...BEHIND this modern beauty is that permanence of construction, that is always assured by the use of Youngstown Pipe.
Erskine Copper Radiators

Erskine Radiators for New York U.S. Courthouse

The new Federal Courthouse in New York City will use Erskine Copper Radiators exclusively for concealed radiation. About 60,000 square feet of Erskine Radiation is on order for this important project, designed by the office of Cass Gilbert, Inc. And so again Erskine Copper Radiators are used when the greatest efficiency and reliability are demanded.

Reasons for their Excelling Efficiency

Supply tubes full 3/4". Fins 2 1/2" high. Patented, permanent all-copper bond. All of which means abundant supply of heat even in the coldest weather, and lowered heating costs. See Sweet's, page D-414. Or send for catalog.

For Your Garden Library

Natural Rock Gardening

This is more than a mere book on rock gardening. It tells how to make a picture for all
times of the year, and the materials used are rock and open spaces, firs, flowers, water
and bridges. The spirit of the mountains is translated into terms of practical gardening.

The information throughout is clear and such that from it even a beginner can make a
beautiful garden. On the other hand, the more experienced will find assistance and
new avenues to explore. Size and expense are not governing factors of success; a small
site and a few dollars can also produce a complete picture. 131 pages, 6¼ by 9¼ inches
Illustrations from drawings and photographs. $1.50.

By B. H. B. SYMONS-JEUNE

Water-Lilies & Water-Plants

Water-plants, and particularly water lilies, are becoming more and more popular as
gardeners realize that they are among the hardiest of plants; that of all hardy plants
many of them produce the largest flowers and the most beautiful colors; and that they
can be grown easily and cheaply in the simplest of ponds in the smallest of gardens. No
modern book has hitherto existed, in English, dealing solely with this fascinating type
of gardening. On the Continent, where water lilies have been grown in increasing num­
bers for many years, the author of this book, who is leader of research into water-plants
for the Guild of German Horticulturists, is recognized as a first authority. 156 pages,
7¾ by 10 inches. Illustrations from drawings and photographs. $3.00.

By ALEXANDER NIKLITSCHEK

The Arrangement of Flowers

The way to arrange flowers so that a genuinely artistic effect results is little known
in the Western world.

Mrs. Hine, an outstanding authority on flower arrangement, for which she has won
many prizes, has written this book primarily for those who want flowers in the house.

She shows how, by the use of certain simple rules, fewer flowers can achieve more varied
and lovelier effects; how standards of excellence, deriving from centuries of experience
in the Orient, have been affected by fashion and expediency; how balance and propor­
tion in flower arrangement are the touchstones of successful decoration.

Her book is profusely illustrated with photographs of flower arrangements that won
prizes, and thus pictorially presents the best efforts of specialists in different kinds of
flowers. 147 pages, 7 by 10 inches. Illustrations from photographs. $2.50.

By MRS. WALTER R. HINE

and—

The New Illustrated Gardening Encyclopaedia

BY RICHARD SUDDELL, F.I.L.A., A.R.H.S.

It is quite impossible, without seeing this book, to appreciate its comprehensive quality.
Every phase of gardening is fully and authoritatively covered, and the book should be
of the utmost value to every gardener, whether amateur or professional.

Gardening, like most arts, is constantly changing. In order to get a proper register of
all that is best and newest in the way of method and information, various specialists
have contributed the sections devoted to their particular subject. And to assist those
amateurs who specialize, some of the more popular flowers have been dealt with rather
fully in the text, and the material in such cases has been supplied by gardeners who have
themselves specialized in the particular flower for many years. In short, the cream of
many years' experience is included in these pages, and as far as possible all that is best
in modern garden information has been expressed in simple form, so that the novice will
find it a useful book of reference.

1152 pages, 5½ by 8

Charles Scribner's Sons, New York

ARCHITECTURE, published by Charles Scribner's Sons, 507 Fifth Avenue, New York, N. Y. May, 1933. Volume LXVII, No. 5. Published monthly
on the 25th of the month preceding date of issue. Entered as second-class matter, March 30, 1879, at the Post Office at New York, N. Y., under
the Act of March 3, 1879. Yearly subscription rate to members of the architectural and allied professions, $3; to all others, $6.

With color frontispiece, 64
pages of half-tone illus­
trations, and 470 line
drawings.
LIGHTING ARCHITECTURE

BY FREDERICK C. HIRONS

In the good old days of candles, oil lamps or gas lights, there was just about one thing to do—let the lights shine, even if they did shine in your eyes. If the room were large, you could let the lights hang high and perhaps put in a few brackets to get light enough to illumine your program or hymn book. The source of light was never hidden and glare was just taken for granted. But times have changed.

In a large auditorium, such as the Worcester Memorial, Worcester, Mass., we had several possibilities. We could have adopted and adapted elaborate ceiling fixtures, chandeliers or brackets, their designs being more or less the heritage from the flame era; we could have designed new light fixtures, breaking with past precedent, yet making the new fixtures accessory features of the design. However, we believed that in this case our objective was to illumine the architecture itself, for the auditorium was designed as an architectural entity, with studied proportion and detail, enriched with color, needing nothing but light itself for its greatest effectiveness. Therefore fixtures, brackets, chandeliers had no place; instead the room is bathed in light through the modern ingenuity of indirect lighting, without glare, without spotting.

The especially devised reflector pedestals are spaced approximately nineteen feet on centers near the walls of the balcony. Their light floods the room largely by reflection from the ceiling, a diffused and pleasing illumination of the room as a room, as it was designed. Skillful illuminating engineering produced the desired effect, eliminating the possibility of disturbing bright spots which sometimes are thrown against walls and pilasters when the reflectors are poorly designed. Here we have lighting with just one function—that of showing the architecture itself to the best possible advantage—a function which can only be fulfilled through modern technical ability and equipment.
LEBRUN TRAVELLING SCHOLARSHIP, 1933

THE award of the LeBrun Travelling Scholarship for 1933 has been announced by Chester Aldrich, of Delano & Aldrich, who is chairman of the Scholarship Committee of the New York Chapter, A. I. A. The winner of the Scholarship is Mr. Walter T. Stopa, of Chicago, nominated by Mr. John Holabird of that city. Honorable men­tions were awarded to: George D. Recher, of Chicago, Ill.; Edward A. Pauly, Hamburg, N. Y.; Magnus Thompson, Washington, D. C.; and Floyd Ribe, Los Angeles, Calif.

The subject of the programme was a Recreation Centre for a Small Community. There were 220 candidates, of whom 122 submitted drawings, nearly twice as many as those competing last year. The other members of the Committee on Scholarship, who served as the Jury of Award, are: L. M. Franklin, Otto F. Langmann, Oliver Reagan, and D. Everett Waid.

JAMES TEMPLETON KELLEY FELLOWSHIP AWARD

THE Educational Committee of the Boston Society of Architects announces that Mr. John E. Linnett, of Boston, has been appointed the fourth holder of the James Templeton Kelley Fellowship in Architecture.

Mr. Linnett expects to depart for Europe very shortly where he will devote his time to the study of domestic architecture in England, France, and Italy.

He has been employed in architecture for the last eighteen years in Boston. His education has been largely obtained in these offices together with his studies carried on at the Boston Architectural Club.

A. A. A. R.

THE winners in the Collaborative Competition of the Association of the Alumni of the American Academy in Rome are as follows:

The team of John L. King as architect, Charles F. Bell as painter, and Raymond Barger as sculptor, of Yale University; the team of Robert K. Chisholm as architect, Doris Monroe as painter, and Edith Barnes as sculptor, of Yale University; and the team of James H. McNaughton as architect, Philip F. Bell as painter, and Katherine McSwigan as sculptor, of Carnegie Institute of Technology, were all given the grade of second medal and were considered a tie for first place. The jury wished specially to commend the sculpture by Mr. Wayland, of the Pennsylvania Academy of the Fine Arts, and they also commended the sculpture by Ivan Edward Mansky, of the Pennsylvania Academy of the Fine Arts. Commendation by the jury is further made of the painting by Herbert J. Gute, of Yale University.

The jury was made up as fellows: architects—J. K. Smith, Thomas H. Ellerton, Eric Gugler; painters—Frank H. Schwarz, Salvatore Lascari, J. C. Bradford; sculptors—John Gregory and Joseph Kiselewski. Edgar J. Williams was in charge of the competition for the Alumni of American Academy in Rome.

ARCHITECTS' EMERGENCY COMMITTEE COMPETITION AWARDS

EIGHTEEN cash prizes have been awarded to unemployed architectural draftsmen competing in the latest of a series of competitions conducted by the Architects' Emergency Committee of New York. In addition to the first, second, and third prizes of $75, $50, and $35, fifteen fourth prizes of $25 each were awarded. The competition called for designs for a roadside mart for the display and sale of products of the West Mountain Mission, West Pawling, N. Y., including needlework, quilts, bakery goods and preserves, honey, plants, and flowers.

The jury consisted of Ralph Reinhold, Gerald Holmes, John F. Thompson, Hermon Wick, and Lucian F. Smith.

HARVARD SCHOLARSHIPS

HARVARD UNIVERSITY offers three scholarships, each with an income equal to the tuition fee for the academic year 1933-34, to men eligible for admission as special students to the School of Architecture. Scholarships will be awarded as a result of a competition, the final drawings in which will be submitted April 8.

A COURSE IN BUILDING CONSTRUCTION FOR THE UNEMPLOYED

DAVID A. FRANKLIN, who is an instructor for the Emergency Unemployed Relief, is giving a course on building construction to unemployed men formerly engaged in the building line. Mr. Franklin would welcome manufacturers' catalogues, details, photographs, blueprints, etc., for use in his course, and would also welcome from the architects, magazines, blueprints of country houses or other work, plates, books, and the like. The course is given at the West Side Continuation School, 131 Sixth Avenue, New York City.

A. S. T. M.

THE thirty-sixth annual meeting of the American Society for Testing Materials will be held in Chicago, June 28-30.

THE SCOULLF COM PETITION

THIS is a reminder of the competition sponsored by the Scovill Manufacturing Company, of Water­ville, Conn., which closes at midnight, June 1. It is open to all architects and to men and women who have been members of an architect's organization at any time since March 1, 1932. There are two classes, and contestants are allowed to enter either class, but not both. It is required to submit an essay not to exceed fifteen hundred words in length on modernizing. Full details may be had from Scovill Manufacturing Company, Waterville, Conn.

AN ARCHITECTURAL TOUR IN EUROPE

UNDER the direction of Jane West, University of Minnesota, and former student in the office of LeCorbusier, a summer tour covering modern architecture in Europe starts from New York on the S.S. Columbus, June 30, returning on the S.S. Bremen, August 30. Details may be had by addressing The Open Road, Inc., 56 West 45th Street, New York City.

MODERNIZE YOUR HOME

THE National Modernize Your Home Exposition, scheduled to have been held at Madison Square Garden, New York City, in March, has been postponed to May 16, 17, 18, 19, 20.

The exposition will serve as the centre of the proposed sales drive which will cover the New York metropolitan area. A committee to supervise the sales drive is now being formed, composed of representatives of organizations in the New York City Building Trades Employers' (Continued on page 6)
Brunswick offers modern fixtures for beer service

PRODUCED BY EXPERT CRAFTSMEN

new ideas in design—new ideas in mechanical refrigeration

—new Record Low Prices

As the largest manufacturers of bar fixtures before prohibition we now present a complete new line of service fixtures at record low prices. Modernistic design characteristic of the present era is combined with the last word in mechanical refrigeration.

When desired, we can supply ice dispensing units for either "under the counter" or remote storage of beer.

You will find a modern Brunswick Service Fixture for every size of room and every class of clientele.

Under counter assemblage of half-barrel and bottle cooling compartments are combined with spacious workboards for the rinsing, draining and storage of glasses. All are made as compact as possible. Where desirable, Brunswick fixtures permitting basement or other remote storage of barrels is available. With the Brunswick mechanically refrigerated counter cooler units the half-barrels are properly pre-cooled in the storage compartments and the beer is delivered at the tap at an even and exact temperature. Thus the essential freshness and flavor of the beverage is assured. These exclusive features provide low operating costs as well as complete sanitation.

