Are You Interested in the Roofing Question?

Imagine an Asphalt Shingle

That is fire resisting.

That will not leak or blow off.

That will not Rust, Rot, or Split.

That will not crack or absorb Moisture.

That is Artistic, Durable and Economical.

That is Easily laid by carpenters.

That is finished in Red and Green and needs no paint or stain.

These are some of the unusual points of excellence that have won for Hudson Asphalt Shingles, National recognition as the Perfect Roofing Material.

We will send postpaid samples of Hudson Shingles and free copy of our book "Shingling & Roofing." Ask for Shingling Aids No. 52.

ASPHALT READY ROOFING CO.

Room 452, 9 Church Street

New York, N. Y.

Yes, Mr. Contractor

You can lay Wood-Mosaic Floors of Hardwood. Our 5/16" Flooring can be laid in old houses as well as new. We make all kinds and thicknesses; Wood-carpet, Strips, Plain and Ornamental Parquetry, Tongue-and-Groove Flooring.

On receipt of accurate measurements of rooms, we will furnish colored sketch with exact estimate of cost of the flooring required. Instructions for laying and finishing accompany all orders shipped.

Send for a free copy of our catalogue in natural wood colors

Sales Office and Parquetry Factory, Rochester, N. Y.

CONCRETE and stucco can be made beautiful with Bay State Brick and Cement Coating—can be given a rich, artistic finish in harmony with the architect's ideas. This overcomes the dreary blue-gray and makes an attractive white or tinted wall.

Bay State Brick and Cement Coating

has another great advantage—it's absolutely waterproof. It fills the porous cement and prevents water seeping through. As an interior finish, nothing compares with Bay State. It resists fire, steam, acid and water—reflects the light and will not peel or dust off.

Builders and architects everywhere endorse it. We'll send A SAMPLE CAN, FREE if you'll try it. When you write, say what tint and ask for Booklet 19.

WADSWORTH, HOWLAND & CO., Inc.

Walls that Stand—

must fight —
TIME, GRAVITATION,
INSECTS and the
ELEMENTS

—and the stucco covered walls that win in such a fight must have a *backing* that is *scientifically* constructed and of *dependable* materials, like

Look at the illustration—creosoted and dovetailed lath imbedded in asphalt-mastic on a background of heavy fibre-board. Not a piece of metal about it to rust and break away from the fastenings. Every piece of material time-resisting and water, weather and vermin proof. The finished construction, a *rigid, permanent* background that holds the stucco, cement or plaster in the *dovetailed* grip *without cracking or peeling*, as long as the house lasts.

Write today for free samples and book, "Built on the Wisdom of Ages." It illustrates homes and other buildings made with Bishopric Board. It gives facts and figures to prove that Bishopric Board *saves twenty-five per cent in labor and material*. And it contains letters from architects, builders and users, together with results from some interesting tests.

701 Este Avenue Cincinnati, Ohio

SAVE 30%

ON YOUR WINDOW FRAMES

Are you buying your window and door frames and letting the mill make the profit? W. M. Knoeller was, and then he bought an **Oshkosh Eveready Saw Rig**. Six months later he wrote us: "Before getting your machine I bought all my window frames at the mill. Now I make them at 30% less cost and get a much better frame, besides being able to work up all my scrap."

Isn't a 30% saving on your mill work worth anything to you, regardless of hundreds of other savings you can effect with an—

EVEREADY SAW RIG

**11 Operations—
One Machine**

Cross Cuts
Rip Saws
Jig Saws
Rabbets
Mitres
Bevels
Bores
Joints
Grinds
Tenons
Sands

The **Eveready Saw Rig** is mounted on skids so that it can be taken out onto the job where it can be used all the time. When not out on the work it is kept busy in the shop with mill work and general jobbing construction. Self-contained, with a powerful engine in the base; trouble proof and easily handled by any man. The biggest, most complete little machine ever offered the carpenter-contractor.

Send for Free Book

that tells all about the different tools and the way you can use them to save money.

The \$2,500,000 Ford Farm and The Sheepshead Bay Motordrome

Are Located About 800 Miles Apart

But the owners of each are together in their ideas on efficient construction service. Henry Ford and the Coast and Lakes Contracting Corporation—the largest automobile manufacturer and one of the largest structural companies in the country—know what work ought to cost. Each demands efficient production. To them such service means but one thing—

Lansing Equipment from Mixers to Wheelbarrows

The Ford Farm

Four No. 7 Lansing Mixers were the equipment selected to build \$2,500,000 worth of buildings on the FORD FARM.

The Lansings kept the job moving. Light in weight—easily portable—they were moved about quickly and the concrete was kept up with the forms. There were no delays. And the little mixers STAYED WITH THE JOB from start to finish.

Write for Catalog No. 21

Made in 5-7-10-12-15 cu. ft. capacities

The Motordrome

The building of the Sheepshead Bay Speedway involved conversion of the famous old Bay horse-racing plant into a motordrome. It was on April 9, 1915, that the forces of the Coast and Lake Contracting Corporation went on the ground. Their work was to erect the new speedway described, in time for an opening that was first spoken of for Labor Day, the first Monday in September, by the promoters, but later postponed to October 20. It was accomplished through the exclusive use of eight Lansing No. 15 mixers.

\$2,430 Clear Profit in 90 Days

—that's what one man made in a town of 375 inhabitants with

What Other Manufacturers Report:

"Landed a \$90,000 Government contract with HELM Cement Brick." "Just landed a contract for 400,000 HELM Pressed Cement Brick." "Made a million brick this season on a HELM Press." "Working on a contract for half a million pressed cement brick." "My daily profits on blocks average \$25.00." "Turned out 17,000 pressed cement blocks for one contract in less than a month." "Six weeks behind on HELM pressed cement and block orders."

Be a Manufacturer of Pressed Cement and Brick Blocks

The greatest opportunity in America to-day and open to you right in your community. Pressed brick and blocks are staple; a billion bricks used annually in the United States—and blocks are just as necessary. Millions in actual profit are made annually out of these products. Builders in small towns and big cities use them in place of wood, stone and clay because it reduces building costs. How much of this big profit do you pocket?

It Will Earn You \$20 to \$50 Daily

With a HELM Press you can start a big money making business with small capital and even without experience. The HELM PRESS makes pressed cement bricks and blocks under 80,000 pounds pressure—1,000 blocks or 10,000 bricks daily—without tamping, burning or hard work, ready for the market in a few days. There's a big demand right in your own community for brick and blocks made by pressure; equip yourself to supply it.

Its Low Cost and Long Wear Make It Ideal for Floors

North Carolina Pine is not a hardwood, nor do we claim that it is preferable to hardwoods in all cases.

But we do want you to know that it is a most valuable floor material. Especially in cases where your client desires to keep down the investment without sacrificing appearance.

And since flooring is a large item of expense in building, nothing will so thoroughly serve the purpose of an inexpensive, yet beautiful floor, as North Carolina Pine.

Costing less than hardwoods, it is equally as serviceable, especially when the Rift grain is used. And with its natural, varied grain, which is susceptible to the most charming hardwood effects, North Carolina Pine will give a distinctive and artistic appearance to any room.

The floors in the North Carolina Pine bungalow at the Country Life Permanent Exposition, Grand Central Terminal, New York (which you are invited to inspect), are constructed exclusively of North Carolina Pine, and have elicited favorable comment from the thousands of visitors who have seen this exhibit.

Architects' and Builders' Reference Book **FREE**

Write for Architects' and Builders' Reference Book, which we have prepared in convenient form for filing. It describes the many uses of North Carolina Pine and the beautiful effects obtainable.

Specimen panels on request.

**North Carolina Pine
Association**
Norfolk, Va.

**Direct
into the
Forms**

End Discharge enables you to spout concrete direct into the forms. End Discharge enables you to use this mixer in tight, narrow places where you couldn't possibly use any other machine except the Archer.

Portability means "Easy to move." One man can lift it at the platform end. These are two big advantages which your judgment as a contractor can see at a glance.

Right now our catalog is ready to mail to you. Send us a postal and you can have it.

ARCHER IRON WORKS

MAKE MONEY

This winter by replacing old floors with modern
hardwood

OAK FLOORING

Many builders make winters profitable in this way. You can do the same. You must know of a number of old floors that need replacing. Don't wait for this business to come to you. Go after it. I can help you. I have spent years in the manufacture of fine oak flooring. All of my flooring is of the finest stock, $\frac{3}{8}$ " thick. It is made in a modern factory; thoroughly kiln dried; is end and side matched. It is easy to lay and is sure to please you and your customers.

Hundreds of particular carpenters and builders buy from me exclusively because they know that the flooring is right. I carry a large stock and give prompt delivery and my prices save them money.

There are several grades of flooring and I will be able to meet your requirements.

Write today and tell me what you need.

Bloomington, Ill.**

Service That Spells Security!

SERVICE is the basic working principle of the Southern Pine Association, an organization of the leading manufacturers of Southern Yellow Pine.

That **SERVICE** embraces practically every interest related to the Southern Yellow Pine industry and practically every person having to do with Southern Yellow Pine. For those who take advantage of it, it is a guarantee of faithful performance from the sawmill to the consumer. For the Architect and Engineer, it is a safeguard against substitution—the insurance on “getting what you specify.”

That you may be **certain** of this, the Southern Pine Association stands ready to provide, on request and for a nominal charge, competent inspectors to pass upon every stick of timber, from whatever source, that goes into the structure you are erecting, thereby eliminating the possibility of faulty material finding its way into your building or other structure.

You know that honest Southern Yellow Pine, better than any other material, meets exacting demands in heavy construction. The inspection of the Southern Pine Association will make certain the honesty of the material.

That **Service** is for **YOU**.

If you care for details of this service, and desire to have your name listed for the Southern Pine Association's new manual of stress tables and grading rules, fill out and mail the attached coupon.

By Specifying All Interior TRIM

OF

ARKANSAS SOFT PINE

Your own requirements will be adequately filled in every detail and your judgment permanently endorsed in the mind of the owner by the beauty, variety and durability of the material itself.

Merely because Arkansas Soft Pine Trim is abundant, it does not follow that it is in any sense a "cheap" wood. On the contrary it compares favorably with the rarest of tropical hardwoods and may be obtained at all times without delay.

Arkansas Soft Pine is particularly adapted to use as Interior Trim because it supplies a wide range of figure, perfectly-balanced absorbing qualities and an ability to provide a sustained lustre to the finished woodwork.

IT IS THE ONE SOFT WOOD TRIM ON WHICH VARNISHES, STAINS AND ENAMELS WILL NOT BECOME DEAD-LOOKING.

Being free from rosin, resinous oils or "sugar," it positively will not discolor White Enamel from underneath.

Our set of finished samples and booklet will help you form an idea. Send for them—they are free. Address Dept. R.

Arkansas Soft Pine is sold by dealers. If yours hasn't it, let us know.

BEFORE YOU BUY A FOOT OF LUMBER

FOR ANY PURPOSE, big or little, indoors or out, in city or country

WRITE for the proper volume of The Cypress Pocket Library. (Free)

Backed by our "Builders' Helps Dept.," it is the "guide, counselor and friend" of

ALL THE PEOPLE WHO CARE
WHAT VALUES THEY GET for their LUMBER MONEY.

Why not buy WOOD with the same discrimination you apply to other things?

We do not advise CYPRESS for *all* uses, but *only* where it can *prove* itself "the one best wood" for *your* use.

- 1** You don't tell your broker: "Buy \$10,000 of Railway stocks!" Hardly! You tell him *what*.
- 2** You don't simply tell your Real Estate agent: "Buy me 'some land'!" You tell him *where*.
- 3** You don't tell the dry goods clerk: "I want 8 yards of cloth!" You say "silk," "wool," or "linen."
- 4** You don't merely order "200 head of live stock!" You specify Horses, Cattle, etc., and *the Breed*.
- 5** You don't tell the contractor: "Build me a house!—and paint it!" You dictate the *plans*. And the *colors*.

WHY NOT BUY LUMBER WITH EQUAL CARE? INSIST on CYPRESS — "THE WOOD ETERNAL."
WRITE AT ONCE for VOL. of CYPRESS PKT. LIBR. that fits your case. WE'LL REPLY AT ONCE.

These Volumes May Be Had NOW:

- | | | |
|--|---|---|
| 5. How to Avoid Mistakes in Bungalows. | 37. "Even Temperature" SILOS (Free Plans and Full Specifications.) | 7. Cypress Shingles "Yes Book" (Last a Century.) |
| 9. CYPRESS for SIDING—and Why. | 38. Cypress "Home Grown" Furniture (Free Working Plans and Specifications.) | 4. Cypress "A Nothing Else." for BARNs, etc. |
| 22. Cypress SILOS and Tanks (of course.) | 39. Cypress "New Insides" for Old Houses (Free Working Plans and Specifications.) | 1. "The Wood Eternal"—What It IS (incl. U. S. Govt. Report.) |
| 18. Cypress Bungalow "A" (Complete Working Plans and Specifications Free.) | 40. "More" Cypress Pergolas (With 2 Sets Working Plans and Specifications.) | 8. Cypress Bungalow "C." (Free Working Plans and Specifications.) |
| 6. Cypress Bungalow "B" (Complete Working Plans and Specifications Free.) | 41. Cypress Bungalow "E" (Complete Working Plans and Specifications.) | 28. Cypress for All Trellises and Arbors. |
| 3. Cypress, "Only GREENHOUSE Wood." | 19. Cypress for Canoes and Boats (defies decay.) | |
| 29. Cypress Shingle House (Free Working Plans and Specifications.) | 24. What People (who know) SAY of Cypress. | |
| 16. Cypress for Porches, etc., and the Reasons. | 26. Japanese Effects (Sugi) in Cypress. | |
| 31. Cypress' Great Beauty for Interior Trim. | 20. Cypress for All FARM Uses. | |
| 84. Shingle House No. 2 (with Free Plans and Specifications.) | 33. "How I Finish Cypress," by a Craftsman. | |
| 35. Cypress for Sun Parlors, Balconies, etc. | 32. Cypress Bungalow "D" (Free working plans and specifications.) | |
| 26. "Cypress Short Cuts to Carpentry on the Farm." | 12. "The Wood Eternal" for Exterior Trim. | |
| | 30. Cypress Pergolas, etc. (8 Working Plans Free.) | |

These in Preparation—Apply NOW:

10. Cypress for Artistic Doors (a revelation.)
2. "Pecky" Cypress—"The Vaccinated Wood."
15. Cypress for Dairy Uses—"The Only Wood."
11. Cypress for Sash, Blinds and Frames.
14. Cypress for Gutters, Curbs and Culverts.
23. Cypress "Perfect for Exterior Painting."
25. "Perfect for Interior Painting and Staining."
27. As a "Preventive of Property Depreciation."
21. Cypress for "All Outdoors" (of course.)
17. Cypress for All "Odd Jobs" (of course.)

DOORWAY,
ISAAC ROYALL HOUSE
at Medford, Massachusetts.
Built of White Pine in 1732.

While the Royall House as it now stands was built in 1732, a section of it—which was originally the Winthrop Farm House—was built in 1631. This is the oldest section of any house now standing in this country.

CARPENTERS, lumber men and architects have for generations agreed that no other wood gives such long and satisfactory service, when exposed to the weather, as

WHITE PINE

Despite an impression that it is scarce there is still plenty of "Good Old White Pine," in all grades, and it can be purchased in all markets at reasonable prices, when considering its value as a structural wood.

If the lumber dealers supplying the materials for those for whom you are building are at any time unable to furnish it, we would appreciate the opportunity of being helpful to you in securing it.

A FREE MAGAZINE FOR CONTRACTORS

We are now publishing a bi-monthly architectural magazine, every issue of which will be full of valuable and helpful information for contractors and builders. If you would like this magazine, write us and we will be pleased to place your name on our mailing list.

Stained with Cabot's Creosote Stains. Olive B. Barre, Architect

Cabot's Creosote Stains

Rich, Velvety, Lasting Colors
Preserve Your Shingles, Sidings and Timbers

You are sure of beautiful coloring, durable wearing qualities, and thorough preservation of the woodwork if you insist upon Cabot's Stains. Their colors are the strongest and finest natural pigments, ground in pure linseed oil and mixed in specially refined Creosote, "the best wood preservative known." They will not wash off or blacken, and are the only stains that are not dangerously inflammable. Quality Proved by Thirty Years' Use. The Original Shingle Stains.

Cabot's Quilt

A scientific heat insulator and sound-deadener that makes houses warmer in winter and cooler in summer and deadens sound in floors and partitions. Not a mere felt or paper, but a non-conducting mat that is about thirty times warmer than common papers.

You can get Cabot's Stains and Quilt all over the country. Send for samples and names of nearest agents.

A Frame House of the Chalêt Type

A Well-Considered Design in a Most Picturesque Setting—A Few Details of Construction—Cost \$4,300

BY CHARLES ALMA BYERS

LIKE the bungalow, the Swiss chalêt is a style of architecture that, in this country, is variously interpreted. Although it must always retain certain characterizing lines and features, it is largely a creation of individuality. And like the bungalow also, it permits these liberties with per-

to different climates. In fact, it is a style that can be employed just as satisfactorily in one section of the country as in another.

The house here shown is an excellent example of the Swiss chalêt style, and possesses many admirable features, from both the exterior and the in-

A Frame House of the Chalêt Type—Architect and Builder, Edward E. Sweet, Los Angeles, Cal.

fect grace, for, if made by a skilled and conscientious builder, the house evolved from individual interpretation of the style will invariably constitute an attractive and comfortable home. The chalêt, however, has a certain important advantage over the bungalow in that it is more universally adaptable

to different climates. In fact, it is a style that can be employed just as satisfactorily in one section of the country as in another. The house here shown is an excellent example of the Swiss chalêt style, and possesses many admirable features, from both the exterior and the in-

ful study of the exterior view is well merited.

The foundation is of concrete, but the chimney and porch piers are mainly of pressed brick, a few clinker brick being worked into them to give a slight rustic effect. The roof is but mildly pitched, which is quite satisfactory in Southern California, where this house was erected, but in other localities it may be given any angle necessary to meet local conditions. The roof covering here used is a gray asbestos composition, but in many places shingles will probably prove equally satisfactory. The wide overhang of the eaves and gables constitute a characteristic of the chalet, and should be invariably maintained.

A feature that, because of its style, helps materially to enhance the outside appearance of this house is the front porch, which virtually extends across the entire front, but is covered only in the center portion by what might be termed a marquise. The flooring is of cement, edged with brick, and

ing baskets help to add charm to these truly delightful outdoor retreats.

To give a still greater artistic appearance to the exterior of this house, or to overcome any possible appearance of plainness at these points, there is a slight projection to the walls of the first story, on either side at a point about midway between the front and the back, and these projections are each covered with a small individual roof. On one side it is the dining room that projects beyond the main line, and on the other side it is a bed room.

The exterior color scheme is quite effective. The siding shakes are stained a light brown color, and the finishing timbers are painted a very dark brown shade. The roofing, as already stated, is gray, and the brick work is naturally a dark red.

Inside the house is comfortable and home-like. More than that, it possesses a number of distinctive features in the way of decorative and built-in effects. The finish is in good taste, and creates a

First Floor

Second Floor

A Frame House of the Chalet Type—Floor Plans—Scale 1/16 In. to the Foot

the low, broad steps are also of brick. Four low, pedestal-like piers are arranged along the front, one at each corner and one on each side of the front steps. These, acting as rests for potted plants, are purely decorative, for they do not help to support the roof in any way. The little individual roof is, instead, supported at the outer end by chains from above. The arrangement of these chains, together with the dependent timbers, should be particularly studied by the prospective builder of a house of this type.

Another admirable feature of the exterior is found in the long, airy balconies of the second floor. There is one of these on each side, running the full length, both identical in dimensions and design—both open at each end and along one side. They are inclosed with low, solid balustrades, and are roofed and ceiled. They are sufficiently wide at each end to be used for sleeping purposes, and may be easily inclosed, if desired, with roll curtains. Hang-

ing baskets help to add charm to these truly delightful outdoor retreats. The different rooms deserve to be studied in more or less detail, and as an assistance in doing so the interior views of the living room and of the dining room should be closely observed. The arrangement and dimensions of the rooms may be noted from the floor plans here shown.

The living room, which extends across the entire front, is long and comparatively narrow. The front door is exactly in the center, and at either side are a broad plate-glass window and two small casement windows. These, with other windows in each end, give the room a great deal of light. In one end is an excellent fireplace with built-in book cases at either side, the whole being of particularly striking and artistic design. Not only is the fireplace constructed of brick, mainly of the clinker kind, but the book cases are also of brick, as well as the broad hearth. The counter-shelf of the fireplace is on line with the shelf-like tops of the book cases, an excel-

View in the Living Room as Seen from the Fireplace End—The Main Entrance Door Is at the Right

A Frame House of the Chalet Type—View of the End of Living Room, Showing the Fireplace and Mantel

lent arrangement, and above each book case is a small window.

The ceiling of the room is beamed in a rather original fashion, which is especially effective, and from the center beams projects a total of seven electric-light globes. A paneled wainscot covers the lower half of the walls, and above this point a paper of distinctive and artistic pattern is used. The woodwork, which is of cedar, is finished in fumed oak color, and the flooring, as in all of the first-floor rooms, is oak.

The Dining Room Buffet

The dining room contains a buffet that is indeed a masterpiece of work. It extends the full length of the outside wall, and is unique not only because of its broad sweep but also for the reason that brick work forms a prominent feature of its construction. In fact, it is built almost entirely of brick, with the exception of the doors and drawers and counter-shelves. The center part of the buffet is extremely low, and contains two cabinet sections and one department of drawers. Above the counter-shelf are four casement windows; and in the corner at each end is a small china closet, the top of which also forms a shelf. Smaller windows are placed above each of these.

The ceiling is beamed in somewhat the same style as in the living room, and, besides the center chandelier, there are four small ceiling-light globes. The walls are paneled to the height of the doors, and along the top of the paneling runs the usual plate rail. The frieze above is of paper, of dignified pattern. The woodwork, as in the living room, is of cedar, and is similarly finished.

The Kitchen Equipment

The kitchen is of the so-called cabinet kind, which means that it contains nearly every possible built-in convenience, in the way of cupboards, cabinets, flour bins, etc. It also possesses a draught cooler. Both the woodwork and the plastered portions of the walls of this room are white enameled.

Off of the kitchen is a screened porch, with stationary wash trays, as well as a lavatory.

There are two bed rooms on the lower floor, and a small hall forms the necessary connections between these rooms and the remainder of the house. One of the bed rooms has a small dressing room, and the other possesses a roomy closet. The hall contains a closet for coats and wraps and a small linen closet. The woodwork of the rooms, as well as the hall, is enameled white, and the walls are papered.

From the hall rises the stairway to the second floor, as well as descends the stairway to the basement. A furnace, located in the 10 x 14 ft. basement, supplies heat to the different rooms. The basement is walled and floored with concrete.

On the second floor are two large bed rooms, each with a closet, and the bath room. The bath room contains, besides the usual fixtures, a linen cabinet and a medicine chest. Maple flooring is used throughout the second floor. The woodwork and plastered walls of the bath room are enameled in ivory tone, and the woodwork of the remainder of the second story is painted a light buff color, while the walls are tinted in delicate shades. Both bed

rooms are exceptionally well lighted with windows, each possessing windows on three sides.

The principal framing timbers of this house are of the following dimensions: Mud sills, 4 x 6 in.; girders, 4 x 4 in.; first-floor joists, 2 x 8 in.; floor joists over basement, 2 x 10 in.; second-floor joists, 2 x 10 in.; ceiling joists, 2 x 4 in.; rafters, 2 x 4 in.; collar ties, 2 x 3 in.; ridge poles, 1 x 6 in.; plates, 2 x 4 in.; studding, 2 x 4 in.; underpins on piers, 4 x 4 in.; underpins on outer walls, 2 x 4 in.

The exterior vertical walls are covered with $\frac{7}{8}$ x 7-in. Oregon pine sheathing, placed diagonally. The sawed Redwood shakes are laid in alternate courses with exposures of 8 in. and 3 in. to the weather, and the belt courses are of 2 x 6 in. Redwood. The exterior stain used is composed of Princess red, lampblack, distillate and boiled oil, the latter constituting a fourth part of the liquid.

The overhang of the roof at the eaves and gables is 2 ft. 6 in. The covering of the roof, an asbestos-like composition, is "Silveroid," made by the Pioneer Paper Company of Los Angeles, Cal.

The sizes of the different rooms are shown by the accompanying floor plans, as already stated. The ceilings of the first-floor rooms are 9 ft. high and of the second-floor rooms 8 ft. 6 in. The paneled wainscot in the living room extends to a height of 4 ft. 6 in., which is also the height of the built-in book-cases and the fireplace mantel shelf. The plate shelf of the dining room, at the top of the paneling, is located approximately 7 ft. 6 in. from the floor, and the china closets reach to a height of 5 ft., while the counter-shelf of the buffet is about one-half this height. The woodwork of these two rooms is stained with Johnson's Wood Dye, made by S. C. Johnson & Son, Racine, Wis.

The furnace is of the hot-air type, called a "Browne," and was made by the Phillips Heating & Ventilating Company of Los Angeles.

This house was recently built in Los Angeles, Cal., at a total cost of \$4,300, and is the home of Thomas Haywood. Edward E. Sweet, a well-known architect of the city named, was the designer and builder.

Death of Frederick W. Dodge

Architects and builders throughout the country will regret to learn of the death of Frederick W. Dodge, president of the F. W. Dodge Company, which occurred at his home in New York City on the morning of Nov. 10. He was born in Melrose, Mass., Jan. 24, 1864, and was 51 years old. In 1891 he founded the company in question in Boston, and in the following year opened a branch office in New York City, where in 1896 he formed a partnership with C. W. Sweet, publisher of the *Architectural Record*, the *Record and Guide*, and *Sweet's Catalogue*. Shortly afterward the head office of the F. W. Dodge Company was transferred to New York City and its business of issuing daily building reports as devised by its founder was rapidly extended to other large cities. At the time of his death Mr. Dodge had been for several years one of the largest publishers of the country in the architectural and building trade fields, several of his publications being issued in New York, Chicago, Pittsburgh and other Western cities.

Some “Wrinkles” in House Building

Suggestions Regarding Constructive Features Likely to Interest the Young Builder in the Smaller Country Towns

By G. L. McMURPHY

WHILE the framing of ordinary houses between the foundations and the roof does not present many problems that should worry the ordinary carpenter, some suggestions relating to methods not commonly put into practice, but which if employed would improve matters, may be of interest, more especially to the younger members of the craft located in the smaller country towns.

Since the use of concrete became so general for foundations, and lumber has increased in price, the practice of using large timbers for sills has fallen largely into disuse and built-up sills are taking their place. In Figs. 1 and 3 are shown two methods of forming such sills which will be found satisfactory if the foundation walls are carefully leveled. Fig. 1 also shows the best method of building up corner posts that I have seen used. It gives strength and ample nailing space to each side.

If the floor lining is laid and partition sills run for both walls and interior partitions, as shown in

should be done wherever lap siding (clapboards) are to be used, I find the angle 8 x 12 handier and easier to work than an angle of 45 deg. The plumb cuts are easier to make and the extreme ends of the square give the angle without looking for figures. Also there is not so much loose upper ends of the sheathing to contend with.

Most headers and trimmers in ordinary houses are put together with spikes, but sometimes a stronger construction is desired where it is not necessary to use girders. The general practice, in the larger towns at least, now is in such cases to use steel hangers, but sometimes these are not readily procured, and, anyway, I am old-fashioned enough to prefer the older and time-tested framing methods. Three methods are shown at A, B and C in Fig. 1, of which A is the best, as it gives the largest proportion of strength in both header and joist with the least weakening by cutting, while the

Fig. 3 — Another Method of Framing Sill of the Built-up Type

Fig. 2—Showing a Good Method of Rat-proof Construction

Fig. 4—A Method of Laying Out Bridging with the Carpenter's Steel Square

Some “Wrinkles” in House Building as Described by the Author

Figs. 1 and 2, and a 2-in. (wide) ground put on next the floor lining it will make it a discouraging business for rats and mice to get through into the wall spaces, as well as help in making a good job of putting down the base. Of course, the floor lining should be laid diagonally, which will prevent its shrinkage from making a bad job of the finish floor, especially if hardwood or parquetry is used for finish. Incidentally I have found 6d casing nails do as well as heavier ones for nailing the finish floor.

Where the walls are sheathed diagonally, as

other two ways are not to be recommended, though I have seen both used by men who considered themselves superior workmen and designers.

The usual practice here is to stud walls and partitions solid and cut out door and window openings afterward, and I suppose most carpenters are familiar with the rule for cutting door openings—3 in. wider and higher than the door size, that is 2 ft. 11 in. x 6 ft. 11 in. for a 2-8 x 6-8 door; but I think few carpenters have any rule for cutting window openings, probably because windows were so

much longer in becoming standardized. It used to be necessary to procure a list of sizes from the dealer, of whom the sash were bought before making the frames. I have several such lists, no two of which give the same sizes for sash of the same sized glass. However, except for sash required to be made to special detailed designs, regular sizes are now pretty well standardized, and an allowance of $10\frac{1}{2}$ in. each way will make the right sized rough opening for windows where the sash are to be hung with weights. This rule will be found very convenient for all stock sizes and I have never seen it given or used outside of my own practice.

Where the extra cost of long studding or the judgment of the designer makes it desirable to build each story independent instead of running the studding all the way up for both stories and the construction at the second floor line is, as shown at Fig. 2, it will be advisable to make a joint in the sheathing about midway of the floor joist and leave an opening of an inch between the sheathing of the two stories to allow for the shrinkage of the joists.

Another thing that, while required by the building ordinances of some cities, is not otherwise usual-

water will find its way in and swell them and they will leak.

While on the subject of gutters I desire to say that many carpenters, in putting on wooden gutters return the gutter against the fascia or barge board, as shown in Fig. 5. This always looks to me like poor taste on the part of the designer or lack of skill by the workman. Fig. 6 shows what I consider the proper way to put on a wooden (or any other) gutter and the proper way to finish the end. Of course, where the gable finishes with a crown molding the gutter will miter against the crown molding. The above refers to the "Bungalow" style of finishing gables where no crown molding is used.

I desire to say in conclusion that all the foregoing is primarily intended for the benefit of the carpenter who is his own designer, and for the more inexperienced men who look to their trade periodicals to post them on matters concerning which they have no opportunity to learn by observation.

Perhaps some of the readers will express their views on various phases of building work so that

Fig. 5—Showing How Some Mechanics "Return" the Gutter Against the Barge Board

Fig. 6—What the Author Regards as the Proper Way to Put on a Wooden Gutter

Some "Wrinkles" in House Building—By G. L. McMurphy

ly done but should be, is that of cutting a row of bridging of the width of the studding midway in the height of all partitions including the walls for a fire stop to prevent a fire from finding a flue with a good draft in every wall space. A header the width of the floor joist should be cut between the joists over every bearing partition also.

I inclose a sketch, Fig. 4, showing how to lay out bridging with the steel square, which is self-explanatory.

When the frame is up and ready for the cornice and shingles the carpenter is sometimes called on to flash the openings for the down spouts, where wooden gutters are used and the tinner is not ready to put up the conductors, because this job can be done much easier and better before the shingling is done than after. The easiest and best way to do this is to get from the plumber a $1\frac{1}{4}$ or $1\frac{1}{2}$ -in. nipple or a short piece of pipe (2 or 3 in. long) with a thread on one end, bore a hole through the bottom of the gutter and screw the pipe in, bedding it well in white lead. This makes a solid job and one that will last as long as the gutter does. The conductor can easily be slipped up over it when the tinner gets ready to put it up. Of course all joints in wooden gutters should be well flashed with strips of sheet lead carefully bedded in paint, otherwise

there may be a comparison of methods as they obtain in different sections of the country. It might result in a most interesting and valuable discussion.

Coming Convention of Brick Manufacturers

The National Brick Manufacturers' Association has voted to hold its next annual convention in the city of Cleveland during the week beginning Monday, Feb. 21, 1916, at the Hotel Statler. The convention will occur at the time the Complete Building Show is in progress, as this occurs in Cleveland Feb. 16 to 26. We understand that had it not been for the Complete Building Show, the brick manufacturers would probably have held their convention in Atlantic City, but those interested in the Cleveland Exposition made a thorough campaign in the interests of that city and endeavored to convince the brick manufacturers that a real opportunity to place their material before a vast building public was offered at the Complete Building Show.

Other conventions that will hold their meetings in Cleveland during the period named include the National Builders' Supply Association and the Ohio Builders' Supply Association.

Need of Accurately Estimating Costs

The Ability to Correctly Estimate Is the Dividing Line Between the Journeyman and the Master Builder

ESTIMATING building construction costs is very largely a mathematical process, but successful estimating often depends upon whether the estimate is made up in a mechanical or in a conscientious way. It requires, in the first place, an analytical mind. In the second place, it demands resourcefulness, while in the third place it calls for a thorough knowledge of a dollar's buying power in the labor and material markets.

Ability to Estimate Is the Dividing Line Between the Journeyman and the Master Builder

It has been said that the ability to estimate is the dividing line between the journeyman and the master builder. It requires more than mere accuracy and deftness in figuring. Experience and judgment are absolutely essential, a working knowledge of building construction, various materials, their market values, and the discounts allowed in the trade is vital. Then he must know how to apply them to the peculiar conditions which surround the operation he is working on. But prices and discounts are constantly changing, and cost of labor is higher to-day than at any time in the history of construction, and even construction methods are not proof against revision and reform. Building laws must conform to this progression, and what was lawful last year may, by ordinance, be entirely unlawful this year, says a writer in a recent issue of *Construction News*. These are only a few of many departments with which the estimator must keep abreast, because each change in practice or improvement in material or methods, has a tremendous bearing upon the ultimate price of the operation, and frequently, in this age of speculation, upon the final decision of the owner as to whether he will go ahead with his plans or postpone.

In Touch with Market Conditions

It therefore is apparent that the estimator must keep in constant touch with market conditions. To do this he must depend largely upon his own queries for figures and discounts, but the only way in which he can know that he is getting all the discount he is entitled to is by consulting market reports and by noting the trend of buying or selling in the wholesale market and the conditions governing the sources of supply and shipment. Despite anti-trust and anti-monopolistic laws the tendency of the times is to standardize building materials of all kinds, and as soon as these are standardized prices naturally will be on a more or less fixed or stable level. The prices for many building materials to-day seldom, if ever, change, but the discounts on them fluctuate widely and sometimes suddenly. Glass and hardware are notable examples of this kind of price changing. Other materials, such as lumber, cement, common brick, sand, steel,

gravel, crushed stone and cinders are subject to the primary law of supply and demand, and their prices are liable to change without warning. There are other materials, such as front brick, stone, marble and roofing material which seldom report a fluctuation, and there are still other materials, like architectural terra cotta, upon which there is no fixed price, a special figure being given by the manufacturers according to the intricacy of the design.

Because of this wide variation in prices some estimators figure their whole proposition out on a time basis, estimating materials in quantities and keep a cost data system in their offices upon which they can rely when information of this sort is sought at some future time. This is done whether the bids were successful or not. They afford an opportunity to compare the estimates of cost of the different items with the actual cost of execution, and if a bid fails to win the job, satisfaction and experience may be gained by noting the items which may have been priced too high or too low. Another source of information is the catalogue. If these are properly indexed for ready reference they will be found of great value for specific information. For close estimating bottom prices and full discounts are necessary, so that the estimator here consults the prices quoted by the salesmen direct, guided the while by the current market reports in his specialty publication carrying this kind of service.

Practice Among Small Contractors

It is the practice among small contractors to add a lump sum to the total costs, the size of which depends entirely upon the activity of competition and the circumstances of the operator. If the payments are to be arranged on advantageous installments, so that the bidder can take advantage of the time discounts allowed on all work, he makes his profit a little lower. If long payments (hence heavy interest charges) are specified, then his profit appropriation is apt to be big. Some estimators base their profits upon a percentage of the estimated cost. This varies in ordinary cases from 10 to 20 per cent., according to the caliber of workmanship stipulated and the selection of materials and the expense of handling it. Therefore, locality counts for much in the high or low cost of the work.

Figuring on duplication is an important item, especially if the work is of the suburban residential type, where one building will be duplicated many times. A considerable saving is then possible, because certain kinds of material are purchasable in large quantities, either worked or unworked. This is especially true in manufactured parts, such as doors, windows, columns, balustrades, trim and flooring. The distance of the work from the material distribution center has much to do with the profit, although when materials can be taken direct

from the car to job on a special order, the cost is materially reduced, because then the material has only one handling and the extent of damage or waste is greatly reduced. Many contractors keep on file data of haulage costs from different sites on which they have figured for reference, and in this way they sometimes are able to underbid their competitors on this item alone. The most convenient and reliable of these systems is known as "cubing." It is a system of taking the cubical contents of a building and fixing a price upon it. The rate is obtained by a comparison of plans and requirements with similar buildings which have been erected under conditions as near like those of the job in hand as it is possible to find them.

Determining Cubical Costs

There are several methods of determining cubical costs, however. One method is to multiply the square feet in the plan of the building by the height from half the depth of the foundation to half the distance to the roof. Another system uses the height from the bottom of the foundation and another obtains the actual cubical contents. Any of these may be used if the data for comparison is obtained in the same way, but all are subject to important variations which experience and judgment alone will determine. For instance, if the contour of the building is very uneven, with low portions, such as porches and sheds and high portions, such as towers and cupolas, these must either be omitted from the whole and compared separately or a lump sum be added or subtracted according to the size and importance of the members.

Estimating by "Cubing" Is Only Approximate

Another variation arises in the sizes of the rooms, giving a ratio of partitions and division walls which is not constant, and, of course, a large building with many duplicate parts will require a different rating from a small one, so that the method of estimating by cubing is at best approximate, and its degree of accuracy depends largely upon the experience and judgment of the contractor. Even long experience will afford no safeguard against unusual feature of the interior, so that the cube rates can only be applied to buildings of ordinary character, and comparisons are only reliable between buildings of like descriptions and uses, as the treatment of even the same materials will vary largely in buildings of varying uses. The height of a building will not increase the cube rate proportionately, unless the internal voids are alike, although it is certain that the higher one builds from the ground the more time and expense it requires to put the material in place, to say nothing of thicker walls or heavier steel and more expensive equipment, especially in elevators.

Estimating by the Square

A convenient method of estimating is by the square of 100 surface feet. This is especially applicable to office buildings, schools, mills, stables, garages and all buildings where the floors are few in number or similar in plan. For one-story buildings the price per square is taken to include the roof walls, floor and foundations, but for buildings of two or more stories the price per square should be

taken separately for each floor, the lower floors being prices to include the foundations and the top to include the roof.

This method of estimating by the square is not so accurate as by cubical contents, but the results are often more convenient and adoptable, because the tabulation of the square area of the various floors may be easily reduced to terms of accommodation for public buildings or shops. For instance, a given floor area in a schoolhouse means accommodation for a certain number of pupils; in a church for a certain number of sittings; in factories for the manufacture of staple goods a certain number of machines and operatives. This unit of accommodation is sometimes carried farther, and, by the reverse process, is made the basis of another method of estimating the approximate cost of such buildings—i. e., schools, churches, factories, hospitals, mills, etc. This also is used as a method of comparison, the known data being supplied by previous experience or by calculation, and it is often valuable as a means of determining the approximate cost of buildings necessary to accommodate a certain number of individuals or machines, even before any definite plans have been drawn.

All of these methods are approximate, with varying degrees of accuracy. But before using this system as a basis for a contract figure, a sum, governed by the judgment of the estimator of the actual operation, should be added to the total of the original estimate to allow for any possible shortage.

Commercial Importance of the Builders' Exchanges

The importance of the Builders' Exchange to the community, in its dual capacity of regulator of estimates, and correct dealing, and its position as the clearing-house for the vast amounts of capital the investor yearly expends in building materials and construction, is hardly recognized at its full value, says a recent issue of the *Western Architect*. Here is an association of identical interests in which the keenest rivalry exists; a "combine," if you please, in which the basic principle is competition, and thus sets aside all the rules of the game that impose upon the public by close corporation methods as they are popularly known. Any man or firm engaged in handling construction contracts, or dealing in materials in a legitimate manner, is welcomed to the Builders' Exchange; ability, honesty and integrity being the only necessary recommendation. Where it has been charged that the Exchange refused admission to the small contractor, it has been found that it was the irresponsible, and therefore detrimental, both to the general contracting interests and to the public, that was barred from membership.

Often misunderstood by labor in its opposition to the "closed shop" principle, its endeavor has been, not to reduce but to equalize and make more stable the wage for efficient performance, both in the interest of the contractor and the wage-earner. In its activities for the betterment of labor conditions, upon which much of success in contracting rests, the Exchange advocates the establishment and maintenance of practical trade schools.

A Seven-Room Dutch Colonial House

A Compact Arrangement with the Living Room a Notable Feature—A Few Details of Construction

IN response to numerous inquiries for the plans, elevations and miscellaneous constructive details of a Dutch colonial dwelling containing seven rooms and bath, we present herewith an interesting example of domestic architecture designed to meet the requirements named. An inspection of the floor plans shows the living room to be one of the noticeable features, this extending the full depth at one end of the house, and having as its central feature an open fireplace with mantel of tapestry brick flanked on either side with French casement doors which give out upon an open porch of cement finish. The main stairs are centrally located and the landing is lighted by a window

flue tile projecting 10 in. above the cap stones.

The foundation walls are to be of concrete 12 in. thick, or of field stone 20 in. thick, resting on footings of stone or concrete not less than 10 in. thick, and projecting at least 6 in. beyond the walls on both sides. The timbering is to be of spruce or hemlock with sills 4 x 6 in., laid flat; girders of 6 x 8-in. spruce; first floor beams of 2 x 10 in. and the second floor beams of 2 x 8-in. long leaf southern pine, all placed 16 in. on centers; the rafters 2 x 8 in. placed 20 in. on centers and the ridges 10 x 1¼ in. The beams are to be doubled for all headers and trimmers, around chimneys, etc., and to be hung in stirrup irons.

The outside vertical walls are to be sheathed with 7/8 x 8-in. matched boards, dressed on one side. On these are to be laid one thickness of building

Perspective View of a Seven-Room Dutch Colonial House—Architect, Frank T. Fellner

in the second story of the rear wall. The stairs to the cellar are directly beneath the main flight and are readily accessible from the kitchen pantry. Entrance through this to the kitchen is from a rear porch, the door of which is in line with the cellar stairs. At the right of the hall is the dining room and beyond this the kitchen, provided with ample cupboards, and with the sink placed directly beneath the window at the rear.

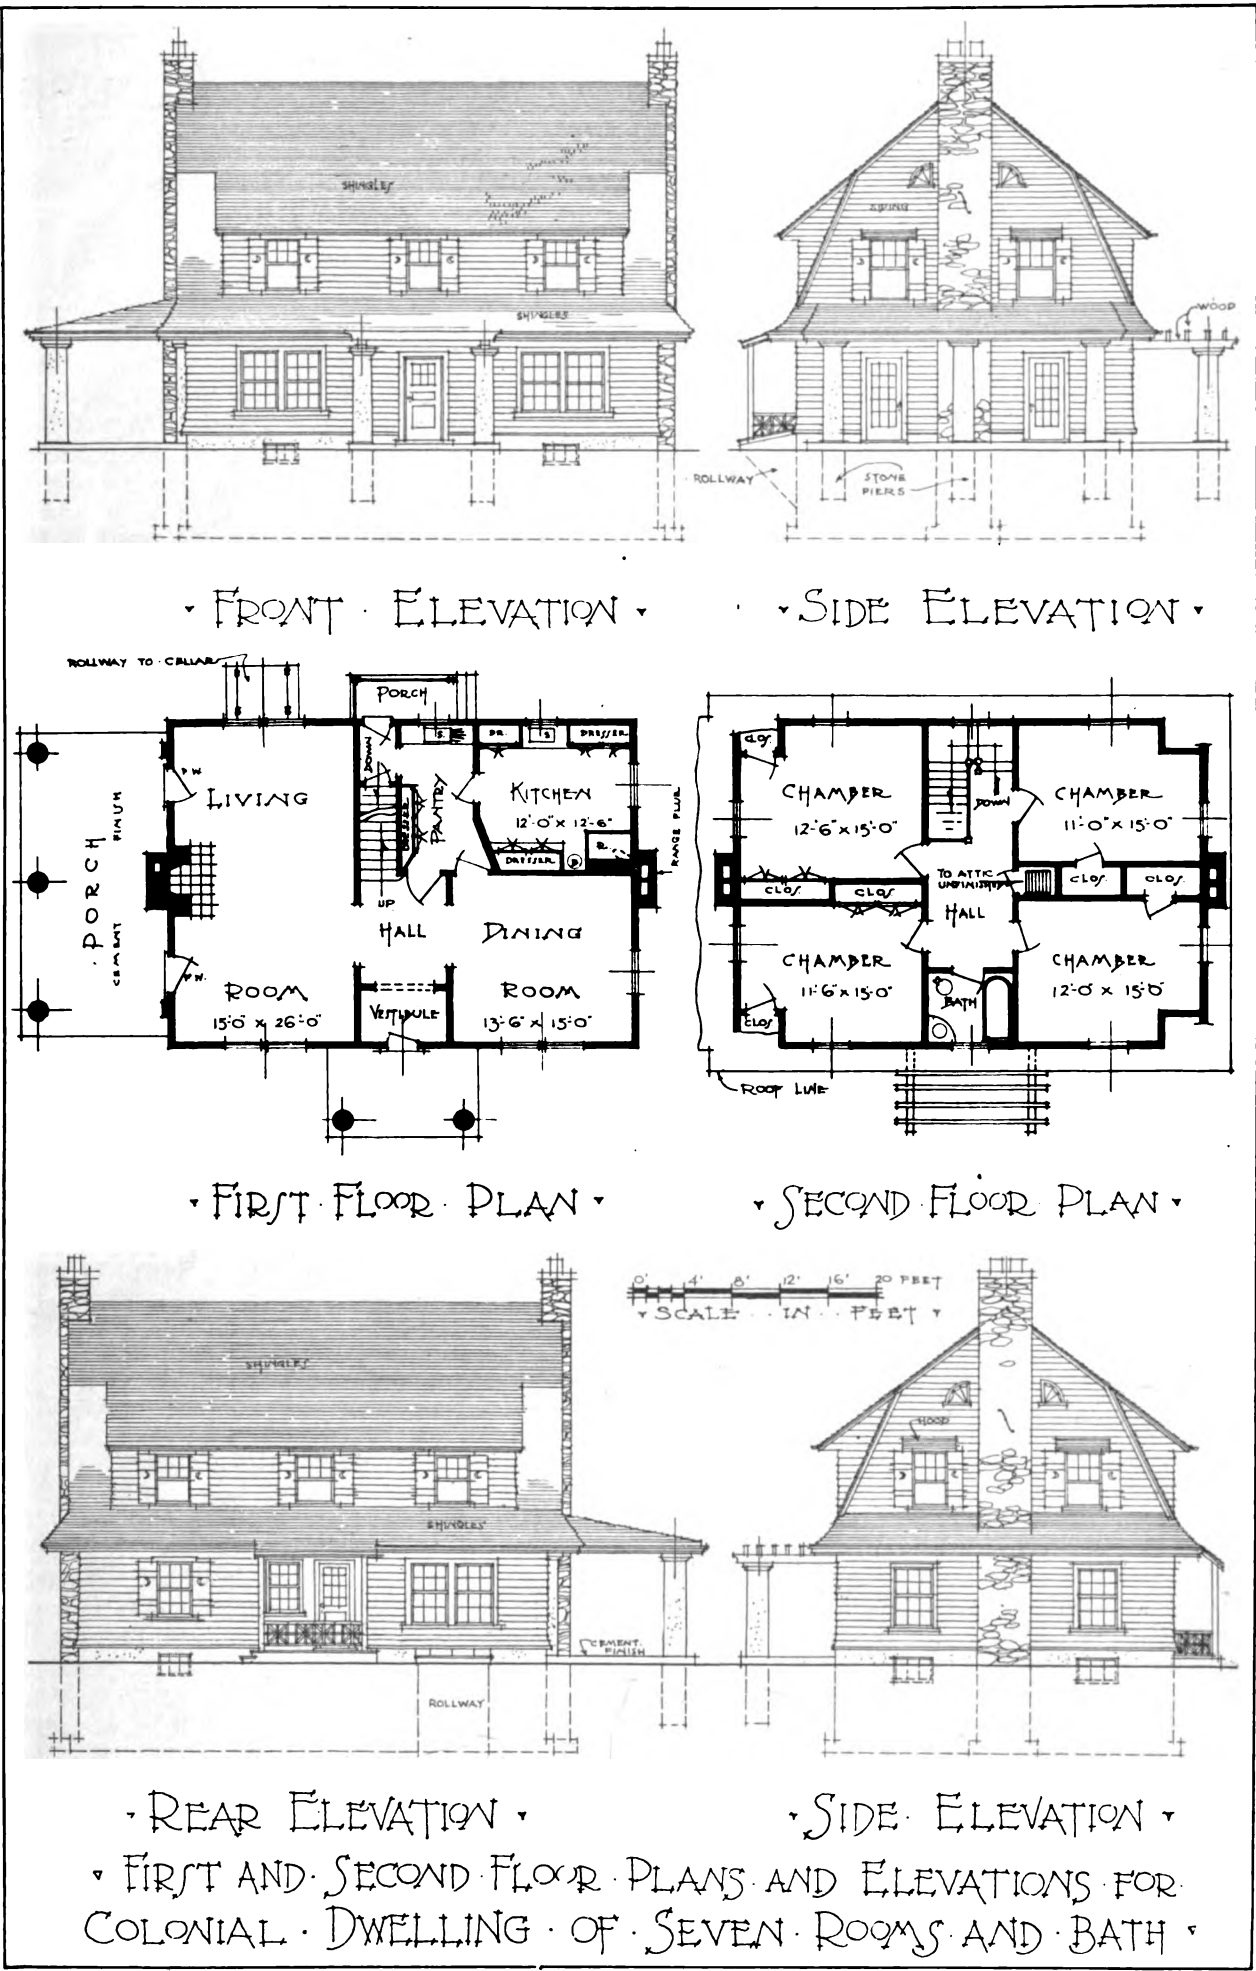

On the second floor are four sleeping rooms, each provided with wardrobes or closets and with the bath room conveniently accessible from all sleeping rooms.

The chimneys at each end of the building are to be constructed of field stone laid up in white cement mortar with struck joints and finished with blue stone caps 5 in. thick and topped with round

paper well lapped and this in turn covered with clapboards.

The roof is to be covered with asbestos, asphalt or wooden shingles, according to the preference of the owner. If wooden shingles are used they are to be laid with an exposure of 5½ in. to the weather.

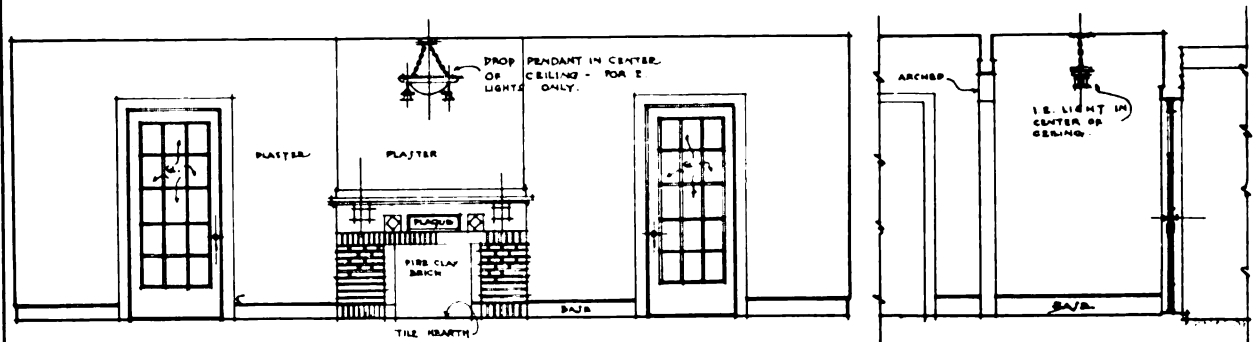

The cellar in the clear is to be 7 ft. 4 in. and is to contain the laundry which will be provided with two tubs and a water heater. The first story rooms are to have double floors, the finish floor to be 7/8 x 2½-in. tongued and grooved best quality maple, blind nailed. All interior trim, base, balustrade on the second story, clothes dressers, etc., are to be of plain design and of thoroughly seasoned and kiln dried white pine or cypress. The main cornice, etc., is to be formed with plain fascia and simple cornice moldings and soffit. Hoods are

to be placed over the second story windows on the sides, as shown in the elevations.

The rooms are to be plastered with three-coat work, the living room, dining room and hall to have a sand finish and the other rooms a hard white finish.

The floor on the bath room in the second story is to be laid with white tile on a cement bed, with tile base and cove. The wainscoting is to be of tile, extending up from the floor a distance of 5 ft. and finish with a neat cap.

The heating is to be by hot water system, the exposed pipes in the cellar to be covered with asbestos packing. All rooms and the hall, except pantry and kitchen, are to have radiators located where possible under the windows or at least in close proximity to them.

The house is to be piped for gas and wired for electric fixtures, the latter to be of the combination type. The fixtures for the dining room and living room are to be drop pendants—a five-light drop for the living room and four-light for the dining room—with wall brackets for the bed rooms. The

hardware is to be of colonial design, black iron finish.

The plumbing fixtures are to be porcelain of modern design and with nickelplated fittings. The building is to be drained to the street sewer or to a cesspool in the rear in case no sewer is provided in the street.

The outside wood and metal surfaces are to receive three coats of paint and the roof shingles, if of wood, are to be dipped in stain before laying. All inside woodwork on the first and second floors is to receive three coats of paint.

The architect gives the approximate cubic content of the house as 34,590 and the unit cost 19c. a cu. ft. He states that this estimate does not include contractor's profit "nor does it cover any particular locality or section of the country in which the house may be erected."

The design here shown was prepared and specifications furnished by Frank T. Fellner, architect, 413 Caton Avenue, Brooklyn, N. Y., or care of THE BUILDING AGE, 239 West Thirty-ninth Street, New York City.

Standard Rules for Measuring Plaster

A Chapter Taken from the Handbook Issued Under the Auspices of the Illinois Society of Architects

THE following are the standard rules covering the measurement of plastering as adopted by the Employing Plasterers' Association of the city of Chicago, and may be of interest to the trade in other parts of the country.

Lath and plastering to be measured by the superficial yard, from floor to ceiling for walls, and from wall to wall for ceiling.

In rooms containing one or more horizontal angles between the floor and ceiling line, the ceiling to be measured from wall to wall, as though all walls were vertical, for contents of ceiling, and from floor to highest point of ceiling for height of wall.

Openings

Openings in plastering to be measured between grounds. No deductions to be made for openings of 2 ft. or less in width. One-half of contents to be deducted for openings 2 ft. or more in width. The contents on all store front openings to be deducted, and the contractor to be allowed 1 ft. 6 in. for each jamb by the height.

All beams or girders projecting below ceiling line to have 1 ft. in width by total length added for each internal and external angle.

No openings to be deducted from "solid" or "hollow" metal lath and plaster partitions nor for openings in suspended ceilings containing less than 100 sq. ft., where furring is carried around such

openings by plasterer. No openings to be deducted from cement wainscot or base.

Corner Beads, Arches, Etc.

All corner angles of more or less than 90 deg., beads, "bullnoses," quirks, rule joints and moldings, to be measured by the lineal foot on their longest extension, and 1 ft. for each stop or miter.

Cornices

Length of cornices to be measured on walls. Plain cornices of 1-ft. girth or less to be measured on walls by the lineal foot. Plain cornices exceeding 1-ft. girth to be measured by the superficial foot. Add one lineal foot to girth for each stop or miter. Enriched cornices (cast work) by the lineal foot for each enrichment.

Arches, corbels, brackets, rings, center pieces, pilasters, columns, capitals, bases, rosettes, bosses, pendants, and niches, by the piece. Ceiling or frieze plates over 8 in. wide by the square foot.

Columns

All columns to be measured by the lineal foot for plain plastered columns.

Cement Wainscoting and Base

All cement wainscot to be measured by the square foot, and cement base by the lineal foot.

Grounds

All grounds for various classes of work to be as follows, unless expressly specified to the contrary.
 Grounds for 2-coat lath work..... $\frac{7}{8}$ in.
 Grounds for 3-coat lath work..... 1 in.

Grounds for 3-coat metal lath work.....	5/8 in.
Grounds for 3-coat metal lath work, on 1/2-in. iron furring	1 1/8 in.
Grounds for 3-coat metal lath work, on 1-in. iron furring	1 5/8 in.
Grounds for hard mortar metal lath work.....	5/8 in.
Grounds for hard mortar metal lath work, on 1/2-in. iron furring.....	1 1/8 in.
Grounds for 2-coat work on brick or tile.....	5/8 in.
Grounds for hard mortar on brick or tile.....	5/8 in.
Grounds for hard mortar lath work.....	5/8 in.
Grounds for plaster board.....	5/8 in.

Where metal lath is spoken of it applies to all wire or metal lath.

Jurisdiction Claims

By Plasterers' Union, any and all plastering, regardless of the nature of the material or of the

structure to which it is applied. By Lathers' Union, any and all lathing, metal corner beads, all light iron furring designed, specified or used primarily as a support for lath and plaster.

Patching of plastering after other mechanics shall not be done as a part of the contract price and shall be paid for at the following scale of prices, which are in accordance with present wage agreements:

Plasterers	90c. per hr.
Lathers	90c. per hr.
Laborers	60c. per hr.
Mortar	\$1.50 per bbl.
Putty	\$2.00 per bbl.
Stucco	70c. per cwt. jute sack
Cement	70c. per cwt. jute sack
18-gage 3/4-in. mesh painted wire lath or	
24-gage metal lath painted.....	25c. per yd.
1 1/2-in. pine lath.....	35c. per bunch

Practical Manual Training in St. Paul

Type of Work Bench Designed Especially for the Purpose—What The Builders' Exchange Has Done

WE take the following relating to the above subject from the last issue of the "Monthly Letter" of The Builders' Exchange of St. Paul, Minn.:

Manual training applied to practical use brought highly satisfactory results in a demonstration made in the public summer schools in St. Paul during the past season. The Department of Education of this city required 150 work benches for the manual training classes of the grade schools. The fund available for the purchase of the equipment was found to be insufficient. The Supervisor of Manual Training of the St. Paul schools, D. V. Ferguson, a practical mechanic, as well as a highly skilled instructor, was determined to have a complete equipment for the fall term of school. He therefore made a proposition to the Department of Education to build the required benches and have same ready on time and to keep the cost within the fund available. His plan involved the use of the shops in one of the high schools. His force to be made up of four instructors from the Manual Training Department of the schools, to be selected by him because of their practical knowledge of the work. The crew was to be made up of students attending the Manual Training Department of the summer schools. Mr. Ferguson's proposition was accepted by the department, and when the summer school opened he went to work.

One of the things which Mr. Ferguson resolved to do was to build the benches on the plan of his own design, with a drawing board and seat attachment as shown in the accompanying picture. This bench is known as the "Ferguson Special."

Mr. Ferguson, in speaking of his assistants and the system by which the work was done, has this to say: "Perhaps one of the greatest secrets of the success of the enterprise was the fact that I was permitted to have practical shop men (instructors in the city schools) who knew the commercial as well

as the teaching side of the work for instructors."

The school opened with an enrollment of twenty-five boys, seven entering later. The average attendance during the term was twenty-seven. The total number of hours worked was 120. The benches were completed on time, the cost of each being \$8.61, which included material, power, salaries of instructors, etc. The commercial price of a bench lacking the improvements of the "Ferguson Special" would

Style of Manual Training Bench Used in the St. Paul Schools

have been \$14. This practical instructor not only had 150 benches ready to install in his department on the opening of schools at a considerable saving in price to the city, but also had the satisfaction of making a successful practical demonstration in the use of the Manual Training Department of the public schools, which has attracted the attention of

school authorities in a large number of the cities of the country.

The Builders' Exchange of St. Paul has been instrumental in bringing about conditions which made the above demonstration possible. Years ago Manual Training was looked upon as a fad in the public schools. Few of the instructors were men with practical knowledge of the subject they were teaching. When we first interested ourselves in the work, the instruction was such as any boy could give himself. The necessary rudiments of mechanics were lacking. No attempt had been made to instruct the boys how to sharpen or correctly use the tools with which they were to work. This has all been changed now. Practical men have been put in charge of Manual Training and the courses are of a practical character; while trades are not learned in the schools the instruction received is of a kind that lays the proper foundation for entering a trade if a student desires.

Sand Foundations for High Buildings

Sand, being almost incompressible under ordinary conditions, can sustain very heavy loads with slight or negligible compression. When it directly overlays rock or other thick, hard stratum and is securely confined or otherwise protected against possibility of lateral displacement it forms a satisfactory foundation and will carry heavy loads with safety as long as these conditions are maintained, says the *Engineering Record*. It transmits pressure laterally so that a heavy vertical load may produce considerable horizontal thrust and to resist it the sand must be confined horizontally by natural or artificial means. At considerable depths below the surface the weight of the superincumbent material affords resistance to transverse or upward pressure and is equivalent to lateral confinement for ordinary pressures. This resistance, of course, ceases whenever an excavation is made below and adjacent to the point of application of vertical pressure.

The presence of water makes a great difference in the character of the sand so that the drainage of wet sand or the saturation of dry sand under pressure is an important matter, while flowing water passing through sand, especially if fine, is very likely to carry the grains with it or produce a considerable movement.

Careful consideration must, therefore, be given to these factors when it is proposed to build heavy structures on sand foundations. If any changes in the amount of water in the sand are possible adequate safeguards to maintain the conditions must be adopted.

Many heavy buildings of moderate height, including some of the earlier steel cage skyscrapers, have foundations on sand, usually only a few feet below the surface, and these foundations in many instances have proved entirely reliable. Almost all of them are at or above ground water level. Formerly they were made with timber and masonry footings, then of concrete and now almost entirely of reinforced concrete or of steel beams enclosed in concrete.

Some buildings have a monolithic foundation slab covering the entire area. While theoretically this distributes the load uniformly and produces

the smallest unit pressure, it is generally very difficult and expensive to avoid excessive stresses in the distribution, and some such footings, especially those of concrete without adequate reinforcement, have become badly cracked and broken and have permitted serious settlement. It is, therefore, the general practice now to support the columns singly or in small groups on isolated separate footings proportioned to reduce the loads to substantially the same unit pressure on all.

The Spreckels Building, San Francisco, fifteen stories high, was built about fifteen years ago with all of its columns seated on a double grillage of continuous I-beams reaching entirely across the lot in both directions and embedded in a mass of concrete more than 4½ ft. thick resting on wet sand 25 ft. below the surface of the street. This has proved satisfactory, enduring severe earthquake shocks which it was expected to resist.

The columns of the St. Paul Building, a twenty-six-story structure in New York, have steel beam and girder grillage with concrete footings on the wet sand about 30 ft. below the street. The sand was loaded to 8000 lb. per square foot and in several years has settled only a fraction of an inch and with such regularity that it has been unnecessary to adopt the special provisions designed for compensating irregular or excessive settlement.

In the new Municipal Building, New York, part of the foundations are carried to solid rock and part supported on wet sand.

Building Material Exhibit in San Francisco

Arrangements have been made by a number of exhibitors of building material at the Panama-Pacific Exposition to establish a permanent exhibit when the fair is over, for the convenience of architects and prospective builders in San Francisco and vicinity. The collective exhibit will be installed on the third floor of the Newman-Magnin Building at Stockton and O'Farrell Streets, and will be under the management of L. Fisher and T. M. Simpson, who have recently made a study of such exhibits as conducted in other cities. The lines exhibited will include brick and tile, glass, marble, plumbing and electrical fixtures, building hardware, hardwood fittings, paints and varnishes, heaters and refrigerators, etc. According to the preliminary plan, a number of exhibits will be brought intact from the Exposition to the new location.

Accelerator for Hardening Concrete

Experiments have been made by the United States Bureau of Standards to develop a method for accelerating the hardening of concrete in order that the material might be utilized in place of the willow mats that have been used in the past along the Mississippi River. The Bureau finds that 4 per cent of calcium chloride added to the mixing water increases the strength of the concrete at the age of one day 100 per cent or more. In some cases the strength of the concrete in which the calcium chloride was used at the age of two days equaled 75 per cent or more of the strength normally attained in one month.

A Sanitary Corn Crib — For The Up-to-Date Farmer

A Necessary Adjunct of the Farm That Is Unique in Its Construction and Is Both Fireproof and Ratproof

BY W. E. FRUDDEN

THE day of better corn cribs is at hand, for corn that is worth 50 to 60 cents per bushel needs to be cured and cared for in a proper manner, and this fact is being appreciated by the progressive farmer. Rats that spread plague and disease as well as eat up the profits of the farmer are dangerous. The present-day crib construction immunizes the cribbed corn from the invasion of mold or rot and assures the owner that every kernel will be turned into money. Farm efficiency is cutting wide swaths in twentieth century agriculture.

In the pictures and detail drawings here presented there is told the story of how one Iowa company built a 10,000 - bushel round crib that is fit for high-priced corn. It was constructed of hollow clay blocks with the open ends out and set at an angle so that the rain could not reach the cribbed corn. Its construction is such that it lessens the work of cribbing since a small elevator in the center ventilating core, operated by a small oil engine, hoists the corn to the crib from the wagon dumps. It cures the corn properly and stores it with safety. It is a type of corn crib that corn belt farmers can well afford to build. This method of crib construction can be carried out to advantage in any size or capacity of crib. It is adaptable to the needs of the small quarter-section farmer as well as of the big farm

that covers a section or more of land. It is a crib that if made in large sizes fits well the needs of the small or large elevators over the country.

Thirty by thirty-two feet is the size of the crib shown in the details, and which gives promise to become exceedingly popular in the corn States. Round cribs need less material and have more strength than rectangular cribs of the same capacity. When the method of building becomes more

generally known by builders, this type of crib will come to its own. Circular walls are easiest built of blocks, and when safely reinforced in the mortar joints by $\frac{1}{4}$ -in. wires, the resulting wall is a permanent and serviceable improvement.

For the foundation of cribs of this sort footings 2 ft. wide are necessary. This is 8 in. thick and goes down about 3 ft. below the grade line to insure safety from frost. A 16-in.

or 18-in. foundation wall of concrete will support the building. Use a 1:5 or a 1:4 mixture for this work. The foundation for the center 10-ft. ventilating core will be of just the same dimensions as for the outside walls.

In laying the foundation wall above grade, the 5-in. drain tile must be imbedded into the concrete. These are for drainage and also as an air space under the floor. Crib floor construction of concrete has had many enemies in the past due to the

The Corn Crib in Process of Erection and Showing Appearance of the Hollow-Tile Wall with the Rat-proof Table

fact that it causes moldy corn. Concrete floors must be built to be dry. Good results will be secured if one follows out the details as shown in the cross section of the walls. Keep the concrete from coming in direct contact with the soil and soil moisture. Cover the entire space with 6 in. or 8 in. of coarse gravel before laying the 5-in. thick floor. The drain tile are set in first before the floor is laid and placed about 4 or 5 feet apart and run through to the ventilating core. Shelling trenches in the floor, 18 in. wide and 18 in. deep, are built in to make easy the job of shelling corn. An endless belt runs through the trench and carries

The walls of the crib are 8 in. thick. The blocks made especially for the purpose are set at a slope of one to four, as shown in the diagram. The blocks are 8 x 8 x 8 in. in size. Each has four air cells. Since they are not square cut, they will make a smooth outside and inside wall and will at all times keep out the rain and moisture. It is necessary that the walls be smooth and perpendicular, or the corn will lodge and bridge across, throwing an unusual strain on the walls. No. 2 and No. 3 corn has been shelled out of these cribs when in the same community other cribs have been a source of nothing but moldy corn. Ventilating cribs are a

A Sanitary Corn Crib for the Up-to-date Farmer—Some Miscellaneous Details of the Construction

out the ear corn to the sheller. Short pieces of plank are laid over the trench when being filled. It is estimated that from $\frac{1}{2}$ to $\frac{3}{4}$ cents per bushel of shelling costs can be saved by using a crib of this kind. One man can roll the ear-corn into the trench and feed more corn than the average sheller can handle. The walls of these trenches are of concrete or could be made up from a hollow block, thereby eliminating the building of the "forms." For the floor and foundation of this Iowa crib there was required about 8 yd. of gravel and 14 barrels of cement.

big problem to solve, but this tile crib seems to fill the bill in a very acceptable manner. Every course of blocks in the wall are reinforced with three $\frac{1}{4}$ -in. black unannealed wires set in the mortar joints. To fight the hungry and troublesome rats, a rat-proofing screen covers the inside of the three lower blocks, while a galvanized rat-proofing table projects out 4 in. Made of heavy material, it will not readily be bent out of shape, and if the outer edge is bent downward, horses or other stock will not be injured. The roof is built with a double 2 x 8-in. plate

bolted to the top of the tile wall, as shown in the details. These bolts can be easily made by any blacksmith. The rafters of 2 x 6 in. are then nailed to the plate and are supported at the center by posts projecting upward from the ventilation core walls. At the lower end of the rafters near the outside walls the rafters should not be over 3 ft. apart.

A Sanitary Corn Crib for the Up-to-date Farmer—Two Examples—One Having a Capacity of 8000 Bu. and the Other 12,000 Bu.

When all the rafters have been spiked to the plates, pieces are nailed in between at intervals of 6 ft., starting at the lower end and running upward; then nail on the sheathing so as to run with the rafters. It is a good plan to curve the pieces which are nailed in between the rafters; that is, make them a little higher in the center. The resulting roof will then be perfectly smooth and will give a very pleasing appearance. One by four sheathing is commonly used with shingles of a tar and asphalt preparation or of metal. At the top of the roof is placed a large cupola or ventilator of galvanized metal. This will draw like a chimney up through the ventilating core and the result is that all the moisture is pulled out of the corn that is stored in the surrounding cribs.

The round 10,000-bushel crib here shown can be built for \$2,700. This price includes the building complete with roof, the cup elevator and the gas engine and everything in readiness for operation—ready to receive the corn. The tile were purchased at the rate of \$60 per 1000. This particular crib was built for a farmers' co-operative elevator company in Iowa. For the average farm, however, a much smaller crib would be needed. Many of the smaller size have been built on smaller farms with good results. A capacity of about one-quarter this size would fit well on many farms. For \$700 or \$800 a farmer could build a very satisfactory crib of this type and one that would last a lifetime, fight rats and mold and give him big returns for the money spent in the building of the crib. The scheme is adapted for almost any section of country and should interest many readers.

Novel Method of Handling Plaster

A somewhat unique method of handling plaster by means of wheelbarrows and hoists was utilized in connection with the interior finish of a reinforced concrete building in a Northwestern city. The plaster was mixed by hand and shoveled into steel wheelbarrows, which were raised to the various floors.

A steam hoist on the ground had its cable led through a boom on the tower of the concrete elevator, and a landing platform projected from the floor where the plastering was in progress. The end of the cable had a three-rope sling; one rope had a hook which engaged the wheel of the wheelbarrow, and the others had iron rings to be slipped over the handles of the barrow.

Four men were employed for doing the work. One mixed the plaster and loaded the wheelbarrows; one handled the hoist; one wheeled the barrows to and from the hoist, attached and detached the sling and held a tag line to steady the barrow and keep it clear of the building in raising and lowering, while the fourth man was on the upper floor to swing in the loaded barrow on the landing platform, unhitch the sling, wheel the barrows on the floor and attach the sling to the empty barrows.

Panama-Pacific Exposition Buildings Sold

During several weeks preceding the close of the Panama-Pacific Exposition, many of the State and special exhibit buildings were put up at auction. Notwithstanding the high architectural merit of

View of Crib Showing Rat-Proofing Band, Shelling Trenches and Openings in the Base for the Ventilation of the Floor

many of the buildings, some of which were substantially built, the prices realized were very low, the buyers in nearly all cases being wrecking firms. The fine building erected by the State of Illinois at a cost of \$92,000, was sold for \$1,730, and the New York City building, costing \$34,000, brought only \$300.

The figures on some of the other buildings are as follows: Washington State, cost \$45,000, sold for \$800; Mississippi, cost \$13,000, brought \$225; Idaho, cost \$16,000, brought \$270; Texas, cost \$10,000, brought \$225; and the Iowa State Building, costing \$28,000, brought \$500.

The picturesque Oregon building, of massive log construction, did fairly well, selling for \$1,520. A proposition has been made to move the New Jersey building across the bay on a barge, and convert it into "flats"; and local patriotic societies are endeavoring to raise funds to move the Virginia building to Lincoln Park.

The movement to preserve the Palace of Fine Arts, the most substantial of the palaces and generally considered the most beautiful, has been practically given up, as the building stands on Government land which is needed for military purposes; but there is talk of rebuilding it in Golden Gate

Park. Efforts are also being made to preserve the California building, but the outcome is doubtful.

The impressive Lumbermen's Building and House of Hoo Hoo, built of characteristic logs of many kinds and ornamented largely with redwood bark, has been sold to the Peninsula Land & Improvement Company, and will be set up as a public building in the nearby town of Monte Vista.

There is some probability that the removal in the near future of most, if not all, of the main exhibit palaces may glut the local market with large dimension timber, which is the main material used in their construction, and which was bolted together in such a way as to cause comparatively little injury to the material. On the other hand, the large quantity of bolts, rods and bars used in these buildings should find a good market, if they can be removed within the next few months, as deliveries of new material are badly delayed and the supply light.

Convention of Builders' Exchanges

The Coming Meeting to Be Held in Baltimore in February Looms Large in Importance

AS the time approaches for the National Convention of the Builders' Associations of the country, to be held at Baltimore, Md., Feb. 22, 23 and 24, 1916, the building fraternity is impressed with the strong probability that these deliberations will be looked back upon as marking an important turning point in the method of conducting the building operations of the country.

We find the leading architects advocating contract reform with full arbitration for all questions, the builders strenuously working to attain the same end, and many leading real estate journals that support and protect the owners' interests insisting upon their universal use, for building improvement.

It certainly is a striking situation that a reform which the builders conceived and inaugurated less than three years ago, in order to better building conditions, should now be so fully approved and earnestly supported by leading architects, owners and in fact by all interests concerned. It emphasizes the point that their policies possessed merit, and that this reform must have been conducted upon intelligent, diplomatic and firm lines.

It is rather unusual for all interested parties, especially when at times in direct opposition to each other, to have been so harmonious in eradicating obsolete methods, and acting as a unit. It is an indication that the builders' ideas and policies were well founded, and best for all concerned.

The Baltimore convention will assemble under these conditions with its members having a feeling of pride in their past accomplishments and a confidence in the future that will be an extremely important factor in guiding their deliberations, and insuring the successful execution of their conclusions.

The realization of the many needs for improve-

ment, and the cure of unbusinesslike methods current in the builder's vocation is apparent, and has created a deep impression, resulting in everyone fully appreciating his manifest duty for action to be taken upon these questions for their rapid and permanent cure.

