THOTHMES I. OF EGYPT WATCHING THE BUILDING OF THE GREAT PILLARED HALL AT KARNAK

The early Egyptians were skilled architects and builders—achieving with the crudest mechanisms results not easily repeatable with modern machinery. Their scholars' early findings in astronomy and mathematics paved the path for modern discovery. They laid the foundations of our civic law. At a time when most men were barbarians, the Egyptians were comparatively civilised. Why?

It is certain that the energy of mind and body from which their culture sprang was due to a climate which was always temperate and invigorating.

*They lived in a climatic belt where at that time areas of moderate humidity coincided with an average temperature of 70°F. The influence of this climate is demonstrated by the fact that, for 4,000 years, no civilisation comparable to Egypt's developed outside this belt until the brazier and roof smoke-hole had been replaced as a heating arrangement by the hypocaust and later by the chimney fireplace.

These improved but primitive defences against extremes of weather are recognisable as rudiments of Air Conditioning and resulted in the extension of civilisation to less favourable climates. The modern analogy is the Carrier installation producing in any enclosed space—in any climate—the atmosphere in which we work and live with maximum energy, efficiency and comfort.

*Since that time it is significant that deterioration of climate has been followed by deterioration in national prosperity and world influence.

reated VITAL SERVICE

"That which is built soundly, endures well."

The great truth of this statement is being repeatedly proved by the activities of all sections of the British war machine. And in none of the three services, perhaps, is this more marked than in the successes achieved by the Royal Air Force.

This same degree of care and skill which goes into the training of personnel and the building of planes is expressed in the manufacture of Crabtree electrical products. The design of Crabtree Ironclad "Compact" Switch Socket-outlets, for example, is based upon a wide appreciation of practical requirements and only the finest materials are employed in their construction. They are offered in 2, 5 and 15 Amp. patterns and are in every way suitable for service wherever control units of a robust character—both electrical and mechanical—are called for.

This advertisement does not imply that Crabtree products are necessarily available either in the United Kingdom or for export to any country overseas,

STANDARD WOOD CASEMENTS

are based on

SOUND LIGHTING PRINCIPLES

Sheet Five

Many windows, especially in urban areas, will be obstructed in some way (Fig. 8), either by adjoining buildings, trees, or some other impediment and the amount of daylight entering the room from the sky will be cut down. To compensate for this, a taller window should be chosen so that the largest possible angle with the visible sky may be subtended by the window opening.

Put very simply, long horizontal obstructions, such as the roof-line of a nearby house, may cut down the penetration of light into a room without very much altering its spread. This effect is illustrated in the diagram which shows the graph of the same daylight factor contour, first with the window unobstructed, then with an obstruction of 26° and finally with one of 40°. This is one of the problems EJMA had in mind when providing their range of tall windows as part of the standard series.

For other sheets of this series and for full particulars of the EJMA range of Standard Wood Casements apply to:-

The door to the future

When architects once again begin to specify, they will find in "REPLICATE" Doors a finish to grace any architectural scheme. They reproduce in a beautiful and practical way, and by a new and unique process, the choicest grain of rare woods.

"REPLICATE" Doors will be available after the war.

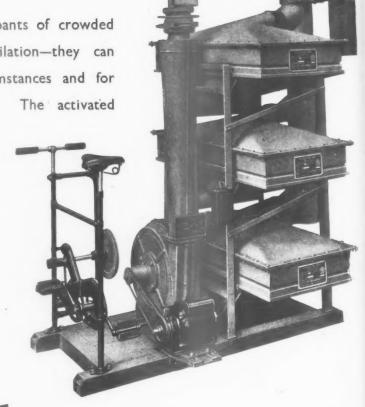

replicate doors

frankly a reproduction

instal Filtavent. and breathe

There is no need for occupants of crowded spaces to suffer inadequate ventilation—they can breathe fresh air under all circumstances and for however long may be necessary. The activated carbon and particulate filters effectively remove deleterious gases and dusts. The plant illustrated has three filter units and is designed for 105 persons. Standby operation is by pedal—less fatiguing than manual operation if mains current fails.

Even before the bombing, the squares of Clerkenwell had, at least for one observer, an air at once gallant and nostalgic. Scarcely a hundred years old, they were a surprising survival of the world of seventy years before, the world of the Woods, the Adams and Leverton. Even in their trim brick facades they were faithful to the precedent of Bloomsbury. Were they a conscious attempt to recapture the past? Perhaps it is safer to see in them a last brave attempt, in the Victorian wilderness, to serve human needs with honesty and dignity, to be sincere and logical.

They are a sterling proof of the hard-dying persistence of the English tradition of civic planning. The Clerkenwell squares should reassure those whose mission it is to replace and regenerate our modern towns . . . whose work, if it also is to serve human needs with honesty and dignity, must involve the use of the most efficient materials . . . amongst which will certainly be those of Celotex Limited.

HY-RIB is the answer to your centering problem

UTILISE THE
REINFORGING STEEL
AS CENTERING

Hy-Rib is a centering for concrete during construction.

Hy-Rib is a reinforcement for the structural slab.

Above right. Hy-Rib sheets in position ready to receive concrete slab. Tubular scaffold may be used for supporting Hy-Rib if timber is not available.

Left. Soffit of slab after striking bearers. Hy-Rib provides 'keyed' surface for plaster.

Over 11,000,000 square feet of HY-RIB has been used in Wartime building

For the guidance of Constructional Staffs we provide working drawings for particular applications of Hy-Rib.

Hy-Rib is unequalled in providing the above facilities and its use reduces labour costs to a minimum.

Hy-Rib is immediately available from stock.

Insulating existing buildings

To cure unsatisfactory winter temperatures in factories and similar buildings, with resulting complaints of discomfort and reduced output, there are usually two alternatives—one, to instal a larger heating plant and burn more fuel, the other, to insulate the building and secure adequate temperatures, often with less fuel than before.

Apart from the fact that the first is, nowadays, ruled out by the need to reduce and not increase fuel consumption, insulation is always a better investment, often involves a smaller capital outlay and keeps the building cooler in summer.

LET THE PEOPLE BREATHE

After the war we think that many buildings instead of few will have scientific ventilation and air conditioning as a matter of course.

If we are right, we must plan for a bigger output than ever of incorrosible URASTONE—the material for ducting that has given such a good account of itself in the war factories and service buildings of every sort.

Remember the name—URASTONE. Note it down now as the ideal ducting and flue material for all plans. At present it is available only under Control by the M.O.W. Reference details for your files gladly sent on request.

LIKELY TO BE HEARD often in the great symphony of reconstruction . . . the theme is IBECO, famous industrial waterproof paper; and the variations are its manifold applications to the problems of building and rebuilding.

IBECO, like many apt solutions to difficult problems, is simple in itself. It is a tough, light, easily handled kraft paper that is an impenetrable barrier to damp or actual moisture. Once its possibilities are fully realised, the conscientious, practical, progressive builder will find a multiplicity of uses for it.

It will go under every lay of concrete he makes, as a positive safeguard against uneven hydration and honeycombing. It will underlie every wood-block or parquet floor to prevent damp rising. It will turn out to be a "natural" for sarking jobs. It will prove an ideal interlay between concrete and asphalt in roofing work. It will line the walls of wooden structures to keep out wind and weather . . .

The secret of IBECO's perfect fitness for all these functions is that its waterproofing is part of the paper itself. The proofing bitumen is mingled with the paper fibres while these are still in the fluid state. No amount of folding, handling, trampling can impair its damp-resisting properties. It does not crack or perish. Add that IBECO is low in cost, British made, easy to store and transport and it will be clear that our first sentence was no exaggeration! You should know about IBECO in detail. Write for samples and fuller information to C. Davidson & Sons Ltd., (Dept. K.27), Mugie Moss, Aberdeen.

ARE MUNITIONS OF WAR

Of all the ships of war, submarines are most dependent on cables. No other fighting vessel is so fully equipped for electrical operation.

The General Cable Manufacturing Co. Ltd. are specialists in Cables for Electrical Purposes and are manned and machined to supply virtually all types whether rubber or thermoplastic covered.

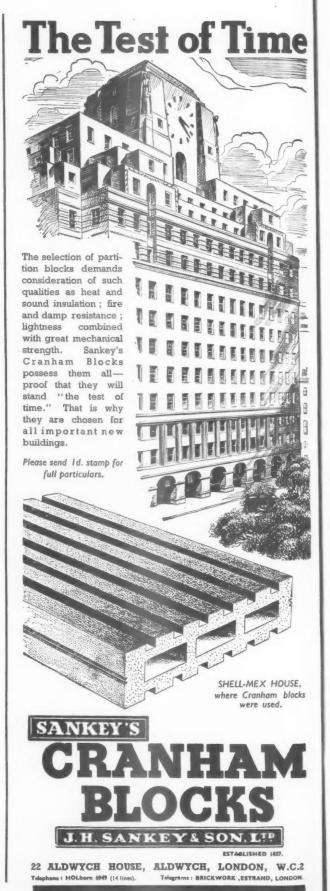

A completely equipped Research Laboratory is at your service when required. Our technical staff will be pleased to advise and assist on any problem involving cables.

Patent No. 519406

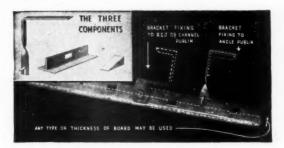

FOR APPLYING ANY TYPE OF BOARD TO CEILING & WALLS

The Wallboard is secured to sherardised, pressed steel, slotted T-section by wedges. Below are shown the methods of attaching the support to various forms of purlin.

Escalator Tunnel of St. John's Wood Underground Station. Architect: S. A. Hecps.

POINTS TO BE NOTED

- Fixed to UNDERSIDE of purlins steel or wood covering unsightly hook bolts, clips, etc.
- 2. Assures the insulating value of air-space between roof and underside of purlins. No dust or dirt.
- 3. Can be fixed to steel or wood purlins of roofs and joists of flat ceiling.
- 4. No unsightly nail heads showing.
- 5. Can be applied to new or old buildings of any construction independently of the roofing contractor,
- who proceeds with his work ahead of the AnD Wedge
- Any thickness of board can be used, from $\frac{1}{8}$ " to $\frac{5}{8}$ ".
- 7. This method can be used for applying linings to exterior walls.
- The simplicity of application is such that any contractor can apply the AnD Wedge Method, and the materials making up this method can be purchased by the contractor.

Full particulars, specification and a typical layout will be sent on request

Had Fire Fighting Equipment as it is now understood been available in Sir Christopher Wren's day, it is safe to assume that the master mind would have provided for its inclusion in his plans. But its inclusion would have been unobtrusive as indeed is the case in modern architecture, examples of which have been photographically recorded and are at the disposal of the profession.

Which IS BEST?

The best of sinks placed wrongly, will call forth more curses than the worst of sinks, placed rightly, ever will. For the sink is not an entity, complete in itself; it is a unit in a system which should include draining-boards, taps, towel-rail, plate-rack, windows, electric light and floor space, and therefore calls for as much care and forethought as any other piece of domestic equipment.

The Institute has always taken a great interest in sinks. Why not consult them?

THE GOOD HOUSEKEEPING INSTITUTE

30, GROSVENOR GARDENS, LONDON, S.W.1 SLOane 4591.

Sleeping rough

... but not as rough as if a reliable ground-sheet were not part of the soldier's equipment. Though one of those everyday commodities taken very much for granted in peacetime, proofed and coated cloths have called for constant research and experiment to ensure materials able to stand up to the hard wear of war. Since war began, Imperial Chemical Industries have produced millions of yards of proofed cloths and "Rexine" and "Vynide" leather-cloths for military and civil services.

Science allied to long manufacturing experience has contributed to the production of the high quality demanded. When the knowledge gained can be applied to the production of peacetime requirements, manufacturers of every type of article of which leathercloth and proofed cloths form a part can rely upon a range of materials outstanding in quality and unrestricted in colour and design.

66 WIGMORE STREET, LONDON, W.1

The New Horizon . . 6

Original Fainting by John Armstrong

The world of travel has become three dimensional and, in happier and wiser days to come, air conveyance will be as commonplace as rail or sea traffic.

No economic scheme for the future can be complete without due regard to the immense vistas opened up for aviation, not only for travellers, but also for the swift distribution of precious and perishable cargoes.

This nation, which was the cradle of engineering, has still a reputation for skill and craftsmanship second to none and evidenced in no small degree by our superb aircraft. This proud tradition is fostered by our desire to learn, to adopt and to adapt all that is best in scientific progress, in administration, management and in general production.