Brunswick offers an individual service for planning and arranging all essential fixtures. This includes designing and estimating of special fixtures of any size. Do not fail to make use of this experienced service. No obligation—write or wire for details and catalog.

THE BRUNSWICK-BALKE-COLLENDER CO.
General Offices: 623-633 S. Wabash Ave., Chicago, Ill. — Branches in Principal Cities of the United States and Canada
THE BULLETIN-BOARD Continued

Association, lumber and supply dealers' associations, and building trades organizations in Westchester and New Jersey and on Long Island.

Realizing that modernization and replacement work represent the one point where business can be created in the building industry this year, the committee will seek to stimulate that work through organized and intensive effort.

AMERICAN FEDERATION OF ARTS

THE Twenty-fourth Annual Convention of the American Federation of Arts will be held in the Art Institute, Chicago, June 8, 9, and 10, 1933.

MILLS COLLEGE SUMMER SESSION

An annual coeducational summer session for students of art, French, and music, will be held by Mills College, Mills College, Calif. On the staff to teach sculpture, painting, drawing, and architecture are Alexander Archipenko and Warren Cheney. The session extends from June 19 to July 29. For detailed information, address Elizabeth Conner Lindsay, Secretary of the Summer Session, Mills College, Calif.

A. I. S. C. BRIDGE DESIGN COMPETITION

TEN students from the 134 who competed in the Fifth Bridge Design Competition of the American Institute of Steel Construction have been selected to submit finished drawings in the final judgment to be held May 4. The students selected to submit final renderings are:

Igor B. Polevitzky, University of Pennsylvania; W. M. Horowitz, University of Illinois; James A. Wares, University of Illinois; George D. Recher, Atelier Adams Nelson, Chicago; Harold T. Emery, Ohio State University; John Strimatter, Ohio State University; W. A. Smith, University of Alberta; Leonard E. Palumba, New York Architectural Club; Adolf Roessling, New York Architectural Club; Robert G. Jachalke, Columbia University.

Students of architecture and of engineering registered at forty-one different schools and colleges entered drawings in the preliminary competition, which was judged on March 21. The jury: Leon S. Moisissel, consulting engineer, of New York; Edward A. Byrne, Chief Engineer of the Department of Plant and Structures of the City of New York; William F. Lamb, architect, of the firm of Shreve, Lamb & Harmon, New York; Kenneth M. Murichson, architect, of New York; and H. H. Saylor, Editor of Architecture.

WELLESLEY SUMMER INSTITUTE

THE Wellesley Summer Institute for Social Progress holds its first session from July 1 to 15, on the campus of Wellesley College, Wellesley, Mass. Architects who are interested in constructive steps toward improving social and economic conditions are invited to take part. The plan is to assemble a group of able men and women—a cross-section of a typical community—to think out practical solutions for some of our most pressing social and economic problems. For information, write Dr. Alfred D. Sheffield, 31 Madison Street, Cambridge, Mass.

ERNEST M. HÉBARD

WORD has been received of the death in Paris of the well-known French architect, Ernest M. Hébard, a brother of Jean Hébard, of the architectural faculty of University of Michigan. Ernest M. Hébard, in 1904, won the Grand Prix de Rome in Architecture at the Ecole.

HENRY B. HERTS,
1871-1933

HENRY B. HERTS, architect, of New York, died March 27, after suffering from a heart ailment for several years. Mr. Herts was the designer of many playhouses in the theatre district, and is credited with the invention of the cantilever-arch method of construction, making possible the building of balconies without supporting columns. Mr. Herts was born in New York, was educated in the public schools, City College, and Columbia University, from which institution he was graduated in 1893. Subsequently he spent several years abroad studying at the Ecole, at the University of Rome, and the University of Heidelberg. Returning to the United States in 1900, he organized the firm of Herts & Tallant, with which he was connected until 1912. Afterward he worked for a time in association with T. Michael Robertson; served as architect for the Playground Commission, and aided the Fire Department in drafting the present building code. Mr. Herts's interests outside of architecture lay mainly in painting and music, his paintings having been exhibited in Paris.

WILLIAM WHETTEN RENWICK, 1864-1923

WILLIAM WHETTEN RENWICK, architect, died March 15, at his home in Indianapolis, IN, after a brief illness. Mr. Renwick was born at Lenox, Mass., and after receiving the degree of Mechanical Engineer from Stevens Institute in 1885, he began the study of architecture in New York City in the office of his uncle, the late James Renwick, architect of St. Patrick's Cathedral and Grace Church. Five years later he was admitted to a junior partnership. Meanwhile, however, he had studied sculpture in Paris with Magnalier of the Ecole des Beaux Arts.

While with his uncle's firm Mr. Renwick did architectural and decorative work on St. Patrick's Cathedral, St. Bartholomew's Church, All Saints Church, and Grace Church. Subsequently while practising alone he designed the Cathedral of St. Peter and St. Paul in Indianapolis, the Church of St. Aloysius in New York City, the parish buildings of All Saints, the chantry, south porch, and open-air pulpit of Grace Church, besides many altars, monuments, and minor works.

Mr. Renwick was widely known for his invention of the mural decorative process called "fresco-relief." One of the finest examples is a panel in All Saints Church. Mr. Renwick was a member of the American Institute of Architects, National Sculpture Society, and The Architectural League of New York.

PERSONAL

Kilham, Hopkins & Greeley, architects, announce the removal of their offices to 126 Newbury Street, Boston, Mass.

James H. Eagen, architect, announces the opening of his office at 18 Masonic Temple, Ridgway, Pa., for the practice of architecture, and requests that manufacturers' catalogues be sent to him.

John Louis Wilson, architect, announces the removal of his office to 57 West 125th Street, New York City.
THERE IS NO SUBSTITUTE FOR QUALITY

Those who pride themselves upon having nothing but the best equipment in their buildings inevitably select Otis elevators. The difference in price between the best and the poorest is not large. But the difference in length of life, up-keep costs and satisfaction may be vast.

Each Otis elevator is custom built to meet the transportation needs of a building. Piece by piece, it is completely manufactured and assembled within the Otis plants and installed in the building by trained elevator mechanics. From blueprint to installation Otis is able to carry out its high aim of giving the safest, most comfortable and most dependable elevator service over a long period.

Efficiency, economy, even life itself in an emergency, may depend upon the elevator installation. Those in control of new building plans must accept this responsibility. Those in charge of existing buildings face it every day.

Otis can help both to discharge these obligations. Expert engineers are available to assist with plans and specifications for new structures. They also will conduct modernization surveys and render dependable reports on the condition of existing equipment. These services and advice are entirely free.

OTIS ELEVATOR COMPANY

Architectural Drawing
A PRACTICAL HANDBOOK FOR STUDENTS AND OTHERS

The authors' aim in compiling the present work has been to condense within a reasonable scope, at a price within the reach of all students, such essential data as will form a solid grounding in this important and varied branch of architectural training.

There has hitherto been no satisfactory, concise text-book on the subject dealing with geometry from the point of view of the young architect, and it was with a view to remedying this deficiency that the volume was first conceived—gradually, however, the field was extended so that the book now covers the whole subject of Architectural Drawing.

With 96 pages of text, 8 pages of half-tone illustrations, and many line illustrations throughout, about 150 drawing figures in all. 6 x 8 3/4 inches. Cloth, $3.75

Abstract Design
A PRACTICAL MANUAL ON THE MAKING OF PATTERNS

By AMOR FENN

MR. FENN'S book is both constructive and analytical. It shows how the use of a few simple units may be elaborated indefinitely into original variants, and how even the most elaborate may be nearly always reduced to a judicious arrangement of quite simple motives. His long experience as a teacher has fitted him perfectly to produce what is the most concise yet comprehensive treatment of the subject of Abstract Design yet issued.

The author is a simple and explicit writer, and the thesis of the book is conveyed by a mass of comparative illustrations, nearly all of which have been specially drawn for the book by the author and assistants. A number of useful historical examples are reproduced photographically, and there are numerous diagrams and drawings of instruments, motives, methods, spacing, etc. Students, teachers, designers, craftsmen, and, in fact, all who have to do with the subject will find the book a wonderful repository of patterns, besides a succinct analysis of the fundamental principles underlying this type of designing, without a thorough understanding of which no really fine work can be evolved.

Price, $4.50

CHARLES SCRIBNER'S SONS, New York
Architects Praise Ruberoid for this Eternit Cypress-Textured Asbestos Shingle—TIMBERTEX

"GIVE us the Natural beauty of wood in a fire-proof, rot-proof tapered shingle at a reasonable cost", architects requested. And so Ruberoid built Eternit Tapered Timbertain® to the architects own sales inviting specifications.

1. AGELESS AND FIRE-PROOF

Ingredients: Portland Cement, reinforced with Asbestos Rock Fibres. Both are time and fire defying.

2. TAPERED CONSTRUCTION

Designed to provide thickness and strength where it is most required. Shaped for perfect application.

3. CYPRESS TEXTURED

Entire shingle textured in various designs of weathered Cypress.

4. WOOD COLORS

Five rich, soft "wood colors" of lasting beauty. The mineral oxide colors are an integral part of the shingle.

5. STAGGERED BUTTS

Double sets of punched nail holes permit laying irregular shingle courses.

6. DEEP SHADOWS

Butts are approximately ¾" thick, assuring deep, heavy shadow.

7. MODERATE COST

Popular price, plus ease of application permits cost in keeping with 1933 incomes.

The acceptance of Eternit Timbertain Asbestos Shingles was prompt and enthusiastic. Because of their many distinctive features and comparatively low cost, sales for new construction, modernizing and re-roofing have been constantly pyramiding. One job invariably sells another.

Regardless of what plans you may have on the boards, if you are not familiar with this faithful reproduction of a Cypress Shingle in time-defying asbestos, see Eternit Timbertain. Measure it point by point by what you believe a good roofing should be. We leave the rest to Timbertain itself. The coupon will bring you free samples. Mail it today.
Protecting the INVESTMENT in Industrial Buildings

With

Byers Genuine Wrought Iron Pipe

Industrial buildings must endure—the investment in them must be protected. Hence, materials that are known values, materials that have proved their worth are today being specified more than ever before for these structures.

Just such a material is Byers Genuine Wrought Iron. The excellence of service records established by this material in corrosive services, over long periods of time, has demonstrated its long-time economy. Today, as a result of these service records, Byers Genuine Wrought Iron Pipe is being specified for general industrial piping as well as process and refrigeration lines. It is delivering lower cost per year service. It is avoiding premature pipe replacement, and it is cutting pipe maintenance to an absolute minimum. In short, Byers Pipe is widely recognized as one of the most effective means of protecting the investment in industrial properties.

A Byers engineer will gladly place wrought iron's service records before you. These records, which show the comparative service of wrought iron in direct relation to other piping materials, are engineering support for any specification of Byers Genuine Wrought Iron. "Pipe Prescription" will interest you as a scientific method for basing pipe specifications on actual requirements and show how, today, it is being generally adopted by leading architects and engineers.

Address our Engineering Service Department at Pittsburgh for any information which you wish on the application of Byers Genuine Wrought Iron for stacks, tanks or boiler breechings. Your request will be answered promptly. A. M. Byers Company, Established 1864. Pittsburgh, Boston, Philadelphia, New York, Chicago, St. Louis, Houston, Los Angeles.

CHARLES SCRIBNER'S SONS, PUBLISHERS

NEW YORK: 597 FIFTH AVENUE AT 48TH STREET
IVY-CLAD BRICK, WHITE SASH, GREEN DOORS, FOREGROUND TREE AND SHADOWS

GERALD K. GEERLINGS left this drawing incomplete — why don't you finish it? He made the original, exactly this size, entirely with a 3B Microtomic Van Dyke Pencil. On the very smooth surface of this paper, you will find a 5B or 6B best. Mr. Geerlings says:

"When we use T-square and triangle, the resultant drawing usually looks convincing. But on outdoor sketching and indoor perspectives we are apt to flounder uncertainly. A method which serves as a sound starting point consists in first doing a straightforward, accurate line drawing, then applying flat tones, and finally, adding such texture details as may be beneficial. The modern tendency favors clear-cut draftsmanship and shuns woolly indecision. If you seek freedom in drawing, follow Whistler's precedent of learning first how to record facts deliberately."

