IN THIS desert home at Palm Springs, California, Kaiser Aluminum corrugated roofing is used in the living room ceiling to diffuse sound and carry the attractive exterior corrugation design inside the house. The corrugations deflect and hinder movement of sound waves.

KAISER ALUMINUM corrugated roofing is used on wing walls to reflect heat from patios and to provide wind shelter. Horizontal corrugations blend with the roof design to give a lower, wider effect.

KAISER ALUMINUM ROOFING helps keep interiors cooler during hot days by reflecting up to 60 percent of the sun’s rays. At night, when desert temperatures fall, the aluminum helps retain interior warmth to give this beautiful home a more uniform temperature over each 24-hour period.

ARCHITECTS: Clark and Frey, Palm Springs.
THE RECORD REPORTS

CRISIS SETS THEME FOR A.I.A.'S 83RD ANNUAL CONVENTION

Institute's Biggest Conclave, May 8-11 in Chicago, Offers Dual Program to Handle Unprecedented Attendance; Burchard Address on "Humanity, Our Client" Is Keynote for Meeting

The nation's architects are expected to turn out in record numbers for the 83rd annual convention of the American Institute of Architects at the Edgewater Beach Hotel in Chicago May 8-11. "Humanity, Our Client," the opening address by John Ely Burchard, dean of humanities at Massachusetts Institute of Technology, will provide the keynote of the convention. Another address underlining the function of architecture in the service of mankind, "Design for Living," will be made by Dean Joseph Hudnut of Harvard University's Graduate School of Design.

Theme of the 1951 convention is "Building for Permanence in Times of Crisis," which is implemented in sessions on "The Architecture of Civil Defense," "Our Threatened Cities," and "Building Under Controls."

Seminar Series Continued

The convention series of seminars on "Fundamentals of Design" is continued in this year's sessions on acoustics and modular coordination; but the unprecedented attendance indicated by advance registration for the convention has led Institute officials to schedule these meetings concurrently with the National Defense sessions.

The annual banquet on Thursday, May 10, the one event of the convention at which it is necessary to assume everybody will gather at once, will be held in the University of Illinois Auditorium at Navy Pier.

For those with an interest in Institute politics—a category which has sometimes seemed pretty inclusive—elections will have a special interest this year. With a new president to be elected, this is a year of change.

By the middle of April, contests had developed for two offices and two regional directorships. First Vice President Glenn Stanton of Portland was the sole candidate for president; Kenneth E. Wischmeyer of St. Louis for first vice president; and Maurice J. Sullivan of Houston for treasurer. G. Thomas Harmon of Columbia, S. C., was unopposed for regional director of the South Atlantic District and Edward Lawrence Wilson of Fort Worth, Tex., for director of the Texas District.

Election Contests Shape Up

But for second vice president, Norman J. Schlossman of Chicago was contested by Howell Lewis Shay of Philadelphia; and Clair W. Ditchey of Detroit, nominated to succeed himself as secretary, also had an opponent, Walter W. Hook of Charlotte, N. C. George B. Allison and Charles O. Matcham, both of Los Angeles, were candidates for the regional directorship of the Sierra Nevada District. The other directorship contest was for the Central States District post, sought by Leonard H. Bailey of Oklahoma City and Thomas K. Fitz Patrick of Ames, Ia.

Traditional ceremonies at the annual banquet will be climaxd by award of the Gold Medal, highest honor in the gift of the Institute, to Bernard Ralph Mayebeck, 89-year-old California architect. Walten White Mayebeck will accept the Gold Medal for his father, who will be unable to attend.

New Fellows Named

Fellowships will be conferred on 39 members of the A.I.A. chosen for outstanding professional achievement.

The new Fellows are: Andrew Thomas Hess, San Francisco; Albert Kruse, Wilmington, Del.; Waldron Faulkner, Luther M. Lisenring and Henry Hodgman Saylor, Washington; Russell Thorn Pancoast, Miami Beach; Samuel Inman Cooper and Philip Trammell Shute, Atlanta.

Also Munroe Walker Copper Jr., Cleveland; Herman Brookman and Walter E. Church, Portland, Ore.; Morton Keast, Howell Lewis Shay, Grant Miles Simon, and Harry Sternfeld, Philadelphia; Thomas Dohoney Broule, Dallas; Maurice Joseph Sullivan, Houston; Clyde Grafner, B. Marcus Priteca and Paul Thiry, Seattle; Edgar Hubert Berners, Green Bay, Wisc.\n
Honorar Are Listed

Honorary memberships in the Institute will be received by Edwin S. Burdell, director of Cooper Union; Lewis Mumford, author and critic; and W. Engelbert Reynolds, Commissioner of the Public Buildings Service.

Other honors to be awarded are the Fine Arts Medal, to Thomas Church, landscape architect, San Francisco; the Edward C. Kemper Award, to Marshall Shaffer, chief architect of the U. S. Public Health Service; and a special Citation for Craftsmanship to Corning Glass Works for its Steuben glass.

Awards in the A.I.A.'s third annual program of Honor Awards for Current Work will be announced at the convention; and convention exhibits will be led by the Honor Awards exhibit of distinguished work in the fields of industrial buildings, hospitals and residences.

Also to be announced are winners in the annual Building Products Literature Competition jointly sponsored by the A.I.A. and the Producers' Council; and winning entries will be on display.

The products exhibit will be comprised of 50 commercial exhibits selected from many times that number.

National Defense sessions will lead off with the program on the architecture of civil defense on the first afternoon of the convention. The program, developed under the general direction of Harry M. Prince of New York, will include talks by Col. Lawrence Wilkinson, assistant (Continued on page 14)
COMPLETE EAST WING OF NEW MUSEUM OF SCIENCE FOR BOSTON’S “SCIENCE PARK” ON CHARLES RIVER

Boston’s new Museum of Science has launched an elaborate building program with completion of its “East Wing” at “Science Park,” a six-acre site on the Charles River basin.

Ames, Child and Graves of Boston are architects for the entire project, which as funds permit will include a central tower and another wing besides two more buildings, one a planetarium and the other an auditorium.

The completed wing, which has more than 500,000 cu ft of space, will serve meanwhile as a self-contained museum of science, with a “little planetarium” and exhibits of natural history.

The building is a three-story structure of steel frame and brick and cinder block exterior walls. It is almost windowless, so lighting throughout can be closely controlled at all times; but the terrace floor has large glass areas to afford a view of the river and the Boston skyline.

Movable partitions have been used for easy shifting to tie in with changing exhibits and needs; and the floor sections themselves can be removed without changing the floor stresses at any other point.

The terrace floor contains lecture and demonstration rooms, educational offices, laboratories and storage. The second and third floors, the museum proper, are in effect two great exhibition halls.

Cost of this first unit was $750,000. The new museum is the successor to the Museum of Natural History, founded in 1864 by the Boston Society of Natural History. Next unit scheduled is the planetarium. A campaign to raise $1 million for its construction and for new exhibits is now in progress.

AWARDS GIVEN AT OPENING OF PHILADELPHIA EXHIBIT

Medals were awarded by the Philadelphia Chapter of the American Institute of Architects to the architects of buildings in several categories at a dinner which opened last month’s exhibition of contemporary architecture at the Art Alliance in Philadelphia.

James A. Nolen Jr. and H. H. Swinburne of Philadelphia were awarded the chapter’s Medal of Honor for design of Presidents’ Hall at Temple University, judged “the most outstanding architectural project” in a competition for buildings in the Philadelphia area, including suburban communities.

Award for “the most outstanding out-of-town project” went to Carl Koch and Associates of Cambridge, Mass., for their Youth Library at Fitchburg, Mass.

Honorable mention in the out-of-town competition was won by Jack Hillmer for a studio-residence at Belvedere Island, San Francisco. Mentions were also awarded to Philip C. Johnson and Landis Gores for a New York town house and to Harold M. Healey and Ketchum, Giúi and Sharp for an Augusta, Ga., department store.

In the Philadelphia competition, honorable mention went to Norman Rice for a store. Mr. Rice also won a mention for a residence in Elkins Park, near Philadelphia. Clifford E. Garner won a mention for an automobile salesroom.

The Cope Prize for student work was shared by Andrew Kirk and Charles L. Miller, both students at the School of Architecture of the University of Penn-

At the dinner which marked formal opening of architectural exhibit at the Art Alliance: standing — Pietro Belluschi and Laurence H. Eldredge, Art Alliance president; seated — Russell Lynes; Theodore B. White, and Professor George Howe.
MARCH AWARD TOTAL OFF; SEE START OF "SQUEEZE"  

CONSTRUCTION CONTRACTS awarded in the 37 eastern states in March as recorded by F. W. Dodge Corporation showed a three per cent decline from March 1950, and Dodge President Thomas S. Holden thought the expected "squeeze" on construction had begun.

Mr. Holden pointed out that, although the March construction figure was the second highest on record for the month of March, it was the first month since July 1949 that failed to show a contract volume increase over the corresponding month of the preceding year.

Declines in commercial, recreational and residential categories were recorded, and Mr. Holden said the figures "showed the restrictive effects of defense rules and regulations."

Three-month totals for this year were running ahead of last year in dollar volume in all categories, according to Dodge statistics. Construction awards of $3,451,225,000 were 23 per cent higher than the figure for the first three months of 1950.

$2 MILLION INDUSTRIAL OFFICE BUILDING FOR LOCKHEED IS UNDER WAY IN BURBANK

The $2 million industrial office building designed by Welton Becket and Associates for Lockheed Aircraft Corpora-tion in Burbank, Calif., has been under construction since March.

The five-story structure will be one of the largest of its type in southern California, providing accommodation for 1500 administrative and engineering personnel in 165,000 sq ft of floor space.

Construction will be reinforced concrete flat slabs, with shear walls on the east and west and fabricated insulated panels acting as spandrels between continuous bands of windows on the north and south elevations.

A steel truss roof will eliminate any need for columns on the top floor, which will be occupied by engineering offices. The basement has been designed both to provide quarters for the tabulating department and to serve as an emergency bomb shelter.

The building will be air conditioned.

Industrial office building for Lockheed Aircraft Corporation in Burbank, Calif. Construction has been under way since March
HAEGER JOINS N. A. H. B. AS MATERIALS EXPEDITER

Leonard A. Haeger has left his post as Home Finance Agency’s Division of Housing Research to become Building Materials Expediter for the National Association of Home Builders.

Mr. Haeger’s job will be to provide liaison with federal agencies which control production and use of materials.

The N.A.H.B. announcement said he will also be concerned with integration of materials with construction to effect savings; building codes; exploration of new materials and products; and keeping N.A.H.B. members informed on construction details of a technical nature.

Mr. Haeger, a 1928 graduate of Washington University at St. Louis, has a master’s degree in architectural engineering and is a member of the American Institute of Architects. He joined the National Housing Agency, which later became the Housing and Home Finance Agency, in 1946, after service with the Navy as a lieutenant commander.

SKIDMORE FIRM IS ALLIED WITH BELLUSCHI ON COAST

Association of Skidmore, Owings & Merrill, Architects, with Pietro Belluschi in a Portland, Ore., office, has been announced by John L. King, a partner in the firm.

Mr. Belluschi, who has had his principal office in Portland, is the new dean of the School of Architecture and Planning at Massachusetts Institute of Technology, Cambridge, Mass. He is a member of the Fine Arts Commission, Washington, D.C.

The Portland staff is at work on several projects, including the Federal Reserve Bank of Portland and the Portland Telephone Exchange Building.

A. I. A. CONVENTION

(Continued from page 11)

to the director of the New York State Civil Defense Commission; Fred N. Severud, engineering consultant, New York; and Morris Ketchum Jr., A.I.A., New York. Mr. Prince will moderate a panel discussion on what communities expect of architects in their civil defense programs. Members of the panel will include Mr. Ketchum and Lawrence B. Perkins of Chicago, Moreland B. Smith of Montgomery, Ala., Perry B. Johanson of Seattle and Victor D. Gruen of Hollywood, Calif., all A.I.A. members.

John L. Haynes, chief of the Building Materials Division of the National Production Authority, is scheduled to start the Thursday afternoon session on “Building under Controls.” Other speakers on the program, developed under the direction of Douglas Orr, F.A.I.A., of New Haven, will be Richard Bronson, assistant general counsel for construction of NPA; and Arthur C. Holden, F.A.I.A., New York. H. C. Turner, president of the Turner Construction Company of New York, will moderate a panel discussion on how to build under controls. Panel speakers, all A.I.A. members, will be Stayton Nunn, Houston; C. E. Silling, Charleston, W. Va.; Welton D. Becket, Los Angeles; and Harold D. Hauf, New York.

Acoustics seminars will feature talks by Dr. Howard C. Hardy of the Armour Research Foundation, Chicago; Hallowell Davis, research director for the Central Institute for the Deaf, St. Louis; Samuel H. Hooper of Remington Rund, Inc.; Verne O. Knudsen, University of California; R. Allen Wilson, Celotex Corporation; C. M. Ashley, Carrier Corporation; Robert B. Newman, Massachusetts Institute of Technology. William Jones Smith, F.A.I.A., of Chicago will preside at both sessions.

William Demarest Jr., A.I.A. secretary for modular coordination, will make an address on that subject, followed by a panel discussion led by C. E. Silling, A.I.A., Charleston, W. Va. M. Edwin Green, A.I.A., Harrisburg, Pa., will be moderator.

RELATIVE CONFUSION MAY STRIKE YOU ANOTHER WAY

For what consolation it may provide to architects with (more) (less) pressing problems, the RECORD here reproduces a poem written 20 years ago when space-time architecture was making the news. The author was George Howe, now executive consultant, New York. Mr. Prince will moderate a panel discussion on what communities expect of architects in their civil defense programs. Members of the panel will include Mr. Ketchum and Lawrence B. Perkins of Chicago, Moreland B. Smith of Montgomery, Ala., Perry B. Johanson of Seattle and Victor D. Gruen of Hollywood, Calif., all A.I.A. members.

John L. Data on Building Design to Withstand Atomic Blast Set for Early Release; “Critical” Areas, “Defense” Standards Stir Housing Debate; Controlled Materials Plan July 1 on Steel, Copper, Aluminum; Report Puts School Needs at $14 Billion

The Federal Civil Defense program shows new signs of life. Better criteria by which architects and engineers can approach their problems of building design in an atomic age are expected to emerge soon from an accumulation of recent developments.

First, the Atomic Energy Commission in its guarded fashion has let it be known that building materials and various types of construction will be tested with atomic weapon blasts at new explosions in the Pacific — on the Eniwetok proving grounds. This comes as welcome news to the architectural profession. In fact, it is partially in answer to the request of the American Institute of Architects that special tests be made to determine the effects of atomic blast on buildings and building components. Results of just such tests as those now planned have been sought by the Institute’s Committee on Architecture and Nuclear Science, Thomas K. Fitzpatrick is chairman.

With new information gained from these experiments to combine with known factors, the Federal Civil Defense Administration will be in a position for the first time to issue reliable and specific information to architects and engineers on the subject of building design to withstand atomic blast. Herefore, the sources for this criteria have been primarily the observations of bombed areas in Japan — Nagasaki and Hiroshima — and for defense against the more conventional types of attack, the experiences of England during blitz periods of World War II.

This has not been enough. FCDA wanted more; the architects have asked for more. More detail is coming.

“The Shelter Package”

Among the first tangible results will be “the shelter package,” so called, which will wrap up specific information on the most suitable materials and best design methods for safe buildings. This will be pointed toward architects and engineers. It can be expected as soon after results of the Eniwetok tests are known as the information can be assembled, combined with present knowledge, and published. FCDA is determined to move as rapidly as it can in a sure and orderly way.

A number of preliminary attempts at issuing similar information have not gotten far before they were abandoned. Principal reason is that officials were not convinced they had the right answers. Take the booklet on how to build an outdoor shelter, for example. This was prepared largely on information gained from England’s experiences with blockbusters. It was ready for issue, but then was held back because authorities came to doubt its usefulness in an atomic age. Also, they feared a rush by the public to construct shelters of the backyard type would put an unjustified drain on critical building material supplies.

Where formerly a basement could be bombproofed easily by the simple installation of square arch construction, making it safe against shock and the debris load on top, now that A-bombs are the threat, lateral forces must be taken into consideration as well.

FCDA personnel are hopeful that the Atomic Energy Commission will come up with valuable results in its Pacific tests. They could be the spring to release the long-sought data. Unofficial reports indicated that the atomic weapons to be used at Eniwetok would be supported on steel towers and exploded to test their effects on nearby structures, partially completed. This could test the effects on various design types and on an array of building materials incorporated in various designs. Instrumentation is expected to be extensive.

Information now coming in from the

NEWS FROM CANADA

Canadian Architects Pledge Support to Defense Program

Complete support of the architectural profession in the implementation and conduct of the program of national defense was pledged in a resolution of the recent 44th annual assembly of the Royal Architectural Institute of Canada.

Presentation of the Massey Medals was made at the annual dinner to representatives of previously-announced winning firms—John B. Parkin Associates, Page & Steele, and Marani & Morris, all of Toronto; Gardiner & Thornton, Vancouver; and J. C. Meadowcroft, Montreal.

J. Roxburgh Smith of Montreal was reelected president by the assembly, which was held at Quebec City.

Other officers elected were: H. H. Simmonds, Vancouver, first vice president; H. Claire Mott, Saint John, second vice president; Harold Lawson, Montreal, honorary secretary; R. Caulfield Smith, Toronto, honorary treasurer. In addition, 25 members were named to serve on the Council.

Institute fellowship was conferred on Pierre Levesque of Quebec City; H. H. G. Moody, Winnipeg; Alfred E. Priest, Halifax; and Leonard E. Shore, Toronto. Honorary fellowships to non-members went to Prime Minister Louis St. Laurent and to Arthur L. Fleming, Institute solicitor.

The Prime Minister told the Institute's annual dinner meeting that if war can be avoided for five more years the world can look forward to a long period of peace. He likened the peace efforts of the democracies to architects constructing a building that would have to withstand rough weather.

Impact of defense construction and inflation curbs on civilian building re-

(Continued on page 260)

Top entries in each category in the Massey competition were awarded Silver Medals. Acres and Company, consulting engineers
Have you seen them? "So beautiful that only natural color photography could do them justice!" said a New York Art Director, when he saw the sets. So we photographed them.

Be sure to see the 1951 Universal-Rundle color advertisements based on these decorator-designed bathrooms, in the SATURDAY EVENING POST and BETTER HOMES & GARDENS. Watch for them—14,000,000 others will be looking, too! And remember, the beauty of these Ving Smith "Bathrooms for Americans" is no more than the natural beauty of Universal-Rundle fixtures. See them, touch them, test them. Then only will you know how salesworthy are the brilliant white, the matched color, the top quality and performance of these world's finest bathroom fixtures.

50th Anniversary Catalog—Yours!
Write today on your letterhead for a copy of the U/R 1951 Catalog. Shows the complete line of bathroom and kitchen fixtures—plans, drawings, specifications, and a world of help for everyone who sells, installs, recommends, or specifies bathroom and kitchen fixtures. See our catalog in Sweet's Builders File.

The whitest fixtures are U/R—whiter by actual scientific test, than any other leading make.
The strongest bond between surface glaze and body in U/R fixtures, means highest resistance to chipping.
"Harder than steel" surfaces are easy to keep clean, scratch-free, and sparkling new in U/R ware.
Who Is Universal-Rundle? U/R is the half-century young pioneer of many industry "firsts": colored vitreous china, one-fire tunnel-kiln firing, complete laboratory control of production, and many others.

Universal-Rundle

UNIVERSAL-RUNDEL CORPORATION • NEW CASTLE, PA.

MAY 1951
tests at Lehigh University, Bethlehem, Pa., will form the basis for the Eniwetok experiments. Some $75,000 was spent at Lehigh under supervision of the Army Corps of Engineers.

The first published manuals based on the Lehigh findings are expected to come out sometime late this month, if the review process is completed without any snags.

It is tentatively planned to bring out the information in the form of five or six manuals on different shelter building topics. The first may be on locating "safe" structures presently available in the neighborhood. The second probably will deal with how to strengthen existing structures to make them more A-bomb-proof. Another will carry information on communal-type shelter construction; still another will provide data on individual-type shelters.

A final manual probably will be issued to round up general information.

The manuals on specific construction matters will carry plans for improvements of existing buildings and for new construction. They will be published independently of the material on the Eniwetok tests of the AEC. The combined material from both projects will be utilized later.

In announcing the tests in the Pacific, the AEC said in part:

"The U. S. Atomic Energy Commission announced today, in response to inquiries from the American Institute of Architects, that test programs at the Commission's Eniwetok proving ground in the Pacific include extensive provisions for measurement of atomic weapons' effects on structures and materials of various kinds.

"The Commission has advised the A. I. A. that a major project is being carried out to supplement data already obtained from other atomic blasts, with instrumentation specifically arranged to provide data for the development of design criteria needed by architects. This information will be made available to the FCDA."

Rex L. Nicholson, widely-known California business leader and government consultant, joined the administration's staff a month ago as special assistant to Administrator Millard Caldwell. He brings to the civil defense agency a wide experience in construction. Before World War II, he was assistant administrator of the Federal Works Agency in charge of construction in 11 western states. There were reports that he might take special interest in the design and materials project, hastening publication of the shelter package. This should be good news to architects and engineers. Mr. Nicholson is serving without compensation.

Where Will the Bombs Fall?

The matter of pinpointing locations for emphasis on defense construction is one of the more baffling phases of the program. This shades into the "classified" realm, but there have been indications of official thinking on these so-called target area locations.

Carefully edited testimony of FCDA officials before the House Appropriations committee was released the first of last month. In it, Administrator Caldwell said there was some "pretty responsible thinking" that an enemy attack would be directed at 15 to 20 American cities...

(Continued on page 22)
The sound structural qualities of concrete admittedly have no equal in the building field. For over 40 years Federal Roofs have demonstrated this lasting structural strength and long life in thousands of installations all over the country.

Yet in addition, Federal also brings light weight, fire safety, insulating value, a fine underfinish, immunity from all effects of weather, moisture, smoke, cinders, fumes. It cannot rot, rust or disintegrate. Moisture in the building or leaks through composition covering cannot shorten its life. There is no maintenance—no replacement—ever. Complete Catalog on request.
simultaneously. These were not specified in detail. However, Washington, D. C., Baltimore, Richmond, Atlanta, Birmingham and St. Louis were mentioned, and it was plain that these cities are being regarded as critical target areas. Among others mentioned as possible targets were Minneapolis, St. Paul, Chicago, Seattle, Portland, San Francisco and Los Angeles.

This listing could not be considered as in any way conclusive. There were obvious omissions, for northeastern industrial centers known to have a high priority in the considerations of possible target areas were not named in the public testimony.

But it was brought out that officials believe any major attack from Russia would start over the polar region, bringing cities in the northern sections into greatest danger first.

Protection in Washington

There are two vivid examples of current thinking on defense construction, public and private, in Washington, D. C.

An elaborate new White House bomb shelter has been described as an elaborate layout for protecting the Chief Executive in event of enemy attack. The shelter area installed in 1942 was a rather simple protection against the dangers then known. This now has been remodeled to permit occupancy for an indefinite period. It has special ventilating systems first erected to guard against poisonous gas and now modernized to filter out radioactive dust particles. The shelter is said to include one large room as living space and office, a small bedchamber, cooking facilities and storage space for medical supplies. Reportedly, the walls are nine ft thick, of reinforced concrete, with entrance gained through double steel doors.

In the plan stage is a new 10-story office structure which, if built, would be the largest in Washington. Architect Matthew G. Lepley has incorporated a number of "atomic age" features in his preliminary plans for the building. He first studied carefully recommendations of the Defense Department, the National Security Resources Board and the Atomic Energy Commission.

The project would accommodate 1300 offices, a two-story-high auditorium with 750 seats and a 450-car garage. At street level there would be space for 10 stores besides the garage area.

Defense features include a sub-basement shelter area buried 27 ft underground. This space would contain a battery-operated telephone connecting it with the rest of the building, a gasoline or diesel-driven power plant, water supplied from two wells under the building, and chemical toilets for emergency use.

Three basement levels are included in the plans. The building would measure 237 ft by 149 ft. Facing would be limestone. Boiler room and cooling tower would be placed in a setback penthouse area. The bomb shelter space would accommodate 8000, Mr. Lepley estimates.

Application for clearance of the project has been made to the National Production Authority but there was no word of approval at this writing.

Quick answer to a
$300,000,000 question

How can you know whether the truck mixers that serve your jobs have the accuracy of water control, design and speed of drum and full amount of free mixing space needed to properly mix the concrete they deliver?

You simply look for this standard rating plate.

To the construction industry, which uses more than $300,000,000 worth of ready-mixed concrete a year, this rating plate gives indispensable protection against questionable concrete from non-standard truck mixers. Insist on it, when you approve or buy concrete ready-mixed.
Take a housewife's eye-view of a CURTIS KITCHEN

When it comes to kitchens, Mrs. America is sharp-eyed. That's why she so readily appreciates the years of experience that have gone into the design and construction of Curtis kitchen cabinets. Here are some features she'll notice in the Curtis kitchens you include in your plans!

Close-up of Curtis wall unit showing large storage space. Cabinet is made in 15" and 44" heights and in eleven widths—from 12" to 44". All are 14" deep.

Just the thing for quick lunches. Tabletop slides into unit. Space below is pan unit for large utensils. May be used alone, or with cabinet above.

Mixers and vegetable storage unit—24½" deep, 32" high, 18" wide. Ventilated vegetable drawer is below. This unit is a "must" with busy housewives.

Pan and bread drawer unit—has two small wood drawers 5" deep and one metal bread drawer 8¾" deep, 19" long, 10½" wide. Two widths, 28" and 32".

For long years of strenuous daily use, Curtis cabinets are made of wood, painted two coats at the factory. They can be left "in the white" or finished in any color of the owner's choice. All hardware is furnished and applied. For complete information, mail the coupon.

Curtis makes a complete line of architectural woodwork for the modern home. Make your next house "all Curtis."

More “Critical” Designations

With passage of a defense housing bill, the number of pinpointed locations in the U. S. being designated as critical defense areas would increase manyfold. When the Interagency Critical Areas Committee was established a little over a month ago, the activity in this field so important to architects and home builders was limited necessarily to determinations regarding Regulation X and its application. Regulation X, imposed as a curb on credit extended for housing sales last October, since has been extended to include most commercial construction and some industrial types.

At this writing only three specific localities in the U. S. had been given the benefit of the credit curb relaxation; this was done to stimulate construction of new housing, principally rental, to be occupied by defense workers certified for that occupancy by their employer. The areas affected were the Savannah River locale, in South Carolina; the Paducah, Ky. region; and three cities in Idaho—Arco, Blackfoot and Idaho Falls. All these are areas where the impact of migrant workers already is being felt. Pressure for a high volume of new housing — and community facilities — is being established.

Under the present law, however, little can be done to provide more than some of the needed residential construction. Particularly in the Savannah River and Paducah regions — and this will apply to areas to be named in considerable number — limitations on the number of new homes that can be erected are imposed immediately by the lack of civic improvements such as sewer systems, water systems, schools and hospitals. Here is where proponents of the new defense housing bill say the legislation is needed desperately.

The new legislation, as approved by the Senate Banking committee, clamped a $60 million lid on the amount of federal expenditures for assisting local areas in providing needed community facilities. At the same time, however, the committee recognized the growing financial overload for those cities whose services will be taxed to a breaking point by an influx of defense workers.
The report accompanying S. 349 pointed up the urgency of this fact: "In many cases, housing cannot be provided at all until necessary additional community facilities such as water, sewers, gas and other public utilities are enlarged or extended. It would be entirely unrealistic to expect local governments to bear the entire burden of furnishing community facilities and services required by the sudden impact of defense activities in the area."

If and when the legislation becomes law, the community facilities assistance provision alone will increase the tempo of critical defense area designations. In addition, the Senate version provided additional Federal Housing Administration mortgage insurance authorization of $1.5 billion. This benefit could be applied only to housing constructed in the defense areas named, a restriction which gave home builders cause for worry because they saw the normal FHA insurance fund dropping to a dangerous low point. Some form of emergency legislation, perhaps in the nature of a last-minute amendment to the defense housing act, was expected to bolster this mortgage insurance fund, supporting construction of housing outside defense areas, the normal year-to-year contribution to the housing supply.

**What Areas Are Critical?**

The matter of designating defense areas to receive the limited advantages of Regulation X relaxation now, and the expected broader benefits of the defense housing bill later on, rests with the Defense Production Administration. Ralph R. Kaul has been named chairman of the Critical Areas Committee. His group will have the benefit of representatives from the Department of Defense, Department of Labor, Housing and Home Finance Agency, and the Federal Security Agency.

Architects and builders are watching closely the operations of 13 regional defense mobilization committees established by the Director of Defense Mobilization to assist the critical areas group in local investigations. It is probable that earliest indications of exactly what areas are under serious consideration for inclusion in the program will come from these regional bodies.

The Interagency committee in Washington, as announced late in March by Defense Production Administrator Harrison, is serving immediately as an advisory group, recommending to DPA on

(Continued on page 26)
the basis of information turned in from the field committees and that known in
Washington. More important work for the Interagency committee is in view,
however, as indicated by this statement from General Harrison:

"At present, the Committee's function is limited to consideration and
recommendation of defense area designations as necessary action prior to
relaxation of residential credit restric-
tions to finance homes for defense work-
ners. However, if defense legislation now
pending in Congress is enacted, the
scope of the Committee's functions
would also include consideration of such
designations prior to the possible use of
special mortgage insurance aids for
needed defense housing and extension
of special assistance to local agencies
for the provision of locally-owned and
operated community facilities needed
for military personnel or defense workers
required to be brought into the area to
carry out essential national defense ac-
tivities. Such facilities might include
waterworks, sewers, roads and similar
public facilities."

