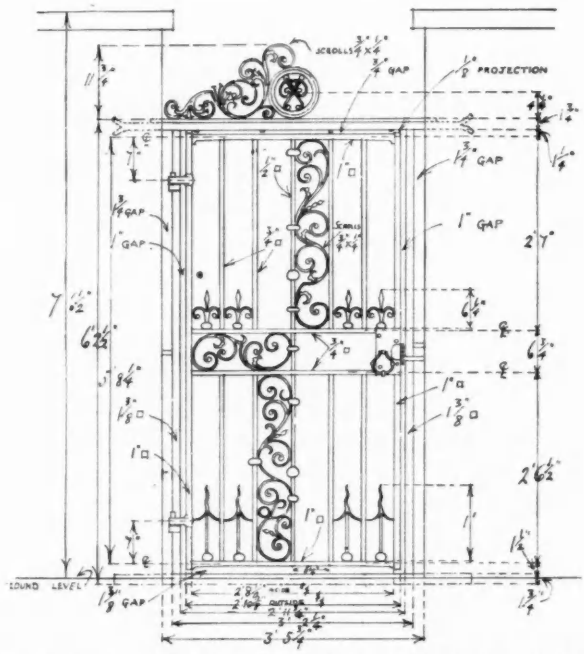
The Devon Smithy, Whimple.

DECORATIVE WROUGHT-IRONWORK

The Din of a Smithy. By J. A. R. Stevenson. London: Chapman and Hall. Price 15s. net.

THE Rt. Hon. Walter Runciman, in his foreword, rightly states that this is a book full of vitality, written by a man who has been happy enough to find his vocation in a field where he has few rivals. The tone of the book from beginning to end is happy. There is the happiness of the artist and of the young man who has done a thing well and knows that he has done it well. He can also congratulate himself in these days of mass production on having demonstrated the virtues of a small unit.

Mr. Runciman continues:



All over the world there has been a tendency, for at least a generation, to imagine that all our economic ills can be cured by cartels, by combines, and by standardization. The larger the organization the more it was commended: the giant was admired for his size. In no one of the great industries was this more marked than in the manufacture and use of iron. It is in this very region of iron that J. A. R. Stevenson challenges so many of our cherished conceptions. He regards ironwork as an art, the giant of mass production is to him an ogre, and he sends from a smithy in Devon a challenge to all the mob who take their philosophy from America. When he left Cambridge, he might successfully have gone into one of our great iron and steel firms and have been engaged at a table or in a laboratory for eleven months in the year. . . . Instead, he has established himself down at Whimple as a maker and an artist. It is as an artist he writes. . . .

Mr. Stevenson, in the first chapter, tells us of the jobs he performed after leaving Harrow in 1919 until he became—to use his own words—a specialist in the designing and making of decorative wrought-ironwork.

I have held a Short Service Commission in the Royal Air Force, and have worked at a bench in an aircraft factory. For a time I was a free-lance journalist; then I turned reporter on a London daily newspaper. After this, in 1925, I went to Canada in a tramp-ship with the idea of finding a job of work. But I didn't find a job. In 1926, I suddenly became anxious. I was twenty-five. . . . Now I would settle down, happy thought, in New Zealand and be a farmer. Waiting for the ship which was to take me there I employed the spare time in apprenticing myself to the blacksmith at Payhembury, where I learned to shoe horses. I thought this would be useful to me in the new country to which I was going. The way in which exciting things have their happening is casual; an inclination towards learning to shoe horses and out of this came the Devon Smithy.

A WROUGHT-IRON GRILLE FOR THE PRINCE OF WALES

The grille, made last year at the Devon Smithy, for the Sunningdale residence of the Prince of Wales. The rectangular frame was welded together into one piece, the scroll-ended diagonals being halved and riveted where they intersected with the frame and with one another. Excepting the small scrolls the piece was constructed from square iron of various sections.

of which are reproduced herewith, is a typical example of how important things often happen in a most unimportant way.

One August morning in 1926 someone came to the smithy and remarked to me that there was a fine wrought-iron gate outside the office of Mr. Snow in Cathedral Close, Exeter. We were not very busy that morning. We had made a few shoes and I had sharpened a pick which had been brought in to me on the previous evening just before we shut down for the night. Apart from the need to make a few more shoes for stock it seemed a shame to be indoors on a lovely morning like this : so I put on my hat and jumped on my motor-bicycle and went off to see this gate for myself, leaving Harry Potter to mind the forge and to sit at the receipt of custom. Arrived at Exeter I paid a call on the owner of the gate and he very kindly gave me permission to look at it and to make a sketch of it. As I was leaving he told me that one of his clients, Mr. Atherton Byrom, was anxious to find someone to make a copy of it on a smaller scale, to be fixed in the wall of the kitchen garden at Culver. I wrote to Mr. Byrom and he wrote to me and, I think, came to see me : and in one way and another that is how I got the order for my first gate.

The whole gate needed to be re-designed as the opening in the wall, which it was to fill, was narrow. It was impressed on me that I must keep the same effect at all costs. This meant that I should have to be very careful about the design of the "overthrow" which is the first part of a gate to catch the eye.

I enjoyed making that gate : coming my way it had been a great piece of luck. It put Harry and me on our mettle as we had never contemplated anything so ambitious as this, with the result that I had to make many discoveries for myself when we sat to work on it.

For the outer frame we picked good straight bars of 1½ in. by 1½ in. iron. The two verticals are spilled, top and bottom, where they pass through the top and bottom horizontals. These holes in the horizontals were punched whilst the bars were hot—a usual practice, though I am not very keen on doing this nowadays.

The overthrow was made from ¾ in. by ¼ in. flat iron, the scrolls being knob-ended and welded to their neighbours. Each spray on either side of the monogram is one continuous length of iron without a rivet anywhere in the piece. For the moving part of the gate we used 1 in. by 1 in. iron for the frame and ¾ in. by ¾ in. iron for the intermediate verticles and for the centre-horizontals. As in the overthrow all the scroll-work for the panels was made from ¾ in. by ¼ in., each piece of scroll-work being continuous and without rivets.

It was a week or two before Harry and I could get to work on it and several weeks more before we got it finished. But it was completed at last and painted : and I felt mighty proud and happy when I saw it fixed and working smoothly at Culver. Then I went back to the Smithy : there was a fat cheque in my trouser-pocket and shoeing had entirely lost its charm.

Books reviewed in these columns may be ordered through The Architectural Press, 9 Queen Anne's Gate, S.W.1.

TRADE NOTES

Every length of steel conduit manufactured by the members of the Association of Steel Conduit Manufacturers will in future bear the registered trade mark of the Association. This distinctive mark, an illustration of which appears on this page, has been adopted to serve as a guarantee of sound quality—of conduit which is made to the most exacting specification for material and workmanship.

A manufacturer is only permitted to affix this mark where he has undertaken to use such materials and to comply with the form of manufacture laid down by the Association in full knowledge of the requirements of the trade, and the appearance of the A.S.C.M. trade mark upon each length of conduit really places in the hands of the electrical contractor a hall-marked material. The Association standards incorporate B.S. Specification No. 31, and also stipulate that all material despatched shall have been properly tested. The A.S.C.M. conduit is entirely of British manufacture.

It has been possible for some thirty-odd years to be certain as to the quality of wires and cables by specifying C.M.A., but no such assurance has been available for the conduit itself. Thus it has been quite possible in the past for the value attaching to the specified conductors to be nullified by an inferior conduit installation. To overcome all these troubles it is now only necessary for architects to specify A.S.C.M. conduit, knowing that compliance with the specification will provide material of the highest possible quality.

*

The Finland State Railways have placed an order for the bulk of their 1933 requirements of rails and soleplates with two British firms of steel manufacturers, Messrs. Dorman Long & Co., Ltd., and the United Steel Companies, Ltd. The total tonnage involved is slightly in excess of 10,000, with a total value of approximately £85,000 sterling.

*

Mr. William J. Sprague, late joint managing director of Messrs. John Bolding & Sons, Ltd., has joined the staff of Messrs. Shanks & Co., Ltd., 81, New Bond Street, W.1, and Barrhead, near Glasgow.

*

In the foreword to *Factories of Steel Construction*, a brochure just issued by the British Steelwork Association, it is pointed out that "the fallacy that factory buildings must essentially be ugly and confined to the back streets of our cities has definitely been exploded by the many recently erected factories contributing architecturally to their surroundings." To substantiate this statement, a number of factories, designed by well-known architects, are illustrated throughout the booklet.

*

F. MCNEILL & COMPANY, LTD.

Centenary Year

Messrs. F. McNeill & Co., Ltd., of 52 Russell Square, London, W.C.1, the roofing contractors, is celebrating its Centenary this year.

The business was founded by Mr. Forbes McNeill in 1833. Since that date, the names of McNeill and its Lion products have become widely known throughout the building world, and factories have been established at London, Manchester and Glasgow. In the first few years the firm specialized in machinery, and although these particular activities ceased three generations ago, repeat orders for machinery are still received occasionally from different parts of the world. Roofing and underlining felts soon became the chief business, these being manufactured at the Patent Felt Works, Bunhill Row, London. Some uncertainty exists as to the exact date that Bunhill Row commenced making roofing felts, but there is no doubt that it was somewhat prior to 1840. Since then Bunhill Row has continued to manufacture this material, and today is still one of McNeill's most extensive factories.

In 1862 the firm was the sole contractors for roofing, with its asphalted felt, the Great International Exhibition, on which over 1,000,000 ft. was used.

The firm has an unbroken record as Government contractors for over 85 years. During the Great War it was employed by the Government both in manufacturing felts—the output at this time was enormous—and in carrying out roofing contracts for all the War Departments. In addition, the firm supplied the French, American and Italian armies with thousands of rolls of Lion roofing.

McNeill's is manufacturing more than twenty different products.

Progress has been made in many other directions, and during the last ten years, a number of subsidiary companies has been formed, or else a controlling interest acquired, the most notable being the General Cable Manufacturing Company Ltd., of Leatherhead, electrical cable manufacturers.

McNeills remained in private hands until 1910 when it was formed into a private limited liability company. In 1925 it was converted into a public company with an issued capital of £200,000.

THE BUILDINGS ILLUSTRATED

Following are the names of the specialists, general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Petrol Filling and General Service Station (page 7). General contractors, F. Milton and Sons, Ltd. Sub-contractors : Young & Co., structural steel ; W. H. Heywood & Co., Ltd., steel roof lights ; Crittall Manufacturing Co., Ltd., metal casements ; E. Pollard & Co., Ltd., shop windows and lettering ; Johnson and Tanner, Ltd., electrical installation ; Clark and Fenn, Ltd., plasterwork and decorations ; Domolac Co., cellulose paint ; H. Pontifex and Sons, Ltd., sanitary fittings. The Station is equipped with Wayne's electrically operated wet-hose petrol pumps and Hammonds' oil pumps. Snowcrete white cement was used for exterior.

The Plaza Cinema, Southampton (pages 8-9). Consulting structural engineer, S. W. Budd, A.M.INST.C.E. Consulting electrical engineer : H. M. Winstanley, A.M.I.E.E. General contractors, L. F. Richardson. Sub-contractors : Horseley Bridge and Engineering Co., Ltd., steelwork ; Berkeley Electrical Engineering Co., Ltd., electrical installation and Bio shutters ; Geo. Pixton & Co., Ltd., seating, carpets, curtains and draperies ; London Radiator Heating Co., Ltd., heating and ventilation ; Plaster Decoration Co., Ltd., fibrous plaster ; Mollo and Egan, decorations ; Alfred Goslett & Co., Ltd., sanitary fittings and mirrors ; Swanser and Son, Ltd., canopy and metal work ; Thos. Cook, Ltd., entrance hall floor ; F. H. Pride, electric light fittings ; Blokcrete Co., Ltd., balcony steppings and pre-cast steps ; Stuart's Granolithic Co., Ltd., stonework ; Hoffman Sprinkler Co., Ltd., fire equipment ; Walter Cassey, Ltd., ironmongery ; W. James & Co., Ltd., metal windows ; Middleton Fire Clay Co., faience plinth ; John Compton Organ Co., Ltd., organ ; Knight & Co., Ltd., console lift ; Wainwright and Waring, Ltd., leaded glazing.

Housemaster's New Quarters, Mill Hill School, N.W. (pages 10-11). General contractors, Arbro, Ltd. Sub-contractors : James Gray (1925), Ltd., hot water services ; Mathew Hall & Co., Ltd., internal plumbing ; Smith Major and Stevens, Ltd., dinner lift ; Hendon Electric Supply Co., Ltd., electric lighting ; G. Mathews, Ltd., fireplaces ; Metro-Vick Supplies, Ltd., electric light fittings.

China Inland Mission, Men's Training Home, 44-45, Newington Green, N.16 (page 21). Surveyors, E. J. Burr, Son and Nunn. General contractors, Allen Fairhead and Sons, Ltd. Sub-contractors : H. Young & Co., Ltd., steelwork ; Stoneware (1928), Ltd., and Midhurst Brick Co., Ltd., bricks ; Empire Stone Co., Ltd., stone ; Kleine Co., Ltd., fireproof floors ; French Asphalte Co., Ltd., asphalt ; Cork Insulation Co., Ltd., floors ; J. Whitehead and Sons, Ltd., tiling, terrazzo, and stairs ; Hayward's, Ltd., escape stairs and roof lights ; Shanks & Co., Ltd., sanitary fittings ; Drake and Gorham, Ltd., electric lighting ; Hammond Bros. and Champness, Ltd., electric lift ; Birmingham Guild, Ltd., wrought-ironwork ; Yannedis & Co., ironmongery ; Richmond Gas Stove Co., Ltd., gas cookers ; G. N. Haden and Sons, Ltd., central and domestic heating.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

The COULSDON U.D.C. has granted consent to Messrs. Harold Williams, Holliday and Partners for the erection of eight houses to the acre on land in the centre of the Mitchley Wood estate.

Plans passed at COULSDON: Two new roads, off Woodplace Lane, for Messrs. Franks Harris Bros., Ltd.; house, Coulsdon Road, and house, Howard Road, for Messrs. Sinden; house, Winifred Road, for Mr. H. J. Salter; pavilion and dressing-rooms, Ashdown Park Hotel, Woodplace Lane, for Mr. F. Sutton Smith; house, Canons Hill, Old Coulsdon, for Mr. J. J. Pink; two houses, St. Andrews Road, for Mr. W. C. E. Ingram; house, Marlpit Avenue, for Mr. J. E. Fox.

The EALING Education Committee is to provide a school for 800 children on a site at Perivale.

Mr. T. Brammal Daniel has prepared plans for the erection of shops and flats on the Station site at EALING BROADWAY.

Plans passed by the EALING Corporation: Eight houses, Park Avenue, for Messrs. B. Smith and Son (Builders), Ltd.; 44 houses, Launceston Road, and 44 in Torrington Road, for Messrs. Swannell and Sly; three shops, Meadow Parade, for Mr. P. P. Langdell; three houses, Perivale Lane, for Messrs. W. P. Hughes & Co., Ltd.; eight houses, North Circular Road, for Messrs. R. Lancaster and Sons; two shops, Bilton Road, for Mr. G. L. Russell; eight houses, Tavistock Avenue, for Mr. A. Murdock; ten houses, Clauson Avenue, for Messrs. B. Smith and Son (Builders), Ltd.; three shops, the Broadway, Ruislip Road, for Mr. E. R. Taylor; 19 houses, Cavendish Avenue, for Messrs. G. K. Metcalf, Ltd.; 60 houses, Currey Road, for Bindon Building Co.; eight houses, Sandringham Road, for Mr. A. M. Burgess; 56 houses, Whitton Avenue, for Messrs. Wood and Waller; two bungalows, Marnham Crescent, for Mr. S. A. Todd; alterations, 11-13 Boston Road, for Mr. S. H. West; alterations, 121-3 The Broadway, for London Drapery Stores; alterations, 23-5 New Broadway, for Messrs. Williamson, Ltd.

Messrs. Commercial Structures, Ltd., who are developing the Langhedge estate at EDMONTON, which is now rapidly reaching completion, are acquiring further land in the district for developments.

Plans passed by the MARYLEBONE B.C.: Building site 101-103 Hallam Street, for Mr. T. H. F. Burditt.

Plans passed by the SOUTHALL-NORWOOD U.D.C.: Three houses, Melbury Avenue and one in Sherbourne Avenue, for Messrs. Warren and Woods; hall, shop and garage, Townsend Road, for Mr. M. Cowen; three shops, Western Road, for Mr. A. E. Boot; 62 houses, Waxlow Estate, for Messrs. G. Wimpey & Co., Ltd.

Messrs. Stanley Hall and Easten and Robertson are to construct a bridge across Carting Lane connecting the Savoy Hotel with Shell-Mex House, STRAND.

Plans passed by the WEALDSTONE U.D.C.: Eight houses, Carmelite Road, for Messrs. Lambert and Cooke; five houses, Clifton Road, for Mr. T. Blade; business premises, Kenton Road, for Central Estates Co., Ltd.; two houses, Herga Road, for Mr. W. F. Bunting; six houses, Kenton Road, for Mr. Pateman; alterations and additions, Northwick Park Hall, Hawthorne Avenue, for Northwick Park Halls, Ltd.

The WESTMINSTER City Council is to make a grant not exceeding £20,000 towards the cost of the erection by the Westminster Housing Trust, Ltd., of 180 flats on a site bordering on Pulford Street.

Plans passed by the WESTMINSTER City Council: Building, 51-5 Strand to abut on Durham House Street and George Court, for Messrs. Val Myer and Watson-Hart; frontage line, 44 Vauxhall Bridge Road, for Messrs. Harper and Tunstall; lay-out of site in Horseferry Road, next to Thorney Street, for Mr. E. G. W. Souster.

SOUTHERN COUNTIES

Plans passed at GUILDFORD: Two houses Waterden Road, for Mr. H. F. Thorpe; office and store, Guildford bye-pass, for Messrs. H. J. Greenham, Ltd.; house, Maori Road, for Mr. C. S. Weekes; two houses, Beckingham Road, for Mr. C. T. Corps; house, Recreation Road, for Mr. A. H. Farlow; two shops, Swan Lane, for Mr. P. Porter; house, Poyle Road, for Mr. E. Thompson.

MIDLAND COUNTIES

The Stoke-on-Trent Corporation has approved plans by the Chatterley-Whitfield Collieries, Ltd., for the layout of an estate off Federation Road, BURSLEM.

Mr. S. Wilkinson is to extend the brick and marl works, at High Lane, BURSLEM.

Plans passed at BURSLEM: 14 houses, Leonard Street, for Mr. J. Dickinson; office alterations, Newcastle Street, for Co-operative Society, Ltd.; extensions, Ellgreave Pottery, for Ellgreave Pottery Co., Ltd.; six houses, Edge Avenue, for Mr. T. H. Hand; 56 houses, Cobridge Road, for Messrs. Taylor, Shaw and Bromley.

Plans have been prepared by Messrs. Adams and Edwards, architects, for alterations at Embrey's bakery, FENTON, Staffs.

Plans passed at HANLEY: Nine bungalows, Longton Road, for Mr. A. Perry; two houses, Longton Road, for Mr. A. Lilley; alterations, Pall Mall, for Theatre Royal; alterations and additions, 105 York Street, for Messrs. Howells (Electric Motors), Ltd.; extensions, Caledonia Road, for Verona Specialities; four houses, Peace Street, for Messrs. Tideswell Bros.

Plans passed by the KETTERING U.D.C.: Factory extension, Avondale Road, for Messrs. Wilson and Watson; two houses, Beatrice Road, for Messrs. Phillips and Slow, Ltd.; factory extension, Dalkeith Court, for Messrs. F. H. and H. S. Pochin, Ltd.; four flats, off Pytchley Road, for Messrs. A. P. Lewis and Sons, Ltd.; house, Beatrice Road, for Mr. C. E. Haddon; house, Windmill Avenue, for Mr. A. Ward; house, Netherfield Road, for Mr. C. W. Miller.

The Co-operative Society is to erect shops at Wells Green, NANTWICH.

The Notts. Education Committee has decided to submit sketch plans to the Board of Education of a portion of the permanent school to be erected on the Walesby Road site, OLLERTON, to accommodate 192 scholars. The estimated cost is £6,050.

The Notts. Education Committee has selected a site off Halam Road, SOUTHWELL, for the erection of an elementary school.

The Norton Motor Company has prepared a scheme for the erection of a motor bus garage at the junction of High Street and Whitfield Road, Ball Green, STOKE-ON-TRENT.

Plans passed by the STOKE-ON-TRENT Corporation: Additions, Boothen Old Road, for Messrs. J. H. Barrett & Co.; five houses, Vivian Road, Fenton, for Crown Staffs Porcelain Co., Ltd.; six houses, Grove Road, for Mr. A. Perry; workshops and garages, Kildare Street, Longton, for Mr. W. A. Eyre; alterations, Albion Works, Longton, for Messrs. Taylor, Tunnicliffe & Co., Ltd.; alterations, "Sea Lion" public-house, Cross Street, for Messrs. Ind, Coope & Co., Ltd.; two houses, Stone Road, for Commercial Estates; two houses, Collin Road, for Messrs. P. Bailey & Co., Ltd.; machine shop additions, Princess Street, Fenton, for Berrisford Engineering Co., Ltd.; additions, King Street, Fenton, for Longton Transport, Ltd.; alterations, North Staffs Hotel, for L.M.S. Railway Co.; alterations and additions, Methodist Church, Stafford Street, Longton, for the trustees; six houses, Chaplin Road, for Messrs. Copeland and Hancock.

NORTHERN COUNTIES

The DURHAM Education Committee has instructed the architect to arrange for the erection of temporary portable accommodation at the Bloemfontein, Billingham, Horden and Blackhall Colliery council schools, by direct labour.

Application is being made to the LEEDS Corporation by the Newton Green Sports Club (1932), Ltd., for consent to erect a country club with greyhound racing track, swimming pool, etc., on the Newton Green Hall Estate, Chapeltown Road.

Mr. Edward Fish has prepared a scheme for the erection of 17 shops at Harrogate Road, Moortown, LEEDS.

The NORTHUMBERLAND Education Committee has purchased a site on the Croft Estate Garden City at Forest Hall, for the erection of a school.

The Estate Co. is to develop the Turls Hill Estate, SEDGLEY.

Plans passed at TUNSTALL: Presbytery, Queen's Avenue, for Rev. P. J. Ryan; two houses, Stonleigh Road, for Messrs. R. Ray and Son; alterations, Railway Inn, Lime Street, for Messrs. Ind, Coope & Co., Ltd.,; eight houses, Oxford Road, for Mr. Poole; 18 houses, Goldenhill, for Messrs. Williams and Davies; 30 houses, off Queen's Avenue, for Messrs. Shaw, Taylor and Bromley; house and shop, Ball Green Lane, for Mr. W. T. Bott; additions, Pinnox Tile Works, for Richards Tiles, Ltd.; eight houses, Leek Road, for Mr. T. Talbot.

The WAKEFIELD Corporation is to erect 80 additional houses on the Darnley estate.

Mr. J. H. James has prepared plans for the erection of 34 houses on the Westfield estate, WALLSEND.

The WALLSEND Corporation recommends the erection of 32 houses of the two-roomed type for the aged.

Messrs. Caldow Bros. are to erect shops on the Chester-West Kirby Road, in the WIRRALL rural district, Cheshire.

MISCELLANEOUS

The GLASGOW Corporation Housing Committee has approved a plan, prepared by the director of housing, showing proposals to build six single and one double shops, and eight houses, at West Drumoyne shopping centre.

J. A. R. Stevenson, in *The Din of a Smithy*, reviewed on pages 24-25, writes of the above illustration: "In 1928 we made a funny little gate for G. McKerrow, who lives in Cheshire."

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

• In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

MONTACUTE HOUSE

MEASURED DRAWINGS OF THE GARDEN PAVILIONS

ONE OF THE PAVILIONS OR SUMMER HOUSES

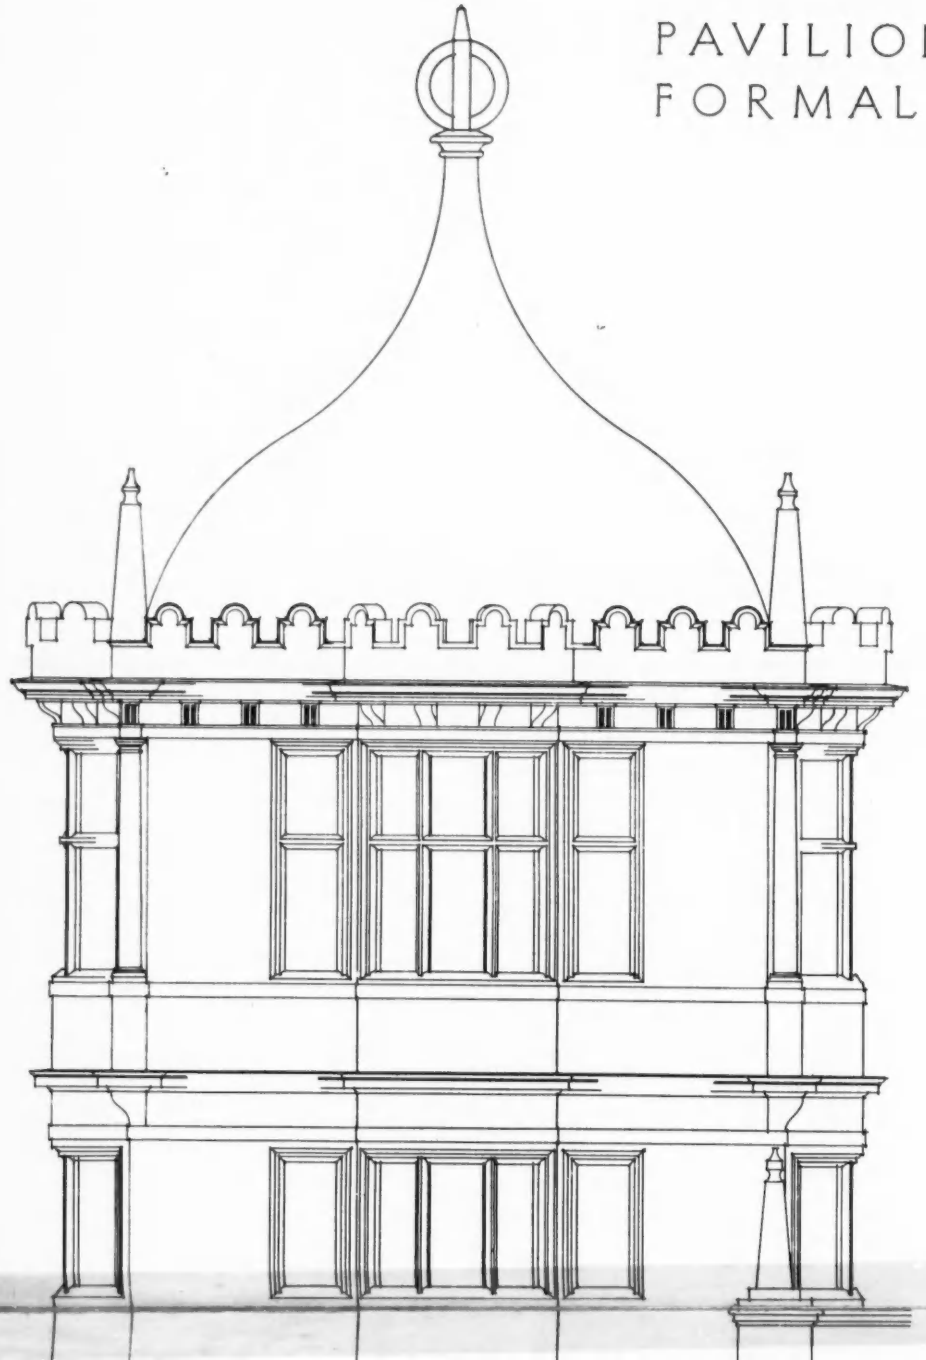
MONTACUTE House, Somerset, which has recently been taken over by the National Trust, was built between 1580 and 1601, and is especially interesting because the formal garden was laid out at the time the house was built and forms, with it, one complete design.

The principal rooms of the house are on the east side and overlook the formal garden, which consists of a large lawn, surrounded by paths and flower-beds, and enclosed on three sides by a high balustrade; in the centre of the eastern side are gates leading to an avenue of trees in the park, laid out on the central axis of the house.

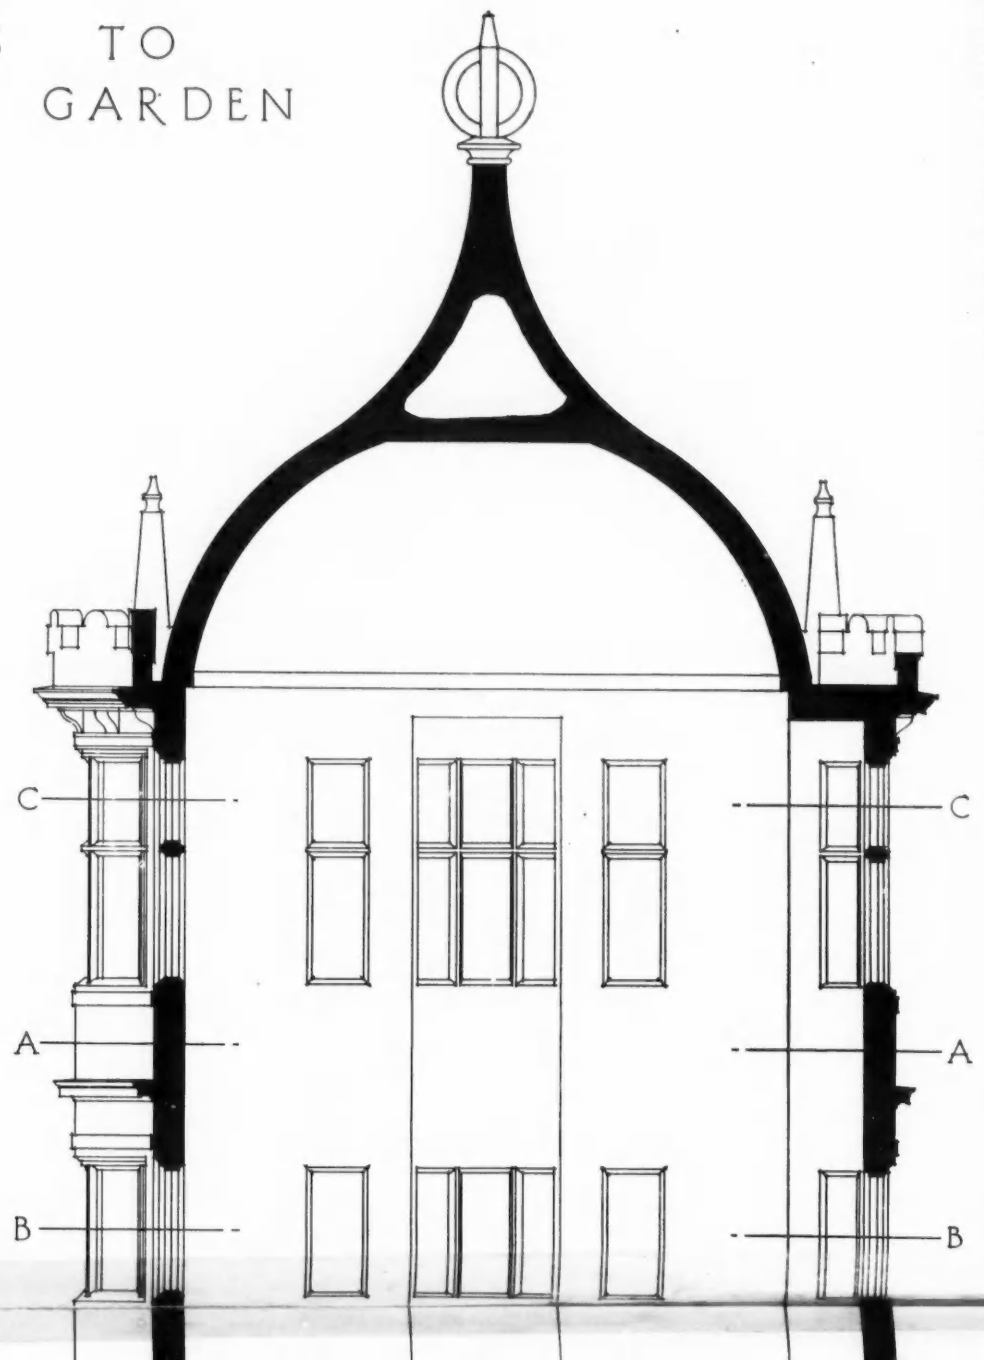
A central doorway (see block plan reproduced overleaf) gives access from the house to a raised terrace, contained within the projecting wings of the house, with steps leading down to the garden. Gates in the north and south sides of the garden lead to other gardens, laid out on an axis passing through these two gates. The layout of the grounds is thus governed by two main axial lines at right angles to each other.

The smaller measured drawing, on the last page, gives a plan and elevation of the eastern balustrade and gateway, and shows the position of the two pavilions. The balustrade on this side has been built three feet lower than those on the north and south, in order to provide a view of the park. The outline of the house is given to indicate how the main characteristics of the design have been kept throughout. The curved roofs of the pavilions match the gables of the house, and the finials of the pavilions and balustrade are similarly characteristic.

The large drawing overleaf gives details of the two pavilions, or summer houses, in the north-east and south-east corners of the formal garden. Internally, each has a single room, 14 feet 6 inches square by 25 feet high.



The external characteristics are in keeping with the design of the house. The curved roof is covered with slates, and terminated by a curious hooped finial, which is repeated on the gate piers. The detatched Doric columns, supported on brackets, and springing from above the lower range of windows, together with the bracketed frieze, are the result of the necessity of obtaining a continuous internal gutter to the roof. The entablature is of classical design, with battlemented blocking course. The whole, including the mullioned and transomed windows, is typical of the Elizabethan period, in which classical detail was applied in a tentative manner to Gothic features.



Ham Hill Stone from the neighbouring quarries has been used throughout. These quarries have supplied the material for the many beautiful and historical buildings in the surrounding district, of which Montacute, with Brympton D'Evercy, and Forde Abbey, already illustrated in supplements, are outstanding examples.

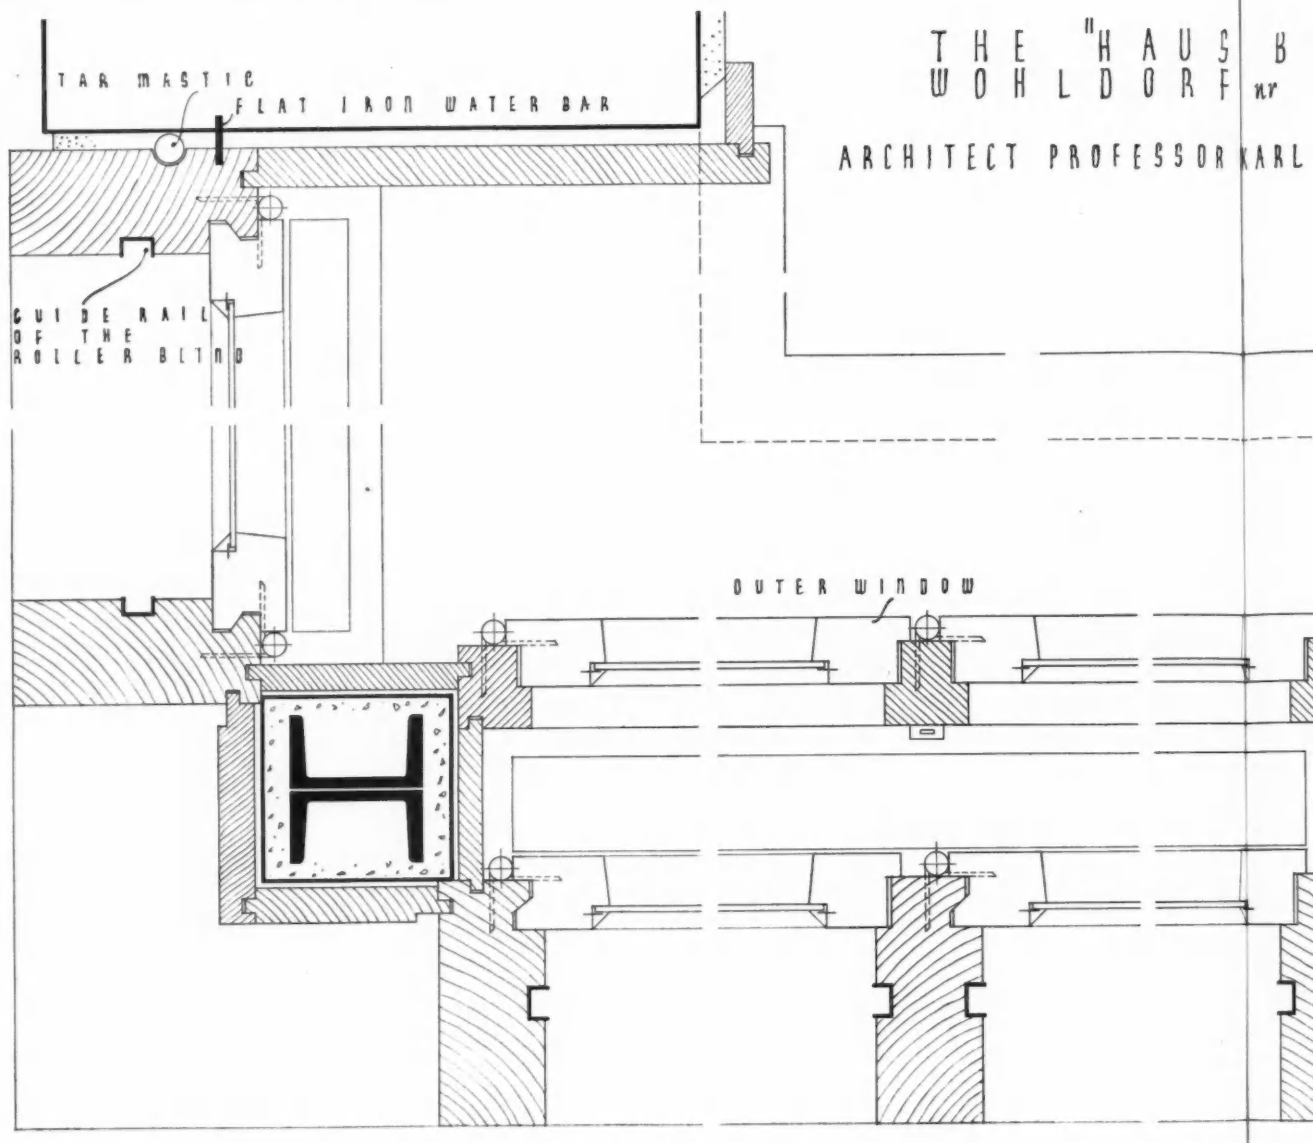
THE "HAUS BAUER" NEAR HAMBURG

DETAIL DRAWINGS OF CORNER WINDOW: : PROFESSOR KARL SCHNEIDER, ARCHITECT

THE GARDEN SIDE OF THE HOUSE AND SWIMMING POOL IN ITS TREE-ENCIRCLED SETTING



IN spite of its Italian appearance, this house stands in the somewhat rigorous climate of North Germany. Its low but attractive clean lines stretch in front of woodland, and are in close relation with the garden. Its spreading outlines freely express the various room-forms and afford sheltered retreats, large corner-windows, almost like verandas, and spacious, sunny lounges in the open air and on the terraces. Obviously it is designed to make the most of sunny hours, which in Hamburg are not very numerous, and, seen through the mists and rain of the North Sea, it will appear less convincing. But it is built to meet the modern inclination for light, air and country surroundings. The technical problems of building such a house to withstand the rigours of a northern climate are exacting, but they can certainly be solved without making the cost prohibitive.

The "Haus Bauer" contains a single living room, a dining room, two bedrooms and offices. The walls are built of brick, faced with klinker on the exterior, and are treated with two coats of mineral colour. In winter the windows can be doubled by the insertion of inner panes, and are given additional security by shutters. The roof consists, counting from above downwards, of a layer of gravel, two thicknesses of dressing, cemented together, wood rafters, with between the timbers pounded clay, inner rafters, and woven reeds with shield dressing. On the top side of the roof lie, upon the gravel, wooden gratings.

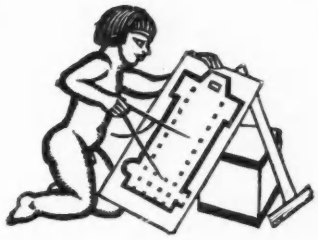
WASHING : A TALE OF TWO CITIES

DALMUIR, GLASGOW : FÜCHSENFELDHOF, VIENNA

NO more than a glance is needed to bring home the contrast between these two pictures—one all gloom, the other all gaiety. Yet both show forecourts of workpeoples' tenements—in Glasgow and Vienna, respectively—conjugating the verb "to wash."

Something must be allowed for northern mists and southern sun, and something for national temperament. But it is man-made conditions that inject into an existence always sufficiently stern the humanity to which mankind is rightly considered heir. There are children in both scenes—in the one, driven by ranks of dank linen to play their meagre games close up against the railings; in the other, frolicking in their own paddling-pool (for the clothes are banished to the communal laundry of the tenement) with so much abandon that mothers must retrieve them with the fist, as one is seen to be doing.

We do not need to see the plans of the Glasgow "flats" to know they are models of gloom, dirt, and darkness, yet an organized effort could give the people of this country living conditions as pleasant as those of the Viennese, at rents no higher than they pay now, and still show a reasonable profit. According to the census of 1931, more than half the population of Glasgow live in dwellings of two rooms or less, and in London the percentage of people living more than three to a room actually increased between 1921 and 1931.



WARNING

Argument was brought to bear, overleaf, on the immediate surroundings of human life in Scotland, which, by the way, are no more deplorable than similar conditions in England. The case for their improvement is irrefutable, the need pressing, and the paradox is that it can not only proceed side-by-side with the rehabilitation of industry, now crippled with paralysis, but can actually contribute to its recovery.

Such sights as that seen above carry a spectacular warning. Industry is shown literally falling to bits. This was a once-prosperous ironworks in the Airdrie district of Scotland. It is now silent and deserted, the fires are cold, and rust is eating away the abandoned plant, so that it stands, precariously, waiting to be engulfed in the dismal swamp, a symbol of what our civilization may look like to the eyes of the future, should it disintegrate, as did the civilization of Rome.

In the article on page 73 Scotland is cited as a concrete example for the application of a reasoned plan of reconstruction. We must reorganize or disintegrate.

ECONOCRAZY*

"I guess I'll have to change my plan."

—Refrain now being played by every dance band in every place where dance bands play.

THE discerning will have noticed that it is the custom of professional papers at this time of the year to adorn the pages of their double numbers with jests and drolleries which would be considered indecorous in spring, summer or autumn. Whether the impulse behind this practice is the desire to be in editorial tune with the glad New Year, or whether it simply represents a praiseworthy wish to bolster up the spirits of the reader against the thought of twelve more insufferable months, we do not presume to say.

At first sight the present New Year issue of the JOURNAL may appear to depart from this happy precedent : it insists upon probing a national sore—the lack of employment in the Building Industry. In other words, it breaks into the field of economics.

Looked at from one point of view, however, the dismal science of *Economics* can be thought of as the biggest joke of all—such a joke that it may yet be the death of us. Certainly, several industries are dying ; though not, unfortunately, with laughter.

The world continues to be full of a number of things, yet somehow we all are not wise and as happy as kings. Despite the fact that food is being dug back into the ground lest it should be eaten, or used as fuel for locomotives, or burnt, or poured into the sea, or simply left to rot on its stalks, the Dismal Science says we cannot afford to have it unless we work.

And when the Building Industry takes off its coat and says : " Here are the men ; here are the machines ; and *there* is the work—"

—" Work ! " screams the Dismal Science." Work ! You can't afford to *work* ! "

A charming dilemma, by means of which the Dismal Science confidently hopes to balance the budget.

But Mr. Meynard Keynes doesn't agree. In a broadcast speech last week he declared that the nation would never balance the budget by adopting measures which reduce the national income, for the simple reason that by recklessly abandoning and preventing activities like building the Government is throwing on the social services an enormous burden of new unemployment which has to be paid for out of taxation—taxation, the yield from which is automatically reduced every time a man goes out of a job.

And why is this curious course being followed? The answer is because, according to the Dismal Science, Industry must be cut to fit Money. Money—the Procrustes bed of Money—is so short that the only way to stop Industry's feet sticking out at the bottom into the cold air of debt is to cut off Industry's head. According to Sir Josiah Stamp, a quarter of the labour and plant of the country are idle.

And what is Money? Money is a token. It is an emblem, an emblem of Industry, invented because it is easier to carry about emblems than chunks of machinery or the products thereof.

So what the Dismal Science is doing—and we may as well enjoy the joke—is to scrap the machinery in order to make the exchange of emblems safe. Or—to borrow from Mr. Eimar O'Duffy a simile which he has borrowed from Mr. Chesterton—the Dismal Science is in the position of a nurse who, finding a particular food does not suit the baby, instead of throwing away the food, throws away the baby.

However, the contortions of the Dismal Science provide a knot which, as the popular song says of marriage, even Houdini can't untie. If the reader is not a professional economist, we would merely ask him to bear the preceding remarks in mind when he wrestles in the following articles with the thorny question of " Reckless Saving."

We do not wish to imply that the only alternative to reckless saving is reckless spending. The whole aim of this issue is to show that money must be wisely, carefully, grudgingly spent, only after the most careful plans have been laid.

That is the whole point : the laying of careful plans.

As we go to press the Russian Five-Year Plan comes to an impressive if rather stealthy end. And at the same time Britain's one executed example of national planning, inaugurated over a decade ago, comes to life. The Grid.

About the Grid much will be found in the pages which follow. Whether the moral that is drawn for the Building Industry by our various distinguished contributors is a sound one the reader will decide, but while on the subject of planning we would draw attention to the distinction made by Sir Basil Blackett (on page 61) between *Planning*, the dynamic principle, and the *Plan*, the static thing.

To paralyse initiative or flexibility by imposing on the country a cast-iron plan would merely be to repeat in dead black all the dark errors we have already committed and paid for heavily, for it is a mistake to suppose that Plans are the perquisite of a depraved

* With acknowledgments to the " New " Art of Technocracy.

Marxian psychotechnic, and that England never had one.

Laisser-faire was a Plan. And a pretty cast-iron one, too.

What we are in need of is some *planning*. The *will* to plan. With the help of the Building Industry, which is, by its nature, a planning organism, we shall get it, and not before it is wanted. It seems that the time is approaching when we must deliberately say to ourselves :

" *Let us reorganize—or disintegrate.*"

NEWS & TOPICS

PISCES

CARLTON House Terrace and Regent Street, being on Crown Lands, are under the direct control of the Department of the Civil Service which used to be called Woods and Forests. This department is answered for in the House of Commons by the Minister of Agriculture and Fisheries. Can it be a pure coincidence that the recreations of Mr. A. S. Gaye, the Permanent Commissioner, as given in *Who's Who*, are " Fishing and Gardening," or is it that his devotion to the salmon-reaches of Carlton House Terrace and the neat shrubberies of Regent Street pursues him even to his recreations ?

*

ANOTHER BRIGHT OPERA-TION

It has been suggested that a new Covent Garden Opera House might be built over the site of the Duke of York's Steps and Column. I agree that it might, but I think it would be a calamity as great as that which now threatens the entire Terrace.

*

The architectural setting of the Column, itself one of the best proportioned monuments in the country, is a work of the very highest merit. We have no other design in which the possibilities inherent in the play of different levels and the contrasts between void and solid and light and dark materials are more happily exploited. Such examples of civic art happen but rarely, and are the outcome of circumstances impossible to re-create. Pictures will continue to be commissioned, and books written, but only special providential dispensations give us a Duke of York's Column with such a setting. To destroy it would be a sin against the generations.

*

WORK FOR ONE THOUSAND MEN

As this page goes to press I receive a letter which confirms Mr. Randolph's argument on p. 65 to the effect that the value of the Grid lies not alone in the distribution of cheap power but in the constructional work it gives outside the electrical industry. It reads :—

We hasten to give you the accompanying information concerning a large contract which has just been placed with the well-known constructional engineering firm Braithwaite & Co., Engineers, Ltd. This comprises welcome news as regards the employment of a large number of men over an extended period, and is, in fact, a noteworthy achievement in the heavy industries.

*

The Swansea Borough Council has placed with Braithwaite & Co., Engineers, Ltd., of Westminster, West Bromwich, and Newport, a contract for the supply and erection of over 6,000 tons of structural steelwork for its new large power station. The work, which will be completed within 12 months, will provide employment for about 1,000 men for that period.

*

NO WHITE MARBLE FOR GRAVESTONES

Some bad things *do* come to bad ends. In recent conversation with a member of the marble trade I listened to a tale of woe concerning the obduracy of the enlightened clergy who forbid the use of white marble for gravestones. It seems that the prohibition has assumed dimensions formidable enough to warrant some firm action on the part of the trade, since persuasion and derision had been productive of nothing helpful.

*

I advised my friend to take an interest in some English stone quarries and some competent designers. His answer was granite; which goes to show that in this life one hill surmounted only brings into view another. For if we attack Aberdeen granite we are of course guilty of lack of patriotism—until such date as Scotland reassumes its sovereign rights.

*

THE ROYAL GOLD MEDALLIST

On Monday night the announcement was made that the Royal Gold Medal for the promotion of architecture is to be presented to Sir Charles Reed Peers, Kt., C.B.E., F.R.I.B.A., Chief Inspector of Ancient Monuments.

*

This award recognizes the work of Sir Charles and that of an extensive body of enlightened people determined that this rapidly changing age should not be bereft of what is left of a wealth of fine and interesting monuments of the past.

*

Sir Charles controls a Government department that contributes to architecture upon a generous scale. Quite recently a further scheduling of buildings was announced.

THE ARCHITECTS' DIARY

WEDNESDAY, JANUARY 11

R.I.B.A., 9 Conduit Street, W.1. Exhibition of the prize drawings for 1932. 10 a.m. to 8 p.m. (Saturdays 10 a.m. to 5 p.m.). Until January 28. **10 a.m.**

TUESDAY, JANUARY 17

LONDON SOCIETY. Visit to the Middle Temple. Assemble at Middle Temple Lane, E.C.4. 3 p.m. Sir Alfred Tobin will conduct the party. **3 p.m.**

and, as we know, this is but a sign of a progressive policy of preservation and rehabilitation, for which we are, as architects, extremely grateful, and for which we can best render thanks by honouring the whole body of preservers in the person of Sir Charles Peers.

*

BENEFITS IN STORE ?

I take my comfort where I find it, these days. And, lo, a grain in the pages of *Old Moore*—or "*Foulsham's* . . . the original and clean Almanack," as it somewhat unfamiliarly, but quite reasonably, describes itself. For what says he of July-to-be ?

*

"It is a good month for the building trade."

*

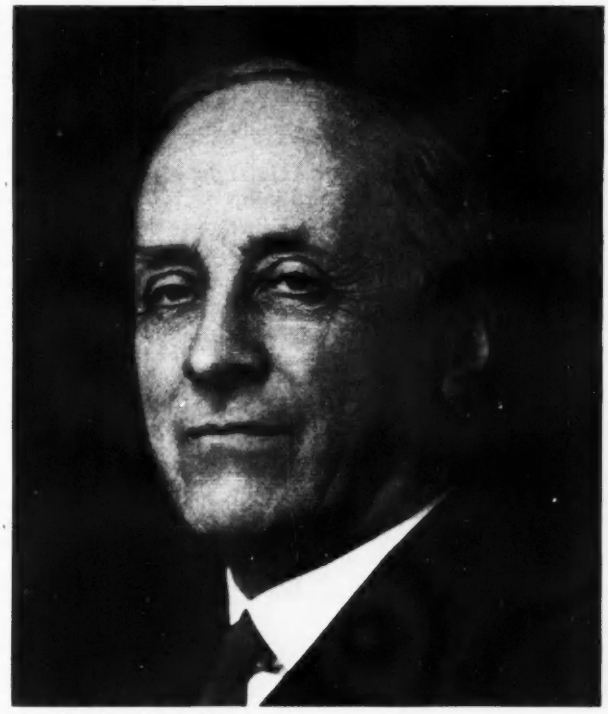
Perhaps it usually is. But on the next page, in the column of predictions for August, there is something more positive :

*

". . . the steel industry will benefit through large orders."

*

In August ! This is but January, and already the steel industry is in sight of one such benefit. Come, come ! Let us take heart. If all this, my friends, does not portend yet more building, let me never trust print again.



*

And so, a Happy New Year to you all—not least to those correspondents the receipt of whose letters has enlivened my labours.

ASTRAGAL

[NOTE : *Astragal's review of "Last Year" appears on pages 87-88.*—ED., *A.J.*]

THE ROYAL GOLD MEDALLIST, 1933

Sir Charles Reed Peers, Kt., C.B.E., F.B.A., M.A., F.R.I.B.A., who, it was announced at Monday's meeting of the Institute, has been nominated by the Council of the R.I.B.A. as the Royal Gold Medallist for 1933. He is President of the Society of Antiquaries, being the first architect to occupy the presidency of this Society ; and has been Chief Inspector of Ancient Monuments for H.M. Office of Works since 1913. He is now recognized all over the world as the foremost authority on his particular subject—the preservation of ancient buildings.

OTHER NEWS ITEMS

Financial Assistance for Housing

Sir Raymond Unwin is calling a private conference to be held next Friday, January 13, in order to discuss proposals for creating a National Public Utility Organization, with the object of obtaining financial assistance for housing, under the Government's new Bill.

The scheme is an ambitious one. There have been at work for the past few years over 250 Voluntary Housing Societies, but some have disappeared and others have become bankrupt. To organize successfully such a Society as Sir Raymond outlines in somewhat vague terms in his memorandum on "The Housing Problem for 1933" means, in the first place, considerable capital, and in the second place skilled administrators. There is talk of raising £2,000,000 for the new venture, but to administer this will need brains and experience, if the money is not to be lost. There is much interest in the question as to who will be Sir Raymond Unwin's associates in this new venture.

Miniature Hospital

The exhibition of the King's Fund Miniature Hospital was opened at the Building Centre, 158 New Bond Street, by the Prince of Wales on Friday last.

The model, designed by Mr. Lionel G. Pearson, F.R.I.B.A., and constructed by Messrs. Humphreys, Ltd., is to a scale of $\frac{3}{4}$ in. to 1 ft. It is approximately 12 ft. long, 4 ft. wide, and 12 ft. high, and is replete with wards and operating theatre, fully furnished with figures representing doctors, nurses, patients, etc. There are also miniature portraits of Florence Nightingale, Lord Lister, Lord Dawson of Penn, and Lord Moynihan, by Mr. Alfred Praga.

The Prince of Wales, at the opening ceremony, said thanks were due not only to the architects and the constructors but to a large number of firms, artists and private individuals who had contributed to the construction and equipment of that unique model. He felt sure that wherever it was shown it would not only arouse the greatest interest in the organization of our modern hospitals but make people realize what splendid work our hospitals were doing for the benefit of the community.

London County Hall

The erection of the fourth and final section of the London County Hall is now on the point of completion. The event is to be celebrated by an afternoon party, given on January 27 by Mr. Angus N. Scott (chairman of the Council) and Mrs. Scott. Owing to existing financial conditions, the Council do not propose to arrange any official ceremonial opening of the new wing completing the whole.

The design of the building by the late Ralph Knott—who died in 1929—was selected in an international competition in 1912. Work was started early in 1913 and, after a lapse in building operations during the war, the main section was finished in 1922. Since Knott's death,

Quotations in this issue from Planned Money, *by Sir Basil Blackett, are by the courtesy of the author and the publishers (Constable & Co. Ltd.); and from* Life and Money, *by courtesy of Eimar O'Duffy, and the publishers (Putnam).*

his partner, E. Stone Collins, has carried on the work. The total cost of the whole project is approximately £3,900,000, of which the final section is estimated at £717,000.

Forthcoming Lectures

The Committee of the London and Home Counties Branch of the Faculty of Architects and Surveyors has arranged for the following programme of lectures to be given at the Lecture Theatre of the Science Museum, Exhibition Road, South Kensington, at 7 p.m., by the courtesy of the Director, Colonel Sir Henry Lyons, F.R.S., during the remainder of the present Winter Session :—

January 18 : "Some Ancient Castles and the Way their Occupants Lived." By Sir Charles C. Allom, F.R.S.A., F.F.A.S.

February 1 : "Fungal Diseases of Timber." By J. Ramsbottom, O.B.E., M.A., Keeper of the Bontany Dept. at the Natural History Museum.

February 17 : "The Work of the British Non-Ferrous Metals Research Association for the Building Industry." By G. L. Bailey, M.SC., who is the Development Officer of that Association.

March 31 : "Copper in Architecture : Some Chemical and Other Aspects." By W. H. J. Vernon, D.SC., PH.D., F.I.C., of the Chemical Research Laboratory at Teddington.

April 7 : "Mastic Asphalts used in the Building Industry : Their properties, manufacture, testing and causes of failure under certain circumstances." By A. Wolf. Lecturer in Oil and Asphalt Technology at the Imperial College of Science and Technology. 6 p.m.

Following is a list of forthcoming lectures to be held at the L.C.C. Central School of Arts and Crafts on Fridays, between 6 and 7 p.m.

January 27 : "General Principles in Regard to the Treatment of Ancient Buildings." By A. R. Powys, F.S.A., A.R.I.B.A.

February 3 : "Ancient Bridges of England." By E. Jervoise, M.I.C.E.

February 10 : "Manor Houses." By R. Minton Taylor, F.R.I.B.A.

February 17 : "Windmills." By Hugh Vowles.

February 24 and March 3 : "Technical Methods to be Adopted in the Repair of Old Buildings." By A. R. Powys, F.S.A., A.R.I.B.A.

All except the first lecture will be illustrated by lantern slides. Admission free. No tickets required.

R.I.B.A.

ROYAL GOLD MEDALLIST

At the general meeting of the Institute, held on Monday night, it was announced that Sir Charles Reed Peers, Kt., C.B.E., F.R.I.B.A. (a portrait of whom is reproduced on the preceding page), has been nominated for the Royal Gold Medal for 1933.

COUNCIL MEETING

Following are some notes from a recent meeting of the Council:

Schools : On the recommendation of the Board of Architectural Education the following decisions were made :—

a : School of Architecture, Glasgow. That the recognition of the Degree Course and the Diploma Course for exemption from the R.I.B.A. Final Examination be continued. That the recognition of the Certificate Course for exemption from the R.I.B.A. Intermediate Examination be continued. *b : School of Architecture, University of Cambridge.* That the recognition of the three years' course (leading to the Final Examination in Architectural studies for the B.A. degree at Cambridge University) for exemption from the R.I.B.A. Intermediate Examination be continued.

c : School of Architecture, The Polytechnic, Regent Street, London. That the recognition of the three years' full-time day course for exemption from the R.I.B.A. Intermediate Examination be continued. *d : Armstrong College, Newcastle-upon-Tyne.* That the recognition of the three-years' Diploma Course and the 3 years' Degree Course for exemption from the R.I.B.A. Intermediate Examination be continued. That the four years' part-time Certificate Course be recognized for exemption from the R.I.B.A. Intermediate Examination. *e : The School of Architecture, Edinburgh College of Art.* That the recognition of the Diploma Course for exemption from the R.I.B.A. Final Examination be continued. That the recognition of the Certificate Course for exemption from the R.I.B.A. Intermediate Examination be continued.

The R.I.B.A. Maintenance Scholarships in Architecture : The Committee report that they have granted renewals of their scholarships for the year 1932–1933 to :—

Ralph Dickinson (£100) (School of Architecture, Birmingham). M. G. Gilling (£100, Artists' General Benevolent Institution Maintenance Scholarship) (Liverpool School of Architecture, University of Liverpool).

The Committee report that they have made the following awards :—The R.I.B.A. Fourth and Fifth Year Maintenance Scholarship of £100 a year to A. M. Irvine of the School of Architecture, Robert Gordon's Colleges, Aberdeen. The R.I.B.A. ordinary Maintenance Scholarship of £100 to E. F. Ward of Northampton. The Ralph Knott Memorial Maintenance Scholarship of £45, tenable at the Architectural Association School of Architecture, to R. L. Townsend.

Rome Scholarship in Architecture, 1930 : The Board reported that the Executive Committee of the British School at Rome had adopted the Faculty of Architecture's recommendation in favour of the extension of Mr. W. G. Holford's Scholarship for a third year.

Sir Arnold Thornely :

The hearty congratulations of the Council were sent to Sir Arnold Thornely (F.) on the honour of knighthood which has been conferred upon him.

Gift of Drawings by Georges Bouet :

The cordial thanks of the Council were sent to Mr. R. Fielding Dodd (F.) for his generous gift of drawings by Georges Bouet.

The Architects' Unemployment Committee :

A special vote of thanks was passed to Mr. Percy W. Lovell for his services to the Architects' Unemployment Committee.

Membership of Committees : Examinations Committee.

On the recommendation of the Board, Mr. Edward Maufe (F.), one of the two R.I.B.A. representatives on the Town Planning Joint Examination Board was appointed to serve on the Examinations Committee.

Salaried Members Committee :

Mr. C. Bertram Parkes (L.) was appointed to serve on this Committee.

Slum Clearance Committee.

Mr. T. S. Barnes (A.) was appointed to serve on this Committee.

Social Committee.

Mr. S. E. Dykes Bower (A.) was appointed to serve on this committee.

Allied Societies' Conference :

Mr. W. F. Hedges (F.) was appointed to serve as an additional member of the Allied Societies' Conference under the terms of Bye-law 81 (f).

Transfer to the Retired Members Class : The following members were transferred to the Retired Members Class :—

As Retired Fellows : Messrs. George Frederick Lake and Edward John May. *As Retired Associate :* Mr. John England Jefferson. *As Retired Licentiates :* Messrs. Benjamin Sagar Dean and Samuel George Walker.

Resignations. The following resignations were accepted with regret :—

Messrs. James Ransome (F.), John Arthur Carter Moffat (A.), William Auger Smith (L.), and John Russell Whitaker (L.).

COMPETITION NEWS

SOUTHWARK TOWN HALL

Is the Southwark Borough Council weakening in its proposal to carry out the new Town Hall? It would seem that such is the case, since, at a meeting of the Council held last week, it was agreed to pay Mr. Cowles-Voysey, whose design was placed first in the competition, £1,445. This sum was claimed by him under the original agreement with the competitors, by which, if the Council did not proceed with the scheme within twelve months, the winning competitor would receive 1½ per cent. of the first £50,000 of the total estimated cost and ½ per cent. of the remainder. As twelve months have elapsed since the award (states *The South London Press*), and the Council have decided to postpone further consideration of a scheme until April, Mr. Cowles-Voysey sent in his account.

It will be recalled that after the Council had expressed their preference for the design of Messrs. Yates, Cook and Darbyshire, Mr. Cowles-Voysey was given the option of collaborating in their scheme or of retiring and accepting a quarter of the fees paid to the firm erecting the building.

Thus, as Mr. Cowles-Voysey has already received £200 premium, the Council have now paid him £1,645 for a design over which they have expressed a preference for another.

Competitions Open

February 1.—The city of Stockholm invites designs for a town plan for the part of the town called Lower Norrmalm. 60,000 kronors (£3,077) in prizes, 1st premium, 20,000 kronors (£1,025).

May 31.—Sending-in Day. Layout of a suburb on the River Escaut, Antwerp. £2,400 in prizes (1st, £800).

Full Particulars of the above competitions were published in our issue for December 7.

The history of reconstruction since the War records many failures as well as successes, and a critical temper has superseded the early optimism which put too much reliance on size and volume and paid too little heed to conservative finance. Nevertheless, the industrial age is transitional, and an organization suited to the twentieth century must be a condition of survival. . . . The portent of Russia cannot be ignored. Under a Communist dictatorship, Russian industry is being reorganized, with, it is true, variable results; but nevertheless the State direction of the industry and the State control of the foreign trade of a vast territory are facts of enormous moment to the rest of the world and particularly to its principal trading nation. British methods and British organization must assert their superiority over those of an ill-disguised tyranny if it should succeed, and in any event they must ensure the prestige of our manufactures.

THE TIMES, April 14, 1932.

FOREWORD

●

[By SIR RAYMOND UNWIN]

President of the Royal Institute of British Architects

●

I HEARTILY welcome the Special Number of THE ARCHITECTS' JOURNAL, which you are devoting to the need for planning on a wider scale. The architect's training naturally leads him to take for granted that the need for planning and designing must be as evident to other people, who have been differently trained, as it is to him. Experience shows that those who are trained to carry out projects put before them, or to carry on business activities in which their attention is concentrated on each transaction, frequently have no such realization of the importance of planning.

The Building Industry as a whole is becoming fully conscious of this need to plan and organize its several sections for fuller co-operation. There is greater appreciation of the part which each section plays, whether as designer, operative, or maker of materials. This mutual understanding should lead to greater efficiency; but you rightly point out that there is need for planning on a wider scale, that the Building Industry may be given the opportunity to play its part more fully in the creation of efficient and comely buildings and towns. There is need, moreover, for the statesman and the financier to realize more fully that planning in time as well as in space is important, and that now is the time to build, and particularly to overtake our housing shortage, when credit and materials are plentiful and cheap, and when labour is not only superabundant, but is costing the community a very heavy outlay for the privilege of maintaining the possessors of all the skill needed, doing nothing, when they might just as well be added to the capital value of the country.

ECONOMY

There are today many well-wishers of their country who believe that the most useful thing which they and their neighbours can do to mend the situation is to save more than usual. If they refrain from spending on buying a larger proportion of their incomes than usual, they believe that they will have helped unemployment. If they are members of Town or County Councils they believe that their course at such a time as this is to oppose expenditure on new amenities or new public works. Now, in certain circumstances all this would be quite right. But in present circumstances, unluckily, it is quite wrong. It is utterly harmful and misguided—the very opposite of the truth. For the object of saving is to release labour for employment on producing capital goods such as houses, factories, roads, machines, and the like. But if there is a large unemployed surplus already available for such purposes, then the effect of saving is merely to add to this surplus and, therefore, to increase the number of unemployed. Moreover, when a man is thrown out of work, in this or any other way, his diminished spending power causes further unemployment amongst those who would have produced what he can no longer afford to buy. And so the position gets worse and worse in a vicious circle.

For what we need now is not to button up our waistcoats, but to be in a mood of expansion, of activity—to do things, to buy things, to make things. Surely all this is the most obvious common sense. For, take the extreme case. Suppose we were to stop spending our incomes altogether, and were to save the lot; why everyone would be out of work. And before long we should have no incomes to spend.

J. M. KEYNES

[*In "The Listener" for January 14, 1931.*]

There is always a moment in political life when original sin emerges to damn even the brightest intellect. In 1920, it took the form of the Geddes Axe, which made quite certain that the industrial leadership of the world, which was then within the grasp of this country, would be effectively transferred to the United States and ultimately to Germany. In 1931, it took the form of the May Report, which again, if I read the situation correctly, has made it quite certain that the financial and commercial leadership of the world will also be transferred to the United States. The economic historian, looking back at these years, will probably brand the Geddes and May Reports as the worst examples of reversion to type recorded in history.

HUGH QUIGLEY

[*In "Industrial Revival through Regional Planning."*]

PART I: BUILD NOW

THE NEW FUNCTION OF THE ARCHITECT

[By HOWARD ROBERTSON]

Chairman of
The Public Relations Committee of the
Building Industries National Council

A good architect or artist is of far more importance at the moment than even a good priest.

Stanley C. Ramsey.

ARCHITECTS in England are just now very much unemployed. But the situation is worse in America. A talented young draughtsman now in New York writes that many of the big offices are practically closed, and their staffs "liquidated"; and that the heads of the firms have gone to the country, which is cheaper to live in, or to Europe, which is cheaper still.

One of these important architects, recently in Europe, not to live, but on business—he is engaged on one of the few large building projects which are going forward—tells the same story; but he suggests that if architecture is once again to revive, this will necessitate a change of outlook and method on the part of the architect.

Men who for years have enjoyed large and lucrative practices are, my informant says, wringing their hands and bewailing the departure of the rich patron. They are waiting for him to return and to supply them with the sort of work which they had before. But this particular architect suggests that such a policy is all wrong; that the architect today must go out and create work for himself by utilizing his capacity to analyse problems and solve them, by proving that his power to plan individual buildings can be extended to planning in general, to planning ahead.

To put his own preaching into practice, my American architect friend is tackling the city housing problem. Not, as he explains, by drawing up schemes in the most approved Continental manner, embodying lavish site planning, gardens, pools and all the amenities which everyone likes but few can afford, but by viewing his problem as that of the minimum conceivable shelter. The planning is of the simplest unit type; the structure is being schemed by technicians to achieve the utmost economy. And every non-essential, such as pleasant things like cupboards, is being wiped out. A cold, hungry and shelterless family would rather have a shelter home without cupboards than none at all. And my friend is even contemplating a flat plan so arranged as to make it possible, if necessary, to do without internal doors, which cost money and form quite an item in a large-scale scheme.

This economic project is perhaps an extreme case; and naturally there are plenty of arguments pro and con the minimum dwelling. But it illustrates an effort to face the facts, to try to build to a cost, providing a rent which families can pay; to produce building which, if not profit-making, is at least sufficiently revenue-producing to support its first costs and overheads.

There are, in England, many architects who are able and willing to serve the community by putting their brains and planning ability to work to help social welfare and industry. They have, in the life of the nation, a particular asset not possessed in like degree by any section of the community. They know how to plan. And they know also how to analyse as well as synthetize. They represent, therefore, at a time when the talent for analysis and planning is woefully absent, a source of potential strength, which is not, alas, being utilized.

It is not utilized because the architect, hampered as he is by his professional status, cannot go out into the worlds of banking, business and industry and sell himself and his ideas; and because the leaders in these worlds do not

realize that the architect is today in a position to be helpful far beyond the limitations of the building contract and its supervision.

Without attempting to answer criticisms of the architect's failure in the past to fulfil all the hopes placed in his power to act skilfully and economically, it is entirely reasonable at this moment to proclaim a high state of competence within the profession. The architect knows the possibilities of structure better than ever before; he recognizes the scope of engineering and of engineers; he has behind him a well-organized industry—tomorrow to be still more powerfully knit under the leadership of the Building Industries National Council; and he has, to reinforce his knowledge of materials, the Government Department of Scientific and Industrial Research, with its continuous work of investigating not only materials of structure but a host of hitherto unexplored problems such as those of illumination.

The client of today should be equally progressive. He should realize that building is not merely a matter for a builder and a surveyor. It may be only that; but if, as a result, it is a building badly placed, served by awkward or inadequate approaches, badly lit and wastefully planned, it will prove to be not only unremunerative but a liability. There are many such today.

To see the results of planning and thinking ahead, pass through the factory belt of the Great West Road, and note how organized effort has built up an efficient nucleus of factories in which men and women can give of their best because their work has been planned for. And see how much finer æsthetically are these bright and well-grouped buildings than the wretched rows of domestic dwellings in the design of which the architect-planner has had no say.

The architect today should study the problem of the factory owner, of the hotel keeper, of the company director, and should be able to advise him not only in his building but in his business; for the welfare of the one is bound up with the other just as much as is the happiness of a working man with his home. The architect does study these problems of business, and he studies building finance to a far greater extent than in the past. But he must do so still more energetically, so that he can prove by actual figures his argument that there are cases when it is better to pull down and build again rather than add another unit to a series of disjointed additions.

There is a vast work of rehabilitation to be undertaken. The fear of taking risks, the inability to look ahead or to follow the progress of our competitors has landed us in England with acres of obsolete factories, miles of potential slums, and streets of offices which have been out of date for decades. All these will have to be swept away, for materially they are a hindrance to revival. The investing public will have to distinguish between the potential asset of the modern building and the liability of the obsolete building. The architects, jointly and singly, will have to force to the front the rôle which they feel they can—and should—play in a national effort towards rehabilitation. The Building Industry, under the ægis of its new National Council, will have to study problems of technique and economics as well as those of organization, and will have to embrace in its survey of current problems such factors as production of materials and their transport, realizing that in these lie the key to the solution of many problems of cost.

Finally, the Government will have to realize the fact that the Building Industry is too large and important to be neglected; that it is an industry which already exports quite heavily—steel windows and sanitary ware are two good instances—and could do so still more; and that a great store of skill and creative imagination within the architectural profession is lying neglected and untapped in a world which can do with an unlimited supply of both.

●

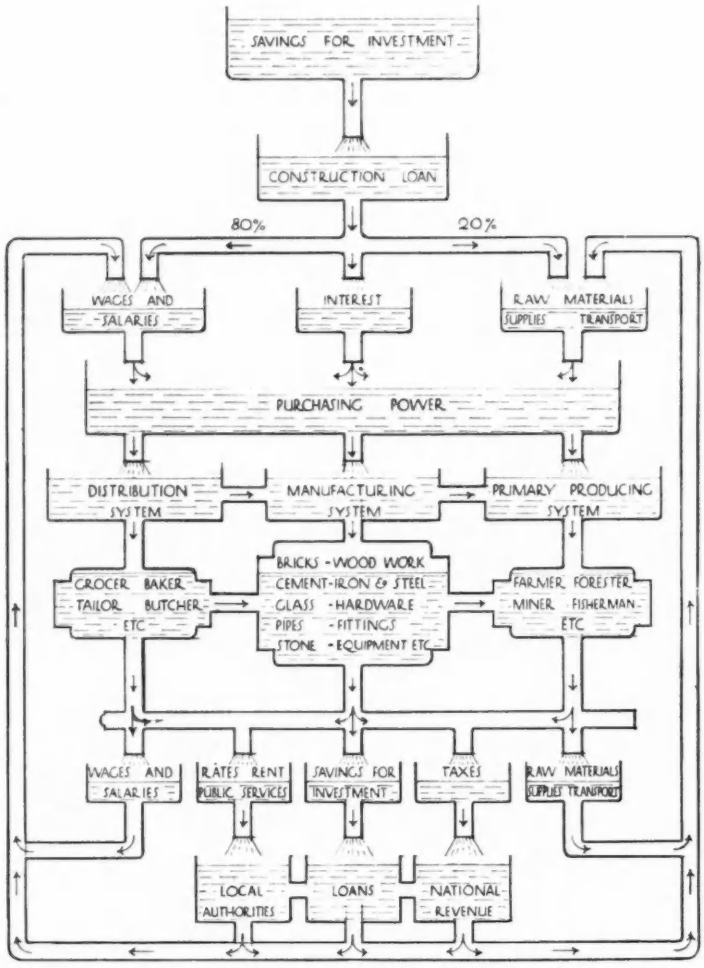
RECKLESS SAVING

[By ARTHUR HARRISON]

We are facing what might be the most difficult winter in our history. Wise and generous spending—systematic expenditure in place of unnecessary retrenchment—will do much to stimulate our trade and industry . . . Paradoxically, we have now to spend to save. Sir Harold Bellman.

●

THE BUILDING INDUSTRY



WE can no longer bandage our economic wounds with political poultices; an industry must cure itself without appeal to old nostrums of this kind. In a period of fundamental change in economic life those industries which have co-ordinated their inner workings and have evolved a concerted policy and an ensuing plan of action are the industries which suffer the least from depression.

ORGANIZATION AND PURPOSE

The trend towards a greater measure of co-operation inside the Building Industry, and with its associated industries, shows that self-consciousness is emerging. How is this consciousness going to express itself? What organization is needed to implement its group needs? What are the national status and responsibilities of the Industry? Can we devise ways and means of carrying through a national campaign for increased building through Reconstruction and through Public Works?

A measure of co-operation has produced the important Memoranda (Nos. 1 and 2) of the Public Relations Committee of the Building Industries National Council of Review. We have the first and the second Interim Reports of the Building Industry Council. Plans are in hand for setting up an organization which shall include an Economic and Statistical Bureau as well as the Public Relations Committee, while the latter Committee is attempting to raise a fund of £15,000 with which

CIRCULATION OF PURCHASING POWER PRODUCED BY CONSTRUCTION LOAN.

This diagram is drawn to show, in simplified and graphic form, by analogy with a system of cisterns and pipes, the main effects of the circulation of a loan through an endless circuit of production and distribution. At each point where an individual in the circuit is given and exercises purchasing power a repetition of expenditure takes place, affecting all the channels.

to carry out educational propaganda work to help the Industry.

PROPAGANDA AND OBJECTIVES

The organization to achieve the Industry's purposes is being constructed, and when this is complete the next task is to determine a policy for the Industry as a whole.

The objects of the propaganda fund are stated as " to counter by educative means the widespread and persistent assumption that the curtailment of remunerative or necessary building work is a constructive measure of public or private economy. A further objective is the proportion of comprehensive research for the purpose of making clear the position of the Building Industry in relation to national prosperity, its importance to the exporting and commodity-producing industries of this country, and its power to render the most efficient service to the process of national industrial rehabilitation."

The achievement of these objectives demands a planned national educational campaign, combined with suitable propaganda and publicity in the form of editorials and special articles in the daily press, broadsheets and circulars to influential bodies, including Local Government Authorities; in general, the creation of an efficient propaganda unit.

THE PARALLEL WITH THE ELECTRICAL INDUSTRY IN 1924

Conditions vary in detail among industries, but the general position of the Building Industry today is paralleled in many respects by that of the electrical industry in 1924. Then it was realized, after the World Power Conference, " that the electrical industry needed a central staff for economic and statistical guidance." This staff was set up, and it was in some measure due to their far-seeing guidance that the B.E.A.M.A. manufacturers urged the creation of a national power scheme, which became the remarkable Grid which is now approaching the end of its construction phase. As foreseen, the creation of the National Grid gave an enormous volume of orders to the electrical manufacturers, which enabled these firms to make a profitable showing when orders from other quarters had declined.

The National Power Scheme represents the material expression of two basic ideas. The Grid is the only nation-wide plan of its kind in Great Britain; and it has been brought about in some measure through the co-operation of the members of an industry. Admitting the advantages of electrical energy over other forms of energy in adaptability, capacity for long-distance transmission and general all-round efficiency, a large work of public education had to be undertaken in the 1924–1926 period.

PARALYTIC POLITICAL RESTRICTION

This illustration provides suggestive lines of thought for the Building Industry in its plan of development. In 1926, when the Grid plan was proposed, there was fortunately less political paralysis than exists today. Politicians of all colours were looking for means to justify themselves by creating active employment through large-scale works. They therefore seized upon the Grid as a way of salvation.

These were fortunate circumstances. The infectious disease of false economy has unfortunately spread itself over the present Government and its advisers. Deflation of a rigorous order has been practised, and a strange economics is preached of national security through reducing wages and construction! In the public interest this restriction

requires strong counter-measures from united industries which have powerful reasons to show why negative national policies should be reversed. There are signs that the general public will respond to such a movement, for the barrenness of such negative policies has become very apparent.

Some good might come from attempting to define what is meant by economy. Instead of the popular politician's idea of reducing all forms of expenditure towards zero point we can substitute the more intelligent concept of "obtaining the most beneficial result from the most efficient means," i.e., wise spending, at the right time, in the right way. If this definition signifies anything, it signifies to the Building Industry a National Reconstruction Plan.

The carrying out of an intelligent construction programme will add to the national wealth of Britain and maintain the circulation of purchasing power throughout the country. The Government would recognize that the time for reconstruction is now, not only because of the reasons we have adduced, but because labour costs and raw material prices are at very low levels. *To postpone necessary reconstruction until prices have risen is the negation of true economy.* Today prices are low, production costs are low and the Building Industry has developed highly efficient organization methods.

"Prosperity through Reconstruction" is a slogan that might be adopted without exaggeration. What are the facts about spending money on building activity?

THE BUILDING INDUSTRY'S NATIONAL IMPORTANCE

Few people realize that the Building Industry is the most basic industry in the country in the extent of its employed men, in the extent of its dependent industries, in the creation of durable capital values, in the creation of new sources of public revenue and, above all, *in the circulation of purchasing power which maintains the home market.*

Full publicity must be given to these dominant facts. The most striking figure brought out by research into the Building Industry's national contribution is that "80 per cent. of the total cost of its products is disbursed through the medium of weekly wages."

These wages are spent on the everyday needs of men and women, and sustain the producers and distributors of these goods. In addition, the Industry obtains practically all its raw materials in this country, and hence maintains, by its activity, fellow industries

The figures given above indicate the fall in prices of building materials and wages and of work executed, during the past three and five years. We do not say that in keenest competition lower prices would not be obtained, for, owing to the condition of industry, work is being undertaken and prices for materials are being accepted below what is considered will bring a reasonable return, but, even on this conservative basis, the figures do show a very marked decline in building costs.

From careful enquiry of merchants in all trades, over the country, we are convinced that prices have reached a low-water level which will not be lower for years to come.

producing for both home and export markets.

THE LONG VIEW ON PUBLIC WORKS

These facts are needed as a corrective to the type of statement made recently by Mr. Neville Chamberlain during a debate on public works construction. He quoted figures to show that the raising of a large loan for road construction had resulted in the employment of only a certain number of men. In saying this he took into account only the men directly employed on the construction of the road and ignored the numerous associated activities which were maintained because these men were working to build the road. He ignored the endless values of employment activity created by that loan in the men who made the raw materials to build the road; in the men who transported these materials; in the men and women distributing, stocking and producing the food and clothing needed—the process can be extended in every direction, for money has been put into circulation. Public services, transport, production—every economic activity has been helped because the loan has been used to create public works, and these represent basic expenditure repeating itself in a myriad forms throughout the country.

This is the effective answer to those short-sighted critics who object to loans for public works on the grounds of alleged economy.

By emphasizing facts of this importance public education may be developed, and this work must include information to important industrialists, speculators and investment corporations, as well as to Local Government Bodies, Chambers of Commerce and Members of Parliament.

BUILDING, THE GREAT EMPLOYER

We have examined the repercussions of expenditure on public works. What are the employment responsibilities of the building industry?

In July, 1932, it contained 339,890 unemployed, equal to 18.2 per cent. of the total number of insured people. This shows considerable worsening from the conditions in September, 1931, when there were 255,190 unemployed, equal to 14.9 per cent. of the total number of insured people.

These unhappy figures mean unemployment benefit payments of huge size, for the public charge per manworker is between 20 and 27 shillings per week. A point of importance to note is the fact that July is a very favourable month, seasonally, for active building operations, and it is the winter months which show the maximum unemployment in any year. The situation is terribly urgent.

To realize the magnitude of one's own industry is to set in motion a course of action to assist it. Building, Public Works Contracting and Constructional Engineering are responsible for employing 1,158,380 men and women. Add to this subsidiary industries, directly and almost entirely dependent upon building and public works, and we obtain a further 407,170. In addition we have 166,340 in other industries, directly and to a substantial extent depending upon building and public works. Finally there are other industries indirectly affected to a substantial degree which employ 722,840. This brings up a total of about 2½ million people affected by the great Industry under review, and we should not forget another two million workers affected indirectly who are employed by the electricity, transport, gas and water industries. These data illustrate the unsoundness of confining attention to the directly-employed labour on any public construction, whether it is a road, a group of buildings or a dockyard.

FRANCE'S PUBLIC CONSTRUCTION PLANS

In contrast to Great Britain we find in France and the U.S.A. a definite policy of increasing purchasing power in the home market through expenditure on public works and on national productive loans.

On Tuesday, December 6th, the French Government announced its 1933 national equipment programme, to include the issue of £28½ million for public works construction.

This loan includes about £9½ million for roads and bridges, £2½ million for waterways and inland harbours, and £5¾ million for hydraulic power works. The French plan undertakes the widening of roads from 21 ft. to 30 ft., abolition of level crossings where feasible, straightening of dangerous turnings and rebuilding of bridges. In addition the French canal system is to be extended and improved.

France is in financial difficulties with her budget, but she is not losing her sense of proportion about maintaining her creative workers through judicious expenditure; the long-term view is, fortunately for the French constructional industry, being upheld. The French are realists and understand the economics of their fundamental industries. They realize that the "more economy" cry which is alleged to secure the release of more money for investment in industry, is a fallacy. The money for investment is already available; we need to help general industry towards a state of profitable operation so that it will attract the investor. Since the Building Industry's activity is so fundamental to this purpose, restriction is a dangerous policy.

WHY BUILDING MUST BE MAINTAINED

We need to make known to the nation the value of maintaining the active life of the Building Industry.

Analysis has shown that out of every £100 spent on building projects £80 is spent on wages and salaries in numerous avenues, in building, in manufac-

WE CAN'T AFFORD TO WORK

TO say that the unemployed are without work because there is no work for them to do is not absolutely true. It is only true so far as the work necessary to produce consumable goods is concerned. Anybody who uses his eyes can see there is plenty of other work to do. For instance, there are slums to be pulled down, and decent homes to be erected in their place, and there are large areas of agricultural land badly in need of drainage. Both these works would be of enormous value—the one in improving the health and happiness (and efficiency) of millions of our hardest-worked people, the other in redeeming unprofitable land and preventing the costly damage done every winter by floods. Between them they constitute a task immense enough to please the most exacting of sisyphists, and to appal anyone who does not realize the vastness of the powers at the disposal of man. Why are they not carried out? Because, say the economists, we cannot afford them.

What does that mean? We have the men, the material, the machinery, all standing idle. We have "overproduced" the food and clothing which the men require. Why can they not start working at once?

Because, says the economist, we have not the money.

True. And that, so far as orthodox economics are concerned, is the end of the matter. So much the worse for orthodox economics. Not only does this alleged science compel us to starve in the midst of plenty; it compels us to stand idle when there is necessary work to be done.

If money is wealth the only way to obtain it is by working for it. We cannot expect it to spring into being spontaneously while our men and our machines stand idle.

But if, as I maintain, it is not wealth, but a means of exchange, a mere token, the position becomes more absurd still. We have the men, we have the machines, we have the material—but we cannot use them for lack of tokens! Suppose a party of men, equipped with axes and spades, were wrecked on a fertile island. Would they refuse to till the soil or build themselves a shelter because they had no money? Yet that is exactly what we are doing. Taught by the economists, we say: "We have millions of unemployed because we are poor," whereas, guided by our common sense, we should say: "We are poor because we have millions of unemployed," or (with better knowledge): "We are rich, but, if our millions of unemployed were working, we should be richer still."

In brief, what we have to do is to reverse our policy and put the horse in the proper position in front of the cart. Instead of waiting until we are rich enough to employ the unemployed we must employ the unemployed to make us richer.

EIMAR O'DUFFY, in LIFE AND MONEY.

turing raw materials and supplies, and in transport; this means a constantly circulating volume of purchasing power within the country.

It is estimated that an average wage for the worker in the industry is £3 per week, this worker being representative with a wife and one or two children. The restriction of building means that this representative worker is costing the State 20-27 shillings per week in unemployment benefit as a general charge upon British industries. Carrying the figures further we have the position as shown on page 45.

On a large scale these figures present a damaging criticism of building restriction, for every £1 million of legitimate constructional work stopped means that the State or local authorities must produce £320,000 in unemployment benefits and public assistance, while, in addition, £480,000 is withdrawn from the wage-earners' purchasing power in circulation. These are hard facts that need to be given the fullest publicity at this time.

The Building Industries National Council suggests that "there should be immediate and general reconsideration of the building and constructional programmes which have been cancelled or postponed since September, 1931, with the object of enabling local authorities to proceed with all projects considered by them remunerative or to minister to real needs."

This first step needs to be followed by a definite plan of reconstruction associated with the Town Planning movement. More building is needed but not more haphazard building, not more eyesores spread over the countryside. Building must be intelligently directed. Slum area reconstruction is needed, not as a sporadic outburst of activity, but as part of a definite plan. This plan has to be developed, its financing carefully studied, its profitability to the investor proved, its social and economic implications understood and made public, and its national value and urgency made known all over the country. There is not anything more chimerical in the idea of a National Construction Plan than there is in the idea of a National Power Plan. We have succeeded in making the Power Plan a reality; our next task is to make the Construction Plan equally tangible and to study how this shall be achieved.

THE SLUM PROBLEM

Housing conditions for large sections of working men in London, Glasgow, Birmingham, Leeds and similar big towns are acknowledged to be disgraceful. The death rates and especially

THAT MUNICIPAL DEBT

Ask any foreign visitor who remembers the appearance of this country in 1914 what impresses him most about Great Britain today, and he will unhesitatingly refer to the great new roads which stretch from end to end, the million-and-a-half municipal houses which have set a new standard in working-class accommodation, the fine new hospitals, schools, playgrounds, swimming baths, motor bus services, electric generating stations, waterworks and similar municipal institutions. These, he will tell you, are the clearest evidence that the material condition of England is actually improving rather than falling into decay, as so many people would have us believe.

"But," you will say, "this must be the municipal debt about which we have heard so much." That is not strictly true. What one can see with the eye is not the debt but the cause of it. If none of these fine civic undertakings or public amenities existed, there would be no municipal debt. And in that event, we are seriously told, the community would be far better off than it is at present! For some reason which has never been satisfactorily explained, the thing which is wealth in the hands of private business becomes a burden in the case of a local authority. People talk of a company "with a capital of £x million," when they wish to emphasize the power and importance and strength of the undertaking. The capital of the company is its debt to the shareholders, yet no one mentions that aspect of the matter. Conversely, municipal debt is the capital of the local governing authorities. Yet no one mentions it. The absurdity and inconsistency of this comes out most strongly in the case of those services, such as electricity supply, which are partly in the hands of local authorities and partly in the hands of joint stock companies.

Capital development is essential to local government expansion; and an increase in the municipal debt is a necessary and proper consequence of that development. Local government urgently needs expansion in almost every field of activity, from slaughter-houses to hospitals, from gasworks to markets. The local communities concerned are perfectly solvent and well able to bear the burden of the expansion. Industry is unable to make use of the money, with the result that the rate of interest is lower than it has been within memory. Yet we are told that the municipal expansion must not take place because it involves something called "debt," which has an ugly sound about it.

Thus do we deceive ourselves with words. Thus are the wheels of industry made to revolve ever slower and slower.

DR. WILLIAM A. ROBSON, PH.D., LL.M., B.SC.

infant mortality rates are horrifying in poor districts in contrast to the well-to-do areas. The congested conditions and lack of access to light and air are directly responsible for the short lives, the prevalence of phthisis in all its forms—the ghastly waste of life which is preventable through proper planning of towns and reconstruction of bad areas.

Idle capital is seeking investment in profitable enterprise. If we can show that slum reconstruction is profitable we are half-way to a solution of our problem. Large-scale operations are the cheapest, and under modern practices, using Time and Progress Schedules in building, substantial reductions in construction costs and in capital charges are achieved. With costs on today's low levels it should be a practical undertaking to rehouse the workers in overcrowded and dilapidated areas of our chief industrial towns by profitable rebuilding. The costs on large-scale operations, dealing with from 1,000 to 25,000 families at a time, would be at a minimum, and low rental figures would result below those at present being paid for unhealthy and decrepit accommodation. It is for builders and architects to prove the profitability of large-scale rehousing plans to the private investor; he is seeking an outlet for his money.

The problem arises whether modern flats shall replace dilapidated cottages or whether the ground shall be cleared for other types of building, and the workers rehoused on the borders of the town or in a satellite town to be constructed. The choice of action must depend upon particular conditions in local areas, but it is evident that a greater measure of consultation will be needed between the various local authorities involved and with the manufacturing interests and transport companies affected.

It will be useful hereto to call in mind in our analogy with the electrical industry, that the Electricity (Supply) Act of 1926 gave powers to the Electricity Commissioners to set up areas and prepare schemes for supply in these areas. The areas were determined after careful study of geographical and industrial sources of energy, with a view to effective linking up of different parts of the area, and with regard to future interconnection between areas. Local representatives have been given a full hearing concerning the schemes and a satisfactory working system has been evolved.

Plans for slum clearance are of urgent national importance, and the Building Industry is now in a position, possessing a Permanent Council, to lay down a policy and prepare a plan which will include slum clearance and rehousing as an important factor.

PLANNING A PROGRAMME

The plan will need to emphasize the long-sighted nature of wise expenditure by Government and Local Authority and the profitable character of expenditure by the private investor in construction and reconstruction undertakings. This is needed to combat the unwise economy proposals of various bodies, including such economic experts as the House of Commons Economy Committee. One proposal put forward by this body is that Local Government expenditure should be reduced by 15 per cent., spread over three years in equal amounts of 5 per cent. This foolish suggestion would simply lead to curtailing public works on top of the many schemes which have been held up by the Economy Act of 1931, and would add to the already excessive unemployment totals of the constructional industries.

It is for the National Council to prepare its plans and initia te a programme for the country. The propaganda campaign must be planned throughout ; it must aim at the achievement of definite objectives laid down by the Council. These will presumably include release of the development work which was held up last year, including roads, docks, promenades, schools, drainage, river defences, etc.

School building operations estimated to cost about £10 million were stopped last year, but there are no less than 1,200 schools on the Government's list of schools unfit for children ! This hold-up is one of the numerous social offences committed in the sacred name of economy.

In any reconstruction scheme it is obvious that London needs replanning ; its railway system, bridges and Southern termini, the Thames southbank and its overcrowded areas, are blots on the national capital.

If the Building Council sets out to plan its objectives on behalf of the construction industries and plans its entire propaganda to attain these objectives there is a reasonable hope that public opinion will be stirred and public men influenced. So far the Building Industry has not received the recognition due to its magnitude and importance ; it has not had sufficient limelight as a major factor in the British industrial configuration ; the Building Industry needs publicity.

Concerning the development work of Local Authorities, while the Town and Country Planning Act (1932) has been mutilated in its passage through Parliament, it does increase planning powers, and the opportunity is ready for Local Authorities to prepare their schemes for the redevelopment of town centres and the development of rural areas.

BUILDING HELD UP

●

SCHOOLS

The building of new schools and extensions to old ones has been held up by the Ministry of Health and Board of Education in Aldershot, £58,438 ; Blyth, Northumberland, £25,000 ; Burnley, £111,500 (approximately) ; Carlisle, £65,000 ; Exeter, £44,000 ; Glossop, £8,800 ; Ilford, £43,000 (approximately) ; Morecambe and Heysham, £30,000 ; Neath, £42,250 ; South Shields, £65,519 ; Twickenham, £43,000 (approximately)—a total sum of approximately *£717,000.*

BATHS

Schemes for public baths have been held up in many places ; among them is Chesterfield, £15,000 ; Hackney, £90,000 ; Marylebone, £163,000 ; Stockton-on-Tees, £47,000 ; Thornaby-on-Tees, £24,000 ; Sunderland, £30,000—a total of approximately *£386,000.*

HOSPITALS

Many proposed new hospitals, as well as extensions and improvements, are also being held up. Ilford (hospital, £50,000 and maternity home, £21,000) ; Tynemouth (£12,000) ; Tadcaster (£13,500).

TOWN HALLS AND MUNICIPAL OFFICES

Among these are Norwich (new Town Hall), £222,000 ; Southampton (new Town Hall, Assembly and Concert Hall for new Civic Centre), £158,606 [lowest tender] ; Stafford (reconstruction of Guildhall), £16,000 ; Stockton-on-Tees (municipal offices), £48,000 ; Tynemouth (Town Hall), £120,000 ; Coalville (municipal offices), £18,000 ; Epsom (municipal buildings), £37,449 ; Tottenham (Town Hall extension), £23,000.

HOUSING SCHEMES AND ROADS

The curtailment in housing schemes all over the country is estimated at the value of more than £1,000,000, and roads at £1,268,132. Parlour houses in particular have come under the ban of the Ministry of Health.

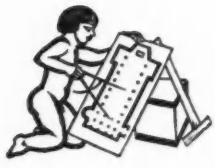
Working on the returns up to date, the average curtailment is £15,600 per local authority. No County Council returns are yet to hand and many of the big towns have still to reply, but one-sixth of the returns are now in and these show a curtailment of £5,000,000. The *minimum* curtailment for the whole country is thus *£30,000,000.*

●

To the Editor of THE ARCHITECTS' JOURNAL.

SIR,—*May I suggest that the matter of cheap cottages is one which you might take up. Financially, we are very near to cottage building in rural districts being a better investment than Government securities: indeed, if cottages can be built for as little as £300* each (*the figure of £250 has been stated*), *they are better.*

NATHANIEL LLOYD



All prices, irrespective of the type of building required and ranging from hospital blocks to houses, showed a considerable drop on previous costs. For houses the all-in price was £271, as compared with £300 for recent months, both figures including an allowance of £25 for roads, drains, etc., Edinburgh Corporation's house-building costs have thus shown a remarkable variation from just after the War, when the price per house ranged as high as £1,100.—From "The Edinburgh Evening Dispatch."

Much depends upon the initiative and vision of Local Authorities in the formation of Joint Committees for regional plans.

For the National Building Council to achieve its objectives successfully, so that Town Planning and slum clearance activities may be initiated on an adequate scale, it is evident that a central body such as a National Planning Board is needed. Politicians are struggling with industrial economic questions for which they have no training and these questions need solving by experienced minds. We look forward to the evolution of a national group in which the Building function can play its important part.

The basic facts of the industry are such that common sense is on the side of planned construction. *The interests of the Building Industry are those of the nation.*

ARGUMENT

National policies have been made to aim at a balanced budget. Rigorous deflation has been practised; national security is preached through reducing wages and construction. Strong counter-measures are necessary to reverse these negative policies. True economy is wise spending at the right time. NOW *is the time to build.*

Building is a good investment: credit and materials are plentiful and cheap; building costs are lower than they have been at any time since the war or are likely to be in the future.

Building relieves taxation: over two million workers are directly affected by the Industry and a further two million indirectly. Eighty per cent. of the total cost of its products is disbursed in weekly wages, causing a constant circulation of purchasing power. The Industry obtains practically all its raw materials in the country.

Building is a necessity of progressive manufacture: England has acres of obsolete factories, streets of out-of-date offices, miles of slums, and at least 1,200 schools unfit for children. All these must be reconstructed.

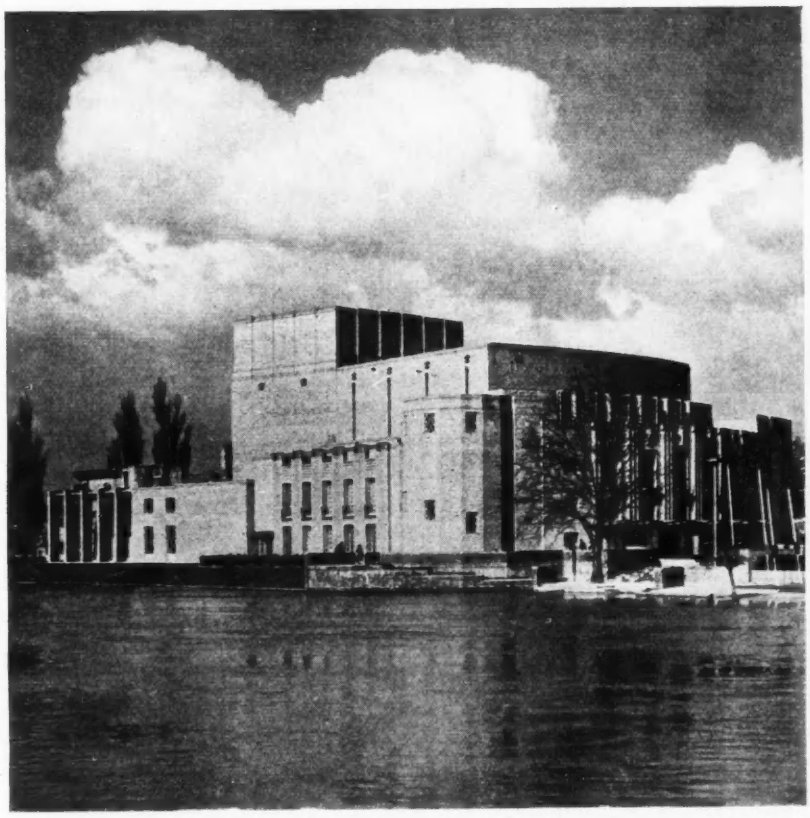
Cheap money, labour and materials are available; yet investors hesitate.

The Public Relations Committee of the Building Industries National Council have made clear the position of the Industry in relation to National prosperity, its power to render efficient service in national industrial rehabilitation.

Architects must play their part by rationalizing their own activities.

PUBLIC WORKS UNDERTAKINGS

Public works undertakings, it is held, during periods of business activity should be limited to the irreducible minimum of immediately essential improvements, and during depression periods should be expanded to include all socially desirable projects which may be postponed or advanced from relatively prosperous times. This goal is so generally agreed upon that supporting arguments need not be presented in this discussion.



DR. WILLIAM N. LOUCKS,
[ASSISTANT PROFESSOR OF ECONOMICS IN THE WHARTON SCHOOL OF FINANCE AND COMMERCE IN THE UNIVERSITY OF PENNSYLVANIA]

THE CITIES CAN CO-OPERATE

The cities can co-operate very greatly in that matter and they ought to be given some compulsion to do so. I believe it would be advisable in every one of our States to adopt legislation which would require every municipality in the state to appoint a city-planning commission if it does not already have one; which would require that commission to arrange a budgeted method of planning for five or six years ahead for public improvements in the approximate order of their urgency; and which would provide for carrying out those improvements. The municipalities would be expected to carry out those improvements from year to year, though of course they could not be compelled to do so.

My belief is that if we would use these methods, we probably should never have another depression such as we are experiencing. But if the statistics, which ought to be kept much more carefully by the Federal Government, were to show an abnormal increase in unemployment at any time, then let the Federal Government come to the aid of the situation not only by speeding up its own public works activities but also by making large sums of money available to the States and the municipalities at a very low rate of interest, say 2 per cent., as an inducement to them to carry out in a period of one year the plans, say, for the next two years, as far as that would be feasible.

HAROLD S. BUTTENHEIM,

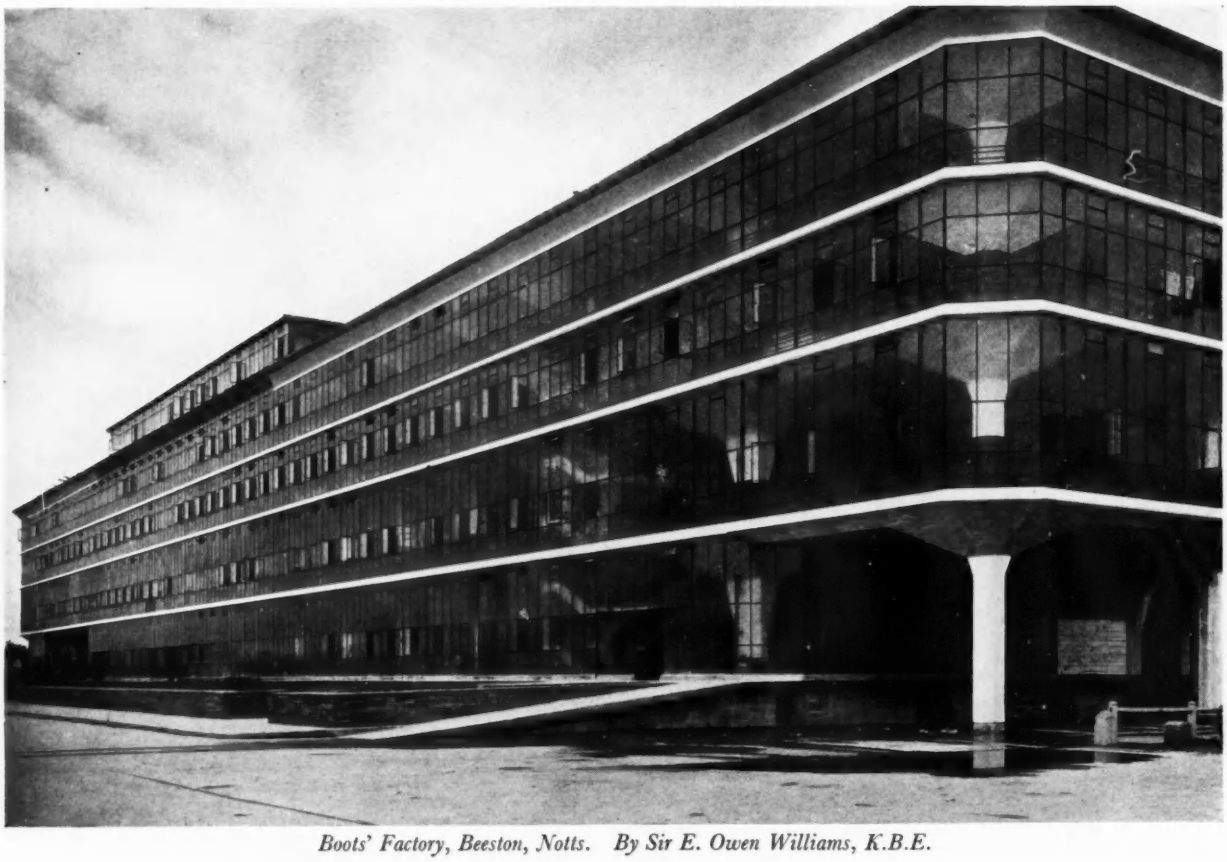
Shakespeare Memorial Theatre, Stratford-upon-Avon. By Scott, Chesterton and Shepherd.

BUILT NOW

●

THE YEAR'S BUILDINGS



[By PROFESSOR C. H. REILLY]

●

THANK goodness, in spite of the outcries of the Jeremiahs and the public retrenchments of every kind, there has been *some* work executed in 1932 after all; and a very fair amount of it. The wise have obviously seized the opportunity of low prices, and will go on doing so. Whatever happens to sterling, bricks and mortar remain. Those who, not reckoning with the characteristics of its inhabitants, believe the country is down and out for ever, may be content to cut down policemen's salaries, and to do noble deeds of that kind, sitting the while on their little hills of interest and imagining the flood will reach them last. The world may perish as long as they have a year or two more in comfort. May a tidal wave sweep such folk away, leaving the land clear for the positive people who still have some faith! Here's, then, to the builders of 1932, whatever kind of architecture they put up—or almost so—provided of course they did not, like those wonderful people, the Crown Commissioners, pull down something far better first.

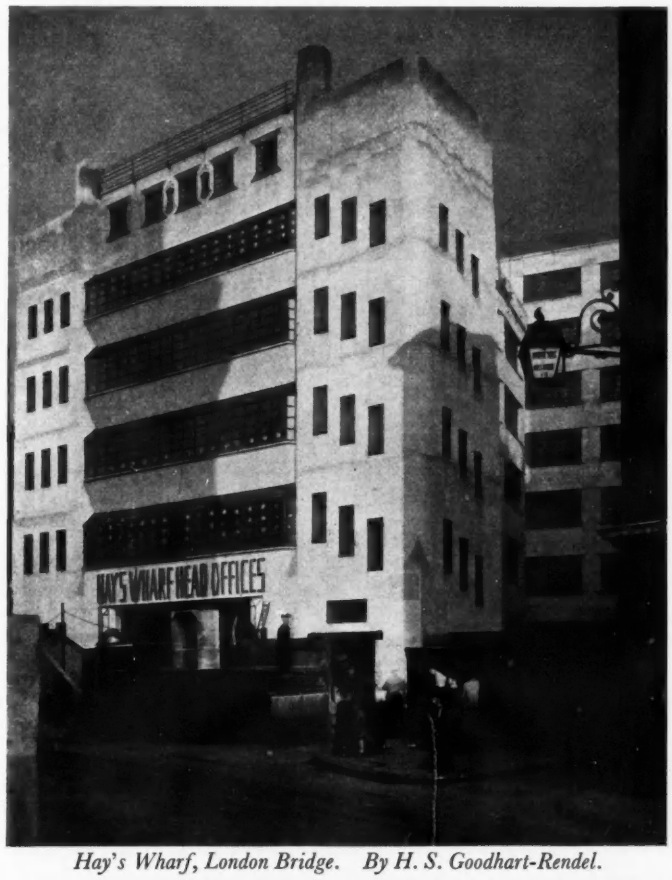
The Three Schools Again

Looking over the illustrations the Editor has sent me, the year's work once more divides itself naturally into that of the Revolutionaries, that of the Evolutionists, and that of the As-You-Were folk, or, if it is liked better, the Left Wing architects, the Centre architects and the Right Wing ones. Let us begin with the Left Wing people; they, at any rate, are the more entertaining. "New Worlds for Old" is their motto, whatever breakages may take place in the transformation. One welcomes their bravery, their fine spirit of adventure. A fresh and exhilarating wind has swept through the studios of the Schools of Architecture since modernism first appeared. Youth has felt that it has at last something of its own to contribute, instead of being endlessly engaged in polishing up the columns of its great-grandfathers. The results to date are, no doubt, a little crude, just as they still are in the streets outside. One could sometimes wish that their brave new world had been forcibly kept to its own new streets and towns, leaving the old world to die in peace. That is why one welcomes the placing of the new Shakespeare Theatre at Stratford-on-Avon, with which I propose to begin. It is outside the old town, facing it squarely and bravely across a wide stretch of grass. It is, too, by a woman, without whom no

Boots' Factory, Beeston, Notts. By Sir E. Owen Williams, K.B.E.

The "Daily Express" Building, Fleet Street, London. By Herbert O. Ellis and Clarke.

popular revolution was ever carried through. I hope to find myself next to one when the time comes to man the barricades—it would at any rate ensure in me an appearance of courage.



Shakespeare Memorial Theatre

No revolutionary building with us has caused so much strife as this one. I remember that when the result was announced by the wireless, I was on my way to India with our wittiest and most distinguished architect. He said it was the end of competitions—just that. Later, when he saw a photograph of the building finished and floodlit on my mantelpiece at home, he expressed his disapproval in a thoroughly Shakespearean manner. Yet for the majority of architects today, it is externally a fine composition of masses, very expressive of its purpose. I like its aloof attitude to the old town and the buildings of Shakespeare's time. It is the attitude of the Parthenon on its Acropolis to the hovels of the ancient Greeks or today to the discordances of modern Athens. After all, it was built as the tribute of our own generation and of no other, and certainly none but ours could have conceived it.

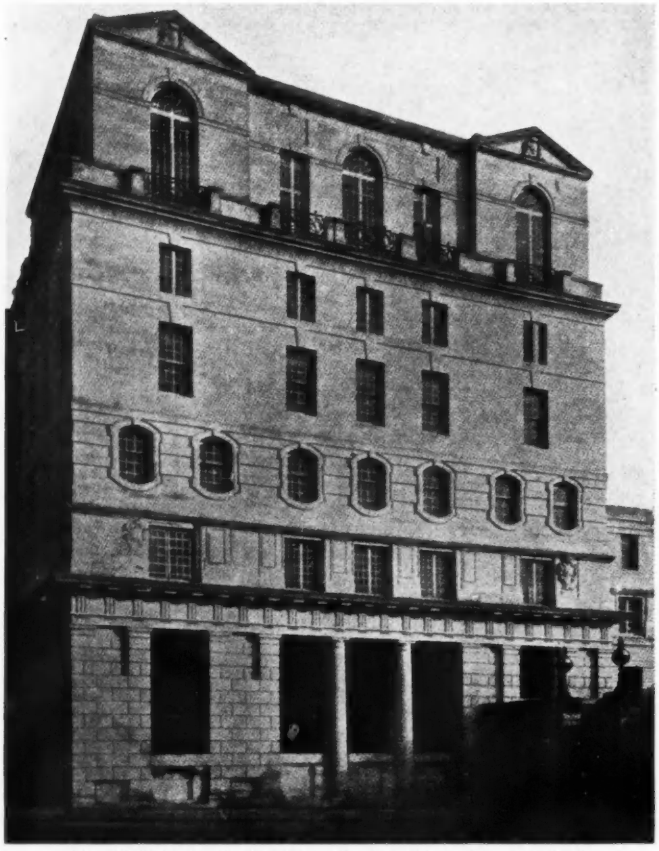
To my thinking it is a noble and stirring tribute, inside and out, though I find the main auditorium the least satisfactory part of the interior. The

scale has not there been so well maintained. The exterior, with its inclusion of the shell of the old theatre and its strong yet suave shapes, makes a fine monument from every point of view. On coming close to it, however, one cannot help being a little disappointed with the brickwork. It might be that of a Surrey villa, neat and nice, of good texture and colour, but with none of the monumental character such great masses of building call for.

One feels our brave young St. Joan should have visited Sweden or Holland before the first brick was laid, and, returning, given lessons to her bricklayers, telling them there are other things to be done with bricks nowadays besides keeping the perpends vertical and the joints neat. May other great opportunities none the less fall to her lot until the fight she has led for a living architecture is finally won! How far away from that the mass of the people still are is only too clear from the square miles of so-called Tudor villas still being erected by the speculative builders round our towns and bought by the uneducated, by the great Tudor Exhibition Halls, the so-called educated erected for us recently in the Argentine, and would have done again at Chicago next year if we had not been too bankrupt to erect anything at all.

Hay's Wharf, London Bridge. By H. S. Goodhart-Rendel.

Boots' Factory, Beeston, Notts.



The other main modern achievements of the year lie at the two extremes, in factories and warehouses on the one hand, and in decoration on the other. In either of these extremes, one can the more easily, one supposes, find freedom. The factory for Messrs. Boots in glass and concrete at Beeston by Sir Owen Williams is, of course, not so thrilling as the Van Nelle tobacco factory at Rotterdam by Brinkman and Van der Vlugt, in the same materials, but one can hardly expect an English engineer in his first experiment to equal two of Holland's best architects. Still, it is a great step forward in this land of muddled illogical factories, often, up here in Lancashire, where I write, aping the worst late Victorian town halls and Edwardian cinemas with their pressed bricks and terra-cotta decorations. The vast nave of the Boots building, to judge from the photographs, is a very impressive affair, while the cliff of glass on the outside, or better still, the long glass screen hanging in mid-air over the railway siding, are from their very unexpectedness not without drama.

Motor Coach Station, Victoria, London. By Wallis, Gilbert and Partners.

The "Daily Express" Building

Though it is not quite a factory, even of news, the *Daily Express* building in Fleet Street, by the same engineer, but

No. 68 Pall Mall, London. By Sir Edwin Lutyens, R.A.

with architects to help him this time (Herbert Ellis and Clarke for the general structure and Robert Atkinson for the highly-decorated entrance hall) is a very similar structure, and, being placed where it is, has brought the new architecture and the new materials home to everyone. Its sleek, black, polished surface, with its silver lines, its simple symmetrical shape with curved corners, which prevent any harshness or greenhouse effect, the easy way the building is cantilevered out or set back, and, most of all, its contrast with its overdressed neighbours, makes it, everything considered, the most arresting building of the year.

Is this what we are coming to in our business streets? Shall we work in future in gay cardboard structures of this kind, readily washed down, instead of in heavy Portland stone palaces, richly encrusted with soot, except where the rain has bleached them? When the authorities allow the concrete walls behind the glass to be dispensed with we shall be back to a modern version of the half-timbered overhanging mediæval street, but bright and clean and workmanlike, and not at all unpleasant, I fancy, for narrow thoroughfares.

It will be difficult, as Mr. Atkinson has found in this instance, to add decorations, even to the doorways of such exteriors. One might as well try to decorate the hull of a modern liner.

Hay's Wharf

The warehouse, near London Bridge, called Hay's Wharf, rebuilt by H. S. Goodhart-Rendel, is a very notable effort in direct functional building which, by its proportions, the pattern of its parts, and the compositions of its masses, becomes architecture. This particularly applies, I think, to the elevation to Tooley Street, to the escape staircase, to the lift wells and the entrance to the car park. There is very little decoration to any of these except to the latter doorway, yet the forms used give a strong sense not only of ordered but of decorative building. In this regard I feel these portions of this building, without any return to traditional forms, show an advance on pure functionalism. The machine here has taken on some colour and shape, like the modern motor car. The elevation to the river, however, where the decoration is more forced, does not seem to me so satisfactory. The masses of the structure are not simple enough to carry across the broad surface of the Thames, and the great central decorative panel, interesting as it is close at hand, seems largely wasted.

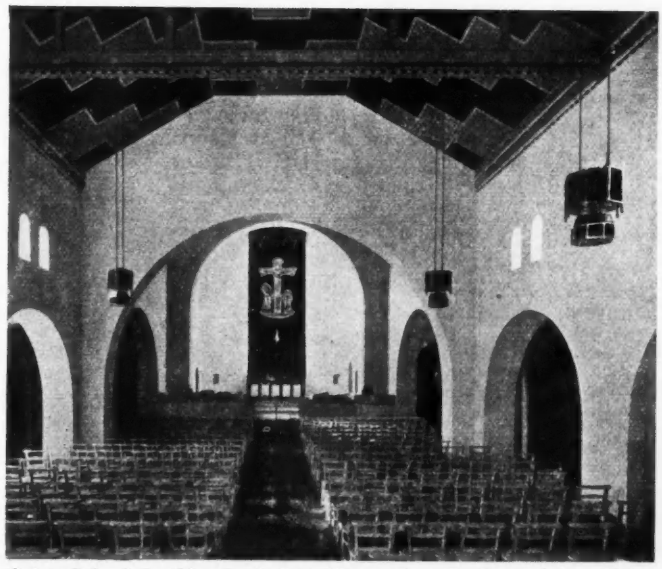
Victoria Coach Station

A building of the same class, but relying like so many of these modern structures on the sudden contrast of vertical lines to represent a stair or a lift with long horizontal lines to represent the various floors, is the new omnibus station at the corner of Buckingham Palace Road and Elizabeth Street, for the London Coastal Services, by Wallis, Gilbert and Partners, the architects of so many of our best factories. It is an imposing affair, making everything near it seem small, out of date and insignificant. It is for this reason one would wish these Gargantuan things, with their sudden contrasts, to have streets or even districts to themselves. A zoological garden for the wilder of the new species, until they become acclimatized, has a good deal to be said for it.

So much for the extreme left wing, though there are a number of small domestic buildings, such as the house at Rye, by Frank Scarlett, and that at Cambridge by Marshall Sisson, which depart quite as far from tradition, and yet suggest to me a very happy life for young people cursed with no old furniture and family belongings. Space does not allow of a discussion of these and other interesting smaller buildings in the new manner which have cropped up during the year, nor of the new decorative interiors such as the B.B.C. studios and the Embassy Ball Room, clean and bright and gay, yet very positive and sure, which are as significant of the new attitude to life as any of the new buildings.

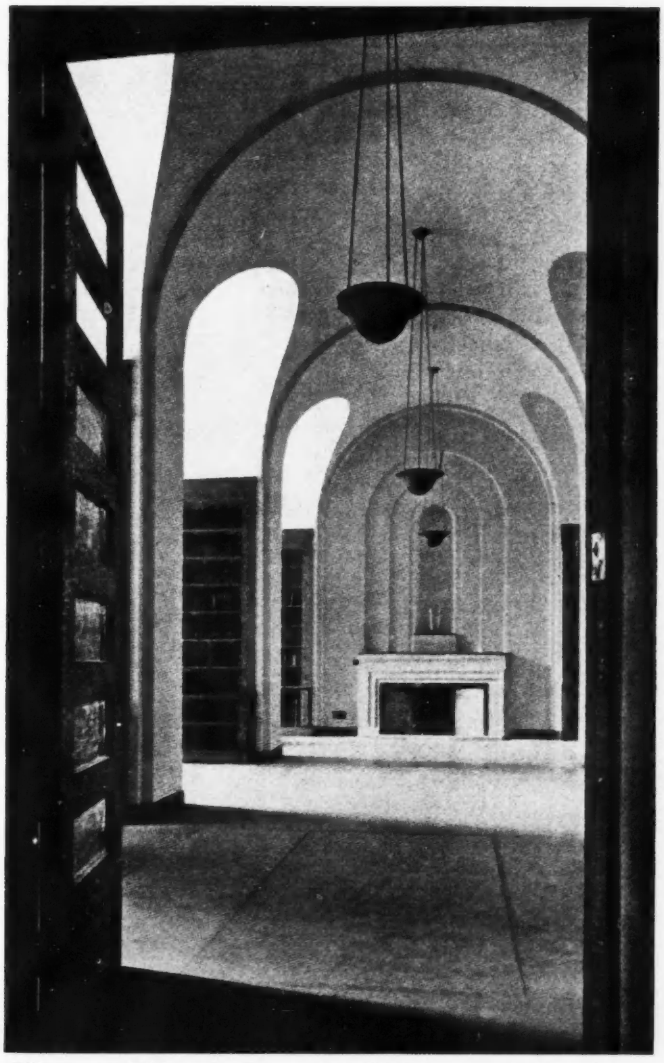
The Centre Party

The Evolutionists or the Centre Party, whose methods are, perhaps, more suited to our English temperament than those of the Revolutionaries, are well represented this year. There is some work at Richmond in a library by Edward Maufe, who may be looked upon as a leader of the left wing of this party (when he is not designing cathedrals) and other work by that valiant old warhorse, ever young and nearly always inspired, Sir Edwin Lutyens. If, in his general attitude, the latter is nearer the traditionalists, he never stands still. In his great palace at Delhi, in his big city buildings, in his workmen's flats at Westminster, he has given new life to traditional forms by boldly accepting the new requirements. This year his fine block of flats and offices, No. 68 Pall Mall, was finished. This is no "As-you-were" architecture. It would be difficult to find, except in his own work, precedents for its composition, or for some of its detail, yet how exactly right are its general shape and its two pedimented



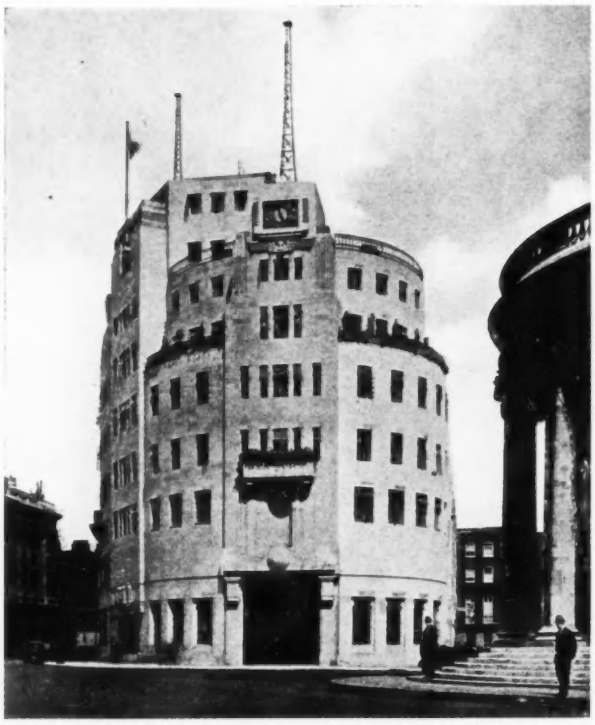
roof features as a stop to the run of buildings on the south side of Pall Mall, holding them back as if to provide a clear entrance for the Prince to Marlborough House !

In the library at Richmond, for a theological college, Maufe has produced some delightfully elegant forms, both externally in his long first floor windows and balconies, and internally with the domical vaulting of the bays of his library. He seems in domestic work able to give us the elegance of the eighteenth century without its formalism and pedantry. There are hardly any mouldings and neither a pilaster nor cornice on the building, inside or out, yet one receives the effect of the ordered refinement and dignity these things, when properly managed, can give. One receives indeed the essence of them, but with a mind still free to weave its own dreams.



I think that may be the secret of the charm of Maufe's architecture, whether based on eighteenth-century classic or thirteenth-century Gothic—that he produces an atmosphere in which the mind can expand. He does not hammer us with urns and swags and triglyphs, like the ordinary bank architect, nor with complicated tracery and vaulting, like the ordinary church one. Instead, he gently makes suggestions, and it would take a very hard-hearted person not to fall in with his mood.

St. Columba's Church, Anfield



A follower of his in spirit, who has built two lovely modern churches this year in Liverpool, is Bernard A. Miller. St. Columba's, Anfield, is so far the only one of which views have been published. It is a church on a narrow triangular site, in silver grey bricks, with a bright glazed green tile roof. At the apex of the site Miller has placed the chancel and has made that the loftiest section of the church, which then steps down in two sections so that when one enters at the west end of the nave, one has before one a continually rising church, each compartment more strongly lit than the last. The result is dramatic and solemn at the same time, and it is enhanced by the brilliant colours, edged with chromium-plating, Miller has used everywhere but on the walls. The Sabbath gloom of one's youth cannot exist in such an atmosphere, yet there is no denying the feeling that the place is a house of prayer. Here, then, is a distinct advance, a building with a certain traditional basis to it, as is almost necessary with such a programme, but achieving effects in a new way and using the new materials. St. Columba's must surely be the first church with choir stalls built up in plywood, painted in panels of dark and light blue, separated by strips of stainless steel.

Saint Columba's Church, Anfield, Liverpool. By Bernard A. Miller.

Library at Richmond, Surrey, for Wesleyan Theological College. By Edward Maufe.

Broadcasting House, London. By Lt.-Col. G. Val Myer.

Shell-Mex House, London. By Messrs. Joseph.

Shell-Mex

There are two big buildings which belong to this evolutionary category, though it is difficult to see in what direction their compromises lead. They are Shell-Mex House on the Embankment and the B.B.C. building in Portland Place. I have not seen the former close at hand nor photographs of much of its detail. What I have suggests the influence of Sir Edwin Lutyens in the setting back of the walls in a series of steps and blocks. The result is a strong, powerful-looking mass to the main body of the building, suited to the great spaces in front of it. There is no suggestion, however, of the steel frame within, which one knows to be there. The upper part of the building, where the main rectangular mass breaks into a number of smaller but similarly-shaped masses, though effective from a distance, is clearly a little crude, and the central clock-tower more so.

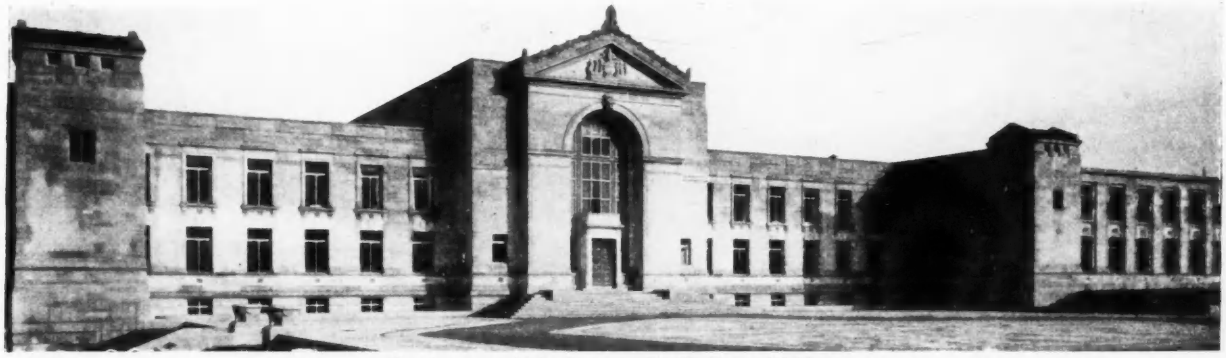
Broadcasting House

The B.B.C. building makes the same compromise both with tradition and its surroundings by using the ordinary vertical type of window, but is more successful, with its large vertical flat planes and the shallow offsets from them, in suggesting the steel frame within. This building is much hampered by its potato-shaped site and by the ancient lights which have made the end-on view of it, as one approaches from Regent Street, so lop-sided. It seems a great pity that the architect was not allowed more opportunity to express on the exterior his mysterious studios but had to hide them everywhere behind a film of ordinary offices. The small suggestion of them in the blank wall at the top of the façade, with its port-holes, and the steel masts on the roof are the things which chiefly give the building its distinction and suggest its purpose. As with the Underground building last year, the B.B.C. this year is the building that has the best modern sculpture. In its studios and concert halls too are the year's best decorations.

Thames House

Thames House is another big building which would fall within this centre group if by that we meant buildings for which no exact precedent could be found, but we really mean more than that. We mean buildings which, while departing from precedent, seem to be leading somewhere. Thames House, though big and ornate, like its immediate predecessors by the same hand, seems to be leading nowhere. Architecturally it solves no problems.

Manchester Grammar School

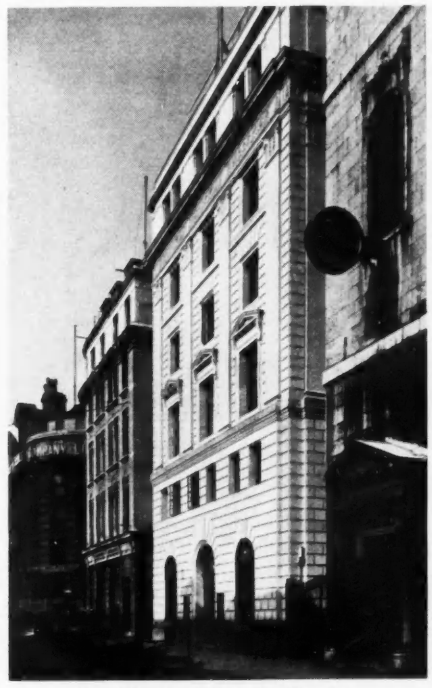


Lastly in this group we have two fine schools, the new Manchester Grammar School by Percy Worthington and Francis Jones, and the St. Swithun's girls' school outside Winchester, by Mitchell and Bridgwater. Both these buildings use the late classical precedents, but give them new life and energy by simplification. Neither set of architects, however, carry their simplification as far as Edward Maufe does. The former have planned their school round several great courts, with blocks of high buildings in simple shapes standing up and showing plain, strong flanks above the lower ones. Cloisters of semicircular arches and vaults link up the buildings and the whole makes a group undoubtedly of our time yet distant cousin to the larger and later Oxford and Cambridge Colleges. The interiors of the main apartments are more strictly traditional than the exteriors.

St. Swithun's School, Winchester

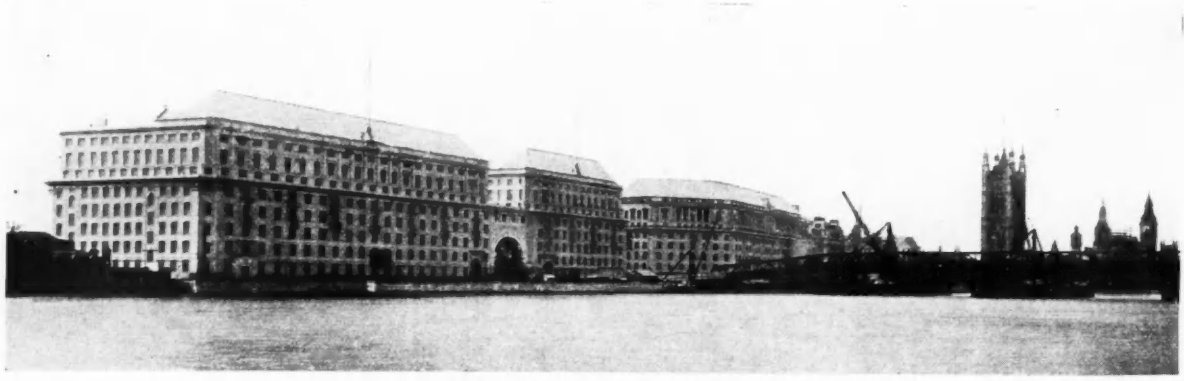
The Winchester School, in a charming orange brick, is a more delicate affair but achieves considerable dignity. On the exterior, cornices have been reduced to bands and the masses left to tell their own tale, though some of the façades are perhaps a little over-windowed. Curiously enough, this school is the reverse of the Manchester one, being more modern in its interior.

The Right Wing

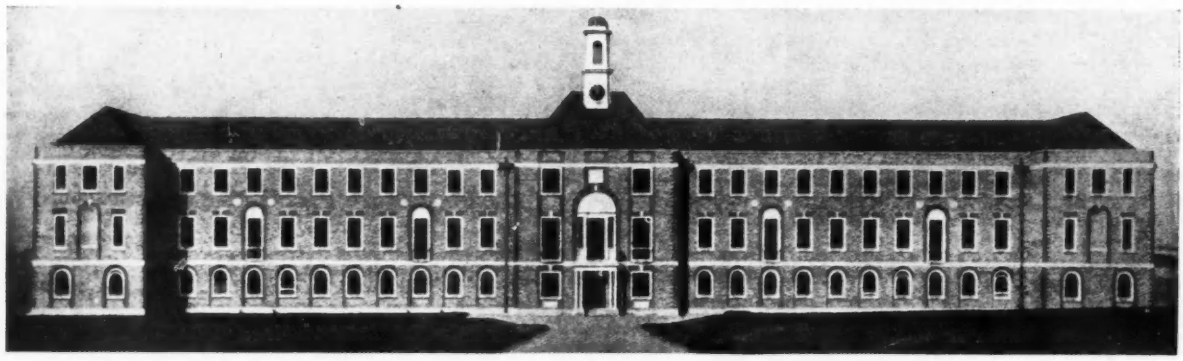


We now come to the buildings of the Conservative or the Right Wing architects, for whose work these days, perhaps

Southampton Civic Centre. By E. Berry Webber.



National Provincial Bank, Princes Street, London. By Sir Edwin Cooper, A.R.A.



Royal Bank of Canada, London. By S. G. Davenport.

Unilever House, London. By Sir John Burnet, Tait and Lorne (J. Lomax Simpson, consulting).

Thames House, London. By Sir Frank Baines.

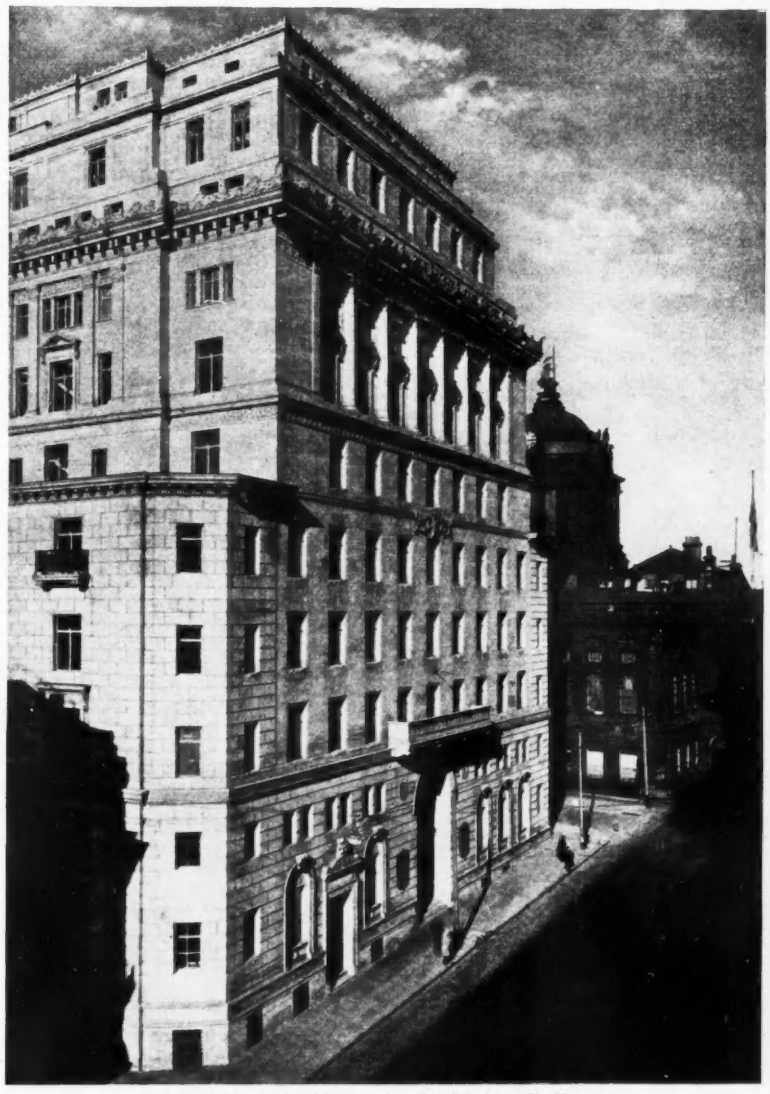
Manchester Grammar School. By Percy Worthington and Francis Jones.

because I was brought up among them, there is, I feel, a tendency unduly to decry. When the dust of the new battle of the styles has died down it will be seen, I am sure, that the work of men like Vincent Harris, Herbert Rowse and Berry Webber has what Wren, I think, called the elements of the eternal in it, in that its mass compositions, apart altogether from the stylistic signification of the detail, very generally hold the imagination.

Sheffield City Hall



Vincent Harris's City Hall, Sheffield, finished this year, is a good case in point. See, from the illustration of its main front, how well its planes recede and how expressive are the alternate vertical strips of light and shade of the long portico in contrast to the main horizontal masses. The strength and simplicity of this front will hold its own, I fancy, however boldly and in the bravest modern manner its surroundings are rebuilt. The detail does not seem to me so satisfactory when one gets close to it, nor is it wholly happy to find that this very rectangular exterior clothes a simple, great elliptical hall.

Sheffield City Hall. By E. Vincent Harris.

Martin's Bank, Liverpool

Herbert J. Rowse's great bank at Liverpool, the headquarters of Martin's Bank, is, in its interior, in its general layout and in its efficiency, regarded as a machine for its combined purposes—as a great block of offices and as a great bank—probably the best building of its kind in the country. The sugar icing which covers the steel frame, too, is very prettily done, with more knowledge and a more consistent sense of scale than is usual in these buildings based entirely on tradition but stretched out to modern size. One says "entirely," but here the sculpture brings a fresh note. Mr. Tyson Smith has shown great invention, wherever the rules of the game have allowed him to do so, in providing new motives.

Martin's Bank, Liverpool. By Herbert J. Rowse.

Southampton Civic Centre

Berry Webber's great block of municipal buildings at Southampton, called already with fine municipal enthusiasm a Civic Centre, though it is only the first block of four to be built, cannot well be judged apart from the other three. Everyone remembers when the competition drawings were published what

Northern Ireland Parliament Building. By Sir Arnold Thornely.

a fine composition the varied masses and the tower made. Of the detail of this first block one can say it is very restrained and meets the modern desire for simplicity in that way. One will not tire of it as one does already of most of Regent Street.

National Provincial Bank

Sir Edwin Cooper's great building in the city for the National Provincial Bank falls into its place in the group of great banks round the Bank of England with admirable general effect. In this architecturally top-hatted neighbourhood its clothes are well cut in the best San Michele manner, though a few of the buttons look to me a little worried by minute chasing and carving. It is interesting when in the neighbourhood to walk up St. Mildred's Court and compare the detail of the work of the two Sir Edwins where they abut. One learns a good deal by doing so, as one could at Delhi in the similar places where one Sir Edwin is reputed to have said he had met his Bakerloo.

Northern Ireland Parliament Building

The Ulster Houses of Parliament, with a plan like that of an American State Capitol and with the detail of the later phases of the work of McKim, Mead and White, may be said to be repaying in compliments some of our debt to America. Apart from this, it is a severe, massive building, well-suited, one imagines, to the reputed Ulster temperament. One is glad the architect was knighted both for his own sake and because it is still good for the profession to have a few people so decorated.

To the Editor of THE ARCHITECTS' JOURNAL.

DEAR SIR,—*Your effort towards the encouragement of greater activity in building cannot be too heartily commended. Costs at the present time are lower than they are ever likely to be in the future, and this fact alone should be an incentive, to all who are in a position to do so, to embark on the adventure of building. Moreover, "bricks and mortar," unlike so many other forms of investment, constitute a security that appreciates in value, provided a competent architect and a responsible contractor are allowed to co-operate in the operation.*

You will in the columns of your Journal be preaching the gospel to the converted, but if your message could be broadcast to the lay public, it would do much to counteract the ill-considered policy of so-called economy initiated by the Government a year ago with such disastrous results to the greatest industry in the country.*

Yours faithfully,

SYDNEY TATCHELL, V.-P.R.I.B.A.

* It will. [ED. *A.J.*]

Unilever House

Unilever House on the Embankment, like the Ulster Parliament House, impresses by its unity. Standing opposite Blackfriars Bridge, on a fine convex sweep of the Embankment, the architects (J. Lomax Simpson and Sir John Burnet, Tait and Lorne) by the sweeping lines of their raised colonnade have made the most in their chosen manner of the fine position. The interior is very workmanlike, simple and strong, with a modern note not to be found on the exterior. A little public buffet, embodied in the building to preserve the licence, and approached up a side street, is a perfect little gem of modern colour and design, which gives one the same surprise as when one used to find Sir Michael Sadler's brilliant Van Goghs and Cezannes in the sombre Waterhouse classrooms of Leeds University.

Royal Bank of Canada

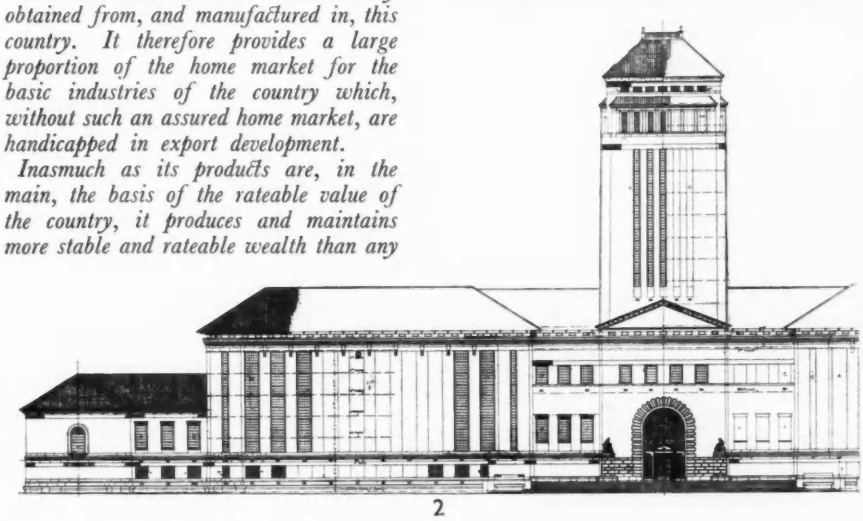
Best perhaps of all the Conservative buildings that have come to my notice is a Canadian one, a small bank—No. 6 Lothbury—by S. G. Davenport, of Montreal. Stanley Hall and Easton and Robertson have been connected with the building and have put a little of the modern spirit into the interior. The exterior, however, except for some highly-painted coats of arms, is a perfect example of the American respect for tradition which, like their respect for titles, is really far deeper than our own. In this case, however, the respect is shown in a combination of elegance and restraint everyone must admire in a building next door to a Wren one and opposite to a Soane one. If Sir Arnold Thornely has been repaying a debt to America Mr. Davenport has been repaying one to us, so unfortunately on balance we have got no further; but that is only to be expected in "As-you-were" architecture.

BUILDING NOW

CORROBORATION rises upon corroboration that the violent form of creeping paralysis from which the Building Industry is suffering will have far-reaching effects on the social structure of the whole nation. A comparatively small number of buildings are being erected and all are reaping the benefit of the present-day low costs. A few are shown in the accompanying illustrations; but projects are curtailed all over the country, even though they would prove immediately remunerative. The minimum cost of the work held up or postponed by local authorities alone is estimated by the Public Relations Committee at £30,000,000.

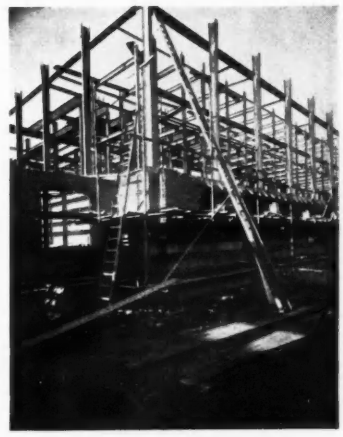
Corroboration also rises upon corroboration that a revival of building would quickly radiate throughout the whole of British industry, and that the suggestions of the Committee for the rehabilitation of the Building Industry should be immediately adopted.

The raw materials are almost entirely obtained from, and manufactured in, this country. It therefore provides a large proportion of the home market for the basic industries of the country which, without such an assured home market, are handicapped in export development.



Inasmuch as its products are, in the main, the basis of the rateable value of the country, it produces and maintains more stable and rateable wealth than any other form of commercial activity, and is constantly providing new sources of public revenue.

It creates a demand for the products of a greater number of ancillary industries and to a greater extent than any other industry.



The Building Industry is organized for the most efficient production.

(1) Manchester Reference Library (E. Vincent Harris), now in course of construction, is being faced with Portland stone.

(2) The University Library, Cambridge (Sir Giles Gilbert Scott), is being erected around two large courts. The steelwork is well advanced over practically the whole area of the building and in certain portions the walls are built up to the level of the first floor.

(3) Freemasons' Hospital, Ravenscourt Park, W. (Sir John Burnet, Tait and Lorne). The projecting wings will terminate in wide semi-circular balconies and the stepped roofs will provide sun traps.

● BUILDING NOW ● WORK IN COURSE OF CONSTRUCTION ●

Save money by using it for building while prices are low and interest otherwise obtainable small. For every £1,000,000 devoted to new building and constructional work during 1933, the wastage on unemployment benefit and public assistance will be redeemed to the extent, it is estimated, of about £375,000.—SIR RAYMOND UNWIN, P.R.I.B.A.

It would be difficult to conceive a more advantageous time for building than the present; everything is in favour of the building owner. Prices of materials are lower than they are likely to be again for some very considerable period, and contractors are tendering at the lowest margin of profit and sometimes at even lower than cost. The speed at which contracts are executed makes for considerable increase in investment value.—ALFRED D. S. RICE, *President, London Master Builders' Association.*

All conditions point to the advantage of commencing works of a speculative nature or otherwise at the present time. Repairs, alteration and maintenance works held up might be done now with great advantage to the building owners.—J. A. BARKER, *President, National Federation of Building Trade Employers.*

Building costs will never again be so low as they are at present, and we feel that an upward tendency is bound to take place.—LESLIE AND CO., LTD.

We unhesitatingly advocate a progressing policy in the building industry at the present time. The prosecution of building schemes would undoubtedly inspire confidence and help to dispel the "depression" miasma which has been accepted by the world with such dire results. It is unlikely that building materials will ever be cheaper. — S. ROMILLY HALL, *President, National Federation of Associated Paint, Colour and Varnish Manufacturers of the United Kingdom.*

NOTES

(1) *Middlesex County Mental Hospital.*

Associated Paint, Colour and Varnish Manufacturers of the United Kingdom.

5

7

NOTES

(4) Middlesex County Mental Hospital, Shenley, Herts. (W. T. Curtis). It will consist of 48 buildings. The photograph shows about one quarter of the proposed buildings.

(5) Liverpool Metropolitan Cathedral (Sir Edwin Lutyens). The site is now being cleared and levelled. The foundation stone will be laid on June 5 next.

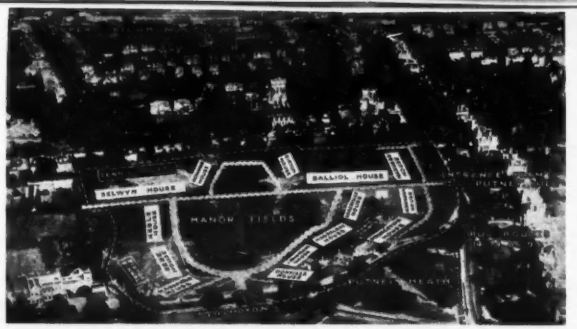
(6) The site of the new Staff Home for the Hospital for Sick Children, Great Ormond Street, W.C. (Stanley Hall and Easton and Robertson). The building will have a frontage to Guilford Street of 190 ft. and will rise 85 ft. above the pavement.

(7) Cumberland Hotel, Marble Arch, W. (F. J. Wills). The public rooms will provide seating for about 1,500 exclusive of a winter garden, lounges and a Mason Lyons Corner House seating 2,000. Eight bedroom floors will contain 966 bedrooms.

(8) Flats at Manor Fields, Putney Heath and Putney Hill, S.W. (Coleridge, Jennings and Soimenow). The scheme is estimated to cost £300,000.

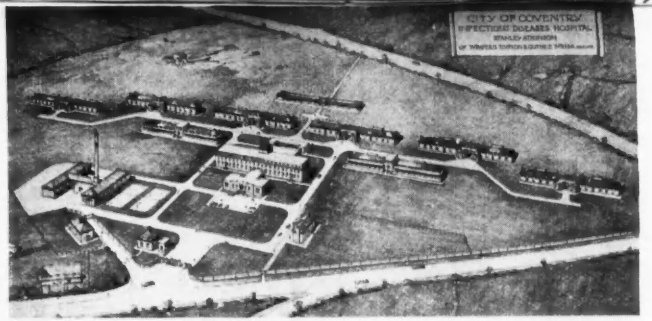
(9) Infectious Diseases Hospital, Coventry (Wimperis, Simpson and Guthrie). Work was commenced last June and is expected to be finished early in 1934.

(10) Troxy Cinema, Commercial Road East, London (George Coles), will seat 3,500 and be fully equipped with three revolving stages.



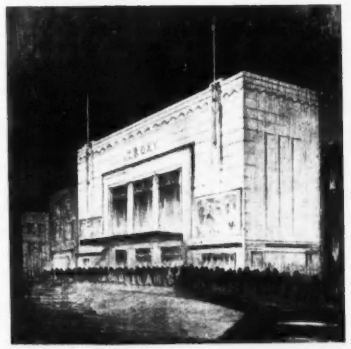
(11) The Bloomsbury site of the new buildings of London University (Charles Holden [Adams, Holden and Pearson]). Excavation work for the first section of the building commenced last month.

(12) Bentalls' Store, Kingston - upon - Thames (Sir Aston Webb and Son). The first two sections have been completed.



(13) Battersea Power Station (Sir Giles Gilbert Scott, architect for the exterior; Halliday and Agate, architects for the interior; Dr. S. L. Pearce, engineer-in-chief). Approximately one half of the station is at present under construction.

(14) New Paper Mills, Dartford (Wallis, Gilbert and Partners). The work comprises four separate buildings and a water tower.



(15) Tuberculosis Hospital, Sully (William A. Pite, Son and Fairweather). Tenders will be obtained within the next few weeks. The full scheme of 300 beds will be proceeded with.

PART II: ORGANIZE NOW

●

THE PLANNING OF INDUSTRIAL EFFORT

[By WILLIAM RANDOLPH]

●

My own prejudices are frankly individualist. . . . I am still clearer in my mind, however, that if we continue much longer in our present degree of individualist disorganization life will rapidly approximate to Hobbes' description of primitive life—solitary, poor, nasty, brutish and short. . . . The business world has come to realize that unrestricted competition means cut-throat warfare in which no one is strong enough to feel confident of being the victor.

From INTERNATIONAL AFFAIRS : THE STATE AND ECONOMIC LIFE, *by Sir Andrew McFadyean, formerly Secretary to the Reparations Commission.*

In the course of the last few years the Western world has gradually come to realize that there is something more in the Russian Five-Year Plan than a manifestation of Bolshevist doctrine. It has begun to ask whether Russia—and Italy too—may not be right in their insistence on national planning, however wrong they may be in their aggressive repudiation of the overriding claims of freedom. In this country the idea of planning has passed rapidly beyond the stage of being suspect for its communist connotations and has become perfectly respectable. The word " Planning " which was hardly ever used a few years ago except in such phrases as " Town and Regional Planning " has come into common vogue in political circles. . . .

It has taken a war unexampled in history for its destructiveness of material things and of human life, and a trade depression which has immobilized for want of employment more human beings than were ever mobilized at any one time on all the battle fronts of the war, to drive home the lesson that some better method must be found and applied to the ordering of man's economic life than the unregulated competitiveness of human beings guided solely by their own self-interest, however enlightened.

From PLANNED MONEY, *by Sir Basil P. Blackett, Director of the Bank of England.*

THE CRITICAL MOMENT

AT every critical period in economic history, a time comes when all the forces making for reconstruction coalesce and cause a powerful effort which in time conquers obstruction and brings new vitality. The question which is agitating the minds of the more intelligent observers is this :—Has the critical moment in our present crisis arrived when we can expect some change to take place? Superficial indications would merely point to an intensification of the difficulties confronting us and not to any strong urge towards reconstruction. All the factors which have been stigmatized as contributory to depression are apparently gaining a new lease of life —the growth of economic nationalism, the further erection of tariff barriers, above all in countries which at one time were free trade, the controversies over war debts and reparations, isolated indications of militarism overcoming political sanity, as in the Far East and South America, the determination to carry out deflation to the bitter end, and the cessation of all public works and construction, whether productive or non-productive.

DECLINE?

Yet it would be a mistake to confine attention wholly to those things and assume that the political capacity and the economic intelligence of the world have become paralysed and that we are confronted with a definite and probably rapid decline in our industrial civilization. If one looks more closely, one can find indications of recuperative power, and this recuperation is tending more and more towards the institution of control over economic factors which at one time were allowed to operate in complete independence and, as a consequence, were not hindered in any way from producing chaos as a condition of free operation.

ITALY AND RUSSIA

This tendency at its extreme point is, of course, illustrated by State control of the whole life of the people, including production, distribution, finance, commerce and transport. It is exemplified by the Russian Five-Year Plan and by the corporate state as developed by Mussolini, a State which bears very marked resemblances to that evolved by the Soviet and is due to the same

What then does "Planning" mean? First and foremost it stands for a political philosophy which is the antithesis of *laisser-faire*. The nineteenth century believed that in *laisser-faire* it had discovered an automatic and self-regulating economic system, which nothing but unwise governmental interference could prevent from promoting public well-being. . . . The twentieth century is now painfully discovering that this automatic self-regulating system was a myth, and that the marvellous material prosperity which the world enjoyed in the seventy-five years before 1914 was not due to the supposed merits of this system, but to a fortuitous combination of circumstances, essentially precarious and ephemeral, which has now passed away.

A distinction should be drawn between forward Planning and the framing of a Plan. Planning must, as has been said, be dynamic. A Plan cannot avoid the appearance of being static.

From PLANNED MONEY, *by Sir Basil P. Blackett.*

habit or direction of thought. Of the two, the Italian experiment appears to be more successful, because it does not aim at being so completely all-embracing; it is confined at the moment to the more effective utilization of the economic resources of Italy in agriculture, principally as shown in the draining of the marshes round Rimini, Ferrara and Ravenna and Venetia, by the opening up of the Campagna and the introduction of irrigation on an extensive scale in Puglia, in electricity supply through the financing of large water-power plants in the Alps and the construction of main transmission lines linking up those resources with the main centres of industrial activity and of population and by the electrification of long stretches of railway running out of Turin, Genoa and Naples. Its most recent form can be seen in the rebuilding of Rome and the development of arterial roads throughout Central Italy. Italy does provide a remarkable example of what can result from the application of order and centralized control to the basic economic activities of the country, in its way a much more remarkable thing than the enormously varied and dissipated effort of the Russian Soviet.

THE UNITED STATES

At its least extreme point, the movement is shown by the sporadic efforts towards public works activities in the United States, efforts which have been associated with economic waste of the most extreme type and with acute dissension between the individual States and the Federal executive. In its most recent manifestation it has been shown in the technical amalgamation of the principal railway companies, with the assistance of the American Reconstruction Finance Corporation, the operations of the Farm Board and the close investigation of the activities of holding companies, above all in the public utilities. In a less practical sphere it can be seen in the very widespread discussion of economic planning which is taking place, principally in academic circles, in the United States. The important thing to note is that even in the nation which has no tradition of State control or public guidance, for that matter, in industrial and economic affairs, the desire to ensure more effective utilization of the economic resources of the country by combined effort is slowly finding expression in action.

GERMANY

It is possible to strike an intermediate course between the Mussolini corporate State and the somewhat chaotic *laisser-faire* state of the Republican party in the United States, and in Great Britain and Germany this mid-way stage has already been reached. Germany does provide an almost perfect instance of national economic reconstruction through co-operative effort on the part of industries assisted and encouraged by the Government. The rebuilding of iron and steel works, the re-grouping of coal mines and potash works, the concentration of chemical production, the building of new transport and communication facilities, the construction of large water-power plants and the elaboration of main transmission systems interconnected over the principal industrial areas of Germany, the opening up of new agricultural territory, principally in East Prussia and Bavaria—all this has taken place as a deliberate policy working along lines already carefully determined. Financial difficulties, associated principally with reparations, have, of course, disturbed and in some ways diverted progress, but reparations at best are only a temporary phenomenon, while the economic reconstruction of the country remains. One can see further indications of it in the progress of Germany both in marine and air transport.

Now, in Great Britain, the conditions necessary for combined effort are not so favourable as in Germany, where practically all industries of any importance are organized in cartels and the State itself has been a large shareholder in innumerable productive enterprises.

GREAT BRITAIN

Our industries have not been organized in the type of cartel which has become current in German practice; they are, with few exceptions, linked together in price-fixing arrangements, but combination begins and ends at price fixing—it does not bear on competition outside of price and does not aim at control of productive capacity. Consequently, the reconstruction of our economic life is moving in a different direction and may in the future be even more productive of success than the German or Italian or Russian experiments.

We are moving slowly towards some conception of co-ordinated national effort, largely because the forces of competition and of *laisser-faire* have exhausted themselves and there is apparently nothing to take their place.

THE MINISTRY OF RECONSTRUCTION

The first experiments in such centralized activity were, of course, during the period of reconstruction at the end of the War, when industrial experts came together to serve more efficiently the nation at its time of greatest economic stress. Many of the ideas

All this clearly requires a regulating or planning body in possession of statistical information and means of measuring current economic and social happenings far more complete and accurate than are at present available. This country has much to learn from abroad, for example from Germany, the U.S.A. and some of the British Dominions, in the technique of gathering and applying statistical data. One of the most immediate preliminary steps towards national reconstruction ought to be a thorough overhaul of existing statistical methods and machinery. The need for this must be becoming increasingly felt by the Tariff Advisory Committee which already presents some of the characteristic features of a National Planning Commission. It is impossible to approach questions such as a Tariff on Iron and Steel, or on Pig Products, without becoming involved in the problems of efficient organization of industry and rationalized marketing methods. The setting up of the Tariff Advisory Committee provides a good illustration of the fact that the National Government has already moved far in the direction of Planning, without as yet publicly adopting the philosophy of Planning or making clear to itself or to the country the full implications of what it is doing. The fact that this Committee is advisory and not executive is specially important for the purposes of the present discussion, since it suggests strongly that it is possible to adopt Planning and set up a National Planning Commission without superseding either the Cabinet or Parliament and without dragooning the producer.

From PLANNED MONEY, *by Sir Basil P. Blackett.*

put forward at that time proved rather wasteful in execution and no one can claim, for example, that the economic machine, even with the degree of centralization and co-ordination then attempted, worked with a high standard of efficiency. But the important thing to note is that it did work and met a strain which otherwise would have proved too much for our resources.

COAL

Between 1918 and 1929 no developments of any importance took place, but between 1929 and 1932 progress has been achieved in almost a revolutionary fashion. Thus, the Coal Mines Act is an example of rationalization on a purely regional basis, which, through incompleteness, has not really achieved the benefits of rationalization. Each district is subjected to quota and price regulation of the most drastic type and there is no co-ordination between districts and, until recently, no real conception of the possibilities of economic expansion in the coal industry itself. It is a remarkable circumstance that in the last few months the coal industry should be devoting its attention to the possibility of national co-ordination and standardization of product and price and to the proper allocation of quotas between one district and another. It has, in its Coal Utilization Council, embarked on educative and research work, designed to improve the economic status of the industry and widen its range of supply.

IRON AND STEEL

In iron and steel a series of committees, inspired by the Tariff Advisory Board, are studying the possibilities of co-ordination on a regional basis with ultimate national co-ordination, although in this case a large number of price-fixing associations and agreements and the presence of international arrangements have contravened deliberations and created a whole series of conflicting interests, not necessarily coincident with national economic welfare.

COTTON, WOOL AND ENGINEERING

The three main exporting industries, which are still without co-ordination of any kind and are still bereft of any conception of planning, are cotton, wool and engineering. The chemical industry is held together in one enormous group which has evolved important regional plans that have not yet come into full operation, possibly owing to the fact of the trade depression. In the case of engineering, some co-ordination already exists in electrical manufacture on the heavy plant side, and the fact that the principal consumers of this industry, such as the Central Electricity Board, the Post Office and the great public services generally, are already fully organized and in a position to insist on some measure of standardization and co-ordination in production, makes it quite certain that planning will become reality, if only through induction.

Consequently, one is left with textiles and general engineering trades among the principal industries of the country, and the circumstance that the cotton and wool control boards were easily the most successful during the war in their functions, makes one think that with a little guidance those industries could tackle their own troubles with some prospect of success.

The Agricultural Marketing Act has already laid the foundations for an entirely new order in agriculture. The Report of the Pig Reorganization Commission is an extraordinary example of co-ordination worked out in its last detail, covering what might be a very large industry, and the plan of control aims above all at increasing enormously the output of the industry.

THE PIG COMMISSION

In this respect it is quite different from the plans proposed for the heavy industries generally, where the principal object has been restriction and adjustment rather than expansion, and it bears some resemblance to the proposals of the Central Electricity Board, which are based on the assumption that the demand for electricity can be and will be greatly stimulated during the next ten years. The points of comparison between the proposals of the Pig Commission and the work carried out by the Central Electricity Board are much greater than the points of dissimilarity. It is almost certain that similar proposals will apply to milk, and the operation of the wheat quota

may lead ultimately to the proper planning of wheat production.

TRANSPORT

The new London Transport Bill does provide also for co-ordination of transport within the London area, under a central executive board which is apparently independent of political influence and will operate with the sole view of obtaining efficiency consonant with a reasonable return on the capital invested in the enterprise.

THE AVOIDANCE OF NATIONALIZATION

Now, the characteristic of all those developments has been the avoidance as far as possible of nationalization or State control. The industry has received legislative assistance in its efforts to effect joint working and overcome the obstruction caused by excessive individualism, with the result that the best elements in those industries, particularly on the administrative side, have been given some real encouragement to aim at economic reorganization. It is too early yet to decide what measure of success has attended or will attend those experiments in the near future, but they show that the British conception of economic planning is a typical British compromise between rigid national control, as practised in Italy and in Russia, and financial amalgamations or trusts as practised in the United States and, to some extent, Germany.

Perhaps the best examples of such co-ordination under some form of public control are the British Broadcasting Corporation and the Central Electricity Board.

THE PORT OF LONDON AUTHORITY

There has been a tendency to confuse those organizations with such bodies as the Metropolitan Water Board, the Port of London Authority and the various Docks and Harbour Boards, which were brought into existence to administer and consolidate a local monopoly, a monopoly which was previously administered by a whole series of individual undertakings, none of them large enough to make the fullest use of the technical conditions governing their branch of the public utility industry. The Port of London Authority and the Docks and Harbour Boards are financed by the issue of stock, and normally do not earn profits. In this they should be distinguished from the various canal companies, such as the Manchester Ship Canal Company, but their functions are not noticeably different. They have not a national monopoly in any sense, and their activities are limited to a realization of higher efficiency in providing a local public utility service.

THE BRITISH BROADCASTING CORPORATION

There is a considerable difference between the British Broadcasting Corporation and the Central Electricity Board, not only in constitution, but in methods of finance and of obtaining revenue. The British Broadcasting Corporation is a Government department controlled by the Post Office, and it derives its revenue from the proceeds of licences issued to broadcast listeners. It is financed, therefore, through a form of taxation, and its capital expenditure has been (with the exception of an overdraft on the bank, raised in connection with the construction of the new building) derived from revenue.

THE CENTRAL ELECTRICITY BOARD

The Central Electricity Board, on the other hand, is a public corporation, very similar to an ordinary industrial company. It raises its capital in the open market and its capital expenditure is sharply distinguished from revenue. The Board itself is different from an ordinary industrial board in the sense that it is not elected by shareholders but is nominated by the Minister of Transport and is sufficiently small in number to ensure rapidity of decision and co-operation in the realization of policy.

It is unnecessary here to go into the history of the formation of the Central Board. Like other developments in this direction, it dates from the period of reconstruction, and is, perhaps, the only instance on record of proposals put forward by experts attached to the Ministry of Reconstruction being translated into practical shape. From the Williamson and Haldane Reports of 1917 to the Weir Report of 1925 there is an even transition, inasmuch as the Weir Report underlined the main recommendations put forward in previous reports and showed what should be adopted to put them into operation.

The Weir Committee distinguished between the two functions of production and distribution, the former of which may be more easily rationalized, although the latter is its due complement, and recommended that a new central organization—the Central Electricity Board—should be created to co-ordinate the production of electricity throughout the country, to reduce the cost of generation by concentrating production in relatively few highly efficient stations which were to be interconnected by a main transmission system operating at 132,000 volts. They suggested that 58 selected stations were sufficient, 15 of

A study of the similarity between the Government's agricultural policy and the " grid " organization of the Central Electricity Board may provide a clue to what the new model for industry ought to be. This is an interesting association of an experiment with a demonstrable success. Freedom in efficient production is linked with freedom in efficient distribution by a co-ordinating board, exercising initiative and stimulating enterprise and development.

THE TIMES

Planning as here conceived is a policy poles asunder from State Socialism with nationalized industries, nationalized land, a State medical service, and a thorough-going regimentation of every phase of the citizen's life.

From PLANNED MONEY, *by Sir Basil P. Blackett, Director of the Bank of England*

which should be new, while 432 stations should be closed down. Reserve plant could thus be dispensed with, since stations were interdependent, some taking the base load, others the peak load. The Committee further considered that an indispensable factor in this scheme for national transmission was standardization of frequency, which they proposed to make 50 cycles, as this was the most usual frequency obtaining among generating stations at that time; and they provided for a certain amount of compulsion in the carrying out of their proposals. These were given legislative force in the Electricity (Supply) Act of the following year, 1926.

MAKE-UP OF THE BOARD

The Board itself is nominated by the Minister of Transport, who, in selection, has paid attention to special qualities for membership of this Board, such as knowledge of industrial administration, finance, and the control of large manufacturing groups. Some attention has been given to interests involved in or affected by the national power scheme, such as the railways, labour, local authorities, electricity supply companies; but ability has been the principal test of selection. Parliamentary control over the activities of the Board is limited by the Supply Act of 1926, and is no greater than it would be in the case of an ordinary supply undertaking which, under present legislation, must obtain the approval of the Electricity Commission for raising capital for the construction of generating stations and for the erection of transmission lines. The Board can make its own arrangements with supply undertakings, fix its own tariffs and control absolutely its own administrative organization. It is, consequently, a new type which combines public control with a very large measure of independence in operation, and the criteria of success are those which obtain in industry generally without any reference to the Government or to a Government department.

FUNCTIONS OF THE BOARD

The main functions of the Board are:—

I. To concentrate the output of electricity into a number of generating stations selected for their efficiency and low operating costs, to construct a transmission system which would interconnect those stations, and in this way improve load factor and general operating conditions.

For the purposes of the scheme, 4,027 miles of transmission lines are required, 2,891 representing lines operating at 132,000 volts and the remainder operating at 33,000 and 66,000 volts. The most extensive areas are South-East England, South-West England and South Wales, North-West England and North Wales and Mid-East England.

Construction work on lines operating at 132,000 volts is completed in Central Scotland, South Scotland, North-East England, North-West England, Mid-East England, East England, and is approaching completion in South-East England. In secondary lines operating principally at 33,000 volts, construction is complete in Central Scotland, North-East England, Mid-East England, Central England and East England, and is virtually finished in South-East England, and it is calculated that the entire construction work will end in the late spring of this year.

The map shows the principal transmission lines operating at 132,000 volts, linking up the whole country into one unified power scheme. For each of the eight areas into which the country is divided (East England being included with South-East England), a central control room has been or will be built, so that, ultimately, eight control centres will be established for the operation of the selected generating stations, to the number of about 135, with 263 substations, and ultimately one control room for the whole country, probably in the North.

The principal arrangement is clear; main transmission lines run north and south, on the east and west, with lines linking them up running transversely across the central area with extensions outward to tap counties on the extreme east and extreme west. North Wales remains outside of the Grid to some extent, since it is already served by a very complete main transmission to the North Wales industries, sea resorts and Crewe. In the Highlands, the Loch Rannock water-power schemes feed into Central Scotland at Abernethy, while a new water-power scheme is being developed in Galloway, which will feed into North-West England. When the national Grid is complete, the capacity of all plant, directly or indirectly under the Board, will probably exceed 9,000,000 h.p., 2,000,000 h.p. in South-East England.

II. To standardize frequency of generation at A.C. 50 cycles throughout the whole of Great Britain, so that interconnection could be carried out and a national power system be created, capable of functioning smoothly from one district to another.

III. To take over the entire output of selected generating stations and sell them to authorized distributors, the selling price to be composed of a fixed charge based on the kilowatts of maximum load and a running charge covering the costs of production.

For the purposes of the National Power Scheme, Great Britain has been split up into nine areas, namely, Central Scotland, South Scotland, North-West England, North-East England, Mid-East England, East England, Central England, South-West England and South-East England, all of them under the control of a regional body responsible to the national organization, so that one has here an example of national and regional planning directed to the sole end of effecting co-ordination in an important public service and to introducing the most modern methods of operation, so that a reduction in cost may be realized and a high national average of efficiency obtained.

EXIT LAISSER-FAIRE

It is unnecessary to go into further details with regard to the Central Electricity Board, because the important matter is not so much what has been achieved in electrical development as the methods which have been adopted to concentrate the national effort in the direction of greatest value. It may be found, for example, that every industry requires its own type of organization to achieve the most economic results. It would be a mistake to advocate mere imitation, but it is sufficiently clear that the benefits resulting from combined effort are greater than those which might have resulted if undiluted *laisser-faire* had been retained as an active principle.

Now, the motives of those who were responsible for the co-ordination of electrical development were not solely idealistic. The electrical manufacturing industry, for example, in supporting the idea of a national power scheme, saw quite clearly that the work of creating this enormously powerful weapon of co-ordination would entail a vast amount of activity in its workshops, so that the national power scheme is a good example of that type of public works activity which is productive in every sense.

BENEFITS OF ORGANIZATION

It benefits a whole series of industries through the contracts awarded in construction ; it will, when it is in full commercial operation, have a beneficial effect on the supplies of an essential commodity and on the cost of such supplies for general distribution. It also makes certain that changes in technical and scientific development can be tackled by a body most competent to deal with them, as far as they affect the generation and main transmission of electricity, and it creates what may be a very powerful force making for electrification, and even economic reconstruction, based on modernization of equipment and electrification of manufacturing processes.

THE LONG-TERM VIEW

The tendency of contemporary thought is undoubtedly towards combined effort and co-ordination, and the industries which are capable of the long-term view and are prepared to make full use of that tendency will no doubt find a reward for any real achievement they have to their credit in such a direction.

●

ARCHITECTURAL EFFECTS *OF* THE GRID

[By Adam Gowans Whyte, B.Sc.]

●

ABOUT a quarter of a century ago one of the leading members of the electrical industry wrote a pamphlet on " Industrial Redistribution." He pointed out how steam power had led to the building of factories and dwellings round the centres of production, and how electric power, which could be economically transmitted over long distances, would enable factories to be established in open country. Electricity would thus reverse the centralising tendency of steam. The age of steam was marked —and marred—by the aggregation of population ; the age of electricity would bring a segregation of industrial centres and consequently of the bulk of the people.

This vision has been realized to some extent, but not, perhaps, so fully as its author expected. The effect was delayed because the development of the cause itself took a long time. Electricity supply began on a parochial plan, with the local government area as the unit of production and distribution, and although various electric power enterprises were established to supply electricity wholesale over hundreds of square miles, the industry continued until recently to present a picture of numerous stations of comparatively small size distributing current within restricted areas. We now have a national system of generation from a small number of selected stations linked together and pouring their supplies into the Grid, which forms a pool from which distributing undertakings in all parts of the country can draw practically unlimited amounts of electricity.

While this revolution has been taking place on the production side, there has been a marked development of distribution in rural areas previously neglected. Within the next few years such development is certain to proceed with increasing rapidity. The net effect is that electric power may be considered to be available on practically every site, rural as well as urban. Anyone who is planning to establish a new industry has a very much wider choice of location, so far as power is concerned, than he enjoyed in previous years.

Another consequence of the spread of electrical facilities is that the workers attached to *any* industrial centre can enjoy the amenities and conveniences of electrical service. The contrast between the urban dwelling, with its electric lighting, heating, cooking and labour-saving, and the rural dwelling, with its more laborious methods of operation, is gradually disappearing. The material comforts of country life

are being raised towards the town standard.

These developments will be assisted by the reorganization on a larger scale of the distribution of electricity. For engineering reasons a national basis was chosen in production; in the case of distribution the tendency is to adopt regional planning, a number of distributing authorities being grouped together and operated through a central organization. The evolution of such regional distributing authorities is, in fact, the next problem to be tackled by the electrical industry, and its solution will enable the supply of electricity to come into line with regional planning in building.

The more clearly these broad changes are realized, the more will we appreciate the opportunity not only of laying out new centres of population to take full advantage of modern electrical facilities, but also of adjusting our domestic architecture to suit them. Hitherto we have been content, in the main, to superimpose electrical equipment upon structures of the traditional type. With the prospect of cheap and abundant electricity becoming universal, we can tackle the problem of designing houses where the special characteristics of electric lighting, heating, water heating, cooking, refrigeration, and cleaning are taken into consideration at the outset of planning and not as an afterthought. There is ample scope here for originality and ingenuity and for a fuller development of that co-operation between architect and electrical engineer which has already been so fruitful in the lighting field.

PLANNING
IN THE
MAIN INDUSTRIES

●

BENEFITS OF REORGANIZATION

The time has gone when an important industry can maintain its right to run its business inefficiently; with our present social services the cost of its inefficiency is largely borne by the State.

Sir Andrew McFadyean.

●

NATIONAL PLANNING IN THE COAL INDUSTRY

[*By EVAN WILLIAMS, D.L.*]

PRESIDENT
of
THE MINING ASSOCIATION

THE fact that the output capacity of the coal mines of Great Britain is considerably greater than the demand for their coal has led to the regulation of both production and price, and the industry is now engaged in examining the results of that regulation in the light of two years' experience.

But it is not sufficient to control production and to co-ordinate prices. It is essential to expand the market. For this purpose the Coal Utilization Council has recently been formed by the Mining Association, the National Council of Coal Traders, the Coal Merchants' Federation and the British Coal Exporters' Federation. Thus, for the first time, a body representative of the whole industry is charged with the tasks of Market Research and Commercial Publicity.

The Council is carrying out a systematic enquiry into the problems and preferences of consumers of fuel, both industrial and domestic, and is particularly interested in the views of architects on this subject.

It is also examining the numerous appliances for burning coal in all its forms now on the market, some of the newest and most efficient of which are not as fully known as they should be to the general public or even to architects. It is prepared to recommend, without bias, such appliances, burning coal or a derivative of coal, as are suitable for given conditions, or will solve a given problem.

When its investigations are complete the Coal Utilization Council proposes to undertake propaganda on a wide scale with the object of bringing home to the British public the advantages, direct and indirect, from the point of view of economy, efficiency and health, of using British coal.

An increase in the consumption of coal, in all its forms, means the employment of more miners, with the result that their purchasing power will be increased and the burden upon the State of unemployment pay diminished.

By the substitution of British coal and its derivatives for imported fuel the strain upon our trade balance will be eased and the exchange value of the pound supported. For these reasons all sections of the coal industry are agreed in regarding the Coal Utilization Council as having an important place in the plans for national economic recovery.

NATIONAL PLANNING IN THE CHEMICAL INDUSTRY

[*By H. J. MITCHELL*]

DIRECTOR
of
IMPERIAL CHEMICAL INDUSTRIES

THE chemical industry is regarded, and with some justice, as the prototype of modern British industrial planning. In 1917 the Association of British Chemical Manufacturers provided the industry with authoritative representation in the councils of the nation. The Association has affiliated with it the Association of Tar Distillers, the Bradford Dyers' Association, the British Chemical Plant Manufacturers' Association, the British Cotton and Wool Dyers' Association, the British Disinfectant Manufacturers' Association, the British Sulphate of Ammonia Federation, the British Wood Distillers' Association, the Fertilizer Manufacturers' Association, the National Benzole Association, the National Sulphuric Acid Association and the Wholesale Drug Trade Association. All these bodies are concerned either with the co-operative marketing of their particular products or with the more rational control of the industry carried on by their independent member firms. These common services which are rendered eliminate undesirable competition, without resorting to anything like the State interference in

Italy and Russia on the one hand, or even the rigid cartel organization of Germany on the other.

Simultaneously, another set of factors has been at work. Even before the war the United Alkali Company welded together a large number of separate producers. As one achievement of the A.B.C.M. the dye industry was slowly built up by a definite governmental policy. At the close of the war the explosives industry was consolidated in a single unit—Nobel Industries, Ltd.—and the infant nitrogen scheme of the Government was weaned by Brunner, Mond & Co. for peace instead of war. In 1926 these movements culminated in the formation of Imperial Chemical Industries, Ltd. This is a single business unit, differing only in size from others, but whereas a small firm can be run efficiently on individualistic lines, in a large one co-ordination and planning are essentials.

A combination of co-operation by association and co-operation by merger is shown by the close arrangements existing between, for example, the British Sulphate of Ammonia Federation, and Imperial Chemical Industries, Ltd., in the world marketing of nitrogenous fertilizers. Again, I.C.I. are co-operating with the British Steelwork Association in exploring problems which involve joint study by the metallurgist and the chemist.

This leads to a matter of fundamental social importance and of special interest to the architect—slum clearance. Slums persist because the economic conditions do not encourage property owners to assist in the problem. By co-operation, however, between the steel industry and the chemical and other industries supplying raw materials, the Building Research Association, tackling the problem from the scientific point of view, and the Government, attempts are being made, such as the recent revision in building regulations and the investigations into the strengths and weathering of materials, to reduce the cost of building in order that the individual landlord or, alternatively, the State, in cases of compulsory clearance, shall not be out of pocket. This is only one instance of the objective which planning places before itself.

With true co-operation planning does not stop short at production. In the modern world scientific distribution is even more necessary than scientific production. As far as may be consistent with the taste of the individual, consumption also is being planned. Where the buyer and seller from past experience have learnt to trust each other, they can co-operate in the solution of their mutual problems.

NATIONAL PLANNING IN ELECTRICITY SUPPLY

[By SIR HUGO HIRST]

CHAIRMAN
of the
GENERAL ELECTRIC CO.

THE electrical industry is about fifty years old. It belongs almost wholly to the period in which organization on the large scale has been the standard of efficiency and progress. Naturally, therefore, one would expect it to present an unusually complete picture of rationalization and co-operative action. The expectation is largely fulfilled, but only within recent years and at the cost of great effort.

In the early stages of electrical manufacture the individualist tradition of British industry was dominant. Production was carried on by a large number of comparatively small firms whose mutual competition was intensified by the rivalry of electrical manufacturing groups in protected countries, capable of covering the whole electrical field on mass-production lines. The destructive effects of this arrangement became so acute that previous to the War the necessity of reform was realized and some steps taken towards bringing it about; it was not, however, until after the War that the industry put its house in order. On the one hand, the manufacturers, either by extending their operations or by amalgamations which eliminated redundant forms of production, replaced many small centres by a few large organizations capable of covering the whole field of electrical manufacture.

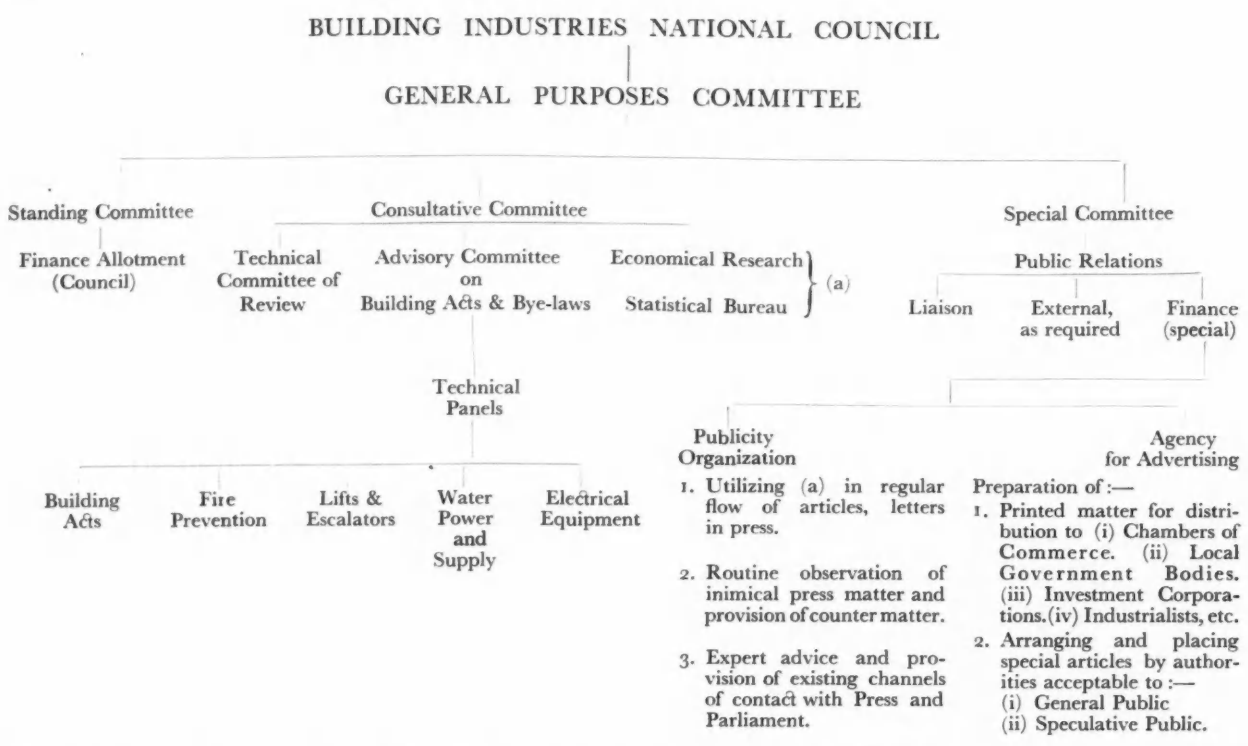
On the other hand, the various firms, both those of universalist type and those specializing in certain lines of manufacture, formed the British Electrical and Allied Manufacturers' Association for the defence and the promotion of their common interests. Other branches of the electrical industry became organized in a similar fashion. When desired, these organized bodies co-operate with each other. They are, for example, represented on the British Electrical Development Association, which concerns itself with national propaganda and publicity.

A corresponding type of progress has been achieved in connection with the production of electricity itself. Under the Central Electricity Board the generation of electricity, instead of being conducted by a large number of small independent stations, is now concentrated in a limited number of selected stations linked together and pooling their production in a national network of high tension mains—the Grid—from which all the distributing undertakings draw their supplies. The rationalization of electrical production could hardly have been brought to a successful issue without the previous rationalization of electrical manufacture, which gave us an industry with the capacity, the technical skill and the efficiency to meet the exacting demands of the modern power station and transmission system.

The main problem now confronting the electrical industry is to organize the *distribution* of electricity on the same lines as the production of electricity and of electrical plant. The supply undertakings are the link between the Grid and the general public, and they are still operating for the most part as disconnected units in limited areas. The conviction is growing that electrical service, in its full meaning, to industries and to the domestic consumer will become possible only when the undertakings unite in developing their distribution mains, their methods of salesmanship and their facilities for wiring premises and hiring apparatus, on up-to-date lines with popular tariffs. Great Britain is now able to produce on the cheapest basis all the electricity required for every need, including the electrification of all suburban and main line railways. Our manufacturers are able to produce, again on the most efficient lines, all the electrical plant and apparatus that consumers, large or small, may require. All that remains is to bring the full measure of these triumphs of organization into the daily lives of the people.

NATIONAL PLANNING IN THE STEEL INDUSTRY

[By C. J. KAVANAGH]



DIRECTOR
of the
BRITISH STEELWORK ASSOCIATION

UNDER the impetus of the economic policy which the country has now adopted, the New Year will undoubtedly show a great deal of progress in the planning of one of our most important basic industries—steel.

Steel, as the pivot of our industrial life, is of prime importance to national welfare, and the reorganization of the industry will infuse fresh vigour and prosperity into a wide range of other industries which, as suppliers of raw material, are intimately linked up with steel.

This reorganization on national lines which is in progress merits all the support and encouragement which such large-scale readjustment entails.

Close collaboration between the steel industry and the architectural profession is being promoted by the British

Steelwork Association on lines of national interest which cannot fail to win approval. Already certain definite achievements in national planning are to be recorded ; the regulations for steel-frame buildings have been rationalized, and today it is possible to design the composite steel-frame structure for any part of the country to the most modern code of regulations in existence. This national uniformity will, we hope, become an Empire uniformity, and the steel industry looks with confidence towards the architectural profession throughout the Commonwealth for its generous assistance in this direction.

The very extensive research programme which the Department of Scientific and Industrial Research has undertaken for the British Steelwork Association is undoubtedly a measure of planning from which much is expected. Hand in hand with the maintenance of the Steel-building Code at the highest standard of efficiency, investigations are in progress to promote every further economy in design. These results will be incorporated as they accrue into the national regulations by means of a British Standard Specification acceptable by all Government departments and local authorities.

In another field the co-operation between the British Steelwork Association and Imperial Chemical Industries will lead to an examination of building problems from the point of view of harnessing to the solution of structural and acoustic problems the vast developments and potentialities of chemical science.

The British steel and steelwork industries are fully conscious of the fact that only by establishing a really efficient and economic basis for building can that vast amount of reconstruction which is long overdue be speedily brought about.

In every large town and industrial centre vast aggregates of traffic-congested and slum property require immediate demolition and reconstruction. Men, money and materials are to hand, and a national effort to replan by a full utilization of modern resources would bring much work, and with it happiness to the homes of our people.

NATIONAL PLANNING IN THE BUILDING INDUSTRY

[By H. B. BRYANT]

SECRETARY
of the
PUBLIC RELATIONS COMMITTEE

THE formation of the Building Industries National Council is the most recent step on the part of the Building Industry, the biggest directly-employing industry of the country, to reach that state of comprehensive unity without which, under modern industrial conditions, it is not possible for any great industry to do justice either to itself—i.e., those dependent upon it—or to the country at large.

The objectives of the Council, as set up by its constitution, are to initiate, supervise and provide a medium for co-operative action and common effort on the part of appropriate bodies and organizations, which is likely to conduce to the advancement and welfare of the Building and Constructional Group of Industries (hereinafter called "the Industry") generally. As a whole the Council would seek to maintain the industry as an efficient unit in the economic structure of the country, capable of providing employment and a means of livelihood for a substantial part of the population. In furtherance of these objects it would be the duty of the Council :—

(*a*) To act as a consultative and advisory body, and to collect, co-ordinate and give expression to views upon subjects, technical and otherwise, which may affect the industry as a whole.

(*b*) To provide and supervise appropriate machinery for the purpose of facilitating joint consultations between representatives of the above-mentioned bodies and organizations.

(*c*) To provide and maintain, when and for so long as required, and to supervise when provided, machinery for carrying into effect any policy adopted for the furtherance of any of the objects of the Council which requires conjoint or co-operative action.

(*d*) To consider matters relating to external factors or movements, which in the opinion of the Council affect, or may tend to affect, the interests of the Industry as a whole.

(*e*) To arrange, as and when the Council considers it desirable, for the collection of statistical and other data and for the collation therefrom, in a common centre, of such statements as may be deemed necessary or advisable for issue as information to the members of the Council or to others.

(*f*) To co-operate, if and when the Council consider it desirable, with any similar bodies in other industrial groups in Great Britain and Northern Ireland, upon subjects within the purview of such bodies and of the Council.

(*g*) To arrange for the collection and administration of funds in order to enable the objects of the Council to be adequately fulfilled.

h) To do all such other things as are incidental or conducive to the attainment of the objects of the Council.

It proposes to achieve these objects under the following conditions :—

(i) That nothing shall be done by the Council in pursuance of its objects which would constitute an interference with any associated body in the conduct or management by that associated body of its own affairs, or which is inconsistent with the retention by each associated body of its complete autonomy and independence of action ;

(ii) That the Council shall have no power of intervention in matters which form or properly would form the subject of direct negotiations between two or more of the associated bodies or which are concerned with the direct relationships between their respective members or which involve or may involve contractual or other obligations as between their respective members or as between their respective members and others ;

(iii) That the Council shall not communicate to any outside body or person any information furnished to it by an associated body except with the consent of the associated body concerned ;

(iv) That the Council shall not engage in any trade or concern in the nature of trade with a view to profit.

The creation of the Council is a true sign of the times. It is the practical application of the truth that no industry can hope to remain wholly efficient or bear its fair share of the moral responsibility involved by its position in the economic machinery of the country unless its efforts are organized and directed with due regard to the general well-being of all concerned.

As in the case of nations, industry is realizing that the maintenance of industrial peace and prosperity lies in mutual co-operation. It is no longer possible for any single industry effectively to function as a self-sufficient unit in disregard of its relation to, and its dependence upon, the other sections of the economic fabric of the country, or in any way to work, or attempt to exist, in what might be called a watertight compartment.

The Building Industry was one of the first to realize the importance of this trend of economic forces towards greater co-ordination and co-operation of industrial effort generally.

It has become more than ever apparent in recent years that the waste due to unfettered and unscientific competition among industries, and groups of industries, must lead to the eventual debasement of all industry, however much such a system may benefit occasionally a few industries at the expense of all the rest.

The present system of individual striving and struggling to snatch the largest possible portion of whatever trade happens momentarily to be available must, and can only be, replaced by an organized effort, having for its aim the intelligent adjustment of means to ends and the proper distribution of productive effort the common object of which must be a consistently increasing volume of trade.

Industry and commerce, as now largely practised, are not unlike those petty industrial wars which we have, fortunately, outgrown, the individual trader, ever trying to obtain a little more than, and at the expense of, another trader, conforming withal to a law not very much higher than that of the jungle.

To expect that such a horde of struggling and disorganized traders will ever achieve any permanent degree of progressive national prosperity is as reasonable as to suppose that it is possible to win wars by allowing the soldiers to spend their time fighting against their own comrades for their share of the rations. National prosperity must be the aim of industry. It is only in the effort to this end that the welfare and prosperity of the individual can be ensured.

The cut-throat competition of crude barter can only result in increasing the load of negative national social services, and in the end lead to further national mental debasement.

No industry is constituted quite like the Building Industry, in that it is made up of a large number of ancillary inter-dependent industries subject to, and to a large extent controlled by, its associated professions.

As a general application its products involve a greater degree of professional services than the products of any other industry. This is one of the many reasons why any drastic curtailment of its activities has such widespread disastrous results.

After the basic food-producing industries, the Building Industry is unquestionably the most fundamental industry of the country. No other industry or private interest can exist without in some form invoking the products and services of the Building Industry. It is because it is such a fundamental industry that its powers and potentialities require to be most scientifically planned and developed. It is to be feared that hitherto the other industries of the country have not realized the extent to which their position of well-being is affected, or can be served by, the Building Industry. It would appear that very few indeed of the manufacturers of the country realize what an enormous advance has taken place in the technique of industrial building construction during the last fifty or sixty years. Dr. Samuel W. Stratton, in drawing up his nine scientific wonders of the world, places fifth " Modern methods of structure, building with both metals and cement." There can be little doubt that by far the greater proportion of British commodities are now produced in factories that are out of date by anything up to fifty years. A tour through such areas as the cotton-manufacturing parts of Lancashire, or the woollen-producing parts of Yorkshire, reveals the extent to which so many of the mills and factories there might be improved by being modernized in the way of approach, lighting, floor area, industrial amenities, etc. A single visit, on the other hand, to some of the more recently erected factories reveals the advantages modern factory construction offers, not only to the factory owner, in the way of minimum overhead costs, but also to the factory operative in the way of industrial environment and amenities generally. All this is indicative of the great advance in constructional technique since the early days of the industrial era.

The " lag " of obsolete industrial buildings is a matter that must sooner or later be tackled by British industry as a whole, if it is to survive the competition from certain Continental countries where industrial re-construction has almost become a religion, and where every modern factory, shipyard or mine, is regarded as a national asset and with national pride.

Apart from purely industrial reconstruction, there is the further great mass of obsolete houses and buildings generally, all calling for reconstruction, the existence of which adds so much to the increasing load of negative social services in the form of health insurance, poor law administration, crime detection, and the protection of the inhabitants generally.

The country must be brought to realize to the full the powers and possibilities of the Building Industry to

deal efficiently with such vitally important matters as these, and the great benefits that would accrue to the country if they were so dealt with upon orderly and wisely-planned lines. The solution of most of the country's present difficulties and problems lies in an improved industrialism. No industry is more capable of providing this solution than is the Building Industry. In its own sphere it has attempted to show the way in its efforts to obtain unity in progressive action; exemplified in its National Council.

The task before the Building Industry is mainly twofold—first, to maintain the degree of unity in purpose and function it has achieved to date in the machine of its National Council, and secondly, to educate the investing public, and the industrial leaders of the country, as to the means the Building Industry offers of solving along economic lines so many of their troubles.

In an effort to achieve this latter task the National Council has appointed its "Special Committee for Public Relations."

Upon this Committee rests perhaps the greatest task the Industry could ever have placed upon a single committee. Its duty will be to serve as the vanguard in the campaign of creating an intelligently-planned, increasing sequence of trade for the Industry, instead of the inadequate and sporadic supply now available, not by negative and largely obsolete methods (the effect of which appears to be reducing so many industries to the mental level of an industrial scrum), but by education and keeping the public informed as to the ways and means by which the products of the Industry can add to the individual and public wealth of the country, and how, withal, the social amenities which it can produce will render a national service unequalled by any other form of national expenditure.

It must, further, bring home to the investing public the fact that efficiently organized building enterprise — that is, using the architect for what he actually is, namely, a building adviser —represents the pre-eminent medium of stable investment. All this means public education, and there is no doubt that a great deal more will be heard of the activities of this Committee, if it is sufficiently supported by the Industry, in the New Year.

All these efforts on behalf of the Industry are fundamental and far-reaching. The policy of the effort might be expressed as "planned and organized progress" as opposed to "sporadic and disorganized effort."

The Council has a difficult and complicated task before it, but in the broadest sense its objects and efforts warrant the complete support of the enlightened thought of the Industry.

THE PUBLIC RELATIONS OF THE BUILDING

Howard Robertson, F.R.I.B.A. (Chairman)

Lt.-Colonel C. W. D. Rowe

Stanley C. Ramsey, F.R.I.B.A.

R. Coppock is General Secretary of the National Federation of Building Trades Operatives.
H. Halliday is General Secretary of the National Federation of Clay Industries, and Honorary Secretary of the Building Material Manufacturers' and Suppliers' Committee.
I. Ernest Jones is Joint Secretary of the National Federation of Building Trades Employers.
Oswald Healing (Treasurer) is Chairman of the Quantity Surveyors' Committee of the Institute of Chartered Surveyors.
Lt.-Col. C. W. D. Rowe (Co-opted Member) is Deputy Managing Director of the London Brick Co. and Forders, Ltd.
H. B. Bryant (Secretary) is also Secretary of the Building Industries National Council.
Howard Robertson and Stanley C. Ramsey (Co-opted Member) are the well-known architects.

PART III: PLAN NOW

ECONOMIC REORGANIZATION

[By BASIL CLYTHEROE]

Proper Planning is a measure of economy. It does not destroy values; it creates them.

W. R. Davidge, in *The Daily Telegraph*

WHAT IS ECONOMIC REORGANIZATION?

ARISING out of the discussion of the type of body which ought to come into existence in the various industries to co-ordinate effort and ensure the most rapid and effective utilization of the economic resources of this country, one should consider the direction and the form that economic reconstruction should take. It is always easier to be vague and uncertain about planning, largely because vagueness is a sure method of avoiding controversy and opposition. If, however, instead of vagueness one were to give a concrete example, which may or may not be capable of translation into practice immediately, one could force attention to practical problems which vague discussion has relegated to oblivion in advance.

THE MEANING OF PLANNING

An examination of the voluminous American literature on the question of planning would show that there is no intricate or elaborate theory involved in it other than the general conception that the next phase in scientific development is not the discovery of new inventions calculated to increase production or accelerate manufacture or introduce new services and new facilities, but the application to the administration of industry and control of the economic machine, to the study of the problems inherent in distribution and consumption, of precisely those qualities which have been so productive in research and invention. In other words, the future must depend on our capacity to size up properly the economic position of this country, use all our efforts to strengthen that position, and, in this way, avoid the worst consequences of trade cycles and chaotic duplication of effort and of product.

A PLAN

There is no doubt whatever that if even one important industry had before it a proper conception of what it ought to do, and the machinery it ought to bring into existence to get that something done, it would in a short time find the whole nation behind it and it would be granted sufficient support, both politically and financially, to carry out its proposals.

FOUR POINTS

The experiences of the last few years have taught at least four things :—

I. That the theory of profits being the entire justification of industrial enterprise has been seriously weakened through a better conception of social responsibility. Great public boards are not expected to make colossal profits and they are not seriously criticized if their operations, while conducive to a low cost and highly efficient service, may at certain moments cause temporary losses.

II. Expenditure by local authorities—and by the State, for that matter—on activities which at one time were held to be purely the affair of private enterprise, is, despite the economy campaign, considered necessary to economic progress in this country. A recent examination made by Professor Robson of expenditure by local authorities and the relationship between productive and non-productive activities gives a

The New London Survey reports that the percentage of persons living more than three to a room actually increased between 1921 and 1931.

E. D. Simon, in *The Manchester Guardian*.

complete justification for continued development in this direction.

III. Through the greater intrusion of the State and the local authority into all types of economic enterprise, such as housing, public utilities, transport, roads, agriculture and afforestation, there has been induced into a number of basic industries the necessity to combine together for the purpose of handling very large contracts, so that even the most individualistic industrialists are finding themselves compelled to think in terms of the industry to which they are attached.

IV. The enormous achievement of the past ten years in every range of public life, particularly in the public utilities, housing and commercial and industrial building, has made the public accustomed to think in terms of very large enterprises indeed, so that it is not easy to frighten it with a tale of millions which may at some point or other impinge on taxation. The discussions about war debts and conversion loans have served to render the public more familiar with what at one time would have been considered spectacular and rather dangerous figures.

As the result of those four changes it is true to state that public opinion, where it has had any instruction at all, is in advance of the policy carried out both by the National Government and by the local authorities, and it is prepared to accept even the most spectacular schemes, if such schemes aim ultimately at something productive which has, at the same time, the promise of continuity of effort.

CONTROL

There is a feeling, however, that greater benefit might have resulted from the unco-ordinated activities of the country since the war, if some central guidance had been applied and some control imposed on largely speculative enterprises. Thus, the drift of industry southward to form new masses of labour, which may represent a dangerous problem in the future, might have been arrested, or, at least, forced to conform to some definite policy; expenditure on construction in many directions might have been more wisely applied to even out inequalities as between one area and another, and many unproductive features in commercial and industrial activity been avoided. There is still, for example, the theory that unproductive expenditure is confined to local authorities. But all the local authorities in Britain could not together have lost as much money on unproductive enterprises as those mushroom companies which came into existence in 1928, and as quicky disappeared, entailing an enormous financial loss; as those manufacturing combines which, in defiance of all sound economic doctrine, insisted on installing productive capacity which could never be properly used; as those experiments, not so much in new industries, as in the extension of old industries in new directions without any conception of the market available or the technical and economic factors governing expansion.

WASTE

Investigation into the whole field of national activity, public and private, would probably show that, on the whole, less capital has been wasted in public enterprise than in private. One has only to study the long reports of capital reconstruction in almost every industry of consequence to see how lack of order and planned economy has resulted in waste and in misdirected effort. There is no basis for the theory that the future of this country should be confided entirely to unco-ordinated and highly speculative operations.

NO STATE CONTROL

On the other hand, there is equally no basis for the theory that the State should enter into control of industry and determine the volume and tempo of construction. It should be possible for industry to deal with this work of economic reorganization on the widest possible scale, provided that some fundamental economic research is carried out, that a sound policy of development, spreading over a number of years is rigidly adhered to, and that co-operation should be something more than an agreement to hold up prices.

ECONOMIC SURVEYS

The country is still largely ignorant of its economic configuration, and so importance must be placed on proper economic surveys. A first approach towards this type of research was made by the Universities when they investigated conditions in the South-West of Scotland, North-East of England, Lancashire, the Mersey Estuary and South Wales, but those surveys suffered from two fundamental defects. They were not carried out on a uniform basis, so that they could not be compared with one another, and their scope was limited merely to deciding the amount of surplus labour in those areas without any sure indication of what ought to be done to give employment to such labour.

Largely under the auspices of the Institute of Sociology and the Ministry of Health, a number of regional surveys have been carried out in England, and in all about fifty reports have been issued, relating principally to Lancashire, Yorkshire, Surrey, Sussex, Middlesex, Cheshire, Greater London, the Lake District, Devon and Cornwall, Essex, Northampton, Hertfordshire, Buckinghamshire, Berkshire. Those surveys are based on fairly careful field work, and they supply a certain amount of additional material which might be used for the elaboration of wider studies, fitting in ultimately to a national framework. The defect of all, however, is that there is no real economic background given to them, and no policy of constructive activity suggested, other than the obvious one of arranging building construction, domestic, commercial and industrial, in such a way that essential amenities are preserved and some value given to social considerations.

THE LONG-TERM PLAN

The type of planning which is now required is something much bigger, something which will use the economic information contained in the University surveys, the local information given in the regional surveys, and bring them forward into the creation of a constructive long-term plan, capable of making use of the real economic resources of the country and affording some stability and some equalization of the various areas forming the national economic unit.

AN EXAMPLE

I promised, at the outset of my argument, to give a concrete example forcing attention to the practical problems of economic rehabilitation. If one were to take Scotland for that example, one should be able to desig-

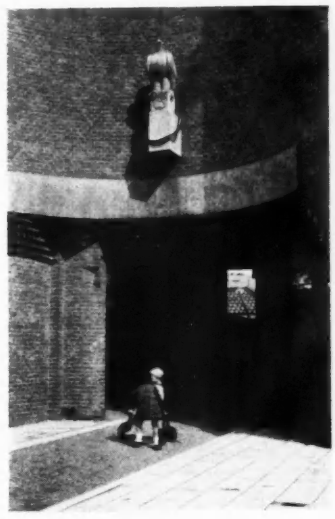
nate, with some approach to accuracy, three lines of expansion and reconstruction :—

SCOTLAND

I. *Immediate measures*

The first steps would concern almost entirely housing construction, the elimination of slums through a scientifically designed series of new town planning projects, which would be not an improvement on the site of existing dwellings but the construction of totally new centres of population to draw away insufficiently housed population in older centres and allow the laws of supply and demand to effect their own remedy.

If one were to take the example of Glasgow where, according to the census of 1931, there were more than 148,000 dwellings of two rooms or less containing half the population, one could visualize an ambitious plan which would have sufficient economic justification to permit of its introduction and conclusion. The remedy for the housing situation in a centre like Glasgow is really the building of a new town, where everything would be carried out on mass lines, with the maximum degree of standardization ; central purchasing of all essential materials, uniform specifications covering methods of construction, not only of building but also transport, road making, public utilities ; the adoption of the most modern design, which would permit of the reduction of unnecessary expense on decoration and yet give an effect æsthetically satisfactory.



I am quite certain that if any authority were to project a town of this size, complete in every detail, to be constructed on the most economic lines, it would find itself capable of quoting rents for flats of three rooms with modern conveniences sufficiently low to compete with rents already paid in the two-roomed and single-roomed dwellings in Glasgow and obtain a reasonable return on the capital invested. Such a proposition has never yet been worked out in any detail, but if municipalities like Amsterdam, Frankfurt and Vienna have been able to embark on projects almost as ambitious as these, with complete success, the ability of a large municipality such as Glasgow to do so should not really be questioned. This is given merely as an example of a type of construction which might be contemplated.

II. *Plans which would be rather less immediate and yet would be necessary*

The Ministry of Reconstruction at the end of the war received from County Councils and other local authorities,

AMSTERDAM

Amsterdam furnishes an example of planned housing construction, intelligently and beautifully achieved,

where economic building can enlist to advantage the plastic arts. Statistics of the enterprise are quoted below.

TABLE I.
Capacity of Houses Newly Built at Amsterdam During Years 1925–30.

Year	Number of dwellings in houses with					Low labourers' dwellings		Total number of dwellings
	One dwelling	Two dwellings	Three dwellings	Four dwellings	Five and more dwellings	One-family house	Houses with two stories	
1925	33	118	528	3,820	1,384	168	1,145	7,196

KEY TO INDUSTRY MAP

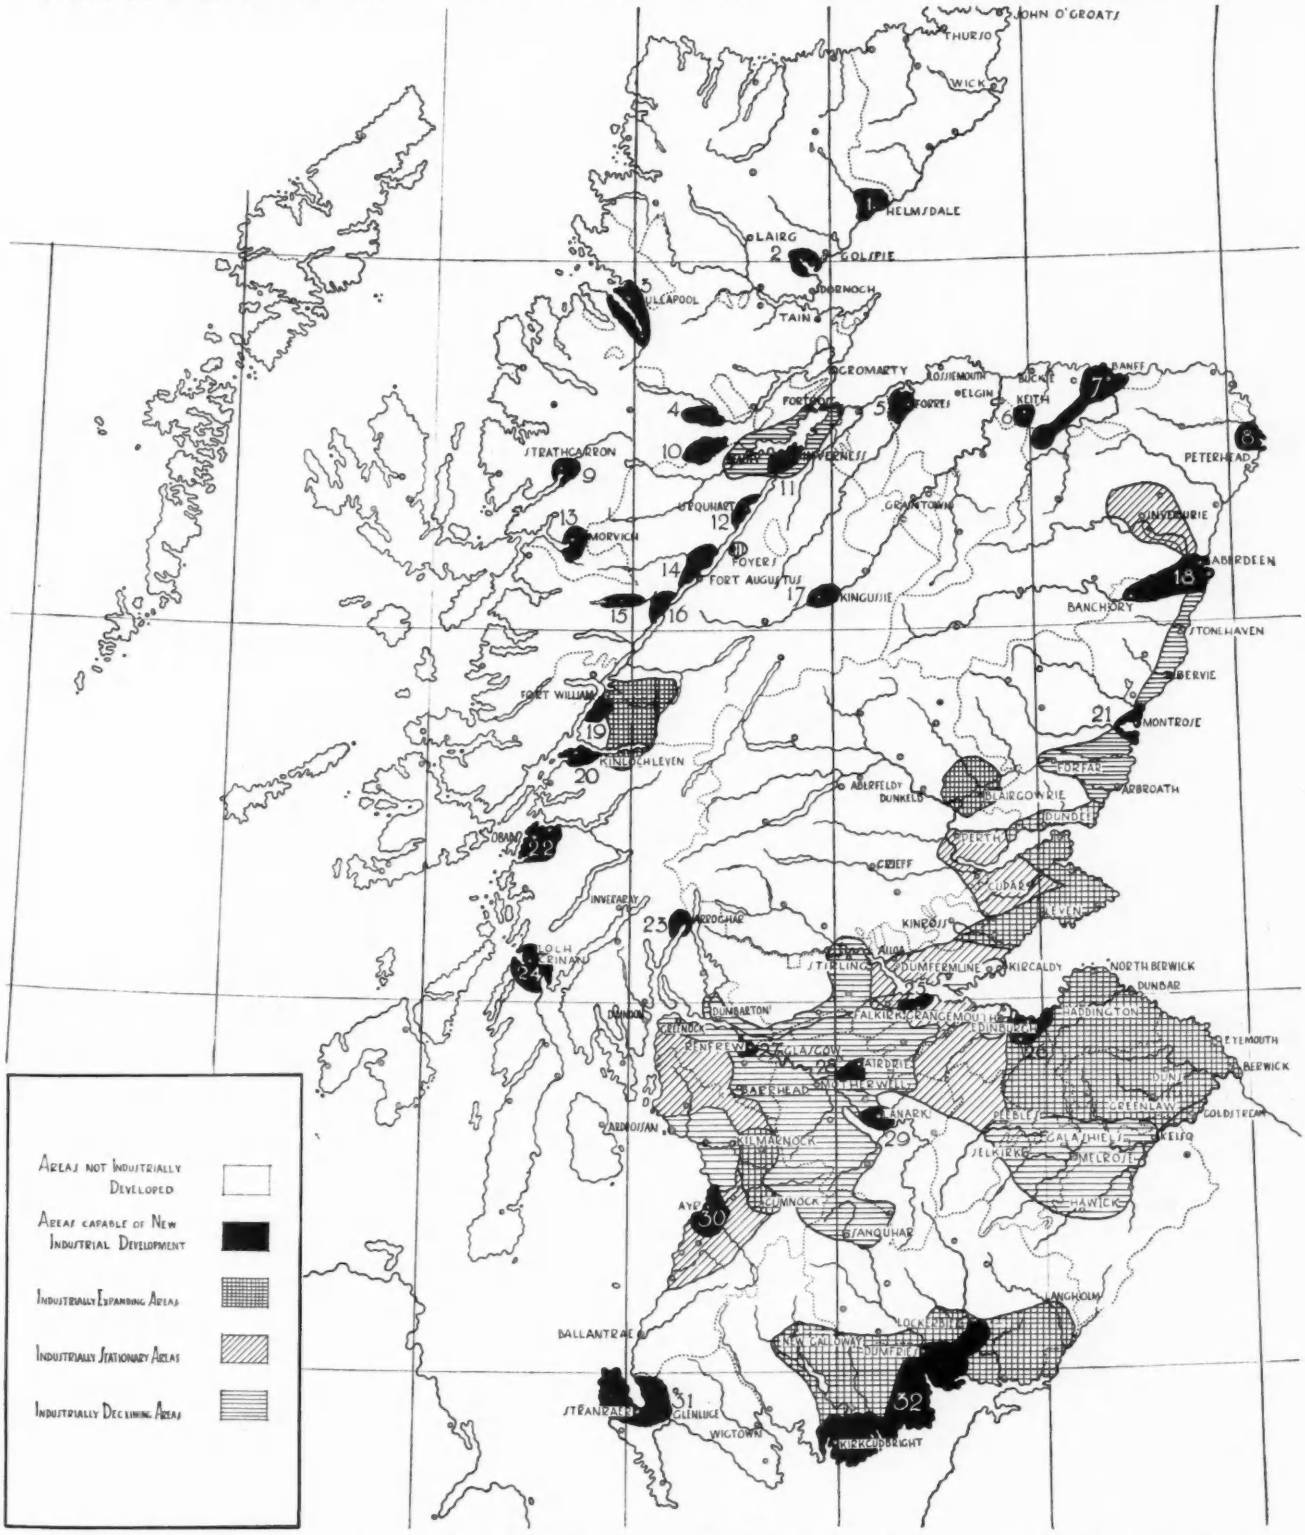
1. SHIPBUILDING
2. TEXTILES.
3. PAPER.
4. LINOLEUM
5. CHEMICALS AND OIL REFINING.
6. ALUMINIUM.
7. BOOTS AND SHOES.
8. FRUIT FARMING.

COAL MINING.
PRINCIPAL MAIN TRANSMISSION LINES
SECONDARY " " "
STEAM GENERATING STATIONS
HYDRO ELECTRIC
TOWNS UNDERLINED - IRON & STEEL & ENGINEERING.

These two maps of Scotland constitute a first attempt to survey as a whole the industrial position and possibilities of Scotland.

The second map is based very largely on a study of the various reports issued by the Ministry of Reconstruction and the proposals put forward for the development of their areas by various county councils in Scotland. It presupposes the adoption of a policy of extensive afforestation in the Highlands, the construction of a canal across Scotland, linking up Grangemouth and Renfrew, the widening of the Crinan Canal and the extension of the capacity of the Caledonian Canal to take traffic running between the Irish Channel and the North Sea and the new industrial centres which would come into existence with proper agricultural and sylvicultural development.

The first map gives a clue to the power equipment of Scotland and the part played by the Grid in linking up steam-power stations and water-power plants in the Highlands and in South Scotland. Industrial development has not accompanied intensive water-power development, particularly in South Scotland, and the fullest use has not been made even of existing water-power plants in the Highlands for the purpose of opening up areas within an economic distribution range.



The basis of any economic survey in Scotland is to be found in the transfer of population out of the depressed and declining areas shown in the second map into the Highlands and into Southern Scotland. The power equipment of the country is moving in that direction, so that any plan has already the fundamentals laid down. A closer survey of potentialities, particularly in the Highlands, might call for readjustment of the new areas capable of industrial development, but the purpose of the maps is really to concentrate attention on :

I. The existing resources which are not being properly utilized.

II. The change that has taken place in existing industrialized areas.

III. The areas where any planning policy would be most active.

POSITION AND POSSIBILITIES FOR DEVELOPMENT

The numbers shown on the above map in the areas capable of new industrial development refer to industrial possibilities, which are enumerated as follows :—

Nos. 1, 2, 4, 10, 11, 13, 14, 15, 16, 22, 23 — *Hydro-electric plants harnessing local water-power resources.*

Nos. 3, 9, 11, 13, 22 — *Electro-chemical or electro-metallurgical plants attached to water-power schemes.*

Nos. 5, 11, 12, 14, 15, 16, 17 — *Paper, pulp and wood-working enterprises, linked up with afforestation projects.*

Nos. 5, 6, 7 — *Paper and textiles.*

No. 8 — *Fish canning and curing industries.*

No. 18 — *Fish canning and curing, and paper-milling, textiles and wood-working industries, linked up with the afforestation of Deeside and the South-East Grampians.*

No. 21 — *Heavy paper, light engineering and fruit canning industries.*

Nos. 19 and 20 — *Miscellaneous industries based on increased development of aluminium and electro-chemical and electro-metallurgical industries.*

No. 24 — *Widening of the Crinan Canal and development of marine transport services.*

No. 25 — *Terminal of Forth and Clyde Canal : iron and steel and heavy engineering.*

No. 27 — *Iron and steel, cement, clothing manufacture.*

No. 28 — *Electrical apparatus, light castings, textiles, clothing.*

No. 29 — *Textiles, clothing, fruit preserving and canning.*

No. 30 — *Paper-making, electrical supplies, seaport extensions.*

No. 31 — *Seaport facilities, linking up with intensively developed agricultural hinterland.*

No. 32 — *Miscellaneous industries, co-operative dairies, bacon factories, textile mills, linked up with the Galloway water-power schemes.*

WHERE INDUSTRY IS DYING FOR WANT OF RECONSTRUCTION

The only blast furnace operating in Scotland.

Derelict ironworks in the Coatbridge district of Scotland.

Abandoned machinery rotting beside a stagnant Scottish canal.

particularly in Scotland, suggestions for public works which would improve the economic status of their area. Now those suggestions, with very few exceptions, have not been put into operation, and they constitute a body of opinion much of which is still valuable. In this class should be considered the provision of new roads to open up less developed parts of the country, the intensive development of public utilities, transport facilities, water-power schemes and activities of a type calculated to supply the machinery necessary for the prosecution of short-term plans, and the raw materials, semi-manufactured products and services necessary to render possible any work of reconstruction.

With this should be considered the encouragement of new industries and the extension of old industries which have not been able to maintain a sound competitive position. The economic survey by the University of Glasgow did indicate many possibilities of extension and reconstruction of old industries which are proving more and more inadequate to the economic needs of the country, and to that one can add industrial works necessary to meet the requirements of the country in commodities and products which at the present time are not being satisfied in the most economic fashion.

III. *Long-Term Planning*

Such long-term planning would aim at complete reorganization of the agricultural activity of the country, and be bound up, in Scotland, with the expansion of the economic resources of the Highlands—resources represented predominantly by the possibilities of afforestation combined with stock-rearing on a more intensive scale than at the present time.

It has been estimated, for example, that over five-and-a-half million acres of land in Scotland can be devoted to afforestation, compared with the acreage under forest at the present time —probably less than 700,000.

Combined with such afforestation would be the development of industries in the Highlands, such as the wood-pulp and printing industries, capable of using the raw materials on the site —but they obviously cannot come into existence until the forests are mature, so that this group of industries depends on the long-term planning of afforestation.

A NATIONAL PLANNING BODY

I have given one or two instances of the type of activity which falls into the three categories defined merely to

give some direction to opinion and material for criticism. If the national planning body were in existence it would be able to draw up a map of Scotland indicating where activities entering into those three categories should be located and when they should be initiated.

The whole of Great Britain ought to be examined by such a body, in closest detail, using all material at the disposal of the State departments and local authorities, with a view to deciding what should be the balance of activity, as between one area and another, what resources exploited, what industries encouraged and what public utilities and services developed to make the work of economic reconstruction possible.

Every basic industry is vitally interested in such planning—particularly coal-mining, iron and steel, chemicals, wood-working, and even textiles, but most of all the Building Industry, since new enterprise must call on building in one or all of its phases.

It might be suggested that such work should be carried out by the Government itself, should be left entirely to the Government, but this view is rather short-sighted, since the Government has enough preoccupations to keep it adequately employed.

Unless one sane and vigorous organization makes a proper survey and insists on its recommendations being carried out no action may be taken for years.

THE BUILDING INDUSTRY

At the end of the war the Ministry of Reconstruction might have been that type of organization, but now the matter devolves more and more on the industries concerned, above all on the Building Industry in co-operation with the architectural profession.

If the Building Industry were to create a Development Board, whose function was to carry out a survey of new types and new forms in economic reconstruction, and insist that the recommendations resulting from such a survey should be put into operation, it would accomplish more in a few years than any amount of sporadic building or adverse criticism of economy campaigns.

The country requires at the present time a constructive lead. It is sick of obstruction and adverse criticism, and any industry which can make a proper use of this sentiment will reap an enormous advantage and at the same time assist in the economic development of the country.

ARGUMENT

National policies have been made to aim at a balanced budget. Rigorous deflation has been practised; national security is preached through reducing wages and construction. Strong counter-measures are necessary to reverse these negative policies. True economy is wise spending at the right time. Now *is the time to build.*

Building is a good investment: credit and materials are plentiful and cheap; building costs are lower than they have been at any time since the war or are likely to be in the future.

Building relieves taxation: over two million workers are directly affected by the Industry and a further two million indirectly. Eighty per cent. of the total cost of its products is disbursed in weekly wages, causing a constant circulation of purchasing power. The Industry obtains practically all its raw materials in the country.