Aeronautical engineering is indebted to the research of the metallurgist in producing special alloy steels to withstand high stresses. Through aviation, time and distance are being conquered so as to bring about a closer and more intimate contact with the peoples of the world. But the freedom of the air is as vital a consideration as the freedom of the seas, since liberty is the inspiration of progress.

DIARY FOR APRIL MAY AND JUNE

Titles of exhibitions, lectures and papers are printed in italics. In the case of papers and lectures the authors' names come first. Sponsors are represented by their initials as given in the glossary of abbreviations on the front cover.

BIRMINGHAM. Homes They Come From Exhibition. (Sponsor, HC.) APRIL 13-28

DARLINGTON. Royal Sanitary Institute Sessional Meeting. 10.30 a.m. At the Town Hall, Darlington. Welcome by the Mayor. Housing and Town Planning, by Mr. Ernest Minors, Borough Engineer and Surveyor, Darlington. Discussion opened by the Town Clerk, Mr. Henry Hopkins. Darlington's colour film, Health Services. 1.0 p.m. Luncheon by invitation of the Mayor and Corporation at Spark's Café, Northgate, Darlington. 2.30 p.m. Visit to Greenbank Health Centre, including Maternity Hospital (36 beds), and the Memorial Voluntary Hospital (240 beds); or to Infectious Diseases Hospital (160 beds) and Hunden's Lane War-time Nursery (80 places), open 24 hours.

DERBY. Homes to Live In Exhibition. At the School Museum. (Sponsor, BIAE)

APRIL

HYDE. Living In Cities Exhibition. At Bayley Hall, Hyde. (Sponsor, BIAE.)

APRIL 15-MAY 6

KIDDERMINSTER. Homes to Live In Exhibition. At Kidderminster Public Library, Museum and Art Gallery. Guide lecturer, Miss Kapp. (Sponsor, BIAE.) APRIL 15-29

LONDON. Reconditioning England Exhibition.
At St. Martin's School of Art, 109, Charing Cross Road, W.C.2., by fourteen societies interested in the preservation of beautiful and historical buildings. The exhibition is intended to show how many of these buildings have been reconditioned so that their external appearance is not spoilt but their internal arrangements altered to suit some form of modern use. Lectures are to be given in the afternoons.

APRIL 13-22

Jacob Miller. The Scope of Soviet Reconconstruction and Its Administrative Framework. At the London School of Hygiene and Tropical Medicine, Gower Street, W.C.1. Mr. Miller worked for a time in Gosplan (the Soviet State Planning Commission) as a research student. (Sponsor, Society for Cultural Relations with the USSR.) 2.30 p.m. APRIL 15

AA Nomination of Officers and Council for Session 1944-5. At ordinary general meeting at 34-36, Bedford Square, W.C.1. 6 p.m.

Bernard H. Cox. An Architectural Tour in the Balkans. At the Westminster Branch of ABT, 5, Ashley Place, S.W.1. The lecture will be illustrated by natural colour slides. Nonmembers are invited. (Sponsor, Westminster Branch, ABT.) 6.30 p.m. APRIL 19

Dr. A. Parker, Director of Fuel Research. The Organization of a Research Department. At the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W.I., Brig.-Gen. Sir Harold Hartley, K.C.V.O., C.B.E., in the chair. (Sponsor, Institute of Fuel.) 2.30 p.m.

Professor Sargant Florence. Planning and Industry. At Essex Hall, Essex Street, W.C.2. (Sponsor, TPI.) 6 p.m. APRIL 20

Eric Godfrey. The Restoration of Soviet Communications and Essential Services. At the London School of Hygiene and Tropical Medicine, Gower Street, W.C.1. Mr. Godfrey worked in the USSR for some years as a telecommunications engineer. (Sponsor. Society for Cultural Relations with the USSR.) 2.30 p.m.

W. N. C. Clinch and F. Lynn. The Design and Performance of Domestic Electric Appliances. At the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, W.C.2. 5 p.m. May 4

Arthur Ling. Housing and Town Planning in the Soviet Liberated Areas. At the London School of Hygiene and Tropical Medicine, Gower Street, W.C.1 Chairman, Professor C. H. Reilly. (Sponsor, Society for Cultural Relations with the USSR.) 2.30 p.m.

George Laws. Chief Sanitary Inspector to the Richmond Corporation. A Hundred Years of Sanitary Progress. At the Royal Sanitary Institute, 90, Buckingham Palace Road, S.W.1. Chairman, Kenneth R. Hay. 2.30 p.m.

AA Election of Officers and Council for Session 1944-45. At ordinary general meeting at 34-36, Bedford Square, W.C.1. 6 p.m.

Dr. J. H. Paterson. The Welding of Plastics. At Institution of Civil Engineers, Great George Street, S.W.1. (Sponsor, Institute of Welding.) Dr. Paterson's paper will be followed by a demonstration. 6 p.m. May 17

MOLD, FLINTSHIRE. Twenty Women at Home Exhibition. (Sponsor, HC.)

Though no feature in the JOURNAL is without value for someone, there are often good reasons why certain news calls for special emphasis. The JOURNAL'S starring system is designed to give this emphasis, but without prejudice to the unstarred items which are often no less important.

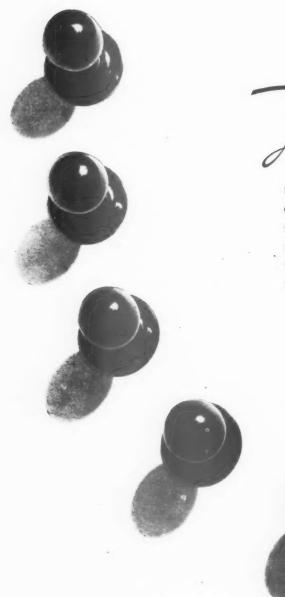

means spare a second for this it will probably be worth it.

** means important news, for reasons which may or may not be obvious.

Any feature marked with more than two stars is very big building news indeed.

It is proposed that BRIGHTON'S BOUNDARY SHOULD BE EXTENDED to include Hove, Portslade, Southwick, Shore ham and Salt dean. The proposal is made in a town planning memorandum issued by the Brighton, Hove and District Trades Council. It is proposed that the sea front should be completely replanned, and behind it should run a main shopping, residential and business route as far as Black Rock. The buildings should be eight storeys high, and the area between this route and the front should be zoned and reconstructed for hotels and blocks of flats. The three northern routes out of the town should be similarly replanned.

A section of the first interim report of the WELSH RE-CONSTRUCTION Advisory Council concerned with 25 the tourist industry. It makes the point that any balanced plan of national development must make full use of the magnificent scenery of Wales while guard-ing against spoliation of that asset. A trunk road from North to South Wales and a Severn road-crossing are considered of the highest importance; so are improved interregional roads, which should be charged to the national Exchequer, At least one trans-Atlantic aerial terminus should be established At the earliest suitable moment in Wales. at least one national park should be developed in North Wales and another in South Wales.

HE RIGHT SHAPE is often the result of thinking afresh about familiar objects. Working on that principle we have produced designs of door furniture which we believe will be particularly successful. Our aim has been to make door furniture which will be functionally perfect and a lasting delight to both hand and eye, and to sell it at a price that will ensure its widest use.

SOMETHING OF HOLLYWOOD. [From Where Shall John Go? by Anthony Bourne (Article in Horizon, a Review of Literature and Art, January, 1944)]. Let me explain that Hollywood, a name usually applied abroad to express the film capital, is nothing more than a suburb of Los Angeles, and a rather shabby one at that. The stars who once lived there have long ago moved away, and the studios have migrated to roomier locations; however, the term Hollywood has still a perfectly valid application to the city of Los Angeles and its environs, for it expresses the deep imprint of the film industry on the city. The first impression is of sunshine, hard and brilliant like a spotlight, seldom uncomfortably hot, but enveloping everything, and rather cruel to the architecture. The residential districts are a nightmare of jumbled styles, neo-Spanish, colonial Georgian, chateau, a moorish mosque placed next to a Chinese pagoda, all constructed in such a way as to look shabby the moment they have been built, the whole thing suggestive of the stage properties of a second-rate touring company. The city rambles aimlessly, uncertain where to stop, over the landscape, down to the sea, up into the hills, leaving great empty untidy spaces ready for yet another block of French chateau apartments which someone failed to build because the city moved too fast.

Mr. A. C. Macdiamid has been elected PRESIDENT OF THE BRITISH IRON AND STEEL FEDERATION.

Mr. Macdiarmid succeeds Sir James Lithgow who has been President of the Federation since February 1942. He is chairman and general managing director of Stewart and Lloyds, and a Vice-President of the British Employers' Confederation.

A £400,000 to £500,000 LONDON MUSIC CENTRE for international artists is planned for after the war. It forms part of a scheme to rebuild Queen's Hall, the home of the Proms for many years, and St. George's Hall. There will be a large hall and a smaller one, seating 3,000 and 1,500 respectively, rehearsal studios and secretarial facilities.

There are people who expect to make a packet of MONEY OUT OF PREFABRICA-TION said Mr. R. Coppock.

Mr. R. Coppock, national secretary of the Building Trade Operatives' Federation, made this remark while criticizing the Government's 500,000 emergency houses plan at a luncheon of the National Federation of Demolition Contractors in London. We in the building industry, he said, are ready with the normal type of building. We can produce not 360,000 but half a million normal houses each year.

How prefabrication may help to solve the post-war housing problem is explained and illustrated in the Ulster Planning Group HOMES FOR THE PEOPLE Exhibition now touring Northern Ireland. The Ulster Planning Group's idea of the factory produced minimum house is also exhibited. It is of stressed skin plywood with a specially designed plumbing duct. Another feature of the exhibition is a layout of ten-storey maisonettes (two-storey flats) each with its

own garden. The blocks are on stilts, the ground floor being used for bicycles and pram storage. Among the other exhibits are drawings and models and various suggestions for post-war housing. The cost of the exhibition was borne by CEMA.

The Board of Education has stated that the AA REFRESHER COURSE will be acceptable in principle for assistance under the Government Scheme of Further Education and Training for men and women who have been engaged in various types of war service. The scheme provides for awards to applicants who require refresher courses on returning to their profession. The course will be limited to those who have reached the standard of the Final Examination of the RIBA. It will be open to all students whatever their nationality. Should a large number of students wish to attend preference will be given to students who have the AA Diploma, students of British nationality and Dominion and Colonial students in this order. As the purpose of the refresher course is to meet the needs of the demobilized architect, it is realized that the extent of the instruction will vary according to individual requirements.

Mr. David W. Smith said that ALTERNATIVE MATERIALS ARE NO OPEN SESAME to the solution of the housing problem. Mr. David W. Smith, a director of the Halifax Building Society, was speaking at the annual meeting of the Leeds Property Owners' Association. He said: While I welcome Mr. Churchill's announcement that the Government is definitely committed to building 500,000 prefabricated houses as a temporary expedient, I would utter a word of warning against the idea that the use of alternative materials is the open sesame to the solution of the housing problem. The value of certain alternative materials under British weather conditions for any substantial length of time has yet to be proved.

Glasgow Corporation Housing Committee proposes to prepare SITES FOR OVER FOUR THOUSAND HOUSES.

Glasgow Housing Committee has had a discussion with Scottish Department of Health officials and proposes to prepare the sites for 4,724 houses in accordance with a recom-

A living room in the Ulster Planning Group Homes for the People Exhibition now Touring Northern Ireland. See news note on this page.

