HELPING ARCHITECT AND CONTRACTOR FULFILL THEIR PLEDGES

When work must be completed on schedule, materials must be delivered on time and installations must be made quickly and efficiently. A manufacturer is selected as much for his capacity for meeting his promises as for his ability to produce a superior product. Thorp has built an enviable reputation for doing both. When the Sterrick Building of Memphis was under construction, 132 sets of elevator enclosures were installed without causing the slightest delay to the other trades on the job. The ability of Thorp to hold up its end on any project is recognized by architects and contractors—a record deservedly earned.

A Chinese Coolie can live on a few cents worth of rice a day. So Coolie work, such as it is, costs very little.

A Kewanee Smokeless Boiler, designed and built by American workmen according to American standards, burns the lowest priced coals (even screenings); and does it very thoroughly. It lives on cheap coal yet produces a maximum amount of heat.

This every day fuel saving, plus sturdy steel construction which adds many extra years to the life of a Kewanee; brings its actual cost down to a point that makes it a preferred investment.

If the fuel supply in your city is a problem, investigate the advantages of a Kewanee Smokeless before making a boiler selection.

Alcoa Aluminum expresses both the grace and the vigor of today's design.

Entrance doors, exemplifying the adaptability of Alcoa Aluminum. (See above)

The entire vault gate construction is fabricated out of Alcoa Aluminum. (See above)

In design and detail, the Howard Avenue Trust & Savings Bank Building, Chicago, expresses both grace and vigor.

Using Alcoa No. 43 Aluminum Alloy—the architect, Jens J. Jensen, has secured a pleasing combination of strength, durability and softness of tone—an effect in evidence in front door and vestibule grilles, lobby door frames and grilles, mail box, balcony and stair railing, vault grilles and screen.

Alcoa Aluminum is produced in cast, extruded and sheet form. In any form it is easily worked and finished. It is remarkably light—1/3 the weight of other metals commonly used—but it is strong and tough. It is eminently adaptable for exterior use as it resists corrosion—does not streak adjoining surfaces. And, with all its virtues, Alcoa Aluminum is low in cost—comparable to other metals which do not possess its specific advantages. These important advantages are putting Alcoa Aluminum at the architects’ disposal for spandrels, mullions, sills, door frames, grilles and for many other purposes.

Specifications

Alcoa No. 43 Aluminum Alloy is recommended for most architectural purposes. To meet the numerous demands for structural stability, Alcoa Aluminum alloys are available in various tensile strengths. In each of our offices we have competent representatives with a wealth of experience as to the decorative and structural uses of each of the special Alcoa Aluminum alloys. The services of these representatives are available to the designer and the specification writer. May we urge you to accept this cooperation without obligation in designing and writing specifications for buildings in which Alcoa Aluminum alloys will form a part? ALUMINUM COMPANY OF AMERICA; 2440 Oliver Building, Pittsburgh, Pennsylvania.
Another palatial New York hotel, the magnificent Hotel Pierre at Fifth Avenue and 61st Street, is added to the imposing list of notable structures in whose construction C B sections (Carnegie Beams) have been used. If you are interested in efficient and economical steel construction, investigate the merits of these modern sections.

Our engineers are at your service.
MODERNE—approved ornament from our Chicago Studios

Architects everywhere will be interested in the modern plaster ornaments being produced in our Chicago Studios. A portfolio of this new and brilliant ornament has just been prepared and is available for architects and designers. In this portfolio you will find not one type of ornament but a variety to suit the individual tastes of the designer. This book will prove a helpful tool in designing and creating interiors of good taste in the modern manner.

At this time we wish to also announce to architects the retention of Professor Rexford Newcomb of the University of Illinois, as professional advisor to our Chicago Studios. Mr. Newcomb is Professor of the History of Architecture at the University of Illinois and is the author of many well-known architectural books. He will act as our advisor and consultant to insure our clients approved designs of authenticity and beauty. This is just another step on the part of the Architectural Decorating Company to insure our clients the most complete service possible in the plaster ornament field.

NEW MODERN TOILET SEATS

.. FOR MODERN BUILDINGS.

Empire White Seamless Finish

Empire White Seamless Finish toilet seats are ideal for the modern hotel, apartment or office building. These new seats offer every advantage of the most expensive toilet seat at a price that enables the architect or owner to make a substantial saving on cost.

We believe that our Empire finish is unequalled by any other type of finish on the market today.

Empire Seamless Finish is made from pure Pyralin dissolved and then applied to the seat in liquid form. This produces a tough, glistening, sanitary finish, impervious to moisture. Sanitary, because there are no laps or joints to collect germ-laden dirt. Easy to keep clean because an occasional wipe with a damp cloth will keep them spotless and glistening.

Guaranteed for five years not to crack, chip, craze or peel.

Distributed by leading jobbers and plumbing supply houses.

Stasco Arch-Built Hard Rubber Seats

Because of the special arch construction these seats have exceptional strength and resiliency. Stasco Arch-Built seats are the only hard rubber seats on the market with a solid wall of hard rubber, 3/16" thick. They are built to withstand all of the hard knocks and abuses of public use. The lustre of these seats is permanent because the hard rubber itself is buffed to a high polish.

Heavy nickel or chromium-plated brass hinges are attached to brass insert anchors molded into solid rubber. These seats can also be supplied with hard rubber-covered hinges eliminating all exposed metal.

Sold by leading plumbing supply houses.

Fully guaranteed. Moderately priced. A special A.I.A. file folder on Stasco Seats will be mailed on request.

Decorative Value - Practical Value - Hand in Hand

The architect finds beauty and decorative value in Stedman Reinforced Rubber Tile. He finds in them a great adaptability to almost any architectural treatment. He has the choice of a wide variety of patterns and color combinations, through Stedman's standard and custom color types in tile and border forms.

Please note Announcement at right, of our new Architectural Custom Department.

The practical value of Stedman Tile is just as apparent. This reinforced, new live rubber flooring insures continuous satisfaction for the client by its silence, sanitary qualities, dustlessness, ease of maintenance, comfort, and prolonged resistance to wear. For over ten years, these signal advantages have all contributed to a steady impressive, and merited increase of prestige among architects and the public.

Send for architectural catalog, with full description, specifications and color-charts. Stedman RubberFlooringCompany, South Braintree, Massachusetts.

Stedman Reinforced* Rubber Tile

* REINFORCED: In the Stedman Process minute cotton filaments, uniting with the rubber under high pressure and heat, are responsible for its unusual resistance to wear and distortion, its lasting resilience and smooth impervious surface—characterized by color veining of remarkable fineness and beauty.

The Dining Room of the Chicago Club, Chicago, Granger & Bollenbacher, Architects. The floor is laid in an interesting pattern worked out in three contrasting Stedman tints—Red Gold Paisley, Black Gold and Grey Walnut Gold.

NEW
ARCHITECTURAL
CUSTOM DEPARTMENT

We announce the establishment of a new architectural Custom Department which is prepared to interpret in color, form and effect the thought of the creative architect. Flexibility of process, and an organization devoted to a single product make possible this revolutionary "to order" service. We invite you to discuss this new plan with any of our sales organizations throughout the country or direct contact with our executives.

ARCHITECTS' wives usually have a keen appreciation for the finer aspects of home furnishing. So we make this suggestion: Send for a few representative patterns of this rich fabric wall covering and go into a conference with Mrs. Architect. Chances are she will find them the most charming patterns and beautiful colorings she has ever seen in moderately priced wall coverings. She will be delighted with their refreshing individuality — and much of their charm she will attribute to their richness of fabric texture.

And Mrs. Architect will be quick to see the practical side of Wall-Tex. Those dust streaks from radiators — and children's finger marks above the stairway — are easily wiped away with a damp cloth. Colors, even the most subtle pastel shades, are non-fading. The beauty of this fabric wall covering lasts for years.

Wall-Tex is used in many of America's finest residences — and because of its long-run economy it is the ideal wall-covering for hotels, hospitals, public buildings of all kinds.

Write us today for interesting folder, "The Modern Trend in Wall Coverings" and samples of charming new patterns styled by Virginia Hamill.

"GIVE us more rental space," building owners demand. So the architect fits heating units inside the walls of the building.

In modern structures these radiator recesses are insulated with Armstrong's Corkboard. Walls must be kept thin or there is no saving in space. But the thinner the walls, the more heat is lost through them—unless its passage is stopped. Heat must be thrown into the room to be effective—not conducted outdoors by brick or steel.

The insulating efficiency of Armstrong's Corkboard assures permanent service. Its resistance to moisture makes it last as long as the building itself. Structurally strong, it is easily worked for this or any other type of installation.

Many other uses

There are many places where Armstrong's Corkboard is serving building needs. For years it has insulated roofs of all kinds. Especially in factories, where "ceiling sweat" threatens damage to materials and machinery corkboard on the roof checks this danger. It makes it possible to maintain low temperatures in cold storage plants and quick-freezing rooms.

Because of its unique composition, cork is useful for many other purposes. Air-borne sounds can be muffled with cork. So Armstrong's Corkoustic, the cork acoustical material which lends itself to decoration, lines many school and theater auditoriums. Cork is resilient, too. Armstrong's Cork Machinery Isolation absorbs vibration and noise caused by all types of machinery. In the Koppers Building, for instance, vibration has been banished from air compressors and ventilating pumps by means of cork.

Every day sees some new use for cork.

It may be just the material you are looking for now to do some special work, solve some puzzling situation. Armstrong engineers are always at your service for consultation. Armstrong Cork & Insulation Company, 936 Concord Street, Lancaster, Pennsylvania.

Concrete columns and floors at the newly remodeled Saddle & Sirloin Club, Chicago; high-early-strength concrete made with Universal Atlas methods and cement used in the construction. Parrot Construction Co., Chicago, contractor.

Saving time and materials with Universal Atlas high-early-strength concrete

• • • The high-early-strength concrete used in remodeling the Saddle and Sirloin Club, Chicago, permitted the removal of alternate rows of shores five days after the concrete was placed. This is much sooner than is practicable with concrete made by ordinary methods. Not only was time saved but equipment also. Shores that were removed at the five-day periods were immediately available for use on other sections of the work. This permitted the contractor to cut down on the equipment required for the job.

• • • High-early-strength concrete made with Universal Atlas methods and cement (the same Universal Atlas standard portland cement as furnished for regular work) is stronger, more durable and more watertight than ordinary concrete. Send for booklet containing these methods for saving time and securing improved concrete.

For Better Buildings

Steel Sheets are serving an important and ever-growing list of uses. For roofing and siding in industrial construction; for gutters, spouting, flashings, metal lath, and similar uses in well-built structures; for ventilating and air-conditioning systems in great skyscrapers; for molding, sash, trim and doors in fireproof buildings; and for metal furniture, cabinets, and equipment for both office and home. Also in growing demand for airfield work, culverts, and underground uses.

WHILE the exploits of George Washington as a truthful boy, great statesman and valiant soldier are emphasized on the anniversary of his birth, the contribution of his family to American domestic architecture is given scant attention. Yet today Mt. Vernon, a harmonious unit, restful and dignified, well-built, stands pre-eminently a good house. In enlarging the original house built by his elder brother, Washington said: "Nothing but durable materials shall be used in this house"; to his good taste we are indebted for a living example of a house designed with refinement and restraint. Of the multitudes who have visited and who will visit this historic shrine there must be few who have not been impressed by its beauty or have failed to realize that Mt. Vernon was not only the country seat of the "father of our country" but that it is also the symbol of what a good house should be.

A GOOD house takes its place gracefully in its environment. It fits its site. It meets the specific requirements of those who live in it. If it meets these needs well, it must of necessity express something of the personality and individuality of its owners. It is a house built of honest materials and honest workmanship. True to itself it typifies the spirit of a home-loving people.

THE home is said to be the backbone of the nation. Good houses cannot fail to cement the qualities that make good homes, better citizens, and a more stable and upright nation. In giving American families houses that are a "source of profound influence and inspiration in the lives of all citizens," architects are making a substantial contribution to the well-being of the United States.
Is the GOVERNMENT TREATING ARCHITECTS FAIRLY?

To what extent should government enter into business? In maintaining a Supervising Architect's office which is actually a "Designing" architect's office, hasn't the United States Government entered into competition with all architects of this country? A "Supervising" architect's office has its place and is an essential government office. The extent to which the government should enter into the practice of architecture has been a moot question for years. The present unemployment emergency should demonstrate the fallacy of the precedent that has been set up and the desirability of employing private architects to design Government buildings.

If the Government is justified in conducting an architectural office in competition with its private citizens, who have invested capital in the maintaining of offices throughout the country, it can with equal propriety and justice enter into any other business. So far the Government has not entered into the making of automobiles, fabricating of steel, production of cement, nor the operation of public utilities.

Business is not the function of government. A government is set up to administer the affairs of state; to regulate the affairs of the nation for the good of the whole. The question was summed up by Abraham Lincoln, "A Government of the people, by the people, and for the people..."

However, the question is not wholly one of whether the Government should or should not usurp the functions of private architects, but whether or not in the last analysis the nation obtains the best designed buildings for its money in which to conduct the affairs of government. Is it not reasonable to assume that a proper selection of private architects would result in better conceived buildings that would better meet locations and traditions than one designed in a remote central office?

What the office of the Supervising Architect thinks about the employment of outside architects is graphically told in Government reports of the discussion which resulted when Congress was asked for an appropriation to cover 1932 activities. This discussion took place on November 24, 1930, before the Subcommittee of House Committee on Appropriations in charge of the Treasury Appropriation Bill for 1932. Included among those who took part in the discussion were Ferry K. Heath, Secretary in Charge of Public Buildings; James A. Wetmore, Acting Supervising Architect; L. C. Martin, assistant to Assistant Secretary of the Treasury in charge of public buildings, members of the subcommittee, and others.

William R. Wood, chairman of the subcommittee, wanted to know whether the employment of outside architects would not expedite the public buildings program. He said, "If you will take my own town, for instance, where they will build a new court-house, we have some of the best architects in the country. They know the kind of building that is suitable for that section of the country and they could draw plans for the..."
A BILL

To enable the Secretary of the Treasury to expedite Federal building programs.

The Government should employ private architects and GET SOME WORK STARTED

By Benjamin F. Bells, A.I.A.

EMPLOYMENT of private architects as a means of expediting the government's program of public construction work should be given favorable consideration by Congress and the Treasury Department. To do so would be in harmony with the government's asserted intention to have underway within the next few months what is reported to be a billion dollars worth of construction work as a means of relieving unemployment.

In the past, the Treasury Department has had but limited power to engage outside architects. But on July 3, 1930, an act was passed which gives this department authority to contract with private architects for complete services. The Treasury Department has made the statement that the question of employing private archi-

building which would be perfectly proper. Do you not think that you could expedite this business a whole lot by using local architects at, perhaps, a cheaper figure than by doing it here, handling this great mass of business in your establishment?" To this, Mr. Heath, Secretary in Charge of Public Buildings, replied, "You could not do it more cheaply."

James A. Wetmore, Acting Supervising Architect, at once amplified this statement saying, "You could not do it more cheaply nor faster. In every case where we have matched our office against outside architects we have beaten them in time and cost."

Where speed is a requirement probably the average architect could compete successfully. Time spent in the preparation of sketches and working drawings is an important element when work must be gotten underway quickly, but the proper

(Continued on page 100)
YOU CAN'T SATISFY THE MOTOR CAR

"Horse and Buggy"

SHOULD we or should we not solve our present day architectural problems in terms of modern materials, modern construction and in consonance with the modern point of view without too much slavish regard for tradition? Is it not true that every great age of civilization has produced a contemporary architecture? In asking this I am thinking of the great temples in Egypt, the Parthenon in Greece, Notre Dame in France, the architecture of the Italian Renaissance and subsequent periods in which the architects planned and designed their buildings with materials which were at hand, solving the problems of the day in which they lived.

Let us take a cross section through the present day movement in architecture, and pause to consider the manner in which we accomplish certain things and our reasons for so doing. This is distinctly a machine age. Today we are able to turn out thousands of motor cars in twenty-four hours, whereas only thirty or forty years ago perhaps one or two beautiful carriages would have been manufactured in the same time. In some instances, during the dark and middle ages, centuries were required to complete certain monuments in Europe, whereas now a plot empty today may become in less than a year's time the resting place of a monument perhaps a thousand feet high.

What does all this mean? It means that we have been educated to see things grow fast, to think fast, and to live fast. We drive our motor cars today at an average speed of fifty miles an hour without batting an eyelash, whereas the past generation were content to drive in their carriages at the rate of six or eight miles an hour.

As this increase of speed marks the modern age, so does the multiplication of building materials and equipment. Compared to Colonial times the modern period is rich indeed in this respect, yet it should be noted that while we have gained many new materials and methods we have lost certain others that the early builders enjoyed. Chief of these is wood. In Colonial days the architects were limited in their structural work largely to the use of wood and stone and brick. Steel was an unknown quantity, and this means that their spans and lintels had limits which seem restricted indeed to us. A wooden truss having a span of sixty feet would have been considered a remarkable achievement. Compare this with the Hudson River suspension bridge, which is thirty-five hundred feet from pier to pier. I know of an engineer who is developing a clear span for airplane hangars of half a mile, worked out on the principle of the suspension bridge. If, however, we followed tradition in building our skyscrapers as we do in building our country houses, we would be greatly limited in solving our present day urban problem.

We have been ambitious in the solution of our commercial architectural problems, while we have progressed very little in

THE SAME GENIUS that has created the airplane, the metal chair, and the motor car, would have conceived buildings in the light of modern thought, materials and needs... if there had never been a building.

By FRANCIS KEALLY, A. I. A.

Sketches by the author

THE AMERICAN ARCHITECT
A 500-YEAR OLD BUILDING used as a model for a modern building is like offering the motor car owner a horse and buggy for a fast journey.

the use of modern materials and practices in our domestic architecture. Should we not plan a house, for example, to conform to our new mode of living and give the owner a plan that meets his modern needs? To do this should we not orient ourselves architecturally to face the rising sun? If we hold to tradition in such problems, we are likely to start at the roof and build down, thus limiting the floor plan to certain dispositions which may not accord with the requirements of our modern ways of living. Should not every architectural problem be solved by beginning at the ground and permitting the building to take such interior and exterior expression as the plan dictates?

To illustrate the effect of the difference between our modern life and older days, note the relation of dress to domestic architecture. Costume design has always followed architectural design, and has often been in harmony with it. Consider the beautiful Venetian costumes that were contemporary with ornate palaces, and the elaborate Elizabethan costumes for which the Tudor manor architecture furnished a background.

Today, however, the keynote of our clothes is comfort and simplicity, conforming to our needs in a fast-moving, practical age. Yet we go on building houses which copy Elizabethan manors, French chateaux and Italian villas. The incongruity is obvious. While interest in architecture and furniture of early periods is an admirable thing in itself, it may lead to abuses. For example, in certain houses we may find straight-backed chairs of the Italian and Spanish Renaissance provided for general use; these chairs are uncomfortable; they always were uncomfortable. But they were designed to be used transiently; a person was not supposed to attempt to relax for hours in them and find comfort. Other chairs, one may hope, were provided for that purpose. Should not the interior of our houses reflect, then, the comfort which we all like and the lack of ceremony which is characteristic of our mode of living today?

What is new in architecture? Are we approaching or have we arrived at a new architectural era? If we have arrived, what has been the cause of the change in architectural expression? (Continued on page 72)
The Experience of the Washington State Chapter, A. I. A. By JOSHUA H. VOGEL
Chairman, Committee on Public Information

These benefits were: 1, that the newspaper would give architects proper credit when buildings were illustrated; 2, that new clients would be developed through paid advertisements; 3, the advertisements would be read by important business men.

The committee came to the conclusion that the greatest benefits result from properly prepared stories, written by architects, which are effective in the way of general education of the public. These stories are read.

If the money is to be spent for printed matter, the committee believes that direct mail pamphlets should receive first consideration.

The Chapter, like other architectural associations, believes that something should be done to influence the public in favor of the use of architectural services. Plans were accordingly made in 1928 and an agreement was entered into with the Seattle-Post Intelligencer to the effect that the Chapter would purchase advertising space for a definite term, and that the paper would turn
WASTED OUR MONEY'

its weekly small house plans space over to the Chapter and otherwise endeavor to give more publicity to matters in which the Chapter was interested. Similar informal arrangements were made with other Seattle newspapers, and they were supplied with news articles which were also made available for publication in other cities in the State.

An advertising fund was raised by sending personal letters to each Chapter member asking for a weekly subscription pledge. These pledges constituted contracts, and when a sufficient number were received to cover six months advertising in a newspaper, these contracts were turned over to the newspaper for collection.

The advertising copy was prepared in cooperation with the newspaper. News articles were published, generally on the building page of the newspapers. The plans used on the building page were obtained from the Architects' Small House Service Bureau.

In addition to this, contacts were made with material manufacturers, and through social events, cooperative dinners, exhibits, etc.

For instance, the Chapter sponsored an exhibit of photographs of Brick Architecture made available by the Pacific Northwest Brick and Tile Association. Thousands of people visited this exhibit in 1928, which was held in the auditorium of Seattle's leading department store and in another large department store in Tacoma.

The Chapter supported the introduction to the public of the Metropolitan Builder's Exhibit in Seattle as a permanent exhibit of building materials. The local architects have contributed to an architectural exhibit which is displayed throughout the building material space, where prospective builders daily pass in and out.

The Chapter adopted a design for a sign to be

THE editors of The American Architect would like to receive a story written by an architect analysing this campaign of the Washington State chapter. The story should tell:

1. what was wrong with the advertising.
2. what should have been done in order to make the campaign a success.

Seventy-five dollars will be paid for the best story submitted. It should be not more than 1,500 words and be sent to the editors by February 28.

WHY WAS THE CAMPAIGN A FAILURE?

(Continued on page 118)
ONLY ONE PLACE TO WORSHIP is left in this forgotten old town, the Cathedral of Senlis, which boasts one of the few completed Romanesque towers found in the North of France.
SENLIS... the town that PARIS FORGOT

By Samuel Chamberlain

Dry-points by the author

W
gen the incessant clatter of taxi horns and screeching brakes begins to break down his resistance and shatter his nerves, the Parisian, like every other city dweller, begins to cast about for a quiet corner in the country. Over a period of some years the suburbs of Paris have been developing. Green slopes have been transformed into "lotissements" of pink and mustard villas, each with its pale green set of ceramic gee-gaws. Glaring red roofs now dominate the suburban scene. Where the "bourgeoisie" has its villas, the humbler Frenchman has his ready-made two-room "pavillon" (and what a misleading word that is), built of the flimsiest materials that will hold together, and bought on the installment plan. By now the noise-weary Parisian has gotten to the country, but by so doing he has not strewn much beauty in his path.

