August 1936 • The Better House • No. 4 Concrete Construction
Four heaters with Everdur Shells, made by THE PATTISON-KELLEY CO., INC., East Stroudsburg, Pa. The two small heaters (left) are each 20" x 60" and are for the U.S. Post Offices at Burlington, N.J., and Mt. Vernon, N.Y. The medium-sized heater (middle) is 36" x 96" and is for the U.S. Parcel Post Building, Detroit, Michigan. The large heater (right) is 48" x 168" and is for the Myron Stratton Home, Colorado Springs, Colorado.

NON-RUST STORAGE HEATERS OF

EVERDUR METAL . . . Strengthened Copper
reduce maintenance costs . . . assure rust-free water indefinitely

These four Patterson Combined Hot Water Service and Storage Heaters . . . all with solid Everdur shells . . . are destined for buildings in four different states. Proof again of the growing acceptance of Everdur as the ideal metal for non-rust water heater shells!

From small residential range boilers to giant storage heaters for hotels, laundries, hospitals, etc... thousands of Everdur tanks are giving rust-free, repair-free service—saving money for owners because Everdur cannot rust. This rugged copper-silicon alloy possesses remarkable corrosion-resistance, yet it has the strength of steel . . . and is readily welded by all usual methods. Our new publication E-10 contains complete information on Everdur Metal for tanks and heaters.

Equally logical and satisfactory are many other uses for Everdur. Among them: air-conditioning equipment, masonry anchors, drains and ducts, electrical conduit. Additional data on any use of Everdur gladly sent on request.

EVERDUR METAL for TANKS

A COPPER ALLOY WITH THE STRENGTH OF STEEL
FITZGIBBONS presents maximum boiler value!

in the

OIL-EIGHTY AUTOMATIC

Points that home owners appreciate!

- Beautiful streamlined, enamel-finished jacket that harmonizes with the plan of any basement recreation room.
- Without increasing the length of the jacket, space is provided behind easily removable panels for the oil burner, which is thus protected from dust, dirt, careless feet, prying fingers. All accessories are also enclosed.
- With this boiler, no hot water storage tank is required. The Fitzgibbons TANK-SAVER, a copper coil submerged within the boiler, provides clean hot water for every tap, summer and winter.
- The OIL-EIGHTY is easily cleaned when necessary through readily accessible flue passages—an unusual feature in a residence boiler.
- Remarkably quick pick-up, when the burner goes on, thus providing maximum heat from every gallon of fuel, with high efficiency and low flue gas temperature—in short, low operating cost. Exclusive features enable the OIL-EIGHTY to meet every condition of oil firing—to cooperate with any burner.
- Lastly, the Fitzgibbons reputation of fifty years of building soundly designed steel boilers.

“In advising the selection of the Oil-Eighty, I know my reputation will be protected,” says the architect. This is the feeling of security which is back of the multitude of Oil-Eighty installations. Needless to say, the Fitzgibbons organization will continue to bend every effort to maintain the high standing of its products, and to cooperate closely with any dealer, contractor or architect to meet every condition which may arise in the installation or operation of the Oil-Eighty Automatic — the maximum boiler value of today.

WRITE FOR THE NEW OIL-EIGHTY CATALOG

Every architect should have the new Oil-Eighty Catalog at hand. This profusely illustrated book has helped to sell many automatic heating installations. Write today for your copy.

"CORROSION STUDY"
shows uses for
Wrought Iron

During recent years we have been the focal point in the collection of much data on current installations and comparative pipe service records.

Although leading architects and engineers tell us this work has been invaluable to them as a guide in selecting the correct pipe material, we have felt that its scope should be broadened.

Now we will gladly cooperate with architects and engineers in a "corrosion study" of local water, soil and gases in order to determine the exact conditions under which pipe must serve.

With this additional assistance "Pipe Prescription" became a more complete engineering procedure, incorporating an analysis of local conditions plus the experience of the building profession in using wrought iron during the last half century. Note in the examples illustrated that wrought iron is specified for those corrosive conditions where its record proves it longer lived and more economical.

Send your requests for assistance in making a "corrosion study of local conditions" to our nearest Division Office or our Engineering Service Department in Pittsburgh, A. M. Byers Company. Established 1864. Pittsburgh, Boston, New York, Washington, Chicago, St. Louis, Houston.

Examples by
WILLIAM E. FISHER
& ARTHUR A. FISHER
Denver Architects

Byers Genuine Wrought Iron pipe was specified in the Security Building, Denver, for hot and cold water lines, concealed waste lines, and drains; also for heating supply and return lines.

In the residence of Mr. and Mrs. L. M. Hughes, Denver, Byers Genuine Wrought Iron pipe was specified for main supply, hot, cold and drinking water lines and vents.

Byers Genuine Wrought Iron pipe was specified in Midland Savings Building for hot and cold water, waste lines and drains; also for heating supply and return lines.

THE CORK & BOTTLE, INC., is a new liquor store in New York designed by Morris Sanders, architect. It is an excellent example of modern merchandising through the medium of architecture

HOUSE OF FRANK N. HORTON, PALM BEACH, FLORIDA. A formal house in the French style built of concrete. Wyeth and King were the architects

BOOKS
Olympic athletes live in the 140-house village at Doeberitz, ten miles from the Reich Sports Field, where the contests are held. There are trees and shrubbery in profusion, a charming lake and a natural outdoor amphitheatre, a large auditorium for motion pictures and meetings near the village. A complete training field as well as a monster dining hall, containing a special kitchen and dining room for every participating nation are also part of the development. This project was built for permanency by the German army and will revert to it after the contests. (Below) a “Sauna” or Finnish bathhouse which has been erected in the Olympic Village.

Housing Holiday

A lot of Congressmen, a lot of newspaper and syndicate writers, a lot of lobbyists, and a lot of political hangers-on moved out of Washington last month, signifying that another session of Congress had come to an end. Thus ended, for the time being at least, the housing dream of Senator Robert F. Wagner. For after months of blowing first hot and then cold on building promotion, housing, in the last analysis, became just one of those things that Congress didn’t do.

It may or may not be significant that most of these Congressmen, writers and lobbyists had scarcely shaken the dirt of Washington from their feet before they were thinking in terms of housing again—making plans for a bigger and better attack on “reptants” next fall.

There is no particular secret about the fact that business and industry would look with a good bit more favor on housing and housing bills if these measures were sponsored by a Republican Congress or administration. Both business and industry can see how housing would be beneficial to their interests. Nevertheless, both continue to look on any measure bearing the New Deal banner as a risk—as a possible intrusion on their private rights. This attitude, right or wrong, will be the biggest single obstacle that any housing bill will have to overcome at the next session of Congress.

It is also fairly obvious that housing will get an even bigger push from its supporters when next it comes up for consideration. In addition, it will have more and stronger allies.

For nearly a year magazine and newspaper publishers in the consumer fields have been grooming for the expected national splurge. Nearly all have building editors. Why? Because the first time building is going to be “heavy-sugar” in national advertising. Air conditioning, electrification, etc. are all nationally advertised and each consumer magazine is vitally interested in upping the sales of these commodities through a national housing boom.

Consequently, when the housing forces line up next fall it is a better than even bet that newspapers and magazines will be on the side of any housing bill that does not have obvious shortcomings. Certainly, too, nothing could do so much for the quick passage of a housing bill as widespread publicity in magazines of all kinds. So, despite the current failure of the Wagner bill, it seems now that the fight will not have been in vain.

3,000,000 New Homes

Ever since the World War, England and Wales have been carrying on a conscientious housing program. Last month a milestone in this campaign was reached. The 3,000,000th new house was completed. Before the war there were about 7,500,000 houses in England. These 3,000,000 new homes, therefore, represent an increase of approximately 40 per cent in seventeen years. Even in the last six months 176,609 new houses have been completed.

Selling Housing

Discussions of housing problems in the United States have been so rampant during the last few months that most observers have lost sight of the real scope of this problem. Housing has long since passed from its purely national aspects and now appears to be as much of an international problem as tariff, treaties, or even war.

Nearly every nation right now is confronted with a housing problem that is at least as acute as our own. Only one,
WHERE YOU SPECIFY "JOINED BY WELDING"

You can be sure that your client will have a piping system that is permanently leakproof if you specify oxy-acetylene welding as the method for joining the pipe. Air conditioning ducts, also, can be made "jointless" by welding.

Oxy-acetylene welds have the full strength of the pipe or sheet metal. Welds take up less space than any other type of joint, look neater and involve no additional cost or time for construction. Pipe and ducts of all sizes and of any metal can be joined by the oxy-acetylene welding process.

Linde engineers, from their welding experience on many millions of feet of building pipe, have prepared technical data especially for those interested in designing and specifying "Piping Joined by Welding." Ask the Linde Office in your city for complete details before writing specifications. The Linde Air Products Company, Unit of Union Carbide and Carbon Corporation, New York and Principal Cities.

The unique and highly complicated system of ramps and roadways keeps traffic moving without interruption on New York's $63,000,000 Triboro Bridge. This huge structure of roadways and bridges totalling 17 1/2 miles in length was recently opened by President Roosevelt.

Great Britain, has made any real progress toward solution. Following closely in the footsteps of the parent country, however, is Canada. Because of its proximity, because its problems are much the same as ours, it might be well for American planners to keep their eyes on the Dominion.

Right now conservative estimates place the number of homes needed in Canada at 70,000. All of the causes that have contributed to the housing shortage here have also played their part in Canada. One fundamental difference remains: The Canadian government, through the Housing Act, has already taken concrete steps to remedy the housing shortage. Yet, even after this legislation has been enacted, Canada is no closer to a solution to this problem than the United States.

Looking at Canada's problem it becomes at once apparent that the lack of a solution to the housing problem is definitely not the fault of the Housing Act. Modeled after the British measure, the Canadian legislation leaves little to be desired. It works like this: If a man were interested in building a home to cost $5,000 (a fair figure for Canada), he first puts up $1,000 and receives a loan for $4,000 at 5 per cent interest. His easy interest terms make it practically easier than paying rent. He pays interest on the loan at 5 per cent and amortizes it at the rate of $26.15 per month for 240 months. Then the home is his. To the Canadian who is now paying $45 per month rent (also a fair figure) this proposition looks like a real opportunity. Why, as facts demonstrate, aren't more people taking advantage of it?

First, because mortgage money isn't plentiful. But the big reason is that Canadians, like all Americans, have had a five or six year course in pinching pennies and anything that looks like an investment is definitely out. So even though Canada's population is increasing at the rate of 175,000 annually—$75,000 in the last five years—eventhough the Dominion Housing Act has been passed and has made available 49 million dollars for home building, Canada today is little closer to a happy ending to housing problems than we.

Naturally this strange backwardness among potential home-buyers has aroused considerable comment in Canadian business circles. It has been pointed out that sales of bonds in the last five years have risen from $52 per capita to $74 per capita. Per capita ownership of automobiles, and other luxury products, has similarly increased. Yet during this same period residential construction has decreased 50.62 per cent.

How can the Canadian government or Canadian business interest its potential home-owners in building now? Here is the problem that is facing housing in Canada. And more and more often the same answer is thundering out: publicity and advertising.

For so skillful are the present day sales efforts of manufacturers of cars, refrigerators, radios, etc., that today the home is basically in competition with these products. Canada is rapidly coming to the conclusion that the prospective home builder must be reached with informative straight talk that "will sell him to action." Says one man foremost in the housing fight: "Advertising is the only force that can sell a nation. There's publicity, but let it be emphasized again that THIS IS A SELLING JOB."

In the fact that Canada has available a fund of fifty million dollars for housing that no one is using, lies a significant truth for housing experts in this country. All through our talk of housing there has been a smug assurance that the American public is "watering at the mouth" for an opportunity to build homes. We, like the Canadians, have assumed that only money is needed. All of which brings home with a thud the fact that in any future "Wagner Bill" there must be provision for "merchandising" housing even as you would a bag of salt or a pound of butter. Not only must funds be made available but people must be "sold" on its easy availability and on the fact that now, and now only, is the time to build.

In this respect, one American housing agency, The Federal Housing Administration, has done an admirable job. Even in the earliest days of FHA part of their funds were set aside for advertising and publicity. FHA bought billboard space at strategic locations in virtually all of the large cities in the country. Car-cards in subways, elevators and street cars advised that through FHA money at low interest rates could be easily procured. And FHA's record of successful modernization and mortgage insurance fully justifies these expenditures.

During the next few months it will not only be interesting, but instructive to watch the campaign that undoubtedly will be launched out in Canada to "sell" the public on "early building of homes for all." Even though our first task lies in getting suitable legislation enacted by Congress, no harm can come from keeping an eye on Canada. Housing experts here may get a sound approach to the problem of "Housing salesmanship."

(Continued on page 8)
Maybe These Architects
Are Plumb Crazy
Then Again Maybe They Are Not

[Not That It Matters]

Not so far back, an architect in a big up North city was asked to do a bank. One of those top-rung ones that would throw out bait for the tall-hats, especially especially the feuds.

After a whole passel of pow-wowing on what it should be built of, the architect stuck to it that brick it must be. And so brick it was and is.

Some of the bank's big-wigs, so am told, had a notion it ought to have sort of a staid old look, as if somebody's grandfather had laid the cornerstone or something, way back there in early Colonial days.

After doing a powerful lot of looking at various brick, some of which so rumor has it, were made from Virginia "mud-clay," the conclusion was that none of them would do.

About then, our Old Virginians came into the picture. Their color, natural off-shapeness (just enough, not too much) and their born-old look kinda' got 'em. But when they heard that the freight from down here to up there, was nigh as much as the cost of the brick, understand there was quite a to-do.

Well, to make a short story still shorter, our Old Virginian shale-clay brick won out. They wanted a certain color and an age-old effect. So as no other brick we ever heard tell about can quite do it, we fired up a kiln and made up a batch and the bank was built.

About that same time, some folks up Cleveland way, and several in Detroit, seemed to feel the same way about it, and up and ordered some for buildings of a like considerable importance.

Every once in a while you hear of a feller who imports brick from Holland. When you come to make inquiries, he imported them because they were the brick he wanted. Nothing else would do.

That's mostly the reason most folks buy our Old Virginians. Being a brick maker with these bricks for sale, somehow it seems almost intelligent to me.

Quietus on "Quoddy"

Unless there is more of the same presidential magic that started the Passamaquoddy tide harnessing project in Eastport, Maine, this development is doomed to end sometime around the fifteenth of August. Thus, the world’s greatest plan to make the ocean’s tides form electricity for man’s use will be at least temporarily stowed away.

Originally, President Roosevelt allocated $7,000,000 to “Quoddy” — this amount coming from the $4,800,000,000 relief appropriation for 1935. Now, since the seven million has been spent, and there is strong congressional opposition to further appropriation, the project faces a “close-down” unless the President can obtain more funds.

Even though the project is suspended, certain tangible and intangible assets will remain. These will include four small dams, completely built to stand in place indefinitely; a model housing development, constructed originally to house the administrative workers; and a handsome administration building, as well as a quantity of tools and construction equipment.

In the opinion of the engineers, however, the greatest single asset is largely intangible. This includes the engineering reports and specifications, the research that went into the solution of the tide harnessing problem. These data, elaborately compiled at a cost of probably $1,500,000, will be invaluable in future projects of a similar nature—such as the proposed harnessing of the tides of the Bay of Fundy.

Theoretically, the dollars and cents cost of postponement should not be large. On the other hand, engineers feel that despite the fact that buildings and structures should have a useful life of at least fifteen years, the cost of dispersing and then attempting to reassemble the expert staff, familiar with all details of the problem, would be tremendous.

Naturally the citizens of Eastport, in fact the whole eastern coast of Maine, feel strongly about the “Quoddy” shutdown. For a number of years this section of Maine has been going through a gradual process of retrogression. The “Quoddy” project has been viewed by all as the stimulus needed to bring new vitality to this section.

President Roosevelt, whose vacation home in Campobello (Canada) is only a few sailing miles from Eastport, has long taken a sort of paternal interest in the “Quoddy” project. His is a familiar figure on the streets of Eastport, and even now with the end for “Quoddy” almost in sight, citizens feel that he will pull an eleventh hour miracle and save it.

Undoubtedly President Roosevelt would like to do just that. But so strong is congressional disapproval, so powerful is the urge to economize on the eve of election, that it is practically a certainty that “Quoddy” is just about gasping its last breath.

Better Business

“How’s business?” Anyone seeking an answer to this perennial question gets a truly surprising response. There have been droughts, threatening labor difficulties, politics. Yet, with all of these obstacles, the business outlook for the remainder of 1936 continues favorable. Industrial activity is still at its highest point since 1929. Wages are going up; payrolls being expanded.

"Business Week," in fact, estimates that the national income this year will exceed $60,000,000,000 as against $53,870,000,000 in 1935.

Naturally this better business also means increased activity in the home building field. Even though automobile sales are way ahead of last year even though retail sales are constantly gaining, building is still leading the parade. The highest volume of public projects of the year and the highest volume of home construction since May 1931, lifted June construction totals to $233,054,600—8 per cent better than May and 57 per cent ahead of a year ago. In the first half of 1936, residential construction has gained 61 per cent over the same months of 1935. Non-residential building is up 89 per cent.

Public works and utilities are 76 per cent ahead. Total awards of $1,257,731,000 are 78 per cent ahead.

With this really remarkable upturn in business of all kinds, few people find occasion to grumble about price increases, although there is definitely a trend toward 1929 price levels. At the present time the cost of food, which increased five per cent between May and June, is 80 per cent of the 1929 scale. Rents are more than keeping pace with food increases.

Wary Veterans' Dollars

Responsibility for the biggest disappointment of recent weeks undoubtedly goes to bonus money. Such a tremendous build-up had been given this so-called "1936 gold rush" that the actual results were distinctly anti-climactic.

For weeks promoters had been seeking shares of the veterans' dollars. Automobiles, clothing, household equipment, even homes were suggested to the ex-soldiers as proper purchases. Now, a month or so after checks have been circulated, more than one retail store, shop, or furnishing establishment is wondering what happened to the potential "boom."

What did happen to the bonus money? Checking up in a few states it can be seen that the bulk of this cash went for paying (Continued on page 12)
N. Snellenburg & Co., the flooring contractors, have been good enough to say the following about this installation: "The design for this linoleum was of a very interesting character. The field is solid black, the circular design is brilliant red, and the horizontal stripes white. It illustrates one of the many decorative ideas which can be created with various colored linoleums especially adapted to modern treatments. The services and co-operation of Sloane-Blabon Corporation were very helpful in creating the design, character and color of this flooring."

THE richness and clearness of the many distinctive Sloane-Blabon colors—Azure Blue, Flame Orange, Sunshine Yellow, Ocean Green, Burgundy Red, Clear White, Jet Black, to name a few—make them particularly effective wherever a modern treatment is called for.

The Junior Ballroom of The Warwick, Philadelphia residential hotel, is a case in point. The colors selected—Burgundy Red, Clear White and Jet Black—harmonize beautifully and help create a room that is distinctly modern without being in the least bit blatant.

The Hotel Warwick is but one of many recent outstanding Sloane-Blabon installations. We shall be glad to send you a list of others, together with linoleum samples and our new Linoleum Handbook. Write W. & J. Sloane, Selling Agents Division, 295 Fifth Ave., N. Y.

SLOANE-BLABON LINOLEUM
..."Grit got my goat"...

Says President of University of Venisiata
Tells how he cured himself of Scratchitus

As a psychological study we gave half a class ordinary pencils for 10 days, the other half Venus Pencils.

"The students were of equal dullness and did not suspect our test. I know what Venus pencils have done for me, saving me from more than death.

"So I wanted to watch, laboratorily, the reactions of those less intelligent than I.

