# All cables in ONE duct

Unilever Ltd., Hesketh House,  
Portman Square, London, W.1.  
Another Greenwood-Airvac  
Conduit underfloor  
installation.

Underfloor Junction Box shown fitted with Flyover Separator.

Greenwood-Airvac conduit systems provide for all cables to be housed in one duct with adequate screening between telephone and power cables. The unique construction of the underfloor system enables it to be laid where necessary in only 1½" of screed, and for applications where underfloor fitting is impracticable, a skirting system is readily available. Please write or telephone for the publication 'Greenwood-Airvac Conduit Systems' or call to see the demonstration layout in the Beacon House showroom.

**TYLEX**  
the tile-like  
wall finish

does not  
harbour dirt  
or germs

**T Y L E X**

Hygiene requirements frequently call for a glazed wall surface in canteens, schools, hospitals and industrial premises but cost may prohibit the use of glazed wall tiles. Tylex is the answer to this problem. Applied like a paint, Tylex has a hard, glossy, non-absorbent finish, resistant to moulds, steam, grease and many forms of chemical attack. The coating stands up to heavy wear and is unaffected by frequent washing. Please send for specification sheet and colour range.

## For Electric Cables, too— you need green fingers

Given the same soil, the same fertilizers, the same sunshine and rain; using, apparently, identical methods; two gardeners do not get identical results. One gardener grows perfect blooms in profusion but, try as he will, he can never tell you exactly how he does it. We say he has green fingers. But what really seems to have happened is that much he has learned over the years has become so completely part of himself that he does the right thing instinctively.

Something of the same kind seems to happen in engineering—with a whole works playing the gardener. It is not a question of craftsmanship in the old sense, for it occurs even on a production line. But in a works that has been making cable (for instance) for years, the right decision seems 'natural', being based on knowledge that is so much a part of past experience that it is taken for granted. This is one reason why a name with a long history can still mean so much.

# Crompton

## They took no risk of frost

Throughout the coldest weather the concrete continued to flow thanks to Evo-set.  
Every yard of concrete and cement Monk's of Warrington put into the great new Heinz food factory at Kitt Green was protected and improved by the addition of a small amount of Evo-set. Protected because Evo-set gives complete frost protection right down to a temperature as low as 6°F. Improved because Evo-set accelerates setting and hardening and completely waterproofs.

*Evo-set has no corrosive action on properly imbedded steel reinforcement.*

*Evo-set reduces mixing ratios and saves more than its own cost, too.*

*This brochure explains the economics of Evo-set. Write now.*

## *This well designed nursery is evenly warmed—How?*

With Crane Skirting Heating. This has been installed, so that there is even, comfortable radiant heat effective all over the room. And, of course, the heating is inconspicuous, for Crane panels take the place of the normal skirting. So obviously it does not hamper your design but leaves the wall and floor space completely free.

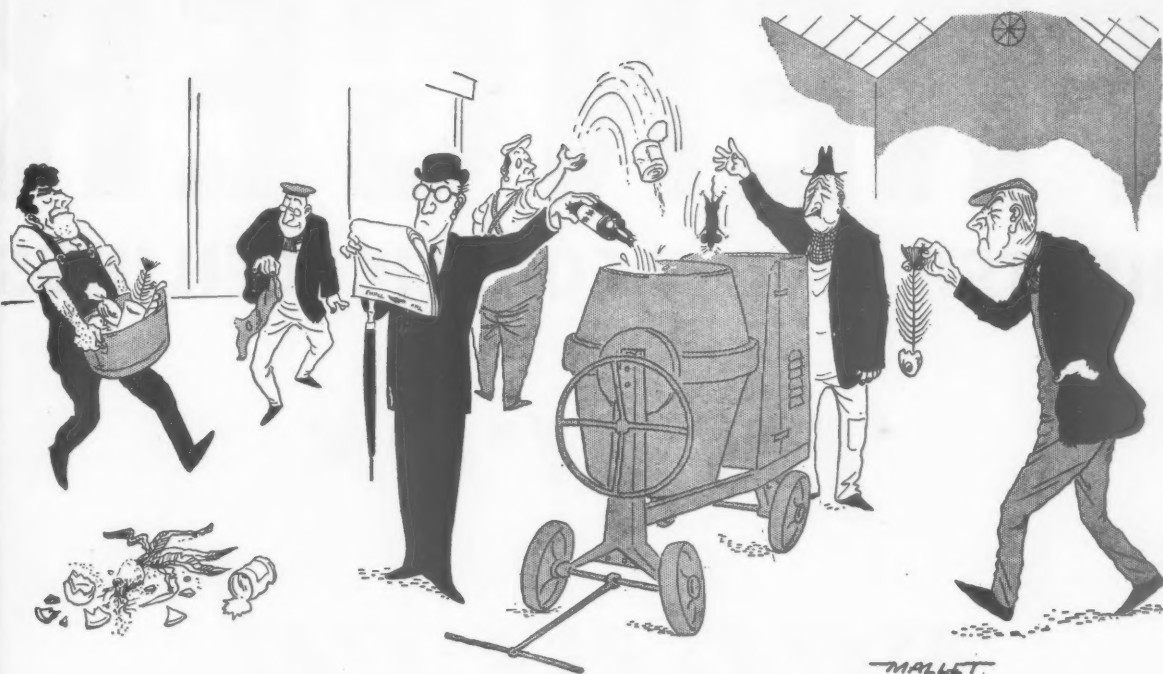

Here are three noteworthy advantages of this latest heating medium. One, you don't have to worry about space for heating units or unsightly lateral pipework—panels complete that

part of the circuit. Two, these cast iron panels have real strength—they will not buckle or yield under the most arduous duty. Three, installation is easy—ordering and fixing follows routine procedures.

*There are two types of Crane Skirting Heating: Type R (Radiant) in 1' or 2' lengths, 6" or 9" high. Type RC (Radiant-Convactor) in 1' or 2' lengths, 9" high.*

## cement additives?

*the 'Site' as seen by Dennis Mallet*

*The above scene is hardly our own idea of a well-ordered building site. Gone is the sense of urgency and responsibility, gone the smooth and efficient team work, the well-oiled machine — AND WHERE'S THE CEMENTONE???*

*But, of course, that must be the moral!*

In future advertisements we shall endeavour to give comprehensive details of the various cement additives — colours, hardener, water-proofer, frost-proofer, plasticiser — and of other Cementone Products, each specially made for the job; and Mr. Mallet will again be illustrating why, in his view, they should be used in appropriate circumstances.

Meanwhile, you are invited to write for a copy of the Cementone Handbook which gives full details of all these products, and which will be sent, free on request.

# When appearances count...

To look their best, good clothes, lovely jewellery, handsome furnishings, fine paint and all those things that make life more colourful must be seen in a worthy setting. For that reason Binns Ltd. have specified International paints for their new stores. With Interlux Gloss Finish and Interlight Emulsion Paint they have achieved a decor that graces a superb building . . . provides a perfect setting for their goods and offers a gracious welcome to their customers. Throughout commerce and industry generally, International paints are lending an added distinction to many fine stores, factories and offices. For the architect there is a first-class advisory service always ready to assist on painting problems.

Binns' new store at Middlesbrough is painted throughout with Interlux Gloss Finish and Interlight Emulsion Paint—both available in a wide range of colours.

'Only paints as good as  
**DOCKERS'** are good  
enough for me!'

'Why do you say that, sir?'

'Simple, my boy! I've been specifying DOCKERS' PAINTS all my professional life—and so did my father before me—and Dockers' Paints have never let us down. Remember—Dockers' Paints are reserved exclusively for professional decorators. That means that they must match up to the standards of men who know good paint when they meet it.

Then look at the selection—Dockers' make a paint for every purpose. Dockers' standard range offers a magnificent choice.

Which brings me to my last point: Dockers' service. Their fellows understand our problems and take endless trouble to help with the choice and use of the best paint for the job, and the working out of complete colour schemes. Here endeth this lesson. Think you've mastered it?'

'I think so, sir. How's this: if it's paints, specify DOCKERS.'

'Excellent! We may make an architect of you yet.'

## The Bankers' Dilemma

**WHEN** the Metropolitan & Suburban Bank decided to open a branch in Harvenage New Town, they were confronted with a grave architectural dilemma.

A normal Met. & Sub. branch office, with its Grecian pillars, rusticated stonework and brass-studded doors epitomizing security, was out of the question. And what sort of bank could be built with plain yellow bricks and armoured glass?

The result, something between an exhibition stand and a welfare centre, was surprisingly effective. The Man from Chubb, consulted at the blue-print stage about strongrooms, safes, and fire-resisting equipment, had the idea of making the strongroom door visible from the street.

"A more up-to-date symbol of strength than stone pillars," he said, "and stronger, too."

And so it was. The one professional burglar who had moved to Harvenage for easy pickings took a quick look and caught the next train for London.

"These Chubb people are getting in everywhere," he was heard to say. "It's downright dishonest."

There are many ways in which these Chubb people can co-operate with architects, at every stage of planning. But for a start, you should certainly have the Chubb catalogue. It details the simpler, but equally burglar-daunting, equipment which you might need any day. Write or telephone for your copy to Chubb & Son's Lock and Safe Co. Ltd., 175-176 Tottenham Court Road, London, W.1. (MUSEum 5822).

#### PRE-CAST

## The Plate System by Truscon

One of the finished blocks of Council Flats, Midland Hill Estate, Birmingham.  
I.C.I. Shropshire Valley, F.A.R.I.B.A. City Architects  
completed with the model of the Plate System.

When we design and construct in the Plate System we provide a concrete frame without beams. We do not do this by making them into walls, or by using heavy, deep floors, or deep panels with flare-heads to the columns; but simply by designing the beams away. The Plate System is at its best with a regular grid, but it is often the only reasonable solution when columns are irregularly placed.

The Plate System does not compress an architect's work within the framework of a stereotyped plan: nor does it attempt to do his work for him. It is more than a system of design, for combined with careful planning and the use of cranes and precast components we have made it a very rapid system of construction. It is cheap in cost but not in appearance.

The outstanding application of the Plate System in flats and offices, and recent developments have widened its scope in industrial work.

## HY-RIB ceiling survives four-hour FIRE test

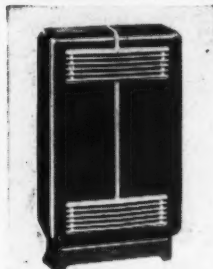

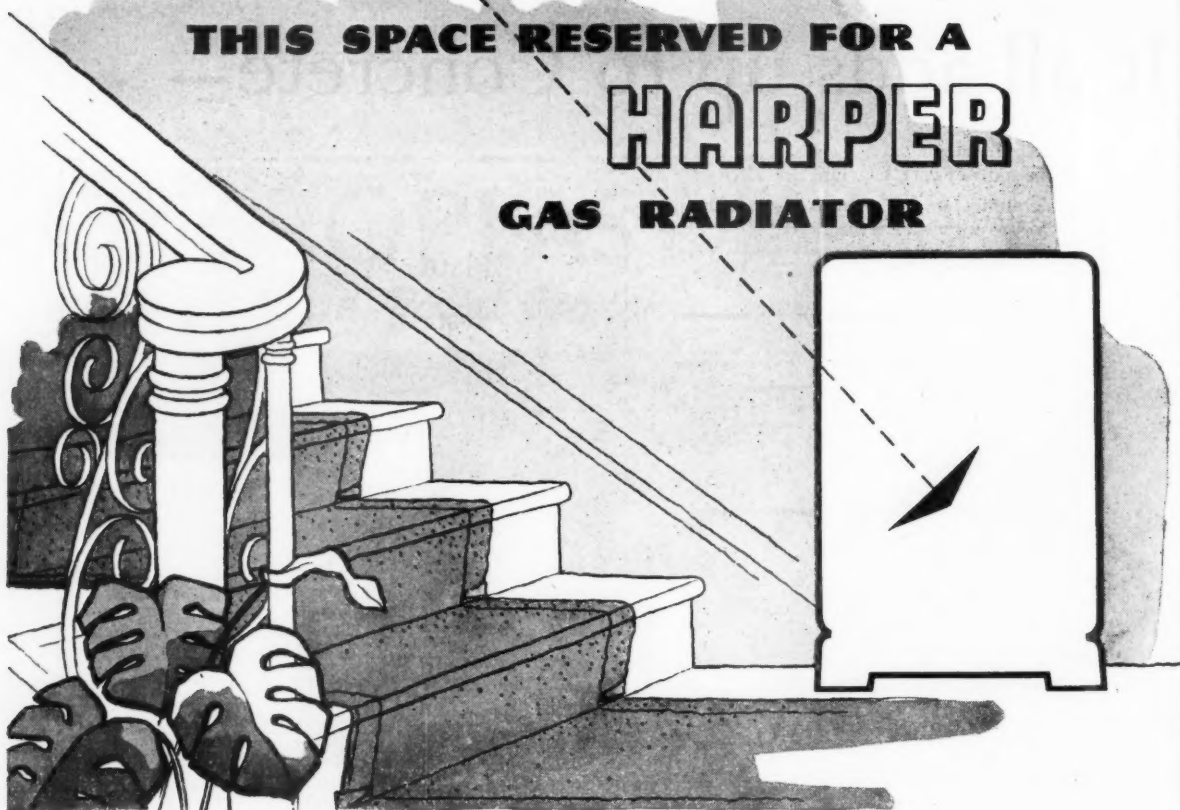

Plaster on a Hy-Rib base is true and sound — held fast and fortified by the steel mesh and tangs. And it is a very efficient fire shield. At the Fire Research Station recently a thin concrete floor — an uncertainty for a one hour rating — qualified with a Hy-Rib ceiling close below for four hours fire resistance. In the last stages of the test, the furnace temperature topped 1120°C. yet Hy-Rib still held the basic hemihydrate gypsum plaster intact. We will gladly advise on the fire resistance potential of any floor and Hy-Rib combination. Ask for Hy-Rib Department.

Whatever the floor, a Hy-Rib ceiling will much increase the fire resistance

*Finish*—Heat resisting coinage bronze. The top louvre and the door (which has concealed hinges) are cream vitreous enamelled. Gas consumption: 2 cu. ft. per hour.

*Dimensions*: Height 25 in. Width 16 $\frac{1}{2}$  in. Depth 6 $\frac{1}{2}$  in. Weight: 31 lb.

Model No. 300

*Its graceful lines and pleasing finish blend with any surroundings.*

*Finish*—Front panel, heat resisting coinage bronze paint. Baffle, vitreous enamelled. Louvres, vitreous enamelled.

*Burner*—Cast iron with luminous bray jets.  $\frac{1}{2}$  in. gas inlet.

*Governor*—Constant pressure. Gas consumption—18 cu. ft. per hour at  $2\frac{1}{2}$  in. W.G.

*Maximum output per hour*—8,100 B.Th.U. at 500 c.v.

*Dimensions*—(a) Panel: Height 27 $\frac{1}{2}$  in.; Width 17 in.  
(b) Overall dimensions required for recess: Height 24 in.; Width 12 $\frac{1}{2}$  in.; Depth 3 $\frac{1}{2}$  in. to 4 in. Series of three nautilus flue blocks, type S.1.

For many years Harper gas radiators have been specified by leading architects throughout the country.

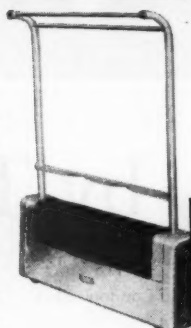

Unequalled in design, quality and finish, Harper radiators are economical, require virtually no maintenance, and will give years of efficient use.

Harper's make a comprehensive range of door furniture, cast iron and finished in bronze lustre vitreous enamel to withstand exposure to severe weather conditions. May we send you details of the full range?

## Harper No. 325 Gas Heated Towel Rail

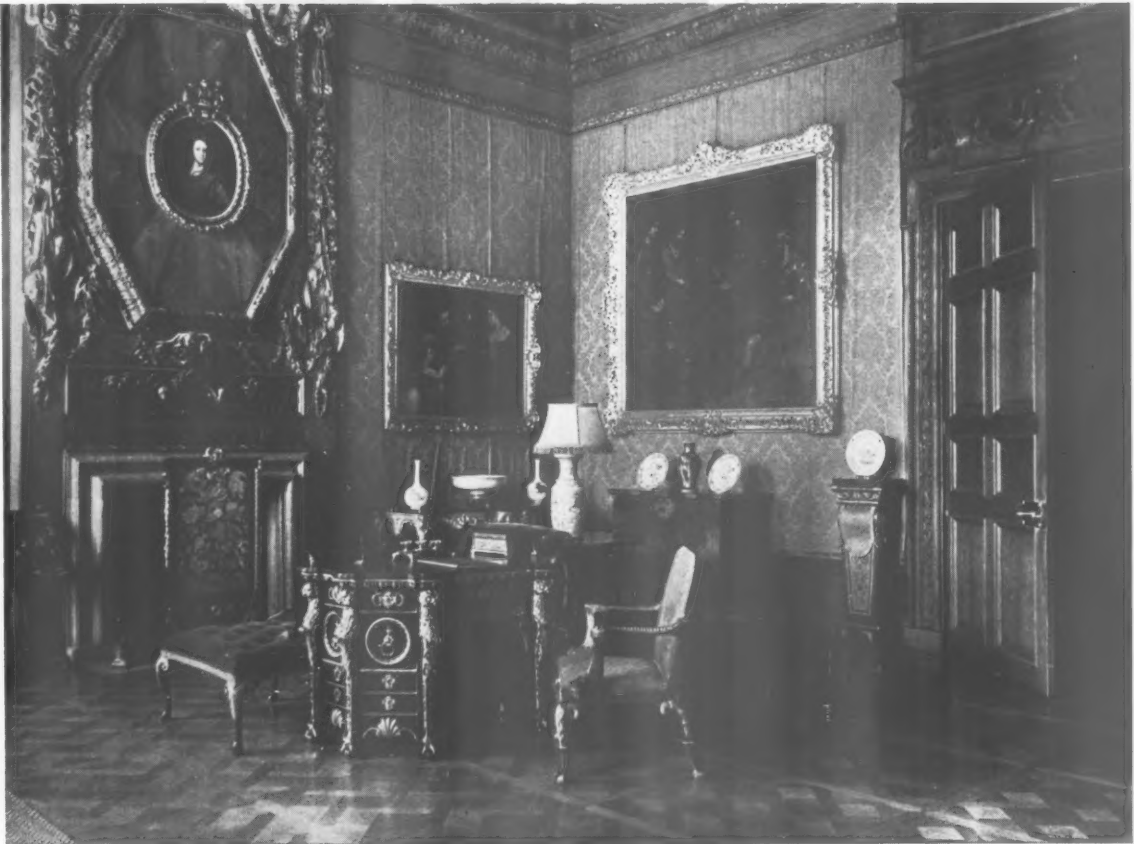

Easily installed, compact and economical. A single luminous burner keeps bathroom towels warm and dry. A governor controls gas consumption (4 $\frac{1}{2}$  cu. ft. per hour.) Finished in ivory and green. Provision is made for screwing to the floor although it is stable enough to stand unsupported.

## the AGELESS BRITISH HARDWOOD FLOOR

Whether exponent of the traditional or contemporary, the Architect cannot ignore time. His works are judged through the passage of years, so too, the materials he uses.

For that part of the building which gets most wear, the floors, the choice must be Hardwood; the only material which combines durability with dignity, warmth and comfort, which mellows with age . . . and lasts through the ages.

The Chatsworth floors are typical. Accounts show that £200 was spent on "OAKE boards for ye floor of ye upper storey" in the year 1690. The floor illustrated is the original laid. No restoration has been necessary even within living memory.

Of what other flooring material can such be truly said.

*Chatsworth is open to visitors throughout the Summer months.*

FRANCIS BENNET, M.A., A.R.I.B.A.,</b> 35 Queens Gate Mews, S.W.7

THE scientific application of nuclear physics to the problem of fire prevention has cut dramatically the time necessary for calling into action fire-fighting services and equipment. The first trace of combustion (before any flame or appreciable heat is generated) is sensed by the Minerva Nuclear Detector which immediately operates an alarm or brings automatic fire-fighting equipment into action. Exhaustive tests by independent public bodies have proved that in buildings, stores and factories protected by Minerva, fire is given no chance to establish a hold before the alarm is raised.

### HOW MINERVA IS INSTALLED

One Minerva Detector guards up to 1,000 sq. ft. of floor space. Groups of Detectors, wired in a 2-wire system following normal electrical installation practice, are connected to a combined control unit and signal panel which indicates the area in which the alarm originates. From the signal panel, the alarm can be automatically transmitted to the Fire Station or watch office, or it can be arranged to activate fire-fighting equipment on the spot.

### OTHER USERS OF MINERVA

include the Admiralty, Air Ministry, Ministry of Supply, G.P.O., British Electricity Authority, London Transport Executive, U.K. Atomic Energy Authority and British Railways. In factories, department stores, warehouses, museums and offices, Minerva is continually on watch, consuming no power whilst on guard but springing instantly to life and summoning aid the moment combustion products approach any of its radioactive Detector heads.

**No building protected by Minerva has ever been destroyed by fire.**

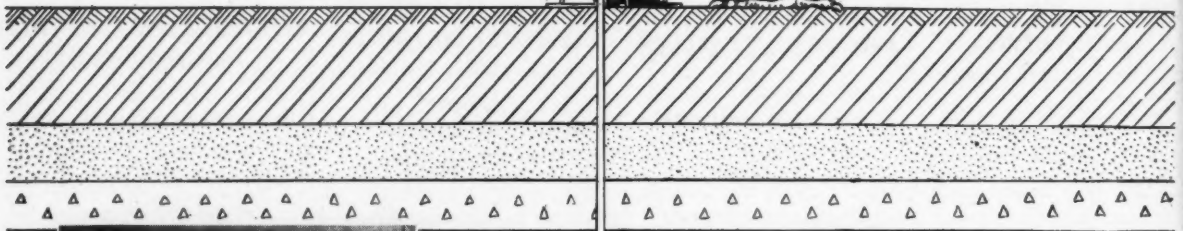

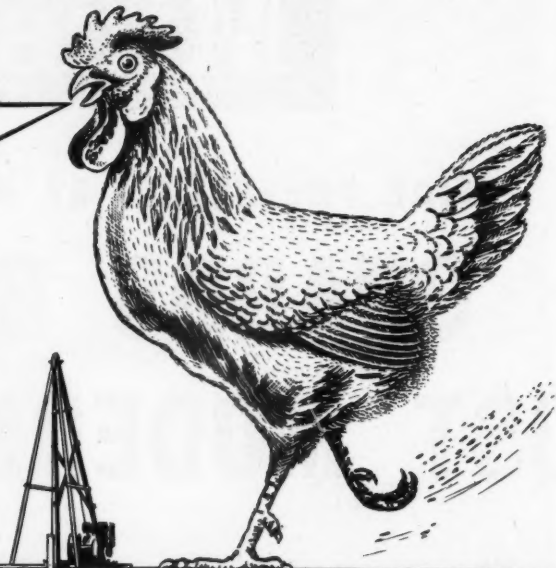

Write for full details of the Minerva System of Fire Prevention by Nuclear Detection to :

But DOUGLAS do  
more than scratch  
the surface!

To investigate the characteristics and strength of the subsoil before foundations are constructed calls for study by the Douglas Foundation Engineering Department. This is a vital stage in any construction programme.

So before you build, have a word with Douglas or even ask them to interpret results already to hand—it may save you a lot of trouble later on.

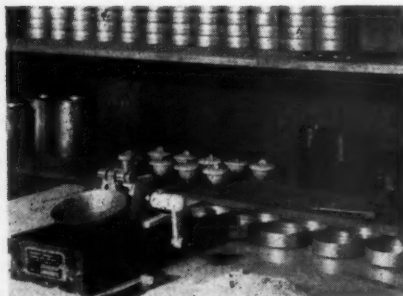

#### TRIAXIAL COMPRESSION TEST

*This test accurately measures the shear strength of soils under known stress conditions. On this information can depend the whole foundation design.*

#### INDEX PROPERTIES OF SOILS

*The two illustrations below show apparatus used to provide information on the state of materials in the field and to assess their probable behaviour under various conditions. Another vital factor when considering foundation engineering.*

#### SPECIAL PROBLEMS

*Douglas can test and design for a variety of special problems such as—earth movements and stability of slopes and cuttings, soil stabilisation, pavement design, ground water lowering, piling, underpinning, accelerated consolidation of soft clays, earth pressures, etc.*

# WARMTH

**projected  
where  
you need it!**

## **METROVICK Radiant Space Heater**

Radiant space heating is the new idea for providing warmth for people at work, waiting in queues, watching games, shopping, etc. Thus in a large building it is possible to direct heat to just those areas where operatives are working.

**Available from stock**

The Metrovick radiant space heater consists of an anodised aluminium reflector with a tubular sheathed heating element rated at 3 kW at specified single phase voltages. It weighs under 5 lb. and is easily erected on a single 1 in. conduit from the die-cast aluminium alloy weather-proof terminal box.

**THOSE CRITTALL CHAPS  
REALLY KNOW A LOT  
ABOUT ELECTRIC HEATING!**

It makes me shudder to think of the trouble I had with heating systems before I called in Richard Crittall.

No problems now, though.

Those Crittall chaps *really* know how to choose between

ELECTRICITY, COAL, OIL or GAS to provide the best and most economic system in each case. Their advice is completely unbiased, too!

They can handle the entire heating system whatever the type and if it is decided that electricity is the answer they can also handle the general wiring.

That, you will agree, is a complete service!

Take my advice if you have heating problems, 'phone those Crittall chaps at MUSEum 3366—you won't regret it!

## A TUDOR HOUSE

*with oil-fired central heating*

THIS HISTORIC Manor House was built about 1550. Its fabric remains unchanged to the present day. In early times court leets, which kept law and order for the Manors of Whitkirk and Temple Newsam, were held at the Manor House. Records of the proceedings are in Leeds Public Library. These courts were held as recently as 150 years ago.

Today, the Manor House takes advantage of the most up-to-date equipment. It is kept beautifully warm and comfortable by automatic oil-fired central heating, the supremely modern heating method with no equal for convenience with economy.

Oil-fired heating is clean and labour-saving. There is no fuel to carry, no stoking to be done and no ash to clear away. It maintains a constant but adjustable temperature with the minimum need for attention. And oil fuel, bought in bulk, is surprisingly economical.

Oil-fired heating is suited to houses of any size, for every need from full central heating in the large country house to hot water supply in the smaller home. And manufacturers are now producing boiler/burner units specially designed for oil firing. Shell Domestic Fuel Oil is used for the larger installations. BP Domesticol has been specially developed for the smaller boilers with vaporising burners.

*The Manor House, Whitkirk, Leeds, is shown in early records as being purchased by Sir Arthur Ingram in 1623. It remained in the Ingram family until it was bought by the present owners, Mr. and Councillor Mrs. Bray, in 1955. It is equipped with an oil-fired central heating plant of the hot air type, using Shell Domestic Fuel Oil.*

If you are interested in the construction, design or modification of any house or public building and would like to know more about the costs and practical application of fuel oil, please write for a copy of 'Oil Fuel at Home' to Shell-Mex and B.P. Ltd., Fuel Oil Dept. D3L, Shell-Mex House, Strand, London, W.C.2.