As a consequence one has to scour the countryside to find an unspoiled town close to Paris, one that is neither "banlieue" nor too populous. But such a town does exist, and its name is Senlis, twenty-five miles due north of Paris.

Two things account for its preservation: it is not on a main railway line, and, being an ancient, close-packed fortified town, it provides no haven for the intruding villa. Senlis supplies an old world tranquility within an hour of the screeching bustle of the Gare du Nord, and fortunate is the Parisian business man who can make this calm old town his home. For years the real estate agencies of Senlis have not been burdened by the listing of any houses for sale.

At present Senlis has a population of about six thousand, but in its prime it boasted fifty. Komroff's celebrated novel "Coronet" gives a graphic picture of its former grandeur. But in this hectic twentieth century, Senlis seems a bit subdued and overshadowed, and quite content to enjoy a ruddy old age.

One of the most striking reminders of its former magnitude is the number of ... (Continued on page 110)

CHARLIE CHAPLIN cavorts on a silver screen in the apse of a fine old towerless church, with the drone of murmured prayers and medieval chants replaced by the snappy blare of tingling jazz and horseplay humor.
FROST?...No, Decay!

By D. W. KESSLER
Civil Engineer
United States Bureau of Standards

EXPERIENCE has shown that permanence is a relative term and that the most carefully executed structures suffer deterioration from the ravages of time. In this country we have not fully realized the extent of such effects on stone structures, nor should we for many years to come. However, it is portentous to note that some of our older buildings have undergone repairs where decay has weakened or removed conspicuous parts of the stonework. Close inspection of most buildings which are past the half century mark in age will usually reveal many defects not apparent to the casual observer.

Early obsolescence of many buildings caused by rapid growth of the nation and the march of progress removes them from considerations of permanence, but we have structures which should stand for centuries. If this nation has not yet rivaled the Old World in architectural achievements, there can be little doubt that it will in the future, and in building for centuries there arises the all-important question of durable materials. How can one select materials for centuries of service in a rigorous climate, where actual demonstrations of our materials for even one century are few? Estimates...
of durability based on examination of stone outcrops have been tried, but due to different conditions arising in masonry walls from those in the natural ledge that method is open to question. Laboratory tests simulating the actual conditions of exposure may afford valuable information but this depends much on how well actual conditions are duplicated in the tests. Questions of durability have not received as much attention in the past as they should and much research is needed to establish a scientific basis for such determination.

Weathering processes are probably more complicated than is generally realized. Many writers on the subject of masonry decay have been inclined to place most of the blame on frost action. While it can be readily demonstrated that frost can injure or totally disintegrate many masonry materials, it can also be demonstrated by tests in the laboratory that some materials which are not very durable have an extremely high resistance to frost action.

Dense materials like granite, marble and slate have shown very great resistance to frost action under laboratory test conditions which are probably far more severe than the conditions of service exposure. It is a well-known fact that slate has a low degree of coherence along the cleavage and hence if frost produced appreciable internal stresses in this material, it would split into thin sheets. Since this does not occur we must conclude that such dense materials are not stressed appreciably by frost.

Other weathering causes may render a sound material unsound and susceptible to frost attack. A group of materials between the very dense and very porous appear to be susceptible to frost action, while the very porous may or may not be very resistant to frost action, depending on the size of the pores. Large pore materials where free to drain do not hold water in the pores for an appreciable length of time, hence they are seldom frozen in a soaked condition. Materials having a large percentage of fine pores do not dry rapidly and are often frozen in a soaked condition, which is apt to produce disintegration.

an answer to the
client's question

"HOW MUCH
will it cost?"

By TIRRELL J. FERRENZ, A. I. A.
of Frank D. Chase, Inc., architects and engineers

"Our firm's work extends from coast to coast. In the past four years, there has been no case that I can recall wherein final bids have materially exceeded our judgment on costs."

The loss of many desirable commissions and the downfall of many otherwise capable architects may be directly attributed to a lack of familiarity with costs. "How much will the building cost?" That is the question which the client invariably asks—frequently before he has crystallized in his own mind exactly what sort of a building he wants. The architect is expected to answer and woe unto him if his preliminary shot goes wide of the target. Available reports indicate a high percentage of misses. Blind estimating is all too prevalent. How can this unhappy situation be corrected?

The simplest policy is to avoid a commitment until a definite program has been established, but it is rarely possible to sidestep an answer without creating an element of doubt in the client's mind. A reasonable and fairly accurate idea of what an undertaking may be expected to cost is usually essential to a decision as to whether it is worth while proceeding with. The client is therefore justified to a certain extent in demanding a preliminary estimate. But whether justified or not, the demand is invariably made.

Poorly considered estimates and guesses based on snap judgment are always saturated with dynamite. If they are inaccurate, a client may be led into an expensive program beyond his ability or desire to finance. Sometimes this unpleasant situation is recognized before final commitments are made: the project is then either abandoned or revamped. Clipping the wings of a soaring ideal to bring it back to harsh realities is always an agonizing process. The result in either case is most likely to be a loss of confidence by the client and a loss in monetary return by the architect. The profession as a whole suffers in consequence.

It has been often said that first impressions are the most lasting. This is particularly true with respect to estimates. A preliminary figure will frequently be retained in a client's mind until the project has been completed even though the subsequent development may be unrecognizable when compared to the original plan.

It is thus evident that ability to judge quickly and accurately the cost of any proposed structure is a priceless boon to any architect. Like (Continued on page 96)
TO MAKE GOOD PRELIMINARY ESTIMATES

1. RECORD THE COST of every project going through the office, breaking costs down into major items. Supplement this first hand information with data from other architects, contractors, appraisers, estimators, etc.

2. KEEP SQUARE FOOT AND CUBIC FOOT COSTS on every job which goes through the office.

3. CLASSIFY COST DATA according to materials, such as marble, heating, structural steel, etc.

FOR MORE ACCURATE ESTIMATES prepare a detailed estimate based on approximations of quantities involved in the building as indicated by preliminary plans.

FOR FEBRUARY 1931
FIFTH AVENUE recently witnessed the opening of one of its finest stores selling women's shoes, the production of a firm of New York interior decorators and an American architect interpreting the conceptions of Louis Sue, one of France's prominent architects of the modern school. Through the cooperation of these artists and craftsmen they succeeded in solving a novel and unusual merchandising problem.

Expensive wearing apparel and its merchandising are an old story to New Yorkers. But successfully to operate a retail store and sell women's shoes for as much as fifty dollars a pair, in these days of trade recession and falling prices, calls for courage, ingenuity and imagination. And the problems were solved so well that the store, opened early in September, is already a proven success.

When F. Pinet, founded in Paris in 1807, selected as a site for their first American store a unit having a frontage of sixteen feet in the building on Fifth Avenue between Fifty-third and Fifty-fourth streets, a problem arose of designing a store front hedged about by many limitations. Each of the store units in this block is bounded on the sides and top by an ornamental bronze moulding, which is an integral part of the architectural treatment of the whole facade. This space had to be utilized to provide a show window and a broad inviting entrance to a corridor, fifty feet in length, leading from the sidewalk to the large salon where the fitting and sale of shoes takes place.

It is patent, to anybody who gives the matter thought, that the large retail show window is a poor place to display for sale a few pairs of dainty shoes literally worth their weight in gold. And yet to draw enough customers within the doors of the shop to support the business requires an impressive display of store front and merchandise.

The solution of these problems may be seen in the photograph of the store front. The vitrine, or show case, isolated in a broad expanse of Levanto marble, and the plain semicircular arch, lead the fascinated passer-by to investigate the long corridor, whose walls are executed in the same marble, and repeat the vitrines at regular
The only small show window on the block

The small size of this show window contrasts so well with the larger windows on the rest of the block that more people seem to stop and look at this window than at any of the others. Display cases similar in design are placed along the fifty-foot corridor leading to the store itself.

For February 1931
Buckles and Shoes are displayed in a few strategically placed show cases, the merchandise for sale being kept in a stock room which is entered through doors panelled in various decorative woods intervals, leading the eye to the main display fixture placed axially in respect to the corridor at the far end of the rose, silver, grey and green salon. The effect of this arrangement is that the shopper starting at the street vitrine is lured, while still out of doors, by a logical and seductive series of delightful impressions into the store itself.

Within the store the customer discovers a richly appointed and restful place to make herself comfortable and a heavily upholstered chair of shape and coloring to suit her mood and costume. No shoe boxes are visible. A few show cases, each containing three or four pairs of exquisite footwear, are placed at strategic points in the architectural scheme. The main part of the salon is arranged symmetrically about the axis of the corridor, false columns having been introduced to supply a formal arrangement. To the right of the main section is a raised dais reached by two steps running the full length of the salon, where two vitrines, one in each window, comfortable chairs, smoking stands, French telephones and other comforts invite the customer to be at her ease.

Indirect lighting from lamps concealed behind glass panels in the cornice throws a soft glow on the cove above, and diffuses a mellow light which mingles with the natural daylight from large curtained windows.

Louis Sue, well known modern French designer, executed rough sketches in pencil and color from dimensions supplied by the owners. These suggestions were turned over to the New York decorating firm, A. Kimbel and Son, Inc., who, working with a measured plan supplied by Henry C. Pelton, architect, interpreted the scheme, making such structural and color changes as were necessitated by the specific details of the problem. Mr. Octave Tierce, of A. Kimbel and Son, Inc., designed all the furniture and had it made in their own workrooms, supplied the design for the carpet, which was woven especially for the job, as was the silk damask in silver and soft rose tones to complete the color scheme.

Working drawings for the structural changes and the exterior were made by Henry C. Pelton, architect, and executed by Marc Eidlitz and Son, Inc.

Vitrines, torcheres, and the structural parts of the salesmen's stools are made of German silver, chromium...
are seen in this shoe store

BEHIND THE CURTAINS are show cases to be seen from Fifty-fourth Street which adjoins this side of the store

FROM THE INSIDE looking towards Fifth Avenue. Indirect lighting, levanto marble and heavy carpets induce a feeling of respect towards the fashion of the merchandise displayed for sale.

plated with a satin finish. Oriental walnut is used throughout for the chairs and sofas.

A variety of fabrics has been used on the furniture, augmenting and emphasizing the rose, silver and pale gold tones of the wall coverings. An occasional sharp accent of green relieves the scheme of any monotony, as do the furniture fabrics which are of varying designs and textures, practically all of them having been especially designed and woven for this particular job.

The Pinet policy includes the principle that a customer paying from twenty to fifty dollars for a pair of shoes is entitled to the satisfaction of knowing she is buying an article which few other women will be seen wearing. Consequently each style is limited to an edition of thirty-six pairs, each pair numbered like a fine
NECKLACES, suitable for wear with the shoes in the case in which they are displayed, help lend a suitably luxurious air.

The merchandise is kept out of sight except for a few samples discreetly displayed in the show cases. Ample space is provided in another room for the hidden stock.

Liaison between the French owners and the French designer on the one hand, and the American architect, decorator and building contractor on the other, was maintained entirely by letter and by the store manager. The designing of the furniture, fabrics and fixtures and the revision of the original plans was entrusted to the decorators. In spite of the fact that the French and American architects never met during the entire period, nor in fact have ever met in person, the venture was carried through to a successful conclusion.

This unusual experiment, whereby leading talent in two widely separated countries was brought together for the amiable prosecution of the work, opens up a truly international field for the operation of the talents of architects and decorators whose work seems to be well liked by an owner, regardless of how many miles may separate the designer from the locality of the job. It presages that day when talent shall be truly international, when the American architect shall design the Parisian skyscraper and the Parisian designer lend his playful and chic fancy to the New Yorker.

MIRROR framed in oriental walnut of crossed veneers with satin-finish chromium plate supports, a combination of materials extensively used for the furniture scattered throughout the store. Furniture designed and executed by A. Kimbel & Son, Inc. Wall covering is an especially woven brocaded damask in tones of grey and rose; it gives a lustrous glowing background that at no time is overemphasized.

touch subordinate the price thought

FOR FEBRUARY 1931
Out of 46 Buildings,
Investors have fewer

So full of provocative ideas was the address made by Mr. Simon at the dinner given to Secretary Lamont by the Board of Governors of the Philadelphia Building Congress, December 9, 1930, that it is printed here.

Motorizing through the woods of Maine several years ago I was uncertain as to the proper road to reach my destination, and accosting a stranger asked him a number of questions regarding the roads thereabouts and the names of the nearest villages. To all my questions his answer was "I don't know"; finally, in desperation, I asked him what did he know. After a pause he said, "Well, I know I'm not lost."

It would seem to me the Building Industry finds itself in the position that both the stranger and I occupied at that time. He knew where he was, and I knew where I wanted to go.

I may well start with the question: How can we best take steps to ascertain where we are going and thereby aim to cure certain ills which today afflict the building industry?

This question is being asked throughout the world today, as is evidenced by the report of the proceedings of the International Congress of Architects, held at Budapest, in September of this year. I quote from their proceedings: "Considering the economic conditions of today, as well as the radical changes in production since the World War, the Congress deems it necessary that a more complete instruction should be given in finance, economics and the working of organizations than formerly. Without detriment to the Architects' artistic conceptions, the compositions should be studied with an idea of their actual execution, especially from an economic point of view."

Let us consider what has happened during the life of the present generation. It has been relatively only a few years ago since Philadelphia's City Hall tower was the highest in America, dwarfed only, in the world at large, by the Eiffel Tower in Paris. Today William Penn's statue is overshadowed on all sides by giant structures, some of which house enough workers to populate a fair sized city.

The economic structure of buildings has changed no less than the physical during the last fifty years. Formerly, the typical building enterprise concerned one man or a small group; if a manufacturer or a merchant needed a new factory or store he paid for it out of the profits of his business. Today, almost every building of importance is owned by a great body of investors. A mistake in building economics seventy-five years ago affected only one enterprise; a mistake in building today reaches far beyond the building into the pockets of thousands of direct investors.

For example, had Harper and Brothers in 1854 sunk more capital in the building they then erected in Franklin Square, New York, than their publishing business could afford, their consequent losses would have affected only Harper and Brothers. When, however, an Empire State Building is erected in 1930, representing an investment of approximately $50,000,000, its financial success directly involves the fortunes of thousands of people, many of whom may never even see the building.

The American Architect
THE SOLUTION

RISK TO CAPITAL can be reduced by economic research and education, which will stimulate building.

FINANCIAL RESPONSIBILITY of owner, contractor and sub-contractors should be known by all parties.

INFORMATION POOLED by architects, material men, bankers, contractors and sub-contractors, will eliminate irresponsible persons.

ONE SOURCE should supply the architect with accurate and comprehensive information about all factors which he must consider.

A CENTRAL BUREAU or building congress should coordinate the various organizations in the building industry in each city for the mutual welfare of all.

By EDWARD P. SIMON, A.I.A.

of Simon and Simon, Architects, and Vice-President Philadelphia Building Congress

An uneconomic building in 1930 is obviously much more serious to the public than was the same type of building in 1850. The shift in ownership and financing has effected a complete dependence of every branch of the building industry upon every other branch. I do not mean the obvious fact that the work of architects, engineers and contractors is all interrelated; but in the most inclusive sense, the fortunes of realtors, bankers, designers, builders and investors hinge upon the success of every sizable building project.

In the long run, realtors cannot flourish at the expense of bankers, nor operators at the expense of contractors. Every unsound enterprise means direct loss, not only to the owners and builders of that particular building, but to every sound project in the neighborhood as well, because the soundly financed projects must meet the competition of lowered rents in the foreclosed projects.

It's like the rain
"That falls alike
Upon the just and unjust fellow;
But most upon the just, because
The unjust has the just's umbrella."

Now no investor or contractor courts loss. Losses in building occur because owners ignore or do not understand all the elements in modern building economics.

A wrong estimate spells disaster, and that wrong estimates are as common as right ones is attested by the general state of the building industry throughout the country. The Associated General Contractors of America vouch for the statement that there have been fifty per cent of failures in cycles of five year periods in the building industry.

Many millions have been invested in building improvements and developments. Without the benefit of full and completed surveys and analysis there is growth, yet there are growing pains as the price of this progress. Some of these improvements are more apparent than real. Today vacancy is in many quarters at an unprecedented level, some buildings have not fulfilled expectations, some are very definite disappointments. Outstanding successes are all too few. (Continued on page 88)
PARK SYSTEM operates at a PROFIT

an interview by William H. Gregory
with
JAY DOWNER
Chief Engineer
Westchester County Park Commission
New York

U N I Q U E in diversity of its physical characteristics, motor parkways and recreational facilities, the Westchester County Park System is also notable for the fact that it is paying for itself through the medium of enhanced values of taxable property combined with direct income from golf courses, beaches, pools, rentals, concessions and amusement park features. It is, moreover, of particular interest to the architectural profession because of the high standards of design in the treatment of its structures and the influence particularly of the parkways on an adjacent building development. Bridges, bath houses and other park structures are designed primarily for their utilitarian purposes but they are artistically adjusted to their surroundings.

Westchester County embraces a 450 square mile expanse of picturesque territory lying immediately north of New York City. Through this area are distributed public park reservations aggregating more than 17,000 acres of land and an interconnecting system of 160 miles of parkway routes.

The park system has unquestionably exerted an important influence on architectural standards in the development of Westchester County as a whole. Distinction of design has opened up broader fields for architectural expression and the community has been enriched both in material prosperity and artistic standards.

The influence of the parkways in establishing higher standards, according to Jay Downer, Chief Engineer, has been due to economic factors rather than ordinances or other regulatory measures. Lands along the parkways have become so valuable for high class residential uses that cheap or unsightly building developments would not bring adequate returns. This may be regarded as an important fundamental factor. It is in turn reinforced by zoning regulations which are not controlled by the Park Commission but formulated and enforced by the separate forty-six cities, towns and villages in the county.

The Park Commission has, however, secured the cooperation of local municipalities along the parkways in framing their zoning ordinances. In general these ordinances limit apartment house districts adjoining the reservations or within sight of the parkways to the garden type of apartment buildings. The Commission cooperates with contractors and architects who contemplate building in these areas. The services, in an advisory capacity, of Major Gilmore D. Clarke, landscape architect of the Commission, are available to prospective builders who submit plans for approval or criticism. This system has produced satisfactory results.

The matter of improved architecture and high stand-

THE AMERICAN ARCHITECT
GASOLINE STATIONS afford a fruitful source of revenue and utility sides are kept away from the main road, as in the site plan of the station on the Sawmill River Parkway shown above. Designed by C. F. Lloyd and Perry Duncan of the office of the county's landscape architect, Gilmore D. Clarke.

MANY TYPES of architecture are used for gasoline stations, this colonial type on the Hutchinson River Parkway being in strong contrast to the English type shown above. Penrose V. Stout was consulting architect.

ards of building development along these parkways is really an aspect of the underlying economics of road building that has only recently been given the attention it deserves. For this reason the Westchester type of parkway has attracted world-wide attention. Officials and engineers from nearly all European countries, from China, Japan, Australia and New Zealand have journeyed to Westchester County to study these parkways.

Heretofore arterial express highways have been considered almost entirely from the standpoint of traffic movement. The new angle of economics involved is the effect of the road on its adjacent lands. It has now been demonstrated that enormous mileages directly abutting on trunk highways built in recent years cannot be absorbed by industrial or business uses. Lands so situated are, on the other hand, undesirable for residential use by reason of close proximity to heavy motor traffic.

The Westchester County parkways are planned on the principles of securing both efficiency in the movement of traffic and the most profitable utilization of adjoining lands. This result is attained by acquiring a right-of-way of sufficient width to afford strips of land for park treatment on both sides of the paved roadway. There are no privately owned lands directly abutting the pavement.
Promiscuous access to the parkway drive from intersecting streets is thereby excluded. Grade crossings are eliminated by bridges carrying main intersecting thoroughfares over or under the parkways.

As there are no privately owned dwellings or buildings adjoining the pavement, there are no roadside parking problems. The result is that the parkways afford the nearest approach to the uninterrupted flow of express traffic that has yet been devised.

The desirable minimum width for parkway reservations is 250 feet. The paved roadways are laid to a width of 40 feet with provision for future widening to 60 feet. Geometric planning on rigid lines is avoided. With the flexibility of location afforded by the excess width, the motor road weaves through the reservation. Depending upon ever-varying topography, it may lie near the middle or pass close to either side, now through a wooded stretch, or along the stream bank. Even at places where the flanking strip is narrow, naturalistic landscape has been preserved and restored. The result has been described by some visitors as an illusion of driving for many miles through an unlimited park.

The effect of these parkways has been an immediate increase in the value of adjoining lands in private ownership. Instead of overlooking a bare pavement, such lands have the advantage of a park-like prospect with its grass, trees, light and air. At the same time they are conveniently accessible to an express motor route.

Within a few years, land values have risen in some instances from acreage prices of 10 cents or less per square foot to $2.00 or more. The general level of values in the southerly part of the county is such that the future trend will probably shift from private dwellings along the parkways to garden apartments. Heavy investments
proved their investment value in Westchester

AMONG THE FINEST bridges of their period in the world are those designed for the Westchester County Park system. Gilmore D. Clarke, landscape architect

of capital in this type of housing have yielded large increases in the county’s tax revenue.

The park program now involves appropriations of more than $60,000,000 for the purchase of land, construction and development work. These appropriations have been financed through bonds to be paid off in from 40 to 50 years. Interest and amortization on these bonds is offset by tax revenue from enhanced valuations created by the park system. In 1923 the total assessed valuation of taxable property in the county was $788,029,966 representing the accumulated wealth in the 240 years since the county was founded in 1683. At the end of 1929 the total had risen to $1,644,114,324, an increase in 6 years greater than the total for the previous 240 years.

Entirely independent of the capital financing are the operation and maintenance expenses of the system, which amounted to $1,544,207.84 for the year 1929. But the receipts from golf courses, bath houses, rentals, concessions and amusement park features were $1,583,631.82. The taxpayers were, therefore, entirely relieved of expenses and a surplus of $39,423.98 was turned in to the county treasury. A large proportion of the total revenue was derived from Playland, the unique development at Rye Beach, which converted what was formerly a seaside slum area into a great recreational center. The golf courses also turned in substantial receipts.

WHAT TO PUT ON

Working Drawings

An architect was being selected for a school building. Out of the many who had applied, six were being considered, and of these six, three were to be allowed to compete for the job.

These six had submitted sets of plans for inspection, and the professional advisor was explaining their various features. "Here," he said, "is a large scale drawing of a soil pipe. What possible interest has a plumber in a picture of a soil pipe? What he wants to know is size and runs and valves and cleanouts, and these are scarcely shown at all." This architect was at once eliminated.