Never before has a convention assembled where the necessity for advancement, improvement, and obligations to the owner as well as to the public, were so apparent, so fully realized, or have had such a wide study and preparation for their solution. Out of such thoughts are bound to grow important policies. Practically every building organization of note, whether a member of the National Association or not, will be represented at the Baltimore convention, and the representatives will come fully prepared intelligently to consider these important matters, and formulate plans to place the building business on the same commercial plane as other important branches of commerce and industry. To attain this end, the architects and builders are fully co-operating in a sincere and friendly manner.

Their just settlement under these conditions may be regarded as a foregone conclusion, as it means a new era of businesslike procedure in the conduct of building—a day to be welcomed by the architects and builders, also by the owner and all building interests subservient to his investment.

Registration of Architects in Ohio

After spending a year preparing a comprehensive report, the Cincinnati Chapter of the American Institute of Architects has launched a movement for a State registration system for architects.

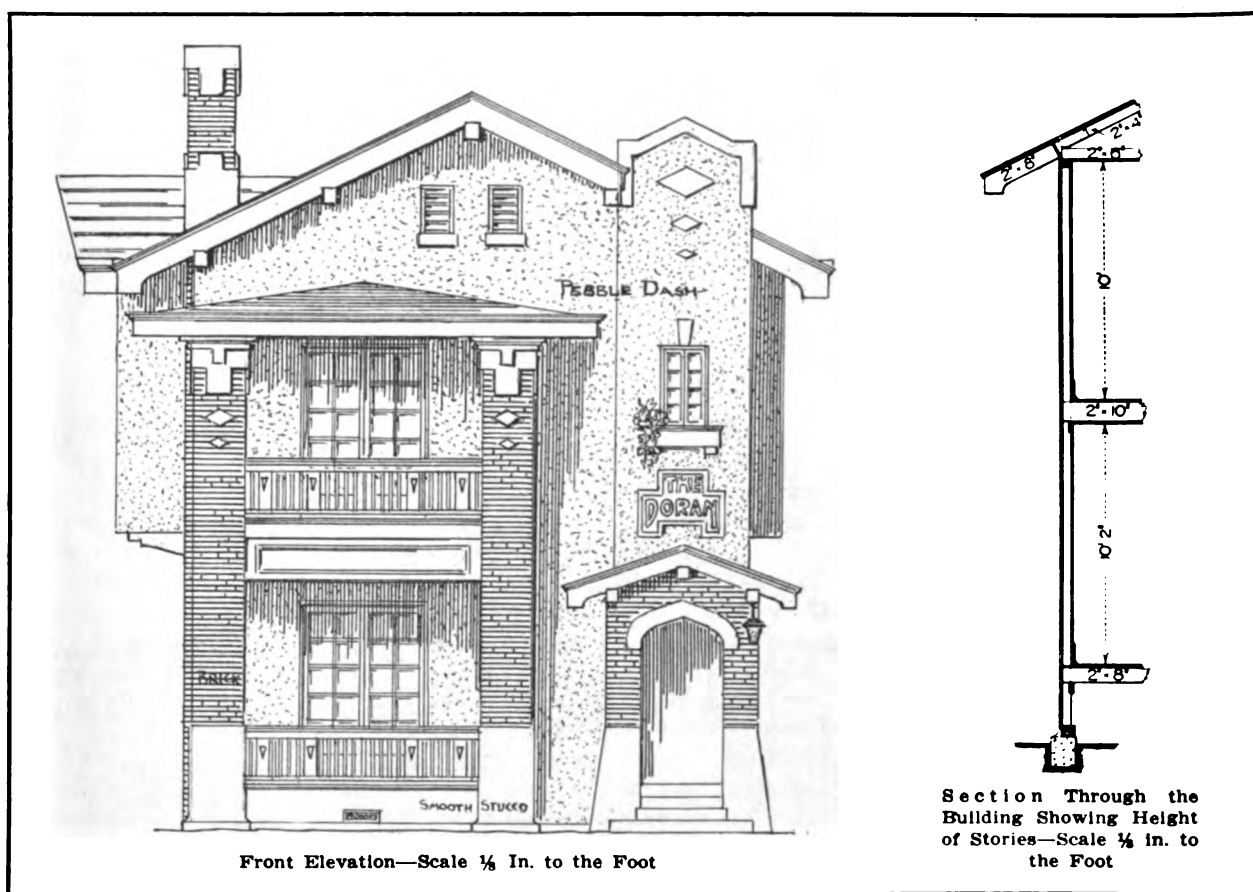

A Three-Family House in Pensacola

Practical Details Relating to a Style of Multiple-Dwelling Quite Common in the City Named

WE take pleasure in presenting herewith an interesting example of the style of flat building or small apartment house which is quite common in Pensacola, Fla., and which seems to be growing in public favor. The floor plans are such as to furnish accommodations for three families, there being one upon the main or ground floor and two upon the second floor. It will be seen that in the latter case the living room is converted at night into a sleeping room by the use of the "disappearing bed," which occupies space

stucco is applied having a "pebble dash" finish. The inside of the building is finished with hard plaster. The sills are creosoted so as to render them more durable than would otherwise be the case. The building is covered with vulcanite asphalt roofing and the ventilator has a fancy top as compared with the vents usually found protruding through the roofs of dwellings in more northern sections of the country.

All interior trim is of "A" grade Florida pine and is hand smoothed. The vestibule has a floor

A Three-Family House in Pensacola, Fla.—Architect, W. C. Frederic

under the bookcase and extends into a wardrobe. A dressing room with running water adjoins the wardrobe and this arrangement is duplicated for the family occupying the rear portion of the house. The kitchen is compact and conveniently equipped, cooking being accomplished by means of a gas range. The bath room is so located as to be readily accessible by both families.

As few buildings in Pensacola and vicinity have cellars, none is required for the multiple dwelling here shown. The frame is of the usual style, but the outside is covered with wire lath to which

of encaustic tile while the floors of the kitchen and bath room are of Everlastic cork tiling. The woodwork is stained and has a wax finish while the interior walls are tinted.

There are four intercommunicating house telephones, an electric front door opener and the disappearing beds are in ventilated cases when closed.

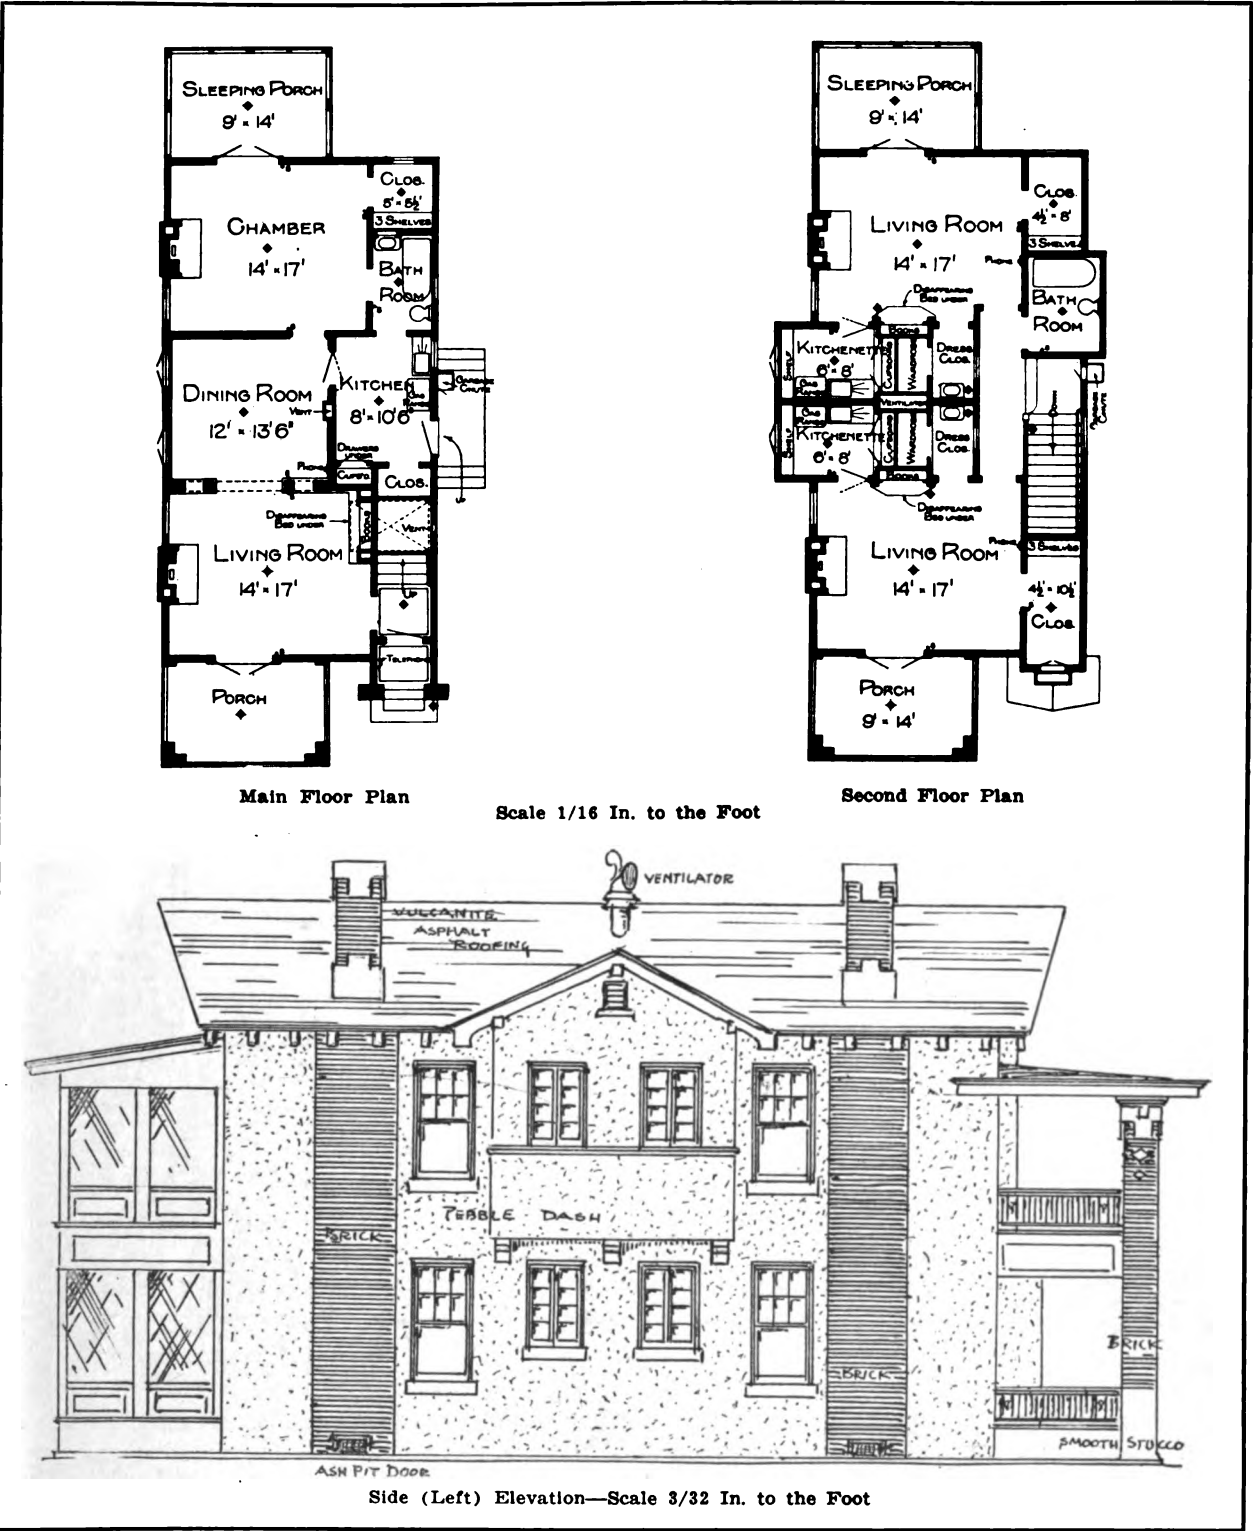

The plumbing and fixtures are of standard type and what little heating is required is furnished by the open grates which are provided with ash dumps.

The figures of cost, as furnished by the architect are as follows:

Excavating and grading	\$25.00
Masonry and concrete work	365.00
Stucco work	280.00
Interior plaster work	225.00
Tile floors	150.00
Lumber and mill work	1,150.00
Carpenter labor	925.00
Hardware, rough and finish	150.00
Painting, staining and tinting	300.00
Metal work (gutters and down pipes, etc.)	47.00
Plumbing, gas fitting, etc.	300.00
Mantels and grates	120.00
Electric wiring	90.00

The three-family house here shown was designed by W. C. Frederic, architect, Suite 415 Thiesen Building, Pensacola, Fla.

In discussing the construction of concrete buildings in a paper before the Boston Society of Civil Engineers, Leonard C. Watson advises casting the

A Three-Family House in Pensacola, Fla.—Floor Plans and Elevation

Lighting fixtures, switches, phones	200.00
Three disappearing beds complete	90.00
Vulcanite asphalt roofing	85.00
Extra for small items	45.00
	\$4,647.00
The architect's commission	235.00
	\$4,882.00

stairs considerably later than the floors and in a separate operation. In casting the floors, rods are left projecting from the floor to bond in the stairs, thus preserving the same measure of strength in the latter as would be the case were the whole job done at one and the same time.

Roofing in Chile

The material mostly used for roofing in Chile is corrugated iron, plain or galvanized, says United States Consul General L. J. Keena, writing from Valparaiso.

There are two reasons for this general use of corrugated iron for roofing purposes—first, because, as Chile is a country subject to periodical earthquakes, a light roofing is needed; second, because

type of ceiling generally found there is of matched wood. Earthquakes make it impossible to use plaster ceilings. The lumber employed for ceilings is partly of native production and partly imported from the United States and Canada.

A wall-board ceiling should have an advantage over the wooden ceiling, both in the matter of lightness of weight and ease of placing.

The present general type of construction calls for

the heavy rains in central and southern Chile make necessary a roofing which will give substantial protection.

To introduce any other type of roofing in Chile would be difficult. Possibly the port through which it would be most easy to introduce prepared roofing would be Antofagasta, as that northern section of Chile has little or no rainfall.

Chile offers an excellent opportunity for the introduction and sale of wall board for ceilings. The

the use of wooden studding, filled in with adobe bricks for all inner and to a considerable extent also for outer walls in houses.

Timber-frame buildings on the Panama Canal zone are made ant-proof by resting the posts on concrete footings having shallow gutters. The gutters are kept filled with the standard larvacide used by the sanitary department.

Banquet of Builders'

A "Red Letter" Night in
zation—Important Featu

Rochester Trade Asso.

the History of the Organi-
res Pictorially Described

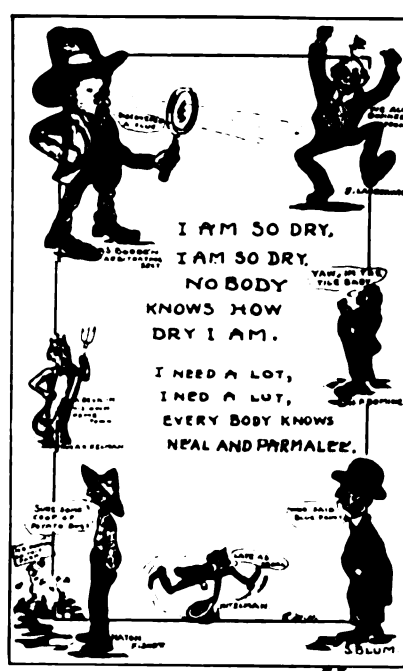

THERE is in the city of Rochester an organiza-
tion of prominent contractors identified
with the industry, which THE BUILDING
AGE represents, known as the Builders' Trade Asso-
ciation. The members are of the right sort and
believe in the establishment of a firm foundation of
good fellowship and friendly relations not only
among themselves but also among the business asso-

ciated with whom they daily come in contact. With
a view to promoting this delightful sentiment the
members of the organization, together with num-
bers of their friends, gathered at Powers Hotel on
the evening of December 4 for the purpose of cele-
brating the first annual banquet of the association.
The committee having the affair in charge was
composed of C. M. Hirschfelder, Frederick Bieger,
Joseph Joroslow, A. Placksin, N. Natapow, S. Bor-
den and C. Becker, all of whom entered enthusi-
astically into the spirit of the occasion and deter-

allied trades, and while the comments largely had
to do with a serious consideration of leading
aspects of the subjects discussed, a lighter vein
of humor percolated through it all in a way which
kept the members and guests constantly on the *qui*
vive. The entertainment was charming in all its
aspects and the spirit of good fellowship prevailed.
One of the features most unique in its way and
which attracted much favorable comment was the
style of the *menu*. This was in the form of a set of
blue print specifications bound together at the top

Digitized by Google

in regulation architectural style and bearing upon the first page a cartoon of the presiding officer. The caricatures throughout were admirably executed and the pleasantries evoked roars of laughter. Across the face of the first page was the rubber stamp of Fire Marshal Edward Wheeler, Jr., reading "Approved Dec. 4, 1915. Any alterations of these plans without permission from this office is a violation of the Building Ordinance subject to a fine of \$150.00. E. W., Jr."

There were ten pages of the specification *menu*, each page a cartoon of a decidedly clever nature and taking off incidents which the members did not fail to appreciate as well as outlining the "bill of fare" in a most humorous vein.

The *menu* was the work of Mr. Hirschfelder, chairman of the Entertainment Committee, a young architect of the city whose talent in this line is decidedly beyond the ordinary and who, in following the practice of architecture, has evidently mistaken

his vocation. As will be seen from the cartoon sketches which it is our privilege to reproduce with such fidelity of detail as the limitations of the engraving process will permit, the drawings are full of life and action and certainly reflect great credit upon the artist who prepared them.

A Wooden Table of Many Pieces

A carpenter by the name of Stephen Horosak of Auburn, N. Y., has just finished, after six months' work, an inlaid table containing 28,996 separate pieces. The table is highly polished and set in the top is a perfect American flag held in the talons of an eagle. Around the top are set mosaics of different colored woods of geometrical shapes arranged in a border. The same general design is followed in the decoration of the legs and pedestal.

Country House of Frame Construction

A Well-Planned Home with an Exterior of Clapboards and Roof Covered with Shingles

THE subject of our colored supplemental plate this month is an attractive country house of colonial style, noticeable features being the open porch at one end, the gambrel-shaped roof and the dormer windows which pierce the lower slope of the front roof.

The house was designed for a plot of ground having a frontage of 75 or 100 ft., and it should be placed with its broad façade to the road, this giving a more impressive effect. The house should be set back 25 or 30 ft. from the front line of the lot, thus permitting of an ample lawn which may be laid out with flower beds, shrubbery or other landscape features.

The Foundation Work

According to the architect's specifications there is to be a cellar under the entire house, this to contain the furnace and storage rooms. All footings and foundation walls are to be of concrete mixed in the proportions of one of cement to three of sand and five of broken stones. The foundation walls are to be 10 in. thick resting upon footings 10 in. thick and 20 in. wide.

All framing timbers are to be of spruce. The sills are to be 4 x 6 in., the girders 6 x 8 in., and the floor beams 2 x 10 in., placed 16 in. on centers. The floor beams are to be strengthened with rows of 2 x 4 in. cross bridging, spaced about 6 ft. apart. The rafters of the main roof are to be 2 x 8 in. placed 20 in. on centers and the dormer rafters 2 x 6 in. also placed 20 in. on centers. The corner posts are to be 4 x 6 in., and the studding 2 x 4 in., placed 16 in. on centers braced with cross bridging. The ridge board is to be 1½ x 10 in. The porch roof rafters and floor beams are to be 2 x 6 in., placed 20 in. on centers.

The Exterior Covering

The exterior walls of the building are to be covered with hemlock sheathing boards laid diagonally and these to be covered with a layer of heavy building paper. Over this in turn are to be placed pine clapboards 6 in. wide and painted a cream white.

The roof is to be covered with red cedar shingles laid 5½ in. to the weather and stained a dark sap green to contrast with the color of the siding.

The outside trim as well as the siding is to be painted two coats white lead and oil. All ceiling boards on the porch ceiling and the underside of the cornice are to be varnished.

The chimney is to start from a concrete base and be built of brick and capped above the roof, as shown in the picture forming the basis of the sup-

plemental plate. All flues are to be lined with vitrified flue lining.

The rooms of the first story are to have double floors, the rough flooring to be of 1 x 6 in. North Carolina pine and the finish floor in the living room, the dining room and the hall to be of ¾ x 2½ in. maple. All other rooms on the first and second floors are to have ¾ x 2½ in. North Carolina pine flooring. All floors are to be finished natural, a paste filler being used and the succeeding coats flat varnished.

The Interior Finish

The interior finish of the living room, the dining room and the hall is to be cypress, while all other rooms are to be finished in white pine.

The trim in the living and dining rooms, hall and vestibule is to be finished in old mission, and all plaster work to be tinted with the exception of the ceilings, which are to be left pure white.

The bed room trim is to be painted or enameled white and have a velour finish. All doors are to be of birch and stained a rich mahogany.

All interior plastering is to be two-coat work and have a smooth hard finish except in the living room, the dining room and the hall, which shall have a sand finish.

The walls of the kitchen and pantry are to be treated with a good enamel paint.

The bath room floor is to be of tile and have a sanitary cove and base. Its equipment shall consist of porcelain enamel bath tub, water closet with low down tank and wash stand with china basin and marble top.

All windows are to be glazed with double thick American glass, and the hardware in the living room, dining room and the hall is to be of an old antique mission finish. The hardware throughout the rest of the house is to be of dull bronze finish.

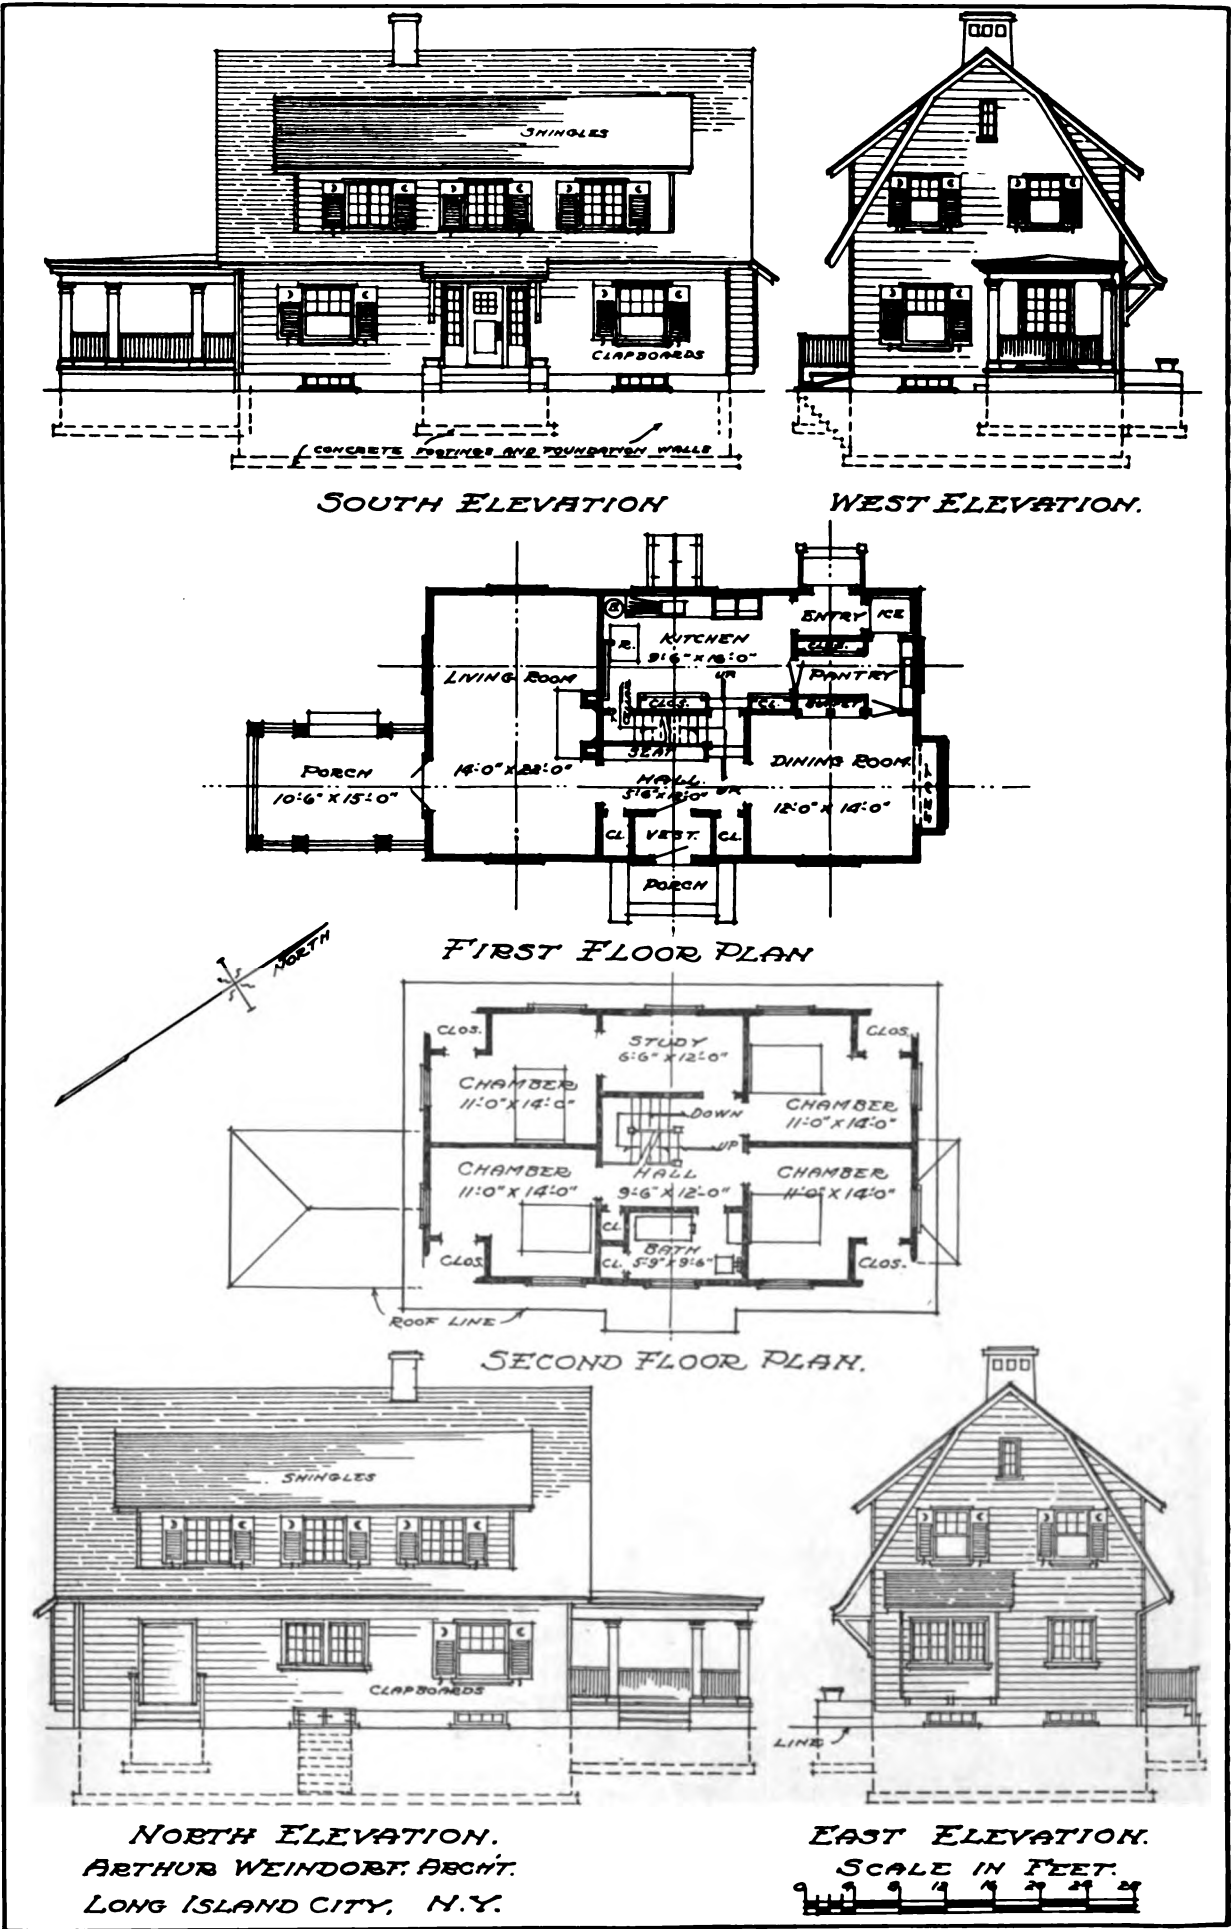

The Lighting Arrangement

The house is to be piped for gas and wired for electric lighting. All rooms are to have outlets for gas fixtures and so arranged that combination fixtures may be used. All lighting fixtures are to match the hardware in finish and design. The living room is to have two drop pendants of two lights each and two wall outlets. The dining room is to have a drop pendant of three lights. All rooms will have one side wall and one ceiling outlet, while the halls are to have ceiling outlets.

A hot water heating system is to be installed in the cellar and is to be of sufficient size to properly heat the building to 70 deg. in zero weather. All pipes in the cellar are to be covered with asbestos. All radiators are to be of such finish as to match the hardware.

The country house here shown is intended for a family of five persons with a spare room for guests

Miscellaneous Constructive Details of Country House Shown on Colored Supplemental Plate

and a servant's room in the attic. All rooms have ample ventilation and light and all sleeping rooms have clothes closets. The arrangement is such that there is easy communication from the kitchen to the second floor chambers, also to the cellar and to the front door. At the rear entry the arrangement is such that ice can be supplied to the refrigerator without the necessity of coming into the house. One chimney supplies the kitchen range, living room fireplace in the cellar.

The dining room is of good size and contains a built-in buffet and window seat. The kitchen is of good size and has range, sink and wash trays within easy reach. The pantry gives direct access to the dining room and contains cupboards, sink and entrance to the icebox. The hall opens directly into the living and dining rooms and contains two large closets and a comfortable seat.

The living room is large, light and airy, the trim

is very plain and French casements open from this room onto a private porch.

The plumbing is of standard make, and all exposed pipes in the bath room have nickel-plated finish. All exposed pipes in the kitchen are to be painted with enamel paint. The kitchen equipment includes an iron enamel sink, a two-part wash tray of soapstone and a 40-gal. galvanized iron boiler to be connected with the range and with the furnace in the cellar.

The cubic content of the house equals 28,604 cu. ft., which, according to the architect, should cost 19 cents per cu. ft. He points out that the estimate and specifications are based on prices, labor and materials about 40 miles from New York City on Long Island.

The design was prepared by Architect Arthur Weindorf, Long Island City, N. Y., or care of THE BUILDING AGE, 239 West Thirty-ninth Street, N. Y.

Roof Framing with the Steel Square

Some Figures On the Square to Use in Cutting Rafters of Various Rise and Run

BY D. P. BARRY

SUPPLEMENTING what appeared in the October issue on the above subject, I am presenting some figures on the steel square which the practical carpenter and builder will find useful in cutting common hips and valley rafters. At the outset I would suggest that before cutting the rafters the following tests be applied:

For $\frac{1}{4}$ pitch multiply the span by 0.559
 For $\frac{1}{2}$ pitch multiply the span by 0.6
 For $\frac{3}{4}$ pitch multiply the span by 0.625
 For $\frac{1}{2}$ pitch multiply the span by 0.707
 For $\frac{3}{4}$ pitch multiply the span by 0.8
 For Gothic, multiply the span by 1.12

Figures to use on the square to cut sheathing for square roofs:

For $\frac{1}{4}$ pitch: $10\frac{1}{2}$ on tongue and 12 on blade.
 For $\frac{1}{2}$ pitch: 10 on tongue and 12 on blade.
 For $\frac{3}{4}$ pitch: $8\frac{1}{2}$ on tongue and 12 on blade.
 For $\frac{1}{2}$ pitch: $6\frac{1}{2}$ on tongue and 12 on blade.

This sheathing is of course the roof boards. The figures cut the top side of the boards for hips and valleys, and they will also cut the plancier and edges of facia cut by the tongue.

The edge cut for the same respective pitches is shown below:

For $\frac{1}{4}$ pitch: $5\frac{1}{2}$ on tongue and 12 on blade.
 For $\frac{1}{2}$ pitch: $6\frac{1}{2}$ on tongue and 12 on blade.
 For $\frac{3}{4}$ pitch: $8\frac{1}{2}$ on tongue and 12 on blade.
 For $\frac{1}{2}$ pitch: 10 on tongue and 12 on blade cut by tongue.

This will cut both roof board and plancier edges as well as side of facia.

A simple rule for getting the backing of hip rafters and the grooving of valley rafters in addition to what I have given is as follows:

Gage the rafters on the center of the top edge; then take the length of the hip or valley on the blade and the rise of these rafters on the tongue; place these figures on the gage lines and mark by the tongue, reverse the square; then square across the rafter and you have the bevel to work to.

The following are the figures to use in cutting the rafters:

Rise	Run	Cuts for Com. Rafters; Hips and Val.
3 in.	12 in.	3 x 12
4 in.	12 in.	4 x 12
5 in.	12 in.	5 x 12
6 in.	12 in.	6 x 12
7 in.	12 in.	7 x 12
8 in.	12 in.	8 x 12
9 in.	12 in.	9 x 12
10 in.	12 in.	10 x 12
11 in.	12 in.	11 x 12
12 in.	12 in.	12 x 12
13 in.	12 in.	13 x 12
14 in.	12 in.	14 x 12
15 in.	12 in.	15 x 12
16 in.	12 in.	16 x 12

Rise of Rafter	Run of Rafter	Figures on Square by Which to Cut Cripples
3 in.	12 in.	$12\frac{1}{2}$ and 12
4 in.	12 in.	$12\frac{1}{2}$ and 12
5 in.	12 in.	13 and 12
6 in.	12 in.	$13\frac{1}{2}$ and 12
7 in.	12 in.	$13\frac{1}{2}$ and 12
8 in.	12 in.	$14\frac{1}{2}$ and 12
9 in.	12 in.	15 and 12
10 in.	12 in.	$15\frac{1}{2}$ and 12
11 in.	12 in.	$16\frac{1}{2}$ and 12
12 in.	12 in.	17 and 12
13 in.	12 in.	$17\frac{1}{2}$ and 12
14 in.	12 in.	$18\frac{1}{2}$ and 12
15 in.	12 in.	$19\frac{1}{2}$ and 12
16 in.	12 in.	20 and 12

Cut by the varying figures. For the top cut of hip and valley rafters use the same figures as for cripples, except cut by the 12 side of the square. These figures are for rafters that are backed.

The following are the figures to use for the top cut on the hip and valley rafters. The rafters are not backed:

Rise of Rafter	Run of Rafter	Figures to Cut By
3 in.	12 in.	$11\frac{1}{2}$ and 12
5 in.	12 in.	$11\frac{1}{2}$ and 12
6 in.	12 in.	$11\frac{1}{2}$ and 12
7 in.	12 in.	$11\frac{1}{2}$ and 12
8 in.	12 in.	11 and 12
9 in.	12 in.	$10\frac{1}{2}$ and 12
10 in.	12 in.	$10\frac{1}{2}$ and 12
11 in.	12 in.	$10\frac{1}{2}$ and 12
12 in.	12 in.	10 and 12
13 in.	12 in.	$9\frac{1}{2}$ and 12
14 in.	12 in.	$9\frac{1}{2}$ and 12
15 in.	12 in.	$9\frac{1}{2}$ and 12
16 in.	12 in.	9 and 12

$8\frac{1}{2}$ and 12 cut by the 12

Figures showing length of rafter for 1-ft. run for the same roof pitches:

Rise of Rafter	Run of Rafter	Length Com. Rafter	Hip or Val. Rafter
3 in.	12 in.	12.37	17.23
4 in.	12 in.	12.65	17.43
5 in.	12 in.	13	17.69
6 in.	12 in.	13.41	18
7 in.	12 in.	13.89	18.36
8 in.	12 in.	14.42	18.76
9 in.	12 in.	15	19.21
10 in.	12 in.	15.62	19.69
11 in.	12 in.	16.28	20.22
12 in.	12 in.	16.97	20.78
13 in.	12 in.	17.69	21.37
14 in.	12 in.	18.44	22
15 in.	12 in.	19.21	22.64
16 in.	12 in.	20	23.31

Some of these figures are given on some of the squares. Suppose a roof rises 8 in. per foot run and is 16 ft. wide; to get length of rafters we have $14.42 \times 8 = 115.36$ in., or 9 ft. $7\frac{3}{8}$ in. for length of common rafter. $18.76 \times 8 = 150.08$ in., or 12 ft. $6\frac{1}{4}$ in. the length of the hip or valley rafter.

In reading over the article in the October, 1915, issue I found a few errors of omission and commission. In the printed matter 8 ft. 8 in. should read 9 ft. 8 in. In the last proportion 4 ft. should read 2 ft. The sentence giving the cuts for hip and

valley rafters to fit against the ridge or themselves implied that the rafters are backed. The figures for rafters not backed are given above. Condensing all the rules into one that will apply on all kinds and pitches of roofs, we have:

Take the length of the common rafter, c-b of Figs. 3 and 4 on the blade and the length of the ridge r or the plate r, r, same figures, Oct. issue, on the tongue and cut by the blade.

One need not care anything about the run of the rafters or the pitches of the roofs.

After all that has been said there are those who cannot follow it. If these persons will put the vertical cut line on their cripples then measure down or up the rafter, according to the kind of cripples they are cutting, a distance equal to the thickness of the cripple then square across the rafter, make another vertical line and connect the two verticals they will have a perfect cut.

Another good way to get all the bevels is to consider a-c and b-c of Figs. 3 and 4 of the article in the October issue as chalk lines. We use silk lines in this way to get the bevels for spouting in flouring mills, as it is rapid and absolutely accurate.

Building Boom vs. Unfair Lien Laws

Some of the Reasons Put Forth Explaining the Check to Local Building Operations

HERE seems to be a feeling in many lines that one of the main factors in preventing an immediate resumption of building operations on a large scale in Greater New York is the unfairness of some of the existing lien laws, and with a view to correcting the evils, leading building supplymen in common with sub-contractors are said to be organizing for a redress of grievances through the

Legislature, which convenes at Albany in January. In regard to this matter President P. H. Hart of the Building Trades Credit Association of New York says:

"Drastic changes in our laws must be made, and with those changes will come a 'boom' in construction work such as New York has not known in a long time.

"At present the sub-contractors and material men are at the mercy of contractors, builders and owners. Grant the honesty and conservatism of those with whom we do business and we are all right. But the trouble is that the 'wildcat' and dishonest speculative builder frequently comes to us with a good reputation and a fair statement of equities, which are mortgaged soon after contracts are signed.

"For several years conditions in the building trade in New York have been growing steadily worse, until to-day, though we are all ready for a building 'boom,' we still are in a state of demoral-

ization. Correct a few of our laws and there will be so much building that it will be difficult to supply the necessary amount of labor in the city.

"Fraudulent practices on the part of builders, contractors and loan men, who are permitted to operate 'within the law,' are responsible to a large extent for the present stagnation. Liens filed when there has been no default under contracts have in many instances brought ruin to builders, and building operations, sound in all respects, have terminated disastrously because of unnecessary embarrassment on the part of the builders precipitated by the filing of one lien that brought an avalanche of others, which subsequently could not be lifted without the unanimous consent of all the lienors.

"For five years we have been working to have the existing lien law changed in order to lessen such fraudulent practices and others, and in order to conserve assets to meet claims.

"In many States the sub-contractor has for his labor done or material furnished a lien upon the building and also upon the land on which the building is situated. The lien is frequently superior to all other encumbrances or has priority over mortgages recorded after ground is broken, and builders and owners in those States do not find the law oppressive. The dishonest builder, however, and the 'wildcat' speculator seldom operate in those States. There are not the same 'opportunities.'

"What we demand in this State is a law abolishing priority in liens, giving an extension of right to file liens in certain cases against mortgages and purchasers and as against assignees of moneys due,

and extension of right to file liens in favor of certain trades not now protected.

"All liens should be made concurrent upon the property improved and all liens should be paid pro rata, except as to laborers.

"When this is done the filing of one lien will not precipitate a rush to file other liens. Creditors will take their time; they will investigate and inquire as to whether the first lien was justified and necessary. Combinations will be prevented between the builder and a lienor at the top of the list to wipe out the subsequent ones through foreclosure.

"Such a law as we ask will make it possible on the failure of a general contractor for all the sub-contractors to get together, complete the contract and share equally in the fund. We would stop the 'blackmail liens' that now frequently are filed. Many dishonest contractors terrify a builder into modifying a contract and changing the price and terms simply by threatening to file a lien which the builder well knows will tie up his work and possibly ruin him.

"We demand that the law shall compel that immediate record be made of assignments of payment on public works by a contractor, so as to at least notify the sub-contractors and material men, whose labor and material have been assigned, in advance.

"Most emphatically we demand redress against those dishonest builders who by means of second and third mortgages, defraud all connected with them.

"These are some of the reforms demanded by sub-contractors and material men. We have asked for relief from other Legislatures, but this time we are going to Albany with a very strong combination back of us. The Credit Association of the Building Trades of New York has invited all reputable sub-contractors and material men to join us; they are responding in a manner that demonstrates their interest. We also have the support of the big money lending institutions and the larger real estate interests. We are going to get that legislation which we need, and the New York building trades will prosper."

Opportunities at the Cement Show

Some of the Features Which Will Greatly Aid
the Practical Builder in His Business Relations

THE coming Cement Show to be held in Chicago in February will probably be the largest and best that has ever occurred in the short but remarkable history of this progressive movement started eight years ago. There are thousands of building contractors who have attended this annual affair ever since the initial opening, making the trip a happy combination of business and pleasure.

There are many logical reasons why contractors from Maine to California and from Canada to the Gulf visit the show each year. They consider it a profitable investment by realizing, first of all, that it is by far the most opportune time to let business take care of itself for a week or so. When times are dull, and snow lies thick on the ground, then thought is concentrated on what the forthcoming building season has to offer. These men who always visit the show are in distinct contrast to the unprogressives who stay at home year after year, continuing the same work in the same monotonous fashion, never gaining much, never losing much; lacking business punch, originality and initiative.

But to the business builder, the aggressive, ever-alert architect-builder and contractor, the Cement Show, immediately preceding the building season, is a timely event for the investigation and purchase of modern equipment and materials.

Profitable expansion should be the ambition of every building contractor. It is possible to learn

where bigger and more desirable business is to be had by mingling with the manufacturers at the Cement Show. These concerns employ salesmen, mostly practical men, who are familiar with every phase of construction work. They are cognizant of cheaper and more efficient ways of accomplishing certain results, and the information is available for the builder for the asking. They will help solve his problems; will point the way to his establishing closer connections with his customers and prospective clients; will show him what opportunities there are in the field.

The Cement Show will broaden his mind. He will be greeted by men who make business a pleasure. Thousands of men will be there, who, like himself, are anxious to learn new methods. With them he may profitably discuss his personal activities, his costs, his prospects. This interchange of ideas, getting the other fellow's viewpoint, is worth more than dollars and cents to the appreciative builder, yet he will gain these dollars and cents in the long run by assimilation, cultivation, and intensive application of the knowledge thus acquired.

The Cement Show has always been held in the Chicago Coliseum, but so fast has been its growth that this year both the annex and the adjacent armory have been leased in order to accommodate the manufacturers. Twenty-six cement companies, shipping cement within 1000 miles of Chicago, have entered into an agreement to participate in a \$10,000 exhibit of concrete products which will occupy the entire south half of the armory. The materials for this exhibit will be drawn from the resources of practically the whole

cement industry, including the Association of American Portland Cement Manufacturers. All duplication of effort by cement companies will be eliminated by a joint exhibit plan which will enable the cement manufacturers to install such a display of concrete products as has never before been attempted. Unquestionably, this joint exhibit will set forth the possibilities of concrete in such a manner as will enable the visitor to acquire a broad and intimate knowledge of the uses of cement.

Particular attention will be paid to the surface treatment of concrete. There will be demonstrations of bush hammering, acid treating, brushing with water, and other methods of treating surfaces, and these will be taught in what might be termed a school for builders. This feature will be a part of the joint exhibit.

The builder will surely feel at home at the Cement Show, and the trade papers stand ready to do their share to make his visit a pleasant and profitable one.

Our greeting is: Make the booth of THE BUILDING AGE your information bureau. Its representatives will do all they can to assist you. If you are planning to spend a week in Chicago, you will undoubtedly want to see the points of interest, visit the best theaters, etc. THE BUILDING AGE men will be well posted, and they will be at your service from Feb. 12 to 19. Your wishes will be their pleasure.

Mark the date on your calendar—Feb. 12 to 19. If you decide to spend but one or two days there, you will leave with the resolve that next year will find you on hand from start to finish.

Handbook for Architects and Builders

We have received a copy of the eighteenth annual edition of the above work, just off the press, which is the official publication of the Illinois Society of Architects. The volume this year is up to the usual high standard and contains much valuable information for the architect, as it furnishes him with information under one cover which he requires in the daily practice of his profession. Among the many things to be found within the covers of the book are the Building Ordinance of the city of Chicago with all of the amendments up to July 15, 1915; a complete and comprehensive index covering the sections in the Ordinance; all of the Special Rules of the Building Department with indications at the beginning of each section of the Ordinance to which the ruling applies; a revised Schedule of Charges for Architects as recommended by the Illinois Society of Architects; a list of architects licensed to practise in Illinois; a list of members of the Illinois Society of Architects as well as of the Illinois Chapter of the American Institute of Architects; rules of the Telephone, Gas and Electric Light companies; Standard Specifications for Hollow Tile Fireproofing; Rules of Measurement for Excavation and Concrete Work; Standard Specifications for Structural Steel; Specifications for Billet-Steel Concrete Reinforcement Bars; Strength of Materials; Specifications for Plain Concrete Floors; Formula for Heating and Ventilating; Sections of the Sanitary Code of interest to architects with index; Office Practice as rec-

ommended by the Society; Paints to Prevent Electrolysis in Concrete Structures, by H. A. Gardner; Rules for Measurement of Plastering, also numerous rules and tables, such as Ultimate and Safe Strength of Iron and Steel in Pounds per Square Inch; Percentage of Hooping for Various Core Diameters and Hooping for Reinforced Concrete Columns, by Benjamin E. Winslow; Weights of Materials, the Orders of Architecture, etc., etc.

Not the least attractive features of the valuable work are engravings of the officers of the Illinois Society of Architects and of the State Board of Examiners of Architects. In passing, it may be stated that the book is published in the interests of the architects of the State of Illinois and is distributed to them free of charge. The work is edited by Emery Stanford Hall, Chairman of the Legislative Committee of the Illinois Society of Architects.

The Architectural League of New York

The thirty-first annual exhibition of the Architectural League of New York will be held in the building of the American Fine Arts Society, 215 West Fifty-seventh Street, New York City, from Feb. 6 to 26, inclusive. The annual dinner of the League will occur Friday evening, Feb. 4, and the League reception will be held on the afternoon of Saturday, Feb. 5.

This exhibition will consist of drawings and models of proposed or executed work in the structural, decorative and landscape architecture; with sketches and finished examples of decorative painting; sketches, models, and finished examples of decorative and monumental sculpture; drawings and models of works in the decorative arts and photographs of executed work in any of the above branches. There will be a competition for the Henry O. Avery Prize, and a special prize of \$300, the latter being for the best design submitted by an architect, a sculptor and a mural painter in collaboration.

The subject proposed is the design of the interior of a small chapel not exceeding 16 x 36 ft. in plan and 24 ft. in height. The chapel is assumed to be built as a memorial to three brothers who had died in defense of their country and the pictorial and sculptural enrichment should be designed with a view to the glorification of patriotic self-sacrifice.

The Architectural League also awards a Medal of Honor to mural painters, and a Medal of Honor to sculptors represented in the annual exhibition.

Convention of American Concrete Institute

The annual convention of the American Concrete Institute will be held at the Auditorium Hotel, Chicago, Ill., on Feb. 14 to 17, inclusive, 1916, during the same week that the Ninth Annual Cement Show will be in progress in that city.

The French Pavilion at the Panama-Pacific Exposition was sold to a wrecking company for \$2,000. Its original cost was \$100,000.

Laying Out Face Mold in Stair Work

A Problem in Stair Building Likely to Interest Many Readers of The Building Age

A CORRESPONDENT of THE BUILDING AGE writing from Woodstock, Ont., has sent us the sketches, Fig. 1, showing a plan and elevation of a flight of stairs with side wreath and easement, and desires to know how to lay out the face mold for it. He says:

"It has a close string as shown with 7-in. rise and 10-in. run. The rise on the easement is $3\frac{1}{2}$ in. higher than the regular pitch of the rail. The stairs are already up and I am awaiting a solution. If therefore Mr. Williams will give me a quick response I shall greatly appreciate it.

"I have followed a great deal of the work of Morris Williams and believe that he can give me the proper sketches for the solution of the above problem. I have been a subscriber to THE BUILDING AGE for a good

"already up" and presumably the newel is also up. As a consequence the conditions as stated above must be adhered to.

In Fig. 2 is presented an explanatory diagram bearing particular relation to preliminary consideration regarding the height of rail and length of newel. In this figure is shown the elevation of the steps within and without the curve, also three different arrangements of the rail tangents. It will be observed that the bottom tangent in each case is a level line necessitated by the requirement of an easement in the wreath rail.

The bottom level tangent N-W shows the position required for it when the easement is to be $3\frac{1}{2}$ in. higher than the regular pitch of the rail. The inclined tangent for this condition is shown from

Fig. 1—Sketches Submitted by the Canadian Correspondent

Fig. 2—Diagram Bearing Upon the Height of Rail and Length of Newel

Laying Out Face Mold in Stair Work

many years and I am continually finding good things in its pages."

The problem of our correspondent was submitted to Morris Williams, who replies as follows:

The correspondent's sketches illustrate a turn-out curve at the bottom of a stairway, the curve containing six steps. The elevation shows the top of the rail to be at a height of 2 ft. 4 in. above the nosing of the steps; then an easement $3\frac{1}{2}$ in. higher than the regular pitch of the rail, which makes the height of the rail where it strikes the newel post 2 ft. $7\frac{1}{2}$ in. plus the height of the baluster. The correspondent says that the stairs are

W to C' deviating from the pitch of the straight rail and therefore necessitating a ramp either in the wreath or the straight rail.

The objection to this arrangement of the tangents is, as shown at W, that it will cause the wreath rail to be too low.

Another position for the tangents is shown at P-M for the level tangent and from M to C' for the top tangent. In this case the easement would meet the newel at the height of 20 in. higher than the regular pitch of the rail, as shown at P; instead of $3\frac{1}{2}$ in., as shown at N, thus necessitating that much additional length to the newel.

At $S-B'$ and $B'-C'$, another position for the tangents is shown. In this case the pitch of the straight rail is continued to B' as shown and a level line drawn from B' to S for the level tangent. Here S meets the newel at a height of 2 ft. 1 in. higher than the regular pitch of the rail, as the correspondent terms the nosing line of the steps. The last arrangement of the tangents is the customary one in practice and in every sense is satisfactory when the curve contains only two or three steps; but when it contains six, as in this case, it is better to lower the pitched tangent from C' to M , because it follows the nosing of the steps along its length and shortens by $4\frac{1}{2}$ in., as at P , the height of easement.

To help out the correspondent I would suggest two solutions, either one of which will produce a wreath that will meet the newel $3\frac{1}{2}$ in. above the nosing line of the step required: One is to make the nosing line without the easement, as shown in Fig. 3, and the other as shown in Fig. 6 with an easement but in two sections.

The one shown in Fig. 3 is the easiest to con-

Find the directing ordinates by connecting A with A'' and draw all the others parallel to it, as shown, from the points 0-2- B' and 1.

Now find the dots 0-2-3-1 on the ordinates by measuring from the tangents the same distances as shown from the plan tangents to corresponding dots upon the plan ordinates.

The face mold may now be completed by tracing through the dots as shown in the diagram.

The bevels to twist the wreath are shown at each end applied reversely. In this case they are called bevels, owing to the tangents being equal.

The manner in which the bevel is found is illustrated in Fig. 5. Make $A-X$ equal to $A-X$ of Fig. 3 and $X-N$ equal to $Z-N$ in the same figure. Connect N with A as shown. The distances between 1 and 2 upon the long edge of the bevel gives the width of the face mold at each end.

In Fig. 6 is shown the plan, elevation and development of the tangents for a wreath made in two sections. From the center O of the plan draw a line to C , the center of the plan curve and square to it draw the plan tangents $B-C$ and $C-D$.

To develop the tangents continue the pitch of the straight rail as shown from F to D' of the elevation. Fix the height of the bottom level tangent $A'''-B'$, as shown, $3\frac{1}{2}$ in. from the top of the first step and connect B' with D' . The joint between the two sections is shown at C' . The face molds

Fig. 3—Making the Nosing Line Without the Easement

Fig. 5—Diagram for Finding the Bevel

Fig. 4—Simple Method of Laying Out Face Mold

Laying Out Face Mold in Stair Work

struct, and when in position would appear quite as satisfactory. Fig. 3 represents the plan, elevation and pitch of the tangents $C'-B'$ and $B'-A''$. The points upon the tangents are developed from the plan. The plan ordinates are made parallel to the plan directing ordinate $A-A'$, which is found by swinging the plan tangent $A-B$ to A' , and connecting A with A' .

In Fig. 4 is shown the simplest method known of laying out the face mold. The level line in this figure and the points upon it represent the pitched tangents as shown in Fig. 3. From the point Z draw an indefinite line and from B' draw a line the length of the bottom tangent $A''-B'$ of Fig. 3, to cut the line from Z in A which represents the bottom tangent as it is required upon the face mold. The top tangent will be $B'-C'$ and from C' to D will be the shank shown in Fig. 3 from C' to D . Make the joints square to the tangents at A and D .

are laid out as indicated in Figs. 7 and 8, the curves being drawn by ordinates as in Fig. 4. The face mold for the bottom section of the rail is shown in the diagram, Fig. 7.

The line $C'-B'-S-W$ is transferred from Fig. 6 as there shown, from C' to B' , the pitched tangent, and beyond to W . From S in Fig. 7 draw a perpendicular line, as shown, to A ; revolve W to cut it at A and connect A with B' . This line will be the bottom level tangent as required upon the face mold. The pitched tangent will be from B' to C' . Make the joints square to these tangents.

By reason of the fact that the tangent is level it stands for the directing ordinate. Make the other ordinates parallel to it and upon each one find the dots corresponding to those shown on the plan in Fig. 6, measuring the distances from the tangent $B'-C'$.

The bevels are shown applied to each end square

to the joint and directed toward the inside.

The face mold for the top section of the reach is shown in Fig. 8 similarly laid out by ordinates. In this case the line $W-M-D'-E-F$ is taken from Fig. 6, as there shown, along the top tangent $E-D'$ to W . To find the directing ordinate in Fig. 8 drop a line from M to C ; connect C with W for the directing ordinate and C with D' for the tangent. Make the other ordinates parallel to CW and find the points corresponding with those in the plan and from the points trace the curves.

Figs. 9 and 10 illustrate the appearance of the wreaths after they are twisted by means of the bevels.

The simplest method of finding the bevels is illustrated in Figs. 11 and 12. Make $X-A$ of Fig. 11 equal to $X-A$ of the plan in Fig. 6. Make $X-S$ equal to $X-S$ of the elevation in Fig. 6 and $X-R$

Fig. 6—Making Nosing Line with Easement and in Two Sections

Fig. 7—Face Mold for Bottom Section of the Rail

Fig. 8—Face Mold for Top Section of the Rail

Fig. 9

Figs. 9 and 10—The Wreaths After They Are Twisted

Fig. 11

Figs. 11 and 12—Simple Method of Finding the Various Bevels

Laying Out Face Mold in Stair Work

equal to $X-R$ of Fig. 6. Connect R and S with A , as shown, for the bevels.

These two bevels are for the bottom section of the wreath and are shown applied in Figs. 7 and 9.

In Fig. 12 is illustrated the manner in which the bevels are found for the top wreath. Make $V-C$ equal to $V-C$ of the plan in Fig. 6 and make $V-N$ equal to $X-N$ of the elevation in Fig. 6. Make $V-M$ equal to $X-M$ of the elevation in Fig. 6 and connect N and M with C for the bevels. These are shown applied to the face mold in Fig. 8 and to the twisted wreath in Fig. 10.

Another Sumptuous Apartment House

In addition to the apartment houses with costly suites of rooms to which we have already alluded in these columns must be added another which is to be erected on the one-time site of the Progress Club at the northeast corner of Fifth Avenue and Sixty-third Street, New York City, at a total cost of \$2,500,000, this including the land which is

valued at a trifle less than \$1,400,000. The building will be twelve stories in height and is designed to accommodate one family on each floor, the suites consisting of sixteen to twenty rooms and providing a more convenient home than any private residence. A feature of the new structure is that the two first floor suites will be designed as private dwellings with separate entrances. The plans were drawn by Starrett & Van Vleck.

Remodeling a San Francisco Landmark

Extensive alterations are being made in the Claus Spreckels Building, once known as the "Call" Building, at Third and Market Streets, San Francisco, which was for years the tallest building on the Pacific Coast. The most conspicuous change is the

removal of massive columns and stonework at the ground floor, which are to give place to store fronts of modern design, so as to give more space for the use of tenants in displaying merchandise. The carved sandstone columns at the entrance have come to be regarded almost as landmarks. The building withstood the earthquake of 1906 with little damage, but the fire made it necessary to refinish the interior throughout, as well as to repair much of the stonework around the windows.

Meeting of Hemlock and Hardwood Manufacturers

A special meeting of the Northern Hemlock and Hardwood Manufacturers' Association was held in Milwaukee, Wis., Dec. 8, for the purpose of considering the adoption of methods in manufacture and grading "which would improve the quality and uniformity of Hemlock shipped from the mills of Wisconsin and northern Michigan." President R. B. Goodman pointed out that the meeting was the first

logical step in the hemlock promotion campaign which was formally undertaken at the previous meeting. He said that in order to make an appeal to the public that would be far reaching and lasting the association must concern itself not only with the intrinsic value of hemlock as a wood but must be able to assure the consumer that it is properly manufactured and graded and that the product delivered to him must fulfill all the claims which have been made for it.

S. Gibson presented a strong report condemning the sale of resawed hemlock unless it is re-graded. J. J. Lingle presented a report on Uniform Manufacture, and W. J. Kessler stated that the term "merchantable hemlock" had become ambiguous in that it was quite generally understood that a merchantable grade of hemlock piece stuff was the natural run of the log with No. 3 out. Uniform methods of selling were discussed as were also market conditions and the advantages of the adoption by the association of the hemlock trade mark.

Building in the Winter Months

With modern construction methods, building work is carried on in almost as great a volume in the winter months as in summer. It is thoroughly proper that this should be so and there is no reason why such construction should not be of the highest standard in every respect. Architects and builders must understand, however, that construction methods must be adapted to the weather conditions and that the methods used in the summer time may produce disastrous results if continued throughout the winter. Certain precautionary measures are necessary to counteract the effect of freezing and these are usually very simply applied.

It is a notable fact that accidents in construction due to cold weather are more frequent in the fall months than in the extreme cold of winter, says a recent issue of *Modern Building*. This is no doubt partly due to the careless workmanship arising from a desire to rush work to completion before the arrival of winter. Also the sudden coming of cold weather has no doubt found the contractor unprepared to meet the new conditions before the damage due to freezing has been done.

But the one great cause for these early construction troubles is the deceptive nature of the weather conditions. In the late fall, although the weather is not extremely cold it is usually hovering near the freezing mark and is always accompanied by great humidity and frosty nights. This atmospheric condition is such that, even though not causing actual freezing of cements or mortars, it greatly retards their setting. In fact, the material may lie chemically dormant for weeks at a time.

The contractor, if he relies on his summer experience, believes that his materials have had sufficient time to properly harden to support their loads and upon removal of temporary false work may have an accident on his hands. He never should take chances in matters of this kind but should convince himself by actual tests that his materials have developed their full strength.

Simple precautions will avoid all troubles. The danger of cold weather lies very largely in the freezing of the materials used in the construction.

Therefore the thing to do is to avoid this freezing by heating the materials, by covering the completed work with insulating materials, such as canvas, etc., and by inclosing the building and heating the interior with burning salamanders. The point of the matter is—don't let the materials freeze, and don't remove centering too soon, and there can be no possibility of trouble. If any concrete should have become seriously frozen, by all means remove and replace it even though it may possibly thaw out and reset.

See that the same rigid standards of inspection and workmanship are maintained throughout the cold weather. Under such conditions the building erected in winter will prove of highest quality, sometimes even superior to the summer construction owing to the fact that the contractor may have better workmen at his disposal.

Two New Factory Buildings

A three-story and basement reinforced concrete factory building with roof covered with felt and slag is being erected at Baldwin Avenue and High Street, Jersey City, N. J., in accordance with plans and specifications by Francisco & Jacobus of New York City. The main building will cover a ground area 40 x 179 ft. with a wing 40 x 60 ft. The contract has been awarded to the John W. Ferguson Company, New York City. The same concern also has the contract for a manufacturing building at Shadyside, N. J., the walls being of brick and the floors of concrete and steel beam floor frames set directly into the walls. The building will be 54 x 55 ft. and two stories in height. A tower 20 ft. square will rise from one corner 30 ft. above the main building.

How to Shingle a Roof

If you want a roof that is a roof in every sense of the word, writes G. M. Keepauver in the *American Lumberman*, place your rafters 2 ft. on centers of 2 x 4 or 2 x 6, depending on the length to be spanned. Sheath with a good grade of 1 x 6 s2s; nail with common 8d galvanized wire nails.

Use a premium red cedar 5 to 2 shingle, clear and vertical grain; start at the bottom of the roof with a double course, line or use a straight edge every 4 or 4½ in., this being the amount showing to the weather. Split all shingles of extra width. Do not nail closer than 6 in. to the bottom of each course, nor closer than 1 in. to the edge of each shingle. Break joints not less than 1 in. Never have the roof flatter than one-third pitch; steeper will last much longer. Have the shingles moistened before laying to prevent cupping and warping.

Do not crowd them too closely, as this is a hindrance instead of a benefit. Use the old style cut, the triple galvanized or zinc-coated nail. Past records have proven beyond doubt that this type of a roof is the cheapest and most lasting. It will resist heat and cold and all of the other elements better than any other roof known to-day.

"How did you come out on the \$3,000 house you contracted for?"

"Came out in pretty fair shape. The contractor spent my \$3,000 and took the house for the difference."—*Louisville Courier-Journal*.

Trade Topics—Every Reader is Invited to Participate

Design for Fence and Gateway

From Builder, Moffittsville, N. Y.—With regard to the query of "W. M. L.," Orange, N. J., I would say that the best material to use in building such a fence is cypress. All the joints and laps should be primed with crude petroleum, and, if painted, crude oil should be used in the first coat. If the wood is oiled I would suggest crude oil be used for the filler. The next most durable and workable material is cedar, and then comes white pine. If the latter material is used, every piece should be primed before putting in, after fitting.

The bottom ends of the posts should be left the full size of the log, charred $\frac{1}{4}$ in. deep and set in

ture which they desire to be both damp proof and waterproof, that the addition of 10 per cent of hydrated lime, by weight of cement, will successfully damp proof and waterproof any concrete work, even under pressure conditions.

Hydrated lime is the most economical, efficient, and permanent medium that can be employed for waterproofing concrete. Due to its extremely fine state of subdivision it fills the voids and results in a dense, impermeable concrete, retaining its power of imparting impermeability to the concrete as long as the structure lasts. While the value of hydrated lime as a waterproofing material has never been widely advertised, and is not as generally known

Design for Fence and Gateway—Scale $\frac{1}{2}$ In. to the Foot—Contributed by "Builder," Moffittsville, N. Y.

cobblestones well tamped in. No dirt should be placed around the posts. The stone may be covered with hard, dry wood ashes. The hole should be $3\frac{1}{2}$ ft. deep and small stones put in the bottom to furnish drainage.

If desired the posts may be thoroughly soaked in hot asphaltum or tar and set in concrete mixed with 10 per cent Maltha. If the ground is clay or heaves, the posts should be anchored.

Remedy for Damp Cellar

From L. N. Whitcraft, Chief Engineer, Pittsburgh, Pa.—In the November issue of THE BUILDING AGE, page 59, I notice three letters relative to a "Remedy for a Damp Cellar," giving therein as many different remedies for overcoming or preventing this undesirable condition. In this connection I would like to suggest, for the benefit of your numerous readers, and especially for those contemplating building cellars, or any concrete struc-

as it deserves, it has, however, been used for this purpose in a great number of cases, including some very important structures and, so far as recorded, success has always attended its use.

Mr. Barry Replies to His Critics on Roof Framing

From D. P. Barry, Redford, N. Y.—I have read the strictures of "G. L. McM." in the November issue, and when I finished I could not restrain the observation of the devil when he was shearing a hog: "Much squeal and little wool." I did not say to put a work line on any rafter, but to put it on a pattern, which should be made of inch material and save for use another day. Some writers call this a "template." No such work line as the correspondent mentions was ever used here to my knowledge, and frame buildings were built in this place about as early as elsewhere in the United States. No rafter that I have seen has any

other line than the hew line. Most frames have no projection on the rafters, and when they have they are put on as shown in a former issue—the top of rafter being flush with outside corner of plate. The work line is used in framing to avoid working off superfluous timber, for hewed as well as sawed timber greatly varies. In one of the barns on my place, built probably seventy-five years ago, some brace seats are $1\frac{1}{4}$ in. deep.

No rafter is hypothetical. If any such rafter exists it cannot be other than real. In spite of everything on the steel square, that method is prone to error. Then, again, the framing squares have errors, and the lengths on them must be computed by square root or trigonometry. Furthermore, I have been a teacher for many years, and in teaching we go to the original documents, and I am trying to prepare young men to be independent of steel squares and books.

I insist that every complicated roof should be worked out before it is built. I do not have patience or time to use one stick to get the length of a rafter and another to mark the bevels. One would seem to be entirely adequate for the purpose.

A word more as to backing. Unless the hips are backed and the valleys grooved and the hips grooved on the under side the fascia at those points will be too narrow. Now, to overcome this a few builders cut the cornice bearer of these rafters narrower by a sort of guess, which makes the lower end too low and the rafters too long.

If "McM." worked in these parts he would see rafters grooved and backed. A joint cannot be made for rafter finish unless the valley is grooved. Back the hips neatly and get them straight, and groove the under side of projection and put up a decent roof. What's the use of knowing mathematics if they are not going to be used? Some day when somebody takes down your roof, what will he say?

Criticism of Barn Roof Construction

From Builder, Redford, N. Y.—Regarding the barn construction of L. H. B. H., Palestine, Ill., I do not think his Fig. 1 worth considering. It may stay up in Illinois, but it would not in this place. It is not self-supporting; the only thing that contributes to self-support is the little piece at the peak; the tension pieces at the foot are all that keep it from collapsing. A self-supporting roof is one that has no horizontal thrust, and neither of his roofs is such.

His Fig. 2 is the best illustration of a craze that I know of. It is loaded down with superfluous lumber to give it the curb roof effect. Gambrel barn roofs are objectionable on two grounds—they take a lot of lumber and they become filthy with litter hanging to the labyrinth of members. I would say that rafters 2 in. by 6 in. and 24 in. on centers will hold up a 28-ft. span in this section of heavy snow. In this region 30 ft. x 40 ft. is the standard barn, and not half of them has a ridge pole or purlins.

I went to examine the biggest frame building now standing in this place, which is over 40 ft. x 60 ft., with 22-ft. posts. The roof is about one-quarter pitch, the rafters are 4 x 7 in. sawed and

the ridge pole is an inch board. Part of the roof has collar beams, but no purlins. The rafters are 3 ft. on centers and, of course, they had sagged some. The rafters start from the edge of the plate, the roofing board projects about 2 in. and the shingles 3 in. This was built for a hotel in 1832, and it is a magnificent piece of framing.

If this roof stands here what is the sense of loading down a 28-ft. span and a 12-ft. post?

A heavy ridge pole not supported by king posts is a danger. The purlins should be set up with their sides plumb and level and the purlin supported on vertical posts. The 2 x 6's at the plate should be thrown out and rods put in. We never use them here, but would have saved some barns and stock one year when the hard snow on the roof was higher than the men's heads shoveling it off.

Views of Veteran Reader of The Building Age

From W. H. Blair, Architect, Janesville, Wis.—In moments of relaxation it is refreshing to turn to files of *The Building Age*, where we find interchange of thought by men of kindred minds and experience, which gives a sense of fellowship seldom found elsewhere.

I began the building business some time after the three gentlemen whose pictures appear in the right-hand column, on page 36, of the March number of this year, retired, and I have been continually connected with building operations in some capacity ever since.

I have had to scratch my head many times over the problems which constantly arise, but this I have lived through and still have at least as much hair left on top of my head as the gentleman on the right, on page 49 of the above issue.

I have read each issue, more or less closely, beginning with the January, 1879, number, and have found many valuable suggestions. In recent issues it appears that many are having their troubles with flour bins, but I got away from most of my troubles in that line, by adopting antifric-tion drawer slides, which give better satisfaction in working and more economy of space.

Methods of Cottage Construction

From James F. Hobart, Indianapolis, Ind.—In my recent journeyings I could not help but notice certain methods of doing work which differed so radically from eastern practice that it may not be without interest to briefly refer to them. In connection with the balloon frame cottage, Fig. 1, there was not a sign of siding about the job, neither was there a scrap of lumber save the shingles shown in the picture, together with the partial stagings. The floor was laid and the walls sheathed inside with boards $\frac{1}{2}$ -in. thick which had been run with dovetail grooves about 2 in. apart to receive and hold the plaster. The roof was complete, the door and window frames were set, and it appealed to me very strongly that here was a job which was to be covered with metal lath and stucco after the fashion somewhat prevalent in this vicinity. I marked down the location of the frame and promised myself to go back later

and secure a picture of the cottage after the stucco had been applied. In the course of time I did go back, but there was no stucco. The cottage had been finished with shiplap siding cut from Oregon fir logs.

In the completed cottage shown in Fig. 2, sev-

in the picture. Very long O. G. goosenecks are used to connect the eave troughs and the down spouts. These may serve in Indiana, but they would be pretty well frozen solid many times were they to be used in latitudes a little farther North, where the winters are a joke compared with New York and Massachusetts winters. There will undoubtedly be a whole lot of freezing stoppage when water will spill over the gutters instead of running away to the sewer. I would rather such connections be made on some other house than on mine.

Referring again to Fig. 1, the picture shows the amazing cheapness of construction of the cottage and gives a hint as to how hot the interior is likely to be in summer and how cold in winter. The walls are plastered inside and $\frac{1}{2}$ in. of grooved boards behind the plaster with a thickness of $\frac{1}{4}$ in. of siding on the outside of the studding and no building paper between certainly does not promise much warmth in cold weather or

Methods of Cottage Construction—Fig. 1—Building Ready for Its Outside Covering

eral characteristics are noticeable. There was no attempt made on the front of the house to bring the siding even with the lower edge of any window stool, but this was done on the side. The siding seems to have been run on both side and end on a predetermined spacing, taking no account of top of piazza floor or top of piazza roof. Neither was the bottom of the overhanging bay window considered.

It seems as though this window could have been dropped far enough or at least furred down far enough to bring it even with a course of siding, for the bottom of the window splits one course and another course is split in order to bring the courses of siding to an even break around the window. Two courses of siding are also split on the front of the bay window.

Another case of what I regard as slack designing or lack thereof is evidenced by the very short pieces of siding at either side of the mullioned window sash. It would seem as if the bay could have been made a little wider to give full window casings and a fair width of siding or else dispense with the casings and allow wide corner boards to take the place of the narrow casings.

The picture also shows a neat looking oval vent hole below and to the left of the bay window. The manner of placing the cornice gutters and the amount of drop given to them is plainly visible

much heat-repelling capacity in summer.

The placing of the window and door frames to receive the siding is, however, rather ingenious. The siding is so placed that the door and window frame can just slip inside of them, and then the double studs nailed on receive the frames and permit the casings to be nailed thereto. The threshold of the front door is left entirely free

Fig. 2—The Cottage as It Looked When Completed

from all supports save for the rebates in the jambs, but when the piazza floor was "poured" the concrete was tamped under the threshold until the cavity there shown was completely filled, thus making sure of a thorough support for that portion of the door.

Fitting and Hanging Doors

From G. L. McM., Tacoma, Wash.—I have read with much interest the article of Mr. Hobart in the November issue of the paper describing the way too many carpenters fit and hang doors. I am quite pleased with his "jig" or template for saving considerable of the unnecessary labor he describes, but out in this "neck of the woods" where the tendency is to reduce to its lowest terms the amount of tools the journeyman takes with him on the job, and where such a thing as a contractor furnishing transportation for tools from one job to another is one of the "lost arts"—the common practice being for the journeyman to take his tools in a "suitcase" hand box, the means of transportation being the street cars, a bicycle or the journeyman's shoulder—I am afraid such a tool would find little sale.

It would undoubtedly be a very convenient and labor-saving device if only the contractor would furnish it, but there would need to be a very radical change of attitude here before that would come to pass. Extra appliances for doing special work do not find a very ready acceptance in this part of the country for the above reasons, as they add materially to the load the workman must carry with him from one job to another.

Fortunately, however, it is possible for one to fit and hang doors without either the unnecessary

Fitting and Hanging Doors

and frequent lifting and trying so graphically described by Mr. Hobart, or burdening oneself with extra appliances like his "jig" though one would be pleased to have it to use. All the extra appliances necessary for the rapid and easy fitting of doors can be easily made or found on any job, while at the same time they cost nothing and after being utilized can be thrown away.

Aside from the usual tools found in every workman's hand box, the appliances are a pair of trestles—the lighter the better—a straight-edge the length of the door, a floor clamp for holding the door while jointing it, and a slide rule of some kind or a couple of narrow strips of wood for measuring rods, with which to take the widths of the door frames and transfer them to the door.

Of the slide rule there are several patterns to be found in the hardware stores. One of the most convenient tools I have ever found for this purpose is a 2-ft. one-fold rule with a slide in one side. This combines both rule and measuring gage, the only objection to it being that it requires a special pocket in which to carry it. I had mine made on the outside of the left thigh.

I am sending a sketch of the most convenient floor clamp with which I am familiar for holding doors while jointing them. Side and end views are shown which would seem to be self-explanatory. The clamp can be made by nailing 2 x 6-in. blocks on a thin strip of lath by cutting a notch nearly through

a longer piece of 2 x 6, or the workman who wants something better than the ordinary can use a steel spring and screw hardwood blocks to it, in which case one end should be slotted so that the blocks can be adjusted for different thicknesses of doors.