"But the experiment had to be curtailed at the end of the first day—the users of ordinary pencils as a group became unmanageable.

"It seems that Scratchitus, which comes from gritty pencils, is suffered in silence by countless individuals, but as a group disease it almost causes rioting.

"Our experiment proves conclusively that groups such as office people cannot get along using ordinary pencils, unless coerced. Venus Pencils, we find, are uniformly smooth, never gritty, never scratch."

* Copies of the President's findings, unabridged, unexpurgated, will be sent upon request. But today buy some Venus Pencils and save yourself from Scratchitus.

The column advertisement on the left is one of a series, written to the general public, stressing the smoothness of Venus Pencils.

Professional men, such as you, will be far more interested in another feature of Venus Pencils—uniform grading.

This absolute precision in grading makes each one of the 17 shades of black always identical.

Elaborate supervision and a costly system of tests guard this Venus superiority, so important to you.

It is just one of the reasons why Venus is the largest selling quality pencil in the world.

10 RU-BER-OID PRODUCTS
THAT ASSURE BETTER BUILT HOMES

PICTURED are 10 RU-BER-OID Building Products that play an important role in the construction of well-built homes. In every home you plan, regardless of price range, several of these products will efficiently and economically fulfill your ideas of good construction.

Most RU-BER-OID Building Products combine the features of beauty and protection. Some are solely for increased comfort. All reduce the home owner's upkeep expense... an important factor in home ownership.

You can always specify RU-BER-OID Products with confidence. For more than 50 years, every RU-BER-OID Product has been made to meet an inflexible standard of quality. This exacting policy has been reflected in the service records of RU-BER-OID Products the world over.

Check, in the coupon below, the RU-BER-OID Building Products that interest you most. There is a real story behind each of these products which should be in your files. Clip and mail the coupon today.

ONE INCH OF CELOTEX
EQUALS 3 FEET OF CONCRETE

In Insulating Efficiency

World's Most Widely-Used Building Insulation
Enables You to Deliver Better, Stronger Homes
... Faster ... At Lower Cost!

(Above) Millions of sealed air cells within the fibres of Celotex are a natural bar to heat transmission.
Open network of strong Celotex fibres means increased air space—increased insulating efficiency.

Celotex is easily cut and fitted with ordinary tools—nails firmly into place—stays put permanently.

Celotex sheathing spans four studs—meets on the stud—provides a stronger, better-braced, more wind-tight wall.

Celotex insulates right up to the frame—including pulley sockets which cannot be protected by fill-type insulation.

WHEREVER building insulation is desired, Celotex enables you to build better—build stronger—build at lower cost. For Celotex is more than just a strong, permanent, easily handled building material. It also supplies lasting insulation at the same time. It builds and insulates, both—at one material cost.

A single inch of Celotex equals 4 1/2 inches of plaster board—15 inches of brick or 3 feet of concrete in insulating value

With this tried and proved material—already used to insulate more homes than any other form of building insulation—both you and your clients will be better satisfied. For Celotex is a better insulation because:

FIRST Celotex is naturally good insulation, as the microscope proves. Millions of tiny dead-air cells within the strong, close-matted fibres, as well as between them, offer a permanent bar against heat transmission.

SECOND Celotex is a far better insulation structurally. It is easily applied. It can't settle, shift or shrink because it's nailed where you want it and stays there. It insulates pulley sockets. It stops wind infiltration—eliminating knot-holes and unbacked joints. And it's waterproofed for permanent protection against waterlogging and consequent loss of efficiency.

Let us send you further facts about this strong, lasting material used as sheathing lath interior finish that builds and insulates both—at ONE material cost. There's no obligation, of course.

The Celotex Corporation, 919 N. Michigan Ave., Chicago, Ill.
Sales Distributors in Principal Cities Throughout the World

CELOTEX

BRAND

Celotex Cone Fibre Products are manufactured under the Ferex Process (patented) and resist damage by Fungus Growth, Dry Rot, Termites (white ants).

Look for the brand name. Accept no substitutes.
majority of applications developed under the service will materialize into actual loans—and that the percentage of acceptable applications will be considerably higher than on our regular run-of-the-mill applications for construction loans, where, in many cases, poor design or unsuitable, and insufficient specifications account for a restricted commitment, or a flat rejection.

In addition to the new business attracted directly to the Home Building Service Department, our advertising campaign has evidently increased our regular construction activities, as evidenced by actual construction loans made....

"Although it is apparent that the permanent benefits of the service are cumulative, Perpetual feels that the results to date amply justify the time, effort, and money invested."

On the surface the success of this plan would appear to be primarily due to a skillful advertising program. Certainly, at least part of the results must be attributed to this promotional effort. But Perpetual justifiably feels that some measure of acclaim must be given to the technical personnel (architects) on hand to answer preliminary questions and guide the prospect over the first and most difficult hurdles. Naturally this scheme is not unique. Small House Associates of New York have a similar plan. Undoubtedly there are other such organizations throughout the country, employing more than 400 construction engineers—this in addition to the headquarters staff in Washington where fifty more engineers are employed.

To facilitate this work the country has been divided into eight districts. Each district is in charge of an engineer whose past experience has qualified him particularly for such responsibilities. These district engineers are not subjected to control from headquarters except on matters of policy controversy. This particular feature is designed to prevent costly decision delays.

In the Washington office design has been completely divorced from construction. Thus the architectural division, under the direction of L. A. Simon, supervising architect, is altogether detached. Mr. Simon has equal rank with the supervising engineer.

Also remaining active in the architectural division is the consulting board, an advisory committee on design. This group is made up of the following widely known architects: Charles Z. Klauder, chairman, Philadelphia; Aymar Embury II, New York; Philip Maher, Chicago; and Robert Shepley, Boston. Mr. Simon also sits as a member of this board.

Directly under Mr. Simon is W. G. Noll, who serves as superintendent of Architecture. T. C. Brooks is superintendent of structural engineering. N. S. Thompson is superintendent of mechanical engineering, while J. W. Ginder superintends the architectural engineering work.

This organization, probably the largest of its kind, comes designs and complete working drawings and specifications for all federal post offices, court houses, Public Health service hospitals and quarantine stations, as well as work for other departments. Naturally, it also takes charge of the preparation of working drawings and specifications under contract by private architects and performs all other necessary work preliminary to the award of construction contracts.

Emergency Construction Fund

The $60,000,000 Emergency Construction Fund will finance at least three hundred and twenty one public building projects in the near future. This became a certainty last month when Secretary of the Treasury Morgenthau gave final approval of the projects, money to come from the fund authorized under the First Deficiency Act passed by Congress.

Biggest number of projects went to New York with 21. Projects in many cases, are post offices.
Architectural ingenuity, expressed in larger glass areas, is bringing the boon of light and air to thousands of new home owners who, like the average person, spend at least half a lifetime between four walls. And architectural discrimination generally specifies for these ample areas the highest-quality glass available.

Libbej-Owens-Ford Company, Toledo, Ohio manufactures a complete line of flat glass, including Flax Drawn Window Glass...Polished Plate Glass... both clear and in colors...Heavy Sheet Glass...Greenhouse Glass...Safety Glass...Tuf-Flex tempered plate glass...Vitrolite opaque structural glass... Aklo heat-absorbing glass...and distributes the Figured and Wire Glass manufactured by the Blue Ridge Glass Corporation of Kingsport, Tennessee.
The architectural renderings show three of the permanent buildings at the Texas Centennial which will beautify the exposition grounds at Dallas for years to come. These buildings represent careful selection of materials and equipment with a view to modernity, convenience, and dependability. JOHNSON automatic temperature regulation devices perform the important function of controlling the temperatures produced by the blast heating apparatus—silently, effectively and economically. The JOHNSON organization celebrated last year its "semi-centennial"—half a century devoted to this one line of business. Whatever the temperature or humidity control problem—heating, cooling, ventilating, air conditioning—JOHNSON apparatus is the answer.

Johnson Service Company, Milwaukee, Wisconsin.
Direct branch offices in all principal cities.

JOHNSON AUTOMATIC HEAT & HUMIDITY CONTROL
for Heating, Cooling, Ventilating, Air Conditioning
FOR beautifying commercial and public buildings, there is no more attractive material than gleaming USS Stainless Steel trimming in polished or satin luster.

This wondrous new metal is as practical as it is beautiful. Lustrous stainless trimming cleans easily, saves cleaning expense. Its high strength permits the use of lighter sections — a metal saving which tends to offset the extra cost-per-pound, and offers an excellent means to lighten or strengthen heavy canopies and hangings. And because it is tarnish-proof USS Stainless trimming will keep your building young. A damp sponge will always restore that same sparkling newness you see today.

Don't overlook the advantages of specifying "USS" Stainless Steel for your stainless trim. As America's largest group of steel producers, we have the experience and the facilities to offer you a wide variety of shapes and dimensions — quickest delivery — and uniform dependable stainless steels which will look as brilliantly spotless in the years to come as they do today.

A HOUSE OF CONCRETE ON THE COAST OF CORNWALL, ENGLAND . . . by MARSHALL SISSON, F.R.I.B.A.
The orientation of most buildings in relation to sunlight has been haphazard, executed by mistaken rules of thumb. In the Town Planning Studio at Columbia University sunlight-control on a scientific basis affects both site planning and architectural form which this technique works out in practice are shown on the following pages. The first, a community of low cost row houses, and the second, a single commercial structure.

As a result of the studies made under Henry Wright’s direction, even the despised cornice may come back to its architectural own, exonerated and validated by practical engineering analysis. The function of the cornice as an element in the control of undesirable hot, direct sunlight may recommend it to modern and eclectic alike. Its aesthetic form is, of course, scientifically unimportant, but its position, projection and relation to openings and wall surfaces are being studied anew in relation to the characteristics of sunlight at different latitudes and at different times of the year. We may even find a renaissance of the wide, flat projecting cornice of the “prairie” architecture of that other famous Wright, Frank Lloyd. In its new guise, however, it will be recognized perhaps more for its practical function than for its aesthetic appeal.

Air conditioning gives new impetus to the further study of controlling direct sunlight. The load on summer air cooling apparatus may be considerably reduced by shielding wall and window surfaces from the direct rays of the sun, by incorporating cornices or cantilevered horizontal projections in the design of the building. Luckily, in this latitude, such projections can produce shade from the undesirable hot sun in the summer—yet, due to the lower angle of the sun in winter, the projections then do not eliminate wholly the warming sunlight penetration.

Modern architecture, with its larger expanses of glass, and with its lack of inhibitions regarding horizontal projections, offers a fertile field for the direct application of sunlight control through orientation and form. While traditionalists may hesitate to use desirable sunlight shields, the functionalists would grasp the opportunity to produce a more comfortable building by analyzing the sunlight conditions for suitable control, and by building accordingly.

Of course, venetian blinds, louvers, window shades and blinds can be used, instead of employing permanent projections, as they can be adjusted. This is an advantage for the days when there is no direct sunlight. Awnings too are an easily adjustable means of controlling undesirable summer sun. Natural or landscape planning is also useful in sun control. One of the students in Mr. Wright’s studio was able to shade the terrace of his house and several vital windows by studying the shadow patterns of existing trees on the property and by so placing his house in relation to them to ameliorate the effects of the hot western sun in the late afternoon.
A HOUSING PROJECT
PLANNED FOR SUNLIGHT

An actual site of some 17 acres of rolling land near Flushing, Long Island was chosen for a thorough site-planning study. The New York World's Fair of 1939 will be nearby. Low-cost row-housing was determined upon as a solution of the problem.

The method pursued in the solution of the physical problem was to first make a "negative-contour" model of the existing property. On one of the casts made from this negative model, studies of street layout were made in relation to probable best orientation and to economy of roads and utilities. Through the many studies of sunlight carried on in Henry Wright's studio of Town Planning at Columbia University, the most advantageous orientation of buildings for various locations had been determined in general. The masses of the carefully-studied small row-houses in block form, were then placed on the model for the detailed study of sunlight relationships.

The street plan adopted is carefully related to the contours of the site and at the same time provides for the desirable southwestern exposure for the principal rooms of the majority of the houses. The garages are grouped in the least desirable portion of the property both regarding outlook and orientation. A large apartment house is placed on the highest part of the property where it has a commanding view, looks over the low houses and garages to the south, and where it does not interfere with the sunlight or view of its neighbors.

Photographs were taken of the model giving conditions of minimum sunlight (December 21st) and maximum sunlight (June 21st) to show whether or not one building might be robbing another of its sunlight. In this way, an accurate plan was developed to provide the maximum desirable sunlight for all buildings by slightly altering their positions, elevations or the spaces between them. A study of the photographs of the model taken on the Heliodon show the extent and direction of the shadows cast by the buildings. Remarkably little shadow is cast by one building on another even at the most unfavorable time (December 21st). This is due to the careful study of the problem in three dimensions to take full advantage of the contours of the property.

This study was developed by Harmon Hendricks Goldstone as the subject of his thesis and is a concrete demonstration of the possibilities of three dimensional site-planning with the Heliodon as a practical, direct, and time-saving tool for architectural and community planners.

The rows of houses were made up of the units of small houses having two or three bedrooms each (as shown in plan on page 26). As an economy there is no basement except for the heating pits which are shown in this section. Each pit is equipped with an oil burner, and from the pit...
SUNLIGHT IN JUNE AND IN DECEMBER

PHOTOS: HENRY WRIGHT, JR.
access may be had to both heating and plumbing pipes. For economy also, the utilities are concentrated on the party wall without any sacrifice of convenience. The exterior walls are 8" hollow cinder concrete block, waterproofed and stuccoed. All parapets are capped with standard salt-glazed tile copings with socket joints, and extend above the roof to receive the flashing. Roof and floor construction is of 4" cinder concrete on steel. The roof surface is of a 10 year guaranteed roll roofing. Partitions are of 2" gypsum plank. Doors are of wood. Interior finish, 3-coat plaster on metal lath and furring. Party walls, 2 coat plaster; Gypsum partitions are finished with Kanite. Finished floors; battleship linoleum over wood flooring on sleepers. Venetian blinds are called for at all windows having south or southwest exposures so that sunlight may be controlled.

**A COMMERCIAL APPLICATION OF SITE-PLANNING WITH SUNLIGHT**

The photographs below are of models designed for an office building in Macon, Ga. The form of the building with its candidly projecting planes is accurately designed to shield the fenestration from hot direct sunlight in summer months and to take advantage of the warming sun in the winter. The illustration at the left shows the sunlight condition at noon on December 21st; that at the right shows the welcome shadows at noon on June 21st. These are but part of the complete study made of this building from the standpoint of architecture, economics and engineering by Logan Stanley Chappell as a thesis in Henry Wright’s studio at Columbia University. It is designed for an actual site and shows a practical problem and a solution designed to minimize undesirable direct sunlight in the summer.
HENRY WRIGHT
1878 - 1936

HENRY WRIGHT was like a flame that suddenly lighted up and thus clarified and simplified what seemed complicated problems. He was an original. His reasoning was his own—based on his own experience and observation. A varied experience in architectural, site, landscape, and subdivision planning formed the sound basis of his conclusions. His was an unusually active mind—an inquisitive, analytical mind—that constantly drove him on from one problem to another, and from one solution to a still better solution of a problem. His ingenuity forced him to follow his reasoning to its ultimate conclusion and to fight for that conclusion. No matter what sacrifice was needed, financial or otherwise, he made them for his beliefs. He was always big enough and brave enough to attack his own past opinions when he found a better means of attaining the end towards which he was working.

His objectives did not change. Most architects have many unrelated jobs; from the time Henry came to see clearly what he wanted to attain, he had one job. This was the building of better communities—the rehousing of urban Americans in more desirable communities in a practical way. It was all one job—the planning of Sunnyside, Radburn and Chatham Village; his ceaseless analytic writing; his reports on city and state planning; his teaching at various universities.

Henry Wright dealt with essentials. He never had patience with the endless details that lie between conception and ultimate execution, though he carefully considered all the factors of each problem. His flame went on to light up other problems. That active mind of his was constantly driving him ahead. It drove Henry on to new tasks—searching always for means to a simpler and finer way of living in modern communities. His mind jumped with intuitive speed from needs and facts to conclusions and conceptions of form and arrangement.

He had what seemed a supernatural sense of site and the possibilities of relating buildings and living to the facts of nature—to the sun, the winds, the views, but, above all, to the form of the land—so as to get the maximum use in terms of good living, of open spaces, attractive views, quiet and safety at a minimum expenditure for roads, foundations, and yard work.

This apparent intuitive sense grew out of the fact that he combined the training of an architect with the long experience of civil engineer, landscape architect, and architect as a team to design towns. Wright, with his background as house designer, city and site planner, and subdivider, was invaluable. He was greatly influenced, at this time, by the theories and reasoning of Raymond Unwin, as expressed in "Town Planning in Practice." With the work over the work ceased, but enough had been done in Chester, Pa., Newburgh, N. Y., and elsewhere, to give Henry Wright confidence in his approach to the problem of community development and for him to determine that his future work must be in connection with providing better homes and communities for the large masses of the people.

There was then no chance of carrying on private practice to

number of salable lots with as many front feet as possible available for sale. The ultimate location of house in relation to site and to its neighbors and to the ultimate cost of public utilities, finished roads, and of grading or yard work was always left for the future. Henry Wright, even then, as a young man, could not see things that way. Land, road utilities, grading, house were all one—must be conceived of as an integrated unit to serve living, not selling. It sounds simple to us now after these years of housing education, but it was revolutionary then. So many of Henry Wright's other conceptions in the years that followed seemed revolutionary, but were ultimately accepted as the common sense basis for practical attainment.

To have freedom to carry out his work in his own way, Wright set up his own office in 1909. It was a brave thing to do. Henry was married and had two children. He gave up a secure position and a good salary so that he might try to carry out his own conceptions. Again and again in the future he was to do the same thing—to risk all for the attainment of an ideal: to try out what seemed to him a better, more logical way of using land and building to improve living. Mrs. Wright always shared with Henry a willingness to sacrifice comfort and gain for beliefs.

Wright had the opportunity to plan a number of small suburban developments outside of St. Louis with house and land development related, and in certain cases he was architect of house as well as site planner. These were homes of the wealthy or modestly wealthy and were too limited in scope, so he turned to civic affairs. He helped to organize, and was secretary of, the St. Louis City Plan Association, 1909-10. He urged the St. Louis Chapter of the A.I.A. to study the critical city plan situation in 1916, and directed the study and exhibition of the Chapter which laid the foundation for a forward-looking city planning program.

His real opportunity to make practical application of his theories of community development came soon afterwards as a town planner for the Housing Division of the Emergency Fleet Corporation in 1918. The Production Division under Robert Kohn, with Frederick Ackerman in charge of design, had the difficult task of trying to harness civil engineer, landscape architect, and architect as a team to design towns. Wright, with his background as house designer, city and site planner, and subdivider, was invaluable. He was greatly influenced, at this time, by the theories and reasoning of Raymond Unwin, as expressed in "Town Planning in Practice." With the war over the work ceased, but enough had been done in Chester, Pa., Newburgh, N. Y., and elsewhere, to give Henry Wright confidence in his approach to the problem of community development and for him to determine that his future work must be in connection with providing better homes and communities for the large masses of the people.

There was then no chance of carrying on private practice to
attain this end. He returned to St. Louis and, as architect for the City Plan Commission, prepared and administered rules for land subdivision control. He attempted to guide the subdividers to relate their plans more closely to the requirements of better living at moderate cost. But more and more he saw that the slow, unrelated processes of land subdivision and speculation, followed by scattered building of houses, was excusably wasteful and antagonistic to the attainment of desirable housing. At this time, he wrote a report for St. Louis on the economics of land subdivision that contained the seed of much of his future thinking, writing and work.