It is important to note that under this
early approach to the problem of hous-
ing shortages no area will be set aside as
a critical location merely to provide
housing or other facilities required by
the reasonable expansion and growth of
a community. This injects a note of ex-
treme emergency into the program. Au-
thorizations are being limited, DPA
said, "to the meeting of newly arising
housing and community facilities needs
which are directly attributable to the
requirements of the defense mobilization
program and which cannot otherwise be
provided for, and then only for the
period and to the extent necessary to
prevent serious delays in urgent mobiliza-
tion projects."

Powers of the new committee will not
be limited to recommendations of new
areas to be named for critical defense
designations. On the basis of its studies
it also will recommend, when it feels
such action is warranted, that proposed
additional defense construction or mili-
tary activities be placed in areas where
existing community facilities and serv-
ices are more adequate.

While not probing the labor situation
too deeply, the committee has a Labor
Department representative among its
members, and will give consideration
to construction workers, and others, in
making its recommendations. This was
indicated by General Harrison's state-
ment that:

"If additional workers must be
brought into the area in substantial
numbers, information will also be ob-
tained locally as to whether housing
needs can be met through the existing
housing supply, including new housing
already under construction or spe-
cifically planned to be started, and how
much additional housing, if any, will be
required. Similar information as to
necessary community facilities and serv-
ces will also be obtained locally."

Protest "Defense" Standards

New concern was being expressed by
some industry groups over federal
agency moves to establish new stand-
ards for housing to be constructed under
the defense mobilization program. More,
and more violent, protests could be
expected. For the time being, the op-

It's Exciting... Different... and made by Fremont

VINYL PLASTIC COVE BASE TRIM

in 8 Smart colors!

CB 44 (DUBONNET)

Here's added color charm for your next floor installation. Fremont continuous length Cove Base now comes in permanent colors that never need refinishing—nothing to chip or peel. Properly adhered on either flat or curved wall surfaces, it gives a low-cost base trim protection from dirt, vermin, water or scuffing. It cleans easily with a damp cloth. For best installation, Fremont Rubber Tile Adhesive is recommended.

Plan your next job with the perfect finish—Fremont Cove Base in color.

NEW COLORS... CB 40 (EBONY)... CB 41 (NAVY)... CB 42 (LIGHT BLUE)... CB 43 (CHERRY)... CB 44 (DUBONNET)... CB 45 (SEA GREEN)... CB 46 (FOREST)... CB 47 (CHOCOLATE)

Please send me the new brochure on Cove Base in colors:

### The Index Numbers Shown are for Combined Material and Labor Costs. The Indexes for each separate type of construction relate to the United States average for 1926-29 for that particular type—considered 100.

Cost comparisons, as percentage differences for any particular type of construction, are possible between localities, or periods of time within the same city, by dividing the difference between the two index numbers by one of them; i.e.:

- Index for city A = 110
- Index for city B = 95

(both indexes must be for the same type of construction).

Then: costs in A are approximately 16 per cent higher than in B.

\[ \frac{110 - 95}{95} = 0.158 \]

Conversely: costs in B are approximately 14 per cent lower than in A.

\[ \frac{110 - 95}{110} = 0.136 \]

Cost comparisons cannot be made between different types of construction because the index numbers for each type relate to a different U. S. average for 1926-29.

Material prices and wage rates used in the current indexes make no allowance for payments in excess of published list prices, thus indexes reflect minimum costs and not necessarily actual costs.

These index numbers will appear regularly on this page.
These walls can be moved quickly ...conveniently...economically

By tomorrow morning this executive office could be converted into several smaller offices or made part of a large general office if necessary to meet the changing needs of business. Mills Movable Metal Walls make quick changes like these possible with a minimum of labor and expense.

Mills Walls combine this efficient movability with permanent solidity, structural stability and attractive appearance. Insulated and sound-proofed, they are easily erected and require no maintenance except occasional washing of their baked-on enamel finishes.

Mills Movable Metal Walls are completely prefabricated in a wide variety of styles and types—for executive, general and factory offices, plant enclosures, laboratories—for all types of buildings, for every industrial and business need.

No interruption of business
No dust, debris, commotion

Maximum mobility is the result of many Mills features developed through more than 30 years of perfecting this demonstrably superior system. Mills exclusive all-welded panel construction assures permanent true alignment of walls no matter how many times they are moved. Units are interchangeable, whole sections may be moved intact, all materials are reused.

Immovable walls, "frozen space", handicap any building. Why not investigate the possibility of installing Mills Movable Metal Walls now? Write for Mills Catalog No. 51 and specific recommendations to meet your specific space needs.
EARLY AMERICAN HOUSES

The Dwellings of Colonial America. By Thomas Tileston Waterman. The University of North Carolina Press (Chapel Hill, N. C.), 1950. 7 1/2 by 10 1/4 in. 320 pp., illus. $10.00.

To anyone interested in the architectural history and development of the United States this volume will be of tremendous interest. For first of all it contains an account of "The Settling of America," sketching the traditions which influenced the buildings erected by the first settlers; and next it traces "though necessarily in broad lines, the pattern of development in the building of colonial America's dwellings . . . ." The period it covers is from the first English settlement to the close of the Revolution. The area with which it is concerned is that occupied by the United States in 1793.

Mr. Waterman has chosen to present his material geographically, starting with the Southern Colonies, progressing northward through the Delaware Valley to the Hudson Valley and New England. The choice was a logical one, since climate, local materials, and the traditions brought by the settlers from many parts of Europe varied widely from one region to another. Rather unexpectedly, the chapter on New England is the shortest of the four. This, Mr. Waterman explains, is because New England was settled densely, and quickly developed a regional style to which substantially all of its houses adhere. This was true also in the Hudson Valley, he continues, but in the other two regions "there were many national strains among the settlers which produced numerous expressions that require lengthy discussion."

The book is handsomely illustrated with some 250 photos, a great many of them full-page reproductions. Plans are numerous. There is a three-page glossary as well as a detailed glossary of architectural terms and a very complete index. End-papers are maps of "The Northern United States as they were in 1783." All in all, this new volume is a worthy successor to Mr. Waterman's earlier The Mansions of Virginia.

NORWAY

REVIEWED BY FELLO ATKINSON

Exactly a century passed between the Norwegian visit of Mary Wollstonecraft, formidable bluestocking mother-in-law of the poet Shelley, and that of William Morris, in 1896. Incongruous comparison perhaps; she young, vital, opinionated, the first modern woman—travelling medievally, roughing it and thrilled by the archaism of it all, and he,
who in despair at the ugliness of industrialism had turned to the middle ages for refreshment: Morris, the dying titan, prematurely aged, going on a luxury orient cruise, chilled in spirit by the sight of the very fjords and mountains whose sagas had been his inspiration. Yet the interval between saw the rise of the English romantic-radical movement of which both were members, and for which Norway was one of the few beacons of sturdy independence against the arrogant tyrannies of art and men. It saw also a Norwegian intellectual renaissance culminating in the art of Grieg and Ibsen.

Yet this very isolation, albeit sturdy but let us state inevitable, which gave peculiar, if haunting and melancholy vitality to Norwegian music and literature, resulted in a certain sterility in the visual arts. The Scandinavian countries, to a greater or lesser degree, suffer in the arts from sparse and static populations and consequently small audience, and in Norway this is particularly so. Building there has always been sporadic and architecture has never been a great art, but rather a peasant craft, often superficially emulating or copying foreign models.

While there are modern buildings and renaissance buildings in Norway there was no indigenous renaissance and as yet there is no modern movement. But there is a great deal of lovely vernacular buildings, akin for the most part to the sagas and the songs and the anonymous crafts like boatbuilding and cheesemaking, which cannot be judged academically and intellectually but only instinctively and sensuously.

Looking through this book, which largely consists of pictures and plans with a brief historical background, I find it frankly rather dreary, not because the buildings aren't quite lovely, but because I believe the authors have failed to express their real significance and have dealt with them as we would treat the high architecture of Italy and England. They have isolated them from their landscape and the people and their crafts. The simple log sitters with their turf roofs, instinctively grouping in response to climate and contour; the dark barbaric stave-churches, spiking the air and clawing at the narrow skies above the deep valleys, the huddled jostling quay-

Question: Is there any way to control the temperature in an apartment building so that all tenants will be satisfied at the same time?

Answer: There certainly is—by installing Honeywell Personalized Heating Control. With PHC, each apartment has its own individual thermostat—each tenant can select the temperature most comfortable for him.

Question: But we've got to consider fuel bills. Won't they go up—with every tenant free to regulate his own heat?

Answer: On the contrary, they'll go down—as much as 20% annually! Surveys show owners often have to overheat a whole building to satisfy the 10% who like to live at 76°. Yet, most tenants want no more than 72°. Their PHC will regulate to that temperature—and save your client money.

Question: How about the added cost of PHC? Is individual control equipment more expensive to install than ordinary equipment?

Answer: Initially, Personalized Heating Control does cost more—although probably less than you think. But PHC is not just an added cost. It's an investment that pays definite, worth-while dividends. Experience has shown tenants will gladly pay a little extra for the greater comfort individual controls give. In just a few years, this extra will pay for the thermostats and valves. And from then on, the added income will benefit your client.
side warehouses and houses have a tremendous visual vitality while even the rather na"ve "classical" civic buildings of the 18th and 19th centuries have great charm. Isolated as these buildings are here from the environment which molded them, they are emasculated. For the most part the photographs are neat little labelled packages, often very small and taken from afar off, all apparently on the same dull day, hardly conscious of the sparkling winter snow and the long shadows of the midnight sun. These buildings should have swelled out beyond the margins and been dramatized as their builder-owners would have sensed them, returning at evening through the pine woods, between the sails returning to harbor, from the rooftops where they paused after relaying the turf, suddenly revealed on some plateau after the long climb up the mountainside or from some corner where they had dozed in the sun observing things very near. I have not seen Norway since I was very young and perhaps this is childish nostalgia disappointed at failing to rediscover memories. Such buildings may be better seen with the eyes of a child while here they are seen with the tired apologetic eyes of the wise. Indeed I hazard that it is this same sophistication, too conscious of good taste and therefore too afraid to venture which is corroding the virility of so much of Scandinavia's art today. When one looks at her buildings one hears Ibsen's Solness' bitter cry, "I build no more church towers nor churches either... only homes for human beings..." and one's heart warms to Hilda for her vulgar robust yearnings (fully realizing the Eastlake like little horrors she probably had in mind) when she pleads "Couldn't you build a little bit of a church tower over these houses as well...?"

BOOKS RECEIVED

(Continued on page 276)
Mobilization will certainly bring new housing, but this time it will not be just "housing." In place of "defense housing," just for "the duration," we shall now be building for permanence.

We shall build some new towns — for new mills, mines, atomic developments. Some existing towns will see great changes. We shall be thinking about dispersal of factories and people, and making a start on what is grandiloquently called "rebuilding America."

The task here is planning.

Carl Feiss states the rather urgent case for planning on page 111.

The best current proving ground of community planning is Park Forest, Ill., a completely new town near Chicago. Our progress report on Park Forest is extensive, for here was encountered virtually every problem — economic, physical, social, political — which could possibly arise in building any new community.

The study closes with a few examples of postwar housing which contain some suggestions for smaller "mobilization housing."
PARK FOREST, ILLINOIS

PROVING GROUND FOR COMMUNITY PLANNING TECHNIQUES

American Community Builders, Inc., Philip M. Klutznick, President

Loeb, Schlossman & Bennett, Architects and Planners

Elbert Peets, Consultant, Site and Town Planning

Kincaid & Hutchinson, City Planners and Architects (Planners, Sub-division Area)

Consoer, Townsend & Associates, Consulting Engineers

PARK FOREST is a new town, not a housing project. This distinction gives it significance, as a proving ground for a wide variety of planning theories. As such it becomes, fortunately but inadvertently, a test area for the sort of ideas that architects and planners will be called upon to produce in developing new communities for mobilization industries. It is especially noteworthy in showing the extent to which planning must take account of social and political problems of a community which must pull itself up by its boot straps.

In the five years since its conception, Park Forest has encountered virtually every theory, every problem, of community planning and building. It has made its own way — it is strictly private enterprise — without any governmental munificence; indeed red tape is not the least of its troubles. It has had to improvise on many an unanticipated problem — such as how to get a cemetery started, or how to decide the dogs-vs.-no-dogs question. In short it has experienced all of the thrills and pangs of bringing forth a new American town via the method of scientific planning.

The decision to tackle it this way was quite deliberate. Park Forest is an attempt to prove that the planning method can produce better communities than the Topsy
For other planners, the reasons Park Forest did not develop along different lines are probably as interesting as the reasons for its present form.

The Neighborhood Concept. — The earliest sketches show well defined areas centered about elementary schools with greenbelt carefully separating one from another. This schematic approach was abandoned for a number of reasons:

1. Because it came to be felt that communities of people exist only because of common interests, and for most interests
approach. It is an attempt, moreover, to do it all by the
most enlightened social concepts, to prove that this is
good business.

As a matter of fact, Park Forest has represented some
fairly enlightened searches for new ways to make a dol­
lar, or a nickel, out of the great "game" of subdividing
and building. Philip M. Klutznick, its president and
personal powerhouse, says that Park Forest tries to go
the meat-packing industry one better, and utilize the
squeal as well as the ham.

In evaluating Park Forest, it is important to remem­
ber the difference between creating a town and building
a housing project. This distinction was clearly estab­
lished early in the project, and it affected a great many
important decisions. A housing project, for example,
would not have ventured so far from Chicago (28 miles),
and would not have tackled so many problems of site
development, provision of utilities, schools, churches,
shops, or the tricky problems of establishing new gov­
ernmental units, new school boards, police and fire de­
partments, and so on. Chicago provides an economic
base for Park Forest, but the new town had to be far
enough removed to be able to establish its own patterns.

Business Principles

The objective of creating a town was by no means
altruistic or idealistic in purpose. It was for profit.
The basic premise was that a subdivider or builder
creates many values on which he does not realize. He
takes his quick profit on the main items, land and
buildings, but neglects the buying power newly con­
centrated in the community. American Community
Builders envisioned a larger operation, with a substan­
tial number of rental units under long-term ownership,
a profitable shopping center, several sidelines, on the
theory that this was the way to profitable operation
without excessive income from one single item, say
rents.

In the beginning the progenitors foresaw the possi­
ability of building and reselling electric power (sub­
metering), reselling gas, selling their own water, oper­
ating their own bus lines, and so on, in addition to owning and leasing rental units and store buildings, not to mention all of those items repeated in an industrial subdivision on adjoining land.

Business Results

These sidelines have not all developed, but the main items are proving out well. The sub-metering idea largely disappeared in the practical matter of getting shoppers (already is) from a substantial surrounding area, as new stores are added and as people come to appreciate the convenience, the pleasantness and the parking space of the center.

Lesson No. 1

The many complications of so sweeping a beginning as Park Forest produced the first lesson in community building. In Klutznick's words it is "that no organiza-

into operation a really large installation of utilities, though the company does operate its own water system on a commercial basis. The bus lines similarly went to existing outside enterprise.

The shopping center seemed to loom larger, however, as the project developed. The shops are leased to merchandising companies on a selective basis, and company income will grow as store volume increases and as new shops add to the center.

Shopping center tenants have a solid base of purchasing power in 3000 families already in the rental units. And the house-for-sale program, now just really started, will add another 3000 to 5000 families directly located in Park Forest. Studies have shown, moreover, that the shopping center may be expected to attract much the same thing happened in gas service, and in electric service. Even though Park Forest anticipated its problems of utilities, it had occasion again and again to be impressed with the magnitude of the task, and its importance.
Basis of residential planning in the rental area is a scheme of courts and malls. Buildings are grouped around a parking court (there are no garages), but the space between groups of buildings is kept open to form a fairly continuous mall. The courts tend to become informal and active — each has a small “tot yard.” The more open areas appear more formal and are quieter. The parking courts identify a neighborhood group and tie close neighbors together through daily activity. The open areas tend to tie groups of buildings together and broaden the outlook somewhat.
Utilities for Mobilization Housing

Turning to the problems of other new communities, Klutznick says: "From purely a physical point of view, my experience in the last war [administrator, Federal Public Housing Authority] and the experience in Park Forest lead me to believe that the basic problem that will confront community development is the lack of adequate utility installations in the areas of need. The growth of our population and the deferral, over many years through the depression and the last war, of utility replacement programs as well as extension programs, will find us in a difficult position, if the mobilization authorities embark on any degree of dispersal into new areas without simultaneously considering the demands of the population that will have to man the machinery. I see nothing in the current scene to make me happy in the thought that we learned our lesson. The building of houses is the easiest part of the mobilization housing job. The big problem, from a physical point of view, is to develop the first plan, provide adequate sewage disposal, water and other essential utilities without which a house becomes merely an outhouse. These problems we had to face in Park Forest and we believe we conquered them.

"The three ingredients in the handling of the physical problems are a good and feasible plan, ingenuity in its execution and available funds, either one's own or through a public body. Long ago, I took the position that in any future mobilization program, the first and most important step is to ascertain quite early the areas that will be affected by expansion and to undertake to extend or create the necessary basic utility systems. Without such steps, tremendous waste of time, men, money and material is inevitable."

Social Aspects of Community Building

"The principle that has been enunciated above (use outside skills), which had motivated us on the fronts indicated, has also been a guide in our treatment of community problems, such as municipal government, fire and police protection, medical care, schools and churches. We have been, and still continue to be, criticized for our position.

"There are some people who feel that we should do many things ourselves which we agree could be done more quickly and perhaps at less cost, but with ultimate disadvantage to the growth of the community. We have taken the position that public authorities, school officials, the people themselves, whether they be tenant or home owner, must be involved in the community building process from the beginning and must assume their share of the load in terms of administration, thinking and execution. We have never side-stepped our contributory responsibilities in terms of dollars.

"For example, on the church front, before a single line was drawn in our plan for Park Forest, the Church Federation of Metropolitan Chicago, the Cardinal's office, the Lutheran Synod, which is not in the Federa-
Loeb, Schlossman & Bennett planned the shopping center to be informal in layout, efficient in merchandising methods, and gay and attractive in appearance. The plan seems quite free and casual, but actually it is carefully worked out for good merchandising. It has no focal point, no "100 per cent location," no obvious concentration of traffic, since the parking space virtually surrounds it. Free forms of the store buildings bothered the tenants in the negotiation stage, but they soon learned that the buildings were thoughtfully planned for selling, even though they didn't meet standard layouts of chain stores, and came to appreciate that the free forms sprang from the true selling function. Store buildings are kept in a uniform white, and store tenants have been glad to sacrifice their traditional colored fronts for the pleasant brightness of the center. The shopping center is lighted at night, as a bright center of attraction. Covered walks shelter pedestrians between stores — no auto traffic can enter the center itself, though there are access turn-arounds at several points so that cars can come close for heavy packages. Landscaping will add a note of gaiety, and contribute to a fair-like spirit that is an especial objective of the planners.
tion, and the Episcopal Bishop, who likewise is not in the Federation, were involved in the planning aspects.

We agreed to and have contributed improved land; but we have insisted, as a condition to that contribution, that they organize their congregations and assume the responsibility for structures. There have been some delays. You don't build a solid church structure on prayer without action, even if that sounds blasphemous. Consequently, we have only one church completed, the Trinity Lutheran Church. The Catholic school, church and accessory buildings are well along and should be completed within a few months. The United Protestant Church is out for bids next week, as is the Episcopal Church. Ministers and a Priest were long ago stationed in Park Forest and they and their adherents are building the churches.

"In connection with the school problem, which in many ways has been the most aggravating of them all, particularly under the Illinois law, we have pursued a similar course. The largest part of our development lies in what was once a rural district which never had enough resources to support even a minimum schoolhouse for its 20 pupils. That portion of Park Forest lying in this district was withdrawn and the school district of our own tenants was established at the beginning. From the start, we outlined a program in our own thinking which from time to time we negotiated with the school board. In view of tax lag and bonding power lag, we undertook to subsidize the school board by contributing to their budget for the last two years. We provided temporary facilities during that same period of time. Together we established a non-profit corporation to build the first permanent schools, to which our company contributed the necessary funds. The first permanent school building is in the process of completion. When it is complete and as soon as the school board has the necessary bonding power in a few months after its completion, under their contract with us they will acquire it and issue the bonds. The second school goes out for bids this month and will be built on exactly the same pattern. A third school is scheduled to start before the end of the year. By this process, it is true that we have involved our company financially, but what to me is more important, the people themselves have had their feet thoroughly wetted in the problems of school administration, school budgets, school operation, so that we can properly look forward to one of the best school systems in this whole area, when it has matured in the next few years.

"In general public administration, we have pursued a similar course. We encouraged the incorporation of the village when we only had 150 families resident in Park Forest. We were operating a private police force and using a contract service for fire protection. In the first year we contributed to the new village sufficient funds so that they could get the Department of Public Safety organized. We have a crackajack police department, small but effective, and a top-notch volunteer fire
Jewel Tea was the first of the larger store tenants in Park Forest. The building done for their tenancy by Loeb, Schlossman & Bennett was something of a surprise to the chain's merchandising experts, but has proved to be fine for selling. Aisles for grocery items run diagonally, pointing toward checking counters. By the simple device of tilting the large trusses the architects have given the store a clerestory, the sloping ceiling adds noticeably to the openness which a clerestory section seems always to contribute.
TYPICAL RENTAL UNITS — RENTS: $75 TO $99.50

department to whom we contributed the first two pieces of equipment. It would not be fair to say that all these things happened easily. Quite to the contrary, there were periods when it would have been much easier for us to discharge functions ourselves than to haggle and argue with people who were learning the practical aspects of building a town. But as a result, we have a maturing town government with a sense of responsibility growing each day. We have a public plan commission and a town hall that is in process of erection.

"On the medical care and public health front, we have not made as much patent progress. We do have a citizens’ public health committee. We have interested a group of doctors and public health specialists who are planning for the day when the hospital and medical center will emerge; the latter, not too far off, the former some way off. We are just beginning to formalize steps on a community recreational program. Here again the principal stimulus comes from the people and what we ultimately develop here will be that which they want and, we hope, can afford.

"By example, I have tried to illustrate our basic philosophy. One of the great failures in government operation of villages and towns that it was compelled to build or undertook as an experiment was the great difficulty it had in withdrawing from responsibilities that it once assumed. Another inequity, perhaps, was the development of public services of a gilded character and altogether beyond the capacity of the people who live in the town to pay for. In connection with this type of criticism, I must point out that it probably could not have been otherwise. Government is subject to pressures to a greater degree than we are as a private company. Not only is it subject to pressures, but it does not have the same type of balance sheet with which to compare itself as we do. While we believe that we are a thoroughly enlightened type of company in this field, nevertheless, we are inhibited by practical considerations from yielding to the point of committing business suicide. Our income and outgo must at least balance in our determining how far we may want to go in meeting the demands of residents in Park Forest. This is a strong barrier against outright disproportions.

"Probably more important than dollar consideration is the fact that the method that we have pursued, in my opinion, tends to fill more people with a sense of responsibility and certainly makes them more knowledgeable, in the fields of public concern. As one public official who visited Park Forest once said, ‘This is probably the most significant school in civics in all of our country’. Our population is primarily youthful. They are people who would be lost in the jungles of great metropolitan communities. Perhaps they would live their entire lives in such a community without knowing the significance of a school budget, what it takes to make a fire department or police department run, or how you pay for any of the things that are implicit in public operation. Many of these people are bright and able people with fine academic background who, if they continued to live in large metropolitan centers, probably

MAY 1951
never would become members of plan commissions, school boards, village boards, recreational committees or public health committees. Here in the impressionable stage of their lives they have been compelled to assume significant responsibilities in their community. It would be foolhardy to say that all have met the challenge. But it would be untrue not to state that the growth and understanding of many has been something at which to marvel.

"What has all this to do with the potential contribution of what we term private enterprise in the forthcoming mobilization effort? Nothing more than to point out that the government would be well advised to lay the ground work to perform only those tasks which it must essentially perform in order to keep the mobilization machinery going. In the field of town development in areas completely rural and desolate in character, government must substitute for non-existing public agencies on an interim basis to finance utilities, schools and similar public services. Beyond that, to the extent that the people to be served can afford the production, private enterprise should be called upon to do the job. There can be a melding of responsibilities which should result in the development of permanent communities in which the government does not stay as a vested interest exposed to all of the pressures and responsibilities which it is not established to discharge. By collaborative interest we can build communities in which the people who live there discharge the normal functions of communities."

Planning Park Forest

While details of the original scheme have changed, the basic concept and its major elements have remained constant, and Park Forest has developed according to its schedule. There was one major change — the rental units were built first instead of houses for sale. One reason was the great need in postwar years for rental units, especially for married veterans. Also 608 financing made rental units particularly attractive. The main reason, though, was that building rental units was the
The first Park Forest school is now under construction. School is built by American Community Builders, for lease to the school board until such time as the board is properly organized and gains its bonding power. Then it will be taken over by the board for normal ownership. School was designed by Loeb, Schlossman & Bennett, architects.
quickest way to get Park Forest into being and give it identity. Three thousand families, coming in quickly, would permit a sizeable start on the shopping center, would bring quick income to get schools, churches and so on started. Only now are the houses for sale really in volume production.

There was some careful figuring in the determination of the figure of 3000 rental units. This number seemed to assert itself strongly, coming largely from the requirements for utilities — the initial installation was of necessity so large that no lesser number of units would be feasible.

Then it was necessary to do some selling to arrange financing for so large a group. Once the initial shock was absorbed, however, there was no difficulty, and the FHA granted approval on nine separate mortgages totalling $27,600,000, the largest single commitment made. Three life insurance companies share in the mortgages — New York Life, Sun Life of Canada, and Northwestern Mutual.

The principal here is important — starting a new community is a big undertaking, with a huge investment in land acquisition, planning, roadways, utilities, etc., and these investments fix a certain minimum number of units to assure sound operation. Park Forest might have got along with 2000 at first, but 3000 was a much better figure. And the necessary speed was much easier with rental units than with houses for sale. There were real difficulties at the start nevertheless — for a while the symbol of Park Forest was MUD, and the operation was almost mired in complaints — but the tenants came as fast as buildings could be completed, and Park Forest was successfully launched.

Prefabs in Park Forest

Park Forest has been probably the largest potential customer for prefabricated houses, although almost none have been built there. With all of the building troubles after the war, there was much enthusiasm for prefabs. It seemed quite logical, for prefabs might help get many families in quickly, solve construction difficulties, save time, and help in that perennial problem of the lag between investment and recovery of funds.

At one time Park Forest placed an order for 2000 Lustron houses, but none were ever delivered, for Lustron’s difficulties caught up with them just at that time. Virtually every other prefab offering has been carefully investigated, and a few houses are included in the test group now. But no large contract was actually placed.

Most potential deals failed over a basic point. American Community Builders knew they would have to do heavy selling and promotion to win buyers’ acceptance, especially in a large, quick operation. They asked for sales help from the prefab companies, in the form of discounts to permit necessary advertising. But no house
Design for the United Church, Park Forest, Schweikher and Elting, architects
maker could then agree to grant this "trade discount," even for the mass selling operation that was involved. So Park Forest is building its own houses.

**Houses for Sale**

The houses-for-sale program finally did not get into actual construction until last fall, when work began on 525 two-bedroom "ranch" houses, with masonry walls and radiant heat. The first 100 were completed about April 1, 1951.

The next 300 houses, it is expected, may still be pre-fabs, with three bedrooms. Then will follow 800 more, conventional or prefab depending on public acceptance and demand. For next year it is contemplated to go into different types and sizes of houses, although Park Forest will probably remain a small-house development.

It is a source of considerable satisfaction to Mr. Klutznick that of the first 100 houses sold, 35 went to tenants in Park Forest. And, he adds with a grin, they are already forming a home-owners' association. "Maybe now there will be somebody organizing to save taxes instead of spend them."

*Proposed synagogue for Park Forest; Loeb, Schlossman & Bennett, architects and engineers*
John Coolidge, in his remarkable study of the founding and development of Lowell, Massachusetts, speaks of the vision of this manufacturing town conceived as an ideal community by that conservative and hard-headed industrialist, Francis Cabot Lowell, in the year of our Lord 1814. Mr. Coolidge says, "The founders of Lowell certainly expected a city to grow up around their factories. They were resolved that it should be an ideal city. But they failed to appreciate the important part which planning and real estate management would play in the layout and gradual evolution of the perfect town. . . . Planning has nothing to do with its quality, for planning was not recognized as a controlling activity. . . . Still less did they feel any responsibility to mold the form that the community assumed as it developed."

There would be little gained if I were to attempt to review the history of American industrialization here. However, I want to emphasize that our historic industrial tradition during the pioneer, Colonial, and early Republican periods contains much evidence that our industrial forefathers were interested in the social and physical environments of plant location. For the complete story of what happened to our cities as the industrialization of the country took place during the 19th and first half of the 20th Century, I refer to Lewis Mumford's comprehensive chapters on the subject in "The Culture of Cities."†

Ebenezer Howard,†† the inventor of the Garden City idea and progenitor of the British New Town program (See Architectural Record for December, 1950), and his successors, including many modern philosophers of.