Having accumulated the necessary appliances, place the door in the clamp and joint the hinge side, testing the hinge jamb with the straight-edge and making the necessary allowances for variations from a straight line in the jamb by the use of the straight-edge while jointing the door. This is where the principal utility of the straight-edge comes in, as with very little practice one can readily fit the sides of the door to any ordinary jamb with the use of the straight-edge, before the door is ever lifted to place in the frame. The hinge edge of the door should be jointed with a barely perceptible bevel, to prevent its being hinge-bound when hung.

Having jointed the one edge place the door on the trestles, take the measures of the width of the frame both top and bottom and transfer them to the door, making the proper allowance for clearance at the same time; then with the aid of the steel square the proper cut for the top of the door can be found and the door cut accordingly. When there are to be no thresholds the bottom of the door can often be cut to the proper clearance from the floor while the door is still on the trestles, but sometimes it may be better to leave this till the door is hinged. Then the door can be replaced in the clamp and the other edge be jointed to the right width and to correspond to the jamb. If the work is done with care it will be found that it can be done more rapidly, with less lifting, and fully as good a fit can be made as when it is continually lifted, scribed and tried. In most cases with ordinary doors the door will be found to fit at the first trial and can be wedged to the proper height in the frame and the position of the hinges marked on both door and jamb at the same time, and the door is ready for hingeing with only one lifting to place. The lock edge of the door will need to be bevelled from $\frac{1}{8}$ in. for $1\frac{1}{2}$ -in. doors to $3/16$ in. or $\frac{1}{4}$ in. for $2\frac{1}{4}$ -in. doors.

I find it better to use the steel square for squaring and bevelling the edges, as in many cases the stiles are not true with the width of the door and a smaller square will not give the right angle, as the angle should be with the whole face of the door and not with the stile alone.

Sometimes there is considerable surplus wood to be removed from the width of the door; too much to allow of its all being taken off one side alone, in which case it may be necessary to place the door on the trestles and mark the widths before jointing either edge.

Hanging and fitting doors is hard work, though many, myself included, like to do it as well or better than any other work on the building, and the above method which saves a large percentage of the lifting that many do makes it very much more pleasant work to perform. In most cases it will only be necessary to lift the door into place in the frame twice—once to see that it fits and to mark for the hinges, and once to put it on the hinges.

Evidences of the growing prosperity are reported by architects in the larger interest which is being manifested in country homes.

Wall Board The Interior Finish- ing Material

Some Reference to Its Merits and Reasons Why Many Builders Prefer It for Interior Finish to Lath and Plaster

BY JOSEPH A. POESL

THERE are two good reasons why so many builders use wall board to finish the interiors of most of the buildings they erect. One is the certainty of thereby pleasing the owner, and the other is the added convenience and greater profit in having the entire job under direct control, which it permits.

Apparently, the better this material becomes known the better it is liked, for within the last few years it has made unprecedented strides in winning the indorsement of the building fraternity. And why not?

The manufacture of wall board has progressed to a remarkable extent during this period. Through earnest research and tireless experimentation a number of improvements have been applied so that the wall board of to-day is much different from that of yesterday. To-day it is a standard building material favored by leading carpenters and builders throughout the length and breadth of the land.

The most important improvement made is sizing the board. That is, the board is thoroughly impregnated with a special chemical compound which renders it moisture-proof. This idea is not new, but not until a short time ago was a size produced that would keep out moisture and act as a priming coat as well. Some of the best known moisture-proofing agents, like paraffine, had to be rejected by the experts in their search for this size because of the extreme difficulty of painting over it. As it is wall board can be easily painted. Doing away with the necessity of the priming coat saves money in decorating—actually a matter of at least \$5 on every thousand square feet.

This leads to the much discussed

question, "Is wall board really better than lath and plaster?" The answer of "yes," is not based on theory alone but on actual tests and on the experience of users. Yet, it must not be said that wall board is absolutely free from certain limitations, although its advantages outweigh them, and lath and plaster possesses undesirable features also.

Wall board is considerably cleaner to handle; in fact it may be compared with high grade lumber in this respect. A fine-toothed saw cuts it with a straight, smooth edge. The board is fastened direct to the studding, joists and headers with nails. And just as soon as this is done the decoration may proceed, and the job completed weeks earlier than if lath and plaster were used.

After the decoration has been completed battens or decorative strips are placed over the joints,

THE SCHEME OF LETTING THE BAND ANSWER FOR THE DOOR AND WINDOW HEADS, AND THE BEAM CEILING ARE INTERESTING FEATURES OF THE ATTRACTIVE LIVING ROOM SHOWN IN THIS PICTURE

bringing about a panel effect. Some home-owners object to paneling because ordinarily they are unfamiliar with the wide possibilities of this method of treating interiors and, as a result, are quickly won over. It is truly one of the most effective means of relieving the uninteresting plainness of a wall or ceiling. A plastered wall is nearly always covered with wall paper or paint, which only partly serves this purpose. The unlimited variety of panel effects that can be worked out with wall board permits of a particular treatment for each room, yet they may be totally unlike those of the adjoining rooms. In this way monotony is avoided.

The two rooms shown in the small pictures are in the same house. The one at the right is finished with wall board while the other had lath and plaster walls and ceiling. It is alleged that striking bridge-workers dynamited a nearby viaduct with the result that the lath and plaster came down; the wall board held fast and only a repainting was needed to put the room into shape again. Yet, the wall board room was but eight feet from the explosion and the other room was forty feet away.

With reference to the cost of wall board, this

and cold retarding qualities. The peculiar way of building it up, layer upon layer, is conducive of this, which means that a wall board room is cool in summer, and cozy and warm in winter.

Inasmuch as the basis of nearly all wall board is wood pulp it does not take fire readily. The fact is that it has never been known to take a higher insurance than lath and plaster.

It is proof against vermin. The special adhesive employed to hold the layers together and produce an almost homogeneous mass, is repellent to household pests such as rats, mice and the like.

The decoration of wall board is similar to that of wood and having a slightly pebbled surface it produces a more artistic effect. With sized board a good finish is readily secured with only one coat of the darker shades of oil paint and two of the lighter. However, water paint, tiffany glazing, dry fresco—practically any form of decoration is possible on it. The ability of the decorator is the only limit. It lends itself well to stencil decoration and to the aesthetic skill of the free-hand artist.

It is noteworthy that the wall board idea originated because of the insistent demand for something

WALL BOARD, THE INTERIOR FINISHING MATERIAL—EFFECT OF AN OUTSIDE EXPLOSION UPON THE INTERIOR OF TWO ROOMS—ONE FINISHED WITH LATH AND PLASTER AND THE OTHER WITH WALL BOARD

runs about the same as that of lath and plaster. There are, however, certain sections of the country where it is more expensive; in others, especially where transportation facilities are poor and skilled labor scarce, it is much less. But, taken all in all, both coverings average about the same as stated.

While speaking of cost, it is unfortunate that most people are governed by the first cost of an article in dollars and cents and not by the actual value received. In wall board is obtained a material which makes permanent, substantial and beautiful interiors—interiors that will never have cracked walls ready to fall at the wrong moment. The upkeep expense is practically nothing, and it follows that the first cost is the only cost. In addition, rooms finished with it have wholesome and sanitary walls and ceilings. When oil paint is used for the decoration the surface can be quickly cleansed with a damp cloth, making an almost ideal interior finish.

Perhaps it is not generally known that a newly plastered house is dangerous from the standpoint of health. It may be that on account of this ignorance many houses are tenanted about as soon as completed, but wall board requires no drying so a house may be occupied as soon as it is on the wall.

Other good points about wall board are its heat

that would do away with the delay, dirt, muss and general inconvenience incident to lath and plaster work, especially for remodeling. For this reason it appeals to the home-owner who contemplates re-fixing or repairing. With it defective plastered rooms are quickly made new and attractive by simply applying it directly over the walls and ceiling. At small cost attics are transformed into habitable rooms, thus utilizing what is often considered waste space in a house. In the vault-like cellar neat, dry and clean fruit-rooms, laundries and workshops are erected with very little trouble. There is also the old barn or outbuilding that is remodeled into a fine garage or studio.

We must not overlook the uses of wall board tile. In the kitchen and bath room it is ideal for wainscots, bringing about, when properly enameled, the effect of tile which is hard to detect from the genuine article. Besides it has the advantage of never cracking or disintegrating.

Then there is the grained wall board which is worthy of our attention. The process of faithfully reproducing the grain effect of wood on the surface of the board has reached a high stage of perfection. It is popular for use instead of solid wood or veneer wainscoting or other form of wood paneling.

Making Concrete Posts for Mail Boxes

One of the Very Many Uses for Which Concrete Is Well Adapted—Proportions of the Mixture

BY PERCY H. WILSON

A RATHER novel but at the same time thoroughly practical use of concrete is shown in the half tone engraving presented herewith. It is a post supporting a mail box on a rural free delivery route near the city of Dallas, Tex. It is a well known fact that wooden posts are always subject to rapid decay at the ground level where alternate wetting and drying takes place, and to avoid the necessity of renewals and repairs the concrete post was made. It is quite ornamental in design, and conveys the impression that the owner takes pride in the appearance of his premises.

A more simple post, one easier to make, would effect the same economy. The "form" for casting a post of this kind is shown in Fig. 1. The post should be about 7 ft. long. Planted at a depth of 3 ft. this would leave the box at convenient height for the delivery or extraction of mail. The form, as shown on the drawing, is simply a three-sided box

Fig. 1—"Form" for Casting a Concrete Post Similar to that Shown in Fig. 2

The "form" or mold may be made with one or more braces nailed across the upper or open side to prevent the sides from spreading when the concrete is tamped. The bracket effect at the top is obtained by inserting extra pieces of wood at the corners, as shown. If preferable a post in the shape of a letter T may be made, eliminating the bracket feature. A perfectly plain post without projecting top would also answer the purpose.

To provide for fastening the mail box to the post, bore two or perhaps four holes through the board

Fig. 2—General View of a Concrete Post for a Mail Box

Making Concrete Posts for Mail Boxes

providing for a post 6 in. square. The "form" is placed on the ground in horizontal position, with open side up, and filled with well-tamped concrete to the depth of about 1 in. Then $\frac{3}{8}$ -in. reinforcing rods are placed at either side, leaving about 1 in. space between each rod and the side of the "form." The box is then filled to within 1 in. from the top and two more reinforcing rods are placed on the concrete. The "form" is then filled to the top and the concrete struck off. The rods may go straight from the bottom to the top of the post, as it will not be necessary to curve them outward at the bracket.

at the top of the form. Insert in these holes the bolts with the heads down, or inside the "form." The bolts will be imbedded in the concrete when it is placed and when the "form" is removed the threaded ends of the bolts will project slightly above the top of the post. Holes cut in corresponding position in the bottom of the mail box will permit the bolts to pass through and the box will be secure when nuts are placed on the bolts.

Mix the concrete in the proportion of 1 part Portland cement, 2 parts sharp, clean sand and 4 parts crushed stone, ranging from $\frac{1}{2}$ in. to 1 in. in size. Allow the concrete to remain in the

"forms" for at least 24 hours. When the post is removed protect it from freezing, or if made in summer, from hot winds and sun. Wet it thoroughly for a week or ten days after removing it from the "forms."

Concrete posts do not warp, decay or burn. When used for fencing they keep in better alignment than wooden posts. Concrete is now used for fence posts, clothes poles, hitching posts and gate posts. Concrete fence posts have been made at an average cost of less than 25 cents each, notwithstanding the fact that all material was purchased, and even in well-timbered districts they are being substituted for wooden posts on account of their low first cost and everlasting qualities.

A New Idea in Weatherboarding

Originally the siding or outside covering on a house was called weatherboarding, and was really a clapboard proposition. Later it became beveled siding, with the development of saw and planing mills; then in time came the manufacture of quite a series of patterns in what was termed drop-siding, the use of a standard thickness of 1-in. lumber, dressed on the outside and shaped to pattern varying from that of the old beveled siding in appear-

A New Idea in Weather-boarding—Elevation and Section of Wall

ance. The last offering in the weatherboarding class, says T. C. James in the *Wood Worker*, is a standard thickness, comparatively narrow strip of lumber, dressed on the inside instead of the outside, shiplapped at the joints and grooved lengthwise and crosswise, so that the finished wall is in imitation of brick in outline.

The machine wood-working involved in this stock is that of milling it through a planer to get the shiplap and the lengthwise groove, all of which is made at the same time; meantime the strip is sized to $\frac{3}{4}$ -in. thick by dressing the inside. The outside is left rough, to present a better rustic appearance and make a closer imitation of brick. After the shiplap is milled the strip is passed through a gang gainer which cuts cross-grooves $\frac{1}{2}$ -in. wide and $\frac{5}{16}$ -in. deep, which take the place of the end mortar joints in a brick wall.

This class of siding is put up with miter joints at

the corner. The end jointing is practically all done in the cross-groove, so that short pieces may be used without the end joints showing much. In laying it up it is of course arranged to have the cross-groove break joints, as in the laying up of brick in a wall. The usual method of finishing off this class of work is to paint the wall face a brick red, then paint the groove which imitates the mortar joint, black. A sheet metal stencil or brush guide fits snugly into the groove and makes it easily practical to paint the groove rapidly and without smearing the outer surface with paint.

The Complete Building Show

One of the important coming events of deep interest to builders throughout the country, and especially to those in the Central West, is the exhibit of building materials which is to be held in the Coliseum in the city of Cleveland, Feb. 16 to 26. It is under the auspices of the Society Advocating Fire Elimination and will be a most powerful appeal to the American builder in the interest of safety, beauty, comfort and economy in construction, equipment and adornment that has probably ever been held in the United States. It will combine the best that formerly have contributed to the Cement, Clay, Real Estate and Building Shows of the country. It will be known as the "Complete Building Show" and will be patterned after the well known Building Trades Exposition of London.

A distinct feature will be the architectural exhibit in which will be shown drawings submitted in the contest that is to be held by the Directors of the Exposition. This will afford opportunity for the display of the plans and specifications of a building together with the construction which these plans and specifications cover and of the completed structure. The contest will be for a six-room workman's home to cost not more than \$3,000.

Detailed particulars regarding this exposition are obtainable through the general secretary of the society, Ralph P. Stoddard, 356 *Leader-News* Building, Cleveland, Ohio.

Babson on the Building Outlook

In the last report of Babson's Statistical Bureau, the following regarding the building situation appears in the column headed "The Mercantile Outlook."

"New building is now making an exceptionally good showing. Contrary to the usual movement at this season construction projects have not shown much tendency to decrease. So far this year the greatest proportional advance has been made in factory building which has increased to fully six times its volume last spring. After a winter of good business with big profits, however, a great expansion in residential building is almost inevitable and in actual dollars and cents this class of construction is by far the largest. Moreover, the railroads may soon undertake considerable new construction. Surely, a wonderful, perhaps a record-breaking, building boom should take place next spring."

Design of Beams, Girders and Trusses*

A Series of Articles on the Above Subjects in Which Only Arithmetic Is Used for the Calculations

BY ERNEST MCCULLOUGH, C.E.

COMPOUND beams have been made consisting of two shallow beams superimposed (Fig. 52). If not carefully fastened together they act singly because the line between them is in the position occupied by the neutral axis of a solid beam, having a depth equal to the combined depth of the two pieces. Several methods have been used to cause the two pieces to act together, one of which is shown in Fig. 52, the other in Fig. 53.

No matter how thoroughly the pieces are fastened together the strength of such a compound beam is only about 70 to 75 per cent of the strength of a beam of equal dimensions made from one piece of timber. The deflection of such a beam under load is much greater than the deflection of a beam of equal dimensions made from one piece of timber.

The diagonal side pieces shown in Fig. 52 should be preferably of a harder wood than the beam, and each should be not less than one-eighth the thickness

where a pin is placed by the allowable bearing times the breadth to obtain the depth of the hole, half of which will be cut in each half of the beam. The shear divided by the breadth times the allowable unit shear with the grain gives the minimum distance allowable between pins. When the computations are completed it will be discovered that the pins get farther apart as the middle of the span is approached.

Flitch plate girders, Fig. 54, are seldom used to-day, although very popular at one time. The only reason for referring to this type of compound girder here is to show wherein it fails. A flitched girder consists of a plate of steel, or wrought iron, between two planks, the whole construction being firmly bolted together. The writer, in wrecking old buildings, found a number of such beams evidently put together on a basis of relative fiber stresses with no thought for relative deflections. He worked once

Fig. 52—Compound Beams

Fig. 53—Another Style of Compound Girder

Fig. 54—End View of Flitch Plate Girder

Design of Beams, Girders and Trusses

of the beam, thus making a beam 25 per cent wider than the width of the pieces of which it is composed. The pieces should be diagonal and slope in opposite directions on the sides of the beam. Plenty of nails must be used.

In Fig. 53 the pins should be of hard wood or of metal. It is best to use two pieces in each hole, wedge shaped so they may be driven tight and have a bearing against the wood the full width of the beam. The shear being greatest along the neutral axis it is here the pieces should join and the pins be driven. Between the pins should be vertical bolts with large washers to hold the pieces together. The spacing of the pins will be determined in like manner as the pitch of nails is determined when reinforcing planks are used on the side. First determine the bearing value of the wood and the shearing value with the grain. Divide the shear

in the office of an architect who tried to get him to design such a beam in this way and the man was greatly surprised when the proper method was shown him. The method not to use is as follows: Assuming a maximum bending fiber stress of 1300 lb. per square inch for wood and 16,000 lb. per square inch for steel, the relative areas of wood and steel will be $16,000 \div 1300 = 12.5$, or a $\frac{1}{4}$ -in. steel plate between two $\frac{7}{8}$ -in. planks makes a girder having the strength of four $\frac{7}{8}$ -in. planks.

Referring to the deflection formulas it is seen that for a fiber stress of 16,000 lb. in steel the deflection

in inches on any span = $\frac{L^3}{60h}$, while for a fiber stress of 1300 lb. in wood the deflection = $\frac{L^3}{41h}$

Therefore yellow pine deflects $60 \div 41 = 1.46$ times as much as steel, under the respective fiber stresses given. This question of deflection does not take into consideration the thickness of the material, for deflection is governed by the span and the depth.

The statement about relative deflections means that if the thicknesses are proportioned by the relative stresses then the wood planks must be 1.46

Note in this series of articles no algebra is used. The rules are written in the modern way in the shape of formulas by using letters instead of writing in full words that are often employed. The words for which the letters stand are explained for every formula so that readers may in time understand how to read and comprehend formulas used by other writers. The actual computation is arithmetical and worked examples are given.—Editor.

*Continued from page 51 of the December issue for 1915.

times as deep as the steel plate between them. This will not do in practice, so it is necessary to obtain the relation between the stresses when the plate has a depth equal to the depth of the inclosing planks. The fiber stress in the wood divided by the fiber stress in the steel must equal the modulus of elasticity of the wood divided by the modulus of elasticity of the steel; that is,

$$\frac{f_w}{f_s} = \frac{E_w}{E_s}$$

$$\text{Then } f_w = \frac{f_s E_w}{E_s} = \frac{16,000 \times 1,500,000}{30,000,000} = 800 \text{ lb.}$$

per square inch.

This is a low stress for yellow pine, so a softer wood can be used. Assume a wood having a modulus of elasticity of 1,000,000, then

$$f_w = \frac{16,000 \times 1,000,000}{30,000,000} = 535 \text{ lb. per square inch.}$$

If a steel fiber stress of 18,000 lb. per square inch is assumed the fiber stress in the wood = 600 lb. per square inch. The computations show that for

Fig. 55—Side and End Views of Plate Girder with Stiffeners

Design of Beams, Girders and Trusses

a flitch plate beam a soft, cheap wood is the kind to use. It is wasteful to use a wood in which a high fiber stress may be permitted.

To design a flitched girder the fiber stresses are first found. Then assume the depth and thickness of the steel plate. Find how much it will carry as a thin deep beam and deduct this load from the total load to be carried. The difference is to be carried by the two wood planks of which we know the depth and the fiber stress, so it is easy to find the thickness. The bolts are figured to transmit the shear. It is an interesting exercise to design a flitch girder, but a rolled steel beam or a trussed wooden girder will usually be cheaper.

Plate Girders

Plate girders are compound girders made of wrought iron or steel, the latter material being generally used to-day, for it may be used with a higher fiber stress, thereby reducing the weight. When rolled beams are not obtainable in a large enough size a plate girder is used, provided a rolled beam cannot be made to serve, by attaching plates to the flanges. Tables of plate girders are given in the steel hand books, so the architect or builder finds it as easy to select a plate girder for much of his work as it is to select a rolled I-beam or channel for light loads on shorter spans. When the load, or the span, either or both, make a plate girder too heavy a trussed girder is used.

Fig. 55 shows a plate girder. The thin vertical plate is known as the web and is made thick enough to carry the shear. It acts also as a long slender

column, so must be safe against crippling. When proportioned to carry the shear and the thickness is greater than 1/60 the depth between the rivets in the upper and lower flanges the plate is safe against crippling. When designed to carry the shear and a thickness less than 1/60 the depth is obtained, it is necessary to use stiffeners spaced regularly at intervals equal to the depth of the girder. Additional stiffeners are placed under concentrated loads and at the ends. Intermediate stiffeners are sometimes crimped over the flange angles, but it is as common to have fillers placed under them, the thickness of the fillers being equal to the thickness of the flange angle, so the stiffeners will be straight and have the ends resting on the outstanding leg of the flange angles. No scientific rules seem to be commonly accepted for designing intermediate stiffeners, the usual empirical method being to have the outstanding leg equal in width to 1/30 the depth plus 2 in..

End stiffeners act as columns to carry the end shear, which is delivered to them by the web plate and carried to the bearing plate. Stiffeners under concentrated loads are also designed as columns. The ends of all stiffeners designed as columns should be milled or ground to fit perfectly against the bottom flange angles. Divide the load by a fiber stress of 12,500 lb. per square inch for the area of the stiffeners and use fillers to keep the stiffeners straight.

(To be continued.)

Silver Rivet Instead of Cornerstone

One of the unique features in connection with recent building operations in New York City was the use of a silver rivet instead of the time-honored custom of laying the cornerstone of a new building. At the corner of Madison Avenue and Forty-Second Street, a twenty-six-story structure is being erected, and instead of the usual ceremonies incident to the laying of the cornerstone, the owner drove a silver rivet into the iron work of the building. When completed this rivet will be exposed in a silver-lined recess in the main entrance lobby of the building, which is expected to be ready by the first of May, 1916. This new structure, it may be interesting to state, is the first steel building designed in accordance with the recent building ordinance. The architects are Jardine, Hill & Murdock, and the contracting engineer Russell B. Smith.

White Cedar Shingle Makers Organize

The Northern White Cedar Shingle Manufacturers' Association is the title of an organization just effected with W. B. Thomas of Manistique, Mich., as president; W. H. Holt of Oconto, Wis., as first vice-president; M. D. Reeder of Boyne City, Mich., as second vice-president, and A. C. Wells of Menominee, Mich., as treasurer.

According to the Constitution and By-Laws the association purposes "to establish definite grades, a thorough inspection service, a trade mark, publicity campaign, the inauguration of favorable freight rates, supervise legislation—this to include tariff protection—and to effect more harmonious relationship between employers and employees."

Ventilation of Buildings in New York

Makers of the New Building Code Propose Some Radical Changes Regarding Light and Ventilation

IN the revision of the new Building Code for New York City a general plan has been laid out by Rudolph P. Miller, expert to the Building Committee of the Board of Aldermen, which will compel builders of commercial structures to follow the general regulations of the Tenement House law with regard to apartment and tenement buildings in the matter of light and ventilation.

The preliminary draft dealing with this subject provides that the rooms of business buildings hereafter erected must be so ventilated, in case a direct exterior ventilation is not secured, that the temperature therein, under ordinary conditions, is not excessive, and that a standard of purity of air is maintained. The object sought is to secure proper conditions for the rooms in buildings of different kinds to make them habitable.

Ventilation Provisions

In public buildings a more positive means of ventilation is required. The provision in this case is that there shall be such a system of ventilation that there is an actual change of air within any room used for public purposes, such as places of assembly, hospitals and asylums, schools, etc. The provisions, however, are not to apply when the rooms used for public purposes are so large that there is more than 1000 cu. ft. of air space to each occupant and there is some exterior ventilation by means of windows.

A minimum size of rooms in residence buildings is specified, and another section excludes store-rooms from the application of the article. Bath-rooms may be ventilated in several ways, and windows utilized for the purpose of ventilating rooms to the outer air are required to have an area of at least one-eighth of the floor area of the rooms. The minimum area of any window is to be 12 sq. ft. and the window is to be so arranged as to open for about one-half of its area. Provision, however, is made so as not to exclude mullioned windows in which the aggregate area of the separate parts equal the required area for any window.

The Size of Courts

No attempt is made to say what shall be provided in any building in the way of courts, but a minimum size of court, dependent on its height to the roof of the building, is specified when courts are to be used for purposes of ventilating rooms. No court under the proposed article shall be less than 4 ft. wide in any case, nor shall such minimum width be less than $1\frac{1}{4}$ in. for every foot of height to the roof of the building.

Yards are required at the rear of every residence building having a minimum width of 10 per cent of the depth of the lot, but in no case less than 6 ft. Such yards must extend across the entire width of the lot, and be unobstructed for their full height from the floor level of the lowest story used for residence purposes. When a building, however, faces on two or more streets these yards are not required.

Regulation for Old Buildings

Another section provides that all courts used for ventilation purposes as in the article prescribed shall be connected to the street or yard by means of an intake at the bottom of the court. The minimum size of such intake is 5 per cent of the area of the court, except that no intake shall be less than 4 sq. ft. When, however, a court exceeds 400 sq. ft., then the aggregate areas of intakes need not be more than is required for a court of 400 sq. ft.

These provisions are made to apply to buildings hereafter erected, but it is also provided that no existing building shall be enlarged, or its lot so diminished as to reduce the area of the yard or court below what is required for the proper ventilation of any room. It is also provided that no additional rooms shall be placed in any buildings that may hereafter be enlarged or altered unless such rooms comply with the requirements for rooms in new buildings.

Strength of Treated Timbers

A series of tests for the purpose of determining whether timber is weakened by preservative treatment have recently been made by the Forest Service and the result announced in Bulletin 286. The timbers used were Southern yellow pine and Douglas fir, and beams of large size were employed. Some of the deductions arrived at were as follows:

Timber may be very materially weakened by preservative processes.

Creosote in itself does not appear to weaken timber.

A preservative process which will seriously injure one timber may have little effect or no effect on the strength of another.

A comparison of the effect of a preservative process on the strength of different species should not be made, unless it is the common or best adapted process for all the species compared.

The same treatment given to a timber of a particular species may have a different effect upon different pieces of that species, depending upon the form of the timber used, its size, and its condition at the time of treatment.

New Publications

Safety Engineering Applied to Scaffolds. 350 pages. Size 6 by 9 in. Illustrated by 128 engravings most of which are from photographs. Bound in board covers. Published by the Travelers' Insurance Company. Price, \$3.

The need of literature on the subject of scaffolds is readily demonstrated by the great number of accidents that occur, and the treatise under review has been brought out by the Engineering and Inspection Division of the Travelers' Insurance Company for the purpose of dealing with the safety problem in connection with scaffolds and scaffold-like structures. The first section of the book discusses the reality of the scaffold hazard while the second section treats of scaffolds in a general way, outlining the subject as a whole and reviewing the various forms that are most commonly used. There are thirteen sections in all, the third dealing with bricklayers' pole scaffold—American practice; the fourth, independent pole scaffold; the fifth, lashed scaffolds, and those which follow deal with special safety features; general features and operations of ladders, runways, stairways, etc.; building the horses; suspended scaffolds for construction work; platform and overhead types of scaffold machine; features common to both types of suspended scaffolds; carpenters' and outrigger scaffolds; painters' swinging scaffolds; needle-beam scaffolds; plasterers' and decorators' inside scaffolds; structures similar to scaffolds, and the final section is devoted to general counsel with regard to scaffold work.

Throughout the treatise special attention has been paid to American practice which differs in many respects from that which obtains in Europe.

Architects' and Builders' Pocket Book. By the late Frank E. Kidder. Compiled by a staff of specialists with Thomas Nolan, Editor-in-Chief. 1816 pages. 4¼ by 7 in. in size. 1000 illustrations. Bound in flexible morocco. Published by John Wiley & Sons. Price, \$5.

This is the sixteenth edition of one of the best known works on building construction with which the trade is familiar. It has been revised and greatly enlarged, and Prof. Nolan with his corps of experts has rewritten the book from cover to cover. The authors have quoted from many authentic sources as well as presented the results obtained in their own daily practice. Every item has been carefully checked and the aim throughout has been to present clearly and concisely as well as in the least possible space all the information that is likely to be required by the architect, the building-contractor, the structural engineer and the draftsman, including data for estimating approximate costs.

This new edition of the work is divided into three sections, Part I explaining the practical application of arithmetic, geometry and trigonometry, while Part II treats of the materials, construction and strength and stability of structures. All the matter in the twenty-eight chapters of this section consists of special essays by experts. Reinforced concrete mill and factory construction is among

the new subjects here treated. Part III is devoted to miscellaneous data and much new matter has been added, such as extended tables of specific gravities, weights of substances, architectural acoustics, waterproofing for foundations, the Quantity System of Estimating, etc.

Many of the tables have been re-arranged so as to read across the page instead of lengthwise as heretofore. One of the most important changes is the re-calculation of the tables and problems relating to unit stresses, especially those for the different woods. These have been changed to conform to the latest engineering practice. The derivation of many of the formulas used has been explained and numerous cross references enable the reader to use this new edition of Kidder's work as a text book for certain parts of the mechanics of materials as well as a handbook for office work. The tables of the properties of structural shapes, of safe loads for columns, beams and girders have been revised and many new tables added.

A large number of illustrations have been added, and the diagrams used from the latest edition have been redrawn and some have been printed with lines of different colors for the purpose of making clearer the demonstrations.

In its present shape the book is of such a nature as to make it a necessary volume in the library of every architect and builder in the country. It can be furnished through THE BUILDING AGE Technical Book Department, 239 West Thirty-ninth Street, New York City.

The Building Estimator's Reference Book. By Frank R. Walker. 612 pages. Size, 4½ x 7 in. Profusely illustrated. Bound in flexible covers. Published by the author. Price, \$10.

This has been compiled as a reference book for those engaged in estimating the cost of constructing all classes of modern buildings, and gives the labor costs and methods employed in the erection of some of our present-day structures together with the prices of the necessary material and labor entering into the cost of all classes of buildings. The costs have been reduced to actual hours per unit of measure so that the figures may be applied to any rate of wage. The matter is comprised in 26 chapters and covers all phases of building construction ranging from the foundations to the finished structure. One of the features often overlooked by the estimator in preparing his bid is the overhead expense, and as the success or failure of a contractor depends upon the accuracy of the estimate this item is emphasized in the present work.

New Flat Buildings in Brooklyn

A notable feature of the building activity along the line of the recently opened Fourth Avenue subway in Brooklyn, N. Y., is the contemplated erection in the Bay Ridge section of twenty 6-family apartment houses estimated to cost \$250,000. The buildings are to be erected on a plot 600 x 100, comprising the entire frontage on the south side of Sixtieth Street and Seventh Avenue.

Current News of Builders' Exchanges

"Organ" of the National Association of Builders' Exchanges—Important Meetings—Exchange at Sacramento

Minnesota State Association of Builders' Exchanges.

SUPPLEMENTING the brief announcement in our last issue of the annual meeting of the Minnesota State Association of Builders' Exchanges held at the headquarters of the Minneapolis Builders' Exchange, it is interesting to state that representatives of twenty-five cities were in attendance, completely filling the main assembly room of the Exchange. The morning session was devoted largely to a report of the president and other routine matters, and in the afternoon various trade topics were discussed in a way which showed a lively interest on the part of those in attendance. The "Uniform Contract Blank" adopted by the American Institute of Architects and the National Association of Builders' Exchanges was indorsed, and former president, F. J. Romer of the St. Paul Builders' Exchange, spoke in praise of this standard document, which is the result of so much thought and which represents the proper spirit of co-operation between architects, contractors, sub-contractors and owners.

The program included a luncheon at the Dyckman during which selections were rendered by a ladies' quartet. After the menu had been properly considered clever remarks were made by a number of those present. These included Emil Zauft, the retiring president of the State Association of Builders' Exchanges, and president of the Builders' Exchange at Duluth, A. P. Cameron, who had just been re-elected president of the St. Paul Exchange, Herbert M. Gardner, former president of the Minneapolis Exchange and of the State Association, F. D. Corning of St. Paul, and a Mr. Scott, a lumberman of Duluth, who gave a very interesting talk on the demand for better goods, finer workmanship and general improvement all along the line in the building field. The officers for 1916 were given in our last issue.

"The National Exchange Builder."

The National Association of Builders' Exchanges is about to issue an official organ to be called the *National Exchange Builder*. The magazine is to be devoted entirely to the interests of builders' associations as well as the building interest in general.

Sacramento Builders' Exchange.

Contractors, architects and material dealers of Sacramento have joined in the formation of a Builders' Exchange. Preliminary organization has been effected with a membership of about ninety, with William B. Rohl as chairman pro tem. A meeting will be held shortly to elect permanent officers and decide upon the definite lines to be followed, and several officers of the San Francisco Builders' Exchange will be present.

New Quarters for Detroit Exchange.

If present plans are carried to a successful conclusion, the Builders' and Traders' Exchange of Detroit, Mich., will, about March 1, take possession of the entire fourth floor of the Penobscot Building, and also the addition that is now being erected on Congress Street. We understand that over 15,000 sq. ft. of floor space will be devoted to provide offices and a permanent building exposition. The new addition will be devoted entirely to this building exposition, which is composed of exhibits of all kinds relating to the building industry. The architects of the city are co-operating to make the exposition successful, as it will prove advantageous to

them, since they will be able to bring their clients to inspect materials, specialties, equipment, etc., located in a central place and at a great saving of time and effort.

Talk to Master Builders on India.

The members of the Master Builders' Association of Salem, Mass., were greatly interested in the talk given on Dec. 2 by Rev. O. W. Warmingham, who spoke on buildings and life in India. What made the event doubly interesting was the fact that Mr. Warmingham was born in India and possessed a fund of valuable information regarding the subjects upon which he spoke. A box lunch was served during the evening and a feeling of good fellowship prevailed.

Banquet of Pittsburgh Exchange.

The annual banquet of the Builders' Exchange of Pittsburgh, Pa., was held at the Fort Pitt Hotel on the evening of Thursday, Dec. 16, when a large representation of the membership was present to listen to the address of W. B. King, Washington, D. C., counsel for the National Association of Builders' Exchanges. The toastmaster of the evening was D. L. Gillespie, and in addition to a most excellent menu there was vaudeville entertainment and music.

Master Builders Hosts at a Coffee Party.

Bigelow & Harriman were the hosts at the recent coffee party of the Master Builders' Association at their rooms on Devonshire Street, Boston, Mass., over which Secretary William H. Sayward presided.

The speaker was William Stanley Parker, a Boston architect, who had for his subject "The New Standard Contracts."

After the address Mr. Parker answered questions from the floor pertaining to the "eternal triangle" that exists in the building business between the owner, architect and contractor.

Birmingham Builders' Exchange.

At the meeting of the Builders' Exchange of Birmingham, Ala., held Nov. 22, the president appointed W. A. Currie, P. E. Bostick, C. P. Lichty, a committee to consider the feasibility of adopting the new Standard Contract Documents approved by a joint committee from the American Institute of Architects and the National Association of Builders' Exchanges, and at the same time to devise ways and means for securing the co-operation of all contractors and sub-contractors interested.

At the same meeting Frank Rushton gave a very interesting and instructive talk on "The Necessity of Business Organizations," and urged closer co-operation and more loyal support of such organizations.

New Secretary of Memphis Exchange.

Nearly a year ago the secretary of the Builders' Exchange at Memphis resigned, since which time the duties of the office have been in the hands of the assistant secretary, Miss Annie Laurie Berton. At a recent meeting of the board of directors A. L. Banning, Jr., was elected to fill the office of secretary, and early in December he entered upon his duties. Miss Berton will continue as assistant secretary.

Brief Review of the Building Situation

November Shows a Marked Increase in the Planning of New Work as Compared with November, 1914

THE encouraging reports which were noted in our last issue have continued in increasing volume and the building operations as reported for November show a very marked increase when compared with those for the corresponding month of 1914. The increased activity is confined to no particular locality as all four of the zones into which we have divided the country show very appreciable gains over the year before. Even in the extreme West, where heretofore the amount of new work planned has been less than during the corresponding

period of 1914, the figures indicate a gain for November of 23¼ per cent. The gain for the country is 44.73 per cent.

In the cities of the Eastern States, of which thirty-seven have reported, there are thirty increases and only seven decreases, with a resultant gain as compared with November of the year before of 52.39 per cent. The more conspicuous gains are shown in Albany, Boston, Buffalo, Hartford, Newark, the five boroughs of Greater New York, Philadelphia, Rochester, Springfield, Syracuse, Trenton and Utica. The important decreases are confined to Allentown, Pittsburgh, Worcester, Wilkes-Barre, and Schenectady. The accompanying table gives the comparative figures.

CITIES OF THE EASTERN STATES

	Nov., 1915	Nov., 1914
Albany	\$588,305	\$301,578
Allentown	133,800	366,035
Binghamton	86,160	130,699
Boston	3,035,573	1,366,778
Bridgeport	490,973	368,859
Buffalo	788,000	498,000
East Orange	89,018	79,605
Easton	37,300	60,000
Harrisburg	84,375	34,000
Hartford	707,709	399,385
Lawrence	152,275	78,600
Manchester	111,898	87,665
Newark, N. J.	641,385	373,627
New Britain	199,585	60,263
New Haven	966,080	315,755
New York:		
Manhattan	4,601,215	2,058,244
Bronx	3,355,038	448,013
Brooklyn	4,282,576	1,617,445
Queens	1,760,389	1,148,586
Richmond	242,522	131,405
Paterson	149,585	46,961
Philadelphia	2,408,665	1,240,530
Pittsburgh	663,312	777,368
Portland	115,200	77,050
Reading	21,025	20,350
Rochester	817,254	397,830
Scranton	322,164	88,852
Schenectady	60,425	76,385
South Orange	100,220	41,550
Springfield	650,050	197,502
Syracuse	608,324	235,365
Trenton	157,595	79,239
Troy	70,735	37,450
Utica	151,035	96,300
Williamsport	17,500	1,500
Wilkes-Barre	48,535	76,493
Worcester	354,839	424,124

In the cities of what may be considered as the Middle States of the country thirty-three report an increase as compared with November, 1914, of 41.32 per cent. Of the cities reporting twenty-nine indicate increased activity while four show decreases. The conspicuous features are Chicago, Akron, Detroit, Milwaukee, Minneapolis, Omaha, Toledo and Youngstown.

CITIES OF THE MIDDLE STATES

	Nov., 1915	Nov., 1914
Akron	\$525,105	\$179,395
Cedar Rapids	119,000	250,000
Canton	135,050	43,875

CITIES OF THE MIDDLE STATES—Continued

	Nov., 1915	Nov., 1914
Chicago	10,861,600	6,513,150
Cincinnati	790,965	336,210

Kansas City, Mo.	724,115	341,220
Lincoln	186,705	39,475
Milwaukee	1,123,925	643,888
Minneapolis	1,539,225	703,615
Omaha	656,075	133,583
Peoria	197,575	605,200
Salina, Kan.	114,699	10,355
St. Joseph	64,819	36,410
St. Louis	782,943	650,029
St. Paul	619,701	710,697
Sioux City	194,297	84,477
South Bend	77,300	16,275
Springfield	147,145	55,100
Toledo	535,755	276,676
Topeka	69,650	35,105
Youngstown	203,790	38,405

Coming now to what may be designated as the southern zone, of the twenty-three cities reporting only two show decreases as compared with November of the year before. These two cities are San Antonio, Tex., and Shreveport, La.

CITIES OF THE SOUTHERN STATES

	Nov., 1915	Nov., 1914
Atlanta	\$284,647	\$232,104
Baltimore	690,478	274,980
Birmingham	121,904	79,710
Charleston	70,700	54,755
Chattanooga	53,532	28,258
Columbus, Ga.	17,200	6,600
Dallas, Tex.	269,498	133,850
El Paso	189,317	159,285
Fort Worth	124,243	104,840
Houston	204,255	100,076
Louisville	246,030	151,600
Memphis	191,485	133,275
Montgomery	16,541	15,790
Nashville	108,665	33,655
New Orleans	156,551	69,632
Norfolk, Va.	138,255	64,255
Oklahoma City	99,765	9,915
Richmond, Va.	275,251	130,638
Savannah	80,515	54,900
San Antonio	127,340	210,575
Shreveport	55,683	77,764
Washington	594,925	419,544
Wilmington	138,020	61,036

In the extreme Western section embracing the Pacific slope former decreases have been turned into increases with a result that the thirteen cities reporting show a gain of 23.25 per cent over the year before.

San Francisco	1,332,053	988,587
Seattle	798,810	229,615
Spokane	46,475	55,700
Tacoma	75,465	270,655

The gains which have been made during the last few months of 1915 have been sufficient to offset the decreases in the earlier portion of the year so that there is an appreciable percentage of gain for the eleven months of which reports have been presented. All indications point to a veritable "boom" in the building industry with the opening of the spring season.

Every Customer
Becomes
My Salesman

I am the Neponset man in my own. Twenty-seven salesmen are working for me and more are coming.

These are my customers whose residences I have covered with Neponset Shingles. They're turning business my way all the time.

Neponset put me on the map—I am making good money. The very first job gave me the best advertising a man could get—other jobs keep coming right along.

Big Architects specify Neponset Shingles and property owners are highly pleased with them.

If a fire comes along, leaping from roof to roof it will skip my roofs—blazing sparks and embers die harmless on Neponset.

It does everything a wood shingle will do, and can be laid twice as fast, because every Neponset is not only double-width but uniform; no trimming.

I advise you to be the Neponset man in your town.

Builders' Appliances and Equipment

Some Things of Special Interest to Those Having to do with the Various Branches of the Building Business

Berger's Puttyless Skylight

One of the prime requisites of a satisfactory skylight is that it shall not leak, and experience has shown that a great deal of the trouble encountered with leaky skylights is traceable to the inferiority of the putty that is used in connection with them. For the purpose of overcoming this difficulty and rendering skylights water tight there has just been placed upon the market by the Berger Mfg. Company, Canton, Ohio, a con-

Fig. 1—General View of Berger's Puttyless Skylight

struction especially designed for the purpose and which entirely eliminates the use of putty. Through mechanical means the joints of glass and frames are made wind and water tight. An idea of the appearance of the skylight may be gathered from an inspection of Fig. 1. The point is made that these puttyless skylights are more easily and quickly erected, and in the case of a broken glass, replacement can be made without difficulty or loss of time.

Upson's Processed Board

Samples of what is described as "the most dependable board made in America" are being distributed among the trade by the Upson Company, Lockport, N. Y. Each sample is inclosed in one of the pockets of a folded envelope while the other contains an illustrated circular giving the facts in regard to the wall board in question. The sample measures about 3 in. in width by $4\frac{3}{4}$ in. in length, one side being finished to show the actual appearance of the material. Emphasis is laid upon the fact that the board in addition to being sized through and through is also kiln cured and waterproofed "by the original Upson method." It is claimed that walls and ceilings lined with this "processed" board will not chip, crack or fall. Panels of Upson board can be nailed directly over old plaster or on to new framework by any man who is handy with a hammer and saw.

Whalebone Wall Ties

One of the leading products of the Allegheny Steel Band Company, Pittsburgh, Pa., is the whalebone wall tie which can be used for any style of construction whether solid or veneer, and is claimed to be a permanent fixture when once placed. The company lays special emphasis upon the quality of these ties, and states that they are made from the best grade of galvanized sheets. It is not the scrap from several other articles running in gages as light as tin and weighing as low as 30 lb. to the thousand, "but is the best grade, never lighter than 22 gage or $1/20$ to $1/32$ in thickness and weighing 50 lb. to the thousand." Every tie is said to be guaranteed as represented. The ties are made $\frac{7}{8}$ in. wide and 7 in. in length and are not only "high in quality but low in price."

Catalog of Carpenters' Tools

A handsome sixty-four-page catalog covering a wide variety of hollow mortising chisels and wood-boring tools is being sent to carpenters and builders by the Forest City Bit & Tool Co., 1206A Kishwaukee Street, Rockford, Ill. The index at the back of the book contains reference to more than sixty commodities. In the introductory it is stated that all tools are manufactured from selected grades of steel, and high grade products are turned out from a factory equipped with modern machinery, operated by skilled machinists. A copy of this catalog may be had by any reader of the paper if he will write to the company at the given address.

Sheet Metal for Interior Decoration

We have before us a copy of a very attractive catalog of metal ceilings and side walls which is being sent out by W. C. Hopson Company, Grand Rapids, Mich. It consists of sixty pages measuring $12\frac{1}{4}$ x 9 in. in size and carrying a large number of well executed halftone engravings of original and exclusive patterns in French, Gothic, Colonial and miscellaneous designs. Attention is called to the fact that the new lines of steel ceilings illustrated embody the best thought and skill of the most experienced designers and artisans in ornamental metal. The requirements of the architect, the owner and the builder have been met by designers having a full appreciation of the possibilities of sheet metal as a decorative material as well as of its restrictions. The engravings have been executed with a fidelity to detail which cannot fail to impress the architect and the builder, and as showing one of the multi-

Fig. 2—Sheet Metal for Interior Decoration

tude of designs contained within the covers of the catalog, we present in Fig. 2 a picture of a field plate 24 x 24 in. in size. Among the early pages of the catalog are rules for measuring ceilings and side walls which cannot fail to be appreciated by the sheet-metal contractor, and there are also general instructions for installing the work. In many instances an entire

page is devoted to a composition design so that the reader may obtain a much better idea of the effect produced than would be the case from a small field plate. In other instances a number of illustrations are found on a single page, more particularly in connection with moldings, cornices, cornice miters, etc. We learn from the company that it has recently installed a new and modern stamping room for the purpose of turning out the new line of steel ceilings and side walls above referred to.

The Fiberlic "White House"

There has recently been completed on the Jersey coast a most attractive cottage of the bungalow type which is known as the Fiberlic "White House." It was built by A. N. Hanson, Atlantic Highlands, N. J., and embodies many interesting features from the standpoint of the architect and builder. The living room is a

Fig. 4

The Fiberlic "White House"—Figs. 3 and 4, Showing Interior Views of a Bath Room and a Living Room Finished with Fiberlic Board

striking feature of the planning, and is reached through a hall communicating with the porch by means of a Craftsman front door. At the northern end of the living room is a veranda, from which can be seen New York, Sandy Hook, Coney Island and Far Rockaway. An attractive feature of the interior is the material used in the walls and ceilings, this being Fiberlic wall board. Fig. 3 of the illustrations is a view of the living room showing the fireplace end and the effect produced by the use of the wall board in question. Fig. 4 is a view in the bathroom, which is surfaced with white enameled Fiberlic. It may be interesting to state in this connection that the wall board as made by The Fiberlic Company, Camden, N. J., possesses great strength and durability, and is claimed to be not only odorless and sanitary but also a good non-conductor of sound as well as a fire-retardant. This combination makes Fiberlic especially attractive to the home builder.

Arkansas Soft Pine for Enamel Finishes

The Arkansas Soft Pine Bureau, Little Rock, Ark., has recently issued an attractive eight-page booklet entitled "Do You Prefer White Enamel?" The cover is printed on blue stock and the title is reproduced to resemble white enamel. The first four pages give many interesting facts about the use of white enameled woodwork for interior decoration, and the remaining data present some conclusive arguments for Arkansas soft pine as the best wood on which to apply white enamel. It is said that it will not overabsorb or stain white enamel. The specific

tically free from pitch, rosin, resinous oils, or "sugar"; that it has a fine grain and tough fiber, which create a physical condition favorable to well-balanced absorption, and that while the wood, being free from rosin, is soft, it is not of the cork-like softness of certain woods which, for their part, actually drink up the applied enamel. It is, in fact, a tough, resilient wood which takes the filler and flat white coats to a nice degree of penetration. The pigment and oil are tenaciously embraced by the fiber of the wood in such a way that the application becomes actually inlaid with its "roots" in the core of the wood and its outer surface coinciding with the surface of the woodwork itself. A fixed surface is thus established on which the final enamel coats are applied. As the wood ages, this surface becomes harder, so that a durable woodwork on which the enamel retains its luster is the ultimate result. With this character of surface and because of the absence of pitch, rosin, and sugar elements, which are the primary causes for discoloration, it is said to be physically impossible for Arkansas soft pine to stain the enamel from underneath. In the light of these advantages this wood offers a very durable and economical medium for white enamel finishes. It has the additional advantage of being readily obtainable, due to an unlimited supply. For good results the following formula is presented: Sand perfectly smooth and apply one coat of white lead; sand smooth again, then apply two coats of enamel undercoating; sand smooth and apply two coats of finish enamel. This will produce a gloss finish. If an egg-shell or dull effect is desired, the last coat should be rubbed, when hard, with pulverized pumice stone and water.

New Double Crank Ratchet Bit Brace

A new whimble or double crank ratchet bit brace, known as No. 124 W, has been placed upon the market by the John S. Fray Company, Bridgeport, Conn. This brace is designed for heavy work, having the advantage of the double sweep, with ratchet action, and it is fitted with the company's "Dreadnaught" ball bearing chuck. The chuck, which is made of wrought and bar steel throughout, with all the wearing parts hardened, has a capacity for holding and driving from the smallest sized twist drill up to the 1½-in. round, straight or taper shank drills and bits, also any square taper shank bit up to and including No. 2 Clark expansive bits. The head and handle are made of cocobolo. All metal parts are full polished and nickel-plated, except the jaws and pawls, which are straw color.

Ball Bearing Floor Surfacing Machine

A floor surfacing machine operated by electricity, and embodying as one of its most important features heavy steel ball bearings on both the roller and the shaft is illustrated in Fig. 5. The machine is one which has been added to the assortment turned out by Wayvell Chappell & Co., Department E, 4845 East Ravenswood Avenue, Chicago, Ill., and is constructed of ample weight for both rapid and high-grade work. It is provided with a readily exchangeable motor, mounted above the roller, and with a large and powerful dust-collector fan set close behind the roller, thus making a very compact and strong machine. In order to secure a smooth-running yet flexible roller, free from vibration and chain jumping, the company has provided an exclusive feature in the shape of its countershaft chain drive. The roller is supported on arms, which are pivotally mounted to move about this shaft as a center, and in this

Fig. 5—General View of Floor Surfacing Machine

way is allowed a yielding movement so that the chain pull is at an even tension. The arrangement of parts is such as to allow the roller to adjust itself to any unevenness of the surface as it advances over the

floor as well as to take up any sudden jar on the machine. The brake-gage, which is instantly locked in position by the finger lever on the handle, holds the roller in a tilted position against the floor, gages the depth of cut for steady and uniform work, and brakes the forward progress of the machine, which is self-propelling when in operation, thus making continuous work easy. The moment the brake-gage is unlocked the weight of the motor raises the roller from the floor, stopping the work without the operator being obliged to shut off the power. The claim is made the machine surfaces to within 3 in. of the wall without the edge roller and with it, close up to the baseboard. The machine is made in five sizes, thus meeting many requirements.

Bigger Profits in Asphalt Shingles

An aggressive campaign for better roofs is being successfully carried on by the Asphalt Shingle Publicity Bureau, 854 Marquette Building, Chicago, Ill. A book of suggestions, entitled "The Roof Distinctive," has been issued for distribution among carpenters and builders to substantiate the Bureau's claim that the asphalt shingle is "destined to roof the nation's homes." This book not only tells about the beauty and long life of this class of roofing, but also gives many valuable pointers for making larger profits and some concrete examples illustrating why the house owner will be better pleased with asphalt shingles. Many convincing arguments are advanced to demonstrate the superiority of these products. It is pointed out that too often home

Fig. 6—Cement Coated House Roofed with Asphalt Shingles

builders neglect the roof, largely because they do not wish to incur the expense of the more costly and more decorative roofing materials. Asphalt shingles are fire resisting, easily laid and of moderate cost. The shingle is composed of a flexible body of felt, made of long fibers through which hot asphalt is forced and into every pore of the felt, so it is completely coated and surrounded with asphalt. On the upper surface a layer of crushed stone or rock is applied. The shingles are uniform in size, measuring about 8 in. wide by 12½ to 12¾ in. long. A house roofed with these shingles is shown in Fig. 6 of this illustration.

When the year's business is analyzed by the building contractor and he discovers that profits are not up to expectations, he naturally seeks broader fields offering opportunities for increased business. The sale of asphalt shingles, if intelligently handled, will not only decrease overhead expenses and increase profits, but will insure the continual employment of workmen who will soon become skilled artisans, or specialists, in one particular branch of the building industry.

Now that the winter has set in roofs will be forced to stand the test of climatic extremes, and the coming of spring will find many roofs fallen by the wayside. This is an opportunity for the enterprising carpenter and builder to solicit desirable business by selling a roof which is impervious to decay. The progressive builder will find it profitable to divide his town into a number

Rent this Level 10 Months Then It's Yours

Builders and Contractors

This is not the old style Architect's Level. It is the newest 1915 model *convertible* level. There is not a single Builder or Contractor who has not almost daily need for this instrument, for laying out buildings, locating foundation piers, leveling up foundations, walls and floors, aligning shafting, walls, piers, etc., for getting angles, locating levels anywhere, ditching, laying streets and walks, running straight lines, and a hundred other uses.

Instruction Book Free

Complete illustrated booklet, telling how a builder or contractor can use the Convertible Level, sent free on request.

WARNING

The Level we offer is the new Aloe Convertible Level, 1915 model. Don't confuse the Convertible Level with the ordinary old style Architect's Level. The only work that can be satisfactorily done with the ordinary Architect's Level is the determining of elevations. But the Convertible Level, besides its use as a level, is a modified transit and broadens the use of the level 100%. You can't afford to buy any but the Aloe Convertible Level.

HALF CENTURY REPUTATION

We have been manufacturers of transits and levels since 1863, and our instruments are the standard of the world.

FREE TRIAL

We allow you to convince yourself by a trial of the instrument before you obligate yourself.

THE RENT BUYS IT

No large cash outlay needed. Just pay the rent for a few months and the instrument is your absolute property.

Send Coupon- No Obligation

Send the attached coupon today and we'll send illustrated booklet and complete details of how you can own the Aloe Convertible Level for 10 months' rent.

A. S. Aloe Co., 625 Olive St., St. Louis, Mo.

Keep Your Men Busy This Winter at a Big Profit to You

THERE IS A BIG PROFIT TO YOU IN SELLING AND LAYING "SANTILITE COMPOSITION FLOORING" IN THE

DULL WINTER MONTHS.

As you know, "SANTILITE COMPOSITION FLOORING" is laid just like plaster 1/2 of an inch thick on any sub-floor of wood or cement—sets in 6 to 8 hours into a smooth, jointless, absolutely sanitary surface without cracks to collect dirt, germs and filth—absolutely no trouble to keep clean—never grows dusty regardless of wear—extremely easy to stand and walk upon—fire will not burn it—water will not soak it—of permanent pleasing appearance—never requires painting and will last the life of the building.

"SANTILITE" is the ideal floor in the home for the kitchen, pantry, bath or any room where a sanitary, dustless floor is wanted. It is extensively used in the factory, for offices, halls, lockers, toilets in the store, restaurant, cafe, public or semi-public building in areas subjected to heavy wear where a pleasing appearance, durability and absolute sanitation are required.

There are many masons, building and cement contractors who are making big profits in selling and laying "SANTILITE." It enlarges that branch of your business where there is an ever-increasing demand—every home with a wooden bathroom or kitchen floor needs it—every public place that has lots of wear must have it. You will find that there is little competition in your own locality and it is especially attractive, for it keeps your men profitably busy during the closed or Winter Season.

Write for samples, illustrated instructions for laying "SANTILITE" and our proposition to make your winter's work profitable.

SANITARY COMPOSITION FLOOR CO.

134 Plum Street, Syracuse, N. Y.

of districts. When the snow melts, sections should be visited periodically, and for the man owning an automobile the matter is really a sinecure. When a roof gets so old that leaks are constantly developing the cheapest repair work is to tear the roof off and replace it with a new one. It will be money saved in the end.

Attractive literature will be furnished by the individual asphalt shingle manufacturers for the purpose of assisting the contractor to circularize his customers and prospective clients. This missionary work may be profitably augmented by personal calls. In other words, instead of waiting for work to come to the shop the progressive contractor elevates himself from the class of an order taker to that of a business builder. It will mean the inauguration of a selling scheme that will unquestionably produce satisfying results at a very low cost for overhead expense.

A close study of this field will fortify the contractor with a line of logical arguments against which there can be little comeback. Houseowners who contemplate selling their homes will find a re-roofing job a profitable investment, and a great many houses are in such a poor condition from a roofing standpoint simply because the local contractor is not alive to the opportunities in his town. Real estate operators and contractors who make it a practice to build rows of houses, either for direct sale or on the installment plan, are becoming large buyers of asphalt shingles. Many years' experience has proven that this type of shingle almost invariably adds to the price that can be secured for the homes, or, at least, makes them far easier to sell.

The Asphalt Shingle Publicity Bureau is ready to co-operate with readers of THE BUILDING AGE in the distribution of literature. Lists of names sent to 854 Marquette Building, Chicago, Ill., will be kept on file and helpful descriptive matter on asphalt shingles will be mailed.

A New Diamond Slab Asphalt Shingle

An asphalt shingle which is the result of years of painstaking effort and experiment, and which is claimed to be actually cheaper than wood, is the Diamond slab Flex-A-Tile which has been placed upon the market by the Heppes Company, 1011 South Kilbourne Avenue,

Fig. 7—New Diamond Slab Asphalt Shingle

Chicago, Ill., and illustrated in Fig. 7. The first noticeable difference in the appearance of the shingle as contrasted with the ordinary product is its shape, the new shingle being built in the form of a diamond. The reason for this shape is said to be that it permits of a more economical arrangement of the shingles on the roof, and the company points out that in this respect the economy is such as to effect an annual saving of 33 per cent in material without changing protection qualities of the shingle. This diamond shape is the patented feature which differentiates the Diamond slab shingle from other asphalt shingles. There is also a very perceptible saving in labor, for instead of laying the shingles one at a time as in the old way, they can be laid four at a time, and are self-spacing. Other features of economy are the saving in nails and in the cost of transportation. The latter is said to be due not to any reduction in the essential ingredients, for in fact the Diamond slab shingles are actually heavier than many standard weight asphalt shingles, but the method of cutting them permits of economy of material weight amounting to at least one-third. The Diamond shape permits of unusual color combinations and decorative schemes unobtainable with old-style shingles. Attention is called to the improved appearance of the new

Coal Cost -GUARANTEED

If you are a builder, or are having a house built for you, it will pay you to investigate the wonderful money-saving advantages of the Williamson New-Feed UNDERFEED Furnace or Boiler.

As an example of UNDERFEED efficiency and economy, just read this letter—one of thousands like it telling of advantages of the Williamson New-Feed UNDERFEED way:

"Upon your request as to how I liked the UNDERFEED that was installed in my house about two years ago, will say that I am perfectly satisfied, as I have eight rooms and bath in my house—and not small rooms at that. The house is 30' x 34'; first story, 9' 4"; second story, 8' 6" high.

"The first year I used about \$37 worth of coal and this last year \$35 worth. The entire house was kept warm and no other stove in the house except a gas stove for cooking.

"In the last two years I saved not less than 45 per cent on my fuel bill with every room warm."

(Signed) SAMUEL ISELY, Monroe, Wis.

WILLIAMSON NEW-FEED UNDERFEED CUT COAL BILLS
Furnaces and Boilers $\frac{1}{2}$ to $\frac{2}{3}$

The "Candle" Principle

The New-Feed UNDERFEED effects this great economy and comfort because it burns coal on the "candle" principle. All fuel is fed from below. Thus the fire is always on top—it doesn't have to fight its way against new coal—fire is never chilled because there are no top feed doors to open. And, what is very important, all smoke, dirt and gas are burned and transformed into valuable heat because they must pass up, through the fire.

Burns Cheaper Coal

And the UNDERFEED burns the cheaper grades of coal as effectively as other heaters burn the more expensive grades. That's a first great saying that the owner can be absolutely sure of. Operation is simplicity itself—a boy of 12 can do it all with "expert" results.

$\frac{1}{2}$ to $\frac{2}{3}$ Saving GUARANTEED

Yes, this saving is actually guaranteed where the New-Feed UNDERFEED is properly installed and operated. A Million Dollar concern stands back of that guarantee. Thirty-five thousand UNDERFEEDS are in use. Adapted for use with warm air, steam, hot water, vacuum vapor and combination systems.

Ask for Free Book

shingle, which means a more attractive roof, and at the same time the new product retains all the advantages of the regular Flex-A-Tile.

Concrete Mixers for Mortars and Plasters

The advantages of having a machine that can be used for mixing concrete and cement mortar, as well as lime mortars and plasters are especially important to the building contractor, as he is enabled thereby to keep the machine in use most of the time during building operations. Many contractors using in connection with their concrete work the "Standard" low-charging mixer,

Concrete Mixers for Mortars and Plasters—Fig. 8—The Machine in Use

made by the Standard Scale & Supply Company, 1345-47 Wabash Avenue, Chicago, Ill., have found that they could utilize the cement machine for mixing mortars and plasters and obtain even better results than with special mortar mixers. The reason for this is said to be due to the fact that the "Standard" machine is easy to operate and does not provoke the troubles so frequently experienced with the revolving blade type. The discharge does not clog or prevent the free mixing of the materials. The company states that one of the first big jobs with which the machine was used was the towering Woolworth Building in New York City, all the plaster for this gigantic structure having been mixed in the "Standard." In Figs. 8 and 9 we show the machine in use for mixing mortar for a building 75 x 100 ft. in plan. The same mixer was also used for the concrete foundation work and also for lime and cement. All the mortar for the work was mixed by the one machine. The contractors for the building were J. C. Nel-

Fig. 9—Another View of the Building Operation Showing the Mixer

son & Son, Minneapolis, Minn., and Mr. Nelson states that in the future he will use the machine for mixing brick mortar at all times as it is the cheapest and best method. In the picture the mortar boxes are shown in front of the machines where the lime is slacked and the preliminary mix with the cement is given. By the discharge side of the machine can be seen the mixed mortar.

Carpenters—

Here's a Chance to Make Money This Winter

An indoor closet that is cheaper than an outdoor privy and makes you more money. Easy to install—sells on sight—a sure sale in almost every home that has no bath room. Absolutely sanitary and odorless. No disease breeding outdoor vault. Germs destroyed chemically. As easily emptied as the ash pan of a stove.

Ro-San

Indoor Closet

Guaranteed To Be Satisfactory

Don't these letters from carpenters sound like business?

"I haven't been able to put in much time on your proposition, but I enclose seven orders. These will help sell others who are waiting to see how the closets work."

Ed. Lamen, Flora, N. Dak.

"I set my closet up in my office and sold it the next day. Enclosed find six more orders."

S. W. Cassidy, Herkimer, N. Y.

"Enclosed find five orders. One is for a sample for myself. The other four I sold right from your catalog."

C. F. Berthelsen, Clear Lake, Ia.

"Please hurry shipment of closets. I sold two today without doing any talking at all. They sell themselves."

C. B. La Huie, Grand Rapids, Mich.

Representatives wanted in each town. Carpenters—contractors, here is your chance. Good profit for little work. Write today for complete details.

Rowe Sanitary Mfg. Co.

185 Sixth Street

Detroit, Mich.

The House With a SYKES
Metal Lath Backbone

Metal Lath—surely! That's the true backbone of strength. But what kind of metal lath? It is well to remember that **weight** adds rigidity and durability; and that Sykes Expanded Cup Metal Lath, having **wider strands**, is much **heavier** than others cut from the same gauge. Judge metal lath by weight and gauge—not by gauge alone. Also remember that

SYKES Expanded Cup Lath *Self Furring*

being fastened direct to sheathing boards or studding, requires no furring strips, and so saves you 5 to 10 cts. a square yard.

Best for Interior Work as well as for Stucco Work.

A perfect key is assured by the expanded cup style. Sykes Metal Lath can't be applied wrong.

Approved by U. S. Government for Post Office work; indorsed by architects.

The Sykes Booklet—Complete Specifications for Stucco on Metal Lath—sent free on request—will show you how to save money. Let us send you this booklet and a Free Sample of Sykes Expanded Cup Metal Lath. Write us today—

Sykes Metal Lath and Roofing Co.

Handles Easily

—saws clean and smooth, no shrinking or warping to allow for when you are nailing it on, does not crack or break like wood paneling, always lies flat and straight,—these are some of the many strong features that our patented construction gives to

Trade Mark Reg. No. 94745

It's a "right hand" material for any carpenter.

There are 1001 jobs that can be done with Compo-Board more satisfactorily, quicker, and with less muss, fuss and worry.

But do not get the impression, as many folks have, that "Compo-Board" is a popular name for "wall board." Compo-Board is our trade mark name for our distinctive kind of a wall board,—the kind with our patented centre core of wood slats, as illustrated in the border of this ad.

The wood core is the feature that gives Compo-Board so many strong advantages over other kinds of wall boards, and also the feature that makes "Compo-Board" so easily identified.

Sold by dealers everywhere in strips four feet wide and in lengths of one to eighteen feet, as desired.

Write for interesting
book and sample.

Try This On Cement Stuccos

You can turn a forceful stream of water on Kellastone Stucco and it cannot permeate the rock-like Kellastone mass because its firm, compact, texture renders it non-porous. It defies the attack of the elements. There's a vast difference in stuccos—just as there is in lumber, brick, paint, etc. Kellastone is pre-eminently a stucco. It is prepared to withstand the ravages of time, fire and water.

You Can Apply

KELLASTONE

IMPERISHABLE STUCCO

In Zero Weather

because, not being mixed with water, it will not freeze. Cement stucco is mixed with water. Turn a hose on it and note the rapid absorption of the water. Rain acts exactly the same. Cement stuccos are cheaper in first cost and may look nice for a time, but a Portland cement stucco is certain to absorb water, expand and contract, which will ruin it. Cheap stuccos are poor economy. Our free literature gives you the reasons. Send for it. It also describes

Kellastone Composition Flooring

for private homes, apartments, public buildings and industrial plants and Kellastone plasters for interior finish. A postal brings complete details.

Waterproofing Concrete with Hydrated Lime

Some very interesting information on the subject indicated by the above title is contained in a 16-page pamphlet just sent out by the Hydrated Lime Bureau of the National Lime Manufacturers' Association, with offices in the Oliver Building, Pittsburgh, Pa. Emphasis is laid upon the fact that the use of hydrated lime in cement mortars and concretes, "increases the plasticity and lubricates the mass; reduces to a minimum the tendency toward segregation and increases the density and uniformity." The Bureau of Standards at Washington made elaborate tests covering practically all compounds which have been recommended for waterproofing cement mortars and concretes, and very complimentary reference is made to the merits of hydrated lime for the purpose named. In the pamphlet in question attention is called to the fact that the amount of hydrated lime to use for each specific job is dependent upon the proportions and grading of the aggregates. One point should therefore be borne in mind by the building-contractor, and that is, "no waterproofing material will compensate for improperly proportioned aggregate and poor workmanship in the laying of concrete and that the aggregate should be as carefully selected as the cement and waterproofing material." We understand that the bureau will send a copy of this little work designated as "Pamphlet F" to any architect, builder or contractor who may make application for it.

New Russell Jennings Screwdrivers

A full line of fiber-handled screwdrivers embodying interesting features from the standpoint of the practical mechanic has been recently placed on the market by the Russell Jennings Mfg. Company, Chester, Conn. The handles are made from vulcanized fiber which is practically indestructible, and the blade, forged from tool steel, extends through the handle.

The company's method of manufacture permits the use of a high-grade crucible tool steel high in carbon. These screwdrivers are made in standard dimensions and are also made with straight blade for cabinet-makers' use. For electricians' work a fiber cap is used on the end of the handle in place of the metal cap. The company is also putting out a special machinists' screwdriver made from square stock so that a wrench can be used on the blade when necessary.

This firm is also furnishing a special screwdriver kit which comprises one interchangeable blade handle and several screwdriver bits for use in the handle. Some of the kits are also put up with other tools. These same screwdriver bits can be used in the Russell Jennings precision bit braces. One advantage of this set is the fact that the blades themselves are comparatively inexpensive and the handle practically indestructible, so that after once purchasing a kit of these tools the cost for renewals is light.

Shingles That Last

"Make a Thatch for Thy Roof," is the opening phrase in the new catalog devoted to "Shingles That Last," issued by the National Sheet Metal Roofing Company, 339-345 Grand Street, Jersey City, N. J. At the top and bottom of every page in the book in a conspicuous color the words "Shingles That Last" are presented. It describes in detail how the metal shingle came to be devised by Charles D. Cooper in 1882 and calls attention to roofs which were covered with metal shingles in that period which are still in service. To answer the question as to their appearance pictures are given of a number of fine residences, churches and public buildings. Views are also shown in the manufacturing plant where the metal shingles, after being stamped to various ornamental designs, are coated with zinc on the tin coating of the material used for the purpose, giving a heavy weather-proof coating. Other pictures show the metal shingles laid on sheathing boards over shingles, and tables show the relative weights of a roof covered with different materials. The shingles are made 7 x 10, 10 x 14 and 14 x 20 in. in size with a special lock. The company also makes a Spanish tile either in galvanized tin plate or in copper of different weights. It also makes valleys, ridging gutters, flashings and finials.

CORNELL WOOD PRODUCTS CO., 306 Insurance Exchange Bldg., Chicago, Ill.

Building Construction and Superintendence

By FRANK E. KIDDER, C. E., Ph.D.
Architect

Part I.—MASON'S WORK, Ninth Edition

Thoroughly revised and enlarged by Thomas Nolan, Prof. Arch., University of Pennsylvania. A most exhaustive treatise on masonry construction for buildings in all its branches. New chapters on fire-proofing and concrete, plain and reinforced. Foundations have received careful consideration, and the most approved work in recent structures is clearly illustrated.

964 pages, 628 illustrations, cloth. Price, \$6.00

Part II.—CARPENTER'S WORK, Ninth Edition

Treating on Wood Framing—sheathing, windows, outside door frames, interior woodwork, rough work, finish, heavy framing, builders' hardware, and the large variety of detail that the subject covers.

910 pages, 830 illustrations, cloth. Price, \$6.00

Part III.—TRUSSED ROOFS and ROOF TRUSSES, Second Edition

This part describes nearly every type of roof construction commonly met with in buildings, pointing out the advantages of different types of wooden and steel trusses for different spans and building requirements. Special attention is given to description of wooden trusses and steel trusses, in order to make the work of practical value to the architect, draughtsman and builder.

1201 Tacoma Building, Chicago, Ill.

Petty's "Uniform" Saw Set

What is known as the "Uniform" saw set, a device operated by foot power, thereby leaving the operator's hands free to hold the saw, has just been put on the market by J. O. Petty of Belvidere, Ill., and a general view of it is shown in Fig. 10. The device may be fastened to the wall with two screws at a height convenient to the workman. For explanatory convenience the equipment has been keyed as follows: 1, tension adjusting screw; 2, frame; 3, tension spring; 4, lever operating the pawl; 5, cord extending to the operator's foot; 6, ratchet; 7, screw for affixing the device to the wall; 8, pawl; 9, plunger, or hammer; 10, positioning spring, for bringing the pawl back to normal position; 11, guide plate; 12, stop pin; 13, anvil. The saw is placed on the anvil with the tooth to be set located directly against the notch in the guide plate, and raised to come in contact with the stop pin. An upward and downward motion of the operator's foot causes the lever to operate a pawl and ratchet, causing the plunger to strike a sharp blow and return to its former position ready for the next blow. The desired force of the blow is obtained by means of the adjusting screw, which is locked in position by means of the staple which fits over the frame at the back. The required angle of the set is obtained by raising or lowering the stop pin. A bent stop is furnished for use in setting narrow band saws. For ordinary work the pin should be turned outwards.

Fig. 10—Petty's "Uniform" Saw Set

The anvil has four different surfaces, making it adaptable to different sized teeth. The parts of this saw set are made of the best materials, being furnished in white nickel plate to enhance the appearance and to prevent rusting. The price of the outfit is extremely reasonable, and a five days' free trial is offered by Mr. Petty as evidence of its merits.

Catalog of Woodworkers' Tools

A catalog and price list of woodworkers' tools, including band saws, boring machines, jointers, swing saws, drills, tenoning machines, saw tables, etc., and consisting of eighty-eight pages of profusely illustrated descriptive text is being sent out by the Silver Mfg. Company, Salem, Ohio, and with New York office at 71 and 73 Murray Street. The matter is arranged in a way to interest the practical woodworker and the information given is directly to the point. One of the recent additions to the company's line is a swing cut-off saw having cored frame in one piece and is intended to be suspended from the countershaft close to the hangers in such a way that its weight does not bind or interfere with the free movement of the pulleys. The saw is of machinery steel 1 1/2 in. in diameter, and the shield for covering the saw and protecting the oper-

(Continued on page 82)

Let Your Specifications Read Wright Wire Lathing

Many of the country's foremost architects specify Wright Wire Lathing. It was used in the Grand Central Station and many other famous structures, because it resists the ravages of time and fire as no other lath can.

Wright Wire Lath is made in three finishes—Plain, Japanned and Galvanized. The illustration at the left shows Wright Galvanized Lath. For strength, rigidity and durability it has no superior.

Our Catalog X, describing Wright Wire Lathing in detail, is an intelligent guide for architects and builders. Free on request.

WRIGHT WIRE COMPANY, Worcester, Mass.

Hard, Stiff, Waterproof and Sized

Try to bend a piece of it. Whittle it. Drop water or ink on it. Rap it on your knuckle. Then you'll understand how PLASTERGON WALL BOARD differs from all other boards.

PLASTERGON WALL-BOARD

The Chemically Treated Wall Board That Does Not Shrink

For every kind of building, PLASTERGON WALL BOARD is best because it is absolutely dependable. It is hard and stiff enough to lay smooth over studs and joists WITHOUT WAVING. Dampness has NO EFFECT on it, and the waterproofing not only "lumberizes" the board, but also sizes it, saving you from \$4.00 to \$6.00 per thousand. BUT DON'T TAKE OUR WORD FOR THIS. Get samples of WATER-PROOF Plastergon, test them and then order some of the board. The price will surprise you. Send today.

PLASTERGON WALL BOARD CO., 102 Fillmore Ave., Tonawanda, N. Y.

Specify "CREO-DIPT" Stained Shingles

We are responsible for both quality of shingles and permanency of even colors as ordered.

Save the waste, muss and bother of staining-on-the-job, the labor, cost and time in handling.

We use only selected, seasoned British Columbia grades cut from live timber—no wedge shapes. Pure creosote, linseed oil and earth pigment stains that we grind and mix ourselves.

Write for Catalog and full particulars. Book of "CREO-DIPT" Homes. Sample colors on wood.

Make your Lumber Dealer carry three standard colors in stock.

A Stairway That Disappears When Not in Use

A stairway that is ready at moment's notice when needed and quickly put out of the way when not in use.