I became acquainted with Henry at that time as a result of our association on the Committee on Community Planning of the A.I.A., and our work with Charles Whitaker on the Journal of the A.I.A., and finally, in 1921, in planning a small industrial workers' community. This project was not carried out. But by working together we found that we were interested in the same objectives, although we had quite different contributions to make in their attainment. We found that we could not fit our conceptions into the pattern of the existing city, its manner of physical growth and the economic or social methods of bringing about that growth. We turned to Ebenezer Howard's Garden City as fundamentally the most valid answer to the problem of American city development.

Garden Cities, we felt, must be built in America to meet American ways of living. In 1923, Alexander Bing (a man of vision and leadership with practical experience in large operations), Henry Wright and I co-operated in the plan of a small self-contained community within the boundaries of New York. This development would have exemplified, on a small scale, most of the principles of the Garden City; the retention of the land increment by the community; large scale, organized, comprehensive and related planning, construction, and management; industry and business within walking distance of the homes; the elimination of costly though unessential elements which were customary in American city planning. It was impossible to secure sufficient finances for this project, but as a result of these studies the City Housing Corporation was formed, Sunnyside was built, and ultimately a major step toward the future rebuilding of America with modern communities was made in the conception and partial creation of Radburn.

Wright wrote of the Radburn Idea for which he was to such a large extent responsible—

"The application of this social plan to Radburn was an event, in my judgment equal in significance to that other 'social' plan of Ebenezer Howard (1898). The Garden City Plan (1898) - fitted into the old condition of its day, but Radburn (1928) had to meet an entirely new set of conditions. City Planning had been engrossed in the solution of traffic movement, adjusting old time street systems to new demands of the motor car, but no completely new town had recognized the necessity of meeting the human problems of danger, noise, and nuisance accompanying the convenience of the new vehicle. The Radburn Idea attacked the problem as a related whole."

Those were busy years for Henry Wright. He became consultant to the New York State Commission of Housing and Regional Planning, and in the report on a Plan for the State of New York he did pioneering work in this country. The report was a masterly analysis of past, present, and possible future physical developments of the State. It blazed the way for the many subsequent State plans.

This report was merely one sign of the broadening scope of Henry's life work. Although he continued with the study of the detailed problems of plan organization of apartment and house units and their relation to each other to the site, his main interest was the broader picture.

His thinking was stimulated by a group of men who sometimes came together as the Regional Planning Association of America and who approached, from a variety of angles, the problem that absorbed Henry. There was Frederick Ackerman, Lewis Mumford, Stuart Chase, John Bright, Frederick Bigger, Henry Klaper, Benton MacKaye, Robert Kohn, Charles Whitaker, Alexander Bing, among others. Henry's original angle on all that was discussed was always provocative and stimulating. The apparent solution never satisfied him. If it were generally accepted, he immediately questioned it. He had to get at the roots or foundations and see how the whole works built up and why. He never got over the boy's inquisitive taking apart the works of a watch, but he always found a new and original and generally a better way to put it together.

Writing and public speaking at first were difficult for Henry Wright. But he felt the need of passing on his experience particularly to the younger generation. He lectured at a number of universities. His unassailing mastery of his subject and his simple sincerity in time made him an easy speaker. He spoke first as a technician in the architectural schools. But this did not satisfy him. His subject was broader than architecture or site planning or city planning. He gathered around him professors and students of economics, sociology, government, engineering, as well as architecture and city planning, and with them discussed the broader problems of community building.

So that he might have more constant contact with them, for a number of summers he invited a group of younger instructors and advanced students to his simple farm in New Jersey. They worked out projects in community planning and in their spare time remodeled the old mill to serve as drafting room and dormitory. In the evening they discussed endlessly, spurred on by the provocative mind of Henry Wright.

His book, "Rehousing Urban America," was published by the Columbia University Press early in 1935. It is unquestionably the best technical book on housing in America. A volume that was to sum up Henry Wright's experience and point of view on housing never could be finished. His mind and imagination flew ahead of his pen. The first part of the book was always obsolete for him before the end was reached no matter how fresh it might be for others.

He started the Housing Study Guild in association with Albert Mayer, Carol Aronovici, Henry Churchill and Lewis Mumford for the clarification and development of thinking in regard to housing through discussion and research. Last year he was appointed Associate Professor at the Columbia School of Architecture for a term of four years, and was given the freedom to carry on his work with his students according to the methods he had developed at his farm.

Most of our lives have no plot. Henry Wright's life had a definite theme. He devoted his life to a cause with a singleness of purpose. But he was never a propagandist: he preached no cure-all. His ever youthful, searching mind and his integrity would not permit him to freeze his point of view and become doctrinaire. He once said to me, "If I had my way, over the gate of every university, I would carve a great question mark." Technically and intuitively he probably knew more about housing than anyone in this country. But he always remained the seeker after new truth whose brilliant flashes constantly lighted the way for those of us who were fortunate enough to work with him.

THE ACACIA MUTUAL LIFE INSURANCE COMPANY'S
HOME OFFICE BUILDING, WASHINGTON, D. C.
SHREVE, LAMB & HARMON, ARCHITECTS
The ordinary requirements of an office building were in this case subordinated to the civic responsibilities laid upon the owner of this particular site. In the first stage the portion of the plan shown in black was built; eventually, expansion will require the completion of the pentagonal form.

The problem presented to the architects had three major elements: first, the building of a home office for the Acacia that would embody all that the modern science of building could offer, in comfort, adaptability to minor changes of plan, and fireproof construction; second, the utilization of a low site through which flows the Tiber Creek sewer; and third, the creation, through its architectural dress, of a building worthy of taking a place with other notable structures grouped about the Capitol of the United States.

As to the first of these considerations, the building, from the entrance floor throughout its height, has been designed without interior structural columns. There is thus gained the utmost freedom in planning departmental arrangements and their inevitable revision from time to time. Moreover, the pentagonal plan, following the perimeter of the irregular plot, with a central court, gives a building that can utilize daylight to the utmost from both sides of a comparatively narrow span.

Expansion for future growth, in an insurance company building as in a bank, is a factor that can be plotted with reasonable accuracy. Eventually, the full pentagonal building will probably be needed; for the present, the southeast side will serve, but naturally the architects have endeavored to give this first stage an appearance of completion in itself. The next addition will take the form of an extension along New Jersey Avenue to D Street. The arrangement of walls and steel is such that this addition and later ones can be made without structural changes other than the removal of an end wall of the present building.

In the matter of construction, there has been none of the usual pressure to cut first costs to the bone. In this case the aim has been to arrive at the proper means which would provide a minimum of continuing maintenance charges, without undue increase of the capital investment. Granite and limestone were used for the exterior. All exterior window and door frames, interior door frames, doors, trim and departmental sub-
divisions are either steel or bronze, except where, on the executive floor, wood paneling has been used to mark the importance of certain rooms. The entrance lobby and the elevator lobbies have been finished in various marbles and Virginia Greenstone. Stair treads throughout are of this same stone.

Above the basement the entire building has been air-conditioned and all ceilings have been acoustically treated. There is a low-pressure steam heating system, thermostatically controlled, with all radiators concealed within the thickness of the exterior walls.

The site is comparatively level, but the grounds of Capitol Park rise slowly to the southeast, so that at a point somewhat over 500 ft. to the east the grade is about 18 ft. higher. Less than 8 ft. below the first floor of the building is the top of the Tiber Creek sewer. Both of these facts pointed to a solution in which the second floor becomes the main entrance floor, approached by a wide flight of steps and a broad terrace along the facade parallel to Louisiana Avenue. There was another advantage gained by thus establishing a higher base for the building: the height was limited to 90 ft., measured from the top of the curb on the central line of the front; obviously, then, this limitation would permit a more efficient use of the site if it could be reckoned near the highest point of the curb, which is at the corner of New Jersey and Louisiana Avenues.

The placing of the front terrace to establish a higher base for the building had a further and eminently practical advantage. If the building had been erected nearer to the Louisiana lot line, the elevators would have been over the sewer, with no possibility of their reaching the basement, and some difficulty of arranging them to serve even the first floor.

Elimination of interior columns brought a new problem in the provision for an acceptable distribution of conditioned air and heat. Closely coupled with this problem was the need for a choice between six stories and seven in the limited height. Weighing, therefore, the factors of light penetration through greater ceiling heights with larger windows, the possibility of using the girder web spaces for air ducts, and a better scale for the facade, as against the additional story with one or even two rows of interior columns to cut down the beam depth, the six-story building was chosen.

In the plot plan on the facing page, it will be noticed that a unit of hexagonal plan is indicated, projecting into the interior court. An auditorium or a cafeteria may occupy this space in a one-story building, or both in a twostory building, without encroaching unduly upon the court's light-producing function.
Granite and limestone help to bring Acacia into harmonious relationship with the other notable structures grouped about Capitol Hill. The building is as nearly fireproof as modern knowledge could devise. Main entrance lobby, finished in various marbles and Virginia Greenstone (facing page).
The president's office, temporarily equipped with furniture from his former office; new furniture has been designed by the architects. In the director's room (facing page) as in the president's office the walls are finished in dark woods, the ceilings in acoustical tile.

On the main floor—the second—the visitor finds, flanking the entrance lobby, the two main departments of the institution with which he is likely to have contact—policy holders' service, and mortgage loans.

The Acacia Life Insurance Company's Home Office Building
Washington, D. C. Shreve, Lamb & Harmon, Architects

American Architect and Architecture, August 1936
There are no intermediate columns intruding upon the open floor space, so that rearrangement of partitions is greatly simplified. Air-conditioning ducts and their registers are carried along the webs of the steel beams. There is a supplementary low-pressure steam heating system, with radiators concealed in the exterior walls.

WASHINGTON, D. C. SHREVE, LAMB & HARMON, ARCHITECTS

Above, a typical floor, unobstructed by partitions or columns, and generously lighted from all sides. Flanking the broad entrance steps leading up to the southeast terrace are these stone griffins—symbols of watchfulness and guardianship... Edmond Amateis, sculptor.
OLD MISSION BUILDINGS IN CALIFORNIA

Twenty-four important missions built by the Franciscans were once linked by only the fragile 600-mile thread of the "King's Highway." Today all but three of them remain as splendid architectural relics of Spanish imperialism. Stories of the privations, journeys and the difficulties of constructing these buildings, which marked the efforts of the padres to colonize and convert the Indians to Christianity, portray this as one of the most colorful periods in American history.

SAN LUIS REY, 1798 . . . Once the richest of all the Californian missions, with 3,500 Indians living within its boundaries at the time of secularization in 1835, the San Luis Rey Mission was returned to the possession of the Franciscans in 1894.
SAN ANTONIO DE PALA, 1816

This mission (above and right) is located in the picturesque mountains twenty miles northeast of San Luis Rey of which it is an asistencia. Descendants of the early converts still worship here.

SAN DIEGO, 1769

The campanile of the first California mission. After many Indian uprisings, prosperity finally came to this mission in 1830, yet after secularization five years later, Richard Henry Dana in "Two Years Before the Mast" wrote: "We drove into the open square in which the stillness of death reigned."
SAN FERNANDO, 1797

This old monastery stands amid shading pepper trees. The statue in the foreground is that of Junipero Serra, leader of the missionaries sent from Mexico. The first gold discovery in California was made in a canyon on the property of the Mission.

SAN JUAN CAPISTRANO, 1777

Masons were brought from Culiacan to build a stone church (right and opposite page), the first one in the chain of missions. San Juan prospered until 1812, at which time an earthquake reduced the building to ruins.
SAN ANTONIO DE PADUA, 1771

In the valley of Los Robles, amid the Sierra Santa Lucia, stands the brick and adobe ruins of California’s third mission. About the old church are still to be found traces of many buildings and an extensive water system. The land is now part of the William Randolph Hearst ranch.
San Buenaventura, in Ventura, was the last mission to be founded by Junipero Serra. Santa Barbara (opposite page) is the only mission that has been served continuously since its founding by the Franciscans.
SAN CARLOS IN CARMEI, 1771 . . . This building is unusual in the Moorish architectural influence on the stone domed bell tower and the star window. Located near Monterey, which was once the capital of California, this mission attained importance as the home of the President of the Missions
REALISTIC OR VISIONARY?

YOUTH must be served, and the youth of the architectural profession is serious in its attack on the problems facing the profession. It is not satisfied, and should not be satisfied, with things as they are. The younger men look upon architecture as a profession which should play a leading part in shaping the physical environment in which we live. They resent any implication that architects are merely plan-drawing stylists of buildings. Several young architects who attended the recent Convention of the A.I.A. left it with the distinct feeling that, as an organization, the profession was failing to face realistically the problems of today and tomorrow and that it was rather harking back to the good old days which the younger men had never known.

Youth does well to cherish the high hope that it can really make the profession of greater service to society. It is believed that through a broader vision and a clearer understanding of the social and economic aspects of architecture and city-and-community-planning, the profession will be more competent to offer better solutions to the physical problems and will create more advantageous environments. The training—and the thinking—of the younger men differs in many ways from that of their predecessors. The leading architectural schools of the country are placing emphasis on a more rational approach to the problems of architecture and are fostering inquisitive straight-thinking methods of attack.

Specifically, youth takes issue with the present "pussy-footing" methods and would like to see a realistic facing of the problems of the profession. In the list of subjects that occupy the discussion of the younger groups may be listed:

- The necessity for community planning, city planning, economic land usage and the study of trends to determine the actual need for buildings of various types.
- The relationship of individual buildings to their neighbors, and to the city pattern, is assumed by right to be a proper sphere for analysis by the architect. There is less interest in the individual building as an unrelated entity.
- Youth would be more frank in the matter of architectural fees or commissions, and would come out flat-footed to recognize the lump-sum fee as well as the cost-plus fee and the familiar percentage type, with its variation of 5 per cent up or down.
- Likewise, organized publicity and advertising would find their place in architectural thinking and action, for potential clients must be made aware of the competence of the architect to plan, efficiently and economically as well as aesthetically.
- To increase this competence, the younger men can see no reason for the lack of a central bureau which would provide scientific, accurate, unprejudiced facts regarding building materials and equipment, so that architects would know definitely and with assurance the best products for each particular purpose.
- By establishing standards through such a bureau, it would not be a difficult task to bring about a uniformity of building codes,—codes based on the performance of materials and building methods, instead of the present codes which constitute, in so large a measure, mandatory specifications for certain obsolete practices.
- Fully realizing that an open competition for a large building brings with it an expenditure of time and money on the part of the majority of competitors, the younger men feel that it still may constitute the only way in which they can gain recognition for their ability as designers. They believe that the stimulation to better design which is inherent in architectural competitions is worth the apparent waste to the profession, to say nothing of the possibilities of increasing public interest in the value of architectural services.

These are but a few of the major themes that are in the minds and conversations of the newer generation of architects, just as they engaged the attention of the men who have gone before. The question is, will the new phalanx be better able to penetrate the wall of professional and public inertia which discouraged the older shock-troops? If zeal, courage, intelligence, and honesty of purpose count,—we believe the answer is "yes".

EDITOR
another two-foot course upon a wall that are easily achieved by titling wooden forms in building progress. The suction applied, the blanket is left in place for a considerable period. Billner's device sucks the surplus water out of the concrete immediately after it has been poured, and at the same time uses the convenient and easily applied atmospheric pressure to hold the concrete in place. Incidentally, he uses forms of paper to provide an interior air space. Wall openings are easily achieved by fitting wooden bucks into the forms and covering the faces of these with paper. Outside and inside forms consist merely of the canvas suction blanket stiffened with boards placed in at intervals between bottom and top edge pieces. An hour after the wet concrete has been poured and the suction applied, the blanket forms are removed, and stepped up to another two-foot course upon a wall that is already hard enough to resist indentation by the edge of a coin.

Thursday, July 2.—Of particular interest to those who hold the theory that this country has reached a stage where its building needs include less factories and more recreational buildings, comes the year book of the National Recreation Association. It contains a ten-year review of leisure activities, and indicates a marked increase in architectural types that contribute to the enjoyment of leisure. Bathing beaches, public golf courses, skating rinks, and swimming pools doubled in number between 1925 and 1936. Schools and other buildings used in part as recreation centers tripled. The number of buildings used entirely for recreation increased four times in the ten years.

Friday, July 3.—A significant straw in the wind is the shifting of the ratio between the amount of money being spent for refinancing of maturing mortgages on the one hand, and the amount being spent for new construction and reconditioning of homes. In April of last year 55 per cent of all loans by the Federal Savings and Loan associations were for refinancing of maturing mortgages. At present the advances for refinancing have dropped to 32.4 per cent of the total. In other words, distress borrowing is shifting rapidly to progress borrowing.

Saturday, July 4.—Carl F. Gould, having finished his arduous labors as Architectural Advisor to the Oregon State Capitol Commission in its recent competition, had luncheon with us just before sailing for Europe the other day. I always thought Gould knew how to live, but am more convinced of it than ever, for he and Mrs. Gould and their son and their daughter are enrolled for the summer school at Fontainebleau, after which they will return in September to new battles.

Sunday, July 5.—NPHC, which are the letters indicating the National Public Housing Conference, is putting some sparks into its publication, "Public Housing Progress." One of the sparks calls attention to a recent decision in the Federal Court of Appeals condemning the Bound Brook, N. J. resettlement project: "The Constitution will be scanned in vain for a power conferred upon the Federal government to regulate housing or to 'resettle population.'" On that basis, the Editor suggests that the Supreme Court itself may find that the rehousing of its own nine members in a twelve-million-dollar building, while millions of people are still living in shacks and illegal habitations, may of itself be unconstitutional.

Tuesday, July 7.—W. L. Wood, who edits The Architect and Building News of London, has hit on what seems to me an excellent idea. He publishes from time to time obituaries of buildings. One of these was the north side of Brimswoode Square, and now he publishes a side of Mecklenburgh Square, the old houses of which are to be destroyed. As part of the obituary, there is a photograph of the work as it stands, together with plans and carefully measured details.

Thursday, July 9.—Out of an air-cooled sleeper into the scorching streets of Washington to find out what is going on in the Resettlement Administration. The famous and architecturally somewhat infamous house of the late Senator Walsh, in which some of the department's personnel is quartered, suggests nothing so much as a palace of old Russia taken over by the Soviets. There are rather more than four hundred men and women working in the old mansion, surrounded by frescoes, carved wood, marble statues, silk damask wall hangings, and an interior that resembles no other structure quite so closely as one of the old North German Lloyd boats.

After a busy morning with the architectural and town planning heads of the four resettlement projects, Greenbrook, Greensdale, Greenbelt, and Greenshills, we lunched with J. S. Lansill, assistant administrator, who gave us a very comprehensive picture of the aims and policies of these patterns for rebuilding America.

Out to see Greenbelt in Berysyn, Md., almost mid-way between Baltimore and Washington where Douglas Ellington and Hale Walker showed us the various types of dwelling units in progressive stages from foundation to plastering. There is a great story in these concentrated efforts to develop better housing, but the story is far too long to tell here.

Back to Washington for a further accumulation of data in the resettlement projects, and then met Edwin Morris, William Dewey Foster, Eric Kehbon, and A. S. Thorne for dinner on a roof where there seemed to be some breeze even over a parched city.

News of Henry Wright's untimely death reached us at the Resettlement offices, and saddened the whole organization. Here was, indeed, a man who pushed straight forward on his course from college days to the end. He not only accumulated advanced knowledge about housing here and abroad, but with his keen and orderly mind, brought a vast accumulation of techniques into a form in which these aids were being made available for his many pupils, disciples, and followers. Henry Wright, in the last months of his life, must have had a real sense of satisfaction and achievement in seeing the growth of the better housing idea during his brief span of years.
Saturday, July 11.—The evidence as to the economic absurdity of slums piles up. In Indianapolis a blighted area containing 10% of the city’s population used 26% of the city’s money devoted to service. To put it in another way, taxpayers in Indianapolis are spending $27.29 for the maintenance of each person in this blighted area as against $4.00 per person in other areas. Again in Cleveland, in a certain blighted area in the city, the tax income was $225,035, whereas the cost of service in that section of the city was $1,972,437. If Cleveland were to put into construction this yearly loss, she would have at the end of twenty years 7,300 new four-room dwelling units.