This advertisement is produced to B.S. 1311, 1956, governing Trade and Technical publications

THE COMBINED RESULT IS

**An exciting new material which will revolutionise 1,001 industries**

John Summers & Sons Limited are now making what is undoubtedly one of the most remarkable materials ever produced by the steel industry—STELVETITE—a sheet of steel *permanently* covered on one side with a sheet of specially formulated Velbex P.V.C. made by BX Plastics Limited. The plastic is a thick coating, not a film, available in an enormous variety of finishes and colours, and its qualities include durability, resistance to acids, grease, water, hard wear, kicks, scuffs and chipping. *But this is only the beginning.*

***Stelvetite can be bent and shaped!*** Its bending qualities are remarkable—even through 180 degrees. *Stelvetite can also be sheared, perforated and cut.*

***Stelvetite can be deep drawn!*** It is suitable for deep drawing and even extra deep drawing for special applications, with the plastic surface inside or out, and it may be seamed or crimped without disturbing the plastic surface.

***Stelvetite can be joined!*** There are many ways of joining Stelvetite—even a special welding process which does not affect the plastic.

As you will see, even from this, the industrial possibilities inherent in Stelvetite are enormous. In fact, wherever steel goes, there can go Stelvetite—the steel with the built-in finish.

John Summers & Sons Limited and their products are known the world over. Stelvetite will be no exception. It is a revolutionary material produced by a free enterprise company whose policy is one of continuous venture. Write to: John Summers & Sons Limited, Dept. MRD.7, Shotton, Chester, for further details of Stelvetite.

# They never let you down

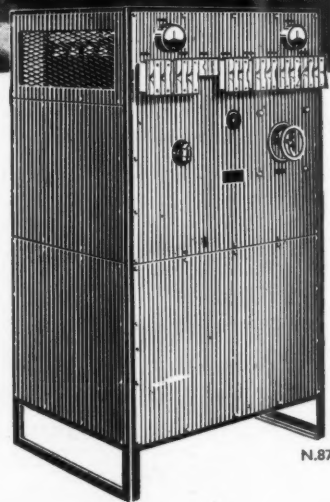

#### THE ROYAL NATIONAL LIFEBOAT INSTITUTION

*Perhaps the greatest of British charities, this famous institution was founded in 1824, and by the time its second report was published had already contributed to the saving of 342 lives. By 1924—centenary year—it had given awards for the saving of nearly 60,000 lives and today that figure stands at over 78,000. At this very moment, all along our coastline, 154 lifeboat crews are ready for the emergency call which means that someone is in peril on the sea. They never let them down.*

**Y**OU CAN BE CERTAIN TOO that Nife-Neverfayle Emergency Lighting Equipment will never let you down. *Whenever* needed, these reliable units will instantly, automatically spring into action. That is the special advantage of the Nife Steel Alkaline Battery—it never deteriorates, even after long periods of inactivity.

Nife-Neverfayle units occupy only one-third of the space required by conventional equipment and, as they can be installed adjacent to other equipment, a separate battery room is not needed—a point worth remembering when planning new buildings. Maintenance costs are negligible—after years of trouble-free service you will realise just how economical your Nife-Neverfayle equipment has been.

# TEAK

-won from the forest by huge endeavour

In the mountainous forests of Burma and Siam, men work with elephants to extract the prized *Tectona grandis*, and send it on the long, slow journey down-river to the world's markets. Machines are useless; the terrain is too wild, the trees marked for felling often too far apart. Creeks run dry between monsoons, and elephants are strong but slow. The journey lasts for years.

Such arduous effort is justified only for a wood of quite exceptional quality, and teak is such a

wood. Teak can be used for every kind of joinery. And, though it costs more than most other woods, teak is always an economy in the long run. It lasts for centuries and needs no painting; its shrinkage is less than that of any other commercial timber; and it is highly resistant to moisture, fluctuating temperatures, acids, insect attacks and fungi.

And, because we stock teak in an enormous number of sizes, we can help you to cut down on waste and save still more. Ask us for samples and prices.

## specialist building materials For FLOORING

### VENTROT

for effective Damp-proofing

VENTROT is a proprietary blend of residual bitumens specially designed for hot application to solid sub-floors, providing a continuous membrane impervious to rising damp, whether in the form of liquid or vapour. Ventrot meets the requirements laid down by the B.R.S. in Building Research Digest No. 1—The Design of Timber Floors to Prevent Dry Rot, and Digest No. 86—Damp-proof Treatment for Solid Floors.

VENTROT will indefinitely protect timber flooring laid in direct contact with concrete against the ingress of moisture, which unless prevented permits the growth of fungi.

VENTROT is recommended whenever linoleum, rubber sheeting, P.V.C. sheeting, magnesite composition or thermoplastic tiles are to be laid on concrete in conditions where rising damp is suspected.

VENTROT has been specified on many schools, public and large industrial buildings in many parts of the country.

**FULL TECHNICAL ADVISORY PANEL.** The services of our Technical Staff and the I.B.E. Laboratories are available to you.

This panel not only acts as a proving ground for the products, but also investigates customers' problems and advises on the best method to adopt for any particular requirement. You are invited to make full use of this service, entirely without obligation.

Most of the products manufactured by the I.B.E. Group of Companies are obtainable from Builders' Merchants. In case of difficulty write to us direct.

# I.B.E.

## GROUP OF COMPANIES

Descriptive booklets, folders, leaflets together with information and specification sheets are available from any one of our offices, dealing with individual products or those grouped under the heading of Roofing, Flooring, and Special Building Materials, including Mortar and Concrete Additives and will be sent to you immediately on request.

### A RANGE OF FLOORING PRODUCTS FOR ALL PURPOSES

B.B.E. specialises in Adhesives, Levelling Compounds and Seals.

**WEARBOND** — For exterior use in making up worn and uneven surfaces.

**WEARPROOF** — An emulsion mixed with aggregates for patching or complete overlays on existing concrete or timber floors.

**ISOVAR** — Transparent coating for protecting wood and cork.

**ISOSEAL** — Deep-seal semi-gloss coating acting as a protective surface for wood.

**PLYCOL** Asphalt Tile Adhesive—quick drying solution adhesive for fixing all kinds of thermoplastic tiles.

**PLYCOL** Cork and Lino Adhesive—a resinous type adhesive for fixing cork and linoleum to concrete floors. A special aqueous grade available for suspended concrete, and also wooden floors.

**BITUFLO** Latex Screeding Compound for levelling uneven floors prior to laying tiles, etc.

**BITUFLO** Flooring Emulsion as a bituminous underlay for floor coverings.

**BITUPROOF** Cold Mastic—three grades of bitumen/latex emulsions for fixing wood blocks and prefabricated panels.

(a) 648 — dipping grade for normal wood block laying.

(b) 682 — trowelling grade for miniature parquet panels, etc.

(c) WB3 — special heat resisting grade for panel heated floors.

**ISOCON**—A neutral deep-penetrating surface hardener for concrete.

**J.4** — A special oil resistant emulsion.

## Garage canopy in British Aluminium

*Architects: J. Douglass Mathews & Partners  
Consulting Engineer: R. A. Sefton Jenkins, B.Sc., A.C.G.I., M.I.C.E., A.M.I.Struct.E.  
Main Contractors for Aluminium Roofing: MacKey Bowley & Co. Ltd.*

This garage canopy at Richmond is clad entirely with Rigidal corrugated aluminium sheet, Industrial Trough T being used for the upper surface, and embossed and Alocrom-treated Mansard for the lower.

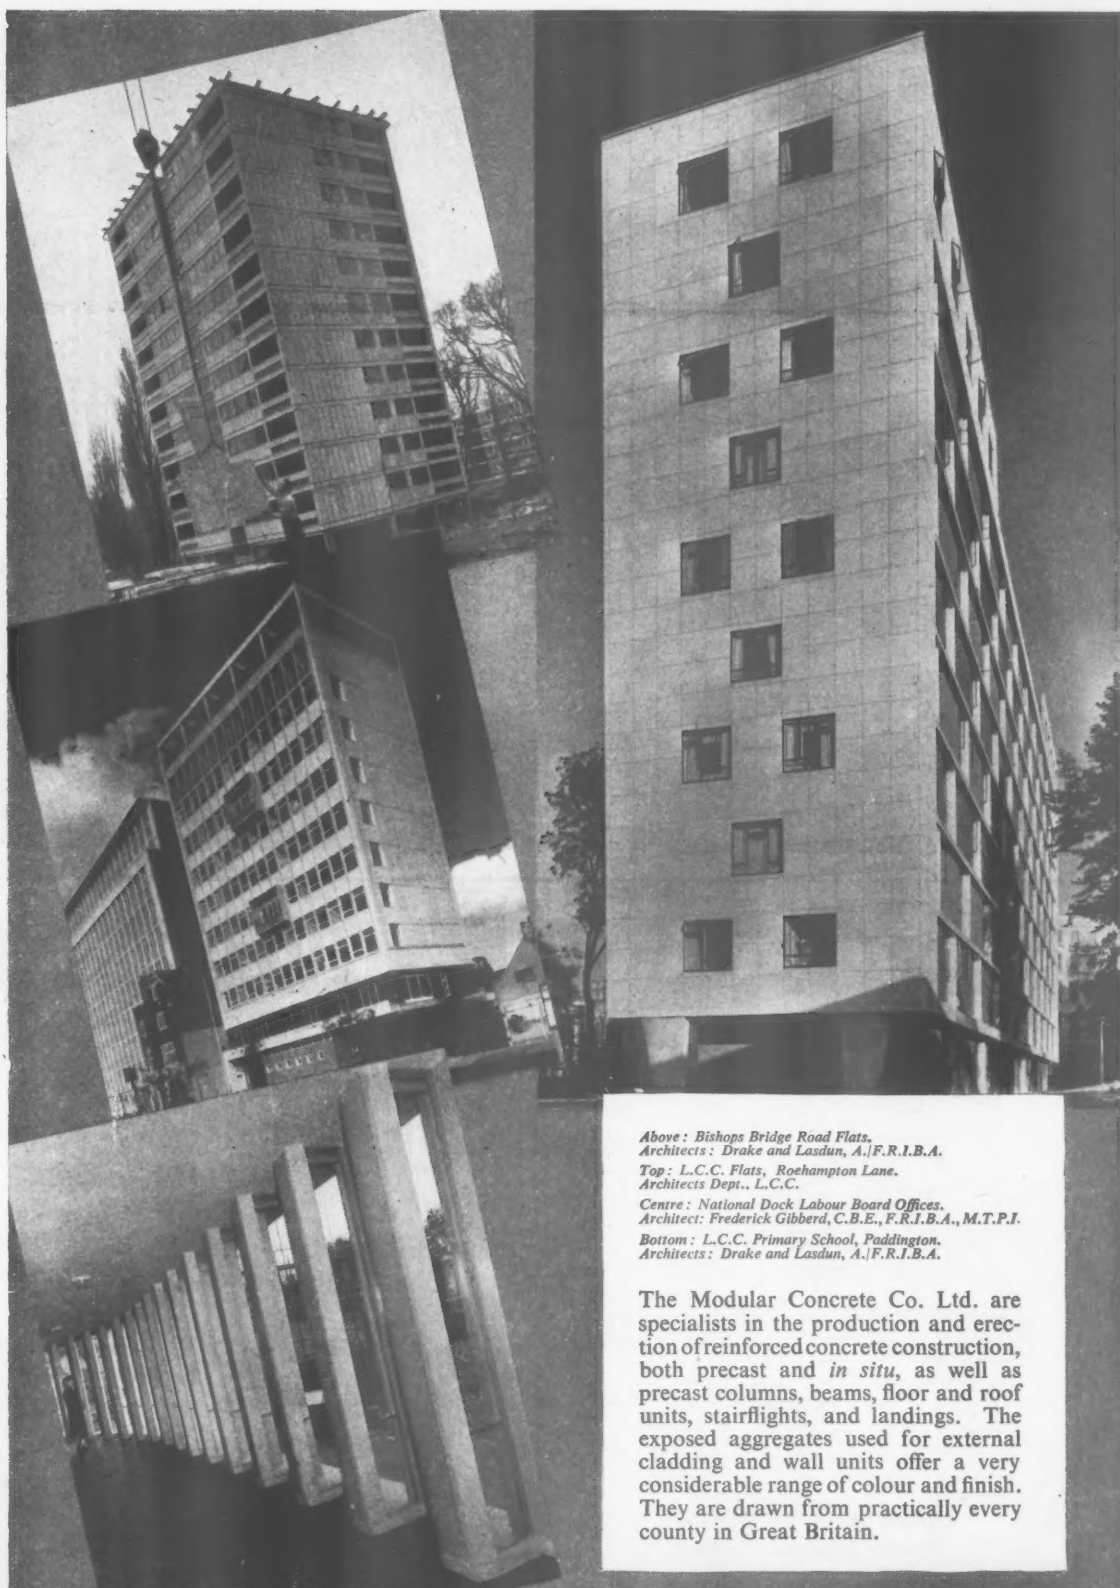

The lightness of the aluminium made possible some reduction in the sizes of the canopy structural members and a choice of design that permits unrestricted access to the pumps. Aluminium is durable and will require little or no maintenance; its cost compares favourably with other roofing materials of comparable life.

## ● DESIGN ● FABRICATION ● ERECTION

For this B.E.A. Building, speed was the essence of the contract. Sommerfelds designed the Steelwork and from unloading the first lorry on site to completion of a 250-ton steelwork erection, took three weeks.

New Air Terminus buildings in Kensington for B.E.A. Photograph taken 16 days after commencement of steel deliveries. Main Contractors: Messrs. Richard Costain Limited.

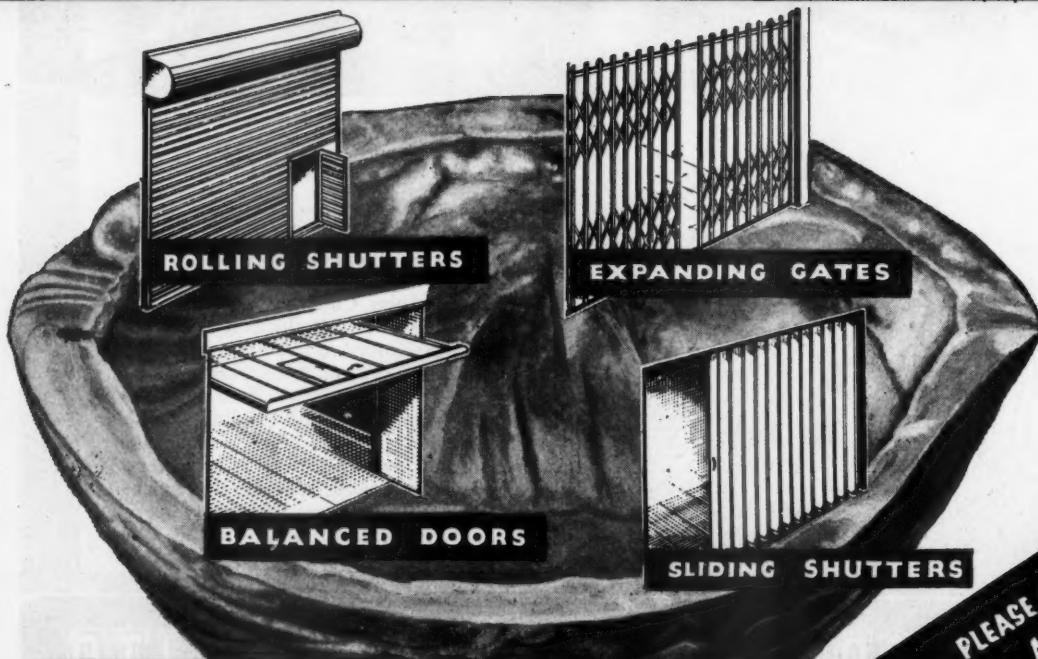

The Architects for the Bowater Paper Corporation Limited's new Office Blocks at both Northfleet and Mersey required Lattice Steelwork on a 3ft. 4in. module. This allowed complete flexibility of internal arrangements and all service lines are easily run between floor and ceiling.

Part of a new Office Block for The Bowater Paper Corporation Limited. Architects: Messrs. Farmer and Dark.

## Lighting as you like it

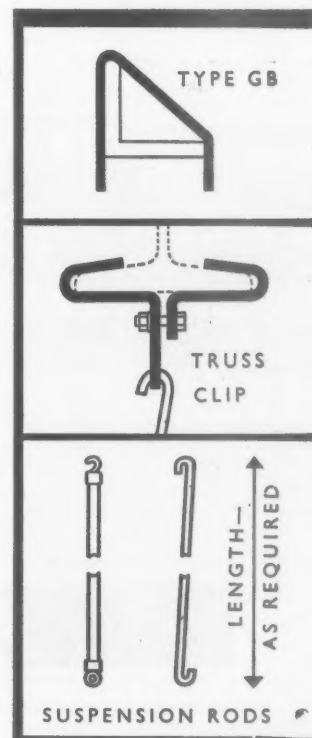

Sieline Continuous Lighting Trunking is permanent—until you want to change it. Plan it as a whole, then alter it piecemeal to suit your changing needs. Reposition and adjust your lighting as often as you like. It is widely used in rented factories where the standard lighting power and distribution do not meet the requirements of the tenant, and it has already been supplied for installations costing from £20 to £20,000.

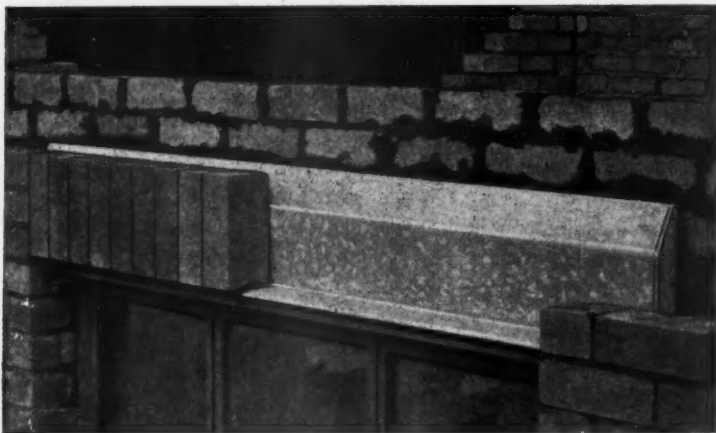

The trunking is delivered in an advanced state of assembly for easy erection. Control gear and lighting units can be spaced at any intervals. A complete range of suspensions (specimens illustrated) provides for erection under any type of roof. If you would like complete information about Sieline Continuous Lighting Trunking, write for leaflet F.22 or get in touch with your local Siemens Ediswan lighting engineer for advice—no obligation.

## KNOBSETS

It is with considerable and justified pride that we present these **UNION** Knobsets, and we hope that you, the Architects and Builders, to whom this advertisement is addressed, will be able to make use of them, not only in new buildings, but when renovating older property of all kinds. The special features which they offer in comparison with the conventional locks and furniture include ease of fixing and simplicity and lightness of operation. We hope also that you will find the external appearance suitably pleasing, as well as being modern. The full description of them and their many advantages are described in booklet 533, which can be obtained on application.

Though supplies are obtainable only through your usual Builders' Hardware Merchants, our expert advice is always at your disposal.

## **RICHARD COSTAIN LIMITED**

**and J. E. LESSER & SONS LIMITED**

Jointly introduce Ciel Structures, a new technique in prefabricated steel buildings involving the use of cold rolled sections of high tensile steel.

These lightweight sections have an effective strength at least 50% greater than that of hot rolled mild steel and a resistance to atmospheric corrosion from four to six times as great. The full range of the Ciel System, spanning from 12 to 96 feet, is covered by three distinct sections—Medium Span, Monospan and Industrial Span Structures. The many applications of these easily transported, quickly erected, low-cost buildings are described in a new illustrated brochure now available on request.

## UTILE—the U-word for the U-wood

The panelling in the recently completed bar of Charrington's "Red Lion", Watling Street, E.C., is in solid Utile, a West African hardwood. (The counter, seen through our empty glass—thanks, we don't mind if we do—is Utile and Sycamore).

Utile is a close relation of the more familiar Sapele. If you're a Lifeman, you may like to know that its botanical name is *Entandrophragma utile*; if you want to be up-to-date on your finishes you really need to know about this and the other West African hardwoods.

### vital facts on Utile

Colour: Varies from a lightish to a dark brown.

Strength: Equivalent to Mahogany but harder.

Weight: About 40 lb./cu. ft.

Resistance to decay: Good.

Texture: Fairly close.

Workability: Good. Takes a high polish.

Principal uses: Interior decoration. Panelling. Shopfitting. Furniture-making. Flooring. Boat-building.

Other West African hardwoods include:

DAHOMA	MAHOGANY
DANTA	MANSONIA
EDINAM	MAKORE
GUAREA	OBECHE
IDIGBO	SAPELE

**FORMICA**

*polythene piping!”*

From the 1st January this year all De La Rue plastics products take the family name of FORMICA. In the case of the famous flexible, no-corrosion, never-burst polythene piping, this change of name accompanies developments in the product itself. The new FORMICA polythene piping is, from every aspect, polythene piping of the highest quality in the world—the most dependable, the most convenient, the most scrupulously manufactured. How can you be sure your piping is FORMICA polythene? By the coloured protective wrapping which distinguishes the two grades. By its high degree of internal and external polish . . . By this clear marking down the length of the pipe: FORMICA BS 1972/1953 POLYTHENE.

*Plastics piping of **FORMICA**\* quality!*

## OFFICES UNDER WATER

### Space-saving arrangement for Bowaters

The 'stalk' of Bowaters 143 foot high water tower at Northfleet accommodates, so far, six floors of office and storage space. The tank—which holds 200,000 gallons and serves the whole of the vast paper mill and provides water for the emergency sprinkler system—is carried on six reinforced concrete columns which are set back from the angles of the hexagonally planned base. The floor slabs are also reinforced concrete and carry the cladding—Williams & Williams 'Aluminex' Patent Glazing.

The whole exterior is anodized aluminium and glass. Aluminium glazing bars (and cover strips), aluminium purpose-made horizontal centre-hung windows, and aluminium faced 'Asbestolux' spandrel panels. The whole installation is designed to afford the maximum corrosion resistance in this heavy industrial atmosphere—and it is easily kept in new condition by periodical washing down, a cradle runway being incorporated in the underside of the tank.

*'Aluminex' Patent Glazing was specified for three main reasons:*

- 1 Its low cost.
- 2 Its 'clean' exterior appearance.
- 3 The fact that the glazing bars can readily be supplied anodized.

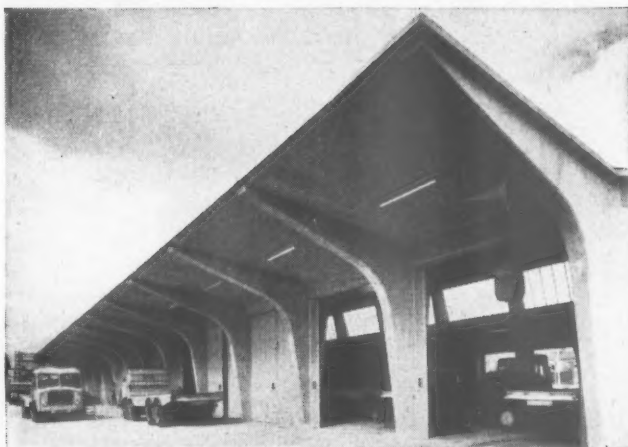

'Aluminex' is also used in the excitingly designed Transport Centre and is scheduled for the Machine House, due for completion later in 1958, which will house one of the largest paper-making machines in the world.

## WALLSPAN

### saves on a small building

'Wallspan' was specified for the cladding of the Romford printing works of Wilson & Whitworth Ltd. only after careful costing by the Architect. He calculated that 'Wallspan', because it would enable roof and floor construction to be carried on uninterrupted by the erection of external masonry walls, would be an economy even on a building as small as this. After a detailed post-mortem, so it proved to be: 'Wallspan' effected a saving in time and cost when compared with good quality traditional construction.

Another noteworthy feature of this contract is the unusual infilling panels of artificial stone.

# Greenwood Dual-Purpose Cowl

NEAT — UNOBTRUSIVE — EFFICIENT

Intensive research into the problems raised by downdraught and smoky chimneys lies behind the design of the Greenwood Dual-Purpose Chimney Cowl.

★ **DUAL-PURPOSE**

The circular construction prevents wide fluctuation in updraught by constant changes in wind direction and allows a gentle form of positive ventilation in the room over which it is fitted.

★ **EFFICIENT**

Aerodynamically designed to harness wind currents of varying strength and direction, the Greenwood Cowl has proved its efficiency after being rigorously tested under severe practical conditions.

★ **GOOD-LOOKING**

Even on exposed elevations the circular design offers an extremely neat and unobtrusive appearance, in keeping with the shape of the normal chimney-pot.

★ **GUARANTEED**

Greenwood Cowls are supplied under guarantee. Please write for details to :

# STRAMIT partitions

## for quieter, more attractive offices

Compactom Ltd., the partition specialists, erected these good-looking partitions in the offices of the Northern Aluminium Company in Bush House, London. They used hardboard-faced Stramit slabs of standard grade for the job. There were good reasons for this. Stramit partitions—so easy to erect and with such remarkable sound-deadening properties—commend themselves to architects

and contractors alike. As the Stramit partitions illustrated above, in flush 'V' joints and aluminium framing, are faced with hardboard, they offer an exceptionally good decoration surface. Stramit of standard grade, however, cheerfully accepts paint and plaster direct, if desired. It is also available faced with fabric in a variety of attractive colours and designs.

### What is Stramit?

Stramit is a low-cost, dry-construction material made of scientifically-compressed straw. It combines great strength and rigidity with exceptional values of thermal insulation and sound reduction. And official tests (reports available on request) prove that it resists fire resolutely.

Stramit of standard grade costs from 1s. per square foot, including delivery. Also available—Roofing grade, Low-Density grade (for non-load-bearing thermal insulation) and a special asbestos facing which gives a Class 1 rating for spread of flame.

STOCK SIZES: 4ft. wide x 6ft., 8ft., 9ft., 10ft. and 12ft. long.

NOT QUITE ARCHITECTURE

# BUILDING A 14-ft. DINGHY

One morning the parts of a 14-ft. dinghy which I had rashly undertaken to build with the aid of my two sons, appeared on the doorstep. They arrived in a wooden packing case, some 12 ft. by 8 ft., 18 inches deep, and two long thin parcels, one of which clearly contained a mast. The remaining ingredients, thoughtfully provided by the designer and the manufacturer, were a set of detailed drawings, a clear specification of work, and a list of parts, numbered in the order in which they were to be used in construction, a most desirable refinement as it turned out.

To go back for a moment to the pre-planning stage, the basic requirements of anyone undertaking this sort of thing, are, I quote "The minimum of tools—the minimum of space—a fairly level floor and an opening big enough to get the boat out when she is finished." To this I think I would add a patient wife.

With materials, instructions and labour all on the site the first task was to unpack, and check against the inventory all the 72 parts, some bearing such mysterious names as sheet lead pads, shroud plates (polished brass).

Taking stock of the strange collection of rough ply sheets, mahogany battens, brass fittings and glues it seemed improbable, to say the least, that they would ever assemble into something that would float, and support the combined weight of the three builders, and patient wife. There was, however, no looking back now. Among the parts of the boat were five formers, or templates, cut to the cross-sectional shape of the hull at various points in its length, and these were set out on a spine grid. After being checked to see that they were vertical and properly spaced they were screwed firmly to the floor (in this case wood blocks—but of this, more hereafter!)