Combines all the advantages of the stationary stairway and does away with the waste of floor space in the room below necessary with the old type.

Designed originally to be used from the second floor to the attic, it has been used in bungalows, office buildings, hospitals, schools, etc.

Don't plan any work for the coming season without first investigating *The Bessler Movable Stairway*. This is a proposition for the progressive builder.

A postal will bring full particulars.

**The BESSLER
MOVABLE
STAIRWAY CO.**

Dept. 1

Akron, Ohio

ator is made of cast iron securely bolted to the main frame in such a way that it can be quickly removed when desired. The floor space required for the saw is only 50 x 42 in., and the power necessary varies from 5 to 7 hp. Silver's new jointers made in five sizes are also features of the catalog.

A New Sheet Metal Concern

Under the name of the Cincinnati Can Company, there was incorporated at Columbus, Ohio, Nov. 23, by the interests identified with the Edwards Mfg. Company of Cincinnati, Ohio, a new concern which will manufacture a line of sheet-metal specialties, including oil cans, ice-cream freezers and other miscellaneous goods. The new concern is a consolidation of several small companies, the plants of which are located in other cities. The principal concerns taken over are the Eureka Specialty Company, which has a plant at Ludlow, Ky., and another plant at Greenfield, Ohio. The new concern will occupy the factory buildings in Cincinnati, Ohio, at Carthage Pike and the Big Four Railroad, formerly occupied by the Cellular Metal Company, the property belonging to the Edwards interests. New additions will be made to the plant and a force of 200 men will soon be employed.

E. W. Edwards, president of the Edwards Mfg. Company, will be president of the new concern, H. W. Edwards will be vice-president, O. S. Larby will be secretary, G. D. Myers will be treasurer, J. C. Miller superintendent, H. A. Greening sales manager.

Demand for "Northwestern" Concrete Mixers

Walter H. Kestin has been appointed sales manager for the concrete machinery department of the Northwestern Steel & Iron Works, Eau Claire, Wisconsin. This addition has been made necessary by the marked increase in the demand for Northwestern mixers and the return of activity in the building lines. Thorman W. Rosholt, vice-president of the company, who has heretofore devoted a portion of his time to this work, will in the future devote more of his time to work among the trade. E. R. Hamilton, secretary and general manager, states that they have had a substantial increase in the business during the past twelve months and that present indications seem to insure still greater gains for the coming year.

TRADE NOTES

E. W. Edwards, president of the Edwards Mfg. Company, Cincinnati, Ohio, has been selected as one of the five members to serve on the Rapid Transit Commission of that city. He was a member of the original commission and was reappointed, also elected president of the Board, which speaks highly for the esteem and regard in which he is held by his fellow members.

"Building for the Future" is the title of a handsome brochure which is being sent out by the Marquette Cement Mfg. Company, Chicago, Ill. It is made up for the most part of handsome reproductions from photographs of work in connection with which Marquette Portland cement was used.

To insure a consistently fireproof structure throughout, Johns-Manville Corrugated Asbestocel sheets were specified for insulating the walls, ceilings and floors of the three humidifying rooms for the storage of cigars in the new plant of the Parodi Cigar Company, Jersey City. One-inch Asbestocel sheets were finished with ¼-in. asbestos board, coated on the face side with Liquid Vitrex Cement. Six thousand square feet were necessary for the purpose.

E. C. Atkins & Co., Indianapolis, Ind., has recently enlarged its list of products by more than 50 items, which are listed in its new catalog. The illustrations are excellent and the descriptions are complete. The catalog describes the company's line of saws, saw tools, scrapers, cement tools, bit braces and tool specialties.

(Continued on page 84)

Stanley Tools

Stanley Bench Bracket No. 203

A tool that will immediately commend itself to the Carpenter, the Cabinet Maker or in fact to any one occupied or interested in carpentry or woodworking of any kind where a bench is necessary.

It simply requires that one or more holes (not smaller than one inch) be bored in the front of the bench. The shape of the tool is such that when the jaw or nose is put through the hole, it is automatically held in place, and by means of the screw clamp, the board being worked upon, is quickly and firmly secured.

The body of the Bracket is made of iron—japanned—and the clamp screw is strong, well threaded and nickel plated.

PRICE EACH 35 CENTS

Send for special circular showing several ways in which this handy little tool can be used.

BAYONNE
Used on All
the Porches
(Gedney Farm Hotel, White Plains, N. Y.)

Builders and contractors give preference to BAYONNE where wearing qualities, clean finish and economy are essential. BAYONNE gives complete satisfaction where other prepared materials and even metal coverings fail.

It is the simplest covering to lay; tacked only on the edges after spreading on the dry boards (no setting in wet paint).

Does not shrink, expand, buckle or crumble. It stays flat. Never leaks and stands any amount of hardest wear. One coat of paint is sufficient for ordinary uses.

Hundreds of letters from contractors all over the States prove BAYONNE'S superiority. Write for Sample Book "D" giving prices and laying instructions. See Sweet's, Page 539.

The business of the Standard Pump & Engineering Company, Cleveland, Ohio, builders of pump equipment for water supply systems for residences, has been taken over by the Adamson Machine Company, Akron, Ohio. The plant will be removed from Cleveland to Akron.

The Globe Iron Roofing & Corrugating Company, Cincinnati, Ohio, is sending out a very attractive pamphlet relating to Globe metal shingles which are made in three different styles and can be furnished in either painted or galvanized steel. The point is made that these shingles are suitable for any building with a pitch of 3 in. or more to the foot; that they are economical as regards cost; are fireproof, thus involving a lower rate of insurance on buildings where they are used and will not break or come loose from any cause. Their construction is such as to fully provide for contraction and expansion.

Hoggson Bros., who under one contract for the work complete a building operation from the furnishing of the architectural plans through to construction, equipment, decoration and furnishing, have leased and occupy the entire tenth floor of the building at 485 Fifth Avenue, New York City, where they will have a total of $3\frac{1}{2}$ acres of floor space. The concern was founded in 1889 and incorporated in 1907. It outgrew its quarters twice, hence the removal to the present location and commodious quarters.

Aberthaw Construction Company, specialists in concrete, has just removed its offices to more commodious quarters in the newly erected Niles Building at 27 School Street, Boston, Mass.

Hecla Iron Works and the Winslow Bros. Company were merged in 1913 under the name of Hecla-Winslow Company, Inc. The purpose of the merger was chiefly to effect economies by joint operation. Announcement is made in a circular just issued that it has been demonstrated that such economies have not been obtained and, therefore, "in a mutual and friendly spirit it has been decided to reinstate the two companies under their original names, ownership and management as of Sept. 1, 1915." The circular is signed by Hecla Iron Works, New York, established 1876, and Winslow Bros. Company, Chicago, established 1885.

One of the latest issues of DooR-Ways—the house organ of the Richards-Wilcox Mfg. Company, Aurora, Ill.—has an article dealing with the handling of material with R-W overhead trolley and I-beam carrying equipment; also some comments on hanging heavy doors and the advantages and conveniences of sliding doors in the modern home.

Bird & Son, East Walpole, Mass., are sending out a folder printed in colors upon tinted paper announcing the fact that they have now added a "colored surface" to their Neponset asphalt shingle. The present gray-surfaced Neponset shingle on the market is built, they point out, on the right principle and is most durable

Kolesch "Builders" Tilting Level No. 7850

Designed particularly for the levelling and plumbing of walls, giving lines and levels for buildings, laying out angles, grading streets, sewers, drains, etc.

Sturdily built for durability, yet sensitively accurate. Sold complete in a polished box with plumb bob, adjusting pins, metal trivet, book of instructions, and tripod for \$57.50.

KOLESCH & CO.

138 Fulton Street New York, N. Y.

in its construction, but they have now added a layer of crushed slate—red or green—to both sides of this double width, built up, heavy butt Neponset shingle which fills the demand for a colored shingle. The makers will be glad to furnish those interested information telling how they can establish themselves as shingle headquarters in handling "the greatest roofing development of the twentieth century."

We are indebted to the Crescent Portland Cement Company of Wampum, Pa., for a copy of the reprint of a Portland cement booklet which was originally published about 1883. It was issued by the Wampum Cement & Lime Company, Ltd., "manufacturers of Shinn Bros., centennial Portland cement, equal in quality to the best brands of English, German and French Portland cement, made by the same process and possessing the same chemical analysis." This appeared over the name of "John K. Shinn, Secretary and Treasurer, New Castle, Lawrence County, Pa." This original copy was recently discovered by the Crescent Portland Cement Company among some old documents, and is, so far as they know, the earliest pamphlet of its kind in America.

The latest issue of the *Disston Crucible*—a magazine for the millman, and published by Henry Disston & Sons, Philadelphia, Pa., contains the usual amount of interesting matter along the lines indicated. There are comments on grindstones, a description of the "greatest lumber mill in the northwest," some comments regarding hard woods and their uses, together with safety regulations for stored lumber. Not the least interesting feature is an excellent likeness of Frank Disston, president of the Disston Company.

Leo W. Schaefer has opened an office for the practice of architecture in the Terrahe Building, St. Cloud, Minn., and would like to receive catalogues and samples from manufacturers of materials entering into building construction.

Some very interesting information relating to Reynolds asphalt shingles and accompanied by a number of half-tone engravings of buildings on which they have been used is contained in a recent issue of the house organ of the H. M. Reynolds Asphalt Shingle Co., Grand Rapids, Mich.

W. A. Ives Mfg. Company, Wallingford, Conn., and 86 Warren Street, New York City, has recently added to its extensive line the "Mephisto" chisels and braces. Its new goods are said to carry the same guarantee as the "Mephisto" bits.

"The Technician" is the name of a monthly Bulletin devoted to the professional interests of technical men which has just been published by Associated Technical Men, Inc., 1215 Monadnock Block, Chicago, Ill.

The Harvey Company is the name of a concern which has been incorporated under the laws of the state of Maryland for the purpose of selling supplies and equipment directly to building-contractors, industrial establishments, etc. The office and warehouse is at 113 South street, Baltimore, Md.

J. H. Lendi, formerly assistant to A. G. Carlson, Mechanical Engineer, Universal Portland Cement Co., has been given the title of Electrical Engineer in the Engineering Department of that company.

Bird & Son, East Walpole, Mass., are sending out a folder relating to Neponset floor covering, which in appearance resembles printed linoleum. The base, however, is waterproof all the way through, and consequently is sanitary and more durable than would otherwise be the case. The folder carries twenty-two

patterns of floor covering, all printed in colors showing the exact appearance of the material.

The heating question is one of all-absorbing interest to the building contractor and house owner, and anything which will tend to reduce the coal consumption, and thereby the fuel bill, is a proper subject for consideration. They are therefore likely to find profit in an investigation of the merits of the Williamson New-feed Underfeed furnace or boiler made by the Williamson Heater Co., 432 Fifth Avenue, Cincinnati, Ohio. The claim is made that its great economy and comfort is produced by reason of the fact that it burns the coal on the "candle" principle. All fuel is fed from below, thus keeping the fire always on top. The company states that the Underfeed burns the cheaper grades of coal just as effectively as some other heaters burn the more expensive grades and that is a first great saving, of which the owner can be sure. An interesting book entitled "From Overfeed to Underfeed" has been issued for free distribution and readers can secure copies on application to the company.

The builder who may have trouble in deciding as to the best material with which to cover a porch or deck roof, cannot fail to be interested in what is known as the "Bayonne" brand of cloth for this purpose made by John Boyle & Co., Inc., 114 Duane Street, New York City. The point is made that the material is very easily laid; that it is tacked only on the edges after spreading on the dry boards; that it does not shrink, expand or buckle, but stays flat. Another point which is made for it is that one coat of paint is ample for ordinary uses. Readers interested can secure a copy of "Sample Book D," which gives instructions for laying by writing to the above address.

The National Lead Co., with headquarters in New York and branches in many of the leading cities of the country, has prepared for distribution to interested readers "General Painting Specifications" and a chart of 39 color treatments. Those desiring the matter should write for "Folders C." The company calls attention to the fact that for durable painting of all kinds the architect and owner should specify "Dutch Boy White Lead," as it shrinks and stretches without cracking. It also anchors itself into the pores of the wood, wears well and presents a good appearance.

The Waukesha Motor Co., Waukesha, Wis., is making additions to its heating plant building which will contain a new experimental department. The buildings will be of structural steel and brick, with skylights and composition roofing.

Warren & Goin, architects, Gainesville, Fla., have dissolved partnership, but the business will be continued at 11 and 12 Baird Building by Mr. Warren. Mr. Goin severed his connection to engage in contracting.

Dahlstrom Metallic Door Company has recently located its New York City offices and show rooms on the fifth floor of the new office building at 130 East Fifteenth street. The show rooms are not confined to a suite of offices, but embrace the entire 20-story and basement building which is equipped throughout with the Dahlstrom products.

A new type of construction consisting of a steel frame with metal lath, stucco, concrete and plaster is being brought to the attention of architects, builders and contractors by the Trussed Concrete Steel Company, Youngstown, Ohio. All wood is entirely eliminated in the structural parts of the building and the claim is made that the construction can be erected more rapidly and easily than even the simplest wood construction. An illustrated pamphlet sent out by the company gives full particulars regarding the system and numerous illustrations clearly indicate the parts which are utilized in the frame work. The statement is made that the only tool required is a hammer.

Builders' Transit

Building requirements of to-day demand the use of an accurate instrument for plumbing walls; laying out and leveling foundations; locating stakes, etc. The Transit illustrated herewith is designed especially for the use of the Contractor and Builder. It is of light construction without sacrificing strength and rigidity. All of the necessary surveying connected with building operations can be done with this instrument at a great saving of time over the convertible Level because levels can be taken, horizontal and vertical angles can be read without the necessity of changing the instrument. We make this Transit in 4 styles and the price is well within the reach of all. Ask for illustrated catalog describing a large variety of Levels and Transits. Catalogue is free.

How Close Do Your Estimates Run? Five Books to Help You

The stress of modern competitive bidding for construction contracts has caused the passing of the old-time guess-work estimate. Now-a-days, the Contractor and Builder, the Architect and the Engineer, Insurance Adjusters and Appraisers need a more practical basis on which to calculate costs or prepare estimates.

"THE NEW BUILDING ESTIMATOR," by William Arthur, is the modern working guide for all who figure the cost of building construction either in detail or approximately. It gives the actual time, labor, and material required on every operation in all classes of residential and municipal work. No expense has been spared to make the new edition complete and absolutely correct. "THE NEW BUILDING ESTIMATOR," with 248 added pages, thoroughly revised and reset throughout, now contains 744 pages, 5 x 7 inches in size, bound in flexible leather. It is the one indispensable aid in estimating. Owners of the older editions will surely want the new one. Price \$3.00 Prepaid.

"ESTIMATING THE COST OF BUILDINGS," by Arthur W. Joslin, a thorough and clearly presented system for figuring the actual cost of residential work, schools, banks, hospitals and other public buildings of moderate size, with chapters on reading architects' drawings. Special attention is given to the cost of building alterations. 238 pages; illustrated. Cloth Bound, \$1.50.

"ESTIMATING FRAME AND BRICK HOUSES, BARN, STABLES AND OUTBUILDINGS," by F. T. Hodgson, Revised 1913; 252 Pages; 25 Illustrations. Cloth Bound, Price \$1.00.

"THE ESTIMATOR'S PRICE BOOK AND POCKET COMPANION," by I. P. Hicks, a complete and convenient guide to the prices of all kinds of building material. The 1914 edition contains 172 Pages and over 100 useful tables; Handy Pocket Size; \$1.00 Postpaid.

"HICK'S BUILDERS' GUIDE," comprising an easy, practical system of estimating labor and material. One of the most popular books; 23,000 sold. 166 Pages; 114 Illustrations. Cloth Bound, \$1.00.

Carpenters!

Earn \$1500 to \$5000 a Year

If you want to become a contractor or superintendent these great books will give you the thorough knowledge of building practice necessary to successfully direct other men. They will fit you—in your spare time—to earn \$1500 to \$5000 a year as a Contractor and Builder, Building Superintendent, or Boss Carpenter.

Newly Revised Cyclopedia of Architecture, Carpentry and Building

consists of ten large volumes, handsomely bound in half red morocco, gold stamped, containing 4,760 7 x 10-inch pages; 4,000 illustrations, full page plates, building plans, diagrams, etc.; hundreds of valuable tables and formulas, carefully cross indexed for quick, easy reference.

PARTIAL TABLE OF CONTENTS
Mechanical, Freehand, Perspective and Architectural Drawing, Lettering, Pen and Ink Rendering, The Orders, Superintendence, Strength of Materials, Masonry, Reinforced Concrete, Carpentry, Steel Square, Stair-Building, Hardware, Steel Construction, Roof Trusses, Practical Problems, Estimating, Contracts, Specifications, Building Law, Sanitation, Sheet Metal Work, Electric Wiring and Lighting.

Plan Book and Consulting Service FREE

We give free to every purchaser of our Cyclopedia of Architecture, Carpentry and Building, a copy of "Modern American Homes," a complete and up-to-date plan book. Contains plans and specifications for 168 structures, including excellent exterior and interior views, detailed estimates, etc. Designed by leading architects, it covers city, suburban, and country homes; bungalows; summer cottages; tent houses and camps; apartment houses; garages, and public buildings. 224 pages, 9 1/2 x 12 1/4 inches, and 426 illustrations. Printed on enameled paper and substantially bound. With this plan book in your shop you are prepared to figure on any job, no matter how large. No need for the prospective builder to consult an architect—you can offer him his choice of practically every type of home. This saving of the usual architect's fee should get you the business.

In addition we give free with each set a year's consulting membership in the American Technical Society. Through this service you have the assistance of a staff of experts. These men are no farther from you than the nearest mail box. They stand ready to solve your perplexing problems, to offer suggestions, to point out the things you should avoid. In fact, they enable you to compete with the biggest and most experienced men in the construction field.

Send for this great combination today

We will send the complete eleven volumes to your home for seven days' free examination, express prepaid. Look them over carefully—make use of them at your work for a week—then if they fail to meet your expectations they may be returned at our expense. If you keep them send us \$2.00 within seven days and \$2.00 a month until the specially reduced price of \$24.80 has been paid. Remember—the consulting membership and plan book are included absolutely free.

Can you afford to let \$2.00 a month—50c a week—stand between you and success? The consulting membership alone is worth many times the first cost of the books. Fill in and mail the coupon—NOW!

MOST DEPENDABLE BOARD MADE IN AMERICA

Don't Lose Money Through Misunderstanding

YOU wouldn't deliberately pass up money—if you knew. You may NOT know that there is a bigger difference between wall boards than there is between hemlock and oak.

If you, yourself, have put on unsatisfactory wall board or have heard of some board going wrong, you have no more cause to condemn Upson Processed Board than you would to condemn all lumber because some pieces were bad in one installation.

What you've complained about probably was a board made of punky "jack pine," tamarack, or coarse, lumpy fibres; or old junk such as "chip" fibres—boards that broke or gummed your saw—that you couldn't cut, fit or handle.

Perhaps that board curled and buckled on the wall. And likely your customer kicked because it soaked up gallons of paint and streaked, blistered and spotted.

But there isn't one complaint to the million feet with Upson Processed Board!

Yet there isn't a dollar's difference in the cost of the cheapest board and **DEPENDABLE** Upson Board, for the average room. And from the standpoint of your customer you ought to know that Upson Processed Board saves this slight difference in initial cost many times over in the *lower cost of painting.*

Upson Processed Board gives you the nearest perfect lining for walls and ceilings—gives you the work which plasterers now get—a chance for all-the-year-round work. And there is money in it, too, for a shop making cabinets, screens,

Don't judge wall board until you get the facts on

UPSON PROCESSED BOARD

Hundreds of carpenters are materially increasing their incomes.—not a dull month in the year. THEY have found there is a **DEPENDABLE wall board.**

household articles, window trims, etc.

WORKS LIKE LUMBER: You can apply 25% more of Upson Board than any other wall board in the same time. Handles, saws, cuts, planes and moulds like lumber. It really is artificial lumber—made of long, tough, wiry, **PURE WOOD FIBRES**, pressed into hard, stiff, woodlike panels. Stands a pressure of more than 400 pounds to the square inch!

GIVES YOU FINEST JOB AND REPUTATION: UPSON PROCESSED

BOARD IS SCIENTIFICALLY PROCESSED. Kiln cured, like interior trim. *Waterproofed* so that ordinary leaks will not hurt it. *Surface-filled* to give the most perfect painting surface of any board, usually saving \$5 to \$15 per thousand square feet in the painting cost.

There is no board "like" Upson Processed Board on the market.

So don't let any "prejudiced" dealer put it over on you by telling you that his board is as "good as Upson Processed Board."

We challenge any manufacturer to show his stock board to be as good, durable or satisfactory as Upson Processed Board.

You'll discover a hundred and one advantages and many money-making jobs, when you write for your sample of Upson Processed Board and for our plan of working with you to build up your trade. Start today. Send **NOW** for information.

Indispensable in Calculating Costs

Contractors and builders in all parts of the country find Arthur's "New Building Estimator" indispensable in calculating costs. It is a practical working guide to estimating the cost of labor and material in building construction. The new edition contains 744 pages, is 5 x 7 inches in size, bound in flexible leather. Price \$3.00 Postpaid.

Building Age, 239 W. 39th St., N. Y.

Contractors Using Berger Materials Are "Making Good" and Making Money

Patented

No Support for Short Spans

Berger's Ferro-Lithic Reinforcing Plates are used extensively for reinforcing and centering concrete slabs for flat or arched roofs and floors, sidings of buildings, sidewalks, etc. Made of a series of dovetailed members running full length of the sheet, which stiffen the plate and furnish a key for bonding the concrete and plaster.

Makes Plaster Go Farthest

Berger's Expanded Metal Lath. A minimum quantity of plaster will go farthest and make a practical job on stucco walls, partitions, ceilings, and every other kind of work requiring plaster. The diamond shaped openings are small and expanded so that the plaster clinches perfectly. Standard sheets are 18" wide by 96" long.

Patented

Reduce Cost and Dead Load

Berger's Pressed Steel Cores will enable you to do this in both light and heavy long-span construction. Our standard size has a 20-inch base with flanges adapted for making concrete joists 24" on centers. Ceilings can be erected after all wires and pipes are placed. We make both Permanent and Removable Cores.

Patented

Save Money and Material

Berger's Rib-Truss Reinforcing and Furring Plates, being expanded vertically (not laterally) are especially serviceable for reinforcing thin concrete slabs for roofs, floors, sidewalls and partitions. Ribs running through-out each sheet on 6-inch centers stiffen the plate and support it while the soft concrete is being poured.

Save Concrete

Berger's Multiplex Steel Plates save concrete and minimize dead load in heavy service floor, roof, bridge and sidewalk construction. Easily installed with unskilled labor. Particularly desirable where no plaster ceilings are wanted or required, or where the underside cannot be readily plastered. 16 to 24 gauge sheet metal; lengths up to 10 ft.

See Sweet's, Pages 210 and 221-224. Write for Hand Book F. B. Covering Metal Building Materials

Use Berger's Metal Lumber Instead of Wood

Patented

The reasons are obvious. It is stronger and more durable, and officially proven to be fireproof and indestructible. It is also sound proof, damp proof, and vermin proof. Not affected by climatic changes and can be installed in winter just as well as in summer. We cut and number each unit to fit your plans—you put them together on the job, thus making erection easy and saving considerable money in time and labor.

Use Berger's Metal Lumber for safety, economy, permanence and satisfaction. See Sweet's, pages 278-285. Also write for Catalog L.B.

Would You Like to Live in This House?

The house illustrated above cost less than \$5000. Would it please you? If not, what is your ideal home?

What would you give to be able, as often as you liked, to discuss your ideal home with somebody who could understand and who would tell you just how to make your ideas practical and workable? Do you need counsel? Hundreds of people make costly mistakes in building. What would you give to secure, at small cost, the practical advice which would help you avoid these mistakes?

Your Ideal Home

Whether these happy days are actually here or whether they are far off in the dim future, the ideal home is what you like to think about; to dream about; to talk about; and finally to make your dream come true. Do you need counsel on this important subject?

Pleasant Evenings in Your Library

Suppose you could invite competent architects, landscape gardeners, vegetable growers, florists, interior decorators, and the host of other expert craftsmen who make home-planning their business, to spend some of these winter evenings in conference with you!

\$3 invested in House & Garden will bring you into direct contact with experienced experts whose counsel may save you \$300 or even \$3000 or more in building, decorating or beautifying your home

Your Guide

House & Garden, the magazine of home-making, brings you all this and, more besides—the real joy of living.

It is the experienced guide who meets you at the gate, stays as long as you like, and shows you month after month, in wisely chosen text and pleasing picture, how to plan your home; how to decorate it, and how to plant your garden and arrange your grounds.

Important Special Issues for 1916

January: Annual Building Number. The American home an institution—tabulated costs of building—mission of artistic brick work.
February: Garden Planning Number. Making the plan—the selection of seeds—color schemes, successful grouping and landscaping.
March: Spring Gardening Guide. When to plant—vines and their use—insect pests and their problems—paths—new houses.
April: Spring Building Number. Architecture for the vacation home—water supply—new gardens—the sewage problem.
May: Summer Furnishing Number. Summer curtains and rugs—rattan and willow—the young girl's room—cool color schemes.
June: Garden Furnishing Number. Living out of doors—the pergola and garden pottery—flower boxes—pools and statuary.

July: Small House Number. Twenty inexpensive houses—economies in fireproof houses—evergreens—the remodeled farm house.
August: Motor Number. The automobile at home on a farm—garages—motors in suburban life—community improvement.
September: Autumn Furnishing Number. New decoration tendencies—bathrooms—the man's room—furniture grouping which is distinctive.
October: Fall Planting Guide. Directions for planting—bulbs and shrubs—plant storing—trees and their care—the greenhouse.
November: House Planning Number. How to read plans—selection of hardware—new moderate priced homes—the architect's client.
December: Christmas Gift Number. 200 suggestions for gifts for the home—the music room a holiday God-send—how to hang pictures.

The Value of Experience

Suppose you could induce them to give you leisurely, but authoritatively, out of their store of knowledge, the best ideas they have gained through long experience in building and beautifying the finest of homes. Would not a few such visits be invaluable to you?

Eliminate Worry and Save Money

With their help your ideal home would be very much nearer to you. You can actually see it grow and know that you are saving yourself long hours of experimenting, which would mean not only worry and care, but possibly a needless outlay of hundreds—even thousands—of dollars.

Your Problems

House & Garden brings you the counsel and advice of experts who know how to talk pleasingly and understandingly about your home problems. And they not only tell you what they know, but show you picture after picture as examples of what their experience has gleaned after years of study.

Best of all, *House & Garden* is not merely a magazine of utility and economy—it is also a vehicle of constant delight and inspiration.

Annual Building Number January is brimful of suggestions about home-lover ought to have this number, whether he is planning to build now, or a year from now. The suggestions in this number alone may save you many dollars when you are ready to build. Join the circle of *House & Garden* readers and thus bring yourself into personal contact with its experienced authorities by taking advantage of this extraordinary special introductory offer.

Special Introductory Offer A whole year, twelve numbers, for \$3. Or, if you **subscribe now** beginning with the January (Annual Building Number) you may take advantage of our six months' special introductory dollar offer, using the coupon below.

Do not even take time to write a letter. The coupon will do and is easier and quicker. With one stroke of the pen you can solve your building, furnishing and gardening problems, improve your home and its surroundings, make many real savings, and bring to yourself some of the real joys of living.

House & Garden

Flex-a-tile Asphalt Shingles

These Shingles Are Scientifically Perfect

HUMAN minds and perfected machinery could not make more perfect shingles than Flex-A-Tile Asphalt Shingles. There is no guesswork in their manufacture. Pure wool felt is saturated with twice its weight of high-melt, oil-free asphalt; over this we lay a coating of tough, rubber-like gilsonite; and into this is compressed under tons of pressure the beautiful crushed slate or granite surfacings.

That's why Flex-A-Tiles hold up under all conditions of weather and give such lasting service. That's why you can depend on Flex-A-Tile roofs to be a credit to the owner and a credit to the builder alike. Flex-A-Tile Asphalt Shingles save building cost, because they require no painting and no repairing. They won't discolor rainwater. Build your roofs of Flex-A-Tiles and you will build an enviable reputation and handsome profits for yourself.

Look out for imitations. Be sure you get genuine Flex-A-Tiles, made only by the Heppes Company.

An Optimistic Note *from* The Craftsman Advertising Department

There is a man engaged in the construction of worthwhile houses.

He operates in Westchester County, New York, just outside of New York City.

This Fall while all about him cried

"Hard Times!"

"Real Estate Is Dead!"

He Built Seven Houses!

Sold All of Them in Less Than a Month!!

At \$10,000 Each!!!

And He Is Building

Another Batch of Domiciles!

SUCCESS ATTENDED HIS WORK.

Why?

His architect strove with true professional zeal to provide real homes.

The material employed was of the best, such as is advertised in THE CRAFTSMAN.

He Buildded Well!

He Did Not Skimp!

In the parlance of these days—

He Delivered the Goods!

If you, Mr. Advertiser, can deliver the goods, and will use CRAFTSMAN advertising in exploiting your product; do it persistently, in season and out, you will find a market awaiting you throughout the year.

Since September, two hundred and fifty CRAFTSMAN subscribers have informed us that they will build during the coming Spring, and there are others.

THIS IS ONLY INCIDENTAL EVIDENCE.
OF A PROSPEROUS 1916.

THE CRAFTSMAN Magazine has earned the confidence of its readers, and the acceptance of your advertisement by THE CRAFTSMAN stamps your product with the imprint of Reliability.

Write today for rate card.

Kidder's Architects' and Builders' Pocket Book

The 16th revised and enlarged edition of this standard work has just been issued. Prof. Nolan and a corps of experts have rewritten the book from cover to cover and it is a veritable digest of the latest approved practice in all branches of the Building Trades.

The authors have quoted from many authentic sources as well as giving the results obtained in their own daily practice. Every item has been carefully checked and rechecked to see that it is technically correct and the aim throughout has been to present clearly and concisely and in the least possible space, all the information that is likely to be required by the architect, builder, structural engineer, draughtsman or contractor, including data for estimating the approximate cost.

This New Kidder is divided into three sections: *Part I*, which contains 90 pages, explains the practical application of arithmetic, geometry and trigonometry. This data has been carefully checked and much of the matter rearranged. *Part II*, with its 1324 pages, treats the materials of construction and strength and stability of structures. All the matter in the 28 chapters included in this section are special essays by experts. Reinforced Concrete Mill and Factory Construction is one of the new subjects given in this edition. *Part III*, contains 358 pages of miscellaneous data and much new matter has been added such as extended tables of specific gravities, weights of substances, architectural acoustics, waterproofing for foundations, the new quantity system of estimating, etc.

One of the most important changes is the recalculation of the tables and problems relating to unit stresses, especially those for the different woods. These were changed to conform to the latest engineering practice. The derivation of many of the formulas used has been explained, and numerous cross references enable the reader to use the New Kidder as a text book for

certain parts of the mechanics of materials as well as a handbook for office work. The tables of the properties of structural shapes, of safe loads for columns, beams and girders have been revised and many new tables added.

Many of the tables have been rearranged so as to read across the page instead of lengthwise as heretofore. A large number of illustrations have been added and the diagrams used from the last edition have been redrawn and some have been printed with lines of different colors to make the demonstrations clearer.

Every paragraph of the text starts with a black faced caption describing the subject matter of the paragraph the same as in Arthur's New Building Estimator. This facilitates quick reference. An elaborate cross reference index of 40 pages set in two columns is also provided. The subjects covered in every paragraph have been carefully indexed and cross-indexed so the reader will be sure to find any item he is likely to look up, at a glance.

Special Offer. We will stamp the customer's name in gold without charge on all copies of this book, ordered through us.

CONTENTS OF NEW KIDDER BY CHAPTERS

PART I—PRACTICAL ARITHMETIC, GEOMETRY AND TRIGONOMETRY (90 Pages)

Mathematics.
Weights and Measures.
The Metric System.
Conversion Tables.
Mensuration and Geometry.
Geometrical Problems.
Table of Chords.
Hip and Jack-Rafters.
Trigonometry, Formulas and Tables.

PART II—STRENGTH OF MATERIALS, CONSTRUCTION AND STABILITY OF STRUCTURES (1324 Pages)

Terms Used in Architectural Engineering.
Foundations of Buildings.
Masonry Walls. Footings for Light Buildings. Cements and Concretes.
Retaining-Walls, Breast-Walls and Vault-Walls.
Strength of Brick, Stone, Mass-Concrete and Masonry.
Forces and Moments.
Stability of Piers and Buttresses.
The Stability of Masonry Arches.
Reactions and Bending Moments for Beams.
Properties of Structural Shapes. Moment of Inertia, Moment of Resistance, Section-Modulus and Radius of Gyration.

Resistance to Tension, Properties of Iron and Steel.
Resistance to Shear. Riveted Joints. Pins and Bolts.
Bearing-Plates and Bases for Columns, Beams and Girders. Brackets on Cast-Iron Columns.
Strength of Columns, Posts and Struts.
Strength of Beams and Beam Girders.
Framing and Connecting Steel Beams.
Strength of Cast-Iron Lintels and Wooden Beams.
Strength of Built-Up, Flitched and Trussed Wooden Girders.
Stiffness and Deflection of Beams.
Strength and Stiffness of Continuous Girders.
Riveted Steel Plate and Box Girders.
Strength and Stiffness of Wooden Floors.
Wooden Mill and Warehouse-Construction.
Fireproofing of Buildings.
Reinforced-Concrete Construction.
Reinforced-Concrete Factory and Mill-Construction.
Types of Roof Trusses.
Stresses in Roof-Trusses.
Wind-Bracing for Tall Buildings.

PART III—USEFUL INFORMATION FOR ARCHITECTS, BUILDERS AND SUPERINTENDENTS (358 Pages)

Heating and Ventilation. Heat, Fuel,

Water, Steam and Air Chimneys.
Hydraulics, Plumbing and Drainage.
Gas and Gas-Piping.
Lighting and Illumination of Buildings.
Electric Work for Buildings.
Architectural Acoustics.
Data on Excavating.
Stonework.
Bricks and Brickwork.
Lime.
Sand and Gravel.
Lathing and Plastering.
Lumber and Carpenters' Work.
Building Papers, Building Felts and Quilts.
Paint and Varnish.
Window-Glass and Glazing.
Asphaltum.
Mineral Wool.
Structural Steel.
Estimating the Cost of Buildings.
Quantity System of Estimating.
Mail-Chutes, Elevator Installation.
Mechanical Refrigeration.
Tower-Clocks.
The Classical Orders.
Lightning-Conductors.
Vacuum-Cleaning.
Waterproofing of Foundations.
Horse-Power, Pulleys, Gears, Belting and Shafting.
Chain-Blocks.
Hoists and Hooks.
Architectural Terms Used in Law, etc.

1812 Pages 4½ x 7 Inches 1000 Figures Flexible Morocco with Gilt Edges, \$5.00

BUILDING AGE BOOK DEPT., 239 West 39th Street, New York

Going to Build? Remodel or Repair?

For \$1000

We will furnish all material, except masonry, to build this 8-room house. Plans free.

For \$895

We will furnish all material, except masonry, to build this 8-room house. Plans free.

For \$755

We will furnish all material, except masonry, to build this 6-room house. Plans free.

For \$800

We will furnish all material, except masonry, to build this 7-room house. Plans free.

For \$740

We will furnish all material, except masonry, to build this 5-room bungalow. Plans free.

Save \$5 to \$500 on Every Order for Building Material

BUY your lumber and millwork direct. Every contractor, carpenter and builder should have our big free catalog of building material—the book of 8000 price bargains. A copy is ready and waiting for you and will be sent free, postage prepaid, at your request. *The tremendous saving* afforded by our method of supplying building material direct to the actual builder has proven a boon to thousands. Let us show you how to make more money by saving more money.

H. W. Minger
President

Everything in Building Material

is described in this big book. It quotes low, net, rock bottom prices for lumber, flooring, roofing, doors, windows, interior trimmings, cabinet work, colonnades, porchwork, hardware, tile, paints, wallboard, metal work, plumbing and heating equipment, cement machinery, water supply outfits and thousands of building specialties. It is a handy book of information and reference that no builder can afford to be without.

Free Architect's Blue Prints

You do not need to have costly plans prepared by high-priced architects, thus adding to the cost of building, because we have had just such plans prepared for us by some of the ablest licensed architects in the country. These plans are complete in every detail and include a full set of specifications. Our FREE PLAN BOOK tells how to secure these plans without one cent of cost to you. A contractor will find this book of the utmost assistance in securing new trade because with it he can show his customers newer and better designs that may be built for less money.

Houses of Standard Construction

These buildings are of standard construction. They are built from high-grade guaranteed material with all cutting and fitting done by the carpenter on the job. They are not "ready-cut," "factory built" or freak houses in any sense of the term, but are erected as any house must be put up to secure best and most lasting results. Practical builders will readily appreciate the importance of this feature. It means more work for them and a better and less expensive building for their client.

Two Big Free Books

We want every carpenter, contractor and builder to have a copy of our big, free catalog, whether or not he is now in need of building material. It will keep him in touch with the very lowest prevailing prices and prove an invaluable guide to right buying. "Plan Book of Modern Homes" is filled from cover to cover with designs of convenient bungalows, handsome suburban residences, town houses, practical country homes and barns. Write for either or both these books today. Both are free. A postal request will bring them by return mail, or fill out the coupon below.

Gentlemen: Please send your FREE Books listed below to

Name _____

Address _____

Catalog No. 1424, of Building Material
Plan Book No. 1424, House and Barn Plans

Gentlemen:

I got a pair of stairs from you, and the price was about \$75.00. I think, when our local mill man wanted \$150.00 for the same. I am a lover of net-priced catalogs and hate to get hold of one that is afraid to tell you what they want for their goods. Yours very truly,
J. B. FEASTER & CO., Greensburg, Ind.

Gentlemen:

The carload of lumber which I bought of you on order No. 3548 was all that I could ask. The grade was up to the standard and I saved after paying my freight and drayage, \$127.00. I certainly will keep you in mind when in the market.
Yours respectfully, F. N. CLINE, Muskegon, Mich.

Please quote BUILDING AGE when writing to advertisers

Gentlemen:

I desire to express to you my sincere thanks for the manner in which you have handled my orders, accounts, etc. I found the lumber to be of the very best quality, and the attention you gave the orders to be first-class. I am very much pleased with it all. The party for whom this building was put up was more than pleased, and I assure you that it will be a pleasure for me to turn any business your way.
I can—Yours very truly, C. B. PATRICK, Burnside, Pa.

Dear Sirs:

I received order No. 10671 in good shape, and am well pleased with the goods. I saved on my order 15 to 20 per cent. Hope to be a customer again.
Yours very truly,

M. O. TERRELL, Cartersville, Ga.

Here's the Big, Quick Profit Chance You've Waited For!

OPPORTUNITY is pounding on your door with sledge-hammer blows through this advertisement. In response to our strong advertising in the leading magazines, thousands of people everywhere are demanding Edwards' Metal Ceilings, Tiles and Walls. Our business is growing so rapidly that we must have a good,

live agent in every community. *One representative* is wanted for each territory to demonstrate, take orders and apply Edwards' Metal Ceilings and Walls. Will *you* be the *one* man to reap the harvest of quick, easy profits? It's squarely up to you. But you must hurry. This opportunity won't linger.

Edwards' Metal Ceilings and Walls

Here is a chance to build up an independent, profitable business for yourself right at home. Many are now devoting their entire time to selling our metal ceilings and walls. Others have made big profits simply devoting part of their time to selling and applying our Metal Ceilings and Walls. No matter how you handle the proposition, the profit is in it, because the demand has already been created.

You Must Act Quick.

Write us about your territory at once. This doesn't mean next month, or next week, or even tomorrow, but right now! One hour's delay may mean that someone else may be given your territory. Send the coupon. It brings our special agent's proposition and large illustrated Ceiling catalogue of attractive salesmaking designs.

**You Save 25%
to 40%**

in erection cost every time you use Berger's "Classik" Steel Ceilings, because our improved pressed bead and button construction makes a perfectly tight joint without tamping and calking. The nails can't slip, but go in straight and true.

"BERGER'S" Classik STEEL CEILINGS

Please the Owner by Their Attractiveness Durability and Economy

THOSE are the three features that strongly appeal to the owner of a building—and the fulfilling of them is a credit to the contractor or builder.

The variety of artistic designs and the many decorative possibilities offered by Berger's "Classik" Steel Ceilings compare favorably with the most expensively moulded plaster—yet cost much less and are incomparably more durable because they cannot crack, chip, or fall down. In fact, they are a permanent fixture.

Fire-resisting—many a building has been saved from total destruction by a "Classik" Ceiling confining the fire to the room in which it started.

Perfectly constructed and give lasting satisfaction. Easily and profitably erected in all kinds and sizes of buildings.

Show our New "Classik" Book D. B. to the owner whose contract you're trying for. Its hundreds of beautiful illustrations and designs will help you get it. Send for your copy now.

Garage at
Newport, R. I.

Ten Years' Service Without Ten Cents Expense

In the ten years which have passed since the Ambler Asbestos "Century" Shingles were applied on this garage not a cent has been expended for roof repair. Not a shingle has cracked, twisted, curled or otherwise failed to give permanent service. No painting, no repairing, no replacing, no worry.

This service was given in the teeth of destructive winter storms such as are witnessed on the New England Coast. Ambler Asbestos "Century" Shingles withstand the stress as no other roofs will do.

Ambler Asbestos "Century" Shingles

What a fine feather this is for the cap of the contractor who applied the roof. It hasn't shown even a suggestion of its ten years' exposure to the rugged storms of the New England coast. It is just as tight—just as firm—as fireproof—as storm proof and as good looking as it was ten years ago.

Reputations are made quickly with Ambler Asbestos "Century" Shingle roofs. You'll have no stronger recom-

mendation in your town and you'll need none.

Whether you are specifying for or laying roofs on garages, houses, hospitals, schools, churches or in fact on any building where permanent service is your aim, you will best serve the owners by using Ambler Asbestos "Century" Shingles.

Write us at once for terms and trade prices. Samples furnished.

KEASBEY & MATTISON CO., Factors

Branch Offices in Principal Cities of the United States

"I can recommend it"

"I was a Builder
3000 years ago
and My efforts
are still standing"

—and the same principles in use when the pyramids were built, used in building construction ever since, and *today* acknowledged the most efficient, are combined in that modern, dependable background for stucco, cement or plaster finished houses

It contains *no metal* to rust and *break away* from its fastenings, nothing but creosoted lath, asphalt-mastic, and heavy fibre board, that will outlast any materials known, that is proof against moisture, vermin, heat and cold, and that holds the stucco in its dovetailed grip so it can't crack, loosen or let go.

Bishopric Board costs less than other backgrounds and saves at least 25% in material and labor.

Our book "Built on the Wisdom of Ages"

gives facts and figures to prove our claims. It also illustrates homes, apartments, factories and public buildings constructed with Bishopric Board, and gives letters from architects, builders and users, also some interesting results of scientific tests.

Write today for samples and this book—all free.

Do Your Own Millwork Increase Your Profits

Over 4,000 builders and contractors are doing their own millwork on the "Famous"—the time tested woodworker. What the "Famous" is doing for others it can do for you.

Every "Famous" machine is backed up by the "Famous" factory. It must be absolutely right or we will make it right. The "Famous" line offers a choice of Band Saws, Hand Jointers, Pony Planers, Saw Benches for ripping, cutting off or variety work, Post Borers, Hollow Chisel Morticers, Morticer and Tenoner, Swing Cut Off

Saws, Lathes for wood turning or pattern making, Single and Double Spindle Shapers and the "Famous" line of Universal Woodworkers containing fifty-four different styles and models.

Ask any man who owns a "Famous" what he thinks of it. The fact that it is saving him money doesn't necessarily mean it would save you, yet it's worth your time to send for a catalog and to investigate. Just drop us a line and we will be pleased to send you a copy of the Little Black Book (pocket size) on Woodworking Machinery.

Get the Oshkosh

Contractors' Manual

You need this book. Every up-to-date cement contractor does. It is full of vital information for you, to help you in figuring your costs on work. It tells the yardage capacity of machines (in terms of wet mixture, not dry material) number of men needed to serve each size, speed in batches, horsepower required and amount of fuel. With this you can figure your exact costs on any job. Send for your copy now and stop guessing at your profits.

THE NEW OSHKOSH LOW LOADER

See our Machines—Booth 150 and 153 Chicago Cement Show

Oshkosh Four Motion Mixers

Four complete turnovers of the batch to every revolution of the drum insures a smooth and rapid mix. Rapid mixing means more batches per hour at a great saving in labor. Due to these reduced costs you make more profits at association figures, or get more jobs because of lower figures if you use an OSHKOSH FOUR MOTION MIXER OR PAVER. Remember, when figuring the cost of your machines, that the up-keep and operation cost must be counted before the purchase price.

Eveready Saw Rig

Parks Latest Improved Combination

A Woodworker that gives Builders practically all the Facilities of a Planing Mill. With the complete Combination selling at such a reasonable price, you can't possibly afford to be without one. Think of the money you'll save in one season alone, sawing all your dimension stuff, doing your exterior millwork and interior trim. Why, you're bound to grow and branch out.

One of these machines will set you way ahead of any contractor—you can outbid him, you can handle more work in a season and you can make more money. Any of our single or combination machines can be driven with either gasoline engine or electric motor.

SWING CUT-OFF SAW has proven to be of great value in convenience, being set ready for instant use, and especially in working long material. One man can lay it in position to get special cut desired, and our swinging frame being short and rigid you get a clean square cut, and will be often used where a regular saw bench that you have to change the saw and guides would not be.

The saw drops below the table when not in use, unless it is set for ripping, in which case the swinging frame is hooked up so saw remains above the table. The cross-cut guide is held in place with dowel pins and can be instantly lifted off and the rip guide put on, which is held in line with the saw by the two hand wheels in front.

Swing Cut-Off and Rip Saw

Double Table Circular Saw
12-inch Jointer
22-inch Band Saw
Swing Cut-off Saw
Reversible Spindle Shaper
Upright Hollow Chisel Mortiser
Double Tenoner
18-inch Sand Disk

WE ARE THE ORIGINATORS of the circular saw-band saw, jointer combination. The proof of the practicability of our machines is the large number of other makes now for sale. Our latest improvements are the UPRIGHT HOLLOW CHISEL MORTISER and SWING CUT-OFF SAW, the latter having proven to be the most practical machine of all on the job, and which we think none of our competitors have so far.

With our combinations, you can select what you need and add other attachments later. Machines are especially adapted for small shop and portable use, and we are not only better equipped to take care of your needs for a machine and attachments but have a complete line of moulding knives, boring bits, emery wheels, saws, pulleys, belting, etc.

Complete Catalog sent upon request.

PARKS BALL BEARING MACHINE CO.

Station A, Cincinnati, Ohio

Why Don't You Get a Barnes Hand Circular Rip Saw?

Sawing by hand is "backbreaking" work—sawing with our machine prevents the aches, and requires no skill.

One man with a Barnes Hand Circular Rip Saw can easily rip (line measure) 600 feet of one inch pine in an hour, or 6,000 feet in 10 hours.

It will rip boards or planks of either soft or hard wood, of any thickness up to 3¾ inches and any width up to 19 inches.

Feeds slow or fast as desired; can be instantly set to or from the gauge to any width.

The Barnes is a money maker, and the price a money saver.

Build a Reputation For Service

It isn't alone the prices that a contractor can make that determine his success. Another big thing is the service he gives for his price—the speed he makes on a job and the kind of work he does.

The

"AMERICAN" Contractor's Portable Variety WOOD-WORKER

Helps its owner to win out in competition both in price and service. It makes for lower prices by cutting down costs without sacrificing profits. And it helps build a reputation for service by turning out better work in less time.

NEW YORK CITY

The Crescent Universal Wood-Worker

Four men can work at the same time on a No. 51 Crescent Universal Wood-Worker. It is a combination of machines, each independent of the others, compactly and conveniently arranged and all driven by one main belt from the line shaft. There is no separate countershafting to take up room—all the space around the machine is left clear for the convenient handling of the lumber. Write for our catalog.

The Crescent Machine Co.
206 Main St. Leetonia, O.

Steel "Stitches" Every Few Inches

Columns which have staves simply glued together will surely open up. Columns which have any kind of a lock-joint are liable to open up. Columns which are glued under hydraulic pressure, where the staves are locked with a double V joint and sewed with cold rolled steel staples every few inches of their entire length *cannot* open up. And this is the way "Steel-Sewed" Columns are always made. Catalog explains the construction and shows many beautiful illustrations. Write for it.

AMERICAN COLUMN CO., Battle Creek, Mich.

The Stormproof Roof

SELL CORTRIGHT METAL SHINGLES

FOR 28 years Cortright Metal Shingles have been making good as a permanent, fine appearing and moderate priced covering for sloping roofs. In every neighborhood there is a demand for roofing material that is permanent, fireproof, and weatherproof, yet low enough in cost to meet the average pocketbook. Builders most everywhere now sell Cortright Shingles with a good combination of volume and profit. Write today for complete proposition.

Profitable to You and Your Customer

Your greatest asset in business is the satisfaction of your customer. Give him what he wants at the price he wants to pay and you've really *doubled* your profit.

For building construction, whether exterior or interior, you can specify

North Carolina Pine

"The Wood Universal"

with the assurance that your customer will be *more* than satisfied, both from the standpoint of economy and of appearance.

North Carolina Pine is today being more widely used than ever before. Its beauty and variety of grain adapt it most admirably to interior ornamentation. Its use for exterior purposes demands only the same discriminating care in selection and protection as other woods under similar conditions. *It has proven its worth in both fields.*

Write for Our Instructive New Book

We have compiled an elaborate and exhaustive booklet on North Carolina Pine for the information of contractors, builders and architects. It shows you most emphatically that "the wood universal" is a wood *most profitable*—to you and your customer. Write today.

J-M Responsibility—the logical outgrowth of over half a century's progress, achievement and business integrity—stands as a stronger assurance for your satisfaction than even the most complete written guarantee.

Flying Sparks are no menace to a J-M Transite Asbestos Shingle Roof

Being fire-proof, J-M Transite Asbestos Shingles are a safeguard to the home or building they cover. And not only are they fire-retardant, but because of their composition, sharp freezes or sudden thaws have no effect on them. They actually toughen under such conditions. The artistic possibilities of J-M Transite Asbestos Shingles are limitless, too, because they are made in nine shapes, nine sizes and two thicknesses; rough or smooth edges in gray, Indian red and mottled brown colors. Have all the information on these shingles in your files. Get the facts from any J-M Branch. J-M Transite Asbestos Shingles are tested, approved and labeled by the Underwriters' Laboratories under the direction of the National Board of Fire Underwriters. Laid American method, they are given class B rating, laid French method they secure C rating.

**This Structure at Augusta, Ga.
Is Still a Substantial Home After 101
Years of Honest Service**

During much of its long life it has been without the protection afforded by reasonably frequent paintings—exposed to the trying influences of a very warm, moist climate.

It is constructed throughout of

SOUTHERN YELLOW PINE

“The Wood of Service”

Southern Yellow Pine today is a better, more dependable building material than it was 101 years ago, because, under the grading and inspection rules of the Southern Pine Association, it is much more carefully, skilfully and accurately manufactured.

Under those rules all question as to quality specified in timbers, dimension and trim is eliminated. That, conjoined with the wood's inherent qualities of strength, workability, durabil-

ity and beauty, makes it the most valuable all-purpose structural material in the world today.

It costs less because it is plentiful. It is available in standard sizes and grades everywhere.

If you would know more of the possibilities in the present-day uses of Southern Yellow Pine—the possibilities in Service, Saving and Satisfaction—ask us. The information is *Free*.

SOUTHERN PINE ASSOCIATION

**678 Interstate Bank Building

In addition to providing a finish of sustained life to any desired color effect in stains, varnish or white enamel

ARKANSAS SOFT PINE

has the decided advantage of being readily obtainable because of an abundant supply.

This wood therefore provides an interior finishing material at a comparatively

Moderate Cost

Due to the wide variety of figure which it possesses, ranging from the bold grain of flat sawn to the conservative pen line of the "quartered," Arkansas Soft Pine may be selected to harmonize with any desired interior decorative scheme. It will provide a durable finish of lasting life when stained in Mahogany, dark or light Oak, Silver Gray, Natural varnish or other effects.

Well-balanced absorbing qualities, due to absence of rosin, make it a perfect base for white enamel treatment. The wood will not stain the enamel from underneath nor will the finished surface ultimately become dead-looking.

In short, it is a reliable woodwork.

INSIST ON CYPRESS AT YOUR LOCAL LUMBER DEALER'S. IF HE HASN'T IT LET US KNOW IMMEDIATELY

Why White Pine?

A Reminder of a Few Facts Every Experienced Carpenter Knows

It would be presumptuous for us to try to tell you men who are working with wood every day, anything about the superior qualities of White Pine. You know the facts enumerated below. We simply wish to remind you of them before the rush of another building season is upon you.

WHITE PINE

It Lasts Longer. Three centuries of building experience in America have proved that no other wood can withstand the attack of time and weather so successfully as White Pine.

It Holds Its Place Better. White Pine does not shrink, swell, twist, warp or rot. Once in place it "stays put," even after years of exposure in the closest fitting mitres and in delicate mouldings and carvings.

It Works Easier. Because of its softness and smooth, close grain, it works more easily under your tools. It does what you want it to do—without waste of time and needless wear on your tools.

Could Any Wood Do More?

There is still plenty of White Pine. If the lumber dealers supplying the materials for those for whom you are building are at any time unable to furnish it, we would appreciate the opportunity of being helpful to you in securing it.

Rufus D. Wood, Architect, Pittsburgh, Pa.

Read what this Architect says about his own house, which is stained with

Cabot's Creosote Stains

"The shingles of the roof and second story are stained with your brown stain and the plaster on the outside columns with your white Waterproof Cement Stain. A number of the shingled houses in my neighborhood have been stained with creosote (?) stains manufactured by local concerns and their colors are very muddy and disagreeable and do not seem to stand the weather, while mine has retained the original nut-brown color which I desired." (Signed) RUFUS D. WOOD.

Cabot's Stains have been the standard for more than twenty-five years, and are specified by nine-tenths of the architects, who know them from experience. Their colors are soft, rich and beautiful, and guaranteed fast. Their vehicle is Creosote, which thoroughly preserves the wood, and they contain no kerosene or other cheapener. Why experiment with unknown stains, when you are sure of Cabot's?

Cabot's Waterproof Cement Stains

are the only artistic cement finishes. They give soft, natural coloring effects, without covering the surface with a painty coating. They are also cheaper than coatings and easier to apply, and they cannot crack or peel.

You can get Cabot's goods all over the country. Send for samples and name of nearest agent.

NEW YORK, FEBRUARY, 1916

A Western Type of Two-Family House

A Striking Exterior Finished in Rough Stucco
with Roof Covered with Gray Asbestos Shingles

THERE is abundant evidence to be gathered from architects and builders who specialize in moderate-priced construction in the Middle West that the two-family apartment building has

upkeep as compared with a modern residence. In the well-designed structure of this type the owner sacrifices none of his home comforts, while at the same time he is assured of an income from the

View in Dining Room of Two-Family House Looking Toward the Enclosed Porch at the Left

come to stay. In recent years landowners in city and suburb have realized that a plot of ground may be well utilized to accommodate the needs of two families without incurring what might be considered a prohibitive cost for construction and

rented portion of the home which makes his own apartments practically rent free. An excellent example of a house of this type has been selected as the basis of this article, principally because of its moderate cost, attractive appearance and

commodious arrangement of five rooms to each floor. Another important feature is that of the application of asbestos stucco and asbestos shingles which tend to prevent the building suffering severe damage in the event of a conflagration.

The house has a southern frontage and one of the accompanying pictures taken from the south-east shows a combination of brick and stucco with half timber treatment which is decidedly pleasing. The entrance on the east side gives access to both apartments. It is reached by ten stone steps, which terminate in a wide platform, the arrangement being graced by an iron railing on the exposed side. The front door opens into a vestibule which has a floor tiled to imitate an Oriental carpet. The first floor apartments are directly off this hall,

three sections of almost equal proportions. From the front, the first section is made up of the sun parlor and living room, the second of the reception hall, two bedrooms and a bathroom, and at the rear are dining room, an enclosed porch, a kitchen and a pantry.

The living room is 24 x 13 ft. in area, and at the west end of it is a cosy brick fireplace, flanked on either side by a bookcase. A shelf above has been provided for such decorations as small lamps and vases. Windows at both ends of the room provide an abundance of natural light, a feature which is greatly assisted by the large amount of glass surface in the sun parlor to the south. The sun parlor is reached from the living room by French doors. It is approximately 15 ft. long and

First Floor Plan

Second Floor Plan

A Western Type of Two-Family House—Floor Plans—Scale 1/16 In. to the Foot

while an inner door leads to the basement. Two flights of stairs, well lighted by landing windows, rise to the second floor and are continued to the attic. A basement under the entire building contains two store rooms, a laundry, a toilet room, coal and boiler rooms, and a section which may be used in the future as a billiard room.

Exclusive of the front and rear porches the building is 56 ft. long and approximately 25 ft. wide. The sun parlor in the front and breakfast porch in the rear extend 10 ft. and 8 ft. respectively, making the total length 74 ft.

On entering either apartment the visitor finds a reception hall, to the right of which is a roomy clothes closet. The plan has been divided into

9½ ft. wide. There are nine windows in all, five taking up the greater proportion of the front, while the remaining four are distributed two on each side. A large radiator of the low type is installed on the west side of the porch, so that this room may also be used with comfort during the bleak, cold months of our Northern winters.

A pleasing perspective is presented in the view taken from the sun parlor, looking through the living room and down the hall, at the end of which is the dining room. Off the hall on one side is a guest's bedroom, and on the other the owner's bedroom, communicating directly with the bathroom. Adjacent to the bathroom is a linen closet with four shelves.

Another of our pictures shows the dining room with the breakfast and sewing porch beyond, both rooms being exceptionally well lighted. The former has a large buffet, provided with sufficient drawers and cupboards and a wide sideboard to

shelves and three drawers, the location being clearly indicated on the floor plan on the facing page.

A careful examination of the plans will show the close proximity of the fixtures in the kitchen and bathroom, a feature which tends to reduce the

A Western Type of Two-Family House—General View, Showing the Striking Appearance of the Finished Building and also of the Front and Side Elevations

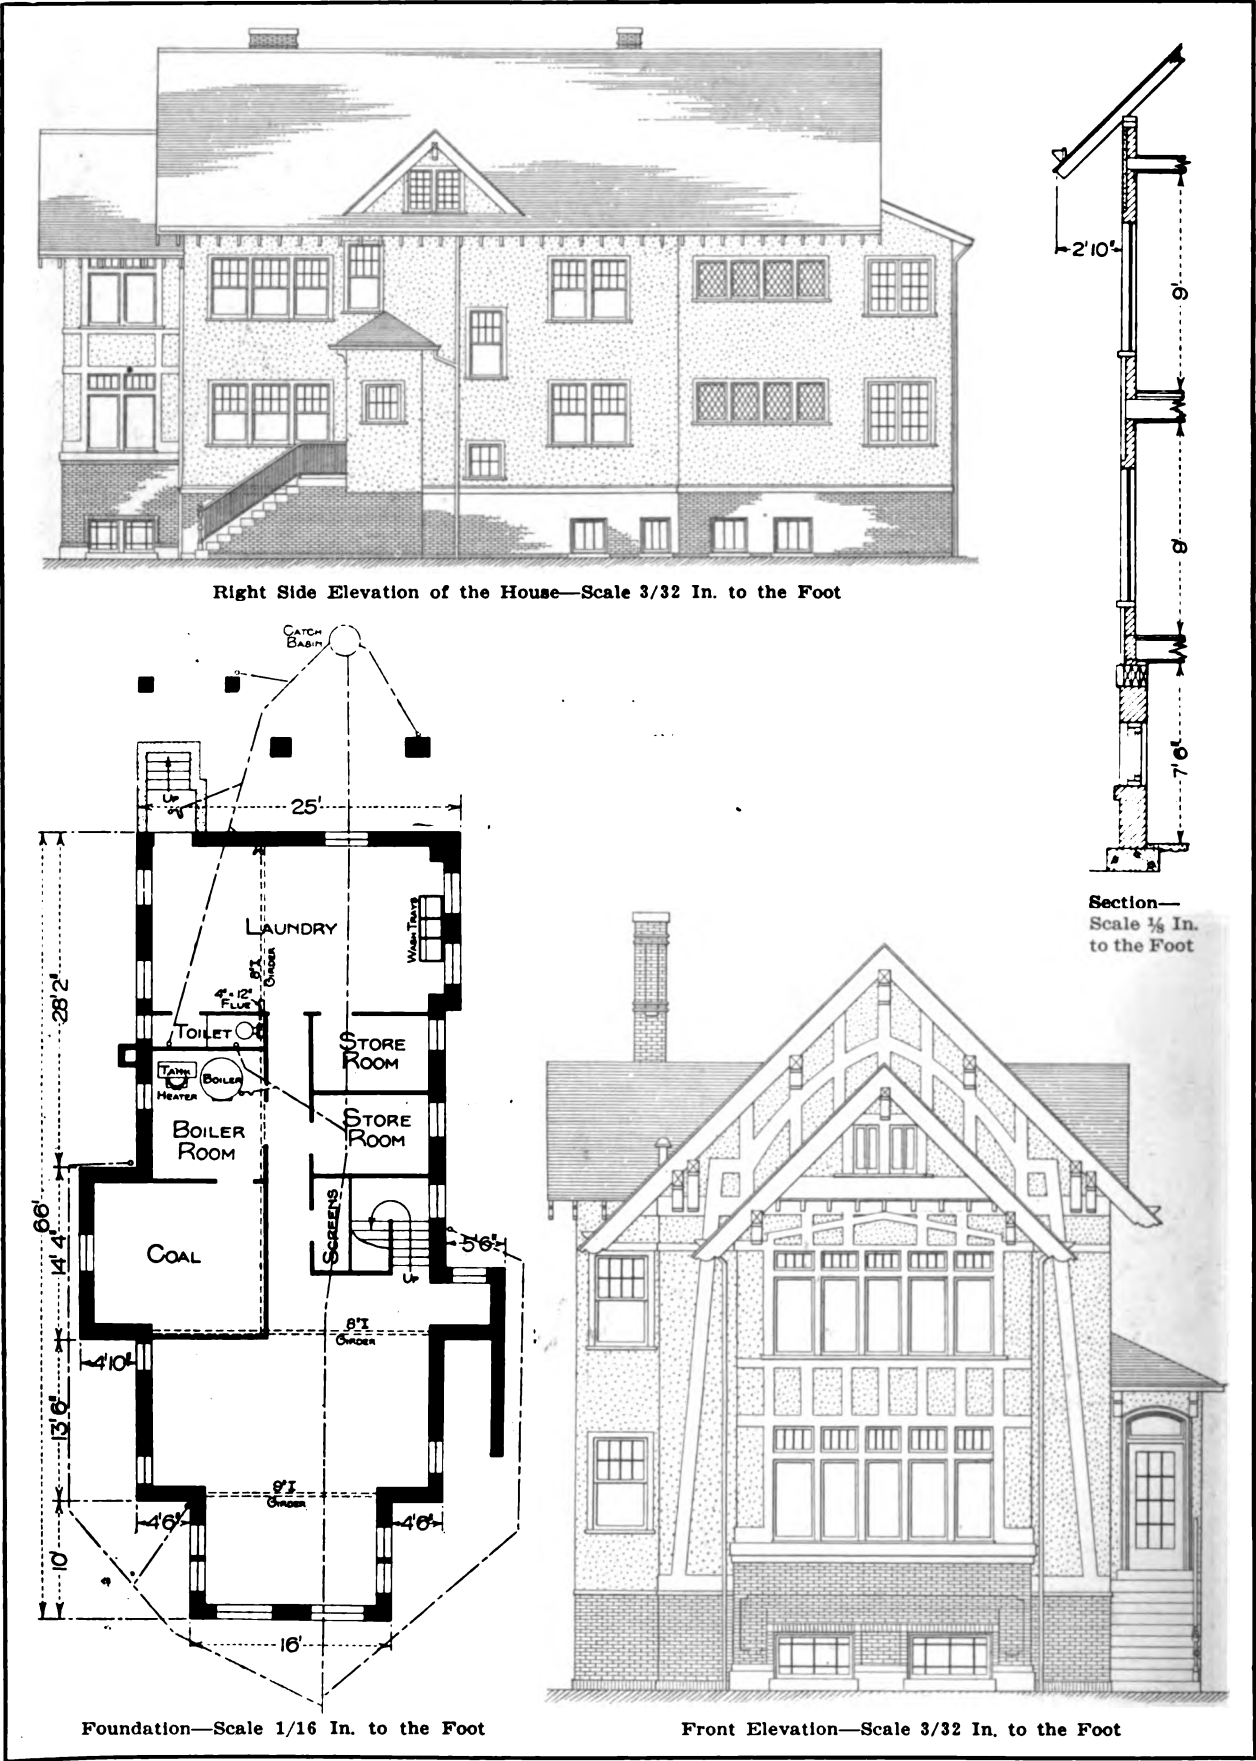

accommodate all the needs of an average family.

The floor plan provides for two rear entrances, one to the kitchen and the other direct to the porch. Between the kitchen and the living room is a pantry containing the ice box and a case with four

cost of installation. It will also be noticed that each bedroom has a closet in which electric light connections have been extended. The closet in the main bedroom has a Lowrie wall safe, and the backs of the bedroom doors are mirrored.

The footings of walls and piers are constructed of concrete consisting of Portland cement, torpedo gravel and small crushed stone in the proportions

mortar. All brick work is neatly bonded every sixth course, all joints being well filled with mortar and neatly struck on the exterior and interior. The

A Western Type of Two-Family House—Plan, Elevations and Section

of 1:3:5. The piers are 13 x 13 in., and the footings 2 ft. 4 in. Two courses of paving brick were laid below grade all round the building in cement

outside walls and inside of the basement walls are plastered from the foundations to the water table with a damp-course consisting of one part of

View in Living Room Looking Toward the Fireplace Flanked on Either Side with Bookcases

Portland cement and two parts of torpedo sand.

The basement floor was leveled to the required grade and then rough concrete work 3 in. thick was laid, consisting of Portland cement, torpedo gravel

and small crushed stone in proportions of 1:2:4, thoroughly mixed and tamped in place. A finishing coat $\frac{1}{2}$ in. thick, consisting of two parts Portland cement and three parts of torpedo gravel, was

A Western Type of Two-Family House—Another View in Living Room with Hall Beyond

added and troweled to a true, smooth surface.

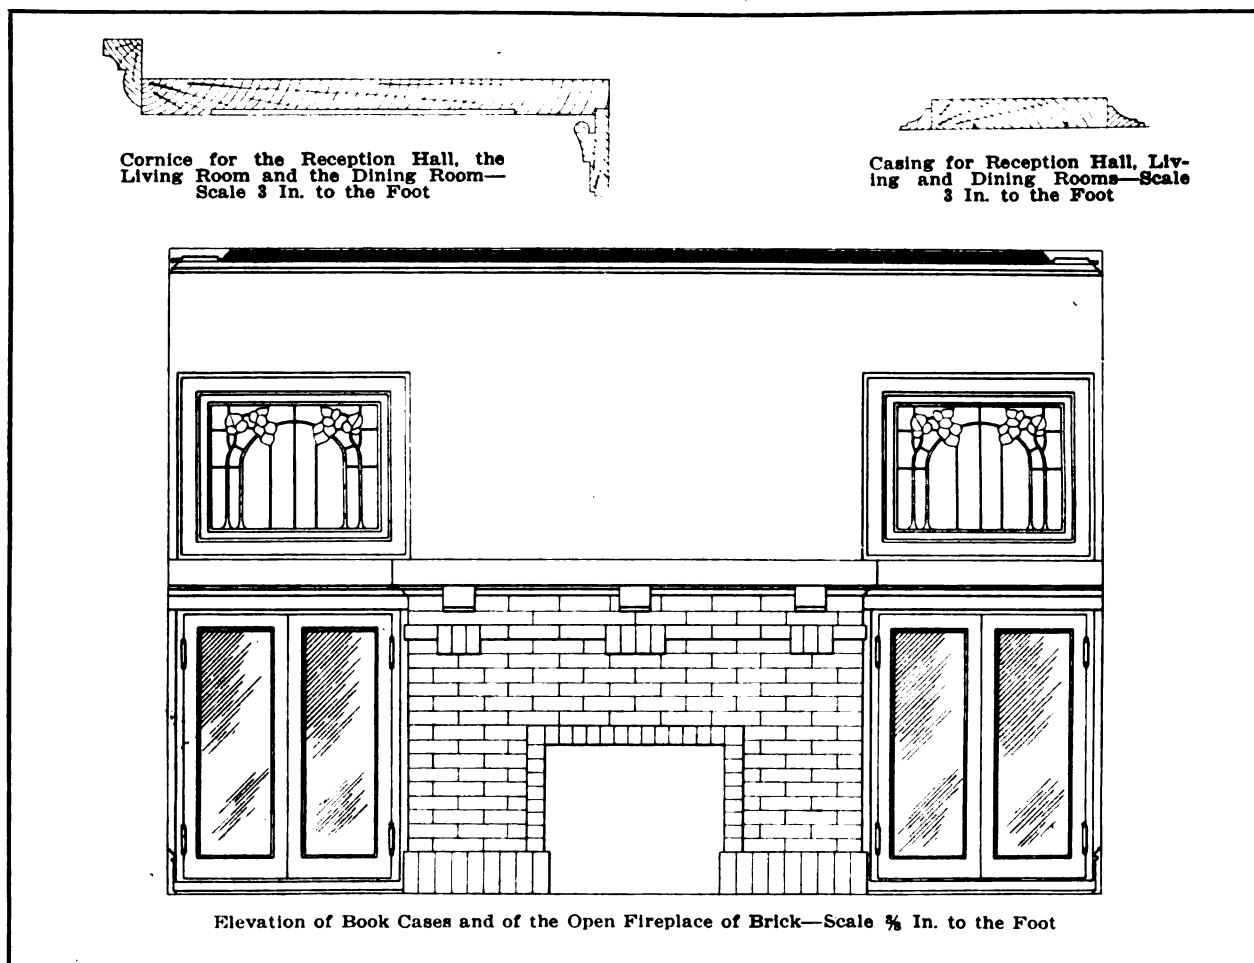

The timbers used throughout the house are of well seasoned No. 1 yellow pine. The joists for the first and second floors are 2 x 10 in., and for the attic are 2 x 6 in. The rafters are also 2 x 6 in., and all are spaced 16 in. on centers. The studding for partitions and outside walls are 2 x 4 yellow pine spaced 16 in. on centers. Sills all round the building are 2 x 10 in. yellow pine, double plates being provided for outside walls and bearing partitions. All openings in the latter are substantially trussed. A 1 x 4-in. ribbon plate is let into the studding to receive the joist in all outside frame walls, the joists being spiked to the studding. A 2 x 4-in. collar beam is nailed to every other rafter.

Each tier of floor joists has two rows of 1 x 4-in.

lake sand, a small quantity of lime mortar and hair, well mixed and troweled in place. The next coat was composed of one part Portland cement and two parts of sand. Asbestos stucco made by the H. W. Johns-Manville Co., New York City, was used to produce a rough texture in the final coating.

Selected buff Bedford stone was chosen for the front of the building. The railing gracing the front steps has a 3-in. post and a cap rail $\frac{5}{8}$ in. square, the balusters being spaced 3 in. on centers. All iron work received one coat of mineral paint before being set up.

The front door is of oak 2½ in. thick, fitted with wooden bars and twelve small panes of glass. In the rear the door is of paneled pine 1¾ in. thick. The basement doors are 5-panel white pine stock,

A Western Type of Two-Family House—Various Details of Construction

cross bridging, and all bearing partitions are bridged once through the center. Headers and trimmers are hung in iron stirrups let in flush with the top of the joist. The basement partitions are $\frac{7}{8}$ x 5½ in. dressed and matched flooring put on diagonally.

The first and second floor joists, attic joists and entire outside walls above the first floor, roofs and dormers, are sheathed with $\frac{7}{8}$ x 5½ in. dressed and matched yellow pine. Over this was placed two layers of Neponsit waterproofing paper, on top of which were nailed $\frac{7}{8}$ x 2-in. yellow pine furring strips placed 12 in. on centers.

The exterior walls were covered with expanded metal lath of No. 24 gage to receive the cement coat. In plastering the exterior the first coat consisted of one part Portland cement, one part sharp

lake sand, a small quantity of lime mortar and hair, well mixed and troweled in place. The next coat was composed of one part Portland cement and two parts of sand. Asbestos stucco made by the H. W. Johns-Manville Co., New York City, was used to produce a rough texture in the final coating.

Selected buff Bedford stone was chosen for the front of the building. The railing gracing the front steps has a 3-in. post and a cap rail $\frac{5}{8}$ in. square, the balusters being spaced 3 in. on centers. All iron work received one coat of mineral paint before being set up.

The front door is of oak 2½ in. thick, fitted with wooden bars and twelve small panes of glass. In the rear the door is of paneled pine 1¾ in. thick. The basement doors are 5-panel white pine stock,

Above the front stairs to the left of the entrance Corbin combination letter boxes and speaking tubes have been installed. A speaking tube is also carried from each floor to the laundry. A No. 101 "Majestic" coal chute, made by the Majestic Co., Huntingdon, Ind., is visible on the west wall of the building.

All roofs are covered with H. W. Johns-Manville Co.'s asbestos shingles of gray which harmonize with the stucco walls.

Galvanized iron work throughout is of 26 gage. In addition to the ridges, guttering and flashing, seven corrugated downspouts, each 3 x 4 in., have been put up secured to the building with iron fasteners.

The chimney located where shown on the plan is faced with selected red pressed brick made by The Hydraulic-Press Brick Co., St. Louis, Mo. The same color and quality face brick was used for the fireplace and hearth in the living room. The chimney is lined with fireclay flue lining and topped with a stone coping. All pressed brick was laid with $\frac{1}{4}$ -in. raked out joints.

All walls, partitions and ceilings on the first and second floors as well as the basement ceiling are lathed and plastered with two coat work. Expanded metal lath was installed over the boiler. The first coat of plaster consisted of a rich lime mortar composed of fresh quick lime, sharp sand and plenty of hair. The second coat was a plaster of Paris hard finish. The bathroom ceiling was plastered with ready mixed "Adamant" cement plaster and has a finish coat of the same material.

The floor strips for both floors are of No. 1 yellow pine. On the first floor they measure 2 x $\frac{1}{4}$ in., spaced 16 in. on centers, and on the second story $1\frac{1}{2}$ x 2 in. It was specified that for the second floor two layers of "Eureka" heavy deadening felt be laid, one on top and one below the floor strips. One layer of rosin sized paper was laid on top of the first floor.

