DETAIL OF A WINDOW, PALERMO, ITALY
The English House of the Tudor Period

It is with some satisfaction that we learn of the completion of this monumental work, which in its importance as forming a permanent and accurate record of the most interesting period of the history of domestic architecture in England, ranks with the Georgian Period in this country. Architects who have fortunately secured the first two parts will of course add this third and concluding volume to their library. Those who have not been equally fortunate will doubtless be anxious to add to their collection of books this very important series. Its acquisition places at the owner’s disposal a wealth of information and a series of photographic reproductions of the best work of the Tudor period, all of which possesses the highest suggestive and educational value.

The authors, in the preface to the third volume, just to hand, state:—

“That architecture should be unmoved by passing phases which lead other arts first in one direction, then in another, is acknowledged on all hands. No surer indication, however, of the eclecticism of the last few decades could be cited than the
ever changing course through which it has been led from the straight path of development. The cry for years past has been for symmetry, classic feeling, and monumental effect, and the largest books and finest illustrations have been in the cause of an architecture foreign to the soil and not well suited to the climate of this country. Love of home is a strong characteristic of the English race, yet as a nation England has done little to preserve what has been bequeathed from the past. The essentially national type of fifteenth and sixteenth century domestic architecture, which is her precious heritage, has hitherto received no adequate recognition, and in too many instances no effort has been made to stop the work of destruction, which has already robbed the country of many of its finest works of craftsmanship in materials of widely different natures."

If we stop to consider the vicissitudes through which the extant examples of Tudor domestic architecture have passed, the uses to which these buildings have been put, and what has perhaps worked greater harm, successive periods of restoration and repair, it is almost incredible that so many beautiful examples exist today as are shown in these three volumes.

Many of these houses have passed through wars and warlike uprisings, many have been allowed to go to almost total ruin owing to the impoverishment of their owners and but few of them have fortunately remained in the same family, through successive generations.

Referring to the quoted words above, the English race as a nation has done little to preserve what has been bequeathed from the past. We on this side of the Atlantic have shown equal indifference—The best examples of our early building are fast disappearing. A work like the one under present consideration is therefore of great value. It not only preserves for the bene-
fit of posterity accurate reproductions of
what may be safely stated as the best period
of domestic architecture in England, but
it also enables us to avail of the lessons
taught by this work and by careful study
adapt it in all its beauty of line and form
to our present day requirements.

The illustration of these houses reared
by English builders and enriched both out­
side and in by English craftsmen, during a
period of their best achievement, represent
something more than the builders' art, they
typify in a large measure the social
life of the Tudor period.

The very well-written text that accom­
panies these three volumes gives the his­
tory of the owners of some of the statelier
examples. It is interesting to note how
intimately family names and houses are
interwoven into the political history of
the times.

Claiming a certain amount of familiarity
with the illustration of Tudor work that
has been made during recent years, we
find that a majority of the houses illustrated
are not generally known by reason of
previous presentation.

What will directly appeal to the archi­
tect in this work is the reproduction on a
large scale of the more prominent details
of the subjects presented. Particularly does
this apply to the interior treatment of
houses built during the Tudor period.

The open timber roofs that were fea­
tures of the great halls of these houses, are
shown by many photographs and measured
drawings. These roofs are mostly of the
hammer-beam type, with principals set
widely apart, the wide bays calling for
longitudinal arches and with braces, fea­
tures but seldom found in later forms of
construction.

Details of half timber work that are il­
lustrated demonstrate the constructive skill
and versatile design of the craftsmen of the
fifteenth and sixteenth centuries perhaps
more forcibly than stone or brick. Unlike stone or brick, houses of this type have not withstood the ravages of time and it is therefore a very valuable part of these volumes that presents reproductions of examples, many of which are no longer extant.

In the interiors of the houses of the Tudor period nothing perhaps gave greater impression of dignity than the richly paneled walls, combined with the lofty effect of the open timbered ceilings.

In the greater number of English mediaeval houses the walls appear to have been covered with a coating of plaster. A later and more lasting method was to cover the walls to a certain height with oak paneling, or wainscot, a term derived it is said from the Danish wagenschat.

Prior to the Tudor period such paneling as may have been introduced was probably relieved by the application of color, but when the craftsmen that flocked to England during the latter part of the reign of Henry VIII, had set their impress on the builders' art of England, color was no longer resorted to and in its place the beautifully proportioned panels began to receive that refinement of carving that is so much admired and so often very poorly imitated in the machine work of today.

Other features of the Tudor interiors were the well designed chimney pieces, often the central motive from which the decorative treatment of the wainscot and ceilings took its detail.

We find that the earlier ceilings were of wood but during a later period plaster was largely used. Such important examples as have withstood the ravages of time follow closely in design the earlier pattern of the modern ceiling.

In fact, the ceiling became one of the most valued fields for the display of decorative work in moulded and modeled plaster. Few important houses of that time are without evidence of having possessed ceilings of great interest.

In design these ceilings were bold and vigorous. Few if any motives are found that may be considered as having been derived from abroad. They are thoroughly English in their conception and suited to a climate that calls for strong contrasts in light and shade.

So alluring is the topic when writing of a period fraught with good architecture that one might at some length review the many beautiful examples that are set forth in this splendid work. In concluding this appreciation of the collecting and editing of this monumental series, it may be well to refer to the illustrations of leadwork.
Here we have a department of the craftsman's work that has practically become a lost art. Lead has been superseded by other and more durable material. We are not prepared to admit that this superseding has resulted in more artistic production, but its pliability lent its use to many adaptations that have withstood many years of exposure. In Tudor houses apart from the glazing of windows and its occasional use in plaster ceilings, lead was extensively used as leader heads for the collection and discharge of water from roofs. The rainwater head and leader became important decorative features of many houses. Owing to vandalism and the insistence of the collector, many very beautiful examples have disappeared, but enough have been preserved and find illustration in this work to demonstrate the very artistic work that was lavished on these lead details.

As time passes and the coming generations take our places, much of this beautiful Tudor work will have become but a memory. How very valuable it is and how greatly important that through the indefatigable energy of the men who have given up time and gone to no end of trouble to collect and publish these beautiful examples of Tudor domestic architecture, that we are enabled to have before us this permanent collection of important work.