Architect's Giftthe Nation to

Captain H. S. Goodhart-Rendel has presented his house, Hatchlands, with 421 acres of land, to the National Trust. Hatchlands is near East Clandon, Surrey, on the north side of the main Leatherhead to Guildford road. It is the first house acquired by the Trust definitely associated with Robert Adam, who in 1759 began on the interior of Hatchlands, finishing his work in 1761. Adam's internal decorations here are his earliest known work. They include seven rich plaster ceilings and the most ambitious of his caryatid chimney-pieces. When Adam came on the scene the red brick shell of the house was nearly completed from designs of unknown authorship. At the close of the eighteenth

mendation by the department to local authorities for the mass preparation of housing sites. Scotland plans to build 20,000 houses in the first year after the war, and 30,000 in the second. After that it is hoped to build 50,000 houses a year to clean up Scotland's post-war housing programme of 500,000 houses in ten years. Temporary legislation is to be introduced for Scotland to provide financial assistance for all approved house-building. Subsidy arrangements exist at present only Subsidy arrangements exist at present only for slum clearance, decrowding and the general needs of the agricultural population. Local authorities are urged to earmark sites for after the war. The present restriction on the acquisition of land for more than one the acquisition of land for more than one year's building programme will be removed. To speed up the machinery for acquiring housing sites, the Scottish Secretary has decided to seek power to confirm compulsory purchase orders without first holding public local inquiries. Sites already earmarked in Scotland amount to about 5,000 acres and will take about 42,000 houses.

century certain alterations were made from designs by Joseph Bonomi, and the Victorian period brought only a few changes, in which the original work was carefully respected. Hatchlands was built for Admiral Boscawen, to whom the French Fleet surrendered at Louisburg in 1758. The admiral died there at the early age of 50 in 1761, and his widow continued to live there until 1770. Hatchlands later became the home of the late Lord Rendel, the grandfather of the donor. Captain Goodhart-Rendel, who is now serving with his old regiment, the Grenadier Guards, has been president of the RIBA and Slade Professor at Oxford.

The British Iron and Steel Federation has approved the formation NEW A RESEARCH ASSOCIATION. The Council of the British Iron and Steel Federation has approved a scheme prepared by a Committee set up by Sir James Lithgow (the outgoing President, who was Chairman of the Committee) for the formation of the British Iron and Steel Research Association, which will take over the work of the Iron and Steel Industrial Research Council. The Constitution of the new Research Association provides for collaboration with the Iron and Steel Institute, with the right of nomination of members of the Council of the new Association. It is understood that these will be scientists not connected with the Industry but engaged in fields of work related to the work of the Association. The Federation will nominate members who will represent the different departments of the Industryscientific, technological and The present Research Council developed out of a Fuel Economy Committee established in 1924, and has now become one of the largest and leading collective research organizations and reading collective research organizations in the country. Heretofore it has been a Standing Committee of the Federation, but a report on the work of the Research Council by the Department of Scientific and Industrial Research (October, 1942), which bore high testimony both to the scope and to the quality of the work which had been carried out under the direction of the Council, also recommended that it had now reached. recommended that it had now reached a stage where it was desirable that its work should be transferred to an autonomous research association under the ægis of the research association under the eggs of the research becomes an activity of the whole Industry and not merely a service rendered to it. The scheme adopted provides for an annual expenditure of any amount which the Council of the Research Association may find necessary for the work required;

into cour mon appr is he in th authority has been given to the Association to expend in the first instance up to £250,000 annually without further reference for the approval of the Federation. In the meantime, the Iron and Steel Industrial Research Council is continuing to direct the large range of research which it has in progress.

MOS has appointed Mr. E. B. Monkhouse, Deputy Controller, DEPARTMENT IV, TIMBER CONTROL, in succession to the late Sir William Mallinson.

Mr. Russell Latham has been appointed Deputy Controller, Department III, in succession to Mr. Monkhouse, and Mr. G. B. Crow has been appointed Assistant Controller, Department III/9, in succession to Mr. Latham.

Plans are being made by the Board of Education TO TRAIN 10,000 BOYS a year for the building industry. To reach this figure and to enable training to begin at once, the Board is asking local authorities to expand the provision of junior technical schools, and to explore the possibilities of establishing new schools and enlarging existing ones. The age of entry for boys is about thirteen and the courses last two or three years.

In view of certain misstatements the Dean and Chapter of St. Paul's wish to make known the following facts about THE ST. PAUL'S WATCH. The Surveyor to the Fabric, Mr. Godfrey Allen, F.R.I.B.A., was placed in charge of the St. Paul's ARP arrangements shortly before the outbreak of war. In September, 1939, he called for volunteers from the RIBA and organized them, together with other volunteers and employees of the Cathedral, into the instructed and drilled teams composing the St. Paul's Watch, so that when the attacks on London began the Watch was trained and ready. The Watch, under Mr. Allen's leadership, has dealt with every enemy attack.

Mr. Joseph Westwood, M.P., Joint Under Secretary of State for Scotland, is hopeful that the aim of GEARING PRODUCTION IN SCOTLAND up to a total of 500,000 houses annually in the years after the war will be realised. With goodwill, co-operation, and that vitality which our people have shown during the war, he said, the target can be reached. He said: It is intended to try to bring in 200,000 trainees into the building industry throughout the country. There will be an intensive six months training course, and with the preapprentice training scheme also in operation it is hoped to increase the number of employees in the industry from 750,000 to 1,250,000.

ORGANIZE THE FACTS

NE of the few post-war happenings in Britain which we can expect with certainty is an increase in public guidance of national activities. This increase will occur in the wider fields of national policy—foreign trade or social security—where it will be a true increase. It will also occur in relation to most projects for changing the use of land: and in this field it will in many ways be an innovation rather than an increase.

The degree of public guidance in this latter field may be great or small: our rulers are still arguing the point. But if one assumes that it will be great enough to achieve at least some of the intended aims, it is worth while to give some thought to the machinery which will be needed to supply the guidance. When a project for the development of land is proposed, it will be necessary that all factors relevant to the project should be collected, valued individually and comparatively, discussed with all interested parties and finally be given appropriate weight in the approved plan: and it will be necessary that the whole process should take place reasonably quickly. So much will be agreed. It is clear also that the number of factors and the complexity of their interrelations increase prodigiously as the size of the project grows: and that this difficulty can only be surmounted by a process of very skilled selection, weighing and simplification. The main needs of the machine remain, however, two in number: a system for the quick collection of all relevant information, and a system for quick consultation, discussion and decision between all interested parties.

Let us consider the formidable job of assembling quickly the information relevant to a big development proposal. The foundation of such information are national statistics and it is broadly true that in the past national statistics in each field have been collected for areas, at times and in forms which differ from those of every other field. It is probably impossible to produce all national statistical returns on a uniform basis; but it would certainly be possible to bring about great improvements and to compel all Ministries to produce "standard" returns as well as those in the form most convenient for individual Ministry purposes.

The national statistics bearing on a given project will need to be supplemented by information on the special circumstances of the area or city. A great deal of this information is already available in published works and all over the country in the past three years local authorities, universities, groups and individuals have been carrying out surveys. Survey is an essential part of planning and there is no limit to the number of people who can usefully take part in it. But there is danger that widespread and unguided surveying may lead to duplication of work, loss of valuable individual results, leaving of serious gaps, and resentment on the part of the surveyed. The JOURNAL suggests that it should be possible to produce

Model Forms of Survey applicable to areas and cities of different size, and that all survey organizations should be encouraged to help in the completion of their local Model Survey before tackling other tasks.

There is also a third source of information—that which has been obtained by the various Ministries since the war began. Never has Britain been so surveyed, checked, and docketed. And not only for war purposes. University and professional circles throughout the country are liberally peppered with men and women who are doing something for a Ministry on some post-war problem. It is excellent that this is so. But are we sure that all the factual information which has flowed into London since September 1939 has been sifted, indexed, exchanged between all Ministries and prepared for issue to all local authorities and other responsible organizations when the system of central guidance—that is, public guidance—of land use comes into operation?

If this has not been done the JOURNAL recommends that the work should be started at once. The first essential for the central guidance of national activity is full and fast exchange of information between all the Ministries which rule us in London and the governments which rule us locally.

RIBA PREFAB. DISCUSSION

Surprisingly enough, no sparks flew during the discussion on prefabrication held at the RIBA last week. Everyone who spoke accepted the development of prefabrication and standardization as inevitable, some sadly but others gladly.

Mr. Jellicoe, who was the first of the three speakers to open the discussion (the other two were Mr. R. H. Shepherd, and Mr. A. Pott of the BRS), no doubt helped to create a calm and objective atmosphere with a philosophical dissertation in which

he called for a close link between the machine and nature, between mechanical and organic forms. The job of the architect in the machine world was to humanize building, to dispose houses properly on their sites, and to make full use of planting so that a link was formed between the new machine-produced architecture and Mother Nature, between buildings and earth. He spoke sincerely and well, and no one could have disagreed with him.

The discussion made it clear that to many architects, prefabrication is still something of a bogy, which will not only produce inhuman buildings but, worse than that, oust architects from their jobs. This is surely due to confusion of thought. Certainly the architect's functions will alter considerably as a result of ever-increasing use of standardization and factory-produced building parts, but he will still have a very definite and necessary place in the modern world.

For instance, on the one hand, the architect will tend to take more and more to industrial design of standard building parts for mass production. In the assembly of these parts into a complete building, his scope so far as design of detail and elaborate

drawing is concerned, will become more limited, but in their co-ordination, assembly, and planning, his scope will be as wide, if not wider, than ever. On the other hand, the architect will tend to concern himself far more than hitherto with the layout of buildings, landscape designing, town - planning, and the general humanizing of our physical environment.

Moreover, most of the larger types of building will still have to be designed individually to suit inevitably varying needs, and here rationalization and careful organization of site work, as well as the designing and production of parts made in the factory specially for the job, will need the qualities which only a thorough architectural training can give.

The Machine is too often regarded, not only by the lay but by architects and designers who should know better, as some horrific, inhuman and nightmare juggernaut filled with a satanic life of its own, when it is, if properly used, merely a very useful extension of the hand-operated tool of the craftsman, an extension different in degree and power rather than in kind. So why worry?

POST-WAR SCHOOLS

The scuffling in the House of Commons over the clauses of the Education Bill which affect the Unprovided Schools has made us lose sight of some of the main issues contained in it. These will have an enormous effect on the post-war building programme and on the size and cost of schools. In the first place, it is proposed that each form should have its own classroom so that the number of classrooms in the post-war school will be doubled. It is once more proposed that classes shall be reduced from 40 to 30, so there will have to be a third as many again; and the school leaving age is to be raised to 15. If these proposals are taken by themselves and are not regarded as pious aspirations they mean very much bigger schools.

But they are not all. The curriculum is to be expanded particularly in

scientific and technical subjects; there are the young people's colleges and the day continuation schools. Black listed and obsolete schools—and they form the majority—must eventually be rebuilt. When these are added together the school building programme seems to become almost astronomical.

When one looks for some estimate of the number of new buildings which will be necessary, it is not available. In housing almost everyone has had a stab at a target estimate of the numbers required and someone might be right. is time that the Butler proposals were examined, against the known shortages and the black listed schools in use before the war. There seems to be a curious lack of any organisation for research into buildings at the Board of Education. Local education authorities are entirely ignorant as to the sort of schools the Bill, which now becomes law, will bring into effect. They don't know what a young people's college is, nor what it will cost. Surely as a method of rousing support for the proposals, some plans illustrating them might have been drawn up? There are good proposals in the Bill or rather they appear to be if one is prepared to take a good deal

Worse, however, is the almost total absence of any realisation of the importance of architecture in relation to education. Looking through both the Spens and Hadow Reports, which may be regarded as the spade work to the proposals recently before the House, there is very little reference to architecture in either. It does not seem to be appreciated that well-designed buildings can not only assist the educational process, but create in the child a sense of order and fitness. In neither report is there any adequate recognition of

Possibly it is accounted for by the fact that on the consultative committees there were no architect members. This seems an extraordinary omission, and one which the profession should take up. To give point to its importance are

the statements which are made about the bottleneck in teachers after the war. It won't be the only bottleneck in education unless somebody at the Board gets down to a close examination of the building requirements of the Bill. Let us remember the fate of the Education Act in the last war. Mr. Butler knows about that.

POETS' CORNER

LINDY-LEWIS PLAN

To a Nameless Critic.

A sheaf of script upon a dusty board, Betrays the secret of their drastic ways, With those who—working of their own accord— Disdain to plan with word and sounding phrase.

Shifting their tee squares from an inky proof, Fearfully they gaze on those of us who stoop To practise our profession—all aloof, Instead of bandying words around a group.

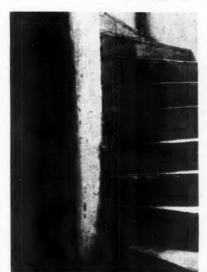

Sadly they walk through leafy squares
And mark the absent railings of the envied park,
Blushing that some more enterprising pairs,
Should dare express their egos—AFTER DARK
Phantastic Individualists.

AN UNUSUAL STAIRCASE

A JOURNAL reader has sent me the photograph reproduced below of an unusual staircase. It is at Rivenhall Place, Essex, a Tudor mansion, and is built round the King mast of a ship.