Building is a necessity of progressive manufacture: England has acres of obsolete factories, streets of out-of-date offices, miles of slums, and at least 1,200 schools unfit for children. All these must be reconstructed.

Cheap money, labour and materials are available; yet investors hesitate.

The Public Relations Committee of the Building Industries National Council have made clear the position of the Industry in relation to national prosperity, its power to render efficient service in national industrial rehabilitation.

Architects must play their part by rationalizing their own activities.

National prosperity must be the aim of every industry. It is only combined effort that can assure individual welfare and prosperity.

The new National Council of the Building Industry seeks to maintain the Industry as an efficient unit in the economic structure of the country. Its offspring, the Public Relations Committee, has been formed to act as a consultative and advisory body, to collect, co-ordinate and give expression to views affecting the Industry as a whole, to consider matters relating to external factors, to collect statistics and data, and to co-operate, when desirable, with similar bodies in other industrial groups.

The policy of the National Council is planned and organized progress. Coal, steel, electricity, agriculture, transport and other industries are rationalizing themselves. The time is rapidly approaching when co-ordination in and between all industries will be accomplished. Cut-throat competition can only result in increasing the unproductive load of national social services. National prosperity through efficiency is the aim of the Building Industry.

There is no basis for the theory that the future of the country should be confided entirely to unco-ordinated and highly speculative operations.

Economic reorganization must be on the widest scale, and a sound policy of development, spreading over a number of years, must be rigidly adhered to.

It is not enough that the Building Industry should organize itself. A plan for the Building Industry involves a plan for the whole country. Our future depends on our capacity to size up the nation's economic capacity.

The whole of Great Britain ought to be examined in the closest detail by a National Planning Body with a view to deciding what should be the balance of activity as between one area and another, what resources exploited, what industries encouraged and what public utilities and services developed.

There must be National Reconstruction through the combined efforts of every industry, led by the Building Industry, of which the architectural profession is the brain.

PART IV: HOW TO PLAN

A CONCRETE SUGGESTION *FOR A* NATIONAL PLANNING BOARD

[By C. B. PURDOM]

Neither in politics nor in economics have any of the political parties grasped that the first and urgent necessity is planning ahead. The great fund of individual and corporate goodwill goes to waste, and all our wills are frustrated for want of a large-scale plan of national reorganization. Particular projects, often of great potential value, are put forward without any effort being made to relate them to each other or to a national plan, and they either break down or function imperfectly through needless friction engendered by absence of ordered planning.

From PLANNED MONEY, *by Sir Basil P. Blackett, Director of the Bank of England.*

At first glance, the facts with regard to town planning should give all who talk about national planning to pause. Town-planning powers have existed in this country since 1909, and since 1919 their exercise has been compulsory. During that period, more than a thousand town-planning schemes have been prepared for over seven-and-a-half million acres. In the last few years, "regional" planning has become fashionable, and reports and plans have been published for many more million acres. I do not know the exact number. Are we, as the result of all this work on paper, getting better towns, are we getting order and form into the building of cities? We know that we are not. In fact, during the past 13 years, which has been one of the greatest periods of domestic building in our history, when towns have made big extensions and vast sums of public and private money have been spent upon them, there has been more spoliation of the countryside than ever before and more bitter controversy over the destruction of natural beauty by uncontrolled urban building than at any time in history.

THEY DON'T WANT IT

What is the explanation? It is not for lack of experts devoted to the art that town-planning has meant so little; for the number of professional town-planners can be counted in hundreds. It is not for lack of propaganda; for enthusiasts have been preaching the advantages of town-planning for not far short of 30 years. Why is it? The answer surely must be that apart from the enthusiasts, nobody has wanted town-planning. By "nobody" I mean no one actually concerned with building and land-ownership. Neither architects, engineers, surveyors, builders, land agents nor financiers have really thought there was money in town-planning for the interests they represent.

Yet, if there is any meaning in "planning" at all, town-planning is the most important aspect of it. What is the use of planning an electricity supply, transport, industry, finance, and any other service or activity, if the distribution of population is not planned with them? These things do not exist for themselves, but to supply people with what they need, and if the distribution of people is left to chance, how will it be possible to take advantage of the planning of the things they need to use? Is it sensible to plan part of the structure of the national economic life, giving no thought to the placing of the human element that is to make that structure and to give it reality? That is exactly what is happening now. The best brains of the country are devoting themselves to the scientific treatment of industry, transport and power, but nothing whatever is being done to examine scientifically the distribution of human beings in town and country, so that the nation may function as an economically sound whole.

LOCAL *v.* NATIONAL

The reason for this may, perhaps, be found partly in the fact that town-planning is in the hands of municipal authorities, which are not at all directly concerned with industry and only partially with transport or power, and partly also in the fact that there never has existed in modern times any science of town building. Municipal authorities look after their own local affairs—that is all they are required to do—while the distribution of population is a national concern. And even for dealing with their own problems of town extensions, town improvement and slum clearance, municipal authorities have no guidance as to the social or economic principles on which they should act. Everything in town building is experimental and uncertain. Everywhere the line of least resistance is followed. Public subsidies and private speculation work independently with no aim but the immediate satisfaction of pressing needs or personal profit. Town-planning exists on paper, but is so formless, and so devoid of scientific basis, that it is of comparatively little help in controlling or guiding either public or private builders. What the ordinary man knows about town-planning is that it means twelve houses to the acre. The result is that towns continue to sprawl out in a disorderly manner as best they can; and ugliness is rampant.

TOWN PLANNING

The truth is that we need a National Scheme of Town-Planning. The time has gone when town-extension can be looked upon as a purely local affair. Transport has made the country one. Electricity supply and industrial reorganization require a national point of view. Individual cities, even groups of cities, do not get a wide enough survey of economic or social factors to be able to plan for their future with any confidence. That is realized—perhaps subconsciously!—even by those responsible for the planning of the London region, with the result that after five years' work, nothing has been

done and a future is looked forward to in which nothing shall be allowed to be done. Neither London nor Manchester nor any other region can plan for itself, only a national authority can do it for the country as a whole.

Is it realized, for instance, that in the local town-planning schemes in the region of London over forty square miles have been set aside for industrial areas, sufficient to double the population of London? Who wants that? Would it benefit the nation? Yet only a national plan could provide an alternative.

> The very notion of planning is obnoxious to most minds, and meets with instinctive hostility from those who have been brought up in British traditions of freedom. . . . Any planning of national reconstruction in this country must do full justice to the sound common sense of this traditional British scepticism. It must be dynamic planning, not a cut and dried programme devised for a static world; but planning there must be.
>
> *From* PLANNED MONEY, *by Sir Basil P. Blackett.*

A CENTRAL PLANNING BOARD

What we must have to give reality to town-planning is a central planning authority that will think for the nation. We need an organism with a thinking brain, so that the main lines of the physical development of the country can be marked out. Until this is done, town plans will remain on paper, town-planning legislation will continue to be abortive, uneconomic building will be done by local authorities and private persons, traffic congestion and waste will increase, no national transport system will be workable, and the best use will not be made of the national electricity supply.

The formation of such a Central Town and Country Planning Board is practicable. The men could easily be found for it, and it could get to work at least as quickly as did the Central Electricity Board. Its functions should be to plan in outline the distribution of population, based on economic surveys, and in co-ordination with electricity and transport and arterial road construction. It should not be an advisory body, but an executive authority, supervising town-planning throughout the country. The town-planning schemes of local authorities should be subject to it. All planning schemes beyond a certain size should come directly into its hands. Building schemes on new areas by local authorities or private persons should be made subject to the plans of the Central Board.

FINANCING PLANNING

The Board should have power to raise money to finance planning and building schemes required by its plan of economic development. What is wanted is construction—plans made into bricks and mortar—but in the right places and in accordance with a master design. One of the arguments that used to be urged in favour of town-planning schemes was that they did not mean building. No indeed! And fortunately so; for had building been artificially encouraged on the seven-and-a-half million acres already included in town-planning schemes, in what a mess we should be! But the Central Planning Board must have building powers. I see no sense in setting up an organization that will merely offer advice and print beautiful reports: we need something done. That needs courage, of course, but courage is called for today to bring the nation out of inertia and despondency.

The practical work of a Central Planning Board would include schemes for semi-derelict industrial areas such as exist in South Wales and the North of England, and for stemming the flow of population to London and the South of England by providing a structure for fresh industrial development elsewhere, while to the extent that new population in the South is desirable, provision could be made for it. By this means the burdens on local authorities would be relieved and unregulated building in the South would be effectively checked.

This means a certain amount of Government interference with industry and the movement of population. But interference of one sort or another is inevitable. Is it not better that it should be planned? And it is too late now to object to Governmental action in private affairs.

WHO WILL ORGANIZE IT?

The Central Planning Board should not be a Government department or associated with a Government department. It should be a public authority set up in a similar way to that in which the Central Electricity Board was established, responsible for discharging a public function, but free from political interference.

Who will provide the driving power required to get this Central Town and Country Planning Board set up? It could be found by the building and allied industries. It is no use to wait for a popular movement in its favour. That will never come. Besides, it is necessary to get this work of planning out of the hands of social reformers and politicians, and into the hands of practical men. Town-planning has been far too long an academic subject. It should now be seen to be sound business. The Building Industry can find the practical men required. Why not attempt it?

The Industry has everything to gain. It will mean the employment of its resources on a scale not hitherto dreamed of. The existing towns and cities are largely out of date, inconvenient, uneconomical and in need of drastic rebuilding. There can be no doubt that such rebuilding would pay handsomely. What a task for the building trades! But that task will be attempted only when the pressure of population has been relieved, which will be brought about only when a central authority becomes responsible for planning for it.

THE CHANCE FOR THE BUILDING TRADES

Organized town-building, to meet the needs of the times and to provide for future industrial development, is what is required. Industrial plants are being rationalized, whole industries are being reorganized, and re-planning and reorganization will have to be achieved throughout the national life. It is urgently required in our towns and cities. It must be provided for new areas. It can be done only by a Central Authority that has behind it the power of an industry capable of carrying out what the Authority has to do. This is the great chance for the building trades now so heavily hit by the depression and with no other opportunity for immediate revival.

I admit that the proposal made here is seemingly impossible to carry out; but that impossibility would vanish before the determined effort of a few men who knew what they wanted. Masters and operatives should work together in this; let them learn from the recent prosperity of the electrical industries how they may bring prosperity to themselves.

RESULTS *of* UNPLANNING

Why can't we abolish poverty? The answer is, because we are too wealthy. Why is it necessary for anybody to go cold? The answer is because we have too much coal and too much fuel oil. Why must anybody go with shabby clothing? In the observation car the other day I was reading the fashion notes. (You would be astonished to learn what a man reads in an observation car.) I read that men will wear grey a great deal this spring. The man beside me said, "They certainly will, if they wore it last spring." Why shouldn't we all have new clothes? The answer is because we have too much wool, too much cotton, too many woollen mills, too many cotton mills, too many mill hands and too many tailors. Why must anybody go hungry? Well, I have just been from Aroostook County, in Maine, where everybody was groaning because they had produced too many potatoes, to Southern California, where everybody was groaning because they had produced too many eggs. Why do we have to live in shabby houses? That, of course, is because we have too much steel, too much lumber, too much cement, too many architects, too many carpenters, and too many plumbers.

But if we have too much of one thing in one place and not enough in another, why don't we transport the surplus from where the people do not want it to where they do want it? The answer to that question is the easiest of all. That is because we have too many railroads, too many ships, and too many trucks.

— WILLIAM TRUFANT FOSTER, FROM THE ANNALS OF THE AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE.

TO SUM UP—

THE CASE FOR PROSECUTION

[By the EDITOR]

I suggest, therefore, that the first step towards the "rationalization" of planning should be to set up a Joint Committee, representative of these three groups (Town Planning, Industry and Transport). Such a Committee could, and should, form the nucleus of a larger body representative of all the interests concerned and for whom an appropriate designation would be the "National Planning Board." It would be the duty of the Board to collect and examine all available data, to investigate exhaustively the problems that have to be solved, and finally, to formulate a national planning policy that can be adapted to local needs.

F. LONGSTRETH THOMPSON,
President of the Town Planning Institute.

A NATIONAL SURVEY ESSENTIAL

THERE are in existence four Regional plans which include in their survey the ancient city of Chester. These four regional plans have been prepared by four different regional bodies, and these four different regional bodies have seen no reason to compound with their birthright as liberty-loving Englishmen, by entering into any form of co-operation.

This is only an instance of what has been emphasized elsewhere in this issue—that unco-ordinated regional planning defeats its own object. Regional planning without a co-ordinating national survey is like a house without a staircase; and when individual industries and groups of industries reorganize and combine as they are in process of doing today, one of the first things they ask for *is* the staircase. Not unnaturally they want a national survey, both of their own resources and of the nation's requirements; a comprehensive national survey which will give them some conception of the inter-regional balance of activities.

THE BUILDING PLAN

Further, the fact that a National Planning Scheme for the distribution of *power* has now been practically completed, not only furnishes a precedent which the Builders and Transport industries might follow, but itself involves planning on a national scale. For power will now be available for industrial and agricultural development throughout the length and breadth of the land. Can it be seriously main-

tained that the utilization or exploitation of this power should be left to the control of purely local, or even regional interests?

We find, therefore, that the industrialists and professional town planners are *thinking* the same way—towards a national plan. Mr. William Randolph, Mr. Basil Clytheroe and Mr. C. B. Purdom, in the preceding article, make a strong plea for a National Planning Board with executive power. It is suggested that just as the electrical industry has got out a National Power plan, and not only got it out but turned it on, so the Building Industry must get out a National Building plan. When one investigates a National Building plan, however, one discovers that it involves a sort of all-in policy, social, economic, industrial. We are thus led to conclude that to fulfil its function and to exploit its resources fully, the Building Industry will eventually be forced to produce a plan of campaign on a scale which no English body, private or public, has yet attempted.

Well, why not? It sounds a big thing. Mr. Purdom's National Planning Board with executive powers may strike horror into some not-too-firmly-beating hearts, the sort of shaking-hands-with-murder horror which accompanies the mention of the Five-Year Plan. Though, as a matter of fact, there is no reason why we should allow a conservative idea like national planning to be monopolized by the red flag. It sounds a big thing, but the Building Industry is a big thing, too, the biggest thing in the country. Besides, there are a hundred different bodies, societies and interests behind the movement which would back the Building Industry up. The Central Electricity Board, for instance, has already carried out a general survey of Scotland, and is preparing to tackle England during the next three years. Co-operation here would be fruitful. However, to allay suspicion, let us drop the "national," the "executive" and the capital letters and see if a planning board such as Mr. Purdom proposes could be made a practical proposition.

FORMATION OF THE BOARD

The first step would be for the National Council of the Building Industry, or for the Public Relations Committee to *form* the board, which would be composed of members from the building and allied industries, the transport industry, the chief regional planning bodies in the country and the Town Planning Institute, whose president recently made a proposal for some such scheme, which he described

• FACTS AND FIGURES •

The table below sets out the numbers of workpeople insured in the Industries of Building, Public Works Contracting and Constructional Engineering. The figures are taken from the *Ministry of Labour Gazette*, August, 1932, as at the last computation, July, 1931. They cover Great Britain and Northern Ireland.

	Males.	Females.	Total.
Building	848,250	9,920	858,170
Public Works Contracting ..	269,330	1,300	270,630
Constructional Engineering ..	28,310	1,270	29,580
	1,145,890	12,490	1,158,380

For purposes of comparison the following figures are given to indicate the corresponding numbers insured in the other chief and prominent industries (also at July, 1931).

"Distributive Trades"	1,874,780
(of which 1,136,530 are males)	
Coal Mining	1,046,870
(of which 1,041,120 are males)	
General Engineering	576,380
(of which 528,910 are males)	
Cotton Textiles	550,110
Motor Vehicles, Cycles and Aircraft	251,320
Woollen and Worsted	238,870
Shipbuilding and Repairing	195,390
Steel Melting and Iron Puddling, Iron and Steel Rolling and Forging	169,350
Boots, Shoes, Slippers and Clogs	137,840
Chemicals	98,940
Linen	78,210
Silk Manufacture and Artificial Silk Weaving	45,020

Agriculture is not an insured Industry, but the latest figures published are in the *Annual Agricultural Statistics* of the Ministry of Agriculture and of the Department of Agriculture for Scotland (see page 32 of the *Twentieth Abstract of Labour Statistics*, Cmd. 3831, of March, 1931). They cover Great Britain only—not Northern Ireland.

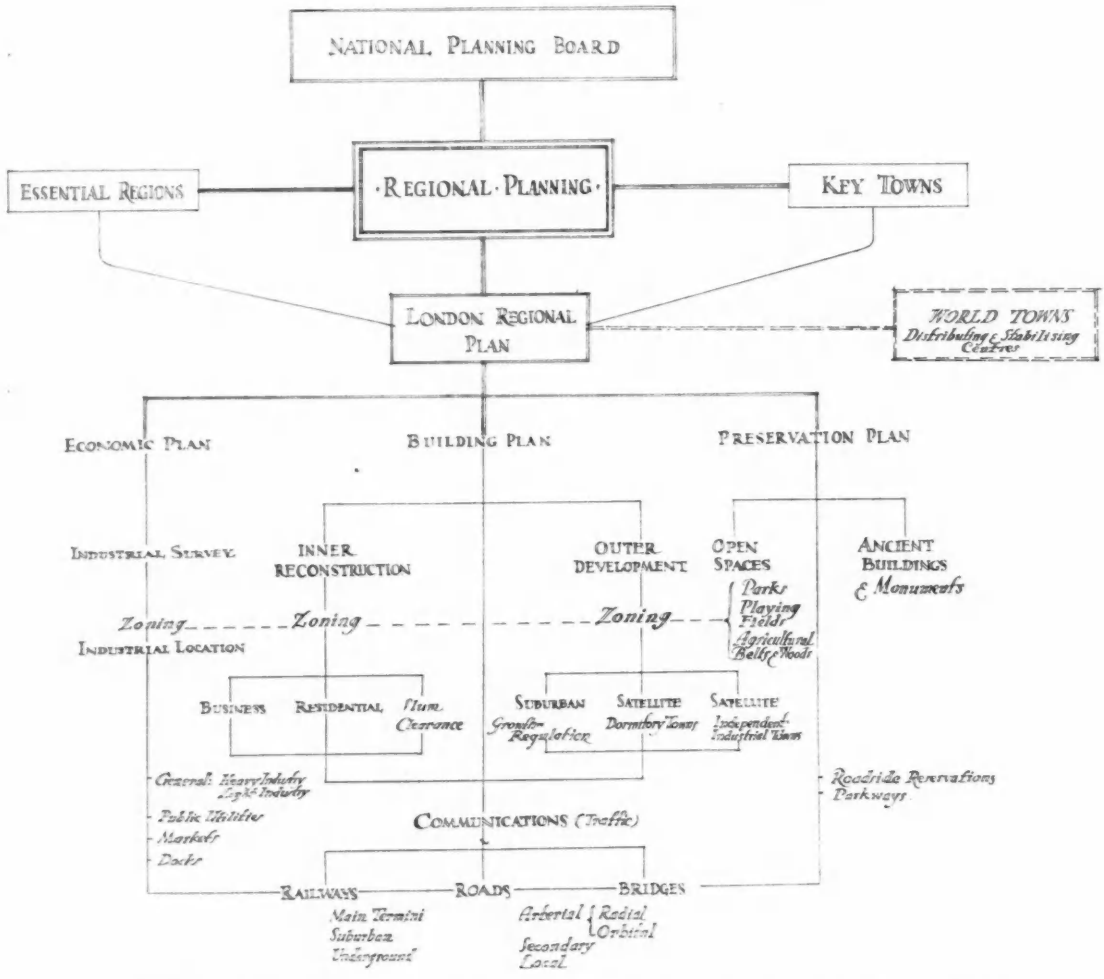
The figures are :—

GREAT BRITAIN.

	Males.	Females.
Regular Workers	645,014	83,926
Casuals	89,466	38,808
	734,480	122,734
Total Agricultural Workers		857,214

Subsidiary Industries directly and almost entirely dependent upon building and public works employ 407,170. This figure should be added to the number of those for whose employment the industrial group mentioned in the above table is responsible—giving a total of 1,158,380, plus 407,170, or 1,565,550. Other industries affected directly or indirectly by activity in building and public works employ 889,180. Thus, at a conservative estimate, the employment or otherwise of at least 2,000,000 workers is determined by the degree of activity in the Building and Public Works Group of Industries. This takes no account of the large number of professional workers engaged in the Industry.

In a first analysis it may be said that, on an average, each £100 spent on building or constructional projects include about £40 paid out to building trades workers, £45 to £50 devoted to the purchase of materials and from £10 to £15 devoted to overhead costs (which also include remuneration of various kinds).



A further analysis will reveal that of the £45 to £50 devoted to the purchase of materials, probably from £35 to £40 is paid out in wages to workers in the manufacturing, producing and transport industries. Here again, the balance remaining for overhead costs will include remuneration payments of various kinds.

Thus it will appear that, of each £100 spent on building or constructional projects, over £80 is generally devoted to payment of earned remuneration—either as wages in the building or the manufacturing trades or in transport or in salaries.

The net result of refraining from an expenditure of £100 upon justifiable building or constructional projects is to withdraw £80 of wage-payments (which would have created new wealth) and to substitute two-fifths of that amount (£32) as unproductive payments at the expense of industries generally.

For every £1,000,000 of building or constructional work abandoned, the State or local authorities will be called upon to bear an unproductive expenditure of £375,000 in unemployment benefits and public assistance, while a further £425,000 is withdrawn from the purchasing power of the wage earners.

Together with their families, the workers in the Building Industry form a considerable proportion of the whole population. The total cessation of building work would mean that more than two million adult male *workers would be thrown out of employment, and that (having regard to their families) the purchasing power of eight million persons would be much reduced, with very great repercussions upon local commerce and local industries.*

This diagram shows the National Planning Board —which would be related to Agriculture, Industry, Finance and Transport—as distributing its executive functions through Regional Planning, exercised by essential (i.e., socio-geographical) Regional Units and Key Towns. The London Regional Plan is shown as an example, in detail, as a region around a central nucleus—though a phenomenon in the economic organization of the country, by reason of its situation and functions as a national administrative and world financial centre.

For clarity, the Regional Plan is divided into three branches: (1) Economic Plan, (2) Building Plan (including communications), (3) Preservation Plan; though these are, of course, in practice inter-connected. The first relates to an industrial survey and zoning for industries and public utilities. The Building Plan is divided into Inner Re-construction and Outer Development, from which proceed categories of development filtered by the process of Zoning. With these are inter-connected Railway, Road and Bridge communications. The third branch, the Preservation Plan, relates to the provision of open spaces, including Parks and Playing Fields; to which is added the essential revivified Regional Agricultural Belt or background, depending upon a definite agricultural policy. The Preservation Plan would also include the reservation of roadside strips for checking "villa" development. The preservation of ancient buildings and monuments (requiring some sort of schedule) also comes within the legitimate scope of this group.

as eminently desirable. Representatives of other essential industries, landowners and agricultural interests would be co-opted to the board. This board would then approach the Ministry of Health which, I am informed, would be inclined to regard its existence favourably, in order to obtain an official blessing and official aid. Possibly a representative from one or more of the Government departments would sit on the board.

Some public statement of policy would no doubt be required and the board would then proceed under the advice of the Ministry of Health to revise and integrate the regional surveys, co-ordinating the activities of one region with another until a general picture of the nation's social, industrial and economic requirements could be evolved. Possibly the country would be split up into several main districts, as it is under the Central Electricity Board, the Traffic Commissioners and the Ministry of Labour.

FINANCING BUILDING: THE SECOND STAGE

Having completed its economic survey and having gained the support of the various Government Departments involved, the planning board would then proceed to the second stage of its activities. It would proceed to finance and put into operat on such schemes as met with the approval of itself and the Ministry of Health, in

exactly the same way as the Central Electricity Board finances electrical operations.

THE BANKERS' INDUSTRIAL DEVELOPMENT COMPANY

The financial basis of large constructive schemes initiated on the advice of the planning board—such as have been indicated on p. 79—would involve the co-operation of building finance companies for the raising of initial capital. We have the case of the Bankers' Industrial Development Company in connection with the Northamptonshire Ironworks developments. If this project, for instance, were assumed to be part of the board's programme, the machinery for the complementary provision of housing and regulation of development would be available *pari passu* for utilization by the local and regional authorities.

"SPECULATIVENESS"

For other works, a large amount of capital now locked up on account of the excessive *speculativeness* of building without facts, figures, knowledge of requirements, potentialities, movements of population—the *speculativeness* which invariably accompanies building *without planning*—would become immediately available.

Planning, national, regional and local, will do more to attract the investor than propaganda. For planning, as Mr. W. R. Davidge very rightly says, not only creates values but maintains them. The general trend of development can thereby be reasonably foreseen.

There is no further space in which to develop this theme, but I hope that the nature and functions of the planning board will be discussed in future issues of this JOURNAL. Such an organization would be "typically British" in its combination of—or compromise between—individual enterprise and Government control. There is no virtue in state control of industrial organization if this can be achieved by co-ordination amongst the industries themselves, including the basic industries of agriculture and building.

LASTLY—

Let us remember that our gods are just gods. The so-called slump will not suddenly get up and walk away. "Good times" will remain round the corner until we take the trouble to turn it ourselves.

ARGUMENT

¶ *National policies have been made to aim at a balanced budget. Rigorous deflation has been practised; national security is preached through reducing wages and construction. Strong counter-measures are necessary to reverse these negative policies. True economy is wise spending at the right time.* Now *is the time to build.*

Building is a good investment: credit and materials are plentiful and cheap; building costs are lower than they have been at any time since the war or are likely to be in the future.

Building relieves taxation: over two million workers are directly affected by the Industry and a further two million indirectly. Eighty per cent. of the total cost of its products is disbursed in weekly wages, causing a constant circulation of purchasing power. The Industry obtains practically all its raw materials in the country.

Building is a necessity of progressive manufacture: England has acres of obsolete factories, streets of out-of-date offices, miles of slums, and at least 1,200 schools unfit for children. All these must be reconstructed.

Cheap money, labour and materials are available; yet investors hesitate.

The Public Relations Committee of the Building Industries National Council have made clear the position of the Industry in relation to National prosperity, its power to render efficient service in national industrial rehabilitation.

Architects must play their part by rationalizing their own activities.

¶ *National prosperity must be the aim of every industry. It is only combined effort that can assure individual welfare and prosperity.*

The new National Council of the Building Industry seeks to maintain the Industry as an efficient unit in the economic structure of the country. Its offspring, the Public Relations Committee, has been formed to act as a consultative and advisory body, to collect, co-ordinate and give expression to views affecting the Industry as a whole, to consider matters relating to external factors, to collect statistics and data, and to co-operate, when desirable, with similar bodies in other industrial groups.

The policy of the National Council is planned and organized progress. Coal, steel, electricity, agriculture, transport and other industries are rationalizing themselves. The time is rapidly approaching when co-ordination in and between all industries will be accomplished. Cut-throat competition can only result in increasing the unproductive load of national social services. National prosperity through efficiency is the aim of the Building Industry.

There is no basis for the theory that the future of the country should be confided entirely to unco-ordinated and highly speculative operations.

Economic reorganization must be on the widest scale, and a sound policy of development spreading over a number of years must be rigidly adhered to.

It is not enough that the Building Industry should organize itself. A plan for the Building Industry involves a plan for the whole country. Our future depends on our capacity to size up the nation's economic capacity.

The whole of Great Britain ought to be examined in the closest detail by a National Planning Body with a view to deciding what should be the balance of activity as between one area and another, what resources exploited, what industries encouraged and what public utilities and services developed.

There must be National Reconstruction through the combined efforts of every industry, led by the Building Industry, of which the architectural profession is the brain.

How is National Reconstruction to be achieved?

—By a National scheme of co-ordinated town and regional planning. The time has gone by when urban development can be looked upon as a purely local affair. Individual cities, even regional groups, cannot take a wide enough survey of economic or social factors to be able to plan for the future with confidence. Only a National Survey can comprehend the country as a whole.

—By setting up a National Planning Board, organized by the Building Industry, which, while free from political influence, would make contacts between the Ministry of Health and other Government departments where necessary. Its function should be to plan in outline the distribution of population, based on economic surveys, and, in co-ordination with electricity and transport and arterial road construction, to inspire town planning and building throughout the country. The Board should have power to raise money to finance planning and building schemes.

LETTERS FROM READERS

Carlton House Terrace

SIR,—It is difficult to use temperate language on the proposed devastation of Carlton House Terrace, and I cannot trust myself to make any comment either on the destruction of the existing scheme or the design of the "bloomer" (if I may call it that) which is to replace it.

One question arises and I think it ought to be answered; who are the men who have sanctioned the disaster? Would it not be possible for you to publish portraits of them? It would be well to know what such men look like. It might be possible to forgive them much if we could see their faces, and again, perhaps, it would enable us to understand everything about the scheme and the motives that prompted it.

A humble suggestion, Sir, but I am sure it would gratify your readers if you could act upon it. JOHN GLOAG

[*A portrait of Mr. A. S. Gaye, the Permanent Crown Commissioner, is given on page 89.*—ED. *A. J.*]

SIR,—I am very pleased that you have undertaken a movement to prevent the demolition of these houses. Are the amenities of the public parks improved by tall and unsightly buildings?

My own view is that the value of London is deteriorated by spoiling or doing away with the amenities for private houses as London has not the architectural attractions of Continental cities, which have rules to preserve buildings. On the other hand, there are many sites of mean houses in London which might be improved by large buildings; and it is not necessary to sacrifice the advantage of a private residence for that of an office. The first duty of the Crown Commissioners should be to the city as a whole before their own immediate affairs.

CALEDON

[*The Earl of Caledon, whose letter is printed above, is the occupant of No. 5 Carlton House Terrace. The house was leased to him by the Crown Commissioners in 1926 for a period of sixty years.*—ED., *A. J.*]

Greater London Planning

SIR,—I admire your courage and tenacity in continuing to devote so much prominence in your influential JOURNAL to the above matter and to the subordinate but inseparable problem of Carlton House Terrace; but I cannot help echoing the sentiments expressed in your last issue in connection with the latter, namely, that you might (without imperilling our loyalty to the R.I.B.A.) do something about the Portland Place façade. Especially about the surprising columns which flank the main entrance. Can you imagine what an expectant public will say to what looks like Adam and Eve stuck on posts in enforced separation on either side of the great portal? Besides, are not these excrescences, however amusing, rather dangerous to the matrimonial stability of a future President, who may, after a festive installation, back his Rolls into the dexter one and return home with the wrong Eve?

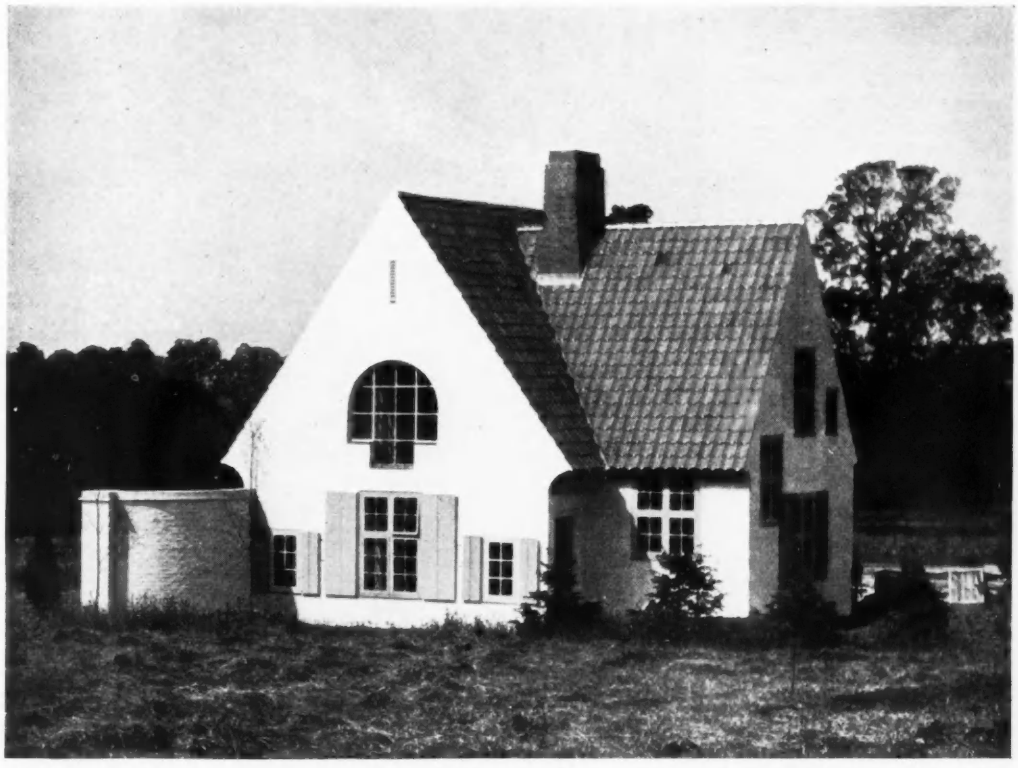
This of course may or may not happen, but what must happen at all costs is that London must be planned. The Carlton House Terrace scheme, or any other, cannot be viewed properly in the absence of a co-ordinating plan any more than can the rebuilding of one unit of the Terrace without reference to a scheme for the whole.

You, however, state in your current leader that "London by its official inaction in this matter (of planning) has focussed the criticism of world opinion." Whilst feeling that this observation must be perfectly true, I cannot help thinking that the planning of the vast London Region is a very grave problem, and I doubt whether there is a man living (from the Minister of Health downwards) who would care to shoulder the tremendous responsibility of taking the really drastic measures which would need to be taken if this "official inaction" were to be successfully overcome. Local authorities are very jealous of their powers, and in my opinion you will never get a plan for Greater London until an Act of Parliament is passed, setting up a Special Commission charged especially with this task, under the leadership of one such as Sir Raymond Unwin, who, in spite of almost insuperable difficulties, has so ably piloted the ship so far. The weight of public opinion is, I believe, more in favour of planning than at any previous time when similar attempts have been made to plan London. The present urgency of the situation should at least secure a sympathetic ear in

the House, though of course the intricate detail to be worked out would not make for a speedy passage.

The Act would, of course, only deal with the machinery necessary for the preparation of, and define the scope of, the plan (including the legal instrument) and do no more, for, as you wisely state, "such a unique and vital problem as the Plan of London in its initial stages could not properly be compressed into a too restricted legal framework."

The object of such an Act would, of course, be in effect to command that a plan shall be prepared for the Greater London Region and to define exactly by whom and by when it is to be so prepared, and at what cost, etc.



The planning of Greater London is a problem in itself and should not be confused with schemes which may be prepared throughout the country under the Town and Country Planning Act, 1932. London is the capital of a vast Empire, but it has no Mussolini to control its destiny. The whole principle of English constitutional law dictates that important undertakings must receive the direct sanction of Parliament, and only by the passing of a special Act will we, I submit, ever get a plan for London.

The legal instrument, as part of the plan, would, of course, need to determine the method of enforcement. It is no use preparing a plan if it is not enforced, at least so far as its main outlines and spirit are concerned—and this would probably ultimately entail a supplementary Act; but first let us plan and always remember that it is the architectural expression of the plan that ultimately matters, so that, in preparing, administering and realizing the plan, we shall need skilled architect-town-planners, of whom at present we have all too few.

I suggest in conclusion that your JOURNAL might do worse than engage in an intensive campaign in favour of direct legislation facilitating the planning of Greater London.

T. F. THOMSON

SOME BOOKS OF 1932: AN ARCHITECT'S SURVEY

HOUSE AT ABINGER, SURREY, *DESIGNED BY OLIVER HILL*

Cost: approximately £1,100. Materials: the walls are of brick, 11 ins. thick, cavity-built, and are slurried over with white cement. The chimney is in heather-coloured 2-ins. bricks; and the roof is covered with jade-green Dutch pantiles. The shutters to the front elevation are in salmon pink; the floors and stairs are of oak. [*From* SMALL HOUSES AND BUNGALOWS.]

BY P. M. STRATTON

THE year 1932 has been marked with black letters for architects by the slump. Affecting primarily the commercial and industrial types of work, it also lessened the demand for good class medium-sized houses. The sort of man who built a country house with as little concern as he took a fence was already broken by war and taxes, of course; to make good the wastage in clients, architects have turned their thoughts to the enlargement of the scope of their work. They still see considerable sums being spent on small residences in town and country, for which their services are not asked; and they feel afraid lest the concrete and steel factories, workshops, bridges, garages, power stations and other industrial buildings may fall from the laps of our plutocratic gods to the engineers.

It follows that the most important books of last year are those which the architect may use to extend his authority and make his point of view acceptable to a number and variety of persons. First there came that best seller among booklets, *The Adventure of Building*. Written in simple and disarming style,

it made out a good case for the use of an architect's knowledge and imagination. The writer's points were these—the architect obtains the lowest price at which the house can be properly built, he is an expert on materials and construction and obtains the most desirable results for which the client can pay, he can give an individual note to a house, he will prevent abnormal charges for variations from the contract. The appeal, of course, is to the special class of the "New Poor," whose ranks are filled by those rising into it and assimilating its manners and mode of living as well as by those who drop down into it and obstinately keep their particularism.

We cannot begin too young in the defence of art, and Mr. Humphrey Pakington has written a book for the children who have a "birdnesting eye" for buildings; it is called *How the World Builds*, and if the reader did not give it to his nephews and nieces this Christmas, let him note it for the next. The drawings alone, by Mr. Enthoven, are worth the mere half-crown which Messrs. A. and C. Black charge for their "How and Why Series."

One way to spend the enforced leisure of a slump is in studying how the other man designs and in comparing his results with our own—a pastime which Mr. Chatterton makes agreeable by the book he edits on *Small Houses and Bungalows*. He includes 104 varieties in his collection, each costing under £2,000, and gives dimensioned drawings with his photographs. The examples are from towns, the country and the seaside, and include houses on the L.C.C. estates. Together they form an impressive show of traditional lively English work. Reverting to the work of the L.C.C., it is seldom that "official architecture" is recognized in such a volume. A group of men, however, such as the L.C.C. staff, who spend their lives in solving endless varieties of the same problem, pooling their knowledge under a technical head, do arrive generally at highly accomplished results, in a quiet way.

If architects are to oust the speculative builder, a man who has organized his job to combine the last farthing of cheapness with the last compatible ounce of attraction, they must go one better, using in their case imagination to find both economies and smartness, and Mr. Edwin Gunn's book, *Economy in House Building*, will be a safe guide, especially to the younger man. And here should be mentioned the latest book of measured details by C. Woodbridge and Tunstall Small. It is called *English Brickwork Details* and comprises examples of such modest features as are suitable for small buildings.

Before leaving the subject of house design, it is fitting to mention Mr. Alan Fortescue's experiment—he is building a series of flat-roofed houses as a speculation, and it is to be hoped he will in due course give the world his experiences as a builder-architect in what may be a very interesting volume. There is no doubt that many architects are prepared to follow his example, and for them "Kidder-Parker's Architects' and Builders' Handbook," an Anglicized hold-all of American origin, is well worth having. *Pricing and Costing for Buildings and Public Works* is another useful and practical work; meanwhile an old friend, *Spon's*, has entered its 59th edition under the editorship of Mr. Clyde Young.

In regard to the sections of building over which architects have a divided sway with engineers, two useful books come from Germany on garages—*Kleingaragen und Hallengaragen* and *Grossgaragen*, both by Hans Conradi. The latter is particularly valuable as showing the most economic use of city sites. Few lifts for motor cars are being installed on the Continent, the ramp being the general practice for increasing the floor level. Underground garages, constructed under streets and squares, are pretty sure to arrive in due course. Not merely floor space is usually provided in these "grossgaragen," but repair shops, spare parts stores, body and spraying shops, washes, tanks and pumps, and a central ticket office to control both entrance and exit.

The literature of aviation shows the addition of *Aviation and the Aerodrome* by H. A. Lewis-Dale, and *Buildings for Aerodromes* by the British Steelwork Association (the latter a piece of intelligent salesmanship). Mr. Alan Munby has given us the fruit of long experience in *Laboratories, their Planning and Fittings*.

A WAREHOUSE AT BRUNSWICK

The Kurzag Warehouse and Offices, Brunswick, Germany, designed by Otto Haesler, shows the thorough application of the principles of contemporary design. The symmetry is functionally justifiable since the stairwell serves central corridors. [*From* THE INTERNATIONAL STYLE: ARCHITECTURE SINCE 1922.]

Applied Building Mechanics, by A. D. Turner, meets the needs of factory designers by its simplification of advanced mathematics. Steel construction, it may be added, on the authority of the *National Physical Laboratory Report of 1931*, is possibly to receive a fillip by the adoption of electric fusion welding for joints of steel-framed buildings. This method is in vogue on the Continent, but not yet permitted in Great Britain. Another State publication is on *Empire Timber*, by the E.M.B., from which is surely due one of its colourful posters to "Tell England" about Empire woods.

The stream of Regional Planning reports flows on—the past year has seen the issue of those on Eastbourne and District, Cumbria (including much of the Lake District), West Surrey, South Essex, Brighton and Hove, and Mid-Northamptonshire. The Brighton and Hove report is of especial interest because the electrification of the railway line from London has been completed, and Brighton's fate to become London's biggest dormitory will be consummated. Messrs. Adams, Thompson and Fry are responsible for the volume, amongst others, on Mid-Northants, a region lying round about Wellingborough, on the oölitic backbone of England. It is recommended to bye-pass such lovely but irregularly planned villages as Irthlingborough and Rothwell; it is proposed to return the many scrapheaps left from quarrying, and subsidences formed by mining, to agricultural use, and that steps shall be taken to stop the spoliation due to these causes. The report should be carefully studied by all concerned in the enterprise lately announced for establishing a huge steelworks on the border of the region.

It is doubtful whether any of our younger men will write more mettlesome reminiscences than *Memoirs of An Architect*, by Sir Reginald Blomfield; he has played Rugby football for Haileybury and Oxford, batted to first-class bowling, hunted, and been a highly successful agitator. The last of the Victorian "Toughs," his courage outlived the Great War and the Menin Gate has the look of it. His brother professor, C. H. Reilly, has completed 25 years' service as head of Liverpool University School. A witness of regard and veneration has been prepared in last year's *Book of the Liverpool School of Architecture*, which has a reproduction of Augustus John's great portrait, and a personal appreciation by Mr. S. C. Ramsey. The homage from his past pupils takes the form of photographs of their buildings; in the majority of them may be traced the clear-cut and logical Greek manner which seems native to the Professor, and is exemplified in his own work, such as the Veterinary Building at Liverpool.

Journalistic skirmishings have continued merrily throughout the year between traditionalists and modernists. As though to spur on the combatants, Mr. Goodhart-Rendel has had published in book form many of his provocative lectures, and *Vitruvian Nights* has delighted everybody by its wit and pleased nobody by its conclusions and lack of conclusions. For the author leaves us in No Man's Land, and with his last chapter, "Where Are We Going?" his verbal lightning passes before direction can be traced. Probably Mr. Howard Robertson's *Modern Architectural Design* is the most effective book on architecture of the year. The chapter on Organization and Plan is a tonic to the mind. As an exposition of Functionalism the book appears adequate. The author, however, might have stated the case of those who see in "Modernism" more than the function of the building, and who point out that adjoining buildings with differing functions must sink their differences if they want to be as satisfactory as, say, Carlton Gardens and Dorset Square; and that such examples prove the importance of function to be exaggerated and suggest there is some other wider and deeper-founded basis to architecture. (It is certainly true that when we speak of a "functionary" it is with faint scorn, as of something a little lower than a man.) The volume, therefore, though generally thorough and inspiring, allows its subject to escape the net of words on certain pages.

English architects still find their chief inspiration in a type of patriotism which includes the buildings of England as part of the soil, a thing to which loyalty is due. Apparently their Spanish brothers do not have a similar outlook, for no complete history of their art exists. The Marquéz de Loyonza is to fill the blank, however, with his *Historia del Arte Hispanico;* the first volume, in which the origins of Spanish art are traced, has now been issued. Meanwhile at home we continue our manuals and great volumes of devotion to the past. *The Windmills of Essex, Herts. and Bucks.* have been recorded. The Royal Commission has issued a further inventory of *Historical Monuments*, dealing with East Herefordshire. The high standard of these publications is maintained; the photographs are composed with excellent taste, and take us half-way to the enjoyment of what we may not have time to see in actuality. But the setting cannot be given in a book, or realized without a visit to this county, which has mighty hills and rivers, but not harshness or barren marshes; and where the farmhouses are deep in cider apple thickets; and vast cattle make the meadows small; and the ploughed soil wears purple.

LAST YEAR

BY ASTRAGAL

LAST year started fairly hopelessly with an unbalanced budget. I remember dimly that an international conference on debts and money was to seal our fates in June. But June came and went with no solution, and the rest of the year rolled by, creaking ominously, but reaching this latter end "bloody but unbowed."

*

During the year we felt the after-effects of a hardly-balanced budget. Waves of criminal parsimony, misnamed economy, added increasingly to unemployment generally, and, in the building industry, to an extent that will leave a permanent mark. We reached the end of the year with over 40 per cent. of unemployment in building and no remedy but *wait*, *see* and, above all, *hope*.

*

As a profession we are unprepared for bad times. Architecture is still too gentlemanly. Half our practice is done by engineers, estate agents, shopfitters and departmental stores. Our elders sniff at "functionalism" as though it were a state of sin, though Wotton placed "commodity" first in his trinity of virtues.

*

But, my friends, there is nothing so upshaking to hidebound tradition as depression. Writers are driven to write for money, and architects—and others—to think. The year may see us saved.

*

The newest thing born out of last year was the ill-starred Town and Country Planning Act. Saved over from the wreck of a former Parliament, it struggled manfully through two readings only to fall victim to a wanton

and ill-judged attack in Committee. The narrowest interests of property, goaded by fear, treated this wise and by no means over-Socialist measure with the utmost brutality, so that it emerged at last unrecognizable and, for its great purposes, nearly useless. The R.I.B.A. fought manfully, in the person of its President, for an Act that might have launched us fairly on a task to defy even depression at its worst.

*

For the R.I.B.A. itself the year has been great with promise, for close upon the heels of Registration accomplished came the designing of its new quarters in Portland Place. It was indeed an adventure to make strong men pause. A move from Conduit Street was imperative, but to put up a great and important building at a time when the whole body of architecture was, phœnix-like, consuming in fierce flames and not yet newly risen, was a grave risk. Thoughtful criticism had already rejected the old formulæ and looked to the profession to evolve out of the competition a solution of difficulties successfully met by Continental designers; and we ourselves, led on by fair words, were hopeful.

*

But even our best friends averted their eyes from those miles of depressing, still-born drawings that hung the walls of Thames House; for the central problem was hardly touched upon, and every trick, every outworn cliché, and nearly every style but style itself, found representatives—sometimes surprising representatives!

*

It is matter for congratulation that we should have been given the new premises as they exist on paper today. They appear to me to be an elegant and personal compromise between what was and might have been: the inevitable outcome of a period of change, when young men have still to look backwards for an approval they would be better without.

*

Another competition, for the Town Hall of Norwich, was taking place at the same time, attended with no less happy result. A definite departure from the very medium standards of municipal architecture was achieved in a grandiose scheme, which, when carried out, will create one of the finest and most interesting communal centres in Europe. Alas, economy sits heavily at this moment upon Norwich, as upon all England, and the good effects of that competition are for the future.

*

Depression and economy are our enemies, but in some strange way the deliverers of architecture. The problems which the year has opened to us, slum clearance and the housing of the very poor, could never have been fairly met with the weapons of the academic tradition. Even now we are not certain of the approach, but the need for economy has whetted our taste for enquiry and brought us closer to the bones of the thing.

*

The howl of rage that greeted an attempt to exploit a sentimental and unpractical approach to the building of a small house showed the spirit of the times. That disastrous competition for a £1,000 *make-believe* house proved beyond a doubt that architects were saying "Good-bye to all that," and moving perhaps towards a more logical solution.

*

The plan of London kept well out of sight throughout the year. A new bridge was built at Lambeth, with stone piers, gilded pineapple pylons and very daring steel arches left uncovered. But at the last moment the steel work was painted stone colour.

*

Otherwise, small fragments of London continued to fall off here and there, being replaced by lumps of greater weight in order to obliterate the memory of what was there before. A clock bigger than any for miles around, and bigger even than the building upon which it sits, was placed on a new commercial building on the site of the late Hotel Cecil. The last classical palace of the City of London was built for the directors and clerks of a soap company further along the Embankment. These were all subsequently outweighed by the Freemasons' headquarters, lying embedded beyond Covent Garden.

*

Further afield, the Underground Company performed good deeds in a naughty suburban world by building a chain of lively, graceful and altogether delightful stations; one good station to ten square miles of suburban dreariness: a good democratic ratio.

*

Another great concern, the B.B.C., was brave enough to let young men loose upon its unfinished studios, and has had no cause to regret it; and finally, as though the tide had indeed turned in favour of common sense and good works, the Senate of London University appointed as their architect for the vast new central university buildings the very best man for the job.

*

Therefore the gloom is seen to be spangled with some stars of real effulgence. But lest we should think

Alfred D. S. Rice, new president of the London Master Builders' Association.

ourselves too nearly out of the wood comes the Carlton House Terrace rumpus, led by our stoutest anti-revolutionist, a host in himself and a fighter before anything.

*

I advance beyond my allotted time. I may not predict the future, but only hope for my readers and myself that the year 1933 will be a good deal better than this last.

ARCHITECTURE INVESTED

BY JOHN GLOAG

London is no mean city, save in thought,
For any portion of it can be bought
And changed from something that was almost planned
To something manifestly out of hand,
And those who criticize are soon requested
To recollect that *interests are vested!*

There was a Terrace once, a noble span,
A part of London's most enlightened plan;
But bricks were dropped and bloomers were committed,
And civic wisdom once again outwitted;
Too late we learned that business men had nested,
Thereafter, *all the interests were vested!*

A half-completed patchwork that must line
Approaches of magnificent design
Will not for half a century attain
The unity once lost for petty gain;
When sense by crass stupidity is bested,
Thereafter, all the interests are vested!

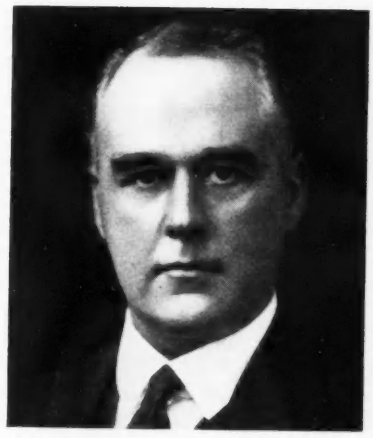
Is all the gimcrack, hugger-mugger maze
Of bank-clerk's classic in its senile phase,
That darkens every changing London way,
To speak for architecture of to-day?
No, to the future let it be suggested
This style's *commercial*, like the *interests (vested)*

Building Exhibition

The fifth International Exhibition of Building and Allied Trades and Decorative Art is to be held at Brussels from January 18 to 30. Application forms may be obtained from the Department of Overseas Trade.

CROWN LANDS

A paper was read by Mr. A. S. Gaye, Permanent Commissioner for Crown Lands, at a meeting of The Chartered Surveyors' Institution on Monday last. The paper is discussed by Miss M. I. Batten in the following article.



THE paper read by Mr. Gaye on Crown Lands at The Chartered Surveyors' Institution was most interesting, especially in view of all that has been written recently in this and other papers about the Commissioners of Crown Lands and their management of property. Mr. Gaye presumably thinks that this paper of his makes the whole position clear, and justifies every action taken by the Commissioners in the past, the present and the future. Mr. Gaye, having read his paper, obviously expects a chorus of "Well done, thou good and faithful servant." May I, as a "peevish scribe" continue to be peevish and extract a few points from his address and discuss them?

At the beginning of his paper Mr. Gaye stated that "the history of the hereditary estates of the English Crown may conveniently be divided into two periods," before the accession of Queen Anne, and after. "*The distinctive feature of the second period, from the beginning of the eighteenth century to the present day, is the gradual assumption by Parliament of responsibility for the expense of government, necessitating control of the national revenue, including the revenue from Crown Lands.*"

If Parliament accepts the responsibility for the control of the revenue from Crown Lands then the First Commissioner, *ex-officio* the Minister of Agriculture, must *ipso facto* have the deciding vote in any matter relating to the management of the Crown Lands. In the House of Commons recently Major Elliot said that no clash had ever occurred between the First Commissioner and the Permanent Commissioner, at present Mr. A. S. Gaye, and "that if there was any difference of opinion he did not know what would happen."

A challenging question by Sir William Davison, in which he suggested that "the two Commissioners have equal powers," was not contradicted, but this statement of Mr. Gaye's would seem to admit that the Minister of Agriculture is his superior and that the Commissioners of Crown Lands are responsible to Parliament.

Two-thirds of Mr. Gaye's lecture dealt with the history of the Crown Lands, with various references to such things as "*Kings persistently sold Crown Lands in order to provide money both for their personal needs and for the general purposes of government, and Parliament, with equal persistence, passed Acts of Resumption revesting the alienated estates in the Crown.*" This seems to have a parallel in the story of the Regency fireplaces in No. 4 Carlton Gardens. It will be remembered that these fireplaces were sold by the housebreakers to a dealer, from whom they were brought by the National Arts Collection Fund and presented to the Victoria and Albert Museum, who treasure them greatly. Thus in the year of grace 1932 the Nation's property still goes wandering, but now it has to be bought back again

A. S. Gaye, C.B., O.B.E., the Permanent Commissioner for Crown Lands.

by the nation instead of being firmly taken possession of as was done in the good old days which Mr. Gaye deplores.

But many kings seem to have behaved in this way, and later, though a law was passed which "*effectively restrained Queen Anne and her successors from indulging their generous instincts*" it did not, according to Mr. Gaye, "*provide against the corruptibility of Ministers, and the insatiable acquisitiveness of other public servants.*" The story of the Crown Lands as told in this paper seems to be a sorry sequence of bad management mixed up with countless Bills and Amendments endeavouring to put things straight.

In 1786 Parliament passed an Act appointing three Commissioners to enquire into the state and conditions of the Woods, Forests, and Land Revenues of the Crown, and these Commissioners denounced "*in scathing language the malpractices which persisted.*" Incidentally, Mr. Gaye does not explain when and why the three Commissioners were reduced to two.

Between the years 1794 and 1829 19 statutes dealing with the management of the Crown Lands were passed and "*at last in 1829 the law on the subject was consolidated by 10 Geo. IV, cap. 50. This Act of Parliament covers 63 foolscap pages in print, and although a great part of it has since been repealed, or re-enacted, it remains the principal Act under which the present Commissioners of Crown Lands exercise their powers, and some of its main provisions deserve particular notice.*

"*Section 8 defines 'the Possessions and Land Revenues of the Crown to which this Act relates' as 'All Honours, Hundreds, Castles, Lordships, Manors, Forests, Chases, Woods, Parks, Messuages, Lands, Tithes, Fisheries, Franchises, Services, Rents, and other Land Revenues, Possessions, Tenements, and Hereditaments whatsoever (Advowsons of Churches and Vicarages only excepted) which now do belong to His Majesty, or hereafter shall belong to His Majesty, His Heirs or Successors, within the Ordering and Survey of the Court of Exchequer in England or Wales, in Ireland, in the Isle of Man, and its Dependencies, and the Isle of Alderney, whether in Possession, Remainder, or Reversion.'*

"*By Section 9 the Commissioners are required to observe the directions of the Treasury 'not being contrary to the provisions of this Act,' and by Section 10 they have to swear that they 'will truly, honestly, faithfully and diligently execute the duties of their office.'*" Mr. Gaye goes on to say that "*then follow precise instructions defining the Commissioners' powers and duties in respect of sales, purchases and leases, Section 25 providing that no part of the Royal Forest Parks or Chases should be leased, and Section 61 requiring a survey to be made in each case, with some trifling exceptions, and the surveyor has to swear that he has acted faithfully and impartially to the best of his skill and judgment.*"

I quote Mr. Gaye at such length because he complains at the end of his lecture, "'*Who are the Commissioners of Crown Lands?*' *rhetorically asked a peevish scribe in a popular journal a few weeks ago, and did not wait for an answer; he supplied his own rhetorical answer, 'No one knows.' Anyone who wishes to know can easily find out.*" Supposing a "peevish scribe" wanted to know what the powers and duties of the Commissioners were? Mr. Gaye purports to tell the world in this paper of his, but actually he produces a string of words and names from an old Act, grand sentences which reverberate with "truly, honestly, faithfully, and diligently," but divulges nothing of the "precise instructions" governing the Commissioners' powers and duties. We are almost as much in the dark as ever we were. For instance, we have not the smallest idea how and when the Commissioners come to such grave decisions as that recently taken to destroy the amenities and beauties of Carlton House Terrace and Carlton Gardens and change stucco for Port-

land stone, residential for commercial, and altogether ruin one of the nation's finest possessions. There are only two Commissioners. Do they just have a telephone conversation or a jolly lunch and say "Let us pull down Carlton House Terrace"? Are the 251,000 acres of Crown Lands managed in this way or are there regular committee meetings with quorums and minute books? It seems inconceivable that such a vast business should not be run on the most thorough business lines, but nothing that has leaked out so far in Parliament or in Mr. Gaye's paper gives us any clue as to how this immense property is managed. Most big business firms have a managing director and a number of other directors who discuss at board meetings all matters of importance. But apparently not so the Commissioners of Crown Lands.

Mr. Gaye goes on relating the history of the Crown Lands, of how they were connected with Parliament, taken away again, and connected again by the Crown Lands Act of 1906, which made the Minister of Agriculture and Fisheries the First Commissioner.

"*From the foregoing summary it will be seen that a great amount of parliamentary time has been devoted to legislation affecting the hereditary landed estates of the Crown, more, perhaps, than to any other subject. And the end is not yet. There are still doubts to be removed, still difficulties for which the law at present provides no satisfactory solution, and it may be safely predicted that before very long Parliament will once more be asked to consider a Crown Lands Bill.*" We think and trust that Mr. Gaye is right in this.

The powers and duties of the Commissioners are summarized by Mr. Gaye as follows :—

First, they must preserve, and, if possible, increase the capital value of the estates entrusted to their charge—for the benefit of the reversioner, the Crown.

Secondly, they must collect the revenues from those estates, and after defraying the costs of collection and management, they must pay the balance into the Exchequer—for the benefit of the tenant for life, the public.

Thirdly, and generally, they must act reasonably, in accordance with the principles of good estate management.

We would like to ask if it is "*in accordance with the principles of good estate management*" to encourage private persons to take long leases on a "strictly residential" basis, as has been done in Carlton Gardens and Carlton House Terrace, and then, without a by-your-leave or word of warning, to instal a commercial firm in an utterly alien new building in the midst of these older lessees? If so, if this is the correct principle of landlords, as shown by the Crown Commissioners, then no lessee in the future on any property can have any feeling of security. "*A strange belief exists in many minds*," continues Mr. Gaye, "*that the Commissioners of Crown Lands can and do defy the laws which are binding on private landlords, and that they can and do treat their contracts as scraps of paper.*" Considering that almost all the lessees of Carlton House Terrace and Carlton Gardens have had to agree to use their houses for residential purposes only, and that they have taken long leases on the understanding that the whole property is "residential," the Commissioners have surely come very near treating "their contracts as scraps of paper"; for although they have signed nothing to say that this property is residential they have, until as recently as 18 months ago, forced that clause on their lessees.

"*The Treasury can be trusted to prevent any excessive generosity, and public opinion, expressed in Parliament and the Press, will unfailingly call the Commissioners to account for any real or imaginary infliction of hardship.*"

Doubtless the Treasury can be trusted, but the Commissioners see to it that they themselves act quickly and silently and destroy the Nation's property before the Press or Public Opinion hear a word of the matter. Parliament, Public Opinion and the Press are doing their utmost now "to call the Commissioners to account" and we can only reiterate Mr. Gaye's hope that before very long Parliament will once more be asked to consider a Crown Lands Bill. In view of the Carlton Gardens scandal reorganization of the management of the Crown Lands has become essential.

M. I. BATTEN

LAW REPORT

ALLEGED NUISANCE FROM MUSIC

Western Mansions, Ltd., v. *Foster.*—*King's Bench Division. Before Mr. Justice Branson.*

THIS was an action by Western Mansions, Ltd., against Mr. G. Foster, to recover the sum of £81 odd, being a quarter's rent of a flat at Ridgmount Gardens, St. Pancras, due December 25, 1931. Defendant held a lease of his flat, and he admitted the claim. He set up a counter-claim for damages for alleged breach of covenant in his lease of quiet enjoyment, alleging that he had been compelled to leave his flat in consequence of successive musical and other noises coming from the flat above.

Mr. Morle, counsel for the defendant, said there was a rule that no piano or other musical instrument should be used between midnight and eight in the morning, but his client's contention was that there was such an abominable nuisance from the flat above that he was compelled to leave in September, 1931. The noises complained of were caused by a jazz band, singing, a gramophone with loud speaker, and dancing and skipping. Complaint had been made, but his client's view was that no effectual steps had been taken to abate the nuisance.

Defendant gave evidence, and said yelling and shrieking came from the flat above, and as he could not get sleep, he left the flat.

Mr. Cyril Atkinson, K.C., said his clients had taken all possible steps to prevent the nuisance complained of. An action had been brought against the tenant of the flat above, and she had given an undertaking to abate the noise. He was instructed that the flats had concrete floors, and were among the best sound-proof flats in London. His contention was that the complaints were exaggerated.

His Lordship, in giving judgment, said he was satisfied that the complaints by the defendant and his wife were greatly exaggerated, and he gave judgment for the plaintiffs on the claim and counter-claim with costs. In his opinion the defendant, so far as he depended upon a breach of covenant for quiet enjoyment, failed, because there was no suggestion that there had been any disturbance of a physical character. In his view the landlords had taken every step they could to prevent a repetition of the breach by their tenant.

TRADE NOTES

Messrs. F. McNeill & Co., Ltd. who are now celebrating their Centenary, have an interesting exhibit at the Building Centre, New Bond Street, W.1. This Exhibit shows a section of a built up roof constructed of pure bitumen, sheet asphalt, rock pumice (rendered in cement) with waterproof expansion joints.

It is claimed that this roof, for which provisional patents have been obtained, is waterproof, fireproof, soundproof and prevents condensation. Further, it is claimed that it is unaffected by extremes of temperature, cannot crack or leak, and is superior to asphalt, lead or zinc. This roof carries with it a guarantee for a long term of years. It is laid by McNeill's in the Greater London Area at a cost of approximately 14s. per square yard.

The Merchant Trading Co., Ltd., have removed from their Bishopsgate offices to Columbia House, Aldwych, London, W.C.2. (Telephone No. Holborn 3291.) With their showroom at 36 Newman Street, W.1, their organization will be conveniently situated and easily accessible in the west end of London. All modern office equipment will be used in the new premises, which are compact and spacious and cover an additional 1,000 feet of floor space to those at present occupied by the company.

One of the stages of the firm's progressive policy, which is framed to permit of immediate expansion of their activities as soon as general conditions show signs of improvement, provides for the marketing of several new British-made products of the types and in the fields with which the company have been long associated.

Messrs. Holophane, Ltd., inform us that the Holophane Ripple-Lite units have been installed for the lighting of the offices of the Midland Counties Mutual Benefit Society at Dudley; also for the new George Hotel at Wolverhampton for the Wolverhampton Breweries.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

The EDMONTON U.D.C. has approved plans, submitted by Mr. C. A. Aish, for the erection of a cinema in Silver Street, at the corner of Fore Street.

Plans passed at EDMONTON : Houses (amended plan), Church Street Estate, for Messrs. Swannell and Sly ; dairy, Oakthorpe Estate, for the London Co-operative Society ; additions to factory, 258 Fore Street, for Messrs. R. S. Lawrence & Co. ; eight houses, Sandal Road, for Mr. G. W. Newman ; factory, Abbey Road, for Mr. J. Neilson ; store, Commercial Road, for Mr. F. J. Baxter ; four houses, Ridge Avenue, for Mr. J. A. Quelsh ; factory, Pretoria Road, for Messrs. Commercial Structures, Ltd. ; 83 houses, Cambridge Arterial Road, Kendal Avenue and Kendal Gardens and 47 houses, Cambridge Road, by Weir Hall, for Mr. G. W. Newman ; house, Cambridge Road, for Messrs. R. F. Peachey and Sons ; three houses, Dysons Road, for Messrs. Swannell and Sly ; workshop, rear 66 Gilpin Grove, for Mr. A. G. Bagging ; two houses and shops, Dysons Road, for Mr. Gregory ; houses, York Road, for Mr. C. A. Hannaford.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

• In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

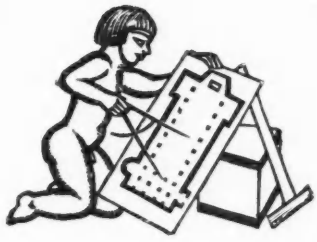
LADY MARGARET HALL, OXFORD

NEW CHAPEL BY SIR GILES GILBERT SCOTT

ON Saturday the new Chapel illustrated above and overleaf was dedicated by Bishop Talbot, who played the leading part in founding Lady Margaret Hall, Oxford, in 1878. Sir Giles Gilbert Scott, R.A., in designing the Chapel, which is adjacent to his new block of buildings, and supplies them with a focal point of interest, has found inspiration in the Byzantine tradition. The building is planned as a Greek cross, and has a domed apse behind the altar at the east end, shallow transepts and a barrel roof.

The main entrance is at the west end, shown above, through a small ante-chapel, with organ and choir gallery over. The flights of stairs leading up to this from the floor of the Chapel enclose stalls for the Principal and Fellows. The internal surface of the walls is finished in rough plaster, stone-coloured; the flooring is of brown marbles; the oak seats are arranged longitudinally.



NEW CHAPEL AT LADY MARGARET HALL, OXFORD

Designed by
Sir Giles Gilbert Scott, R.A.

The walls of the chapel are built of rich red-brown bricks, and the central dome and the roofs are covered with red Lombardy tiles. The main entrance from Benson Place, shown in the above view, has a stone portal, surmounted with a carved tympanum. On the south side (to the right) is a vaulted corridor connecting with the new Deneke Building of the college; in this corridor it is intended to place memorials to former members of the Hall.

Loans for building material up to 2,500 marks (£180) are granted by the Land Bank at 5%, including sinking fund, with the exception of the first two years, when they are at 2%. In addition, the city of Stuttgart grants loans up to 300 marks (£21) for each house, and the labour of the future owners is assessed at 200 marks (£14), bringing the total value of the house to 3,000 marks (£215) . . . The total charge to each tenant for his house and 800 sq. metres of land is less than 20 marks (30s.) per month, which, in comparison with 40 marks (£3), the average monthly rental paid by the same families for city tenements, shows a substantial saving.

From the report of the American Consul at Stuttgart on suburban settlements for unemployed on the outskirts of that city.

FINANCING RECONSTRUCTION

RECONSTRUCTION on a national scale was the goal kept in view in last week's special New Year issue; movement towards it, like any other movement, necessarily involves finance—and on a scale equally national. The brains to plan our industrial revival are immediately available; have we the money to render them mobile? There is no question of it, but at the moment it is in cold storage.

For the balance sheets issued by our joint stock banks show a very large increase in deposits and a shrinkage in advances to industry, while the increased funds available have been almost entirely devoted to the purchase of Government securities and Treasury Bills. The banks during 1932 have not only done their best to cut down legitimate industrial enterprise as part of the great principle of *economy*, but they have immobilized a very considerable proportion of the national savings in Government securities which have not had any real influence on the volume of credit available for economic activity in the country.

In other words, the joint stock banks have been engaged in hoarding on an immense scale; and in this they have been imitated by the public, who have preferred to keep their funds immediately available, even if they earn practically nothing.

Now, this situation is one which is not only critical in itself but constitutes a vital part of the problem which must be solved if any revival is to take place. In any event this enormous accumulation of funds is bound to find some outlet; and that outlet, we repeat, should be offered in the work of national reconstruction. The Building Industry has an opportunity which may not easily recur for stimulating new enterprise in directions which will be immediately beneficial to the country and will have a permanent influence in raising our whole standard of economic and social welfare.

From time to time proposals have been put forward for the financing of new construction, the majority of which appear too good to be true; nevertheless, we submit that the present financial system does lend itself easily to the financing of new construction, provided the proper direction is given to investment and some control exerted over the volume and yield of such investment. There is a danger of confusing immediate purchasing power, as represented by credits and currency necessary to the ordinary processes of production, consumption and exchange, with long-term finance, which should be devoted to the creation of durable consumption goods or capital equipment, as represented by houses, factories, schools, roads, public utilities, transport and the heavy industries.

There is no shortage of finance available for new enterprise, and there is probably a real desire on the part of the investing public to take funds out of unprofitable bank deposits and put them to work again, but the influence of *economy* as dictated by the Government and translated into practice by local authorities, has choked up many possibilities of proper disposal of the national savings.

Now, the Building Industry, through concerted effort, can do three things :—

I. It can concentrate adverse criticism on the Ministry of Health and on the Government until they abandon their wholly stupid and dangerous *economy* policy. A good opportunity for such criticism will undoubtedly be afforded by the budget, which will prove beyond all doubt that increased taxation is impossible with a deliberate policy of reduction in the national income, such reduction being caused by cessation of public construction.

II. It can use its influence to make the local authorities adopt a more independent attitude towards the Ministry of Health. Local authorities should not accept as final opinions or vetoes imposed by the Ministry; they should question in public every ordinance contrary to their interests and test on every occasion the legality of such decisions. The Ministry of Health in many cases is definitely exceeding its powers. The Building Industry should be behind all efforts made to counter the deflationary activities of the Ministry of Health.

III. The Building Industry and its allied trades, as we suggested last week, should at once create a National Construction and Planning Board which, in addition to adopting the weapons of criticism as outlined above, should get down to the business of suggesting new types of activity to local authorities and to the Ministry of Health and link up with it the question of finance.

The ordinary methods adopted, namely, the issue of loan capital, the use of short-term and even long-term Bills, local loans and, in the final resort, bank advances, which have been used hitherto by trades in the Building Industry, in common with all other trades, should be supplemented by the creation of a central organization which will pool the credit resources of the Building

Industry and, on the strength of such pooling, come to the money market and raise, specifically, capital for new construction. This capital may or may not be guaranteed by the Government; in the present state of accumulation of deposits there will probably be no necessity even for such a guarantee.

The important thing is that the public should have confidence in the personnel of the new Board, should have concrete evidence of the construction to be undertaken, and should have a clear idea that such construction is not for speculative building purposes but forms part of a properly co-ordinated plan of national economic revival.

NEWS & TOPICS

L.C.C. COMMITTEE ON HOSPITAL PLANNING

THE problems of hospital planning and construction have been considered by a special Committee set up by the London County Council. Some of their conclusions, which are of general interest to architects, are contained in an official report on Public Health that has just been circulated.

*

The relative merits of vertical and horizontal planning were considered, and the Committee came to the conclusion that in this country it was not desirable to build to a greater height than six stories, and then only when high site values necessitated the restricted use of ground area. The cost of administration is probably less for a vertical than for a horizontal building, whilst the problem of heating is simplified in the former type. On the other hand, low buildings lend themselves to a more "open" treatment and encourage a greater use of exercising grounds for recovery purposes, etc. The difference between the costs per bed in the two types may not be great, but this depends largely upon the character and situation of the site. Although vertical planning involves greater fire risks, under modern conditions these tend to be reduced to a minimum.

*

The relative merits of the following types of construction were considered :—

1 : Temporary (such as frame of timber with lining of asbestos and corrugated iron exterior).

2 : Light permanent one- or two-story buildings, similar to the type adopted in the reconstruction of Long Reach Hospital (hollow walls built of two thicknesses of concrete slabs, rough-cast outside; steel and timber roofs carried on stanchions, concrete encased—estimated life about 60 years).

3 : Heavy permanent construction.

*

For new hospitals in the suburbs it was agreed tentatively to recommend the adoption of as light a form of permanent construction as was compatible with normal requirements and due provision against fire risks. Although, in view of such risks, the use of temporary buildings is not considered advisable, the erection of buildings of this character might be required to meet an urgent need for accommodation in abnormal epidemics, and in such an event it would be necessary to devote careful attention to the question of fire risks. The Committee do not favour the heavy permanent type of building in view of the constant adjustments necessary to meet the changing requirements of medical science. For a convalescent hospital in the suburbs, one- or two-story buildings of light permanent construction are advocated.

*

THE NATIONAL COUNCIL AND FINANCE

Naturally, the Building Industries National Council is not without its problems. The fundamental question is that of financial strength. Architects must not expect too much from this new body until it has become firmly consolidated and unless it is generously supported by the Industry as a whole.

*

Appeal letters have been sent out during the past few days, and on the result of these will largely depend the future of the Council, which, in theory at any rate, is supported by all branches of the Industry.

*

NEW BUILDINGS FOR BRISTOL

Bristol City Council have taken the definite step of nominating E. Vincent Harris to design their new municipal buildings on the College Green site. The progress of the project was interrupted some time ago in order that the claims of local architects should be considered, and the acute need of finding work for men in the building trades has admittedly weighed with the authorities in the immediate decision to proceed. The Council anticipate that the scheme will provide work for 400 men for two years directly, and recognize that it will benefit many more indirectly.

*

But all is not yet clear to go ahead. Permission must be obtained from the Government to raise a loan of £300,000; and it will be interesting to see what course events take in view of the present suicidal ban on expenditure.

*

Incidentally, at the Council meeting, a member bemoaned the sums spent on architects' (and surveyors') fees by Bristol during the last three years, and suggested that much of the work could be carried out by a properly organized engineers' department, *with qualified assistants*.

*

There is news of other activity in the Bristol area. The

THE ARCHITECTS' DIARY

WEDNESDAY, JANUARY 18

R.I.B.A., 9 Conduit Street, W.1. Exhibition of the prize drawings for 1932. 10 a.m. to 8 p.m. (Saturdays 10 a.m. to 5 p.m.). Until January 28. **10 a.m.**

ROYAL ACADEMY OF ARTS, Burlington House, Piccadilly, W.1. Winter Exhibition, 1933. 10 a.m. to 6 p.m. Until March 11. **10 a.m.**

LIVERPOOL ARCHITECTURAL SOCIETY, Bluecoat Chambers, School Lane, Liverpool. "Martin's Bank New Headquarters." By Herbert J. Rowse, F.R.I.B.A. **6 p.m.**

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Roman Architecture—1." By Sir Banister Fletcher, PP.R.I.B.A. **6 p.m.**

INSTITUTION OF WELDING ENGINEERS. At the Institution of Mechanical Engineers, Storey's Gate, S.W.1. "Welding in Civil Engineering." By C. Helsby, M.I.STRUCT.E. **7.45 p.m.**

THURSDAY, JANUARY 19

INSTITUTION OF STRUCTURAL ENGINEERS. Yorkshire Branch. "Fatigue Stresses in Steel Structures." By Professor F. C. Lea, O.B.E., D.SC.

FRIDAY, JANUARY 20

LONDON SOCIETY. At the Royal Society of Arts, John Street, Adelphi, W.C.2. "Replanning London's Built-up Areas." By Thomas Adams, F.S.I., PP.T.P.I. **5 p.m.**

HANTS AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION. At Winchester. Council Meeting, 3.30 p.m. General Meeting, 6.15 p.m. Lecture by G. Roberts, of Dorman Long and Co., Ltd. 6.30 p.m. **3.30 p.m.**

SATURDAY, JANUARY 21

Sunrise 7.54 a.m. Sunset 4.29 p.m.

MONDAY, JANUARY 23

R.I.B.A., 9 Conduit Street, W.1. General Meeting. Address to students and presentation of medals and prizes, 1933. **9 p.m.**

TUESDAY, JANUARY 24

LONDON SOCIETY. Visit to the Church of St. Giles, Cripplegate, E.C.2. **2.30 p.m.**

Four of the R.I.B.A. prize-winners: left to right, Alexander Varcoe (Archibald Dawnay Scholarship); Basil Spence (Pugin Studentship); Alan Reiach (Tite Prize); A. G. S. Fidler (Victory Scholarship). The first three received their training at Edinburgh College of Art; Mr. Fidler is a student of the Liverpool School of Architecture.

building of a large cinema at Clifton to seat 2,300, is to be begun immediately, and this promises 200 men employment for nine months.

*

If these things can happen now, under isolated municipal and private auspices, there is no question that concerted enterprise on a national scale would soon get us out of the rut of unemployment.

*

MORE GIFTS FOR LONDON UNIVERSITY

Grants continue to be promised towards the cost of the new London University Buildings, upon which the actual start was recorded in the JOURNAL a week or two ago. The City of London has put up £100,000, the Clothworkers' Company, £20,000, the Mercers', Fishmongers' and Grocers' subscribe £10,000 each, and the Drapers' and Skinners' £5,000 each. The benefactions will be applied towards meeting the cost of the new Ceremonial Hall.

A TIP FOR ARCHITECTURAL FINALISTS

I was talking to one of the R.I.B.A. Final Examiners the other day, and was interested to hear from him that he always sets at least one question which candidates can have no hope of answering unless they make a habit of reading the advertisement pages in architectural periodicals —an instructive sidelight on their importance nowadays in keeping architects abreast of modern methods and modern materials.

*

YE GODDES!

From *The Evening Standard* (Londoner's Diary) :—

While walking with a friend yesterday I found the best sample yet of "ye olde" mania, which I loathe.

A "tradesman's entrance" was neatly labelled "Ye merchants' entrance."

My friend bestowed on this device one look
"Uppe ye olde polee," he remarked.

OTHER NEWS ITEMS

Carlton House Terrace

Already over two hundred eminent men and women have given their support to the movement for the preservation of Carlton House Terrace by joining the General Committee in process of formation for its defence. The Rt. Hon. Sir Arthur Steel-Maitland has consented to serve as chairman, with Mr. J. C. Squire as vice-chairman. It is proposed to call an early general meeting for the purpose of appointing a small executive committee. Anyone interested or desirous of subscribing should communicate with Mr. Squire, or the secretary, Miss M. I. Batten, 39 St. James's Street, S.W.1.

Design and Production

Mr. R. A. Duncan, A.R.I.B.A., is to deliver a lantern lecture on "Designing for Industrial Production" at the First Edition Club, 6 Little Russell Street, W.C.1, on Thursday, January 26, at 8.15 p.m. The lecture is being held under the auspices of the Design and Industries Association.

Timber Preservation

Two "broadcast talks" on timber preservation are to be given by Mr. R. C. B. Gardner, Secretary of the British Wood Preserving Association. On Friday next, January 20, he will speak on "The Decay of Timber in Houses," and on Friday, February 3, his subject will be "Beetle Enemies of Timber." Both talks are scheduled from 7.5 to 7.25 p.m.

Architects' Unemployment Fund

Following is a letter, signed by Sir Raymond Unwin, P.R.I.B.A., and Maurice E. Webb, F.R.I.B.A., appealing for further contributions to the Architects' Unemployment Fund.

DEAR SIR,

It is now a year since we wrote you last appealing for funds to start a scheme for the relief of unemployment among architects.

Thanks to the prompt and generous nature of the response to our letter the scheme was started early in January (1932) and a number of architects, who found themselves without a livelihood as a result of the economic depression, were placed in emergency work. As it was felt that the men would prefer to earn the money rather than receive it as a free gift, assistance was only given in return for work done.

Careful consideration was given to the kind of work to be provided. It was desirable that it should not compete with work done by the architectural profession generally, and it should preferably be of public interest and importance. The Committee were fortunate in finding, through the London Society, the type of employment they wanted. Work was immediately begun in London in making measured drawings

of seventeenth- and eighteenth-century architecture, on Surface Utilization maps showing the built-up districts and on surveys illustrating the height of existing buildings. The indexing of architectural drawings in London libraries for the Architectural Graphic Records Committee was also undertaken and work of a useful and public nature outside London started at Bristol, Gloucester, Guildford, Eastbourne, Manchester, Liverpool and Marlow.

All applicants for employment have to appear before a Sub-committee and work is given as far as funds allow. Unfortunately, it has not been possible to help all, and only the most serious cases have been given work. These latter are generally married men with families. There are at present 61 men employed and the salary list averages £130 a week. The total receipts (donations, £3,880 3s., which includes £1,050 from the dance at Olympia, subscriptions, £2,811 2s. 5d.) amount to £6,691 5s. 5d. for the period January to November 30, 1932. The balance in hand at the beginning of this month was £2,076 1s. 1d., or approximately sixteen weeks' salaries.

No charge whatever is made for stationery, postage or clerical assistance. The whole of the money subscribed goes into the fund for the payment of salaries to unemployed men. Up to date 80 men have been helped. Nineteen of these have since obtained other work and 61 remain on the salary list. It is felt that more claims may be made on the fund unless the present outlook improves very rapidly. Many men who have managed to carry on with the aid of small savings are approaching the time when they will need the Committee's help. Every effort must be made to add to the funds if the Committee are to be able to assist even the most serious cases during the winter. An appeal is made to all who have contributed to the fund in 1932 to continue their support in 1933, and it is earnestly hoped that those architects in work who have not yet contributed to the fund may see their way to do so either by way of a donation or a subscription in the New Year.

We are,
Yours faithfully,

RAYMOND UNWIN
(PRESIDENT R.I.B.A.)

MAURICE E. WEBB
(CHAIRMAN, ARCHITECTS' UNEMPLOYMENT COMMITTEE)

Cheques should be made payable to the Architects' Unemployment Committee and sent to the Secretary, the Architects' Unemployment Committee, 9 Conduit Street, London, W.1.

Exhibition of Drawings

In our issue for January 4 we published particulars of the exhibition, to be held at Lewis's, Ltd., Manchester, of the drawings submitted in the Incorporated Association of Architects and Surveyors £1,000 All-British House Competition, together with models of the prize-winning houses and a number of drawings by Sir Edwin Lutyens, R.A. (President of the I.A.A.S.). In addition to the exhibition at Manchester, which will remain open from January 19 to 28 inclusive, the drawings, etc., will be on view at Lewis's stores in the following towns: Liverpool: February 9 to 18 inclusive; Birmingham: March 2 to 11 inclusive; Glasgow: March 23 to April 1 inclusive. Each store will be open daily from 9 a.m. to 6 p.m. (Wednesdays, 1 o'clock; Glasgow: Tuesday, 1 o'clock).

R.I.B.A.

THE NEXT MEETING

On Monday next, January 23, at 9 p.m., Sir Raymond Unwin will deliver his address to architectural students. The address will be followed by the annual presentation of the Prizes and Studentships in the award of the R.I.B.A. The awards, announced on Monday of last week, are as follows:—

PRIZES AND STUDENTSHIPS

The Tite Prize. A Certificate and £50 for the Study of Italian Architecture. Subject: "A Ball Room in the Grounds of an Italian Embassy." Awarded to A. Reiach (School of Architecture, Edinburgh College of Art). Certificate of Honourable Mention: G. Clark, Sydney, Australia.

The Victory Scholarship. A Silver Medal and £150 for the Advancement of Professional Education. Subject: "A Group of Buildings and their surrounding Layout in a Botanical Garden." Awarded to A. G. S. Fidler, B.ARCH. (School of Architecture, University of Liverpool). Certificate of Honourable Mention: D. McIntyre, A.R.I.B.A. Armstrong College, University of Durham.

The Pugin Studentship. A Silver Medal and £75 for the Study of Mediæval Architecture of Great Britain and Ireland. Awarded to Basil Spence, Edinburgh Coll. Certificate of Honourable Mention and the sum of £10 to K. J. Grice, Birmingham School.

The Owen Jones Studentship. A Certificate and £100 for the Study of Ornament and Colour Decoration. Subject: "Interior Treatment of the Entrance Hall of a Newspaper Building." Awarded to H. F. Hoar, B.A. HON. (ARCH.) LOND., A.R.I.B.A. (Bartlett School of Architecture, University of London). Certificate of Honourable Mention: Miss Sadie Speight, B.A. HON. (ARCH.) MANCHESTER, A.R.I.B.A.

The Royal Institute Silver Medal and £50 for an Essay. The Council regret that they are unable to award the Silver Medal and £50. They have, however, awarded a Certificate of Honourable Mention to R. H. C. Finch (London University), for "An Essay on Old St. Paul's, London."

The Henry Saxon Snell Prize. £100 offered jointly by the R.I.B.A. and the A.A. for the Study of the improved design and construction of hospitals, convalescent homes and asylums for the aged and infirm poor. Awarded to Ernest E. Davis, A.R.I.B.A., London.

The Alfred Bossom Travelling Studentship. A Gold Medal and £250 for the Study of Commercial Architecture in America. Subject: "A Block of Service Flats." Awarded to D. E. Harrington, A.R.I.B.A. (Department of Architecture, Northern Polytechnic, Holloway); Silver Medal for the competitor placed second: R. F. Orfeur, A.R.I.B.A., (A.A., London); and the Alfred Bossom Recognized School Silver Medal to A. Johnson, DIP. ARCH., LEEDS, A.R.I.B.A.

The Henry L. Florence Bursary. £360 for the Study of Greek and Hellenistic Architecture of the Mediterranean Basin. Awarded to D. Theodore Fyfe, F.R.I.B.A.

The Godwin and Wimperis Bursary. A Silver Medal and £200 for the Study of Works of Modern Architecture Abroad. Awarded to Howard Robertson, F.R.I.B.A.

The Grissell Gold Medal and £50 for the Encouragement of the Study of Construction. Subject: "Premises for a Sporting Club." Awarded to R. Ashton (School of Architecture, the Architectural Association, London). Certificate of Honourable Mention: J. A. Carrick (Glasgow School).

The Hunt Bursary. £50 for the Encouragement of the Study of Housing and Town Planning. Awarded to F. G. Costello (London University).

The Arthur Cates Prize. £50. (In the current year the prize was offered for the promotion of architecture, more especially in relation to the application of geometry to vaulting stability of edifice and design.) Awarded to Hubert Bennett (Manchester University), who was the only applicant.

The Athens Bursary. £100 for Study at the British School at Athens. Awarded to William James Smith, F.R.I.B.A. (Glasgow School).

The Ashpitel Prize, 1932. Prize of books, value £10, awarded to the candidate who has most highly distinguished himself among the candidates in the Final Examinations of the year, to Francis William Wright (Sheffield School).

The R.I.B.A. Silver Medal and £5 in Books for Students of Schools of Architecture recognized for exemption from the Final Examination. The Council have awarded the Silver Medal and £5 in books for the best set of drawings submitted at the annual exhibition of designs by students of schools of architecture recognized for exemption from the Final Examination to Elie Mayorcas (Student), of the School of Architecture, The Architectural Association, and a Certificate of Honourable Mention to Alwyn G. S. Fidler (Student) of the Liverpool School of Architecture, University of Liverpool.

The R.I.B.A. Bronze Medal and £5 in Books for Students of Schools of Architecture recognized for exemption from the Intermediate Examination. The Council have awarded the Bronze Medal and £5 in books for the best set of drawings submitted at the annual exhibition of designs by students of schools of architecture recognized for exemption from the Intermediate Examination to Paul K. Pope, of the R.W.A. School of Architecture, Bristol, and a Certificate of Honourable Mention to Malcolm G. Gilling (Student) of the Liverpool School of Architecture, University of Liverpool.

The Archibald Dawnay Scholarships. One of the value of £75 and one of the value of £50 for the advanced study of construction. The Council have awarded the £75 Scholarship to Alexander W. Varcoe (Student), of the School of Architecture, Edinburgh College of Art, and the £50 Scholarship to Malcolm G. Gilling (Student), of the Liverpool School of Architecture, University of Liverpool.

The R.I.B.A. Prize for Art Schools and Technical Institutions with facilities for the instruction of intending architects (*£5 in books*). Awarded to Miss Kathleen I. Maynard (Student), of the Central School of Arts and Crafts, Plymouth.

The R.I.B.A. Prizes for Public and Secondary Schools. Prizes for Essays. The Council have made the following awards: 2 guineas to Elsie A. Leach, of West Leeds High School, for her essay "Kirkstall Abbey"; 1 guinea to Kenneth New, of the Grammar School, Castleford, for his essay "Sherburn Parish Church"; 1 guinea to D. Brian Peace, of Mill Hill School, for his essay "Time and the Church of Hope in Derbyshire." Prizes for Sketches: 4 guineas to C. C. Giffard, of Charterhouse, Godalming, for his miscellaneous sketches; 2 guineas to S. C. Halbritter, of Chatham House (County) School, Ramsgate, for his drawings of Canterbury Cathedral.

The designs and drawings submitted in competition for the prizes and studentships are on Exhibition in the R.I.B.A. Galleries until January 28, between the hours of 10 a.m. and 8 p.m. (Saturdays 5 p.m.).

ELECTION OF MEMBERS

At a recent Council Meeting of the Institute the following members were elected:

As Hon. Associate (1): Wilson, J. S.

As Fellows (17): Butcher, A. J.; Norton, C. J.; Stanley, L. S.; Waterhouse, M. T.; Williams, E.; Agate, C. G.; Armistead, Lieut.-Col. R. B.; Chermayeff, S. I.; Crimp, A. G.; Kennard, C.; Ochterlony, Sir M. M., Bart.; Palmer, F. M.; Randle, G.; Sunderland, A.; Watson, G. P. H.; Folkes, H. E.; Smith, T. H.

As Associates (14): Berman, M. D., DIP. ARCH., Cape Town (School of Architecture, University of Cape Town); Birks, T. H. (School of Architecture, Victoria University, Manchester); Coates, U. A., B.Arch., Lvpl. (School of Architecture, University of Liverpool); Fairhurst, R. F., DIP. ARCH., Lvpl. (School of Architecture, University of Liverpool); Flegg, B. M., A.A. Diploma (Architectural Association, London); Gibson, A. G. (Architectural Association, London); Gordon, H. V.; Greenaway, G. F. (School of Architecture, Victoria University, Manchester); Martineau, D. (School of Architectural Studies, Cambridge University, and the Architectural Association, London); Myerscough-Walker, H. R. (Architectural Association, London); Peace, F. N., DIP. ARCH., Lvpl. (School of Architecture, University of Liverpool); Poppleton, W. C.; Stott, J. P. (School of Architecture, Victoria University, Manchester); Wilcockson, I. D.

As Licentiates (11): Ash, Captain A. S.; Bellis, G.; Carr, H.; Cox, Captain H. J.; Higuer, A. A.; Milburn, E.; Rushworth, S. H.; Shutt, R. P.; Smith, E. L.; Waterhouse, B.; Webb, H. F.

PRELIMINARY COMPETITIONS

The preliminary competitions for the Tite Prize and the Soane Medallion will be held in London and at centres in the provinces on Wednesday, March 1, and Thursday, March 2 respectively.

Forms of application for admission to the preliminary competitions may be obtained at the R.I.B.A., 9 Conduit Street, W.1. The closing date for the submission of forms of application is Friday, February 10, 1933.

THE RATIONALIZED ARCHITECT

●

PLANNED OFFICE PRACTICE

●

THE JOURNAL'S NEW FEATURE

In his article in the New Year issue of the JOURNAL, Mr. Howard Robertson showed that architects today must extend the scope of their ability to plan. Planning should have greater significance than it has had in the past; it should be the basis not of one branch only of the architect's work but of the whole of his professional practice. He should plan and organize within his own firm, and rationalize every one of the activities of his office.

A short time ago I happened to call on Mr. Francis Lorne, and there, on a piece of linen laid out on a drawing board, I found a drawing that, in its own small way, was as fine a bit of planning as I have ever seen. It was an Information Sheet got out for the use of the members of the office of Sir John Burnet, Tait and Lorne; one of a hundred odd sheets by means of which the practice of the firm is "rationalized."

Information sheets are greatly used in German and American offices, but I think I am pretty safe in saying none so detailed and comprehensive have ever before been drawn up in any country in the world.

These information sheets, of course, were made specially for one particular office, but they seemed to me to be such excellent examples of rationalization applied to architectural design, and they so aptly pointed the moral drawn by the New Year Planning Issue of this JOURNAL, that I suggested to Mr. Lorne that they should be published for the use of other architects.

Far from rejecting the idea of making public property of these sheets (which, incidentally, cost several hundred pounds to produce, not to mention the immaculate labours of Mr. Bayne, who must be one of the finest draughtsmen in the country—like several other fine British draughtsmen he is an Australian) the firm jumped at my proposal. It was finally decided that this JOURNAL should publish one drawing a week, which it now proposes to do, the drawing on one of this week's supplements being the first of the series.

May I add that this desire to broadcast information acquired at great cost, in both money and experience, for the use of other members of the profession is one of the few marks which still distinguish architects from tradesmen.

The Americans are particularly generous about broadcasting all their information for the use of brother architects, and so are the Germans, as the travelling English architect invariably finds. I am glad to be able to state that Sir John Burnet, Tait and Lorne helped certain firms of architects in Brussels and Paris not long ago by providing them with a complete set of their working drawings for the Eastman Dental Clinic.

COMPETITION NEWS

Architectural Assessment

[The letter which follows, from Mr. Kendrick Edwards, M.INST.C.E., F.R.I.B.A., explains itself. Owing to the pressure on our space, the article referred to by Mr. Kendrick will be published in our next issue.—ED., *A.J.*]

Sir,—It must be understood that nothing contained herein is intended as adverse criticism of the R.I.B.A. I have seen so much proof of the high efficiency of the Royal Institute and of the wonderful self-sacrificing nature of those of its members who give whole-heartedly of their time and services for the welfare of the profession, that I could not but range myself on its side if defensive support were necessary or desirable. Further, this subject of Architectural Assessment is one in which I am sure that the R.I.B.A. Council will take an active interest if any reasonable suggestion can be put forward which is likely to result in any improvement. But until any Member is able to put forward some improvement upon, or alternative for the suggestion I describe, we must not expect any notice to be taken of our endeavours. The Council is doubtless far too busy with heavy routine and special obligations to indulge in speculative improvements until convincing suggestions are available.

I have been much impressed by the letter of the Town Clerk of Southwark, published in your JOURNAL *for November 30, particularly as regards the high character and ability displayed throughout the difficulties.*

In the same JOURNAL *you publish an article entitled "Judge or Jury," in which it is stated that the idea of a competition has often been abandoned due to the promoters realizing that, although they have their say in the drafting of conditions, they may, beyond that stage, "find themselves in the hands of an omnipotent assessor who may or may not, in their view, be omniscient." The article then proceeds to suggest that the appointing of laymen to work with the assessor is, in the opinion of many, likely to give greater satisfaction.*

In my opinion it would be better for the assessor, or assessors, to work independently of the promoters as regards formulating their findings, but the assessors should thereafter be able to meet the promoters, thus constituting a jury, and to be able to advance reasons for their findings in terms which laymen would understand, thereby carrying their jury with them. The ultimate decisions should be those of the assessors but it should be in order for them to amend or entirely reverse their findings if the promoters or their representatives should be able to show them sound reasons for anticipating that a design, not so far favoured, offers a greater prospect of meeting the requirements of the promoters.

The enclosed article on "Architectural Assessment" was written prior to any matter in your JOURNAL *having attracted my attention to the Southwark Competition, but it now appears to be so germane to that subject that I trust it may be of interest.*

Friendly criticism of my article has so far only advanced the following objections :—

1 : That from an educational point of view there is not great waste in architectural competitions. On the contrary, the R.I.B.A. regard them as one of the most stimulating and enlightening parts of its system. Also a large number of men owe their success in life chiefly to what they have learned from competitions.

Answer : To this perhaps it is only necessary now to observe that the number of men who would owe their success in life to competitions would probably be the same under any system of assessing. But the happy results should be greatly augmented if the competitions are won under an improved system. The waste lies chiefly in the results of assessments not being formulated for the use of architectural schools and also in the promiscuous admission of competitors without any preliminary qualifications.

2 : That if my system had been used in the R.I.B.A. Competition the Assessors would have required to fill up the schedule for 280 designs.

Answer : My system is quite adaptable to a large competition such as this. Under my system it would not have been necessary for any assessor to even see the work of another assessor. The number of assessors would have been decided when the number of designs was known and they would have been selected from a Register of Assessors. There could have been 280 assessors, to each of whom one design would have been sent, or a smaller number for two or more designs each. Alternatively, each design could have had two or three independent assessors because the completed schedules would be calculated and co-ordinated by a clerk or clerks. It is entirely a matter of organization, amongst the benefits being reduced labour per assessor, more analytical results and increased representation of professional opinion. The assessors who prepared the conditions could be umpires for the co-ordinated results.

3 : That detailed schedules of precise opinions of assessors on every point would require to be sent to each competitor.

Answer : Not necessarily. Competitors would probably be satisfied with the knowledge that such a studied investigation had been made. But the co-ordinated results could usefully be circulated to the schools through the Board of Architectural Education of the Registration Council.

4 : That, again taking the R.I.B.A. Competition for the purpose of illustration, an unreasonable amount of time of the five assessors would have been necessary.

Answer : Reference to the answer to question 2 above will show that this need not be the result. In fact the inroads upon their time might have been less, or alternatively, more usefully co-ordinated.

5 : That a competitor may prefer to accept his unsuccess without receiving definite criticisms.

Answer : Question and Answer No. 3 rather dispose of this objection ; alternatively, such criticisms might be provided for any competitor desiring them upon payment of a fee. Such are matters of detail which need not invalidate the principle.

The subject is, of course, a very extensive one and many more criticisms could easily be advanced. Nevertheless I trust my article may stimulate thought in a new direction. Perhaps, if criticisms are sympathetically compared with the broad lines of my suggestions, with the desire to effect improvement, a system of architectural assessment may be evolved which would both inspire confidence and carry conviction.

KENDRICK EDWARDS

Competitions Open

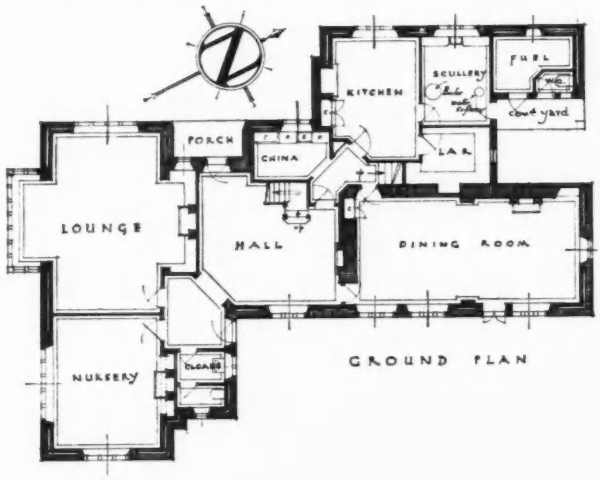
***February 1.**—The city of Stockholm invites designs for a town plan for the part of the town called Lower Norrmalm. 60,000 kronors (£3,077) in prizes, 1st premium, 20,000 kronors (£1,025).

March 24.—Façade to a newspaper office in grey Cornish granite, for the Cornish Quarry Masters' Association. Open to all architects, architects' assistants, and architectural students. Assessors : A. B. Knapp-Fisher, F.R.I.B.A. (President of the Architectural Association) : G. Grey Wornum, F.R.I.B.A. ; and Howard Robertson, F.R.I.B.A. Also, two members of the Cornish Quarry Masters' Association. First prize, £50. The design, etc., is to be sent to the Secretary of the Architectural Association, 34-36 Bedford Square, London, W.C.1, by Friday, March 24, noon. Full particulars of the competition may be obtained from the Secretary, Architectural Association, 34 Bedford Square, London, W.C.1.

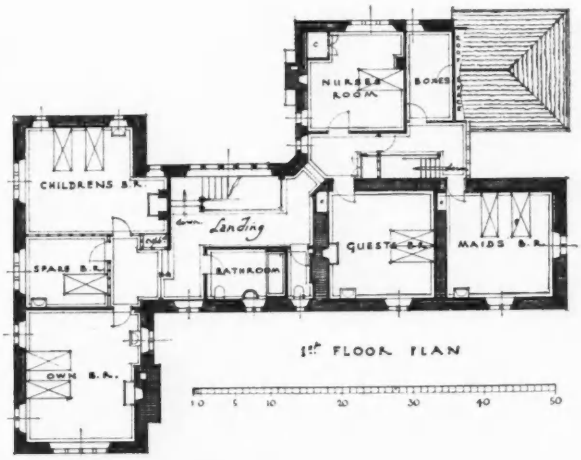
***May 31.**—Sending-in Day. Layout of a suburb on the River Escaut, Antwerp. £2,400 in prizes (1st, £800).

**Full Particulars of the above competitions were published in our issue for December 7.*

Forthcoming Dinners



The annual dinner of the Institution of Structural Engineers will take place at the May Fair Hotel on Friday, March 17. The principal guest will be the First Commissioner of Works, Major the Rt. Hon. W. G. A. Ormsby-Gore, P.C., M.P.

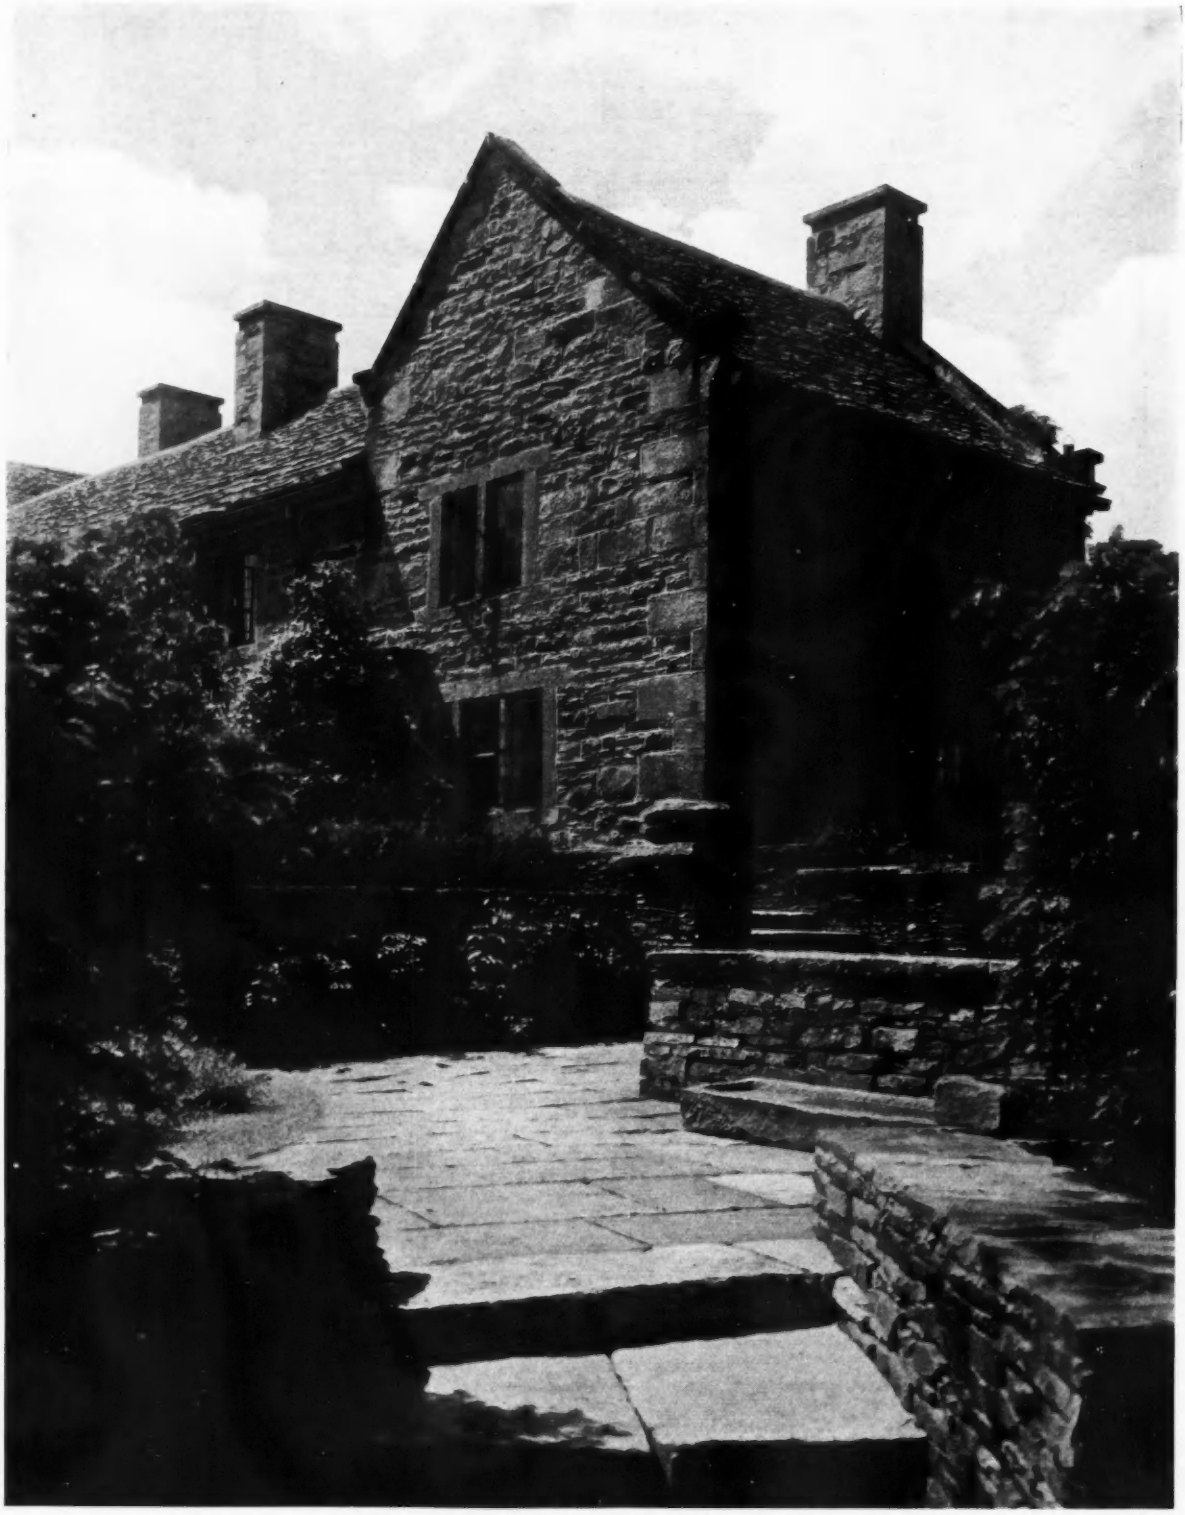


The Annual Dinner of the Drawing Office Materials Manufacturers' and Dealers' Association will be held at the Hotel Metropole, Northumberland Avenue, W.C., on January 25. The annual general meeting takes place earlier that day.

£250,000 Seaside Scheme

The Portsmouth City Council passed plans last week for a proposed winter garden on a site facing the seafront. The frontage of the new buildings, estimated to cost £250,000, will extend approximately 300 feet. The scheme provides for a large indoor swimming pool, ballroom, super cinema, café, roof-garden, etc.

A STONE HOUSE NEAR BAKEWELL, DERBYSHIRE



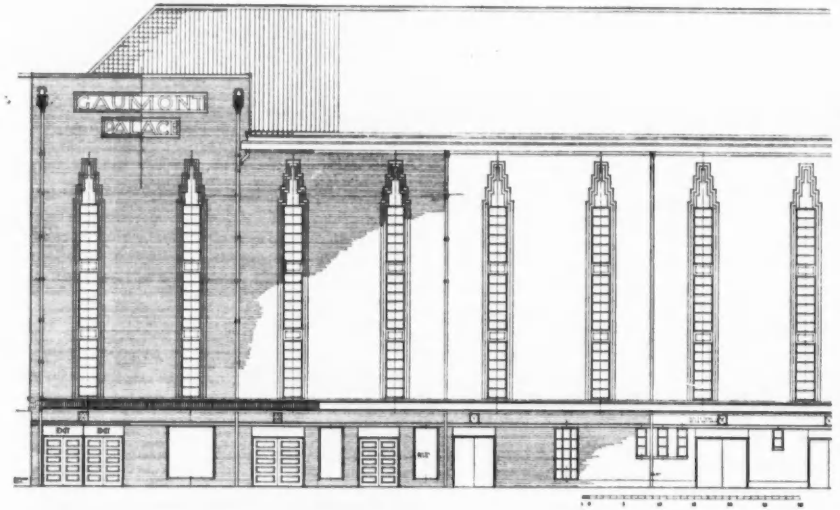
DESIGNED BY NAYLOR, SALE AND WIDDOWS

This house at Chanderhill, overlooking the rolling Derbyshire moors that form part of the Chatsworth estate, incorporates the remains of an old three-roomed cottage, of which only the stone main walls were standing. They form the easterly corner of the plans illustrated and contain part of the hall and the dining-room, of which a view appears above. In the photograph of the garden approach to the house, reproduced on the following page, these cottage walls are seen nearest the camera; the new work, carried out in the local Brampton stone, with sawn dressings to the windows, tones perfectly with the old. The roofing is of Cotswold slates; the soffits are in stone and an eaves gutter of square section with a stray beaded edge has been adopted. The walls are 18 in. thick, with a 4½ ins. brick lining and a 2-ins. cavity.

Internally, all floors are in oak, and single-panel doors are fixed throughout. Each bedroom contains an amber coloured basin, with hot and cold water supply. The bathroom has a 5 ft. dado of light blue tiles, 3 ins. square, with white cement joints. There is a recess in the thick outer wall for bath toys and sponges. The floor is in rubber and the woodwork is enamelled white; all fittings are chromium-plated.

A STONE HOUSE NEAR BAKEWELL, DERBYSHIRE:

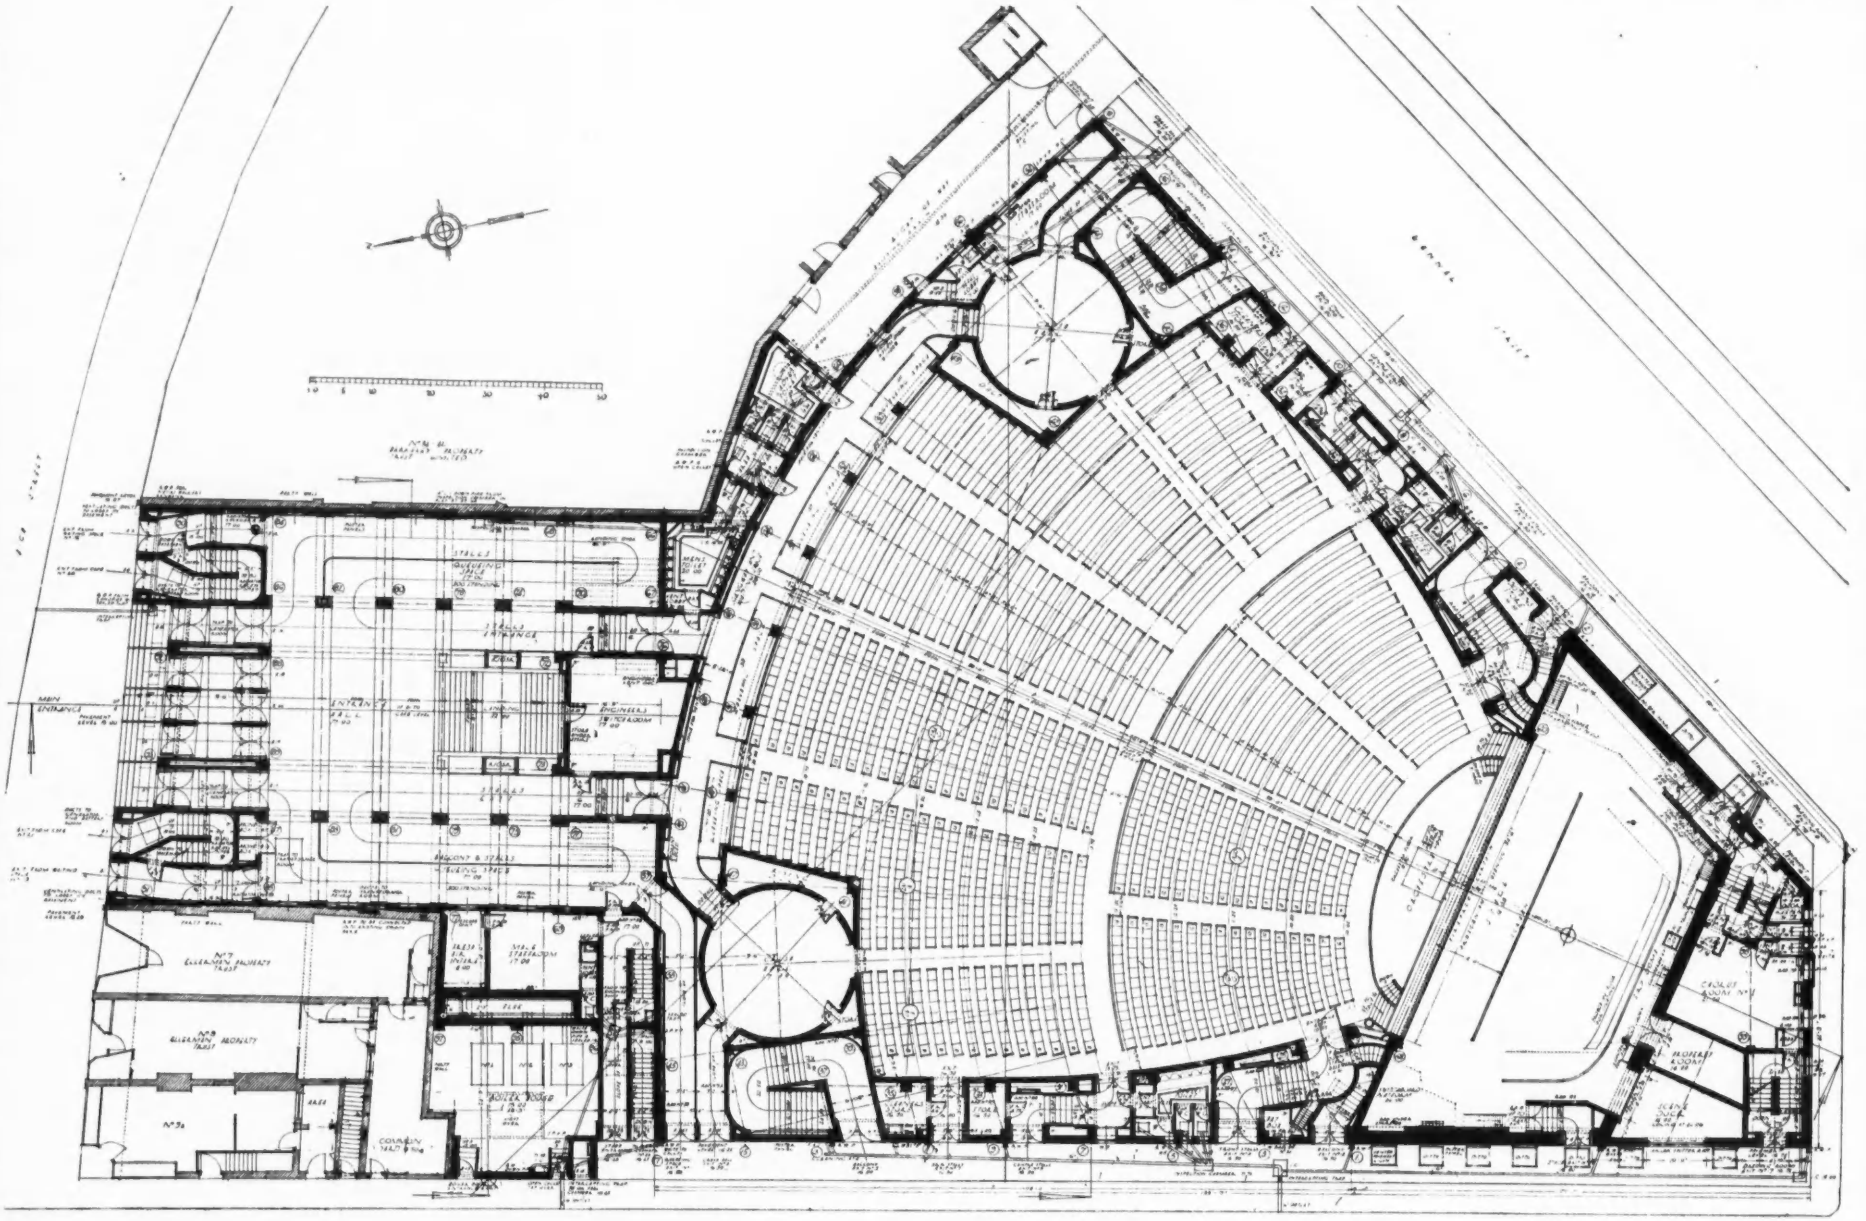
The views reproduced on these two pages are of the house as seen from the east (with cottage portion in foreground), the west and the north. The main entrance faces north-west, and has a deep porch. The photograph in which it occurs not only shows the flagged terracing and stone walls that give unity to house and garden, but illustrates the difference



DESIGNED BY NAYLOR, SALE AND WIDDOWS

in treatment of the south-west front, containing the prominent bay window to the lounge. Here the windows have heavy oak frames and steel casements with a transverse bar, glazed in lead lights above and in plate glass below, in contrast to the stone dressings used elsewhere. The last picture is taken from outside the boundary wall of Chanderhill Lane.

THE GAUMONT PALACE, LEWISHAM: BY W. E. TRENT (JAS. MORRISON, ASSISTANT)



The drawing shows the elevation to Molesworth Street; that to Rennel Street is similar, both being carried out in brick. The photographs show the main entrance in Loampit Vale and two interior views on the first floor: the foyer passage behind the balcony, and the main balcony foyer itself. Plans are reproduced on the two pages overleaf, together with a view of the auditorium from the balcony. The proscenium frame is carried out in blue and silver, and the ceiling is stepped back from it in a series of curves from which concealed lighting is diffused. Drawings of lighting fittings in various parts of the house are the subject of a supplement with this issue.

LETTERS FROM READERS

A National Plan

SIR,—The New Year issue of THE ARCHITECTS' JOURNAL is a call to action for the whole country and its industries. The whole world looks to Britain for a way out and Britain must show the way. But who shall show Britain? Industry in some form, it must be, and the Building Industry is in every way in a position to take the lead. It is British, its men are British, its materials are British and it is the one industry whose whole output remains in Britain and makes Britain what it is today.

Its towns have been built by it, its monuments (and also, it is true, its slums), its villages, its stately mansions, its cottage homes. It is an industry which is used to planning, and its professional members, both architects and town planners, owe their existence to their skill in planning.

Who, then, is better fitted to lead its planning?

Good planning is but common sense and sound business applied to the problem in hand.

The economists have checked the machine, but it must not stop a moment longer, once the stocktaking process is over. The accountants have done their work, and useful work, too, and they have shown the man in the street the real position of affairs.

The balance sheet is clear, but not by any means discouraging. It shows us where we are.

The world is not poorer than ever before; it is far, far richer so far as production is concerned. The shops are full of goods, the stores of food are everywhere greater than before, the world is full of good things, the banks are full of money, and yet there are nearly three millions of people unemployed and in the world as a whole at least thirty millions. Britain is relatively better off than almost any other land, but it is clear that we must set our house in order and look to our own affairs first.

So far as international trade is concerned, for the moment no one wants to buy anything beyond absolute necessities for food and raw materials. International trade can revive only when each nation is earning a surplus beyond its own immediate needs. Britain must show the way.

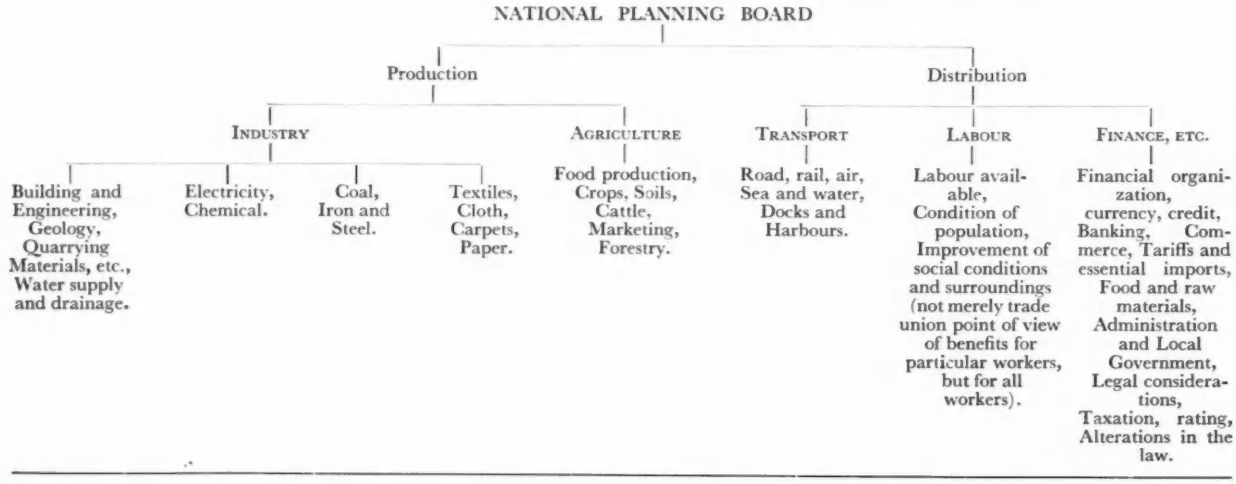
We must recognize that conditions today are not what they were; they are, in fact, far better, if they are rightly handled, and every new invention should still further improve the conditions of the people. This is an age of rapid communication, of machinery that can turn out rapidly the same goods, or better goods, with less men than were needed twenty years ago. With further improvements in sight in all directions, we shall do one of two things; we shall either increase our unemployed problem, with its consequent misery, or we shall have to deliberately plan for easier times and better conditions and better wages for everybody. This in itself means replanning on a vast and generous scale.

Machines are saving men in every industry. With proper guidance they may save mankind.

We have the men, we have the materials, we have the money for vast constructional works of every kind, but these works must be part of a well-considered plan—a national plan. Money left with a banker, or an insurance society, or even a building society, can only be productive if it is used to promote productive works. In the past, the financiers have been ready to assist almost every country except our own. The openings abroad are closed; it is now the time for Britain itself to use the resources of Britain for the British people. There must be an end to restriction of output; there must be an end to compulsory unemployment; there must be an end to every evil condition in our towns and in our countryside.

We must plan for better things, if we want better things; we can afford it, if we but use the resources we have to hand; we cannot afford any longer to leave undone those things that we ought to have done, or indeed there is no health in us.

A national survey must be undertaken as the first duty of any National Planning Board.



Its object must be to ascertain the assets and resources and present condition of the country and their potential application and improvement for the welfare of the nation.

The Planning Board must be representative of all creative interests, as distinct from merely administrative functions. It must comprise representative planners of industry, agriculture, transport, labour and finance. It must naturally include town and regional planners of experience, who in their daily work have already had to consider in some degree all or most of the questions involved.

The Building Industry is concerned with all other industries whose interests lie in constructional work, and it is fitting that this Industry should take the lead in inviting the co-operation and assistance of any and every branch of industry to take a hand in a matter which so vitally affects the future of all.

The five groupings already mentioned will give an indication of the working of the scheme as a whole, but the diagram printed below may help to make the suggestion clearer.

Each of these five groupings would

have any necessary sub-committees for research into particular problems affecting each sub-division, the terms of reference to each group being the same as in the case of the main planning board, the word "Industry" taking the place of "Country."

It will be seen that the function of the National Planning Board would lie in co-ordinating and bringing into line the research work and proposals of the component groups. Each industry would, in fact, plan itself and make such suggestions as it thought fit for securing the object which all have in view.

It must not be thought that the suggestions would involve anything in the nature of an indefinite number of Royal Commissions with years of investigation and enquiry before anything can be done. In most cases, there are men in each industry or group well qualified to analyse the facts as they at present exist and to sum up the potential lines of development. Comparatively young men with clear insight and vision are to be found in every group, and definite reports and recommendations could be expected from each group within a very short space of time. Probably from three to six months would suffice for all the essential facts and tentative proposals to be available for the National Planning Board.

The various professional and trade associations would have no difficulty in nominating the right men for this responsible task.

The final result of a well-considered plan cannot, in the nature of things, be expected to be achieved all at once. It must be a long-term plan whose operations will extend over a series of years, but so adjusted that a programme of advance works is always available as and when the need arises.

Hasty relief works adopted as a panic measure are not an economy and are indications of the want of a plan. With a national plan in operation, the wheels of industry would again revolve and the wasteful bogey of unemployment, with its attendant distress, would steadily disappear.

W. R. DAVIDGE

Carlton House Terrace

SIR,—Financial loss is what motives the projected destruction of Carlton House Terrace. Are we Britishers, then, such poor "mutts" in building development that the Commissioners of Crown Lands and their advisers could conceive no alternative to demolition, in order to meet the financial loss?

Are we inferior to the French, notoriously hard bargainers in these matters, who consistently achieve financial success when faced with similar problems?

The façade of the Place de la Concorde remains intact, but behind it are to be found the Hotel Crillon, two large modern clubs, and a recent internal transformation at the corner of the Rue Royale for the offices of an American financial company. The same process has been followed in the Place Vendôme, and over and over again in the Avenue des Champs Elysées, and elsewhere, when circumstances demanded it.

This Carlton House Terrace business has the air of a comfortable "frame-up" for the interested parties; everything is, of course, perfectly honourable, honest, and legitimate in the affair, but it looks like a "frame-up" nevertheless, because financial loss is to be averted without the "framers-up" being obliged to call into consideration those tiresome æsthetics which would make the money problem difficult.

Crown Commissioners, architects and contractors are now all very happily and profitably tied up in the provisions of legal documents. They could not stay the progress of the work, even if they would. The leaseholders only can do that. As yet there has been no pronouncement in this matter collectively or individually from the directors of the enterprising and wealthy firm of paint manufacturers holding the lease. Such an able body cannot be accounted indifferent to all æsthetic sense.

SIR ROBERT BIRD, BT., M.P.

Crown Lands at Regent's Park

SIR,—I attended Mr. Gaye's lecture to the Chartered Surveyors on January 9, and was greatly interested to hear of the demolition of the slums on Crown lands, which lie to the east of Regent's Park. "Health and hygiene," said Mr. Gaye, "are replacing the rats and mice which infested the houses that Nash built, the great, the incomparable, the almost-sainted Nash."

The only point which I was unable to follow was whether Nash designed the houses for rats and mice, or whether the landlords (the Crown Commissioners) subsequently allowed them to enter as tenants, on, say, a 99 years' lease. (Please do not think that I am comparing the situation in Carlton Gardens to the rodents of Regent's Park.)

Nor did I quite understand whether Nash intended that area to be a slum area when he built it, or whether the landlords (the Crown Commissioners) subsequently allowed it to degenerate.

A. G. MACDONELL

Jerry-Building

SIR,—Mr. Kenneth W. Bland's courteous letter and excellent design do not, I am afraid, help much towards a better-designed elevation to terrace houses.

The builder naturally thinks of putting up something that will sell. When I was a young man, a builder gave me his prescription: "A wide passage, a light kitchen, and a bit of stone round the entrance."

There is just one thing about the elevation of Mr. Bland's pair of houses: Is it true art to cover up a durable thing like a brick wall with a non-durable thing like boarding?

RICHARD J. JENKINS

The R.I.B.A. New Building

SIR,—Like Jacobus (see JOURNAL for December 28) I, too, have been struck by the "curious unanimity of the architectural profession" in the matter of the elevations for the new R.I.B.A. Headquarters.

I can only think it must be due to the intense loyalty of the profession to its elected representatives and to the winner.

The wrought iron grilles to the windows seem to have completely hypnotized critics.

These grilles, which are common enough features in hot climates, where they serve a definite purpose, will—in London—need to be washed at least once a week if they are not to become filthy obstructions—and if the windows are not made to open inwards, it will be impossible to clean the glass, except by means of a hose or the removal of the grilles.

Omit the grilles, and what is left but a square box with rectangular perforations in its sides—obviously incongruous in the stateliness of Portland Place?

Perhaps someone competent will be good enough to explain why we should be enraptured by the contemplation of the elevations for our new "Home"—and perhaps more particularly the reason for the two detached (and isolated) columns which a skidding car is likely to bring down.

GILBERT T. GARDNER

A Paul Nash Drawing

SIR,—I hardly think you will want to continue this correspondence, but it is interesting to hear that Mr. Nash was a pupil of Girtin and Cotman. I was looking at drawings by these two masters only yesterday and if it is still possible to them, I feel they would turn in their graves if they could see their pupil's work.

I am a pupil of Michael Angelo? Poor old Mike!

R. W. SAMPSON

AN EXHIBITION OF HOSPITALS: THE KING'S

The children's ward of the miniature hospital, constructed to a scale of ¾-in. = 1 foot. The design was the work of the late Percy Adams, of Adams, Holden and Pearson, and after his death in 1930, his place was taken by his partner, Lionel Pearson. The walls are tiled with thousands of actual model tiles, showing nursery rhymes from original cartoons.

FUND MODEL, DESIGNED BY THE LATE PERCY ADAMS

An exterior view of the model. The whole has been coated with a bricklike face, indicating approximately a million separate bricks and 7,000 separate stones. There are patients' balconies, and the flat roof supplies a roof garden and bears a flagstaff, flying the Union Jack. The tower contains working parts of the lift and clock.

IT was the intention of the Founders of the Building Centre that its exhibition of building materials should be kept in forward motion and underlined at intervals by smaller exhibitions related to specialized forms of building.

THE KING'S FUND MODEL

It is therefore fitting that the King's Fund Miniature Hospital, designed in the first case by the late Percy Adams, F.R.I.B.A., should be on view at the Building Centre to illustrate the interesting advances made in hospital building since the days before Lister made his revolutionary discovery of antiseptics and anæsthetics.

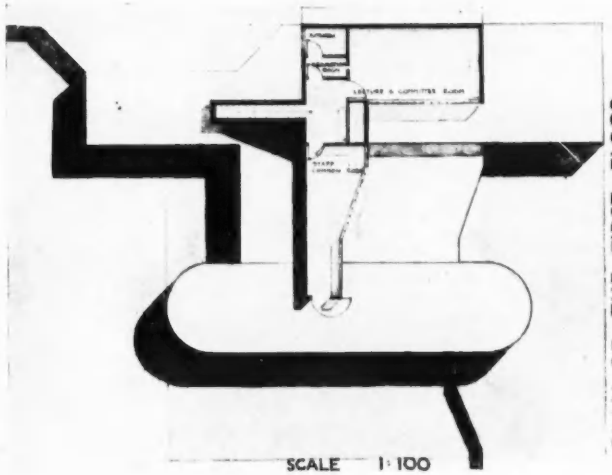
The model is not that of a complete hospital but is in the nature of a composite wing, into which have been compressed as many hospital functions as a model of this sort could carry. The Plan is T-shaped, with administration at one end and a solarium termination at the other, and is of three floors; the top floor is given over to a sixteen-bed children's ward and kitchens; the middle floor to a twelve-bed adult ward and to operating theatres; while the ground floor houses a very complete X-ray department and a board room, secretary's and matron's suite.

The main object of the model is, of course, to raise money. It is therefore not primarily intended for the instruction of architects. Even so, in a model designed by a firm of acknowledged hospital experts and in which every piece of equipment has been made to scale and in photographs quite completely deceives the eye, we cannot fail to be professionally interested in its visible workings.

Being at the Building Centre, the thing does not end there. In the model one can follow the organization of, let us say, the X-ray department. In the various sections of the Building Centre one may examine at full size actual X-ray and other hospital equipment, which, related to the model, is a deal more usefully informative than it might otherwise be. I was particularly struck by a small selection of X-ray photographs which hinted at new uses tending still further to narrow the field of error in building. X-ray photography used to detect flaws in welded steel, for instance, would be another step towards the exact science of building.

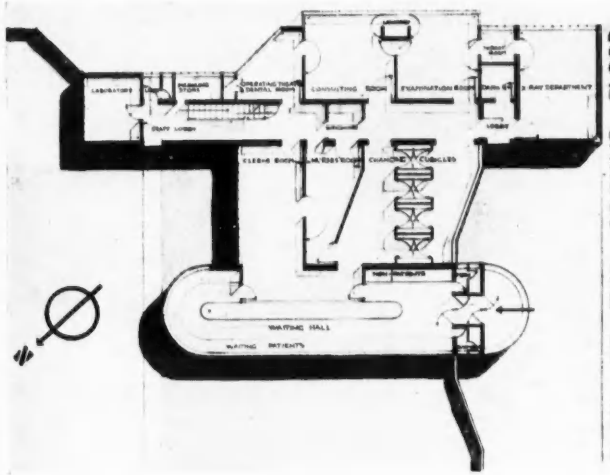
The amount of equipment applied to hospital building and finding a place at the Centre would occupy considerable space in the telling. It is enough to say that the hospital model, interesting as it is, provides only half the instruction available.

A TUBERCULOSIS CLINIC



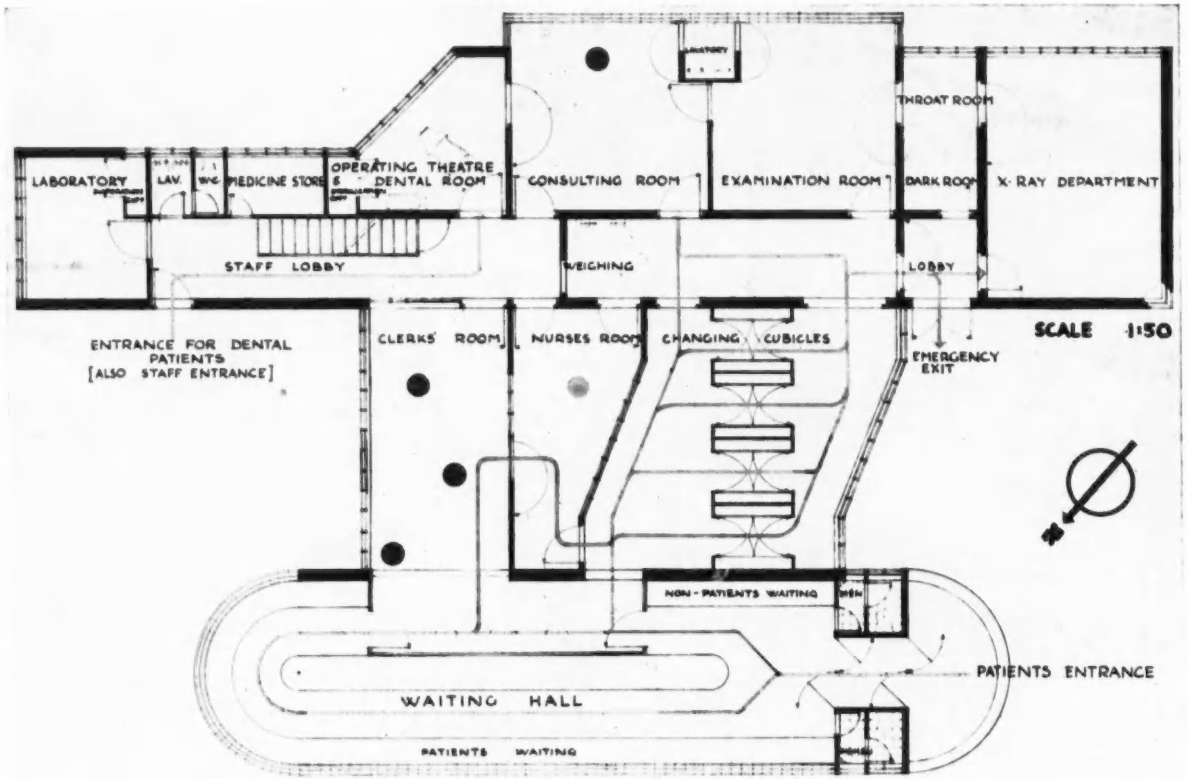
Rather different in kind, but not in function, is the projected Tuberculosis Clinic by Tecton, architects, which has been prepared for Dr. Philip Elman, M.D., M.R.C.P. This extremely interesting design is planned for and nearly exactly clothes a particular clinical organization. The circulation of both patient and staff has been worked out very thoroughly and quite obviously forms the working basis of the plan and section, but that, to the student of hospital planning, is no new thing, even when it is done with the exactness so evidently striven for here; for after satisfying mechanical functions of organization, the architects have gone on to make a fuller use than hitherto has been made of modern methods of construction, which allow of the entrance of a great deal more light to working spaces and of a greater flexibility in plan. The result, as one would expect, and as the architects themselves evidently looked for, is lively and dynamic to a degree, cutting through even the revised conventions of hospital planning like an operator's knife. It is a work of three-dimensional design intended to stand by itself as an isolated unit.

In principle the plan aims at separating the public parts of the clinic from the administrative, avoiding cross-circulation. The arrangement of the waiting room, with complete supervision of the patients by the nurse, is so planned that patients, whether they appear for the first time or have already passed through the stages of identification, etc., follow one another in regular order. The dressing cubicles separate the dressed from the undressed and allow those who have not undressed to pass through directly to the consulting room; and the circulation finishes through a clerks' room where information is collected and tabulated.



At first-floor level are staff rooms, including a lecture room, which can be adapted for a committee room and is provided with a cinema or lecture lantern. From the point of view of design one feels that the functional basis would have been strained to breaking point had there been any difficulty in achieving the delightful effect of this little nautical "top hamper," which adds so much to the interest of the design. This is a necessary qualification to its so pointedly functional nature.

For the rest it would appear to have been the result of a very close collaboration between client and architects, and a refreshing attempt to accept the consequences involved by a strict solution of a set programme in terms of the most fitting materials. E. M. F.

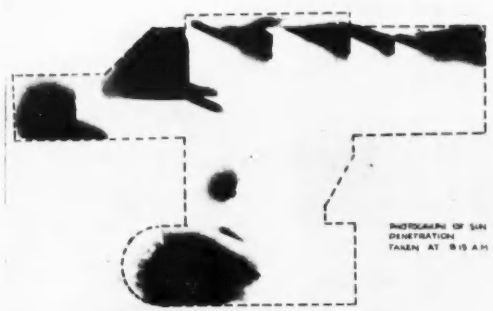


HOSPITALS EXHIBITION: PROJECT FOR A TUBERCULOSIS CLINIC, BY TECTON

PLAN OF THE FIRST FLOOR

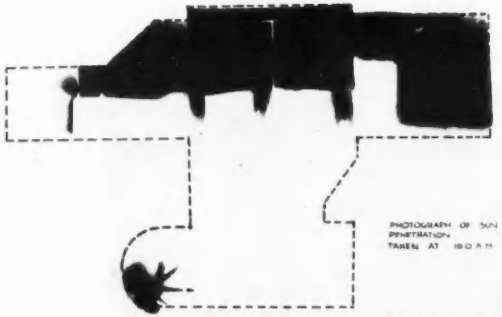
PLAN OF THE GROUND FLOOR

The underlying principle of the plan is the separation of the public parts of the clinic from the administrative, so that all cross circulation may be avoided.



The Waiting Room is designed for complete supervision of the patients by the nurse in charge, and is so arranged that the patients may follow one another easily in regular order. The walls of glass bricks, a not uneconomical form of construction, would create an atmosphere of cheerfulness for the patients. A system of cross ventilation would be provided.

The Clerical and Filing Section concentrates the records of the patients and facilitates cross-reference between the nurse's "history" files, the doctor's "medical" files and the clerk's "financial" files.



The Dressing Cubicles are so arranged that undressed patients are separated from those dressed, while both may be adequately supervized by the nursing staff. Cross ventilation is provided. A through way is provided for patients who are not required to undress. From the cubicles the patients enter directly into a lobby where a nurse can take weights, temperatures, etc., and can direct them either to the consulting room or to the X-ray department.

The Consulting Room Suite has a S.E. aspect and the maximum of light and air. Staff

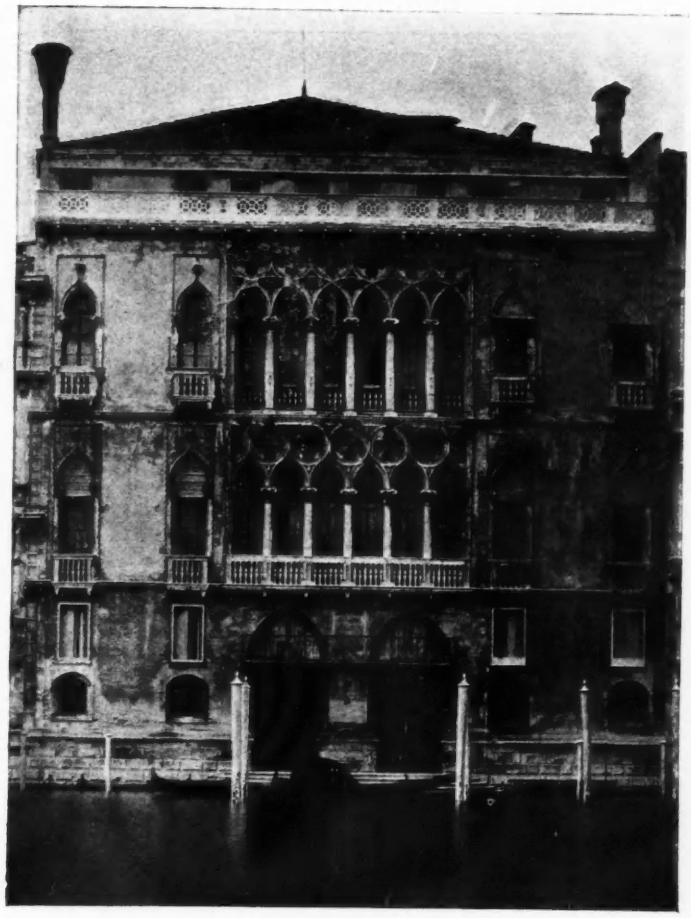
circulation is separate from that for patients. Adequate washing facilities are provided for all departments. A small throat room in connection with the examination room and a specially orientated operating theatre (which can also be used as a dental room) complete the suite.



The X-Ray Department is provided with independent access for special X-ray visitors and has a small dark room attached.

A Small Clinical Laboratory is included in connection with the staff section of the clinic.

Staff Rooms on the upper floor comprise a common room, with small kitchen-pantry, having access to the flat roof, and a lecture room designed to be adapted for a committee room. A small projection chamber is attached to this room for cinema or lantern lectures.

The Construction of the building is principally of brick, with parts in glass bricks and in reinforced concrete.

LITERATURE

Palazzo Pisani, Venice. | The Venetian palace is planned specially to suit the peculiar conditions of the city. The main front faced the canal, but there was an entrance from the campo at the back. The water front followed more or less one type. On the lower floor a flight of steps rises from the water to the door of the hall. This and the rooms above it run through and have smaller rooms to right and left. The large hall on each floor divides the house in two. These central halls are so lofty that sometimes the side rooms have two stances in the height of the central hall. On the upper floor, the *piano nobile*, a great window with marble tracery is set in a frame that occupies the whole end of the central hall. All the architectural features are in marble, and the wall spaces faced with slabs of marble. The main building is of brick. [*From* ARCHITECTURE.]

THE BOND AND THE FREE

Architecture. By the late Sir Thomas Graham Jackson, Bart., R.A. A Re-issue. London : Macmillan and Co., Ltd. Price 12s. 6d. net.

SIR THOMAS JACKSON wrote this book during his last illness but, we regret to record, died a month after it was finished. He traces the development of European architecture from the days of early Greece up through the ages to the time of the later Renaissance. There are thirty-four chapters and nearly two hundred illustrations. In his introduction he says :

I remember Dr. Jowett, the Master of Balliol, once citing to me what he said was Ruskin's definition of architecture. It was to this effect : "So we see that architecture is nothing but ornament added to building." The Master quoted from memory, and could not give the reference. I can only hope for Ruskin's sake that he was mistaken : for though this definition has been widely held and may satisfy many who ought to know better, it embodies the most mischievous fallacy by which the proper understanding of the subject has ever been perverted. Even Fergusson, though with some qualification, commits himself to the statement that "Architecture commences when some embellishment is added to the building which was not strictly a structural necessity." As well might it be said that prose passes into poetry with the introduction of metre and verse, though the magnificent rhapsodies of Job and Isaiah teach us that the highest qualities of poetry may be reached without either. In the same way some of the sublimest works of architecture have either no ornament at all, or only such as is of the simplest and most abstract kind. Architecture does not consist in beautifying . . . building, but on the contrary, in building beautifully, which is quite another thing. . . . In a word—architecture is the poetry of construction.

Only two styles of architecture are explained and contrasted by the author: that of freedom and common sense on one hand, that of authority and dogma on the other. These are the two methods open to us, the Bond and the Free, and it depends on our choice what the future history of our art will be.

THE BRAINS BEHIND THE BIG DRUM

Advertising: Its Methods, Preparation and Uses. Issued by the Institute of Incorporated Practitioners in Advertising.

THE dear old lady who once said to a well-known furniture designer : "What wonderful sawmills you must have !" was no sillier than many an educated and intelligent person who says to the professional practitioner in advertising : "I do think some posters are so clever !" or (alternatively) : "I hope you don't do those horrible ——— posters !" Advertising to most people means posters, and that means either disfigurement of the countryside or decoration on an Underground Station.

The educated man is usually quite ignorant of what advertising tries to do and what effect it has upon him, and he will seldom admit that he ever reads advertisements. But let him read this little book on the subject, issued by the I.I.P.A., and he will soon realize that all is not posters. He may also begin to understand how he is cajoled into courses that he did not determine himself, how his expenditure is deflected into paths that were chosen for him in some board room, in a firm he has never heard of, at an advertising conference the existence of which he has never even suspected.

In this clearly-written and compactly-planned little book, which can be had for the asking from the Institute of Incorporated Practitioners in Advertising, 3-4, Clements Inn, W.C.2, the structural side of advertising is described and the potency of this force in the economic life of an industrial state can be apprehended. It is a force that can be used for the betterment of life ; but nothing in its history has suggested that it is incapable of evil, and for that reason it should be understood by those on whom it operates.

JOHN GLOAG

ANCIENT BRIDGES

The Ancient Bridges of Mid and Eastern England. By E. Jervoise. London : The Architectural Press. Price 5s. 6d. net.

THE problem confronting the Society for the Protection of Ancient Buildings seems to reach gargantuan proportions when one considers that in this little volume, the third of a series, the author makes a survey of over five hundred bridges, and yet confines

THE NORTH FRONT OF THE CHÂTEAU AT BLOIS

Between 1515 and 1519 Francis I built the wing forming the north side of the court of the château at Blois. Its front to the court contains the famous staircase with its open arches, and the north front is faced with open arcades surmounted by a loggia. From this new building, only thirteen years later than the flamboyant east wing of Louis XII, all Gothic detail has disappeared. The walls are divided by pilasters, with capitals and bases in each story, the invention of Alberti at the Palazzo Rucellai half a century before; the stories are divided by classic entablatures; and the staircase is enriched with Italian arabesques. And yet the main structure is still Gothic; the windows have mullions and transomes; the high roofs have dormers, Renaissance versions of their flamboyant predecessors; the statues stand in niches in the old way, though the canopies are modelled in the new fashion; the architect, in short, has worked with the freedom of the Middle Ages. [*From* ARCHITECTURE. *For review, see previous page.*]

himself to the Midlands and Eastern Counties of England. Many of the bridges he describes have already vanished, many have been ruined by ruthlessly utilitarian schemes for road-widening, but many fortunately remain, each one a brand to be saved from the burning.

Mr. Jervoise has had necessarily to condense an abundance of material, but within the scope of a hundred and sixty pages he has given a record of almost every bridge of any importance in this part of England. Many of those standing to-day are the descendants of generations of bridges on the same site, the wooden structures of very early times being superseded by mediæval bridges of stone or brick, which were frequently reconstructed in the eighteenth century, while these too often gave place in the last century to cast iron bridges "of modern design and highly ornamental." Research into the historical records of these bridges shows that our ancestors were loth to accept the responsibility of keeping them in good repair; when sums were voted for their maintenance it was generally because they were "utterly overthrown," or "washed down by a calamitous flood." But it is modern schemes for road-widening that have had the most disastrous effects on old bridges, and some sad facts are related concerning the masking of old stone work by blue brick or concrete in the present century. However, the building of by-pass roads and wide new bridges has saved them in some places, with the additional advantage that from the new bridge one can often see the full beauty of the old arches a short distance away. One only wonders what will be the fate of these old bridges when they have no further justification for their existence than an æsthetic one.

The author, however, does not set out to solve any problems; he is recording briefly the results of a comprehensive survey of the conditions of the bridges as they stand to-day, and of the past history of their use and maintenance. He quotes frequently from historical records, and his book is fully illustrated; one's only regret is that the results of such intensive research in a subject of such great interest has had to be confined within so small a compass.

ARCHITECTURAL ASSOCIATION

The Architectural Association have just issued *The Architects' Diary and Technical Reference for 1933*. The volume includes special articles on "The Work of the Building Station," by R. E. Stradling, M.C.; "Empire Timbers," by Major J. R. Cosgrove, D.S.O., M.C.; "The Efficient Use of Timber," by Major F. M. Oliphant; and "The Building Centre," by Maurice E. Webb, F.R.I.B.A.

Books reviewed in these columns may be ordered through The Architectural Press, 9 Queen Anne's Gate, S.W.1.

Granite for Liverpool Cathedral

Irish granite may be used for the new £3,000,000 R.C. Cathedral at Liverpool. Sir Edwin Lutyens, R.A., has made the following statement: "The stone we shall probably use is Irish granite, fawn-coloured, from Wicklow. But whether this stone will actually be used depends on events in Ireland. If there is a tax on the stone, the price will be prohibitive."

Mr. D. Winton Thorpe, A.M.I.E.E., consulting electrical engineer, has removed to 100 Victoria Street, London, S.W.1. Tel. No.: Victoria 6436.

THE SPECIFICATION WRITER: FILLER-JOIST FLOORS

IN filler-joist floors the strength due to the joint action of the steel beam and the surrounding concrete received official recognition last year. The extravagance of considering the surrounding concrete as a dead load on the steel has been abandoned, so that the advantages of this old and simple type of floor are now available with greater economy than formerly.

The first report of the Steel Structures Research Committee to the Committee of the Privy Council for Scientific and Industrial Research contains recommendations for the use of filler-joist floors, and these, with slight modifications, have been included in the British Standard Specification No. 449–1932 and the L.C.C. Code of Practice for the use of Structural Steel in Building, 1932.

Possibly full advantage is not being taken of the official recognition of filler-joist floors in these codes because the formulæ for the recommended method of calculation are not given.

This article is intended to supply this deficiency.

The recommendations, as contained in the British Standard Specification, are :—

(1) The strength of filler-floor beams entirely encased in a concrete floor slab *may be estimated on the basis of the combined moment of inertia of the steel and surrounding concrete*, neglecting the strength of concrete in tension and taking the limit of flexural stress in the steel at *9 tons per square inch.*

(2) If such floor beams are spaced further apart than *six times the thickness of the concrete floor slab* suitable transverse reinforcement shall be provided.

(3) The span of any filler-floor beam encased in concrete shall not exceed *32 times the depth* measured from the bottom flange of the floor beam to the top surface of the concrete slab.

Clause (2) is not included in the L.C.C. Code of Practice

Quality A steel is specified.

The italics are mine.

Referring to Clause (1), if I may judge from my correspondence, it appears that either the method of calculating the combined moment of inertia of a steel I-beam and the surrounding concrete is not well known or it is supposed to be an involved mathematical process.

The equivalent moment of inertia method, by which the calculation may be made, may not be as well known as it deserves to be, but its name is the most formidable part of it, and I hope to show by details and examples that no more than arithmetical rules are required for its use.

Only three formulæ are needed. They will be explained fully and are printed here for reference.

The first formula is for the position of the neutral axis ; it is the usual formula for reinforced concrete as in the L.C.C. Regulations :—

$$n=(\sqrt{m^2\cdot r^2+2m\cdot r}-m\cdot r)d \quad \ldots\ldots\ldots \quad (1)$$

The second formula is for the combined moment of inertia :—

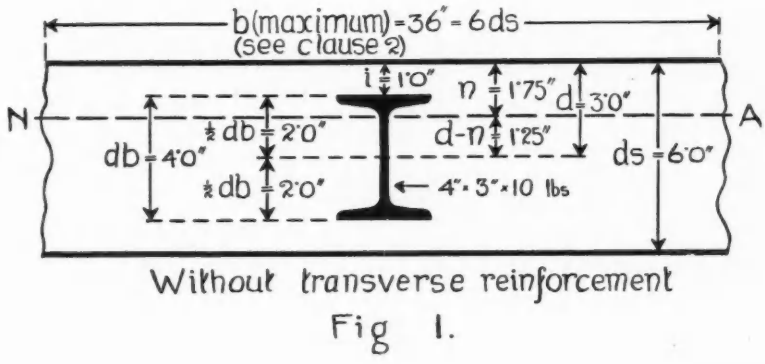
$$I=\frac{b\cdot n^3}{3m}+Ib+A(d-n)^2 \quad \ldots\ldots\ldots \quad (2)$$

The third formula is for the safe load in tons for a given span in feet :—

$$W=\frac{6I}{L(db+i-n)} \quad \ldots\ldots\ldots \quad (3)$$

Example No. 1

Steel I-beam
= 4 ins. × 3 ins. × 10 lb. per foot.
A = area = 2·94 sq. ins.
Ib = maximum moment of inertia = 7·786.



Concrete :
ds = slab depth = 6 ins.
b = breadth = $6ds$ maximum = 36 in.
d = effective depth .. .. } $d=i+\frac{1}{2}db$
i = inset or cover .. .. } = 1·0 + 2·0
db = depth of I-beam .. } = 3·0 ins.
$b\cdot d$ = the area of the effective concrete = 36·0 × 3·0 = 108·0 sq. ins.

Position of Neutral Axis

Use Formula (1), in which :—
n = the distance from the top of the slab to the neutral axis N—A.
m = the modular ratio, assumed = 15.
d = the effective depth of the concrete (see above).
r = the ratio of the area of the I-beam to the area of the effective concrete = $A \div b\cdot d$ = 2·94 ÷ 108 = 0·0272.

$m\cdot r = 15 \times 0{\cdot}0272 = 0{\cdot}408$ $2m\cdot r = 0{\cdot}816$.
$m^2 = 225$ $r^2 = 0{\cdot}00074$ $m^2\cdot r^2 = 0{\cdot}1665$.

$n=(\sqrt{m^2\cdot r^2+2m\cdot r}-m\cdot r)\,d \quad \ldots\ldots \quad (1)$
$=(\sqrt{0{\cdot}1665+0{\cdot}816}-0{\cdot}408)3{\cdot}0$.
$=(\sqrt{0{\cdot}9825}-0{\cdot}408)\ 3{\cdot}0$
$=(0{\cdot}9912-0{\cdot}408)\ 3{\cdot}0$
$=0{\cdot}5832 \times 3{\cdot}0 = 1{\cdot}75$ in.

Without transverse reinforcement

Fig 1.

Combined Moment of Inertia

Use Formula (2) :—

The only terms in this formula which have not yet been defined are $(d-n)$ = the distance from the middle point of the I-beam to the neutral axis N—A, and I = the combined moment of inertia.

$$I=\frac{b\cdot n^3}{3m}+Ib+A(d-n)^2 \quad \ldots\ldots\ldots \quad (2)$$
$$=\frac{36\times 1{\cdot}75^3}{3\times 15}+7{\cdot}786+2{\cdot}94\times 1{\cdot}25^2.$$
$$=4{\cdot}288+7{\cdot}786+4{\cdot}594=16{\cdot}668.$$

Safe Load

Use Formula (3) :—

This formula is for the total uniformly distributed safe load, including the weight of the slab, for the special conditions of 9 tons per square inch tensile stress in the steel I-beam (see Clause 1) and the length of the effective span of the slab in feet.

W = safe load as above.
L = span in feet as above. Assume L = 12 ft.

$$W=\frac{6I}{L(db+i-n)} \quad \ldots\ldots\ldots \quad (3)$$
$$=\frac{6\times 16{\cdot}668}{12(4+1-1{\cdot}75)}=\frac{100}{39}=2{\cdot}56 \text{ tons.}$$

Example No. 2

Steel I-beam
= 4 ins. × 1⅞ in. × 5 lb. per foot.
A = area = 1·47 sq. ins.
Ib = maximum moment of inertia = 3·664.

Concrete :
ds = slab depth = 3 ins.

With transverse reinforcement :
b = breadth = 30·0 ins.
d = effective depth .. .. } $d=i+\frac{1}{2}db$
i = inset or cover .. .. } = 1·0 + 2·0
db = depth of I-beam .. .. } = 3·0 ins.
$b\cdot d$ = the area of the effective concrete = 30·0 × 3·0 = 90·0 sq. ins.

Position of Neutral Axis

Use Formula (1) :—

$r = A \div b\cdot d = 1{\cdot}47 \div 90 = 0{\cdot}0163$.
$m\cdot r = 15 \times 0{\cdot}0163 = 0{\cdot}2445$ $2m\cdot r = 0{\cdot}489$.
$m^2 = 225$ $r^2 = 0{\cdot}000266$ $m^2\cdot r^2 = 0{\cdot}0598$.

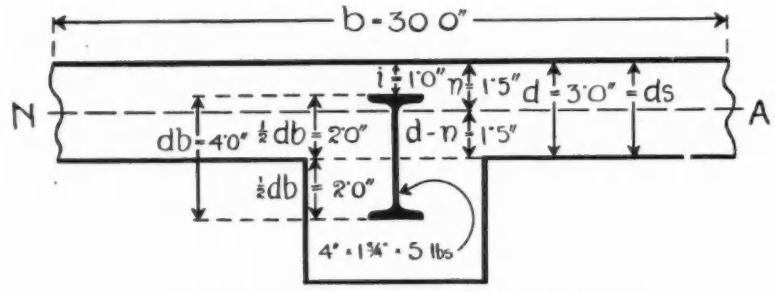
$n=(\sqrt{m^2\cdot r^2+2m\cdot r}-m\cdot r)d$.
$=(\sqrt{0{\cdot}0598+0{\cdot}489}-0{\cdot}2445)\ 3{\cdot}0$.
$=(0{\cdot}7408-0{\cdot}2445)\ 3{\cdot}0=0{\cdot}4963\times 3{\cdot}0$
$=1{\cdot}5$ in.

Combined Moment of Inertia

Use Formula (2) :—

$$I=\frac{b\cdot n^3}{3m}+Ib+A(d-n)^2 \quad \ldots\ldots\ldots \quad (2)$$
$$=\frac{30\times 1{\cdot}5^3}{3\times 15}+3{\cdot}664+1{\cdot}47\times 1{\cdot}5^2.$$
$$=2{\cdot}25+3{\cdot}664+3{\cdot}307=9{\cdot}22.$$

Safe Load



Use Formula (3) :—

$$W=\frac{6I}{L(db+i-n)} \quad \ldots\ldots\ldots \quad (3)$$
$$=\frac{6\times 9{\cdot}22}{12(4+1-1{\cdot}5)}=\frac{55{\cdot}32}{42}=1{\cdot}32 \text{ tons.}$$

Comparisons

Consideration may now be given to the economy permitted by taking the joint action of the concrete and steel into account instead of assuming the concrete to be a dead load supported entirely by the steel.

For this purpose comparisons will be made between the strengths of the slabs of Examples 1 and 2 as calculated and the strength of the steel alone at the

With transverse reinforcement

Fig. 2.

usual working stress of 8 tons per square inch :—

12 ft. span.
Slab of Example No. 1.
(*a*) Safe load, including weight of slab.

		Tons.
Slab No. 1	Safe load =	2·56
4 ins. × 3 ins. I-beam ..	,, ,, =	1·73
Increase for slab	=	0·83
	or *48 per cent.*	

(*b*) For the superimposed load.

		Lb.
Weight of concrete, Slab No. 1 = 36 sq. ft. at 70 lbs.	=	2,520
Weight of I-beam, 4 ins. × 3 ins. = 12 ft. at 10 lb.	=	120
Total weight of slab = 1·18 tons =		2,640

Deduct the weight of the slab from each of the above safe inclusive loads and divide the remainder by the floor area of 36 sq. ft., then the balances available for superimposed load, weight of plaster, etc., are :—

For Slab No. 1, 86 lbs. per sq. ft. live load is allowable.

For I-beam, 4 ins. × 3 ins., 34 lb. per sq. ft. live load is allowable.

On this basis the increase of strength in favour of the slab is *more than 150 per cent.*

Slab of Example No. 2.
(*c*) Safe load, including weight of slab.

		Tons.
Slab No. 2	Safe load =	1·32
4 ins. = 1¾ ins. I-beam ..	,, ,, =	0·81
Increase for slab	=	0·51
	or *63 per cent.*	

(*d*) For the superimposed load.

		Lbs.
Weight of concrete, Slab No. 2 = 30 sq. ft. at 35 lb.	=	1,050
Weight of rib, Slab No. 2 = 12 ft. at 22·4 lb.	=	268
Weight of I-beam, 4 ins. × 1¾ in. = 12 ft. at 5 lb.	=	60
Total weight of slab = 0·62 ton =		1,378

Deduct weight of slab as before and divide by floor area of 30 sq. ft., then the balances available for superimposed load, weight of plaster, etc., are :—

For Slab No. 2, 52 lb. per sq. ft. live load is allowable.

For I-beam, 4 ins. × 1¾ ins., 14 lb. per sq. ft. live load is allowable.

On this basis the increase of strength in favour of the slab is *more than 260 per cent.*

Suitability of Slabs for Floor Loads

In the new British Standard and L.C.C. Codes there are the following floor loads :—

	Lb. per sq. ft.
Rooms for domestic purposes, hotel bedrooms, hospital rooms and wards	40
Offices, floors above entrance floor ..	50
Offices, entrance floor and floors below entrance floor	80
Churches, schools, reading-rooms, art galleries and similar uses	70
Retail shops and garages for cars of not more than 2 tons dead weight ..	80

As calculated for the combined strength, Slab No. 1 is, therefore, suitable for the 70 and 80 lb. per square foot superimposed floor loads, depending on the weights of the floor finishings : and, similarly, Slab No. 2 is suitable for the 40 and 50 lb. per square foot loads.

An important point to be noted is that, under the old method of considering the concrete as a dead load on the steel, neither of the slabs would have been suitable for the lightest new load of 40 lb. per square foot.

The new Codes of Practice have revived interest in filler-joist floors, and now that they can be designed on an economical basis it is probable that there will be a return to their frequent use.

W. BASIL SCOTT, M.I.STRUCT.E.

LAW REPORTS

ARCHITECT'S CLAIM FOR SERVICES RENDERED

King v. *Traders Markets, Ltd.—King's Bench Division. Before Mr. Justice Macnaghten*

THIS was an action by Mr. William James King, an architect, of 5, Great James Street, Bedford Row, London, against Traders Markets, Ltd., The Mall, Ealing, for the payment of £1,050 for services rendered in connection with the preparation of plans, measurement and specifications for the proposed building of flats in High Street, Fulham, during 1930.

Defendants by their defence denied liability for the sum claimed, but agreed that plaintiff was entitled to twenty-five guineas, which had been paid already to plaintiff for certain preliminary drawings to enable the builders concerned to give an estimate. It was further agreed that if the estimate was acceptable, plaintiff should carry out all the necessary surveys, and draw up plans for £1,500, but the construction scheme had been abandoned in October, 1930. Plaintiff was, therefore, not required to undertake the work of supervising the actual construction. It was denied that plaintiff was entitled to a *quantum meruit* and alternatively, if he was so entitled the fees he had charged were excessive.

Mr. Le Quesne, K.C., and Mr. R. Sullivan appeared for plaintiff, and Mr. St. John Micklethwaite, K.C., with Mr. W. Price, were for defendants.

After hearing the evidence, his lordship gave judgment for defendants, holding that the work for which plaintiff claimed to be paid, was done by him gratuitously, and with the object of obtaining the contract, if the scheme of defendants had matured.

SINKING FUND PAYMENTS

St. James's and Pall Mall Electric Light Co., Ltd., v. *City of Westminster Assessment Committee. Before Lords Justices Scrutton, Greer and Slesser*

THIS was an appeal by the City of Westminster Assessment Co. from a judgment of a King's Bench Divisional Court consisting of the Lord Chief Justice and Justices Avory and Macnaghten, who had allowed an appeal of the St. James's and Pall Mall Electric Light Co., Ltd., on a case stated by consent under section 40 of the Valuation (Metropolis) Act, 1869, after notice on appeal to Quarter Sessions.

The point raised by the appeal was as to the treatment for purposes of rating of the sinking fund payments which the company—like other electrical undertakings—are required by law to provide out of their revenues.

The company claimed that their rating in respect of their hereditaments—land, buildings, machinery, mains, etc.—should be reduced from £110,001 gross and £55,001 rateable value, to £72,664 and £36,332 respectively. The Assessment Committee reduced the gross and rateable values to £89,922 and £44,961 respectively.

The undertaking is to be transferred to the Joint Electricity Authority in 1971 and the matter arose with regard to the sinking funds.

The company are required by their act to form two sinking funds by setting aside out of their revenue such sums as with interest thereon would be sufficient to liquidate the value of the physical assets to be transferred and certain other capital expenditure. The company did set aside sufficient contributions to provide the sinking funds which on the transfer of their undertaking to the Joint Electricity Authority were to be retained by the company.

The company argued that, in arriving at the gross and rateable value of the hereditaments, the sums which they were required to set aside for the sinking funds should be excluded from their receipts or allowed as a reduction therefrom.

The Divisional Court came to the conclusion that in arriving at the rateable value of the undertaking on the profits basis, the sinking fund payments must be deducted from the profits, since a hypothetical tenant would not pay a higher rent to collect revenue from which he could derive no benefit.

Mr. Tyldesley Jones, K.C., argued the case for the applicants and Mr. A. T. Miller, K.C., for the respondents.

The Court held that the King's Bench Divisional Court came to a wrong conclusion, that the question in the special case must be answered in favour of the Assessment Committee, and that the appeal must be allowed with costs there and below.

Lord Justice Scrutton said in his view the undertaking or the owners did get the benefit of the sinking funds in either repaying

borrowed capital or replacing shareholders' capital. It was true that the Electricity Authority would get the benefit of the sinking funds when the authority in 1971 got the undertaking free. That was because the consumers, out of standard prices, before 1971 would have paid sums which were by statute to go to form the sinking funds which would relieve the authority from the necessity of replacing the undertakers' capital by payment of a price in 1971, but the owner, undertaker, or hypothetical landlord also got the benefit of those payments when they would be included in the balance coming to him in the nature of rent.

Lords Justices Greer and Slesser concurred.

SOCIETIES AND INSTITUTIONS

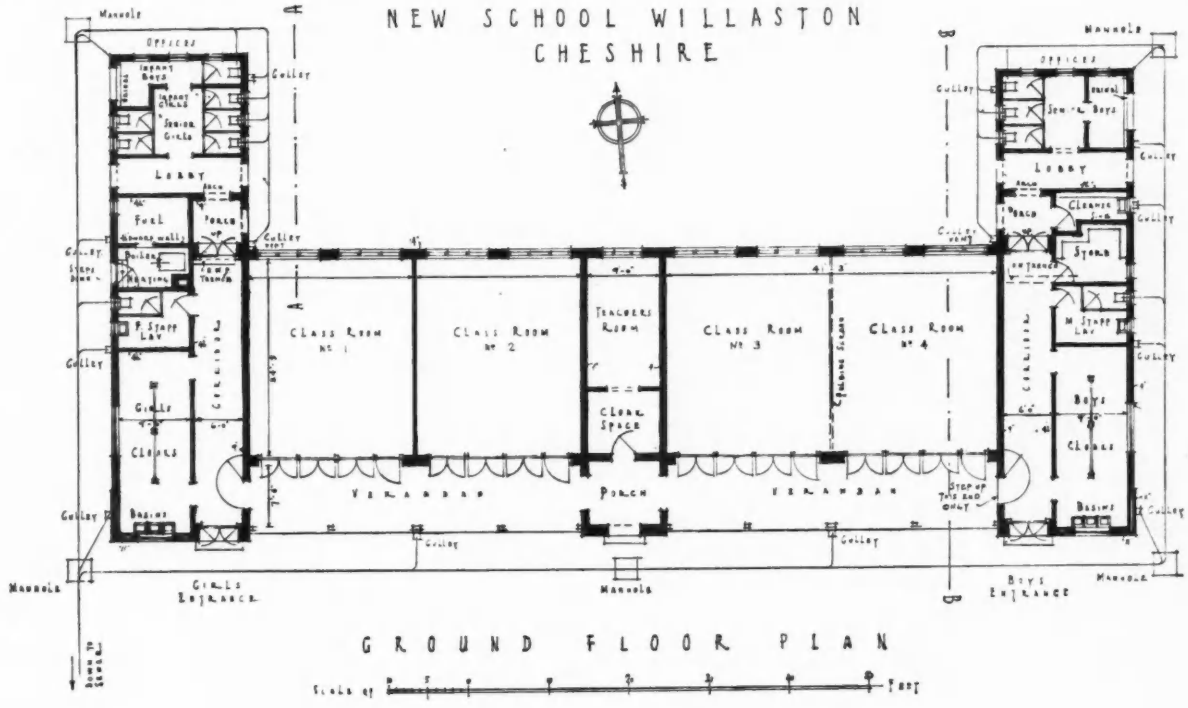
ENGINEERING EXHIBITION AT MULTAN

An engineering exhibition was held at Multan, Punjab, India, in November last. This exhibition—the first of its kind to be held in that country—was arranged by Iqkal Narain, B.A., Civil Engineer (Roorke), at the request of various officials of Multan. The exhibits included models of bridges, roads, new and old houses, etc.

HOUSES AND QUALIFIED DESIGNERS

The fifty-fifth exhibition of the Athenæum Graphic Club, Manchester, was opened by Mr. J. Hubert Worthington, F.R.I.B.A., on Tuesday of last week. In the course of his address, he said: *When you want to be cut open to have your appendix cut out you don't go to the plumber. If you want a house or any other skilled work you must go to the qualified designer. Yet of ten houses built only one is designed by a qualified architect. It is a dreadful state of affairs. It applies equally to lamp standards, tramway shelters, and receptacles for litter. When you have a telephone box designed by a Giles Gilbert Scott you get a tremendous improvement. Of course, Manchester only gets the old ones palmed off on to it. They assume that it doesn't matter what you send to Manchester.*

NEW SCHOOL IN CHESHIRE



DESIGNED BY WILLINK AND DOD

Christ Church Schools replace an old and worn-out stone building standing in the centre of the pleasant Wirral village of Willaston. It is hoped that the old site will be turned into the village green, a purpose for which it is most admirably suited, the village inn and smithy being already in position. Indeed, it would seem that the old school had originally been built on the village green and that now there is a reversion to the old order.

The building stands some little distance back from the main road and adjoins the new public playing fields. It is planned on semi-open-air lines, there being four classrooms for 40 pupils each. On the south side runs a veranda, in the shelter of which, either from sun or rain, the large doors can be opened the whole width of the classrooms. Clerestory windows above the veranda roof enable a desirable amount of sunshine to enter the rooms. They also provide good cross-ventilation.

There is no assembly hall, but two of the classrooms are separated by a folding screen and so serve that purpose. The sanitary accommodation is contained within the building but is cut off by a ventilated lobby. The cupola shown on the photograph was not included in the original contract, but it is hoped that it will be built when funds are forthcoming. Meanwhile, it is somewhat of an achievement, in these days, for a village church to have entirely rebuilt its schools on the most modern lines. The cost of the new building, excluding only furniture, worked out at £28 10s. per seat, a low figure, since the school is a small one.

TRADE NOTES

The organ at the Gaumont Palace, Lewisham, illustrated on pages 106-109 of this issue, was installed by The John Compton Organ Co., Ltd., of Chase Road, North Acton, N.W.10. Thirty-four Compton organs have been installed in Gaumont Palace Theatres in various parts of the country. The Compton Co. are now erecting a four-manual organ for the Concert Hall at the B.B.C., Portland Place, W.1.

*

The Egyptian State Railways, Telegraphs and Telephones, has placed with Messrs. Marryat & Scott, Ltd., a large order for lifts for Tanta Station, Egypt. There was considerable competition from Continental and American firms.

*

Early last year, extensions were made at the factory of Messrs. Electrolux, Ltd., at Luton, to increase manufacturing facilities. A bigger extension scheme has now been embarked upon, embracing the building of new offices, and the increase of productive capacity by utilizing the space occupied by the present offices for manufacturing purposes. A new receiving depot and a raw materials store, as well as an extension to the finished stores, will accommodate many additional thousands of the company's products. More employment for people in Luton and its environs will accrue from the scheme. It is interesting to recall that, in his speech at the Coming-of-Age Dinner of the British Commercial Gas Association, in Leeds, on September 28, Prince George, referring to the various uses to which gas is applied, said: "I was perhaps most interested of all to see it being used for refrigeration. Using heat to produce cold is certainly rather surprising." Electrolux, Ltd., are the sole manufacturers of gas refrigerators in this country.

*

The Cement Marketing Company, Ltd., has arranged a series of demonstrations on the use of Retardo to be given at the following towns:—Leeds, Jan. 11; Manchester and Liverpool, Jan. 12; Newcastle, Jan. 13; Edinburgh and Glasgow, Jan. 16; Sheffield and Nottingham, Jan. 18.

Full particulars are obtainable from the London Office of the Company, Portland House, Tothill Street, S.W.1.

*

The Edison Swan Electric Co., Ltd., has secured a large contract for the supply of telephone switchboard lamps to the G.P.O.

*

The name of the Prior Oil Burner, Ltd., combustion engineers, has been changed to Prior Burners, Ltd. No other change has been made, the directorate and constitution of the company remaining as hitherto.

Messrs. Holophane, Ltd., of Elverton Street, Westminster, S.W.1, have recently issued a four-page coloured leaflet illustrating a new series of coloured lighting fittings of modern design, suitable for drawing-rooms, restaurants, ballrooms, theatres, cinemas, etc. The standard colours are amber, rose-pink and ivory, and the standard finish of the metalwork is natural bronze.

*

The contract for roofing the new Grand Stand at Kempton Park Race-course has been secured by Messrs. Vitreflex, Ltd. The former grand stand, which is replaced by the new building, was destroyed by fire recently. The new stand will be ready for opening by the Easter Meeting, 1933.

*

The Tunnel Portland Cement Company, Ltd., have removed their offices from West Thurrock to London. Their new address is as follows: Victoria Station House, Victoria Street, London, S.W.1. Telephone: Franklin 6164 (7 lines).

*

Messrs. E. Pollard & Co., Ltd., of St. John Street, E.C., paid their final preference dividend on January 1 last, making 7 per cent. for the year 1932.

*

Two of the three staircases in the section of the Prudential Company's building in Holborn, now in course of erection, are to be covered with rubber. These staircases are made of special steel casings which are filled with cement, and the rubber treads are being specially moulded in one piece—tread, nosing and riser—conforming to the exact profile of the stairs.

There is approximately an area of 5,000 sq. ft. of treads, nosings and risers and 1,250 sq. yds. of landings to be covered. This work was placed with Dunlop Rubber Co., Ltd., by Messrs. Trollope and Colls, Ltd. The architects are Messrs. Joseph.

*

Messrs. Benham and Sons, Ltd., of Wigmore Street, W.1, have secured the order for the cafeteria equipment of the Sharikoposhipnick Works in Moscow, claimed to be the largest ball bearing factory in the world. This will be the first equipment of its kind fitted up in Russia, the scheme and specification being drawn up by a consulting engineer from Chicago.

*

BANK NEWS

The Directors of the Midland Bank, Ltd., report that, after making an appropriation towards bad and doubtful debts (all of which have been fully provided for) the net profits for the year 1932 amount to £2,019,142 which, with £850,016 brought forward, makes £2,869,158, out of which appropriations amounting to £1,154,880 have been made.

The net profits of Westminster Bank, Ltd., for 1932, after providing for rebate and income tax, and after appropriations to the credit of contingency accounts, out of which accounts full provision for bad and doubtful debts has been made, amount to £1,495,172. This sum, added to £431,256 brought forward from 1931, leaves available the sum of £1,926,428.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors, and some of the sub-contractors for the buildings illustrated in this issue:

Morrell ; additions, 73 Goodramgate, for Phitwell Tailoring Co., Ltd. ; house, Greencliffe Drive, for Messrs. R. J. Pulleyn and Sons ; additions, Three Cranes Hotel, St. Sampson's Square, for Tadcaster Tower Brewery Co., Ltd. ; greyhound race track, James Street, for Greyhound Racing Co. ; house and shop, Abbotsford Road, for Mr. L. Ashton ; additions, 36 Monkgate, for Messrs. T. Moyser and Son ; additions, 75 Gillygate, for Robert Sinclair Tobacco Co., Ltd. ; two houses, Kilburn Road, for Messrs. F. Shepherd and Son, Ltd. ; new premises, 9–10 High Ousegate, for Messrs. M. Burton, Ltd. ; two houses, Abbey street, for Mr. A. Leaper ; alterations, Light Horseman Hotel, Fishergate, for Tadcaster Tower Brewery Co., Ltd. ; eight houses, Heworth Green, for Mr. H. Williamson.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

• In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

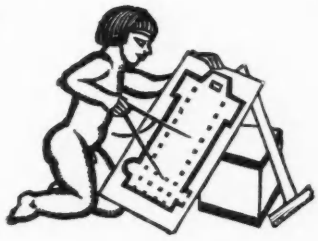
A LAUNDRY IN NEW YORK

DESIGNED BY IRVING M. FENICHEL



THE premises of the Knickerbocker Laundry Company, Long Island City, New York, of which the power house section is illustrated above, and the main entrance on the frontispiece, overleaf, occupies an acre of land, and gives, in two stories with a mezzanine, a total of 92,000 sq. ft. of floor space in a cube of 1,500,000. The structure is of steel skeleton and concrete, with brick walls and dressings of reconstructed marble on the façade and principal returns. It was specifically designed to house a plant of the most up-to-date character, that includes not only laundry machinery but apparatus for dry-cleaning garments with a non-inflammable liquid solvent, and for cleaning rugs and carpets, curtains and blankets. The building is passed daily by half-a-million season-ticket holders on the Long Island railway 150 feet away, so that its outward appearance has a definite advertising value. To combine the useful and ornamental functions was therefore the key-problem of the programme.

A LAUNDRY IN NEW YORK

In this design, by Irving M. Fenichel, the main entrance is the central feature in a front in which horizontal fenestration in the two wings is effectively contrasted with deep vertical window spaces in two terminal blocks, which have been kept a little lower than the central one. The whole of the front is faced with reconstructed marble.

£15,000 FOR £40,000,000

PRIVATE enterprise is not often able to correct the results of political stupidity, but the Building Industries National Council can, through its Special Committee for Public Relations, do much to restore activity in the Building Industry. The Committee, after widespread circularization of municipal and other bodies, now estimate that building work to the value of nearly £40,000,000 has been abandoned in this country since the warnings and prohibitions were issued by the politicians to whom we have entrusted the political and economic welfare of this wonderful and wondering Empire.

Our national reluctance to plan anything produces the most humiliating situations when there happens to be a crisis. The Ship of State was sinking, we were told not so long ago, but, fortunately, gold would float, and the glorious vessel could be buoyed up by keeping to the gold standard; and then, with the inverted confidence which makes politicians believe that they can fool all of the people all of the time, we were asked to applaud the sudden discovery by our statesmen that gold was dragging the Ship of State to the bottom, and that it must be heaved overboard forthwith.

Then came the "Buy British" slogan, tempered with the admonition: "But don't buy anything unless you have to."

Then followed the disastrous interference, in the name of economy, with building schemes, the holding up of fruitful work that provided employment and would have left the country with something to show for money spent, something tangible in brick and stone and steel, instead of the intangible but bitter and corroding spirit that inevitably grows up among skilled men who are willing to work, but who are kept idle on payments grudgingly made by the State. This spirit, compounded of injured pride, frustration and a sense of deep injustice, may permanently impair the technical ability of British industry. It is not possible to assess the cost of the trouble that is accumulating; it is sufficiently disquieting to imagine its extent; but it is possible to know that the estrangement of our rulers from economic realities has deprived one of the great industries of the country of forty million pounds' worth of work.

Now, if it is supported, the Building Industries National Council may get some of that work restarted. But the Special Committee for Public Relations cannot act without funds. It is asking for £15,000, which is a modest sum enough for the task to which it is addressing its energies, and, in promises and actual subscriptions, it has received under a seventh of the amount needed.

In our New Year issue we published articles written by many specialists who had studied the present situation from their own particular points of view. They were at one in showing the drastic and immediate need for organization in the Building Industry and the many trades dependent upon it, which, together, form an industrial group second only to agriculture in the number of operatives concerned. The need is national in its scope. It was stated that the Building Industry had it within its power, by a proper use of the Public Relations Committee, to win back prosperity not only for itself but for the numberless commercial interests contingent upon its healthy condition. And for that object to be achieved, a National Plan was shown to be a necessity.

If this statement is true—and it is confirmed on every hand—it is obvious that the money necessary to take the first step, namely, to set the wheels in motion, *must* be found. You, reader, are a member of the Building Industry. Is it worth your while to spend money in order to get building started again? Even from the lowest business standpoint it is.

With a plan in being, it behoves every member to contribute towards its fulfilment to the utmost of his ability. As we have said, one of the most important objects of the Committee is to take "action with regard to all cases where building schemes have been notified as being held up or delayed as the result of economic measures." That is one of the specific aims set forth by the Committee; and although the Committee should be generously supported by the Building Industry and by manufacturers of building materials, *it should be realized that no contribution is too small to be effective.*

To get work restarted is admittedly but the first action in the general campaign of national reconstruction. As for that larger enterprise, it is far-reaching, and no doubt the formation of a National Plan, complete in all its details, is too ambitious an undertaking for the Public Relations Committee to lay themselves out on at once. But to join issue where building schemes are held up seems to be a line of attack which they can develop practically and forthwith.

Let them take specific schemes and concentrate upon the removal from them of the insensate ban imposed by false economy. And let them work the more gladly in the assurance that any movement of the kind is bound to gather momentum, snowball-fashion. Here, if ever, is a case where the first cut counts.

NEWS & TOPICS

BLOWING COLD AND HOT

MR. A. H. DUNGAY, whose letter registering fatigue with "all the 'hot air' about the Carlton House Terrace scheme" appeared in these columns on December 28, and goaded me, and Mr. Gerald McMichael (letter published in January 4 issue) to reason with him, writes :—

> Your criticism of my protest, and the delightful though self-contradictory letter of Mr. Gerald McMichael, leave me cold. My view is, I think, that of a normal outsider—who generally sees most of the game—protesting against the methods employed. I am not interested in the merits or otherwise of the scheme, but one-sided criticism persisted in does make one rather tired.
>
> Surely the advocates of any scheme can scarcely be accused of effrontery because they express their views ; they have as much right to do so as their opponents and neither side has a monopoly of good taste. Some of the letters you have printed certainly do not exhibit good taste and one is inclined to wonder if the writers would have declined "the job" if they had been offered it and what their views would have been then. Cannot these writers (not all of them by any means) be more reasonably accused of effrontery ?
>
> Most questions have two sides and I suggest this may not be an exception. Some may even dare to think the new building an improvement—what an uplifting of hands in pious horror ! Surely they have the right to think so without being accused of being lacking in taste, etc. !

*

Mr. Dungay professes that he dislikes hot air ; and that criticism leaves him cold. So cold does he remain that the point I made still escapes him. He again confounds two issues I thought I had separated : that of fair play and that of deliberate falsification.

*

I am all for fair play ; as for deliberate falsification of the kind the protagonists in the Carlton House Terrace controversy have employed, effrontery was a mere pale symbol of a word to use—a symbol for the very much stronger expressions that are really in my mind.

*

For let me just recall once again what was done. The design for the whole new scheme for rebuilding Carlton House Terrace and Carlton Gardens *was not* referred to the Fine Art Commission. The Commission were asked one question : whether they would pass a design by Sir Reginald Blomfield—not a design for No. 4, Carlton Gardens, nor a design for Carlton House Terrace. Just a design. They did so, with reservations. The Crown Commissioners used this procedure to try to bluff the public into thinking the Fine Art Commission had approved the demolition and rebuilding of Carlton Gardens and Carlton House Terrace. If this is not effrontery, what is it ?

*

DR. ADAMS AND THE NEW LONDON

The address given by Dr. Thomas Adams to the London Society last Friday evening was significant. Dr. Adams, as the General Director of the Plan of New York and its environs, has unique experience in the replanning of a city already built up. I found it, therefore, not discouraging to learn that in his view New York is reconstructing itself much more out of scale than London. Dr. Adams, on the whole, praises London's development of the last thirty years, although he regrets, like the rest of us, the destruction of parts of Park Lane and Carlton House Terrace.

*

But the important part of his speech was at the end, when he came down heavily on one side of the fence with regard to the application to London of the Town and Country Planning Act, which comes into force on April 1. He is not one of those who think that the Act can be used to enable the whole of London to be replanned and zoned. He would like town-planning schemes to be prepared without delay for the so-called "static areas." Incidentally, Lord Haddo and the Town-Planning Committee of the London County Council have already started to plan certain of these areas.

*

BOMB-PROOF PLANNING

The publication of a book, *The Danger from the Air*, by M. Paul Vauthier, a French architect, shows town-planning in a new guise. Not only must we replan our towns but we must replan them bomb-proof. Our author visualizes his ideal city as one of isolated sky-scrapers with armoured roofs—three feet of convex concrete would, he thinks, deflect the lighter incendiary bombs.

*

But the heavier metal would penetrate and explode in the ten-foot space above a second three-foot slab of concrete. Nevertheless, on alarm, the three top stories of a 30-story building would be evacuated ; and so would the bottom seven, for fear of poison gas.

*

From all such glimpses of the next war the mind recoils, shuddering. Must we really all prepare to live in fortresses ? And if we do, will it avail us ?

*

RESTORING THE HOUSES OF PARLIAMENT

The unhappy choice of stone for Barry's Houses of Parliament has been and will still be a very costly matter.

THE ARCHITECTS' DIARY

WEDNESDAY, JANUARY 25

R.I.B.A., 9, Conduit Street, W.1. Exhibition of the prize drawings for 1932. 10 a.m. to 8 p.m. Last day, January 28. **10 a.m.**

ROYAL ACADEMY OF ARTS, Burlington House, Piccadilly, W.1. Winter Exhibition, 1933. 10 a.m. to 6 p.m. Until March 11. **10 a.m.**

MONDAY, JANUARY 30

ARCHITECTURAL ASSOCIATION, 34 Bedford Square, W.C.1. "The Training of an Architect." By Howard Robertson, F.R.I.B.A. 8 p.m. Also, exhibition of work illustrative of the special features of the course of training at the Association. 10 a.m. to 8 p.m. Until February 24. **8 p.m.**

LONDON SOCIETY. Two visits to the Building Centre, 158 New Bond Street, W.1. 11 a.m. and 4 p.m. **11 a.m.**

TUESDAY, JANUARY 31

FACULTY OF ARCHITECTS AND SURVEYORS. At the Science Museum, Exhibition Road, South Kensington, S.W.7. "Fungal Diseases of Timber." By J. Ramsbottom, O.B.E. **7 p.m.**

The first of a large number of small blocks of flats on the Barnhill Estate, Wembley, designed on "cubic" lines by Herbert A. Welch (Welch, Cachemaile-Day and Lander) and erected by Haymills, Ltd. Each block comprises twelve flats. They are of brick, but cased with cream-coloured cement. They rise in three tiers, and are stepped flat by flat from each end, the roof of one forming the garden to the flat above. The ground floor flats, of course, have the ordinary gardens. Internally, everything has been planned for easy running and convenience, and each room has the maximum amount of window space. An estate at Hendon is also being developed by Haymills, Ltd. (See note below.)

When the work of restoration was started upon it was estimated to cost £1,000,000.

*

The drop in building prices and other economies have reduced this by half, which is a substantial reduction. Nevertheless, restoration is bound to go on for a long time. New work is inserted in a much harder stone, and wherever possible carving is simplified to a degree that would doubtless give pain to Pugin's shade, but is otherwise blameless.

*

The most successful stone restoration that I can remember was the rigid pruning of the Westminster Hospital that changed the character of the building from that of dull revival Gothic to something nearly modern in its pleasing severity. This is not offered as a solution of the Houses of Parliament problem.

*

A SIGN OF THE TIMES

In the advertisement pages of this issue, I am told, there is to appear a call from certain trustees for applications from architects competent "to carry out all architectural work in connection with estate development" of their property in the south-west of England. This is an encouraging sign which, read in conjunction with other signs of the times, goes to show a growth of appreciation of the architect's proper place in the scheme of things mundane.

OTHER NEWS ITEMS

Surburban Housing

The undeniable enterprise of speculative builders has been responsible all too frequently for the deplorable hotch-potch of villas which surround practically every town in England. It is interesting, therefore, to note the improvement, both in appearance and amenities, which occurs when one of these firms has the discrimination to acquire the services of an architect in carrying out a suburban housing scheme.

About two years ago, Messrs. Haymills, Ltd., who are developing large estates at Wembley and Hendon, sought the advice of Mr. Herbert A. Welch, of Messrs. Welch, Cachemaille-Day and Lander, and the fruits of their wisdom are now to be seen in the houses and flats which have recently been completed there, and were inspected last week by invitation.

Those designed by Mr. Welch, and erected under his supervision, are very simple in their general treatment but with some unmistakably architectural details—the iron handrails to the steps of the smallest houses are particularly attractive. The most interesting feature, however, is that all these houses have flat roofs, some with glass sun-rooms. There are several blocks of flats which, rising in three tiers, have stepped roofs—the roof of one forming the garden to the flat above, while the ground floor flat has its garden on *terra firma* in the usual way, as shown in the illustration on this page. Inside, everything has been planned for easy running and convenience, and each room has the maximum window space. In developing this estate care has been taken in the orientation of the buildings, and the lay-out was planned so that each house should have an open outlook. The prices of the houses range from about £1,725 to £2,350, and they are selling rapidly.

It is a pity that there is not more co-operation of this kind between architect and builder. The architect would not find it unprofitable, and the builder and the public would gain inestimably. Together they could produce really inexpensive dwellings—only possible when worked out as part of a large scheme—which would have the individuality which only an architect's specialized knowledge can give to the design of a building. England then, perhaps, might be a land fit for architects to live in.

Public Utility

Sir Raymond Unwin, P.R.I.B.A., is summoning a further conference to consider the proposed public utility organization on February 1. The first conference, held on January 13, was

attended by Mr. A. T. Pike, the Chairman of the Finchley Urban District Council and Secretary of the Garden Cities and Town Planning Association and by representatives of the Mansion House Council of Social Service.

It is hoped on February 1 to put forward a definite programme of action, and at the same time to report on a proposed deputation to Sir Hilton Young, the Minister of Health, who is being asked to grant the same financial facilities to a public utility organization as are to be given, under the new Housing Bill, to building societies.

A.A. Leverhulme Scholarships

Mr. A. B. Knapp-Fisher, F.R.I.B.A., at a meeting of the Architectural Association, held on Monday of last week, announced that five scholarships, each worth £200 a year, had been granted by the trustees of the late Lord Leverhulme. The scholarships are to enable British students of insufficient means to obtain full training for the profession in the Architectural Association's School of Architecture. The following five students already at the school have been selected for the scholarships: D. S. Pearce, R. R. Wilkins, R. A. Kirby, A. F. Barnard and R. Wilson. Mr. Knapp-Fisher said that grants would be made for foreign travel during the scholarships.

Full particulars of the scholarships are given on page 152.

Standardizing Natural Asphalt

An inaugural luncheon of the Natural Asphalt Mine-Owners and Manufacturers' Council was held at the Café Royal, Regent Street, W., on Tuesday of last week. Mr. F. M. Bond, who presided, stated that the Council was a body representative of the principal asphalt companies in the United Kingdom, and had been formed for the purpose of co-ordinating and standardizing the manufacture and application of mastic asphalt for building construction in regard to raw materials, technical equipment, research and executive practice. The Council's primary object had been achieved and standard specifications had been drawn up governing the three main classes of mastic asphalt: roofing, damp-course and basement work and flooring. In future the joint resources of raw materials, which included many of the best known asphalt mines in the world, would be at the common disposal of all members of the Council, and the standardizing of manufacture, according to the findings of the experts, had thus been made practicable.

In order to ensure that the asphalt shall be carefully applied on the contract, a Standard Code of executive practice had also been drawn up which all companies represented would undertake to observe.

The Council has prepared an illustrated brochure, containing numerous diagrams, showing methods of construction in buildings embodying the uses of asphalt. Copies are obtainable from the offices of the Council, Terminal House, Westminster, S.W.1.

Public Relations Committee

The Honorary Treasurer desires to acknowledge having received the following subscriptions on behalf of the Special Committee for Public Relations of the Building Industries National Council:

Shanks & Co., Ltd.	26	5	0
Yorkshire Amalgamated Products, Ltd. (first instalment of £100)	25	0	0
E. J. and J. Pearson, Ltd.	10	0	0
	£1,637	15	0

The following subscriptions have been promised:

Coronet Brick Co.	£50	0	0
Crittall, R., & Co.	100	0	0
Hemel Hempstead Patent Brick Co.	25	0	0
Kerner-Greenwood & Co., Ltd.	50	0	0
Moler Products, Ltd.	25	0	0

Subscriptions should be sent to the Special Committee for Public Relations, and addressed to the Honorary Treasurer, Mr. Oswald Healing, F.S.I., at 5, Duke Street, Adelphi, W.C.2. As pointed out in this week's leading article, no contribution is too small to be effective.

Lighting Conferences

The first of a series of evening conferences for the exchange of professional experience on lighting matters was held at the Lighting Service Bureau, 2 Savoy Hill, W.C., on Wednesday last. These conferences, to be held every alternate Wednesday until March 29, have been arranged by the Joint Lighting Committee of the Architectural Profession and the E.L.M.A. Lighting Service Bureau, the architect-members of which are Messrs. A. B. Knapp-Fisher, L. H. Bucknell, C. Lovett Gill, Grey Wornum, Howard Robertson and J. P. Waldram.

Mr. W. P. Moir, Chairman of the E.L.M.A., in opening the conference, expressed the hope that during the series architects and engineers would find practical solutions to many lighting problems, and in so doing give better service to the community at large. A paper was then read by Mr. W. J. Jones on "Electric Lighting," and the discussion opened by Mr. Robert Atkinson.

Following is a list of the forthcoming conferences:—

February 1: "Domestic Lighting." By R. O. Ackerley. Discussion to be opened by C. Lovett Gill, F.R.I.B.A. February 15: "Lighting of Commercial Buildings." By H. C. Wheat. Discussion opened by L. H. Bucknell, F.R.I.B.A. March 1: "Lighting of Schools." By C. H. Hughes. Discussion opened by T. S. Tait, F.R.I.B.A. March 15: "Floodlighting." By H. Lingard. Discussion opened by Howard Robertson, F.R.I.B.A. March 29: "The Lighting of Theatres and Cinemas." By Waldo Maitland. Discussion opened by G. Grey Wornum, F.R.I.B.A.

R.I.B.A.

HENRY L. FLORENCE BURSARY, 1933

As announced in our last issue, the R.I.B.A. Henry L. Florence Bursary has been awarded to Mr. Theodore Fyfe, M.A., F.R.I.B.A., Director of the Cambridge University School of Architecture.

The Bursary, which is awarded for the first time this year, is of the value of £360, and its general object is the study of the Greek and Hellenistic architecture of the Mediterranean basin with a view to making available for architects, from an architectural standpoint, the results of the more recent archæological researches. The holder of the Bursary is required to spend a period of not less than six months in travel and research.

Candidates must be Members of the Royal Institute of British Architects.

Mr. Fyfe's experience at Knossos and his special qualifications will enable him during the six months he will spend in travel and research to present a report from an architectural standpoint, which will be looked forward to with great interest.

COMPETITION NEWS

Architectural Assessment

[On page 102 of last week's issue we published a letter from Mr. Kendrick Edwards on "Architectural Assessment." Following is his article on the subject.—ED., *A. J.*]

ARCHITECTURALLY, from educational and economic viewpoints, I consider that great waste is associated with architectural competitions. Sir Raymond Unwin, P.R.I.B.A., has pointed out that each competitor cannot fail to learn much from each competition he enters; but could it be said that each competition contributes any advance in the art of assessing?

When assessors traverse several sets of designs prepared by architects of varied attainments, as interpretations of the problems set up by the same conditions, the process involves studious thought and reasoned opinions. These, being unrecorded, constitute a most regrettable waste of valuable information, and although this is not the only waste to which competitions lend themselves, it nevertheless appears to the writer to be the one which inflicts the greatest loss of opportunity for progress.

Legal assessors, arbitrators and judges record, in their notes of evidence and their decisions, the facts and reasons which enable them to arrive at their judgments, with the result that our judicature has established precedents and laws which are our guiding stars of government. Further, as new thought and new basic facts present themselves, the traditions of experience, so accumulated for betterment, are utilized both in practice and in education.

The architectural competition system is an important feature in the policy of the R.I.B.A., which holds that the best results for clients are obtained by it. Some prospective clients are loath to accept this view, fearing that in binding themselves to accept the decision of the assessor or assessors, they may become the owners of a building which, in their opinion, might not be the best for its duties, or might be unsatisfactory in its appearance.

I understand that the professional reply which the R.I.B.A. gives is that the clients do not bind themselves to become the owners of a building which, in their opinion, might not be the best for its duties or might be unsatisfactory in its appearance. On the contrary, the R.I.B.A. tells the client that he binds himself to nothing except the engagement of the winner as his architect. He has then, if necessary, to alter his design until he has given his client exactly what the latter wants. But this is not sufficiently convincing, even to those who admit, as all should, that architects are specially trained to know how to plan for the best duty results, and also how to design for appearance according to the best æsthetic principles which culture has produced. Neither will it do for us to ignore the layman's diffidence and content ourselves with pressing home the R.I.B.A. view that the assessor's problem is to find the man who is best able to give what is wanted, irrespective of whether the employer can arrive at the same conclusion from the premiated design.

We must appreciate the fact that, even as it is not possible to ensure that assessors, who are all expert architects, shall agree upon their findings without the need of compromise, so is it even more impossible to ensure that promoters who may have little or no architectural knowledge, shall be convinced when we cry Ecce Homo, *notwithstanding that we have no common ground upon which the assessors' values can meet their understanding of these matters.*

From the standpoint of assessors, it would require an extensive treatise to define the reasons for those preferences which in their opinion establish the merit of one design over another. But there does not appear to be any sound reason why architects should not adopt a code of architectural assessment capable of giving numerical expression to the architectural value of a building, in a somewhat similar manner to that by which golfers express the value of a player.

If a golfer can reach a specified position after conforming with certain conditions, there is a numerical value for his attainment. The value is in inverse ratio to his efficiency, consisting of a series of debits upon an agreed scale. By what genius or by what application of art or science he may realize a minimum of debits, it would baffle the ingenuity of man to describe; but the aggregate of his debits for his 18 objectives, each being subject to varying conditions and requirements, establishes the total debit value of his endeavour. Similarly, with a building design, if we can devise an agreed schedule of debits for imperfections, it should be possible to arrive at an aggregate of debit values which would establish the efficiency with which it conforms with the requirements and conditions.

Such a system of assessing, connoted in schedule form, and translated into percentage of efficiency, would provide an evaluation figure which would be an index of the position the proposed building holds under architectural criticisms. A building would become known to experts as having a rated value of 40, 50, 68, 74 or of 100 in the highly improbable event of it having established 100 per cent. overhead efficiency as regards its duties, construction, and æsthetics. It would define its "handicap" intelligibly to both specialists and laymen interested in buildings.

Before preparing a schedule of debit values, it is necessary to establish in concise and simple terms the essentials which should govern architectural assessments, deriving them from the duties and aspirations which find expression in the decision to build.

Whatever may be the purpose for which a building is intended, probably no building scheme is projected which does not owe its origin to the need of an enclosure within which certain duties shall be performed. Its excellence as a building will therefore primarily be established by the efficiency with which it enables those duties to be performed, the economy it permits in numbers and movements of staff, and convenience of access and circulation for the interested public. We therefore establish as the first cardinal essential in architectural assessment:—

The attainment of the closest possible approximation to 100 per cent. efficiency, with its attendant minimum administration and organization costs.

It is an axiom that simple construction realizes economy in first cost; therefore, when 100 per cent. efficiency in simplicity of construction can be attained in conjunction with 100 per cent. duty efficiency, the client has the happiest of results, namely, minimum first cost and minimum administration costs. But this is unattainable unless the building is required for duties having 100 per cent. of simplicity. This means it is usually essential to compromise.

For example, a building required for complex duties may be designed of simple construction with a low percentage of duty efficiency; and the result is low first cost and high administration costs. Or it may be designed with complex construction with a high percentage of duty efficiency; and the result becomes high first cost and low administration costs. Time now enters into the problem, because if the building has only to function for a short period, the low first cost is obviously preferable; but if for a long period, the high first cost is the better. It also follows that if a building for complex duties is intended to be a model of high efficiency planning, then simplicity of construction must be sacrificed whenever it hazards the attaining of duty efficiency. Fortunately, the expert use of modern steel construction frequently solves this problem without violating æsthetics.

We can now state as the second cardinal essential in architectural assessment:—

The attainment of that closest possible approximation to 100 per cent. construction efficiency, which may be possible after satisfying the first cardinal essential.

Beyond the duties and construction of the building, there is the aspiration, which the great majority of clients have, that their building should possess such internal and external beauty as shall provide a satisfying expression of its purpose, thereby conserving and increasing its amenities, This introduces the subject of æsthetics.

which provides us with the third cardinal essential in architectural assessment :—

The attainment of that closest possible approximation to 100 per cent. æsthetic efficiency which may be possible as an harmonious accompaniment to the duties of the building.

These three cardinal essentials for the design of a building should therefore constitute the basis for assessment of architectural designs, in conjunction with a standardized code defining limits of assessment values for classified architectural adverse criticisms. It will be found to be simpler to think of the assessment values in terms of adverse criticism, namely, as debits for shortcomings rather than in terms of appreciation as credits for attainments ; that is to say, to charge against a design figures representative of the gravity of its shortcomings.

We may now develop a system of analysis for the purpose of classifying the shortcomings of a design, and after careful consideration it is suggested that these should be classified for each cardinal essential, under two sections—Defaults and Blemishes—each having two sub-sections against which would be stated the minimum and maximum debits which are to be used according to the assessors' evaluation of their gravity.

Defaults.—These consist of the omission of a stated requirement or of non-conformity with a condition.

Defaults may be only nominal, or relatively so ; but it is only fair that a distinction should be made between a competitor who conforms and one who defaults. Therefore, for nominal defaults, debits vary from minimum 1 to maximum 10. A default may be redeemed by the substitution of an acceptable alternative provision, in which event no debit would obtain.

A serious default is one which is unredeemed and will be debited minimum 11 to maximum 100. But if a default should fall within the category of requirements or conditions deemed indispensable, then the design would be disqualified under the condition which prescribes disqualification for failure to provide substantially what is specified.

Blemishes.—These consist of imperfections, faults, and deficiencies, but a blemish may be either redeemable or irredeemable. Redeemable blemishes will be debited minimum 1 and maximum 10. Irredeemable blemishes will be debited minimum 11 and maximum 100.

An assessment schedule may now be designed to give effect to this endeavour to establish an intelligible code for architectural criticism, but it is necessary to realize that some compromise with values is essential if we are to remove architectural criticism from its hitherto inarticulate code by relieving it of its mysticism, and enabling it to approach within measure of being reasonably expressive in answering the question " Why is this design better than that " ?

The information made available by such a schedule as that reproduced on this page is more far-reaching than is immediately apparent.

1 : The grand total of debits establishes a reliable basis for comparison of designs.

2 : The totals for the three cardinal essentials disclose relative values of these essentials and assist directional " choice."

3 : The debit totals of sections or sub-sections are simply transposable into percentages of efficiency for comparison with the ideal of 100 per cent. efficiency. The grand total may similarly be expressed as an overhead percentage of efficiency.

4 : The overhead percentage figure provides a numeral rating value for the design, and therefore for the building.

5 : The concise notes of defaults and blemishes under " items " along with the connoted values provide an invaluable recorded analysis for reference, etc.

6 : As an analysis of a design, the assessment schedule is valuable for tuition purposes.

7 : The analysis constitutes a useful basis for preparation of a report.

8 : Each assessor may individually note his items and values.

9 : When more than one assessor is appointed, the respective totals may be averaged to obtain an average assessment.

10 : This analytical system of assessment sustains the individual opinions of assessors, and neutralizes the preponderating weight of overbearing or ultra-persistent personalities.

If this article stimulates endeavour to produce any studied system which is an improvement upon present practice, it will have served its purpose. By so doing, it will have helped towards an antidote to that dissatisfaction which most competitors feel, even though few express it, when awards are made in favour of designs which are seriously lacking in the things that matter, although resplendent with those which do not.

KENDRICK EDWARDS

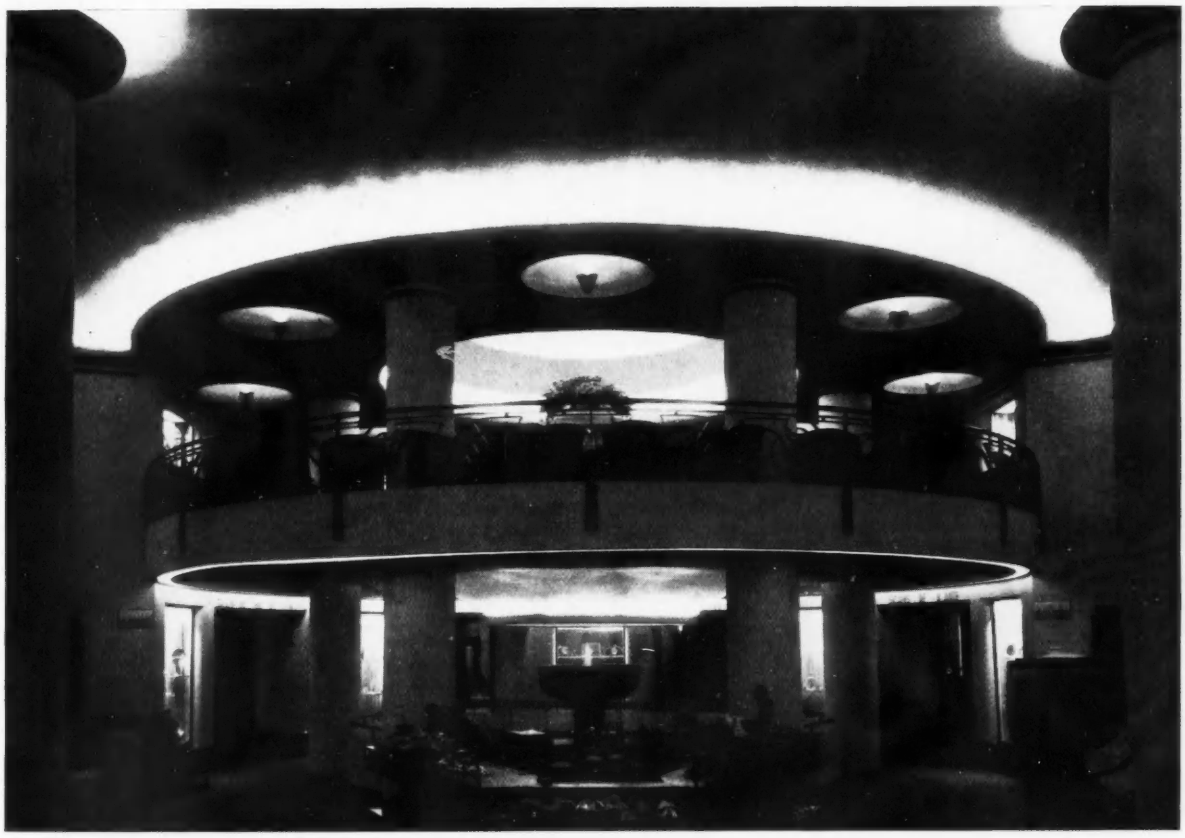
SMALL HOUSES

The assessors' award in the Cement Marketing Co., Ltd's. competition for designs for houses promoting the artistic use of cement will be announced at a conversazione to be held in the restaurant at the new Shell-Mex House, Strand, on Tuesday next, January 31, to which all entrants have been invited. Selected designs will be displayed for inspection at 6 o'clock ; at 6.30 a report, illustrated by lantern slides, will be presented by the assessors, Messrs. Louis de Soissons, F.R.I.B.A., Howard Robertson, F.R.I.B.A. and P. D. Hepworth, F.R.I.B.A.

Competitions Open



***February 1.**—The city of Stockholm invites designs for a town plan for the part of the town called Lower Norrmalm. 60,000 kronors (£3,077) in prizes, 1st premium, 20,000 kronors (£1,025).

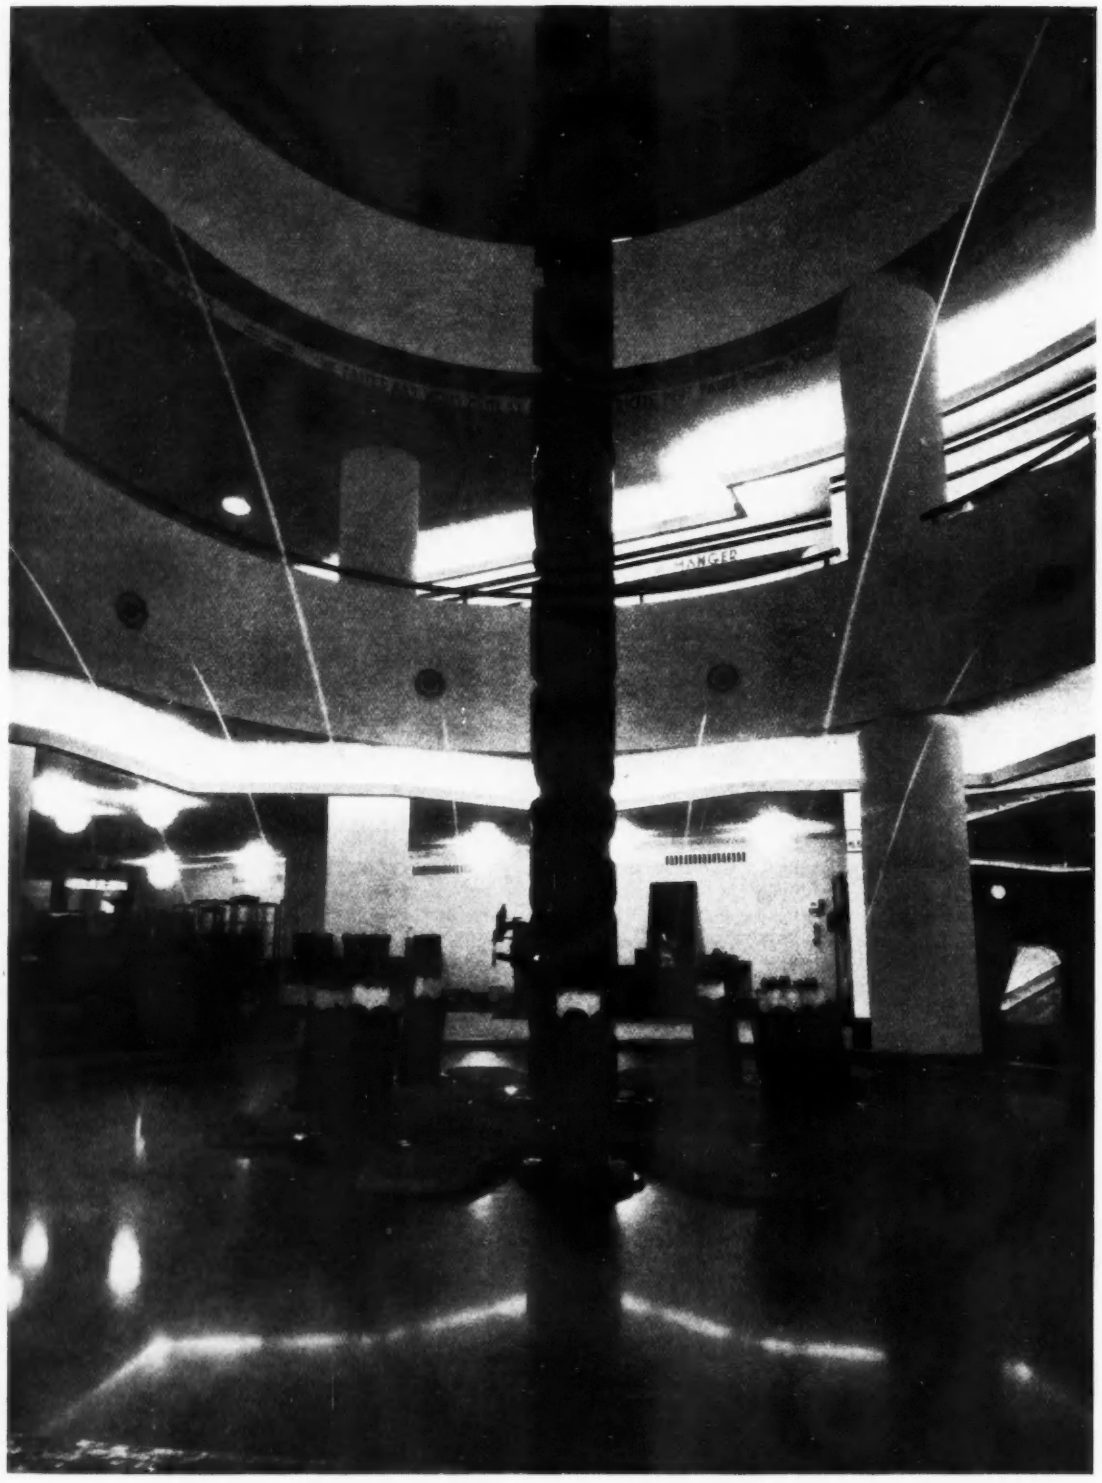
March 24.—Façade to a newspaper office in grey Cornish granite, for the Cornish Quarry Masters' Association. Open to all architects, architects' assistants, and architectural students. Assessors : A. B. Knapp-Fisher, F.R.I.B.A. (President of the Architectural Association) : G. Grey Wornum, F.R.I.B.A. : and Howard Robertson, F.R.I.B.A. Also, two members of the Cornish Quarry Masters' Association. First prize, £50. The design, etc., is to be sent to the Secretary of the Architectural Association, 34-36 Bedford Square, London, W.C.1, by Friday, March 24, noon. Full particulars of the competition may be obtained from the Secretary, Architectural Association, 34 Bedford Square, London, W.C.1.

