Want a better looking and better serving interior—today? Start with the floor. Kentile, the new low cost floor that is so speedily laid, piece by piece, does wonders for a room. Here are just a few of Kentile's advantages:

1. Kentile, although resilient underfoot, is one of the most durable floorings made—practical even in heavy duty plants.
2. Kentile is one of the lowest cost floors made.
3. Kentile is moistureproof—perfect even on basement concrete in direct contact with earth.
4. Kentile resists almost any kind of staining.
5. Kentile is laid with amazing speed—is available immediately—is installed by authorized contractors in any part of America.
6. Kentile offers a million patterns—any design you conceive with its 44 colors, 15 tile sizes.
7. A Kentile floor can be altered in any part—without disturbing the other areas.

GREASEPROOF KENTILE isn't stained by any animal, vegetable or mineral oil or fat. Check "Grease Tester" on the coupon for our fascinating grease testing job. Or send for a representative. There's above.

Learn ALL about Kentile NOW! Without any obligation send for our big, fully detailed, full color catalogue. Mail the coupon now.
COTTON OVERCOATS keep Tibetans WARM at 20° below

The high-thin air of Tibet is often bitterly cold. Yet the Tibetans keep warm and snug in their coats made of padded cotton. Reyn-o-Cell Insulation uses this same principle. It wraps houses in a thick coat of cotton fibres containing numberless hollow cells. These dead air spaces give protection from the cold of winter and the heat of summer as well.

YOU OUGHT TO HAVE THE COMPLETE STORY. Write for Booklet A1A 37al giving details, facts, and scientific data.

REYNOLDS METALS COMPANY
BUILDING PRODUCTS DIVISION RICHMOND, VIRGINIA
It takes no daring to predict a brilliant future for K&M Sprayed "Limpet" acoustical treatment in the architecture of Tomorrow.

Already, in many hospitals it is bringing new comfort to patients by smothering nerve-nagging noise. When sprayed onto room and corridor ceilings it turns clacking heels and shrill voices into soothing silence.

And not only in hospitals. Sprayed "Limpet" is doing the same outstanding job of sound control in hotels, offices, theatres and restaurants. Sprayed from a gun it "builds" to any desired thickness, faithfully follows any contour — performs in new buildings or old — and has, besides unrivaled acoustical virtues, a most helpful way of insulating against heat and cold.

When K&M is able to relax its all-out effort for war, there can be no doubt that Sprayed "Limpet" asbestos will promptly resume its great peace-time career.

Meanwhile, our research laboratories are seeking new uses for asbestos, new ways in which this gifted mineral may serve the world. We invite you to tell us how we might make it better serve you.

* * *

Nature made asbestos;
Kesbey & Mattison, America's asbestos pioneer,
has made it serve mankind... since 1873
Establishment of a quantity "ceiling" on metals used in some types of construction is being seriously discussed ... but from a practical standpoint it already exists. Shortages and delayed deliveries have set up their own restrictions, and created some tough problems for heating engineers.

The problem is acute in industrial heating. Certain types of equipment ordinarily used are no longer available. Other types demand extravagant tonnages of vital materials. As a result, many engineers are giving renewed thought to Radiant Heating, as the best means of getting first-class heating results, and at the same time saving metal the Nation so badly needs.

The extent of this saving is suggested by a comparative check recently made on a small structure. For Radiant Heating, 930' of 3/4" pipe were required; total weight, 850 lbs. For a conventional hot water system of equivalent capacity, the metal required totaled 1700 lbs., and for an equivalent 2-pipe steam system, 1200 lbs. All figures exclusive of weight of boiler.

Industry is well represented in the 400-plus Radiant Heating installations now serving. One New York concern reports 30 years of satisfactory service from a floor-type job. After several years' experience, a Wisconsin company writes, "We are well satisfied with its (Radiant Heating) operation from all angles." A Steel and Foundry Company executive calls their radiant heated building, "the most comfortable we have ever worked in," and reports a fuel consumption 1/3 that estimated for conventional systems. Installations have been recently made, are on the boards, or in process, in Illinois, Michigan, Ohio and Maryland plants.

Your own experience will explain the importance of using wrought iron for Radiant Heating. Wrought iron's unusual corrosion resistance has been repeatedly proved. Its thermal properties are excellent, as any handbook will show. (Its coefficient of expansion is practically identical to that of concrete and plaster, which helps eliminate cracked floors, and loss of bond). And it can be easily and economically formed and welded or threaded, in the shop and on the site.

You will find our 48-page technical bulletin, "Byers Wrought Iron for Radiant Heating Installations," filled with helpful information on design and installation. If you want additional assistance, we will put you in touch with some of the many engineers who have first-hand experience with Radiant Heating in all its phases.

BEHIND THE RECORD

The home construction front cannot be conquered only in terms of housing and industrial plants. Towns and cities throughout the land need schools, hospitals, public utilities and recreational structures to assure their "health and safety" and to keep up morale for a civilian blitzkrieg of production.

In its December and January issues the RECORD dramatized this situation, and today the FWA is confirming the RECORD's surveys and forecasts by approving scores of PWA projects to provide war-workers with much needed community facilities. These PWA structures are not going to be elaborate affairs. Every one of them is going to be designed and built in conformity with the increasingly strict limitations imposed by scarce materials. But to the architectural and engineering professions, trained in all the arts of technical ingenuity, that ought to be a challenge!

So in May we are going to discuss these limitations and report the various ways in which they may affect the type, design, construction and equipment of Community War Buildings. To balance these technical stories—which will include another of the RECORD's famous Building Type Studies and more Time-Saver Standards—we are including a photographic presentation of community buildings designed for a wide variety of uses to suggest the range of opportunities.

(continued on page 7)
"Not you, Bulwinkle, you’d be a round peg in a square hole!"

In planning York industrial air conditioning, you never have to take a chance in deciding which unit should do what.

So comprehensive is the range of York equipment that whether the job is a huge blackout plant (such as those York has air conditioned for Ford, Studebaker, Douglas, Consolidated Aircraft), or extreme condition test chambers (such as those for the U.S. Army, Wright Aeronautical and others), you always have on hand a square peg for a square hole, a round one for a round hole.

For example, you may select either a chilled water or direct expansion system, reciprocating or turbo compressors, from \( \frac{1}{4} \) ton to 1200 tons capacity, for steam turbine, electric motor or gas engine drive; Freon 12 or ammonia refrigerant, air-cooled or water-cooled condensers.

If there are places in your client’s plant where process air conditioning or comfort air conditioning may step up production, cut rejects, we shall be glad to place York experience and research facilities at your service. York Ice Machinery Corporation, York, Penna.

**KEEP'EM FLYING!**
Speaking of standards, one could dream away a lot of hours imagining what might be the future of building construction methods as a result of this current pressure for material conservation. At the very least we are in for an era of all-out technical simplification. The Bureau of Standards report on plumbing is a case in point—a case discussed in former RECORD issues.

The same sort of thing is developing in other phases of building. Take heating for example. Because of metal scarcities, heating plants must be smaller. Less heat requires more insulation to maintain heating standards. And presto!—there’s a new construction must for designers to conjure with.

Carried to an ultimate conclusion, all our technical habits may be in for a complete revolution. Many believe that a completely new construction technique is just around the corner. We know about one chap, for example, who is working out a way to heat a house without any heating plant: you turn on both heat and cold by flicking a switch!

Who knows—maybe we’ll all soon be living and working in buildings in which everything is controlled by push buttons. And instead of talking about the architectural profession, these pages may have to chronicle the doings of high-gear production organizations with anonymous designers as preoccupied with line assemblies, pressure points and efficiency units as architects used to be with form, function and priorities!

But that is a long way off, to judge by some of the problems that still beset us in the housing field.

Proof that we still don’t know all the answers to current housing questions is offered by Elisabeth Coit, AIA, in the Building Type Study that begins on page 71. Developed as result of an extensive field survey, this article suggests that we are still quite a distance from the millennium where mundane matters of living will smoothly fulfill theories of housing. Tenants, Miss Coit found, do not always use their living spaces as design-ers think they should! And in reporting what such unobliging people do and do not want, the author gives sage counsel and practical suggestions for the future benefit of all concerned.

Some such survey could well have preceded PBA’s construction of its 800-house project in Portsmouth, N. H. As you may recall—from the Portsmouth "case study" that the RECORD published in December—this is the largest of several new housing developments built to shelter part of the 7,000 new industrial workers that have recently swelled this New England town’s wartime population.

But only 100 families have been sufficiently attracted by PBA’s good intentions to move into its new houses. And the remaining 700 units are standing forlorn and empty as a barracks-like point of emphasis to New England apathy, stubbornness, pride or you-name-it.

PBA officials seem puzzled about the situation. They may be pondering the fact that the project was never popular with the town fathers, who had earmarked the site for future industrial expansion. There was also some small ruckus between town and Government officials regarding installation of public utilities for the project. We understand that even today the 100 families are enjoying their 800-house estate without benefit of police protection or garbage disposal service!

We almost sawed the limb from under us last month in the lead story "On to Washington." Just as it was being completed news broke of the long-anticipated housing reorganization. In the flurry of last minute developments, we apparently didn’t quite clarify the duties of the AIA’s Washington minute-man Edmund Purves.

On page 39 we said "Many Government agencies consult this file and confer with Edmund Purves in compiling lists for selecting local architects." Because some might misinterpret this sentence we hasten to say that Ed Purves has nothing to do with recommending any architects—local or otherwise—for work by any Government agency. When he is asked for information concerning architects, he impartially passes on to any inquiring agency the questionnaire data which architects themselves have furnished him.

And that’s that—both for Ed Purves and the RECORD!
A Great New Advance in Fluorescent Lighting

...THE MERCURY BOMB!

INTO every fluorescent lamp, just before completion, goes a little blob of mercury. Not too little, because the lamp needs a minimum amount to operate efficiently; not too much, because then, in time, the excess deposits itself on the surface in the form of dark streaks and splotches.

To make sure the quantity is accurately measured, Hygrade engineers have produced the "mercury bomb" — a tiny metal container of mercury, weighed to the thousandth of a gram. Heated to the bursting point before the lamp is sealed, the "bomb" explodes — releasing mercury vapor in the precise volume required for best results.

But the "mercury bomb" is only one of the reasons for the superiority of Hygrade Lamps.

They give more light — a greater output of lumens per watt.

They have a smoother coating texture — something you'll readily observe if you compare them with other lamps.

You can see, too, that they're more uniform in color — each lamp producing the same color of light.

And they last longer — a fact Hygrade users well know.

Good as these lamps are in any fixture they're even better when used in Hygrade "Miralume" fixtures — a complete "package" that's unit-engineered — lamps, fixtures and accessories made for each other by Hygrade — with every part performing in harmony with the rest.

So when you recommend Hygrade Fluorescent Lighting, you're not only doing right by your client — you're building your own name as well. If you haven't yet received our free file-size kit — containing catalogs, prices and complete technical specifications on all Hygrade Fluorescent Lighting Equipment — write today to Dept. AR 4.

WHERE FUEL IS VITAL TO DEFENSE, HOFFMAN TRAPS CONSERVE IT

At sea, a vessel's range of usefulness is bounded strictly by its fuel supply. Full value from every ounce of steam, in these days, is a positive demand!

Any heating plant is sparing of fuel in direct proportion to the efficiency of its control equipment. That the Navy plane carrier, U. S. S. Saratoga, far-ranging unit of our first defense line, is equipped with Hoffman Steam Traps is a clue to anyone planning a new or modernized heating plant. For on land or sea, Hoffman Specialties assure full utilization of steam and conservation of precious fuel.

For a quarter century, heating engineers have specified Hoffman Products... because every refinement of design which adds to performance is included in them—at no greater cost!

Hoffman Valves, Traps and Pumps are thus a quality, time-tested line of products. Apply any standard of measurement you choose... efficient operation... dependability... service life... or what experienced heating men say of them, and you will have shown yourself why Hoffman is the choice in so many installations.

The Hoffman line is complete. From this single source you can satisfy every specialty requirement of a steam heating system... and receive that extra guarantee which comes only with undivided responsibility for satisfactory operation.

Write for information on Hoffman Controlled Steam or Hot Water Heating Systems and for counsel on heating problems. Hoffman Specialty Company, Dept. AR-4, Indianapolis, Ind.
Peaslee Urges Ban on Publication of Confusing ARP Information

A WAR measure to prevent the circulation of confusing misinformation on air raid protection methods is urged by Howard W. Peaslee, chairman of the Committee on Civilian Protection of AIA, who believes that architects and engineers should speak out frankly against published findings based on unsound assumptions.

"Why should architects and engineers defer to normal professional courtesies which stand in the way of frank speaking when loss of life may be the consequence?" Mr. Peaslee asked recently. "We haven't time to let errors find their ways to the surface. Such-and-such a book may be referred to as the 'bible' of air raid protection, but if a recognized authority knows that certain of its findings are based on assumptions that cannot be substantiated, such knowledge should be brought into the open."

"We need not discourage initiative or the desire to help," he added, "but we dare not permit errors to appear and remain uncorrected. We would not favor hard and fast technical censorship, but we could well support a system of clearance by which we could get the facts straight and clear on both sides of debatable questions. The technical professions entail a sweeping responsibility for life and death."

Post-war use for shelters

Mr. Peaslee's contention is that air raid shelters should be adaptable to use when the war is over. "With current experiments demonstrating the terrific effect of confined explosions," he commented, "it would seem that any discussion of underground shelters or basement retreats should be amply qualified by counterpoints which call attention to variables in soil conditions, to the need of extra heavy walls, to dangers from steam mains, oil storage tanks, electric circuits and sewer lines, and possible gas attacks."

Serious attention should be given to the erection in some cities of garagelike tanks, electric circuits and sewer lines, and possible gas attacks. Type shelters above ground, amortized by post-war use, this architect feels. Refuges in the mountains, for evacuated populations, could be made peace-time summer camps, he suggests.

"The cost of rustic camp construction would be but a fraction of the cost of buildings designed against fragments, blast and fire. This is not a local problem nor is it one to be solved by traffic expeditors. It may be possible to evacuate expeditiously, but to receive and absorb large sections of the population is a major problem. State and interstate planning commissions should be at work on this problem and the most highly qualified planners brought into the picture."

Another category of shelters with post-war possibilities, offered by Mr. Peaslee, are shelters so designed, located and constructed that they form the ground floors of future houses.

ARP Course

DESIGN of bomb-resistant shelters, provision of protection for industrial equipment and design of industrial camouflage installations are subjects of a current lecture series provided free of charge for practicing architects and engineers at Pratt Institute, Brooklyn, N. Y. The roster of lecturers is headed by James C. Boudev, director of the Pratt Art School and a former Air Corps officer, who instituted courses in aerial photography and protective obscuration at Pratt, now an information center on the subject. The series, sponsored by the United States Office of Education, opens April 6.

* * *

A LIMITED number of students will be accepted by the Department of Architecture, College of Fine Arts, Syracuse University, for a six-week Summer session to begin July 6. Courses to be offered include Elements of Design and Theory of Architecture, Introduction to Construction, Materials of Construction, Freehand Drawing, Architectural Design, and Shelter.

Awards

ALUMNI Association of the American Academy in Rome has announced the winners of its 16th annual collaborative competition for students of architecture, landscape architecture, painting and sculpture. The problem was "A Railroad Station and Bus Terminal for Appleton, Wis. First prize of $200 went to a team from Cranbrook Academy of Art comprising Ann Sirotenko and Stephen S. Page, who collaborated as architect and landscape architect, Jack Steele, painter, and Winslow Eaves, sculptor. The $100 (continued on page 12)
In defense plants all over the country, Lupton Metal Windows and Doors provide the abundant daylighting and controlled ventilation so important in all-out production. Flexible in design, they meet every requirement of defense construction. Strong, trouble-free, weather-tight. And back of the Lupton line is an experience of more than thirty years in modern metal window design.

Webster Moderator System Gives Continuous, Even Heat in New 10-Story Hospital Building

MODERATE COST OF HEATING

Problem of Steam Distribution and Control Solved for Each of Three Hospital Units

Wilmington, Del.—The heating of the new Delaware Hospital presented a problem in steam distribution and control that led to the selection of a Webster Moderator System of Steam Heating for each of the three units in the beautiful U-shaped building. Steam is produced in our oil-fired boilers. Webster steam consumption to a minimum so that the cost of this luxury heat is surprisingly low."

Unit No. 1, New Delaware Hospital, Wilmington, Delaware

Unit No. 1 of the new Delaware Hospital was occupied in 1940. It includes a 4-floor private pavilion, operating and delivery rooms, x-ray laboratory, physio-therapy department, offices and dining rooms.

Unit No. 2 of the new Delaware Hospital was occupied in 1941. It includes a 4-floor ward and clinic pavilion, emergency receiving department, business office, clinics, some private rooms, the central supply station and interns' quarters.

Unit No. 3 is the new Nurses' Home, a 6-story building, ready for occupancy in 1943.

There is a total of 17,695 sq. ft. of installed direct radiation. In Unit No. 1, 14,045 sq. ft., in Unit No. 2, and 8,500 sq. ft. in Unit No. 3.

Massena & duPont, Wilmington architects, designed the building. Jaros, Baum & Bolles, of New York, served as Consulting Engineers, designing the mechanical installation. Turner Construction Co., of Philadelphia, was the general contractor, and Benjamin F. Shaw Co., of Wilmington, made the heating and piping installation.

WITH RECORD READERS

(continued from page 10)

second award was taken by William D. Slaye, architect, John Wright, painter, and Robert Spurgeon, sculptor, from the Pennsylvania Academy of Fine Arts and the University of Pennsylvania.

Honorable mentions include: Howard Carn, architect, Mary Lou Jones, landscape architect, Tony Vaiksnoras, sculptor, and Dean Ellis, painter, from the Cleveland School of Architecture and Cleveland School of Art; and George Felton, architect, Jean Craig, painter, and Stephanie Barys, sculptor, from the Pennsylvania Academy of Fine Arts and University of Pennsylvania.

To students from Iowa State College went first, second and third prizes in the Annual Students' Bridge Design Competition of the American Institute of Steel Construction. First prize of $200 was awarded to Everett Throbbroger, second prize of $100 to R. Kenneth Kendall, and third prize, $50, to Carlton Mueller. A total of 59 students submitted solutions to the problem—a steel bridge to carry a highway over a river.

Competition Deferred

IN THE INTEREST of conserving critical materials, the Airport Authority of Fitchburg, Mass., has acceded to the request of WPB and deferred for the present construction of the proposed Administration Building at the Fitchburg Airport. Competition for the building was announced in the March issue of the RECORD.

Competition

The Liturgical Arts Society has announced to 76 American sculptors that on the basis of photographs of their work submitted last Fall they have been selected to compete for a statue of Christ. The statue is to form the main element in the architectural design of the facade of the new building, now completed, which will house the national headquarters of the National Catholic Welfare Conference in Washington, D. C. The final statue will be of bronze, 15 feet high. In addition to a prize of $1,500, one of $500 and five additional prizes of $200 each, the Society offers the winner a contract to make a finished full-size model of the statue, for which he will receive $6,000. Judges include: Frederick Vernon Murphy, architect of the building, Barry Byrne, architect, Lee Lawrie, C. Paul Jenneswini, Gaetano Cecere, sculptors.

American Institute of Steel Construction, in accordance with its custom of 14 years, will award a plaque to the most beautiful steel bridges built during 1941. Designs which a jury of architects and engineers consider the most aesthetic solutions among monumental, medium-sized bridges, bridges of short span and movable bridges will be selected from photographs and, builders and owners of such structures are asked to submit photographs not later than May 1 to the American Institute of Steel Construction, 101 Park Avenue, New York City.

Fellowships

University of Pennsylvania School of Fine Arts announces the Theophilus Parsons Chandler Fellowships in Architecture and the Joseph V. Horn Fellowship in Architecture—to provide advanced study for graduates of approved architectural schools and the Albert Kahn Scholarship in Industrial Architecture, a part-tuition graduate or undergraduate award. Applications must be made by letter to the Chairman of the Committee on Prizes and Scholarships by April 15.

Personal

EUGENE WESTON of Los Angeles has been elected a director of AIA succeeding Gordon B. Kaufmann, who resigned. Mr. Weston will direct the work of the Institute Chapters in Arizona, California, Nevada and Hawaii.

JOHN D. ROCKEFELLER, JR., has received the second Medal of Honor for City Planning, awarded jointly by

(continued on page 14)
BIRTH OF AN ENEMY

Today, even the smallest spark is a potential enemy. For, today, once fire is born in any building, it requires but a few minutes' headway to destroy irreplaceable materials or equipment — literally to sabotage defense effort.

That is why it is all-important to equip your buildings with sprinkler fire protection systems that automatically stop fire at its source. Fire underwriters the country over can testify that no system will accomplish this more positively and reliably than a Grinnell Automatic Sprinkler System!

Make this vital fire protection a blended part of your original designs. Over 50 years of intensive fire protection engineering enables Grinnell engineers to assist you with complete understanding of both your mechanical and your decorative requirements. Grinnell Systems have been installed in properties totaling over fifty billion dollars in value.