Now it may be argued that his was a small point, but not at all. Any man who will waste his drafting time merely putting lines on paper is not the best man to handle a job. Simply making pictures of things is the sign of a man who can't make himself think. Such methods are a waste of time and confusing to those who must make practical use of the drawings.

Let us consider what a drawing really is. It is a document of information which can be expressed better by lines than by words. We are telling the carpenter and steel man what to do. Anything beyond this is confusing and wasteful, anything less fails of its purpose.

Take, for an example, the laying out of a service stair. It is usually drawn in detail at small scale. Then the floor heights may change, and this elaborate drawing has to be erased and done over again. When the iron man finally gets the job, he makes his own shop drawing and submits it for approval.

Now here is the vital point—only the iron man's drawing really counted. Care in drawing the stairway on the plans was only a pretty picture. To make his detail, the contractor needed to know the number of risers, width of stair, and size of well. The architect needed to know that a given stair could be run between the floors, that his story height was practicable, and if he wanted to change the story height, how much and how easily could it be done. For all this, a line diagram of the stair tells the whole story. The newel and handrail are shown at larger scale once, for all floors. The kind of stair and its supporting value are specified. Then, when the plans are determined beyond probable change, the newels and rail can be shown for the client's benefit—but it is for his benefit only.

Probably the greatest source of waste is in the drawing of windows, especially in plan. The window boxes are shown, kind of sash, and sometimes the sill. Each window in the whole plan is done thus, and in masonry it is dimensioned for opening and pier.

Now what does the architect need to know? Just two things—inside opening and outside opening, so partitions will not come in the reveal or pipes interfere. What does the mason need to know? The center of the frame. That is the point to which he works in setting the frame in the wall. The dimensioned opening means nothing to him—he is merely building something into the wall, and if he has to work back to the center through a maze of figures he will somewhere make a mistake and set a frame wrong. What does the contractor need to know? The kind of window needed for the mason to set. He can get this from the elevations where the openings are scheduled, one window of each type being drawn completely and the rest blank openings with a number or letter. Moreover, the type of window should be shown on the elevations as above, or similarly on the plans, but not on both. Under no circumstances should a feature be shown definitely in more than one place. First, it takes time, and second, there is no man living who can carry changes all the way through a job and not miss some of the various places where a feature may be shown. And the contractor will be sure to base his price on the one detail not changed. Then trouble. Show it once, and show it there completely.

What should a steel framing plan show? The size and kind of beam, its grade above or below the floor, its location, and its reactions. From this the contractor can order the material and ... (Continued on page 74)
WRONG
Start dimensions from property line; give center of windows, which is what the mason wants to know; and detail each type of window once, lettering repetitions, as a means of simplification.

RIGHT

WRONG
The good-looking drawing at the left is confusing and hard to follow. That at the right gives all information without repetition, and is not as confusing as it appears at first glance.

WRONG
Below—To get length of bars, adjacent beam details must be found; for size and number of bars, plan must be consulted; double dotted lines take excessive time to draw; shop drawings are difficult to check. Yet this method is standard in some offices.

RIGHT
Above—Instead of being scattered over a number of sheets, all information is given in one place at 1/4" or 1/8" scale.

MAKE IT EASY FOR THE CONTRACTOR AND MISTAKES WILL BE FEWER

OUR GUIDE, an unwashed little urchin with a dirty turban and ragged bournous

... They serve plenty of local color with their architecture in...

KAIRWAN

By Arthur H. Gilkison
Architect, New Rochelle, New York

SOMEWWHAT travel stained after a trip through Sicily, I left Palermo by steamer for Tunis, from which city I reluctantly departed in three days to journey to Kairwan by way of the uninteresting town of Susa. I say uninteresting since, on rising at 5 A.M. and riding six hours in an African train, few towns would seem interesting. Here we met an Englishman whose hobby was warning all and sundry not to go to a certain hotel in Cairo. It seems that while a guest of this hotel the Englishman was greatly annoyed by the prevalence of those inquisitive little bugs which frequent beds. Calling the proprietor he made adverse criticism of the accommodations whereupon he was told he could take it or leave it, or words to that effect, which so annoyed him that he told everyone about the incident and then sent a card to tell the proprietor he had lost another prospective customer. This had been going on for two years and he confided to me that it was not worth the trouble and time it took. But the English are a stubborn race.

Kairwan proved to be all that I had expected and the old Town enclosed by a high battlemented wall seemed almost a city of the unreal, with its white walls, towers, domes and medley of costumes, people, camels and odors.

We stayed at the Hotel Splendide but splendid it was in name only. While here we met two young American scenic painters, who had saved up enough money to spend two years abroad doing "real painting," as they called it. They told us that the night before we arrived, they were awakened by someone turning their door knob and trying to enter the room. Peering through the keyhole, they saw an Arab go stealthily along the corridor testing each door. The next night these lads, who hailed from New York's East Side, left their door unlocked and took turns sitting up with a "thirty-two" trained on the doorknob. Fortunately for the Arab he failed to continue his nocturnal wanderings in that section of the hotel. Our own room was keyless, so we slept with a first line of defense consisting of the dresser backed solidly against the door and a tin wash basin and pitcher
THE MOST CURIOUS CITY in Tunisia is entirely enclosed by battlemented walls through the gates of which issue a weird conglomeration of costumes, people, camels and odors.
IMPROVISED SALES ROOMS crowd the passer-by off the sidewalks of streets that seem to have evolved with an utter disregard of everything but the picturesque.

OUT OF THE RUINS of Carthage and Susa came most of the building materials used in the Sidi Okba Mosque, which accounts for the many beautiful columns used in this arcade.

neatly balanced on the edge ready to crash a warning if it were moved. The same night, a guest lost his watch, cheques and even his trousers while he slept.

Later in Batna, we had a somewhat similar experience. Our room was on the ground floor overlooking a garden and in American fashion we threw the French windows open and went to sleep surrounded by fresh air and nothing else. About 4 A.M. I was awakened by a slight sound and looking up saw silhouetted against the open window an Arab. Happily he was as frightened as I and made his exit through the window as quickly as a cat. We aroused the landlord, who reluctantly changed us to a second floor room insisting all the while that we had been dreaming. He still professed not to believe us next morning until shown the trampled bushes outside the window. Needless to say, that was our last ground floor room and our request on arriving at a hotel after that was a room on the second floor and a key.

To return to Kairwan on our first sortie from the
SIDI OKBA is one of the oldest mosques in the world and, in plan, resembles those of ancient Egypt. It was started in A.D. 671

hotel we were greeted by a group of men and boys who insisted, one and all, on being our personal guides. We impressed upon them in our best Arabic French that we did not wish guides, but not to be discouraged the whole pack followed us, lead us and guided us to wherever we did not wish to go. It grew to be almost a game: When they pointed to a mosque we would look the other way, just to show our dislike for guides. It was a hard battle but we gradually wore the pack down until just one remained, a ragged urchin of about thirteen years, with a scabby head covered by a dirty turban and a ragged bournous for decency. But shake this one we could not: if we went into a store, he waited until we reappeared; if we returned to the hotel, he followed us. We had lunch and when we came out again, there he was. We sought to lose him by taking a lengthy nap; when I looked out, he was at the hotel entrance. So we gave up and from then on as long as we remained in Kairwan we had a constant companion who carried our sketching out—(Continued on page 84)
when the King violates his duty, the compact between the people and the King can be dissolved

HANOVER COURT-HOUSE IN EASTERN VIRGINIA, BUILT 1735

where PATRICK HENRY lighted the torch of American liberty

BY BEAUFORT N. EUBANK
of Eubank & Caldwell, Inc.

LAST summer, on a hot day in July, my wife and I were driving through Eastern Virginia. We came to Hanover Court-house about noon and stopped to have lunch in the shade of the trees on the old court-house lawn. The Clerk of the Court joined us and told some interesting facts concerning the history of the building.

The Hanover Court-house was built in 1735 and has been in constant use as a court-house ever since. On this spot the eloquent Samuel Davies, founder of the Presbyterian Church in Virginia and subsequently President of Princeton College, on May 8th, 1758, recruited Captain Samuel Meredith's Company and sent them forward to the old French War. Within the walls of this historic building, Patrick Henry on December 1st, 1763, made his great speech for the people in the "Parson's Case" taking the bold ground that when the King had violated his duty at that time the compact between the people and the King could be dissolved. The torch of the American Revolution was lighted on that memorable day.

The building is constructed of brick which measures 9"x4 1/4"x2 3/4", with glazed headers. They are laid four courses in thirteen inches in lime mortar with a flush joint, ornamented by running the side of the trowel about 3/4" deep along the center of the joints. All arches,
base course and corners are ground to a smooth surface, the entire work being laid in Flemish bond.

The exterior walls are 20 inches thick, while the wall between the court-room and arcade is 10" thick. The building is plastered throughout, including the arcade walls and ceiling. There is no moulded plaster, everything being square with flared window jambs. The upper sashes are fixed while the lower sashes slide up and are held in an open position with wooden pegs. The blinds are hung on wrought iron hinges and held open with wrought iron hardware.

The floor of the arcade is paved with 18"x18" stone slabs about 3" thick; these are very much worn. The court-room was paved in the same way until a few years ago, when a wood floor was installed. The interior contains no woodwork of importance. The exterior wood cornice gives a nice effect with an interesting detail at the corner, where (Continued on page 118)

KITCHENS are superseding kitchenettes, according to a survey made in twenty-six cities by the National Association of Real Estate Boards. Less than one-fifth of one per cent of the thousand apartment houses surveyed were without kitchen or kitchenette facilities. In Chicago, the survey shows that the tendency is towards more laundry work being done at home.

FORMATION of large-scale housing development corporations, with a portion of the initial capital contributed by manufacturers of building materials and supplies, would diminish the number of unsanitary, poorly built residential structures in New York City and stimulate the building industry, according to Louis J. Horowitz, chairman of Thompson-Starrett Company, Inc. These corporations would provide opportunity to introduce installment home buying on a large scale.

STORE planning is bound to be considerably influenced by the growing popularity of open displays, that is, where the merchandise is openly displayed inside the store. In a test recently conducted in a drug store, and described in a recent issue of Advertising & Selling, a number of well-advertised specialties were hidden from view for two weeks and only sold to customers who asked for them by name. Then the same goods were put on open display for two weeks. There was a tremendous increase in sales, ranging from 43 per cent to 500 per cent. The average increase was 118 per cent.

THE sales value of murals for decoration is testified to by Milton Rogasner, proprietor of the recently renovated Iris Theatre in Kensington, Philadelphia. The patronage of this theatre had faded to almost nothing, when it was decided to close it and have John C. Wonsetler paint a number of murals despite the forecasts of those who felt that such an industrial district cared nothing for art. In the words of Mr. Rogasner, “These hard-working mill operatives went wild over the murals. We discovered that they had really a better appreciation of art than many persons who claim an extended and profound knowledge of art. They came to enjoy and not to criticize. The beauty of these murals sank deep into their souls, and quickly the popularity of the theatre extended for miles around and beyond the limits of our district. Mothers brought their children from a distance to see the murals; the theatre with its murals has become

EASY STAIRS used on the new buses of the Fifth Avenue Coach Company, New York. These stairs, which are 18" in width, are exceptionally easy for the average person and present a proportion that is excellent wherever there is necessity for a steep stair which is to be used by a large number of people.

one of the show places of Kensington. We have discovered that it pays big to mix art with business."

RAYMOND HOOD, according to an article in the
New York Times, has to pay an extra cover charge
at the restaurants he visits because he defaces so many
table cloths with his pencil notations. It is related that
once, taking his little cousin for a walk, he was inspired
with an idea for the Daily News building and, having
no paper handy, used her new white frock as a sketching
pad to the great dismay of his wife. Incidentally, the
porch columns of his house are covered with his designs
for buildings.

OBsolescence of skyscrapers is reported on by
Arthur Warner, chairman of the National Association
of Building Owners and Managers. He says:
"The useful life of office buildings is much shorter
than most people presume. Skyscrapers don't wear out.
They are torn down before actual old age creeps upon
them and are replaced by structures that are more suitable
for modern requirements. Style is as important in
the office building field as it is in women's wear. Style,
however, in skyscrapers is evidenced by an increasing
utility and an improvement in service.
"There are five factors of obsolescence affecting the
useful life of skyscrapers. (Continued on page 112)

The architects of Dallas have recently held an exhibition of their work which may possibly have set a record for the ease and simplicity with which it was assembled and hung for public inspection. As an example of maximum results in public interest with the minimum of effort on the part of the exhibitors, the Dallas display might well be an inspiration to architects in any community.

From the thirtieth of November to the fifteenth of December, 1930, with an extension of time to January first, due to public interest, an exhibition of some one hundred and fifty pieces was hung in the Norvell Galleries in Dallas, representative of the current work of fifteen local offices. During that time, it is estimated that some one thousand patrons of the arts and prospective builders viewed the display. The only publicity used was a form letter to the patrons of the gallery and editorial comment on the art pages of the Dallas newspaper. One thousand visitors may not seem a particularly startling total but considering the absence in this case of modern high-pressure methods of publicity, generally considered necessary for getting the public away from the fireside or the office, it was most gratifying.

The moral of the above is that it is possible to assemble a collection of architectural work without the effort that generally frightens the average group of architects out of the idea, and that once assembled the resultant publicity can be just as much or little as the energy of the group dictates. Admitting that architectural exhibits are attractive forms of public education, it is hoped that the results of the Dallas show may encourage others.

The idea of an architectural exhibit has been discussed by architects in Dallas since 1922, when the Dallas Architectural Club staged a most successful exhibit of Texas work. This was the first comprehensive collection of its kind to be held in the State, and while its results were satisfactory, it entailed much hard work. And it has been the recollection of the effort put forth at that time that kept the North Texas Chapter from
A GOOD LOCATION for an architectural exhibit because the store was centrally located and consequently easy for people to visit holding a similar exhibition. It appears that the architects of Texas are no different from those elsewhere, in that they are too modest or lethargic to do much for advertisement of their wares.

It was outside effort that aroused the Dallas architects. The Norvell Gallery is a private institution with a splendid reputation for collecting, displaying and selling objets d'art. It occurred to the owners of the Gallery that the hanging of an exhibit of architectural work in their rooms would bring an attractive array of visitors to their premises. This is a sound bit of logic and a good business idea. The idea was thought to be creditable when broached informally to individual members of the local chapter and so was officially put before the North Texas Chapter of the American Institute of Architects. The Gallery assumed the obligations of assembling the exhibit, of the hanging, of the publicity and of maintaining a competent attendant at the show. In exchange it asked for the approval of the chapter and for the appointment of a committee to assist, primarily, as a jury to judge work.

Within two weeks the secretary of the Gallery personally called upon each architect in the informally selected group, aroused his interest, looked over his material, caused sketches to be mounted and photographs to be framed, and finally delivered in time for the judging and hanging preparatory to the opening tea on Sunday afternoon, the thirtieth of November.

The attractive and efficient secretary did not have an easy job in those two weeks, as anyone who has tried to assemble work from fifteen offices knows. But as a capable worker in line of duty she made it easy for the exhibitors and did a better job of it than an individual architect or a committee of them would probably have had the energy to do.

So there is the formula for a community exhibit: A reputable down-town show place, known for its connection with the arts, and one willing to carry out the mechanics of collecting and showing the exhibit in exchange for the visitors which such a show will attract to its place of business. Add to the formula speeches, radio-broadcasting, paid advertising, and similar forms of ballyhoo which the energies, enthusiasm and purses of the interested parties may afford, and you have as simple or as elaborate a bit of public education as can be desired. Suffice it to say, for the Dallas show, that the interest it created in the newspapers, in the lay comment and within the profession, has made an exhibit in 1931 a certainty with slightly greater plans for publicity. It may be that by gradually crawling up on the architects, year by year, the exhibit may finally become one of the big things of the Southwest with every architect working his head off, and liking it, instead of wanting to be shoved into activity. However, there are limits to anyone's optimism.
Riverside Church

The proponents of honesty in construction are having a rather hearty laugh at the expense of the recently finished Riverside Church in New York City. The American Weekly recently published a story about this church, in which it was stated that “in the old Gothic, where there was nothing but stone in the construction, the walls were made thick at the base and thinner toward the top. This obviously could not be done with steel. However, the problem was triumphantly solved. It took engineers two weeks of solid work to figure out how they could re-distribute the load.” Two weeks of solid work to fit modern materials to a design based upon tradition!

Railway Lifts

Smokers have long wondered when railroads would “be their age” and come to a realization that courtesy to the fair sex no longer demands that one refrain from smoking. The Boston & Maine Railroad conducted a poll among 7,182 persons; the result was 78 per cent in favor of smoking in diners and 22 per cent against. Of the women, 74 per cent wanted tobacco; of the men, 80 per cent. What a change in sentiment during the last fifteen years! But no greater than the changes which have come over the architectural profession, changes which must be met frankly and honestly, with clear thinking unhindered by traditions as out-of-date as the diner’s ban on smoking.

Reliable Estimates

That architects are interested in estimating is indicated by the many excellent articles received in answer to the request for such articles printed in the November issue. Most of the articles met on somewhat common ground, but there were many variations which indicated how large a part good judgment and experience play in attaining any degree of accuracy.

It was plainly evident that there are many architects who know how to make reliable approximations of cost. Opinions varied on the subject of the degree of accuracy of the preliminary estimate. These ranged from five to twenty per cent of the low bid, to a close approximation of the average of all bids received.

Opinion was general that for reliable estimates it is essential to keep careful records of job costs with major trade costs broken down; square foot and cubic foot costs; and, in the cases of certain types of buildings, unit costs per room, theatre seat, hospital bed, or other unit. Some, however, advocated the use of quantities of structural materials involved and percentage allowances for items of other classes. Still others felt that a contractor should be called in to make a preliminary estimate based on reasonably complete plans and a preliminary specification. It seems apparent that most unreliable estimates made by architects are due to failure to take into consideration all items that a contractor must of necessity include in his estimate.

Practically all agreed that both the square foot and cubic foot method are fraught with danger and of value only as a check on more careful calculations or as a rough guide which is of value in the early stages of developing studies of a project.

Foundations of Lead and Hair

While it is not entirely accurate to say that the new Waldorf-Astoria is supported on a foundation of lead and hair, these materials are used in the column foundations as cushions to insulate the superstructure from the vibration of railroad trains which pass below the hotel. This is not the first example of a building supported on materials rarely thought of in connection with foundations, for all buildings built over railroad tracks in New York, Philadelphia, and Chicago are insulated from vibration by some such means. Engineers go to much pains to prevent buildings, as well as the nerves of its occupants, from being racked to pieces by the movement of heavy trains.

Medusa Advertises

Ask Your Architect

In recent advertisements, the Medusa Portland Cement Company has made prominent use of the phrase, “Ask your Architect.” One fine result from the use of this phrase is that architects will more and more have to become experts on materials in order to be able to answer the questions which clients will undoubtedly ask them after reading advertisements such as this. It is to be hoped that the time is not far distant when every prominent manufacturer of building materials will make use of some such phrase in his advertising. It will be to both his and the public’s welfare.

"Consult A Builder"

The December issue of The American Architect contained an editorial which discussed the plan of a building magazine to urge use of the slogan, “Consult A Builder.” The editor of that publication states, “We have no thought to ‘short circuit’ the architect, as you suggest.

We have the greatest admiration and respect for the architectural profession and it is our only regret that the architects are so limited geographically. It would be very desirable if all communities could have the benefit of the special training which many of the architects possess and we are heartily in accord with any program that would cause the architects to become more enterprising, to extend their services, and to acquaint the general building public with the benefits which come from employing skilled and competent talent.”
Oak Flooring Grades a Mistake

JUST how the Oak Flooring Manufacturers' Association expects to clear up the naming of their grades by the new terms is somewhat of a mystery—although quite in keeping with the impractical and sales hindering terminology of the entire lumber industry, intelligible only to experts. The new quarter sawed grades are, "clear," "sap clear" and "select." Plain sawed grades are now known as "clear," "select," No. 1 common and No. 2 common. An architect using oak flooring, which is only one of countless items with which he must be familiar, will find himself tripping up time after time by specifying "select" quarter sawed when he wants the second quality just because "select" is second quality when he orders plain sawed. The lumber trade is always full of explanations for the use of their antiquated terminology—all of which are just rather foolish alibies.

A Cause for Alarm

CONSIDERABLE publicity has been given a statement made abroad by Frank Baldwin, secretary of The American Institute of Architects, particularly the portion in which he referred to the increasing tendency toward the development of great construction companies that include architects and engineers on their staffs. Many others view this situation with concern both for the profession and its effect on architecture in the United States. No one can say with assurance that the idea will become thoroughly established. It would appear to be a long way off, at any rate, but at the same time is something to think about. A more logical development of this idea would be the selection, by the owner, of an architect, engineer, contractor and possibly others at the inception of a building to act in a harmonious relationship throughout the design and construction of the building.

A.I.A. on "Consult an Architect"

In various recent issues of The American Architect, considerable publicity has been given to the idea of manufacturers advertising, "Consult an Architect." Many A.I.A. chapters have written to the magazine endorsing this idea, as have many manufacturers. The Southern California Chapter thought that the Producers Council ought to do something about it, and so wrote them. The Council withheld a definite answer until after referring the matter to the Board of Directors of the Institute because, as we understand, the idea had formerly been frowned on by the Institute through fear that the use of incompetent architects might be encouraged. The progressive thought shown by the changed attitude of the Institute is well expressed in a resolution passed at the recent Detroit meeting of the Directors, which reads, "Resolved: That as far as the Board of Directors is concerned it can say to the Producers' Council and to all others interested in the use of slogans, referring to the employment of the architect, that the Institute has no objection to the use of such slogans." It is to be hoped that every Producers' Council member will now make use of some such phrase in his advertising.

Less Coal Consumed

SIXTY-FOUR million less tons of coal were consumed in the first eleven months of 1930 than during the same period in 1929, according to the National Industrial Conference Board, Incorporated. While the industrial depression may account for a large part of the decrease, other more permanent factors are playing an increasingly larger part. Among these may be mentioned the increased efficiency of coal-burning equipment, competition of gas, oil and other fuels; water power developments; and increased production of coal in foreign countries. In 1929 the fuel oil consumption increase was equivalent to about four million tons of coal. The increase in natural gas consumption for replacing coal for the same year was equivalent to about one million tons of coal. Long distance natural gas pipe lines now under construction will add to coal's competition.