FREE SAMPLES of any two degrees of the Microtomic Van Dyke Pencils are yours for the asking. Write to the Eberhard Faber Pencil Co., Dept. AR 5-33, 37 Greenpoint Ave., Brooklyn, N. Y.

MEET THE FOUR-SIDED TRIANGLE

"An unnatural phenomenon, perhaps, but a drafting suggestion worth passing on. Until you try it, you have no idea how useful a triangle can be, which serves both as a 45° and a 30°-60°. Cut off the acute end of a 12-inch 30°-60° triangle, so that it becomes a 45°, as shown left. The long leg of the triangle is still 9 inches and will serve as well as before. This four-sided 'triangle' will make 15° with the T-square; in combination with another angle, and with a little practice, it will become increasingly useful."

—Gerald K. Geerlings.

MICROTOMIC VAN DYKE EBERHARD FABER

Made by the new Eberhard Faber chemical process in 18 consistently accurate degrees—7B softest to 9H hardest.
UTRECHT CATHEDRAL, 1930
From the pencil drawing by Gerald K. Geerlings
The Way Out

By Marshal L. Oliver

The most urgent problem of the present crisis is to provide the means of immediate unemployment relief. Since local and even State authorities are no longer able to cope with the emergency, this has finally become one of the major responsibilities of the Federal Government. All that remains to be decided is whether the authorities will seek to bring about a recovery of business by undertaking a courageously conceived programme of public works or whether, at last, we must resort to the dole.

The fact has been repeatedly brought out that the underlying cause of economic depression is a failure of buying power. Whereas in the past it was generally believed that a surplus of labor could be absorbed only by the gradual, automatic resumption of industrial activity, recent events have forced the conclusion that the shoe is on the other foot. Economists now unite in proclaiming that until buying power has been restored by creating employment for labor there can be no general recovery of trade.

No industry in the country provides a wider or more highly diversified market than does building. At the same time there is no more constant, unsatisfied demand than that for public and semi-public improvements: slum clearance, model housing, better facilities for education, recreation, and the public health.

If, as is undeniable, these needs can now be satisfied with the maximum of economy and in such a way as to provide work for a vast number of men who must otherwise be degraded by charity, it is unthinkable that we should hesitate longer before initiating immediate, intelligent action to bring about an extensive programme of Government-financed public works.

Responsibility for the development of such a programme must rest ultimately with our architects and engineers. Since this is so it seems essential that members of these professions should unite to carry on the educational work which is necessary before it can be brought about.

Here, then, are the essential principles involved, expressed for the most part in the words of experts who have studied the matter in whole and in some of its many ramifications. The quotations which follow have been chosen, from a mass of equally relevant material, with the idea of boiling the subject down to its essentials and answering the chief questions which arise.

The statements immediately following were extracted from hearings before a sub-committee of the United States Senate Committee on Banking and Currency, which met in Washington last February to consider further unemployment relief through the Reconstruction Finance Corporation.

In this country we have a surplus manpower now, and consequently any co-operative effort on the part of the Federal Government that will encourage the building of en-
during edifices and public works that are of benefit to society as a whole, socially, esthetically, or from the standpoint of education or public health, in my opinion, is a very wise measure.

CARL B. FRITSCHE, M. E., member of the Committee on Aeronautics of the American Society of Mechanical Engineers, Detroit, Mich.

A public-works programme is necessary to start us out of the slump. It is not the only thing. It will not do it alone. But all other reasonable measures would be assisted by it. For instance, if you want to increase commodity prices, public works increases commodity prices by creating a demand for a large number of construction materials. The worker does not buy concrete. He buys shirts and consumer’s goods. Therefore, we create a demand for all of those things. And as some one has said, it merely “primes the pump.”

ORTO T. MALLERY, economist specializing in unemployment and public works, Philadelphia, Pa.

At the end of the World War our Federal public debt was in the neighborhood of $25,000,000,000 and nobody worried about the solvency of this country. Nobody questioned but that it was sound.

Today our public debt is $20,000,000,000, in round numbers.

Suppose it does take a $5,000,000,000 programme to get this economic engine off dead centre. What of it? Certainly in actual wealth and in potential wealth this country is a far better risk than it was in 1918.

CARL B. FRITSCHE.

There seems to be quite a general misconception that since there are ten or twelve million people out of work the Federal Government of course cannot provide jobs for all of those people on public works, so why bother with it at all? The idea is entirely overlooked that construction of public works and the stimulation of public works generally is only one of several means, and it occurs to our minds, perhaps, that it is assisting to prime the pump of recovery, to get business here and to get business there, and to give some jobs in that manner so that we may get back to a position where trade and industry can re-employ these people, as it is only from revived trade and industry that the ten or twelve million people are ever going to get genuine and permanent employment.

MARTIN DODGE, representing the Banking and Industrial Committee of the Second Federal Reserve District.

Engineering studies have gone into this matter very carefully and have indicated that for all public-works construction directly and indirectly about 80 per cent of the cost of the project goes to the laborer, goes to wages and salaries.

And that is distributed over a large area. It offers one of the sound methods of helping unemployed men as well as stimulating business.

MARTIN DODGE.

A bond of obligation issued for the purpose of raising money to be distributed in a dole represents no value. A bond, however, issued for public works represents a needful and economically sound addition to community facilities and the benefits derived therefrom will, in more prosperous times, permit the retirement of the obligation.

To illustrate the economy of unemployment relief by public works rather than by taxation to pay a dole, assume a public-works construction programme amounting to $1,000,000,000. This involves a charge for interest and amortization of about $150,000,000 a year. It is estimated that such a programme would give employment to between 1,500,000 and 2,000,000 workers per year, distributed between the construction work and the many industries that serve construction. To support these same workers in idleness would cost the community between $750,000,000 and a billion dollars a year, as compared to interest charges of $150,000,000 on a public-works programme.

Money expended in doles or direct relief contributes little to the stimulation of trade, whereas money spent in public works stimulates business not only in the community itself but throughout the material and transportation industries. If the money for a dole is to come out of taxes, as it properly should, since it is ruinous to borrow money to give away, the present burden on the taxpayer would be actually relieved through a public-works programme because the taxpayer will only have to bear the interest charge on the moneys expended. If the Government and its subdivisions must borrow to effect economic relief, it will be far better to invest the funds so raised in community facilities, thereby conserving the public wealth and stimulating a normal resumption of trade.

It is recognized that the word “tax" has come to be a bugaboo to the American public, but it need not be so, if properly administered. As the funds for relief must necessarily come from public sources we have no other alternative than to resort to taxation and we maintain that it is far better to tax for improvement which will raise the standards of living within the community and increase property values.
because of an added convenience, than to tax and apportion out these same funds without the production of this asset.

John P. Hogan, Consulting Engineer, New York City; chairman of the Public Works Committee of the American Society of Civil Engineers.

The balancing of budgets so far as current operations are concerned is desirable and necessary; but it is not necessary to include in such balancing the principal sums invested in useful community facilities. Competent economic opinion has almost universally held that it is wise governmental finance to borrow for public works in periods of depression and to repay out of taxes levied upon the future surplus earnings of prosperity. Public works built at present low wages and price levels and financed at reasonable rates of interest will carry a very low cost and require a relatively lower debt-service charge in the tax rate over years to come. It is good business as well as good tactics to use this opportunity to add substantially to the public wealth.

John P. Hogan.

At this time this is the only way out. Those who still have private means need such encouragement before they will invest their capital in productive enterprise. When the Government borrows money, all it does is to mobilize timid private capital and make it available under public auspices.

Senator Wagner. It is a stimulation to private industry, after all?

Mr. Fritsche. In the long run, it is, unquestionably, and this is the true way to promote dependable prosperity.

Carl B. Fritsche.

In his statement, Mr. Robert D. Kohn, Chairman of the Construction League of the United States and past President of the A. I. A., made the following remarks about slum clearance and housing which he recommends as being especially suitable forms of public work:

Sir Raymond Unwin, speaking to a parliamentary commission in London about housing, said: "Gentlemen, every £100 that you spend on slum clearance is £100 less paid out in the dole." Every $1 we put into a thing like cleaning up a city is $1 less spent on direct charities, and we are actually improving the tax income of the city by that because in New York, although they have given tax exemption on the improvement in this housing on the buildings themselves, the land value has been so increased by reason of these improvements, the better housing, that the land now returns to the city in every case a larger tax than both the land and the old buildings on the land returned to the city before the housing was built.

The chairman of the Federal Reserve Board, Mr. Meyer, said to the Real Estate Board in New York, that they should not oppose the housing. "You cannot possibly be injured by the competition of these new cheap apartments, no matter how many are built. As a matter of fact you will not be injured as much as you will be injured if you do not give work to people who are out of work." Property values are going to be more injured from the lack of work for workmen than they can possibly be injured by the competition of the new buildings that might be built up.

Those members of the Federal Government now engaged in formulating a plan for work relief are comparing the respective merits of many projects, highly diverse in character and purpose which have been submitted for their approval.

It is, of course, desirable that the benefits of public work be as widely spread as possible. To this end we must support such undertakings as the scheme for reforestation, the construction of needed bridges and tunnels and the extension of facilities for water supply, electrification, and sewage disposal.

The architect in approaching the subject must naturally consider the possibilities of essential building construction. No vital problem has more persistently escaped solution than has slum elimination combined with some means of providing suitable habitations for families in the low-wage-earning group.

We must profoundly believe that the combination of our present circumstances (i.e., unemployment and industrial stagnation, which can be alleviated only through provision by the Government of funds for the creation of work on public improvements) plus the liberalization of public opinion which has grown out of the unavoidable facing of facts during three long years, have removed the solution of housing problems from the realm of the impossible. Believing further that its solution is a primary duty of the architectural profession, we urge on all its members the necessity for informing themselves on this subject.
Under their leadership it can reasonably be hoped that a proportion of the money allotted by the Government to the provision of useful employment may be utilized as well to accomplish a second, equally desirable result: to improve the unhealthful, uneconomic, unsocial surroundings in which such a large majority of our population are now condemned to dwell.

Numerous questions arise whenever the words "public works," "slum clearance," or "housing projects" are introduced into conversation. On the following pages it has been our intention to phrase for the reader some of the questions which most often recur in this connection. They make no pretense of exhausting the subject or of going much below the surface of the matter under consideration. It is our desire, rather, to indicate what form such queries usually take and by answering them authoritatively to show how much ground has already been gained in what we conceive to be the right direction.

Mr. David Cushman Coyle, to whom we submitted one list of questions on the economic implications, is a consulting engineer who has devoted much time to the consideration of modern economic problems. He has made notable contributions to the subject, both in writing and speaking before many organizations. He was among those invited to present their views before the Senate sub-committee above mentioned.

Can the Federal Government, by appropriating funds with which to finance extensive necessary building construction projects, materially improve our present economic condition?

Yes, provided work is undertaken on a sufficiently large scale. Private capital investment is no longer an adequate source of consumer buying power. To the extent that the Government can put men who are now unemployed to work on useful projects it can replace private investment as a source of buying power, thus bringing about a resumption of business activity, without creating dangerous quantities of new commercial debt.

Under existing circumstances can the Government "afford" to embark on such an undertaking?

So long as action on an adequate scale is postponed, the depression continues to deepen and the Federal revenues to dry up. The Federal deficit can be wiped out only by increasing expenditures enough to end the depression.

In what manner can the Government obtain the funds with which to carry out a public-works programme?

The public must be aroused to the need for immediate action, in order to permit the sale of Government bonds. It will be necessary at the same time to expand currency or bank credit, and the Federal Government must hold absolute authority to force banking cooperation.

What general requirements must be fulfilled by work projects before they may be expected to accomplish the desired result?

They must be obviously useful and carried out in an efficient and workmanlike manner, so as to maintain public support for an adequate volume of expenditure. They should not be of such a nature as to duplicate the undertakings of private enterprise.

Must all Government work projects be financially self-liquidating?

On the contrary, a self-liquidating project is a burden on the consumer buying market, the same as a commercial plant. Only non-self-liquidating works are of permanent value in creating sound business conditions.

Is it desirable for the Government to do its building during depressed periods rather than in times of normal business activity?