Monday, July 13.—Lunched a few days ago with several members of the Small House Associates representing New York City’s effort to bring architectural service into the small house field. While the Washington group and the Boston group, both working closely in co-operation with lending agencies, are apparently making good progress, the New York group is finding the going rather hard. Applicants who come to this office seem to require work of a somewhat larger scale than the standardized designs, and seek a more extensive type of service than was contemplated. Apparently there must be a very clear line of demarcation between the limited architectural service furnished with standardized plans on the one hand, and full architectural service at a ten per cent fee on the other hand. Any tendency to bring these two fields closer together seems inevitably to promise that the more expensive branch will be dragged down to the lower level. I have an idea that the Boston crowd probably solved a real problem when they decided that the designs offered as standards were to be taken as they were, save for very minor changes, and these latter paid for. As contrasted with this policy one entered upon by the New York group, in which each client was to have a house designed for him—even though on the basis of one of the standardized plans—involves the architect so nearly in a full service that he must, in self defense, receive eight or ten per cent for it.

Wednesday, July 15.—Mark Daniels, Editor of California Arts and Architecture, who is one of the few architectural writers whose words we sit up late at night to devour, says he is a hardware drunkard. “I can no more resist a pair of polished steel calipers glinting seductively in the window of a merciless hardware dealer than a forty-year alcoholic can turn his nose away from a glass of sixteen-year-old bourbon.” I am another one, and I think we ought to form a guild. In my particular form of besottedness, however, there are two temptations: the hardware store window, and the photographic equipment window. The only way of resisting the temptation to spend all of one’s available means on either of these forms of dissipation is to sight these windows from afar, and cross the street, passing by on the other side.

Friday, July 17.—Walter Meigs over from Philadelphia a few days ago for a social and professional call, in which we became deeply entangled in a discussion concerning some of the national philosophy of architecture. Meigs is considerably exercised over the fact that whereas architecture in the past was developed from above, there are those who now argue that it should develop from below. In a word, there seems to be the view in some circles that we are building, occasionally, residences based on architectural forms that have been developed for the commercial building, warehouse, and factory. All of the architecture we regard as great in past eras has been enforced from above—sometimes by the church, the government, the wealthy patron, the feudal lord. It had, at least, the merit of being inspired by the better educated minds. Of course, any discussion along these lines inevitably leads to the broader question of just how well a democracy works.

Tuesday, July 21.—Radio, after having been put to work to open garage doors, has been given another job. It serves to light up a show window when the passerby approaches. The presence of the additional electric capacity in the body of the observer is sufficient to react upon a delicately adjusted aerial along the top of the window so as to trip a switch. When the window is otherwise dark, an illuminated sign appears reading “Approach this window, and you will light it up.”

Wednesday, July 22.—Lunched with Harry Ahrens, who has taken Joe Hautman’s place as head draftsman in the Park Department’s Division of Design, Hautman having been taken over by the World’s Fair group. There are still many architects, draftsmen, and landscape technicians in the Park Department work, but the number is slowly but steadily being decreased as private industry offers its opportunities. The problem of security, as it presents itself to the architectural draftsman these days, is a staggering one. The up-and-down movement of building activity is a perpetual threat to the security of all but a very few long established men. Nor does the alternative of public work offer a haven of rest. Appropriations for public work are sure to be co-ordinated with the demands of private industry, so that as the latter increases, public work decreases and with it the opportunities for the technician. The prophet who will tell the architectural draftsman how to secure a job and hold it for the rest of his life would not be without honor in his own country or elsewhere.

Thursday, July 23.—Jerry Geerlings back from the West where he has been spending six weeks designing plumbing fixtures. There apparently is a deep satisfaction in simplifying the curves of a piece of brassware so that the saving in the buffing process alone amounts to a fraction of a cent. The thousandth part of a cent saving on one comparatively insignificant item may mean a saving of thousands of dollars a year. Geerlings says that after a study of the intricacies of design for the machine, the working out of architectural details seems like kindergarten work.

Monday, July 27.—It is amusing to consider the paradox presented by the fact that functional simplicity at present is a luxury that can be afforded only by the wealthy, while the poor, who need it most, cannot buy it. Of course, the reason is that any breaking away from the regular current into experimental design entails expense. Functional simplicity may eventually be within the reach of those who need it, but not for a while yet.

Wednesday, July 29.—Modern refrigeration in domestic units has made amazing leaps in recent years. The industry has now reached a stage where replacements are assuming a far larger ratio as compared with new installations. Apparently the time is not far off when, as in the automobile industry, replacements will exceed new sales.
FOURTEEN EXAMPLES OF THE

The neo-classic style (above) finds a satisfactory expression in painted stucco over frame construction. Cellar floor is 6" concrete slab, waterproofed; foundation walls are poured concrete and concrete block are used for garage. Trim is of painted wood and the roofing is random width slate.

HOUSE IN NASSAU SHORES, LONG ISLAND, NEW YORK. RANDOLPH EVANS, ARCHITECT

The overhanging eaves offer excellent sun protection in this house of concrete block with a painted stucco finish (opposite page). Foundation is 12" x 30" spread concrete footings; floor, mesh reinforced concrete slab on fill. The artificial chimney is used as a water storage tank.
HOUSE OF L. MURRAY DIXON, MIAMI BEACH, FLORIDA. L. MURRAY DIXON, ARCHITECT

AMERICAN ARCHITECT AND ARCHITECTURE AUGUST 1936
Stucco finish on cinder concrete block has the precise surface quality required for modern architecture (above). Concrete is used for roof and floor slabs, and joists. A basement recreation room is executed in colored concrete. Cost $9,000 in 1935.

Stucco and brick, over frame construction, combine to lend textural interest to this California "Colonial" house (opposite page). Roof is hand split red cedar shingles. Bookcases in the deep window reveals of the living room are interesting.

HOUSE OF N. L. DUNCAN, READING, MASSACHUSETTS. SAMUEL GLASER, ARCHITECT
HOUSE OF HAROLD H. PATTERSON, WEST LOS ANGELES, CALIFORNIA. H. ROY KELLEY, ARCHITECT
HOUSE OF C. E. VESY, SANTA MONICA, CALIFORNIA. JOHN BYERS, ARCHITECT
Stucco finished concrete walls effectively recall the charm of the early type California ranch houses (opposite page). The roof is of tile, and Mexican tiles are used for floors on the first floor. Edna Muir was associated with the architect.

Stuccoed cinder concrete block walls on concrete foundations are an excellent medium for modern design (above). Roofing is four-ply built up, on concrete slab over steel-truss joist. Insulation, rock wool. The windows are all-steel casements.

HOUSE OF GEORGE KIEYE, ORANGE, CONNECTICUT. SCHILLING & GOLDBECKER, ARCHITECTS
Native stone is used for the first story and foundation walls, while stucco finished concrete block is used for the second story walls. Floors and roof are of concrete slab. Windows are steel casement. All interior walls have plaster finish except in playroom where stone is pointed with white cement joints.
A modernized Colonial type house of reinforced concrete block with a stucco finish and run stucco molds. The roof is of black asbestos shingle and sash is of steel. The open porch has a brick floor and the glazed second story porch floor is of tile.
A one-story house of simple design, has an effectively textured surface in painted cinder concrete block. The interior walls are insulated and plastered. Cost $4,200

HOUSE OF RALPH SEYMOUR, DARIEN, CONNECTICUT. FREDERICK JENKINS WALLIS, ARCHITECT
This house of painted concrete block was built in three stages. The terrace over the kitchen is a reinforced concrete panel waterproofed with asphalt and finished with slate.
Built of concrete block laid in a coursed ashlar pattern, this house has one wing finished with stucco. Cost approximately $8,500.

MAYFAIR ACRES, ELMSFORD, N. Y.
EARL NELSON, ARCHITECT

A cinder concrete block house finished with cement paint. Floors and joists are of pre-cast concrete. The ceilings are insulated and roofing is of hand split shingles. Cost $2,506.

HOUSE IN NORRIS, TENNESSEE. DIVISION OF LAND PLANNING AND HOUSING, TENNESSEE VALLEY AUTHORITY
Foundation walls are of concrete masonry and the exterior walls are of concrete block laid in a random ashlar pattern, left untreated. Cost about 25¢ per cubic foot.

**House of Dr. Allen Hempel, St. Paul, Minnesota. Designed by Mrs. Allen Hempel**

8" and 4" cinder-concrete blocks, unpainted, form an interesting horizontal pattern. Joists are 8" precast concrete. Cost $7,200.

IMPROVEMENTS in methods of using concrete in residential construction have increased its attractiveness, made it more adaptable to varying architectural requirements, and lowered its cost. The economic pressure of the last seven years has fostered an interest in substantial construction. While building budgets are still on the conservative side, there is a strong demand for minimum-upkeep types of construction, as well as the low first-cost dictated by financial considerations.

Concrete appears to reconcile the somewhat contradictory demands of the homeowner and the low first-cost type of construction. While some plants make block by a semi-automatic process in which the machine, it is placed in curing (not drying) chambers, subjected to a combination of heat and moist air approaching 100% humidity for 12 to 36 hours, depending upon the season and other conditions, to accelerate the hardening process.

Sizes: The standard unit is the "block": nominal size 8" (three brick courses) high; 16" long; 8, 10 and 12 inches wide. Partition and veneer block are made in 3, 4 and 6-inch widths. Actual height and length are usually about 3 1/4" scant to allow for mortar joint.

Concrete "tile," made in some parts of the country, is lighter and smaller. Usually handled by the mason with one hand without having to lay down his trowel, they are speedily laid and economical. Common sizes are 8" x 12" face, and 3 1/2" x 12" face, in 8" width. The 8" unit is two brick courses high; and the 3 1/2" unit lays up two courses to three courses of brick.

All three types of unit, including the "specials"--corner, chamfer and joint block, etc.,--are shown in Figures 2 and 3. Most plants furnish sills, and reinforced lintels necessary for complete wall construction.

Weights: Not all manufacturers make block with the same size cores or voids, these vary from 33% to 50% of the volume of the block. Roughly, light-
weight aggregate blocks 8" x 8" x 16" size, run from 28 to 35 lbs. each (.9 sq. ft. of wall). A sand and gravel block of the same size will weigh approximately 50 lbs.

If the weight of the unit is likely to affect the structural design of supporting members, check with local manufacturers.

Quality: Building Code requirements for strength vary, but generally range between 700 and 800 lbs. per square inch, gross area, in compression, for load-bearing units. For non-load-bearing (partition) block, strength requirement is usually waived.

Absorption limit is usually set at 10% or 12% (frequently expressed in number of pounds of water which may be absorbed for each cubic foot of concrete actually contained in the unit). In the absence of existing Building Code standards of quality, American Concrete Institute Specification P-1A-25S(1) or A. S. T. M. Specification C90-34T(1) may be used. In the event that the American Concrete Institute Specification is used, it is advisable to include the following paragraph under Absorption, based on a clause in the A. S. T. M. Specification:

"The average percentage of moisture in the units at the time of delivery shall not exceed 40% of the total absorption of the units."

The purpose of this clause is to prevent the delivery of saturated block, which by shrinking slightly in drying out, might cause cracking in the wall. As a corollary, it is well to specify that stock piles at job be kept dry by covering at the end of the day. As in brickwork, the top of the unfinished wall should be protected by covering at night and in wet weather. As in brickwork, the top of the unfinished wall should be protected by covering at the end of the day.

Wall Thickness: The following table of wall thickness recommended in the Report of the Building Code Committee, U. S. Bureau of Standards, 1925, applies to residences and buildings up to four stories. In special cases the Bureau of Standards recommends a 12" wall throughout in four-story buildings.

(1) Both specifications are contained in the Manual "Concrete Masonry Construction" which may be obtained free of charge from the Portland Cement Association.

Ashlar Walls: The pre-depression concrete masonry wall was customarily stuccoed outside; furred, lathed and plastered inside. It is possible to use the block exposed in ashlar patterns—to use colored units, and whitewashed masonry effects, plus the texture of interesting surfaces, and an endless variety of joint patterns. The saving in the cost of the stucco is not all clear gain, however, as the use of fractional block increases the cost of the material; the larger number of pieces to be handled, and the greater care required in laying, also increase the labor cost. Coupled with the use of ashlar interiors, however, this method offers opportunities for real economies without sacrifice of appearance or quality of construction. True random walls are rarely attempted. The usual procedure is to adopt a pattern or "repeat" covering twelve or fifteen square feet of wall area, which is laid over and over again. Owing to the interposition of door and window openings, corners, etc., it is practically impossible to detect a well designed "repeat" in the finished wall.

Figures 4 and 5 show several typical patterns for coursed and random ashlar; others can readily be evolved, using the block sizes shown in Figures 2 and 3. A construction "kink" which helps to lower the cost of these walls, by avoiding the waste of mason's time involved in constant reference to blueprints to check on the pattern, is to have the "repeat" painted full size on a large piece of wall board, which is set up just inside the wall, where the mason can follow it until the pattern unit is completed, whereupon the board is shifted along the wall and built again.

Color: Variety in color is obtained by adding small percentages of non-fading mineral pigments to the mix(2) or by the use of chemical stains, applied to the surface.

(2) Lists of Manufacturers of Mineral Pigments may be obtained from Portland Cement Association.
Textures are obtained by wire-brushing or combing the block as they leave the machine, or by subjecting to a fine, high-pressure water spray which will lightly erode the surface, and expose the coarse aggregate in the mix.

In general, light-weight aggregate block has an agreeable, coarse texture, needs no special treatment, and is more attractive if painted. These units are eminently suited for obtaining "whitewashed" ashlar wall effects. Block may be left appropriately exposed for ashlar effects for interiors in the same architectural types. Reference Table II will show the economy of this treatment: insulation values for such construction are given in Table I. A relatively fine-textured block is most satisfactory for such use.

Paints: Cement Paints. The use of two coats of portland cement paint is recommended on ashlar walls to seal the masonry and the joints. On colored ashlar walls, clear waterproofings are desirable as a final finish for the same reasons.

Portland cement paint consists essentially of portland cement, especially prepared and ground with other materials, lime, sunproof pigments, etc. It is sold in dry powder form to be mixed with water before applying. Portland cement paint should not be confused with ordinary cold-water paints sometimes referred to as "cement paints," which contain large proportions of hydrated lime, casein or glues, many of which offer little resistance to the weather. For outdoors, and locations subject to moisture, only paints should be used which the manufacturer can definitely show have stood up under similar conditions.

Portland cement paint can be applied successfully to masonry surfaces that are damp; in fact, all surfaces must be damp when this paint is applied. It can therefore be applied to concrete immediately after the forms have been removed, or to fresh cement plaster or stucco.

It is essential that surfaces be uniformly damp to obtain even absorption. If paint be applied with a brush, first coat should be sufficiently heavy to seal the wall, and should be well brushed, or better, scrubbed into the surface of the block. If applied with a spray gun, the nozzle should be held so that the spray jet strikes the wall from several different angles successively, so that the paint actually enters and seals all voids.

After the first coat has hardened sufficiently to prevent injury to the surface, it should be moistened, and should be again wetted down just before applying the second coat. This in turn should be moistened with a fine spray just as soon as the paint has hardened enough to prevent marring the surface, and kept damp as long as practicable. During warm or windy weather the wall needs frequent rewetting.

Oil Paints: If it is desired to use an oil paint, concrete work should be given at least 8 to 10 weeks to dry before the paint is applied.

It then should be given a neutralizing wash to prevent saponification of the oils. A solution consisting of 2 to 3 lbs. of zinc sulphate crystals per gallon of water, or a solution containing 2 lbs. magnesium sulphate per gallon of water may be used. A small amount of pigment may be added to the wash so it will be seen when applied, preventing the skipping of areas. At least 48 hours should be allowed for the solution to dry. When thoroughly dry, all protruding crystal should be removed by brushing. This treatment is not necessary on old concrete or old stucco.

Then the concrete surface should be given a binding and suction-killing treatment, consisting of one or more coats of oil or varnish carrying some pigment. A suitable primer may be made by mixing one gallon of oil paint, one-half gallon of china wood oil spar varnish and one quart of turpentine or similar thinner. Special china wood oil priming paints for concrete are also available. The prime coats should be allowed to dry thoroughly, after which paint can be applied in accordance with the manufacturers' directions.

Insulation: In cold climates walls of sand-and-gravel concrete block should not be plastered direct, because of heat losses and the likelihood of condensation. With regard to block made with lightweight aggregates, practice has been less uniform.

During 1935 a series of tests was run at the University of Minnesota to determine the heat transmission of various types of concrete masonry residence walls. From Table I it will be seen that a cement painted or stuccoed wall of 8" thickness would have a heat transmission equal to that of various types of materials (asbestos cement, brick, stone, etc.).

(3) The tests were under the sponsorship of the American Society of Heating and Ventilating Engineers in cooperation with the Portland Cement Association. Table I is based on an article, "Thermal Properties of Concrete Construction," by F. H. Bosley, A. B. Ager, and Arthur Carlson of the Engineering Experiment Station staff. Published in January, 1936, issue of "Heating, Piping and Air Conditioning."
cinder block with 1/2" plaster on metal lath, furred, has a coefficient of transmission "U" of .25. (27 without cement paint or stucco.) For comparison, the following are taken from the current "Guide" of the American Society of Heating and Ventilating Engineers:

Wood frame construction, wood siding or clapboards, 3/8" plaster on metal lath.......... .30
Wood frame construction, brick veneer, 3/8" plaster on metal lath.......................... .32
Wood frame construction, stuccoed, 3/8" plaster on metal lath.............................. .30

Where added insulation is desired, the use of rigid insulation as a plaster base, furred out from the masonry, is effective in lowering heat losses.

The most remarkable results, however, are apparently obtained by the simple expedient of filling the cores in the blocks with insulation such as regranulated cork, rock or mineral wool, expanded micaeous shale, etc. Granite insulating materials, costing from 12 to 20 cents per cubic foot, can be poured down through several courses of block after they have been laid. About one-quarter cubic foot is required per square foot of wall.

Table No. 11 is a rating chart for comparing the cost and insulating efficiency of a few of the various wall constructions shown in Table No. 1. For each of the five types of wall, construction costs have been estimated for light- and heavy-aggregate block, with cores filled and unfilled, and with the units laid either as exposed ashlar, to be cement-painted, or as base for stucco. (Ashlar walls cost more to lay). It is immediately apparent from

### TABLE I. HEAT TRANSMISSION OF VARIOUS TYPES OF CONCRETE MASONRY RESIDENCE WALLS

Based on data obtained in co-operative research sponsored by the American Society of Heating and Ventilating Engineers in cooperation with the Portland Cement Association and the University of Minnesota. The report was published in the January 1936 issue of Heating, Piping, and Air Conditioning under the title "Thermal Properties of Concrete Construction," by F. B. Rowley, A. B. Algren and Clifford Carlson of the Engineering Experiment Station staff.

**Table II. Rating chart for relative cost and relative insulating efficiency. The upper light-faced figures represent costs for common bond painted; the lower heavy-faced figures, common bond covered with stucco.**

this table that the walls which are low in

construction cost are not efficient, from the standpoint of insulation, but by comparison of walls having the same
cost ratings, it will be found that some

represent much better insulation "buys" than others.