The dining room has an oak floor and trim; the living room, birch trim with mahogany stain and oak floor; the sun parlor, an oak floor with pine trim, white enameled; the rear porch an oak floor; the vestibule, oak trim; the kitchen, a maple floor; the bedrooms, birch trim, white enameled, with oak floors; the bathroom, birch trim, white enameled; and the hall, birch trim and oak floor.

All flooring is $\frac{7}{8}$ x $2\frac{1}{2}$ in. and the oak floors were filled with Wheeler's patented filler, after which were applied two coats of Pratt & Lambert's No. 61 floor varnish. The same treatment was

given the treads of inside stairs. Maple floors were treated to one coat of boiled oil and two coats of the above varnish.

All outside woodwork and metal received two

View in the Bath Room

coats of white lead and linseed oil paint, the final coats being of selected tints.

All oak trim was treated with Wheeler's patented filler and had two coats of Murphy Varnish Co.'s transparent finish, sandpapered between coats, the last having a dull finish. Birch woodwork re-

A Western Type of Two-Family House—View of the Side Elevation Showing Picturesque Setting

ceived one coat of mahogany water stain and two coats of the above varnish. The bedroom, bathroom doors and sun verandas received three applications of Pratt & Lambert's undercoating and four coats of the company's "Vitalite."

The bathroom has tile floor and walls, the latter to the height of the window and door tops, and is skirted by a narrow green border. It is provided with modern fixtures, consisting of a lavatory, closet, bathroom and shower equipment. The lavatory has a mixing faucet, and such accessories as soap and glass holders are provided. A wood medicine cabinet with a white enameled finish is also a part of the bathroom equipment. The closet has a low-down porcelain tank, while the seat and cover are also finished in white. The plumbing equipment takes care of all wastes from the ice boxes on both floors. In the basement is a 3-part laundry tray. Hot water throughout the building

New Building Construction in Manhattan and Brooklyn in 1915

While building operations in the borough of Manhattan, New York, showed an appreciable gain over 1914, they were not up to the figures of any one of the seven years prior to 1914. According to the filings with the Bureau of Buildings, permits were taken out last year for 489 new structures, estimated to cost \$64,652,869, as against 411 new buildings costing \$45,471,165 in the year previous.

According to classification, there were plans filed for 25 dwelling houses, to cost \$792,500; also 193 tenement houses, to cost \$24,980,500; 9 hotels to cost \$2,030,000; 61 store and loft buildings, to cost \$15,979,000; 24 office buildings, to cost \$5,535,000; 20 manufactories and workshops, to cost \$1,957,500; 5 school houses, to cost \$1,045,000; 10 churches, to cost \$872,000; 6

A Western Type of Two-Family House—Elevation of the Sideboard in the Dining Room, Showing the Leaded Glass Windows Directly Over It—Scale $\frac{3}{8}$ in. to the Foot

is supplied by a No. 5 coal heater manufactured by the Illinois Malleable Iron Co., Chicago, Ill.

The building is heated by a two-pipe system of hot water through the medium of a No. 2 "Kewanee" boiler, made by The Kewanee Boiler Co., Kewanee, Ill. The total radiation distributed is approximately 1200 sq. ft. The building is piped for gas and wired for electric lighting.

The two-family house here illustrated and described was built in Chicago at a cost not exceeding \$10,000 from plans prepared by Architect George F. Lovdall, 953 Belmont Avenue, Chicago, for William J. Strohm, 7616 Rogers Avenue, Chicago, Ill. All work was let to separate contractors direct, the process of construction being supervised personally by Mr. Strohm.

municipal buildings, to cost \$10,454,000; 23 places of amusement, to cost \$1,531,250; 6 hospitals, to cost \$595,000; 63 stables and garages, to cost \$872,705, and 44 other structures, to cost \$57,414.

Plans were filed during the year for alterations to 3237 old buildings, estimated to cost \$9,019,805.

During 1915, permits were granted in Brooklyn for 5121 buildings to cost \$40,300,600, as compared with 2375 permits for 4379 buildings to cost \$38,269,185 in 1914. Of the 5121 new buildings, for which plans were filed 3794 costing \$33,413,720 were completed. This compares with 3483 buildings, costing \$31,460,770, completed in 1914, an increase of 311 buildings and \$1,952,950.

Permits were filed also for alterations to 9394 buildings to cost \$5,301,251 in 1915, against alterations to 7066 buildings costing \$3,603,122 in 1914. The combined operations during 1915 aggregated \$45,601,851, an increase of \$3,729,544.

Approximately \$14,000,000 went into more than 600 apartment houses, while \$10,000,000 was spent for nearly 2300 dwellings. Most of the new construction was along the subway routes.

An exhibition of the work of the pupils of the Baron de Hirsch Trade School was held on Tuesday evening, Jan. 25, at the institution, 222 East Sixty-fourth Street, New York City.

Concrete Floors in Dwelling Houses*

The Experience of a Man Living in a House Having Floors of Concrete—Their Treatment

WHEN I was about to erect my home and decide on the subject of floors, my father, who had been a strong advocate of concrete floors in office buildings, advised me against their use in a residence. Careful inquiry developed the fact that he was not opposed to the floors but was satisfied that my friends and others would interpose all the objections to their use in a residence that we had formerly gone through in our office building, and so I decided to put wooden floors downstairs for the benefit of my friends and concrete floors upstairs for the use of my family; but finally we worked up one excuse after another for leaving the wood floors out of certain downstairs rooms and finally they were left out altogether.

Treatment of the Floors

My floors are of a warm brown tone and come up on the side walls about 6 inches and flush with the plaster to form what would otherwise be a baseboard. Downstairs they are decorated with a palette-knife and look somewhat like carved leather. After the "carving" had been done an artist worked various colors of the rainbow into the decoration and then they were all varnished and waxed so that keeping them in order is similar to the polishing of wood floors but the polishing is required much less frequently.

Upstairs we use velvet carpets of double width and plain colors, sewed together to form a mat or rug, but without a border, and extending within 6 in. or 8 in. of the side walls all the way around. We find that no nailing strips or other means of fastening are necessary, since the carpet lies perfectly flat and is sufficiently large so that it will not move about.

Downstairs we use Oriental rugs entirely and a curious feature in this respect is that moths will not hatch on the under side of a rug in contact with concrete, where they do hatch when it is in contact with wood. This applies to the under side of the rug only, because it is not impossible for them to hatch within the rug fabric itself.

The Use of Carpets or Rugs

Now, the common impression is that a concrete floor will make the room cold, but this impression is reached by people who have gone into rooms with concrete floors where there was no carpet on the floor and because at the moment, they were critical of concrete, but if one will go into a bare room where hard wood floors have been used they will get exactly the same effect. The addition of carpets and tapestries decreases the number of square feet where the air of the rooms comes in contact directly with the floor or side walls.

There is also an impression that concrete floors are damp. They are damp for the first two months after being laid and on this account should not be varnished or waxed, but after this period they are as dry as wooden floors. I have made accurate tests with hygrometers, to determine this point.

The concrete floor is to me most satisfactory because it is free from cracks in which dust accumulates and ascend every time the floor is flexed by stepping on it. There is never a squeak or other noise produced by the rubbing of one board of the interior floor on another. With carpets on the floors they are absolutely noiseless, and one cannot detect a person walking on an upper floor when he is in the room below, provided, of course, that there is a carpet on the floor above.

The concrete floor makes a much handsomer setting and background for Oriental rugs than wooden floors and one can do away with the unsightly baseboard, which always collects dust. Then there is none of the trouble of warping which comes with the use of wooden floors.

Above all else the house is fireproof when properly built in other respects and one can leave home with the assurance that neither property of any considerable value nor lives will be destroyed in the event of fire. I feel that my pictures, rugs and porcelains are as safe in my house as in a vault at the bank, barring the possibility of theft, which is rather remote.

Why Windows in Incompleted Buildings Are Whitened

The reason window panes are whitened in buildings not yet completed is thus explained by a local building contractor:

"We don't plaster them all over with chalk to prevent the public from seeing the unfinished condition of the interior, but to keep the workmen from battering out the glass. Transparent glass looks just about as transparent as air to the man who is moving a wooden or an iron beam in a hurry, and he is likely to ram the end of it through an expensive window, but when the glass is coated with white it becomes visible, and the workmen hand their material in through the door."

The "Home of Redwood" to Be Moved

The Redwood Bungalow at the Panama-Pacific Exposition, built to illustrate the use of redwood in building, several pictures of which were presented in the August issue of *THE BUILDING AGE*, and said to have cost \$20,000, has been sold for \$7,500 to George North, who plans to load it on two barges and move it to Santa Venetia, on the Marin county shore. The weight is estimated at 50 tons.

*Extracts from a letter of Homer Laughlin, Jr., in *Concrete-Cement Age*.

Chicago's 1915 Building Operations

Apartment Houses an Important Factor in an
Approximate Increase of 16 Per Cent Over 1914

THE figures compiled by the building department of Chicago indicate that the industry in 1915 enjoyed a prosperity second only to the year 1911, which holds the record for the past decade. The year's showing is particularly impressive in view of the fact that for the first half there was a decrease of 533 in the number of permits issued and \$5,146,400 in the estimated cost as compared with the first half of 1914.

Permits were issued in 1915 for the construction of 10,340 buildings, having a frontage of 318,011 ft. and estimated to cost \$97,301,480, as against 9945 buildings consuming 289,271 ft. and involving an expenditure of \$83,261,710 in 1914.

This data reveals an increase of 395 buildings and 28,740 ft. frontage and a greater cost of \$14,040,000. In other words, the gain is approximately 16 per cent.

The best months in 1915 were October, November and December, with October slightly in the lead.

In explanation of the loss in the first half and the gain in the last half of the year, as compared with 1914, it may be

last half of 1914 the building industry, like many other lines of business, suffered a partial paralysis as the result of the chaotic financial and general business conditions which followed the outbreak of the war. However, eliminating the comparison with 1914, it will be seen from the table below giving the figures for the past ten years that Chicago really enjoyed a year of prosperity.

It was a year of real expansion. This statement means that the greatest activity was noticeable in the outlying sections of the city, and there was comparatively little construction in the downtown district. In fact, the work was conducted on a greater scale than ever before attempted in the city's history. It was of a broad character, involving the erection of high grade apartments and residences, mercantile and manufacturing buildings, in addition to considerable church and school construction.

Chicago is rapidly acquiring a reputation as a

One of Chicago's Important Building Improvements in 1915—The Edgewater Beach Hotel Here Shown in Process of Erection

stated that the comparison for the earlier months is with the period just preceding the European war. At that time there was great activity in building as the result of the rapidly growing ease in the money market. Building operations in the first half of 1915 were also hampered by trouble in the building trades.

Contractors are now looking forward with some degree of confidence to a good business in 1916.

The gain in 1915 did not commence until the month of August, and from that time until the end of the year there was a very gratifying increase. This, too, may be traced to the fact that during the

city of flats, and the activities during the past year are substantial evidence that the statement is one of actual fact. Apartment house construction all over the city has been on a particularly large scale, and while the actual volume cannot be stated with accuracy it has been said that, including store and theater buildings containing flats, this figure may be estimated at nearly 40 per cent of the total expenditure. Brick has been used in enormous quantities, and most modern apartments are not complete without sun parlors. A large number of the court type have been completed, while apartments designed to accommodate anywhere from two to

Chicago's Building Operations in 1915—Some of the More Important Structures Erected

twelve families are very much in demand. The arrangements usually embody such fixtures as buffets and china closets, bookcases, etc., which means that the carpenter is getting his share of the prosperity.

It is said that there was a much greater percentage of high class buildings erected last year than during 1914. The public taste has been undergoing a rapid education in this respect during the last few years, a fact which progressive builders have come to recognize.

The table here given shows comparisons for the past 10 years.

Years	Number of Buildings	Number Feet Frontage	Cost
1906	10,447	276,770	\$64,298,335
1907	9,338	253,993	59,085,080
1908	10,771	291,655	68,204,080
1909	11,211	310,351	90,509,580
1910	11,409	327,250	96,932,700
1911	11,106	299,032	105,269,700
1912	11,210	322,154	88,048,500
1913	10,901	322,002	89,495,000
1914	9,915	289,271	83,261,710
1915	10,340	318,011	97,301,480

General building construction has been on a large scale in the Kenwood and Hyde Park districts on the south side, as well as in the new so-called South Shore section. On the north side Lake View and Rogers Park have seen many improvements, while the same may be said of Ravenswood and other parts of the growing northwest. The outlying western sections have also seen a building boom, and the suburb of Oak Park has witnessed an unprecedented amount of flat building.

Building in the "loop" was conducted on a comparatively limited scale as compared with former years, although permits were taken out for the construction of several fine structures, some of which have been completed.

The most important of these was the Kimball Building, which cost in the neighborhood of \$1,250,000. The new Lyon & Healy Building involved an expenditure of \$650,000, the 20th Century Building \$500,000, and the Y. M. C. A. Hotel, about a mile south of downtown, \$750,000. Other modern structures erected in the "loop" are the addition to the Boston Store, to make room for which the Champlain Building was demolished, and the Cunard Building, on which \$200,000 was spent. Some of these buildings are pictured on the previous page.

The largest permit of the year was for the Chicago and Northwestern elevator in South Chicago, costing \$3,500,000.

The Edgewater Beach Hotel, now in course of construction, will be one of the largest of its kind outside of the business district. It is being erected by the Darling & Eitel Co., Chicago, on a plot of ground on Sheridan Road, facing Lake Michigan, about seven miles from downtown in a northerly direction. A view of it will be found on the first page of this article.

In the construction of the South Shore Country Club, the Armour & Co. oleo building, the Midland Warehouse & Transportation Co. Building, and several more, a dozen in all, the sum of approximately \$3,000,000 was involved. In addition to this sixty-two permits were taken out for apartments, mercantile, manufacturing and school buildings, ranging from \$100,000 to \$200,000.

Low Cost Concrete Houses in Scotland

A housing scheme has been carried out at Renfrew, in Scotland, which is particularly interesting from the fact that the houses have been built of concrete. The architect is an enthusiastic believer in concrete for houses, holding that it is the solution of the cheap housing problem, though he thinks the best method of building with it has yet to be devised. He estimates that he effects a saving of £12 (\$60) on a pair of cottages, and where large numbers are built together the saving is still greater.

The Renfrew houses, according to a London paper, are conveniently planned, and of attractive appearance. The walls are 9 in. thick, including a 2 in. air space. The longitudinal partitions are formed of coke breeze concrete slabs, and the cross partitions are brick. The external walls are rough casted with Portland cement and granite chips.

Officers of American Institute of Architects

At the forty-ninth annual convention of the American Institute of Architects, held in the city of Washington in December, the following officers were chosen for the ensuing year:

President—John L. Mauran of St. Louis.

First Vice-Pres.—C. Grant La Farg of New York City.

Second Vice-Pres.—M. B. Medary, Jr., of Philadelphia.

Secy.—Burt L. Fernner of New York City.

Treas.—D. E. Waid of New York City.

One of the most interesting reports presented was that of the Committee on Contracts and Specifications, which recorded the completion of the new Standard Documents of the Institute and which represent the results of the joint committee of the American Institute of Architects and of the National Association of Builders' Exchanges. In connection with this matter great credit is due to the tact and perseverance of Frank Miles Day, a former president of the institute, and to the committee of which he was the head.

Lumber Exploitation Plans

Realizing the important work accomplished by organizations for the promotion of other materials, the leading lumbermen of San Francisco, representing both California redwood and pine and northern Douglas fir and cedar, have organized the San Francisco Wood Products Association to promote the use of wood in every way possible, to counteract disparaging statements circulated regarding lumber, to maintain a permanent wood-products exhibit in San Francisco and to advertise lumber throughout California as far as possible by lectures, moving pictures and portable exhibits, and to furnish information to the public regarding all Pacific coast wood products. The first work planned is the installation of an elaborate exhibit in the building material exhibit at O'Farrell and Stockton streets.

The West Coast Lumber Manufacturers' Association also is assembling large exhibits of woods of this section to be shown at the various retail lumbermen's conventions during the year

The Economy of the Concrete Mixer

Advantages Which the Builder Doing Concrete Work Cannot Afford to Disregard—Machine vs. Hand Mixing

BY H. COLIN CAMPBELL

IF machine mixing of concrete had accomplished no other end than the elimination of the manual labor of hand mixing, concrete mixers would hold their own without necessity of proving they have other advantages. These have been numerous enough to have almost relegated hand mixing into the past, except where a certain combination of circumstances occasionally makes it advisable to manufacture concrete in

that way. On all extensive concrete construction the material is now mixed by machine, yet under certain conditions hand mixing is necessary and may at times be more economical. To summarize, these may be stated as follows:

Where the quantity is so small as to prohibit the expense of purchasing or renting a mixer.

Where the quantity of concrete is distributed at different places in small quantities so that the labor and expense of moving the mixer frequently would offset the saving otherwise resulting from its use.

And sometimes at the commencement of a large job before all of the equipment has been set up and the work put under way at full speed.

Cost accounting has been kept on many concrete jobs, all of which shows that where the work is of any considerable expense the saving of machine mixing as compared with hand mixing may range anywhere from 25 to 55 cents per cubic yard of con-

ing. To secure full efficiency of a machine, the materials must be measured with more or less definiteness, therefore the concrete is proportioned more nearly as it should be. This, of course, has a marked influence on the uniformity of strength of the resulting concrete. In addition to this, numerous tests have proved that on account of more uni-

Some Concrete Boxes Designed for the Reception of Ashes and Garbage

form proportioning, which in a measure is compelled by the machine mixer, and the thoroughness of mechanical intermixing of materials, the strength of machine-mixed concrete is from 15 to 25 per cent greater than that of the average hand-mixed concrete.

In hand mixing, on account of the carelessness displayed in constructing mixing platforms, there is more or less loss of cement from leaky platforms as the result of the methods by which water is frequently added to the materials when mixing the mass. This loss of cement is rarely or never regained, hence the resulting concrete will be weakened by being robbed of cement which should have been made a part of the mixture; likewise, it is all too common practice for a small quantity of concrete to be mixed on a roughly smoothed area of the ground and considerable earth is then taken up with the materials, either while mixing or when shoveling into barrows for placing. Not only is there a loss of cement, and adulteration from foreign materials from such indifferent methods of mixing, but there is also a loss of water which is absorbed by the ground or which leaks from the mixing platform.

Choice between machine and hand mixing depends largely upon the nature of the work in which the contractor is engaged. On small relatively unimportant jobs, especially where the builder uses concrete only at wide intervals, it is not ordinarily much cheaper nor more efficient to mix concrete by

A Small Portable Concrete Mixer in Use in Connection with a Suburban Job

crete. It requires but little figuring to show how soon such a saving can be made to absorb the cost of one of the small or medium-sized mixers at least, which are now the types popular with the average building contractor.

Machine mixing eliminates much of the guesswork that is sometimes too common in hand mix-

machine. Usually economies are in favor of hand mixing under such conditions. This is more specially true where only a small crew is engaged on the work, say from three to four men, and the concrete is placed in scattered positions where necessity would compel moving the mixer about from place to place. Only a few years ago there were many engineers and contractors who regarded me-

The Economy of the Concrete Mixer—A Small Pool Built of Concrete

chanical mixing of concrete as a dangerous proposition, one that was likely to result in a weakening rather than an increase in strength of the resulting concrete. Such an attitude can perhaps be partly understood when we realize that practically all innovations along similar lines have met with like objection on the part of those who could not foresee the result of any departure from common practice; that is, they regarded all innovations in the light of danger rather than benefit. To-day, however, the superiority of the mixer has been proved and it has become an indispensable adjunct to construction. Even in those cases mentioned where it seems that hand mixing shows greater economy, there is no question but that the resulting concrete is not so good as it might be, if mixed by machine. Mixer manufacturers have brought out machines in great variety. The small mixers, of admirable design and low price, fall within the range of any contractor's requirements and purse.

The small mixer is particularly adapted to concrete house and small building construction, sidewalk work, and being constructed, as it nowadays is—as a unit complete with gasoline engine for its operation—it can often be made to serve admirably where one would sometimes be inclined to think a larger class or type of machine would better serve the purpose.

As to the best type of machine for any one to choose to meet his individual requirements, this cannot be answered in a word. Regardless of how small the builder's field of operation may be, he certainly wants a machine having a capacity that permits making no smaller than one-sack batches. This prevents the necessity of breaking sacks and measuring fractional parts of cubic foot of cement, since the 94-lb. cement sack is regarded as 1 cu. ft. in proportioning concrete mixtures by volume. Therefore, greater capacity, if desired, will be determined by the size of the gang to be served and the required speed of construction.

In mixing concrete in the proportions of 1:2:3,

6 cu. ft. of loose materials are required for a one-bag batch, while in a leaner mixture such as at 1:3:5, 9 cu. ft. of loose materials are put into the mixture. This bulk, of course, becomes less when the materials begin to combine as the result of mixing, but the drum capacity should be such that when the desired quantity of materials has been placed in it preparatory to mixing, the drum will not be more than one-third full. This is quite essential to best results in mixing.

Many carpenter-contractors and builders have no doubt often refused to take the concrete portion of the job on which they were working, simply because of lacking means to machine-mix concrete. Profit on concrete work is just as good as profit on other building work and considering the fact that medium-sized mixers are now sold for such relatively low prices, only a few concrete jobs are necessary to cause profits on foundation, floor, and similar work to absorb the cost of an outfit.

Concrete mixers have been and often can be profitably made to serve the purpose for which not primarily intended. Many have found the machine mixer of advantage in washing aggregates that were unfit for use because of clay coating or foreign materials and have dumped the aggregates into the drum, added water in excess and operated the machine in the usual way, thus making available otherwise unsuitable aggregates. Some mixers have been advantageously employed for mixing mortar as well as concrete.

With the exceptions mentioned, every feature of the machine mixer is in its favor as compared with the slow and laborious process of hand mixing. Even farmers who have little concrete work to do by comparison with the actively engaged building contractor have in many instances found it not only advantageous but profitable to purchase some one of the small types of hand or machine-operated mixer, so that they might mix better concrete, with

A Job of Concrete Work on the Farm. The Wire Reinforcement in Place

less labor and greater economy. Also, dealers in building materials have recognized the popular rural demands for concrete mixers and many such dealers have bought one or several mixers for rental purposes exclusively, and in some cases have found these a direct double source of revenue, in that they attract cement purchasers to their place because the necessary equipment for mixing concrete can also be obtained on reasonable terms.

The Modern Plank Frame Farm Barn

The Foundation Walls, Which Are of Concrete, Extend 2 Ft. Above the Grade Line

BY W. E. FRUDDEN

ONE of the systems of barn framing which is proving very popular in many of the agricultural districts of the country is that involving the use of planks instead of large timbers, and known as plank frame construction. It is easy to erect, offers a maximum of mow space and is economical in the use of building materials. There are hundreds of farmers who have found this type of framing best adapted to their needs.

The standard barn width, namely 36 ft. has been considered in this article, but the length of barn can be made to suit the particular needs of the farm. The foundation walls are of concrete 12 in. thick and extend 2 ft. above the grade line so that the soil moisture will not rot out the wood sills. The concrete walls can be tapered to 8 in. at the top, if desired, or in case hollow clay or cement blocks are available at a reasonable price, they may be used to advantage.

The studding sills, plates and rafters are of 2 x 6 in. material. The sills are doubled and anchored to the wall every 6 ft. The studding, rafters and floor joists are spaced 2 ft. center to center throughout the whole length of the barn. The floor

joists are 2 x 12 in. and are supported by center girders which are built-up, being made from four 12-in. planks spiked together and supported by 5 in. steel columns or 6 x 6 in. posts spaced conveniently in the first floor. Each roof arch is braced down to the mow floor and bolted at the joint. The floor joists are lapped over the girders and well spiked together so as to be a continuous tie across the barn and thereby take up the outward thrust of it.

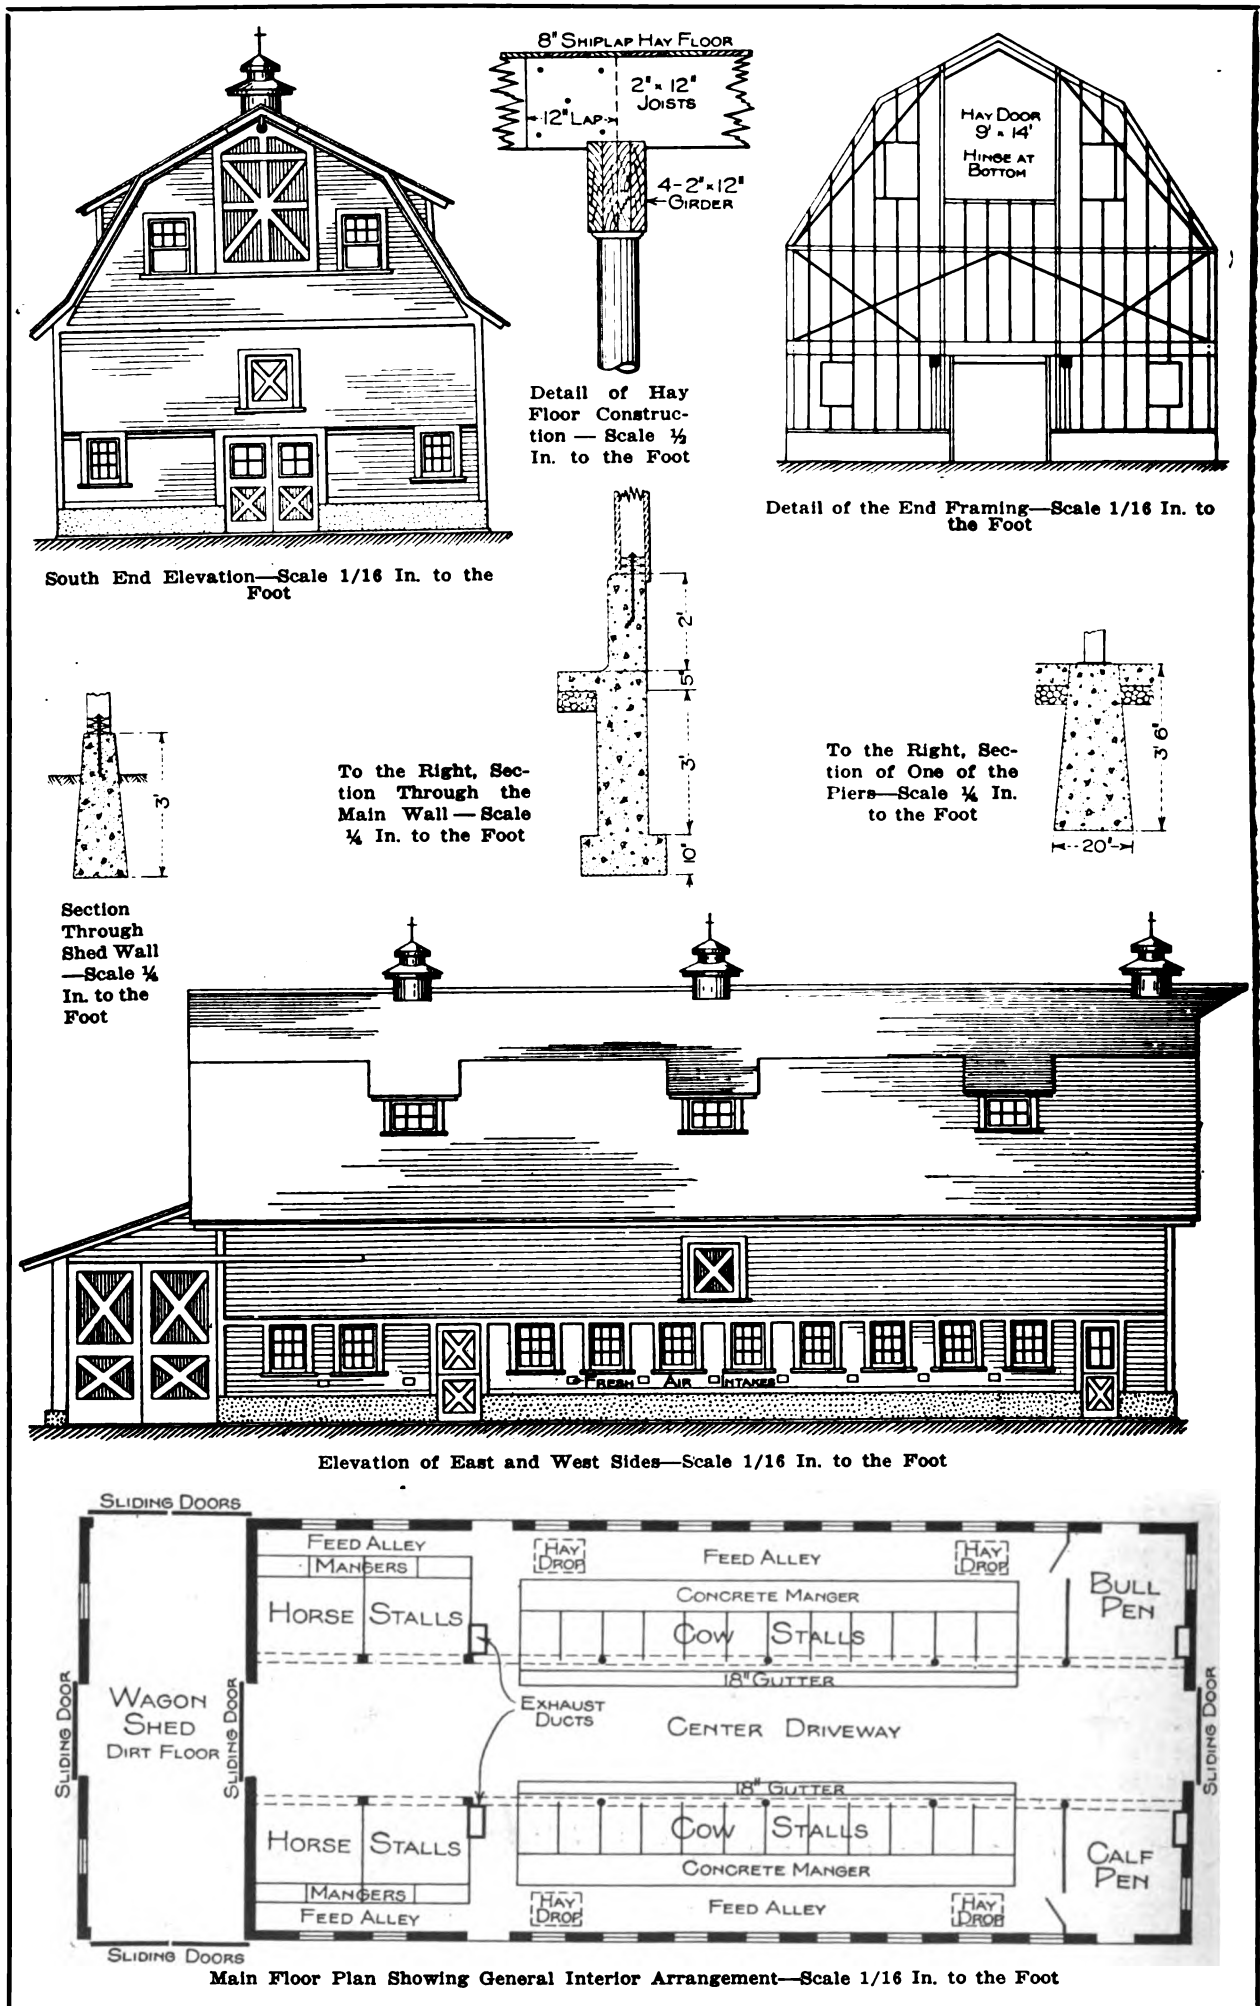

In what follows describes the different steps as they are taken up by the contractor in the building of this type of a farm barn:

The side walls, which are framed out of 2 x 6 in. material, are commonly made from 16 ft. lumber, as shown in the cross sections. The framing is best if done before it is raised into position. The double 2 x 6 in. sill is

A 36 x 80-Ft. Barn Showing the Roof Bents Being Placed in Position

spiked to the bottom of the studs and another double 2 x 6 to the top for the plate. The 6-in. rib plate which serves as a bearing for the hay mow joists are notched 1 in. into the inside face of the studding. Frame out for the windows, doors and vent shafts and then bore holes through the sill for the anchor bolts which have been set 6 ft. on centers in the solid masonry walls of the barn.

The Modern Plank Frame Farm Barn—Plan, Elevation and Various Details of Construction

For long barns, the side walls are raised in several sections.

In the same manner as the side walls, the ends are framed and raised into position and set plumb and well braced against wind. A double 2 x 10-in. plate instead of 6-in. will be preferable for the end walls.

The two continuous girders are built up four-ply on top of the supporting columns which have been set in their proper places. In the building of the girders, the 12-in. planks are so placed that no two end butt joints will come at the same place in the completed girder. The girders are set straight and level and so that the floor joists will be dapped about 2 in.

The outward end of the joists are bolted to the studding. The center span of the joists are of 14 ft. lumber and the sides of 12 ft. lumber, and since the girders are 12 ft. apart there will be a 1-ft. lap of joists over each girder, which are well spiked with 16d. spikes, which will just go through the two timbers. There may be cases where all 12-ft. joists are to be used where they will butt together over the girders, in which case it will be necessary that this joint be well tied together with a 1 x 8-in. cleat on both sides of the joists.

Bridging the joists means that the loads will be evenly distributed over the floor. One by four-inch material is used for this work and nailed into position as soon as the joists are set true and plumb.

The Plank Frame Barn Showing the Roof Bents or Arches in Place

The gable end framing is clearly shown in the details. The ends are braced securely with strong plank, and diagonal braces which are not shown run from the side plate to the end wall plate as an added stiffener for the end of the barn. The studding on both sides of the hay door are doubled and in many cases are braced down to the floor.

Now that all the side and end walls have been erected and the floor joists set, they may be covered with the regular siding and flooring lumber that is to be used. This will tend to stiffen that part of the frame that is already up. The siding best used is the

common 6-in. or 8-in. pine drop siding which is double nailed to each studding. The floor joists are covered usually with a 10-in. wide yellow pine ship-lap lumber.

Inside View of the Framework Showing the Temporary Working Platform

The mow floor is a good level place for the building of the roof trusses. For a barn of this type, there is required for each roof arch, four rafters, two of which are 12 ft. long and the others 16 ft., the four 8-in. boards for braces 12 ft. long, as there will be two at each hip joint. At the ridge there is required a short piece of 2 x 6-in. material for a collar beam and short pieces of boards for cleats and an 8-in. plank for a strut, so as to make a tight and solid joint.

All arches are built up on the mow floor before being hoisted into position. This insures the builder that they will all be alike and of exactly the same contour. The use of crooked rafters will

prove to be a very uneven roof. When the arches are hoisted by means of a block and tackle from the end arch they are set directly over the studding or on 2-ft. centers with the lower rafters resting on the side wall plate, and securely nailed to it. Allow the sheathing boards to project from the gable so as to hold the arch in position as fast as they are being raised. Break the sheathing joints so as to make a continuous tie for the entire length of the barn.

From the center of the lower rafters 2 x 6-in braces run to the inter-section of the studding and the floor joists, and are held firmly in place there by a 1/2-in bolt. At the plate 1 x 8-in. cleats, doubled, run out to the brace to act as a stiffener.

inches is the greatest thickness, 12 in. is the greatest width and 6 ft. is the longest timber required in the entire barn frame. No special sizes or extra long, heavy timbers are to go into the frame. All can be secured of any lumber dealer's stock in section of the Corn Belt. The kinds of covering which is common have been listed in the bill of materials which follow:

As a basis for estimate, a 14-ft. section of the 36-ft. wide barn has been taken. To compute the amounts of materials required and a general idea as to the cost of them multiply the amounts listed below by the number of times that 14 is contained in the length of barn wanted. For example: Take

A Modern Plank Frame Farm Barn—Various Details of Construction

This completes the arch from floor to floor. In case all joints have been made to fit properly in this barn frame, the roof arch or the side walls will not spread or be forced out of position. Good workmanship, good materials and good judgment used in the building will give as a result a barn that will be serviceable and one that will last the farmers for years. In case wider barns are necessary, this design will not hold good, but sizes of timbers and braces must be increased accordingly.

A factor which strongly recommends this barn design is that small timbers alone are needed. Two

a 70-ft. barn—requires five times the materials for a 14-ft. section; then add to this amount that which will be required for the two ends of the barn as has been listed below. The total cost of the barn can be roughly estimated by adding to the costs of materials as listed about 50 per cent to cover barn equipment, labor, windows, doors, hardware and paint. An estimate of several of this type of barns has developed the fact that they will cost in the neighborhood of about \$1 per square foot of the floor; such barns, however, are elaborately equipped. The matter of prices, of course, cannot

be treated satisfactorily, so that it will meet all farmers' conditions.

The illustrations relate to the farm barn of E. M. Sherman in Emmet County, Iowa, and the drawings were prepared by the author.

The Quantity System of Estimating

We are in receipt of the following announcement from G. Alexander Wright of San Francisco, Cal., who was the pioneer in this country in the movement in aid of the quantity system and better contract methods:

"The movement urging the adoption of the quantity system in the United States was commenced in San Francisco early in 1891. This movement has continued down to the present time. Its object has never been, and is not, to profit financially, but to promote better contracting methods between owner and contractor, solely because they are better. Neither the movement nor its promoter indorses any firm or individual, as is commonly supposed, or suggested.

"Considerable interest has been aroused in the United States as a direct result of these long continued efforts. Much of an educational value has been accomplished. Those, however, who have the future adoption of the quantity system really at heart (and not because of the business it may bring them) realize that much more preliminary and gratuitous work must be done before the advantages of the quantity system can be fully understood and appreciated by contractors and owners.

"Unfortunately, however, as is so often the case (when likely-looking prospects appear upon the business horizon), the commercial spirit, the dollar desire which cannot wait, has been aroused, and we already have business enterprises advertising their

Note—No bill of quantities should be regarded as acceptable which contains any clause making it the duty of a bidder to refer back to the drawings and specifications concerning quantity. All such clauses are against the bidder, and they impose a responsibility upon him which he should not accept, and which may be construed as constituting a condition precedent to his bidding.

wares, their material lists, or what not, from a few dollars up. Then, again, during the last year or two there have sprung up, principally in our larger Eastern cities, certain self-styled exponents of the quantity system, some of whom, it is safe to say, have no practical experience of the quantity system, and herein lies a danger before us.

"It therefore behooves the conservative admirers or advocates of the quantity system to mark time and not be too ready, at least for the present, to allow the use of their names as advocates of the immature, faulty and varying methods adopted by firms, bureaus or individuals who, to get business, are far too ready to make claims for their so-called lists, quantity surveys, unit items or whatever name the promoters invent to attract customers. It is sufficient to say that such methods are not those of persons educated in the practical operation of the quantity system, and which is the only standard method which possesses any advantage over the contracting practices of to-day. The 'quantity system' is the proper term to use, and it possesses a greater significance than anything else."

San Francisco Masons and Builders Meet

At a meeting on Jan. 3, the Masons' and Builders' Association of San Francisco elected officers for the ensuing year as follows: Emil Hogberg, president; E. S. Rainey, first vice-president; Alonzo Reed, second vice-president; William S. Scott, secretary, and J. E. Brennan, treasurer.

The following directors were also elected: Thomas J. Campbell, W. A. Rainey, A. W. Lawson, J. J. Butler and N. Larsen.

The arbitration committee includes Jerome Collins, Thomas F. Mulcahy and William S. Scott.

Giant Trees of Sequoia

In one of the National parks of the country there are more than a million monstrous Sequoia trees, one of which is known to have sprouted 3200 years ago and has lived through written history. It is said that 3000 fence posts, sufficient to support a wire fence around 8000 or 9000 acres, have been made from one of these giants, and that was only the first step toward using its huge carcass. The second item of its product was 65,000 shingles—enough to cover the roofs of seventy or eighty houses. Finally, there still remained hundreds of cords of firewood which no one could use, because of the expense of hauling it out of the mountains.

These trees are found in the Sequoia National Park, which was created for the use and pleasure of the people of the United States, and constitutes the greatest groves of the oldest, the biggest and the most remarkable trees in the world. They number 1,166,000, and of these 12,000 are more than 10 ft. in diameter. The highest known is the Dalton, which is 292 ft. in height and 27 ft. in diameter. Most celebrated of all, however, is the General Sherman tree, 279.9 ft. in height and having a diameter of 36½ ft. The base circumference is 102.8 ft. and the circumference 6 ft. above the ground is 86 ft., while the diameter 100 ft. above the ground is 17.7 ft.

The Molded Concrete House of Today

Some Carefully Prepared Figures of Cost with a Brief Description of a Small Concrete House

BY MILTON DANA MORRILL

THE progressive builder realizes to-day the increasing demand for more permanent houses and he is constantly on the lookout to improve his materials and methods of construction. Heretofore the higher cost of permanent houses has been the most serious obstacle encountered, and it will perhaps be of interest to readers of *THE BUILDING AGE* to give a short description and carefully made cost data of a small house of molded concrete lately built near Washington, D. C., showing

walks and to-day it has largely supplanted other materials for this purpose. It then came into use for foundations and basement walls, and is fast supplanting other materials in this work. In the last few years concrete has been used more and more for wall construction and is "making good," with the prospect of a much more general use in the near future, as builders and the public learn to know it better.

Concrete must be "mixed with brains," and there

General Appearance of a Small Concrete House Recently Erected Near Washington, D. C.

the possibilities offered the builder by the use of this type of construction.

It is useless to claim that this or any other type of permanent building can be put up for less than the cheap frame house, but where "the best and cheapest in the end" is sought, there molded concrete comes in for consideration, and at a cost which is in no way prohibitive wherever average building conditions prevail.

We have all watched the adoption of concrete grow in its many present uses. Only a few years ago it began to take the place of flagstones for side-

is nothing more misleading than the general impression prevalent that care and skill are not necessary in concrete work. On the other hand, while molded concrete is one of the easiest building materials to use it must be "done right the first time" if a workmanlike job is to result. The very permanent character of this work which is perhaps its greatest advantage makes it difficult, if not impossible, to undo what has been once completed. Mistakes, therefore, are expensive.

The house here illustrated represents one of the latest designs for the molded type and is the first

of a group of six to be built from the same floor plan, but with roofs of different shapes, in order to get away from the monotonous effect produced by rows of houses of the same design.

The cottage is compact in arrangement, and is planned to give a generous house, although of small dimensions.

A cellar extends under the whole house, the earth excavated being used to make a grass terrace on all sides. A hot air furnace is installed in the cellar and the bath and kitchen sink are connected for hot and cold water.

In the first story is a small porch arranged to be screened in during the summer and inclosed in glass in winter. This opens directly into the living room, where the alcove hall, screened by a curtain, affords entrance to the bath and bedrooms without taking any excess of space. The dining and living rooms are practically one, so that a generous appearance is given to both. On the second floor are two good-

and over again for several years, and are counted in by the builder as permanent equipment.

Some Figures of Cost

The following figures of cost of various parts of the work are likely to prove of general interest.

Material;

Lime, cement and reinforcing rods delivered	\$62.35	
Cinders	5.00	
Hardware	32.14	
Sand delivered	17.50	
Terra cotta flue lining	5.35	
Vulcanite roofing and siding	75.86	
Two white-wash brushes at 50c	1.00	
Lumber, etc.	448.48	
Two ventilators for gables at 50c	1.00	
Mirror for bath room	2.25	
Beaver board	96.83	\$746.76

Drayage;

Drayage of cinders	\$9.00	
Drayage of plates	1.00	
Drayage of returning cement sacks	0.50	10.50

Common labor;

Excavating, including team	\$10.00	
Labor erecting walls, etc.	111.00	
Labor grading and sodding lawn and finishing cellar	15.87	
Labor digging sewerage cistern and applying cover	34.00	170.87

The Molded Concrete House of To-day—Floor Plans—Scale 1/16 In. to the Foot

sized bedrooms with ample closets and store rooms.

The walls are of reinforced concrete, 4 in. thick, in which are embedded small wood blocks to receive the wood furring strips so that an air space is created between the concrete and the plaster or wall board that may be used. This construction makes an exceptionally warm, dry house.

The walls were molded in steel forms so that a wet mixture could be used giving an excellent bond with the reinforcing rods which were run both horizontally and vertically, as is necessary in thin walls. The steel forms leave a smooth surface, which is covered with a thin coat of cement stucco. This may be left rough or smooth, and tinted as desired, giving an excellent finish at small expense.

The construction of molded concrete houses is a simple process as is shown by the picture taken while the molds were being filled, and the only equipment necessary are the steel molds, which, being practically indestructible, can be used over

Contracts;

Supervision of concrete work	\$25.00	
Carpenter work on house	300.00	
Carpenter work on porch	15.00	340.00

Sub-contracts, including labor and material;

Plumbing	\$184.75	
Heating plant	73.00	
Painting	100.00	
Lighting	26.00	383.75

Skilled labor not specified in contracts;

Placing ventilators in gables	\$5.00	5.00
---	--------	------

Total	\$1657.88	
Less credit for returning 100 cement sacks	10.00	
Total	\$1647.88	
Extra work not included in contracts	30.00	
Total	\$1677.88	

The substantial character and the attractive appearance of the molded concrete houses make a striking contrast with the usual frame dwellings and the saving in paint and up-keep is a factor which the home owner cannot profitably disregard.

Construction of the Garage

Perhaps no industrial development has eclipsed the manufacture of automobiles in this country during the past few years. The output has reached millions and is increasing annually. The housing

practically a standard interior size for the one-car garage, and 23 x 24 ft. for the two-car type. Even if the car is below the average measurement it is wise to allow for contingencies.

The material of which the garage is to be built might properly match the house, but the desirability of fireproof construction, masonry or hollow tile with stucco finish, whose first cost is not much greater than that of wood should be considered. For the finish of the interior the masonry or tile will require only a coat of rough plaster, while if it is found necessary to build of shingle or sheathing on studding, an interior lining of sheet metal is probably the best and safest finish. A slate or tile roof is to be preferred to one of shingles for purposes of fire protection. Cement laid on concrete foundation makes a desirable floor. It should be laid with a slight slope, say $\frac{1}{4}$ in. to the foot, sloping to a 3-in. center drain. A help in keeping clean the floor of the garage is to carry up the cement against the wall

The Molded Concrete House of Today—A Rear View of the House Shown on the First Page of This Article

of these machines has widened to almost the same degree. The city flat dweller must perforce keep his car at the commercially conducted garage, but the town or country owner—and most of the machines are now going to the country—must provide his own shelter. The private garage, at first the ornate accessory of the country mansion, is now the usual accompaniment of the moderate sized dwelling and has descended to the purview of the most modest young architect. Its proper construction concerns him intimately.

It is argued by architects generally, says an Eastern newspaper, that the initial cost of constructing a two-car type of garage is only slightly larger when contrasted with that of a one-car building, while the additional room gained affords the convenience of putting up a visitor's car over night or anticipates the almost inevitable acquisition of a second car. The farther away one lives in the country and the greater the distance to a public garage, the more weight these arguments will probably have.

The standard width of automobiles varies little from 6 ft. 6 in., taking an over all measurement. The length is more variable, with 18 ft. as a maximum and 15 ft. as an average. If a clear space of 3 ft. is allowed around the car, which is none too much, and slightly more room is allowed in the rear for the space occupied by work bench and lockers, 13 x 24 ft. becomes

to form a base 12 in. high, finishing with a rounded corner at the junction of wall and floor, thus leaving no difficult corner to clean. In the more elaborate garages the floor is sometimes made of 12 in. square quarry tile with a glazed tile wall wainscot.

Both swinging and sliding doors are in use, with advantage both ways. A small door for entering is desirable and excessive window space cannot well be provided, since light is needed at the work bench. Heating is also to be desired to preserve an equable

The Concrete Work in Progress, Showing the Steel Forms in Position

temperature in cold weather. When the garage is within close distance of the house it is sometimes possible to run a line of steam pipes in a well protected conduit to the garage and thus provide a simple solution of the heating problem.

A Cement-Coated Country House

Foundations Are of Concrete, the Walls
of Brick or Tile and the Roof of Shingles

THE subject of our colored supplemental plate this month is a country house of pleasing exterior and with roof lines so broken as to present a rather striking effect. The gables are finished in half timber with stucco in the panels. The picture affords an excellent idea of the architect's conception of the design while the plans, elevations and miscellaneous details upon the two pages which follow these comments clearly indicate the interior arrangement and the more important details of construction.

Layout of the Rooms

An inspection of the floor plans shows a commodious living room with open fireplace, a dining room well lighted at the side and rear and a kitchen which is so placed as to enable one to reach the front door without the necessity of passing through any other room. There is a commodious kitchen pantry and also a pot closet which, if necessary, might accommodate the refrigerator. A small door might be cut in the wall between it and the rear porch, so that it could be iced from the outside. The sink is well lighted, being placed under the double window at the side. The cellar is reached by means of a flight of stairs leading directly from the kitchen and running under the main stairs which rise from the hall.

On the second floor are four bed rooms and bath room, the position of the latter being somewhat unique. In the attic is ample storage room and also one bed room.

According to the architect's specifications, the foundations are to be of concrete, the first story main walls of brick or hollow tile, according to preference and covered with a stucco-finish. The trim around the windows, porch arches, etc., is to be tapestry brick. The second story also calls for trim of terra cotta with half timber effect and three coats of pebble-dash stucco finish the same tone as the first story walls. The roof is to be covered with shingles. The finish of the stucco is to be dark gray and the trim to be dark brown.

The Cellar

The cellar is to be excavated to the necessary depth to give a height of 7 ft. in the clear. The concrete foundations are to rest upon a footing course of concrete 12 in. thick and project 6 in. on both sides. All piers are to rest on footings 4 ft. below the ground.

The first and second floor beams are to be of 3 x 10-in. yellow pine and the rafters 2 x 8-in. yellow pine, all placed 16 in. on centers. The par-

tion studs are to be 2 x 4 in. also placed 16 in. on centers, and doubled at all openings. The floors are to be of tongued and grooved maple, and the trim to be of a plain neat pattern with no base blocks. The kitchen is to be wainscoted with ceiling stuff 4 ft. 6 in. above the floor level. The sash are to be double hung and the lights are to be divided as shown on the elevations. The main stairway, balusters, rails, panelling, seat, etc., are to be of hard wood.

The Plastering

The plastering throughout is to be three-coat work with hard white finish. If brick are used for the exterior main walls they are to be furred out to receive lath for plastering.

The bath room is to have a tile floor and base 8 in. high and the living room mantel hearth is to be of square tile.

The house is to be piped for gas and wired for electric fixtures, the latter to be of the combination pattern, of the latest design. There are to be wall outlets for bed rooms and ceiling drops for the living and dining rooms.

The house is to be piped for the plumbing fixtures and have 4-in. run trap and fresh air inlet at the front of the cellar. The main vent lines are to be of 3-in. cast-iron pipe and the branch vents are to be of 2-in. cast iron. The main soil pipe is to be 4 in. and the branches to the tubs and sink, etc., to be 2 in. All fixtures are to be porcelain enameled iron of the latest type.

The house is to be heated by hot water with registers placed under the windows in all rooms, the apparatus to be of sufficient capacity to heat the interior to 70 deg. in zero weather. All pipes and registers which are exposed are to be bronzed.

The Finish of the Trim

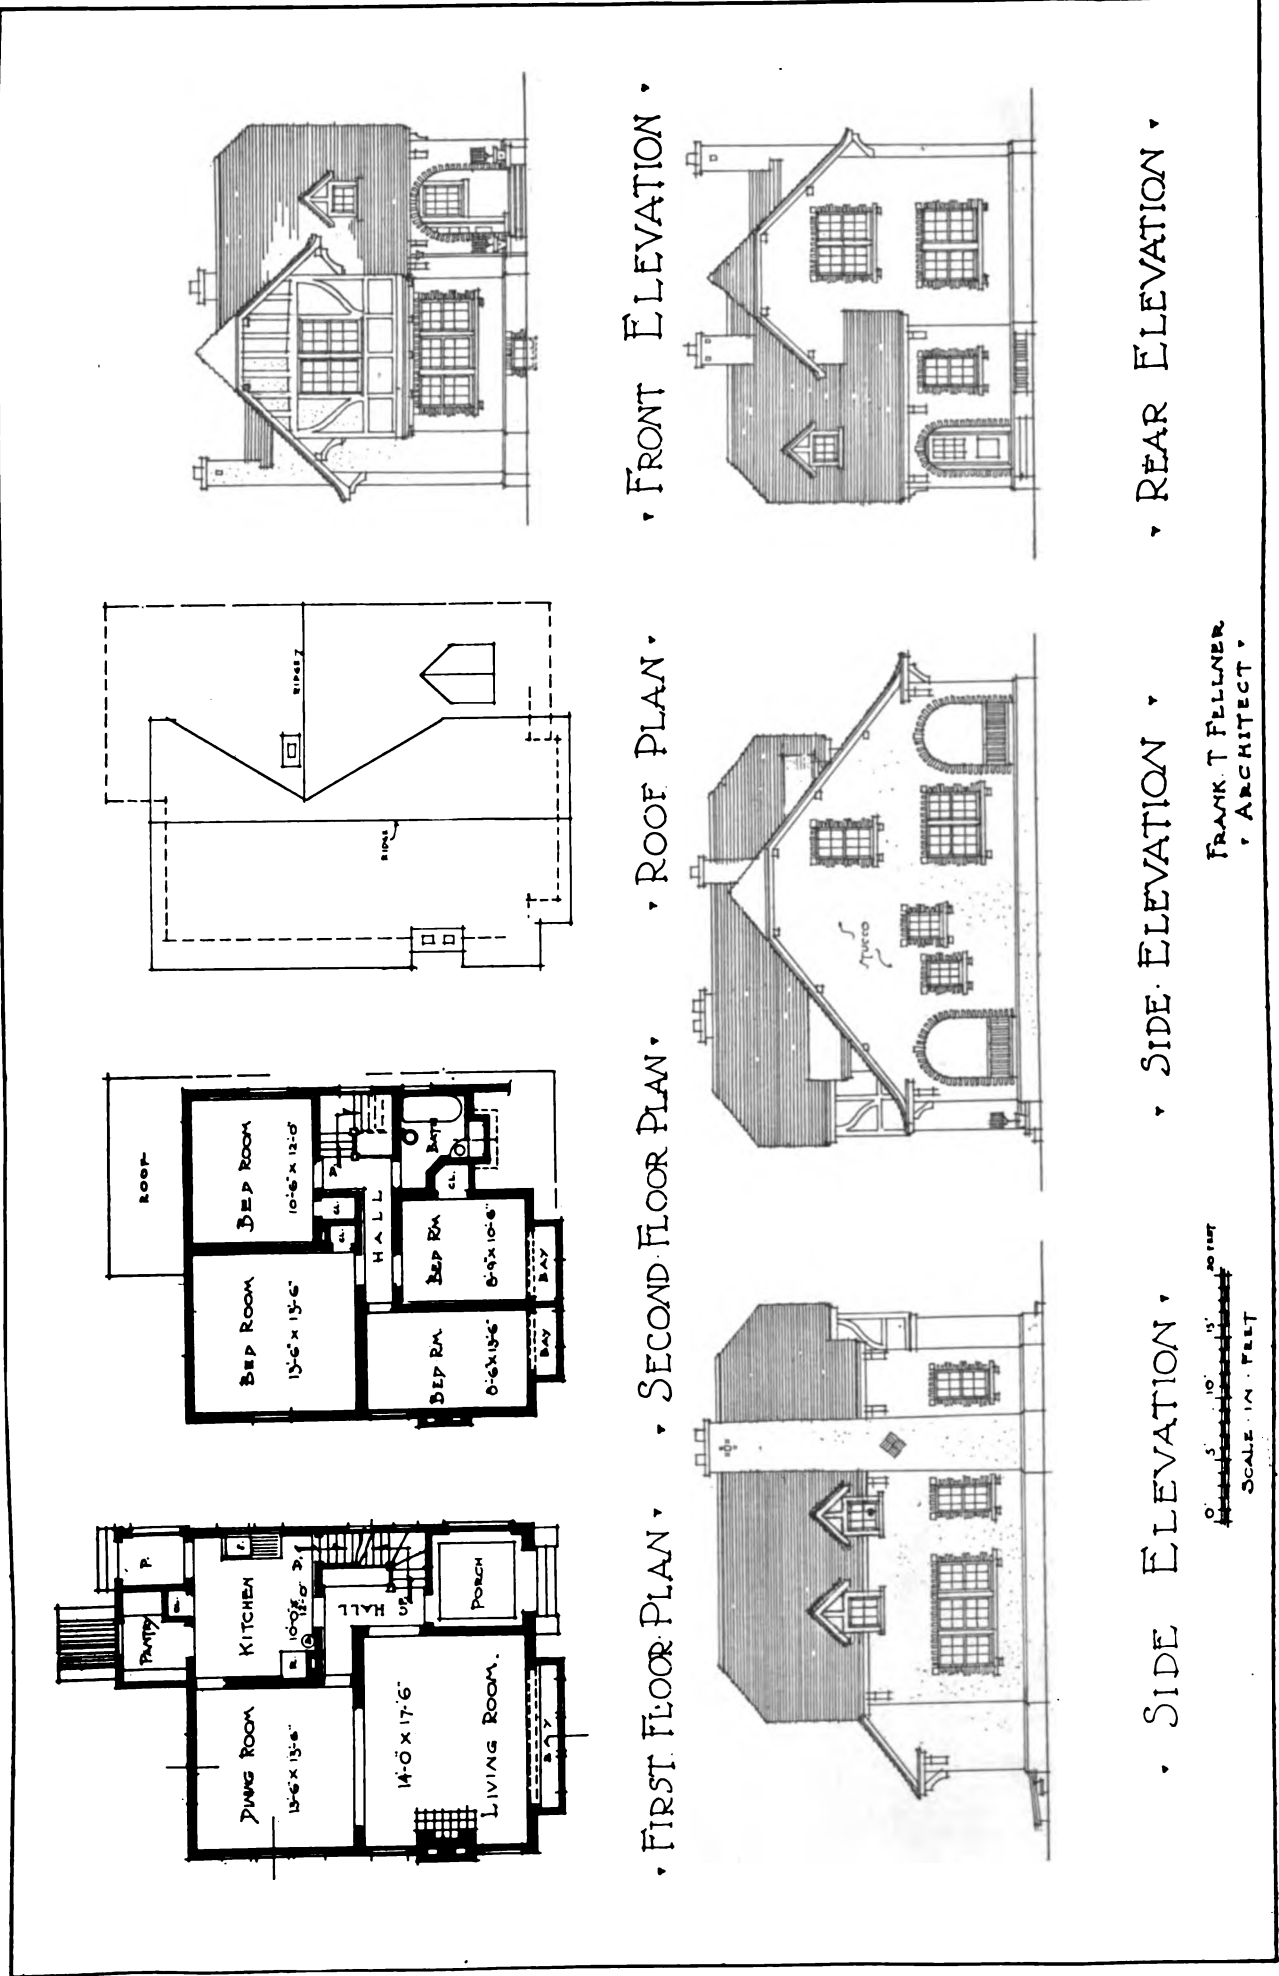

All exterior trim and woodwork are to receive three coats of dark brown paint. The doors are to be varnished. All inside trim is to be filled and varnished and the floors are to be varnished. The roof shingles are to be dipped in Cabot's stain before being laid.

All ridges, valleys, hips, etc., are to be flashed with tin, painted both sides before laying. The gutters and leaders are to be of galvanized iron. The gutters are to be hung with adjustable hangers graded to the leaders which are to be of 3-in. diameter.

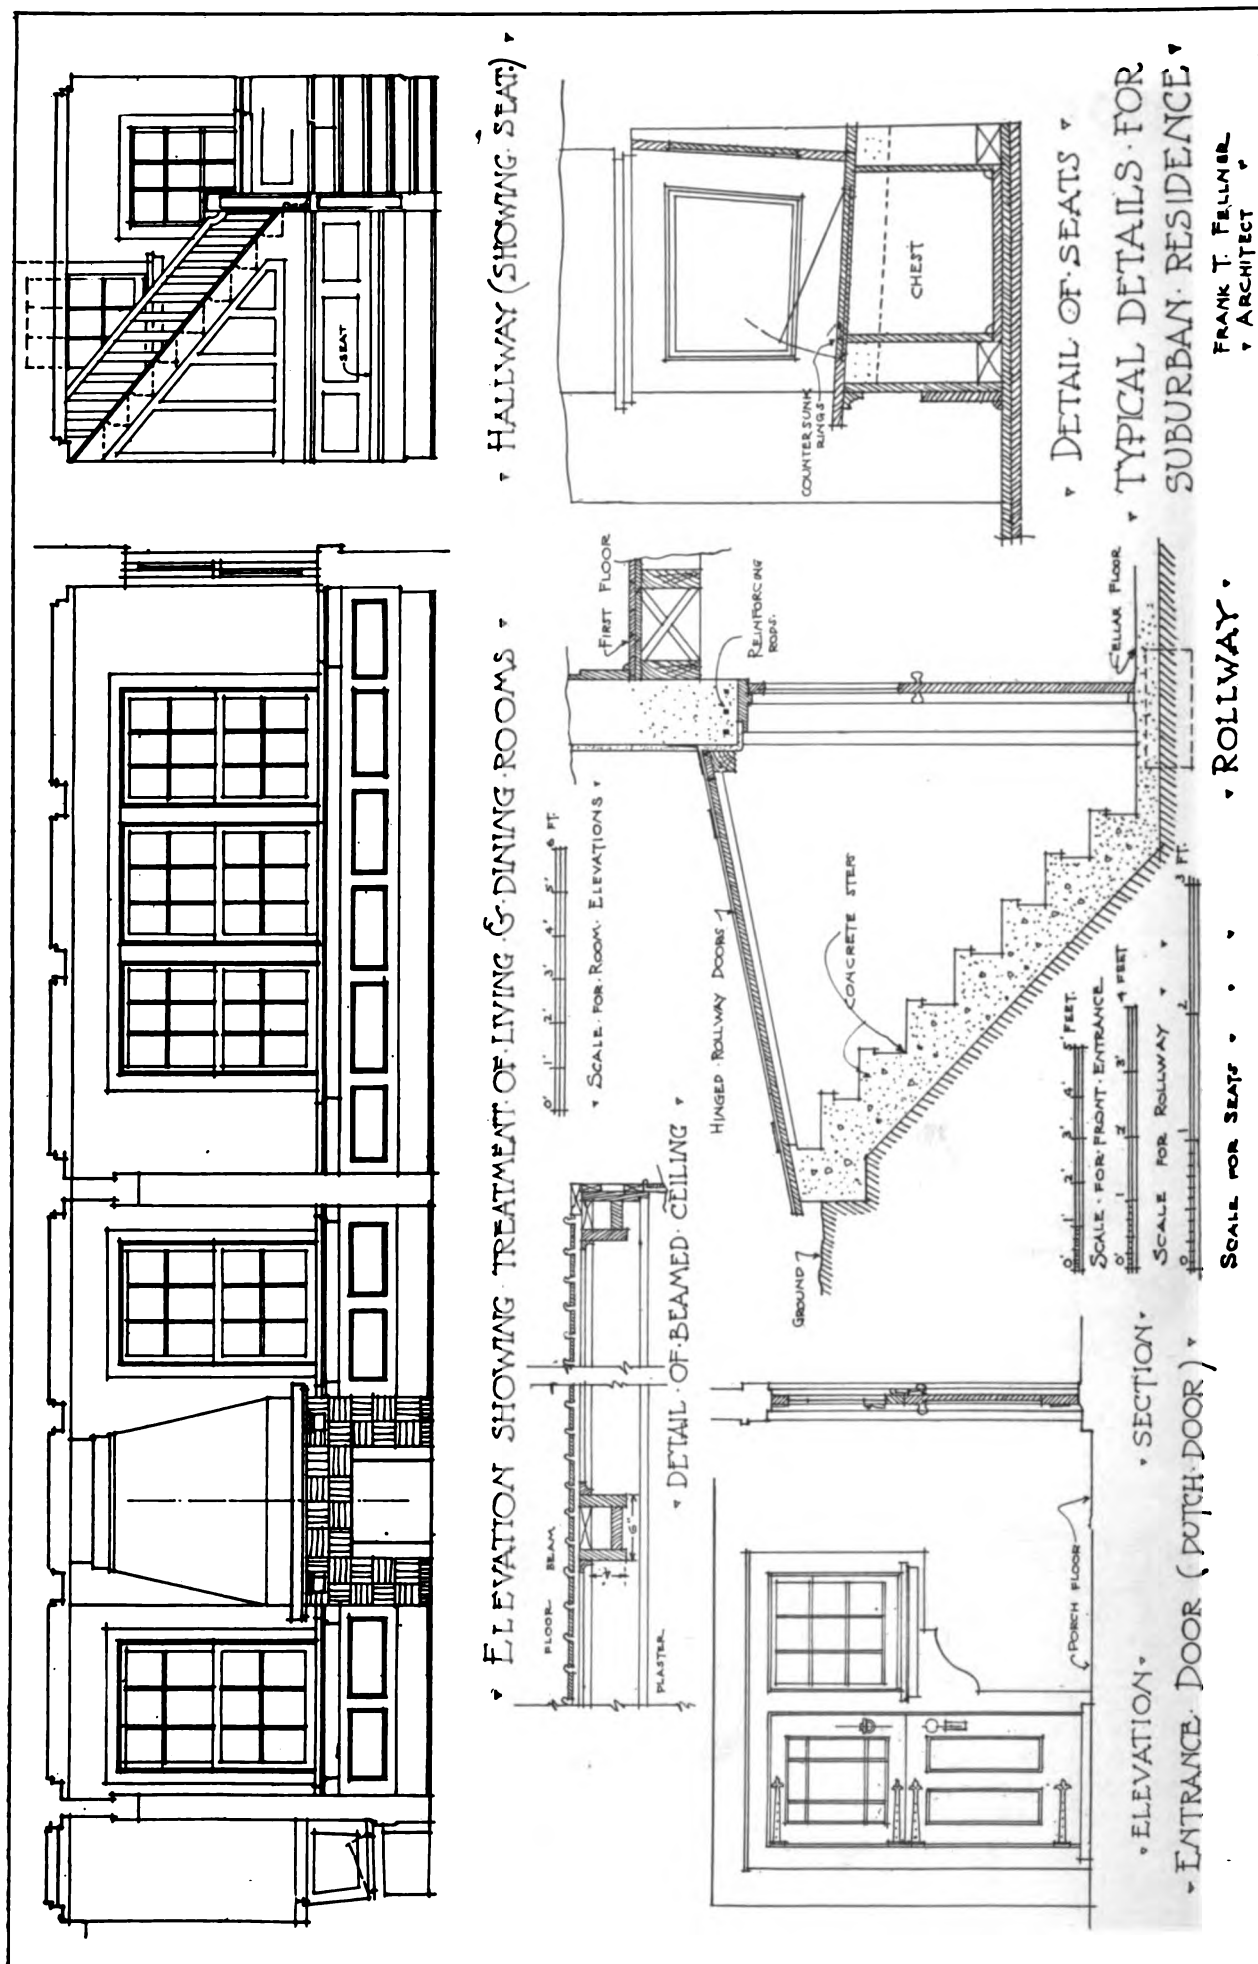

The architect estimates the cubic content of the house to be 29,625 cu. ft. and figures the cost on the basis of a unit price of 16c. per cubic foot.

The country house here described was designed by Architect Frank T. Fellner, 413 Caton Avenue, Brooklyn, N. Y., or care of THE BUILDING AGE, 239 West Thirty-ninth Street, New York City.

Important Legal Decisions in 1915

Phases of Building Contracts Adjudicated—Responsibility for Personal Injuries—Rights of Builder's Surety

By A. L. H. STREET

IN addition to decisions affecting the building trades and handed down in 1915 by courts of last resort already referred to in previous issues of *THE BUILDING AGE*, the year was productive of several other important decisions which serve to better establish legal principles which have a peculiar bearing upon those trades. A summary of these additional decisions is presented in what here follows:

In the case of *Metayer vs. Grant*, the Massachusetts Supreme Judicial Court recognized the rule that, in general, it is the duty of an employing builder to furnish a reasonably safe place of work for his employees, considering the nature of the work carried on, but holds that this rule does not comprehend negligent acts of fellow workmen by reason of which the place is rendered unsafe.

A contracting builder is bound to do agreed work in a proper and workmanlike manner regardless of whether there is an express warranty of quality of work in the contract, according to the holding of the Supreme Court of New Jersey in the case of *Mayer Ice Machine & Engineering Company vs. Van Voorhis*. The court said: "We do not mean to say that an express guaranty of work and materials is presumed to have been embodied in the primary contract. But its absence is immaterial; for where the contract fails to so specify, there is an implied agreement that the work shall be done in a proper and workmanlike manner."

Damages for Builder's Delay

Although it is a well-settled rule of law that a clause in a building contract subjecting the builder to a stated penalty for failure to complete the work by a given time will not be enforced by the courts when it is manifest that the actual damages sustained by the owner are much less than the prescribed penalty, the Appellate Term of the New York Supreme Court decided, in the case of *Brooklyn Structural Steel Corporation vs. Lechtman*, that provision for payment of \$10 a day for inexcusable delay in finishing a building, as liquidated damages, will be enforced, notwithstanding there may be no proof of specific damage.

On the question of waiver of the owner's claim of damages, Judge Bijur said:

"The learned judge below was of the opinion that, as defendants had permitted the plaintiff to finish the work after the date originally fixed for completion, this constituted a waiver of the right to recover the amount of damages liquidated by the terms of the contract, even by way of counterclaim. I cannot concur in this view. . . . The acceptance of the work at the delayed day may quite properly be regarded as a waiver or abandonment of any defense to the

action for compensation provided in the contract; but, as said by the Court of Appeals, defendant is merely thereby remitted to a counterclaim for his damages, and in the case at bar these damages are fixed by the very contract upon which plaintiff seeks to recover."

Omission to have oak floors laid in a dwelling-house by the time agreed upon for delivery of the building was held by the Washington Supreme Court to be such default as entitled the owner to claim damages, but that the claim was waived by releasing a mortgage given to secure performance of the contract. (*Colby vs. Interlaken Land Company*.)

On the question of conclusiveness of an architect's decision under a building contract, it was said by the same court:

"Where the parties by their contract constitute an architect, or other named person, an umpire or arbiter, to determine differences which may arise in the performance of the contract, and provide that his determination shall be conclusive, . . . the contract will be upheld as binding upon the parties. In this case, however, the contract does not go that far. It only provides that the completion of the house is to be 'evidenced by a certificate' of the architect. There is nothing in the contract which constitutes the architect an arbiter or umpire to determine differences which may arise in its performance. Neither is there any provision that his determination of such differences shall be final and conclusive upon the parties. A contract should not be construed so as to deny the parties thereto, or either of them, their day in court upon any differences that may arise, unless the contract clearly shows that this was the intent of the parties. Under the contract in the present case, the giving of the architect's certificate would doubtless be *prima facie* evidence of the completion of the building; and its refusal, in the absence of fraud or arbitrary conduct, would likewise be *prima facie* evidence that the building was not completed within the time specified."

But the certificate, under such a contract, is not conclusive on the point.

The courts have often declared that where a public building is authorized by vote of electors at a stated cost, a contractor must take notice of the limitation as to cost and cannot enforce a contract calling for a greater expenditure. It was sought to apply this rule in a suit brought by the builder of a school-house to recover against the school district for extras furnished under his contract. But the Oregon Supreme Court decided (*Rush vs. School District No. 5 of Union County*) that he was entitled to recover; it appearing that his total claim was within the amount authorized at an election, although the school board exceeded that amount by making independent contracts with other contractors for plumbing, heating and ventilating equipment. The court said:

"We conclude that plaintiff's contract was valid at the time it was executed, and that the subsequent action of the board of directors in exceeding the appropriation in other details cannot prevent plaintiff's recovery."

Scope of Compensation Acts

A carpenter casually employed by one not engaged in a building trade is not comprehended by the New York Workmen's Compensation Act, according to the view taken of the Act by the Appellate Division of the New York Supreme Court, in the case of *Bargey vs. Massaro Macaroni Company*.

Plaintiff's husband was employed casually as a carpenter to repair a building for defendant, who was engaged in the macaroni and saloon business, and was killed while doing the work. In dismissing plaintiff's claim to compensation under the Act, the court said:

"I do not believe that he was an employee in a business declared hazardous by the Workmen's Compensation Law. Clearly he was not engaged in the macaroni business, but his sole business was a carpenter. The company was not carrying on the carpenter business, or doing any carpenter work for profit; it was making repairs and improvements upon its real estate and hired a general workman for that purpose. If a man in a business not hazardous employs a carpenter to do some work upon his property, like fixing a window or door, I do not think the person performing the work is an employee engaged in the hazardous business of structural carpentry."

Owner's Liability for Labor and Materials

A North Carolina builder became insolvent while constructing a building under contract with a bank, and it was thereupon agreed that he should complete the work, but that the bank should directly pay for all labor and materials thereafter furnished. Under these circumstances, the Supreme Court of the State held, in the case of Carolina Hardware Company vs. Raleigh Banking & Trust Company, that such agreement on the part of the bank was enforceable by persons furnishing labor and materials, regardless of whether they knew of the agreement when they furnished the materials or

services. By virtue of the bank's promise, the builder ceased to be an independent contractor and became the mere agent of the bank, so far as concerns liability on labor and material claims.

A decision of the Virginia Supreme Court of Appeals recognizes the principle that a contract should be interpreted in the light of any well-established trade custom in the locality which may fairly be presumed to have been known to the parties to the contract, except, of course, that application of a trade custom is excluded by any specific clause of the agreement at variance with it.

As decided by the Kansas Supreme Court, in the case of School District vs. United States Fidelity & Guaranty Company, a guaranty company, insuring the performance of a building contract, is not entitled to insist upon the withholding of the final payment, or that a percentage of the contract price shall be retained until the completion of the building, unless it is specially provided for in the contract with the guaranty company. In any event such company has no right to complain of the time and manner in which payments are made by the owner to the contractor, unless damaged in a material way by a departure from the provisions of the contract and of the obligation which it assumed.

A Concrete Stable with Hollow Walls

A Form of Construction Resulting in a Building That Is Warm in Winter and Cool in Summer

THE picture which we present herewith represents the hollow wall concrete stable with provision for 50 horses, recently erected for the Lederle Laboratories at Pearl River, N. Y., in accordance with the Van Guilder system of construction. The outside of the building consists of

it was not necessary to fur and lath the walls before plastering, and as they contain nothing but concrete and steel they are referred to as absolutely fireproof and perfectly sanitary. The double walls produce an insulation which eliminates all dampness, thus making the stable build-

Hollow-Wall Concrete Stable for Lederle Laboratories, Designed by Architect William E. Austin

two 4-in. concrete walls separated from each other by a continuous air space 2½ in. wide. The walls are tied together across the air space every 2 ft. horizontally, and every 9 in. in height by means of steel wall ties. Both walls are also reinforced by steel wire and rods all around the building every 9 in. high, thus creating a very strong construction. On account of the continuous air space

ing warm in winter and cool in summer and tending to protect the horses against sudden changes of the weather at all seasons. The floor of the stable is concrete and the roof is of tin.

The stable was designed by architect William E. Austin, 46 West Twenty-fourth Street, New York City, and the contract was executed by the Schouler Cement Construction Company of Newark, N. J.