Business stability requires high and increasing public expenditure. The rate of increase should be greater during depressed periods, but any tendency to reduce public spending during prosperity will tend to bring on depression. A constantly rising rate of public spending is the necessary adjustment to rising technological productivity.

Do projects involving the clearance of slums and the erection of model housing meet the above specified requirements of economically sound work relief?

The social advantages of better housing are sufficient to justify it. So far as its effects on permanent prosperity are concerned, the essential factors are these: Enough old building must be torn down to prevent an oversupply of space with its consequent bankruptcies; and it must be recognized that so far as the projects are self-liquidating they add nothing to the buying power of the community in the long run.
In what manner and to what extent may private enterprise be affected by competition from model housing?

Unless a sufficient quantity of existing property is acquired and destroyed, in the course of the general public-works programme, to prevent an oversupply of housing, there is no escape from serious dislocation of private enterprise.

Mr. Clarence Stein, who has spent many years in the study of housing and community planning, has won for himself a reputation as an authority on these matters which is equalled by few American architects. No one has a broader understanding than he of the difficulties which these problems present, nor has any one clung more persistently to the belief that they would eventually be overcome and so striven more determinedly to bring this about.

Here are the questions put to him, and his answers:

What is the difference between restrictive and constructive housing legislation?

1. Restrictive legislation attempts to improve housing conditions by the exercise of police power. Legislation such as the New York and New Jersey Tenement House Laws has done much to improve living conditions by setting up minimum standards of construction, safety, and sanitation for individual builders. But these minimum requirements, based on small-scale development, have become maximum attainments. Restrictive legislation merely says "thou shalt not" and applies only to the individual speculative methods of development.

2. A constructive housing policy has been found necessary because of the inadequacy of private initiative. The Commission of Housing and Regional Planning of the State of New York in its proposal for permanent housing relief dated February 18, 1926, said:

"When private building for profit satisfies the immediate housing demand of 30 per cent of the population, further construction becomes unprofitable. Construction usually continues as long as the market is 'favorable,' or until evidence of surplus is discovered in a downward trend in the higher rentals. Then the lending agencies become conservative and private building stops. The cycle revolves slowly. Even this limited surplus is infrequent. And this small and occasional surplus derived from housing construction intended to satisfy the demand of only 30 per cent of the population represents all that commercial enterprise ever provides to meet the constantly increasing needs of 70 per cent of the population. At all times and in all places, private enterprise has been unable to supply adequate housing to meet the needs of the underlying population.

"This condition has always prevailed. Building on a speculative basis is confined to a field which offers the margin of profit that speculative enterprise requires. The speculative method is based on a series of negotiations, a combination of independent activities and a heaping up of small profits which accumulate to put the newly constructed dwelling quite beyond the reach of the average family.

"The average family must be content with the left-overs—and there are never enough of these to permit adequate housing for more than half the population.

"A system of producing houses which is geared to satisfy less than one-third of the current requirement of society must be accounted a social failure. It may function satisfactorily in its limited field but it must be supplemented by some other producing agency if the social need for housing is ever to be satisfied."

3. Constructive housing legislation is intended to give Government a direct responsibility for producing high-standard and low-cost housing. Only through constructive legislation is it possible to prevent the continued social degeneration of our slums and the economic deterioration of our cities caused by blight.

In what ways can Government take a constructive part in large-scale community housing that will give benefit to the occupant of the house rather than to the speculative builder?

1. By direct action.

By direct Government construction and management, as in many countries in Europe. Or——

By a municipal housing authority as is now proposed in a bill before the legislature of the State of New York.

2. By direct Government subsidy to limited-dividend companies or municipalities, as in England, Holland, etc.

3. By indirect subsidy to limited-dividend companies:

a. By tax exemption, as in New York City (on buildings alone).
b. By federal income-tax exemption on stock dividends.
c. By charging a low rental on land owned by city, as proposed for Chrystie-Forsythe Street property owned by City of New York.
d. By municipal purchase from housing companies of land not covered by building, as in the development of the Prudential Life Insurance Company in Newark.

4. By lending money at:
   (1) A low rate of interest.
   (2) For large part of cost of project.
   (3) For a long period, i.e., at low rate of amortization.

What is the best form of constructive assistance?

Either—
1. Direct action of Government.
2. Lending large amounts of money at low rates of interest and amortization to companies which are restricted so as to prevent speculation and poor housing.
3. Direct subsidy—but only for those who cannot be decently housed on an economic basis.

There should be no indirect subsidies.
All the cost of housing should be apparent. The more clearly the books are kept, the more incentive there will be to find more economical ways of producing decent homes and communities.

What form of constructive Governmental housing machinery now exists in this country?

The only important example that has been tested by experience is the New York State Housing Law. Its essential features are:
2. The limited-dividend company accepts:
   a. Limitation of 6 per cent return on investment.
   b. Limitation of rentals, and
   c. Supervision of the State Housing Board.
3. The mortgagee (in the past, insurance companies and savings banks, now the Reconstruction Finance Corporation) accepts limitation of 5 per cent interest.

What development has taken place in State laws during the past year and why?

Reconstruction Finance Corporation money, under the Emergency Relief and Construction Act, July, 1932, has been available to private corporations "formed wholly for the purpose of providing housing for families of low income or for reconstruction of slum areas, which are regulated by state or municipal laws as to rents, charges, capital structure, rate of returns, areas and methods of operation. . . ." So as to take advantage of these loans State housing laws have been passed in Ohio, Texas, and New Jersey (not yet signed by the Governor), and proposed in Arkansas, Delaware, Oregon, Minnesota, Massachusetts, Missouri, Pennsylvania, Indiana, Illinois, Wisconsin, California, and the District of Columbia.

Why, in spite of the fact that the Emergency Relief and Construction Act was passed, has no construction of housing with Governmental money taken place?

1. Difficulty of securing equity money, i.e., the difference between cost of project and two-thirds offered by the Reconstruction Finance Corporation.
2. Even limited private initiative has disappeared.

How can we start a large programme of housing and city rebuilding?

This is possible at the present time only through direct Governmental action. States or municipalities should appoint Housing Authorities similar in structure to the Authority of the Port of New York. Through such an agency money made available by the Federal Government for the purpose of relieving unemployment can be applied directly and effectively to the rebuilding of the rotting areas of our cities. These bodies should be vested with corporate power and should be able to condemn, acquire, and replan areas for the purpose of rehabilitation and community building.

Such agencies should plan, construct, and manage housing developments. At a future time, it may be possible to set up private companies to take over these developments. At the present time it is unlikely that the large amount of work that is needed, to affect the unemployment situation to any extent, can be carried on effectively and efficiently by other than direct Governmental agencies.
OLD ALSATIAN HOUSE,
FREDERICKSBURG, TEXAS

From the pencil drawing by E. M. Schiwetz
BASILICA PATRIARCAL, MONTERREY, MEXICO

From the pencil drawing by E. M. Schiwetz
The Amphitheatre, completed about 1917 as a memorial to the soldiers and sailors of all wars, was a single item unrelated to any broad scheme of treatment in Arlington. The architect's present task consisted of bringing this large building into relationship with the whole scheme while furnishing a fitting site for the Tomb of the Unknown Soldier. As the result of a competition held in 1928, five of the architects and sculptors entering that competition were selected to restudy their schemes and resubmit them with models of the Tomb itself. After the appointment of Messrs. Jones and Rich as sculptor and architect of the Tomb, Mr. Rich was further commissioned to design the approaches.
Plan of the approaches to the Tomb.
Lorimer Rich, architect
The Tomb as one approaches from below.
Thomas Hudson Jones, sculptor; Larimer Rich, architect
One arrives at the Tomb on the grassy hill in the foreground, looking at the terrace and walking on a foot path, which is walled in at either side by a magnificent hedge of box, thirty feet in height. (Being but newly planted and without foliage, the hedge in this photograph lacks the impressive setting that it in reality possesses.) Lorimer Rich, architect.
The panel on the front of the Tomb, facing Washington and the Potomac, bears three figures commemorative of the spirit of the Allies in the war—Victory in the centre, Valor on the left, Peace on the right with her palm branch to reward the devotion and sacrifice that, with Courage, made the cause of righteousness triumphant. Each side is divided into three panels by Doric pilasters, in each panel of which is carved an inverted wreath. The Tomb above its sub-base is made of only three pieces of marble—base, the block containing the sculpture, and the top slab. The marble is from Yule, Colorado, the same as that used in the Lincoln Memorial. Thomas Hudson Jones, sculptor; Lorimer Rich, architect.
The Tomb from the rear. In the distance at the right one catches the
glint of the Capitol dome. Thomas Hudson Jones, sculptor; Lorimer

Drawing as a Basis for Etching

By Gerald K. Geerlings

There is no architect-made etching in existence that I cannot spot from across the room. Why is it that usually architects can't draw?" So queries the secretary of an etching society.

"When you make an etching, for heaven's sake don't make it look like an 'architect's drawing.'" The advice which one of the leading print experts of New York gave me.

Any architect is apt to resent that, of course. Not draw Preposterous. Why, since the age of seven—

Viewing architectural drawings done out-of-doors quite dispassionately, however, rather brings one around to agree. When an architect produces drawings with the aid of T-square and triangle he records facts and realities. The final result bears the stamp of authority. But when the architect goes out to sketch, freedom from office restrictions seems to make him less responsible. His sense of selection does not function conscientiously. He is led astray by trying to draw as he thinks he remembers some one else did, instead of recording truth to the best of his ability. Lines (particularly ridge lines on old houses) become doddering. Loosely defined shadows smother detail where it would be most informative. The sun invariably beats down with Andalusian brilliance. All surfaces glisten like the Elgin marbles. The result lacks definition, solidity, and conviction.

It is not that the outdoor drawing should resemble a labored office production. But it should not depend on flashy cleverness, catchy "picturesqueness," or repetitious tricks copied from some one else. It should have the sincerity which makes a Meryon etching vital. Particularly should this be true if the drawing is to be a reference guide for an etching, for in that medium the form must be expressed in individual lines and cannot depend on indefinite pencil smudges. Examine the work of any artist who is truly great (a form of recreation indulged in far too infrequently), and you will find the immortal quality is dependent primarily on straightforward, intelligent drawing. Not just an embroidery of inconsequential lines, but an economic structure of only the essential ones.

Almost any one can do a drawing of a million lines, but only a master can express the same truth in one hundred lines. Analyze any masterly etching or drawing and you will find the engineering bones underlie the whole structure. The mood of the subject has been studied and the chiaroscuro determined accordingly. Short-cuts are not resorted to. Each square millimetre has informative, vital lines, not meaningless straws. Lines are drawn as true as the artist's ability permitted. When a single surface, such as a roof, is depicted, there is not a false mosaic of the whitest whites and darkest blacks. In a word, there is evidence that the subject has been studied, planned, lived with.
Every artist should of course develop his own method of working. By no means are the drawings here reproduced meant to be held up as models. They are perhaps of interest because of being working drawings drawn on the spot, untouched thereafter, and executed standing up—I never am able to find a place to sit down to get what I want. Obviously they are not finished drawings; rather are they outlines for essays to be built around them later with the various details (not shown). None of them will be used as it is. Each will be composed and combined, providing it serves the purpose of creating a satisfactory interpretation of a theme. Their value to me lies in the architectural anatomy which they record, in their suggestion of masses and compositions, and in the pattern of shadows (these are mostly in outline rather than filled in). In all cases 2B “black chalk” or “carbon” pencil (synonymous terms) was used on a heavy grade of white vellum, except in the Chicago drawing on page 264, where charcoal tones were added. All reproductions are reproduced at the actual size of the originals, except the frontispiece, which has been slightly enlarged.
Above—Friesland, Holland; a composite landscape. Below—Binnen Hoff, The Hague, 1929; both of these from the pencil drawings by Gerald K. Geerlings
Chicago: Michigan Boulevard, looking north, 1930. From the pencil drawing by Gerald K. Geerlings. The upper insert sketch is one of several made in establishing a desirable viewpoint; tones in the lower drawing consist of charcoal "washes."
Lamination in Metal Work

By Eugene Clute

PLATES and sheets of metal were hard to produce in the days before men had the heavy machinery needed to roll them from the billets and the power to operate it. Now they can be rolled easily and cheaply. While the old-time workers made little use of metal in this form, we may use plates and sheets freely and with advantage. They can be had in various thicknesses at moderate cost. Bold relief, effective scale, and a lively play of light and shade can be secured by lamination in metal work with comparatively little expenditure of labor.