Phone the Grinnell office near you for advisory interview. Grinnell Company, Inc., Executive Offices, Providence, R. I. Branch offices in all principal cities.

GRINNELL Automatic Sprinkler Fire Protection

A BLENDED PART OF YOUR BUILDING'S DESIGN
Adequate Wiring
Provide Save Specify
Wiring War Materials These Hazard Wires

FOR WET LOCATION WIRING... specify Hazard Watertite, Type RW. Its submarine rubber insulation requires no lead sheath protection and saves this vital material. Meets all code requirements. Available in all sizes. Ask for Bulletin 168A.

FOR REWIRING... specify Hazard small diameter wire, Type SN. It permits more and larger capacity wires to be installed in original conduit, eliminating the need for new conduit and thus save steel. Type SN is the only small diameter wire available in sizes up to 4/0. Ask for Bulletin 200.

FOR NEW WIRING... for the duration use Type R—(Code Grade) instead of the higher grades, Types RP and RH, rubber insulated wire. It contains less rubber, thereby conserving this precious material. Hazacode Wire meets all requirements of the National Board of Fire Underwriters for general wiring. Available in all sizes.

All of these wires are fully approved by the National Electrical Code and are carefully built to deliver the continuous, trouble-free operation you and your clients want. Call on our experienced engineering department for assistance in planning jobs these days. It is there to help without obligation.

the New York and Brooklyn Chapters of AIA, New York Chapter of the American Society of Landscape Architects and the Metropolitan Section of the American Society of Civil Engineers. Presenting the medal, on which was inscribed "For distinguished contribution to the Plan of the City of New York," Harold M. Lewis of ASCE cited specific projects in the metropolitan area which Mr. Rockefeller had "initiated or made possible." They were: Palisades Interstate Park, Fort Tryon Park, The Cloisters, Riverside Church, International House, Rockefeller Center and "several model housing developments."

* * *

JOHN Schofield has been appointed Chief Architect of the Canadian National Railways System, with headquarters in Montreal. Mr. Schofield has spent 35 years with Canadian National Railways. He was made Architect in 1923, and with formation of Trans-Canada Air Lines in 1937 was also named architect for that organization. In addition to the railway stations, erection shops and other quarters to his credit, Mr. Schofield designed the Charlottetown, P. E. I. Hotel, Jasper Park Lodge, and Minaki Lodge in the Lake of the Woods district.

Died

CLARENCE HOWARD BLACKALL, 85, in Boston. Credited with erecting the first steel frame building in Boston, Mr. Blackall specialized in theaters, hotels, office buildings. He designed Tremont Temple and the Copley Plaza. A Fellow of AIA, he was a founder and first president of the Boston Architectural Club.

Exhibitions

WARTIME HOUSING is the subject of an exhibition which will open April 22 at the Museum of Modern Art, New York City, with the collaboration of the National Committee on the Housing Emergency. The exhibition, to run through July 19, is being planned to show graphically and dramatically "why adequate housing, designed by the foremost modern architects, is necessary to help America win the war."

Medal to Kahn

For the most distinguished work in defense plant design which he and his architect-engineer organization is carrying out throughout the country, Albert Kahn of Detroit has been awarded the Medal of the Philadelphia Chapter of AIA. Much of Mr. Kahn's work has appeared in the RECORD: one of his war plants on pages 44 and 45 last month.

Change of Address

OTTO H. LANG, pioneer architect of Dallas, Tex., announces the retirement from business of his firm, Lang & Mitchell, and his association in an advisory and consulting capacity with Grayson Gill, local architect and engineer. Plan files and good will of Lang & Mitchell have been transferred to Mr. Gill. Mr. Lang established his partnership with Frank O. Mitchell, now retired, in 1905. The firm designed many of the large buildings throughout the state and more than 27 office buildings on the Dallas skyline.

Correction

CARTER-HALLS-ALDINGER, builders of the all-wood Canadian aircraft plant described in the January RECORD (page 74) have called our attention to several points which need clarification:

1. Chief engineer and designer on the job was R. C. Pybus. Mr. Coville acted as consulting architect. 2. The trusses were prefabricated before treated, using a total of 72 wood trusses and 12 steel trusses. 3. The building was painted with one coat of pigment-tinted synthetic resin sealer by brush and one coat of fire-retardent synthetic resinous-bound plastic paint by brush. The third coat was not applied at the time of the fire mentioned in the story.

4. Treated plywood contributed materially to retarding the fire spread.
What steels to use in defense housing

...to reduce costs...to add durability

Many types of steel are being made that actually double, triple, or quadruple the life of products made from them. Others permit lighter construction of sinks, lavatories, bathtubs, furnaces, and thus save much needed iron ore.

Properties and advantages of various U·S·S Steels

1. U·S·S Copper Steel—2 to 3 times the corrosion resistance of plain steel. Low cost. Can be used black or galvanized for gutters, downspouts, valleys, flashings, duct work, coal chutes, garbage receptacles.

2. U·S·S Copper Steel for furnaces—Saves considerable metal, has high resistance to smoke corrosion, maintains a tight fire box, gives a long, satisfactory service. Low cost.

3. U·S·S Copper Steel for hot water tanks—Galvanized or plain steel, lined with cement. The cement-lined tank is rapidly replacing alloyed metals now difficult to get.

4. U·S·S Paintbond—A galvanized Bonderized Steel. Permits immediate painting. Paint holds tighter, lasts longer. Highly recommended for all outdoor uses, such as gutters, downspouts, complete metal buildings for army camps, airplane hangars, air-raid shelters, industrial plants.

In the South and West, U·S·S Dul-Kote with similar properties to Paintbond is available. Only the method of manufacture is different.

5. U·S·S Vitrenamel—For formed bathtubs, lavatories, sinks. Takes a superior porcelain finish, decreases the amount of metal in the fixtures, makes dimensions more uniform for mass housing projects, equals the life of other porcelain enamel. Lower cost.

NEWS FROM WASHINGTON

By RAYMOND R. Dickey

HERBERT EMMERICH APPOINTED NEW HEAD OF FPHA

The primary topic of conversation in Washington housing circles these days is what the new National Housing Agency will look like. It is too early yet to tell what the eventual setup of the National Housing Agency will be. However, Administrator Blandford has said privately that he will not make blanket changes in personnel or policy immediately. His technique in filling any positions will probably be to infiltrate the old organizations which NHA consolidates with hand-picked men after careful study.

So far the major move in this direction has been placing Herbert Emmerich as head of the Public Housing Authority, replacing Acting Commissioner Leon Keyserling, who went to the post of General Counsel for the NHA.

Mr. Emmerich has a long career in public administration and housing. In the 1920's Mr. Emmerich was a pioneer in the development of limited dividend corporation projects in the New York area. During the earlier days of the Roosevelt administration, he was Executive Assistant to the head of the old Farm Credit Administration. Just prior to his going to the WPB as Executive Secretary, from which job he was appointed by Mr. Blandford as Federal Public Housing Authority Commissioner, Mr. Emmerich was Assistant Director of the Public Administration Clearing House. In that position he was responsible for studies and surveys in public administration, with particular emphasis on the Federal picture.

As yet no public statement as to his policy has been forthcoming from the new commissioner. However, it is safe to say that he was promised a fairly free hand by the National Housing Agency Administrator, else he would not have left the War Production Board. Donald Nelson, WPB chief, regarded Emmerich very highly and did not want to let him go until he was assured that his position as new commissioner would benefit the war effort more than his job as top administrative officer in WPB.

Straws in the wind indicate that Mr. Blandford's next major policy move will probably be creation of an overall technical division that would cut out the overlapping of the technical divisions of the old FHA, PBA, FWA, etc., which are still functioning. If this is done there is a strong possibility that A.C. Shire, former technical director of USHA, will take a policy-making post in the new NHA. Mr. Shire and Mr. Emmerich have seen eye-to-eye on a number of occasions and it is believed in housing agency circles here that if such a move is made Mr. Emmerich may push for Mr. Shire's appointment.

The elevation of Mr. Emmerich will probably see the demountable and prefabrication picture develop toward an increased use of this type of housing. Leon Keyserling, former Acting Commissioner of the FPHA, was not a strong advocate of the prefabrication idea in housing. A former secretary to Senator Robert Wagner of New York, Mr. Keyserling apparently favored the more permanent type of dwelling which, though sometimes slower in erection, would possibly have a greater resale value after the war.

Army's new architect-engineer contract

Ever since a scathing denunciation by the Truman Committee of excessive costs in cantonment and other construction done on a cost-plus-fixed-fee basis, the War Department has been trying to reestablish a competitive bidding basis on war construction. Its latest attempt has been to break up the bigger jobs through the medium of "architect-engineer-manager contracts." The War Department has recently started to use this type of contract on practically all of its big construction jobs for depots, munitions and plants, almost to the exclusion of every other type.

Here's the way it works: The War Department casts around for a firm capable of doing the architectural, engineering and construction works. In the majority of instances the Department has been unable to find such firms in sufficient numbers to carry out all of its needed construction. Architect-engineering firms, therefore, are now being asked by the War Department and given every encouragement to make a formal or informal merger with contractors so that they can bid on A-E-M contracts.

Reasoning behind form

The basis of the reasoning behind the new form of contract is that the Department feels costs can be estimated to a sufficient degree of accuracy on about 50 per cent of the work on any contract, no matter how big. That being true, it feels that a contractor shouldn't be getting a fixed fee for this work. So it pays a fixed fee only on that part of the job where costs cannot be estimated accurately and where, because of that fact, a contractor might come out very much in the red on a lump sum contract. Thus, under the A-E-M contract, as soon as it is awarded the architect-engineering firm handling it starts in on the difficult planning and designing part of the job immediately on a fee basis. Other sections of the firm work on other parts of the job in a piece-by-piece fashion. When any piece is completed they turn blueprints on it over to the Corps of Engineers, which immediately awards a separate lump-sum contract on each portion as it is completed. A contractor getting one of these "part-project" awards must work under the supervision and direction of the firm handling the A-E-M contract. This, in effect, makes the smaller firm a sub-contractor. Naturally, since it doesn't do all the work, the A-E-M firm gets a smaller fee.

With the increase in the use of this type of contract, the work should be spread among considerably more firms and give more people an opportunity to get in on war construction.

More Production...Less Fatigue...Greater Precision...Less Rejects...Fewer Accidents...and Highest Employee Morale DEPEND ON GEARING THE LIGHTING TO WAR PRODUCTION!

This new manual tells you how Benjamin Lighting Specifications can be applied today...under today's conditions...to meet today's production problems...today's need for greater utilization of existing floor space...today's problems of installation!

**An Up-To-Minute Lighting Guide**

Today, as never before, management must utilize lighting as a production tool. The lighting problems involved are many, but whatever they are and however they may be complicated by the problems of cost, installation, deadlines and the unavailability of certain types of lighting units, there is a way to solve each and every one of them.

**How This Manual Will Help**

Purposes of this manual is to provide you with up-to-the-minute information on the elements involved in securing Better Lighting for War Production...to show you how to analyze your lighting problems...and to provide you with a practical guide to their solution.

**20 Ready-To-Use Solutions**

In this manual are twenty typical lighting problem solutions based upon Benjamin Specifications for Productive Lighting in War Industries! These twenty problems are illustrative of the problems most frequently encountered by the Benjamin Engineering Department. The specifications given for their solution are typical of those which Benjamin Engineers are employing every day to solve similar problems on a thousand industrial war fronts...from the hazardous locations of a powder plant...to the precision inspection line of an instrument factory.

**The Lighting Manual for Everyone!**

This manual is written for the busy industrial executive, engineer, foreman, architect and all others concerned with the planning, purchasing and installation of industrial lighting equipment in plants engaged in essential war or civilian production. Your copy is ready for you! Just mail the coupon or address the Benjamin Electric Mfg. Co., Dept. B1, Des Plaines, Illinois.

**This Manual Brings You Up-to-Date Data on the Use of Lighting as a Production Tool!**

Contains pages on how to approach the lighting problem, how to analyze the seeing task, how to analyze the factors involved in proper equipment selection...also how to determine the proper amount of footcandles with special up-to-minute footcandle recommendation tables as guides.

**Here are a few of the twenty problem solutions given in this Manual**

- How to Provide Efficient High Level Fluorescent Lighting for Large Areas.
- Fluorescent Lighting for Areas Requiring Moderately High Intensities.
- Glasssteel Diffuser General Lighting of Soft, Well Diffused, Glareless Quality.
- General Overhead Lighting for High Bay Erecting Shops, Steel Mills, Foundries.
- High Level Local Lighting over Extended Areas of Inspection or Assembly Benches.
- Local Lighting of Spray Booths.
- Protecting Material in Open Vats from Contamination in Case of Broken Lamps.
- Safe Lighting in Atmospheres Containing Highly Flammable and Explosive Vapors.
- Lighting in Locations with Deteriorating Effects of Steam Vapors and Moisture.

**To Reserve Your Copy Mail This Coupon Today**

Please reserve and send me, upon publication May 1, without cost or obligation of any kind, a copy of Benjamin Specifications for Productive Lighting in War Plants.

Cost-plus contractors

The Comptroller-General on March 17 made a ruling which may seriously affect many building contractors working on Government jobs. In many cases it has been the practice for contractors working on a cost-plus-fixed-fee basis to subcontract certain technical work on a cost-plus-a-percentage-of-cost basis. The Comptroller-General has just ruled that when a prime contractor contracts on a cost-plus-percentage-of-cost basis he is violating Federal statutes which prohibit such contracts (Act of July 2, 1940) and may not be reimbursed for any funds he has paid to his subcontractor.

As an example, assume that a prime contractor on a building project subcontracted the site improvement work to a landscaping firm on a cost-plus-percentage-of-cost basis. Assume further that the landscaping firm had an actual loss of $20,000 for site improvement and that it was working on a basis of 10 per cent of the cost. In other words, their fee would be $2,000, making a total of $22,000 for site improvement work. Under the Comptroller-General's ruling the Government could not reimburse the prime contractor this $22,000 because it was done on a cost-plus-percentage-of-cost basis—despite the fact that such site improvement was necessary and was definitely a cost involved in constructing the entire project.

Cuts in building materials

Because of L’Affaire Guthrie there’s a lot of agitation which looks as if it could be successful in sharply cutting production of building materials to go into non-defense housing. Latest furor has been the alleged action of the Plumbing and Heating Branch of WPB in failing to restrict production in the industries under its jurisdiction and instead granting wide-spread priority ratings to oil burner and coal stoker manufacturers for the first quarter of 1942 equal to about one-half of their normal production. W. Walter Timmis, head of the Plumbing Branch, has defended his action by saying that due to priorities at the raw materials level the industry has been curtailed to such a degree that priority ratings permitting manufacturers to obtain necessary supplies have only been sufficient to equip defense housing projects. Despite this, there are several orders now in the works which will sharply curtail plumbing and heating supplies.

On a broader scale issuance of the construction “freezing” order which has been pending for two or three months is again reported to be imminent. John L. Haynes, chief of the building materials branch of WPB, has indicated that the new order will not be as drastic as most everybody has believed. Apparently the reason is that as supplies get picked off there won’t be much need for an order prohibiting non-essential construction.

In essence, all the order will do will be to formalize a system now being used informally, which forbids priority assistance on all non-essential construction, including private dwellings outside defense housing areas. The new order will permit necessary maintenance and repairs to be made and will give a special preference to farmers who need materials for homes and barns. Under the order essential public utilities will continue to get sufficiently high allotments of materials to maintain or even increase their necessary services.

Public Works Reserve

The Public Works Reserve bill, which was voted down in the House, may be revived in the Senate. A lot of pressure is being put on senators now by the National Resources Planning Board on the theory that Public Works Reserve planning and operations are necessary to cushion a postwar economic shock. The Republican senatorial contingent will probably fight the measure almost en bloc. An argument that is being used by proponents to get it through is that it is merely an authorization bill—that is, a bill that would set up a division in one of the existing agencies. The proponents argue that no money would be appropriated by the bill, that is, it doesn’t cost anything. Of course, in a majority of instances, after a new division in an agency has been set up, the appropriation bill follows close on its heels. So the real fight will be whether the authorization gets through. If it does, the appropriation is almost sure to follow.

Priorities and Defense Housing Critical List Revision

The new “Defense Housing Critical List,” effective February 24, is now available. The list is based upon the critical positions, at the time of issuance, of materials essential to the construction, allocation and equipment of housing, and is subject to revision by the Director of Industry Operations whenever warranted by a change in the critical position of the materials included. It is very wide in its scope and should be in the files of every architect, engineer and contractor who is intending to do Government business. To obtain it, write to the War Production Board, Division of Industry Operations, Housing Priorities Branch, and ask for the “Defense Housing Critical List, Effective February 24, 1942” and any later revisions.

Along this same line, the WPB recently granted priority assistance on an additional 350,000 defense housing units, of which 150,000 are to be Federally built and 200,000 privately financed. This doubles the original program announced last September 19. Preference ratings to enable contractors to get materials for this program will be assigned by WPB and any houses built with such priority assistance will be limited to a $50 monthly rental and a maximum sale price of $6,000. At least 100,000 of the privately financed dwellings will be for rent. The cost of the units will not exceed 20 per cent of the workers’ income on the basis of their estimated annual earnings. Defense workers will get a “priority” on the units for at least 30 days after completion. The rental set on the houses must be kept in effect for at least one year. There are various provisions made for credit rents against an option to buy.

Subcontractors commonly making minor changes in material which they install in defense housing projects are now allowed to extend ratings under the P-55 amended order, but suppliers who change the material they furnish (continued on page 22)
From all over the world, frightened, helpless eyes peer through the mists of war toward American smokestacks. Will children die of hunger? Will rifles in men's hands have bullets? Will the air above them swarm with friendly planes . . . or hostile? It's up to American industry.

Because Koppers cuts across the whole American industrial scene like a common denominator, every new job for American industry puts fresh responsibilities on Koppers and some Koppers product.

Ships gliding down the ways with the hopes of civilization clinging about their bows, have been speeded into the service with bronze propellers from Koppers foundries. The plane soaring protectively above you probably has Koppers piston rings. The carriages of the anti-aircraft guns that rumble comfortably past on their way to the coast were possibly built by Koppers.

Beneath all these, at the very roots of almost every one of the herculean tasks American industry is performing, is that great storehouse of energy—coal.

Koppers is mining vast quantities of coal for fuel. Koppers coke ovens are transforming much of that coal into coke, gas and the flood of other products which eventually mean munitions, drugs, plastics, synthetics, rubber and other indispensables.

With the lives of boys from your home and our homes at stake . . . and the hopes of engulfed nations in the balance . . . every word from an American factory becomes the world's greatest news story. It's up to American industry. Koppers Company, Pittsburgh, Pa.

C. Howard Crane, Noted Architect, Gives This Authentic Answer On The Problem Of War Plant Design.

Architect Crane—who designs aircraft, munitions and other industrial plants for the British Government—recently arrived in this country for a brief visit. To American architects he brings the latest and most authoritative data on war plant design to come from the embattled British Isles. His remarks are of vital importance to every architect engaged in designing plants for wartime production—and after.

Architect Crane says: “Very few windowless buildings are being constructed. We have found them too expensive to build and operate. We keep in mind that such construction, for one thing, necessitates air ducts, fans and other mechanical equipment requiring metals that are more urgently needed for other defense purposes.

“Solid walls are particularly dangerous under bombing conditions and insofar as blackout is concerned, we have found a much more efficient method of construction.

“First of all, exterior walls to a height of eight feet are of blast-wall design, 14” thick. Above that height, regular steel sash is used in the walls. Temporarily, about one third of the sash area is being glazed, the remainder of the panes being filled in with asbestos, so that after the war these panels can be removed and glazed, and the building used in a normal manner. Too, in case of bombing, such walls are more quickly repaired and, of course, less costly.

“The most effective blackout method is accomplished by painting the glass in fixed sash wall areas black. Windows, to assure light and ventilation during the day, are not painted but are provided with black curtains.

“There is a visible trend here to a type of building we feel sure is the best under all circumstances—the modern skeleton frame, either steel or concrete, with great windowed areas. While war is a horrible thing, it should serve to create a world of beautiful, completely utilitarian types of buildings everywhere.”

Libbey-Owens-Ford Glass Company, 1526 Nicholas Building, Toledo, Ohio.

Quality Flat Glass Products
Copper and brass are not only essential metals for armament and munitions, but they are also extremely scarce.

Practically 100% of our production in cooper and brass, which formerly was used in the manufacture of STREAMLINE copper pipe and fittings and other non-ferrous products, is now used for Army and Navy requirements.

We Americans, no matter in what walk of life, realize that armament work must come first. IT MUST TAKE PRECEDENCE OVER EVERYTHING ELSE IF FOR NO OTHER REASON THAN THIS—THAT WE MAY PRESERVE FOR THE FUTURE THOSE VERY BUSINESSES OF WHICH WE ARE NOW TEMPORARILY DEPRIVED. If we fail, everything is lost—our businesses, our freedoms and our democratic way of life.