Lays Bet On Heating Cost

CONFIDENCE in the operation of his heating system has led a manufacturer to wager that the system will save fuel cost for its owner. The wager can, naturally, apply to replacement installations only. This manufacturer has organized a subsidiary funding corporation to finance the replacement of obsolete heating systems. The owner pays twenty-five per cent of the contract price upon signing the contract. The balance of the contract is paid in three equal annual amounts. If the fuel saved by the new system does not equal the amount of the annual payment, the owner owes the manufacturer nothing. It is stated that fourteen systems have been installed under this type of contract. Thus far fourteen owners have had to pay their installments.

Architects Good Contributors

NEW YORK CITY'S Emergency Employment Committee has secured pledges amounting to more than eight millions of dollars to be used as a fund to give employment to the heads of needy families three days each week for a period of eighteen weeks. The Building Industry Division, under the chairmanship of Stephen Voorhees, of Voorhees, Gmelin and Walker, architects, pledged a sum in excess of $240,000. Of this amount, the architects of New York City pledged approximately forty thousand dollars. As a group this was exceeded only by the mason builders' contribution of forty-four thousand dollars. Rather good for a group in the building industry that has felt the lack of active building as much or more than any other.
The Golden Gate Bridge
San Francisco

Morrow & Morrow, Architects

The longest span and the highest clearance of any bridge in the world is the claim for the $35,000,000 Golden Gate Bridge, which will connect the city of San Francisco with the prosperous though not fully developed country to the north. The span will be 4,200 ft., the length 6,400 ft. from end to end, and the distance between portals 8,943 ft.

According to Irving F. Morrow, architect, "Throughout a considerable portion of the year, high fogs render the light of San Francisco colorless or gray. Even in full sunshine the characteristic atmospheric effects are blue rather than warm. Local architecture has consistently evaded the implications of this situation by remaining itself colorless.

"Our conception is a full polychrome, increasing in richness by successive steps as it focuses upon the bridge, culminating in the final monumental pylons in pure metallic gold—veritably, as well as symbolically, the Golden Gate. The entire composition thus at all times will be alive, on the grayest day only a degree less so than on the brightest. Confident use of color is characteristic of modern architectural developments."

North Approach, conceived in full polychrome with monumental pylons in pure metallic gold

The Readers Have a Word to Say About Government Employment of Private Architects

- Writes Newspaper

Editor, The American Architect:

This morning I read the editorial in your December issue entitled, "The Government Should Employ Private Architects."

I am delighted that you have encouraged the profession to seek publicity on this matter, and I am writing The New York Times in the hope that I may do my part with a letter pertaining to this question, as I have realized for some time that the Government was not doing the right thing by our profession, and that if any work has been given to outside architects, it has been largely a matter of political influence.

From the Treasury Department, however, I have learned that very little if any work has been given out in this manner and the time is certainly opportune to bring pressure to bear on Secretary Mellon, who, I understand, has the entire matter under his control. I have personally talked with Mr. Mellon about this but got little if any satisfaction.

Congratulating you on taking the initiative in this matter, which I hope will meet with success, I am—

Alien Minnivo, of the architectural firm of Ethan Allen Dennison and Associates, 40 East 49th Street, New York City.

- Informs Congressmen

Editor, The American Architect:

In relation to the employment of private architects on government work I would say that it is a matter which we, of course, would heartily approve.

As far back as August 13 we wrote to Mr. Ferry K. Heath, Assistant Secretary of the Treasury, who has charge of the government architectural office, urging that private architectural service be utilized. I quote from his reply as follows: "At the present time it is the intention to employ the services of private architects for only a limited number of the federal building projects."

We wrote to the following Congressmen whom we are acquainted with or who represent our district: Mr. Richard B. Wigglesworth, Mr. Charles L. Underhill and Mr. Frederick W. Dallinger, also to Mr. George Akerson, the secretary of the President. Replies from all the Congressmen indicated approval of the idea and showed that in bringing the matter to the attention of Mr. Heath they received the same answer that I did directly. It would appear, therefore, that it is Mr. Heath who must be convinced of the desirability of the objects outlined in your editorial.

If you will send us three or four reprints of your editorial I shall be glad to send them to the persons mentioned above and use them elsewhere if possible.—Lloyd M. Hendrick, Jr., Hendrick and Hayward, architectural service, 192 Boylston Street, Boston.

- Arranges Radio Talk

Editor, The American Architect:

I am arranging for the dissemination of particulars, in connection with your "Get Some Work Started" campaign, over Station WBNX in the Bronx during the next few weeks.—Edward Whitewell, architect, 606 West 116th Street, New York City.

- Tells About Springfield Trouble

Editor, The American Architect:

I have just read your editorial in regard to the Government practice of designing Government buildings by Government employed architects.

I heartily agree with you that this practice is improper in every way. The U. S. Government has enough to do without operating an architectural department. I think that a careful survey of the many public buildings that have been constructed under government architectural supervision and design demonstrate the fact that the Government does not design and arrange buildings for the purposes to which they are put.

Springfield at this time has a controversy with the Government architectural force on the design of a new post office. I have not concerned myself particularly in regard to it but the pictures that have appeared show a building that is certainly not architecturally sound. There is a fight on now between the interests in Springfield and the Government architectural force on this question, and, of course, it will delay the work. If this had been placed in the hands of private architects of known ability, there would not have been any public protest on the question of design, and in my opinion the Government would have gotten a very much better building in every way.—S. M. Green, Samuel M. Green Company, architects and engineers, Springfield, Mass.

- Writes Governor

Editor's Note: Mr. Ragan sent The American Architect the following copy of a letter he had written to the Hon. John Garland Pollard, Governor of Virginia.

My dear Governor:

Some time ago I wrote you as to the wisdom of letting the State's architectural work to local architects, or at least giving local architects the preference, all things being equal. You favored me with a most courteous and
prompt reply, for which I thank you.

I am again taking the liberty to address you along this line, because I believe it the wiser policy and I sincerely trust that you can and do see it in this light.

First, it gives all a fair and equal chance to succeed and appeals mightily to the local pride of local architects and communities.

Second, it stimulates wholesome competition and promotes more rapid development locally and generally in both architecture and material achievement.

Third, it insures better and more commodious buildings at less expense to the tax-payer and meets with more general and uniform public approval.

Fourth, all the architects of the State are citizens and taxpayers and as such each contributes his part and all should stand upon the same footing and enjoy equal opportunity in the matter of home building and supporting and in local and State development.

Fifth, architects and their respective families are caught and hard pinched in this financial and business depression and each should have a fair chance at any line of employment the State may have to offer them, including the erection of public school buildings.

Sixth, I can see no reason why the Government, State or Federal, should engage in architecture any more than in manufacturing or railroad constructing.

Seventh, every job taken from the local architect contributes to unemployment in such community.

Enclosed please find a personal letter to me and an editorial from The American Architect's December issue, which I will thank you to note carefully.—C. R. Ragan, architect, 202½ Second Street, S. W., Roanoke, Va.

• WE TALK PROFESSIONAL ETHICS—
  BUT DON'T USE THEM

Editor, The American Architect:

Frank Lloyd Wright's remarks in the December issue of The American Architect about the Institute touched a responsive chord. I am just convolscing from a brisk encounter with professional ethics as some members of the Institute see them; if you will lend me your shoulder for a moment I would like to cry on it.

In a little town near Grand Rapids a Methodist Church burned to the ground immediately after a dinner had been given to a local politician. (Perhaps there was no connection.) This town has a very efficient fire department, as you will realize when I tell you that the fire department had the fire well under control before architects arrived on the job. However, I have no doubt that several of my colleagues arrived in time to trip over the hose.

The next day the invasion commenced in earnest, and before the architect was finally selected, twenty-one architects by actual count had put in an appearance and asked for the work. This does not include the number who applied by letter only. I have done quite a bit of work in this town, and the Board of Trustees of the church invited me to come up to a meeting. The first thing that they asked me was, "Will you make a sketch without obligating the Board?"

Thereupon I went into my dance and told them that as a member of the Institute I could not prepare preliminary sketches until I had been engaged. They replied, "But Mr.— of Detroit has already prepared a sketch, and so has Mr.— of Grand Rapids; both of them are members of the Institute, aren't they?"

This left me out on a limb, but nevertheless I stuck to it that I would not make any preliminary drawings. Finally I gave in sufficiently to make a pencil layout of a floor plan idea that I wanted to explain; I am sorry I ever did that.

Before they got through they had a stack of sketches on hand that a greyhound would have had difficulty in jumping over. When the final decision was made, Mr. X.— of Grand Rapids (who hadn't submitted a sketch at all) had three votes and I had two. Mr. X.—, incidentally, had done a great deal of work for the local politician aforesaid, who was chairman of the Board.

Now I am very glad indeed that Mr. X.— got the job; I would have been even gladder to get it myself, but failing that I am very glad indeed that it went to someone with sufficient self respect to refrain from spending money on water-color drawings purely on speculation. But what do you imagine the Board in this case thinks of architects as professional men?

The older I get (and the past season has brought my age way up in the nineties) the more convinced I am that all the ills that afflict the architect are our own fault. We scheme and intrigue; we are as jealous of each other as a lot of opera singers, and we insist on doing a lot of work for nothing. Then when we get a job we cap the climax by allowing irresponsible contractors to figure simply to knock the price down. Some times I regret that I didn't take up some good clean profession like umbrella mending.

I have decided, however, that in my own case the game isn't worth the candle; if the only way that I can get jobs is to make a lot of preliminary drawings without any assurance of ever being paid for them, then I will get along without those jobs. Fortunately I am able to supplement my professional income by writing of various kinds, and I have enough steady clients to allow me to greet the wolf with the ancient Chinese gesture of contempt.—Frank P. Allen, Architect, Frank P. Allen & Son, Grand Rapids, Mich.

Editor's Note: The following letter was written by Mr. Allen to the chairman of the church building committee and shows a good sales angle from which to handle the question of speculative sketches.

Mr. Z.—:

We would regret it very much if your committee, now engaged in the selection of an architect for the rebuilding of your church edifice, should get the idea that we have refrained from submitting preliminary sketches of this work because we were not interested sufficiently to do the necessary work entailed in drawing an intelligent sketch.

Our attitude has been simply this; selection of an architect on the basis of preliminary sketches is a dangerous procedure, and one in which the honest architect is penalized in direct proportion to his honesty. In other words, when the presentation of attractive sketches is made the basis on which the architect is to be selected there is a constant temptation for the competing architects to promise more than they can perform. The architect who makes a sincere effort to keep the cost of the building down within your appropriation will find
BRONZE...
NICKEL SILVER...OR IRON...but ever faithful to Architect’s Designs

On this page are three examples of recent General Bronze jobs...Three types of elevator doors—three different styles of designs—three different metals.

The doors of the Chicago Daily News Building are of modern nickel silver. The vertical design gives an effect of height and loftiness. Metal strips on each side accent this idea...

The design of 1 La Salle Street shows the use of bronze at its best. Fineness of scale, of line and of shading—such as bronze can achieve...

The Foshay Tower doors are cast iron with a classically wrought design. The bas relief representation of the building—worked into the door—is bronze—an effective combination for contrast...

A NEW ENGINEERING SERVICE

Both with the older and modern architectural metals, General Bronze has had wide experience. This construction and technique experience is available through the new “Metal Engineering Service.” It is a practical and personal service rendered from our New York and Minneapolis offices. Architects are sincerely invited to avail themselves of this new General Bronze department.

“DISTINCTIVE PRODUCTIONS IN ALL METALS”

GENERAL BRONZE CORPORATION

480 HANCOCK STREET • LONG ISLAND CITY, N.Y.

FOR FEBRUARY 1931
his sketches outshone by some competitor who has disregarded the cost element in an effort to get a good looking sketch.

An architect should be selected on the same basis as a doctor or a lawyer is selected—solely on the basis of their reputations and on the results that they have achieved in the past. You can learn more about an architect in ten minutes by looking at work that he has designed and supervised and talking to clients for whom he has worked in the past, than you can learn in hours of looking at well-drawn and handsomely colored sketches. Water colors will not keep a poor roof from leaking, and pen and ink perspectives will not keep your plaster from cracking if the footings are inadequate.

At R—, less than 10 miles from Z— there is now being erected a school building from our plans and under our supervision. The R— Board of Education desired to spend $85,000 for the school complete. The Secretary will tell you that all the contracts are let, the fixtures and equipment purchased, architect’s fees paid, and there remains a slight balance out of the appropriation. Mr. K—, the secretary of the Board, is a friend of yours and I refer you to him for evidence as to whether the service we rendered his board satisfied them.

You will learn far more about an architect’s ability by thus consulting his clients than by weeks of dazed contemplation of preliminary sales sketches, which in the last analysis are merely exhibitions of water-color technique.

We hope that we will have an opportunity to talk to your full committee before they reach a final decision.

• CHURCH ASKS BAILEY QUESTIONS ABOUT DECEMBER ARTICLE

Editor, The American Architect:

Both your magazine and Mr. G. R. Bailey are to be congratulated upon the very timely and interesting article appearing in the December 1930 issue of The American Architect. It presents in a very forceful manner the possible results of an intensive study of building economics together with one method of prosecuting such a study. However, there are some items that are not clear and are, therefore, open to question.

1. It is stated that, "This factor of land charge places a proper penalty on the plans which develop the smaller net rentable areas. With properties valued upward of $200 per sq. ft. this land investment charge will vary from 75 cents per net rentable square foot for a twenty story building to four times that figure for a five story building." From the explanation given, it seems that this "land charge" is intended as an annual sq. ft. rental rate required to pay interest on the land cost. If so, it is not a "land charge" but a land interest. But it is an error to suppose that this can be derived by "assessing a percentage, such as 5 per cent" because the ratio of net to gross income must also be considered. It is also an error to suppose that this land rental rate will vary inversely as the number of stories; because every increment of height brings its increment of loss in the net rentable area. Not only so, but the land rental will be nearer $2.50 for 20 stories and $9.00 for 5 stories than $0.75 and $3.00 respectively, depending upon the governing conditions in each individual case.

2. The same or similar errors of mathematical conception seem to apply to the "additional construction charge" for extra perimeter. Quite evidently, the author does not understand the mathematical relations of the economic elements of buildings.

3. It would be interesting to know the complete schedule of rental rates upon which the three given rates were based; it might be possible to prove that the office depths here used are too great and hence uneconomical. It is quite generally considered that 24 to 26 feet is the most satisfactory depth and it would be a valuable contribution to our common store of knowledge if it could be shown that 30 feet is still better.

But the value of the objective lessons of this series of studies is not destroyed by such inaccuracies of detail. This study points to the fact that, in perhaps the average case, the architect assumes too little initiative in and responsibility for the economic success of the project; and that the owner seldom gives his full cooperation and assistance. He is an incompetent architect who can furnish merely "plans" and nothing more; and he is an incompetent owner who expects nothing more of the architect. It is probably true that the owner is the more incompetent of the two. The absolutely common purpose (as between the owner and the architect) so essential to the highest pecuniary excellence of the project is too frequently lost sight of in the mad scramble to "rush plans to completion." The most critical period in the history of the entire project is thus neglected and permanent assets to the investment are replaced by equally permanent liabilities.—Eugene B. Church, architect, Houston, Texas.

• AND BAILEY ANSWERS CHURCH

Editor, The American Architect:

Although it seems to me that Mr. Church has been a little unduly critical, nevertheless it is a very satisfying thing to realize that other people, and particularly architects, are interested enough in the subject to take up the cudgels with as much zest as has Mr. Church and his criticisms as being his sincere feeling regarding the matter and, consequently, constructive.

With respect to Mr. Church’s first paragraph, he is quite correct in stating that the land charge is a land interest, the only difference being that in real estate parlance, at least in this district, interest is frequently referred to as a land charge. I believe that Mr. Church feels that my analysis set-up was more or less of an operating estimate, which it was not, it being purely and simply a comparative analysis for the purpose of determining the economics of various floor plans. As a matter of fact, it would be useless as either an operating or financial set-up but it does illustrate the economics of alternate floor plans with a fraction of the labor that would be involved if the whole procedure were gone through with. As I stated before, the origin of this set-up was with the National Association of Building Owners and Managers, which includes in its membership some of the keenest minds, so far as this subject is concerned, that are to be found in the country. Mr. Church is quite correct in stating that it is an error to suppose that this land charge or interest will vary inversely as the number of stories but for comparative purposes, we
When these old Pennsylvania Dutch farm houses were restored to their original beauty, tile was used for the roofs — weathered Colonial Shingle Tiles identical in texture with the original split wood shingles. There are patterns of Ludowici Roofing Tile adapted to every type of architecture. Whether for Colonial, Georgian, Spanish or Norman architecture, Ludowici Tiles are ageless in beauty and permanent in protection against the elements, fire and the ravages of time. On request, a catalogue will be mailed or our representative will call.

LUDOWICI TILE

LUDOWICI-CELADON COMPANY

FOR FEBRUARY 1931
obtain the desired result by making it inversely proportional to the rentable area. I do not agree with Mr. Church's statement to the effect that every increment of height brings its increment of loss in the net rentable area, as many buildings, particularly in Chicago, have more rentable area on the twentieth floor than they have on the eighth or ninth, for the reason that banks of local elevators drop off. I do not understand Mr. Church's figures for the land interest charge per square foot when he figures it out to be $2.50 for twenty stories and $9.00 for five stories. As a simple example, take a lot 100 feet by 200 feet. The 20,000 square feet in this lot at $200 per square foot would represent an investment of $4,000,000 and a five per cent interest charge would amount to $200,000 per annum. Now, a twenty story building on a lot of these dimensions should develop at least 212,000 net rentable square feet exclusive of the basement and there consequently would be a charge on a square foot basis of $200,000 divided by 212,000 square feet or 94.5 cents in this instance. A five story building, roughly speaking, would have approximately one-fourth the area and four times the square foot land charge or $3.78 a square foot.

With respect to Mr. Church's second paragraph, I vigorously protest that I do have some understanding of the mathematical relations of the economic elements of buildings and that same understanding has been the result of studies made by some of our largest construction companies and some of our largest architects. Any building, all other things being equal, which has a great deal more exterior wall than another, is going to cost more per square foot.

So far as Mr. Church's third paragraph is concerned, there perhaps he has picked up something which I was remiss in not including in the article and that is, that different cities have vastly different requirements as to the depth of office space. Chicago and New York can rent 30 foot space. As a matter of fact, there has been a demand in the Board of Trade Building for space in excess of 30 feet in depth, particularly on the part of brokers who desire to have a quotation board on the back of the corridor wall and the exterior wall so that the clients sit with their backs to the light and read the stock quotations. Detroit, on the other hand, and some of our other cities have difficulty in disposing of deep space.

Let me say in conclusion that an analysis, such as was outlined in your magazine, is no more than a fractional beginning of the study that should be put on an office building. Such an analysis serves its purpose and has done so time and again in determining the relative values of various floor plans but no two projects are in any way the same and in addition to an analysis study, there should be the operating set-up, the income set-up, the annual financial set-up and the year to year or progressive picture estimate.—G. R. Bailey of Albert H. Watten & Co., Real Estate, Chicago, Ill.

Building Complaints Handled by Better Business Bureau

The type of complaint being handled by the Construction Industries Division of the Better Business Bureau of St. Louis, the first organization of its kind and described in the May issue of The American Architect, is shown from the following cases:

A man complained to the Bureau that the installation of his furnace was defective. He related that efforts to procure an adjustment were ineffectual.

A woman complained that a contractor charged her for painting done which was to be included in her original contract.

A man complained to this office that he thought his general contract included the millwork, but now he had received a bill from a planing mill company, after his payment of the original contract in full.

A man complained to this office in reference to a deal with a real estate company that involved the exchange of a four-family flat for a lot with the condition that he would be able to secure a permit from the Building Department to build a double flat on the lot. After the exchange was completed he was refused a permit.

A woman complained to this office that she was being charged twice for the lumber which was bought for her, with the possibility of a lien being filed against her property if she did not pay.

A man complained that the plans and specifications in his contract with a construction company were not being carried out as agreed.

An appeal for aid in securing a receipt for an electrical job which had recently been completed and paid for in full.

A woman complained to the Bureau that a planing mill failed to repair improperly veneered doors.

A woman complained that a roofing company had agreed to put a new roof on a building, when actually they had only repaired it.

Two owners of homes complained that they had contracted with a company to waterproof damp brick walls with a proprietary cement paint. The paint was applied, but the walls are still damp.

Checked advertising in daily newspaper in reference to the infringement of the trade-name of a local material company. Secured satisfactory adjustment and change in advertising copy.

Sunshine is harnessed to furnish hot water in Florida, residents of which state make use of the sun's rays to heat water without fuel cost. The heaters consist of two parts: an insulated copper tank in which water is stored, and a copper plate to which is soldered a flat coil of copper pipe enclosed in a glass-covered air tight frame which is placed on the roof. The heated water is kept hot over night and during cloudy periods in an insulated storage tank. It is said that over 5,000 such heaters are in use.
STRUCTURAL STEEL CREATED THE SKYSCRAPER

STEEL SOON BEARS RIPE PROFITS

The "cloud-touchers" are steel! Every one knows that now. Knows, too, that the higher spires and more daring spans to come must be steel. Of greater significance is a growing recognition of this fact: The humble building at a skyscraper's base, or the modest bridge astride a rural stream, is ready sooner, serves better and lasts longer when this matchless metal is used.

For steel brings the same speed and economy in construction, the same predetermined strength and security to homes, schools, and small as well as large apartment and mercantile houses, factories and bridges. It comes to a building site ready to go into place. Heat or cold, rain or snow cannot affect it. It is permanent, fire-resistant, cannot shrink. It may be quickly erected wherever and whenever men can work.

Before building anything, find out what steel can do for you. The Institute serves as a clearing house for technical and economic information on steel construction, and offers full and free cooperation in the use of such data to architects, engineers and all others interested.

The co-operative non-profit service organization of the structural steel industry of North America. Through its extensive test and research program, the Institute aims to establish the full facts regarding steel in relation to every type of construction. The Institute's many publications, covering every phase of steel construction, are available on request. Please address all inquiries to 200 Madison Avenue, New York City.—In Canada, to 710 Bank of Hamilton Bldg., Toronto, Ontario. District offices in New York, Worcester, Philadelphia, Birmingham, Cleveland, Chicago, Milwaukee, St. Louis, Topeka, Dallas, San Francisco and Toronto.

"MUNICIPAL CENTER FOR CITY OF MEDIUM SIZE," AN ENLARGEMENT OF THIS DESIGN BY HUGH FERRIS, ON SPECIAL STOCK FOR FRAMING, WILL BE MAILED WITHOUT CHARGE TO ANY ARCHITECT, ENGINEER OR BUSINESS EXECUTIVE.
Judged the Best House

built in the
borough of Queens
New York, in 1929

CERTIFICATES of appreciation are awarded each year by the Queensboro Chamber of Commerce, to the architect, owner and builder of the structure in each of several classes which in the opinion of the Better Building Committee contributed most to borough improvement during the previous year.