The mast leads right up from ground floor to the top of the third storey—no mean height. The mast is a relic from an old American sailing vessel, which may have been engaged in some great naval battle of its day.

ASTRAGAL

A staircase at Rivenhall Place, Essex, a Tudor mansion, is built round the mast of an old American sailing ship. See Astragal's note above.

LETTERS

C. B. Willcocks, F.R.I.B.A., A.M.P.T.I.

Geoffrey Thomas (Research Officer, Wartime Social Survey)

The Teaching of Architectural Appreciation in Schools

SIR,—I was very interested in Mr. Martin-Kaye's letter as his ideas are so in accord with those of the Council for Education in Appreciation of Physical Environment. It is being generally realized that the real education of the people in the appreciation

It is being generally realized that the real education of the people in the appreciation of physical environment, including architecture, town and country planning and the fine and industrial arts, must begin at home and be continued throughout school life—that every child should receive instruction in this subject from the cradle upwards as part of his education. For this reason the child, from the earliest period, should be brought up in well-designed surroundings, as it is his environment that first influences his ideas of colour and design. The matter, it is suggested, should not be dealt with as a separate subject, but should be woven into the fabric of the school curriculum and form a background, not only to the art classes, but to others, such as history, geography and literature. That it can be dealt with in this way educationists and teachers agree.

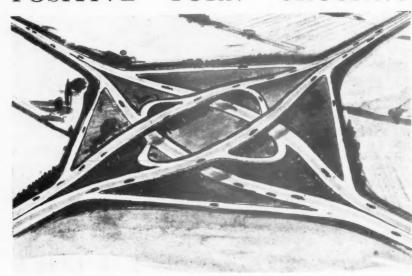

and teachers agree.

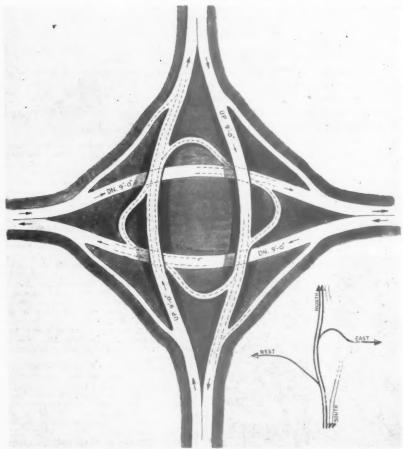

In the past most lectures on the subject have treated it more from the historical than the appreciation standpoint and have been largely given to adults; also they have not been systematic. The result, unfortunately, has been almost negligible, as is shown by the design of many buildings erected after the last was and their contents.

war and their contents.

The CEAPE arose out of the suggestion made some two years ago that good design should be taught in all schools by the existing staffs, when competent to do so. The simplicity and practicability of this suggestion has been realized by educationists, and during the last two years a number of lecture courses for teachers on the subject have been organized throughout the country, especially in the north. Whilst this is a matter to be handled chiefly by educationists, architects and others interested in the subject can give valuable help by organizing conferences of teachers to discuss the matter, assisting with lecture

POSITIVE CROSSING

The Maltese and the Switchback Road Crossings were illustrated in the JOURNAL for April 22 and August 19 respectively of last year. We now illustrate the Positive Turn Crossing designed by Arthur G. Wise, A.R.I.B.A. This is a variation of the Cloverleaf and permits a normal arrangement of traffic-lanes and a right-hand turn by means of an actual turn to the right instead of to the left. The ground space occupied is about the same as for the Cloverleaf, but the spiral ramps are rather less than a semicircle instead of a full three-quarter circle. There are four bridges in place of one, but the bridged area is little more than in the straight crossing, the main roads being divided into their one-way components and bridged separately. Right-hand turns are made direct from the inner (fast) lane, but all re-entries are into the outer (slow) lanes.

courses and in other ways. Some of the allied societies of the RIBA, realizing the importance of the project, have already formed special committees to deal with it. If all will do so and form the proposed local panels of lecturers on the appreciation of architecture, town and country planning and the industrial arts it will be very helpful, as there is a growing demand for such lectures, not only from education authorities, but from Army Directors

of Education and the WEA, etc.
Unfortunately, few lecture courses have been arranged in the Greater London area, which contains about a quarter of the population of the country. If the RIBA will organize such courses throughout this area, it will be of the greatest value.

Coal Storage Space

SIR,—In some recent correspondence in your columns, reference has been made to coal storage space in relation to the housecoal storage space in relation to the house-wife's purchasing habits. In the course of its inquiries the War-time Social Survey has had occasion to ask housewives both the storage capacity they have in their homes and the amount of coal they buy at a time. The following figures, based on a random sample of 3,087 households, may therefore be of interest to you.
The Amount of Coal purchased at a time by

Housewives.

Up to	and i	neluc	ling 2 c	wt	 33
Over 2	cwt.	and	includin	g 5 cwt.	 24
,, 5	11	11	**	10 ,,	18
., 10		71	11	20 ,,	17
Over 1					 4
Quanti	ty un	speci	fied		 4

100 = All Housewives. A third of all housewives buy less than 2 cwt. at a time and rather more than a third over 5 cwt. at a time. There are distinct differences between economic classes, that is between those in which the chief wage-earner of a household has a weekly income of either (1) up to £3 12s.; (2) £3 12s. 0d. to £5 0s. 0d.; or (3) £5 0s. 0d. to £10 0s. 0d.

Group Group Group

	Group	Group 2	Group 3
	07	%	
Up to and including 2 cwt.	47	32	17
Over 2 cwt. and up to 5 cwt.	. 26	25	23
Over 5 cwt. and up to	. 13	20	24
Over 10 cwt, and up to 20 cwt.	0	16	25
Over 1 ton	. 1	3	6
Quantity unspecified .	. 5	4	5
	100	100	100

When these figures are compared with the figures for storage space possessed by two of the same three groups it is clear that buying habits are not, under present conditions, influenced very greatly by storage space. The following table shows storage space in the same quantities.

arrie quartities.		_	
		Group	Group
		1	2
		0/	0
No storage space		1	
		. 1	-
Up to 2 cwt		7	4

Leslie Hardern, author of this week's article on Coal. Gas and Electricity, is a B.A. (Cambridge). He is Public Relations Officer to the Gas Light and Coke Company. Joint Secretary of the Greater London Gas and Electricity Committee and a Director of the Capitol Housing Association, which was responsible for Kensal House.

JOBS TO BE

As the author of this week's article points out, there are a number of problems common to the coal, gas and electricity industries. Each industry suffers from an excessive number of units, and excessive variation of size of unit. Each wants an overhaul of the existing legislation. Each intends to effect improvements in the efficiency of production, distribution, utilization and standards The enormous physical problems that post-war reconstruction will pose to these industries and the need to allow freedom of choice between fuels for their various purposes, demand a degree of co-operation between the industries which the author believes will be greatly facilitated by the National Fuel Advisory Council now being set up by the Minister of Fuel and Power. A council such as this, containing representatives of the various fuel industries, should be able to establish a national fuel policy whereby each user can obtain the service most suitable to his purpose, consistent with the proper utilization of the nation's fuel resources.

MUST PLAN SERVICES WITHIN A NATIONAL POLICY

by Leslie Hardern

survey of the coal industry

The coal industry contains 2,000 separate collieries and 1,000 separate owners.

A third of the total output is produced by 25 of the 1,000 companies. The collieries vary in size from a giant producing 10 million tons a year to tiny firms working outcrops with less than 20 men.

There are 25 coalfields in Great Britain, 9 of which are of major importance.

The character of the coalfields varies widely. South Wales, East Scotland and Durham are the export coalfields. South Wales produces anthracite and steam coals, Durham gas and coking coals. The Midlands supply household and industrial coals, Northumberland house and steam coals. These differences result in wide variations in district costs.

The number of men employed has fallen from 750,000 in 1938 to 700,000 in 1944.

The total output of coal has fallen from 227 million tons in 1938 to less than 200 million tons in 1943. Output has dropped from 231 cwts. to 21 cwts. per man shift.

There are 27,000 separate retail outlets. Only about 2% turn over more than 40,000 tons a year, and about 8% exceed 8,000 tons. 30% handle less than 200 tons a year.

In 1938, 46 million tons were exported and 181 million tons supplied to the home market. 20 million tons were used for gas, 20 million for electricity, 17 million for iron and steel, 12 million on the railways and 12 million in colliery engines. Part I of the Coal Mines Act 1930 dealt with the production, supply and sale of coal. A Central Council assessed national coal requirements and allocated tonnages to districts. District Executive Boards allocated quotas to individual mines. Quotas were transferable. Minimum prices were fixed for all classes of coal in each district.

Part II of the Act set up Coal Commissioners to reorganize the industry and to promote amalgamation in the national interest.

Part I of the Coal Mines Act 1938 arranged for the nationalization of royalties.

Part II of the Act charged the Coal Commissioners with the duty of reorganizing the industry.

At the outbreak of the war, the Government appointed to each coalfield a Coal Supplies Officer, a Divisional Coal Officer and a Coal Export Officer.

In 1942, the new Ministry of Fuel and Power set up:

 A Controller General, assisted by Directors for Production, Labour, Services and Finance.

 A National Coal Board, under the chairmanship of the Minister, to consider the planning of production.

Regional Controllers and Regional Coal Boards.

Between 1926 and 1936, 41 voluntary amalgamation schemes were completed, affecting 390 pits employing 250,000 workers.

The main organizations in the industry are the Mining Association of Great Britain, the Coal Utilization Council, and the Combustion Appliance Makers' Association.

In 1937, the industry set up the British Coal Utilization Research Association. Considerable progress has since been made in improved methods of burning solid-fuels for industrial and domestic purposes.

problems of coal

The industry consists of too many small production units. If areas are to be properly planned and worked, and full advantage taken of modern technique, the hundreds of small collieries must be brought together into larger units. Concentration of production would reduce the average costs of the industry.

Further economies in production cost depend very largely on mechanization—machine cutters, pneumatic picks and drills, and mechanical

conveyors.

The excessive number of small dealers results in a low standard of service and a high average cost of distribution. Coal merchants of reasonable size who have to maintain sidings and depots and transport are hampered by the competition of small dealers, who hawk round the streets small loads on hired lorries. Often the coal is of indifferent quality. Frequent cases occur of short weight.

There are 4,000 waggon owners and 750,000 waggons of many varying types. Many are more than 30 years old and four-fifths of 8 to 12 tons

capacity only.

The whole trend of utilization, domestic, commercial and industrial, is towards elimination of waste and greater efficiency of equipment. This will result in a continuous

decline in the home market, which will be accentuated by every increase in coal prices.

The increasing pre-war demand for cleaned and sized coal will continue after the war and necessitates the introduction of crushing machines on a much larger scale.

plans for coal

Integration of the collieries will be resumed by the Coal Commissioners after the war, under Part II of the 1938 Act.

The National Council of Labour, in conjunction with the Mineworkers' Federation, have placed before the Government a proposal for the requisitioning of mines and their control by a National Coal Board. The Board would consist of representatives of the Government, the Mining Association, and the Mineworkers' Federation; its functions would be to plan and organize the industry. Regional Boards similar in composition would handle the day-to-day problems of production, labour relations, etc. Pit Committees would be established of equal representatives of mineworkers and colliery companies.

This proposal is opposed by the Mining Association, who argue that under Government control in the last war output fell, costs increased, and the industry had to be heavily

subsidized.

Proposals for improving efficiency and service includes the adoption of standard 20-ton waggons, the pooling of waggons, the concentration of distribution in fewer hands, and the licensing of distributors. It is also suggested that export trade should be handled by a British Coal Export Association.

survey of the gas industry

The industry has an embarked capital of £238,000,000, consisting of £149,000,000 in statutory undertakings, and £84,000,000 in Local Authority Undertakings.

It provides employment, directly and indirectly, for about a quarter of a million

persons:

It consists of 1,079 undertakings, 496 owned by independent companies, 310 by 19 gas corporations, 268 by local authorities and 5 by joint gas authorities.

The 15 largest undertakings

supply half of the gas sold, and the other half is supplied by over a thousand other undertakings.

There are more than 11,000,000 gas consumers, which means that nearly every household has a gas

supply.

In 1937, the industry processed more than 19,000,000 tons of coal, obtaining some 1,500,000,000 therms of gas, 8,500,000 tons of coke for sale, and over a million tons of tar, benzole and other by-products.