In the initial setting out of the hull—two

## Milestone of Progress?

The building illustrated above, believe it or not, might almost be described as the home of Zeta. It is the new head office in Grosvenor Place, overlooking Buckingham Palace gardens, of Associated Electrical Industries, the firm which advertises its part in the production of Zeta as "A Milestone in Thermo-nuclear Research." Like Hawker-Siddeley and English

Electric, which have revealed a similarly split personality, AEI pride themselves on advanced industrial technique, yet cling to the illusion that neo-classical or neo-Georgian is appropriate for their offices. The architects are Wimperis, Simpson and Fyffe, and the consultant architect is Sir Albert Richardson.

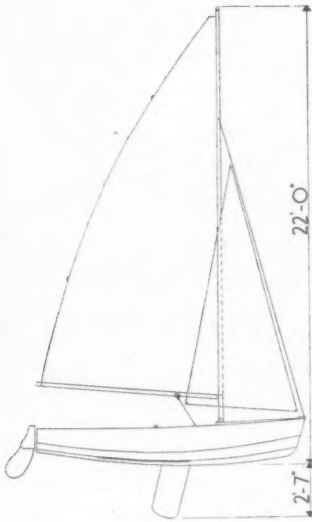

The new offices for Tube Investments Ltd. at Edgbaston, Birmingham, by Cotton, Ballard and Blow, have aroused controversy in the Midlands. The clients, the architects, the Calthorpe Estate and Sir Herbert Manzoni, Birmingham's City Engineer and Planning Officer, agreed on a design that would, in their view, be an appropriate "gateway to Edgbaston." A partner in Cotton, Ballard and Blow says

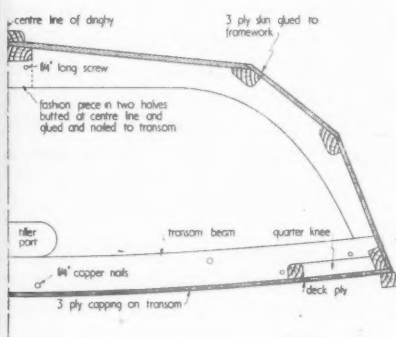

in reply to criticism: "It's a lot of nonsense to say it isn't an attractive building. You can see the same sort of building going up in Grosvenor Square now. Certainly it isn't contemporary, nor is it out of date. I would prefer to call some of the contemporary stuff out of date. It fits into the background of houses in the Georgian style. I think anything contemporary on this site would be out of place."

members—the stem and the stern (transom) were placed in position and received the keel and chines, which give the boat its shape when screwed into position.

At this point disaster overtook us in a somewhat unexpected form. The formers screwed to the wood blocks—being under the considerable strain from keel and

Above, the Enterprise sailing dinghy, designed by Jack Holt for the News Chronicle, and below a section through the hull. The drawings, praised by architect John Lacey for their clarity, are reproduced by permission of the News Chronicle.

chines—had a strong tendency to pull up the blocks to which they were fixed, and did succeed in dislocating some of these from the mastic bed in which they had happily lain for some years. The boat was thus twisted out of shape early in its career, and drastic cross battening and brute force were needed to bring it back to shape. A final check at this stage before beginning to put on the irrevocable stressed skin, revealed vital dimensions that were as near accurate as seemed possible. So far the problem was not one of reading drawings, which were indeed abundantly clear (and supplemented by photographs) but of draughting materials to correspond to them.

JOHN LACEY

(to be concluded next week)

## The Editors

### THE LEADERS OF THE RIBA

WHO runs the RIBA? This question must be exercising the minds of all those members who are perturbed by the Royal Institute's present financial crisis. Obviously the Council itself acts as little more than a debating chamber and a rubber-stamp; with over seventy members it would be hard for it to act in any other way. The Executive Committee could claim to be the policy-maker of the RIBA, but with fifteen members it is still an unwieldy size to provide the leadership the profession needs. Leadership can best be provided by a committee where the members have complete confidence in each other, are agreed on their aims, and are largely agreed on the methods of achieving them. With this in mind, the membership of the Executive merits examination. Nearly half of the Committee are the Honorary Officers of the Council (with the exception of the Past Presidents); the remaining eight, of the total of fifteen, consist of the Chairman of the Board of Architectural Education and of the RIBA Registration Committee, and six Fellows and Associates who have either been elected to Council or, more rarely, represent an allied society. It can be seen from this that the Honorary Officers are liable largely to dominate this Committee. The significant thing is that, of the Honorary Officers, all must be Fellows of the Royal Institute and only two of the four vice-presidents need be *elected* members of the RIBA Council.

The effect of this can be judged by a study of the list of all Honorary Officers of the Council for the last nine years. This list is given on pages 312-13. The top nine lines show the continuity of office which a relatively small number of architects has maintained: twenty-nine architects have filled a possible total of eighty-one "annual offices." Such continuity need not, of course, be a bad thing. But what is significant, we suggest, is the number of officers who hold a position despite the fact that when they last stood for election by the membership they were *not elected*.

Democracy can, perhaps, be carried too far, but the dangers of even partial autocracy are greater. The present financial trouble is, almost certainly, partly the result of the Honorary Officers being out of touch with the membership, and therefore being unaware of the exacting requirements of a professional body in these complex post-war years. For too long the RIBA has been run as a society for professional gentlemen, depending largely for its direction on the loyal but necessarily spare-time advice of those few whose private practices are so large that the constant presence of the principal is no longer necessary, or of those who are in partial retirement. The administration of the headquarters has been carried out by a secretariat which has been hardworking and faithful, but untrained in certain essentials. It has been, in fact, an amateur show, which was no doubt quite satisfactory for pre-war conditions, but which is cruelly handicapped when it attempts to deal with the more exacting conditions of today.

The RIBA now needs professional administration: actuarial and statistical advice on membership, a qualified accountant, and the advice of a financier on investments. With an annual expenditure of over £150,000 it must not rely so much on part-time or only partly-qualified help. It is significant that, although over forty per cent. of the RIBA's annual expenditure is on salaries, the economies introduced as a result of the crisis (in publishing costs, and public relations) have been on matters which amount to only a very small proportion of the total. The role and status of the Royal Institute have reached a critical position. The speed with which it will master its troubles depends, for the next two years, on who is next elected President and on the type of honorary officers he appoints.

### A DIRTY WORD?

We would not be inclined to take very seriously an after-dinner speech given by Lord Mancroft to the London Appreciation Society, were it not for two facts: he is a member of the government, as Minister without Portfolio, and extracts from his speech were circulated by the Ministry of Housing and Local Government. If it is an expression of policy it is unfortunate that Lord Mancroft made his criticism of the æsthetic control of architecture the vehicle for some other remarks which betrayed confusion, prejudice and irresponsibility. Lord Mancroft spoke about the lamentable condition of "some of our architecture today," attributing it to the excesses of the preservationists. Later he blamed *planning* for what he called "the glutinous mass" of buildings arising around us, and said that planning would soon become a dirty word if we did not *have less of it*.

Lord Mancroft's diagnosis is hopelessly wrong. If every preservation society were to be abolished tomorrow the effect on contemporary building would be negligible. If æsthetic control were to be abolished, we do not believe that this would give us, as he says it would, either many more horrors, many more excellent buildings, or much less mediocrity. The application of æsthetic control is a major irritant to some architects in some areas, but it has had little or no effect on the mass of mediocre designs submitted to it. Lord Mancroft is deceiving himself if he anticipates sweeping results from his proposal to free architects from æsthetic control, except in special areas and subject to restriction on the mass of a building. One reason for severely limiting æsthetic control would be to compel both the government itself, and the planning authorities, to concentrate on achieving positive solutions of the problems that are being neglected at the present time—overspill, the redevelopment of central areas and the rebuilding of the industrial towns, the growth of motor traffic and the spoliation of the countryside. Britain needs more planning, not less, and much of the "glutinous mass" that Lord Mancroft decries stems directly from measures taken by successive governments to whittle planning down, and to set some very dubious characters free. While looking at the mote in the planners' eye, Lord Mancroft would do well to examine the beam in his own.

### KEEPS IN KEEPING

The most interesting thing about the exhibition of "Castles in Spain" at the RIBA is the body that organized it. This is called, suitably quixotically, the *Asociacion de Amigos de los Castillos*. The five-year-old Amigos are very different from Britain's Friends of this and that. While our Friendly groups are often little more than fan clubs for museum directors and broken-down aristocrats, the Amigos are always busy restoring old castles, finding new uses for them or—most quixotic of all—persuading the owners to live in them.

The photographic exhibits at the RIBA are just what one would hope for—fantastic towers, grim keeps and crazy turrets. And many of the castles are balanced on top of improbable rock pinnacles, backed by El Greco landscapes. As ASTRAGAL contemplated this stuff that dreams are made on, digging his heels into the magnificent Spanish carpeting (sorry, it was removed after the opening), he pondered on the state of many of our own architectural treasures and brooded bitterly about our negligent guardians of culture.

### ARMS AND THE MANUAL

A few days later ASTRAGAL realized that his brooding had been a little unjust. A UNESCO manual, pub-

lished by the Stationery Office, reminded him that when governments hear the word "revolver" they reach for their culture—and put it in a safe place. This manual tries to explain its contents in the snappy title, *Protection of Cultural Property in the Event of Armed Conflict*. Armed Conflict forsooth! This is more than a book on how to protect your oil paintings from the barbs of arrows. It is, in fact, a revision of a work that first appeared four years ago, and it tells you—among other things—how to put protective structures round buildings that might get in the way of a thermonuclear war. You are also recommended to pack sculptures and pictures into atom-bomb-proof depositories. And you are reminded that a 20-megaton bomb detonated near Abbeville would break half the windows in London, Paris and Brussels. Only a pessimist would point out that elaborate precautions don't seem practical when you consider that instant retaliation would be the order of the day. And only a pessimist would ask if the Government is likely to fork out the money for such precautions. In these matters ASTRAGAL is a pessimist.

#### SMITH'S CRISP REPORT

Full marks to *Architecture and Building* for sending John Smith on a five-week marathon round all the 74 schools which offer training in architecture—three a day if you stop for petrol and spares on Saturdays and Sundays. The survey published in the February issue is equally breathless and is going to make some people hopping mad, but reading between the lines (or bang along them here and there) and looking at the pictures of students' work, ASTRAGAL guesses it catches the essential atmosphere of each school pretty fairly.

\*

Appalled by the revelations of his ghastly journey, Smith gives a Draconian verdict: sweep away the Board of Architectural Education because it has proved itself incompetent; set up a new body of "progressive" architects and intellectuals to disestablish the existing schools and reform the pattern of education; abolish the external examination system; flush out the old teachers and professors and replace them with men "dedicated not to teaching but to

architecture"—and lots more for 2s. 6d. Too easy to say? Yes, but a real wallop won't do any of us any harm, and it's nicely timed, too, for the London Conference on Architectural Education in April. Smith, as Outsider No. 1, certainly ought to be in on it.

\*

On the credit side one thing stands head and shoulders above everything else in significance: the Birmingham School's Live Projects. In the past seven years the school has designed, put out to contract and built several blocks of flats, houses, old people's bungalows, two clubs and a pathology laboratory. The pages describing this should be compulsory reading for everyone in any way responsible for the education of the architect.

#### TAKE YOUR CHOICE

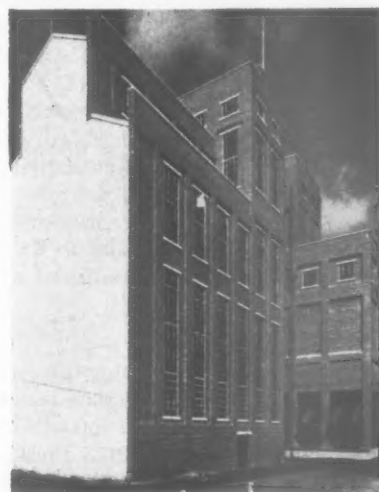

You don't have to be a student to know about the illogical salary structure in local government. Anyone could have learned about this by reading two advertisements which appeared last week in the same column of *The Times*. One asked for an assistant architect in the LCC's General Division. The successful candidate will be deputy to a man who is responsible for a staff of over 150 architects and designers. The other advertisement asked for an area planning officer at Chelmsford. The salary range for the first job, which will involve the controlling of work on industrial and office buildings, fire stations, old people's homes, expanded town development and extensions to the Crystal Palace and the Festival Hall, is £1,500 to £1,800. The area planning officer will get £1,405 to £1,625. You will see as quickly as John Gordon what this means. The deputy chief of the LCC's General Division may be getting less money than Chelmsford's area planning officer.

#### BRITAIN'S LIGHT HEART

What sort of a show will we put up in Brussels? Things do not sound too good. The Government, for misguided reasons of economy, handed the industrial pavilion site to the FBI. And the Federation is recovering the cost of building by letting space at £10 per sq. ft. to anyone who will buy it. Many of the stands to be built around the 8 ft. (!) aisles will be 20 ft. high, the idea being to cram as much in as

The Scottish Gas Board has proudly published these pictures of its buildings, labelling the top one (at Dumbarton) "modern" and the bottom one (at Dumfries) "contemporary".

possible. And as it has proved almost impossible for stand design to be brought under control (though there is some control over lettering) it seems unlikely that our industrial displays will have any visual coherence.

\*

Many things ASTRAGAL hears about Britain's contributions to the Brussels Fair makes him despondent. But here is a cheering news item. Last week the President of the Board of Trade agreed with an advisory committee that in future the Board should fill national pavilions in trade fairs with representative exhibits, and that it should bear any loss. Let us hope this means the end of our save-penny policy.

\*

Incidentally, if you are going to Brussels you might as well get your blushes over in good time. The official description of the City of London section refers to a "giant coat of arms

in metal sculpture superimposed over an illuminated glass heart, the whole surrounded by a giant world map, with hundreds of lights pinpointing centres of world commerce. As the heart lights up in heartbeat pulsations so do clusters of light appear on the map. The theme for this display is 'The City of London, the Heart of World Commerce.'"

#### SPEC AND SPAN

Eric Lyons, the architect to the Span group's excellent spec flats and houses, spoke at the AA last week on "Working for a Spec Builder." Mr. Lyons has a refreshingly outspoken disrespect for both the RIBA and the Town Planning fraternity (he believes that planners, like economists, always know the answer to the last crisis). Those who did not know of his achievements both as an architect and as an opponent of the deadhead planning boys, will have been fascinated by his modestly-told success story. Those of us who did know all about him were delighted to listen again to his wit and to be reminded of his triumphant battles with obstructive committees.

\*

Eric Lyons believes that the spec housing field is in a bad state because architects have not been interested in it, and he blames the RIBA for making a scale of fees which precludes both interest and experiment. He compares himself with the industrial designer who develops a manufacturer's product for an uncertain market, and soon begins to know a great deal about that market. He believes passionately that designing of the kind he is doing is the only way the architect can regain his lost prestige for domestic architecture.

\*

From a talk that was packed with quotable sayings of the week, here are two:

"There is no solution to the collections of individual small houses from a town planning point of view."

And

"There is no possibility of cost control with quantity surveyors."

#### WHY NOT ABOLISH HUNTING . . .

### Short Sighted Policy

SIR,—The RIBA's decision to raise, yet again, the annual subscriptions of its members is clear evidence of its inability to manage its financial affairs effectively. One may well ask why the need for two increases within so short a period? Was the RIBA not able to foresee the trend of their financial position a year ago, when membership subscriptions were last increased?

The report in your JOURNAL last week makes particularly depressing reading to the younger Associates of the profession. One has merely to glance down the columns of "Architectural Appointments Vacant" each week to see how poor salaries are. Principal architects seeking assistants lack the courage to state the salaries they are prepared to offer. No doubt they do not wish to dishearten would-be employees by being frank and open about the all important £ s. d. factor.

I would refer to the Hon. Treasurer's answers to questions put to him at the RIBA press conference. He informs us that more and more architects are seeking employment abroad and that the number of new entrants to the profession is decreasing. Can we expect anything else, when entrance examination fees and subscriptions are increasing so much and salaries offered to qualified assistants after years of training are so poor? How can the young architect live up to the status of a "Professional Man"? What, one may ask, is the prospect of any improvement when such a short-

sighted policy is adopted by the RIBA? Would it not have been a wiser policy to give an incentive to prospective architects instead of shutting all the doors to those who have the interests of our profession at heart and sincerely desire to become enthusiastic architects.

RONALD H. MORGAN.

Dorking.

SIR,—We, members of the RIBA employed by a Local Authority are as much dismayed by your attitude to the RIBA's increased subs as by the increases themselves.

You suggest in your editorial that we should pay a higher subscription than our equivalents in private offices because of our increased security. You seem to forget two facts.

1. None of our security is due to the RIBA, it is derived solely from our superannuation scheme and from the work of NALGO and other unions, to which we pay a large contribution annually. The RIBA has in fact (for good reasons; we admit) refused to concern itself with this question.

2. At present all our subscriptions are paid from taxed income (see AJ, February 13, 1958, page 243). If you compare our total present contributions with those of the assistant in private practice you will find that the following deductions are made from our respective gross salaries:

Local Government Architect earning less than £1000 p.a.	Sum received by Institute etc. from member	Equivalent Deduction from members' gross salary
	£ s. d.	£ s. d.
RIBA	6 6 0	10 19 0
ARCUK	1 0 0	1 14 9
NALGO	2 14 0	4 14 0
TOTAL	10 0 0	17 7 9
Private Architect		
RIBA	6 6 0	6 6 0
ARCUK	1 0 0	1 0 0
TOTAL	7 6 0	7 6 0

In the future these figures will probably become

Local Government Architect		
RIBA	7 17 6	13 14 0
ARCUK	1 0 0	1 14 9
NALGO	2 14 0	4 14 0
Local Govt. Archts. Soc.	10 0	17 3
TOTAL	12 1 6	21 0 0
Private Architect		
RIBA	7 17 6	7 17 6
ARCUK	1 0 0	1 0 0
TOTAL	8 17 6	8 17 6

If you will bear in mind that though it is impractical for us to evade these subscriptions, we can only expect direct benefit from NALGO and our new society, you will surely agree that we are bearing more than our fair share of the burden imposed by the RIBA.

Surely it would be in the interest of all the profession for subscriptions to be raised as much as possible from the untaxed income of members.

JEREMY B. LOWE,  
JOSEPH N. LONGVILLE,  
W. RAMSAY,  
K. SWALES.

Durham.

SIR,—After reading the current issue of the RIBA Journal we are shocked at the amazing proposal to increase again the annual subscription in 1959.

Salaried associates who form the bulk of the membership must, we feel, now consider if they are able to afford membership of a body which despite its other merits, certainly has little or no effect on negotiations for salaries and service conditions. Most young associates do, in fact, subscribe to the RIBA simply in order to retain the distinction of A.R.I.B.A., which has become the nominal symbol of qualification. We must

certainly state that we have received little else for our subscriptions during our years of membership.

Now, however, we in local government are faced with expenditure which we feel goes too far. The all-important registration fee is £1; the proposed RIBA fee—£7 17s. 6d.; RIAS and allied Society—£1 1s. 0d., and in order to safeguard our most vital interests we have to be members of NALGO at a fee of £3 per annum—a grand annual total of £12 18s. 6d. If the *ad hoc* Committee's proposals for a Local Government Architects' Society are accepted, we are no doubt faced with an additional fee. Is it to be wondered that we are perturbed, especially as others of comparable status in our department have not the crushing burden of RIBA fees, whilst enjoying the same salary and conditions. To increase this burden as now proposed could result in a decrease in membership which in itself would defeat the purpose of the increase, and do nothing to mitigate the apathy towards the RIBA which already exists among salaried assistants particularly in Scotland.

We note that a major financial problem is the amount required for RIBA headquarters, building and staff. We would respectfully point out that most northern architects can hardly afford to visit Portland Place, far less make use of its facilities. Is it fair that these architects be required to subsidize, to this extent, those in London and the Home Counties who are the only ones able to take advantage of the Institute Building?

No doubt, a pamphlet would be required to cover all the points at issue. However, we would conclude by urging the RIBA Council to reconsider this proposal, or failing this, to revise the charter of the Institute so that salaried associates can rely on it for real protection in their daily work, and thus reduce the commitments to other bodies who at present are carrying out the work which should be the duty of the RIBA.

We have, of course, protested to the RIBA in like terms but we are writing to the JOURNAL in the hope that there may be other members who, thinking as we do, will add their protests too.

PETER G. ROBB.

Ayr.

SIR.—The manner in which the financial statement by the RIBA, published in your recent issue, was set down is quite extraordinary. As an interim statement of accounts, it would have been inadequate, but as an explanation accompanying such a grave move as the raising of subscriptions it was inexcusable. Each member of the profession should be given a complete picture of the state of finance, not a mere summary.

What, for instance, does the substantial proportion of the liabilities shown as 8.9 per cent and labelled miscellaneous really represent? I calculate that this figure would be between ten and twelve thousand pounds—a large sum of money.

On this subject, may I suggest that the RIBA present a copy of the last balance sheet to every newly elected member of the Institute. This surely should be standard practice.

D. T. DOXAT-PRATT.

Worcester Park.

## How Can Architects Fail To Cure Subtopia?

SIR.—Re last week's third letter; thank God somebody's said it.

IAN NAIRN.

London.

## Thermal Insulation

SIR.—Houses and factories obviously ought to be properly insulated: it is not so obvious that the matter should be controlled by law. The fact that it may very often be in the owner's financial interest to insulate a building is a good point for an advisory pamphlet, but not for an Act of Parliament.

Your editorial comment of February 6 brings out the difficulty of setting a standard of thermal insulation. Every regulation which prescribes a minimum immediately sets a standard; and if to guard against this the minimum is raised, the standard must be too high for some cases, and the result is legally-enforced waste. A standard of thermal insulation sufficient for a house on Flamborough Head would be unnecessary in Bournemouth, and the requirements of the main body of a house may be higher than those of an attached draught-lobby, fuel store, tool-shed or conservatory. If a low average standard is set, it gives the cachet of official approval to inadequate insulation in exposed positions, and thus where insulation is most important a regulation may do more harm than good.

Secondly, and more important, it is beyond the skill and imagination of any man to draft regulations sufficiently flexible to bear upon things as diverse as buildings without arbitrary restriction of the architect's invention. Architects today have to use considerable ingenuity in wriggling through the loopholes to put up anything better than the conventional builder's semi-detached villas and Wareham-and-Drury type "Buildings of the Jaggard Class" which the regulations are drafted to contemplate.

The cross-wall construction used by Eric Lyons in some of his flats is an excellent example of the ingenious exploitation of such a loophole to put up something cheaper and better than the by-law house, and his glass-walled dwellings are much in demand in a market hitherto limited by cost to the spec-builder's pet formula. Has it been realized that Mr. Nabarro's Bill will kill cross-wall construction, because the necessity for a large area of double- or triple-glazing will destroy its economic basis?

Glass-and-steel houses, such as those designed recently by James Cubitt & Partners, would also come under the ban. In fact, any house with a flat roof would present very great difficulties, if a very low "U" value were prescribed. Only the conventional by-law brick box could be adapted to comply with the new rules at no great cost—and it is precisely that which any architect worth his salt does his best to avoid!

Again, a Bill which seizes on one aspect only of comfort, the "house U value," will stimulate the indiscriminate use of thin, highly-efficient insulating materials, which if wrongly applied in our cold, damp climate will by interstitial condensation cause discomfort and serious structural damage.

If it is felt that official control is needed, a panel of professional experts should be convened to draft a code of practice for the thermal insulation of dwellings. The Model By-laws could be amended to enforce adherence to the code, which could prescribe methods of construction and establish variable standards of thermal insulation according to the degree of exposure and class of use. Such a code could be revised more easily than an Act of Parliament, and would be therefore less of an obstacle to the evolution of building technique.

However, on the whole we think that the present system of leaving the matter to the skill and judgment of the architect is best. He alone is trained to see the problem of building as a whole, and does not think of separate functions, such as thermal insulation, in water-tight compartments. Fundamentally, the only way to get good build-

ings is to employ good architects and good builders.

FEATFIELD AND BODGENER.

London.

## "Remarkably Cheap"

SIR.—I detect a definite note of laughable cynicism in Mr. Handiside's letter and your own postscript (AJ February 13), at the mere thought of a factory being built for £1 10s. per sq. ft. super. Any client who even thinks of any figure less than £2 per ft. is of course quite mad!

Let me, however, recount a recent experience. I was required by clients to design 25,000 sq. ft. of open factory space and 5,000 sq. ft. of open office space on a sloping site near London. The clear height in the factory area was to be 15ft. 6 in. and the standard of finishes, while to be of the minimum cost, had to meet the requirements of "permanent building." No frills were required, either architectural or otherwise, nor could they be afforded, for the main requirements by the clients was that the cost had to be kept down to £1 12s. 6d. per sq. ft. Being faced by this, I consulted three of my quantity surveyor friends—the first said nothing could be built for less than £2 per sq. ft. The second cautiously came down to 37s. 6d. The third surveyor—who it must be admitted, has factual experience in real low cost building, felt that 30s. per ft. was a possibility.

In fact detail drawings and a bill of quantities were prepared and priced—the result—a building costing less than 30s. per sq. ft. super, inclusive.

The great danger these days is that, in all fields of low cost building, architects are getting the reputation of being an expensive luxury. Let's face it—few architects appear to be able to produce a really cheap but well-designed building, which is the essential problem to be solved in so many of our buildings these days.

H. OWEN LUDER.

London.

## Funny Storey

SIR.—It is always a comfort to know that one can count on the support of one's colleagues in all matters affecting one's architectural activities, though one never quite knows the form which that support will take.

ASTRAGAL, for instance, has just been so kind as to point out in "This week's funny storey" (AJ, February 13) that I have forgotten to provide a stair in the first stage of my house, thinking, of course, that as I am building it myself I should, but for his keen perceptive comment, find myself trapped upstairs unable to descend.

Well meant as this no doubt is, I have the feeling that it was phrased in such a way as might make people think that architects are just a wee bit stupid. I hope that he will not feel hurt when I say that even without his help I had realized that some sort of stair—perhaps even a temporary one—would be needed in order to reach the upper floor, and had actually provided for a portion of building wherein it would stand.

But as I said, it is reassuring to know that someone of ASTRAGAL's calibre has our interests at heart in case one day one of us forgets his walls and windows.

JOHN AMOR.

Ongar.

## Spons Price Book

SIR.—Your review of *Spon's Architects' and Builders' Price Book* (AJ, February 6) asks what size of job is assumed in the Comparative Prices section and whether the prices include overheads and profit, discount, etc. As is stated in the Directions for the section on page 468 of the book the prices are based on those for Measured Work; they

Above, and opposite page, are listed the Honorary Officers of the RIBA for the years 1949-50 to 1957-8. The list includes, where relevant, the date, or dates when an officer stood for election to the Council as an ordinary member and was defeated. It also shows how relatively few are architects who might be described as belonging to the "modern movement" and therefore in sympathy with the aims and

ideals of the post-war architectural world. These Honorary Officers, and, of course, particularly the President, the Honorary Secretary and the Honorary Treasurer, are the prime creators of RIBA policy, yet only two of all the Officers have to be elected members of the RIBA Council. These key positions were not affected when the revisions to the membership of the Council were

assume a job in outer London costing about £60,000, and they include for overhead charges and profit, etc., but not, of course, for job "Preliminaries." We agree that it would be helpful if this information is repeated in the preamble at the top of the Comparative Prices and this will be done in future editions.

As for abandoning the foot cube prices of different types of building in favour of foot super prices, it may be possible to give both when sufficient information accumulates. At present, there is insufficient background knowledge of foot super rates for many types of building and in any case the foot super method also conceals "statistical fallacies," the most obvious of which is that it makes no allowance for differences in storey heights.

DAVIS, BELFIELD & EVEREST.

London.