*This article was prepared by Mr. Feiss in his private capacity as a professional city planner and does not necessarily reflect the opinions or policies of the Housing and Home Finance Agency, of which he is an official.

urban life, rather seem to have failed in two things:
1. To face squarely the solution of the planning problems of the old, central city.
2. To provide convincing proof that the replanning and rebuilding of old cities and the planning of new ones would benefit the American industrialist and businessman.

Now I am not certain that it is ever the role of the philosopher to do more than point the way for others to follow. Howard succeeded in getting two Garden Cities built in England during his lifetime, Letchworth and Welwyn; influenced the work of John Nolen at Kingsport, Tennessee in 1915; the development of the Greenbelt Towns by the Suburban Resettlement Administration in 1936; and such towns recently constructed in the United States as Park Forest, Levittown, and Midwest City. Of the American towns, only Kingsport has an industrial base and Park Forest an area for industrial use still to be developed. The Garden Cities and New Towns of England have as a fundamental purpose the idea that industrial advantage will result from industrial dispersal from central cities. A sufficient number of imaginative industrialists were found to prove the point conclusively at Letchworth, Welwyn, and Kingsport. Howard’s philosophy turned out to be practical and attractive to a few investors. The Garden City idea, based on three good experiments, has panned out in actuality.

But Geddes’ and Mumford’s “Insensate Industrial Town” still grows more and more insensate. Even the actuality of war in Europe and the threat of war here make little impression on the increasing congestion, squalor, and inefficiency of our huge industrial complexes. It should be apparent to even the dullest intellect that the value of the assembly line indoors is canceled out by the lack of environmental efficiency outside the plant. Neither the mechanical nor social environment of our dirty, smoky, and noisy Cleveland and Birming-
community, the community's ability to attract and retain workers, and its ability to provide the necessary housing facilities and services demanded not only by the taxing industry itself but also by the taxing worker for that industry. American business has never been and never can be conducted in a vacuum. Business and industry in the modern world are the production units housed in skyscraper and factory, in the city hall, the home, the store, the school, and the park. Only these factors together constitute a productive unit. Only by planning together can we create a truly livable and efficient country and society.

There are three discernible trends in industrial development today which will affect city planning and the housing industry. They can be roughly designated as:

1. The Isolated Unit System
2. The Planned Industrial District System
3. The Decentralization System

While the study of trends in industrial planning per se is not the subject of this article, it is important to recognize that trends in the development of industrial housing are to a large extent controlled by these three systems. The architect and engineer interested in both industrial development and housing must be able to determine the relationships between trends in plant location and the availability and desirable character of housing for industrial workers. In the scatter pattern of industry normal to most cities, and identified with System No. 1, industrial housing (too often slum housing) also is part of this scatter pattern. In the Planned Industrial District System (No. 2), such districts seldom include industrial housing as part of the plan, and in No. 3, the Decentralization System, including both the growth of industry in the urban periphery and into small town or dispersed locations, again we find a habitual lack of interest in worker's housing on the part of industry and the technician responsible for industrial plant planning.

The most important reasons for a decentralization policy of an industry in 1948 were market expansion, new labor, certain efficiencies in small plants, functional segregation of operations, and the advantages of small city and town location with attendant improvement of human and public relations. While the last named items are important, the record of purely "company towns" has not always been too happy. This is brought out sharply in the 1947 report of the Coal Mines Administration, "A Medical Survey of the Bituminous-Coal Industry," better known as "Admiral Boone's Report." The coal industry, of course, has always been dispersed. Labor history in isolated industry of many types in rural villages in many parts of the country has been unfortunate, and the development of the rural non-farm slum is one of the large-scale problems we are facing today. Based on past experience, experts in the field of public administration should work with industrial management in the invention of the provisions and safeguards which will assure that industrial decentralization of the future will not only benefit industry, but also the community in which industry is located or the community created by industry.

Decentralization takes on a new meaning in 1951. While it is too early to define clearly the impact of the present defense effort on industrial movement, the need for industrial housing appears to be growing in many small towns. The Architectural Record editorial for December 1950, "City Planning and Civil Defense," stated, "Every slum clearance project, housing development, industrial plant, traffic artery or other public improvement should be planned with a view to the military as well as the civil aspects of dispersal." This places an obligation on the architect who must not shirk. He must come to the realization that in many instances he has a selling job to do to convince the industry building a decentralized plant (for defense production or protection or for any other reason), that the plant is not and cannot be complete without adequate workers' housing and community facilities and services.

Because of some unhappy experiences with plant managed communities during the last war and the "company housing" history mentioned above, many industries today are inclined to let nature take its course and are avoiding the issue — in fact completely leaning over backward to do so. While it is true that the Willow Runs of World War II were discouraging experiences, the problem is not solved by avoiding the issue. The fullest possible concentrated attack is needed with industry, local government, and the federal government, using the architect, engineer, and town planner in a joint endeavor to avoid past mistakes being repeated over and over again. We have the technical know-how if we can put it to work.

For instance, and this is one of several recent examples, a small rural town in the East with a population of 6500 is about to receive the impact of two industrial developments whose workers alone (not including their families) may more than double the existing population. The industries also have a wide range in employment types. There are no extra rooms in the town, let alone houses, one little hotel, a small shopping center at the crossroads, a couple of old and crowded schools, inadequate water, one small sewage disposal plant, only one paved street, little power, or anything else. Bulldozers are already clearing the land, and real estate speculation is growing in the vicinity. Nature's course is an obvious one since neither the new industries nor the city council can solve the problem as part of a planned development. We can expect the impact here to be destructive in the same way it was in so many areas in and around our cities during the last war. Shack towns, trailer slums, and the usual mixed land uses due to lack of a master plan, zoning, building codes. Even municipal bankruptcy may occur as the debt charges mount in an effort to meet the service needs of the increased population.

The tragedy is not only the resultant waste but also the fact that we are ignoring our own well established technical and managerial capacities. Leadership in the
developmental sciences of community building must come from the planners, architects and engineers involved in each specific development. While we hammer this point over and over again, we seldom drive it home. I am sure that in the industrial development for this small town are to be found the men who could do the comprehensive program so badly needed.

To add to the gloom of this picture we must recognize that the defense worker today is a highly mobile individual. He migrates easily. The last war proved that. Where housing, shopping, schools, and health conditions are unsatisfactory, even though salaries may be high, the worker thinks nothing of pulling up stakes at a moment’s notice and the whole family, dragging a loaded trailer behind an expensive car (which can be more easily acquired than a good house), goes off to a rival area where there is also a labor demand and where it is hoped that there will be found better living conditions. There is or will be developing in many areas a most encouraging competition for labor in which high salary and good working conditions are not the only inducements. It is my hope that architects and engineers will begin to recognize the character of such inducements and their importance not only to successful plant expansion but also to the furthering of the defense effort.

**Industrial Housing**

There has been and will continue to be much discussion of industrial housing. Housing built by an industry for its workers — company housing — is one clear-cut example of industrial housing. Beyond this it is hard to distinguish industrial housing from any other worker’s dwelling, industrial or otherwise. General proximity to an industrial area may be an identification but there is no real importance to the term except in the identification of deficiencies in the housing supply. These deficiencies would indicate a scarcity of housing at a cost or rent commensurate with a worker’s income, of a desirable standard of design and construction, and in a location suitable for family life. Such standards as have been established by the Committee on the Hygiene of Housing of the American Public Health Association *are the desirable ones to be considered for any or all housing.

The importance of a housing program developed simultaneously with an industrial development plan was emphasized at the beginning of this paper. The wise community and the wise industry will prepare a complete market analysis for both before signing the final papers.

**Industrial and Planning Cooperation**

We have, to date, very little specific evidence on the relationships between industrial management and municipal management as far as cooperation in the physical planning sense is concerned. It is true that economic cooperation or assistance in the form of inducements to industry through tax exemption is common, and administrative and legal sanctions through the waiver of zoning restrictions are also common. But we are just now beginning to find in the average American city evidence that industry is becoming aware of its responsibilities in the preservation of amenity or in adding to the livability of the community. In Pittsburgh, St. Louis and Los Angeles real attempts have been made to control smoke and fumes, with industry and the community working in close harmony. For all the wealth created by industry, much of which may have been added to the collections of museums or the coffers of universities and hospitals, the smog still lays its pall over most blackened cities and industry walls in the sludge of the valleys; the Cuyahoga, the Mahoning, the Monongahela. And descending into the valley are the rows of sordid tenements, waiting for someone to do something about them. To me the great federally assisted Geneva Mill at Provo, Utah, is a presage of what can be done — clean, well designed, free standing against the Wasatch Range — good housing near by, good transportation, all the factors that make industry rightfully proud and us proud of industry.

The spread of slum and blight in our industrial cities has been due in large measure to the lack of guidance and to the lack of the assumption by local government of responsibilities for the protection of the interests of both the inhabitants of the community and industry. The resultant decay which has occurred in almost every one of our industrial centers, while due in part to plant obsolescence and new technological findings which are improving production and management, is also due to location factors. These adverse environmental considerations may have been in existence at the time of the original location of the plant, or they may have occurred through the years through the development of mixed uses in the vicinity of the plant, or they may have been created by the plant itself.

At the very beginning of this article I quoted from John Coolidge’s study of the development of Lowell and the objectives of the founders of that city. Planning as a controlling or guiding activity is still not recognized, nor is the importance which it may play in preventing the deterioration of an industrial locality.

Whatever the circumstances causing deterioration and blight, it is becoming necessary for local government to prepare master or general plans for land use. These plans have as the objective not necessarily the creation of an “ideal” community but certainly the correction of existing problems and the improvement of the locality as a whole. The courage and imagination of our industrialists who have had considerable responsibility for the incomparable economic and social structure which we enjoy have not been sufficiently directed towards the creation of the additional physical improvements needed to complete the picture. Therefore, it is important that the function of a city planning commission is clearly understood by all citizens. With some of

---

this in mind, the U. S. Chamber of Commerce’s Sub-Committee on City Planning is preparing a manual to be completed by the end of 1951, to advise businessmen throughout the country as to the importance of planning and the relationships that should be developed between business, industry and a local planning program. It should be emphasized here that good community planning is good business, and it is my firm belief that great savings in land value and taxation will result from good community planning, quite apart from the benefits to the citizens from such a program.

But for the purpose of this article I have little new to show you. We are making progress in residential area and commercial area planning. We have yet to get started on industrial planning and redevelopment and the correct correlations with residential and other areas. There is a great future in it for architect, engineer, worker and industrialist.

**Industries and New Towns**

Whether industry moves because of strategic or other decentralization purposes or remains where it is, new towns are in order. The correction of past errors in the design and construction of our old cities and in the location of our industries in them, entails the reconstruction of old towns into new towns — just as new and efficient and permanent and desirable as the new towns in rural areas which Great Britain is so diligently building or which we may build here.

It is much harder to make old towns into new towns than to start afresh in a cow pasture. But the facts are that we have the old towns to deal with and we can’t scrap them. The standards for the design of the new-old town remain the same as for the new-new town. The solution will be different. If there were any slogan I could devise for the defense period, it would be, ”New Towns for America — The American Way of Life is our Best Defense.” And then, as an objective, assume that every architect, builder, industrial realtor, town planner, and the rest — every man with any responsibility for the physical development of our communities, whoever he may be — takes this responsibility as part of his contribution to the defense effort: to see that every sub-standard living unit and neighborhood is eliminated in his own community. In so doing he will create new towns out of the old and a decent and sound environment for both our people and our industry. In so doing he will have assisted in the establishment of an American Way of Life which will be unassailable. In so doing we will all of us have won a world wide victory.
HAMPshire Heights
NORTHAMPTON
MASSACHUSETTS
Veterans' housing, of course, is not the industrial or military housing which the present mobilization for production will entail; but it is group housing; it is, in the aggregate, a pretty apropos demonstration of the effects of minimum standards; and (though the examples shown here are fortunately well above average) the norm has too often been sterile as well as sanitary and "decent". Now that we can look back we can begin to realize the depressingly monotonous characterlessness of much housing done during the succeeding emergencies of depression years and World War II. And just as we get pretty discouraged, along comes such a project as Hampshire Heights to show us that a modicum of architectural talent can produce pretty good architecture in spite of repetitive planning and rigorous economies and spatial standards so low as to be little more than substandard.

Examination of unit plans (next page) reveals that the architects adhered closely to these minimum space requirements. Bedrooms are barely adequate, but their size could not be increased; so there are fairly generous, well-disposed closet space and full basements (with laundries and individual furnaces) for all units. Living rooms are tiny, but there is wall space for furniture and all—and most bedrooms, too—open out to pleasant "rear" yards, away from street noises. The buildings are identical in plan, but they are disposed with studied haphazardness— and land coverage of only 10.64 per cent—over the sloping 9.61-acre site, taking full advantage of the distant view of two mountain ranges and the more intimate, informal perspectives which their own arrangement creates. They are vividly colorful, with red brick, white paint, warm natural wood and an occasional glimpse of hot, primary red on the hidden side of an entrance trellis. All this can be done with severely restricted veterans' housing. Let's see what we can produce for mobilization housing.
Above, left, brick and wood street facade of a 4-family building; right, corrugated asbestos-cement sheet and brick veneer on garden side of a 6-family unit. Below, right, another 4-family facade. Despite exact repetition of right plans (below), site development and facade treatment, as well as use of brilliant color, give Hampshire Heights a pleasant aspect and help emphasize individuality. Each family has a full basement with laundry and hot air furnace.

ARCHITECTURAL RECORD
Economies in construction obtained by such planning devices as pairing kitchens and baths, one above the other, are demonstrated by the simple plumbing stack (right), repeated throughout. Equally economical are window details (below) and conventional wood construction (lower right). Including furnace, range, water heater, incinerator, laundry, and site development, per-family cost was $10,479.
LOW-RENT HOUSING, MASSACHUSETTS: II

MIDDLEBOROUGH HOUSING PROJECT
MIDDLEBOROUGH
MASSACHUSETTS
Kennedy & Smith, Architects
Dan Kiley, Landscape Architect
Gordon MacNeill, Engineer

MIDDLEBOROUGH, again, is an example of what can be done to mitigate low housing standards. Let the architects speak:

"The unit plans of Middletown," Kennedy says, "are far below what we could have done had it not been for the State Board of Housing’s standards, and particularly for the way in which they interpreted them. Their room sizes and average unit sizes were both maximum and minimum. They had very conservative, conventional ideas about construction, and so forced the houses into the conventional mold. The two factors combined made building more expensive and less easy than necessary, even though this was one of the cheapest of the hundred or more projects done at the time.

"The greatest weakness in all mass housing is site planning. Middletown’s chief quality is sensitive adjustment to topography, trees, roads, colors. Too often site planning has to be a total regrading job, cutting down trees, changing run-off courses, etc., resulting in bare, shadeless, ugly sites and more cellars leaking than not."
Above, typical end-unit kitchen equipment. Basements are small, under central portion only of each building, and contain the boiler and hot water heater for the building.

Pleasantly site-planned—to help make up for unthinkingly rigid local interpretations of veterans' housing criteria—Middleborough's row houses have identical two- and three-bedroom units.
ONE OF THE FIRST PROJECTS under the new far reaching FHA Title VIII military housing program is being constructed to alleviate living conditions at the Edwards Air Force Base in the Mojave Desert. The site was originally developed as a test base to take advantage of the Muroc dry lake as a large, flat natural runway. Extreme living conditions, however, resulted in a serious morale problem. It was not until Congress passed the Title VIII housing law that much could be done about relieving the situation.

Because of the isolation of the base, practically all labor had to be imported. Speedy construction methods and a large combination of labor-saving devices were employed to help offset the added labor costs.

Wood frame construction, covered with fireproof materials, was selected as the most permanent building material for the desert, where excessive dehydration prevents fungus and decay. All houses are air conditioned, and have walls and windows specially insulated and sealed against dust or possible wartime use of poison gas, etc. The project comprises 724 dwellings, a good many of which have been completed. Five floor plan variations were used, each averaging 1115 sq ft of living space plus garage.
Labor saving devices were used where possible to speed construction. These included large volume concrete mixer (top left), cement placing and finishing devices (center), powered nail drivers (bottom).
The structures are specially insulated against dust (see sections above). Walls have protective membranes and insulation which are said to guard against radio-active dust, poison gas and products of germ warfare. Most of the windows are permanently sealed; mechanically filtered air is provided for ventilation. The few vented openings are fitted with self-sealing air stripping. Interior panels (right) are fire-resisting, applied with automatic taping and gluing devices. Moss construction methods were used throughout the project, as in photos (below) showing application of roofing.
CHEMICAL ENGINEERING BUILDING
UNIVERSITY OF MINNESOTA

Magney, Tusler & Setter,
Architects & Engineers

Roy Childs Jones
Advisory Architect

University of Minnesota

Flexibility and safety were the controlling factors in the design of this new building at the University of Minnesota. The flexibility was achieved by modular planning; the safety, by laboratory placement, ventilation, flash-proof partitions.

The entire building is designed on the modular principle. The window pattern gives external evidence: mullions between windows are centered on module lines, 3 ft 8 in. center to center. The same dimension serves as the module unit throughout the building. Interior partitions, overhead suspension hangers and in-wall tension strips for apparatus suspensions or installations are all spaced accordingly. All piping is in manifold systems,
with branch plug openings spaced every fourth module (14 ft 8 in.); this permits complete flexibility in laboratory area installations with ready access to water, steam, gas, air and other supply lines provided at the recurring intervals. All structural weight is carried on concrete columns and steel mullions in the exterior walls, with all interior partitions non-load-bearing and easily removed or rearranged to meet space requirements. The entire structure could be quickly and economically converted to research work in the event of an emergency.

The building is designed around a "unit operations core" (model above), a utility core extending from the third-floor unit operations laboratory up to the top of the penthouse. This core includes provision for the installation of barometric legs and steam ejector legs from the penthouse to the sump drain at the ground floor. Accessibility of the utility core makes it possible to change the legs easily for various experimental purposes. (This would not be done normally in a chemical plant, but enables the laboratory to duplicate a variety of conditions that might be encountered in the industry.) All piping and ducts are so installed that they can be
CHEMICAL ENGINEERING BUILDING

removed or augmented without structural change. Piping is color-identified throughout, and left exposed. Heating is by continuous radiation strips; partitions may be placed at any module line without any change in the installation.

Experimental laboratories are on the top floor, a location which the architects consider advantageous from the standpoint of safety — in the event of an explosion only the top floors would suffer; such laboratory placement also simplifies traffic problems, since undergraduate classrooms are on the lower floors. Both natural ventilation and "blow-out" protection are supplied by the wide expanse of windows; an explosion would force the glass outward, preventing structural damage and minimizing injuries to personnel. Flash-proof partitions separate the laboratory areas, and forced exhaust hood-type ventilators are installed above each partitioned area. Each laboratory has safety showers.
Opposite: looking upward from third floor through the several levels of grating on fourth and penthouse floors. Below: between rows of tables in undergraduate laboratories are white-painted glass units containing indirect lighting fixtures.
GOLDEN STRAND HOTEL

Miami Beach, Fla.

Igor B. Polevitzky, Architect
Richard A. Belsham, Structural Engineer
Frederick B. Stressau, Landscape Architect

Resort hotels are expected to be luxurious, and this new one at Miami Beach really is. Consisting of two five-story buildings and 16 small villas, it has its own beach, boardwalk, shuffleboard court, cabanas with hot and cold water, and a salt-water pool 40 ft wide and 82 ft long equipped for a complete water change every four hours. Every hotel apartment has a private terrace overlooking the ocean; each villa has a screened patio with a view of the ocean; and all rooms throughout the development have cross ventilation.

The two larger buildings have complete hotel facilities including dining rooms, bar, barber and beauty shops and drug store; many of the suites have kitchens. The villas are all two-bedroom, with fully equipped kitchens and separate service entrances, large living-dining areas, and two baths.
The deep site, stretching from the street back to a private beach, has been carefully planned for maximum use and maximum privacy. The two five-story buildings at the front serve as office and reception area. The villas behind them are arranged so that each has a view of the ocean and a private lawn. The beach is flanked by attendants' quarters.
The twin buildings of the hotel proper offer various types of accommodation, including two-bedroom suites with living room and kitchen. Plans above are of second and third floors (lower plan) and fourth and fifth floors (upper plan). Below, left: bar and cocktail lounge, looking toward main dining room. Below, right: a typical bedroom in hotel proper, showing balcony in center rear.
The villas are all free-standing one-story cottages with good kitchens and ample living space. Four of them (above) front directly on the ocean. Below: typical villa interiors.
ANDERSON & BECKWITH,

HARKNESS & GEDDES,

Associated Architects

GYMNASIUM BUILDING
PRIVATE SCHOOLS, no less than public, must watch costs, particularly when constructing new buildings. The new gymnasium building for Portsmouth Priory School is noteworthy in this respect as well as for the quality of its design. For economy it is common to find gymnasium locker rooms in basements; here the sloping site has been utilized to permit large windows in what might otherwise have been a less suitable location for such facilities. The pitched roof follows naturally the form achieved by roof trusses which are almost arched, to gain maximum height without wasting cubage. The long east and west walls are largely glass; wood louvers (photo above) inside the glass of the west wall protect against breakage and against over-strong sunlight (east wall glass has rope netting for protection).

The plywood dado in the main room (also in photo above) not only supplies a finished interior surface; it also forms a combined plenum chamber for the warm air heating (note supply grilles at baseboard level) and a radiant heating panel, whose contribution to solving the heating problem was taken into account in system design. Primary heat comes from a boiler in another building. Framing is wood and steel on painted cinder block basement walls; exterior finish, gray-cresosoted pine T & G siding, rough sawn; roof, special built-up, for steep pitch.
Above, left, basement locker room, well lighted since placement of building with respect to grades permits large windows. Right, east entrance leads to classroom which is used as a snack bar.

Richard Garrison Photos
Section, right, shows unusual truss designed with elevated bottom chord in center of span to provide ample free height for basketball. Wall detail and photograph below show vertical wood louver inside west window wall, for the double purpose of sun control and to protect glass against breakage. Heating is combination of circulating and radiant warm air. At each corner of gym is a space heater which blows warm air behind the plywood dado before expelling it into room for recirculation. Warm dado provides auxiliary radiant heat. Basement rooms have fin tube radiation or unit heaters.
RESIDENCE FOR
MR. AND MRS. GEORGE PALLEY

When a house is designed, as was this, chiefly for summer and weekend use, it should be as open and informal as possible. This one was planned as the successor to an earlier one on the same site which had burned to the ground except for the chimney. The first house had been two stories in height, and the chimney had been correspondingly tall; in this new version the chimney was left intact, and towers unexpectedly above the low roofline.

The bi-unit plan shown opposite was developed to meet the demands of a family which, entertaining a great deal and therefore needing a large dining room, nevertheless did not wish to waste space for dining facilities. By dividing the house into two wholly separate units—one for living and service, the other for bedrooms—and joining the two by a rather narrow passage containing the dining area, the architects not only solved the entertainment problem but also achieved an exceptionally open effect. And having achieved that effect they emphasized it by giving each wing a separate color for its below-window panel; yellow for the living room, bright red for the children's wing, gray for maid's room, blue-black for common areas, brown for owner's room. Other exterior walls are white-painted concrete block.

Croton-on-Hudson, N. Y.

Sanders & Malsin, Architects
Fireplace wall separating living room and entrance hall (above left and below) is duplicate of that in original house; owner is carving design in pine panel above mantel. Coat closet in entrance hall (above right) has no doors, an innovation which has proved popular with family.
Bathhouse at end of swimming pool (above) was built by owner to architects' design; it is topped by a bright red tank in which water for the showers is heated by sun's rays.

Interior walls are sheetrock covered with burlap and painted. Ceilings are plaster on wire lath, floors cork or rubber tile. Huge dining table is ash, was built by owner to architects' design as was much other furniture.
HOUSE FOR DR. & MRS. H. ENGELBERG,

Henry Robert Harrison, Architect
Structon General Contractors, Builders

Nestled closely into a hillside, this quiet house opens on a spectacular view of the Los Angeles area to the east, south and west. The architect worked in collaboration with the owners — a young doctor, his semi-invalid wife, and three active sons — to produce a structure exactly fitted to their needs. Minimum walking distances were achieved by planning the house on a single level, with main and service entries adjoining the carport (visible in left portion of photo above). At one end of the house, the master bedroom suite forms a secondary sitting room with adjoining study where the doctor can work at night. Living and service areas baffle noise from the children's combination playroom and dormitory, placed at the other end of the house close to the supervision of the nursemaid. The view is dramatized from all family rooms by large, unscreened windows with ventilating louvers in the sills. A two-level outdoor living area at the rear has provision for future swimming pool.
LOS ANGELES, CALIF.

Eckbo-Royston-Williams, Landscape Architects

MAY 1951
The master bedroom (above and below) provides a quiet retreat for the owners. The character of a living room is imparted by the use of simple, natural materials and finishes. The study alcove (above) is lighted by clerestory window.
Living, dining and service areas (below), centrally located for convenience to all members of the family, open on a large outdoor terrace. Use of interior glass panels and half-partitions increases sense of spaciousness. Cabinet work and furniture, other than chairs, were designed by the architect and executed by Hans Grassl in water stained birch. Walls are birch plywood and brick.

Plate glass (extreme right in photo above) runs completely to the floor in living and dining areas to emphasize the view. Inside glass reflection is avoided at night by use of soft indirect lighting. High windows on the north stimulate air movement across the ceiling. Radiant heating is provided by hot water coils in the concrete floor slab. The system is divided into four zones, controlled by thermostats with motorized valves. Extra coils heat air entering from ventilating grilles placed under many of the windows.
Children's combination playroom and dormitory has folding partitions for conversion into three private rooms. Built-in cabinets give ample storage space for clothes and play equipment. Floors are asphalt tile, walls plywood.

Warm air entering grilles by beds (above and right) heats walls, prevents drafts. Detail below shows use of supplementary hot water coil to heat the incoming air.
ROAD CAMP WITH BENEFIT OF ARCHITECTURE

Mill Creek Summit Maintenance Yard

Los Angeles Country Road Department

Richard J. Neutra, Architect

CAMPS FOR HIGHWAY CREWS are far from the normal routine of an architectural office. But this one, by a well-known architect, makes its point rather well. Here is a well ordered group consisting of: dormitories and dining facilities for the road maintenance crew, equipment garage and yard, and manager’s house, done in domestic scale and manner, to lend a note of dignity to what so frequently suggests a rough and humdrum existence. The architect devoted especial care to preserving the appeal of a really grand site in the mountains. Climatic conditions are extreme, ranging from six-foot snows and mountain gales to hot winds from the inland desert. All in all, the touch of an architect has added those imponderable values of orderliness and pride to a type of abode which has a notable need for them.

MAY 1951
Manager's house faces away from road equipment yard, with a magnificent view of valley and mountains. Wide shaded porch looks toward these views, enjoys privacy from activities of the yard.
Road maintenance workers live in the camp through the week, see their families over week-ends, weather and work permitting. Dormitory building is placed at end of equipment yard, and elevated several steps above it. This placing permits good observation of the yard itself, but also opens views to mountains beyond. The elevation is useful, too, when six-foot snows are a problem.
Dormitory building was designed to have a residential character, and to keep camp life as orderly as possible. Besides the dining room and kitchen there are laundry facilities, baths and storage rooms to give every encouragement to tidiness, and thus subtly to set a favorable pattern for life in a road camp.
MODULAR COORDINATION IN FRAME HOUSES

By James T. Lendrum, Acting Director
Small Homes Council, University of Illinois

Articles and Time-Saver Standards in recent issues have discussed the principles of Modular Coordination, based on the 4-in. module. Now, Professor Lendrum tells how the Small Homes Council has adapted the system to frame construction. Time-Saver Standards on pages 177, 179, 181 discuss construction details.

We consider modular coordination a tool whereby the draftsman or designer can predict with a high degree of accuracy, and very easily, some of the conditions which are going to appear in the field — greatly reducing cutting and fitting. It is also a tool with which the foreman or craftsman can check the accuracy of his work at any point and thereby be assured that subsequent operations can be done with greatest ease.

One difference between our work at the Small Homes Council, which admittedly has been primarily in frame construction, and masonry construction is in the size of the working module. The standard 4-in. module, which is so effective with masonry, loses some of its value in frame structures because of the increased size of the individual pieces going into the house and because of the reduction in the number of these pieces.

Practically, we operate in a rather simple fashion, and the only requirement that is absolutely necessary in order that any architect might duplicate our results is a mental one. You must agree to accept the mental discipline — it is something like stopping smoking or going on a diet; it is easy to talk about and often easy not to do, but once you have mentally accepted the responsibility, it is not hard.

Convenient Modules
A 4-ft module would be ideal from a construction standpoint, since it corresponds with stock sizes of sheet materials. It is not impossible from a planning standpoint, but often we find a 2-ft or half module is desirable, and on occasions, we think in terms of a 16-in. or a 32-in. module, corresponding with 16-in. stud spacing. Of course, these are all multiples of the basic 4-in. cube.

In one detail only do we vary from most people who are using sheet materials in frame construction. We use the 4-ft module (or the 2-ft or 32-in., etc.) to

The lower plan shows how a 4-ft module has been used to design a house based on the system of unit planning of the Small Homes Council. In this system, standardized plans for rooms or groups of rooms (made up of a certain number of 4-ft squares) can be combined in different ways to form a variety of complete house plans.
The only variance from common application of sheet materials for frame construction is that the 4-ft module (or 2-ft or 32-in.) is used to the nominal inside face of the wall rather than to the exterior face. This is shown above in an example of tip-up wall construction. Sheet and insulation materials (left) either inside or out fall directly into place, and may be applied before walls are erected. The end stud (above, right) must be off-set to allow for wall assembly.