The Refining Influences of Art

The one thing that stamps the enlightenment of a century is its art. Battles are lost and won, aqueducts constructed, and canals built, but the intelligence of the epoch in which the work was accomplished is decided by, perhaps, a little tracery upon the battle instrument, or the proportion, arches, or, perhaps, the capital of some column in the engineering feat. Napoleon Bonaparte has been dead less than ninety years, and what lives today of his master brain and energy? Is it not principally the good roads he built, and the works of art he acquired for France? Why is Washington the most beautiful city in this country? Not on account of its natural advantages, but on account of its artistic plan, a city of monumental centers. Unfortunately, the beautiful early architecture of the city has deteriorated. Public buildings should be an educator as well as public schools. You may talk about fine things to the child, but unless one is brought up in touch with them the nature of the individual is seldom influenced. A person need not be rich in Europe to be surrounded by beautiful things, they are everywhere, the State owns thousands of superb paintings and statuary and the public works have been constructed by artists for centuries. It is said we have had too much to do in developing the natural resources of our great country to pay attention to art. Is this so? Was not our art of the colonial epoch a classic and does it not make people with refinement in their souls wish they had lived at that time? In most of the cities of Europe there are certain restrictions on all buildings, for example: On certain streets, the first stories must be of the same height; this gives a uniformity to the street, but as the height of the buildings is not necessarily the same, there is no monotony. This principle was carried out by the architects of the Chicago World's Fair. Will not the future generations liken the statesmen in power to the art, architecture, and engineering constructed during their lives? There should be a minister of fine arts. In a great country like ours, where millions go into public buildings, this man should not be merely a bureau chief, but a man of artistic and executive ability.

All public architecture, painting or sculpture should be referred to the secretary of fine arts, where an efficient staff could pass on same. Every year there should be a fine arts exhibition in Washington where the best works could be bought by government for the adornment of public buildings in Washington and the other cities. Young Americans abroad today are doing some
of the finest work, but when they return to this country the bottom drops out, they feel at once there is no national artistic pride. An artist is delighted to sell his Salon picture to the French government for a nominal value for the reputation it gives him; and in this way the government every year makes excellent investments, and at the same time encourages and fosters art.

CLYDE DU VERNET HUNT,
MAJOR U. S. ARMY.

Recent Legal Decisions

DESTRUCTION OF BUILDING BY EARTHQUAKE—APPORTIONMENT OF LOSS BETWEEN OWNER AND CONTRACTOR

An action was brought by a contractor to recover a balance due under his contract for the construction of a building in Palo Alto, which was in course of construction when it was destroyed by the great earthquake of 1906. The contract price was $21,965, and the contract provided for the apportionment of the loss between contractor and owner should the building be destroyed by earthquake before completion. It provided that the owner should lose the installments he had paid or that might be due under a clause of the contract which required him to pay to the contractor 75 per cent, of the value of the work as it progressed, on the architect's certificate. The contractor's loss was to be for the uncompleted portion of the work for which no payment was yet due under the contract. In construing this provision the court held that it was evidently in the minds of the parties that in case of destruction by earthquake the contract would end; that the contractor would not be required to commence again and build an entirely new building, nor would the owner be required to pay for a new building. The owner after his losses might have been unable to pay for another building of the same cost. The contractor might have been unable to rebuild on the same terms. The ground might have been so changed as to make it an absolute loss to the owner to pay for another building. The owner had paid $8,800. As to what was due the owner contended that under the contract nothing could be due until the contractor had obtained the architect's certificate, or made the proper demand in writing therefore. The court held that this would be the law during the life of the contract and before it had been ended by the destruction of the building; but it could not hold that the contract contemplated that the contractor could not recover the amount that had become due at the time of the earthquake merely because he had not obtained the architect's certificate. The jury found that the value of work and materials done and furnished was $16,473.75. Taking 75 per cent. of that gave $12,355.31; deducting the payment of $8,800 already made left $3,555.31, for which the jury gave their verdict. The complaint, however, only alleged that the value of work and materials was $15,664.75. The court, therefore, held the verdict to be excessive to the extent of $806.65, and modified the judgment for the plaintiff by deducting that amount.

Hettinger v. Thiele, California Court of Appeal, 113 Pac. 121. (J. S.)

WAIVER OF TIME STIPULATED FOR DELIVERY OF PLANS

In an action for architect's fees a defense was that the plans were not delivered within the time provided in the contract. It was held that even if time were of the essence of the contract, if rescission was not claimed by the owner and negotiations between him and the architect continued for a long period beyond the time claimed to be fixed for completion, the owner waived his right to stand upon that defense.

CIVIC ART IN AMERICA

The change that has taken place in the attitude of the public toward the subject of civic art during the past dozen years is cause for extreme gratification on the part of all cultured people. It is, in fact, one of the most convincing evidences of the growth of culture in this country. Manifestations of this change are to be found in the formation of associations organized throughout the land for the purpose of fostering and advancing the movement now well under way and beginning to take practical form. The work is being carried forward in a variety of ways, the majority of which could be grouped together under the general caption of City Planning. The enthusiasm which marks the development of this comparatively virgin field of art in America promises to carry it safely over the obstacles and obstructions that ordinarily confront a movement of this nature. It should be borne in mind, however, that full accomplishment can seldom if ever be attained without individual cases of error and even complete failure in plan or execution. Such instances should be regarded as inevitable and not be permitted to produce discouragement as to the general movement.

At no time in the history of this country has the future for art looked brighter than at present, and it is significant that the avenues through which the greatest progress is being made are those in which architecture forms the principal features.

INFLUENCE OF GOVERNMENTAL ARCHITECTURE

It will probably be conceded that no class of buildings erected in this country have exerted a more beneficial influence on the architecture of the smaller cities and towns than the Federal buildings that have been constructed within the last decade. In many instances they are quite the most important structures in their neighborhood, and invariably they stand as examples of good design. Nor is their influence for better art confined to architecture. Good proportion, careful and correct detail, use of suitable materials, harmony of colors, all have an effect, the value of which can scarcely be computed, in producing a love for and an appreciation of art in its broadest sense.

The Treasury Department has recently shown a laudable desire to further extend, improve or intensify this influence for good, by some contemplated change of plan permitting wider competition among architects. While such a scheme possesses features that are attractive, particularly to the lay mind, we feel that it should be approached with extreme caution, and only after the most careful consideration, accompanied by test if practicable, should conditions that have produced such gratifying results be disturbed or changed.

