NEW CEILING FINISHES

Multitone, finely textured. Three finishes. Available on five Artman® patterns. For our brochure, call 1 800 233-3823 and ask for Ceiling Finishes.
CUSTOM CEILINGS

New 2' x 2' Syllables® ceiling system. Seven systems available. Each offers unlimited custom opportunities. For our brochure, call 1 800 233-3823 and ask for Custom Ceilings.

Ceiling designs copyrighted by Armstrong.
Upon attending the recent exhibition Deconstructivist Architecture at the Museum of Modern Art in New York City, I was struck with very profound emotions. Although too little space was allotted for the exhibition, the displays were remarkably well presented. I was brought to laughter upon seeing the three-dimensional manifestations of designs I have only seen before in the pages of magazines such as ARCHITECTURAL RECORD. The whimsical colors and idiosyncratic shapes seemingly used at random caused great delight. I am curious to feel the impact of being in these spaces.

One of the main flaws of this exhibition is the mislabeling of Deconstructivist Architecture as “disturbed architecture.” When compared with some of the extremes of Russian Constructivism, or the starkness of high Modern, Deconstructivist architecture is infinitely more humane. The forms, while distorted, are not “disturbed,” and rarely disturbing. To label them as such suggests that they deviate from true architecture, which they do not. They are a logical progression most definitely inspired by our culture. We have already discarded more architectural styles in the 20th century than in the previous five hundred years.

Our culture also suffers from the trivialization of style, not from a profusion of art. We have gone a long way towards dehumanizing the earth, and the Deconstructivist architects shown in the exhibition seem to be reintroducing individualism and idiosyncrasy into architecture. Thank you, Misters Johnson and Wigley, for architecture. Thank you, Misters and idiosyncrasy into bringing this collection to our shown in the exhibition seem to be reintroducing individualism styles in the extremes of Russian deviate from true architecture, delight. I am curious to feel the discarded more architectural impact of being in these spaces.

Deconstructivist Architecture as the previous five hundred years. the trivialization of style, not which they do not. They are a "intermediate large double-story south recessions, a terrace, a transitional elements, that could shown on your mid-April cover, a such an unintegrated house as the surrounding horse farm nature around, elements that should we see "purist" spirit of Le Corbusier strongly survives in these “prime geometrical shapes and forms.” How about a change? The triangle for 1989!

And my second remark. I wonder why, after more than a half century since Frank Lloyd Wright’s houses integrated the building with its surrounding nature, and site, should we see such an uninhanced integrated house as shown on your mid-April cover, a house completely separated from the surrounding horse farm (nature), like an alien space ship. What this house really misses is an "intermediate space," or transitional elements, that could mediate between it and the nature around, elements that produce a sense of shelter, such as an entry porch, or attracting recessions, a terrace, a balcony . . . or even shading devices that could protect the large double-story south windows from the sun.

Letters

Jeffrey Scott Penn
Huntington, Massachusetts

It seems that the year 1988 marked the victory of the square and the circle in house planning, as RECORD HOUSES 1988 shows. The square appeared either as a whole or as a part in the plans of 10 houses of the 14 shown in the mid-April issue, and in elevations as a window boundary, and internally as square-gridded partitions, cabinet divisions, and even in furniture as tables. The circle appeared in the plans of about half of these. Although we are now living in an era of Postmodern dominance, the “purist” spirit of Le Corbusier strongly survives in these “prime geometrical shapes and forms.” How about a change? The triangle for 1989!

And my second remark. I wonder why, after more than a half century since Frank Lloyd Wright’s houses integrated the building with its surrounding nature, and site, should we see such an uninhanced integrated house as shown on your mid-April cover, a house completely separated from the surrounding horse farm (nature), like an alien space ship. What this house really misses is an "intermediate space," or transitional elements, that could mediate between it and the nature around, elements that produce a sense of shelter, such as an entry porch, or attracting recessions, a terrace, a balcony . . . or even shading devices that could protect the large double-story south windows from the sun.

This new barrier-free cooler is one beautiful example of how Elkay is bringing coolers for the disabled out into the open.

It's stylish enough to belong in any public lobby. Yet sports the technology and features for which Elkay is known.

The Light Touch™ pressbar technology is an example. The wrap-around bar enhances the cooler's design aesthetics. Yet it makes drinking less difficult for many people, particularly the disabled, since it's easy to operate from any direction.

Just as importantly, the Light Touch technology helps reduce maintenance difficulties. It uses simple mechanical levers instead of complex electronics. Like all our coolers, this new barrier-free design comes with the exclusive Flexi-Guard™ safety bubbler to help prevent accidental mouth injuries. And the cooler meets every known state and federal building code.

For more information about Elkay's new barrier-free cooler and the rest of our complete line of barrier-free coolers, contact your Elkay representative, or write Elkay Manufacturing Company, 2222 Camden Court, Oak Brook, IL 60521.

You'll find out why Elkay presents no barriers to beautiful designs.

At Last An Indoor Worth Weaving
It's The First Flame-Retardant Canvas You Can Warm Up To.

Inside and out, there's nothing like awnings and decorative fabric treatments to interest to commercial settings. The only problem is finding fabric that can measure up to your expectations as well as it does to fire codes. That's because most flame-retardant materials are coated with vinyl, making them shiny or stiff or both. Which is why Sunbrella Firesist® is such a breakthrough for designers.

Our material is woven entirely from self-extinguishing fibers — woven so it has the look and feel of traditional canvas. And yet its fibers are made of color-pigmented modacrylic. So they last much longer than any duck or cotton. And they provide rich, saturated hues, too. Hues that are colorfast so they can't be faded or washed out.

In addition, Sunbrella Firesist won't crack, peel, harden, mildew or rot. And it's highly soil resistant. In fact, we're so sure Sunbrella Firesist will live up to these promises, it comes with a 5-year limited warranty. And it has another advantage, too: It's highly breathable, making it very energy efficient.

Of course, Sunbrella Firesist meets the toughest codes like the requirements of the National Fire Protection Association and the California Fire Marshal's test. Which means you can specify canvas treatments such as awnings, canopies or decorative panels just about anywhere. And finally get the results you want. So find out about our wide selection of solids and patterns. Contact your local fabricator or Glen Raven Mills, Inc., Glen Raven, NC 27215, 919/227-6211. *Sunbrella Firesist is a registered trademark of Glen Raven Mills, Inc. *SEE-PLUS is a registered trademark of Monsanto Chemical Company.

Versatility you never thought possible with exterior insulation systems.

Creating a stunning surface that intrigues the eye with its form and color while providing optimum building protection demands exceptional materials.

STO Exterior Insulation Systems and Coatings envelope the outside of your building like a protective shield that insulates and resists moisture, yet remains flexible even in extreme or changeable conditions. And STO Wall Systems may be sculpted and scored into shapes you never thought possible.

With over 350 colors and 30 textures, the widest range available, freedom of design is truly at your fingertips.
Recognized for its design excellence, Phase 1 of the Tegel Harbor Housing Complex was completed in 1987 for the International Building Exhibition in Berlin. Master-planned by Charles Moore, FAIA, and Moore Ruble Yudell, winners of the design competition, it represents classic Post Modernism at its best. Tegel Harbor also exemplifies the extraordinary quality and versatility of STO materials through the project's magnitude and award-winning design. Based on STO's theories of Applied Color Use in Architecture, extensive color analysis and renderings were produced by the STO Color Studio. The final colors and forms of Tegel lend each new housing complex its exquisite appeal and accomplish its playful yet dignified integration into the surrounding environment of old Berlin.
Now, Pella doubles your choice of window colors.

Pella® introduces Tan and Gray colors to their standard brown and white offerings to meet your need for greater design flexibility.

Accept no limitations.
Of course, we still offer dozens of Pella Custom Clad Colors. If you have a specific color in mind, we'll match most any sample. But even on these custom orders you'll marvel at our fast turnaround time.
You can obtain information on these new colors and free samples from your Pella distributor. Look in your Yellow Pages under "Windows", call Sweet's BUYLINE or consult Sweet's General Building File. Or send us the coupon below.

Bring your designs to Pella.

A BAD ROOF CAN BE THE RUIN OF A GREAT IDEA.

Consider the Parthenon. Then imagine its beauty today if the roof had stood the test of time.

HOW HYPALON* HELPS PUT YOUR BRIGHT IDEAS ON TOP.

With roofing systems based on HYPALON synthetic rubber, imaginative colors and inventive design can make the roof an integral part of your architectural statement. Roofing systems based on HYPALON are easy to install, even over complex shapes. They're simply unrolled, secured in place, and heat or solvent welded—all at competitive installed costs. And even when systems are fully cured, additions and repairs are easy to do.

WHY NOTHING UNDER THE SUN—OR RAIN—IS Better THAN HYPALON.

With HYPALON, design versatility does not diminish roofing integrity. The sunlight that can weaken other roofs actually strengthens roofing systems based on HYPALON. When installed, these roofing systems exhibit high strength and flexibility—and resist attack from snow, ozone, acid rain, corrosive chemicals and temperature extremes.

Also, the chlorine in the molecular makeup of HYPALON gives these roofing systems a flame propagation resistance that can qualify them for UL Class A and FM Class 1 fire ratings.

SPECIFY HYPALON AND PROTECT YOUR CLIENTS' MONUMENTAL INVESTMENTS

For over 20 years, HYPALON synthetic rubber for single-ply roofing systems has been proven itself in hundreds of installations throughout the world. To give yourself and your clients the security and value of a long-lasting roof, specify roofing systems based on HYPALON. To learn more just call 1-800-441-7111.

*Du Pont's registered trademark for its synthetic rubber. Du Pont manufactures HYPALON, not single-ply roofing membranes or systems.

GE Is The Light That Will Reshape The Way

GE BIAX lamps make everybody and everything, including operating costs, look better.

It won't take you long to discover that with GE BIAX™ 40-watt lamps, the design possibilities are endless. Because they're only 22.5 inches long, deliver all the light of standard four-foot rescents, you can design with smaller fixtures. And that means more attractive ceilings.

And because BIAX lamps make colors richer and more vibrant than standard fl
can, the lighting you design will make the environment and the people who work in it attractive. Additionally attractive is the amount your clients save on operating costs. GE BIAX 40-watt lamps, as you see, last up to 8,000 hours longer than conventional U-shaped tubes. And 13% longer than incandescents. Let your imagination on the endless possibilities of the GE BIAX family of lamps. For more product or application information, call your local GE Specification Area Manager. Or call the GE Lighting Information Center at 1-800-523-5520.

GE is Light.

EUROPEAN DESIGN HAS FOUND ITS PLACE IN AMERICAN LIVING

Our remarkable new line of Hostess® kitchen sinks gives you the best of both continents.

Designed and crafted in Europe, these sinks have sleek, elegant curves made of the finest fire-clay ceramic for the look and feel of luxurious china.

And their design features reflect the sophistication of American lifestyles. With contoured shapes, custom-fitted utility baskets and optional cutting boards that offer more room for creativity.

In addition, all four distinctive models are available exclusively in Champagne or Pearl White.

The American Standard Hostess kitchen sinks, where European design and American ingenuity come together.

To find out how successful our Hostess sinks can be for you, see your local American Standard wholesaler or call 1-800-821-7700 (ext. 4023) for your local showroom.

For our Luxury Products Brochure, write to American Standard, PO Box 6820, Piscataway, NJ 08855-6820.

Two years ago, Dave Jenkins, seating design manager for Stow & Davis, needed a design for a new chair. One that would show a high degree of craftsmanship, and make a unique statement.

So, while in New York for Designer's Saturday, Dave called the most unique person he knew—Calvin Morgan.

Former professor of literature, drama, and theater design. Rebuilder and director of Juilliard's stage department. Internationally acclaimed set designer. Master woodworker. Now doing commercial and residential interiors as well as furniture.
Calvin, are you working on anything interesting?" Dave asked.

They got together for lunch at Calvin's house in the Dakota. Calvin showed Dave the Acanthus prototypes, and told him this story:

I reached an impasse, struggling with the idea of a square chair. On the one hand, I loved the look of the flat-sided parquet. But the back kept ending up square, and a square-backed chair won't sit. Then I remembered Burdo's drawing of a man standing inside a squared circle. I started working with wire, plaster, and foam, and at 3 A.M. the chair came out as if I'd discovered it, not created it. And once the chair arrived, the table concept evolved. Sometimes art seems to be pre-existent, and the artist the lightning rod who finds the means to express it.

The Acanthus collection. A chair, and a table in three sizes. As much craftsmanship as anyone can manufacture. Something to behold.
An architect, a statement...and Terne
"Imaginative new conceptions in architecture can frequently trace their origin to a basically simple idea. One of the oldest types of roofing, terne metal, thus lends itself to many dramatic new applications in the contemporary idiom. Because of its inherent adaptability in both form and color, Follansbee Terne permits the visible roof area to become a significant part of structural design. Thus by re-discovering and re-interpreting a time-tested material, we make out of the very old the very new. I have furthermore found terne superior to other roofing metals in economy, color-adherence, heat-reflection, permanence, workability, and low coefficient of expansion."  Frank Lloyd Wright
Actually, we've been pounding away at the subject of noise reduction for about eighty years. That's why our 440 CarpetBoard is the sound solution to the problem.

Easily applied over ordinary plywood or concrete, 440 CarpetBoard provides a resilient, sound-deadening layer between floors. More sound isolating than plywood alone. It's been proven an effective part of the flooring system for carpet, tile, wood parquet or hardwood strip flooring in thousands of applications—residential, commercial and institutional.

Homasote 440 CarpetBoard virtually assures you a higher STC for a quieter structure.

When you specify it, you'll end up with a unique selling feature and happy clients. Which is something to jump up and down about.

Whenever you have a problem with noise—impact or otherwise—Homasote has the answer you can build on. For a free sample of Homasote 440 CarpetBoard, technical specifications and application details, call our toll-free number: 1-800-257-9491, Ext. 88.

Write: Homasote, 440 CarpetBoard, Box 7240, Trenton, NJ 08628-0724

We're here by design.
At first glance, it's difficult to imagine how these six different buildings are related. But if you take a closer look at their histories, you'll find they all share a common theme: the washrooms in all six buildings have been refitted with Sloan flushometers.

True, these buildings don't look old enough to need major plumbing repairs. But the fact is, the original flushometers that were installed just didn't hold up. Even after repeated servicing, they continued to malfunction. They didn't shut off properly. They leaked at the stops. In some cases, they even flooded the washrooms. In short, they weren't Sloan flushometers.

Unlike substitutes, Sloan flushometers offer proven, reliable service. With built-in quality at an affordable price. That's why today more buildings are equipped with Sloan flushometers than with any other brand.

Only Sloan's rugged, tamper-proof design can assure the quiet, dependable operation so critical in buildings like these. Plus, Sloan flushometers are built to last for years with only minimal, routine maintenance—an important consideration for specifiers who value time and money.

The next time you consider specifying a substitute, think about these six buildings. Then specify Sloan. The first time.

1. Valley Forge Park Place, King of Prussia, PA 2. Virginia Mason Hospital, Seattle, WA 3. Swedish Hospital, Seattle, WA 4. Heartthrob Cafe, Orland Park, IL 5. Spruance Hall, Embry Riddle University, Daytona Beach, FL 6. Foster Plaza Building No. 6, Pittsburgh, PA

Another six reasons to specify Sloan...

the first time.

WE MAKE WINDOWS WHERE MONEY'S NO OBJECT.
Over the years, we here at Marvin have built something of a reputation for ourselves. We've become the company to call when the plans call for a dazzling, one-of-a-kind masterpiece.

But there's another side to Marvin. A more practical, down-to-earth side. In addition to difficult, one-of-a-kind windows, we make the industry's broadest and most versatile line of standard shapes and sizes.

As a result, you can probably maintain the basic integrity of your design at practically any budget level.

You see, we make windows to order. Which means you can specify the features you want us to build in. And you can specify the features you want us to leave out.

For more information call 1-800-346-5128 (in Minnesota, 1-800-552-1167; in Canada, 1-800-263-6161) or write, Marvin Windows, Warroad, MN 56763.

Sometimes money's no object. Sometimes money's precisely the point. Which is precisely why Marvin Windows are always a smart choice.

MARVIN WINDOWS ARE MADE TO ORDER.
JLY CARPETS OF ANTRON PRECEDENT™ SURVIVE THIS BEAUTIFULLY.

Good looks that last longer. Antron Precedent™ has superior soil resistance along with unsurpassed texture retention, so it retains its new look up to two times longer than most commercial carpet. When you specify contract carpet, make sure for Antron Precedent™, and enjoy a carpet whose beauty will stand the test of time. Find out more about Antron Precedent™ in the DuPont Antron Specifiers Guide. For your free copy, call 1-800-443-9835.

LEARN THE FACTS!

Beware of misleading fire rating data

Ambiguous and potentially misleading information on glass block fire resistance has been disseminated to architects, interior designers, owners, builders and national code bodies by a U.S. distributor of a foreign-manufactured glass block.

Get the facts before you specify any glass block for fire-rated applications!

All UL fire-rated glass block on the market are tested in accordance with UL9, "Fire Test of Window Assemblies," for a 45-minute period in openings not to exceed 120 ft² in area.

The UL window assembly tests performed on the imported glass block do not qualify these glass block products for use as wall assemblies. Presently, no glass block are qualified as fire-rated wall assemblies as no glass block presently can pass the UL wall assembly test.

Don't be misled by incomplete information. Get the facts about glass block fire rating. Ask for the free brochure, "GLASS BLOCK FIRE RATING FACTS," by calling our Architectural Products Hotline at 800-992-5769; or write Pittsburgh Corning Corporation, Technical Systems, 800 Presque Isle Drive, Pittsburgh, PA 15239.

Break away from this sort of thing!

EKKI timbers don’t do this sort of thing.

EKKI (Bongossi/Azobe) hardwood has the characteristics you associate with steel and concrete. Strength and durability.

EKKI also has one thing neither steel or concrete will ever have: The enduring beauty of natural hardwood. And, EKKI has durability that soft pines or other wood simply cannot offer.

EKKI is so strong, so durable, it needs no chemical treatment. None whatsoever. EKKI also fends off insects, decay, and fire! — even fire!

Environmentally, EKKI is perfect. It presents no hazards at all. Think what a boon that is to installation crews, the people who erect bridges, build docks, fenders, and fender systems.

HWH Corporation is an affiliate of The GWZ Group, The Netherlands, which has 90 years of experience working with this wonderful wood. We can design, engineer or fabricate your hardwood structure. We can and we will.

Make a break away from the way certain projects are always done at your place. Call Dave Harkins, our Director of Marketing at 215-661-2000. Tell him about your next project. Discover the benefits you get when you opt for EKKI.

One will almost surely be cost effectiveness.

Working with EKKI frequently reduces the amount of material you need by one-third.

Not bad. Not bad at all!

EKKI does what you never thought wood could!
To most of us, William Shakespeare is the quintessential playwright.

But when the Ballard Realty Company of Montgomery, Alabama, needed tenants for a new apartment complex, Mr. Shakespeare proved to be a top-notch salesman as well. With every signed lease, Ballard Realty offered free membership subscriptions to the nearby Alabama Shakespeare Festival. In no time, over 80% of the company’s units were leased before construction was even completed.

Throughout the country, small and medium-sized businesses, like Ballard Realty, are discovering what blue chippers have known for years: that the arts can help create a positive public image, increase a company’s visibility and improve sales. All this while reducing taxable income.

If you would like information on how your company — no matter what its size — can benefit through a partnership with the arts, contact the Business Committee for the Arts, Inc., 1775 Broadway, Suite 510, New York, New York 10019, or call (212) 664-0600.

It may just be the factor that decides whether this year’s sales goals are to be or not to be.

A BESTEEL modular classroom is the fast track, high quality solution to student overcrowding and rising construction costs. Ask hundreds of school board members, school administrative officials, architects, principals, teachers and students nationwide. For over 30 years, as one of the nation’s leading manufacturers of modular building systems, we’ve done our homework and built our reputation on research, design, development and installation of classrooms which provide a “permanent” solution to population surges yet are relocatable for flexibility. Whether your present need is for a single classroom or a complete campus, we understand education—the needs and the problems—and can work best with you to provide on-time delivery to meet your schedule.
BESTEEL structures can be ready in as little as 30 to 45 days from the day permits are granted.

B BESTEEL modular classrooms are constructed with rigid steel frames and structural components all designed to withstand the stress of time and relocation. Our non-combustible buildings meet the most stringent state requirements, yet are cost-effective and relatively maintenance free.

Compared to traditional buildings of conventional construction methods, our classrooms have more structural steel combined with concrete and glass which provides a longer lifecycle for a safe, quiet and comfortable educational environment. For more information including lease and finance assistance, mail the coupon below today or call 1-800-BESTEEL.

THEIRS: $5,280

Ours: $3,500

Want to avoid taking a bath on shower room costs?
Then compare the expense of individual privacy showers to Bradley multi-station privacy showers.
The facts add up.
The total installed cost of a six-person Bradley column shower with partitions is only $3,500, compared to $5,280 for six individual showers with partitions.*
That's a savings of $1,780.

Now, consider the total number of heads needed in a typical shower room.
In a 12-showerhead room, Bradley multi-station privacy showers will save you $3,560.
In an 18-showerhead room, $5,340. And you save even more because a Bradley multi-station shower gives you the sanitary benefits of a trough drain without the expense.
And since we have a broad line of multi-station showers and privacy options, Bradly can help you handle a shower room design challenge more efficiently.

To find out more, send for a free price comparison data sheet, shower design guide and layout book by circling the reader service number, or call your Bradley representative.

We get the job done better

The American Consulting Engineers Council is assisting the Pennsylvania chapter in its lawsuit against that state's architectural licensing board. The suit challenges the board's proposed regulations limiting practice to design firms owned by at least one-third registered architects. Although the ACEC legal defense fund committee rarely involves itself in cases until they reach the appellate level, the Pennsylvania regulations are seen as encouraging similar ones in other states and the national organization is jumping in early.

ACEC by at least one-third registered architectural licensing board.

Although the level, the legal defense fund committee proposed regulations limiting practice to design firms owned by at least one-third registered architects. Although the ACEC legal defense fund committee rarely involves itself in cases until they reach the appellate level, the Pennsylvania regulations are seen as encouraging similar ones in other states and the national organization is jumping in early. ACEC president Jim Poiriot explains that, in many cases, members will not be able to operate under the regulations. And, of course, architects, looking at the issue from the other side of the fence, will indeed watch the proceedings in Pennsylvania with interest.

All of this helps work being done by ATRA at the state level around the country. To date, 39 states have passed tort reform laws of some kind, but much must still be done, says Childs. One of ATRA's prime goals is the elimination of joint-and-several liability in which all parties even remotely connected to a case can be named as defendants, and plaintiff awards imposed on not the most guilty, but the richest. Other goals include limits on noneconomic and punitive damages, the elimination of double recoveries, limits on lawyers' contingency fees, and sanctions on frivolous suits.

ATRA is a coalition of some 400 organizations and claims to represent 35-million people. As to the Democratic position, "We weren't asked and there isn't one," said ATRA spokeswoman Libby Dolvin.

Citing his testimony before the Republican platform committee as the basis, Blair Childs (photo), executive director of the American Tort Reform Association, applauded language that calls for "a reasonable state and federal liability standard that will be fair to small businesses, including professionals [and] return the fault-based standard to the civil-justice system." He says such a standard would save jobs, encourage useful and sometimes lifesaving products, and stimulate the nation's ability to compete, as well as lower costs in general.

In a seeming contradiction to his own party's position that would lower professionals' liability exposure (see article at left), Senator Lowell Weicker, Jr. (R-Conn.) has sponsored S. 2518, the Construction and Health Improvement Act of 1988, which would require architects and engineers to not just check that a project is being built according to plans and specifications but to physically supervise it. In what observers regard as a well-meaning reaction to much-publicized structural collapses and faults in his state, the senator's bill would blur longstanding distinctions between design professionals and contractors that have made what gets built the former's responsibility and how it gets built the latter's.

The bill reads: "Work on a construction project shall be performed only when the engineer-architect or his certified representative is present at the site," and, "[H]e shall be liable to the same extent the supervisor is liable for applicable provisions of this act." Those provisions, of course, include job safety— an issue that architects and engineers are particularly warned to steer clear of in these litigious times. "Call the owner but don't even talk to the contractor about dangerous conditions," advises one lawyer.

The Environmental Protection Agency, in its July announcement of the deadline change, warned that a deferral request can be granted only when it "is accepted [by the state] as complete and acknowledged in writing."