### "A Real Maniac"

SIR.—No wonder Sir Hugh Casson found it nice to listen to "a real maniac" at the AA on January 29 in the year 1958.

After we have heard all the certified sane and safe lamenting, as Sir Hugh did recently over the threatening American scene, and asking what can we do to be saved, a "maniac" who suggests that our problems are not just matters of aesthetics or "getting people to see things in the right way" is a godsend!

Of course he went and spoilt it all by mentioning that Money might have something to do with our problems. Too bad!

ANDREW CARDEN.

London.

## THE UNIVERSITIES

### £60 Million Programme

A correspondent writes: £60,000,000 worth of new building is to be put in hand during the four-year period beginning in 1960 to help the universities accommodate the 124,000 undergraduates who will be following full-time courses by the middle of the decade. This sum will be scarcely sufficient to provide all that is needed to meet the essentials of basic vocational training. Wisdom of a high order and the utmost professional skill will be needed to deploy it so that the universities can fulfil their true function—the culture of whole men.

Are we, as a profession, adequately equipped to play our part in this formidable operation? The two numbers which we recently devoted to the universities and the October issue of the *Review* revealed the cumulative effect of failure to understand the nature of the problems both of strategic planning and of detailed design of individual buildings. The mistakes of the past were for the most part paid for by the universities themselves or their private benefactors. Today the nation foots the major part of the bill.

Alone among the bodies dependent on public funds, the universities do not answer directly to the exchequer for their expenditure. Between them and the Government of the day stands the University Grants Committee, shouldering collective responsibility for both the capital and day-to-day cost of university education. By this typically British device individual universities remain free;

free to teach what they think fit; free to fashion their own environment; free to choose their own architects. Their share of the "ration" of public funds is the only limitation imposed upon them, and even this they are free to supplement from other sources if they can.

But to fulfil its duty to the public and to the universities as a whole, the Grants Committee must satisfy itself and the Treasury that public money buys good value in university building. It is showing itself sharply aware of the problems inherent in this urgent responsibility. In the last year, its machinery for grant applications has been overhauled. Forward planning has been advanced from two to three years, thus allowing much more time to be devoted to investigation of requirements. It now recommends universities to seek architectural advice from the very earliest stage of each project and offers the co-operation of its own recently acquired architectural staff which is rapidly equipping itself to give guidance and help on space requirements, on planning and on costs.

There are signs too that the universities, so well informed on every other intellectual, artistic and scientific pursuit of human kind, are at last discovering that architecture is not only that which the more fortunate inherit from the past. Copyist compromises are being deplored. Demand is growing for honest solutions to practical problems, touched with that indefinable quality which distinguishes architecture from ingenuity.

This is the challenge. During the sixties will be fashioned the mirror which will reveal us to the professors and students of the twenty-first century. How will we look?

## SOCIETIES OVERSEAS ON THE RIBA COUNCIL FROM 1949-1957

introduced last year. Indeed the Council Committee charged in 1954 with reporting on the constitution of the Council and on the representation of the various classes of membership on it, found the present procedure for the appointment of officers "right and proper." The same committee ignored the problem of the represen-

tation of allied societies overseas on the Council. The U.K. representatives for the same period are also shown above. It is interesting to note how often a U.K. representative is also an officer or an ex-officer, thereby keeping new blood from joining the Council or old blood from leaving it.

## TDA

Timber Furniture  
Competition

The Timber Development Association has organized a competition for the design of office furniture made mainly, but not necessarily exclusively, of wood and/or plywood. The competition is open to bona fide designers working in collaboration with

manufacturers. There is a prize of £500 for the best design for suites or unitary systems of office furniture (appropriate to the needs of typists, junior and senior staff), and five prizes of £100 for individual items of furniture. These items are desks for typists, for junior grades, or for senior grades, a chair for general office use, and filing units.

The requirement that there should be collaboration between designers and manufacturers is intended to ensure that the designs produced are practicable, and lend themselves to production by a manufacturer at competitive prices, and also to enable the TDA to call for the submission not only of designs on paper but of full-size prototype furniture also. This will subsequently be put on exhibition, and will enable the public to appreciate more fully the results of the competition.

Both manufacturers and individual designers are invited to enter, and those firms which do not have their own design staff, and those designers who have no standing arrangements with a manufacturer, will be introduced to each other so that they will have the opportunity of collaborating. No prizes are offered to manufacturers, as their reward is intended to take the form of orders for furniture.

The competition will be judged by the assessors in two stages. Intending competitors must enter by April 30, 1958, and the closing date for the submission of sketch designs sufficient to indicate their intentions and reports not exceeding two foolscap sheets will be August 29, 1958. This stage is in the nature of a preliminary round, during which collaboration between

designers and manufacturers, although desirable, is not essential, and submissions from an unattached designer will be accepted.

In the light of the assessors' judgment of the sketch designs and reports competitors will decide whether or not to proceed to the second stage; designs submitted by unattached designers which have been recommended by the assessors will be brought to the attention of manufacturers, in a further effort to secure the collaboration required. In the second stage, for which the closing date is February 27, 1959, entries will consist of working drawings, specifications, prototype furniture, and a short report to be submitted jointly by the designer and the manufacturer, with approximate retail prices.

The assessors are: Professor Robert H. Matthew, Professor R. Y. Godden (Royal College of Art), O. G. Pickard (Office Management Association), B. McGeoghan (Council of Industrial Design), D. A. C. A. Boyne (executive editor, *THE ARCHITECTS' JOURNAL*), E. Levin (TDA). Copies of the rules and notes for the guidance of competitors can be obtained from the Secretary, TDA, 21, College Hill, London, E.C.4.

## PLANNING

## "Let Architects Loose"

Lord Mancroft, Minister without Portfolio, speaking at the Jubilee Dinner of the London Appreciation Society, said: Some

people have become preservation mad. Hence the lamentable condition of some of our architecture today. The fright we have taken at the idea of high buildings has ended in a dreadful compromise. Why can't we turn our architects loose? I have myself little faith in control of design.

I think we should draw a protective ring round a few special places: elsewhere we should let the architects experiment, subject, of course, to the total amount of building to be allowed in relation to the site. Of course, we shall get some horrors, but we shall also get some excellent building and nothing like so much mediocrity. If we don't have a bit less planning, planning may become a dirty word. What happens is we are all in favour of less planning until we find something we personally dislike. Then we all demand more planning and the result is the glutinous mass we see rising around us today.

## BIRMINGHAM

### "Services Can Be Fun"

The Birmingham School of Architecture has completed another week's course at Attingham Park, near Shrewsbury, to which it takes its students every year as an antidote to Birmingham. The subject this year was heating, beginning with a lecture by Mr. Chrenko, of the Medical Research Council, on the physiological approach to heating, and culminating in a lecture by W. White, of Grenfell Baines and Hargreaves, on the effect of heating service on the design of a large building. A correspondent writes that the school discovered the real heart of the problem to be this: since we can't all become service engineers, the engineers ought to learn that architecture is fun (as many structural engineers have done) and that their work becomes more interesting when it fits in with the thinking of the rest of the building team. This, he adds, is not asking very much because many architects have already decided that services can be fun.

## IUA

### Congress News

Some additional information about travel arrangements for the Moscow IUA conference (already reported on January 23) has now been issued by the RIBA. The return fare by night flight to Helsinki and thence by train to Moscow is £68, but the inclusive cost is expected to be £110, the figure quoted earlier of £90 not having included overnight stay and meals in Helsinki, nor the cost of meals en route. The cheapest route, for the extremely hardy, is second class train and boat, for which the return fare is £55; but this does not include a sleeper (£23 extra) or the cost of meals on the four-day journey each way. The travel agencies in touch with Intourist are Thomas Cook and Son Ltd., 45, Berkeley Street, Piccadilly, W.1, Co-operative Travel Service, 4, Regency Street, London, S.W.1, L. W. Morland & Co. Ltd., 5, Whitlington Avenue, London, E.C.3, Progressive Tours Ltd., 100a, Rochester Row, London, S.W.1, and Workers' Travel Association Ltd., Eccleston Court, Gillingham Street, London, S.W.1. The Bank of England has authorized additional currency for those attending the Congress, and those wishing to take advantage of this facility should write to the Secretary, UK Committee, IUA, at the RIBA.

At the Congress, of which the theme is Construction and Reconstruction of Towns, 1945-1957, the discussions will be divided into two main headings, "the plan" and "the realization of the plan." Simultaneous translation will be provided into and from English.

The seven Working Commissions of the

Congress have been reorganized. One national section of the IUA will be responsible for the secretarial work of each of the Commissions, and a delegate has been appointed in each Commission to be in charge of its work. The "Commission de l'Architecte" has been re-established as two separate commissions, one on professional practice, on which the British delegate is J. M. Austin-Smith, and one on architectural education, on which the British delegate is professor R. J. Gardner-Medwin. Professor Gardner-Medwin is the commission's rapporteur, and the RIBA is responsible for the secretarial work of this commission.

International meetings in 1958 include the General Assembly of the International Standardization Organization (Harrogate, June 9-21), Congress of the International Federation of Housing and Town Planning (Liège, August 31), and Congress of the International Federation of Landscape Architects (Washington, August).

## RIBA SYMPOSIUM

### Private House Design

A one-day Symposium has been arranged by the Town and Country Planning and Housing Committee of the RIBA to take place on May 2, 1958. The purpose of the meeting is to stimulate action to improve the appearance of town and countryside through the better design of private housing. The Committee are sure that this is not only socially desirable, but is a business-like and worthwhile object. It is hoped that this joint meeting of architects, builders, representatives of building societies and clients will do much to promote the understanding which is thought to be necessary before better design can be commissioned.

The meeting will be opened by Henry Brooke, the Minister of Housing and Local Government, and it will be held under the Chairmanship of Sir Hugh Casson, who will speak on "The situation." Other speakers are C. Douglas Calverley, a house builder; Hubert Newton, the general manager of a building society; Miss May Abbott, the news editor of a national newspaper for women; Clifford Culpin; Tom Mellor; Peter Dunham; G. Grenfell Baines; Eric Lyons, Norman Wates and Roger Raymond (builders); Paul Reilly, Deputy Director, Council of Industrial Design, and P. G. Laws.

Tickets for the Symposium, costing £1 each, and including a copy of the printed report of the proceedings, are obtainable from the Secretary, RIBA, 66, Portland Place, London, W.1.

### Visit to Brussels Exhibition

The Essex, Cambridge & Hertfordshire Society of Architects has arranged a four-day visit to the Brussels Exhibition, May 9-12. Members and their friends will fly to Ostend where hotel accommodation has been booked and thence journey by coach on two successive days to Brussels. Over 80 people are participating. Approximate cost, return air fare, hotel and coaches, £15. There are a few vacancies left and anyone interested is invited to write to the Hon. Secretary, R. Owen Vine, Tudor Chambers, Station Road, Wood Green, London, N.22.

## YORK INSTITUTE

### 1958 Courses

The York Institute of Architectural Study includes the following courses in its programme for 1958: Protection and repair of historic buildings, March 20-29; The care of churches, March 29-April 3; Landscape reclamation, April 17-22; Architectural

design, July 26-August 23; Landscape design, July 26-August 16; Modern techniques in timber construction, September 11-15; Mining subsidence, September 15-19; Architectural project management, September 19-23. There will also be four schools: for architectural students, from July 26-August 9; on the history of English architecture, from August 9-16; on the English country house, from August 16-23; and on the history of railway architecture, from August 23-30. Further information is obtainable from the York Institute of Architectural Study, Mickelgate, York.

## HAMPSTEAD

### Anti-Subtopia Society

The New Hampstead Society, a unique organization formed originally by a small group of architects and others to press for a Civic Centre of modern design, is to be kept in being as a permanent organization with broader aims. Professor Pevsner is to be the speaker at an inaugural meeting on March 6. A statement issued by Christopher Gotch, the secretary, says:

There already exist organizations devoted to the preservation of what is good in old Hampstead; but while we support their efforts, we feel that something more is required. The New Hampstead Society will make war on ugliness in all its forms; it will be the sworn enemy of Subtopia or unnecessary tree felling, the erection of ugly lamp posts, and the proliferation of badly designed street "furniture." It will continue to interest itself in the development of the Civic Centre, and it will try to promote a high standard of architecture particularly by the Borough Council, to which it looks to set an example.

It deplores the fact that Hampstead has no Borough Architect. Hampstead, it believes, should appoint a Borough Architect and make him responsible not only for the Council's housing and other building, but also for Town Planning when certain town planning controls are delegated to the Borough Council by the LCC. In all these matters it will try to act as a link between architects and others who value the good appearance of Hampstead.

## DIARY

**Spanish Castles.** Exhibition of photographs at the RIBA, 66, Portland Place, W.1. Monday to Friday 10 a.m.—7 p.m.; Saturday 10 a.m.—5 p.m. Admission free.

## THE INDUSTRY

*This week Brian Grant describes a new range of decking tiles, vinyl flooring, a fireproof wood preservative, a new refrigerator, plastic surfacing and a switch.*

**Asbestos-cement decking tiles**

Asbestos-cement decking tiles are now being produced as a permanent finish for use over asphalt and built-up felt roof coverings. The tiles are 12-in. sq. and  $\frac{1}{8}$ -in. thick, and have a slightly domed centre and chamfered edges. They provide a hard-wearing surface for flat roofs or balconies and give protection to roof finishes which would otherwise be liable to damage from foot traffic. Fire resistance and insulation are improved, and the light grey surface of the tiles also helps to reflect solar radiation. The tiles cost 1s. 7d. each and there is a range of standard accessories for abutments, verges and eaves, with half tiles, drips and coves: special purpose tiles can also be produced without undue difficulty. (The Universal Asbestos Manufacturing Co. Ltd., Tolpits, Watford, Herts.)

**New vinyl flooring**

A new flexible and silent sheet flooring made from vinyl plastic reinforced with asbestos fibre has recently been added to the Marley range. It is known as Marleyfloor No. 1 and is available retail in rolls 48 in. wide at a price of about 21s. a sq. yd.: it has a marbled finish and is made in ground colours of red, blue, cream, yellow, green, black and dark and light grey. It can be fixed permanently with Marley No. 12 adhesive, or, as it lies quite flat, it can be laid loose like linoleum. It is suitable for laying on smooth solid sub floors such as concrete or cement screed, which should be level and dry. With timber floors any gaps between boards should be filled, and nails punched down. The flooring is not suitable for use below ground level, or for laying on wood block. A water emulsion polish such as Marley waterwax is recommended for cleaning. (The Marley Group Ltd., Sevenoaks, Kent.)

**Fireproofing timber**

For some considerable time Messrs. Celcure have been producing wood preservatives to give protection against attack by fungus and insects, and they have just introduced a new Grade F, which gives, additionally, a very high degree of flameproofing. The compound is applied by vacuum and pressure impregnation to give a retention of about 2.5 lb. of solids per cu. ft. of timber. The chemicals used consist of ammonium salts and borates, and other compounds not disclosed, but fire tests at Boreham Wood show that samples of softwood treated with the compound have surfaces of Low Flame Spread (Class 1). After treatment the timber has a pale green colour and is quite odourless when dry: it will take paint, stains or varnish as easily as untreated wood, and is not corrosive to metals. The most suitable timber to use where flameproofing is required is European redwood, because of its permeability, but some of the softer hardwoods such as beech and birch are easily treatable. Whitewood and spruce can also be treated, but not so easily, while Columbian pine is not really suitable as it is almost always 100 per cent. heartwood. The cost of the treatment is 3s. 10½d. per cu. ft. in quantities of one standard or more, and the process can be carried out at the company's various plants as required. (Celcure Ltd., Aldwych House, Aldwych, London, W.C.2.)

**Small refrigerators**

The illustration on the right shows the new 2 cu. ft. Lec refrigerator, which now has an extra second shelf, giving a total area of 3.6 sq. ft. The compressor unit and motor are guaranteed for five years, and the refrigerator costs £45 19s. 3d. including purchase tax. (Lec Refrigeration Ltd., Shripney Road, Bognor Regis, Sussex.)

**Bespoke plastic surfacing**

Architects and designers can now have their own patterns incorporated in wear resistant melamine surface finishes, even when the quantities involved are comparatively small. The scheme has been worked out by the Aircscrew Company & Jicwood in conjunction with Sandersons wallpapers, and the melamine surface is applied to Hardec board. A wide range of suitable papers is offered by Sandersons, who are prepared to adapt any colours to suit individual requirements. From the stan-

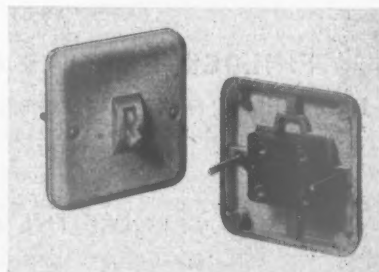

dard range of papers a minimum quantity of 200 8-ft. x 4-ft. sheets can be supplied, but if a special colour is needed then the minimum quantity is increased to 2,000 boards. Alternatively, architects' own designs can be used even if the quantity needed is comparatively small. (The Aircscrew Company & Jicwood Ltd., Weybridge, Surrey.)

**Intermediate switches**

Crabtree's have just added a 5-amp intermediate switch to their Lincoln range of flush type a.c. switches. The new type is in every way uniform with the one and two way units with which it will be used, and it is shallow enough to be used with plaster depth boxes. The mechanism, which moves on nylon pivots, is sealed, and only the wiring terminals are accessible. A connection diagram has been moulded in the base. (J. A. Crabtree Ltd., Lincoln Works, Walsall, Staffs.)

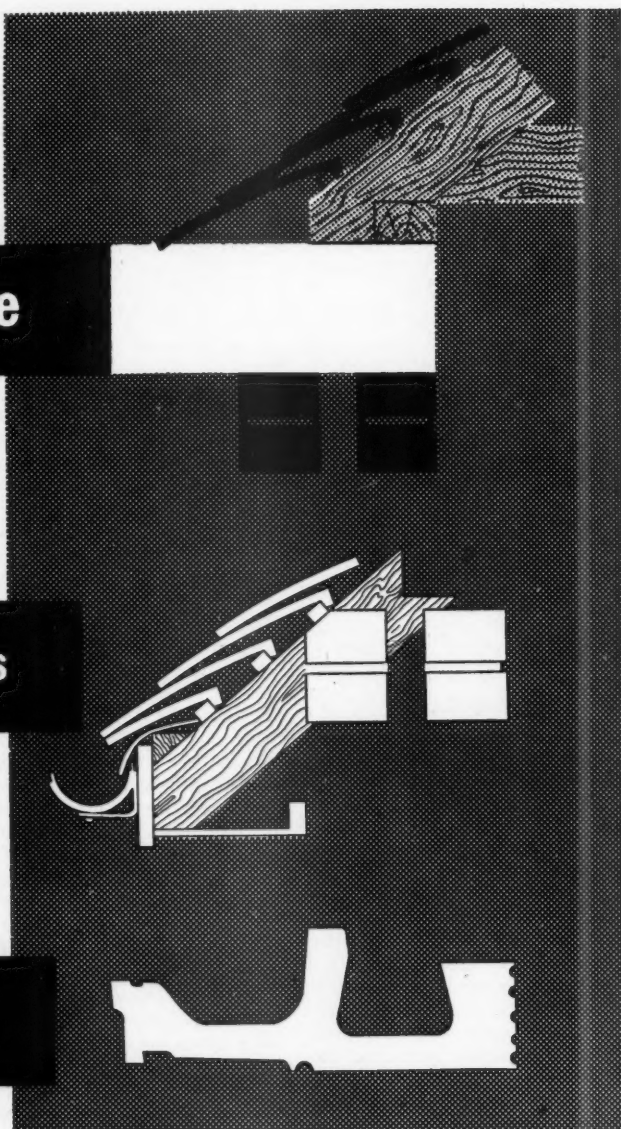

Above, the Lec 2-cu. ft. refrigerator, now fitted with an extra shelf giving a total area of 3.6 sq. ft. Below, the Crabtree 5-amp intermediate switch.

## 26 SERVICES AND EQUIPMENT

small electrical installations, 6  
screwed conduit (continued)

In the issue of February 13, Peter Jay and Clive Wooster considered the advantages (and disadvantages) of screwed conduit and described the components which it requires\*; this week they continue by discussing the layout of screwed conduit installations.

In the previous article we described the proper use of boxes, the limits of conduit bends, etc. It now remains to explain how these principles are applied in actual installations.

For easy reference we shall here repeat the table giving the capacity of the smaller sizes of conduit for 250-volt. grade VIR cables of the sizes most commonly used in private house wiring.

CAPACITY OF HEAVY GAUGE CONDUIT

Size of Cable	Size of Conduit ½ in.	¾ in.	1 in.
3/-029	4	6	13
7/-029	3	4	9

In practice it is most unwise ever to use ½-in. conduit. Even when no need for more than four 3/-029 cables in one conduit can be envisaged at the start, cases in which an increase to five or six are required are so frequent that as a general rule it is very much better to stick to ¾-in. throughout. ¾-in. conduit costs only about 12s. per 100 ft. less than 1-in. conduit, which small saving is offset by the need to use reducing adaptors whenever it is required to branch in ¾-in. conduit from a box with spouts for 1-in.

This is a matter in which it is possible to construct special cases, and in such cases ½-in. conduit might be quite acceptable. However, although no reasons can be given to show that it should *never* be used, a very little experience convinces most people that it is wise to avoid it.

Switchdrops in a flush installation form a very difficult case. It is rarely necessary to take more than three cables down to a single switch from the ceiling above, and whereas ½-in. conduit can sometimes be accommodated behind plaster without a chase into the brickwork, a chase will always be necessary with ¾-in. conduit. We will examine this point again when describing a private house installation in conduit.

## The layout of installations

It is scarcely possible to give any general principles governing conduit layouts, and we can only show examples of some well-designed installations, and describe certain methods applicable to particular

circumstances. Conduit work is like joinery, in that the difference between good and bad work can be recognized immediately by eye, although it is very hard to describe in words.

Fig. 1 shows a very simple surface installation in an office, in which two lights are controlled by one switch.

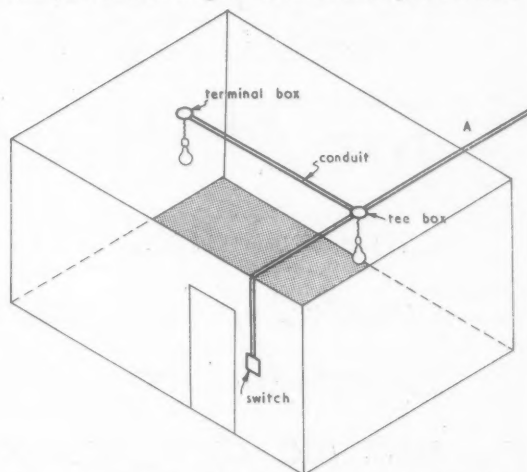

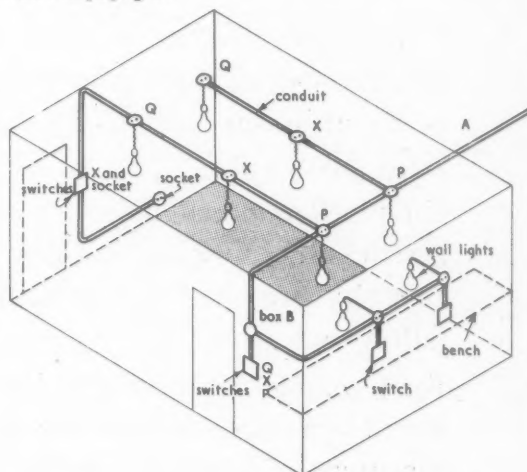

Fig. 1 (above), isometric diagram showing simple conduit installation on the surface. Fig. 2 (below), isometric diagram showing a more elaborate conduit installation on the surface. The wiring diagrams of both installations are shown on page 321.

The feed comes through from the next room at the point A. Fig. 2 is an elaboration of this installation, in which we have a larger office with six lights, controlled in pairs, the centre pair, marked X-X being two-way switched. There is also a bench along one wall with two lighting brackets above it, each controlled by a local switch, and on another wall there is a 2-amp. socket controlled by a switch at one of the doors as shown.

**Separation of circuits:** Lighting and power circuits should be run in separate conduits. The socket in Fig. 2 shares the lighting conduit only because it is a 2-amp. socket and is therefore fed from the lighting fuseway. Power (that is, 15 and 13 amp.) sockets should be fed from a separate conduit system.

On paper it may sometimes appear to be more

MEMBER OF THE METAL  WINDOW ASSOCIATION

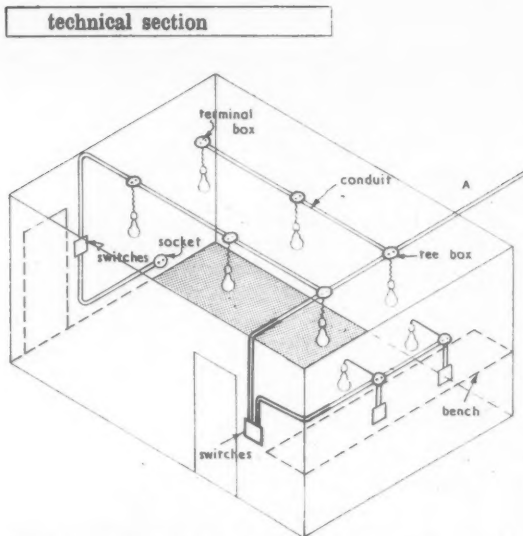

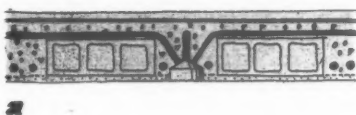

Fig. 3, installation similar to that shown in Fig. 2, but flush.

economical to allow lighting and power to share the same conduit in an interfloor space, although it very rarely turns out to be so in practice. Sharing conduits in this way makes the installation confusing to wire and to service later, and can sometimes lead to accidents, since an electrician will normally suppose that a conduit carrying primarily lighting wiring will be rendered quite safe by withdrawing the lighting fuses. There is, however, no objection to running the wiring from two different fuseways through one conduit, provided that both fuseways serve a similar kind of load.

**Flush installations:** Both the installations shown in Figs. 1 and 2 are on the surface. If the installations had to be flush, the box B in Fig. 2 would either be buried completely beneath the plaster, or its lid would be visible on the finished surface. Neither of these solutions is satisfactory, and we would adopt a rather different layout, shown in Fig. 3.

This illustrates a very important point. In surface work boxes are used wherever they may be required, although for reasons of neatness and economy, a good workman will arrange that he does not need too many. On the other hand, in flush work the conduit should be so arranged that boxes are used only at outlets, an outlet being a switch, socket or ceiling rose.

Fig. 4 (below, left), diagram showing layout of conduit to ceiling points where conduit is buried. Fig. 5 (below, right), two types of "loop-in" conduit boxes: a, domed top; b, flat top.

In other words, the principles of conduit layout are rather similar to those governing cable connections in TRS installations.

There is one solution sometimes resorted to when long runs are necessary behind plastered walls, and this is to sink the box lid under the plaster, but to mark its position by means of long brass screws, left projecting until the plastering is completed, and then cut off flush with the finished surface. We will not say that this method is never necessary, but we have never seen a case in which it could not have been avoided by more careful planning.

**Ceiling points in flush installations:** A box with a spout will cause trouble in a flush ceiling, so that a round box without spouts must be used, from which the conduit can rise to near the surface of the floor above, to avoid interfering unduly with the structure, as shown in Fig. 4. This method is applicable to nearly all types of ceiling, including suspended, hollow-tile and solid concrete construction. The type of box used is called a "loop-in box," and we have described it before, when considering the use of metal lighting fittings with installations in TRS. Such boxes are obtainable with both domed and flat tops (Fig. 5). Whereas the domed top has considerable advantages for use with TRS, the flat top is generally adequate for conduit work.