Any feature having for its object the standardization of designs for Federal Buildings is, of course, undesirable from every important point of view, and will no doubt be eliminated, if indeed it has ever been seriously considered.
THE AMERICAN ARCHITECT

FIRE LOSS IN AMERICA

FROM information gathered by the Government through its Consuls in various parts of Europe and reported in the "Daily Trade Reports," issued by the Department of Commerce and Labor, it would appear that the very material toll exacted by fire in this country is so out of proportion to that suffered by other European countries as to excite comment and warrant the closest investigation of the reasons for the very large discrepancy.

In this country the annual fire loss on buildings and their contents equals a per capita tax of $2.51 or a grand total of more than $215,000,000. To these enormous figures must be added the loss, difficult of exact computation, sustained from forest fires, bringing the grand total up to more than $456,000,000.

All of this great waste occurs in spite of the fact that we spend more money per capita in the United States in maintaining our fire departments and policing the forest areas, than any other country in the world.

Recent statistics published in consular reports indicate that the cost per capita in European cities averages about 20 cents while in this country the per capita cost is $1.53 or seven and a half times as great.

As the greater number of fires occurring in this country are from preventable causes, it would seem that efforts towards fire prevention would be more logical and efficient than those directed towards their extinguishment. The enormous loss has become a burden, insufferable because it is in so large a measure preventable.

The means of prevention are so thoroughly understood that it is not necessary to dwell on them here. That every city in the country should perfect an organization looking to prevention and that every code should be so amended as to secure all possible immunity has now become apparent to everyone.

Ignoring the large loss in money, we can no longer ignore the loss of life yearly occurring and even if we are indifferent to the destruction of our national wealth, we should at least take the necessary steps to protect life.

The Triangle Waist Company fire, which shocked the world, can readily be paralleled any day, while we wait for warring interests which stand in the way of the adoption of a code in this city to pool their issues and adjust their differences.

The situation calls for a general awakening and prompt action.

THE DICKSON HOME FOR AGED MEN

THE John Dickson Home for Aged Men, of which Mr. Arthur B. Heaton is the architect, is now being erected in Washington, D. C., in accordance with the plans and working drawings published in this issue.

In the preparation of the design the architect has adhered to those well accepted types of Colonial forms that were used in the early building in Philadelphia and vicinity. The exterior material employed is red Colonial brick laid in Flemish bond, the trim columns and cornices being painted white to conform to the accepted type of Colonial or Georgian architecture. The roof is of green unfading slate, varying in thickness and size. As is shown in the floor plans, much careful consideration has been given to the living part of the building and it is so arranged as to permit of the maximum amount of sunlight and air. It is to be borne in mind that this building is to provide a home for aged and indigent men who require the greatest amount of sunlight and the very best sanitary surroundings. With this idea in view, the various porches have been studied so that they may be converted to sun parlors and permit of their use throughout the entire year. A modern, steam-heating plant has been introduced and the electric lighting is most complete in its equipment, as is also the plumbing system that will be installed. The floors and partitions are of fireproof material. The surrounding grounds will upon completion of the building receive careful consideration as to their landscape features, as it is the intention of the trustees for the estate to make this an attractive and recreating adjunct to the group. The construction is now under way and the main building is about half completed.

Ninth International Congress of Architects. Rome, 1911

The following is a copy of a circular issued by the committee of the Ninth International Congress of Architects, to be held in Rome from the 2nd to 10th of October, 1911. Further particulars may be obtained by addressing any of the members of the permanent committee (American section) whose names are as follows: William S. Eames, chairman; Francis R. Allen, Glenn Brown, Daniel H. Burnham, George B. Post. Geo. Oakley Totten, Jr., secretary.

The members of the general organization committee have the honor of inviting you to take part in the congress which is to be held in Rome from the 2nd to the 10th of next October, according to arrangements made with the permanent committee in Paris, for International Congresses. It was agreed at the Congress of Vienna that this meeting, the ninth of its kind, should be convened in Rome on the occasion of the festivities in Italy, organized to commemorate the fiftieth anniversary of the proclamation of Rome as capital of the Kingdom. The eighth preceding, of which the first was held in 1867, met in Paris, Brussels, Madrid, London, and lastly in Vienna. All led to important results, both as to the artistic and technical aspects of our profession.

H. M. the King of Italy has graciously acceded to the wishes of our committee in accepting the patronage of this congress, and the Ministers of Foreign Affairs, of Public Instruction and of Art have kindly consented to act as honorary presidents.

By kind permission of the Syndic of Rome the congress will be inaugurated in the historic hall of the Foratii and Curiaii. The following subjects will be considered:

- Reinforced concrete, the mode of using it in different countries, and how it may be applied to great buildings both as regards the technical and the decorative point of view.
- Duties and rights of the architect with regard to his employer.
- The technical and artistic education of the architect, and the architects' diploma. The exercise of his profession beyond the limits of his own country.
- Considerations as to modern architecture.
- The carrying out of architectural works for the State or other public bodies.
- The desirability of a dictionary of comparative architectural terminology.
- Foreign academies in Rome. (History, Course of study and works of the pupils. Their influence in their respective countries.)

Written communications and lectures are admissible on the following subjects:

- Plans for the laying out and aesthetics of towns.
- Building regulations.

The committee will be extremely obliged to all those who will furnish written articles on the above subjects, to be sent in before the 15th of August next, accompanied by a summary in one of the four languages to be employed in the discussions of the congress, viz., French, English, Italian and German.

In every country the sections of the permanent committee for International Congresses, or failing such section, a representative to be hereafter named, will receive the applications of those desiring to become members. The applicants are requested to return the enclosed card without delay, so that the committee may know the probable number of persons to be expected.

The committee, earnestly hoping that representatives from every country will honor the approaching congress with their presence, sends to each a cordial greeting.

Ninth Annual Philadelphia Water Color Exhibition, 1911

The Pennsylvania Academy of the Fine Arts and the Philadelphia Water Color Club announce that under their joint management an exhibition of original work in water color, black and white, pastel, or drawing with pencil, crayon or pen, and illustrations in whatever medium, will be held at the Academy, November 13 to December 17, 1911, both inclusive.

All work intended for exhibition must be entered and delivered not later than October 21.

The One Hundred and Seventh Annual Exhibition of The Pennsylvania Academy of the Fine Arts will open February 4, 1912. The exhibition will consist of original works by American artists in oil painting and sculpture, which have not before been publicly shown in Philadelphia.

Personal

Mr. Martin Charles Huggett, architect, announces the opening of offices for the general practice of architecture, with offices in the Hannan-Mills Building, Farmer street, Detroit, Mich.