In terms of money, the industry converted £25,000,000 of coal into £75,000,000 of gas, coke, tar and other pro-

ducts.

In 1937, 57 coke oven plants supplied 140,000,000 therms, or about 9 per cent. of the total gas sold, to 64 gas undertakings.

72 per cent. of the total gas was sold by 357 undertakings in seven industrial areas, $20\frac{1}{2}\%$ by 75 undertakings in 73 urban areas and $7\frac{1}{2}\%$ by 647 undertakings in rural areas.

Gas is normally used in the following proportions:

Domestic . . 60%—70% Commercial . . 10%—20% Industrial . . 10%—20% Cooking accounts for three-quarters of the consumption of the average household.

The high quality of modern industrial work calls for precise temperature control in heat processes, and gas has been used on an increasing scale in recent years in factories. As a result of wartime experiences, an even greater expansion may

be expected.

All aspects of the gas industry are covered by a number of national organizations, such as the Institution of Gas Engineers, the Society of British Gas Industries, the British Commercial Gas Association, and the National Gas Council.

A recent development is the Gas Industry Advisory Committee, comprising five members nominated by the gas industry, appointed by the Minister of Fuel, to assist him in dealing with the affairs of the industry.

Fundamental and long-term research is carried out by the Gas Research Board in conjunction with the Department of Scientific and Industrial Research.

As regards industrial and commercial gas, a national scheme of Industrial Gas

Centres has operated for several

The industry operates under complex statutory regulations, based on the false assumption that gas is a fuel monopoly.

Various methods of integration have been practised:
(a) Amalgamation of con-

tiguous undertakings under single management.
(b) Association of gas under-

takings under a gas corporation.

(c) Joint gas authorities.(d) Transmission companies.

(e) Joint working arrangements between undertakings.

problems of gas

The industry consists of too many separate units.

Size of itself is no absolute criterion of efficiency. Nevertheless, below a certain size it is difficult for an undertaking to employ specialist personnel, to take advantage of modern developments or to raise capital on favourable terms.

New satellite towns, decentralization of existing towns and rural development will call for new production plant and extensions of distribution

mains.

Long-distance transmission, bulk supplies and fringe connections were established before the war. The economic limitations were recognized, but newer mechanical methods may render transmission schemes economic which hitherto have been unremunerative.

The industry cannot remain satisfied while pressures at users' premises are liable to wide fluctuations or while the sulphur content of the gas exceeds reasonable limits. Standards of practice must be set up with which all gas works must comply.

Where material contrasts of commercial policy and practice exist between gas undertakings in the same part of the country, the result is a feeling of exasperation on the part of the consumer.

Integration of undertakings, and co-operative buying would cut down the needlessly wide variations in appliances, and enable consumers to benefit from the economies of mass production.

The research and technical development work of the industry calls for a threefold development scheme. First, long-term research; second,

by the and ap extensio and tec Comp badly n tion and policy : An ag is also ning an firmly ment of to judg technic mercial

technical development work by the manufacturers of plant and appliances; third, the extension of applied research and technical investigation.

al

0

t

Comprehensive statistics are badly needed for the introduction and development of sound policy and practice.

An agreed system of costing is also acquired, so that planning and integration may be firmly based and the management of an undertaking enabled to judge the efficiency of its technical operations and commercial policy.

plans for gas

It is proposed to set up a British Gas Association which will be the accepted authoritative body of the Gas Supply Industry.

In this Association every undertaking will be represented upon the appropriate district council. The district councils will elect the Central Council, which will become the parliament of the industry. The Central Council will have committees to deal with such matters as development, statistics and legislation.

The Central Council will operate through the district councils, of which a dozen will be sufficient to cover the country.

The district councils will form a focus for co-operation between undertakings and will acquire sufficient prestige to challenge undertakings providing indifferent service. They will afford commercial, technical and specialized help to ensure minimum standards and assist in the planning of schemes of integration. Their functions will demand the service of members with initiative and experience.

An expert committee is reviewing, on behalf of the gas industry, the complex and often antiquated provisions of existing legislation, with particular regard to planning and the necessity for its revision and codification.

Whatever the future form of control and ownership of the industry may be, the practical problems will remain the same. Progress has hitherto been associated with personal and collective enterprise. It is proposed to build upon co-operative company and local authority enterprise appropriately controlled, and to support all merging, joint operation or association of gas

undertakings where increased efficiency and economy would result.

Minor differences exist within each form of integration, but the intent is the same, namely, that as a result of the co-ordination, efficiency and economy achieved the consumer shall receive the best possible service. Wherever these conditions can be satisfied, integration will be encouraged.

No one of the alternative means of integration could be adapted exclusively to meet all the varying conditions. Each, however, may be suited to particular areas and circumstances. The problem is (i) to ascertain the needs of the area and the circumstances of each undertaking; and (ii) to determine the means by which integration could best be brought about.

Enabling legislation will be necessary if the execution of integration schemes is to be expedited.

To ensure that the further development of integration is not unduly delayed, the British Gas Association should render annual statements to the Ministry of Fuel and Power showing what progress the industry has made during the year.

recommended that It is Parliament should appoint a standing Integration Tribunal, to which could be referred any integrating proposal which could not be agreed. All interested parties should have the right to appear before the Tribunal, the findings of which should be final, subject to the decision of Parliament. The members of the Tribunal should be independent and judicially competent and they should have the assistance of expert assessors having adequate experience of the gas industry.

Increased demand for gas will dictate increased capacity of manufacturing plant. The doubling of gas output would not require a doubling of gas manufacturing plant, whilst the interlinking of adjacent distribution systems would reduce the margin of carbonization plant necessary. Where mains become overloaded, it may not be necessary to replace them bodily, but to adopt the cheaper expedients of high-pressure feeder mains or of increasing the pressure in the mains and fitting governors on consumers'

Interconnections with other sources of gas become desirable where works are too small to be economic engineering units, are handicapped by obsolete plant, have difficult access to coal or for other reasons have a high cost of gas or a low standard of output or service. Wherever desirable, the establishment of transmission companies should be facilitated.

The industry is preparing for long-term changes in engineering technique which in due time must arise as a result of research. High-pressure processing, complete gasification, closer co-operation with electrical generation, district steam heating are developments of the future. Constant gas pressure, removal of sulphur, reduction of variations in calorific value, the observance of agreed standards in gas manufacture, distribution and utilization are goals for early attainment.

In commercial matters the autonomy of the individual undertaking must remain secondary to the well-being of the gas-using community. The broad lines of policy will be formulated by the British Gas Association, but its interpretation will be district and local responsibilities.

There will be a number of undertakings too small to cooperate fully in such common policy. Pending the full development of integration, aid must be given to enable them to provide gas service in conformity with the agreed policy of the area.

District commercial development committees will work in close collaboration with area technical development centres, ensuring close liaison between the technical and commercial side of the industry.

It is recommended that cooperative research and technical development should be undertaken by Area Technical Development Centres which would incorporate the present Industrial Gas Centres. Some half-dozen Centres would cover the country. The work of the Centres would be centrally co-ordinated.

It is proposed to set up a properly equipped Statistical Bureau within the British Gas Association. The accumulation and availability of statistics will reinforce the experience which the British Gas Association will acquire of the various methods of integration, and

facilitate its task of advising which alternative is most suitable in each area.

survey of the electricity industry

The industry had in 1938 an embarked capital of £553,000,000 consisting of £330,000,000 in local authorities' undertakings, and £223,000,000 in company undertakings.

There were in 1938 600 separate authorised undertakings, comprising, in addition to the Central Electricity Board, 3 Joint Electricity Authorities, 5 Joint Boards, 377 local authorities and 214 independent companies.

These undertakings vary in size from an undertaking supplying a few hundred acres and selling a few thousand units a year to a few hundred people, to an undertaking supplying 5,000 square miles and selling 500 million units a year, to a million people.

There were 10 million consumers of electricity in Great Britain in 1940.

The number of persons employed amounts to 100,000. If electrical manufacturing and ancillary industries are included, the industry gives employment to about 400,000 workers.

Allowing for the generating capacity of private plants the total consumption of coal in the production of electrical power is estimated at 20 million tons a year.

The Central Electricity Board concentrates the generation of energy in a limited number of selected generating stations, linked by high tension main transmission systems.

The total number of units sold in 1938 was 19,000 millions; 12,000 millions by local authorities and 7,000 millions by companies.

In 1935 the percentage of the total consumption of electricity represented by industrial power was 56%, that by lighting and domestic supplies 35%, and that by electric traction 7%.

In 1935, 12 holding companies controlled 166 supply companies, or 27% of the total number of undertakings in Great Britain, representing a capital of £74 millions, supplying over 1½ million consumers and having a total sale of 2,000 million units.

The Electricity Commissioners grant powers under statute to supply electricity, local authorities powers to borrow money, and for generating stations and main transmission lines. Central Electricity Board coordinates generation and hightension transmission. In war time the Joint Committee of Electrical Supply Associations has been speaking on behalf of the Incorporated Municipal Electrical Association, the Incorporated Association of Electric Power Companies, the Provincial Electric Supply Association and the London Electricity Supply Association.

The British Electrical Development Association Incorporated is responsible for commercial development and

publicity.

Research is in the hands of the British Electrical Research Association.

problems of electricity

The large number of small undertakings causes a lack of uniformity in such matters as systems of supply and voltages, tariffs and methods of charge, facilities for hire or hirepurchase of apparatus and assisted wiring.

Legislation is based on the idea of electricity as a local problem, to be solved in each town or district by the local authority or a company. When more comprehensive schemes for serving large areas were evolved later, and it became technically desirable for neighbouring undertakings to associate, they were prevented by statutory prohibition. These restrictions are responsible for many of the present day difficulties.

There is wide scope for greater standardization of the design and dimensions of appliances, which would lead to economies in manufacture, and help the industry to meet the demands of the post-war housing programme.

There are still too many different voltages and systems of supply, so that people moving from one district to another frequently cannot use the apparatus they have

purchased.

There are far too many different forms of tariff in

different parts of the country, and many of them are too complicated to be understood

by consumers.

Many undertakings do not offer adequate hire or hirepurchase terms for appliances.

In some parts of the country there are overlapping rights of supply, with consequent duplication of mains and plant, and extra costs to consumers.

Many farms and isolated villages and houses are not supplied with electricity and considerable capital and maintenance costs would be necessary to connect them. To keep down the cost of current to what their consumers can afford, it would be necessary to subsidise them from urban areas.

One of the first and most important tasks of any authority responsible for reorganising and supervising distribution will be to obtain uniform and reliable data about comparative distribution costs.

plans for electricity
Planning proposals have been issued by:—

(a) The London & Home Counties Joint Electricity Authority.

(b) The Electric Power Engineers Association.

(c) The Incorporated Association of Electric Power Companies.

(d) The Incorporated Municipal Electrical Association—with members of the London and the Provincial electric supply associations and some of the power companies.

The London & Home Counties Joint Electricity Authority proposes that the whole of the distribution of electricity in London and the Home Counties should be placed under a London Electricity Board, to facilitate uniformity and efficiency.

The Electric Power Engineers Association wishes to see national and regional control of the whole of the electricity

supply industry.

The Incorporated Association of Electric Power Companies base their proposals on the report of the McGowan Committee of 1936, which recommended regionalisation by the absorption in each area of the smaller and less efficient units by the larger and more efficient undertakings, whether local authority or company owned, and advocated ultimate public ownership of all undertakings after a period not exceeding 50 The I.A.E.P.C. would strengthen the Electricity Commissioners, who would delimit electricity districts, appoint district committees to prepare

schemes of improvement for each district, and have powers of enforcement. The I.A.E.P.C. would, however, make 50 years the minimum, not the maximum period before which local authority purchasing rights can be exercised. They recommend the standardization of systems, voltages and tariffs.