**Conduit to socket outlets:** Under suspended floors the layout of conduit presents no special problem, and if the sockets are close enough together, conduit can be run directly from one to the other.

Where the outlets are more widely spaced, or the building construction is such that many bends have to be made between each point, intermediate boxes have to be used, and a short board or a trap must be left above each. The number of these boxes and traps should be as small as possible, although it is important that the rules already given should still be observed, that boxes, or outlets should be spaced not more than 15 ft. apart measured along the run, and that no more than two right-angle bends should be used between successive boxes or outlets.

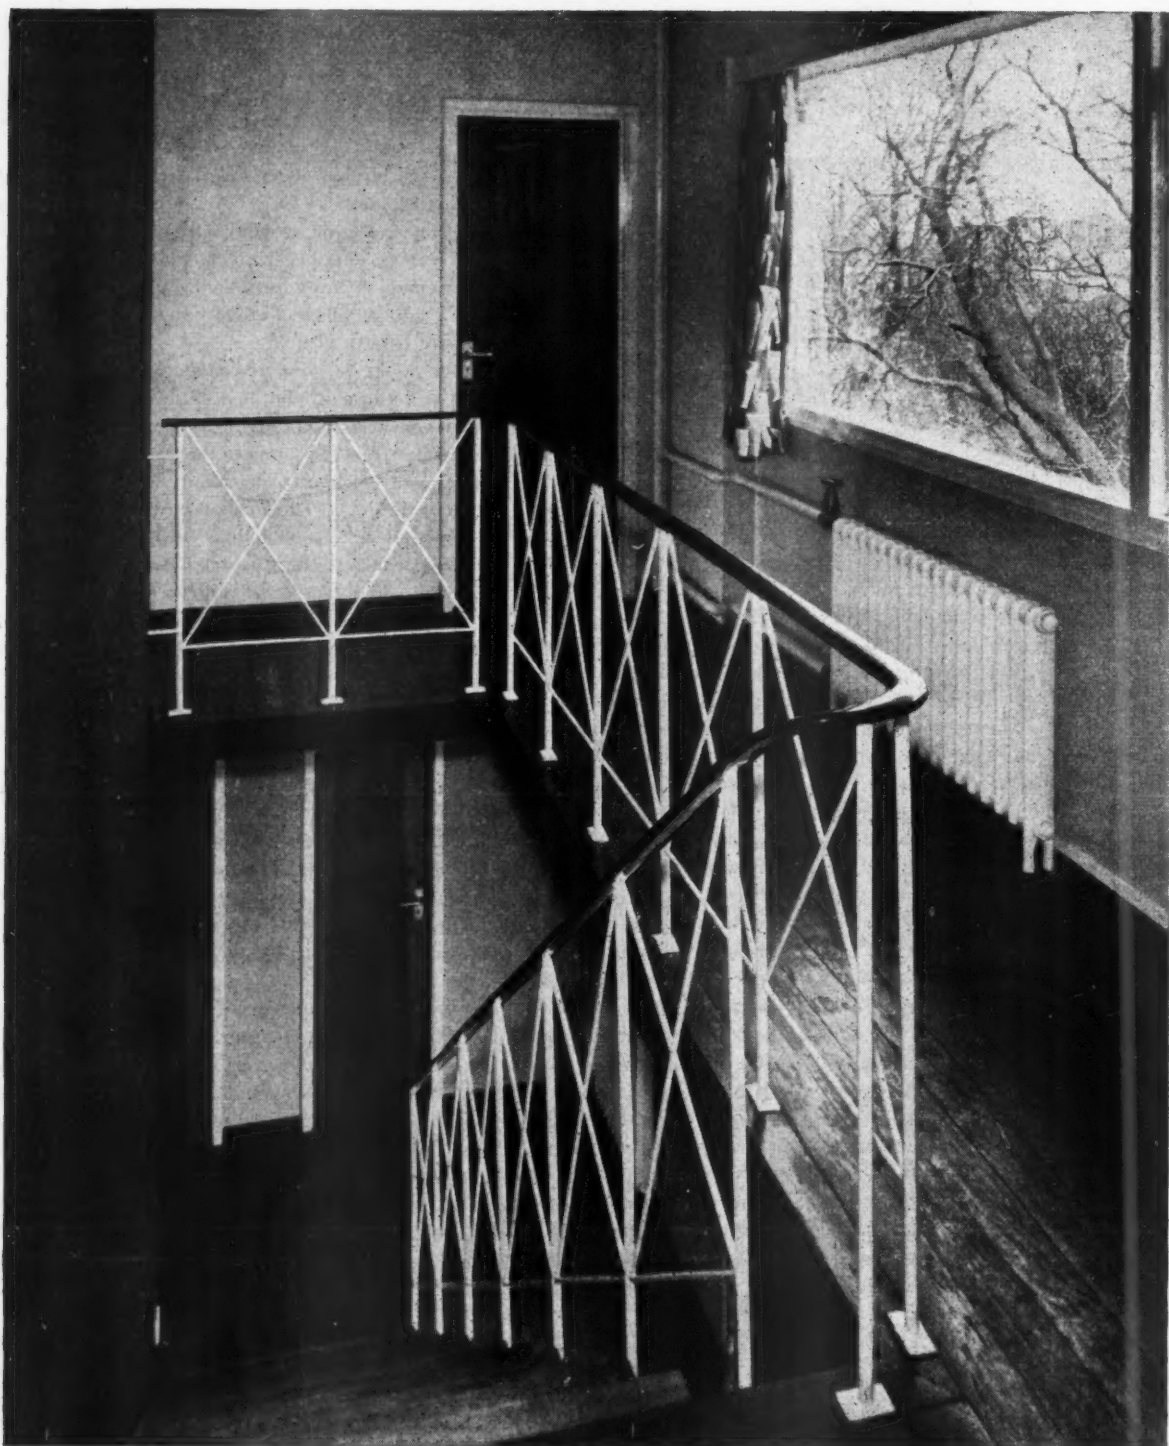

In buildings with solid floors it is often very difficult to avoid the use of intermediate boxes set in the screed. In such cases access to the boxes is obtained by inserting a trap in the floor finish, which may be lifted by means of a key or hookplate.

**Routing of conduits under suspended floors:** Where conduit has to cross joists it should do so at right-angles, and it must be dropped into notches. Notches must not, of course, be cut in the middle third of the span, and it is a good idea to specify that all such notches must be cut under the second board out from the skirting.

Conduit should be secured by means of crampets in such a way as to hold it reasonably rigid, and where it runs for some distance between two joists it should be secured either to the side of one of them, or to a batten specially fixed between them.

#### The protection of conduit

**Conduit in concrete:** Galvanized conduit must always

## technical section

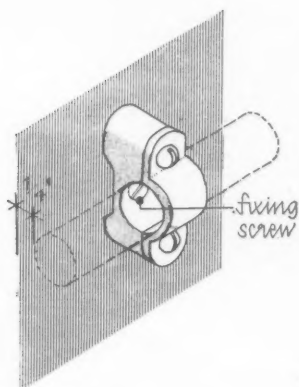

Fig. 6, drawing illustrating hospital saddle.

be used for runs through structural and site concrete. The rate at which the conduit will be attacked will depend upon the nature of the concrete, but it has sometimes happened that electricians seeking to re-wire an installation only a few years after it has been installed have found that the conduit set in the concrete has simply vanished.

**Conduit behind plaster:** The black enamel with which conduit is normally finished provides adequate protection against corrosion in plaster, but where this enamel has been stripped off, the conduit should be painted with red lead paint. Unless the site is under constant supervision it is very difficult to keep a check on things of this kind, and it is as well to specify red lead painting throughout.

No method appears to be known of preventing an unsightly rim of rust round the edge of a flush switch-box, unless it be by setting the box back a little way from the finished surface. This is an untidy way of coping with the situation, and the use of galvanized switchboxes is recommended. This does not imply that galvanized conduit need be used as well.

Where socket outlets are set in plaster, their boxes should also be galvanized.

**Conduit and other services:** Conduits should be kept well away from all water pipes, and should never be run in a duct provided for water pipes. Cold pipes give rise to condensation, while heat is bad for the insulation of the cables.

When crossing a hot water pipe, conduit should do so at right angles and pass beneath it. Where space is restricted, as under a suspended floor, insulating material, such as a piece of building board, should be placed between the two, to extend at least eighteen inches on either side of the pipe.

Conduit should also be kept well away from gas pipes. If it should prove impossible to do this, the conduit and gas pipe must be bonded together, that is firmly connected by means of an earth wire and clamps, to avoid any possibility of one becoming live relative to the other, and a spark passing between them. Permission should be obtained from the Gas Board before bonding the pipes.

Bonding of conduit to water pipes is necessary whenever an appliance containing exposed metalwork is placed in a room containing a water tap. It is especially important in bathrooms, where the bonding wire should be at least a 7/036, and should not be neglected in the kitchen.

A detailed description of bonding procedure was given in the third article in this series, as applied to TRS installations. With conduit installations the same precautions are necessary, except that the bond can be made between the pipes and the nearest run of conduit, and not necessarily to the appliance itself.

**Protection against mechanical damage:** No special protection is required against mechanical damage, although a certain amount of common sense should be used in running the conduits, as constant knocks will at least strip the paint off and so lead to rusting. Conduits should not be placed in such a position that ladders or other objects are likely to be leaned against them, nor where they are likely to be used as tie rails for clothes lines, etc.

**Protection against corrosion:** In earlier sections of this article we stressed the importance of avoiding rust on conduit. For ordinary surface installations in fairly dry conditions regular painting is the best protection. Water-bound distemper is not adequate for this purpose, and where surface conduit has been installed on walls or ceilings which will be distempered, the conduit should be painted separately with oil-bound paint. When redecoration becomes necessary, the conduit should be cleaned off and repainted, as although distemper, when thick enough, will hide rust, it does little to prevent rusting.

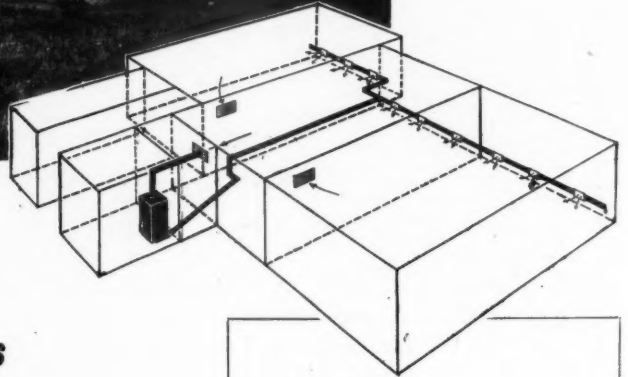

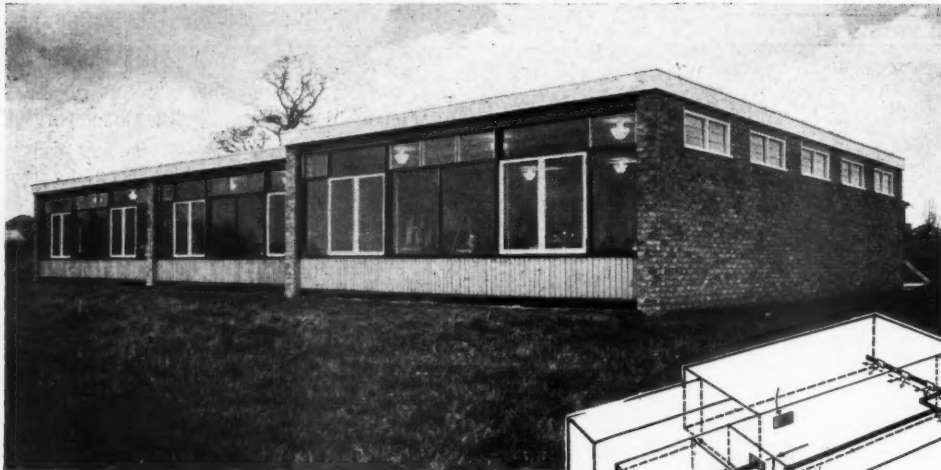

In factories and workshops the conduit is often painted with aluminium paint, and this is an excellent preservative for normal atmospheres, but is not adequate for really corrosive situations.

**In exposed situations:** Galvanized conduit should always be used out of doors or in exposed situations, and should be mounted on hospital saddles, shown in Fig. 6. Watertight switches, shown in Fig. 7, should also be used. These are ordinary switches, mounted in watertight boxes, and the dolly is operated by a lever connected to a knob on the exterior by a rod passing through a gland.

Watertight lighting fittings, such as bulkheads or well-glasses should always be used, and these are illustrated in Figs. 8 and 9.

If socket outlets have to be mounted in the open air (and their use out of doors should be avoided where possible) the watertight pattern, with a screw cover, shown in Fig. 10 should always be employed.

It is very difficult to make conduit watertight, but it is important to allow any water which has leaked in, or condensed inside, to run away. Work out of doors, or where severe condensation may be expected, should therefore be planned with this in mind, and a number of drain points be provided wherever condensed water may be expected to collect. These may be boxes with an open spout pointing downwards, or with holes drilled in the bottom. Long horizontal runs should, in

**The best of all modern  
heating systems is  
warm air heating—  
by Waterbury**

**It is more efficient  
Running costs are low  
Installation costs are low**

Waterbury heating can be applied to nearly all types of building ranging from the factory to the house, from the school to the church, from the garage to the shop. Flexibility in installation is the keynote and high efficiency the rule. Low capital cost and fuel economy are combined with heating at its best. Gently moving filtered warm air quickly circulates to all parts, obviating cold spots, banishing draughts and providing positive ventilation within minutes from starting. Sturdy construction, attractive appearance, long life and the latest oil and gas firing techniques are built into each Waterbury furnace.

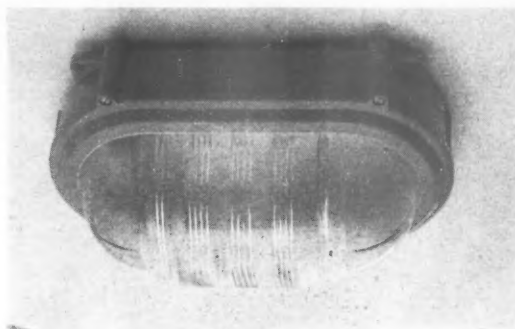

Fig. 8, bulkhead lighting fitting.

Fig. 9 (above), wellglass lighting fitting. Fig. 10 (below), watertight socket outlet with cover and plug.

these situations, be given a slight fall towards one end or the other.

*The painting of conduits out of doors:* Even galvanized conduits will not withstand the effects of wind and weather indefinitely. The caution already given against cutting too many threads so leaving some, from which the protective covering has been stripped, exposed, is especially important with galvanized conduit. Such conduit should always be painted first with an undercoat of red lead paint, and then be finished off in oil-bound paint as required.

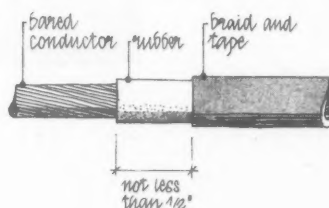

*Conduit in laundries, hotel kitchens, etc.:* In steamy atmospheres the precautions described above, for out-of-doors, should be observed, except that the use of watertight switches is not necessary, and watertight lighting fittings are optional. The lighting fittings selected should either be "vapour proof" so that no moisture can get inside, or should be open bottomed so that condensed water cannot collect in the base.

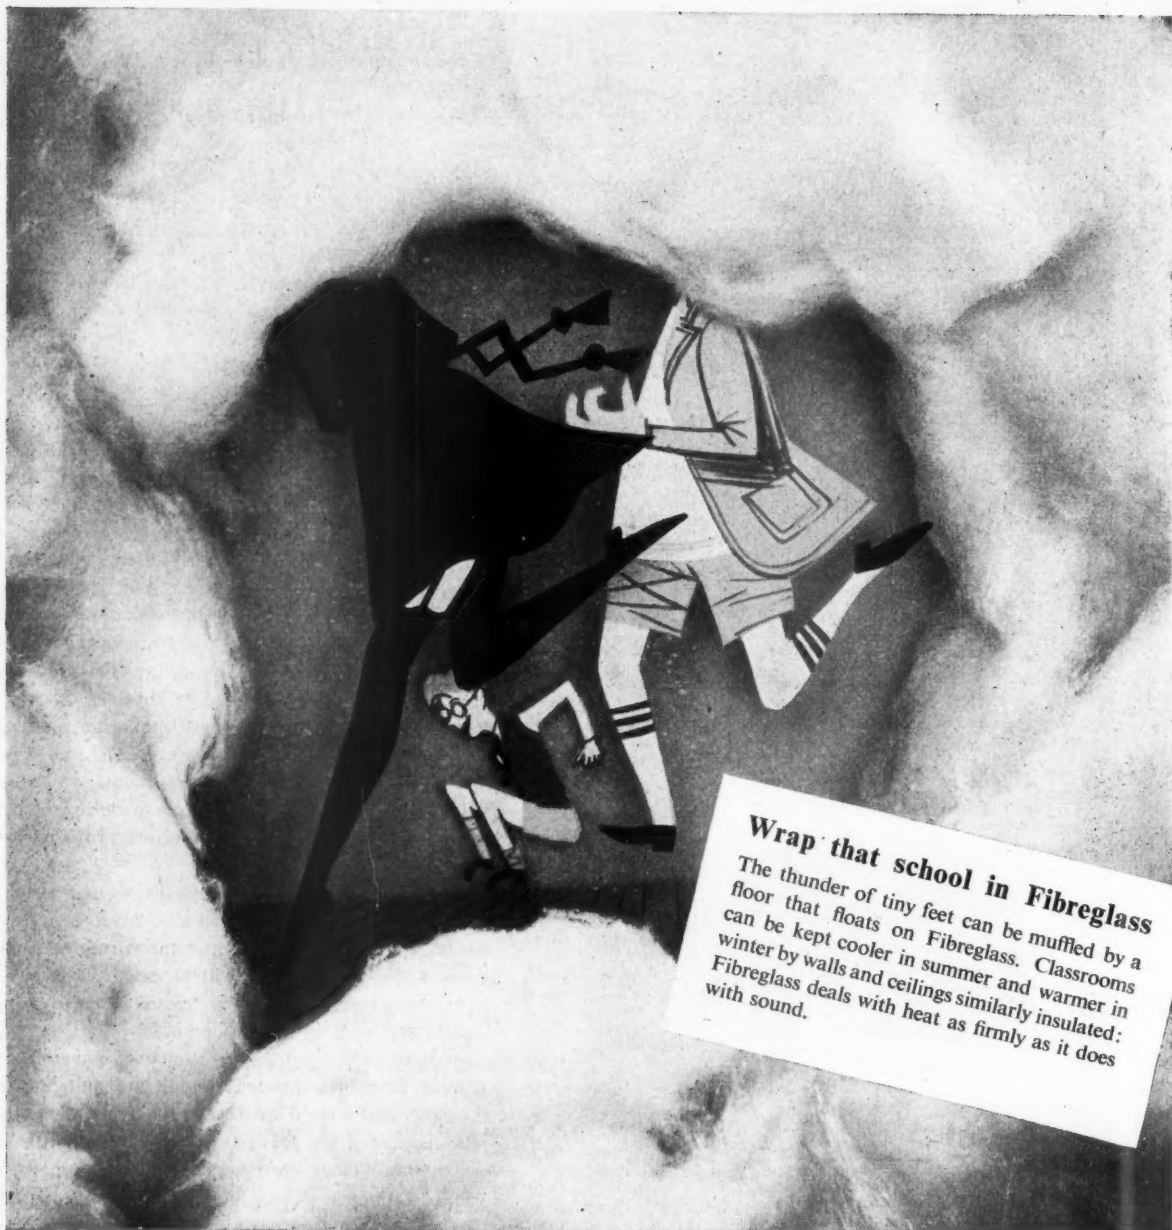

*Conduit in corrosive situations:* The only corrosive situation likely to be met with, outside industry, is in boiler houses. Here the risk is from heat, condensation, and the products of combustion. The precautions noted for the open air should be observed, except that painting should be with black bitumastic paint, and watertight switches are not necessary. The use of bulkheads and wellglasses for lighting points is necessary. VIR cables are not ideally suited to wiring in boiler houses, and plastic-covered cables are probably better for lighting wiring.

Where there are automatic controls, as in a large oil-fired boiler house, neither plastic-covered nor VIR cables are ideally suitable, and the wiring becomes a complicated matter. This will be discussed in a later article. Coal cellars should be treated as boiler houses, except that VIR cables may be used.

*Choice of cable route:* The principles governing the routing of cables through conduit are quite straightforward, and should be readily understood by those who have read the previous articles dealing with TRS installations. There are two points worth noting before giving examples: firstly, connectors should never be used in conduit, but cables should be looped from switches, sockets or ceiling roses, as described for TRS. Secondly, in making connections, the tape and braid should be stripped back at least half-an-inch further than the rubber, as shown in Fig. 11, to avoid all risk of leakage if the fabric should become damp. Single-core cables are used in conduit, so that certain

Fig. 11, cable end prepared for connection.

**Wrap that school in Fibreglass**

The thunder of tiny feet can be muffled by a floor that floats on Fibreglass. Classrooms can be kept cooler in summer and warmer in winter by walls and ceilings similarly insulated: Fibreglass deals with heat as firmly as it does with sound.

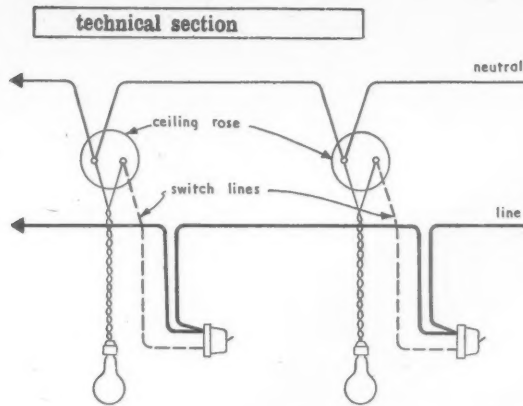

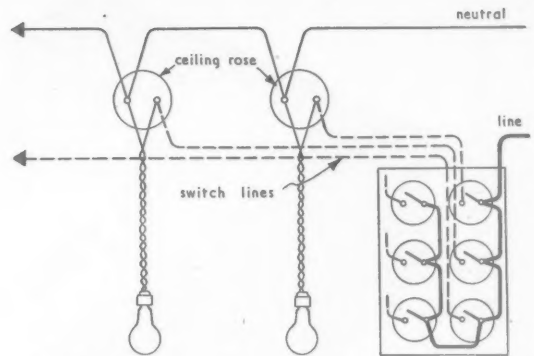

Fig. 12 (above left), method of wiring in which line cable is "looped" from switch to switch (cf. article 2,

limitations on looping, which are necessary with TRS because two- or three-core cables have to be used, do not apply. In particular, the live cable can be looped from switch to switch, if so desired, instead of from ceiling rose to ceiling rose, so that three-plate ceiling roses need not be used. This method is shown in Fig. 12. It is particularly useful in a multi-gang switchbox, and only one red feed need be brought to such a box, and can be looped to the live side of all the switches, as shown in Fig. 13.

August 8, Fig. 10). Fig. 13 (above right), application of method shown in Fig. 12 to a multi-gang switchbox.

Figs. 14 and 15 show suggested cable routes that might be used for the installations given in Figs. 1 and 2.

Fig. 16 is an expansion of the circuit for two-way switching used in Fig. 15. A method very similar to this was discussed and condemned for TRS. The circuit, which has to be used for TRS, shown here in Fig. 17, may be used for conduit as well, but is rarely convenient, except when converting a circuit formerly one-way switched to two-way switching.

*Sports pavilions at Hayes (Kent), Acton and Oundle*

## SPORTS PAVILION

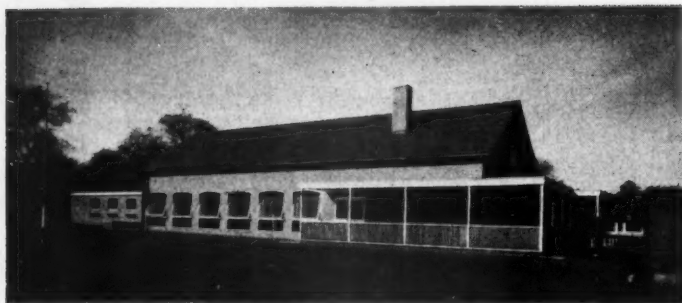

at BARNETWOOD ROAD, HAYES, KENT, for the Catford Bridge RFC and Hayes (Kent) Cricket and Tennis Club designed by PITE, SON and FAIRWEATHER; assistant architects PETER BOSTON and ALAN BLANC quantity surveyors ARTHUR J. WILLIS and THOMPSON

Sports pavilions—three of them—are the subject of cost analysis this week; they are the first buildings of their kind to be analysed in the JOURNAL. The first, at Hayes, in Kent, was built to replace two existing pavilions and greatly extend the amenities they had to offer, for the new building is also a social club with a clubroom which can be used both for social and for indoor sports. As a result the building is in constant use in all seasons, providing an unusually comfortable and attractive environment for a wide range of activities.

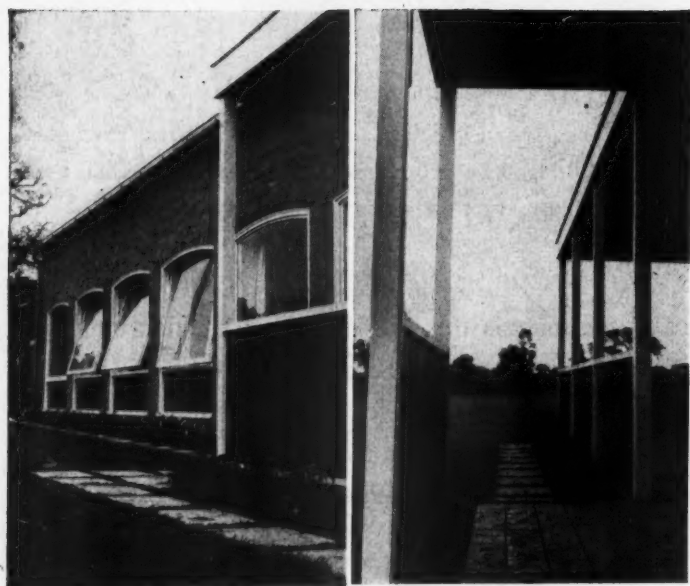

*Viewpoint 1: from the south-east.*

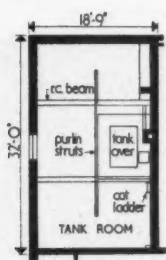

## building illustrated

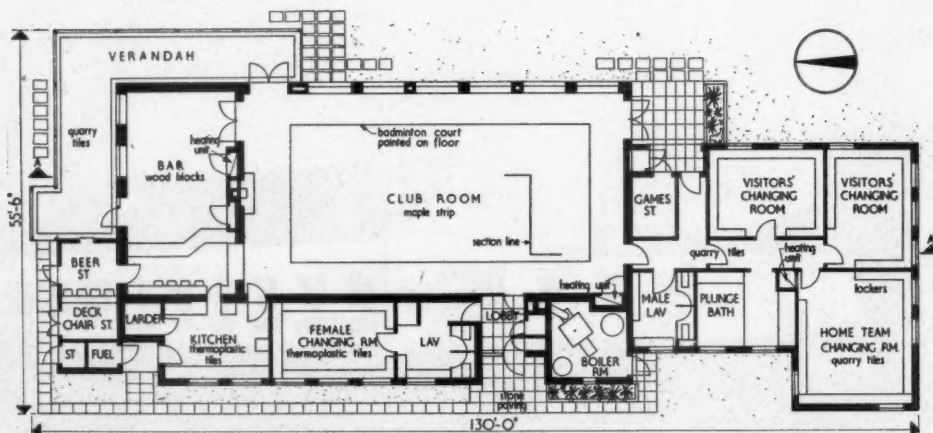

Viewpoint 2 (left): the main clubroom faces east and the large windows frame a pleasant view as well as providing efficient internal space for spectators to observe the games. The verandah provides covered space for spectators and is continuous around the north side where it overlooks the tennis courts. The double doors beneath the verandah provide access direct to the clubroom. On the left is the entrance to the changing rooms and sanitary accommodation. Clay facing bricks are very light brown from a local kiln, and the pitched roof is covered with dark brown concrete interlocking tiles. Proportions and choice of materials give a quality of calmness to this elevation.