Mr. Henry Killam Murphy and Mr. Richard Henry Dana, Jr., architects, announce that they have removed their offices from 103 Park avenue to 331 Madison Square, New York City.
Officers Elected by Cleveland Architectural Club

The Cleveland Architectural Club at its annual meeting on June 20 elected the following officers for the ensuing year: President, Wm. R. Powell; vice-president, Albert E. Skeel; Treasurer, Wm. A. Bohnard; secretary, L. Fewsmith, Jr.; Librarian, Stephan C. Gladwin.

Proceedings of the Technology Congress

It is announced that the proceedings of the Congress of Technology, held in Boston April 10-11, will be published. The single volume, of about 500 pages, which will be sold at a moderate price, will contain the seventy odd technical papers relating to many fields of industry which were read at the celebration of the fiftieth anniversary of the granting of the charter of the Massachusetts Institute of Technology.

BOOK NOTES

Mr. Saylor’s familiarity with his topic has enabled him to gather a series of illustrations and provide a text that makes his book the best exposition of the subject we have seen.

It is gratifying to note that the author appreciates what so many people who have written on the subject seem to have failed to comprehend, that the true type of bungalow is never more than one story in height and that any other building, no matter how picturesque its appearance or low its roof line that does not fulfill this requirement cannot be correctly termed a bungalow.

The inexpensive character of the bungalow is probably the principal reason why in the East, at least, architects have not devoted much time to the design and plan of this type. When they have, either for their own occupancy or as a recreation, the result has generally been satisfactory. But, unfortunately in most cases, the design and construction of bungalows has fallen to the task of the dilettante or the amateur builder, whose efforts, while well intended, often tend toward results that leave much to be desired. The author is, therefore, fortunate in having been able to secure—no doubt with much searching—a satisfactory lot of examples with which to illustrate his book.

To the architect confronted with a bungalow problem the book will afford suggestions that have the value of practical application.

As its name indicates, this book is a popular treatment, in contradistinction to the ultra-technical presentation of the subject, of cement and concrete. Divested of much that can be only understood by the practical worker in concrete, it affords an opportunity to acquire readily a knowledge of reinforced concrete in building and railroad construction. For this reason it would seem as if it might be recommended for a place in the architect's library. Chapters on the artistic treatment of concrete surfaces, how to design concrete, and the waterproofing of concrete structures are of particular interest to architects.

FIRE AND FIRE LOSSES

The American School of Correspondence, Chicago, Ill., has issued in the form of an “Instruction Paper,” a bound volume of 94 pages, uniform in size with previous publications, which treats of fire and fire losses.

This paper is written by Mr. F. W. Fitzpatrick. The author takes up the large conflagrations that have been experienced in this country and endeavors to point out the lessons that have been taught and seeks to show how any serious recurrence may be avoided.

Those familiar with Mr. Fitzpatrick’s writing need not be told that he approaches his subject with a knowledge born of wide experience.

CEMENT SPECIFICATIONS

These specifications were adopted by the American Society for Testing Materials, and this is an authorized report from the copyright proceedings of the Society.

It is announced that the Wheeling Corrugating Co., manufacturers of sheet metals and sheet-metal products, Wheeling, W. Va., will open a branch office and warehouse at Tenth and Hickory streets, Kansas City, Mo., on September 1. The branch will be in charge of Mr. H. J. Morgan, who has been assistant manager at St. Louis.

The Foundation Company, New York, announces that Mr. Kingsley L. Martin, formerly Chief Engineer and recently Commissioner of Bridges, City of New York, has become a principal member in this company and will act as one of its vice-presidents.

ALABAMA

FAIRHOPE.—Banking company, just organized, will erect home. Bailey Bros. are interested.

OPELIKA.—Plans of E. and E. A. Zohle, architects of Roanoke and LaFayette, have been accepted for $10,000 Lee County high school. School building committee is ready to receive bids for construction.

CALIFORNIA

BERKELEY.—Riding Academy costing $200,000 will be erected on Grove, Josephine and Hopkins Sts. by J. Mason Fisher.

CORA.—City Trustees have accepted plans for erection of proposed $46,000 school.

GLENDALE.—Dr. L. N. Rudy and the Glendale Investment Company have asked for bids for erection of a $30,000 business block on corner of Fourth St. and Brand Boulevard. Plans by C. V. Turner.

LOS ANGELES.—Plains have been received for the Mary Andrews Clark Memorial Home, which is to be erected by ex-senator W. A. Clark in tribute to his mother, and, upon its completion, turned over to the Young Women’s Christian Association.

The Knights of Columbus are to erect a handsome club building within the near future to cost approximately $100,000. Mr. John W. Considine, of New York, says he intends to build a theater in this city to cost from a quarter to a half million dollars.

LOS ANGELES.—Plans are being made by Dr. Howard W. Sackett for erection of a $15,000 residence on a lot in Alexander Ave. in Chapman Park.

LOS ANGELES.—Plans are being discussed for erection of building in Spring St. Mr. I. W. Hellman, Jr., of San Francisco, is interested.

MONROVIA.—School building to cost $35,000 is about to be erected.

NAPA.—Board of Supervisors has decided to erect detention home. Supervisor Alexander is interested.

OAKLAND.—Work it is to be begun in a short time on new $30,000 Methodist Episcopal church at Corner of Twenty-first St. and Broadway.

Architect John Galen Howard is preparing plans and specifications for construction of a two-story-and-basement reinforced concrete hall building which is to be erected on the campus of the University of California in near future.

OAKLAND.—Erection of manual training and commercial high school will commence shortly.

ONTARIO.—Congregation of First Methodist Church intend erecting $50,000 edifice.

PLACERVILLE.—Bids will be asked at once for erection of proposed court house.

POMONA.—P. J. Yorba has decided to enlarge Hotel Pomona at Second and Thomas Sts. by addition of two stories.

RIO HONDO BEACH.—Grammar School is about to be erected; cost $2,500 to $5,000.

REDWOOD CITY.—A deed of trust conveying the property of the Menlo Country Club to the Mercantile Trust Company of San Francisco was filed in the County Recorder’s office today. The trust company will secure the $80,000 bond issue which will be used in the erection of a new clubhouse.

SAN FRANCISCO.—According to an announcement made by S. H. Friedlander, another theater may shortly spring up in the downtown district on the site of the old Tiwoli, Mason and Eddy Sts. Mr. Friedlander announces that the Downtown Realty Company is ready to erect the new theater and will break ground at an early date so that the playhouse will be ready for occupancy next spring.