We have many jobs to do; let’s do the first one FIRST!

in any way cannot extend the rating under the order. Builders, subcontractors or suppliers, if they want to use the preference rating on defense housing material, should serve a copy of the order upon each subcontractor or supplier with whom they have placed contracts or purchase orders and endorse each purchase order or contract with their certifications. Builders or subcontractors can only extend the rating by having such extension countersigned by an FHA official. Suppliers entitled to extend the rating may do so without countersignature. It is important to know that suppliers and subcontractors may extend ratings even after the expiration date of a particular priorities order under which the ratings were assigned if the ratings, being extended, were applied by the builder prior to the expiration date.

On P-19-h builders may extend preference ratings by simple endorsement on their purchase orders containing the serial number of the project. Suppliers may extend preference ratings under P-19-h by the same procedure, but they must first execute and file a special acceptance with WPB. Only one filing of the acceptance is necessary; afterwards the supplier may extend any rating assigned by P-19-h regardless of the serial number. Reference to the Priorities Critical List has been eliminated, but generally only those materials which will be physically incorporated in the rated project may be secured by use of the assigned ratings under P-19-h.

Where wholesaler fits in

One of the biggest unsolved problems in priorities has been the place where the distributor, wholesaler or jobber could fit into the priorities system. Up until recently they haven't been able to get a priority because since their products were going into hands of retailers this made it impossible to show any connection between the distribution of small units to retailers and the war effort.

Now a plan has been devised that gives them a definite status in the system. Application for the new distributors’ plan, which will go into effect shortly after April 1, will be made on the new form, PD-1X, which requires information regarding sales and inventories on the type of material for which ratings are being sought, percentage of materials being shipped out of stock on rated orders during the preceding month, and other information as to the supply picture. The plan will be applicable in the building supply business only for the following type of supplies: builders’ hardware, construction, plumbing and heating, refrigeration, restaurant equipment, welding and cutting.

The new form won’t cover all situations in which distributors may find themselves. For example, when a wholesale house fills an order from a retailer calling for a substantial amount of material of the same type, he should demand a rating from the retailer and extend that rating to his producer instead of applying for a new rating.

How it would work

Generally, here’s how PD-1X would work: A distributor of hardware supplies to retailers in a defense housing critical area may receive a large number of small orders for hammers and other hand tools which will be used by workmen engaged in defense housing construction. But it would be difficult or impossible for the retailer to furnish him with a priority rating on each order. In such cases a distributor could apply for priority assistance to replenish his inventory.

As material gets shorter and shorter, the jobs of the architect, engineer and contractor get more and more difficult. All types of metal are becoming increasingly scarce. A special bulletin which the Army developed for advice of its contracting engineers lists a number of raw materials in order of their relative scarcity: rubber and tin; aluminum and magnesium; nickel and nickel alloy; chromium; copper; zinc and cadmium; lead; steel and iron.

It is equally interesting to note that the Building Materials Branch of WPB called a meeting of the industries on March 19 to discuss the curtailment of metal lath production to save sheet steel. An order is under consideration which would reduce to a substantial degree the production of metal bases in plaster or stucco construction and accessories of such bases.
One of the most important characteristics any mortar can possess is *plasticity*. Within certain limits, plasticity is the greatest single factor not only in the *economy* of the brickwork, but also in its strength, its neatness and its resistance to the passage of water.

One of the most outstanding characteristics of Brixment mortar is its unusual plasticity. For nearly twenty-five years, bricklayers all over the United States have agreed that the working qualities of Brixment are comparable to those of straight lime putty. This exceptional plasticity makes it easy for the bricklayer to secure neat, economical brickwork, with the brick properly bedded, and the joints well filled. And because of this unusual plasticity, a bag of Brixment will carry three full cubic feet of sand and still make an ideally workable mortar.

**BRIXMENT Makes a More PLASTIC Mortar!**

*BRIXMENT* for Mortar and Stucco

PREFABRICATED BUILDINGS HOUSE U. S. TROOPS IN TROPICS OR ARCTIC

Four types of prefabricated, demountable cantonment buildings have been developed by the Army engineers for use in the far corners of the earth, according to a recent announcement of the War Department. Designed for housing troops in various climates, they can be easily shipped and quickly assembled.

Several thousand units already have been purchased by the War Department for quartering troops where permanent construction is not necessary or feasible. Erection of prefabricated units will not replace methods of constructing large cantonments of a permanent character.

All-wood or wood and steel

The prefabricated buildings are approximately 20 feet wide, from 48 to 100 feet long, accommodate 20 to 40 men each and are made of all-wood or wood and steel construction.

Of the all-wood types, one is designed for temperate climates such as the United States, another for tropical climates, and a third for cold climates. Types designed for the tropics have insulated roofs and stand well above the ground to protect troops against reptiles and insects. Those for cold climates are well insulated and strong enough to resist a heavy gale.

A fourth type, made of steel with wood floor and heavy inside insulation, also will be used in frigid climates. It is known as the "Nissen Hut" type, named after a type of barracks built by the French at Nissen, France, during the World War. The Nissen type was redesigned by the U. S. Navy and the Army Corps of Engineers further simplified the structure using substitute materials, installing a less elaborate electrical system and effecting other economies without reducing usability.

One each of the four types of ready-made buildings has been erected at Fort Belvoir, Virginia, for additional experimental purposes. Experiments disclosed that one of the buildings can be erected by 12 workers in less than half a day.

2 TIRES FOR 5 TRAILERS, SAYS WPB

The trailer industry will have its own war boom in spite of tire shortages, if a novel plan of the War Production Board for making one set of tires serve five trailers works out.

An output of 50,000 house trailers is scheduled for this year, for use where new war industries have caused a sudden concentration of workers. Preference ratings will be given by the WPB, with restrictions that the trailers be sold only to workers in defense areas, and that manufacturers simplify designs to save critical materials.

One of the difficult problems confronting the trailer industry is the rubber shortage, and resultant ban on the production and sale of tires. In line with the desire of the War Production Board to keep the trailer industry effective as a provider of defense housing, 4,000 tires and tubes have been made available to manufacturers.

For delivery only

A novel procedure, however, has been worked out in order to utilize these tires to the fullest possible extent. As soon as a trailer is delivered to a defense worker, the tires are to be removed and returned to the trailer manufacturer for further "delivery" use. The trailer generally is propped up on wood blocks or timbers. An additional restriction on the use of tires on house trailers permits manufacturers to buy only one set of tires for every five trailers manufactured.

The House Trailer Section (WPB) is working with the industry to perfect a wooden tire for use on a wooden wheel, and one with a steel rim for use over an old rubber tire. If such substitutes become available, the industry plans to use them instead of rubber tires for transporting the trailers from factory to ultimate consumer.

BULLETIN FOR PURVEYORS TO GOV'T.

For manufacturers and others interested in supplying the Government with any of the thousands of items now being purchased for military purposes, a new publication of the War Production Board will have especial interest. It is "WPB Contract News," published by the Production Division, Contract Distribution Branch of the War Production Board. Publication offices are in the Chanin Building, 122 West 42nd St., New York City.

The news bulletin carries advance notices of prospective purchases, news of items for which bids are currently being taken, contracts awarded, together with lists of the many offices of the several buying agencies. There are also special descriptions of items needed, and brief articles on how other manufacturers and suppliers handle their own war conversion problems.

NON-Glass WINDOW REPLACEMENTS

An answer to the replacement of windows smashed in London air raids has been found in a window fabric which saw wide pre-war use in this country in horticultural work, as a substitute for glass (ARCHITECTURAL RECORD April, 1939, p. 39).

The London correspondent of Industrial and Engineering Chemistry, publication of the American Chemical Society, reports it is general practice in the case of large broken plate glass windows to fill the window with ply in which a small glass window is inserted to permit a view of the wares inside.

The material is a loosely woven fabric with an open or network structure. Bleached and finished with starch or dextrin, it is later passed through a dope of cellulose acetate and plasticizers and given a protracted drying. The finished fabric is nailed on wooden battens and fixed in the window frame.
The Horn That Gets Things Done!

RCA Victor Sound System Speeds Communications
in Plants and Buildings!

PICTURED ABOVE is the business end of an RCA Victor Sound System—vital expeditor for defense activities.

By including it in your designs of plants and buildings, you can greatly speed the war efforts of your clients—just as important companies such as Curtiss-Wright, Botany Worsted Mills, Weston Electrical Instrument Co., and many others are doing.

For by specifying an RCA Victor Sound System you will help your clients locate executives and key men, instantly, saving valuable time. Important directions and information can be transmitted quickly to any or every department. Air raid and other emergency warnings, together with full information, reach every employee simultaneously. In addition, music can be played during lunch and rest periods and to relieve employee fatigue.

Find out all about an RCA Victor Sound System. Mail the coupon today!

ANACONDA RESEARCH

From mines to fabricating plants, production of Anaconda Copper and Brass is devoted wholeheartedly to our country's war program.

But meanwhile, Anaconda Research carries on with redoubled effort...not only for war purposes...but looking also towards the time when—the present emergency over—copper and brass will again be available for unrestricted use.

The future is bright for the building industry—never in our country's history has such a backlog of needed housing accumulated. One day it will be released.

Anaconda Copper and Brass—in old and new forms of usefulness—will be ready.

The American Brass Company

General Offices: Waterbury, Connecticut, Subsidiary of Anaconda Copper Mining Co.
Highlights of ANACONDA SERVICE to the building industry

1900 — EXTRUDED SHAPES
Introduction and development of the extrusion process for architectural bronze and nickel silver.

1922 — ANACONDA BRASS PIPE
Introduced and promoted Brass Pipe for plumbing. Later developed, developed 95 Red Brass Pipe after a nationwide 10-year study of water corrosion.

1927 — EVERDUR METAL
Commercial development of high-strength, weldable copper-silicon allows use for water tanks.

1932 — "ELECTRO-SHEET" COPPER
New process makes thin copper available for low-cost, lasting, damp-proofing, weather-proofing and concealed flashing.

1935 — THROUGH-WALL FLASHING
Patented new design provides positive protection and easier installation at reduced cost.

1938 — COPPER WALL PANELS
A new dry-construction, patented wall facing, weather-tight, non-absorptive, erected without solder or caulking compounds; allows free movement to prevent buckling. Panel walls can be dismantled and re-erected in another location.

1940 — ANACONDA COPPER REGLET
Patented reglet to receive flashing in concrete construction—strong, efficient and easily installed.

1942 — ANACONDA RESEARCH
This program of The American Brass Company is carrying on many varied directions to improve efficiency and usefulness of existing products, and to develop new products which will make building in the coming era more efficient, more lasting.

makers of Anaconda Copper & Brass

IN THESE DAYS an advertisement is no place either for hosannas or sermons about production. Every man knows how well he is doing the job that is before him. Deeds, not words, are the measure.

BUT WORDS CAN BECKON beyond the realms of immediate duty.

IMAGINEERING is such a word. We coined it to make the needs of the future a reality, here and now. It is a way of describing what a man can do about the day when...

HOW DO YOU DO IT? You let your imagination soar and then engineer it down to earth. You think about the things you used to make, and decide that if you don't find out some way to make them immeasurably better you may never be asked by your customers to make them again.

YOU FORGET YOUR OLD ASSUMPTIONS. For instance, you may be one who used to assume that aluminum was too expensive. Even if you were right then (and you may not have been) the price trend of aluminum knocks those assumptions into a cocked hat.

WERE YOU ONE who used to assume that structures behaved exactly the way the theory said? Have you looked into the new answers the mammoth testing machine in the Aluminum Research Laboratory has found for that one?

DID YOUR OLD PRODUCT GROW like Topsy? More than one designer is Imagineering with this point of view: My product was in a groove. I couldn't get it out, because I didn't dare get too far away from last year's model. Now's my chance to start from scratch, and let tradition be hanged.

THAT IS THE KIND OF THINKING that will make jobs in the future. It is the kind we can help with: help with ideas and with know-how. Will you invite us?

Aluminum Company of America, 2167 Gulf Building, Pittsburgh, Pennsylvania.

ALCOA ALUMINUM
This fine Installation of FITZGIBBONS STEEL BOILERS

heats the equally fine new plant of the Brewster Aeronautical Corporation where the famous “Brewster Buccaneers” in ever-increasing numbers will swell the invincible total of aircraft upon which in large measure, America depends to win this war. Already nearing completion, four more identical Fitzgibbons boilers, of 304 horse-power each, will serve an addition to this plant.

At another Brewster plant, three R-Z-U Fitzgibbons boilers supply the warmth and comfort essential to the speedy construction of thousands of fast Brewster fighters and trainers for the armies and navies of the allied nations.

Naturally, in plants like these and particularly in the present critical times, only equipment of proven dependability would be selected... such as Fitzgibbons Steel Boilers.

Fitzgibbons Boiler Company, Inc.

101 PARK AVENUE, NEW YORK, N. Y.

Branches and Representatives in Principal Cities
FENCE LIGHTING is an indispensable factor in any effective system of plant protection. Holophane Refractors, designed for this purpose, have been installed in over 350 major armament plants in recent months.

WHY REFRACTORS? . . . They control the light vertically and horizontally, shaping the light to the specific job needs . . . Made of heavy prismatic glass, they are durable and impervious to the effects of time and weather. Their high output efficiency and controlled distribution permit wider spacings to reduce operating and maintenance costs.

Three types of refractors are most widely used for protective lighting; (1) 2-Way asymmetric, for fence lighting; (2) C-Way asymmetric, for roadways; (3) Symmetrical, for yards and gates.

WRITE FOR COMPREHENSIVE BOOK of specifications and installation methods for protective lighting, sent without cost or obligation.
How a "Wall of Light" Blocks Plant Sabotage

Here is another substantial contribution by our lighting engineers to sustain and safeguard America's 24-hour war production schedules. It's the Westinghouse Type SG-10 Refractolux Luminaire.

This new Refractolux combines a steel-protected silvered glass reflector with better methods of light control. When installed on the sides of industrial plants or on properly located poles, the units produce a protective "wall" of intense light. Trespassers are immediately revealed as they approach plant boundaries, fences, storage areas or production centers.

We've designed this high-candlepower luminaire to assure effective, night-after-night protective lighting. SG-10 is typical of Westinghouse engineered seeing—the combination of scientifically designed fixtures expertly applied to achieve the best visibility conditions. Full data is available in our new Protective Lighting Planning Book, B-3085. Write Westinghouse Electric & Mfg. Company, Edgewater Park, Cleveland, O.

The SG-10 consists of a canopy, high or low voltage type for internal or external wiring; a socket, mogul multiple or series type; a sheet steel housing that protects the glass reflector; a silvered glass reflector, cushion-mounted to absorb shock; and either a refractor or globe. Canopies, wiring and mounting arrangements and glassware are all interchangeable. A porcelain enameled shield, with refractor type units, redirects light from the pole side, and a hand-operated toggle latch releases the hinged globe or refractor for safe, easy maintenance.
TOWN AND COUNTRY PLANNING. By Gilbert and Elizabeth Glen McAlister, London, Faber and Faber (1941). 176 pp., $5.50 by 8 in. 12.5 s. 6 d.

The authors, the editor of the quarterly Town and Country Planning and his journalist wife, distinguish clearly between mere dormitory housing developments and the essentials of planning real towns, with sympathy decidedly on the side of the garden city and the cottage with garden as against the large city and the flat.

The matter is compactly presented with many useful statistical items. The style is vivid and the argument vigorous, if sometimes short of convincing. The reader will look in vain for authorities and statistics to support many of the statements made.

Sickness and mortality figures, for instance, for six old industrial cities compare in no useful way with those for three newish garden cities, the populations of which are necessarily selected in more senses than one. Again, slum poor health and low mental development are not the result of poor housing alone, but of forty-seven poverty-born factors; and similar factors doubtless produce similar results among the rural poor for whom no figures are given. Metropolitan time and cost figures for workers' transportation to and from work show appalling waste; but even garden cities such as Letchworth and Welwyn import 42 and 23 per cent respectively of their labor, or a third of the whole for the two.

The flat may be an admission of defeat, and perhaps anyone who continues to pursue a policy of tenement development is deliberately sinning against the light; but flats have for generations in many countries sheltered healthy happy home life. And even low-rental flats are not necessarily vermin-infested. Neither do flats in small-town atmosphere necessarily make sunless congested areas.

Again not all families include a very young or a very old member needing access on the same level to a private garden space; and even in cottages some stair climbing is usually necessary.

The assumption is that good housing in small communities "in the heart of the English scene" makes for the good life, at least for the middle and lower-income family. But post-war planning must take into consideration that cities must also lodge, in addition to those who operate their industries and services, the many unadventurous, hard-working, law-abiding souls of all classes, whether somewhat non-conforming or not, who stifle no less fatally in a small-town atmosphere because your small town is called a garden city.

HILLS BEYOND MANHATTAN. By Guido D'Agostino. New York, Double-day, 1942. 297 pp., $2.50

Time: the present; place: somewhere not far north of the Buttermilk Range—the author does not say that place and scenes are imaginary and one is free to use the time and route information supplied; dramatis personae: a few suburbanites and some villagers—from the lumber dealer, one of a family generations-long resident, to the Italian master-mason and the laborer. The hero is a French architect, who, after six years apparently successful experience of American metropolitan life finds at last in this village, where he is the working guest of his client, the sense of American life. An unusual story with a solution logical and yet so untypical as to so satisfying to all concerned that it may prove Mr. D'Agostino not only the inventor of a new fiction plot-plan but a prophet of architectural things to come.

THE AIR RAID SAFETY MANUAL. By Burr Leysen. New York, Dutton, 1942. 92 pp., 5 by 7½ in., illus. $1.00

FIRE FROM THE AIR. By J. Enrique Zanetti. New York, Columbia Univ. Press, 1941. 55 pp., 4 by 6½ in., illus. $0.50

These two little books have much to say on the behaviour of building materials and construction types under gas, fire, and explosion. The second explains the nature of modern incendiaries, their use, and protection against them, while the "Manual," on the assumption that we can function rationally only when we understand, explains in terms unforgettably clear the many effects of fire and explosion, with velocities, resistances and the logical precautions and remedies with which to meet these effects. Architect and builder will find adequate the information on various types of shelters, with information on thicknesses of various materials which will completely resist attack.

A HANDBOOK OF URBAN REDEVELOPMENT FOR CITIES IN THE UNITED STATES. Washington, Govt. Prtg. Off., 1941. 105 pp., 6 by 9 in. (FHA No. 23891, 15 c.)

A compilation of suggested reasonable procedures for a long-term broad view program by which public and private enterprise may together work to reclaim existing blighted areas and prevent the blighting of others. Powers and responsibilities of typical local authorities are described and explained, pitfalls are charted, and routes and routines indicated for escape from costly and hazardous maladjustments which, if they interest the FHA to the tune of some $3½ billion of insured loans, cost the communities concerned many times that amount.

HEATING VENTILATING AIR CONDITIONING GUIDE. V. 20. New York, A.S.H.V.E., 1942. 360 pp., 6 by 9 in., illus. $5.50; with thumb index $5.50

From its first edition 20 years ago of 360 pages, limited to technical discussion and equipment data, the "Guide" has expanded to a 10,000 copy edition of 1,274 pages covering every phase of the industry.

The main addition to the last volume is a chapter on Fundamentals of Heat Transfer; but a dozen other chapters have either been revised or rewritten to bring them up to date.

I WISH I COULD DRAW. By Percy V. Bradshaw. New York, Studios Pubns., 1941. 96 pp., illus. $3.50. (How To Do It Series)
Faithful, research-built Anaconda wires and cables keep uninterrupted pace with 3-shift operation.

There's more to war than the equipping of bombers and battleships. The plants and shipyards that make them, the factories and mills turning out thousands of large and small parts, must be powered through wires and cables that can stand the pace of 3-shift operation.

Anaconda research has developed scores of product improvements and many completely new products that are today meeting these critical demands. They are fitted for the job...their improved constructions deliver greater capacities with less power loss, their insulations can withstand high heat, corrosion, abrasion. The research that built these wires and cables continues at a fast pace. Now in addition to delving into experiments for improvements in industrial products, Anaconda is devoting much of its research to wiring for residential and commercial building.

When peace returns, adequate commercial and residential wiring will need your attention

The electrical future will place greater demands than ever before on those in a position to make wiring selections. Anaconda will cooperate with architects with information and with products measuring up to their specifications.

APRIL 1942
PENCIL DRAWING. By Ernest W. Watson. New York, Watson-Guptil Pubns., 1941. 70 pp., illus. $2.50

Between Mr. Bradshaw's "system of art teaching by natural methods" and Mr. Watson's book designed to show some effects which can be produced with various lead pencils, with stumps, and with combined pencil and wash, one learns much about how to draw. Mr. Watson's book, a second and enlarged edition of his well-known earlier book, assumes that one has been taught how to see; whereas Mr. Bradshaw's work tells the student how to observe. Seeing is partly visual observation, partly understanding the functions of the lines he sees, or thinks he sees, or ought to see, in plant, beast, man, landscape and miscellaneous objects. Useful hints abound on qualities of line, on types of paper, on how to use a model or to substitute for one; and some masterpieces of drawing are analyzed.

OLD ADOBES OF FORGOTTEN FORT TEJON. By Clarence Culimore. Bakersfield, Calif., Kern County Historical Society, 1941. 88 pp., 6 by 9 in., illus.