(Exact costs will have to be deter-

mined by the user for each locality; figures used in the table are fair aver-

ages, but are neither minimum nor maximum prices.)

**Laying:** As in all masonry, proper

mortar mix, and competent workman-

ship in laying, are of paramount im-

portance for satisfactory performance.

In the matter of mortar mix, specifi-

cation errors are usually on the side of

too high a cement content (1 part
cement, 3 parts sand, 10% hydrated
dime by volume). Tests show that bond

developed between concrete units and
cement mortar is three or four times

great as bond between clay products and
cement mortar. Excessive bond in

effect results in the equivalent of a

hole monolithic wall unreinforced for

temperature stresses. A weaker mortal

avoids this. A mix consisting of 1 cu.

ft. cement, 1 cu. ft. hydrated lime, 6 cu.

ft. sand possesses ample bonding

strength, plasticity, waterproofness.

The mortar bed should be spread

only on the longitudinal or face shells

of the block, and not on the cross webs.

Then, if water enters a joint, it will not

be drawn through the wall by capil-

larity in the mortal bed.

Raked, stripped and stuck joints
greatly increase the chance of developing

cut joints also are likely to

be torn and drawn away from the units.

If these joints be used, adequate means

of waterproofing or parging should be

provided, or special attention given to

the selection of materials and tooling

of joints.

Weathered, concave and "V" joints

afford the best protection against leaks and

are recommended in preference to other
types as they shed water. Their

formation requires a pressure sufficient

to compress the mortar and create a

firm bond between the mortar and the

units.

Thin mortar joints are best, produc-

ing a stronger, more watertight wall.

Unless precautions are taken to make

the wall surface tight when the joints

are more than 1/2" thick, watertightness

may be sacrificed for appearance.

**Waterproofing:** Admixtures and inte-
gral waterproofings in the block rarely

add to the watertight qualities of the

wall.

Walls most frequently leak through

faulty mortar joints, particularly the

vertical joints: rarely through the units

themselves. Failure to provide adequate

drip-moldings at sills, belt courses,
coping and other poor detailing is re-

sponsible for many leaks. The water fol-

lows back along the underside of the

projecting member and then into the

wall through a defective mortar joint

so frequently found under large or

heavy elements such as sills. Rowlock

brick sills, or sills having intermediate

dirtual joints, should be laid in flash-

ing. Lintel construction sometimes re-

quires flashing to prevent the entry of

water. Coping and parapet flashing

should follow only best current prac-

tice.

**Special Considerations:** Concrete Ma-

sonry requires little special considera-

tion in design. Pipe chases and ducts

in outside walls should be formed by

using 4" block where required instead

of cutting slots in 8" walls after they

have been laid. See Figure 6. At such

points of weakened section it is well to

minimize the possibility of cracking by

having masons lay ¾" or 1½" rein-

forcing rods in the mortar beds extend-

ing approximately 2 feet either side of

the weakened section. Rods should be

kept at least 1" back of the face of the

mortal to avoid rusting through.

in furred walls, wiring can usually

be run in flexible conduit in the furring

space. Where exposed ashlars walls are

planned inside and the wiring must be

built into the wall, rigid conduit must

be employed and can usually be han-

dled most easily by running horizontal-

ly in a bed joint.

Furring strips can be nailed directly
to light-weight aggregate units; where

walls are heavy-aggregate block, fur-

rering strips are nailed to mortal joints

soon after walls are laid. Certain types

of insulation, such as cork board, can

be applied direct to the wall in an

asphaltic binder without furring.
Rafters are usually spiked to a wooden plate secured to the top of the wall by bolts, lower ends of which extend down two courses in cores in the block which have been filled with concrete.

Most plants supply special jamb block for wood and steel sash. Such block are essential for exposed ashlar work, and should be specified.

 Provision for floor beams is usually made by using a unit similar to the jamb block; or the projecting lip at the ends of the ordinary block can be broken by the mason before laying, to form the desired opening between adjoining block to receive the joist. See Figure 7. In ashlar construction it is sometimes necessary to build the joist course of two tiers of 4" block, to maintain the desired joint pattern or bond on the face of the wall.

**MONOLITHIC (REINFORCED) CONCRETE**

While the reinforced concrete house has been somewhat overshadowed by the rapid growth of block construction, it appeals to many owners because of its exceptional structural stability, especially in localities subject to flood, hurricane, earthquake, etc.

Three types of wall construction commonly used are shown in Figure 8. Many other types have been developed, but are not in as general use as those shown.

**Wall Thickness:** Recommended wall thickness for various conditions are given in Table III, which is self explanatory.

**Forms:** Form costs are an important element in the monolithic house. Forms for the ribbed wall can be built on the job if necessary, but there are several proprietary forms on the market designed for this type of construction, which can be bought or rented.

Either metal or plywood on steel frames or job-fabricated wooden forms can be used for solid wall construction. Metal or plywood panel forms can be bought or rented. Wood forms can be built of ship-lap or tongue-and-groove sheathing lumber or roofers, but tighter forms can be made by using the special plywood developed for concrete forms, or the hard-surfaced water-resistant composition boards like "tempered plywood" with consequent improvement in the appearance of the finished concrete surfaces.

Forms may be bolted together, or plain rods used with special clamps. Bolts and rods should be clean and straight, or they cannot be driven out of the set concrete. Wires should be avoided as ties, since they will rust through unless cut off at least 1" back from the face of the wall, which is almost never done in actual practice. Special devices are on the market to overcome some of these difficulties in tying forms.

Handholes should be provided at the bottom of deep forms, or other provision made for cleaning out prior to placing concrete.

Ornament: This construction offers unusual opportunities for the introduction of decoration, through the same form technique as is used in monumental structures of Architectural Concrete.

Briefly, reinforced concrete wall surfaces may be adorned by the use of shaped or corrugated metal for forms, or by the application of various molded strips to the forms to create flutes, reed moldings, stepped planes, and curved or warped surfaces. Band courses, splayed or panels can be ornamented to any desired degree by the introduction of the forms of suitable waste-molds of plaster at slight additional cost.

Much of the present bare and frequently uninteresting post-war architecture stems from European precedent, where the elimination of ornament was necessary for economic reasons.

**Notes:**

Reinforcement: Proper distribution and placing of reinforcing steel is important. Figure 9 shows typical bar steel reinforcement for solid wall construction. Mesh reinforcement of equivalent effective area may be substituted if desired. Attention is particularly directed to the necessity of providing adequate reinforcement over, under, and in the jambs of door and window openings; note also the diagonal corner bars at openings.

Mix: Maximum economy will be obtained by producing a concrete wall of such character as that it can be left exposed, with no other finish than a brush coat of portland cement paint. Such a wall presupposes a properly designed concrete mix, carefully placed to avoid segregation and honeycombing.

Concrete can be mixed on the job, or ready-mixed concrete from a central plant may be used. Care must be exercised in the selection of aggregates, proportioning of mix, and amount of mixing water, so that the concrete may be readily placed in the forms to produce a dense, strong, watertight mass.

For walls 6" or less in thickness, aggregate should not be larger than 1". Not more than 7 gallons of mixing water per sack of cement should be used. Generally, a mix of 1 part cement, 2 1/2 parts fine aggregate, and 3 to 3 1/2 parts of coarse aggregate will be satisfactory. Mixes either too dry or too wet should be avoided.

Placing: Before placing concrete, forms should be carefully cleaned out to remove all dirt, chips, shavings, etc. Hardened scum or laitance should be chopped off, exposing clean sound concrete. Old concrete should be well wet down, and excess water allowed to drain off. (Old concrete should be damp, but should not have water standing on it, when fresh concrete is deposited).

The first batch deposited on the old concrete should have half, or even all, of the coarse aggregate omitted. This will make a tighter seal with the old work, and minimize chances of honeycomb. Concrete should be placed evenly around the structure, not dumped in one place in the hope that it will flow the rest of the way. It will not, unless it be far too sloppy, in which case it will be badly streaked, and probably leaky, wall will result. Each batch should be well packed with slice bars or long poles to consolidate it with concrete already placed.

When work is stopped for the day, it is advisable to end at tops of window or door openings, to permit settlement. Excess water which has come to the top should be worked to a low place and bailed out, leaving only good concrete, free of muck or laitance, to receive the next fill. (Laitance—the hardened chalk-like scum on top of concrete which has been placed too wet—has no strength; will not weather; new concrete will not bond to it).

Exterior Finishes: If the concrete wall is in good condition when the forms are removed, it will be necessary only to rub down lightly with a fine carborundum brick to eliminate evidences of form joints, and apply the cement paint. Honeycomb, if any, will have to be pointed up. Bolt holes are best closed by driving in one or two corks dipped in white lead paste, and then pointing with cement mortar.

Cement paint should be applied preferably while the concrete is still green. Stucco can also best be applied at this time. If it is not going to be possible to apply the scratch coat as soon as forms are stripped, a bonding surface may be obtained by coating the forms with a compound (13) which will check the set of the film of cement next to the forms, making it possible to brush it off the next day, leaving the aggregate exposed to receive the stucco. If stucco is to be applied to concrete, forms should not be soaked or oiled.

On hardened concrete, hacking or brush-hammering may be required for bond. Some plasterers bond stucco by first applying a thin grout, dashed on with considerable force, and allowed to set.

Veneers of concrete masonry ashlar or brick can be secured to the wall with wire ties tacked to the forms before concreting.

<table>
<thead>
<tr>
<th>TABLE III—RECOMMENDED MINIMUM THICKNESSES OF REINFORCED CONCRETE WALLS</th>
</tr>
</thead>
<tbody>
<tr>
<td>FOREWORD—The following recommended wall thicknesses will be conservative with usual conditions of design and loads in one- and two-story houses. Load bearing walls should be not less than 4&quot; thick. Walls, floors and partitions should be securely connected at intersections. However, rigid floor to wall connections such as produce fixed end conditions should be avoided unless the wall is reinforced for the bending stresses thus produced.</td>

</tr>
<tr>
<td>Double (1)</td>
</tr>
<tr>
<td>Axial or Ribbed</td>
</tr>
</tbody>
</table>

NOTES: (1) If eccentric distance exceeds 1" in 6' walls, stresses should be investigated. 4" walls should have axial loading.

(2) The 6" thickness is usually required by codes. If reinforced a 6" wall usually will analyze satisfactorily.

(3) Unsupported length of 4" walls should not exceed 20 ft. Offsets of 24" or more or connected intersecting walls are considered as suitable supports.

(4) Except as noted (5) thicknesses apply to the inner wall.

PARTITIONS:

Load bearing partitions should be at least 4" thick. In one-story houses, L. B. partitions should be 6" in basement and 4" in lst story.

In two-story houses, L. B. partitions should be 6" in basement, 4" to 6" in 1st story and 4" in 2nd story. Non-load bearing partitions may be 3" thick.
crete, or metal keys can be set in the forms to leave slots to engage anchors.

Insulation: Insulation is required for monolithic concrete walls in northerly climates. Double-wall construction has apparently been satisfactory without insulation in the center air space, but is much more efficient if filled. See Table IV.

With the ribbed wall construction, lath or insulating board can be fastened to wooden strips or nailing plugs cast in the projecting ribs. Except under the most severe conditions this will be as satisfactory as other uninsulated types of construction.

In solid wall construction, nailing strips or plugs are cast into the wall, to which nailing can be carried, and the lath or insulating board applied in the usual manner; or cork board can be set against the concrete in an asphaltic binder.

Floors: Concrete floors of the tin-pan, and solid-slab types can be constructed along with the wall, as in industrial building practice. Where precast concrete joists are to be used, they can either be set in place in the forms and concreted in, or removable boxes built into the forms at the proper points, and the joists set afterwards.

Special Considerations: Wiring has to be run in rigid conduit, if built into the forms, to conform to Underwriters requirements in most localities. It is often possible to avoid this by running flexible conduit in interior partitions or in furring spaces.

Ducts, chases and radiator recesses can be formed where desired in the walls, but attention should be given to the reinforcement at these points to avoid the possibility of cracking at weakened sections. Where wiring or piping enters or leaves the house, sleeves should be set in the forms, sloped to the outside, to prevent moisture entering around faulty points.

Nailing plugs or inserts should be provided for furring, trim, etc. Careful study of these points, and adequate detailing, will avoid costly cutting and drilling after the structure is concreted.

### Figure 10. Pre-cast concrete joint cross-sections

Concrete structural floors for residences are fireproof and immune to the attacks of termites. Such floors are not subject to shrinking, and there is no settlement of the walls or partitions they carry, and no cracked plaster and out-of-square door and window frames. The absence of vibration and squeaks, and the fact that concrete floors form an effective barrier against the passage of odors, smoke and dust, make them pleasant to live with.

Residence floors of the solid-slab, and "tin-pan" types have usually proved too expensive for the moderate cost house. The construction of special forms, lumber wastes, etc., has kept the cost close to 50 cents per square foot. To reduce this figure, there has been developed recently a precast, reinforced concrete I-beam, which for ordinary spans is light enough to be handled and set by two men. Depending on the size of the
job, and its proximity to a concrete products plant making joists, a floor of this type can usually be constructed for thirty or thirty-five cents per square foot, (figures exclusive of wood or other coverings), Figure 10.

Fornwork for the 2" or 2½" slab has been simplified, and is carried by the joists themselves without posting or shoring except in spans longer than 15 feet, when one row of shores is used: Figure 11. Lumber waste is negligible. Reinforcement is extremely simple and can be rods or mesh.

The joists are made by the larger concrete products plants throughout the country to standard designs. Framing details at openings, under partitions, etc., follow wood framing practice, joists being doubled, and steel stirrup joist hangers used in the conventional manner. Joists are spaced from 24" to 30" on centers, however.

Hung ceilings can be added at a cost of approximately 10 cents per square foot in some parts of the New York area. Because of the clean ceiling surfaces (especially if plywood forms are used for the slab), the absence of bridging, and the uniformity of the joists themselves, it is quite customary to leave the construction exposed. Suitable color combinations are then developed for the ceiling treatment, sometimes with the addition of stencilled ornament on the beam soffits.

The most economical floor finish is of course simply to trowel the slab to a smooth hard surface, and then stain or treat with a good floor paint after neutralizing the concrete, as described in the notes on Painting.

A terrazzo finish has many advantages, but price will depend upon size and location of job. It offers unfading color, the beauty of the marble aggregates, the decorative metal strips in pattern, ease of cleaning, resistance to marring.

Strip or plank floors of wood can be laid on sleepers, fastened to clips or anchors set in the concrete, or wired to the stirrups which project above the top of the joists. A more compact method is the use of blocks of strip flooring, 6¼", 9" or 11¼" square, which are bedded in mastic directly on top of the finished concrete slab. Other finishes include cork, asphalt and rubber tile, "preswood," linoleum, carpet, wall to wall carpeting, etc.

A few average prices follow—these are general figures, and will vary somewhat in a quotation on a specific job:

Asphalt tile......16c per sq. ft. up
Wood block in mastic......20c per sq. ft. up
Rubber tile........65c per sq. ft. up
Linoleum......53½c per sq. ft. without felt
Broadloom carpet
$1.41½c per sq. ft. over 36 oz. lining

Special Considerations: Openings for pipes, ducts, etc., should be carefully noted on the drawings so that sleeves can be set in the forms. Wiring in the slab must be run in rigid conduit. Where horizontal pipe runs must be carried through the joists and cannot be shung underneath, joist manufacturers will provide opening in web of joist if given required information before joists are cast. If, for any reason, it is necessary to drill a hole through the slab or through a joist, hole should be worked from both sides; otherwise large and unsightly spall is likely to be driven off far side from drill.

Figure 12. Reinforced concrete stairs designed as a beam simply supported by the cross beam at the top and the floor at the bottom. L.L. equals 40 lbs. per sq. ft.

Figure 11. Pre-cast concrete joint residence floor, as shown in detail perspective, longitudinal section, cross section, and perspective of the whole assembly

Figure 13. Reinforced concrete stairs, both flights designed as simple beams. L.L. equals 40 lbs. per sq. ft. For convenience, the same amount of reinforcement is used in the shorter top flight span as in the bottom one.

AMERICAN ARCHITECT AND ARCHITECTURE: AUGUST 1936
A LIQUOR STORE IN NEW YORK
MORRIS SANDERS, ARCHITECT

A customer-attracting shop front that quickly conveys an impression of the type of merchandise sold and the name of the seller. This is accomplished by means of framing an invisible glass window with white metal and travertine, and mounting aluminum letters on black tile. The effect of a frame within a frame created by the setback and contrast of materials, and the window for specials, in the angle near the entrance, have added merchandising value.

(Left) Wine bottles in the cellar are kept in drain tiles...
The ingenious plan arrangement, effective displays and a clever handling of materials create a masculine and dignified atmosphere in the interior. Cork tile is used for flooring and certain wall surfaces; other walls are plaster, and the cabinets are of pine. Mirrored solid glass bricks are used as display backgrounds and other glass bricks are used as interior partitions. View toward the front of the shop (opposite page, top). View of the rear of the shop showing a glass brick partition (above). The wine cellar (right).
Constructed of 8" interlocking hollow tile on poured concrete foundation walls and footings, this house has an unusual safeguard against high winds, a reinforced concrete collar, 12" deep and the width of the tile walls, extending around the entire exterior perimeter of the house at the second story.
Quoins and hand courses are of run cement, steps are quarry keystone and the walk is of old brick. Iron work, gutters and leaders are painted the same oyster white as the house and handrails are of brass (above). The floor of the entry hall is black and white (above, left). The Persian procession was painted on the walls of the back stairs (left) by Richard Jones.
The patio (above) is paved with quarry keystone and the loggia with white marble. Shutters are a warmer white than the walls and the roof shingle tiles grade from light salmon at the ridges to deep wine red at the eaves. The graceful stair recalls the essentially French character of the house. The painting in the dining room (right) is also by Richard Jones. Norma Sears, Decorator

HOUSE OF FRANK N. HORTON, PALM BEACH, FLORIDA
WYETH & KING, ARCHITECTS
The simple yet formal air of the exterior is repeated in the interior. Marble mantels, trim, doors and hardware are all in the manner of Louis XVI.
PURPOSE
Correct proportions and mandatory requirements for the design of interior fireplaces, smoke chambers and fireplace flues are indicated on this sheet.

GENERAL
Dimensions of correctly designed fireplaces are proportional within certain limits, the basis for proper proportions being the width of the fireplace opening. The accompanying table includes simple formulae for various widths. When followed within the limits indicated, adequate draft is assured, thus eliminating the smoke nuisance always present in poorly designed fireplaces.

CONSTRUCTION DETAILS
Fireplace. Design practice common to some localities has produced fireplaces with proportions other than those recommended on this sheet. Much variation, however, from the proportions indicated here will tend to interfere with proper draft. These dimensions are also recommended for the construction of fireplaces designed to throw a maximum of heat. For fireplaces larger than 84 inches similar proportions should obtain. However, such fireplaces usually require metal hoods to lower the effective height (H). The same result may be obtained by raising the back hearth. Lowering the back hearth from 2 to 4 will aid in keeping ashes within the back-hearth area. Effective height of the fireplace (H) is always height of clear opening.

The reflecting wall at the back should always be built as a plane surface sloping up into the lower edge of the throat and terminating slightly above the level of the lintel. When the back is built in a vertical curve, air currents are deflected under the lintel, thus causing smoke to roll past the throat and into the room.

Throat. This should extend the full width of the fireplace opening. Limiting dimensions for throats are given in the table. Unless a metal throat (see below) or masonry arch is used, iron or steel is usually required to support masonry lintels. Maximum thickness of masonry at the lintel in front of the opening ranges from 4 to 6 inches depending on the material used.