One of the most natural things to do with a plate of metal is to cut out a design in silhouette. It is only a step further to pile up cut-out plates one upon another to form a design and fasten them together. It is surprising that the possibilities that lie in lamination seem to have been overlooked by designers until within the last three or four years. Now, however, several architects and craftsmen are working along this line, with some admirable results.

Among the most interesting examples of this technique are the hinges upon the exterior doors of the recently completed Centenary-West End Methodist Episcopal Church, South, at Winston-Salem, N. C., which are shown here by photographs and working drawings. They are the result of evolution from the limited use of lamination in the hinges of the Church of the Heavenly Rest, New York City, which was built about four years ago by the same architects, Mayers, Murray & Phillip.

The hinges at the Church of the Heavenly Rest are very rich examples of costly hand craftsmanship, elaborately pierced, engraved and chased in a decoratively treated pictorial design of local historical significance. Lamination is employed in them only as an auxiliary method, a single plate being applied in certain parts to give the required depth.

Desiring to do something equally good in its way, but much less elaborate, for the church at Winston-Salem, the architects set about developing the designs of these hinges on the basis of lamination, with simple piercing, and in this way they became pioneers in creating a new technique in craftsmanship and a new manner of design growing out of its requirements.

In order that the designs might be fully studied in the third dimension, which is so important in laminated work, they constructed full-size cardboard models of the hinges by gluing cut-out layers of cardboard together. To study the effects of color and texture upon the designs, they applied aluminum paint and black paint to these models to simulate the appearance of half-polished wrought iron.

When the craftsmen—Ostrander & Eshleman—received the full-size drawings they made templates of metal for use in marking the designs upon the sheet metal. They engraved the outlines of the pieces by hand, following the templates, then cut out the pieces with a hack saw. The piercing was done also with the saw. Next they filed the pieces exactly to the engraved outlines.
In order that no screws, rivets, or other means of attachment might show upon the face of the work, it was determined to fasten the laminations together with pins fixed to the back of each piece. Therefore, the templates were spotted for the pins and for the holes to match them, drilled and fitted together. Then, the locations of pins and holes were transferred to the plates with a center-punch. The pins, of a non-ferrous metal, were brazed to the backs of

ARCHITECTURE

266
the pieces and the holes were reamed on the backs of the plates to form conical recesses.

There are knuckles at one end of each back plate of the hinges for the chapel and narthex doors, forged from the same piece, to fit upon a pintle set in the stone jamb. The hinges in the main portal have separate decorative plates. For ease in forging these knuckles, and because it can be had in desirable thicknesses, high-grade American steel was chosen as the material for the hinges. In passing, it may be noted that these hinges work easily and smoothly, for the knuckles, excepting in the hinges of the chapel doors, rest upon Tobin bronze bearings in the pintles, so designed that they may be screwed up or down and secured by a lock nut. By this means it is possible to obtain proper adjustment and make each hinge bear its share of the weight.

To prevent rusting, each part was separately cadmium-plated by a process that insures a lasting and impervious coating. Then the parts were assembled, the pins on the back of the topmost plate being inserted in the holes in the next plate below it and spread out with a hammer and punches to form countersunk rivet heads in the backs of the holes. Any projections of the pins were filed down flush with the back of the plate. The same method was carried on progressively, each plate being attached to the one beneath it, down to the back plate. As a result, any water that may find its way between the plates can do no harm, for
A simple three-plate strap hinge of steel for the Bathing Enclosure, Jones Beach State Park, Long Island. Designed by Herbert A. Magoon, architect of the Long Island State Park Commission; craftsmanship by Ostrander & Eisleman

Each plate is completely enclosed in a material that does not rust, and the pins, being non-ferrous, cannot rust. The back plates are one-eighth inch thick and the laminae are one-sixteenth inch thick. Four plates are used in the hinges of the doors in the main entrance and the chapel, and three plates in those for the narthex aisle doors. A half-polished finish was produced by the application of a black coating which was removed from the prominences and allowed to remain in the depressions of the surface. The texture is that produced naturally by the process of plating with cadmium, a wrinkled grain effect; there is no hammer marking or other applied texture. The metal was worked cold excepting the forging of the knuckles.

The same method has recently been employed by these craftsmen in executing the laminated hinges for the bathing enclosure at Jones Beach, State Park, Long Island. These hinges also are of high-grade American steel. They have a half-polished finish produced by applying a chemical that turns cadmium black. This is neutralized before its action has progressed far enough to harm the plating as a protective coating, and the neutralizing reagent is removed by thorough washing. Then, the resulting patina is polished off of the prominences.

Practically any metal can be used for laminated work, such as: nickel-chrome steel, Monel metal, bronze, nickel-bronze or aluminum, as well as wrought iron and mild steel. When a non-ferrous metal or alloy-steel is used which does not require protective plating, the parts can be joined by welding. Work in wrought iron and mild steel, when not to be exposed to the weather, may be unprotected and can be welded. Monel metal, various copper-base alloys, aluminum, and wrought iron may well be welded with the oxy-acetylene torch. Spot welding with the electric arc is much used in joining parts of mild steel or nickel-chrome steel. The danger of burning the metal in spot welding can be minimized by placing a thick metal plate as a backer behind the work during the process and focussing the arc in the backer instead of the work.

Lamination is just as applicable to the making of grilles, banking screens, doors, or any other architectural metal work as to the making of hinges. That it lends itself readily to designs of a traditional character is well demonstrated by the suitability of these church door hinges to their place. Something very like this, we may assume, is what the mediæval craftsmen would have done if plates of metal had been as available in their times as they are in our day.

There is nothing to prevent the combination of various metals in laminated work, if those metals which tend to set up destructive electrolytic action are not used together, or if they are used with effective electrical insulation between them. A new method of electrical insulation developed by Oscar B. Bach, and employed in the making of the colossal repousse decorations in combinations of various metals for Radio City, makes it possible to use any desired metals together freely. As a rule it may be said that metals of a more or less similar nature may be used in combination without insulation. For example: bronze, Monel metal, nickel-bronze, and copper; or iron, steel, and nickel-chrome steel. Iron and copper are frequently combined. Care should be used in combining other metals, the special conditions to which the work is to be subjected being taken into account and met by the precautions of an experienced craftsman.

< ARCHITECTURE >
The Yale Divinity School
New Haven, Conn.

DELANO & ALDRICH, ARCHITECTS
THE authorities in charge of the new Yale Divinity School, and the architects, were in accord in their desire to carry out the programme in a kind of architecture which, first of all, should avoid elaboration, richness of ornamentation, and the consequent added expense; and, second, should express in a free and untrammelled way the traditions of old New Haven, of which the key is struck by the ancient buildings of the University and the town and especially by the three churches on the Green, unique in America, or anywhere else for that matter. The scheme was worked out along these lines with the result that while some other recent buildings destined for purely secular use are of a medieval architecture usually associated in the public mind with the Church, the Divinity School itself, dominated by its Chapel and dedicated to religious education, is in the cool and restrained Georgian of Puritan New England.

ARCHITECTURE
A view from the upper end of the campus where the Chapel dominates the dormitory ranges. Although quite different in detail, there is something in these buildings that is akin to Jefferson's University of Virginia.

These buildings depend for their interest almost entirely upon their form and grouping, determined largely by the levels of the site. The ground slopes gradually from the entrance up to the dominating Chapel at the highest point, behind which on a broad grassy terrace are the Commons and Refectory on one side, and the Gymnasium, hand-ball courts, etc., on the other. Beyond this the land slopes steeply down. In front of the Chapel, on a wide campus, are the Libraries, entered through a circular rotunda, and the Auditorium, and in front of these again the dormitories with grass courts between, connected by arcades. Flanking the entrance are the two small octagonal guest houses. All of these buildings are of simple masonry in a warm pinkish brick which comes from kilns near New Haven. In the Chapel itself an effort has been made—and apparently appreciated—to give a churchly atmosphere while holding to the Georgian style. We believe that the buildings speak for themselves and that they hang together as a unit in expressing the rather austere type of feeling and teaching associated with the Yale Divinity School, one of the oldest institutions in New England.
In the Chapel the simple rectangular plan with its apsidal chancel carries forward into a more sophisticated age the dignity and austerity of the colonial meeting-house.

On the page facing, a detail of the chancel. The lighting fixtures were executed by Cox, Nostrand & Gunnison from the architects' designs; the central fixtures are of chrome-plated brass, glass rods and a spiral arrangement of the lamps around the central support—the eagle and tassel are gold-plated.

The circular hall connecting the Library with the Reading Room, shown on the plan (page 270) to the right of the Chapel
Above: the Commons Room, in which one unusual feature is found in the lighting fixtures of carved wood, touched with gilding. Below, a corner of the Reading Room

“There ought to be a law”—but apparently it has not yet been put on the statute books, for the creation on the left exists in Los Angeles, and that on the right in Portland, Ore.
BOOK REVIEWS

COMPOSITION AND RENDERING. By A. Thornton Bishop. 128 pages, 7 by 10 1/2 inches. Illustrations from pencil drawings. New York: 1933: John Wiley & Sons, Inc. $2.75.

Mr. Bishop, whose pencil drawings are widely and favorably known, lays great stress in this volume on composition, discussing its essentials, and showing parallel drawings illustrating possession of and lack of the fundamental qualifications. He presents also a detailed exposition of pencil indication of building materials and accessories. There is also a chapter on composition in the theatre.

This is the second issue of The Studio Gardening Annual—a creditable relative of The Studio's year books on various subjects. Moreover, certain sections dealing with popular specialties are treated much more fully and in accordance with the latest approved practices. There is even a special calendar of garden operations by months, the months being found as headings in the regular alphabetical sequence.

An indispensable collection of reference data on the design and specification of heating and ventilating systems. These annual volumes, of which this is the eleventh, bring a fast-moving science up to date in the practitioner's office.

The old saying that a city has a physiognomy could scarcely be better exemplified than in the case of New Orleans, and the author, who is an architect and a lecturer at Tulane University, has successfully caught the characteristics that give New Orleans its distinct individuality. Mr. Curtis not only has an inspiring subject for his book, but displays unusual charm in unfolding it.

As soon as the amateur gardener has passed the early stages of his fever, the seed catalogues and the specialized reference books will tax more and more frequently his ability to find answers to questions that arise in his work. Here is a book designed to answer many of those questions through easy alphabetical access to subject matter and to data concerning individual plants. Moreover, certain sections dealing with popular specialties are treated much more fully and in accordance with the latest approved practices. There is even a special calendar of garden operations by months, the months being found as headings in the regular alphabetical sequence.

There has been a tendency in this generation to regard protection against lightning as more or less of an outworn fetish. As a matter of fact, the annual fatalities from lightning in the United States are about 500, with about 1300 injured. Moreover, in Iowa, over a five-year period, there were twenty-nine unprotected buildings destroyed for every rodded building destroyed by lightning—and this in the face of a large proportion of obviously defective installations.

Public Rooms of
The Park Plaza, St. Louis, Mo.

HALL & PROETZ
ARCHITECTS FOR
THE PUBLIC ROOMS

The Music Room. Walls are sand-finished and smooth white plaster; the ceiling gray. There is a parquetry floor with black border in oak; lapis-colored baseboard; ebonized colonnettes with gray marbled capitals. The curtains are silver, gold, and yellow. Furniture and lighting fixtures were designed by the architects.

The Lacquer Room—a private dining-room. Two end walls and a dado are in yellow lacquer; the side walls covered with glazed chintz designed by Albert Herter. The carpet is gray bordered with black; the furniture upholstered in black horsehair.
The Marine Dining-room. Walls, chalk white; columns, with carved wood marine motifs, in white lacquer; upper dado, cobalt blue; balustrade in gray lacquer; windows in cherry lacquer. Lower floor is stained pink; the ceiling covered with gold foil.
The Coffee Bar. There is a linoleum floor, dado, and ceiling in nine gradations of gray; flat wall surfaces, butter yellow; trim, fixtures, furniture, etc., aluminum. Upholstery is in metallic blue leather; bar in black rubber; the mirror doors, gray.