Plans are in preparation in the office of Shea & Lofgren, architects, for the addition of four stories upon the Grace Bldg., at the northeast corner of Mission and Third Sts. The cost of the four additional stories is given at $40,000.

A six-story and basement brick and steel structure is to be erected on Mission St., between Fourth and Fifth Sts., from plans prepared by Reid Brothers, architects. This building will be a hotel of the modern type. The estimated cost is given at about $60,000. Contractors are figuring on bids in the office of N. B. Sexton, the architect, for an apartment house to be erected on the south line of Bush St., 137.6 east of Mason St., for E. Fleisher. The house will be five stories high, with a basement. Its front will be faced with red and white brick, and the structural part will be of steel and brick. The area of the building is 46 by 137.6. The estimated cost is $60,000. Bids will be opened within a week and contracts awarded.

The H. C. Rea Co. will erect a Baptist Institute on Snyder Ave. Plans call for three-story stone structure; cost, $90,000. Contract has been awarded to McLaughlin & McNamara for
SANIFLOR

A sanitary, coated, non-absorbent, waterproofed, vermin-proof sound deadening and insulating felt, especially made for hospitals, residences, churches, schools, cold storage insulation, etc.

The most serious defect in the old style deadening felts is the lack of protection against moisture, water, vermin and odors. Such felts are not only nesting places for vermin, but absorb and hold moisture, water and odors. They are not hygienic.

"Saniflor" has a shell-like, flexible coating or veneer on both sides, which hermetically seals in the dry felt and perfectly waterproofs its two surfaces so that it cannot absorb moisture or odors, and also makes it obnoxious to mice and other vermin which will not eat the coating.

The MODERN SASH CORD

REGAL BRAID

makes windows work as if ball-bearing.

This cord, on account of the modern machinery used in our mill, is absolutely free of all imperfections.

Regal Braid Cord is easily distinguished by the Blue Strand, encircling the cord in a broken spiral.

Longest staple cotton used in its manufacture means longest lived cord.

Doubly inspected, and Every Inch Guaranteed.

Manufactured solely by
PURITAN CORDAGE MILLS
Louisville, Ky.

Carter White Lead

Enjoys the largest sale and widest distribution of any single brand of strictly pure white lead.

You can specify it for use anywhere in the United States with the assurance that the painting contractor can get it and that the quality will run perfectly uniform.

Samples for analysis sent upon request

CARTER WHITE LEAD CO.
West Pullman Sta. 100
Chicago, III.

Factories: Chicago, Omaha
Economy System of Automatic Water Supply

furnishes clean, aerated water under pressure and requires no large storage tanks. Will stand severe service and does not require skilled care.

Installed in basement. Consists of a centrifugal pump direct connected by an insulated flexible coupling to an electric motor, an automatic switch and a pneumatic tank.

We also manufacture:

- Bilge Pumps
- Sewage Ejectors
- Condensation Pumps and Receivers
- Cellar Drainers
- Centrifugal and Triple Pumps
- Hot Air Engines
- Vacuum Cleaning Apparatus
- Air Washers
- Purifiers
- Cooling Devices

SILVER LAKE COMPANY

BOSTON
THE LARGEST MANUFACTURERS of the BEST VENTILATORS in the UNITED STATES

THE "STAR" VENTILATOR

STATIONARY

The "Star" Ventilators are recognized by the U. S. Government and prominent builders to be the best made. Proven exhaust speed in excess of all others. Guaranteed storm-proof. On thousands of buildings all over the country. Look out of your window and see a "Star" Ventilator.

THE "STAR" VENTILATOR

MODEL "A"

Fire protection is essential in a roof ventilator. The "Star" Fire Retarding Ventilator is specially designed to meet this need. Model "A" has a damper top, held open by a lever and controlled by a fusible link. In case of fire, the link parts and the damper close by gravity. Ample exhaust capacity.

THE "STAR" VENTILATOR

MODEL "B"—SKYLIGHT

Light and ventilation together ensure the highest industrial efficiency. The Model "B" "Star" Fire Retarding Ventilator is provided with a glass top, admitting plenty of light. Its fire-retarding feature is operated by chain and fusible link.

(Patented and Trade-Marked.)

Special Drip Pans, Condensation Gutters and Bases on Order.

The Hot Weather Ventilator

When it's as hot outside as inside, what good is the ventilator which is dependent upon a difference in temperature? The SWARTWOUT ROTARY—BALL BEARING VENTILATOR uses the wind; it is not dependent upon difference in temperature. That's why it removes heated air on a hot day.

Terra-Cotta in Architecture
Permanent Beauty

In cities, where the air is constantly filled with smoke and dirt, and where buildings soon become soiled and stained, the only material that will make permanent the beauty of the architect's original design, is high-grade architectural terra-cotta. Stone can be cleaned, but at great expense and trouble. Terra-cotta can be cleaned with ordinary soap and water and thus can be made to retain perennially its original freshness and charm.

Up-To-Date Roof Ideas

"Out of the Ordinary"

Roof Slates

What are they?

SLATES prepared by progressive people.
SLATES of greater than ordinary thickness and variety of color effect.
SLATES of random sizes and thicknesses in the one roof.
SLATES of two or more colors in the one roof.
SLATES in red, green, purple and black with combinations of colors in the one slate.

All of the above made in thicknesses from Standard No. 1 up to 1 1-2 inches with rough dressed edges.

JOHNSON OLD EUROPEAN METHOD consisting of Roof Slates graduated in sizes and thicknesses with random widths. The roof may be a one tone or contain two or more colors. An old country idea revived. Lay outs supplied to suit any style roof and any requirement covering high or low cost. Write for our Roof specifications, stating approximately your requirements.

JOHNSON'S SLATE SIDING of extra thickness and size to give exposure that supplies a "long to the weather" effect similar to the old colonial shingle. Colors: Green, Purple, Red or Black. Beautiful, substantial and enduring. A new idea. Write for full specifications.

JOHNSON'S BANGORVEIN SLATE BLACKBOARDS; a black slate of superior strength and smoothness of writing surface, necessary qualities of a high grade Slate Blackboard. Get our Blackboard Pamphlet containing descriptive matter and erecting instructions.

JOHNSON'S BANGORVEIN STRUCTURAL SLATE. The strongest black slate for Steps, Platforms, Urinals, Base, etc.