Given a 4-ft planning module to the inside face of the wall, anyone can lay out, even without previous experience, a perfect modular wall—it is automatic. The sheet materials, either inside or out, fall into place perfectly. Stud spacing, either 16-in. or 24-in. on center is natural. Only one adjustment must be made in an entire wall, and that is the end stud which (see top figures this page) must be offset to allow for an assembly

Modular coordination ties right in with engineering methods for frame construction of houses. Assembly line fabrication of wood trusses is demonstrated below.
process. Since the wall is so simple are there any difficulties? The answer is yes — openings.

**Windows Need Study**

There still remains work to be done on windows before our frame structures become truly modular, and the work will not be an isolated study of the window itself, but a study of the window in relation to a wall frame and such things as headers over windows, etc.

We have made a continuous study on windows and are still far from satisfied with the results. These are a few essentials:

1. The window detail must be flexible to allow for glass in any position on the wall from bottom plate to top plate.
2. The detail must provide for ventilation or fixed glass in any of these wall positions.
3. The detail should not require quantities of special millwork.

**Pre-assembled Trusses**

For the roof of the house, "pre-cut and pre-assembled" trusses, combined with automatic, even spacing which results from a control of the basic house dimensions, makes work rather simple.

**The Interior**

Interior partitions still need a great deal of study. Kitchen cabinets and closets are still in an exploratory stage. The manufactured kitchen cabinet is entirely in keeping with our "pre-cut, pre-assembled, pre-finished" recommendations. The rest of our recommendations, such as continuous ceiling, continuous floor, etc., are not really modular, they are the result of our combination of modular and improved methods. They do save time and money.

**Floor and Foundation**

The use of concrete block for foundations is greatly simplified by the acceptance of dimensional control for the over-all house size. When slab-on-ground construction is used, there is no problem with the floor. When a basement or crawl space is used, there are a variety of ways in which the detail can be handled. The fact that we run our modular dimension to the inner face of the wall means that the joints, which come in 2-ft increments, may be either too short or too long, unless a double header or blocking is used (see Time-Saver Standards, page 179). This is a relatively minor material and labor cost when compared with the major savings which can be made above the floor line.
PREPARING THE LAND FOR BUILDING

The editors believe this article to be particularly timely in view of defense housing developments mushrooming over the country. Insufficient study of sites and inadequate knowledge of good principles of drainage frequently have resulted in permanent damage or costly corrective work to housing projects.

Grading and drainage are necessary evils in almost all construction. Unfortunately, the planner usually visualizes his site completely developed as either flat land or gently rolling ground completely void of water. Consequently, he proceeds to draw plans for his development complete in every detail except for the grading and drainage, which are either completely omitted or an appendage hastily added at the last minute.

If any grading or drainage plans are drawn up, they are frequently glossed over in the construction mainly through carelessness and lack of interest. After all, there is no danger to life if the ground ends up low where it should be high, or if people must walk through puddles to get into a building.

However, the items that often make one project more attractive than another are dry grounds and the lack of dampness in the building.

Drainage is simply the control of the flow of water on top of or under the ground; so the subject may be divided into surface drainage (Part I) and underdrainage (Part II).

Surface Drainage

The purposes of surface drainage may be listed briefly as follows:
A. To prevent or minimize property damage.
B. To permit the maximum safe use of facilities either during or immediately after a rainstorm.
C. To make land valuable that was formerly of no practical use — thus swamps are drained to create new farmland.
D. To better the health of a community. Drainage will kill the larvae of mosquitoes.
E. To enhance the beauty of a site.

Good surface drainage can be obtained by any one or a combination of the following methods. Most important is choosing the proper location to utilize the natural topography, or perhaps the contour of the site may have to be altered somewhat. Other man-made methods are ditches and pipe systems (including culverts, manholes, inlets) to lead water to the nearest watercourse (river, lake, drainage channel). Some types of drainage structures return the water directly to the watertable.

Methods of Drainage

The simplest way of obtaining good surface drainage would be to raise one end of a site so that all the ground slopes to the other end. This is found frequently in natural formations, but unfortunately it does not work out in developments — there is always a building, walk or pavement blocking some of the water. A remedy is to alter the contour of the land to form swales (a shallow ditch, see Fig. 3) and ditches, with these ditches sloped so the water will run off. Still, we must at some time cross a path. At these points, underground pipes or bridges come in very handy.

The use of drainage pipe and inlet structures (catch basins, manholes, etc.)

Drainage is simply the control of the flow of water. As an introduction, this drawing reviews nature’s endless rain cycle. Rain either runs off through watercourses to lakes or rivers, remains on top of the ground forming puddles, evaporates, or goes into the ground. When it goes into the ground it is either picked up by plant life, is absorbed by the soil, or flows into underground streams or lakes. The level water seeks underground is known as the watertable.
Drainage

Part 1: Surface Drainage

By J. L. Staunton, Hydraulic and Sanitary Engineer,
of Seelye Stevenson Value & Knecht,
Consulting Engineers

under the ground will improve the appearance of a site by minimizing topographical alterations. This sometimes decreases the amount of earthwork.

Disposal of Rainwater to Soil

Runoff may be discharged to the watertable when we are fortunate enough to have a suitably porous soil. This was done at a military airfield constructed for the army at British Guiana, and at the Miami International Airport. In both cases the ground is so porous that almost all the rainfall is promptly absorbed, requiring very little drainage pipe and permitting the ground, except for the pavement, to be quite flat.

Drywells are used to drain water to the watertable when the surface of the soil (top soil and grass) is relatively impervious but the underlayers relatively absorptive. Figure 1 shows a typical drywell quite successfully used at the Grumman Airport, Bethpage, Long Island, New York.

In order for a drywell to be properly designed, it is necessary to make tests of the soil to see how fast the water will be carried away. It is my belief that improperly designed and constructed drywells have caused more water in the basements of small houses than any other single factor.

Frequently, a house built on completely dry ground is troubled with a flooded basement six months to a year after construction. Upon inspection, one would find that the roof leaders ended in drywells about 5 to 20 ft from the house. At first, the ground would carry the water away from the drywells but eventually a lake would form around most of the foundation after each rainfall. Drywells should never be used in tight soil such as clay as this is bound to cause flooding of basements.

Recharge basins are drywells which are used to add water to the watertable.

Design of Drainage for Probable Rainfall

A drainage system can never be adequately designed to care for all the water that might run off. A drainage system can be designed only on mathematical probabilities, based on either rainfall or runoff. This might sound odd, but all

War housing in California was built on inexpensive land in such way as to take advantage of topography for surface drainage. Note direction of slopes around the buildings.
design is based on probability: highways are designed for a certain number of cars per hour; bridges and buildings are designed to support so many pounds per sq ft; airports are designed for planes of certain weights and landing speeds; etc. When these limits are exceeded, we either have to scrap our initial structure or suffer failure in some form or other.

Since drainage is constructed to protect, enhance, or increase the usefulness of a development it is essential to weigh: (1) cost of the drainage system, (2) cost of the remainder of the development, and (3) the amount of damage and frequency of its occurrence.

**Estimating Size of Drainage System**

How does one determine the amount of water that must be cared for? The simplest and most primitive way is to go to a site and measure the high water marks at existing watercourses (streams, existing drainage structures). When these are obtained, together with survey data, it is relatively simple to compute the amount of water that ran off at the time of the high water.

The next simplest way is by the use of empirical formulas: the most common being Talbot's Formula: \( a = C \sqrt{\frac{A}{t}} \) where \( a \) = required cross section of waterway in square feet, \( A \) = drainage area in acres, and \( C \) = a coefficient depending on the character of the ground. These formulas were originally devised for one particular location and as such were very good. Unfortunately, they have fallen into relative disrepute because they had the misfortune of being universally used and runoff patterns vary in different locations of the country.

The most common procedure used for determining runoff is the so-called National Method. This formula states that \( Q = CIA \) where \( Q \) is the rate of runoff in cubic feet per second; \( C \) is a coefficient of runoff which depends upon the type and character of the site being drained; \( I \) is the intensity of rainfall in inches per hour; and \( A \) is the drainage area in acres. With this method, we can obtain from records the rainfall intensity probabilities at almost any location and by knowledge of the site we can arrive at the other factors.

The Unit Hydrograph is also frequently employed to determine drainage requirements. This graph is based on actual data either of the watershed in question or one having similar characteristics. This method is much more accurate than any of the others but is also much more laborious to compute, and at
present is used primarily for flood control determinations. A well-designed drainage system should make adequate allowances for future development. As a community develops, more houses are built and more roads and walks are constructed. All these surfaces are both relatively impervious and smooth. Thus, a greater volume of water must run off in a shorter length of time.

Sometimes it is possible to obtain an economical drainage system by making use of lakes or ponding areas. The effect of using ponding is shown in Fig. 2.

**Grading**

In planning the grading of a site to be sure water drains off properly, it is important to know the minimum slopes required to avoid the formation of soft spots or unsightly puddles. One essential is to know what sort of workmanship will be obtained. This is very similar to specifying tolerances in machine shop practice. For general work, it can be said that a minimum effective grade of 0.3 to 0.75 ft per 100 ft should be sufficient for paved areas and 0.5 to 1.0 ft per 100 ft should be sufficient for turfed or graveled areas. Detailed information appears in the table on page 161.

It is not considered good practice to have water running from dirt onto and across paved areas, washing dirt onto the pavement. However, this is done at times in the interests of economy. Ground should be approximately 1 1/2 in. below the pavement to allow for turf development, since grass pulls up the earth with it. If not done, this prevents water from running off.

A recommended method of draining an embankment to prevent soil erosion is shown above. The berm, swale and inlet keep the water from running down the side of the bank, the pipe controls the water through the bank, and the headwall and ditch assure that the water is kept clear of the toe.

Steeply cut slopes on the old highway (left) caused serious erosion, clogged drainways and restricted sight distance. In the same highway after reconstruction, note flat cut slopes, rounded at the top and seeded. This is considerable improvement, but the method at the top of the page is better.
Typical drainage structures are shown at the left. Manholes and catch basins are designed to connect drainage lines and for inspection purposes. Catch basins are not recommended, because they are generally poorly maintained, leaving large deposits of silt and furnishing a breeding place for mosquitoes.

**Erosion**

Erosion is particularly annoying in grading and draining a site. There have been compiled all sorts of tables giving maximum velocities of water permissible in order to avoid erosion of ditches. Unfortunately it is seldom practical to adhere to these very conservative figures. The best ditches are paved or riprapped (covered by rocks and stones, see Fig. 7). The next best are sodded or turfed.

Sands and silts are undesirable in ditches. Quite often a ditch when first constructed will erode until a stand of grass has developed. Also, the tendency toward erosion or settlement in front of an inlet to a ditch causes some initial maintenance. As these should not be recurring expenses, it is simpler to accept these two minor initial maintenance costs than to devise some elaborate and expensive design to avoid them.

If prevailing grades are steep, erosion of ditches can be minimized by constructing the ditch flatter than adjacent grades and then dropping the ditch from time to time over little check dams which may be constructed of wood, rock or concrete.

Erosion is a very serious problem with high embankments. Here, water is apt to wash away the entire embankment if sufficient care is not taken. Theoret-
Some Fundamentals of Hydraulics

A knowledge of the basic principles of hydraulics is quite important in designing a drainage system. It is possible to choose a correct pipe size and ditch laid to correct grades and still have flooding if proper attention is not paid to hydraulics. Figs 6 and 8 show two typical cases where this has occurred.

Facilities for Maintenance

Adequate slopes for pipes and culverts and facilities for maintenance and inspection of drainage are essential. It is desirable to have a minimum velocity of 2.5 to 3.0 ft per sec when the pipes are flowing at full capacity to keep the pipes clean. Lower velocities let solids settle and eventually clog the pipe.

Manholes should be placed approximately 200 to 400 ft on centers along drainage pipes, at all intersections and at all changes in grade. Fig 4 shows various types of drainage structures. They may be of any desired shape and may be constructed of brick, monolithic concrete or concrete block. Similarly the covers or gratings may be of wood, steel, cast iron or concrete and can be made in any desired shape. Manholes are provided with solid covers where they are employed only for maintenance and inspection purposes. The size of the structure below grade should be adequate (4 ft dia) to permit the use of cleaning implements.

The main difference between a catch basin and an inlet manhole is that a catch basin has a sump, usually 18 in. minimum, below the bottom of the effluent pipe. The purpose of this sump is to catch the silt that is washed in from the surface of the ground before it gets into the drain line.

The use of catch basins is not recommended since sewers are now designed with self-cleaning velocities capable of carrying along all matter that is washed in, and since catch basins are usually poorly maintained. There are times, however, when shallow sumps, say 4 to 12 in., are desirable. For instance, water dripping a long distance through a drainage structure tends to erode the invert. A shallow sump assures a water cushion which protects this invert.

Drainage to Kill Mosquitoes

Drainage is one way employed in destroying certain mosquitoes. Mosquitoes all pass through the larval stage which takes approximately 7-10 days for development. The larvae develop in still water; therefore, it is usually sufficient to see that the water drains off in less than one week in order to kill the larvae. Another method that has been successful in larve eradication is to raise the pool level a few feet relatively quickly and thus drown the larvae.

It is very important to maintain a proper slope of water along the top of a bank. Actually, this does not occur. Due to the water along the top of all the top of that page.

Table from "Public Housing Design" NA, June 1946

</tbody>
</table>

1. 0.75% for dished section.
2. Less where icy conditions may occur frequently.
3. Slopes up to 10% or more are satisfactory provided walks are long enough to employ a curved profile, so that a slope not exceeding 4% can be used adjoining the building platform. See also preceding note.
4. Steepest grade recommended for power mower.
5. Less for drainage areas of more than approximately ½ acre.
6. 2.00% preferable in all cases, particularly so where swales cross walks.

These figures again demonstrate how it might be possible to choose a correct pipe size and ditch laid to correct grades and still have flooding. At right, the ditch is theoretically oversized, but if the pipe flowed full, the ditch would be overtopped by 2 ft. Rocks shown in sketch, left, prevent erosion at transition section.

MAY 1951
CONSTRUCTION PROBLEMS OF AN ATOMIC LAB

Brookhaven National Laboratory, Upton, N. Y.

H. K. Ferguson Co., Design and Construction

IN THE CONSTRUCTION OF BUILDINGS to house atomic processes, common concepts of material selection and structural requirements must be tossed out the window.

Some idea of the complexities of design can be gained from an acquaintance with the construction problems in building the nation's newest atomic reactor at Brookhaven National Laboratory, Upton, N. Y., first reactor ever built exclusively for research.

The Brookhaven reactor consists of a giant cube of graphite penetrated by a rectangular array of parallel holes carrying uranium metal rods. Its primary purpose is to produce neutrons for studies on the nature of neutrons themselves, and on substances exposed to them.

The Graphite Cube

The cube is composed of 60,000 pieces of graphite stacked like building blocks. There are 2600 different sizes and shapes. The "stacking" is accomplished by a complicated keying system, in which every piece is keyed once or twice. No bonding agent could be used as it would have made the process unworkable.

Shielding

The pile shield which encases the graphite cube on all sides to protect personnel from radiation, is constructed of a special type of concrete, several ft thick, and steel plate ranging in thickness from 9 to 18 in. The steel is used structurally as well as protectively.

The heavy steel plate was obtained from surplus in the Panama Canal Zone, and was fabricated by the New York Naval Shipyard in sections weighing approximately 10 tons each.

Cooling System

Air cooling was chosen to remove the tremendous heat generated within the pile because of its simplicity, reliability, and stability. Heavy duty centrifugal compressors ejet the heated air at the rate of several tons a minute from the stack. The inlet air is filtered to remove dust which might become active while passing through the reactor, or might lodge within the graphite structure. The heated air is again filtered on leaving the reactor to remove activated particles originating within the structure.

The heated air is released 350 ft above the surrounding country. By maintaining a meteorological station and a number of radiation monitoring stations, it will be possible to insure that surrounding areas will be safe.

A secondary cooling system was installed around the concrete ducts to prevent impairment of concrete strength and life which might result from the high temperature of exhaust gases leaving the pile.

Foundation Problems

The nature of the pile and the method of assembling the graphite required prediction of settlement and tilting of the foundation within very close tolerances. Weight of the pile is so great that it caused stresses of more than 1 ton per sq ft at a depth of 100 ft below the footing. The total weight of the pile (about 40 million lb including the foundation) produces a soil pressure of 6500 lb per sq ft under the footing.
Fire-Resistant Roofs For Row Houses

A method of constructing continuous fire-retardant roof decks, spanning two or more row houses separated by two hour masonry walls, has been developed by the Engineering Committee of the Asphalt Roofing Industry Bureau. The method is approved by the Dept. of Public Works of the City of Baltimore.

The design is said to eliminate protruding parapets at party walls, to permit use of fire-resistant asphalt shingles, and to promote economical construction.

As shown in the drawings below, the fire-resistant roof construction extends on both sides of the party wall to include the second rafter (2) from the wall. Space between the rafters is enclosed with two thicknesses of ½-in. gypsum board (6), separated by 20 ga. 1-in. mesh galvanized poultry netting. The time temperature rating of this construction is 1 hour with wire mesh, 45 minutes without.

The roof deck itself is designed so that if fire should cause the roof to collapse, it will fall at or beyond the second rafter from the party wall. This is achieved by ending all roof boards over the center of the second rafter on each side of the party wall (9). A 2 by 2 in. fulcrum (14) nailed to the second rafter facilitates failure at the desired place in the event of fire.

The gypsum board between the first two rafters is claimed not to fall when the roof collapses, but to remain in place and serve as a deflector to prevent flames from jumping over the party wall to adjacent dwellings. Asphalt Roofing Industry Bureau, 2 W. 45th St., New York, 18, N.Y.

Electric Dehumidifiers

- The "Sahara" is a new electric dehumidifier, designed for home and commercial use. The unit, says the manufacturer, removes from two to three gallons of water from up to 10,000 cu ft of closed area in a 24-hour period. The unit requires no chemicals. Action is accomplished by drawing warm air into the system where it passes over cold metal coils containing freon-12. When the water vapor in the air condenses, it drains into a container or permanent drain. Operating on 115 volts, 60 cycles AC, the machine is one ft sq by 33 in. high, and weighs 55 lb. Mitchell Manufacturing Co., 2525 North Clybourn, Chicago, Ill.

- The Moisture Magnet is a portable, electric dehumidifier, designed for use in damp basements, locker rooms, printing

(Continued on page 184)
LITERATURE FOR THE OFFICE

School Desks

Bargen Slap-Up-Movable Pedestal Desks. Brochure describes various types of school desks designed with a movable pedestal. Eight models are illustrated and basic design and construction data are included in addition to variations in seat styles, book storage space, work tops, etc. Diagrams indicate required space for junior and senior sizes; and photos show sundry classroom arrangements using the movable, pedestal type desk. 8 pp., illus. Bargen-Built Industries, Inc., 625 Bryant Ave., No., Minneapolis 11, Minn.

Garbage Disposers

The Use of General Electric Disposalls on Private Septic Tank Systems. Booklet gives full details on how a private system can be used for handling both household sewage and fresh food wastes. Functions of a septic tank are discussed as well as design requirements for new or existing septic tanks which are to serve a disposer. Recommendations on capacity, location, etc., are given, and data on soil absorption systems is included. A list gives sources for further reference. 8 pp. General Electric Co., Bridgeport 2, Conn.

Circuit Breakers

Non-Enclosed, General Purpose Circuit Breakers (Bulletin No. 3410). Booklet describes fully magnetic non-thermal, non-enclosed, general purpose circuit breakers. These coil connections are included: terminal construction, series overload, calibrating tap, shunt trip and relay trip. Data is given on one-, two- and three-pole breakers for general industrial use. Time overload curves and coil resistance curves are also included. 12 pp., illus. Heinemann Electric Co., Trenton 4, N. J.

Stainless Steel

Architectural Uses of the Stainless Steels. The pamphlet is a reference for architects, engineers and builders to technical data on the stainless steels. Diversified applications of the metal are illustrated in extensive photographs of buildings, installations, etc. Parts available in stock are shown. These include stainless steel fasteners, roll formed sections, round and shaped tubing, textured stainless panels, perforated and expanded metal. Interiors, fronts and entrances, exterior walls, and flashing, roofing and drainage aspects are treated in photographs and diagrammed details. Specifications for various types of stainless steel are given, as well as tips on construction. 32 pp., illus. The Committee of Stainless Steel Producers, American Iron and Steel Institute, 350 Fifth Ave., New York 1, N. Y.

Lighting and Decoration

Contemporary Lighting in Modern and Traditional Interiors. Report, written in layman's language, deals with adequate lighting as combined with interior decoration techniques. All periods are covered, from Colonial and Early American through Victorian and Modern, and all rooms of the home except kitchen and bath. Types of lighting treated include: cove, recessed, window, wall, ceiling fixtures, lamps and fluorescent. Photographs show interiors and details of each lighting technique are given. Glossary of terms included. 64 pp., illus. Price, $1.00, quantity prices upon request. Publications Office, Illuminating Engineering Society, 51 Madison Avenue, New York 10, N. Y.

Piping

One Hundred Years of Piping Progress. Booklet issued to commemorate 100th anniversary of founding of Grinnell Corporation. Included are: history of the organization, typical products, interiors of plants and warehouses, and typical installations. Details are given on pipe fittings hangers, valves, prefabricated piping and unit heaters. 26 pp., illus. Grinnell Corp., 260 W. Exchange St., Providence, R. I.

Church Equipment

Pews, Pulpits, Rails, Screens. Brochure shows many styles of pews, over 48 types of pew ends, chancel sets and accessories including pulpits, communion tables, lecterns, chairs, dossal curtains, etc. All are shown in detailed diagram. Furniture dimensions are listed. 32 pp., illus. Carondelet Mfr. Co., 5826 South Broadway, Dover to Elwood St., St. Louis, Mo.

*Other product information in Sweet's File, 1951.
Diagram shows how the warm air is directed into the room by Fedders built-in angular louvers in front face of enclosure.

Also see how cool air flows down from the wall and is directed out into the warm air stream by means of curved top enclosure. These Fedders features greatly reduce streaking of walls and draperies, as well as contribute to uniformity of temperature from floor to ceiling.

Dramatic tests using finely divided powdered charcoal have been made in which the laboratory wall was coated with oil. No deposit of the charcoal powder clung to the oiled surface.

FEDDERS-QUIGAN CORPORATION, BUFFALO 7, N. Y.
DECORATIVE HARMONY

Covers are finished in neutral primer coat ready for finishing on the job to conform to any decorative scheme whether it be solid color, pastel or grained treatment.

CLEANLINESS

Heated air is directed away from walls by means of exclusive die-formed louvers, thus contributing to cleanliness and reducing cleaning and redecorating costs. Smooth surface of cover is easily dusted.

EASY INSTALLATION

Available in two types of flush or semi-recessed installations. Brackets, heating elements and covers are designed for quick, easy installation. Two-piece back is specially designed for good plastering practice. Fedders Baseboard Radiation can be completely installed as soon as rough flooring is laid. No delays, —not dependent on carpenters’ finishing schedule.

APPLICATIONS

Architects, interior decorators and owners are finding Fedders Baseboard Radiation an attractive and efficient means of heating for homes, apartments, offices, hospitals, churches and institutions. It can be used in new or remodeling work,—semi-recessed or flush mounted.

LAYOUT ADVANTAGES

Fedders Baseboard Radiation occupies little more space than ordinary baseboards. It makes all floor space useable and eliminates bulky radiators under windows. There is no interference with location of furniture or hanging draperies. Particularly well suited for use with picture windows.

HEATING COMFORT

Uniform rather than spot distribution of heat—provides comfort in all parts of the room. No hot spots —no cold spots. Convector-type covers activate circulation of heat thus providing more uniform temperatures from floor to ceiling, eliminating cold, drafty floors.

DAMPERS

Dampers (Patent Pending) are optional. They may be installed with the original job or can be purchased and installed at a later date. No dangling chains. A simple lever operates the damper for open or closed positions depending upon the occupants' comfort. Dampers reduce the overall job cost as they eliminate by-pass connections and expensive valves.
Heating Elements
Designed for Permanent Efficiency

HEATING ELEMENT

Heating element is made of cold drawn, seamless steel pressure type tubing with steel fins. Tube is bullet expanded into self-spacing, die-formed collared fins providing large area permanent metal-to-metal contact for efficient heat transfer. Die-formed pattern adds turbulence and scrubbing action to air flow plus added fin strength. Heating elements act as mains, thereby simplifying basement installations with consequent economy in piping. Cutting and threading on the job is reduced to a minimum. Heating elements are made in lengths from 2 ft. to 12 feet in 4" increments. Tubing available in 1" and 1 1/4" standard pipe sizes.

COVER LENGTHS

Furnished in sixteen lengths. Joining strips, end covers and corners available to suit installation requirements.

Showing uniformly spaced die-formed fins of heating element. Note collared holes for maximum heat transfer from tube to fins.

Showing Part of Test Set-Up at Fedders-Quigan Corporation.
ARCHITECTS’ SPECIFICATIONS

HEATING ELEMENT—shall consist of seamless steel tubing, ASTM Specifications applicable thereto. Capable of withstanding hydraulic test of 1000 p.s.i. Fins shall be die-cut, uniformly self-spacing, embossed, plate type, mechanically bonded to steel tubing. Elements shall be finished with one coat of rust-resistant paint capable of withstanding standard salt spray test of a minimum of 75 hours.

COVERS—shall have integral die-formed directional louvers. Top shall have a reverse O.G. curve with radii of 2½". Cover shall have integral one-piece front with die-formed ribs extending entire length. Lower edge of front cover shall be flanged inwardly at an acute angle to eliminate exposed sharp edge. Cover shall be given one coat of rust-resistant paint inside and out, capable of being covered with any type of finish coat. Prime coat must also withstand standard salt-spray test of a minimum of 75 hours.

ELEMENT SUPPORTS—must perform the dual function of adequately supporting the element and spacing the front cover. Supports must also position the element so that fins are not in contact with front and back plate. Supports shall be coated with one coat of paint identical with that used on element.

ALL JOINING STRIPS—as well as corners and end covers must overlap the main enclosure.

DAMPERS—shall be of the removable type, lever operated.

HOW TO ORDER

1. ELEMENT—Specify the pipe diameter. (1” or 1 ¾” diameter). Specify individual lengths required. Elements are made in lengths from 2 ft. to 12 ft. in 4” increments. If the run of element is greater than 12 ft., specify the actual length of each element required. Allowance must be made for expansion, couplings, ells, and miscellaneous fittings.

2. ELEMENT SUPPORT—Specify the number of supports required and the length of pipe. It is recommended that a minimum of 2 supports be used up to 6 ft. Over 6 ft., use one support every 3 ft.

3. RECESSED OR FLUSH INSTALLATION—Specify if installation is recessed or flush.

4. BACK PLATE—Specify the number of back plates required and if the job is to be recessed or flush. This part is made in 4 ft. lengths only. Order number of back plates in relation to the front cover, corners, end caps, and joining strips. Cut odd lengths to suit at time of installation.

5. HANGER STRIP—Specify the number of hanger strips required. (This part is made in 4 ft. lengths only.) Order sufficient pieces to support the entire front cover, corners, end caps, and joining strips. Cut odd lengths to suit at time of installation.

6. INSIDE AND OUTSIDE CORNERS—Specify the number of each required. (Corners are designed to overlap front cover by a maximum of 2¾”.)

7. FRONT COVER—Specify the number and length in feet and inches to nearest 4” beyond the required length. The covers are made in 4 inch increments from a minimum of 2’-o/8” to a maximum of 7’-o/8”.

8. END PLATE AND END COVER—Specify the required number of each part and also right hand or left hand. The end cover can overlap the front cover by a maximum of 2¾ inches.

9. JOINING STRIP—Specify the required quantity. (The joining strips are designed to give an overlap on each front cover of ¾ inches.)

</table>

**Notes:**
- Friction is in Millinches. 12,000 Millinches equals 1 foot of water pressure.
- Velocity is measured in inches per second.
- MBH equals thousands of Btu/hr.
- For 10° Temp. Drop, the MBH is one half the amount shown for the same velocity and friction.
The following method has been accepted for many years as the best design and engineering procedure to follow when estimating, laying-out, and specifying Fedders Baseboard Radiation. Do not use "shortcut methods" for calculating and layout.

1. **HEAT LOSS**—Calculate the hourly B.T.U. heat loss for each room. Use standard methods as recommended by leading heating engineers and societies. This heat loss is the amount of heat that will be required from the system to maintain the inside design temperature. To simplify the calculations, convert this loss to thousands of B.T.U. per hr. (M.B.H.) by dividing by 1,000. Thus, if the hourly heat loss of a room is 7,500 B.T.U., 7.5 M.B.H. will be required from the system.

2. **SYSTEM LAYOUT**—Make a sketch to scale for the entire system. Show the boiler location and indicate all the auxiliary equipment such as pump, compression tank, relief valve, automatic feed, etc. Locate all cocks and control valves. Add sizes and indicate lengths. Locate the Fedders Baseboard Radiation to blanket as much as possible the outside walls. A two circuit system is commonly used with a centrally located boiler.

3. **WATER TEMPERATURE**—Divide the heat loss for each room by the wall space available for Fedders Baseboard Radiation. Consult the Capacity Chart, page 6. The average temperature to use is obtained from the largest loss per foot of available wall space. Thus, in a room where the total B.T.U. is 13.0 M.B.H. and the available wall space for the Fedders Baseboard Radiation is 20 lineal feet, a B.T.U. per foot of 13.0 ÷ 20 = 0.65 is required. By consulting the Capacity Tables, it will be found that the 1⅛" element with an average water temperature of 180° is required.