Viewpoint 3 (far left): the windows to the main clubroom. Frames and opening lights are in softwood, painted white gloss oil and glazed with  $\frac{1}{4}$ -in. polished plate. The panel below the opening light is glazed with  $\frac{1}{4}$ -in. Georgian wired cast glass taped to  $\frac{1}{2}$ -in. double rolled green tinted glass. This construction was used to increase thermal insulation and to attempt to link the internal space with the grass outside. The windows have a deep reveal internally and the horizontal opening lights can be opened wide enough to provide efficient ventilation without fouling the curtains. Rainwater gutter and downpipe are flush socketed stove enamelled pressed steel, the rainwater being drained to soakaways. Viewpoint 4 (left): looking east along the verandah on the north side of the building; the tennis courts are on the left. The verandah is constructed of 4-in.  $\times$  3-in. softwood posts carrying a roof of 6-in.  $\times$  2-in. joists, woodwool and roofing felt with a ceiling of moulded Swedish plywood. The infill panel below the leaning rail is out of 4-in.  $\times$  1-in. moulded cedar boarding finished with clear varnish. The floor is finished with quarry tiles having a  $\frac{3}{8}$ -in. wide joint. It is laid to a fall so that driving rain or snow will drain to the small channel formed in the grano margin which can be seen below the nearest infill panel.

First floor plan

Ground floor plan [Scale:  $\frac{1}{8}$ " = 1' 0"]

## analysis

## CLIENTS' BRIEF

A building was required to replace two existing sports pavilions. It was to be a social centre as well as providing for the other more usual functions. A large club room was to be suitable for badminton and table tennis and as a meeting place with ancillary bar and kitchens. One large and two small changing rooms were required for men, a changing room for women and a verandah overlooking the main grounds and the tennis courts.

## SITE

The site for the new pavilion is on one edge of the existing sports field. It is in open country on the outskirts of Bromley and in fairly rural surroundings with many mature trees. There are views to the north and east. The building site has a fall of about 4 ft. from north to south and is accessible from a private road off the Barnet Wood Road.

## PLAN

The accommodation falls fairly easily into two groups (a) the communal areas for social needs and (b) changing and sanitary accommodation. The largest single unit is the club room around which is grouped on one side the changing rooms and on the other, bar, kitchens and ancillaries. Separate access is provided for both the main groups from the car park and the playing fields. The bar communicates with the kitchen and also serves the main club room and the verandah. The lavatory accommodation is planned so that it is accessible to the club room and also to spectators when the changing rooms are locked.

## MAIN CONSTRUCTION

The club room is the only space which needs a relatively large span and height. It has a frame structure of three welded steel Portal frames carrying a pitched roof. The rest of the accommodation is of smaller units and load-bearing brickwork is used to carry felt roofs of timber construction.

cost per sq. ft. (figures based on final cost)	s	d
preliminaries and insurances	2	5½
contingencies	—	—

## Work below ground floor level

7 10½

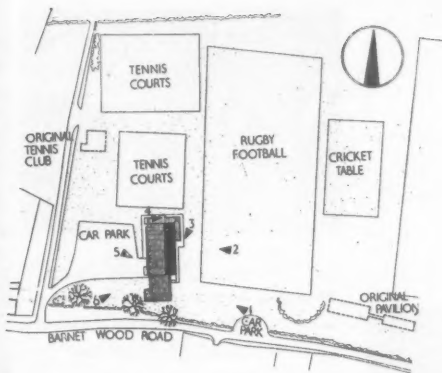

Main club room: Shallow r.c. ring beam mainly 18-in. wide × 2-ft. 3-in. deep inverted T section continuous on four sides. This is used to span shallow pockets of made-up ground and to distribute point loads of Portal frames. Elsewhere: concrete strip foundations average depth 2 ft. 9 in. Strips 9 in. × 2 ft. wide under 11-in. walls, 2 ft. 9 in. wide under 13½-in. walls. Floors are 6-in. concrete with integral water-proofer except below wood block floor where a bituminous membrane is brushed on.

## STRUCTURAL ELEMENTS

## Frame

2 10

Main club room: Three welded steel Portal frames out of 8-in. × 6-in. r.s.j. sections spanning 29 ft. 9 in. at 15 ft. 9 in. c/c with 6-in. × 3-in. r.s.c.'s as purlins and 4-in. × 2½-in. r.s.l.'s as wind bracing.

Site plan with photographic viewpoints

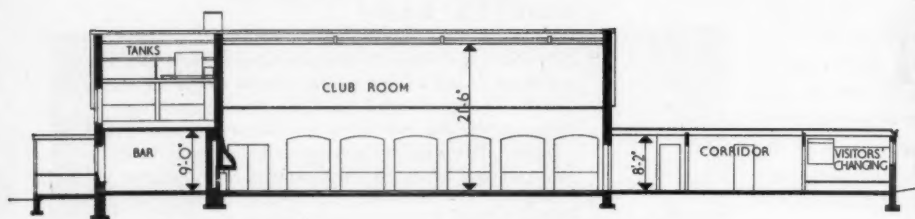

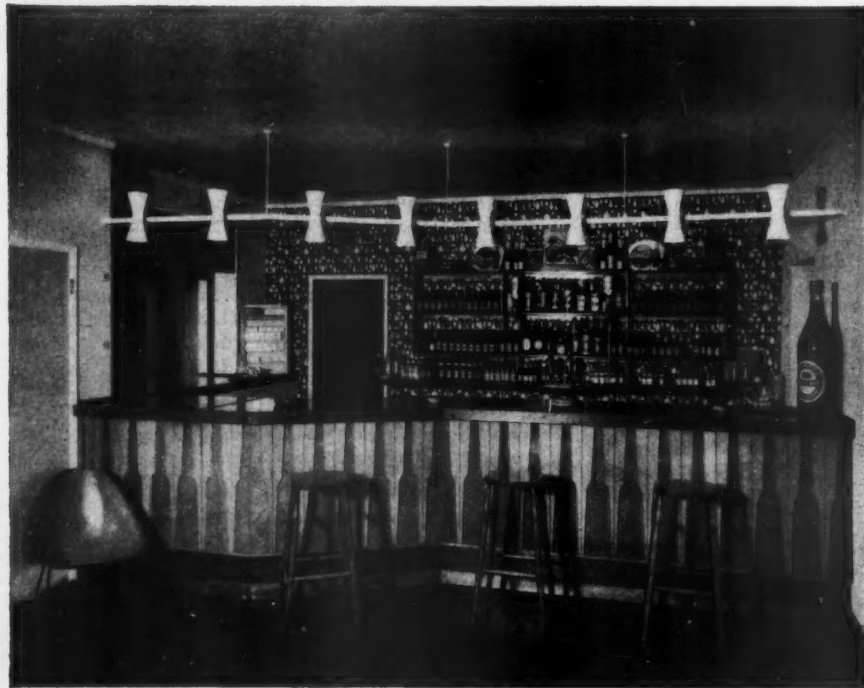

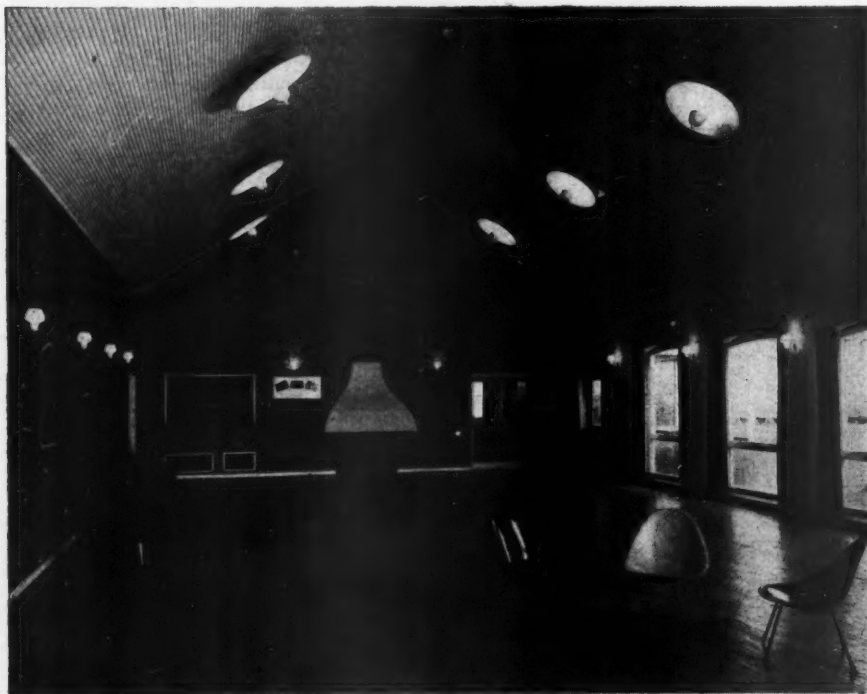

Viewpoint 5: the main entrance. The external opening has an artificial stone surround the top of which is used as permanent shuttering to the r.c. lintel behind the brick arch. Door and frame are all of hardwood, ex. 2½-in. × 4½-in. frame, twice oiled and clear varnished with a softwood architrave which is planted on and painted white. Door stiles and head are 4½ in. × 2 in. with 8-in. × 2-in. middle and bottom rails. Glazing is ½-in. Georgian wired polished plate with painted hardwood beads. The moulded cedar boarding on the right of the door is a facing to the 4½-in. brick wall behind. Paving is 1½-in. thick artificial stone to match the surround.

Viewpoint 6: the building from the south-west with the men's changing rooms on the right, women's changing room, kitchen and main entrance, centre, and kitchen entrance, beer and games store, extreme left. The stack is the boiler flue, access to the boiler house being through the lowered door at the junction of the flat and pitched roofs. Oil storage tanks are placed in the open on the west side of the car park which was laid by club members, its cost not being included in the cost analysis.

## building illustrated

Section A-A [Scale:  $\frac{1}{4}'' = 1' 0''$ ]

Left: the main clubroom looking towards the double doors leading to the bar. The room provides space for badminton and is spanned by three steel portal frames at 15 ft. 9 in. c/c. These are contained within the brick piers between the windows and the 13½-in. solid brick wall on the left. Above: the south wall of the clubroom with the doors from the main entrance lobby on the right and access to the men's changing rooms through the door on the right-hand side of the gable wall. To the left-hand side of this wall is a built-in heater cabinet. Floor finish is maple strip on 2-in. x 2-in. battens. The dark wall is plaster finished with wood float and emulsion paint (BS 9.098, dark blue). The main light fittings were manufactured to the architect's design to give an even light without shadows when the room is used for badminton.

Left: view of the bar with, on the left, the serving hatch to the clubroom and in the rear wall the stable-type door to the kitchen. The bar is softwood-framed with a blockboard top finished with a plastic material. The bar front is built up with alternate gabbon and beech veneered plywood. Above: showers serving the men's changing rooms. Walls are finished with 6-in. x 6-in. cushion-edged white glazed tiles which continue through the plunge bath and act as a shower tray. Dark portion of the floor is 6-in. x 6-in. quarry tiles. The ceiling is plastered and finished with dark-blue plastic cloth which is stuck on. It has been used for its durability and to control condensation.

## analysis

## External walls and facings

Perimeter walls to main clubroom and bar of 13½-in. solid brickwork. Piers on east elevation formed either of 9-in. and 4½-in. skins with 7-in. cavity or 4½-in. brick skin surrounding concrete cased steelwork. To changing rooms and kitchen 11-in. load-bearing cavity brickwork with clay facing bricks used externally and white sand-lime bricks used fair-face internally, in changing rooms. External walls to beer store, deck chair store, etc., are in 4½-in. brickwork faced externally with ex. 4-in. × 1-in. cedar boarding on building paper and ex. 2-in. × 1½-in. grounds.

$$\text{Ratio: } \frac{\text{solid wall}}{\text{floor area}} = \frac{0.60}{1}$$

## Windows

All window frames are in softwood with hardwood sills and drips. Opening lights are in softwood, usually horizontally pivot hung. Window sizes vary; 3-ft. 9-in. square brick opening for changing rooms and lavatories, 6-ft. 4-in. × 7-ft. 9-in. brick opening for clubroom and 4-ft. × 4-ft. 6-in. for the bar. These latter windows include a timber window seat built into the thickness of the wall below them. All windows and frames are finished with white gloss oil paint.

$$\text{Ratio: } \frac{\text{window area}}{\text{floor area}} = \frac{0.138}{1}$$

## External doors

Main entrance: hardwood glazed doors, 4½-in. × 2-in. stiles and heads, 8-in. × 2-in. middle and

bottom rails, contained in hardwood frame, 4½-in. × 2½-in. All finished two coats clear varnish. Doors from clubroom to veranda, and bar to verandah: softwood framed with 8-in. × 2-in. middle and bottom rails, 5-in. × 2-in. stiles and top rail, finished white gloss oil paint and glazed. Doors from beer store and deck chair store, framed, ledged and braced and faced with 4-in. × 1-in. moulded cedar boarding to match external facing. External doors elsewhere are flush, faced with external quality plywood and finished with gloss oil paint.

$$\text{Ratio: } \frac{\text{external door area}}{\text{floor area}} = \frac{0.067}{1}$$

## Upper floor construction

Floor of tank room over bar in 4-in. r.c. with two r.c. upstand beams 18-in. × 9-in. carrying timber supports to purlins and having waterproof rendering to form an overflow tray below water storage cisterns.

## Roof construction

Club room, bar, women's changing room; 4-in. × 1½-in. timber rafters at 18 in. c/c covered with sarking felt and 1½-in. × 1-in. battens at 14 in. c/c carrying concrete interlocking tiles. Men's changing rooms 7-in. × 2-in., or 9-in. × 2-in., timber joists at 15 in. c/c with 1-in. woodwool slabs, screed laid to falls and three layers roofing felt. Verandah similar but with 6-in. × 2-in. joists. Approximately 39 squares of pitched roof at 32°. Approximately 230 yd. super of flat roof.

## Glazing

Main windows to club room and bar where undistorted vision of playing fields is required; ¼-in. polished plate glass, elsewhere ⅜-in. rough-cast. In lower panels of club room windows ¼-in. double rolled green tinted glass is taped before glazing to ¼-in. Georgian wired rough cast. Elsewhere: 32-oz. selected quality or ⅜-in. roughcast.

$$\text{Total of structural elements } 25.5$$

## PARTITIONING AND FITTINGS

## Internal partitions

Changing rooms: 4½-in. sand lime bricks finished with emulsion paint. Elsewhere: 4½-in. or 9-in. brickwork plastered and painted or papered.

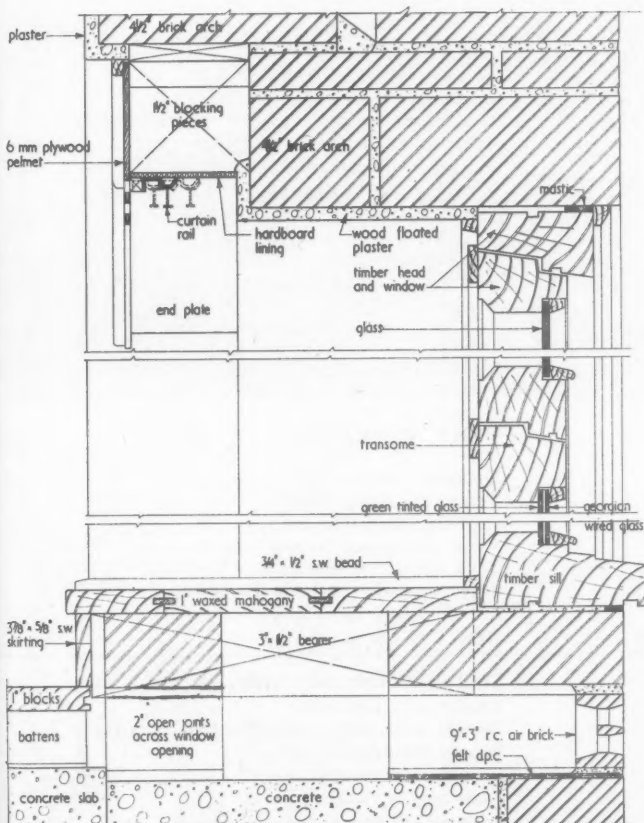

## W.c. partitions

## Internal doors

W.c. doors are by specialists and out of aluminium sheet finished with gloss oil paint. Internal doors are generally plywood faced skeleton cored flush type veneered and wax polished or painted gloss oil. Double doors between bar and club room are flush type glazed with ¼-in. Georgian wired polished plate. Doors to telephone kiosk and meter cupboard in main entrance lobby are faced with ex. 4-in. × 1-in. moulded cedar boarding.

## Ironmongery

Satin chrome lever handles with mortice latches or deadlocks. No. of single doors: 26. No. of double doors: 4.

Section, typical east window [Scale: 1½" = 1' 0"]

## analysis

## FITTINGS

s d  
3 4½

Bar counter and shelving: softwood framing with ½-in. gaboon and beech veneered plywood facings. ½-in. blockboard top, veneered with ½-in. plastic resembling wood.

Shelving of ½-in. softwood, lino veneered and carried on 1-in. × 1-in. × ½-in. m.s. tee pieces, built in.

Benches in changing rooms: softwood framing carrying 1-in. softwood seat, 15 in. wide.

Kitchen equipment: 1½-in. teak twice oiled.

Cupboards of softwood framing, plywood facings.

Total of partitioning and fittings 7 4½

## FINISHINGS

## Floor finishes 4 6½

Club room: 185 sq. yd. maple strip on 2-in. × 2-in. battens. 34s. 8d. per sq. yd.

Bar: 37 sq. yd. woodblock. 45s. 3d. per sq. yd.

Women's changing room and kitchen: 42 sq. yd. of thermoplastic tile. 32s. per sq. yd.

Men's changing rooms: 130 sq. yd. of ½-in. quarry tiles. 20s. 3d. per sq. yd.

Verandah: 51 sq. yd. of quarry tiles. 30s. per sq. yd.

## Wall finishes 2 9½

Clubroom and bar: Gypsum plaster. Showers: 6-in. × 6-in. cushion edge eggshell finish wall tiles. Entrance lobby: ex. 4-in. × 1-in. moulded cedar boarding on battens.

## Ceiling finishes 2 9½

Clubroom: 1½-in. × 2-in. bearers hung at 2 ft. c/c from purlins carrying moulded matchboarding painted matt oil paint. Men's changing rooms similar but with matchboarding fixed direct to roof joists. Showers and lavatories: plaster board fixed direct to roof joists with a skim. Women's changing room, bar, kitchen plastered. Verandah and entrance lobbies, moulded Swedish plywood clear varnished.

## Decorations 2 6½

All colours selected from BS2660/1955.

Woodwork throughout, white oil paint. Ancillary rooms, stores, painted with white emulsion paint.

Men's changing rooms: walls, emulsion paint.

Clubroom: ceiling white matt oil paint. West wall, dark blue emulsion paint. South wall papers, east wall, white emulsion, north wall, fair-face brickwork.

Bar: ceiling white emulsion, west wall papered, east wall dark blue emulsion, north and south walls, white emulsion paint.

Total of finishings 12s 8d

## SERVICES

## Plumbing, external 9½

All flashing of 4-lb. lead. Rainwater disposal from pitched roof, stove enamelled pressed steel box gutter with flush socketed stove enamelled pressed steel r.w.p.s. From flat roofs, cast iron internal r.w.p.s with rainwater sumps formed in woodwool.

## Plumbing, internal 2 0½

600-gallon galvanized steel cold water storage tank in tank room over bar. Hot and cold water services through copper pipes with chromium-plated shower fittings. Trapped wastes all out of copper pipe.

## Sanitary fittings

Kitchen: double sink unit in stainless steel. Four w.c. and five lavatory basins in vitreous china. 7-ft. long urinal stall in glazed fireclay.

## Heating and hot water installation

Thermostatically controlled blown warm air system, fed by pumped hot water from oil-fired boilers to heater cabinets. Criteria temp. 65° for 30° externally. Heater cabinets situated in clubroom, kitchen, changing rooms in built-in recesses with pressed metal louvred grilles contained in flush doors. Hot water is stored in two galvanised steel cylinders in boiler house. Boilers are c.i. sectional with fully automatic oil burner which is also suitable for gas or diesel oil. Reasons: heating system chosen because of its flexibility for planning and its ease of control. Rapid warming up period required for building of heavy but intermittent use.

## Gas installation

Supply to kitchen cookers only.

## Electric installation

Main supply 240 volts single phase carried by p.v.c. cables in conduit. Switches are BMA flush type in plastered walls, surface pattern where brickwork is fair face. Socket outlets 13 amp. from ring mains.

Light fittings: wall bracket types in flushed opal glass. Saucer domes in changing rooms, water-proof bulkhead fittings showers and lavatories. Special spun metal fittings in clubroom designed by architects to produce shadow free evenly distributed light for badminton.

Total of services 16s. 4½d

## Drainage

Soil and waste water in separate systems to main sewers in public highway. Surface water to soakaways. All pipes in s.g.s.w.

Note: cost includes £550 for extension of main sewer.

## Paved areas

2-in. pre-cast concrete flags to BS laid direct on ground.

Cost includes £25 for flagpole and base.

Total cost per sq. ft. of floor area:  $\frac{£17,642}{4,580 \text{ sq. ft.}} = 77 \text{ 0½}$

## TIME SCHEDULE

Drawings: March 1955.

Tender date: July 1955.

Contract signed: October 1955.

Work commenced: August 1955.

Work completed: July 1956.

Type of contract: RIBA with quantities.

## COST SUMMARY

Total ground floor area: 4,580 sq. ft.

Tender date: July 1955.

Price of work above ground floor level: £15,723.

Price of foundations: £1,798.

Price of external works: £121.

Gross total: £17,642.

Price per sq. ft.: 77s. 0½d.

Price per cube ft.: 4s. 1½d.

## SPORTS PAVILION

in TWYFORD AVENUE, ACTON, LONDON, W.3, designed by HENING and CHITTY architects-in-charge ANTHONY M. CHITTY and MICHAEL G. MURRAY; quantity surveyors LANGDON and EVERY

This pavilion was built for the Sports Committee of the North Thames Gas Board, who own 60 acres of land in Acton. For nearly 20 years the Board intended to replace wooden army huts erected in the first world war, but the present building has only recently been completed. The large hall has a floor-to-ceiling height of 27 ft. for use as a badminton court and is also suitable for dancing, drama and social gatherings. Mesh screens divide the changing room area, and non-return gates ensure that once a team leaves a compartment it is locked until the members return, as a safeguard for personal property.

Viewpoint 1: the main hall from the north-west.

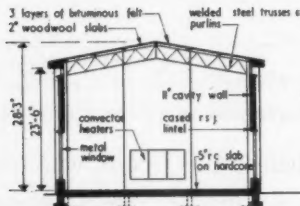

Site plan with photographic viewpoints

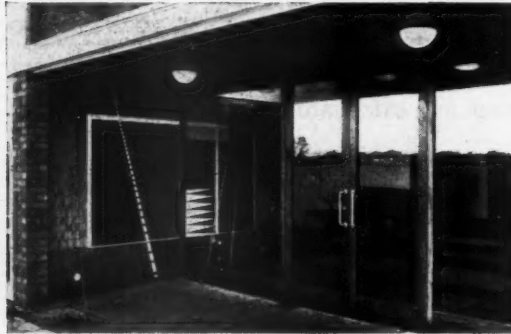

Viewpoint 2: from the south-west. In the foreground is an old bowling green which is now used for outdoor receptions and tea-parties, and is directly accessible from the hall and kitchen. On the first floor of the two-storey wing on the right is the club steward's flat.

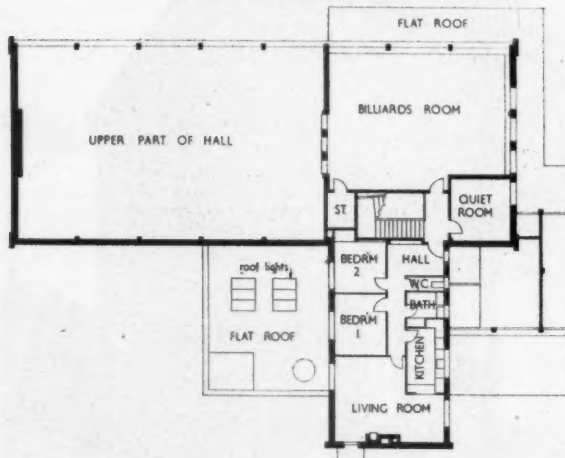

building illustrated

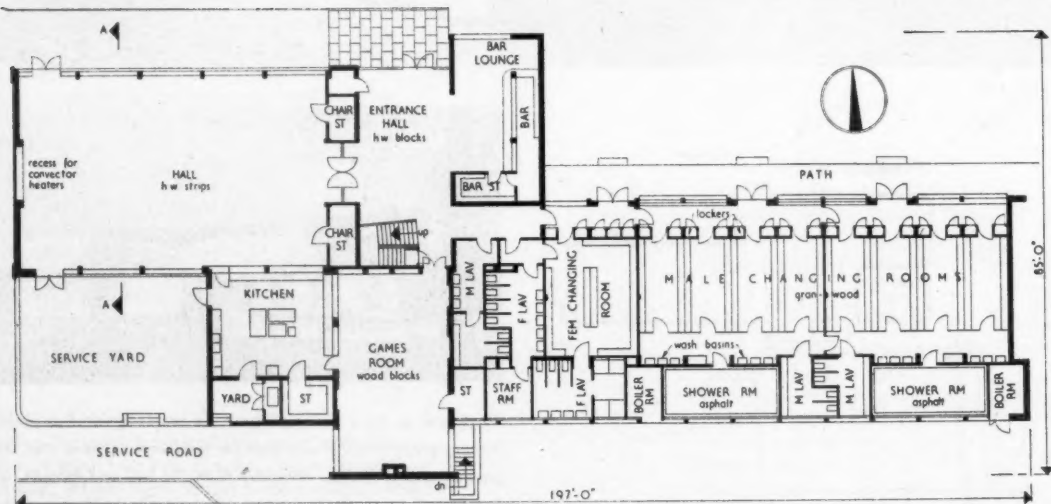

Section A-A [Scale:  $\frac{1}{8}" = 1' 0"$ ]

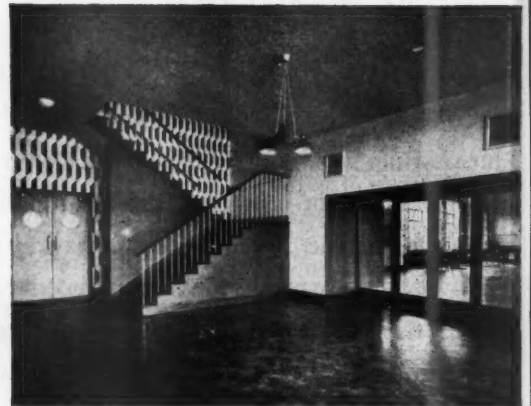

Viewpoint 3: the main entrance on the north side. The mural on the left is by Kenneth Rowntree.