***May 31.**—Sending-in Day. Layout of a suburb on the River Escaut, Antwerp. £2,400 in prizes (1st, £800).

**Full Particulars of the above competitions were published in our issue for December 7, 1932.*

ELECTRICITY SHOWROOMS IN PARIS

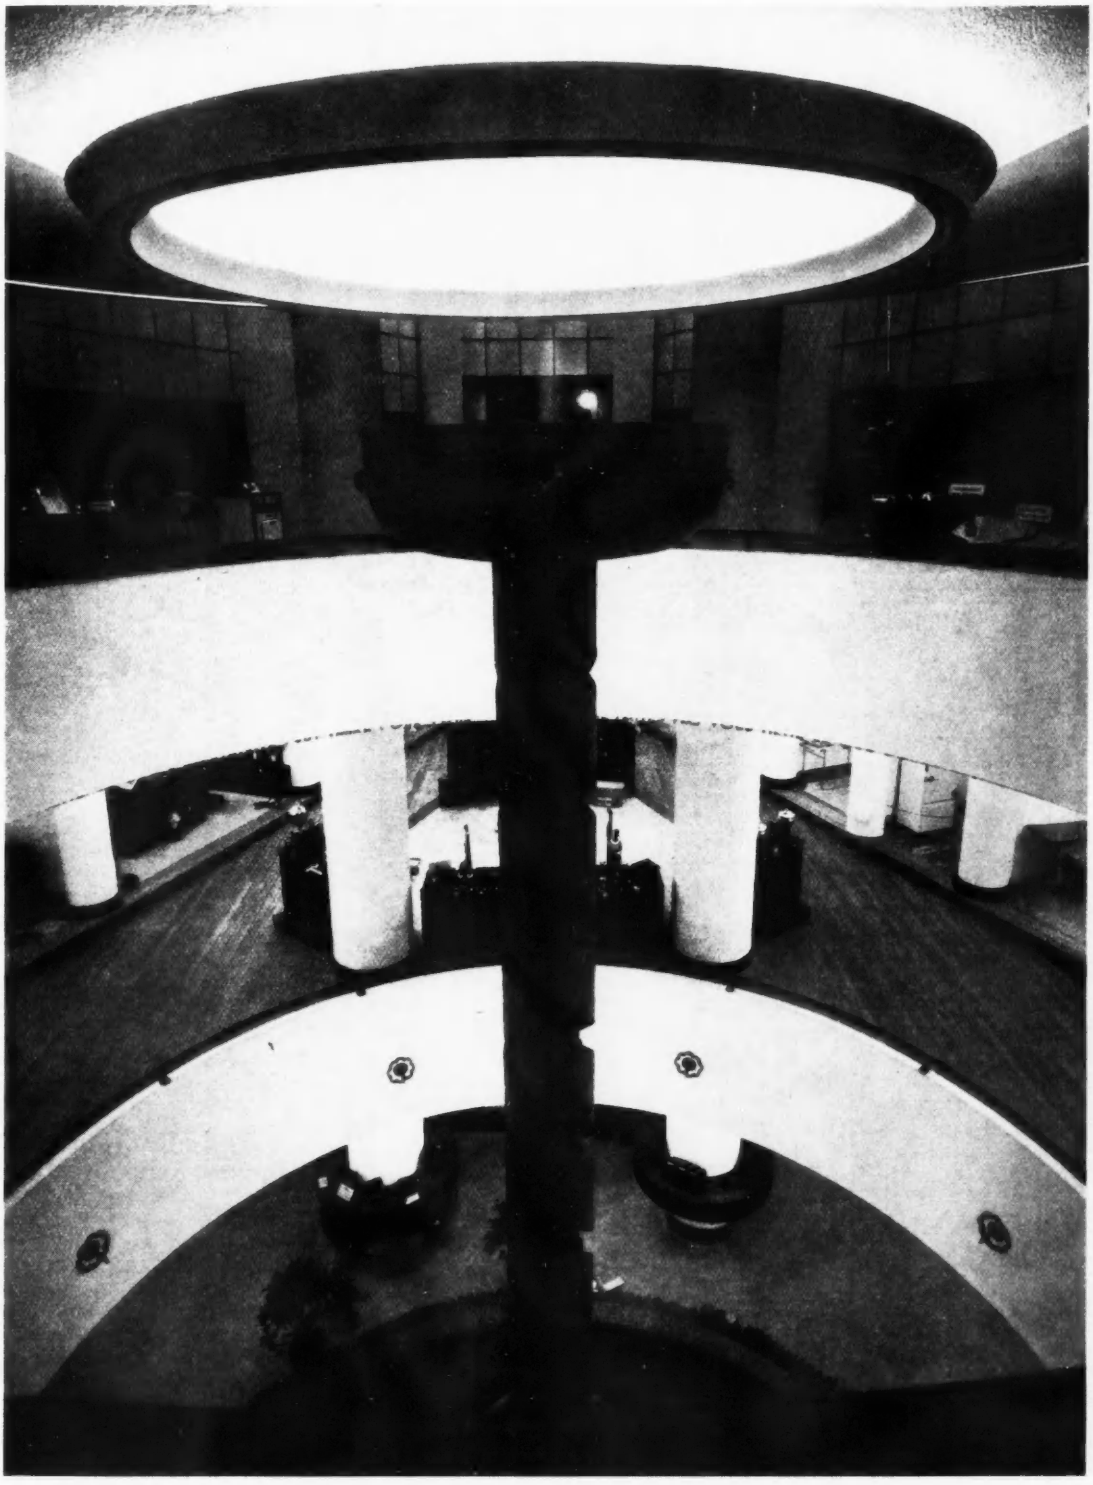
DESIGNED BY LAPRADE AND BAZIN



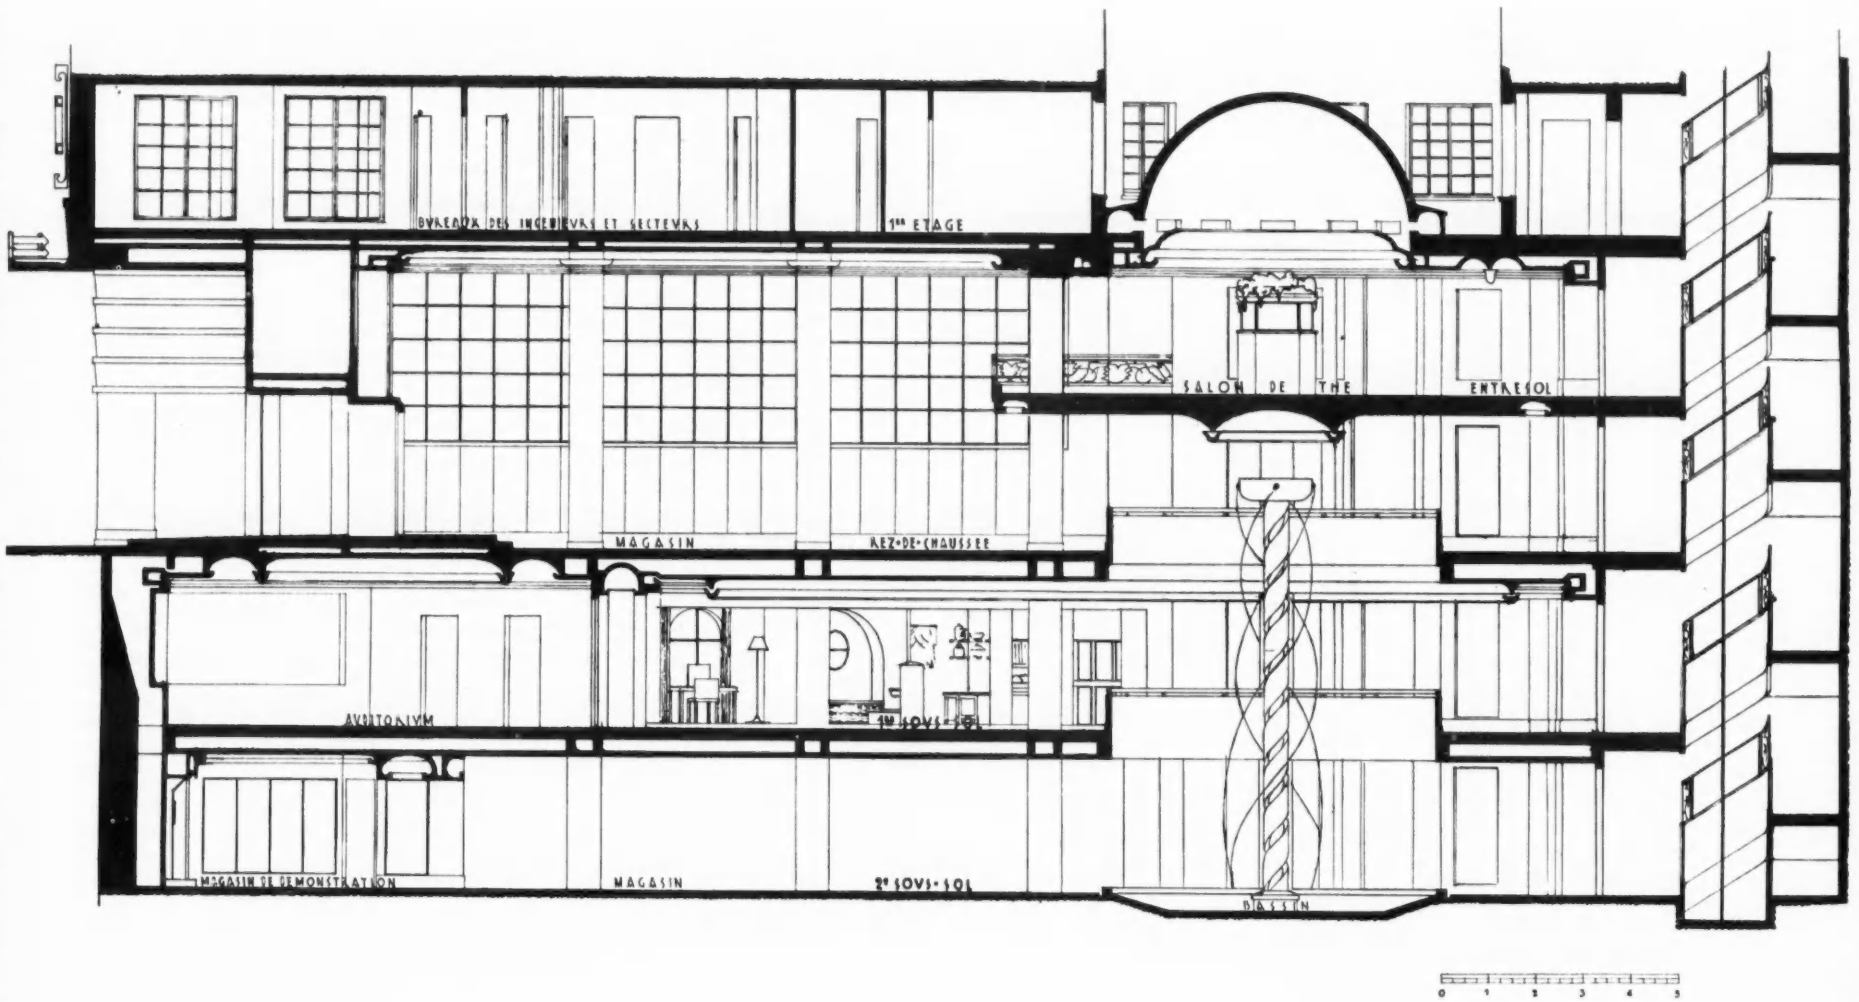
The site of the *Office Central Electrique* ("Ocel") in Paris resembles an isosceles triangle with the two base angles lopped off: the Boulevard Haussmann and the Rue Taitbout are its long sides, and the main entrance is at the acute angle where they meet. At what would be the centre of gravity of the triangle is placed the striking "Oculus" fountain, which, rising from the sub-basement, penetrates through openings to above the ground floor level: its head figures in the above view and the details of its design are shown in the illustrations overleaf. The bowl carries jets set obliquely, and streams of water also spout from the first tier of the galleries that encircle it, falling into the pool below.

Above the uppermost tier is the tea room shown in the adjacent photograph. Over this rises a glazed dome. On the side windows around this room and around the upper gallery is inscribed the injunction: "Do not do yourself what electricity can do for you."

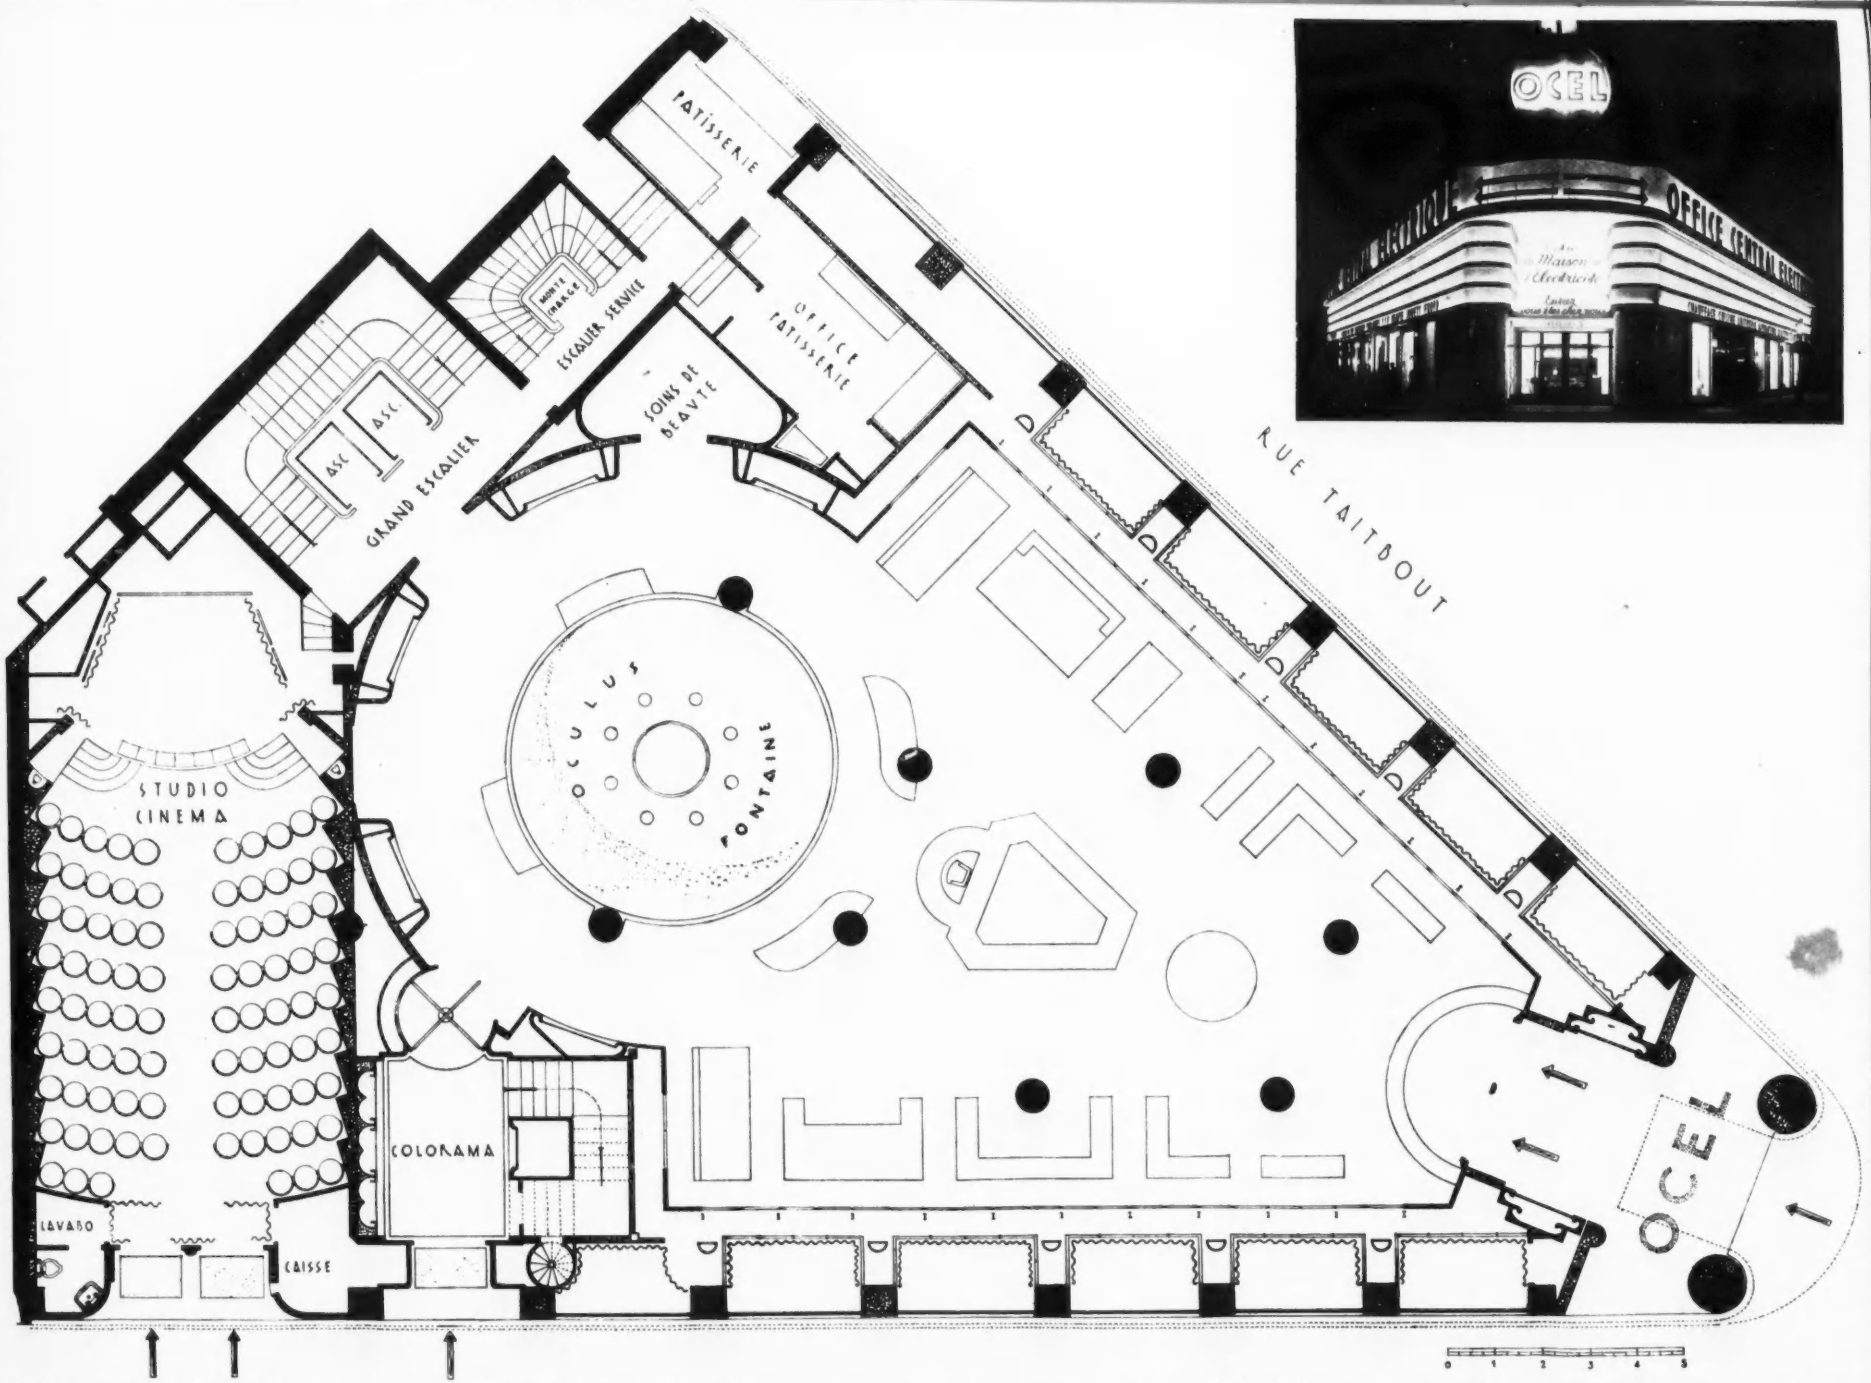
Grouped skilfully about this spectacular nucleus, are showrooms, a beauty parlour and confectionery department, while on the top floor are are offices. A small cinema hall is included.



ELECTRICITY SHOWROOMS IN PARIS:



THE SUB-BASEMENT POOL AND BASE OF THE "OCULUS" FOUNTAIN—



DESIGNED BY LAPRADE AND BAZIN

LETTERS FROM READERS

National Planning

SIR,—I should like warmly to congratulate you on the special New Year's issue, with its admirable articles and useful information on this all-important question. I think it speaks well for the soundness and virility of the great Building Industry that, at a time of wide-spread depression like the present, instead of sitting still with folded arms and waiting for things to improve of themselves, its leaders are seeking a future which is wisely planned and expounding their views with no uncertain voice. And this planning is to be on a nation-wide basis, not only for our own industry, but for the country as a whole.

It seems to me, Sir, that we, whose work is essentially based on planning, should take the lead in this matter. The whole world is suffering from lack of direction and planning in relation to currency, industrials and economic policy.

In our own country an unwise "economania" in Government circles has resulted in the stoppage of public and private building and appalling unemployment, at a time when costs are lower and money is cheaper than they have been since 1914.

National housing policy, again, which since the war has been subject to a certain measure of planning and control under successive Acts, is now to be officially reversed. Except for slum clearance, which is not sufficiently lucrative to be freed from Government and municipal direction and financial assistance, the provision of small houses for letting is now to be left to private enterprise, with apparently no safeguards as regards density, layout and design, except such general ones as may be available under town planning schemes, which will necessarily take many years to prepare.

Here is surely a job in which, with mutual confidence and goodwill, architects and builders can combine in an endeavour to prevent further spoliation and wastage of assets in town and country. It is an aspect of national planning which we shall do well to keep in the forefront.

With best wishes for the success of your efforts,

T. ALWYN LLOYD
(CHAIRMAN, NATIONAL HOUSING AND TOWN PLANNING COUNCIL)

SIR,—Much interest has undoubtedly been aroused in the movement to substitute a concerted plan of wise expenditure for the present foolhardy measures of false economy decreed by the Ministry of Health.

This common-sense project as applied to the Building Industry and allied trades, which was so comprehensively dealt with in the New Year number of THE ARCHITECTS' JOURNAL, has now been further supplemented by well-reasoned suggestions for the immediate formation of a National Planning Board, whose objective would be to review the country's needs and resources and to seek public financial support in its national scheme of reconstruction.

As is indicated in the leading article and the letter from Mr. W. R. Davidge in the last issue of the JOURNAL, a National Planning Board of this kind necessitates the unrestricted co-operation of representatives of the various branches of production and distribution.

Interest in the scheme therefore reaches far beyond members of the building trade and architectural profession, and it is not unnatural that criticism will be offered from many quarters.

The first matter which needs to be challenged concerns the grossly misleading and wholly erroneous statement that the joint stock banks have been engaged in hoarding on an immense scale. If I may be allowed to state the view of an outside party, the fact of the matter is that, far from placing any restriction on advances for reasonable and legitimate industrial enterprise, the banks have found that a plethora of credit is already available for this purpose, and have therefore been forced to turn to the Bill Market in the hope of finding some remunerative channel for the employment of their funds.

Let us pass on now to the work of the National Planning Board.

If the scheme is to be successful it must have national support. That the nation is able to support it financially is evidenced by the greatly increasing total of deposits held with the joint stock banks, and there is also every reason to believe that support would not be lacking if the public were convinced that the reconstruction was on a well-planned and sound commercial basis.

The architect must play a very prominent part in the scheme. The public does appreciate an architect-planned house, but the design must cater for individual requirements, not merely for the architect's own fanciful ideas.

A house without cupboards, such as that of which Mr. Howard Robertson tells us is contemplated in connection with an extreme economy plan in America, would not be tolerated by the British public.

Therefore if the National Planning Board is to be of real service to the nation, it must study very closely the requirements of the public for whom it is to cater, and must evolve a plan which will combine beauty with utility.

H. D. G.

SIR,—The Englishman has traditionally regarded two conditions as indispensable to a tolerable life—the right to grumble at the weather and the right to muddle through in all things.

The weather will no doubt continue to justify its special place in English life. But are we going to be still content to muddle through?

One should be cautious in detecting change in the mentality of a creature so essentially conservative as an Englishman. Yet have the old ways the same hold as, say, a generation ago? Are the Ottawa agreements—and some developments which preceded them—portents? Or are they merely isolated events without any general significance?

The state of the world today, at any rate, is a sufficient condemnation of the old outlook and the muddled methods which it inspired. One is less certain about what will succeed it and where the beginning will be made. The Englishman, with his inborn gift of compromise, will probably evolve a technique of action between extreme individualism on the one hand and cast-iron State control—as in Russia—on the other.

An impressive case for a beginning, as Mr. C. B. Purdom showed in your New Year issue, can be made for a National Scheme of Town Planning.

Certainly, I think, housing development should be taken out of politics and given an atmosphere favourable to a long and comprehensive view which promises orderly development in accordance with the real needs of the situation.

In my opinion:—

1: A National Planning Board in any sphere, if it is to be assured of success, would probably have to be the creation of the legislature, on the same lines as the Central Electricity Board, etc.

2: Its function would be, broadly, to initiate and co-ordinate development in its special province. Its exact functions would vary according to the sphere to which it applied; in some cases it would mainly control and in others it might both control and undertake development.

3: Personnel would be the crucial aspect of any such system. It may be representative up to a point, but should not be composed of strong partisans. Outstanding qualities which are needed are executive ability, balanced views and the faculty of forming opinions from a mass of conflicting evidence. One of the greatest difficulties in the scheme

is to devise machinery which will result in the best possible appointments being made.

(SIR) HAROLD BELLMAN
(MANAGING DIRECTOR, ABBEY ROAD BUILDING SOCIETY)

Combating the Speculative Builder

SIR,—As there seems to be some interest in houses that are competing with the average speculative type, we are enclosing a plan and perspective of some houses that are being built in Darlington.

They are being built by a firm of local contractors—Messrs. Lambell and Sutton—by contract, the whole of the details being carefully worked out by us to be of the most simple character.

The walls are finished in cream stucco with local rustic brick dressings; 11-ins. cavity walls, and steel windows, built direct into brickwork, these being specially made windows. The price per house, including fencing, paths, drainage, etc., is £370, exclusive of land.

Although these houses are small they are about the size to which the speculative builder in this town confines his particular attention.

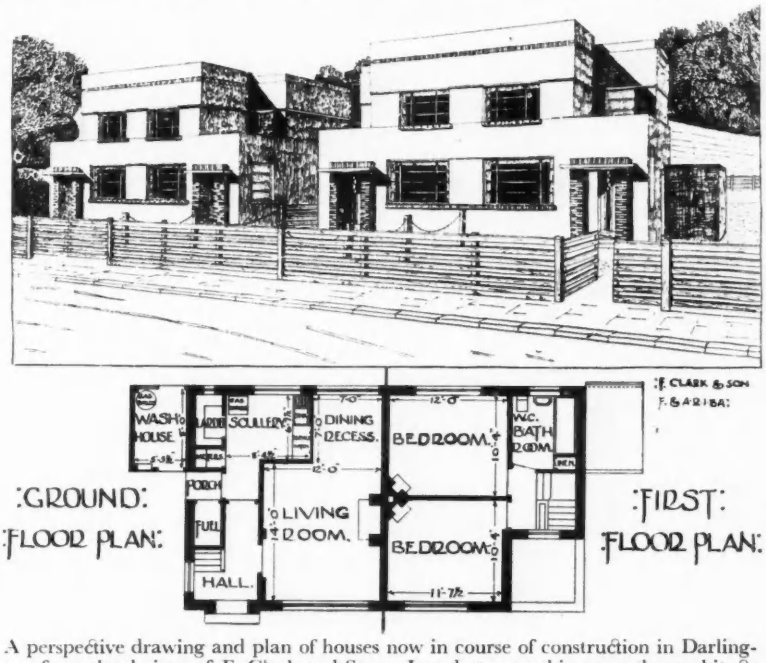
We are sending you this drawing and information trusting you will publish them, as no doubt they will be of interest to some members of the profession.

F. CLARK AND SON
(DARLINGTON)

Architectural Wrong-Doing

SIR,—May I be permitted to congratulate you on your New Year number, and the way you have carried on in the past year—the arrival of the JOURNAL has brightened my breakfast table on many Wednesdays. You have kept us in touch with the new, and laboured manfully for the preservation of the old—especially in the Carlton House Terrace case.

If I might be permitted to make a suggestion, it is that you should spend some space in an exploration of the state of affairs which permits so much architectural wrong-doing—because the Terrace is only one among many other examples. Day by day we hear of pylons across the Downs, ribbon development and bungaloid growths destroying the face of England. How does it all come about? Could we but find the cause a cure might be devised. These technocrats are doubtless quite respectable citizens, but why should they be so blind to beauty, and strangely insensitive?



I trace all the trouble to an extraordinary institution called the School Certificate—an examination set by the Oxford and Cambridge Universities Joint Board. All boys and girls have to pass this, and the history papers never mention construction but concentrate on destruction—it is battles, not building, and politics rather than planning. As the School Certificate is the end of education for the great majority of young people, they pass out into the world without any ideas of what John Burns called the "Amenities" in the 1909 Act, and they are prepared to do any of the wrong things which I have mentioned because they do not know any better.

So that it seems to me that unless we are prepared to see that our clients are properly educated, the best we can hope is, that when they come to us, they will ask for something old-fashioned with "Ye Olde Tea Shoppe" as their ideal.

I am afraid you have not much chance with such a people. Regent Street as rebuilt is a splendid example of twentieth-century architecture. From your point of view it may be very bad, but considered from the historical standpoint it is splendid and just like the people who produced it—as all architecture is.

C. H. B. QUENNELL

COMBATING THE SPECULATIVE BUILDER

A perspective drawing and plan of houses now in course of construction in Darlington from the designs of F. Clark and Son. In a letter on this page the architects point out that these houses are about the size to which the speculative builder in this town confines his particular attention.

"The New Function of the Architect"

SIR,

[*At present individual architects are at the mercy of vulgar accidents, such as having a flow of dinner-talk, or being in a business syndicate, or knowing a lord. This Institute (R.I.B.A.) has to win a place for the ablest building directors, considered as essential ministers of civilization, and to see to it that public works are done in the proper way. We have, in the meantime, merely to satisfy the whims of generously-minded employers, and until we have a life independent of that hanging-on, no architecture is possible. One of the most important things in modern architecture is the Art of Dining Out.*—LETHABY]

From Mr. Howard Robertson's article in your New Year issue on what he calls "The New Function of the Architect" we are evidently intended to gather that, up till now, "the architect has been too much of a gentleman"; that in the past he has never done his duty and, in a word, never performed his true function.

In our rush to reorganize the world it might be well to ask ourselves if we have diagnosed the disease correctly and if we are setting the right way to cure it.

The world has lasted a long time and may last an even longer time, and a backward glance through history suggests that architecture as an art or even as good building has been one of the main means of self-expression of the peoples of all ages, and has been, as it were, a chart of the religious and social life of the people.

In the middle ages there could have been little organization, as we understand the term, and I suggest that an over-organized profession may lead us into considering architecture as even more of a business than it has become today.

We are told that the architect "cannot go out into the worlds of banking,

business and industry and sell himself and his ideas." Perhaps not, until "the code" is altered, but the successful (commercially) architect has been known to do so already and to advise him to do it now is no new thing.

Art cannot be organized. It either exists or does not. Organization usually ends in commercialism and we have experienced quite a lot of commercialism since the War.

I do not wish to throw cold water on any live movement to better the conditions of life, but I suggest that we are in danger in that life, viewed as a materialistic problem divorced from the beauty of art and considered as a mere matter of function and organizing, may lead us astray at what might be termed the great cross-roads into the future.

Might I be allowed, Sir, to refer further to your New Year Number?

On page 46 you refer to the housing of a certain Corporation and talk of a £271 all-in price and appear to commend it as against the £1,100 immediate post-war house by the same Corporation.

Such figures are not only misleading but inaccurate and, I would respectfully suggest, are a disservice to the profession. The layman reading such a report cannot be expected to interpret it accurately, and I am sure, Sir, that if you even had photographs of the houses under consideration before you, you would agree that the latter are not only a real asset to the amenity of the community but as a business proposition are of infinitely greater value. The £1,100 house will be a thing of beauty 200 years after this (if mankind is not by that time all living once again in caves and reinforced concrete tunnels), while the £271 all-in house will look like a slum in ten years or less. A price without relation to quality and beauty is meaningless. The £1,100 house has a freshness and quality which ranks it with the best simple Renaissance work of Northamptonshire and the other has neither.

One other point out of many raised by your progressive and comprehensive New Year Number. Assuming that the £30,000,000 amount of building work abandoned by the Municipalities since last May was to have been carried out by official architects, have their staffs been reduced by that amount, relatively? A vital point for the ratepayers.

If this work could have been distributed among private practising architects it would have given, at 5 per cent., an income of £1,000 to 1,500 architects.

Again, if the £30,000,000 was projected work abandoned, what about work since last May, which, in the ordinary course, would have been projected and never saw the light of day, and what about work which would have evolved naturally out of the £30,000,000, if it had not been abandoned?

This may appear all theory but it appears logical and gives us a ghastly picture of the state of affairs in the profession. Under the circumstances we must perhaps risk "ceasing to be gentlemen" and go out into the market place, but if we must do so let us remember that it is more important to make a life than a living and that we are the real custodians of most that makes modern life possible, and guardians of amenity and heirs to the beauty of all past ages.

I hope Mr. Howard Robertson will allow me to wish him and his Public Relations Committee real success in their altruistic endeavours.

WILLIAM DAVIDSON

Information Sheets

SIR,—No one can fail to admire the practical aims of Messrs. Burnet, Tait and Lorne's rationalization scheme. The attitude of mind which could conceive and carry out so comprehensive a record as, for instance, Information Sheet No. 1 would be as valuable in assisting the staff to work with maximum efficiency, as the Sheet itself.

There can be no doubt that it is a great economy of time to have a systematic record of such data as can be regarded as indisputable facts, and therefore not subject to alteration; but, as regards such details as are a matter of opinion or circumstance, constant revision would be necessary in the light of fresh experience and changes in materials and fittings.

There is the possibility that the use of standard types might tend to eliminate sufficient consideration of individual requirements, as it is obviously so much quicker and easier to use an available copy than to work out a variation to effect an improvement. It is unlikely that the young draughtsman himself would absorb so many facts, and, as facts become knowledge, which is subjected to the exercise of the user's critical judgment, his work might tend to become stereotyped and less intelligent.

With these considerations in mind, the use of Information Sheets is undoubtedly helpful, and both in this and other ways every effort should be made to rationalize the work of the office, though the best methods of doing so must be evolved by each according to his own needs.

REES PHILLIPS
(ALFRED SAXON SNELL AND PHILLIPS)

SIR,—I think your JOURNAL is to be congratulated on publishing the standardized sheets of plumbing and other data prepared by Sir John Burnet, Tait and Lorne.

The information contained in your first sheet is very concise and likely to prove most useful, besides saving no end of time in looking up catalogues and back drawings.

There is so much repetition work in one's various jobs, that any means that can be adopted for reducing the work will, I am sure, be greatly appreciated.

STANLEY TOWSE

SIR,—I consider your new feature in THE JOURNAL of exceptional value, and those instrumental in having these information sheets are to be thanked.

CLIFFORD BOND

Ancient Lights

SIR,—Your correspondent Mr. E. A. L. Martyn, in your issue for December 21, is quite correct in refuting the suggestion that there are any restrictions against the use of the calculating diagram devised by my son and myself.

Your correspondent T.U.J. has possibly been misled by an action which I brought in 1929 to restrain someone else from claiming our diagram as *his own* copyright.

To the new edition, recently published by H.M. Stationery Office, of Technical Paper No. 7, Illumination Research, Department of Scientific and Industrial Research, on *The Penetration of Daylight and Sunlight into Buildings* (1s. 6d.), there has now been added a short description of the geometrical basis of the rectangular diagram and of the method of setting it out.

I was also desired to write a new appendix describing the device known as the "Droop Diagram," which eliminates a great deal of the labour of applying any measuring diagram to the problems met with in practice. This labour can occasionally be tedious, especially if it be not intelligently organized; but it is quite simple in the case of single windows. It can be and has been carried out by intelligent schoolboys.

If, however, either of your correspondents can evolve anything simpler we should be only too glad to use it.

There are, of course, many instruments capable of measuring daylight factors under conditions which exist; but their use is restricted to what they can see. The effect of conditions of obstruction which exist only on paper must be worked out.

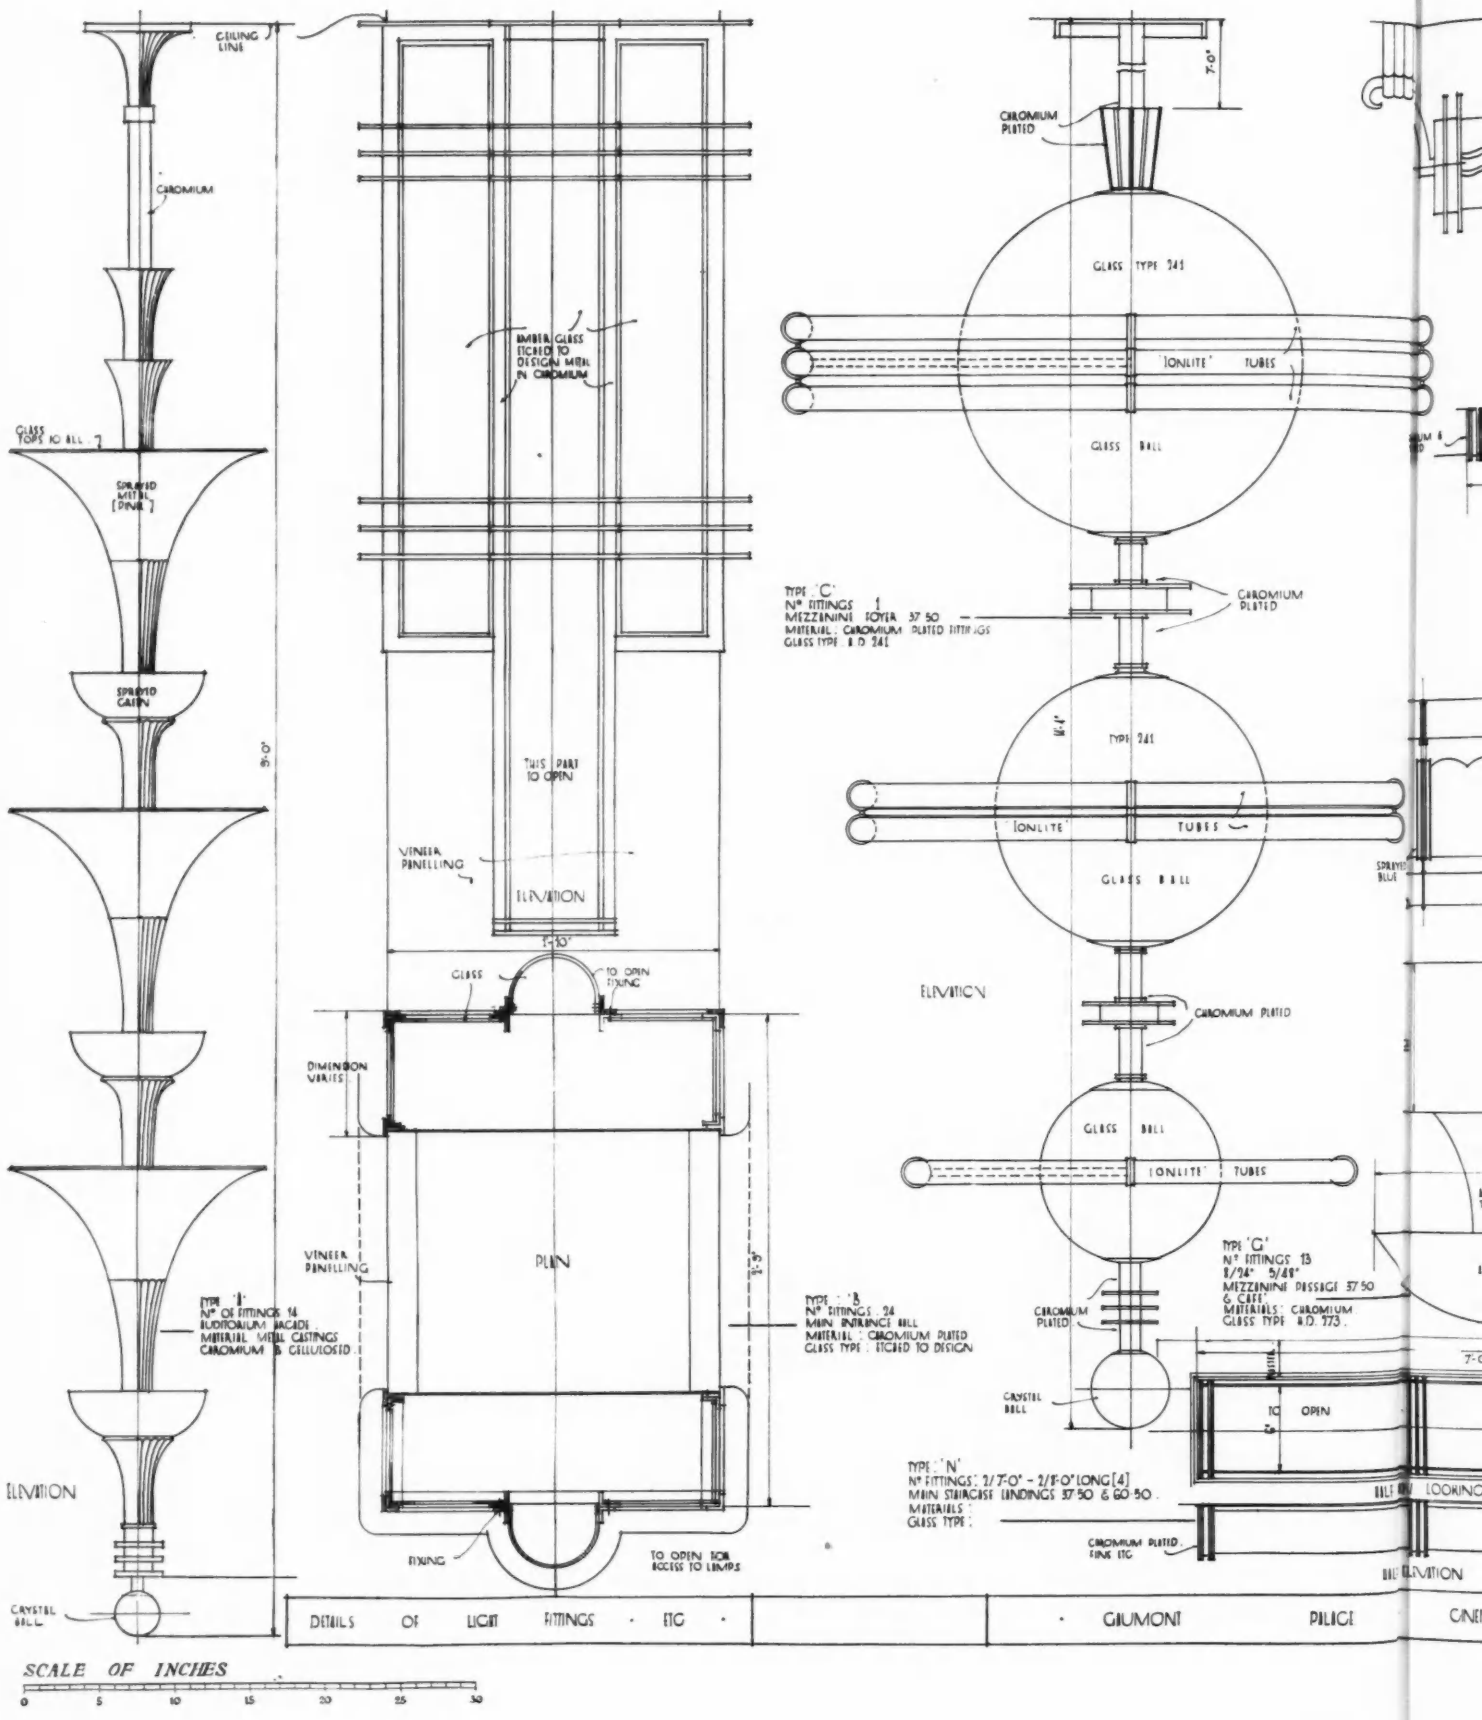
Papers are being completed dealing with drawing office routine work in the preparation of the usual contour plans indicating the penetration of daylight and sunlight into buildings, and covering, it is hoped, such difficulties as may arise in practice in connection with interiors lit by several windows.

Pending their publication I should be glad to give to any of your readers who may have experienced such difficulties any assistance which may lie in my power.

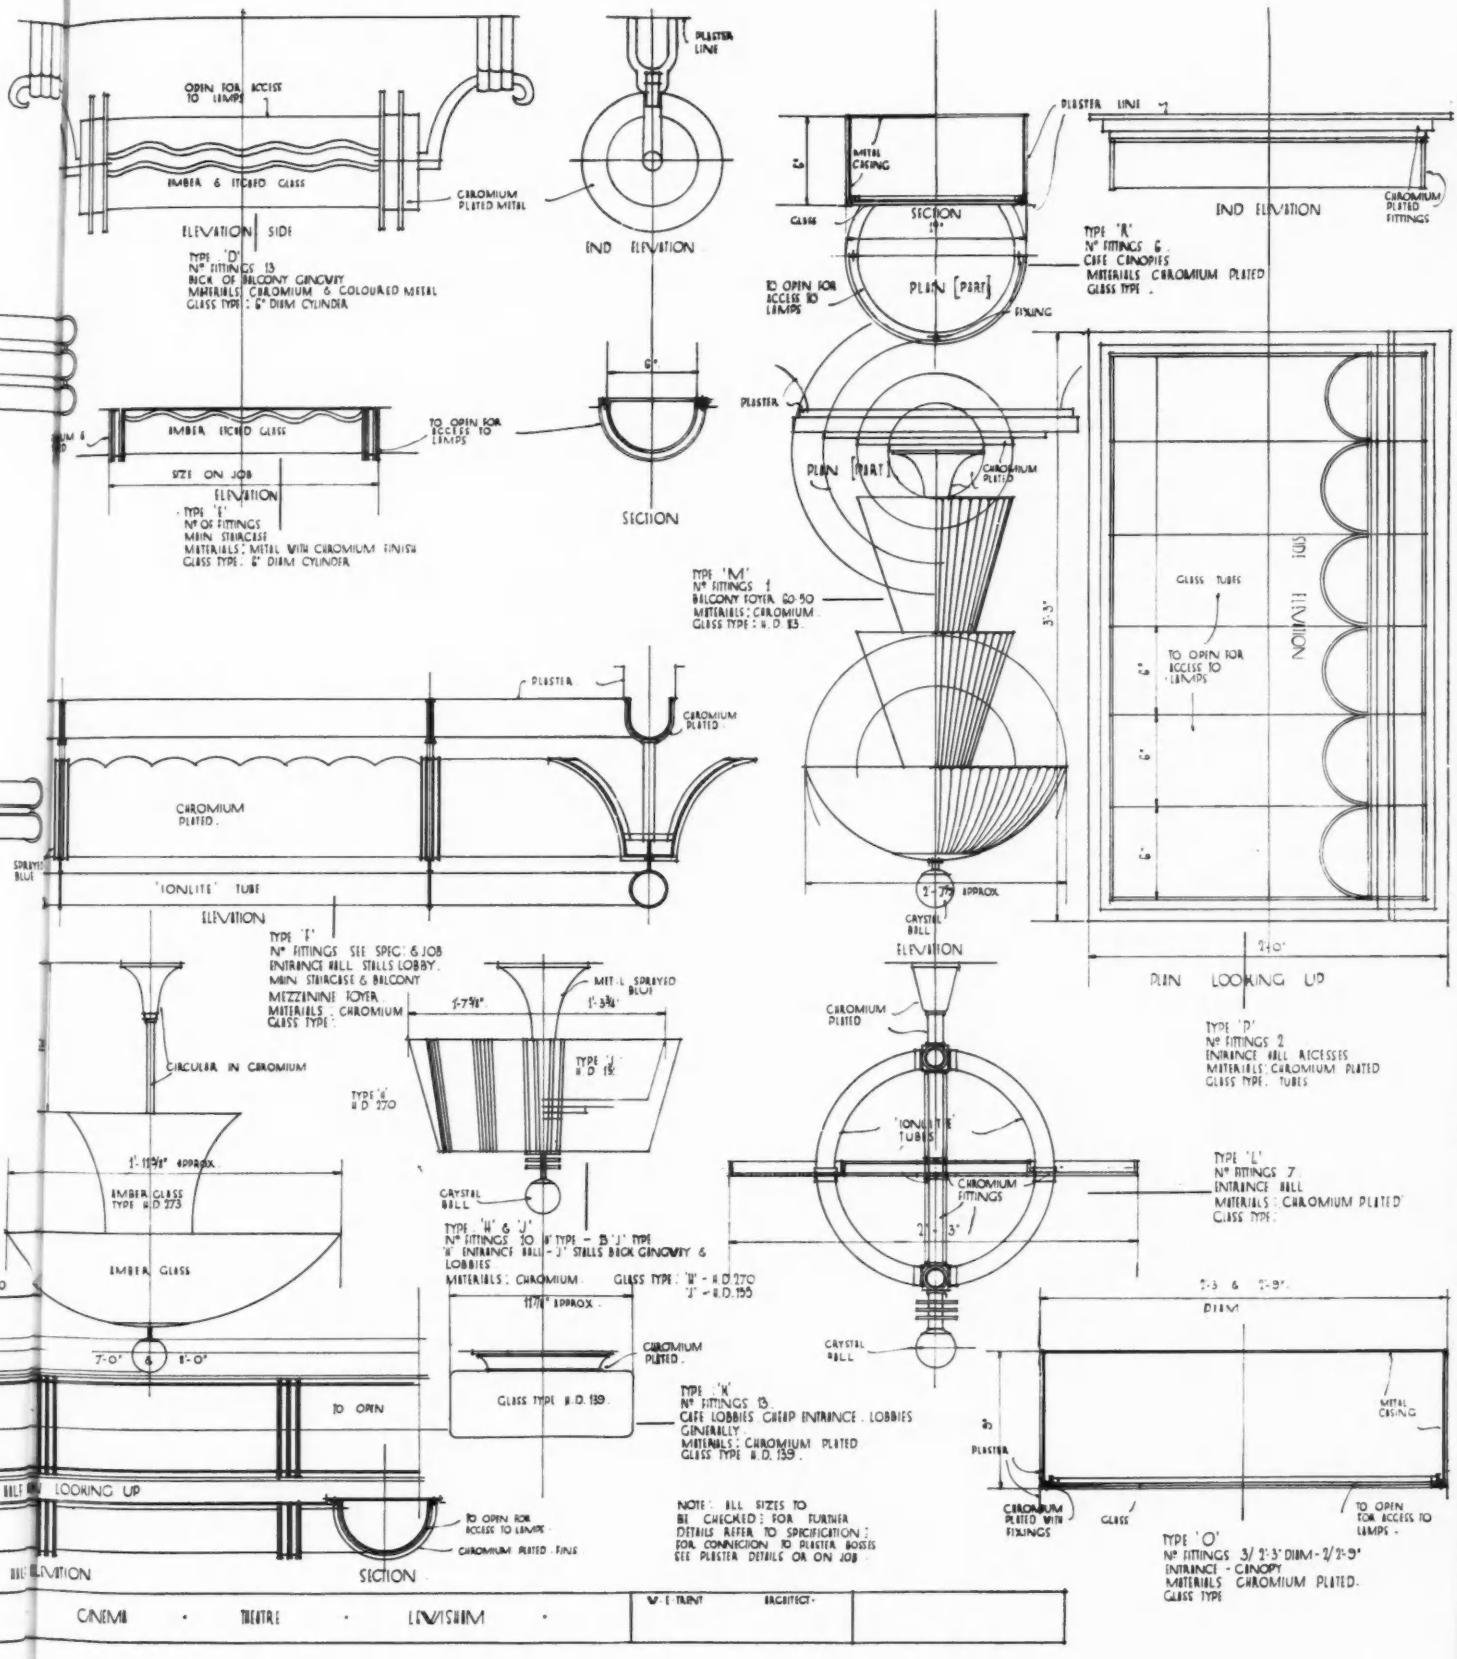
PERCY J. WALDRAM

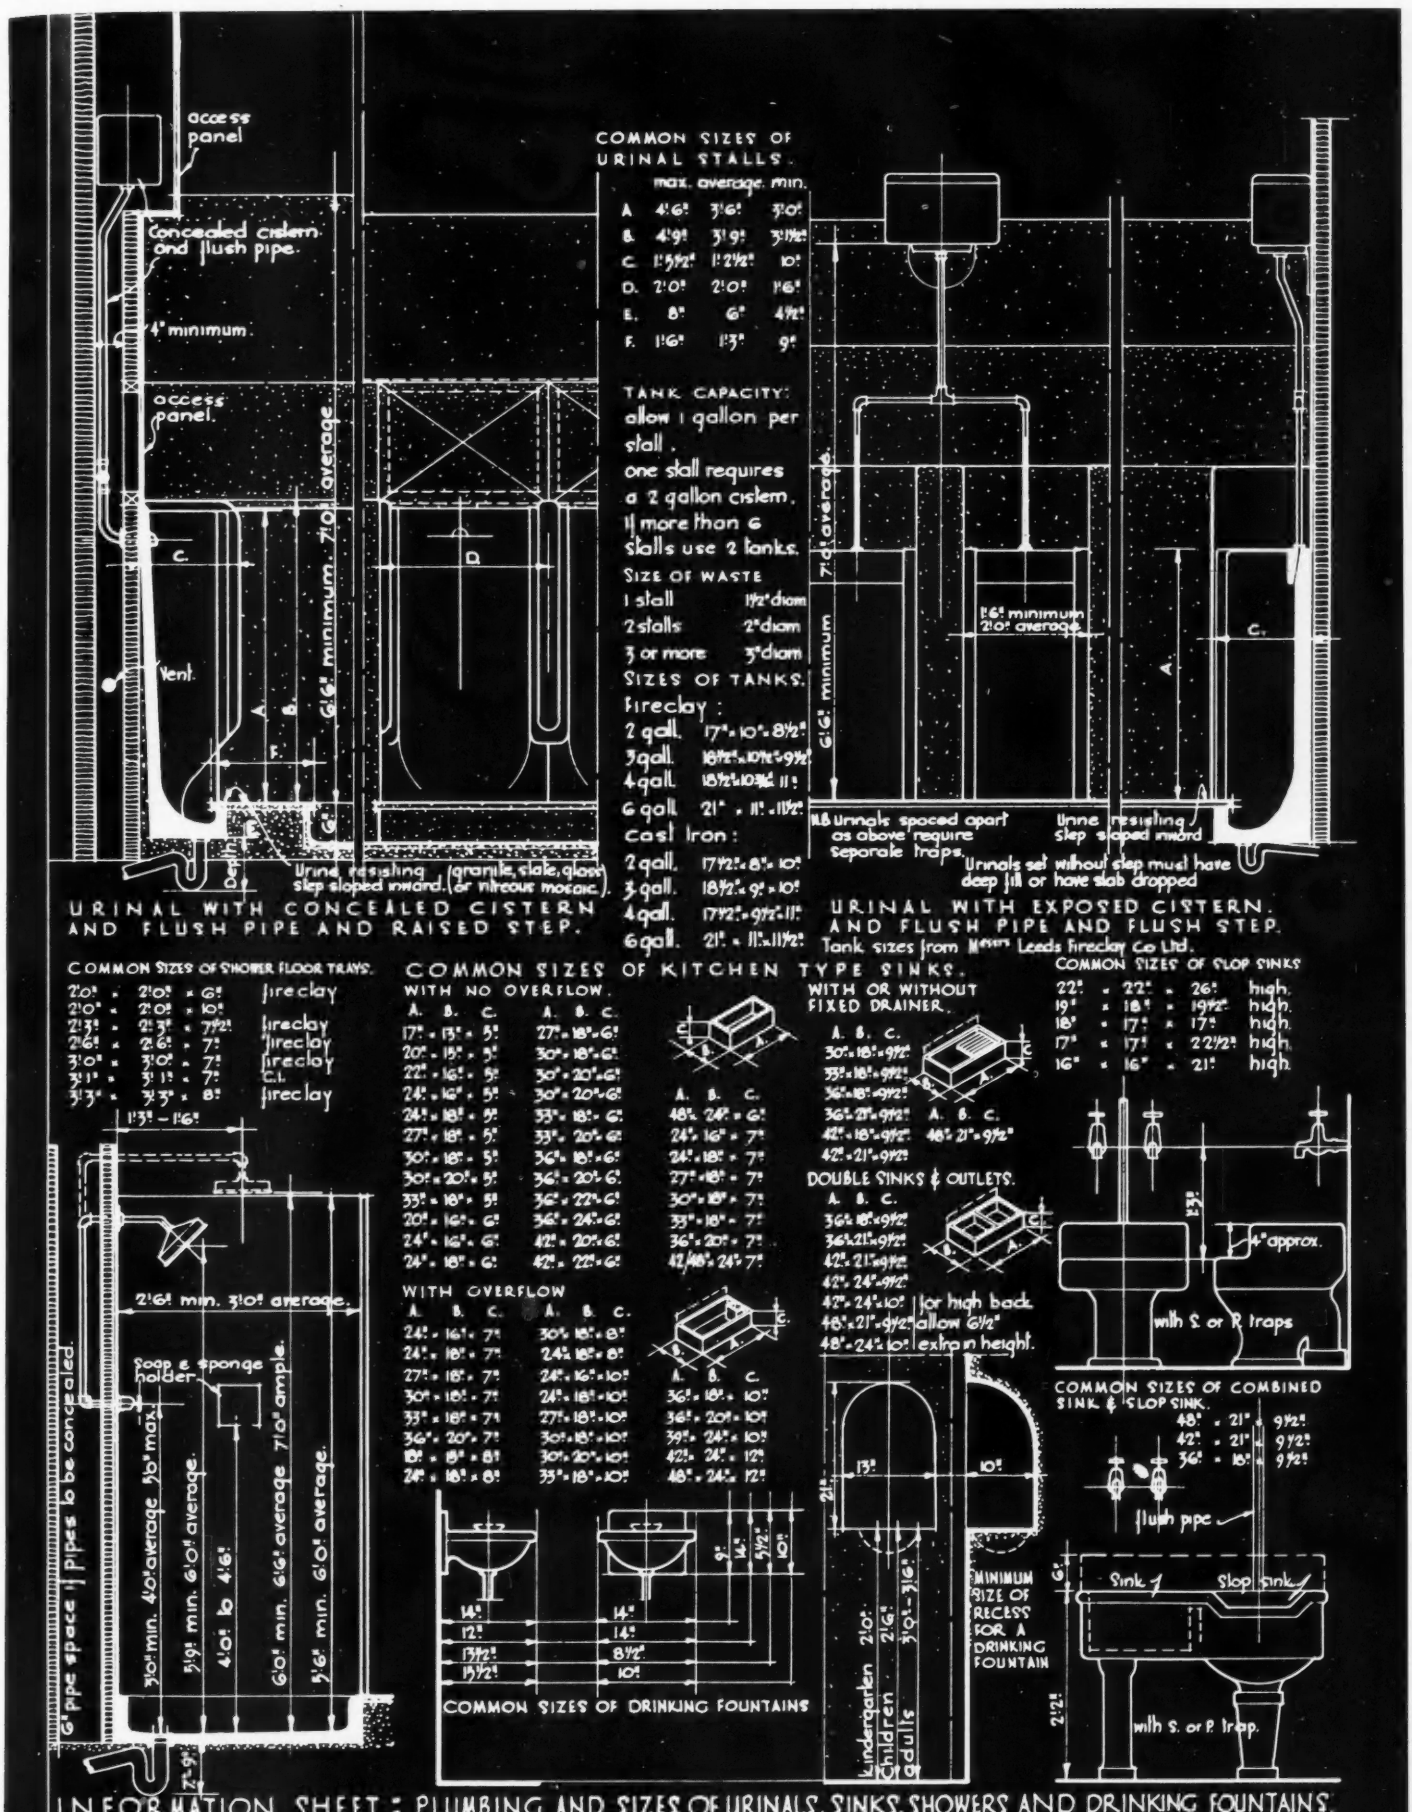
GAUMONT, LEWISHAM

DRAWINGS OF LIGHT FITTINGS



W. E. TRENT, ARCHITECT
JAMES MORRISON, ASSISTANT





PENDANTS BENEATH THE BALCONY

ON the double page overleaf are reproduced the large-scale drawings for a number of light fittings that occur in various parts of the house. As will be clear from the above illustration, and those given on pages 106–9, concealed lighting is made to exercise a definitely architectural function in emphasizing some of the broader constructional outlines of the auditorium. The visible light fittings supply focal points of interest in this general illumination scheme.

Indications of the materials appear on the drawings. Most of the metal parts are chromium-plated, and some are sprayed with bright colours, while a variety of glass is employed in combination with lighting elements of several shapes and kinds.

INFORMATION SHEET: PLUMBING AND SIZES OF URINALS, SINKS, SHOWERS AND DRINKING FOUNTAINS.
SIR JOHN BURNET, TAIT AND LORNE ARCHITECTS ONE MONTAGUE PLACE BEDFORD SQUARE LONDON W.C.1.

Supplement to THE ARCHITECTS' JOURNAL for January 18, 1933

INFORMATION SHEETS

• 1 •

PLUMBING FIXTURES

•

THE architect learns something new from each job he undertakes, and Information Sheets form an efficient means of tabulating the heterogeneous knowledge which he amasses, for his own use in the future, and for the help of every member of the office staff. They supply, in an accessible form, those useful facts which, having been learnt once, are apt to slip from the memory and lie hidden away on old drawings where, perhaps, they can only be found after a lengthy search.

Time is too precious to be wasted in this way, so all information that can be standardized is collected and set out on sheets of uniform size, forming an encyclopaedia of knowledge useful to everyone in the firm.

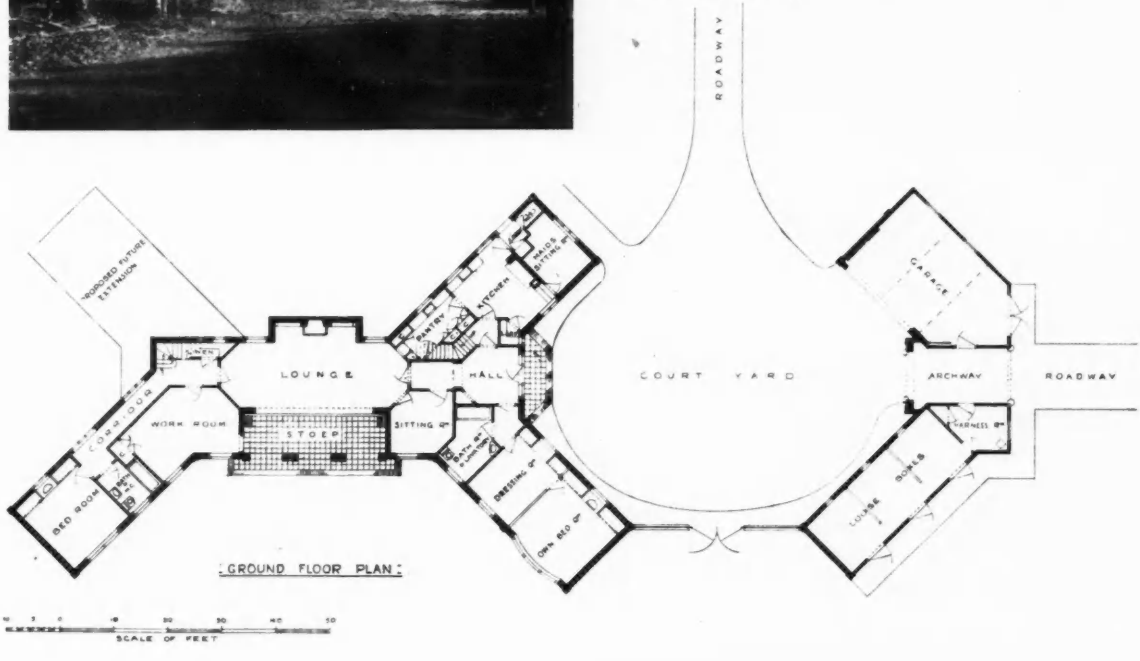
Information Sheets have been in use in architects' offices in America and Germany for some time, but they are not found in this country, where most of us have a secret and somewhat patronizing disdain of efficiency. For many years, however, Sir John Burnet, Tait and Lorne have made a remarkable record of all the information that a practice full of variety has brought to their office, and the comprehensive and detailed Information Sheets which they have compiled are grouped and classified to make the finding of any specific fact as easy as possible.

There are sheets of standard plumbing details—such as this one—sheets of lighting fittings, and door and window details. There are sheets giving the sizes of sports fields and courts, vehicles and their turning diameters, and the type of seating accommodation required for every kind of hall. Some of the sheets supply particulars for the use of the draughtsmen, such as the standard lay-out for the firm's drawings, the type of lettering used, and the symbols to indicate materials, etc. There are sheets, too, with details for the setting out of letters, agenda, minutes and filing, and the accounting system of the firm. No information which will help to simplify the working of the office has been omitted, nor any fact which will save unnecessary work.

The present Information Sheet—the first of a series—shows standard types of urinals, sinks, showers and drinking fountains. It gives tables of their common sizes, and adds various useful tips of which accumulated office experience has proved the value.

It was intended at first to reproduce these drawings in the form of double-page plates. The size finally chosen, however, was exactly that of the original drawing, which follows the dimensions adopted by the American Institute of Architects as the standard filing size for catalogues and leaflets; practically all the architectural publications of American manufacturers conform to it. As we lack a standard in England, we have chosen the best substitute—the American standard. Until further notice, therefore, this sheet will take the place of the second double-page plate which usually appears in the JOURNAL.

A WOODLAND BUNGALOW: BY ERNEST R. BARROW



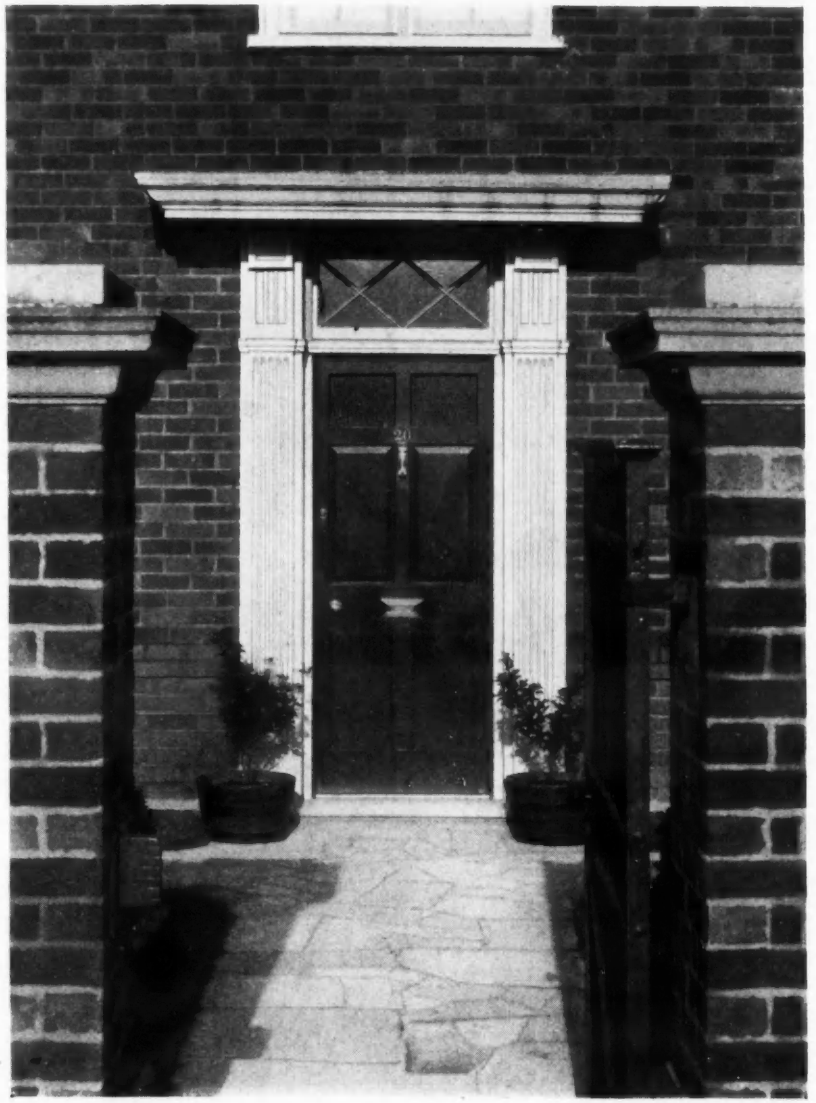
This house is built on high ground in a woodland clearing near Upper Basildon, Berks. The client desired a bungalow type of home, the various parts of which could be opened up or shut off at will. Four good-sized bedrooms —two for servants—and a bathroom have been provided in the roof. All have fitted cupboards and lavatory basins.

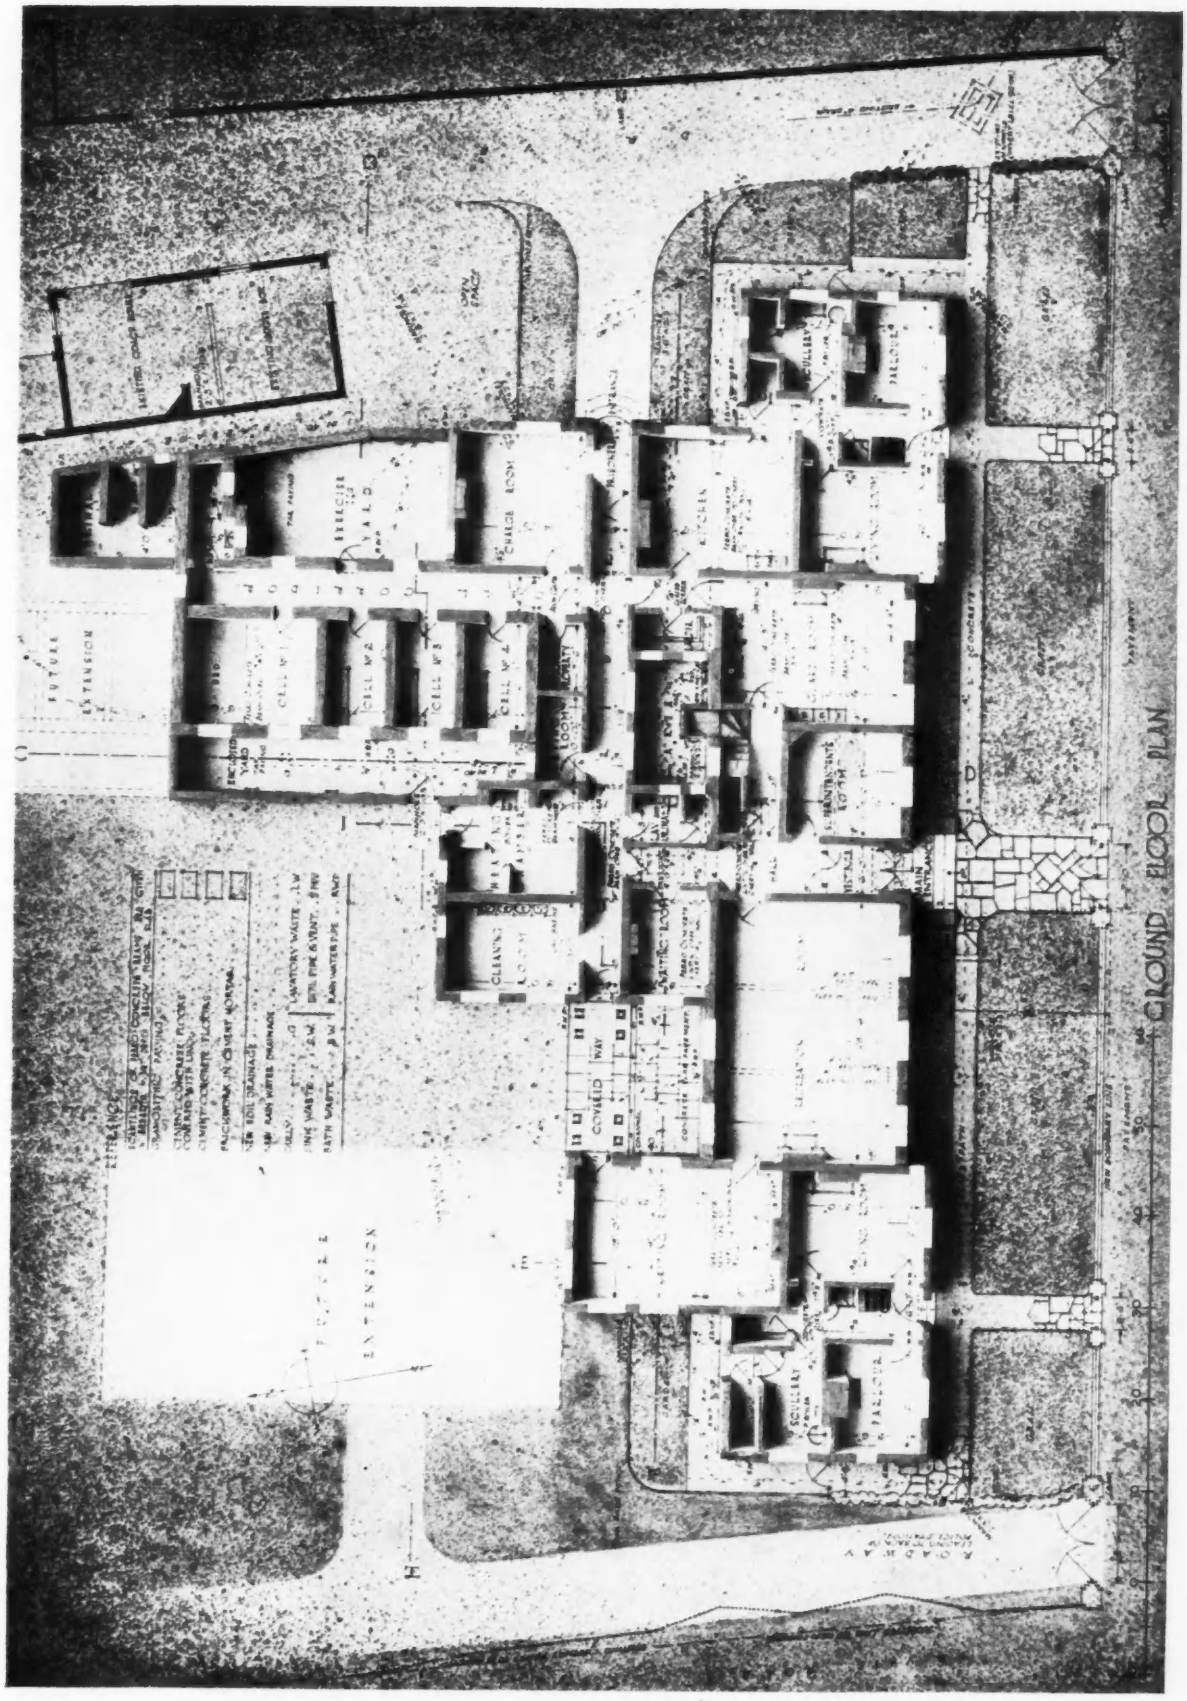
The whole front of the lounge is filled in with glazed folding doors, arranged to fold back into a recess to form, with the stoep, a large open-air room. On the east side are a garage and stables, the outline plan of which follows that of the house, thus forming a symmetrical courtyard, approached either by a drive through the wood or through the stable archway.

The walls of house and garage are faced with rough cement of a warm cream colour, with columns and quoins of a darker tone. The roof is covered with reddish-brown hand-made tiles and the chimney stacks are of 2-inch red, hand-made bricks.

C

EASTLEIGH POLICE STATION, HAMPSHIRE : BY A. L. ROBERTS





The new police station has accommodation for one sergeant, three married and ten single constables. Space has been left for the erection of a future Petty Sessional Court. The constable's wife in the south-east cottage cooks for the single men, and it will be noted from the plan, which is a photograph of a scale model, with walls shown four feet high, that their kitchen, wash-up and larder adjoin this cottage.

The working part of the station has been well screened from the main entrance. A recreation room has been provided, in which billiard tables have been supplied by the men; also a writing room, in which constables can write their reports and on occasions be addressed by the Chief Constable or members of his staff.

The walls are faced with Hampshire bricks, and the roof covered with hand-made, sand-faced tiles. The windows to the cells are of manganese steel. Cells, charge room and writing room are heated by hot water. The building was erected from the designs of the Hampshire county architect. The contract price was £9,998.

IN THAT CONTINGENCY

The following abstracts of inquiries represent a number of those recently submitted to the Building Research Station. The information given in the replies quoted is based on available knowledge. It has to be borne in mind that further scientific investigations may in the course of time indicate directions in which the replies might be supplemented or modified. Moreover, the replies relate to the specific subject of each inquiry, and are not necessarily suitable for general application to all similar problems. [Crown Copyright Reserved].

Corrosion of Lead Gutters

¶ *INFORMATION was sought on the corrosion of lead gutters of a bacon drying stove. The bacon was stored in racks in a building some 30 feet high; during the process of drying sawdust was allowed to smoulder on the concrete floor, and the smoke escaped through a louvred top-light in the slate roof. The lead gutters running along each side of the roof were badly corroded at intervals.*

At the outset it should be mentioned that it is a little difficult to hazard a definite opinion on the trouble without first-hand knowledge of the conditions under which corrosion is taking place, or even without an examination of the corrosion product formed on the lead, especially since it is noted that no trouble has arisen in other stoves constructed in a similar manner to the one in which failure occurred. It seems quite likely, however, that the cause of failure may be attributed to the vapour given off by the smouldering sawdust. A small laboratory experiment showed that the vapour expelled from heated sawdust contains an appreciable amount of acetic acid, which would certainly lead to the corrosion of lead.

The manner in which such acidic vapour could reach the lead gutters in this instance can only be conjectural, but it is quite possible that condensation of the vapour on the slate may have been an important factor. It would then be quite easy for the acid deposit to be washed into the gutters by rain and thus set up corrosion.

With regard to remedial methods it will be appreciated that any form of metal gutter would be likely to corrode under these conditions, and some protective coating would be required. Asphalt appears to be the only covering material which is likely to be unaffected. A bituminous paint may be effective for a time, but it is unlikely that it would afford a permanent cure unless carefully maintained.

Corrosion of Steel by Breeze Concrete

¶ *AN architect inquired about the corrosion of an iron service pipe which passed through a breeze concrete partition.*

Deterioration of steel or iron in contact with breeze and clinker concretes is well known. A number of such cases are reported from time to time, and judging from a superficial examination of the piece of piping submitted the failure in the present instance is of the usual type.

It is now realized that a number of causes, in most cases arising out of the properties of the breeze concrete itself, may contribute to the rusting of steel when the two materials are used in contact with each other. Of these the porous structure of the material, and the probability of the presence of compounds of sulphur may be said to be the most likely factors which would lead to corrosion. The subject is fully dealt with in Building Research Special Report No. 15, *The Corrosion of Steel by Breeze and Clinker Concretes* (H.M. Stationery Office, price 6d. net). As is explained in this report, the porous structure of these concretes allows ready access of moisture and oxygen and so permits rapid rusting, although the effects produced by moisture permeability alone should not be considered the *primary* cause of corrosion; if, however, sulphur compounds are present, as is usually the case with a clinker aggregate, the combined effects of all three factors, i.e., free access of moisture and oxygen, and the presence of sulphur, will then undoubtedly cause rapid corrosion. It is also probable that, as the result of their absorptive powers, breeze or clinker aggregates may promote corrosion of steel even under "dry" indoor conditions.

Under ordinary conditions of manufacture it is virtually impossible to obtain a breeze or clinker aggregate which could be safely assumed to be free from sulphur compounds; it is important, therefore, that steel or iron should not be used in direct contact with this material, and if, in the laying of service pipes, it is found impossible to avoid penetrating a breeze or clinker concrete partition, suitable precautions should be taken to protect and insulate the piping where it passes through the partition.

Plaster Failure

¶ *SERIOUS cracking of plaster on lathing of ceilings and stud partitions was reported. The architect had specified that the mix was to be one part of chalk lime putty to three parts of sand, with the usual amount of hair, and immediately before applying the plaster about 10 per cent. of Portland cement was to be added.*

The failure is apparently of the usual type, the cracking being due to drying shrinkage.

Failures of this kind are to some extent inherent in the materials used, and perhaps it would be helpful to summarize the present position as regards plaster finishes generally. At the outset it must be admitted that this is far from satisfactory, but some of the more serious difficulties will be removed when British Standard Specifications are available for plastering materials; a very great deal of work has already been done in this direction and publication of the specifications should not be long deferred unless unforeseen complications arise.

Ungauged lime plasters on lathing are probably the most prolific cause of failures of any building materials. Modern craftsmanship, and particularly modern building conditions, render the traditional materials inadequate. Haste for completion makes it impossible to allow sufficient time for undercoats to dry and shrink, and to carbonate, before finishing coats are applied. There is also a much greater risk of disturbing fresh plasters. Numerous specialist tradesmen, such as electricians, pipe fitters, etc., may be expected to be working in the building while the plaster is still green, and the shrinkage and warping of insufficiently seasoned timber will contribute to the general disturbance.

It follows, therefore, that a lime plaster must of necessity be gauged with a proportion of some cementing material having a definite hydraulic set: Portland cement is very commonly used. The alternative would be a calcium sulphate gauging plaster of a suitable slow-setting type. These plasters are ideal for the purpose since they do not shrink appreciably on drying; unfortunately there are as yet no standard specifications, and the characteristics of the various types of plaster are often not fully appreciated by the operatives, so that failures due to misuse are by no means infrequent.

A gauging of Portland cement, such as has been specified in the case under reference, should eliminate the worst type of failure where ceilings on lathing collapse entirely due to inadequate key strength; it will not, however, overcome the difficulty of shrinkage crack formation. Portland cement is a material which shrinks on drying, and this, of course, is the cause of the almost universal cracking which cement renderings exhibit. On solid backgrounds the shrinkage of a Portland cement gauged plaster may be restrained by the unshrinking backing, but lathing does not provide the necessary restraint, and the tendency to crack formation then depends entirely upon the drying conditions during and immediately following the plastering operation. If the undercoats can be allowed ample time to dry and complete their shrinkage before the finishing coats are proceeded with, it is quite possible to obtain a good job, but under ordinary building conditions this is an ideal state of affairs which can hardly be hoped for. It more often happens that thorough drying out only takes place at a much later stage in the history of the building, when it is being prepared for occupation. If, as is sometimes the case, the drying process is accelerated in cold weather by forcing the heating installation, the likelihood of extensive cracking is very much accentuated.

Accelerated Drying of a Building

¶ *A CONTRACTOR estimated that the moisture content of a building, which had been considerably delayed in erection, was between 18 and 21 per cent., and he considered that conditions were far too damp to commence joinery work. Plastering and the laying of terrazzo floors had been started, however, and since the*

architects were anxious to heat the building as soon as possible, the contractor wished to know whether reduction of the moisture content to within 12 and 14 per cent. by artificial heating would result in drying shrinkage and cracking of terrazzo and plaster finishes. He also wished to know what would be the limit beyond which it would be unwise to dry out the building.

It would be agreed that accelerated drying is likely to have objectionable results, although it is not possible to lay down any arbitrary rate of moisture loss which would be safe.

The effects are likely to be more serious, if anything, with finishes other than ordinary plasters; the tendency to shrinkage crack formation in terrazzo finishes and cement rendered backings would be augmented, and rapid drying of structural concrete work would also tend to produce cracks which would not form when drying was permitted to take place gradually. The tendency of tiled floors to "arch" from their bed would also be accentuated, and a case has recently been investigated where an extensive failure could be attributed almost entirely to accelerated drying with artificial heat.

It seems, within practical limits, that the rate of drying is more important than the ultimate stage to which the building is dried out in a case of this sort.

Failure of Floor Finish

¶ *THE contractors for a large city building requested the Building Research Station to inspect and report upon certain magnesium oxychloride jointless floors, in which abnormal cracking and loosening of the material had occurred. The jointless floor was laid on a pumice concrete screeding, and, in certain cases, the major shrinkage cracks in the floor finish coincided with shrinkage cracks in the screeding beneath.*

Magnesium oxychloride flooring, particularly when it contains a large proportion of wood filler, is liable to undergo a very large shrinkage on drying, which is much greater in magnitude than that of any of the building materials with which it is usually employed. Unless this shrinkage can be restrained, a thin floor finish of this kind must inevitably crack; in practice the necessary restraint is usually provided by adhesion to a relatively non-shrinking base.

Pumice concrete is a material which itself is generally liable to greater shrinkage than normal gravel concrete. A certain amount of cracking must undoubtedly be attributed to shrinkage of the pumice concrete screeding underneath the flooring, but this is not sufficient completely to account for the exceedingly bad condition of these floors.

The worst cases arise when the adhesion of the magnesium oxychloride finish to the base concrete fails; this has actually occurred over large areas in the floors inspected. When this happens, the excessive shrinkage of the floor finish is quite unrestrained, and it must be expected to crack up generally.

No examination could be made of the pumice concrete, but the condition of the floors suggests that it may not have been a simple matter to obtain a good bond between the magnesium oxychloride finish and the pumice concrete. It is generally recognized that an essential process in applying a plastic material, such as plaster or mortar, to any kind of surface is to adjust the "suction" of the background, so that water is not removed from the plastic material at an excessive rate. Pumice concrete may be expected to behave differently from a normal, dense cement mortar in this respect, and it seems questionable whether it would have been possible under any circumstances to obtain satisfactory conditions for adhesion of the finish to the base.

An examination of a sample of the floor finish shows that the material contains a very large proportion of wood fibre, and this necessitates the use of a large quantity of magnesium chloride solution to make the mixture workable; this is likely to increase the ultimate shrinkage of the finish.

There are certain secondary effects which should be taken into account where magnesium oxychloride cement is used. This material has an aggressively corrosive effect on certain metals, particularly steel and iron. During the inspection it was observed that water service pipes leading to a radiator passed through a magnesium oxychloride dado, and that no insulation had been provided round the pipe. In consequence the pipe was corroded where it passed through the dado, and it was strongly recommended that this should receive attention, since, if no steps are taken to arrest corrosion, the pipe will be perforated. In fact, all metal pipes, conduits, etc., which pass through floors or dados should be inspected, and where no insulation exists this should be provided.

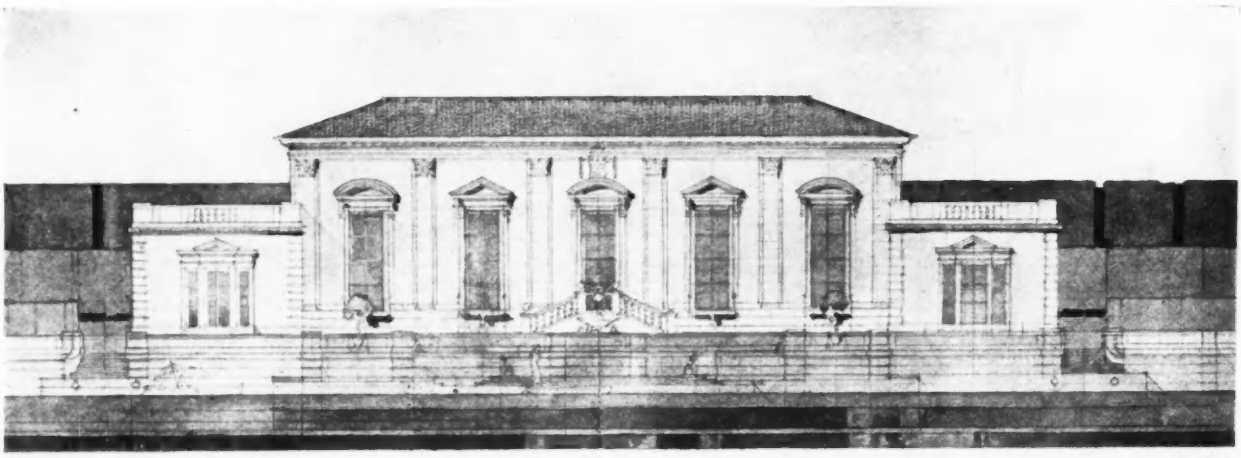
It is assumed that the main function of the pumice concrete is to provide cover for various services, such as electric cable conduits, pneumatic despatch tubes, etc. It is the practice of floor layers to flood the concrete base with magnesium chloride solution in order to control suction, and it is therefore quite possible that the magnesium chloride solution may have penetrated the pumice concrete where it may lead to corrosion of the various conduits and tubings, etc. The fact that the lower coat of the floor contains a high proportion of wood fibre is a likely cause for the use of an excess of magnesium chloride. Therefore, before taking steps to relay these floors, it is most desirable to ascertain whether there is a high content of magnesium chloride in the pumice concrete, and whether there are any signs of corrosion of the conduits and tubings, etc., embedded in it.

In view of the failure which has already occurred, it may be felt undesirable to relay the floors in magnesium oxychloride, especially as this will necessitate the introduction of additional magnesium chloride. Any finish which involves the introduction of a considerable amount of water is to be deprecated, as the presence of moisture will promote corrosion where the magnesium chloride is already present in the concrete.

LITERATURE

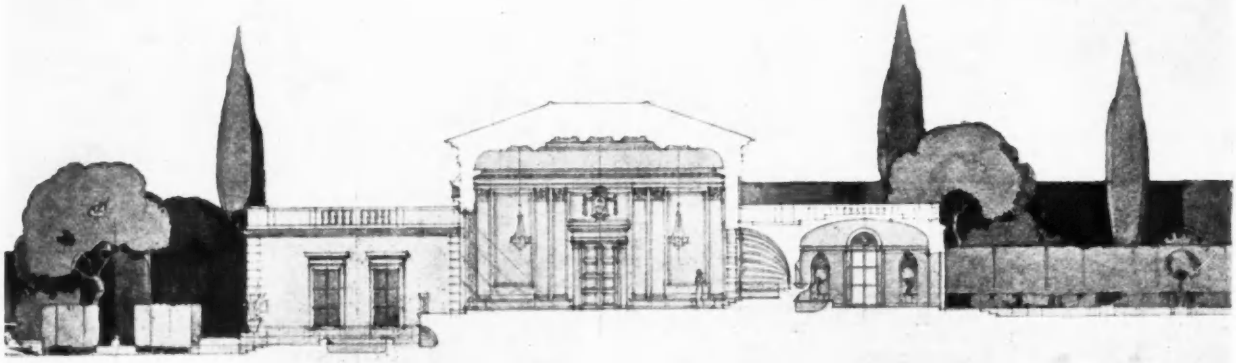
PROGRESS OF TIMBER RESEARCH

The Report of the Forest Products Research Board for 1931. London: H.M. Stationery Office. Price 3s. 6d. net.



THE Report of the Forest Products Research Board for 1931, issued on Wednesday last by the Department of Scientific and Industrial Research, refers to the improved facilities available for large-scale investigations into dry rot and the deathwatch beetle made possible by the completion of the new experimental building erected at the Forest Products Research Laboratory, Princes Risborough.

The ground floor of this building, the report states, contains a series of rooms in which solid floors are laid, with and without bituminous damp-proof courses, and in which the boards are fixed to the concrete in various ways. One room contains all the undesirable features which are found in badly-constructed houses—there is no ventilation under the floors and the soil beneath is not concreted over. There is no damp-proof course, and the outer wall is solid. In another room, on the other hand, the construction is good, and every precaution has been taken to ensure that there is adequate ventilation under the floor. The floors can be removed in sections for examination, and half-length panels, some of deal and some of oak, have been placed on the walls and have been treated with various paints and varnishes. "Every section of flooring and every panel was infected at the beginning of the summer with a piece of wood containing the dry rot fungus, *Merulius lacrymans*, in active growth, and the floors were covered with linoleum. The first inspection of the infected floors and panels was carried out four months after infection, and it was found that in the 'bad construction' room and on some of the solid floors the fungus had already made considerable growth, spreading several feet from the points of inoculation."



A record is being obtained of the variations in the moisture in the timber resulting from the various types of construction, and a further record is kept of the temperatures above and below the floors.

"As soon as decay has reached a certain stage, it is proposed to test out various methods which have been suggested for sterilizing *in situ* members such as joists, which are mechanically sound but carry traces of infection. The infected floors will also provide an excellent testing ground for determining

SECTION

the resistance to dry rot of various new Empire timbers which it is proposed to use for flooring. The resistance to dry rot of various makes of wall board is being investigated. The majority of the pulp boards so far tested have proved susceptible to fungal decay provided they are kept sufficiently moist."

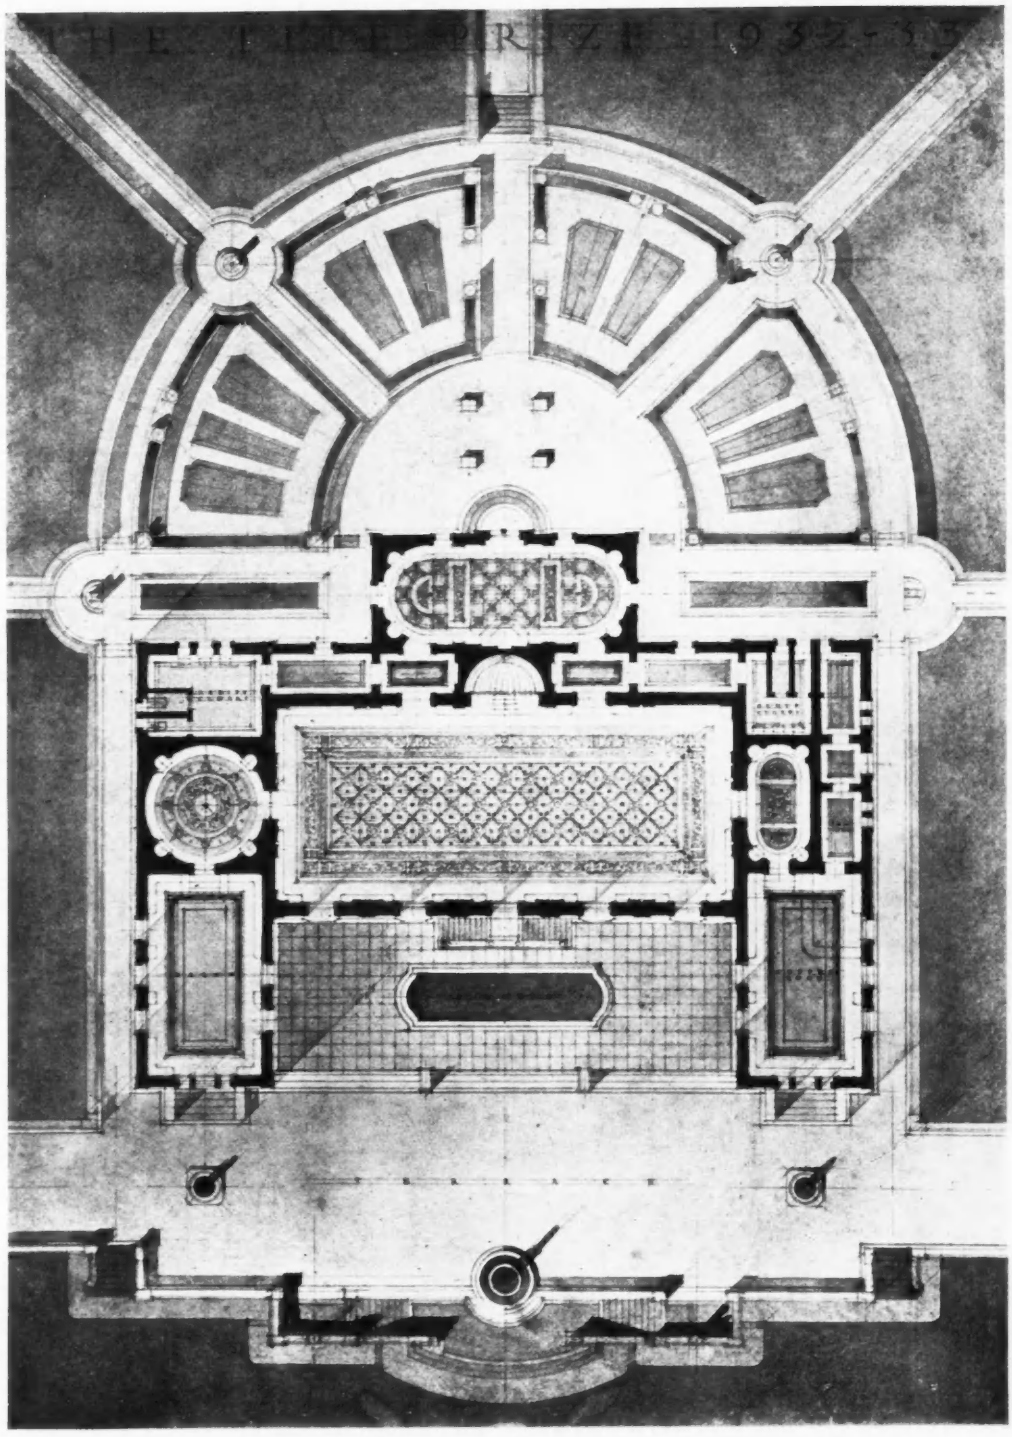
Numerous enquiries have been received by the Laboratory during the year seeking information upon the death-watch beetle and methods of control. It is stated that the correspondence clearly shows "that the damage caused by this insect is frequently confused with the less important and less serious damage caused by the common furniture beetle or even by dry rot fungus." The investigations carried out have again dealt primarily with the biology of the insect, special attention being given to the relation between the life of the insect and the conditions which affect its existence and propagation.

ADVERTISING AND ARCHITECTURE

Lay-out and Commercial Art. By Charles C. Knights, in collaboration with Edward Swann. London: Butterworth & Co. (Publishers), Ltd. Price 21s. net.

A CASUAL glance at this book makes one wonder what possible use can a knowledge of advertising be to the architect. But a more methodical investigation makes one reflect how magnificent a thing good advertising can be to spur the public to a greater appreciation and understanding of architecture. One meets, almost every day, a man too blind mentally even to notice the most brilliantly flood-lit building, but whose attention will be immediately arrested and overawed by an advertisement on a railway, in the tube, or in his favourite magazine. Yet the principles of advertisement design bear the closest resemblance to those in architecture. As the authors state:

Modern advertising art has no use for cluttering detail, irritating superfluities, or meaningless decoration. Its keynotes are simplicity of line and form, purity and rhythm: its favourite means of expression are the unusual viewpoint and the unconventional use of light and shade. Modern art exalts the beauty of everyday things, releases the hidden unsuspected charm of the commonplace . . . Modern art . . . despises what is false. Modern art believes, and practises the belief, that what is useful should also be beautiful, and that beauty must be made inherent in the object and not be a matter of mere decoration. . . .

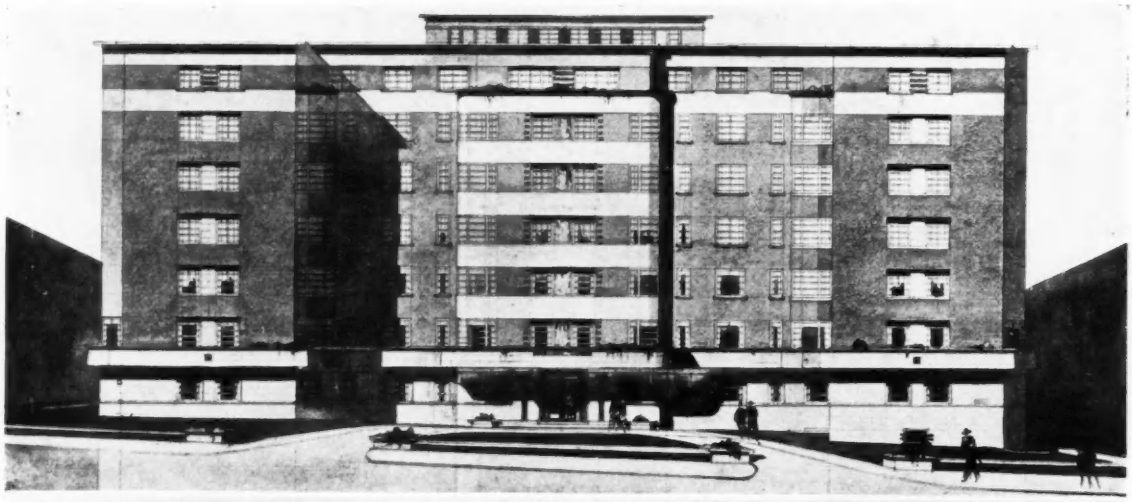


And thus through advertising shall our mentally-blind man be aroused from profound slumber, and a new gossamer web architecture be created for his dreams.

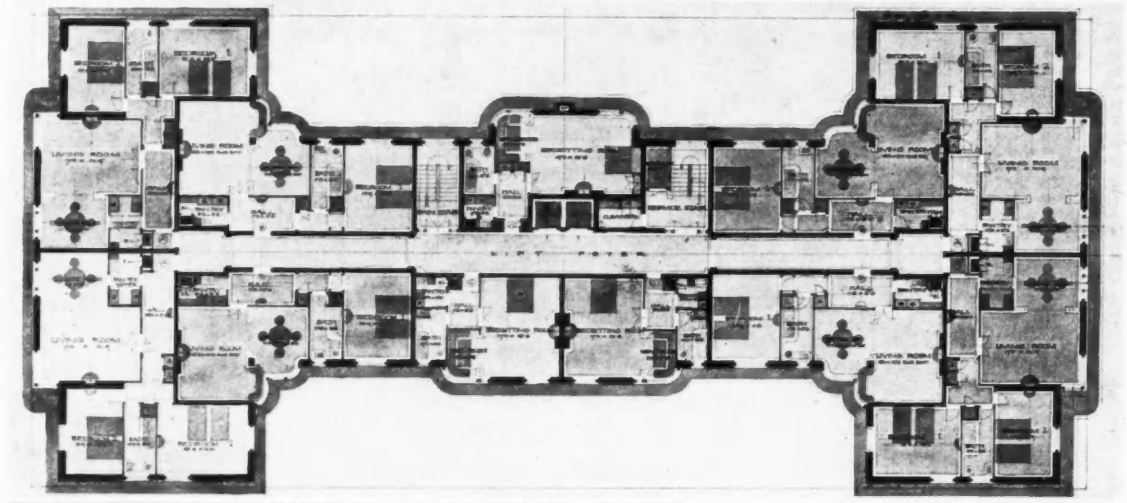
Publication Received

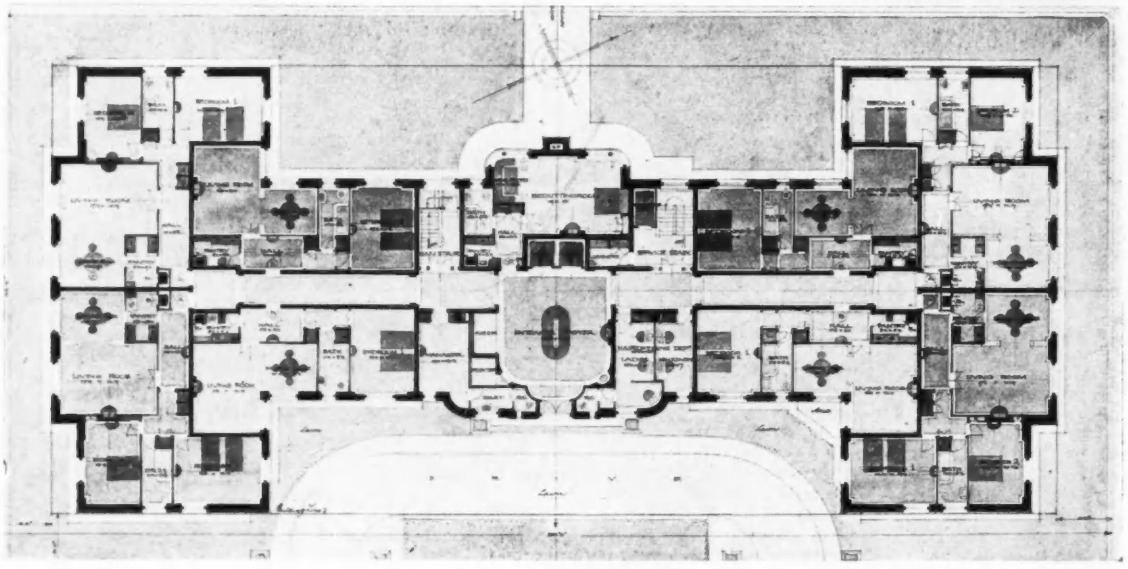
Guide Pratique de L'Urbaniste. By Jean Raymond. Paris: Dunod. Price 45 francs.

Books reviewed in these columns may be ordered through The Architectural Press, 9 Queen Anne's Gate, S.W.1.



WINNING DESIGN IN THE TITE PRIZE

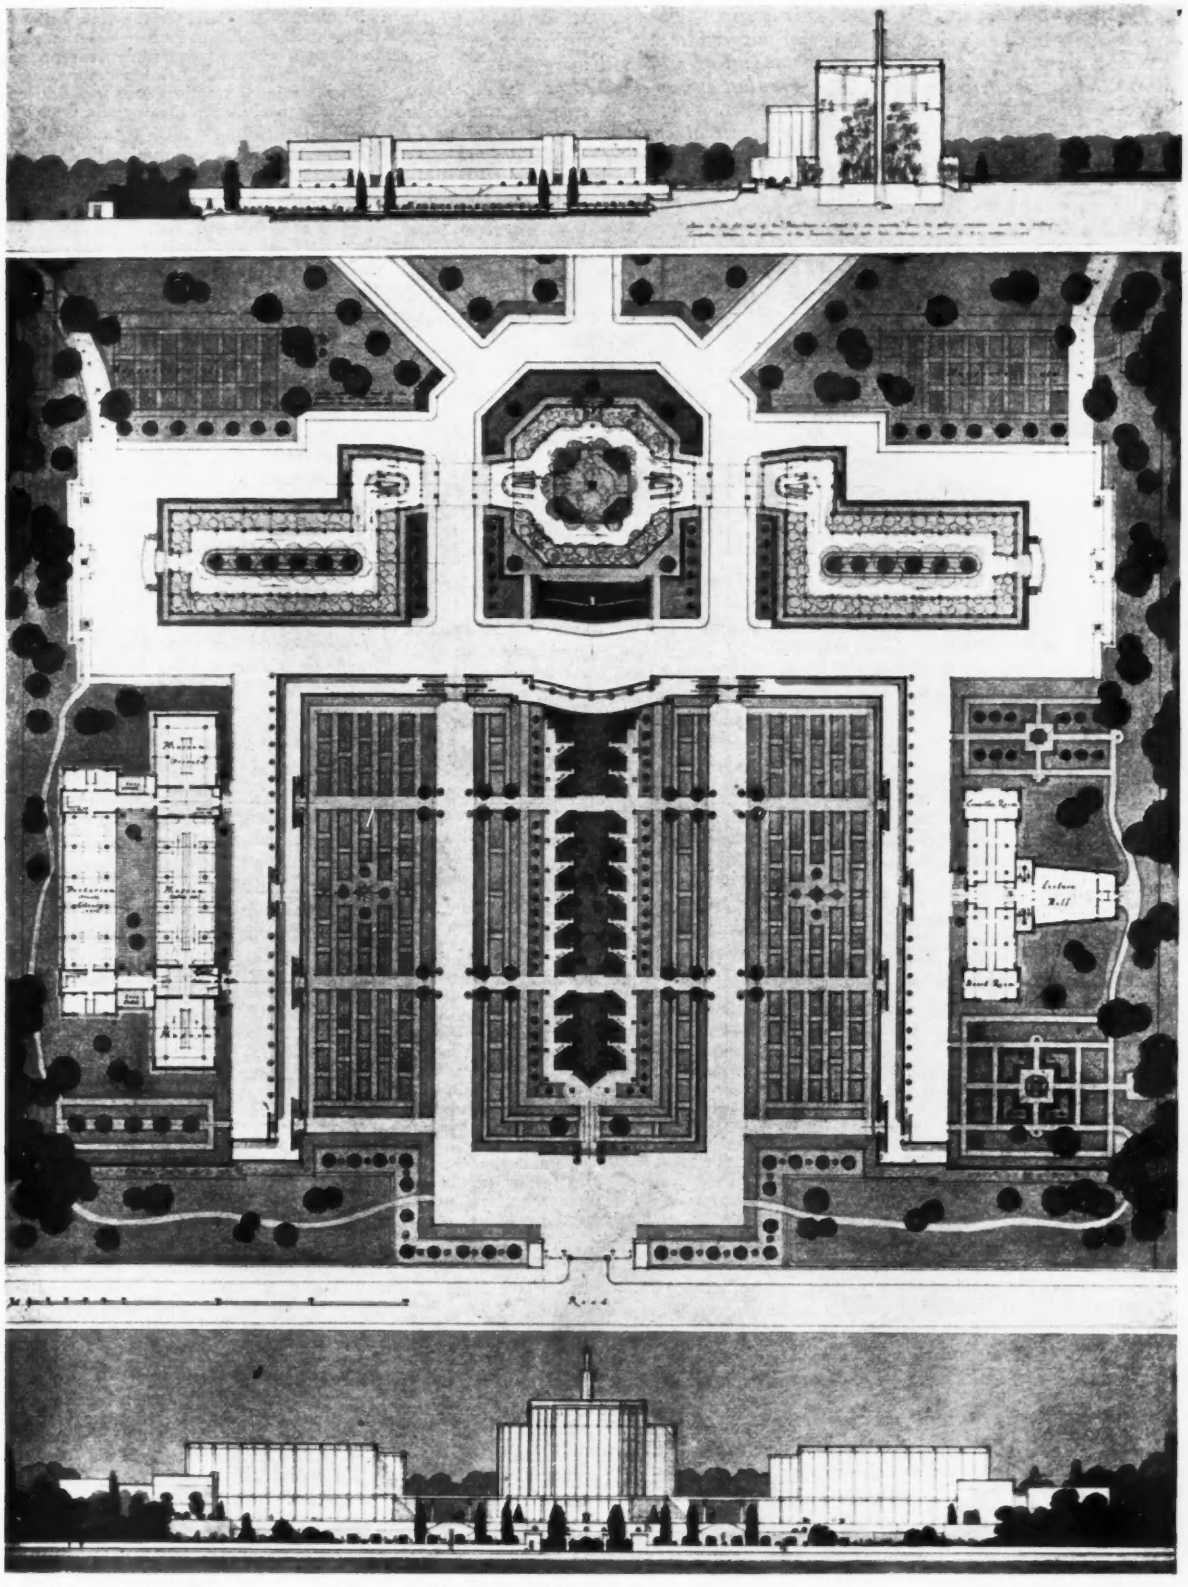




On this and the following pages are reproduced some of the prize-winning designs of which the awards have been already announced. All the drawings are on exhibition at the R.I.B.A., where the President, Sir Raymond Unwin, on Monday night, delivered his annual address to architectural students.

The Tite Prize (elevations on page 148) • A Ballroom in the Grounds of an Italian Embassy • Won by Alan Reiach (School of Architecture, Edinburgh College of Art).

R.I.B.A. AWARDS • WINNING DESIGNS IN THE



The Alfred Bossom Travelling Studentship • A Block of Service Flats • Won by D. E. Harrington, A.R.I.B.A. (Department of Architecture, Northern Polytechnic, London, N.)

ALFRED BOSSOM AND VICTORY SCHOLARSHIPS

The Victory Scholarship • A Group of Buildings and their Surrounding Lay-out in a Botanical Garden • Won by A. G. S. Fidler, B.ARCH. (Liverpool School.)

SOCIETIES AND INSTITUTIONS

DESIGNING AN INN

English Inns. By Basil Oliver. Sheffield, South Yorkshire and District Society of Architects and Surveyors. At Sheffield. January 12.

In designing an inn, one of the pitfalls for the architect to avoid is making it look like a bank or like Council offices or some technical institute. I can think of several instances. A public house should, in fact, look what it is but without being too "pubby," and it should be free externally rom all paper advertisements. The architect should have complete control over the lettering, which should be preferably in bronze gilt, or, at any rate, of simple Roman form, and restricted to the name of the house and the firm whose property it is, and whose products are on sale within.

Pictorial signs should be adopted wherever possible, and the wrought ironwork in connection with them should be simple, designed by the architect and executed by a smith who knows his job. Where the name of the house does not lend itself to pictorial treatment unaffected legible lettering should be adopted.

CHURCH TECHNIQUE

Modern Churches. By H. S. Goodhart-Rendel, F.R.I.B.A. Artworkers' Guild. January 6.

A new question that those who build churches in towns now have to face is that of how long a time they are building for, how soon the sites they are now covering will be cleared again and sold for commercial purposes. Unless the dwellers in mushroom suburbs show greater ambition to provide themselves with churches than they show now, it seems likely that the ecclesiastical authorities will pursue indefinitely their present policy of selling old buildings to pay for new ones (I speak here of the Church of England).

Let us give our new churches all the durability we can afford to pay for, in the hope that it will be needed. Let us, when we can, make them without stint of materials as resistant as possible to the general corrosion of time and weather, and, if need be, to the particular corrosion of polluted air. Let us refrain from the hazardous experiments of poise and counterpoise that in too many buildings of the Gothic age make their guardianship an unrelenting anxiety. Let us recognize, also, that the guardianship of church fabrics, when not kept alert by visible danger, is commonly neither vigilant nor wise, that what is out of sight to a churchwarden is commonly out of mind too, until a bit of it falls upon his head.

The church architects of the present reign have, as a body, shown no alacrity to learn from the shortcomings, and no aptitude for learning from the achievements, of their predecessors. They seldom attempt incombustible roofs, they have made little development in convenience of plan, and, when for reproduction they seem to give us novelty, that novelty is usually the involuntary product of ignorance. The glass-painter has lost little of his evil monopoly of decoration. The standard of organized mass-production has been lost and no standard as good has taken its place. To anyone who has studied the emergence of church-designing technique in the period immediately preceding that of Pugin, it is curious to observe how many of the errors of that time are recurring in ours.

I imagine that all defence against these strictures must be based upon three grounds: that there still, happily, are church architects at work who have not lost touch with tradition, that there are a few of their younger brethren making bold but rational experiments in development, and that in the work of almost all of our contemporary architects, good, bad and indifferent, there is greater sensitiveness than there used to be to surface qualities of colour and texture. I rejoice in the survival of the stalwart elders, in the enterprise of the not irresponsible young.

THE A.A. LEVERHULME SCHOLARSHIP

The Leverhulme scholarship is intended to enable suitable British students of insufficient means to obtain a full training for the architectural profession in the Architectural Association School of Architecture.

One scholarship of the value of £200 will be awarded each year, provided a candidate of sufficient merit presents himself, and will be tenable, subject to the general conduct of the student concerned and his or her progress being satisfactory, for one year, and may be renewed annually to cover a period of five years in all.

The scholarship will entitle the successful student to the following benefits :—

1 : Payment of the fees at the Architectural Association School of Architecture during the period of the scholarship.

2 : An annual allowance of £10 to cover subscriptions, working materials, etc.

3 : A maintenance allowance of £120 per annum which will be paid in 12 equal monthly instalments commencing on October 31 in each year, the last payment being made on July 1 of the year of the termination of the scholarship.

4 : During the fourth year, an allowance of £20 will be made for travel, and during the fifth year an allowance of £40 for travel abroad. The programme for these travels must be submitted to and approved by the Principal of the School of Architecture.

The Association may terminate at any time any of the scholarships or withhold the maintenance or travel allowances if the scholar's work and conduct are not satisfactory to the Council. In the event of a scholarship or maintenance allowance being terminated before the end of the fifth year course, the Council may transfer these benefits to another suitable student.

Candidates or their parents or guardians will be required to give evidence of means, and forms for this purpose together with scholarship application forms may be obtained from the Secretary of the Architectural Association.

A permanent committee has been set up to deal with the award of the scholarship. This is composed of the following members :

President of the A.A. for the time being ; a representative of the Trustees of the Will of the First Viscount Leverhulme ; a representative of the R.I.B.A. : two members of the Council of the A.A. : the Director of Education the A.A. ; Mr. C. D. Medley and Mr. F. R. Yerbury.

The Committee will make their recommendations upon the results of an examination in the subjects to be selected and also after a personal interview with the candidates. The candidates will also be required to satisfy the committee that they have reached a standard of general education equal to that required for admission to the Architectural Association Schools for students generally. They must not be below the age of 17 years on December 31 in the year of application for the scholarship. Applications for the scholarship must be sent to reach the Secretary of the Architectural Association not later than June 1 in each year, after which due notice will be given of the date of the examination to be held later. The successful candidate will be admitted to the first-year course of the School at the commencement of the ensuing term in early October.

All communications on the above subject must be made to the Secretary of the Architectural Association, 36 Bedford Square, W.C.1.

HEALTH EXHIBITION AT BLACKPOOL

The annual congress and exhibition of the Royal Sanitary Institute will be held at Blackpool in June.

The exhibition, to which the general public are admitted, will give practical illustrations of the many appliances and products used in municipal administration, in hospitals and other public institutions and in the home.

LAW REPORTS

ALLEGED OBSTRUCTION FROM A HOARDING

Harper v. *Haden and Sons, Ltd.—Court of Appeal. Before the Master of the Rolls and Lords Justices Lawrence and Romer.*

THIS appeal, by the defendants, from a judgment of Mr. Justice Bennett, Chancery Division, raised an interesting point in regard to claims for damages for alleged obstruction of premises by the erection of a hoarding outside adjoining premises during the course of building operations. In the Court below the plaintiff brought an action for damages on the ground that the takings from his shop had been seriously reduced in consequence of the erection of a hoarding by the defendants, at adjoining premises, where they were carrying out certain building operations. It appeared that in order to provide for the safe passage of the public, the defendants had made a passage in front of the hoarding.

The plaintiff's case was that these obstructions were derogatory to his business and the public.

Defendants by their defence denied the plaintiff's allegations, and pleaded that the local authority had licensed the erection of the hoarding.

Mr. Justice Bennett held that the

plaintiff had suffered damage and gave judgment for him for £150.

From this the defendants now appealed, and Mr. Spens, K.C., argued the case on their behalf.

Mr. Elliott Gorst appeared for the respondent, and supported the finding of Mr. Justice Bennett.

The Court allowed the appeal with costs, holding that there had been no such prolonged or unreasonable inconvenience to the plaintiff as to constitute a wrongful act.

ALLEGED NUISANCE—MODERN CITIES AND BUILDING OPERATIONS

Salaman v. *Summit Estates, Ltd.—King's Bench Division. Before Mr. Justice Macnaghten.*

THIS was an action by the tenants of a top flat at Queen's Court, Hyde Park, Mr. and Mrs. Salaman, against the defendants, Summit Estates, Ltd., for damages for nuisance alleged to have been caused by the defendants in their erection of adjoining flats. Plaintiffs also sought an injunction.

Mr. Earengey, K.C., for the plaintiffs, said his clients complained of serious nuisance and inconvenience suffered by them from noise, etc., arising from the work of the defendants on adjoining flats from July, 1931, to April, 1932. There was the drilling when iron girders were put in, and hammering and dust when the various workmen were at work. The plaintiffs also complained of workmen working on a tennis court on the roof of the building, and the working of a machine in the ice rink. Owing to the continual noise the sleep of plaintiffs had been interfered with and visitors had had to be given beds in the hall. His clients also complained of noise from the lift. They held the flat on a seven years' agreement, at a yearly rental of £230.

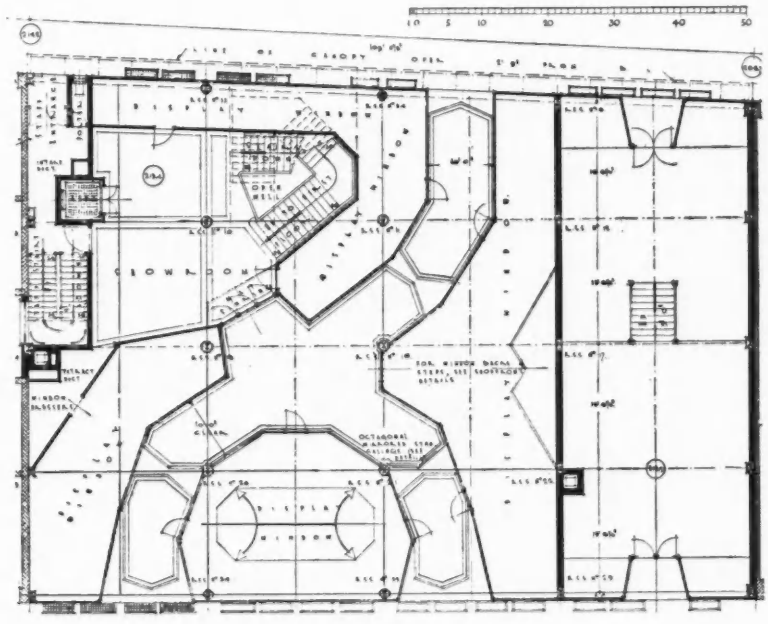
Plaintiffs gave evidence in support of their case and Mrs. Margaret Holmes also gave evidence, and stated that she left the flats in March, when there was continuous loud hammering.

Mr. Van den Berg, K.C., for the defendants, denied that there was any actionable nuisance. He submitted that when the plaintiffs took the flat they were aware of the work that was in contemplation on adjoining flats. Under their agreement it was provided that no diminution of rent or compensation should be claimed for discomfort arising from repairs and improvements at the flats or adjoining premises. Part of the work was alteration of flats in the nature of improvements contemplated under the agreement. As to the lift the defendants were not liable to plaintiffs in respect of any defect. According to the authorities a temporary inconvenience was not a breach of covenant for quiet enjoyment.

Mr. J. L. W. Crane, of Messrs. Lucas and Pike, a consulting engineer, said he had visited the building, and in his opinion every possible step was taken to prevent vibration being transmitted to the framework of the building.

His lordship held that the action failed, and dismissed it with costs. His lordship said plaintiffs complained of noise from the erection of additional flats, but in his view, having heard the evidence, he had no hesitation in saying that Mr. Salaman, one of the plaintiffs, had deluded himself into the views he had expressed. It must be admitted that the building was erected in a proper manner, and that no unnecessary noise was made. He thought that if people chose to live in a town they must put up with the inconveniences to be found in a town. It was not possible for a man to stop an adjoining owner from pulling his house down and erecting another, whatever the noise and inconvenience. On the evidence he arrived at the conclusion that there was no justification for the complaints.

LADIES' STORE AT SHEFFIELD



DESIGNED BY NORTH, ROBIN AND WILSDON

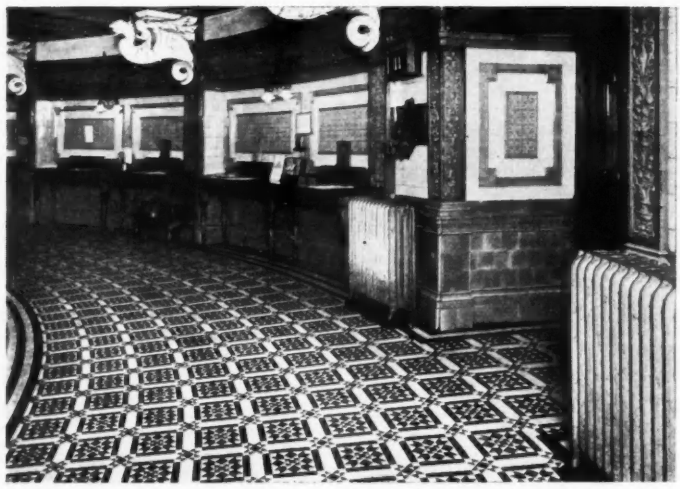
The new building recently completed in High Street, Sheffield, for Messrs. C. and A. Modes, consists of basement, ground, first and second floor showrooms, and a third floor devoted to workrooms, offices and canteen. The sub-soil was of rock and the whole site had to be excavated, an operation which took one month out of the six occupied in completing the structure, which is steel-framed, with entire elevations of artificial Portland stone. Maximum daylight has been obtained by the large, almost continuous, vertical windows between the piers.

The planning of the ground floor was difficult : an arcade was desired, giving direct access from High Street to King Street, and the whole of the ground floor had to be sloped in two directions owing to the fact that there was a considerable fall in the pavement levels and also a difference in level of six feet between the two streets. It is without steps, and acuteness of the slope has been obviated by taking it diagonally across the ground floor.

The main staircase, of oak, is some 7 ft. in width, with a wrought iron continuous balustrade. The whole of the window backs and window features are of veneered figured walnut. The basement is artificially ventilated and central heating is installed throughout.

TRADE NOTES

Over thirty-four years ago the Silvertown Co. laid a rubber floor in the branch of the Westminster Bank, Ltd., at 329 High Holborn, W.C.1, formerly known as Birbeck Buildings. The floor, which is shown in the photograph reproduced on this page, occupies the whole of the public space in the banking hall. Although it has naturally received much wear and tear, the floor has only required one trifling repair since its installation in 1898—and that during the last twelve months. It is claimed to be one of the oldest floors of its type in existence.



The architect for the building was the late T. E. Knightley, of Messrs. Knightley and Battenbury.

*

Messrs. The Kleine Company, Ltd., of New Oxford House, Hart Street, Bloomsbury, W.C.1, have secured the contract for the erection of their Kleine patent reinforced hollow brick floors, flat roofs, balcony steppings and staircases at the New Cinema in Rowlands Road, Worthing. The cinema, which also includes a number of well-appointed shops, is being built for Messrs. Kay Bros., of 167, Oxford Street, W.1, who have been associated with cinematograph entertainment since its inception. The cinema has been designed by H. Weston. Work will commence on the site almost immediately, and it is expected to be opened early in June.

*

The Key Underfloor Duct System for the distribution of lighting, heating, power, telephone and bell services in banks, large office buildings, hotels, etc., is illustrated and described in a booklet recently issued by the Key Engineering Co., Ltd., of London and Manchester. The duct is made of fibrous material impregnated with a preservative bituminous compound, consequently breathing and condensation are at a minimum. It is stated that it has been proved by many years of experience that the duct cannot ignite through cable breakdowns. The System, it is claimed, permits the placing of outlets for additional desk lights, telephones, buzzers, etc., for use when and where required, on any magnitude of floor area, without unsightly expedients, at any time during the life of the building. Wires are hidden from view. Draw-in box covers and outlet fittings are so made that the flooring is not damaged in removing box covers or in making outlet connections. All future development is provided for without disfigurement. No joints or tees are made underfloor either in the Duct or draw-in boxes ; and all points are looped in. Also, no cables are laid in the ducts until required, and no outlet is made until the floor is completed. The cables are drawn in as and when required. Ceiling lights and wall fittings fixed in predetermined positions, each of these points is fed from a draw-in box, dead end or special outlet. The whole system is claimed to be water-tight.

Banking hall, Westminster Bank, 329 High Holborn, W.C. The rubber floor is claimed to be one of the oldest in existence. See note on this page.

Messrs. Rhodes, Brydon and Young, of Gorsey Mount Street, Stockport, have just issued a leaflet (No. 146) devoted to the Axcel Mopump.

*

Artistic Concrete is the title of a brochure recently issued by the Cement Marketing Co., Ltd., of Portland House, Tothill Street, S.W.1. It illustrates, in colour, various types of structure for which one or other of the products supplied by the firm for producing artistic concrete have been used. These photographs show a road house, faced with white cement ; a row of council houses sprayed with cream cement ; a weir sprayed with white cement ; a public garage rendered with cream cement ; a factory with walls of white concrete throughout ; a cinema in various coloured cements ; swimming baths faced with white cement ; and a road with buff concrete carriageway, etc. Most of the pictures are reproduced from actual colour photographs.

OBITUARY

We regret to record the death of Mr. Charles Magee, the Belfast Branch Manager of Messrs. W. T. Henley's Telegraph Works Co., Ltd. Mr. Magee had been in charge of the Belfast branch since September, 1924.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

House at Upper Basildon, Berks (page 143). General contractors, T. Harding and Sons. Sub-contractors : B. G. Suthers, Ltd., electric light installation ; Aquaheat Co., heating and hot-water supplies ; Educational Supply Association, Ltd., sliding doors to loggia ; The Guildford Glass Works, metal casements ; Sussex Brick and Tile Co., tiles ; Thomas Lawrence and Sons, bricks ; John Bolding and Sons, Ltd., sanitary fittings.

New Police Station, Eastleigh (pages 144–145). General contractor, C. T. Tucker. Engineers, L. G. Mouchel and Partners. Sub-contractors : Playfair and Toole, Ltd., reinforced concrete work ; Whitehead Iron and Steel Co., steel ; Daneshill Brick and Tile Works, Ltd., external brick facings ; James Gibbons, general ironmongery, manganese steel windows (cells) and cell doors, etc. ; Hartshill Brick and Tile Co. supplied the roof tiling, which was executed by W. T. Lamb and Sons ; Hyflo Gould, Ltd., Hyflo-Gould system of hot water heating to cells, charge-room and writing-room ; installation of hot-water heating by Cook and Son ; installation of domestic hot water by G. Green ; Wm. Sugg & Co., gas fittings ; Shepherd and Hedger, furniture and fittings.

New Shop Premises, High Street and King Street, Sheffield (page 153). General contractors, George Longden and Sons, Ltd. Sub-contractors : D. O'Neill and Sons, demolition ; Banister, Walton & Co., Ltd., steelwork ; Crittall Manufacturing Co., Ltd., metal windows ; Hodkin and Jones, Ltd., artificial stone and fibrous plaster ; Saunders and Taylor, Ltd., heating and ventilating ; Waygood-Otis, Ltd., lift ; E. Coules and Son, metal balustrading, etc. ; Saml. Elliott and Sons, Ltd., shop fronts ; F. Naylor, Ltd. (Marb-l-Cote Material), decorations ; J. H. Maynard, flag staff and flags ; Monarch Flooring Co., patent floors ; Yannedis & Co., ironmongery ; Luxfer, Ltd., pavement lights and roof lights ; Leeds Fireclay Co., Ltd., sanitary fittings ; Hollis Bros. & Co., Ltd., wood block floors ; Philips Lamps, Ltd., lighting fittings ; Arthur Lyon & Co., electric clock ; Waring and Gillow, Ltd., carpets, etc. ; Baker and Hyman, Ltd., electrical installation.

Stalls Bar, His Majesty's Theatre (Supplement). Hall and Dixon, plasterwork, woodwork and decoration ; J. Jeffreys & Co., Ltd., ventilation ; Strand Electrical Engineering Co., Ltd., electrical work.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

Plans passed at KENLEY : 42 houses, Kenmore Road, Oaks Road ; and new road off Oaks Road, for Mr. F. W. Thomas.

Plans passed at SOUTHGATE : Additions, Chase Bank Nursing Home, Avenue Road, for Miss Jarvis ; lay-out of land, Drayton Gardens, for Mr. Tomlin ; lay-out, rear Cherry Tree Hotel, for Temple Estates Co. ; factory, Chequers Way, for The Metal Box Co. ; (amended) eight houses, Willow Walk, for The Ideal Housing Co.: six houses, Bowes Road, for Mr. W. S. Read ; lay-out of Oak Lodge Estate, for Messrs. Matthews and Son ; six shops, Green Lanes, for Mr. S. Scott ; two houses, Hoppers Road, for Mr. W. Drinkwater ; four houses, Woodcroft, for Mr. G. W. S. Ingram ; two houses, Dawlish Avenue, for Mr. C. E. Ward ; extension to factory, North Circular Road, for The Metal Box Co., Ltd. ; house, Arnos Grove, for Messrs. H. S. Couchman and Sons ; shop and seven flats, Hazelwood Lane, for Mr. A. Pryke ; six houses, Brookdale, for James' Estates, Ltd. ; 63 houses, Greenway, for Mr. C. E. Hartshorne ; six houses, Drayton Gardens, for Mr. F. F. Tomlin ; five houses, Wades Hill, for Messrs. Martyn, Ltd.

The TEDDINGTON U.D.C. has agreed upon a scheme for the extension of the swimming bath, and instructed the architect to include in the scheme the provision of a separate pool for children and non-swimmers.

SOUTHERN COUNTIES

Plans passed at PORTSMOUTH : Transformer sub-station, Crown Street, for Messrs. Hipperson and Son ; additions and alterations, 2, Albert Road, for Messrs. Jordan, Ltd. ; house, Meryl Road, for Messrs. Cake and McPherson ; eight houses, Northern Parade, for Mr. E. A. G. Wright ; house, Lodge Avenue, Cosham, for Mr. J. C. Nicholls ; public-house, Cobden Avenue and Westover Road, public-house, Moneyfields-Redcar Avenues, and hotel premises, London Road, Hillsea, for Portsmouth and Brighton United Breweries, Ltd. ; two houses, Kingsley Road, for City and Suburban Builders ; house, Sussex Road, for Mr. C. V. Thorpe ; additions, 52, Albert Road, for Messrs. Morey & Co. ; house, Kent Road, for Mr. C. V. Thorpe ; winter gardens, Southsea Terrace, for Southsea Development Co., Ltd.

SOUTH-WESTERN COUNTIES

The BRISTOL Corporation Municipal Buildings Committee has further considered the appointment of an architect for the work of preparing plans and elevations in connection with the proposed municipal buildings, and re-submits its former recommendation that Mr. E. Vincent Harris, F.R.I.B.A., be appointed the architect to carry out the work.

Plans passed at PAIGNTON : Four flats, Cedar Road, for Messrs. T. H. and L. Rees ; layout of five houses, new road, off Preston Down Road, for Mr. W. H. Webber ; extension to pavilion, South Devon Holiday Camp, for Mr. R. T. Leins ; four houses, Marldon Avenue, for Messrs. Mitchell Bros.

Plans passed at PLYMOUTH : Three houses, Vapron Way, for Mr. M. Oldrey ; four houses, Mutley Park, for Mr. F. Pearse ; eight houses, Edith Avenue, for Mr. J. Rendle ; six houses, Broome Park Estate, for Mr. F. J. Squance ; seven houses, South View Terrace, for Messrs. Mexbro, Ltd. ; additions, Blue Bird Café, Efford Road, for Mrs. Cannon ; alterations and additions, 34 Hobart Street, for Mr. G. Sparkes ; two houses, Victoria Road, St. Budeaux, for Messrs. A. E. Searle and Son ; two houses, Park Road, Lower Compton, for Mr. J. Hannaford ; two houses, Thornhill Road, for Mr. R. H. Roberts ; two houses, Green Park Avenue, for Messrs. Brown and Sleeman.

Plans passed by the TORQUAY Corporation : Two bungalows, St. Vincents Road, for Mrs. Jackson ; two bungalows, Marldon Road, Shiphay, for Mr. H. Pearce ; additions, Burlington Hotel, Babbacombe Road, for Mr. H. Shearing ; house, Wellswood Hall estate, for Mr. L. E. Curry ; additions, Livermead Cliff Hotel, Torbay Road, for Mr. E. Hardman ; flats, Cleveland Road, for Mr. F. C. Yeo ; flats, St. Marychurch Road, for Mr. J. Blackler ; four houses, Reeves Road, for Chelston Building Co. ; two bungalows, Shiphay Lane, for Mr. H. J. Breyley ; house, Watcombe Heights estate, for Mr. H. J. Scoles ; house, Marldon Road, for Mr. W. A. Pridham ; alterations, 25 Union Street, for Mr. W. D. Creed.

The TORQUAY Corporation Electricity Committee is negotiating for the acquisition of land at Moretonhampstead, for a sub-station, stores and showroom.

The YORK Corporation has sold two building sites in Carr Lane to Mr. N. Hall.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

* In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

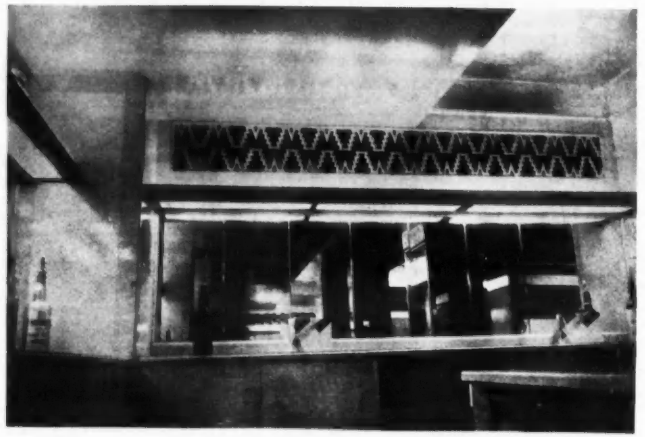
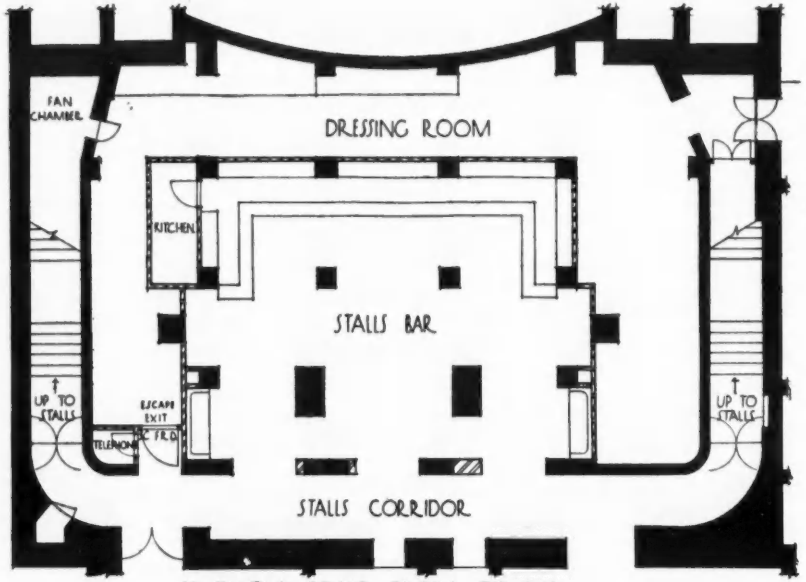
NEW BAR IN A LONDON THEATRE

HIS MAJESTY'S : : MICHAEL ROSENAUER, ARCHITECT



THE BAR AND ITS COUNTER, SEEN BETWEEN THE MIRROR-CLAD PIERS



IN forming this new stalls bar in a basement space at His Majesty's Theatre, its apparent size has been increased by the use of mirrors, of French peach glass, upon the walls and piers. Silver leaf covers the ceiling, gold lacquered on the lighting trough and the lower tier. Metal work and skirtings are gold-cellulosed. Lighting is indirect, from the trough and from a double illuminated glass shelf at the back of the bar. The wood fitments to the counter are in quartered panels of maple and sycamore. The arrangement and design of the details are indicated on the plan and elevations and the large-scale drawings reproduced overleaf.

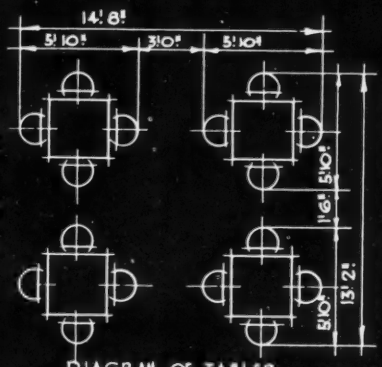
RESTAURANTS.

Seating area required per person
for the "grille" or "a la carte" type- 10, 12 to 16 sq ft.
for the "table d'hote" type.- 7, 8 to 10 sq ft.

Kitchen proper (excluding stores, pantries) requires to be equal to 35% to 50% of the dining area.

A dining room of 5000 sq. ft. requires approx. 4000 sq feet service area & should seat from 350 – 450 persons



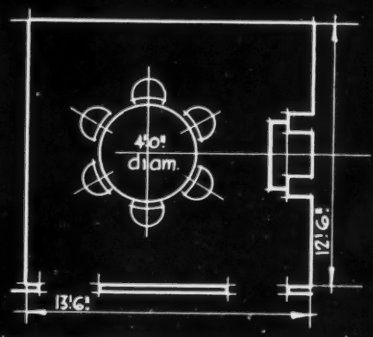


DIAGRAM OF TABLES. SQUARE ARRANGEMENT

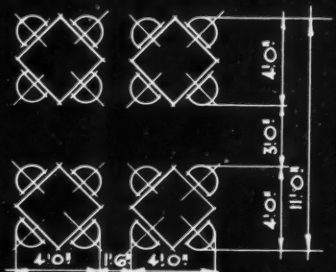

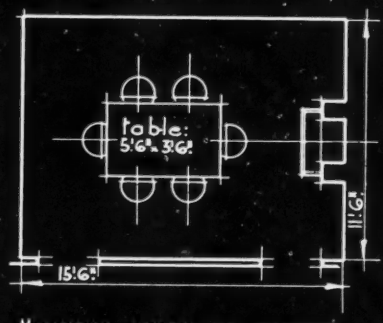

DIAGRAM OF TABLES DIAGONAL ARRANGEMENT

MINIMUM SIZES OF DINING ROOMS TO SEAT 6 PERSONS

LUNCHROOM TYPE.

Seating area required per person:- 10-12 sq.ft.
including kitchen & all service space :-
15.- 28 sq.ft.

Kitchen proper (excluding stores, pantries etc.) requires to be equal to 30% of the dining area.

a space 60'.0" x 14'.0" will allow a counter but no tables.

a space 60'.0" x 18'.0" will allow a counter & one row of tables.

CAFETERIAS.

area required per person . . . . . 8, 10 to 12 sq.ft.
including all counter and service space . . . 15. to 18. sq.ft.
Kitchen proper (excluding stores, pantries etc.) requires to be equal to 30% to 35% of dining area.
a seating area of 3500 sq.ft. requires 3000 sq.ft. of service area.

TABLES.	height of table		30"

RESTAURANT SEATING

•

THE first Sheet in this series, published with last week's issue, dealt with plumbing fixtures. There are others to follow on the same subject, but in order to give readers an early indication of the far-reaching scope of these Information Sheets, we turn now to another field, selecting one of several, relating to seating accommodation.

The story of how these drawings—in themselves exemplars of the draughtsman's art—came into existence in the office of Sir John Burnet, Tait and Lorne, and of how, far from grudging the broadcasting of information they had been at pains to tabulate for use in the course of their own practice, they embraced the proposal with enthusiasm, was told in editorial terms last week.

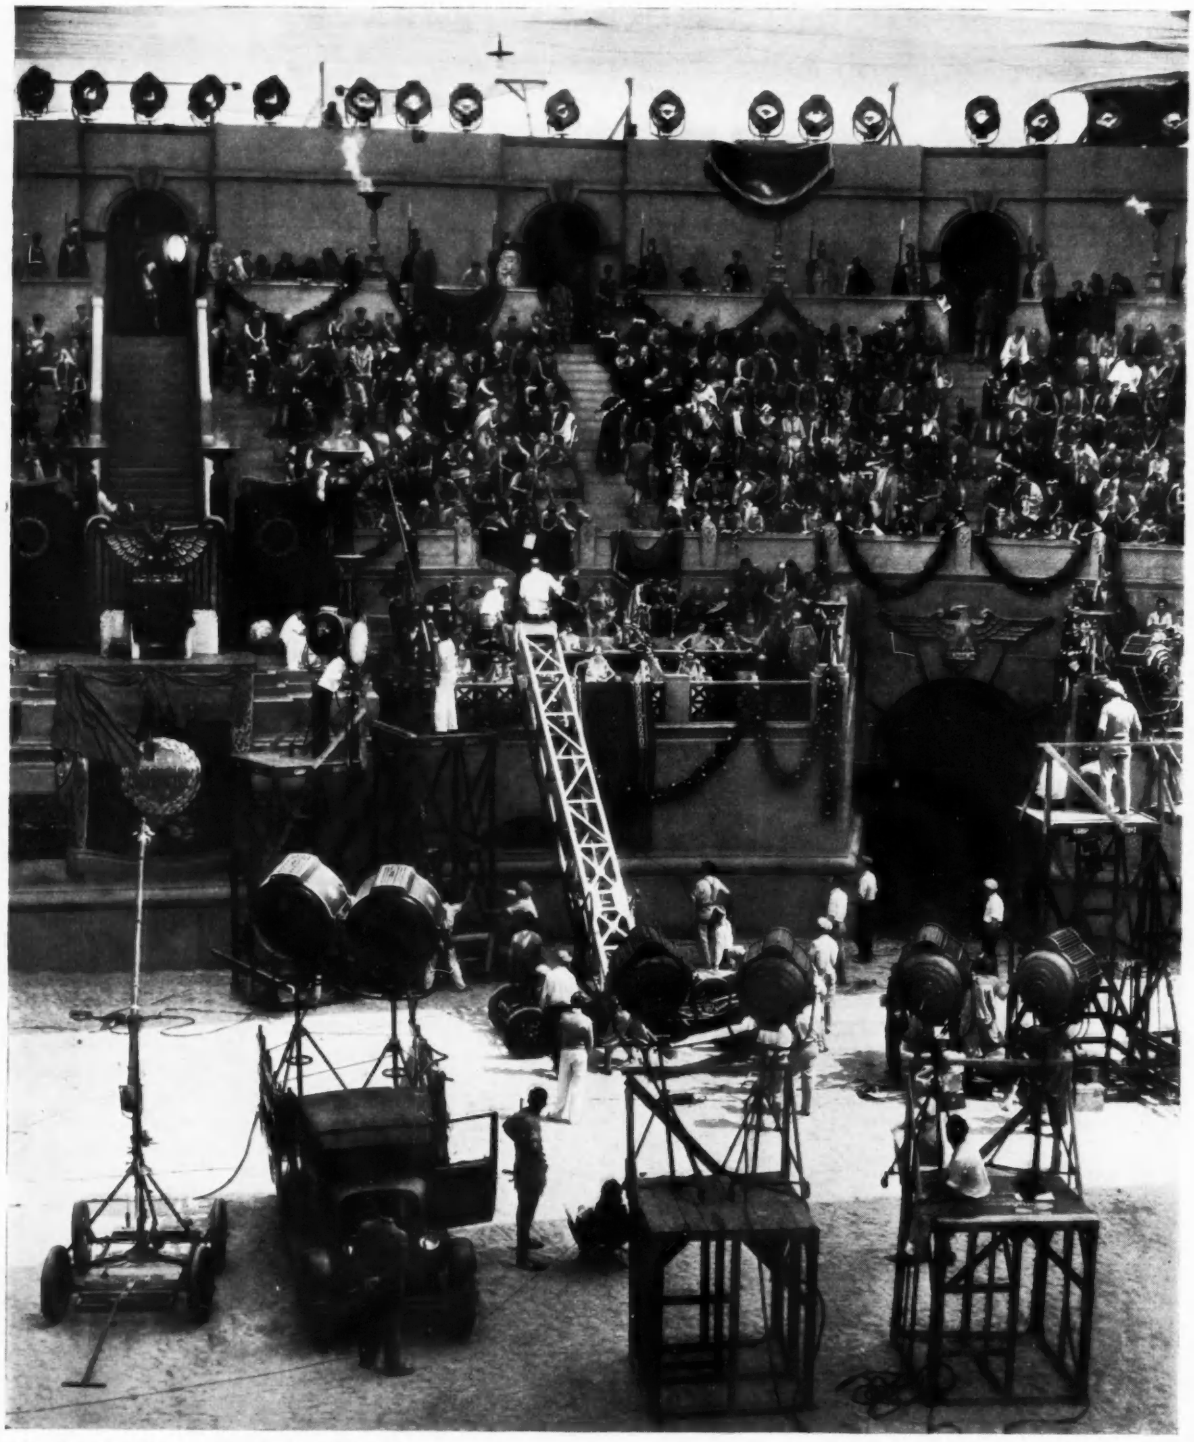
The very fact that these Information Sheets, of a type in common use in America and Germany, are new to us here points the moral of Mr. Howard Robertson's article in our New Year issue, urging the need for architects in this country to rationalize the activities in their own offices.

No one can avoid being impressed by the vital character of the information conveyed by these graphic and tabular means in the minimum of space with the maximum of clarity: they give, at a glance, just those very details which, though known to have been received some time or other, will usually take hours of search to unearth. Needless to say, their value depends on their being up to date.

It is arguable that one reason why, in the past, it has not been easy to collate such statistics, has been the reluctance of manufacturers in this country to perceive the advantages to them of standardizing the size and style of their catalogues and lists of goods, and the loose sheets by which, from time to time they are revised, so as to reduce the architect's problems in compiling a reference library. Standardization in this respect has long been adopted in other countries.

It was desired to present these Information Sheets in a standardized form, but no standard filing size has existed, hitherto, in Great Britain. The decision was therefore taken to make the reproductions the same size as the original drawings, which themselves follow the standard dimensions adopted by the American Institute of Architects, as being more convenient than reproduction to the double-page size associated with THE ARCHITECTS' JOURNAL Supplements.

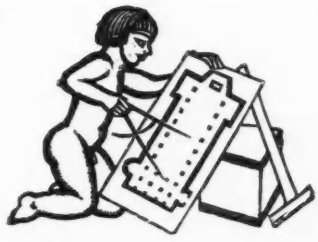
Until further notice, therefore, these Sheets will take the place of the second double-page plate that is usually issued, week by week.



CARLTON HOUSE TERRACE

DEFENCE COMMITTEE CHAIRMEN

THE Rt. Hon. Sir Arthur Steel-Maitland, M.P., and Mr. J. C. Squire, the Chairman and Vice-Chairman of the Carlton House Terrace Defence Committee, a meeting of which is to be held at Caxton Hall, Westminster, S.W., tomorrow, February 2, at 5.30 p.m. Over three hundred eminent men and women have joined the committee ; their names are given on page 172 of this issue. The meeting has been called for the purpose of appointing a small executive committee. Anyone interested in the fate of the Terrace is invited to attend.



ANCIENT ROME IN HOLLYWOOD

On Monday last, at the Carlton Theatre, London, the Paramount film, "The Sign of the Cross," was shown for the first time in Europe. This spectacle of pagan Rome in the days of Nero was produced on a gigantic scale. Practically the entire Paramount studios, covering many acres of land near Hollywood, were converted into a replica of the Imperial City.

The above photograph, taken during the shooting of scenes in the Roman Circus, shows the famous director, Cecil De Mille, in the saddle at the top of an extensible ladder. He had built a section of the stadium, large enough to seat his 7,500 supers, as well as the entire arena of 90,000 square feet. The streets, public squares and palaces, modelled upon the researches of several hundreds of years of excavations, took many months to build; they were destroyed by fire in ten minutes for the purpose of realistically depicting the burning of Rome.

The art director, Mitchell H. Leisen, sketched the whole of the sets, and no doubt it was worked out by the many architects whose services American film companies are always careful to retain. The English film world is not yet alive to the value of architects, but the day will soon come for the architects of this country to obtain a real footing in the film industry, with immense advantage to the film.

UNDERCONSUMPTION

"O WHAT a world to live in," says the song. What a world, indeed! There is a grim irony in the thought that while millions of our countrymen suffer the doubtful pleasures of semi-starvation the chief evil the world is said to be suffering from should be called Overproduction.

Overproduction, we are told, means that more goods are produced than we can afford to consume. Now the producer cannot afford to manufacture goods without selling them. He is therefore forced to produce fewer goods, and in order to produce fewer goods he employs fewer men. Men are thus thrown out of work, and as each man thrown out of work involves an equivalent loss of buying, or consuming, power, the producer again has to reduce his output, which throws still further men out of work.

The world is experiencing the fruits of this process at the present time. In the three chief producing nations there are today twenty million unemployed. Every employed person is horrified at the plight of these unlucky people. How the process is to be reversed is the study of politicians, economists and business men.

It is here that the technocrats step in. [We use the term to cover the thoughtful economists who put forward the technological argument before technocracy was heard of, for, according to *The Daily Express*, technocracy proper is temporarily under a cloud owing to the expulsion of its prophet from Columbia University. This, however, does not affect its main conclusions.]

Before the industrial revolution, say the technocrats, society was almost entirely dependent upon human labour for the satisfaction of its needs; today machines are being built which have anything up to nine million times the output capacity of the average human being working an eight-hour day. The old-fashioned brick-maker, for instance, never made more than an average of 450 bricks a day, yet a modern brick plant can produce 400,000 bricks a day per employee.

By the use of such figures, the technocrats show that, were production in the United States to regain its height of boom output, not more than 55 per cent. of the present unemployed would be reabsorbed into industry, and that, with the development of machine production, the physical wants of the world may be provided by fewer men than are at present employed. The more the world prospers the more widespread unemployment will be.

This is not a new thought. Over a hundred years ago the Luddites were saying the same thing, and their solution—to smash the machines—is, in effect, one which certain schools of thought advocate today. Most sensible people feel that it is a stupid solution, but at the same time if we do not smash the machines we are faced with this appalling problem of unemployment.

The fallacy, of course, lies in regarding unemployment as a disaster. The Luddites naturally saw it in this light because they knew that if they were thrown out of work they would starve, and so they saw the machine taking their livelihood away from them. But what they really wanted was not *work* but *pay*. In the future we shall have to revise our habit of thinking of pay in terms of work. Having got the machines to do the work for us, it is no good sitting back and wistfully starving to death just because we cannot think how to get paid for not working. Clearly a system must be evolved by which we reimburse ourselves handsomely for doing practically nothing. Unemployment is, in fact, not a tragedy but a triumph—the greatest triumph man has achieved, provided he can learn to profit—in every sense of the word—from his leisure. It was no doubt with these thoughts in the back of his mind that the Prince of Wales, when he broadcast, by wireless, an appeal for voluntary work in aid of the unemployed, said recently that the question of how to teach workless people to use their leisure was possibly the most vital problem of the age. And no doubt Mr. S. P. B. Mais's S.O.S. talks on the wireless will bear the same interpretation. To adapt a phrase from Mr. Wyatt's telling letter on page 171, the unemployed may be regarded as the shock troops of a new epoch.

It may seem paradoxical to lead up to a plea for more work by arguing that unemployment is the highest good; but that is exactly what we intend to do, and for a sufficiently obvious reason. The long-term view may show us that the phenomenon now called unemployment will eventually be regarded as leisure; nevertheless, while it remains a symptom of depression and not a product of prosperity, while it contributes to Overproduction (or, more correctly, to Underconsumption) it is indeed a disaster.

In the Building Industry it is our manifest duty—for the sake of the country and for the sake of the unemployed—to get work started again. We hope our readers have noticed that in the past few days all the principal daily papers have taken up the *Build Now* campaign—a building revival is the Industry's only real answer to its unemployed.

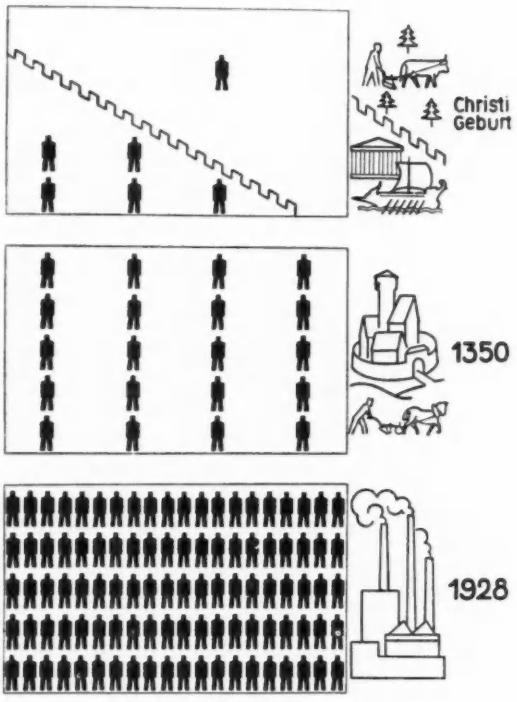
Therefore, we say, it is simply a matter of common sense to support the committee which has been formed to fight for more building. The Public Relations Committee of the Building Industry has started its work well and is already producing results. If any member of the Industry wishes to help his country, to help the unemployed, and at the same time to have the selfish pleasure of helping himself, let him contribute as generously as he can to its funds.

NEWS & TOPICS

●

OXFORD COMATOSE

PROFESSOR J. Arthur Thompson, addressing Oxford architects at the second annual dinner of the Doric Architectural Club, suggested that Oxford should interest itself in the development of some scheme for the training of architects.



*

It seems barely believable to me that Oxford, the depository of so much fine architectural achievement of the past, should be so barren of promise or interest today, and that, an instrument for fitting men and women to take a directing share of the world's affairs, it should so completely fail to make them aware of so humanizing and civilizing an art as architecture.

*

Perhaps, with Mr. C. H. B. Quennell, we may blame the school certificates for sending so many children blinded to the sense of creation to Oxford and the world. I hold English education responsible, through its examination bias, for a great deal of ugliness in life. Yet so far as architecture and the two universities are concerned, there must be something in the fact that Cambridge, with its school and theatre, is a centre of life and quite brilliant architectural achievement, and Oxford, without these, is reactionary and nearly dead.

*

An example of Dr. Neurath's picture-statistics referred to on this page. It indicates the population of Europe and phases of life and work at three periods of history. Each figure represents 5 million men, and the area of Europe is given as 11 million square kilometres.

Walter Goodesmith, A.T.C.(Syd.) A.R.I.B.A., A.R.A.I.A., who has been awarded the Travelling Scholarship and Gold Medal of the Institution of Structural Engineers for 1932. The subject set in the "Portland House" competition was a concrete church, an acoustic shaped shell being the outstanding feature in the winning design. In a similar scholarship he was awarded the Silver Medal in 1930. He is to travel on the Continent to study and report upon the latest developments in concrete structures, etc. Mr. Goodesmith received his architectural and engineering training in Sydney, N.S.W., where he is also a captain of engineers (Reserve of Officers) whose specialist subject is camouflage. He has been in London since 1929. Has made literary contributions to the technical press, notably "The Evolution of Design in Steel and Concrete." (in "The Architectural Review" Special Number on Steel and Concrete, November, 1932). He is Chairman of the Atelier of London University, and Hon. Secretary of the Australian Architectural Club in London.

PICTORIAL STATISTICS

The passing visit to England of Dr. Neurath introduces a form of pictorial statistics about which I think we are likely to hear more in the near future.

*

The system of which Dr. Neurath is the inventor will probably replace in great measure the tiresome masses of figures and graphs which generally fail to tell us what their authors so much want us to know.

*

Though the idea of pictorial representation of fact is not new it has been left to Dr. Neurath so to elaborate a simple trick as to make it capable of an exact representation of a wide field of fact, and to do this with artistry.

*

We may think over the matter for a time, and when we are paid a longer visit perhaps the R.I.B.A. may be induced to use this intelligent method of educating a dull-witted public to a rosier view of the work of architects.

*

THE GENTLE ART OF LETTERING

We are strangely driven these days. Thinking upon the lovely and gentle art of lettering, I recalled how much,

by talking and nagging, we turned the ordinary man to see some virtue in good Roman lettering. There has been indeed a steady improvement in this so long neglected art.

*

And yet, does the solution lie that way? Could we ever hope, in streets humming with buses and cars, in a world of cheap goods, sold by general display, to popularize a form of lettering whose very nature is a quiet repose? I think not.

*

Therefore, while we continue to curse roundly the patent vulgarity of the six-foot trade signature and every other commercial beastliness, we might teach the young to admire something with a greater capacity for usefulness than Roman lettering—say, that of the Underground.

*

THE REPROACH OF PADDINGTON

The conditions of tenants of the Church in the slums of Paddington, exposed last year by the Westminster Survey Group, have spread dismay throughout the national assembly. Action in this involved matter is difficult, but one has the feeling that if the Church does not set about removing the reproach at once, and effectively, it will be doing a smaller task for men than many a good town council.

*

It may require an Act of Parliament, it may cost much money and involve a loss to Church revenue, but it undoubtedly must be done.

*

THE RESERVATION

From a winter sale catalogue; a table cloth.

"No. 18. Treated in the modernist manner, this delightful design is *nevertheless* in the best of taste, and being woven by hand its beauty is made the most of."

There is something really ingenuous and nice about the departmental store's reception of modernism. My respected aunt sits upon my steel furniture with just such mental reservation.

OTHER NEWS ITEMS

WATERLOO BRIDGE

"His Majesty's Government have come to the conclusion that there is no alternative but to proceed to recondition the existing bridge (at an estimated cost of £685,000), and to suggest that the question of the design to be adopted for corbelling out the bridge should be referred to the Royal Fine Art Commission for their advice." The decision of the Government, conveyed in a letter from the Ministry of Transport to the L.C.C., and read by Sir Percy Simmons at a meeting of the latter body last week, has been received with much satisfaction by those who have for long advocated the retention of Rennie's Bridge. The Minister further states the he "would be prepared to make a grant of 60 per cent. of the approved cost of reconditioning the bridge."

The proposal and offer made by the Government will be considered at the meeting of the Improvements Committee of the L.C.C. to be held today, February 1. It is generally believed that the offer will be accepted, with, perhaps, some minor adjustments.

* * *

On the same day as the Government announced their decision, Lt.-Colonel J. Benskin, O.B.E., read a paper before the Royal Society of Arts on "The Bridges of London—Past, Present and Future." Discussing Waterloo Bridge, he said he came upon an interesting passage in Westall and Owen's *Picturesque Tour of the Thames*. It faces the aquatint of Waterloo Bridge and reads: "The plan for this Bridge was furnished by the late unfortunate Mr. George Dodd; but the late John Rennie, Esq., had the merit of executing the undertaking." He believed that there was a lesson to be learned from that slight slice of history. One could not help wondering if just a small proportion of the adulation which in recent years had been bestowed on Rennie might not have been spared for the unfortunate Dodd. He believed that the brothers Westall, and they were artists, would have given him a share.

CANADIAN TIMBER TRADE

The timber trade between England and Canada should benefit considerably by the visit to this country of Mr. Fensom, who has come on a special mission from the Canadian Hardwood Bureau, which works in close connec-

tion with the Ottawa Forest Products Research Laboratory. Mr. Fensom hopes to remove certain difficulties in the trade by ascertaining the actual requirements of the United Kingdom timber merchants in quality, size and marketing, and by extending a knowledge of Canadian resources.

REBUILD BRITAIN!

A "Rebuild Britain" movement was suggested by Sir Enoch Hill, President of the Halifax Building Society, speaking at the National Federation of Property Owners and Ratepayers' dinner, in London on Thursday. He said:

Although a step in the right direction has been taken by the introduction of the Housing Bill—a measure designed to encourage private enterprise in the erection of dwelling-houses—I feel that there is ample scope for a National Building Reconstruction Scheme.

We have only to look at the gloomy slums and at the out-of-date and inefficient blocks of offices which characterize most of our towns to realize that there are many directions in which the 250,000 builders now out of work could usefully be employed. The haphazard planning of many towns, with streets so ill-suited to modern traffic that they actually impede rather than facilitate business, is in direct opposition to progress.

When I pass through some towns I feel that a few carefully-placed sticks of dynamite would materially improve matters—they would ensure, at all events, some change.

What we need today is a movement to 'Rebuild Britain'—to make a clean sweep of all these unhygienic houses, makeshift offices and haphazard streets. Let us gather the finest brains in the building world—the architects, woodworkers, metal-workers, surveyors and builders—and let them work on broad lines, planning not for individual buildings but for towns as a whole.

This scrapping may sound drastic, but it is, after all, logical. We scrap old clothes and out-of-date or worn machinery, yet we cling to old and out-of-date buildings, condemning those who live and work in them to suffer from lack of comfort and modern amenities.

The erection of new, modern buildings would mean an increase in the real wealth of the country and value added to the land on which they are built. I do not think it impossible for the Government to be persuaded to consider this idea, and for some system of credits to be arranged to enable the scheme to be financed and carried out on national lines.

LOOKING FORWARD

On Monday, Mr. Howard Robertson, F.R.I.B.A., Principal of the Architectural Association School of Architecture, read a paper on "The Training of an Architect." The following are some of its points:—

In reviewing architectural development, I see three broad phases, which I would thus summarize:—

1: The past, when architecture and building construction were so clearly related as to become indivisible.

2: The period, dating from roughly the middle of the last century, marked by the development of structural engineering and the adaptation of architectural elements as a clothing to the novel structural system.

3: The period of the present, and presumably of the future, when architectural forms become again significantly expressive of engineering structure, when the architect co-operates with the specialist technician due to the complexities of the building system.

Architectural education has echoed the results of these three phases.

All signs point to a closer linking of architecture and engineering, and in engineering I include the developing science of mechanical equipment. I foresee the architect, not as an engineer, but as a designer, increasingly aware of engineering possibilities: and the engineer not as an architect, but widening his knowledge to embrace a better understanding of building construction, and thus coming better to realize architecture and the architect's task.

Engineering and mechanical equipment, which I would group as architectural engineering, must come more closely into the curriculum. The solution from the point of view of personnel is by no means easy, but gradually, with the help of Watford and changed methods of teaching and practice, a nucleus of special teachers in this subject will be formed.

The architect must be able to put up complete schemes of plan and finance. It is no use wringing our hands. We have to create work and we will do this only by offering ideas, which must be supported by facts.

RATES OF WAGES

On Monday, February 13, the speakers in the B.B.C.'s series of weekly talks and discussions on housing will be Colonel Sir Francis Freemantle, M.D., M.P., and Mr. R. Coppock, Secretary of the National Federation of Trades Operatives. They will discuss the question of wage-rates in the Building Industry.

* * *

The revised wages scales in the Building Industry came into operation today, February 1. They are given on page 188 of this issue.

PLANLESS LONDON

Sir Raymond Unwin, speaking at a London Labour Party week-end school on Saturday last, said London was one of the biggest examples of haphazard and planless growth. "There has" he continued, "been an enormous change in the character of residential property and a very great loss and wastage of value in degeneration, brought about by the intrusion of smelly factories which destroyed the amenities of a district.

"The conditions for which our streets were originally built have been entirely changed. We are now running what are practically locomotives at the speed of locomotives up and down all our streets that were made for horses and pedestrians to go along at a reasonable and quiet pace.

"It is not right, and it was never intended, that you should turn little children, running in and out of home and school doors, on to unprotected streets along which run locomotives at any sort of speed up to thirty and forty miles an hour.

"That can only be remedied by replanning these areas, and one of the first things to do in replanning is to work out a kind of technique in street planning, by which we can separate the use of streets. Certain streets should be used for passing traffic along as quickly as possible. These streets should not be used for shops, and the public should go out on to quiet streets which would only connect with the other streets at proper intervals."

R.I.B.A.

PERSIAN ARCHITECTURE

An exhibition of enlarged photographs of monuments of Islamic architecture in Persia, made by Arthur Upham Pope, Director of the American Institute for Persian Art and Archæology, will be formally opened by the American Ambassador at the Institute on Monday next, February 6, at 3.30 p.m.

The exhibition will remain open until Saturday, February 25, between the hours of 10 a.m. and 8 p.m. (Saturdays 5 p.m.). Admission will be free.

SOCIAL EVENING

On Monday evening next, instead of the usual sessional paper, a concert, organized by the Social Committee, will be held at the Institute. The concert will commence at 8.15 p.m. and the price of admission is 2s. 6d. Tickets can only be obtained by or through members of the Institute, who should apply to the Secretary, Social Committee, 9 Conduit Street, W.1. Early application is advisable.

THE ASSOCIATESHIP

Attention is called to the decision of the Council of the Institute that, owing to the present economic depression, and notwithstanding the regulation regarding twelve months' office experience, the Associateship of the R.I.B.A. shall not be withheld through inability to obtain such office experience. The time during which this concession is effective has now been extended until January 31, 1934.

The effect of the decision is that a candidate who has been unemployed will be able to become a candidate for election as an Associate at the same time as if he had been employed.

In the case of students of recognized schools of architecture, the length of time during which students have gained experience in architect's offices or the length of time during which they have been unable to obtain employment, in connection with their school course, may both be counted as part of the twelve months' experience required.

REBUILD BRITAIN!

DYNAMITE the slums!

Rebuild the cities of Britain on a plan worthy of the heart of a great Empire!

Set a quarter of a million unemployed builders on to the task!

Stir the sluggish arteries of trade by the vigorous influx of fresh purchasing power in the form of wages paid for work that the nation needs in the interests of its health!

This was the plan Sir Enoch Hill, president of the Halifax Building Society, set forth last night before the National Federation of Property Owners and Ratepayers.

We agree with every word of it.

The countryside of Britain is the loveliest of all the possessions of our people.

The slums in our cities are a national shame. They are the breeding ground of disease, discontent, despair.

We ought to waste no more time or money on reconditioning or re-patching these drab habitations. A great country like Britain ought not to tackle in a paltry way so great a problem as its slums.

We should blow them up.

We should build on their sites new dwellings, vast blocks of flats, not single buildings, but whole constellations of them, majestic, spacious, aired, lighted, warmed.

All these things the genius of modern architecture and construction can supply. Indeed, they have been already supplied by pioneers in this work in St. Pancras, London, and in Salford.

Other municipalities and building trusts should follow suit. If the planning and the construction of this work are handled on a nation-wide scale good homes can be put within the reach of the poorest citizen in the country.

We are not a little, struggling people dependent on the will of greater powers.

We are the masters of a quarter of the world's riches and resources.

We ought to take up the challenge of the slums and destroy them with the hands of giants.

THE MANCHESTER GUARDIAN,

MORE BUILDING

"Back to Sane Local Government"

Some authorities, like Bath, Bristol, and Portsmouth, are now taking things into their own hands and putting work under way. Bath states that within a week or two they will see to it that there is no skilled man unemployed, and few unskilled, in their town. Five new supercinemas are shortly to be built in London suburbs at a cost of approximately £750,000. Brighton is to build swimming-baths to cost £100,000. Leicester is build-

Mr. H. J. Bryant, secretary of the Building Industries National Council, stated yesterday that **£4,000,000** is to be spent now, or in the immediate future, on building construction. He added:

"There are signs on every hand that we are beginning to move slowly in the direction of a saner appreciation of the nation's need to-day."

WHERE WORK IS GOING

The following places, he said, are among those embarking in work schemes.

Brighton.—Swimming baths to cost £100,000.

Leicester. — £15,000 aerodrome and £25,000 tramway garage.

Bath.—Programme of £250,000.

Portsmouth.—To spend £300,000.

Bournemouth.—Cliff works, £2,700.

THE BUILDING DRIVE. Dynamite—thaw—boom—£4,000,000: such are some of the stirring terms which, during the last few days, have emerged, in the newspapers, from the verbal barrage launched to cover the assault upon the bogey, Economy—a barrage for which the Public Relations Committee of the Building Industries National Council is supplying munitions. "There is ample scope," said Sir Enoch Hill, in the speech of which a summary appears on the facing page, with extracts in the press cuttings above, "for a National Building Reconstruction Scheme."

THE HOUSING BILL

[By OUR SPECIAL CORRESPONDENT]

THIS week housing is "in the news." The Financial Resolution on the Government's Housing Bill will be considered in the House of Commons as soon as they reassemble on February 7. The B.B.C. are broadcasting a series of speeches and dialogues that are being severely criticized in some quarters, but which, at any rate, are arousing considerable interest. The presence of Sir Austen Chamberlain in the chair at the Housing Conference at the R.I.B.A. yesterday is another sign that political leaders recognize the importance of the problem.

It is advisable that the real significance of the Government's Housing Bill and its probable effects should be understood by the members of the architectural profession.

Sir Hilton Young, the Minister of Health, is not an expert on either housing or town planning. It is an open secret in Parliament that he was given his present appointment because of his financial experience, and therefore he could be of considerable assistance to the Chancellor of the Exchequer in guiding the financial policy of this country. His Bill is not one that will provide more houses. It is not, in itself, a constructive measure. As the very title shows it is a "Financial Provisions Bill."

The first clause proposes to abolish for ever the State grant offered under the Wheatley Act of 1924 and thereby brings to an end the fifteen years "gentlemen's agreement" for a housing programme. The second clause simply extends the powers given under the 1925 Act, and enables local authorities to share with the State in guaranteeing mortgages on houses intended for letting at comparatively low rents.

The Financial Resolution that will be considered by M.P.'s on February 7 expresses in legal language the bringing to an end of State subsidies, except those for slum clearances, and enables the Minister of Health to undertake to make contribution in certain cases towards losses sustained by authorities under guarantees given by them for facilitating the provision of houses to be let to the working classes.

The amendment to the Resolution is of special interest to architects and builders. It is to be moved by Lord Eustace Percy, M.P. for Hastings. He is one of the younger M.P.'s, who, after being President of the Board of Education in the late Conservative Government, is now out of office. He has taken a keen interest in the Building Industry. He spoke with considerable force at the International Building Congress some years ago, and his views on the need to create a Housing Corporation, independent of party politics, bear a close resemblance to those put forward by Sir Raymond Unwin to the Housing Conference. He has made no secret of his belief in the need of a substantially financed Housing Society. Accordingly, those who sat with him, when he was chairman of the Housing Sub-committee of the Private Members Economy Committee, are not at all surprised that he has given notice of an amendment to the financial resolution, so as to enable the State to contribute towards losses sustained by local authorities on a wider scale than is proposed by the Government.

Another resolution of interest to architects is to be moved by Sir Percy Harris, M.P. for Bethnal Green. There are fears felt in many quarters that, if building societies are allowed without check to finance any kind of houses, we shall see in the next few months a mushroom growth of badly designed bungalows and villas, spread out in most atrocious forms of ribbon development, and let at profiteering rents. Sir Hilton Young insisted during the debate on the second reading of the Bill that the only guarantee of housing standards would be the local authorities, and their consent is, of course, necessary for the guarantee for building society money. But is there any certainty that the Rural District Council of Marshmallows, for example, will pay any serious attention to the design of rural cottages, or to density? Accordingly, Sir Percy Harris has given notice to move a new clause which will make it obligatory upon any local authority giving a guarantee for loans advanced by a building society to specify the number and nature of the houses, the size of the rooms, the average number of houses per acre, the provision of a fixed bath, and the maximum rents to be charged.

Naturally the larger local authorities will pay strict attention to housing standards, but Sir Percy Harris and those who will vote with him consider that more safeguards are necessary. For Mr. Shakespeare, the capable Parliamentary Secretary of the Ministry of Health, let the cat out of the bag in debate when he ingenuously said: "If you are going to hand over to private enterprise, or to the great building societies, the function of building houses, and you hedge it round with all sorts of restrictions, you are defeating the very object you set out to secure."

Can the nation have it both ways? Will the building societies freely supply the capital unless they are given a free hand? On the other hand will it be really in the national interest if the expenditure of possibly £100,000,000 during the next two or three years leads to a lowering of housing standards, deterioration of the outskirts of our towns, and the desecration of the countryside? The Government will have to face these questions in the House of Commons during February, and architects will anxiously watch the outcome of the debates.

COMPETITION NEWS

Travelling Scholarship

The award of the Portland House Travelling Scholarship for 1932 was announced at a meeting of the Instition of Structural Engineers, held on Thursday last, as follows:

SCHOLARSHIP AND GOLD MEDAL: Mr. Walter M. Goodesmith, Graduate; SILVER MEDAL: Mr. D. Bethune-Williams, Graduate; BRONZE MEDAL: Mr. C. Wright, Associate Member.

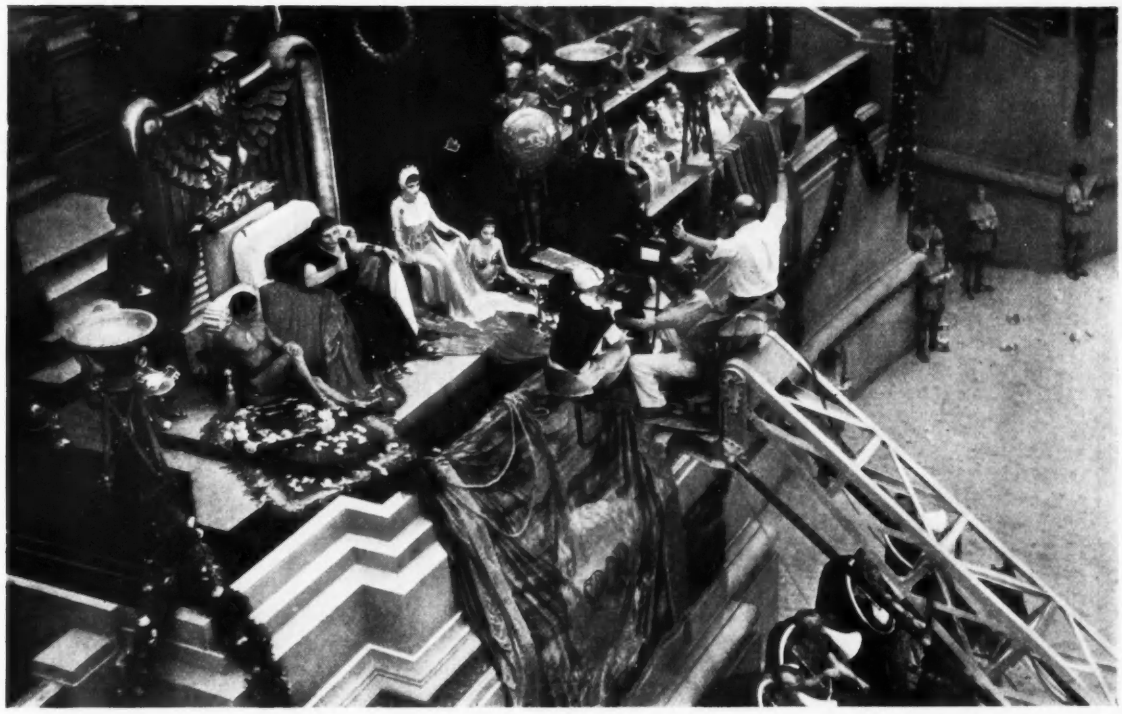
The value of the scholarship, as originally established, was £300, but it was afterwards decided to divide the competition into two sections: one for £150 to be held in 1932, and the second for £150 to be held in 1933, with a different subject set. The subject set for the 1932 Scholarship was the design of a concrete church. The first part of the competition was held in September, and the finished drawings were submitted by the candidates on November 23.

The drawings will be exhibited at the Institution during the next few weeks. Details of the second part of the Scholarship will be announced shortly.

Competitions Open

March 24.—Façade to a newspaper office in grey Cornish granite, for the Cornish Quarry Masters' Association. Open to all architects, architects' assistants, and architectural students. Assessors: A. B. Knapp-Fisher, F.R.I.B.A. (President of the Architectural Association); G. Grey Wornum, F.R.I.B.A.; and Howard Robertson, F.R.I.B.A. Also, two members of the Cornish Quarry Masters' Association. First prize, £50. The design, etc., is to be sent to the Secretary of the Architectural Association, 34-36 Bedford Square, London, W.C.1, by Friday, March 24, noon. Full particulars of the competition may be obtained from the Secretary, Architectural Association, 34 Bedford Square, London, W.C.1.

***May 31.**—Sending-in Day. Layout of a suburb on the River Escaut, Antwerp. £2,400 in prizes (1st, £800).

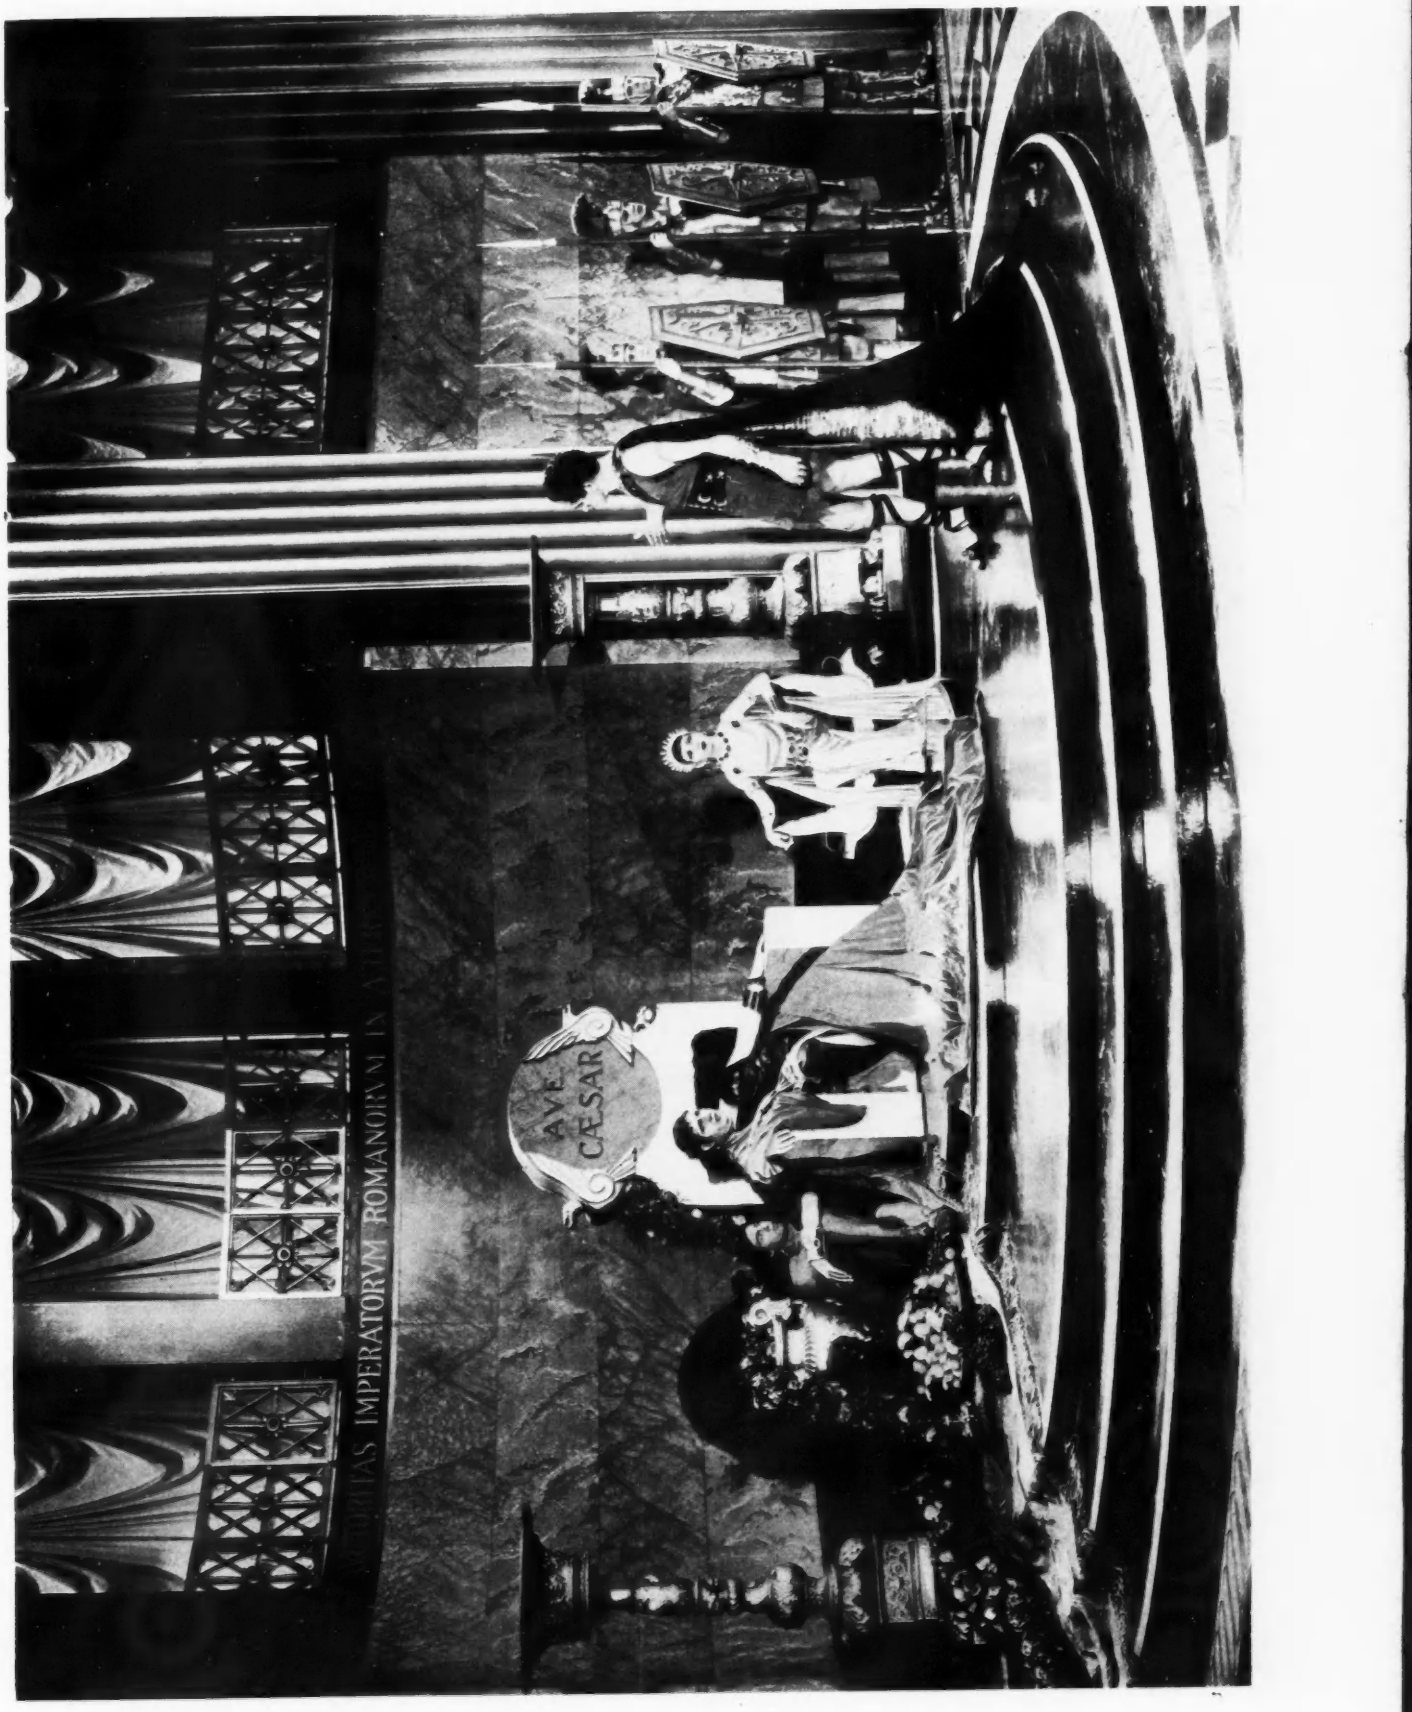


**Full Particulars of the above competition were published in our issue for December 7, 1932.*

The Humber Bridge

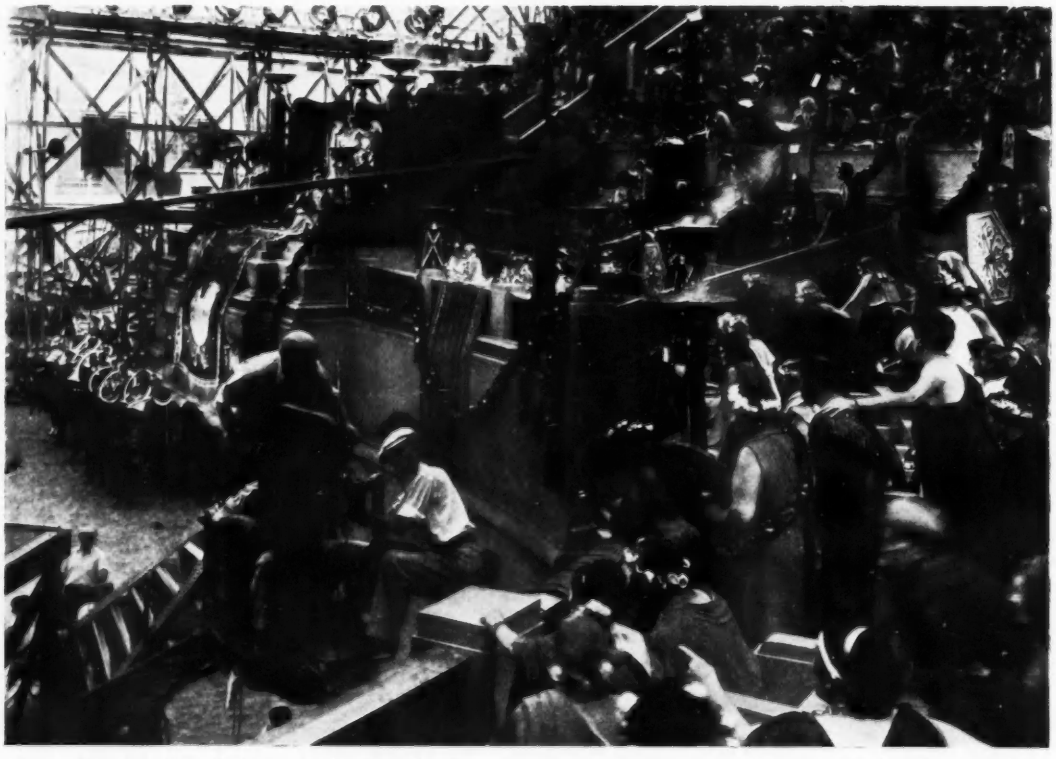
The Hull City Council has approved amended proposals for the construction of the Humber Bridge, estimated to cost £1,500,000.

ANCIENT ROME IN HOLLYWOOD



A Roman holiday! The photograph at the top of the page, a sequel to the frontispiece to this issue, depicts a fight to the death between forty women, all over six feet in height and armed with scimitars, and forty dwarfs who are carrying three-tined spears. On the throne can be seen Nero (played by the English actor, Charles Laughton). Below is a close-up view of the throne, with Cecil B. De Mille, the director, accompanied by the cameraman, giving instructions to the cast. On the following pages are reproduced further scenes from the Paramount film, "The Sign of the Cross," which was given its European première in London on Monday last.

ANCIENT ROME IN HOLLYWOOD: POPPÆA'S BATH OF MILK



Five hundred gallons of milk, strewn with rose petals, were used for the Imperial bath of Poppæa (played by Claudette Colbert). The bath was constructed upon data unearthed during recent excavations. Approximately 15½ feet long, 7 feet wide and 5 feet deep, it was built of Roman tiles faced with marble. Milk spouts into it from a lion's head. On the facing page is reproduced the interior of Nero's Palace of Gold. Here we see the Prefect of Rome (Fredric March) pleading for the Christian girl, Mercia (Elissa Landi). On the right of Nero is the Empress Poppæa. It is interesting to note that Charles Laughton, who plays the rôle of Nero, has had his nose transformed into a Roman one by the judicious use of wax make-up. These two lavish settings again demonstrate the scope for the extensive employment of architects in our film industry.

AVE
CÆSAR

ANCIENT ROME IN HOLLYWOOD

Branded by fire! Here is shown the shooting of a dungeon scene in which a Christian boy is being tortured by Roman soldiers. Note the director and camera-man up aloft on their girder-ladder on the right and the powerful arc lamps illuminating the set. Approximately 14,000 ampères were consumed by the 329 giant lamps used for lighting the arena scene; some of these can be seen in the photograph below, taken looking towards Nero's throne, with Mr. De Mille and the camera-man once more shooting a close-up from their mobile stand.

LETTERS FROM READERS

In a Land of Plenty

SIR,—As one of the unemployed, allow me to thank and congratulate you for your New Year Issue.

It is essential that the gravity of the problem of unemployment, and all that it entails, should be brought to the notice of the nation.

Unemployment to the nation is what tubercular disease is to the individual; it is gradually and insidiously eating its way into the vitals of the nation.

An Irishman once said: "People only open their eyes when their brains are bashed out." Unfortunately, that, to a large extent, is true.

I know an individual whose services were dispensed with, owing to slackness; his employers said they were sorry. He replied:

"I am sorry for myself, but I am sorrier for you."

"Why?" they asked.

He replied, "You pay rent for your offices, rent for the space I have occupied. You have no one now occupying that space; the consequence is that you are getting no return for your outlay. You are losing that amount. Small, I admit—only a leak, a sign of weakness; but, if that leak extends the bank may give way. In other words, your business is declining. I shall be totally unemployed, but you will be relatively unemployed, and unless you take steps to check that tendency you yourselves may be overwhelmed."

For ten years I was officially employed—I say officially—at one of the County Asylums. When I look round and see poverty, want, destitution and despair existing, unnecessarily, in a Land of Plenty, I am almost led to believe that there is more sanity in insanity than there is in sanity.

If the present Government administered the whole of the country in the same way as lunatic asylums are at present administered, the administration would be less brutal than it is now.

There is a tendency to view the unemployment question from a maudlin and sentimental standpoint. That is absolutely wrong. Unemployment is a dangerous, insidious, and will be ultimately a fatal, national disease. I would ask everyone to look at it from a personal standpoint, before they themselves become defenceless and engulfed.

As one of the unemployed I do not ask for charity. I want no one to give me a pair of their old trousers, or an orange. What I do ask is for everyone to treat the problem as an individual problem, and to realize that they of themselves are skating on very thin ice. By doing this, they will be assisting the unemployed, who are but the shock troops in an economic war—a war in which no one will win and all will be losers, and therefore a state of things which should be brought to a speedy and immediate termination.

When one considers all the sentimental tosh and tripe that has been uttered regarding unemployment, I feel I cannot conclude without thanking all the contributors to this admirable issue for having, in the limited space at their disposal, shown that the problem is not insuperable if honesty, integrity, and effort is brought to bear upon the subject.

A. W. WYATT

[*This letter is given point by the fact that Mr. Wyatt is a member of an illustrious architectural family, being a descendant of the great James Wyatt.*—ED., *A.J.*]

Blowing Hot and Cold

SIR,—I feel very grateful to Mr. A. H. Dungay for his very kindly reference to my letter in last week's issue of the JOURNAL, but I do not follow him when he says it was contradictory, and after careful thought the only conclusion I can come to is that he has got so frightfully cold he has become frozen. The weather is undoubtedly very trying just at the present time.

GERALD MCMICHAEL

The R.I.B.A. Building

SIR,—There are loyalties to family, friends and immediate associates, and in a wider sense to the general community and one's country.

I submit that loyalty to the architectural profession as a whole, and to the public, demands a further consideration of the façade to Portland Place, an illustration of which appeared in your JOURNAL for December 7, 1932.

There seems to be a grave lack of proportion and correlation between the terrific hole in the centre, surrounded by smaller holes, to the total surface area, and the same exaggerated disproportion between the small figures perched on the slender columns and the bas-relief over the central opening.

Now that it has been decided to curtail the size of the building and to retain the northernmost house, I suggest to the Council of the Institute that they should give heed to Mr. Voysey's suggestion, made, I believe, some twelve months ago in your JOURNAL, that the new building should be treated as an isolated unit. This house should be pulled down to make way for a court and garden (imagination can suggest a charming architectural treatment). Would Mr. Wornum not welcome such an opportunity? Additional light would also become available.

The façade as designed can never form a portion of a general scheme and the logical treatment would now appear to be an isolated building.

F. WORTHINGTON SIMON
(THE BRITISH CLUB, ALASSIO)

Information Sheets

SIR,—We consider the idea of the Information Sheets, of which you publish the first in this week's issue of the JOURNAL, generally to be excellent.

In our office we have certain tabulated information on various crafts, trades, and so on, which prove to be very useful.

A system which you propose, accompanied by clear drawings, should be of very great value to any architect's office as a standard reference.

We might suggest the following:—

(*a*) The sheets be of stiff paper.

(*b*) A binding margin allowed.

(*c*) Printing to be black on white or grey paper.

(*d*) Any special points regarding the illustrations be printed on the back of sheet so as to avoid overcrowding the drawings.

WILLIAM AND EDWARD HUNT

[*With regard to the suggestions made by the above correspondents:* (*a*) *It has been found by experimenting with both stiff and flimsy papers that the latter is more suitable for its purpose.* (*b*) *A binding margin is allowed.* (*c*) *This question is really a matter of opinion.* (*d*) *Points regarding the information sheets* are *printed on the back of each.*—ED., *A.J.*]

SIR,—I was pleased to notice in your issue for January 18 the first of a series of Information Sheets. For many years I have wanted technical information that was really at hand when the need arose, and to have a convenient file of these sheets will surely ease the labour of this trying part of our work.

In a similarly concise manner you have in the past so successfully dealt with details of architectural design that I am sure your efforts in the technical field will be equally appreciated and successful.

WALLACE MARCHMENT

SIR,—The action of Sir John Burnet, Tait and Lorne in permitting the publication of their Information Sheets accords with the highest traditions of the profession. Their generous gesture

adds yet one more item to the debt which architects and architecture owe to this most happy band of master-craftsmen.

To the enterprise and vision of THE ARCHITECTS' JOURNAL for its part in this undertaking "full marks" are also due.

Every practitioner and each member of his staff will have good cause to be grateful for these Sheets long before their publication has come to an end.

SYDNEY TATCHELL

Roofing Tiles

SIR,—Can you inform me where I can obtain a plain roofing tile (10½ ins. by by 6½ ins.) machine pressed in green with a glazed surface? I have seen some on the outskirts of North London, but have been unable to trace the makers. Perhaps you or some of your readers could give me the information.

W. M.

Carlton House Terrace

A meeting of the Carlton House Terrace Defence Committee will be held at Caxton Hall, Caxton Street, Westminster, S.W., tomorrow, February 2, at 5.30 p.m. The Right Hon. Sir Arthur Steel-Maitland, the chairman of the Committee, will preside. Following is an up-to-date list of the members of the Committee, of which Mr. J. C. Squire is the vice-chairman, and Miss M. I. Batten the secretary:

Sir John Sandeman Allen, M.P.; H. V. Ashley, F.R.I.B.A.; Robert Atkinson, F.R.I.B.A.; T. H. R. Adams, F.R.I.B.A.; C. R. Ashbee, F.R.I.B.A.; M. B. Adams (fifty-one years Editor, *Building News*); Maxwell Ayrton, F.R.I.B.A.; C. B. J. Athoe; Herbert Alexander, R.W.G.S.; Major G. B. J. Athoe; Martin Armstrong; F. N. Astbury, A.R.I.B.A.; Lord Astor.

Sir Alfred Beit, M.P.; Sir Adrian Baillie, M.P.; Sir Robert Bird, M.P.; Alfred Bossom, M.P., F.R.I.B.A.; C. E. Brocklebank, M.P.; P. G. T. Buchan-Hepburn, M.P.; Sir John Burnet, F.R.I.B.A.; R. Bernays, M.P.; H. Harris Brown; Darcy Braddell, F.R.I.B.A.; L. H. Bucknell, F.R.I.B.A.; H. Buckland, F.R.I.B.A.; Laurence Binyon, Keeper British Museum; Robert Byron; Clive Bell; Hope Bagenal; Muirhead Bone, LL.D.; A. P. Butler; Christian Barman, Editor, *Architectural Review*; John Betjeman, Sub-Editor, *Architectural Review*; Lady Baxter; James Bone, London Editor, *Manchester Guardian*; Gerald Barry, Editor, *Week-End Review*; Gordon Bottomley; Clifford Bax; J. M. Bulloch, LL.D.; Hon. Maurice Baring, O.B.E.; Reginald Blunt, A.K.C.; Lawrence Binyon, C.H.; Miss L. Baylis, C.H.; Leonard Barmit; Rt. Hon. Augustine Birrell, K.C.; E. F. Benson; J. I. C. Bodger; Lord Berwick; Viscount Bearsted; H. Martin Benson; Arnold Bax; John Betts, Joint Editor of *The City Press*.

The Viscount Castlereagh, M.P.; The Marquess of Crewe, P.C., K.G.; Major W. H. Carver, M.P.; Captain H. Crookshank, M.P.; A. C. Caporn, M.P.; Sir George Clausen, R.A.; Beresford Chancellor, F.S.A., HON. A.R.I.B.A.; G. K. Chesterton, F.R.S.L., LL.D. (Edin.), D.LITT. (Ireland); Hon. E. Charteris, K.C.; Prof. R. S. Conway, LITT.D.; R. Cory; W. G. Constable, Director Courtauld Institute of Art; C. R. V. Coutts, F.I.A.; Lord Charnwood; Miss Cazalet, M.P.; Harold Cox; Cyril Carter; Rt. Hon. Sir Austen Chamberlain, K.G., K.C., M.P.; Lord Cushendun, P.C., J.P.; W. D. Caröe, F.R.I.B.A.; Col. C. de W. Crookshank, M.P.; Rev. H. Costley-White, D.D., Headmaster of Winchester School.

Lord Darling; T. L. Dale, F.R.I.B.A.; Walter de la Mare; Guy Dawber, A.R.A., F.S.A., Chairman, C.P.R.E.; John Drinkwater; Sir William Davison, M.P.; The Marquess of Dufferin and Ava; Lord Dickinson; Alfred Denville, M.P.; Major J. Despencer-Robertson, O.B.E., M.P.; Sir Gerald du Maurier.

Viscount Esher, Chairman, S.P.A.B.; Charles Emmott, M.P.; Joseph Emberton, F.R.I.B.A.; Miss M. E. Edwards; Frederick Etchells, F.R.I.B.A.; Sir Edward Elgar, Bt., O.M., K.C.V.O.; Simon Elwes; Capt. G. S. Elliston, M.C., M.P.

Rt. Hon. H. A. L. Fisher, F.R.S., Warden, New College, Oxford; Sir Walter Fletcher, K.B.E., C.B., SC.D., F.R.C.P., F.R.S.; Sir Banister Fletcher, PP.R.I.B.A.; M. Fletcher; E. Maxwell Fry, A.R.I.B.A.; Hanslip Fletcher; M. D. Forbes; Lord Farrar; Sir Johnston Forbes-Robertson; Herbert Furst; Edward B. Fielden, M.P.

Sir E. Graham-Little, M.P., M.D., F.R.C.P.; J. C. M. Guy, M.P., M.C.; Sir Robert Gower, M.P., O.B.E.; Sir Edward German; Mark Gertler; J. L. Garvin, Editor, *The Observer*; John Gloag; R. H. New Standards for Ventilation

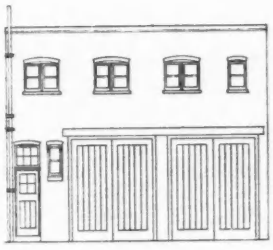
Ventilation and the need for new standards will be the subject of a discussion which is to take place at the Royal Sanitary Institute, 90, Buckingham Palace Road, London, S.W.1, on Tuesday, February 14, at 5.30 p.m.



Sir Leonard Hill, LL.D., F.R.S., M.B., will preside, and the discussion will be opened by Dr. J. S. Owens, ASSOC.M. INST.C.E.

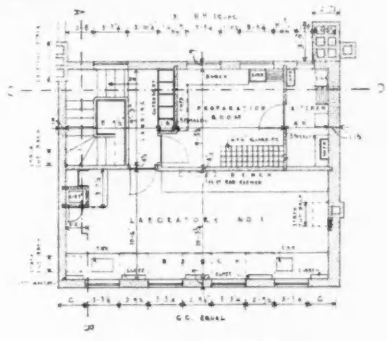
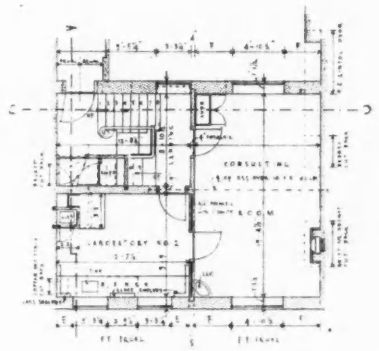
COURTENAY THEOBALD
AND
DEANE SKURRAY,
ARCHITECTS

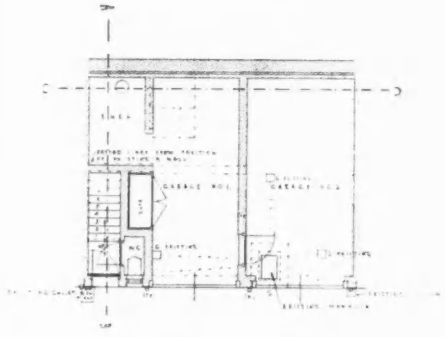


FIRST FLOOR PLAN



GROUND FLOOR PLAN

To meet the needs of a specialist's expanding practice, what had been a chauffeur's flat, at 47 Wimpole Street, was replanned, as to first floor and stairs, and a second story added, as shown in the plans, before (black) and after (grey). An attendant showing in a patient communicates by a bell with a secretary in lab. No. 2, who ushers him into the consulting room. The doctor is in close touch with his assistants in lab. No. 2, and they, in their turn, with the second floor, by telephone and hand-lift, used for sending down the results of experiments or other preparations required.



All floors are paved with rubber with a wide black border and wood teak skirting. Every available space is used for cupboards and shelves, each designed for a definite purpose. All doors are flush, and cupboards and drawer frames are edged with teak. The bench in lab. No. 1, where a dark background is required for microscopic observation, is covered with waxed teak and egg-shell black tiling; that in lab. No. 2 with white opalite and white glazed tiling. Shelves are of plate glass with chromium-plated brackets; arched taps and other sanitary fittings are also chromium-plated. The staircase walls and ceilings are enamel painted. The stairs are of reinforced concrete, with teak treads and risers.

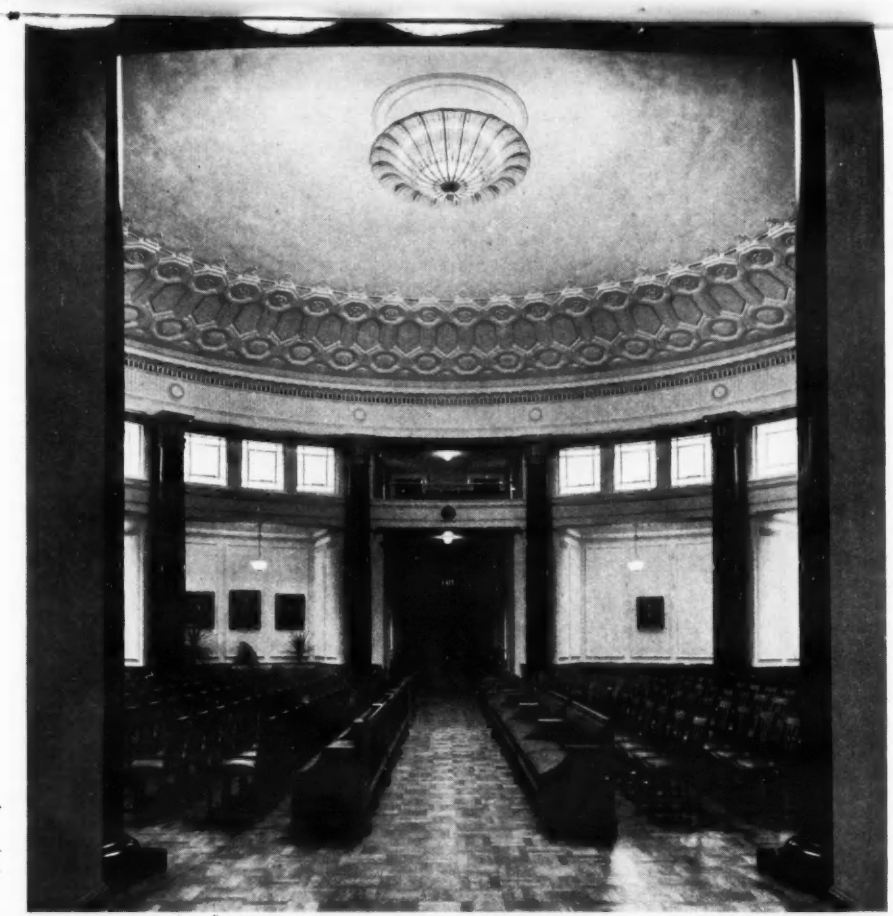
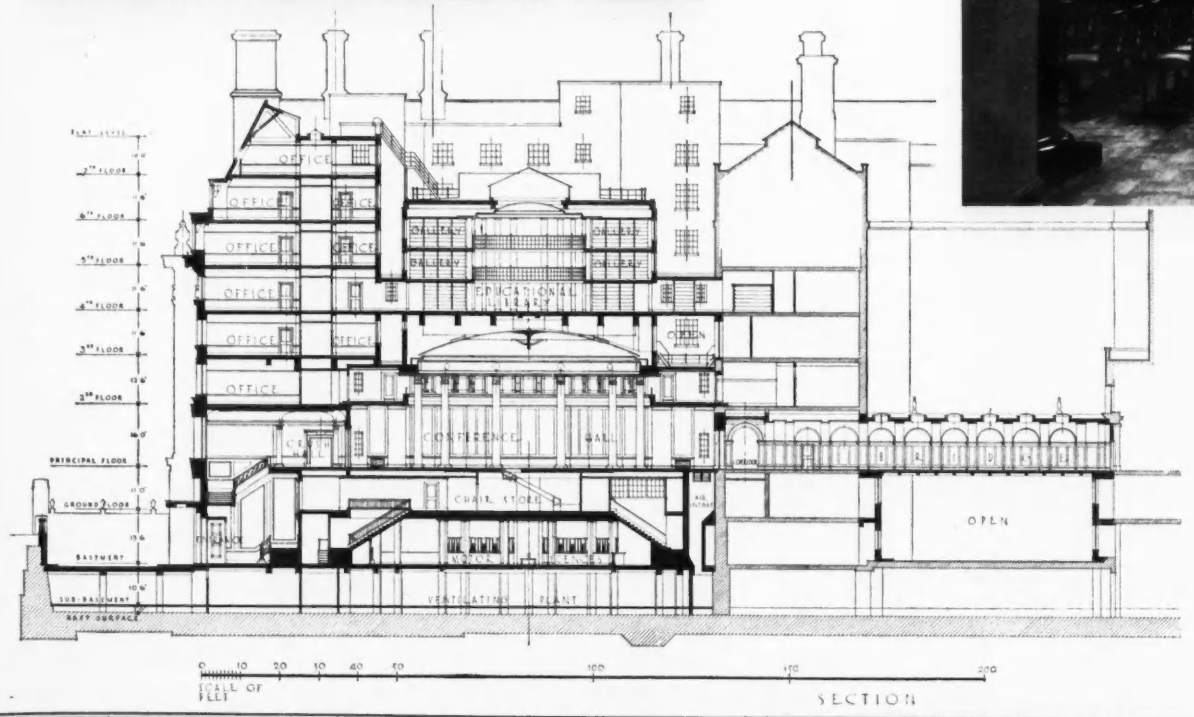
C

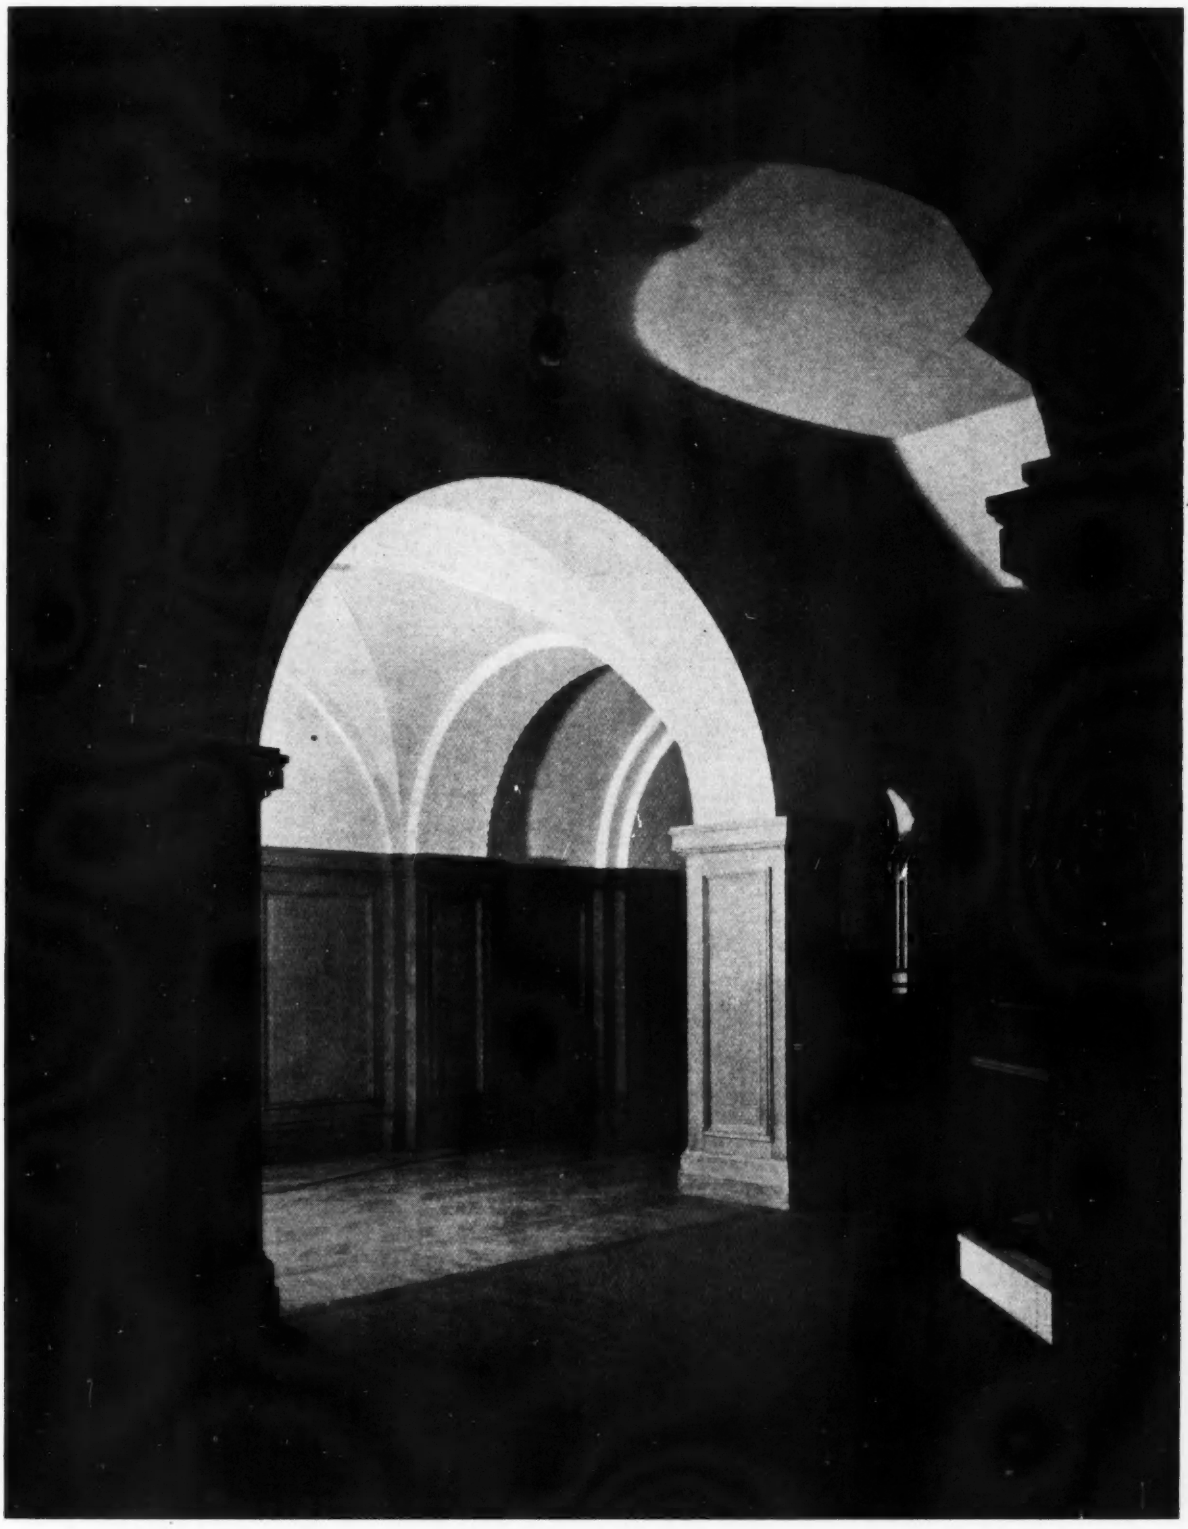
LONDON COUNTY HALL • NORTH WING • BY RALPH KNOTT AND E. STONE COLLINS

[*This photograph was taken from across the river by means of an infra-red plate, in the misty weather of last Friday, when the details of the building was invisible to the eye.*—ED., *A.J.*]



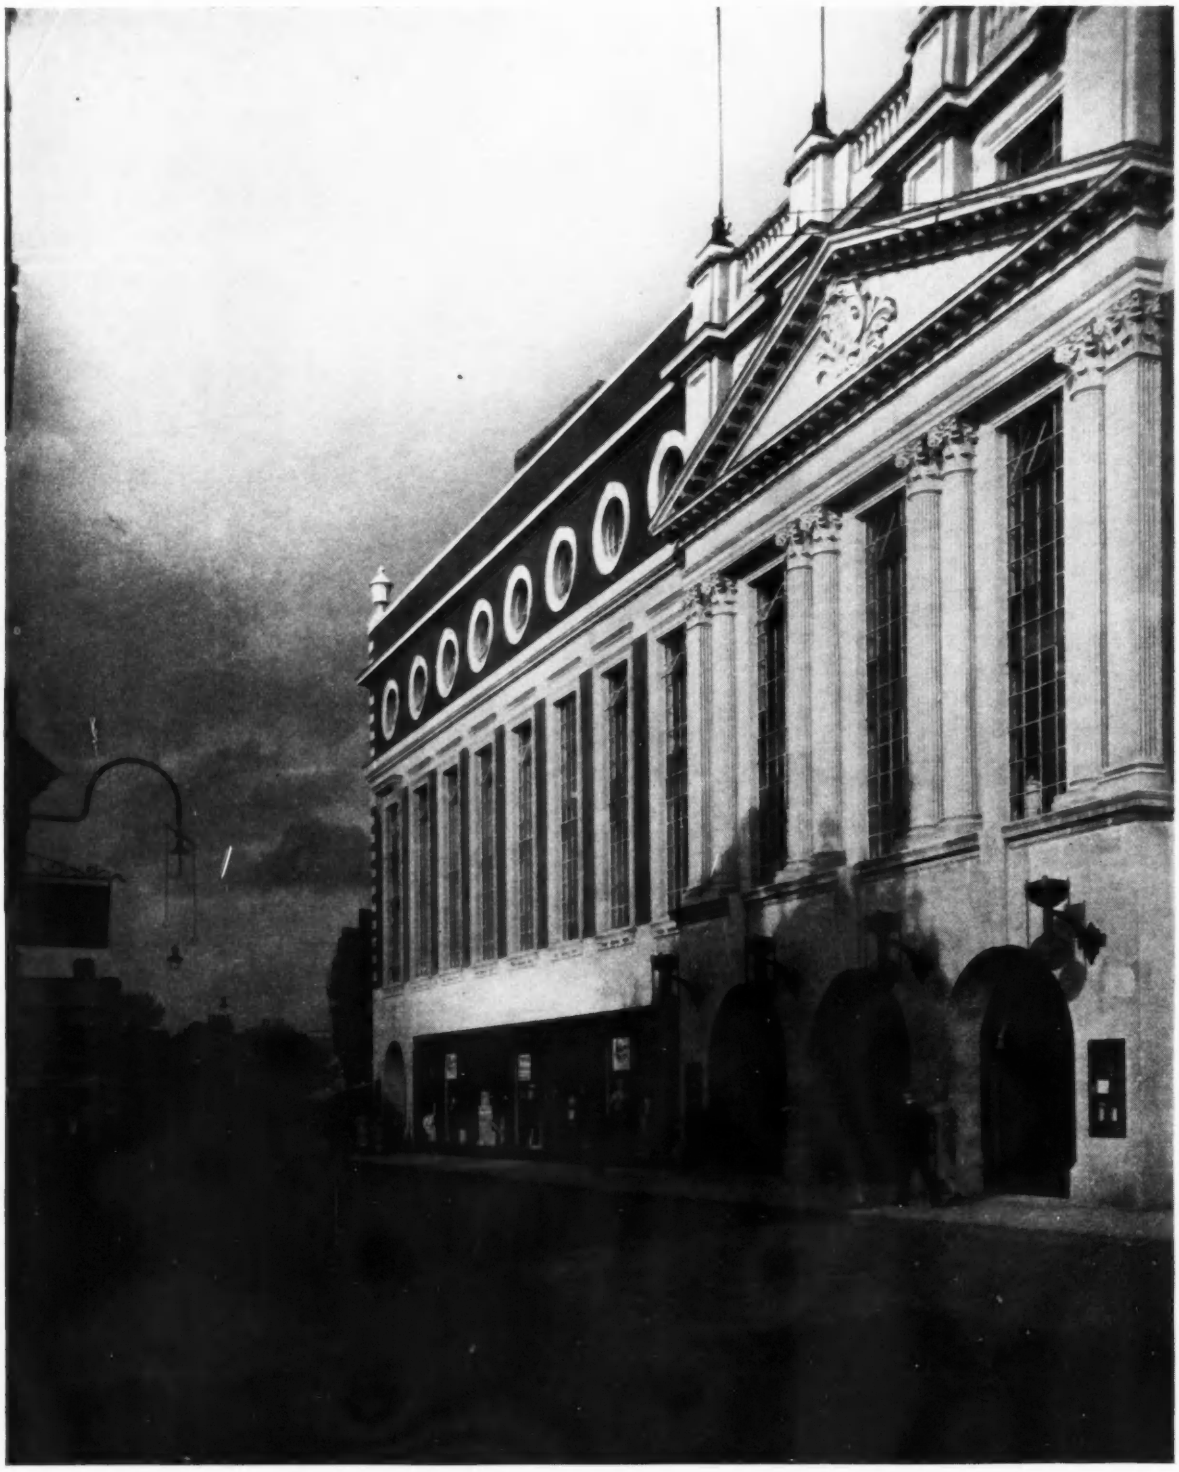


London County Hall was opened by the King, accompanied by the Queen, in July, 1922, rather more than ten years after his Majesty had laid the foundation stone. There is to be no official opening of the northern wing, but, to mark its completion, the Prime Minister will be entertained at luncheon by the Chairman on March 1 next, in the new conference hall, illustrated above.