Smoke Shelf (also called “wind shelf”). This element is required in all fireplaces to prevent downdraft in the chimney from destroying the updraft and thus blowing smoke into the room. In all cases, parging on the smoke shelf is recommended as indicated in the detail. When this is done, the normal downdraft tends to circle up, mingle with hot gases and aid updraft through the chimney flue. Otherwise, a pocket may be formed within the smoke chamber which may produce uneven, turbulent downdraft currents and consequently, a smoky fireplace.

A smoke chamber is an essential part of fireplace construction. It provides space for the smoke to mix with cold chimney air before the flue is sufficiently heated to carry heated gases up the chimney through normal convection. Actual construction will vary with the type of throat and the size of the fireplace. In all cases, however, the smoke chamber should be constructed with a 60° slope from throat to chimney flue as indicated in the accompanying drawings, and should have a smooth interior surface so as not to impede drafts.

Flues. The proper size of flue has an important bearing on efficient operation of the fireplace. When possible, round flues are preferable to square or oblong flues; and a flue lining is recommended for use with fireplaces of all types and sizes. Unlined flues are usually rough. Deposits of inflammable creosote distilled from fireplace fuels tend to form on rough surfaces, producing a constant fire hazard which should be avoided. Effective areas of flues, particularly the rectangular type, are always less than the actual cross-sectional inside area. Sizes of square and round flue linings and of unlined flues are shown in the accompanying table of recommended flue dimensions.

Ash dumps and pits. The ash dump should be fitted with a hinged cast-iron cover. It is common practice to locate the ash dump in the center of the back hearth. However, in certain cases where sub-construction makes it possible, the ash dump may be conveniently located on either side of the back hearth. The passage from ash dump to pit should be lined with at least an 8½" x 8½" flue tile if the pit is to serve more than one fireplace, or if it is not possible to construct a straight passage. Any bend in the ash passage should not be less than 90° to avoid the possibility of clogging. Floors of ash pits should be parged with mortar or otherwise sloped to a cast-iron cleanout door for convenience in removing ashes. The bottom of a cleanout door should be at least 8" above the cellar floor to permit use of an ash receptacle when the pit is being cleaned.

Wood framing members must be kept at least 2" away from all fireplace or chimney masonry. In addition, it is recommended that wood mantels and trim be kept 8" back from the fireplace opening at the sides and 12" clear above the opening, although custom or local ordinances often permit much less clearance.

Prefabricated fireplace equipment. All dimensions and details of construction shown on this sheet may be subject to some adjustment to conform to installation requirements of prefabricated metal dampers, throats, smoke chamber linings, ash dumps and cleanout doors. Each of these units is manufactured in a number of types. No common standard of dimensions has been established and manufacturers' data should be consulted in all cases prior to a selection for specific use.

Heating systems for fireplaces are also manufactured in a variety of types and sizes. Installation requirements of these units are also subject to variations noted and proportional dimensions given here should be carefully adjusted to their use in accordance with manufacturers' data.

PURPOSE
Data on this sheet make possible the quick solution of any stair problem ordinarily encountered in architectural practice. These data include a chart of proportional treads and risers and tabular material giving handrail heights, headroom, and stair gradients for stairs with risers from 5 to 9 inches.

Material on this sheet has been adapted to its present form from data originally developed by Ernest Irving Freese and published in American Architect, partly in the July, 1933 issue, and partly in the March, 1934 issue.

PROPORTIONAL TREAD AND RISER DIAGRAM
It has been found that dimensions of stair treads and risers are proportional to one another and can be plotted on a hyperbola, reproduced here in the form of a working chart. Rules for its use are given in the caption. No formulae are required to produce results desired, for dimensions are accurate to the nearest 1/8 in., a tolerance that is not ordinarily excessive in building practice. For mathematical accuracy, however, the following formulae can be solved to determine correct proportions of either tread or risers when one or the other is fixed.

\[
T = \text{Tread, } R = \text{Riser.}
\]

When T is fixed:

\[R = \frac{9}{\sqrt[1/7]{(T-8)(T-2)}}\]

When R is fixed:

\[T = 5 + \sqrt[1/7]{(9-R)^2 - 9}\]

In all cases the width of tread is exclusive of a nosing.

Use of this diagram makes unnecessary any adherence to former "rules" for proportioning of tread and riser. Both usual rules for stair layout are violated in the diagram. These are, "the sum of tread and riser shall not exceed 17 1/2 in." and, "the product of tread and riser shall not exceed 75."

However, the average of the risers shown, 7 in., is proportional to a tread of 11 in., a combination that produces a stair which is comfortable to use and generally economical of floor space. At the lower extreme, a riser of 5 in. produces a tread of 16 in. which approximates the proportions of a brick step with a tread equal to two stretchers and a rise equal to two courses.

```
PROPORTIONAL TREAD AND RISER DIAGRAM
All Dimensions are at 1/2 Full Size
```
STAIRS—Tread and Riser Data

TIME-SAVER STANDARDS

STAIRWAY LAYOUTS

Comfortable stairways cannot be designed except in relation to dimensions of the average human figure. These are indicated in detail on T-S.S. Serial No. 38, February, 1936 (A5.1.1). As applied to stairways these dimensions and the equivalent of the average comfortable walking stride of about 24 in. fixes the gradient of stairways, the proportional relation of treads and risers, the height of the handrail and the minimum necessary headroom.

The accompanying diagram indicates the influence of human figure dimensions and suggests the desirability of varying ceiling clearances and handrail heights according to variations in stair gradients. These variations are included in the table as related to dimensions of treads and risers developed from the Proportional Tread and Riser Diagram.

For the sake of practical classification a stairway can be defined as follows:

"A stepped footway having a gradient not less than 5:18 pitch, or 31½ per cent, or an angle of 17 degrees and 21 minutes; and not greater than 9:8 pitch or 112½ per cent, or an angle of 48 degrees and 22 minutes."

Below these limits, footways become ramps; above them step-ladders. Both types of footways are subject to rules similar to those applicable to stairway design.

### NOTES

1. 7" by 11" is the proportion by which all steps are laid out.
2. Risers from 5" to 6½" are suitable for exterior and "grand" interior stairs.
3. Risers from 6½" to 7½" are most comfortable and most suitable for interior stairs.
4. Risers for cellar and attic stairs may be up to 9" high.
5. Width—minimum for single-file travel, 30".
6. Width—minimum for comfort, 36".
7. Width—desirable (for furniture passage etc.), 42".
8. Consult local building codes on all stair problems.
OUTDOOR TENNIS COURTS

PURPOSE

Details and diagrams on this sheet illustrate approved layouts, construction types and utility arrangements for outdoor tennis courts. The text outlines recommended technical procedure relating directly to the subjects covered by the drawings. Data have been adapted from the Official Code of the International Lawn Tennis Federation, of which the U. S. Lawn Tennis Association is a member, and the published experience of recognized experts.

GENERAL

Most desirable location of the court is an open, unshaded area with good natural drainage. Orientation should protect players from directly facing the sun. For greatest use in Northern states the long axis should run east of north and southwest for afternoon play, northwest and southeast for morning play. For greatest use in tennis courts. The text outlines recommended technical procedure for tennis court layout, dimensions, and construction details.

DRAINAGE

Natural seepage through porous finishing materials and grading the playing area as indicated on the drawing, together with border drainage trenches, will provide a good playing surface at all times. Subsurface drainage is necessary, particularly under impervious court surfaces, to prevent excessive damage by freezing and thawing weather.

Subsurface drainage lines should be spaced no less than 10 ft. in heavy clay subsoil and 15 ft. in light clay or sandy loam. Tiles can be 4 in. laid with open joints at a pitch of % in. to the foot. Surrounding drainage trenches should be partially filled with cinders tamped in layers about 1 in. thick.

CONSTRUCTION

Courts can be surfaced with grass, dirt, clay, wood, concrete, or special types of quick-draining materials. Some materials include:

- **Dirt**: When firm, well-drained subsoil exists, stone or slag foundations are not necessary for inexpensive dirt courts. Remove topsoil and level subsoil by rolling and filling. Surface with at least a 2 in. covering of clay, sand and silt as noted below for clay courts. Subsoil should be raked prior to surfacing to bond the clay mixture to the dirt foundation.

- **Clay**: Remove topsoil and soft earth a foot below grade of finished court. Grade to drain, roll preferably with a 4-ton roller) and install drain tile as indicated. Necessary filling should be installed in layers of 4 in., thoroughly wetted and rolled. On prepared subgrade spread cinders or good gravel, then wet and thoroughly roll to a finished thickness of 5 in. Next, spread a layer of 1½ in. slag, crushed stone or coarse gravel to a rolled and finished depth of 3 in. Fill voids of the gravel surface with a layer of washed gravel or slag of about 2 in. screen, well wetted and rolled. Set net posts of wood (cypress, locust or chestnut, creosoted below ground) or pipe in 8 in. vitrified sewn tile sunk to a depth of 3 ft. and filled with concrete to secure posts. Posts can be installed for removal by setting a sleeve within the tile. Next, apply clay foundation course. Use stiff clay, of % or 1 in. screen to a 3 in. depth. Before rolling spread a 1 in. surface course consisting of stiff clay pulverized through ¼ in. mesh, clean sharp sand of % in. mesh, and common farmer's salt. Proportions recommended are: clay, 50 per cent; sand, 50 per cent by weight, to which should be added one part of salt by weight to 40 or 50 parts clay. Before mixing with sand, natural clay should contain from 25 to 35 per cent silt and from 15 to 65 per cent pure clay with no sand or organic matter. When surface course is spread, compact carefully with a 400-500 lb. lawn roller. Allowance should be made for about 25 per cent shrinkage from rolling when spreading clay courses. After rolling check grades with a long straight-edge and level. Then spray until a film of water covers the court. Roll again until all water disappears.

- **Concrete**: Structural requirements are indicated in the detail. A 1 in. expansion joint for slab should be provided at the net line. This can be filled with tar, prepared felt or other elastic material. Troweling of the court surface should be minimized. Slabs should be cured by covering with damp sand or earth sprinkled at intervals with water for at least ten days.

- **Quick-drying and special surfaces**: Solid construction with layers of stone or slag, cinders, gravel and fine stone dust produces a very porous and quick-drying, but firm surface. Other quick-drying surfaces are available as proprietary compounds. Special surfaces include asphalt, macadam, marl dust, all of which are satisfactory.

MISCELLANEOUS

**Lighting**. The multiple-court diagram indicates minimum requirements for lighting—two 2,000 or 1,500 watt projectors on 40-foot poles on each side of court. Recommended lighting for single court includes five 1,500 watt lamps on each side spaced so that one pole is at the net, one at each service line and one slightly behind base line, or 26 ft. from service line. Lights are carried on bracket arms extending over court, 30 ft. above playing surface. For lighting of multiple courts for championship play, advice of a qualified lighting engineer should be sought.

**Water**. Essential water outlets are indicated in the multiple court diagram. Faucets with hose connection and outlets of % or ¾ in. are preferable. Each should be well outside playing area and can best be placed below grade in a small concrete box with a hinged cover flush with turf. Each outlet should be supplied with a drain.

TECHNIQUES

METHODS • MATERIALS • RESEARCH • PRACTICES

The majority of modern buildings require a simple, straightforward surfacing of rigid sheet materials. A new system designed for this purpose, combining ease of erection, permanency and flexibility, is produced by Revere Copper and Brass, Incorporated. The Revere System employs a framework of extruded aluminum sections that hold in place any type of rigid sheet finishing material and thus produce plane, curved or angular facings over both solid and skeleton construction.

The sections interlock to form an integral structural unit but are so fashioned that each element of an assembly is free to expand and contract without distortion. Assemblies are light in weight, are quickly erected and dismantled. Thus alterations are easily made. Maintenance is minimized since sections require no painting and nearly any desired combination of surface color or texture can be had through the use of various sorts of flat sheet materials.

Elements of Construction—The Revere System is considered primarily as a means of surfacing or enclosing and requires some sort of structural support for its use. Its three main elements are: (1) Revere Members, (2) Finishing materials, used as flat sheets or as pre-formed panels, and (3) Revere Metallic Mastic, used at all joints to render the construction both air- and water-tight.

Revere members are extruded from a strong aluminum alloy in sections that include various types of interlocking holding members and channels, gripping members and cap members and furring strips. Holding members, gripping members and furring strips are designed for attachment by nails or screws to supporting construction. Caps are anchored by friction to serrated inside surfaces of gripping members. All sections may be aluminized in various colors upon order and require no painting or other maintenance.

Finishing materials include any kind of flat sheet, not over ½ in. thick which is sufficiently rigid to support itself on edge. A partial list of such materials would embrace plain sheets of copper, tin, iron, steel, or lead; sheets of copper coated with lead, chromium or porcelain enamel; sheets of bronze or brass, aluminum alloy, nickel, or stainless steel, monel metal and porcelainenameled iron or steel. Non-metallic materials include glass of many types, translucent or opaque marble, plastics, asbestos cement, wall boards of all sorts and those insulation or acoustical materials which are manufactured in sheet form. These materials can be used singly or in combination with one another to form panels with an impervious surface and a backing of some insulating membrane.

Revere Metallic Mastic not only seals the entire construction against the weather but also allows movement within joints resulting from contraction and expansion of panel materials and metallic members. The base of the mastic is a non-mineral substance with a binder of asbestos fibre. It contains aluminum powder which "leafs out" upon exposure and keeps other ingredients permanently plastic by protecting them against oxidation and light rays.

Types of Revere Construction — A great number and variety of assemblies are possible because Revere sections are available in a wide range of interlocking types and sizes for use with varying types and thicknesses of panel materials. All combinations, however, are based upon two fundamental types of Revere construction. These, shown in the accompanying diagrams, are 1. Capped-joint Construction and 2. Pointed-joint Construction. A third, Combination Construction, results when these two are used in one installation.

In Capped-joint Construction, rigid, flat-sheet materials are held in place as panels by metal caps which are set into gripping members, framed both vertically and horizontally. Gripping members may be attached directly to whatever construction supports the Revere System or may ride in holding members, set either vertically or horizontally depending upon job conditions.

Pointed-joint Construction involves use of metal panels with edges formed to press into the holding members, which are set horizontally and with channels set vertically. Joints are filled with mastic. No Revere Members are visible on finished surfaces. Only formed-edge materials can be used for panels in Pointed-joint Construction, with Capped-joint construction, any type of flat sheet material may be employed.

In combination construction, gripping members holding flat sheets ride in the same holding member to which the curved edge of the formed sheet is locked.

Installation of the Revere System requires few tools, a slotted screwdriver, and possibly a wrench or hammer, since members can be attached to supporting construction by bolts, screws or nails.

Range of Uses — It is evident that any simple, light-weight, yet strong system of this kind has wide possibilities for use on both old and new structures and for interior and exterior problems. One of the most obvious applications is over old buildings, as an exterior facing, or for the redecoration of interior walls and ceilings. When so applied over an exterior structure, thickness of the Revere System is only 1 in. when Pointed-joint Construction is employed and from ½ in. to 1 in. when Capped-jointConstruction is used. Light interior construction requires a clearance little more than ½ in.

Thus, the adaptability of the panelled sections for exterior reconstruction of stores, theatres, office-buildings and many other commercial buildings can be readily seen. Since members can be applied over furring strips or other types of skeleton construction, panels can be installed to cover rough surfaced walls as well as other types. Apparently the Revere technique can be (Continued on page 94)
LIKE A DOVETAIL JOINT
THE KEYS IN

Cheney Flashing

LIKE A DOVETAIL JOINT
THE KEYS IN

Cheney Flashing

HOLD FAST!

Cheney Flashing gives complete protection to buildings on two important counts: 1. It provides perfect drainage, preventing leakage and seepage that would otherwise weaken and disfigure the structure. 2. It bonds in every direction within the mortar bed, its “Z” bends gripping the mortar like a dove-tail joint—at the same time automatically compensating for expansion and contraction.

The rigid counter-flashing face hugs the wall smoothly over the base flashing, assuring a neat job.

Use Cheney Flashing under coping stones, just above the roof line, over tops of cornices, through penthouse and rising walls, over doors and windows, under window sills, over concrete foundations where the first courses of stone or brick start upward, at all spandrel beams, and at all projecting belt courses. Cheney Flashing is supplied in standard sheets of even widths from 6 to 60 inches, length 42 inches, providing a 2-inch interlocking overlap which requires no soldering. Or it can be furnished formed and bent to shape at small extra cost. Packed 30 flashings to the case.

Patented Revere Thru-Wall Flashing may also be had at moderate prices. This is an effective as well as economical flashing, providing a bond in all lateral directions. Furnished in sheet form for cutting and forming to meet requirements.

American Architect and Architecture, August 1936
applied to any surfacing or enclosing problem without regard to size, type, condition or use. Thus, it would be as applicable to enclosures for boilers and to the construction of signs, spandrels or lighting fixtures as it would be to refinishing a store front or installing a counter or show-case.

As applied to residential construction, the Revecon System appears to offer possibilities of potentially far-reaching importance. Its application to interior surfacing follows from its similar employment in the commercial field. It seems also possible that sections might be employed with light weight framing members to form a double-walled structure meeting every present requirement of residential construction.

Many such applications remain to be tested in the field before they can be stamped as generally practical. But the Revecon technique is apparently well-directed along the trend toward the simplification of building practices and the coordinated utilization of building elements thus far considered as a series of isolated products.

The Revecon System has been in actual use for several years but the official announcement of its availability through Revere Copper and Brass, Incorporated, has just been made, concurrently with the publication of the first seven of a comprehensive series of Time-Saver Standards of Advertised Products, prepared by the Technical Service Staff of American Architect and Architecture. Complete design information is contained in these Time-Saver Standards, which will also be republished in bound form.

CABINET HEATERS

Newest addition to the line of modern oil burning appliances manufactured by the Heater Division of Motor Wheel Corp., is a complete line of kerosene burning cabinet heaters of modern design. The new Kero-Therm units are offered in six models and are available in both double and single burner sizes—including two combination heater and cooker models. Black crackled baked enamel finish with chrome trim and a new bronze baked enamel finish are available. Features include extra heavy gauge steel casings, baked enamel inside and out, automatic wickless type burners of extra large capacity, handy leg levelers, visible spirit levels.

VENT VALVES

American Radiator Company, New York has announced the development of a new radiator vent valve with adjustable vent port for balancing the distribution of heat throughout the house, and a new quick vent valve for rapid venting of steam mains. Both valves are made for either one-pipe steam or vacuum systems. By setting the valves of the radiators nearest the boilers so that they vent air slowly, and by opening the valves on the radiators at a more distant point from the boiler, and increasing this opening as the distance increases so that they vent more quickly, all radiators are filled simultaneously with their quota of steam and heat is (Continued on page 100)

MONA LISA OIL CHALK STICKS

Words cannot do justice to these remarkable chalks. They are so strong that breakage is rare. Their durability makes them economical. Their square shape and large size permit extremely rapid work. They are absolutely free from grit. They come in 27 permanent colors which blend perfectly. Much stronger than pastels, they require no fixative. They are just the thing for modern effects.

Only by trial can you realize the possibilities of these sticks. Get a set and convince yourself. Set of 13 assorted colors, $1.00. Individual colors, 10 cents a stick.
NU-WOOD—the multiple-purpose wall and ceiling treatment—enhances the gay informality of this private bar. Notice how the architect has combined Nu-Wood Tile and Nu-Wood Wainscot to make an interestingly varied pattern. Soft, glowing, distinctive colors and rich texture distinguish Nu-Wood from other wall and ceiling materials.