The ruins of Fort Tejon, established in 1854 and abandoned 10 years later, stand in the pass connecting Los Angeles with the San Joaquin Valley, through which drive nearly two million cars each year.

The history of this fort, which was built to guard the pass and to control neighboring Indians, is here preserved in a little book whose value for architects lies in the fact that the description of the fort, illustrated with construction details, perspectives and photographs, is a thoroughly good job done by a colleague, a member of the Southern California AIA Chapter, who knows his adobe as he does his local history.

ENGLISH COUNTRY HOUSES. By V. Sackville-West. New York, Chanticleer Press, 1942. 48 pp., 6\(\frac{1}{4}\) by 8\(\frac{3}{4}\) in., illus. (Britain in Pictures, 10 v., $18.50 the set)

This is one of the set forming the first publication of the Chanticleer Press. The aim of the series is to match the value of its pictures with its text; and for this volume truly the pictures are worthy of Mrs. Sackville-West's well known acquaintance with English country life and her mastery of prose. Many of the pictures reproduced in the set have never before been photographed, others are now reproduced for the first time in color. Each volume has 12 colored plates and about 20 in monochrome. The houses shown are great and small; some give architectural detail, others appear merely as the center of the landscape which is their setting. A beautiful book, sold only as part of the set which comes in a rack made of timber from bombed historic buildings,
MAHON
Steel
ROOF DECK

Protects against FIRE, WEATHER and TROUBLE
Quickly and Easily Installed

Makes WAR PLANT Roofs a Complete Interlocked Unit of Rigid, Ribbed Steel

To the architect, builder, or executive charged with the responsibility of war plant construction, Mahon Steel Roof Deck warrants special consideration.

It provides permanent protection against fire—weather—and trouble. It can be installed with remarkable speed.

Mahon Deck is a simple assembly of standard steel plates, quickly and easily fitted together and welded into an integral whole with the steel structure which supports it, insuring permanent strength and rigidity. Both plant and equipment are protected by a roof that is virtually a solid unit of rigid, ribbed steel.

Hundreds of industrial plants across the country are protected by Mahon Steel Roof Deck. It is planned for hundreds more. Write for the NEW Mahon catalog—or see Sweet's—and you'll understand why.

THE R. C. MAHON COMPANY • DETROIT • CHICAGO
Representatives in Principal Cities

Mahon Steel Roof Deck can be installed immediately the structural steel has been erected. Work on the building beneath proceeds without interference or interruption.

Manufacturers of Steel Roof Deck, Rolling Steel Doors, Shutters and Grilles; Kalamein Doors, Tin Clad Doors, Cast Iron Roof Sumps and Sump Recesses.
PERIODICAL LITERATURE

OUR SUMMER RESORT ARCHITECTURE. By Roger Hale Newton. Art Quarterly, Detroit, V. 4, No. 4., 1941, pp. 297-322., illus.

A RECORD of ideas resulting from the exhibit "A Century of Summer Architecture in the United States" arranged last summer by Professor Hamlin at Columbia University.

A capital summary of successive and co-incidental trends: Romanticism 1830-65, with Saratoga's Congress Hotel and Rockaway's Marine Pavilion . . . Eclecticism from 1850 onwards bringing Greek revival, Italian renaissance, rustic Anglo-Bavarian-Swiss, Gothic . . . Victorian grandeur . . . through the whole range to the garden cities of today.

Some of the "architectural horrors of the American '80's from the recently released film 'Ball of Fire'," assembled for "conclusive proof that this was the lowest of low points of our architecture."

In spite of strict paper rationing the journal allots itself more than double the average number of pages of recent issues for a well presented review of 1941's achievements in architecture and allied arts, including election of an architect to the presidency of an author's society and our own Mildred Godfrey of Flatbush who "set a light to her parents' furniture 'because it was so ugly.'"

NOTES HISPANIC. New York, Hispanic Society of America, 1941. 124 pp., 6 by 9 in., illus. $1.00

Planned as an annual, consisting of papers on the arts and crafts of Spain and Portugal written by the staff and members of the Society, publication "if found advisable may be continued in the future." Of the four well written, fully documented papers, illustrated with almost a hundred cuts, the "Custodias for the Processionals of Corpus Christi" and the "Apothecaries' Shops in Spain" will be of first interest to most architects.

American colleges in early days were vocational schools operated mostly under grants. . . . In all major sciences colleges today get men well started toward jobs in industry. . . . No such thing is happening with graduates of architectural schools. A liberal education is a preparation for life; architects need also preparation for making a living. Wanted, ideas for post-war curricula for schools of architecture.
Something more than just a floor

WHEN IT'S TERRAZZO

You expect Fine Terrazzo to resist years of wear and save money on upkeep.

But Fine Terrazzo, made with Atlas White cement, offers more than floors that are hard to wear out. It allows you unlimited opportunities for new and more decorative floor designs. It permits selection of any color or color combination you want in your patterns. Fine Terrazzo gives you wide latitude in adding beauty and life to interiors.

Specify Fine Terrazzo made with Atlas White cement for new and remodeled structures — hospitals, schools, hotels, churches, clubs, or commercial buildings.

With Atlas White cement you can depend on exact color control and clean-cut patterns. You can be sure that the original sparkle and freshness will still be alive years later.

For more details see Sweet's Building File, Section 4, or write for free booklet showing 24 true-color specimens of Fine Terrazzo. Universal Atlas Cement Co. (United States Steel Corporation Subsidiary), Chrysler Bldg., New York City.

OFFICES: New York, Chicago, Philadelphia, Boston, Albany, Pittsburgh, Cleveland, Minneapolis, Duluth, St. Louis, Kansas City, Des Moines, Birmingham, Waco.

McQUAY COILS HEAT AND COOL
A NEW AIRPLANE ENGINE PLANT

AGAIN, McQUAY equipment has been selected for another of Albert Kahn's outstanding jobs ... this time a new engine plant in the Middle West. Standard McQuay Heating and Cooling Coils will provide year around industrial temperature control for this up-to-the-minute plant ... Special units were designed to meet the exacting specifications covering certain areas, where split-degree control was essential ... In Defense Plants from coast to coast, McQuay Proven Products are actively engaged in speeding production. When you specify McQuay Heating and Cooling equipment, you are enlisting the services of an organization dedicated to the building of Quality Products and delivering them on time ... McQuay, Inc., 1605 Broadway Street N.E., Minneapolis, Minn. Representatives in principal cities.
CLEARER PERSPECTIVE

WE ARE SO CLOSE TO THINGS NOW, so much in the midst of things, that our vision is naturally limited to the problems we are up against, both literally and figuratively. And it's difficult to get away from them far enough to make a fair appraisal of their real importance and of our relationship to and attitude toward them. Priorities and allocations, critical materials, conservation, vanished clients, Government agencies, speed-up, red-tape, active service, disturbing news — they crowd in on us, we can't escape them, their impact is continuous — and confusing. To see things clearly, and in true perspective, we must get far enough away to get a comprehensive view.

We are faced with conditions we did not make and can change but little. The war has forced inevitable limitations on our accustomed activities to align them with the production for war. We are not alone in that predicament, nor is our position unique. Most other professions and industries are forced to make the trying adjustments to a war economy. Knowing the necessity for concentrating on war building exclusively in order to save materials and labor for the machines of war, it is unthinkable to complain, to be resentful, or to indulge in self-pity — we must do the adjusting, adjusting ourselves to the best of our ability and intelligence. We might profit in this by the philosophy of the happy negro handyman, who, when asked why he was always smiling and cheerful, explained, "Well, you see, I've learned to cooperate wid de inevitable." A sound philosophy if we are careful to make sure "the inevitable" is genuine.

We need a "station point" from which to see in its true perspective the changing picture — the detail in relation to the pattern as a whole, the light and shade and color, the form and function. No one can claim to see it whole or with absolute clarity. But we can in our minds step back to a point far enough away to see it at least in outline.

AS a "station point" we may well take our faith in the future — faith in the enduring ideals of democracy, in the growing need of and place for the planners and creators of buildings, faith in ourselves to function efficiently and cooperatively when opportunity offers.

This is natural and not too difficult for the many architectural firms throughout the country that are already working at top speed producing the nation's factories, housing and facilities of war. They have made the adjustment. But in non-defense areas this may seem a big order for a man — talented, sensitive, capable, now faced with the necessity of finding a place, for a time, where his abilities can be made to count in winning the war. Yet in facing that immediate problem there is strength to be gained from the clearer perspective one has from that station point of basic faith in one's country, one's profession and one's self. We see that the situation we are in is temporary, if protracted, out-of-joint, and frustrating. We can — and must — look beyond the present, and in so doing there comes to every one of us a new determination, not only to carry on in whatever capacity now, but to keep abreast of trends, informed of techniques, ready to adjust ourselves, to collaborate with others now and to take a vital part in the work that will be necessary when armed conflict is over and the building of a better world begins in earnest.

In clearer perspective, we see beyond the dark foreground of immediate war necessities the sunnier form of the planning and the building that inevitably will follow and for which we must prepare.

S. Kenneth Stowell

EDITOR-IN-CHIEF
WHAT WE ARE ALL SEEKING just now is Victory—and future Peace. This is a war of civilians as well as of armies and navies, in which cooperation on the home front is equally as important as military advances. Yet in the face of this, too much "business as usual" thinking persists.

This may seem a blunt statement. But the facts justify it. In the construction of industrial buildings no effort has been spared to expand our production capacity; and all our technical skill and resources have been focused on the job of quickly developing new plants fully adequate to carry our war load. But in housing the record is far from satisfactory.

This is particularly unfortunate, because housing today is a vitally necessary complement to the industrial part of our war program. Victory depends on production; production depends on the manpower behind production machines; and men and women cannot

"Men and women cannot work at the top efficiency our situation demands if they are not housed..."
work at the top efficiency our situation demands if they are not housed under circumstances that will assure their continuing ability to stay on the job.

Thus, adequate housing for war workers becomes truly a part of our national assembly line. And it must be made progressively available as new war-production plants near completion. It must be timed to mesh with every cog in our gigantic wheel of preparation for victory. Housing needs must be anticipated. Housing shortages have blocked progress in the past; today we cannot afford to tolerate that condition. We cannot allow production to be hampered by a dearth of adequate housing.

Nor can we look with favor on an unplanned program of jerry-building which will only result in creation of vast suburban and rural slums in the immediate post-war future. Common sense and energy coupled with an understanding of the job to be done must provide the full housing equipment necessary to keep our war production geared to top speed.

How extensive is this housing job? And to what extent are needs now being met?

Housing is not needed with equal urgency in all industrial sections of the country; nor are the requirements constant even in those areas where war production activity is most concentrated. The extent of the housing job to be done can really be discovered only as a result of local investigation. It is just as true that local needs can be adequately met only by providing the type of housing that will best conform to the industrial and civic character of the locality.

It is certainly true that many thousands of houses have recently been built—with both Government and private funds. But many more thousands are urgently needed. Travel along the highways of the nation and you can see men building their homes of roofing paper and old boards. You can observe families living in shelters that seem hardly sufficient to keep the rain out. You come upon dreary-looking trailer camps where cramped living quarters are mired in undeveloped lots and serviced by home-made privies. You can pass through hundreds of towns and cities in which there exists not one empty dwelling fit to house a human being. And on every side you hear of men—skilled artisans urgently needed in war industry—who have left town because they could not find a place in which an American workman might live.

And yet, along these same highways and in these same towns and cities, new factories are being rushed to completion. In Fort Wayne, for example, one of our great electrical companies is building a plant to employ thousands. But Fort Wayne is already crowded beyond its present capacity. Where will the new workers live?

At Detroit mammoth new factories are nearing completion that will need more than 100,000 new workers to keep them running on the 24-hour schedule that our war-production program demands. And at South Bend—where three large war housing projects have already been built in addition to a great many private houses—the airport staff searched three months to find housing for extra personnel pressed into service to carry a rapidly increasing transportation load.

Consider the housing situation in the light of conditions that exist in Fort Wayne, in Detroit, in Buffalo, Kansas City and San Diego—to name only a few—and you get some conception of how really acute is the shortage of decent living quarters that war has suddenly imposed upon us.

If this problem were just one of quantity it would still be difficult enough to find a timely solution. But it is complicated by other factors.
Whole new communities will be needed—and needed soon.

Many of these new war factories are springing up in open country, miles from a town or city or in towns which do not contain a labor supply sufficient to man them. They depend upon a supply of labor accustomed to roll to work, but less and less able to do so as the rubber shortage becomes more acute and tires wear out. Thus, transportation of vitally necessary workers looms importantly as a part of the housing problem. With the required number of busses unavailable and the widespread development of commuting trains a practical impossibility, more and more labor must be housed within walking distance of the plant.

This suggests that in several instances whole new communities will be needed—and needed soon.

Many, of course, will be temporary. But it is fair to say that a number of our great new industrial plants represent a permanent investment in money, brains and effort; and that housing for workers will be needed for years to come as such plants swing over from present wartime to future peacetime activity.

In any case the necessity for quick action on the housing front is now paramount. And it must be based on thorough-going local surveys, bold and far-sighted planning, the quick intelligence to meet and solve current problems and a constant, energetic drive for maximum production.

On whom should responsibility for this dwelling-production be placed?

Attempts to find an answer to this question—an answer to please everybody—have consumed too much time in every community. The promoters and developers, real estate men and builders, architects, contractors and chambers of commerce that represent private enterprise have offered to see the job through. And to their credit many of these individuals have built great numbers of houses throughout the country and are now even beginning to produce rental units in appreciable quantity.

But "business as usual" efforts have completely failed to meet the most urgent needs of a wartime housing emergency. Government, viewing the problem in the round, seems to have bent over backward to help private enterprise to build. Today it can no longer do so. Active war has telescoped our timetable for passive defense. And after frittering away precious weeks and months waiting for private enterprise to produce, Government can hold off no longer. Today this nation is under increasing pressure—pressure for action, not propositions; results, not conversation. Speculation no longer has a valid place in the housing segment of the country's war effort. Too much is at stake; and now we can only deal with sure things.

In view of all this a simple formula can easily be applied. First, let private enterprise promptly build all the rental units that can be soundly financed. Second, let Government take on the responsibility for just as promptly producing all remaining types according to the overall needs of the moment. Third, let private enterprise and Government cooperate in all instances so that present confusion will be avoided and future waste minimized.

The necessity for such a formula can be illustrated by two examples. In Buffalo, construction of new factories created an acute housing shortage. Early last September private enterprise undertook the responsibility of providing some 5,000 dwelling units. But the program lagged so woefully that by March first of this year only 1,100 of these units were under construction. The result is that many war factories in the Buffalo area cannot yet operate at full efficiency. And to make mat-
the promised program to keep pace with production schedules of new industrial plants.

In fairness it should be said that these "business as usual" promoters do not realize that their tenacious hold on conventional procedures is seriously impeding our war progress. Many able leaders in the private construction field do recognize the necessity for cooperation in this war effort. But they are having trouble with their flock. Indianapolis developers, for example, have recently agreed to push the rapid development of a combined private and public construction program. But can they make their associates see the vital urgency of such a cooperative combination?

Who understandably cannot forecast the duration of their stay in a community on their future ability to meet the financial obligations of home ownership.

It seems obvious, then, that it is unwise from both the social and financial viewpoints to urge or even encourage such workers to buy houses. The old pattern of the speculative, wholesale development of houses-for-sale as an alternative, for construction of adequate rental units should have no place in our thinking for the duration of this war emergency period. Experience has shown that factory workers themselves agree with this statement. Many have frankly admitted that when their jobs end in a locality where lack of rental facilities has made home ownership necessary they have no choice but to leave town and dump their properties.

The result of this general situation is not only psychologically disastrous in killing the sense of personal responsibility. It is disastrous economically, for it may well force widespread foreclosure of properties which have been poorly maintained because the owner was not owner by choice.

In view of such a possibility it is not too visionary to contemplate a future situation in which thousands of rundown dwellings will be inherited by a Governmental insuring agency and necessarily offered to new buyers or renters at prices substantially under the market. Thus, it is reasonable to draw a conclusion that "for-sale" developments not only are out of line with current housing requirements, but also tend to work an ultimate hardship on the very ones who have been responsible for their creation.

Proof that even workers have a keen sense of this general situation is offered by the fact that more and more they are refusing to go through the motions of home ownership. This explains at least in part why the FHA has finally instituted an active campaign for the privately-financed construction of large-scale rental units.

This campaign has, so far, not been rousing fully successful. It has bogged down chiefly because of the unfortunate pattern of speculation that runs through our real estate customs. The in-and-out-with-quick-profits technique is stereotyped. But it is out of place in the war housing situation, first because few entrepreneurs will stay with a rental project and thus offer assurance of stable and responsible management. Second, in many localities builders are either unacquainted with mass-production building methods or are unable to finance or to organize large-scale construction programs. And large-scale projects—dwellings by the hundreds and by the thousands—are what we most need today.

If such large-scale projects are to become worthwhile additions to our industrial communities they must be sponsored by responsible capital willing to invest—not speculate—in a long-term program. Responsible capital is that willing to initiate, plan, operate and maintain rental housing. Such capital is abundant today in the
hands of insurance companies, savings banks and conservative, far-sighted operators. It should be immediately channeled into the rental housing field. Legitimate investment opportunities await development in many war-active areas which give evidence of a stable population core. Particularly is this true in towns and cities containing areas of sub-standard housing that could, and should, be demolished after the war.

Properly located, planned, constructed and maintained rental projects would constitute an excellent social and economic investment as well as a conservatively satisfactory financial one. Their very existence would tend to raise or maintain local standards of living, and if past experience is any indication would serve to stabilize rents and reality values at levels adequate to the character of the locality.

Rental housing developments of this character are at once an immediate opportunity and a challenge to responsible capital and responsible developers, architects and builders. If no such legitimate sponsors can be enlisted, the alternative is extensive investment by Government. Private enterprise can be a boon to the war housing effort if it will accept its responsibility to put patriotism on a par with profits—if it will actually invest substantial equity funds and allow full play to the inherently American genius for achievement and able management.

**What kind of housing should be built?**

If we are to profit at all by experiences of the past and if we are justified in thinking of future redevelopment within our cities, we have an obligation now to design our housing projects as well-planned, self-contained neighborhood units that fulfill the requirements of a modern urban community. This means low land coverage with generous open areas for recreation and gardens. It means living quarters that are built away from traffic ways, street crossings and play spaces that are safe, parking and service areas that are adequate and well located.

This is the sort of housing we need to build now—for both today and tomorrow. The Lanham Act provides that Government-financed homes must be disposed of to private enterprise when the war is over. It is hoped that the new National Housing Agency will interpret this provision intelli-
"SAN FELIPE COURTS." In both design and structure, this 1,000-unit low-rent housing project merits special study. Particularly noteworthy elements are the unit plans (see next page), integration of units of differing size into row houses, and the three-story blocks which occupy the central area (see page 50). The remarkable Project Center Building spanning the internal thoroughfare (shown in the rendering at left) will be analyzed in detail in the May RECORD. The 80 row houses, 12 of which are three stories in height, are oriented to face north or south, providing maximum ventilation from prevailing breezes. Circulation throughout the project involves crossing but the single transverse street.
OF THE 1000 dwelling units, 440 are on one floor; the remainder are two-story apartments. Figuring the kitchen and dining space as 1½ rooms, units are 3, 4, 4½, 5½ and 6½ rooms (see typical plans at left). In the two-story buildings, all apartments have both front and rear entrances, with the exception of end units which have ventilation on three sides. All rooms are planned to obtain cross ventilation. The buildings are of fireproof construction with reinforced concrete frame. First floors are of pan and joist construction; other floors are solid slab poured on forms lined with hard-surfaced construction board to form smooth ceilings. Walls (see section opposite) are cavity type, with exterior face of 4-in. brick; interior, 3-in. hollow tile plastered. Interior partitions are 2-in. metal lath and plaster, except between units, where 4-in. hollow tile plastered partitions are used. The project is heated by natural gas circulating heaters in each apartment.
Treatment of end unit of a two-story row house. The second floor plan repeats the first:

- Burgundy brown brick and black mortar between windows; elsewhere reddish buff.
- DOORWAYS: Adjacent entrances separated by a fin, openings bordered by projecting tile, entrance shielded by concrete canopy.
- Note doorstep slab integral with wall structure, earth filled beneath after completion.
THREE-STORY UNITS

In the center of the plot, bordering the internal thoroughfare, are the 12 three-story row houses. Planned so that all dwelling units have front and back exterior openings, flats are located on the ground floor, living quarters of two-story apartments are on the second, and bedrooms and baths of these apartments occupy the top floor. Similar in construction to the two-story units (reinforced concrete frame and floors, cavity type walls), the taller buildings are a welcome visual contrast to the monotony of so large an area of buildings of similar height. Within the project are three large playgrounds, and park areas are provided between the fronts of row houses. All buildings are serviced either from the cross street or from service drives projected from the east and west boundary drives.
ALAMEDA, CALIFORNIA

Typical one-story house, with two dwelling units

"WOODSTOCK." HOUSING AUTHORITY OF THE CITY OF ALAMEDA. ANDREW T. HASS, ARCHITECT; CARL I. WARNECKE, ASSOCIATE ARCHITECT. A victory housing project for Naval personnel and Navy workers, this West Coast development contains 200 dwelling units. Located on a flat site in the midst of an established residential area, the project is laid out on curving streets, with indented, off-street parking space. Construction of all dwellings consists of poured-in-place concrete foundations, wood frame, redwood siding, and wood shingle roofs. It is noteworthy that all plans, specifications and contract documents for the project were completed in less than one month's time.
In both "Lake Forest" (at top) and "Greenfield Terrace" (above) the one-story buildings are placed to form intimate groupings or courts.