This is the central apartment of the new wing, which consists of blocks 13, 14 and 15, and its relation to the remainder of the building is seen in the plan on the facing page. It has over it the library for 80,000 volumes, also shown, and is surrounded by a number of committee rooms. There have been considerable modifications of the original design with which the late Ralph Knott won the competition (and a prize of £30,000), for requirements have changed in the intervening twenty-six years; after his death, in 1929, the work was carried on by his lifelong friend and partner, E. Stone Collins, who, in partnership with Llewellyn Roberts, has practically designed the whole of this new section. Its cost approaches £700,000, bringing up the total expenditure to nearly £4,000,000, and it adds some 200 rooms to the existing 700.

LONDON COUNTY HALL • THE NEW NORTH WING •



An oak doorway in one of the committee rooms, carved by A. H. Wilkinson.

BY THE LATE RALPH KNOTT AND E. STONE COLLINS

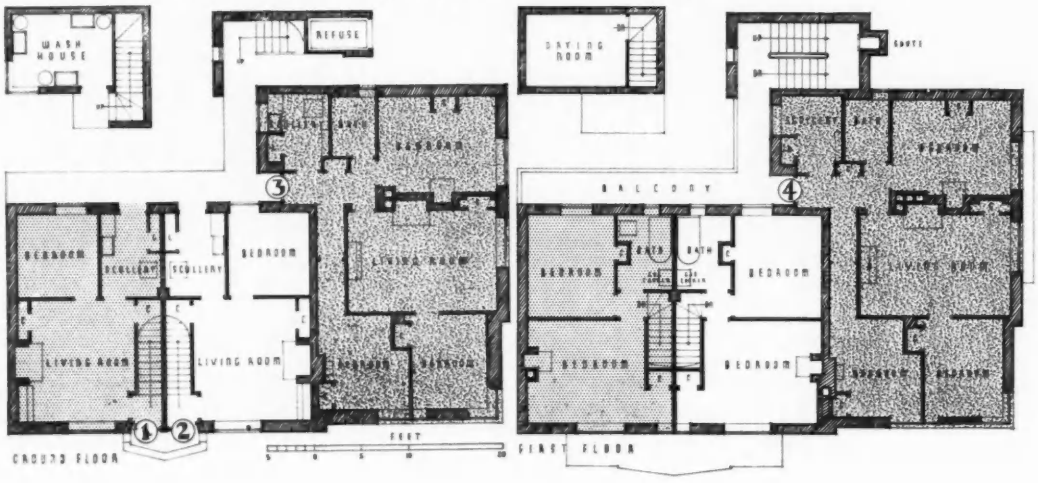
The staircase landing on the principal floor, at the north-east corner of the new extension.

BENTALL'S STORE KINGSTON-UPON-THAMES:

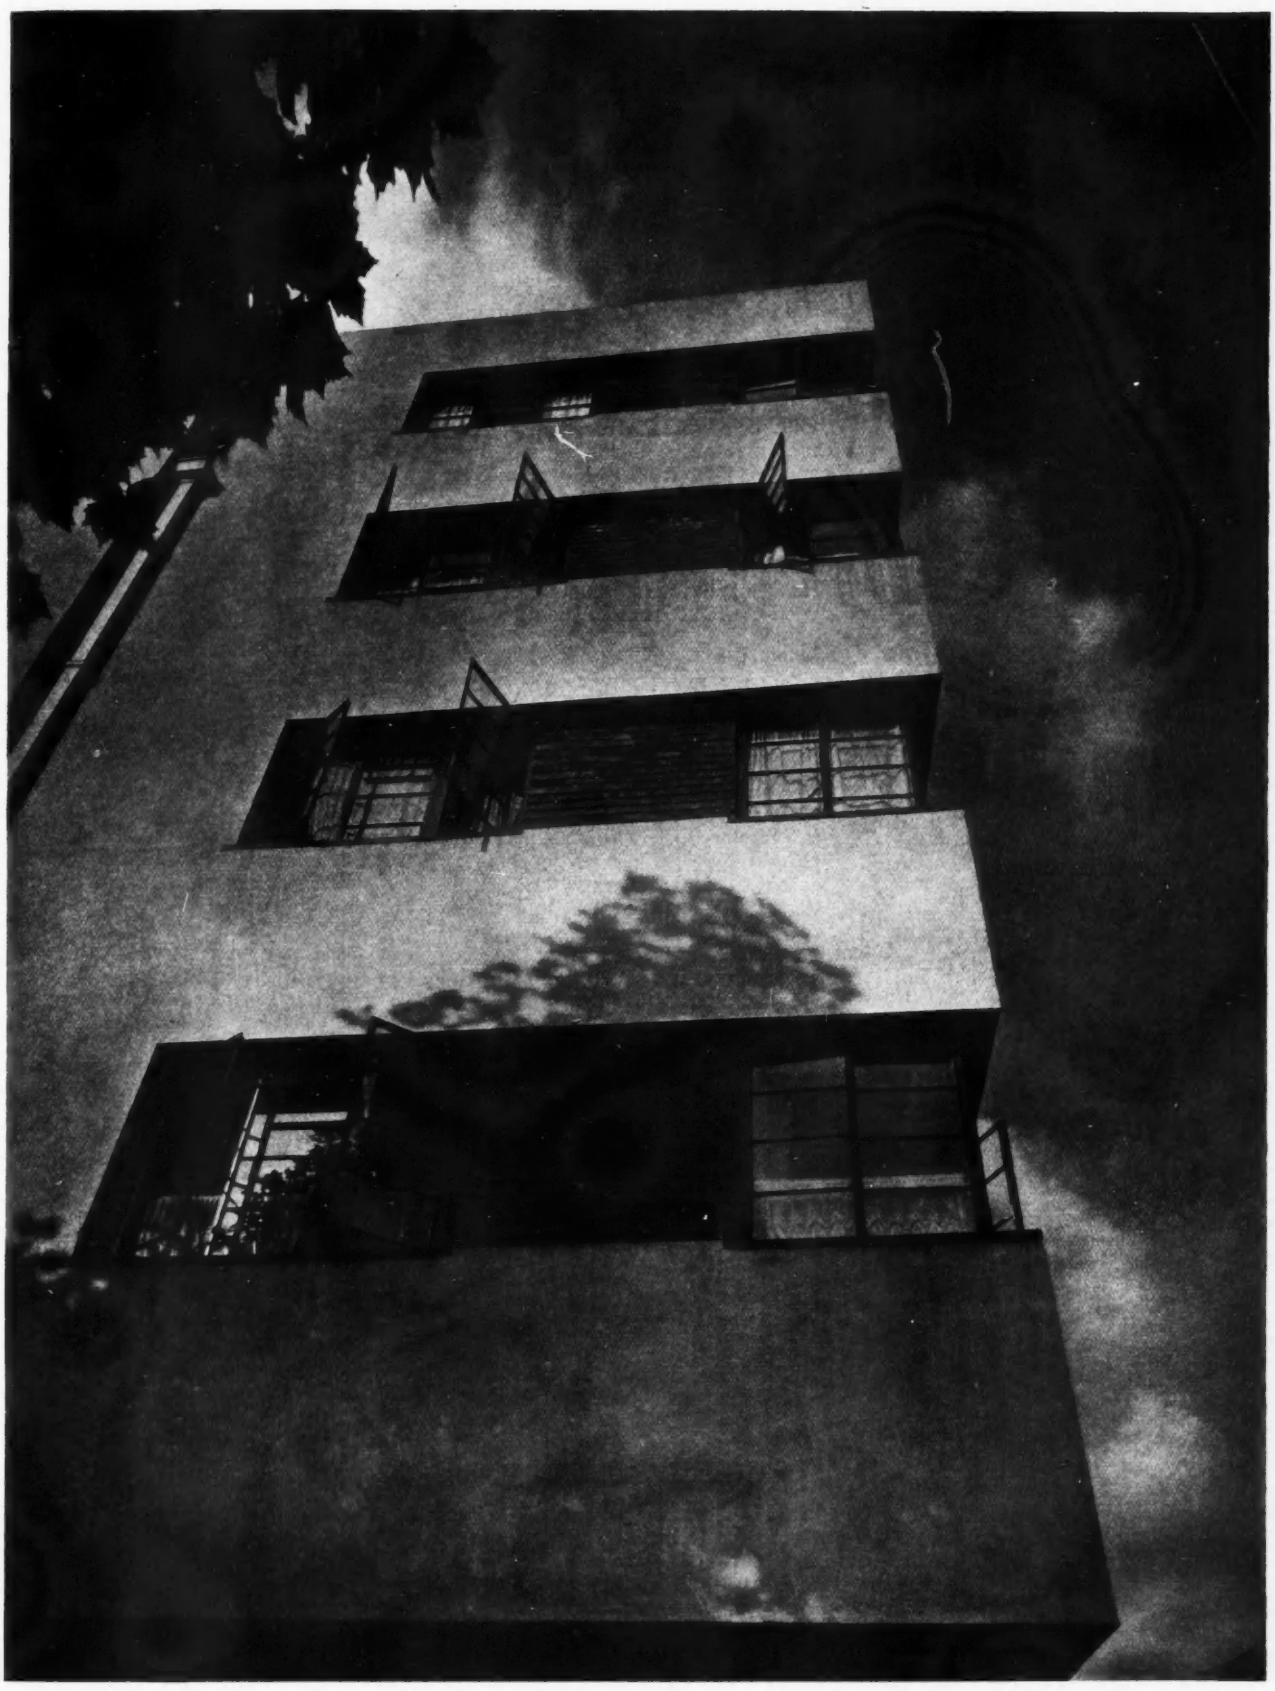
DESIGNED BY SIR ASTON WEBB AND SON

As will be seen from the plan reproduced on the last page of the four-page supplement with this issue, the site of these extensive premises, taken as a whole, has some resemblance to a triangle, with its base fronting Clarence Street, Kingston, and a long side facing Wood Street. In the course of a year's work there has been erected the new central block, with its entrance in Wood Street, now illustrated; the apex and the base of the triangle are to be remodelled in due course. The views on the facing page and above show the Wood Street entrance from without and within; the supplement includes a detail drawing of its centre bay.

This store, which has grown, under two generations of the same family, from a small haberdashery shop on the same site, is probably the largest of its kind in the satellite towns of London. A staff of 2,500 is provided for. The fact that it is outside the area administered by the L.C.C. has facilitated certain arrangements, among the most significant of which is the substitution of escalators for the usual main staircase; stairs and lifts are, however, provided. A large central open space, lit by a great laylight above, thus effectively displays the show-space on the ground floor, and also gives views of those on the three floors above. There is a restaurant seating 700 people.



WORKING CLASS FLATS AT KENSINGTON: BY



These flats are situated in Silchester Road, North Kensington. They are built of brick externally, conforming to the requirements of the L.C.C., and are rendered with cream Portland cement. Internal stanchions and steel joists are used to support the filler-joist floors, with steel cantilevers for the angle windows.

Each flat contains a living-room, three bedrooms, a bathroom and scullery. There are also built-in cupboards to all the rooms and a built-in dresser in the living-room. One block has a communal wash-house with large drying room over; the other an individual copper in scullery.

The flats are fully illustrated and described in the February issue of THE ARCHITECTURAL REVIEW.

S. CAMERON KIRBY (T. Smith Shearer and S. Cameron Kirby)

QUESTIONS THAT ARISE

Squash Rackets Court

¶ D. S. writes: "*Would you please advise me as to the best material for the walls and floor for a squash rackets court and also supply any other particulars of interest.*

"*Is a concrete floor satisfactory; or, alternatively, a jointless floor? If boards are best, is there any other board as good as maple, without its disadvantage of swelling and lifting at the joints?*

"*Is the wall finish in cement and parian satisfactory, or again, if boards, can plywood be used and how can the jointing difficulty be overcome? I want the best method for each surface regardless of cost.*"

The floor should be resilient, so that neither concrete nor a jointless composition would be suitable—they might also suffer from sweating. There is no boarding so generally suitable as maple, and if laid in narrow widths, with provision for expansion next walls, there ought to be no trouble from swelling and lifting.

The walls should be finished with non-sweating plaster, a speciality made by one or two firms whose names could be obtained from The Sports Press, 43-44 Shoe Lane, E.C.4. The portion of the wall under the playboard should be covered with sheet metal or similar resonant material to signify when the ball is out of play. There should be no skirting, cove, or angle fillet on the playing surface, and all doors must be flush and must not have any projecting ironmongery.

Presumably the querist is acquainted with the planning, lighting and arrangement for spectators.

E. G.

Sound Insulation

¶ W. and J. write: "*We have a glazed screen to erect and are anxious to make it as sound-resisting as we can without going to the extent of double glazing, or incurring too much expense in other ways. Would you please let us know whether any noticeable benefit would be derived from using plate glass bedded in washleather instead of sheet glass. Also would you let us have any other information as to simple and inexpensive expedients.*"

The principal requirements for sound insulation in construction are :—

A : Mass.

B : Rigidity.

C : Laminated and separated construction.

In the case in question, it is not possible to rely upon mass or laminated construction, in which inertia effects of rigid lamination are combined with the sound absorption effects of flexible porous interiors.

Great care should, however, be taken :

1 : To make the construction reasonably airtight.

2 : To make the construction rigid. This is of very considerable importance and deep sections for the studding or vertical members of the frame should be adopted with the object of increasing the resistance of the screen to deflection under acoustic pressures.

3 : Heavy plate glass set in washleather is preferable to sheet glass and small panes are preferable to large panes, provided the framing is rigid.

If a high degree of sound insulation is required, such as that necessary to insulate ordinary conversation, which is of an average level 60 db. above threshhold, rigid laminated construction should be adopted, with double glazing, each outer surface being entirely independent without structural contact or bridging pieces. The interior air space should be loosely filled with a sound absorbing quilt of eelgrass, asbestos blanket or acoustic down.

Half measures in soundproof construction are always disappointing.

C. W. G.

SOCIETIES AND INSTITUTIONS

MANCHESTER ARCHITECTS AT DINNER

THE annual dinner of the Manchester Society of Architects was held on Friday, January 20, at the Masonic Temple, Manchester.

Mr. J. Hubert Worthington, O.B.E., M.A., F.R.I.B.A., President of the Manchester Society of Architects, proposed the toast of the R.I.B.A., coupling with it the names of Sir Raymond and Lady Unwin. He spoke of the great and widespread influence of the Institute, and referred to its educational work and its many activities of public service. Mr. Worthington also referred to the recent death of his predecessor in office, Mr. J. Theo. Halliday. The Society had never had a better president, nor had Manchester ever had a more public-spirited architect to help it in an advisory manner.

Sir Raymond Unwin, in his reply, said: *The R.I.B.A. are about to contribute £20,000 to the Chancellor of the Exchequer, for, in proceeding with our new building, this amount will be saved to the country in unemployment pay, and this fact has largely influenced the Institute in making its decision.*

I am proposing to call a conference in London to see what part can be played by the Building Industry in setting the wheels of commerce in motion again. I am not certain that it is the best thing for architecture and the Building Industry that the subject of housing should be so much a political one. I would like to see created a great Housing Board which would handle the problem consistently and in conjunction with the improvement of old houses and slum clearance. As the basis of family life there should be a decent house for each family.

In the past architects have kept apart from builders, and both have kept apart from the makers of materials. Today they are trying to create a Council for the whole building trade, who should meet in an effort to make a more efficient industry for carrying out the building works which the country require.

Other speakers included Major Harry Barnes, F.R.I.B.A., the Bishop of Middleton, Mr. Francis Jones, F.R.I.B.A., and Mr. T. D. Barlow, President of the Manchester Chamber of Commerce.

NOTTS., DERBY AND LINCOLN ARCHITECTS' ANNUAL DINNER

The annual dinner of the Nottingham, Derby and Lincoln Architectural Society was held at Nottingham on January 19. The President, Mr. T. Cecil Howitt, D.S.O., F.R.I.B.A., who presided, in proposing the toast of "The Nottingham, Derby and Lincoln Architectural Society," said :—

Each year the work of the building contractor becomes more and more the work of a specialist, very similar in a way to the American methods. This indicates very clearly that the specialist who has devoted the whole of his time to one particular subject is obviously more equipped to deal with the problem that any person with just a casual knowledge. I would specially draw the attention of our civic representatives to this point so that, when they have a big engineering problem, they will see that it is carried out by a specialist engineer in that particular work, and, when they have an architectural problem, that they carry it out with an efficient and registered architect. This is the day of specialists.

When any new building is completed the owner is naturally so proud of it as compared with the accommodation it has replaced that it seems a most successful scheme. The real point in examining this new building is to ask whether it could have been made more efficient in arrangement, more attractive to look at, and erected at any less cost.

In my opinion the building of the future will still be erected with a steel frame. Electrical welding is, however, now playing such a prominent part that when this steel frame is welded into a monolith, its weight of metal and cost can be reduced some 30 to 40 per cent., thus marrying together the views of the steel specialist with those of the concrete specialist, and considerably reducing the cost of our buildings. The difficulty of keeping local bye-laws up to date is the biggest obstacle in producing more economic construction.

Other speakers included Sir Raymond Unwin, P.R.I.B.A., the Lord Mayors of

Nottingham and Lincoln, Messrs. Charles H. Calvert, A.R.I.B.A., H. A. Dickman, F.R.I.B.A., N. Denham Davis and Major Harry Barnes, F.R.I.B.A.

MASTER CARVERS' ASSOCIATION

The 35th annual dinner of The Master Carvers' Association was held at the Connaught Rooms, on Tuesday, January 24. The President, Mr. P. G. Bentham, A.R.B.S., occupied the chair.

Mr. A. B. Knapp-Fisher, F.R.I.B.A., proposed the toast of the Association. Mr. W. Aumonier, in proposing the toast of "The Visitors," paid a tribute to the Architectural Press—represented by Mr. Maurice Regan. He expressed the appreciation of the Master Carvers for the great encouragement and stimulus the Architectural Press had given to the industrial arts of England.

Amongst the guests present were the following :—

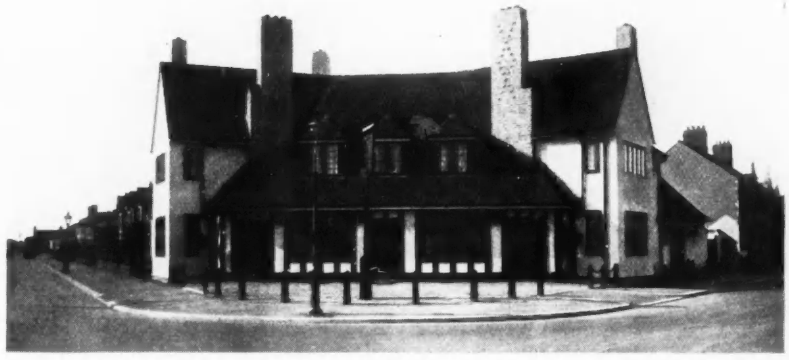
Messrs. F. R. Yerbury, HON. A.R.I.B.A., A. B. Knapp-Fisher, F.R.I.B.A., E. Stone Collins, F.R.I.B.A. ; J. L. Denman, F.R.I.B.A. : L. A. Culliford, F.R.I.B.A. ; Maurice Regan ; J. Stooke-Vaughan ; Lawrence Wright, B.A.ARCH. A.R.I.B.A. ; F. A. Richards, M.A., F.R.I.B.A. ; Colin Farmer, A.R.I.B.A. ; F. T. Bush, A.R.I.B.A. ; Wheeler Carmichael, A.R.I.B.A. ; and Col. J. E. Dixon-Spain, F.R.I.B.A.

LAW REPORT

OFFICIAL REFEREE AND AN UNNECESSARY ACTION

G. J. Abell v. *Imperial Hotel, Exmouth (1916), Ltd.—Official Referees' Court (High Court of Justice). Before Sir Francis Newbolt, K.C.*

THIS was an action in which the plaintiff, Mr. G. J. Abell, of Exmouth, sued as owner of the Imperial Hotel, Exmouth, to recover possession of the premises from the lessees, the Imperial Hotel, Exmouth (1916), Ltd., on the ground of breach of the covenant to repair.

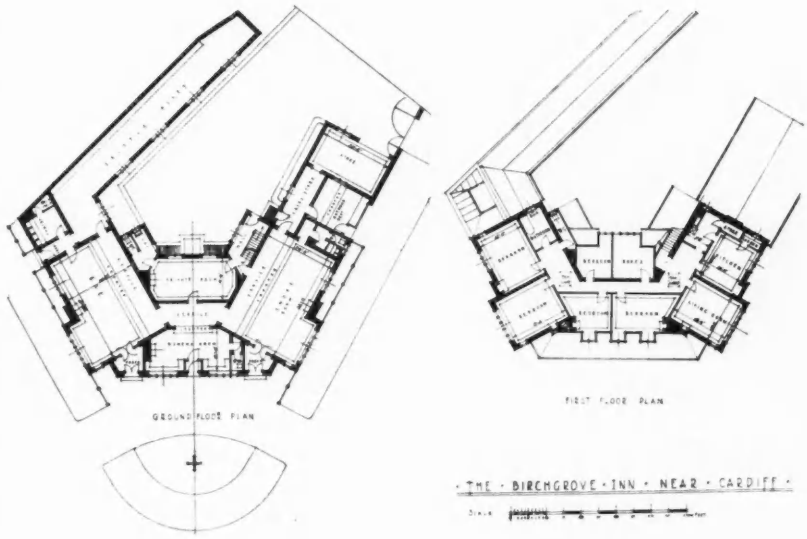


Mr. Croom Johnson, K.C., said his client considered that the defendants had not only failed to keep the premises in repair but had not carried out a notice which had been served upon them to carry out certain repairs.

Mr. Cave, K.C., for the defendants, denied the plaintiff's allegation, and said during the last five years the defendants had spent £2,000 in repairs. In 1929 his clients were served with a schedule of dilapidations and as the result of an action the defendants had carried out the repairs they undertook to do and paid £70 in settlement of the claim. His clients' reply to the present action was that the repairs now demanded were substantially the same as those covered in the High Court action, and under the circumstances, defendants were entitled to relief from forfeiture. In any case defendants had paid into Court £35 in satisfaction of plaintiff's claim and for the sake of peace.

Evidence was called for the defence that the hotel was now in a first class condition.

The learned official referee, in giving judgment, said the law was different now from what it was before March, 1928, as a lessor could not now obtain any damages for breaches of covenants for repair which did not diminish the value of the reversion. Here the hotel was a large one, held under lease at a rental of £500 per annum, and there had been two actions by the plaintiff for repair, who, being a builder, was familiar with such business. The claim to possession was hopeless and had been abandoned. The evidence was conclusive that the plaintiff could not recover damages. So far as he could see, the defendants were anxious to satisfy the lessor's demands and in his view the bringing of a second action against defendants within such a short period was vexatious and unnecessary. He had had evidence which showed that the hotel was in good condition, with no damage to the reversion, and therefore the plaintiff was not entitled to forfeiture. He considered the action premature and vexatious and he was sure if the plaintiff had met the defendants in a friendly way there need not have been any legal proceedings. He could not but think that plaintiff's real aim was to turn out the defendants or to harass them so that they would go. He gave judgment for defendants on the claim and counter-claim, with costs, and made an order for the money in Court to be paid out to defendants.



BIRCHGROVE INN, CARDIFF

DESIGNED BY IVOR JONES AND PERCY THOMAS

This new inn, at the junction of four roads just outside the City of Cardiff, replaces an old building set right on a corner dangerous to motor traffic. The accommodation for the public is entirely on the ground floor, and consists of a large public bar, a smoke room, and a separate bar for women. A skittle alley is arranged adjoining the public bar, so that it can be served by the same attendant. An off-licence department is provided, and the building is planned so that the landlord has a private room on the ground floor and also exercises complete control and supervision of the services from behind the counter. The first floor is devoted to private accommodation for the landlord and his staff, with a separate entrance at the rear.

The building is constructed of brickwork, finished with stucco in white cement. The roofs are of hand-made sand-faced tiles, and the chimneys of brindled bricks. The windows throughout are metal casements in oak frames, fixed flush with the stucco. The interiors of all the public rooms are panelled in oak, with oak settles, window seats and bar fittings.

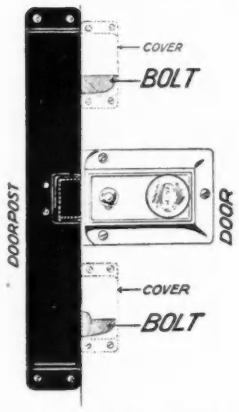
THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Laboratory, 47 Wimpole Street, W.1 (page 173). General contractors, E. H. Burgess. Sub-contractors : Tyler and Freeman, electrical work ; Leyland and Birmingham Rubber Co., Ltd., rubber flooring ; Crittall Manufacturing Co., Ltd., windows ; Waygood-Otis, Ltd., lifts ; Considere Construction Co., Ltd., reinforced concrete staircase ; Carter & Co., tiling ; Allenson, Ltd., joinery ; J. P. White, doors ; Leeds Fireclay Co., Ltd., sanitary fittings ; Baird and Tatlock, sinks and sanitary fittings ; Jas. Gibbons, Ltd., door furniture.



Completion of the London County Hall : Section D (pages 174-177). Generalcontractors, Gee, Walker and Slater, Ltd. Surveyors : J. Leaning and Sons and J. Rider, Hunt & Co. Stone carving : C. H. Mabey. Wood carving : A. H. Wilkinson. Consulting engineers for steelwork : Whitaker, Hall and Owen. Sub-contractors: Holloway Bros. (London), Ltd., extension of the raft foundation and the erection of the retaining walls ; Henry Hope and Sons, Ltd., steel casement windows and door furniture ; A. D. Dawnay and Sons, Ltd., constructional steel ; Fenning & Co., Ltd., granite ; Ames and Finnis, roofing tiles ; Morris-Singer Co., cast lead gutters, rain water pipes and heads ; South Western Stone Co., Ltd., Portland stone ; J. A. King & Co., Ltd., pavement lights ; Acme Flooring and Paving Co. (1904), Ltd., wood block flooring ; F. Braby & Co., Ltd., copper covering to dormers ; James Walker, Ltd., decorative plasterwork ; J. Whitehead and Sons, Ltd., Hopton Wood stone ; Birmingham Guild, Ltd., bronze work ; Luxfer, Ltd., galleries and book stacks in the education library ; Bellman, Ivey and Carter, Ltd., scagliola marble columns ; H. H. Martyn & Co., Ltd., wrot-iron gates and railings ; Paint and Cellulose Spraying Co., Ltd., special decorations in the conference hall ; Patent Impermeable Millboard Co., Ltd., acoustic panelling in the conference hall ; May Acoustics, Ltd., "Maycoustic" felt ; Best and Lloyd, Ltd., Galsworthy, Ltd., and Osler and Faraday, Ltd., electric light fittings to main floor ; D. Burkle and Sons, Ltd., joinery ; General Electric Co., Ltd., Edison Swan Electric Co., Ltd., and James Gibbons, Ltd., electric light fittings ; James Gibbons, Ltd., roadway gates, window grilles, railings and hardware ; Joseph Avery & Co., dark blinds ; Waygood-Otis, Ltd., electric lifts ; Hobbs, Hart & Co., Ltd., locks ; Gillett and Johnson, Ltd., electric clocks ; Roneo, Ltd., card index cabinets ; Robert Adams, floor springs ; Blunt and Wray, Ltd., skeleton clock dials ; Richard Crittall & Co. Ltd., Norris Warming Co., Ltd., G. N. Haden and Sons, Ltd., and J. Jeffreys & Co., Ltd., main heating and ventilation, hot water services and steam ; Shanks & Co., Ltd., sanitary fittings ; Burn Bros. (London), Ltd., drainage fittings ; Benham and Sons, Ltd., cooking apparatus ; Keystone Paint and Varnish Co., Ltd., "Kenstona" paint, etc. ; Ferodo, Ltd., stair treads ; Haywards, Ltd., escape stairs ; A. L. Gibson & Co., Ltd., revolving shutters ; Mather and Platt, Ltd., storage tanks ; British Vacuum Cleaner and Engineering Co., Ltd., vacuum cleaning plant ; Automatic Sprinkler Co., Ltd., sprinklers.

Bentall's Store, Kingston-on-Thames (pages 178-9 and supplement). General contractors, John Mowlem & Co., Ltd. ; L. A. Turner, carving. Sub-contractors : Redpath, Brown & Co., Ltd., steel construction ; Art Marble, Stone and Mosaic Co., Ltd., marble floor and steel linings ; Diespeker & Co., Ltd., hollow tile floors and concrete beam casings ; Automatic Sprinkler Co., Ltd., fire sprinkler installation ; Bath and Portland Stone Firms, Ltd., stone facing ; Lawford Asphalte Co., Ltd., asphalt ; Tucker Armoured Plywood Co., Ltd., armoured plywood stanchion casings ; Samuel Haskins and Bros., Ltd., fireproof shutters ; Electrical Installations, Ltd., electrical installation ; Davidson & Co., Ltd. heating and ventilating ; F. Sage & Co., Ltd., shop fronts and bronze balustrades ; Crittall Manufacturing Co., Ltd., and F. A. Norris & Co., Ltd., metal sashes ; Morris-Singer Co., laylights and ornamental metal glazed door panels ; Haywards, Ltd., metal lantern lights ; Aldous and Campbell, Ltd., service lifts ; Merryweather and Sons, Ltd., hydraulically operated metal raising partitions ; May Acoustics, Ltd., acoustic plastering ; Adrian Stokes & Co., wrot-iron balustrades ; Frazzi, Ltd., Paropa roof covering ; Carter & Co. (London), Ltd., wall tiling and tile floors ; J. and E. Hall, Ltd., escalators and goods lift ; Dent and Hellyer, Ltd., sanitary fittings ; Lamson Stone Service Co., Ltd., pneumatic cash tubes installation and letter box and chute ; Bostwick Gate and Shutter Co., Ltd., collapsible gates; Hermon Cawthra, decorative frieze in mannequin hall.

Birchgrove Inn, Cardiff (page 183). General contractors, F. J. Thomas and Sons, Ltd. Sub-contractors : McNeill & Co., Ltd., Leadonite ; Western Trinidad Lake Asphalt Co., Ltd., asphalt ; Phœnix Brick Co., Ltd., bricks ; Thos. Exley and Sons, Ltd., tiles ; Hallett Flooring Co., wood block flooring ; J. G. Proger and Sons, Ltd., central heating ; Leonard Padfield, grates, sanitary fittings and mantels ; S. A. Brain & Co., Ltd., electric wiring ; James Gibbons, Ltd., door furniture ; John Williams and Sons (Cardiff), Ltd., casements and window furniture ; Cardiff Corporation, water supply.

Mr. Percy Leslie Waterhouse, of Epsom, retired architect, left £21,515 (net personalty £18,837).

TRADE NOTES

A drawing of the lock described in the note below.

Automatic Locks, of 9 Berkeley Square, Mayfair, have recently marketed a patent burglar-proof lock. This new lock, it is claimed, not only fastens the catch, but also simultaneously and by the mere slamming of the door securely bolts it top and bottom. The accompanying illustration indicates the working of the bolts. The same key, turned in the same way, operates both lock and bolts, the difference being that whereas with the ordinary door latch it is quite a simple matter to force the door back towards its hinges and so release the catch, with this new lock, as the bolts work in the opposite direction to the latch, any forcing of this kind should defeat its own object.

Besides forcing a door back against its hinges and so releasing its fastening, whether of latch or mortice variety, the commonest line of action for a burglar to take is to cut a hole in the panel of the door, through which the hand may be slipped and so the catch opened from inside. In this new lock, however, this has been circumvented by a dead-lock device. All the householder has to do, when leaving the premises entirely unoccupied, is to put his key in the door, after he has slammed it behind him, and give it a single turn in the opposite direction to that which opens it. This action, it is claimed, renders it impossible to open the door from the inside.

A further device is also incorporated with the complete door set. This is a bolt operated by a key which, after the door has been bolted, is removed. This prevents a burglar, who has made his entry by a window, from securing his get-away by the obvious means of unlatching the front door. This bolt is not shown in the illustration, but forms a very important part of the complete lock. Further particulars are obtainable from the firm at the address given above.

We regret that in our last issue the name of Messrs. Rhodes, Brydon and Youatt, of Stockport, was incorrectly printed.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

Plans passed at ACTON: Factory, Standard Road, for Mr. F. E. Simpkins: alterations to factory, Park Royal Road, and factory, Acton Lane, for Mr. F. E. Smpkins: extension to works, Standard Surgical Instrument Manufacturing Co., Ltd., Westfields Road, for Corolite Construction, Ltd.: 17 houses, Willesden Lane, for Mr. W. Atkinson: additions, Park Royal Road, for Mr. W. E. Matchett.

The BERMONDSEY B.C. is to erect 10 cottages in Rotherhithe Street, at a cost of £5,250: 82 flats in Vauban Street, at £44,000: and 11 flats on the Millpond estate, at £6,220.

The Lincoln Street Housing Co., Ltd., is to erect 34 flats in Lincoln Street, BOW.

Plans passed by the CROYDON Corporation: Two houses, Warminster Road, for Mr. P. Richardson: two houses, Bridle Road, for Mr. A. D. Reith; five garages and flat, Spring Park Road, for Mr. H. Miller: 117 houses, Ockley Road and Sheldon Road, for Mr. H. Macintosh: 12 houses, Davidson Road, for Houselands, Ltd.: 24 garages, rear 11 Tavistock Road, for Vesta Finance, Ltd.: five houses, The Glade, for Messrs. Wylie and Berlyn, Ltd.: six houses and two bungalows, Wickham Road, for Mr. R. W. Trent: five houses, Storrington Road, for Mr. F. H. Willcocks.

The CROYDON Corporation has prepared a scheme for electricity development, including the extension of mains, plant and buildings, at a cost of £104,000.

Plans passed by the DEPTFORD B.C.: Offices, Tarry Lane, for Mr. A. Keefe; blocks of flats, Avingdon Road, for Messrs. Gee, Walker and Slater, Ltd.; dwellings, Evelyn Street, for Messrs. Henry Boot and Sons, Ltd.; factory, Mantle Road, for Mr. H. A. Scrase.

The EALING Corporation has approved plans submitted by Greenford Estates, Ltd., Costons Lane, Greenford, for the erection of 72 flats in Wordsworth Avenue: 12 flats in Chaucer Road; 28 flats in Shelley Avenue: and 44 in Shelley Close.

Plans passed at EALING: 43 houses, Clauson Avenue and Russell Road, for Messrs. W. Gradwell & Co.: four houses, Priory Gardens, for Messrs. R. Lancaster and Sons, Ltd.: two bungalows, Marnham Crescent, for Mr. J. M. Wilson; 24 houses, Rydal Crescent, for Messrs. R. Lancaster and Sons, Ltd.; 12 shops, North Circular Road, for Messrs. R. Lancaster and Sons, Ltd.; additions to two shops, Bilton Road, for Messrs. Percy Bilton, Ltd.: 13 houses, Tavistock Avenue, for Mr. A. E. Murdoch; 10 houses, Lynwood Road, for the London and Provincial Building Co.: 10 houses, Westvale Terrace, for Messrs. R. Fielding and Son; nine houses, Bideford Avenue, for Messrs. R. Fielding and Son; 20 houses, Ruislip Road, for Mr. R. A. C. Churchward: five houses, Perivale Lane, for Messrs. W. H. Read & Co., Ltd.; three houses, Corringway, for Messrs. Haymills, Ltd.; 11 shops, Ruislip Road, for The Morris Estates, Ltd.: hall, Green Man Passage, for Mr. E. E. Farrant.

The EAST HAM Corporation has approved revised plans for the erection of 88 houses and flats on the Gooseley Lane site, at an estimated cost of £37,000.

SOUTHERN COUNTIES

Plans passed by the BEXHILL Corporation: Three houses, Southlands Avenue, for Messrs. Bowcock and Jeffery; three houses, Cooden Drive, and development of land off Hastings Road, for Mr. J. E. Maynard; house and shop, Turkey Road, for Mrs. E. L. Earl.

Morris; two shops, Penn Road, for Mr. H. Hitchen; three houses, Rowan Crescent, for Mr. E. Leach; three houses, Bilston Road, for Mr. E. Collins.

NORTHERN COUNTIES

The BOOTLE Corporation has sanctioned a scheme submitted by Messrs. Williams and Kelly for the development of land in Southport Road and Aintree Road by the erection of 83 houses.

Plans passed at BOOTLE: Four houses, Fernhill Avenue; extension of office, Miller's Bridge: conversion of Talbot Hotel, Derby Road, into two houses: four houses, Oxford Road: 17 shops, Stanley Road and Merton Road.

Plans passed at CARLISLE: Seven houses, Duke Street, for Mr. H. Foxall: two houses, St. James's Road, for Messrs. J. and R. Bell, Ltd.: two houses, Warwick Road, for Mr. E. J. Hill: 21 houses, Dale Street, for Mr. S. W. B. Jack: six houses, Scawfell Road, for Mr. W. C. Johnston; house, Brampton Road, for Mr. Tiffen.

Plans passed by the CHESTER Corporation: 25 houses, Canadian Avenue, Hoole, for Messrs Amos, Ltd.: three houses, Brook Lane, Newton, for Mr. W. A. Davies; alterations, Shakespeare Inn, Foregate Street, for Bents Brewery Co., Ltd.

The HYDE Corporation has prepared a modified scheme for the erection of 38 houses on the Back Bower site.

The RAWTENSTALL Corporation has received sanction to borrow £20,400 for the provision of houses on the Lower Carr Farm Estate.

The SHEFFIELD Corporation has passed estimates of £534,680 for the erection of 1,532 houses for the period 1933-34.

The SOUTH SHIELDS Corporation is to proceed with clearance schemes at Laygate Square and Drake's Street.

Plans passed by the SOUTH SHIELDS Corporation: 20 bungalows, Central Avenue, for Mr. F. W. Newby; five houses, Osborne Avenue, house and shop, Eccleston Road, and alterations, Turf Inn, Green Street, for Messrs. T. A. Page and Son: alterations to school, Westoe Village, and flats, John Clay Street, for Mr. Howard Hill.

Plans passed by the STRETFORD U.D.C.: Eight houses, Seymour Grove, for Messrs. Smith and Alcock; flats, Birch Avenue and Stretford Road, for Residential Flats, Ltd.; office extension, Trafford Park Road, for Messrs. M. Kilvert and Sons, Ltd.; shops, 57 and 65, King Street, for Mr. A. Shaftsby.

The TYNEMOUTH Corporation urges the necessity for the provision of a new administration block at the Moor Park Hospital, and is seeking a grant for the scheme, which is estimated to cost £12,000.

WALES

Plans passed at SWANSEA: Four houses, Carmarthen Road, Fforestfach, for Mr. W. Morgan; house and shop, Mayhill Road, for Mr. W. E. Williams; three houses and shops, Llangyfelach Road, Brynhyfryd, for Mr. M. A. Harries; house and shop, Townhill Road, for Mr. C. S. Kenwood.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

• In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

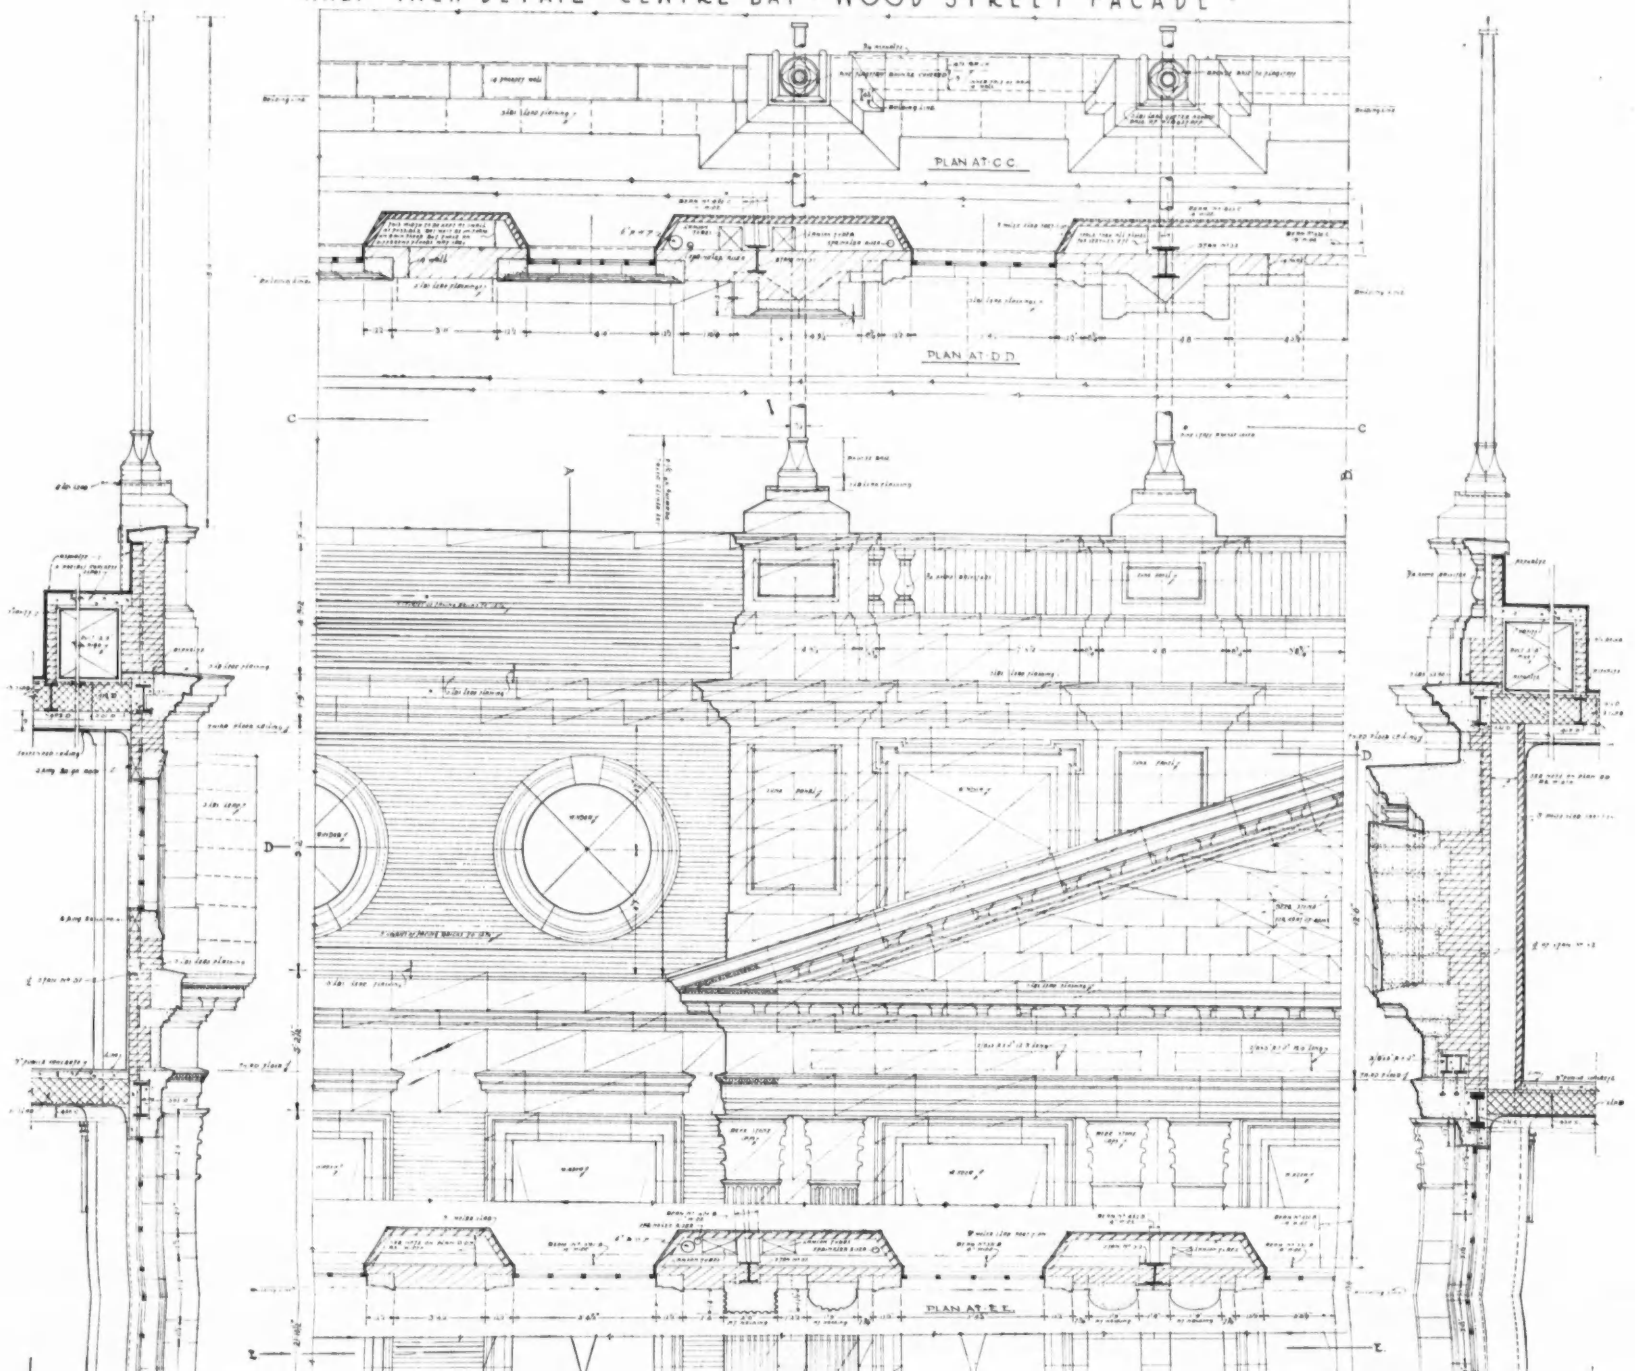
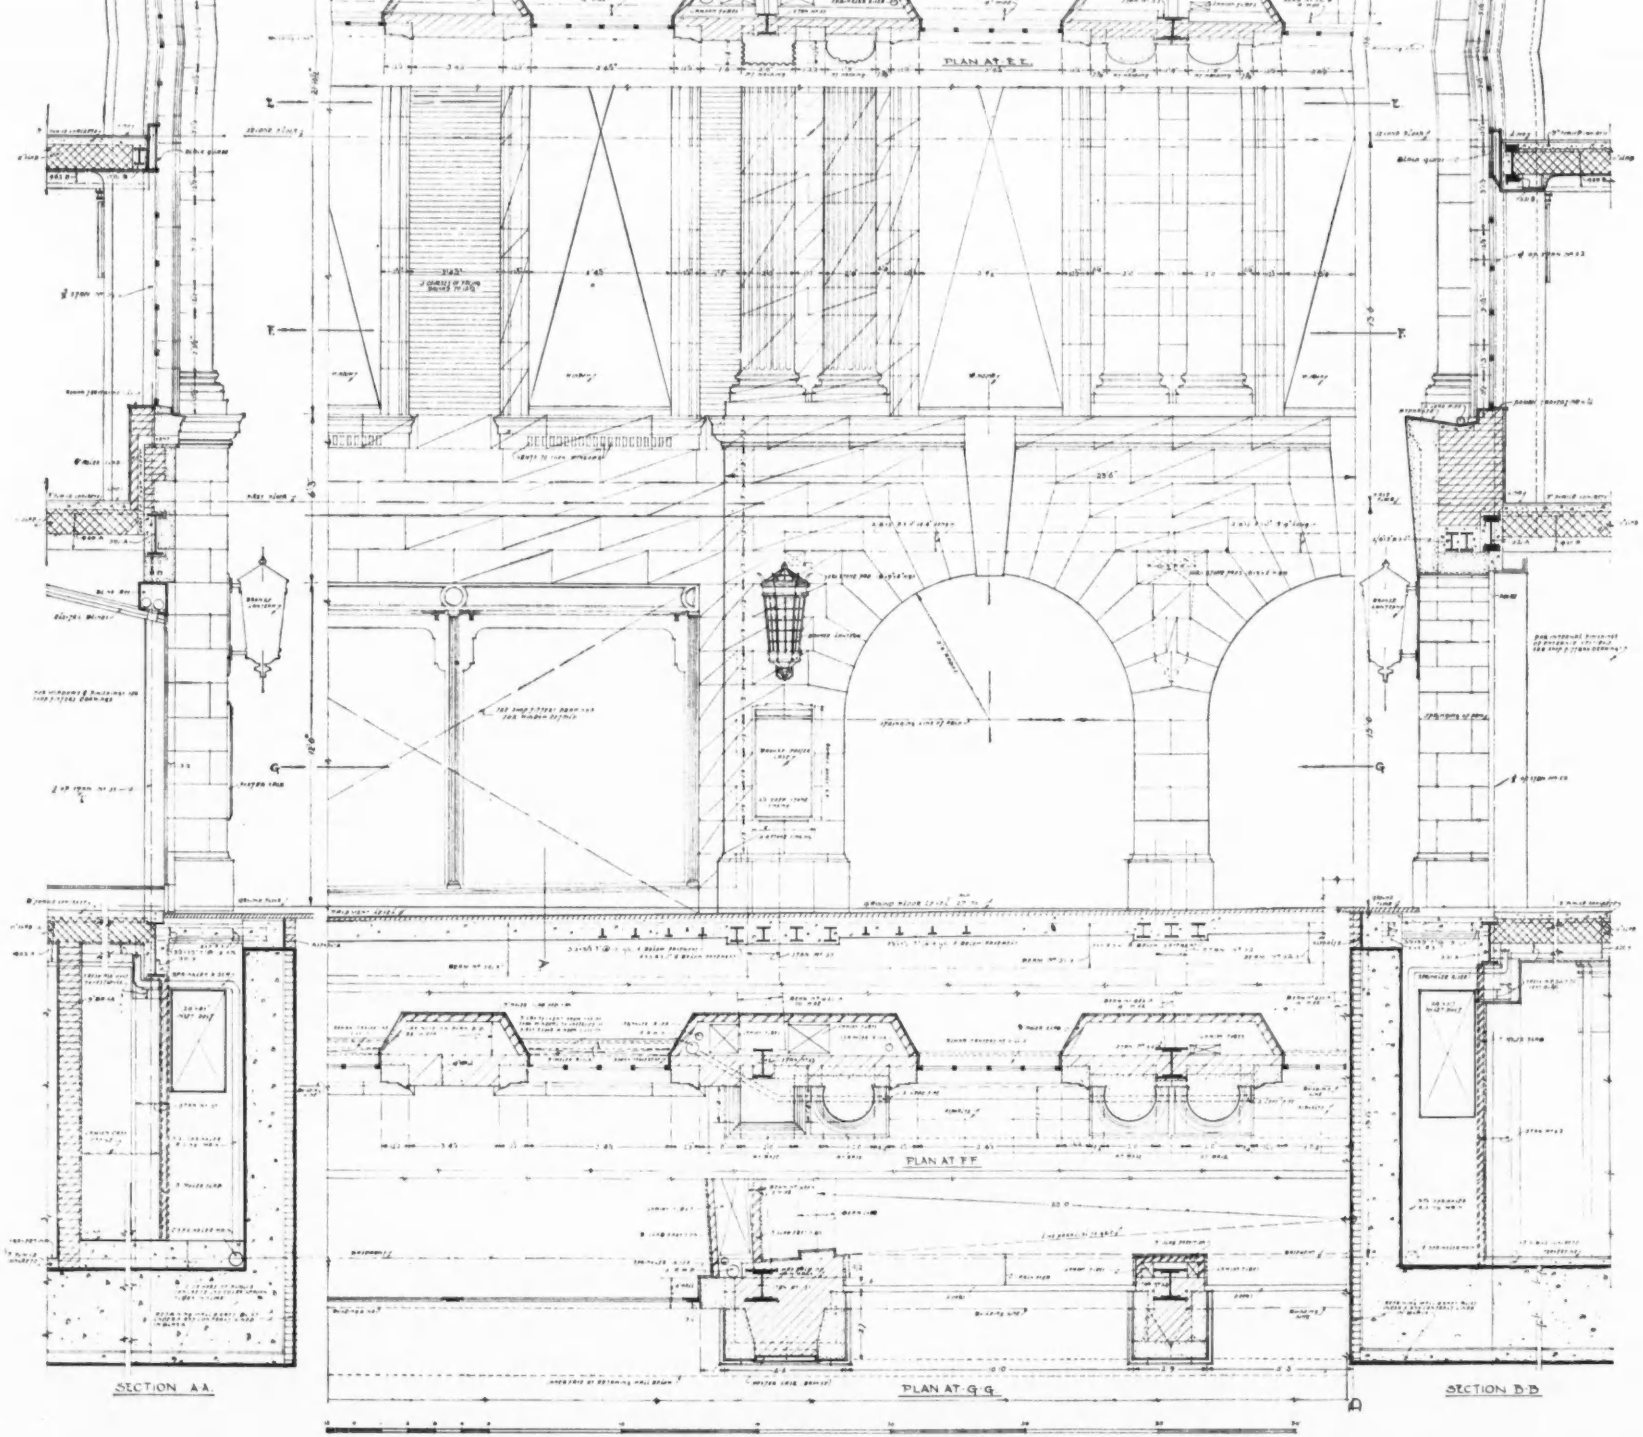
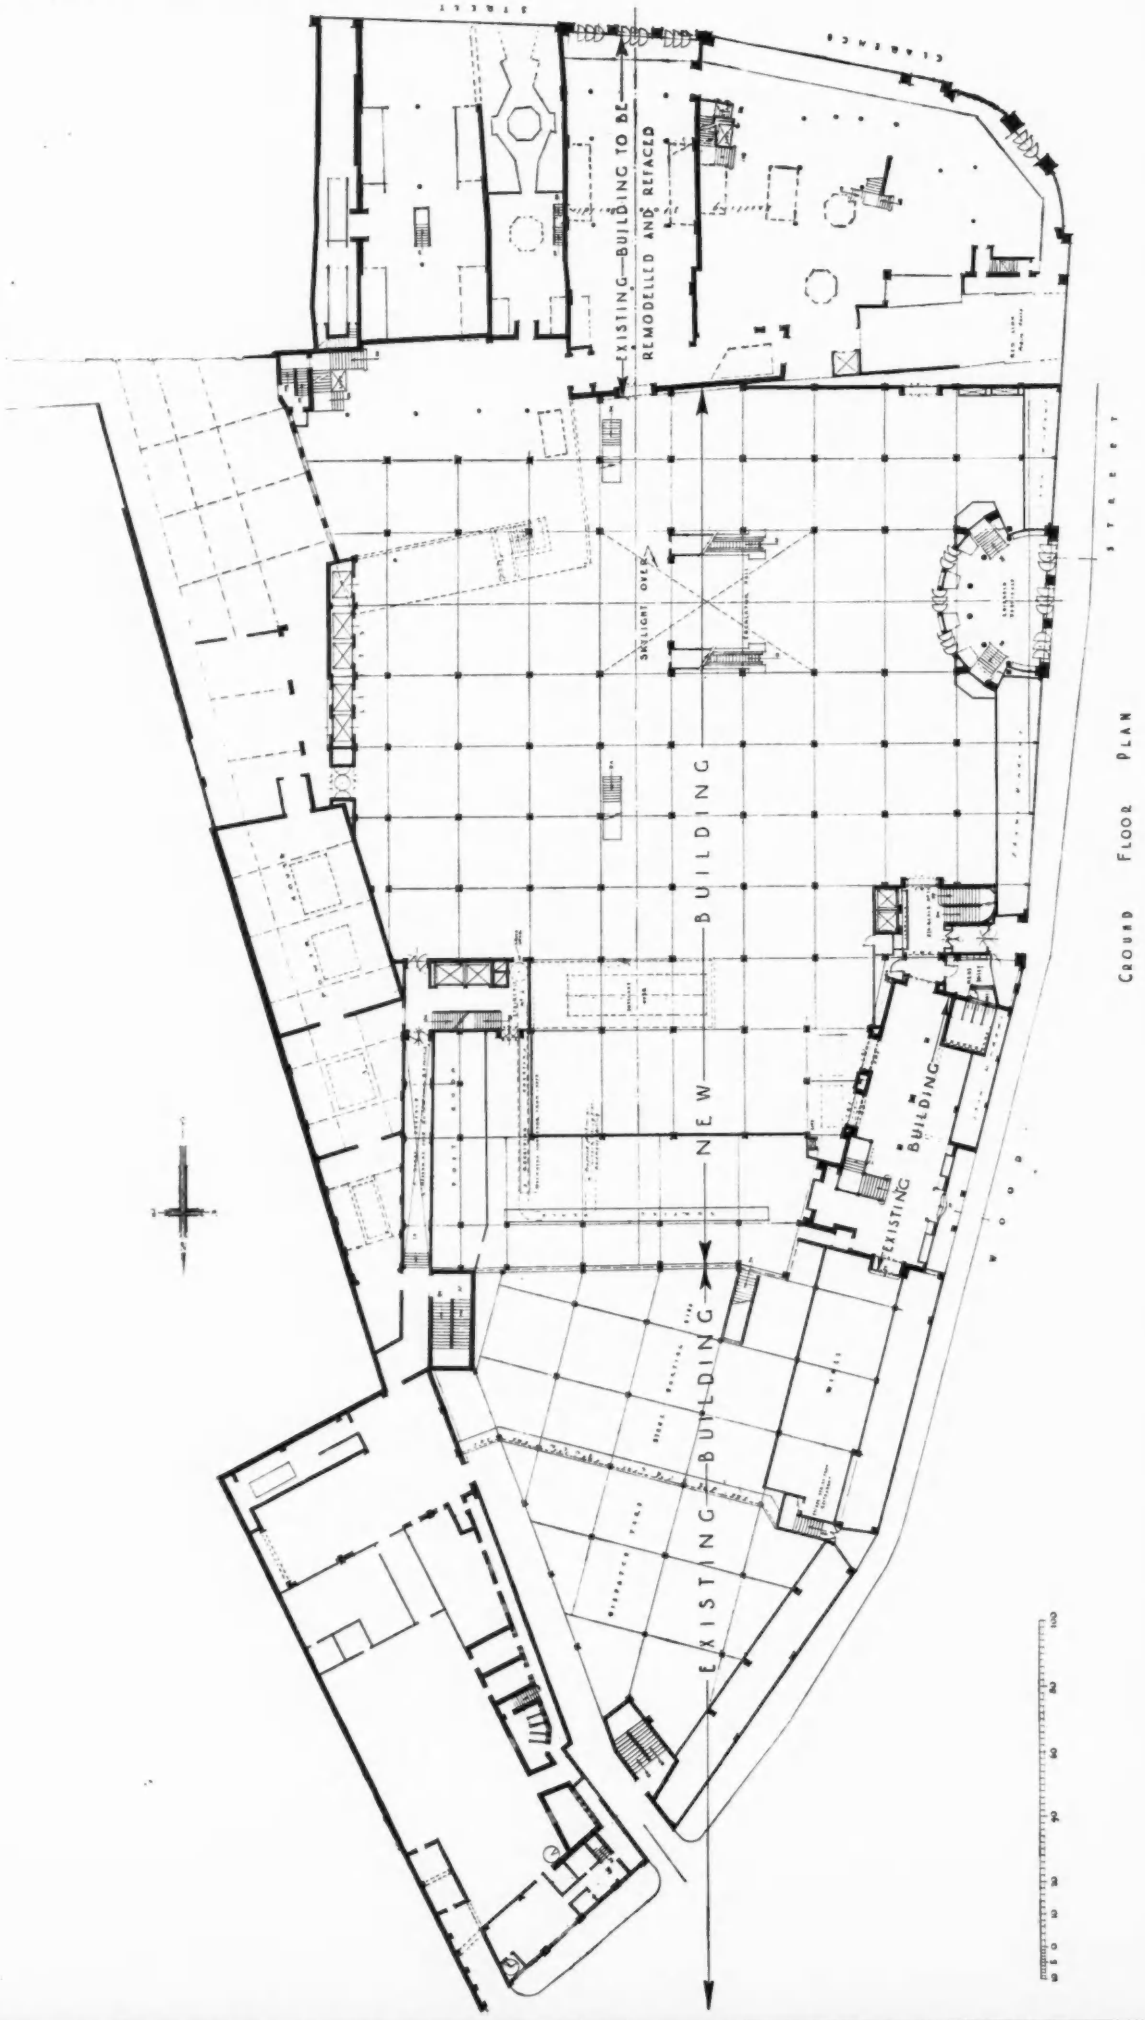
BENTALL'S, KINGSTON-UPON-THAMES

THE NEW CENTRAL SECTION: : SIR ASTON WEBB AND SON, ARCHITECTS





THE MAIN ENTRANCE TO THE STORE FROM WOOD STREET



THROUGH the doors shown in the above view entrance is gained to the semi-circular entrance-hall illustrated elsewhere in this issue. The large-scale drawing reproduced overleaf gives details of the centre bay of this façade, while a plan of the whole building, existing and new, is given on the last page of this supplement.

The main facing materials are brick and stone; the capitals to the columns are of Beer Stone. The lanterns and poster cases are of bronze and so are the bases for flagstaffs, which are themselves of pine, bronze-cased.

INFORMATION SHEET : SEATING, AREAS, ETC FOR SCHOOLS.
SIR JOHN BURNET, TAIT AND LORNE ARCHITECTS ONE MONTAGUE PLACE BEDFORD SQUARE LONDON W.C.1.

INFORMATION SHEETS • 3 • SEATING FOR SCHOOLS

INFORMATION SHEETS

• 3 •

SEATING FOR SCHOOLS

•

LAST week's Information Sheet dealt with the seating in restaurants. This week's is a companion, giving similar data in respect of schools.

The story of how these drawings—in themselves exemplars of the draughtsman's art—came into existence in the office of Sir John Burnet, Tait and Lorne, and of how, far from grudging the broadcasting of information they had been at pains to tabulate for use in the course of their own practice, they embraced the proposal with enthusiasm, has already been told.

The very fact that these Information Sheets, of a type in common use in America and Germany, are new to us here points the need for architects in this country to rationalize the activities in their own offices.

No one can avoid being impressed by the vital character of the information conveyed by these graphic and tabular means in the minimum of space with the maximum of clarity; they give, at a glance, just those very details which, though known to have been received some time or other, will usually take hours of search to unearth. Needless to say, their value depends on their being up-to-date.

It is arguable that one reason why, in the past, it has not been easy to collate such statistics, has been the reluctance of manufacturers in this country to perceive the advantages to them of standardizing the size and style of their catalogues and lists of goods, and the loose sheets by which, from time to time, they are revised, so as to reduce the architect's problems in compiling a reference library. Standardization in this respect has long been adopted in other countries.

It was desired to present these Information Sheets in a standardized form, but no standard filing size has existed, hitherto, in Great Britain. The decision was therefore taken to make the reproductions the same size as the original drawings, which themselves follow the standard dimensions adopted by the American Institute of Architects, as being more convenient than reproduction to the double-page size associated with THE ARCHITECTS' JOURNAL Supplements.

Until further notice, therefore, these Sheets will take the place of the second double-page plate that is usually issued, week by week.

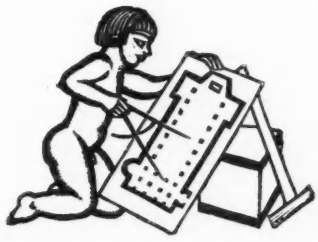
THE SKELETON ON THE SKY-LINE

CARLTON HOUSE TERRACE OVERTOPPED

THIS photograph, taken from the Mall last week, shows the steel frame of the new block of offices, designed by Sir Reginald Blomfield for Messrs. Pinchin, Johnson, to occupy the site of No. 4 Carlton Gardens. It disposes, once for all, of the claim that the project entered into with such ill-consideration on the part of the Commissioners of Crown Lands, would not destroy the character of Carlton House Terrace, or be conspicuous from the Mall. It is conspicuous from the Mall, and it will not be the less so when clothed in Portland stone.

It is the immediate object of the Carlton House Terrace Defence Committee, who met, several hundred strong, last week, to secure at least the abandonment of the two uppermost stories and the preservation of the Terrace in its entirety. But the ultimate object of their activities is much wider—to form a permanent body charged with the task of preserving the amenities that remain, and to create fresh ones, in the architectural anatomy of London.

On the question of preserving the Terrace, Viscount Castlerosse, who edits "The Londoner's Log" in "The Sunday Express," allowed him his say, this week, in the words: "No wonder many men wish to preserve Carlton House Terrace. And, believe me, I am not sneering at these excellent folks; there is surely a good deal to be said in their favour. If Carlton House Terrace is preserved it will be a lesson to future architects what to avoid."



This is a pronouncement that can be read in two ways. It should be framed and hung in the office of one London architect.

ASYMMETRICAL FENESTRATION IN A SCHOOL AT FRANKFURT

DESIGNED BY MARTIN ELSAESSER

It is the unexpected placing of the window-voids, accepted without question by the eye, yet giving them almost the semblance of random building blocks, that gives the elevations their individual attraction. The fountain in this forecourt of the school shows the same direct simplicity of line characteristic of the main structure, of which further photographs appear on pages 198-202 of this issue. The classrooms have an outlook over the surrounding landscape; and terraces afford facilities for open-air classes.

THUNDER IN THE AIR

PARLIAMENT has been in recess. Out of the question, then, as anyone can see, to withstand officialdom, to save unblemished the Carlton House Terrace prospect of the Mall. But natural enough that the contractors should have been put to work overtime, in the interim, on the offending block of offices. On the site of No. 4 Carlton Gardens, already the stonework is going up ; as for the steel frame-work, that has been erected to its full height, hunching its gaunt and ghastly shoulders to frown down upon London's fairest processional way. Our photograph on the first page shows the position clearly enough.

So much for Sir Reginald Blomfield's assertions that the proposed building would not overlook the Mall. There it stands, thrusting itself upon the wondering gaze of all who, walking in St. James's Park, chance to turn their eyes northwards. Citizens of London—more sharply, citizens from other civilized countries—may rub their eyes in astonishment that such " flagrant and insensate vandalism " can be committed with impunity by any in the world's centre of taste and culture, let alone by the very folk who should set an example as model landlords. But let them reflect. Parliament has been in recess ; so nothing *could* be done.

It went into recess shortly after the storm broke. It was early in December that Sir Reginald, in his letter to the *Times*, told an astonished world that the Commissioners of Crown Lands had decided that the Terrace was to be rebuilt at an early date (though how he or they could expect it, with long-term leases of many of the houses still to run, is a mystery) ; for which reason he would have us not judge his new offices for Messrs. Pinchin, Johnson as a single unit, but as part of a comprehensive scheme—a scheme for which he had been good enough to draw the plans and elevations. Almost immediately he was given the lie, in Parliament, by the statement that there was " no project in being " for rebuilding the Terrace. And there, for the time being, Parliament left it.

Did our legislators fondly hope that, while Members were taking their vacation, the process of building would be automatically stayed, like the process of legislature ; or did they, more fondly, imagine that the storm might blow over ? Who knows ? To seek to analyse the workings of the political mind would be sheer waste of time. Neither event has happened. And for very good reasons.

As to staying the process of building, Major Elliot did nothing to impede it when, in his formal statement on the subject, he announced that " the Government have had the matter very fully under review . . . and feel bound to state that . . . they consider no useful purpose would be served by any further intervention by the Government in the matter of Messrs. Pinchin, Johnson's lease of No. 4 Carlton Gardens." The " further intervention " is good. Evidence is to seek that the Government ever intervened at all. Far from it. They forbade intervention. Sir Arthur Steel-Maitland, M.P. (now chairman of the Carlton House Terrace Defence Committee) sought authority to approach Messrs. Pinchin, Johnson, while there was yet time, with a view to negotiating a settlement ; and his offer was refused. Small wonder that he has since given it as his opinion that the Government had not done everything they might to compound for a lease that ought never to have been granted. Small wonder that the process of building the eyesore has been accelerated.

And as to the storm blowing over, it is, in truth, only now blowing up. On January 31 the Minister of Agriculture (*ex officio*, First Commissioner of Crown Lands) issued a statement in which he said : " the Commissioners do not propose to take any further action in regard to the development of Carlton House Terrace until public opinion has had time and opportunity to express itself, and these opinions have been fully considered."

There is no need to give public opinion time and opportunity to express itself. Public opinion has already made both. Its gathering thunder pealed very freely and forcibly at the first meeting, last week, of the Carlton House Terrace Defence Committee, which has now grown to a membership of over four hundred. The Committee means business. It proceeded to elect an Executive of seven Members of the House of Lords, nine Members of the House of Commons and seven non-Parliamentary members, drawn from many walks of life. If that is not an unmistakable expression of public opinion, what is it ? No mere passing squall, at all events.

But Parliament is no longer in recess. The deep depression hitherto centred on No. 4 Carlton Gardens bids fair to rage about the Metropolis, provoking such a landslide as will sweep the Crown Commissioners clean off their feet. It is as certain as things can be that the days of their maladministration are numbered.

For, whatever eventually happens along the Mall, what is in view is a permanent Vigilance Committee, designed to keep a wary eye on cracksmen of Carlton Terrace, assassins of the Adelphi, wreckers of Waterloo Bridge, and all such fry as have no soul for the amenities.

Speakers at the first meeting of the Carlton House Terrace Defence Committee: Sir Arthur Steel-Maitland, M.P. (Chairman); Mr. J. C. Squire (Vice-chairman); Lady Oxford and Asquith (who held up an illustration of the Terrace from "The Architectural Review," displaying which she said, "How dare they try to pull that down!"); and the Bishop of Southwark.

NOTES & TOPICS

THE MUSTER FOR ACTION

A PACKED hall—a packed gallery—rows of figures standing, hat in hand, uncomfortable yet eager, round the walls—this was the scene at 5.30 on Thursday night, when Sir Arthur Steel-Maitland rose to open the first meeting of the first members of the first committee for the Defence of Carlton House Terrace.

*

As Mr. Squire said later, it was difficult to realize that this was a committee meeting. If the committee at its present size fills the Caxton Hall, it will fill the Albert Hall next time.

*

What does this mean? It means that public opinion is roused. What *Country Life* calls "our unguarded city" is to be left unguarded no longer. A really impressive phalanx of people, drawn from all interests, has formed up, not in order to utter a "strong protest" but to say "*we will not let this sort of thing go on.* We will take action." And action—unfortunately for Mr. A. S. Gaye, the Permanent Commissioner of Crown Lands—there is going to be.

*

Not that the decapitation of Number Four Carlton Gardens, nor even the cold storage of Carlton House Terrace, is the only objective. I suppose even Mr. A. H. Dungay, my coldest reader, will have realized by now that there is more in this disturbance than meets the eye. As Mr. Frank Pick said, "the smallest matter we are invited to consider here is the fate of Number Four Carlton Gardens." About the ultimate objective of this committee I believe something is said elsewhere in this issue.

*

The "platform" itself provided an interesting study in contrasts. Sir Arthur Steel-Maitland, a finely-chiselled patrician; Mr. Squire, a rubicund Mephistopheles; the sharp wiry silhouette of Lady Oxford—all the sharper and wirier against the glorious substantiality of Sir William Davison and Mr. Frank Pick; Lord Esher, dark and *disturbing*; Sir Leslie Scott, legal and dapper. And somewhere out in the Great Beyond, the dim, nearly indistinguishable figure of the Editor of THE ARCHITECTS' JOURNAL.

*

The greatest clap of the afternoon was given when Lady Oxford held up a vast illustration of Carlton House Terrace from *The Architectural Review* and cried: "How dare they try to pull that down!"

The Carlton House affair is a melancholy business, but it has already served one purpose—a noble purpose: it has introduced brightness and amusement into Beachcomber's drab life. And his comments in last Wednesday's *Daily Express* have, in their turn, entertained me, as, indeed, his column seldom fails to do.

*

After all, perhaps what Beachcomber suggests is right. What is all "the Carlton House Terrace fuss" about? Why *not* pull it down? Where is its half-timbering, that it should be reckoned as architecture, or beauty either? Tush!

*

> There is a persistent rumour (he writes) that the first to complain of the new tall building was a gentleman who did a roaring trade in skyscrapers in New York. It was only recently that the architects who had lost the contract began to cry . . . What hurts me is that the whole thing is commercial. Fancy thinking of money!

*

Actually, of course, the "rumour" referred to is incorrect—the agitation started in this JOURNAL, and many minds trained in architectural (not antiquarian) appreciation took up the cause; although men (American as well as British) who have built skyscrapers in New York are as satisfied about the unsuitability of high buildings to London as they are about the beauty of Nash's terrace. What does surprise me is to hear Beachcomber (who usually champions sensibility against commercial encroachment) allow that finance should have any consideration at all—however faulty. His journalism is better than his architecture; he is a better columnist than logician; a finer comic than critic.

*

THE BUILDING INDUSTRIES COUNCIL IN BEING

Tomorrow (Thursday), as some of my readers are aware, the Building Industries National Council comes into being as a constitutional body, and the first step in the mobilization of the Industry, due to the initiative of Sir Raymond Unwin in calling the representative conference of last August, is accomplished.

*

"The costly experience of what was thought to be 'economy,'" says Mr. H. B. Bryant, the secretary, in the course of an interview for the general press, "and the play of sheer expediency with the vital interests of the Building and ancillary Industries, will not again be perpetrated on an unsuspecting industry and public."

Meanwhile, Mr. Bryant, who is also secretary of the Council's Public Relations Committee, tells me that the publicity recently accorded to the movement is showing a healthy influence. The borough surveyors, who have been canvassed by the Committee as to work suspended, are waking up, and their returns are not only coming in by the hundred, ranging over jobs from £250,000 down to £3,000, but are much more detailed.

*

The newspaper cuttings in last week's JOURNAL about "the Building Drive" all over the country were a cheerful sign of the times.

*

The scheme of the building societies for financing repairs and additions for house-owners is another straw which shows clearly enough which way the wind is blowing; and the Prime Minister has bestowed his official blessing on it. This is, I believe, the first occasion on which financial interests have recognized the possibilities of organizing finance for the Building Industry.

*

From this it is not such a very big step to the establishment of close and definite relations between finance and housing.

*

THE HOUSING CONFERENCE

The R.I.B.A. Conference last week provided a variety of interesting speakers, whose utterances were marked by sincerity and purpose.

*

Sir Austen Chamberlain, has, of course, a family tradition of housing work behind him, and spoke feelingly of the human element of this work of reconstruction. So, too, did the Marquess of Salisbury, laying great stress upon the value of reconditioning—the cheaper way of bringing health and happiness into the slums. Owner of vast areas of workmen's dwellings in Liverpool, which he is gradually rehabilitating, he is better fitted than anyone else to press for the less spectacular way of tackling the slums.

*

Lord Balfour of Burleigh supported with an eloquent speech, and others that followed served to show that the resolutions passed had the backing of a keenly interested conference.

*

It was left to Mr. J. M. Keynes to surprise us with a show of figures that made Sir Raymond Unwin's calculations as to the effects of not spending appear modest and diffident. Which was a pity; unless Mr. Keynes is going on to develop his case, and produce very telling evidence in its support.

*

WATERLOO BRIDGE SAVED

The L.C.C. Improvements Committee have at last agreed to the Government solution of the Waterloo Bridge problem; but with bad grace, and reservation.

*

It would look less like sulking on their part if they had been able at any time to produce good town planning reasons to show why six lines of traffic should be brought at great additional expense to debauch into the bottleneck of the Strand.

*

It is some small comfort to Mr. William Muirhead that the sane evidence he gave to Lord Lee's Royal Commission has withstood the opposition of several stormy years.

THE ARCHITECTS' DIARY

Wednesday, February 8

R.I.B.A., 9 Conduit Street, W.1. Exhibition of photographs of monuments of Islamic architecture in Persia. Until February 25.

ROYAL ACADEMY OF ARTS, Burlington House, Piccadilly, W.1. Winter Exhibition, 1933. 10 a.m. to 6 p.m. Until March 11. 10 *a.m.*

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Roman Architecture—IV." By Sir Banister Fletcher, PP.R.I.B.A. 6 *p.m.*

ILLUMINATING ENGINEERING SOCIETY. At the Polytechnic, Regent Street, W.1. "Light in the Service of Mankind." By C. C. Paterson. 6 *p.m.*

INSTITUTION OF STRUCTURAL ENGINEERS. Lancashire and Cheshire Branch. At the College of Technology, Manchester. "The Greatest Spans Attainable by Reinforced Concrete Bridges." By T. J. Gueritte. 7 *p.m.*

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. At the Hotel Russell, W.C. "Warming and the Ventilation of the Masonic Peace Memorial Building, W.C." By Edgar Herring. 2.30 *p.m.*

INSTITUTE OF FUEL. At Burlington House, Piccadilly, W.1. "Practice of Heat Insulation." By L. Forster. 6 *p.m.*

INSTITUTION OF CIVIL ENGINEERS, Great George Street, Westminster, S.W.1. "Design and Construction of a Covered Concrete Service Reservoir at Plumstead, for the Metropolitan Water Board." By J. H. Tweedie. 6 *p.m.*

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "Design and Form as Applied to the Manufacture of Glassware." By James H. Hogan. 8 *p.m.*

Thursday, February 9

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "The Creep of Concrete Under Load." By W. H. Glanville and F. G. Thomas. 6.30 *p.m.*

Friday, February 10

TOWN PLANNING INSTITUTE. At Caxton Hall, Caxton Street, S.W.1. "The Town and Country Planning Act and the Countryside." By Professor Patrick Abercrombie, F.R.I.B.A. 6 *p.m.*

FACULTY OF ARCHITECTS AND SURVEYORS. London and Home Counties Branch. Visit to the Building Centre, 158 New Bond Street, W.1. 6.15 *p.m.*

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Manor Houses." By R. Minton Taylor, F.R.I.B.A. 6 *p.m.*

INSTITUTION OF STRUCTURAL ENGINEERS. Midland Counties Branch. At the Chamber of Commerce Building, 95 New Street, Birmingham. Discussion on "The Nature of Stress in Concrete." To be opened by A. Ashworth, B.SC. 7 *p.m.*

Saturday, February 11

Sunrise 7·23 a.m. Sunset 5·7 p.m.

Tuesday, February 14

ROYAL SANITARY INSTITUTE, 90 Buckingham Palace Road, S.W.1. Discussion on "Ventilation and the Need for Standards." To be opened by J. S. Owens, A.M.INST.C.E. 5.30 *p.m.*

HANTS AND ISLE OF WIGHT ARCHITECTURAL ASSOCIATION. At Southampton. Annual Dinner and Dance.

INSTITUTE OF LANDSCAPE ARCHITECTS. At the Royal Horticultural Hall, S.W.1. "A Layman's View of Landscape Architecture." By C. E. Hughes. 3.30 *p.m.*

INSTITUTION OF HEATING AND VENTILATING ENGINEERS. Manchester and District Branch. At the Engineer's Club, Albert Square, Manchester. "Snags in Heating and Hot Water Supply Installations." By A. Hindley. 7 *p.m.*

LONDON SOCIETY. Visit to the Jewish Museum and Central Library, Woburn House, Upper Woburn Place, W.C.1. 3 *p.m.*

—AND NOW RICHMOND BRIDGE

Richmond Bridge is endangered by the washing away of its foundations, and another opportunity for preservation and widening presents itself.

*

In neither case is affection misplaced, for both appear to me to be masterpieces, the loss of which we cannot afford. There is no question of demolition in Richmond or Twickenham, I understand, for both appear to realize the high monetary value of a fine work of art in the forefront of their picture.

ASTRAGAL

NEWS

POINTS FROM THIS ISSUE

The chief object of making a plan is to avoid waste expenditure of effort and capital 203
We have reached the point when cheap houses and slum clearance have got to be tackled in real earnest, and as one problem 210
£30,000,000 spent on housing would probably increase the national income by £60,000,000 in one way and another 211
So-called functionalism must acquire more psychology and human feeling 213
The professional builder who organizes a job should be paid . . . like the architect a definite percentage 217
7 sq. ft. per person is the approximate seating allowance for a theatre .... *Supplement*

REFRESHER COURSES

The first of two refresher courses for architects was commenced at the Building Research Station, Watford, on Monday last, and will be concluded on Saturday, February 18. The second will be held from Monday, February 20, to Saturday, March 4.

Broad questions relating to the economics of the building industry, to architectural acoustics, to moisture movement, fire resistance, and to sources of technical information, are to be dealt with by Mr. Zaiman and Mr. Barnett.

Mixed with lectures will be laboratory work. The architects attending the refresher course in building science will have the opportunity to do practical work on concrete, bricks, stones and slates, lime and plaster, bitumens, waterproofers, cast stone, illumination, stone preservers and strength testing. One whole day is to be given to the study of steel-framed buildings.

ARCHITECTS AND ENGINEERS

Mr. J. Hubert Worthington, F.R.I.B.A., speaking at the annual dinner of the Manchester Branch of the Institution of Structural Engineers, held on Wednesday last, emphasized that one of the really significant things of the present time was that engineers and architects were getting closer together rather than farther apart. The rising generation of architects loathed columns hung on buildings, and ornamentation (described by Mr. Worthington as "kippers and onions"). The young architect was absolutely absorbed with functionalism, and thought in terms of engineering. What was wanted was for architecture to have the best of engineering, and engineering to have the best of architecture.

The list of subscriptions received by the Public Relations Committee of the Building Industries National Council up to Friday last, February 3, amounted to £1,880 2s. 0d.
Subscriptions should be addressed to the Honorary Treasurer, Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

THE ARCHITECTURE CLUB

The next supper-discussion of the Architecture Club will be held at the Architectural Association, 34 Bedford Square, W.C., on February 17 at 7.30 p.m. "Architecture and Modern Production" is the subject for discussion, which will be opened by Mr. R. A. Duncan, A.R.I.B.A.

HOUSING CONFERENCE

The following resolutions were passed at the Housing Conference held at the R.I.B.A. last week and attended by a large gathering widely representative of all those interested in various branches of housing :

RESOLUTION NO. 1

Proposed by Sir Raymond Unwin, President R.I.B.A. Seconded by Sir John Mann, K.B.E.

That this Conference, having heard the statements made relative to the changes in the conditions governing the supply of dwellings for the lower paid workers, considers that the proposal to set up a National Public Utility Housing Board should be fully explored, in conjunction with the authorities and interests concerned, and that the assistance of the Minister of Health should be invited.

RESOLUTION NO. 2

Proposed by The Rt. Hon. Lord Balfour of Burleigh. Seconded by Sir Edgar Bonham-Carter, K.C.M.G.

The Conference urges His Majesty's Government to take what steps they can to maintain an adequate provision of dwellings for the lower paid workers by encouraging local authorities in appropriate cases to carry on with the building of dwellings without subsidy, and, where the circumstances require, by developing improvement areas under the 1930 Housing Act on a large scale and dealing rapidly with the overcrowded families in those areas.

A vote of thanks to the Chairman was proposed by Mr. J. Maynard Keynes, C.B., and carried unanimously.

A special article on the Conference is printed on page 208.

WEST YORKSHIRE ARCHITECTS' DINNER

The biennial dinner of the above Society was held at Leeds, on February 2, under the presidency of Mr. B. R. Gribbon.

The Earl of Harewood, in giving the toast of the R.I.B.A., said an important part of the duty of many architects was the designing of small houses which would be within the means of the poorer classes of the community. The amount of land to be allotted to each house was a controversial question. For his part he considered that even an increase of a fifth of an acre per house would tend to throw any scheme over a much larger area, and further from the centre of employment and so create a transport problem, and that was one of the most difficult questions they had to face at the present. With regard to unemployment, a subject on which he felt very deeply, he thought that many builders must have a number of unskilled jobs which they might be able to fill with sturdy youths who would be willing to do a hard day's work for little more than the minimum wage, and he hoped they might use their influence in this direction.

During the proceedings, the R.I.B.A. architecture medal for West Yorkshire, 1931, was presented by Major Barnes to Mr. G. H. Foggitt, of the firm of Chorley, Gribbon, and Foggitt, for the Yorkshire Penny Bank branch building in Headingley, Leeds.

NEWS REEL THEATRE

Mr. Alister G. MacDonald has submitted plans to the Westminster City Council, for a news reel theatre which it is proposed to erect in the Southern Railway Co.'s Victoria Station, adjoining Buckingham Palace Road. The plans have been approved by the Duke of Westminster and the London County Council.

FRENCH REIGNS EXHIBITION

The Three French Reigns Loan Exhibition (Louis XIV, XV and XVI), organized by Sir Philip Sassoon, will be held at 25, Park Lane, W. from, February 21 to April 5 inclusive (11 a.m. to 7 p.m., Sundays included).

We regret that the name of Mr. E. Stone Collins's partner in the work of completing London County Hall was misquoted in last week's issue. It should have appeared as Brian S. Roberts.

R.I.B.A.

PERSIAN ARCHITECTURE

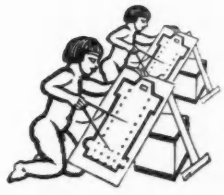
An exhibition of enlarged photographs of monuments of Islamic architecture in Persia, made by Arthur Upham Pope, Director of the American Institute for Persian Art and Archæology, was formally opened at the Institute on Monday afternoon by the American Ambassador.

The material constitutes a systematic survey of some of the earliest and most important monuments of the Islamic period left standing on Persian soil, and represents the first inclusive group of photographs of these monuments to be shown.

It has long been recognized that the architecture of Persia of this period was especially important, not only for its own beauty and for the magnificent solution of difficult structural problems which it exemplifies, but also as a link in the history of European architecture. But it has been impossible to get adequate knowledge of the most important monuments, owing to the fact that all of the greatest buildings are mosques in active use, and it was forbidden on pain of death for a non-believer even to enter these. Occasionally a European has been able to go in for a few moments in disguise, but really careful observation was rendered impossible by the danger of the situation, and photographing, save for a few rare and quite inadequate snapshots, was quite out of the question. Four years ago, however, the Shah permitted Mr. Pope to enter the mosques, providing a Government guard, for the purpose of making a photographic record for scientific study.

The photographs are on an especially large scale, which gives the full effect both of the monumentality of the structures and of the exquisite and infinitely varied detail of the ornamentation.

The exhibition will remain open until Saturday, February 25, between the hours of 10 a.m. and 8 p.m. (Saturdays 5 p.m.).



MEMBERSHIP

The 1933 edition of the R.I.B.A. Pamphlet, *Membership of the R.I.B.A.*, has now been published. Copies may be obtained from the Secretary, R.I.B.A., price 1s. each, exclusive of postage.

The pamphlet, in addition to containink information regarding the examinations and membership of the R.I.B.A., contains full particulars with regard to architectural training, scholarships available at the Schools of Architecture recognised for exemption from the R.I.B.A. examinations, a selected list of books on architectural subjects, etc. Maps showing the local distribution of facilities available for architectural education in the British Empire are an important feature of the pamphlet. These maps are accompanied by lists of Schools throughout the countries and by a schedule showing the local distribution of facilities. This schedule gives the R.I.B.A. allied societies and their provinces and states the educational facilities available in the area of each allied society.

Ardistan: Masjid-i-Jurneh (Cathedral Mosque) 1135. Looking into the domed sanctuary from the east. From the exhibition of photographs of Persian Architecture, opened by the American Ambassador at the R.I.B.A. on Monday last.

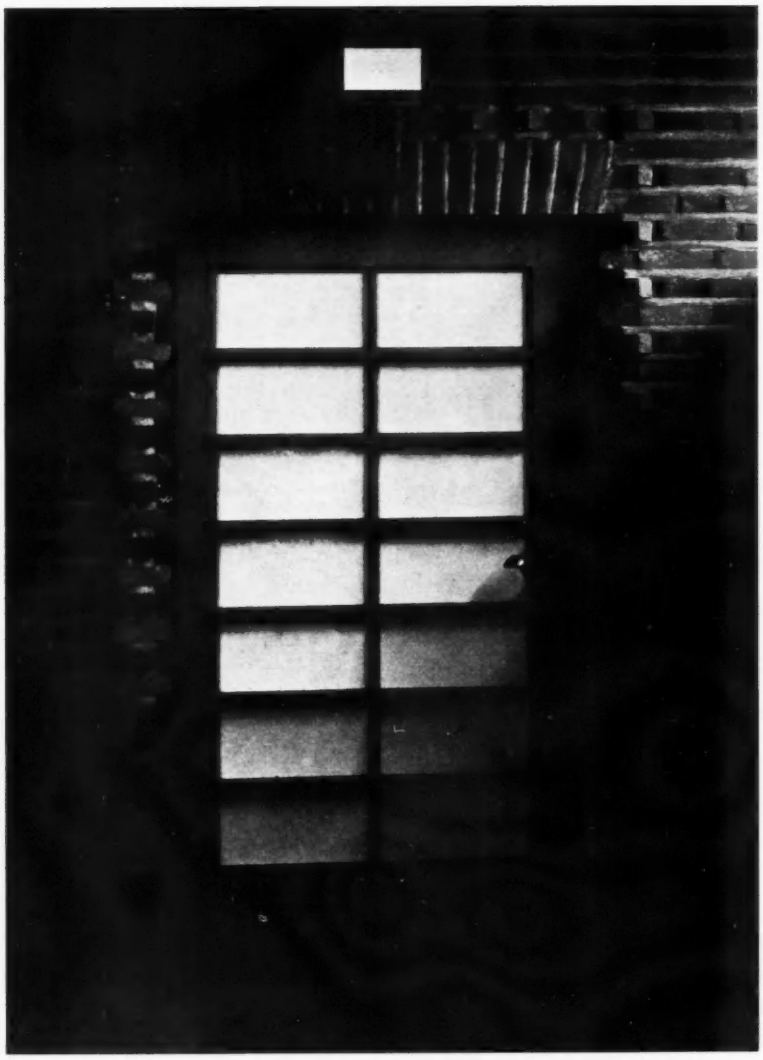
COMPETITION NEWS

CEMENT HOUSES

The assessors' award in the Cement Marketing Co., Ltd.'s., competition for four types of houses promoting the artistic uses of cement was first published in a supplement with last week's JOURNAL, issued the day after the award was publicly announced. Extracts from the assessors' comments on some of the premiated designs, reproduced elsewhere in this number, are given below.

TYPE A: A TERRACE THREE-BEDROOM HOUSE COSTING £500 TO BUILD (SUITABLE FOR A SCHEME OF 48 HOUSES IN TERRACES OF 6). First Prize—Thirty guineas: C. A. Charlewood Turner, A.R.I.B.A., of Wrotham, Kent. (See supplement). The living room, open to the hall, permits the use of a screen, curtain, or doors, yet provides a sense of ease and space. The kitchen is well arranged and the bedroom planning excellent. Access to the back door is faulty owing to the necessity of passing the dining recess window, nor would the garden be attractive and private. Access from house to garden is through the kitchen, which is not ideal. No provision for tank storage space or access thereto is shown.

The external walls are specified to be of precast pumice concrete blocks, rendered externally with coloured cements and finished internally with Hydralime plaster. The hood to the front door is to be of reinforced concrete. The kitchen floor is to be surfaced with Cullamix, coarse grading.



TYPE A: SPECIAL PRIZE—FIFTEEN GUINEAS. By E. Wamsley Lewis, A.R.I.B.A., of Weymouth. (See page 213.) The front service yard is a very commendable feature, ensuring privacy to the back gardens; as is also the sun porch. There is only one W.C. downstairs, but there is room for a fitting in the bathroom with rearrangement.

This scheme is one of the few submitted in which, with a single large living room, the kitchen is treated as combined cooking and dining space. The bedrooms are very well planned from the standpoint of furniture and fitting.

The walls are of 4 in. reinforced concrete but the system of construction does not appear practicable. The specification offers grounds for criticism on the score of insufficient information. Coloured cement is specified for the outside walls and Hydralime plaster for the inner walls. The construction would not provide for concealment of services, etc., and no provision is shown for storage tank.

The figure of 9d. per cu. ft. is optimistic.

TYPE A: SECOND PRIZE—FIFTEEN GUINEAS. By C. P. Greenwood and Ivan Williams, of Wolverhampton. (See supplement.) The kitchen might be better arranged as regards its fittings to permit of its occasional use as a dining room. The corner window in the living room would give an unfortunate view of any hedge or fence separating the back gardens; the view down the length of the garden is the

The Konrad Haenisch School, Frankfurt-on-Maine • By Martin Elsaesser. Craftsmanship in a brick doorway in the building illustrated on the following pages.

one usually desired. The support of the main wall over the single-story flat on the rear elevation is not fully explained. The passages through the building giving access to back doors, which face each other, are too narrow. This might have been avoided by planning the doors differently in each house.

The houses are specified of brick construction with 9 in. external walls, rendered with cream Cullamix, fine grading, the slightly projecting plinth and architrave around the external walls being of dark grey Cullamix. The parapet coping is of precast stone, projecting 9 in. and sprayed with Tintocrete of dark grey colour. All floors on the ground floor, other than that in the living room, to be finished with red Cullamix, coarse grading. Hydralime is specified for internal plastering.

TYPE B: SEMI-DETACHED THREE-BEDROOM HOUSE COSTING £600 TO BUILD. First Prize—Thirty guineas. William A. Funnell, of Purley. (See supplement.) A very pleasant plan, but with its main room only 10 ft. 6 in. wide and a dining room in which the door is awkwardly placed. The dining and living rooms might have been reversed in position, placing the former next to the kitchen. The hall, on the other hand, is very ample.

The walls, which are of 9 in. brickwork, are rendered on a water-repellent cement mortar with Snowcrete, the entrance door and hood being in concrete sprayed with Tintocrete. Cullamix coarse grading is specified for finishing the concrete floors of entrance hall and kitchen. Hydralime is to be used for internal plastering.

TYPE D: DETACHED FOUR-BEDROOM HOUSE WITH GARAGE INCORPORATED OR DETACHED, COSTING £1,000 TO BUILD. First prize—Thirty guineas. By J. W. Davidson, of Sheffield. All dining and bedrooms have south aspect, and furniture is well provided for, though the bedrooms would bear further study. The kitchen, with its maid's recess, is both workable and pleasant, and all other items of service are well considered. The large first floor landing would be useful, as it is large enough to be furnished, but the arrangement of bedroom and cupboard doors giving on to it might be bettered.

The cost of 1s. is a fairly reasonable assumption. A good point of this scheme is that the garage could be omitted for later addition if required. The walls are specified to be of 9 in. concrete blocks, treated externally with water-repellent cement and rendered with Cullamix, fine grading (yellow stone colour), and finished with a wood float. All parapets to have 2 in. green concrete tiles set in cement.

The hall, staircase and first floor landing are to be treated with Tintocrete to approved colours. Cullamix, coarse grading, is to be used in the form of pre-cast tiles for the hall, and to be laid *in situ* as a finish to the floors of kitchen and bathroom.

Hydralime is to be used for rendering internal walls and ceilings.

TYPE D: SECOND PRIZE, EX AEQUO—FIFTEEN GUINEAS. By E. Maxwell Fry, B.Arch., A.R.I.B.A. (Adams Thompson & Fry), of London. Unfortunately the house is a little expensive for the sum allowed. The living rooms face south as well as the bedrooms; the detail planning of the latter is the best submitted. The fenestration of the main living room requires consideration in conjunction with the furnishing. The "L" of this room would appear more suitable as a study or sitting recess, with perhaps a fireplace, while the piano might be placed in the larger "reception" area. The door to the garden seems at present crowded between window and suggested location for piano, and would interfere with sitting arrangements, which might focus around the former. The kitchen is small, table space is lacking, and the service lobby is unworkable. The omission of fireplaces is a reasonable conception but there is little doubt that in the living room a fireplace is generally welcome.

The outer walls are of cavity blocks, lined on the inner face with insulating boards; externally they are to be treated by rendering with Cullamix, fine grading, in shades of yellow and brown, whilst Snowcrete is also to be introduced, as well as a mixture of black Portland cement and black basalt.

Concrete tiles 2 ft. square, finished with Cullamix, coarse grading, are to be used for the floors to hall and kitchen, whilst the stairs and landing, which are in reinforced concrete, are to be finished in Cullamix and bedded into and on to the walls.

HENRY SAXON SNELL PRIZE

The Henry Saxon Snell Prize was founded to encourage improvements in the construction or adaptation of sanitary appliances, and is to be awarded by the Council of the Royal Sanitary Institute at intervals of three years, the funds being provided by the legacy left by the late Henry Saxon Snell.

The Prize for 1933 will consist of fifty guineas and a medal of the Institute, and is offered for an essay, 5,000 words in length, on "Suggestions for Improvements in Apparatus and Appliances for dealing with House Refuse."

Essays must be delivered on or before September 30, 1933, addressed to the Secretary of the Royal Sanitary Institute, 90 Buckingham Palace Road, London, S.W.1, from whom full particulars of the competition are obtainable.

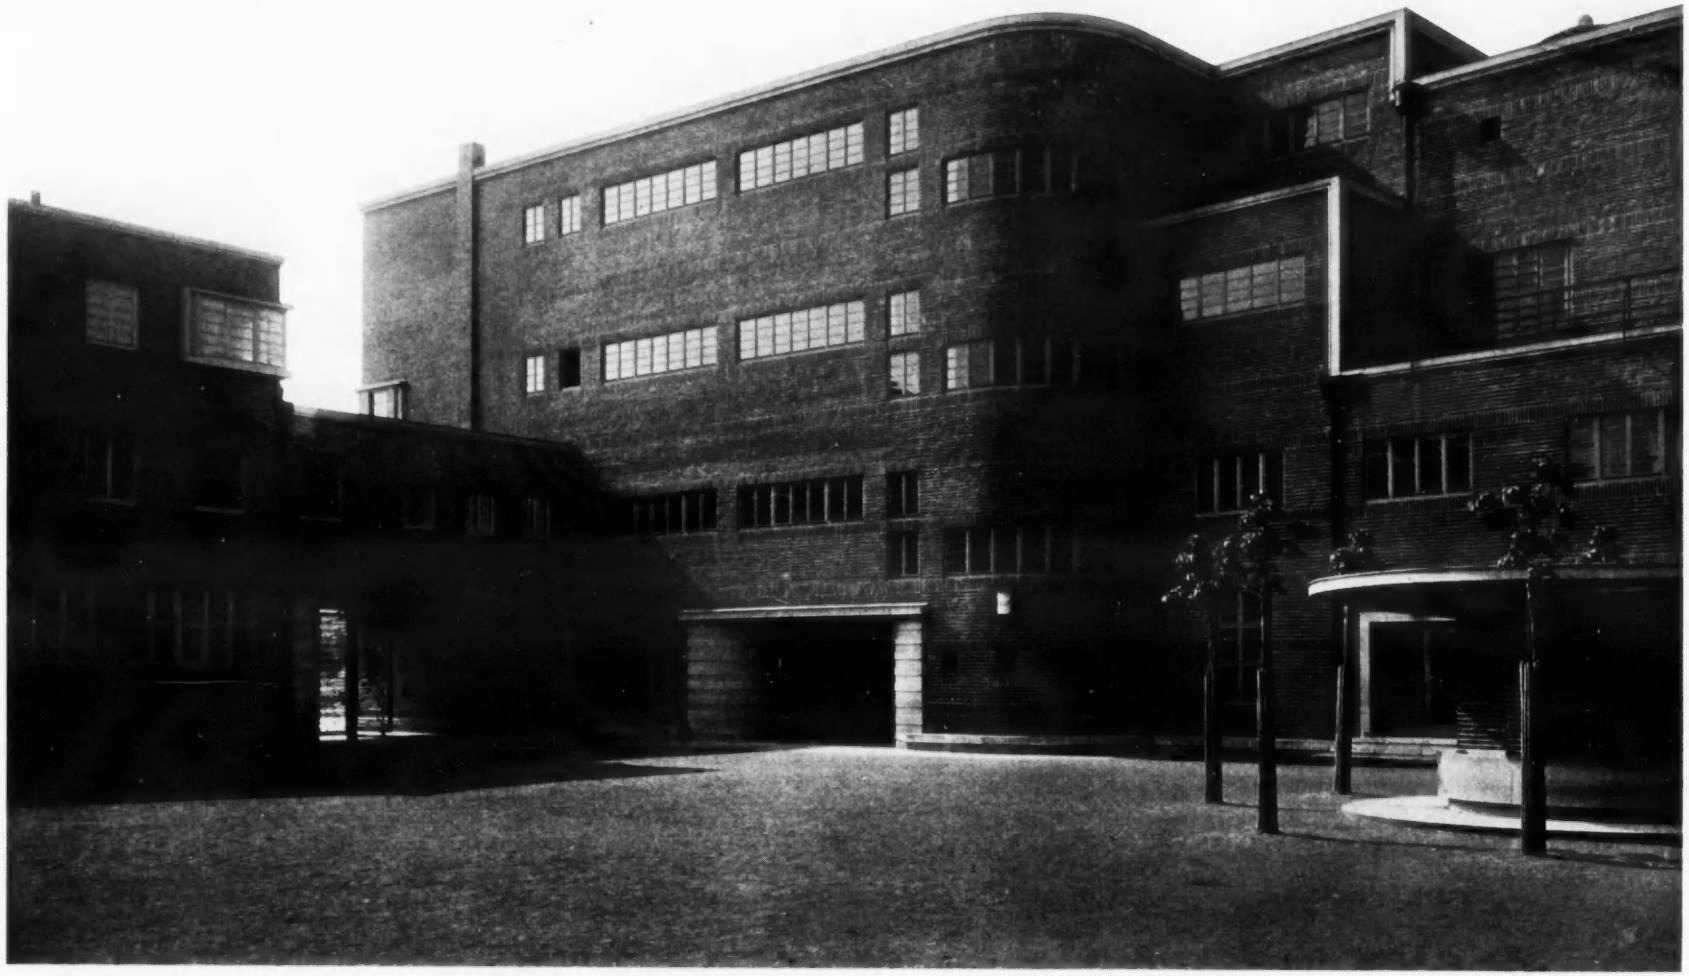
Competitions Open

March 24.—Façade to a newspaper office in grey Cornish granite, for the Cornish Quarry Masters' Association. First prize, £50.

May 31.—Sending-in Day. Layout of a suburb on the River Escaut, Antwerp. £2,400 in prizes (1st, £800).

Full Particulars of the above competitions were published in our issue for February 1 last, and December 7, 1932, respectively.

SCHOOL AT FRANKFURT : BY MARTIN ELSAESSER



In designing the exterior of the Konrad Haenisch School at Frankfurt-on-Maine, of which the south and east fronts are illustrated on this page, no particular innovations were made; the elevations show the clean rectangularity dictated by the need for economy of construction in modern Germany; neither has the fact that dwelling-houses are included in the group been concealed. The internal arrangements, however, mark certain reforms. The large hall is intended for use also as lecture-theatre and concert-hall; the gymnasium, with its changing rooms and baths, has a separate entrance for gymnastic clubs; there are a nursery, kindergarten and crêche, with terraces, covered-in play-hall, paddling-pool and welfare rooms.

Though a sparing use has been made of limestone tiles, the structural material is mainly brick; the illustration on the opposite page, and the frontispiece to this issue, show the expert craftsmanship with which the medium has been handled. On the following pages are further views of the building.

THE KONRAD HAENISCH SCHOOL, FRANKFURT : BY MARTIN ELSAESSER

The upper view is taken from the school playground, and shows one of the entrance doorways; the lower view is a detail of the patterned brickwork surrounding a companion entrance.

LETTERS FROM READERS

A National Planning Board

SIR,—Knowing nothing of the organization and difficulties of the Building Industry, I propose to submit to you the general reflections to which a study of your interesting New Year issue gave rise in my mind.

The remarks of mine which you quote had immediate reference to industries which were suffering in their efficiency and earning power by unrestricted internal competition: they had a remoter reference to the world difficulties created by unrestricted international competition in the marketing of such a product, for instance, as coal.

Building is clearly an industry which, regarded as a whole, is sheltered from foreign competition; foreign labour cannot design or erect our buildings, though it may supply some of the raw materials. I am unaware whether or not the efficiency of building (or of some of the manufacturing industries dependent on building) is being affected by excessive competition internally, involving loss of profit and waste of capital, or whether its progress is hampered by exactly the contrary defect—a rigidity of high costs which makes its production and services expensive in relation to the general level of costs in the community. In other words, I have not the knowledge which would tell me whether the Industry as a whole resembles, say, the coal industry or the railway industry in this country. In this connection I note that the table of comparative prices given in your New Year issue gives 1914 prices in relatively few cases. But if, in fact, there are defects in the economic structure of the subsidiary building trades, any constructive programme for the industry as a whole would have to be based on rationalization—merely another name for planning—of those trades, which would call for examination by a rather different kind of Planning Board from the main one to which you direct attention.

Assuming, however, that the Industry as a whole is healthy, not over-equipped with capital or labour, and capable of producing at an economic price, its main trouble at the present minute, as your pages bear witness, is a consumer's strike. Personally, I have much sympathy with the views which you express as to the economic effect of a drastic restriction in building programmes, but plainly what is required to alleviate that situation is a Propaganda Board rather than a Planning Board.

I do, however, see one direction in which the Building Industry can initiate or collaborate in national planning, directed to orderly development in the future rather than the immediate present. The chief object of making a plan is to avoid waste expenditure of effort and capital. How much waste has been involved in the last ten years in the construction of new factories and whole housing districts in the south of England while acres of building have been becoming derelict in the north? Does this not provide a chance for planning—of a kind, be it noted, that may conflict with the immediate interests of the Building Industry? And is not the necessity for this planning, which requires a board which must comprise much more than building interests, reinforced by the approaching decline in population, to which attention is directed in an article in a recent issue of *The Times*? This decline, and even more the change in the age structure of the population by which it must necessarily be accompanied, will involve very considerable changes in the kind of buildings and class of construction which will be required in the next twenty years.

ANDREW McFADYEAN

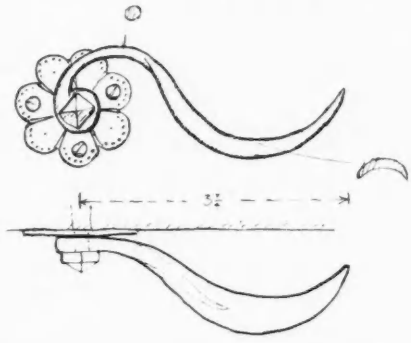
[*The point to which Sir Andrew McFadyean draws attention in his last paragraph is exactly the one that leads many thoughtful people to feel that a National Planning Board—of some kind—is inevitable.*—ED., *A.J.*]

The Winchester Cut

SIR,—Can any of your thousands of readers clearly explain "The Winchester Cut" in weather tiling to the verge up a gable head.

Is this "cut" still used today, and what is the necessity, if any, for it?

No textbooks describe it fully—they simply state that "some tiles up under the verge must be cut fan-shaped."



ERNEST W. FAGG

Door Handle Design

SIR,—In these days the shelves of the architect's office groan under an endless array of catalogues. These are mostly very depressing publications and we look in vain amongst the products of the machine for any indication of that friendly human spirit which we find in old craftsmanship.

In nothing is this more noticeable than in door furniture, which is all characterized by the slick shop finish and smart appearance which vulgarizes most modern productions. The old flattish door knobs are discarded for spherical forms like impaled billiards balls, and the pock-marked, so-called "antique" latches are equally repulsive.

The lever type of handle, too, of which there are many beautiful models, in old Swiss houses especially, is only to be had in debased patterns. I enclose a sketch of a handle the design of which is based on the old patterns. Is it too much to hope that some manufacturer might be prepared to

supply it at a reasonable price and with a finish which will suggest that it has been made by human hands and not with the soulless perfection of machinery?

M. H. BAILLIE SCOTT

Unemployment

SIR,—I was extremely interested in your leader on Unemployment in the last issue of the JOURNAL, and I should like to draw your attention, and possibly the attention of Mr. S. P. B. Mais—if he is not already aware of it—to what Stuttgart is doing, in the way of building for the unemployed. While this affects neither the ultimate problem of unemployment nor the revival of industry, it *does* do something to ameliorate the immediate hardships and degradations of the unemployed who cannot be left to starve and deteriorate, while the world works out a leisurely "cure."

The enclosed quotation is from the *Monthly Labor Review* published by the U.S. Department of Labour.

H. J. C. CUNNINGHAM

In accordance with the national emergency decree of October 8, 1931, the Stuttgart City Council had by November of that year formulated plans for erecting settlements on the outskirts of the city for labourers of the community and their families, with the two-fold purpose of affording economic relief to the overburdened city welfare bureau and of placing in a new social environment unemployed heads of families who were not expected to find remunerative employment in the near future, *if ever, under existing economic conditions.*

The above-mentioned decree provided that, in cases where cities made land available for settlements, the State, through the German Building and Land Bank, would grant loans through municipal guarantors to unemployed for the purchase of building material for the dwellings to be erected up to 2,500 marks ($595). In Stuttgart the original intention of the emergency decree was modified to the extent that instead of the city accepting loans from the Building and Land Bank, guaranty corporations were formed with municipal approval, which

take loans from the Building and Land Bank for the individual builders and future owners of the houses erected. The intermediary capacity of these loan corporations lasts for only the first three years after the first harvest, at which time the tenants take over the loans, pay their interest charges directly to the Land Bank, and obtain title to their lots.

The loans for building material up to 2,500 marks ($595) are granted by the Land Bank at the rate of 5 per cent., including sinking fund, with the exception of the first two years, when they are at the rate of 2 per cent. In addition to this sum, the city of Stuttgart grants loans up to 300 marks ($71·40) for each house, and the labour of the future owners is assessed at 200 marks ($47·60) bringing the total value of the house to 3,000 marks ($714), the maximum limit set by law. In addition, the city provides a lot of 800 square meters in area from its city lands for each house built, which lot is granted at a rental of 3 marks (71·4 cents) per 100 square meters per year to the dweller for the period of 45 years, at the end of which period the ownership of the land reverts to the city. In accordance with the above programme the total charge to each tenant for his house and lot is less than 20 marks ($4·76) per month, which in comparison with 40 marks ($9·52), the average monthly rental paid by the same families for city tenants, shows a substantial saving. An added provision is that the occupants are exempted from all taxes during the period of their occupancy. The erection of the house is carried on by the persons destined to live in it after completion. The membership of the community settlements is chosen by the city welfare bureau, and in its choice care is taken to include, in each construction group of 10 or 12 persons sent out, a sufficient number with the technical ability to superintend the manual labour needed and to perform themselves the more intricate building operations. Each house is built by such a group, one man exchanging his labour for that of another; the group continuing until all the houses, in which the families accounted for therein, have been completed. The laying of gas, electric, and water lines, however, demands more manual labour than a group of ten or a dozen persons could perform. To meet this demand the city has encouraged the voluntary labour service movement (Freiwillige Arbeitsdienst) by accepting the services of those receiving unemployment benefits who offer their labour without compensation for the sake of having something to do. By these methods the settlements are built on city land with national means through the labour of their future owners and with the assistance of the brotherhood of unemployed.

The garden belonging to each house will enable the occupants to keep a few chickens and perhaps a goat, and to raise enough fruit and vegetables to make the family practically self-supporting during the summer months at least, and to raise a supply of such staples as potatoes sufficient for the greater part of the year.

The late Percy Tubbs

We record, with deep regret, the death of Mr. Percy Burnell Tubbs, F.R.I.B.A., senior partner in the firm of Messrs. Percy Tubbs, Son and Duncan, which took place in a London nursing home on Friday last, in his sixty-fifth year.

The third son of the late Henry Thomas Tubbs, J.P., he was educated at Highgate School, and commenced practice in 1894, after being articled to the late W. Patterson and studying in Paris. He designed numerous buildings in London and elsewhere, including premises for Lloyds and Barclays Banks, a housing scheme of flats at Chelsea, new offices for *The Glasgow Herald*, in Fleet Street, and many factories, schools, houses and war memorials. He also carried out some work in France, including a factory at Colombes. He was President of the Society of Architects during 1912-1914, and was largely instrumental in the founding of the First Atelier of Architecture, promoted by the Beaux Arts Committee, being always closely identified with its work; he also took a very active part in the preliminary work which ultimately led to the establishment of the Commission of Fine Art.

During the war Mr. Tubbs gave up much of his time to work for the welfare of troops passing through London, and it was he who invented the scheme whereby soldiers on leave were met at the station by members of the City of London National Guard. His interests apart from architecture included photography, in which he made early experiments in colour work.

He married Alice Maude, younger daughter of the late Frederick Augustus Waite, Barrister-at-Law, had four sons, two of whom served during the late war, one being killed in action.

Carlton House Terrace

At the first meeting of the general committee, held at Caxton Hall on Thursday last, the chairman, Sir Arthur Steel-Maitland, M.P., stated that the immediate object of the Carlton House Terrace Defence Committee was to protect the Mall, the great processional road in the capital.

The Crown Commissioners were allowing to be raised there a "sky-scraping monstrosity," and the Committee had not given up their efforts to get it stopped.

Carlton House Terrace was not an isolated case. Sky-scraping flats would have covered the Crown site of Bute House, if the Cabinet had not heard of the proposal in time and put a stop to it. They all knew what a mess had been made of Regent Street.

The chairman read a large number of letters from distinguished people who supported the protest, including the Archbishops of Canterbury and York, Sir William Llewellyn, President of the Royal Academy, and the late George Moore.

Sir William Llewellyn wrote: It is to be hoped that a much-concerned public will not be much longer kept in ignorance as to the intentions of those with whom a decision rests . . . if those in authority are only reasonable I am sure we shall not be disappointed.

Mr. George Moore wrote, in what was probably his last letter: They have done enough mischief in Park Lane and elsewhere to stay their hands; but no, the moment they see a fine building they form a plot to pull it down. Yesterday it was Park Lane, today it is Carlton House Terrace, and tomorrow it will be the churches in the Strand.

Mr. J. C. Squire, vice-chairman of the Committee, outlined its formation and objects, which are sufficiently well known to our readers. Carlton House Terrace and Gardens were not the end of the issue. When they had finished with that matter, it was to be hoped there would grow out of the movement a permanent vigilance committee to look after the public amenities such as Carlton House Terrace and the Adelphi. They had received among their subscriptions shillings and sixpences from domestic servants.

Two resolutions were carried unanimously by the large, influential and enthusiastic company.

The first, moved the Bishop of Southwark, in the absence of Sir William Llewellyn, condemned the erection of the present building at No. 4 Carlton Gardens, and the lack of regard for the Fine Art Commission, and urged the Government to make a change in the administration of the urban Crown properties, so that Parliamentary and public opinion should have the right to be consulted in the future before drastic alterations were made which prejudiced the amenity of Crown properties.

Mr. Frank Pick seconded, in the absence of Mr. G. K. Chesterton, and Lady Oxford and Asquith, in supporting the motion, urged all present to put all the pressure they could on local Members of Parliament. She said:—

We have seen a number of famous buildings come down and seen hideous buildings and empty flats in their places. We ought not to be led like sheep; in Paris, in Berlin and in Vienna it would not be allowed.

The second resolution, for the appointment of an Executive Committee, was proposed by Sir Leslie Scott, K.C. He said:—

The objects of the Committee should be to devise and recommend machinery which would prevent a repetition of this scandal of the Crown Lands question, and would ensure that due regard should be paid in all urban rebuilding and re-development to the amenity aspect. The Committee might also take suitable steps to bring about necessary legislation, and form an influential and representative body for stimulating public interest and guiding public opinion in urban amenity.

Dr. H. Costley-White, headmaster of Westminster School, seconded.

On the motion of Mr. A. C. Bossom, M.P., votes of thanks were passed to the chairman and vice-chairman.

The names of the Executive Committee preliminarily elected are as follows:—

The Rt. Hon. the Earl of Ilchester, Trustee of the British Museum and National Portrait Gallery; The Rt. Hon. the Earl of Lytton, P.C.S.I., G.C.I.E., President, Garden Cities and Town Planning Association; the Rt. Hon. Viscount Burnham, G.C.M.G., C.H., P.D.; The Rt. Hon. Viscount Esher, Chairman, S.P.A.B.; The Rt. Hon. Lord Conway of Allington; The Rt. Hon. Lord

COTTAGES AT BYFLEET: BY PAKINGTON, ENTHOVEN AND GREY

Perspective drawing of the scheme of twelve houses for the Chertsey Rural District Council, illustrated overleaf.

O'Hagen; The Rt. Hon. Earl Crawford and Balcarres, P.C., K.T.; A. C. Bossom, M.P., F.R.I.B.A.; John Buchan, C.H., M.P.; Capt. H. Crookshank, M.P.; Sir William Davison, M.P., K.B.E.; The Most Honourable The Marquess of Hartington, M.P.; A. H. E. Molson, M.P.; Lord Scone, M.P.; Sir Arthur Steel-Maitland, Bart., P.C., M.P.; The Rt. Hon. Earl Winterton, P.C., M.P.; Sir Lionel Earle, K.C.V.O., C.B., C.M.G., J.P.; J. C. Squire; H. de Cronin Hastings, Editor of THE ARCHITECTS' JOURNAL; Dr. Thomas Adams, F.R.I.B.A.; Frank Pick; Sir William Llewellyn, G.C.V.O., President of the Royal Academy; Sir Raymond Unwin, P.R.I.B.A.

Town Planning Institute

A dinner to the Rt. Hon. Sir Edward Hilton Young, G.B.E., D.S.O., D.SC., M.P., Minister of Health, will be given by the Town Planning Institute at the Savoy Hotel, W.C., on Friday, March 24, at 7.15 for 7.45 p.m. The dinner has been arranged on the eve of the coming into operation of the Town and Country Planning Act, 1932. The price of tickets, obtainable from Mr. Alfred R. Potter, Secretary, 11 Arundel Street, Strand, W.C.2, is 15s. (exclusive of wines).

The annual dinner of the Institution of Electrical Engineers will be held at Grosvenor House, Park Lane, W.1, on Thursday, February 16, under the Presidency of Professor E. W. Marchant, D.SC.

Registration

As pointed out in a circular letter issued by the Architectural Association for the benefit of its members, the Architects' Registration Council of the United Kingdom is prepared to receive applications for admission to the Register of Registered Architects.

A copy of the Council's Regulations, together with the prescribed form of application, containing details of qualifications and procedure, may be obtained, price one shilling, at the Offices of the Council, 18, Abingdon Street, Westminster, London, S.W.1, between the hours of 10 a.m. and 5 p.m. (Saturdays 1 p.m.) or by post if a remittance of one shilling is enclosed.

Courses for Teachers

The Board of Education have arranged a short course of lectures for teachers in recognized technical colleges, art schools, etc., in England and Wales, to be held in London and the provinces during July and August. The subjects to be treated include building, painting and decorating, electrical engineering, etc. The building course (London: July 24 to August 3 inc.) will be conducted by J. L. Manson, H.M.I.

Full particulars of the courses may be obtained from the Secretary, Board of Education, Whitehall, London, S.W.1.

Building Centre Reception

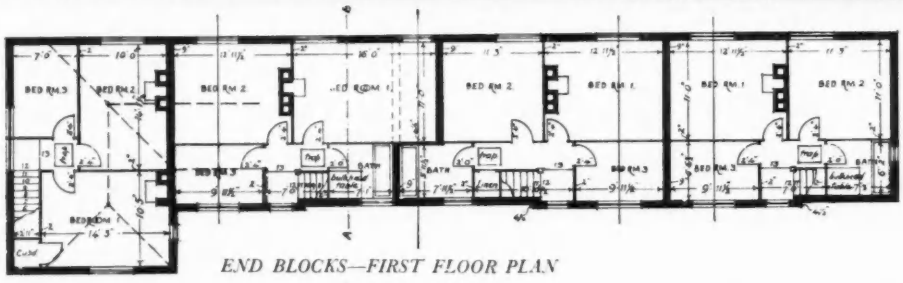
At a reception held at the Building Centre, 158 New Bond Street, W., last week, in connection with the King Edward's Hospital Fund, the guests were received by Viscount Burnham, on behalf of the Fund, and Mr. and Mrs. Sidney Gluckstein, on behalf of the directors of the Centre.

Since the King's Fund miniature hospital has been on exhibition at the Centre, it has been visited by about 10,000 people. The directors handed over a cheque for £200 to the Fund on account of the contributions collected.

The miniature hospital was illustrated in the JOURNAL for January 18.

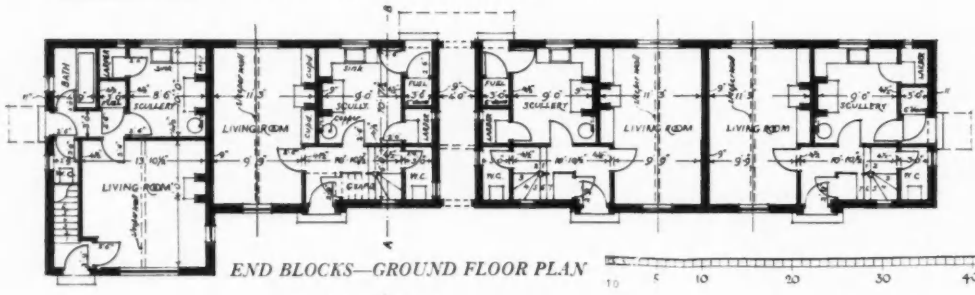
Industrial Art

The Council of the British Institute of Industrial Art have elected the following four new Fellows:—Captain J. R. I. Brooke, M.B.E. (Director of the Rural Industries Bureau); Professor E. M. O'R. Dickey (Chief Art Inspector of the Board of Education); Captain C. Geoffrey Holme, M.B.E. (Editor of *The Studio*); and Mr. Keith Murray, A.R.I.B.A. (designer of glass). These elections bring the total number of Fellows to 134.



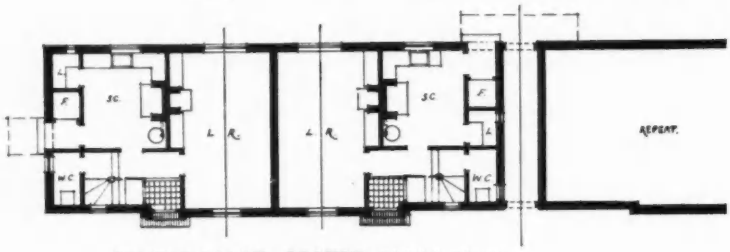
The Brangwyn Panels

The Brangwyn panels, a series of decorative panels designed by Mr. Frank Brangwyn for the redecoration of the Royal Gallery of the House of Lords, are to be exhibited for the first time at the *Daily Mail* Ideal Home Exhibition, which is to be opened by Mrs. Stanley Baldwin at Olympia, London, W., on March 29.



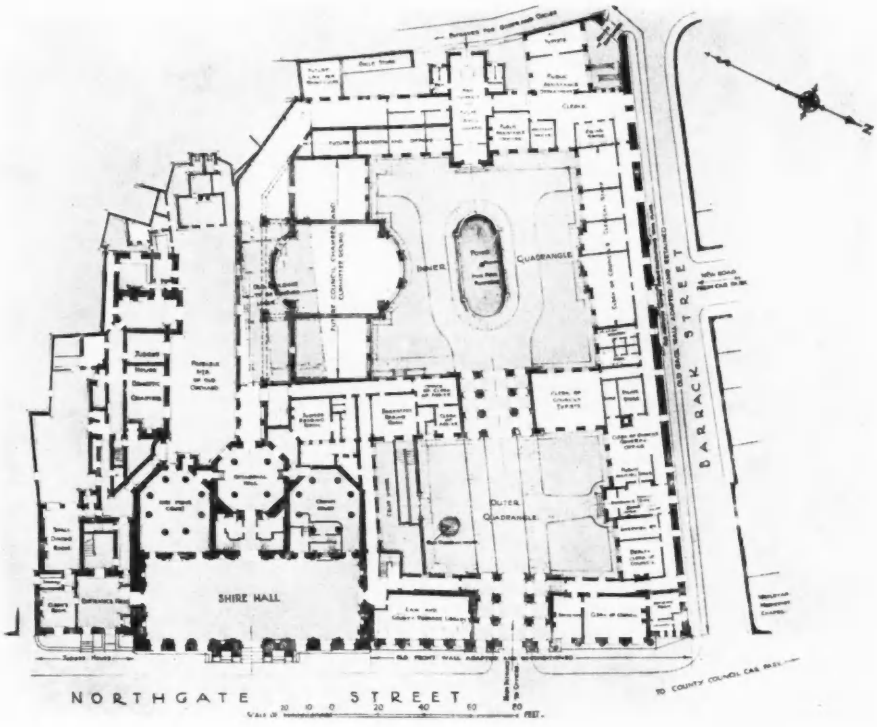
The exhibition will remain open until April 29.

COTTAGES: BY PAKINGTON, ENTHOVEN AND GREY



END BLOCKS—FIRST FLOOR PLAN

END BLOCKS—GROUND FLOOR PLAN



CENTRE BLOCK—GROUND FLOOR PLAN

The housing scheme of twelve cottages, in Oyster Lane, Byfleet, Surrey, illustrated here, with a perspective view on the preceding page, was undertaken for the Chertsey R.D.C. The contract price was £6,643 13s. 0d., and the cost per foot cube is given as 1s. 1d.

The cottages are built of colour-washed brick, with orange-red roofs of interlocking tiles. The doors are of the single-panel type, and the windows are metal casements.

WARWICK COUNTY OFFICES: BY A. C. BUNCH

The ancient Shire Hall of Warwick, after many vicissitudes, has been altered and reconditioned, as shown in the view taken from Northgate Street and reproduced below, from designs by the county architect of Warwickshire, to form the entrance-nucleus of the new County Offices. On the adjacent plan the new work is shown in white. The whole of it is of steel-frame construction, cased throughout in concrete, while the majority of the external walling is in brickwork with a 2-ins. cavity. Reconstructed stone has been used for dressings and other masonry features. The timber roof, supported on steel principals, is covered with old Westmorland slates obtained from a demolished mansion, supplemented by grey-greens. The cost, including all services, furniture and fittings, is about £107,000.

HOUSING PROBLEMS IN 1933

Last Week's Conference

BY E. MAXWELL FRY

THE solution of the housing problem involves the consideration of three major factors—which are: the nature and circumstances of those that are to be housed; the legislative machinery for housing them; and the economic situation in which the operation is carried out. From year to year the character of housing has varied with the alterations apparent in these factors. In the years succeeding the war the dearth of houses was such that the artisan and the higher-paid worker was capable of absorbing some millions of houses before the lower strata were touched, and it has not been until recent years that the pressure of overcrowding in the towns, coupled with more stringent economic conditions, have forced the dual issue of slum clearance and the provision of very small houses into the political forefront.

It might be said that the problem of housing the lower strata of society has been present from the beginning, and has been passed over from expediency rather than from any other cause, and it has only been due to the inability of completed programmes to reduce urban overcrowding in any substantial way that it has been necessary to evolve new legislation to cope with what we may call a new situation, but which is in fact a chronic ailment only now properly diagnosed.

As first contributor of a series of articles upon *A National Housing Programme*, to be published in *The New Statesman and Nation*, Mr. E. D. Simon draws attention to the discrepancy in the machinery proposed by Parliament to deal with the changing situation. The Wheatley Act, framed to deal with the situation as it presented itself at that time, set out to build houses, and paid no attention to the slum problem. The Greenwood Act, coming at a time when slum clearance was looming large upon the horizon, granted a subsidy for any new house built that simultaneously involved the demolition of a slum house. Using Manchester as an example, Mr. Simon points out that the slum problem was such that the operation of the Greenwood Act was powerless to better the situation, since each slum house pulled down left a family bereft of lodging, while there still remained a large unhoused population capable of filling up slum dwellings vacated for new houses built. He makes a plea for the creation of very much greater improvement areas for slum clearance on a scale that might hope within measurable time to lower the number of people without houses, either within or outside urban centres, and the situation he draws upon for his example serves to illustrate very forcibly the acuteness of the need for a long-term programme, and its immensity.

At this moment, while the unhoused population is nearly as great as ever it was, and the state of overcrowding in the towns worse perhaps than it was twenty years ago, we have at our command resources waiting for employment. Building costs are very low, unemployment in the Building Industry is high, and there exists a very strong desire among all sections of this great industry to pool its resources for the benefit of a national regeneration from which the industry should draw benefit. The events of the past two or three years have served to show that no problems are local, and that the well-being of vast sections of the population cannot be left to the play of sectional interests. The time is ripe for action on a national programme.

It is the pressure of these needs forcing us to acknowledge the gravity of the situation that has brought about the Conference on Housing called by the President of the R.I.B.A. and presided over, very fittingly, by Sir Austen Chamberlain, P.C.

The idea of having a conference was to thrash out, as far as a conference of this sort could, the terms of a resolution to be put forward to the Government. It has been felt that to allow housing at this moment to escape from some form of national control would be an act of folly. There are many who believe that housing costs have reached a point when a subsidy is no longer of vital importance; though there are many who doubt whether in practice small houses could be built to be let at economic rents. It has been a temptation to make use of the vast sums invested in building societies for the creation of new houses, but there again there has been present a very healthy doubt as to whether the proposition of building really cheap houses would present itself to capitalists in a favourable light.

If cheap houses are not to form the major part of our next programme, the effort will largely be in vain, for we have reached the point when cheap houses and slum clearance have got to be tackled in real earnest, and as one problem. Control is a matter of as great urgency as ever it was: not only architectural control but financial. It has seemed obvious to those who have gone into the question that houses of the smallest class could be built only on money borrowed at a very low rate, lower probably than the building societies would be prepared for.

Gradually there has evolved, in the minds of those who have considered the newly-presented problem in detail, an organization in the form of a National Public Utility Housing Board—something not entirely Governmental, yet with its funds guaranteed, if necessary, by the State, and paying only a low rate of interest.

The resolution sent up by the Conference urged that such an organization should be very fully explored in conjunction with the authorities and interests concerned, and with the assistance of the Minister of Health.

The Conference went on to add to this a second resolution, urging the Government, while it took steps to maintain an adequate supply of dwellings for lower-paid workers by encouraging the local authorities to build dwellings without subsidy, to facilitate the developing of improvement areas under the 1930 Housing Act on a large scale to deal rapidly with the overcrowded families in these areas.

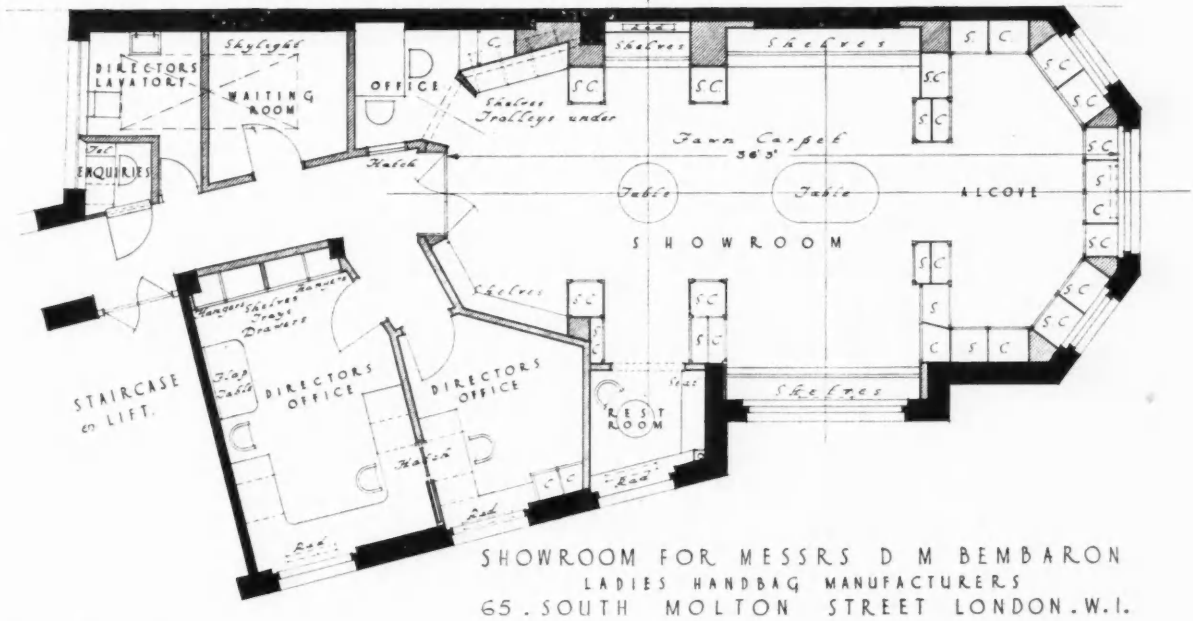
The Conference did little more than explore the outer fringes of matters affected by the resolution passed, but enough was said by Sir Austen Chamberlain and other speakers to indicate the complexity of the situation today, and we have to deal as much with old property as with new.

The Marquess of Salisbury, in particular, emphasized the need for reconditioning, and it will be realized that he speaks with the experience of a large landowner of small property who is very actively engaged in a reconditioning scheme of some magnitude. But a detailed examination is out of place at this point, and it will be better for the purpose of giving this Conference its due weight to look once again at the larger aspects of a national organization. To do this we must return to the problem raised so capably and eloquently by Sir Raymond Unwin, and underlined by Professor J. M. Keynes in the last speech at the Conference.

"We have today," said Mr. Keynes, "a quarter of a million building operatives unemployed. We have a decline in rate of interest and building costs lower than we have experienced since before the War." As a result, the rental to be expected was only 60 per cent. of that which would have been needed five years ago. We have therefore the opportunity now of gaining the fruits of the great Conversion scheme. If it could benefit the Treasury

(Continued on page 211.)

LEATHER HANDBAG SHOWROOM



DESIGNED BY MINOPRIO AND SPENCELY

The showroom and offices illustrated here and overleaf were planned, in conjunction with a factory, to meet the needs of an expanding business, in reconstructed three-floor premises at the corner of South Molton Street and Brook Street, W. The factory, accommodating 200 workers, was placed on the two upper floors, and the showroom and private offices on the first floor, with the general offices, stock-room and packing room.

Inside the showroom, seen above, the woodwork is of Australian walnut. The showcases consist of three tiers of drawers, with herring-bone veneer and solid walnut handles, surmounted by open shelves or glass cabinets. They are lit by electric strips hidden behind the projecting canopy. The ceiling is painted with pale blue and white clouds and the walls are a warm buff stippled with pale Indian red. The general lighting is diffused from concealed lamps above the six projecting showcases. Bays are provided in which customers can make their selection of goods. On the right of the door is a small room which can be curtained off for interviews. The room has a greyish-fawn carpet, brown curtains, and grey corduroy upholstery on the chairs.

The two private offices are panelled in Australian walnut to a height of 7 ft. 5 ins., and painted above. Both rooms are provided with built-in desks and cupboards. Desk lights are enclosed in boxes placed over the sliding panel between the two rooms. The stud partitions of these offices are sound-proofed with eel-grass quilting.

by the saving of interest, the whole community should benefit to an even greater extent, for there has been a new level of rates established and we can talk business without having to invoke large elements of subsidy. It was not going to be a question of the community having to make a great sacrifice, for the rest of the people would gain immeasurably if a great movement of this sort was set going. The increased employment would not only help the men at present unemployed; it would help those with whom they would spend the wages they were not now receiving; it would save the Treasury from expending from the dole; and so on. "The figures," said Mr. Keynes, "are staggering."

His conclusion was that if one spent £30,000,000 on housing it would probably increase the national income by £60,000,000 in one way and another; and putting into work about a quarter of a million men, one saved £15,000,000 on the dole. Today, with the high level of taxation and 20 per cent. of the national income returning to the Chancellor of the Exchequer in taxes, this increased income would produce something like £12,000,000 of new taxable revenue, in addition to saving £15,000,000 on the dole. Such a measure as the one proposed, by increasing the national income and also the well-being of the people, would help the Treasury enormously, for 90 per cent. would go back in benefit to it.

Mr. Keynes, in conclusion, said that it was a thing well worth doing, and he was willing to stake any reputation he might have that he was not in error.

More than this, I would, myself, make the point that if our new housing programmes are to be national planning, in the best sense of the word, they must rest upon a basis of town planning. New housing outside the towns, slum clearance, even reconditioning, cannot be isolated from the present need to make workable machines of our towns under modern conditions. The waste involved by unplanned reconstruction is not good to think upon. Probably what we require more than anything else as a ground plan for a new programme is a nationally co-ordinated survey of existing conditions. From this, efficiently carried out, there would emerge a programme well founded on fact to carry us forward for the next decade.

LAW REPORTS

CONTRACTORS' LIABILITY

G. N. Haden and Sons, Ltd. v. *Higgs and Hill, Ltd.—King's Bench Division. Before Mr. Justice Swift*

THIS was an action by G. N. Haden and Sons, Ltd., heating engineers, of Trowbridge, Wilts., against Higgs and Hill, Ltd., builders and contractors, to recover £6,994 for which they alleged the defendants were liable to them in respect of contracts they had entered into during the years 1930-1931 for the supply, delivery, and work of horizontal inlet and extraction ducts from the subbasement level to the roof of premises in Hereford Gardens, which were being erected for Gamages (West End), Ltd., which company had gone into voluntary liquidation, and for the erection of which building Higgs and Hill, Ltd., had the principal contract.

The defence was that the subcontract with the plaintiffs expressly provided that the plaintiffs should at no time be entitled to be paid in respect of their work a greater sum than that which had at the time been paid to the contractors (the defendants) under the principal contract in respect of such subcontract work, and that the final balance should only be payable as, and when, the contractors received their final payment, under their contract, and that as Gamages (West End), Ltd., went into voluntary liquidation and the defendants had not received their final payment under the principal contract, defendants were not liable to pay plaintiffs the sum claimed.

His lordship, after hearing the evidence, in giving judgment, held, upon the construction of the contract which the plaintiffs had entered into with the defendants, that plaintiffs were entitled to be paid by defendants the balance of their account for the plant and material supplied, and the work and labour done. He said the fact was that the defendants had had a settlement with Gamages (West End), Ltd., but it was a very unsatisfactory settlement so far as defendants were concerned. He was of opinion, however, that under the terms of the contract between the plaintiffs and defendants, the plaintiffs were entitled to judgment for the sum claimed with costs.

His lordship granted a stay of execution on terms pending an appeal by the defendants.

INJUNCTION AGAINST SALE REFUSED

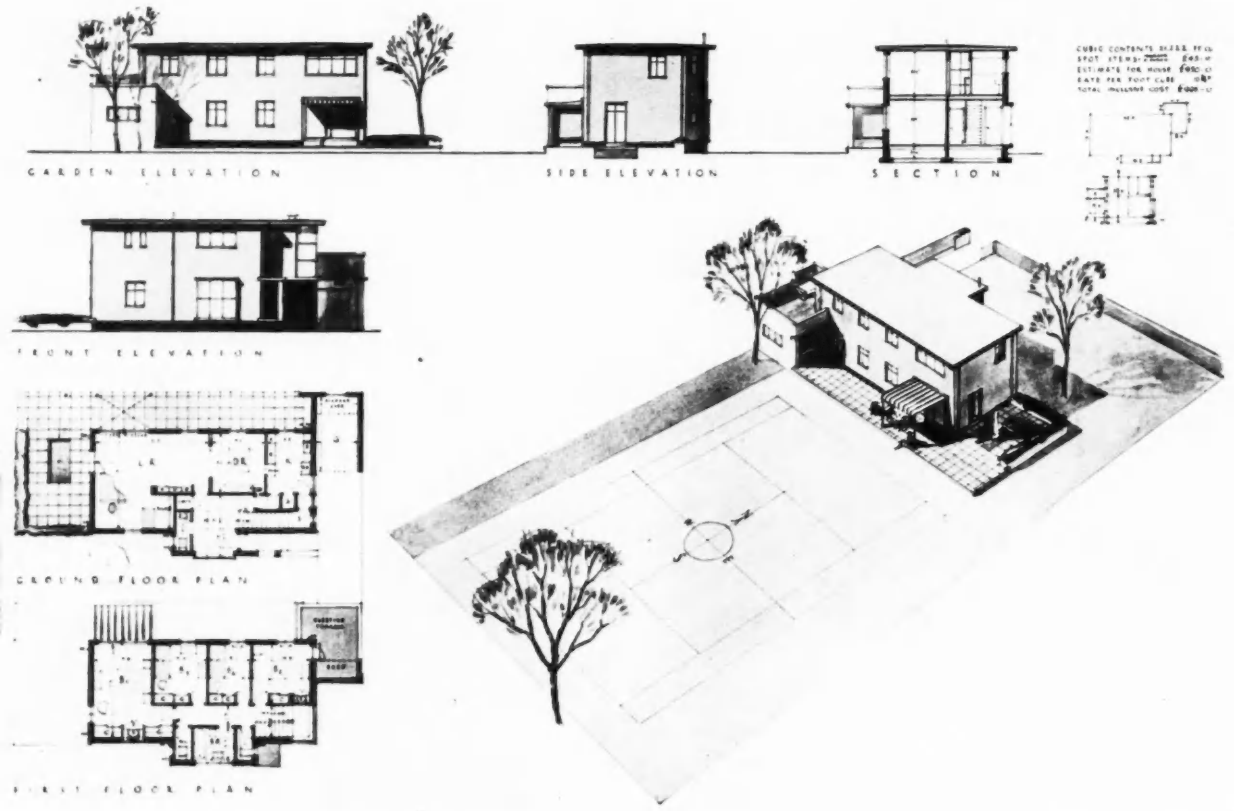
Harvey v. *Lloyds Bank Ltd.—Chancery Division. Before Mr. Justice Luxmoore*

THIS was a motion by Mr. Martin Wm. Harvey, lessee of Berkeley Court, a block of shops and flats in Baker Street and Marylebone Road, W., for an interim injunction to restrain the defendants, Lloyds' Bank, Ltd., first mortgagees of the property, from selling it for £520,000 to the Eagle, Star and British Dominions Investment Co., Ltd., the second mortgagees.

Mr. F. E. S. James, for the plaintiff, said his client's case as to the property, which had cost £800,000 to erect, was that it was now worth at least £610,000. His client had not succeeded so far in obtaining a firm offer for the property of more than £520,000. He, however, had had it valued and his valuers put its value at the moment at £620,000.

Mr. W. F. Waite appeared for the Bank, and said his clients had also had a valuation of the property made, and it showed a very different figure to that submitted to the Court by the plaintiff. He added that there was default in payment of the interest and the mortgages 18 months ago.

His lordship said that the plaintiff had not been able to procure a better offer, and the question whether the proposed purchase price was proper could be determined if and when the action came before the Courts for trial. He accordingly refused the plaintiff's motion.



PERPETUAL YEARLY RENT CHARGES EXTINGUISHED

Sykes v. *Williams.—Court of Appeal. Before the Master of the Rolls and Lords Justices Lawrence and Romer*

THIS was an appeal by the defendant, Mr. Edward Wiiliams, from a judgment of Mr. Justice Eve, sitting in the Chancery Division, in favour of the plaintiff, Mr. H. R. Sykes.

In the Court below, the plaintiff sought to recover the possession of a certain

COMPETITION FOR CEMENT HOUSES : DESIGN BY E. MAXWELL FRY

Detached four-bedroom house, with garage incorporated, costing £1,000 to build, excluding profits, land and fees. Awarded one of the two second prizes (fifteen guineas) for Type D of the Cement Marketing Co., Ltd.'s competition. For the assessors' criticism of this design (by E. Maxwell Fry, of Adams, Thompson and Fry) and others reproduced in this week's Supplement, see page 198.

plot of land at Edgeley, near Stockport, and claimed that he was entitled to exercise the power of re-entry in the events that had happened. It appeared that in 1912 plaintiff granted to the defendant a plot of land, creating a perpetual yearly rent charge of £25 upon it and the buildings to be erected thereon. This charge was to be paid half-yearly in March and September, and was to be subject to the usual statutory powers and remedies for its recovery. The defendant covenanted on his part to pay the rent charge. The conveyance contained a power of re-entry should the rent charge be a year in arrear, or upon any breach of the covenants during the lives of Queen Victoria or her survivors and for 21 years after the death of the last survivor.

The plaintiff's case was that four houses had been erected on the land, and that no part of the rent charge had ever been paid.

Defendant in his reply contended that by virtue of the Real Property Limitation Acts, 1833 and 1874, the yearly rent charge and the rights of re-entry were barred. In the alternative defendant sought relief from the forfeiture.

Mr. Justice Eve held that the plaintiff was entitled to the relief he claimed, but he granted relief to the defendant on his paying 10 years' arrears of rent, with interest, and entering into a new deed to pay £25 a year rent.

It was from this decision that the defendant now appealed.

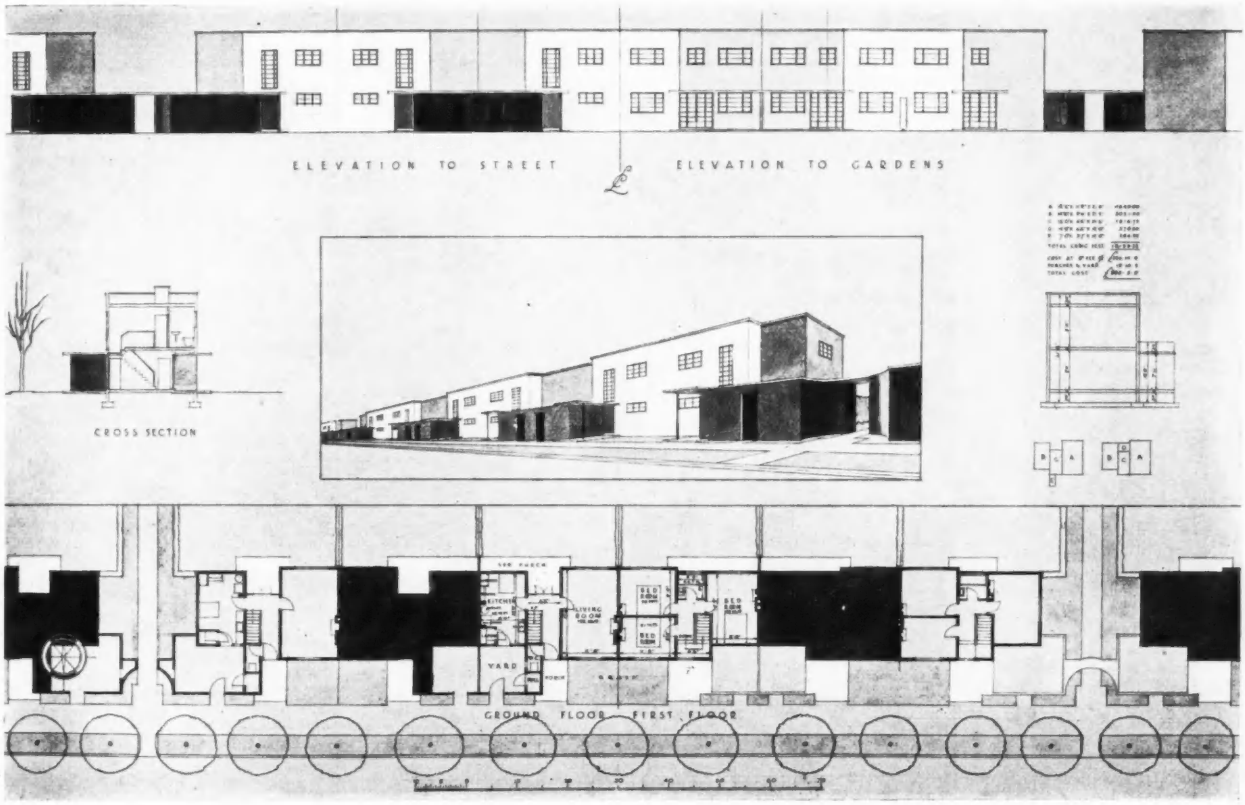
Sir Gerald Hurst, K.C., argued the case for the appellant, and Mr. Henry Johnston for the respondent.

The Court allowed the appeal with costs, holding that in the circumstances of the case the plaintiff was not for the time being the owner of the rent charge.

The Master of the Rolls, in giving judgment, said in this case the important date was in March, 1925, when twelve years had elapsed without payment of the rent charge, as, under the Acts, the right to recover the rent charge and arrears had become extinguished. Then the next point was that the writ in the action was not issued for more than 7 years after that, viz., in 1932. Under these circumstances the Court had to see whether at the date of the writ the rent charge and the powers as to recovery, had been barred and were extinguished. As the respondent's counsel did not challenge that both had gone, what was left? Respondent put forward that there was a proviso in the conveyance for right of re-entry, and that it accrued at each half-year following the non-payment of the money. The proviso only gave respondent the right to re-enter on failure to pay the rent charge. The question was in what sense was the respondent owner of the rent-charge. It had been admitted that everything connected with the charge had been extinguished, and therefore the respondent was not the owner of the rent-charge for the time being. The appeal, therefore, succeeded, and would be allowed with costs.

Lords Justices Lawrence and Romer concurred.

British Museum Appointment



Sir Charles Reed Peers, C.B.E., F.R.I.B.A., Chief Inspector of Ancient Monuments to the Office of Works and the Royal Gold Medalist for 1933, has been elected a Trustee of the British Museum in place of the late Viscount Dillon.

The City of the Future

That sun, air and verdure, in cities of 50,000 to 200,000 inhabitants, living in pleasant and practical dwellings, should characterize the city of the future is the opinion of Sven Markelius, a Swedish architect, given in opening a round-table discussion between a number of Sweden's modern architects, recently broadcast from Stockholm.

The big city will disappear, Mr. Markelius said, and will be spread over a wider area through regional planning

COMPETITION FOR CEMENT HOUSES : DESIGN BY E. WAMSLEY LEWIS

A terrace three-bedroom house, costing £500 to build, and suitable for a scheme of forty-eight houses in terraces of six. The assessors' criticism of this design, awarded a special prize of fifteen guineas in Type A of the Cement Marketing Co., Ltd.'s competition, is given on p. 198.

but held together as an integral unit. The dwellings and working places of the city people will, through a successive reorganization of the big towns, be rationally distributed, and the city of the future will by no means look like the picture given in the famous film fantasy "Metropolis" with gigantic masses of houses and a seething whirlpool of traffic.

Mr. Hakon Ahlberg voiced the opinion that the big cities will continue to grow while the small towns will remain stagnant or disappear. Sven Wallander, the creator of the big Co-operative Rent-payers' Society, with their huge and ultra-modern houses, strongly opposed the garden city idea, saying that the best mode of life is the big apartment house in the city alternating with vacations and week-ends in the country.

Professor E. G. Asplund said that the planning of the city and of the house must start from the primary "cell," the room, but warned against making this cell a prison cell by too much standardization or by too stringent building systems that will finally not leave any space for the individual, whose comfort and home feeling must go ahead of any rationalization. Human beings, he said, must not be changed into military-drilled Tiller girls and so-called functionalism must acquire more psychology and human feeling.

Better Housing Conditions

The St. Pancras House Improvement Society, Ltd., the annual meeting of which was held last month, has succeeded in showing how it is possible by voluntary means to improve housing conditions. The Society has a general fund of over £178,000, much of which has been spent upon erecting blocks of flats in the drab district near Euston Station. The Society's architect is Mr. I. B. M. Hamilton, A.R.I.B.A.

During the last twelve months two new blocks of flats have been opened, providing for 66 familes, and including four one-roomed flats for old people. A contract for two blocks of flats to be built during the next 18 months has been signed.

Of special interest is the attention given to æsthetic details. Coloured bas-reliefs are set in the centre window-arches of each elevation of St. Christopher's Flats. On the top of the posts in the circular drying ground in the courtyards are four-and-twenty blackbirds. A fried fish-shop has been demolished and its place has been taken by a garden extension with a graceful statue of the Virgin and Child. Full use is being made in the flats of the generous gift of window-boxes.

Announcement

Messrs. Ivor F. B. Richards, F. W. Harper and H. A. Bull have commenced practice at 14 St. Andrew's Crescent, Cardiff. They would be pleased to receive manufacturers' catalogues, etc.

In the letterpress beneath the photograph of Mr. Walter Goodesmith, published in our last issue, on the occasion of his being awarded the Portland House Travelling Scholarship for 1932, he was inadvertently stated to be the Chairman of the Atelier of London University. This was a printers' error: the caption should have read, ". . . Chairman of the Members' Committee of the London Atelier."

THE SPECIFICATION WRITER: LIGHT AND HEAT EFFICIENCY IN BUILDINGS

FURTHER extracts are given this week from the Report of the Building Research Board for the year 1931, from which a summary, "Materials Under Test," appeared in the issue for November 2 last. The following are taken from the section headed "Efficiency of Buildings from the Standpoint of the User," which, after all, is the standard by which architects' creations are judged by the majority of people. Part of this section deals with a subject also dealt with in the R.I.B.A. report on the "Orientation of Buildings."

Sun-planning by Means of Models

In the climate of Great Britain it is generally considered desirable that buildings in which human beings dwell and work should receive as much direct sunlight as possible and that sunlight should also flood streets and open spaces. Planning for sunlight has not, however, received the attention which it deserves, and has usually necessitated collaboration with a specialist familiar with the calculation of the direction of sunshine at different hours of the day and seasons of the year for the latitude considered.

In order to facilitate sun planning, a simple apparatus has been devised which shows the direction of sunshine at any hour on any day of the year for all latitudes. This apparatus, which may be termed a heliodon, enables the architect to demonstrate to his clients by means of a model how sunlight has been taken into account in the planning of a proposed building.

The apparatus comprises a board representing the surface of the earth at the site, and a lamp, some distance from the board, representing the sun. The lamp can be moved vertically to positions corresponding to the various days of the year, and the board is mounted on a vertical axis, the inclination to the axis being equal to the latitude. As the board is rotated, a pointer indicates the corresponding hour of the day upon a horizontal scale.

With this apparatus, not only is the study of the insolation of the walls of a building much simplified, but it is possible also to determine with a simple model the manner in which the sun shines into the interior of a room. Furthermore, by means of suitable models, it is possible to study certain problems of town planning. The apparatus is now being manufactured for sale by Messrs. G. Cussons, Ltd., of Manchester.

Two further aspects of "sun planning" are discussed—ultra-violet radiation and the exclusion of the sun's heat from rooms in which it may be undesirable.

With regard to the first the report says :—

During recent years the attention of the public has been increasingly directed to the importance, from a health standpoint, of the ultra-violet radiation which is present in sunshine.

Ordinary window-glass is entirely opaque to this radiation, but special glasses designed to transmit it are now on the market. It is pertinent, therefore, to consider what intensities of therapeutic radiation the special glasses can make available in a room.

With simple fenestrations and with certain assumptions the problem can be attacked mathematically, but in the more complex

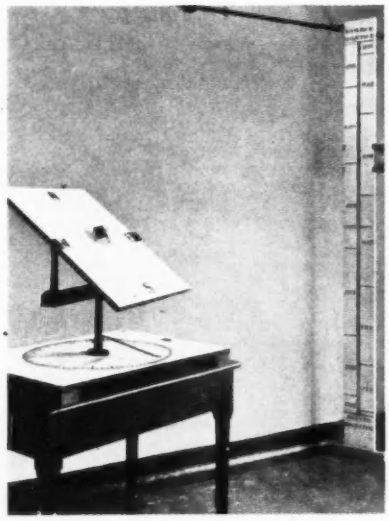


Figure one. The heliodon, with a small house model on the observation board.

problems the computation of the radiation received from the sky is virtually precluded by the amount of labour involved. For the investigation of such problems an experimental method has been developed.

A small model of the room in question is fitted with a sheet of sensitized paper in the plane over which the distribution of therapeutic radiation is required, and is placed outside on a day when the sky is uniformly overcast. The photographic record obtained shows the distribution of actinic radiation over the particular plane, and it is possible to derive from the contours of actinic radiation the corresponding contours of therapeutic radiation.

The reflectivities of the internal surfaces of the model for actinic radiation should be the same as those of the actual room for therapeutic radiation. Luckiesh has recently measured the ultra-violet reflectivities of a number of common materials, but information is not yet available in sufficient detail to enable this factor to be taken into account. It is advisable, therefore, to paint the interior of the model black, thus reproducing the condition which has perforce to be assumed in the calculation of radiation intensities. Owing to the neglect of reflected radiation the present estimates of ultra-violet intensities must be somewhat lower than obtain in actual rooms. The experimental method has been tested in the simple case for which calculations have been made and yields results in close agreement with the computed figures.

For the second investigation various methods of treating a clear sheet of glass so as to exclude the solar heat were tried, and the table below shows the results. The "relative temperature excess" refers to the excess of the maximum inside temperature over maximum shade temperature, expressed as a ratio of the corresponding excess beneath the clear glass.

Treatment of specimen.	Relative temperature excess.
Clear	1.00
One coat whitewash below	0.61
White calico below ..	0.57
One coat green distemper above	0.55
One coat whitewash above	0.49
Two coats whitewash below	0.46
White calico above ..	0.40
Two coats whitewash above	0.28

The white calico blinds were placed at a distance of about 1 in. above or below the glass, and, in the former case, free air circulation between calico and glass was permitted.

The efficacy of whitewash as a surface treatment obviously depends in a large degree on the thickness of the layer. Treatment of the under surface of a glass roof is somewhat less efficient than treatment of the upper surface, but may be preferable in wet and dirty atmospheres.

The Heating of Rooms

The remainder of this section of the report deals with artificial heating. It is pointed out that with intermittent heating it is important to reduce the heating-up period to a minimum both for economy and convenience,

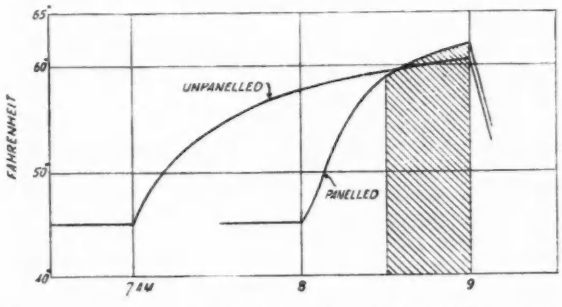

Figure two. The effect of panelling on the warming of a room.

and that in this respect some rooms are much more difficult to warm than others. Tests were carried out on a breakfast room, fitted with a gas fire, before and after the walls had been lined with wood panelling.

Without taking the furniture into account, only one-half of the boundary surface of the room was changed by the panelling—the ceiling, window, floor and door were not affected—yet the change in the room is remarkable. The room is now warmer after half-an-hour than it used to be after an hour-and-a-quarter.

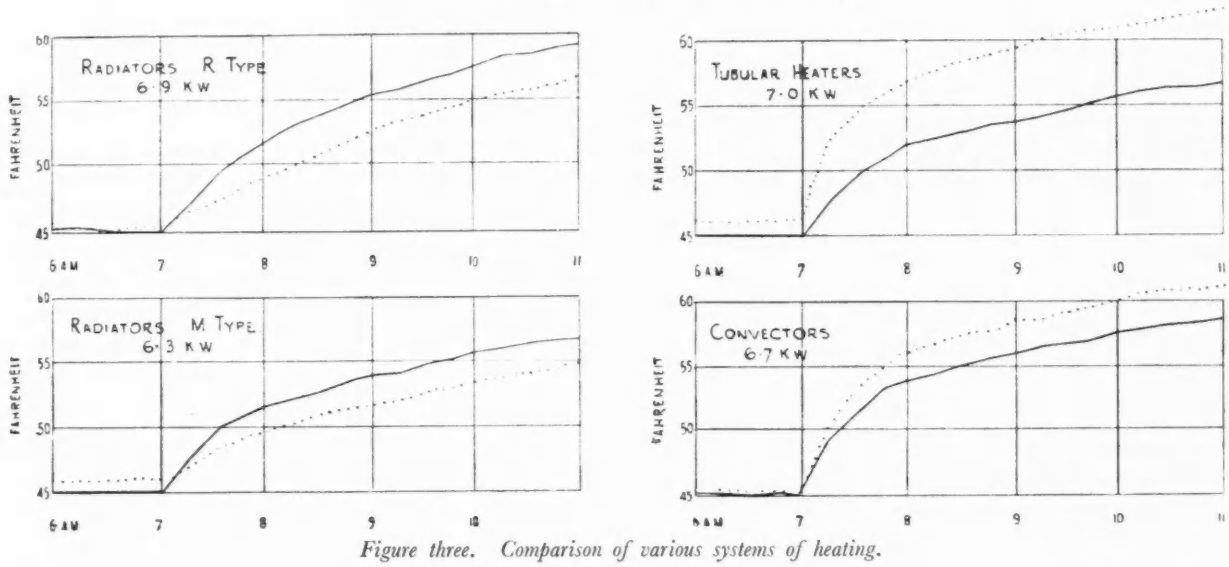

Figure three. Comparison of various systems of heating.

Fig 2 shows records obtained, and is arranged to show the warming for one half-hour occupation. From the practical point of view the important fact is not that one hour's heating now suffices instead of two, but that a fire may reasonably be lit half-an-hour before the room is wanted. The room was formerly uncomfortable unless the fire was lit an hour and a half before breakfast. For the most efficient use of intermittent heating the walls of a room should be lined with wood or other insulation of small thermal capacity.

In the report for 1930, experiments were described which showed that the heat requirements of certain rooms warmed, without ventilation, by an installation of ceiling panels, were approximately 14 per cent. greater than with convective heating. It was pointed out that the relative advantage in the two methods of heating is not likely to remain the same with freely-ventilated rooms and is, indeed, likely to be reversed.

It was desired to obtain some experimental evidence on this point. In the experiments which have been carried out, it was not practicable to use the ceiling panels ; consequently recourse was had to the radiant heating installation previously used. With this it had been found that, without ventilation, the heat requirements of the rooms were some 7 per cent. greater than with convective heating.

Observations have now been made with each room ventilated by means of a small wall ventilator, which was left open continually. This resulted in an increase of 16 per cent. in the amount of convective heating required, but made no measurable difference to the cost of the radiant heating.

The heating of schoolrooms by radiant heat was investigated, using actual classrooms for the tests. Observations of the " equivalent temperature " were made with an " eupatheoscope," with various conditions of heating and ventilation in the room. These terms may need further explanation, since they are part of the terminology of recent advances in the science of heating. It has been found that the temperature of an environment with air and walls at different temperatures is not easily specified. From the point of view of comfort, it is the rate at which heat is lost from the body which seems to be important. The " effective temperature " of an environment has, therefore, been provisionally defined as that temperature of a uniform enclosure in which, in still air, a sizable black body at 75 deg. F. would lose heat at the same rate as in the environment. A scale of equivalent temperature is therefore essentially a refinement of the sensation scale. In terms of our sensations we may say " It is colder now that the sun has gone in." or "Come round the corner ; it will be warmer out of the wind." But when we attempt to express " how much colder," or " how much warmer," it is necessary to have a scale of temperature. Human sensations are affected by diurnal and seasonal acclimatization and are notoriously variable and individual. For accurate work, physiological sensations must be interpreted in terms of physical quantities capable of exact measurement, and in 1929 an instrument was therefore constructed for recording equivalent temperature. This instrument is called an eupatheoscope.

Two types of electric heating panels (these are called radiators in the report) installed at ceiling level are compared with tubular heaters and " convectors " (these are what the ordinary person calls " radiators," but which heat by convection and not by radiation).

Typical records obtained with ventilated rooms are shown in Fig. 3, in which the " equivalent temperature " is shown by a full curve and the air temperature by a dotted curve. Dealing with the comparison between " R " type radiators and tubular heaters, it will be seen that before the heat was switched on at seven o'clock the equivalent temperature was three or four degrees lower than the air temperature. This is due to the cooling effect of draughts in a room.

The comparison between "R" type radiators and convectors was done on a calm day, and the equivalent temperature at the start was practically equal to the air temperature. The records show a slight advantage of the radiators over the convectors.

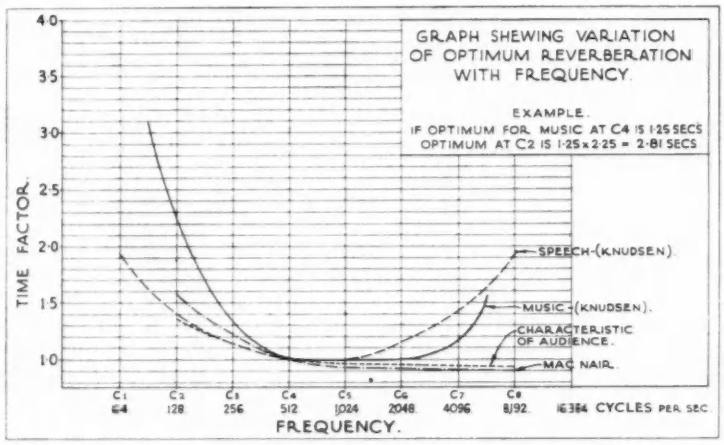
In unventilated rooms there were more striking differences between the air temperature and the equivalent temperatures : when the equivalent temperature was 55 deg. F., the air temperature was 61 deg. F., with the tubular heaters, 57 deg. F., with the convectors, 53 deg. F., with the " M " type and 52 deg. F. with the " R " type radiators. It is significant that in raising the equivalent temperature 10 deg. F. it was found that one system raised the air temperature 9 deg. F. more than another.

W. E. J. B.

OBITUARY

JOHN MURRAY

We regret to record the death of Mr. John C. T. Murray, F.R.I.B.A., which occurred at his home at Streatham. He was born in Glasgow seventy-one years ago, and was educated in that town. At an early age he became associated with Sir Rowand Anderson.



Mr. Murray specialized in ecclesiastical architecture ; churches erected from his designs are to be found in London, Ireland and abroad. He was commissioned by the Government for several important undertakings, including the military hospitals at Gibraltar and Chatham. He also designed the recently-completed Straits Chinese Presbyterian Church, Singapore.

J. E. WRATHMELL

We regret to record the death, in his fifty-second year, of Mr. John Ernest Wrathmell, L.R.I.B.A. of Stockport.

He was a partner in the firm of Wrathmell and Blackshaw, Stockport, who designed many local buildings, and a Fellow of the Manchester Society of Architects.

LITERATURE

ARCHITECTURAL ACOUSTICS

Architectural Acoustics. By Vern. O. Knudsen, Ph. D. London: Chapman and Hall. New York: John Wiley & Sons. Price 40s. net.

THIS work serves as a complete and up-to-date treatise on the behaviour of sound in buildings and lays special emphasis on the recent developments in theory and experiment.

The author, a recognized authority on the subject, presents, in a well-ordered sequence, the theoretical and mathematical steps leading up to the application of the principles underlying practical problems.

In the first part of the book, dealing with physical and physiological acoustics, he presents to us the elementary facts as examined by the well-known pioneer workers in this field, and does not claim to have included new and original material.

In the second section, dealing with the basic principles and data affecting the acoustical design of buildings, Mr. Knudsen includes the main substance and the novel features of the book, whilst in the third he deals with the applications to building design.

The various methods for controlling the reverberation in rooms are fully discussed, but as to the determination of the optimum time, the author makes a very important contribution.

Hitherto "optimum" was set down by Sabine, Watson, Lifshitz and others as the consensus of discerning opinion upon the acoustical condition of well-known auditoria; indeed, the ear being the ultimate criterion in such matters, no other course appears to have been open to the early workers in this field.

By a very careful study of the effects of reverberation upon the hearing of speech and music in auditoria, Dr. Knudsen sets down recommended optima for all classes of buildings, including in this book very valuable curves showing separately the periods desirable in the following:

Churches: Discriminating between Christian Science churches, Protestant and Jewish churches, and cathedrals and Roman Catholic churches.

Cinemas: Showing recommended times for 128 and 2,048 cycles—which periods are, by the way, shorter than usually adopted.

Legitimate theatres and sound studios: Discriminating for frequency; and school auditoria and speech rooms at 512 cycles.

Dealing with the vexed question of the desirable reverberation characteristic, the author asks the following questions:

1. Should the reverberation time be the same for all frequencies?
2. Should the reverberation characteristic be what we are accustomed to—a composite make-up of the absorption characteristics of the room?
3. Should it be based upon the frequency distribution of sound energy—so that all components will die away to inaudibility in the same length of time?
4. Should it be based upon the physiological relation between loudness, intensity and frequency, so that the rate of decay of loudness will be the same for all frequencies as proposed by Macnair? Or:—
5. Should the reverberation time increase as the frequency increases, as suggested by Wente?

Dr. Knudsen rules out the first and fifth criteria on the ground that their adoption would over-emphasize many of the overtones, and points out that the other three criteria lead to conclusions not widely divergent.

He recommends reverberation characteristics based upon the *equal time of decay* for all frequency components in speech and average music rather than upon the analytical functions of the ear which would seem to call for a characteristic ensuring *equal rates of change of loudness* for different pitch components.

His curves are re-plotted herewith on a common datum and with *unity reverberation* at 512 cycles. The ordinates thus become time factors, so that, knowing the optimum at 512 cycles, that at any other frequency can be calculated by multiplying this by the appropriate time factor read off from the graph.

For comparison, Macnair's characteristic, based upon equal rates of change of loudness, is also shown, together with the characteristic corresponding to the average audience.

The absorption of the audience in an auditorium has the greatest influence on the characteristics, and this curve can therefore be taken as approximately representing the conditions referred to in criterion No. 2 above.

The book also contains useful tables of absorption co-efficients of American acoustical materials; a table of physical properties of absorptive materials; and extensive tabulated data on sound transmission tests on different types of wall, floor and ceiling constructions.

The author has applied a reasoned "correction" to the data published by various testing authorities, and gives therefrom what he calls the probable average value of transmission loss in d.b., a figure which renders the results from these different laboratories directly comparable.

SOCIETIES AND INSTITUTIONS

LEICESTER ARCHITECTS' ANNUAL DINNER

The Lord Mayor of Leicester (Councillor A. Hawkes), speaking at the annual dinner of the Leicester and Leicestershire Society of Architects, held on January 27, expressed himself strongly opposed to the withdrawal or cancellation of Government housing subsidies. He said: *The "block system" of housing schemes is no good. Immediately the subsidies come to an end, ratepayers will see what they have been let in for, and there is bound to be a very substantial increase in local rates.*

What do we see today? We see, owing to the tremendous cost of road-making, builders erecting houses along main road frontages without a proper sewerage system, but sooner or later that will have to be done by the local authority and will be a very, very expensive item.

Twelve houses to the acre is making it a very difficult proposition for the private builder and contractor to speculate like he used to in the old days.

I am fully assured, in my own mind, that if the Government will only handle housing now it will go on even better than at the present time.

Other speakers included Sir Raymond Unwin, P.R.I.B.A., George Nott,

F.R.I.B.A. (President of the Society); E. C. Bewlay, F.R.I.B.A.; J. B. Surman, F.R.I.B.A.; Walter Brand; and T. Trevor Sawday.

SEASIDE ARCHITECTURE

The Architecture of Brighton and Hove. By H. S. Goodhart-Rendel, F.R.I.B.A. At a recent meeting of the Brighton Chapter of the South-Eastern Society of Architects.

I yield to nobody in my admiration for good architecture of the Regency period. I admit that the Royal Crescent, with its sparkling black tiles, can look gay and inviting; and that so also can a few of the stucco houses coeval with it (always provided the stucco be newly painted). Regency Square, for example, must have been enchanting when fresh from its builder's hands, and even now, with all its deformation, is a smiling, attractive place. I think, nevertheless, that the general aspect of seaside terrace houses in England, even when as good an architect as Hardwick or Decimus Burton has been employed, is depressing. Rather gaunt streets appear to have come down from London, with a few extra bow windows and balconies to wear on their holiday, but without any great hopes of the weather.

THE ARCHITECTURE OF DISPLAY

The Architecture of Display. By H. Hinchliffe Davies, A.R.I.B.A. Liverpool Display Association. January 31.

Large windows are unmanagable from the display man's point of view. They are difficult to dress effectively, and from the customer's point of view the eye wanders all around the window because it is too large for the eye to take it all in simultaneously. The background should have a minimum of decoration in order to avoid competing with the merchandise; limed oak or wall board painted and stippled to the desired colour are two of the best substances to use.

The important thing is to give the display man the utmost freedom. There should be no shelves, steps or any permanent fixtures to limit that freedom. Lighting is a very material factor; there should be plenty of it and, most important of all, it must be concealed.

A DISGRACE TO ENGLAND

Professor C. H. Reilly, F.R.I.B.A., in distributing awards, on January 30, to students in the Building Trades Department of the Liverpool Central Technical School, said:

In comparison to Continental cities, Liverpool, as an orderly, efficient town, is a disgrace to England, second only to Manchester. It is not that we have not the ability. Mr. Keay, the Director of Housing, can build the finest workmen's houses in the country, yet his work is surrounded and overwhelmed by the vulgar little villas put up by the hundred as speculations. He can design fine blocks of flats, yet he is not given a hundredth of the chances that poverty-stricken Vienna has given its architects. Instead of pulling down whole areas and rebuilding them, so making possible gardens, swimming pools and all sorts of fine public things as well as a splendid layout of the whole, we put up a block here and a block there unrelated to one another, and even these are ceasing at a time when half the building trade is out of work. One would have imagined that this time of unemployment was the ideal time to rebuild our towns and make them clean and efficient instruments both for work and for life.

The professional builder who organizes a job should be paid, like the architect, a definite percentage. Good as we are as individual designers and craftsmen, the present system makes neither for good architecture nor good craftsmanship, neither for a fine town nor for happy and contented workmen.

SOUTH WALES ARCHITECTS' MEETING

At the invitation of the Chairman (Mr. Percy Thomas, F.R.I.B.A.) and the Executive Committee of the South Wales Institute of Architects (Central Branch), a tea and discussion meeting was held at Cardiff on January 24.

The subjects dealt with were: a: "Is early specialization in some particular branch advisable for the young architect?" and b: "Does the R.I.B.A. tend to safeguard the interests of Architecture as a Profession rather than as an Art?"

With regard to the first subject, the general consensus of opinion seemed to be against the idea of specialization, while in the case of the second subject some of those who were present and were most familiar with the activities of the R.I.B.A. were able to give some useful information as to the work done by the R.I.B.A. not only in safeguarding the interests of the Profession but also in furthering the art of architecture.

THE VALUE OF ADVERTISING

The Rt. Hon. Viscount Monck, speaking at the fourteenth annual dinner of the Drawing Office Materials and Manufacturers' Association, held at the Hotel Metropole, London, on January 25, stressed the importance of advertising in technical journals. "An advertisement," he said, "is always working; even if our goods are really good we must advertise in our trade journals and tell our customers by this means."

TRADE NOTES

Three-coat brush-painting within a period of eight hours is the claim advanced for Novax. The simple statement requires amplification for a full realisation of its possibilities. Novax does not contain cellulose; on the contrary, it is a linseed oil paint. Neither is its quick-drying quality due to a large admixture of driers—an expedient that every experienced decorator knows to be fraught with dangers of its own. The secret is the fruit of patient research on the part of chemists. Briefly, the linseed oil used as the vehicle in Novax has been partially oxidised beforehand, so that the period occupied by the paint-film, after application, in absorbing oxygen from the atmosphere, and so setting hard, is correspondingly curtailed. It is otherwise a normally compounded paint.

The new thirty-one story stone-faced R.K.O. office building in the Rockefeller Centre, New York, the new entertainment and shopping district covering six square blocks from Fifth to Sixth Avenues and from 48th to 51st Streets, which is rapidly approaching its final form. The rustic buff and variegated limestone in the R.K.O. building is shot-sawn, giving it a ripple effect like waves.

Novax is available in thirty-six colours, in undercoatings and glossy finish. Two grades of undercoating are prepared: one for spraying, the other for brushing. In brushing by hand, successive coats can be safely applied at four-hour intervals, and such is said to be the covering power of Novax that two-coat work will, in normal circumstances, be found perfectly adequate. If spraying is employed, the period of application is considerably reduced, an hour's interval between coats being suggested as ample. Novax is thinned, in the ordinary way, with turpentine; linseed oil must not be used.

It is perfectly obvious that, as the number and variety of contracts increase wherein speed in decorating is the dominating re-

quirement, a genuine brushing paint capable of such speedy application will be of high value, provided its appearance and lasting powers can be assured. Needless to say the Walpamur Co. (Walpamur House, 35-6, Rathbone Place, Oxford Street, W.1), the manufacturers, have not placed it on the market without exhaustive laboratory and practical tests. They will be glad to give information to all interested enquirers.

*

The following contracts have been secured by Messrs. W. H. Gaze and Sons, Ltd. (the architects' names are given in brackets): Synagogue House, Seymour Place, W.1 (Mewés and Davis); new premises, 22-26 Osnaburgh Street, N.W. (George Vernon); United Dairies, Esher (F. T. Dear); new ward block, Lewisham Hospital (L.C.C. Architect's Department); shops, Holland Estate, Stepney (L.C.C. Architect's Department); new premises, Chitty Street, W.1 (William Clark); Grand Theatre, Hanwell (F. C. Mitchell).

*

Messrs. J. H. Sankey and Son, Ltd., of Canning Town, E.16, have just issued a booklet illustrating and describing the Holbric Hollow Building Block, a new method of construction for panel walls, manufactured to meet the revised L.C.C. Code of Practice. Among the many features claimed by the firm for this new form of wall construction, an illustration of which is reproduced on this page, are the following:—1: A saving of approximately 10 per cent. over the cost of ordinary jointed brickwork. 2: The saving in weight between the Holbric Block and ordinary brick is approximately 50 per cent. 3: Great economy on wall-carrying steelwork—from 30 per cent. to 45 per cent. 4: The ease of laying, and the fact that each block represents the equivalent of six bricks, results in rapid construction and reduced jointing. 5: Improved insulation against damp, heat and sound, owing to the multi-cellular cavity construction.

The booklet, which is obtainable on application to the firm, also contains an article by Mr. Donovan H. Lee, A.M.I.C.E., entitled "Some Notes on the Holbric System." He writes: "Solid brickwork may be considered to weigh anything from 95 lb. to 130 lb. per cubic foot, according to the type of brick used, a typical weight for purposes of calculation being 120 lb. per cubic foot, which is, I believe, the weight usually taken by district surveyors. A Holbric wall weighs, including allowance for weight of mortar, 57 lb. per cubic foot, or approximately half the weight of brickwork. When used in conjunction with a facing of brickwork for a 14-inch exterior wall, the saving in weight *per lineal foot* for a story height of 12 feet is 540 lb. or 0.24 tons. This saving in weight has, usually, a proportionately greater effect on the stanchions of a steel-frame building, where there is eccentric loading, as the multiplication by the eccentricity factor increases the economy of the lighter construction. The small variation in radius of gyration of stanchions in general use keeps them to approximately the same efficiency per ton of load carried. This generalization, while not applicable to unusual circumstances, is sufficient to lead to the inference that if a saving can be made of one-third the load on a stanchion, its size, weight and therefore cost, will each in turn be reduced by about one-third. This is not applicable to beams, the cost of which, for equal spans, does not vary in proportion to the load carried, but even in this case a noticeable saving can be shown.

"It can be accepted that the Holbric construction shows distinct economies in structural steelwork and in foundation concrete and excavation. It allows of shallower beams and smaller stanchions. At the same time it improves the thermal insulation and also the damp-resisting properties of exterior walls when they are backed with these blocks."

A 13-in. brick-faced Holbric wall. This new form of wall construction, described in a note on this page, employs hollow terra-cotta blocks of special shape which interlock, and, it is claimed, permit, in exterior walls, a secure form of bonding with the outer skin of facing bricks or masonry.

THE BUILDINGS ILLUSTRATED

Following are the names of the specialists, general contractors and some of the sub-contractors for the buildings illustrated in this issue:

Housing Scheme at Byfleet, Surrey (pages 205-206). General contractors, Childs and Shee. Sub-contractors: T. Faldo & Co., Ltd., asphalt; W. T. Baker, plumbing; W. Thompson, plaster.

New County Offices, Warwick (page 207). General contractor, Edgar Crowder. Sub-contractors: Chas. Wade & Co., Ltd., constructional steelwork; Jerram & Co., Ltd., heating and domestic hot water supply; The Midland Electric Light and Power Co., electric lighting and power installation; Sturtevant Engineering Co., Ltd., vacuum cleaning plant; Reliance Telephone Co., Ltd., internal automatic telephone installation; Waygood-Otis, Ltd., electric passenger lift; Comyn Ching & Co., Ltd., iron entrance gates, staircase balustrades, lift entrance and door furniture, etc.; Crittall Manufacturing Co., Ltd., metal windows; The Limmer and Trinidad Lake Asphalt Co., Ltd., asphalt roofing, etc.; Adamsez, Ltd., sanitary fittings; Croft Granite Co., reconstructed stone facings and cast stone staircases; Wormells, Ltd., slating to roofs; Whitfields Safe and Door Co., Ltd., fire-resisting strong room doors and ventilators; Carter & Co., Ltd., internal wall tiling; Marbello and Durus, Ltd., Pavino Flooring Co., Ltd. and Berrite, Ltd., terrazzo flooring and wall dadoes; W. S. Hodkinson & Co., Ltd., linoleum floor coverings; John Elbo, cork parquetry flooring; Osler and Faraday, Ltd., electric light fittings; J. F. Blakeborough and Son, fire-fighting equipment; Thomas Ingram, bronze and cream enamel inscription plates; Bideford-on-Avon Brick Co., facing bricks; S. Flavel & Co., Ltd., firegrates; Edgehill Quarries, stone fire surrounds; The Improved Wood Pavement Co., Ltd., roadways; Tarmac, Ltd., Vinculum cast stone slabs for paving paths and footways; Kerner-Greenwood & Co., Ltd., Pudlo waterproofing for storage tank; Shapland and Petter, Ltd., internal furnishings and fittings; Waring and Gillow, Ltd. and Osda, Ltd., oak tables, chairs, bookcases, and general fittings; Harris and Sheldon, Ltd., steel furniture and fittings throughout; P. H. Woodward & Co., Ltd. and W. H. Hodkinson & Co., Ltd., curtains and hangings, etc.; "Old Delabole" grey-green slates, Setchell and Sons; internal walls and ceilings treated with "Walpamur"; stained glass memorial windows, Bromsgrove Guild Ltd.

Showroom and Offices, South Molton Street, W. (pages 209-211). General contractors, Blay Bros. Sub-contractors: Bovis, Ltd., plumbing, fire doors, sanitary work, lavatories, and front door; James Latham, Ltd., veneering; Abbey Heating Co., heating; A. Goslett & Co., Ltd., and John Bolding & Co., Ltd., sanitary fittings; W. G. Hodgson & Co. and Electronos, Ltd., electrical work (showcase lighting); Yannedis & Co., ironmongery; A. Jones Lock Co., Ltd., radiator grilles; Besway Manufacturing Co., trolleys; Camden Tile Co., Ltd., composition floors; Gas Light and Coke Co., gas fitting; E. Pollard & Co., Ltd., lettering (front door); Callon, painted decoration in showroom and private office; backs of showcases (Ibus board), Pharaohs Wallboard, Ltd.; fittings to showcases, Tonks, Ltd.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

Plans passed by the BRENTFORD AND CHISWICK Corporation: Alterations, Coronet cinema, High Street, for Mr. F. A. Sergeant; three houses, Grove Park Road, for Kinnaird Estate Co.; shops, Sutton Lane, for Mr. F. Secret; factory, Great West Road, for Mr. H. C. Hollis; alterations, "Steam Packet" public-house, Strand on the Green, for Royal Brewery.

The COULSDON U.D.C. has agreed to a scheme, submitted by Mr. C. H. Ridge, for the development of a shopping area in Addington Road, Sanderstead.

The London Electric Railway Co. is to arrange for a subway to form part of the new station which is about to be constructed underneath the Cockfosters Road, ENFIELD.

The ENFIELD U.D.C. has obtained sanction for a loan of £33,340 for the erection of an elementary school on the Suffolks estate.

Plans passed by the ENFIELD U.D.C.: 15 houses, Grange Park, for Messrs. Swannell and Sly; two houses, Carterhatch Lane, for Mr. R. F. Wyman; extensions, Enfield Rolling Mills, Millmarsh Lane, for Messrs. Griggs and Sons, Ltd.; extensions, Baptist Church, Totteridge Road, for Mr. G. P. Walker; extensions, Greyhound Works, Lincoln Road, for Messrs. J. Hamilton and Son.

Homemakers, Ltd., are to erect 170 houses on the Sunnyside estate, ENFIELD.

Plans passed by the FINCHLEY U.D.C.: Four flats, East End Road, for Mr. H. C. Brown; 12 shops and flats, Falloden Way, for Greater London Properties, Ltd.; four houses, Widecombe Way, for Mr. G. S. Smith; four houses, Tillingbourne Gardens, for Messrs. Bolton and Norris; two roads, Hampstead Garden Suburb, for Copartnership Tenants, Ltd.; house, Wentworth Avenue, for Messrs. F. W. Bristow and Son, Ltd.; six flats, Litchfield Way, for Mr. A. Mart.

Plans passed by the FRIERN BARNET U.D.C.: Flats, junction of Fernwood Crescent and Oakleigh Road, for Mr. J. Hutchinson; house, Friern Mount Drive, for Messrs. C. F. Day, Ltd.; two houses, Friern Barnet Lane, for Mr. F. Riley; house, Church Way, for Mr. H. A. Nash; nine houses, Colney Hatch Lane, for Messrs. Lord and Mellodew, Ltd.; 31 houses, Bawtry Road, for Bateman Building Co.

The FULHAM B.C. recommends a scheme of extensions at the town hall, prepared by Mr. Walter Cave, at an estimated cost of £19,776.

Messrs. W. Seymour & Co. have purchased land from the L.C.C. in Tunnel Avenue, GREENWICH, for the erection of blocks of houses.

Plans passed by the HORNSEY Corporation: Lay-out for road and buildings, South Close, Southwood Hall estate, for Mr. H. H. Holmes, 53 High Road, Wood Green, for Messrs. W. and F. Yeowell; four houses, Stormont Road, for Mr. H. A. Smith; three houses, Twyford Avenue, for Mr. W. B. Collins.

The Blessed Sacrament Roman Catholic Church, Copenhagen Street, ISLINGTON, is to erect a school for 450 pupils in Edward Square.

The Surrey Education Committee is obtaining a site at KENLEY for the erection of an elementary school.

The KENSINGTON B.C. is to clear the Lancaster Road and Talbot Grove areas and erect dwellings, at a cost of £19,000.

Plans passed by the LEWISHAM B.C.: Two houses, Upwood Road, for Messrs. T. Allen (Lee), Ltd.; church hall, Bellingham Green, for Mr. P. W. Meredith; hall, Allerford Road, for Messrs. A. J. Glock, Ltd.; alterations, "General Napier" public-house, Bovill Road, for Mr. F. M. Kirby; six houses, Como Road, for Messrs. M. Holmes & Co.

Plans passed at PURLEY: Two houses, Lower Barn Road, for Mr. E. Smith; eight houses, Brighton Road, for Messrs. J. W. Hall and Son, Ltd.; six houses, Burwood Avenue, for Mr. E. B. Hayward; 10 houses, Whitecliffe Road, for Mr. F. W. Thomas.

The STOKE NEWINGTON B.C. is to acquire land in Lordship Terrace for the erection of 56 flats, at a cost of about £32,000.

The L.C.C. is to erect 29 three-roomed houses of simplified type on the White Hart estate, TOTTENHAM, at a cost of £11,420.

The WOOLWICH B.C. is to erect further houses on the Middle Park Estate, at a cost of £33,628.

SOUTHERN COUNTIES

Plans passed at GRAVESEND: Additions at works, Clifton Marine Parade, for the Imperial Paper Mills, Ltd.; extension of Trosley Avenue to St. Thomas's Road, for Mr. T. Bennett; extension of Coombe Road, for Mr. L. F. L. Bridgland, on behalf of The Gravesend Land Co., Ltd.; two houses (amended plan), Wrotham Road, for Mr. P. H. Martin.

Plans passed at GUILDFORD: Six houses, New Road, Woodbridge Estate, for Mr. H. Ashenden; two houses, New Road, Ardmore Estate, for Mr. W. Hoptroff; cellulose shop, High Street, for Messrs. Crow Bros.; alterations, The Angel Hotel, for The Surrey Public House Trust Co., Ltd.; new road, Shepherd's Farm Estate, for Messrs. Chas. Osenton & Co.; four houses, William Road, for Mr. G. C. Clark.

Plans passed at HASTINGS: Restaurant, Hastings Pier, for Messrs. Callow and Callow; alterations, Shah Hotel, Mount Pleasant Road, for Mr. Bedford; two houses, Hoad's Wood Road, St. Helen's, for Messrs. Henry Ward, Son and Wray; eight houses, St. Helen's Road, for Mr. J. D. Hicks; two houses, Fairlight Avenue, for Mr. F. W. Southwell.

Messrs. Goodwin and Russell, Ltd., are to develop land bounded by Sea Street, Cobblers Bridge Road and Greenhill Bridge, HERNE BAY. About 100 houses will be erected at an average cost of approximately £450 each.

Plans passed by the OXFORD Corporation: Ten garages, Ferry Lane, for Mr. W. J. Jarvis; two houses, Iffley Road, for Messrs. Pye Bros.; 12 flats, Observatory Street, for St. John's Baptist College trustees; two houses, Quarry Road, Headington, for Messrs. F. and E. J. Watson; house, Mill Lane, for Donnington Hospital trustees; house, Talbot Road, for North Oxford Estates Co., Ltd.; two houses, Bowness Avenue, and house, Ambleside Drive, for Mr. A. C. Carter.

SOUTH-WESTERN COUNTIES

The PORTLAND U.D.C. has obtained sanction from the Ministry of Health for the erection of 30 houses in Weston Street.

MIDLAND COUNTIES

Plans passed at KIDDERMINSTER: Alterations and additions, Leswell Lane, for St. George's Parochial Church Council; two houses, Highfield Road, for Messrs. F. Hughes and Sons; additions, Holy Innocents' Church, Stourport Road, for St. John's Parochial Church Council; bungalow, Sutton Park Road, for Mr. A. W. Ryder; additions to premises, Castle Road and Exchange Street, for Messrs. Brintons, Ltd.; two houses, Highfield Road, for Messrs. W. T. and J. Spilsbury; alterations to property, George Street, for Mr. T. Webster.

The SMETHWICK Corporation recommends proceeding with the erection of 468 houses to complete the development of the Warley estate, at a cost of £138,500.

The SMETHWICK Education Committee recommends the following schemes: Provision of practical instruction accommodation at schools, £4,400; education department workshops, £650; school cloakroom improvements, £3,000; school w.c. improvements, £2,500, and school lavatory improvements, £2,500.

The SMETHWICK Corporation recommends the following schemes: Reconstruction of unclassified roads, £2,177; widening of Stony Lane, £2,200; Holly Lane hospital extension, £7,000; erection of new library and clinic at Windmill Lane, £8,000; alteration of fire station doors, £500; provision of shelter and dressing-rooms at West Smethwick Park, £750; provision of hard tennis courts in Harry Mitchell Park, £300.

The SUTTON COLDFIELD Corporation is to prepare plans for 168 houses proposed to be erected on the Holland House estate.

Plans passed at SUTTON COLDFIELD: 74 houses (amended plan) off Boldmere Road, for Messrs. Morris, Jacombs & Co.; eight shops, Birmingham Road, for Mr. F. W. Wheeldon; house, Chester Road, for Mr. J. W. Britton; six houses, Chester Road, for Midland Dwellings, Ltd.; seven houses, Clarence Road, for Messrs. Streathers, Ltd.; three houses, Holifast Road, for the Excelda Housing Supplies; eight houses, Kineton Road, for Mr. T. A. Glynn; two houses, Station Road, for Messrs. Tew & Co.; two houses, Whitehouse Common Road, for Mr. L. W. James; 10 houses, Bedford Road, for Mr. Lawson.

NORTHERN COUNTIES

Plans passed by the BLYTH Corporation: 16 flats, Columbia Terrace, for Mr. J. E. Dover; 16 flats, Princess Louise Road, for Mr. H. Bower.

The BLYTH Corporation has granted an application by Lord Ridley for permission to develop land in the vicinity of Wensleydale Terrace, by the erection of houses, at 20 to the acre.

The BLYTH Corporation has approved the lay-out of the South Farm estate and is to seek permission for the erection of 200 houses.

The HULL Corporation has decided to obtain all the land required for the scheme for the provision of a central coach station.

Plans passed by the SHEFFIELD Corporation: Two houses, Hallgate Road, for Mr. T. J. Sanderson; 10 houses, Warminster Road, for Messrs. C. H. Leadbeater and Sons; four houses, Cawthorne Grove, for Mr. W. A. Wright; two houses, Harley Road, for Mr. J. A. Wragg; house and shop, Manor Lane, for Mr. J. H. Starmer; 20 houses, Bawtry Road, for Mr. G. R. Parkin; 10 houses, Skelwith Road, for Mr. J. W. Sandall; six houses, Wood Road, for Mr. P. H. Slater; eight houses, Bishop's Hill, for Mr. G. H. Cottrill; five houses, Derbyshire Lane, for Messrs. F. B. Skinner and Sons; eight houses, Embankment Road, for Mr. W. Laver; 44 houses, Longfield Road, for Mr. A. Ramsay; three houses, Pingle Road, for Mr. J. Broadhead; two houses, Whirlow County Road, for Mr. E. Walker; six houses, Gillott Road, for Mr. H. Haywood; 190 houses, Woodthorpe estate, for Corporation Estates Committee; two houses, Chesterfield Road, for Mr. C. H. Beardow; two houses, Hollinsend Road, for Mr. H. Fidler; two houses, Crowland Crescent, for Messrs. T. Wilkinson and Sons, Ltd.; two houses, Hands Lane, for Messrs. T. W. and A. E. Larder; 16 houses, Carrfield Road, for Mr. J. Barker; two houses, Butler Road, for Mr. A. Fawcett; house and shop, Cricket Inn Road, for Mr. C. W. Alflat.

The TYNEMOUTH Corporation is to prepare plans for the erection of 96 self-contained houses on land west of Silkey's Lane.

Plans passed by the TYNEMOUTH Corporation: Three houses, Balkwell Lane, for Mr. J. F. Charlton; flats, Morpeth Terrace, for Messrs. G. W. and S. Black; house and shops, Wallsend Road, for Mr. J. R. Charlton; nine houses, Warkworth Terrace, for Mr. J. R. Wallace; alterations, Queensway, for Messrs. H. D. Burton, Ltd.; 22 houses, North Chirton estate, and 17 houses, Lynn Road, for Messrs. F. R. N. Haswell and Son; six houses, Addington Crescent, and two shops and houses, Hawkey's Hill estate, for Mr. W. Moore; 12 houses, Balkwell Lane, for Mr. J. S. Hurrell; 10 houses, Albion Road, for Mr. W. Stockdale; four houses, Lansdowne Terrace, for Mr. B. Sadler; flats, Pineapple estate, for Messrs. F. R. N. Haswell and Son; nine houses, Warkworth Terrace, for Messrs. B. Peel, Ltd.

The WALLSEND Corporation Health Committee recommends the erection of 85 small houses for small families, and 143 ordinary houses for re-housing purposes.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

• In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

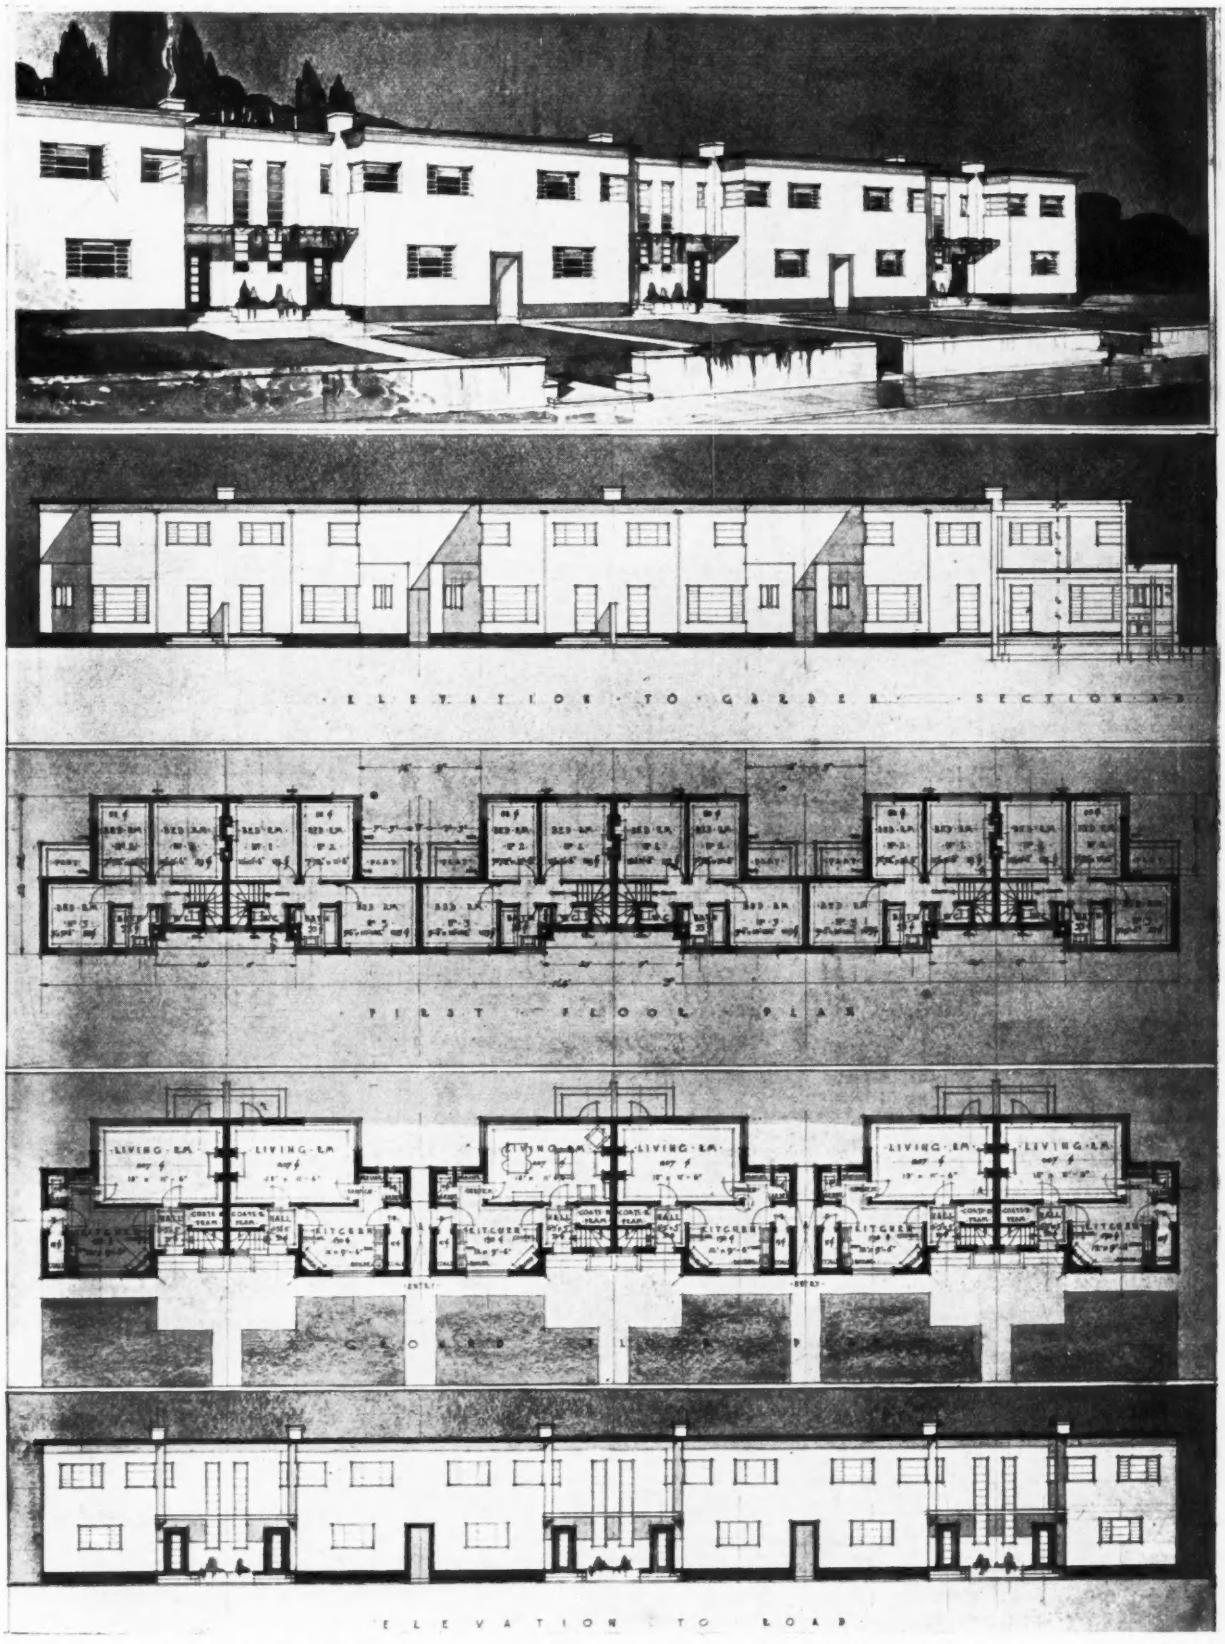
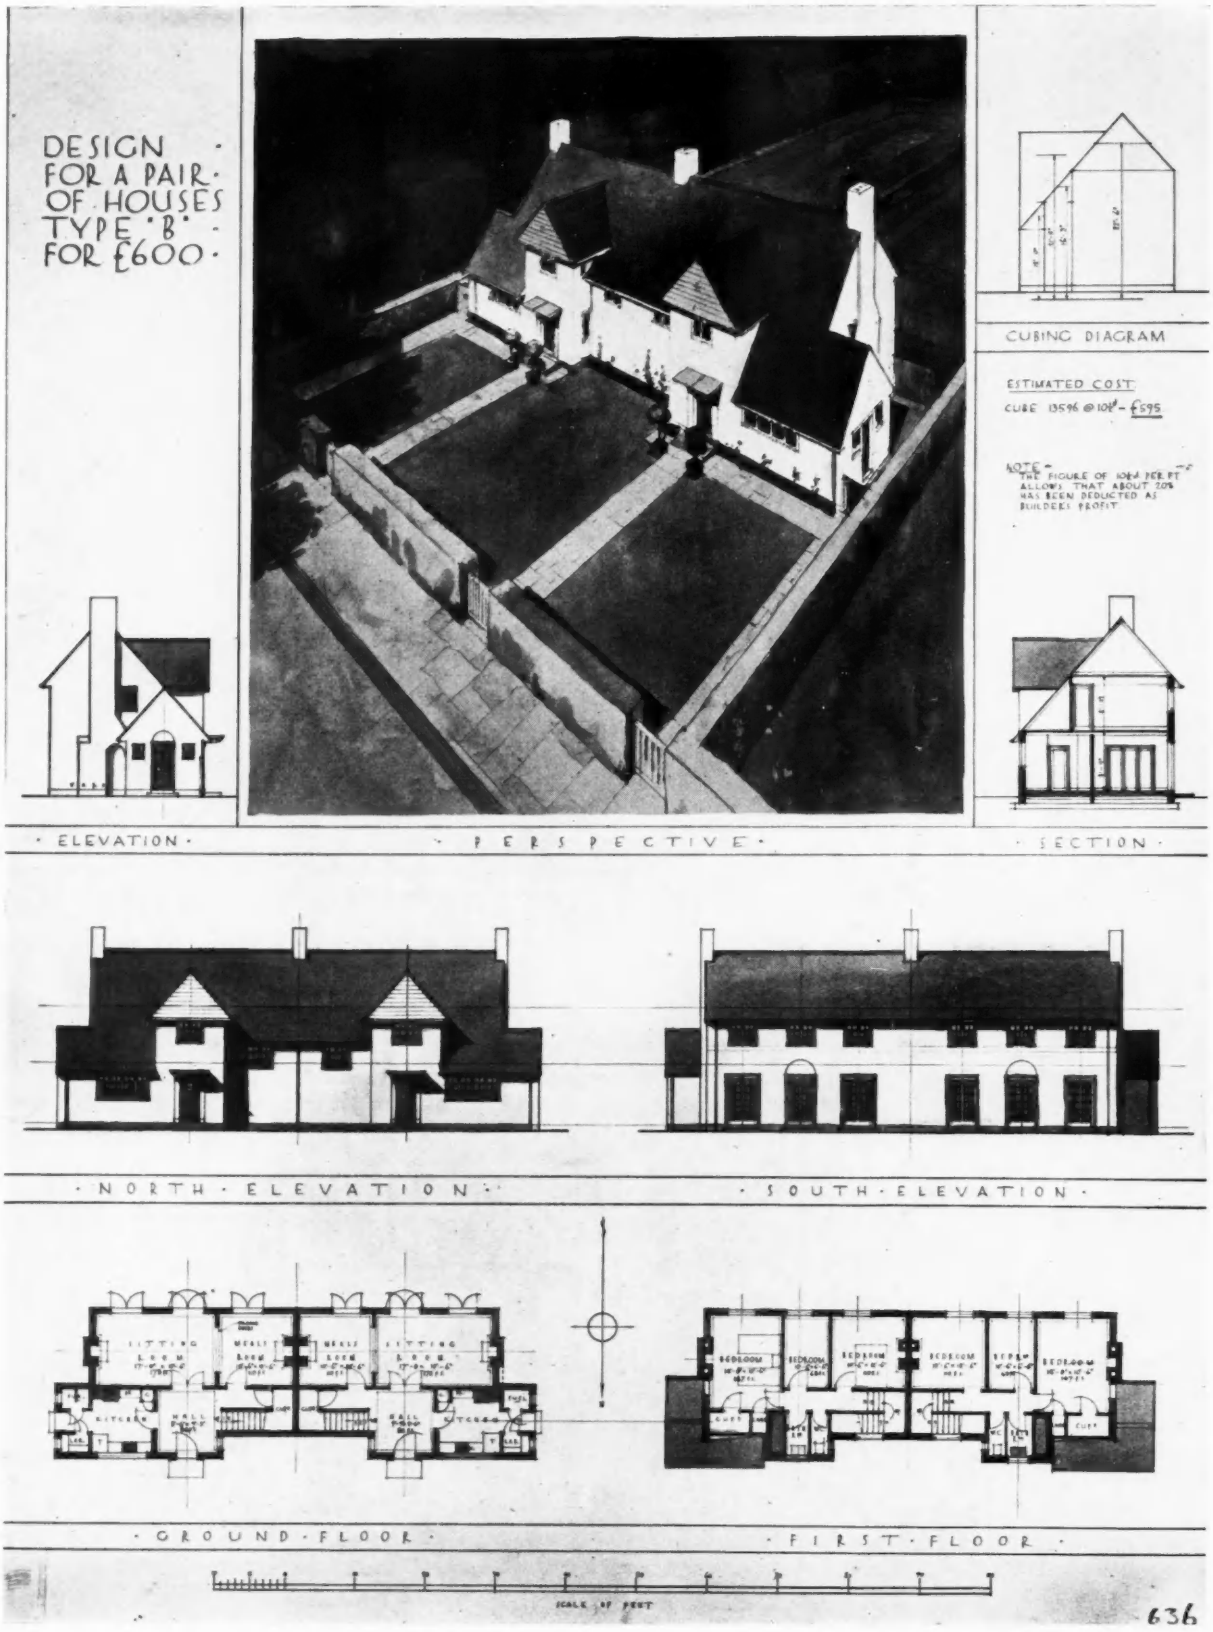
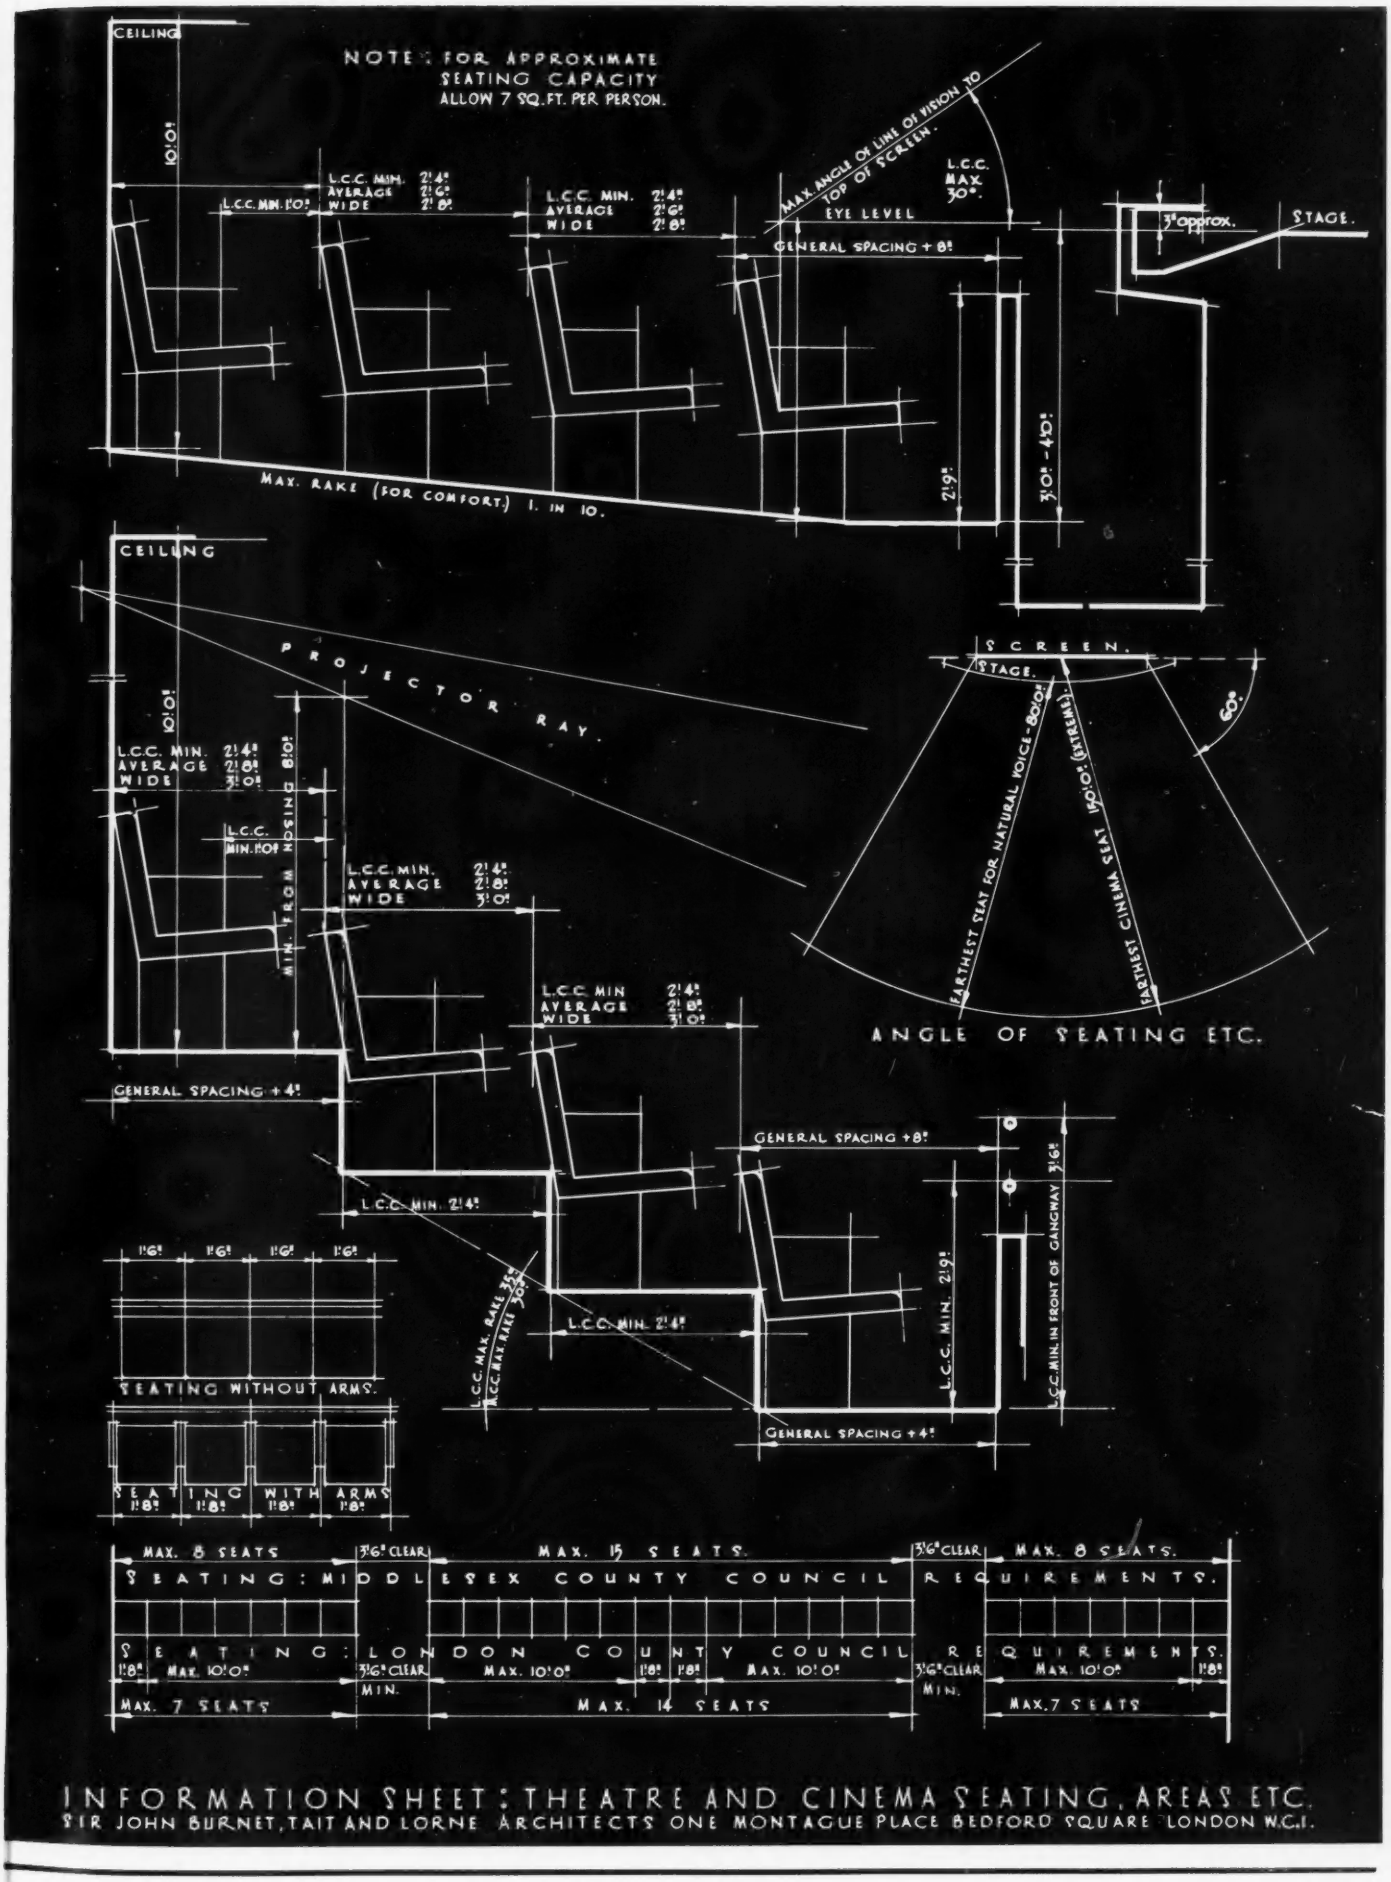
COMPETITION FOR CEMENT HOUSES



A SELECTION OF THE PREMIATED DESIGNS



Type D • Detached four-bedroom house, with garage incorporated or detached, costing £1,000 • First prize (thirty guineas) • J. W. Davidson, Sheffield. The assessors' comments on this and the other designs reproduced in this issue appear on page 198.



Type A • Terrace three-bedroom house, costing £500 (suitable for a scheme of 48 houses in terraces of six). First prize (thirty guineas) • C. A. Charlewood Turner, Wrotham, Kent.

Type A • Terrace three-bedroom house, costing £500 (suitable for a scheme of 48 houses in terraces of six). Second prize (fifteen guineas) • C. P. Greenwood and Ivan Williams, Wolverhampton.

Type B • Semi-detached three-bedroom house, costing £600 • First prize (thirty guineas) • William A. Funnell, Purley.

INFORMATION SHEET: THEATRE AND CINEMA SEATING, AREAS ETC.
SIR JOHN BURNET, TAIT AND LORNE ARCHITECTS ONE MONTAGUE PLACE BEDFORD SQUARE LONDON W.C.I.