Lawrence M. Elliott was the architect who received the 1929 award for the Guyon L. C. Earle house at Forest Hills Gardens, of which Mr. Earle acted as general contractor.

THE FIRST COMMISSION of the architect after entering practice, and the first Queens award for a house designed and built for sale.

COMBINATION OF MATERIALS in the forms of Elizabethan England and provincial France contribute to the interest of this house at Forest Hills Gardens.

THIRD FLOOR has guest room and bath, two servants rooms and bath, and a large storage space. Basement has playroom, card room, toilet, and the usual heating space.
THIS new, modern home of the Aetna Life Insurance Co., Hartford, Conn., for instance, is completely protected by A. D. T. Central Station Services, consisting of A. D. T. Watchman's Compulsory Tour and Fire Alarm Service, Police Call and A. D. T. Phonetalarm protection for the vault.

Practically all the leading insurance companies throughout the country have standardized on A. D. T. Protection for many years. They appreciate the record of exceptionally low fire and theft losses incurred by A. D. T.-protected premises.

A. D. T. Central Station Services are available in all principal cities. Systems for owner operation may be provided when desired.

What part of our work is new and what part old? Between the Scylla and Charybdis of new and old, what should be our proper course?

Does tradition hamper progress in architectural thinking? This question and many others are now passing through the minds of many of us. When did this so-called modern movement begin? When and where will it end? When balconies in theatres and similar structures were first cantilevered, about thirty years ago, thus eliminating the old system of carrying the balcony load by intermediate columns—that was new. And what a shock it must have been to the eye to have seen such a balcony for the first time! When, about fifty years ago, the first steel skeleton building was constructed in Chicago, thus eliminating the old method of bearing walls—that was new. When cement was discovered—that was new. When steel was invented—that was new. So we go back through the centuries, noting continual discoveries and improvements of methods and materials and the new types of building in which they found expression. So we find the primitive house, or hut, for shelter, as a shrine for some kind of worship, a stockade for defense, a mound for the grave of a chief or hero; these simple buildings are expressions of very old inventions and usages. Were they not new ideas once?

New problems are today being presented to the architect which cannot be expressed in traditional terms but require that he evolve or create his own style and expression if the particular problem is to be solved in a straightforward, honest manner conforming to modern requirements. It is only in recent years that the architect has been required to deal with extensive mechanical equipment involving complicated systems of heating, ventilation, plumbing and electric wiring. These mechanical equipments have become a part of our life and must be dealt with. They are as necessary today as the vital organs in the human body.

I believe the day is forever past when we, as architects, can sell the idea of transplanting a Venetian palace from Venice to Fifth Avenue, and by clever juggling of parts transform this same building which was originally used as a residence by some famous Venetian family, into a modern jewelry shop, or a modern department store, or perhaps a modern restaurant. The new development in architecture which we are considering comes usually under the name of "modern," but the significance of this term is easily lost. It is modern only in the sense that it is contemporary. As such it is bound to have many expressions, some of which are and will be badly conceived.

We have spoken of solving problems in a modern way. This should not be misunderstood. There is no new principle involved. The development of the architecture of the age of Louis XIV was a modern, that is to say contemporary, movement in its day. Architects and builders of all ages have asked and answered these questions:—What is the function of the building? What is its purpose? What shall be its character? From this analysis it is clear that the dominant thought has been form should follow function. Consider, for example, all the tombs of Abydos, the most venerated of all burial grounds of Egypt. One finds that their problem was to build a structure that could be used for a tomb and then they proceeded to build it with the available materials.

It is a long reach from the tombs of Egypt to the house of today, and while the uses to which the tomb may be put are not very different today from what they were in Egypt, our mode of living is very different from that of the Egyptians. Should not our houses be designed in accordance with it? Let us consider three representative influences that have modified our conception of domestic work.

The traditional house, as most of us picture it, has some form of slanting roof. Prior to the invention of methods of making flat roofs that would be water tight, the house had to have some form of slanting roof to shed the rain. That is not true today; our houses may have flat roofs with impunity. This one invention gives the architect an opportunity for utilizing his roof surfaces and for reducing the cubage of his building.

The motor car developed as a commercial success about 1902 and since then has become of such importance that it must be taken into consideration in every residential problem, just as the kitchen is taken into account. The motor car must be housed just as the mechanical equipment in the kitchen must be housed. It is part and parcel of the present day domestic architecture.

When the motor car came upon us suddenly some twenty-eight years ago, no accommodations had been made in our houses for this vehicle. What happened? Those who were fortunate enough to have stables, converted them into garages. Those who did not have stables met the problem in a helter-skelter manner. The sheet metal manufacturers seized the opportunity over a small buildings known as metal garages. For the main part these garages were badly designed. They were frequently placed as far from the house and road as possible; and usually they were located at the rear of the property. The owner, evidently indifferent to his own comfort and convenience, did not stop to think that perhaps the garage was as much a part of his house as any other room. This treatment of the garage continued for years until someone was courageous enough to bring the garage from the rear of the lot and see that it was well designed and placed near the house or that it was incorporated into the house itself. In other words, the garage has become, in a way, the front entrance to the house.

Another transforming influence in recent years has been the perfecting of methods of heating and ventilation. One of the effects of this improvement has been the metamorphosis of the cellar. The old-fashioned cellar was and, where it exists, still is the hiding place of all kinds of junk which a family collects over a period of years. Into this part of the house, until re-
THE NATION SALUTES ANOTHER ARCHITECTURAL AND ENGINEERING TRIUMPH

EMPIRE STATE BUILDING
New York City

Architects: Shreve, Lamb & Harmon, New York City
Heating and Ventilating Engineers: Meyer, Strong & Jones, New York City
Heating Contractors: Baker, Smith & Company, New York City
General Contractors: Starrett Bros. & Eken, Inc., New York City

Conceived in great daring, designed in a consciousness of means never before given to architecture, the new Empire State Building will lift its beacon to pierce the sky eighty-five stories above the streets of New York. Framed with steel, clothed in stone and concrete, fortified and made lasting by every provision that art or science commends—America salutes this latest architectural and engineering achievement. In such an edifice, the use of any material is a high recognition of merit.

As in other structures of advanced design and monumental character, NATIONAL Pipe has an important place in the Empire State Building—a large portion of the piping being NATIONAL—

America's Standard Wrought Pipe

Subsidiary of United States Steel Corporation

NATIONAL PIPE
FOR FEBRUARY 1931
What to Put on Working Drawings

(Continued from page 47)

detail the members and connections. These things should be shown simply and directly. But here again, what is meant should be said. Is the clearance to the center or to the edge of a beam? Show the dimensions accordingly. Is the column or beam directly over the one below? Say so in an intelligible way.

Take the drawing of an average spandrel section for example. It probably shows a beautifully drawn I-beam sealing four and a half inches back of the facing. That looks fairly definite. But where is that beam from some given point? No hint is given, except that it is so far from the face and the face is so far from somewhere else. A long hunt will reveal that the wall has or has not set back at this story. Simplify this—run a plane up the full height of the building, such as the property line. Measure everything from this plane. If the edge of the spandrel is to be four and a half inches back from the face, dimension it to this edge. Don't get out the steel handbook and, from the width of flange, compute the distance to the center. Say what you want to say, and if changes of sections are made in the shop for some reason, the detail still holds good.

What does the contractor for the concrete work want to know? He wants to know the size and location of beams and slabs, and the number and size of bars. But here we are dealing with a continuous structure and one part laps over onto the next. The size of beam tells him how to make his forms, but noting the number of bars tells him next to nothing. The bars may be in the bottom of one beam, bend up, and lie in the top of the next. He needs to know which bars do this, where they bend, and how far they lap over. Only a continuous diagram of the whole line of the beam will show this, though it can well be done at small scale. The bends and lengths of bars should be dimensioned, and the number and spacing of stirrups shown. To show each beam by itself is sheer folly—the individual bars are the important thing, for from that information the steel is bent and cut. It saves time to do the job thoroughly, for checking a bar schedule is hopeless for the man who designs the details. And on the job, errors show up at once.

Lastly, what about the controversy over the right way to dimension a partition? Should it be to both sides, or to the middle? The answer is, no. It is all a case of what you are trying to say. Must a room be a certain width? Then dimension the room wall to wall. Does the partition line with the reveal of a window? Then show it that way, and call attention to it. Get the location from the window, for the window will be there before the partition is set—it is, so to speak, logically prior. If it lines with the edge of a beam, show that.

Contractors sometimes waste hundreds of dollars making the fireproofing just an inch and a half instead of standardizing beam bottoms. For all they know, some partition may have to come on the edge of a beam and it may be dimensioned as such. But they have no way of telling without much study. If the partition comes more or less to a given line, dimension it to the middle—many partitions are located to a convenient inch or foot anyway. Usually the thickness shows to scale, but if there is any doubt, show the nominal thickness separately. It won't be just that thickness actually, so why pretend that it will be in a long tie-up of dimensions? There is no place more liable to error than such a line anyway, and if two such lines have to match at various points it is deadly—and often useless.

These cases are merely instances of a general principle. Ask yourself: What does the man on the job want to know? Then say that, and no more and no less. Especially don't say more. He won't take the time to read any of it if you do.

The next movement which we shall probably see in the field of architecture will be the giving up of traditional forms in domestic work in favor of simpler forms derived from conditions imposed by modern methods of construction.

By way of summary, I could do no better than to cite the following illustration: I have been asked to design a modern theatre railroad car. The character of the structure of the shell of the car is metallic; in other words, the car must be structurally and decoratively executed in metal of one kind or another. What attitude should one take in solving this problem? Should one go back to traditional styles, in which plaster, stone and wood were the mediums which made up the architect's palette, so to speak, or should he attack this problem in such a manner as to utilize present day materials, so that the car shall express the material of which it is built? The answer seems clear to me: The car should be designed irrespective of traditional styles, and forms of decoration should be used which would not in any way interfere with the effectiveness of the car considered as a practical and useful adjunct to modern life.
Front page news says, "Drive out the public enemies." Include leaky faucets and make it unanimous!

Every architect and engineer knows what it costs to maintain and replace faulty equipment. In the case of faucets, millions of dollars annually are dissipated in wasted water, hot and cold, repairs, replacements and labor.

All of this could be avoided by installing Chicago Faucets.

Wherever Chicago Faucets are used, the bigger the building the bigger the saving. They never need replacing and last indefinitely. One standardized unit fits all faucets. It is instantly removable—replacing the seat or washer, which costs only a few cents, is the only expense for upkeep.

Why not put your buildings on this economical basis? Mail the coupon for catalog and cut-open sample, free.

To make a Chicago Faucet as good as new, unscrew and lift out the unit—replace the washer or seat—no harder or more expensive than changing a light bulb.

LET ME TELL YOU MORE ABOUT CHICAGO FAUCETS AND THE SAVINGS THEY ARE EFFECTING IN MANY LARGE BUILDINGS.

NAME

ADDRESS

THE CHICAGO FAUCET CO.,
2700-22 North Crawford Avenue,
Chicago.

To make a Chicago Faucet as good as new, unscrew and lift out the unit—replace the washer or seat—no harder or more expensive than changing a light bulb.

CHICAGO FAUCETS
FOR FEBRUARY 1931

75
have been considered as affecting masonry mainly at the surface, but in the light of present knowledge the surface effects are usually insignificant compared with what takes place within. During the past century the acid condition of rainwater has been greatly augmented, particularly in industrial centers, by sulphur gases from the burning of coal and oils. Evidently this contamination has greatly accelerated acid action over that of the ever-present content of carbonic acid gases. The solvent action of acid rainwater on limestone and marble has long been recognized by the surface effects, but there has been little said of the same action striking at the more vital parts of such materials.

Some studies have been made at the Bureau of Standards for the purpose of learning more about this phase of weathering and the results have given marked indications that the action of weak acid solutions or rainwater on the interior of carbonate stones is a prominent factor in bringing about decay. This process is probably analogous to that which results in the formation of caves in limestone regions, but on a much smaller scale. Acid rainwater permeates the pores and each time the pores are enlarged somewhat at the expense of the bonding material between the grains or crystals.

A good example of this action is seen in the United States Patent Office Building. The part referred to is of a very large crystal calcite marble formerly called "Alum marble." There are parts of this building from which one can pull out crystals which have become entirely loosened from the blocks. Figure 5 is the base of a column in this building which shows an advanced stage of weathering. This seems to be mainly due to solution between the grains, but no doubt frost action becomes a factor in the process after the pores have been enlarged by acid action.

A block of marble 8 inches thick was taken out of the top of a chimney on the Patent Office Building and sawed into six slabs each about one inch thick. These were tested for strength and absorption and the results are shown in Figure 3. The strength of the slab from the outside face is seen to be less than one-third that of the original marble, then it increases toward the middle of the block to over one-half of the original and drops down to about two-fifths on the other face.

ACID RAINWATER permeated the pores of the crystal calcite marble columns of the United States Patent Office Building and enlarged them at the expense of the bonding material between the grains. One can pull out occasional loosened crystals which was somewhat protected from the weather. The porosity of this marble when fresh from the quarry is about one per cent. Absorption values indicate that the porosity was about twice as high on the weathered faces as in the middle of the block, which in turn was fifty per cent higher in porosity than the original material.

Further evidence that the interior of limestones and marbles is dissolved by rainwater is presented by Figure 4. This shows the results of weight measurements on sandstone, marble and limestone freely exposed to the weather over a period of seven years. The sandstone, due to its inert constituents, showed no loss in weight but rather a slight gain, which was probably due to the accumulation of dirt on the surface. The marble showed a definite loss and the limestone a little more than twice that of the marble. Since the last two materials are practically identical in composition the different rates of solution must be accounted for by the physical structure. The porosity of the limestone being several times that of the marble, the logical conclusion is, that the limestone was dissolved inside at a greater rate because rainwater could reach the interior more readily.

The weathering of materials such as sandstone, granite and slate, which are mainly inert to acid attack, is not so easily accounted for as that for carbonate stones. Since these materials usually consist of a conglomeration of different materials, which vary greatly from one deposit to another, each particular deposit may be a problem within itself.

One type of decay which frequently affects masonry is that due to efflorescence. This is caused by a leaching process carrying water soluble salts from the masonry walls and depositing them where the water finally evaporates. The surface deposit of efflorescence does not injure the masonry but often some of the salts crystallize in the pores near the surface. It is the internal stresses produced by the growth of crystals inside the stone that caused scaling of the surface. This type of decay appears to affect all types of masonry, but not at the same rate.

Decay of stone masonry from efflorescence seems to be the most serious of all weathering agencies but its
NEW I.T. & T. BUILDING uses

The new International Telephone & Telegraph Corporation at 67 Broad St., New York City, is equipped with W. & J. Sloane Double-Waxed Linoleum. 16,000 square yards of 6 mm. brown Battleship Linoleum cover the floors of the huge structure where I.T. & T. executives, through their far-flung cable systems, literally have their fingers on the pulse of the world.

The International Telephone & Telegraph Corporation adds another distinguished name to the list of users of W. & J. Sloane Linoleum, some of the more important of whom are: Yale University, Chase National Bank, N. Y. Central Lines, Doctors Hospital, N. Y. C., Western Electric Co., Presbyterian Hospital, N. Y. C., Lambert Pharmacal Co., Eastern Outfitting Co., Los Angeles.

W. & J. Sloane Linoleum is made with a natural fine-textured finish, the result of extra-processing in the grinding and mixing of raw materials and extra pressure in the calenders. It is then double-waxed at the plant by an exclusive Sloane process. When you specify W. & J. Sloane Linoleum you assure your client of the finest money can buy. It is easy to handle and lay and is ready for use as soon as laid. Examine this superfine finish before you write the specifications. We will gladly send you a quality sample.

W. & J. SLOANE DOUBLE-WAXED LINOLEUM

FOR FEBRUARY 1931
remedy is largely a structural problem. It is not feasible to select materials that are free from water soluble salts but even though such are present no harm will result unless considerable water passes through the walls. (See Bureau of Standards Technologic Paper No. 349, pp. 540-543.) The rise of moisture from the ground is often as serious as faulty drainage from the roof or open masonry joints.

Some materials are subject to rather early disintegration due to inherent causes. Certain slates have been found to give satisfactory service for only 15 or 20 years. The decay is a result of chemical alterations taking place within the slate and seems to be independent of all external agencies except for an occasional soaking. This type of decay can be reproduced by merely soaking and drying the material several times. Although the mineral constituents of such slates may be relatively stable by themselves, certain combinations of these are conducive to a chemical interchange of elements which results in decay. A serpentine stone formerly used to a considerable extent for exterior purposes appears to be affected by chemical changes within. This stone has given good service over a period of fifty years or more, but after such exposure it begins to show considerable erosion. This is probably not caused by a chemical interchange of elements but merely by expansive forces due to a hydration of certain mineral constituents.

Considerable space has been given by various writers on the subject of weathering to the effect of heat and cold on stone exclusive of frost effects. It is assumed that the thermal expansion of the surface layers due to being heated or cooled through a greater range of temperature than the interior causes stresses which result in decay. Also in materials composed of aggregates of different minerals having different rates of expansion, the result is said to be harmful. Aside from a few geological examples of this type of decay we have very little evidence in support of the theory. Granites might be expected to suffer from such causes more than any other type on account of having large crystals of different minerals. Also large crystal marble might be affected because calcite crystals expand differently in different directions. Such decay would be expected to be more pronounced on the east, south and west sides of buildings and less on the north.

It would be a difficult matter to prove the theory from such exposure comparisons because the northern exposures are often weathered the most. Figure 1 is a close-up view of the base of the Washington Monument in Washington, D. C., taken on the north side, while Figure 2 is a similar view of the south side. The marble is a very large crystal material which should show as great temperature weathering as any marble. Although both views show considerable spalling, the condition appears to be no worse on the south side of the monument.

Granite has, in several cases, been observed to scale, particularly in the base courses of buildings but seldom in monuments. The evidence indicates that this is not a temperature effect because it is usually more prominent on the shaded parts. An example of this is found on the pilasters on the east side of the Union Station at Washington. The scaling is not very conspicuous on the sunny side but more so on the shady side. This decay is evidently due to the crystallizing effects of water soluble salts, being more pronounced on the less exposed side, no doubt, because the rains cannot wash away the salts there as they do on the more exposed sides.

In some granites there is also found evidence of decay from a kind of internal decomposition similar to that of certain slates. Many are of the opinion that this action on granite is confined to a shallow zone which has been injured in the finishing process, but this theory is not always substantiated by observations.

The state penitentiary walls in Philadelphia show deep erosion, although it may be remarked that this is not a good example of granite but rather a descendant of this material, it being a granite gneiss. This structure was built in 1823.

As a tribute to the durability of granite for building purposes it seems only fair to point to what is probably the oldest granite structure in this country, the old King’s Chapel in Boston. Constructed about the middle of the eighteenth century of blocks obtained from surface boulders said to have been split by fire, this building has shown excellent weathering resistance under very severe climatic conditions.

After considering various ills to which masonry is susceptible, one may wonder if there are not remedies for any of them. Although the decay of masonry is not as serious a question in this country as in the older ones, nevertheless, there is a growing demand for means of preserving old structures. Various theories and processes have been propounded but the treatments most relied upon in this country are those which strive to prevent the percolation of water through the masonry. Evidently this object, if successfully attained, will prevent decay by any of the causes mentioned in this article except the possible injury from temperature changes.

There are a number of difficulties attached to the task of preventing moisture penetration into the masonry. Surface applications even where effective are not all that is desired because moisture often rises through the foundation. Sealing the exterior surface causes most of the rising moisture to pass out through the inside of the walls. Partial sealing of the exterior surface may cause it to scale off from frost or salt action, and it seems that there are a number of materials that offer great difficulty when it comes to sealing all of the surface pores. In spite of these difficulties there are cases in which it seems evident that decay has been arrested by successful treatment.

A treatment for preserving masonry should be reasonably permanent and its life expectancy should be known, so that renewal can be made at the proper time. Treatments of paraffin base appear to be good for at least ten years, stearate solutions about two years, while some others are still less permanent. In Europe considerable attention has been given to developing a treatment which supplies a cementing material as well as a void filler. This seems to be the ideal goal, as it would enable us to bring about the restoration of materials that have become too friable for effective treatment with wax preparations.
THESE SPLENDID CORRIDORS
in the CAREW TOWER BUILDING
are faced with EVERLASTING
ATLANTIC WALL UNITS

Miles of corridors stretch their length throughout
40 stories of this impressive addition to Cincin­
nati's sky line...cheerful and attractive in their
facing of Atlantic Wall Units. These new mechani­
tically made Wall Units achieve a symmetry of
joint alignment that has no equal. They possess
all the advantages of hand made terra cotta units, plus
a price advantage due to quantity production. Atlantic
Wall Units are available in rounded as well as flat shapes,
in base and moulding designs, in all desired surface fin­
nishes, and in the full range of hundreds of Atlantic Terra
Cotta colors. They are offered as a new and progressive
development in the building materials field, backed by
the resources and facilities of four large factories engaged
for many years in terra cotta manufacture.

Consult with us about your new building requirements. Avail
yourself of our long experience. Our booklet "Atlantic Wall
Units" will be sent upon request.

FOR FEBRUARY 1931
Most home owners know that incineration is one of the welcome conveniences of a modern home. But everyone doesn’t know how little it costs! Compared with other home conveniences the cost of a Kernerator represents a most amazing value. It lasts as long as the building and there is no upkeep cost. It is a daily convenience and health protection. All garbage and other household waste is placed in the handy hopper door in the kitchen and falls to the combustion chamber in the basement. The accumulation is air-dried and destroyed by burning—no extra fuel is necessary. Non-combustibles are flame sterilized and removed with the ashes.

When you specify a Kernerator you are selecting a product guaranteed by a financially responsible manufacturer with a nation-wide service organization.

See our catalog in Sweet’s or write for A. I. A. folder.

INCINERATION FOR THE MODERN HOME

THE AMERICAN ARCHITECT
“CHARMING ROOM”

—and notice how much of its beauty depends on its color-rich floor

Decorative units, charming in themselves, do not always combine pleasingly. When you see a room that immediately appeals to you, the chances are that one unit has taken a firm hand in the situation and made the others behave. And frequently that unit is the floor—the largest decorative area in any interior.

That’s why the architect should specify the floor. Selecting floors for clients is a part of that “follow through” that insures satisfaction no matter how the client chooses to decorate.

Specify an appropriate color-rich floor of Armstrong’s Linoleum—a design in harmony with the spirit of the room or the house—and the probability of client-satisfaction will be high.