Setback curb lines form parking areas.

The lakeside site is organized so that as many units as possible face the lake. All houses front on circulation walks and are serviced from the rear with drives.
WILMINGTON, NORTH CAROLINA

HOUSING AUTHORITY OF THE CITY OF WILMINGTON

"LAKE FOREST," LESLIE N. BONEY, PRINCIPAL ARCHITECT; LYNCH & FOARD, ASSOCIATE ARCHITECTS; WM. HENLEY DEITRICK, COORDINATING ARCHITECT

"GREENFIELD TERRACE" AND THE DEMOUNTABLE PROJECT. LYNCH & FOARD, PRINCIPAL ARCHITECTS; WM. HENLEY DEITRICK, COORDINATING ARCHITECT

THREE WAR HOUSING PROJECTS, located on adjoining sites, form one large project with an eventual total of 1,059 dwelling units. On these two pages the typical housing units used in both "Lake Forest" and "Greenfield Terrace" are analyzed. The slightly plot for the projects overlooks a landscaped drive and lake. As far as possible natural elements have been preserved. In "Lake Forest" there are 284 dwelling units—42 three-room, 170 four-room and 72 five-room apartments—in 121 two- and four-family buildings. In "Greenfield Terrace" there are 300 dwelling units—44 three-room, 180 four-room and 76 five-room units—in 128 two- and four-family buildings.

The houses are built of cinder block on footings and foundation walls of concrete-filled cinder block. Floors are dampproofed, reinforced concrete slab construction on sand fill. Roof framing is of trussed wood rafters and wood sheathing; the roof surface is asphalt shingles; interior partitions are of 2-in. solid plaster on %4-in. channel studs supporting board-type lath.

Interlocking units of three, four and five rooms form the various building types

Entrance detail, and typical two-apartment block

SEATTLE, WASHINGTON

"SAND POINT HOMES." HOUSING AUTHORITY OF THE CITY OF SEATTLE, JOHN GRAHAM AND B. MARCUS PRITECA, ASSOCIATED ARCHITECTS. Situated on a rugged hillside with widespread views, this war housing project respects regional preferences, site amenities and the qualities of local materials to an unusually high degree. Built for the use of married enlisted Naval personnel, the project provides homes for 150 families—112 3-room units; 38 with 4 rooms. The two-bedroom homes are grouped in short two-story buildings allowing cross ventilation of each room. Standard frame construction employs native woods, left natural or stained in rich colors. Sash are of steel.

Rear doors of one-story units

Houses grouped around a court
FREEPORT, TEXAS

HOUSES FOR INDUSTRY. ALDEN B. DOW, ARCHITECT.
Unlike the other projects in this study, the group of houses shown on this and the next five pages are separate one-family units, designed for personnel of an important war industry, and they are built on available street sites rather than as a separate project planned from scratch. In structure, most of these frame houses were built with poured ring foundations and concrete piers supporting a termite-proofed wood platform. Alternate systems are wood floors on wood sleepers over a concrete mat, and asphalt tile laid directly on the mat. Exterior surfacings are stucco, asbestos siding or wood. Roofs are white asbestos shingles, felt, matched roof boards and wood rafters. Hurricane-proofing consists of metal ties between studs and wall sills and—in some cases—dual purpose shutters which, in sunny weather, raise to form canopies.
Features of the living room are a broad window band and wall surfaces of large-size fiber wallboard. One entire wall of the dining area opens onto the porch.

TYPE A

A perfectly square plan distinguishes this compact, three-bedroom house. Partitioning is at a minimum, with closet areas simply recesses—or one end—of the bedrooms. Note the ample closet provided for general storage.

TYPE B

An extension of the Type A plan, this rectangular house provides a larger living room plus a dining area. Both of the houses are of frame, diagonally sheathed and stucco-surfaced. House shown is reverse of plan.
**TYPE D**

This house and the one below illustrate variations in similar basic plans and the construction of units in reverse. The integrated organization of garage, storage closet, kitchen and dining room is particularly efficient.

**TYPE E**

The open planning of living and dining areas is similar to that of Type D. Planned for a family affording a servant, the scheme includes a generous utility room-laundry.
Living room has a wall-length window seat

TYPE G
One of the larger houses, this plan includes a dramatic front-to-back living-dining room. The broad overhang of eaves shields the window areas from sun glare.

Living room, with window wall at end
Bookshelves border the main entrance
Bedroom showing closet detail
TYPE H

Although a sizable house, this type follows the same forthright, economical planning and structural procedure as the others—closets banked in partition walls, wide overhang of eaves, a single, large area for living and dining space, and simple detailing. Livability in the Texas climate is enhanced by large window areas and cross ventilation in the majority of rooms. In plan, Type H is another variation and extension of the basic scheme that was used for house Types D and E.

TYPE J

One of the most recent of the house types to be built at Freeport, this compact and efficient little plan further develops open planning to include the kitchen as a partitioned area off the living room. Extensive use of functional built-ins and shelving, and a carefully studied organization of storage spaces are highlights of the house design. At far right on opposite page are interior photographs showing a few built-ins and storage units.
TYPE K

IN THIS HOUSE, the living room bay projects on two sides to obtain maximum of air and ventilation. As in several of the later houses, this one is surfaced in wood instead of stucco. The openness of living room and porch areas is well illustrated in the photographs at right. Other notable plan features include a centrally located heater closet, isolation of bedrooms from the living areas of the house and provision of a utility-laundry room.

from the house is sheltered by the broad roof overhang
CHICOPEE, MASSACHUSETTS

"SHERIDAN CIRCLE." DESIGNED AND CONSTRUCTED BY THE PUBLIC BUILDINGS ADMINISTRATION. Made up of dwellings for 2, 4 and 6 families respectively, this New England housing project has a total of 200 dwelling units for Army enlisted and civilian personnel. The different structures consist of varying alignments of the one- and two-story unit plans shown. Curved streets feature the site layout and create a pleasing residential character. There are 15 buildings with 6 apartments each; 7 houses of the 4-family type and 41 of the one-story houses containing two dwelling units each.

The plan of the one-story house is repeated for the end units of the 6-family houses.
WPB ISSUES

WARTIME RULES FOR HOUSE HEATING

Provisions of the new “Defense Housing Critical List,” which became effective on February 24, set performance standards for house heating which may ultimately effect permanent changes in residential design and building practice.

The first objective of the new WPB ruling is, of course, to effect a substantial saving of the metal used in heating systems by reducing the weight of the systems themselves. But instead of specifying arbitrary weight criteria, it limits the size of the heating plant that may be used in any “Victory House.”

This limitation is phrased in terms of a maximum net hourly capacity and sets this capacity in Btu per hr. at 66 times the total square foot area of the dwelling. In addition, the new ruling specifies that houses in which such limited heating equipment is used must be so constructed that the maximum hourly heat loss does not exceed the heat-generating capacity of the equipment. As to type, warm air plants may be used in all Victory Houses; but boiler installations are restricted to buildings containing two or more dwelling units or to extensions of existing plants to service additional living areas.

These provisions point directly to the necessity of employing one or more forms of insulation in house construction in nearly every section of the country. As another result, basements may now be regarded as more important than formerly. Aside from the extra space (for coal storage, etc.) they would provide in a small house, basements have an insulating value from a heating point of view.

To quote from Robert Thulman, heating engineer of FHA’s Technical Division, “Check calculations on typical houses show that floor losses are not only of major proportion, but are one of the primary causes of unsatisfactory heating. With tightening restrictions on motors, controls and metals generally, the fan-furnace unit may have to give way to the gravity furnace, the proper operation of which requires a basement.”

Check calculations have also shown that it will be difficult to follow provisions of the new ruling if unusually large windows or masonry walls are used—particularly in a house without a basement. Though heat losses through large window areas can, of course, be substantially reduced by using storm sash—or some other means of double-glazing—added costs would probably be prohibitive. And it is generally true that masonry walls cannot be insulated as efficiently as those of wood construction.

Thus over-all results of the new “Critical List” heating requirements may operate to effect a rigid standardization in residential construction at least so far as the single-family “Victory House” is concerned. This statement applies to “prefabricated” houses as well as those built in the traditional fashion. Designers will have more leeway, of course, in the case of multi-family dwellings. But even here limitations are strict and will produce the same general results.

(continued on page 66)
Heat loss reductions as a result of insulation are reasonable averages resulting from a great number of check calculations. Figures can be used to determine overall heat loss reduction as a basis for selecting type and capacity of heating plant according to provisions of the "Defense Housing Critical List"—provided that structural elements and insulation types follow those described and sketched here. There are many other possible combinations. These were chosen as representing the most usual type of "Victory House" construction.

In general, masonry walls, though desirable fireproof, lose heat faster than walls of wood construction; application of insulation is also more difficult.
NEW WPB RULING ON HEATING issued February 24 as part of the "Defense Housing Critical List.

It is subject to revision according to possible changes in the present critical position of materials.

511 The maximum net hourly output capacity of the heating unit or system as determined in 314 or 315 hereof is the capacity—after deductions have been made for piping and pickup, attached domestic water heaters, and non-dwelling heating loads—available to provide for the total hourly heat loss of the dwelling it heats. Such maximum net hourly output capacity in B.t.u. shall not exceed 66 times the dwelling area in square feet or 80,000 B.t.u. per dwelling unit, whichever is the smaller.

512 The total hourly heat loss of a dwelling shall not exceed such maximum net output capacity and shall be determined in accordance with the data and methods described in the current edition of the "Guide" of the American Society of Heating and Ventilating Engineers or by an alternate method which results in not less than the amount determined by the "Guide" method. Such total hourly heat loss shall be based on maintaining 70°F inside the dwelling; when the outside temperature is at or below the design temperature for the locality. Spaces such as unheated garages, attics and basementless spaces shall be calculated at outside design temperature. Storm windows and doors furnished shall be credited with the heat loss reduction they effect.

513 Dwelling area is the total area used for dwelling purposes contained within the exterior walls at each principal floor level excluding garage and unfinished storage space but including only the finished area of any living, sleeping, dining or kitchen space located in the basement or attic.

514 Prior to sixty days after the effective date of this Defense Housing Critical List, the maximum net hourly output capacity shall be determined from catalog ratings in effect on such effective date. On or after sixty days after the effective date of this Defense Housing Critical List only equipment rated in accordance with 515 hereof shall be eligible. Equipment may be rated within a range of specified firing rates selected by the manufacturer if at any firing rate within that range its performance certified by the manufacturer to have been determined by test is within the limitation of the applicable code or standard specified in 515.

515 Except as provided in 514 hereof, the maximum net hourly output capacity is determined as follows:

5151 Floor furnace:
Gas-fired—90 percent of published, listed, or labeled rating determined in accordance with the current "Commercial Standard" or "Proposed Commercial Standard for Heat Exchangers".
Oil-fired—90 percent of the manufacturer's certified output rating at 70 percent or higher efficiency.

5152 Space heater:
Hand-fired coal or wood—90 percent of manufacturer's certified output rating at 60 percent or higher efficiency.
Gas-fired—90 percent of A. G. A. output rating.
Oil-fired—100 percent of the published, listed, or labeled rating determined in accordance with the current "Commercial Standard" or "Proposed Commercial Standard for Heat Exchangers".

513 Pipeless gravity furnace:
Hand-fired coal—90 percent of the manufacturer's certified register output at 55 percent or higher efficiency.
Oil-fired—90 percent of the manufacturer's certified register output at 70 percent or higher efficiency.

514 Gravity furnace:
Hand-fired coal—110 percent of the manufacturer's certified "Standard Gravity Code" rating in square inches leader area times 180 B.t.u.
Mechanically fired (conversion installations) same as for hand-fired.
Gas-fired (furnace-burner unit) 75 percent of A. G. A. bonnet output rating.
Oil-fired (furnace-burner unit) 75 percent of the manufacturer's certified bonnet output at 70 percent or higher efficiency.

5155 Forced warm air furnace:
Hand or mechanically fired coal (gravity rate furnace with fan conversion) 100 percent of the manufacturer's certified "Standard Gravity Code" leader pipe area in square inches times 180 B.t.u.
Gas-fired (fan-burner-furnace unit) 85 percent of A. G. A. output rating.
Oil-fired (fan-burner-furnace unit) 85 percent of the output rating as determined by the "Proposed Commercial Code of the N.W.A.H. & A.C.A. for Testing and Rating Oil-Fired, Fan-Furnace Combinations".
Stoker-fired (fan-burner-furnace unit) 85 percent of manufacturer's certified output rating at 70 percent or greater boiler efficiency.

5156 Boiler (only for heating systems serving two or more dwelling units or for extensions of existing plants to service additional living accommodations.)
Gas-fired—65 percent of A. G. A. output rating.
Hand-fired or mechanically fired (all fuels) 100 percent of current I. B. R. net rating for cast iron boilers, or 100 percent of net rating certified by the manufacturer to have been obtained by test procedure in accordance with the I. B. R. Testing and Rating Code less (in each case) 12,000 net B.t.u. per dwelling unit for domestic hot water heated indirectly by the heating boiler.

516 Limitation on gas-fired equipment: The use of gas-fired equipment for heating space is subject to the availability of natural or mixed natural and manufactured gas from the utility company servicing the project. In addition, in areas where prohibitions or restrictions on deliveries of such gas for gas-fired equipment for heating space are imposed by the War Production Board, proof must be submitted establishing exemption from such prohibitions or restrictions.

The "Critical List" requirements will prove particularly important as an insulation yardstick. They should effectively settle the long-standing controversy over how extensively a house should be insulated, for they specify insulation where it is most necessary on the basis of technical performance.

As a corollary value, the new ruling will make reduction in fuel consumption almost automatic in proportion to the amount of reduction in the total hourly heat loss.

It is conceivable that much will ultimately result from such wartime restrictions as these. Certainly they pre-sage development of construction techniques that emphasize efficiency and economies of various sorts. Designers and manufacturers alike will more and more be forced to discard traditional methods in search of those which will more effectively meet the conditions of new technical problems.
WARM AIR HEATING:
1-TYPES OF SYSTEMS

This series of two Time-Saver Standards sheets contains data on selecting heating systems and furnaces for small single-family dwellings of types at present authorized as "Defense Housing." The War Production Board's "Defense Housing Critical List" (Feb. 24, 1942) restricts heating systems for new single-family dwellings to various types of warm air heat. Since, in many areas, oil and gas fuel are now unavailable, these sheets are further restricted to coal-fired equipment, except for general specifications.

Sources include the aforementioned "Critical List"; also publications of the Nat'l. Warm Air Heating and Air Conditioning Assn. and the Nat'l. Bd. Fire Protection, and the "Selecting Furnaces" sheet by Konzo, U. of Illinois. Data were prepared for publication by Frank G. Lopez, Jr.

SELECTING FURNACES

It is assumed in these sheets that insulation requirements and Btu heat loss calculations have been completed, and that requirements of the "Critical List" in these respects have been met.

General considerations include the following: Temperature of circulated air should not ordinarily exceed 175°F; should never exceed 200°F. Units must not be fire hazards. Flue gas temperatures must be kept within reasonable limits; this entails proper control and adequate heating surface to extract heat from combustion gases. Ratings for all types of fuel (oil, gas, coal) should be accurately determined according to standards of the appropriate trade associations, or certified by the manufacturer. Special considerations are listed below and in notes at right.

Types of Systems

General considerations include the following: Whatever the system, it should be capable of heating every room to an air temperature of 70°F at breathing level when outdoor temperatures are at design value. Types defined as "low-temperature" by the Nat'l. Bd. Fire Underwriters are preferable, because the low air temperatures (175°F usual, 200°F max.) required not only reduce fire hazards, but also (1) eliminate danger of burns from hot registers in the somewhat restricted defense-house quarters, and (2) produce smaller temperature differences, floor to ceiling.

Floor furnaces and space heaters, originally developed as auxiliary units for seasonal use, are satisfactory as the principal type of forced warm air systems for new single-family dwellings of types at present authorized for defense housing. Types of systems for new single-family dwellings of types at present authorized for defense housing include the following:

1. Determine heat loss per room in Btu per hr.
2. Locate warm air and return registers on house plans, beginning with basement heating system. High-limit controls should be provided to stop combustion when bonnet temperature exceeds 200F.
3. Determine assume air temperature at furnace onset.
4. Determine approximate value of temperature reduction per duct caused by heat loss from ductwork.
5. Subtract from 5 to obtain air temperature for each register.
6. Determine required warm air volume per room.
7. Determine warm air register sizes.
8. Select either a "trunk" or "individual" duct system, and size ducts to maintain desired air flow despite Changes in size, fractional re-assembly, etc. Return duct systems are similarly designed.
9. Determine total frictional resistance and select fan accordingly.
10. Select furnace according to total Btu required, taking into account type of fuel, method of firing, and heating procedure (in-room or central) with required limit controls.
11. Determine location and type of dampers for supplies and return; select controls.

Controls. Warm air furnaces of all types require controls which limit flue gas temperatures. For coal-fired furnaces, an automatic regulating damper in the smoke-pipe will limit maximum draft, and hence flue gas temperature. Air temperature limit controls, if provided to stop combustion when bonnet air temperature exceeds 200F, Room thermostat, check and draft damper motor, bonnet fan switch (to operate blower when bonnet air temperature reaches the desired level), are all necessary for safely operating any type of forced warm air system. For stokers, a control to stop stoker if fire goes out is desirable, though not essential; an automatic device to hold the fire in mild weather is desirable. Special combustion controls are essential for gas- and oil-fired furnaces.

**EXAMPLE: SELECTING RETURN AIR RUN ACCORDING TO CARRYING CAPACITY, B. t. u. SERVICED**

The following example will show how Tables 1 and 2 are used.

**Given:** Return duct in hall — See diagrams of types A, B, C, D, and E below.

**Type C** to be used — See Table 1, third column, marked "Types B and C."

B. t. u. serviced assumed to be 30,000. B. t. u. per hour — Next largest value shown in 30,600. Follow horizontally to left to get Unit No. 35. See Table 2, below, for recommended sizes for Unit No. 35.

---

**WARM AIR HEATING FOR DEFENSE HOUSING:**

**2—GRAVITY WARM AIR SYSTEM DESIGN**

**PROCEDURE**

1. Determine heat loss from each room in Btu per hr., following any approved method.
2. Make tentative basement or first-floor layout, to scale locating:
   a. Furnace, chimney and smokepipe
   b. Warm air (supply) registers (indicating as wall, floor or baseboard)
   c. Return air grilles
3. Indicate on each warm air run:
   a. Whether room supplied is first or second floor
   b. Approx. length of leader (usually basement)
   c. Number of 90° elbows, including elbow at return air boot to furnace. (Each 45° elbow equals 1/2 a 90° elbow; two sharp 90° elbows in a crossover equal three 90° elbows)
4. Determine sizes of suitable combinations of warm air and return leaders, ducts, fittings, registers and grilles, designated as "Units" in the accompanying Tables 1 to 7.
5. Indicate on plan number and location of return air grilles, and type of return duct system (see Table 1).
6. In determining size of return air ducts, sum of heat capacities of return air ducts should equal total heat loss of entire structure.
7. Select furnace having capacity rating, in sq. in. of leader area times 136 Btu (or Btu per hr.), equal to total heat loss from structure.
8. Install system according to recommended practice as shown on sheet No. 4 of this series.

Note: Commercial sizes vary 1/4 inch from values shown. Sheet metal double-wall ducts are not permitted under the "Defense Housing Critical List." (Feb. 24, 1942).

All tables are condensed from publications of The National Warm Air Heating and Air Conditioning Association.
WARM AIR HEATING FOR DEFENSE HOUSING: 4-CONSTRUCTION DETAILS GRAVITY & FORCED WARM AIR

Fire Underwriters. The requirements of the War Production Board’s “Defense Housing Critical List” (Feb, 24, 1942) are also complied with.

Top at least 1'-0" above flat roof or 2'-0" above ridge of peak roof.

Chimney Straight - No offsets. Separate flue for furnace.

Brick Work Laid in spread mortar. All joints pushed filled and pointed.

Fire stop - Incombustible material.

Furnace casing.

Supply Leaders: supply ducts and leaders, if not over 14" wide, may be of 30 gauge sheet metal; if over 15" wide, use 28 gauge sheet metal or its equivalent in incombustible material.

Building paper.

Double wall stack. 20 gauge galvanized iron from boot piece in basement to top of stackhead.

Warm air ducts insulated with 1/2" inch air cell material.

Air tight sheet metal.

Airtight. Sheet metal.

Metal pan.