INFORMATION SHEETS • 4 • SEATING FOR THEATRES

INFORMATION SHEETS

• 4 •

SEATING FOR THEATRES

•

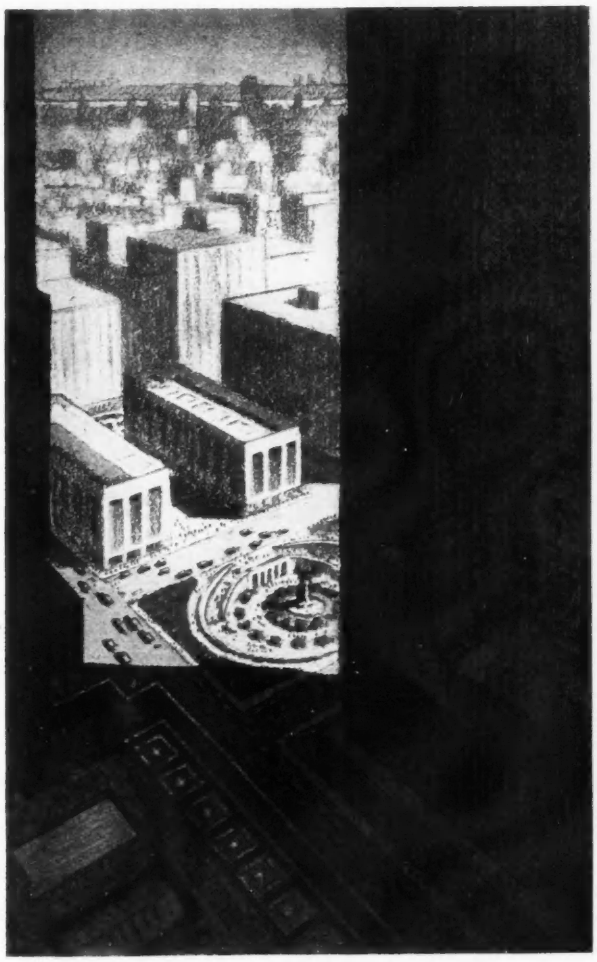
THIS week's Information Sheet deals with seating in theatres, cinemas, etc., being a companion to its two predecessors, giving similar data for restaurants and for schools.

The story of how these drawings—in themselves exemplars of the draughtsman's art—came into existence in the office of Sir John Burnet, Tait and Lorne, and of how, far from grudging the broadcasting of information they had been at pains to tabulate for use in the course of their own practice, they embraced the proposal with enthusiasm, has already been told.

The very fact that these Information Sheets, of a type in common use in America and Germany, are new to us here points the need for architects in this country to rationalize the activities in their own offices.

No one can avoid being impressed by the vital character of the information conveyed by these graphic and tabular means in the minimum of space with the maximum of clarity; they give, at a glance, just those very details which, though known to have been received some time or other, will usually take hours of search to unearth. Needless to say, their value depends on their being up-to-date.

It is arguable that one reason why, in the past, it has not been easy to collate such statistics, has been the reluctance of manufacturers in this country to perceive the advantages to them of standardizing the size and style of their catalogues and lists of goods, and the loose sheets by which, from time to time, they are revised, so as to reduce the architect's problems in compiling a reference library. Standardization in this respect has long been adopted in other countries.



It was desired to present these Information Sheets in a standardized form, but no standard filing size has existed, hitherto, in Great Britain. The decision was therefore taken to make the reproductions the same size as the original drawings, which themselves follow the standard dimensions adopted by the American Institute of Architects, as being more convenient than reproduction to the double-page size associated with THE ARCHITECTS' JOURNAL Supplements.

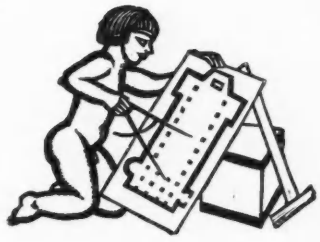
Until further notice, therefore, these Sheets will take the place of the second double-page plate that is usually issued, week by week.

THE ROCKEFELLER CENTER, NEW YORK

THE SITE, AND BRITISH EMPIRE BUILDING

THE British Empire Building, which figures in several illustrations of the Rockefeller Center in this issue, and is seen in this lower view—it is the left-hand of the two small blocks, that on the right being the French — is one of four national buildings in the group that is to cover the twelve-acre site in the heart of New York. That site was formerly occupied by the Elgin Botanic Garden, of which the upper illustration is reproduced from an old print in Valentine's Manual, 1859. It was bought by Dr. David Hosack in 1801 for $5,000; by 1875 its value had increased to about $7,000,000.

Though imposing as a unit, the British Empire Building, which faces Fifth Avenue, is tiny in comparison with the 70-story R.C.A. skyscraper which towers behind it to a height of 850 ft., and is the heart of Radio City. To this building Frank Brangwyn is to contribute mural decorations. The Center is to carry four other skyscrapers of from 30 to 50 stories in height. One of these—the R.K.O. building—was illustrated last week.



Between the British and French buildings is schemed a wide promenade leading down to the Sunken Plaza, nearly an acre in extent, laid out with flower walks and fountains. The associations of the site are commemorated both by this garden and by the profusion of roof gardens.

In the British Empire Building will be displayed the finest products of British art and craftsmanship. On these, by special Act of Congress, Customs duties are to be waived. The building is to be open in May.

THE ROCKEFELLER CENTER, NEW YORK

This imaginative impression shows the view from Fifth Avenue of the group of towers of masonry under "the star-spangled banner" of night. On the extreme right is dimly seen the outline of the British Empire Building with, next it, to the left, its companion, The French National Building. Other views of the Center appear on pages 231-233.

BUILDING SOCIETIES AND RECONSTRUCTION

THE movement towards co-ordination of national activities as far as housing construction is concerned has gained impetus, and several weighty pronouncements have been issued, particularly by the chairmen of the Building Societies, regarding the necessity for a new Housing Board which, at some points, would resemble closely the organization described by THE ARCHITECTS' JOURNAL.

There is, however, a danger that enthusiasm for housing may take the form of support for the Government in its new anti-housing bill. We have never maintained that housing should be taken out of the hands of local authorities and municipalities, and transferred exclusively to private enterprise, and that the State should wriggle out of its responsibility to provide a proper standard of social welfare for the population under its control.

What we have advocated is the development of an ambitious plan of national reconstruction which would carry on the proposals elaborated by the Minister of Reconstruction, fit them into properly-conceived regional-planning and town-planning systems, and, in this way, initiate a period of economic revival unaccompanied by economic waste. In this work the Building Societies can perform a very useful function, but we should not blind ourselves to the fact that housing developments under the Building Society system have not, on the whole, been as beneficial as they ought to have been.

The Building Societies are essentially financial institutions which advance funds on the security of mortgages raised on building property. They are directly concerned in the value of such security and only indirectly in design, function or location. Consequently, innumerable housing schemes have come into existence which, under any proper plan, would not have been permitted, and those housing schemes have been financed by the Building Societies.

It is doubtful also whether the housing has, in the long-term view, been benefited by this separation between finance and construction on the one hand, and, in innumerable cases, between construction and architectural planning on the other.

The interest charges have been excessively high by any standard, with a result that houses have been either expensive, if properly designed and constructed, or shoddy and cheap, if inexpensive. What is wanted now is a more intimate relationship between the organizations financing building and the purchase of houses and the organizations actually designing and constructing them, so that the fullest advantage can be taken of the existing low rates of interest, of existing improvements in the use and application of materials, of existing standards in domestic architecture. Such co-operation pre-supposes a new body altogether or, if such a new body is not desirable, a complete change in the principles under which the Building Societies operate. Such a change may require legislation and might be preferable to the formation of an entirely new type of utility organization.

The chairmen of the Building Societies have shown themselves to be men of progressive minds and, if entrusted to them, the new Housing Board or Boards would no doubt carry out their function with complete success. But we must be careful to distinguish between what the Building Societies have done in the past and what a scheme of planned reconstruction based on housing demands would now require. The proposals put forward by Sir Raymond Unwin deserve the closest scrutiny if a confusion of ideas is to be avoided. We do not want in this country an enormous collection of houses, built indiscriminately in order to provide immediate employment to the Building Industry, because we have suffered in the past from this type of activity.

The building trades will be served more effectively by proper co-ordination of housing schemes, by introduction on the widest possible scale of architectural and economic planning, and by a proper conception of the part construction should play in the rebuilding of Britain. In our New Year number, one writer advocated the rebuilding of Glasgow, a proposal which has met with some opposition in that city, partly because vested interest in property is so strongly consolidated there. But the rebuilding of Glasgow is only part of the whole national programme of rebuilding all our centres of population to clear away the debris left behind by the industrial revolution. Practically the whole of the housing and commercial building carried out by the Victorians is now completely out of date and should be destroyed. It has no artistic value and very little remaining functional value.

The truth of this has already been recognized by industry, which has been forced by pressure of competition to carry out a work of piecemeal reconstruction, with the result that the most daring inventions in architecture and in planning have been associated with industry in recent years.

What has been done in the great industrial plants should be done in housing and commercial building, and the new Housing and Construction Board should devote its attention to this aspect first of all.

Mr. C. Holden, who has been appointed a member of the Royal Fine Art Commission.

NOTES & TOPICS

STIRRINGS FROM OXFORD

OXFORD may compare poorly with its rival, Cambridge, as a vessel for architectural culture, but it is resolved not to suffer the final indignity of allowing the façades of its new buildings to be judged by a bench of magistrates.

*

That such a thing could be proposed in the Oxford Corporation Bill, now before the House of Lords, is a most curious reflection upon the state of mind of this transitional period; and if the whole University did not rise at once (as it has risen !) to silence the horrible suggestion, there might be no health left in that city.

*

This "control of elevations" legislation is proving more useful as a means of arousing interest in architecture than it could hope to be as a restrictive bye-law.

*

I understand that Professor Reilly's resignation from the Roscoe Chair of Architecture at Liverpool University has been accepted and will take effect from September 30.

*

I do not know how I shall be able to think of the Liverpool School without him, for never was an institution more closely bound up with the life of one man. Professor Reilly is its spirit, its energy, its organizer and its mouth-piece.

*

He did very little that directly or indirectly had no bearing upon its welfare, for he went outside the world of architectural education only to preach a still wider crusade to the general public.

*

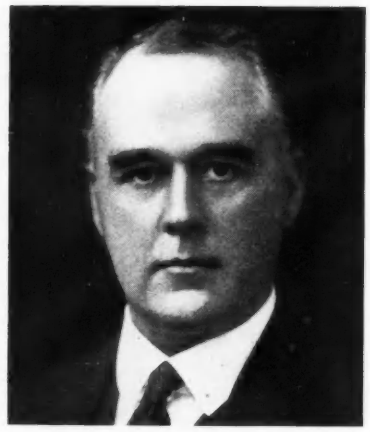
In his adopted city he turned indifference towards architecture into civic pride, and with a steady stream of persuasive writing and still more persuasive speech his personal efforts have done more to raise the common level of taste than any other single agency.

*

He retires just when the Liverpool School opens a new chapter in the buildings that are now nearing completion. "within sight of the promised land. . ." as he wrote sadly in a recent letter.

It would be some consolation if this first of architectural educators should be given a knighthood for public services in the cause of architectural education, which not only included the foundation of a school that has become a national asset of first importance, but the education of great masses of the public to an appreciation of fine architecture.

*



VICTORY

I have no wish to trample on a fallen foe. At the same time it would be folly to pass over the victory that was won on the floor of the House of Commons on Wednesday night for the stout-hearted people—architects and M.P.'s, dukes and dustmen*—who have given their support to the Carlton House Terrace Campaign. Folly because, unless the fact is driven home to our legislators and bureaucrats—yes, and our paint manufacturers too—that responsible public opinion will no longer tolerate the grab-and-be-damned-to-you attitude which is one of the results of *unplanning*—unless the fact is driven home with a pick-axe, they will try the same game on again.

*

One would have thought the Waterloo Bridge business would have taught them a lesson. Not a bit of it. This time *we* have learnt *our* lesson. The Carlton House Terrace Defence Committee represents a body of people with influence in every department of life. Let me warn our friends the enemy that this Committee has no intention of disbanding when the "trouble" has blown over.

*

Mr. A. S. Gaye, Permanent Commissioner of Crown Lands. By a decision of the Government made public in the House of Commons at the end of the Carlton House Terrace Debate the control of Crown Lands is now to be removed from the Permanent Commissioner who formally shared it with the First Commissioner. In future all decisions are to be made by the latter—Major Elliot the Minister of Agriculture—who in his turn is to be advised by a committee of five experts on town planning, etc. This is the first result of the Carlton House Terrace Campaign.

* A figure of speech. Actually, *maidservants* would be more accurate than *dustmen;* for, as Mr. J. C. Squire revealed at its first meeting, the funds of the Carlton House Terrace Defence Committee have been swollen by shillings from maidservants as well as cheques from dukes. —Astragal.

Monday, February 20

R.I.B.A., 9 Conduit Street, W. "Factories." By Thomas Wallis, F.R.I.B.A. 8 *p.m.*

It has come to stay, and its object, I understand, will be to act as a Vigilance Committee.

*

A Vigilance Committee which will seek not only to preserve but to create amenities; not to prevent building (except in the wrong place), but to *create* building, of the right kind, in the right place. To represent the principle of *planning* in urban development against the non-principle of *unplanning*.

*

Unfortunately, the Committee lacks the support of two eminent men. I refer to *Beachcomber* and Lord Castlerosse. Never mind. It will have to drag along somehow without them.

*

IN THE HOUSE OF COMMONS

The trial in *Alice* after the pack had got up and fluttered down on the unfortunate girl—that was what the floor of the "'ouse" looked like to the Distinguished Stranger on the night of the debate. Every bench was littered with large sheets of paper. Closer inspection showed that they were copies of the "opinions" on Carlton House Terrace published in *The Architectural Review* and THE ARCHITECTS' JOURNAL for the Defence Committee. Sir Arthur Steel-Maitland and Mr. Hugh Molson had obviously been busy.

*

When Captain Crookshank referred to THE ARCHITECTS' JOURNAL I noticed Major Elliot, the Minister for Agriculture, who had to reply for the Government—and for himself, for he is first Crown Commissioner—scribbling hurriedly. I hoped that he was going to challenge some of the accusations made in this JOURNAL, but when he got up he very wisely evaded referring to them.

*

Not that he shirked the issue. He made what amounted to a very handsome apology—for himself, for the Crown Commissioners, and for the Government. Major Elliot is much too able a man to believe in underpinning a rotten cause. He is spoken of as a future Prime Minister.

*

In agreeing with the motion put by Captain Crookshank* he admitted that maladministration had occurred, and undertook to reorganize the office in such a way that the First Commissioner will in future be solely responsible for all decisions and policies. This means that the Permanent Commissioner, Mr. A. S. Gaye, is deprived of his powers.

*

Up till now, as I have constantly reminded my readers, Mr. Gaye has had equal powers with the Minister, and has used those powers to pull down Carlton Gardens. Major Elliot himself, of course, had nothing to do with this, as he became First Commissioner after the deed had been done.

*

But Major Elliot went further than this. He revealed that the Prime Minister has stepped in and has decided to appoint a committee of five "suitable" persons to advise Major Elliot himself on all questions of art and town planning as related to the work of the Crown Lands.

*

This means that the First Commissioner himself cannot take decisions without the consent of persons responsible to the public—so we may deduce that Carlton House Terrace is definitely "saved."

*

But where the Fine Art Commission comes in, quite frankly I don't know. Incidentally, I hear that there has been a change in that august body. Sir Reginald Blomfield has resigned.

*

MR. MORRISON'S WATERLOO

Although the L.C.C. has decided by a majority vote to recondition Waterloo Bridge the bad grace that has marked that body's dealings with the problem will spin out the preliminaries until it may be said that ten years have gone by with nothing done.

*

Why the idea of architectural dictation should arise in the mind of Mr. Herbert Morrison I find it hard to understand, because, Waterloo Bridge being a matter of public interest, the expression of architectural (and lay) opinion one way or another is only a matter of informed taste saying that the bridge is a beautiful thing and too good to lose, or *vice versa*.

*

It so happens that most people have thought it good, and that Mr. Morrison is in a minority. This painful discovery seems to have angered him considerably.

ASTRAGAL

ROYAL FINE ART COMMISSION

Mr. Charles Holden, F.R.I.B.A., has been appointed a member of the Royal Fine Art Commission, in place of Sir Reginald Blomfield, R.A., who has resigned. Sir Reginald has made the following statement :

I have resigned because I was not satisfied about several subjects which have arisen recently.

It has been stated that the controversy which has occurred over the rebuilding of No. 4, Carlton Gardens has led to my decision. That is only one of the points which have been under discussion.

My resignation is not due to any quarrel with the Fine Arts Commission itself. It is rather a personal matter, and I do not wish to discuss the reasons.

RATES OF WAGES

A debate on wage-rates in the building industry between Lt.-Col. Sir Francis Freemantle, M.P., and Mr. R. Coppock, the Secretary of the National Federation of Building Trades Operatives, was broadcast in the National Programme on Monday night.

The first speaker contended that building could be cheapened by a reduction of wage costs, the second that, employment being irregular, high wage rates were necessary.

SIR,—*It is wonderful to see the Building Industry which has for 2,000 years been content to take what business came its way suddenly realizing that the British public might be persuaded to build for the advantages of good building, that business might be increased by publicity, and that a building boom is a possibility which may be secured by a united effort.*

I am sure that during the last month more comment has been published on building in the general press than ever before which does great credit to the Public Relations Committee of the Building Industry.

A. LEDAMUN

[*The list of subscriptions received by the Public Relations Committee up to Monday last amounted to £1,895 17s. Subscriptions should be addressed to Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.* —ED., *A.J.*]

THE TWO TERRACES

Professor A. E. Richardson, F.R.I.B.A., in last Sunday's *Observer*, discussed the threatened destruction of the two terraces—Carlton House and Adelphi. He suggested that it showed the need for a survey of the historical quarters of London which remain—and not only a survey, but a scheme for the preservation of famous centres.

Following the proposals to rebuild Carlton House Terrace, there comes the renewed threat to destroy the sole remaining quarter of Georgian London between the Temple and Whitehall.

To my way of thinking the re-conditioning of the Adelphi should be the first step towards the realisation of a scheme for the preservation of the accepted amenities of London. It should not be beyond the scope of architects competent to deal with such matters to re-endow this famous quarter with a measure of its former status.

MODERN TENDENCIES

"Modern Tendencies in Architectural Design," was the title of a paper read by Mr. W. B. Edwards, M.A., A.R.I.B.A., Lecturer on Architecture at the Victoria University, at a meeting of the Manchester Society of Architects on Wednesday last.

Owing to the development of steel, concrete and glass, any architect, he said, who today borrowed a stylistic envelope from the past did so because he was not original enough to create the one truly appropriate to the new age.

EDWIN GUNN ON TEXTBOOKS

Mr. Edwin Gunn, A.R.I.B.A., lecturing on "The Textbook and the Craftsman" at Sheffield University on February 9, pointed out the importance of, and need for a single building book to supplement the ordinary textbook, "oriented not towards technical examinations, but towards the execution of plain good work .... mainly a series of whys, wherefores and don'ts, with convincing photographic comparisons."

Mr. Gunn also remarked that measures should be taken "to interest executants in their work by letting them know the general aim and motive—for instance, photo prints are cheap, and a set exhibited in the men's mess room would at least prevent them from working blind."

R. I. B. A.

THE NEXT MEETING

A paper entitled "Factories" is to be read by Mr. Thomas Wallis, F.R.I.B.A., at the Institute on Monday next at 8 p.m.

THE ROYAL GOLD MEDALIST

Intimation has just been received that His Majesty the King has approved the award of the Royal Gold Medal to Sir Charles Peers, C.B.E., M.A., F.R.I.B.A., in recognition of his distinguished services to Architecture and Archæology.

The Medal will be presented to Sir Charles Peers at a general meeting of the Institute on April 3, at 9 p.m.

ELECTION OF MEMBERS

At a meeting of the Council, held on February 6, the following members were elected :—

As Hon. Corresponding Member (1)—Pond, Irving K., C.E., Past-President American Institute of Architects, HON.M.A., HON.D.ARCH. (MICHIGAN).

As Fellows (9)—Auty, J. ; Calvert, Major C. H., M.C. ; Edwards, A. T., M.A. OXON ; Meldrum, P. H. ; Stephenson, A. G. ; Tranmer, F. ; Turner, D. K. ; Brinsley, H. G. W. ; Rees-Poole V. S.

As Associates (12)—Ap Thomas, I. ; Atkinson, J. R. ; Bayes, K. A. H. ; Campbell, K. J. ; Ciregna, A. P. ; Denison, T. E. T. ; De Wet, R. L. ; Gollins, F. ; Kerswill, F. E. ; McKenzie, C. C. ; Nicholas, M. F. ; Sidbottom, J. G.

As Licentiates (7)—Arnold, W. L. N. ; Campbell, D. C. ; Leech, J. ; MacTaggart, M. ; Osborne, S. M. ; Sugden, J. T. ; Ware, E. F

THE TIMES

FLATS FOR LONDON WORKERS

A £70,000 SCHEME

IMPROVEMENTS IN CANNING TOWN AND LAMBETH

Schemes to provide, at a cost of £70,000, for the erection of flats and cottages for working-class families in Canning Town and Lambeth are to be carried out by the Society for Improving the Conditions of the Labouring Classes, an organization founded in 1830 and incorporated by Royal Charter 20 years later.

The work of erecting the "Temple of Peace" in Cathays Park, to the north of the Technical College, at Cardiff, is about to be commenced. The new building, which is estimated to cost £120,000, will be the joint headquarters of the Welsh League of Nations Union and the King Edward VII. Welsh National Memorial Association, which is engaged in fighting tuberculosis.

YORKSHIRE TELEGRAPH AND STAR

£750,000 SKYSCRAPER.

Sheffield Architect's Plans Provisionally Approved.

A Sheffield architect's plans for a skyscraper hotel to be erected on the South Shore, Blackpool, at a cost of about £750,000, were provisionally approved by the Blackpool Corporation Building Plans Committee yesterday.

IPSWICH EVENING STAR

COLCHESTER'S NEW £200,000 BUILDING.

A scheme mooted twelve years ago for additional buildings for the Royal Eastern Counties' Institution at Colchester has now reached fruition, for there is in progress at Turner Road, Mile End, excavation work and foundation laying for blocks and premises which will cost, in erection and equipment, a figure over £200,000. This is, however, only part of a larger scheme, which it is intended ultimately

THE MANCHESTER GUARDIAN

A new Post Office building to be used as parcels and sorting offices is to be erected at a cost of £100,000 at Hatton Garden, Liverpool.

NEW £100,000 HOTEL FOR CLEVELEYS

The Fleetwood magistrates yesterday granted a provisional licence for a new hotel, to cost £100,000 which it is proposed to build on the promenade at Cleveleys. The hotel is to have a bathing pool, and will have 129 bedrooms.

GLASGOW HERALD

SCOTSTOUN HOUSING SCHEME

A minute of the Housing Committee recommending the acceptance of offers amounting to more than £200,000 for the erection of 730 houses at Victoria Drive, Scotstoun (398 in the tenement section and 332 in the cottage section), was adopted.

NEWCASTLE EVENING CHRONICLE & EVENING WORLD

BUILDING BOOM FOR TYNESIDE

£2,000,000 Private Housing Projects

HOUSING schemes, to cost approximately £2,000,000, are being promoted on Tyneside by private enterprise, and rapid development is anticipated in the Spring.

Biggest of these schemes is the lay-out of a new town on the outskirts of Newcastle, planned to provide sites for 1,900 semi-detached villas, to accommodate some 8,000 people.

Schemes for a further 300 houses at Low Fell, to cost approximately £200,000 have been approved by Gateshead Housing Committee this week. Work has already begun on 116 houses and a further 66 are to be built by Mr. E. P. Calderwood, who has in recent years developed the Chowdene Estate, Low Fell.

On the Broadway estate at Whitley Bay, the first 140 houses have been completed, and at Briardene, Whitley Bay the £200,000 scheme is rapidly developing

THE STAR,

Tenders are invited for the reconstruction of Harefield Sanatorium at a cost of £165,000.

PRESTON'S NEW BATHS

£58,000 Scheme Approved by Council

With only one dissentient, Preston Town Council to-day decided in favour of the erection of new baths at a cost of £58,000

GRIMSBY EVENING TELEGRAPH

PLANS PASSED FOR 800 NEW HOUSES

BUILDING schemes submitted on behalf of several landowners who propose to develop estates in the Laceby-road and Little Coates areas were agreed to by the Grimsby Corporation Highways Committee last night after a protracted discussion.

DAILY HERALD

Dudley has resolved to proceed with a £60,000 plan for new municipal buildings, and hopes that the Board of Education will now sanction the £90,000 project for a new technical college.

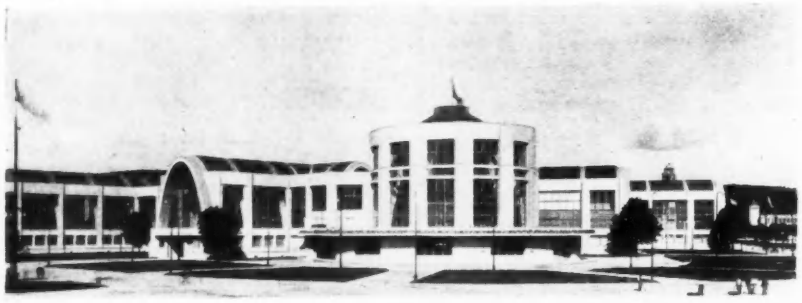
THE MANCHESTER CITY NEWS,

One of the big plans on which work is now beginning is the new £150,000 structure for the Manchester Northern Hospital, situate on 3½ acres of Alms Hill, off Cheetham Hill Road.

A big municipal job which it has been decided to put in hand at once—under Government pressure, curiously enough—is the new police headquarters, Jackson's Row. The estimated cost is £120,000

THE DAILY TELEGRAPH,

The Ministry of Health has approved of an expenditure of £37,242 on Willesden's third large municipal housing scheme.



THE DAILY EXPRESS.

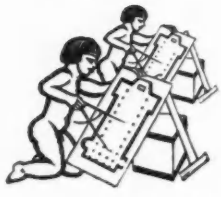
BURGH TO SPEND £25,000 ON NEW HOUSES

At to-day's sitting of the Dean of Guild Court of the Burgh of Motherwell and Wishaw building plans amounting to a total of £25,000 were passed.

THE BUILDING DRIVE. On the page corresponding to this, in our issue for February 1, there was reproduced a mere handful of snippets from among the week's newspapers. They were fraught with promise of a building boom. But the activities of the Public Relations Committee of the Building Industries National Council are already producing something more concrete than optimistic anticipations. The above cuttings refer to work actually started or definitely contracted for, north, east, south and west. There could be no stronger argument in favour of financial support on the modest scale for which the Committee has appealed.

BRÜNN—AND BRUM

ABOVE: THE BRÜNN EXHIBITION—GENERAL VIEW.



The exhibition buildings are established over an area of 75 acres in the Vale of Pisárky, adjacent to the ancient and modern town of Brünn, which has a population approaching a quarter of a million, and is the greatest industrial centre of Czechoslovakia. Brünn is the Manchester (or Birmingham) of the country, and produces cotton, wool and silk goods, light and heavy machinery, leather and hardware. The layout of the grounds, and the design of the buildings was entrusted to architects. An interior view of the machinery section appears on page 248.

RIGHT: THE BRITISH INDUSTRIES FAIR, BIRMINGHAM.

The exhibition buildings are established at Castle Bromwich, adjacent to the modern city of Birmingham, the "city of a thousand trades," which has for its watchword "Forward" and is the greatest industrial centre in the world. The buildings are large sheds, extended from time to time, but still too small to provide adequate space for would-be exhibitors. There is no apparent plan for the arrangement of exhibits, and there is no indication that the buildings have been designed to house an exhibition.

COMPETITION

NEWS

EXHIBITION HALL

The Management of the Manchester Building Trades Exhibition (April 25 to May 6) offer three awards, of £150, £75 and £25, to the authors of the schemes placed, first, second, and third, respectively, in a competition, open to all British subjects, for the design of a new Exhibition Hall for Manchester. The assessors, appointed by the Manchester Society of Architects, are as follow: Messrs. H. S. Fairhurst, F.R.I.B.A.; A. J. Hope, F.R.I.B.A.; and J. Hubert Worthington, F.R.I.B.A.

The conditions of the competition, to save readers the trouble of writing for them, are printed in full below:

SITE: Site to be on a main street in the City with a frontage of 200 ft. and a depth of 600 ft. The back and sides to face minor streets.

ACCOMMODATION: The hall must be planned to give a clear floor area of approximately one hundred thousand square ft., including gallery, free from pillar obstructions.

After provision has been made for an imposing and substantial entrance, with the necessary pay boxes, turnstiles, etc., the remainder of the front should be planned for shops. Shops should also be planned on the two sides and back of hall to a depth of 16 ft. These would be let off as showrooms.

Provision should be made for a balcony on all four sides inside the hall to a depth of approximately 26 ft., and the shops would run underneath. The letting space therefore inside the hall underneath the balcony and backing on to the shops would be 10 ft. in depth. Emergency exits should be provided on each of the two sides and the back, the minimum width to be 12 ft. and the height 16 ft.

As the hall would be used occasionally for seating large audiences, provision should be made for portable seating for horse shows, military tournaments, boxing, etc., and a skating surface suitable for hockey matches.

It will, of course, be necessary to determine the height underneath the balcony by the rake of the seating, in order that the maximum seating accommodation can be provided.

It is suggested that the hall be provided with underground facilities for car parking, storage, etc., etc.

Suitable cafés and kitchen accommodation must be provided.

Mains for the lighting and power, gas pipes, water and waste pipes, etc., will be conducted underneath the floor and ducts should be provided for this purpose. Provision should also be made for overhead electric cranes, and there must be, of course, the usual offices, cloak-rooms, lavatories, boiler house, etc.

Prominent means must be devised to indicate the position of the building by day and night.

The structure must be fireproof, and the materials are left to the discretion of the competitor.

The whole of the designs should comply with the bye-laws and regulations required by the Manchester Corporation.

DRAWINGS REQUIRED: Plans ($\frac{1}{16}$ in. = 1 ft.) of the basement, ground and gallery floors; one front and one side elevations; two sections; $\frac{1}{2}$ in. detail of the main entrance; also an explanatory report. The drawings may be in pencil and wash or ink and wash.

All the drawings submitted are to be exhibited by the Management, who will take due care of them, but will accept no responsibility for injury. The prize drawings may be exhibited by the Manchester Society of Architects if thought desirable to do so, and will afterwards be returned immediately to the competitors concerned, carriage paid. All other drawings will be returned by the Management to the competitors, carriage paid, after the close of the Manchester Building Trades Exhibition.

All designs must be addressed "Architectural Competition," Competition Manager, City Hall, Deansgate, Manchester, and be delivered no later than 5 p.m. on Thursday, April 13, 1933. Any designs submitted later, without satisfactory explanation, will be rejected by the assessors.

No distinguishing mark may be placed upon the drawings or report. The name and address of each competitor must be enclosed in a sealed envelope, in the same package as the drawings. The envelopes will not be opened until after the awards have been made.

DESIGNS FOR COTTAGES

With a view to stimulating interest in the urgent housing needs of the country and also in the campaign to emphasize the necessity of building now, with its attendant advantages of creating employment in the Building Industry, the Building Centre is organizing a competition to produce designs for cottages to be built at a minimum cost and at an economic rent.

A cash prize of one hundred pounds for the most suitable design is offered. To assist competitors, the Centre supply plans.

The assessors will be the Directors of the Building Centre:—

Messrs. Maurice E. Webb, D.S.O., F.R.I.B.A. (Chairman); Robert Atkinson, F.R.I.B.A.; L. H. Bucknell, F.R.I.B.A.; Louis de Soissons, S.A.D.G., F.R.I.B.A.; Sidney Gluckstein, F.I.O.B.; Vincent Gluckstein, F.I.O.B.; G. Grey Wornum, F.R.I.B.A.; and F. R. Yerbury, HON.A.R.I.B.A.

Full particulars are obtainable from the Building Centre, 158 New Bond Street, W.

EXHIBITION OF DRAWINGS

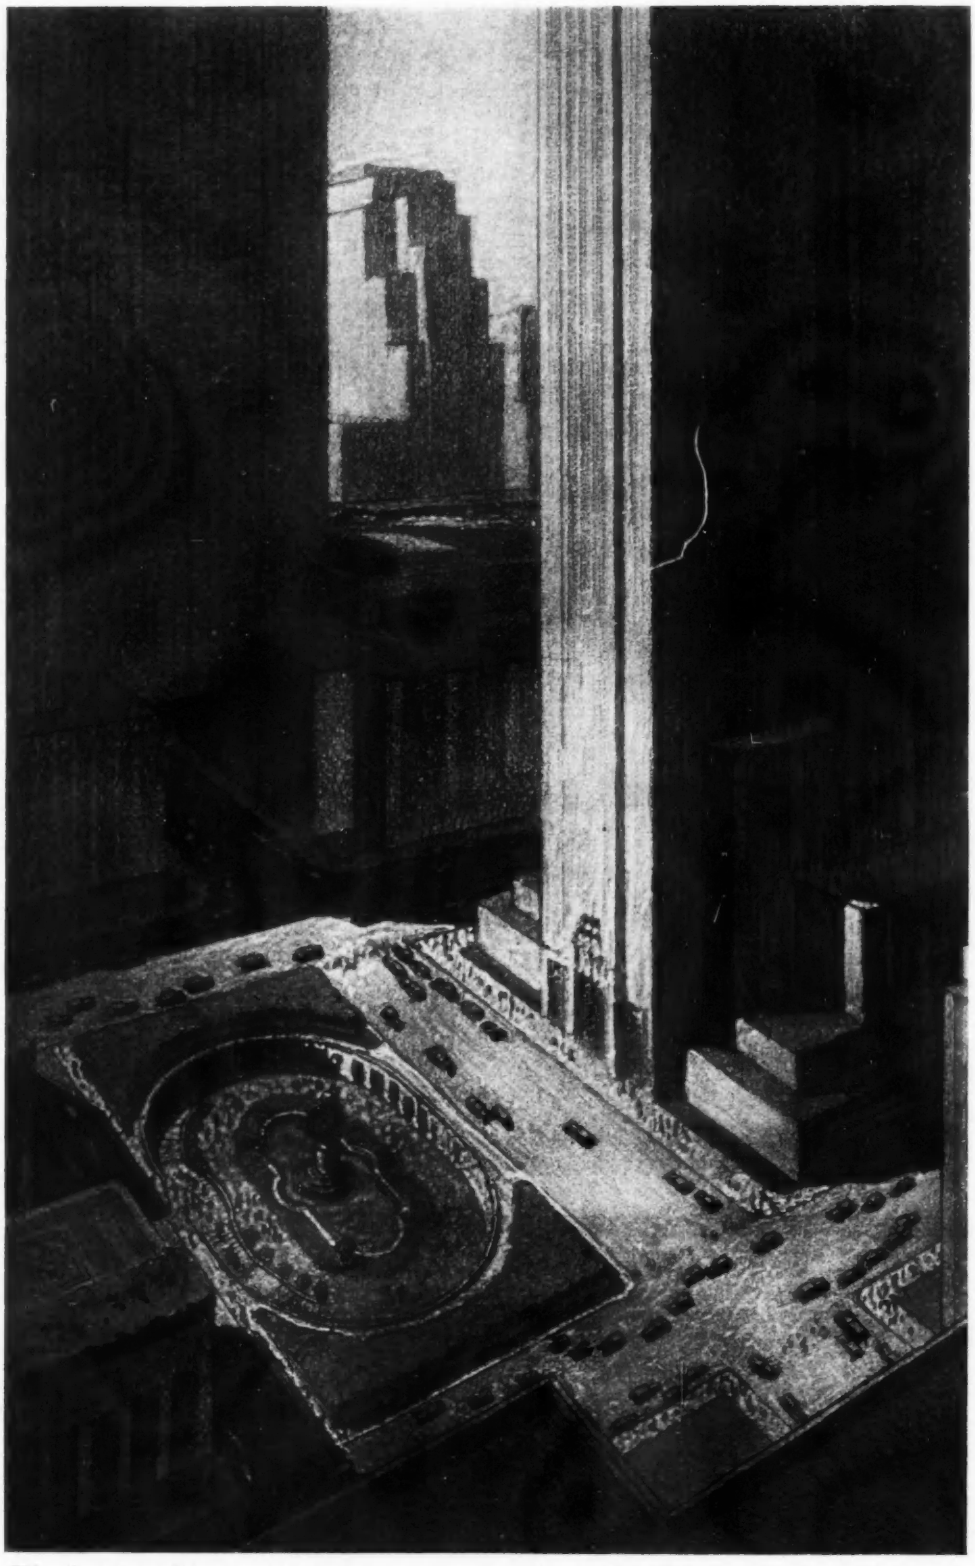
The Cement Marketing Co., Ltd., have arranged a display of 81 of the 825 sets of drawings entered for their competition for designs of houses to promote the artistic use of cement to be held at the Building Centre, 158 New Bond Street, from Monday, February 20, to Monday, March 6, inclusive.

Scale models will be on view and also sample slabs of the materials specified by the winning competitors.

Competitions Open

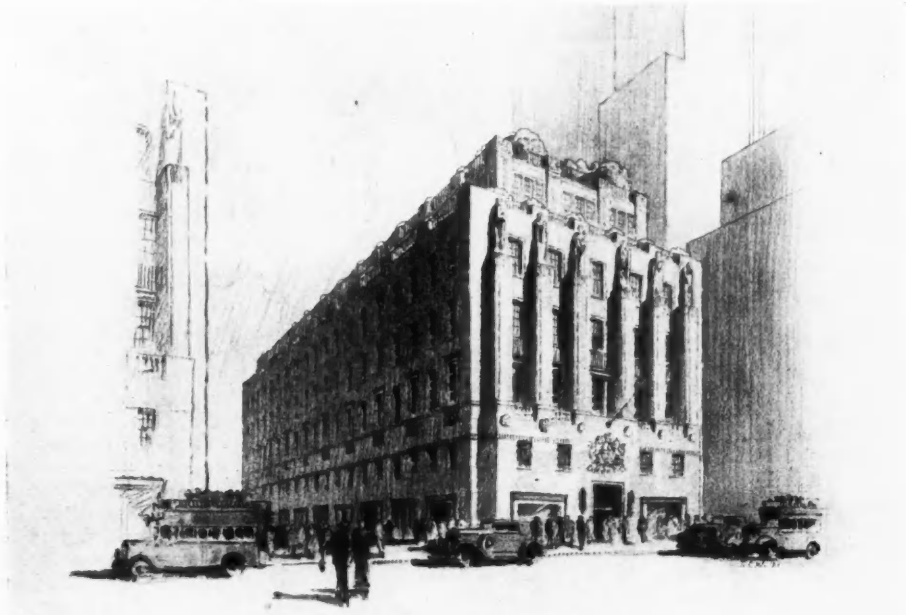
March 24.—Façade to a newspaper office in grey Cornish granite, for the Cornish Quarry Masters' Association. First prize, £50.

May 31.—Sending-in Day. Layout of a suburb on the River Escaut, Antwerp. £2,400 in prizes (1st, £800).



Full Particulars of the above competitions were published in our issue for February 1 last, and December 7, 1932, respectively.

ROCKEFELLER CENTER, NEW YORK



This drawing reveals the plan. The tallest building is the R.C.A. ; at its feet is the Sunken Plaza, with, before it, the British Empire Building (right) and the French National Building (left)

ROCKEFELLER CENTER: BRITISH AND FRENCH

OPENING DAY: MONDAY, FEBRUARY 20

REBUILD

THE

BRITISH INDUSTRIES FAIR

AT BIRMINGHAM

[By F. R. S. YORKE]

THERE is no change, it appears, in the general layout of the exhibition, and, as in previous years, the visitor must trudge along interminable passages, shut in on every side by booths that do little credit to the stand-fitter's art.

The scheme is the exact opposite of what it ought to be. The gangways are monotonous because one is so like another, with no open spaces to permit hesitation and a freeing of the mind, without a focal point, a climax, or anything to lend interest to the visual scene. The stands are themselves monotonous because they are all different, conforming to no standard in design, and though one or two isolated examples are not without merit, the majority are meaningless.

Far better if the planning were free and open, and the design of the stands more rigidly controlled, on the lines, for instance, of the late Mr. Tanner's scheme for the exhibition of "Ideal Homes."

There is no sense of spaciousness. From the moment when, on entering the hall, one is brought rudely into contact with a row of stand-ends, the impression is that of a ragged collection of exhibitor's pens, each doing its best to shout its neighbour down.

One is informed, if one presumes to criticize the layout, or the appearance of the ensemble, that "the Midlander is a practical chap, concerned with utility, not æsthetics" and this is, of course, exactly the case. That æsthetics can be of great utilitarian value, the British manufacturer—who can make things as well as anyone else in the world, when he wants to—will not believe. He continues to regard the business man and the artist as distinct types, best apart; though the success of his Continental competitor, whose appreciation of design has done a great deal to stimulate the demand for his goods, should by this time have convinced our own people that "Design in Industry" and "Fitness for Purpose" are more than mere slogans to create employment for the artist.

A bird's-eye view of the chaotic interior of the British Industries Fair, Birmingham.

It must be remembered that no matter what the personal opinion of the inhabitant of "the city of a thousand trades," it is his business at the present time, and especially at the British Industries Fair, to attempt to re-capture foreign trade, and to attract the foreign buyer, who has probably seen exhibitions at Stockholm, Berlin, and Brünn, where the goods exhibited were of admirable design, and excellently presented, and the ensemble governed by a plan.

When the industrial products of Czechoslovakia were shown at Brünn, there was co-operation between artist and manufacturer; the several towns, industrial groups and faculties of art, architecture and engineering, were represented by such men as Goçár, Fuchs and Havliček. The principal hall was designed by Josef Kalous. At Stockholm the architect Asplund prepared the plan, and designed many of the exhibition buildings. At Birmingham there is no sign that either planner or artist have been consulted. There is no indication that the organizers have the remotest conception of the function of the architect, or the importance, to such a scheme, of his powers of co-ordination, by virtue of which the act of walking round an exhibition is made a pleasure rather than a labour. And all this despite the fact that the exhibition is sponsored by the Government.

The exhibitor, who pays for space, has the right to demand an arrangement that is attractive, creating a good impression immediately, enhancing his goods, and enabling the visitor to move in comfort, and to spend several hours in the building without suffering fatigue. In less than an hour, under present conditions, one becomes mentally exhausted.

If the exhibitor did demand such amenities, they would probably be forthcoming, but he is apathetic, and the appalling state of affairs goes on.

The building itself is against the achievement of a broad and spacious effect, being nothing more than a vast shed, of great length—about 1,500 ft. —but with neither the height nor the width of such a hall, even, as Olympia.

Since the exhibition has become a permanent institution, why cannot it be housed in a proper building, erected for the specific purpose? There is without doubt the demand for it. The present shed has been several times extended, and this year, in spite of trade depression, not an inch of available space is unlet. Many exhibitors are showing their goods in the open air, and late applicants, to whom outdoor space is of no use, are being turned away.

In this lack of space lies the only excuse for the congested arrangement, but, if the building is too small, something larger should take its place, and if the building is of an obsolete type it would seem futile to extend it again. Here is an opportunity to provide employment in the building trades. Why not scrap the whole thing and build again, on modern lines? Why not a new hall for the next B.I.F.?

FIRST NOTICES OF THE EXHIBITS

Henry Hope and Sons are exhibiting, for the first time, a horizontal sliding folding window, which differs from previous models in that all gearing is on the inside instead of being exposed to the weather, and there are no exterior channels to corrode or collect moisture. The window can be fully opened or closed by a single movement.

A window with flexible wire opening gear, such as that made for Shell-Mex House, is shown with a sun-blind fitted externally but operated from the internal face.

The ventilating lights of the new coupled window (illustrated) are securely latched when closed, and are as weathertight as the independent horizontally-pivoted type. Each swinging ventilator is secured by two spring catches, instead of the usual single central one. The bottom-hung casement can be made to work independently by a turn of the telescopic connecting links.

*

Messrs. Parker, Winder and Achurch, who were pioneers in the introduction of

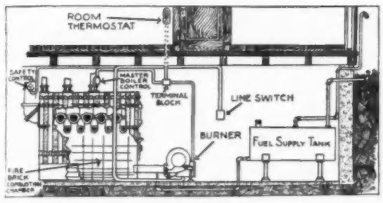

Diagram of the P.2 Parwinac oil-burner installed in a small office building.

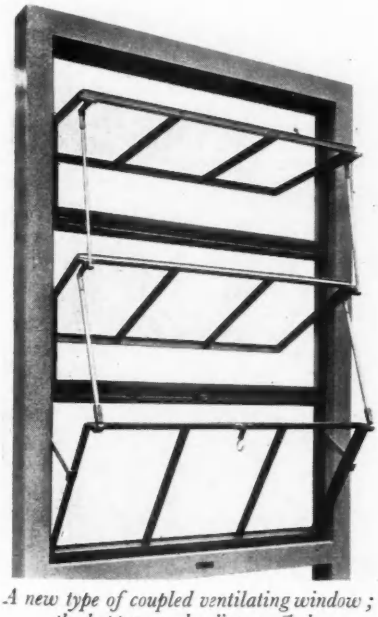
the American oil-burner that has until recently held the field on the British market, are now producing a complete range of automatic oil-burners, British-made throughout, and considered by independent experts to be an improvement on the American type.



The general advantages of the oil-burner are well known, but an innovation, "peculiar to the Parwinac," is the bent, chromium-plated, heavy drawn copper delivery and return oil pipe, which, by dispensing with right-angle bends, reduces pump friction to a minimum.

Three burners are exhibited under operating conditions. The P.2 type, which is able to deal with boilers up to 450,000 B.T.U.'s (i.e., a small office building or cinema), is shown in the diagram connected to a sectional Beeston boiler.

*

Radiation Ltd., are showing the new Eagle Combination Grate, which provides a big oven for roasting and baking, a boiling hot-plate for boiling and frying, and for use of an extra oven when required, ample hot water, quickly and constantly supplied to bathroom and kitchen sink, and a cheerful kitchen fire that burns brightly whilst cooking proceeds.

Fuel economy has been a primary consideration, one scuttle-full of coal being sufficient to keep the fire burning throughout the day.

A new type of coupled ventilating window; the hopper can be disconnected.

CARLTON HOUSE TERRACE

[By M. I. BATTEN]

THE campaign to save Carlton House Terrace from vandalism has been a long and fierce one, but it has not been in vain. Although the one new and obnoxious building has not been prevented and Messrs. Pinchin Johnson—a firm which, by reason of some of its directors and the holdings of certain blocks of shares, must come under American influence—has seen fit to carry on building operations in the teeth of the strongest architectural, public and Parliamentary opinion; although their Majesties themselves may have to move from Buckingham Palace, if we are to believe *The Daily Express*, yet a victory has been won. Carlton House Terrace itself has been saved, at any rate for the present, Mr. Gaye has been divested of some of his power, and the Government has admitted that a mistake has been made and climbed down.

The questions of the Pinchin Johnson building, the administrations of the Crown Lands and the scandal of Regent Street were thoroughly discussed in the House on February 8, when Captain Crookshank moved, "That in view of the widely expressed dissatisfaction over the recent decisions of the Commissioners of Crown Lands in regard to No. 4 Carlton Gardens, and the uneasiness still felt as to the future of Carlton House Terrace, Carlton Gardens and other Crown Lands in London, this House urges the Government to take immediate steps to reorganize the administration of Crown Lands, and, in particular, to secure that in any future decision, educated and responsible opinion shall be fully taken into consideration."

This resolution the Government accepted, without waiting for a division. The capitulation of the Government is all the more remarkable seeing that it is now revealed by Major Elliot that Messrs. Pinchin Johnson have been approached three times. On each occasion they refused to consider any of the Commissioners' proposals, their argument being that the lease had been signed, that they were acting absolutely within their legal rights in erecting this building to the full height, and that they must consider their shareholders. The Commissioners have asked them to refrain from building the two top stories, offering them accommodation in the adjoining house, No. 1 Carlton House Terrace, and a reduced ground rent if they would accept that accommodation. As the two top stories of their new building have a total area, including corridors, etc., of only 5,270 ft., and as No. 1 Carlton House Terrace has a total area of 19,284 ft., there seems to be no reason why they should be unable to accommodate themselves.

But no, Messrs. Pinchin Johnson choose to carry on, caring nothing for public opinion, Parliament, amenities, the Mall or anything in the world except their American shareholders. It has been said at intervals during the controversy that this well-known firm would be making a most gracious and universally appreciated gesture if it could see its way to meeting public opinion; and that is still the feeling. If the Government can admit that a mistake has been made and climb down, cannot Messrs. Pinchin Johnson do so?

After Captain Crookshank, Mr. Molson and Sir Arthur Steel-Maitland, supported by several other Members, had spoken against the new building and the management of the Crown Lands, Major Elliot rose to defend, as best he might, and at the same time made what was virtually a full apology.

He promised two things on behalf of the Government. First, that the administration of the Crown Lands should be reorganized; that in future all decisions should be made by the First Commissioner, that is, the Minister of Agriculture, ex-officio, who would be entirely responsible to Parliament. Up till now the First Commissioner and the Permanent Commissioner, for the last several years Mr. A. S. Gaye, have apparently had equal powers, and as the one Commissioner is permanent and the other temporary, the former has almost certainly had the controlling voice.

Secondly, Major Elliot announced that the Prime Minister had authorized him to say that a committee of, say, five would be appointed to advise the Minister on such questions.

This Committee, he continued, would not in any way side-track the Royal Fine Art Commission. Perhaps this new committee will not clash with the

Commission, though at a glance it would seem as if the position of that body will become more ambiguous than ever. It remains to be seen who will be chosen for the new Committee, but it is the business of the Carlton House Terrace Defence Committee to see that it is not so constituted that it is merely a sop to public opinion and in reality made up of bureaucrats from Whitehall, who will be inaccessible to the real public opinion and will merely back up the policy of the bureaucrats in the Crown Office.

We do not wish unduly to humiliate the Commissioners of Crown Lands, since our general case has been won, but it must be pointed out that the Carlton House Terrace Defence Committee has no intention of disbanding. It does, in fact, regard itself as a permanent Vigilance Committee for preserving and creating London amenities, and it intends to watch further developments very closely. Public opinion has at last shown that it really does care about fine buildings and amenities and town planning, by presenting a large, united and stalwart front. As *Truth* says in an excellent article this last week, "that so many Londoners are interested in their city is more important than the future of any particular site." The members of the Defence Committee are not only Londoners, they are widespread. They intend to go on being interested, and the battle of No. 4 Carlton Gardens has shown that public opinion, backed up by the Press, carries a very great deal of weight.

The Parliamentary Debate

A FURTHER debate on Carlton House Terrace and Carlton Gardens took place in the House of Commons last week, when Captain Crookshank, a Unionist Member, moved :—"That, in view of the widely-expressed dissatisfaction over the recent decisions of the Commissioners of Crown Lands with regard to 4 Carlton Gardens, and the uneasiness still felt as to the future of Carlton House Terrace, Carlton Gardens, and other Crown lands in London, this House urges the Government to take immediate steps to reorganise the administration of Crown lands, and in particular to secure that in any future decision educated and responsible opinion should be taken fully into consideration."

He said that Carlton House Terrace was a most discreditable episode in the most discreditable story of the Crown Lands Commissioners, but this grave mistake might do some good in the long run if it woke up some Government to the scandalous conduct of affairs by the Crown Lands Commissioners. What was the good of the House dealing with town planning when a Government Department went out of its way to encroach on one of the few parts of London which were adequately planned at the time they were built? The Carlton House Terrace question was a scandal. The Commissioners for Crown Lands should be dealt with and their administration reorganized so that Parliament had a say in the matter, if for no other reason than that the Commissioners had thought fit in their folly to tamper with what was the great processional way of the Empire.

Mr. Molson, who seconded, said that the House was entitled to know exactly in what capacity Sir Reginald Blomfield was charged with the responsibility of submitting plans to the Royal Fine Art Commission.

Sir A. Steel-Maitland declaredthat the erection of the building in progress was a villainous business. He declined to believe that it was too late to have substantial changes made in its height and character.

The Government's reply was entrusted to Major Elliot, the Minister of Agriculture, who made the best of a bad case. He said it was clear that a regrettable misunderstanding had taken place. No recommendation as to the height of the building was submitted by the Royal Fine Art Commission when they gave their approval, as they considered themselves precluded from making any such recommendations at the time. But they had not felt themselves precluded from making recommendations since. It was a pity that no such advice was given. It was true that the Minister (his predecessor, Sir John Gilmour) had decided that the building should be carried up to the full height permitted by the London Building Act, but he, Major Elliot, was certain that if a recommendation had been submitted by a body of the weight and authority of the Royal Fine Art Commission, such recommendation would have received the attention of the Minister. At any rate, it would have placed on him a responsibility which it was difficult to attach to him in the absence of such a recommendation attached to the approval given by the Commission. The Commissioners offered Messrs. Pinchin Johnson accommodation in the house next door at a reduction of the ground rent, but they were unable to accept the offer. On three occasions the matter had been ventilated with the firm. In his anxiety to make sure that no misunderstanding was taking place, he himself approached the firm before the House rose at Christmas, to see if any useful purpose could be served by an interview, but the firm thought no useful purpose could be served. As to compensation, the compensation required was such that it could not be considered. If the negotiations had succeeded, an additional burden would have been put on the taxpayer, who was already being squeezed and ground down. So far as the Commissioners of Crown Lands were concerned, he did not think that further steps could with dignity or usefully have been taken.

The Government intended to accept the motion. They had decided that in future the Minister should be solely responsible for decisions on policy, and should be responsible to Parliament for such decisions. They also proposed that in the future, in any questions involving æsthetic and other important considerations such as town planning, independent advisory opinion should be obtained, and the Prime Minister authorized him to say that a Committee of, say, five members, would be appointed by him to advise the Minister on such questions when they were raised. This would be an *ad hoc* body, and was not intended to sidetrack the Royal Fine Art Commission, whose advice had been sought before. He would be glad to consult with members who had been interested in this matter, and discuss with them interests that might be suitable to be represented on this body. He hoped the House would consider that, with these decisions, the Government had done justice to this important matter.

The motion was agreed to.

On the Air

Mr. Howard Marshall, on Monday next, will continue the B.B.C. series of talks on "Other People's Houses" with "An Eye-witness Account of Existing Conditions in Manchester." The talk will be broadcast in the National programme at 9.20 p.m.

ALLEY OF THE HUNDRED FOUNTAINS

The Villa D'Este, Tivoli, Italy. (Pirro Ligorio). Mr. C. E. Hughes, in a paper on "Garden Design: An Inquiry by a Layman," read at a meeting of the Institute of Landscape Architects, held in London yesterday, pointed out that steps ought not to be hidden away, because people going through a properly-designed garden should be enticed by the design from one part to another, and it should be possible to see at a glance, if not the actual steps, at least the spot where they are likely to be situated.

National Planning

SIR,—If it were necessary to adduce further arguments in support of the setting up of a National Planning Board of the kind adumbrated in my Presidential Address to the Town Planning Institute and discussed at length in the pages of THE ARCHITECTS' JOURNAL, they are to be found in their final and most powerful form in the article which appeared in *The Times* for January 23 under the title of "The Population Trap." In calling attention to the present trends in the growth and distribution of population in this country (and "few things" says the author, "can so accurately be predicted ahead as the trend of human population"), the author states that "some decline in the near future appears inevitable and in certain and not very remote eventualities the drop may be sudden and heavy." He goes on to say that "the effects of this turn in the tide of population must in any case be immense. If some areas are permitted to encourage unplanned growth, such as we have seen in Greater London recently, by attracting population from other parts which are left derelict, the social and economical consequences may well amount to a national catastrophe."

As an example of the new type of situation to be faced, he mentions the decision made by the Manchester Waterworks Committee, a year ago, to postpone indefinitely its Haweswater undertaking, not as a measure of economy but because it was realized that Manchester's demand for water, which had been expected in the next few years to require a great new source of supply, was suddenly ceasing to expand at the anticipated rate. "Unless appropriate measures are quickly taken, many more local authorities, boards of directors and others will find themselves caught in the same unenviable trap. There is a real risk that new housing may be provided, of a type unsuited to the smaller and more adult household which is rapidly replacing the old-fashioned family, and new centres launched, with expensive drains, utility services, roads, schools, libraries, shops and so forth which are doomed never to attract the population they need to justify their existence, or at best to attract it only by ruining rival centres where public and private capital is already irretrievably sunk in providing the same services. If such a process is desirable, it calls for careful planning. Once population approaches stability, competition for it can only lead to losses all round."

"Ultimately," as the author points out, "all human demand is linked to population," and "an authoritative statistical centre to which councils and boards might apply for technical advice when such forward undertakings as the Haweswater project are under consideration might save millions of pounds to the British taxpayer, ratepayer and shareholder."

This is the first essential function that a National Planning Board should perform: the collection, collation and keeping up to date of accurate statistical information, not only in respect of population but concerning all the factors that have to be taken into account in planning for a community that is rapidly reaching, if it has not already reached, the point when it must plan or perish.

Having amassed and digested the necessary data, the Board should produce not a plan but a planning policy, to be applied regionally by regional planning authorities and locally by local authorities, in the form of statutory planning schemes.

Local authorities and regional committees have already done much good work in this direction, but except perhaps in the matter of main road communications, it has lacked any co-ordination from the national standpoint. The growth of individual districts has been planned, but it has been planned without effective consideration being given to any national policy with regard to the fundamental problem of the economic distribution of population and industry. However efficient the platoons may be, they cannot be effective without a plan of campaign.

If, as I think is now generally conceded, a National Planning Policy is urgently required, steps should at once be taken to form a National Planning Board. The Board should, in my view, consist of representatives of all the chief interests concerned; it is impracticable to set out here an exhaustive list, but it will serve to indicate what I have in mind to mention the following: industry, agriculture, commerce, transport, power distribution and public utility services, housing, open spaces, landowners and local authorities.

The National Planning Board could be either an advisory body, as I originally contemplated, or an executive body endowed with the requisite powers not merely to frame a policy but to see that the policy is effectively put into operation through the agency of Regional Committees and Local Authorities. Experience has shown that while advisory planning committees have performed a very useful function they have undoubtedly suffered from a lack of executive powers. On the whole, therefore, I favour an executive National Planning Board. The main thing, however, is that the Board should be constituted as soon and on as broad a basis as possible.

F. LONGSTRETH THOMPSON

SIR,—The Building Industries National Council, so ably described last month in the New Year issue of the JOURNAL, is probably one of the most stimulating facts in the industrial world today. Together with the Central Electricity Board, it marks the beginning of a British Plan which, rightly understood, will effect great changes in our standards of living and also in the whole tone of our industrial relations, with incalculable benefit to both.

This may sound extravagant, but I think it will bear examination. It is the proposed National Planning Board that is so far-reaching. It is now suggested—I believe for the first time in history—that the Building Industry itself shall take a hand, not only in the execution, but also in the planning of a great building programme on the finest possible lines. The Industry itself is to mobilize, for the enrichment of the community, all those vast reserves of technical knowledge, equipment and skill that are at present only partly used. The Industry itself is to create a planning authority—a central Development Board that will turn all this potential wealth into real wealth—the size of the programme being limited only by the available man-power.

It is a very great and unforgettable conception. But as you very rightly observe, it cannot stop there. "Planning for the Building Industry means planning for all industries." In pushing forward our National Planning Board, therefore, we must regard it as a nucleus of something even greater—a National Development Board that will apply the same principle over an ever-widening field and convert what we now call Unemployment Benefit into Reserve Pay with Training. A National Industrial Reserve of Man-

Commission, though at a glance it would seem as if the position of that body will become more ambiguous than ever. It remains to be seen who will be chosen for the new Committee, but it is the business of the Carlton House Terrace Defence Committee to see that it is not so constituted that it is merely a sop to public opinion and in reality made up of bureaucrats from Whitehall, who will be inaccessible to the real public opinion and will merely back up the policy of the bureaucrats in the Crown Office.

We do not wish unduly to humiliate the Commissioners of Crown Lands, since our general case has been won, but it must be pointed out that the Carlton House Terrace Defence Committee has no intention of disbanding. It does, in fact, regard itself as a permanent Vigilance Committee for preserving and creating London amenities, and it intends to watch further developments very closely. Public opinion has at last shown that it really does care about fine buildings and amenities and town planning, by presenting a large, united and stalwart front. As *Truth* says in an excellent article this last week, "that so many Londoners are interested in their city is more important than the future of any particular site." The members of the Defence Committee are not only Londoners, they are widespread. They intend to go on being interested, and the battle of No. 4 Carlton Gardens has shown that public opinion, backed up by the Press, carries a very great deal of weight.

The Parliamentary Debate

A FURTHER debate on Carlton House Terrace and Carlton Gardens took place in the House of Commons last week, when Captain Crookshank, a Unionist Member, moved :—"That, in view of the widely-expressed dissatisfaction over the recent decisions of the Commissioners of Crown Lands with regard to 4 Carlton Gardens, and the uneasiness still felt as to the future of Carlton House Terrace, Carlton Gardens, and other Crown lands in London, this House urges the Government to take immediate steps to reorganise the administration of Crown lands, and in particular to secure that in any future decision educated and responsible opinion should be taken fully into consideration."

He said that Carlton House Terrace was a most discreditable episode in the most discreditable story of the Crown Lands Commissioners, but this grave mistake might do some good in the long run if it woke up some Government to the scandalous conduct of affairs by the Crown Lands Commissioners. What was the good of the House dealing with town planning when a Government Department went out of its way to encroach on one of the few parts of London which were adequately planned at the time they were built? The Carlton House Terrace question was a scandal. The Commissioners for Crown Lands should be dealt with and their administration reorganized so that Parliament had a say in the matter, if for no other reason than that the Commissioners had thought fit in their folly to tamper with what was the great processional way of the Empire.

Mr. Molson, who seconded, said that the House was entitled to know exactly in what capacity Sir Reginald Blomfield was charged with the responsibility of submitting plans to the Royal Fine Art Commission.

Sir A. Steel-Maitland declaredthat the erection of the building in progress was a villainous business. He declined to believe that it was too late to have substantial changes made in its height and character.

The Government's reply was entrusted to Major Elliot, the Minister of Agriculture, who made the best of a bad case. He said it was clear that a regrettable misunderstanding had taken place. No recommendation as to the height of the building was submitted by the Royal Fine Art Commission when they gave their approval, as they considered themselves precluded from making any such recommendations at the time. But they had not felt themselves precluded from making recommendations since. It was a pity that no such advice was given. F. LONGSTRETH THOMPSON

SIR,—The Building Industries National Council, so ably described last month in the New Year issue of the JOURNAL, is probably one of the most stimulating facts in the industrial world today. Together with the Central Electricity Board, it marks the beginning of a British Plan which, rightly understood, will effect great changes in our standards of living and also in the whole tone of our industrial relations, with incalculable benefit to both.

This may sound extravagant, but I think it will bear examination. It is the proposed National Planning Board that is so far-reaching. It is now suggested—I believe for the first time in history—that the Building Industry itself shall take a hand, not only in the execution, but also in the planning of a great building programme on the finest possible lines. The Industry itself is to mobilize, for the enrichment of the community, all those vast reserves of technical knowledge, equipment and skill that are at present only partly used. The Industry itself is to create a planning authority—a central Development Board that will turn all this potential wealth into real wealth—the size of the programme being limited only by the available man-power.

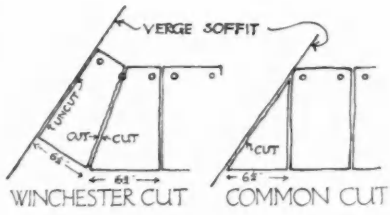
It is a very great and unforgettable conception. But as you very rightly observe, it cannot stop there. "Planning for the Building Industry means planning for all industries." In pushing forward our National Planning Board, therefore, we must regard it as a nucleus of something even greater—a National Development Board that will apply the same principle over an ever-widening field and convert what we now call Unemployment Benefit into Reserve Pay with Training. A National Industrial Reserve of Man-

power, with adequate pay and free training, enrolled voluntarily by a National Development Board, responsible to organized industry, is, I believe, the essential background that will lift the fear of unemployment and make swift development possible.

So long as that fear remains the trade unions will very rightly hesitate to double or treble their membership. Its removal, however, will not only make this possible but will do much to make trade unionism into an even greater constructive force than it is today.

The cost of Reserve Pay can be met, as the "Dole" is now, partly by a levy on earnings and partly by State subvention, but I believe it will convert a heavy tax into a most remunerative investment. It is urgently overdue and the coming review of the whole question of unemployment insurance makes it most opportune.

One vital point remains—the source of Development Finance. We shall probably be told that loans will not meet the case because our reserves of capital are insufficient to employ our man-power. I do not think this should deter us. Our National Development Board will soon realize that the creation of new wealth through the utilization of Reserve Man-power can very fairly be met by the issue of new currency in exchange for it—with a ten-year sinking fund to cancel it. This is only a modern adaptation of the famous Guernsey plan of a century ago. I believe that with courageous leadership something on these lines would now be possible.



It is not the first time that the Building Industry has given a great lead—and I do not think it will be the last.

MALCOLM SPARKES

The Winchester Cut

SIR,—If your correspondent, Mr. Fagg, likes to refer to my book, *Little Things that Matter*, he will find therein what I hope is a clear description of the Winchester Cut, with reasons for its occurrence and precise directions for application. Even earlier, in an article in THE ARCHITECTS' JOURNAL some years before the war, I described this practice, which is virtually confined to Winchester in old work, but is now embodied in general good practice in tile-hanging.

To anyone not anxious to pursue the matter further it may be briefly described as a system which, by cutting *two* tiles in each course running out beneath a verge so as to retain one nail hole, gives each tile positive fixing in place of the common alternative in which the last tile against the verge

consists of a triangular piece which can only be fixed by adhesion to cement.

The tipped-up course-lines produced also make an agreeable finish. The enclosed rough sketches may make the matter plain.

EDWIN GUNN

SIR,—In reply to the enquiry in your current issue by Mr. Ernest W. Fagg, asking what is the "Winchester Cut," I enclose a photograph of a weather-tiled gable in Southgate Street, Winchester, which illustrates this treatment. This illustration is drawn from my book on *Building Craftsmanship in Brick, Tile and in Stone Slates*. But I think the first publication of the method was by Mr. E. S. Gunn in *Little Things that Matter to Those who Build*. In both these works are many devices not to be found in textbooks, most of which merely repeat the bad details of forty years ago.

NATHANIEL LLOYD

Economy

SIR,—Yesterday I had to spend some time in the train, so popped Cobbett's *Cottage Economy* into my pocket to read during the journey. This, as you know, was written in 1821, when times were bad, and economy much to the fore. In the Introduction Cobbett says:

> The word *Economy*, like a great many others has, in its application, been very much abused. It is generally used as if it meant parsimony, stinginess, or niggardliness; and, at best, merely the refraining from expending money. Hence misers and close-fisted men disguise their propensity and conduct under the name *Economy*; whereas the most liberal disposition, a disposition precisely the contrary of that of the miser, is perfectly consistent with economy. Economy means *management*, and nothing more.

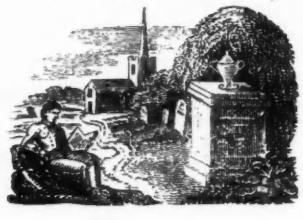
Now that is first-rate stuff, but unfortunately it does not hold much hope for us, because we are, as a nation, parsimonious, stingy and niggardly, and we have not the foggiest idea of what is meant by management or planning. We can cut shillings off wages, and reduce the spending power of the people. We can destroy Carlton House Terrace; but we cannot make any plan for its general rebuilding—and the Terrace is only one example.

In last week's JOURNAL you quote Prof. Reilly as having stated that "Liverpool, as an orderly, efficient town, is a disgrace to England, second only to Manchester," and this notwithstanding the fact that they have a first-rate Director of Housing. Unfortunately this gentleman deals with Management, or Planning, and the City Fathers of Liverpool apparently do not know the meaning of the word.

Which brings me to the pet bee which inhabits my bonnet—Education, and not the Education of the Architect, but the Education of the client. I think you, with your Carlton House Terrace campaign, have done more in a few months in the way of educating the public in architectural principles than has been achieved in many past years. I hope you will continue.

C. H. B. QUENNELL

Information Sheets



SIR,—While I wish to join heartily in the congratulations being bestowed on your publication of these Sheets, I do most strongly protest against the general tendency of today (as shown by your notes on the back of No. 3) to assume that we are a nation afflicted with a very bad inferiority complex while every other nation appears to be held up as a superior example.

It may interest you to know that as long ago as 1903 I prepared a series of similar Information Sheets, but in moving my office they were destroyed, having become torn, dirty and thoroughly worn out.

At the same time I also made a complete set of "cut-outs" to half-inch scale for rapid use.

GILBERT T. GARDNER

[Owing to the pressure on our space we are compelled to hold over several letters from this issue.—ED., *A.J.*]

THE INAUGURAL MEETING OF THE COUNCIL WAS HELD ON FEB. 9

THE BUILDING INDUSTRIES *NATIONAL COUNCIL*

A CALL FOR ACTION

[By Dr. William A. Robson]

The establishment of the Building Industries National Council and the proposal to set up a National Housing Board indicate that the Building Industry is in process of developing a sense of social responsibility and becoming aware of its great importance in the scheme of national affairs. This is an event of very considerable significance not merely to the Industry itself, but to the whole community.

A COMPARISON WITH THE MEDICAL PROFESSION

A CERTAIN comparison may be drawn with the Building Industry and the Medical Profession. The Medical Profession grew up during long centuries on the basis of a series of isolated transactions between the individual consumer—the patient—and the private practitioner. With the rise of preventive medicine the Medical Profession and the suppliers of drugs and similar commodities came to participate in a great collectively-provided public health service, and the outlook and conscience of the Medical Profession has to a considerable extent become transformed.

It would be a hypocritical evasion of an obvious fact not to regret that the Building Industry did not become more aware of its creative opportunities and ultimate responsibilities at an earlier date, before the policy of contractionism from which we are now suffering, was put into operation in all its full disastrous force. I say frankly that it is an infinite pity that during the piping times of the past decade architects and builders and manufacturers of materials should have been content to accept orders for a couple of million houses, built largely out of public funds, and put the profits in their pockets, without any real attempt to direct creatively this immense public effort. It may be said that it was not their business to do so ; but it was certainly as much their business then as it is now, assuming, as I do, that the present movement has wider and higher objects than the restoration of prosperity to the Industry.

PLANNING AND EXECUTION : THE DISTINCTION

So much for the past. Now as to the present and the future. The first thing which I suggest requires consideration is the desirability of recognizing the distinction between planning or designing on the one hand and execution or operation on the other. The architect's profession is a monument to that distinction.

A great deal of the success of the National Electricity Scheme is due to the fact that there are two distinct but co-ordinated bodies charged with these separate functions : the Electricity Commission draws up the schemes while the Central Electricity Board carries the schemes into operation after it has adopted them. There is an excellent proposal on foot that a National Housing Board should be set up as a public service corporation to co-ordinate and promote the building of houses of certain kinds and the reconditioning or improvement of others, and to undertake similar tasks. This project should not be allowed to obscure or to interfere with the separate but related question of establishing a National Planning Board or Commission. The functions of the two bodies do not overlap ; they are complementary.

TEN MISDIRECTED YEARS

Anyone who looks at the broad results of our industrial and housing development of the past ten years can see how absurdly misdirected, or perhaps one should say undirected, the whole thing has been in the larger sense. At least three of our most important industrial areas have been declining to the point of becoming almost derelict—Lancashire, the North-East coast, and South Wales—and, instead of endeavouring to reconstruct those areas so as to adapt them and make them more attractive to new industries, we have virtually accepted the assumption that where a town is dependant on a certain industry, such as coal or cotton, and that industry fails, the town should be abandoned and the whole population permitted or expected to migrate elsewhere.

In consequence, we have on the one hand the spectacle of the frightful waste involved in abandoning the capital equipment of the older industries in these areas ; of ceasing to make proper use of the roads, houses, schools, hospitals and other social institutions in these areas ; of allowing industry to wander away from districts which are magnificently equipped with regard to power, fuel, transport, coal supplies, access to the sea, skilled and intelligent workpeople of both sexes.

On the other hand we are confronted with the Morris Motor Works destroying the amenities of the most beautiful city in England ; with new factories employing 150,000 persons (involving a population of 400,000) being set up in the London region and intensifying the fantastic congestion of population in and round the Metropolis ; with vast areas of the countryside in the South being more or less spoilt by the setting up of new industries in totally undeveloped areas.

Of course, the individual manufacturer or *entrepreneur* may claim that it is cheaper for him to plant a factory in the middle of a field and then to demand from the local authorities housing for his workers, roads for his lorries, schools for the children of his workers, hospitals, public utilities and all the rest rather than to go to an area where these facilities already exist. It may be cheaper for him, but that is simply because the social cost involved by such a maldistribution of resources and

efforts is borne by a large number of other persons—ratepayers and taxpayers. The essence of planning on a national scale is, while retaining competition, to get social costs of this kind introduced in some way or other into the individual costs of the particular enterprise which incurs them. The great conflict which has been going on between the Railways and the Motor Transport Industry in this and other countries, resolves itself at bottom into a claim by the railways—largely recognized by the Salter Report—that their competitors on the roads shall be made to bear a large share of the costs involved in providing and maintaining the highways, which have previously been borne by the community at large.

THE NATIONAL SCOPE OF HOUSING

Readers of THE ARCHITECTS' JOURNAL may think that I am wandering a long way away from the question which is of immediate interest to them, namely, the setting up of a National Board for the planning or organization of housing activities. But the point I am seeking to make is that it is absurd and futile to attempt to consider housing as an isolated service.

Any plan that is worth the paper it is written on must have regard to the possible or probable future trends of industry. It must consider housing in relation to the essentially connected services of transport, highways and public utilities.

These four services are indeed the foundations on which a national plan ought to rest, for they are the links in the chain which binds together the home and the place of work. Again, since housing, on its residential side, concerns the home, that gives rise to a series of considerations relating to social services centreing round the family, such as public health, education and civic amenities. These in turn are of definite concern to the Building Industry in that they involve hospitals, sanitoria, schools, colleges, public libraries and so forth. One could enlarge upon this method of approach at considerable length, but I am only concerned to emphasize the necessity, on the planning side, of considering housing in relation to all the other manifold interests and activities with which it is indissolubly connected.

A planning body must consist, accordingly, to a considerable extent of persons who are able and willing to look at these interlocking activities with "a single eye"; the nearest approach we have at present to a comprehensive outlook is to be found in the more progressive Local Authorities, save that their concern is, as the name implies, local rather than national. Despite this serious limitation of scale I suggest that those who are concerned in the matter should very definitely endeavour to bring the local government element into active co-operation. Local Authorities have their defects, but they do not suffer from the "compartmentalism" of the Central Government Departments.

THE NATIONAL HOUSING BOARD'S FIRST TASKS

When one comes to carrying the plan into operation on its housing side, then will come the time for the specialization and predominance of the Building Industry. It will be an excellent thing if the National Housing Board is set up at an early stage and commences some of the obvious and inevitable tasks which it could undertake. There is no need to wait for the formulation of a complete plan.

When the Planning Commission has indicated large *new* developments which depend upon comprehensive planning the Board will be there with, one hopes, a record of good work already achieved, ready to take up its more responsible task.

THE COUNCIL'S INAUGURAL MEETING

A COMPREHENSIVE ORGANIZATION

THE inaugural meeting of the First Members of the Building Industries National Council was held on Thursday afternoon last at the Royal Institute of British Architects under the presidency of Sir Raymond Unwin, P.R.I.B.A.

The First Members who have been appointed by the respective associated bodies are :—

Royal Institute of British Architects
Sir Raymond Unwin,
Sydney Tatchell,
Howard Robertson,
Maurice E. Webb.

Chartered Surveyors' Institution
J. M. Theobald, Oswald Healing,
E. C. Harris, C. H. Bedells.

National Federation of Building Trades Operatives
T. Barron, J. W. Stephenson,
G. Elmer, R. Coppock.

National Federation of Building Trades Employers
J. H. Barker, H. T. Holloway,
W. H. Forsdike, I. Ernest Jones.

Reinforced Concrete Association
R. Chate.

Building Materials Manufacturers' and Suppliers' Committee
Halliday, C. Rogers,
Lt.-Colonel C. W. D. Rowe,
H. J. C. Johnston.

The constitution, as formally drafted by Counsel, was submitted by Mr. Sydney Tatchell, V.-P.R.I.B.A. (Chairman of the Organization and Drafting Committee), and was adopted unanimously.

In proposing its adoption, Mr. Tatchell outlined the objects and functions of the Council as follows :—

The objects of the council shall be to initiate, supervize and provide a medium for co-operative action and common effort on the part of appropriate bodies and organizations, which is likely to conduce to the advancement and welfare of the Building and Constructional Group of Industries generally, and as a whole, for the purpose of maintaining the industry as an efficient unit in the economic structure of the country, capable of providing employment and a means of livelihood for a substantial part of the population.

The constitution was unanimously adopted, and the following Office Bearers of the Council were subsequently appointed :—

President
Sir Raymond Unwin.

Senior Vice-President
Sydney Tatchell.

Junior Vice-Presidents
J. H. Barker, T. Barron, J.P.,
H. J. C. Johnston, Maurice E. Webb.

Hon. Secretary
I. Ernest Jones.

Secretary
H. B. Bryant.

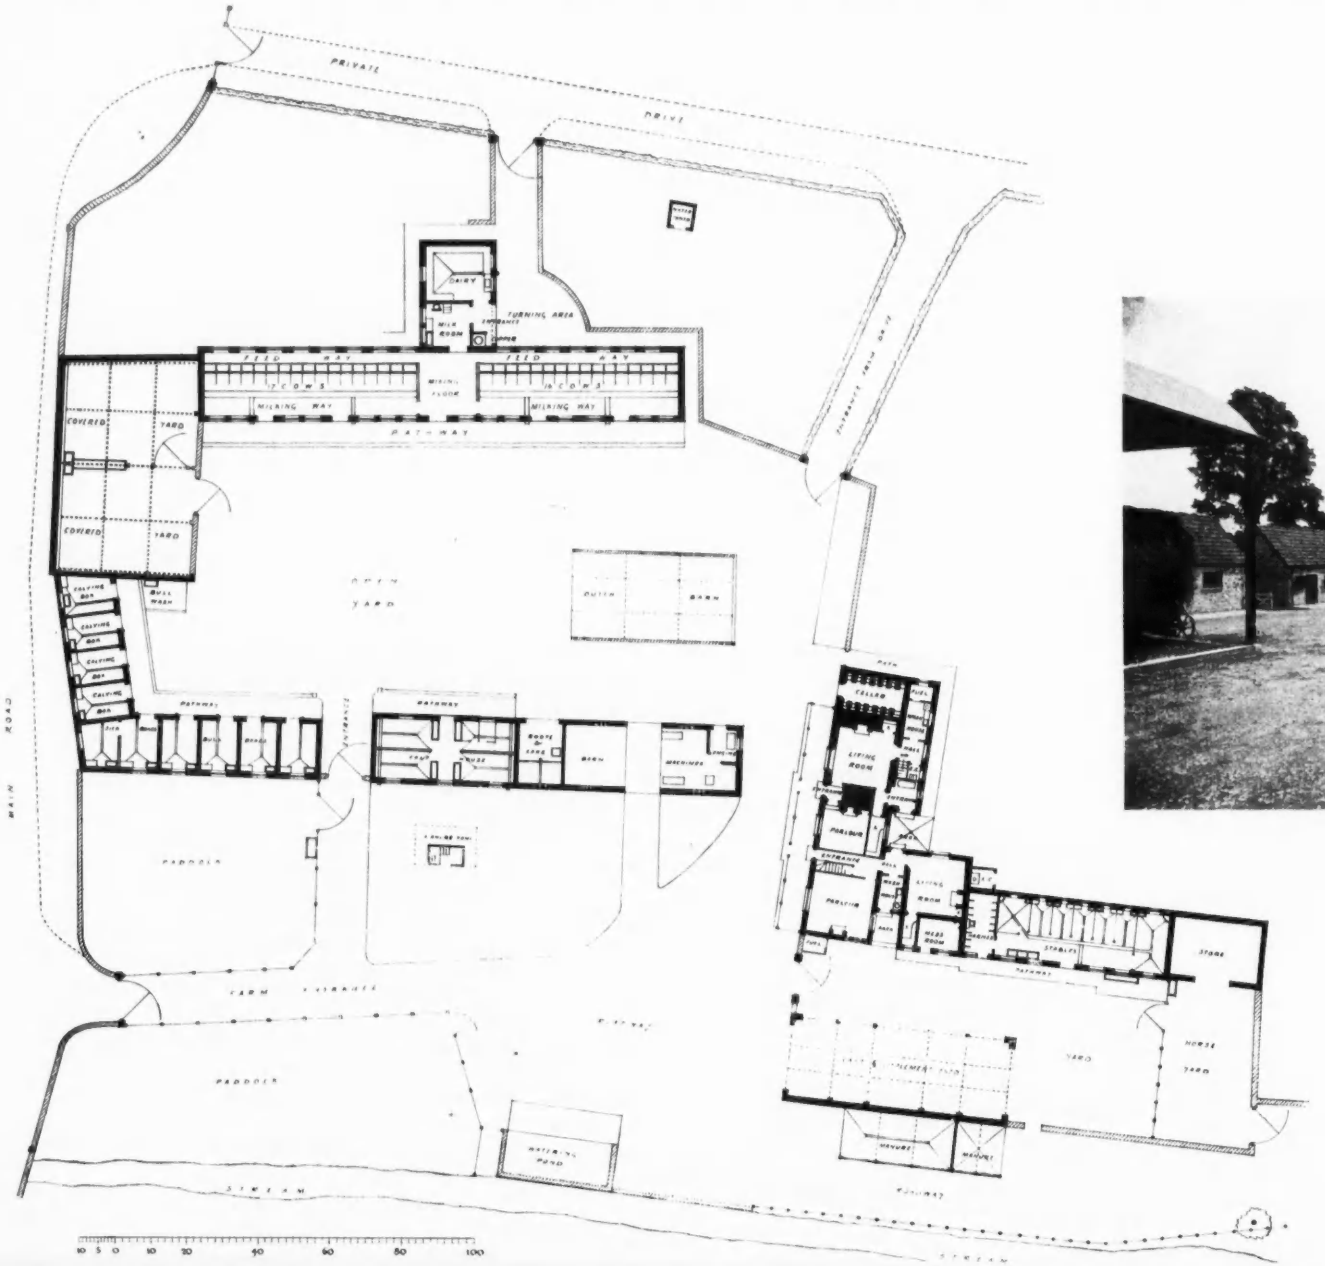
Patrons :
Lord Amulree, K.C. ; and Alfred C. Bossom, M.P., F.R.I.B.A., were invited and agreed to become Patrons of the Council.

Sir Raymond Unwin, addressing the Council as its first President, said that the occasion of the bringing into being of the Council was a memorable one, and one that might well become important in the industrial history of the country.

The Council would be the instrument not only of the industry, but of the nation as a whole. The effective co-ordination of industrial effort over the widest possible field was probably the nation's greatest need at the present time.

There were tremendous possibilities before the industry, chiefly that of industrial reconstruction and the task of housing and slum clearance. These great tasks could only be undertaken to the best advantage by an industry united upon all matters of common interest, but with the numerous sections of the industry still free to develop themselves upon the lines of progressive advance in technique, science and practice.

MILK FARM: BY THEOBALD AND SKURRAY



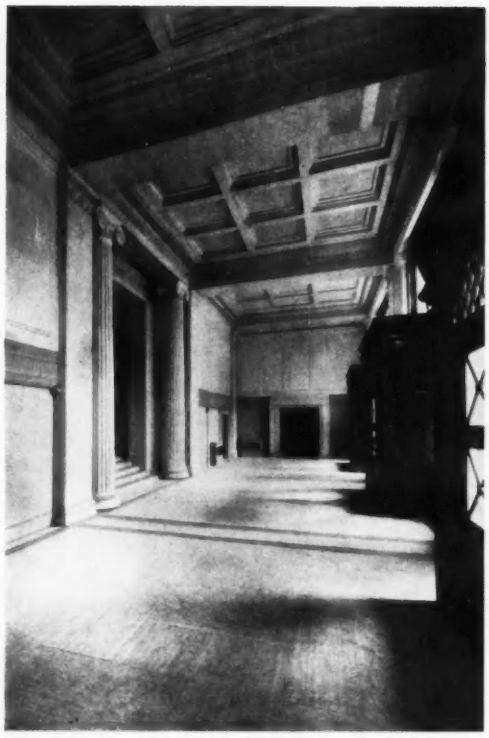
The new owner of The Home Farm, Leweston Manor, Sherborne, Dorset, was anxious to house his pedigree herd of Guernsey cattle there, but as is so often the case, the old farm buildings were found totally unfit for a modern dairy herd, and it was decided to adapt the existing buildings for the production of grade "A" milk.

A new cow byre was built on the site of the old one, to house 33 cows, and off this the milk room and dairy were planned. The old yard was cleared of all rubbish, manure, pig-styes and stacks, and laid to proper falls, surfaced with granite and granite chippings. A covered yard, for stock during the winter, is situated at one end; opposite the cow house run a line of calving boxes, calf houses and bull boxes. The old stables have been converted into a calf house at one end and a machine and food-mixing department at the other. All liquid manure is collected from the cow byre and boxes and taken by a drainage system to the manure tank. From this tank it is pumped out and taken on the land for manuring purposes. A covered manure yard has also been provided behind the cart shed for all solid manure; here the manure "makes" and rots for future use on the land. Under the yard is a tank in which is collected the liquid from the rotting manure. The old barn behind the farmhouse has been converted into stables, and a new cart and implement shed erected opposite. Small paddocks and yards have been made for exercising the animals and for showing purposes.

By having the cows entirely separate from the horses, the milk taken away by a drive separate from that leading to the main buildings, and by keeping the bulls and calving cows separate, efficiency is added to the farm. The cow house is fitted up with tubular fittings and collars, with automatic drinking bowls, while a special cork and bitumen brick has been used for the standing room. This brick has been found very beneficial, being cool in summer and warm in winter. It has none of the sweating effects of concrete which are so harmful to the cows' udders. Tubular fittings have also been employed in the calf house, illustrated above, which has been divided into general small pens for calves of different ages. The boxes have ordinary mangers and low hay-racks at opposite corners and the floors are concrete, grooved and laid to fall with a central channel. Concrete has been used in this instance as an ample bed of straw is always provided.

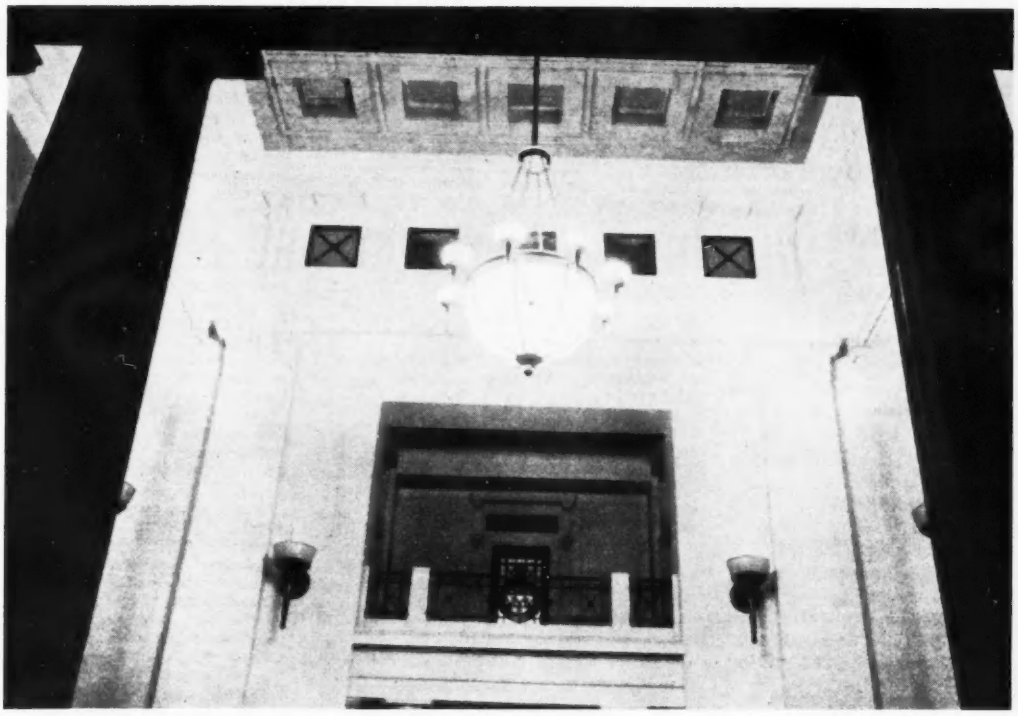
"GRADE A" MILK FARM AT SHERBORNE, DORSET: BY THEOBALD AND SKURRAY

THE HOME FARM, LEWESTON MANOR

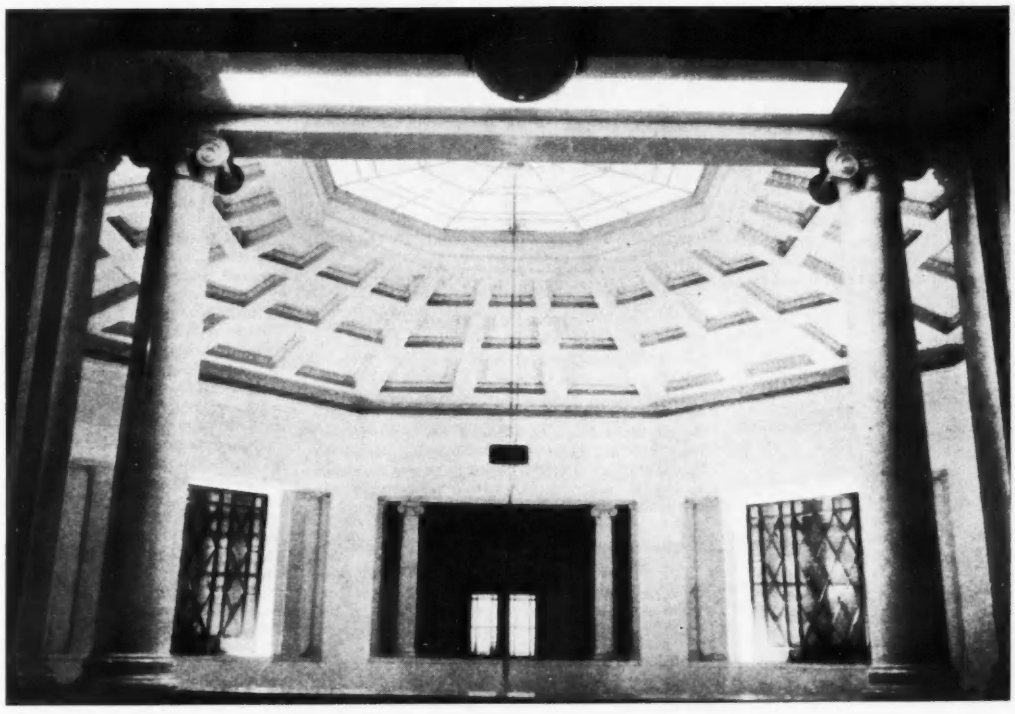


The above view is of the yard, taken from near the gateway of the entrance drive. On the right is the cow house, with, beyond, a divided covered yard. On the left is a corner of the Dutch barn, behind which are the ranges of bull boxes and calving boxes.

The interior of the cowhouse, from the milking way; the feed way runs parallel to it the other side. The fittings are tubular.



VICTORIA HOUSE, LONDON, W.C.:



DESIGNED BY CHARLES W. LONG

This building was primarily designed to serve as headquarter offices for an insurance undertaking—the Liverpool Victoria Friendly Society—but it includes, as disclosed by the plans of the main and lower ground floors, reproduced in a supplement with this issue, facilities of a semi-social order; while, along the Southampton Row front run a series of shops on either side of the central entrance. This entrance appears in the photograph of the exterior on the facing page, below which are shown a view inside the main entrance vestibule, and an exit, in black marble, from one of the halls on the lower ground floor.

On this page are seen, in diminishing perspective, the upper portions of the public hall, with its ceiling of Siena marble, and of the octagonal hall in the claims department, with its ceiling coffered in plaster around the central top light.

THE PLANNING ACT AND THE COUNTRYSIDE

[*By PROFESSOR PATRICK ABERCROMBIE**]

I INTEND to put forward an actual example of a Country Planning Scheme; and, without undue optimism, to attempt to show that a good deal can be done with present powers (i.e., The Town and Country Planning Act) so far as their application can be judged, without the Model Clauses before us.

IN THE COUNTY OF LOAMSHIRE

I have taken the county of Loamshire, which is familiar to us all, and is fairly typical, in that its problem is not mainly an urban one.

Furthermore it happens that the two chief towns in the county, Bulcaster and Colonelton, have already prepared preliminary statements under the 1925 Act (but with an eye to easy transference in one or two directions into the new Act): Bulcaster being the historic county town, Roman-planned and mediæval-cathedraled, and Colonelton being the attractive residential asylum of elderly Anglo-Indians and others who are usually to be found in retirement playing golf by day and bridge by night, on a gravel subsoil. There is also a somewhat scattered manufacturing area, known from its chief centre, Churt, famous for its home-spun, which has decided to prepare a joint scheme; these three contiguous areas, each including a good deal of open country, embrace what might be called the urban aspect of the country, and I am going to omit them from the picture except in so far as they affect the adjacent remainder of the county.

I am going to make, also, the assumption that under Clause 6 (2) (*b*) the whole of the county has been approved as suitable for a Planning Scheme. It might prove a useful subject of discussion as to what land was and what was not likely to satisfy the Minister under this clause: but as that seems to imply an intimate knowledge of the rural psychology of the Minister of Health, I do not feel capable of attempting it. I am further going to assume that a Planning Scheme is to be prepared by a joint committee consisting of the Urban Districts and the County Council, to whom the Rural Districts have relinquished their powers. The Rural District Councils, however, have been given direct representation through co-option, which also enables the Committee to have representatives of the Land Owners, Farmers, C.P.R.E., etc. In order also to make for simplicity of procedure, the whole of the county (with the exception of the three areas of Town Planning Schemes) is to be taken as a single scheme for the purpose of preparing rapidly and effectively a skeleton plan, which will direct and protect the whole area. The Committee earnestly hope the Ministry will not require 25 inch scale maps for such an outline scheme, the cost of these maps being about ten times as much as the cost of a similar area of freehold land. As regards roads, I am hardly going to mention them. The County Surveyor, an able engineer and a tactful man, has these well in hand; his epoch of construction being temporarily suspended, he is proposing to safeguard the routes of several bye-passes and a major river crossing by means of this Country Planning Scheme. In Loamshire, too, there is no antagonism between the one county borough and the county: I hope there is as much co-operation in every county of England and Wales.

FIVE GENERAL PRINCIPLES

It is possible to distinguish, among a mass of suggestions, five broad methods for dealing with the major country problem, of where to build and where to farm (which I prefer to the more usual "where to build and where to refrain from building"). The real difficulty, as we all know, is one of ownership: the plan, to be efficient, cannot primarily concern itself with the freaks of ownership.

The *first method* is therefore *Land Nationalization*, a simple and heroic measure which some would carry out by a stroke of the pen.

The *second method* is the *German* one by which no one has a right to build unless he is given a permit to do so; by this means land is released for building in suitable blocks as planning and public services are ready for it.

The *third* is known as the *Pooling* of increment value. The basis is that the owners should co-operate in a mutual arrangement to the effect that the possessor of the land who is deprived of building value shall be reimbursed from the receipts of the land that is developed.

The *fourth method* is founded upon the principle of *Compensation and Betterment* contained in all the Town Planning Acts that have been in operation in this country: but it aims at a more positive application. It is suggested that when the plan is made everyone whose land is deprived of building should be compensated from a fund, kept strictly for local purposes: this fund is collected on the *realization* of the increased value on the building areas: in other words when land is ripe for development and can be sold by the owner for building, it must pay a betterment tax.

The *fifth* has been called the *Temporary Agricultural Reservation Method*: by this, development is only allowed to proceed upon certain specified conditions: the method does not crystallize out into a *plan* as soon as in the last two methods, but it seeks to obtain control before it is known what the detailed planning requirements will be, and to provide for growth by stages according as a case is made out for the *need* for that growth. It is form of time zoning and is a mild approach towards the German permissive method.

As this method appears in the Town and Country Planning Act under Clause 15 and 16, the reservation is of a negative sort—it is merely pending the change into building land and a transference to normal building densities of portions at a time or even of the whole. Before this takes place, individual building may be allowed; this is not to be refused unless the authority is convinced upon three heads, that (i) equally suitable and reasonable (in price) land is obtainable elsewhere: (ii) the building would not involve danger or injury to health by reason of lack of roads, sewers, water supply or any public services, and that the provision of the services would be premature or likely to involve excessive expenditure of public money; (iii) that the operations would be likely seriously to injure the amenity of the locality. In other words it is for the Public Authority to make out a case *against* building and not for the builder to make out his case *for* it.

Alas, there is one ominous phrase in Clause 15 which casts a blight over this expansive scene: every third year the responsible authority must take into consideration the desirability of making a General Development Order for *all the land* in this temporary agricultural reservation! This is temporary with a vengeance: every remote acre of Loamshire to be solemnly revised every third year.

FOUR MAIN AREAS

It is proposed, therefore, to divide up the County of Loamshire into four main types of area, in addition, of course, to the three large planning schemes which have been already mentioned. These four areas, be it noted, represent a very simple type of zoning:

(1) A General Building Zone.

(2) A Permanently Building-prohibited Reservation.

(3) A Temporary Agricultural Reservation.

(4) An Agricultural Zone.

Of these, the first and second represent the two extremes; the third and fourth are the intermediates.

GENERAL BUILDING ZONES

In considering a county such as this it will be found that the building zones group themselves under four headings. In the first place there are two small towns, Casterbury and Tellbridge, which at any moment may require to have detailed planning schemes prepared for them. It is, however, considered to be an advantage to include them under the general regional powers. To begin with, in one of them most of the ownership is in the hands of two people both looking after their estates and developing them with great care. This happy state of affairs however, might at any moment cease through, shall we say, the death of one of the owners, so that the Regional authority must be prepared for more detailed control. Here is a case for a supplementary scheme to be prepared in the future under Section 9.

Next in importance to these two towns, Casterbury and Tellbridge, there are a number of what might be called market villages. These form each the little sun of a local constellation of satellite farming villages, and are consequently more likely to grow. Each of them has not yet its cinema, but probably it soon will have, and

* *Summary of some points made in a paper entitled "The Town and Country Planning Act and the Countryside," read by the author at the meeting of the Town Planning Institute at Caxton Hall, S.W., on February 10.*

if there is a regeneration of rural life, here are foci for definite expansion. They may also exhibit some satellite growth from the towns or the larger cities of the Midlands.

There are next the villages, which in this particular region are highly-grouped entities, in the north-west portion, and rather more straggling and scattered south-east of the river. As a result of a very careful scrutiny, some of these have been found suitable for growth, others less so, and some quite undesirable. It is largely a question of situation, cheapness in the provision of water and drainage, etc. They have, consequently, been separated into two rough groups; those which are shown as developing areas, and those which are left in a static condition.

The market villages and the developing villages are given an area, including their existing size, of the building zone, with a margin sufficient for five years' growth. Building on a general regionally agreed density will be permitted in these building zones, the buildings, of course, having to conform to normal requirements as to lay-out and appearance.

TEMPORARY AGRICULTURAL RESERVATIONS

Those localities which appear to require more elbow room for their growth, are given a considerable extent of temporary agricultural reservation surrounding them. This refers more particularly to the towns Casterbury and Tellbridge, and to the market villages. In selecting these temporary reservations, care has been taken to see that they can eventually be provided with services.

In one part of the area several villages appear rather close together, strung along a main road. It is a debatable question as to whether they should be connected up with this T.A.R. Fortunately, most of the main roads hereabouts, having a strong Roman origin, are very free from having villages upon them, but there are other parts of the country where the reverse is the case. The T.A.R., unless it is very thoroughly administered, gives a hint of an ultimate complete building up of the road frontage, even though it does definitely indicate that this will be allowed by beginning at the village ends first.

I leave this fascinating subject of the new T.A.R., which is one of the most interesting and valuable features of the new Act, and proceed to the opposite extreme, namely, land which is considered to be unsuitable for building, and so is permanently reserved.

PERMANENTLY BUILDING-PROHIBITED RESERVATIONS

Here two types of area have been scheduled; low lying land and a small area which is so elevated that it would be impossible to supply it with water.

AGRICULTURAL ZONES

There now remains the largest area of land in the whole scheme to be dealt with, which for the moment is called the Agricultural Zone, and which lies, therefore, between the extremes of the building land, and the T.A.R., which under certain circumstances may be converted into building land, and on the other hand, the Permanent Prohibited Reservation. This is the most difficult problem before the rural planner at the moment.

This area represents a zone under a permanent restriction (not a prohibition—the new Act includes both) and the utmost of this restricted building that should be allowed, would be, to use Mr. Pepler's words, "sufficiently sparse in character, that danger or injury to health would not be involved by reason of the lack of services." At present the Minister, under the 1925 *Town* Planning Act, has limited a general density for such an area to one house in three acres, regarding this as a minimum. Under a Town and *Country* Planning Act, with a definite power for prohibiting building operations (Section 12), and withholding compensation for such, Section 19 (1) *(e)** under very wide conditions, the Minister will find himself in a strong position to allow a much lower average density, especially as under the T.A.R., wide areas have been scheduled for possible development. In a word, I maintain that there is very little building value left in this agricultural zone when it has been properly worked over, so that suitable building sites are zoned apart from it.

I could have wished that Clause 16 was applicable not only to T.A.R., but to a permanent restricted area, for it seems to me that the machinery of this clause is quite admirable, if firmly administered. It allows for any type of individual building in any place to be considered on its real merits: hardship is avoided by the necessity of the Local Authority satisfying themselves that other land is available on reasonable terms if they refuse an application and the public have the excellent safeguards of avoiding excessive expenditure or premature provision of services, and also injury to local amenity.

A very simple amendment of the Act could make this clause applicable for permanent restricted land; but, not having this amendment, we are thrown back upon devising some means of arranging for the use of this overall low density, and possibly some additional building, which will still remain so sparse as to come within Mr. Pepler's definition, and also, so as not to create ribbon development.

ARCHITECTURAL GUIDANCE

If the new Act enables the whole area of the scheme to come under adequate architectural guidance, it will have justified itself so far as Loamshire is concerned on that account alone: of such importance is the maintenance of a standard of architectural good manners in a country district and the suppression of hooliganism. For where a great deal of growth is not anticipated, there is all the more reason for concentrating upon the design and materials of each building which may either stand by itself and dominate a wide area or be fitted into an existing group—a village, which has perhaps so far satisfactorily absorbed and maintained examples of the varying types of design practised during 800 years.

It is not so much the extent or technical method of control that the new Act has affected, as the legal administrative machinery; in the first place by extending (as we believe) the scope of the Act to all types of land and in the second by actually and specifically mentioning the "regulation of Design and Exterior Appearance of buildings" (12) (1) (*c*) as matters to be included in the provisions of a scheme. Hitherto we have been working under the vague terms "amenity" and "character."

* *Fortunately (e) is not subject to any of the vexatious provisos that follow in this section.*

LAW REPORT

RIGHT TO DRAINAGE

Gosford Furnishing Co., Ltd. v. *Stone Bros. and Another.—King's Bench Division. Before Lord Wright*

LORD WRIGHT, sitting as an additional judge of the King's Bench Division, had before him an action by Gosford Furnishing Co., Ltd., of 165 Bow Road, against Messrs. Stone Bros., the owners of premises 167a Bow Road, adjoining plaintiff's premises, and Mr. W. Levy, his tenant, for a declaration that the plaintiffs were entitled to a free use of the drain leads from their premises through defendants' premises. The plaintiffs also sought an injunction restraining defendants from interfering with their use of the drain and they alleged trespass and nuisance and asked for damages.

Mr. Harold Simmons appeared for the plaintiffs, and Mr. G. W. Knowles for Stone Bros. Mr. Levy put in no defence.

Mr. Simmons said his case was that the defendants had obstructed his drain, with the result that water and noxious matter had percolated into his premises.

Mr. Knowles said his clients denied that they had obstructed the plaintiffs' drain. The defendants alleged that plaintiffs had used the drain without being entitled to do so and had failed to repair and empty the cess pit. They now counter-claimed for an injunction to restrain excessive use of the drain by the plaintiffs.

For the plaintiffs, evidence was given by an officer of the Poplar Borough Council that the drain was reconstructed in 1929, but it was obstructed in 1931, the obstruction being inside the defendants' premises, and being due to a pipe being run across the drain. The cess pit had been filled up.

For the defence, evidence was called to show that the drain had been completely blocked and that work had been done by the defendants to the drain.

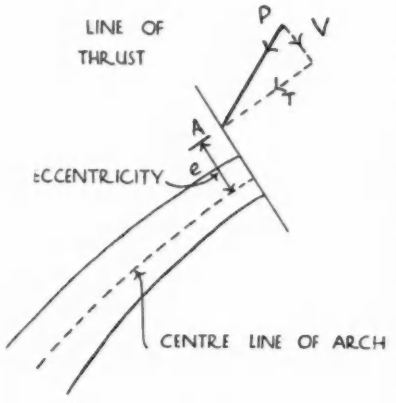
His lordship, after hearing further evidence, gave judgment, and said it appeared that the defendants made a new drain which cut through the drain from the plaintiffs' premises, and that was the cause of all the trouble. Under these circumstances the plaintiffs were entitled to succeed against both defendants. In his view the defendants were also liable for damages for a quantity of water which collected in the plaintiffs' basement, and which he thought came from the premises of the defendants. He referred the question as to the assessment of damages to the official referee.

Dealing with the counter-claim, his lordship took the view that plaintiffs' use of the drain for rainwater had not been to the detriment of the defendants. He therefore awarded them nominal damages of 20 shillings.

Change of Address

Mr. F. E. Towndrow, A.R.I.B.A., Architect, has removed his office to 4 Essex Court, Middle Temple, E.C.4. Telephone: Central 2952.

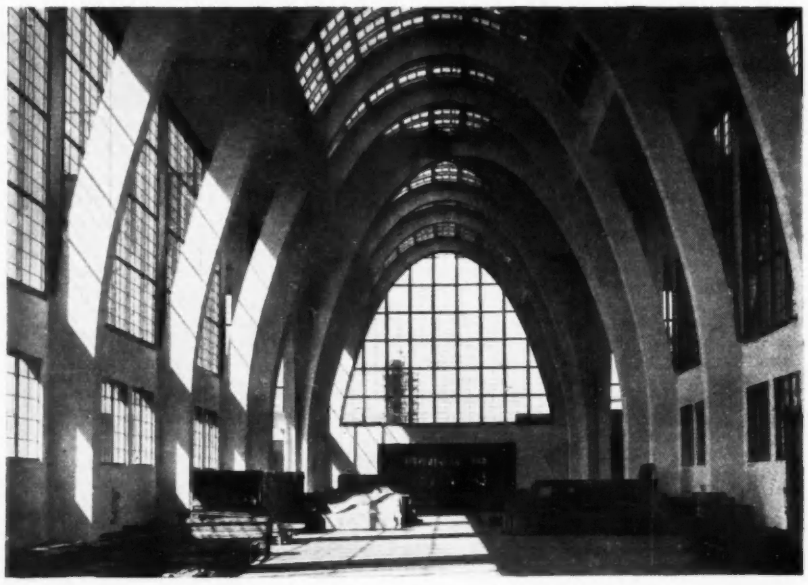
QUESTIONS THAT ARISE



Parabolic Arches

¶ A. B. writes : "*Would your expert please answer the following :—1 : Is there an (or what is the) equation for the curve of the arch or vault that exercises no lateral thrust? 2 : Have the ellipsoidal arches of the Horticultural Hall, Westminster, and the Permanent Exhibition Buildings, Brünn, any peculiar properties?*"

The fundamental difference between a beam and an arch is that while for the beam the reactions are vertical, in an arch the reactions are inclined to the vertical or, in other words, the arch exercises lateral thrust. It is therefore impossible to construct an arch which for any condition of loading does not exert lateral thrust.



The arches of the Horticultural Hall and the Permanent Exhibition Buildings, Brünn, appear to be approximately parabolic in form and not ellipsoidal.

The particular advantage of this form of arch is that with uniform dead load over the whole of the span the line of thrust for the arch follows the centre line of the arch and there is, therefore, no bending moment on the arch. This can be most easily explained by reference to the figure which shows in diagrammatic form he forces acting at any section of an arch ring. P represents the thrust, which is generally inclined to the centre line of the arch and also acts at a point A which is not the centre of gravity of the section. Resolving this force in two directions, across the section and at right angles to it, we have two forces T and V. The force V is the shear across the section and is relatively unimportant. The effect of the force T is the same as that due to a direct thrust equal to T acting at the centre of gravity of the section, causing a uniform stress equal to T/A (where A is the area) over the whole section, and a bending moment of value $T \times e$ acting on the section (compare eccentric loading on stanchions). The maximum stress due to this moment will be Te/Z where Z is the modulus of the section. Therefore, the smaller the eccentricity e the smaller the maximum stress due to bending, and if the eccentricity becomes zero, i.e., the line of thrust coincides with the centre line of the section, the only stress on the section will be that due to the direct thrust T. Hence the advantage of the parabolic arch, although it must be realized that the above condition only holds for this type when it is loaded over the whole of its span with a uniform load, and that while this condition of loading is often the most important, it cannot be guaranteed to exist always, and in addition to possible lack of symmetry of loading the effect of wind pressure must also be considered.

When the load per foot increases from the centre of the span to the springing as, for example, in a bridge with solid filled spandrels, the line of thrust becomes more ellipsoidal than parabolic and for this condition the ellipsoidal form would be more economical.

W. E. J. B.

A typical example of parabolic arches : The Klavinho Palace at the Permanent Exhibition Buildings, Brünn. It is pointed out in the reply to a correspondent's query on this page that the particular advantage of this form of arch is that with uniform dead load over the whole of the span the line of thrust for the arch follows the centre line of the arch and there is therefore no bending moment on the arch.

IN PARLIAMENT

The Housing Bill

ON the first day that the House of Commons reassembled after the Christmas Recess, an interesting discussion arose on the money resolution in connection with the Housing (Financial Provisions) Bill. This measure, it will be remembered, was read a second time last December.

Sir E. Hilton Young, the Minister of Health, in moving the resolution, said that it was the necessary preliminary to the scheme for the enlistment of the building societies in an effort to provide houses to let for the working classes. The scheme provided that a certain guarantee should be extended to the building societies. The guarantee would be in respect of the advances made by the societies in excess of their normal advances for building. Normally the amount advanced by a building society was 70 per cent. of the value of the building : that was to be raised under the present scheme to 90 per cent., and the liability for the 20 per cent. difference was to be guaranteed by the local authority, the Exchequer, and the building society at the rate of one-third each. This guarantee was being given to the building societies because they had large supplies of capital available, and the experience to use that capital in the most effective manner : also because they were making the advances for a period of 30 years at a rate of one-half per cent. below their normal rate, and, by extending their operations to new business, were incurring new risks.

The scheme provided a large step in advance towards meeting the demand for houses for wage-earners of the class just above the lowest paid. The tendency of the cost of building would be downwards by reason of the competition that would arise when private enterprise was freely at work. In order to provide for the transition period before the new system of building came into operation, the Ministry of Health would approve all *bona fide* building schemes that were advanced,

a reasonable degree going through under the old subsidy arrangement. Moreover, local authorities would have full power to impose their own standards of housing for their own localities. The Ministry of Health would also maintain control by its power to approve the guarantee. He recognized that there might be anxiety lest there should be any recession from the accepted standard of housing as a national service. It was, therefore, his intention at a later stage to accept amendments relating to the size and density of houses which would have the effect of maintaining the present standard. This scheme for the enlistment of a vigorous effort on the part of private enterprise for meeting the nation's housing needs was the true long-range policy for providing employment in the building industry.

We stood at the beginning of a new epoch—the end of general subsidies and the beginning of subsidies concentrated on slum clearance. They should therefore review their armoury, and it was his intention at once to start the wheels of inquiry to make such a review. He intended to appoint a committee of his own Department as an essential step to focus knowledge, and he believed that he could find all the knowledge necessary among members of the House of Commons. The Committee would consider the question of public utility societies and the question of a housing corporation for the country as a whole—something in the nature of a super-public utility society. He proposed to include in the inquiry any possible addition in the powers of reconditioning, particularly compulsory purchase of houses by local authorities in order that they might be reconditioned. That was the only important power that they did not possess at present, and the inquiry would include the very essential detail of the price at which such houses should be purchased. The investigation might also be extended to the question of some more appropriate body than the local authority for holding houses when they had once been built. There ought also to be some investigation of alternative powers in default of local authorities. He would not exclude from the consideration of the Committee some extension of financial assistance from the Exchequer for methods of dealing with slums by reconditioning as well as by clearance. The investigation would not be allowed in any way to affect the powers local authorities had at present to deal with slums by the radical method of slum clearance. The inquiry must be prompt and practical, and its results would be put before the House as soon as possible.

Although, in the debate which followed, the Labour opposition vigorously attacked the Government's plans, the resolution was eventually carried by 236 votes to 38.

Slum Clearance

Mr. Emmott asked the Minister of Health whether the Government's programme for slum clearance was limited to 12,000 houses a year.

Sir Hilton Young said it was not. No limitation of the sort was imposed in the Government's programme for the clearance of slums. It was intended by the concentration of assistance from subsidies on slum clearance, and by encouraging the more active administration of the Act of 1930 by the responsible local authorities, to raise the rate of clearance as much as possible, without any arbitrary limitation. The figure of 12,000 houses a year was referred to by him as the estimated number for which, in the light of experience of the working of the Act, it was reasonable to make provision in the estimates for the coming year, which would be the first year of intensified effort to accelerate the rate of clearance. It was expected that after the first year the rate would be increased.

Adelphi Terrace

Mr. Lovat Fraser asked the First Commissioner of Works, if, in view of the intended destruction of Adelphi Terrace and the adjacent buildings, he would take steps to get these buildings scheduled for preservation as an ancient monument.

Mr. Ormesby-Gore said that, unfortunately, he did not think that this was a case in which his Department could take any action. The machinery provided by the Ancient Monuments Acts was not applicable to a group of buildings of this character.

OBITUARY

The late Mr. P. W. Barnett

It is with deep regret we record the premature death of Mr. Percy W. Barnett, A.R.I.B.A., chief assistant of the Building Research Station, Watford, which occurred recently, after a few days' illness, from influenza. His loss will be greatly felt by the architectural profession and the Building Research Station.

Born in 1895, Mr. Barnett was educated at the Hornsey County School, and also attended the Architectural School at the Northern Polytechnic. For a short period he was employed in the offices of Mr. John Murray, F.R.I.B.A. and when the war broke out he joined up and served until March, 1919.

After the war he attended the Bartlett School of Architecture, London University, and became associated for a short time with Mr. Alban A. H. Scott, F.R.I.B.A. In 1921, at the age of twenty-six years, he gained his Associateship of the Institute, and in the same year he was appointed personal assistant to the then Director of Building Research, Mr. H. O. Weller, at the former headquarters at Acton. The inevitable expansion of the Station, due to the increasing demand for scientific assistance in practical problems on the part of various Government Departments and the Building Industry, led to its removal to larger quarters at Watford in 1925, under the directorship of Dr. R. E. Stradling. The importance of this side of the Station's activities, under the charge of Mr. Barnett, can be gauged from the number of interesting and informative answers they have supplied to enquiries submitted; these are published in this JOURNAL every month under the heading, "In that Contingency."

Mr. Barnett was a member of the Science Committee of the R.I.B.A., and also the chief representative of the Station on various committees of the British Standards Institution.

He leaves a widow and one son.

Mr. Alan E. Munby, F.R.I.B.A., for many years a member of the Science Committee of the R.I.B.A., writes: "I was impressed with the able way Mr. Barnett handled the several problems that came before the Science Committee. He formed a most valuable link between the R.I.B.A. and the Building Research Station, and he was always most ready to give advice to architects on any special problems they brought before him."

R. J. WILLIAMS

We regret to record the death of Mr. R. J. Williams, F.R.I.B.A., of Kettering, in his sixty-fifth year.

Born at Southampton, he was educated at Southsea, and later entered the office of Mr. A. H. Ford, A.M.INST.C.E., of High Street, Portsmouth. In 1888 he became assistant architect to Viscount Portman, working on his estates in Somerset, Dorset and North Devon. Three years later he commenced practice in Kettering.

Mr. Williams formed the Northamptonshire Association of Architects, and was a member of the Council; and in 1929 he was the President of an enlarged Association which comprised Northants., Hunts. and Beds.

S. S. REAY

We regret to record the death, which occurred at Monkton Combe, of Mr. Samuel S. Sebastian Reay.

For over 40 years he was in partnership with the late Alderman T. B. Silcock, at Bath.

Mr. Reay originated the old Bath Preservation Society when Bath Street was threatened during a city "improvement" scheme in pre-war days; and was successful in the competitions for the County Offices of Cornwall and the Llandudno Town Hall, whilst his last work was a large house for Mr. Isaac Carr near Southstoke.

Deputation to Minister of Health

Sir Hilton Young, the Minister of Health, received a deputation from the National Housing and Town Planning Council last week.

The deputation was introduced by the

Chairman of the Council, Mr. T. Alywn Lloyd, F.R.I.B.A., and the speakers were :

Mr. F. M. Elgood, C.B.E., F.R.I.B.A. ; Miss Eleanor Rathbone, M.P. ; Mr. George Hicks, M.P. ; Alderman David Adams, J.P. ; Alderman R. M. Challice ; Major E. C. P. Monson, F.R.I.B.A., F.S.I. ; Councillor H. W. Palmer ; and Alderman Frank Sheppard, C.B.E.

The object of the deputation was to present to the Minister the misgivings which the National Housing and Town Planning Council felt at the proposal contained in the Housing Bill now before Parliament to discontinue subsidy under the Act of 1924. If, however, that policy was to be adopted they trusted that the Minister would consider the position of those authorities who had proposals which, though ready for submission, had not actually been submitted before the date fixed in the Bill. The deputation urged also that the housing standards should be safeguarded.

The Minister explained the reasons which had led to the adoption of the Government's policy and referred in particular to the fall which had taken place in the cost of building and the price of money. He said that he was considering sympathetically the position of authorities whose proposals were in an advanced state and thought there would be opportunity of dealing with this question as well as that of housing standards during the Committee stage.

PRESENT-DAY ARCHITECTURE

Sir Reginald Blomfield, F.R.I.B.A., speaking on present-day architecture at a dinner of the Authors' Club, held in London on Monday of last week, said :

The Muses have fled into the wilderness and left chaos behind them, and the Cinderella of the arts has been dragged out of the scullery and been made to wear hideous clothing and to cut all sorts of unseemly capers on an alien stage.

You will find strange buildings with continuous horizontal rows of windows and not a comfortable corner out of the draught ; rooms with no cornices because they are said to hold dust ; buildings which affect to be in reinforced concrete, but are in fact steel framed, filled in with bricks and covered with cement.

Why are all our modern buildings to be based on factory design outside and on the design of the operating theatre of the hospital inside ? It is true that the Germans have devoted much of the money lent them by America to the erection of factories, but that is no precedent for us in England.

Why, again, are we to imitate what they are doing on the Continent ? England is not the Continent, and I hope it will always keep clear of it. But it is part of the gospel of the moderns that internationalism is the ideal, that everything is to be done by mass effort, and that art is to become more and more standardized, another word for its being mechanized.

We are beginning to realize that civilization is killing itself. Yet here are artists, who, par excellence, should be individualists, and whose only contribution to life is what is given by their own individual vision, bowing down before the juggernaut of technocracy and giving us that modern art which is depressing beyond endurance, and which, whatever else it may be, is not art as it has been understood by man since the dawn of civilization.

A BATH PORTICO

Following are copies of letters that have passed between the Town Clerk of Bath and the Secretary of the Bath Preservation Society.

Guildhall, Bath. *January 3, 1933.*

PORTICO—OLD LITERARY INSTITUTION

DEAR MADAM,—I beg to inform you that at the meeting of the City Council this morning the question of the demolition of the portico of the old Literary Institution was considered. After considerable discussion I was instructed to write and enquire whether your Society desire to make arrangements for the removal of the portico and its re-erection on some other site in the City, free of any cost to the Corporation. As you are aware the building is in course of demolition, and I shall be glad if you will let me know within the next 14 days whether your Society is desirous of accepting this offer of the Corporation.

Yours faithfully,
J. BASIL OGDEN,
Town Clerk.

Miss F. Tylee,
Secretary,
Old Bath Preservation Society,
20 Henrietta Street,
Bath.

20 Henrietta Street, Bath. *January 16, 1933.*

J. Basil Ogden, Esq.,
Town Clerk,
Guildhall, Bath.

SIR,—In reply to a letter received from you on January 3 conveying to the Old Bath Preservation Society the City Council's conditional offer of the " Portico," formerly a part of " The Literary Institution," now in course of demolition ; the Committee of the Society, while thoroughly appreciating the motives of the Council, yet feel that their action shows plainly that the aims of the Society are totally misunderstood by those who made such an offer.

The Society is not a body of " Antiquarians," existing to collect and protect, more or less authentic ruins and relics, but an association of nearly a thousand intelligent men and women, fully aware of the Beauty and Uniqueness of Bath, and very anxious that these features of a famous city shall not be destroyed.

It should also be recognized that the idea of re-erecting the portico on some other site, did not originate with this Society, but was the uninvited suggestion of an outsider. My Society would point out that when, in 1924, " The City Improvements Proposals," mainly directed to " slum clearance," but including the demolition of the Literary Institution, was the subject of a poll of the ratepayers, and approved " as a whole," by a majority, the Society was not then functioning, its revival as an active, and steadily increasing body only dating from the summer of 1929.

The Society was desirous of preserving the building as a whole, where it stood, and to this end its efforts were directed. It has no use for the " Fragment " offered, after it has been discovered, that neither for sentimental, nor practical reasons, do any persons wish to acquire it when advertised in " Market overt," and is of opinion that little purpose would be served by preserving the portico, bereft of its background, even were such a course technically possible.

In limiting the time for a reply to " 14 days " it is obvious that the Council do not realize the difficulty of obtaining at this season the considered opinions of those among the members on its roll who are scattered throughout England, the United States, Canada, and the Channel Islands, as well as those residing in Bath and its neighbourhood, who have set in authority the persons responsible for the welfare of the City, but my Committee believes that in declining the Council's offer it speaks for the Society *as a whole.* It cannot, however, refrain from expressing surprise that such an offer should, under existing circumstances, have been made, as it has been admitted by experts with practical and technical knowledge that the condition of the stonework renders removal for re-erection impossible ! Though always ready to support the Council's efforts to increase as well as preserve the attractions and amenities of Bath, the Old Bath Preservation Society feels that in this case it cannot conscientiously and usefully co-operate.

Faithfully yours,
FLORENCE TYLEE,
Hon. Sec., Old Bath Preservation Society.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors, and some of the sub-contractors for the buildings illustrated in this issue :

Victoria House, Kingsway, W.C. (pages 244-5 and Supplement). General contractors, James Carmichael, Ltd. H. V. Palliser, sculptor. Sub-contractors : Willment Bros., excavators, etc. ; Dorman Long & Co., Ltd., steelwork ; Fenning & Co., Ltd., granite ; Bath Portland Stone Firm, Ltd., stonework ; C. Isler & Co., Ltd., Richards, Le Grand Sutcliffe and Gell, Ltd., artesian wells ; Crittalls Mfg. Co., Ltd., windows and bronze doors ; Luxfer, Ltd., roof and lay lights ; J. A. King & Co., Ltd., pavement lights ; William Smith and Evans, slaters ; Pilkington's Asphalte Co., Ltd., asphalters ; Joseph Chaters and Sons, Ltd., glass and copper light glazing ; Smith Major and Stevens, Ltd., and Waygood-Otis, Ltd., lifts ; Merryweather and Sons, Ltd., fire hydrants ; Pollard & Co., Ltd., shop fronts and bronze doors ; Frederick Sage & Co., Ltd., show cases ; Norris Warming Co., Ltd., heating and ventilation ; J. Whitehead and Sons, Ltd., and Carter & Co., Ltd., marble and terrazzo ; Engineering Works, Ltd., electric light and power ; C. H. Mabey, stone carving ; Gilbert Seale and Son, Ltd., stone carving and fibrous plaster ; James Gibbons, Ltd., iron railings ; Relay Automatic Telephone Co., telephones ; Standard Time Co., Ltd., electric clocks ; Zeta Wood Flooring and Bennett's " Tungit " Wood Flooring, wood block floor ; H. H. Martyn & Co., Ltd., bronze doors, grilles and lead cresting ; Birmingham Guild, Ltd., bronze grilles and gates, etc. ; Bromsgrove Guild, Ltd., bronze fire surrounds, etc. ; Lamson Pneumatic Tube Co., Ltd., letter shutes ; F. and E. Eastmans, tilers ; London Brick Co. and Forders, Ltd., and Stourbridge Brick Co., Ltd., bricks.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

The MARYLEBONE B.C. reports that the St. Marylebone Housing Association, Ltd., has purchased a site in the Borough for providing housing accommodation.

Proposals have been submitted to the MARYLEBONE B.C. for developing the site of 132-148 Edgware Road, by Mr. F. J. Wills, acting on behalf of Messrs. Kennedy and Clarke.

Messrs. Morgan, Baines and Clark, on behalf of Mr. A. H. Jennings, are to develop an estate of about 52 acres at Sanderstead Hill, SANDERSTEAD.

Plans passed at SANDERSTEAD: Three houses, Addington Road, for Mr. H. Johnson; four houses, Limpsfield Road, for Messrs. Bridges, Doran and Co., Ltd.; house, Essenden Road, for Messrs. Jenkinson and Hinson; two houses, Court Hill, for Messrs. Thomas and Son; four houses, Addington Road, for Mr. R. V. Tutte.

Plans passed at SOUTHGATE: Alterations and additions, Cuthbert's shop, High Street, for Mr. C. W. Dennis; additions, Chase Bank Nursing Home, Avenue Road, for Mr. H. Harvey; five houses, Wades Hill, for Messrs. Martyn, Ltd.; workshops, rear of Westview and Melville House, Green Lanes, for Mr. C. E. Ward; lay-out of 37 houses, Broadfields Avenue, for Mr. O. R. Davis; (amended plan) lay-out of land, rear of Cherry Tree Hotel, for the Temple Estates Co.; lay-out of Oak Lodge Estate, for the Union Surplus Land Co.; factory, Chequers Works, Chequers Way, for the Metal Box Co.; lay-out of 63 houses, Greenway, for Mr. C. E. Hartshorne; six houses, Broadfields Avenue, for Mr. O. R. Davis; addition to dairy premises, 24 The Green, for Messrs. A. C. Garrard; seven shops, Green Lanes, for Messrs. J. Stanley Beard and Clare; pavilion, Radcliffe Road, for Mr. C. E. Ward; house, Townsend Avenue, for Messrs. G. S. Bentley and Son; church hall, rear of Winchmore Hill Congregational Church, for Messrs. Storrar and Son; alterations, 25 and 27 Green Lanes, for Messrs. J. Myring & Co.; house, Waterfall Road, for Messrs. Mattock and Parsons.

Mr. W. J. King has submitted plans to the SOUTHGATE U.D.C. of a cinema, seven lock-up shops and eight shops with flats over, proposed to be erected in Bowes Road, N.21.

Plans passed at SOUTHALL-NORWOOD: Six houses, Melbury Avenue, for Messrs. Warren and Woods; three houses, Townsend Road, for Mr. G. Marsh; six houses, Beaconsfield Road, for Mrs. C. Grey; two houses, Dorset Avenue, for Messrs. Warren and Woods; four houses, Regina Road, for Messrs. W. and C. Hanshaw, Ltd.; three shops, North Road, for Mr. E. Hayes; 22 houses, Tentelow Lane, for Messrs. Waterhouse & Co.; conversion into flats, 158 Uxbridge Road, Southall Park Estate, for Messrs. R. Fielding and Son; four flats, Lady Margaret Road, for Messrs. E. Plaistowe and Sons, Ltd.

The TEDDINGTON U.D.C. is considering the use of the land at the Waldegrave depot for a housing scheme.

Plans passed by the WESTMINSTER City Council: New street between Floral Street and Covent Garden, for Messrs. Hood and Huggins; bridge reinstatement, Carting Lane, connecting Savoy Hotel with Shell-Mex House, for Messrs. Hall and Robertson; bringing forward front of building, 6 and 7 Lyall Mews, for Messrs. W. J. Smith & Co.; shop, 1 Buckingham Palace Gardens, for Mr. D. G. Somerville; alterations and additions, 25 South Street, for Mr. E. B. Musman.

The WESTMINSTER City Council has arranged for an improvement in connection with a proposal of Mr. F. Etchells to erect houses on the site of 38 Chapel Street, abutting upon Chapel Street and Headfort Place.

SOUTHERN COUNTIES

The EASTBOURNE Corporation is to further consider a scheme for the improvement of the Grand Parade, estimated to cost £17,000.

Plans passed by the GILLINGHAM Corporation: Two bungalows, Thames Avenue, for Mr. S. Darling; two houses, Oxford Road, for Messrs. A. W. Little & Co.; extension, Liberal Club, Canterbury Street, for Mr. C. J. Jarvis; hall, Gardiner Street, for Salvation Army; alterations and additions, 66 Watling Street, for Messrs. T. Cornelius and Son; shop and house, Maidstone Road, for Mr. F. W. Hicks; two houses, Grange Road, for Mr. F. S. Rowden; 29 houses, Chalkenden estate, London Road, for Mr. F. B. Cooper; 18 houses, Pump Lane, Rainham, for Messrs. Newnham and Howard; layout of land in Watling Street, for Messrs. Style and Winch; development of building estate, Rainham Mark, for Mr. G. H. Ward.

The WORTHING Corporation is considering a scheme for extensions at Swandean Hospital, the cost being estimated at £16,850.

SOUTH-WESTERN COUNTIES

Plans passed at PLYMOUTH: Shops, York Street, for Messrs. Jillard Bros.; layout of Barne Estate, St. Budeaux, for Mr. C. Jope; construction of soil and surface water sewer, St. Martin's Avenue, Peverell, for The Pounds Building Estate Co.; eight houses, Barne Estate, for Mr. C. Jope; alterations to premises, Frankfort Lane, for Messrs. Costers, Ltd.; alterations and additions, rear of 3 and 4 Cornwall Street, for Messrs. E. Dingle & Co.; seven houses, Cannon Street, North Corner, for Mr. J. Borrows; layout of land, and 22 building plots, east of Beauchamp Road, for Mr. C. R. Tozer; two houses, Ayreville Road, for Mr. F. Westcott; two houses, Furneaux Avenue, for Mr. W. Edgcumbe; four houses, Beauchamp Lane, Peverell, for Mr. C. R. Tozer; two shops, Wolseley Road, Milehouse, for Messrs. A. C. Jones and Son; offices, showrooms and workshops, Cemetery Road, for Messrs. J. Geach and Son.

MIDLAND COUNTIES

The BIRMINGHAM Corporation has sold land at the junction of Gospel Lane and Lakey Lane, Hall Green, to the Methodist Church trustees for the erection of a church and school.

The CHELTENHAM Corporation Housing Committee has instructed Messrs. Rainger and Rogers to prepare plans for the erection of 50 houses on the Alstone Lawn estate, to provide accommodation for the population displaced from the Swindon Place area.

The DUDLEY Corporation has decided to invite tenders for the erection of 214 houses for the working classes on the Priory estate.

Messrs. Jordans are to erect 34 houses on the Newport-Pagnall Road, HARDINGSTONE.

The NORTHAMPTON Corporation has prepared a new scheme for the erection of a pavilion at the racecourse, at a cost of £9,500.

The OXFORD Corporation is to erect eight houses on the Barton Road site, and has obtained sanction to borrow £19,000 for the Glebe housing scheme.

NORTHERN COUNTIES

The Durham County Council is considering a scheme for converting the infirmary and colony blocks at the BISHOP AUCKLAND institution into a surgical hospital.

The Lancashire Education Committee has purchased a site at DAVYHULME for the erection of an elementary school.

The HULL Corporation has approved amended plans for two-story buildings at Tilworth Grange, with a view to reducing the cost of the proposed extensions to £12,300. The Committee also decided that it is necessary to proceed immediately with the proposed male colony at Winestead, at a cost of £40,000.

At a meeting of the HULL Corporation Mental Hospital Committee, the city architect reported that the working drawings for the proposed villa for 40 patients were now in course of preparation.

The HULL Corporation is to construct roadways in connection with the 60 cottage flats to be erected in Barnsley Street.

The trustees of the Endike Lane Methodist Church are to erect a church in Endike Lane, HULL.

The Lancashire Education Committee has purchased a site at HUYTON for the erection of a junior school.

The Lancashire County Agricultural Committee has prepared schemes for the development of small holdings at FARINGTON, at a cost of £6,615, and at MAGHULL, at a cost of £13,880.

The LANCASHIRE County Agriculture Committee recommends the provision of a further 100 fully equipped small holdings in suitable localities.

The Ministry of Health has now approved the scheme of the LANCASTER Conservancy for dealing with the trade and domestic effluents at present running into the river Lune, at a cost of £70,000, and requested details and estimates for submission in connection with the loan application.

The MANCHESTER Corporation Town Planning Committee has raised no objection to a proposal for the erection of a cinema at the junction of Rochdale Road and Hall Crescent, Collyhurst.

The MANCHESTER Corporation is to proceed with the construction of a bridge at School Lane, Didsbury.

The MANCHESTER Education Committee is to prepare final plans for the erection of the Rack House junior school, at Wythenshawe.

Plans passed at MORECAMBE: Conversion into flats, premises on Skipton Street corner of Marine Road, for Mr. F. Obank; four houses, Balmoral Road, for Mr. A. Heathcote; 24 bungalows, Oxcliffe Grove, and lay-out of street, for Messrs. D. Hunt and Son; cesspools, Westgate, for Messrs. Brook and Kershaw; four houses, Lancaster Road, for Messrs. Barlow and Gerrard; alterations, 45 and 46 Erving Terrace, for Mrs. Sarah A. Airey; alterations to house and shop, Devonshire Road, for Miss G. Ratcliffe; 34 houses, off Westgate, for Messrs. Brook and Kershaw.

The NORTHUMBERLAND C.C. has agreed upon the suitability of the site at Northgate, Morpeth, for the erection of a mental institution. The county architect is now preparing the scheme.

Plans passed by the SHEFFIELD Corporation: Elementary school and house, Oaks Fold Road, for Education Committee; two houses, Richmond Road, for Mr. F. Talbot; 200 houses, Shiregreen Estate, for Corporation Estates Committee; house, Watt Lane, for Messrs. Wright and Walton; four houses, Hurlfield Road, and two in Dobcroft Road, for Messrs. T. Ardern and Son; two houses, Whirlowdale Crescent, for Mr. W. Croft; two bungalows, Dobbin Hill, for Mr. H. Simpson; four houses, Manchester Road, for Mr. A. Spooner; 12 houses, Midhill Road, for Messrs. T. Wilkinson and Sons (Builders), Ltd.; five houses, Bell Hagg Road, for Mrs. C. E. Sales; four houses, Norborough Road, for Mr. G. H. Johnson; two houses, Longley Lane, for Messrs. Oxspring Bros.

The SHEFFIELD Corporation Estates Committee has decided to lease land in Beck Road to the Shiregreen Cinema Syndicate, Ltd., as a site for a cinema with billiard hall and dance hall.

Plans passed at SHIPLEY: 50 houses, Claremont Road, for the Claremont Land Development Co., Ltd.; four houses, Lynfield Avenue, for Messrs. Cooper Bros.; 73 houses, Victoria Park Estate, for Mr. H. Chippindale; 64 houses, Wrose Road, for Messrs. A. and F. Mellor; lay-out of street for 20 houses, off Westfield Lane, for Mr. A. Dickinson.

D

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

•In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

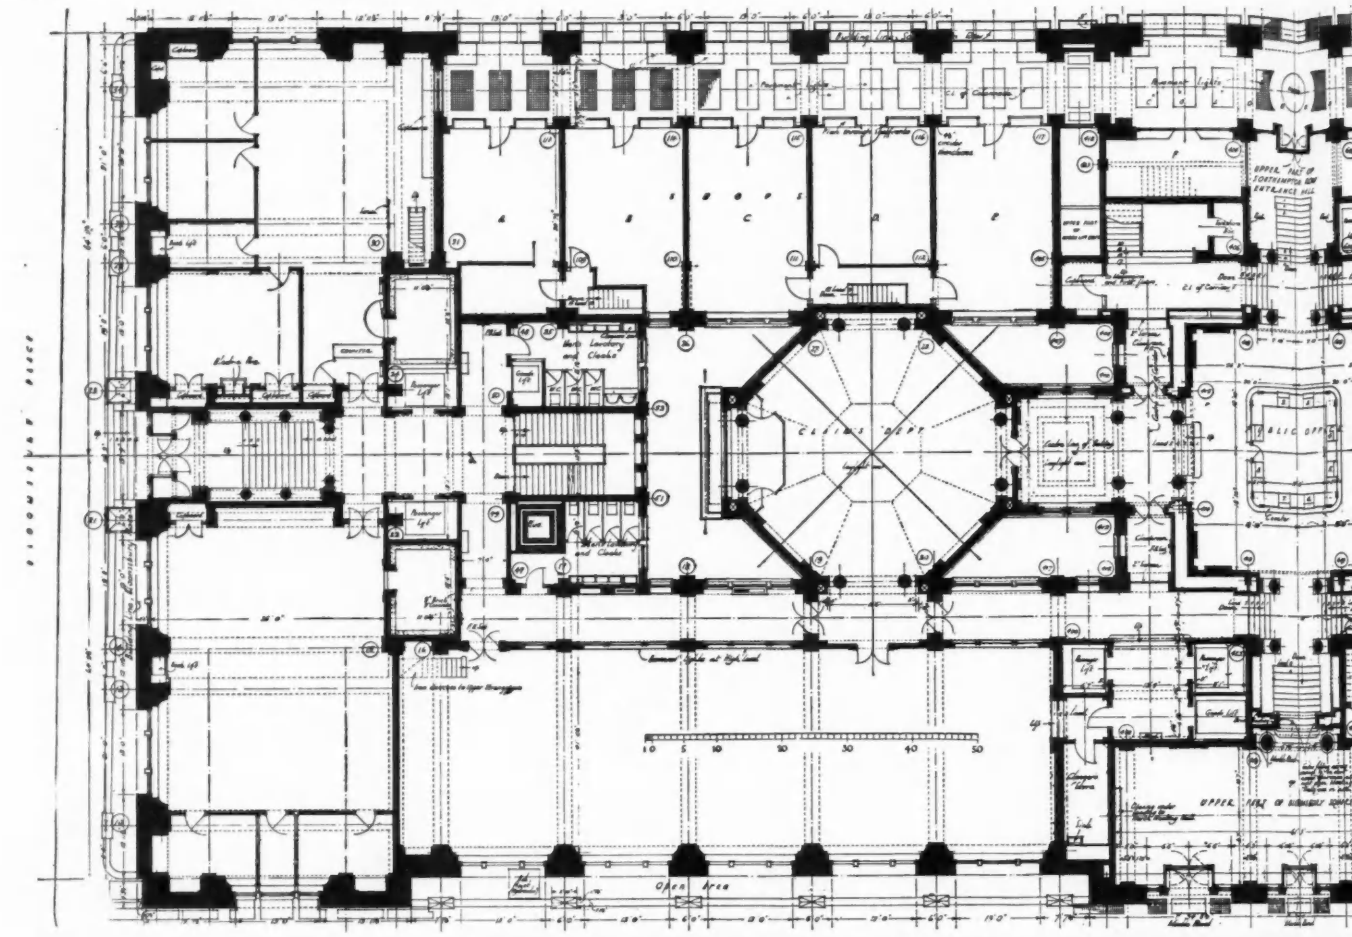
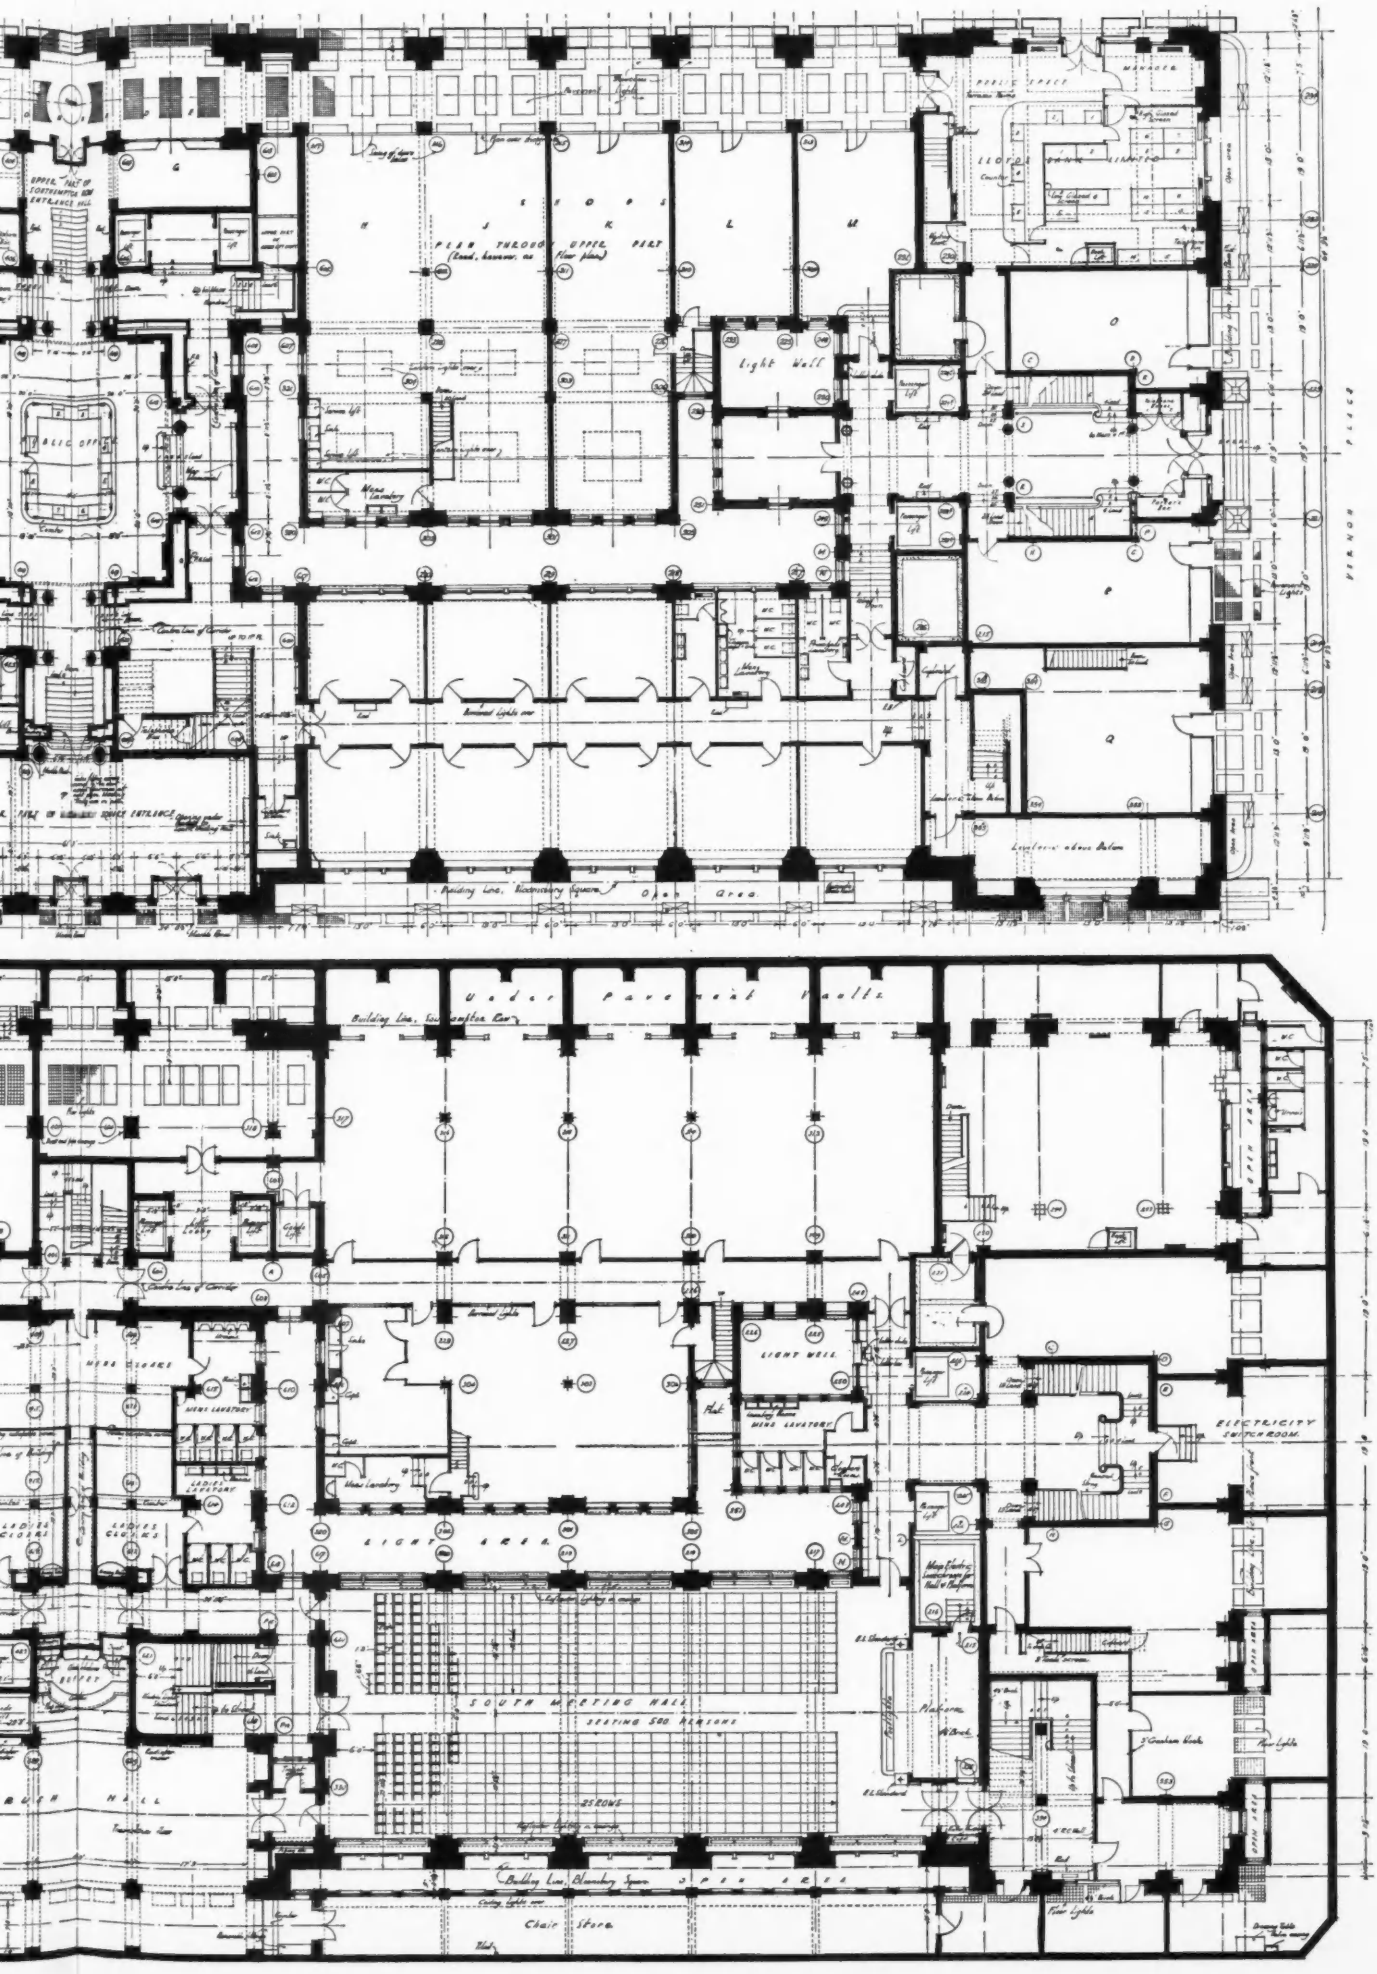
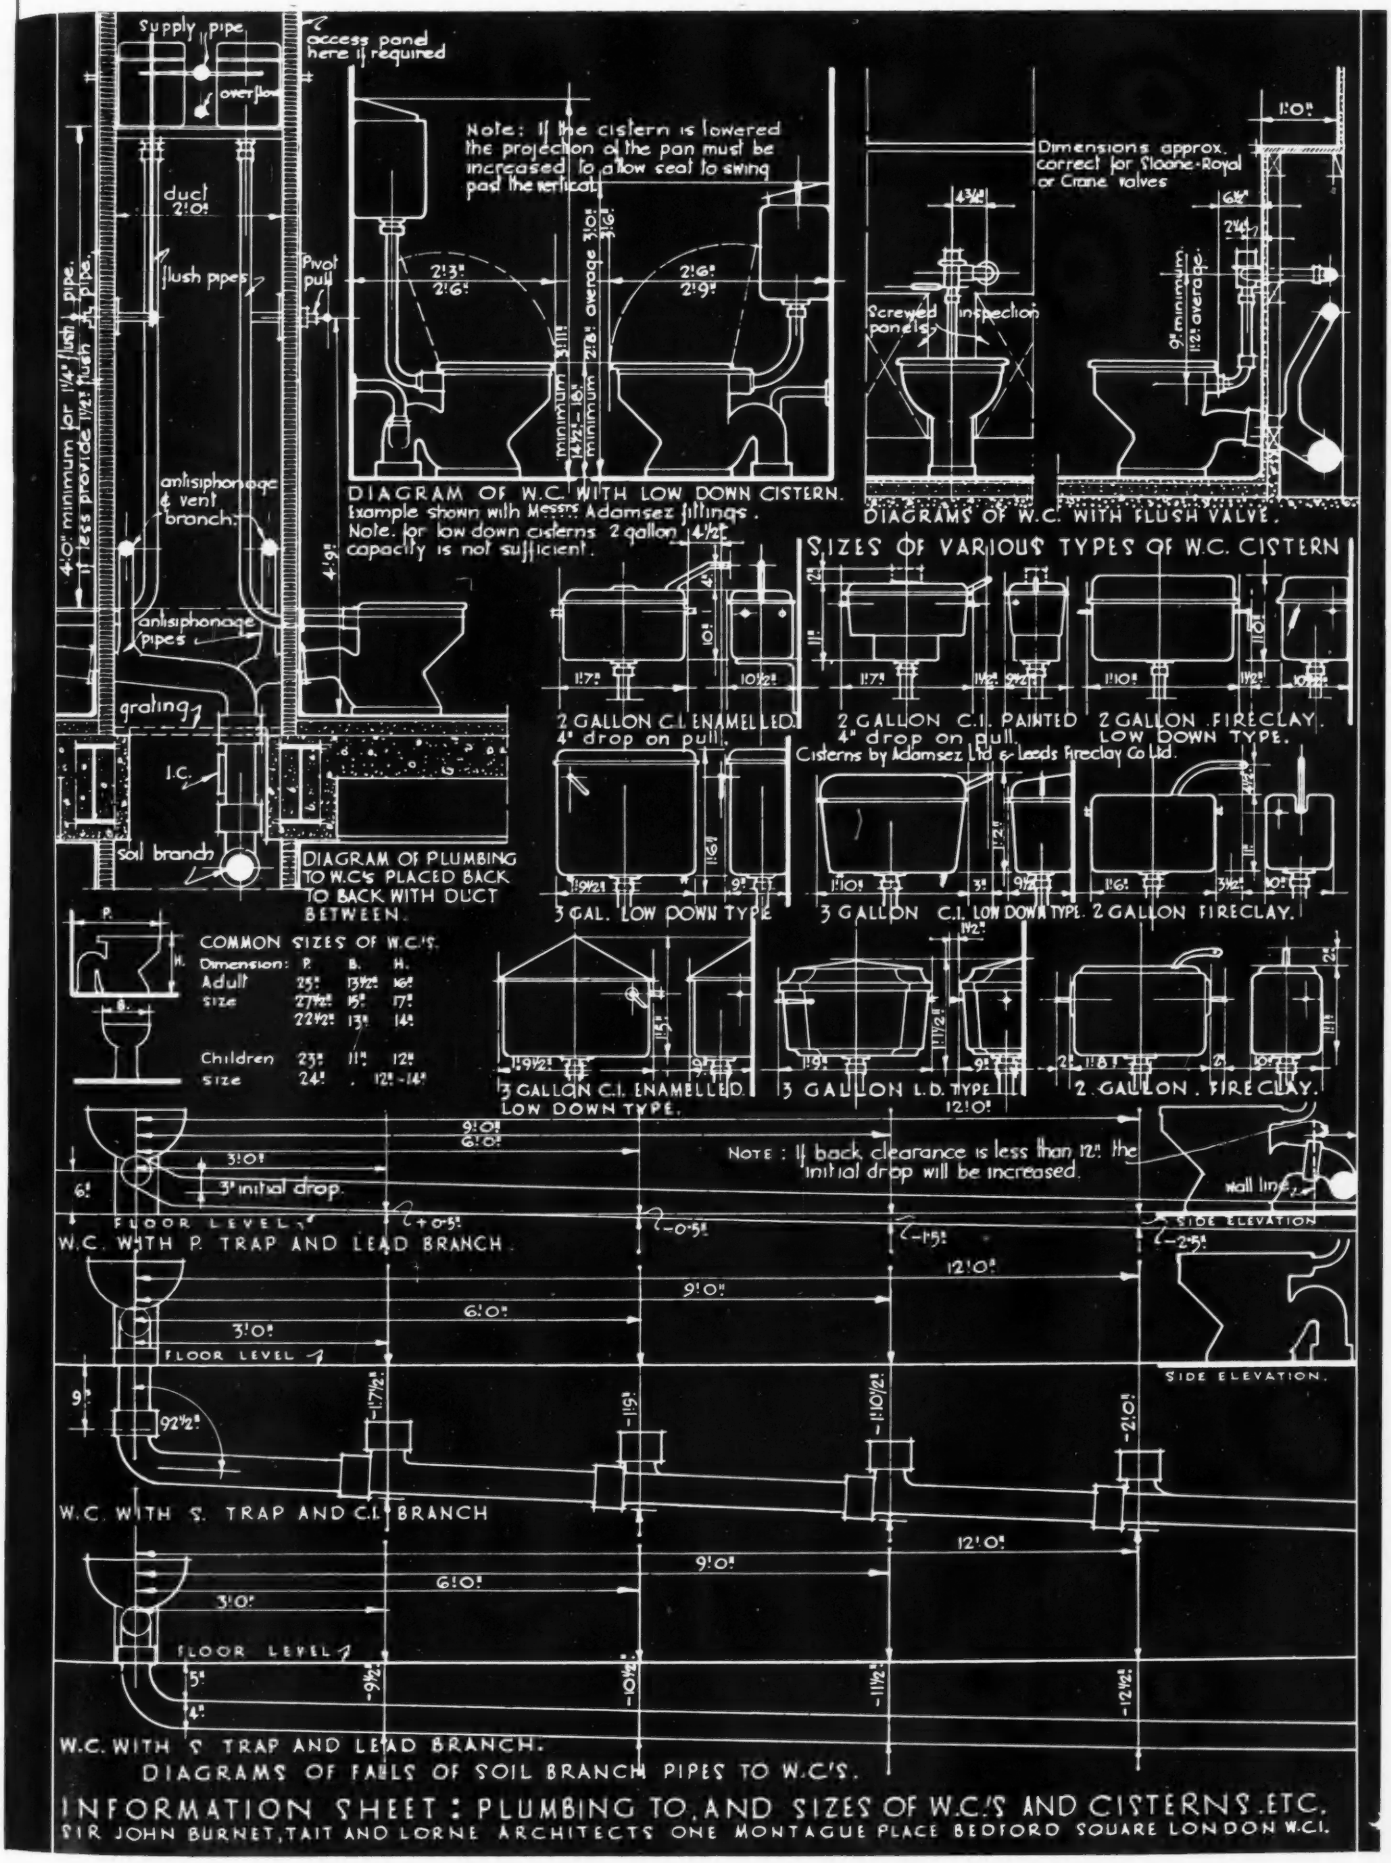
VICTORIA HOUSE, LONDON

DESIGNED BY : : CHARLES W. LONG





THE NORTHERN BLOCK, FROM BLOOMSBURY SQUARE



WITHIN are reproduced plans of the main ground floor and lower ground floor of the large building erected to house the Liverpool Victoria Friendly Society in Southampton Row, W.C., of which other views appear on pages 244-245.

The site measures some 370 ft. by 140 ft., and the foundations are over 30 feet below ground level. In addition to the office accommodation there are a large dance hall, equipped with stage and spot lighting, another hall, and crush hall, buffet, etc.

The external walls are faced with Portland stone on brick, and the roof is of Westmorland slates, with lead cresting. All the windows, which are steel casements, painted, are of standard size in screwed beads, to facilitate reglazing.

INFORMATION SHEETS • 5 • CISTERN PLUMBING

INFORMATION SHEETS

• 5 •

CISTERN PLUMBING

•

THE first Information Sheet in this series dealt with fixtures to urinals, etc. The present one continues the plumbing series, interrupted in order to give three concerned with seating spaces, and is to have a companion concerned with baths and lavatory basins.

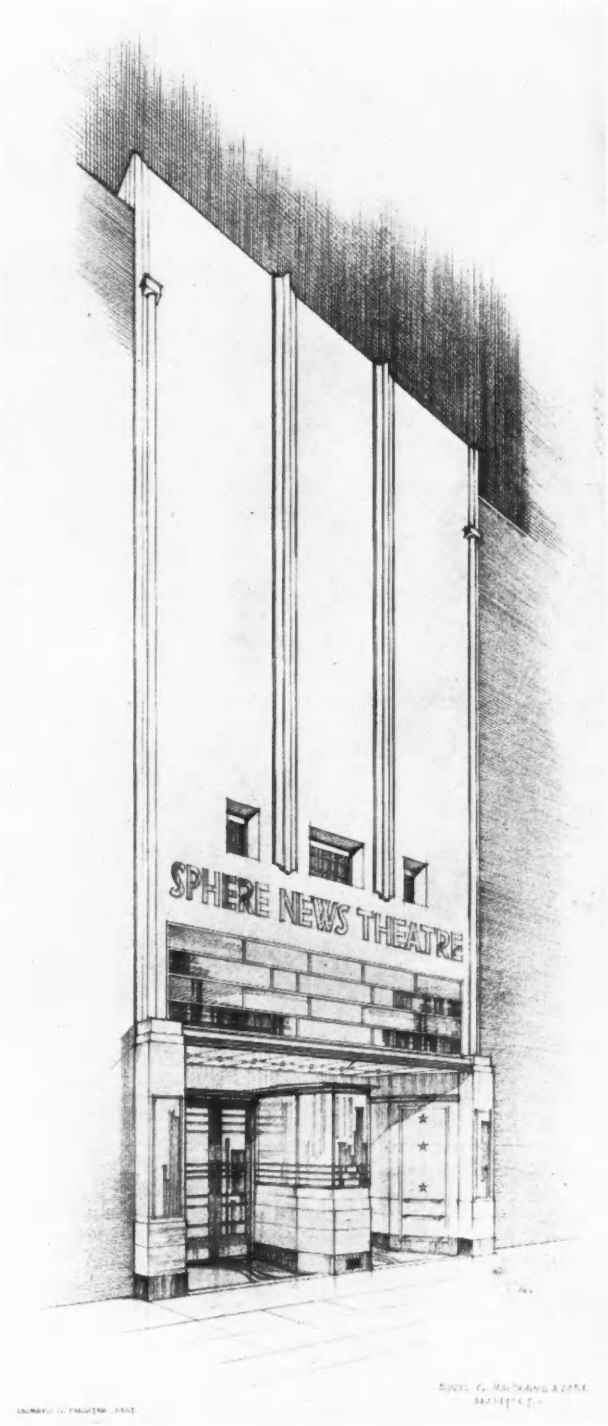
The story of how these drawings—in themselves exemplars of the draughtsman's art—came into existence in the office of Sir John Burnet, Tait and Lorne, and of how, far from grudging the broadcasting of information they had been at pains to tabulate for use in the course of their own practice, they embraced the proposal with enthusiasm, has already been told.

The very fact that these Information Sheets, of a type in common use in America and Germany, are new to us here points the need for architects in this country to rationalize the activities in their own offices.

No one can avoid being impressed by the vital character of the information conveyed by these graphic and tabular means in the minimum of space with the maximum of clarity; they give, at a glance, just those very details which, though known to have been received some time or other, will usually take hours of search to unearth. Needless to say, their value depends on their being up-to-date.

It is arguable that one reason why, in the past, it has not been easy to collate such statistics, has been the reluctance of manufacturers in this country to perceive the advantages to them of standardizing the size and style of their catalogues and lists of goods, and the loose sheets by which, from time to time, they are revised, so as to reduce the architect's problems in compiling a reference library. Standardization in this respect has long been adopted in other countries.

It was desired to present these Information Sheets in a standardized form, but no standard filing size has existed, hitherto, in Great Britain. The decision was therefore taken to make the reproductions the same size as the original drawings, which themselves follow the standard dimensions adopted by the American Institute of Architects, as being more convenient than reproduction to the double-page size associated with THE ARCHITECTS' JOURNAL Supplements.



Until further notice, therefore, these Sheets will take the place of the second double-page plate that is usually issued, week by week.

The following is a list of the subjects previously issued :—

1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.

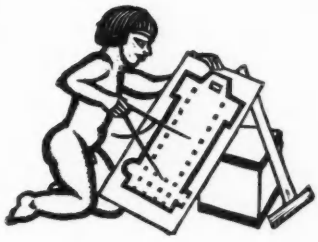
LONDON'S LATEST NEWS CINEMA

RE-MODELLED BY ALISTER MACDONALD

From the perspective drawing by Leonard G. Pargiter.

ON Monday last the Sphere News Theatre in Tottenham Court Road was opened. It has been converted from the old Gaiety Cinema, reputed to be the last silent picture house in London, by Alister MacDonald, A.R.I.B.A.

The windows in the old brick façade have been blocked in, and the whole of the upper portion has been masked with buff cement stucco. The large window above the entrance has a bronze frame and the panes are of black marmosite and reeded gilt glass. The plinth of the building is of golden travertine, and the swing doors into the auditorium are painted bright red.



The pay-desk has a prominent position at the front of the vestibule, and is constructed entirely of clear armour-plate glass. As the vestibule extends the whole way across the narrow façade of the cinema, the weight of the upper portion of the building is supported by two stanchions encased in blue brick piers.

The interior of the building has been completely re-modelled. The new cinema is smaller than the old one, and is decorated simply in shades of terra-cotta and gold.

A PRESSING NATIONAL PROBLEM; AND ITS SOLUTION

THIS New York photograph of the new traffic lane encircling the Grand Central Terminal Station, Manhattan, and connecting it to Park Avenue at either end, should give thought to those who have the abolition of disease-breeding slum areas at heart. It is comparatively easy to clear them if only accommodation on other sites is economically available. There are potential sites over our railways, as Mr. Bossom pointed out in an article from which a salient cutting is reproduced on p. 261. For the streets, here shown covered in, substitute the railways (assuming these are certain to be electrified before long) and, for the traffic lane, another type of structure—housing tenements—and the idea is immediately applicable to London and other cities. On all hands it is agreed that the slum problem must be shelved no longer, depression or no depression; here is revived a definite suggestion for an economical approach to its solution.

THE DAILY EXPRESS

NOTHING is more futile than the employment of half measures to avert a catastrophe. We have suffered long from policies of hesitation. It is therefore stimulating to note the wholehearted vigour with which *The Daily Express* is conducting a campaign, or more correctly perhaps, a series of campaigns, all with the same end in view—to hasten the return to prosperity.

The restoration of the falling fortunes of this country can be accomplished only by accelerating the wheels of the industrial machine. To do this it is necessary, in the words of *The Daily Express*, to create "a mass consuming movement," which can be built up only by bringing into the market, in addition to those who may be made to see the importance of spending what money they have, those who have at present no money at all.

The first way to find work for such people and to pay them money which will help them to become what they want to be—hearty consumers—" is to set on foot large scale capital developments which will cause the stagnant pool of national savings in the bank to circulate." That pool, according to Sir Josiah Stamp, showed an increase of over £200,000,000 last year.

The money at present lying idle, whilst every activity is reduced to a minimum, must be brought into immediate circulation. It can be employed in the construction of public works and municipal building which, besides adding to the real wealth of the country, would provide work and wages, thereby "galvanizing into activity the whole range of wholesale production and retail trade which is now inert."

There is little doubt that the action of the Ministry of Health in placing a ban on building activities, on the grounds of economy, has had a psychological effect, and that, until such time as the ban is lifted and public work resumed, private enterprise will remain in its present dormant state.

For what reason does *The Daily Express* occupy itself with this campaign? Is Lord Beaverbrook merely finding a pretext to attack the Government? Those who disapprove of *The Daily Express*, and of Lord Beaverbrook too, may find it simple enough to explain why a newspaper with a circulation running into millions should support a campaign in favour of maintaining a high wage level—but they will not find it so easy to explain where the advantage lies in running a stunt for the promotion of public works.

The fact is *The Daily Express* has grasped, and is vigorously broadcasting, a truth which is now generally accepted by the leading economists in all camps. Public works should not be reduced, or suspended, when a country is suffering a period of depression; that is just the time when they should go forward, not only to provide work for the unemployed but to act as a stimulant. The boom period is the time when they may cease; and the pursuit of a policy based on this principle will have a steadying influence. It will prevent a depression deteriorating into a crisis, with the consequent disproportionate fall in prices; and it will prevent a period of prosperity developing into the sort of boom where prices soar absurdly high.

We say this is a view held by economists in all camps. To support this assertion we would draw attention to a pamphlet on "Public Works" just issued by the New Fabian Research Bureau. Speaking of a period of trade depression such as we are now going through, Mr. J. E. Mead, the author of the pamphlet, says: "but if at this point public authorities determine to borrow for public works and to spend more on capital goods, at the same time that the banks are lowering interest rates, they will thereby be able to stop the fall in the price of capital goods and also, by maintaining the expenditure on consumption goods of those producing capital goods, to stop the fall in price of consumption goods, and so also the fall in profits and in share prices. Such extra expenditure on public works should be undertaken on a sufficient scale to prevent prices falling. It need only last sufficiently long to enable the banks, by lowering interest rates, to stimulate expenditure by ordinary private business again, and then the expenditure on public works can be diminished, as that of private business increases."

At the best, public works present many difficulties, and opinion is now, in many quarters, against them, particularly since Mr. Neville Chamberlain criticized the spending of money in this direction, and said the provision of public works as a remedy for unemployment had been tried out and had failed. We believe his figures to be wrong, and later hope to show how wrong they are.

The fact is, the pursuit of the policy of public works needs courage, and to those whose nature it is to discover reasons for not doing things it seems impossible.

But Lord Beaverbrook has taken up the cause of public works, and this we believe to be an encouraging sign. If he succeeds in getting something done it will not be the first time he has accomplished that which has been carefully proved impossible.

The Liverpool School Tie: the liver bird motif is taken from that of the pylon designed for the Railway Centenary of 1930 by W. G. Holford and G. Stephenson.

NOTES & TOPICS

"WEARING THEIR OLD SCHOOL TIES."—WESTERN BROTHERS

YOU will soon know them by their ties. The Liverpool School has designed two ties, a blue one for students, and a black one—to go with morning coat and striped trousers—for past students.

*

The design is quiet, modest and gentlemanly, a liver bird, that curious emblem of the city, suitably and well conventionalized within an oval of silver; and they can be obtained from the School Secretary for 4s.

*

As to the liver bird motif, it should be added that this was adapted from Mr. W. G. Holford's design for a column to be placed at an important street junction during the Railway Centenary celebrations. It is, as Professor Reilly says, the only supportable conventional representation of the peculiar fowl he has yet found.

*

PROFESSOR REILLY

My hope that Professor Reilly's name might figure in a future honours list has not been without its echo in other quarters. I can but hope that it may ascend to those high places where notice is taken. And that right early, for I have in mind the opening of the new school buildings which will set the seal of success upon the venture begun so long ago, and which Professor Reilly will enter only to leave again.

*

NATIONAL PLANNING IN THE HOUSE OF COMMONS—

In a week or two's time the House of Commons will have the opportunity of listening to a discussion inspired by the New Year Number of THE ARCHITECTS' JOURNAL. Dr. McLean, Conservative M.P. for the Tradeston Division of Glasgow, is to call attention to the need for a National Development Plan, and will move a resolution. Dr. McLean is Chairman of the Scottish Branch of the Town Planning Institute. He planned the City of Khartoum under the personal direction of the late Lord Kitchener. He also prepared, in 1918, the protective town-planning scheme for the old city of Jerusalem and the Holy Places, which was officially approved by Lord Allenby. I understand that on the same day Viscount Elmley, who is calling attention to the problem of Local Government, will also speak in favour of National Planning.

*

—AND IN THE PERIODICALS

The announcement by the Minister of Health that he will set up a Departmental Committee to inquire into the proposal to create a National Housing Corporation adds immediate interest to Sir Raymond Unwin's contribution, on February 11, to a series of articles on the housing problem that are appearing in *The New Statesman*.

*

Speaking of the provision of houses, Sir Raymond says:

There are two alternatives—Direct action by local authorities, or the creation of a suitable public utility organisation. As regards the former, desirable as it is to free housing from the direct influence and see-saw of party government, it is hardly less so to free its details from local politics.

*

Having dealt with the advantages of the handling of the work by or through a public utility board, Sir Raymond continues:

Post-war housing has proved . . . that under modern conditions the best chance to secure extensive small house building, in a manner that will not further disfigure the towns and country, is through co-ordinated schemes on well laid-out sites. However disappointing in the standard of design a few of the municipal housing projects may seem to the architect, seldom can he look at an adjacent small house area developed speculatively but he is confronted with a worse result.

*

In a recent broadcast, "Housing and Civic Responsibility," reported in *The Listener* on February 15, Sir Cecil Levita said:

The total work done nationally in subsidized housing since 1919 has cost, in capital expenditure, the enormous sum of £630 million.

*

He emphasized the fact that municipal houses are generally houses to let at weekly rents, as opposed to post-war privately-produced houses which, up to now, have been built for sale, and said later:

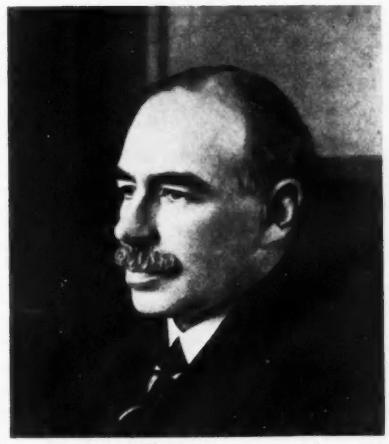
Happily, owing to falling prices, it now appears that a State subsidy is no longer needed to bridge the gap between the cost of production of a working-class house and the suitable rent. It is therefore hoped that private enterprise can start to build profitably houses for letting to all but the poorest classes.

*

Busy people, concerned with the world situation but without time to select from the columns of a daily paper the really vital points, are catered for by a new weekly, non-party bulletin, *Essential News*, which comprises quotations, summaries of significant facts and constructive suggestions, from English and foreign sources.

*

THINKING NATIONALLY



Professor Patrick Abercrombie's letter to *The Times* of Friday last, urging the necessity for a national survey of

A. G. Macdonnell, Honorary Secretary of the Carlton House Terrace Defence Committee.

Miss M. I. Batten, Secretary of the Carlton House Terrace Defence Committee.

J. Meynard Keynes, author of recent valuable contributions on the economics of housing.

housing conditions before entering upon anything we could possibly name a national campaign, is but another instance of the need for a really national survey covering town and countryside, economic and social activities, and, in fact, the entire ground upon which we hope to carry out a co-ordinated scheme of national rehabilitation.

*

Dr. Thomas Adams suggested this need in an earlier letter to *The Times* : perhaps we may look for more definite action—soon, while there is yet time.

*

A GOLF PALACE

"The moment he entered a superb spectacle met his dazzled gaze. It was not the parquet floor, on which his nail-studded shoes squeaked loudly, or the marble columns, or the voluptuous paintings on the ceiling, or the gilt-framed mirrors on the walls, or the chandeliers of a thousand crystals, or even the palms in their gilt pots and synthetic earth, that knocked him all of a heap."

*

No. It was the golfers. This dream of architectural magnificence was none other than a golf club—one of those super golf clubs which nestle so knowingly round London. Distinguished architects are often to be found in them on Sundays—and other days.

*

The quotation comes from *England their England* by A. G. Macdonnell, the latest book to be recommended by the Book Society. The theme is a Scot in search of England. It is a brilliantly funny book, written with a lovely zest, and the Englishman puts it down with a pleasant —if dubious—glow of complaisance.

*

The only place where Mr. Macdonnell's satire really stings is in the foxhunting scenes, which is surprising. It always seems to me that to induce Jews and stockbrokers to go through the rigours of a day in the saddle—even when they know God made no field without a gate—is rather a triumph for the English system. Incidentally, Mr. Macdonnell is the honorary secretary of the Carlton House Terrace Defence Committee, and the book is dedicated to Mr. J. C. Squire.

*

The secretary of that Committee is a woman—Miss M. I. Batten, well known for hunting the kind of foxes who have their earths in city board-rooms, where cunning plots are hatched for despoiling both the town and the countryside. Miss Batten hunts them down, and when they go to ground she digs them out. She has both the pertinacity and the guile of a fine huntsman. Like Oxford—if I may indulge the weakness for analogy which has suddenly overwhelmed my pen—Miss Batten is a home for lost causes. But with this difference : she does not share Oxford's affected predilection for losing its battles. The cause found by Miss Batten is no longer lost, as the Commissioners of Crown Lands have discovered. ASTRAGAL

THE ARCHITECTS' DIARY

Wednesday, February 22

R.I.B.A., 9 CONDUIT STREET, W.1. Exhibition of photographs of monuments of Islamic architecture in Persia. Until February 25. 10 a.m. to 8 p.m. 10 *a.m.*

FRENCH ART

An exhibition of French Art—entitled "The Three French Reigns" (Louis XIV, XV and XVI)—was opened to the public yesterday at the house of Sir Philip Sassoon (25, Park Lane) in aid of the Royal Northern Group of Hospitals.

CIVIC SENSE IN SWEDEN

Mr. R. Gardner-Medwin, A.R.I.B.A., (Honan Scholar, 1932) read a paper on "Civic Sense in Sweden" at a meeting of the Liverpool Architectural Society on Wednesday last. After pointing out that he did not intend to talk about the Stockholm Town Hall—he knew of no lecture or article on Swedish architecture that had not described, with much relish, the bricks and mortar of that building—the lecturer said :

The good standard of design and consistency in Swedish architecture was more impressive to me than the individual qualities of their buildings. It has been said that this generation in Sweden has been unusually prolific in artistic genius. This may be so ; but I believe we have just as large a supply of genius in England, and many modern buildings finer than theirs. Of the buildings well anchored to tradition there is nothing in Sweden which approaches the fine qualities of Liverpool Cathedral ; and, at the other extreme, in modernist machine architecture they have nothing to compare with the stations, coaches and *tout ensemble* of the London Underground, which I never cease to admire even when strap-hanging after a long day at the office . . . But what Sweden *has* got and we have *not* is National Good Taste. In Sweden the people *ask* for good architecture, and are given it : in England they are offered good architecture, *and won't accept it* . . . unless the architect happens to be a very skilful diplomatist.

In April the B.B.C. is going to broadcast a series of talks on the subject of Design in Industries by some of our most able artists and architects. If only we can rouse a little more enthusiasm and make people realize how important architecture really is, our streets will be more exciting than Sweden's . . . and then England will be England again.

The list of subscriptions received by the Public Relations Committee of the Building Industries National Council up to Monday last amounted to £2,019 17s. Subscriptions should be addressed to Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

Mr. Leonard Barnish, F.R.I.B.A., who presided, instead of announcing the winner of the London Travelling Scholarship, stated that, after an inspection of the five sets of drawings submitted, the committee had recommended the withholding of the scholarship.

None of the schemes came up to the required standard, and the committee felt the response was poor to a subject—a design for a country club by the sea—which presented no undue difficulties.

Honoraria of £5 each were awarded to Mr. D. M. Cowin and Mr. R. V. Smith, the former a fifth-year student, and the latter a graduate of the Liverpool University School of Architecture.

BRITISH MUSEUM

The British Museum is to be modernized at a cost of £350,000. The work, which is expected to take five years to complete, is to be carried out for two reasons. First, to make the building fireproof throughout ; secondly, to increase the floor space.

THE ARCHITECTS' (REGISTRATION) ACT

The Architects' Registration Council of the United Kingdom, on the recommendation of the Board of Architectural Education, have decided to recognize the following examinations as a qualification for Registration under Section 6 1 (c) of the Act :—

R.I.B.A. : Final Examination, Special Final Examination. School of Architecture, Robert Gordon's Colleges, Aberdeen : Diploma Final Examination. Birmingham School of Architecture, Central School of Arts and Crafts, Birmingham : Diploma Final Examination. Welsh School of Architecture, The Technical College, Cardiff : Diploma Examination. School of Architecture, Edinburgh College of Art : Diploma Final Examination. Glasgow School of Architecture : Diploma Final Examination. University of Glasgow : Degree of Bachelor of Science in Architecture Final Examination. School of Architecture, Leeds College of Art : Diploma Examination. Liverpool School of Architecture, University of Liverpool : Final Examination for the Degree of Bachelor of Architecture ; Final Examination for the Diploma in Architecture. School of Architecture, The Architectural Association. London : Diploma Final Examination. Bartlett School of Architecture, University of London : Final Examination for the Degree of Bachelor of Arts in Architecture ; Final Examination for the Diploma in Architecture, School of Architecture, University of Manchester : Bachelor of Arts Degree with Honours in Architecture Final Examination ; Certificate Final Examination.

The recognition of the above examinations is retrospective.

FOR PRIVATE BUILDERS

The Manchester Town Planning Committee, in collaboration with the City Architect, Mr. G. Noel Hill, is to circulate a memorandum to all private builders in the Manchester area, suggesting lines on which they might not only improve the standard of their work, but at the same time effect substantial economies.

The memorandum is to be prepared in booklet form, and will contain expert advice upon all phases of house building, from the planning of the site to the best types of doors, eaves and chimneys.

MUNICIPAL EXPENDITURE

The Minister of Health, in the House of Commons on Wednesday last, stated that there was no "blockade" of municipal expenditure. This statement was based on the fact that, of applications for loans amounting to £32,500,000 during the last sixteen months, only £2,500,000 have been refused by the Ministry, and is in apparent conflict with the estimate of the Special Committee for Public Relations of the Building Industries' National Council that works to the value of £30,000,000 have been held up or curtailed as a result of the policy of the Central Government. Actually, however, the figures chosen by Sir F. Hilton Young are apt to be misleading.

The influence of the Ministry of Health on the expenditure of local authorities is much wider and much greater than is indicated by figures of loans applied for and refused. The Ministry largely determines the atmosphere in which plans are prepared and applications for loans made. Then, when plans are prepared they must be approved, and when eventually an application is made for a loan the Ministry may refuse sanction. The figures of loans refused, therefore, indicate only the amount of work held up at the last stage of a very effective filtering process.

THE EVENING STANDARD

LONDON'S SHAME—the SLUMS

WE MUST GET TO WORK AT ONCE

Our Government is talking about a departmental committee to consider the problem of slum clearance.
London's slums cannot wait for a committee.

THE TIMES

WAR ON SLUMS

THE TACTICS FOR VICTORY

Any agency which is to prove successful in liquidating the slums must satisfy certain conditions which are fairly simple to define. It must be in a position to borrow adequate funds at the cheapest possible rate. It must operate on a sufficient scale to obtain the maximum economies from bulk purchase and an optimum load on the *personnel* and plant employed. It must not be unduly hampered by legislation or tradition from providing the utmost comfort and amenity that it is possible to provide at the given price through full use of contemporary materials and layouts. It must have effective power to resist all speculative inflation of costs both in land and materials. The more success

GLASGOW FORWARD

6,347 ONE-ROOM DWELLINGS.

In Dundee there are still 6,347 one-room and 22,252 two-room houses, or 69.9 per cent. of the total houses in the city, and these one- and two-roomed houses are occupied by 56.2 per cent. of the population. That is bad enough, but when these figures come to be analysed, the position is revealed as being most serious indeed.

Looking at the one-roomed houses, we find that 1,176 of them are inhabited by **more than three persons.**

Closer scrutiny reveals some cruel instances of overcrowding.

Four of these one-roomed houses are inhabited by 10, 11, 12, and 14 persons; eight have 9 occupants; thirty have families of 8 in them; no fewer than 98 are occupied by 7 people; 175 one-rooms are tenanted by families of 6; and in 302 cases families of 5 live in a single room.

THE MANCHESTER GUARDIAN

THE PROBLEM OF THE SLUMS

I.—A General Survey

ABOMINABLE LIVING CONDITIONS

Drastic Remedies Needed

All over England in most of the big towns, and perhaps to an even greater extent in middle-sized towns, there are whole areas where living conditions are so abominable that the only cure is demolition of the houses. These true slums differ greatly in character from place to place, but they have certain features in common. Nearly everywhere there are dark, ill-paved, dirty courts behind the streets.

The houses are usually in bad repair and nearly all are hopelessly verminous. Often they are rat infested. The sanitary arrangements are disgusting. In many cases privies are still in use.

THE DAILY EXPRESS

MY PLAN FOR THE SLUMS

By ALFRED C. BOSSOM, M.P.,

The Well-known Architect

I HEARTILY agree with the summons of the "Daily Express" to "dynamite the slums." Let us see how it can be done.

Very clearly the first thing needed is land. Where is it to be found?

My reply is that the land can itself be created. How?

By roofing in the open railway cuttings that are to be found all over the metropolis.

I have gone into this question pretty closely. I believe that in ten years from the first beginnings of operations on the railway cuttings we could break for ever the back of the slum clearance problem in London.

WHAT is more, by working to a clearly defined programme, we could carry out the task at a cost that would really enable the present tenants of the slums to be rehoused at rents they could afford to pay, and without the risk that overcrowding would bring back all the old evil conditions.

THE SLUM DRIVE: In the newspapers the demand for the abolition of slums is widespread; it must stand in the forefront of any policy of national reconstruction.

Thomas Wallis (of Wallis, Gilbert and Partners) whose paper on "Factories," read at a meeting of the R.I.B.A. on Monday night, is summarized on the facing and following pages.

R. I. B. A.

AUSTRALIAN SCHOOLS

The Secretary to the Board of Architectural Education has sent us the following notice :

In the announcement, dated November 17, 1932, sent to you to the effect that under the terms of the scheme agreed between the Royal Institute of British Architects and the Royal Australian Institute of Architects, the School of Architecture of the University of Melbourne had been recognized for exemption from the R.I.B.A. Intermediate and Final Examinations, and the School of Architecture of the Sydney Technical College had been recognized for exemption from the R.I.B.A. Intermediate Examination, it should have been pointed out that the Royal Institute of the Architects of Western Australia does not form part of the Royal Australian Institute of Architects. The Royal Australian Institute has no jurisdiction in Western Australia.

INTERMEDIATE EXAMINATION

The attention of candidates is drawn to the fact that the requirements for the R.I.B.A. Intermediate Examination Testimonies of Study have been revised, and are now as shown below. The revisions have been made in the paragraphs marked.*

The Testimonies of Study must consist, except where otherwise stated, of sheets of drawings, not less than 27 inches by 20 inches, neatly and carefully finished as follows :—

A.—The Orders. A façade or part of a façade of a building of recognised importance, showing the application of one or more of the Greek, Roman or Renaissance Orders of Architecture. Students must state their authority for the Order and the building, which should not be of recent design.

One sheet comprising a general drawing of the building, sufficient to illustrate the application of the Order or Orders, with section of the façade wall, and plans of the façade wall in the stories where the Orders occur.

One sheet of details of the Order or Orders.

*B.—FREEHAND DRAWING. Satisfactory evidence of his capacity to draw, which may be in the form of sketches.

*C.—MEASURED DRAWINGS. One sheet of measured drawings of an existing building or portion of a building, not of recent construction, to be selected by Candidates. Their plottings and sketches are also to be submitted. Care must be exercised to select a building of architectural merit, and such essentials as stone jointing, etc., should be clearly indicated. If Candidates are in doubt as to a suitable subject they should communicate with the Secretary to the Board of Architectural Education.

One sheet comprising a simple design based on the subject measured. Before preparing this sheet the Candidate should try to analyse the character of the subject measured and endeavour to express this character in his design.

D.—CONSTRUCTION APPLIED TO ELEMENTARY DESIGN. Working drawings of a domestic building of moderate dimensions, designed by Candidates, showing clearly the construction of floors, roofs, joinery, etc.

The quality of design will be considered and work not reaching a reasonable standard of simple design will be disqualified on that ground.

One sheet comprising general drawings to a scale of 8 feet to 1 inch.

One sheet comprising a comprehensive half-inch detail.

One sheet comprising some full-size details.

* Candidates are now required to submit *all* the Testimonies of Study together.

EXAMINATIONS IN INDIA

The R.I.B.A. Examination Board in India have arranged to hold the R.I.B.A. Final and Special Examinations in Bombay from April 21 to 29. The last day for receiving applications, which should be sent to the Hon. Secretary of the R.I.B.A. Examination Board in India, 43, Apollo Street, Fort, Bombay, is March 22.

COUNCIL MEETING

Following are some notes from a recent meeting of the Council of the Institute :

University of London Architectural Education Committee : Messrs. W. H. Ansell (F.) and A. H. Moberly (F.), were re-appointed to represent the R.I.B.A. on the University of London Architectural Education Committee.

Fire Tests for Building Materials : Messrs. P. J. Black (L.) and R. Minton Taylor (F.) were appointed to represent the R.I.B.A. on a conference set up by the Department of Scientific and Industrial Research to discuss the establishment of a fire testing station.

Timber Conference : Mr. G. N. Kent (L.) was appointed to represent the R.I.B.A. on a timber conference set up by the British Standards Institution to discuss the preparation of a series of nationally-agreed standard commercial specifications for Empire timbers to facilitate inter-Empire trade.

National Association of Water Users : Mr. R. J. Angel (F.) was appointed to represent the R.I.B.A. on the National Association of Water Users in place of Mr. E. J. Sadgrove, who has resigned his position owing to ill-health.

Comité Permanent Internationale des Architectes (British Section) : The following were invited to serve as members of the British Section of this Comité : Sir Giles Gilbert Scott, R.A. (F.), and Messrs. E. Guy Dawber, A.R.A. (F.), Robert Atkinson (F.), and H. V. Lanchester (F.).

Transfer to the Retired Members Class : The following members were transferred to the Retired Members Class :

As Retired Fellows : Messrs. C. H. Morgan ; W. H. Raffles ; and Herbert Tooley. *As Retired Associates :* Messrs. L. Barlow ; J. P. Clark ; J. A. Woore ; and A. H. Worsley. *As Retired Licentiates :* Messrs. W. Cook ; J. Ellwood ; R. E. Haymes ; C. W. Maplesden.

Resignations : The following resignations were accepted with regret :

Fullford (L.) ; A. H. Kirk (L.) ; W. L. Lissaman (L.) ; H. W. H. Marston (L.) ; F. L. Sargent (L.) ; H. A. Sisley (L.) ; and L. M. Wells-Bladen (L.).

COMPETITION

NEWS

R.S.A. INDUSTRIAL DESIGNS COMPETITION

Particulars of the tenth annual open competition of industrial designs, to be held at the Imperial College of Science and Technology, Imperial Institute Road, South Kensington, London, S.W.7, in June, have now been issued, and can be obtained from the Secretary of the Royal Society of Arts, John Street, Adelphi, London, W.C.2. Intending competitors must apply to the Secretary of the Society between May 1 and May 8 for the necessary entry forms, the last day for receiving entries being May 20. The designs will be received at the Imperial College of Science and Technology, Imperial Institute Road, S.W.7, between June 7 and 9, and after the judging, which takes place in July, the prize and accepted designs will be exhibited to the public at

the Imperial Institute, South Kensington, S.W.7, from August 5 to August 31 (Sundays included). In all, scholarships and prizes amounting to about £1,500 are offered in connection with the 1933 Competition.

In the architectural decoration section, designs are invited for decorations for the vestibule and entrance hall to a cinema and for an airport refreshment room; decorative tile floor for the entrance hall to a public library; decorative metal and glass shopfronts; a public tram or omnibus shelter in concrete; memorials in Portland stone; sign for an inn; fireplaces; standard lamp; a lay-out of exhibition stands, an arrangement of exhibits of building and decorative materials, and a decorative glass screen for an international exhibition.

TOWNHILL CHURCH

The R.I.B.A. has issued the following notice:—

Members of the R.I.B.A. and of its allied societies must not take part in the above competition, because the conditions are not in accordance with the published Regulations of the Royal Institute for Architectural Competitions.

A SHOPPING CENTRE

The provision of a new shopping centre for Blackpool is foreshadowed by the decision of the General Purposes Committee to advertise for competitive designs for the layout of a site between the Town Hall and Church Street, which includes St. John's Market.

The Town Council have already decided to give notice to the market tenants, for whom a new market is to be erected in the Cookson Street locality.

Competitions Open

March 24.—Façade to a newspaper office in grey Cornish granite, for the Cornish Quarry Masters' Association. First Prize, £50. Conditions etc., were published in *A.J.* for Feb. 1.

March 31.—Competitions for Cottages to be built at an economic rent, organized by the Building Centre, 158, New Bond Street, W.1, from whom full conditions are obtainable. Premium: £100.

April 13.—Design of a new exhibition hall at Manchester for the Management of the Manchester Building Trades' Exhibition. Premiums: £150, £75 and £25. Full particulars were published in our last issue.

May 31.—Sending-in Day. Layout of a suburb on the river Escaut, Antwerp. £2,400 in prizes (1st, £800). Conditions, etc., were published in *A.J.* for December 7, 1932.

FACTORY PLANNING *AND* CONSTRUCTION

[By Thomas Wallis]

The following is a summary of the author's lecture delivered to the R.I.B.A. on Monday last

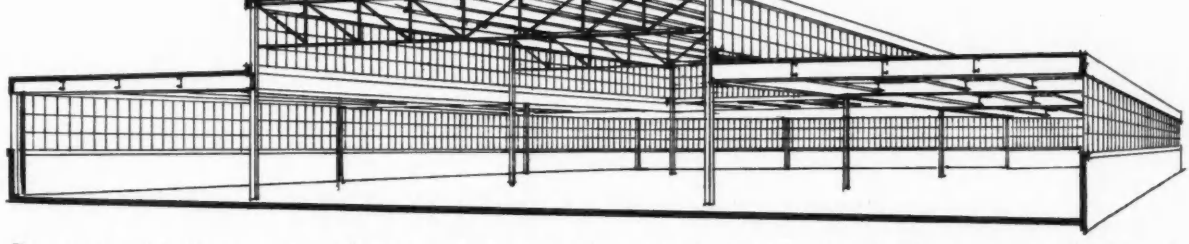
INDUSTRIAL architecture has a clear, unfettered birth, free from tradition, and I lay claim that it is the pioneer of the new style which I will name "Transgressional." Whilst this new-style influence is easily detected in nearly all new buildings, there is still the tendency to copy that great man who was born about 2,000 years ago, and who at that time so cleverly turned rough stone and other materials into beautiful, graceful and dignified buildings, whose christian name was Tuscan and whose surname Architecture.

Probably the greatest reason for copying is the desire to harmonize with surroundings; but if this is so, we shall never make progress—on the contrary, it will hamper our imagination and stop progress. A good, new, modernly-designed building will harmonize if you give it time to age.

It has to be appreciated that the capital cost of plant-installation and buildings is a burden against which dividends have to be paid, and therefore true economy must be foremost in one's mind from beginning to end. By this I mean that a penny piece must not be wasted; I do not mean that a penny must not be spent, providing it is wisely spent and is going to bear its part and use in the making of profits.

The word "economy" has been and is now being abused. The advice from many high quarters with regard to economy is painfully within the very near memories of all of us. In spite of the stoppage of so much municipal and private work, it is encouraging to think that new building of an industrial nature has expanded rather than contracted, an expansion which is largely due to one important factor—the passing of the Tariff Acts—which has brought many American and Continental industrialists down to the necessity of manufacturing their goods in this country.

MAIN TYPES OF INDUSTRIAL BUILDINGS



Industrial buildings may be roughly classified under three headings, as follows:

The one-story building,
The multi-story building, and
A combination of the two.

Generally it is found that the larger factory has to be constructed on the last of these three schemes, for varying reasons. It may be that there are heavy components to be dealt with which can only economically go on the ground floor. For foundries, forge shops and heat-treating plant, the one-story building is also employed, but where an article can be more readily moved by means of conveyors or gravity chutes it is found that a multi-story building is advantageous.

Take, for example, the manufacture of artificial silk or even paper. The raw material is conveyed or pumped to the top of a high building, whence it gravitates or chutes from floor to floor until the manufactured raw material is available on the ground floor, where it passes through a one-story building for its actual manufacture into the finished article, at the end of which process it is often found profitable to enter into the finished goods store in the form of a multi-story building. Even when land is cheap this form of building is advisable for many articles of manufacture.

Factories for the manufacture of motor

For one-story factories, east-and-west-lighting, as indicated in this drawing, is claimed to have the advantage over north-light roofs.

The Ford Experimental Building, Dearborn, Detroit: By Albert A. Kahn. An example of an American type of roof-construction which marked a departure from the use of north lights.

tyres, motor bodies, etc., are far better dealt with on one floor, as the gravity system is barely practicable, but in practice every form of manufacture has to be dealt with on its merits. In designing single-story buildings you will find that, as far as possible, works managers like full open areas of floor space without obstruction, and, in order to meet this, we have found it advantageous to elevate such things as lavatories, cloak rooms and works offices to occupy space in the roof. This form of accommodation is also economical.

ONE-STORY BUILDING ROOFING

To deal now with the various types of one-story buildings, the generally accepted practice in Europe is to use the north-light type, with a clear height of anything from 12 ft. to 15 ft.; and if this roof is to be used with economy, one should be careful to look after the proportion of glazing to floor space. The minimum of glass and the maximum reflection from the underside of the south slope should be adopted, as this method reduces and conserves heat. I have seen many factories of this type with an over-proportion of glass and less effective lighting, simply through bad design.

This form of roofing has its disadvantages, and unless a considerable amount of money is spent on its construction it is not wind- or dustproof, and it does not lend itself to proper ventilation in all weathers. In America they consider this type of roof obsolete, and they have adopted other types of construction, such as the butterfly truss, since they claim that this gives better ventilation and even better lighting. They have carried out tests and are said to have proved that when the intensity of light varies, and when the direction from which the light enters the building also alters, east and west lighting is better for the eyes of the operatives than north lighting. If the rays of the sun are a disadvantage, they can of course be diffused by the use of prismatic or ribbed glass. I am myself convinced that there are many advantages to be obtained by the admission of the rays of the sun into the building.

I have not used this type of truss in this country, but have adopted a simpler form of roofing for east and west lighting, and it has proved to be very satisfactory under working conditions and is definitely dust- and wind-resisting and gives better ventilation. This type of roofing can be seen in the Packard and Coty factories in the Great West Road, but its use is limited to a width in the building of about 140 ft. If it is essential that the roof has to be entirely weatherproof, this type of construction is definitely cheaper than a north-light truss, whilst the cleaning of the roof is simpler and the internal appearance infinitely better.

Where large open areas free from columns are necessary, it is easier to adopt the north-light truss type of construction than any other, as spans up to 200 ft. are economically possible. Lateral supports are obtained by a deep truss running from the apex to the tie beam, the only disadvantage being that this somewhat affects the reflection of the north light, but, to overcome this, it is quite possible to have this main truss on an angle and enclosed in the south slope. I have not tried this form of construction, but it can be seen in Germany, where large open areas are contrived without any visible means of support.

FLOORS

The one-story building readily lends itself to departmental extension and, providing spare land is sufficient, without interference with the original layout; moreover, the work can be carried out without interference to the progress of manufacture. External walls should be weatherproof, but of light construction, so as to make them readily removable, and all roofs should be constructed for easy extension.

It is a long subject to deal with the various types of floor, since each manufacture has to be dealt with on its merits. The commonest form of finish is granolithic. But unless properly laid to latest methods and put to heavy use, its life is under twelve months. These floors can be constructed so that they will not hollow and will not wear; wearing generally is the result of hollowness. Where the wear is extraordinarily heavy, even the latest methods of granolithic laying will not stand, and the only satisfactory form of floor for such conditions is the ordinary type of steel plates firmly bedded into concrete. It is a fallacy for works managers to maintain that granolithic floors are cold for the worker who is seated at his task. They only have the appearance of being cold, and as soon as the worker is persuaded that they are not cold he will readily agree.

The Coty perfumery factory, Great West Road, London: By Wallis, Gilbert and Partners. In this building the east-and-west-lighting described in this article has been adopted.

Where the floor area is to be occupied by a large number of small machines, then granolithic is unsuitable and some form of wood block or planked floor should be adopted, where plant can be readily screwed down, always providing that, if wood blocks are used, the plant movement is insufficient to move the blocks.

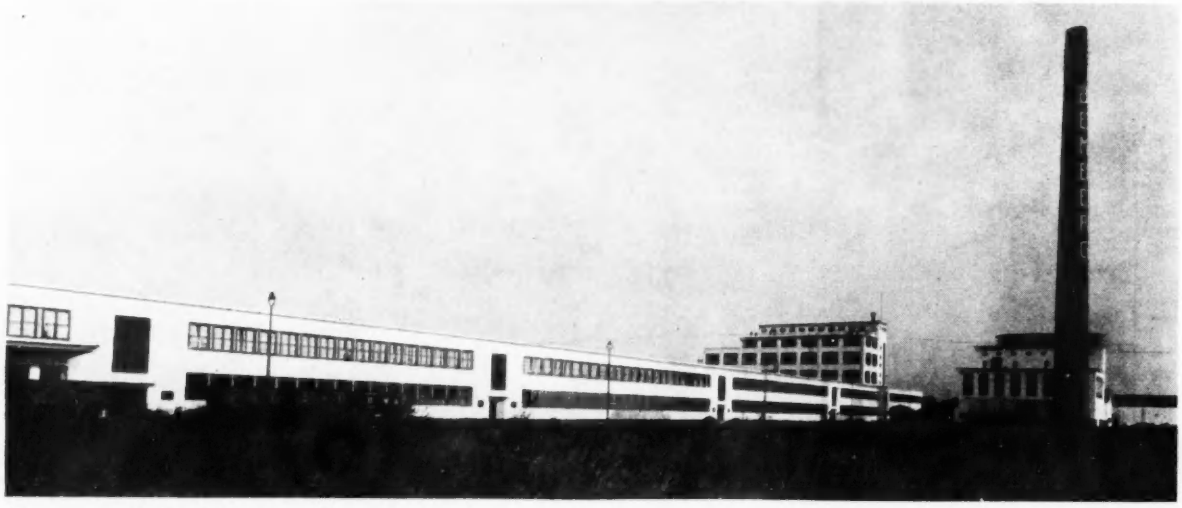
Let me take one other form only of floor construction—that which has to stand up against the effects of various types of acids or other material injurious to cement. Should the acid be of very great strength, and it is necessary for heavy loads to stand upon or to be moved over the floors, I know of nothing other than blue bricks, pointed up with sulphur, that will stand up to the job. Where the acids are of weaker strength, there are many forms of acid-resisting asphalt which can be used; and where temperatures are high or loads somewhat heavy, this asphalt can be strengthened by the incorporation of granite chippings. One further word on acids—be careful with all your metal work in a building where fumes are prevalent. If the strength of the fumes is great, wooden sashes are often necessary, and in places it is often advantageous to adopt the new form of welded roof truss as against the ordinary type of bolted construction.

THE MULTI-STORY BUILDING

It is unnecessary perhaps to say that the effective width of the multi-story building is somewhat dependent upon its height and the ability of the light to reach to the centre. In many cases, however, multi-story buildings can be wide, providing space is essential for the storage of goods, in the centre of the building. Height, floor to floor, is dependent upon many things. Generally speaking, this varies from 12 ft. to 15 ft., whilst the percentage of window space to floor area runs from 30 per cent. to 35 per cent. Big spans in multi-story buildings have to be avoided as far as possible on account of cost.

The various forms of construction adopted are common knowledge, and therefore the only one I will touch upon is the American mushroom type, now fairly universal both in England and on the Continent in various forms. This type, on account of its unbroken ceiling surface and continuous lighting, allows for greater width of building, and where specially heavy loads have to be carried and where large spans are not necessary it is a form of construction that is cheaper than the more ordinary forms.

The extension of multi-story buildings can be arranged upwards for storage or administrative buildings, but where the buildings are used for manufacture extension should, as far as possible, be arranged by a lengthening of the building.



Where reinforced concrete or concrete encasement to steel is adopted, care must be taken in the construction to incorporate holes and inserts so planned that most forms of plant can be attached to the fabric without the necessity of continual cutting away from time to time. These attachments can also be used for easy suspension of services and sprinklers.

THE FACTORY FAÇADE

The industrial architect should, without extravagance, endeavour to give a pleasing effect to his façades, relying as far as possible upon the necessary planning and layout for good and proportionate lines. A little money wisely spent in the incorporation of some form of decoration, especially colour, is not money wasted. It has a psychological effect on the worker. Moreover, an attractive design is good advertisement, more especially where the manufacture depends for its existence upon the public. A properly conceived and well designed façade on a main thoroughfare will give proportionately better results than that obtained from the large yearly expenditure so often incurred in usual advertising.

SITE

The question of site is dependent upon so many things relative to the manufacture that it is difficult to give much useful information. An architect should, in the selection of a site, take responsibility only for its merits in relation to building costs; he should, however, be sure that public services are economically available. I do, however, impress upon industrialists the necessity of allowing ample room for extension to their plant, and, certainly before a site is actually purchased, of obtaining the architect's views, and also his plans for the complete development of the site.

Two views of the Bemberg factory, Doncaster: By Wallis, Gilbert and Partners. That above illustrates a combination of single-story and multi-story planning; that below, the seemly appearance of such necessary factory adjuncts as conditioning towers.

CONTRACTS

The Conditions of Contract as in general use are applicable to normal factory construction, but it is sometimes necessary to make slight alterations and insert additional clauses to deal with circumstances somewhat peculiar to this type of work.

Once an industrial firm definitely decides to build (after the basic principles of layout and cost have been settled), the most important questions are speed of construction, and dates of completion and of occupation, and these points must be fully covered in the Conditions of Contract and Specification.

In the first place, it is in the interests of speedy execution that a clause providing for bonus payment for early completion be inserted, as well as a damage clause for late completion, and better still if the amount of daily or weekly bonus for early completion is in excess of the daily or weekly amount, assessed as liquidated and ascertained damages, usually called a penalty. The insertion of bonus and penalty clauses alone is not sufficient. An industrial firm requiring a factory by a certain date is not primarily concerned with the penalty or bonus, but essentially with getting the buildings at a specified time, as they have to arrange for the machinery and installation of plant, which sometimes takes as long to erect as the building itself.

It must be appreciated that machinery and plant are ordered for delivery at a specified time, and apart from the cost of double handling, storing, etc., of the machinery, the upsetting of their programme of machinery installation is a costly matter and may have far-reaching results from the production aspect.

An additional clause should therefore be inserted in the contract to give the architect power to demand acceleration of any part or parts of the structure which are behind schedule. I will term this clause the "acceleration clause," and this should cover the contractor providing additional labour, extra or better plant and more materials, and also the working of overtime or shift work as may be required from time to time by the architect.

The wording of the completion date clause or clauses should incorporate the working to sectional progress charts. A progress chart or schedule should be prepared for each section of the work, and should be sub-divided under various trades and operations, and these sectional progress charts should collectively arrive at the contract date or dates.

PROGRESS CHARTS

These progress charts, if properly prepared in the first instance, are of immense value throughout the progress of the work, not only to the architects, but to the general contractor and the sub-contractors. They are also essential to the proper interpretation of the "acceleration clause" to which I have previously referred. The progress charts should be prepared jointly by the architect and the contractor and should be very seriously considered before they are finally arranged.

Apart from normal progress, they should take into consideration the following :—

(a) The fact that certain buildings or sections are more complicated than others.

(b) The necessity of completing certain parts before others to enable heavy or intricate machinery or plant to be installed whilst other buildings are being completed.

(c) The harmonious working of the installation of services such as electrical power, process steam, compressed air, water, gas, heating and the like.

In conjunction with the progress charts, the contractor should provide for the taking of progress photographs. These will be found useful not only as a pictorial record of the progress, but for reference purposes at completion, when matters arising out of progress, bonus, penalty, acceleration and other clauses are finally settled.

STORAGE OF MANUFACTURERS' PLANT

Another clause which should be incorporated provides for the factory owner being allowed to bring in, store or erect plant, shafting, machinery, etc., at his own risk, when any part or parts of the buildings are in a fit state to receive them, before they are finally completed. This clause may safeguard the contractor against being impeded in his own work or being caused extra costs. The architect should be specifically nominated as the sole judge as to whether the factory owner may or may

not enter the building to erect the plant, machinery, etc.

When the building is in the form of an extension to an existing factory, clauses should be inserted in the contract according to the circumstances, and the following might be particularly mentioned :—

(a) The contractors may be required to submit to the factory owners' regulations, including checking in and out and submission to search, e.g.—the latter stipulation would arise in factories in which precious metals are used.

(b) The building work must not impede or unduly inconvenience the factory owner in the carrying on of his manufacturing business.

(c) The contractor must protect not only the existing buildings from injury and damage, but also the factory employees from injury from the building operations.

(d) There are, of course, other clauses of this nature, but these are generally referred to in the standard Conditions of Contract.

SEPARATE CONTRACTS

Although it is generally an advantage to have the whole of the building work under one main control and responsibility—namely, that of the general contractor—it is sometimes preferable and occasionally economical to separate certain sections or trades for execution under individual contracts. The latter method can be recommended for very large factory works where speed is the essential factor.

The success of this method is mainly dependent upon the efficiency in drawing up the progress charts, the proper interlacing of the various separate contracts and keeping the various contractors strictly up to time throughout the whole progress of the works.

HEATING AND VENTILATION

No hard and fast rule for the method of heating and ventilating to be adopted can be laid down, as many varying conditions are required to be met in connection with different industries. For example, a heating system designed for a factory in which the work is of a heavy nature, requiring considerable physical effort, would prove totally inadequate for a building where work of a sedentary nature is carried out.

In several factories, where steam has been available for process work, I have utilized the excess or waste steam for heating with considerable success and also the achievement of great economy. A uniform and comfortable warmth is provided by heater units which consist of a heating element or battery enclosed in a casing over which the air is delivered by means of an electrically driven fan.

Control of the heat emission from the units can be effected either by a thermostat operating the fan switch or fitted on the steam supply. The type of unit provided can be conveniently suspended from the roof trusses or fixed on the walls or stanchions.

In several large factories carried out under my supervision accelerated hot-water heating is installed, serving a series of unit heaters, and from this method of warming, good results have been obtained. From my experience, however, I have found that a certain amount of direct heating either by radiators or pipe coils is advisable, enabling the fans on the heater units to be switched off during the night time, the radiators provided being of sufficient capacity to temper the air in the building ; thus during the night it is not essential to run any mechanical equipment.

Wherever possible, I endeavour to avoid the use of any system of warming which necessitates large ducts or metal trunks, as from experience it is found that, unless the trunks are constructed of sufficient size to allow of regular cleaning, they become dust-laden and unhygienic.

The Mansion House

" The Story of the Mansion House " was the title of a paper read by Mr. Sydney Tatchell at a meeting of the London Society on Friday last. " In common with all who attempt to tell any story of the Mansion House," said the lecturer," I have delved into Mr. Sydney Perks's *History of the Mansion House*, a work representing a vast amount of labour and research in the past of one who not only was the City's Surveyor for over twenty years, but who may faithfully be recorded as having, by his unexampled knowledge of the fabric, prepared the way for its reconditioning. To him is chiefly due the credit for the plans which were carried out." Mr. Tatchell then recounted the story of the home of the Lord Mayors of London, from the time it was first decided to erect the building—in 1734—up to the present day. A large part of the paper was devoted to its reconditioning, which was possible only by the public-spirited action of Sir Phené Neal, who relinquished his privilege of residing in the Mansion House during his term of office (1930).

Liverpool Cathedral

Sir Edwin Lutyens, whose plans for the new R. C. Cathedral in Liverpool have been passed by the corporation of the city, says the building will take " anything from 40 to 400 years " to complete.

West Yorkshire Society

Mr. B. R. Gribbon, F.R.I.B.A., presided at a meeting of the above Society, held on February 16, at Halifax, when a lecture on " The Sense of Harmony " was given by the Hon. Humphrey Pakington. He said that to argue that the present state of our civilization was discordant with nature was surely not a tenable proposition, especially when they thought of those Roman equivalents of modern civilization, the fourteen great aqueducts striding across the Campagna. These were now thought to be an adornment to the landscape, but the present-day electric pylons, distributing comfort and wellbeing to the villages of England, were described as scars on the face of the countryside.

He was not going to pretend that electric pylons were as beautiful as the Roman aqueducts, but at least they might try carefully to analyze the æsthetic possibilities of a pylon, or a petrol pump, before condemning them as things inimical to their surroundings, and endeavour, by redesigning them, to bring them into harmony with their environment. Was it too much to hope that our descendants would look back with awe and admiration at the ruined pylons of the twentieth century ? He was trying his best to combat the idea that the works of industry must inevitably be regarded as inimical to the landscape.

New Academician

Mr. W. Curtis Green, A.R.A., F.R.I.B.A., has been elected to the rank of Royal Academician.

The Architecture Club

At the Architecture Club on Friday, February 17, the discussion was opened by Mr. R. A. Duncan, A.R.I.B.A., who showed that the first three periods of architecture—Classic, Mediæval and Renaissance—are governed by the hand tool, and that the fourth period—Twentieth-century Architecture—is a product of the power-driven machine tool—an architecture without precedent.

Standardization is a necessary concomitant for economic reasons, but is not a new thing and does not necessarily lead to monotony. Bricks have always been standardized, but variety has been obtained in brickwork by the intelligent use of a standard unit to produce form and colour-pattern—diaper work. The Greeks had three standard columns, six standard mouldings and six standard plant forms, no more.

Mr. F. E. Towndrow, A.R.I.B.A., supporting the cause of standardization, spoke of his own attempts to produce an adjustable " voluter " to simplify and standardize the detailing of Ionic caps, and suggested a Lutyens's " Proportioner," a Baker " Balustrader " and a Blomfield " Swagger " which would produce swags for application to buildings of any period, excepting, of course, Regency.

ON THE AIR

The next discussion in the B.B.C. series of talks on " Other People's Houses " will be broadcast in the National Programme on Monday next, February 27, at 9.20 p.m. The subject is " How are we to provide for the lower-paid worker ? " and the speakers are Mr. H. R. Selley, M.P., and Major Harry Barnes, F.R.I.B.A., F.S.I.

Unemployment

SIR,—Although it may be true that in an ideal State, inhabited by supermen, unemployment will undoubtedly be regarded not as a tragedy but a triumph of civilization, yet we certainly have a very long way to go before reaching anything approaching this happy state of affairs. In the meantime unemployment must necessarily remain a very real tragedy for the individual and a very real danger to the State.

At present, in spite of our much-vaunted educational system, very few people indeed have the individual ability or capacity to benefit by leisure. Abundant leisure invariably spells decadence—this can be seen on every hand and in all classes of society, especially in the ranks of the idle dole drawers at both ends of the social ladder. Leisure (or unemployment) to them is anything but a "triumph." To the vast majority a leisured life is just more or less boredom, in spite of various artificial stimulants.

Therefore, with conditions as they are, the obvious necessity of the age is to attempt a little foresight, intelligent anticipation, and a little rational planning in the direction of race culture, so that in future we may become capable of intelligently using, instead of ignorantly abusing, the leisure with which science is endowing us.

But what actually is being done, or even attempted, in this direction?

Nothing.

We live in a world that has become obsessed with a passion for quantity, regardless of quality.

This is proved most graphically by Dr. Neurath's picture statistics, which you published in your issue for February 8, showing the extraordinary increase in the population. Each and every day there is a net increase of no fewer than 50,000 people (largely defective) on our little planet. In the normal lifetime of many of us the world's population will have doubled itself.

The problem of providing for this ever-increasing mass of humanity is intensified by the fact that fresh labour-saving robot machinery is continually being devised for eliminating human labour. Concurrently with all this development of labour-saving machinery we have fresh "social reform" legislation of a purely palliative nature continually being devised, but which is purely "ambulance work," rendered necessary by the huge and ever-increasing masses of displaced human labour. There is absolutely nothing of a preventive or socially constructive nature in this legislative ambulance work. Incidentally, the more successful it is, the greater the future increase in the already overburdened population. And thus the vicious circle is completed.

What is the use of us architects concentrating on town planning if we neglect the all-important foundations in the shape of world planning? Surely this is a work, the preservation of our civilization and culture, which now demands most urgently our attention? As your correspondent Mr. A. W. Wyatt remarks, we want less "sentimental tosh and tripe," and more realism, more foresight, more sound constructive vision, and more wide-scale planning.

L. J. REDGRAVE CRIPPS

The Real Truth

SIR,—I feel that I must protest against your journalistic methods in connection with the Carlton House Terrace controversy.

Why did you not give the full facts, which are now disclosed by Sir Reginald Blomfield at the Authors' Dinner?

I do not complain so much that you omitted to mention that the interior of the houses are vulgar; we all know that the rich have vulgar tastes, and dark houses may be an advantage in these days of servant difficulties.

But, to hide the real point that matters is a different thing. Had we known the real truth—that the Doric columns were hollow, and cast iron at that—could you really have claimed our support? The very thought that I have defended these buildings brings shame and remorse to me.

If Nash has used cast iron for a Greek column, I shudder at the prospect of hearing what he used for his Roman Corinthinian.

I feel, however, I shall be able to admire the new building now going up. This will be solid stone—no deceptive brick backing carried by steelwork, such as I feel Nash would have built today.

Sir, we ask for truth in architecture. Is it not more important that we should be given the full truth in journalism, so that at least we may be saved from the awful risk of admiring a cast-iron column.

It has been suggested to me that if all speculations for the improvement of London were carried out as well as Nash carried out his, it might be a better place. But of course this is absurd.

"NO LONGER CAST IRON"

The Winchester Cut

SIR,—In reply to Mr. Fagg, I think he has in mind the old method of cutting tiles to the raking verge of gutter as

sketch enclosed, where the two tiles at the extremity of each course are cut to wedge shape. This avoids the use of small pieces of tiles.

J. C. HALLAM

A Scale of Wages

SIR,—During the present economic depression many practising architects seem to be taking advantage of the difficulty that others, less fortunately situated, have in obtaining employment by giving their assistants a mere pittance for salary.

Much has been said of the R.I.B.A. Scale of Professional Charges, but no suggestions have been put forward for a Scale of Wages for qualified assistants. Is it not time that the whole question of "sweated labour" in the profession was made the subject of enquiry and the injustice rectified?

As qualified assistants, the writers of this letter have had full experience of this deplorable state of affairs and do not write for the sole purpose of finding themselves in print.

Therefore they sign themselves,

"UNDERNEATH THE ARCHES"

Information Sheets

SIR,—May I suggest that when the Information Sheets you are publishing, by the kind permission of Sir John Burnet, Tait and Lorne, are completed, you should yourselves carry on the good work by the preparation of further sheets for this particular purpose.

The presentation of such useful information in so clear and efficient a manner must save an enormous amount of time in the average office.

The thanks of the profession are due to

you and the architects, Sir John Burnet, Tait and Lorne, for this latest evidence of the vitality of THE ARCHITECTS' JOURNAL.

W. H. ANSELL

SIR,—The Information Sheets are splendid. All that is needed now is for you to get out a folder or file in which to keep them !

Would it not be a help to have them ready holed for filing ?

The information they give is just what one wants and often spends endless time in searching for.

I look forward to having the complete series.

R. TILSLEY GREEN

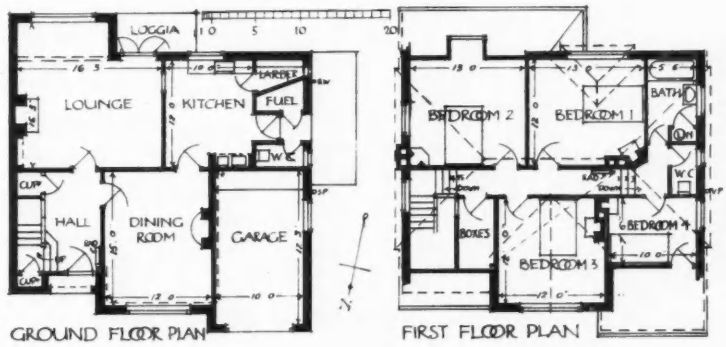
House by Edwin Gunn

SIR,—In my letter (*A.J.*, for December 14) referring to Mr. Alan Fortescue's claims for the flat-roofed house, I promised to produce particulars of a house on conventional lines which should demonstrate that low present-day cost was not dependent on novel forms of construction.

The enclosed plans and photographs are my evidence. I also append details of the cost, materials, etc.

EDWIN GUNN

This house, recently built at a cost of only a trifle over £900, has a rather unusual plan owing to the joint causes that the width of the site was only barely adequate ; that the client laid down exactly the relative positions of the rooms ; and that, from the level of the land in relation to the road, access to the garage was difficult to contrive.



The walls are of stock brick with a cavity, whitewashed externally, and the roof is covered with hand-made tiles laid over untearable felt. The windows are metal casements in wood surrounds, painted bright Brunswick green. A boiler and dual copper cylinder supply hot water, and there is a heating circuit with two radiators. The garage is warmed by the main flow and return pipes on the radiator circuit, which can be shut off by a valve when required. The hall is floored with oak blocks, other floors with narrow grooved-and-tongued boarding, and all rooms have specially-designed fireplaces, that in the dining room being of 2 in. bricks and those in other rooms of tiles with wood mantels. The loggia roof, formed without posts or brackets, by running the floor joists through the wall to join the eaves, may be noted.