A typical elevator lobby. Walls are white; trim, marbleized Prussian blue-green; console and chairs in white, black, and gold, the chairs having seats of black patent-leather.
The Empire Room. Walls and ceiling are white; pilasters of Pyrenees black-and-white marble with cast pewter capitals; the chimney piece, white with Grand Antique marble; chandeliers are pewter and crystal; the carpet, peach color; the furniture in ebony and curly maple upholstered in cloth-of-gold.
Some Pitfalls in Supervision

By W. F. Bartels

XXXI. MECHANICAL APPURTE NANCES
(CONTINUED)

Of course, closed tanks should be tested in the presence of the superintendent for an overpressure of at least 50 per cent more than their service maximum. The hot-water tank is usually of this type and is generally fed from the house tank by gravity. The material of which the tank is made should comply with that which has been specified, both as to thickness and quality of the material. Riveting should be so done that there is but little leakage and so that an excessive amount of calking is unnecessary. The superintendent should see that all the reinforcing around the connections called for has been provided. Ascertaining that the outlets are in their proper location is a wise precaution. After connections have been made, tests may be asked for, to determine the tightness of the tank. When this has been done and the tank emptied of water, the superintendent should see that it is thoroughly cleaned, dried and then coated with one of the better tank preservatives. If the tank has arrived on the job without a coat of red lead it should be cleaned and the exterior then painted, followed by another coat as soon as the first is dry. These coats of paint will of course not be put on while the tank contains water, because of the danger of sweating during the painting. Some architects have found that a coat of aluminum paint over the red lead is very satisfactory, but aluminum paint to be at its best should be freshly made from the powder. Before the tank is finally turned over to the owner the superintendent should see that it is emptied of all water and the sludge removed. Otherwise any stirring up of this sludge will not only cause muddy water but it may cause trouble by getting into some of the valves.

Domestic hot-water heaters are of many types. There are those which use an interior steam coil to heat the water in the tank, while others derive their heat from coils attached directly to the side of the boiler. But no matter what system is used, once selected by the architect or engineer, it is the superintendent's duty to see that all specifications in regard to it are faithfully complied with. I was once called back to a job where a side heater had been installed, the owner complaining that not enough heat was forthcoming. Armed with the specification and the rating book of the heating manufacturer, I assured the owner that theoretically enough hot water should be coming from the heater. But the fact remained that it was not. Digging into the covering on the heater, it was found that the number on the heater corresponded correctly to the one specified. But further investigation under the insulation disclosed the fact that the heater was joined to the boiler both top and bottom by a 1-inch pipe, while the outlet of the heater was made for a 2\(\frac{1}{2}\)-inch connection! The boiler had been delivered to the job tapped for a 1-inch outlet. Finding it thus, rather than laboriously drilling a 2\(\frac{1}{2}\)-inch hole, the mechanic had pushed the heater outlet down to one inch and covered it before any one saw it.

In the small house as well as in the large one, the superintendent should remember that all heat supplied to an indirect heater for hot water is taken away from the boiler. Unless a boiler is of sufficient size to take care of both the hot water and the steam, considerable dissatisfaction may result. It is evident that the size of both the boiler and the hot-water heater must be checked back against the specifications and the manufacturer's catalogue to see that the proper size has been delivered to the job. Then too, all such other equipment as thermometers, gauges, the rheostats, etc., must be gone over to see that they have been delivered to the job. Proper valves to cut off the storage tank from the heater, and the heater from the water supply, should be furnished. These may also provide for cleaning or removing coils without shutting down the main boiler, or for cutting off the flow through a heater not in use, such as might be required when a small heater is used for hot water in the summer and indirect heating from a large boiler in the winter. There is no use in allowing a flow of hot water to warm the water in the large boiler during the summer, which is what will happen unless there is a valve to shut this circulation off. A valve installed at a point to prevent this will save many B.t.u.'s. It may often seem that too many valves, capped tee outlets, etc., are being demanded, but the convenience they afford and the time and money
that they save when repairs are made, will more than compensate for the cost of their installation. It is quite obvious that adequate covering of boilers and pipes is essential in conserving heat. When a boiler is properly insulated the room is not only more comfortable for the persons who must be there, but also more comforting on the check book of the man who foots the fuel bill. Many superintendents are prone to pass hurriedly over insulating work, feeling that it is only "fancy work." But if they were apprised of the astonishing amount of heat saved by good insulation, they would never need to be retold to insist on a first-class job. On tanks and boiler work, blocks of magnesia should be wired on, with a wire mesh fastened on top of them to provide the finish coat with a ground to which it can securely adhere. Another material may be obtained which has metal lath already fastened to it.

Many contrivances are used in connection with boilers besides hot-water heaters and the superintendent must be constantly on guard to prevent any palming off of an inferior article upon an owner unless the latter fully understands exactly what he is getting and what refund is to be given.

An illustration might be mentioned which, while covering one particular item, might be considered typical of many similar tests which might be asked for. An appliance which used the condensate of a steam system for heating the hot water of a building, also had a steam connection in case the condensate did not furnish enough heat to raise the water temperature to the proper degree. The appliance had been specified to perform certain functions, namely that a definite amount of condensate returning to this heater would raise a certain amount of water leaving the appliance a stipulated number of degrees. When the superintendent asked to have a test made he was told that it would be foolish, because all the needs for hot water were being supplied by the appliance and it had never once been necessary to cut in the live steam to help the condensate out. This answer, it will be seen at once, was irrelevant, unless other factors were known. The question might be asked, "Suppose there was an abnormal condensate over the period, and an underestimated amount of hot water used. The appliance might only be doing a quarter of the work it was supposed to and yet for a while might "get away with it." And again it will be seen that the superintendent must follow through in tests.

There is no dearth of pumps on the market today. However fortunate that may be, it is no wonder that the architect is often in a quandary as to which one to select. Each one seems to possess one or two specific and individual valuable features. And, according to their sponsors, the lack of this or that gadget on competitive makes automatically settles the choice.

The superintendent is apt to be in a dilemma when inspecting the pump and its installation. He is beset with such an array of conflicting considerations, and such sheafs of pamphlets with miscellaneous data, curves, graphs, peculiar terms, and highly specialized information, that he is to be excused for sometimes being in a mental fog as to how to proceed. But, be they vacuum, suction lift, pressure, force, or other types, these pumps are built to perform certain work according to specific requirements, if they are to operate successfully. The superintendent should make sure that everything within reason is done to cooperate with the concern supplying the pump so that there may be no argument later that the pump is failing to do its job because "such and such an item was not properly provided or attended to" for the pump contractor.

The proper location of pumps is an important item. While it seems perfectly obvious that they must be readily accessible from all sides, and the lighting more than adequate, nevertheless these are often not provided for on the architect's drawings. There must be ample room to get at the pump in case of repairs, when new parts must be substituted or swung into position. The pump should not require specially formed mechanics. In one building I recall that a pump was so located that it required not only a tall, thin man but one with a gorilla's arms to get at the oil cups. The oiler in charge possessed neither of these qualifications; unfortunately he had both short arms and a generous girth. One day the oiler ran to his chief with word that the pump bearings were "frozen." The oil cups were filled to the top and nobody could understand why the bearings could "freeze" with the cups full of oil—except possibly the oiler, who then realized that filling them after the bearings had "frozen" was of little value. Then too, the turns and run of pipe necessary to reach a central point must be considered. These add to the vibration and friction and should be avoided as far as possible.

Friday, February 24.—Although the facts have been rather widely known for some time, I was rather jarred to realize that out of one hundred forty million dollars set aside by Congress for public building construction this fiscal year, one fifth of it will be spent within the small area constituting the District of Columbia. The Federal projects under way in Washington are as follows:

Extension building, Department of Agriculture .................................. $12,300,000
Archives Building ......................................................... 8,750,000
Central heating plants, Department of Labor .................................. 5,749,000
Department of Justice Building .............................................. 11,335,000
Postoffice Department ....................................................... 12,000,000
Public Health Service ...................................................... 10,300,000
Annex to city postoffice ................................................... 4,000,000
Addition to Senate Office Building ......................................... 2,146,669
Postoffice Office Building addition ........................................... 572,001
Supreme Court Building .................................................... 8,381,980
Addition to Congressional Library ........................................... 8,382,901
Development of Botanical Gardens ......................................... 1,123,000
Congressional garage and terrace development, including the subway fountains ............... 806,001

Total ................................................................. $58,356,987

Saturday, February 25.—Varying from the usual custom of presenting its medallials on the night of the formal opening, the League for this year’s Show postponed the ceremonies until today. There was nothing particularly surprising to most of us in the details of the awards (page 211 of the April ARCHITECTURE). Joseph Urban was the big hero of the occasion in receiving two medals. One of these, the President’s Medal, has not been awarded for some years, and it was a particularly popular gesture when it was given this year to the man who put together what, as a unit, is considered one of the most effective exhibitions in its manner of presentation that the League has ever staged.

Tuesday, February 28.—The evidence continues to pile up in substantiation of the belief that a really large programme of public works offers the only way out of our economic slough. Even the bankers seem to be joining the ranks, for Martin Dodge, representing the Second Federal Reserve District, recently broadcast his wholehearted support of such a view. One of the most interesting bits of his talk was:

“Several misconceptions prevail regarding the construction of public works as an aid in the present depression. For instance, it is said that no reasonable programme of public works could possibly supply jobs for the ten or twelve million persons now out of work, so why bother with it at all? No one contends, of course, that the government can supply jobs to ten or twelve million persons. It is equally true, however, that the government cannot permanently provide food, clothing, and shelter for these ten or twelve million persons and their dependents. The only genuine relief for the unemployed is re-employment by business and industry. Every plan of relief, therefore, should be tested on the basis of whether or not it contributes to economic recovery.

“A third misconception is the belief that ‘public works’ means public works by the national government. The truth of the matter is that the bulk of public works construction has almost always been local or State, rather than national. Such projects as municipal water works, sewer systems, street and highway construction, bridges, tunnels, schools, and county and municipal buildings, constitute by far the largest percentage of all public works construction.

“Can we afford it? Is it not inconsistent with present efforts toward tax reduction, economy, and retrenchment? These questions reflect a fourth misconception regarding public works as a means for stimulating business recovery. The answer here is that if we do not spend money in such a way as to provide employment we shall have to spend it for unemployment; that if economy means blind retrenchment it becomes extravagance; for instance, a wholesale suspension of public works, ostensibly to cut expenses, simply means transferring men from the employment roll to the relief roll, which costs money just the same but adds nothing to the public wealth and makes no contribution to business recovery.

Wednesday, March 1.—James T. Grady, publicist for the A. I. A., joined the architectural editors at luncheon today, and told us something of the present status of the Institute’s efforts toward new Federal legislation. With the change of administration and the strong possibility of a complete reorganization of the government bureaus, it would seem best to sit tight for the moment and await the new course in which the ship of state will be set.

Thursday, March 2.—Lunched with Milton Lowenstein, discussing possibilities in architectural education. It is interesting to speculate on what results would follow an architectural educational movement based on materials rather than on style. If the student were grounded upon the fundamentals of construction in all the various it has achieved throughout the ages, rather than grounded upon what various men did with these materials in the evolution of style, the education of an architect would seem to reach a more logical and rational development. If, instead of studying the history of style, a student were thoroughly grounded (including training in the actual handling of stone, timber, plaster, steel, etc.) in the way, for instance, the French use stone; the Scandinavian countries, timber; Holland, brickwork; and the United States, the steel skeleton, would not the chances for creative achievement be brighter? The Bauhaus, of course, has been attempting this, but it is still early to weigh the results.

The Editor’s Diary

The Bauhaus, of course, has been at least part of the influence of the architect’s efforts toward uniform professional preparation for the practice. The Joint Committee is headed by Charles C. Zantzinger, F. A. I. A., and includes Charles Butler, F. A. I. A.; Emery Stanford Hall and James M. White of the National Council of Architectural Registration Boards; William Emerson and Roy Childs Jones of the Association of Collegiate Schools of Architecture; Ely Jacques Kahn of the Beaux-Arts Institute of Design. The committee outlined a programme calling for a minimum of eleven years of study.

