## Protecting the Client

The Architect is chiefly interested in specifying an article because he knows it will give satisfactory service to his client, and uphold his reputation for foresight and good judgment. The day of engine room appliances on Radiator equipment is past. Radiators demand a valve that is specially designed for radiator surroundings; one that does not require an expert to repack at stated intervals, and that will not leak and spread ruin over floors, rugs, walls and ceilings.

The Sylphon Packless Radiator Valve is an important application of the Sylphon Bellows. By means of this bellows the valve is hermetically sealed at all points around the stem, and its working parts protected from the steam and wash of the system. Having no perishable parts or packing, the valve is frictionless in operation, easy to open and close, and practically indestructible in use. It is the most absolutely and permanently tight Radiator Valve it is possible to produce.