NU-WOOD Tile as the wall treatment brings quiet to this modern study. For Nu-Wood has remarkable sound-absorbing qualities—and it is an efficient insulating material, as well! Nu-Wood is permanent...needs only occasional cleaning to keep it bright and new looking. And don’t forget that it costs amazingly little applied!
CUTTING COSTS IN CONCRETE-FRAME ERECTION

To render a design faithfully, at minimum cost, requires maximum re-use of forms and elimination of costly delays. This is often difficult to achieve, because of the non-productive time consumed while ordinary Portland cement becomes self-supporting.

Through a basic advance in cement-making, "Incor" 24-Hour Cement cures or hardens thoroughly, in one-fifth the usual time. That means working strengths in 24 to 48 hours, instead of 5 to 10 days. Forms are released, ready for re-use, 4 to 8 days sooner. Form requirements are reduced, construction is simplified, non-productive time is eliminated. Substantial savings result. And these savings afford the designer greater opportunity to realize the utmost in beauty and utility within a given total cost.

Plumbing and Heating

1054 . . . "Planned Plumbing and Heating for Better Living" is a new illustrated booklet issued by Kohler Co., Kohler, Wis. Several Kohler bathrooms, a lavatory and a kitchen—with floor plans—are shown in color. Text discusses not only the fixtures but alternative materials for walls and floor. Illustrations and descriptions of Kohler boilers for solid fuels are also included.

Interior Finishes

1055 . . . The new insulating Temlok De Luxe Interior Finishes, available in the form of boards, planks, panels and tiles, are presented in an 8-page catalog issued by Armstrong Cork Products Company, Lancaster, Pa. Installation data, uses, and illustrations, in natural reproduction, showing the colors available are included.

Basement Recreation and Utility Rooms

1056 . . . A pictorial presentation of basement hobby, play, utility, study, rumpus and sports rooms in existing homes designed and executed by Parsons School is contained in a 48-page brochure published by American Radiator Company, New York. The booklet comprises a series of before-and-after pictures of basements, and gives costs for conversion after installation of conditioning equipment.

Revolving Doors

1057 . . . The general construction and operation of Van Kannel Revolving Doors are described in a 16-page filing-sized catalog issued by Van Kannel Revolving Door Co., New York. Suggested applications to various entrances, details of construction and specifications are also included.

Gas Boilers

1058 . . . The complete line of Ideal Gas Boilers for heating and domestic hot water supply is described and illustrated in a new 24-page filing-sized catalog (Form 8080) just released by American Gas Products Corp., New York. Ratings, dimensions and specifications are given.

Concrete Frame Construction

1059 . . . "Cutting Costs in Concrete Frame Construction" is the title of a new brochure issued by International Cement Corp., New York. It contains a discussion of the fundamentals of job planning, gives an erection cost analysis, and offers suggestions for good concreteing. Brief data on the qualities of International 24-Hour Cement are also included.

Stable Fixtures

1060 . . . A complete catalog of stable fixtures in iron, brass, bronze and aluminum has been issued by J. W. Fiske Iron Works, New York. Stall guards and rails, hay racks and mangers, troughs, stall drains, posts and cesspools are but a few of the many items cataloged. Filing size; A.I.A. File 35-L-3.

Lighting Fixtures

1061 . . . A handbook covering a review of the new Miller line of residential lighting fixtures has been prepared by The Miller Company, Meriden, Conn. Each model in the line is illustrated and described, and dimensional data are given.

School Wardrobes

1062 . . . A four-page folder has been issued by American Car and Foundry Co., New York, which presents data on and illustrations of typical installations of its Fairhurst School Wardrobes. Filing size; A. I. A. File 28-B-33.

Knob, Tube and Cleat Wiring

1063 . . . A compact manual in folder form has been prepared by Standard Electrical Porcelain Manufacturers, Chicago, which explains the advantages of porcelain knob and tube wiring and gives installation suggestions and details.

Air Filters

1064 . . . The principles of design, construction and operating mechanism of the Staynew Automatic Impingement Type Air Filter for all ventilating purposes are discussed in Bulletin 120, an 8-page booklet issued by Staynew Filter Corp., Rochester, N. Y. Filing size; 30-D-3.

Lead Shower Pans

1065 . . . An illustrated four-page leaflet giving step-by-step detailed information on the correct installation of lead shower pans, has been issued by the Lead Industries Association, New York. Drawings of correctly installed shower pans and bathtub flashing and a discussion of the advantages of this type of waterproofing are also included.

Safety Window Fixtures

1066 . . . General descriptions, architectural details and specifications for the new Howard Safety Window Fixtures are contained in an 8-page filing sized catalog recently published by Howard Safety Window Co., Milwaukee, Wis.

Fire Control Equipment

1067 . . . Garrison Engineering Corp., Great Barrington, Mass., has issued a new 36-page brochure on fire control. It opens with a complete statement of the meaning and causes of fire, in an ingenious question-and-answer form, and explains in detail how to go about the control of fire. The closing section is devoted to illustrations and descriptions of Garrison fire control equipment.

These NEW Catalogs may be obtained through

AMERICAN ARCHITECT
and ARCHITECTURE

Heating Specialties
1068 ... The various types of heating specialties for vapor and vacuum heating systems are presented in a 16-page catalog issued by Sarco Co., Inc., New York. Roughing-in diagrams, capacity tables and mechanical specifications are given. Filing size; A. I. A. File 30-C-24.

Remote Control Systems
1069 ... The WT series of data sheets on the Te-Lek-Tor Remotely Controlled Sound Systems for residences has been issued in portfolio form by Stromberg-Carlson Telephone Mfg. Co., Rochester, N. Y. Each sheet contains complete descriptions, installation data and details for individual parts or combinations of the systems. Filing size; A. I. A. File 31-i-7.

Stoker
1070 ... The Stokol automatic coal burner for all types of domestic and commercial heating plants is described and illustrated in an 8-page booklet issued by Schwitzer-Cummings Co., Indianapolis.

Oil Burners
1071 ... A new bulletin (No. CF-2) presenting the new Bethlehem-Doe Oil Burners has been published by Bethlehem Foundry & Machine Co., Bethlehem, Pa. It describes in detail the oil burner that has applied the "monitor-top" principle in its design.

Liquid Soap Dispensers
1072 ... Illustrations and descriptions of the various types of liquid soap dispensers manufactured by Clifton Chemical Co., Inc., New York, are contained in a new 4-page folder.

Grilles and Registers
1073 ... Barber-Coleman Company, Rockford, Illinois, has issued a 26-page spiral-bound booklet giving complete data on its line of Uni-lo Grilles and Registers for all types of heating, ventilating and air conditioning systems. Construction details, charts for determining the proper size of grille or register, and many illustrations are included.

Wood Preservative
1074 ... Facts on wood preservation with Graselli Chromated Zinc Chloride are interestingly presented in a new booklet issued by The Graselli Chemical Co., Cleveland, Ohio. A few of the many uses suited to Chromated Zinc Chloride treated lumber are demonstrated by illustrations of typical installations. Filing size; A. I. A. File 19-A-3.

Unit Heater
1075 ... Grinnell Company, Inc., Providence, R. I., has issued a 40-page catalog which illustrates and describes the Thermolier Unit Heater. Capacities, dimensions, piping connections, wiring diagrams and other essential data are given. A few typical installations are illustrated. Filing size; A. I. A. File 30-D-11.

Air Conditioning
1076 ... An engineering manual for Sunbeam Air Conditioning Systems has been issued by The Fox Furnace Company, Elyria, Ohio. It gives a quick accurate method of calculating the air conditioning requirements for any residence using this equipment.

Windows
1077 ... Andersen Casement Window, a complete unit including frame, sash, hardware, screen, double glass, weather-stripping, is described and illustrated in a 16-page, filing-sized catalog issued by Andersen Frame Corp., Bayport, Minn. Details of standard and special applications, tables of sizes and suggested specifications are included. Details and descriptive text on the Andersen Narrowline Double Hung Window and the Andersen Basement Window are also given. Typical installations are illustrated.

Lighting Equipment
1078 ... The Holophane Company, New York announces the publication of a new 44-page catalog on lighting facts called "Datalog." This book contains illustrations and descriptions of the complete Holophane line of equipment for scientific lighting. Classification of the contents has been prepared to facilitate reference.

Household Water Conditioning
1079 ... A new 20-page booklet published by The Permunit Company, New York, gives factual information on its line of water softening and purifying equipment. Typical specifications, a water conditioning data chart, and numerous capacity tables are included. Filing size; A. I. A. File 29-D-3.

Ceiling Fans
1080 ... A 16-page filing-sized catalog illustrating and describing all types of ceiling fans manufactured by The Emerson Electric Mfg. Company, St. Louis, has been released. Detailed information regarding unit glassware and ceiling type lighting fixtures is included, together with wiring diagrams for installations requiring wall switch control.

Air Cooling Equipment
1081 ... A spiral-bound booklet issued by Baker Ice Machine Co., Inc., Omaha, Nebraska, describes the features and characteristics of Baker air conditioning for commercial and residential applications, and illustrates a variety of typical installations.

Lighting Fixtures
1082 ... Many new modernly designed Alabax Porcelain Lighting Fixtures are illustrated and described in the new lighting fixture catalog AL-2 which has recently been published by Pass & Seymour, Inc., Syracuse, N. Y.

Anthracite Burning Equipment
1083 ... Laboratory Bulletin No. 23 issued by The Anthracite Institute, Primos, Pa. pertains to a discussion of "Securing a Maximum of Satisfaction from Anthracite Burning Equipment" and contains heating inspection charts for steam, vapor, hot water and warm air.

Basement Designs
1084 ... The twenty-nine plans which were prize winners in the Iron Fireman-Pencil Points Architectural Competition for designs of present day homes with special attention to the most effective use of the basement, have been embodied in a 32-page filing-sized booklet issued by Iron Fireman Mfg. Company, Cleveland, Ohio.
The Firesafe Concrete Home
*Impressively States Its Case*

A booklet for home prospects that should do much to foster higher construction standards and encourage an appreciation of good architecture in small homes.

IN publishing "Designed for Concrete," the Portland Cement Association reaffirms its confidence that the trend toward permanent, firesafe houses will continue because of its economic soundness. The booklet presents 55 selected designs from the 1936 Pencil Points-Portland Cement Association competition for the design of firesafe concrete houses; photographs; and an appraisal of the advantages of concrete.

Home prospects everywhere will receive this booklet, including several thousand monthly who inquire through our national advertising for more facts about firesafe concrete homes.

"Designed for Concrete" also reaffirms our confidence in the growing importance of the architect in the residence field. His touch is needed if beauty is to survive current modes and be part of the permanence people want today. This booklet asks those who are seriously interested in any of the houses shown to consult the designer for working drawings, and counsels the reader to employ an architect in planning a home to meet individual needs and tastes.

These are significant days for concrete. Designers are giving its possibilities much creative attention. More and more builders are becoming concrete craftsmen. And home buyers, perhaps you've noticed, are awakening to concrete as a source of beauty, comfort, and sound value at low cost per year.

Let us send you a file copy of "Designed for Concrete."

PORTLAND CEMENT ASSOCIATION
Dept. A8-2, 33 West Grand Ave., Chicago, Ill.
evenly distributed to all rooms. The quick vent valve on the end of the steam main allows steam to be supplied almost instantly to the riser connections leading to the more remote radiators as well as the ones adjacent to the boiler. Both types of valves offer a wide range of venting rates and can be easily adjusted by removing the protective cap on top of the valve and turning the adjustment dial.

**ELECTRIC RANGE**

A new apartment house electric range known as “The Mate” measures 20 15/16 inches wide and 24 3/32 inches in depth. The cooking top is 36 inches from the floor. Oven is equipped with two sliding shelves and hydraulic type oven temperature control. A porcelain broiler pan with wire rack is included. Standard equipment includes three Hi-Speed Calrod units. The Mate is approved by the underwriters for installation with the back flush against the rear wall and may be installed with sides flush against adjacent metal cabinets. The range includes a one-piece cooking top and back splasher furnished in stain resisting porcelain enamel. Oven vents are provided in front of the back splasher to prevent discoloration of walls. The range is base type provided with standard toe space and equipped with a full size oven including a newly designed 3000 watt open coil unit. Announcement of this new unit was received from the Appliance and Merchandise Department of General Electric Company, Nela Park, Cleveland, Ohio.

**TECHNIQUES**

If H. G. Wells’ forecast for the future seems amazing... consider what our modern world would have seemed like to our 18th Century forebears, had they been able to visualize it.

In 1761, when the house of A. W. Faber was founded, the world was still a comparatively simple place. But when man’s imagination took wing he required drawing materials that would give graphic expression to his genius. Thus began the alliance between A. W. Faber and architects, engineers, artists, craftsmen and designers. The epitome of 175 years of pencil perfection, “Castell” is the choice of pencil craftsmen the world over. We feel it is no rash prediction to say that “Castell” in the future, as in the past, will keep pace with “Things to come”.

**DRAWING PENCILS**

If H. G. Wells’ forecast for the future seems amazing... consider what our modern world would have seemed like to our 18th Century forebears, had they been able to visualize it.

NEWARK, N. J.
PROTECTION GIVES DOUBLE INSULATION

Bildrite SHEATHING on the outside
(AN INSULITE PRODUCT)

No matter what kind of a house you design, Bildrite Sheathing will fit into the picture—assure stronger, windproof walls—a home that will bring greater comfort and satisfaction to your clients. Only Bildrite Sheathing offers all these advantages:

1. Four times the bracing strength of horizontal eight inch shiplap.
2. Far more insulation than lumber.
3. No open joints or knotholes.
4. Lower application costs.
5. One solid piece—No laminated courses to split.

THE INSULITE COMPANY
Department AA-56, Builders Exchange Building • Minneapolis, Minnesota

LOK-JOINT LATH inside the framework
(AN INSULITE PRODUCT)

You'll assure lasting beauty of plastered interiors when you specify Lok-Joint Lath. The patented Lok-Joint forms a more rigid base—the safest base for plaster. Only Lok-Joint Lath affords all these advantages:

1. Eliminates lath marks on walls and ceilings.
2. Reduces the passage of sound through walls and ceilings.
3. Insulates.
4. Assures greater freedom from plaster cracks.
5. Low cost.

THE WALL OF THE AGE...meets every need!
NEW ELEVATOR CONTROL

Notable progress in elevator control methods has been made with the development by Otis Elevator Company of push-button ("finger-tip") control for all classes of elevators, including low speed, geared-type passenger and freight elevators as well as high-speed gearless machines.

Until recently only the latter class of modern elevators, such as are familiar in all modern skyscrapers and important buildings, could be controlled in a fully automatic manner which eliminates the vagaries of the human element. Now the car operator functions as a monitor or attendant, transmitting the passengers’ orders for floor stops to a wholly automatic mechanism by merely pressing buttons. Car movement is started and stopped, and doors are opened and closed, by properly coordinated devices. In addition, of course, waiting passengers may command the car to stop by pressing the usual buttons at each floor.

The new development makes it possible to convert existing Otis elevators having a speed of 250 to 400 ft. per minute to fully automatic push button control without drastic changes in machinery, cab or shaft. Geared-type elevators in these lower speed ranges are now offered for new structures where the higher speeds of gearless machines are not needed. Thus any building may have the elevator service advantages hitherto practical only in large modern structures.

Significant corollary to this development is the further announcement that Otis has adopted “finger-tip” or push button control as standard for all new and modernization equipment they will hereafter produce (unless old style control is arbitrarily specified).

Seven types of elevator installations are now subject to “finger-tip” control, eliminating the hand operated car switch and the irregularities of service incident to unskilled or indifferent manual stopping and starting. Three types are used for passenger service; the same three are also used for freight service with appropriate modifications, and the seventh type is exclusively for freight elevators. The primary types are:

Signal Control is the highest type of automatic elevator operation with an attendant in the car. It employs a panel of push buttons in the cab as well as “up” and “down” buttons on each floor. The operator in the cab presses buttons for all floors desired by passengers. When a stop is reached car doors open automatically; they close automatically when the operator releases them—and the car then starts automatically. Operation of any floor button, either within the cab or from the floor itself, commands the car to stop at that floor when traveling in the indicated direction. Micro-self-leveling is inherent in this system.

Collective Control represents the highest type of automatic elevator operation without an attendant. An attendant may be used during day time if desired and passengers operate the car by themselves in the slack periods of night service, or as in apartment houses the passengers may use the elevators at all times without the need for an operator. Push buttons in the cab as well as at each floor govern car operation as with ordinary Signal Control, and the Collective feature makes the car stop at each called floor in sequence according to the direction in which it is traveling. For example, when a car is rising in the shaft a passenger on an upper floor will press his “down” button. The car may pass this floor on its rise, but will pick up the call on its return trip. Micro-self-

(Continued on page 104)
More than 7 years ago, the first Electrolux refrigerators went into the properties of Shachnow & Brown, Builders and General Contractors, of 527 Fifth Avenue, New York City. And this firm has continued to install this modern gas refrigerator ever since! Writes Mr. M. Shachnow, President, in a letter to Consolidated Edison Co., of New York:

1,000 Electrolux Installed

"Since 1929, we have been installing Electrolux in our properties. The latest of our buildings to be equipped with this refrigerator was opened just last fall at 635 East 211th Street, Bronx, N. Y. And it is a real pleasure to tell you that our Electrolux Refrigerators, including those installed some 7 years ago in our 137 apartments in premises 666 East 233rd Street and 667 East 232nd St., Bronx, have continually afforded completely efficient performance and unusually low maintenance. We also wish to thank your company for its courtesy and dependable servicing of our one thousand (1000) gas refrigerators.

Valuable Rental Appeals

"I recall that when we first purchased Electrolux we did so because we agreed (1) that a refrigerator without moving parts to wear promised bigger benefits in the way of long life and economical upkeep; (2) that the low operating cost and silence of Electrolux would appeal strongly to tenants. Experience has proved that we were right on both counts. Naturally, therefore, we do not hesitate to recommend Electrolux heartily to any builder or owner."

It will pay you to investigate Electrolux carefully before choosing any new refrigerators for your properties. See the beautiful models on display at your gas company. Servel, Inc., Electrolux Refrigerator Sales Division, Evansville, Indiana.
There's One for every Place and Purpose

This Ad, is frankly by-way-of-remindment. A sort of memory-jogger.

You may have used certain of our boilers and sort of placed us in your mind as not having other kinds. For instance a specially designed Gas Boiler. A heavy-duty high pressure Hot Water Supply Boiler. Likewise a Welded Steel one. Or a big cast iron Twin Section one, that is so largely used for replacements, as the sections can pass through any average size door. Does away with all tearing out cost and nuisance.

All of which boils down to the fact that Burnham makes boilers for all fuels and for every place and purpose.

Burnham Boiler Corporation

IRVINGTON, NEW YORK
ZANESVILLE, OHIO

Representatives in All Principal Cities of the United States and Canada

leveling and automatic car gates are necessarily included in this fully automatic selective system.

Single-Call Control requires no operator and leaves the command of the car movement entirely to the passenger. The car will respond to a call at any floor unless otherwise in use, and then may be operated up or down from that floor by the passenger. This method is frequently employed in apartment buildings and certain classes of freight service.

The three foregoing systems, as noted previously, apply to both passenger and freight equipment. In actuality they therefore represent six classes of elevator control.

The other types are for Freight Service:

Double Button consists of two buttons in the cab and on each floor. To operate the cab the up or down button is pressed and held until the desired level is reached. Removing the pressure stops the car. It is a modern and much safer version of the old rope control for freight elevators.

Dualite Control is an improved form of Double Button operation. There are Up and Down buttons in the car, and it is operated from there in the same manner as Double Button. However, there is only one button on each floor, pressure on which calls the car to that floor from either direction, and where it stops automatically. With each floor button there are two lights, one to indicate when the car is in use, and the other to indicate that the car is at that floor and the doors there may be opened.