In introducing the bill on the House floor, Representative Thomas A. Luken, chairman of the House transportation, tourism, and hazardous-materials subcommittee, said that EPA estimates there are some 31,000 school buildings across the country that contain some form of asbestos. As many as 15-million school children—almost one-third of the nation's school population—and some 1.4 million school employees may be studying and working in buildings with asbestos. Peter Hoffmann, World News, Washington, D. C.
ADD YEARS OF BEAUTY TO YOUR CERAMIC TILE WITH THE NEW

DUROCK® interior tile backer system

1. Install strong, lightweight DUROCK Interior Tile Backer Board quickly and easily over wood or steel framing. This versatile cement board attaches readily with DUROCK screws or roofing nails.

2. Treat joints between boards. Open weave of DUROCK Type P glass fiber tape helps tile-setting mortar or mastic provide a better bond through to the board, reinforcing the joint.

3. Install ceramic tile with either DUROCK Latex Fortified Mortar OR DUROCK Type I Ceramic Tile Mastic, as you prefer. Each of these high performance systems assures optimum results when used as recommended.

DUROCK Interior Tile Backer Board has been tested and shown to resist deterioration for a period of 20 to 25 years. You can be assured that your bath or floor will retain its lasting beauty when you protect it with the DUROCK Tile-Setting System.

Write to United States Gypsum Company or Durabond Professional Products, DAP Inc., 101 S. Wacker Dr., Chicago, IL 60606-4385, Dept. AR108.
Legal perspectives: Should you decline to be the decision-maker in client-contractor disputes?

By Arthur T. Kornblut, Esq.

The architect's role as the initial decision-maker is a time-honored one when disputes or claims arise between the owner and contractor. In the First Standard dition of the AIA General conditions, published in 1911, a clause gave the architect the right to make "the final decision of all questions arising under the contract," with the decision being "a condition precedent to the right of legal action by the Owner or Contractor." The concept embodied in those words has evolved into a nitionally important role — it remains a potentially risky option.

The logic behind the architect's role in dispute resolution stems from the architect's intimate knowledge of the project and the owner's interest in the project's completion. The architect is required to evaluate the performance of the owner and contractor under the terms of the contract and make decisions on claims and disputes.

What can happen when the architect fails or refuses to act? Under the current AIA contract documents, the architect, as a basic service, "shall interpret and decide matters concerning performance of the Owner and Contractor under the requirements of the Contract Documents . . ." (B141, 2.6.15). Under the general conditions, the architect is required to play a pivotal role in dispute resolution, dealing with claims and disputes (A201, 4.3 and 4.4). These contract clauses are appropriate and sensible when the architect is presented with straightforward technical questions as part of the design or construction process. They create a potential trap, however, when the architect is asked by the owner or contractor to decide a single claim involving millions of dollars in delay damages when they are not the decision-maker.

To accomplish this, a clause could be added to Article 12 in B141: "If the services set forth in this contract are not rendered properly, the owner may be liable for the additional services and shall be paid for in accordance with the contract." Alternatively, if the owner is unwilling to agree to this, a basic-service time limit (10 hours, for example) for dispute resolution might be offered.

The other major change that is needed is an opt-out clause to allow the architect an absolute right to decline to make a decision. Consider these possible additions to B141 and the Supplementary Conditions to the construction contract:

- "In the event a claim, dispute or other matter in question is presented by the Owner, Contractor, or any other party to the Architect for interpretation or decision, the Architect shall endeavor to provide such interpretation or decision as required by this Contract. If the Architect determines that an interpretation or decision would be impractical under the circumstances, that the issues presented are beyond his knowledge or expertise, or that there is insufficient time for him to evaluate the issues, or that satisfactory arrangements have not been made for his compensation for the services necessary to evaluate the supporting data and issues presented, the Architect shall have the absolute right to elect not to make the interpretation or decision being requested. In such event the Owner, Contractor, and such other party shall be so notified, and they shall proceed to arbitration or take such other course of action as they may mutually agree."

An opt-out clause is far preferable to claiming an implied waiver of the obligation to serve as the decision-maker when declining to decide is the appropriate course.

Architectural Record October 1988 37
It pays to look high and low for your liability protection.

No professional liability insurer offers you a broader range of coverage choices than the CNA Insurance Companies and Victor O. Schinnerer & Company, Inc. These choices give you great control over your insurance costs by letting you more precisely match your coverage to your needs.

The chart shows two examples of the flexibility you have with CNA coverage offered through Victor O. Schinnerer & Company, Inc. CNA's flexibility accommodates all sizes of firms by providing the lowest deductible of $2,000, minimum liability limits as low as $100,000 and maximum liability limits as high as $15 million.

The stability of the CNA/Schinnerer program is unsurpassed. We've offered coverage to architects and engineers continuously since 1957.* Your future stability can be assured by our financial strength and by CNA's A+ financial rating from the A.M. Best Company.

We also offer extensive loss prevention seminars, newsletters and other guidelines to help you minimize claims. But, if one should arise, we maintain claims offices throughout the country to help you.

Look high and low. You won't find a better quality professional liability program than ours. To learn more, have your independent agent contact Schinnerer.

*CNA/Schinnerer is proud to have earned the commendation of the AIA and NSPE/PEPP.
As the economic expansion approaches its sixth anniversary, unmistakable signs of strain are apparent. Consumers have resumed borrowing to spend.-hourts in manufacturing employment, materials, and reduction are appearing. inflationary pressures are mounting. And interest rates are climbing. With less and less slack in the economy, something is giving.

Starting in 1987, rapidly expanding domestic and overseas demand for U.S. goods generated a resurgence in U.S. manufacturing and exporting. Earlier this year, those sectors took over from consumer spending as the driving force propelling our economic growth.

Initially, there were surpluses of skilled and semiskilled labor, materials, and production capacity. Manufacturers eagerly drew on them to boost output. Equally important, starting in 1987, industrial concerns steadily increased investment. Into early 1988, however, most of those expenditures went to purchase equipment, which, when integrated into current facilities, lifted output. Meanwhile, outlays for new plants, or for additions or rehabilitation of existing structures, dawdled.

Conditions changed in the spring. The dollar, whose plunge in the previous 2 1/2 years had eventually triggered the revival in industrial production, firmed and even gained in value. Still, overseas and domestic orders flowed in. Capacity-utilization rates edged even closer to optimum production levels in many industries. In turn, manufacturers accelerated spending on structures.

Unfortunately, it will be months before those growing expenditures turn into additional operating capacity. Consequently, inflationary pressures in the industrial sector will intensify and spread through the economy—unless there is some slowing in the consumer sector.

Instead of building up their savings, consumers, who had moderated expenditures and credit use in 1986 and 1987, have revived their spending and have borrowed more to do it. A continuation of those trends could soon have several negative impacts on the economy.

Larger household purchases would fuel demand for business output, straining production capacity even more. That would fan inflationary pressures. Expanded borrowings would compete with business for increasingly more costly and tighter supplies of money. Unchecked, relentlessly rising interest rates would eventually undermine economic growth and tumble the economy into a recession.

In the coming months, fiscal policy will offer no relief. The federal deficit is no longer shrinking, having stabilized around $150 billion. Thus, the government will remain a substantial competitor for funds.

In contrast, the Federal Reserve will persistently firm monetary policy to counter inflationary tendencies. Since the spring, it has forced short-term rates up twice as fast as long-term rates.

One result of these movements is that longer-term funds have remained available for business investment at acceptable prices; whereas shorter-term loans have become more costly for consumers. By now, consumers with outstanding adjustable-rate debt (mortgages, equity lines of credit, charge cards, and other consumer loans) have felt the first pinches of the run-up in short-term rates. With less to spend from current income because of higher interest payments and with new credit more expensive, consumer borrowings will ease this quarter.

Nevertheless, the growing competition for funds among businesses, consumers, and governments will push the yield curve up another 50 to 75 basis points (one-hundredth of a percent) by year-end. Rates on quality assets will fluctuate from 8 to 9 percent for short-term instruments; 10 to 11 percent for seven- to 10-year government bonds; and 12.5 to 13.5 percent for mortgages.

Such rate hikes will inhibit construction activity. Industrial building will advance, but housing, retail, and office building will slip below their third-quarter pace.

Dr. Kidd is a prominent economic consultant and former director of economic research for the McGraw-Hill Information Systems Company.
The warmth of traditional stucco without the worry of doing it over. DUROCK system-matched components help you do it right. DUROCK Exterior Cement Board, attaching screws, joint treatment, and DUROCK Exterior Basecoat and Finish are all designed together, to work together. To give you solid, strong attachment. To speed construction. To give you quality assurance from the leader in construction technology—United States Gypsum Company.

Do it once, because the substrate resists dents and penetration. While the basecoat and elastomeric finish system withstand minor building movement, thermal expansion, and moisture.

Enduring beauty in stucco—looks or textures in a spectrum of creative colors. Do it all, once and for all with DUROCK Exterior Finish Systems. Write us at 101 S. Wacker Drive, Chicago, IL 60606-4385. Dept. A R1088

United States Gypsum Company
Construction costs: Should we say inflation?

What else would account for continued strong rises in the cost of construction in the face of slackening demand? Costs in the second quarter of 1988 rose by 0.77 percent and almost matched those in the first, when the greatest rise since 1984 was hoped to be only an aberration.

While, in the opinion of Marshall & Swift analyst Frank Benz, inflation did indeed play some role in the continued run-up, that run-up can be seen to be heavily influenced by activities in just one section of the nation—metropolitan New York and New Jersey where costs rose 1.24 percent.

In the past few years, costs in both that region and the New England states have tended to drag the national averages up substantially, rising even when all the rest of the regions' costs were falling (as they did in the fourth quarter of last year). In this second-quarter report, New York and New Jersey pulled ahead of New England to almost double that region's performance. Cost increases in the remaining regions ranged from a high of 0.89 percent in the other northeastern states to a low of 0.57 in the west-central states. So how much you got depended on where you were.

Why the wide geographic cost variations? Because the old law of supply and demand may still be at play—along with any incipient inflation. Demand has wide geographic variations. While all building construction for the first half of this year was off by 4 percent from last, according to the McGraw-Hill Information Systems Company, the value of residential construction in New England rose by almost $125 million, in New York-New Jersey, by over $200 million, and by some $130 million in the Pacific Northwest. And the value of nonresidential building, beleaguered nationally because of offices, rose by some $560 million in New England.

Most material costs rose modestly. Only such rises as lumber's 0.25 percent and gypsum board's 0.04 percent were noticeable—leaving the probable repeat culprit, labor.

Another Hardheaded Dover Breakthrough On The Three Basic Elevator Functions.

The World’s First Totally Integrated Microprocessor Control System For Hydraulic Elevators.

We’re particular, actually stubborn, about refinements in state-of-the-art technology for hydraulic elevators. Remember, we invented them.

Other manufacturers have made a lot of noise with assorted bells and whistles. Dover has been quietly and patiently perfecting the greatest advance in hydraulic elevators since we invented them 51 years ago. DMC-I®—the first totally integrated microprocessor control system.

Our new DMC-I elevator closes the doors more reliably. Moves the car to the next floor more efficiently. Opens the doors more dependably. What else is an elevator for?

Other brands have offered add-on microprocessor functions on a onesy, twosy basis, like bandages. Only Dover has taken the years and millions of dollars necessary to perfect a total, built-in system. Because only Dover’s volume as the industry leader made it feasible for us to invest such vast resources in its development.

Dover F.A.S.T. unit gives instant performance analysis.

DMC-I has a unique new hand-held F.A.S.T. unit that is literally a “window” into the microprocessor controls. It allows us to reprogram up to 40 elevator functions in minutes. It provides instant analysis of existing performance, permitting faster, more thorough preventive maintenance.

If you’re buying or specifying elevators for low or mid-rise buildings, you need to see what DMC-I can do. Call your local Dover office or write Dover Elevator Systems, Inc., P.O. Box 2177, Memphis, TN 38101.
Weather Shield's cost-effective, Extruded Aluminum "Panning System" was the perfect choice for the Edgewater Psychiatric Center.

— Harrisburg, PA —
At Last!
A Cost-Effective, Extruded Aluminum Panning System

Building renovation is an important segment of the market. And in the past it was difficult to locate retrofit wood windows that were functional in design, easy to install and cost efficient. But not any longer.

Weather Shield's aluminum panning system offers the following advantages: (A) Minimal expenditure of labor; (B) Installation is accomplished from inside of the structure; (C) Existing perimeter wood frames can remain intact; and (D) All cutting, drilling and punching is done at the factory to speed assembly in the field.

Consider the additional benefits of Weather Shield's energy efficient wood windows:

- Extruded aluminum panning of .072 thickness, for strength and paint durability, is available in three colors — White, Adobe and Desert Tan.
- Units are available up to 1½” triple insul glazing with optional hard coat Low “E” glass.
- Architecturally styled extruded aluminum clad sash interlocked to wood sash interior.

Contact Weather Shield for complete details on how our extruded aluminum panning system combined with our energy efficient aluminum clad wood windows can provide for the easy window replacement in both commercial and residential applications.

Weather Shield products are available with SUNGLAS HRp (heat reflective) Low “E” glass. A product of Ford Glass Division.

Weather Shield Mfg., Inc.
Medford, WI 54451 • 715/748-2100

"Better Ideas In Wood Windows!"
Our Bicentennial is only a hundred years away.
In this, our hundredth year, we pause briefly to celebrate past achievements. And to consider the exciting opportunities ahead.

In the past two decades, the Information Revolution has changed the way people live and work. In that time, a new McGraw-Hill has taken shape.

Today we are a multi-media publisher and information services company, creating a vast array of print, software and on-line information products to meet the changing needs of the markets we serve.

As we look to the future, we see new information technologies emerging and new McGraw-Hill products that use those technologies to the fullest.

In the midst of these continuing developments, it is important to remember that the underlying principles that have guided our company for the past century will continue to define us in the next century.

People will always need information.

They will always seek out the authoritative source.

They will always demand timely information they can work with.

But that most essential bit of information is brought to print.

We must ensure that this is not an end, some as-yet-unimaginable form.

We must continue publishing information of the best kind.

Information that leads to action.
It took more than 100,000 men, 2 million blocks of stone and 30 years to complete the great pyramids of Giza. Forty-six hundred years later, they still tower in the Cairo desert, representing perhaps the world’s grandest structures.

At Dow Corning we also help build structures with monumental results. We manufacture an extensive line of high-performance silicone sealants with unmatched service life.

Case in point: The New York Hall of Science. It was one of the first buildings to be caulked with a Dow Corning silicone construction sealant. More than 20 years later, the sealant is still in place, as rubbery and tight-sealing as the day it was installed.

In another case, Dow Corning silicone rubber sealant was used to caulk Chicago’s Northern Trust Bank. After 20 years of Chicago’s icy winters and boiling summers, there’s still no evidence of the sealant pulling away, cracking, hardening or crumbling.

Time after time, Dow Corning sealants work where other materials won’t. The J.C. Penney Headquarters in New York City is a classic example. Originally caulked with a polysulfide sealant in 1964, this 46-story building had curtain-wall leak problems from the start. In 1980, the entire building was recaulked with Dow Corning silicone construction sealants. Since then, there hasn’t been one wall or window leak reported. Not one.

From concept through construction, nobody is better prepared to analyze and solve your sealant problems than Dow Corning. For specification information and technical literature call toll-free 1-800-346-9882 ext 8209. Or write Dow Corning, Department 4025, Midland MI 48640. We’ll help you build a great structure that will pass the test of time.
Today, a new generation of advanced gas cooling equipment brings to commercial air conditioning the same economy and reliability that gas brings to heating. Before you design your next project, let your gas company show you how right gas cooling can be. Gas. America's best energy value.
WITH ANDERSEN® WINDOWS, THE LAST THING TO WORRY ABOUT IS Running INTO A BRICK WALL.

Unlimited design potential. Is it too much to ask of Andersen windows? Simply and emphatically, no. Not with Andersen Perma-Shield® Flexiframe® windows.

For with this versatile window line comes all of the custom benefits of designing buildings with an attractive stick window system.

You can create curtain walls, trapezoids, pentagons, octagons, whatever you fancy. In whatever size and combination you wish.

With our crisp, clean Andersen lines and smooth, tight Andersen corners.

In a style to complement any building facade, any pattern, any texture.

Unlimited design potential? Let's just say that with Perma-Shield Flexiframe windows even running into a brick wall can be a beautiful experience.

Call 1-800-635-7500 for the name of your local Andersen commercial representative. Or write Andersen Commercial Group;
P.O. Box 12, Bayport, MN 55003.

Your Duro-Last Roof Will Be Known By The Company It Keeps.

With a Duro-Last single-ply roofing system, you're joining some pretty good company... like CBS Television City, The Wall Street Journal, Con-Rail, Transwestern Property Company, Lake County Village Shopping Center, just to name a few. These satisfied customers know Duro-Last is the top single-ply performer. And for a variety of reasons:

- **Duro-Last custom** fabrication to your specifications gives you a roofing system big on performance and low on waste.
- A Duro-Last roof goes down quick and that means a savings of time and money.
- Duro-Last means durability with our exclusively designed Celanese Fortrel™ polyester high tenacity fabric, coated on each side with a specially formulated thermoplastic polymer.
- Duro-Last gives you double protection with a 20-year warranty and $6,000,000 liability insurance policy.

Those are just a few reasons why more and more Duro-Last roofs are being seen in some pretty good company. Shouldn't you join the long list of satisfied Duro-Last customers who are buying the “system” and not just roll goods?

**Call today.** It’s your first step to putting... and keeping... your roof in some pretty good company.

Duro-Last Roofing, Inc.
Tigerman’s pictures at an exhibition

After opening in Paris [Record, November 1987, page 69] and traveling to Frankfurt, “Chicago Architecture 1872-1922: Birth of a Metropolis” returned briefly to its origin, The Art Institute of Chicago, in a lavish new installation designed by Stanley Tigerman of Tigerman McCurry. Beginning with a model representing the Chicago fire (right), Tigerman chose to present “pictures of architecture within architecture.” Archways were styled to match the periods presented, and trellises enclosed thematically discrete spaces. Curator John Zukowsky did not require Tigerman to eschew didacticism, and so, for example, the European-academic roots of late 19th-century Chicago architecture were presented in columnated spaces in enfilade. The famous Tribune Tower competition occupied a room populated by street lights and benches, a reference to the Parisian-inspired planning of Burnham that prevailed as Modernism struggled to take hold (below right). The setting for Frank Lloyd Wright’s work recalled the Coonley playhouse. Exhibition themes were reprised in four aediculae (containing books for sale) in the styles of Burnham, Sullivan, Wright, and Mies (below left).

GYM DANDY

The assignment: design an audiovisual fitness center for a large insurance company in Hartford, Connecticut.

The media: WILSONART Color Quest® Decorative Laminates.

The design team: Laura Bordeaux, AFF, IBD and Mike Bartalotta, both of Hartford, Connecticut.

Bordeaux comments: “I wanted the center to be a complete departure from anything institutional; a playful environment, designed to motivate employees past the door and through their workouts. WILSONART Color Quest proved to be the perfect vehicle. It gave me the selection I needed. And the palette to color coordinate everything from the carpet to the clock’s secondhand.”

The result: A happy, healthy insurance company.

The San Francisco Museum of Modern Art has narrowed its search for the architect of its new headquarters to three: Hammond, Beeby, and Babka, of Chicago; Mario Botta, of Switzerland; and Frank O. Gehry and Associates, of Santa Monica. The finalists will prepare a design proposal for the site, part of the Yerba Buena Gardens commercial development in the South of Market area. A decision is expected later this fall.

The Coney Island Cyclone, "a gravity ride of the wood-track roller type, with six fan turns and nine drops,"—i.e., a roller coaster—has been designated a historic landmark by the City of New York. Historian Gary Riazi has written that "New Yorkers should consider the 1927 ride [designed by engineer Non Keenan] as valuable as the Statue of Liberty or the Empire State Building."

Ele Naude Santos's design for a 40-unit multifamily low-cost housing prototype has won an international competition sponsored jointly by The Museum of Contemporary Art and the Community Redevelopment Agency in Los Angeles. The concept was inspired, in part, by Case Study Houses, experimental residences constructed between 1945 and 1966 and designed by architects such as Richard Neutra, Craig Ellwood, and Charles Eames. A retrospective exhibition of the Case Study program will be on view at MOCA late in 1988; the A/CRA housing will be erected in 1990.

XVII Triennale di Milano present (until December 18) "Old Cities and the Future of Metropolis," a thematic exhibition exploring how urban life, particularly in the third world, is being rapidly formed. (What will it mean, in 2050, if the population of New York City grows to a projected 12 million people by the year 2030?)

What do you give an octogenarian architect?

Early this year, Barton Simon, a real-estate developer in Eastlake, Ohio, discovered damaged drawings that his 81-year-old father had produced as a student at Yale—a design for a symphony hall which, though delineated in a meticulous Beaux-Arts style, failed to win Sanford Simon the Rome Prize in 1933. Simon fils had the drawings restored, and a model constructed from them. He reports that his father (who recently resumed his graduate studies in architecture) was thrilled to receive the resurrected project as a surprise 82nd-birthday gift, but less impressed by the forgotten grandeur of his scheme or the intricate construction of the model than with the steadiness of his own youthful hand.

Aimed at restoring the neglected Arno River to a more vital role in the life of Florence, the Tuscan city has approved plans for a five-mile linear promenade, designed by Richard Rogers and Partners, of London, and Claudio Cantella, of Florence, that will serve as a focal point for outdoor recreational and cultural events, and a link to nearby suburbs. The river's unpredictable flow has been a deterrent to revitalization of what was once a primary commercial and industrial artery (memories of the catastrophic 1966 flood are still vivid). By analyzing the effects of 15 years of seasonal crests, the designers determined a height for new riverside promenades that should keep them above water more than two thirds of the year. Food concessions, cafés, and tourist and cultural information services will either be cut into the bank beneath a street-level quay or erected on floating platforms moored along the walkways. Demountable lightweight stairs will provide new access at key points along the quays; existing stairs, ramps, and retaining walls will be rebuilt with Pietra Serena, the characteristic gray building stone of Florence.
What you see here is a brand new building material. Commcoat™ Flurodize® Coil.

The remarkable finish is made by bonding a Flurodize coating to our finest aluminum substrate, right in our rolling mill.

Commcoat looks a lot like anodized aluminum. Only better.

And it comes in seven exciting colors. (Extrusions, too.)

For a price no higher than anodized.

But the difference is, Commcoat Flurodize Coil keeps on looking good year after year. With far less weathering, fading or staining than anodized.

Nor does its color vary from panel to panel. Or crack when sharply bent.

To get your hands on some, call any of these distributors: Petersen Aluminum Corporation, Wrisco Industries or Idéal Metals Inc. Laminated panels are produced by Alucobond Technologies.

Or call us at 1 (800) 556-1234, Ext. 41.
In California, 1 (800) 441-2345, Ext. 41.

Commcoat is a trademark of Commonwealth Aluminum Corp. Flurodize is a registered trademark of DeSoto, Inc.

Circle 41 on inquiry card
191 Peachtree Tower (1) appears to be a slender granite-clad shaft from the street sides of its downtown Atlanta location. Contending with a long, narrow, through-block site, John Burgee Architects (Philip Johnson, consultant) with Kendall/Heaton Associates have configured the long sides of the 50-story building as twin towers, reminiscent of New York’s Waldorf Astoria. Construction will be completed late in 1990.

Domino’s Pizza (2) is analyzing a new prototype freestanding store, designed by Gunnar Birkerts. While the keystone-cum-pizza-slice is intended as an iconic image for the chain, the structure is also seen by Domino’s officials as evoking farmhouse imagery (“natural goodness”). If it passes muster, the design is likely to become ubiquitous: Domino’s has 4,600 stores in operation worldwide.

U.S. Space Camp (3) in Huntsville, Ala., is a 4-story, 53,000-sq-ft “habitat” that will offer its youthful participants six-person sleeping modules with built-in exercise equipment and computer workstations. A series of metallic tubes, inspired by projected space-station designs, will be organized around an atrium. Several aerospace firms are contributing to the $3.61 million project which is being designed by Tom Fricker of the Space and Rocket Center and Design Compendium, Architect; it will open this year.

The Applied Technology and Training Center (4) in Michigan focuses on a five-story atrium that provides an opportunity for casual interaction of users. Architect Perkins & Will has made the internal workings of the center visible, where possible, to the students, faculty, and visiting experts from industry who will use the Grand Rapids Junior College facility to train and retrain workers for expanding midwestern high-technology industries.

Many of the entries in Formica Corporation’s From Table to Tablescape competition were nominally domestic items: lamps, tables, chairs. As interpreted by the likes of Mark Mack, Billie Tsien, and others in the 2000X line of surfacing material, the results were, to say the least, unfettered. One lamp both glows and heats incense (Patrick Elie Naggar); another appears to be blowing in the wind (Mark Simon); a picket fence supports a glass tabletop (Brian Murphy); a serving tray becomes an extension of clothing (Karen Van Lengen & Joel Saunders).