The chief fault found with the present method deals with the period between graduation from college and entrance upon individual practice. One great difficulty here is the lack of opportunity afforded most draftsmen to see the actual work in progress. Possibly a part-time arrangement might be put into

ARCHITECTURE

shortly in advance of the opening of general bids. The general contractor, therefore, is selected on the basis of his own work and profits, and the sub-contractors are selected at their stated price from the entire list of those submitting bids, provided that the one chosen must have the approval of the general contractor with whom they are to work.

Thursday, March 9.—The Pittsburgh Chapter, A. I. A., has launched a well-mapped-out campaign to make an architectural survey of twenty-seven counties in Western Pennsylvania. The purpose is to locate buildings erected in this section before 1860 in so far as these buildings are important architecturally and historically, and to compile photographs, drawings, and information to be preserved in the collection of the Historical Society of Western Pennsylvania. Rody Patterson is Executive Secretary of the Survey, 1707 Koppers Building, Pittsburgh.

Friday, March 10.—Charles H. Higgin, president of the New York Chapter, A. I. A., was telling me the other day that Stanford White built a house for F. Knight Sturgis on East 51st Street, which, in the façade, very closely resembles a house that Robert Adam built for Sir Watkin Williams-Wynn at 20 St. James's Square, London. Sir Watkin's family happens to be in Higgins's direct line of descent. I went to see the Sturgis house today, and, through the courtesy of E. Harold I. Thompson of the Rosenbach Company, I went through it from cellar to roof. The house was designed in all the dignity of the Brothers Adam style, though it seemed to me with a bit less restraint in some of the details than one would expect from a work by Adam. The plan varies considerably from the one in St. James's Square, in accordance with differing modes of living, but in the ceiling of the drawing-room on the third floor Stanford White used a true copy of one of the London house ceilings, excepting for its segmental ends. The elaborate wrought-iron stair railing in the New York house at first glance seems to duplicate the Adam original, but it turns out to be quite different in detail. The London house, too, I understand, is used by a dealer in antique furniture, and it may well be imagined that the stately rooms make an ideal background for eighteenth-century English furniture, silverware, and the like. Incidentally, the London house is rather well illustrated in Bolton's "The Architecture of Robert and James Adam."

Sunday, March 12.—I was interested to see that V. Gilmore Iden, di-rector of public relations for the American Institute of Steel Construction, admits that efforts to build houses entirely of steel are unfortunate. This is setting a good example. In a speech before New Jersey masonry material dealers in January, Mr. Iden quoted Fred T. Lewellyn, consulting engineer of the United States Steel Corporation: "I conclude that the proper design of steel work in residences depends largely on materials other than steel. It depends upon the assistance of the enveloping materials." There has been entirely too much effort on the part of various industries to prove that one material alone is the best material with which to build our houses. More and more we are coming to see that the logical and economical solution will lie in an intricate combination of a number of materials.

Monday, March 11.—Alfred Githens, Thomas Ellett, and I discovered a rather interesting book in a club library today—a book that for some reason has apparently failed to achieve notice in any of the professional journals, or, for that matter, I know, possibly because it is in German. Its title is "Die Baukunst der Neuesten Zeit," an independent unit in an elaborate series of volumes under the general title of "Propylaen Kunstgeschichte." The series constitutes an encyclopedia of art, profusely illustrated. The volume that interested us most, however, is an attempt by Gustav Adolf Platz to summarize modern architecture in the twentieth century, tracing the growth of the so-called modern architecture from its rather innocent beginnings to the extremes of pseudo-functionalism.

Tuesday, March 14.—William G. Tachau and I listened to Frank Lloyd Wright speak before a large luncheon gathering, laying the bulk of the blame...
ARCHITECTURE

May, 1933

for the architecture of the twentieth century. The door of our education, which he says is from the top down in eclecticism.

Thursday, March 16.—Reading Moholy-Nagy's "The New Vision," I have run across the following explanation of distortion in art. I quoted Chester H. Rowell in these pages recently as saying that a fundamental principle of painting these days seems to be that "if one can draw, he mustn't." Moholy-Nagy, who has been lecturing on art at the Bauhaus, explains why. "In our environment there are stereometrically exact objects: flasks, goblets, musical instruments, etc. But since they are all around us, nobody any longer experiences their beauty. So we must make the beauty of the exact clear by an artificial distortion leading to a conscious rectification (in the mind of the observer)."

So now you know.

Moholy-Nagy's explanation of sculpture and its development through the various phases of kinetics, volume secured through motion, and light as spatial projection, leads us still further into the maze of modern thought.

Saturday, March 18.—The National Archives Building now under construction in Washington is, from all accounts, a most unusual problem. The Office of John Russell Pope is designing it, with Clyde R. Place as consulting engineer on mechanical equipment. The building is to be five stories high, but will contain twenty-one tiers of stacks in which the documents and papers will be stored. The basement is to contain cleaning, repairing, and bindery spaces, photographic rooms, storage and mechanical equipment. The new science of air-conditioning here comes into play as a further safeguard against deterioration of the documents. There is to be about four million cubic feet of air-conditioned space. The cooling alone of this large volume of air requires refrigeration equivalent to the melting of one thousand tons of ice every twenty-four hours.

Monday, March 20.—Lunched with Lorimer Rich, discussing, for the most part, our national tendency to haste. Louisiana, I believe, is boasting of having built its State House in twelve months. Stockholm, on the other hand, built its Town Hall, and Ragnar Ostberg took fifteen years to do it. Building a State House in twelve months is a risky business at best. When one looks back over the buildings that satisfy us over long periods, one is apt to find that considerable time was expended in their making. The Boston Public Library was in the office of McKim, Mead & White for ten or twelve years. Henry Bacon spent almost ten years on the Lincoln Memorial. Nebraska is building a State House, too, but, instead of doing it in twelve months, has been at it for some twelve years, and the end is not yet. This seems to be considerable evidence, however, to the effect that when it is finished it will be worthy of the time spent upon it.

Tuesday, March 21.—Spent the evening with Kenneth Murchison, William F. Lamb, and two engineers—Leon S. Moisseiff and Edward A. Byrne—as a jury passing on the first stage of the American Institute of Steel Construction's Annual Students' Bridge Design Competition. There were one hundred thirty-four entries from architectural and engineering schools throughout the United States and Canada; from which we selected ten as worthy of further development by their authors in the final stage of the competition. I was interested to find that even in a subject connected so closely with engineering rather than architecture, the matter of scale proved to be a determining factor in the judgment. Too many students would throw across a gorge span of 250 feet a bridge structure that might have spanned Hell Gate or the Susquehanna River at its widest point. Then too, there seemed to be a great tendency—probably on the part of the architectural competitors chiefly—to display their knowledge of every engineering device ever utilized in bridge design, rather than to make a choice of the most suitable one for this particular problem.

Wednesday, March 22.—There is an exhibit of the New York Chapter's Apartment House awards covering the years 1910 to the present time, hanging in the main exhibition room at The League. It is an instructive picture of the road we have travelled in nearly a quarter of a century—from the heavy overhanging cornices and applied ornamentation to the sleek, businesslike apartments of recent years, such as Andrew Thomas's Dunbar Apartments, Clarence Stein's Phipps, and others. It is not altogether, architecturally, to find how illogical and comparatively futile our designs must have been, made twenty years ago, when one considers that these examples exhibited are the prize awards.

Friday, March 24.—William Sloane Coffin, one of whose jobs is the presidency of the Metropolitan Museum of Art, is somewhat concerned over the fact that nearly ten thousand fewer persons visited the Museum during 1932 than in the previous year—the attendance falling from 1,343,417 to 1,274,672. It might be expected that in a period like the present, more people would have opportunity and leisure to visit the Museum. Mr. Coffin believes, however, that appreciation and enjoyment of art by the adult, as something to fall back upon in times of stress, seldom comes unless early education has provided a background. However, while the total number of visitors fell off, the number of persons coming to lectures, classes, and other museum work increased nearly twenty per cent. The attendance at public concerts given through the generosity of Mr. Edward Harkness, and of Henry L. Julliard, increased, which perhaps may be explained by the fact that more people find it easier to enjoy music than to enjoy painting or sculpture.

Sunday, March 25.—Gordon Simpson, in a new book on the Pacific Coast with word that building activities are rather more marked out there than in the East, due partly to the earthquake. The Pacific Coast more and more seems to be growing to be a little world of its own, rather more self-contained, I imagine, than the East. Here our dependence upon the activities among other peoples abroad and the intricacies of international relationships are unquestionably growing more acute. The Pacific Coast, on the other hand, seems to worry along fairly well under its own power.

Tuesday, March 28.—Douglas Haskell, with the showing of Henry Wright's findings abroad, Wright, in studying modern housing in England and on the Continent, finds a great deal of confirmation for some of the latest conclusions his study has brought out in connection with American housing. Wright is always about two jumps ahead of the prevailing accepted thought regarding housing, and he has just taken another stride. One of the handicaps in our housing has been the tacit assumption that a housing group should be a repetition of one or two sizes of unit. This is not in accordance with our needs, nor Wright's feeling that the family units in any community are very diverse and that their housing should correspond. It is too common practice for young people in a family, for example, when they marry, to have to move to a distant community for accommodations on a smaller scale, thereby straining all ties of family and friends. Through ingenious planning, Wright has arrived at a scheme by which a housing group can provide variety of space on the flat or on two floors, each unit with its own front entrance without the necessity for janitor service, elevators, or other expensive accompaniments of community life. The development of individual heating, hot-water supply, refrigeration, and incineration is likely to bring a new and more workable type of community housing which, for the first time, is adapted to man's needs rather than forcing man with his diverse needs into a Procrustes bed.

THE TELEPHONE COMPANY
HELPED PLAN THIS HOUSE

The telephone arrangements for this distinctive Detroit residence were carefully worked out in advance, with the help of the local telephone company. Outlets were located at eleven strategic, step-saving points throughout the house and the necessary conduit included in walls and floors during construction. All eleven stations are linked by a Bell 750-A dial intercommunicating system, and there are two central office trunk lines.

Intercommunication makes it possible to talk from room to room, or to the outside world, over the same instrument, with equal ease. The household runs more smoothly—with less waste of time and energy. The number of outlets installed takes care of present needs, anticipates future requirements and provides a flexible convenience for which the owner is very naturally grateful to the architect.

Such pre-planning makes for economy and efficient service. Telephone engineers are always ready to assist you, without charge. Just call the Business Office and ask for "Architects' and Builders' Service."
CERTIFIED PERFORMANCE

Something new for Built-In Heaters. But in this age of claims for this and that, architects will be glad to know that there is a Built-In Heater which is certified as to performance. “Notes No. 19” of the Commodore Heaters Corporation, 11 West 42d Street, New York City, gives you complete code tests, ratings and effective heating capacities, with abstracts from test report and explanation. Don’t miss this valuable piece of literature. It is something different and something useful.

ANCIENT WROUGHT IRON

A New Story—published by A. M. Byers Co., Clark Building, Pittsburgh, Pa. Copy will be gladly sent you on receipt of your request. You’re bound to be interested in this modern tale.

ENDURO

A brochure just published by Republic Steel Corporation of Youngstown, Ohio, contains a fund of information on architectural application of Enduro Stainless Steel. The booklet will interest architects, contractors, and fabricators. It gives the fabrication properties, shapes and finish available, and includes the result of collaboration with leading architects and engineers who have specified Enduro in their work. Copies will be sent to those interested upon request. The booklet is identified as Bulletin 217-B.

“DOMINO”

The F. W. Wakefield Brass Co. of Vermilion, Ohio, has some interesting data for you, if you’re interested, on their new “Domino” lighting unit. It is a box-like unit attaching close to the ceiling. It is interconnected at ends and sides so that a combination of two or more can be arranged in a great variety of patterns. The single unit is 31” by 11” by 6¼” over all.

HERE’S A SURPRISE

A wicket, or small door in an overhead operating door—and in a tubular steel door that is as light as wood and in the range of the average pocketbook. What more could you ask? This has all been achieved by the Cornell Iron Works, Long Island City, N. Y. The door is known as the “Float-over.” Wind resistance and sag-proof features have been checked by severe and unbiased tests. They are, of course, fireproof and burglar-proof. Self-adjusting weather-strip is a feature. You will want all the pertinent details on this new door. Don’t fail to send for them.