Not only will a floor of Armstrong’s Linoleum do an effective decorative job today—but it will stay on the job for years. Armstrong Floors are quiet and comfortable under foot because they are resilient. The Accolac-Processed surface is spot-proof and stain-proof. That is why light waxing and polishing keep the surface gleaming. Installation costs are moderate, upkeep costs are reasonable.

Complete information about these modern floors should be part of your files. We have included the information you want in our current file-size specification book. Colorplates and samples, too, if you wish. Just write to the Armstrong Cork Company, Floor Division, Lancaster, Pa. (Also listed in Sweet’s Catalog.)

Armstrong’s Linoleum Floors for every room in the house

Six reasons why Architects should visit Crane Exhibit Rooms

Rich resources of the world have been brought together by Crane Co. to help architects create a new, distinctively American room... the bathroom of today.

From Italy was imported the Brocatello Sienna marble of the Chateau lavatory and the dental lavatory illustrated above. The designs of the lavatory and the Louis XVI metal-work and trimmings used throughout this bathroom are the work of French artists. The colored porcelain of the marble-enclosed Turnica bath and the vitreous china of the closet, reviving an ancient and beautiful art, were produced by Crane potteries in America. The working parts of the quiet Corwith closet, the sure-action pop-up Accesso bath waste, the mechanical perfection of the glass-enclosed shower, have been developed by the most resourceful modern production engineers.

In Crane Exhibit Rooms in every important city in America, such materials... and a wealth of other ideas for the smallest Cape Cod cottage as well as for town houses in chateau or villa style... are on display. Here architects can see all the varied ideas that are revolutionizing bathrooms and plumbing. They will find new and more beautiful fixture designs, helpful suggestions for color decoration, many improved comfort-giving and labor-saving appliances, and innovations in piping materials that increase dependability and lower construction costs. A visit now and periodic visits hereafter to the Crane Exhibit Rooms near you will be richly profitable.
MODERN construction builds with Steel for economy, safety and permanence. Now to the builders of the Central West, Illinois Steel Company offers parallel flange C.B. Sections, formerly produced only in Pittsburgh. These sections are now rolled in Chicago in the complete range of sizes.

Achievement in Factory Flooring!

— and here’s the Reason —

The two most important qualities of good factory flooring are combined in Bloxonend — Durability and Lasting Smoothness. Durable because the tough end grain is the wearing surface—and lastingly smooth by reason of the blocks being dovetailed to long baseboards.

The use of Bloxonend invariably is responsible for a saving in maintenance and production costs. Its smoothness minimizes wear and tear on trucking equipment and means faster and safer trucking. A comfortable working surface assured.

Bloxonend comes in 8 ft. lengths and is laid over old or new concrete or wood floors without interrupting operations. Write for Descriptive Booklet “M”.

fits, shooed off the other urchins and shooed off the flies. In fact, he was one of us. I say he, but for a long time we did not know just what this youngster with the ragged bournous and the constant smile was, so we called him “It.” When we left Kairwan our “It” wanted to go along; he didn’t know where we were going, but he wanted to go, and indeed it was like leaving an old friend when we left him behind.

Baedeker says, “Kairwan is the oldest Capital of Ifrikia and the most curious in Tunisia” but as Baedeker has a habit of saying things like that, and not knowing ourselves just how much of Africa is Ifrikia we shall have to let the first part go as it is, but we will vouch for the second.

We had heard so much about the Aissouas who give what the guide book calls “hideous castigations” every Friday afternoon, that we looked hopefully forward to seeing these people who every week with unfailing regularity cut themselves almost in half with swords, shove their eyeballs out, eat glass, scorpions, cactus, and what have you, and have many other alluring pastimes. They turned out to be well worth seeing, though I entered the mosque where they performed with a feeling of incredulity and emerged with the same.

The matinee began late in the afternoon, when a group had assembled. After much swaying and chanting, to put themselves and their audience in the proper mood, a dish of broken glass was passed around for examination. It appeared to be real. Then a thin gentleman proceeded to make a light lunch of it with relish. Herman the magician used to say that “the hand is quicker than the eye,” so whether he ate the glass or deftly substituted a more delectable substance, I could not say, but in any case he was not fussy about his food. Next, the priest who acted as a stage manager held a live scorpion deftly between his forefinger and thumb, allowing its authenticity to be inspected if desired, and a more nasty looking insect I have never seen. Then a compatriot bit it in half and swallowed it. Some say he ate the end without the sting, but heaven help him if he ever got absent minded and ate the wrong end.

Even if it were only an African grasshopper he has my vote for being braver than the lad who ate the first oyster.

THE much talked of man who cuts himself in the middle with a sword—recently pictured, by the way, in Ripley’s “Believe It or Not”—seemed to me to be palpably a fake, for this fat belled native simply pulled the huge sword deep into one of the many wrinkles of his big stomach until it seemed as though the sword were half way through his body—at that it is a trick to toughen one’s anatomy sufficiently to resist the blade. There were many more tricks and the man who nearly shoved his eyeball from its socket with a long spike had a punishing act if you cared to look at it.

Kairwan has numerous mosques, the largest being the Sidi Okba or Grande Mosquée, one of the oldest in the world and, next to the Kairwan Mosque at Fez, the most important in Barbary. Founded in the year 671, the plan resembles that of the oldest Egyptian Mosques.
TELEPHONE CONVENIENCE CAN BE PLANNED TO MEET FUTURE REQUIREMENTS AS WELL AS PRESENT NEEDS

DISTINCTION in a house is as much a matter of arrangement inside as of appearance outside. Every added convenience contributes to it. And many architects consider telephone convenience especially important.

Telephone convenience consists simply in having enough telephones—in living-room, library, bedroom, boudoir, kitchen and laundry—wherever they will save time and energy. It is as properly a part of the small home as of the large residence. It can be provided for in advance, by specifying conduit for telephone wires within walls and floors.

That conduit permits the owner to have telephone outlets wherever he wants them. He can change them or add to them as occasion demands. And he can enjoy the improved appearance and protection against service interruption that come from concealed wiring.

Your local telephone company will gladly assist you in planning the telephone arrangements for any of your projects. There is no charge whatever. Just call the Business Office.

Eight telephone outlets, including one in the basement, and an inter­commun­icating system, provide suitable telephone convenience on the residence of Mr. Henry P. Williams, 180 Provencal Road, Village of Grosse Pointe Farms, Michigan, as shown above. HUGO T. KEYES, Detroit, Architect.
EXTERIOR LIGHTING
FIXTURES
by
Smyser-Royer
The Attractiveness of Any Structure Depends Upon Distinctive Exterior Lighting

YOU ask—just what makes Smyser-Royer exterior lighting fixtures different and distinctive?

Made of the same metals as any others—cast iron—bronze—or aluminum, yet they are constructed with such skill, care and craftsmanship that these outstanding fixtures are preferred by leading architects the country over.

For 91 years Smyser-Royer has specialized in the careful reproduction of exterior lighting fixtures designed by architects. Long experience in this type of work has built for Smyser-Royer a reputation for dependable craftsmanship among architects.

Architects who specify Smyser-Royer exterior fixtures are assured of careful, distinctive fabrication of their original designs.

Or—if stock designs are desirable, a wide selection of fixtures is offered in the Smyser-Royer Catalogue or in Sweet's Architectural Catalogue, Section D, Pages 6034 to 6044.

Ask for our catalogue for your files.

SMYSER-ROYER COMPANY
MAIN OFFICES AND WORKS, YORK, PENN.
PHILADELPHIA OFFICE, 1700 WALNUT STREET

The building materials were largely supplied from the ruins of Carthage and Susa, which accounts for the many beautiful columns. The massive looking tower has two setbacks resembling those of modern times, with battlemented parapets, and it is topped with a dome. The radiating designs painted on the side of the tower represent huge spiders, symbols having the power to ward off snakes and scorpions.

The mosque, covering an irregular area of about 240 feet by 400 feet and enclosed by a fortress-like wall, has a large court surrounded by a colonade of antique columns. Below the pavement of the court are large cisterns with filtering apparatus to collect rainwater. The interior of the sanctuary has a T shaped plan with a nave and sixteen aisles with eight rows of arcades, giving the impression of a forest of columns. These are of surprisingly varied materials, white and colored marble, granite and porphyry, with a variety of caps including Roman, early-Christian and Byzantine. The beautiful Mihrâb Chapel decorated with gold hued faience is impressive and the Minbar or Friday pulpit a good example of early-Moorish art.

The use of alcohol is prohibited by the Mohammedan religion. However, many cafés exist where the boys park the camel and sit down for a drink of mint tea or coffee. The beggars are a pest and leper women with babies at their breasts expose their sores and ask for alms.

ONE night about 9 o'clock I heard a great beating of drums. I was told it was a wedding procession and that I would do well to follow it as it wound through the streets of the town. The groom walked sadly in the midst of friends who carried torches and lustily beat drums to get him in the spirit of the thing. He wore a white veil to cover his head and shoulders and looked as though he were having a thin time of it and hoped the ceremony would be postponed at the last minute. In Kairwan marriages are arranged by the parents and the groom strangely enough is not supposed to see his bride's face until after the ceremony. What a game of chance this turns out to be!

The shops or Souks consist of a room about 10 x 15 feet where raw material is made into a finished product and sold at a counter at the front, all of which is open to the street. The methods of manufacture are primitive, tailors sewing with the aid of bare toes, wood workers using the bow and string method of drilling holes, while in a carpenter shop I saw two men laboriously making planks, sawing by hand long slices from a large log.

The Place de Tunis is a huge open air market place where everything is sold from old shoes to braised cows hoofs; the latter are made into delicious hoof soup. Many butcher shops display their wares to the delight of millions of flies. I am not certain what the favorite meat of the natives is, but from the meat displayed it seemed to be entrails.

Late in the afternoon the square is taken over by various snake charmers, jugglers and story tellers who are highly amusing and I found myself drawn each afternoon to these performances.

One unpleasant impression of this part of Africa is the prevalence of eye diseases. A good doctor would do a thriving business here, as the children one and all seem to have sore eyes. I was told this condition developed
An Inexhaustible Supply

We have three finishing plants and nine quarries in operation the year round—there is no closed season.

The illustrations show three of our quarries and an air view of our Tate finishing plant. The other two plants are at Nelson, Ga., and Marietta, Ga.

Although the nine quarries now in operation are meeting our needs, new quarries can be opened when necessary. At almost any point over an area of 7000 acres it is possible to open up a new quarry by removing the surface soil.

Test borings indicate that this section contains Georgia Marble in quantities so great that it would take many centuries to quarry even the marble that has been definitely charted.

Those who visit the quarries marvel at the unusual soundness of the marble, and the immensity of this marble deposit. Georgia Marble is available in white, grey, pink, green, and other colors.
IS EXPENSIVE . . .
in dollars...in nerves...in life!

In modern living, noise is a destructive waster of man-power. Architects work side by side with scientists to develop means of guarding the modern worker from jarring, jolting, unnecessary sound. Man must fortify himself against noise; complete door control is the most important weapon in this defense.

The ILCO-BLOUNT Door Check offers the most efficient and sturdy method of door control—it not only quickly, easily and surely closes the door, but checks it in any way desired. It operates with the same thoroughness on the fortieth floor of a skyscraper as at street level, is not affected by varying temperature, moisture or draught conditions, and its cost is amazingly reasonable.

At your request we will gladly send you the complete information on the ILCO-BLOUNT Door Check. Our twelve branch offices throughout the country stand ready to co-operate on prompt deliveries. Make this memo, "Look up ILCO-BLOUNT."

Investors Have Fewer Jobs
(Continued from page 39)

A partial study made of forty-six central city buildings erected since 1923, representing a total investment based on building permits of eighty-six million dollars, has revealed that of these only twelve are probably financed successfully; and of these twelve, seven were erected for special purposes that automatically assured their success. The remaining thirty-four, representing investments totaling fifty-six million dollars, have failed to yield the return anticipated. Some are operating at a loss.

The situation, I grant you, is unduly severe and dependent on many factors possibly not fully capable of control and elimination, yet this alone is not the basic cause of affairs.

Many of these projects could never have been an unqualified success under even boom conditions. In other words, the present distress in the building industry is by no means due entirely to the general business depression. Col. W. A. Starrett, writing in 1928, at the peak of prosperity, said:

"When an industry ranks among the first two or three in a great industrial nation, and no one engaged in it makes more than a living except indirectly, something is wrong. The answer is that building, while conducted with high technical efficiency, is economically the most disorganized major activity known to modern business, agriculture perhaps excepted. Building and farming linger in the economics of the 19th century, whence all but they have fled."

But it is not so much where we are, but where we are going that counts. The entire human family can be divided generally into two great groups—those who are interested in where we are, and those whose chief concern is where we are going. The former believe that deviation from tradition spells disaster. They fulfill a certain function in society by preserving values that have already been won, but the others, that look to the future, the prophets that are interested in where we are going, are the ones who effect progress.

America is a dynamic country, with a dynamic civilization; and building economics must follow a dynamic program to keep pace with it.

Dynamic building economics is an economics of trends based upon facts. The most modern economist realizes, with the most ancient of philosophers, that "everything changes." Nothing is static in modern American cities; and if he is to make change serve him, the American...
THE Dunham Differential Vacuum Heating System is essentially a system—a heating unity, built according to a rational principle. Sub-atmospheric steam controlled in accordance with the demands of outside weather is the simple, logical basis of Differential Heating performance.

That it is a perfected system may be seen from the close approach to the theoretical ideal. The Differential System, installed with the new Dunham concealed radiation, will not be seen nor heard; you will not feel nor smell it, for the heating is so mild and so accurately maintained that there is no overheating to intrude on the consciousness of the building occupants.

Compare both comfort and cost and you will see why Differential Heating is so frequently chosen for the finest buildings as well as for those where costs are most carefully considered.

C. A. DUNHAM CO.
450 E. Ohio Street
Chicago, Illinois

Fuel savings of 25 to 40% have been demonstrated by installations in all types of buildings, including the largest of office, commercial and apartment buildings. Heating costs may also be cut on existing systems. Plants can often be changed over to Differential Heating by simple and convenient alteration, the cost of which is paid out of fuel savings.
Why bother about protecting and insulating your underground steam pipes?

They are underground... out of sight... why not just bury them and try to forget all about it? Think how much cheaper it would be. Well, if you are not concerned with efficiency... if almost continuous repair bills suit your fancy... if staggering fuel bills don’t bother you... then just stick the pipes in the ground.

But you’re interested in economy... you want an installation which can be made in minimum time and which will be permanent and efficient... free from constant expense. In other words, you actually want a Ric-wil Conduit System.

From the Atlantic to the Pacific Ric-wil Conduit is proving every claim made for it. Hospitals, Educational Institutions, Central Heating Plants, Industrial Plants and many others comprise the ever growing list of satisfied Ric-wil customers.

Before you make a decision, investigate all of the various methods of insulating underground pipes. Check drainage facilities, cradling of conduit, loads imposed on conduit, side joints and insulating materials. And investigate efficiencies of actual installations.

The Ric-wil Catalog, efficiency test reports and details of typical installations will be gladly furnished upon request.

builder, along with the American manufacturer and merchant and financier, must develop the facts.

Trends can be charted accurately only from a vast groundwork of facts: facts governing development and relative growth of localities, facts regarding building character and cost, rentals and expenses, management and incomes, facts not only of those conditions as of today but as they were yesterday. We cannot make estimates of the future with any uniform possibility of success until we know the past. The future contains enough uncertainty which can never be accurately foreseen, but if we approach it with the proper perspective, equipped with scientific knowledge, we can at least avoid some of the errors of the past. Their constant repetition is not only unnecessary but overwhelming.

NOTHING will so stimulate building as reducing the likelihood of losses in buildings. Today we cannot escape the fact that many building operations have fallen far short of their expected possibilities.

But this direct loss, often a very severe one, is still only a small part of the widespread damage. Foreclosed properties and their improvements, sold under the hammer or taken over by the mortgage holders, with the previous equity eliminated, may be rented at lower rates and these rentals effect and jeopardize other neighboring properties which may have been economically conceived and soundly financed. In other words, one’s neighbors and what they do can endanger not only our lives and safety but also our pocket books.

Further curtailment in avoidable losses will react very definitely not only towards reducing building costs but likewise the interest required on funds invested in the building industry. Just as life insurance companies have found that health research and health education, by increasing longevity, can reduce insurance rates, so the building industry will discover that economic research and economic education, by reducing risk to capital, can lower building losses.

The question is asked: How can the architect, the builder, the contractor, the investor, get the facts vital to his enterprise? Why should it not be possible for a new owner to profit by the experience of the former owner?

Why should not the architect be in a position to secure from one source accurate and comprehensive information as to the many factors which it is his task to consider, whereas today it is necessary for him to collect his information from many sources, many of which are questionable?

Why should not the banker be in a position to learn accurately the actual cash investment which the prospective builder is prepared to invest in his own enterprise, and why should it not be possible for the builder to determine in advance the financial responsibility both of the owner and the sub-contractor?

What would it mean to the legislator if he had at his disposal a reliable fund of information as to the real property values, the relative congestion of various areas, and above all, business trends? And no less important, what would be the value of such a source of information to the City and State Engineering Departments?

Some of these facts which should be available to all, are known only to the designer, others only to the realtor, and still others only to the builder and the banker.

(Continued on page 92)
PERHAPS as no other craftsman, an architect appreciates the importance of attention to detail. A single jarring note — from a carelessly selected item of equipment — may spoil an otherwise perfect ensemble. With an understanding of the architect's problems, with a knowledge of the mechanics of design, Sargent offers hardware of unquestioned quality in a wealth of designs to harmonize with all standard schemes of building decoration.

 Architects who specify Sargent Hardware have come to consider it — not merely as necessary equipment to be selected in keeping with the building style — but as a dependable, additional means of expressing true character in decoration. Sargent & Company, New Haven, Conn.; 295 Madison Avenue, New York; 150 North Wacker Drive, Chicago.

Our line is adequately represented in Sweet's, 1931 edition, volume C, pages C3780 to C3878.
UTILITY

...Continuous Concealed wireways for any number of Telephones, Desk Lights, Buzzers, and other outlet Connections

Conduo-Base enables you and your clients to install outlet connections at any point along the base in five minutes' time—without the usual tearing up and patching of finished work.

Saves the cost of pre-fixed outlets—the cost of wire molds—the cost of baseboards. Specified by leading architects all over the country. Favored by building owners and tenants.

Conduo-Base eliminates entirely the necessity of determining beforehand the location of electrical outlets, and the unsightly, dangerous exposed wiring for electric equipment at a distance from a pre-fixed outlet.

We will be glad to send you detailed information.

Chicago, Ill.

Obviously it is impossible for one individual or one isolated organization to cover the whole field. The task of getting a comprehensive picture of all phases of the building industry cannot be delegated to the banker any more than it can be represented as strictly an architect's problem. It is a problem which we all must face for it is in this age of dynamic building economics increasingly vital to the success of all.

It would seem that the builder should pool his information with the materials man, the banker with the architect, the electrical contractor with the plumbing contractor. It is industry's problem—one problem of applying scientific principles to an industry which has fallen behind in the march of progress.

I do believe that the problem of coordinating and pooling our information, the question of developing a fund of knowledge which will make it possible for all those interested in the building industry to know, with a great degree of accuracy, where their money is coming from, is not impossible of solution. I believe that reasoning men, brought together by a common interest, can find a way out.

As many of you know, this represents the ideal of the Philadelphia Building Congress, organized eight years ago through the initiative and vision of D. Knickerbacker Boyd. Mr. Boyd was a pioneer in his field. As its president for eight years, he piloted the ship through uncharted seas. Through all these years, with a few loyal and active supporters, he held steadfastly to the ideals for which the Congress was formed.

Today it is the feeling of the officers of the Philadelphia Building Congress that the time is ripe to take active steps to make this ideal a reality. It is my particular desire, and I speak for the other officers of the Congress, to emphasize that:

We believe the plan of coordinating the industry's problems through a central agency is far more important than the Philadelphia Building Congress itself. We recognize that the Congress, or any other scheme of federation, will be unsound if it is without the whole-hearted support of a large proportion of the organizations within the industry in Philadelphia. We further believe that this organization must not be controlled by any one branch of the industry, but must rather be governed by a method of proportional representation which aims to insure complete objectivity in all its functions.

Today some forty-five organizations are functioning in the industry in Philadelphia. The Congress or federation idea does not imply that the functions of any of them will necessarily be lessened. Rather, it means that working together, these organizations can measurably improve their service to their members, effect a substantial saving in funds expended, and derive added assurance of the mutual welfare of all.

I do not anticipate that once there has been brought into being in Philadelphia a central organization of the type that I have indicated that all the ills of the building industry will be miraculously cured over-night; but I do insist that we will be taking the right road, that we will be in step with the times, and that we will have contributed, as much as human intelligence can, to the building of a sound business revival in the building industry and a greater and renewed prosperity for our City.
Norton Memorial Hall is an auditorium seating 1,500 people. The building is approximately 83 by 143 feet, with walls 40 feet high. The entire building is of reinforced concrete, the exterior left just as it came from forms and molds except for cleaning with brush and water.
More clients for the Architect

Slowly but surely there is growing a widespread demand for better residential design and construction. Even speculative builders and development companies are finding it pays to entrust their projects to the skilled hands of an architect.

Good Housekeeping is one of the influences which is bringing this about. No other magazine of equally large circulation champions good domestic architecture as Good Housekeeping does in its pages every month.

In scope the editorial program of Good Housekeeping has 1,750,000 readers, but also because these readers are mainly of the type whose aspirations, standards of living and incomes place them among the most logical prospects for the architect's services and the products of the building material manufacturer in the residential field.

GOOD HOUSEKEEPING
Everywoman's Magazine
DESIGN STOREFRONTS are designed to stay modern because the handsome appearance and rich quality of this equipment are invaluable in keeping the shop looking up-to-date and consequently attractive to tenants and tenants' customers. Made in a wide variety of metals, including solid copper (plain or embossed), solid bronze in all standard finishes and aluminum alloy (white metal), Desco Store Fronts harmonize with any building design. You will be pleased with the results of specifying them for your next building.

CHAIRS ... THAT GIVE THE BUSINESS OFFICE DISTINCTION

A sure way to add that desired touch of individuality to the modern office is by the thoughtful selection of chairs. To reflect truly the character of the executive whose office they grace, they must be sturdy, practical, comfortable, dignified, and in keeping with other features of design.

The best traditions of fine craftsmanship are reflected in B. L. Marble Business Chairs and are further enhanced by the beauty of the natural figure and grain of the fine cabinet woods from which they are constructed. A wide choice of designs permits a selection that fully meets every specific office requirement.