A fountain, by Dan Friedman, (above) suggests a liquid solidity. Eric Owen Moss, on the other hand, has carved out the hinged, gridded cube of One Wilshire with organic curves (it lights when opened, below).

Competition calendar

• “Competition Diomede” seeks ideas to unite the U.S. with Soviet islands across the Bering Strait. Write to PS #1, 46-01 21st Street, Long Island City, N. Y. 11101. Entries are due February 15, 1989.
• Expressions of interest are being solicited from architects who would like to compete for the design of the U.S. pavilion at the 1992 Universal World’s Fair in Seville. Submissions must reach the United States Information Agency by December 1. Additional information: (202/485-6414).
• Work that has been completed since January 1, 1982, is eligible for the American Institute of Architects 41st Honor Awards Program. The registration deadline is October 31, and forms can be obtained from Maria Murray, c/o Honor Awards Program, 1735 New York Avenue N. W., Washington, D. C. 20006 (202/626-7360).
And Winter snow. In every season of the year, Helios Modular Shelters are graceful, colorful structures for shade and shelter. Translucent by day, at night they are a cheerful, luminous accent that glows with underside lighting.

The pre-engineered Helios Modular Shelter is versatile. It can stand alone, or be joined and clustered in any formation that adapts to the requirements of your space. Hexagonal or square configurations in umbrella or inverted tulip shapes are standard.

More than just a pretty parasol, the Modular Shelter is the ultimate in practicality. It has a durable, ten-year-warranty membrane that can be left up through the year or demounted easily. The sturdy steel framework and membrane are engineered for heavy wind and snow loading, meeting many model building codes, and are shipped ready to install in less than a day.

Explore the many possibilities of the Helios Modular Shelter. Our literature tells all.

---

Helios is a leading fabricator of custom designed soft shell structures, used around the world for their flamboyant, curvilinear shapes, light weight and long life. Send us your idea sketch, we'll help turn it into reality.

New plan for Philadelphia: trying to do more with less

The recently unveiled Plan for Center City in Philadelphia embodies many current trends in both planning and urban design, but it is the clarity of this particular city's physical form— inherited from past pioneering efforts—that throws urban strategies applied elsewhere into sharp relief. Overlaid on William Penn's park-block-studded 17th-century grid is the diagonal Benjamin Franklin Parkway, a boulevard that radiates from the Second-Empire City Hall (at the center of Penn's plan) to the Neoclassical Museum of Art. "From the 1940s into the '70s, commercial growth at the core was guided by the ambitious physical redevelopment strategy formulated by Edmund Bacon. No longer limited by a lethargic economy and a so-called gentleman's agreement" on eight, Philadelphia is now seeing a spate of 50-or-more-story buildings—the previous verage had been a modest 30 stories—produced by aggressive at-of-town developers.

Coordinating this expansion will be the impetus for the plan. Many of the greatest achievements of the Bacon years merged from the search for a new plan for Philadelphia, with ideas attributed by the likes of Aldo Giurgola and Louis Kahn. Though widely admired and imitated in other cities, the city—an enormous remaking of Center City (which embraces a commercial business district well as close-in residential areas)—has always been at the center of public and private investment. Scott Brown notes, "We are going to spend public money, but the investment will not be Bacon-style planning; we are going another way, clearing sites and rebuilding." In many parts of the country, commercially oriented plans did not produce the kinds of results that made headlines, however, and "concept" urban master plans, many of them simplistically derived from early European Modernism, were—like some of Bacon's efforts—shouted down. "Even [Bacon] might now admit that the vision and the reality were quite different things," he says. As it turned out, declining local tax revenues and federal budget cutbacks decimated the resources all planners customarily relied on, reflecting society's dwindling commitment to the city.

Barbara Kaplan, Executive Director of the Planning Commission, says, "We've evolved since 25 years ago. Then you really needed the city to assemble sites and write down the value of the land in order to get private investment. Happily, because of that activity and changes in the city's economic fortunes, you have a lot of private investment now. But we're not looking at government as the major agent of change as we were in 1964, when you had millions of dollars of urban-renewal money and you had public acceptance of the use of eminent domain on a wide scale. We are going to spend public money, but the investment will be strategic, to stimulate or respond to private-sector actions." In some ways, however, the new plan is actually more ambitious than Bacon's. It calls for sweeping changes in areas the untutored may not consider planning: new services such as job training, and a unified effort by virtually all city agencies to improve poorly delivered existing services (most obviously, sanitation and street maintenance). Critics have called Kaplan's broad approach a grab bag of disparate ideas, lacking a coordinated set of priorities. "No matter how beautiful or appropriate buildings are, these kinds of management issues get in the way of really being a great city," replies Kaplan. (A new document, Implementing the Plan, organizes the concepts into categories, emphasizing those items that can be accomplished soon; i.e., with little money.)

The plan also specifies detailed proposals that will affect the physical configuration of the city—but at a different scale. "The '63 plan rightly emphasized structure," explains architect Robert Geddes, of Geddes Brecher Qualls Cunningham, who is a consultant to the city. "We have emphasized the fabric, which means carrying ideas to the scale of zoning, historic preservation, even signs and doorways." Yet it is at this scale that problems with the plan Continued on page 63
It is the nature of leaders to break new ground. At BASF Fibers, that’s just what we’ve done. We’ve created an unparalleled legacy of industry firsts in fiber design. In 1970, we introduced the advantages of solution dyeing to the contract market with our Zeftron® nylon fibers. We were first with a 10 year colorfast warranty. First with conductive carpets. First with contract carpet consultants. And first, more than 20 years ago, with a performance certification program guaranteeing the quality of every carpet that bears the Zeftron label from BASF. Like every other leader, we’ve been followed. But we haven’t been caught. When you want to lead, remember the legacy of BASF, and tap into the spirit of innovation. Call 1-800-446-8953 today, for a free brochure and the name of the BASF Consultant in your area.

The Best Industrial Buildings Deserve Aluma Shield® Insulated Panels

Choose Aluma Shield wall and roof panels and choose the most cost efficient high quality system money can buy. We offer a full line of panels insulated with foamed-in-place polyurethane to fit any temperature requirement for any industrial and commercial building design.

**New Panel Products For Roofs, Walls and Partitions**

Aluma Shield offers a new high rib panel for wall or roof application, and is available with a choice of metals including copper. Also new is our flat exterior wall panel with concealed fasteners, and our exposed fastener partition panel for interior or exterior applications.

When compared to existing field assembled metal wall and roof systems, Aluma Shield panels provide a far superior system built in less time, with lower installation cost, and lower insurance premiums.

**New For North America — Proven In Europe**

While Aluma Shield has operated a fully automated continuous line panel manufacturing system since 1983, the technology and equipment for producing our new line of panels is even better. Over 300 million square feet of complete buildings have been constructed in Europe utilizing this system... a system which is totally state-of-the-art and gives us the capacity to supply over 15 million square feet of panels per year.

This means you get the panels you need, when you need them with an assurance that our factory controlled quality and product expertise will result in a building that looks great, is energy efficient and highly affordable.

Call or write today for more information on the full line of Aluma Shield insulated panel products.

Design news continued from page 59

become evident. While officials claim that the plan is "in place" (as a blueprint it requires no enactment, but also has no legal force), zoning changes that implement its most critical aspects are still being formulated.

For example, height limits established for the Parkway and around the venerable City Hall (still the city's most potent symbol) will be extended to prevent erection of structures that would diminish the prominence of City Hall tower from certain vantage points. But in one case, a tower avoids the height-limit zone by stepping back behind a north-facing plaza, though new rules favor extension of street walls (figure 1, page 59). At another critical juncture, high-rises are allowed to abut three- to five-story landmarks on small-scale service streets. The 58-story 2 Liberty Place (2), for example, would not be affected by a 50-foot-high recession plane that restricts bulk on the opposite side of Chestnut Street. It is in these situations where, ironically, the lack of the kind of architectural vision Philadelphia has historically had seems most telling.

In devising guidelines to improve the street-level quality of commercial projects, Kaplan and her staff are caught between the Scylla of possibly toothless as-of-right requirements for bonus-eligible public amenities and the Charybdis of negotiating each project through an excessively complex process. (New York City, a pioneer in zoning-inspired public amenities, has repealed many rules enacted in the 1970s because of the meagerness of the "amenity" usually supplied in exchange for bonus square footage granted.) Philadelphia's planners have yet to come up with a list of amenities that are both genuine and comprehensible to the average code-review official. "There's some risk in this approach," admits Kaplan's deputy, David Baldinger, yet it also reflects an effort to put some distance between their plan and that of San Francisco. Other difference is that Philadelphia, although a pioneer design review, will not extend review board's powers to any aspect of the new plan. While it shares San Francisco's small-scale emphasis, "This is a plan to stimulate growth," Kaplan declares.

It may, though, be too developer-oriented. Philadelphia streets are, with few exceptions, narrow, and yet contemplated zoning lot density is as high as in much more open cities (the maximum allowable floor area ratio, at 24, is even greater than that in overbuilt New York City, at 21). Many of the city's attractive streets, already dark much of the time, are likely to become Wall Street-like canyons. Presumably to avoid conflict within an often-contentious city council, miscellaneous actions that are either underway or were devised apart from the planners' effort have been incorporated boosterishly and uncritically, as if they had evolved in some coherent fashion—when, in truth, the city was asked to create the plan because redevelopment had been occurring in a vacuum. The plan does not tackle disconnected piecemeal development on the waterfront or in Franklintown (a privately owned 1960s urban-renewal area). And critics have questioned the location of the city's proposed convention center on a site selected by a developer rather than the city. That the plan is not very courageous about controversial issues does not surprise Scott Brown: "American planners have never had the power of their counterparts in, say, England. And look at the money that has gone out of planning since the '60s. It is just being realistic to say, as this plan does, that you should deal with the immediate. But something very sad has happened. This document is responding to the will of society, which is not to depart from business as usual."

James S. Russell
Specify the vent with certified performance

When you specify a Bilco Automatic Fire Vent you call for an insulated, gasketed, heavy-gauge product that is built to last...a vent equipped with the Bilco Thermolatch® positive hold/release mechanism. It is quality that assures your client of dependability, long service life and complete satisfaction.

Our new long form specifications include the requirement for a product performance certification and spell out clearly the quality and reliability you want for your clients. May we send you a copy?

Just write “Fire Vent Performance Specifications” on your letterhead and mail to: The Bilco Company, Dept. FS-115, P.O. Box 1203, New Haven, CT 06505.

The Thermolatch® positive hold/release mechanism assures prompt release when activated in an emergency.

And, just as important, it prevents accidental opening at other times due to wind uplift forces or vibrations.

The Bilco Company, P.O. Box 1203
Dept. FS-115, New Haven, CT 06505
The First Water Coolers To Offer TOUCH-FREE Operation

Introducing "Hands-Off" water coolers from Haws. "Hands-Off" coolers feature a patented electronic sensor that activates the water stream as soon as a user comes within range. A built-in timer stops the water flow automatically if the sensor is blocked for more than 30 seconds, thus discouraging tampering and preventing damage to the sensor itself. Another protective feature—a time-delay mechanism—prevents accidental activation by passers-by. Now health care facilities, office complexes and all indoor public areas can be designed with the ultimate in barrier-free convenience.

"Hands-Off," the "Smart" Water Coolers

Models HWCFB1HO, HWCFB-21HO, HWDFS81HO, HWDF58-21HO and HWCT81HO

These sleek, wall-mounted units each feature a receptor, backplate and grille constructed of heavy-gauge stainless steel with #4 Satin finish. They're also available in Stainless Steel with a Sienna Bronze™ finish.

Model HCBF7HO

This handsome wall-mounted model is manufactured of heavy-gauge steel and finished in Kenyan Beige Enamel. Optional finishes include: Alabaster Enamel; Expresso Enamel; Metallic Bronze Enamel; Cork Vinyl; Stainless Steel; and Stainless Steel with Autumn Bronze™.
Design awards/competitions:
Building Stone Institute 1988
Tucker Architectural Awards Program

Five of the eleven buildings the Institute recognized for excellence in the use of natural stone were restoration or renovation projects, testifying to the continuing importance of this construction sector. Projects in the categories of nonresidential building, residential building, and interiors were also selected by jury chairman Philip W. Dinsmore, of Tucson, and his fellow panelists Bruce S. Fowle and James A. Kingsland, both of New York.

1. Fuller House, Pinnacle Peak, Ariz.; Antoine Predock, Architect. Perched on the edge of a mesa in the Sonoran desert, program spaces in this residence allude to indigenous land forms. The kitchen and dining areas are seen as boulders, the pyramidal den (shown) as a mountain. Predock's use of stucco trimmed with native adoquin stone and his "sculptural interplay of forms" were praised by the jury as "ingenious."

2. The Solow Townhouses, New York City; Eli Attia Architects. Panelists commended "the subtle forms and detailing" of alternate bowed and flat rose-toned granite facades for rhythmically distinguishing 11 luxury row houses. While abstractly traditional in exterior details facing the street, each of the 5,300-sq-ft residences is organized inside around a sculpturally dramatic 50-ft-high skylighted living space.

3. 61 Broadway, New York City; Skidmore, Owings & Merrill, Architect. Post-World-War-II renovations were undone and a lower-level lobby was removed in this renovation of the entrance to an office building, originally designed by Francis Kimball in 1914. The restored limestone facade and the lobby of black granite and white marble are "very much in the character of the original building and of many older buildings in New York's Wall Street area."

4. New Museum and Research Complex for the Smithsonian Institution, Washington, D.C.; Shepley Bulfinch Richardson and Abbott, Architect [RECORD, September 1987, pages 112-121]. Exhibit and support spaces are underground, but finely worked granite is prominent above ground on entrance pavilions and in garden elements. "No other material could have been used to achieve the delicate strength of the design," declared the jury.

5. Arthur K. Watson Hall, Yale University, New Haven, Conn; Roth and Moore Architects. Masonry exterior walls were retained in this adaptive reuse an 1884 structure on campus, though the interior structure was entirely rebuilt to house Yale's Department of Computer Science. At street level, a pod of bluestone panels "creates a new base for the building and makes it a much stronger statement than it originally was."

Effort is only part of a long-range modernization of this Chicago landmark, completed in 1921 to designs of Daniel Burnham. "The jury is impressed with the craftsmanship involved in this project...It is a true restoration in its finest detail."

8. **St. Louis Union Station; Hellmuth, Obata & Kassabaum, architect.** Formerly one of the busiest train stations in the country, the 1891 terminal (Theodore C. Link, original architect) now houses a 160,000-sq-ft festival market and 550-room hotel, a combination of new construction and restoration. The architects were able to maintain what was there and create space for entirely different activities; they seem perfectly at home.

8. **IBM Corporate Office Building, Purchase, N. Y.; I. M. Pei and Partners, Architects.** Detailing of this 450,000-sq-ft corporate center is "very subtly but finely resolved," according to the jury, "allowing the richness of the stone itself to prevail." Travertine cladding was selected to convey solidity and a continuity with nearby masonry residences.

9. **Robeck House, New Canaan, Conn.; Herbert Beckhard Frank Richlan & Associates, architect.** A 1945 Marcel Breuer design had been altered both by subsequent owners and by progressive failure of cantilevered elements. The present architect restored the residence, added a wing, and as Breuer had, shored the sagging cantilevered walls with fieldstone piers. This work, the jury concluded, "was very sensitively handled."

10. **1615 L Street, Washington, D. C.; Jung/Brannen Associates, Architect.** New technology was used to bond 3/4-in-thick pieces of marble to a backing, making possible a mosaic effect without requiring mortar joints. Jurors called the project—a six-story atrium lobby in a 13-story speculative office building—"exuberant" with "an uplifting quality."

11. **Riverside Convention Center, Rochester, N. Y.; James Stewart Polshek and Partners, Architect.** A granite-based, glass-clad galleria links a newly developed river promenade in this revitalizing city center to a 50,000-sq-ft column-free exhibition hall. Commented the jury; "The alternating bands of granite are a unifying and enriching element to the otherwise very simple glass-enclosed components of the project."
Cool should whisper.

We don't think you should hear it. It's just meant to be felt. To us, noise is more than a mere annoyance. In fact, we have an entire research group that does nothing but look for ways to cut noise in the things we make. So when our Carrier division set out to design the quietest room air conditioner in existence, all of our engineers took note. You see, whether it's in buildings, planes or cars, silence is more than golden. It's good engineering.

The companies of United Technologies are working together to make the world a quieter place. From the ride of a Sikorsky helicopter to the elevators of Otis, from a Pratt & Whitney jet engine to UT Automotive components, we're turning down the volume.
Great minds don't think alike.

No. 1 in a series.
Max Pack data-entry stations designed by
Mike Tatum, The HOK Interiors Group, Dallas.

This isn't exactly what we had in mind when we created PLACES. But it is what Mike Tatum had in mind. Mike thought people in 36-square-foot workstations shouldn't feel like sardines. And he wanted their computers sitting within reach. But not on their laps. He also wanted something no one had ever seen before. With everything from fanlights to fabrics, wood to glass, PLACES gives you the freedom to create the spaces you always wanted to. No matter what you have in mind.

For more information call 1-800-344-2800.

They're built.

Reviewed by Ellen Posner

In his lifetime Bruce Goff was viciously criticized, lavishly praised, the subject of myth, and an object of curiosity. He was called "The Michelangelo of Kitsch" by Charles Jencks; Ada Louise Huxtable, on the other hand, assessed his work as "outrageous."

DeLong indicates that ultimately a wide range of architects and styles were important: Gaudí, the Viennese Secession, Art Nouveau, German Expressionism, Russian Constructivism, even orthodox Modernism and the Medieval tradition. As Goff began to come into his own, from the late 1930s through the '40s, he explored complicated, irregular, and unconventional geometries, and incorporated found objects. (The owners of the 1947 Ford House, which was at once domed, spired, and based on the structure of a Quonset hut, installed a sign in their yard that read "We don't like your house either.")

In the years that followed, Goff designed small, wood-framed craftsmanlike houses, as well as unbuilt projects that took the American roadside aesthetic to zany heights: a triangular all-glass chapel set over a hexagonal pool of water, the horseshoe-shaped Cowboy Hall of Fame, and the swirling concrete-framed Viva Hotel for Las Vegas.

Goff's remarkably expressive plans are reproduced here with great clarity as are his delicate perspective drawings. Photographs of built work are also included. Since many of the schemes are "internally focused," it is unfortunate that documentation of interiors, with their podlike spaces, conversation pits, and the ritualistic placement of primitivistic fountains, pools, and plants, is frustratingly minimal.

DeLong also moves lightly over Goff's material esthetic, which ranged from goose feathers to purple-tinted mirrors and gold lamé. (In a house for a couple with a turkey farm, he employed plastic syringes—intended for poultry insemination—as sly decorative elements at the entrance.)

There are few illustrations of these materials and virtually no comment by DeLong until the conclusion, at which point he volunteers that Goff "manipulated materials and finishes with a freedom that in itself constituted a kind of innovation, however brassy and unsophisticated the end result might seem."

DeLong knew Bruce Goff and was authorized to go through his papers and drawings after his death. He acknowledges that this book is just a beginning.

Meticulo ses it is (with extremely clear dating and indexes), it leaves critical interpretation still to come, but paves the way for it.

"I have listened to all the theories about communal and social values. What I want to know is this: when it comes down to actually designing, why do we always end up with a bunch of pointy skyscrapers scattered around a couple acres of grass?"
The lightweight, water-resistant properties of the common duck feather make it one of nature's most perfect designs. At Georgia-Pacific, these same features served as our inspiration in the development of Dens-Shield™ tile backer.

Easier To Handle And Less Expensive Than Cement Board.

Dens-Sned is a full 33% lighter than Durock® or Wonder-Board®—and far less expensive than cement board, as well. Because it’s lightweight and easier to cut, Dens-Shield is easier to handle and easier to install. Dens-Shield gives the same 1 and 2-hour fire rating as cement board, yet saves you installation time, effort and cost—and no special cutting or drilling tools are required. Dens-Shield is also less brittle than cement board, so it’s less likely to chip or break—especially at the corners.

Tougher On Moisture Than Conventional Gypsum Board.

Dens-Shield’s revolutionary core consists of a unique gypsum material that provides greater water-resistance and dimensional stability. Fiberglass mats on the front and back add even more protection, and an exclusive water and moisture-resistant coating makes the face practically waterproof. Properly installed, Dens-Shield requires no additional water or vapor barriers to prevent moisture from entering the wall cavity.

Dens-Shield is ideal for use as a backer board for walls or ceilings in tile baths, showers, locker rooms, or other high-moisture areas. It can be tiled, painted or papered and is available either 4' x 8' x 1/2" or 4' x 6' x 1/2".

Check out the light weight, tough-performing alternative to conventional tile backer. Specify Dens-Shield—the revolutionary material inspired by one of nature's most perfect designs.

Phyllis Lambert: Peripatetic heroine of architecture

Laurels rest uneasily on Phyllis Lambert's brow. Although, at 61, the eminent Canadian architect has the noble, close-cropped head of an ancient Roman senator or Picasso's Gertrude Stein, she still confronts the world and all its Picassos with the wary frown of a precocious child unsure of being taken seriously. Marching down the streets of Montreal in denim overalls and running shoes, Lambert is ready enough to shout over the nicknames "Joan of Architecture" and "Notre Dame de la Restauration," which she has earned at home and abroad as scholar-activist, champion of urban civility, and crusader for historic preservation. But mention the acclaim she has also won for philanthropy at every level of the built environment, and her early laughter turns staccato and dismissive. As an heiress to the fortune amassed by her father, the self-made distillery magnate Samuel Bronfman, and strong-willed loner in her own right, Lambert has always resented at the merest hint that her wealth and access to power might somehow diminish the authenticity of her accomplishments. "I don't consider myself rich," she once said in a television interview. "That's meaningless. The reality is that I do every day."

The daily rigors of her self-imposed agenda, and the zeal with which she attacks them, are formidable. Active in the International Confederation of Architectural Museums, chairman of the board of Columbia University's Temple Hoyne Buell Center for the Study of American Architecture, an advisor to the National Gallery of Canada, and a consultant to many other institutions, Lambert presides at a continuous cycle of symposia, lectures, and intermittently resumes research on a history of Montreal's original walled city. For the moment, though, her supreme priority is the opening next May of the permanent headquarters of the Canadian Centre for Architecture, an international museum and research complex in Montreal that she founded in 1979.

The C. C. A.'s collections of books, prints, drawings, and photographs already rival—and in some areas surpass—those of the Royal Institute of British Architects, Avery Library, and the J. Paul Getty Museum. The aim of the C. C. A., Lambert has declared, is to "make a case for architecture," to help remedy what she decries as deplorably widespread ignorance about an essential art. Lambert remains the Centre's director and chief benefactor, having single-handedly purchased its downtown headquarters site, donated more than $10 million (beyond the $8 million pledged by government agencies) towards construction of the new building designed by Montrealer Peter Rose, paid the salaries of a full-time staff that now numbers 100, and contributed the bulk of an undisclosed acquisitions budget (the value of current holdings is estimated to exceed $50 million). Nevertheless, Lambert is indignant at suggestions that the C. C. A. is her personal monument. Even without this crowning triumph, or the slim portfolio of buildings she herself has designed, Phyllis Lambert would rank among architecture's few acknowledged heroines.

"Phyllis's greatest contribution has been as a catalyst," observes architect Robert A. M. Stern, a long-time friend and now colleague at Columbia University's Buell Center. "What did Henry James say about Isabella Stewart Gardner—that she was a force, a locomotive—with a Pullman car attached? Phyllis is that person, only more so. She believes there are things that ought to happen in the world, and she makes them happen. Her passion and directness can offend, but boy, can she be on the mark." Phyllis Bronfman Lambert's vision and fortitude were tested early by a domineering father, the immigrant "rum-runner" she is often said to resemble in her drive and volatile temper, if not in her esthetic sensibility. Studies at Vassar and marriage to French financier Jean Lambert, whom she calls "Daniel," were followed by a 24-year marriage to Samuel Bronfman, the towering, pepperiness, fieriness, and lack of tact were profits for Mies. A confessed tyro, she was nonetheless bravely judged the great form-givers by her own lights. Of Frank Lloyd Wright she wrote to a friend: "His is not the statement that is needed now. America has grown up a bit and... Wright has expressed what it was when its energies were unharvested..." Of Le Corbusier: "One is fascinated by his spaces, his sculptural forms, but are not people likely to be blinded by these and skip over the surface only?" The man of the hour, she concluded, was Ludwig Mies van der Rohe: "Mies forces you in. You have to go deeper. You might think this austere strength, this ugly beauty, is terribly severe. It is, and all the more beauty in it." Her final recommendation of Mies was so compelling that Sam Bronfman not only agreed to hire him, but appointed Lambert director of planning for his bronze-clad tower.