4. **WATER VELOCITY AND TEMPERATURE DROP**—Engineering tests have established that a water velocity in excess of 4 feet per second will present objectionable noise for the average home. Other engineering tests indicated that velocities less than 2 ft. per second provide relatively poor heat transfer. These tests also indicated that for a major circuit heat loss of less than 50 M.B.H., a 10° drop is advantageous, while for major circuits in excess of 50 M.B.H., a 20° drop is preferable.

5. **SIZING THE ELEMENT**—To correctly determine the required length of element for each room, divide the total heat loss of the room by the capacity per foot of length as determined in Step 3.
6. **SIZING THE CIRCULATOR**—The correct size of circulator is determined by the gallons per minute (G.P.M.) of water to be circulated and the friction loss of the system. The amount of water to be circulated is determined from the following formula:

\[
\text{G.P.M.} = \frac{\text{Hourly heat loss of building}}{10,000}
\]

**NOTE:** 10,000 = 8.33 lbs. water per gallon x 60 min. x 20°F drop.

The friction head is determined by the amount of water flowing (G.P.M.), the length and size of pipes including the elements, fittings, boiler, etc. for the largest circuit. The Friction of Standard Fittings Table at bottom of page 6 indicates the friction head of the various components of the circuit. A circulator is selected from the calculated G.P.M. and the friction head. The Typical Circulator Capacity Chart indicates the performance of one of many circulators.

7. **SIZING THE BOILER**—To properly size a boiler it is customary to add at least 10% for piping loss and pickup when using gaseous or liquid type fuels.

---

MODULAR COORDINATION - 9: Frame Houses

Prepared with the cooperation of the Small Homes Council, University of Illinois

Planning and designing of frame houses under the Modular Coordination system follows in general the precepts previously discussed for masonry construction. These sheets present some considerations for wood construction, together with methods used by the Small Homes Council of the University of Illinois and incorporated in their studies of the "industry-engineered" house.

The latter project combined use of Modular Coordination with pre-cutting and pre-assembling of frame members to study possible economies in small home construction. Substantial savings were indicated in material, and in time and labor for cutting and fitting. Platform type of framing is more easily adapted to standardization of modular details than braced or balloon frames, but the principles can be applied to any method. To achieve over all economies, some parts must be cut to fractional dimensions, but in any case, their placement is greatly simplified.

Standard sizes of wallboards for dry-wall construction, insulation bats, and plaster lath are all satisfactory for Modular Coordination. American Standard Yard Lumber Sizes are also convenient for use with the system. Lengths are generally available in 2-ft increments. Nominal stud sizes differ from actual dimen-

Figure 1.
Use of a 4-ft module, referenced to the nominal inside face of wall coincides with stud spacing and wallboard sizes, as shown in partial floor plan above. Wall sections are planned for pre-assembly and tip-up. Heights accommodate 8-ft interior panels. Detail "A" shows corner assembly used with this type of construction.
One of the Nation's finest home developments is equipped with AllianceWare Bathtubs

A vista of the attractive homes in Park Forest, Illinois.

"Plan for ideal family living in spacious beauty, comfort and safety"—this is the aim of the developers of Park Forest, Illinois.

When completed, this extensive home building project will embrace a total of 7,500 dwelling units. The first 3,000 rental units consisting of five- and six-room duplex houses with one, two or three bedrooms have been completed. All of the completed homes are equipped with AllianceWare bathtubs—evidence that AllianceWare meets the exacting demands of progressive designers of homes and apartments.

There are sound reasons for the choice of AllianceWare by leading architects and builders. Modern styling, stainproof surface and a choice of colors in AllianceWare enhance the beauty of bathrooms, large or small. Practical details of AllianceWare construction, such as exact dimensions, wall guard flange that stops water leaks around the tub at the wall line, and anchor lugs which prevent shifting or settling of tub are added values of great importance at no extra cost.

Your plumbing contractor will be glad to give you full details of AllianceWare; or write us for catalog sheets describing the complete AllianceWare line.

ARCHITECTURAL RECORD
MODULAR COORDINATION—10: Frame Houses

Prepared with the cooperation of the Small Homes Council, University of Illinois

Figure 2.
Pre-assembled roof trusses simplify modular construction; spans and 2-ft spacing correspond with 4-ft module. Detail B, above left, shows joining of truss with nominal 4-in. stud wall.

Selection of Module
As with masonry construction, the basic module used for coordination of materials in frame construction is 4-in. However, due to the larger sizes and fewer number of materials used, a 4-ft unit is generally found more convenient for layouts, particularly for use with sheathing board and interior panels. Other multiples of 4 in. are often used to conform with stud or other unit spacing.

Figure 3.
Use of 8-in. grid for layout of concrete block foundation wall reduces cutting of units.

Ciba Engineering Staff
Architects and Engineers
Turner Construction Company
General Contractors, Philadelphia

Better elevatoring is the business of

Otis

This floor plan of the central building at CIBA’s new Toms River Plant is typical of all three buildings. “Factory-traffic” ranges from industrial-truck freight handling to light-duty laboratory service.

OTIS elevatoring at Ciba includes 4 GENERAL-DUTY FREIGHT ELEVATORS (one with explosion-proof features), 1 FREIGHT ELEVATOR for industrial truck loading, 1 ELECTRIC DUMBWAITER and 1 PASSENGER ELEVATOR.

WHY DID CIBA BUY OTIS? Excellent 20-year service record of OTIS elevators in other Ciba plants ... the ability of OTIS to assist on all problems of vertical transportation ... the fact that all the equipment is OTIS designed, manufactured, installed ... that OTIS assumes responsibility for the entire installation.

For further details of OTIS equipment, see SWEET’S Architectural File. Or, call your local OTIS office. Otis Elevator Company, 260 11th Avenue, New York 1, N. Y.
MODULAR COORDINATION - 11: Frame Houses

Prepared with the cooperation of the Small Homes Council, University of Illinois

Grid placement has generally been found most convenient when a grid line is referenced to the nominal inside face of a wall. This permits use of standard interior panels with practically no cutting, and permits flexibility in exterior wall details. Any grid position adopted should be used consistently throughout the job. Modular details for wall corners often determine the best grid position, so that studs maintain a uniform spacing for finish materials. A 4-in. grid is used for the correlation of modular details. Generally when walls are centered on grid lines, studs and joists are centered on grid lines. This may be modified if necessary to provide nailing for finish material.

**Typical House**

The details shown on these pages are of a typical small house planned for modular coordination and pre-assembly methods. Interior bay sizes are 16 by 24 ft to conform with stock panel sizes.

**Organization of Materials**

**Foundation walls** of poured concrete, or ground slab floors are easily made to conform with modular sizes. If concrete blocks are used, savings can be made if dimensions are referenced so that no blocks need be cut. **Floor joists** should be studied to average the greatest savings between cost of labor and materials. As shown in Figure 4, use of a 4-ft grid reference to the inner face of the exterior wall necessitates cutting of the joists or use of a double header or blocking.

*The wall framing* details shown on Sheet 9 are based on assembling sections of the exterior wall and tipping them up into position to reduce construction costs. Heights of the wall sections in this case are planned to accommodate interior panels.

*Pre-assembled roof trusses,* generally spaced on 2-ft centers, give considerable savings in small house construction. Their use permits erection of the outer shell of the house, and installation of flooring, ceilings and wall panels with a minimum of cutting. Interior partitions are then assembled and tipped into place.

---

![Figure 5](image)

**Figure 5.**

Detail shows relationship between 4 by 8 ft sheet board material and interior wall framing. A 1/4-in. clearance eases installation.

---

![Figure 6](image)

**Figure 6** (above).

No cutting is required for ceiling panels except at chimney, girder and bearing partition. Savings are made if finished floors and ceilings are applied before erection of interior partitions. All measurements indicated are from the inside faces of the exterior walls.

**Figure 7** (left).

Cutting of wall panels is minimized by modular room sizes. Material cut from door and windows could be used for closets.

---

MAY 1951
Would this be your choice of

for a modern INDUSTRIAL

Modern industrial buildings must be prepared to meet a host of entirely new conditions. Nuclear fission, reinforced construction, underground shelters, and massive machinery present a different set of problems.

The selection of the proper methods and materials to meet these conditions takes a great amount of study. Determining the correct plumbing drainage products, alone might take days of your time, unless you know that Josam can take this problem off your hands.

Josam’s vast knowledge and experience comes through furnishing the plumbing drainage products for such modern industrial buildings as:
- U. S. Steel "Fairless Works" Plant,
- General Electric Lockland Plant and Office Building,
- Ford Motor Engine Assembly Plant,
- National Advisory Committee Propulsion Science Operation Building,
- Atomic Energy Commission Manufacturing Plant,
- U. S. Navy Aircraft Rocket Plant
- and many other private and governmental industrial projects.

As a result, you can call on Josam with complete confidence that it offers a product for every drainage need, a product that has been tested and approved for the purpose. Today, you cannot afford to waste time, material, or manpower...you cannot afford to take chances on "guessing" right—you need proven experience on the job. In the plumbing drainage field—THAT MEANS JOSAM!
Plumbing Drainage Products...

Illustrated above are a few of the many types of Josam Products developed by Josam especially for use in Industrial Buildings. For further information, send coupon.

Josam Manufacturing Co.

Expanding Again . . . with Quonsets!
Successful experience with this large Quonset plant at Delaware, Ohio, has prompted Ranco, Inc., manufacturers of thermostatic controls, to build a new Quonset plant at Plain City, Ohio.

Build Quicker with Quonsets

IDEAL FOR FACTORIES, WAREHOUSES, MACHINE SHOPS OR STORAGE BUILDINGS

For additions to your present plant—or for new plants—Quonsets mean fast completion, economy of materials, adaptability to any use. Also, should plants need more expansion later, you can add Quonset to Quonset, according to the need.

Expansion Completed in 32 Days! Quonset 40 by 240 feet increased facilities quickly for General Gas Corporation, Baton Rouge, La.

Made of N-A-X HIGH-TENSILE steel, Quonsets provide non-combustible construction and permanence far surpassing less modern buildings. They require little upkeep—are easily maintained. Let Quonsets serve you now. Write us today.

"HET UP" about YOUR wasteful heating
SET UP?
Why not change to

THERMOLIER
UNIT HEATERS

If you're dismayed about last winter's high-cost-of-heating, how about next year — when it may be as hard to get fuel, as it was for you to get heat this year?

Here's a red-hot tip. To save heat and fuel, install Thermolier Unit Heaters. But don't delay. Material shortages can seriously disrupt the production of unit heaters. In addition, skilled men are available to make installations now. They may not be in the days ahead. Study these Thermolier Unit Heater advantages — and act promptly.

HEATING COMFORT Thermoliers provide quick heating from a cold start. Desired room temperatures are easily maintained within a close range.

LOW FIRST COST Thermoliers are so efficient and so compact that their heating capacity is often equivalent to the capacity of cast iron radiation or pipe coils of twice the cost.

ECONOMY OF OPERATION Heat is forced down to the working level . . . not banked uselessly at the ceiling level.

ADAPTABILITY TO EQUIPMENT AND FLOOR LAYOUT Thermolier unit heating is widely used in industrial plants and warehouses, garages, stores and public buildings. The units and the simple piping are overhead where they do not interfere with arrangement of the operating machinery or equipment.

PARKAY Sets the Pattern for Fine Hardwood Floors in Swank Apartments and Modest Homes

The luxury of Parkay ready-finished hardwood floors is not reserved for buildings of any specific type or price class. True, there are no finer hardwood floors than Parkay. Made of choice American Oak, then carefully factory finished, this flooring offers a lifetime of wear while keeping its lustre and beauty.

But Parkay is economical as well as durable and smart. While offering the wearing surface of standard flooring, its thickness permits use with other resilient materials without changing floor levels. Laid with special adhesive on any sound, smooth sub-surface, Parkay installation is fast—and, being ready-finished, it eliminates costly on-the-job finishing.

Yes, Parkay is beautiful, durable, practical—and its cost, laid and ready for traffic, is little, if any, more than conventional strip flooring finished on the job. Parkay is available in two styles—9” x 9” Tiles and 9” wide Broadboard in random lengths. Write for free sample and complete information. Parkay, Inc., Louisville 9, Ky.

PRODUCTS (Continued from page 186)

vibration may be determined. The unit is primarily a laboratory installation; semi-portable units are available. Electro Products Laboratories, 4501 Ravenswood Ave., Chicago 40, Ill.

Lettering Instrument

The new Varigraph lettering instrument is claimed to produce hand lettering in one tenth the usual time, and to make many sizes and shapes of letters from a single template. The device is precision built and is based on a variable pantograph principle. Weight is 1 1/4 lb.

Instrument permits lettering of hundreds of various sizes

The device is said to function simply—a tracing point is guided through an engraved master letter and, two dials having been set to control width and height of desired lettering, a pen reproduces the finished letter. Hundreds of extended or condensed letter sizes are claimed to be achieved in this way. Because a single master template is used, there is not the hindrance of running out of characters. Operation of the machine is simple and little lettering skill is required. Use of the Varigraph is said to give more flexibility in setting headings, lessen the time required to make “trick” lettering effects such as perspective, circular, overlapping and shadow, etc., techniques. The Varigraph Co., Madison 1, Wis.

Button up your
Industrial Coating Problems
with Flintkote's HYDRALT*

Here are coatings especially formulated to solve many of your industrial protective coating problems ... and do it economically...

Flintkote Hydralt Asphalt Emulsions.
These versatile coatings, applied by spray, brush and trowel, form efficient barriers against dampness, weather, acid fumes and smoke. Use them on steel, concrete and insulation materials.

Flintkote HYDRAL Protective Coatings, for example, are a unique mineral colloid type of asphalt emulsion which creates a film reinforced within itself. They are durable. So durable, in fact, that many installations remain just as effective after 20 years.

You'll find many advantages in specifying HYDRAL Protective Coatings.

HYDRAL Emulsions require no heating.
...Won't crack or check from cold.
...Are completely fire-safe and non-toxic.

...Won't sag or flow under heat.
...Are supplied in various consistencies, for every condition and application method.

Be sure and ask about our Asphalt Emulsions for your own use ... and button up your industrial protective coating problems for good.

Mobile Test Laboratory for Heating Systems

The National Warm Air Heating and Air Conditioning Association is placing a completely equipped mobile laboratory in service for testing newer types of warm air heating systems across the nation. A secondary objective is the testing of the use of materials not customarily used to construct or install systems.

The truck-contained laboratory is part of a 32-year-old research program sponsored by the Association at the University of Illinois. It will be placed at the disposal of merchant builders and realty developers to expedite faster dissemination of information about new heating designs and methods, particularly as they affect immediate needs of home construction. National Warm Air Heating and Air Conditioning Association, 145 Public Square, Cleveland 14, Ohio.

Free Wiring Plan Service

The construction Materials Department of General Electric has announced a free Residential Wiring Plan Service for architects and electrical engineers. Through this service, blueprints sent in by architects will be marked to show number and location of all switches for convenient control of all lighting fixtures and outlets for lights and appliances. If, according to the company, lighting fixture outlets are not indicated on the

(Continued on page 192)
The H&H interchangeable line may be employed many diverse ways to suit requirements. Assortment of plates, outlets, switches, pilot lights, etc., is found in H&H catalog.

**CLOCK OUTLET**

Connecting clock electrically, this outlet is concealed by the clock. No wires exposed. Recess for plug cap provides flush job.

**RANGE OUTLET**

Flush, polarized outlet makes range connection easy. Neat appearing and inexpensive. Surface types available.

**SWITCH, RECEPTACLE, LIGHT**

Combination excellent for modern appliances in kitchens. Reminder light warns that switch is ON. Receptacle in same plate affords multiple uses and added convenience.

**THERE’S EVERYDAY PLEASURE IN MODERN KITCHEN-DINETTES HELP YOUR CLIENTS FIND IT WITH H & H WIRING DEVICES**

It’s easy for the average home-planning couple to forget such things as switches and receptacles when they’re describing to you the home they visualize, so they’ll need some reminding. Remember that adequate wiring, and quality wiring devices, can contribute much to making their lives complete—today and tomorrow. You’ll find the complete line of H&H wiring devices contains everything in modern, dependable, service-proved units, standard and special. Plan to specify H&H on every job.

Branch Offices: Boston, Chicago, Dallas, Denver, Detroit, Los Angeles, New York, Philadelphia, San Francisco, Syracuse — In Canada: Arrow-Hart & Hegeman (Canada) Ltd., Mt. Dennis, Toronto

For more information, write today to: 1905 Laurel St., Hartford 6, Conn.

Send for idea-promoting booklet “Electrical Planning in the Home.”

blueprint, the wiring layout will be based on typical fixture locations. In addition, the service is said to supply several booklets on wiring and lighting plus a suggested guide for specifications covering installation of G-E remote control systems. Blueprints should be sent to: Wiring Device Division, General Electric Co., Bridgeport 2, Conn.

**Fireproof Curtain Wall**

A newly developed 6-in. perlite curtain wall has recently received a 4 hr fire rating from the Underwriters' Laboratories, Inc. The technique was worked out by McNulty Bros., lathing and plastering contractors, in collaboration with Bruce A. Gordon Co., Engineers.

The wall consists of an exterior layer of Permalite-portland cement plaster or concrete 4-in. thick, and an interior layer of Permalite-gypsum plaster 1-in. thick, separated by a furring chan-

**DON'T PUT MATCHBOXES ON YOUR BUILDINGS!**

Specify all-metal **Marlo** Cooling Towers and Evaporative Condensers

Avoid the fire hazard of wood—by specifying all-metal Marlo Cooling Towers and Evaporative Condensers that offer complete safety—plus these important advantages:

**DESIGNED FOR INDOOR or OUTDOOR INSTALLATION**

Compact Marlo Units can be installed easily indoors, or on the roof below the skyline... never spoil the beauty of your buildings.

**ECONOMICAL**

Marlo Units assure maximum water savings... up to 93% of normal cooling water demand.

**QUIETER**

Interior surfaces are coated with special sound-deadening mastic; all motors and pumps are resilient-mounted.

**MORE DURABLE**

Marlo Cooling Towers and Evaporative Condensers are doubly-protected inside and outside against corrosion.

Write for full details for "roughing in" for your specific requirements.

Marble Face Building Blocks

Marble Face Building Blocks, available with either cinder or concrete backing, are said to effect savings in construction by creating a completely finished wall in one masonry operation. Special as well as standard block sizes are available and come in white or any

Leadership in Minneapolis and St. Paul

Survey shows: BUILDERS PREFER INSULITE

HERE'S more proof of INSULITE leadership—this time in Minneapolis and St. Paul. It's the same familiar story . . . more builders and contractors prefer INSULITE BILDRITE SHEATHING than any other brand.

A building product has to be good in this area, because of severe extremes in climate. Builders know which products give the most protection against rugged Minnesota winters—with the least time and expense on the job.

"Best for Minnesota weather"—"It's stronger"—"Cuts my costs on every job" . . . that's what these builders say about BILDRITE SHEATHING. And remember . . . you don't need corner-bracing with 4-foot BILDRITE.

Architects everywhere are specifying INSULITE with confidence. For further information and samples write INSULITE at the address below.

"I'm saving $65.00 on every house I build . . . because Bildrite reduces waste to a minimum and corner-bracing isn't necessary," says Roy Olson, Minneapolis builder. That's just one reason why Twin City builders prefer INSULITE.

OZALID saves costly engineering DRAFTING HOURS!

Here's how Ozalid is serving a typical cross-section of America's industry* — speeding up drafting time and saving costly man-hours.

A LEADING AIRLINE — for engineering drawings, wiring diagrams, statistical charts and display advertising.

ONE OF AMERICA'S LARGEST HOME BUILDERS — for topographic survey maps, general and detailed housing construction plans.

A PROMINENT AIR CONDITIONING FIRM — for product designs (as they write, "Ozalid is doing the work of fifteen extra draftsmen.")

A SMALL MANUFACTURER — for production plans, office records and general statistical work.

*Names and details on request.

OZALID IS THE SPEEDY COPYING PROCESS that reproduces anything drawn, typed or written! — in seconds. Cuts skilled manpower hours and costs because changes on drawings, specifications and reports are instantly made on an Ozalid intermediate.

OZALID ELIMINATES NEED FOR SPECIAL stencils, inks, plates and make-readies. Does away with messy chemicals and time-consuming, costly photocopying steps. All copies are immediately available, dry and ready to use.

1. OZALID's greater technical experience helps you meet increased printroom demands.
2. OZALID's better materials give you quality prints for every job.
3. OZALID's nation-wide coverage is your assurance of better service.

WRITE TODAY for your copy of Production Shortcuts. OZALID, Department E-9, Johnson City, N. Y.

Moisture Detector For Building Materials

The new Delmarst Model G Moisture Detector, designed for application in the wood, paint, plaster and other building industries. Interchangeable electrodes permit multi-use application — to determine moisture in any wood product as well as in concrete and plaster surfaces prior to painting to prevent subsequent peeling, discoloration and blistering. Moisture content can be read on a dial 4 1/2 in. wide, in percentages ranging from 7 to 35 per cent. The instrument is small in size, measures 4 1/2 by 7 by 3 1/4 in., and weighs 3 1/4 lb. It is equipped with an adjustable shoulder and neck strap. Featured is a push-pull switch which is said to allow the operator free use of both hands, an advantage in handling materials. Model G is said to be simply operated. Once the instrument
ABOVE: When seats are closed, almost every foot of floor area is "recovered" for regular use.

LEFT: Medart "Two-Level" installation utilizes both balcony and gym floor for maximum audiences.

7 major reasons why you should specify MEDART
TELESCOPIC GYM SEATS

THEY SAVE FLOOR SPACE! Unlike fixed seating, when Medart seats are closed, virtually every foot of floor area is made available for regular class work.

THEY'RE SAFE! Like a steel skyscraper skeleton, the understructure of Medart seats stands alone and supports the entire occupied load on four vertical steel uprights for every row that put the weight on the floor, not the wall.

THEY'RE STRONG! Authoritative tests under loads of 400 pounds per linear foot indicate no apparent deflection. Stability tests show no side-sway at peak of stress.

THEY SAVE MONEY! Medart seats cost less than knockdown or built-in seating. In addition, they provide quickly available, ample accommodations for large and overflow crowds that mean important extra revenue.

THEY'RE CONVENIENT! Exclusive "Floating Motion" design makes the largest seat section easy to handle. Another Medart advantage allows only 1 or more rows to be opened as usage requires, while other rows remain closed.

THEY PROTECT FLOORS! Seat sections roll open or closed on rubber cushioned rollers that retract and let the "live" load rest on large steel shoes when seats are occupied. Medart seats avoid caster depressions in highly finished floors.

THEY'RE GOOD LOOKING! Wood parts are light natural-color, finished in clear lacquer that complements every trim, neat modern gym. Baked-on enamel protects steel parts.

For 78 Years The Standard Of Quality
Low-Cost Home Cooling
WITH HUNTER ATTIC FANS

HERE'S HOW ATTIC VENTILATION COOLS A HOME

It's cooler outside at night.
All day long a home absorbs heat from the summer sun. At night when outside temperatures have fallen to 75°, for example, the dead hot air in your attic may remain as high as 110°. This keeps the rooms below at an unbearable temperature of up to 95° or more.

Attic fan pulls the cool air inside.
A Hunter Attic Fan pulls the cool fresh outside air into the house, driving out the oven-like heat. In a few minutes after the fan is started, room temperatures drop 10° to 20° lower. An automatic time switch can be used to shut off the fan while occupants sleep.

NEW HUNTER PACKAGE FAN IS INEXPENSIVE AND EASY TO INSTALL IN OLD OR NEW HOMES

A Hunter Package Fan is the most practical and least expensive method of keeping a home comfortable on hot summer nights. This compact unit is easily installed in any new or old home. Furnished complete with fan, motor, suction box and ceiling shutter—with a choice of four sizes, to fit any home.

Cool comfort for a few cents a night.
This efficient attic fan is quiet and powerful, requires little or no maintenance. It costs only a few cents a night to operate and will last for many, many years. Backed by Hunter, exclusive fan makers since 1886. Mail coupon below for complete information on comfort cooling with Hunter Fans.

This is somewhat extreme, but it's a fact that BLO-FAN moves more air—quickly, quietly and efficiently!

It's easy to understand why when you study the design of the Blo-Fan blade...

...This blade combines only the positive principles of both fan and blower. The fan element literally scoops up the air and feeds it to the blower element which expels it with great force. Actually, Blo-Fan lowers "shock loss" of the average blower to an irreducible minimum...That's why Blo-Fan moves more air at moderate speeds than either a fan or blower type ventilator...

And, on the subject of speed, Blo-Fan Model 210 is equipped with a 9-speed switch...

...At low to medium speeds, Blo-Fan handles the normal volume of steam and fumes easily, but for emergencies (like burning the toast or grease in the broiler), turn Blo-Fan to high speed and you can clear the room immediately.

This exclusive Blo-Fan feature allows the housewife to control the rate of ventilation in her home as easily as she controls the speed of her car!!!

The exterior has a baked finish that is claimed to be acid- and grease-resistant. The base is recessed for toe room. The automatic interior light is protected against breakage by a steel wire guard. Shipping weight is approx. 253 lb. Kelvinator Division, Nash-Kelvinator Corp., Detroit 32, Mich.

New furniture line employs native Ozark handicrafts in contemporary manner

**NO-SHOK Safety Duplex Receptacles**

installed throughout

3010 UNIT HOUSING PROJECT

**Park Forest, Illinois**

When the additional 3,000 home units now under construction are completed, this suburban community will have a population of 25,000, approximately half of which will be children. To safeguard these thousands of youngsters, American Community Builders have installed NO-SHOK Safety Duplex Receptacles.

No-Shok Safety Duplex Receptacles afford added protection to property and lessen fire hazards by keeping out metal objects, dust, water, etc.—prevent shocks and burns—save lives. Specified by leading architects and engineers all over the U.S. for civilian housing projects, industrial and farm installations and Army and Navy housing. R.E.A. approved. Sold through leading electrical wholesalers. Write for particulars today!

**Ice Cube Makers**

The 1951 line of Ice-Flo automatic ice cube makers are designed for the production and storage of quantities of ice cubes for use in hospitals, restaurants, etc. The new models are said to be extremely simple in operation, and to be easily maintained.

The units are made of stainless steel, and consist of two parts—a cabinet containing the machinery, and storage bins mounted on casters so that a single machine can serve two or more locations with a minimum of ice handling. For hospitals, there is a special storage bin for pharmaceuticals, antibiotics, etc.

The cubes are frozen in a tray under water which is constantly recirculated. At the end of the freezing cycle, the unit defrosts and releases the cubes which float to the top. The cubes are carried by the circulating water over a dam, where they slide into the dry storage bin.

(Continued on page 204)
See how tough welded-wire Pittsburgh Steeltex bites deep into a stucco slab

Look closely at the actual-construction photograph. Notice that the Steeltex mesh is heavy, and the galvanized wires are welded together for greater rigidity. This provides positive protection against later distortion by actually strengthening the entire wall. Notice also the tough, double-ply waterproof backing. This not only protects the structure, it assists proper curing of the stucco slab. Steeltex backing and mesh are applied in one operation, thus saving money. For further good reasons for specifying Steeltex, see Sweet’s or write for catalog D.S. 131, Dept. AR, Pittsburgh Steel Products Co., Grant Building, Pittsburgh 30, Pa.
The cycle then repeats itself. The bins are equipped with a thermal cutout which turns the machine off when the bin is filled, and automatically restarts it when ice is withdrawn. Four sizes are available, producing from 150 to 700 lbs of ice a day. Ice-Flo Sales Corp., 1901 Train Ave., Cleveland, Ohio.

**Multi-Purpose Suspended Ceiling**

The Burgess-Manning Ceiling, according to the manufacturer, is the first suspended ceiling which provides radiant heating and acoustical control, and permits cooling and draftless ventilation if desired. The framework consists of channels of 11/2-in. steel, suspended on 4-ft centers. Two parallel 11/2-in. hot water flow pipes, called headers, are suspended from the channels and connected at intervals throughout their length by parallel 3/4-in. pipes, called laterals.

Headers and laterals are prefabricated and are said to be easily assembled. The ceiling itself consists of standard perforated aluminum acoustic pans connected to the laterals by clips which conduct heat from the laterals to the pans. The pans, in turn, radiate the heat from the ceiling into the room. Ceiling panels are snapped into place and removed for inspection of heating coils or other building services. An acoustic-thermal blanket, installed wall-to-wall over the heating coil, acts as sound absorber, thermal insulator and vapor barrier. Temperatures are controlled by means of a regular thermostat.

The company says that this type of ceiling also provides a type of summer air conditioning, with cold water circulating through the system and absorbing the heat radiated by warmer room objects. It also says that washing and ordinary oil paint do not affect the heat or acoustical properties. The ceiling is claimed to be highly fire-resistant.

While the ceiling is now in the "pilot" stage of production, several experimental installations have been made. General availability will be limited for the time being by material shortages. Burgess-Manning Co., Libertyville, Ill.

**Refrigeration Cell**

Acting on the principle of a storage cell, the Dole Ice-Cel is said to permit the storage of refrigeration effect and provide a means of utilizing the stored-up cooling power to supplement air conditioning systems in many types of buildings having heavy loads of a short duration. The cell can be charged at any time for convenience, at night, for example, and discharged in from 2 to 8 hours. A fairly small condensing unit can operate all day and most of the night to

**Beauty—and the Best!**

When you specify **CABOT'S COLLOPAKES**

for exterior house paint, you’re assuring a finish that is both beautiful and long-lasting. For Cabot's Collopaking process reduces pigments to submicroscopic fineness and uniformly disperses them throughout the vehicle. Collopakes form a porcelain smooth surface that resists the effects of weather for years.