How Much Will It Cost?

(Continued from page 30)

most desirable accomplishments, there are no short cuts to estimating efficiency but with the aid of the proper tools it is not beyond the reach of any practitioner of fair intellect.

There is no single tool so effective as the Experience Table, that mighty prop of the insurance business.

Let the architect begin at the earliest practical moment to keep a careful record of the cost of every building project with which he is identified, breaking down this cost in each instance into all the major items of which it is composed. In offices where it is the practice to award all contracts on a separated basis, a mass of first-hand data on individual items is always available.

This data should be supplemented wherever possible by additional information of an accurate nature obtainable from other architects, contractors, estimators, appraisers, owners, investment houses, technical magazines and any other sources of a reliable nature. Proper information is frequently difficult to obtain owing to its confidential character, but by pursuing a diplomatic and industrious course, the passage of time will reward the seeker with a quantity of data which is susceptible of classification into many highly useful forms.

The basic form for recording this data is one which gives the detailed costs of the individual building. A loose-leaf sheet which has proven very satisfactory is shown in Form No. 1. This sheet is capable of showing in a small space all the essential facts about any one project. Attention is directed to the columns showing the cost per gross square foot of floor area and per cubic foot of contents. It is well to supplant these items with a figure showing cost per room for apartment buildings and cost per bed for hospitals, two very handy units. Additional data may be entered on the back in cases where the space on the face proves insufficient. The cross-section of the building is an extremely helpful feature as it exposes many salient facts at a glance.

All buildings are classified as to type as noted on the upper right hand corner. A summary sheet for each type is then made as shown by Form No. 2. The type illustrated, office buildings, is separated into two groups inasmuch as structures over three stories in height frequently have many characteristics such as elevators, caissons, etc., not possessed by the smaller buildings.

As the volume of data increases, the information contained on Form No. 1 may be conveniently segregated further into many of its components. Thus Form No. 3 contains a summary of data on Structural Steel which gives not only the cost per ton for various buildings but also pounds of steel required per square foot of floor area, both highly significant items. The form for heating likewise shows cost per cubic foot of contents and cost per square foot of radiation. The form for Marble gives the kind, cost per square foot for floors and cost per square foot for wainscoting. Similar sheets may be provided for Lighting, Plumbing, Sprinkler Systems, Smokestacks, Roofing, Tiling, Plastering and so on to suit each particular architect's needs. (Continued on page 98)
This is No. 3 of a series of advertisements setting forth things to look for when considering partitions.

COMPLETE SERVICE
QUICK DELIVERY
LOW PRICES.....

These and other advantages are YOURS when dealing with the largest manufacturer of partitions . . .

HAUSERMAN SERVICE is as distinctly superior as Hauserman Partitions. Every detail is attended to by full-time Hauserman Engineers. Only Hauserman gives Hauserman service . . . Hauserman factory-directed erection crews install the partitions. Erection by experts saves time, assures the best results. Rearrangements, too, are handled by skilled erectors . . . Thirteen years’ experience in the manufacture of partitions and a large volume of standardized production (1100 linear feet of partitions in a day) enables Hauserman to give quick delivery, highest quality and new low prices.

HAUSERMAN MOVABLE STEEL PARTITIONS
FOR FEBRUARY 1931 97
These three groups of forms compose the groundwork of a simple system which requires little labor to maintain and provides a broad range of concise information at one's finger tips. Many interesting and instructive supplementary tables may be made up from these major experience tables, such as: effect of story heights on cost; effect of floor loads, column spacing, number of stories, and number of rooms; relation of cost to width; and others. In addition to these tables, the architect will find it helpful to consult the business graphs published by the Department of Commerce, various business magazines and banking institutions. Especially valuable are those graphs showing total building contracts awarded, iron and steel composite price, steel plant operations, freight car loadings and time money rates. A knowledge of labor rates and labor efficiency is absolutely essential. All such information will serve to fortify and clarify one's own judgment as to price trends and general market conditions.

It is necessary, of course, that all data be applied with careful consideration of the characteristics of the proposed structure. The most pertinent items to keep in mind are the kind of facing material, the number of finished elevations, the type of foundations, the floor loads, the amount of interior subdivision, the general character of the interior finish, type of heating system, sprinklers if any, elevator facilities, and the locality where the building is to be erected.

No undue originality is claimed for the system outlined above. It is not infallible, neither will it function as a substitute for breadth of experience and a balanced mind. It is not intended to replace the more accurate estimates which are obtainable by proper pricing of detailed computations of quantities. Such computations are both useful and essential after drawings have advanced to the stage where reasonably approximate quantity surveys are possible. But for answering preliminary demands for cost information, the results obtainable by the use of these quick judgment units are almost uncanny in their accuracy and effectiveness.

A warning may not be out of place at this juncture. Extravagant promises as to costs can only lead to embarrassment and disappointment. Lean heavily on the experience tables in forming your judgment. Interpret them in the light of your individual experience as applied to the problem at hand. Then tell the client the "bad news" at the start. The outcome will be a happy revelation. The owner will live to a ripe old age and the architect will live to design more and better buildings.

APPLICATION of architectural control in Washington, D. C., and in Rancho Santa Fe, California, was an outstanding development in regional planning during 1930, states a report of the Committee on City and Regional Planning of the American Institute of Architects. The beautiful country district of Rancho Santa Fe, near San Diego, California, has taken effective means to protect itself in this regard. Nearly 200 owners of estates and small farms totalling 5,400 acres in area have signed and put on record a protective covenant not only establishing permanent architectural control, but also a maintenance association in which every owner has a vote, a complete zoning plan, and a building code for the area, which is not under municipal government.
Good ventilation stripped of its high costs has long been sought by school authorities, and health authorities. Today such ventilation is offered.

The Herman Nelson Her-Nel-Co System of Ventilation offers good ventilation at a definite reduction in building and maintenance costs, and a saving of half the fuel costs. This means a saving of millions of dollars to tax payers.

Science has long recognized that the vital factors of good ventilation are: air motion, temperature, and humidity.

The Her-Nel-Co Ventilator controls these factors without the expensive expedient of using a continuous stream of outdoor air. In fact, outdoor air is only used when necessary and in an amount required to remove excess heat or body odor. Such outdoor air when admitted is tempered by intermixture with indoor air, but is not preheated.

Architects are invited to write for the book "The Herman Nelson Her-Nel-Co System of Ventilation," which shows how simply and effectively it offers full ventilation results with saving in building costs, boiler costs, and fuel costs.

Is the Government Treating Architects Fairly?

(Continued from page 21)

designing of the structure should not be sacrificed to make a showing of how fast draftsmen can draw. If the difference in time is due to Government red tape, hampering outside architects, it should be possible to solve this to the advantage of the building program as a whole.

Mr. Byrns, of the House Committee, asked, "Where you use a local architect ... he sticks on the job, does he not? ... As I understand it, he is there, for the fee paid him, to see that the contractor performs the work in the way he has agreed to perform it."

Mr. Wetmore said, "Not to the extent of supervision and inspection ... The architect supervises the work to the extent of seeing that the letter and spirit of his design are carried out, but the actual superintendence of the job and the inspection to see that the contractor lives up at all times to the plans and specifications is done by an inspector from our office."

"If that is true," Mr. Byrns replied, "my question would, of course, fall to the ground, but I was thinking if that other plan prevailed possibly it might not be so very much more expensive than the present method ..."

Government architects often claim that the various types of buildings required are of such special nature that through long experience with the problem they are better able to cope with the situation. Government buildings do not differ greatly in construction from private buildings. Granting that certain planning requirements are somewhat different from those encountered in other buildings, they can be stated as briefly or elaborately as conditions warrant. It should be a function of the Supervising Architect's office to prepare a program for each project and possibly act as a liaison officer between government departments and the architect. Mr. Wetmore made a point of this argument at the hearing.

"We have had so much experience in designing public buildings," Mr. Wetmore explained, "that we can do the work faster than the outside architect. We have this architectural work running on such a basis that it is like a big hopper, with the sites and projects pouring in at one end, and the plans and specifications pouring out at the other. After the hopper is filled, we complete plans and specifications for a building every two and a half days. If the Department of Justice passes on from twelve to fifteen sites per month we could continue to turn out the buildings at that rate. It would mean an average of one building every two and a half days."

"How long would it take to get one project from one end of the hopper to the other?" Mr. Welsh wanted to know.

"From four to six months," replied Mr. Wetmore. "When you have the hopper loaded, and want to speed up, or when you have more sites than you can feed into the hopper and keep it going, then you could let the work to advantage to outside architects."

"Is there any necessity for that, or to what extent are

THE AMERICAN ARCHITECT
Modern Radiation turns to Alcoa Aluminum

It was inevitable that manufacturers should make radiators of Alcoa Aluminum. Today, you can order aluminum radiator units, in standard size sections, from stock.

In principle, these radiators are new. A heating unit passes through a series of hollow flues or fins, made of Alcoa Aluminum. It is only a matter of seconds before these flues heat to steam temperature. Instantly, the air at the floor line rushes through the flue, is charged with heat and shot quickly into the room.

These new radiators, made of Alcoa Aluminum, operate on any hot water, vapor, or vacuum system. The radiators have a rating of up to 600 lbs. pressure. They can be used as concealed or exposed radiation units. They occupy about 1/3 the space of an old-fashioned radiator. With Alcoa Aluminum only 1/3 the weight of common metals, these small, efficient radiators weigh only about 1/7 as much as the old type and bring a saving in shipping, handling and setting up.

Made of Alcoa Aluminum, these new radiators are immune to the attack of rust, even when used under conditions where the atmosphere is loaded with moisture, gas or acid fumes. Their cost is low—considering the better heating they provide.

Our nearest office will be glad to put you in touch with the manufacturers that make and carry aluminum radiator parts. ALUMINUM COMPANY of AMERICA; 2440 Oliver Building, PITTSBURGH, PENNSYLVANIA.
A RIGID HINGE
is NOT
"Just as good"

All Jamison and Stevenson Doors are equipped with Spring Hinges, because long experience has shown that a rigid hinge is unable to compensate for wear. When a door doesn’t seal at the heel, refrigeration escapes. Rigid hinges can’t prevent this. Ball bearings don’t help. Only the pressure of a spring hinge will save the cold air you pay to create. The Jamison Hinge is also adjustable.

Another exclusive feature of Jamison & Stevenson Doors is the patented WEDGETIGHT FASTENER... Faster in closing — faster in opening — forces the floor tighter on its seal.

you getting outside architects?” queried Mr. Thatcher.

“There are twenty-four projects that have either been assigned to private architects . . . or where we are just about ready to make the selection of an outside architect,” reported Mr. Martin.

This was amplified by Mr. Wetmore, “. . . When the Chicago building, for instance, came up for consideration, of course, we were trying to get as many buildings started as we could throughout the country. We wanted to get some work going in every state so as not to be apparently favoring any locality. Now, if my office had taken up the Chicago building, I would have had to put forty men on that job for six months and thereby withdraw forty men who were working on smaller buildings scattered around throughout the country . . . by using outside architects for that job, we were able to prepare plans for several buildings scattered throughout the country.”

It is apparently the policy of the Supervising Architect to retain small buildings in his own office and engage outside architects to handle large work. This policy is open to question since it might be more advantageous to the country as a whole to reverse this procedure, if the Government office must serve in a designing capacity. At the time of the hearing there were ninety projects in the office of the Supervising Architect as against twenty-four being handled by outside architects.

LATFER in the hearing, Mr. Martin said, “As Mr. Wetmore has explained, the policy of the department is to place with outside architects any large projects where the title is vested, and where the Supervising Architect can not start any plans within a month after the time the title becomes vested . . . . We do not intend to have any job or site-owned case lying in the office more than 30 days before we take it up for drawings and specifications. . . . If we secure an accumulation of site cases . . . that . . . would require more than 30 days in order to get started on the plans, immediately one or two of them will be selected for outside architects.”

To the inquiry as to how long it takes to get a report, from the Department of Justice, on a site title, Mr. Wetmore stated that, on an average, it is something like four months, or so, but condemnation cases may run fully a year.

If the delay in passing upon titles to property is due to the Department of Justice’s being clogged up with other and more pressing business, would it not be a good idea to create a separate department to handle this work? It should be possible to quickly solve this problem if it is delaying getting work underway. A business firm or corporation would soon find a means of overcoming a handicap of this nature. Why can’t the Government?

DURING the hearing, the question of the comparative cost of handling work in the Supervising Architect’s office and by outside architects came up for discussion. On this subject Mr. Wetmore said, “The last figures we had showing a comparison of the cost as between work done in our office and by outside architects showed 4½ per cent for work done in our office, including inspection, as against about 6 per cent on the outside, commercial job, plus 1 per cent for a portion of the
A Marked Improvement in
CONCEALED BRACKET LAVATORIES

UNLESS the service is of an extremely severe nature the new Te-pe-co Concealed Bracket Lavatory on Wall Carrier will prove a welcome innovation to Architects for their plans in residences, hotels, apartments and buildings of a semi-public nature.

With a Te-pe-co Vitreous China Lavatory, in sizes from 24x20 to 33x24 can now be supplied this bracket, attached as per diagram below. Its adjustability permits leveling of lavatory. It eliminates the clumsiness of prior types of brackets. The result is an installation of pleasing appearance, simplicity and approved sanitation.

OUR GUARANTEE

We make but one grade of ware—the best that can be produced—and sell it at reasonable prices. We sell no seconds or culls. Our ware is guaranteed to be equal in quality and durability to any sanitary ware made in the world. The Te-pe-co trade mark is found on all goods manufactured by us and is your guarantee that you have received that for which you have paid.

engineering fees for the building, and without inspection.

The estimate of the Supervising Architect of the cost of outside professional services of the public buildings program was $4,078,000 for 1931 and 1932. For the fiscal year 1931, $1,675,000 was appropriated and $2,400,000 was estimated as required for 1932.

Mr. Wetmore was asked how he arrived at the amount paid for outside architectural work. He stated that his office has a scale of fees. In the District of Columbia this scale is 5.3 per cent on the first $5,000,000 and a four-tenths reduction on every $1,500,000 over that amount. One and one-half per cent extra is allowed for special engineering services, these services being based on an engineering cost of not more than twenty-five per cent of the cost of the building.

"How does the outside architectural work in the District of Columbia compare in price with that on the outside?" asked the Chairman.

"Outside we pay 4.5 per cent plus the 1½ per cent for engineering services," replied Mr. Wetmore.

"I do not mean the Institute work," explained the Chairman.

"I am talking about our fee," answered Mr. Wetmore. "Our fee is 4.5 per cent outside, plus 1½ per cent for engineering... 1½ per cent for the limited special engineering service up to 20 per cent of the cost of the building:"

UPON being asked who fixes the fee scale, Mr. Wetmore said, "That has been fixed by the department. You see, the standard scale of the American Institute is a flat 6 per cent plus 1 per cent for engineering. That is, 1 per cent on that part of the special engineering services that may be utilized. That runs to something over 5 per cent."

"Altogether, we are going to pay a pretty good price for outside architectural work before we get through with this," remarked Chairman Wood.

"It is less than the rate of the American Institute," argued Mr. Wetmore.

"I understand it is," replied the Chairman, "but to these gentlemen who get these jobs for the Government it is worth something by way of advertising."

"Do not they have to do something more than these architects do? Do not they supervise?" queried Mr. Byrns.

"They compare very well with what we are doing in outside employment," explained Mr. Wetmore. "The owner furnishes what is called the clerk of the works. He corresponds, too, very well with what we call our construction engineer. He is on the job to see to the inspection of work. The architect on an outside commercial job goes around several times a month to see that everything is going on satisfactorily so that he can certify to the payments due at the end of the month. On our work they do substantially the same thing..."

The chairman asked, "Does the outside architect who gets this work at the scale of prices that you have mentioned here do the same amount of work and the same amount of supervision if it is an outside job and he is getting 6 per cent?"

"Practically, replied Mr. Wetmore, "because in the case of the outside private building, the owner has to put on at his own expense the clerk of the work. The

Mr. Wetmore amplified this, saying, "That was a very special case, where an architect was designing the whole of a civic center in which our building was to be located, and they employed him, not for his whole architectural service, but simply for the designing of the building." Incidentally, there are about 600 employees in the Supervising Architect's office.

What is the smallest construction that you have outside architects' services in?" asked Mr. Thatcher.

"I think the smallest was a contract for the design of a small building down at Kingsport, Tenn.," replied Mr. Martin.

"That was a very special case, where an architect was designing the whole of a civic center in which our building was to be located, and they employed him, not for his whole architectural service, but simply for the designing of the building." Incidentally, there are about 600 employees in the Supervising Architect's office.

What is the smallest job in the field?" inquired Mr. Thatcher.

"The smallest in the field was the Parcel Post Building down at Jacksonville, Fla.," said Mr. Martin. "We selected the architect for that just about two or three weeks ago because we wanted to get something going in Jacksonville."

"That is a flat rate down there of 4 per cent," added Mr. Wetmore.

"How much is available in the expenditure for cost of the building?" asked Mr. Thatcher.

"There is about $375,000 available for construction," answered Mr. Martin. "On present prices that might be reduced to something like $280,000."

"You are not always governed, then, by the smallness of the cost or the bigness of the cost in employing of outside help?" inquired Mr. Thatcher.

"Not always," answered Mr. Wetmore.

Treasury Department, in our case, puts on the superintendent at the expense of the Government."

It was not made clear at the hearing whether or not the 41/4 per cent stated by Mr. Wetmore to be the cost of handling work in his office included overhead, office rent, telephone, stationery, and supplies. If such items as these were not included they should have been since they are actually a part of the cost that must be paid by the taxpayers, including architects. The difference in scale of fees paid for work in the District of Columbia and outside is not easy to understand. No explanation was offered at the hearing. But apparently the Government is interested in saving the architect's fee when possible.

"How do you determine who shall get outside work and who shall get inside work? What rule do you have governing?" queried Mr. Thatcher.

"I do not know that there is any fixed rule except the size of the building," explained Mr. Wetmore. "If we were to take on one of these very large buildings like, for instance, the Chicago building I mentioned before, it would have meant that we would have had to take out of our drafting force 40 men for a period of six months, which would have cut down the output of the smaller buildings in the districts in which Congressmen are interested throughout the country."

Mr. Thatcher interrupted this, saying, "That was a very special case, where an architect was designing the whole of a civic center in which our building was to be located, and they employed him, not for his whole architectural service, but simply for the designing of the building." Incidentally, there are about 600 employees in the Supervising Architect's office.

"You are not always governed, then, by the smallness of the cost or the bigness of the cost in employing of outside help?" inquired Mr. Thatcher.

"Not always," answered Mr. Wetmore.

The office force of the Supervising Architect has been materially increased to speed up the whole building program, so that according to Mr. Martin, "by the end of 1931 we will be going at a rate that would allow us to complete everything that is in the drawing stage before the end of 1933, and the balance of that authorization, $135,000,000, could be completed within two
PeerVents
installed in the new
Sewanhaka High School

Peer VENTS are often selected for these large modern schools by architects who have had experience with PeerVents on previous school buildings or other public or semi-public buildings. Such is the case with the new Sewanhaka Central High School in Floral Park, Long Island.

Many new school buildings are also PeerVent equipped by the recommendation of another school board which has used the PeerVent System.

Economy and noiseless and efficient operation are important considerations in the selection of heating and ventilation units. The PeerVent System gives all of these points. Building superintendents from coast to coast tell of the excellent service given by these PeerVents.

Peerless engineers will gladly call and discuss any of your heating and ventilation problems without obligation on your part.

Send for the illustrated Peerless catalog.

Building Economy
Demands Insulation!

The use of building insulation is steadily increasing—
more individual home builders are realizing what insu-
lation really means in actual savings and added home
comfort.

Were insulation thoroughly understood—no building
would be erected without it.

U. S. Mineral Wool is an indestructible, all-mineral
insulating material which forms a protective shield
throughout a building, which heat, cold,
sound, or vermin cannot penetrate.

It saves about 33 1/3% on fuel con-
sumption, provides warmer rooms in
winter, cooler rooms in summer,
requires smaller heating units, and
reduces fire hazard.

Our FREE booklet explains
the economy of insulation. Send
for it and sample of Mineral
Wool.

THE Committee Chairman asked the question whether
he could be given any idea of the number of people
now employed in various projects that are underway.
It was stated that it is estimated that 1,000 men are em-
ployed on every $10,000,000 job, exclusive of people
employed in manufacturing and fabricating plants. In-
quiry at the Bureau of Labor Statistics of the Depart-
ment of Labor brought the reply that while no definite
figures were available, the indications were that for
every man employed directly on the building there would
be indirect employment provided for five more outside
and apart from the job.

It developed in the hearing that the salary approipa-
tion for the Supervising Architect's office for 1931 is
$418,810 and that estimated for 1932 is $429,720. The
estimated increase was stated to be due to salary adjust-
ments under the Brookhart Act, a limited number of
promotions, and grade reallocations made subsequent to
and hence not provided for in the appropriation for
1931. Mr. Wetmore stated that he had about 600 em-
ployees in his office. Two-hundred and thirty-eight are
under the statutory and three hundred and eighty-eight
are under general expenses. All under the latter were
said to be technical positions. Salaries in the office range
from $7,000 down to $1,500.

Public buildings are unquestionably as a class our
most important buildings. The Government executing
its own work removes this class of building from com-
petition; removes the opportunity of having them de-
signed by the best minds in the profession. At the
salaries paid how can the Supervising Architect attract
to his office the best talent, except possibly in an
emergency like the present? Is the Government using
good judgment in continuing to design its own build-
ings? Have the true functions of government been
overlooked in entering into competition with the busi-
ness of its citizens? One of the functions of the Govern-
ment is to foster business which produces revenue with
which to conduct government. When the government
enters into business it removes a revenue-producing unit.
If carried far enough there would be no revenue with
which to conduct government. The result would be a
different form of government than that upon which the
fundamentals of the Government of the United States
are based.

THE AMERICAN ARCHITECT
THE NEW RIVERSIDE CHURCH—
AN OUTSTANDING CRITTALL INSTALLATION

To the list of outstanding Crittall ecclesiastical installations is now added the new Riverside Church in New York City—architecturally distinguished and internationally renowned. In the tower of this beautiful church, where the offices and assembly-rooms are located, Crittall windows were used throughout—and the installation is in strict keeping with the character of the art glass windows in the other parts of the building.

This harmony between the windows in the utilitarian and spiritual portions of the building represents a notable achievement. For not only does it provide an additional artistic effect but also it gives additional unity to the design.

The Crittall windows which are installed in the Riverside Church are custom-built Universal Casements. Crittall also manufactures Stanwin and Norman Casements—available in a wide variety of standardized types and sizes. See our complete catalog in the new edition of Sweet’s—pages A777 to A842—for details and specifications. Special information will gladly be supplied on request.