Philip Johnson, who joined the Seagram Building project as Mies's associate, recalls that "Phyllis's pepperness, fieriness, and lack of tact were profits for us. Of course, she was younger then, less obdurate, even indecisive. All she knew was, 'Damn it, I'm going to build the best building anyone can build.' Her father would send people over to check on what she was doing and tell her what to do, and every one of them met bloody defeat at her hands. This little girl, slight and short, could walk into a room with eight powerful men, and if she said 'Mies wants this,' it was done. Things like that don't happen in the real world, but they

Phyllis Lambert's first foray into the world of architecture was as a 28-year-old sculptor, called to assist her father in the selection of an architect for his company's headquarters, the now-classic Seagram Building in New York. Architecture has since become a magnificent obsession for Lambert, whose crowning achievement, the Canadian Centre for Architecture, will soon be installed in its first permanent home. RECORD's Douglas Brenner profiles this remarkable woman and her work.

Acid rain, chemicals, sun and severe temperature swings can shortchange any roof. But Robertson has found a way to control those problems with our Total Performance Roof. Protected by Versacor® PF. A coating system that combines our Versacor® epoxy base coat with a PPG Duranar® finish. And creates what is simply the most durable metal roof available.

Best of all, the Versacor PF Coating System is affordable. In fact, it costs only about 15 cents more per square foot than ordinary thin-film paints. So you can include it in your specs and still keep a lid on costs.

If all that sounds a little too good to be true, write H.H. Robertson Company, Department A10, 400 Holiday Drive, Pittsburgh, PA 15220. Or call (412) 928-7500. We'll send you a free copy of our Independent Test Results brochure. And show you what a little spare change can do for your roof.

The No Compromise Roof

happened in her world." While assisting in the creation of a masterpiece, Lambert came to believe that she could best play an active role in the real world by becoming an architect herself. Mies remained her mentor, both as head of the architecture school at the Illinois Institute of Technology, from which she graduated in 1963, and after she entered private practice.

Lambert's most noteworthy esign, the Saidye Bronfman Centre-YM-YWHA, in Montreal, completed in 1968, is a startling exercise in orthodox Laesiana. Her subsequent major innovation—the Ililtmore Hotel—showed no previous formal debt to Mies, though Lambert continued to relate the critical framework to Miesian. In one skirmish over the demolition of the Los Angeles illtmore Hotel—showed no previous formal debt to Mies, though Lambert continued to relate the critical framework to Miesian.

Increasingly, the actual practice of architecture came to seem less fulfilling than other avenues for her interest in pressing urban issues. "I never liked selling myself, personally or as a designer," she explained recently. "In England there's something known as 'voluntary services.' You become like a person in a religious order; you don't have to go out and make a buck. I like that idea. There needs to be a philosophy of architecture. When there's a body of discourse, something else happens. You can pull back and be an advocate rather than be in it for yourself." While heeding the call of her conscience, Lambert also orchestrated exhibitions, supervised a Bicentennial pictorial survey of American courthouses, and systematically photographed Montreal graystones, including the former peanut warehouse she converted into her home and office. The interiors of the loft-dwelling are a self-portrait in vignettes: spartan, almost monastic, white-walled rooms; an industrial reading lamp clamped to the finger of a Rodin bronze, at the head of a mattress on the floor; books heaped on sawhorse tables beside Mies chairs; a construction worker's hard hat; a snapshot of the owner bearing a placard inscribed "Retraite obligé." Lambert's possessions have always reflected her abiding passions, and have in part provided a nucleus for the holdings of the Canadian Centre for Architecture. Similarly, her conviction that the wealth of architectural documents she had collected ought somehow to "count," in a way they might not in a conventional art museum, helped formulate the very idea of a multifaceted study center.

"The concept of the precious object is actively repugnant to Phyllis," one C. C. A. colleague observes. "Her favorite pronouncement is: 'We collect things which show the process of architecture.'" Even when Lambert ran the C. C. A. from her Montreal house, she and her fellow-curators mounted full-scale traveling exhibitions, as impressive for their variety of subject matter as they were for ambitious themes that appealed to scholar and layman alike. "Photography and Architecture: 1839-1939," an exhibition-cum-book produced collaboratively in 1984 with curator Richard Pare, drew universal attention to one of the C. C. A.'s unparalleled strengths. Now comprising some 45,000 items, this assemblage of architectural photographs at the Centre is the finest resource of its kind anywhere. Images range in scope from tiny daguerreotypes to vast compendia on the scale of a 600-picture sequence chronicling the erection of Scotland's Forth Bridge. Phyllis Lambert's fascination with building technology—be it fortress engineering or the hydraulics of Mannerist fountain design—is also apparent in the C. C. A.'s collections of books and graphics. Above all, however, it is the abundance, diversity, and richness of the whole enterprise that dazzles the visitor. The 120,000-volume library encompasses the historical spectrum from incunabula scribed in the 15th century (among them one of the first Renaissance editions of Vitruvius) to ephemera of the 20th-century avant garde.

Arguably less comprehensive, the treasury of prints and drawings is equally catholic in its intended reach.

The largest object in the entire collection is the Shaughnessy House, a mansion built in 1874, rescued a century later by Phyllis Lambert, and now restored as part of Peter Rose's handsome ensemble. More than six times the size of the Victorian relic, the new 130,000-square-foot structure adroitly defers both to its elder partner and to other venerable buildings (from adjoining streets. Rose and Lambert (who is consulting architect as well as client for the project) agreed that the addition should sustain the local tradition of graystone facades, exquisite craftsmanship, and essentially classical proportions without sacrificing modern technology or resorting to stylistic pastiche. "Arguments over Modern versus Postmodern are meaningless," Lambert declares. "Most architects today are just packagers anyhow—including Philip [Johnson]. The only difference between them is that some are clever and some are not. We don't need more 'symbolism.' We need to ask how does a building approach its neighbors? How can we reconstruct the city, take it back?" Lambert pursues this inquiry more vigorously than ever as the C. C. A. prepares for its new home. She has yet to address other vexing questions that echo through the unfinished halls: having dedicated a forum to her own high ideals, how generously will she endow its future—and how graciously yield the floor when others rise to speak? Douglas Bruneau
EIFS AND 100
THE PAST, PRESENT AND

CHATEAU LAKE LOUISE, Lake Louise, Canada
Originally constructed 1896, now a Canadian
Pacific Hotel

Times change. Brick, stucco and probably concrete aren’t the age-old answers anymore. Because high-quality EIFS with 100% acrylic-based coatings deliver excellent resistance to ultraviolet degradation, moisture and environmental pollutants. Plus, greater design flexibility...

Today, thousands of buildings old and new, use EIFS. It’s a lightweight, durable alternative that’s good for the environment and...
CRYLICS.

FUTURE OF EXTERIORS.

There's no time like the present to see what it can mean to your future building projects. For more information on the durability of Rohm and Haas 100% acrylic polymers, write to our Marketing Services Department. Independence Mall West, Phila., PA 19105.

AND 100% ACRYLICS. FOR BEAUTY THAT ENDURES.
At the pinnacle of the Opryland Hotel Conservatory’s lush indoor Victorian garden are angle bay windows, custom built for the hotel.

When Opryland Hotel asked Norco to design some special windows, the results were grand.

Some would call it a tall order... building windows for Opryland Hotel that are in harmony with their Conservatory suites.

But Norco measured up and built custom windows, fine tuned on both the exterior and interior to capture the Conservatory’s lush mood. The Conservatory is over two acres of architectural wonder – Victorian garden with winding trails, bubbling brooks and tumbling waterfalls.

Crowning the Conservatory’s elegance are Norco’s custom Angle Bay Windows,

Norco’s sweeping angle bays complement the southern elegance at Opryland Hotel Conservatory suites and give guests a breathtaking view of the Conservatory.
designed with authentic True Divided Lites, evoking the rustic charm of the Old South.

A high note for each suite.
Each upper level suite is graced with one or more Norco Angle Bay Window, blending with the romantic appointments, giving each guest the impression he is staying in a stately Southern mansion. And each Norco Angle Bay Window was designed to create a floor-to-ceiling wall of windows, set precisely at the right angle to give a glorious view of the Conservatory.

Brand results brought Norco back for an encore.
Opryland Hotel's newest expansion, the cascades, is set for completion in 1988. It is another major, skylighted interior space even rger than the Conservatory. Its 839 additional rooms will enlarge the hotel to 1,896 rooms.

Norco's Custom Angle Bay Casement windows will again be center-stage in the addition.

Norco's performance on the original construction phase was so impressive that Opryland Hotel brought Norco back for encore.

Uncompromising quality, on-time delivery and Norco's capability to build windows to Opryland Hotel's exacting standards (at a surprisingly affordable price) are some of the reasons Norco windows are again at the top.

Norco can make your imaginative window signs a reality.

In this issue

We are all over the map this month, so to speak, in a wide-ranging spirit personified by the well-traveled architect Antoine Predock, delineator of the sketch below and subject of a portfolio on pages 88-97. RECORD's thematic range may not stretch as far as Predock's—whose sources include music, dance, archaeology, and science fiction—but we are just as committed to exploring the diversity of our field. The journey encompassed in the following pages begins in familiar territory, a Modernist office building for IBM by Gwathmey Siegel & Associates (see pages 82-87). This project's exquisite pragmatism is a noteworthy reminder that sometimes the most successful solution to a given problem is the one that confidently honors recognized esthetic and technical boundaries, rather than straining after far-fetched allusions and special effects. The former may not proclaim its ingenuity as boldly as the latter, but may be all the more satisfying for its subtlety.

A very different perspective on the pleasure of rediscovering things we think we know inside and out comes with an excursion to two children's-museum installations designed by architects (pages 98-103). The respective subjects of these exhibits are the basic elements of art and architecture, charmingly devoid of capital "A"s and more fun than a Bauhaus full of monkeys. It's back to the grownup realm of corporate culture and bottom lines in a Building Types Study on design for industry (pages 104-113). A clothing distribution center, a water treatment facility, and a plant/office/warehouse are not exotic assignments, and the finished products are not glossily high-tech. Nevertheless, the architects behind our examples have all refused to turn out assembly-line structures. Efficient and economical, their buildings also respect the people who work in them and the sites they occupy; in short, they exemplify what one architect calls "industrial politeness."

Joie de vivre is not a common term in the architectural lexicon, but it's the phrase that best describes another building in this issue, the restored and expanded Michelin House (pages 114-119). Though located in London, this eccentric edifice fairly sparkles with Gallic wit. "Worth a detour," as the Michelin guidebooks say. Future guides, no doubt, will shower stars on Canada's newest landmark, the National Gallery in Ottawa, designed by Moshe Safdie as nothing less than a monument among monuments. The tour begins on page 120.
Regional offices for IBM and tenants successfully integrate big-city refinement into the suburban spec-office landscape.

If ever there were an architect-client relationship made in heaven, it is the marriage of Gwathmey Siegel & Associates and IBM. Both artist and patron have adopted a stock in trade of functional logic and formal understatement—Gwathmey Siegel through a straightforward manipulation of materials and space-planning principals that has consistently reinforced the validity of architectural Modernism, and IBM through a corporate ethic that tempers profit-motivated impulses with the detached eye of a research scientist. Given the two firms’ affinity for the poetic potential of common sense, it is altogether fitting that the computer giant turned to the New York architects for the regional offices of its marketing and national service divisions, located on a rolling 21-acre site formerly occupied by a golf course just north of downtown Greensboro, North Carolina.

Although Gwathmey Siegel has compiled an impressive portfolio of suburban office buildings over the past decade [see RECORD, July 1985, pages 100-115], Summit Green, as the Greensboro project is dubbed, presented the architects with a number of new challenges. For one thing, it was the firm’s first work in poured-in-place concrete, which for reasons of climate and cost is traditionally preferred over steel-frame construction in the Southeast. Second, the 145,000-square-foot building is only the initial phase of a projected 385,000-square-foot complex, requiring the architects, in Charles Gwathmey’s words, “to design something that could stand alone yet not lose its integrity” when future additions are built to the east and west (site plan left). Then, too, Gwathmey Siegel had to deal with an idiosyncratic program: five floors of offices and an attached one-story warehouse for IBM’s parts-distribution component. Finally, even though IBM was the principal driving force behind Summit Green, Big Blue occupies only 70 percent of the completed first phase; the remaining space is speculatively leased. In order to attract prospective tenants, the architects had to devise a flexible interior with as many perimeter offices as possible, keeping in mind that IBM’s presence, and financial backing, also demanded a higher level of design than this building type normally delivers.

Robert Siegel aptly characterizes the results as “architecture with a capital A.” In response to Summit Green’s setting alongside heavily trafficked Wendover Avenue, Gwathmey Siegel elected to configure the building as a linear, almost two-dimensional architectural graphic meant to be easily read from the highway. The architects exploited the building’s structural system by positioning the glass-walled south-facing facade five feet behind a reinforced-concrete brise-soleil, and they successfully utilized the volumetric device of a full-height entrance tower—articulated by a four-story bay window, glass block, and a clear-glass curtain wall—as a vertical counterpoint to the building’s overriding horizontality (top left and opposite).

In contrast to the sculptured elegance of this street-facing facade, the northern elevation exhibits a far more utilitarian demeanor, shaped not only by the warehouselike character of IBM’s service and parts-storage wing but also by a tripartite storefront glazing system on the office block that comprises reflective, clear, and white spandrel glass panels set between the building’s concrete floor slabs (bottom left). In real-estate terms, the payoff for Gwathmey Siegel’s meticulous architecture has been 100-percent occupancy from opening day at Greensboro’s highest commercial rents; for IBM’s public image, however, the value of Summit Green’s handsome face is incalculable. Paul M. Sochner
Summit Green
Greensboro, North Carolina
Gwathmey Siegel & Associates, Architects
"In all our work," notes Charles Gwathmey, "we try to make materials a direct proposition in the design." Summit Green's material palette of gleaming white ceramic tile, porcelain-enamel panels, glass block, clear-glass curtain wall, and exposed reinforced concrete reflects the architects' decidedly Modernist roots. In addition to breaking down the scale of Summit Green's south elevation, the five-story tower housing the project's atrium lobby, elevator banks, restrooms, and fire stair...
allowed Gwathmey Siegel to plan an uninterrupted interior of 35-foot-deep offices flanking double-loaded corridors. Elevator passengers enjoy momentary glimpses of the North Carolina countryside through two-foot-square windows punched into the tower's western wall (opposite left). Three-foot-wide metal grating set between a concrete brise-soleil and the glass window wall diffuses sunlight entering south-facing offices and serves as a convenient platform for window washers (opposite right).
Gwathmey Siegel softened the jarring juxtaposition of building and parking lot that often mars suburban commercial developments by setting the office block of Summit Green behind a landscaped forecourt whose definition will be clearer once the project's phase-two entrance tower is completed. The architects brought the outdoors into the five-story atrium lobby by sheathing the tower's eastern facade in a full-height clear-glass curtain wall (below) and its southern flank in translucent, 12-inch-square...
glass blocks (opposite). Building occupants emerging from the elevators onto atrium balconies have striking views of Summit Green's concrete sunshade through crisply layered grids formed by white-painted steel balcony rails and the mullions and frame of the curtain wall.

Two-sided bay windows terminate each balcony (below) and were designed, according to Charles Gwathmey, to allow people waiting for elevators "to step beyond the building facade" and enjoy a panorama of the surrounding countryside and downtown Greensboro.

Out of Albuquerque

"You're a regionalist if you can't get a job out of state," quips Albuquerque-based Antoine Predock, who is quick to dissociate himself from the label by pointing to a group of recent commissions all comfortably outside New Mexico state lines (opposite through page 97). A transplanted Missourian who responded to the "lure of the West" 34 years ago, Predock has been identified with his adopted home—until recently, at least—not only as the geographic location of his built work but also as the formal and material source of his inspiration. Now, however, having successfully established his territory, Predock is eager to extend his reach. The eventual completion of the five projects shown here—all currently in late phases of design development or early stages of construction—will physically secure this wider stronghold, even though the architect's theories have already acquired an international reputation. A recent profile in Time magazine, for example, hailed Predock as the "first great New Age architect"—a local guru with a global perspective.

That unusual perspective is a result of Predock's diverse preoccupations. In a single bound, he is apt to leap from discussing his views on the sociological mission of architects ("Testing theoretical boundaries . . . as well as being a closet anthropologist" is only part of Predock's self-imposed mandate) to commenting on his own athletic prowess (he looks forward to skiing his Wyoming building). Although he has been a prolific sketcher since childhood (this month, the John Nichols Gallery in New York will mount a show of recent drawings and models), his inatiable urge to document his surroundings did not immediately suggest a career in the arts. In fact, Predock had no particular field in mind when he entered the University of New Mexico in the early 1960s; he enrolled in his first design course because he admired the professional commitment of the professor. Once seized by the prospect of becoming an architect, however, Predock attacked his new-found field of interest from many angles, supplementing requisite studios with painting classes and office apprenticeships. Aided by the architectural heroes of the day, especially Frank Lloyd Wright, whose "maniacal intensity thrilled and inspired me," Predock set out to emulate the master's attention to detail. Following a final year of schooling at Columbia University and a postgraduate traveling grant to Spain, Predock settled briefly in San Francisco where he absorbed the lessons of a diverse group of artists, including the choreographer Anna Halprin. Fueled by her attempts at blurring distinctions between random and planned movements, Predock strove to create similarly "organic" compositions. After returning to Albuquerque, such methodologies continued to absorb Predock, who now attributes his own deliberate lack of a signature style to the models of indeterminacy set by Halprin and the composer John Cage. Beyond providing a forum for his own research, such extradisciplinary studies also helped Predock distance himself from the historicizing of many of his colleagues, a detachment he sums up in the assertion "I have always been more interested in Ray Bradbury than in Andrea Palladio."

Although Predock is often typecast as an architect of single-family houses, he has maintained a steady flow of commercial and institutional projects in his 21 years of practice. But it was only after returning from a one-year fellowship at the American Academy in Rome in 1985 that Predock devoted his energies to securing larger commissions, his medium being several major "do or die" competitions. In quick succession he won the Fine Arts Complex at Arizona State University (page 94), the University of Wyoming American Heritage Center and Art Museum (pages 92-93), the Las Vegas Library and Children's Museum (not shown), and the Classroom/Laboratory/Administration Building at the California State Polytechnic University in Pomona (CLA; page 95). Predock's definition of architecture as "a surrogate land form" became more evident through the expanded scale of these projects, as did his ability to tailor his helter-skelter symbolic references to the specifics of a given location. His scrutiny of what he loosely refers to as "urban patterns" transcends the city grid to include geological formations and subcultural obsessions, providing him a vast themetic umbrella for his designs. In dismissing conventional notions of context in favor of more cosmic ones, Predock argues that "In the immense conceptual cross section, with geology at the bottom and UFOs at the top, the grid is a barely discernible event."

A scenographic assessment of place is Predock's prologue to choreographing a program. His design for the Forum Theater for the University of California in San Diego (pages 96-97), for example, relies on an almost literal assessment of the universal rituals of theatergoing overlaid with particular characteristics of the given site. Predock partially masked the main hall and adjacent practice studios with a 230-foot-long wall of mirrors intended to enhance any public spectacle. Embellished rituals also figure prominently at Pomona. There Predock devised a tripartite configuration by sorting out components of the program and identifying imagery-potent points of reference: a historic building, the flight pattern into nearby Los Angeles airport, student traffic through a rose garden. He then submitted his social musings to the pattern of archetypal forms by fitting the various pieces into a chamfered triangle set atop a mesa (for all his worldly references Predock still depends heavily on the motifs of his region). Several of the projects are different incarnations of the same metaphor. Like CLA, the ASU Fine Arts Complex and the American Heritage Center and Art Museum are meant to be conceptual gateways between the desert and academic enclaves. Configured like an abstract sphinx, ASU exhibits Predock's flair for the dramatic. According to his design, one of the dance theater's facades will be elongated by a fascia that can serve as a screen for outdoor film festivals. (Predock had hoped to further his drive-in theater imagery by mounting speakers in the parking lot, but the client objected.) Shielded by rows of topiary that contrast with the overgrown foliage of a nearby cemetery, the apparently hermetic Heritage Center conjures up the domain of some James Bond foil.

The masonry dome will contain a maze of archives and reading rooms that form what Predock calls "a volcano of knowledge," whose crater will literally smoke with the exhaust of a central hearth. Programatically his most prosaic scheme is a dormitory for the Los Angeles campus of the University of California (pages 89-91), which Predock shaped into a pyramidal block to create an instant monument for the hillside.

A telling example of Predock's eagerness to capture and synthesize every possible significant aspect of site and program is his purchase of a portable video camera before departing for his stint at the Academy, in hopes of replacing his pencil and sketch pad with more up-to-date equipment. Once in Rome, shooting from the hip like a 1980s cowboy, Predock recorded some 1,000 minutes of video—besides making 500 drawings and filling 70 rolls of slide film. The effort to bring every culturally relevant form of inspiration to bear on architecture continues and Predock cheerfully confesses, "Sometimes I don't know where to stop." Karen D. Stein
Five projects
Antoine Predock, Architect
Northwest Housing
University of California,
Los Angeles

Antoine Predock’s office is one of three firms currently designing 400-bed dormitories for the northwest sector of the University of California’s Los Angeles campus (the other firms are Esherick Homsey Dodge and Davis and Barton Myers Associates; Gensler and Associates is the coordinating architect). In addition to housing, Predock’s commission comprises assorted “infill,” including an auditorium and a variety of student service offices, to be appended to a 1960s building (plan opposite). Hoping to enhance a vehicular passageway and cul-de-sac, Predock fronted the existing building with a projecting canopy that will demarcate an outdoor gathering place (drawing previous page). He likewise exploited the contours of the site by setting his triangular dormitory into the hillside. The building has eight subsections, each with its own entrance; accommodations for 50 people; and a common double-height living room that faces the heavily trafficked stairwell. While the repetitive aspect of the individual suites could not be overcome by a modest budget, the 10-foot change in grade will afford each room a different view. K. D. S.
Project team: Antoine Predock and Christopher Calott, with Wensler and Associates, Executive Architect

1. Outdoor seating
2. Theater
3. Student services
4. Retail
5. Faculty housing
6. Amphitheater
7. Student housing
Like Native Americans and early settlers before him, Antoine Predock looked to the surrounding mountains to site his American Heritage Center and Art Museum on a parcel of land on the outskirts of Laramie, Wyoming. Predock aligned the focal point of the 125,000-square-foot research and exhibition facility with the east-west line between Medicine Bow Peak and Pilot's Knob summits, which he dubbed the "rendez-vous axis." Centered on this axis, which also parallels the city grid, Predock placed the domed American Heritage Center atop a "mesa" of manuscript and artifact vaults, its cross-axis determined by the city stadium to the south. The inward-looking building will be constructed of concentric circles of brick laid on a concrete substrate, giving the exterior a serrated edge, while the more inviting wood-paneled interior, focused on a central wood-burning hearth, will recall a rustic retreat. A field of shaggy conifers and alleés of sculpted topiary will funnel visiting scholars to a curved ramp that leads to the shared lobby of the Center and adjacent Art Museum. A sculpture garden will flank south-facing exhibition rooms. K. D. S.
Although local building codes will most likely limit access to the stair climbing the domed Center, Predock included it in his scheme for symbolic reasons. Leading to an observation deck, it signals the complex's exploratory program.

Project team: Antoine Predock, Geoffrey Beebe, Ronald Jacob, and Eileen Devereux
Antoine Predock conceived his Arizona State University Fine Arts Complex in Tempe as a "desert temple of the arts." Inspired by early Egyptian monuments, he organized the various program elements to resemble, on entry, an abstract sphinx, with low, pawlike galleries flanking the stacked volumes of the more massive "body" of the complex's art museum (1). The latter also includes subterranean exhibition spaces lit from above by glazed risers in a pyramidal bleacher (2). Within an inner courtyard, which will serve as a performance space, Predock overlapped the compendium of desert icons with allusions to a more site-specific theme: the frontier town. A villagelike assemblage, connected by a semicircular arcade, contains studios, classrooms, and the 500-seat dance theater. Predock extended one facade of the theater (3) like a Western false front, to compose a screen for alfresco film festivals. K. D. S.

Project team: Antoine Predock, Geoffrey Beebe, Jon Anderson, and Ronald Jacob
The threefold composition of Antoine Predock's proposed building at California State Polytechnic University consists of a partially subterranean laboratory base; a hollow square block of classrooms, or "the motel," as Predock calls it; and an administrative office tower. Together, the disparate functions and shapes comprise a chamfered triangle, a form echoed in the sawtooth cut-out of the tower's "sky theater." Grassy rooftop terraces (where Predock hopes sheep will graze in acknowledgment of the region's agricultural origins) will straddle various zones. The seemingly random fenestration of the tower actually indicates the varied sizes and functions of rooms contained within (for example, each matrix of tiny windows represents a secretarial pool). The "motel" will be on pilotis, enabling students to pass beneath the complex on their way to nearby campus haunts such as the barbecue pit. K. D. S.