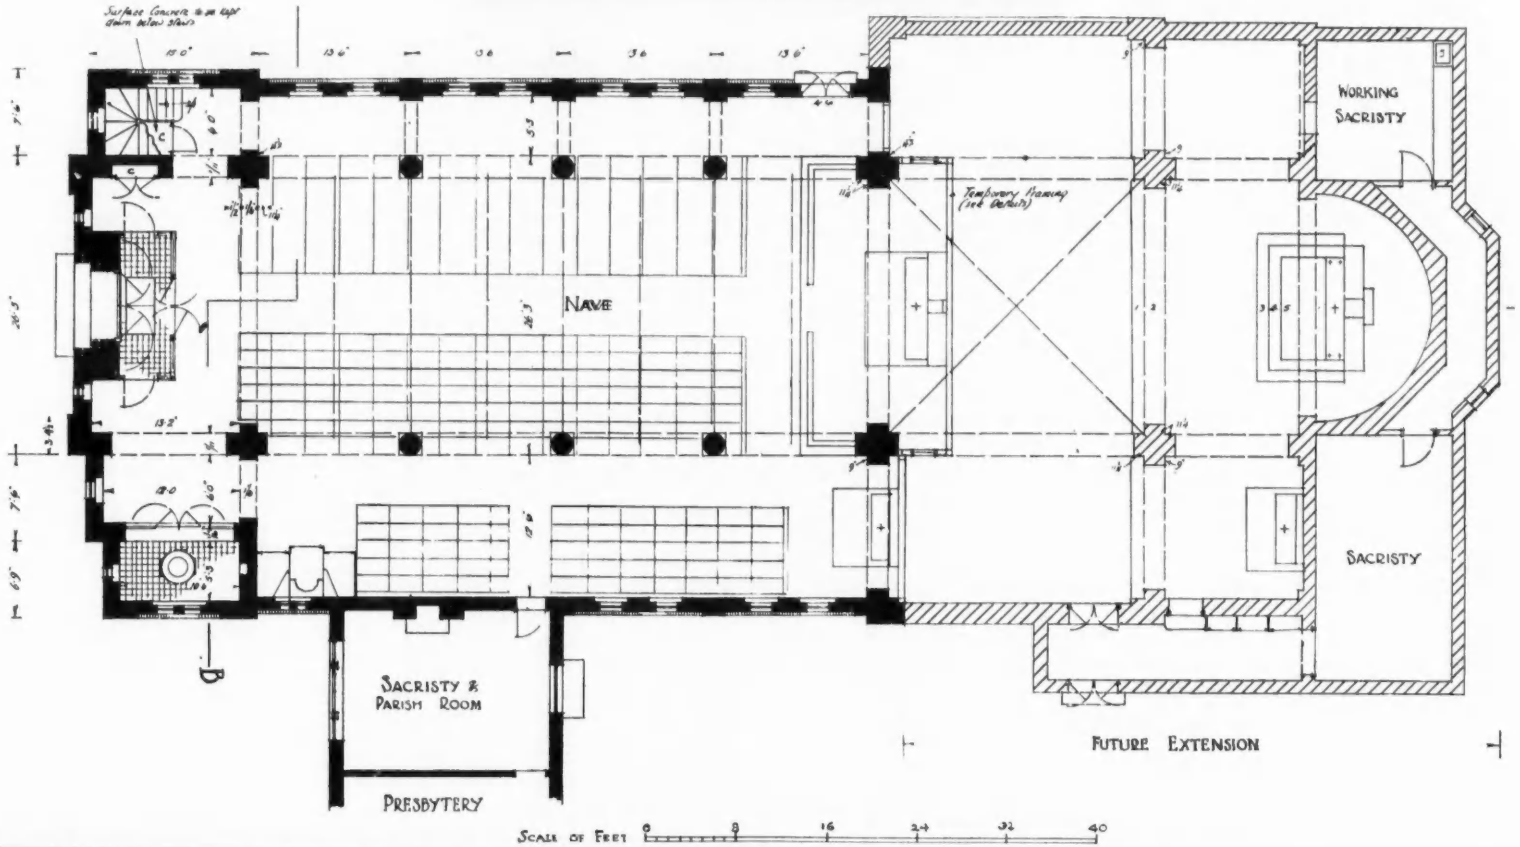
[Owing to the pressure on our space we are compelled to hold over several letters from this issue.—ED., *A.J.*]

HOUSE BY EDWIN GUNN

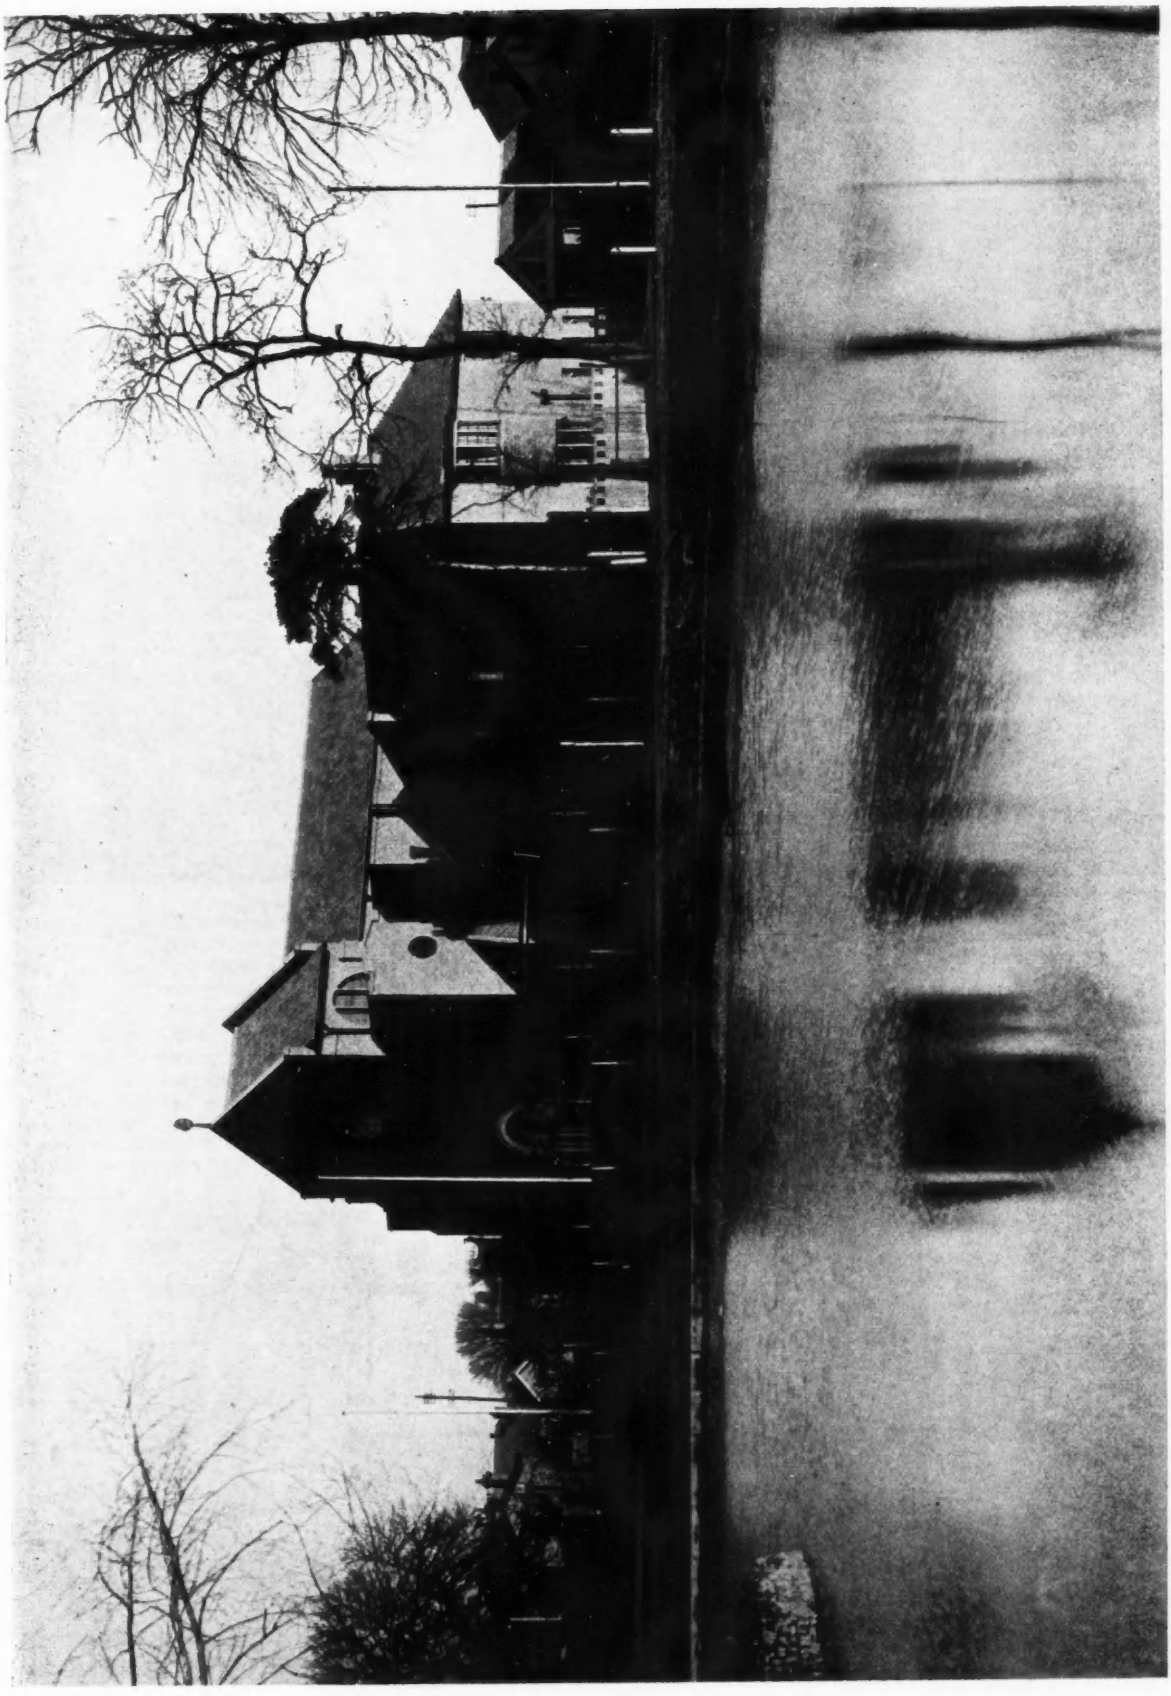
This £900 house, says Mr. Gunn in a letter on this page, demonstrates that low present-day cost is not dependent on novel forms of construction. The house shown on the left of the upper photograph, built by Mr. Gunn in 1924-25, has just been completed by the screen wall and garage in conjunction with the new house on the right. Below is seen the garden front. The materials are given in the letter.

Change of Address

The partnership that has existed between Mr. Mitchell C. Kay, A.R.I.B.A. and Mr. L. Gordon Lunan, A.R.I.B.A., under the style of Kay and Lunan, has been dissolved by mutual consent. Mr. Kay will continue in practice at 15 Wood Street, Wakefield. Telephone No. : 2404.



CHURCH OF ST. LAWRENCE, FELTHAM, MIDDX. : BY THOMAS H. B. SCOTT



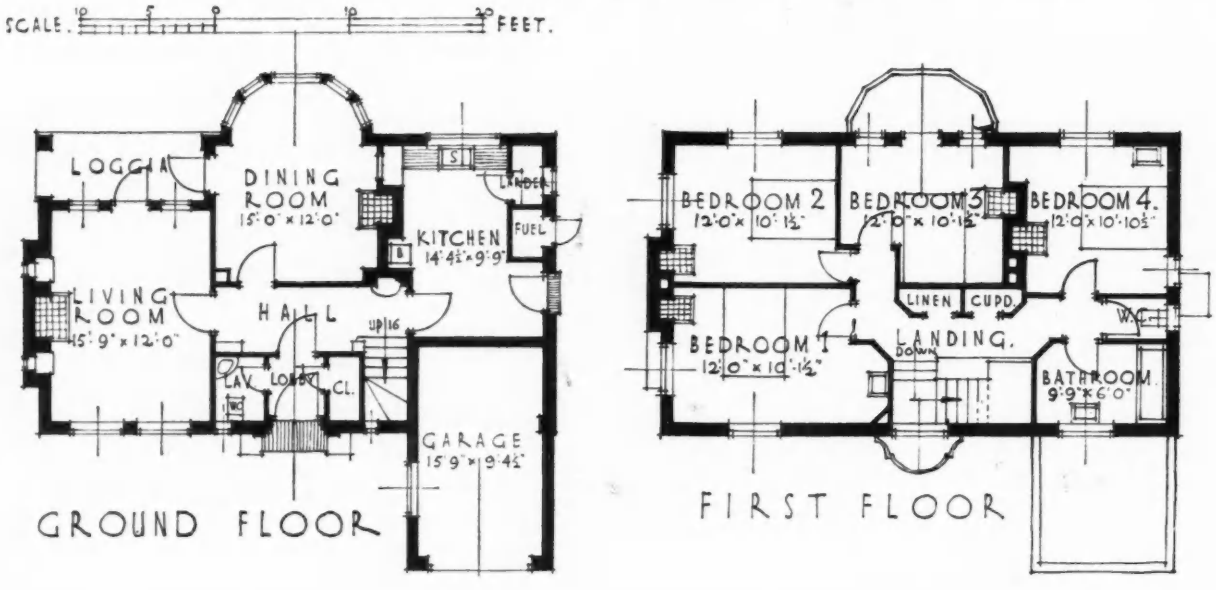
The building here illustrated is the first and major part of a church intended to accommodate 500 worshippers; transept, sanctuary and altar chapels, in the cruciform plan, are left for future development. The front is now complete, and the nave and aisles—a narrow, processional one on the south; the northerly one forming the side chapel of Our Lady—terminate in the lofty arches of the future transept. A temporary closure on a line behind the present high altar is formed with panels. Choir and organ gallery are over the entrance, and nearby is the baptistry, with font of Portland stone and railings and gate of wrought iron, and jewel-like stained glass windows, in the Chartres tradition—the work of John Trinick. The aisle windows are placed high, but there is no clerestory: the lighting is thus soft and diffused.

Fourteen plain blocks of stone ashlar are built into the walls, for future sculpturing with the Stations of the Cross. Heating and concealed lighting are by electricity. The benches, in Columbian pine, were designed by the architect.

Externally, the walls are finished with multi-coloured purple-red facing bricks, the front and higher portion being surmounted by a finial cross of stone. The roof is of Roman red tiles, in harmony. The entrance is of white Portland stone, enriched with carving by P. Lindsey Clark, A.R.B.S., who has also collaborated in the case of the font and other interior sculptures. The present building, with furniture, has cost about £7,500.

The completed portion of the new church, showing the main front.

PRESBYTERY



SCALE OF FEET 0 8 16 24 32 40

HOUSE AT LOWESTOFT: BY ALAN H. DEVEREUX

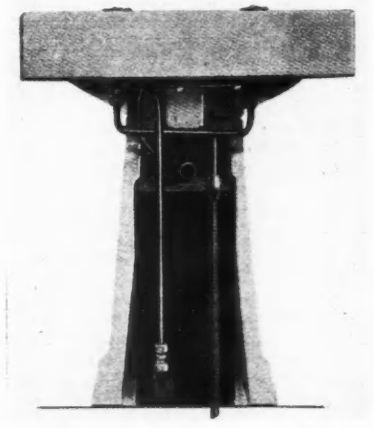
Forton House, St. Peter's Road, Lowestoft, was designed for a site about 50 feet wide, the aspect being nearly due north. The ground was already developed as a garden with lawns, shrubs and a few Scotch firs, and in order to preserve as much as possible of the natural surroundings it was decided to place the house about 70 feet back from the road, with the garage facing the front. The two living rooms and kitchen have a southerly aspect, overlooking the garden at the rear. The small dining room is provided with a large bay. Four bedrooms are afforded, each sufficiently large to accommodate a double bed, and these are placed to get the maximum amount of sunlight.

The external walls are of 11 ins. cavity brickwork, finished in white cement stucco, the roof being of local black glazed pantiles bedded on reeds. The paintwork to the front door and the shutters is carried out in flame and white.

THE BRITISH INDUSTRIES FAIR, BIRMINGHAM

Last week we condemned the entire lack of planning of the Birmingham section of the British Industries Fair. The exhibits are crowded at random into a vast shed, without the possibility of effective display. And "since the exhibition has become a permanent institution . . . . why not," asked our special correspondent, Mr. F. R. S. Yorke, "scrap the whole thing and build again on modern lines? Why not a new hall for the next B.I.F.?"

NOTICES OF EXHIBITS



The Reymez pedestal lavatory basin, made by Messrs. Adamsez, is a self-contained unit designed to give a constant supply of hot water. A water-heating unit, comprising a copper storage tank of approximately 2½ gallons capacity, and an electric heater, is contained within the pedestal. A single connection only, for cold water, is required. The standard arrangement is suited to any low-voltage supply, and heaters of 0·5 kw. to 3·0 kw. are available, the choice of rating depending upon the service required.

*

Walter Macfarlane & Co. have a drain exhibit, shown in half-section. The pipes are treated internally with glass enamel, which is less costly than "acid-resisting" and produces a smooth, durable surface, ensuring an easy flow throughout the system, whilst preventing obstruction and corrosion.

*

Messrs. Bratt Colbran's Tu Ways heater is a quite new form of portable electric radiator in polished rustless steel, with a single element, from which heat is projected in two directions at the same time —an evident advantage, enabling a greater number of persons to sit around the heater, and enjoy its warmth, than is permitted by the present type.

The Reymez lavatory basin, with an electric water-heating unit and storage tank concealed in the pedestal.

*

The wooden top of the old "sociable" two- or three-seater e.c. offered an advantage not possessed by the ordinary w.c. seat: it had apertures of varying size. The aperture in the modern seat is governed by the size of the average adult, with the result that children using it suffer from being thrown into an unnatural position. Some parents adopt a loose seat, but this is clumsy, unsightly and not easy to keep in position.

A three-piece w.c. seat incorporating a secondary — child's — seat, which, when not in use, is held firmly within the lid (patent applied for).

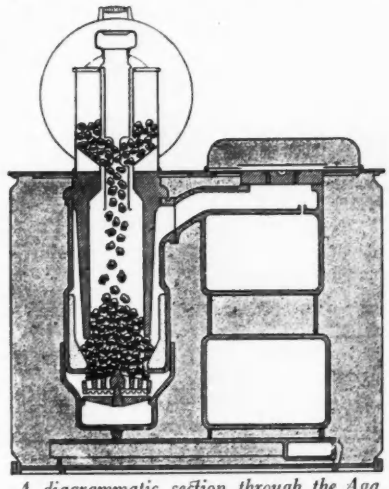
A Birmingham architect has invented a seat that overcomes the difficulty by incorporating within the flap a second seat of smaller size. This, when required, is released by a spring catch in the flap, and when the flap is dropped, after use, it takes up, within its thickness, the smaller seat, and holds it firmly, so that an adult can use the larger one in the usual way, without being incommoded by the smaller, which is automatically lifted with the flap.

A preliminary model is shown by Broughton & Co., who are to commence manufacture immediately.

*

In addition to flues for gas-fired appliances, Messrs. Asbestos Building Products, Ltd. are showing a range in a heavier grade material for slow combustion stoves. These pipes, being somewhat thicker in the wall, prevent the possibility of any chilling in the flue, which might tend to check the smooth upward flow of the products of combustion. The natural insulation in the wall of the pipe retains the heat in the flue, where it is wanted, instead of radiating it from the outer face of the pipe, as sometimes happens when metal is employed.

*

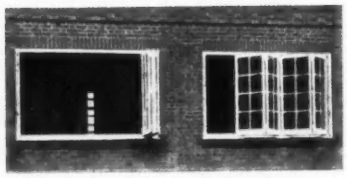


The Aga cooker, manufactured and marketed in England by Messrs. Bell's Heat Appliances, Ltd., is a remarkably efficient anthracite-heated cooking stove, which requires fuelling only once in twenty-four hours, and riddling twice daily. Combustion is quite automatic, and without further attention the fire remains permanently alight. Fuel is easily injected into the fire barrel by means of a patent container supplied by the makers, who state that fuel for a year costs no more than £4. The cooker provides a boiling plate, a simmering plate, quick oven, ordinary cooking oven, and a supply of hot water for cooking, dish washing, etc.

*

The Kleine Co., Ltd. are showing, in addition to standard sections of reinforced hollow brick construction, specimens of the material Duromit, made up in the form of pre-cast tiles, in several colours. Duromit is a flooring material that will stand up to severe wear, being free from attrition-dusting, and possessing remarkable non-slip qualities, which make it eminently suitable for industrial buildings, where such properties are essential to the surface floor. It was used in the floors of the machine rooms at the new *Daily Express* building.

*



The stand of the Educational Supply Association, Ltd., is built on two floors, in order that several types of folding doors, windows and partitions may be satisfactorily displayed. Esavian folding and sliding doors, specially adapted for garages, loading docks, warehouses, etc., are made for openings of any size, and have been used

A diagrammatic section through the Aga cooker, showing the operation of the patent fuel container.

to enclose aeroplane sheds over 100 ft. wide by 35 ft. high (patented).

In the Esavian Maxlite window, Patents Nos. 364,316 and 328,745, the sliding folding lights are formed from narrow wooden sashes, re-inforced with concealed steel angles. Steel glazing bars are welded into the frame, allowing a maximum of

Folding steel-reinforced sliding wooden sashes, shown fully and partially open.

light to enter, and combining the rigidity of wood with the lightness and strength of steel. The movements are housed within the thickness of the leaf, and are thus entirely protected from the weather when the window is shut.

*

The floor of the stand of the India-Rubber, Gutta Percha and Telegraph Works Co., Ltd. is covered with Silvertown rubber flooring, and several new colours are exhibited for the first time. Particularly interesting is the Silvertown escalator rail, made from rubber and fabric.

*

Messrs. Dunlop show rubber floors and rubber blocks for road-marking and traffic rings. The possibilities of these blocks for factory floors and cowsheds are being emphasized.

In the Roads exhibit a section of road is laid with these blocks, and arrows and signs, built-up from them, are shown in conjunction with other types of road surfacing. Rubber units, 12 in. long, are delivered at the site of operations in the form of hollow casings, which the road contractor fills with concrete and beds into the road as desired.

*

The Ruberoid Co., Ltd are exhibiting Ruberoid, Starex and Pluvex roofing. Ruberoid is a high-grade bitumen roofing made in three thicknesses, for use on large commercial and industrial buildings, and is equally efficient on pitched, flat or curved, wood or concrete roofs.

Starex is a sound, medium-weight roofing, suitable for use on garages, large sheds, farm buildings and workshops.

Pluvex is a light-weight roofing for small buildings about farms, factories and so on. It also serves as a lining and rot preventer, under lino or concrete, and makes an efficient underslating for tiled or slated roofs.

*

The I.C.I. water-conditioning exhibit is a joint one, arranged between I.C.I. (Alkali), Ltd., and I.C.I. (General Chemicals), Ltd., the former dealing with water-softening and the latter with sterilization. It should be of especial interest to those connected with industries consuming large supplies of water, particularly power stations, paper mills, etc., to trades having obnoxious effluents, and to health authorities, water engineers and swimming-bath superintendents.

The proper conditioning of water is rapidly assuming greater importance, and it is interesting to learn that the L.M.S. Railway have erected a chain of water-softening plants along the whole of their main line system.

Running water is employed to illustrate the very small quantity of chemical necessary to ensure complete sterilization. Light is thrown on the insidious bacteria which threaten public health, and which are rendered innocuous by very simple treatment with chlorine or ammonia chlorine. The exhibits include models of chlorine dosage plants and other methods of applying the treatment.

The use of chemicals to soften and condition five main types of water for industrial purposes is illustrated by a detailed comparative exhibit. Of especial interest are specimens showing the beneficial effects of treated water on boiler tubes.

*

The British Electrical Development Association (E.D.A.) again occupy the kiosk in the centre of the Electrical Section, where visitors may obtain full and up-to-date information concerning electrical facilities available in any part of the kingdom.

*

An outdoor feature in the Quarry, Roads and Mining Section shows road-making in progress, and full size lengths of road and pavement in various materials, and several stages of completion, from foundation to final surfacing. In conjunction with this exhibit is an interesting collection of lamp-posts, intended, no doubt, to remind us of the monstrous effects that result from the application of ornament to cast iron.

*

Rubery Owen & Co. are showing steel storage equipment, adjustable shelving and storage bins for office and factory. The shelving is an interchangeable type; backs, partitions and dividers can be added with ease. The standard finish is green stoved enamel.

*

Cellactite, the alternative to corrugated iron and asbestos cement for industrial roofing and side cover, is on view. It has a steel core completely enveloped in protective bitumen to which is applied, on each side, under high hydraulic pressure, an imperishable asbestos-asphalt felt.

*

Moler Products, Ltd., show two grades of insulating brick—one with a crushing strength of nearly 1,000 lb. per square in.—special aggregate for insulating concrete, and foundation material for furnaces, boilers, kilns, etc.

*

Sidney Flavel & Co. show the Flavel gas cooker, in new high grade finishes, the Leamington gas fires, the Patriot boiler and the Flavel portable gas heater.

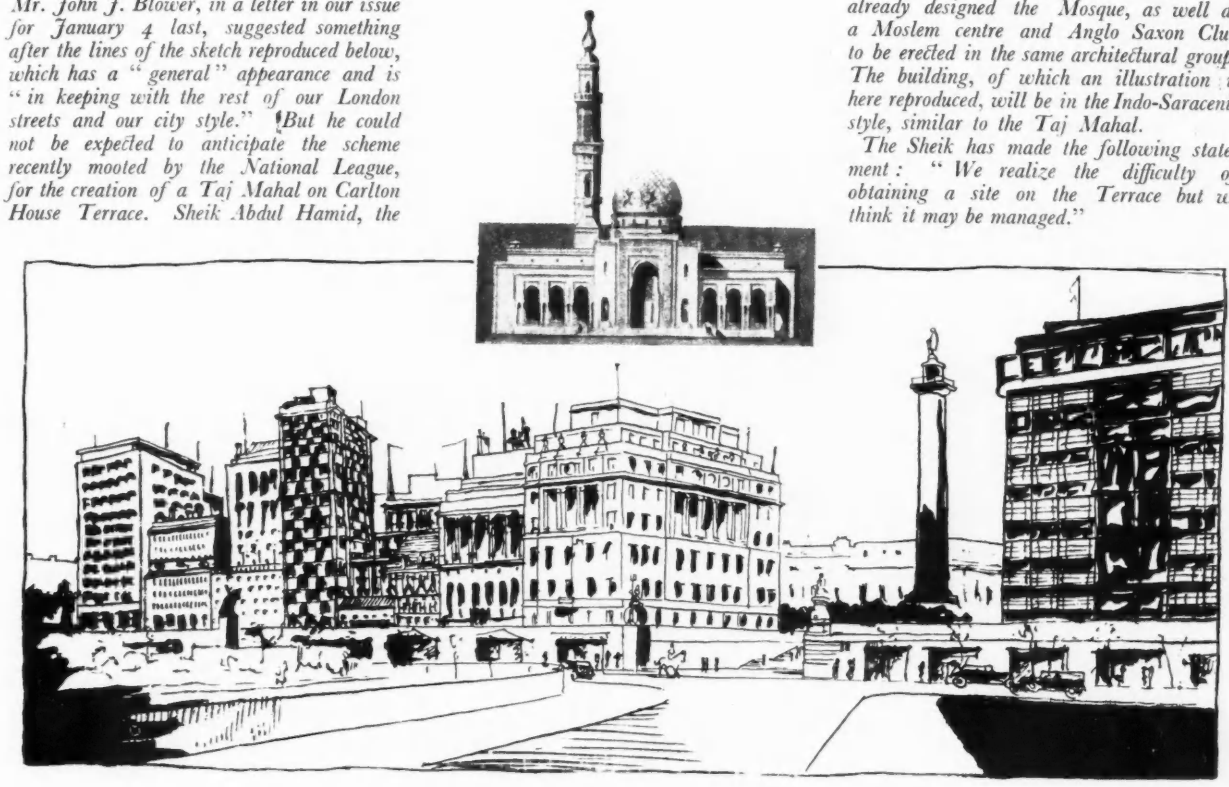
*

The stand of I.C.I. (Metals), Ltd., who are the largest producers of non-ferrous metals in the United Kingdom, is designed by Mr. J. B. Surman, and the exhibits are arranged on the open principle, so that visitors have free access to them. In addition to strip and general metals, plates, rods, wire and tubes, the exhibit includes finished articles manufactured by customers of I.C.I. (Metals), Ltd., that indicate the uses to which various materials can be put.

IN THAT CONTINGENCY

The following abstracts of inquiries represent a number of those recently submitted to the Building Research Station. The information given in the replies quoted is based on available knowledge. It has to be borne in mind that further scientific investigations may, in the course of time, indicate directions in which the replies might be supplemented or modified. Moreover, the replies relate to the specific subject of each inquiry, and are not necessarily suitable for application to all similar problems. Crown Copyright Reserved.

Ceiling of a Laboratory



¶ *FOR the roof of a chemical laboratory an architect proposed to employ the usual type of concrete flat covered with asphalt, and he was concerned with possible methods of avoiding moisture condensation on the ceiling. He also wished to know what effect acid fumes would have on the lining materials, since the atmosphere of the laboratory in question would be more or less continually charged with fumes of this kind.*

At the outset it should be mentioned that there are so many factors involved in the phenomenon of condensation that it is hardly possible to make general recommendations which will eliminate troubles in any and every particular case. Briefly, it may be stated that air at any given temperature can retain a certain maximum quantity of moisture as vapour; when the amount of water vapour in the air is approaching the maximum a small decrease in temperature induces the deposition of part of the moisture as liquid. In cases such as the present, the reduction of air temperature may be effected by heat loss at a cold surface, and it follows, therefore, that the rate of heat loss through the roof is a factor to be taken into account. Concrete roofs are sometimes deficient in thermal insulation, and the provision of additional

SOMETHING JOHN J. BLOWER FORGOT

A Taj Mahal for Carlton House Terrace! Mr. John J. Blower, in a letter in our issue for January 4 last, suggested something after the lines of the sketch reproduced below, which has a "general" appearance and is "in keeping with the rest of our London streets and our city style." But he could not be expected to anticipate the scheme recently mooted by the National League, for the creation of a Taj Mahal on Carlton House Terrace. Sheik Abdul Hamid, the only Indian member of the R.I.B.A., has already designed the Mosque, as well as a Moslem centre and Anglo Saxon Club to be erected in the same architectural group. The building, of which an illustration is here reproduced, will be in the Indo-Saracenic style, similar to the Taj Mahal.

The Sheik has made the following statement: "We realize the difficulty of obtaining a site on the Terrace but we think it may be managed."

insulation would assist in reducing condensation of moisture.

Another important factor, however, is the nature of the surface on which the condensed moisture is deposited. On a highly impervious material, such as high gloss paint, glazed tiles or metal, moisture may be deposited as droplets, which in time will coalesce and drip off, thus causing annoyance. On the other hand, a porous surface such as lime plaster may absorb the moisture for a time and the condensation will not be visible.

The amount of moisture present in the air is, of course, of considerable importance. If the air is constantly in a condition approaching saturation, it will be evident that quite a small temperature fall will lead to condensation. As the concentration of acid fumes in laboratories is usually accompanied by considerable quantities of moisture vapour, the conditions in this instance may be very severe.

High concentration of acid fumes may be expected to have an injurious effect on many building materials, such as plasters, mortars and concretes. Ceramic materials in general would be unaffected. If the tendency for condensed moisture to drip is not objectionable, a glass lining material such as had been proposed for the walls might also be found suitable for the ceiling.

Wood, of course, is in many ways an ideal material; it is little affected by acid fumes, affords high thermal insulation and, in addition, provides a surface which is rapidly warmed, so that condensation of moisture would rarely occur.

Collapse of Plaster Ceiling

¶ *COLLAPSE of part of a plaster ceiling was reported. In submitting a sample of the plaster for examination the contractors stated that the specification for the work called for proportions of one part lime to three parts sand, with the usual proportion of hair added. Plaster ceilings of a similar mix in other parts of the building were suspected to be weak.*

A superficial examination of a sample of the failed plaster indicated that the plaster was apparently three-coat work in lime and sand. It was somewhat harder and rather less friable than such failed plaster is often found to be, with no signs, in the small fragment available, of defective workmanship. The sand in the undercoats was a fine white silica sand, not of the best possible grading for undercoats on lathing, but of a type commonly used successfully; it contained a fair proportion of fine light-coloured silt. The hair was, as is usually observed in modern work, small in quantity, but was well distributed. The lime was well carbonated, and there were no signs of unsoundness. The undercoats consisted of a straight lime-sand mix with a typical greystone or semi-hydraulic lime, low in sulphates, and ungauged. The setting coat was, as is usual, gauged to a moderate extent with a calcium sulphate plaster (presumably of the ordinary "gauging plaster" type), but consisted essentially of lime with a little fine white sand.

It should be pointed out that, as a result of the examination of numerous plaster failures of a similar type, and of recent investigations on the subject, the Building Research Station is led to the conclusion that there is difficulty in the use of a straight lime plaster for lathwork on ceilings. Indeed, under modern conditions, of haste in building, with plaster coats following closely one upon the other, with one trade following another rapidly, with the possibility of greater structural vibration, with accelerated drying conditions and with the difficulty (bearing in mind the number and varied types of limes now available) of developing in the craftsman a craft skill applicable to the various types of lime, the Station is in fact inclined to the opinion that success with a straight lime-sand plaster over lathwork is often merely fortuitous.

It should be made quite clear that the specification employed in the present case did, up till recently, and still does to a great extent, represent normal practice; it will, indeed, be found as a recommended specification in many textbooks. In criticizing it, therefore, the Station is doing so merely in the light of recent scientific investigation, and although every attempt is being made to get the findings of the Station applied in practice, it is not to be expected that a break in long-established traditional practice can be anything but gradual.

The present recommendation of the Building Research Station in relation to lime plaster undercoats on lathwork is

that they should be gauged with Portland cement, or, preferably, a slow-setting calcium sulphate plaster. With either of these additions the key and key necks would early acquire a definite strength and not merely a hardening and feeble increase in strength due to accidental carbonation, as would be the case with straight lime plaster. In this connection it should be mentioned that, even if the lime was hydraulic, the operation of running it to a putty, as is customary for plastering purposes, would "kill" its strength-acquiring properties as a hydraulic lime. Gauging with calcium sulphate plaster instead of Portland cement probably has the advantage of lessening the shrinkage of the plaster mix and, therefore, the tendency of the key necks to shear. With regard to hair, there is no doubt that the quantities now specified serve merely to facilitate application, whereas there is evidence that very much greater quantities were used in earlier years with probably appreciable reinforcing effects when uniformly distributed. It is quite feasible to introduce as much as 1 lb. per 2 cubic feet of plaster, but any increase over this amount would no doubt necessitate a plastering technique which would be strange to the modern plasterer. As an alternative to ceiling lathwork it is, of course, becoming quite common practice to fix plaster (calcium sulphate) boards to the joists and to cover these with one or two skim coats of plaster.

To summarize, the situation in the present case is, in the opinion of the Station, as follows :—

1 : The plaster examined appears to be as good as could be expected even if carefully made to the specification and carefully applied.

2 : The specification, although typical of what has been and still is considered normal practice, is not considered, in the light of recent investigation, to provide a satisfactory undercoat for lathwork on ceilings, taking the drastic changes in building procedure into account.

3 : Since conditions may be the same throughout the house, it is suggested that at various points an examination of the keys be made from the top side in order to ascertain whether they are friable or loose : if they are, then the ceiling below should be replaced either by gauged plaster or by plaster-boards and skim coats.

4 : It has been suggested that a certain amount of the plaster may have been frozen and knocked up again before application. With a putty lime this would not be objectionable. On the other hand, if frost reached the wet plaster *in situ* it would have caused fairly complete disruption, and it cannot be said that this has occurred.

Plaster on Rubber Insulation

¶ *A SURVEYOR proposed to run electric wiring cables of a quality known as "Tough Rubber" over the surface of walls which would eventually be covered with a proprietary calcium sulphate plaster, and he asked whether such plaster would have a deleterious effect on the cables. He added that instances are known of the deterioration of the lead sheathing of lead-covered cables where they have come into contact with this particular plaster.*

The most important causes of deterioration of rubber, under normal conditions, are oxidizing agents and ultra-violet radiation. Since the plaster would to a great extent prevent both light and air from reaching the rubber, it may be concluded that rubber, which would show satisfactory durability when exposed to air, would age equally well, or even better, when protected by plaster, except in cases where the plaster is wet or seriously damp.

If the wiring is carried out in accordance with the regulations of the Institution of Electrical Engineers, the only type of rubber-covered cable which may be installed in plaster is "cable insulated with tough rubber compound to British Standard Specification No. 37."

The corrosion of lead cable coverings in plaster is not an unusual phenomenon, and is dealt with in Building Research Bulletin No. 6 (H.M. Stationery Office, price 4d. net). In contact with lime the lead may corrode, and although the trouble is usually confined to dense cement mortars and concretes where the lime liberated on the setting is protected from access of air and so remains uncarbonated, yet there is no reason to suppose that the same type of corrosion should not occur with this particular type of calcium sulphate plaster which contains lime. This, however, would be an entirely different kind of deterioration from that which rubber is likely to undergo.

The Adelphi

It must be with deep regret, says a writer in the current issue of *The News-Letter*, that innumerable lovers of London and its past will learn that a Bill is shortly going to be introduced into Parliament to authorize the destruction of the Adelphi. With a grim sweep of the destroyer's hand all the beauty and romance and associations of one of the most interesting remains of eighteenth-century London are to be wiped out. Can nothing be done to save it?

It is pointed out that not only is the Adelphi interesting for its architectural merits, but it is full of literary and artistic memories.

At No. 8 Doctor Thomas Monro trained Turner and Girtin and Varley and De Wint, and here long after Thomas Hardy, as a young man, studied architecture. Crabbe and Gibbon and Isaac d'Israeli stayed in the Adelphi Hotel, formerly known as Osborne's. Rowlandson died at No. 1, James Street. Hood lived at No. 2 Robert Street. Dickens used to play among the arches as a boy. Barrie, too, lived in the Adelphi. These are but a few of numerous memories clinging to the spot.

The Transport Bill

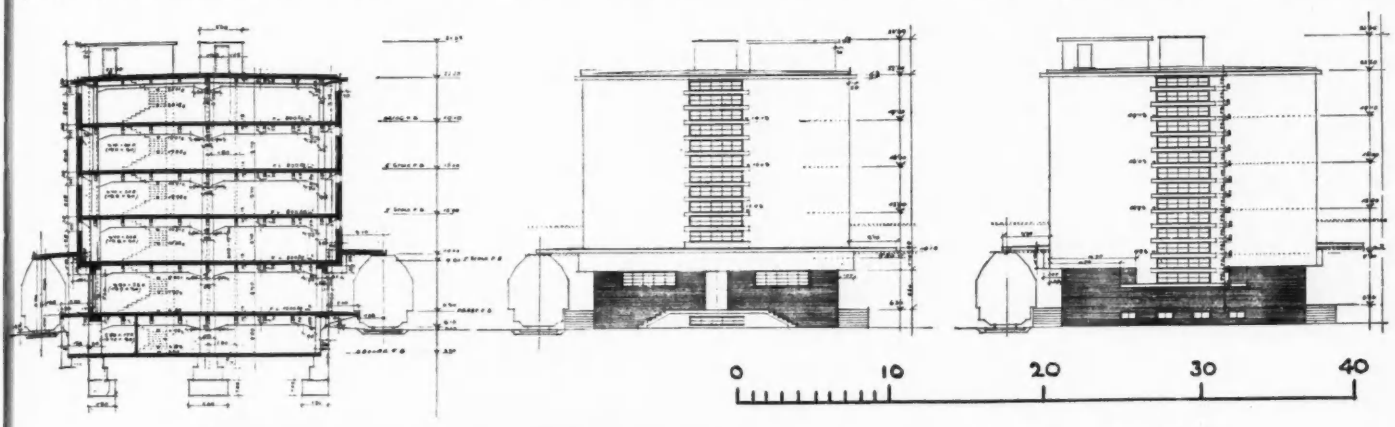
The London Passenger Transport Bill has been read a third time in the House of Commons and will now go before the House of Lords. Briefly, this Bill, which has been before Parliament since March, 1931, proposes to co-ordinate all the traffic facilities of London—tubes, buses and tramways—by placing them under the control of a new London Passenger Transport Board.

This Board is to consist of a chairman and six other members to be appointed by a body known as "the Appointing Trustees," consisting of the following persons :—The chairman of the L.C.C.; a representative of the London and Home Counties Traffic Advisory Committee ; the chairman of the Committee of London Clearing Bankers ; the President of the Law Society ; and the President of the Institute of Chartered Accountants in England and Wales. The chairman and other members of the Board must have had "wide experience and have shown capacity in transport, industrial, commercial or financial matters." Their duty will be "to secure the provision of an adequate and properly co-ordinated system of passenger transport for the London Passenger Transport area."

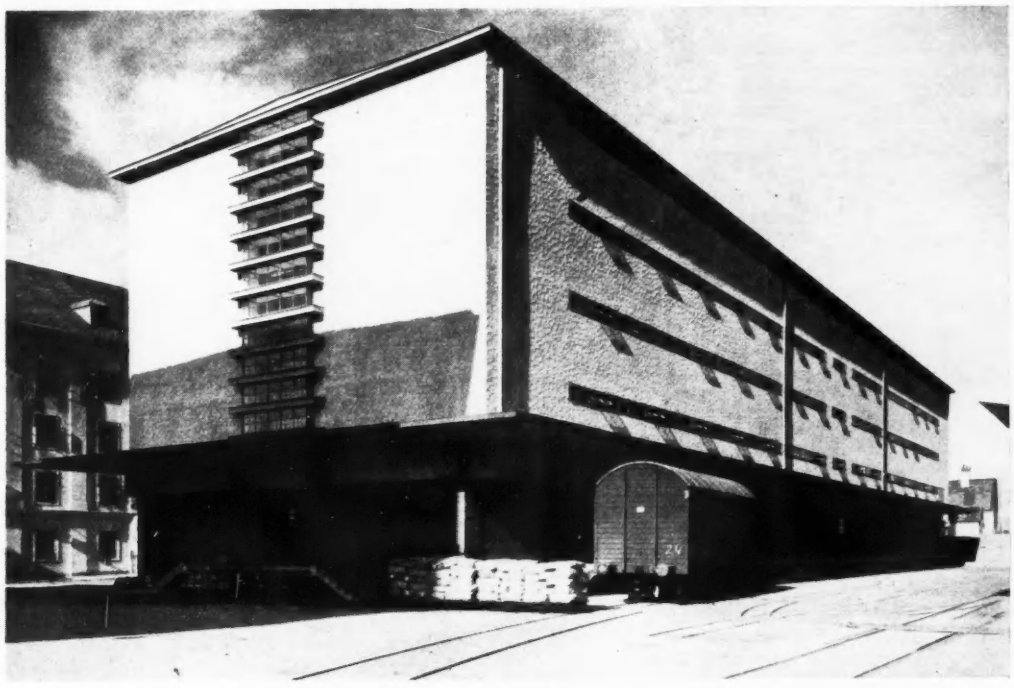
Rhythmic Ornament

On Friday next, February 24, at 9 p.m., Mrs. Ettie Hornibrook, Fellow of the Empire Society, will deliver a lecture at her home, 14, Hinde Street, Manchester Square, W., on the New Zealand Maori rafter patterns compared with other forms of ornament. The lecture will be followed by an exhibition, which will be open on Saturday, February 25, from 10 a.m. to 10 p.m.

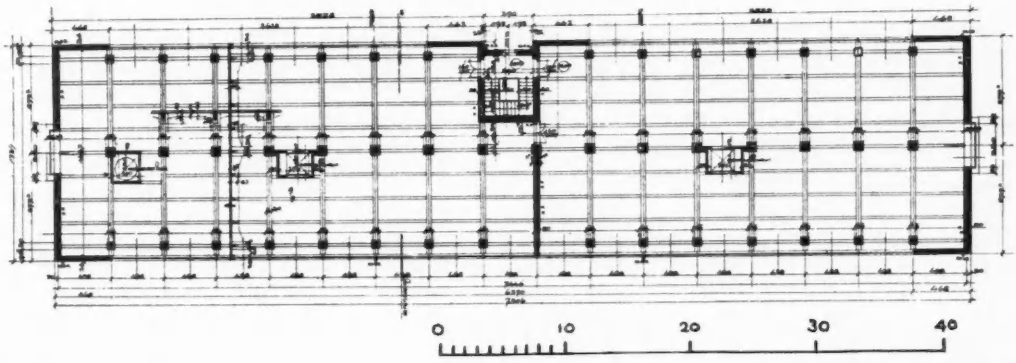
Deputation to Minister of Health



The Minister of Health received a deputation last week from the General Council of the Trades Union Congress on the subject of housing and rents.



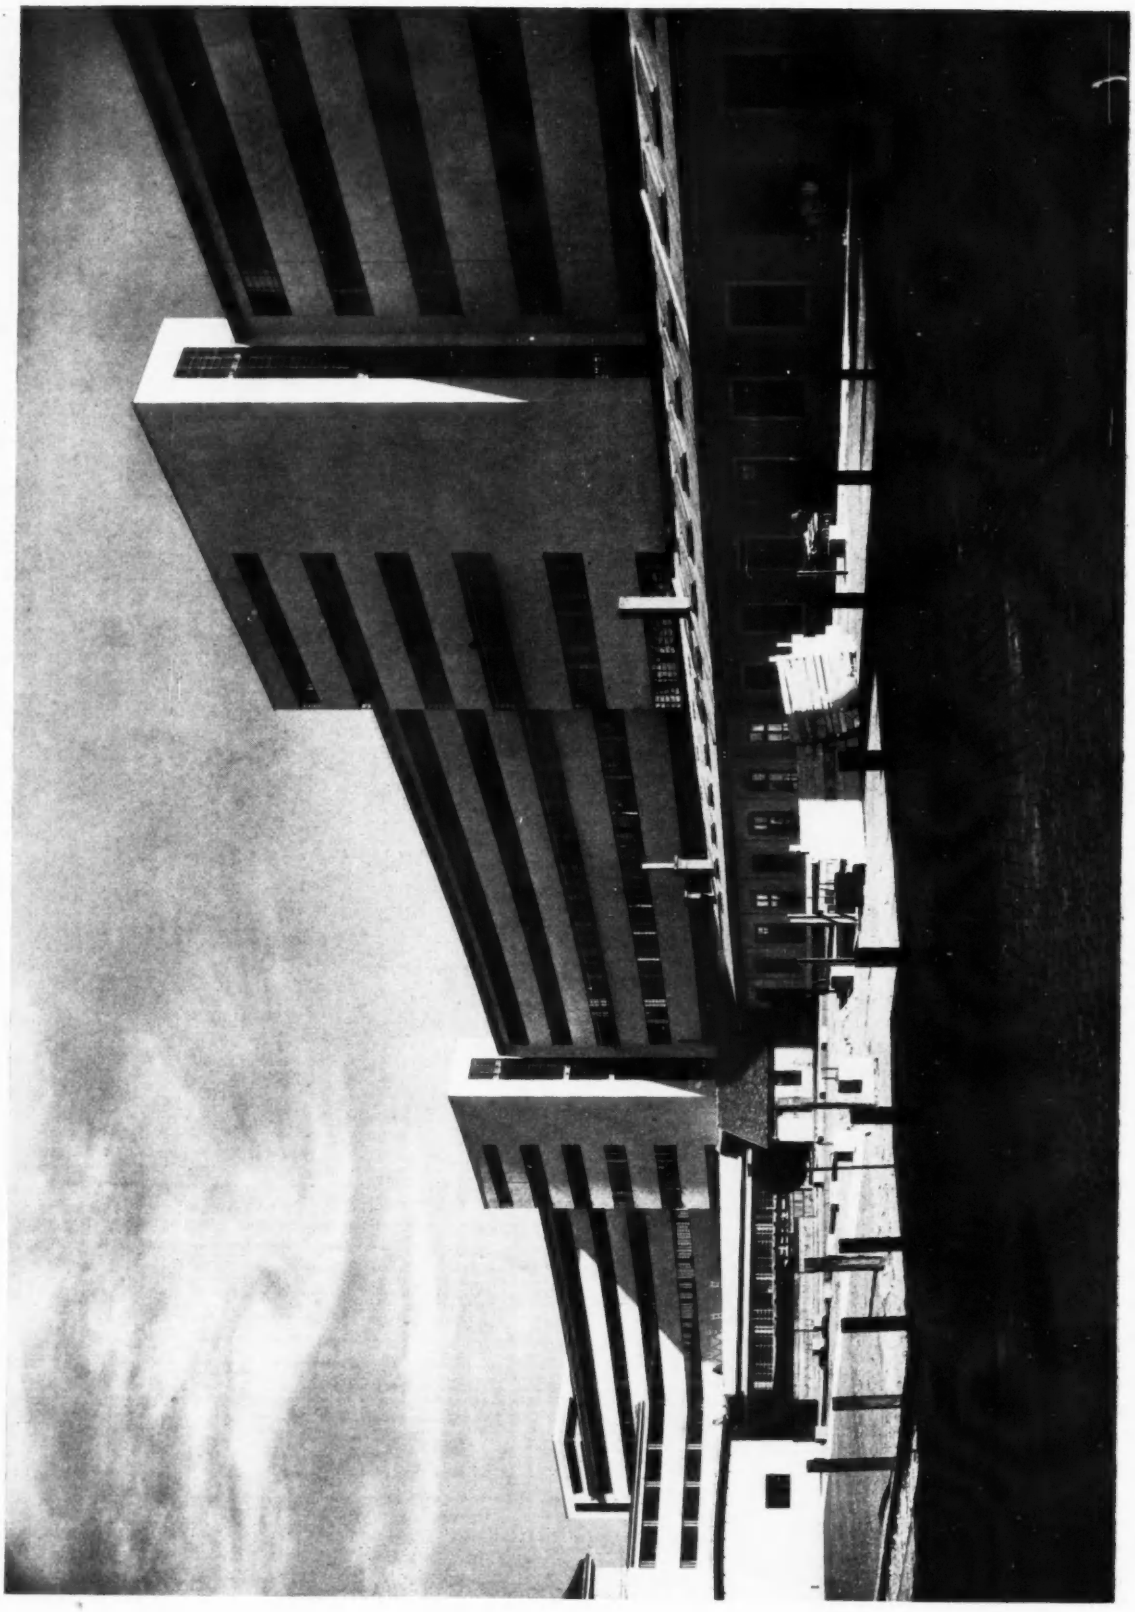
The deputation was introduced by Mr. A. G. Walkden. The other speakers were Mr. Hicks, M.P., and Mr. Wolstencroft.



The deputation attended to discuss a resolution passed by the General Council in September last and raised a number of questions with regard to the Housing Bill and the Government's housing policy for the future, emphasising particularly that, in their view, the essential need of ensuring an adequate supply of small houses for letting to the lower paid wage earners required the continuance and extension of the building activities of local authorities.

The Minister of Health, in reply, said that he keenly welcomed the opportunity of discussing these matters with representatives of the Trades Union Congress. After replying to the detailed points raised by the deputation, he said that he felt there was much common ground between them, and he fully agreed that the essential housing need of the present time was two-fold : the provision of small houses to let at rents within the means of the poorer paid members of the working classes, and an energetic programme of slum clearance. He differed from them only in the methods which were considered most effective to meet this need, and he was confident that the Government's policy was calculated to achieve both of these objects most efficiently and rapidly.

CIGARETTE FACTORY AT LINZ, AUSTRIA



DESIGNED BY PETER BEHRENS AND ALEXANDER POPP

The main building of this very expensive factory, at Linz, on the River Danube, operated under the auspices of the Austrian State Regie, is illustrated, photographically, on the two following pages, and, with plans and description, in a supplement with this issue. The view and drawings on this page are of the leaf warehouse, which has a low-pitched roof and stands apart, with a rail dock on either side of it. This is a simple but elegantly-proportioned rectangular building, surrounded by a thin concrete canopy at loading-gauge level. The interior is lit by four rows of nearly continuous horizontal glazed slits on the longer sides, and by wide vertical windows, barred with overlapping concrete transoms, on the shorter. The exterior is finished in white *Kratzputz* stucco with a base skirting of red brick.

CIGARETTE FACTORY, LINZ, AUSTRIA: BY PETER BEHRENS AND ALEXANDER POPP

The views on these pages show the two sides of the building, which takes a bowstring sweep: in the upper, the large hall projecting at right angles to the inner curve is seen on the left; in the lower, it is clear that only the centre section is bowed—the far end is straight, and so is its fellow.

IN PARLIAMENT

BY OUR SPECIAL REPRESENTATIVE

State-assisted Houses

SIR FRANCIS FREEMANTLE asked the Minister of Health if he would state the number of houses completed under the several Acts, or otherwise, during the last quarter of 1932, and the corresponding figures for 1931.

Sir Hilton Young said that the number of State-assisted houses completed in England and Wales during the last quarter of 1932 was 13,282. Returns as to the number erected without State assistance were made to him half-yearly only, in respect of the six months ending March 31 and September 30 respectively. The number so erected during the six months ended September 30 last was 63,146. The figures for the corresponding periods in 1931 were 18,185 and 61,163 respectively.

The Government and Economy

Captain Beaumont inquired why, in view of the Government's declared policy of economy in national and local expenditure, the Minister had recently sanctioned new expenditure on building by local authorities to the extent of £4,000,000; what circumstances had occurred to warrant this change, and what proportion of the new expenditure would fall on the Exchequer.

Sir Hilton Young said he was not aware how the figure of four million was made up and was accordingly unable to answer the third part of the question. The policy of the Government in this matter continued to be regulated by the circular of September, 1931.

Housing Progress

Mr. Hicks asked for information as to houses completed or under construction by local authorities in England and Wales without State assistance and for letting to members of the working class at cheap rents.

Sir Hilton Young said he was only able to state that during the twelve months ended September 30 last approximately 2,000 houses were completed by local authorities in England and Wales without State assistance.

Captain Erskine-Bolst asked the average estimated construction price of working-class dwellings which had been commenced by local authorities since the announcement that the subsidy would be no longer forthcoming.

Mr. Shakespeare, who replied, said he regretted that information in the form desired was not available, but the average building cost of State-assisted non-parlour houses included in contracts let and in direct labour schemes commenced by local authorities in England and Wales during the month of December last was £296. The corresponding cost for January was not yet available.

Captain Erskine-Bolst asked the Minister if he could state the number of houses which had been put in hand since he announced the cessation of subsidies, and how this figure compared with the total of such houses put in hand in the corresponding period of 1931–32.

Mr. Shakespeare said he regretted that figures in the form desired were not available, but the number of State-assisted houses included in contracts let and in direct-labour schemes commenced by local authorities in England and Wales during the month of December, 1932, the last month for which such figures are at present available, was 4,576. The corresponding figure for the month of December, 1931, was 4,223. The Minister had no information as to the number of houses put in hand for erection without State assistance.

Reconstruction of Premises

Replying to several questions, Sir Hilton Young said that he had asked the Central Valuation Committee to look into the matter of assessments for the reconditioning and improvement of premises, with a view to addressing a communication to local authorities.

Waterloo Bridges

Mr. McEntee asked the Minister of Transport if he would state what was the cost of the temporary Waterloo Bridge and of its maintenance since erection, and the cost of preserving the old bridge since its collapse.

Mr. Pybus said he was informed that the cost of erecting the temporary bridge was £174,647, and that the cost of maintenance since its erection and of preserving the old bridge since its collapse had been £85,000.

The Humber Bridge Bill

The Humber Bridge Bill, which was carried over from the last Parliament, has been withdrawn. The Deputy-Speaker ruled that the fact that the Government had refused to implement its undertaking to contribute 75 per cent. of the cost had so altered conditions that he could not allow the third reading to be proceeded with. The whole financial basis of the Bill had been altered.

LAW REPORT

DAMAGES CLAIMED FOR OVERFLOWING GUTTER

Bishop v. *Consolidated London Properties Ltd.—King's Bench Division. Before Mr. Justice du Parcq.*

THIS was an action by Mrs. J. R. Bishop, of Hyde Park Mansions, claiming damages from the defendants, the Consolidated London Properties, Ltd., for alleged breach of a covenant in her lease and in the alternative for damages for negligence.

Mr. R. J. Sutcliffe, for the plaintiff, said his case was that under the lease of the flat the defendants agreed to keep the exterior of the premises and all parts of the building in good repair. There was also a clause for quiet enjoyment of her flat. When his client arrived home one evening in September last she received a complaint that water was coming from her flat into the flat below. There had been a heavy fall of rain, and it appeared that an open gutter in the box room, not part of the flat, near the roof had overflowed into his client's flat and then into the flat below. Plaintiff's case was that the defendants did not keep the pipe clear, but allowed it to become choked, with the result that the rain came into her flat and damaged her furniture, and deprived her of the use of her flat for a short period.

Mr. Cope Morgan, for defendants, said his clients denied any breach of covenant, and pleaded that they had taken all care to keep the gutters clean and the pipes in repair. The cause of all the trouble was that a pigeon got into the box room and died there, thus blocking the gutter. Counsel argued that if the cause was as suggested the defendants could not reasonably have contemplated it and were not liable.

His lordship said the facts of the case were that the rain water passed along open gutters under the roof of the box room into lead troughs and then down a pipe. In the ordinary way, the gutters being cleaned twice a year, there would have been no serious obstruction, but in some way a dead pigeon and its nest got into the pipe and caused the trouble. He had had evidence that the gutters were of peculiar construction and that the defendants had failed to put wire netting over the troughs. He came to the conclusion that there had been a breach of covenant by the defendants to keep the exterior of the premises in good repair, there being a lack of care on their part in not taking greater precautions than they did to prevent foreign bodies getting into the water courses. The defendants were alive to the danger, as they had just put up some wire netting, which however proved inadequate. He found the plaintiff was entitled to damages and he awarded her £115 with costs.

Stay of execution, pending an appeal, was granted.

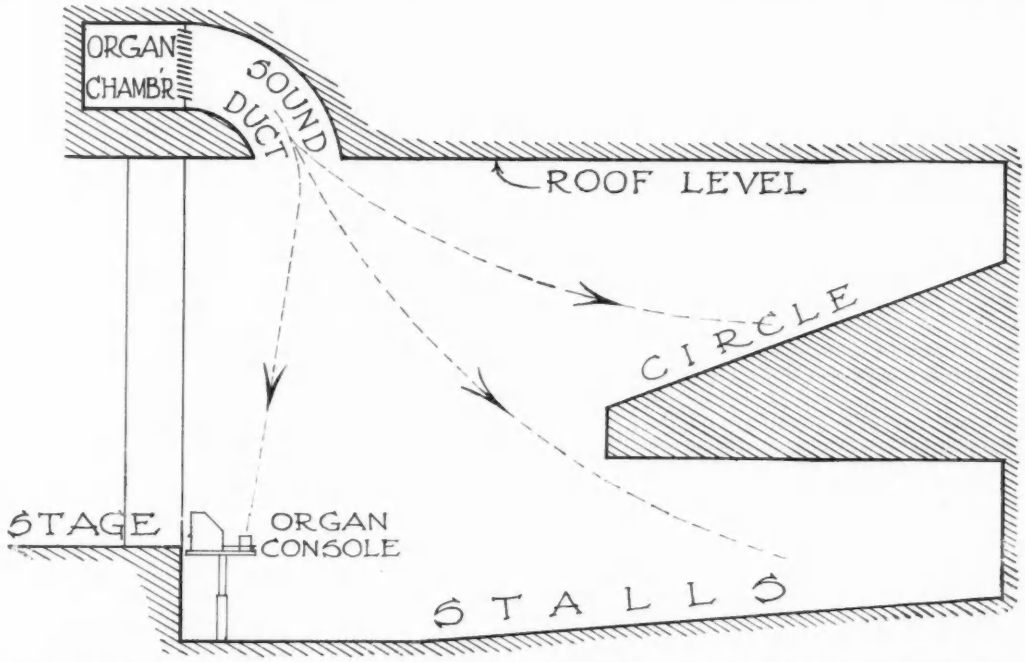
SOCIETIES AND INSTITUTIONS

LIGHTING OF COMMERCIAL BUILDINGS

The second of the series of conferences for architects on electric lighting was held at the Lighting Service Bureau, 2, Savoy Place, W.C., on Wednesday last. Mr. H. C. Wheat, in the course of a paper on "The Lighting of Commercial Buildings," said:

There are five systems or classes of lighting available for interiors, namely:—1: Direct; 2: Semi-direct; 3: General; 4: Semi-indirect; and 5: Indirect.

Of the foregoing, class 3 (General) would usually be the type employed for lighting of general offices, as representing the best compromise as regards cost of installation, operation and maintenance, compared to lighting results secured. It covers most of the so-called enclosing units in which the light source is entirely surrounded by diffusing glassware, so that while the greater portion of the light is still directed below the unit a considerable amount goes upward and sideways. The physical efficiency is not essentially different from Class 2, but the general effect is "softer" and the shadows are even less defined. The psychological effect is improved as the whole apartment is illuminated.



As general illumination should be employed in any circumstances, either alone or to augment local lighting, it may be well to consider the proper spacing of the lighting units. In order to cover an area, either floor or ceiling, fairly uniformly, it should be divided into a number of imaginary squares or rectangles, and a unit placed at the centre of each. Where more than one unit is required in a single rectangular room one should be placed at a quarter of the diagonal from each corner.

BIRMINGHAM ARCHITECTS' EXHIBITION

A photographic exhibition of work of the members of the Birmingham Architectural Association was held last week at the Royal Society of Artists.

The exhibition, which was opened by Sir Charles Grant Robertson, illustrated the development of architecture in Birmingham and the surrounding districts since the war. It was divided into nine groups—domestic, licensed houses, cinemas, public buildings, ecclesiastic, banks, schools and colleges, industrial buildings and hospitals.

THE PLACING OF A CINEMA ORGAN CHAMBER

Diagrammatic section through a cinema, showing an organ chamber placed in such a position that the sound reaches the circle, stalls and organist simultaneously and in equal volume. [*From* SPECIFICATION, 1933.

There were also exhibited measured drawings of buildings erected in Birmingham between 1790 and 1840 which had been carried out by unemployed architectural assistants.

MAIDSTONE ARTS AND CRAFTS SOCIETY

At a meeting of the above Society, held at Maidstone on Wednesday, February 1, lectures were given by members on the following subjects: "The Making of Hand-made Drawing Papers," by Mr. J. Green; "Gesso," by Mr. J. Hale, F.I.B.D.; "Fakes in Furniture," by Mr. F. Bevis.

A short discussion followed each talk. The speakers were thanked by Mr. S. H. Loweth, F.R.I.B.A., a past Chairman of the Society.

LITERATURE

Specification, 1933. Edited by Frederick Chatterton, F.R.I.B.A. London: The Architectural Press. Price 10s. 6d. net.

THE publication of the 1933 edition of *Specification* marks the second year since it appeared in a cloth binding, and the comfort of handling the volume is now so greatly increased that one wonders why we had to wait so long for the new cover.

The standard of impressiveness is well maintained in the current issue and the book still holds its own as the most complete reference work in a single volume which is available "for architects, surveyors, civil engineers, and for all interested in building."

An innovation of a most welcome character is the Gill Sans type designed by Eric Gill, which has been adopted for the section headings, sub-titles and cross-headings throughout the volume.

In the course of revision, several excellent articles and three new specifications have been incorporated in the trade sections forming the main portion of the book, but it is the group of five illustrated special articles occupying the first fifty or sixty pages to which particular attention is drawn.

In the first of these, "Factory Design and Lay-out" by Mr. C. W. Glover—the principle of planning the building in accordance with the sequence of manufacturing processes to be carried out within it—is clearly enunciated and copiously illustrated. Cost factors per square foot of floor area for different types of construction of varying spans are given in tabular form, together with much other valuable information.

Mr. A. Ewart Aston writes at length on "Wallboards and Their Uses," and makes a timely and well-deserved plea for the employment of wallboards for work of a more lasting character than was formerly the case. Instancing improved methods of manufacture, better technique in application, and the production of surface finishes which lend themselves to artistic treatment, he expresses the view that wallboards would appear to have now "a place of permanent value in the Art and Craft of Building."

Mr. F. R. S. Yorke's article on "The Equipment of the Modern Cinema" contains the following facts bearing upon the necessity for cinema ventilation:

> A system of ventilation is demanded by the regulations of local authorities, and the reason for this becomes obvious when we realize that a seated and inactive person gives off, in one hour, 400 B.Th.U.'s and 2 ozs. of water vapour. In a cinema with a seating capacity of 2,000, the effect on the internal atmosphere can be readily imagined.

Describing a typical underground bakehouse, of which large numbers are still to be found in English towns, Mr. S. W. Ackroyd, in his article on "Modern Bakeries," writes:

> In this cellar would be housed the ovens, stoked by coal or coke, the dust from which would settle over the tables and other fittings, to be picked up by the next lump of dough placed thereon. There is little wonder that the premises where the nation's "staff of life" is produced have at last had the attention of the

health authorities, and that modern hygienic bakeries are now taking the place of those "cellar-bakehouses."

"Inside and Outside Blinds," by Mr. Edwin Gunn, is illustrated by the author's own sketches of six standard types of outside blinds.

OBITUARY

We regret to record the death of Mr. Edward Penfold, F.R.I.B.A., A.M.T.P.I., of Reigate, after a very brief illness.

He was born in Reigate in 1866, and was educated at the Reigate Grammar School. He was articled to Mr. T. R. Hooper, A.R.I.B.A., of Redhill, and later was for a considerable time with the firm of Messrs. Ford and Hesketh in London. In 1893 he acquired an interest in the century-old business of Mr. Edward Larmer.

St. Lawrence's Church, Feltham

Following are the names of the general contractors, specialists, and some of the sub-contractors for the Church of St. Lawrence, Feltham (pages 270-271). General contractors: Wm. Downs, Ltd. Craftsmen—Sculptor: P. Lindsey Clark, A.R.B.S. Baptistry windows: John Trinick. Sub-contractors: Anderson, Angell & Co., Ltd., electric heating and lighting; Silexine Decorators, Ltd., internal plastering; Damar Bros., stone masons; Bennett's "Tungit" Wood Block Flooring Co., Tungit flooring; H. C. Parker & Co., external facing; Nicholls and Clarke, Ltd., windows and glazing; Blunt and Wray, Ltd., Baptistry rails and gates; Holley and Pike, seating and furniture; Val de Travers Asphalte Paving Co., Ltd., asphalt; British Reinforced Concrete Eng. Co., reinforcement; Siegwart Fireproof Floor Co., concrete roof flats.

*

We much regret that, in publishing, in our issue of January 18 last, illustrations of the King's Fund Miniature Hospital, we omitted mention of the names of the contractors and sub-contractors for this unique building enterprise. The names being somewhat difficult to trace, Mr. H. Saxe-Wyndham, who was chairman of the Model Committee, has come to our assistance with the following verses celebrating their achievement :—

A DREAM DREAMT LONG AGO
or
The Building of the
King's Fund Miniature Hospital
1929–1932.

How it was thought of: How it took shape—upon paper: How many willing hands lent help: How it grew and prospered: and How the Epilogue fulfilled the Dream.

Wyndham had a brain wave, underneath his hat;
Pearson fetched his drawing-board, nice and smooth and flat.
Bring, said he, my T-square, compasses and ruler;
Never were my mind and will or my intention cooler.
Then he drew his pretty plans, sections, elevations.
Now, he said, we'll show what we can do to other nations.
Entrance hall and board room, offices and wards,
Bathrooms bright and good enough to suit the House of Lords.
Kitchenettes and kitchen, lift and corridors,
Terrazzo stone and korkoid covering the floors.
Then he drew a Babies' Ward and pictures to amuse 'em—
Jack and Jill and Whittington; nothing to confuse 'em.
Last of all he added such a beautiful Solarium
Where they lie as naked as the fish in an aquarium.
Take it all, he said, to Humphreys Limited, Contractors:
All the world's a (building) stage and they're illustrious actors.
Down we went to Knightsbridge, saw Director Freeman,
Found him keen and generous—bluff as any seaman.
Send for Taigel, then, he said, I choose him from them all.
We'll do the best we can to build the King's Fund Hospital.
Taigel quickly set to work, with heart and hand and will.
Director Freeman's generous intention to fulfil.
Nor must Thomson be forgot (No common Thompson he)
For he quickly steered us back to shore when we were all at sea.
A Conference he summoned with the sub-sub-contractors willing,
All professed their readiness to take the King's (Fund) shilling.
Doultons for the baths, etcet, Crittall's window frames;
Waygood-Otis for the lift: all well-renowned names.
The General Electric (Chairman Sir Hugo Hirst)
For wonder-working violet rays among the very first:
Electric light and heating they gaily undertook
But the Gas Light, Coke and Company, appliances that cook.
And Troughton Young are Limited but not in elevation
For they co-operated in electric installation.
The panelling and furniture from Bedford made by White
Are Lilliputian marvels that enthral the wondering sight.
And then within the Children's Ward see Simpson's tiny tiles.
With nursery rhymes in pictures to tempt the kiddies' smiles.
The door handles so weeny they're almost lost to sight
Were made in London City by a firm called Messrs. Knight.
And all the fire appliances you see now put together
By the National Fire Protection and by Messrs. Merryweather.
Among the wondrous marvels that you won't see every day
Are Schall & Sons' equipment for producing the X-Ray.
James Slater is of London and a well-known Engineer
Who sent sterilizing cupboards and the kitchen fittings here.
Some surgeons' gear and ward lockers were made by Messrs. Down—
A firm as every doctor knows of credit and renown.
The cabinets, the instruments, the trollies made by Rose
A firm of ditto ditto dit oh! every doctor knows.
The clothing of the patients kept in lockers made of steel
Which are made by Estler Brothers—how I wish their name were Beal.
My rhymes are getting worse and worse: just try refrigerators
Which absolutely will not rhyme with anything but taters.
The Hotlock firm I rather like, and their electric trolley,
An easy word, a breezy word, a word that's really jolly.
There's Maple now, whose Mister Wray
Took endless pains and trouble
To keep his firm's great fame and faith,
Their reputation double.

From Birmingham in Warwickshire
Came all the beds and cots
By Hoskins Sewell Limited, for adults and for tots.
The tiny tubes that form them, Britannia's famous make
The British castors under them tho' small will never break.
The Midland Springs on bed and cot add to the patients' ease
And so of course do bedclothes and Eastman's mattresses.
Great Kolak made a dark-room, 'tis only 8 inch wide,
I know it isn't large enough—I tried to get inside.
The piano is by Chappell, it really is, by Jove.
And if you want a better firm its far afield you'll rove.
And then the Austin ambulance with bodywork by Strachan—
A better baby combination never has been born.
Sangorski too and Sutcliffe, who supplied a Minute Book
It's so minute that minutes turn to seconds as you look.
To print our books and photographs we had to ask a Riddell,
George Newnes and *Country Life* combined, and which was premier fiddle?
The portraits in the board room are by Praga. R.B.A.
Whom Savages and civilised regard as first to-day.
The carpets and the tiny rugs were labour gained for love
From one whom need and charity have never failed to move.
The bed linen and blankets, the coverlets as well,
Were gifts from gentle ladies whose names I shall not tell.

EPILOGUE

And so it came to pass that, our labours being ended, we sought to crown them in a glorious manner. And being emboldened to believe our efforts and trials would be graciously approved by the Highest in the land, it was said by one of us: let us even ask two Royal Ladies for a very small gift; and it was done. And so we were further encouraged by our success and we took the greater step. We besought the like favour from the Greatest Lady in the Land; and that too was done. And thus it is that in our little yet great Hospital, which the Eldest Son of the Greatest Lady opened for us upon the Sixth January in the year of Grace 1933, we are enabled to place upon each of the six little but greatly honoured beds a delicate, fragile but beautiful lace kerchief, the gifts of these Royal Ladies aforesaid:—

H.R.H. The Princess Royal
H.R.H. The Duchess of York
and
HER MAJESTY THE QUEEN

Announcement

Mr. Waldo Maitland, A.R.I.B.A., architectural adviser to the E.L.M.A. Lighting Service Bureau, has set up practice under the style of Waldo Maitland and Partners, at 32, Bloomsbury Street, W.C.1 (Telephone: Museum 0355). He is undertaking consulting and other work in connection with modern electric lighting schemes for private and public buildings of all types. Mr. Maitland will continue to advise the Lighting Service Bureau on all architectural matters.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

The BARKING Corporation is to negotiate with the L.C.C. for the acquisition of 40 acres in the Becontree area for a housing scheme.

The BARKING Education Committee is to erect the proposed Biffrons school, at an estimated cost of £37,000.

Plans passed by the CATERHAM U.D.C. : Two houses, Milner Road, for Messrs. O'Sullivan (Kenley), Ltd. ; two houses, Court Bushes Road, for Messrs. Gladden and Bridle ; ten houses, Coulsdon Road, for Mr. C. Cooper ; eight houses, Whyteleafe Hill, for Mr. R. J. Clarke ; three houses, Whyteleafe Road, for Mr. J. W. Looby ; two houses, Eldon Road, for Messrs. E. and A. L. Gatwood ; nine houses, and four flats, Eldon Road, for Mr. T. W. Stutchberry ; alterations, 4-6 Croydon Road, for Messrs. Freeman, Hardy and Willis, Ltd.

The L.C.C. has prepared a scheme for the clearance of the Bronze Street area, DEPTFORD, the cost being estimated at £125,000.

Plans passed at EAST HAM : 25 houses, Lawrence Avenue, for Mr. W. E. Edwards ; four houses, Stokes Road, for Mr. R. J. Slater ; 11 houses, Market Street, for Eastern Developments, Ltd. ; two houses, Roman Road, for Mr. R. J. Slater.

The EAST HAM Corporation General Purposes Committee is to consider plans for the erection of office accommodation and school clinics on the site of the employment exchange buildings in High Street.

Plans passed at ILFORD : Four houses, Edwina Gardens, for Mr. R. Shipperd ; alterations, 778 Green Lane, for Messrs. Boots, Ltd. ; 14 houses, South Park Road, for Messrs. E. Glenny and Son ; addition, 19 Mayesford Road, for Mr. P. G. Ashton ; 48 houses, Brian Road, for Mr. G. J. Cullimore ; plant shed at factory, Grove Road, for Ship Carbon Co., Ltd. ; 12 houses, Edwina Gardens, for Mr. T. Anders ; 39 houses, Emmott Avenue, for Mr. C. Fryatt ; alterations, 172 Cranbrook Road, for Messrs. Clemens Bros. ; 23 houses, Highwood Gardens, for Mr. A. Smith ; 18 houses, Woodville Gardens, for Mr. P. E. Brand ; 19 shops, Seven Ways Parade, Woodford Avenue, for Mr. J. Aldridge ; alterations, 189 High Road, for Mr. J. W. Lohden ; packing room, Britannia Works, Roden Street, for Mr. W. J. Lewis ; addition to factory, Grove Road, for Mr. J. T. Perrin ; 13 houses, Hamilton Avenue, for Mr. R. Martin ; offices and store, Ilford Wharf, Roden Street, for Mr. E. Meredith ; methodist church and schools, Oaks Lane, for Mr. P. R. Fincher ; seven houses, Hobart Road, for Mr. G. F. Siegerts ; 15 houses, Eastern Avenue, for Padnall Estates, Ltd. ; three shops, Green Lane, for Mr. A. Moore ; 16 houses, Queenborough Gardens, for Mr. G. White ; 26 houses, Holland Park Avenue, for Messrs. Bolland Bros.

The Padnall Estates, Ltd., are to erect about 1,000 houses on the Padnall estate at ILFORD.

Plans passed by the LEWISHAM B.C. : Eight houses, St. Mildreds Road, for Messrs. H. F. Thoburn, Ltd. ; eight houses, Brockley Grove, for Mr. H. Macintosh ; eight houses, Daneby Road, for Mr. G. T. Harman ; rebuilding 183-5 Rushey Green, for Mr. G. T. Harman ; two houses, Le May Avenue, for Mr. S. E. Wootton ; buildings, site of 227-9 High Street, and Morley Road, for Messrs. Dowton & Co.

The WIMBLEDON Public Utility Society is to erect 16 flats in Effra Road, Wimbledon.

SOUTHERN COUNTIES

Plans passed by the EASTBOURNE Corporation : Houses, Victoria Drive, six houses, Hunloke Avenue, two shops, 45 Seaside Road, two houses, Dillingough Road, alterations, Fishermen's Institute, Royal Parade East, for Mr. A. Ford ; alterations, Bowling Rink, Colonnade Road, motor coach station for Southdown Motor Services, Ltd., in Cavendish Place, alterations, Willington Hotel, Willington Gardens, alterations The Drive Hotel, Victoria Drive, for Messrs. P. D. Stonham and Son ; alterations, Albemarle Hotel, Marine Parade, for Hotel Co. ; four houses, Harding Avenue, for Mr. F. C. Benz ; alterations, 8-9 Grand Parade, for Mr. O. H. H. Nuttal.

Plans passed at HASTINGS : Four houses, Barley Lane, for Messrs. Jeffery and Bowcock ; additions, 37 Clinton Crescent, for Messrs. Oxley and Burleigh ; ten houses, Sedlescombe Road, for Mr. H. Slade ; alterations and additions to laundry, Convent of Our Lady, Filsham Road, for Mr. J. S. D. Hicks ; alterations, Menzi Hall, All Saints Street, for Messrs. Jeffery and Bowcock ; alterations, 8 and 11 Pelham Place, for Messrs. Callow and Callow ; alterations to shop, 26 and 28 London Road, for Messrs. Oxley and Burleigh ; two houses, Woodbroom Road, for Mr. A. Radcliffe ; additions, Warrior Gate Hotel, London Road, for Mr. E. G. Wildin ; alterations, 31 White Rock, for Mr. J. Hunt.

SOUTH-WESTERN COUNTIES

The PLYMOUTH Corporation is to make a grant to the Plymouth Housing Society, Ltd., for the erection of 21 flats in Valleytort Place, and eight in Buckwell Street.

The PLYMOUTH Corporation Land Committee is assisting the Tamar Valley Canning Co., Ltd., to obtain a suitable site for the erection of a canning factory.

EASTERN COUNTIES.

Plans passed by the COLCHESTER Corporation : Two houses, Mile End Road, for Mr. G. M. Farrow ; two houses, Mile End Road, for Mr. A. J. Diss ; alterations, Culver Street, for Messrs. W. A. Hills and Sons ; two houses, Mersea Road, for Mr. F. Taylor ; two houses, Old Heath Road, for Messrs. H. G. Pryke and Son ; five houses, London Road, Lexden, for Mr. F. Humm.

The Tamworth Construction Co., Ltd., is to develop the Whitehall Estate, COLCHESTER.

Mr. W. Reid Dick, R.A., at work on his statue of Sir John Soane, R.A., which is to be placed on the Lothbury front of the Bank of England.

MIDLAND COUNTIES

The BIRMINGHAM Corporation has sold land at the civic centre on the Kingstanding estate to the authorities of the Roman Catholic Church for the erection of a church and school.

The BIRMINGHAM Corporation has leased sites on various housing estates to Mr. Douglas James for the erection of 114 houses ; and to Mr. S. H. Marsh, for the erection of six houses, 12 shops, and 12 houses and shops.

Plans passed at CHELTENHAM : Four houses, Exmouth Street, for Mr. C. H. Reason ; new vestry, St. Paul's Church, for the Church Council ; additions and alterations, Y.M.C.A. Promenade, for the Y.M.C.A. ; conversion of house into two houses, Lagarie, Eldorado Road, for Messrs. L. W. Barnard and Partners ; two houses, Knapp Road, for Mr. F. Willett ; six houses, Evesham Road, for Messrs. A. C. Billings and Sons ; extension to school buildings, St. Mark's School, Alstone Lane, for the school managers ; extension to Christchurch School, Malvern Road, for Christchurch School managers ; 16 houses, Bouncer's Lane, Prestbury, for Mr. W. H. Bowd ; 12 houses, Bouncer's Lane, Prestbury, for Mr. A. E. Hunt.

Plans passed at DUDLEY : Two houses, Forest Road, for Mr. T. D. Edwards ; two houses, Nith Place, Priory Estate, for the Dudley Co-operative Society, Ltd. ; alterations and additions, Wolverhampton Road, for Lloyds Bank, Ltd. ; two houses, Priory Estate, for Mr. F. A. L. Butler ; two houses, Yew Tree Hills, Netherton, for Mr. A. L. Hingley ; two houses, Chestnut Avenue, for Mr. W. H. A. Smith ; two houses, Stourbridge Road, Harts Hill, for Messrs. Lloyd Bros.

NORTHERN COUNTIES

Plans passed at BARROW-IN-FURNESS : Alterations, 159, Dalton Road, for Messrs. Lipton, Ltd. ; four houses, Oxford Street, for Mr. L. Robinson ; two houses, Thorncliffe Road, for Messrs. Rainey Bros., Ltd. ; alterations and additions, 244 Dalton Road, for Messrs. W. T. Story, Ltd. ; two houses, West Avenue, for Messrs. R. T. Dockeray & Co., Ltd. ; alterations and additions, 99 Duke Street, for the Britannia Insurance Co., Ltd. ; alterations and additions, 14, Cavendish Street, for Messrs. McDowell.

Plans passed by the BLACKPOOL Corporation : Six houses, Devonshire Road, for Messrs. Sherratt and Smith, Ltd. ; 16 houses, Walpole Avenue, and house and shop, Squires Gate Lane, for Lancashire Construction Co. ; factory extensions, Devonshire Road, for Bee Bee Biscuit Co. ; station and booking office for miniature railway, Pleasure Beach, for Pleasure Beach Co. ; six houses, Thirsk Grove, for Mr. W. Hornby ; four houses, Ansdell Road, for Mr. A. Nuttall ; two houses, Delphene Avenue, for Mr. W. Spencer ; six houses, Marton Drive, for Messrs. J. Gregson and Son ; 12 houses, Collins Avenue, for Mr. Ernest Riley ; seven houses, Brook Street, for Messrs. Hogarth and Pollard ; 10 houses, Stoke Avenue, for Mr. James Witt ; 10 houses, Westcliffe Drive, for Mr. E. Armitage ; eight houses, Stamford Street, for Mr. W. H. Whiteley ; four houses, Wetherby Avenue, for Mr. W. B. Snape ; two houses, Peddars Lane, for Mr. Thos. Hill ; alterations and additions, 499, Promenade, for Mr. R. Tomlinson ; two workshops, Selbourne Road, for Messrs. J. and R. Fenton, Ltd. ; six houses, St. Luke's Road, for Mr. H. D. Whiteside ; cinema and café, Red Bank Road, for Mr. C. Dunn ; two houses, Manchester Road, for Mrs. H. Cardwell ; two houses, Manchester Road, for Mr. John Cardwell ; 44 houses, Beaufort Avenue, for Messrs. R. Fielding and Son ; junior school, Russell Avenue, for Education Committee.

The BLACKPOOL Corporation is to obtain a site on the Pembroke estate for a swimming-bath, and has authorised the preparation of plans for the buildings.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

*In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

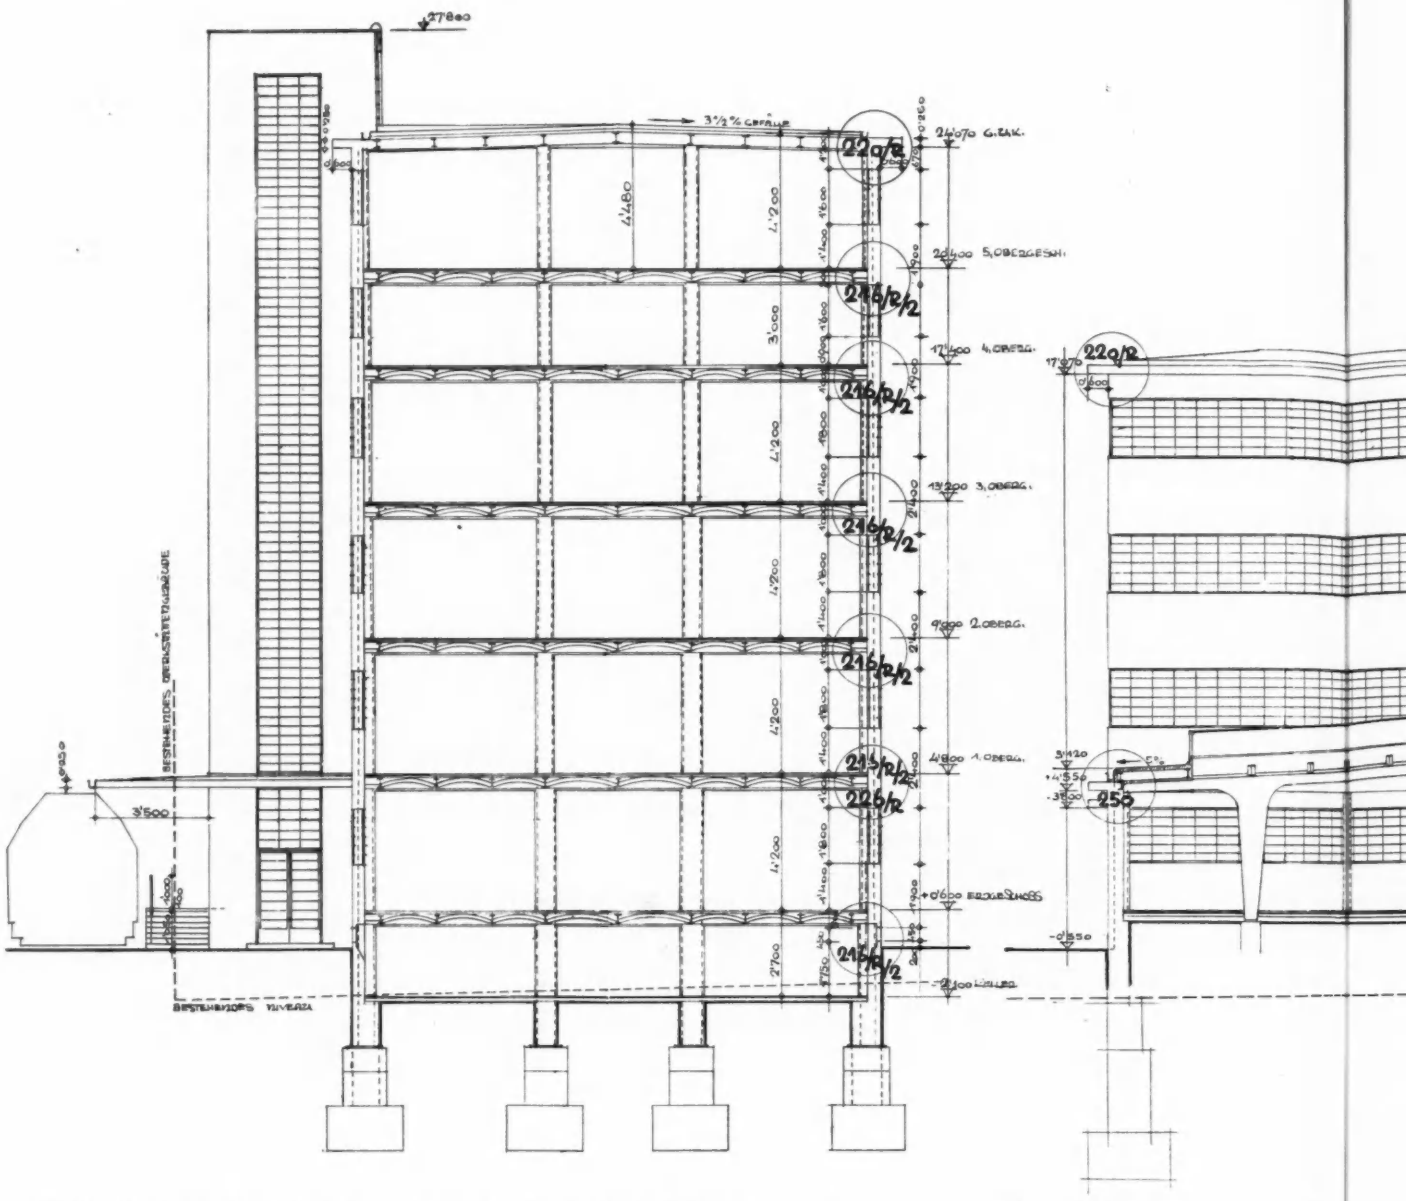
Supplement to THE ARCHITECTS' JOURNAL for February 22, 1933

CIGARETTE FACTORY, LINZ, AUSTRIA

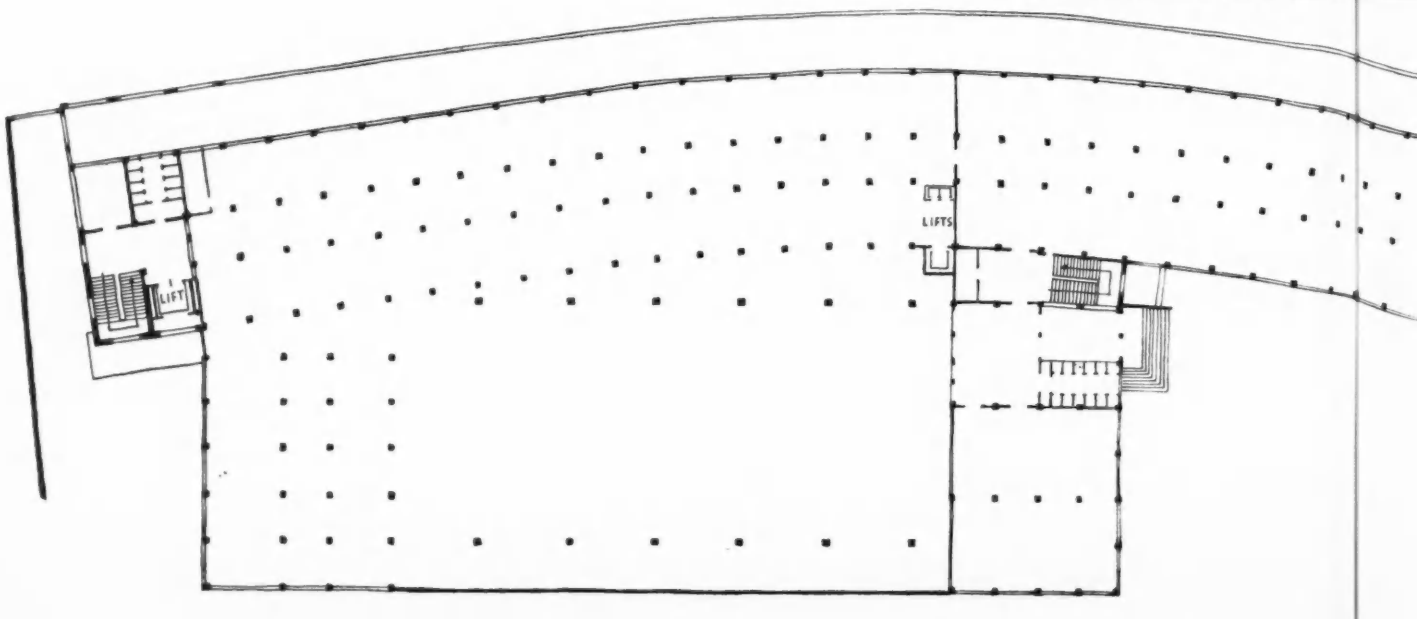
BY DR. PETER BEHRENS AND ALEXANDER POPP: PLAN AND SECTIONS



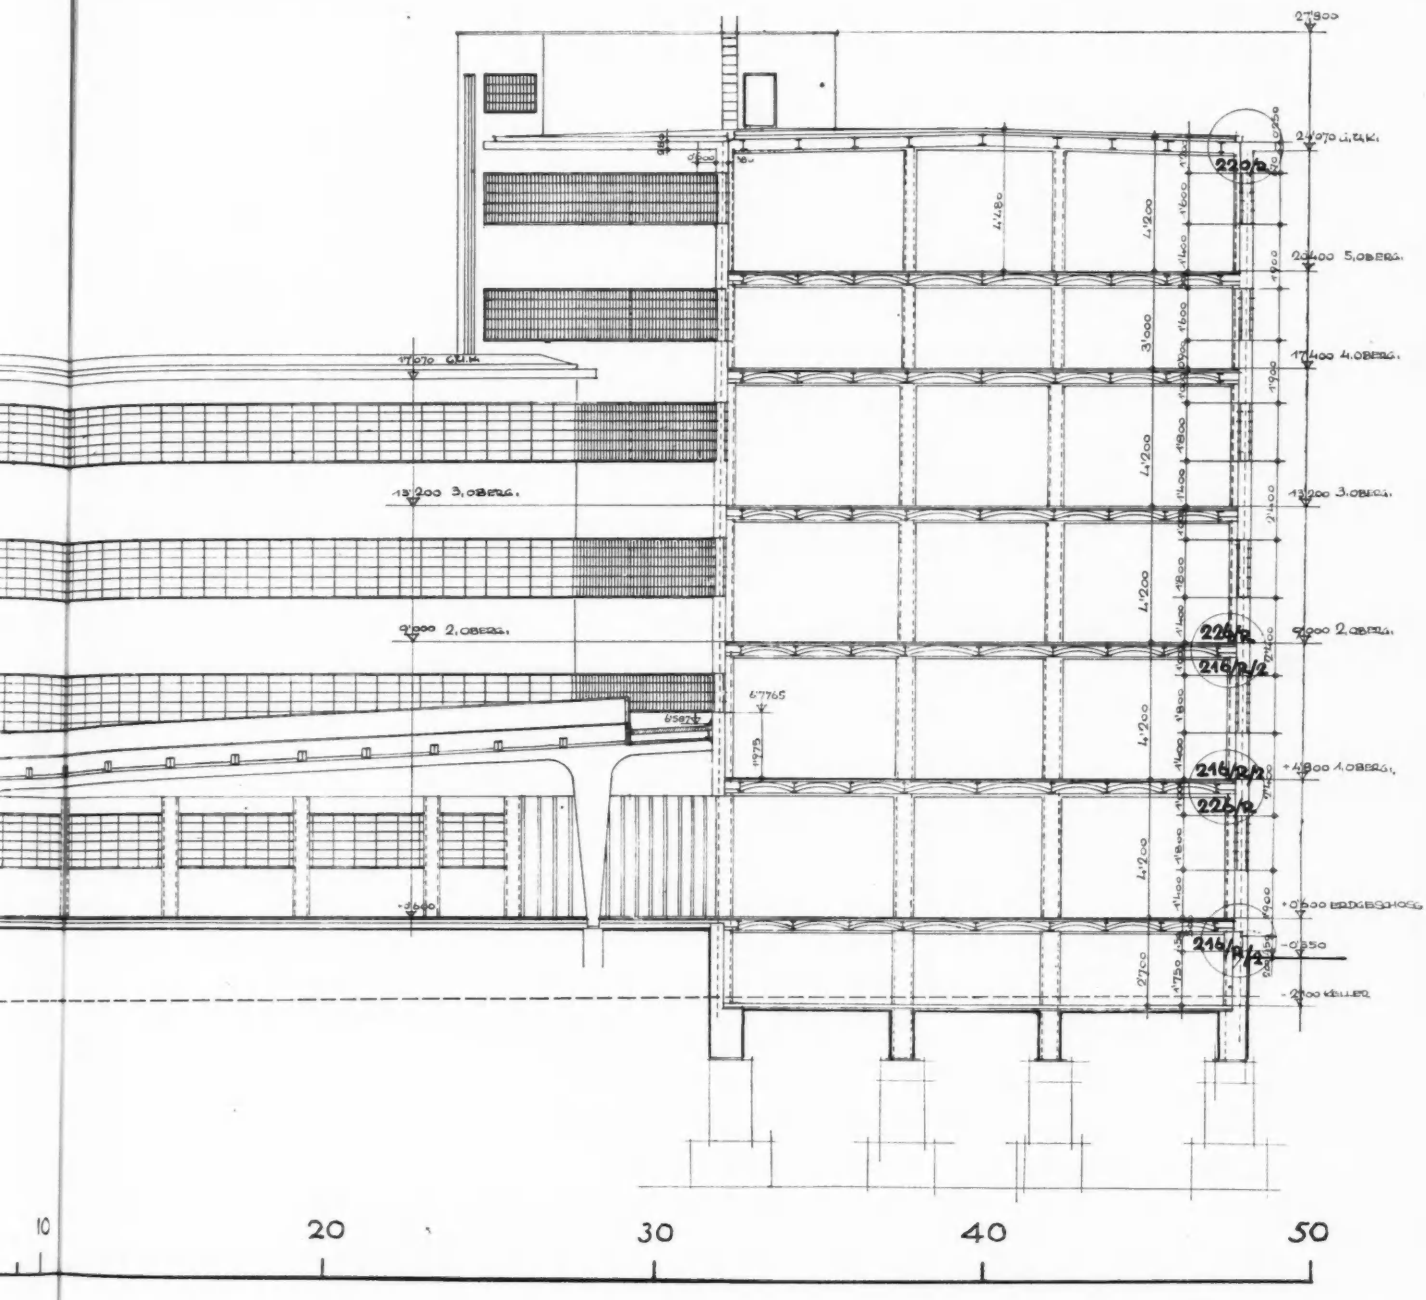
THE CURVING SWEEP OF THE 730-FOOT FRONT TO THE LUDLGASSE

THIS factory, of which plans and two cross-sections appear overleaf and other illustrations elsewhere in this issue, will eventually be the largest of its kind in the world. It is a long, six-storied, steel-framed structure, designed on the standard-unit principle, with very slender supporting points spaced as nearly as possible 4 metres apart.

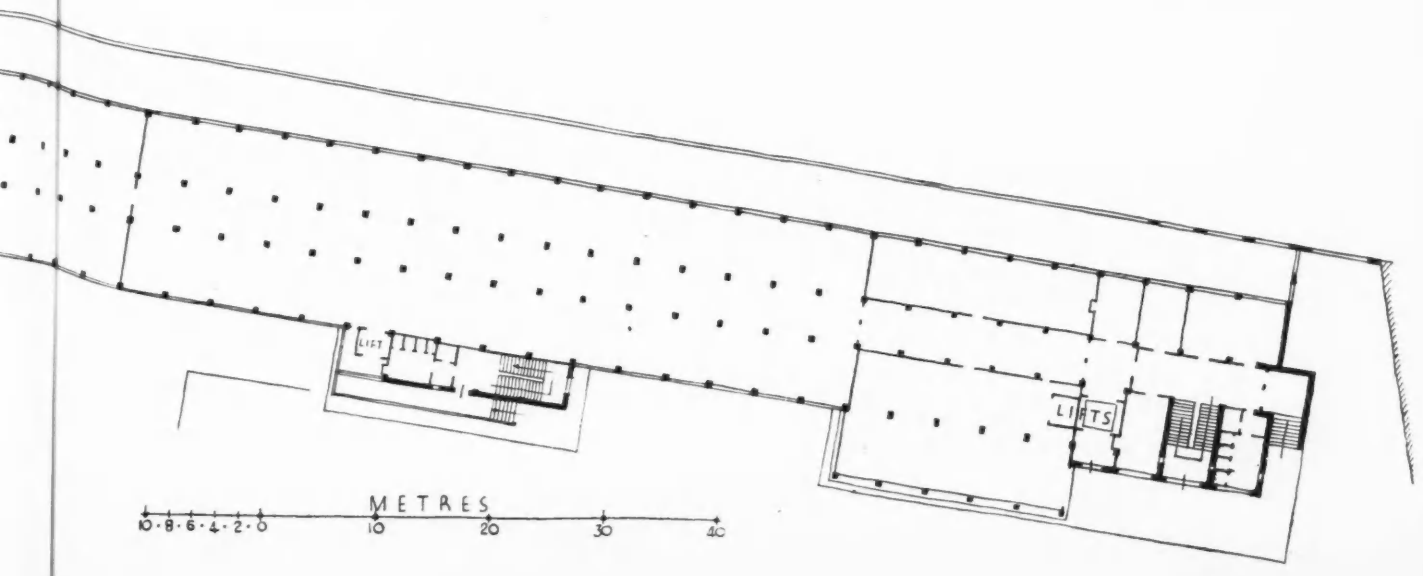
The main façade, which follows the convex curve of the Ludlgasse, is patterned in continuous ribbons of fenestration, with six-panes-deep metal-framed casements, alternated by broad bands of plain, white roughcast rendered directly on to the deep edges of the heavy concrete floors. In the rear the building faces a large yard with a corresponding concave elevation, the line of which is interrupted by twin staircase towers with long perpendicular windows that emphasize their re-entrant angles. Two rather larger staircase-towers, dissimilar in design, flank each end. One, which contains the administrative offices, is joined to a group of older buildings by a flying bridge. The other, which screens the structural link between the factory proper and a four-storied annexe that houses the atmospheric conditioning rooms and despatch department, forms a square apse dominating the landscape with its parallel vertical windows. These four great staircase-towers, in which the lifts and lavatories are placed, overtop the flat roof, punctuating it like hugh squat chimneys.



The Austrian State Régie believes in the business value of design. In spite (or perhaps because) of this it is, oddly enough, about the only really successful commercial undertaking in present-day Austria. Instead of engaging a structural engineer to design its vast new factory, which is one of the most rationally- and economically-constructed yet built, the Régie deliberately chose the most distinguished living German architect, Peter Behrens—whose Turbine-Erecting-Shop in Berlin for the A.E.G. (1909) was the first truly "modern" industrial building. The result is seen in such entirely unacademic details as the way in which the main front repeats the bold sweep of the road instead of tamely squaring it off.



For all its severe and disciplined plainness there is no suggestion here of that grim, prison-like monotony which makes so many "up-to-date" tobacco factories "industrial-looking" in the bad old Victorian sense of the word. This is a fine and seemly building, owing nothing to conventional added graces.



NOTE: The large numbers within circles are references to drawings showing the details on a larger scale.

STANDARD SYMBOLS FOR USE ON DRAWINGS. ELECTRICAL SERVICES.
SIR JOHN BURNET, TAIT AND LORNE ARCHITECTS ONE MONTAGUE PLACE BEDFORD SQUARE LONDON W.C.1.

INFORMATION SHEETS

• 6 •

SYMBOLS FOR ELECTRICAL SERVICES

•

THIS week's Information Sheet is again chosen with a view to giving readers a foretaste of the varied scope of the subjects to be dealt with in the course of the present series. It grows out of the movement in favour of the adoption of a standard code of simple symbols whereby the numerous electrical appliances in current use may be readily and briefly indicated. It is, therefore, in contrast to the group of data about another essential service—plumbing—to which its immediate predecessors were devoted; this will be resumed later.

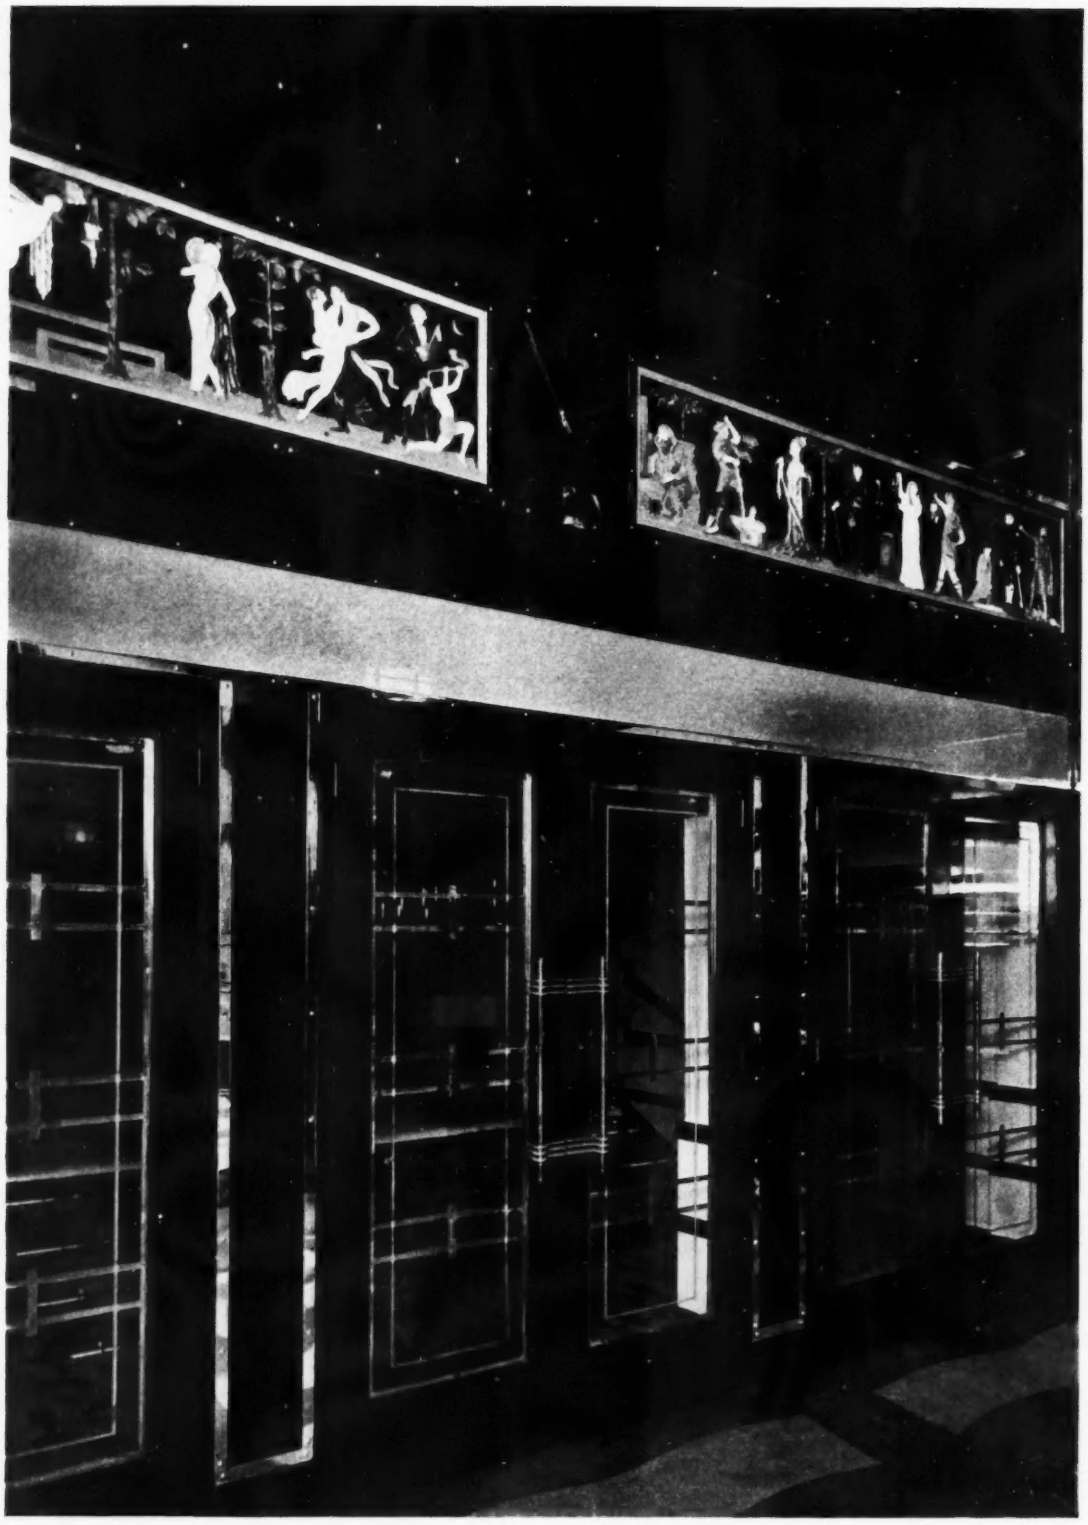
The drawings from which all these Information Sheets are reproduced originated in the office of Sir John Burnet, Tait and Lorne. Far from grudging the broadcasting of information they had been at pains to tabulate for use in the course of their own practice, they embraced the proposal with enthusiasm, thus placing the whole profession in their debt, and incidentally furnishing the student of fine draughtsmanship with specimens for emulation.

It was desired to present these Information Sheets in a standardized form, but no standard filing size has existed, hitherto, in Great Britain. The decision was therefore taken to make the reproductions the same size as the original drawings, which themselves follow the standard dimensions adopted by the American Institute of Architects, as being more convenient than reproduction to the double-page size associated with THE ARCHITECTS' JOURNAL Supplements.

Until further notice, therefore, these Sheets will take the place of the second double-page plate that is usually issued, week by week.

The following is a list of the subjects previously issued :—

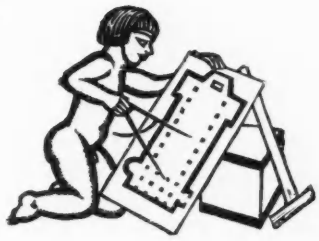
1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.



TENEMENT HOUSES IN AMSTERDAM

FOR A PUBLIC UTILITY SOCIETY : BY PIET KRAMER

A CONFERENCE took place last Friday at the R.I.B.A. of representatives of Public Utility Societies. There have been about 250 voluntary housing societies formed since the war, and the purpose of the conference was for the societies to consider what evidence they would present to the Departmental Committee now being set up to consider methods of dealing with slums. A photograph of flats built by a Public Utility Society at Amsterdam is reproduced on this page. These are from designs by Piet Kramer.



In the City of Amsterdam all buildings are inspected by the city architects and surveyors. Dwellings are classified in three groups according to whether they are uninhabitable, capable of improvement or are in good condition. In the opinion of Herr Keppler, the Director of Housing Services at Amsterdam, this expert study and analysis is indispensable before a conclusion can be reached as to which buildings should be condemned and which can be preserved. Compensation for property demolished is based in Holland on market value, and for buildings in good condition full value is paid.

THE GARRICK THEATRE, SOUTHPORT, LANCS.: THE VESTIBULE DOORS

GEORGE E. TONGE, ARCHITECT

Beyond these doors are seen indications of the short flight of stairs leading up to the grand foyer. The street doors are behind the camera, and to their right is the pay office, illustrated on page 301. The vestibule is carried out in polished black glass and chromium, with a ceiling of black opalite. On either side of the skeletonized clock-face is a frieze of well-known characters in drama.

BUILDING—FIGURES AND FACTS

IN a leading article on February 20 *The Times* supported Mr. Neville Chamberlain in his contention, made in the course of a debate in the House of Commons, that it would be "grotesquely foolish to believe that on balance any improvement in employment" can be secured by a resumption of public works. In support of this *The Times* asserts that it "costs about £500 to give one man work for one year in this way," and comes to the conclusion that "expenditure on such a scale and giving so small a return must add to liabilities incomparably more than it adds to assets."

A contention of this nature, made, as it was, by the Chancellor of the Exchequer, and leading to the conclusion drawn by *The Times*, merits careful examination.

It is an accepted figure that the contractor for building and construction pays out, on the average, 40 per cent. of the amount spent on the work to labour, and 50 per cent. for materials, leaving 10 per cent. for overhead charges and profits. Of the 50 per cent. expended on materials, an average of 40 per cent. represents wages paid by the manufacturer of the materials and the remaining 10 per cent. covers overhead charges and profits. On the whole, therefore, 80 per cent. of expenditure on building and construction goes as wages either in making materials or in assembling them, excavating, etc.

Using these proportions, it is possible to assess the amount of employment that would be provided, on the average, by a programme of building and construction work. Suppose, for the sake of illustration, that such a programme is drawn up and £100 is expended every week. The contractor will spend £40 on wages, employing fifteen men for the week at £2 15s. per week.

The figure quoted by *The Times* apparently only took this employment into account, and, on this basis, it agrees with the above calculation. But, obviously, the employment provided in the manufacture of the materials must also be taken into consideration. The maker of materials, to pursue the illustration, will also spend £40 during the week on wages, employing another fifteen men. This supports the well-known contention that a man employed in building and construction work requires another man to provide him with materials.

The total employment provided, then, in the building and material industries, amounts to thirty man-weeks, so to say.

But the matter does not end there. Not only are thirty men employed for a week, but they are given £80 to spend, so there is, as it were, a stream of purchasing power flowing from each man amounting to £80 in all. This £80 does not disappear, as some of the opponents of public works suggest, but goes out again, in payment for the necessaries of life for our thirty workers. The demand for the products of the industries which make those necessaries is accordingly increased by £80.

It would appear from the figures in the Report of the Committee on Industry and Trade, that, at a conservative estimate in these industries, about 40 per cent. of the total cost is labour cost. We may, therefore, employ this percentage to assess the effects on unemployment of such expenditure by those employed in the building and materials industries.

Of the £80 paid out for food, clothing, etc., 40 per cent.—or £32—is paid out on labour in the manufacture and distribution of the articles. This will employ eleven men for the week at £2 15s. But this £32 is again paid out for food and clothing, and 40 per cent.—or £13—is again paid out in wages. This will employ four men for a week. The total indirect employment created in these industries is therefore fifteen man-weeks.

The total employment created by the expenditure of £100 is thus forty-five man-weeks. Thirty men are employed for a week in the building and materials industries, and on the whole these thirty require an additional fifteen men to supply them with the necessaries of life.

We are now able to determine the accuracy of the statement that expenditure on building and construction "must add to liabilities incomparably more than it adds to assets."

The fact that forty-five men are employed who would otherwise be unemployed means, first, a saving of unemployment benefit. At the rate of 25s. per week this represents a saving in the week of £56 5s. Secondly, not only are these forty-five men not being maintained by the unemployment insurance fund, but they are now contributors to that fund. This represents a further saving of £3 15s. in the week.

To correspond to the item of "£100 spent on building and construction" on the debit side of the account, therefore, one must put on the credit side the building and construction work worth £100, and a saving to the unemployment funds of £60 in the week.

The statement that such a policy adds more to the liabilities than to the assets is thus diametrically opposed to the truth. And that without taking into account other additional assets. For instance, the increased

national income due to this policy would mean an increased yield from taxation, and in addition the buildings erected would be subject to rates. This would confer a great benefit on the national and local finances in addition to the benefit derived from increased employment.

Mr. Keynes has estimated that the expenditure of £30,000,000 on housing would increase the national income by £60,000,000, and that 20 per cent. of this—or £12,000,000—would represent the increased yield from taxation.

Arched houses at Lunel, Provence. A characteristic pen-and-ink study by Leonard R. Squirrell, finished examples of whose work are on view at the Fine Art Society. Another sketch is given on page 293.

NOTES & TOPICS

THE NATIONAL PLANNING RESOLUTION IN THE COMMONS

THE resolution I referred to last week, to be moved in the House of Commons by Dr. W. H. McLean, calling attention to the need for a National Development Plan, has been postponed. From the point of view of those who believe that it is essential to prepare a plan in order to assist local authorities to estimate what they must provide for under their schemes, this postponement is all to the good.

*

For, in the first place, Sir Robert Horne, who carries much weight in Parliament, intends to advocate business planning. Dr. McLean's resolution will also be more appropriate if it leads to a discussion just before April 1, the date on which the Town and Country Planning Act comes into operation.

*

RE-PLANNING GLASGOW : A JOB FOR ARCHITECTS

Glasgow is in need of re-planning. Heavens, is it not !

*

Glasgow, indeed, is by statute bound to engage itself upon a re-planning scheme, but when the Glasgow Institute of Architects put forward the suggestion that an advisory Committee on Amenity should work in conjunction with the Corporation, the City Engineer, Mr. Thomas Somers, objects that co-operation would serve no useful purpose and *that re-planning Glasgow is an engineering job.*

*

Planning a town is not engineering, but planning—designing, architecture.

*

Carrying out the ordered works is a branch of engineering known as civil engineering, and he who is responsible for such in a city is its city engineer.

*

To give into this man's hands work that was not too good for the best architects of the past in Edinburgh and other well-planned towns is a wasteful diversion of trained talent. The architects of Glasgow were too modest.

*

BUILDERS OFFERING EXTENDED CREDIT

I have been sent recently by more than one firm of local builders a circularized invitation to enjoy extended credit on the monthly instalment basis for any work I might wish them to carry out for me.

*

How very sensible ! Work is scarce, labour and materials cheap, and, speaking for myself, capital is low. Never was credit more useful than at this difficult present ; and even though I may be paying next Christmas for the new bathroom I am going to have in, I have the knowledge that I have paid no more than I should for work that is not badly done because the job is a small one. More power to their elbows !

*

THE G.W.R. BUILDING PROGRAMME

I find it surprising that those who are endeavouring to persuade our captains of industry to build and reconstruct have not given more attention to the example set by the Great Western Railway.

*

South Wales is notoriously a depressed area, and Cardiff almost a deserted village, but the directors of the G.W.R. are showing such complete confidence in the future that they are rebuilding the Cardiff station at a cost of over £1,000,000. When completed, it will be bigger than Paddington Station, and the arcades below will be models of convenience and skilled planning.

*

The stations in Bristol and Swansea are also being reconstructed by this company, who are thus showing their faith in the future revival of industry, and are taking full advantage of the present opportunity to carry out improvements when building costs are as low as they are likely to be.

*

THE ART OF LEONARD SQUIRRELL

I dropped in last week to the exhibition of works by Leonard R. Squirrell, R.E., R.I. The quiet charm of his art is best seen in his water-colours, which form the larger part of his show, though his versatility is expressed in oils, etchings and pastels. His interpretation of landscapes and architectural subjects is straightforward, but though he

observes detail closely, his expression is far too subtle, and his colour sense too delicate, for his work to bear the photographic stamp.

*

ELEGANCE IN HALIFAX

What lasting powers a good piece of design possesses! A stranger visiting Halifax—grim enough town, goodness knows—unearths a building known as the Old Piece Hall, and on the strength of this work of eighteenth-century elegance calls Halifax "the aristocrat of the West Riding."

*

I would like to know more of the Old Piece Hall, which I understand to be a two-story quadrangle, built up of small rooms connected by galleries, and used in the past by the clothiers as stores between markets. The original uses soon disappeared, I fancy, yet the thing remains intact, elegant and austere. I'm sure it is worth knowing more of.

*

ECCLESIASTICAL ART

Surrounded by the works of the great masters of Italian painting, the Pope has solemnly and categorically condemned modern religious art, and, by inference, all modern art.

*

In the storm that followed, one side maintained that it was the purpose of *sacred* art to foster religious fervour and to elevate taste, and not to exist for art's sake alone; while the other, pointing to the works of the great masters, reminded their opponents that these men were certainly artists first and churchmen second; and asked, rather pertinently, what quality of religious fervour and what degree of elevation the trumpery figures and tinsel ornaments commonly found in Italian churches could be thought to excite.

*

A wordy battle rages, but could only rage if it is allowed that there can exist in a healthy state such anomalies as *ecclesiastical* painting, ecclesiastical furniture, or ecclesiastical architecture. No such thing existed in Michelangelo's days, and, by slow degrees, it is ceasing to exist for us today.

*

GUILDFORD CATHEDRAL FOUNDATIONS

There has been a good deal of talk among Guildford people of the needlessness of a cathedral there, of the bad site chosen for it, and the costliness of the foundations made necessary by the nature of the subsoil. These fears have been dispelled by a letter from Mr. Edward Maufe, the architect, to Lady Cawdor.

*

Mr. Maufe pointed out that the cathedral is for a diocese, not a parish, and that the possibilities of the site to the west of the town and near the new by-pass road have been insufficiently realized by local people. As to that, a great wooden cross is to be erected on Stag Hill, for all to see, to advertise the site.

*

And as to the foundations, these, costing £24,000, may work out at some 12 per cent. of the total cost, instead of the 7–10 per cent. to be obtained under very favourable conditions—if indeed such conditions are ever possible for a construction of this nature. The proportion does not seem excessive.

*

Incidentally, the Archdeacon of Surrey has stated that he does not think the diocese will be able to afford to build in stone, but thought they could in flint, which is a local material. He foreshadowed "buttresses on the outside" and modifying the design "so as to break up the long lines"—in short, in point of alterations, the history of Liverpool Cathedral is likely to be repeated.

*

"FUMIFUGIUM"

What a charming idea of the Smoke Abatement Society to republish *Fumifugium*! It is, perhaps, the earliest piece of anti-smoke propaganda, and by John Evelyn, who, as the author of *Sylva*, nearly changed the face of rural England single-handed—or is it single-minded?

*

Fumifugium, as republished, will be additionally valuable as being introduced by no less a person than Rose Macaulay. And all this—literature, history and propaganda—between stiff boards for 1s. 6d., or, paper-covered, for 6d.

*

A TWELVE-STORY SKYSCRAPER

The first skyscraper has recently been erected in Amsterdam—an apartment house twelve stories high! Most of the houses in this city are built on piles, owing to the marshy character of the ground, and I am told that the foundations of the twelve-story skyscraper caused more difficulty than those of the Empire State building of 84 stories caused the American engineers. On a clear day it is possible to see as far as Utrecht from the top of the new building.

NEWS

POINTS FROM THIS ISSUE

In Amsterdam, buildings are classified as uninhabitable, capable of improvement, or in good condition 287

The total employment created by the expenditure of £100 on building is forty-five man-weeks 289

Planning a town is not engineering, but planning—designing, architecture 290

London has 40 miles of sunken railway tracks or open cuttings 298

Sheep bones as pegs for fixing slates .. 299

A slum-dweller's method of destroying bugs 306

The humiliation of dying from influenza . . . we shall never be without this needless pain so long as our cities are without plan 307

London is fast becoming the industrial as well as the administrative centre of London 309

2,142 families of two to nine persons live, eat and sleep in one room only, in the Royal Borough of Kensington .. 309

THE ADELPHI BILL

The Adelphi Bill, which is due to come before the House of Lords on March 16, is to be sponsored by Lord Newton. The opposition is to be led by Lord Esher, Chairman of the S.P.A.B.

The object of the Bill is to repeal the Act of 1771, which provided that no building between Adelphi Terrace and the river should be more than twenty feet high. There are also provisions in the new Bill for carrying out the following work :—

Widening of Adam Street, Robert Street, John Street; a new street in continuation towards the south-east of Adam Street, as proposed to be widened under this section; a new street in continuation towards the south-east of Robert Street, as proposed to be widened under this section; a new street following the course of, or parallel with, Adelphi Terrace, commencing by a junction with Adam Street, as proposed to be widened and continued under this section, and terminating by a junction with Robert Street, as proposed to be widened and continued under this section; a new lower roadway commencing at the north-east boundary of the Estate, continuing thence in a south-westerly direction and terminating at or near the south-west boundary of the Estate.

Removing or altering any vaults, arches, cellars, etc.

The list of subscriptions received by the Public Relations Committee of the Building Industries National Council up to Monday last amounted to £2,195. Subscriptions should be addressed to Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

AN "ALL CLEAR" SIGNAL

The Minister of Health (Sir Hilton Young), speaking at a meeting of the Burnley Building Society on Friday last, said :

"I can make tonight an 'all clear' signal, all clear for the builders and building societies to build us the houses we want, all clear for the local authorities to get rid of the slums we don't want."

After reviewing the housing policy of the Government, he continued :

As to the slums, we concentrate the energies and resources of housing authorities on the direct work of getting rid of them.

We shall make a massed attack on the slums. Local authorities must wake up about them. Theirs is the first responsibility. We must have the whole force of public opinion to support the advance. The Government will back it up to the utmost. We set no limit to the pace of the work. The faster the better.

It was hoped that the growth of municipal housing estates would result in a "filtering-up" of the slum-dwellers and the abolition of slums. That hope has been falsified. The new houses have not in general been occupied by the slum-dwellers, and the slums remain. Confronted with the failure of the policy of general subsidies to meet our chief needs we must not rest content with that policy. We must seek out the causes of the failure, and when we have found them, put them right.

£3,000,000 FACTORY

Building work is starting on the £3,000,000 steel and tube works at Corby, Hants, and (according to *The Industrial Daily News*) orders for hundreds of thousands of pounds worth of plant are about to be placed with the engineering industry.

MR. BALDWIN'S NIGHTMARE

Speaking at the annual meeting of the Abbey Road Building Society, held in London on Saturday last, Mr. Stanley Baldwin said : "We must all get together—everybody who can influence the work of building—the Government, the building societies, and private individuals.

"It must be all hands to the pumps with this work, the greatest and most important that lies before us during the forthcoming year. Let us work and get on with it.

"The one nightmare of my life for years past has been the unemployment problem. You may well think how I rejoice to feel that we have now the hour in which we can and ought to start work with new vigour and a new spirit. The Government, I am glad to say, is working hand in hand with the building societies in full sympathy and understanding."

UNIVERSITY OF LONDON

It was announced last week that the King is to lay the foundation stone of the new University of London buildings in Bloomsbury on June 26. His Majesty will be accompanied by the Queen.

The architect for the buildings, estimated to cost £3,000,000, is Mr. Charles Holden.

TOWN HALL FOR OLNEY

The unemployed of Olney, Bucks, propose to build a town hall free of charge. Every owner of the many derelict stone barns and cottages in and around Olney has been asked to give these to the Council in order that they may be demolished and the materials reused for the town hall. It is understood that the building will be designed by a London architect.

WEST YORKS. SOCIETY

Mr. R. J. Edmondson presided at a meeting of the above Society, held at the Keighley School of Art on February 23, when a lecture on "Architecture and the Student" was given by Mr. W. M. Keesey. In the past, he said, architecture as a subject for the student had been unrelated to study in general.

New materials and methods of construction were rapidly affecting design and the tuition which accompanied it, and the latter was being governed by the new demands which invention and industrialism were making upon the architectural treatment of new and varied problems. The "Grand Tour" which in centuries past every gentleman of means was supposed to make through Europe, and in which a study of architecture formed not the least feature, had its modern equivalent in travelling scholarships.

EMPIRE TIMBERS

Following the recent Exhibition of Furniture and other articles in Empire woods at the Forum Club, the Building Centre are displaying in the window of their premises at 158 New Bond Street a collection of samples of Empire timbers presented by the Empire Marketing Board, and on permanent exhibition at the Centre.

The collection of woods on view at

the Centre consists of specimens of the timbers dealt with in the Empire Marketing Board's Handbook, copies of which may be had free, while the somewhat limited supply lasts, by architects or other interested persons on application to the Secretary, Empire Marketing Board, 2 Queen Anne's Gate Buildings, Westminster, S.W.1.

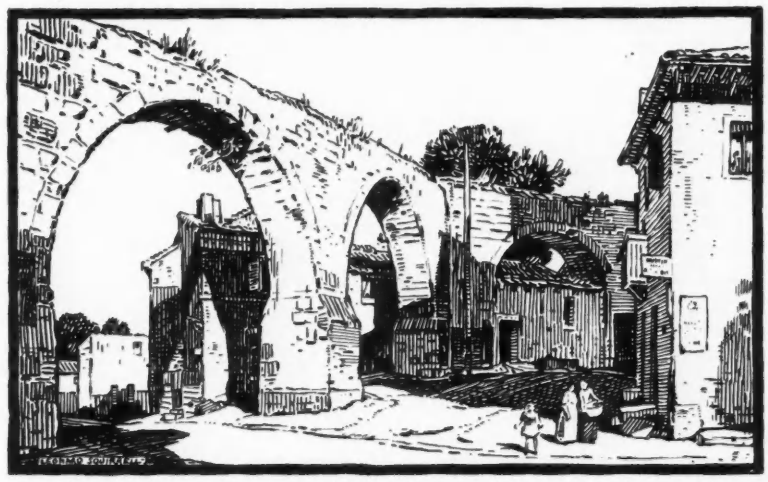
ROME SCHOLARSHIP

The Faculty of Architecture of the British School at Rome have admitted the following candidates to the competition for the Rome Scholarship in Architecture, 1933:

Messrs. P. B. Dunham, (Bartlett School of Architecture, University of London); J. A. Pinckheard (Architectural Association); D. McIntyre and J. C. Clavering, (Armstrong College, University of Durham); J. R. Baxter, A. G. S. Fidler, B.ARCH., and E. Farrar (Liverpool School of Architecture); J. T. Cahill, B.ARCH. (University of Manchester); G. H. Lawrence, A. Reiach, and P. H. D. Ronaldson (Edinburgh College of Art).

MR. COPPOCK AND HOUSING

Mr. R. Coppock, General Secretary of the National Federation of Building Trade Operatives, in the current issue of *The New Statesman and Nation*, contributes an article to the series now being published on housing. He follows Sir Ernest Simon, Mr. Keynes and Sir Raymond Unwin in attacking the Government's present housing proposals, and urging the need for a national effort. Extracts from Mr. Coppock's article are printed below:—



Never in the political history of our country has the fear of consequences been so exploited by any Government in an endeavour to reduce the standard of living of the nation as by the one now in office at Westminster. And behind this fear-complex there is being put through the most reactionary legislation of modern times—reduction of our educational standards, the new Rents Restriction Bill, etc., and, finally, the Housing (Financial Provisions) Bill, which has been termed by Sir E. D. Simon the "Anti-housing Bill." No Minister has ever by his actions created so much poverty and distress as the present occupant of this high office of State—the Minister of Health.

The present position of the building industry, with its colossal figures of unemployment, can be traced to the administrative acts of the Ministry of Health. The issue of the now infamous circular to local authorities in September, 1931, was responsible for the holding up or abandonment of building work to the value of £75 million, which I stated at the time to the Minister would paralyse the industry and force thousands of workers in the building industry and public works on to the unemployment funds of the nation. The circular created the fear-complex throughout the local authorities.

It is not generally known that the Minister of Health and the Chancellor of the Exchequer also prevented the building of houses for rural workers under the Rural Housing Act of 1931.

The present Housing Bill before the House is not a progressive measure at all. It is in truth a repealing Act, but so artfully has it been drawn up that the nation is again discussing housing as though the Bill were the last and final act required to provide houses for the poor and badly paid industrial worker. The bill guarantees nothing at all so far as houses are concerned.

I agree with Sir Raymond Unwin that this question can be dealt with only on planned lines. I would advocate the establishment of a National Development Board, representative of the building industry, local authorities and the State. The Board would be nationally financed by means of direct taxation with no interest charges, and repayment would be made to the Board in the form of rents to enable it to undertake further building. I would give the Board powers under the Housing Acts, Town-Planning Act, Public Health Acts and—for road-making powers—the Road Traffic Act. Decentralisation would be operated through county committees: each year the Board would budget for housing developments and slum clearance. The plan should be operated to produce a million houses in four years, and the money required would amount to approximately £350 million. This figure may stagger the uninformed, but when we remember that in these times of peace we spend some £600 million annually for past and future wars, the sum mentioned for housing purposes is not so very much after all.

The Old Aqueduct at Castries: Pen-and-ink study for a water-colour drawing on view at the exhibition of drawings and etchings of Leonard Squirrell, now being held at the Fine Art Society. *(See note by Astragal on page 290.)*

HOUSING LOANS

A statement was issued last week by the Ministry of Health to clear up a misunderstanding regarding its policy towards local authorities who seek loans for housing schemes.

A letter to an Urban District Council was interpreted as meaning that no loan will be granted until the Minister has satisfied himself that private enterprise has failed to provide houses for the working classes. It is of importance, states the Minister, this misunderstanding should be removed. The statement continues:—

The powers of local authorities to build houses under Exchequer subsidy as against slum clearance schemes under the Act of 1930 remain entirely unaffected. In other cases, where local authorities desire to meet a general need for working-class houses in their area by building without subsidy, it is not the intention of the Minister to hold up applications from such authorities for loans for housing, pending general experience as to the success or failure of private enterprise in providing houses for the working classes. In the future, as in the past, applications will be considered by the Minister in relation to the circumstances of each case.

Where the Minister is satisfied that the needs of the locality, both as to the number and the time of completion of such houses, are not likely to be met by private builders, the application will be favourably considered in accordance with the usual practice.

OUR UGLY CITIES

Mr. Thomas Howarth, President of the Institute of Builders, speaking at its annual dinner, held on Thursday last, said he sympathized with the desire for cheaper houses, but if it meant more mean streets in our already ugly cities then standardization was an evil.

NATIONAL CREDIT

Mr. Winston Churchill, speaking to his constituents at Epping on Thursday last, asked why the national credit had not been used to finance schemes of constructive work during the winter. It was an ideal opportunity. Money was cheap, building materials were cheap, and labour, unhappily, had never been more abundant. Work might have been found for 100,000 men.

SOUTHAMPTON CIVIC CENTRE

The Southampton Borough Council have applied to the Ministry of Health for extended borrowing powers to enable them to build the third block of the Civic Centre. The Ministry will hold an inquiry on March 7. The cost of the Town Hall block is £175,000.

R.I.B.A.

SOCIAL ACTIVITIES

The annual dinner of the Institute will be held at Claridge's Hotel, Brook Street, W.1, on Friday, March 3. 6.45 for 7.15 p.m.

On Monday evening next, March 6, a dance will be held at the R.I.B.A. The dance starts at 9 p.m., and will last till 1 a.m. Tickets which cost 6s. (including refreshments) can be obtained by or through members, and applications should be made to the Secretary, R.I.B.A. Social Committee, 9, Conduit Street, W.

FINAL EXAMINATION

The requirements for the Final Examination Problem in Design have been amended, and are now as follows :

The Design for a Maternity and Child Welfare Clinic may, after it has been approved, be re-submitted with the addition of working drawings consisting of complete half-inch details of an important part of the building, showing internal details, together with a sheet of full-size details.

EXHIBITION

In October, 1928, an exhibition of black and white and colour work by members of the R.I.B.A. was arranged at the Institute Galleries, and in view of its outstanding success the Art Standing Committee have decided to arrange a similar exhibition to be held from May 5 to 22.

All works sent in for exhibition will be submitted to the judgment of the Selection and Hanging Committee, whose decision will be final. Exhibitors will be required to pay the cost of carriage and insurance during transit and to make arrangements for the collection of their works at the close of the exhibition.

In order that the Committee may be in a position to formulate some idea of the amount of work available, members who are willing to submit black and white drawings, original etchings or engravings, and drawings in any medium, for consideration by the Committee are requested to write to the Secretary R.I.B.A. not later than March 18, 1933, giving the following particulars :

i : Sizes. ii : Subjects (these need not necessarily be architectural). iii : Names of artists. iv : Nature of medium in which drawings are rendered. v : Whether the works are framed and glazed (all drawings *must* be mounted). vi : Approximate value of each work. vii : Whether the exhibits are for sale or not. In this connection it is proposed that not less than 25 per cent. of the proceeds resulting from the sale of any work in the exhibition should be given to the Architects' Unemployment Relief Fund.

Drawings by deceased members may be submitted if they are for sale.

It is particularly requested that members should not submit the drawings until notice is sent to them.

ARCHITECTS' WORKING DRAWINGS

An exhibition of architects' working drawings will be held in the R.I.B.A. Galleries from Wednesday, March 8, to Friday, March 17, inclusive.

The exhibition will be open daily between the hours of 10 a.m. and 8 p.m. (Saturdays, 5 p.m.) and will include drawings lent by :—

Mr. Joseph Emberton, F.R.I.B.A. (Royal Corinthian Yacht Club, Burnham-on-Crouch) ; Mr. C. H. Holden, F.R.I.B.A. (Sutton Valence School Chapel ; Arnos Grove Station, Piccadilly Railway ; Metropolitan District Railway Offices, Acton) : Messrs. Ivor Jones and Percy Thomas, A.F.R.I.B.A. (Swansea Civic Centre ; a Small Public House) : Messrs. Richardson and Gill, FF.R.I.B.A. (St. Margaret's House, Wells Street, W.1.).

The exhibition will contain the drawings that a practising architect hands to a contractor, and some very comprehensive sets will be shown. A good idea will be given of the volume of work which must be done by an architect's office to produce a building.

A Special Students' Evening will be held at the exhibition on Tuesday, March 14, at 8 p.m. All students are invited to attend. It is hoped that the architects (or their representatives) who have lent exhibits will be present in order to explain the drawings to the students. Refreshments will be provided, and no cards of admission are required.

CHRISTMAS HOLIDAY LECTURES

The Council of the Institute offered four prizes of books for the best essays on the recent series of Christmas Holiday Lectures for boys and girls given by Mr. Eric R. Jarrett, A.R.I.B.A., at 9, Conduit Street.

The prizes have been awarded to the following :—

Beatrice Bennister (Clapham County Secondary School), Peggy Clark (Mary Datchelor Girls' School), J. W. Gray (Dulwich College), David Harding (School of Cookery, Westminster Technical Institute).

ON THE AIR

Mr. Howard Marshall, on Monday next, will continue the B.C.C. series of talks on "Other People's Houses" with "An Eye-witness Account of Existing Conditions in Leeds." The talk will be broadcast in the National Programme at 9.20 p.m.

COMPETITION

NEWS

MUNICIPAL OFFICES AT STOKE NEWINGTON

The Stoke Newington Borough Council, at a meeting held on Tuesday of last week, passed the following resolution in favour of a competition for new municipal offices, etc.:

"That the site, Nos. 166-180 Church Street, be used for the extension of the public library and the electricity undertaking and for the provision of new municipal offices, and that authority be given to the appropriate Committee of the Council to expend the sum of not more than £400 in respect of competitive designs for the proposed scheme."

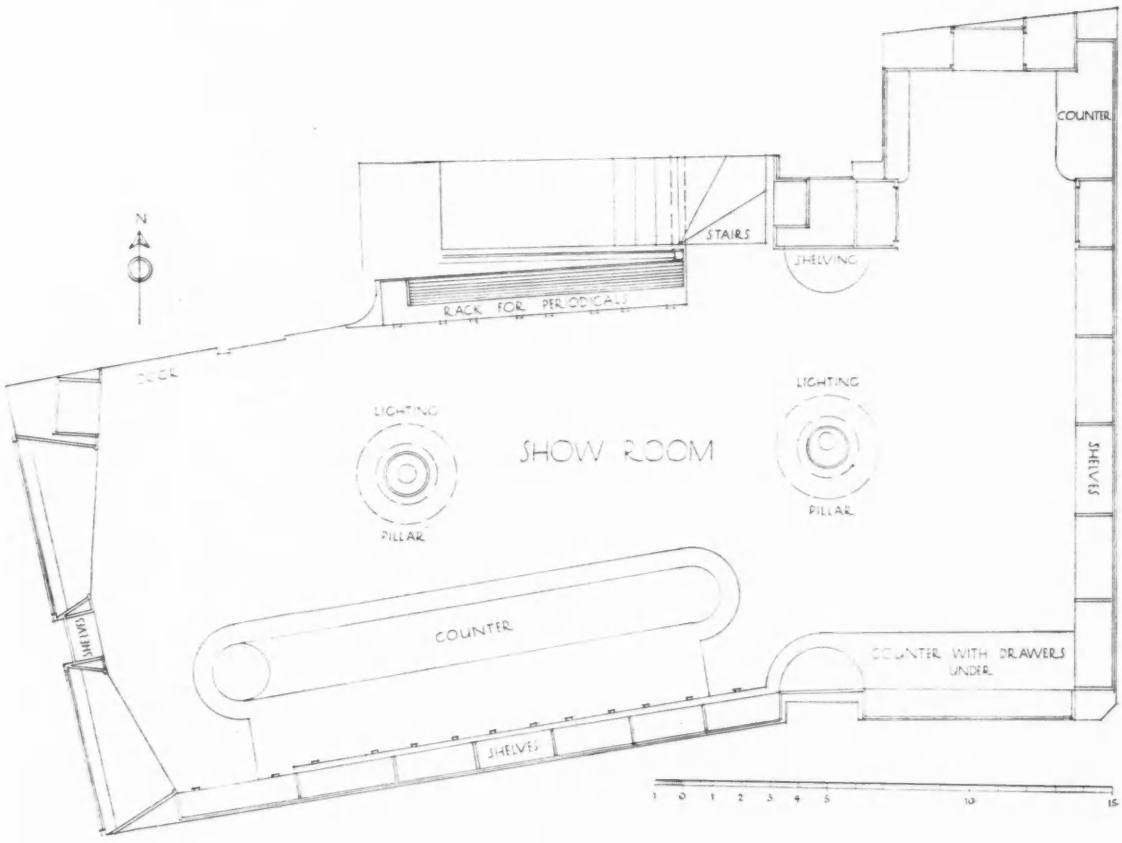
It is expected that the sum of £400 will be allocated as follows : £250, £100 and £50. The scheme is estimated to cost between £40,000 and £80,000.

DESIGNS ON PANELS

The Silicate Paint Co. (J. B. Orr & Co., Ltd.) are organizing an open competition for students, apprentices, operatives or masters of the painting and decorating trades for decorative designs on panels. Five panels will be selected from those submitted and prizes as follows will be awarded :—1st, £6 6s. ; 2nd, £4 4s. ; 3rd, £3 3s. ; 4th, £2 2s. ; 5th, £1 1s. Full particulars are obtainable from the company at Charlton, S.E.7.

Competitions Open

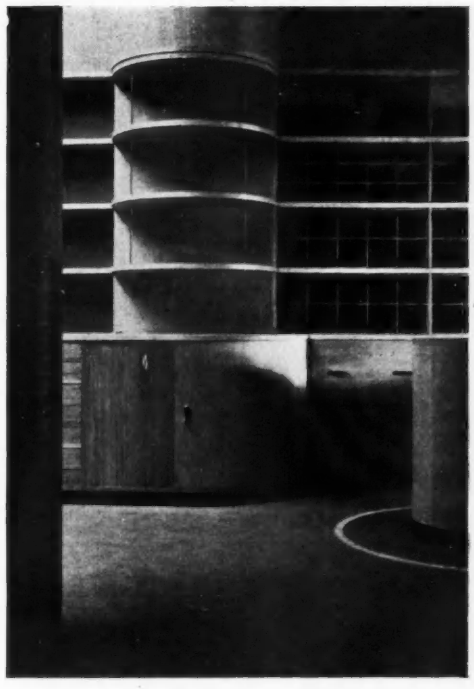
March 15.—Proposed Burgh Chambers, Municipal Offices and Public Baths for the Town Council of the Burgh of Prestwick. Open to architects who have been in practice, either as individuals or as partners in a firm, for at least twelve months prior to March 1, 1933. Assessor : A. Graham Henderson, F.R.I.B.A. Premiums : £200, £100 and £50. Applications for conditions of competition and plan of site should be made to William Shaw, Town Clerk, Burgh Chambers, Prestwick, Ayrshire, together with a deposit for £2 2s., on or before March 15 next. If the applicant decides not to enter, conditions, etc., must be returned before April 15. Designs to be submitted to the Town Clerk not later than 12 noon on May 8.



March 24.—Façade to a newspaper office in grey Cornish granite, for the Cornish Quarry Masters' Association. First Prize, £50. Conditions etc., were published in *A.J.* for Feb. 1.

March 31.—Competitions for Cottages to be built at an economic rent, organized by the Building Centre, 158, New Bond Street, W.1, from whom full conditions are obtainable. Premium : £100.

April 13.—Design of a new exhibition hall at Manchester for the Management of the Manchester Building Trades' Exhibition. Premiums : £150, £75 and £25. Full particulars were published in *A.J.* for February 15.



May 31.—Sending-in Day. Layout of a suburb on the river Escaut, Antwerp. £2,400 in prizes (1st, £800). Conditions, etc., were published in *A.J.* for December 7, 1932.

SHOWROOM INTERIOR : DESIGNED BY L. H. BUCKNELL

In its original condition the shop acquired by Dryad Handicrafts, at 22 Bloomsbury Street, W.C., had the usual cast iron columns, with foliated caps, an indifferent cornice, and doors of a common type, with cut glass panels. There was also an ugly bulkhead, in matchboarding, by the stairs. This has been turned to account as one of the most interesting features of the new interior, having been encased (like the columns) and made into a stepped rack for books and pamphlets as shown in the upper view on the following page.

The shelving surrounding the walls effectively masks the cornice; the pillars carry wide, shallow cylindrical lighting fittings; the doors have been cased flush with plywood. Doors, rubber-topped counter and other important features are faced with figured sycamore veneer, polished the natural colour. The ceiling, pillars and the plain wall surfaces above the racks and shelves have been covered with silver-grey wood veneer paper, laid in a diaper pattern; above, on the walls, is a band of lemon-green. Further details of the colour-scheme are given, together with drawings and other illustrations, in a supplement presented with this issue.

Factory Architecture

SIR,—The idea seems to have got abroad that new buildings are a luxury.

From my own experience, which has to do mainly with factory building, I can state quite definitely that it pays the owner to replace an obsolete factory with a new up-to-date one.

I have been associated with the building of new factories in almost every part of the country during the past year or two, and in every case the new building has resulted in diminished costs and increased production. One owner in the Midlands told me that after nine months in his new building his costs of production had dropped by 20 per cent.: his output itself had increased both in quantity and quality.

At least 75 per cent. of our factories are obsolete and if we are to prosper in the markets of the world, there is no doubt whatever that this state of affairs must be remedied. Wise manufacturers are setting their house in order now when the costs of building are at rock-bottom.

It does not take the eye of an expert to see that the new factories are the prosperous ones.

THOMAS WALLIS

Smoke Abatement and the Slums

SIR,—The imperative demand for slum clearance has received practical endorsement from the Minister of Health.

But there is a very definite impediment to its rapid accomplishment due to the inability and even non-existence of land upon which to construct decanting buildings in which to house the slum-dwellers while their existing habitations are replaced with new ones.

This difficulty throws an appalling cost upon this undertaking and frequently compels the transplanting of the present slum-dweller into a district in which he is not congenial with his environment, and certainly his environment does not desire to become congenial with him until he has been educated away from his slum-creating habits.

London has forty miles of sunken railway tracks or open railway cuttings, which are capable of being easily covered and thus made available either for the construction of decanting tenements, etc., or permanent open spaces, thus stopping and at the same time controlling the belching of the coal smoke day in and day out from the very necessary, incessant trains, thus creating a double benefit and a strong endorsement of the smoke abatement campaign that is now so actively under way.

The covering of the railway tracks with reinforced concrete mats inflicts no impediment or hardship upon the railway, but justifies them in collecting an air-right rent and also produces a real benefit to those who live in the proximity of these cuttings.

Where the lines are not yet, and do not quickly become, electrified, there is no need to wait, for by arranging an open metal tube in the top of any tunnel under such a concrete mat or roof and by putting up shafts for two or three hundred feet, it is possible to carry these smoke fumes from every passing train to the top of any building in the neighbourhood, as though through a chimney, and thus dispose of the engine-vomited smoke above the level of the adjacent structures until such time as electrification does take place.

This principle is in existence in Chicago, where all the trains from the great trunk lines enter the city below the surface and the smoke is carried up through such up-shafts as here mentioned, and the problem in London, Birmingham or such of our cities would be much less difficult, for our buildings do not reach the tremendous altitudes of those gigantic American skyscrapers.

By decanting our slum-dwellers into buildings constructed over sunken railway tracks the double advantage of slum clearance and smoke abatement may be gained, and gained without the interminable delay accompanying legal processes, etc., that today are inseparable from any such effort.

It is strongly urged that all who are sympathetic towards these essential and desirable conditions will push to the utmost at the present time to see first that every legal or statutory impediment to such a progressive movement be ended and, second, that once these impediments are removed, this slum-clearance work be undertaken with a nation-wide concerted effort, for by limiting the slums the stamina of our race will be definitely improved, the elimination of the train's quota of smoke will certainly be beneficial to our atmosphere and lastly, our trains, which have certainly suffered financially, will get an incoming benefit which they do not now enjoy.

ALFRED BOSSOM

[Owing to the pressure on our space we are compelled to hold over several letters from this issue.—ED., *A.J.*]

A Scale of Salaries

SIR,—It may not be unfair to infer that those of your correspondents who have raised the question of a scale of salaries for architects are not members of the Association of Architects, Surveyors and Technical Assistants for, if they were, they could obtain from this body the information and guidance which they are seeking.

But it is well to realize that a Scale of Salaries is only a partial remedy for the trouble complained of. The correlative remedy is unity among the men concerned.

So long as many do no more than call upon others to do something and on their own part carefully avoid the one thing that would be helpful, they must expect the unsatisfactory conditions which they describe.

A SEYMOUR REEVES

The Liverpool School

SIR,—In your issue for February 15 you mention that Professor Reilly's achievements included the foundation of the Liverpool University School of Architecture. I feel I must correct a statement that inflicts a wrong upon those who were responsible for its foundation.

Among the endowments of the University College (now the University of Liverpool), was the Roscoe Chair of Art founded by the citizens of Liverpool in 1881. In 1892 the chair became vacant and the Liverpool Architectural Society approached the Senate urging that steps should be taken to establish a School of Architecture. As a result of the Society's representations, the Roscoe Chair was devoted to architecture. The Liverpool Architectural Society worked tremendously hard for this cause and the names of the late Henry Hartley, F.R.I.B.A., W. E. Willink, M.A., F.R.I.B.A., T. Harnett Harrison, F.R.I.B.A. and Edmund Kirby, F.R.I.B.A., should not be forgotten. These are the men who laid the foundations of the Liver-

pool School of Architecture and it is to them the credit should be given.

The late Frederick Moore Simpson became the first Roscoe Professor of Architecture in 1894, Professor Reilly following him in 1903. The foundation of the School is therefore claimed by the Liverpool Architectural Society.

LEONARD BARNISH

Sheep Bones for Fixing Slates

SIR,—A friend of mine has shown me some sheep bones which were used as pegs for fixing slates on some twelfth-century buildings at Amen Corner, Barnard Castle, co. Durham, reputed to be the site of the original shop of Thomas Humphrey, immortalized by Dickens in "Master Humphrey's Clock." I enclose a sketch of the bones and a photograph showing the house in course of demolition.

I wonder if any of your readers can inform me whether this was a customary method of fixing slates, and the approximate date of its origin?

PERCY THOMAS

The Wayside Pulpit

SIR,—As expected, the JOURNAL again contains its usual weekly wayside pulpit in reference to the Carlton Gardens controversy, and apparently the reinforcements are being brought up hourly, each new issue giving us the photographs of people who are giving their leisure time in the "cause."

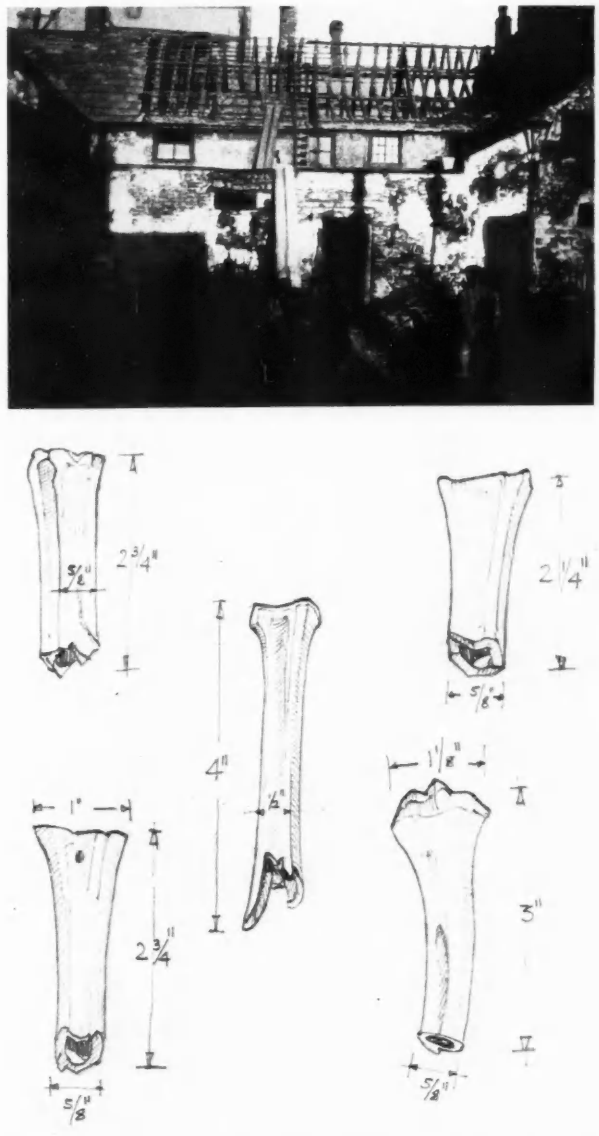
Suddenly it has been discovered that the Doric columns are hollow and cast iron, and one reader, who has apparently been fighting on the wrong side, has retreated (*avec tail entre jambes*) to find a different coloured balloon.

It is particularly stimulating to find the support of the religious sects on the Defence Committee; if their ideals are as constructive as they would have us believe, then Carlton Gardens must stay—but is it not a false reverence of tradition which inevitably arrests progression? It is abortive and contrary to life.

Personally I think we should not take the Defence Committee too seriously, but should look upon it as another Mayfair diversion.

May I express my surprise at the members of the Committee, as I should have thought that such keen followers of blood sport would have been more interested in Japan and China.

INTELLIGENT IGNORAMUS



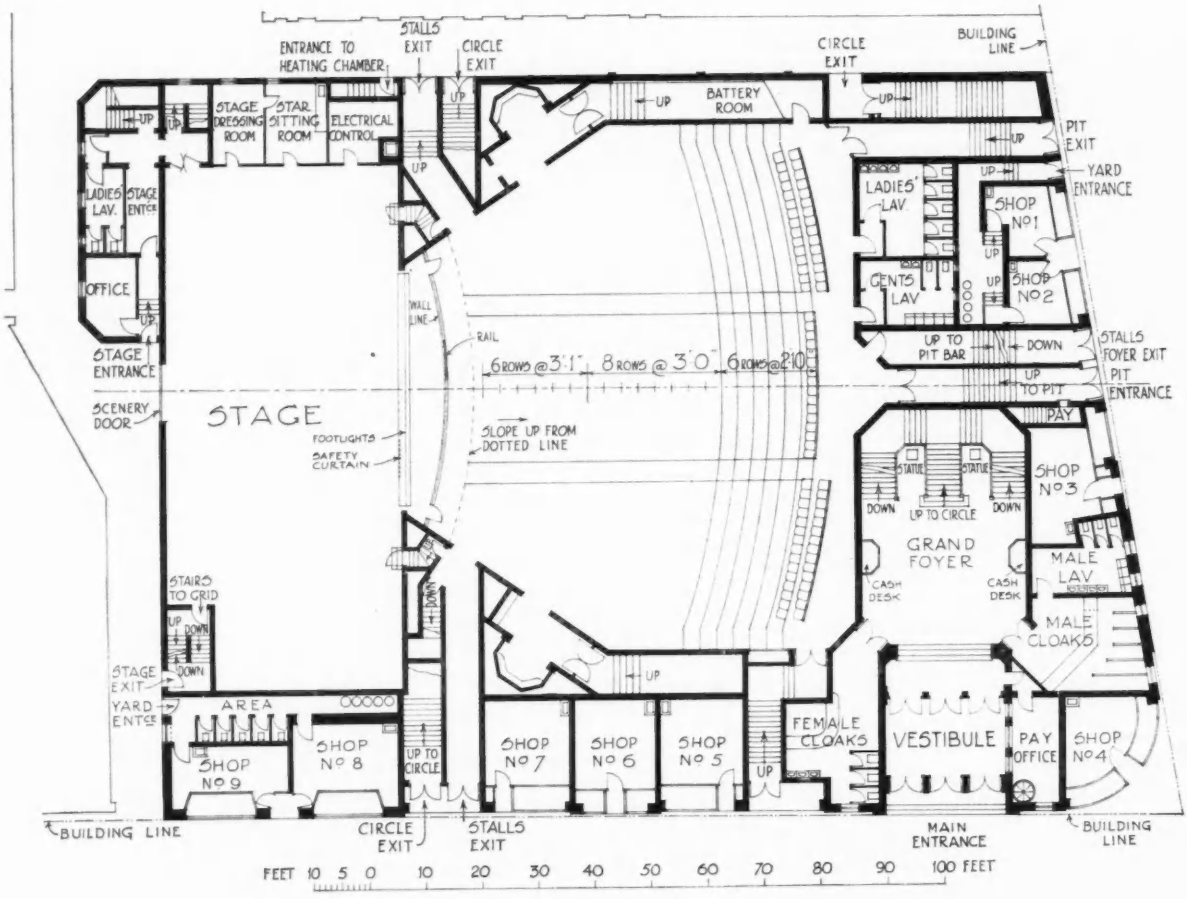
The Flueless House

SIR,—From purely hygienic considerations, there is something to be said for the Bill which is now being promoted in Parliament to stop local authorities forcing their tenants to sign agreements to use one form of heating only. It is this elimination of choice which, in the past, has made possible the flueless house.

The theory that any form of heating justifies the abolition of the household chimney—the most important means of ventilation in the average home—without the substitution of an adequate flue, is bound to be opposed by all those interested in public health. The open fireplace, giving complete choice of fuel, should, in my view, be defended by all health officials as the hygienic right of those who live in small houses.

I am glad to see that the bigger local authorities are granting their tenants freedom of choice of fuel. Those which, in the past, built hundreds of flueless houses in order to induce their tenants to use exclusively the municipal electric supply for heating, must, in these days of economy, be realizing the folly of their policy.

LEONARD HILL

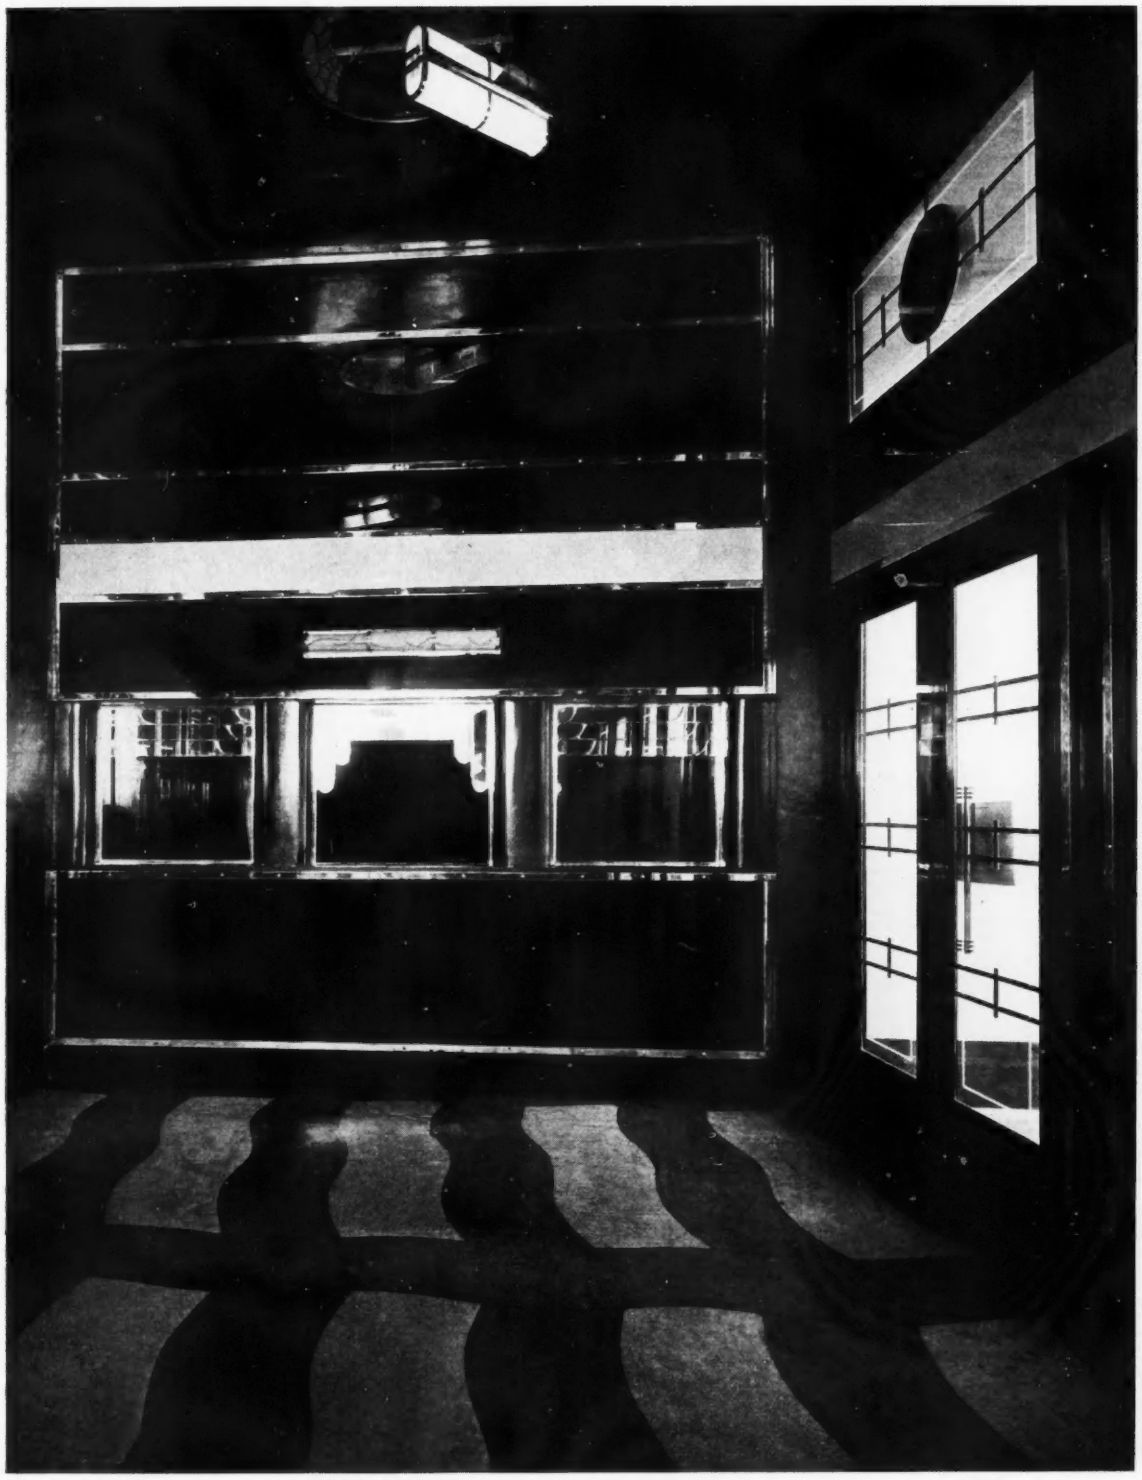


Twelfth-century buildings at Amen Corner, Barnard Castle, co. Durham, in course of demolition, and a sketch of the sheep bones which were used as pegs for fixing the slates. See letter by Percy Thomas.

Would the author of the letter on "Roofing Tiles," published in the JOURNAL for February 1, please forward his address.—ED. *A.J.*

C

THE GARRICK THEATRE, LORD STREET, SOUTHPORT,

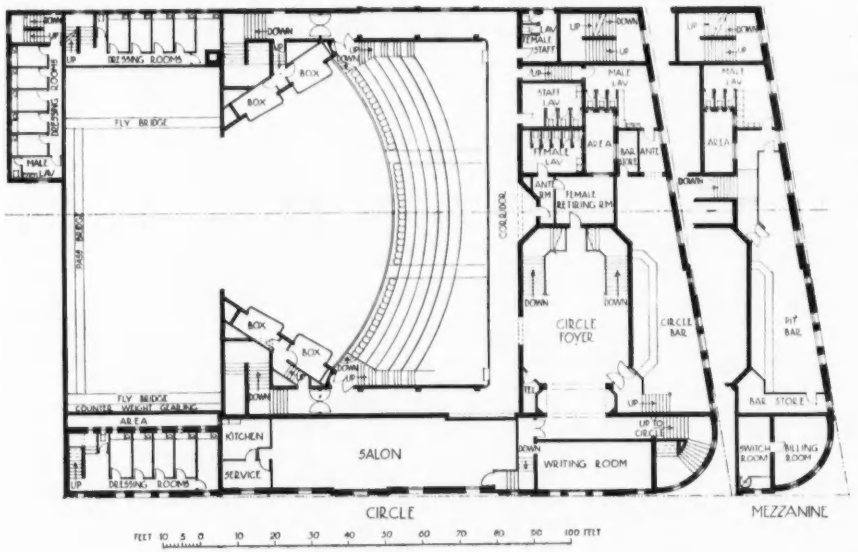


This new theatre, built on the site of the old Opera House, is intended to serve as a centre of interest in the drama ; to which end the Garrick Theatre Club has been provided with a suite of rooms on the first floor, overlooking Lord Street. Moreover, the stage accommodation is laid out on most comprehensive lines, including one of the largest stages in the provinces—93 ft. wide, 43 ft. deep, 60 ft. high—a "star" suite, 30 large dressing-rooms, bathrooms, etc., so as to afford every facility for an annual dramatic festival. The building has a roof loggia, and includes several shops.

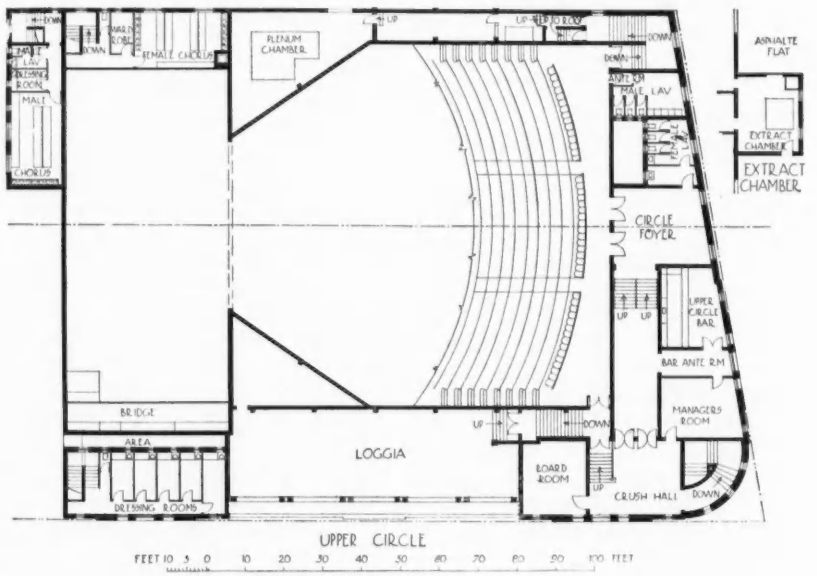
The exterior, shown flood-lit at night in the adjoining view, is faced with red bricks and has dressings of stone. On the facing page is illustrated the entrance vestibule, looking towards the pay office ; the doors from the street are on the right and other double doors, facing them on the left and leading to the grand foyer, appear in the frontispiece to this issue. The walls are of black plate-glass panes, divided by chromium-plated bands ; the ceiling, of black polished opalite, carrying specially-designed lighting fittings in aluminium alloy.

LANCS. : DESIGNED BY GEORGE E. TONGE

THE GARRICK THEATRE, SOUTHPORT, LANCS. : DESIGNED BY GEORGE E. TONGE



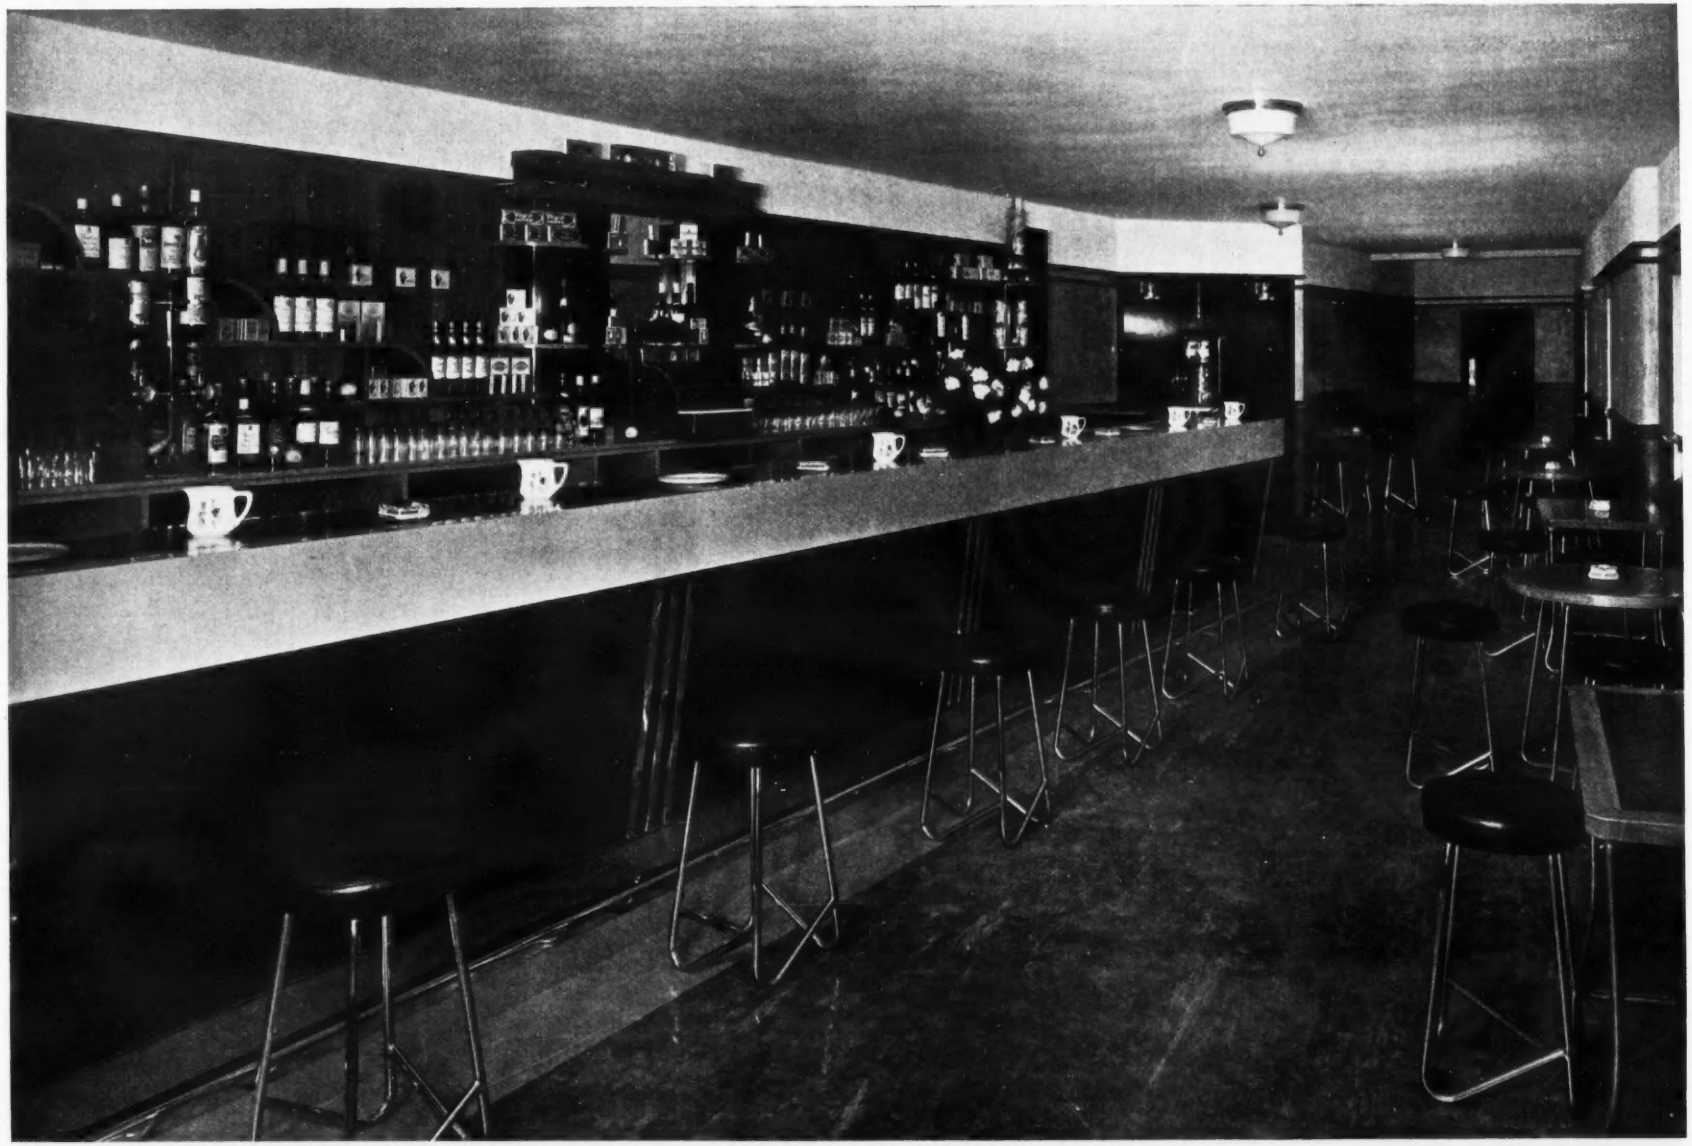
The auditorium is bell-shaped. In the ceiling is a depressed dome, from which spotlights play on the stage. On the following three pages are views of three of the bars :—



COCKTAIL BAR (page 303) : The whole of the stillion is executed in Australian straight-grain walnut, finished with wax polish. The edges of the shelves are picked out in orange cellulose. The fingers of the clock are in stainless steel, cut in the shape of silhouettes of a male and female figure, the numerals being in orange. All fittings, including the sign PRICES, are in stainless steel. The gold ceiling is textured. On the two side walls there is a painted humorous frieze covered by plate glass, with a surrounding band in orange. The walls are stippled and finished in gold. The floor is carried out in sponge rubber.

CIRCLE BAR (page 304) : The stillion is executed in alternate bands of Australian walnut and grey sycamore, with wax polish finish ; dividing these bands are 1 in. red cellulose fillets, while in the centre is a clock with a recess for cash register. The face of this clock is in black cellulose with chromium-plated fingers and red numerals. The semi-circular shelves flanking the clock are black cellulose with red edges. Terminating the stillion are two cupboards in the shape of pylons. Below counter level are storage cupboards carried out in straight-grained walnut with red cellulose strips to cupboard doors. The counter top is in red, with an inlay of black rubber. The counter front is alternate bands of walnut and sycamore, divided again by the red cellulose fillets ; it terminates in a step of stainless steel with black rubber inlaid. The walls are textured in bands of buff and light red ; these are divided by red and gold fillets. The dado is in straight-grained walnut capping and black skirting. The floor is carpeted. The doors are finished in black cellulose. All fittings are in stainless steel.

PIT BAR (page 305) : The whole of the stillion is carried out in walnut. In the centre is a green fluted mirror. The shelves are black cellulose with green edges. The counter top is green cellulose with black rubber inlaid. The counter front is built up of black cellulose. One-inch wide chromium-plated bars cover the joins in the plywood. The stainless steel step is inlaid with black rubber. The floor is in green and black rubber. The walls are stippled and finished with gold. The dado is of Australian walnut with green cellulose dado rail. The doors are green cellulose.



The stillion of the cocktail bar off the stalls foyer in the basement.

THE GARRICK THEATRE, SOUTHPORT, LANCS. : DESIGNED BY GEORGE E. TONGE

The circle bar, on the same floor as the circle; and the pit bar, on the mezzanine, immediately under it.

THE SLUMS

By A SLUM-DWELLER

Of the slums—from outside—much has been written, in this JOURNAL and elsewhere. Below we publish something less familiar—a glimpse from inside. The manuscript came to hand with a note explaining that the writer, who sees THE ARCHITECTS' JOURNAL in his local public library, had been struck with Mr. Bossom's proposal, which we supported last week, for rehousing slum-dwellers above covered-in railway tracks. He is so eager for any measure that will relieve the desperate evil he so feelingly describes that he offers to subscribe thereto out of his modest means.

His contribution is printed here because it is well calculated to dislodge the lingering, comfortable wish to believe that the evil is not, after all, so very desperate and urgent. There is no question about it: slum dwellers must *be shifted to better quarters. The particular point in Mr. Bossom's scheme that appeals to our correspondent is, of course, that it does not involve shifting them miles away from their work to some colony vaguely sited in Essex, Hertfordshire or Kent. In all our towns many mean streets back on to a railway line; the potential sites are available, in close proximity. The plan is practical politics, and architects will appreciate its possibilities.*

IN a certain part of South London there is a very short street comprising several houses sub-let as flats, each flat having two very small rooms. The exteriors of the buildings are of a dirty brown colour, the brickwork in places being extremely unsafe for people walking along the pavement. Many of the windows facing the street are without glass and in their places one sees sheets of old newspapers. My family occupied the second floor of one of these flats. I had four brothers and two sisters, representing, together with my mother and father, nine persons living in two rooms.

The rooms were of the average size of the present-day tenement flat, about 12 ft. by 8 ft. The front door from the landing led into what we described as the living room. My parents and my two sisters slept in the bedroom; my brothers and I in the livingroom. Our ages covered a range of seven years.

The floors were of rotten wood; and the walls of plaster, papered half-way up, the rest being painted with a green wash. This wash was besmattered with small red blobs as if a painter had dabbed his brush at random all round the room. These blobs were, in point of fact, evidence of the large number of bugs that had been killed on the walls. We destroyed them by tearing off a piece of newspaper and just pressing it against the wall. While having meals, I used to see them coming out for their morning stroll, and I had to get up from the table and carry out their execution in the manner described. During the hot weather I could not sleep for the number of bugs—and their fellow-hunters, fleas—crawling and jumping over my face and body. Then again there was the noise of the rats running about trying to find food to satisfy their extraordinary appetites. Although we often fumigated both rooms with sulphur candles, this did not eradicate either the rats or the bugs. No matter how hard the floors were scrubbed it was impossible to keep them clean owing to the large number of inhabitants of the flat.

With regard to the sanitary conditions: when we desired to wash we were compelled to go out of the front door and down a flight of steps to a water tap that stood in a corner of the lavatory—the only one in the building. This lavatory was in constant use owing to the large number of people that were housed in the building; it was seldom devoid of odours. The thought of entering this place for water, I am afraid, compelled us to think twice before deciding to wash ourselves. A bath was a luxury one associated with the richer classes. If we decided to have a bath our only method was to fill a large tin hip bath and sluice ourselves down. This was extraordinarily awkward owing to there being only two rooms to our flat. Also, as we were very respectable it was only possible for the male members of the family to carry out this practice when the female members were out, and *vice versa*.

I do not want you to think that I am one of those persons who believed that it is far better to go without a wash to save the trouble and the waste of soap, but you will agree that the circumstances were extremely difficult. When it was possible for us to start work, at the age of fourteen years, and thus be able to augment the wages (which were very little) earned by my father, we were able to move to a slightly better flat in another street.

The improvement in hygiene was only very small but the different conditions helped us to realize that to get on in life one must use a little soap and water. I have heard it said that slum-dwellers are extraordinarily difficult to move from their dwellings. This is entirely wrong. In my opinion, given the opportunity, they would jump at the idea of moving to a cleaner and better flat or house, as long as it is not too far away from work.

Mr. Bossom's idea of building tenements over the railway track, which you have re-published from *The Daily Express* of a week or two ago is, to my mind, the only solution of the slum problem. If the tenements were built, as described by Mr. Bossom, the people removed from the slums and rehoused in the tenements, the slums then demolished and new buildings erected, the nation would be going a long way towards creating better citizens.

I am not a journalist and am therefore unable to include in my writing the little tit-bits that would induce readers to say "The slums *must* go." I am a working man and as such feel it my duty to send you this somewhat scrappy account of my early life.

The slums *must* go, and I, for one, would willingly contribute a small sum out of my weekly wages to help a fund for the demolition of these areas.

THE MENACE OF THE MEAN STREET

By JOHN GLOAG

THE expert in self-deception who is the hero of Mr. H. G. Wells's new novel, *The Bulpington of Blup*, became aware during his adolescence that "there was dirt and disorder, misery, indignity and crime, multitudinous behind all the London frontages, behind all the frontages of his civilization, and his Aunt Lucinda seemed to think he ought to do something about it. But what on earth was he to do about it?" He never troubled to answer that disturbing question: who does? But he came to the conclusion

that "on the whole he disliked the poor. He wanted to keep away from them and think about them as little as possible." A comfortable and very common desire, and, when it is acted upon, the sores that every city in this country possesses in shameful abundance can be forgotten.

And we go comfortably to bed with 'flu, most of us, year after year, and the children get measles and whooping-cough with the full approval of their parents, who accept these "childish complaints" as inevitable, things that "children have to get"; and diphtheria has helped to smooth the course of many an interview between an undertaker and his bank manager.

We accept the waste of our time and our money and the danger of an early and humiliating death (for it is humiliating to die from 'flu in a world full of cancer, diabetes, and other major ills); but we don't do anything about it; like Theodore Bulpington, we conclude that we dislike disease as on the whole we dislike the poor, and we avoid contact with them, if we can. So we have our annual bout of 'flu, which is so much worse this year, and as the poor and their squalid setting and disease and its irritating discomforts are under the ban of our deliberate inattention, we never indulge in that disturbing and stimulating practice that the editor of *The Eatanswill Gazette* so wisely encouraged, the combining of information.

If we remember all the mean streets we have ever seen, the slums of Battersea, Deptford, Whitechapel or Clerkenwell, to name only a few areas in the greatest and richest city the world has ever seen; if we know something of the hidden streets and courts of seaports like Birkenhead and Southampton, and of proud maritime cities like Liverpool, Glasgow and Newcastle; and if we follow this dismal exercise in recollection by facing the fact that an enormous number of people are ill at the moment, we may begin to lose our almost Oriental passivity under the afflictions that Allah has seen fit to send.

We still retain the lazy, mediæval habit of describing a complaint or an illness as an inevitable curse, only we call it a normal occurrence, or a seasonal visitation; and instead of crowding into a church and giving our seasonal complaints to everybody else, we brightly determine to carry on our job until the last gasp and the highest temperature, and we crowd into a railway carriage or a motor-bus or coach, and pass on our troubles in the name of business instead of in the name of religion. Only the sanitary inspectors and the medical profession stand between any modern industrial country and the most virulent plagues.

Think of our ports of entry for ailments. Think of those slum areas of squalor; the most promising taking-off places for raiding squadrons of disease that civic carelessness could devise. Think then of these facts: In 1925 influenza killed 13,967 people in this country, which represents only a fraction of the number it temporarily and painfully incapacitated.

This is its yearly toll in deaths since:—

1926	10,357
1927	24,289
1928	8,715
1929	32,519
1930	5,715

Figures for the last two years are not yet available, and the present year is dark with the promise of a broken record.

That apparently innocuous complaint, measles, slays its thousands yearly: its death record for the last six years is as follows:—

1925	5,849
1926	4,411
1927	4,282
1928	5,307
1929	3,537
1930	4,980

(Continued on page 309)

A HOUSE AT ESHER, SURREY

DESIGNED BY IMRIE AND ANGELL

The ground floor external walls of this house in Clive Road, Esher, are 11 ins. hollow, part of the first floor walls being 9 ins. solid, covered with weather tiling. The half-timbering on the front is in adzed oak, and all faced brickwork is whitewashed, except the chimney stacks. The wood window frames are filled in with steel casements and leaded lights. The roof is covered with hand-made sand-faced tiles. The floors in the living room and dining room are in oak, and the hall and porch are paved with quarry tiles.

A STONE HOUSE IN WALES: BY E. B. KIRBY

Tirllanerch, Carrog, near Corwen, Merionethshire, designed by E. B. Kirby (Edmund Kirby and Sons), is constructed mainly of Grinshill stone and rough cast on bricks, with quoins, chimneys, etc., of local slatey shale from some dismantled outbuildings. The roof is covered with multi-coloured Precelly slates. The house stands on a hillside sloping down to the valley of the Dee, and the garden front, facing south, enjoys a view of one of the beautiful reaches of that river.

Whooping cough (which children "have to get") has an equally grim story :—

1925	7,795
1926	4,624
1927	4,531
1928	4,048
1929	7,233
1930	2,665

People die of diphtheria at the rate of over 3,000 a year; for the last three recorded years diphtheria fatalities have been increasing, and in 1930 they stood at 3,957.

We shall never be without this needless pain so long as our cities are without plan. As Mr. Arthur Harrison pointed out in our New Year issue : "Plans for slum clearance are of urgent national importance, and the Building Industry is now in a position, possessing a Permanent Council, to lay down a policy and prepare a plan which will include slum clearance and rehousing as an important factor."

No city can have health and slums. Trams, buses and tubes distribute the ills that incubate in such areas; but as a nation we shall doubtless continue to call in doctors to cure what architects could in time prevent.

A FEW FACTS ABOUT SLUMS

The current issue of *The Architectural Review*, in addition to its usual features, devotes several pages to a survey of the nature of the problems that the town planners of London have to face. It gives a list of seventy-eight societies, companies and Government departments which, in an official or unofficial capacity, are intimately connected with the town-planning of London.

The Editor, in an article entitled "A London Planning Board," points out that the slump in the North of England and South Wales has driven thousands of people and several industries to London, which is fast becoming the industrial as well as the administrative centre of England.

Mr. Alwyn Dent outlines the method of dealing with the congestion in Central London; and Miss E. Denby gives a concrete example of how to deal with the terrible slums in Kensington. By means of maps it is shown that the centre of London is overpopulated, unhealthy and dotted about by many unnecessary factories.

Below are printed extracts from the articles :—

A central nucleus, if such were possible, consisting merely of administrative quarters, business premises and amusement centres, is not a city at all, but a monstrosity. What gives interest to London is the diversity of character of its quarters without extreme sectionalization. It is necessary to separate what is essentially *London* and what is, in a sense, parasitic growth. The process of *urbanization* therefore requires primarily the removal of obsolescent industrial areas and their concomitant slums from the central urban district where they have too long continued to function as a legacy of a past industrial confusion.

In Southwark it has been found that at least 36 factories and workshops, employing about 5,700 workers, have been established since the war : and in Lambeth 35 factories with about 3,150 workers. This is a development which should never have been allowed (although many of these are small local workshops, etc.).

To the man in the street the "Royal Borough of Kensington" calls up a picture of prosperous citizens, solid houses, comfortable homes. But this is only half the picture. Another and equally real Kensington is to be found north of the Holland Park Avenue, housing a population of 93,362 persons against 81,438 in the southern half.

Kensington contains some of the densest areas in London, with 10,000 people in a district the size of Lord's cricket ground.

There are few "black spots" in the sense found in Shoreditch, but there is, in Kensington, a housing problem which is one of the most difficult in the metropolis—the problem of overcrowding—a warren of people—eight families in eight rooms, 30 people in a ten-roomed house—houses built for one and now inhabited by many families without structural alteration to meet the changed and multiplied demands . . . Few families can retain their integrity when forced, by lack of alternative accommodation, to live, eat and sleep in one room only. Yet 2,412 families of two to nine persons do so in the Royal Borough.

There are 13,000 inhabited basements in Kensington and in over 400 of them (housing 5,600 persons) the ceiling is at or under the level of the street.

In a large part of North Kensington it is rare for a family to have a living room which has not also to be used for sleeping. And the results of this density of occupation are reflected in the health figures. Here are a few for 1931 :—

	North Kensington	South Kensington
Infantile death rate per 1,000	86	44
Scarlet fever notifications	299	86
Diphtheria notifications	172	50
Tuberculosis deaths ..	105	43
Puerperal fever and pyrexia	51	18
Pneumonia	213	40
Acute rheumatism (under age 16)	43	3

A suggested elevation, indicating the type of dwelling which might replace the existing tenement houses. Architect : James Burford. Prepared for the London Society and the R.I.B.A. Zoning Conference. [*From* THE ARCHITECTURAL REVIEW.

Following are three telling extracts from the articles on the slum problem that have appeared in the newspapers :

I have seen model cow-sheds that are palaces compared with the slums of Liverpool.

Why do people live in slums? For the commonplace reason that there is nowhere else for them to live. One of the deepest tragedies of the slums is that decent folk earning fair wages are compelled to dwell crowded together in one room, or two rooms, in abominable houses, because the proper accommodation for which they are able and willing to pay does not exist.

In Dundee there are still 6,347 one-room and 22,252 two-room houses, or 69.9 per cent. of the total houses in the city, and these one- and two-roomed houses are occupied by 56.2 per cent. of the population.

Looking at the one-roomed houses, we find that 1,176 of them are inhabited by more than three persons.

Four of these one-roomed houses are inhabited by 10, 11, 12 and 14 persons; eight have 9 occupants; 30 have families of 8 in them; no fewer than 98 are occupied by 7 people; 175 one-rooms are tenanted by families of 6; and in 302 cases families of 5 live in a single room.

Part of a plan, reproduced from the current issue of "The Architectural Review," showing unhealthy areas in London. The areas shown in black are those condemned by the Medical Officer of Health and where reconstruction schemes are necessary. Cross-hatched : areas not represented as unhealthy, but may have to be dealt with by reconstruction schemes. Hatched : areas containing a large proportion of seriously defective houses, and others in fair sanitary condition, but falling below standard.

PROPOSED EXTENSION TO OLYMPIA: BY JOSEPH EMBERTON

In our last two issues we stressed the urgent need for rebuilding the shed at Castle Bromwich in which the Birmingham section of the British Industries Fair is inadequately housed. At the London end the need for more space is also felt. Happily, Olympia is to be enlarged; and, more happily still, in setting out to double the present accommodation, the proprietors of that building are wise enough to realize the importance of a greater area of unencumbered floor space and more capacious stands. Demolition is in progress on the new site indicated on the block plan herewith. Addison Road station is to be concentrated on the Hammersmith Road Bridge. The design of the new hall has been entrusted to Joseph Emberton, architect for the last Olympia extension—the Empire Hall. Further illustrations are reproduced overleaf, on page 313.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Whitehall Rebuilding Scheme

IT is now regarded as almost certain in political circles that the Whitehall rebuilding scheme will shortly be revived by the Government, although on a far more modest scale than that envisaged some time ago by Mr. Lansbury, when he was First Commissioner of Works in the Labour Government. If the National Government do decide to put the scheme into operation, there will be no suggestion this time of altering the building line, and hence legislation will not be necessary to put the scheme into operation.

The Government take the view that to spend money on a productive scheme of this sort would be in the national interest, and would help the unemployed. It has been frequently stated that the cost of building is now lower than it is likely to be for some time to come, and the Government feel that now is the opportunity to carry out a scheme which has long been needed. It may be remembered that the plan for new offices in Whitehall was first raised before the war, when an Act was passed which prescribed that the building line should be 168 ft. from the Victoria Embankment. The proposal then was that a building with 360,000 superficial feet of office space should be erected on a site of 86,500 square feet. But, owing to the war, the scheme was held up, although plans had been prepared for the development of the Montagu House site. It was not until two years ago that the scheme was revived. In 1931 Mr. Lansbury, as the First Commissioner of Works, moved the second reading of the Public Office (Sites) Amendment Bill. This measure, which authorized the Government to advance the building line on the Embankment side to the New Scotland Yard level, was, however, rejected by the Select Committee which considered it, and no further progress was made.

The scheme of that particular Bill embodied proposals that the new building should have 741,000 superficial feet of floor space covering a site of 170,000 square feet, the height from the ground to the wall head being 107 ft. The staffs which it was proposed to accommodate in the new building were those of the Air Ministry, the Ministry of Labour, the Ministry of Transport, the Board of Trade, the Ministry of Agriculture and Fisheries, the Cabinet Offices, the Dominions Office, and the Stationery Office. Accommodation was to be provided in all for 7,500 persons, and it was stated that a considerable saving would be effected by concentrating staffs that had previously been scattered all over London. The total cost was estimated at £2,355,000, involving, on a 5 per cent. basis, an annual charge of £117,750. The saving in rents on other offices which could be dispensed with would be £158,000, making a net annual saving of £40,250. The approximate value of the land would be £1,250,000.

It is probable that any scheme which the National Government may put into operation will be of a rather more modest nature.

Housing Loans

Mr. Hutchison asked the Minister of Health how many applications he had received for a housing loan from local district councils: how many of such applications had been sanctioned and how many refused, and, in the latter case, for what reasons; what steps were being taken by his department to ensure that houses were built in the districts to which loans were being refused; and how the Ministry assured itself in these cases that private enterprise would do all that was necessary.

Sir E. Hilton Young said he regretted that all the particulars sought were not available. The total amount of loans sanctioned for housing purposes during the last twelve months was £19,312,110. On the general issue raised, a statement was recently issued.

Mediæval Paintings

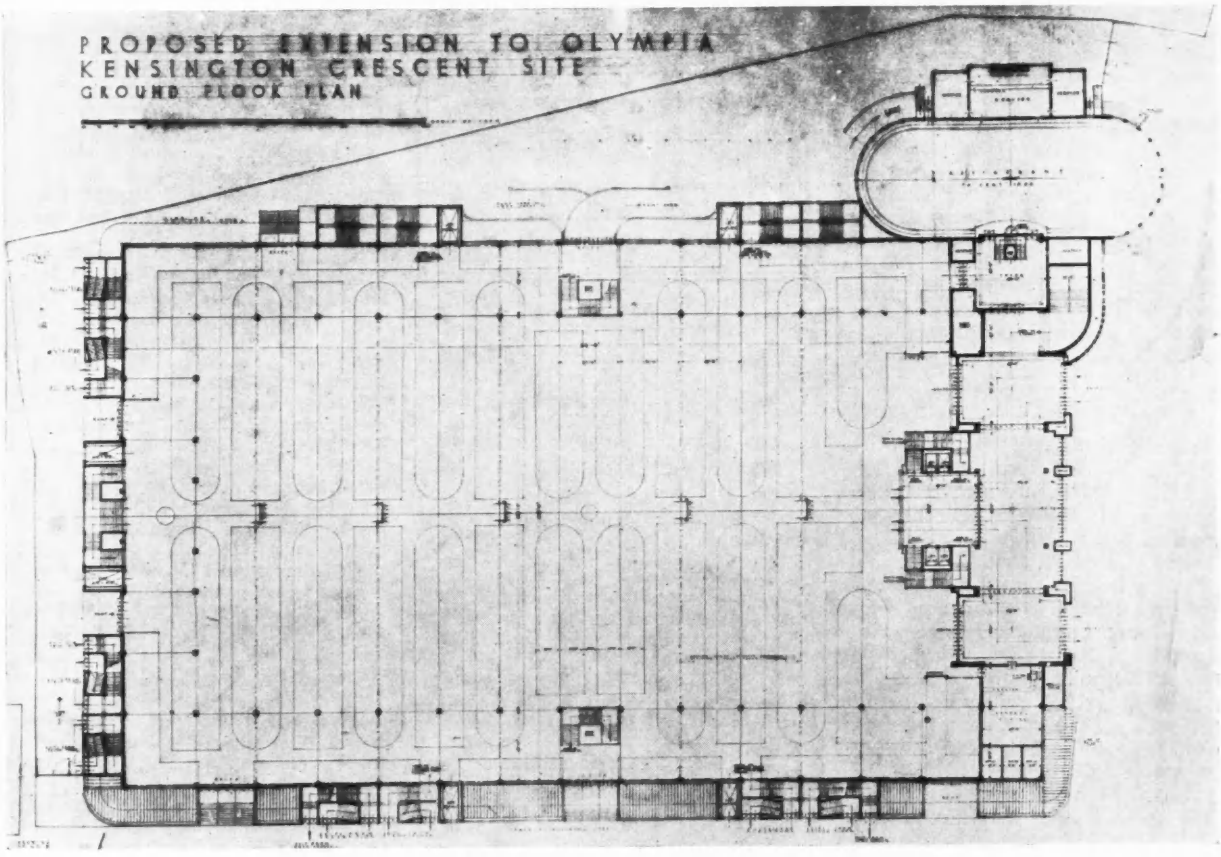
Mr. Burnett asked the First Commissioner of Works whether any remains of the mediæval wall paintings still existed under the Victorian decorations of Westminster crypt (St. Mary's, Undercroft).

Mr. Ormesby-Gore replied that there was nothing in the records at the Office of Works which suggested that any mediæval paintings remained under the present decoration, and the matter could only be cleared up by the removal of the existing paintings.

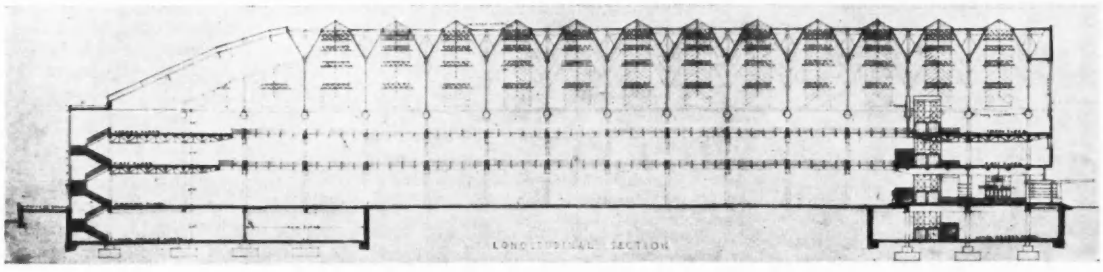
SOCIETIES AND INSTITUTIONS

HANTS. AND I.O.W. ARCHITECTS' DINNER

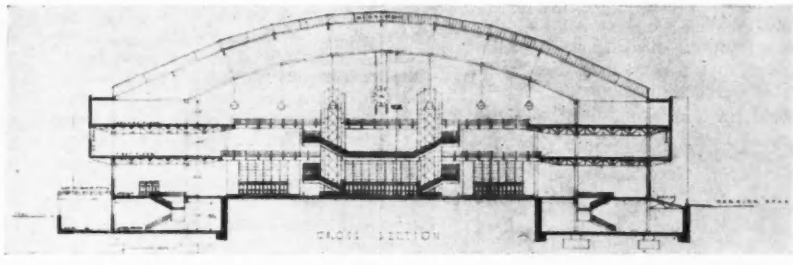
Mr. Ingalton Sanders, F.R.I.B.A., speaking at the annual dinner of the Hampshire and Isle of Wight Architectural Association, of which he is the president, said:



Architects are anxious to co-operate with the municipal authorities throughout the country to forward the town-planning schemes, and their success depends upon the co-operation of the authorities, the architects and the Building Industry generally.



GLOS. ARCHITECTURAL ASSOCIATION



The annual general meeting of the Gloucestershire Architectural Association was held at the Connaught Rooms, Gloucester, on Wednesday, February 15. The President, Mr. H. T. Rainger, A.R.I.B.A., occupied the chair. The Honorary Secretary and Honorary Treasurer had presented their reports for the past year, the following officers and Members of Council were elected for the ensuing session:—

President, Mr. C. W. Yates, A.R.I.B.A., F.S.I.; vice-president and honorary secretary: Mr. Harold F. Trew, F.R.I.B.A., A.M.T.P.I.; honorary assistant secretaries: Messrs. C. M. Cameron Johnson, A.R.I.B.A. and W. J. Rogers, A.R.I.B.A.;

PROPOSED EXTENSION TO OLYMPIA: BY JOSEPH EMBERTON

The ground plan, longitudinal section, and cross section, looking towards the entrance, of the new building. The entire scheme to double the present accommodation of the exhibition premises is estimated to cost £1,500,000. The site has an area of 7¼ acres, with frontages of 450 feet to Hammersmith Road and 600 feet to Warwick Road.

honorary treasurer: Mr. D. N. London, L.R.I.B.A.; honorary librarian: Mr. F. C. Ravenhill, L.R.I.B.A.; honorary auditor: Mr. H. Ellis Moore, L.R.I.B.A. Members of Council: Messrs. H. Stratton Davis, F.S.A., F.R.I.B.A.; Thomas Falconer, F.R.I.B.A., A. Linton Iredale, L.R.I.B.A., H. T. Rainger, A.R.I.B.A., W. J. Rogers, A.R.I.B.A., F. C. Ravenhill, L.R.I.B.A. and H. Ellis Moore, L.R.I.B.A.

The following were elected to serve on the Council of the Wessex Society of Architects in addition to the president and honorary secretary: Messrs. Stratton Davis, Falconer and Iredale.

The meeting was followed by a lecture on the Sydney Harbour Bridge, at which members of the Gloucestershire Engineering Society and other guests were present.

Mr. H. Shirley Smith, A.M.I.C.E., of the firm of Messrs. Dorman Long & Co., Ltd., the constructors of the bridge, traced the history of the scheme for a bridge over the harbour. Illustrations of various designs submitted were shown, the estimates for which varied from nine million to four million pounds, while the accepted contract was for four and a quarter million pounds.

BIRMINGHAM ARCHITECTS AT DINNER

The annual dinner of the Birmingham Architectural Association, held at the Queen's Hotel, Birmingham, on February 17, was presided over by Mr. John B. Surman, F.R.I.B.A. (President).

Alderman M. L. Lanchester, replying

to the toast of "The City," proposed by Mr. Surman, said :

There are some old buildings in Birmingham the beauty of which I greatly admire, but there are some modern buildings at which one look is sufficient for a lifetime. Architects have done a great deal, but there is one respect in which they have failed us in the past generation, namely, the building of workmen's houses, which are ugly and unsuitable.

Sir Raymond Unwin, responding to the toast of "The R.I.B.A.," proposed by the Master of Sempill, said he believed the time was ripe for the solution of the slum problem and for the removal of depressing housing conditions under which many people had now to live.

WELSH STUDENTS' VISIT

A party of about 35 students of the Welsh School of Architecture, accompanied by Messrs. A. C. MacLean, Lewis John and W. S. Purchon, the Head of the School, visited Bristol on Thursday, February 16.

The party was met by Mr. G. D. Gordon Hake, Head of the Bristol School of Architecture, and other members of the staff and students of that school, and conducted round a number of Bristol buildings.

After lunch the students of the two schools played a keenly-contested Rugby match, which resulted in a win for Bristol by 5 points to 3.

The Bristol School of Architecture was then visited and an exhibition of the work of the Bristol students was inspected.

The Cardiff party was entertained to lunch and tea by the Bristol Students' Club.

RECENT WILLS

Mrs. E. B. Bedford, Leeds, widow of Mr. James E. Bedford, Lord Mayor of Leeds, 1914–15, left £13,570 (net personalty, £13,182). After making several bequests she has left the residue of her property to the Leeds and West Yorkshire Architectural Society for founding one or more travelling studentships to be known as the "J. E. Bedford Studentships."

Mr. William Thornton, architect and surveyor, of Dewsbury, left £7,728 (net personalty £5,728).

TRADE NOTES

The Bective Electrical Co., Ltd., in moving to larger premises, has opened new and extensive showrooms at 36 Davies Street, W.1, next to Claridge's Hotel. The ground-floor showroom is notable for some very effective examples of modern concealed lighting. Other exhibits include a selection of period fittings. The basement is devoted mainly to electrical equipment for kitchens and bathrooms, and a Tudor room with a novel method of picture lighting. No prizes are offered for discovering the source of light, but few will be able to solve the problem easily.

The firm offers its services for every kind of electrical work and extends a welcome to all architects who wish to visit the showrooms.

*

Messrs. Chance Bros., and Co., Ltd., have moved their offices to larger premises at Clutha House, Princes Street, Westminster, S.W.1. Telephone Nos. : Whitehall 1846 and 5768. In the new offices there is an extensive showroom, in which the firm's products are exhibited.

Increased demand for the JOURNAL has resulted in the issues for February 1 and February 8 going out of print. If any readers who have copies of these numbers which they no longer require will return them to 9, Queen Anne's Gate, Westminster, S.W.1, the Publishers will be pleased to pay full price for such returned copies.

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :—

Dryad Showrooms, 22 Bloomsbury, W.C.1 (pages 295–297 and supplement). General contractors, Bovis, Ltd. Sub-contractors : Samuel Jones & Co., wood veneer paper ; Cellulin Flooring Co., Ruboleum for floor and top of counter ; Clarke & Co., heating and lighting ; N. F. Ramsay, swing door handles ; Dryad Metal Works, drawer pulls ; Mander Bros., paint ; Eric Munday, stainless steel letters. Electrical fittings : Clarke & Co., columns ; Troughton and Young, Ltd., wall brackets ; McGeoch & Co., pendants.

Garrick Theatre, Southport (pages 300-305) General contractor, Tomkinson and Sons, Ltd., who were also responsible for the electric lighting. Sub-contractors : Banister, Walton & Co., Ltd., structural steelwork : Trussed Concrete Steel Co., Ltd., suspended floorings and balcony ; Pearson Bros. and Campbell, Ltd., Reinforced Concrete Engineers, artificial stonework ; Carrara Marble Co. (Liverpool), Ltd., interior and exterior marble work ; Clark and Fenn, Ltd., fibrous plaster ; Clark and Vigilant Sprinklers, Ltd., sprinklers ; Decorators (Liverpool), Ltd., plumbing and decorating ; Grayson Rollo and Clover Docks, Ltd., bar fittings ; Hughes and Ellison, marquise ; Lift and Engineering, Ltd., stage gearing ; Wm. Mason and Son, Ltd., main entrance doors ; Merryweather and Sons, Ltd., fireproof curtain ; Quiggin Bros., Ltd., iron mongery and handrails ; Arthur Roberts, heating and ventilating ; Sturtevant Engineering Co., Ltd., vacuum cleaner ; J. S. Taylor, carpets, seating and rubber flooring ; Williams and Williams, Ltd., metal windows and stage lantern lights ; Strand Electric Co., Ltd., stage lighting ; Shaw's Glazed Brick Co., Ltd., terra-cotta ; Dodd and Oulton, Ltd., sanitary goods ; Automatic Telephone Manufacturing Co., Ltd., automatic telephones ; General Electric Co., Ltd., electric light fittings, trough lighting, floodlighting, etc. ; Comyn Ching & Co. (London), Ltd., pay boxes ; John Stones, Ltd., steel roller shutter ; G. A. Kiddie, glass work ; Honeywill and Stein, Ltd., acoustic plaster ; L. T. A. Sign Display Co., Ltd., illuminated lettering to verandah ; G. T. Rackstraws, furniture; John Burroughs & Co., "Pel" steel furniture.

House at Carrog, nr. Corwen, Merionethshire (page 308). General contractors, Henry Price and Son, who were also responsible for the excavation, foundations, wood block flooring, plaster and joinery. Sub-contractors : Callender's Cable and Construction Co., Ltd., dampcourses ; Val de Travers Asphalte Paving Co., Ltd., asphalt ; Young, Austen and Young, central heating ; Economic Electric Co., electric wiring ; Waring and Gillow, electric light fixtures ; R. W. Haughton, plumbing ; Quiggin Bros., Ltd., door furniture ; Robert Weare & Co., mantels ; Craven, Dunhill & Co., tiling ; "Esse" stoves.

House at Esher (page 307). General contractors : Cummins, Ltd.

In the list of contractors for St. Lawrence's Church, Feltham, published in our last issue, the work of Silexine Decorators Ltd. was inadvertently described as internal plastering. The material marketed by this firm and used in this contract is Silexine Plastic Stone, which is applied by painters and not by plasterers.

Announcements

In the letterpress accompanying the illustrations of the Austrian State Régie's Cigarette Factory at Linz, by Peter Behrens and Alexander Popp, in our last issue, the building was described as "expensive." This was a misprint for "extensive," and conveyed a meaning exactly opposite to that intended. The whole reason for selecting this building for illustration was to show what can be done by employing architects capable of designing a seemly structure on simple and economical lines.

The G. W. Lewis Tileries wish to correct a mis-statement which was made in their advertisement in THE ARCHITECTS' JOURNAL of January 25. In this advertisement it was inadvertently stated that all the roofs of the Cefn-coed Mental Hospital were covered with Rosemary tiles, but, in point of fact, while Rosemary tiles were used on a portion of the buildings, Messrs. J. W. Greaves and Son, of Portmadoc, supplied half a million slates for this contract, and in fairness to them, the G. W. Lewis Tileries desire to make this correction.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

Messrs. C. J. Fitzpatrick & Co. are to build a factory in the vicinity of Western Avenue, ACTON.

Messrs. Walter Hearn and Chuter are to erect 30 buildings, each containing two flats in four blocks, and one block, containing 18 buildings, on an estate in Fairlawn Park, ACTON.

Messrs. K. W. Matherson and R. O. Sutherland are to erect blocks of flats, seven stories high, fronting The Vale, Oldfields Estate, ACTON.

The ACTON Corporation is acquiring land in Canada Road, for the erection of blocks of flats two stories in height, and in Gunnersbury Lane for blocks of flats two, three and four stories in height.

The ACTON Corporation Libraries Committee recommends proceeding with the scheme for the erection of a public library in Oldham Terrace.

The L.C.C. is to erect another block of tenements on the Teale Street area, BETHNAL GREEN, at a cost of £25,388.

The Surrey Education Committee is to purchase a site on the Nonsuch Park estate, CUDDINGTON, for the erection of a secondary school for girls.

The L.C.C. is to clear and re-develop the Speedwell Street area, DEPTFORD, at a cost of £77,000.

The Surrey Education Committee is to obtain a site near Valley Road, KENLEY, for the erection of an elementary school.

The Woodstock Estate, LEE, is to be developed, and about 242 houses are to be built.

Plans passed by the LEWISHAM B.C.: Streets and houses, Brockley Hall Estate, for Mr. H. Macintosh; one-story shops, 45-7, Brockley Rise; additions, St. John's Hospital, Morden Hill, for Messrs. H. Groves and Son; two houses, Cambridge Road, for Messrs. Thos. Allen (Lee), Ltd.; one-story shops, 37-9, Catford Hill, for Mr. S. F. Prior.

The Derrick Construction Co., Ltd., of 99 Ravensbourne Park, Catford, S.E.6, are to develop an estate adjoining Cockmannings Road, ST. MARY CRAY.

SOUTHERN COUNTIES

The Kent C.C. has prepared a revised scheme for the re-modelling of the DOVER Institution, at an estimated cost of £18,000.

Plans passed at GRAVESEND: Additions, rear "Bat and Ball"; sports pavilion, Wrotham Road, for the Gravesend Cricket Club; alterations, "City of London" public-house, The Terrace, for Messrs. Watney, Combe, Reid & Co., Ltd.; conversion into two flats, 35 Darnley Road, for Mr. Geo. Smith.

In connection with the provision of new office accommodation, the KENT C.C. recommends the erection of further buildings on the Sessions House grounds, at a total cost of £50,000.

Messrs. R. Lawrence and Son, of 16 Heath Grove, Barming Heath, Maidstone, are developing an estate in Farleigh Lane, MAIDSTONE.

Plans passed at PORTSMOUTH: Four houses, Military Road, Hilsea, for Mr. F. D. McLaren; conversion to form billiard hall, London Road, for Messrs. A. and E. Sprigings, Ltd.; warehouse and stables, Somers Road, for Portsea Island Mutual Co-operative Society, Ltd.; alterations and additions to shop, 251 Lake Road, for Messrs. Collett and Collett; additions to school, Surrey Street, for the trustees of Christ Church Day School; reconstruction of workshop, The Avenue, King Street, for Messrs. T. Errington and Sons; 36 houses, Highbury Avenue, for Messrs. G. and W. Mitchell; two houses, Carshalton Avenue, for Mr. E. W. Payne; four houses, Firgrove Crescent, for Mr. F. D. McLaren; additions to works department, 16-18 Flathouse Road, for Portsea Island Mutual Co-operative Society, Ltd.; 13 houses, Westwood Road, for Mr. R. J. Winnicott; two houses, Meredith Road, for Mr. R. J. Winnicott; four houses, Military Road, Hilsea, for Mr. F. D. McLaren; three houses, Carmarthen Avenue, for Mr. H. R. Horsey; 12 houses, Northern Parade, for Mr. E. A. Wright; new street, Second Avenue, Farlington, for City and Suburban Builders; 13 houses, Mayfield Road, for Messrs. Tanner Bros.; new ward, Royal Portsmouth Hospital, for the Governors; hotel premises, Havant Road, Farlington, for Messrs. Brickwoods and Co., Ltd.; public house, Northern Parade, for Portsmouth and Brighton United Breweries; additions to warehouse, St. George's Square, for Messrs. Pink and Son, Ltd.; alterations and additions, 38 St. George's Square, for Portsmouth Rotary Club; conversion into flats, 3 South Parade, for Mr. H. Wells.

SOUTH-WESTERN COUNTIES

Plans passed by the PAIGNTON U.D.C.: Alterations and additions, Tembani Hotel and Monte Rosa, Marine Drive, for Mr. C. H. Wield; shop, Torquay Road, for Mr. J. L. Skidmore; hotel, Broadsands, for Staverton Builders, Ltd.; bakery, Palace Avenue, for Health Bakery, Ltd.

Plans passed at TRURO: Two houses, The Crescent, for Mr. Strout; hotel, Tregolls Estate, for Mr. Wheatly.

MIDLAND COUNTIES

Plans passed by the NORTHAMPTON Corporation: 10 houses, New Duston Road, for Mr. Stanford; extensions, leather works, Bedford Road, for Messrs. Frecknall, Barnard and Scott, Ltd.; church hall, off High Street, for Rector of Weston Favell; temporary classrooms, Kingsley School, for Education Committee; reconstruction, 39 Abingdon Street, for Mr. A. Cleaver; two houses, Greenfield Road, for Mr. A. Atkins; eight houses, Trinity Avenue, for Messrs. Chowns, Ltd.; factory extensions, St. Andrews Road, for Messrs. W. J. Markie & Co.; alterations, Bull Hotel, Regent Square, and Ram Hotel, Sheep Street, for Messrs. P. Phipps & Co., Ltd.; two houses, Rushmere Road, for Messrs. Stafford and Agutter; conveniences, Dover Hall, St. James Park Road, for Messrs. Dover, Ltd.; four shops and houses, Southampton Road, for Messrs. T. Wilson and Son.

Plans passed by the OXFORD Corporation: 10 garages, Jackdaw Lane, for Mr. Jarvis; bell-cote, St. Albans Church, Cowley, for Churchwardens; extension, Botley Road, for Co-operative Society; shop, Old Picture Palace, Castle Street, for Messrs. G. R. Cooper, Ltd.; three houses, Banbury Road, for Mr. R. P. Capel; three flats, 219 Iffley Road, for Mrs. A. D. Carter; additions, Cherwell Hotel, Summertown, for Hall's Oxford Brewery, Ltd.; hall and dormitory, Temple Road, Cowley, for Salasian College trustees; new wing, Radcliffe Science Laboratory, Parks Road, for University of Oxford; eight shops and 21 flats, Observatory Street, for St. John Baptist College trustees.

The OXFORD Corporation has approved the lay-out of the second portion of the Between Towns Estate, Cowley, for Messrs. Moss and Son.

The OXFORD Corporation reports in favour of the construction of an open-air swimming-bath at Sunnymead.

THE WORCESTERSHIRE C.C. has obtained sanction to borrow £10,000 for the erection of a new steel bridge to replace Fladbury Jubilee Bridge.

NORTHERN COUNTIES

Mr. A. Hanson is to erect 51 houses in Green Lane and Clare Road, Wyke, BRADFORD.

The ECCLES Corporation is to prepare plans for the erection of 100 houses on the Peel Green estate.

Plans passed by the ECCLES Corporation: 20 houses, Lane End, for Housing Committee; 14 houses, Peel Green, for Messrs. S. Crompton and Sons; extensions, Thorp Street, for Eccles Co-operative Society.

Plans passed by the ROTHERHAM Corporation: Four houses and shops, Badsley Moor Lane, for Mr. J. W. Bailey; alterations, College Road Inn, College Road, for Mappins Masborough Old Brewery, Ltd.; three shops, Howard Street, for Sterling Estates, Ltd.; 14 houses, Beechwood Road, for Messrs. G. Bilton and Son.

Messrs. Sutcliffe and Taylor of ROTHERHAM are to develop an estate fronting Moorgate, Rotherham.

Messrs. Montague Burton, Ltd., are to construct new premises at the corner of North Street and Newborough, SCARBOROUGH.

Messrs. Wilkinson and Smith are to proceed with the development of the Newlands Park estate, SCARBOROUGH.

The SCARBOROUGH Corporation has arranged to sell a site in Burniston Road for the erection of a church.

Plans passed by the SCARBOROUGH Corporation: Four houses, Northstead Road, for Messrs. J. Petch and Son; two houses, Northstead Road, for Mr. G. H. D. Fawcett; six houses, Peasholm Crescent, for Messrs. F. Mitchell and Sons; hotel (amended plans), Wheatcroft, for Messrs. Jones and Rickaby; two houses, Northstead Road, for Messrs. G. Wright and Son; two houses, Northstead Road, for Mr. A. E. Wright.

Plans passed by the SOUTHPORT Corporation: Two houses, Talbot Street, for Mrs. E. Wright; development of land in Marshside Road and Cambridge Road, for Hesketh Estates, Ltd.; lay-out of the Botanic Gardens, for Mr. W. J. Poole; three flats, Lancaster Road, for Liverpool Victoria Friendly Society; development of Nile Bank, for Mr. Walter Wright; development of land in Queen's Road and Leyland Road, for Mr. W. J. Poole; shop and house, St. Clare Drive, and two houses, Manor Road, for Mr. A. James; creamery, Chesterfield Road, for Mr. Thos. Campbell; shop and workshop, Stamford Road, for Mr. E. Chantler.

SCOTLAND

The GLASGOW Corporation has agreed to a proposal of the John Faill trustees that industrial premises should be permitted on land at Tollcross Road and Sorby Street, subject to the Corporation agreeing to the type and elevation of the buildings.

Plans passed by the GLASGOW Corporation: Shops and houses, West Drumoyne, for Corporation Housing Department; shop, Eckford Road for Mr. William M'Kinlay; factory reconstruction, Flemington Street, Springburn, for Craigpark Electric Cable Co., Ltd.; works extensions, Kennishead, for Messrs. Henry Wiggin and Co., Ltd.; picture house, Clarkston Road and Bogton Avenue, for Mr. W. Beresford Inglis.

The GLASGOW Education Committee has obtained a site on the Carnwadric housing estate for the erection of an elementary school.

WALES

Messrs. Henry Budgen & Co. have prepared plans for a shopping centre on the Fairwater Estate, CARDIFF.