SPECIFY our productions and you will get the benefit of our 27 years of practical experience making slate.

The manufacture of steel window sash has reached such a state of perfection that it is no longer a luxury to use them in modern factory construction, but a positive act of economy over the wooden window sash. It is important that you select the highest type obtainable. This means to use Rapp Rolled steel windows because they are the most advanced, strongest and most durable of all metal windows.

The members of these windows are not merely slipped together and sprung or brazed in place, but are welded together by our own special process, making every joint permanent as the building itself. Rapp Rolled Steel windows diminish the fire risk and increase the safety of buildings. They afford proper light, ventilation, and improve all conditions of occupancy in factories, machine shops and industrial buildings of all types.

Our new catalog No. D-104 describes and illustrates Rapp Rolled Windows for factories and industrial buildings. May we send you a copy? We shall be glad to hear from all architects, engineers and owners.

Mr. Architect—Specify the Kewanee System

The No-Trouble Water System

W HEN you specify the Kewanee System for your client, you will be sure to successfully solve his water supply problem. He will have a plant upon which he can absolutely rely, day after day, year in and year out. And he will have perfect service, with a minimum of attention and expense.

There is a Kewanee System for every problem. Solving thousands of these problems has shown us how to avoid trouble-breeding equipment. We manufacture our own plants and maintain a standard of quality, which insures satisfaction for the client and a good reputation for the architect.

Our engineering services are also of value to you. We relieve you of the work of drawing up specifications and making estimates; and then we are responsible for the results. At the very first opportunity, let us show you how well we can serve you.

In the meantime, write for our beautifully illustrated catalog. Mention the American Architect.

Put Together to Stay

No ordinary strain can pull the joints of "NEVER SPLIT" closet seat apart. They are held together with steel bolts, as well as being tongued, grooved and glued together. This is the strongest possible construction. It places "NEVER SPLIT" far above the ordinary closet seat that is simply glued together and likely to come apart under the influence of strains or moisture.

Moisture will not warp "NEVER SPLIT"—pressure will not open the joints. It will remain unaffected under conditions that would soon destroy an ordinary seat.

You will appreciate the advantages of "NEVER SPLIT" if you send to-day for one of our latest catalogues. Just write your name and address on a postal and send it to us. The catalogue will come by return mail.

J-M Vitribestos Ceiling Insulation

Fireproof Waterproof

Most Effective Insulation for Boiler Rooms

In public and municipal buildings, apartments, schools, etc., the unbearable heat from the boilers, which penetrates first-floor rooms, can be prevented by applying J-M Vitribestos Ceiling Insulation. It makes first-floor rooms 20 to 30 degrees cooler on a warm day, and will prevent spread of fire from overheated boilers.

J-M Vitribestos is the only fireproof ceiling insulation that is also waterproof—the most modern insulation for fireproof buildings. Made of Asbestos, vitrified under our own patented process, it weighs only one-tenth as much as fire-brick.

Is the strongest and most durable ceiling insulation made, and in the event of a fire, does not crack and go to pieces, even if water is thrown on it while hot.

J-M Vitribestos is easily applied on any style of ceiling, and comes in sheets 3 x 3 feet and 3 x 6 feet, ¼ inch to 3 inches thick.

MULLINS Sheet Metal Statuary

fulfils every requirement of ideal architectural adornment. Its effect is nothing short of imposing. It is light—withstanding the ravages of time. Made from artists own models, or can be selected from our great variety of exclusive stock designs. Has the hearty endorsement of numerous sculptors of note. The cost is far below that of cast or sculptured work.

We also manufacture Fireproof Metal Windows, Skylights, Corinices, Finials, Metal Tile Roofing, and Sheet Metal Ornamental Work of every description.

Buildings that are equipped with Mullins Fireproof Windows have lower insurance rates because Mullins Fireproof Windows are manufactured under the supervision of the Underwriters’ Laboratories, Inc., according to the latest specifications of the National Board of Underwriters. Every one of these windows is inspected, approved and labeled with the official approval of that board.

Your written request will bring, by return mail, catalogues covering the line or lines that interest you. Glad to submit quick estimates on architects’ drawings. Attractive prices. Prompt service. Special discounts to the Trade. Write to-day.

No Leaky Joints—No Escaping Sewer Gas—No Further Repair Bills
The Trenton Potteries Company
offers
The Donovan Closet Connection
which makes fast the Water Closet to the soil pipe with a water sealed joint at the floor at a cost no greater than the present method of connecting closets.

The subject of the floor connection for water closets or connecting earthenware to pipe of any kind used in the drainage system of a building has always been of greatest interest to the architect as well as the plumber. On account of the very great difference of material, many devices have been presented, some with much merit but held at a price which made them prohibitive, considering the value of the construction and their reliability over the ordinary floor flange and sewer ring closet. THE DONOVAN FLANGE, which is the result of this state of affairs, affords a wonderfully simple and effective method for connecting closet and soil pipe.

Booklet—A Discussion of Connections for Closets and the various methods for connecting the DONOVAN FLANGE are fully illustrated and discussed.

Probably not a very practical way to do, but it brings out the point

Some architects seem to have the idea that the installation of KAWNEER is a complicated undertaking, and about the quickest and most convincing argument we have against that, is the utter lack of complaints from those using KAWNEER. Why, if KAWNEER were difficult to install and did not serve as an absolute protection to the glass, we would not have time to take care of anything else, but to look after the "sticks." KAWNEER is used exclusively by Architects and Builders in every State of the Union—isn't that pretty good proof of its merits?

KAWNEER is the original, the Pioneer solid, all-metal Store Front Construction. By actual try-outs and tests in buildings large and small, and under all climatic conditions, we claim KAWNEER to be the most practical and efficient Store Front construction on the market. Our ideas have been original from the first and it is by keeping close to this policy that we are able to maintain its coveted position as standard.

Regulated Ventilation

Perhaps to you, as a technical man, the feature of regulated ventilation does not mean a great deal, but to your client, the merchant, it is a wonderful asset. It simply means that with KAWNEER he can actually throw open his show windows in Winter and shut them up (dust-tight) in Summer. It gives him the constant service of his best advertising and selling element—the Show Window.

The gutter (or back part) of KAWNEER sash is provided with a small V-shaped slide by which you can open and close the ventilation and drainage holes. This makes possible, clear windows in Winter and dust-tight sash in Summer.