Project team:
Antoine Predock, Geoffrey Beebe, Jon Anderson, and Jon Bass with Gensler and Associates, Associate Architect
Mandell Weiss Forum Theater
University of California, San Diego

The location for Antoine Predock’s 32,000-square-foot Mandell Weiss Forum Theater is a plateau at the southwest corner of the University of California’s San Diego campus, overlooking Louis Kahn’s Salk Institute. Set in a gravel-covered clearing in a eucalyptus forest, the building is fronted by a 13-foot-high, 230-foot-long mirror intended to emphasize the dramatic spectacles of arriving theatergoers and of the site itself. After passing through a doorway cut through the glass wall and crossing what Predock refers to as the “threshold between dream and reality,” visitors arrive in a semiclosed courtyard, which is intended for outdoor performances. A curved ramp leading into the 400-seat theater provides additional entertainment for spectators, who can look back toward the grove through the one-way mirror and observe late arrivals. On the second-floor of the theater, a balcony pierces the glass wall. Connected to the backstage is a horizontal slab containing a variety of rehearsal spaces, classrooms, and faculty offices joined by an arcade.

K. D. S.
Predock hopes to construct the Forum Theater's 13 1/2-foot-high, 280-foot-long mirror wall in such a manner that it will appear, on approach, to be a mullionless reflective plane. From the interior courtyard, however, the wall will be transparent.

Project team:
Antoine Predock and John Fleming with CLEO, Associate Architect
Children’s museums must nourish prodigious amounts of physical and intellectual energy—a daunting assignment that the architects of these two exhibits clearly relished.

Children’s museums do not offer ruminative contemplation but rather engage all the senses, muscles, and intellect. At the Brooklyn Children’s Museum, the exhibition “Dr. Dimension and the Rulers of the Universe” encourages kids to measure time and distance with such deliberately wacky devices as retractable tongues of various lengths, egg timers and other gadgets, and lightweight columns of assorted heights (from top to bottom above). At the Mississippi Museum of Art (opposite), a girl watches the silhouette of a capering friend on a Tannenbaum screen, to which a computer transmits a delayed colored picture.

Hands on, heads up

According to Linda Trobaugh, architect, art teacher, and designer of one of the children’s exhibits shown here, the ideal design team for a children’s museum comprises “the perfect educator, the perfect architect, and a lot of money.” According to Lee Skolnick, architect, sometime teacher of grade-school pupils, and designer of the other exhibit here, only when you’ve finished designing do you realize all you might have done, and will do the next time.

The increasing number and growing popularity of children’s museums seems more than just a fad. In part, the phenomenon may be demographic, the need of many working mothers for supervised after-school activity, or the need of numerous divorced fathers for children’s indoor entertainment. In any case, the form occurs nationwide and encompasses an enormous range of size, from big, old institutions like those in Boston, Brooklyn, and Indianapolis, with their large, museumlike collections of valuable artifacts, to small, almost ad hoc facilities like those in Pawtucket, Rhode Island, located in a former mansion, and Oak Ridge, Tennessee, in an adapted school building. (An astonishing number of these institutions are instigated by local Junior Leagues, whose young women members perceive a genuine community need.) And the groups designed for vary, too—most children’s museums serve young people up to the age of 12 (adolescents tend to lose interest), who generally arrive in large school groups but who may, at some museums, come in by ones and twos after school. At the same time, the very names Kidspace (Pasadena, California) and Please Touch (Philadelphia) suggest sensitivity to the needs of preschoolers. And one must not forget the grown-ups who drift in on their own—after they’ve taken the children home. On its press release the Children’s Museum of Indianapolis prints, almost as a motto, “...where children grow up and adults don’t have to.”

The design of children’s museums requires more than ordinary architectural skills and more than art-display expertise. Though complex, both disciplines are far too simple. What’s more, the most sophisticated knowledge of child development is not enough; the architect’s three-dimensional thought processes are essential to these designs, which must allow for the active physical participation of youthful users.

A number of key words recur when insiders talk about children’s museums, among them hands-on and interaction. Their vocabulary reflects not only the educational philosophy of learning-by-doing but the indisputable fact that the museum uses share an abundance—some might say a plethora—of physical energy. Educators of course welcome this energy, which they hope to put at the service of the mind. But it is the architect who is technically best equipped to channel it. Because so many people today concentrate on architectural style, they sometimes forget that a basic architectural skill is the accommodation of space to physical use. The architect is accustomed to arranging space as pre-ordained route, freeing the user’s mind for more important concerns than ambulation and orientation.

Most wonderfully, though, these designers speak of the fun—the joy—of working with sizes and shapes and ideas that just don’t arise in conventional commissions. Grace Anderson
Playing around with art works

The Impressions Gallery, a children's exhibit within a larger conventional art museum, deliberately repeals the don't-touch rules that apply elsewhere. Architect Linda Trobaugh's design actively demonstrates the elements of art—color, line, shape, light, and texture—with stationary and moving examples.

The exhibit itself occupies pavilions colored and shaped according to the theories of Bauhaus master Johannes Itten, whose writings discuss the interaction of color, shape, and visual and emotional effects. Visitors here learn not only about artistic theory but also about the physical consequences of manipulating textures and light. (Did you know that if you stand in a red light you cast a green shadow?) In the purple Line pavilion, visitors shape string on plastic pegs to learn about both two and three dimensions, while in the green Texture pavilion clear plastic columns filled with assorted materials show the visual aspects of texture. The gallery also houses active exhibits with names like Tannenbaum's screen, Benham's wheel, and laser pinball.

Pavilion axes, marked by colored neon tubes overhead, converge at a circular black hands-on work area. G. A.

The many faces of architecture

Perhaps no architect can truly gauge the manifold complexity of his art/craft until he tries to see it through the eyes of a child. But before designing this exhibit, Lee Skolnick spent seven years as a volunteer teacher of architecture (grades 2 through 7), and had ample opportunity to think of ways to convey at least part of what he knew.

At the Staten Island Children's Museum, the visitor to the Building Buildings exhibit first sees four columns at the Entrance (tree trunk, Ionic, I-beam, steel truss), and then enters a make-believe house with blueprint facade and breakaway interiors that show a balloon frame and plumbing. After learning in Where Do We Build that we don't build igloos in the desert, the viewer gets some tough lessons about the way Buildings Speak—models and silhouettes illustrating composition and visual rhythm, as well as such ornamental artifacts as a Wright window and a Chinese roof tile. Then, after passing The Colossus with models of wiring and hvac, the visitor learns How Buildings Stand Up, and is enticed to build and balance structures with hinged wood domes, arches, and buttresses (devised by Philadelphia's Franklin Institute). And after meetings with architects and the trades in "office" and "field," there is finally an encyclopedic burst of historical buildings and events. G. A.

Productive politesse

Just yesterday the pundits were consigning not only our wheezing “smokestack” industries but most American manufacturing to the bin where the Model T and the vacuum tube gather dust and nostalgia, passing the country’s economic keys along to wave-of-the-future technology and a burgeoning service sector. Today, they watch an industrial machine fast churning its way toward full capacity. The resulting demand for capital expansion is reflected in spending forecasts that see manufacturing buildings, and related facilities for warehousing and distribution, as one of the few still-vital spots in a generally static or sagging construction economy.

The renewed drive for industrial growth is necessarily yoked to gains in productivity, which managers increasingly perceive as interdependent with factors more encompassing than efficiencies of physical operation alone. Those who have moved toward computer-integrated manufacture, for example, have made the unsettling discovery that highly computerized operations tend to demand of the people employed by them higher skills and/or better training than before. Attracting and holding an able workforce being crucial, plant managers are beginning to appreciate, as their home offices did before, the importance of a positive company “image” backed by a congenial work environment. Even on the more superficial level of public appearances, the image conveyed by quality (read good design), or its lack, is no frivolous consideration for land-hungry industrial enterprises that must compete with such other, traditionally higher, uses as farming and housing for favorable sites. Once the town bullies, the factory and its gang of related facilities are learning that politeness pays.

Margaret Gaskie
When Talbots, which markets upscale women’s wear through both catalogs and shops, decided to move its distribution and fulfillment center to a semirural area 50 commuting miles from the existing facility, holding old workers and attracting new ones rose high on the corporate agenda. Accordingly, the brief given Symmes Maini & McKee Associates called not only for a suitably stylish public face and up-to-the-minute plant, but for a work climate notably more congenial than the industrial norm.

SMMA’s initial charge was actually master planning for a projected 1.3 million enclosed square feet on the 88.5-acre site. But to meet a do-it-yesterday construction schedule, the A/E firm at the same time began rough studies for the 360,000-square-foot first-phase facility—reversing the more common practice of limiting the late-arriving architect to wrapping a pretty shell around a prefixed plan. Working with CAD, the designers settled on a rolled-section and bar-joist framing system with over-sized bays to maximize flexibility, and suggested a basic scheme for plant layout. “There’s no mystery about these operations,” says project architect Robert McNair. “The industrial experts are great at figuring out what comes in, what you do with it, and how you get it out, but they tend to forget about people.” Agreeing, Talbots not only gave SMMA unusual design control, but upped the budget enough to include in the processing areas such amenities as natural lighting and (unheard of!) air conditioning. SMMA, in turn, set an example for architect-consultant collaboration by fine-tuning the plant’s column spacing, configuration, and mechanical/electrical systems in close coordination with the industrial engineer responsible for the plant’s highly sophisticated computerized conveyance systems.

The key layout determinant was the client’s need for the ability to expand or rearrange both the retail distribution and catalog fulfillment operations according to demand. So the solution rejected conventional straight-line processing, with receiving at one end and shipping at the other, in favor of a central receiving area with distribution and fulfillment on either side and shipping at both ends. To maintain flexibility for space trade-offs despite the considerably higher bays required for fulfillment, ceiling heights are kept constant, and “waste” height in retail areas recovered through structurally independent mezzanine floors (bottom opposite). For the same reason, ceiling ducts were obviated by circulating conditioned air through vertical air rotation units.

Despite its generous overall height and L-shaped footprint, the plant’s three-quarter-mile length gives its profile all the verve, McNair observes ruefully, of a pancake. The first step in leavening it was the attention-focusing entry element containing offices, meeting rooms, and employee dining facilities overlooking a reflecting pool. The themes of concrete-trimmed brick and broders of glazing, with mullions in a bright red-and-white tattersall pattern, were then chorused over the full facade. Ten- by 12-foot windows, with punched “attic” openings above, bring daylight deep into the plant, while offering glimpses of sky and weather almost as welcome to employees as the benign inner climate provided by the air conditioning. But such courtesies are perhaps to be expected from a company that refers to its largely unskilled workers as “associates.” M. F. G.
Tying the large reflecting pool—an ingeniously transformed fire pond—to the employee dining room (opposite top), rather than the executive suite, mirrors the company culture as well as the surrounding scene. So, if only symbolically, does the employee entrance (opposite center), appropriately placed at the head of a wedge-shaped court between the curving wing that houses top executives, and the plant itself. The devices used to animate the building's endless facades are prefigured in the administrative unit's sprightly overlapping planes: brick faces brightened by precast-concrete arcades and trim, white metal panels with "spandrels" and "lintels" suggested by recessed accent lines, and variously sized sheets of glazing framed in alternating grids of "Talbots red" and white.
Early in the century, when cities began to replace scattered individual wells powered by hand pumps with central systems for treating and distributing water, the water works, no less than a post office or bank, was considered a structure of high public importance—often prominently located, and cloaked in architectural fashion befitting its status as a civic institution. (The third-graders’ tour of the local water plant is no come-lately custom.) As new sources were sought, and treatment methods became more sophisticated (and space-consuming), the water works moved farther from the heart of town, but the tradition of treating such plants as community commodities, as well as merely utilitarian necessities, continues.

Motives beyond tradition, however, prompted the careful design of recently completed treatment facilities for the city of Edmond, a fast-growing bedroom community in the lightly wooded rolling meadowlands on the “good”—i.e., verdant—side of Oklahoma City. Anticipating that continued expansion would outstrip the water supply it could draw from existing wells (rationing was, in fact, required before the new plant came on line), the city established an additional source by damming a nearby creek. The resulting reservoir, Lake Arcadia, and associated recreational offerings already in place, are expected to stimulate a surge of residential development, within which the water-treatment plant and its 40-acre site will be inescapably prominent. Moreover, the facility is a recognized technological showpiece for its use of ozonation to purify the water, a state-of-the-art process pioneered in Europe but until now virtually untried in this country. (Predictably, the plant’s register of visitors reads like a who’s who of prominent figures in the water utility industry.)

As is all too common—and despite HTB’s responsibility for both architecture and engineering—project designer Edward Riley confronted the fait accompli of a site plan that stretches the plant across the face of the dam in an arrangement based almost solely on a straight-line process flow—as though the plant were exempt from the third dimension. Yet massing was particularly important in light of the client’s insistence that the facility be compatible with the housing-to-come, despite such distinctly unhouselike features as towering chemical silos and four-million-gallon water-storage domes. Rejecting a high-tech glorification of process, Riley aimed instead for “industrial politeness,” deploying a strong geometry of outsize houseforms to link the plant’s disparate components into a coherent profile. The buff brick, ubiquitous in the community’s residential neighborhoods, contributes a subtler domestic note, reinforced by a brown-brick soldier-course that establishes a unifying one-story band across vari-sized elements, as well as an ordering frame for their assorted, irregularly dispersed openings.

In the main building (center left in photo opposite), which combines the filtration gallery and a smaller unit housing administrative spaces and laboratories, the overlap of facing sheds permits insertion of a tall clerestory to light the lobby between them. Unusually large in keeping with the anticipated flow of visitors, the lobby opposes rugged, angled, split-block walls against a slick black terrazzo floor that joins an arced podium rising to the gallery. The juncture is a portal of grid-framed glass penetrated by immense glass-block columns—a dramatic foil for the gallery itself, which reverts from the overplant’s neighborly reticence to the spare purity and drama of a set from a Fritz Lang film. M. F. G.
Following its process flow (diagram below), the plant layout is basically linear. For visual variety as well as containment, however, the sloped shed roofs of the ancillary units—e.g., chemical-feed and ozone building, shops, and storage—all orient to the central structure housing the filtration gallery and laboratory/administration wing. Such massive unenclosed facilities as two 4-million-gallon domed storage tanks (bottom photo, far left) and extensive sludge-holding beds flank the plant’s core.
When the raw red Oklahoma earth gives way to meadow, Edmond’s domesticated plant, seen from the vantage of the main road, will (save for the beacons of its silos) retreat into its landscape. All the greater, then, the impact of the main building’s lobby (opposite far left), the ceremonial greeting area for visitors. Rough-hewn split-block walls against a gleaming black floor set off the grid-framed glazing of clerestory, side openings, and filtration gallery wall, while huge sparkling glass-block columns link the lobby with the gallery proper, where rows of filtration beds lie between gleaming white floor and ceiling planes (opposite near left). Glass-block also fills the windows, and fences the stair to the pipe-filled undergallery with a backdrop for the central computer’s “altar.”

The sawtooth configuration that makes trucking activity more efficient and less space-consuming also lends visual variety to the buildings’ street facades by breaking their repetitive modules into clearly defined entities livened with deeply molded precast panels.

"There was nothing arbitrary or frivolous about it." Designers Herbert Beckhard and Frank Richlan ascribe the sawtooth configuration and boldly modeled facades of the structures comprising the Franklin Township Technical Center not to indulgence in pure form but to rational evolution from specifics of program and site. In addition, though, the buildings hold promise of wider applicability as a protogenic facility combining offices with warehouse and industrial space—a flexible mix with particular appeal for the small manufacturers and distributors often neglected by conventional industrial and office parks.

Like many areas no longer content to watch complacently while open farmlands (and the water supplies that often depend on them) vanish in a tide of development, the township has imposed stringent limits on the permissible extent of building and paving in relation to land left permeable. Since the division of the 40-acre site into five separate development parcels (site plan below) meant an extensive—and irreducible—network of access roads, achieving a profitable building volume hinged on minimizing such other impermeable surfaces as parking lots, drives, and walkways. The ratio of 20 percent office space to 80 percent industrial space, for example, was set by the relative amounts of parking each required. But the decisive ploy was offsetting the repeated 9,000-square-foot long-span modules in a sawtooth configuration. By allowing trailer truck movement to be handled with a one-way traffic system and minimal maneuvering space, the zig-zag plan cuts paved areas by a third, at the same time making loading-dock activity less conspicuous by tucking truck parking tight against the building. Carried through to the street elevations, the sawtooth configuration improves on the usual slab faced industrial box by shaping a well-defined individual entrance for each 50-foot-wide bay.

Similar aesthetic advantage wrung from a pragmatic solution gives the precast-concrete facades their strong sculptural quality. Exaggerated for horizontal emphasis, the projecting ribs that stiffen the panels during handling double as an integrated decorative element, enhanced by their continuation around curved or chamfered corners. On site, the self-supporting units, cast with integral window openings to eliminate added sills and lintels, need only be stacked, fastened, and sealed.
Rubber soul
Michelin House
London
Conran Roche and YRM Architects & Planners
Once the London branch of a French tire company, historic Michelin House has been rejuvenated, expanded, and converted to new uses. A meticulous restoration preserved or recreated every eccentric detail.

Any traveler in search of haute cuisine and local lore will instantly recognize the corpulent fellow on the front of this London landmark. He is Bibendum, the merry cartoon character of stacked pneumatic tires who emblazons every Michelin tourist guide. Conceived in 1898 by Edouard and André Michelin as a logo for their tire distribution firm, the “Michelin man” quickly grew into an internationally recognized emblem of motoring and gastronomy. By 1911, the Michelin Tire Company had expanded its operations to include a headquarters in London, designed by the architect of its Paris offices, François Espinasse. One of the first reinforced-concrete structures built in Britain, Michelin House was exuberantly decorated with polychromatic brick, scenic tiles, stained-glass windows, and illuminated glass cupolas. A year after it opened, a three-story garage was constructed at the rear of the site, followed by a four-story addition a decade later. In 1985, the Michelin Company decided to move its Chelsea premises to a London suburb and sold the building to housewares and design magnate Terence Conran and publisher Paul Hamlyn, who commissioned the joint venture of Conran Roche (an architectural offshoot of the Conran organization) and YRM Architects & Planners to convert the historic complex for their own commercial enterprises. The architects increased the existing 90,000 square feet to 118,000 square feet by lacing a steel framework within the older structure to support four levels of office space and a curved penthouse, which projects above the original roofline. The original building, transformed into a showcase restaurant, serves as a frontispiece to a ground-floor Conran shop (inserted into a former loading dock) and upper-story offices, primarily used by Hamlyn’s Octopus Publishing Company. Clad in buff-colored, powder-coated aluminum paneling to match the adjacent brick stringcourses, the sleek, stepped volumes of the new addition serve as a minimalist foil to the unabashed decoration of the Michelin building’s facades.

Conran Roche and YRM restored the 1911 landmark to its former glory by painstakingly repairing and replacing all its original features after scholarly research. Exterior brickwork was repointed and lightly sandblasted to remove layers of silicone sealants, and faience tiles were consolidated with pigmented resins (opposite, bottom left). Although the 94 ceramic panels depicting victorious racing cars equipped with Michelin tires required few repairs (opposite, bottom right), the damaged tilework surrounding them demanded complete replication. The most complicated preservation task was the reconstruction of two glass cupolas and three stained-glass windows on the front façade (left and opposite, top), which had been removed during World War II and subsequently lost. Designed to resemble stacks of tires, the domes were reconstructed from double-curved sections of sandblasted glass and internally lit by sodium fixtures to simulate the yellow glow of gaslights. Cartoons for the stained-glass windows were redrawn from early black-and-white photographs and posters, and their color scheme derived from Espinasse’s tilework for Michelin’s Paris headquarters, which stands intact. Within the porte-cochère, which now serves as a generous entrance lobby, wrought-iron gates, chandeliers, and a mosaic floor spelling out the tire company’s motto “Nunc est Bibendum” (“Now is the time to drink”) were reinstated. Raising his glass to the shoppers, office workers, diners, and curious visitors who flock to the building, the Michelin man now happily toasts a four-star restoration. Deborah K. Dietsch
The 1911 Michelin building houses a lobby with refurbished pendant fixtures (opposite, bottom right), the Bibendum restaurant (opposite, top), and an oyster bar (opposite, bottom left). In the new addition, offices are arranged around an atrium.

The collection of monuments near the escarpments of the Ottawa River (photo above) commands the skyline of Canada's capital as it is seen from the city of Hull on the opposite bank. Taken in turn (left to right in photo), the Ottawa buildings celebrate art, worship, language, and governance. The newcomer to this iconic ensemble is the building for art, the recently completed National Gallery of Canada by Moshe Safdie, whose crystalline Great Hall he designed as a tribute to the building for language, the Parliamentary Library, which is itself a Victorian reinterpretation of a polygonal Gothic chapter house. Safdie could not have selected a more prominent symbol to evoke. The library and adjoining Parliament Buildings are sufficiently eminent to have been engraved on the Canadian dollar bill. (Tim Hursley shot his photo from the same vantage point used by the engraver, but denies having taken a cue from the Royal Canadian Mint.)

It took nerve on Safdie's part to choose a great work so close by as his inspiration, thereby running the risk that his spunky upstart in concrete, steel, and glass would suffer invidious comparison with its august predecessor decked out in stone
Moshe Safdie designed Ottawa’s immense new showcase for art to be a monument among monuments on the skyline, with a network of noble spaces connecting relaxed and friendly galleries conceived as a series of small museums.

The relationship with the Parliament Buildings was the most political idea I had,” admits Safdie, “and the one that Jean was most concerned about. When I first proposed it she was very intrigued, but worried that the politicians would find it unacceptable, an inappropriate affront to the Parliamentary Library. Even though the Great Hall is smaller and lower both in elevation and absolute height, and in effect takes second place, it still has an enormous presence on the skyline. Yet, when we presented the sketches to the Cabinet, the ministers fell in love with the idea, so we went ahead with it. Pierre Trudeau recalled that, at the time, none of us realized that we had made an intuitive move that would allow Ottawa to become one of the few capitals in the world where an institution of culture shares symbolic prominence with government. And no capital that I or I could think of has art, almost equal to governance, as a symbolic element on the skyline.”

The Great Hall is the National Gallery’s principal public ceremonial space, located where the major galleries converge; in these functions, if not in shape or placement, it is akin to the classical domed rotunda at the cross axis of Karl Friedrich Schinkel’s Altes Museum in Berlin, or the similarly centered and domed foyer of John Russell Pope’s National Gallery of Art in Washington, D. C. Such spaces are analogous to plazas in a townscape, nodes intersected by avenues and streets. Safdie’s singular gesture was to place the Great Hall on an outside corner of his building, projected into the small park overlooking the water toward the Parliament Buildings. Too far away from the edge of the downtown street system to serve as the entrance foyer, it is replicated in form but at smaller scale by the actual entrance pavilion, located at the corner where the building touches the city. Linking the two is a 278-foot-long granite ramp.
within a 62-foot-high poured concrete colonnade. Although there are short cuts to the galleries, Safdie hopes that visitors will elect to use the ramp, a walk of one minute or longer depending upon eagerness and energy. Offering views of the park and the Parliament Buildings along its route, the ramp still strikes some as a needlessly long and steep approach to the art. (The architect counters this criticism by pointing out that the leg of Bernini's colonnade in St. Peter's Square that leads to the steps of the Scala Regia and thence to the Vatican Museum within the Pontifical Palace, is also a long route to the art—and by coincidence, Safdie claims, has the same slope he devised for Ottawa.)

Behind this processional approach, the galleries form an L-shape enclosed by solid walls and penetrated by three skylit courts, so placed as to subdivide 132,700 square feet of exhibition space into smaller areas, rather like a sequence of compact museums. Safdie prefers galleries scaled to provide a sense of intimacy and simultaneously allow the visitor to comprehend the whole complex of which they are a part. He particularly likes, among other museums, New York City's Frick Collection, by Carrère and Hastings, and Fort Worth's Kimbell, by Louis Kahn. "The big museums," he asserts, "partly because they are built piecemeal like the Met, tend to be totally chaotic and disorienting. There are some exceptions like Washington's National Gallery which, though a big building has a clear sense of order, orientation, and circulation—a public series of spaces which really make it easy to find your way through. I was very much preoccupied with making an enormous building, with a gross area of 600,000 square feet, legible and friendly. I tried to achieve these qualities by establishing a series of public spaces that would serve as streets and squares with different buildings entered from them. I have ended up with five Fricks or Kimbells—all the same size. These read as buildings you enter, go through, and come out again."