The Incorporated Municipal Electrical Association and the Supply Associations propose that the Electricity Commissioners should appoint an Advisory Committee to make recommendations for division of the country into a number of Electricity Distribution Areas. In each area there should be a permanent committee, appointed by the undertakings in the area. Its duties would be to survey the area, to recommend on rights of purchase, improved service by grouping of undertakings, duplication of powers of supply, and interconnections of systems, to consider the needs of rural areas, to promote standardization of voltages, to prepare supplies for new industries, to simplify tariffs, stimulate service facilities and development, encourage central repair depots and central purchasing, and arrange for specialist staff to be available to the undertakings.

common problems

A number of problems are common to the coal, gas and electricity industries. industry suffers from an excessive number of units, and excessive variation in size of unit. Each wants an overhaul of existing legislation. Each intends to effect improvements in the efficiency of production, distribution, utilization and standards of practice. Each will benefit by greater standardization of equipment, with its possibilities of mass production and cheaper prices. Each intends to push forward with research on a great scale.

common plans

The plans put forward by the three industries likewise show certain similarities. Each industry is thinking of national planning and of regional planning, of larger and more efficient working units, of a levelling-up of service to the public in all parts of the country. It seems desirable to knit the plans together into a national fuel policy.

national fuel policy

The final authority in so important a matter as the use of fuel is Parliament, but the highly technical considerations involved place much detailed responsibility upon the Ministry of Fuel and Power, who, in turn, require the co-operation of the fuel industries. This will be greatly facilitated by the National Fuel Advisory Council which is being set up by the Minister of Fuel and Power.

It would not be desired or tolerated by the community that fuels should be rigidly allocated for some purposes and prohibited for other purposes. But a responsible and well-informed National Fuel Advisory Council, containing representatives of the various fuel industries, should be able to establish lines of policy in the national interest. function of the Council should be not to destroy but to regulate competition, to check abuses, to stimulate improvements and to ensure due regard to the national welfare.

Appropriate influence could be exerted by publicity and by prices and charges, rather than by regulations. Among the first tasks of the National Fuel Advisory Council should be consideration of the national policy regarding coal conservation, smoke abatement and coal prices and the review of the functions and legislation of the fuel industries.

The enormous housing programme after the war, the decentralization of population from existing towns, the creation of new and satellite towns, will raise problems of new fuel production plant, of highpressure mains, and of the most suitable fuel appliances. It is assumed that the authorities, in the planning and erection of houses, will allow the occupants freedom of choice between the fuels they desire to use for This will various purposes. be assured if all houses are built with flues and piped for gas and electricity at the time of erection. The paramount consideration is that the fuel user should be able to obtain the service most suitable and acceptable for the purpose, consistent with the proper utilization of the nation's fuel resources. This is a complex matter on which invaluable guidance can be given by the National Fuel Advisory Council.

INFORMATION CENTRE

The function of this feature is to supply an index and a digest of all current developments in planning and building technique throughout the world as recorded in technical publications and statements of every kind whether official, private or commercial. Items are written by specialists of the highest authority who are not on the permanent staff of the Journal and views expressed are disinterested and objective. The Editors welcome information on all developments from any source, including manufacturers and contractors.

Book on Quantity Surveying

ELEMENTS OF QUANTITY SURVEYING. A. J. Willis. (Third Edition. Crosbie Lockwood. 15s. 0d.) Useful book brought up to date with improvements on previous editions. General survey of origin and functions of a quantity surveyor and of principles of quantity surveying. Various stages in preparation of Bill of Quantities.

As Mr. Willis has written a more advanced book on the same subject, he has not been tempted to introduce complicated examples which might confuse the student and, at the same time, by giving examples in script and adopting the usual surveyors' abbreviations, he has kept the book close to reality.

This is much more than an examination textbook; it does, incidentally, serve this purpose admirably but it is also an invaluable guide to anyone who wants to learn something of the procedure to be expected in a well-conducted surveyor's office.

BSS for Twisted Steel Bars

BRITISH STANDARD SPECIFICATION FOR COLD TWISTED STEEL BARS FOR CON-

COLD TWISTED STEEL BARS FOR CONCRETE REINFORCEMENT. (B.S. 1144: 1943; price 2s. net.) New standard not covered by B.S. 785 and 405.

B.S. 785 provides for rolled bars for concrete reinforcement of mild steel, medium and high tensile steel and for hard drawn steel wire.

B.S. 405 covers steel expanded metal for concrete reinforcement. These specifications do not, however, apply to mild steel bars which have, had their yield stress raised by cold twisting. This specification has, therefore, been prepared to fill this gap, and it covers both single-twisted and twin-twisted it covers both single-twisted and twin-twisted bars. The material used for these bars is required to conform to the requirements specified in B.S. 785.

Square Twisted Bars

TESTS ON SQUARE TWISTED BARS AND THEIR APPLICATION AS REINFORCEMENT OF CONCRETE. Dr. K. Hajnal-Kónyi. (The Structural Engineer, September, 1943, pp. 327-368). See also discussion in The Structural Engineer, February, 1944, pp. 68-92, and March, 1944, pp. 114-118. Properties of square bars obtained from mild steel by twisting. No yield point, increased ultimate strength. Importance of bond. Possibility of using the full strength of the bars as compared with mild steel where the yield point is the critical value. Suggested increase of permissible tensile stresses by 50 per cent., i.e. up to 30,000 lb./sq. in.

The strength of mild steel can be increased

by stretching beyond the yield point, a process called work hardening. Steel treated in this way has no yield point. A great number of comparative tests has been carried out on beams reinforced with mild steel and square twisted steel respectively. These tests have proved that bond between concrete and reinforcement is maintained until the stress reaches the ultimate strength of square twisted bars, whereas with mild steel bars the destroybars, whereas with mild steel bars the destruction begins at the yield point. Square twisted bars were fractured when the beams failed. Mild steel bars cannot be fractured in normal the limit of practical application.

The ultimate strength of square twisted bars embedded in concrete is greater than their strength of square twisted bars embedded in concrete is greater than their strength obtained from the strength of square twisted bars.

strength obtained from the usual method of testing. This phenomenon needs further research and explanation.

The efficiency of square twisted bars in concrete is 50 to 67 per cent. greater than that of mild steel bars and an increase of the permissible steel stress by 50 per cent. is on the safe side.

The deficiencies of the present method of designing reinforced concrete beams are dis-cussed and the introduction of the plastic theory of design is advocated. The test results agree very well with the plastic theory and contradict the standard method.

The fundamental difference between the two methods is that the standard method is based on working stresses, the plastic theory on ultimate loads. However, for psychological reasons it is suggested that for the time being the standard method should be maintained and square twisted bars should be what the for wild steal in the ratio 21.2 substituted for mild steel in the ratio 2:3.

The main reason for a limitation of permissible stresses is the danger of corrosion if the maximum width of the cracks exceeds a certain limit. .01 in. is considered as a safe limit on the Continent. The tests have proved that this width is never reached at first loading under 40,000 lb./sq. in. The maximum width corresponding to a steel stress of 30,000 lb/sq. in. is .006 in.

The deflection of reinforced concrete beams under design load is nearly the same whether

mild steel or work-hardened steel is used. From the point of view of fire resistance the objection was raised that work-hardened steel exposed to heat loses its higher strength after cooling down. Consequently, after fire a building with work-hardened steel at higher working stresses would be weaker than a building with mild steel. Tests have proved that work-hardened steel loses its strength only if the heat exceeds If this temperature is reached in mild steel reinforcement the building is likely to collapse. The objection is therefore not

LIGHTING

Report on Munsell Colours

MUNSELL COLOURS. (J. Opt. Soc. Am., July, 1943, p. 385). Final report of a sub-committee of the Optical Society of America on the spacing of the Munsell colours.

The Report is a technical document of con-

siderable complexity, presenting the characteristics of a modified and enlarged Munsell solid which has been evolved from the 1940 visual estimates of the Munsell Book of Colour

As a report, architects will find this of limited interest. But ultimately these steps which the Americans are taking to provide a standard colour reference system are likely to prove of the very greatest value to anybody who has any professional interest in colour. It should at least be noted, therefore, that these advances in a very difficult field are being made.

Daylight in Factories

DAYLIGHT ILLUMINATION IN FACTORIES AND WORKSHOPS, P. J. Waldram. (Journal of the Junior Institution of Engineers, December, 1943, p. 65). Methods of analysis for daylighting.

Mr. Waldram's latest paper on daylighting is devoted in the main to a discussion of a few methods of daylighting analysis and the elementary mathematics which form their basis. There are some limited references to specific points about factory lighting.

The discussion of methods of analysis represents the most useful part of the paper, and reflects much of the author's own work. It reflects much of the author's own work. It will be of interest particularly to lighting specialists to have these detailed descriptions of various gauges and grids. The list, in a sense, is supplementary to the group of methods given by P. V. Burnett in his paper for the ASB at the RIBA (see the JOURNAL, August 12, 1943, pp. 116-118, and Information Centre No. 1283, November 11, 1943), for Waldram makes only a passing reference to the BRS daylight factor protractors and the new and simplified methods developed by Walsh, Smith and Dufton to which Burnett referred in detail. What one fails to see, unfortunately, is any agreement among these various experts as to the best method for common practice. Perhaps the new tables of window performance, which Burnett described window performance, which Burnett described and which sound an admirable development, will provide a focus for agreement when they are published.

The references to factories as a specific problem are limited in the paper to a plea for standards of lighting, and to the use of the so-called monitor skylights.

Lighting for Wool Sorting

LIGHTING FOR WOOL SORTING. G. G. Cousins and G. H. Brooks. (Illuminating Engineering, September, 1943, p. 433). Technique and intensity of lighting for special task.

special task.

This is an article for the specialist factory architect. Wool sorting requires plenty of light, from a wide angle, to indicate the correct fibre size. Hitherto sorting has often been restricted to the middle hours of the day because artificial light was not found practicable. These authors experimented with placing fluorescent lights, and found that wide spacing in pairs over the wool was acceptable. The intensity is about 135 ft. candles.

Railway Stair Lighting

LIGHTING FOR SAFETY. E. E. Dorting. (Illuminating Engineering, September, 1943, p. 421). Platform and stair lighting in New York underground railways, with accident statistics.

The platform lighting problem in the New York Underground was primarily one of directing hurried passengers' attention to the platform edge, for there was a gap of 7-12 in. between it and the car doors in some cases. Treatment was by light-coloured tiles in a band 8 in. wide, where the doors are known to come when trains are at the station. The tiles were lighted by a pair of spotlights. Accident rates were effectively reduced. The stair problem proved first to be a question of good stair design. A tread of

10-11 in. and a riser of 7-7½ in. arranged so that two risers and one tread equal 25 in., is recommended, with tolerances of ½ in. from stair to stair. Lighting sources were arranged so that they were not exposed to the view of descending people (to whom most accidents occur), but faced generally towards the bottom of the stair. Illumination value on the stair is 12 foot candles. Accident rates were again brought under effective control.

HEATING and Ventilation

1451 Book on Heating

HEATING AND AIR CONDITIONING OF BUILDINGS. Oscar Faber and J. R. Kell. (Architectural Press, 45s.). Second edition of detailed treatment of whole subject except district heating.

The first edition of the book, published in 1936, is well known. The authors now revise this in the light of more recent knowledge and development and add chapters on Heating by High Pressure Hot Water and Ventilation. The early part of the book deals with principles and should be valuable to both architects and engineers. Thereafter most types of heating and heating apparatus are described in considerable detail. Many illustrations and tables are included and there is information on costs based on pre-war prices.

on costs based on pre-war prices.
Since the original version was published in 1936 there has been considerable development in heating and ventilating science. The tables in the present book have been revised to bring them into line with the Guide to Current Practice of the IHVE. Some new data in this same guide has made it necessary for the authors to revise their section on Air Conditioning. Considerable developments have also taken place in large-scale heating systems and these are taken account of in an enlargement of the chapter on Steam and in a new chapter on Heating by High Pressure Hot Water. District Heating is not dealt with as it is the subject of a separate treatise by the same authors.

This new material, and, indeed, a considerable proportion of the old, is rather formidable reading for the average architect, although the book must be reckoned as a fine and comprehensive reference book for architects. Although few are likely to have either the time or inclination to digest the whole of the 572 pages, 353 figures and 87 tables, all would benefit by making a careful study of the first part of the book, more especially the first three chapters where general principles are dealt with. A real understanding of this part of the book would be a help in the design stage of any building and would also put the architect in a position to talk with understanding to heating engineers.

1452 Central Heating

IMPROVED CENTRAL HEATING EQUIP-MENT. C. C. Downie. (Heating and Ventilating Engineer, January, 1944, p. 252.) Describes a few modern developments.

1453 The Gas Industry

REPORT ON THE PLANNING OF THE GAS INDUSTRY. (British Gas Federation, October, 1943). Review of post-war position of Gas Industry by Central Federation of Employers.