THE HOUSE DURING PROGRESS OF CONSTRUCTION AND BEFORE THE STUCCO FINISH HAD BEEN APPLIED TO THE EXTERIOR

How I Built My Ideal Concrete Home

A Fireproof House Designed by a Layman
Who Had Well-Defined Ideas of His Own

By WILLIAM G. HOAG

IT is the ambition of nearly every man to own a home, whether it be a simple three room cottage located on the outskirts of town or an expensive mansion fronting on the most aristocratic boulevard. It has always been my desire to build homes, not merely houses with roofs on them, but real homes in every sense of the word; homes in which the owners could enjoy themselves the rest of their days without envying the more pretentious dwellings of nearby neighbors or the expensive residences of successful friends. Too many houses I have seen were built simply to sell. Possessing a

conspicuous sameness of design and arrangement, they were entirely void of individuality and in many cases lacked the numerous conveniences so much appreciated by the housewife and which are difficult and expensive to install in a completed house.

After looking through many such houses I wanted more than ever to build some that would be different from the ordinary run; houses that would contain the many, and nowadays necessary, conveniences that make a home livable and at the same time possess a permanency of structure and finish

THE CONCRETE HOME OF MR. HOAG AS IT APPEARED WHEN COMPLETED AND READY FOR OCCUPANCY

often thought of by the buyers only when the alteration and repair bills come in, and lastly houses that would be well built and at the same time sell at moderate prices.

I found with many others that concrete was the coming building material; that its failure to attain a wide degree of popularity in house building was due chiefly to two things—the unattractive appearance of a concrete or cement block wall and the tendency of such walls to become damp and moist on the interior.

Early last year I became interested in a newly patented cement block which is made in a stripper machine. It is rectangular in shape and is made in various lengths and thicknesses, the most practical size being 20 x 4 x 10. The block is also made in quarter, half and three-quarter sizes, and by the

longitudinal rows of vertical ventilating slots" and the "single relatively-deep ventilating channel" which intersects the above-mentioned slots.

A wall built of them affords an ideal surface for stucco. Instead of mortar joints to hide (this takes from $\frac{3}{4}$ to $1\frac{1}{4}$ in. of stucco and even then the joints are apt to show) it has a horizontal key every 4 in. and a vertical key every 20 in.

A stucco material made of cement and crushed marble, granite or stone is of the same nature and possesses the same elements contained in the wall. When the stucco is applied to the wall ($\frac{1}{8}$ in. thick is sufficient) the contraction and expansion of both are the same, thereby doing away entirely with the cracking and separation so commonly found in stucco work. By applying a water-proof stucco to the walls they become frost and moisture proof.

First Floor Plan

Basement Plan

How I Built My Ideal Concrete Home—Floor Plans—Scale 1/16 in. to the Foot

use of different palettes corner blocks can be made. It is described by the inventor as:

"A concrete building block of rectangular formation having on both ends and one horizontal face, a relatively-wide, continuous binder-receiving groove, a longitudinal row of vertical binder receiving openings of less width than said groove into which they open at their upper ends, the block being also formed with two parallel longitudinal rows of vertical ventilating slots located between said row of vertical openings and one side face of the block, said slots of both rows being intersected by a single relatively-deep ventilating channel extending from end to end of the block in its upper horizontal face and the slots in the two rows being arranged in staggered and overlapping relation to provide between them a plurality of connecting necks of relatively small cross-sectional area extending in a longitudinal direction when the block is viewed in plan."

A wall built of these blocks contains a monolithic portion and a hollow portion. The monolithic portion is formed by pouring cement in the "continuous-binder-receiving openings." The hollow portion of the wall is formed by the "two parallel

The air chambers extending around the wall and on either side of the center absorb any moisture or dampness that may penetrate the waterproofed stucco coating. The interior of the walls are free from sweat and require no lathing. A skim brown coat or even the white coat itself can be applied directly to the walls. Interior walls covered with only a thin white coat (sand finish) and decorated in water colors show no signs of dampness. By using a thin coat of stucco on the outside walls and by eliminating the necessity of lathing the inside of these walls, and by putting on only a thin coat of plaster a considerable item of expense in the construction of a house can be materially reduced.

Walls of these blocks are fireproof, and permanent, and when covered by a good stucco look well

for years without requiring expensive patching jobs of cracked stucco or painting every two or three years.

The first house built was a five room bungalow, the basement, as in all the houses built, extending under the entire building. A heavy concrete footing was first put in, then the blocks were laid 5 or 6 ft. high and "poured." No blocks were laid between the joists, but a concrete water table was built around them, having an air chamber corresponding to that in the blocks. The fireplace and the massive columns in front were built of the blocks. The sills and coping were made of cement.

The roof was sheeted solid and covered with building paper and "concrete" shingles, as they

clean, white, dry, plastered laundry with tubs and gas plate.

The bungalow was completed and a "For Sale" sign hung out. Many came and saw, and at least one fine old couple "was conquered." They had lived in rented houses all their lives and decided to spend their declining days in what they called a "real for sure home."

Then a second bungalow was built, similar to the first except that the joists were placed 16 in. on centers and a three-quarter block set in between the joists and sealed up with cement. The water table was then eliminated. This was built for a family who wanted "one like the little bungalow but larger." In addition to a sun room and sleeping

View in the Ideal Concrete Home of Mr. Hoag, Showing Built-in Buffet in Dining Room

are called, were laid. A white waterproofed butter-like stucco material was applied to the walls, including the part below the surface; above the water table fine rock of crushed granite was dashed in with a paddle. The sills, coping and water table were covered with a white float coat containing marble aggregate and the foundation covered with a deep red stucco. The green roof with its broad cornice formed a most attractive setting for the walls and trim of the house and "Edison's dream was realized"—a concrete house, fireproof, practical, permanent, livable and attractive.

A peep into the interior discloses a living room with beamed ceilings, fireplace and built-in seats, a paneled dining room with a massive built-in buffet, a built-in kitchen cabinet and linen closet and a

porch or breakfast room there is a large attic which can readily be converted into two bedrooms.

As these two bungalows were being built and made into homes the ambition of the writer to build the cottage of his dreams grew stronger and could not be satisfied until the dirt began to fly from the carefully selected spot chosen for the site.

The lot, 100 x 150, faces west, with Fall Creek Boulevard running along the south side 150 ft. away. The front of the lot possesses several of those fast disappearing treasured shade trees. To build near the street, "as everyone else did," meant sacrificing some of these treasures. Over the protest of contractors and friends the excavation was begun some 80 ft. back from the street and extended nearly to the rear of the lot. After the ex-

cavation the joy of the builder-owner began. Not an architect or practical builder or natural born mechanic, but just a plain man with some ideas of his own, he waived aside the many friendly suggestions of those more experienced in the game, and began the building of "just what he wanted."

The basement was twice as large as necessary, the roof design could be improved upon; the openings for the windows were too large, etc., etc. These were samples of the advice he received. Advice and suggestions, to the contrary notwithstanding the building progressed as originally planned, and after weeks and weeks of worry and constant struggle to get things done as he wanted, the writer stood in the street running by the "place" and viewed the result—a long, low sweeping bungalow,

causes or, perhaps tempts the visitor to overlook the electric button and to announce his arrival with a vigorous "bang" of the knocker. When the front door swings open the guest is ushered directly into the spacious living room. The south wall of the room has a multiple window in a 10 ft. opening, giving a splendid view of the boulevard and creek beyond. A huge plate window, 7 x 3 ft., permits the western sun to throw much of its sunset glow into the room. After his coat and hat have been hung in the cloak closet opening off the living room opposite the front door, he looks for a comfortable spot and immediately hies himself to the nook in the north end of the room. Here is a fireplace built of blocks and covered with a cream stucco, troweled smooth, into which chipped granite has been thrown

View of Fireplace "Nook" in Living Room in the Ideal Concrete Home Home of Mr. Hoag

32 ft. wide and 60 ft. in depth, with a hip roof, gabled in front and on one side.

The exterior is a light cream stucco with sills, coping and trim in a light gray. The stucco has been acid washed, bringing out the marble aggregate contained in it. When the sun is shining the walls appear to be covered with a myriad of tiny sparkling diamonds. The lot slopes gradually to the back and a winding walk leads to the broad front porch extending across the front of the house. A gabled roof covers half the porch, the rest being open. Massive columns inclose the open part of the porch and support the roof. The floor is in red—more trouble to keep clean, no doubt, but much more inviting than the ordinary cement porch.

A brass knocker on the huge one-piece oak door

as thickly as possible. The hearth is in green with a border of narrow red bricks. The counter shelf of the fireplace and the top of the bookcases on either side are built in one piece 15 ft. long. The nook is formed by 4-ft. paneled walls extending from either side out into the room. Doors built on the living room side of these walls form a writing desk and music cabinet. These walls have square posts which in turn support a heavy beam against the ceiling. Seats with paneled backs and removable lids are built on either side of the nook.

French doors lead from the living room to the Blue dining room with its mass of windows stretching across the entire south wall; between the paneled strips around the room is a bluish putty tone grass paper with tapestry paper above to match.

In these days of breakfast rooms the dining room, like "ye old time" parlor, is used only on special occasions.

The woodwork in both living room and dining room is selected red gum, stained circassian walnut finish. This is fully as good looking as quartered sawed oak and not as expensive.

If the guest whom we have almost forgotten wishes to "see the house" he is taken from the dining room to the back hall, which might be called the "hall of a thousand doors." From it doors open into both bedrooms, bathroom, kitchen, breakfast room, sun porch, dining room and to the basement stairway. If the guest has been expected and Milady has everything "cleaned up" she probably

room, while small, is quite complete. The woodwork, as in the kitchen and bedroom, is finished in old ivory enamel.

Milady's bedroom adjoins the bathroom on the left. This room is large and airy, with plenty of wall space for massive furniture. Through the roomy closet opening from this room the sun porch in the rear can be reached.

A cozy built-in seat in the rear hall, with telephone attached and mirrored door leading to the basement in full view affords a popular stopping place for the feminine contingent of the household.

The walls, with the exception of those in the dining room, are sand finished and decorated in oils, with gray and old ivory predominating.

How I Built My Ideal Concrete Home—View in the "Kellersaal" in the Basement

shows him the kitchen with its old ivory enameled walls and woodwork, its built-in cabinets on either side, its one-piece sink, located beneath the window and between the cabinets. The floor is a red concrete composition with cove base. Adjoining the kitchen is the breakfast room which can also be reached from the hall.

Across the hall from the kitchen is Milady's special pride and joy—the bathroom. The floor and lower part of the side walls are covered with a green composition flooring with a recessed tub in one corner. The room has the appearance of a huge green bowl. There are no joints or cracks or corners in the room where dust and dirt can accumulate. With shower bath attachment, medicine cabinet, mirror, linen closet and laundry chute this

One of the many hobbies of the owner is electricity. All the rooms have ceiling lights, bracket lights, floor receptacles for lamps and the dining room and breakfast room have receptacles for percolator and toaster attachments. A large indirect bowl and floor lamp afford ample light for the living room, which can also be well lighted by the numerous wall brackets in the room.

Three-way switches save many steps in the turning on and off of the many lights.

The windows are of the casement type, opening out, and slide back and forth on a track. All the windows in an opening can be pushed to one side or the other, leaving the entire view through the window space unobstructed.

The house having been fully explored the guest

is requested to "sit down and visit" but no— a nudge and a wink from the erstwhile silent host causes Mr. Visitor to suggest a visit to the basement, commonly thought of only as a haven for dirt, coal dust and cob-webs. The stair-way leading to the basement opens into a large room, 16 x

How I Built My Ideal Concrete Home—Showing the Hollow Wall Construction

20. This is the garage and is reached by a sloping driveway from the rear, walled on either side. Here can be found the tool, fruit and trunk closets. To the right of the stair-way is the servant's room, a large light room having all the appearance of a ground floor room (made possible by the slope of the lot). Like all the basement rooms its walls are plastered, its windows and doors cased and its wood-work stained and finished. A large closet containing toilet and lavatory opens from this room.

The Garage and the "Kellersaal"

The visitor curious and perhaps impatient to learn the significance of the "nudge and wink," follows the host past the laundry with its tubs, gas plate and electric washer and soft water motor which supplies rain water to all parts of the house from a 150-barrel cistern in the rear; past the furnace room with its twin furnaces regulated by a thermostat, through the owner's dressing room, equipped with shower bath and toilet, into the largest room in the house—directly under the living room and called by the somewhat proud designer the "kellersaal." In one end is a large fireplace with wide seats 8 ft. long, built along the side walls. Across the other end is another seat 15 ft. long, with compartments beneath for storing fruit and vegetables. The walls are finished in a rough red water-proof float coat. A billiard table, some lounging chairs, a card table and cellarette make this room what the owner intended—a living room for men, where they can "tickle the ivories," "sit in" a quiet game, smoke and drink an occasional toast without fear of disturbing the rest of the family or arousing the ire of the dirt despising hostess.

Seated in a comfortable roomy chair before a blazing, crackling log of real wood, the guest accepts with a little urging a good cigar and a bit of "good cheer" from the nearby cellarette and assures his host that while the surroundings above are beautiful he hopes on his next visit to again be invited to the "regions below."

Chicago's Coming Cement Show

At the ninth annual Cement Show, to be held in the Coliseum in Chicago, Feb. 12 to 19 inclusive, there will be five general divisions. The first of these will be the Road Division, containing models, actual sections and ample data to give the visitor a clear conception of concrete pavement types. The second will be the Structural and Decorative Division, showing examples of interior and exterior decoration; cast concrete specimens typical of the work which architects, particularly in the East, are using; surfacings with special aggregates and with characteristic treatments displayed in a manner which will show both the finished surface and the processes of production; third, the Rural Contractor Division, which will bring out the possibilities of concreting in rural districts; fourth, the Concrete Unit Division, which will treat of the methods of treating concrete units, and fifth, the Good Concrete Division, which will demonstrate, by means of a 2000-lb. testing machine and other laboratory apparatus, the better and more economical concrete results from the use of graded aggregates than from bank run materials.

New Buildings for University of Chattanooga

The building committee of the University of Chattanooga early in December awarded the contract for two new campus buildings to T. S. Moudy & Co., of Chattanooga, Tenn. The contract calls for the completion of the work by July 1. The buildings will be of rough texture with stone trimmings and of slow burning construction with slate roofs. One structure is the Library and Administration Building and the other the Liberal Arts Building. With

Rear View of House Showing Approach to Basement Garage

the exception of the gymnasium already erected, these buildings are the first step in the general plan for revision and enlargement of the Chattanooga Department School plant made possible by the million dollar endowment secured a few years ago.

According to official statistics, 49,275 new buildings costing \$187,415,861 have been planned in Minneapolis, Minn., during the last twenty-five years. Of this number 32,571 were dwellings.

Design of Beams, Girders and Trusses*

A Series of Articles on the Above Subjects in
Which Only Arithmetic Is Used for the Calculations

BY ERNEST McCULLOUGH, C.E.

THE flange may be made solely of angles extending the whole length of the web plate, or of angles with plates riveted to them, the latter type being adopted when angles alone will not be sufficiently strong. The plates seldom extend the full length and if more than one is used the outer plates are very short, the lengths increasing progressively as they get closer to the angles. These plates are known as cover plates and when different thicknesses are used the thinner plates are on the outside.

The resisting moment is determined as follows: One-eighth the area of the web is considered as forming part of the flange. This is the usual cus-

d = distance center to center of gravity of the angles on the upper and lower edges of web plate.

f = unit fiber stress.

M_r of cover plates = Adf

A = area in square inches of plates along one edge of web plate at middle of span.

d = distance center to center of gravity of cover plates.

f = unit fiber stress.

The total moment of resistance of the plate girder is the sum of the moments of resistance of the web, the angles and the cover plates.

The rivets used to connect the flange angles to

Fig. 56—Moment Curve Due to Uniform and Concentrated Loads

Fig. 57—Graphical Method for Obtaining Lengths of Plate Girder Cover Plates

Design of Beams, Girders and Trusses

tom but some engineers use only one-tenth and some one-twelfth.

$$M_r \text{ of web} = \frac{Rbd^2}{8}$$

$R = f/6$.

b = thickness of web plate.

d = total depth of web plate.

r = unit fiber stress (usually 16,000 lb. per square inch).

M_r of angles = Adf

A = area in square inches of the two angles on one edge of plate.

the web and to connect the cover plates to the angles must be spaced to take care of the shear, this being accomplished by using the following formula,

$$p = \frac{rd}{V}$$

in which

V = total vertical shear at the point considered.

r = the resistance of one rivet.

d = distance in inches between the center of the upper row of rivets and the center of the lower row of rivets.

p = pitch, center to center of rivets, in the flange.

The bending moment due to uniform load varies as a parabola and as plate girders are generally designed for a uniform load the cover plates are varied in length to provide enough area for tension or compression. They extend a short distance past the point where the area is no longer required, to

Note in this series of articles no algebra is used. The rules are written in the modern way in the shape of formulas by using letters instead of writing in full words that are often employed. The words for which the letters stand are explained for every formula so that readers may in time understand how to read and comprehend formulas used by other writers. The actual computation is arithmetical and worked examples are given.—Editor.

*Continued from page 61 of the January issue.

provide for proper connections. By having the plates stop when they are no longer required some weight is saved and economy effected. When concentrated loads must be cared for in addition to a uniform load the process is altered.

Let A = total area of angles and cover plates in one flange at mid-span.

a_1 = area of shortest cover plate.

a_2 = area of second cover plate.

a_x = area of longest plate, the plates being numbered progressively from 1 to the end, x being used to signify any general terminating number.

Similarly l_1, l_2, \dots, l_n , etc. = lengths of the plates, the letter n being used to designate the general number applying to the last plate, thus l_n = length of the last plate considered. Then

$$l_n = \frac{L}{\sqrt{A}} \times \sqrt{a_1 + a_2 + \dots + a_n}$$

The angles always extend full length of web plate.

In spacing rivets in the flanges of plate girders it is common practice to have the rivet spacing uniform between stiffeners, the amount of vertical shear considered being taken at each stiffener. The minimum distance between centers of rivets is three diameters of the rivet but not less than 3 in. for

Design of Beams, Girders and Trusses—Fig. 58—Graphical Method for Spacing Rivets in Plate Girders

$\frac{7}{8}$ -in. rivets and $2\frac{1}{2}$ in. for $\frac{3}{4}$ -in. rivets. In the flanges the maximum pitch should not exceed six times the diameter of the rivets. The maximum pitch at ends of cover plates should not exceed four diameters of the rivets for a length equal to twice the depth of the girder. The maximum pitch in stiffeners is determined by the loading, if any, but should not exceed a maximum of $4\frac{1}{2}$ in. The load on an intermediate stiffener, and the load plus the end shear transmitted to an end stiffener is divided by the bearing or shearing value of the rivet to obtain the number of rivets. These are equally spaced, but the maximum spacing is $4\frac{1}{2}$ in.

When it is necessary to splice the web of a plate girder the splice plates on each side of the web must be proportioned so the rivets will not be unduly stressed. The moment causing vertical bending in the girder makes the stress in the rivets greater as the top or bottom is approached. Sometimes an additional "moment splice" must be added on the sides of the web close to the flange angles.

The lengths of flange cover plates and the spacing

of rivets may be done graphically. In fact the graphical method for obtaining the lengths of cover plates is that commonly used by designers. Fig. 29 shows a moment diagram on a beam carrying a uniform load and several distributed loads. Fig. 56 shows the combined curve for this condition, so that it will not be necessary to measure up and down from the neutral axis and add the lengths.

The moment curve for a plate girder is similarly drawn. For a uniform load the curve is a parabola, so it is necessary to draw only one-half the length. All horizontal measurements are made to the scale of the drawing and all vertical measurements are made to the scale used for the bending moment. Make the drawing no larger than is necessary to obtain accurate data.

Setting Off Lengths of Cover Plates

To set off the lengths of cover plates draw a vertical line through the point of maximum bending moment, Fig. 57. Begin at the bottom and set off first the amount of moment carried by the web (one-eighth, one-tenth or one-twelfth, according to specifications) and above this set off the amount carried by the flange angles. The number of cover plates having been determined set off in succession the amount of moment carried by each. Through the points fixing the amount of moment carried by the web and the angles draw horizontal lines to the ends of the span. Through the points fixing the amount of moment carried by each cover plate draw horizontal lines beyond the moment curve 2 or 3 ft. This projection allows a place for a few rivets so the plates begin to be effective when needed.

The lengths of the cover plates are scaled from the diagram. When the plate girder carries a moving load on top it is usual to have the top cover plate next the angles extend the full length of the girder. This covers the angles against the entry of moisture in the joints and stiffens them near the ends against the effects of deflection of the frame carrying the load.

Diagram for Spacing Rivets

A similar diagram may be used for spacing rivets. The vertical scale represents the total maximum tensile (or compressive) stress in the girder, instead of the maximum moment. The number of rivets necessary to resist this stress is determined by dividing the stress by the safe allowable stress (shearing or bearing) on each rivet. The vertical line is divided into as many parts as there are rivets required. Through the division points draw horizontal lines, Fig. 58, to an intersection with the boundary curve. From these points of intersection with the boundary curve drop vertical lines to the base. A rivet will be used at each intersection thus determined. A similar method may be used for spacing stirrups in beams of reinforced concrete. The moment diagram for obtaining the lengths of cover plates may be used without change for determining rivet spacing by adopting a scale for the vertical lines proportioned to the ratio the total stress bears to the moment. By total stress is meant the product of the area of the flange angles plus the area of the cover plates, multiplied by the unit stress.

Trade Topics—Every Reader is Invited to Participate

Framing the Bottom Ends of Rafters

From G. L. McM., Tacoma, Wash.—I have no desire to enter into a controversy with Mr. Barry in regard to his methods of roof-framing, but as I have worked in Vermont, New Hampshire, Massachusetts, Iowa, California, British Columbia and in this State, also have been framing roofs for forty years, and seeing others frame them, without ever having found it necessary to back a hip, I think when I see a man of Mr. Barry's ability giving a rule as of general applicability that I know would not serve 99 out of every 100 jobs that have come within my observation or experience, I am justified in calling attention to the fact. Had Mr. Barry, in giving the rule said that it would only apply *after the rafter was backed*, there would have been no probability of his misleading any one. On re-reading his October article I notice that he makes a similar omission when he says that "no hip less than 2 in. thick needs to be backed *if the vertical*

bearing came on a post. The last job of heavy framing I had anything to do with the girders were 14 x 16 and all were sized before they came to us. When carpenters wages are from 40 to 50 cents per hour and the mills size lumber for from 50 cents to \$1 per M it does not pay to use unsized lumber.

With regard to what he says about rafter finish and fascias, we use three methods of framing the bottom ends of rafters, as shown in Figs. 1, 2 and 3. Where a "cottage jet" (or cornice) is to be used and the plancier is to be applied directly to the underside of the rafter end the form, Fig. 1, is used. In this case the valley being framed the same way the under side of the projection will be on a line with the underside of the common rafters, and at the hip it will only be necessary to slightly bevel the end of the plancier to make a fit. Where a "box jet" is used, the plancier is applied to lookouts and the size of the rafter projection "cuts no ice," then the form in Fig. 2 is used. The form in Fig.

Fig. 1—One of the Methods of Framing the Bottom Ends of Rafters

Fig. 3—Method Used in Connection with the So-Called "Bungalow Style"

Framing the Bottom Ends of Rafters—Showing the Three Methods

distance at right angles to the seat is made equal to that of the common rafter." The italics are mine. He neglects to say that the distance must be measured at that point where the edge of the hip cuts the edge of the plate—not at the plumb cut of the hip as the figure referred to would indicate—see Fig. 2 in my article in the November number.

If Mr. Barry never saw a "work line" used on hewed timber, he either never saw much framing done on that kind of timber, or else it was framed by "scribe rule," for no workman, in my estimation, can do a good job of framing on hewed timber and work to the hew line. His brace seats are cut 1¼ in. deep because they were laid out from such a line, or I miss my guess.

As to what Mr. Barry says about surplus material on sawed lumber, and that kind of lumber varying in size, it is twenty-five years since I have seen any sawed dimension lumber brought on to a job, that was not sized at the mill to even widths, and in most cases even thicknesses, with the exception, perhaps, of some very small, cheap jobs and occasionally some timbers for use as posts or girders where the variation in size did not matter or where it would only be necessary to size at the place where the

3 is used where the construction is of the so-called "Bungalow" style, the rafter end being a separate piece both where a sweep is made in the roof, as shown, and in most cases where the rafters are finished straight. No fascia is used below the gutter, so that any difference in width of the common and hip or valley ends makes no difference. I therefore fail utterly to see where Mr. Barry gets any ground upon which to rest his assertion "that unless the hip is backed and the valley grooved the fascia will be too narrow." I should add that in "Bungalow" style of cornices the roof boards form the plancier and the entire rafter end below the frieze is exposed.

Hanging Glass Doors

From J. H., Elk Point, S. D.—I have never before asked a favor through the Correspondence Department of THE BUILDING AGE, but as there always must be a first time I come now in regard to the proper method of hanging glass doors. What has been the experience of the practical readers in regard to this point? Which side of a glass door should be outside? I learned the trade

in Holland where they hang the doors with the "stop" outside for the reason that the rain which runs down the glass may escape again outside, but if the molding is placed outside the water is forced inside. I would state, however, that I have seen doors in this country hung both ways.

Answer.—The question raised by our correspondent is one concerning which there exists a considerable diversity of opinion among carpenters and builders in this country as it resolves itself largely into a matter of taste. As a usual thing a glass door is hung putty side out, but it is possible to conceive of conditions which would readily change this plan.

If the raised molding corresponds with the other doors in the vestibule, hall or room, then it would seem that the outer door should be hung with the raised molding on the inside. If, however, there is nothing of this kind to serve as a guide and our correspondent desires to make the exterior as attractive as possible, we would suggest hanging the door with the raised molding out. As already intimated, however, it is largely a matter of taste and we shall be very glad to have the practical readers express their views on the subject.

Average Day's Work for the Carpenter

From Contractor, Moffitsville, N. Y.—In discussing the questions of "Builder," Danville, Ill., I will give him some idea as to where to put his figures, and if he goes beyond this it will be at the expense of his profits. I have built in Missouri, Kansas, Nebraska and Minnesota, as well as in various sections of New York State, and when I get through estimating a building using my own day's work as a standard I cut it in two.

For an 8-hr. day a man will put 400 to 900 sq. ft. of material for a balloon frame; framing and putting up roof 300 to 700 ft. material.

Horizontal rough sheathing 700 to 900 ft., and if placed diagonal half of this.

Matched rough sheathing 300 to 700 ft., and if placed diagonal half of this.

Rough roofing about 1000 ft., and if matched 800 ft.

Rough flooring 1200 ft. and 4-in. matched flooring 500 ft.

2¼ in. matched hard wood, one room 10 x 12, 12 x 12, 12 x 14 ft. laying up to base.

Clapboarding 4 ft., 5 ft. and 6 ft. lengths milled ends 50 to 200 sq. ft. of wall.

These clapboards are 4½ to 5½ in. wide and laid 2½ in. to the weather.

Of 6-in. clapboards unsquared ends laid 3¾ in. to weather the same number of square feet should be laid.

2000 to 2500 shingles on ordinary roofs; compound roof half of this.

1200 ft. on side walls keeps a man hustling all day.

75 to 100 lineal ft. 4 member cornice; double this for corner strips.

Set 8 to 12 window, door or door jamb frames, and fit and hang sash for these 4 doors with 3 butts and mortise lock, 2 ft. 6 in. x 6 ft. 6 in. and larger.

Will case with Eastlake one side of opening an hour; ¾ door 5/4 window.

Will base 2 members 3 times as many rooms as he will floor; 3 members twice as many.

Will fit and hang one pair of sliding doors, but twice as many single doors. Will put up track for either of these.

Durability of Metal Lath for Exterior Work

From G. R. M., Rapidan, Minn.—What data can you give concerning the life of metal lath for exterior work? I have a contract in hand for a stucco exterior on metal lath but my client has been hearing reports of its rusting and rotting out and I wish to learn what has been the experience in regard to the point.

Note.—It is rather surprising to learn the extent of the prejudice existing in many sections against metal lath based on the supposition that it will rust out in a short time and cease to be of any value for holding plaster or stucco. Where objections have been made it is very rarely that a case is found where it may be actually and definitely proven that the metal lath has rusted out. Where such cases do occur it is generally found to be due to the use of a light weight metal lath or one that was not protected by painting or galvanizing.

Another cause is the use of a very lean mixture of stucco or too thin a coat so that the stucco itself is of no real protection to the metal.

Those engaged in the manufacture of metal lath have records of buildings on which metal lath was placed eighteen and twenty years ago and which is in perfect condition to-day. In several instances where it was found necessary to repair stucco houses and the stucco was removed the metal lath underneath was found to be in good condition.

Proper Method of Laying Shingles

From W. H. Blair, Janesville, Wis.—I notice that in the Correspondence columns of THE BUILDING AGE many of the readers have given their personal experience on the above subject, but none of them accord exactly with what I discovered many years ago to be good practice. In my opinion 16-in. shingles will make just as good a roof, exposed 5 in. or less, but other shingles should be exposed according to their length and perfection.

The form of specification which I have adopted for general practice is as follows:

The roof shall be covered with—grade of shingles laid 4¼ in. to the weather and nailed with two 3d galvanized nails to each shingle; nails to be driven 10 in. from lower end and ½ in. from edges of shingle. Side laps shall be not less than 1½ in. In laying shingles care must be taken to allow for expansion by moisture.

Many in the trade do not agree with me in the manner of nailing, but since adopting this method more than thirty years ago my observation is that every test has been favorable.

Why the Chimney Tops Overhang

From D. P. B., Redford, N. Y.—I notice that the explanation which I gave of the "nodding" chimneys of "E. A. N.," Rockville, Conn., does not appear to be satisfactory to him. I gave him a purely scien-

tific opinion. The problem is pure psychology. On my shelves are many volumes on the subject and among them is one by Ladd, who taught and wrote down there in the vicinity of "E. A. N.'s" crooked chimneys. Some day I may give some of Ladd's figures to show how the mind is often deceived by sensation. I should like to see the name of a scientific man signed to a statement that brick chimneys haughtily hold their heads erect for 23 years and then begin to flirt with the Atlantic Ocean.

Cold acts on all sides of a chimney about equally. If cold put out of plumb the chimneys the correspondent mentions, then there would not be a plumb chimney in the entire north. A body will continue in a state of rest or motion unless acted upon by some external force. Cold is a state of absolute rest. Water will expand a little in freezing; brick and mortar will contract. During the last five years the chimneys have been noticed as being out of plumb, but that hardly proves that they were ever plumb.

The statements of "W. B. B.," Southampton, N. Y., are open to severe criticism. It takes some chimneys 23 years to get into the same condition that others do in five years. In getting into the condition he imagines, they would be fractured all around and probably blown down years ago. In addition,

Fig. 1—Waste Pieces Used for Construction of Outside Cellar Stairs

Some "Kinks" for the Carpenter

From H. C. B., Union City, Ind.—There is an old saying to the effect that "There are tricks in all trades but ours," but carpenters at the present day do not consider that it applies to their line of work for the reason that they are learning many new kinks every day. I wonder if my brother chips ever stop to think that the waste pieces sawn out of a set of stair horses would make a good set for the cellarway if spiked firmly to a 2 x 6? The waste pieces of 2 x 4's will answer for a double studding in the corners and around the windows to which to nail the baseboard and casing instead of using a full length piece of material. See Figs. 1 and 2.

If the mechanic will take his rule and a piece of blue chalk and mark the center of each stud upon the floor before a building is plastered, it will prove of great benefit when he comes to finish the house.

A piece of building paper a yard wide placed upon the floor around the room just before the building is plastered and then removed as soon as the work is completed involves but very little expense, and it will keep the grit from being ground into the floor.

Fig. 2—Showing How Waste Pieces May Be Utilized in Place of Double Studs at Openings, Corners, etc.

Some "Kinks" for the Carpenter—By "H. C. B."

it is not necessary to go to the public to find that out. Furthermore, the east side of a chimney gets no heat from the sun in cold weather. At this very writing the sun is 22 deg. south of east, and before it can give any heat at all it is south of the chimney. For this item I examined several ruins which have not had a roof for 30 years, and the trace of the trowel could be seen on the joints. One wall was plastered on the bare rock and the plaster is still in good condition.

Chimneys disintegrate at the top all around and when plastered inside will stand up till the brick has disintegrated and blown down. If brick are set over, 1/16 in. per course, the chimney will lean 2 in. in 5 ft. When building the base the plumb and level are usually employed and then afterward laid aside. A chimney can be put out of plumb and yet the courses be level. There is one cause that possibly could produce the result, but it does not wait 23 years to act.

Details of Grape Arbor

From John Wavrek, Jr., Pa.—In connection with my comments appearing in the December issue of THE BUILDING AGE touching the construction of the grape arbor indicated in Fig. 6, the dimensions should have read 5 ft. 3 in. instead of 15 ft. 3 in.

This applies in cases where no sub-floor is laid. The scheme also saves a lot of work as the paper is easily picked up.

Location of Registers and Furnaces

From Ernest McCullough, Chicago, Ill.—The remarks by "J. F. H.," Union City, Ind., on location of registers and furnaces, which appeared in these columns some time ago, are entitled to consideration. There is reason for considerable dissatisfaction with warm-air furnace heating, but this is because it is not as easily controllable as steam or hot water heating. Hot air furnaces are installed in nearly every instance because of the low first cost. This the contractors know, and it is not hard to persuade owners that a guarantee (so-called) for a temperature of 70 deg. with 0 deg. outside temperature is just as good when made by a man who installs a complete heating plant for \$275 as when made by a man who proposed to install a plant costing double that amount. Therefore, the ignorance of the owner is the first reason why hot-air furnace heating is so often unsatisfactory.

The first great requisite is that the horizontal run of the hot-air pipes shall be as short as possible, and that the runs shall be as nearly as possible equal in length. The logical place for a furnace is then as near as can be to the center of the house.

No pipes should be horizontal, but all should rise to the vertical pipe in the walls. This shortens the runs, because the head room in a basement is low and most furnaces are high. The pipes should leave the hot-air chamber as close as possible to the top and the tops of the pipes should be at the same height, thus the bottom of a 12-in. pipe will be 4 in. below the bottom of an 8-in. pipe. These rules are too frequently violated in hot-air furnace installations. In a low basement the furnace should be placed in a pit so the pipes may leave the top of the hot-air chamber properly and have a good grade to the junction with the vertical pipes.

The vertical pipes should not be square, and if it is not possible to have round pipes in the partitions then use ovalled pipes, which are made by flattening round pipes. There is a downward current of cold air in every pipe and this cold air seeks the corners of rectangular pipes. All pipes should be covered with two layers of asbestos paper instead of the single thickness generally used. These two thicknesses should be applied on different days, that is, the second should not go on until the first is dry. It is also advisable to use double pipes, but this adds to the cost. All runs from the furnace should have a covering of asbestos paper applied each year for two or three years, the spaces between the layers assisting in the insulation and each gain in insulation is shown favorably in the coal bills. If the pipes are double then the outer pipes should have not less than two layers of asbestos paper.

Advantage of Large Pipes

Hot air flows in pipes because of the difference in weight of cold air and warmed air. This produces a very low velocity, and long horizontal runs further reduce it because of surface friction. Large pipes are therefore an advantage because of the saving in frictional losses. Pipes that are too large are an objection because the air is constantly cooling at a rapid rate. Cold winds cool exposed walls and registers placed in the floors of rooms thus cooled conduct cool air to the top surfaces of the hot-air chamber, thereby cooling it so the heating of the entire house is affected. The remedy is to close the dampers, and registers as well, in some rooms, and also cover the registers with heavy cloth. The furnace will work well on account of the increased air pressure, and in a few hours it may be possible to open the registers and warm the rooms which for a time were cut off. If windows are opened in any furnace-heated room, at night for example, the damper in the hot-air pipe in the cellar, as well as the register in the room, should be closed, and the register covered with a heavy cloth to prevent cold air from cooling the top of the hot-air chamber.

The Cost of Operation

The cost of operation of a hot-air furnace is greatly increased by admitting outside air into the cold box. If air is recirculated we can depend upon getting from 65 to 75 per cent. of the hot air from the furnace into the rooms. If, on the contrary, the air is not recirculated, but is all taken from the outside, then the best we can do is to look for about 60 per cent. efficiency, and this often drops to as low as 40 per cent. Here again arises a difficulty. The recirculated air is not much lower in

temperature than the warmed room air, so this means a loss in velocity of the air current. A direct connection to the outside induces a flow of air. The writer has solved this trouble in a number of installations by placing return ducts in the outside walls to the attic. The ducts run close to the windows, and in each room on a level with the floor at the side of, or under, the window is placed a register connecting to the duct. Behind each register is a thin plate at an angle to prevent air from an upper floor from getting into a room below and to keep it in the duct. Within these registers are placed light frames containing two sheets of cheese cloth to clean the air from dust, and one at least of these cloths should be washed each week. In the attic a register is placed in the floor at the upper end of each duct and air cleaners are placed in these boxes also.

Objections to Floor Registers

The worst possible place for registers is in the floor. Air drops to the floor when cooled and every floor has a thin layer of cold air, much of which goes down the registers into the top of the hot-air chamber, with damaging effect. Registers should be placed in the walls and the best location is on line with the picture molding near the ceiling. The warm air coming into the room rises to the ceiling and spreads over the whole room. It falls rapidly as it nears the windows, and if there is a cold air inlet at the level of the floor under the window the entering cold air and the cooled furnace air will drop to the cellar without spreading over the floor. An objection, not as serious as it first appears, to placing registers in the walls close to the ceiling, is that the walls will become discolored because the air is not clean. This objection is greatly lessened by using a vacuum cleaner; a broom or rag making the wall unsightly. If registers are not placed in this location, and most people object to them there, they should be placed in the wall slightly above the floor. This tends to prevent the entrance of cooled air and the pipe is utilized to its greatest capacity in supplying warmed air. The return of cooled air mixed with the entering cold air from the windows does not injure the health of those living in the house provided a larger part of the cold air supply comes from the attic.

Cannot Place Registers Near Windows

A hot-air furnace pipe cannot be placed in an outside wall of a house, and work properly, therefore we cannot place the registers close to the windows, as with hot water or steam heating plants. To prevent the entering of cold air from interfering with the working of hot-air pipes placed as far as possible from windows it is necessary to have the cold-air duct under the window to promote a flow of warm air from the register towards the window, the coldest part of a room. Your correspondent does not clearly understand that a steam or hot water radiator heats a room by radiated heat. A hot-air furnace, on the contrary, heats by convection, that is, by the remainder of the heat in a given volume after the heated air has traveled some distance giving up heat at every point in its path. There is a loss by convection all the way, the final loss being the loss of heat to the room,

and this final giving up of its heat is called heating the room. The air in the pipes is heated by radiation, the air in the room by convection. A hot water or steam radiator heats close by objects by radiation and the corners of the room by convection, that is, by the remainder of the heat left after every square inch of surface in the room has taken all it can absorb. This effect of convection explains why air pipes placed in cold walls are wasted, the proper place being in interior partitions where there is no exposure.

The cold air return pipes from the attic and the rooms and halls should enter a box in the basement, from which a pipe should lead to the lower part of the hot-air chamber. This pipe should have an area at least equal to the sum of the areas of the hot-air pipes from the furnace. It should have a length of not less than 3 ft., and should be clean inside. In the end of this pipe, as far as possible from the furnace, place an electric fan. On days when the wind is blowing start the fan and then the small difference in temperature between the cold and warmed air will not matter; the fan will circulate the air. It is an excellent plan to let the

Side and End Elevations for Grape Arbor—Contributed by "P. B. D."

fan run every morning for an hour or so, and in this way warmed air will be forced into the rooms and the cooled air will be drawn into the basement and warmed, for when the fan pushes air through the hot-air chamber it of course pulls air from the cold-air feeders. In every house wall there are so many crevices through to the outside and there are so many openings in every roof that there is no necessity for a cold-air box from the outside with properly arranged cold-air feeders from each room and from the attic. The writer is strongly opposed to taking air from a basement, and believes this pernicious habit accounts for the dust usually present in rooms heated by hot-air furnaces. In every hot-air furnace, near the top of the chamber, should be a pan about 3 or 4 in. deep, with an area equal to the combined areas of the hot-air flues. This pan should be fed automatically with water by means of a ball cock to supply water for evaporating into the air to maintain a proper humidity in the house. Such a pan will so improve conditions that the rooms will be warm and pleasant even when the temperature as indicated by a thermometer is around 60 deg. Fahr.

Designs Wanted of Carpenters' Tool Chest

From C. R. W., Terre Haute, Ind.—I have noticed in various issues of the paper drawings relating to articles of furniture which seem to be well outlined.

I am taking a course in manual training in the high school and wish to construct a tool chest of tolerably good size, and would like to have some of the practical readers, more especially the carpenters and cabinet makers send for publication a description of the tool chest which they use, as the subject is one which may be of interest to many other readers of the paper besides myself.

Design for Grape Arbor

From P. B. D., Clinton County, N. Y.—Answering the request of "W. M. L.," Orange, N. J., I am sending sketches of a grape arbor which may be made of concrete with the exception of the top stringers and the lattice work. All the concrete work may be done in rustic with round polished stones. The columns are round and fluted but they may be done in brick if desired. If fluted, the correspondent should use two sheets of 2½-in corrugated iron for the "forms." They should be riveted with nails driven from the inside and well bent. When taken off the nails need only be filed

and broken. The columns are made standing in position. The plates are made in position by the use of "forms." The lattice work is 2 in. thick and all woodwork is painted white.

Two Systems of Handrailing Contrasted

From C. F. Stark, Brooklyn, N. Y.—The article bearing the above title by Morris Williams, which appeared in the issue of THE BUILDING AGE for December does not seem to me to treat the Tangent System fairly. There, for the first time, a limit is imposed, which in future is to restrict all wreaths of the system to the center of the plank. The falling line method there shown, and regarded as another system, is however, permitted to find full liberty in planks of unlimited thickness. With all due deference to both Morris Williams and the author of the latter method, I regret that I am unable to share their view when they regard this method as possessing the individuality necessary to constitute it a system, and especially do I confess my inability to view it as in contradistinction to the Tangent System. I shall point out the reasons which oppose my taking this view, and they will show that both methods are rightly to be included in the Tangent System.

It may be a general feature of the Tangent System for a wreath to follow the center of the plank, but no one knows better than the writer of the above article that it does not always do so. The use of

falling molds, and sometimes the mere judgment of the mechanic, is sufficient to evade this restriction. On the other hand, if we consider the "falling line method," though it may not be a general feature, it is quite possible that the demands of the stair, taken in conjunction with the discretionary drawing of the tangent shall require the wreath by this method to follow the center of the plank. This feature then can be possessed in common by a wreath formed upon either method, or it can be absent in both. It therefore seems wrong to consider it as the distinguishing feature of either.

What appears to be the essential distinguishing feature of the Tangent System, as implied in the title, is that tangents are used to determine the mold, bevels and joints.

What becomes of the falling line method if the use of tangents to this end be prohibited? Only the falling line remains.

In regard to this latter method it is important to recognize that between the drawing of the falling line and the drawing of the discretionary tangent, everything pertaining to the problem is indeterminate. An indefinite number of forms may satisfy the face molds, also each of the bevels and the direction of the guide lines may vary indefinitely.

Immediately, however, this tangent is drawn in the elevation all is changed. Now only one mold can satisfy, every bevel is determinate, and the guide lines can have only one direction. In this complex method, as in the simpler methods of the Tangent System, the instant we decide on the elevation of the tangents, all variation in the solution of the problem is excluded.

Does not this seem to show that the falling line answers the same purpose in the elevation as the quadrant or segment does in the plan? Both must be regarded as controlling factors in a similar sense. Together they more definitely state the problem which the tangents are required to solve.

Finally, I find myself surprised at the remarkable ingenuity of any author who can take the fundamental principles of the Tangent System as his basis for evolving a more perfect method and who afterward considers his success as a proof of that system's limitations.

How to Shingle a Roof

From R. O., New Canaan, Conn.—In the January issue of THE BUILDING AGE there appeared an article entitled "How to Shingle a Roof," and in it were statements with which I do not quite agree in all respects. While the author of the article in question is right and safe to follow in the main, yet when he says the nails should be placed not less than 1 in. from the edge and that the joint should not break less than 1 in. also, I do not agree with him.

I think he will find that this would often bring the nail directly *under* the break, causing a leak in a short time by rusting the nail. If he will place the nail $\frac{1}{2}$ in. from the edge this will be avoided.

From R. H. C., Windsor, N. S.—I have been a reader of THE BUILDING AGE for several years

and find it a great help to me. As a general thing the methods described in the Correspondence Department are in accord with my own notions, but I beg to differ with the author of the article in the January issue telling "How to Shingle a Roof." In the most essential part he is wrong; that is, in nailing 1 in. from the edge and breaking joints directly over the nail, which not only rusts the nails but rots the wood.

My suggestion is to nail $\frac{3}{8}$ in. from the edge and break joints $1\frac{1}{4}$ in. from the edge. Do not hit the nail after it is down. I have proved this to be the proper way to nail by comparing the durability of roofs with those done by other systems of nailing and using the same kind of shingles. I know of roofs which are in fairly good condition to-day which were shingled 27 years ago, making use of common wire nails.

Dry Rot in Factory Timbers

From W. H. B., Janesville, Wis.—In a recent issue of THE BUILDING AGE, under the above heading, it was stated that extensive experiments are being made to determine the cause of fungi. From my earliest childhood to early manhood I was in close touch with the manufacture of hardwood lumber, and have since by the nature of my business been required closely to observe the various woods used in building construction. I early became convinced that the development of fungi depended largely on the condition of the timber when taken from the stump, or rather the time of year in which the trees were cut. To particularize, lumber is more liable to fungi when timber is cut during the flow of sap (from the earliest budding until mid-summer), but most liable when cut in the full flow or leafing time.

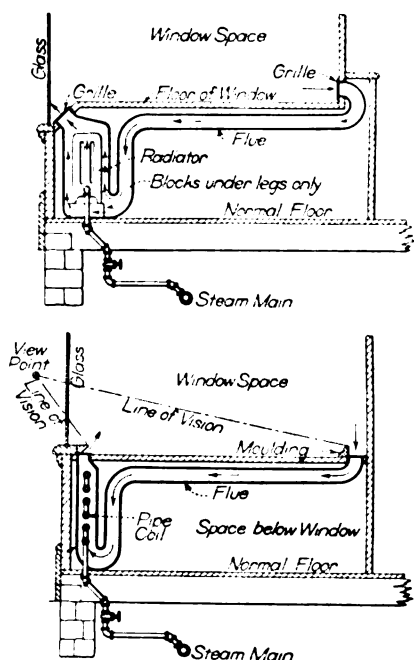

By observation I am convinced that timber will make harder and more durable lumber if felled in mid-summer, or just after the growth has ceased, and care is taken not to let the lumber heat in the pile and form fungi.

Preventing Condensation on Show Windows

From Experience, Chicago, Ill.—So much has been said in the trade press about the annoyance arising from condensation on show windows and the various remedies therefor that the subject would seem to have been pretty well exhausted, but I venture to offer a few remarks that may embody a useful hint or two. The trouble so frequently experienced is very often due to the drying out of the plaster and masonry, when the building is new. The writer knows of one case where a building (which had the sash and sash hardware installed at an early date in order to permit the use of temporary heat), had to have all the hardware replaced, owing to the inroads of corrosion made by the excessive moisture in the air, as the water was driven out of the plaster by the heat.

The cause of moisture collecting on the window glass, or, in fact, on any cold surface, in a building after it has been thoroughly dried out, is the absorption of moisture by the air, and its condensa-

tion, under certain conditions. The exact amount of moisture which a cubic foot of air will carry at any given temperature has been exactly determined, and it has been found to increase with great rapidity as the temperature rises. If the moisture in the air at any given temperature exceeds the

Preventing Condensation on Show Windows—Sectional Views Showing Window with Radiator and Also with Pipe Coil

moisture-carrying capacity of the air at that temperature, the excess moisture is precipitated in the form of water on adjacent surfaces. The reason why cold surfaces are most subject to this precipitating or "sweating" is apparent in the following:

The average amount of moisture carried by outside air at any temperature varies between 50 and 80 per cent. of the amount it could carry before reaching the limit of its capacity (which limit is termed the "saturation" or "dew" point). Note, however, that this average humidity of 50 to 80 per cent. applies to air at any temperature, and is based on the "saturation point" of the air at that temperature only.

If we raise the temperature, the moisture carrying capacity is also raised. Air containing a normal amount of moisture will, if reduced in temperature, approach the saturation point, and, if sufficiently cooled, will precipitate the excess moisture on the cooling surface.

Knowing these facts, it is easy to understand how the sweating and frosting of windows often results.

Of course, there are many causes tending to raise the humidity or moisture in the air. The evaporation of moisture from the body, the vapor in the breath, the steam of the tea kettle, the hot water used in washing, the constant drying out of any and all moist materials which give up their moisture to the surrounding air and (in recently erected buildings) the drying out of damp plaster, all may cause window steaming.

As a general rule the atmosphere of a room in cold weather does not contain sufficient moisture.

Having determined the cause let us look for a remedy.

The first and simplest method is to shut the window off entirely from the store, and, by means of top and bottom registers opening into the outside air, maintaining, as far as possible, equal temperature on both sides of the glass. This method has disadvantages, as the openings admit dust as well as air, may leak when it rains, and the goods displayed may be affected by the varying outside temperatures. Moreover, this method is not suitable to other windows not in stores where the same trouble is experienced.

The second method is to blow air against the inner surface of the glass by means of a small fan, so as to keep up a constant circulation. This is a crude and more or less expensive method, as the fan generally does not do effective work except within limits of three or four feet.

The third and most efficient method is by the use of heat, from a radiator set directly under the window, and covered by a long and narrow shield, so as to throw the heated air up beside the glass on the inside of the window, all as shown in the sketch.

This same method is applied to skylights by the use of skylight coils of steam pipe, a scheme with which almost every one is familiar.

Fastening a Gate to Concrete Posts

From J. F. H., Indianapolis, Ind.—A rather ingenious method of fastening a wooden gate to concrete fence posts is in use on a farm near Fort Wayne, and I am sending herewith a sketch of it which may possibly interest some readers of the paper. The posts are perfectly plain and are straight from top to bottom without the slightest taper, measuring 10 x 10 in. in cross-section.

To attach the gate jambs and the brace pieces, the workman placed a 2 x 8-in. plank on two sides of each post as shown in the sketch. The braces were fitted next and spiked to the outermost planks, while the gate was hung to the inner planks. The

Fastening a Gate to Concrete Posts

fence wires were then twisted tightly around the concrete posts and planks, thus binding all firmly together as shown in the sketch.

Details Wanted of Practical Ash Chutes

From H. V., Paterson, N. J.—Will some of the readers of the Correspondence Department kindly send for publication details of practical ash chutes extending from first floor kitchen range to cellar?

Mount Vernon, N. Y., is to have a new post-office estimated to cost \$100,000.

Details of Wall Board Paneling

Various Suggestions and Directions for Designing Wall Board Interiors—A Practical Example

BY JOSEPH A. POESL

WHEN wall board interiors are unsatisfactory from an artistic viewpoint, the reason why, in most cases, is the lack of care and judgment exercised in designing the panel arrangements. Undoubtedly builders will, therefore, be interested to learn just how they, themselves, can design paneled walls and ceilings which will not only enable them to put good interiors in their houses, but good looking ones as well.

Let it be stated at once, that in order to create the best panel designs one must believe in the panel idea. There is really no more pleasing, no more artistic, no more beautiful means of treating an interior than paneling. The skeptic has only to glance about him to be convinced. Let him note the panel decorations of the most expensive residences, of the costliest public buildings, of the best hotels. Why, away back before the Christian era, when architecture had reached its highest state of perfection, those wise Greeks favored this method of interior decoration.

No matter how large the house to be decorated, it is easy to work out a suitable and entirely different

48's are also adapted to those 24 in. on centers. The 36's are adapted to only those 18 in. on centers. In all, there are thirty-nine different sizes, which, it will be seen, afford numberless combinations and arrangements.

Seemingly, the proportions of a room are affected according to the arrangement of the panels. In Fig. 1, design A, we have an arrangement which has a tendency to increase the height; design D has an entirely opposite effect, while B and C are more or less neutral.

Furthermore, some designs are more appropriate to certain rooms than others. Referring again to Fig. 1, A is most suitable for living rooms, halls, re-

Fig. 1—The 4 Basic Designs of Panel Arrangement

Fig. 2—Showing How a Different Arrangement Can Be Carried Out in Each Room

Fig. 5—Plan for Assisting in Panel Design

Details of Wall Board Paneling

scheme of paneling for every room. The possibilities in this direction are unlimited. There is nothing monotonous about it, provided it is carried out properly.

Although the variety of panel arrangements possible with the many different sized panels, in which wall board is made, are endless, there are actually but four basic designs from which others are derived. These are shown in Fig. 1 of the accompanying illustrations. It might be well to note how the different wall divisions are designated.

The panel sizes just referred to are 32, 36 and 48 in. widths, and 4 to 16 ft. lengths. The 32's and 48's are adapted to studs 16 in. on centers, and the

ception rooms, bed rooms, stores and offices; D for dining rooms, libraries, dens, offices, stores and theaters, and B for kitchens, bath rooms, dining rooms and lunch rooms. To stores, offices, school rooms and any room with a disproportionately high ceiling design D is best adapted. Don't forget these designs are basic and that by the simple addition of extra paneling strips, many variations are easily produced; so that no two rooms need be identical.

While it is true that the majority of building men are well acquainted with wall board, there are those who are not. Recently one of the latter landed contract for a small frame house for which wall-board was specified. He examined the plans, learn-

ing that the lower rooms would be 9 ft. high, the upper 8. After a little figuring, an order for the necessary wall board, including a lot of 9 ft. and 8 ft. lengths, was placed with his lumber man.

As is frequently the case, the wall board salesman got wind of the job and went out to see the builder, hoping to be able to give him a few pointers that might aid him to bring about a first-class job. In the course of their conversation he was surprised to discover that only one panel design was to be followed throughout. That is, all panels would extend in an unbroken length from the floor to the ceiling in all rooms.

Imagine what an uninteresting and monotonous interior that would give the house! Realizing this, the salesman offered panel arrangement sugges-

can carry out a practically different arrangement in each room; and yet use the panels you have ordered. Follow A in the hall and living room; put a plate rail about 32 in. from the ceiling around the dining room. In the bed rooms, place an ordinary decorative strip about 18 or 24 in. from the ceiling, as in C—use 32's in one and 48's in the other; and raise or lower the strip in others as desired. Place a strip about 4 ft. from the floor to form a dado in the kitchen and bath, using 48's in the former and 32's in the latter, as in D. Very simple isn't it?"

"However," he went on, "be sure to place headers back of the board, where these extra cross strips are placed, for nailing the board and strips tight together, one to the other."

Now, this is a pretty good stunt. The simplicity

Details of Wall Board Paneling—Fig. 3—Showing Treatment of Several Ceilings

tions, but was only thanked and informed that, as the board had already been ordered no changes could be made. Here is an instance of lack of forethought and knowledge. There is no doubt that had this builder known about paneling, he would have employed a little time in planning the panel arrangements before ordering the required wall board.

The salesman accepted matters as they were and set about to solve the problem before him—the problem of making this an A No. 1 job, not only in application and decoration, but also in paneling. He knew that a satisfactory job would produce a boosting builder, a pleased owner and a lasting advertisement for wall board.

"Here," he finally said, referring to Fig. 2—a drawing he had prepared—"is a way in which you

of it makes it easy for any builder to have tastefully and neatly paneled rooms in his houses.

It is, perhaps, worth while mentioning here, by way of suggestion, to be careful in fitting panels into the wall spaces so that a balanced effect will result. As many panels of one width as possible should be used in a single room; for it would not be well to have narrow panels on one or two of the walls and wide ones on the rest.

Nothing has as yet been said about ceilings, because nothing much needs to be said about them. Being nearly always square or rectangular in shape, they are easily taken care of. The usual treatment is to have them harmonize with the walls. In other words, let the wall design govern that of the ceiling. Of course, large ceilings are more difficult to treat,

due to the fact that they are often the governing factor, because shelves, hangings and the like hide most of the wall surface. The simplest, and perhaps best way of paneling them is by dividing them into sections by false beams and then working out similar arrangements for each section, thus virtually having panels within panels. Fig. 3 shows several ceilings treated in this way which might be of interest.

The decorative strips used for covering the intersections of the panels may be very simple or elaborate. In Fig. 4 a number of those most common are shown. It is best to have them rather wide than narrow. Thus, a room is given a substantial appearance which is much more pleasing than obtained with those thin, narrow, strips sometimes resorted to for cheapness' sake.

The example presented herewith will assist builders to design panel arrangements in a simple, quick and easy way. From the portion of a floor plan, A, Fig. 5, make a ruled drawing, to scale, if possible, or in fairly good proportion, drawing in all of the openings as in B.

With this drawing before you, select a panel design that is best suited to the size, shape and character of the room. On the ceiling let the panels run in the same direction as the joists extend. Fit the panels into the various wall spaces as uniformly as possible. It is also well to see that the edges of the panels come on studs and joists; otherwise, additional framing members are necessary to provide the required nailing surface for all four edges of every panel.

It will be assumed that design A, Fig. 1, is satisfactory for the room. Sketch in the panel arrangement, indicating the sizes of the panels as shown in C, Fig. 5. This gives, at once, the number of panels needed of each size and serves as a guide in applying the board.

Follow this method for each room, and, as already suggested, be careful to avoid monotony by thoughtful planning; for after all, good paneling is only a matter of good taste and judgment. Every first rate builder possesses these faculties, and consequently there is no reason why every wall board job should not be well paneled.

San Francisco Building Material Market

Our correspondent, writing under date of Jan. 4, says: Following a quiet year, the current movement of building materials has been further curtailed by seasonable weather conditions, but December was rather remarkable for the rapid increase in the number of plans offered for figures, and there is now enough work of importance in sight to cause an active movement in all lines as soon as outside work can be resumed. The prospects include several downtown office buildings and a number of factories in this city, while the enlargement of many chemical works and other manufacturing plants in the industrial district along the east shore of San Francisco Bay is beginning to call for more workmen's dwellings in that vicinity. It was feared that the end of the exposition would find San Francisco and nearby towns overbuilt, but, with the possible exception of high-class hotels,

there is even less surplus building space than there was a year ago.

Prices of most materials are advancing. The high price of metal goods is now an old story and has been pretty well discounted, but the rapid advance of steel products, including structural shapes, reinforcing material of all kinds, metal lath, nails, etc., is causing builders some apprehension, especially as supplies of such goods are in danger of running short. The belief at first expressed that these extreme prices would retard building seems not to have been well founded.

The last item to advance has been lumber, which had been selling practically below cost of production for over a year past. While the mills are still greatly hampered by lack of foreign transportation, there is a large demand for Pacific coast lumber in Europe, and railroads and other large domestic buyers, in addition to the retailers all through the Middle West, have bought liberally during the last two months, causing quite a sharp advance at the mills. In addition, coastwise steamer rates have gone up abruptly with the renewal of demand in California, so that prices in the San Francisco district are now about normal, with an upward tendency.

In brick or cement no immediate advance is expected, as the output is ample for all requirements, and both have been pretty steadily held at remunerative prices for some two years past, cement being quoted here in carloads at \$1.90 per bbl., net, without sacks. Rather large stocks of common brick have been accumulated during the last two years, and manufacturers are disposed to hold their production down to reasonable limits.

Static Load Tests for Concrete Beams

The first of a series of concrete investigations of large-size test members has been started by the United States Bureau of Standards. The making of thirty-six concrete beams, 8 by 11 in. in cross section, and 13 ft. long, is the initial step in the work. These are to be subjected to static load tests, the beams being piled in a criblike manner and then further loaded by a platform carrying a dead weight. The deflection, etc., of the beams will be measured from time to time, and after one year's observation, a duplicate set of beams will be tested to destruction.

New Shingle Measure

The California Department of Weights and Measures recently notified all shingle dealers that in future shingles must be sold on a full-count basis. The Redwood Shingle Association has notified the authorities that it stands ready to give assistance in putting the new rule into effect. The basis formerly used on redwood shingles will be abandoned, and five bundles instead of four will now be regarded as a thousand.

Canada has established a forest products laboratory in connection with McGill University at Montreal, on the lines of the United States institution of the same sort at the University of Wisconsin.

House Moving Hints for the Builder

Past and Present Day Methods of Doing the Work Contrasted—The Proper Equipment

BY E. W. LA PLANT*

EVERY carpenter-contractor and builder is called upon at times to move a building from one location to another so that a new structure may be erected on the old site. Five or six years ago contractors would wreck the building, unless they could find a house-mover to handle the job. In many cases the man found was so independent he would almost have to be bribed to come and figure on it. Nine out of ten of these men only had a wheelbarrow load of old rollers and pulleys and were not equipped to properly handle the job. As a rule they failed in their efforts, and in most cases they would delay the erection of the new building which was both annoying and expensive.

That is why building contractors of to-day are becoming house-moving contractors. With the modern methods they can complete the moving jobs in short order. But a few years ago the carpenter-contractor disliked to tackle house-moving because of the hard, uncertain job due to poor equipment. Nowadays a man cannot really afford to wreck a building because the price of lumber and the cost of erection has increased at a tremendous pace in the past ten years.

Take a city man who has an old-fashioned house, but who wishes a modern home. His logical proceeding would be to buy a reasonable priced lot, move the old house on it and then erect his modern home on the original site. He will be better satisfied that way than to build on and enlarge his old home. Besides, he saves money.

Out on the farm it's the same way. The farmer

and utilized for a milk shed—to-day, our friend-farmer moves the house to another section of his farm for his hired help, or, if he is only three or four miles from town he will buy a cheap lot, move the house on it, fix it up and then rent or sell it.

This gives the house-moving contractor three jobs. First, the moving; second, the repair work

Fig. 2—A 12-Room House Loaded on the 3-Point Method

on the old house, and, third, erecting the new home.

Three house-moving trucks, one of which is shown in Fig. 1, are generally used and are placed under the building as in Fig. 4. One truck is placed in the center at the front, and one at each rear corner. Note that the rear trucks are brought in about one-third the length of the building. This is to divide the load equally. In this particular case the rear trucks were brought in the full one-third because the rear end was the heavier, but in placing the trucks the builder must use his own judgment as to their position.

After the house has been jacked up, the running timbers are run in and held up by jacks at each end, then the cross sills are placed at the proper intervals to carry the overhang of the front corners. Before releasing the jacks and allowing the weight of the house to rest upon the timbers, place a 1-in. board between the front cross sills and house sill at the outer edges, then when the weight is let down the cross sills spring instead of the house. Do the same at the rear end of the running sills also.

Fig. 4 shows how one may bridge across at the rear of the house, and carry the building on three points when the running sills are too short. Many houses of the old style are L-shaped, and that is why I have shown this floor plan.

The chimney should be cut off at the floor level under the joist, then lance in the cross sill; this will carry the chimney. Be sure to remove the chimney tops down to the roof level, as chimneys are very dangerous and may topple off when you least expect.

Fig. 1—One of the House Moving Trucks

sends his children to college; they get new ideas about homes and soon the whole family wish a new, modern home. Years ago on the farm the house was moved, using logs as rollers, into the back yard

This is the first of a series of articles by Mr. La Plant. Any one wishing information on moving or loading buildings should address him in care of the Editor, and the questions will be answered free of charge. This also includes advice on shoring store fronts and raising. The questions and answers will be published in the correspondence department of the paper.—Editor THE BUILDING AGE.

*President La Plant-Choate Mfg. Co.

The method of hitching used to get an equal pull from each running timber is shown in Fig. 3. This point is important and should be watched carefully throughout the progress of the work.

The house in Fig. 2, loaded on three trucks, was raised and moved two miles in four days by four men and a team. The house was in good shape,

House Moving Hints for the Builder—Fig. 3—Method of Hitching to Running Timbers When Pulling Buildings

being only six years old and too good to wreck. The owner received more than \$1,000 for this building. If he had wrecked it he wouldn't have been able to get over \$300 for the lumber. This example points out clearly how the owner of the building saves money and really earns money by the moving method. Then also the builder should consider the extra profits on each job.

Fig. 2 shows the house at right angles to the new foundation. You can run the building right in on the foundation and square it within a fraction of an inch. When the foundation is in and the house is fixed up it will look as good as new.

Three-point loading is the easiest and best way in house moving. Using the three-point method one may carry any building a short or long distance safely without rack or injury.

Production of Sand-Lime Brick

Some very interesting information regarding the production of sand lime brick is contained in a Bulletin recently issued by the U. S. Geological Survey and written by Jefferson Middleton. According to this authority the condition of the industry in the United States in 1914 was on the whole rather unsatisfactory to the manufacturers, though in some States, more particularly Florida and Indiana, considerable progress was made. The number of active operators reporting increased as compared with 1913 and the value of output in 1914 was \$1,058,512 which was a decrease of 14½ per cent as compared with 1913, and a decrease of 11.8 per cent as compared with 1912; but it was an increase of 18 per cent as compared with 1911.

Nine of the twenty-three States reporting a marketed product in 1914 showed an increase and fourteen showed a decrease. The increases and de-

creases were confined to no one section of the country. The following table shows the production of sand lime brick in the United States from 1903 to 1914 inclusive.

Year	Number of Active Firms Reporting	Value of Product
1903.....	16	\$155,040
1904.....	57	463,128
1905.....	84	972,064
1906.....	87	1,170,005
1907.....	94	1,225,769
1908.....	87	1,029,699
1909.....	74	1,150,580
1910.....	76	1,169,153
1911.....	66	897,664
1912.....	71	1,200,223
1913.....	68	1,238,325
1914.....	62	1,058,512

The average price per 1000 for common sand lime brick was \$5.99 in 1914, as compared with \$6.27 in 1913, \$6.46 in 1912, and \$6.09 in 1911. For front brick the average price was \$9.08 in 1914, \$10.61 in 1913, \$10.41 in 1912, and \$9.53 in 1911.

In 1914 common brick represented 93.38 per cent of the value of all products and front and fancy brick 6.62 per cent. In 1913 common brick represented 90.32 per cent of the value of all products and front and fancy brick 9.68 per cent.

Cleaning Sandstone and Limestone

If a front of sand or limestone is stained with dirt and soot, it can be cleaned by a strong solution of caustic soda, which is applied with a long handled fiber brush. After being on for about 20 minutes, the stone is rinsed with clean water, by means of a hose for preference, or failing that, with a large sponge. If the front is water stained, use a rubbing brick, pumice stone, or sandstone of fine grain with

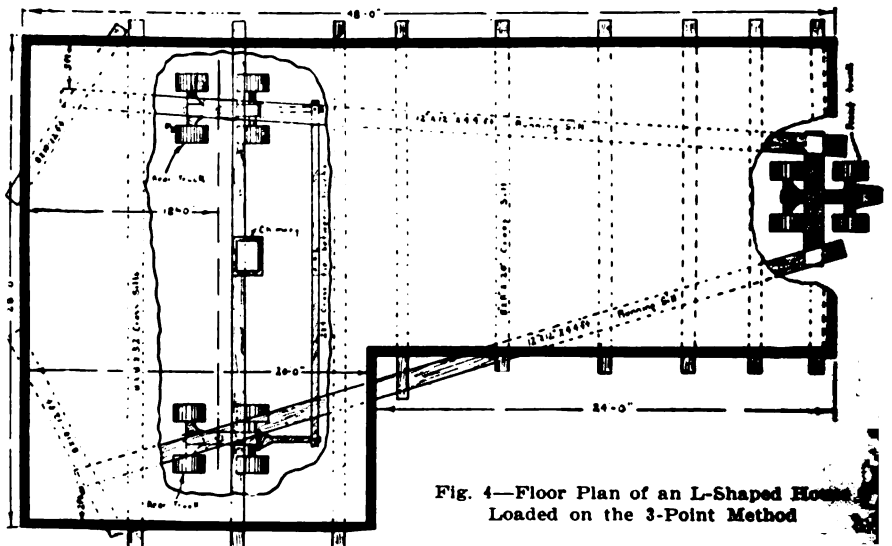

Fig. 4—Floor Plan of an L-Shaped House Loaded on the 3-Point Method

water in which oxalic acid has been dissolved—at the rate of one pound of acid to pail of water. This second method also requires a sponging off with cold water.

There is a thoroughfare in Buffalo, which, for its entire length is restricted to single dwellings of the bungalow type, no two being alike. It is known as Fordham Drive in Nye Park.

Building the Stucco-Coated House

Some Reasons Why This Form of Construction
Should Appeal to the Present-Day Home Builder

BY WARFIELD WEBB

IN building the home we have many important matters to keep in mind, as there is a vast difference between a "home" and a "house." The latter is a living abode in many cases, but the former is to be the ideal, and the one place that should be so erected. The important consideration then is to make the home attractive from the outside. More people see the exterior of the home than the interior, and a good appearance should be planned out well in advance.

There should be a study made of the location—the setting—the size, the style and the material for the exterior. The latter becomes vital, because upon its selection must depend the final success of the undertaking. The exterior should comprise art, durability, good taste, and be capable of making the ideal that we have set up for ourselves. Now there are many styles of exterior material. These comprise a variety of color effects, and when properly put in place bring into being the most exacting requirements of the owner.

If we build we should keep before us the nature of the building, its location, and try to make the material harmonize with the surroundings. Do we fully value the effect that this brings about and the lack of which does so much to depreciate the home from an artistic point? There should be in mind the idea of erecting a home for its beauty, and this becomes, not only to ourselves a source of gratification, but enhances the value of the structure, and magnifies its true value.

There is, however, a vast difference between the home with true art in the exterior, and one that

of beauty lies in its greater conception as applied to the home.

To-day we see many homes erected with a stucco exterior. It might be added that some of these, and a goodly percentage, are lacking in the very essential for which we were originally striving—the at-

ANOTHER EXAMPLE OF STUCCO FINISH RELIEVED BY THE BLOCK EFFECT AT THE CORNERS

tractive exterior. This is due to several things. In the first place the style of the house is such as to make the exterior inharmonious. The lines and angles are out of proportion and the setting lacking in important respects. The exterior itself is devoid of proper color effect, and the material, sometimes of poor quality and improperly applied, gives the structure a hideous appearance.

To make the stucco exterior home of real attractiveness, and to make it likewise durable, we cannot afford to use inferior material. The logic of this is so plain as to need no comment. Then, with good material in the hands of inferior or careless workmen, there will be a like unsatisfactory job, and the house will be to the owner what it is to the beholder—a miserable makeshift. It might be added that with the use of the best stucco the effects possible are wonderful, and with the use of the contrary kind there is nothing that will so mar its value and its outward appearance.

Some contractors, and they are not alone the guilty parties in such cases, resort to inferior material, with the addition of inferior workmanship, and in this way make the home anything but attractive and a just cause for complaint. To make stucco durable, attractive and combine with these attributes the effects that are sought by the home builder, the best material only should be applied to the walls. In no case should lime become a part of the stucco, as lime kills the life of the material, as well as its appearance.

It is an erroneous idea that some home builders have that stucco can only be made in the natural

THE BROAD FACE OF A STUCCO-COATED HOUSE WELL BROKEN BY A MULTIPLICITY OF WINDOWS

partakes of the cumbersome type, the sought-after effects having been stifled in the effort to create something different. The true beauty lies in simplicity, and this is easily attained where the effort is made in earnest. Simplicity in design is the most striking evidence of real merit. The insignia

cement color, or confined to gray, of several shades, or white. The inferior grades, it must be admitted, are confined to a limited number of colors, and even then to such shades as will not long retain their original hue. Instances of this are common, and further there are to be seen vast cracks, even loose sections and sometimes large sections falling off.

Good Materials Should Be Used

These defects are laid to the foundation, or to the lath, by the man who has applied the stucco many times, and he seeks to hide his own inferior material or lack of conscientious labor. Good stucco, that which contains no lime at all, only a combination of Portland cement, pure sand or silica and crushed stone, marble, quartz, granite, or whatever aggregate may be used as the finish, when placed upon a foundation of either wood or metal lath or other durable surface will insure the very best possible results to the home builder. It will do more—it will be possible with a material of this kind to make the color effects, not only of many hues, but to harmonize with any desired effect.

The Color Scheme

The colors are of the most delicate hues, and the shades will last as long as the house itself. But there must be care exercised in the building of the home to bring about this result. The entire structure must be built with honesty and good materials should be used in all important sections. If the foundation is weak in any part, we must expect the best quality of stucco to show cracks when the house settles. Even brick and stone will crack under such strains. The fault in this case is due to inferior workmanship.

The lath should preferably be metal, as it has proven its greater service for such work. Where the best Portland cement stucco is used, however, wood lath, when properly applied, will give entire satisfaction to the owner. One thing should be kept well in mind, and this is the security of the roof. If there are any weaknesses in this way, there will be some serious danger of the best stucco being damaged. The base, water tables, sills, door and window frames should be set with care and the other exterior sections of the house in no essential part slighted. The results of this carelessness will act as a loophole and will permit the stucco to show greater or less damage.

Three Coats Should Be Applied

When properly applied stucco should be put on in three distinct coats. The first, or scratch coat, with as much care as the second and final or "dash coat." The second coat serves as a greater foundation and as a surface for the outer finish. This third coat can be either of "rough cast" or "float," according to the nature of the application, one being less uneven in texture than the other. There should be ample time allowed between the application of the several surfaces to permit them to dry out, and become hardened before applying the successive coat.

To make the color effects possible one has to purchase only the best Portland cement stucco, the color being already mixed in, and only needing the addition of water to make it workable. Sometimes marble, granite, or quartz chips or gravel are used to make a more attractive exterior possible. Some

of these, when mixed and applied with intelligence, permit of an acid washing, that brings out most wonderful effects and distinguishes the house for its signal beauty.

Good stucco can be applied to wood, metal, brick or tile surface. In the remodeling of homes it has been found an ideal material. It is so easily applied and the cost so low, comparatively, that it has become one of the very popular materials for home building. It is durable, lasting for years intact, and is accepted by the insurance fire underwriters as a fire resisting material even when applied to frame houses.

Building for Durability

It might be considered, at least by some, to be an inferior and cheap house material. To-day there are a large number of residences coated with the best quality of stucco. The inferior kind is only found on the cheap house. The man who builds the more costly home is insistent upon having only the best, and this costs so little more than the less desirable kind as to be only a trifling reason why it should not be adopted by the home builder. He is not building for a day or a month, but for years, and he should have not only an attractive exterior, but one that will serve him for years and always be to him a source of comfort.

Electricity in the Home

The growing popularity of electricity for a great variety of purposes in the modern home is well illustrated in the case of the residence of a Mrs. Baldwin, located about 15 miles east of Los Angeles, Cal. Here special attention has been given to the lighting effects. On the large uncovered veranda of the house about twenty-five single lights of unusual design attract the attention of the visitor. In one of the rooms a particularly striking placement of electric lamps reflects indirect lighting units on the light colored ceiling and displays many rare and valuable paintings to the greatest advantage.