9.94. Where space between studs in walls or partitions, or spaces between joists in floors are used as ducts, the portions of such spaces so used shall be cut off from all remaining unused portions by tight-fitting stops of sheet metal or of wood not less than 2" in thickness.

Note: " (Nominal) wood or equivalent is required up to within 6" of heater. 28 or 28 gauge sheet metal required within 6" of heater.
HOUSING FROM THE TENANT'S VIEWPOINT

... Or, how has housing passed the test of actual use by low-income families? That was the subject of a two-year study by ELISABETH COIT, AIA, on an Edward Langley Scholarship award. She subjected to scrutiny some six score housing projects, and any number of published and unpublished reports, always checking the planning theory against the actual living habits and desires of the occupants. Her voluminous report, already abstracted in text form in the "Octagon," is here done graphically, to summarize as quickly as possible the principal points in her conclusions.

There are many surprises in store for one who would learn how the tenant views a low-rent housing project. And some of them would be humbling surprises. The low-income family has been much less articulate about its needs and desires than the planning theorists and social workers, but it can speak pretty positively after a few months of actual occupancy. And for all the inconsistencies, its reactions contain something both incontrovertible and illuminating.

So Miss Coit, architect and housing consultant, spent two years scrutinizing housing from the strictly practical side. Her study has a very timely element. Housing low-income families is definitely established as big business. And the years that have elapsed since Government began to dot the urban scene with large-scale multiple-family buildings have given time for the testing of earlier theories of sponsors and designers.

"I have tried," writes Miss Coit, "to learn what the low-income client thinks he needs or would like to have, and what architects and other experts in the more architectural aspects of home-making think he ought to have, or can have, and how this or that solution works out in practice; collating and comparing, rather than criticizing, the opinions expressed, but keeping in mind always the necessity of reconciling as far as possible expressed desires with the present-day procedure as to cost, design, construction."

The results are here reduced to a largely graphic report. With no intention of making another addition to the mass of housing theory, the report does contain several graphic planning suggestions that came naturally out of complaints frequently voiced by tenants. Plans are shown that did not work out well, along with some that did. Then, drawn in plan and elevation, there are some common-sense but perhaps somewhat radical ideas for making limited space more effective for the low-income family.

A BUILDING TYPES STUDY

Floor plans in this section are reproduced at \( \frac{1}{4} \) inch, unless another scale is shown.
WHERE TENANTS AND TENETS DON'T AGREE

More in sorrow than in anger, one housing project manager remarks, "They use their kitchen for things they ought to use their living room for." And thus he voices, in one sentence, the difficulties forever hounding the planner of low-cost housing. What rooms were designed for and what they are actually used for are frequently quite different things. Thus does the nicest theory fall before the fact.

If cost were no object, a great many of the complaints uncovered in Miss Coit's study could probably be obviated simply by making rooms both plentiful and large. And to a certain extent many of the tenants' complaints do come down to the simple matter of the problem remains one of designing the various areas for maximum utility to the families who are actually to occupy the units, not for some theoretical and more tractable family which the architect might like to visualize.

Principal complaints of tenants deal with congestion in two areas in the apartment: the living room and the kitchen. There is "too much living in the living room." Homework suffers. The breadwinner becomes inefficient for want of rest at home. Or, as tenants phrase it: "Too close companionship when we are in one room." "No place for children to play without bothering their father who wants to rest." "The radio disturbs study." "We have no playroom, no workshop."

As for the living room, there is also the fact that few low-income families can take the time and trouble to use the living room for its intended purposes. "The congestion then occurs in the kitchen," writes Miss Coit, "where there is even greater discomfort, as well as a certain stigma attaching to having only one room for washing, cooking, eating, dishwashing, drying steaming linen, ironing, bathing the baby, changing him, handling his daily quota of diapers, homework, recreation, and the informal entertaining which is all the lower-income family can ordinarily manage. Homework is done there because there light has to be maintained, and because in the poorest home that is the warmest room in winter, says one large group reporting. And over 80 per cent in the same group eat meals there, not only because it is too much trouble to serve meals in the living room, but also because one room must be kept neat, and not 'mussed up' two or three times a day. The farm family naturally eats in the kitchen; but tries to keep washing and other major operations out of it, although ironing is approved because it is a clean job. Preparation of food, eating and clearing away make some nine fixed items on the day's schedule for that room; and laundry work alone is endless. It is not done once a week, but three or four times a week, or daily. Few, if any, working-class families can pile up a week's supply of dresses, play frocks and suits, mechanics' overalls, etc., to say nothing of underwear."

"On the other hand there are great unused spaces, which must be paid for by someone, whether entirely by personally earned wage or salary, or with the aid of public subsidy. The living room is idle most of the day, as is the bathroom. Bedrooms are used only for one-third to one-half of the productive hours of the 24, for sleeping and for the storage of beds, bureaus, a chair or two, and thus equipped, useless for any other purpose. "The teen-age girl, meanwhile, longs for some practicable low-cost version of the Hollywood boudoir; often all she is looking for is a quiet place for her homework. Equally the boy, of whatever class or income bracket, needs some place for his own affairs and room for discussing them with his peers—who are ordinarily not his parents and sisters. Fathers, too, have hobbies, and, like other people, sometimes need quiet and solitude.

"A new nomenclature, combined with changes in plan and detail neither radical nor costly, would restore to use these areas, increasing the efficiency of the shelter, and at the same time embellishing the small-scale family scene." Miss Coit delineates some suggestions along this line on page 83.

Insufficient closet space is another frequent complaint. The low-income family may not worship beauty, or at least may not expect to indulge its worship, but it does demand convenience and order. "Do we," asked a speaker at a housing conference, "need closets in these dwellings? I am not at all sure of their relation to health and delinquency... Every family has a right to... the essentials of decent, happy living, but we can't afford to give any extras." "And the affirmative to this question," says Miss Coit, "is undoubtedly the most unanimous demand in housing today. Broom closets, wrap closets, in the hall and near the back door, cool storage closets, bedroom closets, toy closets... are demanded almost vociferously by a people still rather inarticulate as regards most of its housing needs."

And again, "convenience, labor saving, possibility of ease and rest in a

While the living rooms of these two units (they are actual plans in two large New York apartment developments) might be considered to fulfill the normal requirements of living rooms, they fail to provide any of the tenants' requirements as listed above. In both cases entrance to other rooms is through the living room, making it difficult to keep it neat. There is no possibility of privacy for sleeping in the living room. All dining must be accommodated in these rooms since neither kitchen has dining space
strenuous domestic life seem to dominate tenant requests."

There is little room here for generalities about what they do want, but a few might serve to explain some seemingly odd reactions of tenants. "Especially striking is the record of how little apparently some of the not-so-very poorly housed, as well as the slum dweller, care about modern housing and about the major comforts, conveniences, and safeguards considered their right by safety, hygiene and other welfare organizations, while valuing highly a feeling of freedom, of independence, and of opportunity for self-expression... Some families will not bridge the distance between the new development and the old neighborhood where friends live... Possibly one explanation is that of the London County tenant who disliked the social 'coldness' of the new neighborhood, and moved back to the slum where friends lived. Possibly a soft drink parlor and beer garden, in addition to adult education facilities, would prove a help to both tenant and manager, more especially in projects housing many tenants who do domestic work, for most of whom physical weariness and lack of prospect of any social or economic advantage combine to make organized evening education rather pointless."

**ROOMS AS TENANTS USE THEM**

Where the strenuous activities of family life must be compacted into a few not-too-large rooms, "normal" room uses get sadly confused. Under such circumstances, the tenant's most urgent desires as to room types might be summarized thus:

**Living Rooms**, little used as such by low-income families, are best designed if they serve these purposes:
1. Reception room, kept neat for callers.
2. Bedroom, (a) frequently as regular sleeping place for child or adult; (b) occasionally for a child with illness or "symptoms."
3. Occasionally as dining room, but not as the only dining space.

**Dining Space**, whatever its location, should fulfill three requirements:
1. Convenient place for frequent "staggered" meals.
2. Space for whole family and guests.
3. Light and ventilation.

**Bedrooms**, too often suitable only for sleeping, would be more effective if also useful for:
1. Quiet space for homework or hobbies, for both adults and children.
2. Secondary living room space where club-age boys or girls can discuss their own affairs with their own friends.

**Bathrooms** are often called upon to relieve the over-used kitchen, particularly for laundry work, and might well be arranged and equipped for light laundering.

**Kitchens**, usually the busiest room by far in the whole dwelling, are called upon to accommodate several functions besides that for which they were designed:
1. Some of the bathroom uses overflow into the kitchen; babies and small children are often bathed in the laundry tray, as the bathtub is too low.
2. Even the "laboratory" type of kitchen has to be the small child's play space, and the family assembles where the mother is working.
3. Kitchen is used for snacks, homework, sewing, mending, etc., and for many small tasks done while the stove is watched.

![Diagram of Building Types](image-url)

The combination foyer and dining alcove so often seen does not work out well in use. When the dining table (stored at A or B) is set out for use by four persons, it effectively blocks the passage. And the space is poorly lighted and ventilated.

So many bedrooms, while adequate for the strictly essential furniture, leave no space for other activities. While obviously the answer is not simply a matter of additional area, these bedrooms become simply "passage-plus-furniture" rooms illustrating the increased usefulness of bedrooms just a little bit larger. Here the same furniture is accommodated, plus a few pieces more, but the added space still leaves room for some daytime activities, such as home study or children's games.
STANDARDS FOR ROOM SIZES

Much variation in size and shape of room is shown not only in existing housing surveyed, but also in recommendations of Government authorities and other experts.

A survey of lower- and low-rent developments made by the Housing Study Guild shows the effect of adequate size on rentability: the apartment with an average net room area of 168 sq. ft. proved satisfactory, while that with a net room average of 113 sq. ft. was "very difficult to rent, the bedrooms especially proving too small." USHA minimum areas of 1938 for 3-bedroom units (Figure 1) would give averages of the kind very difficult to rent to lower-income families in New York even in depression years. The National Association of Housing Officials at about the same time advised similar minimum areas. Naturally they do not recommend that minimum dimensions obtain throughout. Neither does USHA, but its "unit plans" show average room areas of 114 sq. ft.

The 1939 revision of USHA recommended areas increases the sizes of second and third bedrooms and suggests more generous areas all along the line. Nevertheless, the recommendations would give little space beyond that necessary for circulation around the usual furniture. It is therefore a

![Figure 1](image1.png)
![Figure 2](image2.png)
![Figure 3](image3.png)
![Figure 4](image4.png)
![Figure 5](image5.png)
![Figure 6](image6.png)
matter of congratulation that, as the list points out, "there will be cases... where the exigencies of the plan impose a greater aggregate area."

In recommending larger room areas, (asking gross areas averaging 237 sq. ft. per room) the Women’s City Club of New York explains in its report, "While it may not now be possible to build such apartments for the lowest-income groups... the additional area makes for housing which is good and not really extravagant. Such apartments should withstand obsolescence, even if new methods of construction enable us a few years hence to build more cheaply."

An unpublished survey of 23 New York workers’ and small "white collar" projects, built from 1904 to 1933, including prosperous and depression years, shows gross apartment areas as 253, 235, 233, 229 sq. ft. and down, while net areas per room in sq. ft. run 182, 171, 169, 165, and down, with an average of 133.7. Eliminating a few non-typical ones of the group, however, gives averages of 190 for the gross and 142.9 for the net.

"Similar areas," concludes Miss Coit, "are found in the 14 projects built in the same city under the state housing law of 1926. Average living room areas are here shown (Figure 6) to be 192.8 sq. ft. and average bedrooms 145.7. The averages of the projects in this group are significant because many of them were built for workers by workers, some in the boom years, some in depression times."

Combining two apartments was necessary to provide for big families in Yellow Mill Village, Bridgeport, Conn. A three- and a five-room apartment (upper plan) became an eight-room unit. Considered to be the first public housing to provide for a family of 12 children, this project can quickly and inexpensively reconvert the space.

Building Types

For the non-typical family

Non-typical layouts are much appreciated in housing projects, for the unattached and the non-typical family group, if for no other reason than to prevent a development from becoming "a too purely parent-and-child community."

Even the typical family has changing housing requirements as it progresses from married couple to family group to aged couple whose children have left the home.

From the standpoint of management, too, the non-typical groups ease certain problems—they use play areas and community facilities at hours different from those of mothers and children. Again, they don’t need the sunnier exposures, the minimum of stairs to climb; they can use units that "normal" tenants would not like.

Because its rooms were generously proportioned when it was originally built, back in 1877, the Tower and Homes development in Brooklyn has had a long and useful life. While it lacked modern layouts and equipment, it was possible to modernize it after half a century.
WHAT TENANTS WANT IN THE LIVING ROOM

Here is a prime example of a living room that suffers from circulation difficulties. The only possible circulation is through the center of the room. Low-income tenants would also complain that it has no privacy for use as a bedroom.

Here is another living room that serves well the functions most wanted by the low-income tenant. It could serve as a spare bedroom complete with closet; it need not be a hallway; and it can be shut off and "kept neat" for guests.

A further example of a living room that must handle too much traffic; in this case virtually all of the circulation is directly through this room. Lively teen-age offspring would soon drive a weary father either to bed or to the corner saloon.

If, as Miss Coit's study indicates, there is "too much living in the living room," what does that mean? It means, at least for the lower-income family, that apartments are designed to leave too many functions for this central room, too few for other rooms. What it amounts to is that the less fortunate family has little time or means for using a living room for its rightful purposes, but at the same time it lives too strenuously and too compactly to crowd its family life into the living room.

Does that mean, then, still larger living rooms, to accommodate other functions? Rather the other way around, it appears to Miss Coit. Be sure the living room fulfills the demands that will really be made on it, but decentralize the family activities in other rooms of the apartment.

"Allowing as much space as possible for the bedrooms, and that somewhat at the expense of the living room area, might better serve a great variety of families especially as the progressively shorter working week and seasonal unemployment are gradually more and more compensated for by intensive recreation and adult education activities requiring some isolation and a little space for use without interruption. The living room, nowadays no longer used as a rule for weddings or funerals, and only occasionally for a formal meal, if treated frankly for what it is, namely a sleeping room and a reception room, can have more, rather than less, charm than has the present wasteful, often little-used omnibus living room. And that would apply particularly to the many recent dwellings in which the living room is merely a kind of lounge extension of the passage from the public hall to bedrooms and bath, with no lights except tenant-supplied lamps."

What tenants particularly ask of living rooms are:

1. That circulation space not interfere with living space.
2. That privacy be possible for bedroom use, perhaps during an illness, or just for quiet.
3. That it be separated from kitchen work space.
IN THE KITCHEN

Most overloaded of all the areas in the low-income family’s dwelling is the “kitchen,” so much so that even the nomenclature is misleading. Miss Coit suggests the term “meal center” as being more descriptive of its true functions. And she has here delineated (below) in plan and elevation what might be taken to represent the ideal meal center; this, for the single-family house, should indeed simplify life for the housewife. It satisfies four tenant requirements most often demanded: more counter shelf space, more storage space, eating space not in living room but out of sight of work area (it is separated from it by head-high cupboards), and usefulness of dining space for other purposes. The work functions are arranged in sequence, according to scientific kitchen planning. There is about two and a half times the usual dresser space below 69 inches from the floor, with corresponding increase in work surface. The “draft closet” may look like the old fashioned pantry, but it is really important to the low-income family—allowing for quantity purchases, for much home canning, and for economy in refrigeration. The back porch entry would be highly prized, for comfort, for summer meals; and the hanging space for wet outer garments would be appreciated. There is no provision for laundering. That, says Miss Coit, is better taken care of in a utility room or basement, in the one-family house, or in the apartments day-to-day washing can be done in a “bath-utility” room (see page 78) or in the communal laundry. Whereas 36 in. is normal height for work surfaces, the wheel table is 32 in., giving a good height for beating and mixing, besides providing useful extra work space where needed. The dining space, not fully separated from kitchen area, would prove useful at non-meal-times, for play space or for hobbies.

For the crowded apartment the elevations (upper right) show a compact one-wall kitchen. Special features which Miss Coit has given it include: draft cupboard vented through louvres to outside to save refrigeration, range hood and flue, ventilated dish-drying cupboard so dishes may be put out of sight, and a shelf for the most used kitchen gadgets.
COMPLAINTS about bathroom layout are many and varied, but in general they are the same complaints that almost any family could register against the typical small bath: never enough storage space, can't open the window without standing in the tub, poor regulation of the shower flow, inconvenient placing of soap trays, towel racks, etc., no locked medicine cabinet, and so on.

A particular trouble in cramped quarters of a public housing project is that tenants must often use the bathroom for additional functions, such as light laundering. Miss Coit suggests a "bath-utility" room (right) which by the simple addition of a single laundry tray and an overhead drying rack, will serve as a combination bathroom and laundry room.

A common error in planning is to put medicine cabinets back to back in a party partition, with no insulation between them. "Insulation between the back-to-back medicine cabinets . . . would not only cut off much of the neighbor's plumbing noise, but would also render his conversation inaudible—and designers of hotels, clubs, and expensive apartments may one day become aware of that simple device and adopt it"

CHECK LIST
OF ESSENTIAL BATHROOM EQUIPMENT

The storage problem in the bathroom is one that seems to plague every housewife, whether in the one-family house or in the crowded apartment. Here is Miss Coit's check list of essential items for which space must be provided in every bathroom, for a family assumed to include four people:

In Convenient Locations
- 4 wash cloths
- 4 hand towels
- 4 bath towels
- hooks for 2 bath robes
- 2 bathing caps (at least)
- 4 tooth brushes
- and perhaps a weighing machine

In Mirror Cabinet
- cosmetics, including nail buffer, etc.
- shaving equipment
- tooth paste
- mouth washes

Stored Out of Sight
- hot water bottle
- enema equipment
- extra toilet paper
- extra soaps
- extra towels
- household remedies, including sodium bicarbonate, mineral oil, mild medicines, liniments, bandages, gauze, Red Cross kit, etc.

In Locked Cabinet
- strong medicines and poisons

In the typical bathroom there should also be space for drying stockings or light underwear.

Plan and elevation for a “bath-utility” room that should solve many problems for the low-income family, delineated by Miss Coit. A single laundry tray provides a place for doing the light but continual washing of stockings, underwear, children’s things, and so on, which the harassed mother must do almost daily. And, as Miss Coit points out, a laundry tray is a fine place for bathing baby. “Apart from the advantage of eliminating from the kitchen the discomforts of steam, dripping clothes and a wet floor . . . such an arrangement would enable the washing to be done at a pace suited to the washer, without interrupting processes at awkward times to fit the meal schedule.”
BEDROOM UTILITY CAN BE INCREASED

Greatest trouble found with bedrooms is that they are commonly just rooms for sleeping and for storing beds and chests—they have little or no daytime utility. With the usual furniture, most bedrooms leave room only for passage, not for play or homework or even sewing. Larger rooms would help, of course, but increased area is not the only answer. Often it is a matter of choice of furniture and its placement. Biggest requirement, says Miss Coit, is a new conception of the purpose of bedrooms. She suggests a new nomenclature, such as: "parents' room," "children's room," etc.

Thinking in these terms, designers would probably use more built-ins. "A girl's room, or a boy's room... could contain one or two cots or bunks. But instead of the tenant-supplied bureau, expensive to buy, especially on the instalment plan, soon dated and sooner shabby, a simple set of shelves and a few inexpensive trays built into a closet to store clothing."

Here are two fairly large bedrooms, with suggested furniture arrangement to meet certain standards—twin beds 3 ft. apart as A.F.H.A. recommends, and larger bedroom to accommodate a crib. To save space the chest is put between beds. But still it is "passage-plus-furniture"

Built-in furniture has greatly improved the usefulness of both of these bedrooms, in a house planned by the John B. Pierce Foundation and Skidmore, Owings & Merrill, architects. The boy's room is really a small bedroom, but the built-in bunks and shelf spaces leave good room for study or hobbies or just conversation

An actual and fairly representative plan of two bedrooms, with the furniture arrangement suggested by the architect. Note 1 ft. 9 in. between bed and wall in the larger room. In neither room would there be space or equipment for any daytime activity, or for homework

The plan at the left is here redrawn to show how much areas would need to be increased for reasonable passage between furniture and to allow 3 ft. at least between beds and crib. (Assuming twin beds 3 ft. by 6 ft. 1 in., and junior beds 2 ft. 9 in. by 6 ft.)

Here the same plan (far left) is again redrawn, this time to same size but with different furniture arrangement. There are built-in beds in principal bedroom, built-in bunks in the other. Linen is stored in drawers under beds and under lower bunk. Usable space is increased
Brooom closets, wrap closets, in the hall and near the back door, cool storage closets, kitchen closets near the stove and near the work surfaces, linen closets, bedroom closets, toy closets..."are demanded almost vociferously by a people still rather inarticulate as regards its housing needs."

"And when the layman rests the expert takes up the tale. The National Safety Research Institute points out the frequency of serious falls caused by keeping household equipment on the cellar stairs for lack of closet space, of falls by people climbing on flimsy furniture because they have no closet in which to keep a step ladder, of children's falls when climbing to a high shelf for toys which ought to be kept in a low toy closet... Not to mention one of the most successful manufacturers of prefabricated houses who... brackets together 'closets and a knowledge of the amount due monthly on the house' as forming the foundation of 'that order and security which are at the base of a successful home'."