First floor plan

Ground floor plan [Scale:  $\frac{1}{8}" = 1' 0"$ ]

The entrance hall looking towards the main hall. The staircase leads to the first floor billiards room and steward's flat. The doors, extreme left, lead to the single storey changing room wing.

The main hall, which is marked out for badminton. Behind the three high level windows in the far wall is the billiards room. These windows are used for umpiring games of badminton.

# analysis

## CLIENT'S REQUIREMENTS

This building was designed for the Sports Committee of a public body owning a 60-acre sports ground in West London, which for nearly 20 years had been planning to replace wooden army huts from World War I with a more worthy building, but had been frustrated by crises, war and financial squeezes. The building serves both indoor and outdoor games and social requirements, including a large club hall for dancing, acting, badminton and social occasions, with a cafeteria; a games room for darts, table tennis, etc., a lounge and bar; a kitchen serving the games room, hall and terrace on the south side; changing rooms to serve 18 teams at one time (200 men and 50 women), and upstairs a billiard room, committee room, and self-contained flat for the club steward.

## PLANNING AIMS

The building lies on the south of the playing fields, protected from the south-east by a grove of elms. To the south is an old bowling green, which has been retained for teas, etc. The main block contains the club hall (27 ft. high for badminton, with polished maple floor for dancing). Adjacent are a games room, entrance lounge, club bar and kitchen, with service direct to hall, games room and terrace. Stairs lead to billiards room and quiet room and steward's flat above. To the east in a single-storey wing are changing rooms, lavatories and locker accommodation.

## SPECIAL FEATURES

A mural painting by Kenneth Rowntree adorns the entrance. The changing room block is designed to ensure easy supervision and protection of players' personal property. Ten full teams can change at once, and mesh screens divide the area, with non-return gates, so that once a team leaves a compartment it is locked until its return. Special attention has been paid to lighting fittings for billiards, darts and badminton, the club hall having a second, low level, system of lights for social occasions. The billiard tables are fitted with electric pay-meters. An umpires' gallery is provided by means of high level windows in the billiard room which give on to the hall. The kitchen is fitted and equipped to serve several hundred guests at a time.

## CRICKET PAVILION

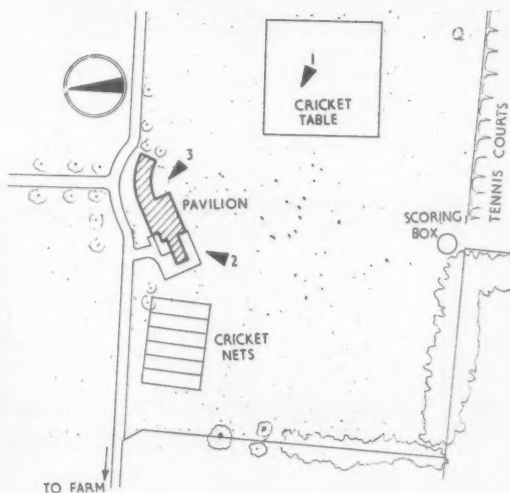

at OUNDLE SCHOOL, NORTHANTS; designed by PETER BICKNELL of H. C. HUGHES and PETER BICKNELL; assistant-in-charge F. W. O. HASLOP; consulting engineer (reinforced concrete) J. H. A. CROCKETT, quantity surveyors DAVIES, BELFIELD and EVEREST

This cricket pavilion at Oundle was built for the school by the Old Oundelian Club, which presented it as a war memorial. The pavilion, which is for use in the cricket season only, contains a large room on the first floor to seat four teams for lunch or tea. Meals are prepared in a servery, with a service lift connection to the ground floor. On the west side is a tuck shop and the changing rooms are in a single storey, curved wing to the east of the main building.

Viewpoint 1: the pavilion from the south-east.

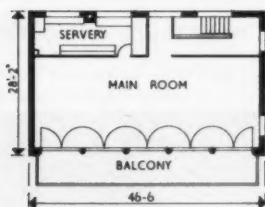

Viewpoint 2: from the south. The single-storey wing on the left contains the tuck shop and store. The pavilion is constructed of load-bearing brick walls, except for the front elevation of the two-storey block, which is r.c. framed.

## analysis

## CLIENT'S BRIEF

A cricket pavilion in the school playing fields, to celebrate the 400th anniversary of the foundation of the school. The building was paid for by subscription and many Old Boys gave materials for the building.

## PLANNING AIMS

A Sports Pavilion to face the field on which 1st games are played (known to the school as the square), with two changing rooms for the 1st game with an adequate view of the square, and two changing rooms for the 2nd game, with an adequate view of the 2nd pitch.

The pavilion to have a dining room on first floor, with a balcony giving a good view of the square. Kitchen entrance to serve lift to pantry and tuck shop.

Space to be provided for visitors to watch matches on the square protected from north east winds.

An existing clump of trees to be retained.

An important feature of the pavilion is the clock tower for a clock with four dials, which was designed and made in the school workshop.

A screen on the first floor was designed to take 1st XI team boards, but it looked so attractive that it was decided to put these boards elsewhere.

The following are details and cost analysis of the original design and tender although variations appear in the final structure and finishes. These variations, being largely due to gifts of materials by Old Boys, render unrealistic any analysis of final cost.

	cost per sq. ft.	s	d
preliminaries and insurances			8
contingencies		1	6½
Work below ground floor level		7	6½

## STRUCTURAL ELEMENTS

Frame or load-bearing element (cost includes external walls) 11 9½

Mainly load-bearing walls, with timber encased steel stanchions to front wall.

## External walls

9-in. and 13½-in. brick, except front, which is r.c. frame.

$$\text{Ratio: } \frac{\text{solid wall}}{\text{floor area}} = \frac{0.8162}{1}$$

Windows 2 0½

Purpose made, softwood casements.

$$\text{Ratio: } \frac{\text{windows}}{\text{floor area}} = \frac{0.1848}{1}$$

External doors 1 9½

Framed, ledged and braced and casement. Mostly softwood, some West African mahogany.

$$\text{Ratio: } \frac{\text{doors}}{\text{floor area}} = \frac{0.1282}{1}$$

Upper floors 3 3½

6-in. r.c. slab, and balcony.

Staircases (cost includes finishings and balustrade) 9½

R.c. beam carrying hardwood treads, with ferodo nosings.

No. of staircases: 1.

Width: 3 ft. 9 in.

Total rise: 9 ft. 1 in.

The staircase and first floor landing. 2-in. hardwood treads are carried by a r.c. stringer beam and there are no risers. The handrail is 2-in. x 3-in. hardwood.

The main room on the first floor. Doors on the left lead to the large balcony. Behind the glazed screen on the right are the servery and landing.

## analysis

	s	d
<b>Roof construction</b>	6	4
Pitched roof, timber, with steel trusses to main roof, and shingles.		
Flat roof (originally reinforced concrete). Timber joists, compressed straw slabs and felt.		
Area of pitched roof, 240 sq. yd.		
Area of flat roof, 201 sq. yd.		
<b>Glazing</b>	6	½
¾-in. polished plate to casement doors. 26-oz. clear sheet elsewhere.		
<b>Total of structural elements</b>	26	8½

## PARTITIONS

<b>Internal partitions</b>	1	1
Ground floor: half brick; w.c. partitions, terrazzo.		
Area, 950 sq. ft.		
<b>Screens</b>	5	
First floor: softwood, with hardboard panels.		
<b>Internal doors</b>	1	9
No. of single doors, 14.		
No. of double doors: 2.		
Mainly West African mahogany framed, ledged and braced. Others softwood and plyfaced flush.		
<b>Ironmongery</b>	1	4
Mainly A.A. (lever handle door furniture).		
<b>Fittings</b>	3	2½
Sunblinds, display shelves, work benches and sink cupboard.		
<b>Total of partitions and fittings</b>	7	9½

## FINISHES

<b>Floor finishes</b>	5	4½
Type of finish:	P.v.c. or other tiles	Quarry tiles Terrazzo
Area in sq. ft.:	2,400	760 460
Price per sq. yd.:	29s. (average)	37s. 6d. 50s.
<b>Wall finishes</b>	2	7½
Two-coat plaster, mainly, some Terrazzo and fair face brickwork		
<b>Ceiling finishes</b>	1	4½
Plaster lath and setting coat under pitched roofs. Two coat plaster on concrete.		
<b>Roof finishes</b>	4	0
Type of finish:	Westmorland green slating to pitched roofs.	Vermiculite screed and asphalt on flat roof.
Area in sq. ft.:	2,400	1,810
<b>Decorations</b>	2	9½
Ceilings: whitened. Walls, emulsion paint, prime and 3 coats oil paint metal and woodwork, prime and 3 coats oil paint. Hardwood, wax polish.		
<hr/>		
<b>Total of finishes</b>	16	1½

## SERVICES

<b>External plumbing</b>	1	1½
Lead ridge, flashings, etc. Cast-iron gutters and rainwater pipes.		
Cast-iron waste and vent stacks.		
<b>Hot and cold water installation</b>	1	10½
Hot and cold to all fittings, hot from gas boiler (see gas installation), galvanised steel tubing.		
<b>Sanitary fittings (including branch wastes)</b>	2	1
Type of fitting, as shown on plan. Steel sinks, others white glazed fireclay.		
<b>Heating and ventilation</b>		
None—used in summer only, except one small gas radiator in hall (see gas installation).		
<b>Gas installation</b>	2	2½
1 small radiator.		
2 boiling rings.		
2 water heaters.		
1 boiler.		
<b>Electrical installation</b>		
None.		
<b>Lifts or other mechanical services</b>	11½	
One hand-operated service lift.		
<b>Total of services</b>	8	2½

Net cost excl. 'other elements' and drainage beyond last collecting m.h.	£13,585	
floor area	3,819 sq. ft.	71 1½

<b>Drainage</b>	2	6
Stoneware drains and brick manholes, immediately adjacent to building.		
Stoneware drains and manholes to main sewer, including connection.	6	0½
<b>Other elements</b>		
Works on site		4½
Fleche	1	3½
Scoring box	1	3½
Connections to gas and water mains	3	5
Roads, paths, external pavings, screen walls, etc.	3	5½

## SUMMARY

Ground floor area: 2,700 sq. ft.  
 Total floor area; 3,819 sq. ft.  
 Type of contract; RIBA (competitive tender)  
 Tender date; July 1954  
 Work began; February 1955  
 Work finished; May 1956  
 Contract price of foundations, superstructure, installations and finishes; £13,585  
 Contract price of external works and ancillary buildings; £3,027. Total: £16,612

## analysis

## COST COMMENTS

The cost analyses for Hayes and Acton are more comparable with each other than either with the analysis for Oundle. The former pavilions differ in size but are both designed to combine social and recreational activities. In addition, the tender date for both contracts was July, 1955. Oundle is required solely as a cricket pavilion for summer

use, and the differing requirements are noticeable throughout the cost analysis. The tender date for Oundle was a year earlier, i.e. July, 1954.

A closer examination of each element or group of elements is quite interesting:

Element	HAYES			ACTON			OUNDLE			Remarks
	Ratio	Cost per sq. ft. s d	Sub total s d	Ratio	Cost per sq. ft. s d	Sub total s d	Ratio	Cost per sq. ft. s d	Sub total s d	
Preliminaries			2 5½		5 5			8		Hayes analysis is based on final costs and therefore excludes contingencies. At Oundle the bulk of the preliminaries appears to have been priced elsewhere
Contingencies					8 6 1			1 6½	2 2½	
Foundations			7 10½		5 4½				7 6½	Hayes is built on partially made up ground; Acton has a basement boiler-house. No details are given for Oundle
External walls	0.6	10 7½		0.57	5 0½		0.8	Inc.		Note Oundle's high perimeter to floor area ratio. The limited use of a frame at Hayes has resulted in a unit cost of solid ext. walls at approx. £8 sq. yd.
Frame		2 10			6 11			11 9½		$\left( \frac{10s. 7\frac{1}{2}d. \text{ sq. ft.}}{0.6} \right)$ Whereas at Acton the cost is approx. £4 sq. yd. $\left( \frac{5s. 0\frac{1}{2}d. \text{ sq. ft.}}{0.57} \right)$
Stairs and steps					5			9½		Oundle's staircase cost 9½d. × 3819 = £155, or a little over £17 per ft. rise
Upper floors		1 0			1 10			3 3½		Ratios not available
Roof		6 4½			5 7			10 4		Oundle appears to have made a feature of its roof
Rooflights					1½					
Windows	0.138	2 8½		0.17	3 5		0.18	2 0½		
External doors	0.067	1 2		0.035	1 2½		0.13	1 9½		
Glazing		8½ 25 5			8 25 3			6½ 30 8½		Note the similarity between the amount per sq. ft. spent on structural elements at Hayes and Acton
Internal partitions		1 11½			1 7			1 1		Oundle's costs include some self-finished terrazzo
Screens					1 7½			5		
Internal doors		1 5½			1 9½			1 9		
Ironmongery		7½ 4 0			8½ 5 9			1 4 4 7		
Fittings		3 4½			2 11½			3 2½		
Floor finishes		4 6½			5 0½			5 4½		
Wall finishes		2 9½			1 9½			2 7½		
Ceiling finishes		2 9½			1 9			1 4½		
Decorations		2 6½ 12 8			3 4 11 11			2 9½ 12 1½		All schemes have achieved a high standard of finish
External plumbing		9½			4½			1 1½		
Internal plumbing		2 0½			2 3½			1 10½		
Sanitary fittings		1 1½			2 2½			2 1		

## analysis

Element	HAYES			ACTON			OUNDLE			Remarks
	Ratio	Cost per sq. ft. s d	Sub total s d	Ratio	Cost per sq. ft. s d	Sub total s d	Ratio	Cost per sq. ft. s d	Sub total s d	
Heating and ventilation		7 7			7 10					Hayes and Acton have spent some 16 per cent. of their net building costs on heating and electrical installation; elements which are not required at Oundle.
Gas		3			5			2 2½		
Lifts								11½		
Electrical installation		4 6½	16 4½		3 0½	16 1½			8 2½	
Net building cost (drainage excl.)			72 2½			73 5½			68 7½	
Drainage		4 3½			3 2			8 6½		The cost of Oundle's main drainage run (£1,146) gives an idea of what it would have cost to lay an underground electric cable for lighting the building. No doubt this high cost made it hardly worthwhile for the short periods when light would be needed.
Paved areas and external works		6½	4 10½		4 10½	8 0½		9 10	18 4½	
Gross total cost per sq. ft. of floor area			77 0½			81 6			86 11½

STAIRCASE: OFFICES IN LONDON, W.C.1

David du R. Aberdeen and Partners, architects

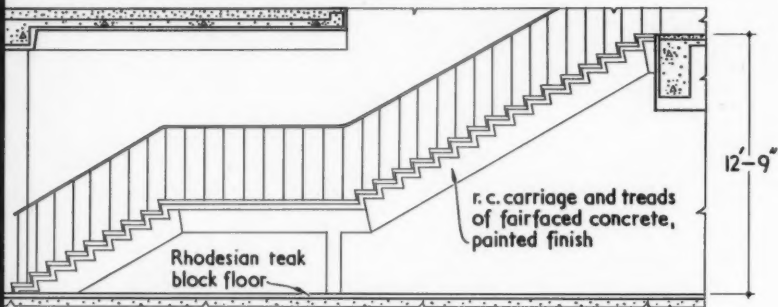

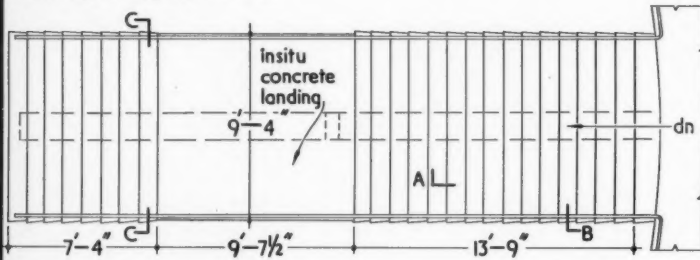

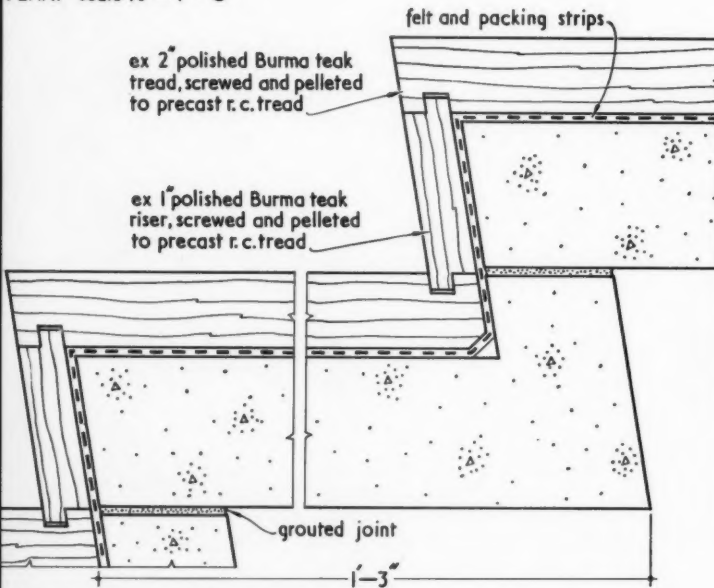

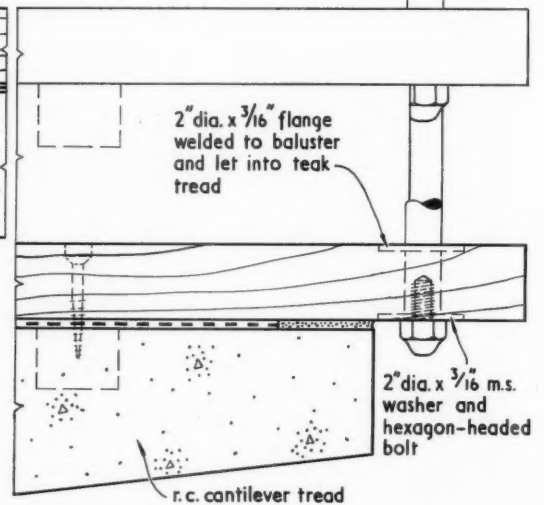

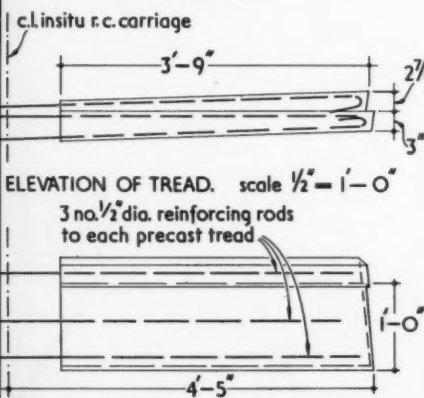

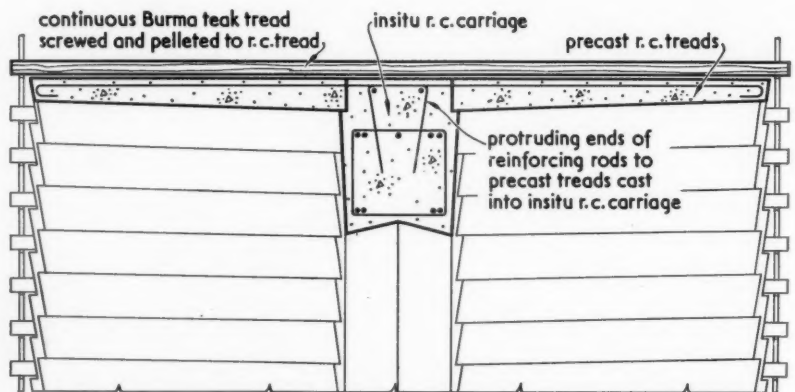

*Precast concrete members comprising both treads and risers are cast into and cantilevered from a central in-situ concrete carriage. In order to enhance the "stepped" effect, the plane of the stair edge is tilted, both downwards and in the direction of the stair head. The treads, risers and floor of the intermediate landing, which are of Burma teak, are laid on felt to provide "give" in the stair and to deaden the sound of footfalls.*

*David du R. Aberdeen and Partners, architects*

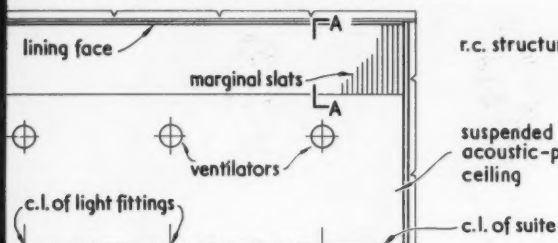

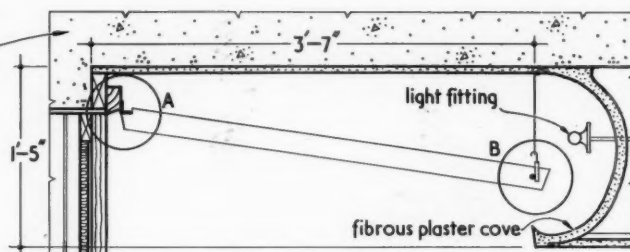

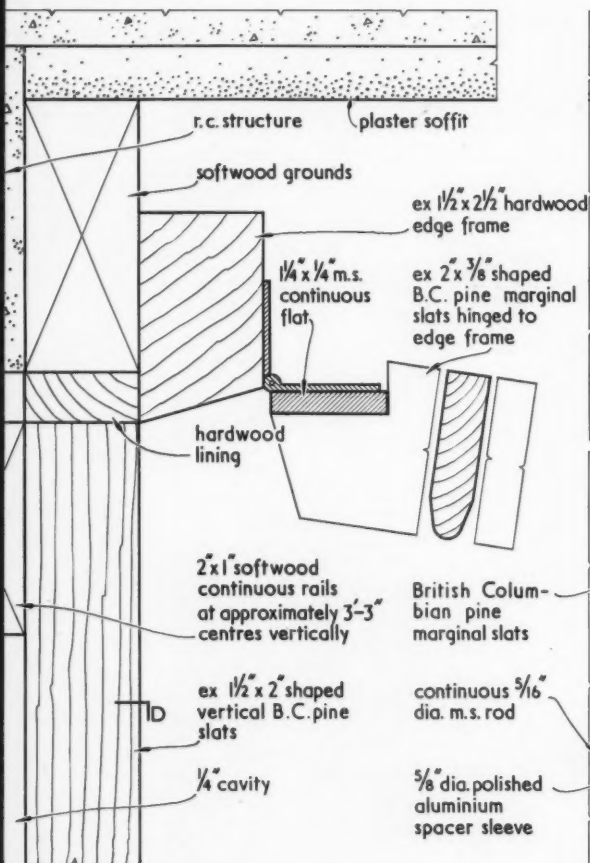

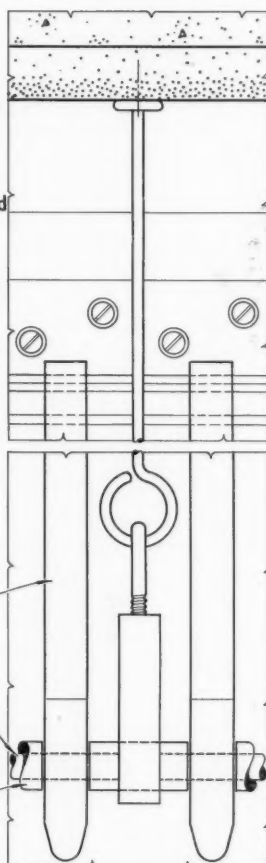

*The combs which serve as a screen for this ceiling lighting are made in lengths of 3 ft. 10½ in. so that their joints fall on the module lines of the windows. Access to the lights is gained through unhooking each comb and lowering it on the hinge: a screw adjustment on each hook enables each comb to be exactly aligned with its neighbour.*

LCC DEVELOPMENT SCHEME FOR MAIDA VALE, LONDON, W.9

A development scheme for the west side of Maida Vale, which has presented a vista of large houses in decay since before the war, was approved at the last meeting of the LCC's Housing Committee. On the north of the narrow, 12-acre site three 18-storey blocks of flats are planned, surrounded by large old trees. To the south will be three 6-storey blocks of maisonettes and behind them three terraces of small houses, with their own gardens and garages, and sharing three communal playspaces for young children. A tenants' clubhouse, doctor's house and surgery, and garages for flat-dwellers are part of the scheme, shown in the model above from the north west, looking across to Maida Vale. Architect: H. J. Whitfield Lewis, principal housing architect to the LCC. Architect-in-charge, J. E. Reid.

### The new small garden

THIS IS A PRACTICAL book in which, with over 130 photographs and plans, the authors illustrate and describe an expertly made selection of successful and charming small gardens. Most of them have been constructed at small cost; all are designed to provide the maximum of peace and relaxation for a minimum of hard work. The plans have been worked out to meet a wide variety of site problems and conditions and the examples include long narrow gardens, children's gardens, a tree garden, a water garden, a roof garden, a scree garden. . . Full details of the materials and plants used in many of the gardens are given; and there is a useful 'How to find out' appendix.

Size 8½ in. by 5½ in. 128 pages with over 100 half-tones and 25 line blocks.  
Price 15s. net, postage 1s. 2d.

THE ARCHITECTURAL PRESS 9-13 Queen Anne's Gate Westminster S.W. 1.

# Sweden Builds: Its Modern Architecture and Land Policy, Background Development and Contribution

By G. E. Kidder Smith. Introduction by Sven Markelius

HAILED AS A MASTERPIECE when first published in 1950, this extensively revised edition brings the lessons of Swedish architecture up to date with new material gathered when the author re-visited Sweden late in 1956. This includes a thorough appraisal of the new town section of Stockholm, Vällingby, where an entire new 'city' for 23,000—completely planned from beginning to end—has evolved in the past decade: one of the finest urban expressions yet created, this offers many lessons for all contemporary planning.

Sweden's greatest architect, Sven Markelius, foremost authority on Swedish land policy and planning, formerly Stockholm's City Planner, contributes an entirely new Introduction, 'The Structure of Stockholm'. The book continues with the native building types and the wood tradition. Then follows a beautifully illustrated comprehensive survey of contemporary Swedish architecture: 50 new pages, including 120 new illustrations, are included. Architects, planners, housing authorities, students, everyone who wants better buildings in better cities will find *Sweden Builds* warmly stimulating, a worthy companion to the same author's *Switzerland Builds* and *Italy Builds*.

Size 11½ ins. x 8½ ins. 280 pages, over 680 photographs and drawings and 7 plates in colour. Second edition, revised, 56s. net, postage 2s. od.

THE ARCHITECTURAL PRESS 9-13 Queen Anne's Gate, London, S.W.1

*The World's Best Slates*

Nature made Coniston beautiful—Ruskin immortalised it. From the ruggedly beautiful mountains he knew come the Broughton Moor Westmorland Green Slates, famous for their extreme durability and colourful picturesqueness. In Light Sea Green, Olive Green and a variety of Mixed Shades they bring charm to even the plainest edifices and remain sound for centuries. IMMEDIATE DELIVERY.