Because no adulterants are used in Cabot's Collopakes, colors stay fresh and true.

**write today** for complete information and Collopakes color card, showing a wide variety of shades.

Thermostat for Radiant Heating Systems

Sarcoltherm Surface-Type Thermostat, a thermostat sensitive to convection air temperature and effect of radiant panels, is designed to function according to effective temperature, according to its developers. Although it is aimed at use with hot water radiant heating systems, it also can be applied to the control of electric radiant heating panels. The instrument can be supplied with a double switch action for special control sequences, and can be used for line or low voltage circuits. Sarcotherm Controls, Inc., Empire State Bldg., New York 1, N. Y.
GOOD BRICKWORK = GOOD DESIGN + GOOD WORKMANSHIP + GOOD MATERIALS

FULL HEAD JOINTS, WITH BRIXMENT, HELP PREVENT LEAKY WALLS

GOOD WORKMANSHIP

Plenty of mortar should be thrown on the end of the brick to be placed. The brick should then be pushed into place, so that mortar oozes out of the head joint.

POOR WORKMANSHIP

When dabs of mortar are spotted on the corners of the brick, the mortar does not completely fill the head joint, and voids are still left.

WE SUGGEST THAT—

All head joints in both face brick and back-up work should be completely filled with mortar. If head joints are not completely filled, water may penetrate to the inside of the wall through openings in the joints. Dabs of mortar spotted on the corners of the brick are not nearly enough to fill the joints.

T
ake a look at the two examples shown at the left, and you’ll instantly see why full head joints are an essential part of good workmanship in bricklaying.

No mortar material alone, not even Brixment, can make watertight masonry walls, so long as open crevices and pockets are left in the mortar joints.

Brixment mortar makes it far easier for the bricklayer to do good work. It is smooth and plastic—so soft and workable that the bricklayer can use enough mortar to fill the joint, and still “place” the brick easily and accurately to the line.

Brixment mortar has greater plasticity, higher water-retaining capacity and bonding quality, greater resistance to freezing and thawing, and freedom from efflorescence. Because of this combination of advantages, Brixment is the leading masonry cement on the market.

LOUISVILLE CEMENT COMPANY, Incorporated, LOUISVILLE, KENTUCKY
How many classrooms in a cafeteria?

"MODERNFOLD" DOORS have the answer

You're looking into a college cafeteria that leads a double life. At lesson time the "Modernfold" doors fold together to form much needed classrooms. At lunch time these steel-framed, accordion-type doors fold back to the wall—and quickly convert the classrooms into a cafeteria.

You keep clients happy when you give them more room—without having to add costly extra floor space. And that's exactly what they get when you specify "Modernfold" doors. As shown above, they're a "natural" for economical and flexible room division. And, as conventional doors, they save the space that swinging doors waste.

Economical? Definitely. "Modernfold" doors are moderate in first cost, and maintenance is practically nothing. Their handsome vinyl covering—in colors to match any decorating scheme—is fire-resistant . . . resists chipping, peeling, cracking, and fading . . . washes clean with soap and water.

For further information, mail the coupon or look up our distributor under "doors" in your classified directory.

Sectional Overhead Garage Door

An all-steel, four sectional garage door, the Roly-Door, is said to insure effortless opening and closing at finger touch, to be rattle- and weather-proof and to neither warp nor corrode. Roly-Door operates within the garage, has no protruding obstructions. Because of complete fabrication at the factory, installation and operation are claimed simple as well as time- and labor-saving.

Prefabricated, sectional garage door is designed for easy installation

A new model of Roly-Door is 9 by 7 ft, and also on the market is the 8 by 7 ft, door, both of which are adaptable to a 6 ft 6 in. opening where sufficient headroom is available. The door is said to have ample radius curve tracks to provide a smooth operation, and beveled metal strips to eliminate friction. It is equipped with a simple hinging device. Prime coated at the factory, the door is said to take any ordinary house paint. Roly-Door Div., Morrison Steel Products, Inc., 601 Amherst St., Buffalo, N. Y.

Electric Ranges

Featured in the 1951 line of Frigidaire Electric Ranges is the "Wonder Oven," which is said to permit the preparation of different foods at different tempera-
needed by Architects with industrial lighting projects: this BULLETIN, containing CHECK-LIST of Manufacturers of 18 Different RLM-Labeled Industrial Lighting Units

simplifies specification of RLM-Labeled Lighting Units to Assure Lighting Performance to High Standards Demanded by Defense Plants and Essential Industries

Everyone who specifies, recommends, buys or sells industrial lighting equipment should have a copy of the new RLM Bulletin 1050. This bulletin brings you an up-to-date check list of all manufacturers of RLM-labeled lighting units and the types of RLM-certified units made by each. It is intended to facilitate the specification of quality lighting units so essential to the success of any Planned Lighting Program.

Featuring an easy-to-use chart, the bulletin enables you to quickly determine: (1) whether or not a certain size and type of unit is RLM certified; (2) the names of all manufacturers who make RLM-labeled units of the type and size desired; (3) the names of manufacturers and the types of lighting units which they currently have on submittal to the Electrical Testing Laboratories for test and certification.

The bulletin supplements the RLM SPECIFICATIONS BOOKLET which contains all RLM Specifications in effect as of March, 1950. When used in conjunction with the Specifications Booklet, the bulletin will prove of important assistance in the procurement of lighting equipment that meets nationally recognized standards of quality and performance.

For your complimentary copy of both the new Bulletin and the 44-page Specifications Booklet, mail coupon or write RLM STANDARDS INSTITUTE, Suite 827, 326 W. Madison Street, Chicago 6, Ill.
For fastening into steel, concrete, masonry and other suitable material, both time and money can be saved with the fast, versatile RAMSET SYSTEM.

Taking less than a minute per fastener from start to finish, RAMSET gets the work done in short minutes instead of long hours, and with amazing reductions in cost.

Fasteners in 76 sizes and styles, like those illustrated, are available for practically any kind of fastening job, from basement to roof. Holding power equal to or better than conventional types of fasteners. Capable RAMSET Specialists will help you select the best fasteners for your specific needs.

To get your projects finished sooner, at less fastening cost, investigate RAMSET SYSTEM. Special Architectural Folder with complete information will be sent on request.

1951 range features large oven with movable divider, dual controls

The upper half of the oven has two heating units—a permanent one in the roof and one in the top side of the movable unit. Thus, this half may be used for broiling as well as baking or roasting. The lower half is equipped with a single, permanent, bottom heating unit. There are separate controls for each section of the oven.

Another feature is that the two small ovens can be converted into a single 6160 cu in. oven by moving the center shelf-unit into the bottom. This special oven is available on the RO-60 and RO-50 models.

Additional features on the above models are: new electric time signal, new large-size storage drawers and preheat oven control. Frigidaire Division, General Motors Corporation, Dayton 1, Ohio.
Concrete Joist Construction

Saves material because only a minimum of critically short steel is needed. Less concrete is necessary than required by other concrete floor constructions.

Ceco originated the removable steelform method of concrete joist construction. The company is first in the field—providing more services than all competitors combined. So call on Ceco... the leader over all.

THIS NEW, HIGHER CAPACITY VENTILATOR SOLVES UNUSUAL AIR REMOVAL PROBLEMS

The highly efficient Burt Free Exhaust Fan Ventilator exhausts an unrestricted column of air vertically upward at high velocity. Full-opening dampers open automatically when its Burt Axial Flow Airfoil Fan is operating—close automatically for thorough weatherproofing when motor is shut down.

If you require rapid spot removal of air contaminated with smoke, fumes, dust and heat, the Burt F.E.F. Ventilator is the most efficient unit for you. It is one of the many types in Burt's complete line of ventilators. See Sweet's or write for Bulletin S.P.V. 18.

Equipped With

BURT AXIAL FLOW AIRFOIL FAN

Aerodynamically designed for the rapid removal of air. Center hub is cast solid, with blades attached separately to permit prestressing and elimination of blade breakage at hub juncture. Each fan is balanced and test run at factory.

Reinforced Concrete

The following pamphlets and reprints on new developments for reinforced concrete are available from the Committee on Reinforced Concrete Research, American Iron and Steel Institute:

• New-Style Deformed Reinforcing Bars (Title No. 46-48), by Raymond C. Reese. (Reprinted from the Journal of the American Concrete Institute, May, 1950.) Pamphlet tells the how and why of the development of "improved" reinforcement for concrete. Tables give dimensional requirements for bars. Also covered are: types of bars and revisions in design practice. 8 pp., illus.

• ASTM Specifications for Steel Bars for Concrete Reinforcement. Booklet gives tentative specifications for Billet-Steel Bars, Rail-Steel Bars, Axle-Steel Bars. Also gives minimum requirements for deformations of deformed steel bars. Data and tables are included. 14 pp. American Society for Testing Materials, 1916 Race St., Philadelphia 3, Penna.

• Reinforced Concrete Wall and Column Footings (Title No. 45-6a), by Frank E. Richart. (Reprinted from the Journal of the American Concrete Institute, October and November, 1948.) Pamphlet presents results of research at University of Illinois. The study is said to be the first extensive one since 1913. Tables and graphs give data on tests. 62 pp., illus.

• Bond of Concrete Reinforcing Bars (Title No. 46-11), by Arthur P. Clark. (Reprinted from the Journal of the American Concrete Institute, Novem-
There's a Kentile color for every flooring need

Kentile Asphalt Tile is available in a wide range of marbleized colors in both Kentile and Special Kentile (grease-proof) grades. The stock sizes for both Kentile and Special Kentile are 9" x 9" with other sizes available on special order. Thicknesses are 1/8" and 1/4".

Residential—Today's architectural designs call for the planned use of modern decorator colors. Kentile offers the specifier of flooring materials a wide choice to allow an almost infinite choice of design and color.

Commercial—The wide range of Kentile colors provides an almost infinite choice of decorative schemes...to fit in with the plan of any commercial interior; store, restaurant, theater. The bright, cheery appearance attracts customers...captures the attention of passers and “impulse” buyers.

Industrial—The proper atmosphere in plant or factory is one of the most important elements in maintaining worker efficiency...production levels. One of the best ways to achieve this atmosphere is by the use of pleasing color with Kentile Floors and Walls.

An added advantage of Kentile Floors for any installation is the ease and economy with which Kentile is maintained...only mild soap and water cleanings plus an occasional no-rub waxing serves to keep floors clean and colors sparkling new.

SPECIFY KENTILE BY NAME because of its...

appearance—a complete range of marbleized colors in Kentile and SPECIAL Kentile. Also, feature strips, decorative inserts, edging and cove base.

installability—Kentile can be applied over any interior smooth wood, metal or concrete surface...even below finish grade over concrete on fill in direct contact with the earth.

availability—Over 3,000 Kentile dealers throughout the country assure prompt attention to your needs.

service—Nine conveniently located Kentile, Inc. offices and a nation-wide system of trained representatives plus a comprehensive selection of technical literature, are available to help solve any flooring problem.

cost—Installed prices are lower than those of practically any flooring material; varying with size and condition of floor; colors and thicknesses chosen and freight rates. Accurate estimates are available from any Kentile dealer—listed under FLOORING in your classified phone directory.

The following literature is available on request and is designed to aid in the specifying of floors and walls for residential, commercial or industrial building or remodeling.

Vanishing Doors
by Richards-Wilcox

Today's greater demand for small homes makes the full utilization of every inch of space more imperative than ever. And the answer to this need is an entirely new Vanishing Door Hanger by Richards-Wilcox that is designed for thin-wall installation and noiseless operation. R-W Silver Streak Vanishing Door Hangers and Aluminum Track are adapted for use on parallel residential wardrobe doors, or for any doors in any room of the house. Note these points of special importance to you and your customers:

- Four types of hangers to accommodate various size doors and building requirements.
- Bronze hanger and aluminum track to withstand salt air for seaboard use.
- Adapted to thin wall to save space and reduce building costs.
- No interference with room furnishings or decorations.
- Tight fit of door to floor avoids drafts, loss of heat.
- Adapted to single sliding and parallel sliding house doors.
- For more information, contact our nearest office or request one of our illustrated folders describing in detail the uses and advantages of SILVER STREAK.

Architectural Engineering

LITERATURE
(Continued from page 214)

ber, 1949.) Booklet reports on tests made at the National Bureau of Standards to compare resistance to slip in concrete (bond) of deformed bars when tested in beams and companion pull-out specimens. Purpose of tests was to secure information on effects of size of bar, type of deformations on the bars and strength of concrete on the bond. 23 pp., illus.

Single copies of above booklets are available free of charge from Committee on Reinforced Concrete Research, American Iron and Steel Institute, 350 Fifth Avenue, New York 1, N. Y.

Decorative Wallboard

Arborite Decorative Wallboard. An assortment of colors for wallboard are shown in this brochure, together with suggestions for use of the material in kitchens, bathrooms, recreation rooms, etc. Specifications for the wallboard are included. One section is devoted to instruction in installation. 2 pp., illus. The Arborite Co., Ltd., 385 Laffeur Ave., Ville LaSalle, Montreal 32, Que.

Wood Structure

Permanent, Functional Industrial Buildings through Engineering in Wood (TSG 6). Booklet describes application of laminated wood for use in prefabricated trusses, beams, girders, columns, crane-ways, arches and rigid frames. Photographs and diagrams illustrate many of these structures. Sizes and properties of standard Douglas fir laminated beams with 1 3/8 in. laminations are given, and charts indicate the dimensions, sizes and weights of typical Tim-Truss, arch Teco and Tim-Flat roof trusses. 8 pp., illus. Timber Structures, Inc., Box 3782, Portland 8, Ore.

Mahogany

Philippine Mahogany for the Building and Furniture Industry. Booklet is a general summary of the varied uses of mahogany. Large-size color reproductions show the wood as paneling and flooring and used in furniture pieces for the church, home, etc. The wood is shown in three finishes. 12 pp., illus. Philippine Mahogany Assn., Inc., 111 West Seventh St., Los Angeles 14, Calif.

3 new structures for the United Nations
...fabricated and erected by the
AMERICAN BRIDGE COMPANY

AGAINST A BACKGROUND of the completed UN Secretariat Building, for which American Bridge Company fabricated and erected 13,800 tons of structural steel-work, two bridgemen direct the unloading of steel columns and beams for the North Parking Space at the UN site.

Now that the UN Secretariat Building is completed, American Bridge is erecting the Meeting Halls Building and cover for the Franklin D. Roosevelt Drive, General Assembly Hall and North Parking Space. When finished these structures will contain 18,600 tons of fabricated steel framework, in addition to the 13,800 tons which went into the Secretariat Building.

This is typical of how the time-tested and proved experience of the American Bridge Company has been linked to the latest in modern architectural and engineering design to create structures of unusual beauty and enduring strength. Hundreds of steel-framed buildings all over the country are proof that for sturdy, economical structural work you can’t beat rigid steel construction—and for varied experience . . . unexcelled facilities . . . trained personnel, you can’t go wrong when you depend on American Bridge.

AVAILABLE NOW! For showing in churches, schools, clubs, and industries, the new sound and color motion picture—BUILDING FOR THE NATIONS—a candid, factual photographic record of the highlights of the fabrication and erection of the United Nations’ Secretariat Building in New York City.

COMPACT, 9-INCH DEEP UNITS in each room take little space, yet circulate air gently through large area. Units are supplied with attractive cabinets (above) or without cabinets for concealed applications. Simple pipe runs circulate chilled water for summer air conditioning, hot water for winter heating. Windows are never blocked.

EXTRA-EFFICIENT, QUIETER! G. E.'s room units filter all air, protecting coils from dust and dirt which cut efficiency drastically. Filter replacement takes less than a minute—it's much simpler and cheaper than costly coil cleaning. G-E units are quiet! There's no compressor in the room unit, just the quiet G-E motor and velvet-smooth, low-speed fans.

Consider how G-E Air Conditioning can make your building more profitable

Because space means money in both new and existing buildings, General Electric Personal Weather Control Systems have been designed for installation with small-size, space-saving ducts or no ducts at all.

- These extremely flexible systems heat in winter and cool in summer. Individual room air conditioners (shown above) are supplied with chilled or hot water through simple pipe runs from a central source.

In new buildings, such as the apartments at Sutton Place South, 53-54 Sts., (at left) New York, the use of wall apertures for ventilation eliminates the need for ductwork and cuts installation cost. In existing buildings such as Houston's Sterling Building and the Hotel Sheraton in St. Louis, adaptability of ventilation methods to individual needs avoids the necessity of building alterations.

Flexibility Means Economy...Future space rearrangement is simplified by the use of G-E room units because of their flexibility in capacity. G-E Air Conditioning pays off in operating cost reduction, too. During periods of system start-up or reduced occupancy, the room units can be operated without the expense of running central ventilation equipment. Units in unoccupied rooms can be shut off. G-E systems often require less compressor capacity, saving both installed and operating cost.

Building Value Increases...Tenants enjoy living or working where they get individual finger-tip control of climate without disturbing other rooms. Greater tenant satisfaction means lower turnover, more profitable occupancy.

Cuts Maintenance Cost..."Never had to replace one," says Clay J. Berry of the Fair Building, Fort Worth, Texas, where 500 G-E room units have been in use since 1939. "Maintenance cost has been no factor, and operating cost has been surprisingly low," says E. F. Puls, National City Building, Dallas, Texas.

Owner satisfaction like this is one of the reasons why G-E Personal Weather Control is going into buildings like New York's new Dun and Bradstreet Building...12 Sheraton Hotels...and banks, hospitals, and other structures in many parts of the country.

Builders Look to Memphis

While the housing standards controversy simmered with the NPA, private home builders turned their attention toward construction methods used in Memphis, Tenn., to produce some 2000 housing units at rental levels ranging from $33 to $50 per month.

Early in May, approximately 400 of the nation's leading home builders were to attend a conference in Memphis sponsored by the National Association of Home Builders. Avowed purpose of the meeting (May 3–5) was to study these economy rental units and find ways to develop financing techniques in following that pattern in every major city throughout the country. As an N. A. H. B. spokesman put it: "We are determined to find at this conference ways and means of constructing housing of similar quality and design in all cities throughout the country."

Memphis is considered the natural laboratory for studies of this kind. Half a dozen builders have produced low-rental developments in the vicinity.

Scheduled to take part in the sessions were top housing officials of the government including Raymond M. Foley, housing administrator; Franklin D. Richards, Federal Housing Administration commissioner; and Curt Mack, assistant FHA commissioner in charge of underwriting.

Senator John J. Sparkman of Alabama, chairman of the Banking subcommittee on housing and rents, was to take part in the round-table discussions, as was Representative Frank Buchanan of Pennsylvania, an active member of the House Banking committee on housing matters. Representative Jesse Wollcott of Michigan, ranking Republican member of the House committee, had

MAY 1951
tentatively accepted an invitation to attend the Memphis meetings.

The meeting marks the first time in the Association's history that a national drive of this magnitude has been undertaken. The presence of outstanding mortgage lenders, architects and others in the home building field made this a particularly important meeting.

Builders attending from throughout the nation were to be given the oppor-
tunity to view the low-cost housing units first hand, and to discuss methods by which housing of similar size and design might be constructed in other parts of the country by the average builder under FHA sections 207, 213, 203 (b) (2) (A).

The conference was called by W. P. "Bill" Atkinson, Association president. Ted Kimbrough, president of the Home Builders Association of Memphis, and the Mayor of Memphis were hosts.

WASHINGTON (Cont. from p. 222)

C.M.P.: 1951 Version

The ponderous system of economic controls over construction materials finally gave tangible signs of shifting from scattered priorities to a firmer method of allocating the three basic metals — steel, copper and aluminum. The Defense Production Administration at long last announced its Controlled Materials Plan, less dramatic than the old War Production Board order, but for the most part welcomed by industry as a means of working some better method for materials distribution out of the chaotic condition arising from more and ever more DO rated priorities.

The plan finally announced early in April was a modification of the plan originally intended by National Production Authority officials. Rather than control of all the supplies of the critical metals, an "open-end" version was decided upon. This called for a strict control on only a portion of the supply with the balance left on the open-end basis for civilian goods use. The World War II plan, by contrast, rigidly controlled all use of the metals from the raw production to the end use stage.

The question of whether there would be a C. M. P. this time at all was touching — go for a time just prior to the announcement. Chief Mobilizer Charles E. Wilson stated publicly that his Office of Defense Mobilization was not sure that strict wartime controls over basic metals was necessary with the rearmament program only partially advanced. Those in NPA charged with administration of details of the program began to fret when officials of the higher defense agencies could not make up their minds. The target date for application of the new plan remained at July 1.

The pressures for institution of a C. M. P. had been building up in and out of government. The National School Boards Association, Inc., for example, took its complaints of scarce materials for schools directly to President Truman. Edward M. Tuttle, executive secretary of the group, wrote the White House urging that something be done at once to relieve the situation. His argument: when the civilian supply of materials and manpower shrinks by reason of large withdrawals for military requirements, public school authorities cannot compete with industry and business on an open market. He urged a "high priority for the needs of education when the C. M. P. becomes effective."

beautiful terrazzo
An aristocrat that works in supermarkets

Does a Terrazzo floor in a supermarket surprise you? It shouldn't, because not only is Terrazzo beautiful, but also its low annual cost prompts the choice.

The designer reasoned: heavy foot-traffic grinds the life and beauty out of most market floors. Terrazzo floors are known for long service life. They require virtually no maintenance and are easy to clean. What's more, Terrazzo stays beautiful throughout its long, long life. All this made "dollars and sense" to management...

Terrazzo offers the architect a spectrum of color, unlimited design possibilities. Made with a true white cement, like Atlas White, any desired color and shading can be produced. In short, Terrazzo gives practical beauty for commercial-building floors or any other.

For more information see SWEET'S Catalog, Section 4g/Uni and 13f/Un, or write Atlas White Bureau, Universal Atlas Cement Company (United States Steel Corporation Subsidiary), 100 Park Avenue, New York 17, N. Y.

FSA Gets Materials Office
The government pressures were exemplified by new activity within the Federal Security Agency touching directly on the school and hospital construction programs. Administrator Oscar R. Ewing set up a new Office of Materials Requirements under immediate direction of Rufus E. Miles Jr., who is assistant administrator for defense activities. This office will carry out details of claims for construction materials for schools and hospitals made to the NPA. (Veterans' hospitals are excluded from this function, coming under Veterans Administration jurisdiction.)

The Office of Education and the Public Health Service, constituents of FSA, are responsible for estimating and justifying materials requirements in their respective fields. For months these agencies have been gathering information to support their claims and preliminary reports have gone to the NPA.

The construction and supply needs of schools, colleges, universities and public libraries will be the responsibility of a staff serving under Ralph C. M. Flynt, director of special educational services. He is coordinating the program for the Office of Education.

The preliminary report to the controls agency was based on information obtained through thousands of questionnaires sent to state and local school bodies. This was supplemented by trade associations and other government agencies as well as by information from other sources. Estimates included copper, steel and aluminum requirements in scheduled building programs and in 278 specific items of supply and equipment.

Meanwhile, the Office of Education has been giving assistance to individual schools and colleges which have had their construction programs interrupted or impaired through shortages of critical materials. It was explained this assistance has been chiefly in expediting the contacts of schools and colleges with the appropriate section of the NPA which could grant emergency relief to them.

Claimant responsibilities for all health construction supplies and equipment
NIBROC gives
your clients wider choice of towels because Nibroc offers
widest range—singlefold and multifold, white or buff—to
meet every washroom requirement.

NIBROC Cabinets
hold up to 50% more towels than ordinary dispensers. No
gadgets to fuss with. Reduce washroom congestion.

NIBROC means
a fast towel delivery service to your clients. Nationwide
distribution and high mill production assure a steady
stream of these towels where and when wanted in any
desired quantity.

NIBROC means
a dependable supply of these quality towels year in and
year out—made by one company from timber-cutting to
finishing. One Brown Company machine, called "Mister
Nibroc," can produce nearly 30 million towels daily.

Be sure you specify Nibroc Cabinets for washrooms. They fit into modern
washroom planning. They dispense fresh, soft, absorvent, lint-free, economical
and hygienic Nibroc towels for everyone.

Why do more and more architects say 
"WRIGHT RUBBER TILE" instead of 
"rubber tile" when they write specifications?

... Why, because it is the only way to be sure of getting top quality material for all important floors.

There is no other way to be sure of getting the high modulus and high density that make Wright Rubber Tile last so long.

There is no other way to be sure of getting a naturally glossy, non-porous rubber tile that means easy cleaning and permanent new appearance.

There is no other way to be sure of getting the uniform color and marbleization that means a truly beautiful installation.

To be sure of getting the best installation, as well as the finest rubber tile, more and more architects are using the suggested installation specifications found in the Wright Section of Sweet's Architectural File. They are the result of thirty years' experience.

THE RECORD REPORTS

WASHINGTON
(Continued from page 226)

fall to the Public Health Service. This now has its own Division of Civilian Health Requirements to carry out the claimant functions connected with construction of hospitals and health centers. Charles G. Lavin is coordinating this program.

Just as did the Office of Education, the Public Health Service has submitted to the controls officials an itemized report of civilian health needs. The federal security administrator said PHS had been rendering substantial assistance to hospitals and health departments which are handicapped in their operations or construction programs due to delays caused by material shortages. In addition, it has provided NPA with information to assist that agency in determining the level of production necessary to meet essential needs for health supplies and equipment.

School Need: $14 Billion

A recently published report out of the Office of Education points up once again the estimated requirements for school housing. Called a progress report by the Citizens Federal Committee on Education, it is titled "Citizens Look at Our Schoolhouses." In the 20 pages of this booklet is a brief review of reasons for the acute shortage of space, both currently and in prospect. In short, it attempts to answer the question, "How did we get this way?" In summary, the drag in the school building programs during the depression years and during World War II times, coupled with increasing birth rates since 1941, have combined to bring the national school system to its present plight.

What about the future? The report states that 10,000 additional classrooms and other facilities for 1.2 million new enrollees in kindergarten and 13th and 14th grades will have to be provided. The reorganization of school districts would require 60,000 more.

Thus it arrives at a grand total of new classrooms needed by 1959-1960 of 520,000, broken down as follows:

For increased enrollments in grades 1 to 12 — 270,000.

For necessary replacements — 150,000.

(Continued on page 230)
Built-In Lighting . . . an Effective Design Medium

Even well-designed interiors can be given added character when modern lighting techniques are used. For example, see what valance lighting does for the living room illustrated above. Cove, cornice, recessed ceiling, and pinhole spot lighting can also be used.

These types of built-in lighting are equally effective in dining rooms, bedrooms and dens... and for that matter, in stores, shops, and offices, too.

In a booklet prepared by the Better Homes Bureau you will find "Design Details" of modern home lighting techniques, as well as suggestions for planning kitchens, laundries and wiring. Why not ask for a copy of "Design Details for Electrical Living Homes"... no charge.

Name:
Street:
City Zone State
For reorganized school districts—60,000.
For kindergartens and grades 13 and 14—40,000.
This spells out a need for 50 per cent more classrooms over the next 10 years than are in the present inventory.
What will filling these requirements cost? Better than $14 billion, says the report. It defines cost this way:
Estimated basic cost per classroom including related facilities, $27,000 in 1950 prices. This means:
270,000 rooms for grades 1 to 12 would cost $7,290 million.
150,000 rooms for replacements would cost $4,050 million.
100,000 rooms for other needs, $2,700 million.
The total: $14,040 million.
What of classroom design? Classrooms should not be all the same, the citizens committee observes. They should be designed with special reference to the age groups and subjects taught—art, physical education, natural science.
The report advises that architects designing schools give special attention to modern scientific methods for lighting, heating and ventilation, laboratories, shop work, auditoriums, gymnasiums, recreational facilities, cafeterias, libraries, special services and vocational education.
One excerpt from the report: "The architect selected should be thoroughly briefed on all points determined upon so that his blueprints will be something more than just a 'standard design.' Decisions about financing should be made only after all aspects of the subject have been explored thoroughly. Failure to appropriate sufficient funds may force the community to forego important advantages and real economies."
The report also deals with site selection, size of school houses and legislative actions.
The needs outlined are considered "feasible under present conditions" by the committee. The long-range school building needs cannot be indefinitely postponed, they insist.
What would be the effect on availability of materials for school building was still a question.

Cemesto* curtain walls need no exterior or interior painting

Cemesto combines amazing structural strength, high insulation value, exterior and interior finish—all in a single handy panel that's quick and easy to apply!

Now, build insulated curtain walls for only slightly more than the cost of ordinary uninsulated construction! Cemesto Insulating Structural Panels quickly, thriftily build permanent curtain walls that require no exterior or interior finish... can't corrode... never need maintenance!

Widely used for roof decks and partition walls, as well as curtain walls—Cemesto Panels offer many advantages and economies. They not only speed up work and cut costs in construction of all kinds—but they also insulate as they build!

Cemesto Panels Offer Many Unique Advantages. Cemesto Panels consist of a core of Celotex cane fibre insulation, to which a non-combustible cement-asbestos facing is bonded on both sides by a vapor-resistant, moistureproof adhesive.

These rigid, pre-formed units are light and easy to handle, yet have remarkable structural strength. Their smooth, hard, stone-gray surfaces have a light reflection value of 58%... provide attractive exterior and interior finish... no costly painting required! And their insulating core is protected by the exclusive (patented) Ferox® Process against fungus, dry rot, vermin and termites!