Kawneer is Complete

By "Complete" we mean that with KAWNEER you can take care of any and all conditions you may encounter. It makes no difference how large or small the opening may be, KAWNEER is suitable. It makes no difference how large the plate glass may be, it is safe in KAWNEER. We have sash and bars designed especially for very large plates, we have sash that is used with a wood backing and sash that is self-supporting. You may want to carry out rather broad lines in your Store Fronts, then use the heavier KAWNEER members.

Booklet No. 3 Compiled for Architects

You ought to have a copy of our booklet No. 3 on file. It details the different KAWNEER sash, corner, division and transom bars, also shows about 100 cold rolled and drawn hollow metal mouldings. Simply drop a card asking for Booklet No. 3, and it will go to you by return mail. Understand, it will not put you under obligation in any way. We want to co-operate with you in your Store Front requirements and sincerely believe that by our specialized experience in this branch, we can be of some service to you.
The Ingham Shower Mixer

Saves Money for Hotels Equipped with Shower Baths

It saves money in the first place, by saving water.

In shower baths where the Ingham Mixer is not used, the bather almost always runs the water through the shower head for some time, constantly adjusting the valves until the temperature of water desired is secured.

This water waste is entirely eliminated by the Ingham Mixer, as the bather simply turns the handle to a given point in order to secure, almost instantly, the temperature of water desired.

With a number of rooms equipped with showers, this is a big saving in the course of a year.

Another point of great economy is this: The Ingham Mixer is the only mixer which will mix either hot water or steam with cold water and give positive safety to the bather against excessive water temperature. Consequently either hot water or steam may be piped direct to the Mixer, and to pipe steam through the building is much cheaper than to pipe hot water because of the comparatively small size of the steampipe and the consequent saving in material and installation.

Moreover, steam is an ever present commodity in Hotel buildings, while hot water must be especially provided for.

These are simply examples of the many valuable features of Ingham Shower Mixers.

The Ingham Mixers have proven successful in all kinds of installations and have been specified by many of the leading Architects of this country.

If you are planning shower baths for Hotels or any other kind of building, you will find it well worth while to write for a copy of our booklet “The Luxury of Shower Bathing.”

The Imperial Brass Mfg. Co.

441 So. Jefferson Street, CHICAGO
Painting New Wood Work Outside

In specifying the paint to be used architects will find the Dutch Boy Painter Specification of great help to them. This specification covers all kinds of painting and the architect can hand it to the painter with the full assurance that if it is carried out to the letter the result will be a painting job of beauty and durability. As a time and labor saver as well as a form of paint insurance it is invaluable.

The following is the way paint for new wood work outside is to be mixed according to the Dutch Boy Painter Specification:

"All white lead used shall be Dutch Boy Painter pure white lead mixed as follows:

<table>
<thead>
<tr>
<th>Priming Coat</th>
<th>Second Coat</th>
</tr>
</thead>
<tbody>
<tr>
<td>100 lbs. pure white lead</td>
<td>100 lbs. pure white lead</td>
</tr>
<tr>
<td>6 to 7 gallons pure raw linseed oil</td>
<td>3½ to 4½ gallons pure raw linseed oil</td>
</tr>
<tr>
<td>1 gallon pure turpentine</td>
<td>½ gallon pure turpentine</td>
</tr>
<tr>
<td>½ pints pure turpentine drier</td>
<td>1 pint pure turpentine drier</td>
</tr>
</tbody>
</table>

Third Coat

| 100 lbs. pure white lead | 3½ to 4½ gallons pure raw linseed oil |
| 1 pint pure turpentine | 1 pint pure turpentine drier |

"The painter may exercise his discretion in using the larger or smaller quantity of oil according to whether the wood is oil absorbing, as pine, poplar and basswood or less permeable, as yellow pine, spruce and hemlock. The painter may in rare cases find it advisable to increase the quantity of turpentine. Where this is done a corresponding decrease shall be made in the specified amount of linseed oil."

Free copies of the Dutch Boy Painter Specification will be sent to architects writing to our nearest branch.

Model K Vestibuled Pullman Touring Car, Price $2,100

Pullman

First Cost Is The Only Cost

We have letters from sixty-two PULLMAN owners in one city showing that they have run their cars 457,600 miles at practically no expense for repairs. One man had a bill of $1.25 for 5,000 miles, while two others said their expenses were very small. The other fifty-nine who drove their cars 447,558 miles spent practically nothing for repairs.

The PULLMAN car has the solid strength of construction that means freedom from repairs. It has the power, the speed to take you anywhere at a low consumption of gasoline and oil. Deep, well cushioned seats, roomy tonneau, ample spring equipment and correct suspension are features which distinguish the PULLMAN car. It is an exceptionally comfortable, powerful and reliable car, built with every consideration of touring requirements. Every part bears a perfect relation to every other part which makes the PULLMAN a perfectly proportioned car—a car in which the correct suspension of every part greatly reduces the wear on tires.

Prices $1,650 to $4,000; 30, 35 and 50 Horse Power.

PART II.
Country and Suburban

Just Off the Press!

ARCHITECTS engaged in, or even interested (as practically all architects are) in domestic work, will find much in this volume to claim their attention.

IT CONTAINS
200 illustrations of Country and Suburban Houses and surroundings—the latest and best work. Some are reprinted from THE AMERICAN ARCHITECT, while a number have never before been published.

Also articles on the following:
GARDEN and LANDSCAPE environment,
DECORATIVE FORMS. TREATMENT, in accordance with English traditions, of SMALL AMERICAN DWELLINGS. THE ARCHITECT of a Country Home, and his CLIENT. The latter is a clear and interesting monograph on professional relationship. It is worth reading.

140 Pages. Size, 9 inches x 12 inches. Cloth Binding.
PRICE, $5.00 postpaid.

ADDRESS BOOK DEPARTMENT
THE AMERICAN ARCHITECT
239 West Thirty-ninth Street, New York
It is important to bear in mind the fact that while unexcelled wood finishing effects are obtained with the Johnson products, finishes which without attention will maintain themselves for a remarkable period of time, no other wood finish is made which is so easily or so inexpensively re-applied.

If, through unusual wear, certain portions of the woodwork receive harder usage than the rest, the worn portion can be separately refinished with the utmost ease and in so satisfactory a manner that it will be impossible to detect where the worn place had been.

It is obviously satisfactory to the architect to have at his command the means of producing the desired artistic effect, with the added knowledge that it may be perpetuated. It also sets his client’s mind at ease to know that any attention that may be necessary later on can be simply and inexpensively given.