CRITTALL CASEMENTS

STANWIN CASEMENTS  •  NORMAN CASEMENTS  •  UNIVERSAL CASEMENTS

FOR FEBRUARY 1931
The Town That Paris Forgot

(Continued from page 27)

old churches which punctuate its medieval profile. There are at least a half dozen of them, in addition to the cathedral, which is quite capable now of housing the entire population. Before the Revolution there were at least half a hundred, according to the town historian. Now only the cathedral serves in the capacity of a house of worship.

But the practical French have not allowed the other churches to remain idle shells. The beautiful little church of St. Pierre, a rich Gothic treasure, has been transformed into the town market place. Twice a week its warm whitewashed nave is thronged with vegetable vendors and bartering housewives. Geese squawk, and the hoarse voices of cheese barons echo down the graceful aisles.

Then there is the town cinema, installed in a fine old towerless church whose name seems lost from the records. Charlie Chaplin cavorts on a silver screen in the apse; the peanut gallery is in the clerestory and on the organ platform. On Saturday nights they have movies in Senlis. The bloods of the town wind fancy silk scarves around their necks, pull their caps down on one side, light strong cigarettes and install themselves in one of Senlis' religious relics.

Another Gothic veteran, the church of St. Fram

bourg, has been taken over by the town carpenter and cabinet maker, and its lofty reaches are filled with stacks of lumber and unfinished casements. The drone of a planer and the whine of a circular saw are the only chants which reverberate through its empty vaults now.

Finally there is the ancient Hotel Dieu, a bit of medieval cloister approached through a fine old Gothic gateway. This has been converted into the headquarters of the town mason. Sun still pours into the mossy cloister, but it no longer lights upon meditative friars strolling in the shelter. In their place are piles of sand and brick, stacks of construction poles and two-wheeled carts.

There is a touch of sadness to all of this, but a touch of the picturesque also. The Senlisians accept the circumstance most casually, so there is really no need for the views of a passing sentimentalist. Yet one cannot help but conjecture in one's mind what a shrine, what a national treasure one of these fifteenth century relics of Senlis would be, if it could by some miracle be transplanted to New America, which the hand of a medieval craftsman never touched.

O. McIntyre, the popular columnist, says "The inside of the Chrysler Building looks like salami."

All Miscellaneous Metal Work Was Intrusted to

HALBACK

IN the erection of the Fuller Building, "Halco" steel case- ment sash and window frames were installed. Also all ornna- mental miscellaneous iron work throughout the building was executed by Halback. Only on the basis of accurate, satisfactory performance of many similar con- tracts, is work of such scope and importance awarded.

Modern homes enjoy spring air all winter

Successful new humidifier banishes winter dryness and discomfort

Invigorating, wholesome moistened air, like that of spring! You can bring it into every radiator-heated home now, and all winter long, at comparatively small cost. Many homes already enjoy it. For the ingenious invention which provides this healthful moistened air, the Doherty-Brehm Humidifying Radiator, is fast being installed in modern homes.

Architects not only specify it for new houses, but also, so great are its advantages, recommend it for the present homes of friends and clients. It is a practical, inexpensive, successful humidifier.

Fewer colds and other winter ills

It banishes completely the excessive dryness that has heretofore been inevitable in radiator-heated homes in winter. It is this dryness that aggravates colds, sinus infections, bronchitis, mastoids, and other ills; that damages furniture, woodwork, and book bindings; that withers flowers and plants.

Fits into any radiator heating system

The Doherty-Brehm Humidifying Radiator can be quickly installed in any steam, hot water, or vapor system, like an ordinary radiator. The only extra piping needed is a water supply and a drain. One will properly humidify a house of 12 rooms or less, or an apartment, and additional units are available for any size building. It evaporates, automatically, the right amount of moisture for health and comfort, from one to 100 gallons a day. And it heats while it humidifies, actually giving off more heat than an ordinary radiator of the same surface. Since overheating is no longer necessary for comfort, it also cuts fuel costs.

No repairs—no inconveniences

It requires no care. There are no moving parts to get out of order; no fans, belts, or motors. No steam, noise, or odor.

Master craftsmen have designed cabinets to harmonize with the furnishings of finest homes. The humidifier may be had in period wood or handsome metal cabinets or for wall recessing.

Sold on the CRANE Budget Plan

The Doherty-Brehm Humidifying Radiator is sold by CRANE through dependable heating and plumbing contractors everywhere. Your clients can buy it under the CRANE Budget Plan and pay only 10% down, the rest monthly. Specify it for new buildings. Recommend it for modernized ones.

Occasional Basement to Sidewalk Service need not be expensive

Engineering experience has proved that loads can be lifted more quickly and more economically by machine than by man power. But—unfortunately for the architect who wants his building perfect from an operating standpoint—the cost of the machine is oftentimes unjustifiable for the service needed.

Energy Electric Dumbwaiters and Elevators are favorably known and widely used, but for satisfactory service with low installation cost we recommend Energy Hand-Operated types.

For instance for the removal of ashes and the occasional receiving of merchandise into the basement, many architects are specifying Energy Hand-Operated Sidewalk Elevators, with capacities of 500 or 1000 lbs. These Energy types have many advantages. They are geared scientifically to move a capacity load with the least amount of effort. They dispense with useless equipment, yet no part which will provide ease of operation or safety to the operator has been omitted. For complete description, see Sweet's (Pages D6273-6277) or write for Bulletins, addressing Energy Elevator Company, 220 New Street, Philadelphia, Pa.

What Architects Are Talking About

(Continued from page 55)

which usually operate to cut short the life of the buildings before actual wear and tear has had much influence. They are:

"Growth of business district. Shifting in location of the business district.

"Erection of newer buildings of a different type.

"The greater efficiency in the layout and operation of the newer buildings.

"Damage caused by new buildings, cutting off light and air."

When talking about building conditions, Colonel William A. Starrett said, "Although the total of new construction of all kinds in 1930 was some 20 per cent. less than the totals for the previous twelve months, still we must not forget that it was approximately six billions of dollars. The figure represents a stupendous volume of human activity and achievement, however it may be measured in point of time or with what other totals it may be compared. Without its beneficial effects on our social and industrial life one dislikes to think what the last year would have been."

Robert D. Kohn, president of the American Institute of Architects and the New York Building Congress, has been elected an honorary corresponding member of the Royal Institute of British Architects.

Others honored by the Royal Institute were Prime Minister James Ramsey MacDonald and the Earl of Derby, who were elected honorary fellows, and Major Sir William Orpen and Sir Bernard Partridge, who were chosen honorary associates.

Construction costs on large buildings are only 3½ per cent. above the lowest point for the last decade, and on monumental type buildings are 1 per cent. below the lowest point, according to a detailed analysis made public by Lou R. Crandall, president of the George A. Fuller Company.

Independent merchants who have organized against chain stores are evidently out for blood. In several instances craftsmen who came on the jobs wearing branded overalls of a national chain store were sent home until they learned better.

Some ideas on elevator planning are contributed by William H. Gompert, architect, who says "The most important factor in the planning of an office building is the elevator layout, since it is the heart and pulse of the structure and greatly influences the general plan of the building. The ideal arrangement for elevators is to have the cars arranged in alcoves of not more than four cars deep and facing one another. This makes a compact arrangement and a simple plan for the upper stories.
A NEW FLATNESS MAKES ALL THE DIFFERENCE

Look through a sheet of ordinary window glass and then through Pennvernon—and you're struck with a difference. "How much clearer, better glass," you'll say... Then look at Pennvernon—along its bright, flat surface—and you see the reason. An almost complete freedom from waves, streaks, "reams" and surface burns—the same flat, shining smoothness on both sides.

The two pieces of glass may contain the same material, but the difference in handling—the new Pennvernon Flat-drawing Process—has produced a flatter, brighter, clearer sheet than was ever before possible—and it has done this without increasing the cost to you.

This new glass is ready at the Pittsburgh Plate Glass Company's warehouses in all leading cities. Samples are yours for the asking. And a really interesting new booklet describing and picturing how Pennvernon is made, will be sent you if you'll just ask the Pittsburgh Plate Glass Company, Grant Building, Pittsburgh, Pa.

FOR FEBRUARY 1931
of the building. It also makes possible better starting supervision on the ground floor.

"To place the required number of elevators in a single row is not in accordance with the best modern practice, although a downtown building completed a few months ago has about twelve cars arranged in a single row with a spread of about 97 feet from one end to the other."

NEW YORK sings tenor, Chicago bass, and London a lusty barytone, according to Dr. William Braid White, Chicago, Director of Research in Acoustics at the American Steel and Wire Co. He says, "Up about fifteen stories above the ground is where the characteristic ground tone of the city may be heard."

UNEMPLOYMENT among draftsmen in New York is being relieved by a committee composed of representatives of all organizations of architects in the City. Headquarters Architectural League, 115 E. 40th Street.

COPPER lightning rods are coming into popularity to protect trees on stock farms and private estates. On stock farms, horses have a habit of gathering under trees during a storm, with many consequent fatalities.

ROY KELLEY, of Los Angeles, won the competition for the model American home, sponsored by the Home Owners Institute of America. This house has been built at Sleepy Hollow, N. Y., Farrar & Watham of New York acting as supervising architects.

"In the sixty years since the Chicago fire, practically the entire loop district of Chicago has been rebuilt twice, more than half of it three times and much of it four times," according to Earle Shulta, of Chicago. "A survey of lower Broadway in New York City, shows that there are only three buildings more than forty years of age, all of which are marked for demolition except one which has been substantially rebuilt within the last ten years. Only seventeen buildings are more than twenty-five years old in that section of New York City."

CONCRETE in building construction will be discussed at the Engineers Club of Philadelphia, 1317 Spruce St. the afternoon and evening of February 17.

Another Installation... by Kundtz Craftsmen

HE First Presbyterian Church of Flint, Michigan is one of the recent additions to our ever-growing list of church installations. Architects all over the country are specifying Kundtz Craftsmanship to insure interiors of permanent beauty.

Our architectural division of planning and designing is at all times ready to cooperate with builders and architects. There is no charge for this service.

THE THEODOR KUNDTZ COMPANY
CLEVELAND, OHIO

KUNDTZ CRAFTSMEN
CHURCH AND SCHOOL FURNITURE

they used a mitered block. The building never had gutters. Originally the building had a room with a fireplace at the rear.

The corners of the original side walls are very clear, as they have installed windows at this point and have used the old bricks to fill in the corners to make the court-room rectangular in shape. The present rear wall was built of the original and other old brick laid in common bond. The high window shown in the north wall of the old cut has been filled in. On the south side there is an old window complete with sash, frame and blinds on the outside, but this has been walled up and plastered over on the inside. This window was not an original opening. The two chimneys on each side of the court-room were added and are not laid to match the original work. The roof is slate.

Advertising Wasted Our Money

placed by Chapter members on all buildings under construction of which they were architects.

An effort was made to have building material manufacturers, through their advertising, carry to the public the message of the value of an architect’s service.

The Chapter Bulletin offered another avenue for public information. This publication was started in 1920 with the primary purpose of conveying Chapter information to members. It has continued with this same purpose but has been used also to give Chapter news to those whom it appeared practicable to effectively interest in matters of public or semi-public importance.

At the end of 1928 we found that our publicity work had resulted in many inches of free space in the form of articles in addition to the paid advertising space. The Committee at this time recommended the continuing of
The entire floor and curb around this pool and the floors of the accompanying two shower rooms assure maximum safety against slipping accidents... for they are 100% Alundum Ceramic Mosaic Tile, non-slip wet or dry. • The floor around the pool is 2 1/4 x 1 1/16", salmon Alundum Mosaics in a basket-weave design with borders of green tile of the same kind and size. The curb is also of green Alundum Mosaics but in the 1 1/16" square size. • The shower room floors are identical with the floor around the pool except that the one off the locker room does not have the green border and has walls of Wheeling buff tile.

NORTON COMPANY — WORCESTER, MASS.
Wallace & Warner designed this house at Rosemont, Pa. The natural resistance of the fieldstone walls to cold, heat and noise has been more than doubled by the use of CABOT'S QUILT.

A Permanent Sentinel Against Cold, Heat and Noise

On the south coast of England stands a curious little building called "Domesday Hut." It was standing in 1086, and its original construction still remains—oak timbers thatched with Zostera Marina; the same tough, century-defying sea plant that is the insulating material in Cabot's Quilt.

Zostera Marina is rot-proof, vermin-proof, and fire-resistant. It will never pack down, decay, or lose its insulating power. Therefore, you can use it to build a warm house in New Brunswick, a cool house in New Orleans, or a quiet house in New York. And you can give your client more comfort, health and peace of mind than he thought possible for so little money.

advertising in the papers in similar form for 1929; favored advertisements in trade journals and in manufacturers' publicity material; and the continuing of articles on art, architecture, architects and building in all publications carrying our advertisements.

The editorial staff of the newspapers were glad to receive help in the form of news items and news articles to make reading matter, for which the architects might have been paid, since it cost them time, and made the newspapers more readable. In other words, we helped the newspapers gather news for the public along the lines of architecture. We saved them the expense of having an art or building page editor, whereas their music department and household economics department cost were handled by paid employees.

During the year 1929 the committee came to the conclusion that paid advertising space in the newspapers was ineffective except insofar as it brought to the attention of the newspapers the fact that the public is interested in architecture and the fact that architects are a body worthy of consideration.

The Washington State Chapter therefore at the end of the two years campaign of public information, after a careful analysis of the results, recommended against paid advertisements in the form of space in newspapers. The chief benefits which it was thought would be received through paid advertising were not obtained.

By paying for space we thought we would oblige the newspapers to always give architects credit for their designs of buildings when these were published in connection with some real estate or other item about the building. We found that the make-up of the paper's staff made it almost impossible for the various reporters to give architects credit for their work. If architects prepared the news articles due credit was given to the author, but in many cases where the article was cut down the name of the architect would be omitted from the article even though the owner or builder or the realtor was mentioned. Newspapers seemed to be unable to give consideration to the fact that the architects were advertising, and paying for advertising space will not change the viewpoint of the reporter, nor does it educate him.

The architectural offices in Seattle analyzed the source of their clientele. They found that the advertisements had brought no clients. By questioning friends at random we found that the advertisements were not read even by some of the architects.

We did, however, find that properly prepared publicity stories by architects were effective in the way of general education of the public through the medium of the daily press, and our friends told us that they read them.

When building a house or other building, people do not go to the newspapers for information. They consult their friends, possibly a neighborhood lumber dealer, material agent, or loan association. They are serious readers of magazines and other literature devoted primarily to architectural subjects. They will then read articles which they can secure at the Permanent Builders Exhibit in Seattle or similar exhibits in other cities.

In Seattle, these articles are publications of the Seattle Real Estate Board regarding "The Use of an Architect," or articles prepared by loan associations such as "The Fee Paid an Architect Is the Cheapest Investment," "An Architect Is an Economical Necessity," "Why Employ an Architect," or articles such as "Do I Need an

Architect, "Architectural Services Protect You," etc. If these articles are received by prospective builders through their natural local contacts they are read.

If men or women read enough articles in the news columns when enjoying themselves with the newspaper or magazine, they will associate architects with all big new buildings. The owner who is going to build a large building will inevitably consider that an architect, engineer, or contracting firm must handle his project. This is the type of owner the architects wish to have for clients. These clients must be and can be educated to favor the choosing of an architect, largely by news articles read as news.

Big business men read the newspapers but do not read the advertisements. We found this out by questioning at random a group of men as to whether they had seen the architects' advertisements. They had not seen them at all. They had, however, read news articles telling why the owners of a recently built big building had valued an architect versus an engineer or contracting firm.

THE architect's state license law does not prevent an engineering or contracting firm from employing a licensed architect and thus meeting the requirements of the law, and at the same time not giving true architectural services. This condition also can be met. Talks before social clubs, contacts with bankers and loan associations, and the real estate boards in which architects personally sell the services of architects are the best ways to reach the large owner. If periodicals similar to The American Architect, in which the architects explain actual cases, were laid on the desk of every business executive regularly each month, it would do more to combat the contracting and engineering concerns usurping architectural functions than any form of advertising.

Summing up, the newspapers get circulation and more profit from the legitimate merchant advertiser who has a finished product to sell in large quantities to many people at a definite time and place. Architects' services are not a finished commodity, but a creative effort or skilled product which rarely sells twice to the same person except at long intervals.

The skill of the architect cannot be sold to a number of people at one time. It is not a question of selling the public something tangible like a set of blueprints. If this were so, blueprints could be advertised. It is a question of educating the public to know what an architect does, why his service is valuable, so that when such a person is in need of an architect's services he is prepared to meet the architect intelligently on common ground, appreciating architectural service for art's sake as well as for economic reasons.

An Easy Way to Hold An Exhibit

(Continued from page 59)

so the above is expressed as a hope rather than as a prophecy.

While this article is supposed to serve as a story of "how it was done," it should not be out of place to say something about the work shown. Generally, it was just such a creditable exhibit as might be had in almost any similar city, where the work finally judged and hung was the selected work of about sixty per cent of the local offices. The work shown ranged from skyscrapers
THE NEW ROOF With—
THE "WEATHER AGE" TEXTURE

CAREYSTONE SHINGLES—a more beautiful roof, with a veined, rippled surface which softens the sunlight and deepens the shadows. A more permanent roof, unaffected by the weather and requiring no attention. A fireproof roof, made entirely of two non-combustible substances, Asbestos Fibre and Portland Cement. And, best of all, these superior shingles cost about the same as smooth surface roofs.

Behind this achievement is more than a half century of successful manufacturing experience, years of patient research, and an ambition to produce a roof covering suitable for the most elaborate structures, but which could be economically used on the small home where first cost is important.

Careystone Shingles are made in several widths, and in five colors—Windsor Gray, Weathered Brown, Georgian Red, Bristol Green and Tudor Black. The colors are solid thru and thru, not veneered or pressed into the surface.

In order that architects may know the appearance and quality of Careystone Shingles, we have made up packages of miniature samples, which will be mailed on request. Write today for your set.

YALE DOOR CLOSERS
An Important Feature of the Well-Planned Building

In modern construction of every type, from private residences to great office buildings, Yale Door Closers contribute the final perfecting touch of quiet, comfort and efficiency.

The strength and dependability of Yale Door Closers are the result of more than thirty years of experience in the construction of fine quality door controlling devices. They are made in models and sizes to meet every requirement.

Write for Illustrated Booklet

THE YALE & TOWNE MFG. CO.
Stamford, Connecticut, U. S. A.

The single exhibit which probably caused the most comment was a collection of photographs of colonial Texas work, taken and assembled by David R. Williams. It is Mr. Williams' philosophy in the design of his houses that we can well go to the examples of early Texas architecture for guidance in our present-day problems of detail, material, texture, color and even plan; that we have such a wealth of indigenous architecture, suitable to us climatically and historically, as to make the employment of foreign styles not only unnecessary but entirely out of place. The practical application of his argument was seen in the picture of his recent residences in Dallas and Corsicana, shown side by side with the photographs of early structures. The success with simplicity and frankness of his work is sometimes shocking to the layman used to detail and plenty of it. It will be interesting to see whether or not Mr. Williams' work will be influential in the development of a Southwestern Architecture.

The following offices were represented in the Dallas exhibit: A. C. Becker, Bryan and Sharp, Dewitt and Washburn, Flint and Broad, Herbert M. Greene, LaRoche and Dahl, Henry C. Knight, Anton F. Korn, Kramer and Kerr, Lang and Witchell, Mark Lemmon, Arthur E. Thomas, H. B. Thomson, and David R. Williams. Photographs of murals by Buck Winn, of Dallas, were also shown, while water-color sketches of old New Orleans by Forrest Kirkland, another Dallas artist, were shown in an adjoining room.

The development that is taking place in the integral garage, or garage built as an integral part of an office, hotel, or other structure in a central district is referred to in a bulletin of the Planning Foundation of America, by Miller McCintock, Director of the Albert Russel Erskine Bureau for Street Traffic Research.

Mr. McClintock states, "The final trend in this development is clearly forecast. It may be called the self-contained block, that is, a block or city square which contains within it all of the facilities necessary so far as it is related to automotive traffic. In the central area of the block there will be a structure capable of accommodating all of the commodity and commercial movements, and in addition provision on the upper floors for the parking requirements of all the tenants and patrons of tenants who have business within the block. This self-contained block has just been proposed by the National Capitol Park and Plan Commission as part of the program for the development of government buildings in the so-called Triangle Area. Another interesting example of the fulfillment of this tendency is shown in the Pickwick Hotels Building in Kansas City and in the Carew Towers now being constructed in Cincinnati."
And **HUMPY HEAT** Means Fuel Waste

First "too hot" and then "too cold!" That is the daily temperature record of rooms and offices in many buildings where hand control valves are employed on steam radiators. Sylphon Automatic Radiator Valves assure temperatures automatically kept just as desired by the room occupants. Their use makes for steady, even heat—personal comfort, health and more efficiency. Once set at the desired marking, they turn the steam "on" or "off" and hold the room temperature exactly at the predetermined point. Actuated by the dependable Sylphon Thermostat, Sylphon Automatic Radiator Valves respond to the slightest air temperature changes, but are not affected by heat from the radiator or pipes.

**INSTALLATION**
**EASY and INEXPENSIVE**
The Sylphon Radiator Valve is a combination packless valve and thermostatic control unit without electrical or mechanical accessories. Know all about this controlling device of lasting efficiency. Our printed matter fully describing both the angle and globe types will be gladly sent. Write today for Bulletin CJ210

**30 Day Free Trial**
In order that you may be convinced of its positive action, we will gladly send one or more of these Sylphon Automatic Radiator Valves on a 30 day free trial, and you incur no obligation. Try them while the heating season is on.

**Other Sylphon Products**
For a quarter of a century Sylphon Instruments for the accurate control of temperatures and pressures of Air, Liquids and Gases have attained wide and diversified employment. Sylphon Regulators for many industrial processes, refrigerating machines, and building temperature regulation. Sylphon Damper Regulators. Packless Expansion Joints for Steam Riser and many other thermostatic instruments have long been favorably known.

INTER-COMM-PHONE SYSTEM

The Stromberg-Carlson Inter-Comm-Phone System is satisfying the service demands of offices, factories, and large residences where simultaneous conversations are necessary, but where the volume of traffic is not large enough for a switchboard system and a paid operator.

Easy to operate, cuts down useless running around, speeds production and increases efficiency. Made by a firm with more than thirty-five years' experience.

Write for literature describing Stromberg-Carlson Telephone and Radio apparatus and trade discounts.