One of the novel features of this electrified home is the fumeless, odorless kitchenette, where a fully-equipped electric range and other appliances help to solve the servant problem.

There is also an electrically equipped laundry, where electric washing machines, irons, driers and other modern apparatus are in constant service. In the basement of the building is located an electrically-driven refrigerating plant of six tons capacity. The machine produces about 400 lb. of ice each day. Adjoining the plant are the electric vacuum cleaning machines, which extend throughout the house.

Water for drinking purposes is electrically cooled and purified and distributed, while water for the entire establishment is obtained from a well in the remote section of the grounds and piped by means of an electrically-driven pump to a nearby reservoir.

The house, which is of Grecian architecture, stands in the center of a 15-acre plot under the Sierras, with a mountain growing out of the back yard. Surrounded by a clump of trees on the west side of the house is an open plunge completely furnished with lockers, showers and other conveniences.

Estimating Mill and Cabinet Work

Various Methods of Figuring Costs—The Task of the Estimator—His Zeal to Get Business

EARLY all the mill work done by the average wood-working shop is secured by competitive bids, based on estimates of the cost of materials and the amount of labor required. The methods of ascertaining these costs depend largely on the kind of cost system used. When the system gives separate results for each department, and each job is worked completely from rough lumber to finished product, under separate order numbers for each class of items, the cost of the frames, doors, sash, trim and cabinet work can each be ascertained and used as a basis for estimating future work of the same class.

finished product, under separate order numbers for each class of items, the cost of the frames, doors, sash, trim and cabinet work can each be ascertained and used as a basis for estimating future work of the same class.

Margin of Profit

If the cost system simply records the time and material, and the same shop order number is used for the entire job, there will be very little from which to determine the cost of any particular item or set of items, to show whether they were made at a profit or loss; but the total figures will show what the margin is for the entire job. This is better than waiting for the annual inventory to show what the average has been for the entire year, but gives no results that will disclose any leaks in any particular department, that may be easily remedied if discovered and located.

Many shops figure the cost of material and labor from a schedule of prices taken from some standard price list, but they have no means of knowing what it costs to produce the goods in their own factory. The percentage added or deducted from the list price is based largely on the competition to be met in securing the work, and the volume of work already on hand.

Task of the Estimator

The task of the estimator doing the work for such firms is an easy one, says W. J. Malette in the *Wood Worker*, as it is not difficult for an experienced man to count off the list of items from the plans and specifications and tack on the schedule price. In the percentage to be added or deducted is where his judgment will have to be pitted against his competitors, as they may be using the same price list. Frequently this point is decided by the head of the firm in consultation with the estimator, and in many cases, especially in small shops, they are one and the same person. The only possible "come-back" to an estimator, with this method, is an error in the quantity taken from the plans, and

even that will not appear unless the quantities furnished are carefully checked against the estimate list.

In higher-grade work there is very little chance of finding a price list that is reliable, and any firm that does that class of work usually has a cost system that can be depended upon to furnish enough data on which to base a reasonable estimate. Regular work, such as counters, shelving, partitions, etc., can usually be reduced to the cost per lineal foot, but any such method is not very accurate, as there are so many different types, sizes and grades, that vary greatly in cost of manufacture.

Basing Cost in Lineal Feet

An estimator who bases cost on lineal feet should be well acquainted with the type of work wanted and the cost of producing it in his factory, or his figures will be only guesswork, and probably pretty wild at that. Experience is the best teacher in this line, but some firms pay pretty dearly for the inexperience of those who do their estimating. The man who has worked his way up through the factory to the position of estimator is pretty sure to know what kinds of work require the most labor to produce. He will usually figure pretty high on special work—and lose the job to some other fellow who does not know the actual cost of special details and set-ups.

Recently I saw a motto which reads something like this: "Any fool can cut prices, but it takes a good man to produce a better article at less cost." This should be displayed conspicuously in every factory office. The zeal of the estimator to get business often gets the better of his judgment, then he depends on the shop management to take it out of the job some way, if possible, to save a margin of profit.

Problem for the Estimator to Solve

When the estimator for cabinet work bases his figures on the cost of producing the goods in his own shop, he has a difficult problem to solve, for he must first find just how much material will go into the finished product. This requires something besides ability to read blueprints, for the average architectural draftsman knows very little about the construction of the work he shows with his finely-drawn lines. Even when full-size details are furnished, the amount of lumber does not show, as the outlines only can be followed in construction. Boxing can often save a lot of lumber, with no loss of necessary strength or durability, but only a practical mechanic can determine how this can be done to advantage. The proportion of labor to the quantity of lumber is a fine way to determine the cost of cabinet work. This can only be determined by past

experience in the same line and class of work, and a proper cost system will furnish the exact data.

The experienced man who has worked in the shop on small cabinets, with lumber worked into small sizes, knows how much more time it takes to work up and finish 100 ft. of lumber in that way than in work where the lumber is in large pieces. Not only is there the extra cutting of lumber into small sizes, but also the working and assembling them in the cabinet room amounts to nearly as much for small pieces as large ones. Sometimes the very smallness of a special cabinet makes it more difficult to machine and assemble than if it were double or treble the size, with exactly the same number of pieces to be handled.

This fact is very easily overlooked by an estimator who has had no shop experience to guide him in determining the labor cost on this class of work. The only safe way is to refer to the records of the cost system in similar work done previously. Often something entirely different from any previous work will show up, and a price is wanted before the order can be secured; and the successful estimator is certainly not the one who gets the work at too low a figure to make a profit for his firm. He may beat the others by figuring lower, but if his factory cannot produce the goods at the price he gets for them he should be called to account for the loss.

It will not do to try to shift the responsibility for the loss to the shop management, for their business is to produce the goods as cheaply as possible and keep within the specifications, regardless of the contract price—which they probably know nothing about and are not responsible for. Of course, proper care in selection of suitable materials, economy in working, and up-to-date machinery and equipment will materially reduce the cost, but that is another chapter. The cost in the drafting room, for detailing, laying out and billing in the materials for special work should not be overlooked in the estimate, unless that expense is provided for in the percentage added for overhead expenses.

When work is scarce and hard to get at a reasonable price, the estimator is expected to figure pretty low, for no mill can afford to let experienced men go and the factory stand idle, hence work taken for the cost of production, plus overhead expense, is better than none at all. Where the management has won the confidence of the employees by fair treatment and wages in prosperous times, it is quite possible to induce them to stand a temporary cut in wages and so reduce the cost of production. This will give the management a chance to secure some orders that it would not otherwise dare to take at the price offered, and keep all hands busy, even in slack periods.

Efficiency in Modern House Painting

Surfaces to Be Painted Must Be Carefully Considered—Two General Classes—Old Surfaces

AT some time or another most of us have kidded carpenter friends about being "wood-butchers," but now along comes a man who calls himself a "Paint Doctor." Odd, isn't it?

But there is at least an interesting likeness between the physician and the painter. The former must study his patient, learn what is wrong, prescribe and treat him. And the painter, to succeed in all of his work, must consider carefully the surface he is to paint and analyze the conditions under which he is to work.

Things to Do Before Painting a Building

When called upon to paint a building this Paint Doctor thinks it is an advantage to examine it and find out the kind of lumber or paint used, says a writer in the *Carter Times*. If the old paint went wrong, he tries to find the cause, so as to guard against its occurring again. When the paint has scaled, he wants to know why. Was the fault in the paint or the wood? With a case of blistering, was wet lumber responsible, a leaky gutter, a careless painter or moisture from other sources? Was the wood primed with yellow ochre, which absorbs moisture and doesn't dry, or else throws off the finishing coats?

To get the most value out of a paint investment involves quite a comprehensive knowledge of ma-

terials, conditions and men. It means finding out the one best way to paint each house, and that amounts to the much talked of "efficiency" of to-day. No two surfaces are exactly alike, but on new work they may be conveniently divided into two general classes: In the first are dry, porous soft woods, such as white pine, poplar, white wood, cotton wood, etc. The second class consists of such lumber as presents a hard surface well filled with sap, which makes it difficult for paint to anchor itself in the pores sufficiently to avoid scaling, such as pitch pine, cypress, redwood and red cedar.

The White Pine Class of Surfaces

With the white pine class of surfaces it is desirable to get as much oil as possible into the wood and paint. The amount and the quality of the linseed oil used determine the length of satisfactory service rendered by the paint. On new lumber at least three fairly thin coats ought to be applied. To use but two requires that the paint be mixed thick to cover well, and thick paint does not carry sufficient oil to satisfy the lumber and bind the pigment to the surface as well. Too few coats, which means too little oil, on this kind of surface result in premature and rapid wearing off of the paint. In the case of gray or slate colors produced with lamp black spotting, or fading in spots, also results. Thin coats are better than thick because they carry

more oil, dry better and brush out more uniformly.

The pitch pine class of lumber is used to-day on most new buildings. It is not more difficult to handle, but requires different treatment. The priming coat should contain less oil and more turpentine. Probably two-thirds oil and one-third turpentine will be found best on an average and will give a surface that does not possess too high a gloss to take the second coat well. It should dry with a semi-flat or eggshell gloss surface.

The Pitch Pine Class of Surfaces

For the pitch pine class of lumber tests made under the direction of the New Jersey Master Painters' Association showed excellent results from the use of a priming coat mixed in the proportion of 34 lb. of Carter pure white lead, 66 lb. Carter dry red lead, 6 gal. raw linseed oil, 1 gal. turpentine and 1 qt. of japan drier. Finishing coats are of pure white lead mixed in the usual way. This requires a three-coat job, but it is cheap insurance against scaling paint, and three coats will usually wear enough longer than two to offset the little additional expense. When white lead is used with a primer on the pitch pine class of lumber the addition of one-half pint of benzole (solvent naphtha 160 deg.) to the gallon of paint, mixed as usual, will assist the paint to penetrate the pores of the

wood more deeply and gain a better anchorage. Add the benzole to the priming coat only immediately before brushing it on. It evaporates rapidly.

Old surfaces to be repainted may likewise be divided into two classes for convenience, and here again the painter, like the doctor, must analyze. He must look carefully to see what is needed before he can intelligently prescribe the treatment.

Old Surfaces

One kind of surface is that which has always been painted with pure white lead and pure linseed oil, and simply has become discolored from smoke and dust. The oil has worn out pretty well, and after dusting off the building is ready for repainting with no additional trouble or expense. The old paint will soak up oil from the new and thus renew its binder and anchorage in the pores of the wood. Usually two coats of paint, mixed fairly thin and yet sufficiently heavy to cover well make a nice job under these conditions.

The other kind of an old surface to be repainted is the one upon which hard, inelastic paint has been used. Then even if the old paint is not cracked and scaled, it is usually too hard to be penetrated by the oil of the new coat and consequently the new coat of paint merely lays on the surface and must depend upon the old paint for its anchorage; it can not anchor itself in the pores of the wood.

Simple Concrete Step Construction

Details Showing an Easy Method of Making Steps Safe and Durable—Proportions of the Mixture

IT is a well known fact that the steps leading to a building entrance are subject to exceedingly severe usage, and where they are made of wood, with the lower portion in contact with the ground, resulting in alternate wetting and drying, decay is apt to be very rapid, making them unsafe and dangerous. Steps at the rear or kitchen entrance of the house encounter especially hard usage, but it is a very easy matter to have them durable and safe by constructing them of concrete. A simple method of doing this is shown in the accompanying drawing. The three forms consist merely of that many boxes open at top and bottom and also at the end adjoining the door-sill.

A rise of 8 in. and a tread of 10 in. will be found convenient. For this reason the height of each box should be 8 in., since every box will form a step. All of the boxes should be of the same width, but each one is 10 in. shorter than the one beneath it, thus forming the tread of the step. If the steps are few in number and not too wide, 1-in. boards will be stiff enough to hold the concrete without bulging, but if there is any doubt about this it is better to use 2-in. plank.

The concrete for the steps should be mixed in the proportion of 1 bag of Portland cement to 2½

cu. ft. of clean coarse sand to 4 cu. ft. of crushed rock or pebbles. The earth beneath the steps should be excavated to a depth of 6 in. below the surface, the excavation being the exact size of the bottom of the steps. Make sure that the earth is level and compact at the bottom of the excavation.

Place the largest box in position around the edge of the excavation, staking it in place at two or

General View of the "Forms" for Building the Steps

three points to prevent shifting. Level the first box very carefully by means of a carpenter's spirit level. The concrete, mixed rather dry, should be

deposited in the box and thoroughly tamped and compacted until moisture rises to the surface. Work or spade the concrete thoroughly along the sides of the "forms" so as to produce a smooth surface. At the front end of the box, where the concrete becomes the tread, the surface of the concrete is carefully leveled off and smoothed with a trowel for a distance of about 12 in. from the outer edge. Immediately after this is done the second and smaller box is placed on top of the first one, being fastened thereto by a few nails through the upright cleats shown in the drawing. The nails must not be so long as to project through the "forms" and into the concrete. Fill the second box with concrete immediately, being careful that no dirt or other foreign matter falls or collects on the surface of the first batch of concrete, as this would prevent a good bond between the two layers. Finish this step or slab in exactly the same manner as described for the first step. The last or third step is constructed in exactly the same manner as those previously described.

The brace between the two back cleats is for the purpose of preventing the boards from spreading at the side next to the wall. The outer surface of the top step is carefully leveled off with a straight-edge and finished by troweling to a smooth surface. Excessive troweling, however, must be avoided. Not more than a half hour should elapse between placing the concrete for each step so that the concrete first deposited will not harden and set up before the next form is filled. After the steps are about one week old, the forms may be removed and the steps used. After the forms are removed any roughness or irregularities may be smoothed down and the surface of the entire steps finally finished by rubbing with an old piece of emery wheel and water or carborundum and water. Where the work includes many steps, a hollow space is generally left under the main body of the steps to effect a saving in materials. Where this is done the platform and steps are reinforced with steel rods or heavy wire mesh to prevent cracking.

Death of John A. Hill

John Alexander Hill, a dominant personality in the technical publishing field, died of heart disease in his automobile on his way to his business offices in New York on Monday morning, Jan. 24. His end is particularly sudden in the light of the recollection of his seemingly limitless energy and his apparently rugged physique; not yet 58 years of age and the head of a towering business which he had been building up in recent years, he was far from being regarded as at the retiring age, either from the standpoint of the industries he was serving or from that of the properties by which these industries were served and of which properties he was the head.

Mr. Hill's career is a notable example of a successful man who did not find his chosen work early in life. Born at Sandgate in February, 1858, he was 38 years of age before he became a publisher, although for eight years he had been editor of *Locomotive Engineering*. Prior to 1888, when he got his contact with the publishing business, he had

owned and operated machine shops and had been a locomotive engineer. Following his editorship of *Locomotive Engineering*, he became president of the *American Machinist Press* in 1896 and in 1902 the Hill Publishing Company, of which he was president, was organized. Meanwhile, from 1900 to 1902, he served as mechanical engineer of the General Manifold Company, Franklin, Pa., building and superintending the arrangement of plant, designing special machinery, including continuous manifolding machines and other improvements in printing machinery, especially sheet-fed rotary presses.

As head of the Hill Publishing Company, he printed what are known as the Hill engineering weeklies; namely, the *American Machinist*, *Power*, *Engineering and Mining Journal*, *Engineering News* and *Coal Age*. He was president of the Mc-

THE LATE J. A. HILL

Graw-Hill Book Company, publisher of scientific books, and he established the Hill Publishing Company of London of which he was chairman, publishing the European edition of the *American Machinist*, and he established the Deutscher Hill Verlag, A.G., of Berlin, publishers of *Maschinenbau*. One of the big monuments to the efforts of his later years is the great building which he erected on Thirty-sixth Street, New York, to house the editorial, business and printing departments of the Hill papers. Not only is this lofty structure a model in respect to the arrangement and equipment for the convenience and economies of the printing and publishing business, but it is conspicuous among New York's industrial buildings in the provisions for the safety, comfort and health of the employees.

Meeting of Agricultural Engineers

The American Society of Agricultural Engineers held its ninth annual meeting at the Hotel Sherman, Chicago, Ill., Dec. 28-30. During the three days' sessions many interesting subjects were discussed, and the papers and committee reports presented showed that much effort was put forth to make the gathering the most notable in the history of the organization.

Current News of Builders' Exchanges

Campaigns for Increasing Membership of Various Bodies—New Officers for 1916—Christmas Frolic

Christmas Frolic of Cleveland Builders' Exchange

MORE than seven hundred members of The Builders' Exchange of Cleveland, Ohio, assembled in Chamber of Commerce Hall in that city on the evening of Dec. 20 for the annual Christmas frolic of the exchange. The occasion was characterized by the presence of former United States Senator Theodore E. Burton, candidate for president, who at the close of his speech was presented with a miniature "White House" as a token of good wishes from the builders of his native city. A toy residence was presented to President Abram Garfield of the Cleveland Chapter, American Institute of Architects, who was another speaker during the evening.

A large representation of the architects was present due chiefly to the fact that a volunteer company of actors from the chapter put on a play, entitled "Selecting an Architect." This sketch illustrated the trials of a Board of Trustees in a neighboring village, choosing from among several architects the one who should design their proposed church.

A play depicting the difficulties encountered by the public in choosing between different kinds of materials was also a feature of the program, this play being entitled "Life's Toughest Problem, or Shall We Build of Lumber or of Brick?" The question was finally settled at the end of a two-act farce by the presentation of a composite house in which all kinds of materials were given due recognition. The sketch for this house was made by a Cleveland architect who received many compliments for his ingenuity.

Annual Meeting of New Orleans Contractors' and Dealers' Exchange

The annual business meeting of the Contractors' and Dealers' Exchange of New Orleans, La., was held on Monday, Dec. 13, when officers for the ensuing year were chosen as follows:

President Herman H. Thomas
Vice-President J. W. Lennox
Treasurer James M. McGowan
Secretary R. L. McChesney

A Board of Directors was also elected, consisting of seventeen members.

Annual Meeting of St. Paul Exchange

The annual meeting of the Builders' Exchange of St. Paul occurred in December, when officers for the ensuing year were elected as follows:

President A. P. Cameron
First Vice-President Paul Steenberg
Second Vice-President R. A. Beier
Treasurer O. Lampland
Secretary A. V. Williams

The president, departing from the usual custom, presented a brief report dealing with the general history of the work of the organization during the year, the details being submitted in reports of various committees.

The Exchange held its annual "Christmas party" at the Masonic Temple on Friday evening, Dec. 17, the number in attendance being 350. It was a representative gathering of the members, young and old, and embraced contractors, sub-contractors, materialmen, bondmen, etc., etc. The hall was appropriately deco-

rated and a Victrola furnished appropriate music while the guests assembled. The president welcomed the guests in a few brief remarks, delivered several good stories, and then introduced the master of ceremonies—Santa Claus. The proceedings were of a decidedly humorous character and the attempt at preserving order was made by "Officer 666." For his services he was rewarded with a purse of \$1.23. The affair closed with an excellent buffet luncheon, and following the usual custom the Christmas tree and trimmings were sent by the committee to the crippled children's ward at the City Hospital.

Sacramento Builders' Exchange

At a meeting held Dec. 23, the newly organized Builders' Exchange of Sacramento, Cal., named the following as a membership committee: W. Keating, C. Guth, R. Rowe, I. C. Boss, E. Hite, W. Scoville, C. V. Schneider, T. Enwright, P. J. O'Brien, E. S. Warner and B. Scollan. On Jan. 11 an executive committee of eleven members was to be elected.

Officers of Salt Lake City Exchange

At the recent annual meeting of the Builders' Exchange of Salt Lake City, Utah, J. H. Angell was elected president; Martin Benson, vice-president; J. M. Silvers, secretary; A. Rudine, treasurer. These officers with G. R. Cushing, E. H. Dundas and O. Chytraus constitute the board of directors.

Annual Meeting of Lansing Exchange

At the annual meeting of the Builders' and Traders' Exchange of Lansing, Mich., officers were elected for the ensuing year as follows:

President A. H. Heise
Vice-President E. L. Smith
Secretary Robert K. Orr
Treasurer A. L. Bertram

A resolution declaring the Exchange in favor of a Building Code in Lansing and authorizing the appointment of a committee of five to confer with the City Council was passed. It was also decided to affiliate with the National Association of Builders' Exchange.

Membership Campaign by Philadelphia Exchange

The Master Builders' Exchange of Philadelphia, Pa., has just been waging a campaign to increase the membership. There are in the city at least 2000 men engaged in the building business who are eligible to membership, and fifty teams consisting of two members each were organized for the purpose under the management of the chairman of the Membership Committee, W. Nelson Mayhew, president of the Iron Trades Association of Philadelphia. These teams were to compete for two handsome trophies to be awarded to those securing the largest number of candidates. Upon securing 1000 members the dues were to be reduced from \$50 to \$25 per annum. Latest reports showed that good progress was being made, and at a dinner given by the officials of the Exchange on Jan. 11 for the 100 field workers conducting the campaign, a unanimous decision was made to continue the movement until 2000 new members were enrolled.

Brief Review of the Building Situation

Building Operations for December in 120 Cities Show
an Increase of 38.18 Per Cent Over December, 1914

THE value of the building operations for which permits were issued in December compares very favorably with the corresponding month of 1914 and brings the total to approximately the same as that for December, 1913. In this connection it should be borne in mind that December a year ago showed a heavy falling off as compared with the year previous, due to the uncertainties growing out of the European conflict. The reports which reach us from 120 cities of the country indicate a gain of 38.18 per cent, as compared with the same month in 1914, thus showing that the building industry has practically assumed a normal condition.

In the eastern zone, which embraces the territory lying east of Pittsburgh and north of Washington, there are forty-seven cities covered by the accompanying report, thirty-one showing increases and sixteen decreases, with a resultant gain of 39.37 per cent.

CITIES OF THE EASTERN STATES

	December, 1915	December, 1914
Albany	\$458,850	\$330,460
Allentown	21,850	37,275
Altoona	10,601	30,079
Atlantic City	442,344	132,812
Auburn	7,600	6,585
Binghamton	114,808	63,118
Bayonne	127,348	64,100
Boston	2,585,093	3,288,000
Bridgeport	701,740	186,574
Brockton	48,475	14,850
Buffalo	895,000	347,000
East Orange	61,066	115,771
Elizabeth	230,828	33,518
Erie	104,523	73,065
Harrisburg	108,450	17,100
Hartford	318,390	284,605
Hoboken	12,315	10,125
Holyoke	57,900	51,500
Haverhill	357,550	80,000
Lawrence	103,795	152,100
Manchester	54,615	197,467
Montclair, N. J.	256,259	91,061
Newark, N. J.	587,287	311,632
New Bedford	166,180	81,317

Troy	28,935	61,335
Utica	54,150	89,740
Wilkes-Barre	79,786	42,029
Worcester	226,822	175,440

The middle section of the country has the distinction of showing the largest increase, as compared with December a year ago, of the four zones considered. Here, thirty-six cities reporting show increased activity in twenty-nine, while seven show decreased activity in new work projected, the result being a gain of 47.65 per cent, as compared with December, 1914.

CITIES OF THE MIDDLE STATES

	December, 1915	December, 1914
Akron	\$566,425	\$143,420
Cedar Rapids	85,000	547,650
Canton	161,700	37,275
Chicago	10,640,200	6,214,050
Cincinnati	1,113,110	209,045
Cleveland	2,985,825	1,216,775
Columbus	150,340	1,005,200

CITIES OF THE MIDDLE STATES (Continued)

	December, 1915	December, 1914
Davenport	120,985	36,450
Dayton	120,195	23,195
Des Moines	82,355	48,700
Detroit	2,966,360	1,440,370
Duluth	172,491	78,975
East St. Louis	10,795	45,885
Evansville	522,842	13,833
Fort Wayne	106,500	272,000
Grand Rapids	130,770	125,750
Indianapolis	434,736	219,460

Omaha	643,830	216,475
Peoria	171,171	79,925
South Bend	17,003	35,980
Saginaw	12,195	12,450
St. Joseph	37,331	24,395
St. Louis	637,977	278,791
St. Paul	1,942,530	510,646
Sioux City	165,400	66,610
Springfield, Ill.	57,200	38,275
Superior, Wis.	19,240	18,395
Toledo	350,425	144,945
Topeka	26,750	6,625
Wichita, Kan.	188,050	31,700
Youngstown	336,125	38,405

The southern cities reporting show a gain of 42.31 per cent as compared with the same month the year before, there being seventeen cities showing increases and only two decreases, the latter being New Orleans and Savannah.

CITIES OF THE SOUTHERN STATES

	December, 1915	December, 1914
Atlanta	\$254,459	\$132,056
Baltimore	360,842	243,750
Birmingham	140,485	100,307
Chattanooga	92,726	28,258
Dallas, Tex.	311,169	110,025
Huntington	80,189	19,075
Jacksonville	236,663	79,800
Louisville	196,130	188,330
Memphis	110,040	52,200
New Orleans	172,892	274,172
Norfolk, Va.	199,227	54,070
Oklahoma City	61,850	7,865
Richmond	285,187	212,500
Savannah	29,475	42,945
San Antonio	324,500	69,295
Shreveport	87,012	17,817
Tampa	69,370	39,295
Washington	540,679	433,036
Wilmington	108,225	12,282

The striking feature of the results from Western cities is the heavy gain in operations in Los Angeles. San Francisco, Berkeley and Sacramento, while important decreases are found in Denver, Portland, Ore., Salt Lake City, Seattle and San Diego.

CITIES OF THE WESTERN STATES

	December, 1915	December, 1914
Berkeley, Cal.	\$215,900	\$73,700
Colorado Springs	9,265	10,000
Denver	128,440	593,510
Eureka, Cal.	6,585	5,250
Los Angeles	1,030,388	651,639
Little Rock	42,832	36,572
Oakland	286,549	278,891
Pasadena	101,372	48,648
Portland, Ore.	286,445	1,601,355
Sacramento	153,669	59,083
San Diego	64,179	173,135
Salt Lake City	78,760	171,450
San Francisco	1,138,966	717,903
San José	42,164	33,203
Seattle	605,385	1,298,165
Spokane	15,120	18,700
Stockton	129,369	25,420
Tacoma	55,088	43,475

For the entire year just closed the country shows a slight increase over 1914, due very largely to the greater activity in the last few months of the year.

I'm On Main Street Now—

Neponset put me there; my roofing business got so big that I had to move. Neponset Shingles have made me—they will make you, too, if you become the Neponset Man in your town.

NEPONSET SHINGLES

The architects like them, the customers like them. It does me good to walk around and look at those fine looking Neponset roofs—my roofs—and to know that several thicknesses of Paroid weather-proof roofing are protecting my customers from storm, sun and fire. Neponset Shingles are made in red, gray and green.

Builders' Appliances and Equipment

Some Things of Special Interest to Those Having to
do with the Various Branches of the Building Business

Economy in Placing Concrete

THE great economy of the use of small concrete mixers in large foundation work was well demonstrated in constructing the foundations for the new building of the Methodist Book Concern, now nearing completion at the corner of Rush and Superior Streets, Chicago, Ill. This building is designed to house the publication department of the Methodist Episcopal Church in this district and is one of the highest type of reinforced concrete construction throughout, all floors being of reinforced slab concrete. The building occupies a ground area 125 ft. square facing the two streets and extending to an alley in the center of the block. By excavating to the curbs, the

Chicago and Pittsburgh. A view of these mixers in operation is presented in Fig. 1. The great portability of these mixers enabled them to be readily moved along the work on the two streets and the alley side of the building and the depth of the basement permitted the spouting of concrete a considerable distance. By moving the mixers along in this manner, all of the concrete in the retaining walls on the two streets and alley sides and a considerable part of the concrete in the inner retaining wall was spouted from the mixers directly into the forms.

For constructing the pier foundations the mixers were placed close to the retaining walls and moved along as the work progressed. Placed in this position, it was possible to spout concrete directly from the mixers a lateral distance of 20 ft., which permitted all concrete in two rows of pier footings on the two street sides and three rows of footings on the alley side to be spouted from mixers direct to forms. For constructing the center pier footings concrete was spouted into bins from which it was gated into carts for delivery to the forms, but the portability of the mixers enabled them to be so placed that it was necessary to wheel very little concrete a distance greater than 50 ft.

The two wide sidewalks on the two street sides of the building were also constructed with these mixers by moving the machine along as the work progressed and spouting much of the concrete into place. It is estimated that fully three-fourths of the large quantity required at and below the street

to this building was spouted direct from the mixers to the forms. This not only made possible rapid work but greatly reduced the cost of construction.

Fireplace Fixtures

In connection with the equipment of the modern dwelling, the fireplace is one of the features usually included not only for the cheer which it gives during the damp, chilly days when the furnace has not yet been started, but also for the comfort which is derived from the genial warmth it throws out. The fireplace as a device for heating homes is centuries old, but today it is used for style as well as for heating. It is furnished with those articles which add to its attractiveness as well as its utility, and modern ingenuity has improved its construction by the use of dampers, fire baskets, screens, etc., which increase its efficiency and render the fireplace perfectly safe. Bearing upon this important feature of the home the Stover Mfg. Company, 747 East Street, Freeport, Ill., has issued a catalog showing the assortment of artistic fireplace fixtures of colonial and modern design which it makes of carefully selected material and by skilled labor. The information concerning each article is of such de-

Fig. 1—Economy in Placing Concrete in the Foundation Construction Work of a Large Building in the City of Chicago, Ill.

basement was extended 17 ft. beyond the building line on one street and 20 ft. on the other.

The foundations and columns of the structure are designed to carry six stories but only four are built at the present time. The exterior of the building on the first floor is faced with Bedford stone, above which the facing is Hytex Rustico brick with a somewhat elaborate trim of maroon terra cotta. The design of the structure provides a very high basement for large printing presses. To provide ample overhead space in the press-room, the basement was designed for a clear space below the sidewalk of 12 ft. 6 in. The foundation piers rest on 45 ft. piling. To furnish a better foundation, the piling was driven an average of three feet deeper than first contemplated, which necessitated surmounting the concrete footings with foot pyramid bases for the piers. The footings for the piers are an average of approximately 9 ft. square by 18 in. thick and the surmounting pyramids are about 6 feet square at base, tapering to 2 feet square at the top. The retaining walls on all four sides of this building are approximately 13 ft. 6 in. high and are of reinforced concrete.

This construction required a very large quantity of concrete at and below the street level. To mix this concrete the contractor used two "Standard" low charging mixers, made by The Standard Scale & Supply Co.,

tail as to enable prospective purchasers to find no difficulty in selecting the pieces best suited to their requirements. A copy of the catalog can be obtained by any reader on application to the company.

"Northwestern" Concrete Mixer

The 5-ft. concrete mixer which has recently been placed upon the market by the Northwestern Steel & Iron Works, Eau Claire, Wis., while embodying no radical departures, combines old and proven principles of mixer construction with new "wrinkles" to produce a machine which is claimed to give exceptional value for the price. Among the special features of this mixer are a semi-convex discharge drum which eliminates the pockets behind the buckets and drum head, thus giving the contents of the drum an extra turn as they are thrust against the drum head by the action of the paddles, buckets, etc.; the drum track which is exceptionally wide; the counter-balanced drum which is chain-driven and a unique side-loading attachment. The attachment is compact, positive and powerful and the parts are all readily accessible for quick repairs. The engine housing is so arranged that the gearing is completely covered, thus complying with all "Safety First" regulations. The wagon track is standard gauge and the construction of the truck frame is heavy, the latter being made of 5/16 x 2 x 3 in. angle iron with hot

Fig. 2—The "Northwestern" Concrete Mixer

riveted cross sections and corner brackets. We understand that this mixer is also built with a 10-ft. capacity and both sizes will carry a 20 per cent over-load. A general view of the mixer is shown in Fig. 2.

New Handy-Man Book

A new work which contains much interesting and valuable information for the contractor or house owner along the line of modern plumbing and heating supplies has just been issued under the title of the Hardin Handy-Man Book, by the Hardin-Lavin Company, 4533 to 4543 Cottage Grove Avenue, Chicago, Ill. The book also gives much information on installing plumbing and heating supplies of all kinds the new Hardin easy-way as well as directions for making every known repair, together with other useful handy-man hints. We understand that a copy of this book will be sent free upon request. The company, which deals wholesale in plumbing and heating supplies exclusively, selling their goods direct, has just finished its new building, which greatly increases its facilities.

Sunlight Acetylene Gas Machine

The lighting of isolated houses is a problem which confronts the dweller in the country, and one of the solutions is found in the use of Sunlight "Omega" generators, illustrated in Fig. 3, and made by the Sunlight Gas Machine Company, 41 and 43 Warren Street, New York City. These generators are said to be so

constructed as to secure the measure of safety prescribed by the rules of the National Board of Fire Underwriters. There are but two parts of the generator—the generator tank proper and the gas holder. At the top of the generator tank a hopper receives the

Fig. 3—General View of the Sunlight "Omega" Acetylene Gas Generator

carbide, and the quantity of the latter to be dropped or fed into the water of the generator tank below is automatically regulated by a feed device. The gas holder consists of a tank full of water, in which is placed an inverted tank with a bell which receives the gas from the generator and rises or falls with the income or outflow of gas, similar to the large gas tanks in cities. Special emphasis is laid upon the indirect feed of the Sunlight generator—a device simple but efficient in construction, consisting of a double oscillating or swinging shutter cup. The carbide in the upper part passes into the lower cup and thence down into the water so that there is no direct connection between the carbide in the hopper and the water below. The arrangement of parts is such that in case of a leak through a broken pipe anywhere in the building, for example, the machines is automatically stopped. Reference is made to the clear white diffusive light produced and to the economy of operation and maintenance. An attractive catalog which the makers have issued sets forth at length the merits of this generator and at the same time shows the general construction.

Parks' New Drum Sanding Machine

A drum sander which has just been placed upon the market with a view to meeting the demand for a low-cost machine is that illustrated in Fig. 4 and which is made by the Parks Ball Bearing Machine Company,

Fig. 4—Parks' New Drum Sanding Machine

Station A, Cincinnati, Ohio. The sand drum has proven to be a great labor-saving machine for smoothing up all kinds of hard and soft woods whether it be those which have laid around and require to be freshened up, or material that has never been planed. In the ma-

Plate K1007, Kohler enameled one-piece sink, with right-hand drain-board

The KOHLER trade-mark appears on every piece of KOHLER enameled plumbing ware. It is incorporated in faint blue in the enamel, at the point indicated by arrow.

A KOHLER SINK will add to the attractiveness of any kitchen

KOHLER trade-marked sinks have no joints or cracks to gather dirt or make cleaning difficult.

A KOHLER sink will add attractiveness to any kitchen, and make a special appeal to every housewife.

The KOHLER trade-mark is a guarantee of the highest quality, and prevents substitution of inferior ware.

Choose KOHLER Enameled Plumbing Ware for bathrooms

The "Viceroy" built-in bathtub is something new in enameled plumbing ware. It is cast in one piece and has many other features that make it notable.

It is enameled all over; full size; 24 inch width inside; 3 1/2 inch roll rim; lightest tub of its class and design; low price, due to manufacturing economies.

Your dealer will be glad to show KOHLER trade-marked, enameled plumbing ware and quote prices.

chine here illustrated the self feed is such that it relieves the operator of the hard pressure required to hold a board by hand and also avoids the danger of a board being jerked from under the hand and thereby cutting him with the sandpaper. The roll, being covered with a coarse grade of sandpaper, serves to pull the board through. The feed works with a link belt from drive shaft and can be changed by using different sized sprocket wheels to feed fast and slow. It is adjustable for different thicknesses by means of handwheel screws which are provided with a spring to allow a variation of thickness up to 2 1/2 in. between the roll and the sand drum. The feed is arranged to swing down below the surface of the table so as to clear it when extra wide material is being run or for sanding boards on the edge. The double-drum sander furnished by the company has a feed on each drum, the one in front being arranged so as to swing down in front of the machine while the other swings down in the rear of it so as to clear the table surface. The great advantage in using the double drum sander is that coarse paper can be used to cut rapidly on one drum while fine paper for finishing may be used on the other.

A New Lansing Concrete Mixer

No doubt many a building contractor doing country work has been greatly disappointed in not being able to purchase just what he wanted ever since concrete mixers were first placed upon the market, namely a high-wheeled wagon-tread mixer. He justly claimed that if the manufacturers of mixers had to take their machines over the rough country roads from one job to another his needs would soon be recognized and

Fig. 5—General View of New Lansing Mixer

supplied. With this ever-increasing demand therefore in mind, the Lansing-Company, Lansing, Mich., has placed on the market what is known as the "Lansing No. 5 Roadster," a general view of which is presented in Fig. 5. This is a 5-ft. split bag machine. It has front wheels 24 in. in diameter and rear wheels 30 in. in diameter that follow a wagon track. It has in fact all the ear-marks of the larger and well-known Lansing mixers and is equipped with either side loader or batch measuring hopper, a rotary pump, silo hoist or folding platform. The side loader feature is the open end type, and is said to be the first open end skip ever placed on a small side-discharging machine. The company points out that it has plenty of power and this coupled with a minimum low weight renders it a desirable machine for country use. The motive power may be an Ideal or Novo engine according to preference.

New Office Building for "Sterling Homes"

The International Mill & Timber Company, Bay City, Mich., well known manufacturers of "Sterling Homes," has recently taken possession of its new fireproof, hollow tile, brick-faced office building which covers an area 100 x 100 ft. in size. It is located next door to the mills of the company and on the first floor are executive offices done in mahogany and opaque glass for the doors. On the second floor are the incoming and outgoing mail departments, the customers' room, the typists' department with room for forty operators, the billing department and the manifold room, together with men's and women's cloak and retiring rooms. On the third or top floor is a large drafting room, flooded with light from numerous windows on two sides and also

The Bigger Market

The rapid increase in the demand for permanent, fireproof construction at popular prices has created a big market for dependable Concrete Blocks.

Many Contractors have realized this and are now supplying their trade with beautiful, permanent, fireproof Concrete Block structures at a cost as low as that of less desirable materials.

Ideal Concrete Block Machinery

because of its interchangeable and face down principles enables these Contractors to make a wide range of concrete blocks in many sizes, shapes and with varied surface treatments.

This is a business proposition of proven merit that holds big returns for the man who has the ability to give this business the attention it deserves.

We are experienced in equipping plants for the manufacturing of Concrete Blocks. Can we help you get started in this profitable business?

Ideal Concrete Machinery Company

1310 Monmouth Ave.

Windsor, Ont., Canada

Cincinnati, Ohio

from the indirect lighting system that is used throughout the building. An interesting feature of the equipment in this department is the Wickes blue print machine which grinds out prints continuously all day long.

The partitions on the second and third floors are all glass and Beaver board panels.

Neponset Wall Board for Exhibition Booths

One of the many uses to which Neponset wall board can be advantageously utilized is in fitting up exhibition booths, the general effect produced being clearly indicated in Fig. 6, which represents a room for exhibition purposes in a large hall where many other exhibits were arranged. While only a temporary construction, it will be seen that it has all the attractiveness of permanency of an interior of a dwelling. In building this booth quartered oak and cream white Neponset finishes were used. These, it may be remarked, are waterproof,

Fig. 6—Showing Use of Neponset Wall Board in Connection with Exhibition Booth Construction

requiring no painting so that it was simply a matter of putting up the sheets of wall board, covering them with battens and arranging the furniture and fixtures. These rooms not only make an excellent place for the exhibition of goods, but are of benefit to those putting up the material for the reason that they are the center of attraction and cause a great deal of comment on the part of the many visitors which crowd the rooms during the period of an exposition. The new heavy weight quartered oak Neponset wall board, also made by Bird & Son, East Walpole, Mass., is especially attractive and an excellent material for making wainscoting and paneling in dining rooms, etc.

Winthrop Tapered Asphalt Shingles

A form of roof covering which is meeting with decided favor in various sections of the country consists of Winthrop tapered asphalt shingles which are referred to as being easy to lay, and which are shaped like wood. The shingles are made of wool felt and asphalt, and into the exposed surfaces of the latter fine chipped slate is rolled under heavy pressure. The shingles are made in red, gray-green and slate-black so far as colors are concerned; are low in cost, light in weight and very durable. They are laid on the roof with ordinary shingle nails. The Beckman-Dawson Company, makers of these shingles, with offices at 1400 Association Building, Chicago, Ill., will send samples and prices to any architect or builder who may be interested in this form of roof covering. As showing the satisfaction which the shingles have given, a firm of contractors using them on more than one hundred roofs of buildings located near salt water state that they have had only one leak to repair.

The Comfort Chemical Closet

Doubtless there are many carpenters and builders among the readers of this journal who are interested

LANSING

Contractors
Are Laying the Foundation
of Their Reputations With

Lansing Equipment—Mixers to Wheelbarrows

In every town or city there are one or more contractors who stand out from the others. The concrete jobs they do, large or small, stamp them as better contractors. The reason is simple enough. They are not only painstaking and careful with their work, but they employ the best concrete mixers and equipment; insuring their work being done efficiently and on time.

For every contractor there is a Lansing Mixer. It will help you do a better job and consequently

get more business. Lansing Mixers have made great records for low concrete costs. You cannot afford to be without one. Do your own mixing and do it with a Lansing, instead of by hand. Put the profits into your own pocket. You may need them as much as somebody else. Light in weight, easily portable, they are quickly moved from one job to another. Lansing Equipment is behind the success of hundreds of contractors. Why not let it help you?

CAUGHT IN THE ACT—

This "LITTLE DEVIL" was caught, as shown above, in the act of mixing 894 lineal feet of concrete for curb and gutter in one day's run.

The "LITTLE DEVIL" when caught was in front of the residence of the Mayor of Lake Forest, Ill.

The Polk Concrete Construction Co. is the proud owner of this machine.

You won't find many machines of the same size that will equal the record mentioned above—and they were not trying for a record. They simply had a contract to finish and were doing a good day's work.

If you are mixing concrete by hand, or if your present mixer is not doing an honest day's work—it is time for you to get acquainted with the "LITTLE DEVIL."

Don't wait.

Write today for an introduction.

If you are going to visit the Cement Show at Chicago be sure and call. The "LITTLE DEVIL" will be there.

Chicago Builders Specialties Co.
1415 Lumber Exchange, Chicago, Ill.

in adding to their business, especially during otherwise comparatively dull seasons, and they will therefore find much to command their attention in the proposition of the Comfort Chemical Closet Company, 322 Factories Building, Toledo, Ohio. It relates to the odorless, sanitary, germproof, Comfort, in-door closet, a sectional view of which is presented in Fig. 7. It is adapted for use in dwellings, schools, stores, hotels, public buildings and is recommended by physicians and State Boards of Health. It can be readily installed and is a great convenience in houses lacking sewage connection.

Fig. 7—The "Comfort" Chemical Closet

A circular which the company has issued gives full information regarding the details, and the builder who is desirous of being appointed agent in his territory for the closet can obtain the information by application to the address given.

A Fireproof Construction at Less Cost Than Wood

The growing tendency toward fireproof construction in connection with private residences is well illustrated in the residence of Prof. G. B. Pegram of Columbia University, New York City, and a general view of which is presented in Fig. 8. In harmony with the trend of safe building methods this substantial residence was constructed with Berger's Metal Lumber in conjunction with expanded metal lath, making an absolutely fireproof construction at "a smaller cost than the lowest bid of the general contractor based on the use of wood joists and studs for the building." It may be interesting to state that metal lumber is punched with prongs on the flanges to which expanded metal lath is attached. The blow of the hammer bends the prong up over the lath, thus clinching it securely so that no wiring of the lath is required. In this way "the necessary ground work for plastering and concreting was secured, and at the same time greatly

Fig. 8—House of Fireproof Construction Which is Said to Cost Less than Wood

facilitating the work while materially reducing the cost of construction." Berger's Metal Lumber and Expanded Metal Lath form a structure that is practically a unit and perfectly rigid even before concrete or plaster is applied. The elimination of combustible materials is the important factor in the results obtained. In addition a sound, damp and rodent proof construction is assured. This combination is also particularly desirable on account of its safety, strength, durability and economy, while a noteworthy feature is

Send for sample of FIBERLIC and prove our claim. Also ask about the special FIBERLIC paints and stains that come in 24 different colors and shades.

For Walls and Ceilings

Fiberlic

Made This Effect Possible

The bathroom illustrated here is an example of what can be done with FIBERLIC for distinctive effects in sanitation. This room was finished with white enameled FIBERLIC. After being applied it was treated with white enamel.

The builder who specified wall board for this construction selected FIBERLIC because he required a wall board that would be absolutely sanitary and vermin-proof. FIBERLIC reaches the 100 per cent mark of perfection in these and all other essentials. This superiority is due solely to the exclusive patented chemical treatment that impregnates every fibre.

FIBERLIC answered the call and proved more economical than lath and plaster because it is nailed right to the studding. It is also more serviceable than tile.

FIBERLIC has superior strength, durability and rigidity. It is odorless, fire-resisting, sound-deadening and thoroughly sized throughout.

You can safely specify FIBERLIC for any kind of room in any kind of building.

THE FIBERLIC COMPANY, CAMDEN, N. J.

LONDON (England) BRANCH: MacAndrews & Forbes, Ltd., Finsbury Court, E. C.

the fact that it can be used in any type of building and in any climate.

The architect of Prof. Pegram's house was William B. Claffin and the construction specialist was F. W. Conner.

The "Boss" Concrete Mixers

The American Cement Machine Company, 1180 Johnson Street, Keokuk, Iowa, has issued an attractive catalog entitled "Specifications," which relate to the leading lines of concrete mixers turned out by this concern. Special reference is made to the "Boss," which embodies a high speed "Re" mixing action which it is claimed mixes and discharges the concrete faster than is usually the case and with fewer drum revolutions. It is claimed that a batch may be mixed in 15 seconds and discharged in from 10 to 15 seconds owing to the fact that the discharge spoon extends nearly two-thirds the way through the drum and every one of the deep scoops or buckets discharges into it. The claim is also made that the machine will mix concrete, grout or semi-dry mortar and plaster. It is practically self-cleaning, and its constructive features are such as are likely to interest contracting-builders generally. It is made in sizes and styles to meet varying requirements and in the catalog in question full information concerning the salient features is set forth. Attention is also called to the "Boss" hoisting attachment, and to watering devices for concrete mixers. A page of the catalog is given up to detailed tables of capacity and weights of "Boss" mixers; also diagrams showing the general dimensions.

Architects' Convertible Level

One of the latest candidates for popular favor in the way of an architect's level is the instrument which we illustrate in Fig. 9. It consists of an improved 12-in. convertible level, and has been especially designed for the requirements of builders, architects and contractors. An important feature of the construction is a patented

axis for converting the instrument from a level and adapting the telescope to sighting vertical lines. This axis is cast in one piece of hard phosphor bronze, which is claimed to increase rigidity and give a reliable and permanent adjustment. The axis is securely attached to the telescope by means of two thumb screws, and the arrangement is such that the change requires but a few seconds to convert the instrument for use as a level

Fig. 9—A New Architects' Convertible Level

from its position for taking vertical sights without detaching the axis from the telescope. This level is made by the New York Blue Print Paper Company, 58-60 Reade Street, New York City.

Blystone Batch Mixer

For Plaster-Concrete-Mortar

A saving of \$25.00 per day was made in mixing hardwall plaster for the big Machinery Palace for the Panama Pacific Exposition.

The Cement Tile & Block Mfg. Co., of Osgood, Ohio, paid for their Blystone in three months work in their block plant.

One man slaked lime and made mortar for ten masons and had time to spare for other work on a job recently done by G. Ed Berry, of Harrisburg, Ill. Mr. Berry also says he got 10% more mortar per barrel of lime.

H. A. Farmer, St. Petersburg, Fla., recently wrote us as follows: "I am so well pleased with mixer, I want another just like it. Ship me another one as soon as possible."

Write for Catalog Today

Blystone Manufacturing Co.

1115 Day St., Cambridge Springs, Pa.

most radical departure in the line of expansion bolt design that has been brought out for a number of years is the "Diamond X" which has just been placed on the market by the Diamond Expansion Bolt Company, 90 West Street, corner of Cedar, New York City. In Fig. 11 is shown a view of the shield with lag screws complete, while in Fig. 10 is shown the eccentric action of the screw. The statement is made that the screw enters the outer end of the shield through a central aperture and emerges from the side of the shield as it

"Diamond X" Expansion Shield. Fig. 10—Showing Eccentric Action of the Screw

Fig. 11—View of Expansion Shield with Lag Screw

progresses, thus bearing upon the side of the hole and with increasing displacement secures a powerful hold by it under contact with the wall and by forcing the shield against the opposite side. The device is referred to as the most simple form of expansion shield for heavy duty that has been devised, the shield being a single unit. The new shield has met with great favor among contractors, builders, plumbers, steam fitters, iron workers, and in similar lines of construction work. Until such time as all of the dealers have demonstrated this shield to their customers the Diamond Expansion Bolt Company is furnishing demonstration orders for this purpose. Such demonstration orders may be had by dealers now selling expansion bolts who desire to show the new shield to their customers. A free sample will be furnished upon application with the privilege of return should the new shield not prove in every way satisfactory to the user.

The "Keep Warm" Weather Strip

The "Keep Warm" metal door and window bottom weather strip illustrated in Fig. 12 has been placed on the market by the Up-to-Date Manufacturing Co., Inc., Lytton Building, Chicago, Ill. It is made of 22-gage cold-rolled steel, selected hardwood and genuine live rubber. While it was originally designed for installation on door bottoms only, the company discovered that it was equally effective on windows and many other places, where it has been used with excellent results. The steel is formed in such a manner that it lays

Fig. 12—The "Keep Warm" Weather Strip

tightly against the door at its top, while the bottom forms a watershed. The heavy rubber loop is fastened between the steel and the hardwood strip in such manner that it rides easily over the sill both ways when the door is opened or shut. When shut it lays tightly against the sill, rendering the opening absolutely weather tight. It has been found effective in keeping the house free from cold air, dust, rain and snow. It can therefore be used to advantage all the

"The STANDARD" Line

Reversible Light Hoist, especially designed for operating double platform contractors' elevators; readily adapted for direct hoisting with single line. Very simple reversing.

Reversible Hoist the most popular size for operating Two-Platform Elevators up to five or six stories. A load can be held at any desired elevation by a heavy brake band with footlever and ratchet.

Single Line Hoists Suitable for a variety of work. The clutch mechanism is on the same shaft with the Drum. These outfits may be used for handling a Pile Hammer as well as for regular hoisting.

Greater Success depends on the equipment and the

Just as the success of the modern battle depends on the performance of the troops and the efficiency of the artillery—so do the profits of the modern contractor depend upon the organization and the fitness of the equipment.

Greater results are obtainable only when every piece of machinery fits the job—and its operation is both simple and economical.

Make every turn of the wheel produce—eliminate lost motion. You who are getting ready for a big year should by all means consider the fitness of your equipment. Preparedness means just as much to the contractor as it does to our naval and military establishment. Don't judge or buy equipment on the price basis alone—adaptability and simple operation mean more than a few dollars to the busy contractor.

Be assured of constant service, low cost of operation, adaptability and simplicity by using "The Standard" line of equipment.

"THE STANDARD"

Have you noticed how many of these speedy workers are found on concrete jobs everywhere.

The low charging feature—making each outfit especially adaptable to every job and condition—cuts labor and power bill one third. It says nothing of the saving on first cost by eliminating the unnecessary charging devices, and avoidance of break down and delays.

Let us show you how adaptable low charging is to your work.

ATLAS PORTLAND CEMENT
The Standard by which all other makes are measured

year round, for the company claims that it is not affected by any weather conditions and will last for years. It is made in two grades, standard sizes 29, 31, 33, 35, 39 and 41-in., or 1 in. shorter than the width of the door or window. Sizes between these are easily cut and special lengths are furnished to order. Grade A-1 is furnished in black enamel, baked on, and oxidized copper, while the second grade is made in black enamel only. Each strip is furnished with the necessary screws and is easily attached in a few moments on single or double hinged doors. Prices may be had on application to the company at the given address.

Ideal Engine Company

At the annual meeting of the stockholders of the Original Gas Engine Company, Lansing, Mich., it was unanimously decided to change the title of the corporation to "Ideal Engine Company." This change was made for the purpose of bringing about closer relationship between the title of the corporation and its products—Ideal gasoline engines and Ideal contractors' equipment. It was also voted to increase the capitalization from \$150,000 to \$300,000.

C-M-T Coating for Exterior and Interior Surfaces

Some interesting information relative to the use of what is known as "C-M-T" coating for exterior or interior surfaces, whether of cement, concrete, brick or stone work, is contained in a circular sent out by Eugene E. Nice, 272 and 274 South Second Street, Philadelphia, Pa. The coating is also adapted for floors, and in the directions which are given it is stated that two coats should be used in order to obtain the best results. The first coat should be applied with a fairly full brush, but well brushed out so as to secure a thin, evenly distributed coat. The second coat should be applied with a full brush and flowed out a little heavier but evenly

distributed and not too much extended. The point is made that one day at least should be allowed to elapse between coats, and that the material should not be applied on a wet or greasy surface.

TRADE NOTES

Universal Portland Cement Company, Chicago, Ill., distributed a New Year's Greeting in the shape of a card worded as follows: "Universal Portland Cement Company thanks you for the pleasant and friendly relations it has enjoyed with you during 1915 and will do all it can to merit their long continuance. It hopes that the new year holds for you an unprecedented measure of success and happiness."

Wise & Ginsburg, civil engineers and architects, 11 Bloomfield Avenue, Passaic, N. J., have opened another office in the Post Office Building, Nutley, N. J., and would be glad to receive manufacturers' catalogues for their reference files.

Hyde-Murphy Company, Ridgway, Pa., makes announcement that its eastern office is now located at 10 East Forty-third Street, New York City.

International Heater Company, Hickory Street, Utica, N. Y., points out that its International "Onepipe" heater opens an entirely new field for profits to the building contractor. As the heater has only one pipe it requires no skilled labor or tools to install other than a screw-driver, a hammer and a saw. The claim is made that it will comfortably heat every room in an average house of ten rooms or less. The heat rises from a single register through open doors and upstairs

(Continued on page 94)

"—it's a handy hoist to have on any job—"

The busy contractor will find in the Ideal "Single Line" Hoist one of the handiest pieces of equipment on the job.

Light in weight—sturdy in construction—low in operating cost and powerful in operation.

An adaptable hoist for handling short lifts under cramped or crowded conditions.

As a general builder's hoist it completely eliminates hand hoisting.

An Ideal "Single Line" Hoist costs less to buy—will outlast and give better service than any hoist on the market.

Ideal "Single Line" Hoists

Built 2 sizes, 4 and 6 H.P., capacities 900 and 1500 pounds—steel skid mounted, small floor space, 10-inch winding drum, extra strong brake. Drum will handle 650-foot $\frac{1}{2}$ -inch cable. Running speed 100-125 per minute. By the way—note the power factor, the ever-ready Constant Service Ideal Engine.

Keep Your Men Busy This Winter at a Big Profit to You

THERE IS A BIG PROFIT TO YOU IN SELLING AND LAYING "SANTILITE COMPOSITION FLOORING" IN THE

DULL WINTER MONTHS.

As you know, "SANTILITE COMPOSITION FLOORING" is laid just like plaster $\frac{1}{8}$ of an inch thick on any sub-floor of wood or cement—sets in 6 to 8 hours into a smooth, jointless absolutely sanitary surface without cracks to collect dirt, germs and filth—absolutely no trouble to keep clean—never grows dusty regardless of wear—extremely easy to stand and walk upon—fire will not burn it—water will not soak it—of permanent pleasing appearance—never requires painting and will last the life of the building.

"SANTILITE" is the ideal floor in the home for the kitchen, pantry, bath or any room where a sanitary, dustless floor is wanted. It is extensively used in the factory for offices, halls, lockers, toilets in the store, restaurant, cafe, public or semi-public building in areas subjected to heavy wear where a pleasing appearance, durability and absolute sanitation are required.

There are many masons, building and cement contractors who are making big profits in selling and laying "SANTILITE." It enlarges that branch of your business where there is an ever-increasing demand—every home with a wooden bathroom or kitchen floor needs it—every public place that has lots of wear must have it. You will find that there is little competition in your own locality and it is especially attractive, for it keeps your men profitably busy during the closed or Winter Season.

Write for samples, illustrated instructions for laying "SANTILITE" and our proposition to make your winter's work profitable.

SANITARY COMPOSITION FLOOR CO.

into the various rooms. A booklet containing the company's proposition can be obtained on application.

The Atlas Portland Cement Company, 30 Broad Street, New York City, has prepared complete Specifications covering stucco construction and makes announcement that it will send them free to any builder upon request. The Specifications cover the kind of construction, foundations, selection, mixing, application and setting of materials and finishes.

The calendar for the new year which is being sent out by the Samson Cordage Works, Boston, Mass., is a neat affair and intended for desk use. It measures 5 in. in width by 4 in. in height and consists of a heavy piece of cardboard, to the lower portion of which are attached the leaflets for the different months of the year. The space above carries the words, one above the other, "Samson Cordage Works," the letters being embossed in imitation of sash cord. Upon the back, or rather on the standard which supports the calendar, is a picture of "Samson Spot Sash Cord," which is the company's extra quality, "warranted free from imperfections." There are a number of colored spots in the cord and these constitute the company's trade-mark, being used only in this quality to distinguish it from common cords which are coarse and rough and wear out quickly by abrasion. The statement is also made that interested readers may obtain a copy of the company's catalogue and samples upon application.

Many a builder has found it profitable in numerous ways to make use of a motor truck in connection with his business, and wide awake and enterprising contractors all over the country will find interest in the announcement of the Federal Motor Truck Company, 562 to 570 Leavitt Street, Detroit, Mich., in regard to Federal trucks. The claim is made that this vehicle is a time and money saver for the building-contractor and some interesting figures regarding low-cost haulage can be obtained by writing the company.

J. E. Porter Company, 620 Fremont Street, Ottawa, Ill., offers to send to builders a copy of its New Barn Plan Booklet and complete catalog upon receipt of a letter containing the names of persons who expect to build or remodel barns. The company suggests that the local builder ascertain the prospects for barn building in his community, then call upon the company for any assistance relative to interior arrangement, construction, ventilation, etc., as the Porter Free Service Bureau is maintained for the benefit of all those interested in better barn construction and equipment. Floor plans are submitted without expense or obligation and any additional information is furnished upon application.

Lehigh Portland Cement Company, Chicago, Ill., has appointed T. L. Hughes District Sales Manager at New Castle, Pa., in place of P. A. Jandernil, resigned. The appointment became effective Dec. 28, 1915.

The Aberthaw Construction Company, Boston, Mass., is undertaking an exhaustive investigation regarding the effect of vibration of structures, and will greatly appreciate any suggestions or reports of experience that readers of THE BUILDING AGE may be able to send them.

Universal Portland Cement Company, Chicago, Ill., favors us with a poster calendar for the New Year which is of striking design. The upper panel is embellished with the picture of a hard-working man carrying upon his shoulder a bag of Universal Portland cement, while underneath is the inscription "Concrete for permanence." The calendar proper consists of twelve leaflets measuring 11 in. in width by 10 $\frac{1}{2}$ in. in height and printed in colors. The figures and lettering are of sufficient size so that the days of the week and month

may be readily seen from a distance. At the bottom of the poster and below the leaflets is a line reading, "40,000 bbls. daily."

The Diamond Expansion Bolt Company, 90 West Street, New York City, is distributing an illustrated folder telling how to reduce the "cost of making attachments." This, it is pointed out, may be accomplished by the use of "Diamond X" shields in holes drilled with a "Diamond" rapid fire drill. Reference is also made to Diamond screw anchors and Diamond reversible toggle.

Wayvell Chappell & Co., makers of the automatic ball bearing electric surfacing machine, recently illustrated and described in these columns, has removed its offices to 358 West Madison Street, Chicago, Ill., which is a much more central location and where the company has its full line of machines ready for demonstration.

Yale & Towne Mfg. Company, 9 East Fortieth Street, New York City, makes announcement of the appointment as general manager of E. C. Waldvogel, who has been connected with the company for the past eleven years and has successively filled the positions of traveling salesman, sales manager, and assistant general manager. In addition to the duties belonging to his new office Mr. Waldvogel will have general supervision of all sales, domestic, Canadian and export.

Among the pleasant incidents of the Christmas holidays at the works of the L. S. Starrett Co., Athol, Mass., was a gift to the 1000 employees of a sum equal to 2 per cent of a year's wages.

Link & Haire advise us that on Feb. 1 they will move their architectural office in Billings, Mont., to the third floor of the New Montana Power Building.

Ideal Concrete Machinery Co., 1310 Monmouth Avenue, Cincinnati, Ohio, points out that the rapid increase in the demand for "permanent," fireproof construction at popular prices has created a big market for dependable concrete blocks, and that the latter may be made on Ideal concrete block machines. The parts being interchangeable and use being made of face-down plates, enables the contractor to turn out a wide range of blocks in many sizes and shapes as well as with varied surface treatment.

The Republic Iron Works, Box 451, Tecumseh, Mich., is calling the attention of builders to its Republic "Light Ten" concrete mixer, which combines a number of "money-making features." It has, among other things, a 26-in. opening for easy cleaning; a large 34-in. cast hopper for rapid and easy loading; a rapid 12-second discharge; a 24-in. low charging platform with automatic power loader if desired; heavy glass and a compact steel construction.

The Loudon Machinery Co., 5401 Court Street, Fairfield, Iowa, has issued an interesting work entitled "Louden Barn Plans" containing 112 pages of practical information relating to the subject indicated. There are more than fifty plans of barns and other farm buildings and the book treats of every phase of modern barn construction, drainage, concrete work, lighting, ventilation, etc. The published price is \$1, but the company states it is free to those who build barns.

E. C. Stearns & Co., 400 Oneida Street, Syracuse, N. Y., shows in a catalog which it is distributing a few of its complete line of cement workers' tools. The latter are of such variety as to meet all reasonable requirements and are made in iron or bronze, thus rendering them strong and durable. A copy of the catalog in question can be had by applying to the company.

Over Five Million in Use

The demand for anything never reaches into the millions, unless there is downright merit in the product.

'Way back in June, 1890, over twenty-five years ago, the General Hospital (Surgical Building), Rochester, N. Y., installed Pullman Unit Sash Balances. They report that these Balances are in fine working order today. Their noiseless operation appealed to them.

In the Wilsonia, a fine modern apartment in Rochester, Pullman Unit Sash Balances are used for all the windows. The windows are large and the service severe. The owner says: "They move as noiselessly and easily as though supported by an air cushion." He also reports a saving of about \$1.00 per window through their use.

Pullman Unit Sash Balances are fast supplanting cords and weights. They require only a small mortise, and as they have a uniform size face-plate, the mortises can all be cut at the mill when the frames are made.

Every balance is guaranteed to give satisfactory service for 10 years. Does such a balance and such a guarantee interest you?

We issue a handsome catalog with blue prints. It's worth sending for.

Pullman Mfg. Company
8 Industrial St., Rochester, N. Y.

Willis Mfg. Company, Galesburg, Ill., has issued an interesting catalog covering fireproof metal doors and windows, skylights and ventilators, a copy of which can be had by any reader of THE BUILDING AGE upon application to the address given.

The January issue of the "Grinnell Automatic Sprinkler Bulletin," published quarterly by the General Fire Extinguisher Company, 271 West Exchange Street, Providence, R. I., contains some very interesting information regarding the protective merits of automatic sprinklers when properly installed in buildings, and cites a number of recent fires which emphasize the necessity of sprinkler protection.

Imperial Brass Mfg. Company, Harrison Street and Racine Avenue, Chicago, Ill., has recently issued an attractive catalog of Imperial hardware products, embracing, among other things, door guards, push plates, thresholds and kick plates. While the company has limited the listing to such designs as might be termed standard patterns, it has a large assortment of designs not shown within the covers of the catalog. Among the numerous illustrations is a door embellishment designated as "an Imperial Creation," designed and constructed for P. & F. Corbin.

Diamond Metal Stamping Company, Kerr Street, Columbus, Ohio, is distributing an attractive folder relating to the metal weather strips which it manufactures, adapted to doors and windows of all kinds. Special attention is directed to the many features embodied in this weather strip and emphasis is laid upon the fact that the phenomenal growth of the company's business in the past five years has been due to the satisfaction which the strip has given. Accompanying the folder is a pamphlet showing 102 houses of the Girard Estate, Philadelphia, Pa., the doors and windows being fitted with Diamond metal weather strips. In addition to the halftone engravings of the houses in question there are pages of letters from some of those who have used the weather strip in question and testifying to the satisfaction which it has given.

Architects, builders and contractors will be interested in learning that the business of the Dearborn Hardware Mfg. Co., Carroll Avenue, has been consolidated with the Payson Mfg. Co., 2920 Jackson Boulevard, Chicago, Ill., and these united interests will continue the business under the style and title of the latter named concern. The Carroll Avenue factory will be continued to be operated indefinitely.

We will receive applications for high grade draughtsman, experienced in all kinds of elevator work. Good salary and future assured to the right man.

Address "H. A.," care *Building Age*, New York.

Better Lumber

A. Van Buren, Hazelton, Idaho, writes: Am satisfied. I saved more than \$250, besides getting better grade materials.

Oscar Indergard, of Gorham, N. D., writes: We saved \$300. When we need more lumber, we will know where to go to get good lumber, cheap.

At big Saving

K. M. Roti, of Fairview, S. D., writes: Very highly pleased with the quality of the material, also my client. He saved \$188 on this bill.

Will Sharp, Springdale, Mont., writes: Your \$19 lumber costs \$30 here; your \$16 lumber costs \$24 here.

Write H-L-F NOW

You can't beat this combination of better lumber at a big saving. Deal direct with H-L-F—the producers. No middle profits. No in-between sorting. But better lumber for less money.

WRITE TODAY, sending your bills of materials for quick quotation, or send sketch of house showing dimensions, for quotation without material bill. Big savings possible by buying now, and sleighing means easy hauling. Send 10c for Prize Plan Book 4c for Barn Builder's Guide, New Millwork Catalog and H-L-F House Pricer free on request.

WALLS AND CEILINGS

We will also give you complete specifications and approximate cost of material needed. This service is absolutely free, and implies no obligation on your part. We do this because we want every builder to know what can be done with this new and wonderful wall and ceiling material. Write us to-day and let us help you get that job you are bidding on.

CORNELL WOOD PRODUCTS CO., 306 Insurance Exchange Bldg., Chicago, Ill.

You Can "Boost" Stucco with Big Profits

—Profits from a money standpoint and profits from the standpoint of reputation.

It takes a good contractor to build stucco houses; but the secret of stucco is laying it on a base of

Kno-Fur Expanded Metal Lath

—Does away with furring and sheathing

"Kno-Fur" is built with the plaster gripping mesh that gives superiority and certainty to every one of the types of metal lath in the North Western line. It is braced by a diagonal "U" shaped rib that is constructed like a miniature bridge truss and more than fulfills all rigidity requirements.

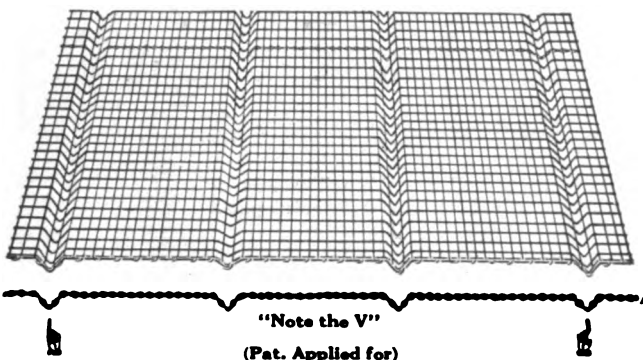

Its use will save you material, labor and uncertainty as to the permanence of your stucco work.

Send at once for booklet 43 and let us give you further particulars.

NORTH WESTERN EXPANDED METAL CO. 904 Old Colony Bldg.
Manufacturers all types of Expanded Metal CHICAGO, ILL.

Grimm's Galvanized Corrugated Wire Lathing

requires no furring on account of the V-shaped corrugations which are imbedded at intervals of seven inches.

This feature alone is worth considering but that's not all. It WILL NOT RUST as it is heavily galvanized with the finest grade of Western Spelter and is much easier to handle and will conform to irregular curves much better than any other form of metal or wood lath.

Walls or ceilings plastered on this lathing WILL NOT CRACK OR DROP OFF, owing to its great keying qualities, which we will explain if you will drop us a card asking for our booklet No. 61 and samples.

We also manufacture Greening's Patent Trussed Steel Wire Lathing, Buffalo Crimped Wire Concrete Reinforcing, Buffalo Wire Cloth of all kinds and Wire and Artistic Metal Work for all purposes. DROP US A LINE AT ONCE.

Odorless Sanitary Germ-Proof Comfort In-Door Closets

Please quote BUILDING AGE when writing to advertisers

HESS Heated Homes Are Healthful Homes

The warm air is circulated evenly and thoroughly and penetrates to every corner. Ample moisture is added to the air which is thus rendered normal, and in this respect superior to the atmosphere from steam, hot water, stoves, or ordinary furnaces.

Hess Welded Steel Furnaces Are Health Furnaces

because every seam is welded tight, sealed with melted steel which never opens nor permits the leakage of gas and dust; because porous cast iron is not used as a radiator for direct contact with the air you breathe.

HESS PIPELESS FURNACES

are recommended for the smaller classes of houses, cottages, and bungalows. One register only is used, which supplies hot air through the center and returns cold air to the heater through the ends. No horizontal air ducts nor pipes are used, thus saving expense and space in the cellar. Less fuel is required than with stoves and the circulation of heat is better than with stoves or radiators.

WE SELL DIRECT from factory to consumer. Easy payments if you wish. Write for booklet and estimate. Special terms to contractors.

HESS WARMING & VENTILATING CO.

1201 Tacoma Building, Chicago, Ill.

Makers also of Hess White Steel Medicine Cabinets and Electric Family Dish Washers.

A New Field for Profit

INTERNATIONAL "Onepipe" Heater

OPENS entirely new field for profits to contractors. As it has only one pipe, it requires no skilled labor, or tools (other than a screwdriver, saw and hammer) to install; costs little more than a good stove and is far superior in heating efficiency. It represents a splendid line for you to actually handle and sell, as well as specify.

Will comfortably heat *every room* in an average house of ten rooms or less. Heat rises from *single register* through open doors and upstairs into every room. Action is positive—a fact readily proven. Does not heat cellar.

YOU Can Sell Many

There are many old houses in your locality—particularly among farmers—that are uncomfortably heated with stoves. Without ripping a house apart you can install our "Onepipe" Heater, providing your customer with a thoroughly efficient and economical heating system that will highly please him, and make a good extra profit that you would otherwise miss.

If you'll reflect a moment you can think of plenty of houses where this furnace is actually needed—and could readily be placed.

Write for complete proposition—Booklet, Guarantee and Trade Agency Arrangement.

INTERNATIONAL HEATER CO.

Makers of the Largest Line of Heating Apparatus in America

Hickory St., Utica, N. Y.

INTERNATIONAL "Onepipe" Heaters are advertised in the farm press and are *guaranteed* satisfactory, on a 60-day trial basis. Full, plain instructions for installing provided with every heater.

This Heater Means BUSINESS

You can guarantee your customers that you will cut their coal bills $\frac{1}{2}$ to $\frac{3}{4}$ with the Williamson New-Feed UNDERFEED Furnace or Boiler. The reason you can make this startling guarantee with perfect safety is that we back you. A million-dollar corporation warrants the UNDERFEED to you—you can warrant it to your customers just as we do to you.

WHY We Can Back You—

We can make our guarantee of a $\frac{1}{2}$ to $\frac{3}{4}$ fuel saving because UNDERFEEDS in use by over 35,000 owners are showing the results which we claim. Not only will the UNDERFEED save $\frac{1}{2}$ to $\frac{3}{4}$ on a winter's coal bill—but it saves further by burning cheap or slack coal with as good results as high priced fuel, and a 12-year-old boy can operate it.

WHY It Pays You To Handle—

WILLIAMSON CUT COAL BILLS
NEW-FEED UNDERFEED
Furnaces and Boilers $\frac{1}{2}$ to $\frac{3}{4}$

They are sootless, smokeless, free from clinkers and dust, and they are adapted to warm air, steam or hot water. They are coal savers because they are built upon the correct combustion principle—that of an upright lighted candle.

"The Candle Principle." In the UNDERFEED the fire is always on top of the fuel, not smothered by it. Coal is fed from below, so nothing but clean, live, usable heat is thrown against the radiating surfaces. That means a really warm house all the time with no soot or smoke and minimum coal cost.

35,000 Boosters. UNDERFEEDS are saving money for 35,000 users—and every owner is a booster. A booster for every UNDERFEED dealer. Every UNDERFEED you install is a year 'round ad for you. We give you the names of prospects gained from widespread national advertising, and help you develop them.

Our Proposition. Don't let one day pass before you write for our special dealer proposition. Get in on our startling dealer quotations now. Utilize Williamson service—Williamson free engineering service for unusual heating plans; Williamson advertising and co-operation.

Write. Sign the coupon now. We will rush you dealer quotations and discounts. But write today. Sign below. Find out what's waiting for you in the Williamson dealer proposition. It can't be beat—so send the coupon.

THAT WOOD CORE

is responsible for the many desirable qualities of

Trade Mark Reg. No. 94745

Consider first, of course, its chief use as a wall lining, and why, because of its wood core, it is *better* in every way than lath and plaster, stronger, more durable and sanitary.

Because it has 101 other uses, such as:

- lining summer garages and outdoor sheds for warmth.
- lining summer cottages (helps keep them cool).
- quick repair partitions.
- enclosing rooms in attic or cellar.
- building dust proof closets or cabinets.
- panels in wainscoting or beamed ceilings.
- shelves, drawer bottoms, cabinet backs, etc.

Sold by dealers everywhere. Write for free sample and interesting booklet.

The Compo-Board Company

5778 Lyndale Ave. No., Minneapolis, Minn.

Mr. Builder—

Increase Your Income Right Now—This Month

Here's something right in your line—a Chemical Closet that you can sell to a home builder cheaper than a wooden privy and make a bigger profit for yourself. Here's something you can sell at odd times or turn over to your son or your foreman to sell.

RO-SAN Chemical Closet

An absolutely sanitary, odorless indoor closet that may be placed anywhere in the house. Abolishes the germ-breeding outdoor vault. A comfort and a convenience where there is no sewer connection. Germs killed by chemical. Easily emptied as the ash pit of a stove.

AGENTS WANTED

We want one live carpenter contractor in each town to act as our agent. Hundreds of builders are selling these fixtures this winter. Good profits for little work. We help you sell them. Write today for complete details.

Rowe Sanitary Mfg. Co.

285 Rowe Building Detroit, Mich.

Ask about the Ro-San Washstand. Hot and cold running water without plumbing.

FIREPLACE MATERIAL

Every Contractor

building fireplaces should know the advantages of the Stover Dome Dampers.

The rod extends out under the brick or tile so there is no interference after the Damper is first set. Wide flanges allow giving sides of Fireplace any angle desired. Cover will not slip out of position. Castings are extra strong. Made with or without angle for carrying brick. We make other styles.

Catalog No. 1550 shows these Dampers in detail and gives valuable suggestions as to the best construction for fireplaces.