'Convenience, labor saving, possibility of ease and rest in a strenuous domestic life seem to dominate tenant requests... And convenience seems to be arrived at by the relatively simple recipe calling for adequate work and storage spaces..."

For the one-family house the utility closet is coming into wide use. "One serves in the atticless, cellarless house as storage place for articles which cannot find a place in closets. USHA recommends in the row house a 'utility room and a small laundry with each unit: this is a vestibule, storage room, laundry and pantry combined,' and this recommendation tends to speed its more general adoption."

A favorite idea of Miss Coifs is this space-saving storage unit for bedrooms, combining bureau, desk and cupboards in one built-in closet. It has pull-out leaves for desk or dressing table use and drawers and cabinets for toys, clothes, linen, hats, etc. While it could be made for a single bedroom, this particular unit is designed for adjoining rooms, half of it facing one room, half the other. The space can be divided in any desired way (see sections)

A USHA plan suggestion showing the now-popular 'utility' closet, which besides providing a much-needed space for the washing machine, will also accommodate a great variety of wheel toys and household equipment. It is separate from heater room

Here is Miss Coifs's desk-bureau-closet combination as it would add storage space to an actual plan. The space at "A" in the upper plan would ordinarily be used for a dresser or chest, but could have almost three times the storage space with the built-in combination, as in the section (upper right). The space at "B" in the lower plan is almost just waste space, but the combination closet (section, right) makes the space very useful
Housing project managers and tenants can offer many practical design suggestions on details of finish and equipment. While they don’t always agree, many of their remarks come up often enough to deserve attention.

Windows and window heights are of especial importance in the livability of a room. “Current practice . . . for window sills at least 30 in. above the floor has several advantages. It avoids glare, it keeps children and toys on the right side of the barrier, and, provided one is fairly close to the window, permits a person in a sitting position to supervise the children’s play and enjoy the passing scene. . . . The 30-in. sill height has the distinct disadvantage, however, of giving less air movement, and thus less comfort during hot weather, especially where humidity is high, than does a lower sill. The lack of air circulation is sometimes painfully noticeable when the entire body is below the sill level, as in the case of a person lying in a bed.”

“Regarding air and light, for which architects are at pains to secure the best orientation possible, it is sometimes difficult to gauge the tenant-consumer viewpoint. . . . Blazing sunlight, a southern exposure and drawn shades, wherever found, are easily understood. But just how does the ‘white-collar’ family in a small apartment use a suite with rooms facing north or south or east or west . . . when most windows—especially living room windows—have a sash curtain covering one-half of the glass area, a drape covering about three-quarters, a shade drawn half way, and perhaps a screen?”

The widespread use in housing projects of living rooms for sleeping suggests a wider use of built-in or dual-purpose furniture (ARCHITECTURAL RECORD August, 1941, p. 68). Where beds are used as couches in daytime, the combination end table and chest (lower left) provides useful storage space. Two views at right show daytime and night use of a combination couch-bed.

“Casements occasion heat loss; but when open permit of more ultra-violet ray penetration. . . . I believe the added advantage of a feeling of being almost in the open air, which the casement affords, has much value in making for contentment.”

“The use of non-transparent glass in some kitchens and bathrooms makes frequent cleaning unnecessary; and gives for that reason a slovenly appearance. For stair hall windows in apartment houses, however, easily fingermarked by everyone passing, a rippled glass is almost a necessity.”

“Lack of proper curtain rods for corner window has occasioned some pitiful makeshifts.”

“A high degree of year-round comfort, combined with saving in heating costs, might be secured by use of the solid shutters frequently used in Continental Europe. Closed after dark in winter, they prevent heat loss by radiation, and diminish street noise.”

“Cooking ranges should be located at least one foot from the window jamb, according to safety experts, for many fires start when window curtains are blown across the stove.”
Tenants do appreciate balconies; under certain conditions they will give them intensive use. The balconies at Lakeview Terrace, Cleveland, don't give tenants quite the desired feeling of privacy. Those at Cedar Central, Cleveland, get intensive use, particularly where a projecting stair well gives them separation and thus privacy.

Similarly roof areas prove very useful, if properly utilized. At the Madison Square Boys' Club, New York (right), the boys find many uses for the club room on roof, and the terrace effect outside the room makes a fine stage for summer shows. At Lavanburg Houses, New York (below), the children enjoy activities on the roof.
**SOME PLANNING SUGGESTIONS**

Dual-purpose rooms in a conventional over-all plan. Here living room activities can be divided between the "kitchen-dining" room and the "day and bedroom," with the foyer permitting full privacy in either. Increased usefulness of "parents'" and "children's" rooms further relieves kitchen and living areas.

Here kitchen, living and dining room functions are frankly combined in one large room. The kitchen has its own wing, screened from the room itself by shoulder-high cabinets. Still the room can be by-passed through the children's room in case father and mother want some quiet in the evening.

A more conventional arrangement of dual-purpose rooms. Here living room is definitely separated from kitchen-dining room. But the latter area is large, with compact kitchen equipment leaving space for sitting without getting in mother’s way. Thus the room relieves the living room in many ways.

**IF ANY ONE CONCLUSION** stands out in Miss Coit's study of low-income families and their housing needs, it is that apartment rooms should be designed for multiple uses, to relieve pressure on the over-used kitchens and inefficient living rooms. Above she has drawn three suggested plans containing dual-purpose rooms. By no means intended to be "perfect" plans, they do illustrate how rooms might be given extra usefulness within economical over-all areas. Essential furniture is concentrated with built-in bunks and combination closet-bureau-desks (see page 80) to leave areas clear for activities which too often are concentrated in kitchens and living rooms. They have the "utility-bathroom" (see page 78) to relieve the kitchen of light laundering. And, emerging from the isolation as "bedrooms," these areas are now designated as "parents' room," "children's room," or "day and bedroom." Kitchen equipment is compact, but kitchens themselves are large, to be "kitchen-living" rooms, or "kitchen-dining" rooms; at any rate to contain the multitudinous activities that commonly go on in this area. Also on this page are three plans from actual projects, selected by Miss Coit as having exceptionally good points from the tenant's standpoint.

**HILLSIDE HOMES, NEW YORK.** Clarence Stein, architect

An excellent plan for a public housing development. Living room can be by-passed for sleeping privacy; the dining room also can serve as a bedroom, permanently if desired, and the bedrooms are uncommonly large, leaving usable space around the furniture.

**GREENHILLS, CINCINNATI.** Roland Wank; G. Frank Cordner; architects

A single-house type of plan particularly good for a southern climate, where complete separation is desired between kitchen and living room. Here, too, the bedrooms are large enough to serve other purposes, and to give plenty of air in hot weather. Closets are large. If the rear position of living room is a bit advanced for low-income families, it does give good cross ventilation through the entrance hall. Stairs lead to two bedrooms and bath on the second floor. The high sash, used in combination with normal windows, gives extra furniture space without interfering with ventilation.

Three words in ANY EMERGENCY FOR THE ARCHITECTS and BUILDERS OF DEFENSE PROJECTS

BARRETT SPECIFICATION ROOFS

With wartime plant construction involving many new and complex problems that must be solved fast and right the first time, those three words have the significance today of sound information to the architects and builders of defense projects.

Written into the specification for any type of flat roof project, BARRETT SPECIFICATION ROOF means that one of your difficult problems has been solved immediately and completely, in all details of materials and installation.

It means that you have specified a roof of proven quality, made of Barrett Specification coal-tar pitch and felt with fire-safe gravel or slag wearing surface.

It means that this roof will be applied according to Barrett Specifications by a Barrett Approved Roofer, selected for his proven experience, integrity and workmanship.

It means that the roof you've specified will be "delivered" to you, installed, bonded, and inspected by Barrett experts.

In short, it means that your entire roofing problem has been solved... fast, and right the first time!

BARRETT SPECIFICATION ROOFS

ONE OF AMERICA'S GREAT BASIC BUSINESSES

APRIL 1942
DAYLIGHTING

plus Insulation

- THERMAG semi-vacuum glass blocks, with "Magnalite" lenses give complete 4-way light diffusion through an entire room. Total solar heat transmission per square foot of skylight area is under 50% by test. Airtight construction virtually eliminates thermal heat loss.

- THERMAG's rigid, insulated reinforced concrete grid construction is designed to withstand all snow loads and foot traffic. THERMAG's smooth surfaces clean easier. Its design and insulation guard against any chance of condensation.

- THERMAG's even diffusion of mellow white daylight over wide room areas keeps skylight areas at a minimum. The soffit is highly ornamental. For details, see Sweets. For prompt engineering service without obligation, write direct to 2139 West Fulton Street, Chicago.

Metal Blackout Awnings

A DIFFERENT answer to the blackout problem for industrial, commercial and residential buildings comes with the introduction of a metal blackout awning which is installed on the outside and operated like a roll-top desk, for either sunlight or blackout protection. The segments telescope together when closed, and the awning is said to be rust-proof and fire-proof. The manufacturer claims nighttime reflections are eliminated. Acklin Stamping Company, Toledo, Ohio. (See fig. 1.)

Asbestos-Cement Board

An asbestos-cement board of the type being used in army cantonments, naval bases, ordnance plants, etc., has been added to a well known line. This is a hard, rigid, non-combustible product with smooth finish, in thicknesses of 1/32, 3/16, 1/4 in. Standard sizes 4 by 4 ft., 4 by 8 ft. It is applied with nails or screens direct to wood sheathing. Celotex Corp., 919 N. Michigan Ave., Chicago, Ill.

Non-Priorities Flashing

A FLASHING that is said to require no priorities has been designed as a substitute for metal flashings. It consists of a felt core bonded on both sides to asphalt-saturated fabric by means of a ductile mastic. This flash-
The men and management of Carrier deeply appreciate the Navy's reward for the work we've been doing for defense. We're human enough to feel proud that Carrier is first in the air conditioning industry to earn the Navy "E".

In the submarine, life depends on huge storage batteries preserved by Carrier Air Conditioning. On board many Liberty Fleet ships, ship's food is like home food, thanks to Carrier Refrigeration.

In the sky and on land, Carrier is earning its letter, too. Instruments and bombsights of unmatched accuracy... motors that climb higher, fly faster, stay in action longer... and a thousand more triumphs of American industry depend on Carrier developments... on the microscopic accuracy made possible by controlling temperature, humidity, and circulation of air.

Today, air conditioning is a mighty weapon. Tomorrow, it will be an even more potent force in building a world of greater abundance for everyone.

Architects Pace The Victory Drive

Across the continent, architects are drawing plans to help speed industrial production. In much of this new, modernizing construction, air conditioning is being incorporated to control essential manufacturing processes. The value of Carrier Air Conditioning and Refrigeration in America's victory drive is shown by its priority ratings in today's war-time construction.

Typical examples are: the "dry-blast" furnaces—one stepped up steel production an extra 27%; the air conditioned black-out plants where even temperature, correct humidity and freedom from dust are essential to fast precision machining; the telephone, gunnery, and other military nerve centers which must be guarded against gas attack; the parachute, food and plywood storage spaces which must provide protection against deterioration.

Carrier with its 40 years of air conditioning development offers the cooperation of its engineers and dealers. We offer our experience in serving Army, Navy and war industries with Carrier Air Conditioning, Refrigeration and Heating. You will find complete Carrier data in your Sweets Catalogue, cover shown here.
Cement-Asbestos Pipe

A CEMENT-ASBESTOS pipe is now being offered which is manufactured by a patented high-pressure process said to give it extremely high density and great mechanical strength. A patented method of coupling, it is claimed, does away with special treatment or threading of the ends. The standard pipe is designed for handling mildly corrosive solutions, transporting water which must be kept free of metallic contamination, etc., handling fumes and gases in ventilating ducts and stacks, etc. For highly corrosive conditions the pipe is available with impregnated or synthetic coating. United States Stoneware Company, Akron, Ohio.

Simplified Kitchen Cabinetry

A LINE of condensed and simplified kitchen cabinetry, suitable for low-cost housing, has been added to a well-known higher-priced kitchen line. Units may be used singly or in assemblages. Kitchen Maid Corporation, Andrews, Ind. (See fig. 3.)

AUTOMATIC COAL HEAT for DEFENSE HOMES...

With the growing importance of coal heating in low cost Defense Housing, these Cooper Stoker-fired 64,000 and 80,000 B.T.U. Air Conditioners are becoming more and more popular with architects, builders and owners everywhere. Designed to meet today's special need for an inexpensive but efficient automatic heating plant, they have proved themselves in service in hundreds of homes throughout the East, in sections noted for severe winters.

The Cooper Stoker-fired Air Conditioner arrives on the job as a packaged unit, ready to set up. It consists of an improved Cooper Anthracite Stoker complete with motor-operated fan and bin-feed attachment; Retort of improved design; heavy, welded fume-tight steel Combustion Chamber; steel jacket with inner lining; large Plenum Chamber; oversize Air-circulating Fan and motor with Air Filter. Stoker and fan are controlled automatically. Installation can be handled by one semi-skilled man within a few hours. No valves or fittings required.

The Cooper Anthracite Stoker used in this unit is approved by the Anthracite Industries Laboratory, Primos, Pa. The furnace is designed in accordance with specifications set up by the Procurement Division of the United States Treasury Department, and meets the requirements of the Federal Housing Authority for Defense Housing.

Your request for further information will receive prompt attention. Full cooperation will be extended to architects and builders. Write today.

64,000 and 80,000 B.T.U. AIR CONDITIONERS
From the Board of Directors
to Architect Ambrose

... "Because he specified the

CELOTEX VAPOR-SEAL ROOF INSULATION

which has helped accelerate our war production"

This orchid might have been presented to any one of many architects—by any one of many boards of directors up and down the land. Because this photograph shows only one of many vast war industry plants where Celotex Vapor-seal Roof Insulation is accelerating production—through temperature and humidity control.

Records show radically reduced air-conditioning costs in plants using Celotex Vapor-seal Roof Insulation. And, in the northern states, it aids amazingly in fuel conservation, important in war time.

If industrial atmospheric control forms any part of your current problems, let us send you latest specifications on this thoroughly tested roof insulation which is (1) readily available NOW, (2) able to compete in efficiency with any other type of rigid roof insulation, since its thermal conductivity is 0.30 Btu, (3) permanently protected against termites and dry rot by the exclusive, patented Ferox Process. Write today!

Maple Frame Double Glazing

To conserve aluminum, hard maple is now being used to make wood frame removable double glazing panels for casement windows. Engineering tests are said to indicate that the new panel is as efficient as the aluminum formerly used. Andersen Corporation, Bayport, Minn.

Heaters For Defense Housing

The following list of heating unit manufacturers and their products, though necessarily incomplete, should provide the designer of defense housing with a wide range of suitable heating equipment. Names of manufacturers and products were for the most part supplied by Anthracite Industries, Inc. As additional data are received they will be published.

The designer should note that products must be checked against the War Production Board’s "Defense Housing Critical List," as outlined in Time-Saver Standards appearing in this issue.

HAND-FIRED COAL FORCED WARM AIR FURNACES

Fitzgibbons Boiler Company, Inc.
101 Park Avenue, New York City
"Fitzgibbons 80-FWA" Williamson Heater Company
Cincinnati, Ohio
"Williamson Model D-18"
Michigan Tank and Furnace Corp.
14101 Prairie Avenue
Detroit, Michigan
"Comfort Zone, Models HB-20, SB-20"
C. A. Olsen Manufacturing Company
Elyria, Ohio
"Luxaire No. 720-S Forced Air Furnace"
Lennox Furnace Company
Marshalltown, Iowa
Columbus, Ohio
Syracuse, New York

ASBESTOS DUCTWORK FOR WARM AIR SYSTEMS

Philip Carey Manufacturing Company
Lockland, Cincinnati, Ohio
"Careyduct"

Here's good news! You can give your low-cost defense housing and rehabilitation homes the great convenience of a shower cabinet made of ARMCO Galvanized PAINTGRIP Metal. It is moderate in cost and will give long, satisfactory service.

Shower cabinets made of this galvanized sheet have a special bondered coating that tightly grips the smooth baked-enamel finish. The PAINTGRIP costing insulates the enamel from the galvanizing and preserves the life and appearance of the finish.

Shower cabinets made of ARMCO PAINTGRIP Metal are approved in the latest defense housing critical list. We shall be glad to put you in touch with reliable manufacturers. Just write to The American Rolling Mill Company, 581 Curtis Street, Middletown, Ohio.
"The man is here to talk about that washroom traffic problem"

The traffic cop doesn't know it yet, but he's going to be completely stymied by that traffic problem.

Actually, it's a job for the Scott Washroom Advisory Service.

That's because this helpful service offers the architect complete technical data on traffic requirements in all types of industrial, institutional and public washrooms. Trained staff members are always available for consultation. And because the Scott Washroom Advisory Service also provides specification material on sanitary needs, fixtures and their arrangements, it is decidedly helpful in planning any washroom for continued efficiency and economy.

For details, and for a set of Don Graf Data Sheets on washroom planning, write Scott Paper Company, Chester, Pa.

SCOTT WASHROOM ADVISORY SERVICE
offered by the makers of the famous
new "Soft-Tuff" ScotTissue Towel and ScotTissue Service Roll
SPECIFICATION STANDARDS FOR GOVERNMENT WORK

By HAROLD R. SLEEPER, AIA

This installment concludes the list of specifications often involved in work for the Federal Government. Parts 1, 2 and 3 appeared in the January, February and March issues of ARCHITECTURAL RECORD.

DIVISION 15. SCREENS

Cloth; wire; screen
Specify Type, and mesh per sq. in.
Type A — Copper
Type B — Commercial bronze (brass)
Type C — Bronze
Type D — Iron or Steel, galvanized
Type E — Copper-nickel-alloy
Type F — Corrosion-resisting steel
Type G — Aluminum alloy

DIVISION 16. WINDOW SHADES & VENETIAN BLINDS

Cloth; shade
Specify: Type of rollers, type a, wooden; type b, metal.
Specify slats: 5/8" or 1 1/2" wide for lengths up to 54".
Specify Type shade cloth: Type I cambric, Type II Holland, Type III Pyroxylin.
Specify color of shade: dark ecru, light ecru, white, medium green, dark green; Type I and III may have dark color on one side and light on other.
Specify whether pulls or cords are to be used.

DIVISION 17. INSULATION & ACOUSTIC MATERIAL

Insulation; (vegetable or wood fiber), blanket, felt and loose fill
Specify Grade A, medium or Grade B, hard. Thickness 7/8", 3/4" or 5/8".

Millboard; asbestos
FED. SPEC. HH-M-351

Mineral-wool; impregnated blanket, block, and pipe covering
(for low temperatures) FED. SPEC. HH-M-371

Acoustic-materials; (for) plastic-application
FED. SPEC. SS-A-111

Fiber-board; insulating
FED. SPEC. LLL-F-321

Cork; granulated, insulating
FED. SPEC. HH-C-571a

Cork; compressed (corkboard) (for thermal insulation)
FED. SPEC. HH-C-561b

Insulation; bat or strip-form and loose-fill
FED. SPEC. HH-I-521b

DIVISION 18. EQUIPMENT & FURNISHINGS

Furniture and cabinets; office, sectional, steel
FED. SPEC. AA-F-791b

Furniture and cabinets; office, sectional, wood
FED. SPEC. AA-F-801

Lockers; clothes, steel
FED. SPEC. AA-L-486

Safety; burglar-resistant
FED. SPEC. AA-S-71

Safety; insulated
FED. SPEC. AA-S-81

Shelving; steel, storage
FED. SPEC. AA-S-271

Matting; rubber
FED. SPEC. ZZ-M-71

Mats, floor; rubber, link-type
FED. SPEC. ZZ-M-46

Cloth; awning
FED. SPEC. CCC-C-406

Lining; carpet
FED. SPEC. DDD-L-416

Mats; door, fiber
FED. SPEC. DDD-M-156a

FED. SPEC., EXCEPT AS NOTED

Type H — Iron or steel, japanned or painted
Type I — Chromium-nickel alloy
FED. SPEC. E-RR-C-451a, Oct. 20, '41 modifies and limits wire as follows: Use only Types B, D, E, or H.

Simplified Practice Rec.
Wire insect screen cloth
Simplified Practice Recommendation R 122

FED. SPEC.

Type I Bat or strip form.
(Class A Lightweight (.30 B.T.U.)
(Class B Medium weight (.50 B.T.U.)

Type II Loose fill form.
(Class A) Lightweight (.30 B.T.U.)
(Class B) Medium weight (.50 B.T.U.)
(Class C) Heavyweight (.50 B.T.U.)

Material Form: Fibrous, granular, modulated fibrous, powdered forms mixed with cellulose fibre, or bat form.

Thickness: 4", 3 1/2", 3" and 2".

Commercial Standard
Board; fiber insulating (second edition) CS 42-35

FED. SPEC.