Cemesto Panels Insulate As They Build. Because of their high built-in insulation value, Cemesto Panels make any building cooler, more economical to air-condition in summer... warmer and thriftier to heat in winter. They make possible more comfortable, healthier working conditions. And this pays off in improved employee efficiency... reduced accidents... increased production!

Cemesto Panels are Amazingly Versatile. Cemesto Panels resist fire, weather and wear. Can be worked with ordinary tools on the job, or pre-cut at the mill for faster application.

Quickly, easily attached to steel framing with metal clips, or to wood framing or wood members with nails. And they are easily demountable, fully salvageable.

Cemesto Insulating Structural Panels make possible important economies in the design, construction and maintenance of every type building... from giant industrial plants to modest homes. Almost 20 years of varied use in all climates, all over the world, have proved their stability, permanence and performance. Discover how they can help you build better, faster... and at lower cost. EVEN AFTER 40 YEARS STILL THE MOST POPULAR CONCEALED DOOR CLOSERS

RIXSON

SINGLE ACTING—OFFSET TYPE CHECKING FLOOR HINGES
No. 18 • No. 20 • No. 25

The original purpose in designing this offset type, was to furnish a ruggedly built CONCEALED CLOSER . . . that would carry the full weight of heavy doors and control the full 180° opening and closing action . . . withstand years of hard usage in public entrances and require a minimum of adjustment and repair.

The fact that they have been the most popular of all concealed closers for over forty years is evidence that they have faithfully carried out their designer's purpose.

Through the years, there have been many improvements . . . and laboratory tests are being made continuously to keep these the most efficient and trouble-free door closers.

unfurled an entirely new emergency tax program founded on a $6 billion reduction in the federal budget. The pay-as-we-go policy was being talked with new fervor both in and out of government.

- The Lustron prefabricated housing plant controversy appeared to be settled — finally, President Truman upheld the decision of Gen. William H. Harrison, defense production administrator, to turn the Columbus, Ohio, facilities over to the Navy to be used in assembling aircraft made by North American. Formal transfer of the defunct corporation plant finally was effected formally, with the Navy agreeing not to disturb the expensive machinery and equipment in the Lustron plant until notified to do so.

ON THE CALENDAR

Current through June 3: Exhibition of prize-winning designs from Lamp Competition — Museum of Modern Art, 11 W. 53rd St., New York City.

Every hour, falling accidents kill or disable 37 workmen!* Are you sure your men are safe from unsafe footing? You can give your workmen maximum protection against costly slipping and falling accidents with A. W. ALGRIP Abrasive Rolled Steel Floor Plate. ALGRIP is made by rolling tough abrasive grain as an integral part of the upper portion of steel floor plate. Wet or dry ALGRIP gives non-slip protection even on steep inclines. Wear only exposes new abrasive particles so maintenance is not required. Engineers, architects, purchasing agents, and safety engineers are specifying A. W. ALGRIP for thousands of industrial and commercial applications. Follow their lead. Get more information now. Write for booklet B-20.

THERE'S NEVER A SLIP ON A.W. ALGRIP!

S-2250 Model 1 SPEAKMAN Anystream Self-Cleaning Shower Head.
America's most famous aid to better shower bathing. A turn of the lever allows the bather to select exactly the kind of spray he wants—needle for stimulation, regular for relaxation, flood for no-splash rinse. Always delivers full pattern shower.

**SENTINEL-ANYSTREAM**

**The Shower that has no equal...**

Together—or used independently—the Sentinel Balanced Pressure Mixing Valve and the Anystream Self-Cleaning Shower Head offer exclusive features not to be found in any other shower. Here are the exclusive features that make Speakman Sentinel-Anystream Showers outstanding:

**THE ANYSTREAM SHOWER HEAD—**

1. Anystream Shower Heads take care of more bathers per gallon of water. Users report water savings up to 50%. This is an important feature during periods of peak demand on hot water. Provides full-pattern shower even on low water pressure.

2. Type of spray—From stimulating, stinging needle spray, or relaxing, smooth normal spray, to non-splash flood spray for rinsing, the Anystream delivers what the user wants. A turn of the lever sets the spray as desired. And, when turned off, there's no annoying after-drip.

3. Self-Cleaning—won't clog. In flood position all dirt and sediment is immediately flushed out. Precision-built for long wear. Integral ball joint with concealed volume control (Model 1). Heads for use in public places may be supplied with Allen set screw to discourage malicious removal.

**THE SPEAKMAN SENTINEL BALANCED PRESSURE MIXING VALVE**

Here's the answer to the problem of what to do about fluctuating water pressure that causes sudden surges of steaming hot or icy cold water in the shower bath. With the Sentinel, the bather sets the temperature where he wants it—and the Speakman Sentinel Mixing Valve holds it there. Here are the outstanding features of this valve.

1. Holds discharge temperatures even.

2. Operation not affected by pressure variations in supply lines.

3. All wearing parts renewable from face of valve.

4. No thermostats, rockers or springs to get out of order—a simple f-l-o-a-t-i-n-g piston does the work. Minimum maintenance.

For DURABLE, SAFE VENTING specify

QC METALBESTOS GAS VENT

Lasting Construction
Permanent protection against the corrosive action of flue gases, condensates and the weather is provided by QC Metalbestos. Deterioration due to corrosion and cracking is eliminated when you specify this sturdy, all-aluminum, double wall gas vent pipe.

Dependable Operation
Metalbestos' unique double wall construction and leak-proof joints give complete protection against fumes or fire hazards. The aluminum inner pipe heats up quickly for efficient venting while the built-in air space minimizes heat loss and insulates the outer pipe against excessive heat. Precision formed QC Couplers and adjustable fittings permit rapid assembly and assure trouble-free, efficient venting.

Independent laboratory tests prove that Metalbestos keeps surrounding walls cooler than any other Type B gas vent listed by Underwriters' Laboratories, Inc.

New Venting Manual Now Available!
Published in the interests of better venting, this booklet, "Venting of Gas Appliances", contains basic rules and other helpful data concerning correct venting practices. For your free copy, just write to Dept.

THE RECORD REPORTS

(Continued from page 234)

residence and studio at 1526 W. Riverside Avenue, Spokane 8, Wash.

- Roland L. Robel, Architect, has established an office for the practice of architecture at 309 Western Surety Bldg., Sioux Falls, S. D.

- Slater and Chait, Architects, announce the opening of additional offices for the practice of architecture at 15 Park Avenue, New York 16, N. Y., and 171 E. 33rd St., New York 16, N. Y.

New Firms, Firm Changes

- The partnership of Benedict M. Ade and Conway L. Todd of Rochester, N. Y., has been dissolved. Both architects will establish offices of their own.

- F. Arthur Bickel, M.E., has become president and treasurer of Brown & Matthews, Inc., Engineers-Constructors, of New York City, following the recent death of Harry G. Matthews, president. P. Schuyler Bloem, P.E., has been named executive vice president in charge of engineering and sales.

- Erling G. Dollar and William F. Bonner Jr. announce the formation of a partnership for the practice of general architecture under the firm name of Dollar and Bonner, Architects, with offices at 1009 Washington St., Wilmington, Del.

- Appointment of Bradford N. Clark as an associate in the firm of Eggers and Higgins, Architects, has been announced by Daniel Paul Higgins and Otto R. Eggers, senior partners of the firm, with offices at 100 E. 42nd St., New York City. Mr. Clark will be responsible for construction and production as well as a newly formed industrial division.

- William E. Graham has announced the dissolution of the firm of Graham and Irwin, Architects, 2014 17th Ave., Vero Beach, Fla. Mr. Graham will continue to practice at that address.

- Lockwood Greene Engineers, Inc., Architects and Engineers, have recently added three new members to the Board of Directors. They are John R. Potter

Construction with Permalite lightweight aggregates

requires less steel...
saves time and manpower

Permalite lightweight aggregates can cut dead-load by as much as 80%!

Today critical steel shortages create an urgent need for lightweight building design. Now, dead-load to live-load ratio can be reduced from 7 to 1 to less than 2 to 1. Much of this saving can be in structural steel. How? By using Permalite aggregates in floors, walls and roof.

Furthermore, concrete and plaster made with Permalite instead of sand are easy to handle — quick to apply. Rigid completion dates can be set and met!

Permalite aggregate in concrete is an efficient lightweight, insulating floor and roof fill material. In plaster, it permits the fireproofing of structural steel without costly imbedding in heavy concrete. On walls and ceilings, it assures lighter, more resilient base coats.

Get the full story on why architects are specifying Permalite for all types of construction—industrial buildings, schools, hospitals, defense housing and military buildings.

TYPICAL USES:

Concrete Aggregate: Roofs and Floors — over lightweight decking. Exterior Walls — thin, light; easily formed and erected. Can be monolithically poured or precast into blocks, slabs and panels — can be sawed or nailed!

Plaster Aggregate: Fireproofing — speedily applied over structural steel. Interior Walls — replaces sand in plaster — at less than half the weight.

A Building Product of Great Lakes Carbon Corporation and its exclusive Permalite Licensees

and H. Morgan Rogers, both electrical engineers, and Harry E. Martin, mechanical engineer.

- Daniel D. Merrill and Charles A. Bradbury announce the formation of a partnership to practice architecture under the name of Merrill & Bradbury, 225 W. 57th St., New York 19, N.Y.

- F. L. Cochran, A.I.A., has been named a partner in Perkins & Will, architects-engineers, Chicago and White Plains, N.Y. Other partners are Lawrence B. Perkins, A.I.A., Philip Will Jr., A.I.A., John E. Starrett, M.E., and John C. Goodall. The firm name remains Perkins & Will. Before joining Perkins & Will in 1945, Mr. Cochran was technical director of the Chicago Housing Authority. Earlier he was associated with Shaw, Naess & Murphy, Chicago; Arthur Bohmen, Chicago; and Alden Dow, Midland, Mich. The branch office at 171 E. Post Road in White Plains has been opened recently by Perkins & Will to maintain closer supervision of work in the East.

- M. De Witt Grow, Architect, has joined the firm of Peterson & Hoffman, which will be known as Peterson, Hoffman & Grow. Offices are at 520 Spitzer Bldg., Toledo 4, Ohio.

- A. Wilson Knecht, mechanical engineer, has been admitted to the firm of Seelye, Stevenson & Value, civil, industrial and structural engineers, with offices at 101 Park Ave., New York 17, N.Y. The firm will be known as Seelye, Stevenson, Value & Knecht, consulting engineers. For the past four years Mr. Knecht has been chief mechanical engineer and assistant chief engineer for Walter Kidde Constructors Inc. Earlier, he had been for many years an associate of the late Clyde R. Place, consulting engineer.

**New Addresses**

The following new addresses have been announced:

- Bruno Amato, Architect, 216 Westchester Ave., Port Chester, N.Y.
- Dawson, Oliver & Murtagh, Architects, 575 Madison Ave., New York 22, N.Y.
- Killham, Hopkins, Greeley and Brodie, Architects, 9 Arlington St., Boston 16, Mass.
- Macklin & Stinson, Architects and Engineers, 639-A W. 5th St., Winston-Salem, N.C.
- Meyer & Ever, Architects, 149 California St., San Francisco 11, Calif.
- Francis Palms Associates, Architects and Engineers, 925 20th St., N.W., Washington, D.C.
- Martin Shapiroy, Architect, 129 Railroad Ave., Jersey City 2, N.J.
- Daniel Denison Streeter, Architect, 214 Fenimore St., Brooklyn 25, N.Y.

How to ZIP-UP a building!

Build it by areas instead of by inches! Use steel or aluminum Fenestra® "C" Panels! Just zip up your walls by interlocking these strong, simple sandwiches of metal and glass fibre insulation. You save time, labor, materials, money... your building is enclosed fast... and starts making money right away. What's more, you can zip these walls apart and set 'em back up again farther out if you ever want to expand your building.

"C" Panels are light weight but tremendously strong and rigid. Only 3" thick... but with insulation value equal to that of a 12"-thick brick wall. Incombustible. So smooth that dirt and grease can't get a grip.

They're another Standardized Fenestra Product engineered to cut the waste out of building (and maintenance). And you can get quick delivery!

A Few Details on Fenestra "C" Panels

Size: Standardized 3" deep, 16" wide, 6' to 12' long, 18-gage painted steel or 16 B&W gage aluminum (or combination). Steel panels weigh only 6.50 lbs. per sq. ft. Aluminum 3 lbs.

Elements: Made from two formed members joined into a structural, vapor-sealed unit. Asphaltic impregnated felt is inserted inside full length between members and end closures to prevent metal-to-metal contact. Packed with glass fibre insulation. Double tongue and groove joints give three positive bearing surfaces per panel, making wall of vertical "C" Panels an integral unit.

For full information on specifications, performance data, installation details, delivery schedules, etc., call your Fenestra Representative today (he's listed in your phone book) or mail the coupon.

*Trademark

This difference in thickness will give you 602 sq. ft. more floor space in a 150' x 250' plant!

THE RECORD REPORTS

AT THE COLLEGES

Thomas W. Mackesey Appointed Architecture Dean at Cornell

Prof. Thomas W. Mackesey has been appointed dean of the College of Architecture at Cornell University.

Professor Mackesey, who joined the Cornell faculty in 1938, has been acting dean since the resignation of Prof. Gilmore D. Clarke last summer.

The new dean helped plan the Sampson Naval Training Station, used for training recruits during World War II. He has also aided in replanning studies for downtown Brooklyn and in studies of traffic problems in New York City.

(Continued from page 240)

Professor Mackesey graduated from Massachusetts Institute of Technology in 1932. He received a master's degree in city planning at M.I.T. in 1938 and did further graduate work at Cornell and Harvard.

Leicester B. Holland Head Of Architecture at Miami

Dr. Leicester B. Holland, F.A.I.A., has been named head of the department of architecture in the School of Fine Arts of Miami University at Oxford, Ohio. Dr. Holland has been professor of architecture since 1948 under the late William Dunbar as head of the department.

Robert W. Modaff, now assistant professor of architecture, will serve Dr. Holland as executive assistant.

Before his recent death, Mr. Dunbar secured the services of two European critics as design critics for the department: Rudolph Frankel, a British subject specializing in theater, factory and civic design; and William de Moor, who was born in Italy, studied in Paris and has been practicing in Sweden.

Pennsylvania Inaugurates Two Programs in Planning

The School of Fine Arts of the University of Pennsylvania will initiate two programs of studies leading to degrees in city planning beginning this fall.

The undergraduate course of studies will be a five-year program leading to the degree of bachelor of city planning, while the graduate program will qualify successful candidates for the degree of master of city planning.

The new curricula will be under the supervision of G. Holmes Perkins, dean of the School of Fine Arts at Pennsylvania and former Charles Dyer Norton professor of regional planning and chairman of the department of regional planning of the Harvard University Graduate School of Design. Mr. Perkins is also editor of the Journal of the American Institute of Planners.

Faculty Appointments

• Reginald R. Isaacs and Coleman Woodbury were appointed visiting critics in the Department of Regional Planning of Harvard University for the Spring term.

Mr. Isaacs, who is director of the planning staff of the Michael Reese Hospital in Chicago, is conducting a col-

(Continued on page 244)
Schools are designed and built to serve for many years. So is Corbin Hardware. That's why so many fine new schools, like the Verplanck Elementary School in Manchester, Connecticut, rely on Corbin for their hardware needs.

From the safety of Corbin Automatic Exit Devices to the durability of our Butt Hinges, you will find that Corbin Hardware meets all of the specialized needs for the smooth flow of school traffic. Corbin Hardware makes an economical installation, too, because it requires little or no maintenance to provide year after year of quiet, trouble-free service.

GOOD BUILDINGS DESERVE GOOD HARDWARE

P. & F. Corbin
DIVISION
THE AMERICAN HARDWARE CORPORATION, NEW BRITAIN, CONNECTICUT, U. S. A.
laborative problem on the redevelopment of the South Side of Chicago, in which students of planning, architecture and landscape architecture are engaged.

Mr. Woodbury is conducting a student problem on the relocation of industry in urban areas. Now director of the Urban Redevelopment Study, he is a former vice chairman of the Chicago Housing Authority and during the war was assistant administrator of the National Housing Agency.

- Two appointments in the Department of Architecture for the Spring quarter have been announced at Stanford University.

Ernest A. Grunsfeld of Chicago will serve as a visiting lecturer in architecture and critic in courses of architectural design.

Dwight A. Coddington of San Francisco will also be a visiting lecturer in architecture, covering mechanical engineering for architects.

- Spero Paul Daltas has been granted a leave of absence from his Fulbright project in Italy to be visiting critic in architecture at the Royal Academy of Denmark. Mr. Daltas, who received his B.Arch. at the University of Minnesota in 1943 and his M.Arch. at Massachusetts Institute of Technology in 1948, will conduct a course in design for advanced students in collaboration with Eric Christian Sorensen, architect formerly on the M.I.T. staff, and Mogens Boetmann, Danish architect. Mr. Daltas will also deliver a series of lectures on American, European and Near Eastern architecture and city planning.

- Architect Marcel Breuer has been appointed visiting lecturer and critic for part of the Spring quarter at the School of Architecture of Georgia Institute of Technology. In announcing the appointment, Prof. Harold Bush-Brown, F.A.I.A., director of the School, said Mr. Breuer’s visit initiates a series of visits to the school by leading architects in practice.

**AWARDS**

Donald De Lue is Awarded Gold Medal for Sculpture

His panels for the Harvey S. Firestone Memorial in Akron, Ohio, won for Sculptor Donald De Lue the Architectural League of New York’s annual Gold Medal for “a fine example of architectural sculpture fitting to its setting with excellent execution.”

“Mind and the Universe” was the theme of the memorial panels.

Mr. De Lue received the award at a dinner at the Architectural League at which the several speakers called for renewed collaboration between sculpture and architecture.

The vital importance of this renewal was emphasized by the principal speaker, Paul Manship, president of the Ameri-

(Continued on page 246)
Every feature of a Q-Panel suits it perfectly for laboratories, research buildings, powerhouses and administration buildings—in fact, for all the types of plants now needed for expansion.

Q-Panels go up fast—50 sq. ft. of insulated wall every 9 minutes; a small crew quickly attaches the panel to the steel framework. Little blocks don’t pile up fast. It’s much quicker to hang a wall than to pile it up.

Q-Panels are prefabricated. This eliminates most of the uncertain conditions accompanying conventional field erection. In spite of the light weight of thin insulated curtain wall (6% of a conventional 12” masonry wall) its insulation value is greater.

Some of the most beautiful buildings of this decade have been designed in Q-Panel. Architects have used various fluted surfaces to produce light and shadow patterns. The metal surfaces, or Galbestos if you wish, are maintenance-free, durable. Quick construction is probably uppermost in your mind right now, but the excellence of Q-Panel and its attractiveness and its maintenance-free nature are qualities you will appreciate over the years.

Consult your architect and write us for FREE LITERATURE which explains the details and shows examples of Q-Panel buildings both large and small. Write for catalog on

THE RECORD REPORTS

(Continued from page 244)

can Academy of Arts and Letters. The kind of architectural “functionalism” which forbids all ornamentation is “not necessarily” an expression of the desire of the people, he suggested.

Leo Friedlander, a previous winner of the Gold Medal in sculpture of the Architectural League, said bluntly that there really is no sculpture today. The reason he found is that there is no longer any framework for sculpture: no architecture. The architect as we know him, said Mr. Friedlander, is “a relic of the past”; and the new architecture and the new sculpture await emergence of a new kind of architect-engineer with an aesthetic sense to match his regard for function.

Wheeler Williams, president of the National Sculpture Society, found reassurance in indications that the “isms” that came in recent years in art are on the wane both abroad and here. “Now we can hope that sculpture which will speak to people of tomorrow as well as those of today, without literary props, is in for a tremendous future in this great country of ours.”

- Frank Lloyd Wright was presented with the medal of honor of the Philadelphia Chapter of the American Institute of Architects at a luncheon following the opening at Gimbel’s in Philadelphia of the exhibition of his work which will later be shown at the Strozzi Palace, Florence, and in other cities of Europe.

- Earl T. Heitschmidt, F.A.I.A., of Los Angeles, was chosen to receive this year’s construction industries achievement award at the annual industries banquet March 15.

- Donald I. Bohn, chief electrical engineer of the Aluminum Company of America, will receive the 1950 Benjamin G. Lamme gold medal at the summer general meeting of the American Institute of Electrical Engineers. The award is being made in recognition of Mr. Bohn’s “pioneering development and application of electrical equipment for controlling rectifying systems in the production of aluminum.”

COMPETITIONS

State of Virginia Holds Competition on Memorial

Virginia architects have been invited to submit examples of their work in a preliminary competition for design of a “Living Memorial” to all Virginians who served in World War II.

A commission created by the State General Assembly is charged with carrying out the project.

Not less than five nor more than eight architects will be selected from the preliminary competition to enter a final competition for actual design of the memorial. The competition will be operated in accordance with the procedure recommended by the American Institute of Architects.

The selected contestants will each be paid a fee of $1000 (as partial expense reimbursement) when their final drawings are submitted. In addition, any

(Continued on page 248)
"A Heatilator Fireplace cuts my supervision time way down!"

says CARL KEMM LOVEN
Nationally-known Architect, Glen Rock, New Jersey

There are many Heatilator installations throughout the country such as this lovely Early American style.

This beautiful home is typical of many designed by Carl Kemm Loven that include the Heatilator Fireplace.

"YOU'LL avoid trouble with a fireplace smoking or not drawing properly if you use a Heatilator* Fireplace unit," says Mr. Loven. It is factory engineered and designed so that even an inexperienced mason can install one with a minimum of supervision.

NO LIMIT TO DESIGN. A versatile architect, Carl Kemm Loven has designed scores of beautiful homes, summer camps and hunting lodges of every style and decorative treatment. The Heatilator unit fits into his plans perfectly because it allows complete freedom of architectural expression with no restrictions on mantel design or use of materials. It is a scientifically designed, heavy-gauge steel form, complete from hearth to flue, around which any style of fireplace can be built.

A LIFETIME OF EXTRA COMFORT.
"A fireplace should be more than a decoration," says Mr. Loven, "My clients want extra comfort, too, and a Heatilator Fireplace gives it." It circulates heat to warm the entire room instead of giving off a little radiant heat and wasting the rest up the chimney.

PROVED FOR 24 YEARS. For complete client satisfaction, specify the Heatilator Fireplace...the first practical method of circulating fireplace heat. The name Heatilator is on both the dome and damper handle. Write today for complete specifications and illustrations. Heatilator, Inc., 915 E. Brighton Ave., Syracuse 5, New York.

*Heatilator is the registered trademark of Heatilator, Inc.
Virginia architects may associate themselves with one or more non-resident architects, who will be regarded only as associates. Personnel of any teams thus formed for the general competition cannot be changed for the final competition without written consent from the professional adviser.

EXHIBITIONS

Architects' Present Exhibit For Western Massachusetts

The Architectural Society of Western Massachusetts and the George Walter Vincent Smith Museum jointly presented the first public exhibition of the work of architects of the area at the Museum building in Springfield from March 11 to April 1.

The exhibit was planned to help forward public understanding of the architect's service to the community. The accompanying program devoted three pages to discussing "What is an architect?" and "What is architecture?" in simple, direct terms.

On display were some 250 exhibits — sketches, plans, renderings, working drawings and models — representing 23 architects in the area.

Otto E. Hermes was chairman of the exhibition committee, which included Louis C. Hinckley and Max R. Uhlig.

Work of Greene and Greene On Exhibit at the Octagon

An exhibition of the work of Greene and Greene opened April 9 in the administration wing of the Octagon, headquarters of the American Institute of Architects, 1741 New York Ave., N.W., Washington, D.C.

The work of the Southern California architects who pioneered the California style 40 years ago is shown chiefly through plans and photographs of seven major houses and gardens designed by the firm from 1903 to 1914.

The exhibit was prepared by the Southern California chapter of the A.I.A. with the assistance of Mrs. Jean Harris of Los Angeles, who has undertaken a complete study of the firm's work. (See Architectural Record, May 1948, pages 138-140.) After the Washington showing, the exhibit will be circulated under the sponsorship of the Institute.
PICTURE WALL captures a beautiful view with a single wide Andersen Gliding Window Unit. It's a WINDOWALL. It provides the crowning touch to a kitchen which shows interesting use of materials throughout.

This WINDOWALL floods light and air into the room that needs lots of both. It adds comfort and beauty to a kitchen work area which too often is needlessly drab. And because it is a WINDOWALL, it is efficient both as window and as wall.

See Detail Catalog in Sweet's Architectural and Builders' Files, or write us for further information. The complete WINDOWALLS Tracing Detail File will be sent on request to architects and designers at no charge. Andersen WINDOWALLS are sold by lumber and millwork dealers. *TRADEMARK OF ANDERSEN CORPORATION
NEW OFFICERS INSTALLED AT ARCHITECTURAL LEAGUE

Harold R. Sleeper was installed as president of the Architectural League of New York for his second consecutive term in traditional ceremonies held at the League following the annual dinner on April 12.

Other officers are: Helen Treadwell, Jane Wasey, Alfred Geiffert III, Philip C. Johnson, Fred N. Severud and George C. Rudolph — vice presidents; Jedd Stow Beissner — secretary; John W. Pickworth — treasurer.

Members of the Committee on Scholarships and Awards are Richard F. Bach, Janet Darling, Elwyn Seelye and Harold W. Rambusch.

Hugh W. Ferris was master of ceremonies for the installation ceremonies, which opened with a procession led by past presidents and Gold Medalists of the League.

The program closed with a discussion by Mr. Sleeper of the League’s plans for the coming year. A project to offer schoolchildren of the city some basis for understanding of architecture and allied arts is one of the new features planned.

ARCHITECTURE MUST SERVE PEOPLE, MEETING IS TOLD

“Upon us as architects rests the responsibility to give our clients the best in physical and psychological environment. Everything we as architects design must favorably reflect conditions surrounding the labor, living and leisure of our people,” Mr. Morris said.

Mr. Morris was principal guest speaker at the annual Ladies’ Night meeting of the chapter, held April 3 at the Fox-Hill Country Club, West Pittston, Pa.

Col. Thomas H. Atherton, president of the chapter, introduced Mr. Morris. Samuel Z. Moskowitz, immediate past president, was in charge of the evening, assisted by Joseph Hoban Jr., Edward Wassell and Jerome McGlynn.

BROOKLYN CHAPTER NAMES STUDENT AWARD WINNERS

Marvin E. Goodly, a student at the Massachusetts Institute of Technology, has been awarded first prize of $100 in the annual architectural competition of the Brooklyn Chapter of the American Institute of Architects.

The award to Mr. Goodly was made with seven others at a dinner meeting of the chapter at which Harold D. Hauf, editor-in-chief of Architectural Record, was the principal speaker.

Second prize of $50 went to Edward Crain of Pratt Institute and third prize of $25 to Elliott Saltzman of M.I.T. Vito P. Battista, chairman of the chapter committee on education, also presented honorable mention awards to Peter A. Giarratano, Walter E. Levi, Robert C. Reichenbach, Robert Welz and Robert A. Wennéle, all architectural students at Pratt Institute.

Subject of the competition was "a (Continued on page 254)
UNIFORM WARMTH AND COMFORT are assured throughout the room when Baseboard Radiant Panels by American-Standard are installed. Baseboard Radiant Panels blanket the entire room with even, constant heat. There are no lags or cold spots. American-Standard Baseboard Radiant Panels completely solve the troublesome heating problems in buildings where large areas of glass are used. Type R Baseboard Radiant Panels are installed in this new home.

CHILL-CHASING BASEBOARD RADIANT PANELS

by AMERICAN-STANDARD

TYPE R PANEL, offering radiant heat, has a smooth, smartly plain front. Made in one and two-foot sections. External dimensions: 8 inches high, 2 inches thick. (Same sizes as Type RC).

TYPE RC PANEL has slotted openings near the top and an array of fins in the back, permitting combined advantages of both radiant and convected heat from the same panel.

FREE LITERATURE: If you would like further information about American-Standard Baseboard Radiant Panels, contact the American-Standard sales office serving you and ask for a free copy of Form No. 716, which describes installation practice, or Form No. 773, which illustrates varied applications of Baseboard Radiant Panels in homes.

American Radiator & Standard Sanitary Corp., P. O. Box 1226, Pittsburgh 30, Pa.
(Continued from page 250)

A civic group in a local neighborhood (Bushwick Section, Brooklyn) to replace the typical obsolete and remotely located public buildings with a well-planned and coordinated group of community buildings.

Architects on the jury included William Ballard, Henry S. Churchill, Nembhard Culin and Lorimer Rich. Representing the chapter were Mr. Battista, Joseph Mathieu and Herman Solin. Peter Norrito, realtor from the Bushwick section of Brooklyn, also participated on the jury.

In his address, on architectural schools and their relation to professional practice, Mr. Hauf noted that the schools today draw much more heavily on the experience and judgment of the profession than practicing architects "as a whole" draw on the schools.

"If the profession of architecture is to achieve and retain a commanding position in our social and economic structure," Mr. Hauf declared, "its practitioners must develop a force and will to participate in the public affairs of their respective communities. Architectural schools and practicing architects should cooperate to the fullest extent possible to assure that the direction, vision and dignity of professional practice make architecture a profession in which young men with initiative and a sense of public responsibility will wish to carve out a career."

JOHN W. ROOT IS HONORED BY ALPHA RHO CHI POST

John Wellborn Root will become the fourth architect in history to hold the position of Master Architect of Alpha Rho Chi Fraternity when he is installed in ceremonies to be held May 11 in Chicago.