FLOODLIGHTING

A fifty-two page publication entitled “Westinghouse Floodlighting Equipment” has been recently issued. It includes illustrations of unusual floodlighting installations together with photograph and description of all types of floodlighting equipment manufactured by Westinghouse. Methods for calculating floodlighting requirements are included. Copies may be obtained from the nearest district office or direct from the Advertising Department, Westinghouse Electric and Manufacturing Co., East Pittsburgh, Pa.

MILCOR STEEL

Architects will be interested to learn of the purchase of the Richsto Metal Trim Co. of Aurora, Ill., by the Milcor Steel Co. of Milwaukee, Wis. The line embodies Casings, Metal Bases, Moulds, Window Trim, Offset Trim, Chair Rail, and Blackboard Trim. The name Richsto will continue to identify these products. This addition will give the Milcor Steel Co. a truly comprehensive group of building materials.

MASTER METAL INSULATION

From the Reynolds Metal Co. of 541 West 25th Street, New York City, comes a description and a sample of a new insulation said to be as efficient an insulator as a wall of concrete twenty inches thick. Its efficiency is based on high reflectivity and low emissivity. Other qualifications are its wind-proof, vermin-proof, fire-resistant and permanence features. In new construction it affords complete insulation—heat, cold and moisture—and may be used effectively in all unlined surfaces in attics and cellars. It is inexpensive, not only in first cost.

“FYNEART-WOODWEB” SHADES

A new development in window shading is announced by the Woodweb Shade Mfg. Co., Inc., of 401 North Broad Street, Philadelphia. The fabric, comprising light, strong strips of wood, is woven with special thread on a variety of colors and combination. A. I. A. file 35-P-51 will be sent on request. It gives detailed description, illustrations and specification directions. Light without glare, ventilation without draft is accomplished through the use of these shades. Their structural strength adds years of service to the ordinary shade installation. You will want to investigate them.

“SCUTTLE-A-DAY”

A pamphlet on the new “Scuttle-A-Day” Ideal Hot Water Supply Boiler and a catalogue on the new “Ideal Oil Burning Boiler No. 12, De Luxe Model” describe two new additions to the American Radiator Company’s line. Copies of this literature will be sent on request. The catalogue aptly suggests that “every attic has a past—every cellar has a future,” and invites you to carry your design efforts below the first floor with a boiler that is handsome in appearance and clean in operation.

SUPER-ILLUMINATOR

A folder from the Edwin F. Guth Co. of 2015 Washington Street, St. Louis, Mo., gives descriptive detail together with views of their latest development in modern illuminative equipment, the Guth Super-Illuminator. The photometric chart shows a light output of 87 per cent.

(Continued on page 16)
A COMPETITION
Sponsored by the Scovill Manufacturing Company

This competition is open to all Architects, and to men or women who have been members of a recognized architects' organization at any time since March 1, 1932.

CLASS A: CASH AWARD $100

PROBLEM: An essay, not to exceed 1500 words, on modernizing an apartment house, hotel, office building, residence, or any building involving plumbing specifications. In the introduction state briefly: First, the value of modernization to the architect and to the building owner. Second, the importance of plumbing modernization as an integral part of such projects. Third, your opinion as to the most important points in specifying plumbing equipment.

To illustrate the subject, outline a modernization commission from your actual experience. Include the type and age of the building; the changes in plans; the solution of the plumbing problems; and the points involved in the selection of the plumbing equipment. (Neither the original nor the new brand of fittings need be mentioned by manufacturer's name.) In conclusion, tell how the building owner was approached, and the line of reasoning used in obtaining the commission.

Results of the solution of the above problem, such as increased tenancy, greater economy of operation, etc., should be covered and attested by a letter from the building owner or his business agent.

CLASS B: CASH AWARD $75

PROBLEM: An essay, not to exceed 1500 words, following the same conditions outlined in the first paragraph of the Class A problem.

To illustrate the points, assume a hypothetical modernization commission. Indicate the line of reasoning you would use with the building owner to obtain this commission. Point out the probable results of modernization—in increased tenancy, etc.—obtainable by skilful planning. A sketch plan may be attached to illustrate your proposal for modernizing plumbing arrangements and fittings.

GENERAL RULES

Contestants may enter either Class A or Class B—but not both. Only one essay will be accepted from each contestant.

Essays must be typed or written legibly in ink on one side of the paper only. Sign with a nom de plume or device and send in a plain envelope to Contest Director, Scovill Manufacturing Co., Plumbers' Brass Goods Division, Waterville, Conn. Enclose with the entry a plain, opaque envelope marked Class A or Class B, containing your real name, full address, position, and name of firm. Excellence of English, while desirable, will not be given undue weight as compared to grasp of the subject. Entries will be returned at the close of the competition if postage is enclosed.

The judges will be the following men:

CASS GILBERT, JR.... Cass Gilbert, Inc., New York City
RAWSON HADDON ......... Waterbury, Conn.
FRANCIS KEALLY ............. New York City
LOUIS A. WALSH ............. Waterbury, Conn.
RUSSELL WHITEHEAD ........ Editor, Pencil Points

They will meet shortly after the close of the competition, and their report will be published. It is understood that all contestants agree to the conditions of this competition. The judges' decision is to be accepted as final.

If one or both winners wish to donate their awards to a charity limited to the Architectural Profession, the Scovill Manufacturing Company will donate an equal sum—provided the donation is made within two weeks after the winners are announced.

This competition closes at midnight, June 1, 1933

Scovill Manufacturing Company
Plumbers' Brass Goods Division
Waterville, Connecticut

Scovill Flush Valves—Shower, Bath and Lavatory Equipment—Tubular and Miscellaneous Plumbers' Brass Goods
If you want to design homes that appeal to the ladies, install a Prometheus Plate Warmer and Towel Dryer in the kitchen. It keeps food hot and flavorful until served. No danger of food being dried out and tasteless. And it dries towels quickly.

Prometheus Plate Warmer costs but little to install and is economical to operate. Can't overheat. Shuts off current automatically if accidentally left on.

Prometheus Plate Warmer is chromium plated and handsomely finished. White porcelain doors. Removable shelves.

Approved by the Underwriters. Write for catalog.

Swartwout Rotary Ventilators

Sanitation? Yes
... and Design, too!

Halsey Taylor Drinking Fountains are famed for their health-safe qualities... but design is also a vital factor in their selection by architects and building authorities! Modern in appearance as well as in their sanitation features, any of the many varied types in our complete line will appeal for your specifications.

Write for catalog.

THE HALSEY W. TAYLOR CO. • WARREN, OHIO.

PECORA
MORTAR STAINS

A half million Stark Salt Glazed Bricks were supplied by the Stark Brick Co., East Canton, Ohio, for Attica Prison, Attica, N.Y. Pecora Mortar Stains can be used advantageously with this or any other style of brick.

There Should be a Law

There should be a law prohibiting the use of drab, colorless mortar in masonry joints. Such mortar never adds anything to the appearance of brickwork. On the contrary, it definitely reduces the attractiveness of masonry wherever exposed to view.

Of course, many architects realize the advantages of using color in the mortar. More than this, they have found that it pays to use Pecora Mortar Stains because these stains may be absolutely depended upon to be rich, uniform and fade-proof.

There are 12 standard colors to choose from, affording harmonious blends and strong contrasts. Pecora Mortar Stains do not cause or increase efflorescence and are supplied in paste form ready to be mixed with lime or cement mortar.

For further details see Sweet's Catalog or write direct to us

PECORA PAINT COMPANY
Fourth and Glenwood Avenue
PHILADELPHIA, PA.
Established 1862 by Smith Bowen

ALSO MAKERS OF PECORA CALKING COMPOUND
A BATH IN STAINLESS STEEL

That may sound a bit precarious—not at all. We refer to a new use to which stainless steel has been put. The Fiat Metal Mfg. Co., in co-operation with the Ingersoll Steel and Disc Co., has developed a shower bath compartment having walls and top of stainless clad steel. These compartments are of knock-down construction, having interlocking leak-proof corner joints of patented construction. They are hence usable for remodelling projects, as well as new construction.

THE IDEAL PIPE

For Water Wells, is a folder describing the Republic Electric Weld Drive Pipe and Casing, just off the press for Republic Steel Corporation of Youngstown, Ohio. It explains the advantages of the pipe for well drilling and includes dimensional tables.

MODERN FURNITURE DESIGN

To foster modern furniture design, not of the hackneyed "Art Moderne," but the type of modern furniture that has a reason behind it, and is basically sound, the American Walnut Manufacturers' Association held a contest recently. It is interesting to note that there were some three hundred entries and all were of a high order. Among the judges of the award were Richard E. Bach, Metropolitan Museum of Art; Richardson Wright, editor of House and Garden; Joseph Urban, Eugene Schoen, W. F. Stromson, of Ford & Taylor; and A. W. Crawford, of John A. Colby & Sons. The awards were as follows: First Prize in Bedroom Suite to Donald M. Douglas, of the office of Hood, Godley & Fouilloux; Second Prize jointly to Fred Geibelt and Charles Beeston of New York; Honorable Mention to Messrs. Edwin G. Adelberger, J. W. Betts, J. L. Berrall, Joseph Roberts, and Paul M. Mitchell. First Prize for Dining-room Suite to J. Gordon Elliott, of Guthrie, Ken.; Honorable Mention to Gilbert Rohde, Wm. A. Balbach, C. G. Kimerly, and Hermann Schoenfeldt. The winning entries will be exhibited at the "Century of Progress" World's Fair at Chicago. The American Walnut Manufacturers' Association is at all times glad to be of service to architects in helping them with their cabinet-wood specifications. Inquiries should be sent to Association at 616 South Michigan Boulevard, Chicago.

THE NEW FRIGIDAIRE

Save more and will pay for themselves faster. They use no more electric current than one ordinary lamp bulb. They employ a 2½ H.P. self-contained rotary compression unit using natural air circulation for cooling. This development is the result of intensive investigation into the fundamental requirements of household refrigeration. Stataflex insulation, automatic defroster, thermostat, and evaporator are all unusual features. But all the story cannot be told here. The Frigidaire Corporation of Dayton, Ohio, will be glad to send you their latest prospectus.

A NEW LIGHT ON THE SITUATION

The Gleason-Tiebout Glass Company, 200 Fifth Avenue, New York City, state in their most recent literature that "Celestialite" solves the lighting problem for schools, hospitals, stores, and offices. They suggest that you get your clients to replace antiquated fixtures with the new patented Celestialite globes—maximum efficiency at the lowest cost in years. Prices will go up soon. You will be interested in the patented features.

**A NEW LIGHT ON THE SITUATION**

---
Cemcoat

For twenty-five years architects have been specifying Cemcoat wherever they wanted a strong light-reflecting white paint.

Made of pure zinc, lithopone, and an oil base, selected and prepared by an exclusive Sonneborn process, Cemcoat has proven itself amazingly durable, lustrous and economical.

Cemcoat comes in a variety of permanent colors.

*Full specifications will be found in Sweet's Catalog, page 355.*

*Write for the Cemcoat book. It is very helpful.*

L. SONNEBORN SONS, Inc., 88 Lexington Avenue, New York

---

Some Other Sonneborn Products...

- **LIGNOPHOL**
  - For finishing, preserving and waterproofing wood floors. Penetrates wood with life-giving gums and oils.

- **HYDROCIDE**
  - No. 631
  - Plaster bond and dampproofing paint for interior or exterior walls above ground.

  - No. 648
  - Mason, Semi-Mastic
  - For waterproofing and dampproofing foundation walls and footings.

  - HYDROCIDE INTEGRAL Paste, Powder
  - For waterproofing mass concrete, stucco, cement plaster and brick mortar.

  - LAPIDOLITH
  - Liquid Chemical concrete floor hardener welds loose particles into a close-grained mass, granite hard.

  - TRIMIX
  - An efficient liquid compound for integral concrete waterproofing and hardening.

---

THE CUTLER MAIL CHUTE

TO INSURE standard, dependable equipment installed promptly at moderate cost, the Cutler Mail Chute should be specified by name.

If desired, approximate estimates will be furnished in advance.

If preferred, a stated sum may be allowed to cover this item.

Full information, details, specifications and estimates on request.