In fact, one of the gratifying things about the use of Johnson’s wood finishes is the way they harmonize the requirements of the architect with the interest of his client.

So much is made possible that is desirable from the client’s as well as the architect’s point of view, that there is no lack of harmony in this feature.

Or if differences should arise, Johnson’s wood finishes make possible such wide variety of treatment that the solution is easily found without sacrifice of the architect’s standards.

We suggest the following specifications for finishing soft woodwork:

For a Natural Finish apply a coat of Johnson’s Paste Wood Filler No. 10 and then two coats of Johnson’s Prepared Wax. For a higher gloss than a waxed finish apply one coat of Johnson’s Under-Lac over the filler and then one coat of Johnson’s Prepared Wax.

For Colored Effects apply a coat of Johnson’s Wood Dye, the desired shade, followed by two coats of Johnson’s Prepared Wax. For a higher gloss apply one coat of Johnson’s Under-Lac over the Dye and then one coat of Johnson’s Prepared Wax. In either of the above instances if a varnish finish is desired, apply one coat of varnish over the Paste Wood Filler, Dye or Under-Lac.
WATERPROOFINGS AND FINISHES FOR CONCRETE

Trus-Con Exterior Wall Finish
For damp-proofing and beautifying exterior brick stucco, and concrete surfaces. Replaces the cold and unattractive appearance of a masonry surface with an artistic, soft-toned effect that is thoroughly damp-proof. This product is especially prepared from selected raw materials and treatments to give a product that perfectly meets the requirements of a cement coating. Uniforms the appearance of the surface, overcoming fine cracks and discolorations. Furnished in a variety of colors.

Trus-Con Liquid Water-Proofing
A transparent product for damp-proofing all exterior porous masonry surfaces above grade line. Deposits in the pores of the surface a permanent water-repellent base that overcomes the positive absorbent nature of the surface without changing the physical appearance of the surface. Also prevents the formation of efflorescence or white salts on the outside of cement blocks, cut stone and brick.

TRUS-CON WATER-PROOFING
An integral waterproofing that successfully combines all the essentials of a perfect product. Is simple in its use, scientifically correct in its composition, and absolutely positive and reliable in results.

PROOFING PASTE
Requires no expensive dry mixing, but is homogeneously distributed in the gauging water, adding to the strength of the concrete and rendering it absolutely impenetrable to water.

Trus-Con Floor Enamel
Produces a tough, elastic, and durable surface on all concrete floors. Prevents the floor from dusting and gives a stain-proof and washable surface which is very resistant to wear. Especially adapted for finishing and providing dustless cement floors in factories, power plants, garages, asylums, hospitals, hotels and all buildings where concrete floors are employed.

Trus-Con Plaster Bond
A bituminous damp-proofing coating for the interior of exposed brick, stone or concrete walls. It is but partially absorbed into the masonry and by remaining flexible and elastic furnishes a strong and permanent bond for a scratch coat of plaster troweled directly on it. Provides a continuous membrane in the wall, insulating the interior plaster and decoration from the continuous penetration of moisture through the wall.

**HY-RIB PARTITIONS**

Hy-Rib actually costs less than lath and channels, besides saving all of the expense and labor of wiring lath to studs. Hy-Rib partitions occupy a minimum space, increase the available floor area and have exceptional strength and rigidity. Merely set up the Hy-Rib sheets and plaster both sides and the partition is complete. Hy-Rib does away with the use of studs.

**HY-RIB ROOFS and FLOORS**

Hy-Rib does away with centering in concrete roofs and floors. Hy-Rib sheets are laid over the support and concrete poured in from above. The plaster is applied directly to the under-side and no centering whatever is required. Used with any type of beam, steel, wood or reinforced concrete. Furnished either in straight sheets, or bent to the desired curve to meet all conditions of roof or floor construction. Write for Hy-Rib catalogue, containing complete details, specifications, applications, etc.

Trussed Concrete Steel Company

KAHN SYSTEM OFFICES IN PRINCIPAL CITIES
Kahn System Flat Ceiling Construction
Without Caps or Brackets at Columns

Here is unquestionably the finest design possible for factory construction. The ceiling is as flat as the floor; there is not a bracket or column cap to obstruct the light or to interfere with the shafting. The Trus-Con Slotted Inserts in the ceiling permit shafting and fixtures to be attached anywhere. The working space is greatly increased by making the ceilings as useful as the floors.

This is an absolute, daylight factory. The walls are practically all glass, the windows extend flush up to the ceiling and the full width between the narrow reinforced concrete pilasters. The United Steel Sash afford maximum fireproofness, permanency, daylighting and weatherproofness.

Designs with results such as these are only made possible by the combination of KAHN SYSTEM Products, KAHN SYSTEM experience and KAHN SYSTEM brains. You need all or part of these in any structure in which you are interested. We are at your service with the absolute assurance of maximum economy and efficiency. KAHN SYSTEM is the one organization with a complete line of products for every type of design.

KAHN TRUSSED BARS
With Rigidly Connected Shear Members for Beams, Girders, Floors and Arches

Other KAHN SYSTEM Building Products include: Rib Bars, supplied either straight or bent—Rib Metal, for slabs, walls, and conduits—Collapsible Spiral Hooping for columns—Hy-Rib for roofs, sidings, partitions, ceilings and furring—Rib Lath and Rib Studs for plaster and stucco—United Steel Sash for fireproof windows—Trus-Con Waterproofs and Finishes for concrete surfaces and Building Specialties.

Norwall Specifications Protect You

It is an added source of satisfaction to the architect to know that when he has specified a good article it cannot be rendered inoperative, and its good qualities cannot be nullified by inexperienced handling. Just such security is provided by the non-adjustability of the Norwall Siphon Air Valve. It is the most simple, dependable, and extremely sensitive air valve made. It closes instantly against the escape of steam or water; opens instantly to permit the escape of air, and, if flooded, drains instantly through the siphon.

Norwall Siphon Air Valves

leave the factory ready for work the minute they are put on the radiator, and operate on a simple, physical principle that automatically adapts itself to all conditions of radiator venting. The architect who specifies this valve does not entrust the success of his specifications to the accuracy or skill of any man, either when it is installed, or after it is in use. The valve is complete in itself. It requires no adjustment (there is no place where it can be adjusted), and it absolutely cannot be tampered with.

Complete descriptive circular mailed free on request.