The technical advances achieved by Otis in applying "finger-tip" control to all classes of elevator service and to all geared as well as gearless machines is far more significant than this summary indicates. Vertical transportation at any speed in common use is now placed on parity with the most modern high speed equipment in terms of efficiency, convenience and reliability. Small buildings may be as modern in elevator equipment as large structures. Old buildings can be brought up to date without replacement of old types of drives that are still in good working order.

MULTIPLE FELLOWSHIP AT MELLON INSTITUTE

Dr. Edward R. Weidlein, Director, Mellon Institute of Industrial Research, Pittsburgh, Pa., has announced that the Pittsburgh Plate Glass Company has founded a Multiple Industrial Fellowship in that institution. This Fellowship will study fundamental problems in the various fields covered by the activities of the Pittsburgh Plate Glass Company.

These activities include the production of plate glass, window glass, safety glass, special glasses, heavy chemicals, paints, varnishes and lacquers. It is interesting that these products which have a close economic interrelationship are also technically closely allied, so that investigation into the technology of one can become of value in its application to another.

Dr. Frederick W. Adams, who has been selected as senior incumbent of this Fellowship, comes to Mellon Institute from the Massachusetts Institute of Technology where for the past fourteen years he has been a member of the Chemical Engineering Department, devoting most of his time to the School of Chemical Engineering Practice. His staff on the Fellowship includes specialists in various lines of research, whose experience adapts them to a scientific investigation of the problems involved. Dr. John D. Jenkins, who took his undergraduate work at Oregon State College and received
WHEN YOU SPECIFY ARMSTRONG'S CORKBOARD
...YOU ASSURE PERMANENT INSULATION

THANKS TO
LOW THERMAL CONDUCTIVITY
AND HIGH MOISTURE
RESISTANCE, THIS PURE
CORK MATERIAL REMAINS
EFFICIENT THROUGHOUT
LONG YEARS OF SERVICE.

CHOICE of Armstrong's Corkboard for all types of normally-heated and air conditioned buildings—as well as for insulation of all low temperature rooms—gives you positive assurance that your clients will be free from insulation worries for many years to come. Installations of this material made as long ago as 1904, and even earlier, are still on the job ... still serving faithfully and economically.

The dependable service of Armstrong's Corkboard is the result of cork's unique cellular structure. Viewed under a microscope, cork shows millions of tiny cells, and entrapped in each cell is a minute quantity of still-air. This structure not only provides an effective barrier to the passage of heat, but also resists the efficiency-destroying effects of moisture—thus insuring permanence.

For cold lines, Armstrong's CorkCovering offers the same kind of lasting protection. Careful machining of inside surfaces permits a snug fit against the pipe and eliminates moisture-catching air pockets.

Armstrong's Architectural Service Bureau is available to assist you on any insulation job. For full information about Armstrong's Corkboard and Cork Covering, see your current Sweet's Catalog or write direct to Armstrong Cork Products Co., Building Materials Division, 926 Concord St., Lancaster, Penna.

NATION-WIDE RAIL-AIR SERVICE

his Ph.D. from University of Wisconsin, majoring in physical chemistry, comes to Mellon Institute from the Ditzler Color Company, a subsidiary of Pittsburgh Plate Glass Company in Detroit, where he has been engaged in the development and production of lacquers and industrial finishes. Dr. Harold E. Simpson, after receiving his Ph.D. at Ohio State University and spending a year in teaching at Rutgers University, has been research engineer in ceramics for the last six years at Battelle Memorial Institute. Dr. Lee Devol graduated from Marietta College and after several years of industrial experience with Westinghouse Electric and Manufacturing Company and the Union Switch and Signal Company, completed graduate studies at the University of Pittsburgh where he received his Ph.D. in physics. Dr. Kenneth R. McAlpine matriculated at the University of Buffalo, received his Ph.D. at Princeton majoring in physical chemistry, and spent several years with the Republic Steel Company at Youngstown before joining the staff of this Fellowship. Mr. Phillip W. Crist graduated this year in physics from Carnegie Institute of Technology.

Work on the various projects which are being started includes basic studies in the technology of glass, heavy chemicals, paints, varnishes and lacquers.

NEW COURSES AT NEW SCHOOL

The broader aspects of housing and the more specific aspects of architecture will be discussed in courses to be offered by the New School for Social Research in the fall term beginning September 28th. Charles Abrams, counsel to the New York City Housing Authority, has arranged a series of twelve lectures on Public Housing: Problems and Solutions. Jan Ruhtenberg, formerly associated with Mies van der Rohe and with the School of Architecture at Columbia University, will discuss Elements of Architecture for Artists, Draughtsmen and Clients.

Mr. Abrams has recruited the most eminent housing authorities to lecture on the aspects of the subject with which they are now associated: Langdon W. Post, tenement house commissioner and chairman of the New York City Housing Authority, will discuss the social and economic backgrounds of the housing problems. Edith Elmer Wood, consultant to the housing division of the PWA will discuss the social aspects of housing; George Gove, executive secretary of the State Board of Housing, the limited dividend corporation as a solution; Coleman Woodbury, director of the National Association of Public Housing Officials, public housing as a solution; B. Charney Vladeck, member of the New York City Housing Authority, European solutions; Rexford G. Tugwell, under secretary of agriculture and resettlement administrator, resettlement as a solution.

Mr. Abrams has recruited the most eminent housing authorities to lecture on the aspects of the subject with which they are now associated: Langdon W. Post, tenement house commissioner and chairman of the New York City Housing Authority, will discuss the social and economic backgrounds of the housing problems. Edith Elmer Wood, consultant to the housing division of the PWA will discuss the social aspects of housing; George Gove, executive secretary of the State Board of Housing, the limited dividend corporation as a solution; Coleman Woodbury, director of the National Association of Public Housing Officials, public housing as a solution; B. Charney Vladeck, member of the New York City Housing Authority, European solutions; Rexford G. Tugwell, under secretary of agriculture and resettlement administrator, resettlement as a solution.

Mr. Abrams will discuss legal and legislative problems; Ernest J. Bohn, President of the National Association of Housing Officials, politics and housing; Frederick L. Ackerman, technical director of the New York City Housing Authority, technical problems; Evans Clark, economic adviser to the Housing Authority, financing public housing; Joseph Milner, real estate adviser to the Authority, the real estate problem of housing; Donald Slesinger, formerly dean of the division of social sciences, University of Chicago, management of public housing.

Mr. Ruhtenberg in his course will present a comparative outline of European and American architecture of today and tomorrow, illustrated by slides of outstanding architectural creations directing and influencing the architecture of the
future. It will be shown what are the mutable elements in architecture, why architecture had to break away from traditions in its expression, as well as to change old construction for new. Sociological, artistic and technical developments will be discussed, likewise what may be expected of the architect beyond his knowledge of building and the use of contemporary construction methods and materials.

**DESIGNERS-CRAFTSMEN ORGANIZE**

The Society of Designer-Craftsmen was organized recently in New York for the purpose of maintaining high standards of craftsmanship and design in the architectural and decorative arts fields; to promote co-operation among those engaged in craft, architectural and art organizations; to represent the interests of the Designer-Craftsmen in major public issues; to establish a code of ethics in design and craft competitions; to promote sound education in the crafts; to maintain a high standard of ethics in professional practice in and with business firms. The Board of the organization consists of Oscar Bach, Waylande Gregory, Maurice Heaton, Walter Kantack, Hildreth Meiere, Karl Schmeig, Eugene Schoen and Giles Whiting. Inquiries should be addressed to the Society of Designer-Craftsmen, 115 East 40th St., New York City.

**ERRATA**

Due to incorrect information furnished with the photograph of the model of the Ford Building used on page 55 of the July issue, Albert Kahn was incorrectly credited as architect. This building was designed by Walter Dorwin Teague. Albert Kahn, Inc., made the working drawings.

**KENMAR COPPER SHINGLE ROOF**

at Rye, N. Y.

Copper Roofs of Kenmar Shingles possess unquestionable charm and distinctiveness. But architects are even more impressed with the complete utility of these modern roofs.

Their 12 distinct advantages interest every active architect.

**THE NEW HAVEN COPPER COMPANY . . SEYMOUR, CONN.**
Manufacturers of Sheet Copper Since 1849

**PRODUCTS TO MEET EVERY INDIVIDUAL REQUIREMENT**

For years, you have accepted Herman Nelson equipment as a standard of quality, efficiency and practicability. And you know, of course, that the skillful Herman Nelson methods of producing healthful air conditions are known and accepted throughout the world.

Naturally, the recent announcement of a complete line of Herman Nelson Automatic Heat and Air Conditioning equipment for the residential and small commercial market was welcomed by architects and builders everywhere. Now, regardless of the requirements of your clients, you can recommend Herman Nelson products of the same high quality and efficiency you have known for years. They are made available through carefully selected distributors.

We can’t go wrong on this equipment ... if Herman Nelson makes it we know it’s right.

Feel free to consult the distributor nearest you or write us for complete information for your files.

7 REASONS
Why Architects Specify
OIL-O-MATIC

7 "Musts" for Oil Burners
(Only Oil-O-Matic Has Them All!)

1. Does it atomize at low pressure, insuring quiet and complete combustion and long life?
2. Has it projected flame burning in mid-air away from the burner, with all mechanism outside the combustion chamber away from the heat?
3. Has it diffuser to insure, with any oil, a perfect blending of oil and air, producing a steady, unwavering flame?
4. Has it positively operated automatic safety shut-off valve?
5. Will it burn the economical, heavier, low-priced fuel oils?
6. Has it metering pump feeding unvarying quantity of oil regardless of viscosity or temperature?
7. Is the manufacturer financially responsible specializing exclusively in temperature control devices?

300 oil burners on the market today! Of course you’re too busy to investigate even a fraction of them. But if you could compare them point by point—check each one for the 7 features that mean economy, long life and freedom from repairs, you’d specify Oil-O-Matic.

The new improved Oil-O-Matic is the finest ever built. It is precision engineered to burn the low-priced fuel oils with truly amazing economy. The leader in the field for more than 18 years—the only oil burner that atomizes at low pressure—Oil-O-Matic has been specified by more architects than any other oil burner.

Oil-O-Matic is built in five different sizes. It can be quickly installed in any furnace or boiler—steam, vapor, hot water or warm air. For new construction it is provided in complete boiler-burner and furnace-burner units through Oil-O-Matic’s association with leading furnace and boiler manufacturers. For useful data for your files, mail the Architect’s coupon below.

ANNOUNCEMENTS

Harry F. Cunningham, Architect, announces the removal of his office to 1707 Eye St., North West, Washington, D. C.

Logan V. Gallaher, Architect, announces the opening of an office at 428 Alfred Street, Kingston, Ontario.

Anthony Thormin, Supervising Architect of Great Lakes Exposition, announces the opening of an office at 1227 Prospect Avenue, Cleveland, Ohio. He requests manufacturers’ samples and catalogs.

Russell Seymour, Architect, announces the removal of his office to 205 Mitchell Building, Jacksonville, Florida.

OBITUARIES

Michael Joseph O’Connor, retired architect, died recently at his home in Mount Kisco, N. Y. He was 75 years old. Mr. O’Connor was born in San Francisco and attended school in New York. He was graduated from the School of Mines and Columbia University and from the University’s School of Architecture. He was a partner in the firm of Little & O’Connor for more than forty years. This firm designed the College of Pharmacy Building at Columbia University, the Scranton (Pa.) High School, and a number of residences including those for H. H. Flagler, Harry Gilbert and William Brokaw.

George Provot, Architect, died recently in New York after a long illness. He was 68 years old. Born in New York, he studied in France, where he received his Bachelor of Science Degree in 1886. Three years later he graduated in architecture from Columbia University. For some years he was a member of the architectural firm of Welch, Smith & Provot from which he resigned to practice alone. He was the architect of the old French Hospital and for extensive alterations for the Hotel Brevoort. Mr. Provot was also active in real estate and was secretary and treasurer and director of the Potter & Provot Realty Company, secretary and director of the Vauhan Realty Corporation, and a director of the Gerbeury Company. He was an associate member of the American Institute of Architects, a member of the French Benevolent Society, the Columbia University Club and the French Club.

George W. Phillips, retired architect, builder and inventor, died recently at his home in Suffern, New York. He was 91 years old. Mr. Phillips was born in Oxford, England, where he studied Gothic and collegiate architecture. He later attended King’s College, London. Shortly after the Civil War he came to America where he, together with Frank Melville, introduced the teaching of drawing in New York public schools. It is said that Mr. Phillips was the first man to obtain a patent on the folding steamer chair. He designed houses and interiors for a number of clients including Spencer Trask, the Paulist Fathers and the post office department. Mr. Phillips was one of the oldest members of the General Society of Mechanics and Tradesmen and of the New York Society of Architects.

America's literature relating to gardens is being slowly but steadily augmented by regional contributions. The compilation of these volumes is being started at a rather late period, in which the compilers are heavily handicapped by the difficulties in securing information and illustrations regarding the plantings of a hundred years or more ago. In this particular volume an effort has been made to combine with the specific garden material, photographs and drawings bearing upon the history and scenic beauty of the State of Tennessee itself.

The first edition of this work, published several years ago, constituted a milestone among architectural reference books. It seemed at that time that additions and improvements would be made only with great difficulty, if at all. Nevertheless, the present volume has been thoroughly revised, improved, and added to in further practical aid of the architectural office. There seems to be every indication that Messrs. Ramsey and Sleeper will be saddled with a responsibility for continuing production very much as was the late F. E. Kidder in connection with his Handbook.

Whatever Samuel Chamberlain has to offer the profession, whether in pencil drawings, etchings, or photographs, is always more than welcome. His insatiable urge for expression has in recent months been satisfied more frequently with camera than with pencil or stylus. The present volume is a pictorial characterization of rural New England.

This annual handbook, as it appears year after year, seems to improve with its lengthening stride. Here are authoritative synopses of improvements in various branches of the industry. The guide offers a convenient means by which the architect and engineer can keep abreast of a forward marching science.

Here is a little book which will in all probability tell the architect a great many things that he has never known about the tool most frequently in his hands. From back in 1565, when an oak tree was up-rooted by a storm, revealing a graphite deposit, pencil making has marched steadily onward in both quality and quantity. Arthur L. Guptill, who should know, tells how he would—and you should—select drawings materials.

(Continued on page 110)
This well known theatre at Miami Beach, Florida, is one of several FRICK installations which operated through the past winter on reversed refrigeration for supplying heat.

As these systems collect up to ten dollars worth of heat for every dollar's worth of power, they offer further proof of the superior economy of Air Conditioning with FRICK Refrigeration.

Estimates on a FRICK system to suit your requirements will be cheerfully submitted.
HOUSES for MODERATE MEANS

by R. Randal Phillips, author of "Small Family Houses," etc.

The seventy selected modern English homes illustrated and described in this book all fall within the $2500 to $7500 price range. The styles are many and various—including numerous examples of the most modern expression with flat roofs, horizontal windows and large unbroken expanses of wall surface, the traditional English country cottage style and the formal Georgian house. Besides the profusion of photographs and floor plans there is a helpful introduction in which style, materials, equipment and building costs are considered, and a description of each house with sufficient details to guide the architect or intending house owner. Builders, architects and prospective owners of small homes will find the book of immediate interest and value. $2.75.

Charles Scribner's Sons, 597 Fifth Avenue, New York
The House that Blends with the Landscape...

The soft, transparent colors of Cabot's Stains have helped many an architect build houses that blend naturally with the landscape. Cabot's Bleaching Oil and Weathering Gray Stains take away the fresh, raw look of new shingles and give, almost overnight, pleasant weather beaten effects that formerly took years to attain. . . . Cabot's Creosote Shingle Stains have a vehicle of pure creosote—the best wood preservative known. They assure beauty, from the beginning, and low upkeep costs for generations. For color card and complete information, mail coupon below.

The Story of Heat and Air-Conditioning at a Moderate Price

In the past when the question of moderate priced air conditioning came up, architects have thrown up their hands.

For some years we have been alive to the ever-growing necessity for a moderately priced combination of both heat and air conditioning. QUIET MAY Scientists and engineers never stopped work on the problem until they solved it with the QUIET MAY “Heat-an-Aire” Conditioner. Briefly speaking, QUIET MAY “Heat-an-Aire” does this:

It heats by both steam radiation and conditioned warm air; it automatically provides domestic hot water all year around by a tankless heater of unique type.

It cleans and circulates the air in winter as part of its air conditioning function and in summer to produce the cooling effect of a gentle breeze.

Especially for architects we have prepared a complete, comprehensive file on the QUIET MAY “Heat-an-Aire” Conditioner. It covers all phases of this really remarkable equipment and it's yours for the asking. Use coupon below.

PLASTER plays the most important part in the construction of walls and ceilings; but plaster is dependent upon plaster base and as a rule a plastering job is just about as good as the plaster base used.

It is an accepted fact that Metal Lath is the finest plaster base available. There has never been any base invented which can approach its many advantages.

Kuehn’s Specialmesh, because of the new meaning it has given to Metal Lath, is accepted by many as the best Metal Lath manufactured. It is fully described on page 5 of the Milcor Manual in “Sweet’s”. (Section 14/7).

Milcor Expansion Corner Bead and Casing, because they perform their particular functions as well as does Metal Lath, are outstanding products.

Write for information or refer to the Milcor Manual in “Sweet’s".
PITTCO Store Front Products impose very few limitations upon the architect's imagination. When you design an original, attractive and distinctive store front, you can be pretty certain that Pittco Store Front Products will enable you to build it exactly as designed. For these glass and paint products combine beauty with utility so well... they are so versatile, so readily adaptable to different handlings and combinations... that they really enlarge the scope of possibilities for store front design.

Undoubtedly, many merchants and property owners in your community will be taking advantage of the Pittsburgh Time Payment Plan (which includes provision for an architect's fee) to remodel with new Pittco Store Fronts. When you are retained on projects of this nature, design your fronts with Pittco Store Front Products in mind. You'll find them thoroughly satisfactory in every way, not only to you but to your clients.

Each month, our staff of store front experts, maintained to cooperate with architects on problems of construction and product application, prepare a style suggestion on some type of front. Clip the coupon below... now... and have your name entered on our architect's list to receive our "Design of the Month" service.

PITTCO Store Front Products
BY UTILIZING Pittco Store Front Products, architects and designers gain new freedom in store front design. These pictures show how Patriarca Store Fixtures, Inc., transformed a store in Boston, Mass., by designing and installing an attractive and effective Pittco Store Front. For perfect execution of the store fronts you design, specify Pittco Store Front Products.
FOR the floors of Seagram’s new executive offices in the Chrysler Building, Architect Morris Lapidus had very definite requirements to meet. Seagram’s wanted floors that would not only reflect the character, dignity, and luxury of the interior scheme, but would also give long service and be easy to maintain. Mr. Lapidus found exactly what was needed in Armstrong’s Rubber Tile, Cork Tile, and Linoleum.

Armstrong offers the only complete line of resilient tile floors. Among them you’ll find materials to suit every pocketbook. Linotile—an exclusive Armstrong product—is a long-wearing floor twice as resistant to indentation as Battleship Linoleum. Rubber Tile is a specially-reinforced tile with a beautiful high finish. Cork Tile is a rich, comfortable floor possessing high sound-deadening qualities. Accotile—a low-cost moisture-resistant tile—is for use wherever floors are in direct contact with the ground. And there are hundreds of Armstrong’s Linoleum patterns for every type of building.

With this complete line of resilient floors, the Armstrong Architectural Service Bureau can give unbiased suggestions on the correct type for any building. For more complete information, see Sweet’s or write direct to Armstrong Cork Products Company, Building Materials Division, 1201 State Street, Lancaster, Pennsylvania.