1. By its annual processing of 20 million tons of coal costing £25 million, the Gas Industry secures gaseous, solid and liquid fuels and numerous by-products to the value of £75 million, each of which is better suited to the performance of specialized tasks than was the original coal

original coal.

2. Wasteful competition between the fuel

industries must be eliminated and co-operation substituted, to facilitate which a National Fuel Advisory Council should be established.

3. Substantial economies in installation and consumption are possible if the house is planned from the outset for the use of gas.

4. The regional supply of gas throughout the country by District Gas Boards, indirectly under the control of the State through its nominees on the Boards, could not be justified as being preferable to the extension of present methods of integration.

5. The inter-connection of an Undertaking with Gas Works and/or with Coke Oven plants for the supply of gas, becomes desirable where Works are too small to be economic engineering units, are handicapped by obsolete plant, have difficult access to coal or for other reasons have a high cost of gas or a low standard of output or service. There are, however, definite limits to the distances over which gas can be economically transmitted and adequate wayleave facilities are essential.

QUESTIONS

and Answers

THE Information Centre answers any question about architecture, building, or the professions and trades within the building industry. It does so free of charge, and its help is available to any member of the industry. Answers are sent direct to enquirers as soon as they have been prepared. The service is confidential, and in no case is the identity of an enquirer disclosed to a third party. Questions should be sent to: The Architects' Journal, 45, The Avenue, Cheam, Surrey.

1454 Defence Regulation 56A

Defence Regulation 56 (a) controlling expenditure on civil building, presumably does not include fixtures, fittings and equipment. If this is the case, is any hard and fast line laid down, and if so, should repairs and alterations to such items as lifts; cooking equipment; blackout screens and curtains; shopfront enclosures and counters; shelving, racking and stockbins, which may or may not be fixed to walls; temporary screens; outside clocks; built-in refrigerators; etc., which are on the border line between building work proper and equipment, be included in estimates and accounts of expenditure returned against building licences and licences granted for current maintenance?

Also, what is the position of expenditure of repairs on such items (if the ruling is that they should be included) where they are removed from the site and repaired at workshop?

A The present regulations include construction, reconstruction, alteration, demolition, repair, decoration or protection against hostile attack. We are not prepared to give a legal definition of what is properly included and what is not included under this heading, but you will find that the Licensing Authorities consider that the regulations extend to practically everything on or about a building, excluding furniture and similar chattels.

consider that the regulations extend to practically everything on or about a building, excluding furniture and similar chattels. It is doubtful whether most people would regard blackout curtains as coming under the regulations although blackout generally may be considered as " protection against hostile attack." With regard to all the other items mentioned, there is little doubt that the Licensing Authorities would consider that all expenditure incurred should be returned against the building or maintenance licences, whether repairs are carried out on the site or

If you are in any doubts, your best course is to consult the Licensing Authority, who will give you a ruling. In the unlikely event of you wanting to dispute it, you would be advised to consult a solicitor.

1455

Project A62

Can you tell me whether Project A. 62, by the Modular Service Association of America, is obtainable direct from that Association or who it is published by?

A The Project A. 62 is published by the American Standards Association, 29, West 39th Street, New York, U.S.A.

Speeches and lectures delivered before societies, as well as reports of their activities, are dealt with under this title, which includes trade associations, Government departments, Parliament and professional societies. To economise space the bodies concerned are represented by their initials, but a glossary of abbreviations will be found on the front cover. Except where inverted commas are used, the reports are summaries, and not verbatim.

BBC

Homes for all

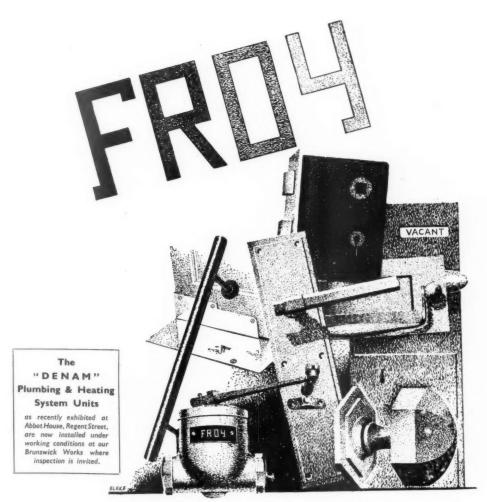

March 24, second broadcast in the series Homes for All—The BBC Looks at the Problem. Chairman, G. O. Slade, K.C. Assessors, Mrs. Doris White and C. S. McCulloch. Witnesses, Percy Thomas, P.R.I.B.A., and F. R. Yerbury.

G. O. Slade: This evening Mr. sident of the Royal Institute of British Architects, and Mr. F. R. Yerbury are coming along to help us. Mr. Thomas, obviously, will be speaking as an architect, while Mr. Yerbury, who's travelled extensively in Europe, will tell us what we have to learn from our continental neighbours; that's to say not only what to do but—just as important—what to avoid. Mr. Thomas is detained in Cardiff but he's recorded his answers to a questionnaire we sent down there to him.

Lloyd-Jones: Mr. Thomas, you are the President of the Royal Institute of British Architects. I think it is your second term of office,

Percy Thomas: Yes, I was President for two years in 1937.

Lloyd-Jones: So naturally it will be chiefly the architect's point of view you will be giving us. Now, before I put to you tome questions which

SANITARY EQUIPMENT - FIREPLACES - HEATING & COOKING EQUIPMENT - DOOR & WINDOW FITTINGS

Though we are today the largest scaffolding organisation in the country, we still remember that 30 years ago we were very 'small fry.' In 1913 we invented tubular steel scaffolding and in those early pioneer days the little jobs were quite gratefully undertaken . . . they were very important to us then, they are still very 'important' to us today. We give to the little job the same care and attention to detail as we give to the big job . . . and we always will.

BRANCHES AND DEPOTS THROUGHOUT THE COUNTRY

have been sent us from London, I think people would probably like to know whether we in Wales have any special housing problems of our own.

Thomas: I don't think there's any special problem. Housing problems in Wales are very much the same as in other parts of Britain. We're hopeful after the war, that New Industries will be brought into the valleys—and in that case the miners will need more and better houses. But there's one thing to remember, they love these valleys and have grown up in them and what they will want most of all is not to be planned out of existence.

Lloyd-Jones: The Chairman, Mr. Slade, and the two assessors, Mrs. White and Mr. McCulloch, want to know whether you think prefabrication is likely to sweep all before it after the war.

Thomas: No, I do not. I daresay that for some years we'll try this and that and one thing and another. But I believe that in the end we shall return for most purposes to traditional building as we've always known it. . . It seems to me that local materials always look exactly right in their own place and it would be a pity to give up using them in favour of something made in the factory which again might look all right in its own place but would be a perfect eye-sore dumped down in our country-side.

Lloyd-Jones: But all these traditional methods and materials were new once. Don't you think we may be on the verge of a new tradition now?

Thomas: Well, it's possible but it's too early to say until the new materials and the new methods have stood the test of time.

Lloyd-Jones: Do you think that every signed by an architect?

Thomas: I certainly think that every house should be designed by a competent architect. If that were done there would be a tremendous difference in the appearance of our towns and villages. I don't know if you realize that only one house in every five in this country is architect-designed. I think that's a fair statement. I'm glad to say, however, that people are coming round to the advantage of employing us.

Lloyd-Jones: Mr. Slade has a rider to that question. He asks, would the employment of an architect increase the cost?

Thomas: No. People forget — this applies to a single house for a private client and also to houses for local authorities—people forget that the architect can save them a lot of money by getting competitive tenders, by choosing suitable materials, and by seeing that his client gets just what he has contracted to pay for. And all that, of course, is quite apart from the improvement in planning and appearance. People ought to demand not merely houses but good-looking houses. They don't cost any more; in fact the architect can save you money by getting his effects from good proportion and simple lines—much better effects than all that hideous ornamentation with bogus half timber so popular with the jerry-builder.

Lloyd-Jones: But if houses were mass produced in factories what part could the architect play?

Thomas: Well, he could at least prevent factory made work from being merely a bad imitation of craftsman's work. Two houses of the same size—having the same number of rooms, I mean—could differ from one another in looks as much as two motor cars of the same size. But one might be the latest stream-lined model and the other would look more like some prehistoric vehicle

dating from the 'nineties. In the new factorymade house, you want something corresponding to the streamlined model and that's where the services of the architect will always come in.

Lloyd-Jones: Mr. McCulloch wants to know whether architects couldn't arrange that the principal rooms in houses in different parts of the country had the same floor dimensions so that if you have to move you find that your carpets and lino fit the new house.

Thomas: Doesn't Mr. McCulloch allow anything for progress? Is the ordinary man always going to stick to the same size of house? I don't think that as an architect I could agree to anything which ties you down so much—both householder and architect—in the matter of design.

Lloyd-Jones: Then here is a special question from the other Assessor, Mrs. White. She asks "Does an architect consider the inside of a house to labour-save the wife's skill, to enable her to have more pleasure and prevent her becoming a drudge in the kitchen?"

Thomas: I'm glad Mrs. White brought that up. Because it's in the planning to avoid unnecessary labour and movement that the architect comes in. That's quite a different matter from labour-saving gadgets. Refrigerators, electric irons, potatopeelers, dish-washers, and so on are all just a question of £.s.d. But it's the skill of the planner who saves the house-wife's legs by placing the sink and the door and the stove in their correct positions in relation to each other. That costs no more. It's merely a matter of good planning.

Slade: You have written a number of books on abroad, Mr. Yerbury. Can you tell us in which countries you've had personal experience of building?

F. R. Yerbury: In most of them—Holland, Belgium, France, Sweden, Norway, Denmark, Germany, Czechoslovakia, Hungary, Russia.

Slade: Have you travelled in a professional capacity or a "busman's holiday"?

Yerbury: Both. I knew most of the housing architects in Europe of any standing and I think I can say that I've seen practically all the typical housing schemes in each particular country. Every country has some contribution to make to our problem, but I think we mustn't overlook, as we so often do, what we've done ourselves; we're rather inclined to exaggerate the importance of things which appear to be new to us but which often we find we've had in this country for years.

C. S. McCulloch: Was the general trend of building in Europe flats or small houses?

Yerbury: That's a very interesting question, because generally speaking the Continentals are rather jealous of our cottage programme. They prefer the small house but they can't afford to build 'em. . . The reason is that on the Continent generally speaking the accommodation provided is so much smaller than the accommodation we consider the proper thing. Take Denmark as one case, and I think it's fairly general. You'll find in blocks of flats there a living-room, two bedrooms and a kitchen, with a bath in the basement. . . .

Doris White: In the basement?

Yerbury: Communal baths in the basement of the building for the use of all the tenants. Well now, if you attempt to build that small accommodation under a small roof with four walls and its own foundations, you can see the costs come very high.

Slade: Yes, I'see that.

Yerbury: Cottages have been built—that's one of the things which Hitler insisted on doing—putting people in cottages rather than big blocks of flats. I rather think this had some political urge behind it, as I gathered that the Nazis contended that big blocks of flats bred communism.

McCulloch: What struck you most abroad, Mr. Yerbury?

Yerbury: Well, there's so much—I can points. Take Rome now. Rome has enormous blocks of flats, very congested and overpopulated both as regards the actual interior of the flats and the sites on which the flats are erected. There's little or nothing to be learned from these except how not to do things. Slade: Outside England, which country would you say was building to the highest standard?

Yerbury: If I may confine myself to a city, I'd say Paris; Paris and the department of the Seine, particularly a place called Maison Alfort—lovely flats. Then there's a place called Drancy, where there's perhaps the biggest example of prefabrication in building in Europe, at least pre-war. The system of flat building was worked out by a French engineer, together with architects and the whole building was erected from prefabricated units in steel and slab concrete. I must say we've learned from that scheme already—practically the same principle was applied on a very big scale in the Quarry Hill flats at Leeds. . . One scheme they have in Paris—they put up these blocks of flats in some places where the amenities on one side of the building are much greater than on the other. There's a block on the banks of the river Seine, the flats facing the Seine have been let at much higher rents to more wealthy people because they have the amenity of the river and they're rather bigger and have garages in connection with them. So that the ordinary working-man has a flat at the back and pays a cheaper rent and by getting a higher rent from the front flats looking over the river they're able to reduce the rent of the working-class tenant.

Slade: What about Sweden?