Plans passed by the SWANSEA Corporation: Shop, Limeslade, for Mr. J. A. Evans; shop, Bellons Terrace, for Mr. D. W. Davies; additions, St. Helens Road, and wards, Phillips Parade, for Hospital Board; two houses, Glanmoor Road, for Modern Builders and Decorators, Ltd.; house and shop, Townhill, for Mr. S. L. Jones; rebuilding, Terminus Hotel, Rutland Street, for Messrs. S. Alsopp and Sons, Ltd.; store, Burrows Lodge, for Shell-Mex, Ltd.; billiard room, Trafalgar House, Oystermouth Road, for Trafalgar Club; dairy and container factory, Carmarthen Road, for Mr. David George; four houses, Derwen Fawr Road, for Mr. Syd. Davies.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

*In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

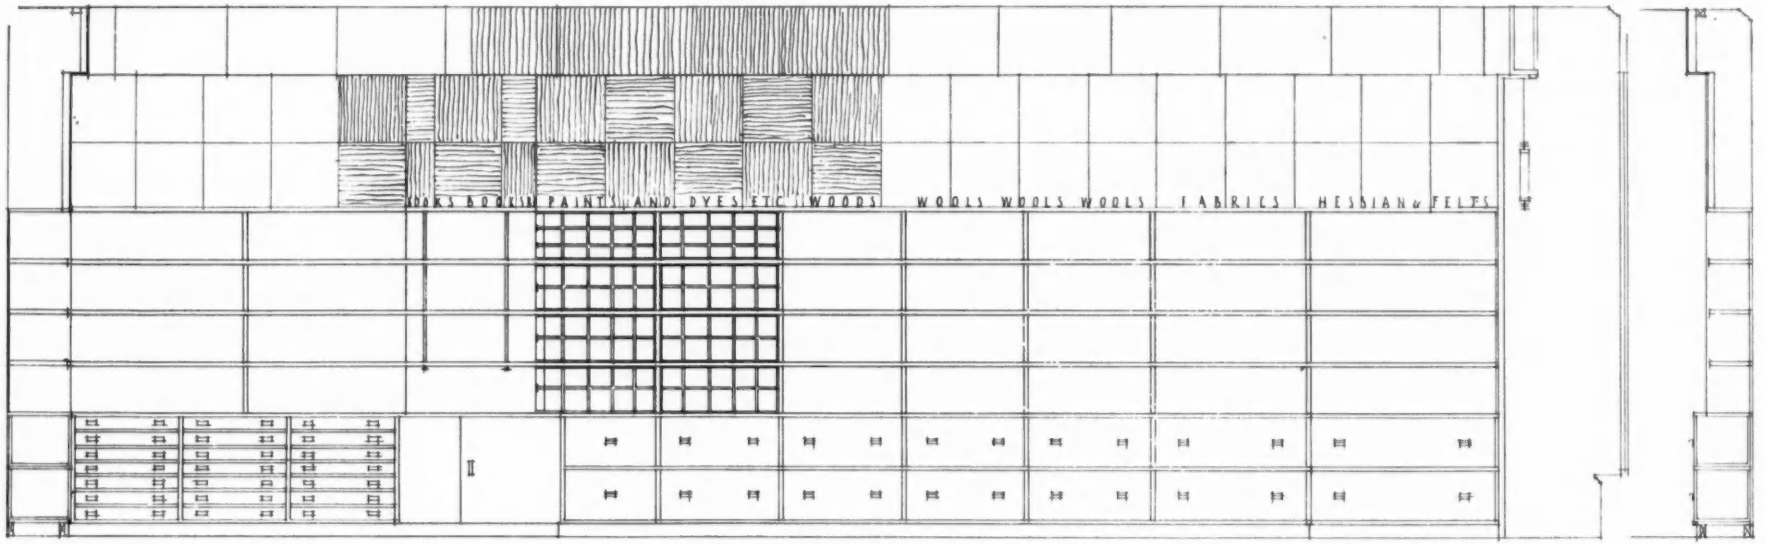
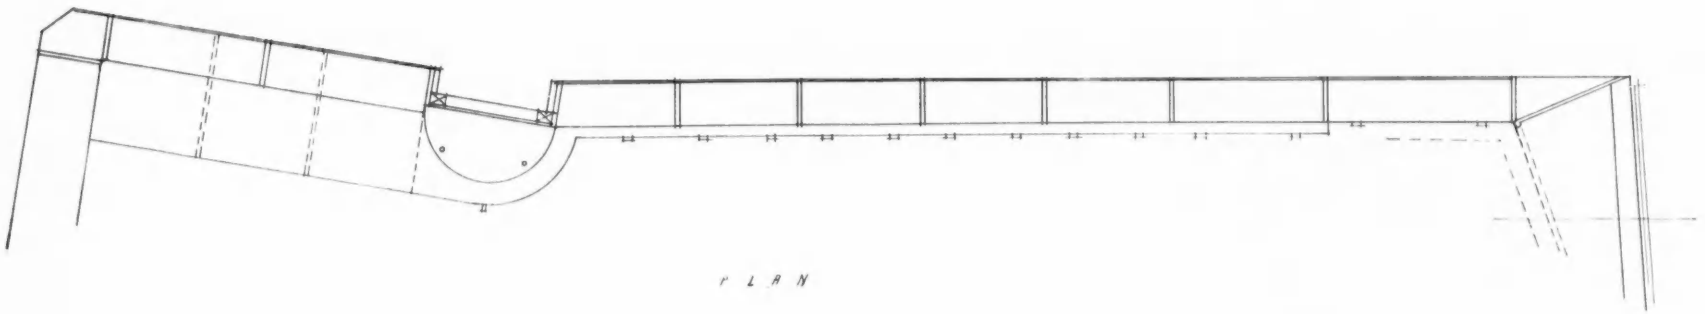
SHOWROOM INTERIOR, LONDON, W.C.

FOR DRYAD HANDICRAFTS : : L. H. BUCKNELL, ARCHITECT



ONE OF THE OLD CAST IRON COLUMNS, CASED AND FITTED WITH LIGHTS

IN a perfectly ordinary interior in Bloomsbury there has come into being the modern showroom pictured, photographically, in this supplement and elsewhere in the present issue (the complete plan is given on page 295). As will be seen from the sectional elevations reproduced, with their plans, on the following three pages, the walls are almost entirely lined with shelves, lockers and racks. Their fronts are continued up to the ceiling to avoid ledges and to conceal the existing cornice. Horizontal shelves are faced with sycamore; vertical divisions and backs are painted turquoise blue.



Turquoise blue is also the colour of the underside of the electric light fittings which project from the casing encircling two of the cast iron columns that existed in the old shop. These casings are faced with wood veneer paper, which is also extensively employed on the uppermost parts of the walls.

The showroom, with its sycamore joinery, veneer, and plywood, presents a general background of silver grey, against which touches of brighter colour are sparingly introduced, as in the drawer handles, of duck's-egg blue and chromium.

RAMPS : in garages : maximum rise, 1 in 6., average 1 in 7.

PARKING : in garages : width, allow 6'9" - 7'0" per car 20'3" in clear for a 3-car bay is common.
depth, allow 15'0" sufficient for garages with average clientel.
aisles, allow 20'0"

N.B. The licensing authority requires all vehicles to be capable of a complete turn within a diameter of 60'0" on either lock. (London.).

The turning diameter given above is twice the dimension "A" plus twice the wing overhang of 18".
The rear overhang of the body does not effect the turning diameter unless the overhang is exceptionally long

INFORMATION SHEET : DIMENSIONS AND TURNING DIAMETERS OF MOTOR VEHICLES

SIR JOHN BURNET, TAIT AND LORNE ARCHITECTS ONE MONTAGUE PLACE BEDFORD SQUARE LONDON W.C.1.

INFORMATION SHEETS

• 7 •

MOTOR CAR DATA

•

THIS week's Information Sheet goes yet further afield. Its tabulated measurements of cars, motor buses and other road vehicles will be invaluable to architects concerned in planning garage accommodation.

The drawings from which all these Information Sheets are reproduced originated in the office of Sir John Burnet, Tait and Lorne. Far from grudging the broadcasting of information they had been at pains to tabulate for use in the course of their own practice, they embraced the proposal with enthusiasm, thus placing the whole profession in their debt, and incidentally furnishing the student of fine draughtsmanship with specimens for emulation.

It was desired to present these Information Sheets in a standardized form, but no standard filing size has existed, hitherto, in Great Britain. The decision was therefore taken to make the reproductions the same size as the original drawings, which themselves follow the standard dimensions adopted by the American Institute of Architects, as being more convenient than reproduction to the double-page size associated with THE ARCHITECTS' JOURNAL Supplements.

Until further notice, therefore, these Sheets will take the place of the second double-page plate that is usually issued, week by week.

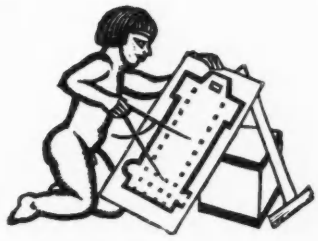
The following is a list of the subjects previously issued :—

1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.

THE CANAL, MAIDA VALE, LONDON, N.W.

FROM THE ALGERNON NEWTON EXHIBITION

THE static quiet of Algernon Newton's paintings, which are now being shown at the Leicester Galleries, brings a comforting sense of restfulness to eyes which are tired of seeing the buildings of London only through the interstices of dazzling electric signs. Needless to say, however, the artist has had to seek his subjects in the less "popular" parts of the city, where, far from being decked out in tawdry finery, the buildings are falling slowly into shabby-genteel decay. Nevertheless, none of their austere dignity is lost, for they are seen through the soft diffusive atmosphere which Mr. Newton excels in capturing, and which makes London sometimes incomparably lovely.



There is an admirable harmony between the technique of the artist and the subjects of his pictures, though this is less complete when he is painting landscape or using his brush more freely than is his usual custom, than when he is painting from his favourite models—the fading beauties of the stucco houses of the Regency period.

HILVERSUM TOWN HALL: THE BRIDAL AISLE

W. M. DUDOK, ARCHITECT

Civil marriage in Dudok's Hilversum Town Hall is an affair of some circumstance. The betrothal party arrives at the main entrance—otherwise used only by Town Councillors when in session—via a long ceremonial covered-walk alongside an ornamental lake. From the entrance hall, stairs of black and white marble have to be ascended, and the course then lies across the large "burgersaal" or public lobby shown in this illustration. It is brightly decorated (in contrast to the sober treatment of the council chamber), and across it the bridal pair see their goal—the red double doors leading to the betrothal rooms. Dudok speeds their passage thereto with a couple of light stripes let into the dark flooring to mark the way of advance up this side aisle. On leaving the betrothal room, which is decorated in red, white and silver, the pair make use of a stairway exclusively reserved for the occasion, leading down to the outer courtyard where the carriages wait.

WHERE MR. CHAMBERLAIN WENT WRONG

IN the leading article in the last issue of the JOURNAL, attention was called to statements made by *The Times* and by the Chancellor of the Exchequer with regard to the employment afforded by public works. The method of estimating the employing capacity of such schemes was then set out by means of an exhaustive analysis of the building and construction costs involved. With this preliminary, we may now examine the matter further, not, let it be clearly understood, with the object of attacking the National Government but, if possible, to convince its responsible members of the error of an anti-building campaign.

The particular part of the speech delivered by the Chancellor in the House on Thursday, February 16, which arrests the attention of those acquainted with the Building Industry, is reported in *Hansard* as follows:—

" There is an enormous sum of money which in the last seven and a half years has been poured out on public works. Nearly £100,000,000 a year has been spent, and what effect has it had in reducing unemployment? I confess I was astounded to find that the average number of men directly employed through the expenditure of this money was only 90,000."

Well might the Chancellor be astounded.

The expenditure of £100,000,000 per annum, or of £700,000,000 in the last seven years, is divided up as follows: housing under subsidy, £450,000,000; grants under the Lewis Committee, £40,000,000; schemes under the Unemployment Grants Committee, £120,000,000; roads, £90,000,000.

The section concerning which there is most published matter, apart from housing, is that under the Unemployment Grants Committee. In Cmd. 3449, of 1929, it is stated, concerning schemes under the Committee, that "about 50 per cent. of the expenditure incurred represents wages." On this basis the expenditure of £16,000,000 per annum would employ directly, at £120 per annum—the figure taken by the Committee—66,666 men every year.

Thus, according to this calculation, the expenditure of the remainder of the £100,000,000 per annum—£84,000,000—only employed 23,334 men.

This is obviously absurd. Housing employs more men for a given expenditure than works under the Unemployment Grants Committee, and expenditure upon it was four times as great. So, even on the face of it, we might assume that the Chancellor's 90,000 men were employed, not by the total expenditure of £700,000,000 in the seven years, but by the £250,000,000 of work which remains after leaving housing out of account.

As a matter of fact, information available with regard to the other schemes bears out this contention. The schemes under the Lewis Committee are not very different, on the average, from those under the Unemployment Grants Committee. Applying the method of the latter Committee, the expenditure of £6,000,000 per annum under the former would employ 25,000 men for a year. This work and work on roads, together with the work under the Unemployment Grants Committee, would certainly employ at least 90,000 men per annum directly, irrespective of employment on housing.

These figures are indeed so unanswerable that it has now been admitted officially that a mistake was made. *Mr. Chamberlain accidentally attributed to the expenditure of £700,000,000 the employment which resulted from the expenditure of £250,000,000.*

The irony of the situation is all the greater in that a passage from Mr. Chamberlain's speech immediately before the passage quoted above, runs:

" The right hon. Gentleman (Mr. Lansbury) has been to a large extent basing his denunciation of the present Government upon a misrepresentation—I am not saying a wilful misrepresentation, but perhaps I might say a misunderstanding. . . . "

An expenditure of £36,000,000 per annum—that is £250,000,000 in seven years—on public works, including " relief schemes," employs 90,000 men directly. It thus requires £400 to employ one man directly for one year. This is not in conflict with the proportions discussed last week, since they concerned only the building and construction cost, whereas total expenditure on public works includes charges for land, wayleaves, and other items.

On the assumption made in our leading article last week that 40 per cent. of expenditure on such schemes goes immediately as wages, £120, the wages for one man directly employed for one year, is 40 per cent. of the cost of building or construction. The total cost is therefore £300. This leaves £100 out of the £400 for land, etc., charges. It would therefore appear that, of the expenditure on such schemes, 25 per cent. on the average goes to meet charges other than those for the actual work of building or construction.

Mr. Chamberlain himself admits, however, that every man employed directly requires another man to supply him with materials. Our £400 per annum therefore employs two men for a year. To push the matter to the last stage, those two men require another to furnish them with food and clothing. The total effect of the expenditure of £400 on public works is therefore to employ three men for one year. The saving to the unemployment funds amounts to £169 per annum; £156 in benefit at £1 per week and £13 on employers' and employees' contributions at 10d. per week each. The net cost of employing the three men for a year and getting work done to the value of £400 is thus only £231.

NOTES & TOPICS

THE MIRACLE OF THE GRID ; AND WHO CARES ?

IF you talked once about Sweden, talk now about Russia, and a packed roomful of *intelligences* sit goggle-eyed with receptiveness, filling up with the latest snob-chat for communal use.

*

But let the A.A. stage a meeting to hear what we ourselves have planned, and through the Electricity Commissioners, actually carried out, and a handful of people try to look like an audience, while Sir Thomas Purvis and Sir Andrew Duncan explain how retrograde England performed the miracle of the Electric Grid, while we were talking about it.

*

It is, I think, an extraordinary thing that this piece of national planning, that has spread light and power in a network all over England and is about to affect the whole trend of future development, should not be examined closely by more than a benchful of architects.

*

" Architects," as Wyndham Lewis said, " where is your vortex ! "

*

THE ARCHITECTURAL WORM TURNS

I suppose one must accept a good deal of tommy-rot from the daily Press without complaint, yet just occasionally, and in terms of mild correction, the architectural worm will turn.

*

Due to her contributions to the Press, Miss Elizabeth Craig occupies a position to influence opinion in matters of house organization and planning. On February 12, in an article published in *The Sunday Express*, her influence was misdirecting. She described her ideal house, which, by efflux of time, is now a Georgian house, and in a detailed article, illustrated by plans, showed the uninitiated how to manage an architect by telling him where to put everything, including the stairs.

*

Now, unfortunately, her staircase, " a simple, gracious affair," to quote her verbal description, is shown on her plan to be, even if simple, just a little less gracious in allowing a headroom of 24 ins. only, a generous allowance for a worm, but not a Georgian, nor a neo-Georgian.

*

Was it her architect that blundered, or was this little plan the sort of thing a good client makes, only to forget as soon as she realizes, by contact with the reality of planning, that nothing is so simple as it looks ?

*

Miss Craig does not entirely forget the architect with the stairs, but Miss Dora Kilmartin, of Whitton, Middlesex, is no friend at all. To *The Sunday Express* reporter she said :

I believe a great proportion of unhappy marriages have been caused in the first place by architects who have never cooked a meal, washed the dishes or swept and dusted a house. . . .

*

Miss Kilmartin is class-conscious. Or is this a further manifestation of the theory that all architects are gentlemen of the type that butlers show immediately into the right room ?

*

" Gentlemen never look out of windows," said Oscar Wilde. Architects never . . . but come, come, nearly all architects start by washing the dishes, and a good deal more, and are better husbands, perhaps, but only ever so slightly better architects.

*

The right person, I feel, to answer Miss Kilmartin's unkind references to our well-meant efforts is a woman architect of my acquaintance. They would make an excellent broadcast between them.

*

KING'S CROSS AIR-PORT—

A company is being formed to build the elevated air-port at King's Cross on which Captain C. W. Glover has for long been working.

*

The air-port is planned like an eight-spoked wheel, half a mile in diameter, each spoke a runway 250 ft. wide, and the whole raised on supports which will be warehouses, hangars, etc, 120 ft. high.

*

The plan aims at a co-ordinated centre of all forms of transport placed in the heart of London. I wish to goodness we knew what effects such a scheme will have upon the plan of London.

*

—AND ONE FOR ROCHESTER ?

There is talk, too, of Rochester, Kent, becoming an air-port of some consequence. Several air lines pass over the town —without stopping—and it has occurred to the elders that Rochester with a port, good land communications, and a rising industrial activity, might very well tap the air lines to its advantage.

*

These things, and a good landing ground site most certainly exist, but one feels that the consideration of such questions is somehow tied up with national planning, and that, in the forthcoming co-ordination of transport resources, both the air and land organization of civil air traffic should be the subject of a nationally envisaged plan of campaign to promote efficiency and avoid damage.

*

THE R.I.B.A. DINNER

I confess I have seldom attended a more enjoyable function than the Institute's annual dinner, held at Claridge's Hotel, on Friday last. Fred May, whom I saw there, sketching personalities for a page in this JOURNAL, must have had a difficult time selecting his subjects from such a large gathering.

*

I offer the R.I.B.A. my hearty congratulations in choosing the speakers. They were all brilliant—particularly Sir Josiah Stamp, who discoursed at an enormous pace. It struck me, while Sir Raymond Unwin was speaking, that it would be a tribute to his excellent work if he were again re-elected to the presidency.

THE ARCHITECTS' DIARY

Wednesday, March 8

R.I.B.A., 9 Conduit Street, W.1. First of a series of six lectures on How to Look at London. "Piccadilly." By H. S. Goodhart-Rendel, F.R.I.B.A. 6 p.m. Also exhibition of architects' working drawings. Until March 17 (10 a.m. to 8 p.m., Saturdays 5 p.m.).

ROYAL ACADEMY OF ARTS, Burlington House, Piccadilly, W.1. Winter exhibition, 10 a.m. to 6 p.m. Until March 11. 10 *a.m.*

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.1. "Roman Architecture—VIII." By Sir Banister Fletcher, PP.R.I.B.A. 6 *p.m.*

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "Recent Developments in the Warming and Ventilation of Buildings." By J. L. Musgrave. 8 *p.m.*

ST. PAUL'S ECCLESIOLOGICAL SOCIETY. At the R.I.B.A., 9 Conduit Street, W.1. "The English Parish Church Before the Reformation: II: From the Normans to the Black Death." By F. Herbert Mansford, F.R.I.B.A. 8 *p.m.*

Thursday, March 9

INSTITUTION OF STRUCTURAL ENGINEERS, 10 Upper Belgrave Street, S.W.1. "Reinforced Concrete Grain Silos." By T. J. Gueritte. 6.30 *p.m.*

SOCIETY OF ANTIQUARIES, Burlington House, W.1. "The Abbot's House at Battle Abbey." By Sir Harold Brakspear, F.R.I.B.A. 8.30 *p.m.*

GEFFRYE MUSEUM, Kingsland Road, Shoreditch, E.2. "Hepplewhite Furniture." By F. Skull. 7.30 *p.m.*

Friday, March 10

INSTITUTION OF STRUCTURAL ENGINEERS (Midland Counties Branch). At the Chamber of Commerce Building, New Street, Birmingham. "The Manufacture of Pre-Cast Concrete Units and Cast Stone." By E. L. Cotterell. 6.30 *p.m.*

TOWN PLANNING INSTITUTE. At Caxton Hall, Caxton Street, S.W.1. "The Town and Country Planning Act and Town Centres." By H. H. Humphries, C.B.E. 6 *p.m.*

Monday, March 13

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "Welding and Allied Processes for Engineering Purposes." By A. Stephenson. 8 *p.m.*

Tuesday, March 14

INSTITUTE OF LANDSCAPE ARCHITECTS. At the A.A., 34 Bedford Square, W.1. "The Education of a Landscape Architect." By Gilbert H. Jenkins, F.R.I.B.A. 3.30 *p.m.*

ROYAL SANITARY INSTITUTE, 90 Buckingham Palace Road, S.W.1. Discussion on "Town and Country Planning," to be opened by W. T. Creswell, HON. A.R.I.B.A. 5.30 *p.m.*

ILLUMINATING ENGINEERING SOCIETY. At the Institution of Mechanical Engineers, Storey's Gate, S.W.1. "Progress in Illuminating Engineering." By Dr. Ing. N. A. Halbertsma. 7 *p.m.*

LONDON SOCIETY. At the Mansion House, E.C.4. Annual meeting. 4.30 *p.m.*

MESSRS. PINCHIN JOHNSON

I have been asked to correct an error which appeared in an article contributed to this JOURNAL a week or two ago. The statement was to the effect that Messrs. Pinchin Johnson is a firm which, by reason of some of its directors and the holdings of certain blocks of shares, must come under American influence. Further, in ignoring public opinion in regard to No. 4 Carlton Gardens, the firm is thinking only of the interests of its American shareholders.

*

It was a silly statement which originated in the House of Commons and was reproduced therefrom.

*

Silly, first, because to distinguish between the nationality of directors or shareholders is an unprofitable speculation, not always calculated to uphold "British prestige." Secondly, because it is an appeal to prejudice rather than to reason, and as such to be deplored. Thirdly, because whether the directors and shareholders of Pinchin Johnson are American or English has no sort of bearing on the Carlton Gardens controversy.

Lastly, it is silly because it is not true. Messrs. Pinchin Johnson have every right to protest against it, and in making the *amende honorable* which the Editor has asked me to offer in the name of this JOURNAL, I would like to give full publicity to a statement I have received from the managing director of that firm, to the effect that 0.35 per cent. of the shares are held by Americans, that none of the directors is an American, and that the business is not controlled or influenced by Americans or American capital in any shape or form.

*

"WHAT MIGHT BE"

Mr. Clough Williams-Ellis, I understand, is reported on another page to have said that if either he or Sir Raymond Unwin had been supreme dictator of this country 30 years ago we would have escaped all our troubles. Thereupon Sir Raymond gave his own version of a *Punch* poem, thus :—

If Jones were Dictator of England—
And he hasn't refused it yet—
He would levy a tax on these Oxford slacks,
And pay the American debt.

If Brown were Dictator of England,
He would stop this shingled hair ;
For *he* thinks the girls ought to keep their curls
That grandmother used to wear.

So if I were Dictator of England,
I'll tell you what I would do ;
I would sell Clough the job for fifteen "bob,"
And throw in some good advice, too.

WHICH DO YOU PREFER ?

The authentic Landseer lion, guaranteed genuine, of Trafalgar Square—

—or the replica built in Hollywood for the filming of Cavalcade ?

SIR W. REYNOLDS-STEPHENS

Sir William Reynolds-Stephens, President of the Royal Society of British Sculptors, will, it is announced, retire from office upon the completion of his eleventh year of service at the end of March.

BRITISH ART IN INDUSTRY

Following are extracts from a letter on the Royal Academy Exhibition of Contemporary British Art in Industry, 1935, signed by Sir William Llewellyn, President of the Royal Academy, and Mr. John A. Milne, Chairman of the Council of the Royal Society of Art :

The urgent national need for the encouragement and support of British Industry has caused the Councils of the Royal Academy of Arts and the Royal Society of Arts to decide upon action within the sphere of their special competence which will, we feel, materially assist in that direction. The means by which they seek to stimulate a quickened interest in British Industry is to devote the Royal Academy's Winter Exhibition of January–March, 1935, to an EXHIBITION OF CONTEMPORARY BRITISH ART IN INDUSTRY to be held by the Royal Academy of Arts in collaboration with the Royal Society of Arts. The special aims and scope of this exhibition are fully explained in a memorandum and circular letter which has been sent to the principal British Industrial Organizations interested in the project.

The list of subscriptions received by the Public Relations Committee of the Building Industries National Council up to Monday last amounted to £2,242/8/4. Subscriptions should be addressed to Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

Their Majesties the King and Queen have graciously consented to be the Patrons, and H.R.H. the Duke of Connaught (President of the Royal Society of Arts) to be the Vice-Patron of the Exhibition, whilst H.R.H. the Prince of Wales has accepted the Presidency of the General Committee which is being formed.

No contributions will be asked from the exhibitors towards the expenses of the exhibition, and no charge made for space. It will thus be seen that it is intended to keep the organization of the Exhibition entirely free from any influences other than those which aim at stimulating in the national interest a fruitful co-operation between the manufacturer and the artist as designer.

SOUTH WALES ARCHITECTS' MEETING

The Western Branch of the South Wales Institute of Architects held their annual general meeting at Swansea last week.

Mr. Edwin Smith, A.R.I.B.A., P.A.S.I., of Neath, was re-elected Branch Chairman, and the following officers were appointed to the Branch Committee : hon. secretary, Mr. J. Herbert Jones, F.R.I.B.A. (President S.W.I.A.) ; hon. treasurer, Mr. G. R. H. Rogers, L.R.I.B.A. Members to serve on the Branch Committee :

Messrs. O. S. Portsmouth, A.R.I.B.A. ; Charles S. Thomas, F.R.I.B.A. ; H. A. Ellis, F.R.I.B.A. ; F. A. Broad, L.R.I.B.A. ; and E. E. Morgan, A.R.I.B.A. Student Members : Messrs. Ernest Billings and W. Roy Thomson.

The following members were elected to serve on the Council of the South Wales Institute of Architects, as from July 1, 1933 :

Messrs. C. S. Thomas, F.R.I.B.A. ; G. R. H. Rogers, L.R.I.B.A. ; Edwin Smith, A.R.I.B.A., P.A.S.I. ; H. A. Ellis, F.R.I.B.A. ; C. S. Portsmouth, A.R.I.B.A. Students' Representative : Mr. W. Roy Thomson.

AN EDINBURGH EXHIBITION

A comprehensive display of builders' materials of all kinds, staged both by Scottish and by national producers, is now on show at the Scottish National Building Exhibition, Waverley Market, Edinburgh. It will remain open until March 11.

TOWN AND COUNTRY PLANNING ACT

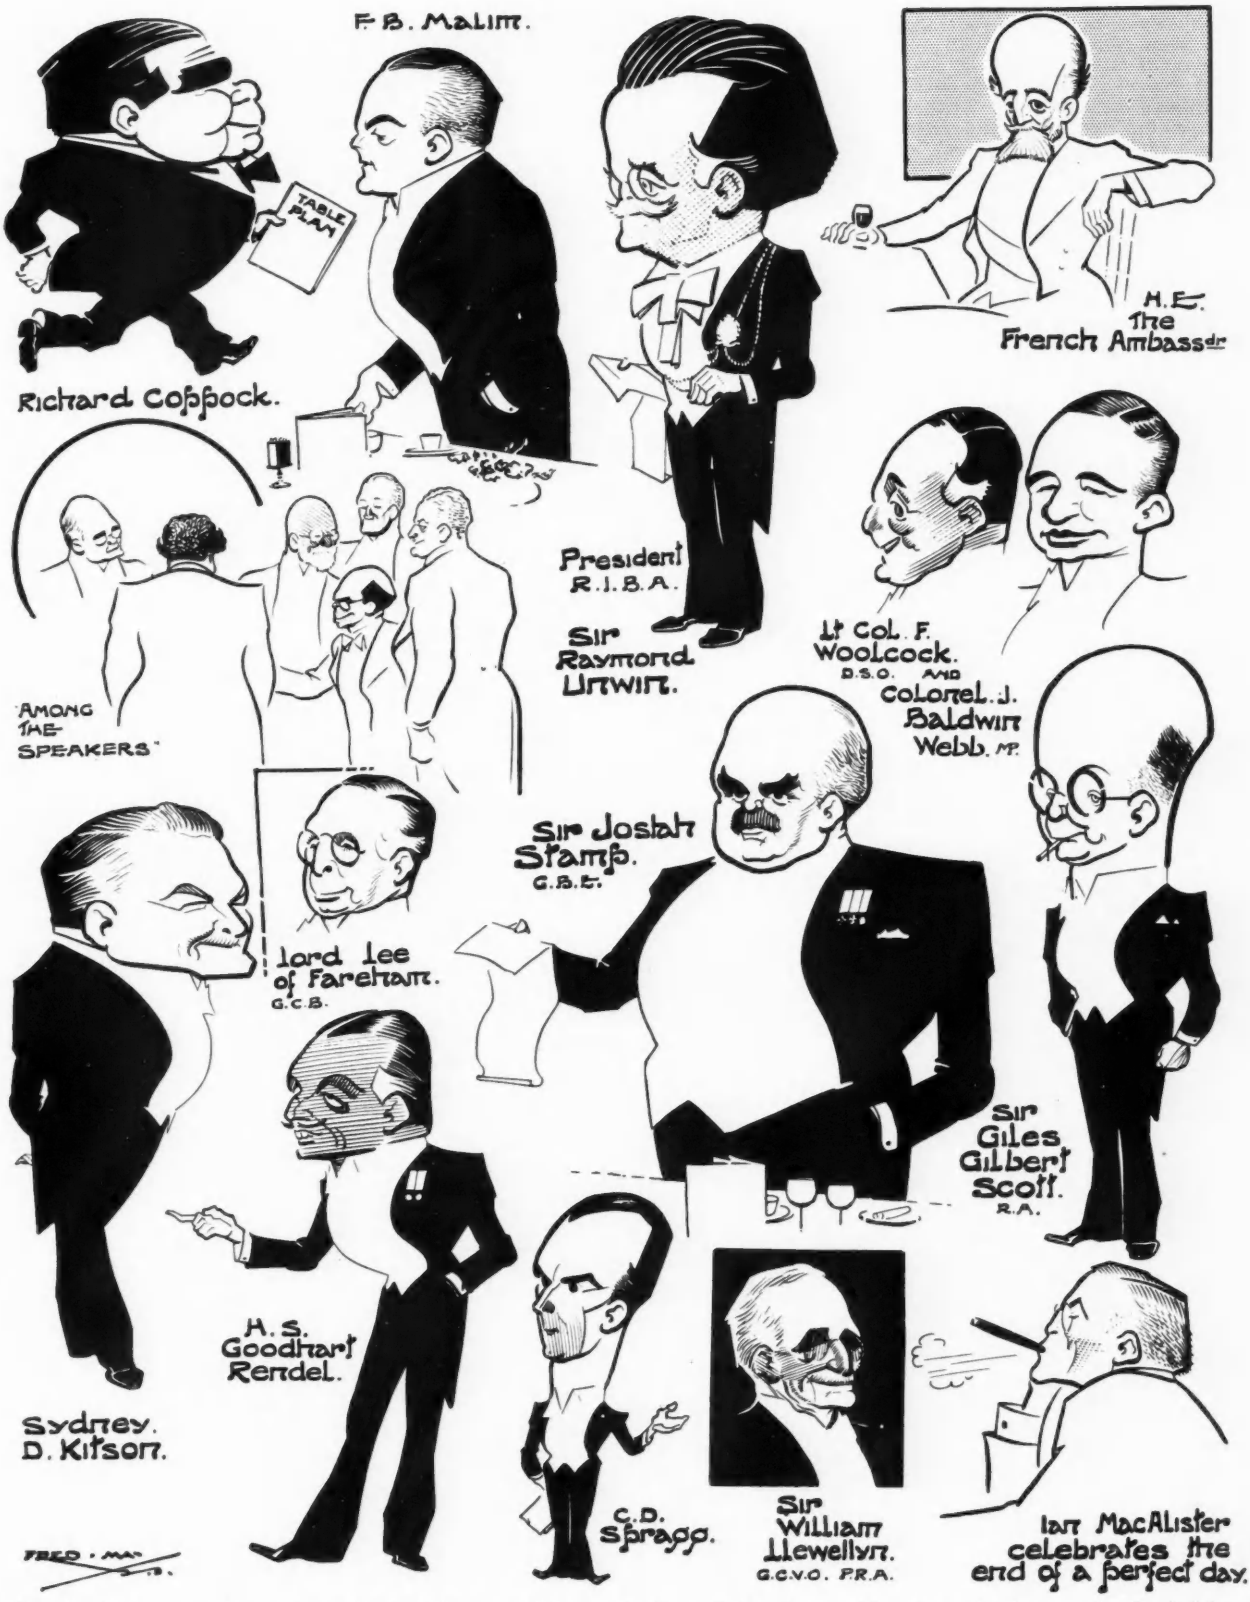
The Minister of Health issued, on Saturday last, a circular letter to local authorities on the Town and Country Planning Act, 1932. He points out that the gains to the community from the Act will depend on how the powers are exercised by local authorities. The principal object of a planning scheme should be to provide a plan within which initiative and enterprise, whether private or public, may be exercised to the best advantage.

A summary of the Act is also being issued, and copies of the circular and of the summary may be purchased from the Stationery Office or through any bookseller, price 4d. each.

R. I. B. A.

THE ANNUAL DINNER

A surprisingly large number of members and guests were present at the annual dinner of the Institute, held at Claridge's Hotel on Friday last, with Sir Raymond Unwin, the President, in the chair. The toasts (excluding that of the King and other members of the Royal Family, proposed by the President) were given and responded to as follows :



"THE R.I.B.A. AND ITS ALLIED SOCIETIES." Proposed by Sir Josiah Stamp, G.B.E., and responded to by Sir Raymond Unwin.

"THE GUESTS." Proposed by Mr. H. S. Goodhart-Rendel, F.R.I.B.A., and responded to by Messrs. F. B. Malim (Master of Wellington College) ; C. Gerald Eve, F.S.I. (President of the Chartered Surveyors' Institution) ; and Frank Pick, LL.B.

Sir Josiah Stamp recalled that he very nearly became an architect ; his first published contributions were on architecture, a profession which was closer to his heart than the one he now followed. However, as the head of a great railway, his contacts with the architectural profession were numerous, responsible and astonishingly wide. He also recalled that, at the risk of being thought a faddist, he had saved Stratford House, one of the few remaining sixteenth-century houses in the Birmingham area, from being butchered to make room for another score of railway trucks in an adjoining siding. It was done at some small economic cost to the corporation.

It was, however, another story when he was told that, in scheming out ideas for a great new terminal, on no account must he touch "the noble proportions of the great hall at Euston Station." This remark caused the most prolonged laughter of the evening. "In vain," he said, "are my struggles to invent any plan for a new Euston which will not involve its destruction. With the site of Carlton House Terrace and the Adelphi in front of me, I can hear the

AT THE R.I.B.A. ANNUAL DINNER

On the facing page is a report of the Dinner, which was held on Friday last. The above sketches are by Fred May.

cries of those whose response to sentiment and æstheticism is greater than it is of my shareholders. How would you like to be in my place, with the responsibility for St. Pancras Hotel?"

He described the Hotel as being completely obsolete and hopeless for its purpose, worse even than useless for offices. "I understand," he continued, "that I am the last remaining man with mid-Victorian spirit who is sufficiently Philistine and bourgeois, and altogether out of the running to be an unashamed admirer of the Albert Memorial. Now I am responsible for St. Pancras Hotel, still described as one of the wonders of the world. Will it be vandalism to destroy it? How does it really stand in the eyes of the profession?"

Sir Raymond Unwin, in his opening remarks, said he much regretted the absence, through ill-health, of Mr. Maurice Webb, the Chairman of the Architects' Unemployment Committee. This Committee had accomplished much useful work. It had tried to make an opportunity out of disaster. A complete survey of London had been made such as had never been created before, which would prove a most valuable basis for dealing with such questions as reconstruction and housing. He was glad to say that the City Corporation had now decided to carry out the reconstruction and improvement of the Guildhall, which had been hanging fire since before the War. This work, he stated, would save at least £25,000 in unemployment relief alone. He thought it was good business to proceed with the erection of the new R.I.B.A. building, which would also save some £20,000 in unemployment relief. Referring to the Board of Architectural Education, Sir Raymond said the retirement of Professor C. H. Reilly would leave a much bigger job for them to do.

EXAMINATIONS

Following are the dates for the R.I.B.A. Examinations, together with the latest dates for applications :

Intermediate Examinations

May 26, 27, 29, 30 and June 1, 1933. (Applications by April 26, 1933.)

November 17, 18, 20, 21 and 23, 1933. (Applications by October 17, 1933.)

June 1, 2, 4, 5, and 7, 1934. (Applications by May 1, 1934.)

November 9, 10, 12, 13 and 15, 1934. (Applications by October 9, 1934.)

Final Examination

July 5, 6, 7, 8, 10, 11 and 13, 1933. (Applications by June 7, 1933.)

December 6, 7, 8, 9, 11, 12 and 14, 1933. (Applications by November 6, 1933.)

July 4, 5, 6, 7, 9, 10 and 12, 1934. (Applications by June 4, 1934.)

December 5, 6, 7, 8, 10, 11 and 13, 1934. (Applications by November 5, 1934.)

Special Examination

July 5, 6, 7, 8, 10 and 11, 1933. (Applications by June 7, 1933.)

December 6, 7, 8, 9, 11 and 12, 1933. (Applications by November 6, 1933.)

July 4, 5, 6, 7, 9 and 10, 1934. (Applications by June 4, 1934.)

December 5, 6, 7, 8, 10 and 11, 1934. (Applications by November 5, 1934.)

Special Examination in Design for Former Members of the Society of Architects

July 5, 6, 7, 8 and 10th, 1933. (Applications by June 7, 1933.)

December 6, 7, 8, 9 and 11, 1933. (Applications by November 6, 1933.)

July 4, 5, 6, 7 and 9, 1934. (Applications by June 4, 1934.)

December 5, 6, 7, 8 and 10, 1934. (Applications by November 5, 1934.)

Special Examination of Licentiates to Qualify as Fellows

October 30, 31, November 1, 2 and 3, 1933. (Applications by September 29, 1933.)

April 9, 10, 11, 12 and 13, 1934. (Applications by March 9, 1934.)

October 29, 30, 31, November 1 and 2, 1934. (Applications by September 28, 1934.)

Statutory Examination for District Surveyor and the Examination for Building Surveyor

May 3, 4 and 5, 1933. (Applications by April 12, 1933.)

October 11, 12 and 13, 1933. (Applications by September 20, 1933).

April 25, 26 and 27, 1934. (Applications by April 4, 1934.)

October 10, 11 and 12, 1934. (Applications by September 19, 1934.)

PUBLIC LECTURES

The first of a series of six public lectures on "How To Look at London," will be given at the Institute today, at 6 p.m., when Mr. H. S. Goodhart-Rendel will speak on "Piccadilly." The succeeding lectures, which will start at the same time every Wednesday, until April 12, are as follow :

March 15 : "Where Londoners Live." Mr. A. S. G. Butler, F.R.I.B.A.

March 22 : "Where Londoners Work." Mr. T. A. Darcy Braddell, F.R.I.B.A.

March 29 : "Where Londoners Play." Mr. P. Morton Shand.

April 5 : "Where Londoners Shop." Mr. F. E. Towndrow, A.R.I.B.A.

April 12 : "What London Might Be." Mr. A. B. Knapp-Fisher, F.R.I.B.A.

The lectures are free, and no cards of admission are required.

INTERNATIONAL CONGRESS

The International Congress of Architects, which was to have been held in September this year in the United States of America, at Washington, has been deferred until improved conditions make it possible to ensure an adequate gathering of international representatives.

A further announcement will be made as soon as the Comité Permanent International des Architectes is able to arrange a suitable date.

Changes of Address

Mr. Thomas S. Cordiner, A.R.I.B.A., Chartered Architect, has transferred his office from 26, Midlothian Drive, Glasgow, S.1, to Blythswood Chambers, 261, West George Street, C.2 Telephone No. Central 8854.

Mr. S. Hodgson Doyle, A.R.I.B.A., A.I.STRUCT.E., Chartered Architect and Surveyor, has removed his offices to Town Hall Chambers, Victoria Square, Leeds. Telephone No. : Leeds 26902.

COMPETITION

NEWS

REPLANNING OF STOCKHOLM

The date for the submission of schemes in the International Competition for Replanning the Centre of Stockholm has been extended to March 15. Over 300 schemes have so far been received. Mr. G. L. Pepler, the Chief Town Planning Inspector of the Ministry of Health, who is one of the two foreign judges, will shortly be going over to Stockholm to help in assessing the plans.

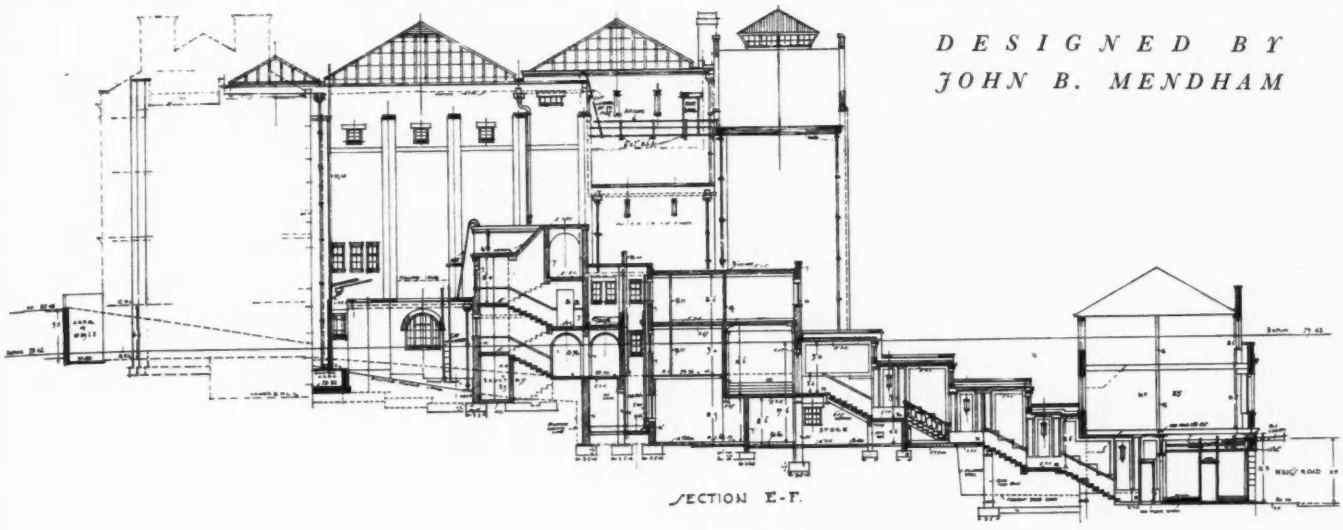
Competitions Open

March 15.—Proposed Burgh Chambers, Municipal Offices and Public Baths for the Town Council of the Burgh of Prestwick. Open to architects who have been in practice, either as individuals or as partners in a firm, for at least twelve months prior to March 1, 1933. Assessor : A Graham Henderson, F.R.I.B.A. Premiums : £200, £100 and £50. Applications for conditions of competition and plan of site should be made to William Shaw, Town Clerk, Burgh Chambers, Prestwick, Ayrshire, together with a deposit for £2 2s., on or before March 15 next. If the applicant decides not to enter, conditions, etc., must be returned before April 15. Designs to be submitted to the Town Clerk not later than 12 noon on May 8.

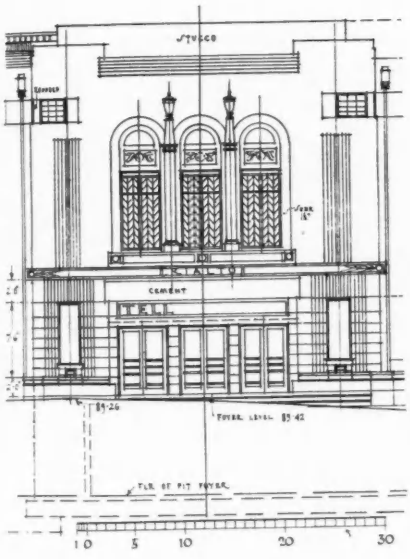
March 24.—Façade to a newspaper office in grey Cornish granite, for the Cornish Quarry Masters' Association. First Prize, £50. Conditions etc., were published in *A.J.* for Feb. 1.

March 31.—Competitions for Cottages to be built at an economic rent, organized by the Building Centre, 158, New Bond Street, W.1, from whom full conditions are obtainable. Premium : £100.

April 13.—Design of a new exhibition hall at Manchester for the Management of the Manchester Building Trades' Exhibition. Premiums : £150, £75 and £25. Full particulars were published in *A.J.* for February 15.



May 31.—Sending-in Day. Layout of a suburb on the river Escaut, Antwerp. £2,400 in prizes (1st, £800). Conditions, etc., were published in *A.J.* for December 7, 1932.

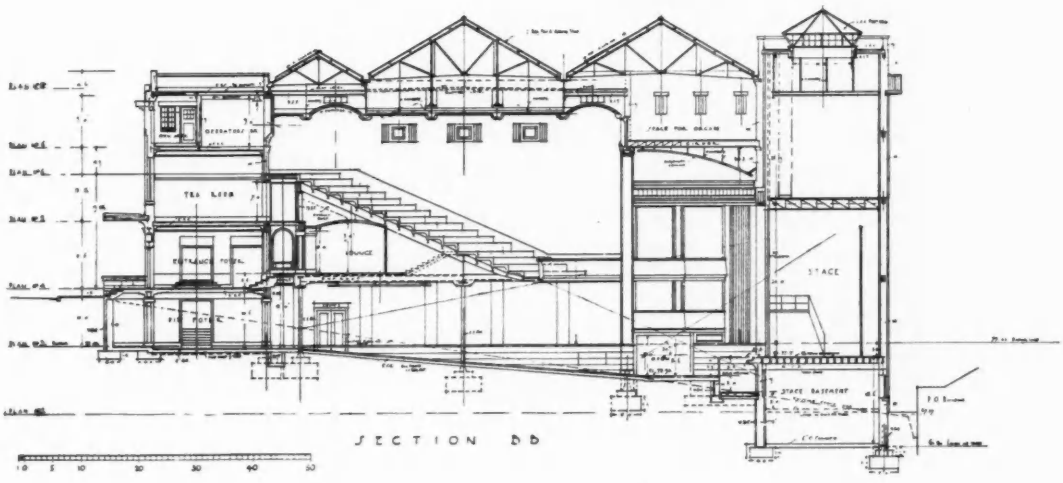


ON THE AIR

The next talk in the B.B.C. series "Other People's Houses" will be broadcast on Monday next, March 13, in the National Programme at 9.20 p.m. It is to be given by Mr. Percy Hurd and his subject will be "Rural Housing."

THE REGAL CINEMA, ST. LEONARD'S-ON-SEA

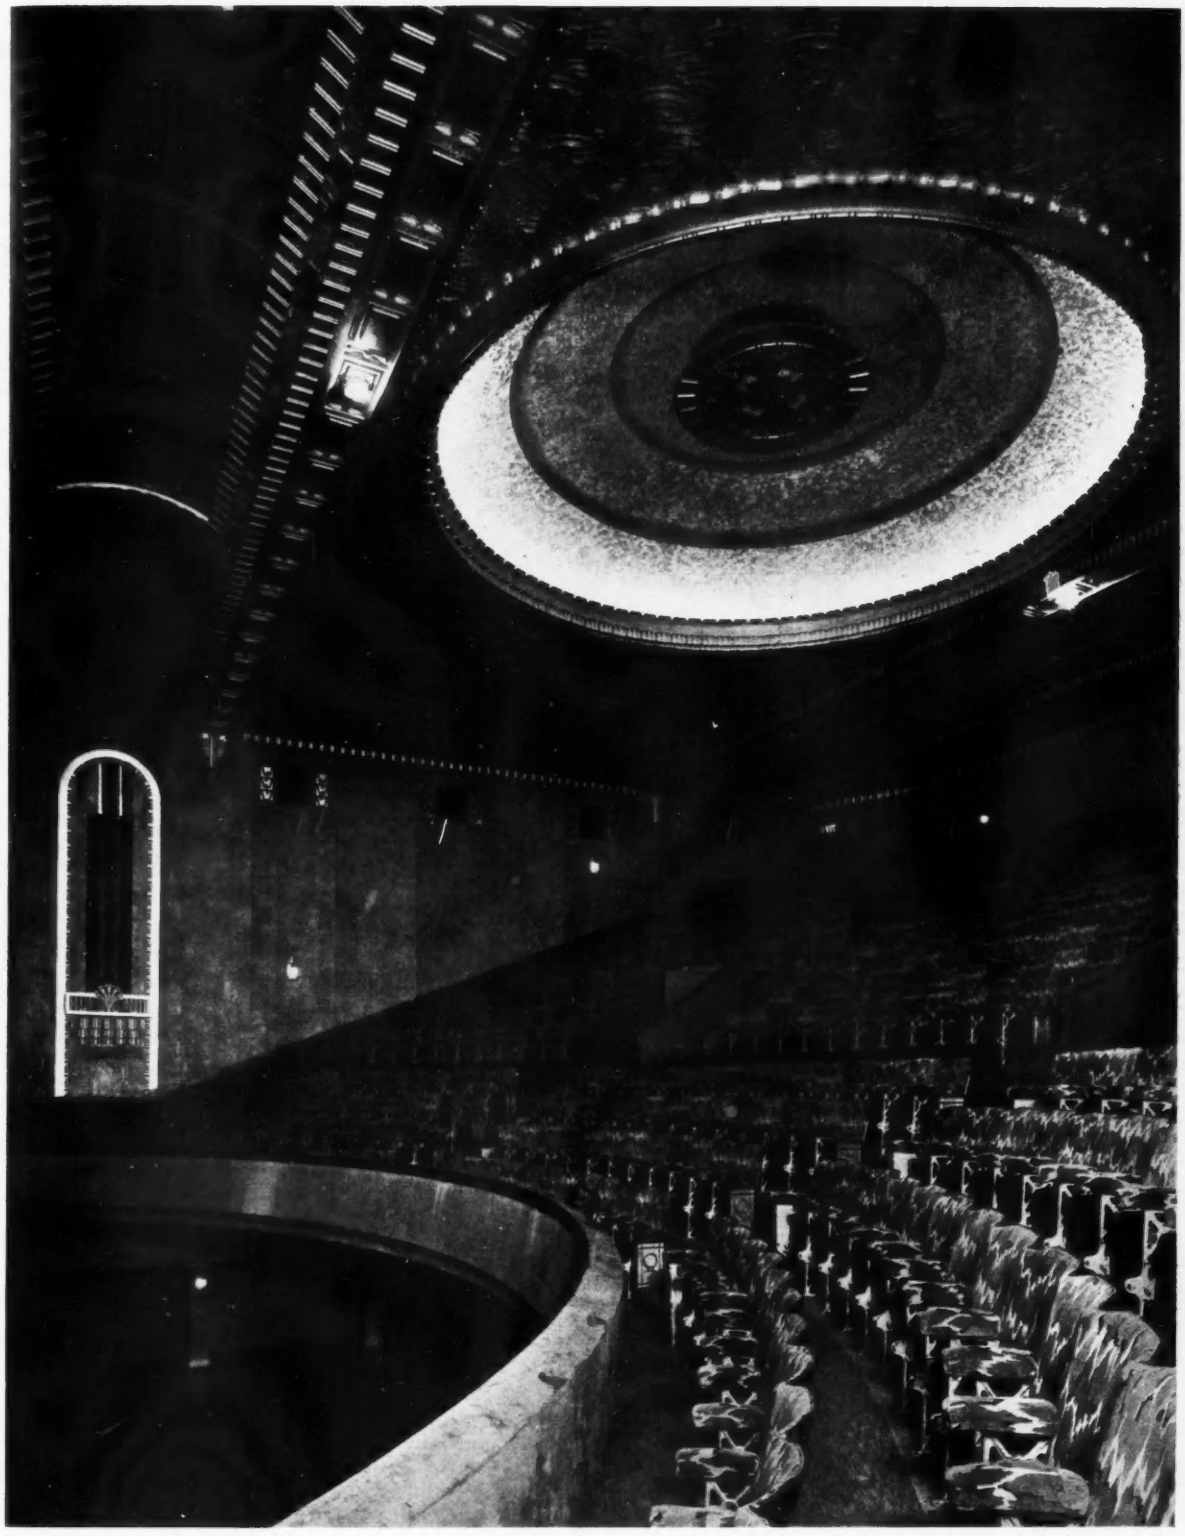
DESIGNED BY JOHN B. MENDHAM

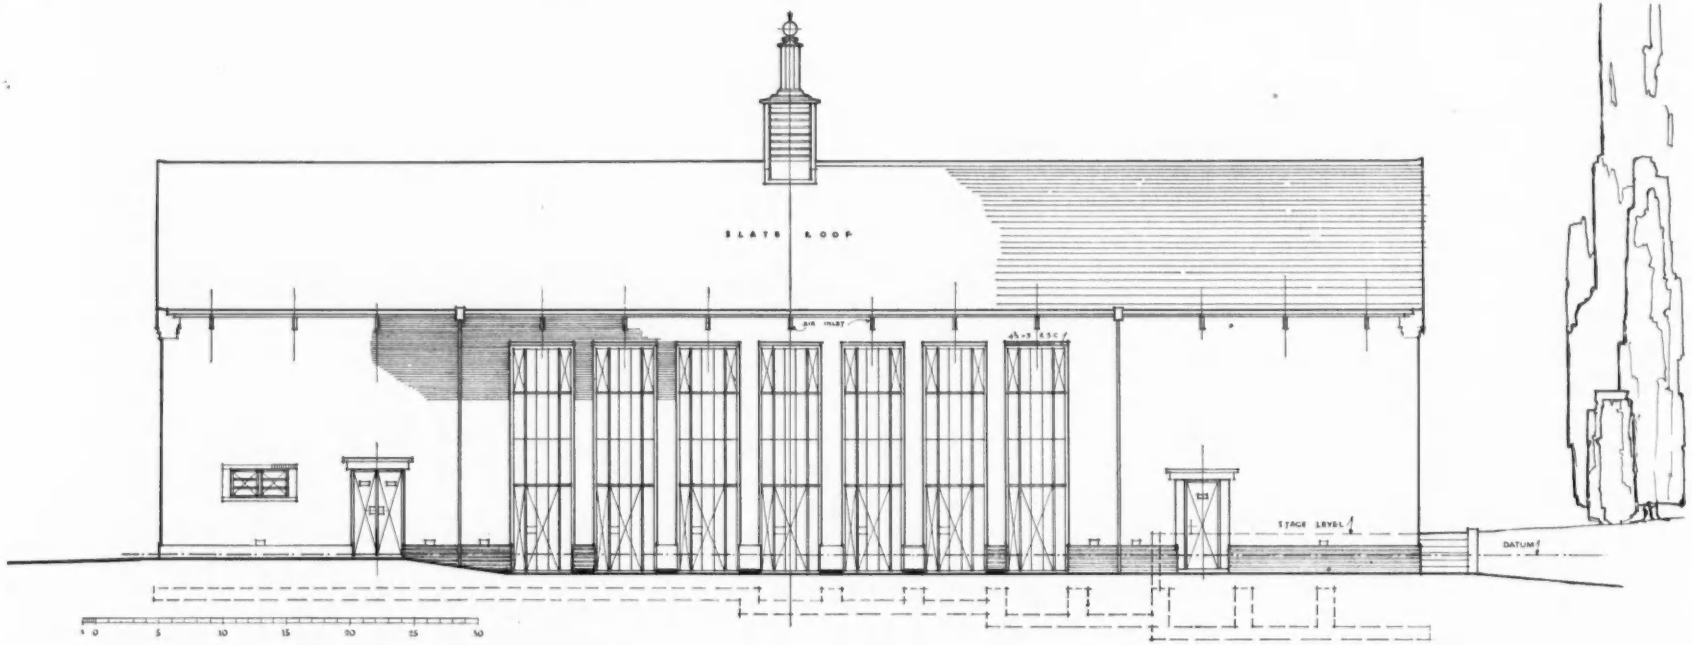


The main entrance, in London Road, to the theatre of which plans are given in a supplement with this issue, is in stone, black marble and white cement, with varied bands of multi-coloured bricks.

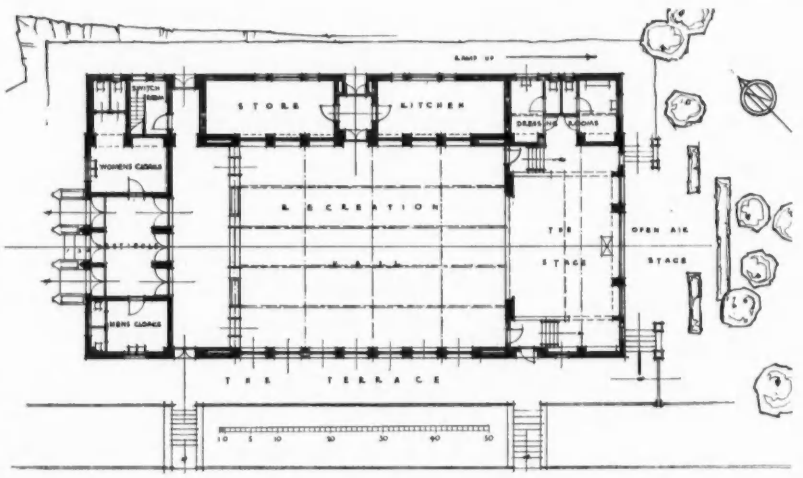
The interior decorations are carried out mainly in silver and pale green. As will be seen from the views of the auditorium given overleaf, the tone duct from the organ comes out on the flat ceiling, with a grille the motifs of which are modelled on notes of music. The main lighting is from a large dome above the balcony; in addition, concealed lighting is employed at the sides and rear of the house, and also at the proscenium opening.

The stage is very fully equipped, and there are sixteen dressing rooms. The accommodation includes waiting space and a tea-lounge.



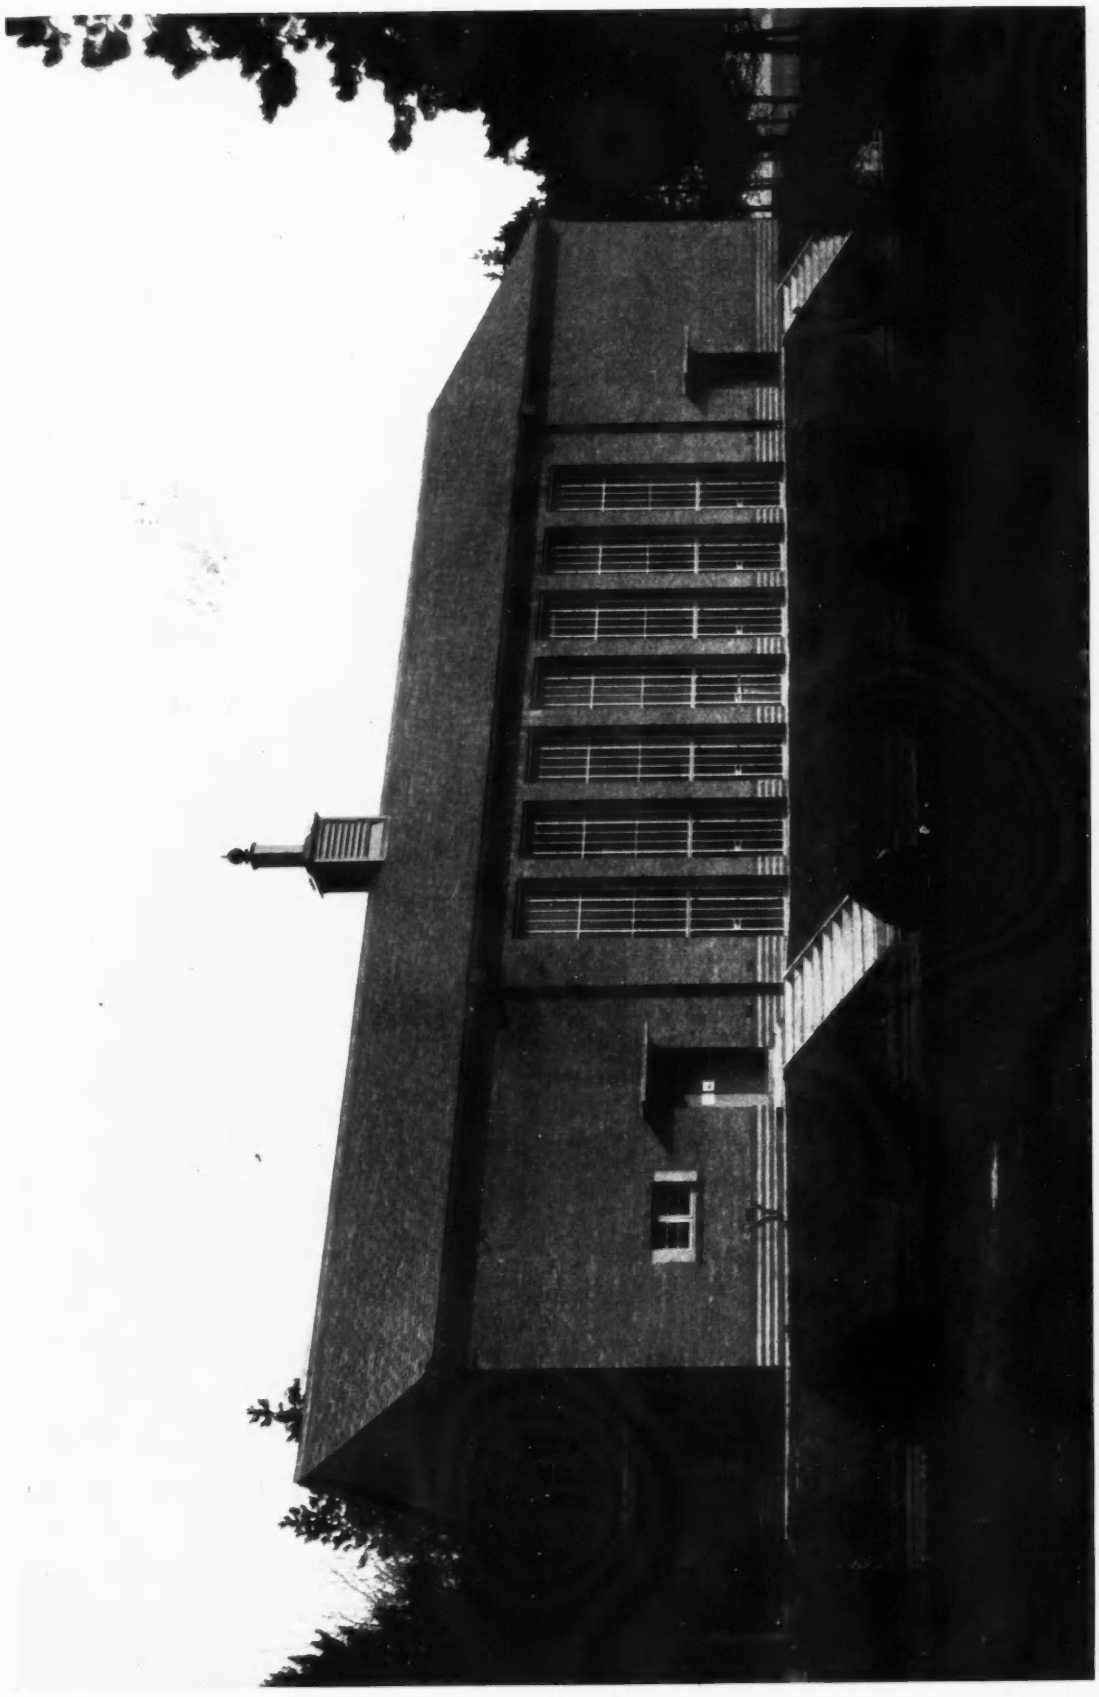


THE REGAL CINEMA THEATRE,



ST. LEONARDS-ON-SEA: BY JOHN B. MENDHAM

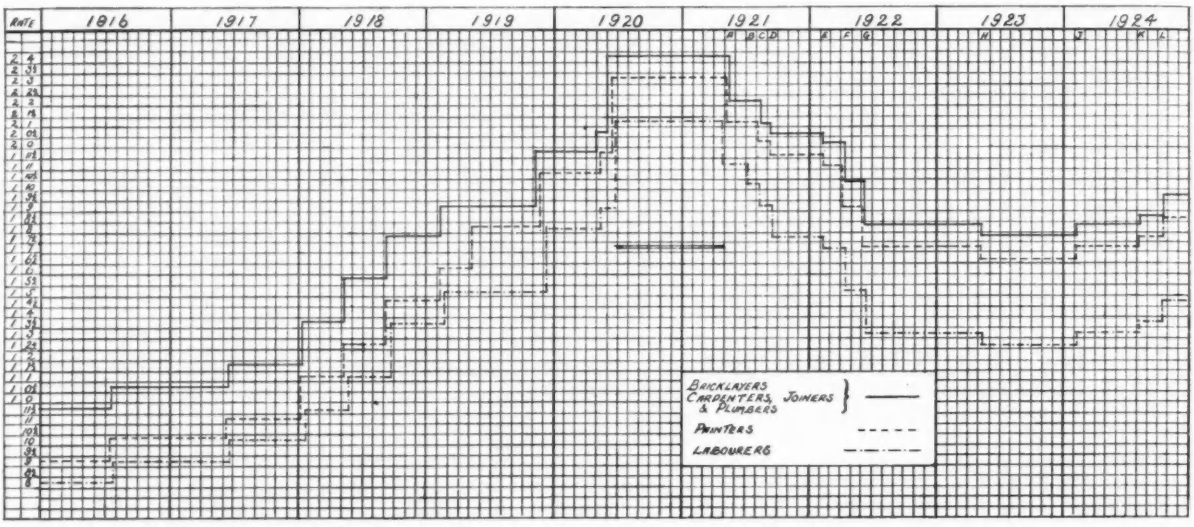
NEW HALL AT LIVERPOOL SANATORIUM : BY ALAN H. HOPE



Recent extensions to the Liverpool Sanatorium at Frodsham have included the erection of this new recreation hall to replace an army canteen which had been in use for many years. The building is isolated from the main block, and is designed to seat some 300 persons on one level, while, at the end of the hall opposite the stage, a raised platform, separated from the main hall by solid flower boxes, will accommodate a number of beds which can be wheeled up the ramp of the main entrance.

An unusual feature of the very open plan is the provision of an open-air stage beyond the roller shutters which form the back of the covered stage; this has for scenery luxuriant yew hedges and pine trees.

The facing bricks are pointed in a tone of yellow brown down to the horizontal bands of the plinth, where they alternate with courses of white cement. The large window arches are treated frankly, with the brick coursing carried unbroken over a steel channel lintel, painted turquoise blue.



The hall is lighted on one side by a series of windows, eighteen feet high, opening at the bottom through glazed doors on to a wide terrace and giving a view of the main lawn of the hospital group, situated high above the Cheshire plain.

The artificial lighting and heating are both by electricity: there are panel lights in the flat ceiling and thermostatically-controlled tubular heaters at floor level, with specially designed convectors in some of the piers. The shape of the ceiling is designed to enable a current of air to pass, from outside, through brick ventilators over the windows, and to be directed by baffles through the ventilating turret in the roof. The vitiated air from the hall is thus drawn out through horizontal grids in the ceiling, ensuring the constantly clear atmosphere so necessary in the treatment of pulmonary tuberculosis.

Glazed doors in the deep windows open on to the terrace above the main hospital lawn.

CHART SHOWING BUILDING TRADES RATES OF

The above chart, showing monthly wage variations between 1916 and the present time, was prepared for their own information by the London firm of contractors, Messrs. E. A. Roome and Co., Ltd., by whose courtesy it is reproduced. The rates per hour are given at either margin, and the notes applicable to the letters, appearing at intervals in the top line, are as follows: A:

Control of Elevations

SIR,—Why is Astragal so deeply shocked at the proposal of the Oxford Corporation to constitute the magisterial bench, and not a professional tribunal, the board of appeal in cases of dispute over elevations?

Does he realize that in the vast majority of cases the matter is settled by agreement, and it is only once in a blue moon that elevations are referred to a board of appeal, however constituted?

Under nearly all legislation concerning elevation control, the local authority have to show that the elevations to which they take exception "seriously disfigure the amenities of the street." These words impose a pretty severe restriction on their powers, and confine the elevations against which they are prepared to fight to two types—a capable design in the wrong place and a hopelessly incapable design anywhere.

In the former type, the fact that his building had been turned down by a tribunal of professional men rather than by a magisterial bench would hardly provide sufficient balm to heal the architect's wounded pride. He might even be justified in assuming that it was the divergent views on traditionalism and modernism of Mr. X, F.R.I.B.A., the architect member of the tribunal and himself which largely accounted for the verdict.

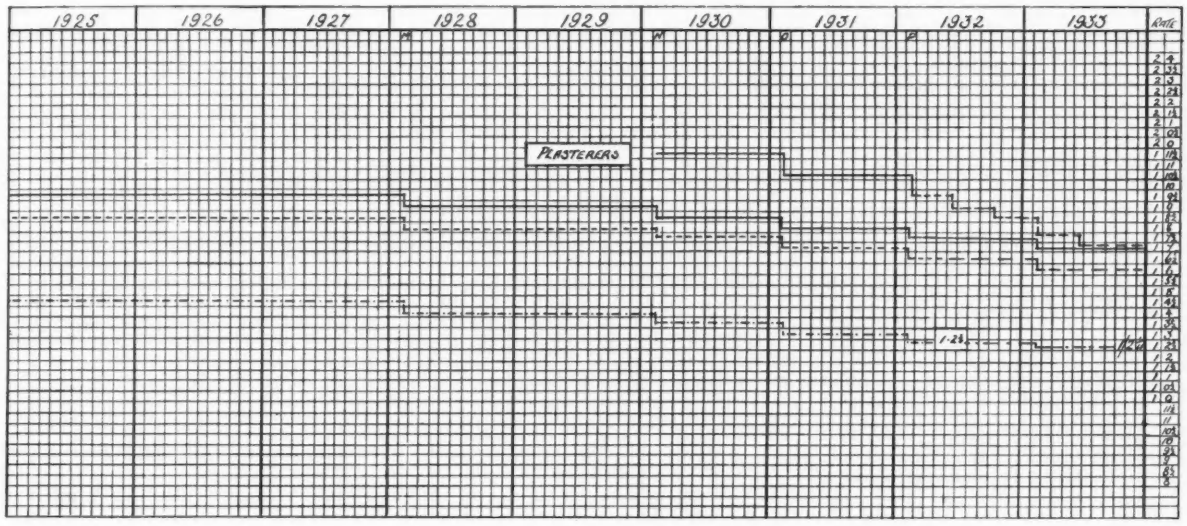
The proud author of the hopelessly incapable design would either consider himself the equal of any F.R.I.B.A., or else realize that as a "practical man" he knew much better than any architect; and really there was no accounting for taste. In neither case is he likely to look any more kindly on the verdict of Mr. X., F.R.I.B.A. and his associates than on that of the magistrates, whereas the latter do possess the advantage of being vested with all the majesty of the law and the constitution.

Elevation control is still in its infancy and depends for its maturity upon the support of public opinion. That support will not be forthcoming if there is any suspicion of professional dictatorship, and I suggest that the general public will be more willing to accept with good grace the verdict of the magistrates than that of a professional tribunal.

Quite apart from that, the appeal stage is too late for the architectural profession to express its views, for there it only deals with those elevations of which the local authority have already disapproved, and does not have the opportunity of censoring those which have received official sanction. This could be prevented if all elevations were referred to an advisory committee of architects before being considered by the local authority. Such a committee should be part and parcel of the legal machinery.

Astragal probably has in mind the case of the capable design which is considered to be unsuitable to its surroundings. I think that the magistrates, supported by the evidence of the advisory committee of architects, would be able to reach a right conclusion, but to safeguard architectural interests further appeal should lie to a central court presided over by the President of the R.I.B.A.

ORONTES



[*Orontes is connected with the Oxford Corporation.*—ED. *A.J.*]

Sheep Bones for Fixing Slates

SIR,—Sheep *shanks*, please!

With reference to the letter from Mr. Percy Thomas, I may say that the traditional roofing in Northumberland, away from the sea and before the days of modern transport, was to lay several courses of sandstone flags—locally known as grey slates—covering at least the thickness of the wall. From that point to the ridge was frequently still grey slates but more generally pantiles. The grey slates were invariably hung with sheep-shanks. I have seen many hundreds. It was very logical. Grey slates and pantiles were local products as were the sheep-shanks, which had no

WAGES VARIATIONS FOR LONDON, 1916-1933

16 May, 1921; B: 1 July, 1921; C: 1 August, 1921; D: 1 September, 1921; E: 1 February, 1922; F: 1 April, 1922; G: 1 June, 1922; H: 26 May, 1923; J: 1 February, 1924; K: 25 August, 1924; L: 25 October, 1924; M: 1 February, 1928; N: 1 February, 1930; O: 1 February, 1931; P: 1 February, 1932.

other value and could be obtained in limitless quantities. I may add that they were practically everlasting and are quite sound even now when we strip an old roof.

G. REAVELL

Changes of Address

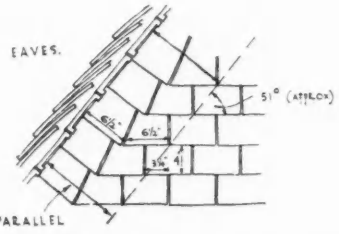
SIR,—I find many manufacturers are slow to note changes of address. May I suggest a short article upon the wisdom of keeping records of changes of address, with a suggestion that firms should make one of their staff responsible for noting such changes as they appear in the trade and professional journals. It is evident many rely upon directories (often old editions) and cannot be as up to date as they might if they followed the procedure outlined above.

S. HODGSON DOYLE

Information Sheets

SIR,—I thoroughly agree with your correspondents' encomiums upon the Information Sheets you are now issuing. I am particularly interested in the suggestions that the sheets should be perforated and that a folder should be supplied.

To merit the everlasting gratitude of your subscribers, I suggest you issue a presentation pound of tea at the end of this series of plates, together with the punched holes and folder.



ANXIOUS

SIR,—With reference to your correspondent's enquiry about covers for Information Sheets, I find Messrs. Straker's spring-back folders at 2s. each answer admirably.

STANLEY TOWSE

The Winchester Cut

SIR,—With reference to the subject of "The Winchester Cut," by your correspondents in your issue for February 15, I shall be pleased to learn if this method is confined to a pitch of 51 degrees approximate (or the angle made by the jointing of the tiles as shown in the enclosed sketch).

Any deviation from this pitch appears to involve complicated cutting and apparently varying widths of tiles next the spandrel shaped eaves tile.

STUDENT

Economy

SIR,—Why all this despair because economy is the order of the day? Did not the people who put the existing Government in power expect a policy such as we are getting?

In every country concerned the mass of the people are to blame for our present trouble, for if only people had political sense we should not be ruled by the most reactionary governments possible.

What on earth is the use of talking of progress and planning on a large scale, when we have individuals in power in every country that is suffering, who have been proved incompetent in the past?

S. D. DICKINSON

[*We do not agree with our correspondent. The National Government is in our opinion full of able men. The trouble is they are committed to a policy of economy which few of them really believe in.*—ED. *A.J.*]

The Roads and Economy

SIR,—I was very much interested to read an extract from THE ARCHITECTS' JOURNAL in *The Daily Express* for February 22. For the last few months I have been doing my best to urge the abolition of what you aptly describe as "half-measures" and "policies of hesitation." I have laid great stress upon the foolishness and short-sightedness of restricting expenditure upon one public service whose importance to the community at large is growing from day to day—namely, the roads.

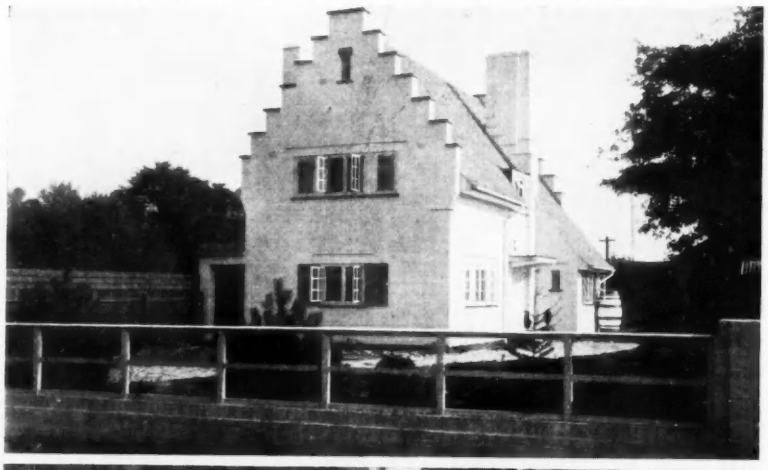
The road system of this country now totals some 177,000 miles. Before the crisis in 1931 the annual expenditure upon the roads was approximately £60,000,000. This sum was raised by means of motor and petrol taxes. Of recent years the Road Fund has lost something of its original function. A large proportion of its revenue has

been diverted to the general purposes of the Exchequer instead of being allocated to the construction, maintenance, and repair of the roads. The public is, of course, powerless to interfere with this arbitrary transference, but the road-using public has every reason to complain that the money it contributes for the purpose of the roads is not being used for that purpose.

The panic cry of "Economy" has already done damage in many quarters; it is beginning to ruin the roads. The present policy of economy-at-all-costs is uneconomic and requires an example such as that set by *The Daily Express* and supported by your own JOURNAL.

R. ST. JOHN COOPER

[Owing to the pressure on our space we are compelled to hold over several letters from this issue.—ED., *A.J.*]



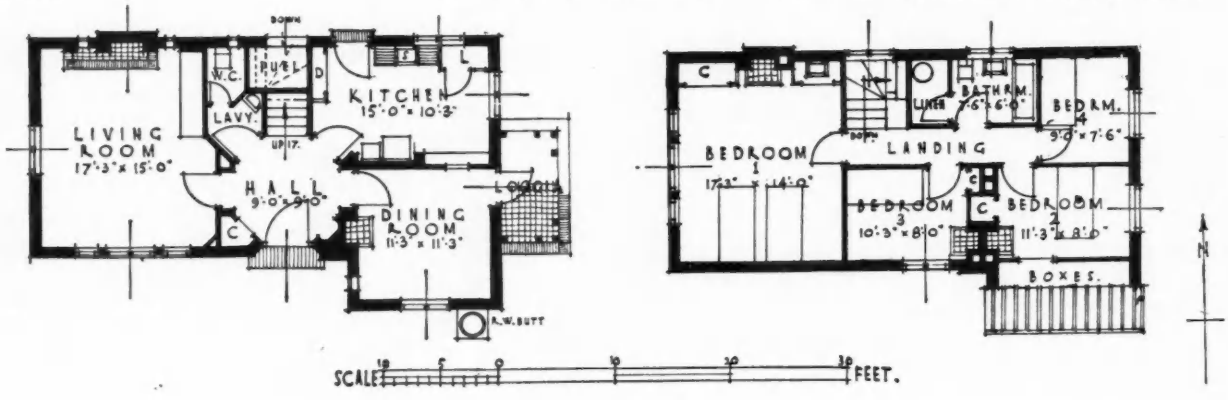
Official Architecture

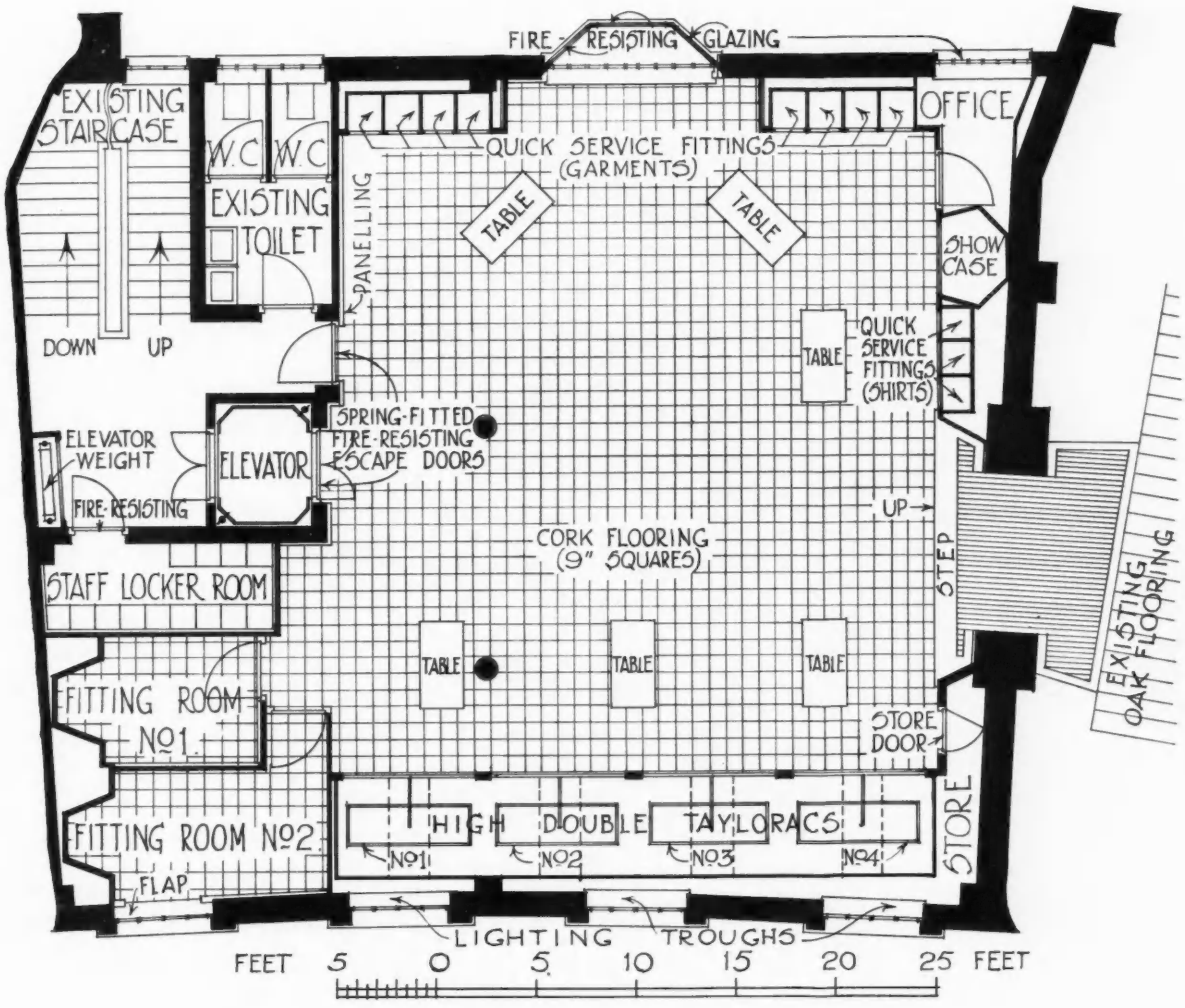
A memorandum has been submitted by the Edinburgh Architectural Association to the Edinburgh Town Council suggesting that some of the work of the City Architect's Department might be deputed to outside architects.

Northern Polytechnic

The Annual Speech Night of the Department of Architecture, Surveying and Building of the above school will be held on Thursday, April 6, commencing at 7 p.m. The Right Hon. the Earl of Crawford and Balcarres, K.T., P.C., is to distribute the prizes.

A HOUSE AT LOWESTOFT





DESIGNED BY ALAN H. DEVEREUX

The plot of The White House, Corton Road, Lowestoft, runs east to west, and the house is placed close to the north boundary, with its narrow end towards the road, so as to allow a long elevation to the south with a large area of garden in front. The front door is on the south, between living room and dining room, and is approached by a curved drive. The walls are of 11 ins. cavity brickwork, painted externally in white, the roof being of apple-green glazed pantiles. Shutters and front door are painted blue and green and window sills are black.

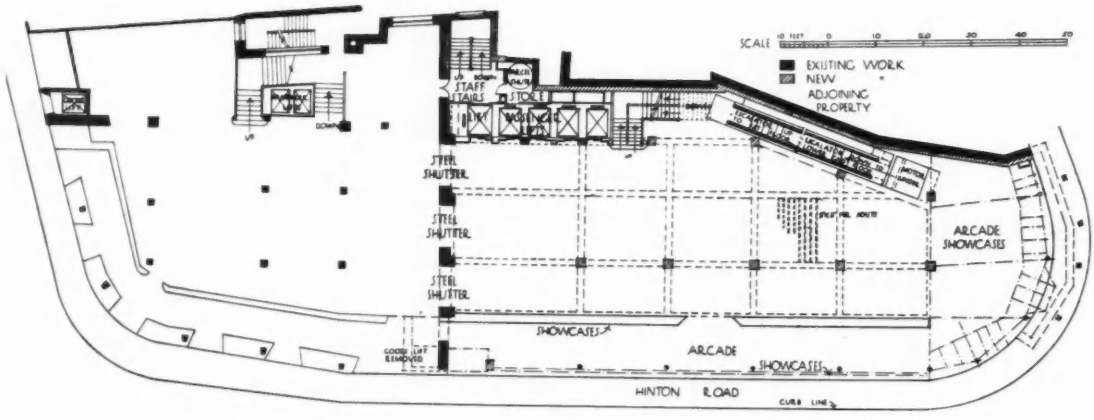
The octagonal hall is the feature of the interior. The staircase is directly opposite the entrance. The doors throughout are of the flush type, and all woodwork, including the wide staircase, is toned.

RED LACQUER SHOWROOM AT AUSTIN REED'S

DESIGNED BY P. J. WESTWOOD

This department for the display and sale of travel and flying kit was designed during the recent extension to Messrs. Austin Reed's West-end headquarters, embodying Nos. 101 and 103 Regent Street, W. All the internal woodwork was finished in red lacquer with appropriate designs and inlaid small real antique panels.

The decoration of the frieze is a feature of the room. This takes the form of a series of oil paintings depicting scenes and incidents of a voyage round the world, painted by Fred Taylor, R.I., who also designed the cloisonné window, seen in the accompanying photograph, and the ceiling decoration.



STORE AT BOURNEMOUTH, HANTS

DESIGNED BY NORTH, ROBIN AND WILSDON

Of the premises for Messrs. J. E. Beale, Ltd., the south block was built by the same architects in 1912, and raised by them two floors in 1930. The photograph shows the recently-completed northerly end, at the corner of Winton and Old Christchurch Roads, providing the main entrance, canopy and arcades—a large display area under cover. Its seven stories in terra-cotta, to harmonize with the older work, replace a former three-story building. The terminal feature is an octagonal tower with a metal bay-window running through six floors; the chiming clock, seen on the right, has revolving figures and is illuminated at night.

There is a wide marble staircase from the basement to the fourth floor, with its restaurant; escalators are also installed, down to the basement, and up to the first floor. On the fifth and sixth floors are kitchens, canteen, staff-rooms and offices.

THE NATIONAL GRID

"The Electric Grid Supply and its Purpose" was the subject of a paper read by Sir Andrew Duncan, M.A., at a meeting of the Architectural Association, held on Monday of last week. Extracts from the paper are printed below.

The establishment of the grid system may shortly be described as a means of rationalizing the production of electricity for the purposes of public supply, and its transmission to the various sources of public supply. Whatever, therefore, were the limitations or hesitations of earlier legislation in electrical matters, Parliament did in the Electricity (Supply) Act, which became law in 1926, deliberately plan for the production of electricity on a comprehensive national scale. Remember, however, that this planning has to be superimposed upon, rather than immediately substituted for, the existing system. It would be one thing for you to town-plan a New London on virgin soil and quite another to transform London by gradually dovetailing the existing scheme of things into a new.

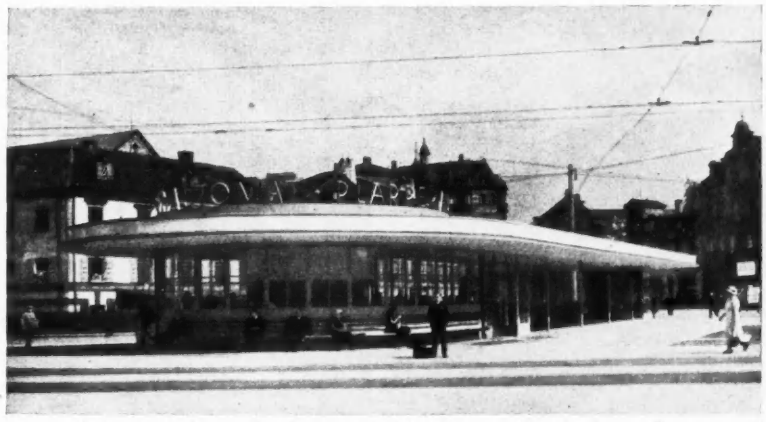
For ease of management and operation, as well as of construction, the country has been divided into 10 areas; schemes have been developed in all these areas—with the exception of North Scotland. Although the Grid will be operated in areas, all the areas are themselves interconnected and so dovetail into each other as to form in every sense a national grid. The tariffs for each area, too, will vary within such narrow limits from the beginning, as to be capable of ultimately linking up to a full degree

of uniformity. Four broad direct results will follow from the new scheme of things :

1 : The average cost of producing electricity for the country as a whole will be substantially reduced. Under the system of independent generation of the past it has been necessary for each undertaking to carry substantial surplus plant in reserve for breakdowns. When the grid scheme is in full operation it will be possible to reduce the proportion of spare plant so considerably that the resultant saving of capital will, during the next 10 years, be in excess of the whole capital cost of the grid.

2 : The bulk of the distributing authorities will be freed not only from the problems of generation, but also from the large capital cost involved in maintaining their own plant, and will, for the future, be free to devote their whole energies to the intensive development of their distribution system, their sales and their services. This process has in fact been operating during the last few years, as the grid has been developing. I mentioned at the outset that the production of electricity in 1926 was 7,000,000,000 units. By 1932 it has grown, in spite of these years of depression, to 12,000,000,000 units.

As the grid policy comes into full operation and as trade and business improve, the rate of growth will reach surprising figures.



3 : Electricity will become much more generally and much more quickly available in areas not already developed, and the undertakings developing these territories will be able to buy in bulk from the grid at prices which compare favourably with cost at large generating stations. The cost of regional transmission for distribution will be reduced, too, as a result of the additional grid points at which supply can be taken. Already a considerable area of rural and agricultural territory has been opened up by receiving temporary supplies from accelerated portions of the grid, pending completion of our scheme.

Industry will be afforded the assurance of a reliable public electrical service in whatever part of the country it may locate itself. Already we have been able, in co-operation with the supply undertakings, to secure large industrial loads for which the local undertaking could not, on its own, have become responsible. The flexibility which the system affords will prove to be of incalculable advantage as trade revives and industrial load grows again.

The step which Parliament took in 1926 was taken, not out of interest and regard for the electrical industry, but out of regard for modern conceptions of the right both of industry and the public to enjoy the advantages of the services which electricity can give. Whatever Britain's relative position *was* electrically, she is now shaping for world leadership, and in the grid the country will have a unique asset in electrical development. The uses of electricity have been greatly enlarged and are rapidly enlarging still further, and the public is becoming electrically minded. Our electrical supply industry realizes that it must devote its whole energy now to the salesmanship of its services and to the satisfaction both of industrial and public demand. In your profession you belong to the creative arts, and in every sphere of domestic and public electrical use there is need not only for your co-operation, but likewise for your guidance and direction. The electrical engineer and salesman cannot be left to his own resources. The public advantage will be greatly served by the contribution which you as a profession can make to the development of the service as an integral part of all modern life and activity.

Slum Clearance in Dublin

The Dublin Corporation are contemplating a large scheme of slum clearance on the north side of the city, at an estimated cost of £2,000,000.

Tram Shelter and Automatic Restaurant, Nürnberg. By Professor Jansen. A modern building for a modern purpose set in an old town square, with complete success. Compare the "Tudor" roadside restaurants, shelters and pump stations to be seen in England.

THE MODERNIST *IN* LEEDS

[By SERGE CHERMAYEFF]

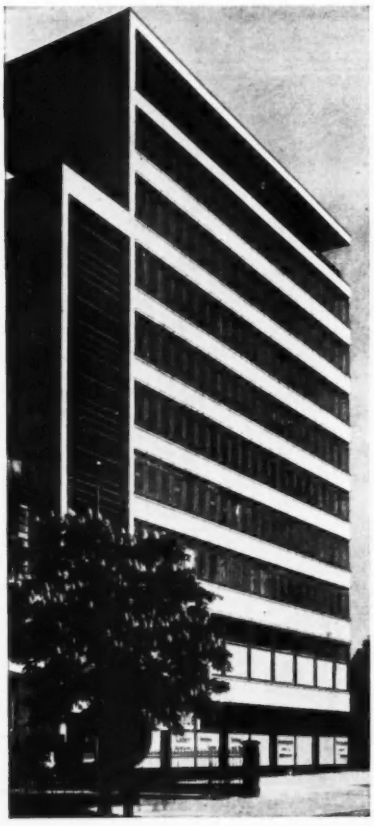
The article below is summarized from the author's lecture to the West Yorkshire Society of Architects, delivered at the College of Arts, Leeds, on Thursday last. Its full title was "The Modern Approach to Architecture and its Equipment."

THE last year has been so eventful, economically, politically, and architecturally, that a great many ideas which appeared revolutionary are now established as progressive. Had this tremendous change not taken place the word "modern" would have retained only its modish significance. Today it is no longer a millinery tag to be regarded with suspicion by the righteous.

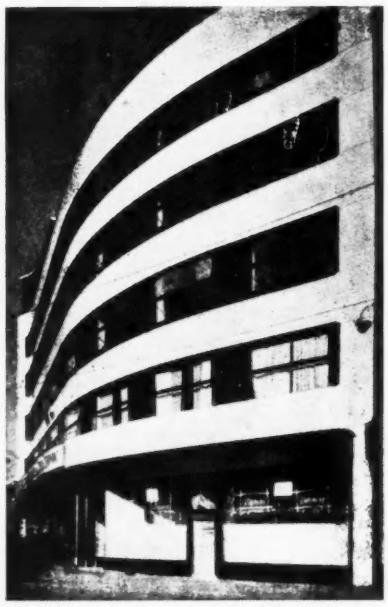
There was, a year ago, a general belief that modern architects and designers despised old things and wished to destroy them. The truth has emerged, which proves exactly the opposite case. Modern designers love and understand old things, and realize that their particular qualities evolved from and flourished under different conditions. What the contemporary designers dislike is the parody and caricature of old things. To quote Mr. Barton :

> Our modern architects, sculptors, painters and designers generally are often described as "breaking away from tradition." It would be far more accurate to say that they are trying to get back to tradition. *Our newest artists know most about the oldest arts.*

The Carlton House Terrace incident not only established this as a real fact, but has led from the particular instance to the general concept that responsibilities towards what is old are involved in modern planning and building.

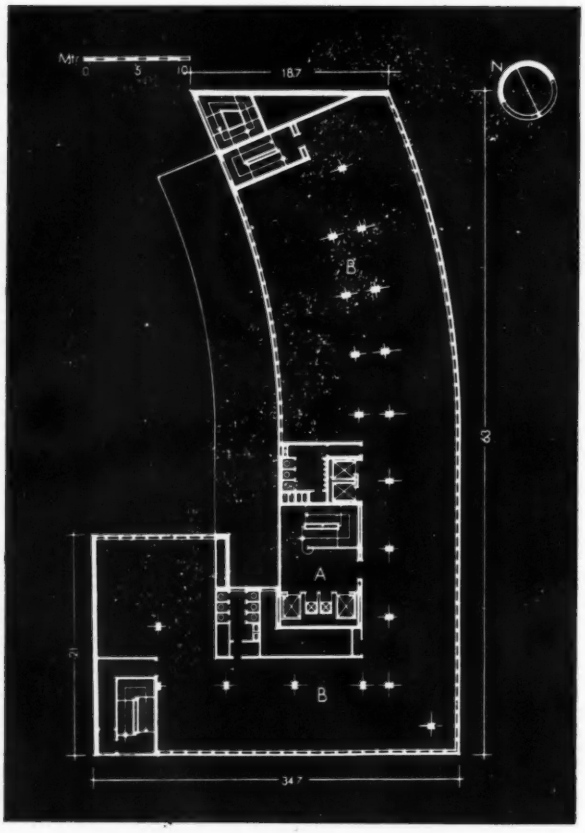


The twentieth century does not claim a moral superiority over its predecessors. On the contrary, we realize that it is essential to live up to our predecessors' creative tradition. All things in their time have been modern.



What does a modern point of view imply ?

In the course of a recent debate on the wireless, we learnt from the Chairman of the Slum Clearance Committee of the London County Council that non-parlour accommodation is being provided, which is utterly inadequate, and a bath to every three families, accessible from *outside*, in order to arrive at a so-called minimum rental, still too large.



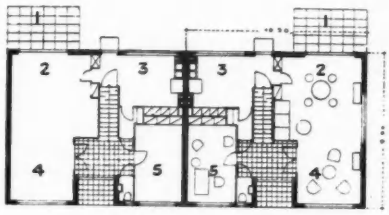
In fact, building *new slums for old !*

But, in view of the progress in education and hygiene, should not revisions be made in building laws ; economies be effected in planning, in constructional methods and materials available, to bring these living conditions up to date ? Plans have been put forward

Columbus House, Berlin (left and below). By Erich Mendelsohn. A new structure, the principles of which are readable, completely unaffected and spontaneous. It was designed to give the maximum possible economic subdivision of letting space unobstructed and uncompromised by stanchions or beams; and maximum windows:—i.e., interior economic flexibility. Compare this with the Telchow Building, Berlin (right), by Luckhardt and Anker. A refacing in the days of the "horizontal" fashion. The bands of white and blue glass between the windows totally contradict the outside steel-frame construction: a piece of "sham modern."

which make this possible within the specified cost, if building laws kept pace with science. Architecture can profit in this respect from the example of transport. If similar obtuseness and obsoleteness existed in the latter, the car would still be a luxury for the few. Again, decoration and furnishing are not in separate watertight compartments which can be dealt with separately from building proper.

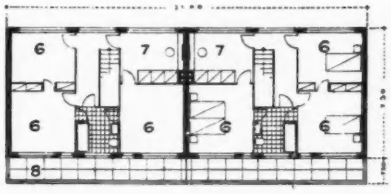
On the contrary, they are part and parcel of architecture. They are interior equipment.



A building, whether it is an office, a theatre, a private house, or a school, is like an organism. Each component part must bear a direct relation to every other part and the whole, and, like a living organism, there must be a harmonious working together of all the separate parts. Obviously this harmony is demanded as much by utilitarian objects as by purely decorative, painting and sculpture, for they are continuously seen together.

The structural revolution has made it possible to hang thin curtains of fabric over a steel skeleton. The walls, which formerly enclosed and supported the building, are no longer the dominating part of the structure. Buildings used to be like shell-fish, with all the hard, resisting structure carried externally. Now buildings are like vertebrates, with an internal skeleton, over which is stretched a skin, the wall. The internal organs have changed accordingly.

However cursorily we examine the more familiar building materials of our machine age, such as fibre boards, plywoods, sheet glass, composition, cork and rubber, we immediately realize that they have not the limitations of equivalent products of other times. Supported as they are by spans in steel and concrete, they require a totally different technique. The forms resulting from these new structural materials, the textures and surfaces, are simpler, broader, and offer a greater variety of interpretation. We have large unbroken expanses of wall, of ceiling, of window, of floor; greater airiness, spaciousness, lightness, cleanliness and warmth.



You have no doubt at some time or another seen a structure or entered an apartment, which has pleased you immediately; which has given you, by its general atmosphere, an invitation to enjoy—a building or an object which has, in fact, satisfied without trying to amuse or startle you; which has not demanded any effort on your part to examine in detail. If you have come across such a thing it would be valuable to examine here the qualities which went to its making. I believe that you will find these qualities summarized in simplicity and directness and appro-

Key to the accommodation :

1, terrace ; 2, dining room ; 3, kitchen ; 4, sitting room ; 5, study ; 6, bedroom ; 7, dressing room ; 8, balcony.

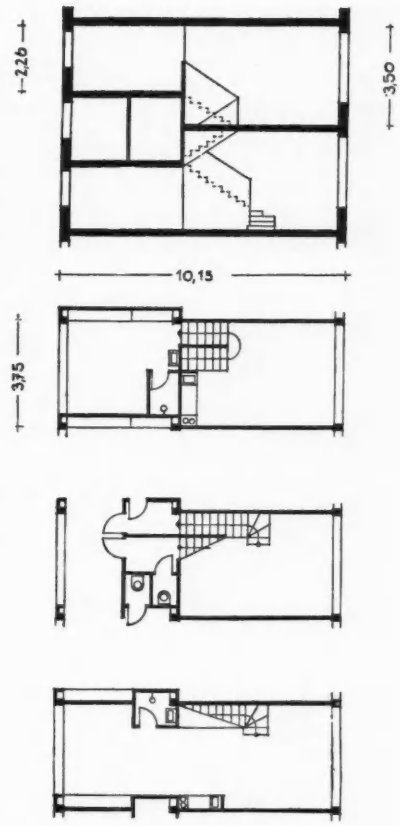
A One-family House in Würzburg. By Walter Loos and Peter Feile. Here compact and direct planning makes for maximum use of the available space without any restrictions imposed by fireplaces or quaintnesses, and gives maximum fresh air and sunbathing facilities to all rooms.

priateness. You can say of such satisfactory things that they are without affectation and self-consciousness.

These effects are not obtained through haphazard effort or absence of scholarly erudition. Inevitably they are the result of the training and culture of the designer concerned, and his attitude. Their apparent simplicity is misleading, for this is arrived at through the power of restraint. It is far easier to arrive at an " effect through elaboration " than to present the logical minimum in a manner to satisfy.

It is the function of the trained designer to be able to visualize an object in direct relation to a whole building and its equipment, and all its complexities. The designer, no matter what his speciality, must fulfil all the wider demands made upon him. Apart from his mere technique, he must be a cultured man. It would be useful here to define the term " cultured " and to quote Professor McMurray :

> We still regard scholarship, and classical scholarship at that, as our main instrument of cultural education. We still, to a large extent, even if to a decreasing extent (thanks to the help of such men as Professor Reilly) look upon the knowledge of Latin and Greek (Architecture of the Orders) as the true key to culture.
>
> To anyone who has an eye to the cultural needs of the modern world, this is little short of tragedy. It is quite possible to be learned and to be stupid !



The cultured designer has an important function of selection. It is this ability to select rightly which is the quality of taste in the artist. There is no problem, however large or small, which has not, as a rule, more than one solution. A choice has to be made. The selector understands that all things are created by man for himself and not for themselves.

I will submit, for what they are worth, one or two principles in design :

> Successful solutions of all problems are arrived at through the process of solving, and not through any preconceived idea of what the finished structure should look like.
>
> Fitness to purpose. Materials are for a purpose and not for an effect. For example, it is architectural nonsense for buildings in brick to ape concrete in their layout and finish.
>
> Form, texture and colour, are *of* a thing and not *on* it, as the above example also illustrates.
>
> Meaningless decoration, as such, is desecration. Buildings and things are like ourselves. They have bodies and skins. Unlike our self-conscious selves, they require no clothes.

We are familiar with festoons of plaster vegetables which crawl over the walls of buildings, inside and out. We have all seen furniture with a Chinese landscape in the middle of an English walnut panel, or inlaid with motifs of stained veneer mocking painting even more horribly. All that gratuitous decoration of this kind achieves is the destruction of the purity of the thing itself. If a job requires, when finished, the addition of ornament, this can only mean that it has failed in the first place. Professor Reilly, speaking at the R.I.B.A. on the occasion of a paper on factories, mentioned the models of factories made by Mendelsohn. The latter's groups of plastic form have a sculptural quality and require no façade enrichment.

Simplicity is essential in a scientific age if we are to retain our sanity. We most of us feel pretty jaded after the rush of our business, the speed and noise of transport, the complexity and variety of powerful light, the medley of signs and colour, the ever-growing press nonsense and advertisements, all of which we encounter inevitably in our daily lives. We require of art a direct

Russian Tenement House at Saratow. By S. A. Lissagor and E. Popow. A new solution for economic housing, having, for its aim, maximum cubic capacity for the living room, uninterrupted through-ventilation and fully lighted and ventilated corridors. Compare the restrictions on the equivalent type of building in the London slum clearance and tenement housing proposals. Should we not, in order to arrive at the topical minimum rent, attempt to reduce cost through new planning, construction and material, and not through restrictions on living space ?

The Metal-workers' Union Headquarters, Berlin. By Erich Mendelsohn. A straightforward exterior treatment preparing the visitor for the interior which is equally topical and free from gratuitous decoration, depending for its effect on texture, scale and magnificent airiness and lightness of the glass-enclosed staircases.

contrast to this bustle in order to give our nerves a well-earned rest. If we are to put these principles into practice, we shall eliminate fussy buildings and fussy things within our houses.

We must take into consideration that this is an age of machines. We all of us have often been interested in the record feats of racing cars and aeroplanes. Nearly all of us are owners or prospective owners of, or travellers in, cars, which are of absorbing personal interest. We are all of us now machine-conscious. I believe we all like machinery. Paradoxically, however, the owner who drives up in an efficient and comfortable car of the latest pattern, of whose very up-to-dateness he is proud, will bark his shins nightly and gladly against the legs of a gate-leg table. Most of us will submit, after insisting on a sunshine roof to the saloon, to being cramped in an over-furnished and under-lit bedroom.

Modern designers are embracing machinery as a heaven-sent opportunity to multiply good design and make it accessible to all. Cheapness is the most essential quality which should underly all logical design today. Designers of furniture, fabrics and objects of all kinds were in the past shy of machinery. Machinery was supposed to be at war with craftsmanship. The result of their attitude was that machine production was not supervized by intelligent designers, and the survival of these bad examples are still to be met everywhere.

This spuriousness encouraged designers to stage various period revivals, and founded the art-and-crafty movements with which we are all too familiar. The profusion of such things as were offered to the public through exhibitions and shops itself created the temptation to acquire many things which were completely useless, of which we got tired and sometimes got to dislike violently.

We have arrived at a point where as drastic a difference can be shown between the spurious modern and the real, as had been drawn in the past between the real antique of quality and the sham. The plethora of the spurious which has damaged the prestige of real endeavour has three causes, roughly classified: Snobbery, sentiment and stupidity. In England, to a greater extent than anywhere else, the middle classes copy the rich. When the rich collected antiques, the demand sprang up among their followers for the sham antique.

Let me quote you a manufacturer's advertisement which recently appeared in a trade paper: "As most *modern* residences are *Tudor*, we invite our clients to inspect our range of *new old-world* furniture." This example of imbecility would be laughable if it were unique. Unfortunately it is only one instance among many.

An examination of houses and flats of a more expensive type reveals the same exhibition of blind snobbery. In the period of post-war prosperity the decorators who exploited new shapes and colour combinations vied with each other in producing novelties which had no roots in realities. The styles of past and more spacious days were squeezed and squashed by ingenious decorators into the utterly inappropriate scale of our modern life.

Complacent prejudice against change, in some cases through sheer persistency and consistency, demands a certain attention, and, having no other qualities, is dangerous.

Sentiment in some cases preserves for some of us a wash-hand stand, forgetful of the fact that ablutions are now more expeditiously and conveniently carried out in the bathroom; or a teapot of precious form and material, forgetful that in these days we no longer have the trained staff of servants which in the past was the most perfect of labour-saving devices. It may be argued that wash-hand stands and fragile teapots are kept by people who cannot afford to replace them. The wrong, however, does not lie in the survival of old pieces, but in the fact that reproductions of the wash-hand stand and fragile teapot are still offered to the public, together with dozens of other similar things of equal obsoleteness.

Stupidity explains such phenomena as:

Glass and metal tables of illogical design which made their appearance in drawing-rooms.

Ignorant chat about Cubism which scattered clumsy square pieces through drawing-rooms.

Floor linoleums which were put on walls inside out to obtain some meaningless effect.

Black glass floors which were laid in expensive bedrooms for ladies to regret at leisure every time they put a foot down.

Tiny electric heaters which replaced large fireplaces in old "period" drawing-rooms, around which giant sofas gathered like a herd of elephants round a glow-worm.

So-called pretty lamps of complicated geometric form, which could only be looked at, but which gave no light, which appeared, together with "modernistic" clocks, giving no indication of the time.

Equally, logical fresh design is not achieved through the elimination of ornament, which many people believe to have been the essence of this new movement. Nothing is gained by simplifying classic forms in order to conform to the new demand. This method only makes a vicious circle of evolution. To take some finished product of elegance produced within the limits of materials and construction of another age, and to eliminate its enrichment is merely walking backwards on the road of its evolution.

In spite of all these obstructions, it is apparent that we are on the road to a simple direct art, expressive of our time and in harmony with it. We are now passing through inevitable experiments between designers, manufacturers, tradesmen, available materials and purchasing power.

To conclude, I should like again to quote some words of Professor McMurray:—

What we need to withstand the transformation of the conditions of life is not the false security of fixed beliefs, but the true security that comes only through the capacity to change our opinions continuously in a balanced and controlled fashion by a continuous testing of them against the changing facts of experience.

THE SPECIFICATION WRITER

X-RAYS FOR TESTING WELDS

[By R. A. STEPHEN, M. Sc.]

The following information, of particular interest in view of the growth of welding in steel structures, is summarized from a paper recently read before the members of the Institution of Welding Engineers.

IN this country welding has been enthusiastically adopted for the fabrication of comparatively low stressed structures, the failure of which would not endanger life. This has encouraged the welding industry to press for the adoption of the process in the field where stresses are severe, where failure is serious, and where specifications are most stringent.

Testing the immense variety of the structures on which welding ultimately will be used presents its own problems. In certain cases it will be found practicable to test every cubic inch of the welds. Here there should be no dispute regarding the value of the X-ray method.

But on consideration of large structures, such as occur in shipbuilding or in civil construction work, which will entail a great number of welded joins, we must face the fact that it will be impossible to test every weld. In such cases a compromise can be effected. However much we dislike this compromise, the probability method of testing is bound to enter on most welded structures. This question naturally follows :—

How can one ensure a uniformly high standard of workmanship of the welder? In my opinion, asking a welder to perform specimen welds, which will afterwards be tested, will not suffice. In these circumstances any operator will do his best. How then can one deal with the problem? Would it not be best to carry out non-destructive tests on regions of the structure selected at random, and to inform all welders of this intention? Should this procedure be followed, because the operators will not know where the tests are to be carried out, they will, in their own interest, maintain a uniformly high standard.

Let us consider the defects to which welds can conceivably be subject.

We can place these defects in two categories :—

1. Microscopic defects.
2. Macroscopic defects.

In Section 1 we include defects in the microstructure of the weld metal, of damage to the microstructure of the parent metal and locked-up stresses, which have not given rise to contraction cracks.

In Section 2 we list imperfect fusion at the bottom and sides of the weld, slag inclusions and blow-holes. In this section we also include improper filling between adjacent runs of metal and cracks which have occurred in the cooling process due to the release of locked up stresses.

Faults in Section 1, other than that of locked-up stresses, can be counteracted by the choice of the correct welding rods, by giving definite instructions and by constantly checking the currents used for welding. This also helps to prevent overheating of the parent structure.

The faults in Section 2, however, depend on the human element or, when automatic welding is carried out, on the correct adjustment and maintenance of the settings. Defects of this type, fortunately, can be detected by the non-destructive test of X-rays.

X-rays are akin to ordinary light in that they travel in straight lines and affect photographic emulsion. Although invisible, they are essentially of the same nature as ordinary light waves, but possess the peculiar property of penetrating opaque materials. In doing this, however, they suffer absorption, the degree of which depends, amongst other factors, on the nature of the material, the length of the path traversed and the kind of X-rays used.

For those X-rays useful for the examination of welds in steel the absorption in air is very small. In metals, however, the absorption is greater and increases with the density. The use of X-rays for the testing of welds depends on the simple principle of absorption.

Let us consider the examination of metals for internal flaws :—

A beam of X-rays traverses a bar of metal, in which we suppose there exists a cavity. That portion of the beam which goes through the cavity is not weakened by absorption to the same degree as the rest of the beam, which has to traverse homogeneous metal. On development of the films there will be registered a black shadow corresponding to the cavity, the intensity of which depends on the dimensions of the flaw in the direction of the incident rays. It will be realized that in principle the examination of welds is exactly the same as in this case, that is the beam of X-rays is passed through the weld and the film is placed behind. But in the weld metal examined we may have blow-holes, cavities, cracks or slag inclusions. The picture of the interior of the weld, however, is registered on the flat film —i.e., in two dimensions. Up to 2½ ins. of steel, flaws of dimensions down to 1·5 per cent. of the parent metal give a shadow of sufficient intensity to be detected with ease against the background corresponding to homogeneous metal.

Having obtained a radiograph of a welded seam, one has to form an opinion of the weld, and for different classes of work, depending on the severity of the stresses to which it may be subjected, one naturally has different standards.

Most common faults are small blow-holes, which, in themselves, are not really serious, but if there are a large number present in a small volume they may seriously weaken the joint. Faults on the part of the operator, such as lack of fusion at the bottom of the Vee or at the sides require consideration and the seriousness of the fault depends on its dimensions. Small cracks or lack of fusion, represented on the negative by thin dark lines at the sides of the Vee, are to be considered as rather more serious than lack of fusion at the bottom. In such cases, as will be appreciated, there may be a thin wedge of weld metal adhering to the parent plate in perhaps one or two places only.

When a fault has been located—an inspector may have some doubt concerning its seriousness—it is then advantageous to take a second picture from a different angle or to use the stereoscopic method of measuring the dimensions of flaws. This is a very simple method akin to that used for the localization by X-rays of bullets in the human body. It is one in almost every day use in medical practice.

Having discussed the X-ray picture which can be obtained, a few remarks regarding the plant which is necessary are called for.

Hitherto X-ray plant has been bulky, difficult to handle and not a little dangerous. Recent apparatus intro-

duced contains such original and striking improvements that for the first time X-ray apparatus can be regarded as a practicable engineering tool, is completely shock-proof and ray-proof, and is transportable. As a result of the use of the unit principle, it has been found possible to dispense with complicated controls. This latter fact is all-important. It means that no metallurgist or engineer need feel debarred from making use of such an equipment through lack of experience of high tension or X-ray technique. Actually, any laboratory assistant of average intelligence can be taught how to obtain X-ray pictures of welded seams of pressure vessels in an extremely short period. The view has been expressed that to carry out the practical side of an X-ray test of welds needs skilled personnel—this is no longer true. There are only two controls of importance.

If defective welds are made, sooner or later they will result in failure. Is it not best to check their quality on the spot where the defects can best be remedied? By this means, too, the technique of the welding process can be improved. Furthermore, there is the all-important question of the additional security to be gained by the use of X-ray examination, a method which experience has shown to be reliable.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

Housing (Financial Provisions) Bill

SEVERAL interesting points were raised during the Committee stage of the Housing (Financial Provisions) Bill in the House of Commons last week.

Mr. Greenwood, on behalf of the Labour Party, moved an amendment to except houses built in rural parishes from the operation of Clause I, which does away with the subsidy. He said that under the Bill as it stood no houses could be built adequately to meet requirements in the countryside, and local authorities could not deal with the problem if the 1924 subsidy were taken away from them.

Sir Hilton Young, the Minister of Health, opposed the amendment, and maintained that there was a better prospect of more new houses being obtained under the Bill than there had been before, because subsidized competition was being cleared away from the path of private enterprise. Therefore, there was no case at all for special treatment of the residents in rural areas other than agricultural labourers. The passing of the amendment would do no good to agricultural labourers. The population of rural areas was shrinking, whereas that of urban areas was increasing. Hence the problem was not the number but the right sort of houses. The agricultural labourer could not pay the rents of the subsidized houses, and the policy of the Bill was to continue to give help in the only form in which it could be of any use—namely, for reconditioning existing houses which, after reconditioning, could still be let at rents which the agricultural labourer could pay. There was a perfectly good Act for that purpose, but it had not been used, and he proposed to take a vigorous initiative in calling the attention of the responsible authorities to it. It had been suggested to him by men of practical knowledge that the reason for the insufficient use of the Act was that it had been too exclusively left to the use of the county councils. Some county councils had done excellent work, but, on the whole, there had been insufficient initiative, and he proposed that there should be a more free transfer of the powers of the county councils to the authorities of the county districts. The subsidies under the Housing Act of 1930 were also available to the rural authorities for clearing the rural slums. With the assistance of these subsidies, the replaced houses could be let in most areas at 3/- or 4/- a week, inclusive of rates.

The amendment was negatived by 305 votes to 51.

Sir Hilton Young moved an amendment providing that if the Minister were satisfied that proposals for providing or promoting the provision of houses under those Acts had been prepared and were substantially ready to be submitted to him before December 7, 1932, he might, subject to the approval of the Treasury, treat the proposals as if they had been submitted to him before that date.

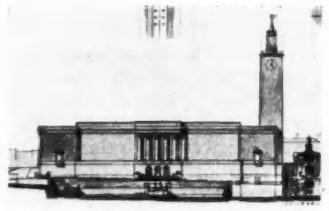
The amendment was agreed to.

Sir Percy Harris moved an amendment to provide that houses should be of not less than 620 and not more than 950 superficial feet, but Sir Hilton Young resisted the amendment. He said that the upper limit was far in advance of anything that was necessary for the provision of the small house to let at a reasonable rent to the lower-paid wage earner, while the lower limit was unnecessary because, it was already provided for in the Act of 1925.

The amendment was negatived by 198 votes to 44.

The following amendment was agreed to:—"Provided that any proposals made to the Minister under this section shall—(*a*) include such particulars as he may direct as to the number and type of the houses intended to be built or acquired and the approximate size of them measured in superficial feet; and—(*b*) make provision for securing that, except in so far as the Minister may in any particular case dispense with the requirements of this paragraph, the number of such houses in relation to the area occupied or intended to be occupied by and in connection with them will not exceed the rate of twelve to the acre."

Mr. Hicks moved to insert a proviso that a fair wages clause should be inserted in all contracts for houses.



Sir Hilton Young said that there was no intention on the part of the Government to make any breaches in the defences of the fair wages clause. But instead of dealing with the matter in the way proposed by the amendment, he would undertake to address a circular to local authorities on the lines of that issued by the Local Government Board in September 1931, in which the strongest possible emphasis was placed on the fair wages clause, and the strongest possible recommendation was given to local authorities to employ that clause in their contracts.

The amendment was negatived by 142 votes to 34, and the Committee stage was afterwards concluded without any further alterations being made in the Bill.

Whitehall Rebuilding Scheme

At question time in the Commons, Mr. Ormsby-Gore, the First Commissioner of Works, informed Mr. Levy that no decision had yet been reached with the proposal to release a number of the departments under one roof in Whitehall. He was considering whether an economical scheme could be worked out, assuming that the decision of Parliament, that the original scheme could not proceed, was accepted and that they could not have all the land originally contemplated.

In reply to Mr. Wedderburn and Sir S. Chapman, Mr. Ormsby-Gore said that the possibility of proceeding with the scheme for centralizing departmental staffs in one building in Edinburgh was at present under consideration by both the Secretary of State for Scotland and himself. As his hon. friends were no doubt aware there were certain site and architectural problems which must be resolved, before a decision whether to proceed with the projected scheme could be taken.

An instance of reckless saving that will lead eventually to excessive expenditure. Mr. Stanley Ramsey explains, below, why Norwich Town Hall, which might be built today for £200,000, may in three years' time cost more than twice that amount.

RECKLESS SAVING

Mr. Stanley C. Ramsey, F.R.I.B.A., speaking at a recent meeting of the Norwich Rotary Club on the subject of "Reckless Saving," suggested that if the rating authorities would declare a rates moratorium on extensions to factories and new business premises for a period of three or five years it would give an impetus to building. He made special reference to the proposal to build a Town Hall for Norwich, pointing to the advantage of building now when costs are low.

Mr. Ramsey then gave some figures to show how Norwich was affected by the postponement of the Town Hall building scheme. He understood that a year ago the estimated cost of building the Town Hall was £250,000. There had been a fall in building costs during the last twelve months of 15 to 25 per cent., according to localities. Speaking subject to local connection, he would take the fall locally at 20 per cent., so that it could be assumed that the Town Hall could now be built for £200,000. Assuming that there was a number of unemployed building operatives in the city who would not be absorbed in other building work, the postponement of the scheme meant a cost in unemployed pay and transitional benefit of, say, £66,000. That was the first year. The second year, if the scheme was still postponed, it would cost the city—not the nation—£66,000 in Poor Law relief; and the third year, supposing the scheme

was still postponed, a similar sum. If Norwich waited, as most people seemed to be waiting, until everybody wanted to build at once, what would be the inevitable result?

Today builders were putting in very low prices because they desired to keep their men and plant employed. Obviously, when a start was made again and everybody desired to build at once, prices would go up. A fair assumption was that there might be a rise of, say, 30 per cent., or £60,000. This, added to the sums which would be paid in three years in unemployment pay and in relief, would total £258,000, which would mean that whereas the Town Hall might be built now for £200,000. £458,000 might be spent in all. "That seems to be reckless saving with a vengeance," said Mr. Ramsey.

There had been a suggestion that the Government might be persuaded to allow the cost of the dole and of transitional benefit towards such a scheme. If so, and they would give a direct grant of, say, £66,000, that might help the situation.

OBITUARY

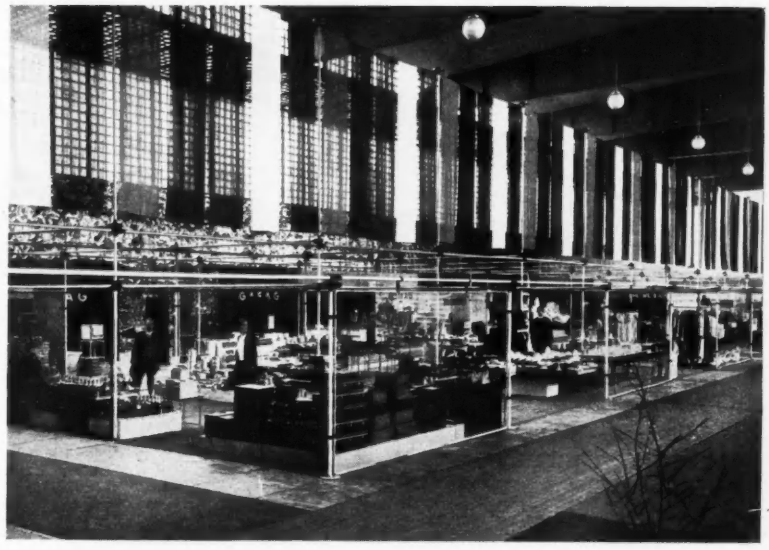
JOHN B. LOFTING

We regret to record the death, in his seventy-sixth year, of Mr. John B. Lofting, F.S.I.

He was in practice as a Chartered Quantity Surveyor for over fifty years, and during that time was associated with many important works, including the Memorial Buildings, Clare College, and the University Library, Cambridge, Lady Margaret Hall and Pusey House, Oxford, the Restoration of Barrington Court, Somerset, and St. Columba Church, Scarborough.

Mr. Lofting took an active part in his work to within six months of his decease. His practice is being carried on as John B. Lofting and Co., at the same address, 44, Bedford Row, London, W.C.1.

W. M. DEAN



We learn with regret of the death of Mr. William Mackereth Dean, M.C., A.R.I.B.A., in his fifty-fourth year.

Born in 1879, Mr. Dean was for many years in partnership with Mr. A. N. Prentice, F.R.I.B.A. In addition to its architectural work in this country, which included a large number of houses, the firm was responsible for the interior decorations of numerous steamships for Australian and South American lines.

Norwich Municipal Aerodrome

The new Municipal Aerodrome, Norwich, will be opened by H.R.H. the Prince of Wales on June 21.

BERLIN AND BRUM

The above illustration shows one of the covered galleries of the permanent exhibition buildings, Berlin, designed by Hans Poelzig and M. Wagner, and transformed for last summer's "Week-End Exhibition." The standardized stands, which are occupied by leading outfitting and furnishing, etc., firms, were designed by Dr. Erwin Gutkind and Professor Adolf Rading. Their constructional elements could not possibly be simpler—tubular-steel scaffold poles, large sheets of plate glass and plain wooden plinths—yet the effect is spacious, orderly and inviting. Compared with the arrangement of this gallery that of the British Industries Fair at Castle Bromwich, Birmingham, is a confused jumble of miscellaneous-sized partitions, crowded booths, and obstructing stanchions and roof-trusses, devoid of co-ordination or coherence, which resembles—in so far as it resembles anything—an Oriental bazaar, set down in the middle of a Canadian mining-camp.

Suburban Horrors

"At the present rate of progress it is only a matter of a few years until the whole countryside from London to Brighton will become for the motorist a series of suburban horrors. I think that London is far too big at the present time, and that steps should be taken to prevent any further increase in its size." This opinion was expressed by Mr. W. D. H. McCullough at a conference of the Master Signmakers' Association, held in London recently. He further stated that "it is only necessary to drive from Charing Cross to Chelmsford to realize the ghastly failure of the commercial architecture of the past 20 years—no planning, no co-ordination of design, a complicated mass of ill-assorted shop fronts huddled together and surrounded by acres of self-satisfied villas and slums."

Stratford-upon-Avon Festival

The original Shakespeare Theatre is not lost to Stratford, but, under a new guise, will have a very important part to play in the future of the town. Practically the whole of the circular walls are still standing, and Messrs. Scott, Chesterton and Shepherd, the architects of the new theatre, have produced a scheme for the roofing over and converting the building into a Conference Hall capable of seating 400 people.

The architectural scheme, while preserving the character of the old building, is designed to bring the Hall into harmony with the more modern style of the new theatre.

It is hoped that the Hall will be completed in time for the opening of this year's Festival on April 17 (Easter Monday).

LAW REPORTS

ALLEGED PUBLIC RIGHTS

Drummond v. *Demoulins and Others.—Chancery Division. Before Mr. Justice Maugham*

THIS was an action by an owner of a lane leading to the sea and/or foreshore against the inhabitants of Fawley, Hants., represented by the Fawley Parish Council and inhabitants, the Southampton County Council and the New Forest R.D.C., for declarations as to his rights, and an injunction restraining trespass.

The plaintiff was Mr. C. A. Drummond, and as owner of the Cadland estate of 4,000 acres at Fawley, he sought declarations that Green Lane on his property leading from the Calshot Lepe Road to the shore of the Solent was not a public highway, that there were no public rights of way along his foreshore, and that the inhabitants of Fawley had no customary right of access to his beach for the purposes of bathing and recreation.

Mr. Gover, K.C., for the plaintiff, said his client was owner of the land and foreshore and he had entered into advantageous contracts for the sale of parts of his estate. The defendants had asserted public rights to the foreshore, and in consequence of this the plaintiff's purchaser had refused to complete. Under these circumstances his client had no other course than to bring this action.

Mr. Swords, K.C., for the defendants, said his clients asserted public rights to the foreshore and they thought it fit to protect them.

His lordship did not see how the defendants could possibly succeed in the face of the plaintiff's rights to the foreshore which he claimed.

Mr. Swords said under these circumstances his clients abandoned their claim to a right of way along the foreshore.

His lordship said in his opinion the alleged public rights had not been established and it necessarily followed that plaintiff must succeed. Judgment for plaintiff, with costs. He granted liberty to apply if necessary for an injunction.

ALLEGED BREACH OF COVENANT

Warne and Others v. *Cook and Another.—Official Referee's Court. Before Mr. S. R. C. Bosanquet, K.C.*

THIS action concerned a claim for possession of four houses at Ram Square, Wandsworth, on the ground of breach of covenant to repair. The defendants were Mr. Cook and Mrs. Channing Stephens, and the first defendant replied that he had no interest in the property. The second, whilst admitting she was the assignee of the lease, denied that the covenants had been broken, and pleaded that she had complied with the notice served upon her.

Mr. J. D. Casswell, for the plaintiffs, said the houses were nearly new when they came into the possession of the defendant, and his instructions were that they had been allowed to get into a dilapidated state.

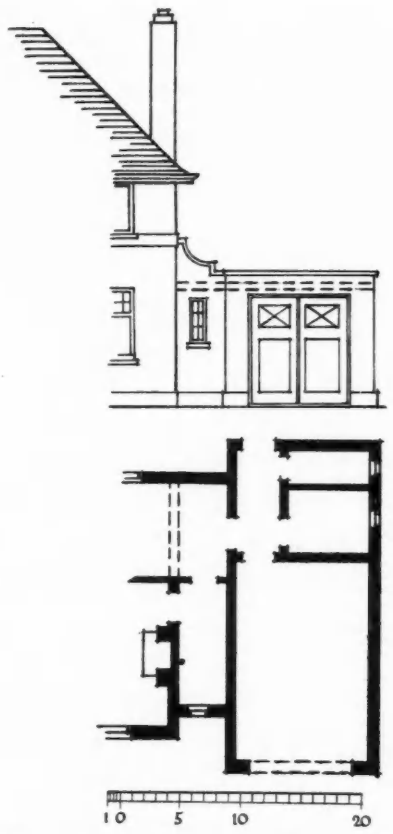
Mr. Martineau submitted that all the work necessary had been carried out and therefore the action was misconceived. He asked that the defendant Cook should be dismissed from the action with costs.

The Official Referee said the action against Mr. Cook would be dismissed with costs, as he was only the agent of the lessee. With regard to the other defendant, Mrs. Channing Stephens, the action against her would also be dismissed with costs. In the course of his judgment, the Official Referee said the notice to repair was served three months before the issue of the writ on Mrs. Stephens, and it appeared that she had carried out most of the repairs, and therefore the question was whether the trivial items that remained entitled the plaintiffs to possession. On behalf of the plaintiffs it had been urged that as the houses were new at the commencement of the leases, they must be kept as such. In his view it was impossible at the end of 90 years to hand back new houses. He held that Mrs. Channing had substantially complied with the covenants of her lease and had done what was reasonable and proper.

QUESTIONS THAT ARISE

Condensation on Roof

¶ A. F. L. writes: "*I would be glad if your technical expert could give me some advice on the prevention of condensation on the underside of a flat concrete roof, the ceiling of which has been cement rendered and finished with patent plaster. Regarding ventilation, the garage doors are generally left wide open all day, but the condensation is still bad. I enclose sketch showing layout of affected part.*"



All materials which are non-absorbent of moisture will show condensation when atmospheric conditions are favourable. If the air is charged with moisture owing to recent rain and the temperature suddenly drops, the moisture will be deposited as dew on all exposed surfaces and this will be more pronounced on cold surfaces. One of the objections raised against concrete buildings is that moisture is condensed more readily than in brick-built buildings.

If the surfaces are papered or covered with lime plaster or similar absorbent material the condensed moisture quickly disappears, but if covered with hard plaster or other non-absorbent material the moisture will collect and finally drop off the ceiling and trickle down the walls.

The garage should, of course, be ventilated for other reasons than condensation, but ventilation will not materially assist in preventing the inconvenience caused. A current of moist air passing through the building will, in fact, favour the deposition of the moisture.

A remedy would be to plaster the ceiling with lime and hair mortar. Expanded metal lathing should first be fixed near the ceiling to form a key for the plastering and the finished work should be distempered.

It would be an advantage to heat the garage—if not already heated. N. H.

A diagram showing a concrete flat roof, the underside of which is affected by condensation. Remedies are suggested in the reply to the accompanying query on Condensation on Roof.

Radiator and Wall Recess

¶ A. E. M. writes: "*I would be glad if any of your readers could tell me if they have experienced a difficulty similar to mine in connection with hot water radiators, recessed and enclosed in brick walls, having bronze grilles to the whole of the front of the openings, screwed to walls flush with plaster. I find that it is almost impossible to obtain any radiated heat, although the radiators themselves are very hot. How can this be remedied?*"

Though misleadingly called "radiators," most of the heat distributed from hot water circulating appliances so named is convected heat, due to the passage of air currents over the heated surfaces and their distribution about the adjoining space. In the circumstances decribed, any such movement must be extremely sluggish and the small balance of genuinely radiated heat would be largely intercepted by the grilles.

If an air inlet to the bottom of each radiator can be contrived, and possibly

an outlet-grating above as well, some improvement may be looked for, but a radiator almost entirely enclosed can never deliver up to anything like its potential heating value.

E. G.

SOCIETIES AND INSTITUTIONS

FURNITURE DESIGN

The Design and Quality of Old English Furniture. By R. W. Symonds. The Auctioneers and Estate Agents' Institute. London : Thursday, March 2.

It is imperative to convince a manufacturer that if he would, instead of telling the public what furniture they should buy, be humble and learn what the public really want, and produce it, he would make more money in the long run. He must realize that the public know what they want when they see it, but that they are unable to describe or define it.

There are artists and designers whose intellectual equipment should enable them to interpret the needs and requirements of the English people today, and it is the help of such designers that the manufacturer should seek. These designers must study old English furniture, not in order that they may merely reproduce the style and ornament—which has been extensively done by all furniture manufacturers during the last fifty years—but that they shall understand the principles on which the past styles of furniture were brought into being, and base their work on those principles.

These principles hold good today as they did in the past. That is the message which old English furniture hands down to those who care to listen to it ; and that is why it must stand for something more than a past craft of mere antiquarian interest.

LIGHTING IN SCHOOLS

Mr. C. A. Hughes, speaking on "Electric Lighting in Schools," at the Conference for Architects, held at the Lighting Service Bureau on Wednesday last, pointed out the need for regulations to provide an adequate supply of artificial light in classrooms, especially in urban districts.

As the formative period for eyes is during the first twenty years of life, it is important that nothing which will cause defective vision by glare or strain should be permitted in school lighting. Light coloured walls, matt surfaces to desks, paper, blackboards, etc., and lamps placed in carefully regulated positions, and provided with diffusive shades, all help to preserve the eyesight. Statistics show that far better results are obtained from children working in rooms where the problem of efficient artificial lighting is carefully considered, than from children working in rooms where the light is inadequate, or badly placed in relation to the position of the scholars.

AN ARCHITECT-DICTATOR

"What Is, What Was, and What Might Be." By Clough Williams-Ellis, F.R.I.B.A. Cardiff Publicity Club. February 23.

Artistry means design and planning, and we are beginning to discover that to try to run civilization without reasonable design and planning in its every-day background is a pretty futile and hopeless thing.

I saw in "The Western Mail" this morning that Sir Raymond Unwin is coming to Cardiff tomorrow—a great man and the best president the Royal Institute of British Architects ever had. If 30 years ago, when I felt I was just right for it, he or I had been made the supreme dictator of this country, things would have been different. There would have been none of this wasteful lack of planning. I feel if we had been in power there would have been no crisis today, no depression, no difficulties of any kind. Probably there would not have been a war. That is what I think might have been !

I do not think a great many of the difficulties of which perfectly hard-headed business men complain today are due to a lack of artistic and fore-thoughtful planning in the lay-out of the country. We must seek the end of public right to do public wrong ; there must be more co-ordination. I feel planning, order, seemliness, efficiency and economic prosperity, are much more one than we fancy. I think you will have a good illustration of this when the Cardiff new station is finished.

I hope some day we may return to sanity, and in the meantime we may preserve here and there ticket specimens of what Wales used to be like.

SOUTH WALES ARCHITECTS' DINNER

The annual dinner of the South Wales Institute of Architects was held at Cardiff on February 24. Mr. J. Herbert Jones, F.R.I.B.A., presided.

Proposing the toast of "The R.I.B.A. and its Allied Societies," Mr. Lewis Jones, M.P., said the State had transferred the onus of building from itself to private enterprise—but the responsibility was not a light one. They had to meet the demand, and they had to proceed with the building of houses on a planned or rational scheme, and nobody appreciated the responsibility of those connected with the industry more readily than Sir Raymond Unwin. His scheme for the formation of a National Housing Board—a public utility company—on the lines of the Central Electricity Board, to co-ordinate the existing 250 or so housing societies, seemed very desirable.

Responding, Sir Raymond Unwin said if we go to work to make it a great public service to house the people, who now cannot afford it, we might do something yet to improve the conditions of housing for those poor people who today had not the means.

Prospero and Ariel, the statue which surmounts the entrance to Broadcasting House. The sculptor, Eric Gill, is here seen putting the finishing touches to his work.

HEATING AND VENTILATING ENGINEERS

The Institution of Heating and Ventilating Engineers, in order to keep its members more up to date with the Institution's work, has decided to issue a monthly Journal instead of its annual Volume of Proceedings.

This Journal, available to members only, will publish reports of the proceedings and papers presented at the Institution meetings. It is proposed to devote space to investigations connected with heating, ventilating and allied subjects carried out at the Building Research Station. The first issue will appear in March.

TRADE NOTES

It will be recalled that in 1932 the world producers of aluminium decided to renew the International Competition, open to technical workers in every part of the world, originated with the object of awarding prizes for the best suggestions made relative to the use of aluminium and its alloys.

The competition jury, who met in December of last year, has allocated the 20,000 (Swiss) francs voted for the prize-money as follows : 4,000 to Dr. Eckert, of Grevenbroich (Germany) ; 4,000 to M. Philippe, of Paris (France) ; 3,000 to Mr. Y. Hirakawa of Yawata (Japan) ; 3,000 to Th. Schweizer, of Zurich (Switzerland) ; 2,000 to M. Py, of Paris (France) ; 2,000 to Mr. Steinborn, of Rodange (Grand Duchy

of Luxemburg); and 2,000 to M. H. Tatu, of Lyons (France).

More than 1,000 persons addressed enquiries to The Bureau International de l'Aluminium as to the details of the Competition, and 405 memoranda were received, which, in the great majority of cases, were based on serious investigations and showed an expert knowledge of the light metals.

*

Messrs. G. A. Harvey & Co. (London), Ltd., of Woolwich Road, S.E.7, have just issued a folder illustrating and describing Harco Patent Metalace, a new form of woven wire. It is pointed out that formerly all weaving, whether of wool, cotton, silk or wire, was limited to the use of strands which always ran at right angles to each other. Now, however, by means of machinery which the firm have recently built, they are able to incorporate additional strands diagonally, thus enabling them to produce a new design in woven wire. Harco Patent Metalace, claimed to be suitable for ventilating panels, radiator covers, guards for hot water piping, etc., can be supplied in pieces cut to any required shape or size. Copies of the folder are obtainable on application to the firm at the above address.

*

The following is extracted from a letter by the Assistant Secretary of the Mercantile Marine Department of the Board of Trade, to Messrs. Pilkington Bros. Ltd.:

"I am directed by the Board of Trade to inform you that they have had under consideration the results of the tests that have been made with your Armourplate glass, and in the light of these tests they are prepared to grant provisional approval for the use of this glass in ships' side scuttles. The Board will also raise no objection to its use, under approved conditions, in other glazed openings on board ship."

Every piece of Armourplate glass for use in ships' side scuttles will, we understand, be subjected to a test agreed with the Board of Trade, and the Board's surveyors will be at liberty to visit the works of the manufacturers, Pilkington Brothers, Ltd., of St. Helens, to carry out any examination at any time.

The Board of Trade will now allow Armourplate glass to be used in the following thicknesses to replace ordinary plate glass of greater thickness:—

		Ordinary Plate Glass
1 in.	Armourplate Glass for	1¼ in.
¾ in.	" " "	1½ in.
½ in.	" " "	1⅛ in.
⅜ in.	" " "	1 in.
¼ in.	" " "	¾ in.
⅛ in.	" " "	½ in.

*

England's Most Modern Factory is the title of a booklet, just issued by Nobel Chemical Finishes, Ltd., dealing with the new building for Boots' Pure Drug Co., Ltd., at Beeston, Notts, designed by Sir Owen Williams, K.B.E. It is pointed out that in the autumn of 1931 tenders were sent out for the paints required for the decoration and protection of Messrs. Boots' new works at Beeston, which were then in the course of erection. On receiving the tenders samples of the paints were called for, and submitted to independent trials by the contractors under the supervision of the engineer. These samples were applied to typical concrete columns and left for three months (November, 1931, to February, 1932), exposed to the weather during the worst part of the winter. At the end of the test the columns were examined and it was found that the Dulux finished column was in better condition than any other. Dulux, which is manufactured by Nobel Chemical Finishes Ltd., was therefore specified exclusively for the entire decoration of the factory. The booklet contains several interior and exterior views of the factory, each with a short description of the surfaces painted and the processes used.

Copies of the booklet are obtainable from the firm at Slough, Bucks.

*

Messrs. W. T. Henley's Telegraph Works Co., Ltd., have transferred the offices of their Birmingham branch to Empire House, 158-159, Great Charles Street, Birmingham, 3. Telephone Nos.: Central 3774 and 3775.

THE BUILDINGS ILLUSTRATED

Following are the names of the specialists, general contractors, and some of the subcontractors for the buildings illustrated in this issue:

Regal Cinema, St. Leonard's-on-Sea (pages 327–329 and supplement). General contractor, H. J. Harvey; consulting electrical engineer, C. H. Mendham. Sub-contractors: H. E. Keen & Co., Ltd., electrical and mechanical gear; Kingsmill Metal Co., Ltd., art metal work (canopy, etc.); Winter & Co., joinery; London Radiator Heating Co., Ltd., vacuum plant; Leyland and Birmingham Rubber Co., Ltd., floor covering; Cinema Supply Co., Ltd., floor covering (carpet); T. P. Bennett and Sons, marble; G. Asserate and Sons, asphalting; Battle Steel Window Co., Ltd., windows; Parker, Winder and Achurch, Ltd., door and window furniture; Clarke Vigilant Sprinkler Co., Ltd., and Pyrene Co., Ltd., fire extinguishers; Cinema Supply Co., seating; Self Sentering Expanded Metal Co., Ltd., reinforcement; Powers and Deane Ransome's, Ltd., steelwork; Brown and Madeley, fibrous plaster work; London Radiator Heating Co., Ltd., ventilating plant, heating and hot water; Pickering & Co., Ltd., lifts for service to buffets; Lumley & Co., Ltd., café equipment; E. G. Turner (The Perforated Front Screen Projection Co., Ltd.), screen; Edison Swan Electric Co., Ltd., flood lighting; John Compton Organ Co., Ltd., organ; Knight & Co., Ltd., stage equipment and safety device; Absorbit, Ltd., sound insulation; Chloride Electrical Storage Co., Ltd., independent lighting; Mollo and Egan, interior decoration; Astral Engineering Co., switchgear; Strand Electric, stage battens; Ross, Ltd., projectors; Western Electric, Ltd., talkie apparatus; Lancashire Dynamo and Crypto Co., Ltd., motor generators; Foster Engineering Co., Ltd., transformers.

New Recreation Hall, Liverpool Sanatorium, Frodsham, Cheshire (pages 330-331). General contractor, Harry Fairclough. Sub-contractors: Thomas James, Ltd., Westmoreland Green Slate Quarries, slates; General Electric Co., Ltd., boilers, electric light fixtures and electric heating; Parrys, electric wiring; Quiggins, Ltd., door furniture; Rea Metal Casements, Ltd., casements.

Store for J. E. Beale, Ltd., Bournemouth (page 336). General contractors, Bainbridge and Sons. Sub-contractors: Aish & Co., electrical installation; Auto-Control Boilers, Ltd., central heating and gas boilers; Banister, Walton & Co., Ltd., steel construction; Frederick Braby & Co., Ltd., steel staircases, copper roofing, iron and bronze balustrading; Carter & Co. (London), Ltd., tiling; J. Caslake, external iron staircases and railings; Crittall Manufacturing Co., Ltd., steel casements; Joseph Ebner, Gurjun wood parquetry flooring; W. J. Furse & Co., Ltd., lightning conductors; Grounds & Newton, Ltd., asphalt roofing; G. N. Haden and Sons, Ltd., central heating and plenum ventilating plant, domestic hot water supplies and destructor boiler; Hobart Manufacturing Co., Ltd., washing up machines; Kennedy (Bournemouth), Ltd., sanitary appliances and fittings; Lamson Pneumatic Tube Co., Ltd., pneumatic cash tubes and vacuum cleaning plant; Leeds Fireclay Co., Ltd., external faience; Gillett and Johnson, Ltd., external clock and figures; Mather and Platt, Ltd., revolving fire-proof shutters and automatic fire sprinklers; Morris Singer Co., steel casements and bay and pavilion windows; F. A. Norris & Co., Ltd., internal iron service staircases; A. E. Llewellyn; two shops, Bridge Street, for Mr. C. E. Tebbs; two houses, Conway Croft, for Messrs. T. Addis and Son, Ltd.

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

*In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

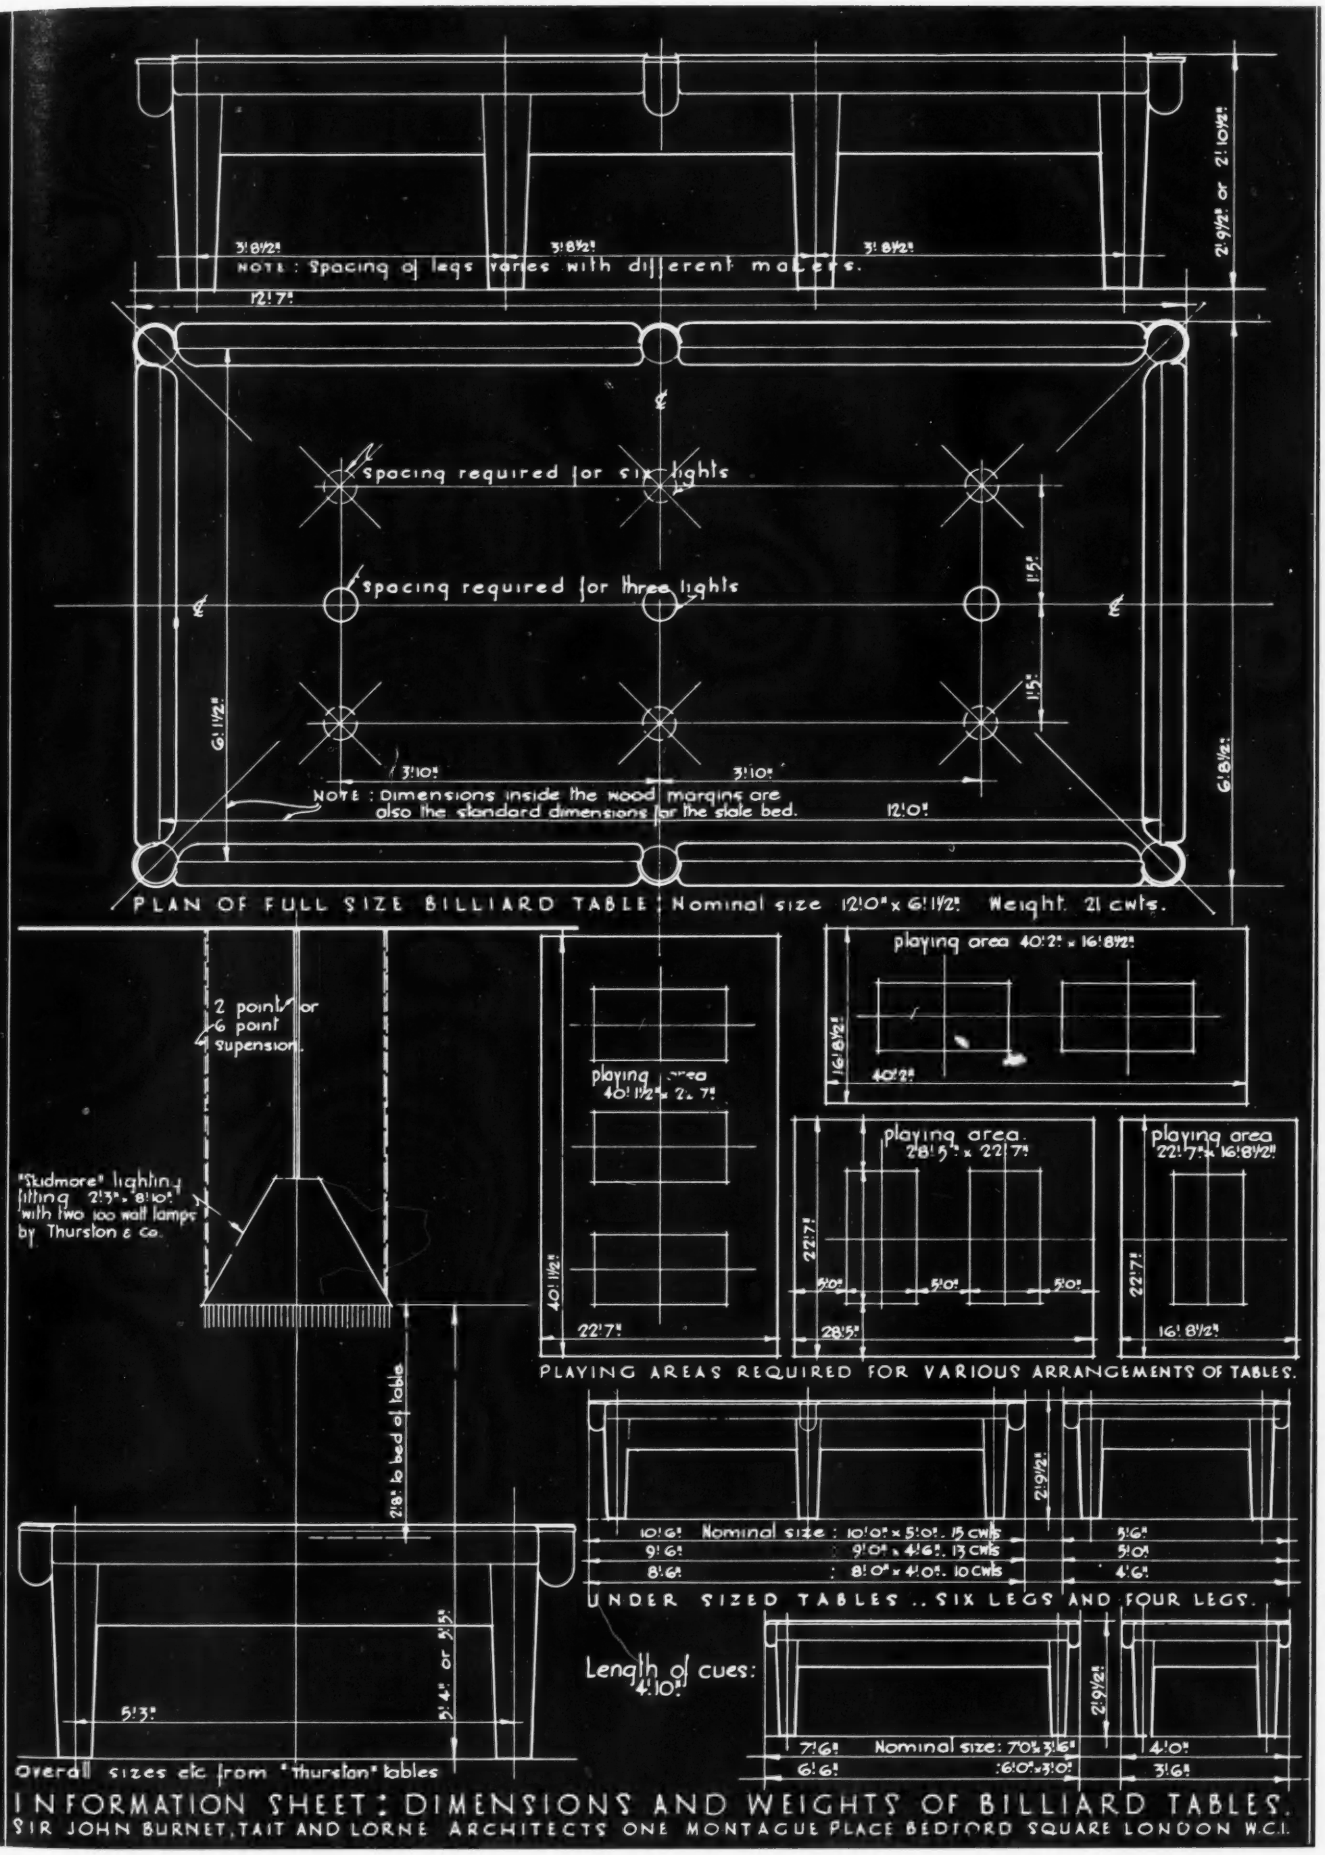
THE REGAL CINEMA, ST. LEONARDS



ARCHITECT: JOHN B. MENDHAM

THE site runs through from London Road to King's Road, rising no fewer than twenty feet in that direction, and is very irregular in outline. The plans reproduced above and within (all to the same scale), together with the section appearing on page 327, show how the difficulties have been met, notably by placing the stage dressing-rooms in a southerly wing.

There are entrances from both roads, and a waiting-lounge, accommodating 250-300 persons, under the balcony at the London Road front. The theatre seats 1,600 people. Photographs appear in the body of this issue.

Supplement to THE ARCHITECTS' JOURNAL for March 8, 1933

INFORMATION SHEETS

• 8 •

BILLIARD TABLE DATA

•

THIS week's Information Sheet again covers a field in which information may be required by the architect at any moment, and must be comprehensive to be of any use. It meets both needs, giving him on one piece of paper figures as to weight, sizes and playing areas of billiard tables, which would occupy some hours of research. did he undertake it personally.

The drawings from which all these Information Sheets are reproduced originated in the office of Sir John Burnet, Tait and Lorne. Far from grudging the broadcasting of information they had been at pains to tabulate for use in the course of their own practice, they embraced the proposal with enthusiasm, thus placing the whole profession in their debt, and incidentally furnishing the student of fine draughtsmanship with specimens for emulation.

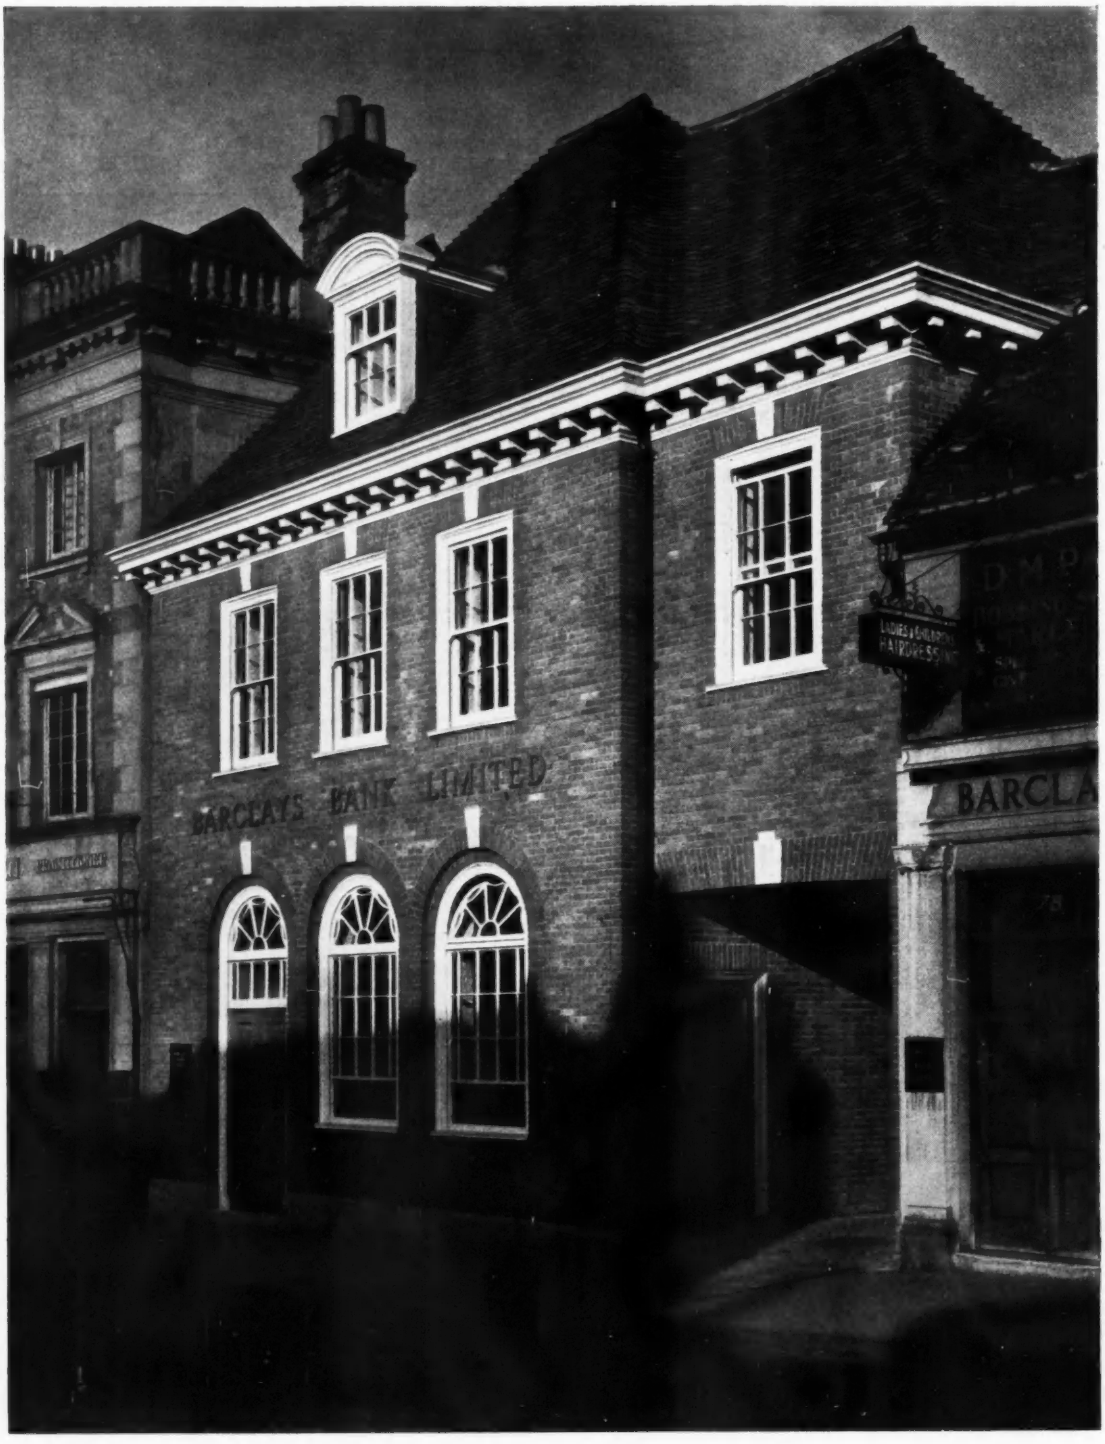
It was desired to present these Information Sheets in a standardized form, but no standard filing size has existed, hitherto, in Great Britain. The decision was therefore taken to make the reproductions the same size as the original drawings, which themselves follow the standard dimensions adopted by the American Institute of Architects, as being more convenient than reproduction to the double-page size associated with THE ARCHITECTS' JOURNAL Supplements.

Until further notice, therefore, these Sheets will take the place of the second double-page plate that is usually issued, week by week.

The following is a list of the subjects previously issued :—

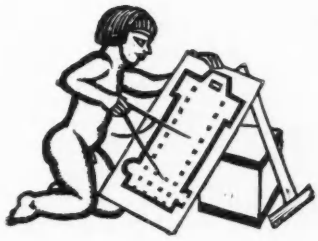
1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.

THE R.I.B.A. NEW PREMISES



MODEL OF THE BUILDING: AND THE SITE

The above model of the new R.I.B.A. building, from the revised design of Mr. G. Grey Wornum, F.R.I.B.A., with sculptured decoration by Mr. Bainbridge Copnall, has received the approval of the Council of the Institute. Tenders for the steelwork have already been received and the contract has been placed. Building contractors are to be invited to send in their names for consideration. It is expected that they will be asked to submit tenders by the end of May.



The site of the new premises, on the east side of Portland Place, with a frontage to Weymouth Street, is also illustrated. Tenders for the demolition of the existing buildings on the site—one of which, however, has now been incorporated in Mr. Wornum's design—have not yet been considered, but it is hoped that the new premises will be completely finished and ready for occupation before the end of 1934.

BANK AT SEVENOAKS

By
Mitchell and Bridgwater

The fact that Redman's Passage, the right-of-way for pedestrians and lorry traffic shown in this view, had to be kept made the design of this façade difficult. The front to High Street is faced with a rather bright but rough cherry-red brick, with slightly darker bricks for the quoins. The gilded letters give it a note of richness. The name plates below are very carefully designed. Special attention has also been given to the lettering on the lower half of the windows. All the woodwork except the front and side doors is cream-coloured. These doors are stippled bright green. The roof is tiled. Further illustrations, plans and particulars appear on pages 364-5.

THE CASE FOR PUBLIC WORKS

HAVING examined in some detail in two previous leading articles the principles on which the employment value of schemes of public works may be computed, we are now in a position to put forward what may be termed a case for public works.

We have already pointed out, in our leading article of March 1, that the statement that a policy of public works adds more to liabilities than to assets is incorrect. Last week we came to the conclusion that the net cost of employing three men for a year—one man in public works, a second making materials and a third making food and clothing—is only £231, while work to the value of £400 is done on the public works.

During the last seven years some £250,000,000 have been spent on public works, £90,000,000 on roads and £160,000,000 under the Development Acts. Of the latter sum, grants under the Lewis Committee amounted to £40,000,000 and grants under the Unemployment Grants Committee to £120,000,000.

Schemes assisted by the last Committee are of three kinds—non-loan schemes, revenue-producing loan schemes, and non-revenue-producing loan schemes. The first type of scheme is practically negligible, being only about 5 per cent. of the total. The second type —revenue-producing schemes—forms about 35 per cent. of the total, and covers a large number of kinds of work. The third type—non-revenue-producing schemes—forms about 60 per cent. of the total.

The view, which seems to be fairly widely held in certain quarters, that expenditure on such schemes represents so much money poured down the drain, so to speak, is thus not correct. Some 35 per cent. of expenditure on these works is directly and immediately remunerative. The remaining 65 per cent., although not directly remunerative, covers much necessary work, such as sewers and sewage disposal, sea defence and river improvement, water, sanitation and land reclamation. A certain amount of road work is also assisted by the Committee.

Thus, of work assisted by the Unemployment Grants Committee, the greater portion is either directly remunerative or necessary in the interests of public health, etc. The work assisted by the Lewis Committee is, on the average, similar in nature to that assisted by the Unemployment Grants Committee, and the same argument applies.

The remaining schemes, forming the total of £250,000,000 spent on public works in the last seven years, are road works under the Ministry of Transport. With regard to the remunerative character or the necessity of these works, nothing can be said without a detailed examination of each particular scheme. It is obvious, however, that these schemes, drawn up or approved by the Ministry of Transport, were not merely works of doubtful utility, but were really necessary.

Practically all assistance to schemes of the kind discussed has now ceased. The Unemployment Grants Committee has adjourned *sine die* and other assistance has either ceased or has been drastically curtailed. Yet some 15 per cent. of this work is definitely and immediately remunerative, and most of the remainder is of a necessary, not to say urgent, character. Further, as we pointed out last week, employment on every £400 worth of such work employs three men for a year at a net cost of only £231.

What would be the effect of continuing expenditure on these schemes at the former rate of about £36,000,000 a year? In the first place, some £9,000,000 would probably go in land and other charges and £11,000,000 of the remaining £27,000,000 would go to provide direct employment for some 91,650 men for a year. This would entail employment for an equal number of men to supply them with materials, making the total direct and indirect employment created 183,300 men for a year. To this must be added employment for about 91,650 men making food and clothing. Not all this employment, however, would be additional, as the 91,650 men directly employed would draw unemployment benefit if unemployed and would thus have some purchasing power. At the rate of £1 per week, this represents a demand for food, clothing, etc., amounting to £4,765,800 in the year and employing some 15,886 men. The increase in employment in the food, etc., industries is thus 75,764, and the total net employment created amounts to 259,064 men-years.

The net cost of such a programme of public works at the present time would therefore be quite small. In the first place, we may deduct from the total of £36,000,000 the revenue-producing schemes, regarding them as in the nature of self-balancing items. This reduces the cost by 15 per cent. to £30,600,000.

Then a saving of £14,600,000 to the unemployment fund must be deducted. This is made up of a saving on benefit at £1 per week of £13,471,000, and a saving in employers' and employees' contributions at 10d. per week each of £1,123,000. This reduces the net cost of the scheme to £20,000,000.

Thirdly, an allowance must be made for the increased yield of taxation which will result from increased expenditure. Mr. J. M. Keynes has estimated that an expenditure of £30,000,000 in the Building Industry would increase the national income by £60,000,000. He further estimates that, on the average, 20 per cent. of income is taken in taxation. But most of the men employed on a scheme of public works would be below

the exemption limit for income tax, though that is, of course, not the only form of taxation. To be on the safe side, therefore, we may estimate the increased yield of taxation as a result of the scheme at 10 per cent.* of the increased national income, or £6,000,000.

The total net cost of doing £36,000,000 worth of work is thus £14,000,000.

And what is the cost of postponement?

For every year these schemes are postponed, the net saving which would accrue if they were put in hand forthwith becomes a net, unproductive burden. In order to postpone these schemes, some 259,000 men must be kept in idleness for the period of postponement.

Thus, if these schemes are postponed for one year, the total cost of getting the £36,000,000 worth of work done will be £36,000,000 (assuming that building and construction costs have not risen), *plus* a loss of £14,600,000 to the unemployment fund—a total of £50,600,000.

Surely, the moral is obvious.

[* *This was written before the publication of Mr. Keynes's first article in "The Times" for Monday, March 13. It is interesting to see that he himself—quite independently, but for similar reasons—has arrived at the same figure, i.e., 10 per cent.*—ED., *A.J.*]

NOTES & TOPICS

ARCHITECTURE AND ENGINEERING

FINDING myself by chance in Sheffield last Thursday, and learning from a local architect friend that Professor J. Husband was to lecture that evening to the Sheffield and South Yorks. architects on "The Architecture of Engineering Structures," I decided to stay the night and attend.

*

After the lecture, I cunningly borrowed his notes and made from them the following abstracts :—

Since all external works are exposed to the public view, the expression of public opinion will naturally vary widely according to the preferences, temperament and training of would-be critics. Thus, an artist will seize on form, colour, light and shade effects, an architect on faithfulness to style and sound proportion, whilst an engineer pure and simple will concentrate more particularly on suitability of material, principle of design and details of construction, which latter are quite frequently uncomprehended by the lay observer. Who, then, is a competent critic? The great mass of untrained observers will probably more or less superficially regard such works and according as a fleeting impression, pleasing or otherwise, is created, pass on their way with a nebulous impression that the work is beautiful, merely satisfactory, or ugly. Even amongst trained observers what may be adjudged as highly commendable and pleasing by one will often be denounced as ugly and unsuitable by others.

Many engineering works are of such magnitude and are required to endure for such long periods of time, that a great moral responsibility rests upon their designers—much greater than in the case of more ephemeral works which, if unsightly, will at least be removed after a short lapse of time. Unfortunately, the ephemeral works are greatly in the majority, embracing, as they do, the great mass of residential and industrial buildings in our towns.

In engineering projects, more so than in purely architectural works, the bulk of the available money is generally expended on the utilitarian necessities of the work, and little or none remains for the creation of artistic effect, although there are not lacking examples in which an excess of funds has resulted in the over-lavish application of undesirable ornament.

*

WHAT OF THE SLATE?

Which is the fouler, a purple slate or a cheap red tile? A difficult question, my masters.

*

I would but say that cheap red tiles look bad with anything, but that slates, nearly the worst of slates, look passable with colour-washed walls.

*

But in both articles it is the tiresome nineteenth-century love of precision that steals charm away, especially where a jerry builder's love of repetition and a quick sale leaves little enough charm to start with.

*

But what are the economics of slate selling? Are the thin, accurately-squared horrors really the cheapest to produce and market, or is it only the end of a period of debased taste that keeps them hanging on?

*

DESIGNING FOR INDUSTRY

The Design and Industries Association, at their annual general meeting last Thursday, reviewed the results of a year's operation under their plan of intensive working. They were able to point to a surprising body of work accomplished for a not-too-richly-endowed body, the launching of a new monthly paper under the auspices of the publishers of *The Week End Review* being pure solid accomplishment of an important element of the plan.

*

The idea was to publish two or more numbers of their journal, treating of D.I.A. matter in concentrated essence and in a new way. Each number was entirely sold out, and the D.I.A. was able to choose between two offers of publication.

*

The first number of *Design for To-day* will appear shortly under the editorship of Mr. Noel Carrington.

*

I like a general meeting that ends, as this one did, with a diversion. Mr. Frank Pick's diversion offered us the choice of two lantern slides shown simultaneously on two screens : Art and Nature : Bad Art and Good Art ; Victorian and Modern ; and so on.

I don't think enough people know of the D.I.A.

*

WHERE DO I STAND IN NEW EUROPE?

I am not so certain where I stand with an organization such as that which calls itself the New Europe Group and issues a magazine *New Britain*, as a first step, I presume, towards federation.

*

I gather that its activities are both political and cultural and that its aim is the breaking down of national barriers through community of purpose and interest, as one might say that our own understanding of German architecture

bound us to that harassed people where there might be nothing but fear and mistrust between us.

*

But, Lord, how difficult it all is! With times so out of joint rash remedies appear like poppies on a railway embankment.

*

A PANACEA FOR DEPRESSION

I have been put in possession of a manifesto, an *epochal* manifesto, its author calls it, in which it is urged that the "only sure, effective and unmistakable cure for the depression is the complete State ownership and control of all natural resources, for production and their distribution" . . . and that "if our governments will, this depression can be eliminated and normal life established in less than a month's time . . . "

*

Sermons in Stones: A few suggestions by an artist in "The Northern Despatch" for enhancing the dignified austerity of Darlington's latest public building. The market cross is included, because of the suggestion recently made that a suitable place for it would be in the new library extensions.

*

CANNON FODDER!

Yet another sign of the times and of the "ungodly" press! Below is the badge of Liverpool School of Architecture students that attended the Anti-War Conference held at Bermondsey last week. That conference, crowded, enthusiastic and respresentative of *real* interests, was entirely unreported by the daily press, which would seem by inference to support war. It is not at all a nice world we live in.

WHAT IS ARCHITECTURE?

I have just come across some brilliant definitions of architectural styles from the pen of that knowing fellow Convolvulus, of *The Sketch*. Quotation isn't a fair method, but here are some gems :—

*

Victorian: This is a very grand architecture indeed. There is no point in keeping old Gothic, Tudor, Jacobean, classical and so forth when Victorian architecture gives you them all in one, and still as good as new, with a lot of jolly ornaments thrown in. None of it is ever likely to fall down, and as long as it stands England will remain what she is. She deserves it.

Or again :—

Modern: The principle of modern architecture is to make everything look like something else. . . To build a modern building all you have to do is to take a look at an old building and build it four times the size in the wrong materials with a baker's dozen (or Lutyen's dozen or Blomfield's dozen) of columns, double columns, gables, statues, pylons, pedimenta and impedimenta stuck on the front. The result is very imposing.

But I'm not sure we haven't been imposed on long enough.

Nor am I. ASTRAGAL

NEWS

POINTS FROM THIS ISSUE

The total net cost of doing £36,000,000 worth of Public works is £14,000,000 353

—But if these schemes are postponed for one year the total cost will be £36,000,000 plus a loss of £14,600,000 to the unemployment fund—a total of £50,600,000.... 353

The danger of catching influenza in buildings where adequate balanced systems of ventilation are installed is practically non-existent 376

The most highly-paid man on the building in America is the man who works the hoist 376

In sixty years the average annual rate of persons affected by the demolition of slums has been less than 3,000.. 377

EXHIBITION OF BRITISH INDUSTRIAL ART

The Exhibition of British Industrial Art in Relation to the Home will be held at Dorland Hall, Lower Regent Street, S.W.1, from June 20 to July 12.

The aim of the Exhibition is to demonstrate that the British Industrial system can produce well designed goods suitable to modern conditions. The goods exhibited, therefore, will be chosen from the best work of manufacturers and designers and will be chiefly the products of industrial processes which are retailed at a reasonable price.

The Committee wish the Exhibition to be thoroughly representative of British industrial art, and so examples from as many fields as possible will be selected, provided that they bear some relation to the design and equipment of the home.

The list of subscriptions received by the Public Relations Committee of the Building Industries National Council up to Monday last amounted to £2,256/11/10. Subscriptions should be addressed to Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

MR. KEYNES, "THE TIMES," AND "THE ARCHITECTS' JOURNAL."

The argument set forth at length in the leading articles in the JOURNAL for the last two issues and completed this week* has received most interesting confirmation at the very moment of going to press from an article in *The Times* for Monday, March 13, by no less an authority than Mr. J. M. Keynes.

He starts with the "Treasury view" that it requires a capital expenditure of £500 to employ one man for a year. By a series of deductions he arrives at a figure of £133 to employ each man. In our articles we started from the opposite end. We took an actual expenditure and examined the effects quantitatively step by step, and concluded that an expenditure of £400 would employ three men for a year. This gives an average per man of £133, exactly the same figure as that arrived at by Mr. Keynes on a different line of reasoning.

The second important point dealt with both by Mr. Keynes and in our articles was the effect on the national income and the relief to the Exchequer arising from a given capital expenditure. Mr. Keynes assumes that a given capital expenditure would increase the national income by 1½ times the amount of the original expenditure. He takes this figure for the purposes of calculation, but states that he believes this to be an under-estimate. In our articles we took a multiple of two for this purpose. This is the sole point upon which our figures disagree with those of Mr. Keynes's. Mr. Keynes then assumes a figure of 10 per cent. as the proportion of the increased national income going in taxation, and concludes that the total benefit to the Exchequer is about two-thirds of the original capital expenditure. We calculated that an expenditure of £36,000,000 per year would mean a net cost of only £14,000,000. The saving to the Exchequer arising from a capital expenditure of £36,000,000 is thus £22,000,000, or roughly two-thirds. As a matter of fact, in coming to this conclusion Mr. Keynes has accidentally ignored his own very conservative figures given earlier in the article. A correction has since appeared in *The Times*.

Mr. Keynes's further articles will be referred to in next week's issue of the JOURNAL. Up to date he has afforded our argument almost complete—though quite independent—confirmation at every point, and in challenging criticism from any quarter he makes it clear that he considers his statements unassailable.

* It is perhaps worth adding that the leading article on p. 353 was written before the publication of Mr. Keynes's article in *The Times*, and is reproduced unaltered.

TOWN PLANNING

A paper on the "Town and Country Planning Act, 1932, and Town Centres," was read by Mr. Herbert H. Humphries, C.B.E., M.INST.C.E., at the Town Planning Institute, on Friday last.

He pointed out that in many ways the new Act modifies the Act of 1925 and that it is disappointing that the procedure for almost every stage of town planning has been made more lengthy than formerly, as each stage now has to be passed by Parliament before it may be carried out by local authorities. A scheme may have to be limited also, by the degree to which "within a reasonably short period development in regard to manufacture and trade would involve rebuilding operations; and the degree to which local authority would embark upon street widenings and the construction of such new streets as might be necessary in regard to building development and traffic conditions. If the application of the Act is to be interpreted other than with wide vision, possibly only small replanning schemes will be able to be brought forward from time to time."

POSTER ART EXHIBITION

Today, March 15, the Hon. Oliver Stanley, M.C., M.P., Minister of Transport, will open, at 2.15 p.m., the London and North Eastern Railway Co.'s eleventh exhibition of poster art at the New Burlington Galleries, Burlington Gardens, W.1. The exhibition will remain open until March 25 between the hours of 11 a.m. to 5 p.m.

THE ADELPHI BILL

The second reading of the Adelphi Estate Bill will come before the House of Lords to-morrow, March 16. It is

to be sponsored by Lord Newton and the Opposition is to be led by Lord Esher, chairman of the S.P.A.B.

Briefly, the object of the Bill is to repeal the Act of 1771, which provided that no building between Adelphi Terrace and the river should be more than twenty feet high. There are also provisions in the new Bill for carrying out road widenings, construction of new streets, removing or altering any vaults, arches, cellars, etc.

SOUTH WALES ARCHITECTS

At the invitation of the Chairman (Mr. Percy Thomas, F.R.I.B.A.), and the Executive Committee of the South Wales Institute of Architects (Central Branch), a tea and discussion meeting was held at the Dorothy Café, St. Mary Street, Cardiff, on March 9.

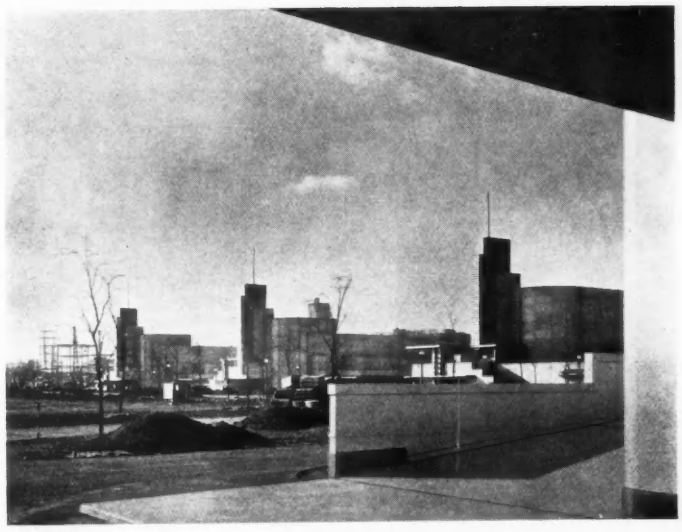
The discussion—on Functionalism in Architecture—was opened by two student members, Messrs. H. J. W. Lewis and D. W. Roberts, the former speaking in favour of functionalism and the latter against. Many of those present joined in the debate.

R. I. B. A.

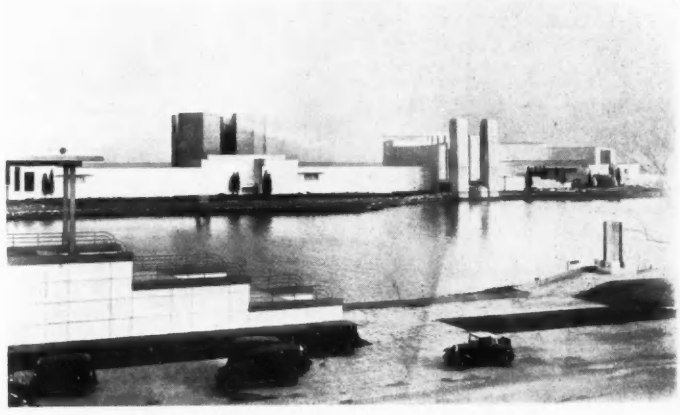
THE NEXT MEETING

A paper entitled "Recent Developments in Buildings" is to be read by Dr. Oscar Faber, O.B.E., M.INST.C.E., at the Institute on Monday next, at 8 p.m.

HOW TO LOOK AT LONDON



On Wednesday last Mr. Goodhart-Rendel gave the first of a series of lectures on "How to Look at London," which are being organized by the R.I.B.A. to take place during March and April.



Mr. Goodhart-Rendel took as his theme the architectural development of Piccadilly during the last hundred years, illustrating his lecture with lantern slides and a series of drawings which have been produced by him showing all the present Piccadilly buildings for comparison with a similar series that was published almost exactly a hundred years ago by John Tallis.

He critically examined Piccadilly as it is today, building by building, starting at No. 1 Piccadilly, which is now part of the London Pavilion, and working westwards.

The lecturer concluded his remarks with an appeal for support of the project of making "new Tallis" drawings of other streets in London, the value of which would be even greater. The preparation of such drawings is a long and expensive business, but Mr. Goodhart-Rendel showed that this scheme could be made possible through subscriptions to the Architects' Unemployment Relief Fund, which could employ otherwise workless architects to help with the preparation of these drawings, with a view to possible publication.

THE WORLD'S FAIR, CHICAGO

Preparations for the World's Fair, Chicago, to be held this summer, are rapidly approaching completion. The photograph above shows the first three of the five pavilions of the General Exhibits Group, in which will be pictured the development of modern industry. Below is seen the Electricity Group, which will be embellished with hanging gardens, steel cypress trees, electric cascades and fountains, gilded pylons and paved terraces. White, red, yellow, gold, blue and silver will be the colours used to decorate this Group.

ELECTION OF MEMBERS

At a council meeting of the Institute held last week, the following members were elected:—

As HON. CORRESPONDING MEMBER (1).—Mr. Maurice Gras.

As FELLOWS (9).—Messrs. R. K. Ellison, P. Hardy, A. P. Lay, E. E. Morgan, M. Skinner, F. L. Atwell, Captain C. C. A. Hobbs, D. E. Ingleton, and W. A. Lea.

As ASSOCIATES (61).—Messrs. E. S. Ambrose, R. Ashton, D. G. Bannerman, E. Bedford, T. Bertram, V. D. Bouchard, (Miss) O. G. V. Briggs, A. Brown, C. L. Bugler, S. A. Comben, D. G. Cutler, E. Davies, T. H. Eley, S. Elgar, K. Exell, J. E. Farnsworth, E. Firth, J. H. Fowler, E. E. Freeborn, J. Galletly, K. W. Gearey, D. Gillespie, G. D. Griffiths, H. L. Hare, D. Harvey, E. R. Heathcote, F. A. Hewitt, A. W. Kendrick, (Miss) E. E. Maclennan, W. E. Marston, J. Miller, A. L. W. Morrison, R. J. Page, H. G. Pescod, J. W. Poltock, (Miss) O. M. E. Price, S. Ripley, H. J. Risbridger, G. Robb, A. Robinson, F. L. Rothwell, J. K. G. Sarjeant, J. J. de Segrais, C. B. Smith, H. B. K. Smith, W. C. B. Smith, C. A. Spivey, D. R. Stark, R. O. Sutherland, W. T. Sutherland, E. G. Thacker, T. E. S. Thwaite, C. R. Tozer, W. Underwood, W. G. Walmsley, A. W. Waters, P. G. K. Watkinson,

F. E. Woolley, W. G. Wright, (Miss) B. Wrinch, H. Wyatt,

As LICENTIATES (8).—Messrs. H. Avison, J. C. Hall, G. Helson, I. L. James, L. H. Patten, C. W. M. Potts, S. E. Tarrant, W. E. Welch.

COUNCIL MEETING

Following are some notes from a recent meeting of the Council of the Institute :

Standing Advisory Committee of the Department of Scientific and Industrial Research on the Testing of Building Materials : The President was re-nominated to represent the R.I.B.A. on this Committee for the year 1933.

Leverhulme Maintenance Scholarships at the Architectural Association School of Architecture : Mr. A. H. Moberly (F.), Chairman of the R.I.B.A. Examinations Committee, was nominated as the R.I.B.A. representative on the Committee appointed to administer the above scholarships.

Technical Committee on Timber Specifications : Mr. R. B. Ling (F.) was appointed to represent the R.I.B.A. on a Technical Committee set up by the British Standards Institution to consider the question of Timber Specifications.

Appointment of Examiners : On the recommendation of the Board of Architectural Education, the Examiners were appointed for the year ending December 31, 1933.

The Architects (Registration) Act, 1931 : The Recognition of Examinations : The Council were formally notified that the R.I.B.A. Final and Special Examinations had been recognized by the Architects' Registration Council as a qualification for registration under Section 6 (1) (c) of the Act.

The Registration of Architects in Shanghai : A letter was submitted from the Foreign Office stating that instructions had been issued by the Executive Yuan of the Chinese Government to the effect that membership of the R.I.B.A. can be accepted as sufficient qualification for registration of architects in China.

Model of Temple of Edfu : On the recommendation of the Literature Standing Committee, it was agreed to lend the Model of the Temple of Edfu to the London University Museum of Models.

Christmas Holiday Lectures for Boys and Girls : The Art Standing Committee reported that they had asked Mr. E. R. Jarrett (A.) to give the lectures again next year.

Alteration of the Name and Rules of the Birmingham Architectural Association : The Council gave formal approval to the revised Name and Rules of the above Association.

Transfer to the Retired Members Class : The following members were transferred to the Retired Members Class :—

As Retired Fellows : Messrs. G. Hornblower ; A. M. Mackenzie ; A. R. Mayston ; J. R. Moore-Smith ; and F. W. Simon. *As Retired Associates :* Messrs. A. W. Addison ; F. B. Cooper ; and W. A. Moull. *As Retired Licentiates :* Messrs. P. Bowden ; E. W. Crickmay ; J. B. Drower ; A. Howard ; F. G. Pain ; and A. W. R. Simpson.

Resignations : The following resignations were accepted with regret :—

Messrs. C. R. Ashbee (F.) ; H. L. Beckwith (F.) ; H. T. Bill (A.) ; G. Capon (L.) ; G. Cash (L.) ; A. S. Gold (L.) ; F. Hatch (L.) ; and W. Kerr (Alloa) (L.).

Reinstatement : The following ex-member was reinstated :—

As Licentiate : Mr. Joseph Boyd.

Election of Students : The following Probationers were elected as Students of the R.I.B.A. :—

Liverpool School of Architecture : Misses M. M. Baird, K. M. Hinchcliffe and Mr. A. Hadjidemetrion. Architectural Association : Messrs. G. I. Clay, V. B. Martin, C. A. V. Smith, Northern Polytechnic : Messrs. G. I. Clothier and C. J. Pickett. University of London : Mr. P. D. Dunham. Glasgow School of Architecture : Messrs. D. G. MacConville and J. B. Watson. Edinburgh College of Art : Mr. A. B. Kerr. University of Sheffield : Messrs. E. V. Knott, J. A. Nixon and A. K. Taylor. Nottingham School of Architecture : Mr. A. G. Nixon. R.W.A., Bristol : Messrs. W. M. T. Parsons and P. K. Pope. The Polytechnic, Regent Street : Messrs. J. B. Smith and L. H. Wilson. School of Arts and Crafts, Southend-on-Sea : Mr. B. G. White. University of Manchester : Miss A. E. Powicke. Intermediate Examination : Mr. A. A. van Montague. Approved qualification in the Dominions : Mr. C. Dainton.

COMPETITION NEWS

FOR THE DESIGNER

Details of an opportunity for British designers to show their worth in open competition against the designers of the rest of the world were announced on Saturday last by Sir William Crawford, the chairman of the Organizing Committee of the forthcoming Advertising and Marketing Exhibition at Olympia.

The opportunity (according to Monday's *Manchester Guardian*) will take the form of a competition in which designers of virtually everything for promoting sales will be given a free hand to submit designs (as many as six entries for each of the forty-and-odd categories will be permitted) for such things, as posters, trade marks, containers, shop-fittings of every kind, illuminated signs, and advertising novelties. And if the competitor feels that his talent lies outside the categories mentioned he may submit designs for any other subject, provided that it "might be said to assist in the sale or distribution of goods."

The exhibition officials, it is further stated, have decided to accept entries from individual designers only and not from commercial concerns, and so give the individual a freedom usually denied to him in competition. Designers of any nationality may compete. The Judging Committee will have Lord Leverhulme as its chairman and will include Sir Ambrose Heal and Messrs. Paul Nash, C. R. W. Nevinson, L. Raven-Hill, and Aubrey Hammond. Winning exhibits will be awarded a diploma.

TRAVELLING SCHOLARSHIP

The Institution of Structural Engineers have just issued particulars of the Portland House Travelling Scholarship, 1933. It will be awarded for the best design for a concrete sports stand, for which a prize of £150 is offered, together with a gold medal. The two designs placed next in order of merit may, if the jury deem them of sufficient merit, be awarded respectively a silver and bronze medal. Candidates for the scholarships may be members in any class of the Institution of Structural Engineers who on June 10, 1933, are under the age of thirty five years. All candidates who submitted designs for the concrete church in 1932 (the winning design is illustrated in this issue) are eligible to compete for the present scholarship.

The scholarship is awarded with the intention of providing an opportunity for the study of cements, concrete, and reinforced-concrete, in foreign countries, to a candidate who has already some knowledge of these subjects.

The winner of the scholarship will be required to spend 28 days on the Continent, there to study the æsthetic and practical conditions pertaining to the uses of cements and concrete.

Entry forms may be obtained from the Institution at 10, Upper Belgrave Street, S.W.1. The closing date is May 20.

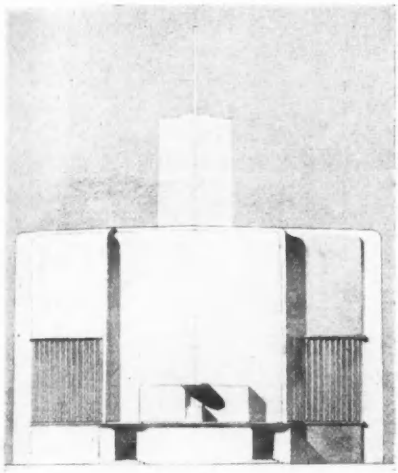
Competitions Open

March 15.—Proposed Burgh Chambers, Municipal Offices and Public Baths for the Town Council of the Burgh of Prestwick. Open to architects who have been in practice, either as individuals or as partners in a firm, for at least twelve months prior to March 1, 1933. Assessor : A Graham Henderson, F.R.I.B.A. Premiums : £200, £100 and £50. Applications for conditions of competition and plan of site should be made to William Shaw, Town Clerk, Burgh Chambers, Prestwick, Ayrshire, together with a deposit for £2 2s., today, March 15. If the applicant decides not to enter, conditions, etc., must be returned before April 15. Designs to be submitted to the Town Clerk not later than 12 noon on May 8.

March 24.—Façade to a newspaper office in grey Cornish granite, for the Cornish Quarry Masters' Association. First Prize, £50. Conditions etc., were published in *A.J.* for Feb. 1.

March 31.—Competitions for Cottages to be built at an economic rent, organized by the Building Centre, 158, New Bond Street, W.1, from whom full conditions are obtainable. Premium : £100.

April 13.—Design of a new exhibition hall at Manchester for the Management of the Manchester Building Trades' Exhibition. Premiums : £150, £75 and £25. Full particulars were published in *A.J.* for February 15.



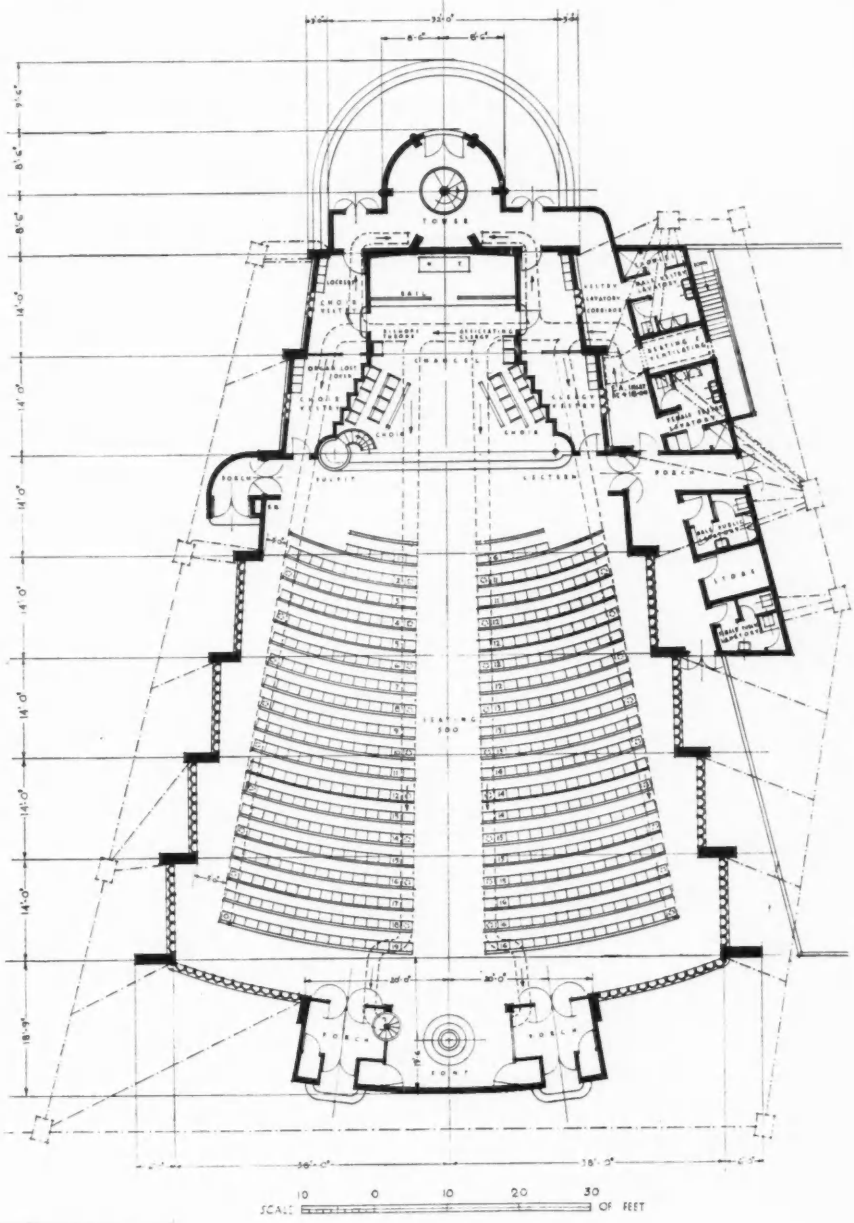
May 31.—Sending-in Day. Layout of a suburb on the river Escaut, Antwerp. £2,400 in prizes (1st, £800). Conditions, etc., were published in *A.J.* for December 7, 1932.

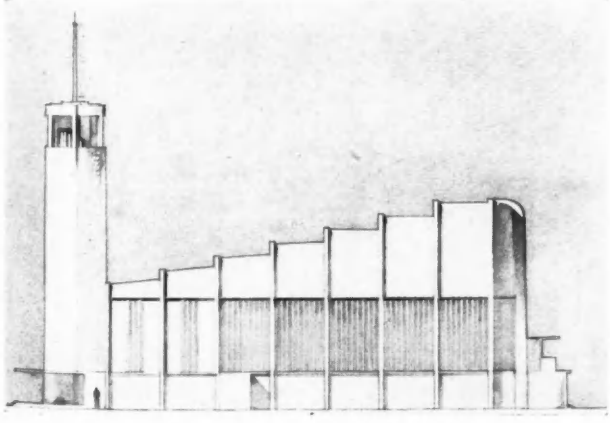
ON THE AIR

The next talk in the B.B.C. series "Other People's Houses" will be broadcast on Monday next, March 20, in the National Programme at 9.20 p.m. It is to be given by Sir Raymond Unwin, P.R.I.B.A., who will speak on "A Proposal for a National Housing Board."

A REINFORCED CONCRETE CHURCH

DESIGNED BY WALTER GOODESMITH





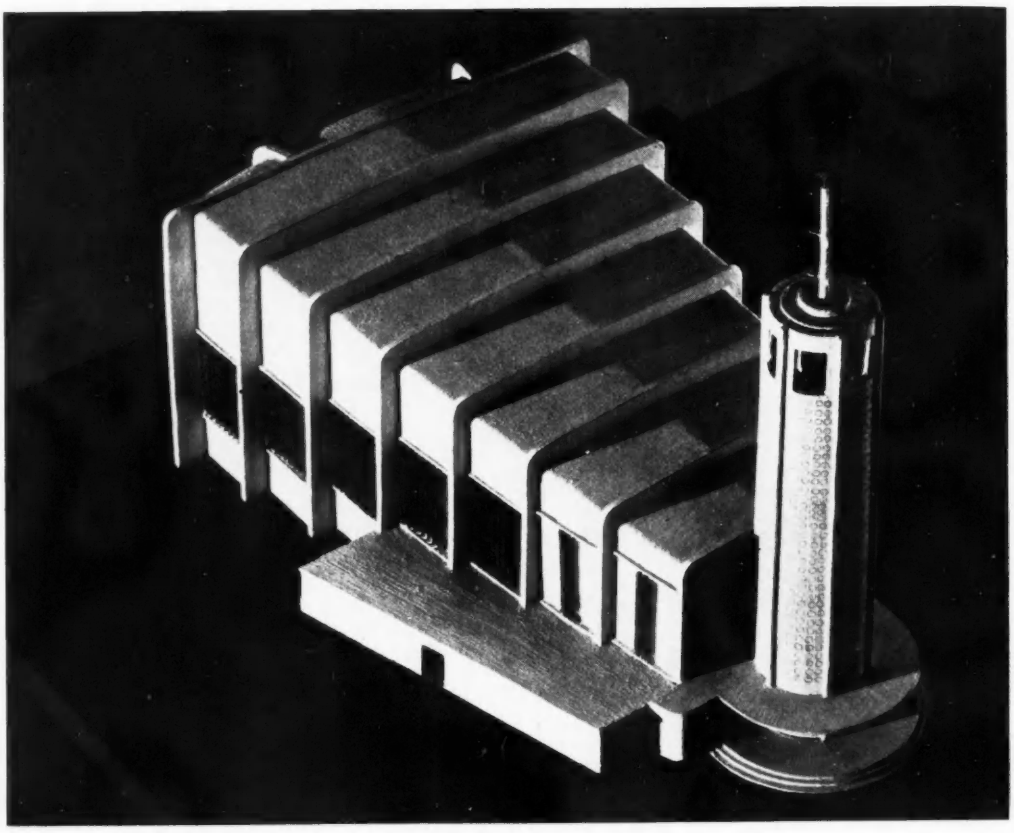
The west elevation, with open-air pulpit.

This design, by Walter Goodesmith, A.T.C. (Syd.), A.R.I.B.A., was awarded the Portland House Travelling Scholarship and Gold Medal of the Institution of Structural Engineers for 1932. The concrete scholarships of the Institution of Structural Engineers are, it is understood, the only ones in Great Britain to combine the two subjects of Architecture and Engineering.

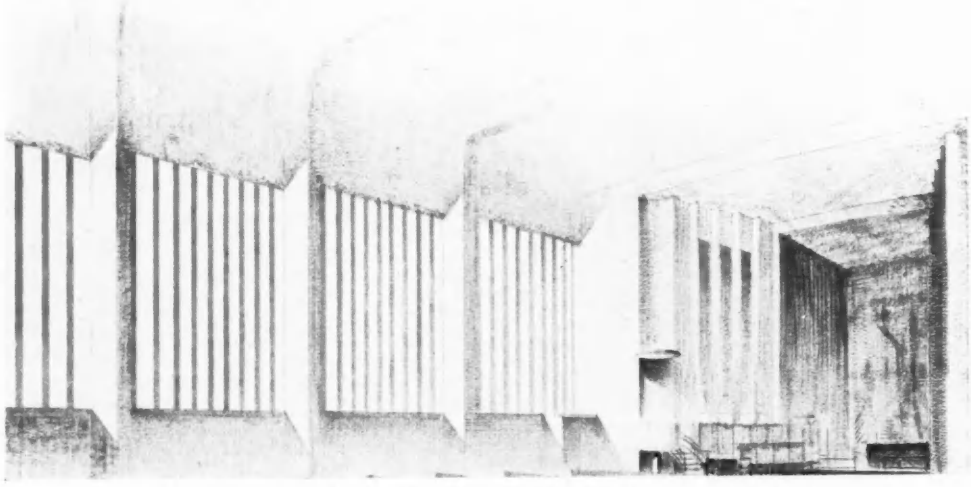
NOTE BY THE ARCHITECT

The acoustical treatment of the problem and the correct expression of the materials used have been the deciding factors in determining the mass and general expression of the structure.

The north elevation.



The side walls and roof are identical in section, the stepped formation increasing directly as the distance from the source of sound.



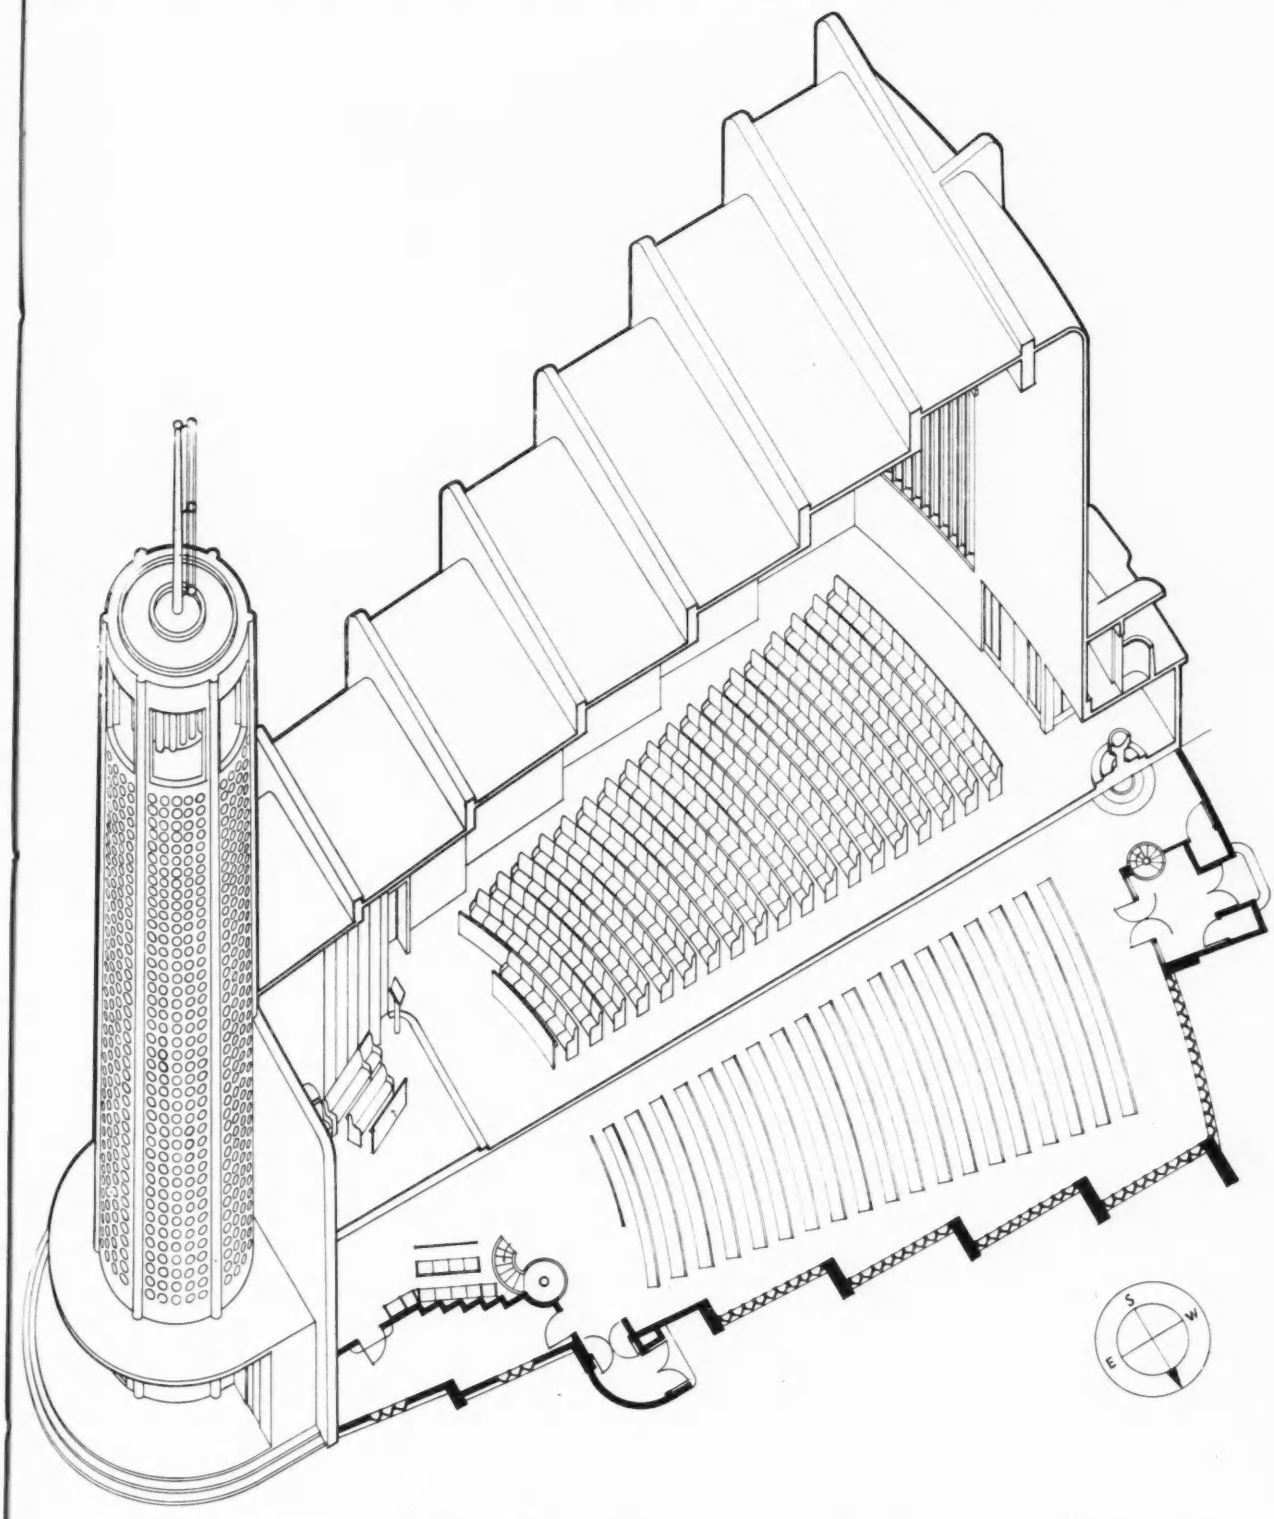
The circular east-end carillon tower has tubular bells and is an expression of circular glass lights set in concrete between vertical piers, the top being surmounted by a wireless mast.

The main windows extend between rigid frames, and consist of rolled plate fluted glass in facets, set alternately at 30 deg. between concrete mullions.

An open-air pulpit is provided at the west end for haranguing the multitudes in the open spaces surrounding; an amplifier is installed therein.

REINFORCED CONCRETE CHURCH DE

NOTE BY THE ARCHITECT

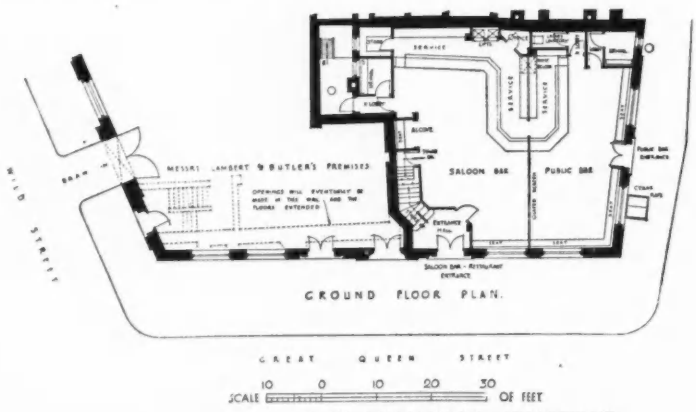


Fortunately, the acoustically-shaped plan is an ideal one from the point of view of sight lines and, with the seating arranged radially, an unobstructed view is obtained from every seat.

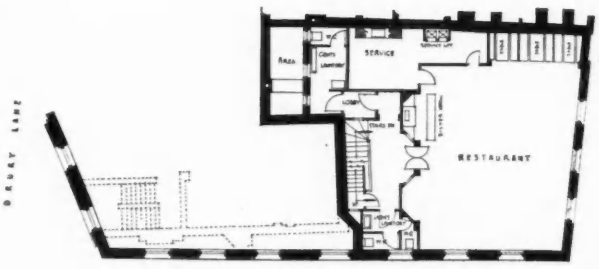
The walls of the chancel have been sloped outwards, producing a better acoustical shape, and at the same time opening up the vista. Complete circulation is provided, enabling the maximum use to be made of the layout.

The organ is expressed by grilles on both stepped sides of the chancel; the organ loft, with blower equipment, is placed above the vestries.

The design of the furnishing throughout is simple and functional, in keeping with the general expression of the whole.



CH DESIGNED BY WALTER GOODESMITH



ISOMETRIC & PART PLAN

10 0 10 20 30
SCALE OF FEET

BEFORE : A TRANSFORMATION SCENE

A. W. BLOMFIELD, ARCHITECT

The photographs show the "Prince of Wales" public-house, as it stood, formerly, at the corner of Great Queen Street (right) and Drury Lane, and as it now stands. Following the building of the Masonic Memorial Hall, further along Great Queen Street, L.C.C. street improvements have resulted in setting the corner back thirty feet. The licensed house occupies only half the new frontage, but, by friendly arrangement, the front wall is continued, as shown on the plans, across Lambert and Butler's warehouse premises, with a return to Wild Street, to form a harmonious whole ; eventually it will be the main front wall of their factory.

The public-house is constructed in brick, with Portland stone facings, and metal windows. On the ground floor the saloon is fitted with an up-to-date snack bar, continuous with the beer counter.

The tenant's quarters are on the second floor, and comprise two bedrooms, sitting-room, bathroom and lavatory. The staff are accommodated in five bedrooms on the third floor, where a sitting-room and additional lavatories are provided.

R. LESLIE ROLLO. F.R.I.B.A. (Head of Aberdeen School of Architecture)
P. WILLIAMS

Building—Figures and Facts

SIR,—Referring to the leading article in your issue for March 1, entitled "Building—Figures and Facts," you have missed out one very important point.

You refer to the £40 spent during the week on wages by the manufacturer of the articles required for the builder, and then go on to account as to how this £40 is disbursed. But you have entirely forgotten that for a manufacturer to spend £40 on wages he must of necessity spend a further amount on the materials which he has to use, and this, to my mind, would probably be in the region of another £25. If you took 40 per cent. of this as representing wages this adds a further £10 to the £80, making, therefore, a total of £90 to be spent on food and clothing, etc., plus the other additions which you mention.

WILLIAM HINTON

[I am afraid that the nature of my assumptions—which, possibly, I did not make sufficiently explicit—has rather misled your correspondent.

I supposed that a contract for £100 was given. The contractor would then spend £40 on wages and £50 on materials, on the average for all types of work. I then went on to say that out of the £50 spent on materials, the manufacturer would pay out £40 in wages. Your correspondent argues that this would entail a further expenditure of £25 on materials, which would contain an element of wages. But only £50 is spent on materials by the contractor, and the manufacturer cannot spend £40 on wages *and* £25 on materials out of £50.

The reason why my statement does not agree with that made by your correspondent's impression of the facts is not because I have omitted elements of wages, or because his impression is incorrect, but because I made an assumption which, for the sake of brevity, I did not make explicit. I assumed, namely, that the manufacture of materials through all stages from the extraction of the raw material was carried on by one person. In the case of bricks, expenditure on wages by the "manufacturer" in my article covers all expenditure on wages from the extraction of the necessary raw material to the completion of the brick.

Through all the processes and on the average for all the different materials, £40 out of an expenditure on the original contract represents the payment of wages by the contractor and an additional £40 the total payment of wages in the manufacture of the materials. Your correspondent's "40 per cent. of £25" is thus already reckoned in the £40 paid in wages by the manufacturer. — YOUR LEADER WRITER]

The Keypoint

SIR,—The wave of public economy permeates every sphere of our national life and, if I may say so, not always to our national advantage.

Board of Trade figures show that our retail trade had diminished in January, 1932, by 5.6 per cent. and in January,

IN DRURY LANE, LONDON : *AFTER*

1933, by 11.6 per cent. This progressive decline in purchasing power is most serious and, if continued, can lead only to stagnation.

May I suggest that the Government should indicate their willingness to local authorities to allow schemes of work to get going again? Mr. J. M. Keynes has said that £30 million spent on houses would add £60 million to our national income.

It is also true that the building trade is always a keypoint in the economic structure and any improvement there would quickly radiate.

I am sure it would.

HERBERT J. ORMOND

A Woman's Ideal Home

SIR,—I am pleased to see that you referred, in your last issue, to Miss Elizabeth Craig's plans for an alleged "ideal home" that were recently given considerable prominence in *The Sunday Express*.

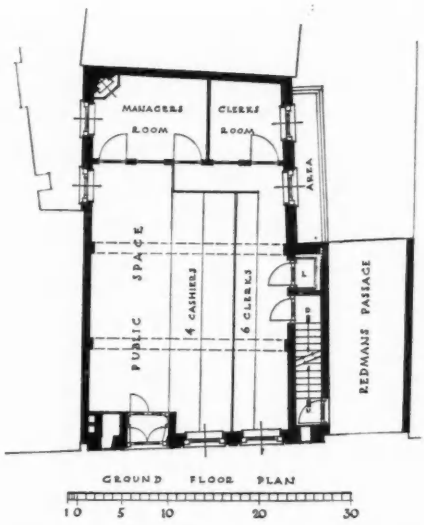
What is the use of such protective measures as the Architects' (Registration) Act if the British public (especially the easily gulled "modern woman") is to be left to the tender mercies of such architects as Miss Craig?

Her so-called "ideal" plan will not bear one moment's expert examination; it is really the greatest lot of juvenile nonsense I have ever seen, and the fact that any responsible paper should publish it shows how gullible people are in this highly-specialized work of domestic architecture.

Not only was the staircase so planned that, for lack of headroom, it would be impossible to get up or down it except by crawling on one's hands and knees, but practically everything else was about as ill-planned as it could possibly be. Thus, winders are provided at both top and bottom of the staircase, so that if you fail to trip up and break your neck on *one* set of winders you have a second chance to do so each time you use this modern woman's "gracious" staircase!

Then, with regard to cupboard accommodation. We men architects have invariably been told, with monotonous insistence, by our lady clients, the old old story about the great importance of providing *plenty* of built-in cupboards. But on reference to Miss Craig's own plans what do we find? *Not one single built-in cupboard in the whole house!* The only cupboard shown is the very small *projecting* cupboard in the kitchen. Furthermore, the kitchen sink is so planned that it is impossible to provide it with a draining-board—*there is absolutely no space for it.* Yet, if a mere man may venture to say so, what earthly use is a kitchen sink *without* a draining-board?

Three bathrooms are provided in this small "ideal" house—all with due *north* aspect. Two of these bathrooms are shown no wider than the width of the stairs, i.e., about 3 ft., which means that by the time the bath is fitted there will be practically no floor space left to get in or out of the bath! As for the maid's bathroom, there would scarcely be room in this for fitting a good-sized lavatory basin, let alone a bath.



The rest room so thoughtfully provided for the maids is a most sumptuous apartment of about 5 ft. square—or just about as large as a glorified telephone box! But this is not all. So that this rest room should justify its title and be as restful as possible, Miss Craig has planned it so that it constitutes the *only* means of access to the kitchen from the rest of the house—and furthermore in order to be cheerful and healthy it has, like each of the two bedrooms provided for the poor unfortunate maids, *a due north aspect!* These thoughtful and considerate arrangements will doubtless duly impress

A BRANCH BANK AT SEVENOAKS

DESIGNED BY
MITCHELL AND BRIDGWATER

A view of the exterior of this new country branch of Barclays Bank, in High Street, Sevenoaks, Kent, is reproduced as frontispiece to this issue.

The ground floor consists of the banking hall (with accommodation for four cashiers and six clerks) and a manager's room (see below) and clerk's room. All woodwork is in oak having a silvery grey stain, with certain parts picked out in ebonized mahogany. In the public space, the floor is covered with rubber in a pattern of black and two shades of coffee-colour, rather following that of the woodwork. The outer edge of this floor is in black rubber, turned up all round as a kicking-plate and skirting. The furniture has been designed by the architects specially for this interior.

The first and second floors are to be let off as offices and are approached from the side door.

the maids and make them realize how very lucky they are to be living in an "ideal home" designed by a modern *woman* and not, thank goodness, by the usual non-understanding and inhuman male architect. And the guests too will also doubtless appreciate the equally convenient and hygienic arrangement whereby *the ground floor w.c. has been planned so as to open direct into the lounge.*

I think a fitting penance for Miss Craig would be to *make her live in her own "ideal" house!* I should love to see her, on her hands and knees, wriggling up and down her own "gracious" staircase!

L. J. REDGRAVE CRIPPS

[*As we go to press, we receive, from Mr. Redgrave Cripps, plans of a house designed by him on parallel but workable lines. Both sets of drawings, with his detailed comments, will appear in our next issue.*—ED., *A.J.*]

Building Societies

SIR,—The statement recently made by Mr. Stanley Baldwin that building societies have helped to finance about one-half of the two million houses constructed since the War in Great Britain will come as a surprise to many. We have heard so much of municipal housing that the work of these societies is apt to be forgotten. The movement recently has had a setback, for so many of the buyers of these houses are faced with depreciation of values, and today sadly recognize that part of their savings invested in their homes has been lost.

It is encouraging, however, to learn from Sir Josiah Stamp that property is now in increasing favour, and has probably reached a more stable level than at any time since the War.

A STUDENT OF ARCHITECTURE

Little Things that Trouble

SIR,—Following is a copy of a letter sent to me from London by a former architectural student who, in these hard times, has turned contractor.