The National Gallery is Safdie's best built work, and its creation was a rich experience for him. Generously, though, he attributes his ultimate success with this project to his client, J. B. Boggs. "Jean developed a good program—and it works. She..."
configuration of the galleries, which are sheathed in rose Tadoussac granite. To the right of the gallery, across a landscaped plaza, is the landmark Canadian War Museum. The honeycombed dome forms (below left and right), a gesture toward the conical shape and spiky surfaces of the Victorian Gothic Parliamentary Library, have little to do with Gothic Revival, but are derived instead from the muqarnas vaults found in the early Islamic architecture of Iran, a long-time interest of Safdie’s.

w, for example, that too many museums put the curators in basement. So, in Ottawa, the curators have the right kind of ce in their own wing oriented toward the river. Too many seums mix food and art, but in Canada’s new gallery patrons e spaces to party outside the exhibition areas. Even though construction was fast-tracked, we looked and relooked at rything together, and Jean kept the project from being nibbled y by cost cutters. I had only one big argument with her. I had wn the Great Hall stepped down to the river—the upper level to be circulation, the lower where parties and ceremonies ld happen—and she kept saying that a great room shouldn’t tepped. She overruled me and said it should be flat. Now I at the results and think she was right. It would have been complicated. The architect’s search for perfection is supported client who is after it too.”

grateful Canada would do well to honor this search and its tiful result. Perhaps the Royal Canadian Mint might issue a y engraved dollar bill that includes this remarkable new mment in the celebrated vista. Mildred F. Schmertz

Architectural Record October 1988 123
Major public and ceremonial spaces are on the museum's perimeter and consist of three interior plazas or nodes connected by multistory skylit passages (opposite). These spaces are not required to meet the standards of humidity and temperature control maintained within the gallery proper, the latter being enclosed by masonry walls with vapor barriers and every opening glazed. Exhibition rooms surround skylit courts, and rectangular slots in the upper gallery-level floor admit natural light to the main gallery level below. The curatorial wing connects with the gallery by means of a bridge spanning a path to the riverfront. The L-shape of the gallery defines a public garden to the south, a new setting for the old War Museum. Day and night, the Great Hall cupola identifies the gallery from vantage points within the city as well as from across the river in Quebec.
The Great Hall (top right and opposite) is 143 feet high at its interior peak. Fabric panels, operated by remote control, modulate light. Each vertical support of the Great Hall dome and the colonnade is a cluster of four poured-in-place concrete columns 30 feet high, tied together at the top with concrete beams. The steel frames above this concrete cornice are wrapped in an aluminum-and-glass "blanket," which is separated from the steel by thermal breaks in the form of gaskets. Safdie calls the system a blanket because it sustains appropriate indoor temperatures with 50-percent humidity, and without condensation, in Ottawa, the coldest capital in the world. Concrete columns aligned with the curtain wall are divided between inside and outside by neoprene inserts that also receive the glass, contributing another mode of thermal separation. The courts (bottom left and right), in deliberate contrast to the Great Hall and colonnade, are of a scale and character typical of smaller, more intimate museums.
The curators found controlled daylight desirable in the rooms displaying traditional works (photos opposite). The curators of contemporary art, however, agreed only reluctantly to introduce even a limited degree of natural illumination to their collections (photos this page). As soon as he knew that the museum was to be two stories high, Safdie began working with lighting consultant Paul Marantz to research ways to bring controlled daylight through the upper gallery level downward to the main gallery level. Unlike conventional skylight and laylight combinations, which use more glass surface than the floor areas of the rooms they illuminate, Safdie’s system limits skylights to a width of six feet, owing to Ottawa’s cold climate. Safdie and Marantz keyed these openings to six-foot-wide shafts lined with mirrored acetate, extending from the skylights through the upper floors to the lower-floor ceilings.

At first, Safdie recalls, the proposed two-story light-shaft system was greeted with skepticism. “The people with the slide rules accused us of wasting precious square feet of floor area in the pursuit of an idea that wouldn’t work. They all warned that light wouldn’t carry more than 25 feet down.” Even after a model was built and successfully tested (opposite bottom right), the clients announced that they were not going to build a lighting system based on a model. Safdie and his consultants finally won their case by creating a full-size mockup with the mirrored acetate in place. “We refined all our details in that mockup,” notes Safdie. “In fact, I don’t know how to do that without a full-size mockup. It also helps us with the contractors: you can hold them to it. Just as important, though, it brings up the unforeseen.”

A flexible approach to fire-code compliance

By Clifford S. Harvey

It is possible to design any building or other large project with nearly total control over your own creative process, and at the same time meet the intent of any nationally recognized building, fire, or life-safety codes. Sound too good to be true? In Boulder, Colorado, we have found that this seemingly unattainable goal can be met in virtually every case when designers, architects, developers, planners, building officials, and fire marshals get together and agree to abide by the Measurement of Building Fire Safety concept, which has been in active use in Boulder for eight years. The key to this cooperation is equivalency, a principle that the nationally recognized codes allow wherever it is accepted by authorities with local jurisdiction.

The equivalency process

Codes were not originally written to be flexible. They established design conventions and expected buildings to be built in the manner specified. Today, however, all codes have an equivalency section which generally states that nothing in the code is intended to prevent the use of any system, device, or method equivalent or superior in quality, effectiveness, or safety to those prescribed by the code. The only stipulation is that technical documentation be submitted to the Authority Having Jurisdiction (AHJ) over that code, and that the AHJ approve of that alternative method.

Additionally, some codes say that requirements for existing buildings may be altered as long as the alteration will ensure as nearly equivalent safety to the occupants as practical. Clearly, it is up to the AHJ to determine this, but architects and designers can assist the process by knowing how to make necessary evaluations of the alternative they are trying to get approved. For example, you might like to design a building with lots of plate glass walls in the corridors, whereas the code requires wire glass. Or perhaps you would want approval for a large, open atrium or flowing, open stairways which the code will not allow. Recognizing that the code has reasons for not allowing these configurations, you need only understand the intent of the code in these instances, and provide some alternative to ensure equivalency with that intent.

If, for example, you propose an automatic sprinkler system to control a fire where the code does not require one, instead of the rated walls or other enclosures required by the codes, your substitution should be allowed. Once you have gained a firm understanding of the various aspects of fire, its growth and control, it will be easy to determine what alternatives are indeed equivalent, and you will be able to present them to the AHJ in a precise, intelligent manner.

It is important to mention the negotiations that must go hand in hand with the use of the Measurement concept. Part of this interchange, perhaps the most important part, is educating your local code officials in the application of the Measurement concept after they have been exposed to its various elements. The utility of this concept is not “cut and dried”; it takes ongoing practice, and it must be fine-tuned on every project because every project is different.

All building, fire, and life-safety codes have one specific goal in mind: limiting the spread of a fire in a building to some level where the fire department can fight it successfully. This critical level is usually expressed as some maximum square footage, or occupant load based on square footage. Stated differently, the fire has to be limited to a specific area. As long as the method used accomplishes this end, it can be considered equivalent to the prescriptive sections of the codes, and should be allowed.

Any fire will go out in one or more of only three ways. First, it might go out by itself, a probability that can be presented in graphic form using something called an “I-curve” (see page 131). Second, if the fire continues to grow and does not go out by itself, it might be extinguished by automatic means (automatic sprinklers). The probability of sprinkler-system fire control can also be presented graphically, in the form of an “A-curve” (page 132). Finally, if the fire has not gone out by itself, and the sprinkler system (if present) has not extinguished it, then manual attack (the fire department) enters the picture and adds its probability of success, plotted as the “M-curve” (page 132).

Because all three of these probabilities are working at the same time, they can be combined into a cumulative limit-of-flame spread, referred to as the “L-curve” (page 134). Remember that as long as the fire has a high probability of being terminated within certain allowable floor areas, it meets the criteria the codes have established. Applying the concept referred to above, one is able not only to graph the potential success of code requirements, but also to graph any alternatives that the designer might find desirable. When comparing the two, if the alternative is at least as strong as the code requirement, the AHJ should have no reason not to accept it.

Self extinguishment: the I-Value

All fires go out sooner or later. But we are really most concerned with terminating the fire shortly after ignition, or as soon as possible after “established burning.” Established burning is generally considered to be a flame 10 in. high—once this level of burning has been reached, it is highly probable the fire will continue to grow. If the fire is not interrupted soon after established burning occurs, the fire will reach the ceiling and progress very rapidly throughout the room where it originated. When only the I-value is considered, this “ceiling phenomenon” will happen every time, regardless of the size of the room of origin.

The fire growth hazard in a room is the natural combustion characteristic of the fuel in the space. The ease with which a fire can develop or terminate within space depends on the type and arrangement of the fuel in the room, the air supply to and in the room, and the configuration of the space itself. Configuration takes into account ceiling height, room shape and volume, and how well the space is insulated.

In order to create a strong I-value, the amount, type, and configuration of the fuel in the room must be carefully monitored. “Fuel packs”—anything that will burn—obviously must be kept away.
When a graph is created for the "domain of the I-value," which represents an I-value for any specific space, that domain might be found anywhere over the entire spectrum of the graph. When the area being evaluated has a high fire-growth hazard, the I-value will be found at the top of the graph, while a low-hazard area will be found toward the left side and bottom of the graph. Notice that the chart allows the user to illustrate a specific probability of success (flame termination) at some predetermined area, represented in square feet.

Going out automatically — the A-curve
If a fire has not already gone out on its own, and established burning (a 10-in. flame) has grown to a fire about 5 to 6 ft tall, the next thing that comes into action, assuming it is present, is the sprinkler system in the room. As noted above, that system's probability of success can be shown as an "A-curve." Before we discuss A-curves, however, it is important to understand some basics about sprinkler systems in general.

Sprinkler systems are designed to stop a fire from reaching the ceiling of a space. Although this was probably an unconscious effort on the part of the designers, it is a fact, and one that has a very positive effect on the life-safety levels of the building. Sprinkler systems have an inherent reluctance to go off at all. In a room with a normal ceiling height, say 8 to 10 ft, a sprinkler system will activate when a fire in that space is about 5 to 6 ft tall. A smaller fire would present an opportunity for the occupant of the room to extinguish the fire himself.

Automatic sprinkler systems are the most effective method of controlling fire. They are over 90-percent effective at controlling or extinguishing the fire before the fire department arrives — and those statistics are even better (somewhere over 95 percent) in countries such as Australia where all sprinkler discharges are required by law to be reported.

More importantly, there has never been a multiple loss of life caused by fire in a building provided with a complete sprinkler system that was properly designed, properly
When the A-value is charted, nothing happens for the first 10 to 100 sq ft. This is because a sprinkler head takes a certain amount of time to open, and during that time there is no probability of success. Notice also however, that when the sprinkler system does react, that reaction results in an extremely high probability of flame termination, at or below the 500-sq-ft level.

installed, and in service at the time the fire occurred. There is no other form of fire “protection” that can boast a record nearly as good as that, especially when the allowance for flexibility of design is also considered.

Since automatic extinguishment can be accomplished most efficiently within the room of fire origin, sprinklers have proven extremely effective in controlling the fire in compartmentalized buildings. In much larger, unseparated spaces, the sprinkler system is imperative in keeping a fire from becoming completely unmanageable by the fire department. For these reasons, and others discussed below, the use of voluntarily installed sprinkler systems and trade-offs is becoming increasingly acceptable for proper building protection.

In order to create a strong A-curve, a sprinkler system must do several things. The system must be geared specifically to the space it is protecting, to ensure that water will, in fact, reach and discharge from the sprinkler heads. Equally important, the system must be designed for the hazard it is to protect. A sprinkler system originally designed to protect a low-hazard space will have a very low probability of success if that space now stores flammable liquids or other highly flammable material. The architect needs to consider this variable not only when a building is first being designed and built, but also when major renovation takes place for a new tenant.

Even with convincing statistics relative to the success of sprinkler systems, some designers are reluctant to install them. Their concerns usually focus on appearance, fear of water damage, and anxiety over accidental operation of the system.

The appearance of sprinkler heads has improved substantially over the past few years, mostly in an attempt to overcome designers’ esthetic reservations. Fear of water damage almost always arises from a misunderstanding of how a sprinkler system actually works; in fact, only the head or heads nearest the fire actually discharge water. When one compares the water discharged from one or two heads, to the water discharged by fire department hose lines, the former is clearly less damaging. Unnecessary discharge of a system head “just going off” happens so rarely that its discussion is unwarranted; that sort of discharge usually results from a weeping head, which can be recognized by building maintenance staff and quickly repaired.

In our experience, when the cost of a sprinkler system is coupled with the cost savings from trade-offs which are allowed in sprinklered buildings, it can actually result in a net saving in the total cost of the building. Also, many times insurance companies will quote lower premiums for sprinklered buildings than for nonsprinklered buildings, resulting in a substantial cost saving over the life of the building.

When sprinkler systems do fail, it is usually due to a control valve being closed, or a change in the configuration of the space served or in the type of fuel being protected. The former problem can be addressed simply by chaining the valves open and having both tamper and flow switches monitored by an approved central receiving station; and the latter by always being aware of what the system was designed to protect.

Additional benefits of sprinkler systems

A sprinkler system is by far the strongest component of the building’s entire fire-safety system, and sprinklers’ proven success has made them generally accepted in lieu of many code requirements, allowing the designer much greater flexibility.

Sprinkler systems are also less easily compromised than most building code requirements. Once a sprinkler system has been properly designed, installed, and inspected, and once steps are taken to ensure that the system will always be in service, it really doesn’t matter whether provisions of the building code are met. An A-curve is much stronger than even the most stringent building code for building occupant safety. The fact that it takes about two seconds of unconscious effort to prop open a required fire door with a wedge, thereby eliminating the function that door was intended to perform, illustrates my point. The larger the building, the lower the probability that it meets the building code, even immediately after it has received its final inspection. Even small plumbing access holes left open in a rated wall destroy that rating, which therefore allows a false sense of security. Sprinkler systems, on the other hand, are usually out of sight and out of mind, and are hence much less easily disabled.

The role of the fire department, the M-Curve

The fire department’s effect on the fire (the M-curve or value, page 135) is the last factor to consider when generating the L-curve. Having been a member of the fire service for 20 years, I recognize perhaps more than most how hard the firefighters of this country work to do their jobs as well as is
When the M-value is applied in graphic form, a relatively long delay precedes any effective action by the fire department. This is because it takes a fair amount of time, under the best of conditions, before the proper extinguishing agent (usually water) is applied, therefore beginning the effect of the manual attack. A comparison of this chart to the one on page 132 shows that the M-value really represents a medium-to-high fire growth hazard; i.e., of limited fire-suppression value, especially for the costs involved.

humanly possible. That is the key to the strength of the M-value: firefighters are only human, and they are able to do only so much to extinguish a fire. I don't make many friends in the fire service by saying this, but this method of flame termination is by far the least effective. When one considers all the aspects of the manual suppression effort which must work in order for it to succeed, it's a small wonder that departments around the country do as well as they do. The best fire department in the world, regardless of its level of dedication, is capable of extinguishing a maximum of about 5,000 sq ft of structure. As you read this, you may think of a large fire reported on the nightly news, a blaze that the fire department seemed to put out, and that far exceeded 5,000 sq ft. Not true. The actual event saw the fire department protecting a barrier of barriers long enough to consume most of the fuel contained within, after which the fire department wet down the remaining fuel with the sources it had. All manual suppression is hold the fire to some size relatively long enough to the fire department, and then department personnel must receive the message accurately when they are notified. Think of all that can go wrong with just this one small subsystem of manual firefighting? There may be no one around to discover the fire. If there is, he may decide to try and fight the fire instead of first reporting it. He may decide to report it, only to find that the phones are down, or he cannot find one. He may get a line to the fire department, only to find he is too excited to give an accurate description of what is wrong and where it is.

Assuming the fire department has been notified adequately enough to respond to the fire, there are variable probabilities of success associated with getting to the scene of the fire: time of day (for traffic purposes), day of the week, weather conditions, etc. The "response time" of the fire department and its status as a volunteer or paid force both affect the M-value. Finally, given that the squad arrives at the fire, it still has to lay out hose lines, find the room (or rooms) of fire involvement, stretch those hose lines to those rooms, and apply the proper amount of water to extinguish the fire.

When evaluating the entire fire-protection system of a community, it is interesting to note that the very subsystem that we have seen to be the weakest is also, by far, the most expensive to provide and maintain. To keep personnel and equipment available for even small communities costs millions of dollars each year, whether or not they ever fight a fire. It is becoming clear that the costs of providing manual fire protection to a community cannot be allowed to increase year after year. In fact, many communities have actually had to reduce the amount of funding they allow their fire departments, but they have not increased other areas of fire protection to make up for that reduction. This means that those communities believe they still have the same levels of fire protection when, in fact, they do not. This fact alone should be enough to convince local governments to allow alternatives to the codes. With the recognition that: 1) the I-value is fragile and generally impossible to predict for any period of time; 2) the M-value is, due to its large number of subsystems, very weak and of limited value; 3) strict adherence to the adopted building code is unlikely; and, 4) the A-value, when present, is by far the strongest of all, the authority having jurisdiction who is seriously concerned with overall fire and life safety has no real choice but to determine how best to protect his community through equivalency utilizing the A-value.

Putting it all together—the L-curve

We have discussed the three elements of a building (or any space) evaluation. These three elements—the L-, A-, and M-values—all work together to give some measurable probability of successful flame termination. Given that a fire has some small probability of going out by itself, and that automatic sprinklers are attacking the fire, and manual suppression is attacking the same fire, all these strengths and weaknesses can be combined mathematically to create a graph that shows the cumulative limit of flame spread, an L-curve (page 134).

Keep in mind that the requirements of an adopted building code can also be graphed to show its acceptable levels of flame spread. The building code graph can be compared to your L-curve and, as long as the L-curve, which is generated by alternatives, is equal to or greater in safety
When the L-, A-, and M-values are combined, and the L-curve is generated, the L-curve is often more effective than the other three, because more than one of the values is working to make the fire go out. This specific L-curve reads as follows: Given established burning, this fire has a 70-percent chance of being extinguished at about 300 sq ft in size. Should it not be extinguished at that point, it has about a 20-percent chance of being extinguished at just under 500 sq ft, and so on. Conclusion: this is a relatively safe space.

**Considering trade-offs with equivalency: the key to L-curve success**

With all the codes architects are asked to meet, it is increasingly difficult to meet them all. It is clearly in everyone's best interest to begin looking at all new and existing buildings as systems, and to address their use and protection using a systems approach. In essence, what you create by doing this is a city where not one building meets all the codes, but every building meets the intent of all those codes. No building would meet the same identical requirements of any other building in that city, but all would meet the intent! I believe that, regardless of whether or not your AHJ buys into this concept at this time, the evaluation process described in this article will be put into place throughout this country anyway, because we as a society simply cannot afford to continue paying the costs of building strictly to code.

What sorts of trade-offs are allowed when a person agrees to provide a sprinkler system that is not required by code? Certainly the most widely accepted trade-off is a reduction in rated separations. Most jurisdictions will allow at least one hour of required separation to be eliminated, while others allow even more. Where a one-hour rated wall is required, that wall may be traded off, and be nonrated. Wire glass no longer becomes necessary, and plate glass may be substituted. Other trade-offs include lifting requirements that stairways and other vertical openings be enclosed, sometimes within any five floor levels. Reductions in the severity of interior finish requirements are already seen written into the codes, when buildings are sprinklered throughout. Openings on property lines, where none are allowed, are also seen more often these days. Some jurisdictions even allow conduit to be eliminated in certain occupancies and sizes of buildings, when the building is provided throughout with a complete sprinkler system. This one alone goes a long way toward paying for the sprinkler system.

What is, or might be, allowed to be traded off in a building that is also required to be sprinklered? Those who have seen the L-curve concept work still allow many of those trade-offs, even though the system is required. They do so because the sprinkler system will, statistically, limit the size of the fire to a manageable range. By providing a well-designed, properly installed and monitored system, those other requirements are simply not necessary, even though they are written into the code. This is what I mean when I urge cities to begin looking at all building projects as systems, instead of structures that must be built to minimally acceptable national standards. By evaluating the relative strengths and weaknesses of all code requirements (that is, assigning each some sort of relative numerical value), authorities could require projected buildings to meet some total numerical value. Clearly the value would be heavily dependent on a strong A-value but, given that, all the other values would be easy to meet, even with greatly increased design flexibility allowances.

**What the future must hold: development review teams and beyond**

How can you begin to implement a review process such as this? The most important first step would be to include a member of your local fire department on your design team for specific projects, and get his input from the very beginning. Clearly that person should be at a level where his input can be counted on for acceptance. This person's contribution can be invaluable at this early stage, not only in pointing out concerns that the fire department might have, but also in suggesting alternatives within the design which may be more attractive to you, the designer.

Approximately every two weeks, sit down as a team with that member of the fire department, and be sure to include a responsible member of the building department as well, preferably the chief building official. Discuss your coming projects with them. With this...
simple process, you will be amazed at how much more cooperation you receive from them in the overall acceptance of your project. And if alternatives are discussed and agreed to at this early stage of development, think how many thousands of dollars might be saved.

See if the following sounds familiar. Most communities afford their architects and developers almost no time for consultation and review until the initial set of building plans is submitted. At that time, each department gets to go over those plans, and make any necessary comments, suggestions, additions, deletions, or changes. Many creative design features have been erased, replaced with code requirements and restrictions. The architect isn't happy and the members of the community organization who reviewed the plans aren't happy either, because they had to spend time ranging plans to meet their specific codes, codes they feel the designer should already know! How can this interchange be friendlier, less adversarial, and more productive? One possibility follows.

About five years ago, the city of Boulder noticed a marked lack of coordination not only between architects and developers and the various city departments, but also among the city departments themselves. A committee was formed of representatives from city departments with a say in developments proposed in Boulder. It was called the Development Review Committee (DRC), and its success was given priority by both the city manager and the city council. The DRC meets every week to facilitate scheduling. Representatives from over a dozen city departments attend: fire, building, water and waste water utilities, transportation, real estate and open space, city attorney, parks and recreation, public service, telephone and cable TV utilities, and the planning departments all send representatives. After a two-week period within which to review individual or series of plans, the entire team sits down to discuss each one. It is at this point that inconsistencies in the various codes surface and are ironed out.

The planning director or his designee often takes the position of devil's advocate, attempting to weed out supposed code requirements that might actually be nothing more than desires of a specific department, instead of genuine code requirements. When this elimination is completed, any remaining conflicts are taken to the city manager for review and determination of policy. This is all done before the applicant has seen any response, so the city can present a clear, concise plan for approaching the specific project. The applicant is then given a specific period of time in which to respond to the concerns expressed in the city's report, and to make necessary changes. When that has been done, the proposed design is sent to the planning board for review and, ultimately, it is hoped, approval.

**A final thought**

I believe the next logical step in revising code policies is for cities to adopt a minimum value for acceptance, rather than minimum codes that need to be met. The decision process for such a necessary prior to the first 20,000 sq ft—a dismal approach. The other curve represents not only a much safer building, but one that can reflect much greater flexibility in the design process.
Before you look at another insulated door, just look at one of the places Tri-Core has insulated.

The Eagle River, Alaska, Municipal Building has to work in extremes that can range fifty degrees on either side of freezing.

That’s why you see Raynor Tri-Core doors on it. Every Raynor Tri-Core comes with a unique, three-inch thick insulated core of polystyrene that retains its insulating properties over time. A patented mechanically interlocked thermal break for maximum thermal performance. And perimeter seals to reduce air infiltration. It’s as close as you can come to keeping the weather just like Spring on the inside. No matter what the weather is like on the outside.

For free design manual, call 1-800-545-0456, look in the Yellow Pages under “Doors”.

RAYNOR GARAGE DOOR
When it comes to outdoor seating, a lot of different manufacturers make it. And a lot of use usually breaks it. However, that's not the case with Kroin Garden and Park Furniture.

This collection of chairs, tables, bench seating and lounges is built to last. Through weather and heavy traffic abuse, it holds up and stands up to any extreme. Because no one makes seating with the kind of heavy tubular steel and fused synthetic coating that we do. And it's appropriate for just about any site you can think of; from indoor malls, to outdoor plazas, to hotels and restaurants.

So, remember Kroin Garden and Park Furniture. It's the outdoor seating that could make or break the success of your next site.

SUMMITVILLE QUARRY.
DON'T WASTE YOUR MIND
ON ANYTHING LESS.

Summitville Quarry.
Don’t waste your mind on
anything less.

Our Quarry has earned its
reputation for the way it performs,
for the way it’s made. For the quality
that goes into every Quarry Tile.

When we talk about Summitville
quality, we mean reliability, service, ease
of maintenance, consistency, and durability.