Yerbury: Funnily enough, [I'm'] fresh from Sweden. I was there last autumn. They're building quite a lot of new flats there just now. Stockholm's practically a city of flats. They're congested there—much too tightly packed in certain parts of the city. Of course, Stockholm is a city with woods and rocks and lakes and sea round it—an openness quite exceptional—so that you might quite easily put up with this state of affairs, but I think we'd be very strongly criticized if we built at the same density in England as they do in Sweden. Also the kitchens are getting smaller and the accommodation of the flats is getting smaller —fewer rooms and smaller.

White: And they're definitely] over-

Yerbury: Yes—they are, I think, very congested and they say there that it has a rather serious effect on the problem of family life—that the families are getting smaller as the flats get smaller. But they have other amenities, and we can learn from them in this respect that they have in most of their buildings, in the basements, very well equipped laundries for washing, drying, ironing and everything complete.

White: Who does the laundry?

Yerbury: It's assumed that the wife will do her own washing. She clocks in for the particular day she wants to wash.

McCulloch: In Scotland we'd couple that up with the old question of the wash-house key, which has always been a trouble and a source of squabbles!

White: Do they get on all right over the communal laundry?

Yerbury: Yes, but you must remember that the equipment is slap up to date and they've very handsome affairs. You wash, iron, and-what d'you call it?

White: Mangle?

Yerbury: Mangle everything by electricity.

McCulloch: Do you think that the British housewife would like the idea of washing her clothes in a place where a neighbour might come down at any moment and see what she's washing?

Yerbury: That seems to be the big objection.

White: I think the young wives have got more pride and they prefer to do their own washing in their own small

Yerbury: Well, that doesn't seem to be a big success. What shall What shall I try now?

Slade: Holland?

Yerbury: No. I ought to say first that one of the things Sweden can teach us is about prefabricated timber houses. It's been the general thing for years past for the Swedish house to be built of timber. The houses are made in sections in the factories near the forests. Any time in the summer one can see families hard at work putting their own new house together.

McCulloch: Of course, they're fortunate in having an endless supply of timber.

Yerbury: Yes, that's quite true, but in recent years they've found that the by-products of timber can be so valuable that for building they're now experimenting with prefabricated concrete to

Slade: Really. Wi What about Holland,

Yerbury: Well, Holland—take Amsterdam. The municipality owns practically the whole of the land in the neighbourhood of Amsterdam. For years past they've been roping in areas for many miles around as well as in Amsterdam itself, so that they have control of everything. And some years ago they produced a plan for the development of Amsterdam for many years to come. And as the city grows they've got this plan to work to and they know exactly this plan to work to and they know exactly where everything is going, which is something we don't know here, and as they own the land they can call the tune when anything is built. It's possible, for instance, to take a lease of a piece of land for a particular purpose: a private individual says, "I want to build a factory"—and they say, "Well, you can only do it just here "—and it means that of course you don't get your bouses mixed up course you don't get your houses mixed up

McCulloch: That, of course, would come in what is developing in this country as the Town Planning

Yerbury: Certainly, but there's this interesting point that supposing you take a site from the municipality and you think, "Well, I won't build now— Till just wait for a bit and sell on the rising value "—you can't do that: if you don't build you forfeit your site.

McCulloch: Even if the buyer is going to build a similar factory?

Yerbury: Yes, it has to go back to the municipality.

Slade: That's suggestive, isn't it? Anything else, Mr. Yerbury?

Yerbury: I'd like to say a word about layout, I think. There's more imagination in the layout of many of the Continental housing schemes than there

is in ours.. Take Vienna, just after the last war they built enormous blocks of flats there but they were most charming with their fine gardens, interesting sculptures by the best sculptors on the staircases, fountains and so forth. Of course, that didn't make up for the lack of accommodation inside. appearance they're much more friendly and charming than we've had, and you'll find that in many of the Continental ones.

McCulloch: This sort of thing you would put down as uplift for the flat dweller?

Yerbury: Yes, I wouldn't like to criticize the London County Council housing blocks because taking it all round they're well built and you've got ample accommodation, but they're rather grim. If you can imagine one of those blocks set in a rather nicely laid out garden with a fountain or two and a bit of sculpture.

White: But then you see we have the cottages—I mean when you get into the suburban districts there's more cottages than what there is flats, and we build those more pleasantly. We don't go in for blocks of flats so much, do we?

Yerbury: No, Mrs. White, that's true, and there's nothing on the Continent anywhere to equal a cottage estate where it's nicely developed.

White: I think our men, if they've got their own garden they take more interest in it than what they would in a garden for everybody.

NFBTE and NFRHB

Deputation to MOH

On March 31, the Minister of Health. Mr. Henry Willink, accompanied by Sir Hugh Beaver, Director-General, Ministry of Works, received a deputation concerning the PREPARATION OF HOUSING SITES SCHEME, from the National Federation of Building Trades Employers and the National Federation of Registered House Builders, which was introduced by Sir J. Walker-Smith, M.P., ¹ Mr. J. G. Grey, President of NFBTE, and Mr. C. D. Calverley, President of NFRHB, spoke for their respective bodies.

In its submission to the Minister of Health the National Federation made the following

(1) The preparation of building sites for the Government's post-war housing programme will be better and more economically done if it is left in the hands of local builders. (The Government's present proposal is that sites should be grouped, and the preliminary work handed over to a number of big contractors using equipment released from aerodrome contracts).

(2) The suggested grouping of a number of small road and sewer contracts does not make the type of large contract upon which the employment of the largest type of firms is

considered to be necessary.

(3) The work should therefore be let by individual local authorities in contracts capable of being undertaken by the smaller and medium-sized firms.

(4) If this were done local firms would be

most likely to give the best service.

(5) The type of plant required, being mostly hired for the purpose, is equally available to large, medium and small contractors; much of this plant has been borrowed from medium and small contractors for use on aerodrome construction; if no longer required for the purpose for which it was borrowed it should be returned to its original owners.

(6) The labour being directed by the Ministry of Labour is equally available to large, medium and small contractors.

and small contractors.

(7) If men can be employed in the area of their home town and so live at home (a) better output will result; (b) the necessity for paying lodging allowances will be avoided; (c) billeting difficulties will be considerably reduced and (d) the employment of local men by local figure would enable local rates of by local firms would enable local rates of wages to be paid instead of, in many cases, London rates.
(8) Even if it is considered necessary or

(8) Even it it is considered necessary or desirable to obtain tenders from the larger contractors on the basis of group contracts aggregating large sums, alternative tenders should be obtained from the smaller contractors for the individual small contracts comprised within the proposed group. If the sum total of the estimates for the various small contracts is not greater than the large contractor's estimate for the group contract the work should be spread over the small

(9) Whether the work is let in large or small contracts the conditions of contract should not require (as is prescribed by Circular 14/44) that the contractors should gamble upon the results of applying the Essential Works Order

and the Uniformity Agreement to the works. In reply, Mr. Willink assured the Deputation that the Government fully recognized the good housing work done by small and medium builders before the war, and appreciated that if new houses were to be built quickly it would be as necessary as in the past to employ builders of all types—small, medium and large. The object of the present scheme was to turn over the labour and organization which had been employed so successfully on airfield and similar construction to the special preparatory work on housing sites. The preparatory work on housing sites. The shortage of labour and the factors of time and cost made it essential that mechanical means should be used to the utmost. To ensure this it was important that only suitable firms, that is, those who could organize the work, should be employed; but there was no distinction between larger or smaller firms. It was not between larger or smaller firms. It was not intended to restrict local authorities to a select list prepared by the Government or to exclude suitable local firms. Indeed, it was open to local authorities to advertise for tenders in the ordinary way, or, if they preferred, to make their own select lists. The Ministry of Works would ensure that where necessary plant is made available for the finally accepted tenderer. The special features of the scheme including the grouping of local finally accepted tenderer. The special features of the scheme, including the grouping of local authorities, were due entirely to the special conditions which existed, and would clearly not be necessary in normal times.

In reply to a question, the Minister gave an assurance that the Federations and other representative bodies would be consulted before any further scheme connected with house-building was adopted.

ngural Nautilus Flues, over a period of more than twenty years, have been built into many thousands of dwellings. The Flue Blocks, $4\frac{1}{2}$ deep, are bonded into the brickwork and there is no projecting chimney breast; room space is saved, building costs are reduced, and effective ventilation is assured. Nautilus Flues will play a valuable part in post-war housing schemes. Full details and sketches to Architects' plans gladly supplied.

Prizewinners

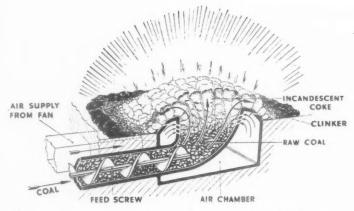

The winners of the Leicester and Leicestershire Society of Architects prizes for the 1943-44 Session are as follows:—

President's Prize value £10 10s. for measured drawings of Keythorpe Hall, Leics., D. Harmer. Prize value £3 3s. measured drawings (Junior) of Evington Church, Leics., D. J. Dainton.

Sketches Prize, value £5 5s., G. A. Bass.
David M. Nesbit Design Prize, value £7 7s.
for a Pavilion on the banks of the River Soar,
G. A. Bass. Second Prize, value £3 3s., Miss
Wenning.
Third Prize, value £1 1s., A. T.
Powell.

TRADE NOTE

Five advantages are claimed for the Underfeed Stoker—which is designed primarily to burn bituminous coal—in a leaflet prepared by the Underfeed Stoker Makers' Association. The five advantages claimed are that the stoker provides heat or process steam at a lower cost than any other method of firing within the range of its application; that it saves the labour of hand firing, the attention being confined to filling the hopper (in hopper-

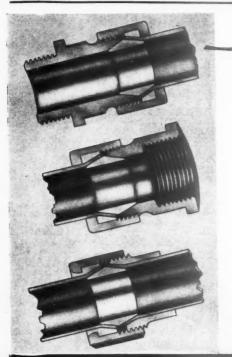

The Underfeed Stoker. See trade note.

fed models) and removing the clinker and ashes at infrequent intervals; that it operates under automatic electric control; that it ensures a clean stokehold with no emission of smoke; and that it permits a higher output

from boiler or furnace without increasing plant. The basic principle of the stoker is that of feeding the raw coal upwards from the underside of the fire-bed whilst leading into it the air necessary for combustion through ports positioned at the most suitable points. At a level some distance below the surface of the coal bed, the coal reaches a region where the temperature is sufficiently high for the release of the volatile contents. These constituents continue to be released as the fuel passes upwards through zones of gradually increasing temperature, and by the time the surface is reached only the carbonaceous residue of coke

remains. The coke is now in an incandescent state and on reaching the surface its combustion proceeds while it is moving towards the perimeter around which the combustible ash is deposited.

This method of firing is claimed to be highly efficient owing to the Underfeed basic principle which, it is stated in the leaflet, ensures that the surface of the fire-bed always presents an incandescent surface which is never blanketed by the feeding of raw coal on top, from which a maximum of radiant heat is transmitted to the boiler surface. Stokers are available in sizes and types which render them suitable for the firing of hot water and central heating boilers—vertical, shell, water-tube and locotype steam boilers as well as industrial ovens and furnaces. The address of the Association is 12, Rickett Street, London, S.W.6.

Jolderlest_ THE SECUREX JOINT

The New Model "SECUREX" (Patent No. 395,536) is a real engineering job. No more tinkering! . . . no more soldering! . . . This new ingenious method of fitting the Rotatable Sleeve allows for a reduction in bulk and gives a much neater job, while at the same time the joint retains all its efficiency and strength.

INSTALLATIONS. Buckingham Palace • London University • Earls Court Exhibition Balmoral Castle • St. Andrew's House, Edinburgh, etc.

IMPORTANT. Tested by the NATIONAL PHYSICAL LABORATORY, Engineering Dept., to withstand a pressure of 3-1 Tons per sq. inch, when the tube burst—but, the fitting remained sound and unaffected.

Lamont's "SECUREX" fittings for copper tubes are in use all over the world, and are saving countless man-hours in installation and pounds in costly replacements.

TOUCHBUTTON HOUSE, NEWMAN STREET, LONDON, W. I

WHEN "THE TIMES" WAS FIRST PUBLISHED in January 1788 Nobles & Hoare Ltd., had just embarked upon their long and successful business career.

For upwards of a century and a half they have adhered unswervingly to the policy of manufacturing only the best in Varnishes and Paints and have made many contributions to decorative art.

To-day, output is confined to "approved uses," but mindful of the post-war needs of the country, plans for meeting all future demands are already in hand.