R. LESLIE ROLLO

DEAR PROFESSOR,—Many thanks for your letter and the form. I'm afraid my optimism is not a virtue. It's an incurable affliction! Life's a sheer joy! I spend my days plumbing the depths of my ignorance. Which reminds me (talking of plumbing) that there are things that I was never told during the delightful course at the School. Who, for instance, would have suspected that such a matter of fact little gadget as a cistern ball valve could lead to sleepless nights for countless countesses. Yet I can now say with authority that if one just orders "56 best quality bronze ball valves," and doesn't mention that the building is to be eight stories high, then most of the dear little balls will stay below the water, instead of bobbing blythly on the surface. And the result is most irritating. If you would like some slightly used ball valves, I could lay my hands on about 20 very cheaply (they're in a cupboard in the office). I shall expect to see a note in next year's construction prospectus that "All the facts concerning ball valves" will be included in the curriculum.

Precisely similar caution has to be observed with regard to square hot water tanks. These are frightfully deceptive and I strongly advise all architects to make a careful study of their habits, and they will be surprised to find that, soon after bulging 6 inches, they burst. I took a short course on these things, and was immersed in my subject. Still, all my friends tell me that I suit grey hair. My little diary (part one), entitled "Mistakes and Disasters—Usual and Unusual—collated and arranged," should win an instant place next every architect's heart, in his vest pocket. One thing I have learned, and that is to approach the smallest detail with caution and suspicion, for even a chromium-plated screw has cunning lurking in its little spiral soul.

I'm building myself a house in Boxot (a lovely spot) with floating ball valves, chromium-plated screws and unburstable square hot water tanks complete, and I hope to settle there towards the end of this year.

With kindest regards,

Yours sincerely,

CARLTON HOUSE TERRACE

A CORRECTION AND AN APOLOGY

We publish below a letter we have received from Messrs. Pinchin Johnson & Co., Ltd.

"DEAR SIR,

"Our attention has been directed to an article appearing in the issue of your JOURNAL for February 15, 1933, dealing with the subject of Carlton House Terrace. In the course of that article appeared two statements which, if uncontradicted, would be likely materially to damage our Company, and those statements, it appears to us, are in their nature libellous.

"In the first of them it is stated that our Company is 'a firm which by reason of some of its directors and the holdings of certain blocks of shares must come under American influence.' In the second of them it is stated that our Company chose to carry on 'caring nothing for public opinion, Parliament, amenities, The Mall, or anything in the world except their American shareholders.'

"We have been at some pains to analyse our share registers and we find that 0.35 per cent. of the shares are held by Americans, and it is totally untrue and extremely damaging to suggest that the holders of those shares exert any influence upon the company.

"We state emphatically that none of our directors is an American; that our business is not controlled or influenced by Americans, or American capital in any shape or form, and we have to ask, therefore, that you immediately withdraw the statements to which we have taken exception, and that such withdrawal and a suitable expression of regret are published in at least as prominent a type and position in the JOURNAL as the article to which we take exception.—Yours faithfully,

PINCHIN JOHNSON & CO., LTD.
R. PALTRIDGE
Managing Director"

We wish to apologize to Messrs. Pinchin Johnson & Co. for having published a statement which it is obvious from the above letter is totally untrue. We unreservedly withdraw that statement and our comments upon it and express our sincere regrets for having given publicity to it.

Three to One

SIR,—Some two years ago I dropped into a Lyons teashop in Fleet Street for a cup of tea. I glanced round the room and noticed that the only other person present was deeply engrossed in a copy of a rival architectural paper. When I left the shop some fifteen minutes later the paper still claimed his attention. I remember at the time thinking that I must obtain a copy of the number and find out for myself whether it deserved so much attention.

You will probably ask why I am writing on a thing that happened two years ago, but this was recalled to mind when on Wednesday last I strolled into the same Lyons to satisfy my inordinate thirst for tea, and I saw not one, but three persons studying THE ARCHITECTS' JOURNAL. Two were obviously reading the current issue, because of its buff-coloured cover, but the third was engrossed in the New Year issue.

Three to one, I think, is very good odds in the small field of architectural papers that are now being published.

P. WILLIAMS

DE-SLUMMING

[BY E. MAXWELL FRY]

THE nearer we get to slum clearance, the more difficult it appears. The more it is looked upon as a difficult but not abnormal extension of the normal housing problem, the less likely we are to make a success of it.

We have shirked it so far because our common standards of living have risen faster than wages, and building costs faster than both.

Secondly, slum clearance is an urban problem, arising out of poverty, congestion and vested interest. It was easier to build small houses upon the outskirts of towns than it was to turn to the depressing mess at the centre. At the time, the easier way was perhaps the better. Most of us acquiesced. It was nearly the only way.

But the process of transferring slum-dwellers from the centre to the outside could not go on indefinitely. It was not always a success. The transferred did not always appreciate their far-flung garden cities. Becontree was saved from failure by the coming of new and not altogether expected industries.

And still the slums remained, and face us, now, with the urgent problem of housing the very poor—those who cannot afford more than 9s. per week for rent—in flats and houses of such a standard as will prevent their occupation by poor people turning them into slums of the future.

And there is this further problem: that in the siting and in the design of these dwellings, we are to build them in the likeness of a civilized town, offering something more than bricks and mortar to their intelligent and worthy inhabitants, who are as much a part of the race as one who lives, better housed, elsewhere. Slum clearance is not enough. It must be town planning too, if it is to last longer than the slums it replaces.

The wireless discussion between Mr. H. R. Selley, M.P., and Major Harry Barnes, reported in *The Listener* for March 8, brought dramatically to the front the terms of the conflict between housing standards and economics, and Major Barnes was surely right to maintain that we cannot afford to lower standards if we mean to abolish slums. The L.C.C. new "B" type of flat which cuts the floor area of a four-room flat to 563 square feet, and provides a bathroom to be shared by three flats, reached from an open balcony, is a signal of defeat at the outset of the struggle.

If this is the last word now, how will we end?

The problem must be solved at the centre. *There* it lies, and between it and open land stand miles of dense property, miles of expensive journeying by road or railway. "It is the habit of herding together that we want to break down," said Mr. Selley. I disagree entirely. To herd is human and urban. I may not love my neighbour, but I like to have neighbours. The fallacy that herding is ignoble led the garden-city movement down their garden path. One of the really central purposes of slum clearance should aim at ennobling, by finely-designed dwellings, the human wish to live a neighbourly and an urban existence. How are we citizens otherwise?

New factors enter the housing problem. I said earlier that this last stage cannot be looked upon as just another problem. It requires a new architecture. It requires a new and larger building organization. And finally, it must be approached as town planning.

Sir Raymond Unwin's proposals for a public utility co-ordinating organization, using cheap money backed by the State, indicates the first move in the direction of unification. This should lead to mass-buying, and by means of forward planning, enable production to be regulated to feed construction as this moves forward. If we are to take Sir Hilton Young at his word, we shall be given a national programme. Our job is to plan it for ultimate completion.

But so long as block dwellings are hidebound in planning and construction, economies are squandered. Instead of lowering standards as the new L.C.C. "B" type plan does, we have got to solve the new problem by *absolute* planning, using new materials and new constructions, and, where necessary, bringing building laws forward to meet these methods, and this we must do on a basis of town planning that rejuvenates the rotten areas and makes a town fit to live in.

The thing can be done. As Mr. Chermayeff said, in a recent speech to the West Yorkshire Society of Architects: "Architecture can profit . . . from the example of transport. If similar obtuseness and obsoleteness existed in the latter, the car would still be a luxury for the few." E. M. F.

Housing the Poor

"In the past the poor never really have been decently housed, and there is no prospect that they ever will be in the future unless the State, in one way or other, is prepared to pay part of the cost. In other words, the housing problem, which, of course, includes the slum problem, cannot be solved without the expenditure of public money." This statement was made by Dr. C. Killick Millard, Medical Officer of Health for Leicester, when he gave the Chadwick Lecture at the Royal Sanitary Institute on Thursday last. He continued:

It is to the interest of the State that all its citizens should be decently housed. Money spent in achieving this end will be wise expenditure, and will incidentally relieve unemployment, and thus help the country back to true prosperity.

In any scheme for helping the poor to obtain better houses, the claims of the children should receive first consideration. Children are the class which suffer most from bad housing and who will benefit most from good housing. As things are today the presence of children is too often a real and serious handicap in the struggle to get a house.

In striving to secure a decent healthy housing for the poor we must not stickle too much about "standards." A small loaf is generally better than no bread. It is better for all to have reasonably good houses than for some favoured ones to have very good houses and the rest to have very bad houses, or no houses at all.

The irony of the present impasse is that, side by side with deplorable housing conditions and an acute shortage of houses, is an army of men in the building trades unemployed, and both materials and money are cheaper than ever before.

Working-Class Houses

The Minister of Health has appointed a Departmental Committee to consider and report on the following points on working-class houses:—

(1) What, if any, further steps are necessary or desirable to secure the maintenance of a proper standard of fitness for human habitation in working-class houses which are neither situate in an area suitable for clearance under Part I of the Housing Act, 1930, nor suitable for demolition under Section 19 of that Act, and

(2) What, if any, further steps are necessary or desirable to promote the supply of houses for the working-classes, without public charge, through the agency of public utility societies or other bodies subject to similar limitations operating in particular areas or otherwise.

The membership of the Committee is as follows:—

The Right Hon. the Lord Moyne, D.S.O. (chairman); The Right Hon. Sir Francis Dyke Acland, BT., J.P., M.P.; Sir Charles

Barrie, K.B.E., M.P. ; Sir Geoffrey Ellis, BT., J.P. M.P. ; Lieutenant-Colonel Sir Vivian Henderson, M.C., M.P. ; Major the Right Hon. J. W. Hills, M.P. ; Miss F. Horsbrugh, M.B.E., M.P. ; Mr. N. K. Lindsay, M.P. ; Major G. Lloyd George, M.P. ; and Mr. J. V. Worthington, M.R.C.S., L.R.C.P., M.P.

All communications should be addressed to the Secretary of the Committee, Mr. S. F. S. Hearder, at the Ministry of Health, Whitehall, S.W.1.

R.A. Summer Exhibition

The days for submitting work for this year's Royal Academy Exhibition, to be held from May 1 to August 7, are as follow :—

Water-colours, pastels, miniatures, black-and-white drawings, engravings and architectural drawings—Friday, March 24.

Oil paintings—Saturday, March 25, and Monday, March 27.

Sculpture—Tuesday, March 28.

Hours for the reception of work : 8 a.m. to 10 p.m. (Saturday, March 25 : 10 a.m. to 2 p.m.).

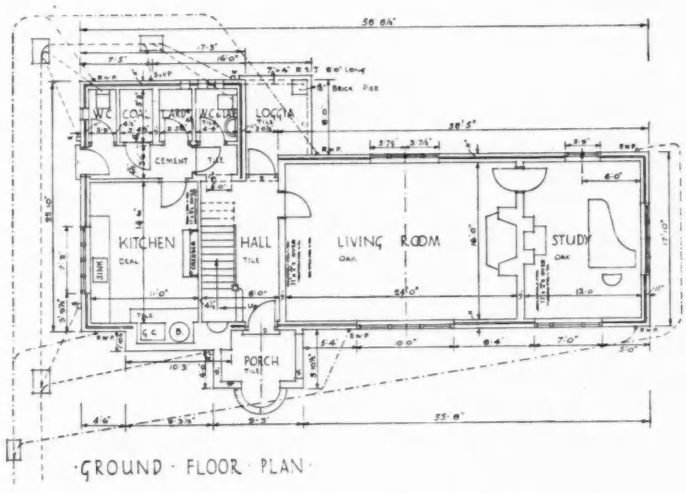
It should be noted that (*a*) not more than three works may be submitted by any one artist ; (*b*) no works will, under any circumstances, be received before or after the specified dates ; (*c*) all work must be delivered (unpacked) at the Burlington Gardens entrance.

Labels and forms can be obtained from the Secretary, Royal Academy of Arts, Piccadilly, W.

Preserving the Amenities

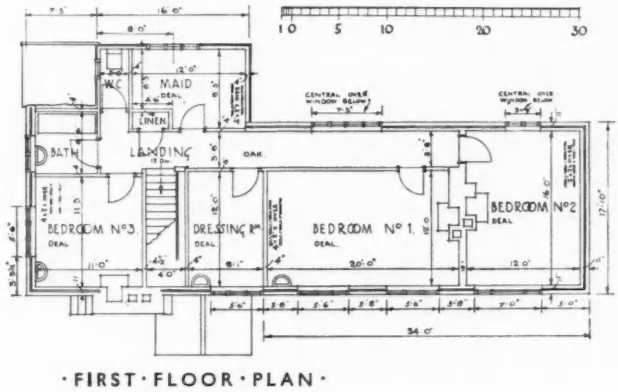
The Council for the Preservation of Rural England has just issued a memorandum on policy and procedure to be adopted in the electrification of England and Wales. The policy of the Council is to assist the undertakers to provide a cheap and abundant supply of electricity, with the least possible damage to the amenities of the countryside. Single copies of the brochure may be obtained, free of charge, on application to the Secretary, C.P.R.E., 17 Gt. Marlborough Street, London, W.1. Extra copies may be had at two shillings per dozen.

Housing Exhibition



The " New Homes For Old " Housing Exhibition, which was first held at the Central Hall, Westminster, in December, 1931, has obtained permanent headquarters at 53 Davies Street, W.1. Sections of the exhibition, which comprises models, photographs, plans, picture diagrams, etc. of the slums, reconditioning, town planning and new buildings, have been exhibited throughout the country. Enquiries for the loan of the exhibits, which can be had for a small fee, should be sent to Miss Elizabeth Alington, the Hon. Secretary, at the above address.

A HOUSE AT ESHER



DESIGNED BY IMRIE AND ANGELL

The external walls of this house are 11 ins. hollow, colourwashed, with a tarred plinth. The chimney stacks above the eaves are built of facing bricks, and the roof is covered with hand-made sand-faced tiles. The oak window frames are filled in with steel casements and leaded lights. The floors to the living room, study and landing are in oak, and the hall, loggia and porch are paved with quarry tiles. The woodwork of the staircase and of all the doors on the ground floor is oak.

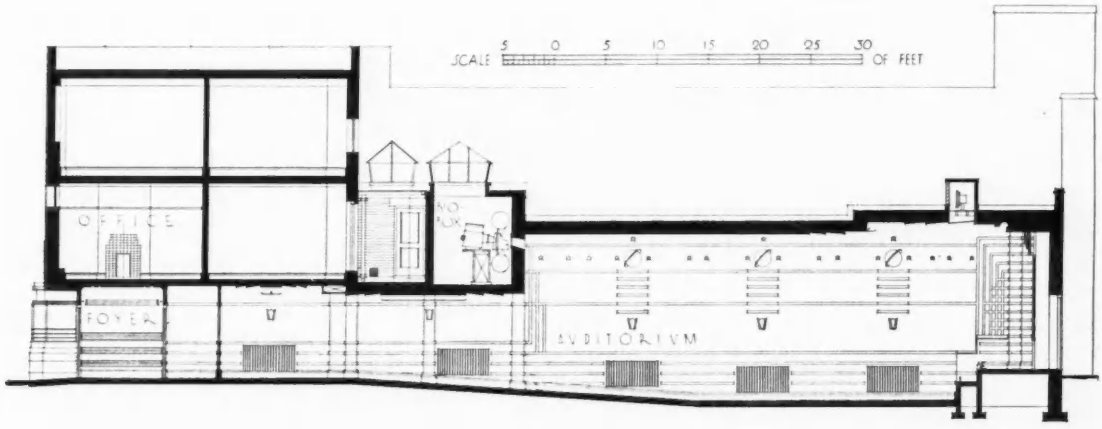
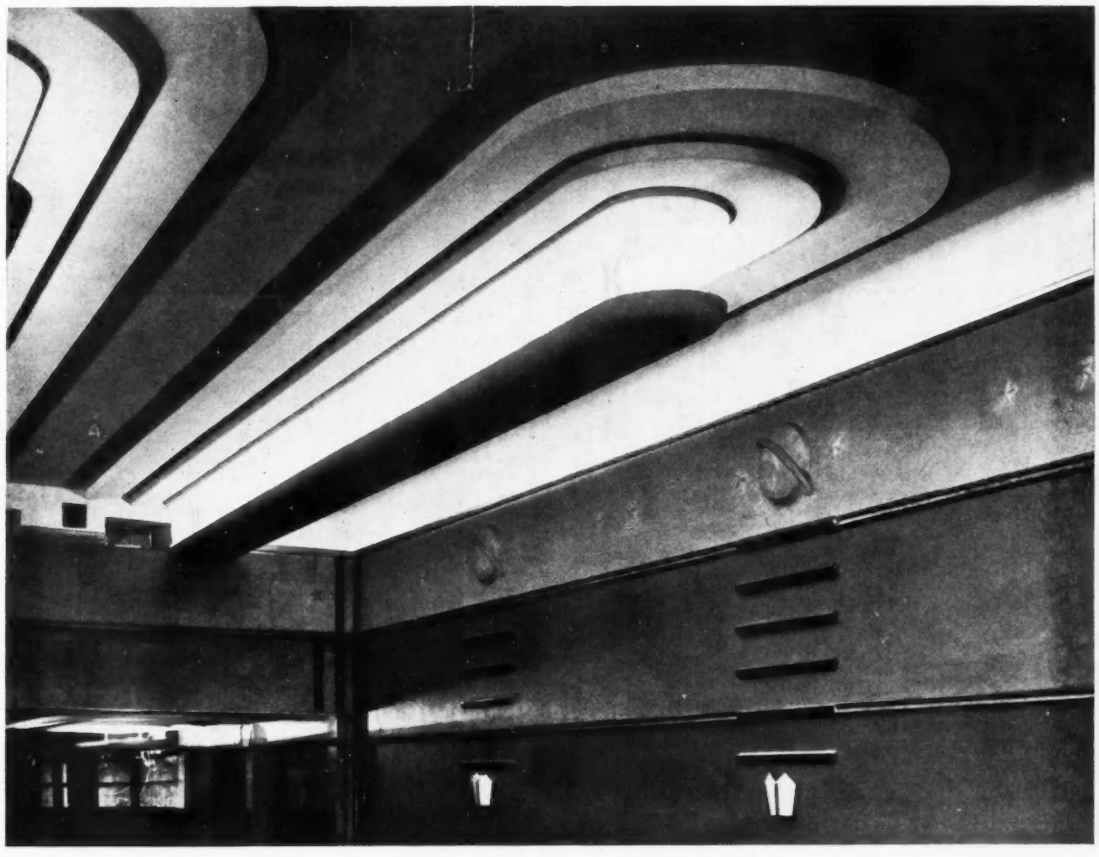
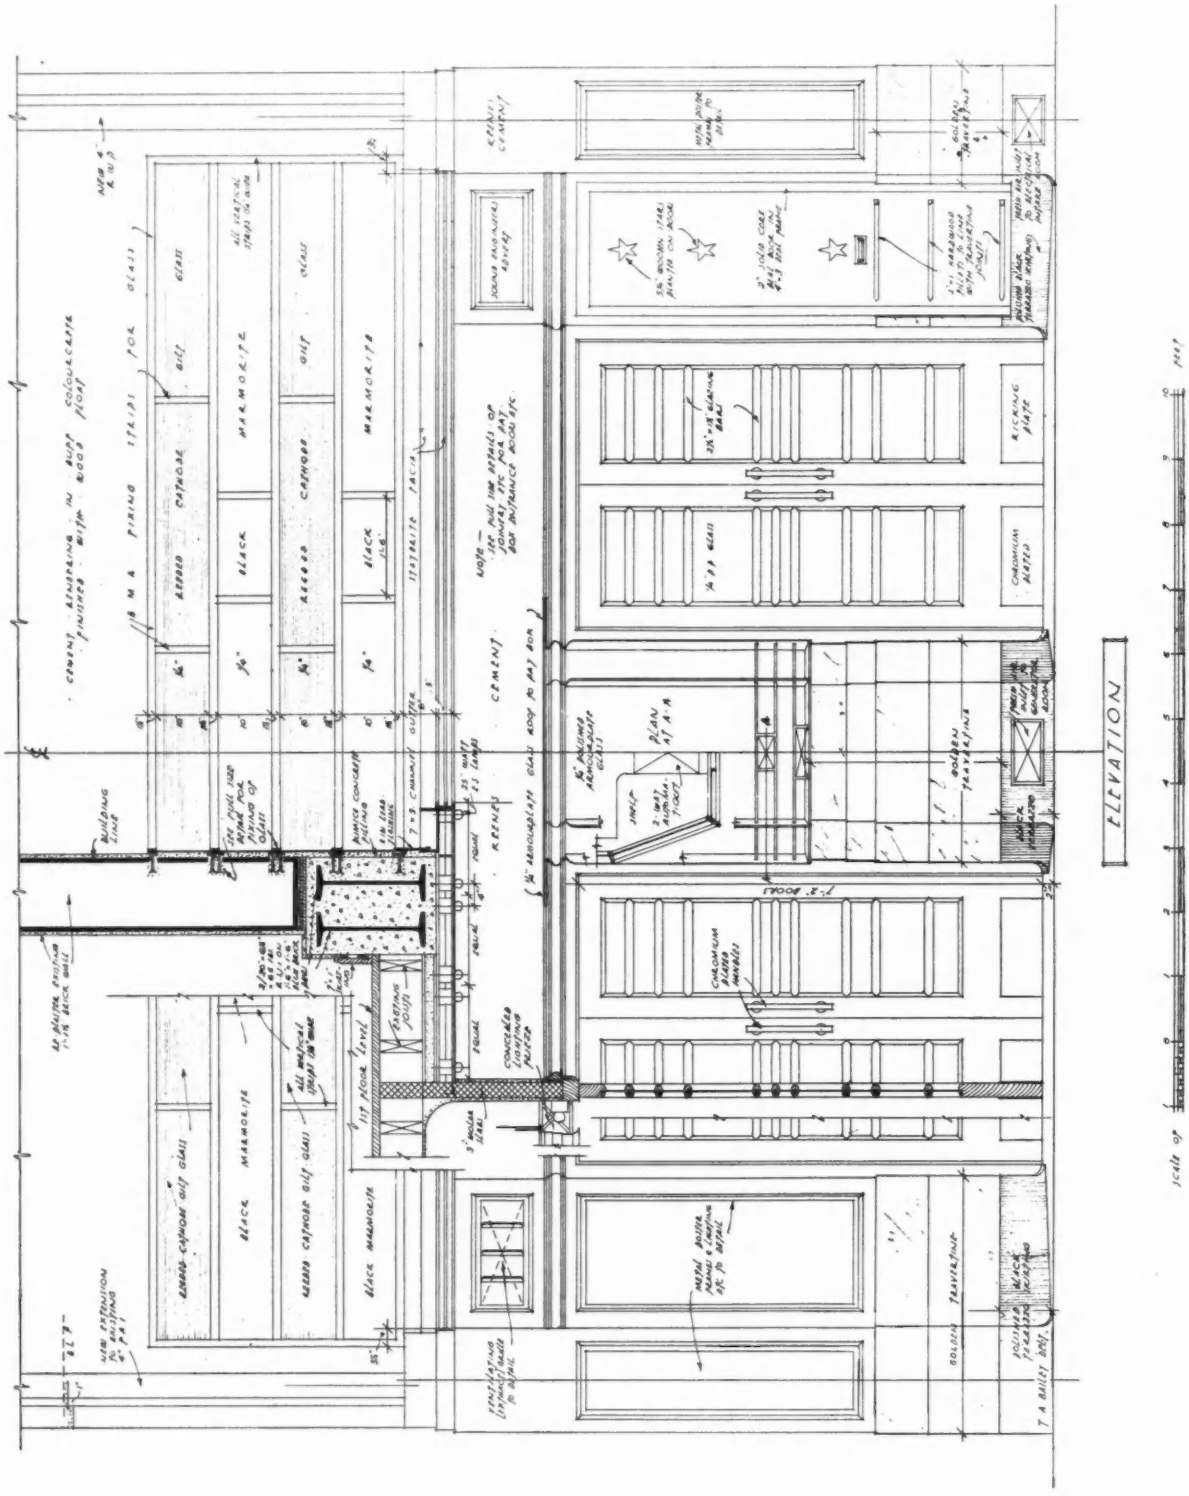
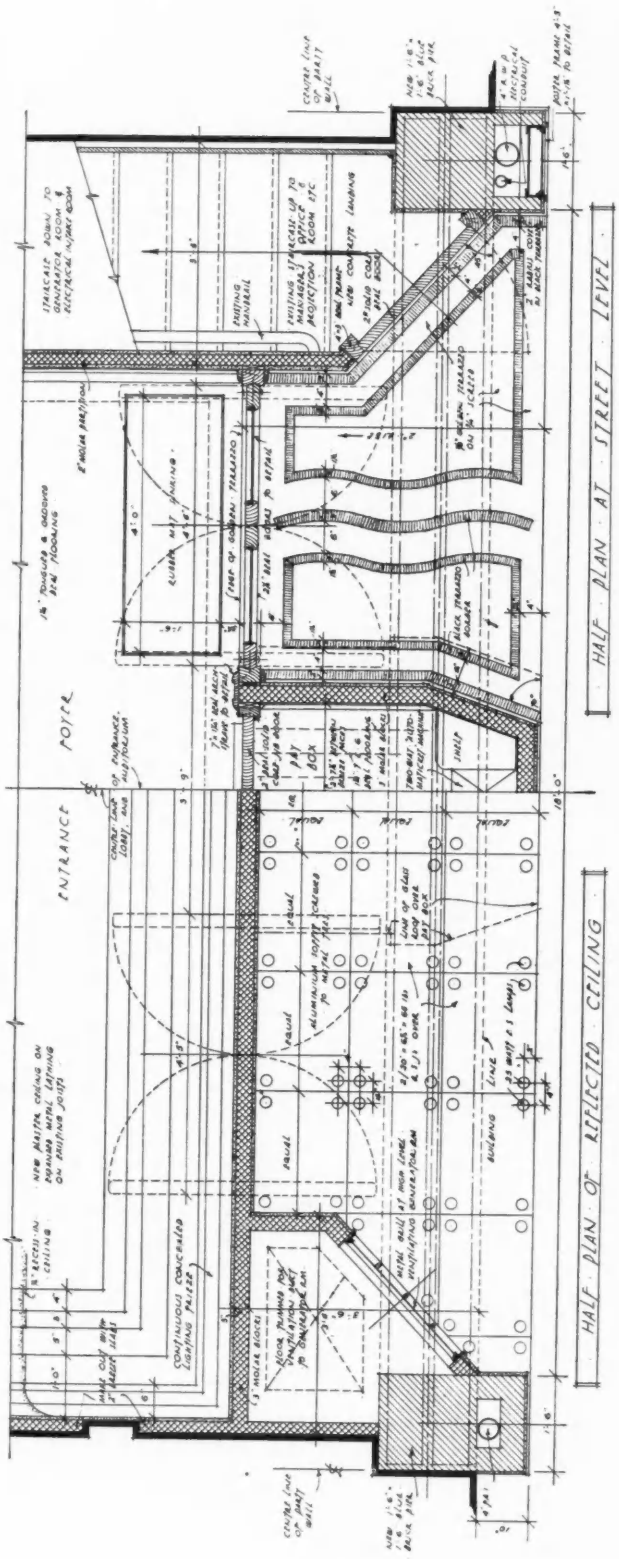
THE SPHERE NEWS CINEMA,



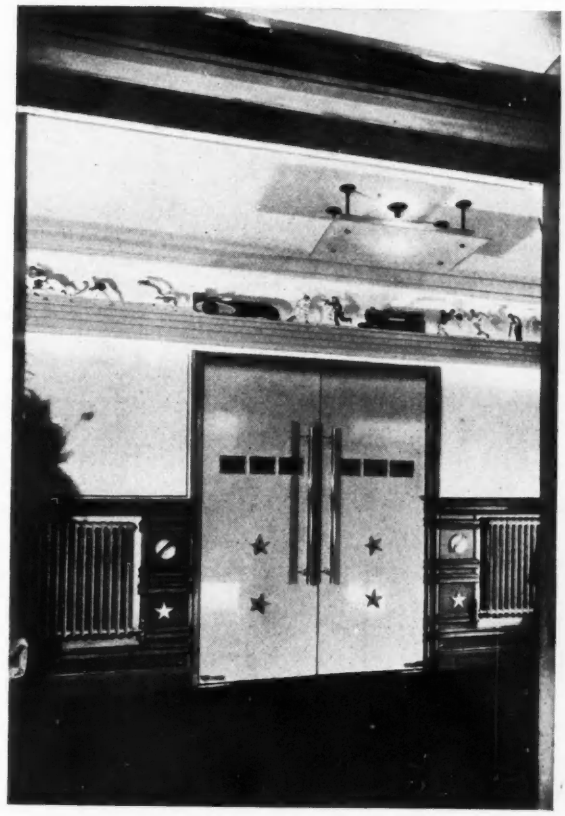


LONDON: BY ALISTER MACDONALD





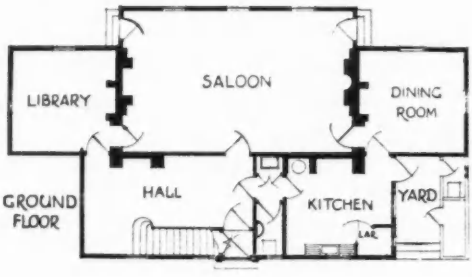
This building used to be the Old Gaiety Cinema in Tottenham Court Road, W.C., reputed to be the last silent picture house in London. There were windows in the old brick façade; they have been blocked in and a mask of buff cement stucco forms a background for the elaborate name-sign, carried out largely in electrical coloured-lighting tubing. Drawings and particulars of the front appear on the following pages.



The interior is smaller than the old one, for it has been designed specially to facilitate hourly changes of audience—e.g. there are but five seats per row—and has been entirely remodelled, and decorated simply in gold and terra-cotta.

THE SPHERE NEWS CINEMA,

LONDON : BY ALISTER MACDONALD



The drawings on these two pages give details of the lower portion of the street front, of which day and night photographs are reproduced on page 368. Prominent between the two pairs of street doors is the pay-box, a superstructure of armour-plate glass above a base of golden travertine with a black terrazzo plinth. Beyond, in the inner wall of the foyer, which extends right across the narrow building, is the single pair of doors, illustrated above, giving access to the auditorium. They are decorated with stars—which, together with the girdled-world sphere, supply motto-motives of which considerable use is made—and surmounted by a running frieze of news events.

The span across the street opening, where the weight of the upper portion of the building is carried by two steel beams on blue brick piers, is faced with a narrow strip of stainless steel with, above, four ten-inch horizontal bands, alternately of black marmorite and reeded gilt glass, the whole enclosed in a frame of bronze. The floor of the entrance is in golden terrazzo, with patterned borders of black terrazzo. The doors have chromium-plated handles and kicking-plates.

TIMBER IN KENT : PHASES OF

DESIGNED BY LORD GERALD WELLESLEY AND TRENWITH WILLS

This week-end house at Hadlow is constructed of timber framework, covered externally with Vancouver weather-boarding, the inside being lined with insulating board. The exterior is painted white, the door and window surrounds bright green; the roof is of black Staffordshire pantiles.

LITERATURE

DECORATIVE ART

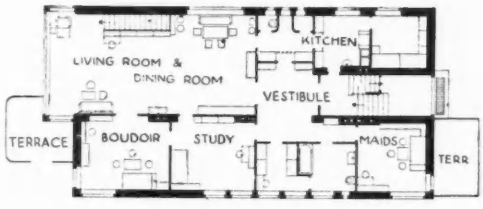
Decorative Art, 1933: The Studio Year Book. Edited by C. G. Holme. London: The Studio, Ltd. Price 7s. 6d. (paper cover), 10s. 6d. (cloth cover).

IF it is possible to judge an age by its art we should be able, after studying *The Studio* Year Book, to abandon a little of our universal pessimism and to take heart that in the domestic arts, at least, there are signs of an æsthetic revival. *Decorative Art* is a comprehensive survey of the work of the architects and designers, not only of our own country, but of Europe and America as well, and it shows us that a definite progress is being made, year by year, towards greater simplicity, efficiency and attractiveness in the objects which surround us in our ordinary existence.

Unfortunately, however, the material selected for *Decorative Art* cannot be taken as being altogether representative—it is chosen by a discriminating Editor from the best products of each country, and he has had to reject an overwhelming preponderance of designs which are much more generally characteristic of taste today.

Modern domestic art has not yet outgrown its self-conscious age, but although it is still far from being a spontaneous expression in the community, the number of people who can discern the good from the bad is growing, "discarding, as it grows, the rubbish with which it would once have been satisfied, and inspiring the creation of still more products of good design."

The present Year Book provides an exhibition of much of the best work of the day. As the Editor says, "there is sufficient among these illustrations to stir the imagination not merely of the connoisseurs of art matters, but of every intelligent man and woman, of every enlightened producer, manufacturer, designer and craftsman. Here is the impulse of the century shaping and modelling, with a new fervour, commonplace things, so that these commonplace things become a romance and an adventure. Our houses, rooms, comforts, conveniences, common utensils, are being transformed as if by the touch of a magic wand. Everything lives afresh, becomes newly desirable, under the hands of the modern designer. The adventure of industrial design, however, is one in which all may share, the public, the retailer, the manufacturer, the artist. To bring them together and lead the way to a finer civilization is the function which *Decorative Art* performs." B. H.



ROMANESQUE ARCHITECTURE

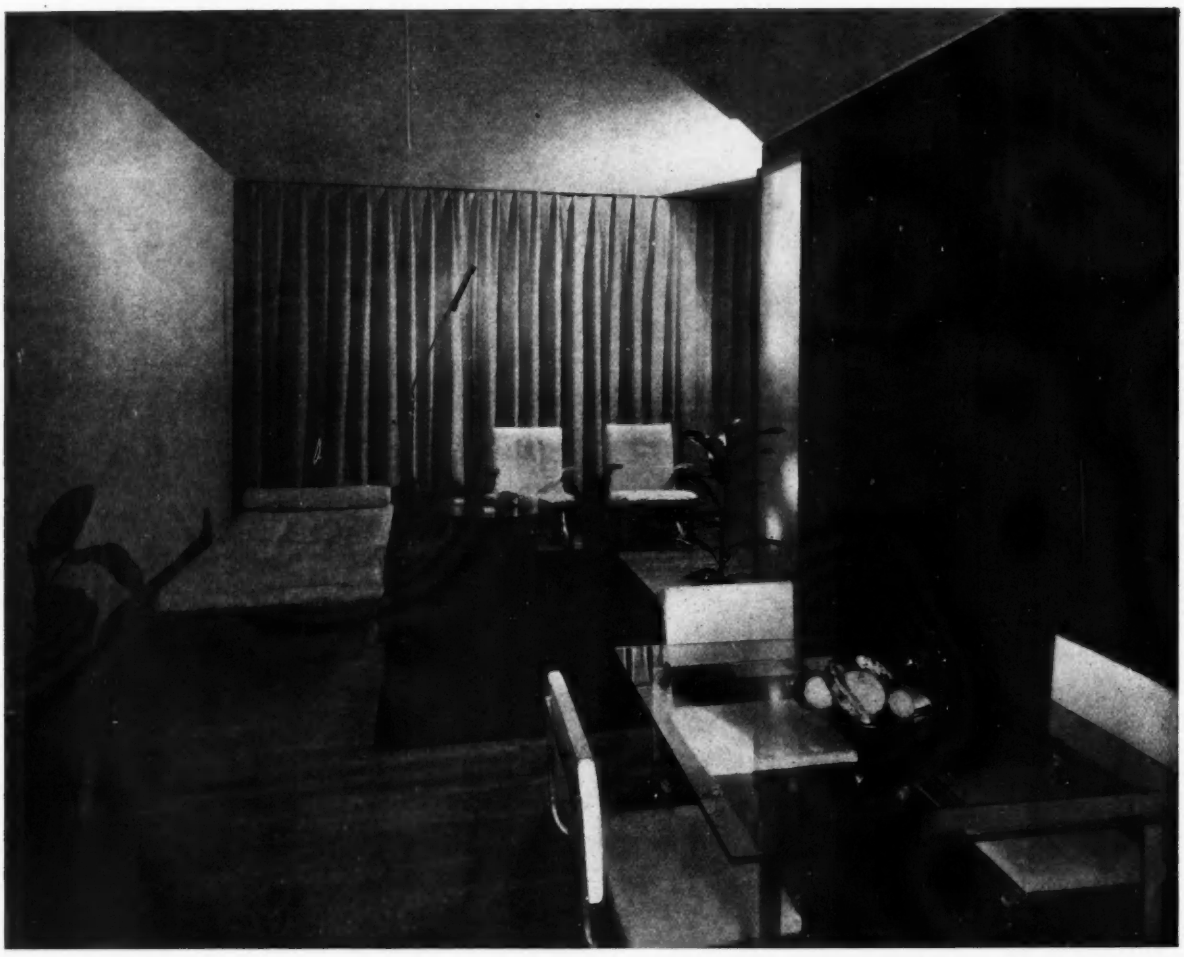
Romanesque Architecture. By F. Eygun. London: Sands & Co. Price 3s. 6d. net.

THIS book has been published in the hope that it "will be of some help both to those who are only beginning and those who have already made some progress in their architectural studies." It treats only of

THE HOUSE : *CONCRETE IN BUDAPEST*

DESIGNED BY L. KOZMA

This house for two families in Budapest was constructed of reinforced concrete, and the pillars of Mannesmann hollow steel tubes. The walls are painted white, the window frames yellow, and the railings grey-blue. [*From* DECORATIVE ART, *reviewed on the previous page.*]



Romanesque architecture, leaving aside as far as possible all mention of church decoration and furnishings, which are to be dealt with in another volume.

The author has divided his subject into three parts. In the first he explains the origin of Romanesque architecture by examining those elements that survived from earlier times and ways of building; he then analyses Romanesque construction by considering the plans and different parts of buildings. Finally, he discusses the general characters of the churches, according to their dates, their local situation and the various schools to which they belong.

The following paragraph from the first chapter sums up, in a few words, the rise and fall of the style :—

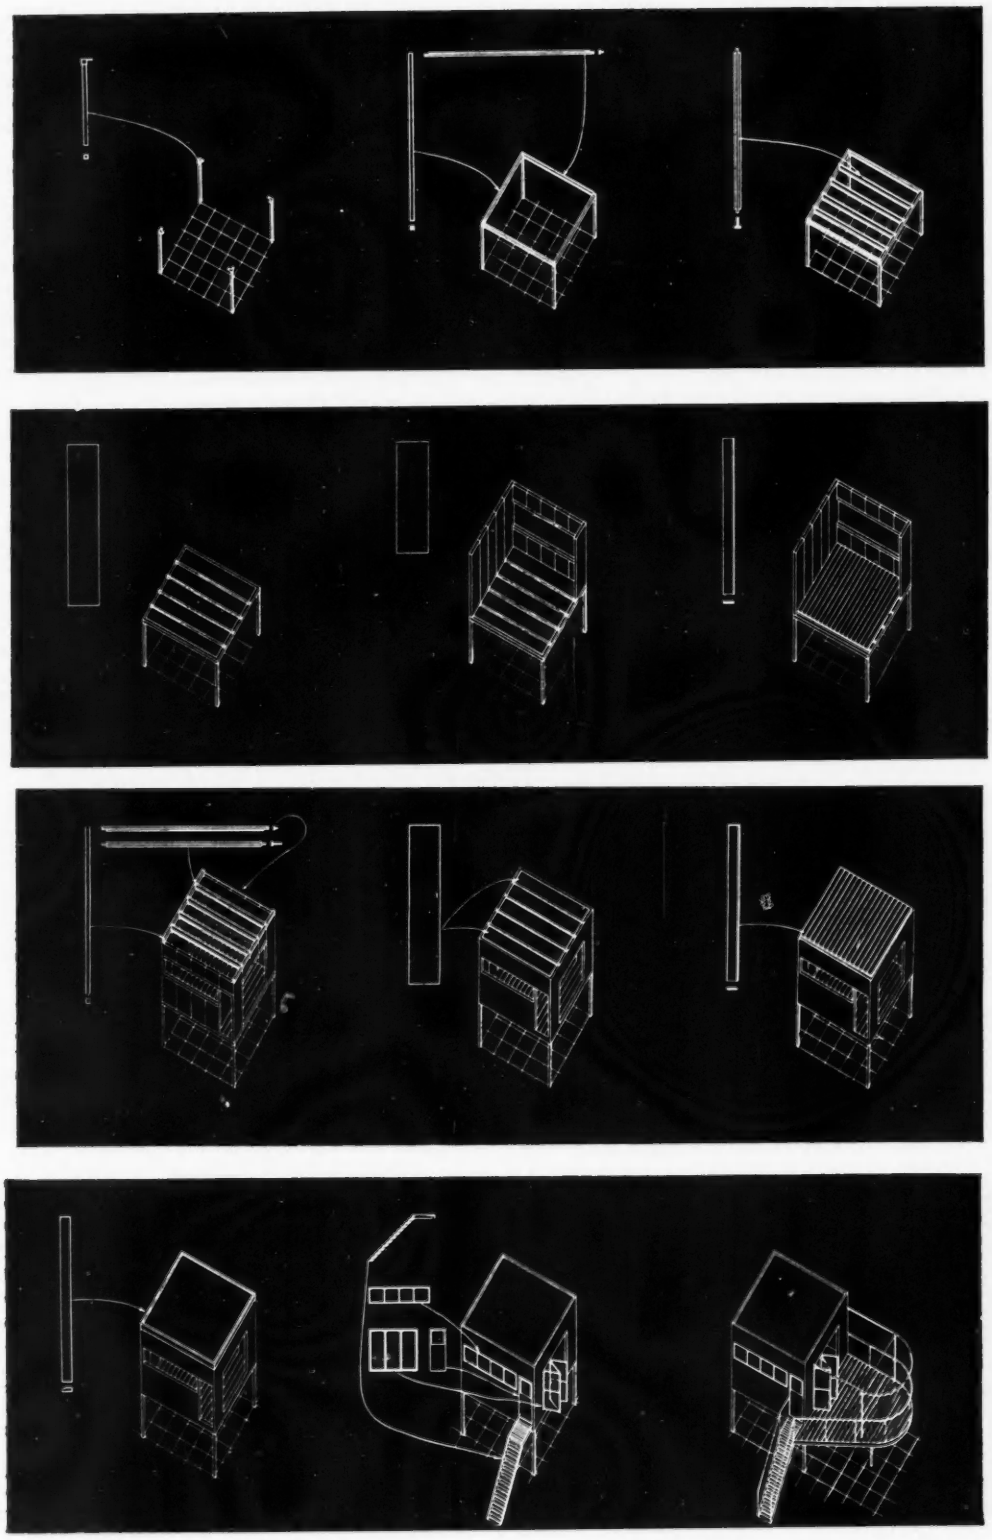
The eleventh century was the archaic period of Romanesque. In the twelfth it came to full maturity, produced its masterpieces, and achieved its many varieties of local forms or schools. Finally, in trying to solve the problem of the vault, it discovered the secret of diagonal

ÆSTHETICS IN AMERICA : PHASES OF DESIGNED BY CLAUSS AND DAUB

An apartment for Alfred Clauss at Sunnyside, Long Island, New York: view looking from the studio into the living room and showing the glass wall. The curtain on the exterior wall of the living room is natural colour; the walls are white; the furniture chromium-plated, upholstered in white leather; and the panel on the right is of macca wool. [*From* DECORATIVE ART, *reviewed on page 372.*]

intersecting ribs. And as soon as builders realized the value of this new feature, Romanesque came to an end.

The book has been admirably translated from the French by the Rev. B. V. Miller.



EASEMENTS OF LIGHT

Easements of Light. Technical Paper No. 7. Published for the Illumination Branch of the Department of Scientific and Industrial Research by H.M. Stationery Office, price 9d.

USEFUL though the first edition of this Paper may have been, it is greatly to be regretted that the Illumination Research Committee appointed to assist a Government Department should have issued a second edition which is neither complete nor yet up-to-date and which contains no description of the most important recent invention affecting the assessment of Light values and the measurement of Daylight.

The remarkable developments that have recently been made have been due largely to the work of Mr. John Swarbrick, F.R.I.B.A. To Mr. Swarbrick we owe the Daylight Factor Theodolite, which makes it possible for the necessary data to be obtained in a matter of one or two seconds, instead of, as formerly, in days, or even in weeks or more. This instrument is well known and widely recognized in scientific circles. In fact, a Paper read by Mr. A. C. Stevenson, of University College, London, at the International Congress of Illumination, 1931, in which this instrument was described, is quoted in the Bibliography of the new issue of Technical Paper No. 7. Even the name of Mr. Swarbrick is not mentioned in the Paper, although he is the author of the well-known textbook on the measurement of daylight and the assessment of compensation in Right of Light cases. The Radial Calculating Sheets that he devised for measuring daylight on both the horizontal and vertical planes are not referred to at all, although they have many advantages over the Rectangular diagrams illustrated. For example, the rectangular diagrams can only be used for measuring daylight on the horizontal plane. It is often equally important to be able to measure daylight on vertical walls. One would

THE HOUSE : *UTILITY IN U.S.S.R.*

A set of diagrams, by M. T. Ginsburg, of Moscow, showing method of construction of a standard concrete house for one family. The exterior walls are washed in various colours : sides, pink ; front, blue, etc.

[*From* DECORATIVE ART, *reviewed on page 372.*]

have thought that the Committee would have observed how necessary this is in art galleries, library stack rooms, and on the labels on the ends of drawers in chemists' shops.

Moreover, there is no reference to photographic methods of determining daylight factors, and consequently, no mention of the co-ordinate and daylight factor grilles which Mr. Swarbrick constructed for super-imposition over the photographic records.

Fortunately, the technical journals and the *Journal of Scientific Instruments* have rendered a valuable service in this respect. The papers in the *Journal of Scientific Instruments* were written by Mr. A. C. Stevenson, and, in his last contribution, he showed how the apparent solar paths, at any time of the year, may be automatically reproduced over photographs, taken with the Daylight Factor Photo-Theodolite. There can be no adequate reason for such omissions, as these photographic methods have been used in well-known cases in the Law Courts.

The second edition of Technical Paper No. 7 is most disappointing. It does not give practitioners the assistance that they have every right to expect from a Committee of the Department of Scientific and Industrial Research. The best way in which the Committee can rectify its serious omission would be to produce, without undue delay, a further Paper, dealing with the rapid modern methods of measuring daylight photographically.

SOCIETIES AND INSTITUTIONS

HEATING AND VENTILATING

Recent Developments in the Heating and Ventilating of Buildings. By J. L. Musgrave. London: Royal Society of Arts. March 8.

During the recent epidemic of influenza, many people have refrained from attending places of amusement, hotels, restaurants and other public places, owing to the fear of infection. This danger is practically non-existent in buildings where adequate balanced systems of ventilation are installed and skilfully operated.

The regulations for heating and ventilating places of amusement laid down by the L.C.C. set a higher standard than most provincial towns; the standard, however, could with advantage be raised, and health authorities in the suburbs of London and provinces should draw up and enforce regulations at least equal to London conditions.

Recognition of the necessity for sunlight will probably at some not-too-distant date lead to the prohibition of the emission in any form of the products of combustion within the boundaries of cities. Factories and large buildings will instal means for dealing with the smoke and deleterious gases which vitiate the atmosphere; and such prohibition might, in all probability, lead to extensive "district heating," a system in which heat is generated at a central source and distributed through mains under the streets, from which branches are taken to the buildings en route.

Rarely has this system proved entirely satisfactory, owing to the enormous overhead cost of installation and the loss of heat during transmission through the mains.

In a comparatively mild climate such as this, where the demand for heat would reach the peak only on a few days each year, the percentage of overhead costs would be higher than in colder countries. The gas and electricity supply authorities may be looked to to assist in the solution of this problem.

SCOTTISH ARCHITECTS

At a recent meeting of the Council of the Royal Incorporation of Architects in Scotland, held in Edinburgh, a new Stirling Chapter was formed, by resolution of the Council, to include all architects within the counties of Stirling and Clackmannan, with a small district of Perthshire to the north.

The following new members were elected:—

Fellows: Messrs. J. S. Johnston, G. F. Shanks and Magnus Duncan. Associates: Messrs. J. D. Carnegie, W. Collyer, D. Wilson, W. K. Fyall, H. W. Liddle, D. E. Hill, T. A. Jeffreys, A. W. Thornton, G. Arthur, J. Lyall, A. Miller, J. Smith, jr., J. E. W. Dallachy and R. Rennie. Students: Messrs. P. R. Whitson, D. M'Culloch, jr., Arthur Rennie, Miss C. S. Waugh, Messrs. W. R. Tocher, T. W. Hepburn, J. A. D. Mair, J. D. Allan, Allan Stevenson and John Steel.

THE SKYSCRAPER

American Architecture. By Alfred Bossom, M.P., F.R.I.B.A., Liverpool Architectural Society. March 1.

In quite early times, the steel frame of the skyscraper took on a form that we have not yet reached in England. It was approximately standardized, supports or stanchions were placed about 20 ft. apart in either direction, and run from basement to roof. These steel frames very much resemble the bones of the human body, and upon these the entire remaining fabric is tied; the walls of constructions forty stories high will be thinner than those of a three-story building in England.

If two buildings exactly similar were to be built, one in Liverpool and one in New York, and were started at the same time, the bricklayer in America would get five times as much per day as the Englishman; the plumber, the carpenter, the mason, three-and-a-half times as much. And yet the completed building in both countries would cost almost the same. The different forms of organization make this possible; the waste of time that we have unfortunately allowed to creep into our methods of building does not exist in America.

The most highly-paid man on the building in that country is the one who has charge of the sending up of the materials to the various workers, the man who works the hoist which appropriately feeds the workers just at the right speed, not over-burdening them nor keeping them waiting. It is amusing to think that his opposite number in England is the lowest-paid man. One often goes through an English building and sees the men either cluttered up with surplus material or waiting for material to be brought up to them, all of which means that someone has got to pay the bill for time that is not constructively used.

In many of these buildings, no window is open below the sixth floor, so that the motor-car fumes do not enter, but the ventilation is undertaken in a way quite different from anything we have. The air is pumped down from the roof to the basement where it is washed and warmed; it is then pumped up and pushed into rooms from hundreds of small jets at ceiling level and then sucked out at floor level. Hence one only breathes absolutely clean air; the dirt walked in from one's shoes is sucked away from them and not blown into one's face.

We do not want tall buildings, they don't suit us, but we can learn that we should take hold of our towns and town plan them with the enthusiasm with which the Americans have zoned all their cities.

THE WELSH SCHOOL OF ARCHITECTURE

Two lectures have recently been given to the students and staff of the Welsh School of Architecture, the Technical College, Cardiff. On Monday, February 27, Mr. George L. Jennings, M.I.H.V.E., A.M.I.GAS E., of the British Commercial Gas Association, spoke on "Smoke Abatement and Gas from an Architectural Point of View."

On Tuesday, March 7, Mr. R. J. Tott, of Messrs. Waygood-Otis, Ltd., exhibited and explained two films showing the construction of the Empire State and the Chrysler Buildings, New York.

SOUTH WALES ARCHITECTS' MEETING

Under the auspices of the South Wales Institute of Architects (Central Branch) and the Institute of Builders (South Wales Branch) a lantern lecture on "The Limits of Professional Design" was given by Sir E. Owen Williams, K.B.E., at Cardiff on March 2. Mr. E. A. Ward, F.I.O.B., presided.

Sir Owen Williams dealt with the present-day significance of design, the way in which it had become almost the sole prerogative of a professional in spite of the fact that the financial responsibility for design was in common law the contractor's. He defined the exact purpose for which a professional adviser was employed, and suggested that the professional adviser who did not set definite limits to the designing side of his function was doing poor service to his client. He also pointed out that the standardization of materials and articles was rendering the position of a

professional adviser more particularly selective rather than a designer of detail and that this would reach its logical conclusion when the designer and contractor were one as was the case with all modern constructions which were not tramelled by professional convention. The professional would then be restricted to his true function as an adviser and selector and would not interfere with the free design by the constructor to facilitate his own operations.

A vote of thanks was proposed and seconded by Mr. Percy Thomas, F.R.I.B.A., and Mr. F. J. Thomas respectively.

IN PARLIAMENT

[BY OUR SPECIAL REPRESENTATIVE]

The Housing Bill

DURING the Report stage of the Housing (Financial Provisions) Bill, Sir Hilton Young accepted an amendment, which was agreed to, to the effect that every house to which the Bill applied should be provided with a fixed bath.

In moving the third reading, Sir Hilton Young outlined the plan by which he said the Government intended to wage war on the evil of the slums. He pointed out that there was a clear demand in the country for action, and he recalled the fact that it was more than 60 years since the first provision was made by Statute for slum clearance. In all those 60 years the average annual rate of persons affected by the demolition of the slums had been less than 3,000 a year. It was 14 years since a subsidy was devoted to slum clearance, and in all those 14 years the total number of houses affected was no more than 15,000; some few more than 1,000 a year. There had been no progress adequate to the evil. Subsidies had only succeeded in scraping the surface of the evil.

There could be no further delay or trifling with the problem, and he proposed to call on every local authority which was a housing authority to prepare a survey of its area from the point of view of slums, and to follow that survey with a programme for the abolition of the slums so revealed. A distinction would be made between those areas which could be dealt with by reconditioning and those which required the more radical remedy of clearance. It would be suggested that the programme should state the periods during which each of the areas would be dealt with. Every house that was unfit for human habitation should be dealt with as quickly as possible—the quicker the better.

The Government would stimulate and assist the local authorities in the preparation of their surveys and programmes. That was in general the function of the general inspectors of the Ministry, but there was a certain weight of inertia to lift, and, therefore, he proposed to assist the local authorities in the preparation of their surveys and programmes by a flying squad of special experts from the Ministry of Health, whose function would be to stimulate initiative where such stimulation was needed and to give technical assistance and advice in the preparation of the programmes. There were ample powers under the Act of 1930 to enable the Minister to carry out this programme in consequence of the passage of the Bill, and in case of need there would be no hesitation in putting those powers into force. He had every confidence in the willingness and enthusiasm of the local authorities to join hands with the Government in a slum clearance campaign. The scheme would not involve any further legislation, but without the passage of the Bill any such attempt as he had outlined would be doomed to failure.

The rejection of the Bill was moved by Mr. Greenwood, on behalf of the Labour party. Mr. Greenwood declared that the only idea of the Bill was a return to private enterprise. It did not contain a single constructive idea.

This motion was, however, negatived by 233 votes to 66, and the Bill was read a third time.

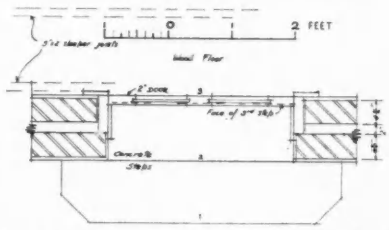
Contracts for Waterloo Bridge

At question time, Mr. Duncan asked the Minister of Transport whether the contracts for the reconstruction of Waterloo Bridge would be offered by public tender; and whether they would be let subject to his approval.

Mr. Stanley said that it was a condition of all grants from the Road Fund that his approval of any arrangement as to tenders and of any contract for constructional works should be obtained, but the procedure to be followed in inviting and accepting tenders for the reconditioning of Waterloo Bridge had not yet been settled.

Mr. Duncan asked whether there would be open competition for these considerable contracts.

Mr. Stanley said he could not give that assurance. There had been cases where, owing to the special nature of the work, its delicacy and danger, tender had been restricted to special lists, and had not been open. But he would assure the House that no arrangements could be entered into without his consent, and he should not give that unless he was satisfied that full opportunity had been given for competition.

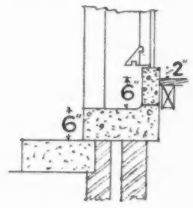


Sir W. Davison asked when the work was likely to be commenced.

Mr. Stanley said that the work could not be commenced without the action of the House of Commons.

QUESTIONS THAT ARISE

Construction of Steps



¶ "Student" writes: "*I would be obliged if your expert would let me know the best construction at the steps of an entrance door to a house. The last step, preferably of concrete, to be ¼ in. back from face of door as shown on the accompanying sketch. Also,*

is a flue necessary for a gas cooker in a bungalow?"

With regard to the query on entrance steps, provision for a mat seems desirable; hence a raised threshold, as shown in concrete in the enclosed sketch, but possibly preferable in oak.

Gas cookers are commonly fixed without flues. Most types have an

outlet for oven fumes, but the only possible provision for the heat and fumes arising from the grille and boiling rings is by a hood connected to a flue. This is always a great convenience and, if provided, the oven outlet can be left to follow the same course. Briefly, desirable, but not strictly a necessity.

E. G.

Dry Rot Fungus

¶ A Brewery Co. writes: "*We are having trouble at one of our licensed houses on the Cotswolds with a soft spongy fungoid growth or substance (sample enclosed) which has appeared behind matchboard dados, on many of the walls, and in various other places, even under the bar counter.*

Can your expert advise me as to what the growth is, the cause of same, and any measures which may be taken to remedy the trouble?

The sample enclosed is a growth of the Dry Rot Fungus, *Merulius lacrymans*. It is evident from your correspondent's remarks that there is a widespread and serious outbreak of dry rot in the house referred to. It will probably be necessary to remove a great deal of the timbering.

When carrying out repairs for dry rot it is essential to trace out the full extent of the damage and to cut out every piece of infected timber, cutting away for 12–18 ins. beyond the last visible signs of attack. The exposed brickwork should be freed from dust and fungus remains, and sterilized by means of a blow lamp passed repeatedly over the surface until this becomes too hot to touch. The new timber used for replacements should be thoroughly treated with a reliable wood preservative, such as a good quality creosote or, where there is objection to the smell of this substance or risk of its bleeding on to paint or plaster, a solution of sodium fluoride may be used (6 oz. of the commercial salt to the gallon of water).

It is evident that the building must be very damp and efforts should be made to dry it out, by increasing the ventilation under the floors, attending to the pointing in the walls, correcting any leakages of water, etc. If there is no

damp-proof course it would be advisable to use only pressure-treated joists for the ground floor construction or to replace the floor with a solid floor of blocks laid on a thick layer of bitumen upon impervious concrete.

It is essential to carry out the work of removing infected material thoroughly if further trouble is to be avoided.

W. P. K. FINDLAY
(FOREST PRODUCTS RESEARCH LABORATORY)

THE BUILDINGS ILLUSTRATED

Following are the names of the general contractors and some of the sub-contractors for the buildings illustrated in this issue :

Barclays Bank, Ltd., Sevenoaks (pages 352, 364-365). General contractors, Ringmer Building Works. Sub-contractors : Trussed Concrete Steel Co., Ltd., Reinforced Concrete Engineers, reinforced concrete work ; Curridge Brick and Tile Co., facing bricks ; Ames and Finnis, roofing ; R. Crittall & Co., Ltd., heating ; R. Grierson, Ltd., electrical work ; Best and Lloyd, Ltd., lighting fittings ; R. W. Brooke & Co., Ltd., wood floors and linoleum ; Wm. Mallinson and Sons, Ltd., entrance doors ; W. Walsingham, painting entrance doors ; Birmingham Guild, Ltd., bronze plates ; A. E. Davis, ironmongery for fittings ; H. H. Martyn & Co., Ltd., bank fittings, interor decoration, furniture, fibrous plaster ; Henry Hope and Sons, Ltd., metal windows ; Stuart's Granolithic Co., Ltd., granolithic paving and stairs ; General Iron Foundry Co., Ltd., wrought iron guard bars and cage ; J. Bolding and Sons, Ltd., sanitary fittings ; Fox Water Heaters (1930), Ltd., gas water heaters ; Wing and Webb, Ltd., ironmongery other than bank fittings ; Robert Adams, floor springs ; S. Parkes & Co., Ltd., spring pivots and casement stays ; James Gibbons, Ltd., tubular steel shelving in strong room and wire mesh cage ; Powell Duffryn Steam Colliery Co., special green stain Presotim ; Waygood-Otis, Ltd., book lift ; Chubb and Sons Lock & Safe Co., Ltd., strong room doors ; Rhodes Chains, Ltd., chains and sleeve axle pulleys for double hung sashes ; Redalon, Ltd., Bull Dog floor clips ; British Challenge Glazing Co., Ltd., lantern light and laylight ; Moreland Hayne & Co., Ltd., steel angle to carry first floor joists ; Leyland and Birmingham Rubber Co., Ltd., rubber flooring and skirtings ; Art Pavements and Decorations, Ltd., marble cubes to entrance lobby ; Pilkington Bros., Ltd., obscured wired Georgian glass ; J. Hall and Sons, Ltd., glacé embossed glass in hall.

"Prince of Wales" Public House, Drury Lane (pages 362-363). General contractors, E. H. Burgess, Ltd. Sub-contractors : Fawcett Construction Co., structural steel work ; Frank Mortimer, stone ; Field and Palmer Ltd.,asphalt; H. W. Dutton and Co., central heating and hot water installations ; Acme Flooring and Paving Co., Ltd., wood block flooring ; Benham and Sons, Ltd., kitchen equipment and silver grille ; Geo. Wright and Sons, Ltd., stoves and grates ; Wm. Sugg & Co., Ltd., gas fixtures ; Buckley and Beach, electric installation ; Graystan Art Glass Co., and Best and Lloyd, electric light fittings ; Duckett and Son, sanitary fittings ; Carter and Aynsley, ironmongery ; Crittall Manufacturing Co., Ltd., metal windows ; Haywards, Ltd., folding gates ; Comyn Ching, Ltd., iron staircases ; A. Glover, fibrous plaster ; Comyn Ching, Ltd., and Blunt and Wray, Ltd., metal work ; Art Pavements and Decorations, Ltd., floor and wall tiling and terrazzo ; Frawley and Coyle, wall papers ; W. H. Heath, Ltd., bar fittings ; Express Lift Co., lifts.

House at Esher (page 367). General Contractors : Cummins Ltd.

The Sphere Theatre, Tottenham Court Road (pages 368-371). General contractors, Griggs and Son, Ltd. Subcontractors: H. and F. Badcock, plastering ; F. Burkitt, lantern lights and steel shutters ; The Central Joinery Co. (1927), Ltd., joinery work ; Cinema Supply Co., seating and carpets ; H. G. Jones, curtains ; James Clark and Son, Ltd., exterior glasswork ; Cope & Co., Ltd., wall tiling ; The Gas Light and Coke Co., heating ; Ionlite, Ltd., neon signs ; F. Knight & Co., Ltd., hardware ; F. A. Norris & Co., Ltd., metal windows and concrete pavement lights ; Philips Industrial, projectors and sound equipment ; Ragusa Asphalte Paving Co., Ltd., asphalt; South Western Stone Co., Ltd., golden travertine ; Strand Electric and Engineering Co., Ltd., electrical work.

LAW REPORT

TEMPORARY BUILDINGS AND THE PUBLIC HEALTH (AMENDMENT) ACT

Mitcham U.D.C. v. *Seale.—King's Bench Division. Before Mr. Justice McCardie*

THE question in this case was whether certain temporary buildings such as caravans, converted tramcars, etc., on certain land at Lewis Road, Mitcham, owned by the defendant, Mrs. Mary Seale, were temporary buildings or structures within the meaning of section 27 of the Public Health (Amendment) Act, 1907. The plaintiff Council contended that they were and sought a declaration accordingly, so that they might remove them.

Defendant admitted that she owned the land, but not the structures. She denied that they were temporary buildings within the meaning of the section of the Act.

Mr. S. G. Turner, K.C., said his clients found that caravans, etc., used by the families as dwellings on the defendant's land, were placed on the defendant's land between October, 1931, and January, 1932. It was decided to have them removed, but when the Council's employees went to carry out instructions to remove them, they were refused admission to the ground. Summonses were then taken out against defendant, but they were dismissed by the Croydon Justices, who held that the plaintiffs had not proved that the defendant was the person who erected the buildings. The Bench did not decide the point as to whether the structures were temporary buildings.

Counsel then proceeded to argue that the structures were temporary buildings, and pointed out that section 27 provided that before a person could set up a building he must apply to the local authority for permission, and that that permission must be obtained in writing. There were certain penalties in default of non-compliance with the section. Should an authority decide to demolish the structures, the costs were recoverable.

Mr. Charles Bray appeared for the defendant, and contended that the Council could not succeed under the section in question against a person who was merely the owner of the land, as in his view the owner of the land did not come into the matter at all.

His lordship said if Mr. Turner's contention was right, the power which the section gave the Council was amazing. They could go on any private property and at their discretion pull down these structures.

Mr. Turner said if the Council went beyond the statute it would lay itself open to proceedings.

His lordship said the points raised were more wide-reaching than he had at first realized, and he would adjourn the further hearing for six weeks, to give the council an opportunity of collecting information as to the housing accommodation in the district. Points had been raised in the case which it would be well for the Council to consider and also discuss the course which a public authority could properly pursue if it desired to limit the number of the caravans in its district. He also thought that the defendant might consider whether she could meet the Council's requirements, if the belief was held that they were acting in good faith in the matter.

Royal Visit to a Slough Factory

On Wednesday, March 1, H.R.H. the Prince of Wales visited the factory of St. Helens Cable and Rubber Co., Ltd., at Slough. The Prince was accompanied by his Equerry, Lt.-Col. Hon. Piers Legh, C.M.G., and the Bishop of Buckingham, and was received by Mr. D. Johnstone Sinclair, managing director of the firm, and Mr. H. Evans, the general manager.

The time allotted for the visit was considerably exceeded owing to the great interest shown by the Prince in the various processes of manufacture of rubber flooring, and other goods manufactured by the company.

While many of the manufacturing processes engaged his close attention, he particularly asked questions regarding the general welfare of the workpeople, and made several suggestions with a view to increasing the comfort of the employees.

Import Duties Act

The Board of Trade announce that regulations have been made under Section 8 (1) of the Finance Act, 1919, and paragraph 1 of the 3rd Schedule to the Import Duties Act, 1932, prescribing that certain classes of goods manufactured in and consigned from, a part of the Empire, must contain a minimum of 50 per cent. of Empire material and labour in order to qualify for Imperial Preference, instead of 25 per cent. as at present. The Regulations, which come into force on April 1, 1933, are being published as the Import Duties (Imperial Preference) No. 1 Regulations, 1933, and copies of the regulations, including the Schedule of goods to which the increased percentage applies, will be obtainable from H.M. Stationery Office, Adastral House, Kingsway, W.C.2.

THE WEEK'S BUILDING NEWS

LONDON & DISTRICTS (15-MILE RADIUS)

The EALING Corporation is to prepare plans, for submission in six months' time, for the construction of an open-air swimming bath at Perivale.

Plans have been prepared, on behalf of Mr. C. Peppiatt, for the erection of a block of shops and offices on a substructure to be built and attached to the bridge over the Great Western Railway in front of the Broadway Station, EALING.

The EALING Corporation has considered preliminary plans for the erection of a block of 24 flats on a site at the corner of Gunnersbury Avenue and Tudor Way.

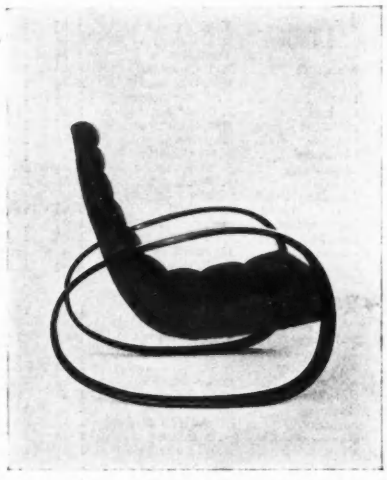
Plans passed at ENFIELD: Two houses, Cedar Park Road, for Mr. E. J. Barnes; showrooms, offices and store, Church Street, for North Metropolitan Electric Power Supply Co.; additions, Cosmos Lamp Works, Millmarsh Lane, Brimsdown, for Mr. A. J. Maxfield; 20 houses (amended plan), Riverside Gardens, for Messrs. G. Reed and Sons, Ltd.; extension to printing factory, off Hertford Road, for Mr. J. Yeomans; additions, Sangamo Works, Great Cambridge Road, for Messrs. Wimperis, Simpson and Guthrie; block of 27 flats and shops, Church Street, for Mr. L. A. Bowden; two factory buildings, Queensway, Ponders End, for Churchbury Investment Co., Ltd.; two houses, Fir Tree Walk, for Messrs. Bowyer and Bowyer; restaurant and dance hall, The Ridgeway, for Messrs. W. Jones and A. Teal; additions and alterations, "Beaconsfield" public-house, 26 The Town, for Messrs. Henekeys, Ltd.; three shops, Chase Side, for Mr. E. O. Ward.

THE FRIERN BARNET U.D.C. is seeking sanction to borrow £18,400, for the erection of 32 three-bedroom flats and 24 two-bedroom flats in connection with the re-housing of persons displaced in the clearance area.

Plans passed by the ILFORD Corporation: Alterations and additions, 20, Ilford Lane, for Express Dairies, Ltd.; two bungalows, Shirley Terrace, for Mr. F. Smith; 25 houses, Holland Park Avenue, for Messrs. Holland Bros.; 11 bungalows, Glenthorne Gardens, for Messrs. Varndell & Co.; factory extension, Bogies Alley, for Ilford Electrical Co.; four houses, Ross Gardens, for Mr. W. Butcher; two bungalows, Tomswood Hill, for Mr. G. F. Seigerts; alterations, "White Hart" public-house, Green Lane, for Messrs. Charrington & Co., Ltd.; two houses, Glencoe Avenue, for Mr. E. Meredith; additions, 2 to 24 Lime Grove, for Mr. G. Fryatt; three houses, Cadby Gardens, for Mr. T. Anders; 36 houses, Longwood Gardens, for Mr. A. Smith; shop additions, 693–7, High Road, for Mr. J. A. Dartnall; three shops, Green Lane, for Mr. A. Moore; new "Fairlop Oak" public-house, Tomswood Road, for Mr. W. Stewart; two shops and flats, Chadwell Heath Lane, for Mr. A. W. Heppell; 60 houses, Dawlish Drive, and 10 in Goodmayes Lane, for Messrs. Stoneley & Co.; new "Maypole" public-house, Fencepiece Road, for Mr. J. W. Hammond; rebuilding 61–3, Cranbrook Road, for Messrs. Hood and Huggins; two shops and eight houses, New Road, for Mr. P. G. Lees.

SOUTHERN COUNTIES

Plans passed by the BEXHILL Corporation: Additions, Cooden Beach Hotel, and additions, Granville Hotel, for Mr. E. Bunce; eight bungalows, Chestnut Walk, for Mr. W. Piper.



Plans passed at BOURNEMOUTH: Additions, The Horse and Jockey, Wimborne Road, for Messrs. Eldridge, Pope and Co., Ltd.; additions, The Quadrant, for Messrs. J. J. Allen, Ltd.; alterations and additions, 67 Southbourne Grove, for Mr. G. T. Richards; store, Wimborne Road, for Messrs. F. W. Woolworth & Co., Ltd.; alterations, Castle Laundry, Castle Road, for Mr. R. Bevington; paint shop and garage, Hovis Van Works, Victoria Park Road, for Messrs. Hovis, Ltd.; additions, Courtlands Hotel, Boscombe Spa Road, for Mr. W. H. Letley; additions, First Church of Christ Scientist, Christchurch Road, for the trustees; conversion into flats, 44 The Avenue, Moordown, for Mr. A. Caplan; flats, Stourwood Avenue, for Mr. H. Whiting; two houses, Christchurch Road, for Mr. E. Elliott; additions to shop, Wimborne Road, for Mr. E. Knott; two cottages, Wicklea Road, Wick, for W. R. Carter; three houses, Redhill Drive, for Mr. F. E. Etches; two houses, Hankinson Road, for Mr. A. F. V. Holly; conversion into four shops, "The Hermitage," Christchurch Road, Boscombe, for Captain S. J. Shippick; house and shop, Portman Road, for Mr. W. Cleaton; two houses, Braidley Road, for Mr. D. H. Horn; three houses, Southwick Road, for Mr. G. Norman; alterations and additions, 37 Palmerston Road, for Mr. F. Rigler; alterations and additions to flats, Meon Road, for Mr. L. G. Smooker; 14 bungalows, Cattistock Road, for Mr. W. J. Clapcott.

Plans passed by the BRIGHTON Corporation: 18 houses, Carden Avenue, and 26 houses, Bevendean Crescent, for Messrs. Braybons, Ltd.; eight houses, Henry Road, and eight houses, Wilson Avenue, for Messrs. T. J. Braybon and Son; alterations, Royal Albion Hotel, Grand Junction Road, for Mr. Harry Preston; rebuilding, 20-22 Marlborough Place, for Citizens' Permanent Building Society; arcade entrance, 200, Western Road, for Messrs. Taylor's (Cash Chemists), London, Ltd.; seven houses, Warmdene Road, for Mr. T. R. Braybon; alterations and additions, 11, 12, 13, Market Street, for Mr. C. J. Botting; alterations, 60 West Street, for British Legion Club, Ltd.; seven houses and four bungalows, Ladies Mile estate, for Messrs. G. Ferguson and Son; hotel, Hillside, Moulsecoomb, for Portsmouth and Brighton United Breweries, Ltd.; new wing, 15 Montpelier Crescent, for Mr. R. J. Heather; shops, 167-9 Lewes Road, for Mr. G. Ayling; two houses, Hollingbury Rise, for Mr. O. G. H. Watts.

MIDLAND COUNTIES

Plans passed at STOKE-ON-TRENT: Two houses, Colin Road, Trent Vale, for Messrs. P. Bailey & Co.; four houses, Kensington Road, Oakhill, for Mr. E. Jones; four houses, London Road, Oakhill, for Messrs. W. Ball and Sons; four houses, off Scotia Road, Burslem, for Mr. T. Barlow; institute, off Broad's Row, Smallthorne, for Norton Miners' Welfare Society; six houses, Longton Road, Bucknall, for Mr. A. Lilley; 27 houses, Portland Street, Hanley, for Messrs. Salt and Clowes; two houses, Eastwood Avenue, Burslem, for Mr. H. Bratt; two houses, Horse Lane, Birches Head, for Messrs. Addison and Forrester; five houses, Drubbery Lane, Longton, for Mr. E. Lea; four houses, Cross Pinnox Street, for Mr. T. H. Hand; additions, "The Mitre," Pitt Street, for Messrs. Parkers Brewery, Ltd.; house and shop, Ball Green Lane, Norton-in-the-Moors, for Mr. W. Bolt; alterations, "Ram's Head" Inn, and "New Vaults" Inn, Market Place, for Messrs. S. Allsopp and Sons, Ltd.; alterations, St. Jude's Hall, Beresford Street, Shelton, for the Stoke-on-Trent Repertory Players; 18 houses, Leek Road, and Ridgway Road, for Messrs. Holloway and Co.; six houses, Longton Road, Bucknall, for Mr. A. Lilley; four houses, London Road, Oakhill, for Messrs. W. Ball and Sons; three shops, Etruria Road, for Mr. G. H. Broad; four houses, Wilfred Place, Hartshill, for Mr. J. Breeze; re-building, "Saracen's Head" Inn, Sandon Road, Meir, for Messrs. J. Joule and Son; alterations and additions, Harley Street, Hanley, for Messrs. Smith and Bourne; two houses, Birches Head Road, for Messrs. Collars, Ltd.; office and workshop, Muirend Road, Cathcart, for Messrs. A. and J. Clark.

D

RATES OF WAGES

The initial letter opposite every entry indicates the grade under the Ministry of Labour schedule. The district is that to which the borough is assigned in the same schedule. Column I gives the rates for craftsmen; Column II for labourers. The rate for craftsmen working at trades in which a separate rate maintains is given in a footnote. The table is a selection only. Particulars for lesser localities not included may be obtained upon application in writing.

*In these areas the rates of wages for certain trades (usually painters and plasterers) vary slightly from those given.

The rates for every trade in any given area will be sent on request.

CURRENT PRICES

The wages are the standard Union rates of wages payable in London at the time of publication. The prices given below are for materials of good quality, and include delivery to site in Central London Area, unless otherwise stated. For delivery outside this area, adjustment should be made for the cost of transport. Though every care has been taken in its compilation, it is impossible to guarantee the accuracy of the list, and readers are advised to have the figures confirmed by trade inquiry. The whole of the information given is copyright.

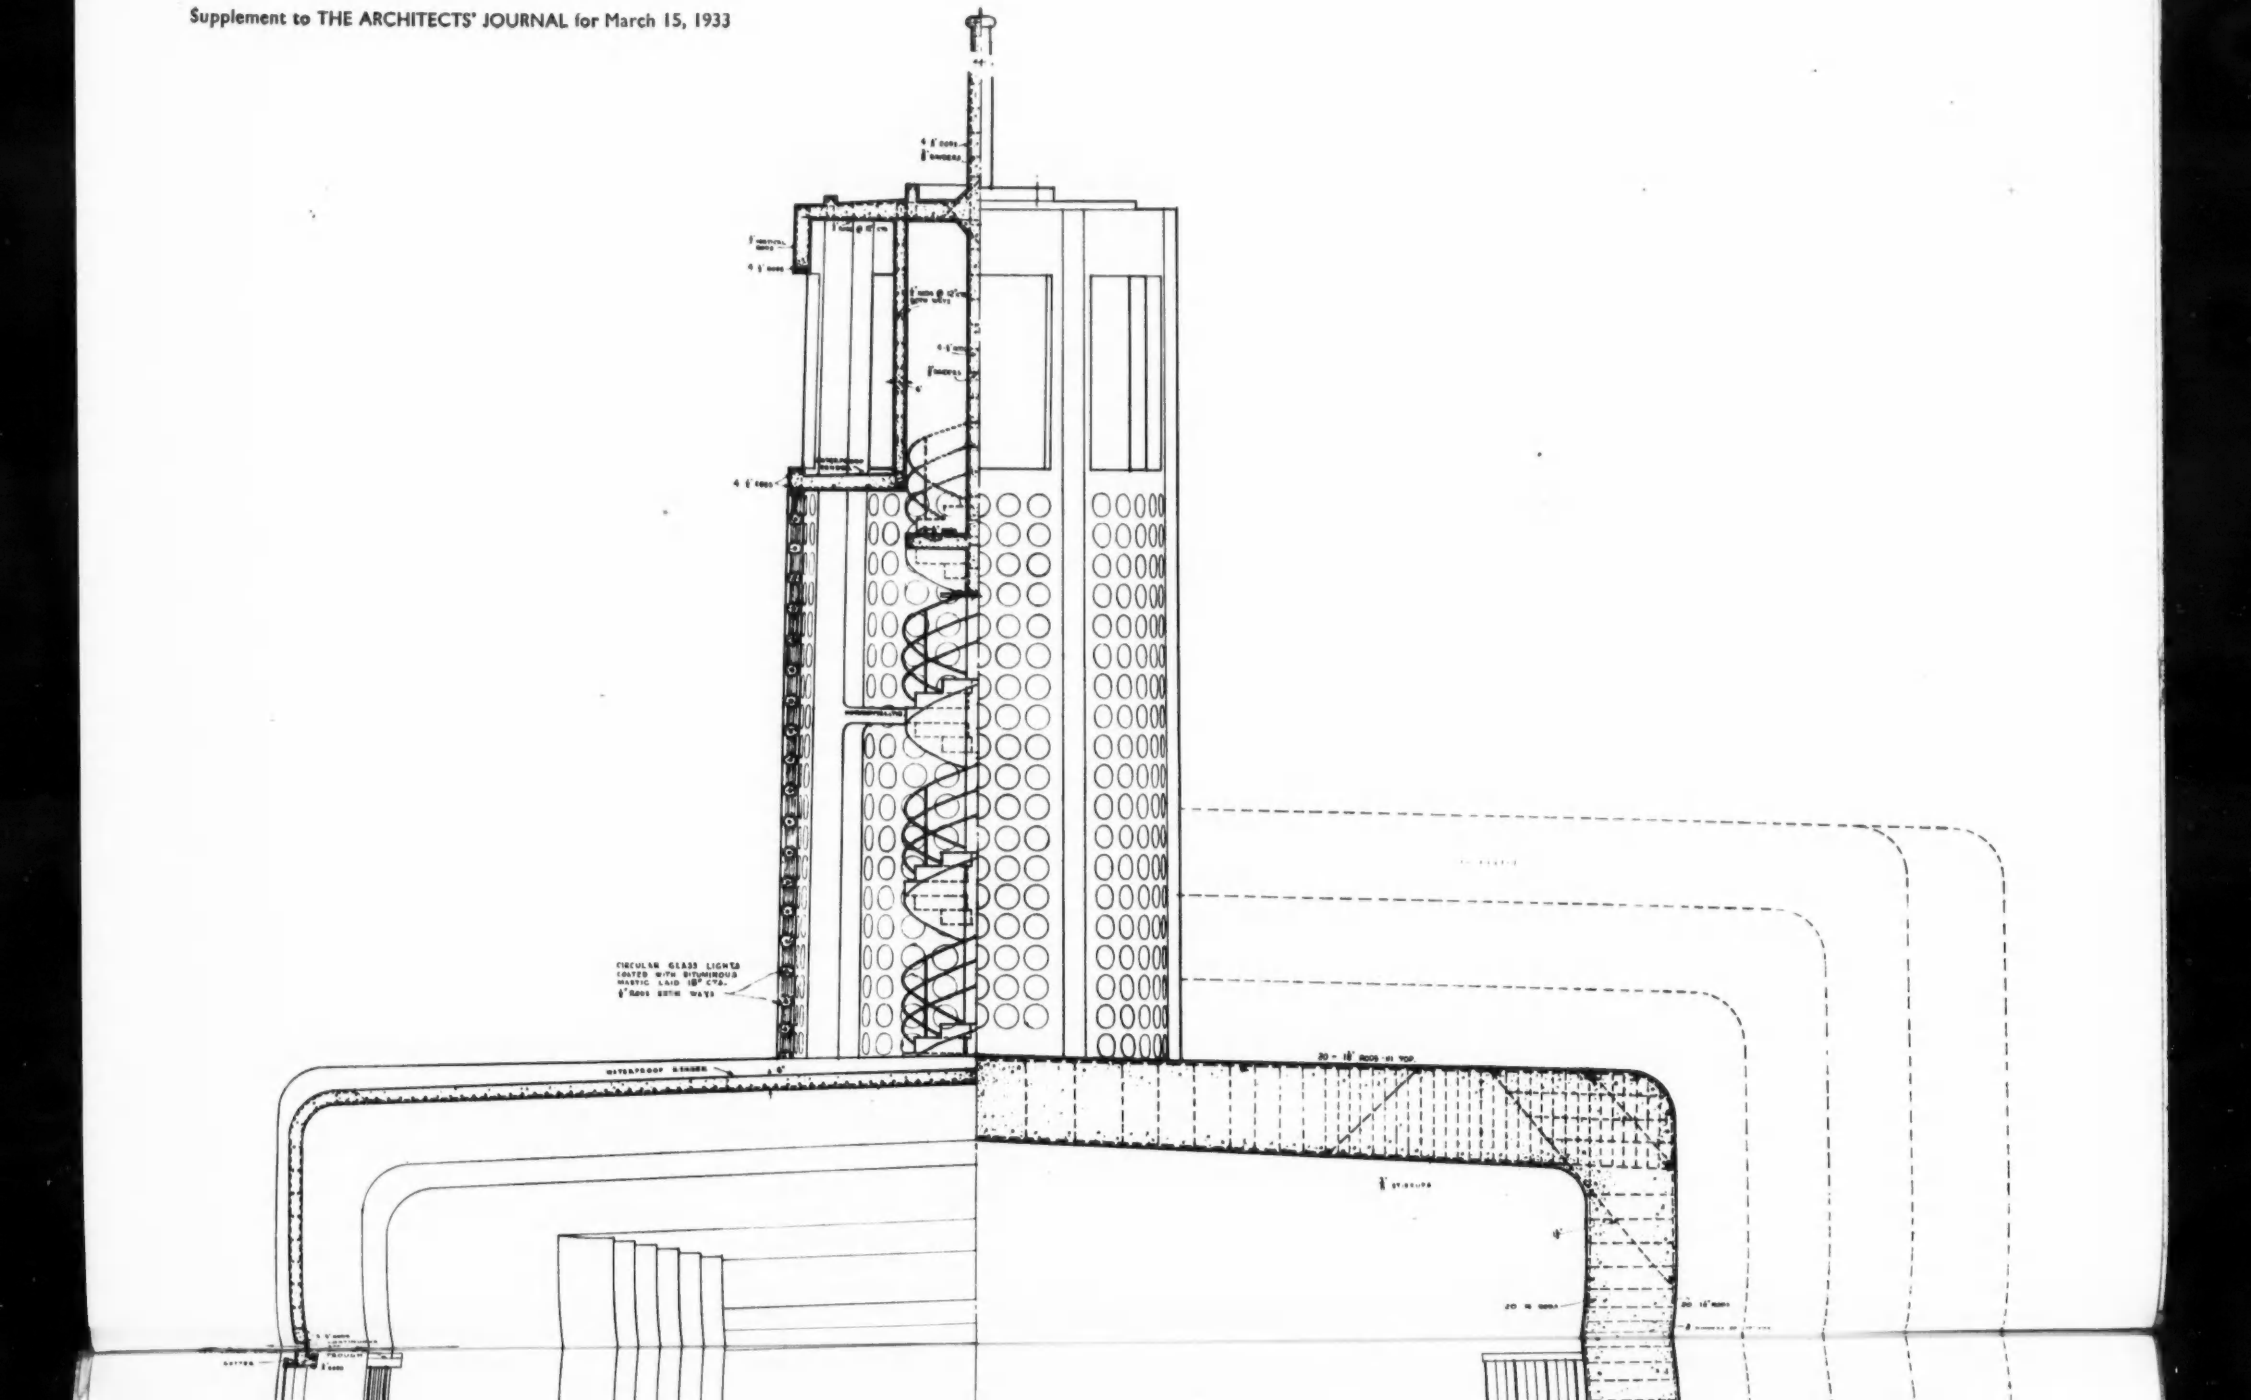
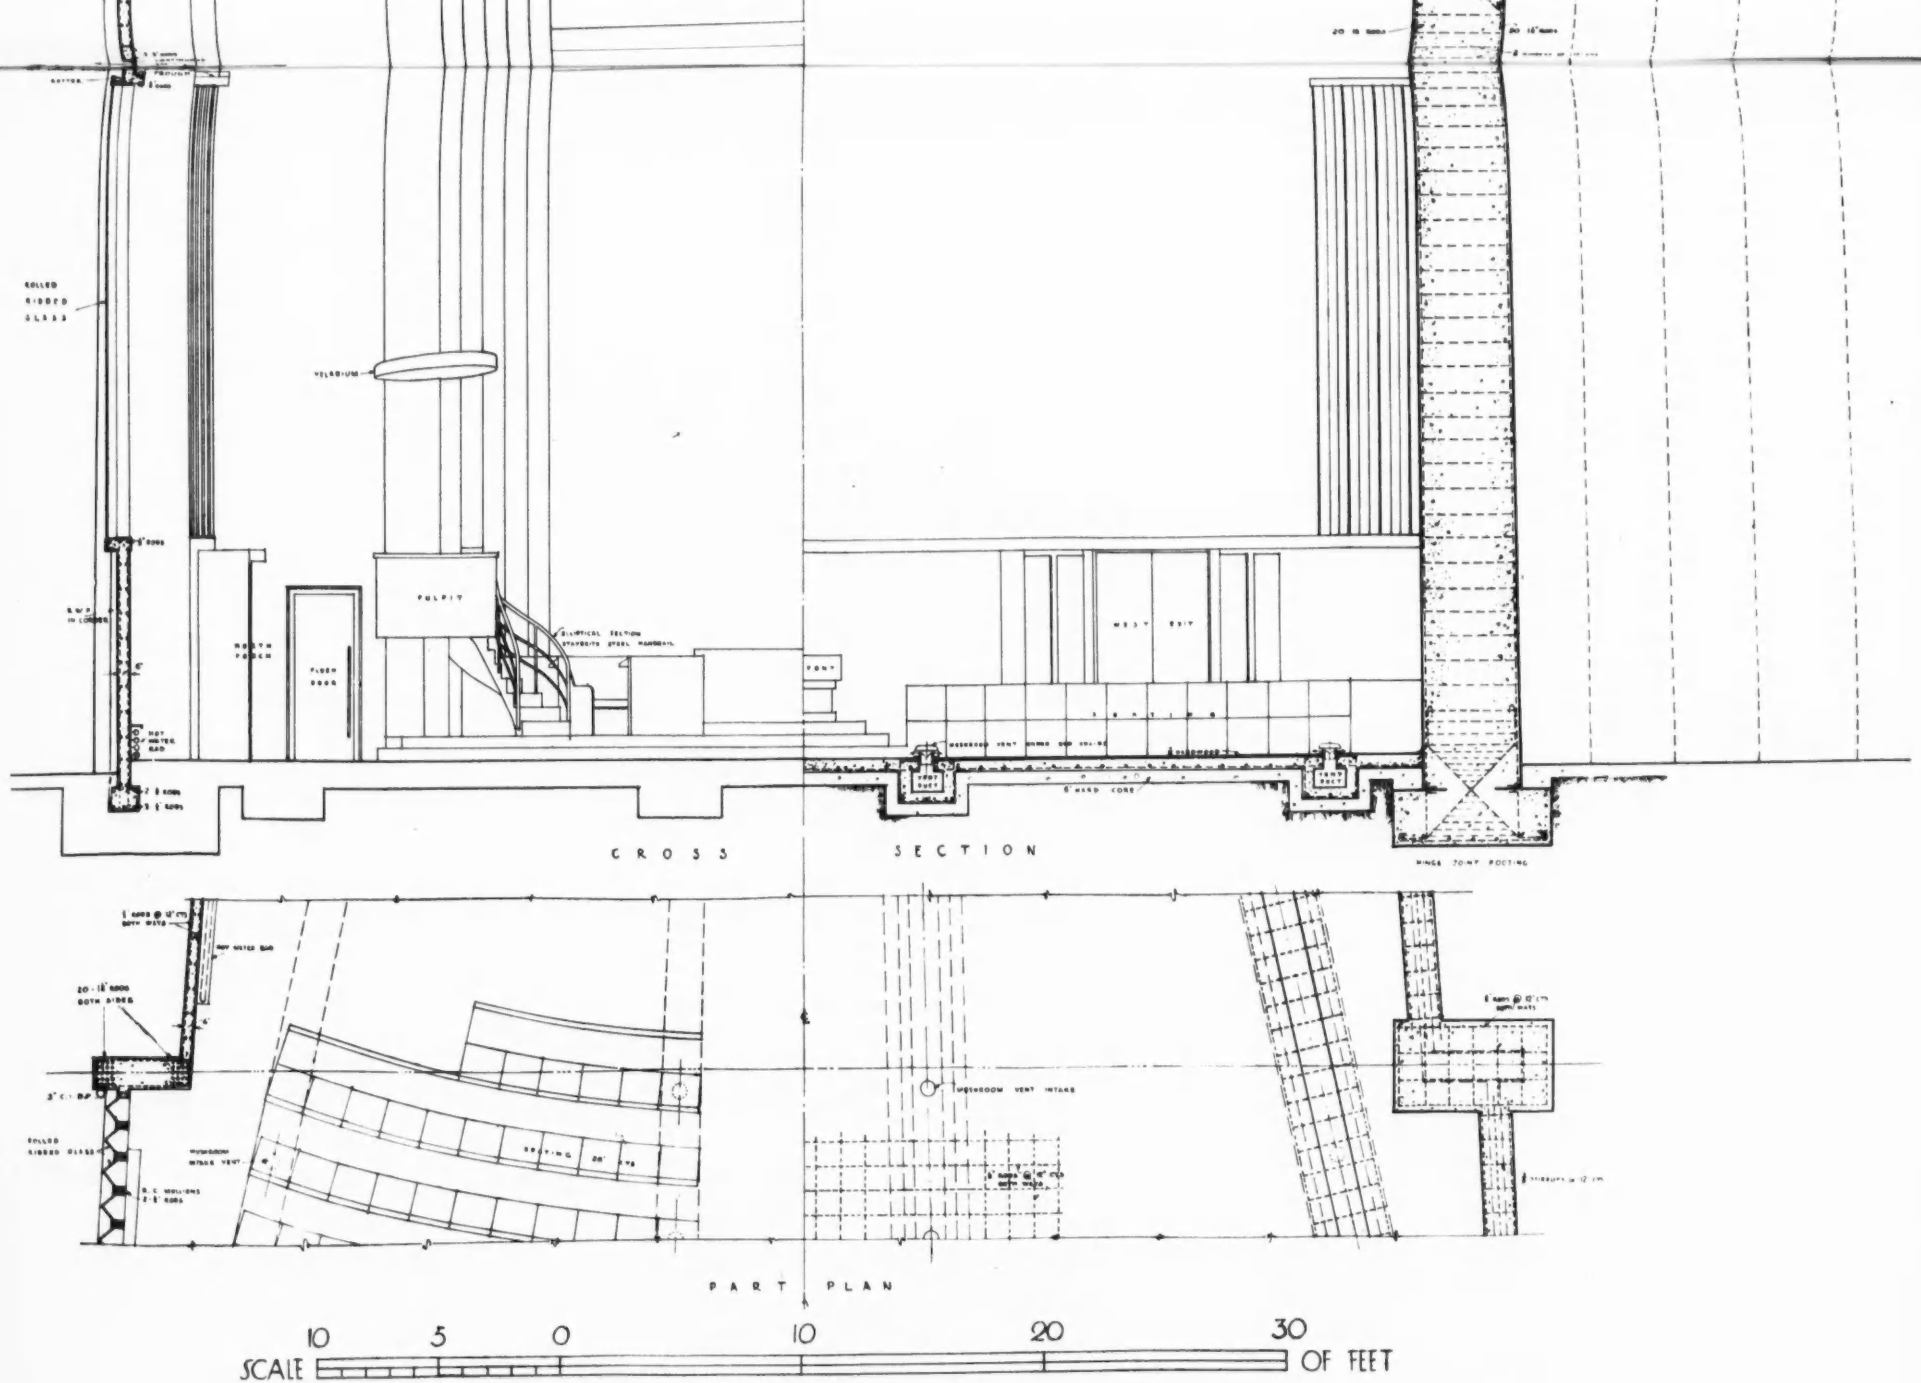
A REINFORCED CONCRETE CHURCH

DESIGNED BY WALTER GOODESMITH





THE MODEL, VIEWED FROM THE EAST END

IN the inner pages of this supplement is reproduced a large-scale drawing of a cross-section through the tower, which, as shown by the above view, completes the east end of the structure.

On the fourth page are printed the architect's comments on some salient constructional and other features of the design, for which he was awarded the Portland House Travelling Scholarship of the Institution of Structural Engineers for 1932.

Other photographs and drawings, together with further notes, appear on pages 359-361 of this issue.

CONSTRUCTION

The construction adopted consists of a graduated series of rigid frames, identical in all respects except that of size. The ends of the frames have been designed as hinge joints.

The roof filling, of pumice concrete, spans between the frames and falls from the ridge to the outer wall. It curves to meet this, and then carries down vertically to the heads of windows. A gutter is formed along the head of each window, with a fall to the east; a r.w.p. in each corner is connected to the drainage system. The lower portion of the panel wall is in concrete and is carried on a wall beam.

The floor of the nave is sloped towards the chancel and consists of a six-inch thickness of concrete laid on top of a six-inch rough concrete hard core.

The tower is formed of six vertical concrete piers with curved infilling between, of circular glass lights, set in mastic and run in a network of rods and concrete. A circular reinforced concrete stair with centre newel is connected at intervals to the outside piers by horizontal ties, thus reducing the unsupported heights of vertical members.

SANITATION

It seems objectionable to place vestry lavatories in juxtaposition to the chancel, whilst it is necessary to have them en suite with the vestries. Full facilities for their use for both clergy and choir vestries have been obtained by entering them off a separate vestry corridor, without the above objection and without sacrificing their privacy and segregation from the public portion of the fabric. This arrangement also promotes extra accommodation, better planning and cleaner plumbing.

VENTILATION

Artificial ventilation has been provided for. The upward plenum system has been used, with "mushroom" inlets under the end seats of every second row, and natural extraction above the heads of windows by means of permanent grilles, under damper control. The F.A.I. and air-conditioning plant are placed adjacent to the lavatory block.

HEATING

The air is heated in connection with the air-conditioning plant, but provision is made for hot water radiators under windows.

LIGHTING

The main lighting of the nave is by continuous electric strip lighting, housed in a cove over the inside heads of windows; a flood light is thus thrown over the ceiling.

Facilities are provided for coloured lighting inside the tower: any required hue is obtained by "mixing" and "dimming."

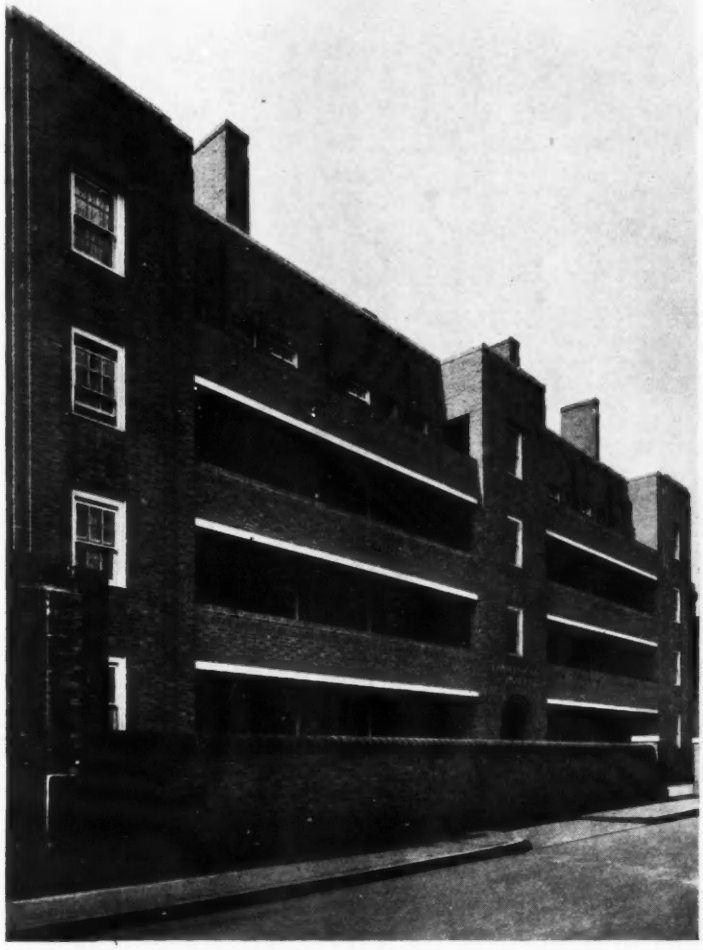
ROOF PITCHES AND DRAINAGE

•

THIS week's Information Sheet enables the architect to find immediate answers to such questions as: "With what shall I cover the roof?"; and "What must I make its minimum pitch?" The inevitable corollary, the problem of draining away the rain-water, is illuminated by a table and a diagram. The diagram of rain-water pipe spacing is taken from a handbook issued by Messrs. Redpath, Brown, and is reproduced here by their permission. The table of pipe sizes is abstracted by permission from British Standard Specification No. 416-1931, official copies of which can be obtained from the British Standards Institution, 28 Victoria Street, London, S.W.1, price 2s. 2d., post free.

The drawings from which all these Information Sheets are reproduced originated in the office of Sir John Burnet, Tait and Lorne. Far from grudging the broadcasting of information they had been at pains to tabulate for use in the course of their own practice, they embraced the proposal with enthusiasm, thus placing the whole profession in their debt, and incidentally furnishing the student of fine draughtsmanship with specimens for emulation.

It was desired to present these Information Sheets in a standardized form, but no standard filing size has existed, hitherto, in Great Britain. The decision was therefore taken to make the reproductions the same size as the original drawings, which themselves follow the standard dimensions adopted by the American Institute of Architects, as being more convenient than reproduction to the double-page size associated with THE ARCHITECTS' JOURNAL Supplements.

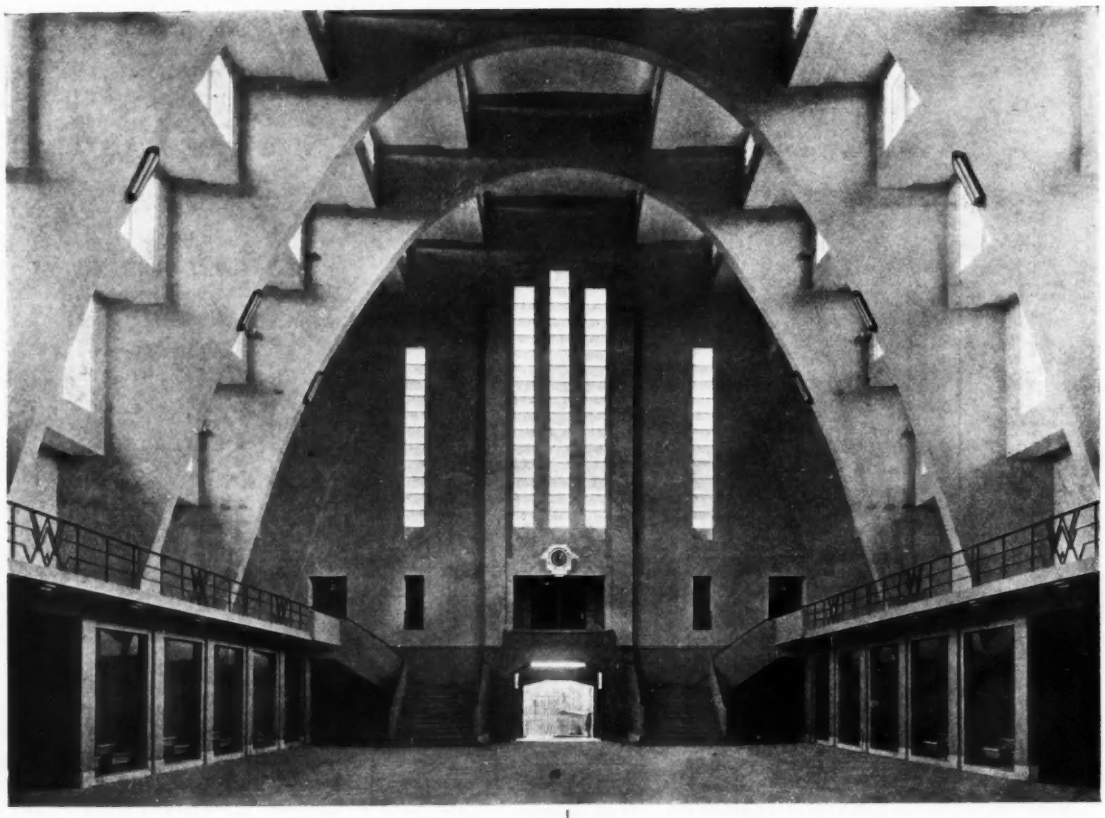


Until further notice, therefore, these Sheets will take the place of the second double-page plate that is usually issued, week by week.

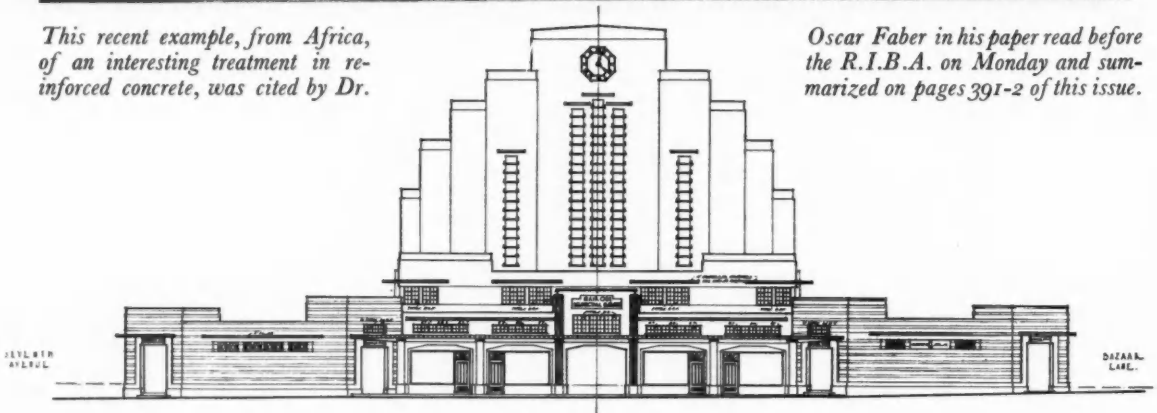
The following is a list of the subjects previously issued:—

1. Jan. 18—Plumbing Fixtures (urinals).
2. Jan. 25—Restaurant Seating.
3. Feb. 1—School Seating.
4. Feb. 8—Theatre Seating.
5. Feb. 15—Cistern Plumbing.
6. Feb. 22—Electrical Symbols.
7. Mar. 1—Motor Car Data.
8. Mar. 15—Billiard Table Data.

FRANCES GRAY HOUSE, STEPNEY

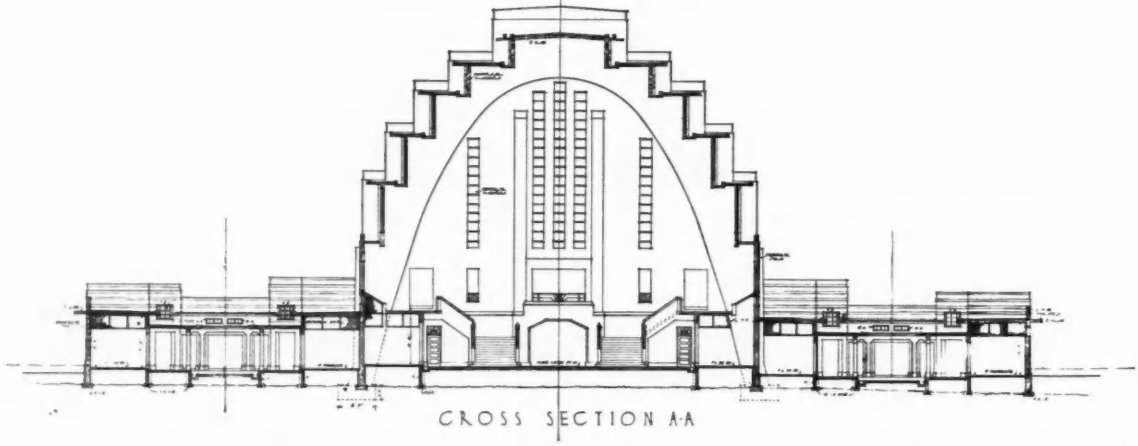


NEW FLATS: BY MITCHELL AND BRIDGWATER



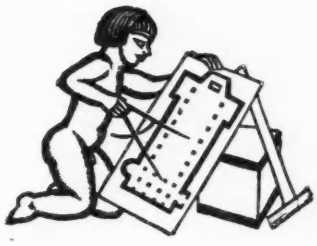
TO-MORROW, March 23, The Duchess of York will open the block of flats in Ocean Street, Stepney, of which the north-east entrance front is here illustrated. Its five stories provide the first sixteen flats to be put in hand by the Stepney Housing Trust, which is sponsored by St. Paul's Girls' School, at a cost, with the land, of £12,500. Funds have been raised partly by gifts and partly by the issue of loan stock at 3 per cent. and £1 shares.

The name over the central arched entrance is in gilt letters; front doors and tree tubs are bright green and windows ivory—a scheme of colouring thrown into effective relief by the purple-brown brickwork and the York stone copings of the walls.



By setting back the building line a small forecourt has been made to give value to the entrance. The concrete floors above one flat, that is to be occupied by a night-worker, have been experimentally sound-proofed with panel boards of reeds 1¼ ins. thick, cork chips in plastic rubber, a layer of plastic rubber, and linoleum.

This recent example, from Africa, of an interesting treatment in reinforced concrete, was cited by Dr. Oscar Faber in his paper read before the R.I.B.A. on Monday and summarized on pages 391-2 of this issue.



ELEVATION TO STEWART STREET

CROSS SECTION A-A

NAIROBI MUNICIPAL MARKET *BY OVERY AND BLACKBURNE*

MR. J. M. KEYNES AND "THE TIMES"

By spending £15 millions a year more than it spends at present keeping 400,000 unemployed, the State could employ those 400,000 men and get executed £45 millions worth of work.

THE TIMES has again rendered a remarkable service to the nation by the publication of Prof. J. M. Keynes's articles, *The Means to Prosperity.** It has realized that economy on capital works is inappropriate to present-day conditions and has had the courage to say so and to publish—and support—Mr. Keynes's proposals. In doing so *The Times*, as its leading article of March 13 admits, gave expression "to a mass of opinion which has been growing rapidly in weight and range."

Mr. J. M. Keynes has probably a greater international reputation than any other economist living, nor is this the first time that his mathematically acute mind has delved into the morass of practical problems and has come up with invaluable suggestions as to public policy. If he is heeded now—as he has been heeded before—in official circles, these four articles may well be Mr. Keynes's most important contribution to the solution of national problems.

The leading articles in the last three issues of the JOURNAL have been concerned with an analysis, from the economic point of view, of expenditure on building and construction. The first article consisted of a somewhat abstract and highly condensed analysis of the effects on employment of such expenditure. On this basis we were able in the following week to expose an error in a speech on the subject of public works by the Chancellor of the Exchequer and to check our previous calculations by the actual figures which he quoted. The leading article last week established a case for public works by setting out the results of expenditure at the former rate of £36 millions per annum. At the very moment of going to press the conclusions arrived at in that article were confirmed by Mr. Keynes's first article.

It is therefore worth while to give a summary of our argument in general terms. Suppose that £45 millions are spent on actual building or construction work. This will give direct employment to some 150,000 men and indirect employment to another 150,000. The total primary employment of 300,000 men is associated with secondary employment in the food and clothing, etc., industries of 150,000 men. But not all this secondary employment is a net addition. The 300,000 men now in primary employment each received before they were employed some £50 a year in unemployment benefit—a purchasing power of £15 millions in all, employing some 50,000 men. The total net addition to employment is thus 400,000 men.

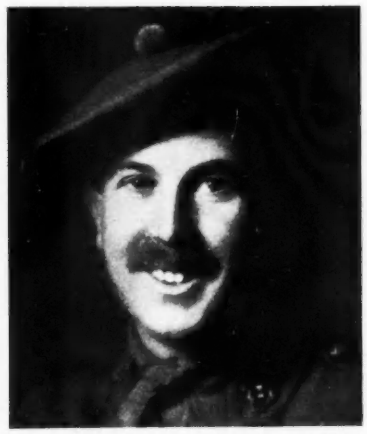
This involves certain savings to the Exchequer. The saving on unemployment benefit amounts to £20 millions, and on employers' and employees' contributions to £1·7 millions. The increased yield of taxation amounts to £9 millions. The total savings to the Exchequer thus amount to £30·7 millions, or two-thirds of the original expenditure of £45 millions.

We therefore have this interesting situation.

By spending £15 millions a year more than it spends at present keeping 400,000 unemployed, the State could employ those 400,000 men and get executed £45 millions worth of work.

The favourable repercussions of such a policy would, as Mr. Keynes points out, be extremely important not only nationally but to the world as a whole, especially if other countries follow suit.

It is to be hoped therefore that the Government will take notice of Mr. Keynes's articles. In the words of *The Times*, "The official appeal for 'wise spending' has always implied Government support for the habit, sooner or later."



Every citizen with the public interest at heart will eagerly await the concrete expression of this policy when the Government decide to implement it. As a first step, the Government cannot do better than recommence those schemes which have been postponed. As the statistics collected by the Building Industries' National Council show, detailed plans exist for schemes to the value of over £30 millions on which work could be begun immediately.

If it is true that the Government "goes a good way with him (Mr. Keynes) already in the opinion that credit may be better defended by development than by the dole," and realizes that "it is in fact only by new capital expenditure, however induced, that the balance of the Budget can be safeguarded," then we may confidently expect a resumption of these schemes in a very short time, as a preliminary to a period of carefully-planned national development.

In three words, *prosperity through reconstruction.*

*"The Means to Prosperity," four articles published in *The Times* for March 13, 14, 15 and 16.

Mr. Christopher Hussey, Chairman of the Executive Committee, and Mr. Oliver Hill, Architect of the Exhibition of British Industrial Art in Relation to the Home, to be held at Dorland Hall in June and July. *(See also pages 388 and 399.)*

NOTES & TOPICS

THE EXHIBITION OF THE YEAR

ON August 26, 1931, Mr. Noel Carrington wrote a letter to this JOURNAL suggesting that an exhibition should be held in London in which "the house will be the central unit."

*

Would it not be a better stimulus to trade [he wrote] than tariff conferences, or nationalist propaganda? Would it not give the younger generation courage and hope after our present long depression?

*

The letter evoked a good deal of correspondence at the time. Today, largely through the courage and enterprise of Mr. Christopher Hussey and Mr. Oliver Hill, I am glad to say the idea has actually become a reality. An exhibition is to be held at Dorland Hall in the summer, which will show the best work England's architects and manufacturers can produce. Of this, more in one moment.

*

Meanwhile, the textile exhibition at Fortnum and Mason's is a stimulating selection of the work of contemporary designers, and there has been no hesitation about naming the designers. It is a good company that includes such names as Paul Nash, Marion Dorn and Terence Prentice.

*

There is a compromise section as well as a modern one in this exciting little show. But the former is an attempt to shake hands with tradition, a gesture that lacks the infectious glory of courage.

*

That gesture will be *verboten* at the Exhibition of British Industrial Art in Relation to the Home—the one I wish to talk about. The aim of this Exhibition was officially un-hushed last week by Sir Francis Goodenough and Mr. Frank Pick. Sir Francis said it was not a rich man's show, but that it would illustrate "how all of us can be rich in beauty wedded to utility in our homes." Mr. Pick aptly symbolized the difference between the Victorian home-making outlook and modern views by comparing the aspidistra, once prized and potted, with the cactus, which today satisfies what I suspect Mr. Pick believes to be a transient appetite for stark angularity.

*

Whether the spacious rhythms of the modern movement will be checked depends upon whether we produce some idiot child from our economic depression and allow it to rave its way into ruling, as Germany has done. The Nazis (or the "Nasties" as some call them) with their war on "the art of the Left" may destroy the new German Renaissance and reinstate the florid taste of those feckless outcasts, the Hohenzollerns.

*

I may yet live to see this paper suspended by order of the organization that delights in the initials, B.F., and be saddened by the spectacle of Messrs. Wells Coates, McGrath and Robert Byron being chased along Piccadilly by a mob of black shirts, howling for the blood of those who believe in steel.

*

THE PERSONNEL OF THE EXHIBITION

I have wandered again into parentheses; let me return to the E.B.I.A.R.H., aforesaid.

*

It differs from every other exhibition held in this country in that it is selective. The various committees are *choosing* the work to be shown, which will be paid for by the exhibitor on a space-rental basis. I believe it will be a worthy successor to the Swedish Exhibition.

*

Mr. Hussey is the chairman of the Executive Committee. He is also of course the brilliant editor of *Country Life*. Furthermore he is an old Etonian, one of the group of O.E.'s who hover, like Jesuits, in the background of honest English commercial life, silently moulding it to their sinister Sitwellesleyan ends.

*

The Exhibition Secretary, Mr. Richard Dudley Ryder, is yet another old Etonian. Mr. Ryder's abilities are as

ROYAL SOCIETY OF ARTS, John Street, Adelphi, W.C.2. "Heraldry." By Sir Gerald W. Wollaston, M.V.O. 8 *p.m.*

LONDON SOCIETY. Visit to the Works of Hoover, Ltd., Perivale, Greenford, Middlesex. 2.45 *p.m.*

NEW HOMES FOR OLD EXHIBITION. At 24 Grosvenor Place, S.W.1. Exhibition entitled: "Housing: The Present Opportunity." Until April 1. 11 a.m. to 7 p.m. 11 *a.m.*

Thursday, March 23

INSTITUTION OF STRUCTURAL ENGINEERS, 10 *Upper Belgrave Street, S.W.1.* "Pressure Distribution under bases and stability of foundations." By Dr. Oscar Faber, O.B.E. M.INST.C.E. 6.30 *p.m.*

INCORPORATED INSTITUTE OF BRITISH DECORATORS. At the London School of Hygiene and Tropical Medicine, *Keppel Street, Gower Street, W.C.1.* "The Trend of Modern Decoration." By Howard Robertson, F.R.I.B.A. 8 *p.m.*

L.C.C. GEFFRYE MUSEUM, Kingsland Road, Shoreditch, E.2. "Sheraton Furniture." By H. Cescinsky. 7 *p.m*

Friday, March 24

TOWN PLANNING INSTITUTE. Dinner to the Rt. Hon. Sir Edward Hilton Young, G.B.E., D.S.O., M.P. 7.15 for 7.45 p.m. 7.45 *p.m.*

ROYAL ACADEMY EXHIBITION. Day for submission of water-colours, pastels, miniatures, black-and-white drawings, engravings and architectural drawings. 8 a.m. to 10 p.m. 8 *a.m.*

Saturday, March 25

Sunrise 5.53 a.m. Sunset 6.21 p.m.

ST. PAUL'S ECCLESIOLOGICAL SOCIETY. Visit to the Whitgift Hospital and Parish Church, Croydon. 2.30 *p.m*

Monday, March 27

LONDON SOCIETY. Visit to the Roman Wall. 2.30 *p.m.*

varied as his activities, and he has hobbies as well as activities. Most hobbies are eccentric, but Mr. Ryder's hobby seems to me even more eccentric than usual.

*

It is acetylene welding.

*

YET ANOTHER EXHIBITION

At the moment, I am very much preoccupied with exhibitions. We have lately heard a lot of talk on exhibition planning and the design of exhibition stands, so, being invited by Mr. E. C. Davies, F.R.I.B.A., who was responsible for the lay-out of stands at the South London Exhibition at the Crystal Palace last week, I took the opportunity to discover for myself whether exhibitors really do benefit from a co-ordinated scheme.

*

I am convinced that they do. But what a trying job it must be for the architect who has to prove it to them, even when he has the sympathy and co-operation of the promoter!

*

Exhibitors will not take space on wide gangways where it is easy for visitors to slip past before the showman can take them by the sleeve, or near "features" calculated to distract attention from the goods displayed.

*

They do not like standard facias, lettering and colour, and, like the skyscraper advertisers, their object is to build high.

*

However, with few exceptions, the booths at the Crystal Palace conform to a single standard of design, are alike in colour and are of even height, with the result that confusion is eliminated. The visitor is immediately able to see the nature of the goods displayed.

*

I was surprised to see Cadbury's among the exceptions, for theirs is a name I have always associated with the preservation and creation of amenities and the promotion of good design.

*

FROM SLUMS TO AERIAL HOMES

I would like to know more of Mr. Joseph Emberton's solution of the slum problem. At first glance I am reminded of le Corbusier's dream, which he called *la cité verte*, and in which congestion was replaced by isolated towers of concrete and glass, standing in parks and connected by elevated roadways.

*

Le Corbusier's scheme was a strictly logical development of engineering structure, helped forward, I always felt, by the poet's enslavement to a conception of crystalline aerial beauty in his structures.

*

In practice, and even with rigid economy, the costs of lifts, terrace spaces and other quite necessary compensations for the comparative isolation of life on a tower have negatived the present-day value of le Corbusier's contribution, and I should imagine that the relative costs are not diminished by cutting down from 20 stories to 6 or 7.

*

Anything that helps to solve the problem is of value. I shall know more of this.

ASTRAGAL

You would say, would you not, that this is a block of flats, or the court of an office building, or, conceivably, a colossal school? Not so, gentle reader; it is a sacred edifice, a church. It represents a modern conjugation of the verb to worship, and has recently been erected in Hamburg.

EXHIBITION OF BRITISH INDUSTRIAL ART

Following are the names of the members of the general and executive committees of the Exhibition of British Industrial Art in Relation to the Home, to be held at Dorland Hall, Lower Regent Street, S.W., from June 20 to July 12.

GENERAL COMMITTEE.—The Lord Aberconway, Chairman, Metropolitan Rly. Co. ; H. H. Berry ; Sir Basil Blackett, K.C.B., K.C.S.I., Director, Bank of England ; The Lord Blanesburgh, G.B.E. ; Alfred Bossom, M.P., F.R.I.B.A. ; Arthur Chamberlain ; Samuel Courtauld ; Kathleen, Countess of Drogheda, C.B.E. ; Major-General The Lord Edward Gleichen, K.C.V.O. ; Sir Francis Goodenough, C.B.E., Executive Chairman, British Commercial Gas Assoc. ; Bryan Guinness ; Sir Martin Hall, Bt., O.B.E. ; The Earl of Harewood, K.G., D.S.O., Royal Trustee, British Museum ; Sir Leonard Hill, F.R.S., HON. A.R.I.B.A. ; C. H. St. John Hornby, F.S.A. ; Edward Hudson ; R. S. Hudson, M.P., Chairman, Country Life, Ltd., etc. ; H. Trevor Jones ; E. McKnight Kauffer ; The Viscount Lee of Fareham, G.C.B., G.C.S.I., G.B.E., F.S.A. ; Rt. Hon. Viscount Leverhulme ; R. Holland Martin, C.B., Director, Martin's Bank Ltd. ; Lady Melchett ; Lady Mount Temple ; Guy Pearce ; Professor C. H. Reilly, O.B.E., Roscoe Professor, Liverpool School of Architecture ; The Lord Riddell ; The Rt. Hon. Sir Philip Sassoon, Bt., G.B.E., C.M.G., M.P., Trustee, Nat. Gallery, etc. ; Viscountess Snowden, J.P., Vice-President, Brit. Music Society, etc. ; Harold Stabler ; Dudley Tooth ; J. T. Webster ; Colonel Sir Harold Wernher, K.C.V.O., Clough Williams-Ellis, M.C., J.P., F.R.I.B.A.

EXECUTIVE COMMITTEE.—*Chairman*, Christopher Hussey, Editor, *Country Life* ; *Vice-Chairman*, Frank Pick, Chairman of Underground Rly. Co. ; Noel Carrington ; Gordon Forsyth, Principal, Burslem Art School ; V. H. Goldsmith, Assistant Controller B.B.C. ; Miss Muriel Harris ; H. de C. Hastings, Editor THE ARCHITECTS' JOURNAL ; Oliver Hill, F.R.I.B.A. ; G. R. Hughes, Major A. A. Longden, O.B.E., D.S.O., Art Advisor, Dept. Overseas Trade ; Charles Marriott, HON.A.R.I.B.A., Art Critic, *The Times* ; Oswald P. Milne, F.R.I.B.A. ; Paul Nash ; Howard Robertson, F.R.I.B.A. ; Miss Dorothy Todd ; *Exhibition Architect*, Oliver Hill, F.R.I.B.A. ; *Treasurer*, G. A. Sawyer, C.B.E. ; *Secretary*, R. Dudley Ryder.

The list of subscriptions received by the Public Relations Committee of the Building Industries National Council up to Monday last amounted to £2,390/14/10. Subscriptions should be addressed to Mr. Oswald Healing, at 5 Duke Street, Adelphi, W.C.2.

WATERLOO BRIDGE

The Improvements Committee of the L.C.C. have recommended the Council to appoint Messrs. Rendel, Palmer and Tritton as engineers for the reconditioning and corbelling-out of Waterloo Bridge. The committee also propose that Mr. G. Topham Forrest, the Council's architect, shall be entrusted with the work of collaborating with the engineers in preparing designs for the corbelling-out process.

SIR RAYMOND UNWIN'S BROADCAST TALK

Sir Raymond Unwin broadcast on Monday night on the proposal for a National Housing Board, making a constructive suggestion towards a solution of the present difficulties.

He pointed out that the need is great, because the number of separate families has been increasing as fast as, or faster than, the supply of separate dwellings ; because, although the rates of interest and the cost of building have fallen and the Minister has consequently abolished the subsidy, unfortunately the rent-paying capacity of millions of the people has fallen still more. There are, therefore, vast numbers who cannot afford to pay a rent which would enable private enterprise unaided to provide the needed dwellings. Local authorities are asked by the Minister of Health to concentrate on the work of slum clearance under the 1930 Act.

The whole problem, however, is a complex one, and cannot be dealt with in sections. Slum clearance needs a margin of new houses, or else the difficulty and expense of it must be greatly increased. There are many local authorities who do not themselves want to undertake housing work, and there are objections to local authorities owning and managing large numbers of dwellings in which voters live.

There are further questions of reconditioning dwellings and helping tenants who from long overcrowding and living in slum dwellings have lost the knowledge of how to live in decent dwellings. All these aspects must be dealt with in combination. The suggestion is therefore made that a National Housing Board should be set up to work in co-operation with the local authorities and deal with all branches of housing and slum clearance, and reconditioning, for those tenants for whom private enterprise cannot afford to cater. The Board would raise capital on the lowest rate of interest in order that the rent may be such as the poorer sections of the people can pay ; it would make no profits but meet the interest. It would work through local public utility societies, not displacing local authorities, but co-operating with them. It would also work through and seek the assistance of all branches of the building industry, and seek to bring about a great improvement in the housing of the poorly-paid members of the community.

STRUCTURAL ENGINEERS AT DINNER

Over 550 members and guests attended the annual dinner of the Institution of Structural Engineers, held at the May Fair Hotel, London, on Friday last. Major E. C. P. Monson, T.D., F.R.I.B.A., occupied the chair. The toasts (excluding that of the Royal Family, given by the President) were proposed and responded to as follows :

"THE INSTITUTION." Proposed by Major The Rt. Hon. W. G. A. Ormsby-Gore, P.C., M.P. (H.M. First Commissioner of Works), and responded to by Major E. C. P. Monson.

"THE GUESTS." Proposed by Mr. A. H. S. Waters, M.INST.C.E. (Vice-president), and responded to by Sir Frank Smith, K.C.B., C.B.E., D.SC. (Secretary to the Department of Scientific and Industrial Research) and Professor Sir Frederick William Keeble, C.B.E., SC.D.

Mr. Ormsby-Gore, discussing the necessity for co-operation between the architect and the structural engineer, said :

There are bound to be difficulties in drawing the line between what is the proper function of the architect and the structural engineer. Where both do their work with mutual goodwill, and comprehension of their respective proper functions, one should get the right type of modern building. Where either is unduly subordinated to the other the marriage cannot be a happy one ! I wish I could feel that at some of our modern buildings there had been a better mutual understanding. In matters of taste everybody is, I believe, entitled to his own personal opinion, and there are some modern buildings where the structural engineer and the architect have attempted co-operation, and where, in my opinion, for what it is worth, the result is not altogether a happy one. If you ask me for an example, I would point to the new Lambeth Bridge. I know I shall be treading on corns, and that there will be many who will differ from my amateur opinion ; but, when I look at that bridge it strikes me that whoever designed the main structure did the work extremely well, and produced a five-

THE STRUCTURAL ENGINEERS' DINNER

On the facing page is a report of the annual dinner and dance of the Institution of Structural Engineers, which was held on Friday last. The above sketches are by Fred May.

arch steel bridge of extremely fine proportions and design. On the other hand, the architectural embellishments in granite that have been superimposed on the work of the engineers, while, no doubt, excellent in themselves as individual parts, do not appear to my eye to have improved the appearance of the bridge.

Regarding functional architecture, the young architects of my acquaintance all tell me that, in architectural style and taste, we are in a transitional period midway between a traditional and classic past and the ideal of the pure functionalism of the future. All success to the aims and aspirations of the functionalists, but I would enter a caveat—we are not constructing buildings and structures on a brand new planet, and the building or structure that aggressively disregards its neighbours, however right and good in itself, will not be really right if it is unneighbourly. At the Office of Works the efforts of my staff are directed to being up to date and modern in design without being unneighbourly.

One element in our modern make-up is going to be a great help to you, and that element is the sometimes popular, but more usually unpopular, word "economy." Your Institution is working on problems of greater economy in the cost of construction, and on getting the most efficient use of every ounce and poundsworth of material. That is right; for in a matter like this, progress and economy walk hand in hand, though I know there are people, including some architects in this country, who think that they are always mutually incompatible.

MODERN SCULPTURE

Mr. B. R. Gribbon presided over a meeting of the West Yorkshire Society of Architects held at the Leeds College of Art on March 16, when Mr. William Aumonier gave a paper on "Modern Sculpture."

He thought that the modern sculptor had risen bravely to his opportunities, and he considered that behind all modern work there was a terrific amount of thought. There could be no doubt that the modern sculptors were upholding the principles of simplicity and directness, and treated a block of stone as stone and as part of a stone building.

THE LATE C. R. MACKINTOSH

It is proposed to hold a memorial exhibition in Glasgow at an early date of the works of the late C. R. Mackintosh and of his wife, the late Margaret Macdonald Mackintosh. Any readers who own work of either of these persons, and are willing to lend it for the exhibition, or who think they can help those in charge of the matter to forward the proposed exhibition, should communicate with Messrs. Macdonald, Smith and Co., 100, West Regent Street, Glasgow, C.2.

LIVERPOOL SOCIETY

The Shakespeare Memorial Theatre was the subject of a lecture by Mr. G. A. Jellicoe, A.R.I.B.A., at a meeting of the Liverpool Architectural Society, held on Wednesday last.

From a landscape point of view, he said, some people were rather shocked by the size of the theatre when they first saw it. But when they got used to it they would appreciate its fine architectural form. Incidentally, thirty such theatres could be built for the same cost as the Paris Opera House.

R. I. B. A.

ARCHITECTURAL EDUCATION

We have received the following letter on the subject of architectural education, signed by Sir Raymond Unwin, P.R.I.B.A., and Mr. W. H. Ansell, F.R.I.B.A. (Chairman of the R.I.B.A. Board of Architectural Education):

The development of architectural education during recent years has been so rapid that it is very probable that the new facilities available are not sufficiently well known. The R.I.B.A. has done its utmost to encourage the foundation of schools of architecture in large centres of population throughout the country, and when these have become established and a sufficiently high standard attained has granted to their graduates who have taken a satisfactory three or five years' course exemption respectively from its Intermediate and Final Examinations for Associate-membership.

By this means any young man or woman can now qualify for practice at an Exempted School of Architecture, just as a medical student qualifies at a recognized Medical School The parallel is very close, because just as the medical student, during his five years' course, attends a hospital to obtain practical experience, so the R.I.B.A. requires that the architectural student for similar reasons shall go into an architect's office for periods amounting in all to twelve months.

The chief reason why schools of architecture have gown up during the last 20 years, and why both the central governing body of the architectural profession as well as its allied societies have fostered them is that the articled pupilage system, by which a young man was articled for three, five or even seven years to a single practising architect, has not been found equal to the exigencies of modern practice. In the substitution of schools of architecture for the older system of articled pupilage the architectural profession is only following the practice of other countries such as France and America, and indeed that of other professions like medicine and engineering in our own country.

The schools of architecture recognized by the R.I.B.A. for exemption from the Intermediate and/or Final Examinations are :—

Robert Gordon's Colleges (Aberdeen); Birmingham School of Architecture; The Technical College, Cardiff; Edinburgh College of Art; Glasgow School of Architecture; Leeds College of Art; University of Liverpool; Architectural Association, London; University of London; University of Manchester; Royal West of England Academy, Bristol; University of Cambridge; Leicester College of Arts and Crafts; Northern Polytechnic, London; The Polytechnic, Regent Street, London; Armstrong College (University of Durham), Newcastle-upon-Tyne; Nottingham School of Architecture; University of Sheffield; Municipal School of Arts and Crafts, Southend-on-Sea; University College, Dublin; University of Melbourne, Australia; University of Sydney, Australia; Sydney Technical College, Australia; Manitoba University, Winnipeg, Canada; McGill University, Montreal, Canada; University of Toronto, Canada; Sir J. J. School of Art, Bombay; Auckland University College, New Zealand; University of the Witwatersrand, Johannesburg, South Africa; University of Cape Town, South Africa.

For some years now the R.I.B.A., by its Maintenance Scholarships scheme, has enabled promising students, whose parents or guardians have not the necessary means, to attend an approved course at one of the exempted schools of architecture.

Apart from offering professional training, an organized and successful school of architecture in a city forms a centre of architectural interest and does important work in leading public opinion to the appreciation of architecture as a subject of general culture.

WHERE LONDONERS LIVE

Is it better to live in a "conveniently equipped box" or in a badly-built house? In other words, should Londoners live in carefully-designed flats of standardized pattern, or should they continue to live in ugly, inconvenient and extremely expensive suburban houses?

This was the query raised on Wednesday last by Mr. A. S. G. Butler in his lecture on "Where Londoners Live," which formed the second of a series of public lectures on "How to Look at London," organized by the R.I.B.A. In this conflict between conservative "gentility" and practical commonsense Mr. Butler was emphatically on the side of commonsense.

He compared the average suburban homes of the typical Londoner, with all the drawbacks resulting from bad building and thoughtless planning, with the convenient and, on the whole, decent-looking blocks of modern flats and new and improved suburban houses.

FRANCO-BRITISH UNION OF ARCHITECTS

The thirteenth annual meeting of the Franco-British Union of Architects will take place at Caen (France) from Friday, June 2, to Monday, June 5.

Members who expect to be able to attend are asked to send their names to the Secretary-General (Lt.-Col. H. P. Cart de Lafontaine), 11 Suffolk Street, Pall Mall, S.W.1, as this will facilitate travel arrangements for which it is hoped to obtain special reduced rates.

STUDENTS' EVENING

On Tuesday of last week a Students' Evening was held in connection with the R.I.B.A. Exhibition of Architects' Working Drawings.

Mr. Joseph Emberton, Mr. Percy Thomas, Mr. F. Hyde (representing Messrs. Richardson and Gill), and Mr. C. Hutton and Mr. T. Haiseldon (representing Mr. C. H. Holden)

attended and explained to the students the special points of interest in their respective drawings.

Change of Address

Mr. F. R. Gould Wills, F.R.I.B.A., architect and surveyor, has removed his offices to No. 16 Harpur Street, W.C.1. Telephone No. : Holborn 2594.

On the Air

The B.B.C. series of talks on "Other People's Houses" will be summed up by the Rt. Hon. Sir Edward Hilton Young, G.B.E., D.S.O., M.P. (Minister of Health) on Monday next, March 27, in the National Programme at 9.20 p.m.

COMPETITION

NEWS

SURBITON : NEW HOSPITAL BUILDINGS

In view of the large number of applications received, the Governors of the Surbiton Hospital have reconsidered their decision to hold a *limited* competition in connection with the new Hospital Buildings to be erected at Hill Manor, Ewell Road, and have decided to make it an *open* competition. Premiums of £125, £75, £50 and £25 are offered. Those desirous of competing must make application to the Assessor, Mr. C. Ernest Elcock, F.R.I.B.A., Adam House, 60, Strand, London, W.C., *before Saturday next, March 25.*

Competitions Open

March 24.—Façade to a newspaper office, in grey Cornish granite, for the Cornish Quarry Masters' Association. First Prize, £50. Conditions etc., were published in *A.J.* for Feb. 1.

March 31.—Competitions for Cottages to be built at an economic rent, organized by the Building Centre, 158, New Bond Street, W.1, from whom full conditions are obtainable. Premium : £100.

April 13.—Design of a new exhibition hall at Manchester for the Management of the Manchester Building Trades' Exhibition. Premiums : £150, £75 and £25. Full particulars were published in *A.J.* for February 15.

April 15.—Proposed Burgh Chambers, Municipal Offices and Public Baths for the Town Council of the Burgh of Prestwick. Premiums : £200, £100 and £50. Designs to be submitted to the Town Clerk not later than 12 noon on May 8. The period for applications for conditions, etc., has now closed. Full particulars were published in our last issue.

May 31.—Sending-in Day. Layout of a suburb on the river Escaut, Antwerp. £2,400 in prizes (1st, £800). Conditions, etc., were published in *A.J.* for December 7, 1932.

BUILDING
STRUCTURES

By OSCAR FABER, O.B.E., D.Sc., M.Inst.C.E.

(Summarized from the Paper read before the Royal Institute of British Architects on Monday, March 20, 1933.)

ECONOMY of construction is a matter of paramount importance in these days. One reason is, of course, that with rents still largely determined by pre-war buildings, and post-war building being largely governed by costs of labour and materials of the order of twice pre-war, building developments are necessarily greatly restricted from financial considerations unless greater economy of construction can be achieved by special effort.

There are two main directions in which this economy can be obtained. One is by using ordinary construction with greater knowledge, which enables us to say where material can be reduced without reducing the general factor of safety, leaving untouched the places which were really the limiting considerations. The second is by investigating new methods of construction altogether, involving a development in the technique of building.

Under the ægis of the Steel Research Committee set up by the Department of Scientific and Industrial Research, tests have been carried out at the New Geological Museum at South Kensington under the supervision of the author of this paper.

These tests have been directed to checking the actual stresses in a full-scale steel frame for a building of four stories.

It should, perhaps, be mentioned here that in the design of steel frames of this character, it has been usual in the past to calculate the bending stresses in the stanchions on the basis of assuming the reactions of the beams to occur on the centres of the stanchion brackets. The eccentricity of this point from the centre line of the stanchion multiplied by the beam reaction in tons determines the bending moment in the stanchion.

This assumption would be correct if this were the only means of attachment between the beam and the stanchion, but obviously a building constructed in this way would have no resistance to lateral forces such as wind and earth tremors, and would be entirely unstable. To give it this necessary stability against lateral forces the joints are given stiffness by adding top cleats between the beams and stanchions as well as bottom cleats, and it has been clear to those who have given thought to the matter that this modification must inevitably modify the correctness of the assumption as to the position of the reaction previously referred to, increasing its eccentricity and the bending moment in the stanchion with it.

The question has been, whether this increase was material or not. The so-called practical man has been disposed to argue that the increase was theoretical and not reflected in the actual conditions on the site. Those, however, who have studied the matter most closely have held that the increase was important.

It was the object of the tests at the Geological Museum to ascertain, among other things, what the order of this increase was.

It should be remarked that the connections in this case were of the minimum degree of stiffness usual in practice. The top cleats were connected to the beams, which consisted of two 24-inch by 7½-inch joists side by side, by only two ⅞-inch bolts. In actual practice, as you are aware, connections of much greater stiffness are often employed, and there, of course, the effect would be even greater in proportion.

To cut a long story short, the general conclusion of this particular investigation has been to show that even with the comparatively light connection referred to, the bending stresses in the stanchions were practically doubled as compared with those calculated on the ordinary basis, and that an approximately correct estimation of the moment is obtained by adding to the moment ordinarily calculated one obtained by considering the top bolts to be stressed to eight tons per square inch in shear and multiplying the force so arrived at by the depth of the beam.

It would, of course, not be justifiable to assume that this would be correct under all conditions, and further tests are in progress by the Department.

I am obliged to the Department and to the Chairman of the Steel Research Committee for permission to refer to this matter at this stage, and a fuller account will be found in the Second Report of the Steel Research Committee which is shortly due for publication.

The next matter to which I propose to refer relates to the distribution of pressure under bases and foundations and the stability thereof arising from this consideration.

In the design of foundations it has been usual, and is still usual today, to assume that a concentrically loaded foundation exerts a uniform pressure over the area of the base, and that the stability may be determined by ascertaining whether the pressure so arrived at is one which gives conditions of stability in the soil at this particular depth.

In 1929 the author, with the assistance of Mr. K. Montgomery-Smith, B.Sc., A.M.INST.C.E., and the collaboration of Mr. R. H. H. Stanger, PP.I.STRUCT.E., made a series of researches which may be of interest in this connection, as they give results very different from those normally assumed.

In practice the experiment was conducted by applying a certain load which could be measured on to the specimens. Extensometer readings were then taken, and the load calculated and reduced to tons per square foot.

The sand used in all these tests was dry Leighton Buzzard sand, as used for cement testing.

Fig. 1 shows the actual distribution obtained in one of the sand tests with no surcharge, i.e., with the foundation on the top surface, where the outer sand was free to escape without restraint in an upward direction.

It will be seen that the bottom curve corresponds to an average pressure on the base of 3·53 tons per square foot, but that the pressures at the edge of the base never exceed 1 ton to the square foot, while the maximum pressure at the centre reaches a figure as high as 9·4 tons to the square foot.

Fig. 2 shows a test with the surrounding material surcharged to 1·46 tons to the square foot, i.e., corresponding approximately to a foundation on sand at a depth of about 30 ft. below the ground.

In this case it will be seen that there is much less difference in pressure between that at the edge and that at the centre.

Without giving all the experiments in detail it may, perhaps, suffice to give the results of the sand experiments in general by stating that distribution of pressure where the foundation is near the free surface is approximately parabolic, and, where the foundation is at a considerable depth below the surface, the distribution is intermediate between parabolic and uniform.

Coming now to the clay tests, it should, perhaps, be explained that clay is a very difficult material to experiment on for a variety of reasons.

First, because it is by no means absolutely uniform in hardness, and secondly, because in a warm, dry laboratory it loses its moisture rapidly and changes its properties accordingly. The latter was prevented by covering the free surface of the clay with a very thin sheet of india-rubber, sufficient to prevent evaporation,

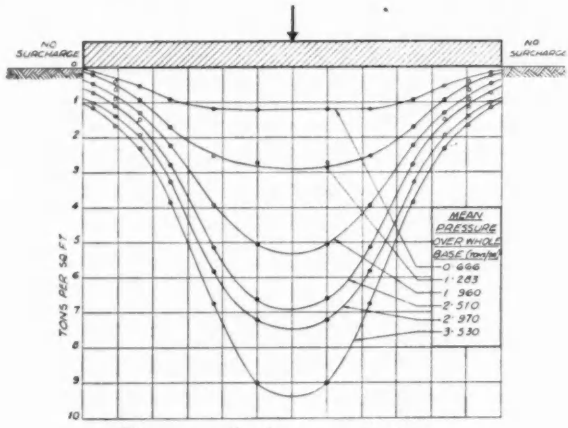

Figure 1. Sand test: no surcharge.

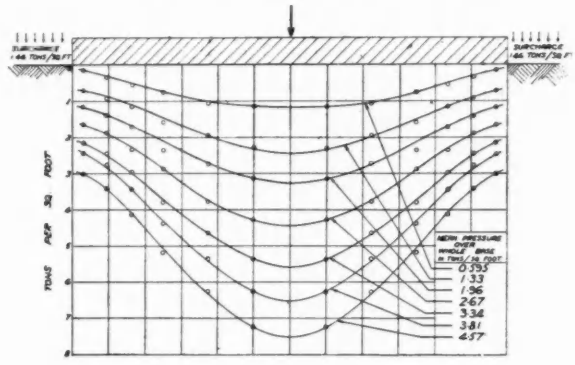

Figure 2. Sand test: surcharge 1·46 tons/sq. ft.

but not sufficient to influence the results by altering the distribution.

The effect of the surcharge appears to be less important with clay, as compared with its effect on sand.

In general it may be said, as the results of the clay experiments, that the distribution generally appears to approximate to one giving a maximum at the edge and a minimum at the centre, the mean pressure being two-thirds of the edge pressure and the distribution between the two being a curve which appears to approximate to an ellipse.

It is now, perhaps, of interest to consider some of the results which appear to follow from these facts.

In the first place, it becomes clear that from the point of view of the stability of the soil, a foundation on sand is going to permit a far higher average pressure than that based on considerations of stability of the sand at the edge of the base.

Foundations on clay, however, appear, on the contrary, to have a total stability less than the stability calculated from consideration of the safe pressure at the edge, and it would appear to be necessary in obtaining the total pressure on a base to multiply the safe pressure at the edge by a factor which may be of the order of two-thirds, in addition, of course, to any factor of safety which it may be prudent to require.

Added to this there is, however, another consideration when we come to the strength of a base itself.

Most bases are designed as cantilevers from the centre, and it will be seen that with the sand foundation the centre of gravity of the load comes nearer to the centre line than it did with uniform distribution, and the total bending moment is much reduced in consequence. The converse is true in the case of clay.

While on the subject of foundations, the author would like to offer a word of warning in connection with *piled foundations*, which often contain traps which are not always obvious.

There seems to be a popular belief that provided a pile gives the set required in accordance with a pile-driving formula corresponding to a particular carrying capacity, or if an individual pile will safely carry a certain test load, a group of similar piles may be assumed to carry the total load with safety *pro rata* to the number of piles. There are many cases where this is entirely untrue.

It sometimes happens that a group of many piles may only carry a small proportion of the load per pile which any individual pile tested singly would appear to justify, whether this test takes the form of a pile-driving formula or whether it is obtained by an actual loading test on the pile.

As a result of experience of many cases the author would submit the following propositions:

(1) The mere fact of a pile driving to a satisfactory set is no indication that a group of similar piles will safely carry any particular load, the accuracy of a pile-driving formula employed notwithstanding.

(2) The fact of a single test pile being loaded to a given load without subsidence is not in itself a guarantee that a group of many piles will carry this load per pile.

(3) Examination of the soil by bore holes will not alone give the information required any more than an examination of the soil with test piles, but the two taken in conjunction with each other often give valuable information.

Test piles should, as far as possible, be driven to a greater depth than it is proposed to drive the permanent piles.

(4) All the circumstances of the strata need to be taken into account in deciding what is a safe load per pile, and no pile-driving formula is in itself sufficient.

On the subject of economy in building a word should, I think, be said on the relative economy of constructional steelwork and reinforced concrete.

No one would suggest that there are not many cases where a steel-frame building is the correct solution to a structural problem. Nevertheless, there is, I think, no doubt that the advantages of reinforced concrete have been too long neglected in this country in cases where economy is an important consideration.

The author recently made a visit to several Continental countries and took the opportunity of studying building in these countries, and perhaps the most outstanding feature which struck him was the way in which reinforced concrete frames are used, almost to the exclusion of constructional steelwork, on the Continent generally, for buildings of many stories.

This has not been so in this country to the same extent, and the author believes the reasons are partly that the economies of this form of construction have in the past not been so necessary or so fully appreciated, and secondly, that reinforced concrete construction in this country has not been so organized as to give sufficiently rapid construction.

Dealing with the question of economy, the author recently prepared comparative designs for a steel and concrete column, each to carry 1,000 tons on a 14 feet story height, with concentric loading, the column being based in both cases on L.C.C. regulations.

The steel stanchion cased came out to £5·79 per foot run, and the reinforced concrete column to £3·39 per foot run, showing that the steel column cased is 1·71 times the cost of the concrete column.

The rates which were used in the calculations were submitted to a competent quantity surveyor, who approved them as being properly comparable.

Approximately the same relation as regards costs exists in regard to beams, as the quantity of concrete and shuttering is approximately common to both, but the amount of steel in the reinforced concrete beam is approximately one-third that required for a steel joist, partly because, owing to continuity, it has to be designed for a smaller moment, and partly because the concrete takes the compression and shearing stresses, and steel has only to be provided for the tension stresses, the rods being bent up towards the end to look after the shear in conjunction with the concrete of the beam.

The author has taken out the costs of the constructional work in a good many large buildings and compared the cost of a steel-frame building cased with that of a reinforced concrete frame building, and in all cases of buildings carrying several stories it is found that the cost in concrete is considerably less than that in steel, cased to meet the requirements of building authorities.

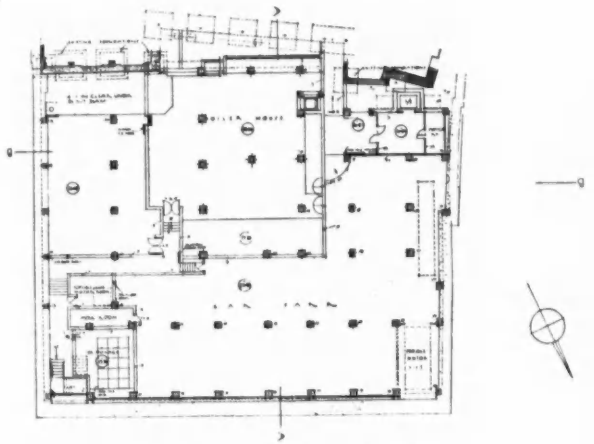
Apart from the use of concrete for the framework of buildings, it is also used in a more interesting manner in structures like the Horticultural Hall, and, more recently, in the new market buildings at Nairobi (Messrs. C. Rand Overy, F.R.I.B.A., and S. L. Blackburne, A.R.I.B.A., architects).*

In this building matters of particular interest included the provision against expansion and contraction due to tropical conditions which had to be specially guarded against.

The author is of the opinion that if architects and engineers were to combine in the development of this kind of construction, such economies might be achieved in building as would open up a new field justifiable financially in spite of the difficult conditions which present themselves today.

* [*See frontispiece to this issue.*—ED. *A.J.*]

ST. HELEN'S COURT, E.C.



DESIGNED BY MESSRS. JOSEPH

The building illustrated on this and the two following pages, and also in a supplement to this issue, is an extension to the headquarters of the Anglo-Saxon and Asiatic Petroleum Companies. Reference to the plans will show how the problem of connecting up to the existing building, St. Helen's Court, E.C., has been overcome; a number of light and air agreements added to the difficulties of design.

The building is steel-framed, and, while the elevation to Great St. Helen's, illustrated above, and by the drawing on page 395, is of faience tile slab and block construction, that to Crosby Square is of Portland stone. Heating is by low-pressure hot water radiators, the water being heated by oil-fired boilers situated in the sub-basement. The offices are ventilated by warmed and cleaned fresh air, which is pumped into the building by fans situated at roof level.

The accommodation includes a garage in the sub-basement, served by a lift from Great St. Helen's. A staff restaurant, with necessary kitchens, etc., occupies the basement, and the remainder of the building, consisting of lower ground and seven floors over, is given up to offices partitioned as required by each department.

L.C.C. HOUSING: PILGRIM

Pilgrim House, Law Street, Southwark, represents the first section of the Tabard Garden Estate to be taken in hand, and is designed to afford a total of 60 dwellings containing 174 rooms. As seen from the above illustration of the first contract, the block is of five stories, built in brick and roofed with tiles. It is of the Council's normal type of rehousing accommodation except that 20 of the dwellings in the second contract, indicated on the plan on the facing page, were completed with a reduced standard of finish with a view to their being let at specially low rents. The scheme, which is by G. Topham Forrest, architect to the L.C.C., also included some workshops, perambulator sheds, costermongers' barrow sheds, and open sheds for lorries.

LETTERS FROM READERS

R. COPPOCK
(Secretary, National Federation of Building Trades Operatives)

L. J. REDGRAVE CRIPPS

[*The week's post has brought us many interesting letters; at the same time, part of our limited space was already earmarked for Mr. L. J. Redgrave Cripps. In view of the immediate importance of Mr. Coppock's letter we are reluctantly compelled to hold over several others.*—ED., "*A.J.*"]

The Housing Bill

SIR,—The Housing Bill which has just passed through the House of Commons is causing grave discontent and dissatisfaction. The Bill has completely reversed the policy of this country in respect of housing.

The 1919 Addison Act wrote into the constitution of local authorities the principle that they would be responsible for working class housing. Local authorities were made legally and morally responsible for the housing of the working classes. The present Bill, however, has taken that responsibility, which was a statutory right of every citizen, out of the constitution of Great Britain.

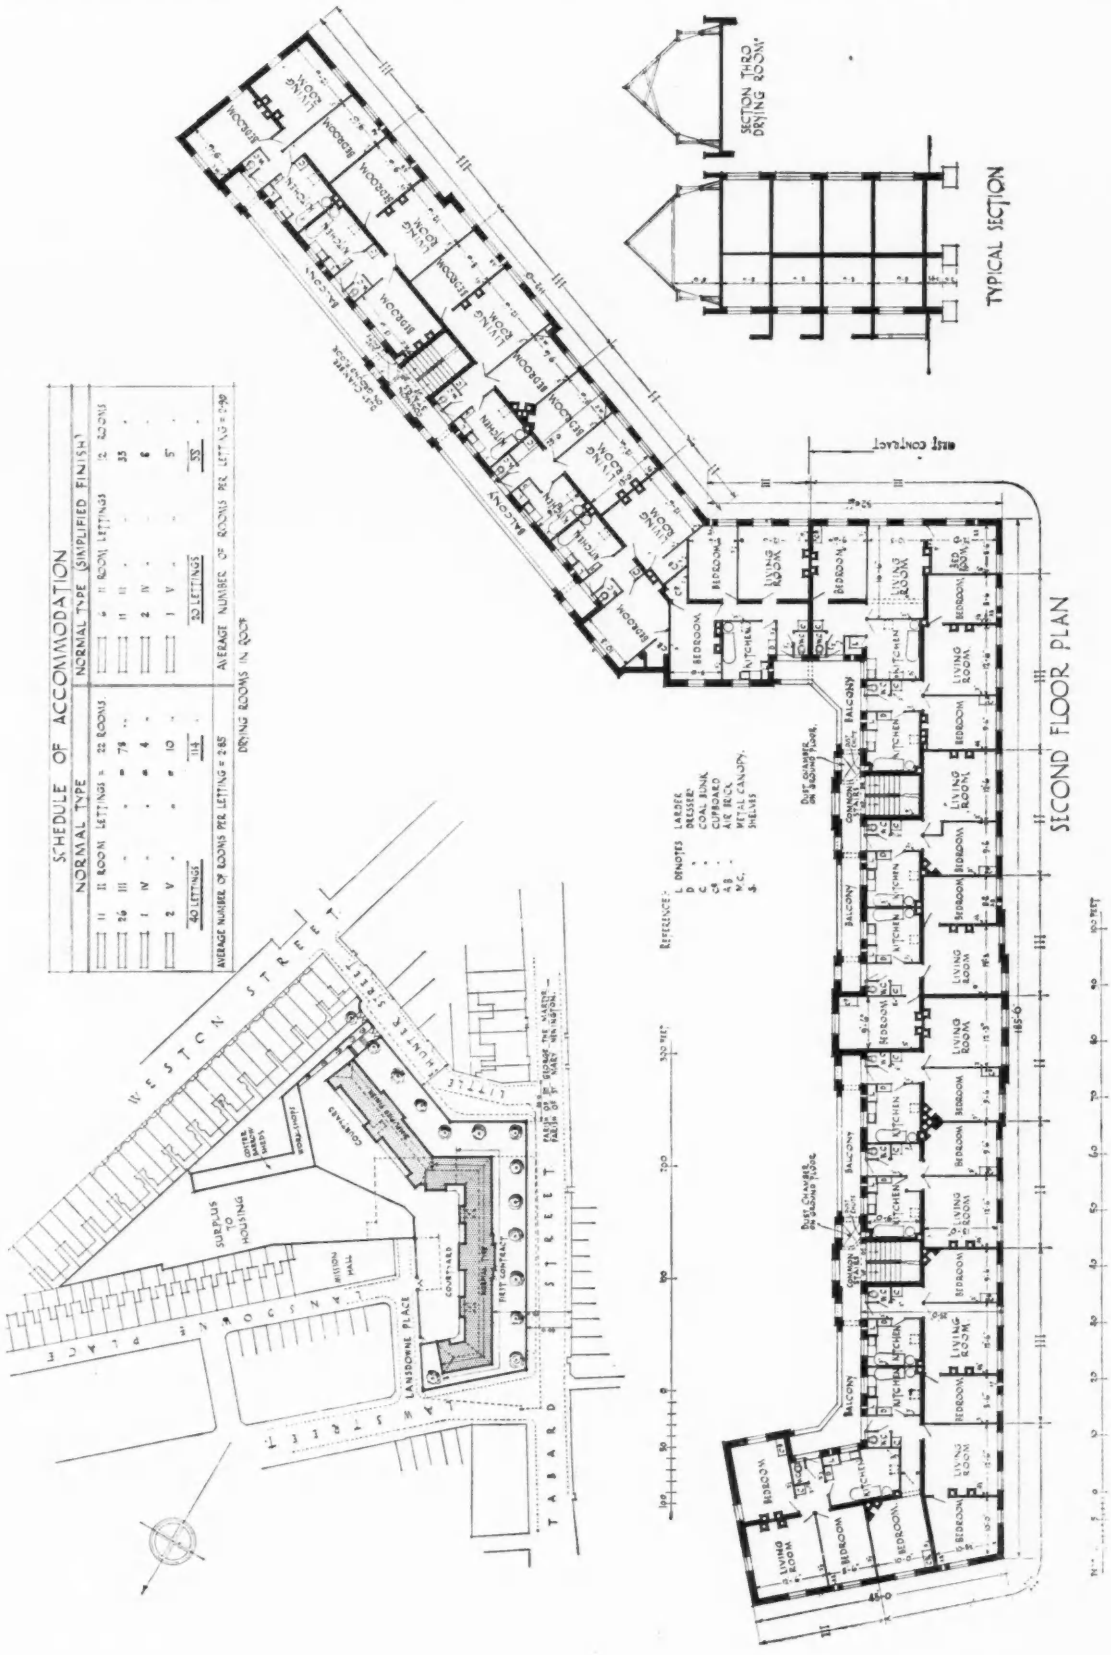
The descent of the economy axe will undoubtedly mean greater and greater unemployment in the building and subsidiary industries. I do not know of more than three large building societies in this country prepared to make financial grants to speculative builders under the Bill which is about to become an Act of Parliament. It will not be possible for houses to be built for the working classes under this Bill.

As to the crying need for such houses take Leeds as an example. In Leeds 34,800 houses which were built before 1844 are still inhabited by working people. These houses are in long unbroken rows and narrow streets. The houses consist of two rooms with a cellar, usually unlighted, and have practically no provision for the storage of food.

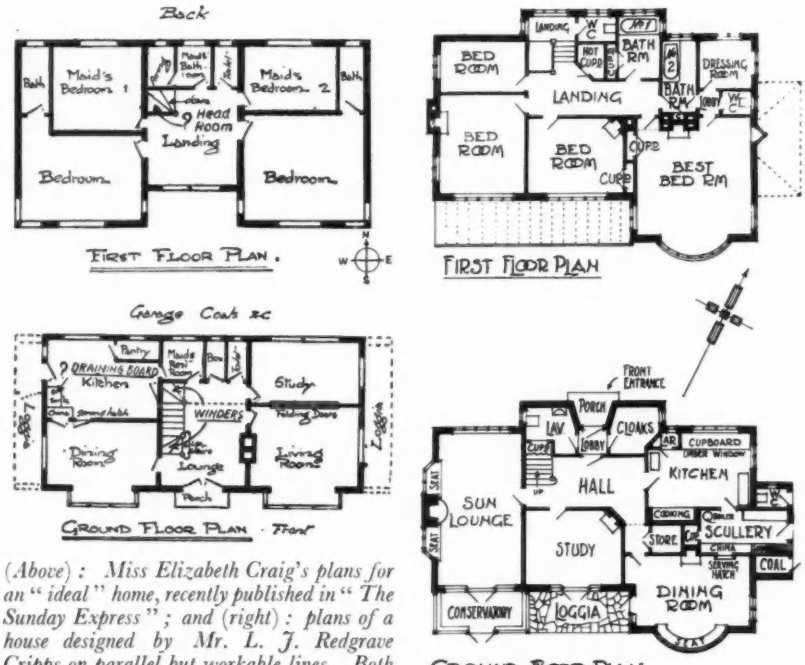
Personal and domestic washing has to be done in the living room. There are no inside W.C.'s. There is no storage for household refuse. Outdoor ashpits and W.C.'s are used for groups of houses. The houses themselves are crowded together, seventy to eighty to an acre.

Conditions similar to those in Leeds are to be found in Liverpool, Birmingham, Glasgow, Manchester, and, indeed, in most large towns in his country. There is no attempt, as a consequence of the negatory legislation just passed through the House of Commons, to abolish these insanitary, infested slums.

R. COPPOCK



A Woman's Ideal Home



[*Below, Mr. L. J. Redgrave Cripps follows up his criticisms of last week under this heading*—ED., *A.J.*]

SIR,—My "ideal" plan is for a house of similar size and cost to that of Miss Elizabeth Craig, but except for size and cost there is certainly no similarity whatsoever between the two plans.

First, with regard to accommodation. By careful planning it has been possible to provide, within practically the same total area, a well-arranged scullery in addition to the kitchen; and a dressing room in addition

HOUSE : BY G. TOPHAM FORREST

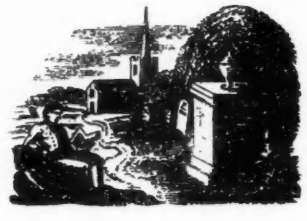
(Above): Miss Elizabeth Craig's plans for an "ideal" home, recently published in "The Sunday Express"; and (right): plans of a house designed by Mr. L. J. Redgrave Cripps on parallel but workable lines. Both sets of plans are described by the author in the accompanying letter; he has also inserted certain queries on the reproduction of Miss Craig's plans.

to the four bedrooms. Also a number of built-in and concealed cupboards, and excellent cloak room and lavatory accommodation have been provided. Thus it will be seen that the accommodation in my ideal house is superior to that in Miss Craig's.

Then with regard to the two important considerations of correct aspect and the general convenience in the planning of the various rooms, both these considerations have been completely ignored by Miss Craig. Yet in any house that claims to be ideal, each and every room should be planned so that it has its correct aspect. Thus the kitchen and meals room should *not* be planned on the west side of the house as in Miss Craig's plan. They should be on the east side so as to get the morning sun. In my plan I have also contrived the principal rooms so that they not only have a southern aspect but also supplementary windows facing east and west, i.e., windows on *three* sides, so as to get the maximum sun.

Now let us turn to the general "labour-saving" convenience of my plan. First note the arrangement of the cloaks and the quite separate lavatory in relation to the front entrance and the hall, and note how these conveniences are secluded by means of the lobby and the two doors from the hall, thereby combining ready access with complete privacy. Compare this arrangement with that of Miss Craig's plan, where she has planned the small w.c. to open direct into the lounge!

Of course, the skill in house planning (as in cooking, at which Miss Craig is an expert) lies in *attention to details*, in getting the *small* points worked out successfully. It is all very well for Miss Craig to say "*I do not know where to place the central heating equipment, the coal store and log house*," and then jauntily to dismiss the difficulty with the remark that these must be put "*somewhere on the back of the house*." In point of fact there is *nowhere* on the back of Elizabeth Craig's house for tacking on *anything* without blocking out one or more of her numerous north windows, of which there are no fewer than thirteen shown. In any case, the "somewhere on the back" would mean that Miss Craig's poor unfortunate maid would have to go out in the wind and rain, right round from the kitchen on the west to the "somewhere on the north," whenever she had occasion to get in any coal or attend to the boiler. All these small difficulties must be faced up to and properly thought out and solved *beforehand*—so that such items as the small central heating boiler, the coal store, the outside w.c., etc., may all be grouped together in the most convenient and economic position—if possible all under the main roof as an integral part of the house. This has been done in my plan.



Of course, anybody can get the *main* points of a house more or less right if he (or rather she) neglects the small but none the less essential points. Unfortunately, Miss Craig not only fails with the *small* points in her planning but she fails even more lamentably with the *main* points. Thus, although with characteristic confidence she describes her staircase as being a "*gracious affair*," yet, in point of fact, it fails in every essential requirement of a good staircase. It is steep; it is in one flight instead of two; it has dangerous winders (at top *and* bottom); and, not content with all this, it is so planned that it would be quite impossible for either Miss Craig herself or anyone else to get up or down it unless she crawled on her hands and knees—and even then she would be lucky if she escaped bumping her head! Yet this is the "gracious" staircase of the ideal "dream" home of Miss Elizabeth Craig! On the other hand, although the staircase in my plan does not make any great pretensions, it is at least of reasonable pitch; it is planned in two easy flights with a convenient half-space landing; it has no winders; and there is ample headroom.

Then with regard to the planning of the kitchen quarters. In a house of this size it is useless trying to compress all the essential domestic conveniences and equipment into one small apartment, the kitchen. Miss Craig attempts this impossible feat, with the result that in her kitchen there is no space for even a draining board to the sink! Yet what earthly use is a kitchen sink *without* a draining board? I tremble to think what any client of mine would say if I tried to palm off on her an "ideal" house so ill-planned that it was impossible (for lack of space) to fix a draining board to the kitchen sink. Miss Craig not only makes no provision for a draining-board but she likewise leaves practically no space for any adequate kitchen cupboards; nor does she indicate by what means any cooking is to be done in her "ideal" kitchen—she has apparently forgotten such an unimportant detail as the cooking stove and the necessary flue. On the other hand, in my ideal house I have most carefully studied the planning of the kitchen quarters so that there shall be a definite and convenient place for all the necessary equipment—and the provision of a small scullery not only keeps all the dirtier work away from the kitchen but it acts as a cut-off lobby between the kitchen and the tradesmen's entrance, and also between the kitchen and the service hatch to the dining room. Furthermore, my plan provides not only for ample cupboard accommodation in the kitchen and scullery, but also for a really good sized and most useful private store adjacent to the dining room.

Another feature in the planning of my house is that of having the best bedroom planned *en suite* with its own private bathroom, w.c. and dressing room—all quite self-contained and independent from the rest of the house and from the other bathroom and lavatory accommodation.

I think I have now demonstrated that we men architects are really not such incompetent fools at our work as our feminist friends would make out. If Miss Craig's attempt at house planning has done nothing else it has at least demonstrated the truth of the old saying that "a little knowledge is dangerous." It is certainly most highly dangerous where the planning of "ideal homes" is concerned, and if anybody is foolish enough to attempt to take Miss Craig's plans as a model, she (it is not likely to be a *he*) will only have herself to blame. My house has actually been built.

L. J. REDGRAVE CRIPPS

A NEW EXHIBITION

BRITISH ART for *BRITISH* INDUSTRY

SIR Francis Goodenough, C.B.E. speaking at a luncheon held by the organizers of the forthcoming Exhibition of British Industrial Art in Relation to the House, at Gatti's Restaurant, London, on Thursday last, said :

We are proud of our great achievements in applied design in the past, but in recent years a revolution has taken place. New needs, new materials, new standards of beauty and fitness have derived not, as hitherto, from the skilled craftsman, but from the perfected machine.

Other countries have been quicker to recognize the opportunity afforded to their manufacturers and designers. England has been less active in the production of modern designs—or, at least, in making them widely known—and, consequently, is in danger of being regarded by overseas customers as, in this respect, a back number ; the home of Shakespeare and all that, of course, but not the home of progress. There is some justification for this accusation, if we compare much of our domestic design to, say, that of our cars, aeroplanes or sports gadgets. They are famous the world over. We have got to make our furniture, our fabrics, our pottery as famous, by making more of them as well-designed in their own sphere and then by bringing them effectively to the public notice. We have to *market* as well as *make*.

The position got so serious that the Board of Trade set up a Committee, under Lord Gorell's Chairmanship, to see what should be done to remedy this apparent inertia. The report was issued a year ago ; the Committee emphasized that :

> This is the psychological moment, while world trade is depressed, for making a special effort to improve Industrial Art, for, in a period of slack trade, time can most profitably be spent in careful planning and preparation for the future.
>
> For the sake of national self respect, as well as profit, the aim must be to use to the full the great artistic genius of the nation and to beautify our products until they *surpass* those of every other nation. *The national aim cannot be too high.*

That was well said.

It is not uninteresting to point out—and it is natural that I should point out—that another Government Committee, that on Education for Salesmanship, devoted a chapter in their final report to the subject of Commerce and Education in Art—a chapter I would like all interested in the improvement of design in industry to read. The attitude of the Committee to the subject can be indicated by one quotation :

> The principles of art are eternal, and the making of things which are useful and at the same time pleasing in form and colour can only be assured by the adoption of such principles, and the carrying on of the traditions of the centuries, while adapting them to the practical requirements of our time. The real progress of a people cannot be better expressed than by the production of good things, practically and artistically. It is by such means that happiness and contentment to the craftsman can be assured and the moral and intellectual progress of a people, which is progress in its best sense, can be maintained.

The policy recommended by the Gorell Committee to achieve their and my Committee's aim was the organization by the Government of a series of Industrial Art Exhibitions ; and ultimately the establishment of a permanent exhibition.

Unfortunately, the economy campaign opened as soon as the report was published, and State action tarries.

It was now that the promoters of the present exhibition came forward to help the Board of Trade out of a rather equivocal situation—if Sir Edward Crowe will forgive my saying so. The promoters felt truly enough that the need was urgent, and that they must act quickly. The project had already taken shape. Public-spirited guarantors had given it their backing—among them Mr. Samuel Courtauld, Sir Philip Sassoon, Mr. Israel M. Sieff, Sir John Latta, and some of the great City companies.

So the plan was put before the Government, and they backed it too. H.R.H. Prince George has been so good as to consent to be Patron, and is to open the exhibition ; Mr. Runciman and Lord Irwin are Vice-Presidents, and Lord Gorell—who should be speaking to you now only he is furthering the good work in America—has linked the exhibition to Government policy by becoming President of the Committee.

It can be said at once that, so far as manufacturers are concerned, the demand for an exhibition of this type was proved immediately it became known. The demand for space was instantaneous, and I feel confident that, when the exhibition opens next June in Dorland Hall, Regent Street, you will be amazed—and proud—of what British manufacturers and designers are doing. And you will not have seen an exhibition of this kind before in England.

It is not aiming at size. But everything in it will have been selected because it is the best of its kind, and the aim is to show the fine products of industry in the settings in which we use them. Some of the most brilliant of the younger generation of designers—for it is essentially an exhibition of youth—will have devised typical rooms in which the things of today—furniture, pottery, glass, lights, textiles, books, kitchen equipment, heating appliances, clocks, silverware, and so on—will be included. In addition, galleries will be devoted to each industry, but all arranged in an original and striking way.

We hear a lot nowadays about planning agriculture, towns, even finance ; this exhibition is a great step in the direction of planning our homes. It is not a rich man's show ; but it will show how all of us can be rich in beauty wedded to utility in our homes. It will set a new standard of values.

ADELPHI ESTATES BILL

[*By our Special Parliamentary Representative*]

BY 64 votes to 27 the House of Lords last week gave a second reading to the Adelphi Estates Bill. This does not mean, however, that the measure will eventually become law. It only ensures its thorough examination by an impartial Committee. Even should the Committee approve the Bill it will have to come back to the House of Lords for third reading before passing through the House of Commons.

In moving the second reading, Lord Newton said that the objects of the Bill were to remove restrictions on the height of buildings, to widen the street, and to construct two new roads at separate levels. It was proposed that one of these roads should pass along Adelphi Terrace. It was on the last point that the real opposition to the Bill arose. The promoters of the Bill had handed over 800 square feet of their property to the public, and the proprietor of the Adelphi Estate asked to be allowed to do what his neighbours had been allowed to do, but he was told that in no circumstances could that be permitted because his property contained buildings of artistic value. Surely he had a right to put his case before an independent tribunal in the shape of a Parliamentary Committee.

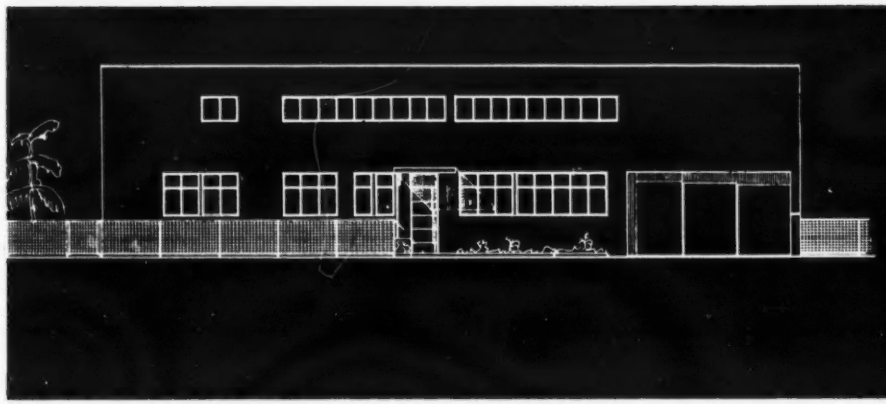
He (Lord Newton) had recently constantly visited Adelphi Terrace and on not one occasion had he seen anyone there in search of amenity. When one got to the Terrace it was quite impossible to see the river. All that could be seen was a flat muddy space covered with rubbish and dotted about with ignoble buildings.

He had no fault to find with the interior of the Terrace buildings. There was no reason, however, why the chimney-pieces and even the ceilings should not be preserved and utilized in some other buildings.

He would remind the opponents of the Bill that it was purely an enabling measure. He had no particular enthusiasm for the Bill but he felt that the promoters had a right to state their case.

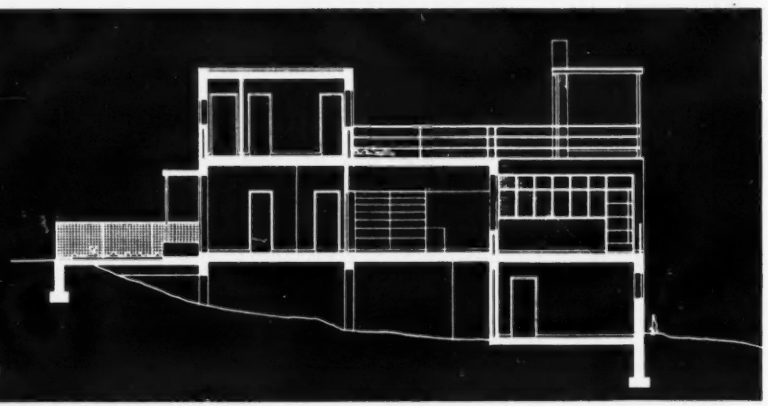
Lord Esher moved the rejection of the Bill. He said that under the Bill the central block would be pulled down. Adam Street, John Street and Robert Street, instead of being the charming streets they were now, would have low eighteenth-century buildings on one side and high modern buildings on the other ; the elevation of these three streets would be entirely ruined. When the block behind was pulled down the promoters of this Bill proposed to build in its place a still larger block, which would come out right over the present Terrace and over the foreground in front ; the present Terrace would be a tunnel underneath. They had not been told what kind of building it was proposed to erect, and if this Bill was passed the House would be voting for a pig in a poke. The whole lay-out of the Adelphi was a delightful and charming piece of eighteenth-century town planning. The Town and Country Planning Act came into force in April, and this seemed to be just one of those areas to which the Act should apply. If the restriction on the frontage were removed the effect would be to advance the building line. The Government were not allowed to advance the building line when they proposed to erect new buildings in Whitehall ; why should a private citizen be allowed to do so ?

The Archbishop of Canterbury said that the block of buildings involved was the crowning achievement of the famous brothers Adam—the last of the beautiful eighteenth-century buildings in London. Let them destroy it not, for there was a blessing in it.



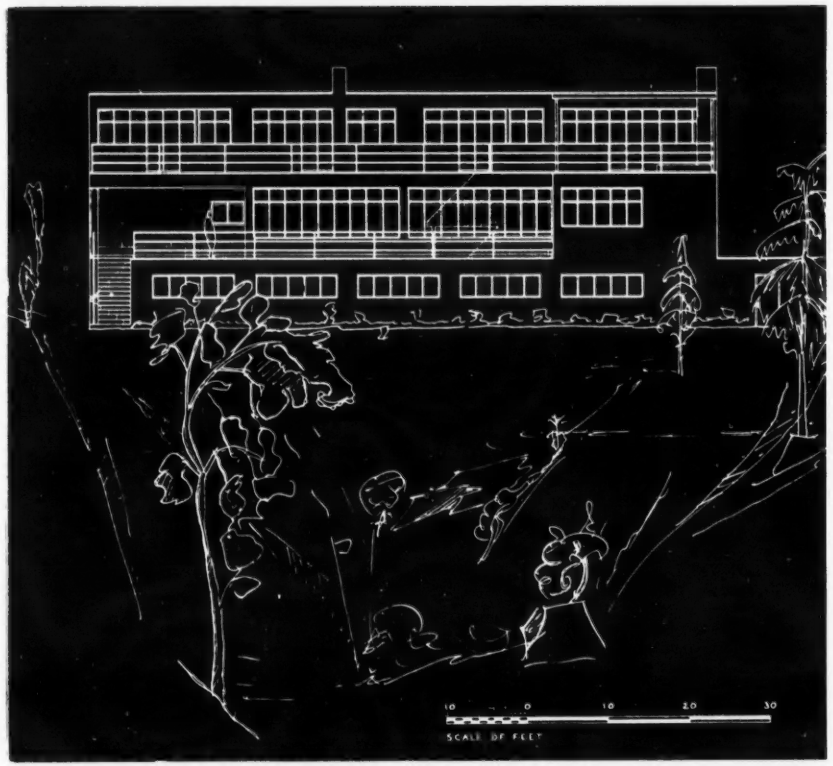
Lord Jessel said that the only way to preserve the Adelphi buildings was to secure their purchase by some of the learned societies interested in the matter.

Lord Olivier said he had always been impressed with this little oasis in London as a tremendous relief from the vulgarisation that was going on.

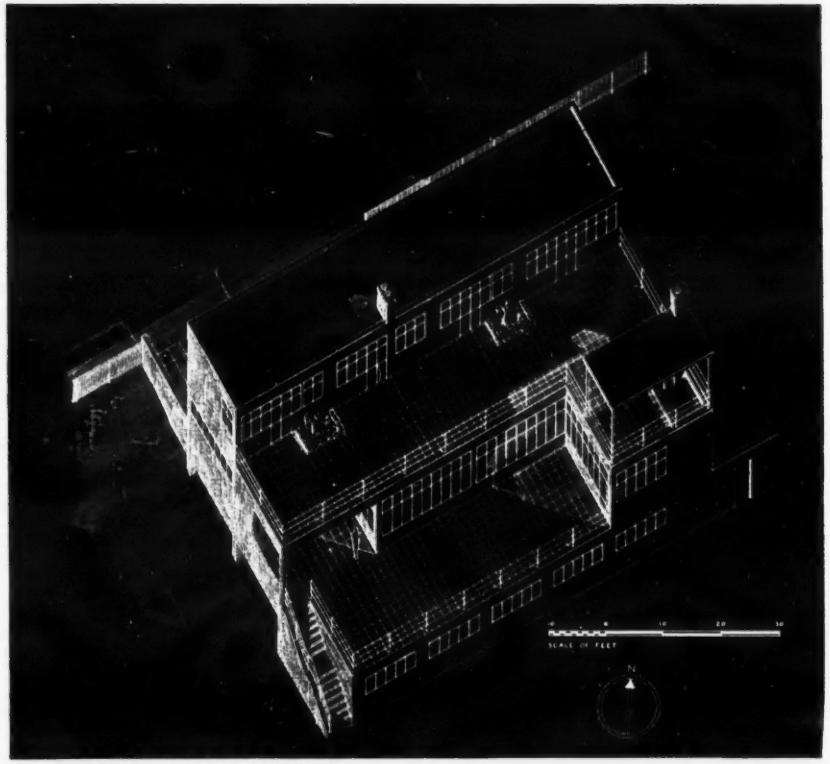


Lord Dickinson, who also opposed the Bill, said that the whole line of buidings to Charing Cross would be affected if permission were given to bring forward the building line of the Adelphi. The scheme for a new Charing Cross bridge might also be seriously affected.

Lord Halsbury, however, thought that the Bill should go to a Committee in order that the whole question might be examined, and this advice was ultimately followed.



HOUSE IN INDIANAPOLIS : BY COLIN T. PENN



ELEVATION TO ROAD

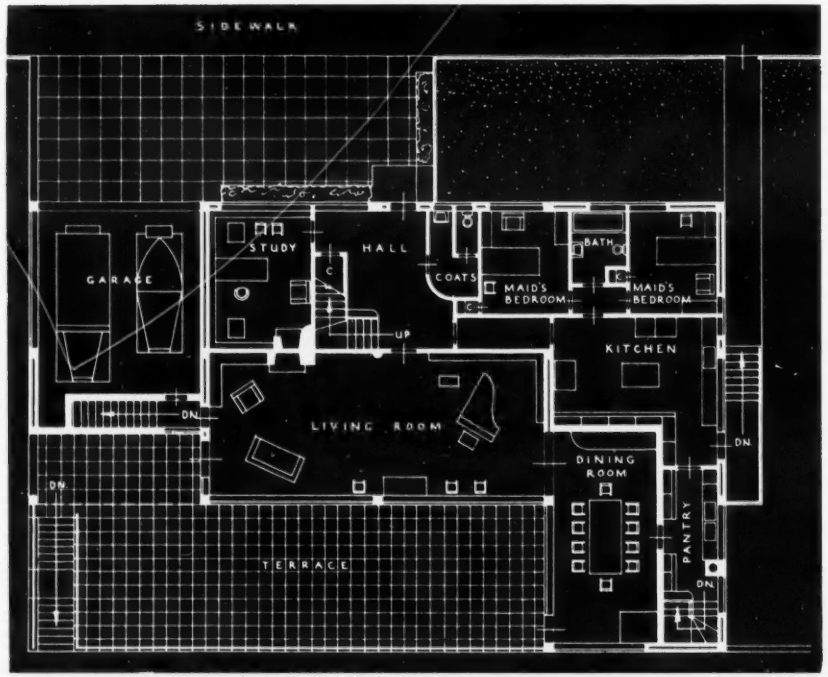
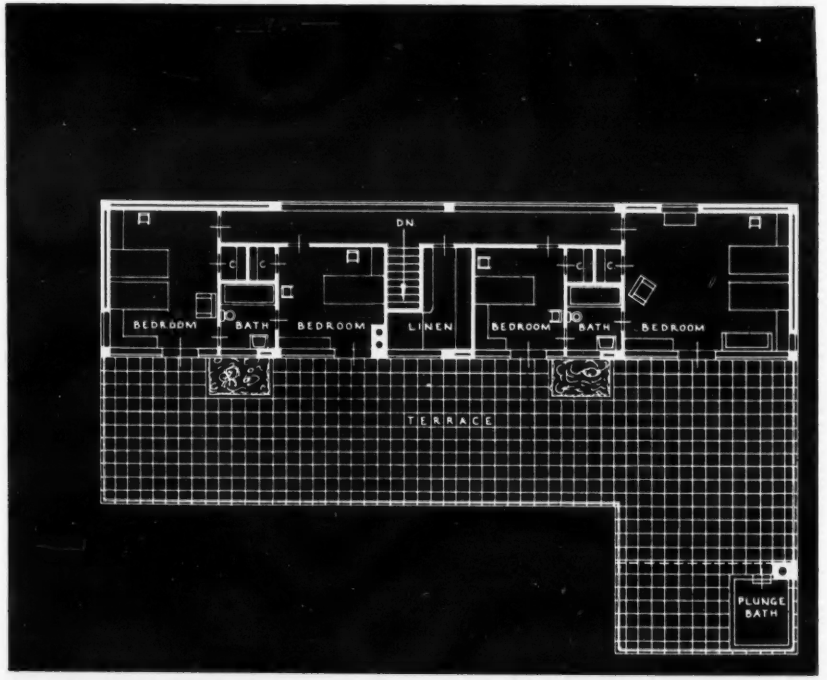
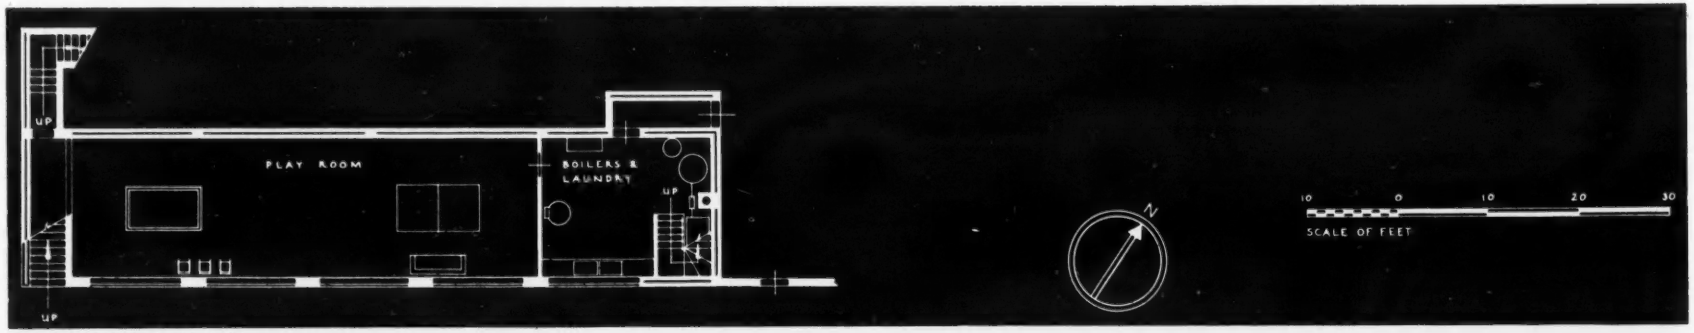
ELEVATION TO GARDEN



ISOMETRIC PROJECTION



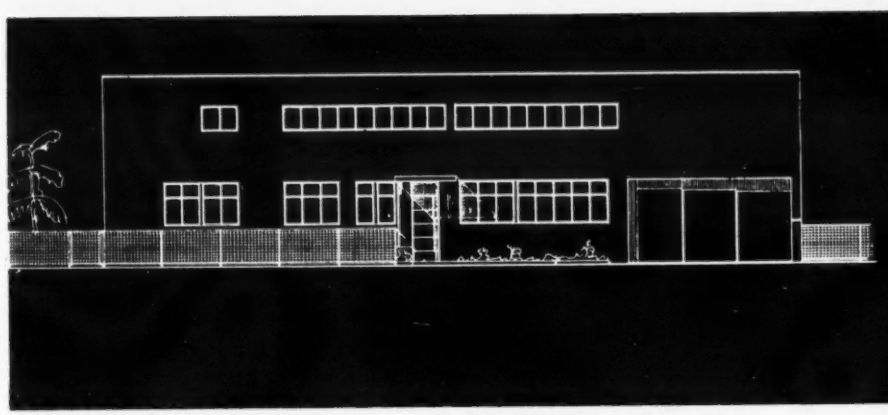
ELEVATION TO GARDEN



ISOMETRIC PROJECTION

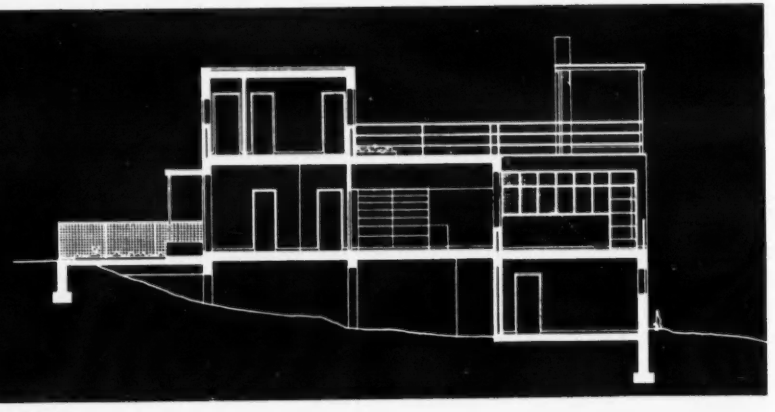
FIRST FLOOR PLAN

SECOND FLOOR PLAN



BASEMENT PLAN

The site was at the head of a steep, rocky ravine, with fine views to the south and south-west. The client was a university professor, and, though the accommodation required was fairly extensive, the cost had to be kept down to a minimum.



It was accordingly decided that the house should be steel-framed, and kept clear of the ground except for the basement. The columns are all evenly spaced, on 16-ft. and 19-ft. centres. External walls consist of a 4-ins. outer skin of hollow tiles, stuccoed, a 4-ins. air space, and a 4-ins. stud partition, offering high resistance to rain, heat and sound. Internal partitions are of 4-ins. studding, plastered on wallboard. Floors and roofs are of concrete, plastered beneath, on wallboard suspended from the beams. Roofs are insulated with three inches of cork, and, where used as terraces, paved with quarries on asphalt.

Points to be noted on the plan are: the study placed near the front door for interviews, etc.; the proximity of the maids' bedrooms to the kitchen, thereby saving a sitting room; the dining room in which 20 persons can be accommodated; and the large playroom in the basement. On the bedroom terrace there is a curtained sunken plunge bath, under cover of a roof.

LITERATURE

THE PENN COUNTRY

The Penn Country of Buckinghamshire. Published for the "Penn Country" Branch of the Council for the Preservation of Rural England by Evans Bros., Ltd. Price 5s. net.

BUCKINGHAMSHIRE is without doubt one of the loveliest counties of England, and the Penn Country—the subject of this volume—shows it in its loveliest moods. Its gently swelling hills, beech-clad slopes and evergreen valleys have countless associations with history, letters and religious endeavour. Here lived Hampden, Disraeli, Burke and Milton; here Gray wrote his Elegy, and here too Penn and the Quakers found a home.

While this volume has as its first aim the furtherance of the principles for which the C.P.R.E. stands, it is also a serious contribution to topographical literature. All the writers who have collaborated in its production are prominent in their respective spheres.

The Rt. Hon. J. Ramsay MacDonald, in his foreword, writes:

The heritage of rural beauty and historical treasure remain largely unimpaired. The Penn Country is one of the many corners where for one cause or another the face of the land has not been greatly spoiled, and whose life remains as the possession of all who have eyes to see and minds to love. And it rests with the people of this country whether the inevitable "development" of our land shall spell despoliation, or whether by ordered planning and national preservation these chosen spots shall continue to be a source of healing and refreshment to us and our children.

Other contributors include the Rt. Hon. H. A. L. Fisher, the Hon. Sir Frank Mackinnon, Major Coningsby Disraeli, and Messrs. Guy Dawber, A.R.A., Clough Williams-Ellis, F.R.I.B.A., C. H. Biddulph-Pinchard, F.R.I.B.A., and G. Langley Taylor, F.R.I.B.A.

Mr. G. Langley Taylor, in his article entitled "House Design: Some Things to Avoid," writes:

The grouping of houses, especially for a large scheme, is vital. If an architectural effect is to be produced then the whole must be visualized and set out so as to give a pleasant perspective. Every case must, of course, be considered on its merits, but generally such grouping as will allow open spaces to be provided is better than simply dividing an acre of land up into so many plots of equal size according to the number allowed to the acre under the Town Planning regulations.

For instance: Fig. 1 shows an uninteresting scheme of houses in two straight lines. The same net number of houses is shown in Fig. 2, which, besides giving scope for grouping and good perspective effects, also provides a considerable saving in road-making charges. The comparable cost per house is in Fig. 1, £52, and in Fig. 2 £30 (based on a road-making charge of £9 per lineal yard as given in the Ministry of Health's Housing Manual, 1927, from which these examples are quoted). If a narrow carriage-way is adopted for the scheme shown in Fig. 2 the saving per house may be £30, or roughly £1,040 on the scheme.

In many cases, the small houses are the chief offenders, but this is by no means always so. Often houses costing quite a good sum are hideous in the extreme, and a disgrace to the owner and the builder.

The junction between roof and walls is another important and often mutilated spot. The cost of making an interesting eaves is not great, and the value of the shadow cast by the overhanging is incalculable. It is held that one of the important matters in design is to make

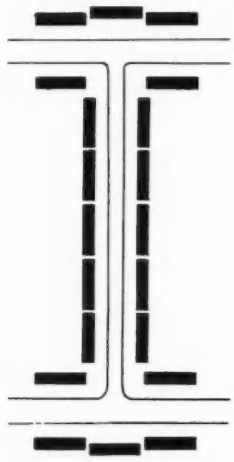

Figure 1.

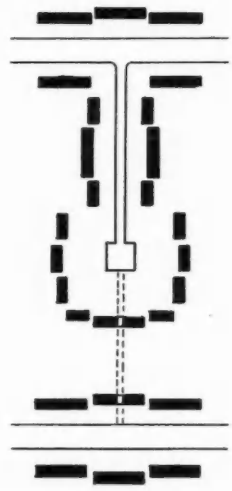

Figure 2.

your building "sit" on the ground, or look as if it grew out of it. Keeping the roof down and having a good, deep shadow will greatly help to do this. The sprocket is not expensive. The rafters' feet should be cased in and the soffit and fascia may be in elm, and so save the cost of painting. The presence of the sprocket will give the lower part of the roof a flatter pitch, and help considerably in its appearance, as shown in Fig. 3.

If the walls are plastered the soffit may be treated in the same way.

The effect produced by the eaves is often spoilt by the size of the rain-water gutter. It should not be mean: 4½ in. or 5 in. looks better than 4 in. One way not to construct the eaves of a roof is shown in Fig. 4.

A BUILDERS' PRICE BOOK

Laxton's and Lockwood's Builders' Price Book. London: Kelly's Directories, Ltd. Price 7s. 6d. net (post free).

THIS book has now reached its one hundred and sixteenth edition. No drastic alterations have been made in the matter contained in the 1933 edition, but minor rearrangements have been carried out to make the information more accessible.

A special feature is the scale of day work charges recently agreed upon between the Chartered Surveyors' Institution and the London Master Builders' Association, besides, of course, the standard rates of wages in the Building Trade in England and Wales, which came into force on February 1, 1933. The prices given in the book include 15 per cent. to cover builders' profit and overhead charges, except where it is more convenient to quote net prices, in which case it is clearly stated.

The London Society

Sir George Truscott presided at the twenty-first annual meeting of the London Society, held at the Mansion House, E.C., on Tuesday of last week.

The Earl of Crawford and Balcarres, in moving the adoption of the annual report and accounts, said we had the power to see the Thames broadside from only one high-level spot in London—the Adelphi Terrace. He hoped that if and when any reconstruction of that historic and very beautiful area became necessary, the frontage over the river and the magnificent view might be preserved. It was the only view of its character which was left; it was all the

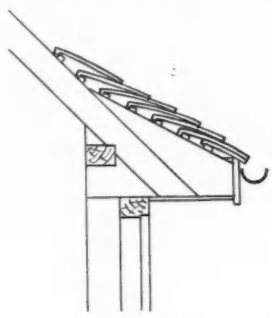

Figure 3.

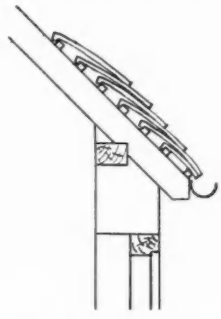

Figure 4.

The figures on this page are from THE PENN COUNTRY OF BUCKINGHAMSHIRE.

more precious and therefore all the more worthy of being preserved. The view belonged to him as much as the houses belonged to their proprietor.

Sir William Llewellyn said all new planning and rebuilding should be carried out under a controlling authority, who would see that important old buildings were preserved with sufficient space around them so that they could be seen at a distance.

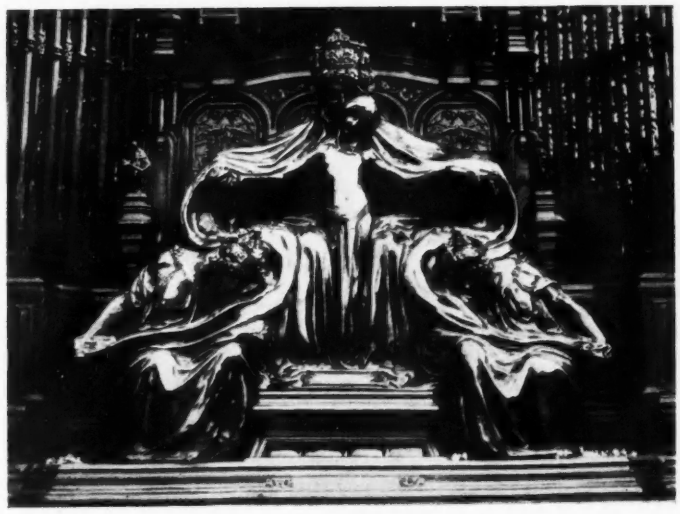
Architecture, more than any other art, he continued, needed the stimulus of public opinion, but that opinion must have knowledge and sympathetic interest at its back. The future of London concerned us all. The matter had become one of extraordinary importance, and, failing the setting up of a controlling body or the adoption of a definite development plan, the London Society might co-operate with other important bodies to form an organization that would be in a position to obtain information and to act quickly before it was too late.

Sir Raymond Unwin, referring to the menace to Adelphi Terrace, feared that the erection of high buildings in front of it might be tolerated because of the open space. The owner of property facing an open space had probably far less right, he said, to increase the height of buildings than those whose land lay farther back. Unless this was realized London would be surrounded by a wall of lofty buildings shutting off light, fresh air and outlook from the public, which had by long use acquired a property right in them.

Architectural Sculpture

On Tuesday of last week Mr. William Aumonier lectured to the Incorporated Association of Architects and Surveyors on "Modern Architectural Sculpture." During the course of the lecture Sir Alfred Gilbert, the sculptor of the Queen Alexandra Memorial, London, here illustrated, walked out of the hall after protesting at some of the lantern slides which were being shown, one of which, "The Annunciation," by Ivan Mestrovic, is also reproduced on this page.

Mr. Gilbert Bayes, who presided, describing the incident, said: "Twice, or possibly three times during the lecture Sir Gilbert rose and asked: 'Are we expected to take all these things seriously?' Frankly, I sympathized with his protest. Some of the photographs we were shown undoubtedly merited that question. It was a protest which was perfectly justified."



Mr. W. Aumonier has made the following statement:

> It stands to reason that in giving a lecture on a subject like this one naturally selects illustrations with a "punch" in them; it does not, however, follow that I personally approve everything I show, especially some of the Continental examples. But for the purpose of a lecture I think it is extremely interesting to see what is being done at home and abroad in modern sculpture.

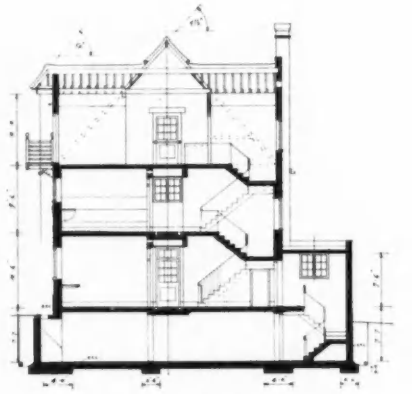
ANIMAL HOUSE, FARM LABORATORIES,

SOUTH ELEVATION

SECTION AB

The purpose of this building is the breeding of absolutely normal and healthy guinea pigs, rats and mice. Accommodation was needed for approximately 1,600 guinea pigs, 2,000 rats and 5,000 mice, with room for future expansion. Among the requirements were a steady temperature of about 65 degrees, a constant change of air without draughts on the animals, construction allowing regular and frequent washing down with lysol and water, an efficient steamer for sterilizing cages, dishes, etc., storage room for large quantities of fodder and accommodation for a daily staff of eight.



Walls are of brick—external sand-faced; internal, smooth sand-lime facings, distempered ivory. The roof is covered with pantiles on battens, felt and boarding. Windows are metal casements in stout wooden frames, all painted broken white. External doors are bright green; frames, broken white. A hand-hoist is provided for stocking the loft, with fixed handrail.

Foundations, floors and staircase are of reinforced concrete. Ground and first floors are laid to falls and paved with special hard asphalt, designed neither to develop germ-harbouring cracks nor to be easily indented with the temperature at 65 deg. These floors are drained by channels along central corridors, covered with movable galvanized gratings.

Ventilation is by inlet gratings under windows (behind radiators), and extract gratings near ceilings, leading to ducts above sub-ceilings to corridors. Extraction is by electric extract fan in a dustproof chamber in the loft.

The building was planned on the system of a large number of small rooms for two reasons: to enable an outbreak of disease to be more easily isolated; and to provide a large wall area for shelving for cages. All shelving, working tables, benches and sinks are cantilevered from walls to leave floors clear for washing down. The shelving is constructed with light steel angles and flat sections, in skeleton form, bitumen painted. Working tables, benches and sinks are constructed in teak.

IN THAT CONTINGENCY

The following abstracts of inquiries represent a number of those recently submitted to the Building Research Station. The information given in the replies quoted is based on available knowledge. It has to be borne in mind that further scientific investigations may in the course of time indicate directions in which the replies might be supplemented or modified. Moreover, the replies relate to the specific subject of each inquiry, and are not necessarily suitable for application to all similar problems. Crown Copyright Reserved.

Sound Insulation

¶ *WITH a view to reducing the transmission of sound between two adjacent houses, and particularly the noise from wireless loud-speakers, the party wall had been built in cavity construction. But this had not been found entirely effective. The builder proposed erecting other houses of similar design, and he asked whether the use of of a light breeze concrete filling, poured into the cavity, would improve the insulation of the wall.*

There are two principal methods by which sound may be transmitted through a party wall. These are :—

1 : The passage of air-borne sound through openings in the wall and through the interstices of the material itself.

2 : The formation of a secondary source of sound due to the vibrant action of the wall.

There is in addition a third possible method —i.e., conduction along carcase walls common to both houses. Though not entirely ruling out this method, since it may be a contributory factor, less importance is attached to it in the case of a small domestic structure, for it is well known that less sound is conducted in this way along a wall which is heterogeneous, such as one constructed of bricks in lime mortar, than along homogeneous fabrics.

To combat the first method of penetration, i.e., by way of passages in the wall and through interstices in the walling material, it is important that the wall should be as air-tight as possible, a condition which implies a high standard of construction. The sound-proofing efficiency of a badly-built wall with open joints would be less than that of a solidly-built wall of the same thickness. Again, the efficiency of a normal 9 ins. solid wall or an 11 ins. cavity wall would be seriously impaired if pierced by floor joists. It is important, therefore, that where this is unavoidable the openings should be completely closed up with cement mortar.

Referring to the second case, in which a secondary source of sound may be created by the wall itself actually vibrating, this action is analogous to the vibration of any very thin membrane. It is evident that the factors governing this vibrational action are the mass and rigidity of the wall section. In other words, a wall which is heavy and reasonably thick, such as a 9 ins. brick wall, would be less liable to transmit sound in this manner than a partition built of lighter membranes, which would be liable to vibrate in sympathy with any given sound, and thus re-transmit the sound to any adjoining room.

Considering now the case of the cavity wall, there is no doubt that considerable increase in sound-proofing efficiency would be gained by the use of two separate solid walls, having only a small air space in between, provided the two walls are entirely independent and unconnected. This advantage is, however, nullified in practice by the connection afforded by the metal ties necessary for structural reasons, since the sound is conducted along the ties, transmitting sound waves from the first to the second leaf and resulting in the vibrational action above mentioned.

With regard to the suggestion to fill the cavity with fine clinkers and cement, apart from the danger if unsound clinker concrete is used for this purpose, owing to the risk of corrosion to the wall ties, it is doubtful whether any significant improvement would be gained by the use of a light filling of this character ; its presence in the cavity would not, so far as can be seen, result in any fundamental change in the structure of the wall, which would still function in respect of sound transmission as a cavity wall. It is probable, however, that if, instead of using a light concrete filling, the cavity was filled with a good, dense, fine concrete, well tamped to ensure consolidation, a definite improvement would result. The effect in this case would be to change the wall structure from that of a two-leaf cavity wall to a solid 11 ins. wall, thereby eliminating all vibrational effect of the separate 4½ ins. leaves and at the same time obtaining the additional sound-proofing efficiency which results from increased mass and rigidity.

Should this not prove entirely effective, the only alternative (apart from two separate 9 ins. walls) would seem to be to construct a 13½ ins. solid wall, for though a well-built 9 ins. wall should offer sufficient obstruction to the transmission of conversational sounds, it seems probable that the intensities and frequencies of the sound in this case may be such as to necessitate the use of a thicker wall.

Wall Finish to Withstand Rough Usage

¶ *AN architect sought information regarding any efficient substitutes for wallboarding on cement rendering that would be suitable for rooms in a hostel and less liable to be damaged by rough usage.*

It is assumed that glazed bricks or glazed terra-cotta blocks would be unsuitable for the purpose mentioned. Ruling out materials of this type, it is somewhat difficult to suggest an alternative which would not be damaged by rough usage, but the following are perhaps worthy of consideration :—

1 : A sprayed cement finish applied over a cement rendered background. This type of finish can be obtained in a fairly wide range of colours by the incorporation of suitable colouring pigments in the white cement base ; there are a number of such proprietary finishes on the market.

2 : Decorated, metal-faced plywood. This material is obtainable in a number of plain colours and marbled finishes and should make a durable lining, though the decorative finish would, of course, be liable to be scarred by rough treatment.

3 : Stout linoleum with a glazed finish, cemented to a smooth rendered background. A lining of this type would not, it is thought, be easily damaged and should not require any periodical maintenance other than ordinary cleaning. The walls and rendering should, of course, be thoroughly dry before the linoleum is applied, and it is recommended that the fixing of the linoleum should be done by a firm who specialize in this work.

Heat Emissivity of Painted Radiators

¶ *AN architect required information on the heat emission of variously painted radiators.*

The nature of the surface of a radiator can only affect that part of the total heat output which is due to the direct radiation of heat to cooler surfaces; the amount of heat given up to the air is independent of the surface. In Food Investigation Special Report No. 9 by Griffiths and Davis (published by H.M. Stationery Office, price 1s. 6d.), the following relative figures are given for the radiant efficiencies of various surfaces :—

Surface	Radiant efficiency
Dead Black	1.0
Black Paint	1.0
Black Enamel	1.0
Dark Green Paint	1.0
White Paint	1.0
White Enamel	1.0
Aluminium Paint (1 coat)	0.7
" " (2 coats)	0.5 to 0.7
" " (rubbed with fine sandpaper)	0.8
Dull Copper Surface	0.15

It will be seen that for all non-metallic paints the radiant efficiency is constant, irrespective of their colour or degree of gloss. Aluminium paint has a lower efficiency, and this property is common to all metallic paints, which, though variable in efficiency, depending upon the amount of binder present, in general may be taken as definitely inferior in emission to black and coloured paints.

For the relative amounts of heat emitted by radiation and convection from various types of radiator under various conditions

reference should be made to Dr. Margaret Fishenden's book on *House Heating* (Witherby, 1925, p. 253, *et seq.*). Assuming that 13 per cent. of the heat of a cast iron sectional radiator at 160° F., coated with ordinary paint, is due to direct radiation. repainting the radiator with one coat of aluminium paint would, from the above figures, reduce the amount of radiated heat by 30 per cent. and the total heat output by 4 per cent.

[Owing to pressure on space, we are reluctantly compelled to hold over part of this section till next week. ED.—*A.J.]*

SOCIETIES AND INSTITUTIONS

FLOODLIT BUILDINGS

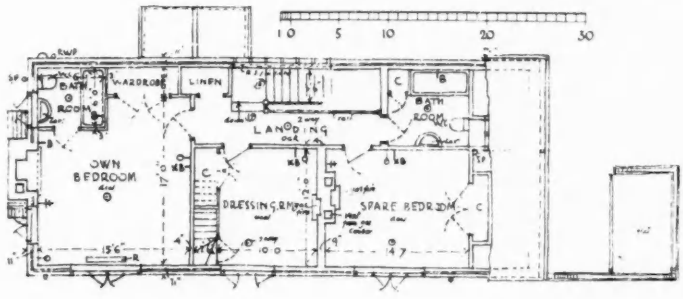
FLOODLIGHTING. By H. Lingard, A.M.I.E.E. At the Lighting Service Bureau, London, March 15.

Superficially it would seem that the best type of floodlighting for any exterior would be that simulating daylight conditions, but, while this may be true for buildings of classical design, much greater variety and flexibility is obtained on buildings of modern design when an alternative is adopted: it is not too much to say that by carefully planning the mouldings and projecting surfaces on a building, it is possible to produce almost any effect of light and shade by skilfully-placed floodlighting apparatus.

One of the most important points in connection with the satisfactory design of floodlighting installations is the concealment of the projectors. It is of paramount importance that this point must be carefully considered by the architect when planning a building which may have to be floodlighted at some time. It should be impossible for the observer to see where the light is coming from.

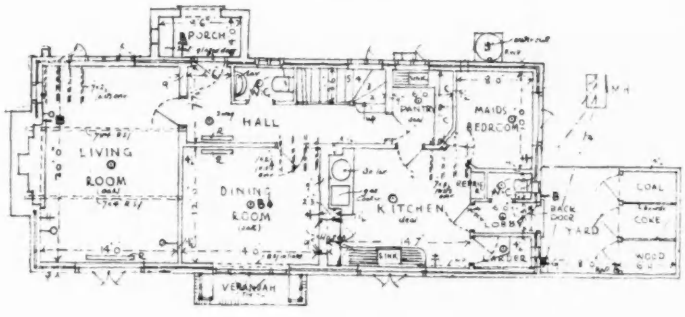
EDINBURGH ARCHITECTS

At the last meeting of the Council of the Edinburgh Architectural Association the secretary reported that the revision of the general conditions of contract affecting building works in Scotland had now practically been completed by the Joint Committee of Architects, Surveyors and Contractors.



Nominations were received for the Scottish Architecture Medal 1927–32, while arrangements were intimated as to the annual Convention of the Royal Incorporation of Architects in Scotland to be held in Edinburgh on June 2 and 3. The following members were elected: Associate: Mr. Basil Spence; Students: Messrs. F. R. Stevenson and John Ogilvie.

A HOUSE AT BYFLEET



DESIGNED BY IMRIE AND ANGELL

The external walls are 11 ins. hollow, the outer face being built with Surrey facing bricks. The oak window frames are filled in with steel casements and leaded lights; and the roof is covered with hand-made sand-faced tiles. The floors to the living room, dining room, hall and landing are in oak, and the porch is paved with quarry tiles. The staircase also is in oak.

GROUND FLOOR PLAN

BRIXTON SCHOOL OF BUILDING

Mr. F. E. Drury, Principal of the Brixton School of Building, speaking at the annual exhibition of work and distribution of prizes on March 10, said the present position of the industry was difficult and there were many young men and women unemployed. He was convinced, however, that it would not be long before we had a definite improvement.

Prizes were distributed by Major A. D. S. Rice, President of the London Master Builders' Association; and Mr. H. D. Searles-Wood, F.R.I.B.A., presided.

TRADE NOTES

BY F. R. S. YORKE, A.R.I.B.A.

¶ Though Trade Notes has been a useful feature of this JOURNAL for many years, it has been felt for some time that a direct approach to the manufacturer through the medium of an architect of recognized standing might increase the value to the reader, since only an architect can realize the exact nature of the information that is required by other architects.

We have therefore arranged to enlarge the scope and point of these notes by placing the selection of products to be reviewed in expert hands, and we have been fortunate in obtaining for this purpose the services of Mr. F. R. S. Yorke, who, besides being well known as one of the most progressive of the younger architects, has a unique knowledge of materials and is in close contact with the work of British manufacturers.

We hope that architects and manufacturers will find this new development useful, and their co-operation in providing information or suggesting lines of approach will be much appreciated.

It is more important than ever today that manufacturers and architects should be kept in close contact with each others' work and aims. ED.—*A.J.*

ONE of the most important functions of the architect is the exercise of that indefinable quality of taste in the selection of materials—a problem becoming more difficult with the incessant invention and marketing of new and unprecedented products, which offer innumerable possibilities and a rare right solution.

Apart from having a general textbook knowledge of structural elements—the size of a brick, the correct proportions of sand to cement, and so on—the architect usually knows little about materials. The manufacturer is in a position to supplement the textbook by introducing the things he makes in an intelligent manner, but, at present, new products are rarely introduced even attractively : the appeal is too often made in the wrong direction, and products which deserve attention are sometimes overlooked by those in whose hands they might be used with understanding, and remain in obscurity, or are employed with no consideration of fitness for purpose, and are so misused that they fall into disrepute before their portent is appreciated or their full resources have been exploited.

I intend to devote these notes, week by week, to a review of building products, not always new ones, but occasionally those that may have escaped notice in the past. My object will be to give the information that is required by the architect, uses and limitations, methods of handling and fixing, measurements, and other data, and, wherever possible, approximate or relative prices.

I shall be grateful to architects and manufacturers who send specifications and illustrations of intelligently-produced materials and fittings, and I particularly want to receive details of new standardized building equipment.

BECAUSE I hope these notes will not be disregarded by manufacturers, I take the present opportunity to mention trade circulars : one of the few subjects upon which architects hold views in common.

•

A few trade circulars give well presented and significant information, and illustrate a product in such manner that its portent is immediately apparent. The others, because they do not fulfil their quite simple function, generally through over-ambition, are useless ; their production and distribution wastes the money of the manufacturer and the time of the architect. I cannot understand why the former fails to realize that 99 per cent. are destined to go to the waste-paper basket, without receiving even casual perusal. An impression is gained at a glance, and I imagine that a representative spends much of his firm's time endeavouring to dissipate impressions created by its literature.

•

It should be remembered that the architect is, in normal times, a busy man, and at any time has something more interesting to do than puzzle through a jumble of irrelevant facts and over-statements.

•

A circular, to be of use to the architect and of profit to the manufacturer, should state precisely and concisely the purpose of the product in question, and should give a brief but complete specification, and when necessary an illustration, preferably a detail drawing, to scale or dimensioned.

•

There is a tendency, too, for the manufacturer to take a first-rate finished product and proceed to "design" it, adding ornament that gives it a second-rate appearance and destroys all indication of its recent origin. Thus an innovation of importance may escape notice because it is prevented from expressing its purpose. This happens, for instance, when a new material is employed in the manufacture of a familiar object, or when a new process is brought to the solution of an old problem, as synthetic resin and metal alloys are used in the production of door furniture and similar fittings, or a new form of electric lighting or electric heating is placed on the market.

•

One realizes that the majority of mass-produced goods will retain their present forms until the demand for something better is sufficiently great to justify a change, but the architect can

assist in the enforcement of a new standard in industrial design by exercising greater care in selection. At the same time, when he is working in a new material that suggests a new form of treatment, the least the manufacturer can do, even in his own interests, is to consult an expert in design, who is conversant with present-day requirements, and who knows that "period," and "jazz" or "modernist" ornament are equally out-of-date. The manufacturer is inclined to design to suit his own taste rather than that of the consumer.

•

My object in these notes is to deal with materials and accessories in so far as they are of interest to the architect. Accordingly I shall not confine myself to the latest inventions only, but I shall discuss developments of existing products, and, in certain cases, interesting devices that have been for some time available, but are possibly little known.

•

I shall be pleased to answer questions that may arise, or give further information when it is required, and I shall welcome suggestions from architects and manufacturers.

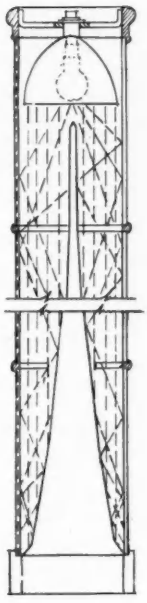
Glass, a useful brochure

A brochure of the type that the architect will, I believe, keep for reference has recently been issued by Messrs. James Clark and Son, who have obviously been at some pains to discover just how much the architect should know about the material he is using.

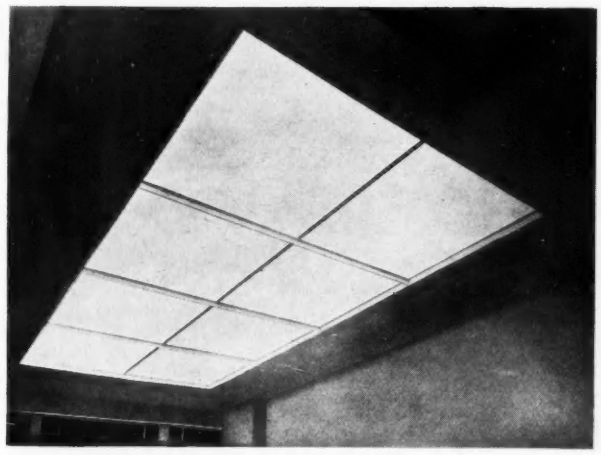
•

A short and sensible foreword is followed by a summary of the various kinds of glass, giving thicknesses, sizes of stock sheets, strength, and, in the case of opaque glass, a table of colours. Distinction is drawn between those colours always in stock and those requiring some weeks for delivery, and the more expensive types are marked by an asterisk.

•



A section on the decorative treatment of glass deals with :—



Grinding and polishing,
Sand-blasting,
Acid etching,
Brilliant cutting,
Chemical deposition of metals,
Colour spraying,

and, finally, a page on fixing gives details of adhesive fixing, screw fixing, and wood and metal fillet fixing.

•

The telephone number of the enquiry department is printed clearly, and against it are the names of the men from whom information may be obtained.

Above : A lay-light, 12 ft. x 6 ft., providing a floor illumination of 9 ft. candles, in a room 25 ft. by 20 ft., from one 300-watt lamp.

Left : A glass column 8 ft. 6 in. high, illuminated by a single 200-watt lamp.

Economical Cornice Lighting

Concealed lighting, in the form of cornice or lay-lights, is generally accepted as the most satisfactory means of providing artificial illumination, but is not generally employed because the multiplicity of bulbs, which must be small and closely spaced if an uneven effect is to be avoided, and the consequent high cost of maintenance and current consumption, makes the method expensive.

•

Since the intensity of artificial light at its source is no longer the determining factor in planning illumination for a given area, and uniformity, extent of distribution, and elimination of glare are dependent upon reflection and diffusion, there should be considerable scope for the G.V.D. system of concealed lighting, directed towards the economical use of current, by which lay-lights, cornices and horizontal or vertical troughs, of considerable dimensions, may be evenly illuminated by a single ordinary lamp of moderate wattage.

By this system a lay-light, for example, 12 ft. by 6 ft. in a room 25 ft. by 20 ft. by 11 ft. high, will yield, from one 300-watt lamp, a floor illumination of 9 ft. candles—a good working light. The glass surface of the lay-light itself is evenly illuminated, though the lamp is arranged at one side, and because the light is diffused from so large an area the illumination in the room is practically shadowless.

•

The heat generated by the single lamp is negligible and no special ventilation arrangements are necessary. A depth of about 12 in. between the lay-light and the underside of a structural floor is sufficient to accommodate the lighting equipment, which consists of two principal parabolic reflectors, and a number of other reflectors, working together to provide an even distribution of light.

•

When the system is applied to cornice lighting a 200-watt lamp, placed at one end of a trough 9 in. square by 17 ft. long, which accommodates the reflectors, will illuminate a room 17 ft. by 12 ft. by 9 ft. high, and yield 4 to 5 ft. candles at floor level.

•

The accompanying diagram shows a glass column, 8 ft. 6 in. high, illuminated by this system from a single 200-watt lamp.

Reginald A. Cordingley, M.A., A.R.I.B.A., who has recently been appointed to the Professorship of Architecture and as Director of the School of Architecture at Manchester University, in succession to Professor A. C. Dickie. From 1929 to 1932 he was Master of Architecture and Head of the School at Armstrong College, Durham University. He was awarded the Rome Scholarship in 1923.