### LIGHT SEA GREEN and OLIVE GREEN STONE

Is eminently suitable for interior or exterior use where great durability and unique appearance are of paramount importance. Architects may specify its use for Facings, Foundation Stones, Paving and Flooring, Steps, Cills, Shop Fronts, Surrounds, Pilasters, Fireplaces, etc. Ask for these Technical Pamphlets:

1. Floorings.
2. Facings.
3. Coping.
4. Cills.
5. Riven Face Slabs.

**SPECIFICATION.** The roof to be covered with Broughton Moor Light Sea Green Best Quality (coarse grained) Westmorland Slates, to be obtained from the Broughton Moor Green Slate Quarries Ltd., Coniston, The Lake District, Lancs., in random sizes about 18in. to 9in. long, proportionate and random widths, laid to a 3in. lap in regularly diminishing courses from eaves to ridge. Each slate to be securely fixed by two stout copper nails and wide slates are to be used on the hips and verges.

**Alternatives:** Seconds, Thirds, Special Peggies; Olive Green and Mixed Shades.

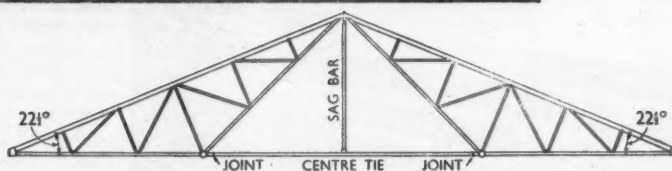

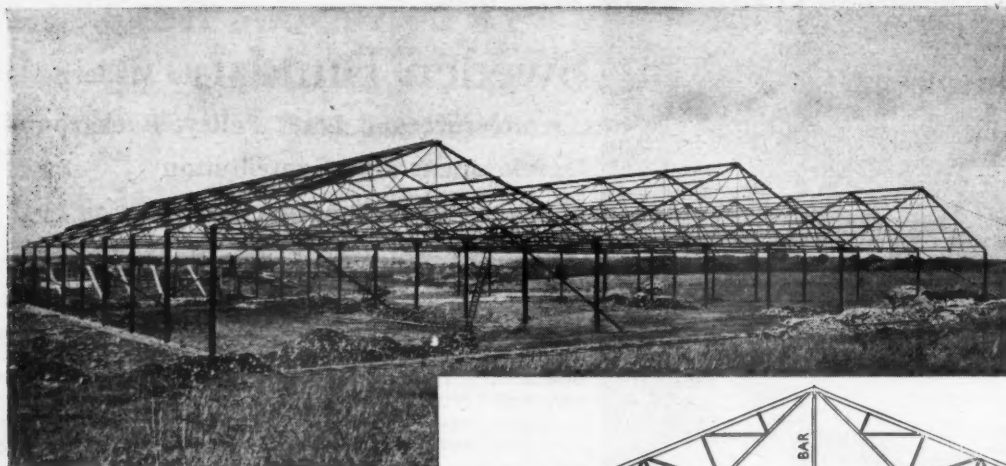

**Ridging:** "Bromoor" purpose-made of crushed and moulded slate from the same veins is recommended.

Technical information, samples and prices on request.

## Electrical Installations

*a handbook  
for architects  
and assistants  
edited by  
Brian Grant*

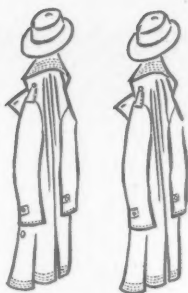

THIS BOOK DOES NOT SET OUT TO BE a technical work on electricity, but is designed to provide architects and their assistants with all the essential information they need for the efficient planning and supervision of electrical installations in cases where no consultant has been employed. The book will also help them to specify and obtain good materials and workmanship, as well as to choose the most suitable available fittings and accessories for the job in hand. In addition it will give them a fair understanding of questions they are likely to be asked by consultant engineers or contractors when working on larger jobs, and so enable them to deal intelligently with any problems that may arise. The majority of the contents were first published in the *Architects' Journal*, but they have now been revised and enlarged for presentation in book form. The size of the book is 8½ x 5½ in. It contains 100 pages including some 100 line diagrams and half-tone illustrations. 16s. net, postage 10d.

THE ARCHITECTURAL PRESS 9-13 Queen Anne's Gate, S.W.1

## Two into one

Where space is at a premium, Evertaut Two-person lockers are the automatic choice. They provide adequate and separate accommodation for two persons in the width required for one conventional locker. Each compartment has its own door, its own lock and its own ventilation system.

... will go

Overall dimensions are: height 72in., width 15in., depth 18in. Each hat compartment is 8in. high, 15in. wide and 18in. deep; each coat compartment 53in. high, 7½in. wide and 18in. deep. The units are finished in olive green or dove grey and are stove enamelled. Other colours are available to order. Price is £11 6s. 6d. per two-person locker, i.e., £5 13s. 3d. per person. Also available in 12in. deep.

## Churches Adam & Berkeley Lettering

### February Architectural Review

The variety and scope of the buildings illustrated, and subjects discussed, in the February issue will be catholic, even for the Review. *Three Churches* around Coventry by Basil Spence will show what the imaginative use of a modicum of rationalisation can do even for a church building programme; the spectacular *Teatro*

Church at Bell Green, Coventry, by Basil Spence & Partners.

*de los Insurgentes*, designed by Alejandro Prieto exhibits Latin-American design at its most exuberant and effective; while Erno Goldfinger's precise *Office block in Albemarle Street* is the kind of building our cities sorely need. Historical studies will re-examine aspects of eighteenth-century architecture: Bishop Berkeley's contributions to

Offices Albemarle Street, W.1 by Erno Goldfinger.

architectural theory will be the subject of an article by Marcus Whiffen, while a sheaf of papers on *Robert Adam* by various hands will include some unknown Clérissieu drawings from Russia. Gordon Cullen will complete his set of townscape studies for Bristol University with an analysis of *Trowbridge*, and Jacqueline Tyrwhitt will examine the planning of *Fatehpur Sikri*, the ideal city of Akbar the Great, somewhat in the manner of Sir Hugh Casson's memorable studies of Peking. In *Skill*, John Sharp will complete his survey of methods and materials in *Architectural Lettering*.

## Milford Haven Lamp-Standards Achthamar

### March Architectural Review

The impending ruination—or transfiguration — of Pembroke-shire, by the proposed industrialisation of the Milford Haven area, will be the subject of an important *Counter-Attack* article by Ian Nairn in the March issue of the Review, while another *Outrage* problem of a more wide-spread (though no less acute) interest, will be surveyed by Peter Witworth—the design of street-lighting standards—in a special article in *Skill*. Among buildings of interest to be described and illustrated, the most outstanding will be two industrial groups; further additions to the distinguished work already done for the *Technicolor Laboratories* by Gooday and Noble, and a complete set of *Pithead Buildings in Fifeshire* by Egon Riss, who has captured

Rothes Colliery, by Egon Riss.

something of that sense of technological drama that has been missing from so much recent English industrial building. In complete contrast will be a *Week-end House* on the seashore at West Wittering by Wells Coates and Michael Lyell. A travelogue by three recent voyagers in Turkey will document and illustrate the extraordinary sculptured church at *Achthamar*, and two historical articles will explore the frontier between architecture and technology in the early nineteenth century, W. J. Sparrow writing on the ingenious and

Carvings at Achthamar.

adventurous *Count Rumford*, inventor, man of action, and landscape architect, and Mary Eldridge examining the impact of plate glass in ever-larger sheets upon the design of urban *Shop-Fronts*.

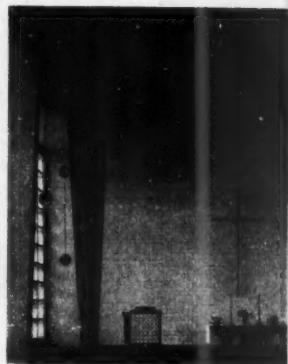

## Costs European Churches Office Blocks

### April, Architectural Review

#### Correction

In this column last week the house at Cowes should have been attributed to James Stirling and James Cowan.

Two contrasting and controversial subjects will be tackled in important articles in the April Review: John Carter will discuss *Cost Analysis*, and its implications for architectural education and the management of design; and Peter Hammond will suggest a drastic overhaul of current attitudes to *Church Architecture*, and especially the need for a rational analysis of liturgical functions. New office blocks at Newport Pagnell, by Gordon and Ursula Bowyer, and Birmingham, by J. A. Madin, will

Church at Dusseldorf by W. Xongeter.

be described and illustrated. Other buildings to be illustrated include a remarkable small house on the Isle of Wight, designed by James Stirling, and James Cowan. The reputation of a pioneer Edwardian modernist, *Lamond of Dundee*, will be rescued from undeserved obscurity by M. D. Walker, and in *Tridon, or the shipwright* Reyner Banham will discuss an unexpected anticipa-

House near Cowes, by James Stirling and James Cowan

tion of mid-century architecture in an academic text of the Twenties. Regular departments such as *Exhibitions*, the *Counter-Attack Bureau* and reviews of important *Books* will continue, and an important new monthly feature will appear for the first time—an *Interior Design* supplement, covering recent and forthcoming developments in the field of "inside architecture".

The annual post free subscription rate payable in advance is £2.2.0 sterling; in U.S.A. and Canada \$10.00; elsewhere abroad \$2.10.0

## PLUMBING modernised...

with ALKATHENE  
BOTTLE TRAPS

Practical in every way, the new Alkathene Bottle Trap offers many unique advantages. It is unbreakable, and will remain undamaged even when thrown on a concrete floor. It is unaffected by hot water and resists frost to a much greater extent than traps made of the conventional metals. Choking provides no problems: the bottom half of the trap is simply unscrewed by hand, cleaned and quickly replaced. The Trap has a loose coupling nut on the inlet, and the outlet is suitable for coupling to alkathene, lead, copper or iron. Alkathene extension pieces can be supplied for direct fitting or, if desired, with brass ferrule or leadfit for cast-iron multi-branch units.

The smart, off-white colour of this unit is in keeping with its clean lines and high quality—and prices are most attractive! Please write for fuller particulars.

the new **HA 167** LOUVRED LIGHT

HERE'S the most modern lighting fitting yet—the HA167. Scientifically designed to meet Ministry of Education requirements, the HA167 is particularly well suited for illumination of classrooms—also hospitals, offices, shops, etc. With 45° cut-off and having low surface brightness, it eliminates eye-strain—provides maximum light, free from glare or dazzle. Perspex shade is easy to clean and practically unbreakable. All parts are just sprung together—no screws or fasteners—to form a permanently rigid fitting. Speedy re-lamping through louvre. Easy to install and maintain. Its low price, pleasing design, combined with its high efficiency, makes the HA167 the best value in lighting today.

Folder describing the HA 167 in detail sent on request.

**LONDON COUNTY COUNCIL  
ARCHITECT'S DEPARTMENT**  
Vacancies for (1) ARCHITECTS, Grade III, starting salary up to £1,090 a year. (2) ARCHITECTURAL ASSISTANTS, starting salary up to £860.

Full and interesting programme of houses, flats, schools and general buildings.

Application form and full particulars from the Architect (AR/EK/5/58), The County Hall, S.E.1. (203) 8741

**GOVERNMENT OF QATAR  
ASSISTANT ARCHITECT  
STATE ENGINEER'S OFFICE**

The Government of Qatar in the Persian Gulf has a vacancy for an Assistant Architect in the State Engineer's Office. Duties will be to assist the Government Architect in the design of many architectural projects associated with the rapidly expanding capital of Doha. Applicants should be qualified Architects (Associates of Royal Institute of British Architects or other internationally recognised body) having good general experience of the design of private and public buildings and being rapid and competent draughtsmen. Salary starting at Rs.1,775 per Arabic month (equivalent to £1,596 per annum) with annual increments of Rs.75 per month for three years and then of Rs.100 per month up to a maximum salary of Rs.2,300 per month. Contract offered is for five years subject to six months probationary period. Gratuity payable on completion of contract. Leave: 6 days for each month of duty taken annually. Free passages, furnished accommodation, fuel, light, water and medical treatment. Duty car allowance. No income tax.

For further details apply in writing only to: C. Tennant Sons & Co. Ltd., 4, Copthall Avenue, London, E.C.2. 8767

**BOROUGH OF HARROW  
APPOINTMENT OF ARCHITECTURAL ASSISTANT**

Applications are invited for the above-mentioned appointment in the Department of the Borough Engineer and Surveyor, at a salary in accordance with A.P.T. Grade II (£725-£845 per annum, plus London "Weighting"). Candidates should have passed the R.I.B.A. Intermediate Examination.

The appointment will be subject to the provisions of the Local Government Superannuation Acts, the passing of a Medical Examination and the National Joint Council's Scheme of Conditions of Service.

The Council are unable to offer housing accommodation.

Forms of application may be obtained from me to whom they should be returned not later than Saturday, 8th March 1958.

**DAVID PRITCHARD,**  
Town Clerk's Department,  
Harrow Weald Lodge,  
Harrow, Middlesex. 8817

**CANADA**  
Central Mortgage and Housing Corporation (the Crown Corporation which administers the National Housing Act of Canada) requires experienced Town Planners in the Architectural and Planning Division, at Head Office in Ottawa for work in connection with housing activities across the country.

Applicants should possess a university degree or equivalent in architecture or engineering with experience in physical planning. Special consideration will be given to those who have experience in the New Towns, the London County Council or a progressive office working on good housing.

The starting salary will be from \$4,800 to \$5,100 per annum, depending on qualifications and experience. Salaries are reviewed annually and advancement is based on merit.

Travel assistance grants to help defray the cost of moving to Canada will be given on the following scale:

Married \$500.  
Single \$200.

Applications, stating age, marital status, qualifications and details of experience, together with the names and addresses of three referees, are to be addressed to Supervisor, Personnel Department, Central Mortgage and Housing Corporation, Head Office, Ottawa. 8820

**UNIVERSITY OF NOTTINGHAM**

Applications are invited from suitably qualified and experienced persons for the appointment of SENIOR ASSISTANT IN THE DRAWING OFFICE OF THE UNIVERSITY SURVEYOR. Commencing salary within the range £800-£1,000, according to qualifications and experience. Superannuation benefits under F.S.S.U. and children's allowances. Applications should be sent as soon as possible, but not later than 18th March, 1958, to the Registrar, from whom further particulars and forms of application may be obtained. 8834

**AIR MINISTRY require WORKERS-UP** in Quantities Division, London. Must be fully experienced and competent to Work-up entire Bills of Quantities. Preference holders C. & G. (Quantities), O.N.C. or equivalent technical qualification. Salary range £695 at age 25 to £1,030; starting pay dependent on age, qualifications and experience. Opportunities may occur for competing for pensionable posts; promotion prospects. 5-day week. Over 3 weeks' leave a year. Applicants normally should be natural born British subjects. Write, stating age, qualifications and previous appointments, including type of work done, to P.E. 104, Manager, Professional and Executive Register, Ministry of Labour and National Service, Atlantic House, Farringdon Street, E.C.4. No original testimonials should be sent. Only candidates selected for interview will be advised. 8471

**E. R. FARR,**  
Town Clerk. 8852

**THE NATIONAL COAL BOARD,** South Western Division, invite applications for the post of ARCHITECTURAL ASSISTANT, Grade 1, in the Divisional Production Department, Architect's Branch, Cambrian Buildings, Mount Stuart Square, Cardiff.

The work involves general drawing office duties in preparation of sketch plans, and working drawings.

The qualification required is the Intermediate Examination of the R.I.B.A., but consideration will be given to candidates who have not passed the Intermediate Examination but have had considerable practical experience.

Salary scale: (male), £715-£825-£850 per annum; (female), £610-£721-£720 per annum.

In exceptional circumstances these scales can be increased to:

Males: £1,000 per annum.  
Females: £870 per annum (subject to equal pay).

Please quote Staff Vacancy No. 44/40.

Full particulars of age, qualifications, experience and positions held, together with details of present post and salary, should be sent to the Divisional Chief Staff Officer, National Coal Board, Cambrian Buildings, Mount Stuart Square, Cardiff, by 6th March, 1958. 8848

**NORTH GLOUCESTERSHIRE TECHNICAL COLLEGE, CHELTENHAM**

LECTURER required for Building Construction and Quantity Surveying in Diploma and National Certificate Courses.

Candidates should have had good professional experience and hold R.I.B.A. or R.I.C.S. qualifications.

Salary scale: £1,200 by £50 to £1,350.

Forms of application may be obtained by forwarding a stamped addressed envelope to the Clerk to the Governors, North Gloucestershire Technical College, The Park, Cheltenham, to whom completed applications should be returned by 14th March, 1958. 8847

**IMPROVEMENT TRUST-SINGAPORE**

The Singapore Improvement Trust requires a PLANNER in the Planning Department on initial contract for 3 years for duties in connection with development control on Singapore Island.

Applicants must be Associate Members of the Town Planning Institute, and either A.R.I.B.A., A.M.I.C.E., A.M.I. Mun.E. or A.R.I.C.S., or equivalent qualification. Applicants should have had experience in development control in a public authority.

Commencing inclusive salary between £1,390 and £1,940 per month (equivalent to £1,946 and £2,716 per annum), according to qualifications and experience. (\$1 Malayan = 2s. 4d. approx.) Increments payable after each completed year of service. No other allowances payable except duty transport. Strict medical examination. Air passages provided.

Officer appointed will be required to join the Singapore Government's Central Provident Fund. Quarters with heavy furniture provided, if available, at moderate fixed rental. 12 weeks full pay leave on completion of contract. 10 days local leave annually.

Applications in duplicate, stating date and place of birth, with details of education, qualifications, training and experience, accompanied by copies of testimonials, to Messrs. Allen & Williams, 1, Victoria Street, London, S.W.1, by Thursday, 13th March, 1958. 8851

**BERKSHIRE COUNTY COUNCIL  
ASSISTANT ARCHITECT, A.P.T. Grade IV (£1,025-£1,175).**

A man capable of taking charge of drawings under a section head from preliminary scheme stage to completion is required. Applicants should be Associates of the R.I.B.A.

**ASSISTANT ARCHITECT, Special Grade (£795-£1,030).**

Candidates should have had good architectural training and be experienced in planning, design and construction. Preference will be given to Associates of the R.I.B.A.

**ARCHITECTURAL ASSISTANT, Grade A.P.T. II (£725-£845).**

Candidates should have had office experience and have reached R.I.B.A. Intermediate standard or have recently completed the recognised architectural course.

In all these posts, opportunity will be given to obtain a varied experience in local government work.

Application forms and further particulars can be obtained from J. T. Castle, Esq., A.R.I.B.A., A.M.P.I., County Architect, Dept. A.A.J. (1), Wilton House, Parkside Road, Reading, to whom they should be returned not later than Wednesday, 5th March, 1958. 8865

**GHANA PUBLIC SERVICE COMMISSION**

**RURAL WATER DEVELOPMENT**

**CIVIL ENGINEERS** for waterworks construction, operation and maintenance. Candidates must be A.M.I.C.E. or have passed Parts I and II of the Finals of the I.C.E. examination plus two years' experience preferably on water supply work. Appointment on contract for three years each of 18-24 months duration in salary range £1,180-£2,080 per annum. Entry point determined by age and experience.

**CHIEF DRAUGHTSMAN** to take charge of engineering drawing office take-off quantities and prepare estimates and the training of drawing office staff. Candidates must be civil engineering draughtsmen with good knowledge of reinforced concrete detailing, as applied to waterworks structure. Preference will be given to holders of Higher National Certificate. Appointment on contract for one year of 18-24 months duration in salary range £1,770-£1,970 per annum. Entry point determined by age and experience.

Other terms of service for both posts: Gratuity at rate of £12 10s. for each completed month of satisfactory service. Outfit allowance £30-£60 on first appointment and Education Allowance for children when not resident in Ghana of £100 a child for up to three children under 18 years. Free first-class passages for officer, wife and up to three children under 18. Quarters at low rental. Generous home leave. Low income tax.

For further particulars and application form write, stating age, qualifications and experience to The Director of Recruitment, Ghana High Commissioner's Office, 13, Belgrave Square, London, S.W.1. 8854

## Macks have the answer

### MACKS STRUCTURES

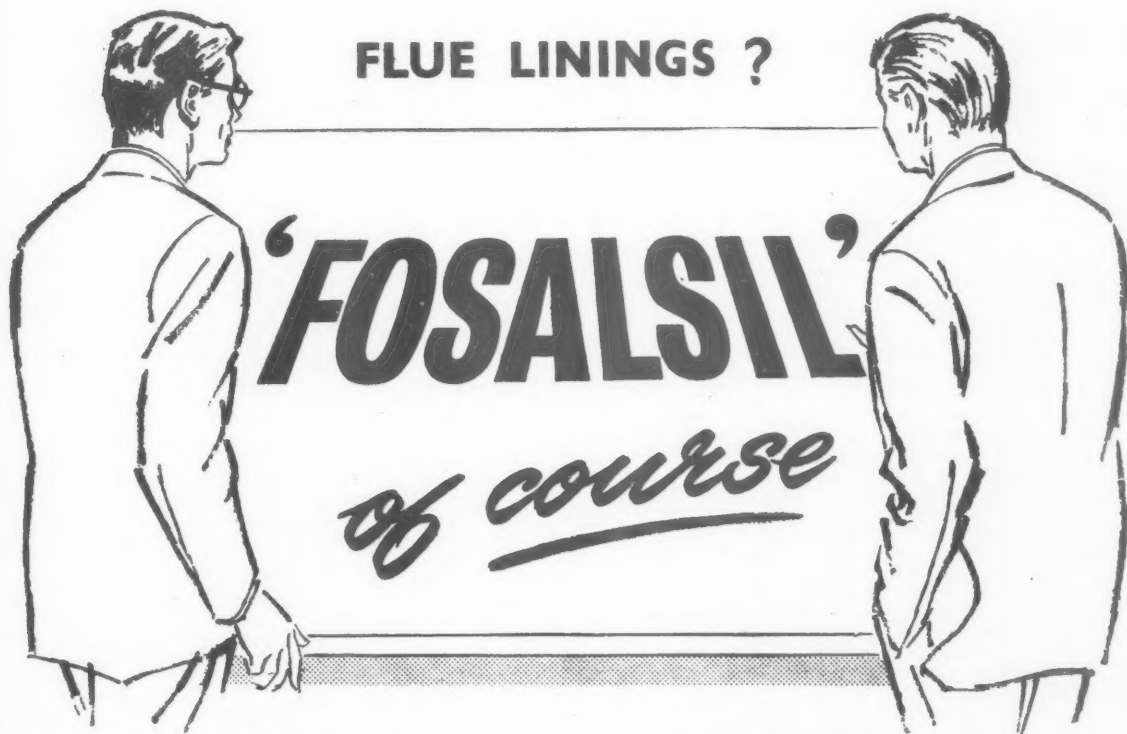

(BIRMINGHAM) LTD.

BELVEDERE WORKS, FELTHAM, MIDDLESEX

Phone: FELTHAM 5761

Crowded working conditions are not conducive to efficient production. If economic conditions prevent your expansion by the construction of the usual type of building, why not contact us and we shall be pleased to advise you on the best possible prefabricated building to suit your requirements.

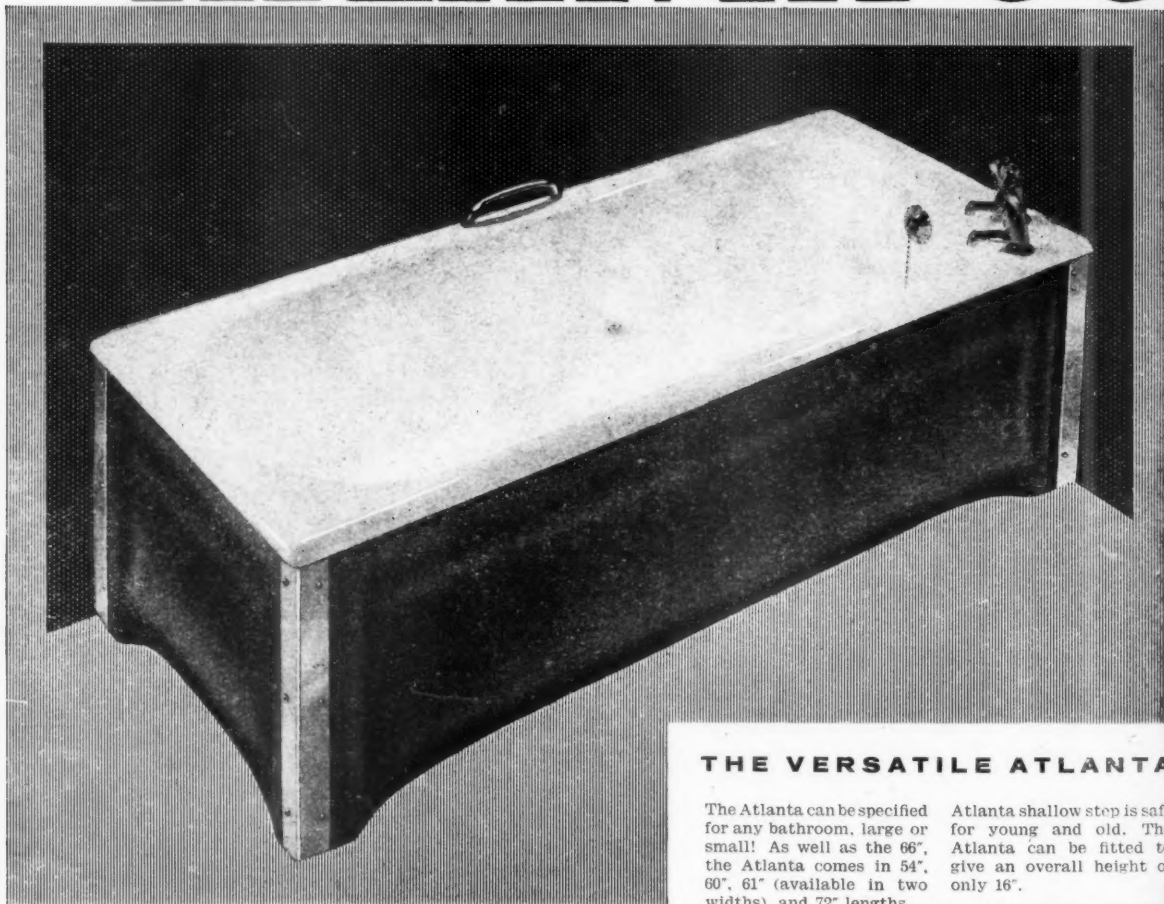

## FLUE LININGS ?

MOLER PRODUCTS LTD. COLCHESTER • ESSEX

*For satisfaction year after year — specify the*

# **BILSTON ATLANTA 66**

No matter how many homes are involved, standard specification of the Bilston Atlanta ensures constant satisfaction. Its brilliant enamel finish remains unimpaired year after year! The Bilston range includes the exact colour required for any decorative scheme. Specify the Atlanta — it costs no more than an ordinary bath.

## **THE VERSATILE ATLANTA**

The Atlanta can be specified for any bathroom, large or small! As well as the 66", the Atlanta comes in 54", 60", 61" (available in two widths), and 72" lengths.

The Atlanta 54 must be preferred to any other bath of this size because it is an exact replica of the full-size bath, scaled down to small proportions.

Atlanta flat bottom helps to prevent slipping . . . ensures comfort.

Atlanta shallow step is safe for young and old. The Atlanta can be fitted to give an overall height of only 16".

With the Atlanta, taps can be fitted in three different positions to meet all possible requirements.

Corner tap mounting facilitates installation and maintenance.

The Atlanta is supplied with or without overflow . . . with or without handgrip.