Summitville Quarry quality gives a sense of
freedom, a sureness and trust, so you can experi-
ment and explore different color combinations and
patterns with confidence. Knowing each one resists oil,
acid and detergent stains.

You can be free with Summitville Quarry, because it doesn’t
restrict your design possibilities. It doesn’t have the limitations of
lesser quality quarry tiles. Our 11 standard colors,
9 shapes and all the trim you need gives your
imagination the broadest palette of choices available.

Summitville Quarry is really the tool that will let you build
a floor of beauty, grace and certainty.

Find out the complete Summitville Story from your nearest
Summitville Distributor.

See how Summitville Quarry can improve the outlook of your
floor plan. On any level.

Circle 57 on inquiry card
Steel joists, colorfully painted, will replace the traditional ceiling in North Charleston’s new Festival Centre. “Not only will this add interest,” said the architect, Gary J. Boehm, A.I.A., “but it will help us achieve the open, gutsy feeling we and the owner want.”

A combination strip shopping center and enclosed mall, known more popularly now as a “power center,” Festival Centre will initially include 350,000 sq. ft., with 80,000 enclosed. An additional 250,000 is planned.

Eye appeal was a bonus feature. The primary reasons for choosing steel joist construction were typical. It was the most economical way to meet the needs, and the availability of steel joists helped meet occupancy dates—critical in shopping centers.

But it also made possible construction features important to the major “anchor” tenants—wide spans and a minimal number of columns, allowing the “wide-open” feeling the big stores want. In every important way, steel joists “looked good!”

New products: Frit glass—more than decorative

Ceramic-enamel coated frit glass is made by applying a pigmented ground-glass powder to a sheet of float glass. One can flood-coat the powdered frit to produce a solid color, or screen-print it in a standard or custom pattern, such as dots, stripes, or holes. The “painted” glass is then placed in an oven and heated until the glass almost softens. Once the powder melts, it becomes permanently fused to the glass surface. The sheet is then carefully cooled to heat-strengthen the glass. Frit-coated glass must be made in the size to be installed; it cannot be cut after heat strengthening.

Both the pattern and the color of the frit act to control daylight, glare, and heat transmission through the glass, without affecting the quality of the light. Patterned glass is, therefore, particularly suitable for the sloped glazing of atriums, skylights, and other overhead structures.

Light frit colors, such as white, peach, or pastels, are translucent, and more effective in diffusing and even amplifying usable daylight, according to Peter McQuillin, product manager for commercial products of PPG Industries’ Glass Group. Dark colored or black frit is better at reducing glare, and cannot be read as easily from the interior, producing a clearer view out. Of course, the total amount of frit, and its spacing in relation to the clear areas, also affects the amount of light transmitted.

For example, architects Murphy/Jahn used frit glass extensively for the United Airlines Terminal at O’Hare International Airport, in Chicago. There, a white frit applied in a grid pattern diffuses daylight from the west-facing vaulted concourse, and creates a sense of enclosure at night when the frit reflects light from interior sources [ARCHITECTURAL RECORD, November 1987, pages 148-154].

The WBDC Group of Grand Rapids, architects for the Steelcase Corporate Development Center in Gaines Township, Michigan, had to work with a fast-track program that included a number of seemingly contradictory requirements: a light-filled and airy space that would take maximum advantage of the views of the surrounding Michigan countryside, as well as a comfortable, low-glare environment for the designers working at light-sensitive CAD workstation CRT screens. The building itself, a 7-story, 500-ft-square pyramid, has 31 skylights with a total of 50,000 sq ft of glass (1).

The interior is a series of setback mezzanines, with each ascending level containing open-plan drafting stations lit directly by overhead sloped skylights. (elevation, 2). And the client did not want any mechanical screening devices used to control sunlight, or obscure the clean lines of the building from the outside. (Months before occupancy, the dramatic shape of the Center has already made it a landmark for airplane passengers into and out of the nearby Grand Rapids airport.) Consequently, Donald J. Koster, AIA, designer of the building for WBDC, had to focus on glass detailing. His elegant solution: horizontal lines of ceramic frit (Patternlite Glass from PPG Industries) alternating on two surfaces of the inboard, laminated glass light.

Koster started with a handmade mockup, using masking tape on small glass panes placed at a 23.96-deg angle of the skylights. Analysis of solar azimuths throughout the year on the southern-facing half of the building determined that the frit louvers should be positioned to most effective against the most severe sun load: overhead on the 21st of June. At that time, direct rays of the sun are completely blocked by the 7/32-in.-wide line of frit. The width of the frit line was the most important factor determining the shading effect, with the bending of light through the glass taken into account.
Black frit on surface 6 is staggered with white frit on surface 4, each 7/16-in.-wide line separated by a 3/16-in. clear space. The frit-glass lights (one bronze-tinted, one clear) are then laminated into a 9/16-in.-thick sandwich.

Dark gray frit was used as an integral solar shade to screen low-angle sunlight on the clear glass of the vertical windows surrounding the terraces.

TYPICAL FADE-OUT PATTERN FOR VERTICAL GLASS:
all horizontal frit is dark gray

---

The precisely spaced lines act as fixed louvers, letting people standing directly opposite (and about 25 ft away from) the sloped skylight see out clearly (photo 4), while appearing as a light-diffusing surface to workers seated below (photo 3). There is still some "view" through the glass for the CAD-based Steelcase designers, as passing clouds, birds—and airplanes—are seen from below. The low-glare, diffuse light through the skylights does not read as a monolithic, luminous ceiling.

The dual-surface frit is obviously most useful for solar control on sloped glass of over 15 deg, where the different viewing angles can exploit the looking-through-the-slot effect of lines placed on two surfaces. But the Steelcase building makes extensive use of vertical glass as well, especially surrounding inset terraces on three levels of each side. There, the Patternlite frit on the upper portion of each window acts as a shading overhang. Dark gray frit is used in horizontal lines 7/16 in. wide at the top, separated by a 1/16-in. space, with the frit lines getting narrower and the spaces getting wider as the pattern fades out in the bottommost patterned section. (Photo 5, shows a view out through the sun-shaded vertical glass).

An extra benefit of Patternlite frit on sloped glazing: it hides the dirt. Joan F. Blatterman

SuperProject Software
What The Experts Have To Say:

Aerospace: “SuperProject is the best. Earned Value Reporting and Work Breakdown Summarization give me complete project control and the graphics make impressive presentations.” Barry Feeley, Technical Manager, Ford Aerospace.

Construction: “The familiar SuperCalc® and 1-2-3 menu system makes it really easy to learn and use. It handles multiple projects, networking and flexible report writing. The multiple resource calendars and histograms manage resources very efficiently.” Ted Ritter, CEO, O’Connor Construction Co.

Data Processing: “The Outliner allows me to quickly sketch critical schedules from the top down. Expert is easy ahead of the pack.” D.W. Nesper, Regional Consulting Manager, Wang Labs.

The SuperProject® Family—Plus, Expert and Expert/2—is the most advanced PC project management software available. The smallest to the largest and most complex projects imaginable are easily handled thanks to its virtual memory management skills.

Newly released SuperProject Expert/2 running under OS/2, gives you true multitasking. For example, this enables you to enter data in the foreground while outputting a report in the background.

And only Computer Associates gives you PC and mainframe project management. Develop your project planning on a PC and then upload to a mainframe with CA-PLANLINKS™. You can then consolidate that project with others via CA-TELLAPLAN™ and take advantage of its resource pooling and presentation graphics.

Computer Associates
1240 McKay Drive, San Jose, CA 95131

- World’s leading independent software company.
- Broad range of integrated business and data processing software for mainframe, mid-range and micro computers.
- Worldwide service and support network of more than 70 offices.
1. High-density filing systems
Spacesaver has introduced a line of high-density mobile storage/filing systems said to provide maximum performance at minimum cost. The S/2-MA hand-crank-operated file, shown here installed in a Colorado hospital, contains three years of active medical files in the same space used to hold only six month's data in standard units. Offered in carriage lengths up to 21 ft, the file's supporting T-rails fit flush with the floor to prevent tripping, and have tongue-and-groove splices to redistribute wheel point loads to the floor evenly. Spacesaver Corp., Fort Atkinson, Wis.

Seismic-activated gas shut-off
The Quake Master valve, in sizes for both residential and commercial natural gas and LP service, is said to minimize the potential for fire and explosion from broken and leaking gas lines due to major earthquakes. Installed where the gas lines enter the structure, the gravity-activated valve is just sensitive enough to activate at the suddenness of a major earthquake. When a machined stainless steel ball is tripped inside the valve,opping into the line to completely block the incoming supply. Once the hazard has passed, a reset plunger or key readied into the valve body frees the seated ball from the seal and repositions it on the valve seat. The seismic valve meets UL, Los Angeles, and California State Architectural standards for this type of device.
Quake Master, Anaheim, Calif.

It only looks like a pen plotter.

But look again. It emulates pen plotters, reading popular 906/907 and HPGL data formats. It comes in pen plotter widths - 24 and 36 inches. And you can use it with your favorite CAD packages, such as AutoCAD, VersaCAD, or MICRO CADAM.

But the Versatec 8500 series is like no pen plotter made. It is more reliable, because it plots with electrons, not pens. It's faster, plotting D or E size drawings in less than a minute. It can plot an unlimited number of vectors, variable line widths (to ½ inch wide), dashed lines, or text without reducing speed.

A built-in rasterizer and full-page buffer enable fast output at a constant rate for outstanding quality. Plot an original in fifty seconds. Make copies without retransmitting data. And plot over one hundred drawings without changing paper.

So fast you can share one plotter among several users. So quiet you can run this plotter at your desk. So reliable you can plot unattended at remote sites. This is the revolutionary new 8500 series of electrostatic plotters. Prices start at under $20,000.

Software reviews for architects

By Steven S. Ross

VersaCAD/Macintosh 1.11

A 2- to 2.5-D CADD program with bill-of-materials processing for the Macintosh. It offers full file compatibility with VersaCAD for MS-DOS and UNIX systems, and with DXF and IGES files produced by other software. The current version is not as versatile as VersaCAD 5.3 for MS-DOS computers, but improvements are promised. And the choice of a Macintosh program, HyperCard, to carry add-on programs assures that many third parties will find it easy to create and offer such enhancements. Version 2.0, released as we went to press, enhances 3-D capabilities.

Vendor: VersaCAD Corp., 2124 Dain St., Huntington Beach, Calif. 92648. 714-960-7720.

Price: $1,995. Deeply discounted for users to explore most of the drawing tools.

Ease of use: Remarkable. Makes excellent use of the Macintosh interface (the software is completely rewritten for the Mac; it is not a DOS adaptation). This version is the first to allow on-screen viewing of symbols from a symbol library (earlier versions, released through the spring of 1988, showed only index numbers on-screen). The standard Macintosh mouse works better than expected; palettes of drawing "tools" can be moved to convenient positions on the screen for easy mouse access. Sometimes, objects are initially drawn in pale yellow, difficult to see on a Macintosh II color monitor. This configuration can be changed. Seasoned Macintosh users may find the technique for defining multipoint objects (click on the point, move the mouse, click at new location) unusual. The norm for the Mac is click-drag-click. The VersaCAD method allows users to redefine settings in the middle of a move—a useful feature.

Error-trapping: Good. The Macintosh is a tough taskmaster and will crash the system by intentionally doing stupid things such as continually offsetting and placing a plane in an isometric image, over and over. Restarting the Mac from the initial SETTINGS menu generally worked in such cases. VersaCAD, like its DOS cousin, saves changes to a temporary workfile on disk as each is entered on-screen.

Most of the reviews published about VersaCAD for the Macintosh since it was released (without HyperCard interface) in February 1988 compare it favorably to other Macintosh CADD software. But the true comparison is with mainframe and MS-DOS alternatives. This is especially so because the Macintosh II with color monitor, 4 megabytes of random-access memory, and a 40-megabyte hard disk can cost $8,000 or more. That's more than twice the price of an MS-DOS or PC-DOS computer based on the 80286 chip—a computer offering about the same on-screen resolution and redrawing speed. VersaCAD helps by selling its Mac version at about $1,000 less than most full-featured DOS CADD software.

VersaCAD/Macintosh, nevertheless, offers enough in the way of features, flexibility, and future promise to make it a worthy competitor indeed—in both the DOS and the Macintosh worlds. The VersaCAD/Macintosh package actually contains two full versions: one for the Macintosh Plus and SE 80286 chip and one for the Mac II and earlier Macs with coprocessor. Running the Plus/SE version may be necessary in a pinch, to show off some of the settings can remain active while other work is being done (bottom).

To keep your roof from coming apart, go to pieces.

We’d like to assume something for a minute. You put a roof over your head so you can stay dry. And warm. (Or cool, for those of you in more tropical climates.)

Now, if a roof is going to do all this, it has to be put together with all the right pieces. In all the right places. By all the right people.

Introducing the Stevens Hi-Tuff Plus™ Total Roofing System.

Hi-Tuff Plus is a fully-integrated roofing system. We started with the membrane itself. (45 mils of white scrim-reinforced Hypalon.*) We included the most popular insulations. (100% UL labeled.) The fasteners. (Stainless steel and ceramic coated.) And the roof-edge fascia. (In a variety of metals and colors.)

And that’s not all, folks.

Once we got all the right pieces together, we made sure only the best applicators would be allowed to put them together. So we picked our most experienced contractors and made them authorized Hi-Tuff Plus applicators. They, in turn, make sure your roof meets our inspectors tough standards. For at least 15 years.

We’ll back it into the 21st century.

O.K., so a 15-year warranty’s nothing new in the roofing business. What is new is what it covers.

Our warranty doesn’t just cover the membrane. It covers the insulation. The fasteners and plates. The adhesives. The fascia. And the workmanship. In short, every part of the system. Even against winds up to 70 m.p.h.

And if, within 15 years, your roof leaks, we’ll fix it. Period. Our Sweets brochure can tell you more. Ask for it at 1-800-848-4400, ext. 163.

Our color-coordinated fascia has the edge in fighting high winds.
Software reviews continued from page 145

The "construct palette" in VersaCAD's Mac version can create parallel lines, cap them in various ways (great for walls), trim unwanted lines, and create lines tangent to existing ones.

In operation, VersaCAD has all the standard drawing tools, and then some. The "tool palette," which is always on-screen when a drawing is started, offers Bezier and spline curves and a "multiline" option that can draw up to 255 parallel lines at once. The "construct palette," which can be switched on and off (with the settings menu), allows the user to create parallel lines, cap them in various ways (great for walls), trim unwanted lines (necessary when one wants to draw lines parallel to an existing one that's snapped to an object), insert fillets and chamfers, and create processor can calculate length of lines tangent to existing ones. Items and groups can be copied, rotated, mirrored, or exploded. The break-up even works with symbols pulled from a library of common objects created by the user.

The construct palette also allows users to break an existing object apart. A quasi 3-D isometric image can be pulled together using the palette's "isometric" tool, modified while an isometric, then "un-isooed" with the modifications still intact. The "constraints palette," however, can also be switched on and off, allows users to snap new elements to a grid, spaces between the grid lines, grid intersections, objects, and so forth. Double-clicking on a palette tool generally opens a dialogue box that allows setting up defaults for each tool. Dialogue boxes often open up when a menu choice is selected as well. Some of the dialogue boxes can be kept open for switching between options. That leads to the downside of not requiring users to wade through a rigid hierarchical menu system to perform a function: moving to the keyboard to change settings or write text in a dialogue box, a user can build up typing what VersaCAD interprets as an entirely different command. One quickly learns to check that a box is active, or simply to click the mouse over the field in the box to be changed.

VersaCAD (like most microcomputer CADD software) is a layer-based system, with 250 separate layers available for, say, putting nonbearing walls on one layer, structural elements on another, and so forth. What is seen on-screen is not necessarily what can be printed or plotted—again, necessary because of the wide range of printers and plotters that can be used with VersaCAD. The on-screen font is a clean Leroy-ish, Hershey-ish character set. There's only one line width on screen as well. The Apple LaserWriter, a Postscript printer, can produce an almost unlimited variety of fonts, however. As with DOS VersaCAD, there's an "undo" option (on the Mac, it is in the Edit menu), and a "crunch" option. Crunch removes all the deletions made on-screen from the file itself. This saves disk space but, of course, no longer can a deletion be undone.

The bill-of-materials processor benefits from the flexibility built into HyperCard (a free-form database program), but suffers [Continued on page 149]
1. **Everything you need.** VersaCAD® DESIGN integrates 2D drafting, true 3D with color shading on any screen, bill of materials and universal translators. No need to buy extra-cost add-ons.

2. **Aggressive pricing.** VersaCAD value includes affordable site licenses that grow with your company. Quantity discounts. Low-cost upgrades. They stretch your design power, not your budget.

3. **Total support.** The industry's most respected technical support staff is just a phone call away. You can always get direct help from the experts, no matter what your question.

4. **Fast productivity.** VersaCAD is consistently ranked the easiest to learn of the full-scale CAD systems. And our CAD programming language works just like BASIC. So you can do it yourself.

5. **Use all your computers.** VersaCAD runs on MS-DOS, Macintosh and UNIX platforms, with complete drawing transfer. Plus proven 2D/3D IGES and DXF translators, all built into the system.

And every VersaCAD system is backed by the strength of Prime Computer, Inc., one of the two largest CAD companies in the world.

Find out why 60,000 users have committed to VersaCAD value. See your authorized dealer today, or call Customer Service at (714) 960-7720.

**VERSACAD**

The Total Design Solution

---

Versacad Corporation, 2124 Main Street, Huntington Beach, CA 92648
A Company of Prime Computer, Inc.

Circle 62 on inquiry card
from HyperCard's current lack of good ways to ensure absolute file integrity. That is, it is easy to inadvertently change "cards" in a HyperCard "stack." The VersaCAD manual contains good advice in this regard. The BOM works by counting the number of symbols used in a drawing. Thus, the symbols have to be predrawn and entered into a library first. There are any number of libraries, and up to 1,000 symbols per library. Users of the BOM associate a description (including labor costs) with each symbol. The BOM processor then counts the symbols, associates the correct descriptions, and adds everything up. Even the total and shelving, or the lines that make up wall plans can be calculated. The output reports are easy to customize. But beware, not everything on a drawing is normally a symbol.

Version 2.0 supports 3-D visualization—not designing in 3-D but taking an existing 2-D drawing and extruding it for presentation and visualization purposes. A floor plan, for instance, can be extruded upward along the Z-axis to visualize walls. Once in 3-D, the display can show isometric, perspective, wire frame, and 2D line views with up to four ews on-screen at once. 2D capabilities come from VersaCAD's HOOPS utilities. Version 2.0, like VersaCAD 5.3 for the DOS world, has light-source shading with up to 256 colors on the Mac. Users can't really change this, however, while in 3-D. True 3-D design capabilities, if you really need them, can be had if VersaCAD is run in conjunction with Visual Dimensions software. Visual's interpreter/VersaCAD—link between the programs—promised for this fall at $295.

**Draw it again, Sam...**

An easy-to-use painting and drawing program for the Macintosh. It allows pixel-based art (like those created by a "paint" program) and objects (like those created by CADD software) in the same drawing. This software supports up to 10 drawing layers and eight "QuickDraw" colors. Zooms and screen redraws are very fast. **Equipment required:** Macintosh 512 Enhanced, Plus, SE, or II with one 3.5-inch drive. Supports color monitor for the Macintosh II. Supports the usual Macintosh printers, such as the ImageWriter dot-matrix and LaserWriter laser printer. Works with MultiFinder.

**Vendor:** Aba Software, Inc., P.O. Box 850, Frazer, Pa. 19355. 800-234-0230.

**Price:** $150 (Version 2.1, due soon, will cost $195).

**Summary**

**Manual:** Good. Well-organized, clearly written, and indexed. As with many Macintosh manuals, installation is so easy that it is not mentioned at all. Simply start up the Macintosh with the Draw it again, Sam... disk in the drive. With a hard disk, start with the 3.5-inch drive empty, get the initial Macintosh screen, and slip Sam in. The Sam disk's menu should appear on-screen.

**Ease of use:** Excellent. Despite some minor quirks, such as the inability to precisely specify values for zooming in and out (image magnification doubles or halves each time a zoom option is selected), users can start creating Sam drawings approximately 30 seconds after loading the disk.

**Error-trapping:** Good. The software warns about leaving without saving drawings. There's the standard undo-last-command feature. Contrary to user expectations for the Mac, what you see is not always what you get. On a standard Postscript printer (and most laser printers for the Mac are), drawing layers obscure one another. The less expensive (and much, much less fast) dot-matrix ImageWriter does, however, produce the printed image that's expected. We managed to crash the program by selecting too many fill patterns for one object, then zooming in the maximum five times (for 32 times original image magnification).

What can Draw it again, Sam... do for you? Well, now that you've made the plunge and bought an expensive Macintosh II CADD system for the office, you may want to do some musing at home, too, on an older and cheaper Mac. Or you've discovered that the super-capable CADD program won't produce nice shading—only cross-hatching that can be plotted, but that doesn't suit the style demands of a rendering.

If so, Sam may be for you. The best thing about Sam (and other inexpensive programs that use the Apple Macintosh QuickDraw routines) is speed. Those lines go up on the screen as fast as you can move your mouse. Sam also uses the wide variety of fill patterns available with QuickDraw. There's the ability to try a pattern, then almost instantly change it (by moving to the menu at the bottom of the screen, clicking the pattern display, then selecting a different pattern). Everything happens faster than with similar "paint" programs for IBM-compatible computers.

Sam has some features that seem to have been added with architects in mind, too—building unlimited numbers of "libraries" with up to 250 images in each, for instance, or creating a drawing pixel-by-pixel (that is, as a "painted" or "bit-mapped" image), then converting it to "objects" that are easily stored. In short, Sam combines most of the features of a "paint" program like MacPaint, and a "draw" program like MacDraft or MacDraft. And one can work on 10 layers at once—numerous office layouts can be overlaid onto the office plan itself, for instance.

Sam has its own file structure, and can also save images in the PICT format that is to the Macintosh world what DXF is to DOS. You can save each layer in a multilayer drawing separately. That's useful, because changing to the PICT format collapses all the layers into one. Current CADD software for the Macintosh can usually throw off a PICT file for Sam to chew on, but can't always receive one in return. MacDraw and MacPaint exchange files freely back and forth with Sam, however.

The QuickDraw fill patterns are a bit quirky. Fill a wall with a brick-like pattern, for instance, then zoom in. The wall is magnified but the bricks are not! Thus, some experimenting is necessary to get an acceptable rendering.
PLOT FASTER,
LONGER,
EASIER!

The JDL 850 GL+ Plotter/Printer makes plotting more productive in every way

Plot faster than pen plotters —
The 850 GL+ combines a one mega-byte plot buffer with new high speed parallel plotting to produce plot output speeds up to five times faster than a pen plotter. Quick check plots save time and increase your system productivity. And the unrivaled plot speed comes with no loss in quality. You get D and E-size readability at C-size. Mini check sets are easier to handle and save on media costs too.

Plot as long as you like —
The 850’s new long axis, “free size”, plotting lets you plot up to 78 inches long. Or, with the new plot-append feature create unlimited length plots. Ideal for mapping, project management or any design that requires an extra-long plot.

Automatic cut sheet feed and roll feed mean reliable, unattended, continuous plot production. Plot over lunch, plot all night long or plot remote on your network.

Plot easier than ever —
The 850 GL+ can be automatically configured to run with many popular CAD and graphics packages. The new, simplified menu provides for quick set-up and flexible image control, including enlargement and reduction and a multiple copy selection. The 850’s proven technology gives you color hardcopy in 14 colors with crisp consistent lines, without the bother of pens and special media, or the worry of running out of ink or constant pen maintenance. You can plot for weeks without so much as a thought to anything more than changing the paper.

Plus added value —
3D rendering and text printing
The 850 GL+ doesn’t limit your design or business potential. Full color, 3D rendering compatible with AutoShade™, VersaCAD Design™, CADkey™ and others, it can produce over 2000 colors, the only low cost C-size plotter capable of true shaded output.

For your business needs the 850 GL+ quietly delivers letter quality text at 144 cps and draft printing at 360 cps for bills of material, estimating, word processing and spreadsheets. No need to spend money on a separate printer.

Find out why more design professionals are specifying the 850 GL+ as their workstation plotter/printer of choice. Call us for specs, plot samples or a demo.

Circle 63 on inquiry card
Terra Cotta PAC-CLAD was selected for installation on the Grand Hilton Hotel in Deerfield Beach, Florida. The architect, John Nichols & Associates, responded to the owners desire for use of vivid color and post-modernist form in their design. The roofing panels were roll-formed on-site by Roth Brothers of Florida, Inc.

PAC-CLAD is a full Kynar 500® finish ideally suited for use in tropical climates. PAC-CLAD is available with a non-prorated warranty covering finish fade, peeling and chalking. Terra Cotta is one of sixteen standard colors available on steel and aluminum.