Cans, corrugated; ash and garbage
FED. SPEC. RR-C-81

Fire-extinguishers; chemical, hand, carbon-tetra-chloride type
FED. SPEC. O-F-351 (1 quart size; use liquid as specified in Fed. Spec. O-F-380.)

Fire-extinguishers; chemical, hand (soda-and-acid type)
FED. SPEC. O-F-355a

Fire-extinguishers; hand, portable, foam-type
FED. SPEC. O-F-361

Fire-extinguishing-liquid; carbon-tetra-chloride base (For use with extinguisher O-F-351.)
FED. SPEC. O-F-380

ARCHITECTURAL RECORD
WARS ARE WON not only on the battle line but on the production line. On each, both equipment and man power must be superior!

In new industrial plants, or governmental buildings, heating must be planned strategically.

For heating equipment—to get proved automatic, fast, effective plant heating, with greater fuel savings and lower maintenance and operating costs—specify Modine Unit Heaters.

And for more productive man power—specify Modine Unit Heaters. Modines deliver heat down to the working level; give circulation without cold drafts or hot blasts; maintain even temperatures. There's less illness; fewer man-hours are lost. Working comfort increases worker co-operation. With everybody “in step,” production goes steadily on . . . and up!

You can get Modines just as soon as you can any unit heaters. And Modines can be installed faster.

Look in your phone book for Modine representative's name—“Where to Buy It” section under heating apparatus.
AN ACRE OF

Speed With Prefabricated Units — Units (up to 50 square feet of wall area) arrive at the job site in a truck... ready to be erected at the rate of one every nine minutes. No delays because of weather; no waiting for wet materials to set.

Fine Architectural Appearance — Q- Panels offer a wide variety of designs. They consist of flat and fluted steel plates (either surface may be used outside) with insulating board sandwiched between. With 1 1/2 inch of insulation, these panels have an insulating value of .14 Btu's per square foot, per degree temperature difference, per hour.

Good-looking, Easily Cleaned Interior Walls — are provided by the flat plate of the Q-Panel. Nothing needs to be added except paint. Architectural relief may be had where desirable, by turning the fluted side of the unit to the interior.

ROBERTSON
FACTORY WALL IN 3 DAYS

YES, but none too quick to meet the "All-Out" production demands of American Industry today. Because Q-Panel can be quickly delivered and quickly erected, they are being specified and used in one urgent plant project after another. Although they are ideal for "Blackout" plants and additions, they also meet the design and engineering needs of Daylighted Structures.

Every Q-Panel section is a complete insulated structural unit for wall or partition. It is provided in standard two-foot widths and in any length up to 25 feet. Thus, one section (which can be placed in 9 minutes) is equal to 50 square feet of wall. Interlocking joints at the edges of the units are caulked to make airtight, weathertight walls.

SPEED characterizes Q-Panel construction from the very beginning. The units arrive at the job site, prefabricated, ready to take off the truck and erect. Only six bolts are necessary to fasten a unit to the structural frame. Q-Panel constitute "dry" construction ... which facilitates winter building. There is no waiting for wet materials to set, no hazards from combustible forms. It is a permanent form of construction; yet, Q-Panel may be salvaged and used again, an important factor for peacetime adaptations of war production plants.

The cross section at the right indicates the salient features of Q-Panel wall construction. Further details, estimates, etc., will be gladly furnished. Usually, plants incorporating Q-Panel for walls and partitions also use Q-Floors and Q-Roof Decks.

Versatility of Use—Q-Panel construction is well suited to use in a wide variety of structures . . . aircraft buildings, munitions plants, warehouses, powerhouses and other types of manufacturing buildings.

SNAPS IN...STAYS IN

The New Stanley Non-Rising Pin

The greatest advance in hinge construction in 40 years! A simple, positive, dependable method of keeping butt pins in place.

The non-rising feature is secured by a split ring attached in a groove in the pin. As the pin is seated, the ring expands into a pocket at the bottom of the top knuckle of the butt. No ears to line up . . . no twisting or turning . . . no pliers. It can’t rise, yet is easily withdrawn.

A TIME-SAVER IN SPECIFYING HARDWARE! WRITE FOR IT!

Catalog No. 61, showing all the many hardware types and lines available from Stanley, will be invaluable as a reference book. Write for a copy, and use it as your guide to good hardware. The Stanley Works, New Britain, Connecticut.
from +90°F to -30°F in 15 minutes!

...with G-E "Scotch Giant" Condensing Unit

In one of America's arsenals, this G-E "Scotch Giant" condensing unit provides the refrigeration for a special enclosure in which instruments may be tested at temperatures as low as -30°F. A temperature tolerance of plus or minus ½°F is also maintained.

For Army and Navy needs...for special industrial processes...for essential air conditioning of war industry plants...engineers are turning to General Electric equipment. The wide range of General Electric products in the refrigeration field—together with G-E research and experience—assures that whatever your war needs, General Electric can meet them.

GENERAL ELECTRIC

FOR THE COMPLETE REFRIGERANT CYCLE

...TURN TO...

G-E Condensing Units ("Scotch Giant"), water-cooled, are available from ½ to 125 hp. May be used in multiple when a larger cooling effect is required.

G-E Evaporative Condensers often save 90% or more in water costs. Available in a full range of sizes with refrigerant capacity of 5 tons and up.

G-E Coils are available in all stock sizes for every heating and cooling need. Also "tailor-made" sizes to meet your specifications.
RIXSON'S FIRST Job Today
...for a Victorious Tomorrow

The entire Rixson organization is pledged to unlimited use of our energies, human and mechanical, in an "all out" effort toward a three-point Victory Program.

RIXSON'S 3-POINT Victory Program

1. Complete cooperation with Uncle Sam, by producing vital equipment for our armed forces... regardless of losses or sacrifices on our part.
   For the civilian building industry we will continue to manufacture and stock all the essential Builder's Hardware permitted by National Defense needs. And if we must build fewer units, there will still be no compromise with Rixson quality!

2. Wholehearted co-operation with all users of Rixson Builders Hardware, new or old, in keeping that equipment in continuous, efficient operation.

Can you expect more from one type of floor material than from another? Just consider that Nairn linoleum alone meets all four of the basic specifications for the modern floor:

1. **EYE APPEAL**—Unequaled beauty and wide variety of color offer unlimited freedom of design. Patterns that are Color Correlated—with each other and other decorating materials.

2. **LONGER WEAR**—Nairn linoleums not only meet, they exceed U. S. Government specifications on every point. Built-in ruggedness that spells long-range economy.

3. **RESILIENCE**—Quiet, "foot easy" Nairn floors are sound absorbing, sound deadening, ... "comeback" with a minimum of marring after indentation.

4. **CLEANLINESS AND EASY MAINTENANCE**—One-piece construction leaves no dirt-catching cracks and joints... reduces maintenance time and cost to a minimum. Positive germicidal properties. No splinters! No "dusting"!

Valuable facts to keep in mind when you buy floor-covering—especially in these times. Why take less than full value—a floor that lacks any of the four musts of the modern floor? Nairn linoleum has "all four"—gives you 100% value.

AND WHEN IT COMES TO WALLS, it's likewise valuable to know why the swing is to Nairn wall linoleum. It lasts as long as the building, and will never fade, stain or dent. Wide range of patterns and colors! Nairn floor and wall linoleum have full guarantee when installed according to specifications.

CONGOLEUM-NAIRN INC., KEARNY, N. J.

* An ideal setting here for the Home Economics class of Calhoun Junior High School at Homestead, Pa. The floor and the wall linoleum are colorful, easy-to-clean Nairn linoleum.
There are varying degrees of quality in window glass, as in almost everything else. That's why the name "Pennvernon" has come to mean so much. It stands for uniformly high quality in window glass. It assures a freedom from distorting defects rare in sheet glass making. It identifies a glass that gives good vision, that is bright and reflective of surface on both sides of the sheet. And it marks a glass which is nationally known and nationally available through our many branches and thousands of dealers. Pittsburgh Plate Glass Company, Grant Bldg., Pittsburgh, Pa.
HELP for DEFENSE HOUSING

They Save Space. Set flush with wall. Doors swing back into wardrobe without blocking aisles.

They Are Simple. Patented trouble-free hardware gives silent, carefree operation for life of building.

They Are Practical. Time-tested wood construction harmonizes with classroom and corridor trim.

They Are Proved. Thousands of schools, throughout the entire country, are equipped with Evans Wardrobes.

They Are Low Cost. Amazingly simple construction results in surprisingly low price. Variety of sizes.

NO TAPES OR CABLES, NO EXPOSED TUBES

Entire balance moves with sash. Always invisible regardless of window position. Tapes and cables eliminated. No interference with neat painting job. No screws or trim to remove for tension adjustment.

EASILY INSTALLED

Only 6 simple steps. Frames require no machining. No cuts in sash, except full height, round-bottom groove in sash stiles. No blocks to fasten on jambs.

ENDORSED FOR FEDERAL HOUSING PROJECTS

Contractors using upwards of 1,000 sets of INVISIBLE balances on government housing projects endorse these for ease and speed of installation and smooth, efficient performance.

Planning a Community center?

Large, clear floor areas readily attained by use of Bethlehem Longspan Joists.

Many localities, suddenly over-populated because of war-production, are greatly in need of such facilities as community centers, hospitals, apartment houses, schools. When you are planning structures such as these, you can provide large floor areas unobstructed by columns, as well as fire-safety and other advantages, with economy in construction costs, by specifying Bethlehem Longspan Joists.

These joists make possible column-less spans of up to 64 feet in light-occupancy buildings. As they can be placed directly on walls, they do away with the need for pilasters or other reinforcements, and can be used regardless of whether or not the building is of steel-frame construction.

When used in combination with a concrete floor slab and plaster ceiling, Bethlehem Longspan Joists provide excellent sound resistance and as much as 21/2-hour fire safety. And because Longspans do not sag or shrink, they prevent many a crack, open baseboard and squeaky floor.

Moreover, Longspans speed construction. They are completely shop-fabricated, clearly marked for quick erection, and can be placed with the aid of only a light gin pole.

Investigate fully the possibilities of using Bethlehem Longspan Joists for floors and roofs of all types of light-occupancy buildings. Send today for copy of booklet giving complete facts about these joists. Address: Bethlehem Steel Company, Bethlehem, Pa.
Show your clients this simple way to **SAVE MONEY ON AIR CONDITIONING**

Summer heat and street dust are sealed out of this air-conditioned building, with the help of three draft-proof Revolving Doors. Low-cost stock wood doors can be interestingly arranged and architecturally individualized by the addition of moldings, enamel, lacquer or special matching finishes.

- Help your clients cut their air conditioning costs to a minimum—by specifying Revolving Doors.

Scientific tests prove that Revolving Doors protect air-conditioned buildings from hot blasts of dust-laden air, and reduce the load on cooling equipment. Even in buildings that are not air-conditioned, Revolving Doors shut out heat, dust, dirt and noise—and provide greater comfort for customers and employees.

- War-time priorities won't permit Revolving Doors of bronze, copper or aluminum. But we can furnish doors of furniture steel, colorful Formica, and most fine cabinet woods.

- Phone your local Revolving Door representative for full technical data. Or write to the factory for a free A. I. A. Data Folder, containing photographs and descriptions of new installations in banks, office buildings, restaurants, hotels, and stores.

5 Ways a Revolving Door Pays for Itself—

1. Cuts heating and cooling costs.
2. Increases usable floor space.
3. Reduces damage from dust and dirt.
5. Safeguards employees' health.

ANSWER: The roof in the foreground is a Johns-Manville ASBESTOS Roof

A strong west wind was blowing through the town of Chelsea, Oklahoma, when fire broke out in a tavern in the business district. Breaking through the roof of the two-story structure, the flames quickly spread to a theatre next door, then to an auto-parts store. Both buildings were completely gutted.

Next building in the row, the First National Bank, was protected by a J-M Asbestos Built-Up Roof. Though the low fire wall (see photo) offered practically no protection from the roaring blaze, the asbestos roof resisted the fierce heat and the bank was saved.

This is a striking example of the effective fire protection offered by J-M Asbestos Built-Up Roofs—protection which is more important today than ever before. And because asbestos has the durability of stone, long exposure to sun, rain and weather has little effect on these roofs. Rotproof, they need no periodic coating—require little if any maintenance.

For further details and specifications write Johns-Manville, 22 East 40th Street, New York, N. Y.
A Home Worth Fighting for is Worth Planning for NOW!

F. W. Dodge Corporation
119 West 40th Street
New York, N. Y.

Gentlemen:

After the war is over, we intend to build a six room brick Dutch Colonial home with a two car attached garage for a cost of about $6,500 or $7,000. It will either be in Middletown, Conn., or Farmington, Conn., for we own property in both places. As yet, we have not selected either architect or builder.

I hope that I am qualified to receive a copy of Home Owners' Catalogs.

PEOPLE are planning now for homes they expect to build after the war is over, and priorities on materials and equipment have been lifted. The above letter is but one piece of evidence. There will be a $25,000 brick residence in the Chicago area after the war—eight rooms, three baths, two car garage—architect not selected. . . . Another owner is planning a $12,000 house in Virginia—architect not selected. . . . Others, taken at random from current Dodge Reports, reveal widespread intention to build when conditions permit. . . . There's an $8,000 home planned for Upper Arlington, Ohio; a $6,500 house in McKeesport, Pa.; and another in Bryn Mawr, Pa.—probably of stone, two and one-half stories and basement.

Many more such verified examples could be quoted. And in all cases, these owners are gathering ideas and information about materials and equipment for their new homes. They find Home Owners' Catalogs a wonderful aid.

If you have clients who have postponed their building plans, or if you know people who are thinking of building at a later date, ask us to send them copies of this comprehensive, beautifully illustrated book. There is no cost or obligation—just the necessity of complying with the restrictions in the coupon below.

Home Owners' Catalogs will help to keep the home building idea alive—and make for speedy action when these potential owners are ready to proceed with their plans.

Home Owners' Catalogs

Published by F. W. Dodge Corporation

REQUEST FREE COPIES OF HOME OWNERS' CATALOGS FOR THOSE WHO WILL BUILD THIS YEAR—OR WHEN WAR PRIORITY CONDITIONS PERMIT.
SELECTED BOOK LIST

Here is an opportunity to add one or more important architectural books to your working library. Each one of these titles is a standard on its particular subject and is well worth the price.

1. AERIAL BOMBARDMENT PROTECTION, by Harold E. Wessman and William A. Rose. 372 pages — 5¾ x 9 in. illustrations—Price, $4.00.

2. BETTER HOUSES FOR BUDGETEERS, by Royal Barry Wills. 104 pages—9 x 12 in.—Sketches, plans and descriptions—Price, $3.00.

3. GLASS IN ARCHITECTURE AND DECORATION, by Raymond McGrath and A. C. Frost. 650 pages, 462 halftone and line illustrations—9½ x 12½ in.—Price, $20.00.

5. HOUSES FOR GOOD LIVING, by Royal Barry Wills. 104 pages, 9 x 12¼ in.—102 illustrations and plans—Price, $4.00.

7. DESIGN THIS DAY, by Walter Dorwin Teague. 291 pages—9½ x 7 in.—Price, $6.00.

8. AN AIR CONDITIONING PRIMER by William Hull Stangle. 236 pages—6 x 9¼ in.—Price, $2.50.

9. SMALLER RETAIL SHOPS, by Bryan and Norman Westwood. 9 x 12½ in.—Price, $4.00.

10. THE DESIGN OF NURSERY AND ELEMENTARY SCHOOLS, by H. Myles Wright and R. Gardner-Medwin. 120 pages—256 illustrations—9 x 12¾ in.—Price, $4.00.

14. APPLIED HEAT TRANSMISSION, by Herman J. Stoever. 226 pages—6 x 9 in.—115 illustrations—Price, $2.50.

15. THE NEW ARCHITECTURE IN MEXICO, by Esther Born. 159 pages—9 x 12 in.—Price, $2.50.

Check on the order form the numbers of the books you want, and mail to Architectural Record with your remittance — no extra charge for postage.
The responsibility for safe, sanitary pool water begins with the architect who designs the pool. You'll be better equipped to fulfill this responsibility with the help of informative, illustrated booklets offered by Wallace & Tiernan, dealing specifically with the following types of pools:

1. Outdoor Commercial Pools
2. Outdoor Municipal Pools
3. Town and Country Club Pools
4. High School Pools
5. College Pools
6. Hotel and Apartment Pools
7. “Y” and Club Pools
8. Private Estate Pools

Copies of any or all of these booklets will be sent on request. Remember, too, that the unmatched experience of Wallace & Tiernan in safeguarding swimming pool water is always "on call" to help you when the need arises.

High Quality and Conduct are "Drilled" into LCNs

- From raw materials to finished product, LCN door closers are brought up to perform with precision and endurance in the discharge of their duties. Now this LCN production "discipline" is also serving Uncle Sam. This is why, even with night-and-day operation, we are asking our regular customers to order for essential requirements only.

The amount of finished stock on hand is limited, and can be replenished only as we are able to do so without interfering with the drive to win the war.

We have been making quality door closers for a long time—and making friends in the bargain. With your cooperation and understanding, we'll do our part of the big job and go back to full time on door closers when the big job's done. LCN, 466 West Superior Street, Chicago.

THE CONSTRUCTION INDUSTRY CONFORMS TO THE VICTORY PROGRAM

With undaunted spirit, America and Americans responded a few short months ago to the urgent call for all-out war production—with those in the construction industry paving the way.

Now tanks, guns, planes and ships are streaming into action ... Bullets, shells, and bombs—uniforms, rations and equipment—are flowing in quantity to our battle lines and training camps.

New buildings and additions to existing structures, required for war production were planned and built in record time—and additional construction is keeping pace with or exceeding, the demands of our expanding production schedules. Our arsenals are still being doubled and trebled. Hundreds of thousands more housing units for war workers still have to be built. Vocational training schools, hospitals, commercial buildings, and all manner of projects necessary to the health and safety of the public must be provided. The end is not in sight—but, neither are the limitations of the construction industry.

We will build ... build ... build. So that the industry can work ... work ... work—and our land, sea and air forces fight ... fight ... fight—for the preservation of our freedom.

TIME IS SHORT – MAKE TIME COUNT

The task of marshalling the manpower, machines, materials and equipment of the construction industry to the needs of the victory program is lightened in a significant manner by Dodge Reports service. Dodge Reports provide a timely and selective flow of confidential information to those who are contributing to the all-out war effort. Through this service owners, architects, engineers, contractors, subcontractors, sub-subcontractors and manufacturers are coordinating their activities—so that the right men, the right materials and the right equipment are available at the right time.

Working closely with officials of the War and Navy Departments, and conforming with established rules of censorship, Dodge is helping to coordinate the activities of leading members of the construction industry—and speed the war program.

But, time is short. So make time count ... in this case by cooperating fully with the Dodge Reporter who calls at your office.

DODGE REPORTS

F. W. DODGE CORPORATION, 119 West 40th St., New York, N. Y.
Look for these three Anchor-Weld features—when you specify iron picket fence: (1) **Inseparable Welded Joints** (see top illustration) welded at every point of contact to prevent sagging and loose pickets. (2) **Rails and Pickets of Equal Weight**, made from weather-resistant copper-bearing steel, assure permanence of alignment and prevent sagging. (3) **No Center Supports.** An Anchor-Weld Fence needs no center supports, yet each panel will support a distributed load of one ton without showing permanent set. Learn how Anchor-Weld Iron Picket Fence lives up to your ideal Fence Specifications in other ways, too. Mail the Coupon below for catalog and a Sample Anchor-Weld (a nice paper-weight). No obligation, of course.

**NATION-WIDE SALES AND ERECTING SERVICE**
Lighthouse throws more light on new type of concrete construction

Architectural Concrete Slabs assure permanence and low maintenance at new Coast Guard Station.

Use of Slabs as exterior forms facilitates erection.

THE United States Coast Guard was faced with two primary problems in planning this lighthouse, which stands somewhere off the Atlantic seaboard:

1—to build a permanent, white structure that would not require periodic refinishing;
2—to build a structure with a minimum number of joints to reduce danger of leakage and disintegration at joints.

Thin, precast Architectural Concrete Slabs made of steel, stone, and Atlas White cement answered both requirements. They provided a permanent, white exterior that will need no repainting. The large size—up to 12' by 4½'—reduced the number of joints. Their varied shapes permitted the returns, including window heads, sills, copings, jambs, and soffits, to be cast integrally with the slab facing. This saved time and cost for waterproofing, flashing, and pointing; reduced danger of leakage and disintegration at joints; and resulted in quicker erection at lower cost. The high strength of slabs enabled them to serve as exterior forms for the structural concrete, reducing scaffolding and job forming to a minimum.

This is just one example of the versatility and adaptability of these factory-made structural and decorative units. To get the complete story, send the coupon for a new 28-page booklet, complete with plans and detailed drawings of many typical jobs. Universal Atlas Cement Company (United States Steel Corporation Subsidiary), Chrysler Bldg., N. Y. C.

Details show: "Plan at 1"—Thinness and curved shape of precast slabs; "Section at 2"—Coping cast integrally with slab facing; "Section at 3"—Large size and varied shapes of slabs with returns integral with slab facing. Also note strong, welded reinforcing and method of anchoring.