Mr. Root, a partner in the firm of Holabird and Root and Bargee, will be initiated immediately following the close of the national convention of the American Institute of Architects. The ceremony will take place in the Michigan Room of the Edgewater Beach Hotel.

Only previous holders of the honor were Dr. Nathan Clifford Ricker, founder of the School of Architecture at the University of Illinois; Cass Gilbert Sr.; and the late Eliel Saarinen.

Alpha Rho Chi was founded in 1914 to organize and "unite in fellowship" the architectural students in colleges and universities of America and to promote artistic, scientific and practical efficiency of the younger members of the profession.

WARDEN H. FENTON DIES; ARCHITECT IN NEW YORK

Warden H. Fenton, for many years a practicing architect in New York City, died on March 1.

Mr. Fenton, a member of the American Institute of Architects and of the Municipal Engineers of the City of New York, was a graduate of the School of Fine Arts of Columbia University and of the School of Architecture of the Pennsylvania Academy of Fine Arts, Philadelphia. He was awarded the Crown Traveling Scholarship in architect-

Marble saves critical metals for critical needs!

Marble eliminates the need for metal supports as shown in this section of an installation of 895 toilet stalls in a large southern aircraft plant.

Sanitary requirements for toilets are best met by the one material which discourages bacterial growth, and which can be maintained hospital-clean with merely the simplest regular attention.

Marble meets every sanitary requirement. It is permanent, durable, modern, and most economical when every cost factor is considered.

Marble shoulders new responsibility today by freeing for critical Army, Navy, and Aircraft Air Force use, metals which should be conserved for the national defense program.

MAY 1951
tecture for two years' study in Europe at the École des Beaux Arts (Atelier Bernier) in Paris. He was also an alumnus of the American Academy in Rome.

In 1918–19, Mr. Fenton served as supervising engineer for Navy housing, as assistant to Rear Admiral H. H. Rousseau and as a member of the Consulting Architectural Committee for the Design of Navy Yards and Naval Stations.

For ten years, from 1922 to 1932, Mr. Fenton was a junior member of the architectural firm of Hiss & Weekes. In 1938 he was appointed director of the Bureau of Architecture of the Department of Public Works. In this post he was in charge of design, plans and specifications for buildings of all types with a total value of $45,000,000. He was technical director of the New York State Division of Housing in 1941–42.

Mas. Gen. Allison Owen, 81;
ARCHITECT, CIVIC LEADER

Maj. Gen. Allison Owen, 81, who died late in January in his native New Orleans, was known as widely for his activities in civic affairs as for his contributions to the architecture of the city.

General Owen, described editorially by a New Orleans paper as "a great citizen of the old school," was still active as an architect at the time of his death and was president of the New Orleans Parkway Commission.

Buildings in New Orleans designed by General Owen included the Criminal Courts Building at Tulane and Broad Streets, the Catholic Seminary, and many church and school buildings.

General Owen attended Boston Tech and had taught history of architecture at Tulane University in addition to his practice. He commanded the Washington Artillery in the First World War and in the Mexican border hostilities just before that war. He was retired in 1933.

In 1924 General Owen was president of the New Orleans Association of Commerce. He had served as a member of the city survey committee and was organizer of the Parkway Commission, of which, except for rare intervals of war or other duty, he was president until the time of his death. He received a plaque in 1950 for 40 years of service to the commission.

General Owen was a Fellow of the American Institute of Architects and a member of numerous civic organizations in New Orleans.

CHARLES WYMAN BUCKHAM,
DUPLEX DESIGN PIONEER

Charles Wyman Buckham of Scarsdale, N. Y., architect and inventor, died March 11 in New York City after a long illness.

Mr. Buckham, who retired 20 years ago, was a pioneer in developing the interlocking floor type of building construction and the duplex apartment. He held patents on an inclined ramp as a substitute for stairs in school buildings and on a multi-level garage for the parking of cars.

After graduating in 1891 from the University of Vermont (of which his father, Matthew Henry Buckham, was president from 1871 to 1910), Mr. Buckham studied architecture at the National Academy of Design and at Columbia University. Later he studied at the Atelier Dure and Pascal in Paris.

Mr. Buckham designed the Pathologi-
DESIGN FOR MORE AND BETTER USE OF DAYLIGHT

...THROUGH Daylight Engineering

You can make free daylight pay profitable dividends by designing for greater and better use of it through Daylight Engineering principles. Through Daylight Engineering an Insulux Fenestration System controls light so efficiently that your building virtually "turns with the sun." Entire glass areas can be used for the transmission of free daylight from early morning to late afternoon. Such areas admit an abundance of cheerful, quality daylight into the farthest corners of your office or plant.

An Insulux Fenestration System can't rust, rot or corrode. Maintenance costs are extremely low. It provides an insulating, sound-reducing panel that is highly fire-resistant.

It's easy to give your present building, or the ones you plan, the many advantages of an Insulux Fenestration System. A Daylight Engineer will be glad to show you the benefits such a system can bring to your structure. Just write: Daylight Engineering Laboratory, Dept. A.R.S, Box 1035, Toledo 1, Ohio. Insulux Division, American Structural Products Company, Subsidiary of Owens-Illinois Glass Company.

INSULUX FENESTRATION SYSTEMS
—by the pioneers of Daylight Engineering
(Continued from page 256)

cal Building in Waterbury, Vt., and the State Office Building in Montpelier, Vt. He was the architect of Morrill Hall for the State Agriculture Department of the University of Vermont.

He joined Warren and Westmore of New York, designers of Grand Central Terminal, in 1900. Later he was with Curren & Hastings, architects of the New York Public Library.

Mr. Buckham was superintendent of construction of several Carnegie branch libraries in New York and was designer of the Gainsborough Studios there. He also redesigned the Salmagundi Club in New York.

THEODORE T. KNAPPEN, 50; CIVIL, HYDRAULIC ENGINEER

Theodore Temple Knappen, civil and hydraulic engineer who was senior part-
ner of the Knappen Tippett's Abett Engineering Company, died March 20 in New York. He was 50 years old.

Mr. Knappen organized his own firm in 1942 and its projects have included design of the ports of Amay, Venezuela, and Haifa and Tel Aviv in Israel; reports on the development of the ports of Philadelphia, Baltimore, Buffalo and Miami; plans for hydro-electric and irrigation projects on the Gediz and Men- deres Rivers in Turkey and on the Artibonite River in Haiti; the designing of a vehicular tunnel in Buenos Aires; and designs for a number of highways, airports, bridges and dams in the United States.

A graduate of the United States Military Academy at West Point, Mr. Knappen had served the Army Corps of Engineers first as an officer and later as a civilian employee. He had also been associated with several private firms and was with Parsons, Klapp, Brinckerhoff & Douglas, New York consulting engineers, as a partner just before he formed his own firm.

CHARLES ADRIANCE MEAD, FORMER PRATT LECTURER

Charles Adriance Mead, consulting engineer, of Montclair, N. J., died on March 29, three days before his 81st birthday.

Mr. Mead was a graduate of Pratt Institute in Brooklyn, and after serving there as an instructor in mechanical and architectural drawing continued to lecture on structural engineering until 1926.

He worked for numerous engineering firms in New York from 1896 till 1907, and from then until 1940 was chief engineer of the division of bridges and grade crossings of the New Jersey Railroad Commission and the Public Utilities Commission of the State of New Jersey.

WILLIAM RALPH SQUIRE, 79; DESIGNER OF EBBETS FIELD

William Ralph Squire, 79, a structural engineer and designer of the original Ebbets Field in Brooklyn, died March 24 in New York.

Mr. Squire was with the American Bridge Company from 1908 to 1910 and then spent three years with the engineering firm of Post & McCord before organ- izing his own company of W. Ralph Squire & Son in 1913.
Strength beyond any possible demands

COREX® is a special composition, molded over a core of hardwood fibrous chips, under tons of pressure, into a homogenous unit whose toughness and resilience defies fracture, cracking, chipping, warping or deterioration.

Rigid laboratory control guarantees uniformity of the physical qualities which make COREX ideal for schools, hospitals, factories, and all sorts of industrial and institutional installations.

The Architect’s Question Box

Published now and then in the interests of wood finishing, by FIRZITE and SATINLAC, those two little WIZARDS with WOOD.

QUESTION: How can I get rid of the ugly wild grain pattern when staining Fir Plywood and some other soft woods?

ANSWER: The cause of this wild grain is the way stains “take” so differently on the soft spring and hard summer growths. You can kill this wild grain by applying a coat of FIRZITE as a pre-sealer. FIRZITE penetrates deeply and in effect brings the soft growth to about the same density as the hard growth, thus “taming” the wild grain. Then, stain and finish as desired—thus achieving a smooth, rich finish.

QUESTION: What’s the best way to bring out the beautiful natural finish on wood paneling and woodwork?

ANSWER: Whether the paneling is soft wood or hardwood, the most effective way to bring out its natural beauty of grain and color, is to apply two coats of SATINLAC about four hours apart; steel wool, dust off and finish with one coat of paste wax.

QUESTION: Is there any one “best” method to obtain a blond or pickled finish?

ANSWER: For such purposes, both on hard wood or soft, plywood or solid, WHITE FIRZITE produces a clear “woody” effect without a “painty” look. Complete the finish with SATINLAC. It’s water clear—so necessary with these effects.

QUESTION: I recently had a job using Fir Plywood that got the usual coats of undercoat and enamel; and still we couldn’t lose the grain raise. Any suggestions?

ANSWER: A first coat of FIRZITE will minimize or virtually eliminate face checking and grain raising on painted or enamelled jobs.

If you have any problems in wood finishing, let us help you. Write also for specification sheet.

May we send you a blond Birch panel showing SATINLAC finish?

ceived top attention by Canada’s architects. Said President Smith: “Should marked redeployment of men and materials occur, it is highly possible that some adjustments within the structure of the profession may be necessary.

“It is no great secret that there is a dearth of really experienced architectural assistant. How to complete our local and civilian obligations, with national obligations arising, is a problem of some moment. Within government circles, the lack of trained architectural personnel is admittedly acute.”

The 1952 annual assembly will be held in Vancouver at a date to be set by council, probably late April or early May.

Committee chairmen who reported were Dr. A. J. Hazelgrove for the Royal Institute of British Architects; James H. Craig for the National Construction Council; P. C. Amos for the Canadian Standards Association and for science and research; J. Roxburgh Smith for the Arts Council; W. Bruce Riddell for the College of Fellows; J. C. Meadowcroft for public relations; Prof. Kent Barker for planning; R. Schofield Morris for legal documents; Harold Lawson for exhibitions and awards; Arthur H. Eadie for the Institute’s editorial board; L. E. Shore for duty on plans; A. T. Galt Durnford for architectural training.

Mr. Amos’ committee on science and research had warm commendation for National Research Council’s Division of Building Research directed by Robert F. Legget.

John B. Parkin Associates Wins in O.A.A. Competition

John B. Parkin Associates, Architects, of Toronto, has been awarded the commission for the new Ontario Association of Architects headquarters building in Toronto.

Parkin Associates' entry was judged best of 36 submissions in a design competition held by the Association. In addition to this award, three honorable mentions were made. Those who received them were George P. Hassig, Port Credit; G. R. Worsley and Page & Steele, Toronto.

In announcing the names of the winning firms, President Earle L. Sheppard said that the standard of design displayed was very high: "Only a small percentage — say 10 per cent — of the designs submitted were traditional in character, the rest being contemporary."

The competition was launched last July, shortly after a suitable building site was acquired. All 500-odd members of the Association in Ontario were eligible to compete, except those on the executive and premises committees, the competition jury, and their office staffs.

Accommodation required included a board room, library, general offices and club facilities.

Members of the jury were Prof. E. R. Arthur, Murray Brown and F. H. Marani, chairman. In its report, the jury pointed out that it sought in the building "the character which one might expect in the headquarters of a society of professional men engaged in the art of architecture."

The plan of the winning design impressed the jury with its extreme simplicity. "It presents an air of spaciousness, and the contact made with the O.A.A. secretary and the grouping of his office with the board room could not be improved on. Control of the library is equally good. As in the case of some other plans submitted, the building is protected, by a blank wall, from any new construction on the south." Unfortunately for the architects, their new headquarters does not belong to a category of building approved by the government at this time. However, (Continued on page 264)
Of particular interest to the designer and contractor is the fact that Macomber standards include all types of roof framing. Numerically, these standards include in addition to the Bowstring Truss—Flat Trusses as illustrated above left, A-Frames, High-Low Monitor type roofs and Longspan Designs. For the owner who desires any one or combination of these designs to house his plant facilities, Macomber can give the designer and builder the production advantages of shop standards for spans—30 to 130 feet. Save time and money by specifying MACOMBER.
Model 1501 is packed with features • Sensationally priced • Now in production

Dual Wheels
Fits in 8-inch joist space
Full 300 CFM — Certified
Extra quiet operation
Easier to install
Interchangeable discharge
Simplified construction
Standard 3½” x 10” furnace duct

For the first time Trade-Wind offers a twin wheel ceiling ventilator with interchangeable discharge that develops a full, certified 300 CFM, yet is priced competitively with ordinary ventilators. Equally important to you, Model 1501 is now in production and deliveries already are being made.

Write or wire us today for the complete story on the biggest ventilator value in 1951. Mail handy coupon now:

as soon as steel and other critical materials now needed for the defense effort are again freely available, a start will be made on construction.

H. Ross Wiggs Named to Lead Quebec Architects

H. Ross Wiggs of Montreal has been elected president of the Province of Quebec Association of Architects.

Mr. Wiggs was born in Quebec City and received his education at the Quebec High School for Boys and Ridley College, St. Catharines. He attended McGill University and the Massachusetts Institute of Technology, from which he was graduated in 1922 with the degree of Bachelor of Science in Architecture.

After serving a period of apprenticeship in New York, he returned to Montreal, where he worked in several architects' offices before establishing his own practice in 1933. His commissions have covered a wide range of residential, commercial and industrial buildings throughout the Province of Quebec as well as Ontario, New Brunswick and Nova Scotia.

Mr. Wiggs has been active on the council of the P.Q.A.A. since 1938 and was elected an associate of the Royal Canadian Academy of Arts in 1944. He is also an associate of the Royal Institute of British Architects.

Alberta Officers Are Named At Meeting Held in Calgary

Architects from all parts of the province attended the one-day annual meeting of the Alberta Association of Architects recently held in Calgary.

T. Gordon Aberdeen was reelected president. Also elected to office were: John Stevenson, first vice president; Cecil S. Burgess, Edmonton, second vice president; George W. Lord, Edmonton, honorary secretary; Ross M. Manley, Edmonton, honorary treasurer; K. C. Stanley, Edmonton, and V. E. Meech, Lethbridge, councillors.

Everybody talks about the weather -- but AUTO-LOK has done something about it! In all the history of window making, no window has forged so quickly into nation-wide popularity -- due largely to the practical manner in which it assures true "weather control."

HOT OR COLD? Auto-Lok Awning Windows (in either aluminum or wood) have vents that open to almost 90 degrees, scooping in welcome breezes. Too, they can be closed up -- literally air-tight -- and consequently effect real fuel and air-conditioning economies.

RAINS OR SNOW? Easy to keep the driving downpours and snow flurries outside -- without sacrificing the ventilation that is so imperative. Auto-Lok's weatherstripping and the automatic locking action make it indeed the TIGHTEST CLOSING WINDOW EVER MADE!

ALL CLIMATIC EXTREMES. Yes, Auto-Lok functions equally well in hurricanes or dust-storms, cold winds or on heat-filled, humid days. It affords protection against the elements, provides perfect visibility -- and fits readily into practically any architectural scheme.

Consult your copy of SWEET'S, and write for name of nearby AUTO-LOK distributor and complimentary copy of "WHAT IS IMPORTANT IN A WINDOW?"

A story of sound heating system operation

"Give us a heating system that will stand the test of time", the owners of the new Hotel Vendome told their heating contractor in 1907. And so it was that the complete mechanical plant—including the Webster Vacuum Steam Heating System—was planned for long service life.

Five floors were added to the Hotel in 1913...a 5-story annex was built in 1927—and both times there was an extension of the Webster Heating System.

In 1950, the Hotel Vendome undertook a complete renovation, including modernization of their mechanical plant. Once again they selected Webster Steam Heating Equipment.

Charles J. Scholz, president, Hotel Vendome, Inc., and his sons, Norman F., and Frederick J., vice-presidents, are convinced that modern heating pays for itself—in satisfied guests and lower operating costs.

Douglas E. Kerland, Toronto architect, presents Craftsmanship Award to Norman Mackay. Center: Bill Nelson of John Nelson & Son Ltd., Toronto plastering firm to which Mr. Mackay is indentured

graduation ceremonies of the provincial building trades training school at Ryerson Institute, Toronto.

Mr. Mackay was presented with the first Ontario Association of Architects award to a final-year apprentice who, after winning first prize in his own class, was judged by the instructing staff to be the most proficient of the first prize winners in all eight trades. Dignitaries from the architectural profession, the provincial government and the construction industry were present.

The award consists of a gold and enamelled lapel button bearing the Association's seal. It is a tribute from the architects to the building mechanics in recognition of the importance of their work. In making it, the O.A.A. hopes that the craftsmen of tomorrow will strive to maintain the high standards of performance established during their apprenticeship.

Return to 1951 B.C. for Museum's Design Exhibit

Industrial Design 1951 B.C.—1951 A.D. was the ambitious title of a recent exhibit at the Royal Museum of Archaeology at Toronto.

The display attempted to show the development of industrial design from ancient Egypt to the Atomic Age to make the point that industrial design is not something new.

(Continued on page 268)
THESE STEEL JOISTS PROMOTE FIRE-SAFETY

When planning any type of light-occupancy structure, it's sound judgment to take advantage of the fire-safety afforded by the use of Bethlehem Open-Web Steel Joists.

Bethlehem Open-Web Joists, used in combination with concrete floor slab and plaster ceiling, provide a floor and roof construction which is incombustible. This type of floor offers effective resistance to the spread of fire. Moreover, it stays firm and true for the life of the structure.

The combination of Bethlehem Open-Web Joists, concrete floors and plaster ceilings also has other important advantages. For example, it is a rigid construction, permanently free from shrinkage.

Cracks can't form between floor and baseboard. These steel joists minimize vibration, and are immune to attack by vermin. They come clearly marked, ready for use, and are light enough to be handled by two men. Bethlehem Joists also simplify the work of other trades, because they permit pipes and wiring to be run through the open webs of the joists.

For full information about Bethlehem Open-Web Joists, get in touch with the nearest Bethlehem sales office. Or write direct to Room 1037, Bethlehem Steel Company, Bethlehem, Pa.

BETHELHEM STEEL COMPANY, BETHLEHEM, PA.

BETHELHEM OPEN-WEB JOISTS
**THE RECORD REPORTS**

**CANADA**

*(Continued from page 266)*

The first section dealt briefly with progress up to the early 19th century. The period of the Industrial Revolution, as an era of great practical achievement but of chaos in design, was covered less comprehensively than the last 75 years. The exhibit showed many of the attempts in this period to recover a true basis for design, and one whole panel was devoted to the school of thinking pioneered by the Bauhaus, as probably the most lasting in its effects. A series of panels supplemented by actual objects as examples was used to illustrate the varied manifestations of contemporary design.

Concluding the exhibition were panels containing statements by the Council of Industrial Design and the Society of Industrial Artists in Great Britain, the Institute of Design and the Society of Industrial Designers in the U.S.A., the National Industrial Design Committee and the Association of Canadian Industrial Designers in Canada itself.

The Museum expresses its interest in modern design by constant emphasis on the good quality of its collections rather than their age. The exhibition program summed up:

"Good design is not a 20th century idea; it is something at which the makers of objects have, by their own lights, always aimed. It is not concerned only with externals — the idea suggested by the word 'styling' — but with the whole form of the object. The keynotes of good design were defined 2000 years ago in three words: 'Appliance, Performance, Production.' That is: Is it attractive? Does it work? Can it be successfully produced in the chosen medium? These are the three questions which maker, seller and buyer of any object have to consider: a good design answers 'yes' to all three."

**1950 House Completions Down**

One of the minor shocks of 1950 was the dip in the number of houses completed.

Instead of the 95,000 units confidently expected, the final tally by D.B.S. showed only 87,299 completions. This is 234 less than the 1949 figure of 87,533.

IT'S HERE! NEW HOLOPHANE Lighting Series...Introducing
HIGH EFFICIENCY with MAXIMUM VISUAL COMFORT

Streamlined Styling
The shallow depth of the 9300 Series simulates the modern overall appearance of recessed units without the expense of roughing-in...

The newest, important Holophane contribution to lighting advancement is the 9300 Series of Surface-Attached HOLOFLUX* Units, result of long research and development...Their enclosed prismatic construction assures the greatest light output for fluorescent lamps with complete absence of cumulative glare, even in long, continuous runs...Because HOLOFLUX Units are applicable to such a wide variety of lamp arrangements, the best level of illumination is attainable for any specific interior. The prismatic glass panels are not subject to permanent depreciation; are easy to keep clean...The 9300 Series is recommended for commercial, and institutional buildings...offices, classrooms, drafting rooms, stores, schools, banks and libraries. Architects and engineers are invited to submit plans for lighting recommendations by Holophane engineers.

Write for New 9300 Series Folder today.
February Awards Continue Upward Trend in Building

Figures released by MacLean Building Reports on construction contracts awarded in February reflect continuation of the upward trend in building activity.

National total of $121,732,000, up $56,950,400 over the $64,781,600 registered for the same month last year, brought the cumulative two-month gain over 1950 to $159,315,500. Residential construction is still behind last year in initiation of new projects, but will be buoyed up by higher-than-usual carry-over from last season.

Engineering awards led other categories in the rise over last year largely because of the starting of the Quebec-Levis tunnel under the St. Lawrence River. The substantial increase shown by commercial construction in February was on the basis of scattered projects, only two of which ran over a million dollars. Industrial construction showed only a marginal gain, trailing at some distance behind residential work.

Two-month totals for various categories, in millions of dollars, follow: residential, $40.9 (down seven per cent from the same period in 1950); commercial and institutional, $75.4 (up 59 per cent); industrial, $79.6 (up 40 per cent); engineering $84.9 (up 165 per cent).

Shortage of Nails Is Felt; Eastern Areas Hardest Hit

As the 1951 building season gets under way, nails are becoming harder to find in eastern Canadian centers.

Shortage is particularly marked in 2½- and 4-in. common nails, essential for wood framing. Special types — finishing nails, roofing nails, blue nails — also are hard to find. Aluminum nails, not always available and somewhat higher in price, cannot be used for wood framing since their maximum length is 1¾ in.

Last year, wire nails entered Canada from England, Belgium, Germany, Austria, Poland and Japan. But imports accounted for only a small percentage of

(Continued on page 272)
The Annual Gold Medal Award of the Architectural League of New York "for excellence in design of industrial products for architecture" was awarded to Henry Dreyfuss, noted industrial designer for his design of the Crane Criterion Lavatory.

Crane leads again with the award-winning Criterion counter-top lavatory. This new idea in bathroom fixture styling is typical of Crane progress—and one reason why Crane is the "Preferred Plumbing."

The Crane Criterion lavatory is solid slab vitreous china in white or a choice of eight Crane colors. Designed for installation in a counter-top or as a free-standing unit. The spacious rectangular basin has the overflow at front. The smart new Criterion trim is brush-finish chromium with clear lucite handles and exclusive Dial-ese controls that operate at finger-tip pressure. Size overall: 30 1/4 x 22 in. Basin: 16 x 12 in. See the Crane Criterion lavatory at your Crane Branch or Crane Wholesaler. For sale by Crane Dealers.
How that New-Type ELDORADO Draws Draftsmen!

Draftsmen acclaim the great new-type ELDORADO as the finest drawing pencil in all their years!

ELDORADO: Correct, that's because you've been using the new-type Eldorado! Its lead is stronger... denser, more uniform. Eldorado means longer point-life. Its Leadfast process insures no splintering or burring—its lead is truly centered. The hexagonal shaft of Eldorado has rounded, smooth edges that put ease in your drawing hand.

DONT WAIT... send for your free samples of the new-type Eldorado today... the two degrees most useful to you... plus... this fine portfolio on pencil technique, absolutely free.

DIXON'S TYPHONITE ELDORADO

THE RECORD REPORTS

CANADA

(Continued from page 270)

the nails used. Canadian manufacturers supplied the bulk of them.

Domestic production has been on a fairly even keel. Latest Dominion Bureau of Statistics figures, for the first 10 months of 1950, show the amount of steel consumed in manufacturing nails to be about the same as for the corresponding period in 1949—72,000 tons. Near-capacity volume will be maintained in 1951, though a sizable share of it will be directed to defense construction.

Considerably more nails might be produced were it not for the steel shortage. Manufacturers, rationed by suppliers, sell to only two types of customer—industrialists who buy in carload lots, and wholesalers and jobbers serving the hardware trade. The second group get by far the lion's share and are on quota—getting a percentage portion of their past purchases. If the manufacturer's steel allotment is changed, the quantity of nails the jobber gets is increased or decreased accordingly.

In turn, the jobbers ration the retailers. Most hardware stores reserve a certain number of kegs for steady customers, then put the rest on the counter.

While it is impossible for nail manufacturers to police distribution of all the nails they make, they are on guard against possible black market operations. Assistance is provided by the National Home Builders Association, whose members are urged to report outlets offering Canadian trademarked nails at more than regular price. The manufacturer involved will then draw the case to the attention of any jobber supplying the outlet. If the jobber fails to act, he may find his own source of nails cut off.

Civil Defense Group Set Up By Building Code Committee

A special technical subcommittee to consider measures which might be taken to strengthen existing buildings against bomb attacks, and to formulate regulations for new construction to give increased protection against the same hazard, has been set up by the Associate

New Heavy-Duty Industrial Floor
by the world's largest maker of hardwood floors

DURA-WOOD BLOCK FLOORS have big advantages for owners and workers

Durable - Economical
Dura-Wood Blocks are made of tough, long-wearing Hickory and Pecan... close grained, heavy hardwoods that resist wear and abrasion. A floor of this type will last indefinitely. It is less subject to damage than most floors, and can easily be repaired.

Simple installation
Prefabricated blocks are laid in mastic over concrete slab. No finishing is needed, as the Toxik treatment is preservative and protective. For added beauty, floor can be given a light sanding and penetrating seal finish after installation.

Less tool damage
Plant engineers report far less damage to tools and machined parts when accidentally dropped on wood floors than on concrete or other hard surfaced floors. This is often a sizeable expense item. There's less wear and tear on power trucks and other rolling equipment, too.

Less fatiguing
Workers find these hardwood floors far more comfortable underfoot—much less fatiguing than unyielding, hard-surface floors. They are warmer in winter... more healthful and fewer colds.

No powdering
Dura-Wood Floors don't powder or dust, thus eliminating a source of discomfort and irritation to workers. No abrasive dust to get into machines or machined parts. Simpler, less expensive floor maintenance.

E. L. BRUCE CO., MEMPHIS, TENN.

BRUCE Dura-Wood BLOCK FLOORS
Bruce also makes 25/32" Dura-Wood Blocks and 25/32" and 33/32" Dura-Wood Strip Flooring

City and State:
Committee on the National Building Code of the National Research Council.
Chairman E. A. Gardner, assistant chief architect of the Department of Public Works, Ottawa, announced that the regulations may be issued as a supplement to the National Building Code or, if such action seems feasible, be incorporated in the code itself.

Transportation Costs Speed Concrete Industry Expansion

The concrete products industry has undergone an enormous expansion process in the last 10 years, President A. D. Wylie told members of the National Concrete Products Association at their recent national convention in Hamilton, Ont.

Production of concrete masonry products has multiplied upwards of 50-fold since the early 1940's, said W. C. Coupland, Association vice president. Gross value was estimated at $70 million in 1950, compared with $3 million in 1939.

"The large number of new firms is due mainly to the high cost of transporting concrete products," Mr. Coupland explained. "Most firms sell one third of their production within a 30-mile radius, another third within 50 miles, and 100 miles is generally regarded as the maximum within which they can compete."

Last year, one in three of new single-family dwellings erected was almost wholly of concrete block wall construction, and about two in three made extensive use of some form of concrete masonry. Manufacture of concrete blocks and kindred products are expected to establish new records of production in 1951. Introduction of smaller, stronger blocks made by new machines will accelerate output. Expansion of existing plants also will help to boost volume.

Hospital Beds in Ontario Are 18 Per Cent Over '47

New construction has resulted in a three-year boost of 18 per cent in the number of Ontario's hospital beds.

By the end of 1950 there were 19,300 beds in all public hospitals. This is nearly 3000 more than the total of 16,000 beds in 1947, when the federal-provincial grant-in-aid program began.
Specify... NEO-RAY
ML LOUVRED CEILINGS

No wonder more and more specifications call for NEO-RAY ML LOUVRED CEILINGS. It's the right combination for beauty and efficiency in lighting. Just check these patented and exclusive features: mating slots and tracks that assure perfect alignment . . . labor-saving hangers and tracks that mean simple, low cost installation . . . stock sections that can be cut on the job to meet any condition. Whether you're designing for beauty or efficiency in lighting — specify Neo-Ray and get both.

NEO-RAY PRODUCTS, Inc.
315 East 22nd St. • New York 10, N. Y.

SEND FOR NEW 64 PAGE CATALOG
Gives complete engineering data and lighting tables for each item in our complete line of fluorescent, slimline, and incandescent fixtures.

Plus
New simplified spot lamp tables for computing light intensities in show windows and all high-lighted areas.

See our catalogue in Sweet's Architectural File for 1951, Sec. 31a