For complete information regarding the Petersen product line, please call for specifier's service toll-free, 1-800-PAC-CLAD.

There's a New Global Leader in ABS Resins...
With the recent acquisition of Borg-Warner Chemicals, GE Plastics can now supply worldwide markets with the broadest line of ABS resins in the industry. Combined with our total resources in high-performance engineering polymers, this expansion forms a global product offering that is unmatched in its scope and versatility—a product range totally supported by the technologies which made these ABS resins and engineering polymers the world leaders in sales.

Now designers and manufacturers all over the world have one source for a wider choice of products and properties to fit specific application needs—products that provide a new dimension of design possibilities and manufacturing efficiencies. LEXAN® resin, NORYL® resin, VALOX® resin, XENOY® thermoplastic alloys, CYCOLAC® ABS,

HEAVY-DUTY DOESN'T HAVE TO MEAN HEAVY-HANDED.

Style. Commercial faucet manufacturers don’t usually talk about it. And no wonder. Most heavy-duty commercial faucets are real lightweights when it comes to design.

But Delta HDF™ is different. The Delta HDF line withstands the demands of commercial and institutional usage, without looking institutional. Take the sleek, continental styling of our widespread, two-handle lever models, for example.

And the good looks are backed up by a reputation for reliability and durability. In fact, Delta HDF faucet standards always surpass those established by the plumbing industry. Our designs undergo a punishing series of tests, in the industry’s most sophisticated testing laboratory. Life-cycle testing regularly exceeds a million cycles—the equivalent to a twenty-year life span in lavatory usage. And we insist that our faucets stringently adhere to energy conservation codes.

The result: Delta HDF faucets perform—beautifully.

Which is important. Whether your application demands a commercial quality faucet, or you simply appreciate the value of a product that not only works better but looks better doing it.
Thermal/acoustic insulation
Fiberglass insulation products for residential and commercial buildings are covered in an architectural catalog. Fire and sound ratings for typical wall assemblies are given. CertainTeed Corp., Valley Forge, Pa. Circle 412 on reader service card

Cedar shingles
Decorative uses of cedar shingles and panels, such as chimneys, side-wall accents, entryways, window treatments, gable ends, and interiors, are shown in a brochure. Shakertown Corp., Winlock, Wash. Circle 413 on reader service card

Recessed and wall-mounted fixtures specifically designed to make the best use of the PL compact fluorescent lamp are illustrated in a 38-page technical catalog. Marco/Marvin Electric, Los Angeles. Circle 423 on reader service card
Test Drive the New “Quatro”...

New SolidFeel™ II access floor system, with Quatro Strength, will drive your business toward increased productivity.

Get-on-the-Floor... Unique 4-in-1 support structure significantly increases rolling load capacity.

Seat in high traffic areas!

Get and Comfortable... Advanced cementitious fill and increased welds provide quiet comfort and solid feel underfoot.

Independent Suspension... New FreeStanding understructure allows quick, easy changes in wiring and furniture layouts.

Road Capabilities... Stronger bottom pan provides improved resistance to concentrated loads—files, desks—in non-traffic areas.

Test... Higher compression fill, coupled with a hardened steel top sheet and under construction, provides superior impact load resistance.

Amazingly Affordable... Our exclusive DesignAid™ cost analysis proves access floors can save our most cost-effective wire management system.

Don’t lock yourself into a wire management system that can’t grow with your business. Ask USG Interiors for a drive™ in the new high-performance SolidFeel II...the only one with Quatro Strength.

USG Interiors, Inc.
The Astro-Glass® automatic sliding door package is unique in what it includes. And what it doesn’t. First, the package comes complete with ⅝” clear tempered glass in doors and sidelights. Yet the ensemble of glass doors and sidelights has no vertical stiles to intrude on the panoramic view! All Astro-Glass packages come complete with safety reversing and two horizontal safety beams.

To meet exit code requirements, the two sliding glass doors can be opened to 90° in an emergency from any position in their cycle thus complying with N.F.P.A. #101.

A manual lock in the bottom door rails is available for night security.

For information, call toll free 1-800-543-4635 or write for our new Astro-Glass Package Brochure.
Vinyl-covered wall panel
Mirage is a new texture in the Durasan line of vinyl-surfaced gypsum wall panels. The refinished wall treatment, offered in tan-gray, plum-beige, and soft gray tones, has a pattern of embossed diagonals and crossing filaments that seem to shimmer as viewing angles change. Gold Bond Building Products, Charlotte, N. C.

In 1986 we created this fantasy in glass and aluminum.

Acoustic ceiling
The Sonex acoustical ceiling, made of flame-resistant melamine resin foam that meets all Class 1 codes, is available in a new alternating anechoic-wedge design. Ceiling tiles in white, beige, or gray come in a 24-by-24-in. size that fits all standard and fine-line suspension grids. Illbruck, Minneapolis.

High-back sled-base
Peter Buhk has designed a pull-up version of his 100 Series seating, with 9 finish options for its aluminum frame. The chair comes in high- and low-back styles. Allsteel Inc., Aurora, Ill.

Maximum-security light
The optical design and low-glare lens of the Maxim task light provide a 20- fc light level with only two fluorescent lamps. The compact fixture comes in ceiling- (shown), wall-, or corner-mount models; all components are durable enough for close-custody detention units. Holophane Div., Manville, Newark, Ohio.

Architect John Minden on sound control with laminated glass.

"We knew this site had a severe traffic noise problem. But we wanted this to be a quality development. So did our client. "We considered a triple glazing system. But it just didn't have enough sound control. Our glazier recommended laminated glass, so I called Monsanto to get more information. "They sent me their Acoustical Glazing Design Guide, and the software to go with it. That helped me get the configuration I wanted. "We're happy with the results. It's a nice development. With apartments that are very leasable ... and that makes our clients happy. "In fact, the only complaint I've heard so far is that the installers can't hear each other through the windows."
Laminated glass.
Because Victorian Apartments wanted high style, not high decibels.

It’s an increasingly common problem. A site so noisy you’re not sure you can make it habitable. Let alone marketable. So you’re stuck, between the need for sound control on one hand and the need for good architecture on the other.

The solution: windows of laminated architectural glass with Saflex® plastic interlayer, like these being installed in the Victorian Apartments.

Laminated glass lets you put in the windows you want, and keep out the sounds you don’t. All at a cost that makes sense.

Find out more. Send in the coupon and we’ll send you a free copy of our Acoustical Glazing Design Guide, plus IBM® PC-compatible software to help you with the specifications. For more information or technical assistance, call 800-325-4330.

WHAT'S BEHIND THE DOOR?

To visitors and customers, a Stanley Magic-Door system is a welcome convenience. After all, busy people appreciate the hands-free operation of automated entrances. And they see their presence as a sign of a successful and thriving business.

To you, an architect, owner, or manager, that same system is your best assurance of the quietest, most dependable, trouble-free entrance you can buy.

What makes our door systems so reliable? While other manufacturers may promise dependable operation, none can match Stanley for design, manufacturing and service innovations. Innovations proven, both in the lab and in the field, to increase the ownership convenience of automated entrances.

Stanley Magic-Door employs new computer-aided design and manufacturing techniques. New, state-of-the-art computerized testing and quality control. We've made exciting, cost- and time-saving advances in microprocessor circuitry as well as field-programming. And we have a new, centralized training center. All these innovations give Stanley Magic-Door systems reliability you can count on. Day after day, year in and year out.

Choose Stanley Magic-Door for automated swinging or sliding entrance systems, operators, controls and accessories. For custom colors, bronze or aluminum finishes. For standard entrances or interior applications, or systems custom-designed to fit your style. Whatever your requirements in automated door systems, look to Stanley Magic-Door. And get behind the leader.

See our new catalog 08720/STA or for more information, call 1-800-232-3663 (in Connecticut, call (203) 677-2861).

Water-based fire caulk
Developed to be used with this maker's Ceramic Fiber to seal penetrations in fire-barrier walls and floors according to UL System 176, cementlike Fire Seal 5000 comes ready-mixed, and can be poured, gunned, or troweled. The sealant is nontoxic and cleans up with water. Protective Treatments, Inc., Dayton, Ohio. Circle 326 on reader service card

'DM roof membrane
A single-ply Synergy Sunset is described by its developer as the most oil- and chemical-resistant roofing membrane available. The material, a corrosion of Santoprene rubber and polypropylene backing, is completely heat-weldable (bottom to), and needs no adhesives, laps, or lap sealants. Its elongation of over 500 percent makes it conform to roof contours and resist tears at the covered areas. Synergy Methods, Danielson, Conn. Circle 327 on reader service card

CALL FOR ENTRIES

Each year a jury of your peers selects THE BEST designs utilizing architectural precast concrete. They look for designs that display a highly animated use of precast which gives life and vitality to the building surface. Other considerations include good control of medium, consistent color and textural control, and a design that exploits the potential of architectural precast.

Those that are selected as THE BEST will be announced in the April issue of this magazine. They will also be featured in other prestigious magazines as part of the APA promotion of Quality with Architectural Precast Concrete.

The 1989 search for THE BEST is now open to all design professionals submitting designs utilizing Architectural Precast Concrete produced by an APA member and completed since January 1, 1987. Entries must be received by January 31, 1989. For an entry kit, call or write APA, or circle #76 on the readership service card.

Architectural Record October 1988 165
And for good reason. In fact, for many good reasons. More and more architects, contractors and builders across the country are turning to Russwin for beautiful, well engineered door hardware.

Whether it's the time-tested Uniloc, the state-of-the-art Security Bolt, or the rugged, new 3400 Series Cylindrical Lock, we supply you with the products and the tools—our one-of-a-kind Specifying Manual—to make your job go more smoothly.

“Russwin is my first choice when I want both the security and beauty today's market demands.”
Arvil Thompson
Director of Physical Plant
Berry College
Mt. Berry, GA

“Only Russwin offers product attributes that have the customer in mind. Easy installation, little or no maintenance.”
Ralph Murphy
Kilroy Industries
Los Angeles, CA

“Only Russwin offers me a specifying guide. It makes my job a lot easier.”
William F. Kiel, CSI, CCS
Chicago, IL

After all, the only way to be the talk of the industry is to listen to your needs. We'd like to hear yours. Call at 1-203-225-7411 or write to Emhart Russwin, Russwin Division, 225 Episcopal Road, Berlin, Connecticut 06037-0503. And let's talk.
For your convenience in locating building materials and other products shown in this month's feature articles, RECORD has asked the architects to identify the products specified.

When you need a high performance glazing but you also want an exclusive hue to set your project apart, specify an Interpane glass coating.

Each of our unique multi-function coatings, for example, combines an attractive color and low-emissivity characteristics into one, single-surface coating. The process is based on our advanced European technology. We call these products IPASOL PLUS. You'll call them amazingly flexible. An IPASOL PLUS coating can help retain cooled or heated inside air while promoting the desired solar control. The net result is a very favorable Energy Balance.

Interpane's total line of proven coatings offers you high or low light transmission and reflectance, superior shading, neutral appearance, the finest in Low-E glass, and a rainbow of colors—from a readily available rich blue to a 24K gold.

To reflect your unique sense of architecture, specify an Interpane coating. For more information contact us at 2 Interpane Lane, Deerfield, WI 53531. Or phone 608 764-5461. You'll receive a colorful response.
A FEW REASONS WHY A 350 TUFFLINE ENTRANCE LIVES UP TO ITS NAME.

A $\frac{3}{16}$" minimum wall thickness in door and frame

Security interlocks at door jambs

Heavy duty frame to complete the entrance package

Rugged 2" deep stile sections

Thru bolt and direct hardware attachment where applicable

High performance welded door corner joinery

Heavy duty standard hardware designed for high abuse areas

AND A FEW REASONS WHY IT HAS TO.

350 Tuffline. Educational tool for the 80's. And beyond. For new and replacement doors at schools, college campuses, and in other high traffic and abuse-prone installations. Tuffline entrances are all their name says they are. Tested in the educational market, Tuffline is offered as single-acting entrances in both singles and pairs to 8' heights. With durable butts, pivots, closers and panics to resist vulnerability and increase security when school's out. And design options such as Paneline* to customize without compromise.

Tuffline. At the head of the class.

CONSULTANT ARCHITECTS, ENGINEERS, CONSTRUCTION MANAGERS

The Division of Design and Construction Management (DDCM) of the NYC Department of General Services (DGS) requests applications from qualified consulting architects, landscape architects, engineers, construction managers, surveyors, value engineers, cost estimators, and asbestos investigators who are interested in performing services for this Municipal Government Agency. The Agency is aiming for excellent quality in developing studies and performing design work and construction management services for the Public Buildings of New York City.

Consultants are invited to submit a Federal Form 254 and an illustrated brochure describing their professional experience. They are to include resumes of key personnel, and three client references with contact persons and telephone numbers. Qualified respondents will be invited for an interview to determine areas of expertise and professional references. These lists will be the firms qualified and certified as Small Business Enterprises (SBEs).

All information will be kept on file and referred to as consultants are considered for specific projects. Forms submitted within the past year are in the consultant data bank; re-submission is not required unless updating is desired.

DDCM administers the following types of projects: Libraries, museums, community centers, police stations, firehouses, correctional facilities, courts, laboratories, theaters, zoos, conservatories, broadcasting facilities, and municipal buildings. It also implements special programs such as historic preservation and restoration, Local Law 10, asbestos abatement, transitional housing for the homeless, access for the handicapped, and energy conservation.

Please address all correspondence to: Consultant Liaison NYC DEPARTMENT OF GENERAL SERVICES Division of Design and Construction Management Bureau of Building Design 1 Centre Street, 15th Fl. New York, N.Y. 10007

FREE SUMMER JOB LISTING

Hire 1990 & 1991 GRADUATING ENGINEERS — NEXT SUMMER!

First, it’s in our industry’s best interest to hold and encourage its life-blood by providing career-conscious undergraduate engineering students with meaningful summer job experience in their future profession.

Second, since there’ll always be more anxious applicants than openings, you’ll be able to select the cream of the crop, then evaluate them under ‘game-conditions’ with an eye towards hiring them after they graduate.

By filling out and returning the coupon below, your organization will be included in summer job listings to be featured in the January 1989 issue of McGraw-Hill’s GRADUATING ENGINEER.

This edition will be distributed to 83,000 engineering students on over 300 campuses by Deans and engineering department heads.

Please supply the name of the person students should contact, and a phone number for our checking purposes only.

From concept to beautiful finish.

ECI Metal Roofing Systems bring your ideas to life.

When crisp, clean lines are needed to show your roof design at its best, only ECI's broad line of metal panels can give you the choice you want. When your plan calls for just the right color to highlight a contour, ECI long-lasting metal finishes can stand up to the job. When you ask texture, style and shapes to blend into a new form, ECI architectural panels have the answers.

ECI metal roofing systems are a beautiful way to show your designs at their best. And ECI is ready to help you break new ground in design—from planning to engineering to a network of builders that will make the installation go smoothly. If you're ready to reach new heights in roof design, write for our free design manual for metal roofing systems. It's all you need to know to get started and all you need to know for your designs to stand the test of time.

and your power, telephone data wiring as needed with Wiremold perimeter raceway system. Now, you can get at your wiring whenever you want to. All you do is remove the Wiremold way covers and lay in the additional wiring and fittings: electrical power in one compartment, low voltage data and phone cables in the other. That’s the distinct advantage of Wiremold perimeter raceway over conventional wiring systems. Wiremold raceway system is ready to grow. Maybe you change your office layout. Or add new factory equipment. Or you bring in more sophisticated telecommunications equipment. Or you add additional cables. There’s capacity for more and more. Something’s got to be done quickly and efficiently.

Large capacity Wiremold perimeter raceway comes in a range of sizes and finishes. Available in baked enamel finish, satin anodized aluminum or plastic, they can be used as is or painted to match or contrast. Available, too, are all the interconnecting fittings you need to extend and expand your raceway system, one that can grow as your business needs grow.

If you’re renovating or retrofitting a building, Wiremold raceway reduces the high cost of labor and general disorder involved in breaking through walls – not just today but in the future. Designing a new building? It makes good sense to design in, from the beginning, a Wiremold perimeter raceway system – so you’re prepared for future expansion of your wiring needs.

To view a specially-prepared video about Wiremold perimeter raceway systems, call 1-800-621-0049 (In Connecticut 1-800-992-2277).

For a fact-filled color brochure, write today to The Wiremold Company, Electrical Division, 60 Woodlawn Street, West Hartford, CT 06110-0639.
Armstone™ Honed Finish Floor Tiles

Beauty That Doesn’t Wear Out.

Foot traffic won’t dull the beauty of this Armstone™ cast marble Honed Finish floor. A finish as deep as the tile is thick means the original elegant gloss will be constantly renewed. Maintenance is easy.

A palette of 31 colors in Polished and Honed Finishes amplifies color and design choices.

Available in 12” x 24”, and selected 48” squares.

For more information on Armstone™ Honed or Polished Finish tiles and wall panels contact your distributor or ArmStar.

An affiliate of Armstrong World Industries and Shell Oil Company • P.O. Box 820, 307 Industrial Park Blvd. • Lenoir City, TN 37771 • (615) 986-4040

Reynolds Smith & Hills is a charter subscriber to CodeCONTROL, an information service which provides building regulatory information. CodeCONTROL provides building, mechanical, energy, plumbing, fire prevention, handicapped accessibility and Life Safety® code information specific to each subscriber's project and location.

Subscribers can request applicable code information by completing a checklist description of their project through PC software or through a manual checklist. John Sorce describes CodeCONTROL:

"All architects and engineers think differently. Before we implemented CodeCONTROL, architects and engineers would perform their own code searches, and even with a checklist, each was a little different. CodeCONTROL enforces consistency as well as thoroughness for each project."

"Quality Assurance is a major part of Reynolds Smith & Hills' operation. We have a Vice President of Quality Management whose charter is to develop, update and implement quality assurance and control procedures. One part of our quality assurance program is on going quality training in procedures such as code searches and quality checking. CodeCONTROL fits in perfectly."

"CodeCONTROL provides a road map for each project. We request a Global Report early on. From the beginning we know what kind of requirements are involved. The Global Report gives us all the applicable code information for the specific project."

John Sorce is Senior Director of Architecture for Reynolds Smith & Hills, a Jacksonville, FL architectural, engineering and planning firm with over 1600 employees. Founded in 1941, Reynolds Smith & Hills has recently become one of the Hunter Companies.
When Deborah Dietsch talks design, architects get design ideas.

Trained in architecture and preservation, editor/writer Deborah Dietsch has contributed to a number of design magazines and was former Special Features Editor of Interiors. She is now part of the largest, most experienced, most professional editorial team in the field.

It's the team that delivers more interiors editorial to architects—more pages, more photographs—than any other architectural magazine.

You read Architectural Record because of editors like Deborah Dietsch. Advertisers use Architectural Record because of readers like you.

Architectural Record, it all begins with an editor.
Solve all your wood problems with Malaysian hardwoods.

Malaysian hardwoods have earned a worldwide reputation for their versatility, quality and durability. Over 100 commercial species offer a tremendous range in physical, mechanical and working properties. Whatever your needs, Malaysian hardwoods have the fitting solution. Here's how:

**Versatility**
Used in varied applications - as structural building components to flooring, paneling, superior joinery and furniture. Malaysian hardwoods like the popular Merantis, Keruing, Kempas, Kapur and Merbau have found ready markets in Europe, Australia, Taiwan, Japan, USA and West Asia...and new woods like the Rubberwood, Kembang Semangkok (Samrong), Mengkulang, Sepetir, Nyatoh and Balau are already making successful inroads into world export.

**Attractiveness**

**Durability**
Resilient too. Specially kiln-dried and treated for long life reliability and low maintenance.

**Quality Control**
Guided by the Malaysian Grading Rules, stringent checks and tests ensure maximum defect-free wood. **Reliability**
Malaysian exporters are capable of prompt and reliable service backed by skilled and experienced manufacturers.

**The experienced back-up of MTIB**
The Malaysian Timber Industry Board (MTIB) provides advisory services on marketing, utilization, quality control and shipping. We furnish overseas clients with essential and specialized information on timber-based industries in Malaysia and we also co-ordinate the activities of more than 1,000 organizations involved in the manufacture and export of timber products in Malaysia.

Whatever your needs, contact us. We can help you select the right wood for your specific requirement.
Use in your car, or go portable and carry it with you.

Transportable Cellular Phone

Radio Shack’s CT-201 puts the whole world in your hand!

A Full-Featured Mobile Phone for Only $999. Now you can make and take calls from your car, truck or van. You can stay in touch while going to and from work, on a service call or making a delivery. You’ll be able to confirm meetings and appointments in advance to avoid wasted trips, as well as receive important messages from home, office and customers.

The CT-201 Can Go Where You Go! Just snap on the Portable Adapter Pack and you can easily use the CT-201 away from your vehicle. Carry it with you to make calls at a job site, in a rental car, aboard a pleasure boat—wherever there’s cellular service. The 3-watt output is five times the power of many other portables for maximum range and clear sound. The CT-201 also features the 832-channel capacity now being used in some cellular cities.

Turn the CT-201 into a Portable for Only $159.80. You’ll get the Portable Adapter Pack (17-203), which includes a portable antenna, DC power adapter/charger with auto lighter plug and shoulder strap; two rechargeable batteries (23-181); and an AC Charger (17-202).

You Can Be Sure of Quality Service and Support. Radio Shack handles the start-up paperwork, obtains your personal cellular telephone number and programs your phone right in the store. The CT-201 is backed by a One-Year Limited Warranty, which covers both parts and labor. Service is available at 7,000 participating Radio Shack stores and dealers nationwide.

Come In Today for a No-Cost, No-Obligation Demonstration. Whether for business, family or personal use, the CT-201 (17-1005) is an excellent investment at only $999*, or $50 per month**.
Ceramic-On-Steel Melds High-Tech With High Style.

Only AllianceWall makes COLORFUSION™ a unique breed of ceramic-on-steel panels as beautiful as they are functional. By a new, proprietary process, we can fuse a limitless range of colors, patterns or graphics into the wall surface. AllianceWall's COLORFUSION panels are virtually indestructible. They won't chip, crack, mar or fade, and they are scratch-, heat- and chemical-resistant.

They're easier and less expensive to install than conventional wall surface materials. And they're maintenance-free.

Nice to know that ceramic-on-steel now gives you endless design possibilities. And that it will keep your design intact...a long way into the future. Write or call for more information on American-made COLORFUSION panels.

Ask about our other new metallic, matte and graphic surfaces.

Need product information fast? Your Architectural Record Subscriber Telephone Access Card number can help speed information to you about any product or service (advertised or new products/manufacturers' literature items) described in this issue.

Architectural Record's exclusive STAC number system enables you to key your "more information" requests directly into our computer's touch-tone telephone. Your personal STAC number is conveniently above your name on the mailing address label for each issue. IMPORTANT: Your STAC number starts after the first four numbers and is separated from them by a space. If your STAC number starts with one or more zeros, insert them, as well as the hyphen. (For example, the STAC number on the label is 98765432.)

Soon after your call, advertisers can access your requests by phone from the computer, and start speeding information to you. So when you need information fast, free help is as close as your STAC number. And STAC service is available to you 24 hours a day, seven days a week.

BEFORE YOU DIAL:

1. Write your STAC number in the boxes in Step 4 below. Do not add leading zeros.

2. Write the Reader Service numbers for those items about which you want more information in the boxes in Step 6. Do not add leading zeros.

CALL STAC:

3. Using a standard touch-tone telephone, call 414/442-2668, and follow the computer-generated instructions.

ENTER YOUR STAC NUMBER AND ISSUE NUMBER:

4. When the recording says, "Enter your subscriber number..." enter your STAC number by pushing the numbers and symbols (# or *) on your telephone keypad. Ignore blank boxes. Enter:

5. When the recording says, "Enter magazine code and issue code..." enter these numbers and symbols:

ENTER YOUR INQUIRIES:

6. When the recording says, "Enter (next) inquiry number..." enter the first Inquiry Selection Number, including symbols from your list below. Enter blank boxes. Wait for the prompt before entering each inquiry number (maximum 12 digits).

END STAC SESSION:

7. When you have entered all your inquiry numbers, the recording prompts you to call by entering:

If you are a subscriber and need assistance, call 212/512-3442. If you are not a subscriber, fill out the subscription card in this issue, or call Architectural Record Subscription Services at 914/628-0821.
ALPOLIC

The Lightweight, Rigid, Bendable Composite Material.

ALPOLIC combines beauty with superior flatness and easy workability. Used for exterior sheathing, display panels, sign boards, and other applications, it resists weather and corrosion. Used for interior applications such as displays, it will enhance the beauty of your designs.

ALPOLIC is available in silver, light bronze, dark bronze, gold and black anodized and painted in a range of colors.