Other Goods We Make

Cleanout Doors, Ash Trap Doors, Cast Chimney Thimbles, Brass Thresholds, Andirons, Fire Baskets, Fire Sets, Fire Screens, Spark Guards, Gas Logs, Door Knockers, Sink Brackets, Screen Door Hinges, Double Acting Hinges, Cast Iron Sash Pulleys, Furnace Pulleys, Stove Pipe Registers, Dampers, Damper Clips, Saw Vises, Door Latches, Foot Scrapers, Chest Handles, Flush Rings, Harness Hooks, House Numbers, Door Pulls, Samson Wind Mills, Feed Mills, Alfalfa and Ensilage Cutters, Gasoline Engines.

Building Construction and Superintendence

By FRANK E. KIDDER, C. E., Ph.D.
Architect

Part I.—MASON'S WORK, Ninth Edition

Thoroughly revised and enlarged by Thomas Nolan, Prof. Arch., University of Pennsylvania. A most exhaustive treatise on masonry construction for buildings in all its branches. New chapters on fire-proofing and concrete, plain and reinforced. Foundations have received careful consideration, and the most approved work in recent structures is clearly illustrated.

964 pages, 628 illustrations, cloth.

Price, \$6.00

Part II.—CARPENTER'S WORK, Ninth Edition

Treating on Wood Framing—sheathing, windows, outside door frames, interior woodwork, rough work, finish, heavy framing, builders' hardware, and the large variety of detail that the subject covers.

910 pages, 830 illustrations, cloth.

Price, \$6.00

Part III.—TRUSSED ROOFS and ROOF TRUSSES, Second Edition

This part describes nearly every type of roof construction commonly met with in buildings, pointing out the advantages of different types of wooden and steel trusses for different spans and building requirements. Special attention is given to description of wooden trusses and steel trusses, in order to make the work of practical value to the architect, draughtsman and builder.

294 pages, 306 illustrations, cloth.

Price, \$3.00

Rent this Level 10 Months 'Then It's Yours Builders and Contractors

This is not the old style Architect's Level. It is the newest 1916 model *convertible* level. There is not a single Builder or Contractor who has not almost daily need for this instrument, for laying out buildings, locating foundation piers, leveling up foundations, walls and floors, aligning shafting, walls, piers, etc., for getting angles, locating levels anywhere, ditching, laying streets and walks, running straight lines, and a hundred other uses.

Instruction Book Free

Complete illustrated booklet, telling how a builder or contractor can use the Convertible Level, sent free on request.

WARNING

The Level we offer is the new Aloe Convertible Level, 1916 model. Don't confuse the Convertible Level with the ordinary old style Architect's Level. The only work that can be satisfactorily done with the ordinary Architect's Level is the determining of elevations. But the Convertible Level, besides its use as a level, is a modified transit and broadens the use of the level 100%. You can't afford to buy any but the Aloe Convertible Level.

HALF CENTURY REPUTATION

We have been manufacturers of transits and levels since 1863, and our instruments are the standard of the world.

FREE TRIAL

We allow you to convince yourself by a trial of the instrument before you obligate yourself.

THE RENT BUYS IT

No large cash outlay needed. Just pay the rent for a few months and the instrument is your absolute property.

Send Coupon—No Obligation

Send the attached coupon today and we'll send illustrated booklet and complete details of how you can own the Aloe Convertible Level for 10 months' rent.

A. S. Aloe Co., 625 Olive St., St. Louis, Mo.

COUPON

C-M-T COATING

The Trade Mark Is What I Go By

I know from experience that it means the best decorative and protective coating for cement concrete and brick work—interior, exterior or floors—that can be produced. It excels in covering and wearing qualities—why, one coat gives a smooth, solid white on a red brick wall, and it wears like iron! It is also made in colors.

Just as I know also that the same trade mark on other goods I use stands for highest attained quality in each case. I've learned that "Nice" Varnishes, Wood Fillers and Japans are high grade, proven materials, such as a high-grade master workman should use, and I've found it pays to use them and pays big.

Send today for prices and information.

Consider Your Reputation

No carpenter or contractor can afford to recommend or use *cheap* wall board. He has his reputation to consider. And cheap wall board is just another name for *unsatisfactory* wall board—with its inevitable "come-back." Bad business!

Play safe. Get *permanent* profit and trade, with

UPSON-BOARD

It's lumber — made synthetically. Looks, feels and *works* like regular lumber. Not one complaint to the million feet!

Shavings—up to 4 feet long—planed from ordinary piece of Upson Board artificial lumber. Looks, feels and works like regular lumber.

The Most Completely Equipped Wall Board Plant in America

Some boards are so soft and punky that they're almost sure to rip and tear under the saw. They're hard to nail, too; the soft board draws around the nail heads. Upson Board saws, cuts and nails exactly like a piece of lumber.

Bank on this: **DEPENDABLE** Wall Board is going to be the wall and ceiling lining of the future. People *expect* plaster to crack, chip and fall—it isn't the ideal lining, by any means. Neither are some wall boards.

But Upson Processed Board is made good to make good—in every kind of building—under every condition—everywhere. It is made only of long, pure, wiry wood fibres, combined under the Upson formula. It is **SCIENTIFICALLY PROCESSED**: kiln-cured like interior trim; really waterproofed; surface-filled. There isn't a dollar's difference, for the ordinary room, between Upson Board and the cheapest, most unsatisfactory board, and the Upson Board saves \$5 to \$15 on the painting. Tell this to your customers.

Try **DEPENDABLE** Upson Processed Board for yourself! Write us today for sample—give it any test you want—and you'll see why it's the Board for your business. We want to tell you, too, about our practical plan to help boost your trade.

THE UPSON CO. Fibre Board Authorities 91 Upson Point, LOCKPORT, N. Y.

LOOK FOR THE BLUE CENTER

Upsonized Walls and Ceilings—Easiest Lining to Install—The most Satisfactory

"We can apply 25% more of Upson Board than of any other board," carpenters write us. It is stiffer, more easily cut, more easily handled. It cuts with a clean edge, when a fine tooth saw is used. Whereas, board put together with tar or asphaltum gum, the saw and soil the hands; and, when applied, are apt to sag with ordinary room heat.

Look and Fit Like Wooden Shingles—Only One Leak in One Hundred Roofs

A prominent firm of Contracting Builders in New York writes:

"We have used eight carloads of your shingles. We have them on over one hundred roofs on Staten Island, and have had only one leak to repair."

Winthrop Tapered Asphalt Shingles

Shaped Like Wood—Easy to Lay

This Home and Many Like It Covered With Winthrop Tapered Asphalt Shingles

These tough, yet pliable fireproof and weatherproof shingles are made of Wool Felt and solid asphalt, into the exposed surface of which fine chipped slate is rolled under heavy pressure. They are extremely durable, easy to lay, light as wood and low in cost. Besides they lay just like wooden shingles, being thin at one end and thick at the other—the **only tapered asphalt shingle made**. Laid with ordinary shingle nails.

RED, GRAY-GREEN AND SLATE-BLACK

We can refer you to Winthrop Roofs in almost every city in America. Before planning your next job, ask for samples, prices, etc.

We also make a large line of quick adjusting, self-locking CLAMPS. Booklet for the asking.

James L. Taylor Mfg. Co., Poughkeepsie N. Y.

Hard, Stiff, Waterproof and Sized

Try to bend a piece of it. Whittle it. Drop water or ink on it. Rap it on your knuckle. Then you'll understand how PLASTERGON WALL BOARD differs from all other boards.

PLASTERGON WALL-BOARD

The Chemically Treated Wall Board That Does Not Shrink

For every kind of building, PLASTERGON WALL BOARD is best because it is absolutely dependable. It is hard and stiff enough to lay smooth over studs and joists WITHOUT WAVING. Dampness has NO EFFECT on it, and the waterproofing not only "lumberizes" the board, but also sizes it, saving you from \$4.00 to \$6.00 per thousand. BUT DON'T TAKE OUR WORD FOR THIS. Get samples of WATER-PROOF Plastergon, test them and then order some of the board. The price will surprise you. Send today.

PLASTERGON WALL BOARD CO., 102 Fillmore Ave., Tonawanda, N. Y.

A New Adze

No. 44-B

The demand was so great that we had to make it. Similar to our No. 44 ship adze, only lighter and shorter from the eye to cutting edge. Ask your dealer to see one of these. We really believe it will suit you.

Remember This

When you want the highest class edge tools of any kind, insist on White's.

The L. & I. J. White Co., 100 Perry St., Buffalo, N.Y.

This Exclusive Design Found Only in

SYKES' TROUGH LATH

Gives You Money-Saving Advantages

For Interior Work Sykes Trough Lath is the best, not only because it is strongest, but also because it is as easy to plaster on as wood lath, and is very economical in amount of mortar used.

For Ceilings, Mantel and Tile Setting Sykes Trough Lath will give both builder and owner the greatest value. It saves time and money. It insures permanent strength.

Furnished painted black. Free sample and prices on request.

When you use Expanded Metal Lath, choose Sykes Expanded Cup—the Self-Furring Metal Lath that saves 5 to 10 cts. a square yard—no furring strips needed.

Write us now for Book of Specifications for Stucco on Metal Lath and for sample of Sykes Expanded Cup Lath—both free.

THE PROGRESSIVE MFG. CO., Torrington, Conn.

Two New Books

On Popular Types of Construction

Cement Houses and Private Garages

The popularity of this type of construction has created a demand for some comprehensive book to cover the question from the standpoint of the contractor and architect, as well as the builder. This volume contains selected designs of artistic cement and coated houses from "Building Age," with full details, elevations, floor plans, all drawn to scale. The designs given range in price from \$1,250 to \$16,500 for the houses and from \$500 to \$10,000 for the garages, these figures representing actual cost, not the estimates of theorists.

Cloth Bound, 240 Pages, Price \$1.50.

Suburban Homes with Constructive Details

The new plan-book will serve the builder and architect, not only in aiding their clients in selecting the styles they require, but in erecting as well. A complete set of working plans drawn to scale accompanies each full-page plate. Details of interiors and exteriors, with actual costs of construction, are given with each design. This volume gives photographic views, floor plans and elevations, selected from prize designs from "Building Age."

200 Pages, Cloth Bound, Price \$1.50.

Building Age Book Department

231-241 West 39th Street

New York City

Try This Level 10 Days—FREE

You pay no money down—don't place yourself under obligation to buy—simply get the level and use it on your own work in your own way. PUT IT TO THE TEST—laying out, squaring and leveling foundations, plumbing walls, girders, etc. At end of 10 days if you don't want to keep the level return it at our expense. Can you ask anything fairer? WRITE FOR DETAILS OF THIS GENEROUS FREE TRIAL OFFER—NOW.

White's Improved Level

Just what the contractor, architect and builder need. Saves its cost several times over every season. An accurate, reliable, moderate-priced instrument, with all complicated and confusing features omitted. Any contractor can master this simple and easily-used level in a short time with aid of complete 16 page instruction book accompanying each instrument. WHITE'S IMPROVED LEVELS are strong, rigid—few adjustments—built to stand hard service. Why keep on using clumsy makeshifts like the spirit-level or straight edge when this up-to-date instrument, with all latest improvements, will make your work easier, prevent costly errors and boost your reputation? FIND OUT WHAT A DIFFERENCE IT MAKES—AT OUR RISK.

Indispensable in Calculating Costs

Contractors and builders in all parts of the country find Arthur's "New Building Estimator" indispensable in calculating costs. It is a practical working guide to estimating the cost of labor and material in building construction. The new edition contains 744 pages, is 5 x 7 inches in size, bound in flexible leather. Price \$3.00 Postpaid.

Building Age, 239 W. 39th St., N. Y.

PAIN**T** to the average individual is most often simply a matter of color—the general pleasing effect to the eye. To the architect or builder, beauty, while of great import, is second to protection. That is as it should be.

Both protection and beauty are part and parcel of every job done with

Dutch Boy
White Lead

and pure linseed oil. The paint wears well on outside work; its attractiveness lasts with it. Inside, an unexcelled, washable, durable, beautiful finish of any desirable color or texture can be had.

SENT FREE!

Don't take our word for it that these books will enormously increase your earning capacity. Get them into your home or shop—free—and determine their value for yourself. The books themselves, not what we say for them, must convince you that you need them, so send the coupon to-day—now—and the entire eleven volumes will come to you at once, express prepaid. If, after a full week's trial, you decide to keep them, you can buy them at half the regular price and on the easiest of easy payment plans.

Newly Revised Cyclopedia of
Architecture, Carpentry and Building

consists of ten large volumes, handsomely bound in half red morocco, gold stamped, containing 4,760 7 x 10-inch pages; 4,000 illustrations, full page plates, building plans, diagrams, etc.; hundreds of valuable tables and formulas, carefully cross indexed for quick, easy reference.

PARTIAL TABLE OF CONTENTS

Mechanical, Freehand, Perspective and Architectural Drawing, Lettering, Pen and Ink Rendering, The Orders, Superintendence, Strength of Materials, Masonry, Reinforced Concrete, Carpentry, Steel Squares, Stair-Building, Hardware, Steel Construction, Roof Trusses, Practical Problems, Estimating, Contracts, Specifications, Building Law, Sanitation, Sheet Metal Work, Electric Wiring and Lighting.

Plan Book and Consulting Service FREE

We give free to every purchaser of our Cyclopedia of Architecture, Carpentry and Building, a copy of "Modern American Homes," a complete and up-to-date plan book. Contains plans and specifications for 168 structures, including excellent exterior and interior views, detailed estimates, etc. Designed by leading architects, it covers city, suburban, and country homes; bungalows; summer cottages; tent houses and camps; apartment houses; garages, and public buildings. 224 pages, 9 1/2 x 12 1/2 inches, and 428 illustrations. Printed on enameled paper and substantially bound. With this plan book in your shop you are prepared to figure on any job, no matter how large. No need for the prospective builder to consult an architect—you can offer him his choice of practically every type of home. This saving of the usual architect's fee should get you the business.

In addition we give free with each set a year's consulting membership in the American Technical Society. Through this service you have the assistance of a staff of architectural and building experts. These men are no farther from you than the nearest mail box. They stand ready to solve your perplexing problems, to offer suggestions, to point out the things you should avoid. In fact, they enable you to compete with the biggest and most experienced men in the construction field.

Send for this great combination today

We will send the complete eleven volumes to your home for seven days' free examination, express prepaid. Look them over carefully—make use of them at your work for a week—then if they fail to meet your expectations they may be returned at our expense. If you keep them send us \$2.00 within seven days and \$2.00 a month until the specially reduced price of \$24.80—regular price \$50.00—has been paid. Remember—the consulting membership and plan book are included absolutely free.

Can you afford to let \$2.00 a month—50c a week—stand between you and success? The consulting membership alone is worth many times the first cost of the books. Fill in and mail the coupon—NOW!

American Technical Society, Chicago, U.S.A.

Name

Address

As I have had no previous dealings with you, I refer you to

When the Architect Specifies BAYONNE

he is giving his client positively the very best material for Porch Roofs and Decks, Sleeping Porches, Conservatories, etc.

BAYONNE

is standard for quality because it has for years met all the requirements in a superior way.

Does *not* leak, crack, buckle or contract. Weather exposure does not affect its appearance or wearing qualities—and it is both noiseless and unaffected by tread of feet and drip of rain.

Very simple and easy to lay—making a clean job. No "setting" in wet paint and only one coat of paint is necessary for ordinary purposes after laying.

Write for Sample Book "D" giving prices and laying instructions.

BEAVER BOARD WITH BEAVER BOARD

Don't be misled into thinking that any wall board is Beaver Board or as good as Beaver Board.

When you order a Maydole hammer or a Simonds saw, you expect to get a hammer made by Maydole and bearing the name of Maydole, or a saw made by Simonds.

It's the same way with Beaver Board. Real Beaver Board has the Beaver trademark on the back of every panel and is made by The Beaver Board Companies.

There's enough difference between Beaver Board and other wall boards to make it worth your while to be sure you get the original.

Genuine Beaver Board is patented—no one else can make a wall board just like it. To avoid disappointment, look for the Beaver trademark on the back of every panel.

THE BEAVER BOARD COMPANIES

600 Beaver Road

Buffalo, N. Y.

Branches in Boston, New York, Philadelphia, Baltimore, Cleveland, Detroit, Indianapolis, Chicago, Minneapolis, Omaha, Kansas City, San Francisco, Los Angeles.

If it hasn't this trademark it isn't Beaver Board.

Write for free illustrated booklet.

These Are the Only Tools Required

A pair of hands, a claw hammer and some nails complete the equipment needed to finish the interior of any house from cellar to attic. Make it more beautiful, more sanitary, more uniform in temperature than a plastered house by using

CAREY
Ceil-Board
SUPERSEDES PLASTER FOR WALLS AND CEILINGS

Contrast with this the old method which requires special crews of lathers and plasterers, tons of sand and lime, sacks of cow hair, cumbersome scaffolding and days or weeks of precious time.

Carey Ceil-Board is made in plain finish for papering or painting and in natural grains of hardwoods for wainscoting and paneling effects. Write to-day for samples and for our handsomely illustrated booklet.

THE PHILIP CAREY COMPANY
1020 Wayne Ave., Lockland, Cincinnati, O.

Why Gamble?

WHY play a child's game of blind man's buff with your reputation? There is only one stucco—and only one—that you can use and recommend with the absolute assurance that the job is going to look as well five years from now as it does the day you complete it. There is only one stucco that is rain-proof, stain-proof—only one that overcomes the conditions which cause cement stucco to crack, as it is so elastic that it actually may be deflected one and a half inches in seven feet without cracking. There is only one stucco which is weather proof—may be applied in any temperature, even zero. That stucco is

KELLASTONE

IMPERISHABLE STUCCO

It is free from every fault of cement and lime plasters. There is no gamble in its use. It is warmest in winter—coolest in summer, and neither rain nor temperature can cause it to expand or contract. It bonds perfectly to wood, lath, brick, stone or tile.

Kellastone is being used by the U. S. Government, by State Institutions, Railroads and large corporations everywhere—and it's best for homes of every size and cost. It solves the stucco problem permanently. For beautifying and renovating old houses and buildings, it is the only satisfactory article known. Any surface and color scheme desired may be obtained with it.

We ask you to do just one thing—give us the opportunity to place before you the actual facts about this superior stucco. That's all.

Kellastone Composition Flooring fulfills the average flooring requirements far better than any other flooring. It has remarkable resistance to abrasion, deadens noise, has no seams or joints, never cracks or shrinks. It can be applied to wood, steel or concrete bases. Lasts indefinitely. Used instead of concrete, tile, wood, rubber tile, cork tile, etc., in schools, hospitals, office buildings, shops, factories, for toilet floors, etc.

Write today for illustrated facts.

Makes Barns and Garages Warm and Weather-proof

Utility Board on the walls means dry, warm barns and outbuildings. It's inexpensive but certain protection against cold and damp, against vermin and dust.

Between each layer of Utility Board is a binding layer of asphalt—a high-quality, tested asphalt that positively assures a water-proof, weather-proof wall-lining. Utility Board stands up splendidly—won't warp, wilt or pry loose. It neutralizes the outside temperature—keeps buildings warm and air-tight in winter, cool in summer.

Be Sure You Specify the Original

Ripping the Mask Off the Composition Floor Business

There has been a lot of mystery thrown around the use of magnesite compositions—oxy-chloride cements. Various formulas, "secret" processes and strange materials have been exploited. Tom, Dick and Harry have sold "territory" to credulous buyers, pocketed the change and gone their way.

What's it all about? Is there any merit to composition flooring? What are these secret processes? Is a magnesite floor a good floor for the architect to specify, for the contractor to lay, for the owner to buy?

There's an article in the January issue of "CONCRETE" that sheds light on these questions. Far from being sensational, it represents the result of months of searching investigation. It condenses into three columns the opinions and experiences of men who *know* about composition floors. This article is the combined effort of a hundred men to rip the mask from the operations of schemers and give a worthy material its due. Send 15 cents to "CONCRETE," 309 New Telegraph Bldg., Detroit, Mich., for a copy of the January issue.

Incidentally this is the Annual Housebuilding Number, containing plans and cost figures on a dozen concrete houses built by various methods.

Let Your Specifications Read Wright Wire Lathing

Many of the country's foremost architects specify Wright Wire Lathing. It was used in the Grand Central Station and many other famous structures, because it resists the ravages of time and fire as no other lath can.

Wright Wire Lath is made in three finishes—Plain, Japanned and Galvanized. The illustration at the left shows Wright Galvanized Lath. For strength, rigidity and durability it has no superior. Our Catalog X, describing Wright Wire Lathing in detail, is an intelligent guide for architects and builders. Free on request.

WRIGHT WIRE COMPANY, Worcester, Mass.

In Any Clime—In Any Type of Building

Wherever you go—north, east, south or west—you'll find buildings of every type and size, from residence to skyscraper, erected with

Berger's *Metal Lumber*

(Patented)

Speed, durability and economy in erection are the reasons for its universal popularity.

Berger's Metal Lumber assures an absolutely indestructible and fireproof structure, as proven by official practical fire, load and water tests. It is also sound, damp and rodent proof. Not affected by climatic changes, so can be installed just as well in winter as in summer.

Berger's Metal Lumber is synonymous with safety and permanency.

Berger's *Ferro-Lithic* Plates

Used extensively for reinforcing concrete slabs for flat or arched roofs and floors, sidings of walls, etc.

In the case of a roof, as shown in above illustration, Ferro-Lithic plates are applied directly upon the roof framing, with purlins spaced at proper intervals. Plates are interlocking and watertight, insuring a dry roof, even before concrete is applied. This is a strong feature, because when weather is unsuitable, concreting and plastering may be completed at a later date.

These plates have proved especially successful in buildings exposed to smoke, acid fumes, gases, etc.—as in various manufacturing plants, chemical works, rolling mills, foundries, power stations, etc.—because the plaster on the underside protects the metal.

See Sweet's, pages 210 and 220-224, for full description of Berger's Reinforced Concrete Materials. Also send for Catalog F.B.

Start a Garden Club

The Davenport (Iowa) Garden Club has 1200 members.

Would such a club help you and your community? Would it add to your store of knowledge about growing things?

Surely it would save you time and money and make your garden a bigger success than ever. Why not be the first to propose this for your town?

Mrs. Frances King, President of the Garden Clubs of America, tells you how. She gives you the practical information about organizing these clubs, getting members enthusiastic and stimulating competition.

You really must read what she says about this interesting subject in House and Garden's

Garden Planning Number

Besides the Garden Club idea, the "*Garden Planning Number*" has concise and valuable suggestions for everyone owning a home.

From A to Z

No one who reads this superb issue need fear an unsuccessful season. The entire subject of vegetable and flower gardening and planting the grounds is covered from A to Z.

It tells what to plant in various locations and what to plant for special effects. How to make a velvety lawn, what hardy flowers you can grow, what to plant in the shady places, what fertilizers to use—the Garden Planning Number tells you all this—and more. It contains planting tables of vegetable and flower seeds, showing when to plant, how deep, how far apart, time of blooming and ripening—all so explicit as to make your Spring an assured success.

\$3 invested in House & Garden may effect a saving of \$300, or even \$3000 or more

It is not merely a magazine of utility and economy, but one with the breath of the broad outdoors blowing through its pages, whispering the pleasures of country life and telling many of the interesting secrets of nature. There are descriptive stories, clear, beautiful pictures—about trees, plants and flowers, in addition to the usual quota of authoritative building and harmonious decorative features.

Surely this is a good investment when you consider that for \$3.00 you may save \$300.00, or even \$3,000 or more, perhaps uselessly spent on furnishings that do not harmonize, on gardening which does not please, or on building which is not practical or useful.

By mailing the coupon below, you are *assured* of valuable suggestions, new ideas, and *ensured* against costly failures.

Special Introductory Offer

You may have this excellent magazine for a whole year, twelve special numbers in all for \$3.00. Or, if you *subscribe now* beginning with the February (*Garden Planning Number*) you may take advantage of our six months' special introductory dollar offer, using the coupon below if you choose.

Do not even take time to write a letter. The coupon will do and is easier and quicker

Introductory Offer to Readers of Building Age

House & Garden, 440 Fourth Ave., New York:
I accept your introductory offer. Send me **five** numbers of House & Garden, beginning with the February issue, and I will remit \$1 on receipt of bill, **OR**—I enclose \$1 herewith, for which send me **six** numbers of House & Garden, beginning with the February issue.

Plan Your Garden Now

Do you know what to plant and where to get it?

Do you know how to make your soil yield the best results?

Are you familiar with the tools necessary to do the work with the least labor?

How should vegetables be planted to get the right successions? What flowers bloom the first year—and which are perennials?

Begin planning your garden now and store up practical information that will save you costly mistakes.

Before the first robin flaunts his red breast upon your lawn, you should know when and where to buy your seed, garden implements, fertilizer and every similar item for Spring planting.

Garden Preparedness

"But how?" you say. "How may I secure all the information I need without endless searching and needless expense? How can I be sure that my garden and grounds will be artistic, beautiful and successful—and bring me real happiness without disappointment?"

A New Plan

Here is a new plan. Below you will find a coupon. It has been designed to make home-making practical. It is to be used by one who wishes to secure a full knowledge of gardening matters.

Information Without Cost

We have found a way to answer all your questions without obligating you—a way that will satisfactorily give you the information you desire. Without expense you can secure information on any of the subjects indicated or others that you may select—all from reliable sources. Look over the list. Check the ones that interest you. More subjects will suggest themselves as you go along. Ask as many questions as you choose relating to all phases of gardening, building and decoration—in fact—everything pertaining to the subject of house and garden and whatever associates itself with it.

Send the Coupon

Enclose it in an envelope or paste it on a postal. Or if you prefer you might write a letter. We will see that you are supplied with valuable information that possibly may save you many dollars—surely time and energy perhaps ill spent. This will solve the garden problem and in the end will afford you endless pleasure.

Subscribers' Monthly Service

This offer is open to readers of House & Garden without cost of any sort. It has no strings attached to it. There are no fees or remuneration now or later. It is entirely free. Our only consideration is that you are sincere in your desire for information and that you will advise us whether the service supplies your wants. It is open to all serious-minded persons who really want to know about gardening and home beautifying. If you really intend to have a garden this Spring and want to have information about how, when and what to plant, use our service.

Free Information for Garden Planners

House & Garden, 440 Fourth Ave., New York:

I would like to know about the subjects checked or additional subjects noted under remarks, or outlined in letter attached. Please arrange to have free information sent me promptly.

Build The Harris Way Greater and Quicker Profits

Harris Home No. 161

MR. BUILDER: Save Hundreds of Dollars by Building Harris Homes:

Because they are easy sellers. Because they are easy to build, carefully planned, popular designs. Because our low prices enable you to make greater and quicker profits.

You must investigate the **SENSIBLY CUT TO FIT** Harris Way System—designed especially to save you time and money and not to puzzle you.

The **HARRIS WAY** means perfected plans, guaranteed bills of material, correct specifications and full directions to work by.

You get without cost these exclusive original advantages developed by us in our twenty-three years of building experience and study.

Harris Homes are shipped to you in one quick shipment from our big Chicago Plant. No Money Down!

All materials furnished for Harris homes are the finest grades—all guaranteed and backed by our \$10,000,000 Capital.

All Materials of Best Grade

We furnish clear, knotless Oregon Fir outside finish, No. 1 dimension lumber, creosoted foundation wall plates, CLEAR Modern Craftman style interior finish, CLEAR millwork, doors, and windows, GUARANTEED shingles and SATIN finish hardware. All materials in harmony with the design. All guaranteed and backed by our \$10,000,000.00 Capital.

The house shown above, No. 161, has six rooms and bath; size 30x36 ft. The house shown below, Design No. 166, has six rooms and bath and a two room attic; size 24x46 ft.

**24 Years' Building Experience;
\$10,000,000.00 Behind Us**

\$931

Harris Home No. 166

Mr. Builder and Mr. Contractor: When you build a Harris home, you are dealing with a house that has been the world's greatest building material bargain center for the last twenty-four years. You are dealing with a house whose reputation for money-saving ability is based on its honesty and fairness. In every transaction you enter into with us, you are protected by our binding guarantee backed with \$10,000,000.00 Capital.

The **HARRIS WAY** is the development of years of research and study by men who have devoted their lives to scientific building construction. It is an original method with us. We developed it slowly, selecting improvements and eliminating less desirable features from time to time. The total **HARRIS WAY** means first, materials at prices that save you hundreds of dollars, then our original perfected plan system, then quick, economical shipments, and lastly, a guarantee of absolute satisfaction.

If You Come to the Cement Show Be Sure to Visit Our 40-Acre Plant Where We Manufacture Harris Homes

Our mammoth manufacturing plant situated in the heart of Chicago is a veritable exposition of all kinds of building material and we have many specially commendable bargains in cement workers' machinery and supplies.

We are prepared to furnish all kinds of structural steel and reinforcing steel forms, steel lath, etc., also concrete mixers, gasoline engines, pumps, hoists, pipe, etc. We have every kind of machinery which the up-to-date builder uses—at prices that actually save him 25 to 50 per cent. Come and see us, if only out of idle curiosity. You will probably get many ideas from a visit to our great plant, and be out nothing but your time.

FREE PLAN BOOK

Every Builder Should Have Our Free Book of Harris Homes, Bungalows, Garages, Etc.

We offer this book which cost us many thousands of dollars to produce, absolutely free for the asking, to contractors and builders everywhere in the United States. It shows over 100 Harris Home Designs in beautiful halftone engravings, giving prices, floor plans and material specifications. It explains the **HARRIS WAY** in detail, and is full of practical information for every builder. It contains vital statistics and facts for you; why you should build the **HARRIS WAY**, etc. Mail the coupon now for your copy.

If you are interested in our other building materials, ask for the other books mentioned in the coupon.

The Question of Bungalows

THE Bungalow Question finds a simple solution in our books. They completely cover the field, showing types of bungalows suited to all climates and all purses. You should have them on hand when clients come to consult you.

THE BUNGALOW BOOK

By H. L. Wilson.

159 pages 7x10 inches, Cloth, \$1.00, showing 117 artistic structures, exterior and interior details and floor plans.

BUNGALOWCRAFT

By H. Menken.

128 Pages, 7½x11 inches, Heavy Paper, \$1.00. 87 floor plans of Bungalows for any climate, that have been built at prices ranging from \$1,000 to \$4,500.

MODERN HOMES OF CALIFORNIA

95 Pages, 7x10, Heavy Paper, \$1.00. Bungalows suited to warm and moderate climates. Photos, floor plans and interiors.

PRACTICAL BUNGALOWS

96 Pages, 7x10, Heavy Paper, 50c. An attractive volume containing plans of one and two-story bungalows, costing from \$2,400 to \$9,000.

PRACTICAL BUNGALOWS FOR TOWN AND COUNTRY

By F. T. Hodgson

420 Pages, 5x7½, 400 Illustrations, Cloth \$1.00. Over 200 Bungalows and Cottages from \$500 to \$3,800 in price are shown in this volume.

CRAFTMAN HOMES

By Gustave Stickley

206 Pages, 8½x11, \$2.00. From the cozy cottage and bungalow to more pretentious residences. Invaluable to architects, landscape architects and builders.

PAYNE'S MODERN HOMES

245 Pages, 7x10 inches, Heavy Paper, \$1.00. Cottages and Residences from \$1,000 to \$10,000, compact in form and convenient in arrangement.

LOG CABINS AND COTTAGES

By W. S. Wicks

135 Pages, 6x9½ inches, Cloth \$1.50. Building for the woods from the simplest shelter to the most elaborate cottage. Special attention to furnishing and fitting.

Working plans and specifications for any design in a majority of these books may be bought from the publisher at nominal prices.

Going to Build? Remodel or Repair?

Save \$5 to \$500 on Every Order for Building Material

BUY your lumber and millwork direct. Every contractor, carpenter and builder should have our big free catalog of building material—the book of *8000 price bargains*. A copy is ready and waiting for you and will be sent free, postage prepaid, at your request. *The tremendous saving* afforded by our method of supplying building material direct to the actual builder has proven a boon to thousands. Let us show you how to make more money by saving more money.

H. M. Munnings
President

Everything in Building Material

is described in this big book. It quotes low, net, rock bottom prices for lumber, flooring, roofing, doors, windows, interior trimmings, cabinet work, colonnades, porch-work, hardware, tile, paints, wallboard, metal work, plumbing and heating equipment, cement machinery, water supply outfits and thousands of building specialties. It is a handy book of information and reference that no builder can afford to be without.

Free Architect's Blue Prints

You do not need to have costly plans prepared by high-priced architects, thus adding to the cost of building, because we have had just such plans prepared for us by some of the ablest licensed architects in the country. These plans are complete in every detail and include a full set of specifications. Our **FREE PLAN BOOK** tells how to secure these plans without one cent of cost to you. A contractor will find this book of the utmost assistance in securing new trade because with it he can show his customers newer and better designs that may be built for less money.

Houses of Standard Construction

These buildings are of standard construction. They are built from high-grade guaranteed material with all cutting and fitting done by the carpenter on the job. They are not "ready-cut," "factory built" or freak houses in any sense of the term, but are erected as any house must be put up to secure best and most lasting results. Practical builders will readily appreciate the importance of this feature. It means more work for them and a better and less expensive building for their client.

Two Big Free Books

We want every carpenter, contractor and builder to have a copy of our big, free catalog, whether or not he is now in need of building material. It will keep him in touch with the very lowest prevailing prices and prove an invaluable guide to right buying. "Plan Book of Modern Homes" is filled from cover to cover with designs of convenient bungalows, handsome suburban residences, town houses, practical country homes and barns. Write for either or both these books today. Both are *free*. A postal request will bring them by return mail, or fill out the coupon below.

Plan Book No. 55, House and Barn Plans

For \$1000

We will furnish all material, except masonry, to build this 8-room house. Plans free.

For \$895

We will furnish all material, except masonry, to build this 8-room house. Plans free.

For \$755

We will furnish all material, except masonry, to build this 6-room house. Plans free.

For \$800

We will furnish all material, except masonry, to build this 7-room house. Plans free.

For \$740

We will furnish all material, except masonry, to build this 5-room bungalow. Plans free.

Gentlemen:

I got a pair of stairs from you, and the price was about \$73.00. I think, when our local mill man wanted \$150.00 for the same. I am a lover of net-priced catalogs and hate to get hold of one that is afraid to tell you what they want for their goods. Yours very truly,
J. B. FEASTER & CO., Greensburg, Ind.

Gentlemen:

The carload of lumber which I bought of you on order No. 3548 was all that I could ask. The grade was up to the standard and I saved after paying my freight and drayage, \$127.00. I certainly will keep you in mind when in the market.

Yours respectfully, F. N. CLINE, Muskegon, Mich.

Please quote BUILDING AGE when writing to advertisers

Gentlemen:

I desire to express to you my sincere thanks for the manner in which you have handled my orders, accounts, etc. I found the lumber to be of the very best quality, and the attention you gave the orders to be first-class. I am very much pleased with it all. The party for whom this building was put up was more than pleased, and I assure you that it will be a pleasure for me to turn any business your way I can. Yours very truly, C. B. PATRICK, Burnside, Pa.

Dear Sirs:

I received order No. 10671 in good shape, and am well pleased with the goods. I saved on my order 15 to 20 per cent. Hope to be able to give you some more orders. Yours very truly,

M. O. TERRELL, Cartersville, Ga.

What Will this House Cost?

A Knowledge of Plan Reading
and Estimating Means
MONEY FOR YOU

Could You

- estimate the cost of this building
- draw the plans for this building
- superintend the construction of this building
- take the contract to build this building

?

Successful men don't guess, they know! To succeed in any branch of the building business you must have a complete knowledge of plans and specifications. You must be able to estimate closely the cost of material and labor. Guessing won't do—you must know. This knowledge is what makes successful foremen, superintendents and general contractors. This knowledge means money—thousands of dollars—to any builder—to you!

Learn at Home Your spare time is enough to master these subjects by our new, easy, quick method. The same expert instructors who are so successful with hundreds of men in our Day and Evening Classes will guide you to a larger success. These instructors are among Chicago's leading Architects, Engineers, Estimators and Contractors. They prepare your instruction matter; they examine and approve your work. They are themselves in charge of real work—big work—and know exactly the training you need.

A Practical Course For BUILDERS

Carpenters Foremen
Bricklayers Superintendents
Plasterers Contractors
and all other men in
Building Lines

Read This!

Any man in the building lines can save many times the cost of this course on one job alone.

Plan Reading, Estimating, Architectural Drawing, Contracting, etc.

This is a course for practical men. We send you actual blue print plans of buildings now being built or recently completed. Practical training, not book knowledge, is what you want—it's what we give. When you think of the opportunities this training offers you will take time—right now—to mail the coupon for full information.

BENJ. EDWARDS
Scarsdale, N. Y.

The Owner Wins So Does the Contractor Who Applies Them

Both win and they deserve to. The owner, because he no longer is willing to take a chance on everything. He wants facts—the permanence, the cost of upkeep, and the dependability of the roof. That is why Ambler Asbestos "Century" Shingles appeal to him. They are the kind that fill the requirements of property owners insisting on value.

These shingles do not split, crack or decay. There is no replacing, no painting, no repairing, no worry. They last a lifetime without repairs. To the owners who want the cheapest coverings for permanent buildings these shingles will appeal.

Ambler Asbestos "Century" Shingles

The contractor wins because this roof covered with Ambler Asbestos "Century" Shingles will stand as a permanent booster of his business. It will outwear the building as a witness of his reliability.

Whether you are specifying or laying roofs on churches, schools, hospitals, garages, houses or on any kind of a building, you will best serve the owner and

yourself by using Ambler Asbestos "Century" Shingles.

Contractors and builders catering to discriminating and intelligently buying clients should be able to supply these shingles. You can cash in on their worth.

We have samples for your inspection. We shall gladly send these and trade prices. A line from you will bring them.

“LOCKED!”

Why are the walls of stucco finished houses so often cracked and the stucco broken off?

Because the background is of *metal*, the moisture in the stucco rusts it, causing it to break away from its fastenings, then the stucco, *unsupported*, cracks from its own weight and finally falls.

Bishopric Board Contains No Metal

Examine well the construction. Creosoted dovetailed lath imbedded in asphalt mastic on a background of heavy fibre board—a combination of materials that possess practically everlasting wearing qualities, water-proof, weather-proof, vermin-proof and sound-proof; put together so as to form a *rigid permanent* background that *locks* the stucco so it *can't* break away.

The principles involved in its construction are as old as the pyramids, and the most efficient known today to building engineers—only the combination of those principles is modern.

OUR BOOK “BUILT ON THE WISDOM OF AGES”

tells all about Bishopric Board and gives some interesting scientific tests. It illustrates homes and other buildings constructed with Bishopric Board, gives letters from builders, architects and users, and furnishes facts and figures to prove that it

**10-FOOT SIZE
5-FOOT PRICE**

Most Extraordinary Mixer Value Ever Offered Combines Strength with Light Weight and Capacity with Low Price

The concrete season is always here. Prepare for it with an adequate mixer—don't get a toy—don't get a white elephant. Buy a mixer you can use on all kinds of work everywhere. You get **capacity**—you get **light weight**—and you get **durability**, MINUS THE MANY DISADVANTAGES OF THE BIG MIXERS, in the Republic "Light Ten"—the best all-round mixer ever made.

A Ten-Foot Size at a Five-Foot Price

Here is the answer to your concrete problems—the light weight, the low price of the small mixer with the full sack size, the wearing qualities and the larger capacity of the big machines—a combination of features too important and profitable to overlook.

Automatic Power Loader and One Man Control

Entirely new, modern, and up-to-date, labor-saving features are combined in the Republic Light Ten Mixer.

The power loader is entirely automatic in operation—throw over the clutch lever and go on about your work—the hopper automatically rises to the proper height, disengages the clutch and applies the brake without any attention from the operator, remaining in the elevated position until released.

This automatic feature, combined with the location of all control levers at one point, enables one operator to do the loading, wetting and discharging of concrete, including putting in the cement.

You effect a tremendous saving in price, labor, time and trouble by owning a Republic machine. Get posted.

Monarch Block Machine

For fifteen years the Monarch has been the leading Block Machine in all modern and up-to-date plants. Note the wide range of adjustments.

Silo Blocks can also be made in any diameter, by a few adjustments of plates.

Write us when in the market for Concrete Machinery of any kind.

Get the Oshkosh

Contractors' Manual

You need this book. Every up-to-date cement contractor does. It is full of vital information for you, to help you in figuring your costs on work. It tells the yardage capacity of machines (in terms of wet mixture, not dry material) number of men needed to serve each size, speed in batches, horsepower required and amount of fuel. With this you can figure your exact costs on any job. Send for your copy now and stop guessing at your profits.

THE NEW OSHKOSH LOW LOADER

Oshkosh Four Motion Mixers

Four complete turnovers of the batch to every revolution of the drum insures a smooth and rapid mix. Rapid mixing means more batches per hour at a great saving in labor. Due to these reduced costs you make more profits at association figures, or get more jobs because of lower figures if you use an OSHKOSH FOUR MOTION MIXER OR PAVER. Remember, when figuring the cost of your machines, that the up-keep and operation cost must be counted before the purchase price.

Eveready Saw Rig

A Complete Job Shop in itself

Steel "Stitches" Every Few Inches

Columns which have staves simply glued together will surely open up. Columns which have any kind of a lock-joint are liable to open up. Columns which are glued under hydraulic pressure, where the staves are locked with a double V joint and sewed with cold rolled steel staples every few inches of their entire length *cannot* open up. And this is the way "Steel-Sewed" Columns are always made. Catalog explains the construction and shows many beautiful illustrations. Write for it.

S. CHENEY & SON, Dept. B, Manlius, New York

Safety—Economy—Speed

These you get when you buy a Fay-Egan

"LIGHTNING" Band Scroll Saw

Made with wheels 30", 33", 36" and 42" dia.

Will do three times as much work, at one-half the power cost and one-third the blade up-keep expense of any Band Saw of the same size. Here are the reasons why such wonderful results are obtained:

SQUARE COLUMN—A much more rigid type of construction than the old "goose neck" frame. Carries wheels without vibration.

SOLID LOWER WHEEL—Acts like the flywheel of an engine, controlling a light, spoked upper one, preventing it from over-running or choking down in a heavy cut.

PATENTED KNIFE EDGE STRAINING DEVICE—Sensitive to even temperature changes, yet so flexible that you can pass a heavy block of wood between the wheels and the blade while in operation without injuring the blade.

The combination of these three principles in one machine, plus the Fay-Egan reputation for high quality and safety throughout, makes No. 50 the unequalled Band Scroll Saw of today.

ANNOUNCEMENT - EXTRAORDINARY

To meet the demand of the many contractors and builders who have only a limited amount of floor surfacing to do we have designed two new models in addition to our old standard Triple "A" SPRING DRIVEN Floor-smoother.

These new models will be known as Triple "A" No. 2, and Triple "A" No. 3. Though somewhat simplified in construction, they embody the essential Triple "A" features which have made our Standard Machine what it is—"The Peer of All Floor Surfacing Machines."

First and foremost, they are **SPRING DRIVEN**. That means a saving of two-thirds of the time and labor required to do the work with an ordinary hand-power machine.

These machines have been specially priced, so as to place them within the reach of every man who needs a floor surfacing machine, and there is now no further need of any one doing without a Spring Driven machine.

If you have an ordinary hand-power machine and want something that will do the work better and easier and make more money for you in the end, write us at once, and we will make you a special allowance on your old machine.

Full description of our three models, prices, etc., will be mailed on request. We will also include an interesting and truthful story which may pave the way to a big increase in your income, as it has done for a goodly number of others.

JOHNS-MANVILLE Service is not "long distance" service—not "service" by correspondence.

Fifty-one J-M organizations in as many North American cities make J-M Service a man-to-man proposition no matter where you are located.

J-M Transite Asbestos Shingles are not expensive —they are cheaper than slate or tile

When you suggest J-M Transite Asbestos Shingles, you offer your client a reliable, fire-retardant roof at a low cost—a roof that possesses artistic qualities with a degree of fireproofness no less than slate. And at the same time, one much lighter in weight. J-M Transite Asbestos Shingles may be laid on rafters designed for light wooden shingles.

Moreover, they never deteriorate, because the action of the elements only toughens and improves them.

They are supplied in a variety of colors. They can be stained any desired tint, and come in all shapes and sizes, rough and smooth edges and in two thicknesses.

Easy to apply and offer a good profit to the builder and permanent satisfaction to your client.

J-M Transite Asbestos Shingles are examined, approved and labeled by the Underwriters Laboratories, Inc., under the direction of the National Board of Fire Underwriters. Laid American Method, they are given class "B" rating. Laid French Method, they are given class "C" rating.

Rose Inn, Crossett, Ark. Frank W. Gibb, Architect. Finished throughout in Arkansas Soft Pine.

When specifying Interior Trim for semi-public buildings, the prime considerations, of course, are attractive appearance and durability. The chosen wood must be serviceable, yet afford a satisfactory base for the desired color treatment.

IN THESE RESPECTS ARKANSAS SOFT PINE

will meet your every requirement and at the same time completely satisfy your client, whatever his taste.

This wood possesses well-balanced absorbing qualities, due to the absence of rosin or sugar. It will take applied stains evenly, definitely avoiding any tendency towards a "blotchy" appearance so often experienced in stained work, at the same time admitting of a rich looking waxed or varnished surface, which will retain its luster permanently.

Together with these advantages, Arkansas Soft Pine is readily obtainable, due to an abundant supply, and therefore at a comparatively

Moderate Cost

Believing you will gain a clearer idea of the wood by personal inspection, we will send a set of finished samples on request. Address Department R.

NORTH CAROLINA PINE

Give Them Hardwood Effects Without the Hardwood Cost

The average home-owner today desires floors with a hardwood appearance, yet many cannot afford genuine hardwood.

Here is a particularly profitable field which you can successfully develop if you specify

North Carolina Pine

"The Wood Universal"

With this wood you can furnish a floor that will look as well, finish as well and wear practically as well as hardwood at a much lower cost and greater profit to you.

Judged from any viewpoint—strength, durability, beauty of grain or susceptibility to finish—it cannot be equaled at the price.

Your customer will be more than pleased with its results and you will gain a prestige of permanent value through its recommendation.

*Our New Reference Book Is
Yours for the Asking*

Just write us today and we'll send you a most valuable Reference Book of North Carolina Pine. It shows the artistic effects possible for interiors and gives a description of its worth for every building purpose. Ask for Book B.

Why White Pine?

A Reminder of a Few Facts Every Experienced Carpenter Knows

It would be presumptuous for us to try to tell you men who are working with wood every day, anything about the superior qualities of White Pine. You know the facts enumerated below. We simply wish to remind you of them before the rush of another building season is upon you.

WHITE PINE

It Lasts Longer. Three centuries of building experience in America have proved that no other wood can withstand the attack of time and weather so successfully as White Pine.

It Holds Its Place Better. White Pine does not shrink, swell, twist, warp or rot. Once in place it "stays put," even after years of exposure in the closest fitting mitres and in delicate mouldings and carvings.

It Works Easier. Because of its softness and smooth, close grain, it works more easily under your tools. It does what you want it to do—without waste of time and needless wear on your tools.

Could Any Wood Do More?

There is still plenty of White Pine. If the lumber dealers supplying the materials for those for whom you are building are at any time unable to furnish it, we would appreciate the opportunity of being helpful to you in securing it.

Rufus D. Wood, Architect, Pittsburgh, Pa.

Read what this Architect says about his own house, which is stained with

Cabot's Creosote Stains

"The shingles of the roof and second story are stained with your brown stain and the plaster on the outside columns with your white Waterproof Cement Stain. A number of the shingled houses in my neighborhood have been stained with creosote (?) stains manufactured by local concerns and their colors are very muddy and disagreeable and do not seem to stand the weather, while mine has retained the original nut-brown color which I desired."
(Signed) RUFUS D. WOOD.

Cabot's Stains have been the standard for more than twenty-five years, and are specified by nine-tenths of the architects, who know them from experience. Their colors are soft, rich and beautiful, and guaranteed fast. Their vehicle is Creosote, which thoroughly preserves the wood, and they contain no kerosene or other cheapener. Why experiment with unknown stains, when you are sure of Cabot's?

Cabot's Waterproof Cement Stains

are the only artistic cement finishes. They give soft, natural coloring effects, without covering the surface with a painty coating. They are also cheaper than coatings and easier to apply, and they cannot crack or peel.

You can get Cabot's goods all over the country. Send for samples and name of nearest agent.

The Bungalow We Built by the Sea

How an Architect Expended \$1,500 in Constructing a Home of the Cozy-Cottage Type

BY L. JEROME AIMAR

SINCE the publication in these columns of the "Reminiscences of a Bungalofer" the writer has been in receipt of numerous letters requesting a further description of the little home

building there was not an item of materials used that is not carried in stock by local yards of any pretensions throughout the country. No moldings of any character were used except in the case

Exterior View of the Cozy Cottage Which a New Jersey Architect Built By the Sea

mentioned in that article, and these have led him to believe that other readers of THE BUILDING AGE might be equally interested in the subject. I wish to say at the start that in the construction of the

of the porch railings, the turned balusters for which I had on hand and which required a molding to correspond.

It may be interesting at the outset to say some-

The Bungalow We Built By the Sea—Plans, Elevations and Various Constructive Details

thing regarding the method in which I went about building the house. It was started during the vacation of the writer, who, in common with innumerable other members of the profession the past few years, must have brought much "grist" to the mills of his Satanic majesty, if there is any foundation for the belief that he it is who furnishes "mischief for the idle hands to do." I drew my plans and specifications with as much care as I should have bestowed upon them for the most exacting client. Had I carried out the usual order of things and drawn up an iron bound contract for some contractor, all would have been well, perhaps. But, laboring under the impression that, no matter what sum the contractor is

meals a day while at work upon the building, but I did, and had to forage for them occasionally. Next, the material-man, who furnished the boards and stuff which we so cheerfully sawed up, became unaccountably interested in our work. He allowed me only a short time to wonder why. I met his rather pointed remarks with a dissertation that he afterwards admitted would have done honor to a bona fide building contractor, although it did not draw a tear or a flicker of the eyelids that I could detect. I did, however, detect a quite perceptible hardening of the muscles around the jaws of said material-man.

Finally I succeeded in getting the building inclosed, the first floors laid and the partitions set,

The Bungalow We Built By the Sea—View in the Dining Room Looking Toward the Main Stairs

getting, he is bound to make about twenty per cent out of the transaction, I calculated that not only could I build the house myself and make a neat little sum during the dull season but on top of that would own the house as well when completed. So with the assistance of two active young men I started in to surprise even myself at the amount of work I could stand and see accomplished in so short a space of time.

Soon things began to happen. First, the thermometer began to climb up to within an inch or two of the nail upon which it hung, and there was no shade on the place. Then there were several things for which no provision had been made in the specifications. The latter breathed not a word in reference to my requiring three

before the two active young men, who made it impossible for me to return the material-man his lumber, began to accept week-end invitations from some mysterious friends. These ends must have met finally, because, after holding me up for the sums due them, they failed to purchase a return trip ticket. I felt proud of the fact, however, that they had put on all of the "plaster boards" throughout the interior before deserting me. I used "plaster boards" for the interior walls and partitions because, as I told inquirers, "masons are such untidy chaps that my artistic instincts cried out against having them around mussing things up." This was not the true reason, but was not so far fetched as some might think.

Now, then, was I in a position to show the world

what was in me. So, doffing collar and cravat and rolling up my sleeves, I embraced the opportunity to work seventeen hours out of twenty-four and "gull" the neighbors into believing that I was doing it for recreation and getting ever so much fun out of it. A few days' work convinced me that, with the expenditure of much surplus energy, I was capable of finishing the building with my own hands, as I kept improving in skill, the amount of work accomplished in a given time, and in the evolution of the scheme and details of finish. As this brings us up to the time when I took things into my own hands and started upon the interior, I will describe the manner in which I finished the

Sectional Elevation Through Bookcase and Divan
Scale $\frac{1}{4}$ in. to the foot

inside and describe the exterior afterwards.

The floors throughout the first story were of $\frac{7}{8}$ in. x 3 in. N. C. matched boards, driven up closely against the outside walls, to prevent the ingress of field mice; there being no cellar under the house. At the bottoms of the studding, on top of the floor, I provided 2 in. x 4 in. pieces, cut in between the studding, to which to nail the plaster board sheets and similar pieces at heights where the sheets would join. The vertical joints I had arranged to come on the studding, behind the casings and the cross joints; two sheets in height established the distance above the floor for the plate shelf, 5 ft. 10 in. This left one cross joint exposed, which I rubbed smooth with a small block of wood and sand paper. The ceilings were 9 ft. high, to the under side of the beams above, requiring exactly three sheets of plaster boards, without waste, all around walls and partitions.

The plate shelf is simply a plain piece of $\frac{7}{8}$ in. x $3\frac{1}{2}$ in. cypress, with a groove in the top and square edges, supported upon a plain $\frac{5}{8}$ in. x 4 in. cypress strip. Below the plate shelf, I thought to form a paneled wainscot. This I did by means of vertical strips $\frac{5}{8}$ in. x 4 in., starting them on top of the plain $\frac{7}{8}$ in. x 6 in. baseboard running around the rooms and finishing up under the supporting strip of the plate shelf.

Originally I had given little thought to having

finished rooms in the attic above, and had placed 2 in. x 6 in. rough beams across to tie the sides of the building together. Concluding to utilize the attic space for sleeping rooms, I deemed it necessary to stiffen these timbers, which were spaced 2 ft. apart. My first thought was to double them. "I have it. Case those beams with $\frac{7}{8}$ -in. boards and have exposed ceiling beams. A timbered ceiling."

So I proceeded to joint up two $\frac{7}{8}$ in. x $7\frac{1}{2}$ in. cypress boards, and a strip of cypress $\frac{7}{8}$ in. x $2\frac{1}{4}$ in. for each beam, and nailed them together in the form of a three-sided box, of sufficient depth and width to surround the widest and thickest beams. I got the neat lengths required and formed these boxes on a work bench on the cool, shady porch. I found that I could easily handle them alone and with little trouble put them up, averaging two an hour. I left the laying of the upper floors until after this work was completed, in order that the flooring would lay snugly down on the tops of my eased beams and require no moldings to make a finished job. Between the ends of the beams, where they rested upon the side walls and partitions, I cut in $\frac{7}{8}$ in. boards of the depth of the finished beams, making neat close

Right Side Elevation of the House—Scale $\frac{1}{4}$ in. to the foot

The House We Built By the Sea—L. Jerome Aimar, Architect

joints. The flooring above was of spruce $\frac{7}{8}$ in. x 6 in. beaded and center beaded on the under side, and answers the double purpose of floor above and ceiling below.

For the trim of the window and door openings I used a plain $\frac{5}{8}$ in. x 4 in. cypress strip, similar to the panel strips of the wainscoting. For all the openings I ran these strips up from the floor to the under sides of the ceiling beams, except that for the window openings they were cut on top of the base, while those of the door openings went by the base to the floor. I cut in similar pieces, between the uprights, to form the head casings and aprons under the windows. No stools were provided in the window openings, the window stops being returned around on top of the aprons, finishing out flush with their front edges.

My idea in using $\frac{5}{8}$ -in. stuff was that I thought it less liable to swell or shrink than thicker material and I have found that I was right in this.

With rooms above, a stairway became a necessity. This I located where shown, because there was no other properly available place to put it. It might be well for me to digress sufficiently to say that I believe about half of the clients I have ever had appeared to believe one can just plant a stairway any old place they may think they wish it. I have met more than one builder, too, who not only appeared to believe this but let themselves in for all kinds of trouble through trying to prove that the architect did not know it all. It can't be done. A certain length of base line is required for a given story height. You cannot shorten this much with-

over into the living room I thus formed a square bay in that apartment, without breaking the lines on the outside. In doing this the little vestibule was evolved, which I consider one of my best "stunts," for by providing this vestibule, I could lower the ceiling in it and make it serve as a platform for the stairs, so that every inch of space was utilized, making it unnecessary that an unsightly "storm door" grace my porch in winter. In the summer time I take down the glazed doors and substitute a wired one.

In the square bay before mentioned, a long seat became possible, which I made extra wide, and being so long I cut it in two through the center of its length and hinged each half. What a commodious locker this seat provided. And how soon it be-

View in Living Room of the Bungalow We Built By the Sea, Showing the Open Fireplace with the Dining Room Seen at the Right

out producing something both uncomfortable and unsightly. A certain amount of space is required for landing on the floor above, and unless the stairs land somewhere near the center of the building it will entail much loss of floor space for hallways reaching the several rooms. In the instance of this little house, the only available base line was too short. In order to overcome this difficulty a platform was introduced and a turn at both top and bottom of the run as shown. I describe how and why this was done, for the benefit of those into whose hands the plans may come, and who might feel justified in saying to their builder, "I don't like a turn in my stairs, just you run them straight up."

The width of the stairway formed a jog in the front line of the rooms, and by carrying this jog

came the repository for old magazines and "junk," just as I predicted it would when I built it.

In the corners of the bay, each side of the mul-lioned window, small book shelves suggested themselves, and a few short pieces of $\frac{7}{8}$ -in. stuff left over from the beam casings, provided the materials. One of these book shelves is shown in the picture, with its top forming a continuation of the plate shelf, upon which you may perhaps note a model of a picturesque cottage, worked out to scale for an appreciative client.

Up to this point I had succeeded in staving off the masons, but when I reached the fireplace I approached the subject with fear and trembling, so I felt obliged to capitulate and call in one to build the chimney. I believe that I could have built it,

but there is something about masons' work that, throughout my many years of practice, has led me to make a considerable detour when within the vicinity of a mortar bed and to treat very courteously "the man with the hoe."

I drew a detail of the fireplace as I desired it built. When, in answer to my mason's inquiry whether I intended using Mottled Roman or pressed bricks, I informed him that I thought to use just such bricks as he had used for the foundation for the house down the street, he gasped:

"You never expect a man to do a job like this with such brick?"

"Why not," I replied. "It is the manner in which I expect you to lay up the bricks that makes the finished design conform with the drawing."

"Many of those bricks have their corners

grained, will do first rate; it will give the cement mortar a creamy cast, which I think I will like."

"Oh, werry well, Governor; you are the boss, but don't expect me to stay and hold that chimney up—if I can ever get it to stand up until I finish it."

After starting and threatening to "chuck up the job" several times, he finally managed to complete it after a fashion. When I had more leisure I dug the mortar out around the edges of each brick with a tool not intended for such purpose.

The following winter he found me sitting before a comfortable wood fire, and was struck with the changes I had worked upon his job.

"Stick your teeth in that mortar, and I will tell you how I did it."

He dug into it with his pocket knife and laughed, "Well you had some job, believe me."

Opening Between Living and Dining Rooms

The Bungalow We Built By the Sea—Miscellaneous Constructive Details—Scale 1/4 In. to the Foot

knocked off," he came back. "I will have to use selected bricks for such a job."

"Suppose I were to insist that you use those very same bricks and to lay them up as I will direct and that I will assume the entire responsibility regarding the outcome, do you think I might prevail upon you to do the job?"

This he finally agreed to do, but when I required an inch and a quarter mortar joint I heard him mutter to his assistant, "Some of these here now archeetexes is just plum crazy."

He insisted upon laying up "flush" joints, and I finally had to let him. For mortar he wanted a load of some special sand.

"That sand we have outside, while a trifle fine

The next trouble was with the painter, who laid out an elaborate scheme for finishing the woodwork.

"No you don't," I cautioned; "now, listen: This is to be a little home that people in very modest circumstances can set about building themselves. It is not to be an elegant mansion at all. What I wish you to do for me is to tint some putty to match this piece of cigar box, neatly putty up the nail holes and the poorest of 'my' bad joints, then sand-paper every part smoothly; brush on some brown stain, diluted with 'turps' and then rub it down painstakingly. I realize how you feel about it, Sonny, but that will be about all I desire."

Well this he did, and I showed him the "pictures" the other day, and he realized that the bringing out

of the lights and shadows was all that was required to make it beautiful. Understand, all along I kept in mind my idea to complete an artistic home, such as anyone desirous of getting away from the commonplace stock designs might afford to build.

I must now accustom myself to saying "we," because my wife thought it about time she took a hand in the game. Of course few would think of going about such a vital matter without consulting an expert and spending days in evolving a color scheme. Not intending to buy a single stick of new furniture to go into this house and possessing just a limited lot of odds and ends, we could afford to throw conventionalities to the winds, rather than our money—which we had not.

Well, after much comparing of notes, we could not convince ourselves that anything would suit for

About two coats more will give it the finish we are aiming for.

I was somewhat extravagant in the items of "flue lining" for our chimney. So, in punishment, "she" keeps the fact before our eyes in the manner shown in the view of the fireplace.

Please take a glance at our "andirons," or, as they are called where we passed our childhood days, "dog irons." But these are neither. Look a little bit closer, and you will see that they are nothing more nor less than part of the "footpiece" of a child's crib.

A little thought—a couple of hours' work—resulted in the really useful accessory shown. And, some day, we are going to have a copper "hood" over the fireplace opening.

I think I have mentioned that there was no cellar

The Bungalow We Built By the Sea—View in Living Room Looking Toward the Divan

the lower, paneled portions of the walls but some shade of green. We finally chose a shade of that color in burlap, but, finding that so many were using this material for wall covering, we lost our interest in it. What we did use was an "oatmeal" paper, which we decided was just as beautiful and more in line with our set scheme of economy.

For the side walls above the plate shelf we used a yellowish gray paper with alternating strips of a darker shade and a border.

The kitchen walls we covered with a washable paper. The attic bed rooms with neat patterns of ribbon paper, the vertical stripes making the ceilings appear higher than they really are. The woodwork throughout the attic was given three coats of "flat" white, sandpapering all between the coats.

under this house. I would advise having a cellar, and expect some day to excavate one under this house, in which case access to same from the floor above will be by stairway through the closet under the present stairway to attic rooms.

This house was set on a low concrete trench wall, which raised the timber sills two or three inches above the ground. The timbers were all of hemlock, the sills being 4 in. x 6 in.; corner posts, 4 in. x 6 in.; plates, 2 in. x 4 in., doubled; floor beams, 2 in. x 6 in.; girder, 4 in. x 6 in.; rafters, 2 in. x 6 in.; piazza timbers, 2 in. x 6 in., all fitted and fastened together in proper manner.

Anticipating the future possibility of there being a cellar, the posts and exterior studding were not carried down to the sills in the usual manner. These

sills, resting upon the dwarf walls, are much below the first floor level, so short pieces for uprights were set up from the sills to the under sides of the floor beams, and the beams were cut 8 in. shorter than the actual width of the building, and similar 2-in. x 6-in. timbers were spiked against their ends, these timbers being doubled, thus forming 4-in. x 6-in. sills on the long sides of the building. The end beams were doubled, making them 4 in. x 6 in. Upon these timbers the studding and corner posts were set, though the sheathing was started from the lower sills, just above the ground.

When the cellar is put under the house all that is necessary is to knock out the short uprights and sheathing and carry the masonry walls up to the level of the higher timbers.

Covering for Exterior Walls

The exterior walls were sheathed horizontally with $\frac{7}{8}$ -in. x $9\frac{1}{2}$ -in. North Carolina shiplap boards covered with heavy building paper and inclosed with 18-in. Western red cedar shingles of promiscuous widths laid in courses, exposing 6 in. to the weather. The roofs were covered with similar shingles laid $5\frac{1}{2}$ in. to the weather and laid on 1-in. x 2-in. spruce strips, set to accommodate the shingled courses. The roof over the piazza was sheathed on top of the rafters with $\frac{7}{8}$ -in. matched and center-beaded North Carolina boards, the rafters being left exposed and rough.

The overhangs at eaves and gables were formed in a simple manner, as shown, and at no greater cost than the usual commonplace box cornice. Shingling over the "rolled" projection necessitated no extra manipulating of the shingles after the double ease courses were laid and the single "drop" course shown on the ends next the eave course. Using somewhat narrow shingles, they laid as flatly and easily over the curve as upon other parts of the roof; $\frac{7}{8}$ -in. x 3-in. matched North Carolina boards were turned over the curved "lookouts" in the gables, and upon these the roof shingles were laid. These "lookouts" were short pieces of 2-in. x 6-in. cut off the ends of the floor timbers, being lined out and shaped with a sharp shingling hatchet. Masons laths were laid under the shingles, where they were laid over the tight sheathing on the piazza roof, to provide ventilation under them.

The Piazza Construction

The piazza flooring was of $\frac{7}{8}$ -in. matched North Carolina pine (white pine would have been preferable) laid in white lead. The arches of front and ends were sheathed in similar manner to the other parts of the building, and the shingled courses continued over to same and cut to the required radii. A row of shingles was then laid around the outside of the arches over the regular courses as shown—a simple and effective treatment. The soffits of the arches and the interior sides of the inclosure were ceiled with $\frac{5}{8}$ -in. x $3\frac{1}{2}$ -in. matched and center-beaded North Carolina pine, with small plain fillet broken in the angles.

All exposed square feet were left rough and of their full depths. To dress them would have reduced their dimensions, while to paint them rough gave a more "weathered" appearance, in keeping with the general character of the design.

All shingles were left to "weather stain." Not that "be-u-ti-ful" silvery gray of which we have heard so much, but have never yet seen materialize, but an equally beautiful "wine" color of metallic luster—under some weather conditions and at other times a very pleasing shade of brown. All shadowed overhangs were stained a brown to emphasize the shadows.

In the kitchen, each side of the end window, we have set up what we term "china cupboards," and under the one farther from the sink we have provided a wide counter shelf, open underneath.

We have a driven well, which is nothing more than a $1\frac{1}{2}$ -in. galvanized iron pipe driven down through a gravel strata 14 ft. below the surface. This was a heart-breaking job but well worth the pains it cost. We put in an ordinary pitcher pump, which we will some day replace with a lift pump. An enameled iron, roll-rim sink is placed about where shown on the plans, and the window put in the center of the side instead of where shown.

The Pantry Arrangement

The pantry is provided with shelves and has ample space for our refrigerator, etc. Where the roof slopes down over the pantry, making the ceiling too low for use, we have run a partition across about 3 ft. from the rear wall and thus provided a coal bin, with a hinged shutter on the outside, up under the eaves. We have also a slide arrangement, by means of which we can get our coal through the pantry. A shelf in the coal bin with a slide opening in the pantry allows us to keep our oil can outside and yet accessible from indoors.

The bathroom is located over the kitchen, the fixtures consisting of a 5-ft. enamel-lined tub with 3-in. roll rim, an enameled iron lavatory and a porcelain closet with low enameled iron tank.

The house is piped for gas, and we have a gas stove in the kitchen, besides our coal range. We are out of range of the sewer system at present, as well as city water. Otherwise there is little left to be desired, unless it might be less frequent visits of the tax collector or the possibility of meeting our grocer and butcher with more mutual satisfaction.

And what did all this cost, ask you? Well, we crawled out from under with an expenditure of fifteen hundred dollars. This price of course does not include such "frills" as our andirons.

The Panama-Pacific Exposition Buildings Go to Oakland Wreckers

A considerable number of the Panama Exposition buildings which were recently sold, were purchased by the Dolan Bros. Wrecking Company of Oakland, Cal., with the understanding that the sites must be cleared by March 15 of the present year. The buildings involved are those of the States of Massachusetts, Illinois, Texas, Wisconsin, West Virginia, New Jersey and Kansas, also the Panama Canal Building, Yellowstone Park, Old Faithful Inn, Alt Nurnberg, Canadian Grand Trunk Railroad and hundreds of exhibit booths. The wreckers claim to have purchased about 50,000,000 ft. of lumber and invested about \$25,000.

Bell Tower and Ventilator Details

An Example of English Practice That May Be of Possible Interest to American Builders

BUILDING methods differ in many essential particulars in various parts of the world, and it is always interesting to note how work is done in sections remote to that in which one may live. Many readers are likely therefore to find points of construction to command their attention in the account of an English builder telling in the *Building World* how to make a ventilator and a bell tower for use upon a school building. According to the author the base or framing is fixed on the main roof of the building, the ventilator being afterward set immediately upon the base. The top space is intended to be occupied by the bell and is

sill framed at the angles. The raking braces should be halved to the angle-posts and spiked, and seating pieces, 5 in. by 4 in., bolted to the collars and posts.

Where the turret is being fitted on an old school building, trusses should be inserted in the roof to

Fig. 1—Elevation of the Bell Tower

Fig. 2—Vertical Section of Tower to a Somewhat Larger Scale Than the Elevation

Fig. 3—Partial Vertical Section on Line A-A of Fig. 4

Fig. 4—A Half Plan of the base

Bell Tower and Ventilator Details—Various Constructive Features

provided with a roof formed in four gables, the whole being surmounted by a wrought-iron weather vane of ornamental design.

The construction of the turret, of which Fig. 1 shows the elevation, is best understood by reference to Fig. 2. The angle-posts of the base are formed from 4-in. by 4-in. pitchpine, with a 4-in. by 3-in

sustain the weight and to form supports to which the corner posts can be bolted.

The ventilating portion of the turret is formed with louvers of 1-in. oak board grooved into the sides of the angle-posts. The covering of the ventilator is of 7-lb. lead laid on properly weathered joists and boarding; it projects over, and is turned

down on the cornice. The bell chamber is provided with leaded lights on all sides, the bell itself being hung on a pitchpine beam, with wrought-iron gudgeons, bell-metal bearings, and a wrought-iron cranked arm for the rope.

The roof over the bell is covered with 7-lb. sheet lead, divided into small bays with 1-in. roll, the gables being filled with 1-in. oak louvers. The wrought-iron vane is bolted through a 4-in. by 4-in. oak post fixed to the turret roof by means of cross bearers passing over the bell beam.

The sections are fixed together with strapped bolts. Fig. 3 shows a half vertical section on the line A A of Fig. 4, which represents a half-plan

of the base; Fig. 5 shows a half-plan of the bell-tower chamber.

Details of the projecting cornices are shown in Figs. 6, 7, 8 and 9 of the sketches.

Fire Losses in 1915

The losses by fire in the United States and Canada during the year 1915, as compiled from the records of the *Journal of Commerce*, aggregated \$182,836,200, as compared with \$235,591,350 in 1914. The fire loss record for 1915 is the smallest the country has enjoyed since 1905, when the figures recorded were \$175,193,800.

The Material Dealers' Credit Association, of Fresno, Cal., held a banquet on the evening of Jan. 24 at Hotel Fresno, celebrating the end of the first six months of its existence. The guests of honor were L. W. Cutler, an insurance man, who spoke on "Bonds," and H. B. Potter, president of the Los Angeles Building Material Dealers' Association, who spoke on "Co-operation." The association now has over fifty members.

A Log Cabin on Mount Hood

There has recently been completed on the summit of Mount Hood, by the United States Forest Service, a log cabin 10 x 12 ft. in size and 17 ft. high, which is to be used as an observatory. Its construction is somewhat interesting, both on account of the difficulties with which the material was transported to the top of the mountain and on account of the fact that it is the highest fire outlook station in the United States, having an elevation above sea level of 11,225 ft.

For most of the distance up the mountain the lumber was carried in packs by mules, but between Crater Rock and the summit the path rises almost 1000 ft. in less than a half mile, and is blocked by crevasses and hanging rocks. One crevasse, 20 ft. wide, had to be crossed on a frail ladder. Directly beyond this crevasse the ascent is so steep that the packers had to cling to a rope to pull themselves up. The lumber was cut into lengths of from three to eight feet, tied into bundles of 75 lb. each and the 5000 ft. of lumber nec-

essary for the cabin were thus carried up the mountain side over rolling lava stone and snow and ice.

Because the wind at the top often reached a velocity of 75 miles an hour the foundation was sunk to 4 ft. and the cabin was anchored by cables extending from the top of the cabin to cement bases. The success of establishing this station has induced the forest service to plan two similar stations on the summits of Mount Adams and Mount St. Helena, thus forming a triangle, from the angles of which all the forests of central Washington and Oregon may be observed.

Marble from Alaska

Marble from Alaska is to a large extent replacing this class of building stone from other quarters in the Pacific States. Large quantities are now being used in the construction of the King County Court House and the American Securities Building, Seattle, and a new postoffice at Everett, Wash. Marble from the large quarries at Token, Alaska, is towed down the coast on barges, a load of 1400 tons having recently arrived at Seattle.

More "Wrinkles" in House Building

Various "Short-Cuts" for Doing Work Which the Younger Carpenters in Country Towns Will Find Useful

By GEORGE L. MCMURPHY

ABOUT the first thing the carpenter requires when he goes to work on a job is a pair of trestles or "saw horses." As there are likely to be several used on a job, it is quite desirable they should be built to standard height, so they will be interchangeable for different kinds of work as needed. I have found that for ordinary use on residence work 2 x 4 in. stuff for tops and 1 x 6 in. for legs make them heavy enough for all practical purposes, and much more convenient to move about than if made heavier. The most convenient height and size I have found to be 3½ ft.

hold bradawls or spiral drills and similar tools when putting on finish.

Much of the present day practice is to mitre siding (clapboards) at the corners instead of using corner boards. It certainly makes a neat looking job when well done, but may puzzle some of the more inexperienced workmen at first to find an easy way to make the cuts. I have found that a piece of the siding tacked against the inside of the mitre-box will make the proper bevel and help greatly in making the cuts. We use cedar siding here, made by re-sawing 1 x 4 in. or 1 x 6 in. boards after they

Fig. 1—Details of Trestle or "Saw-Horse"

Fig. 2—Plan and Side Views of Tool for Removing Nails

Fig. 3—Joint Construction Suggested When Laying a Floor or Putting Up Porch Ceiling.

Fig. 4—A Make-Shift Bead Plane

More "Wrinkles" in House Building as Described By Mr. McMurphy

or 4 ft. long and made as follows: Take a piece of 2 x 4 about 3½ ft. long and cut 6 in. gains on each side 4 in. from each end, making them ½ in. deep on top and tapering to the edge below, as shown in Fig. 1. Making the bevel across the 2 x 4 2 in. in 2 ft. as shown. Cut the legs the same bevel and just the length of the square, or 2 ft., and the trestles will be about the right height for most men. A 1 x 8 board nailed across the legs close to the top will brace them and the bevel in the gains will give the right spread to them. Two or more holes bored through the top in which long pins may be put will be found very convenient when mitreing base or making similar cuts, as well as to

have been dressed. They are re-sawed on a bevel and vary quite a little in thickness,—not enough to be noticeable on the wall but enough to give some trouble at the corners unless care is taken to either select those of even thickness or dress them as they are put on. I like the practice of nailing siding with 4d.—½ in.—casing nails, placing them at random rather than using 6d. nails and following the studs. The nails will pull through the siding before they will pull out of the sheathing. There is very little tendency to warp in cedar siding, but I used 4d. common nails with good success on "machine clapboards" of spruce in Vermont before I left the Green Mountain State some years ago.

It is a good plan to space the siding on a rod long enough to reach at least one story if not the whole height of the building, and use the rod at each corner as well as at windows and doors. The time spent in marking the rod will be more than saved in the time otherwise required at each corner and window, to say nothing of the added satisfaction in having the lines straight all around the building, and preventing mistakes and wrong spacing as is likely to be the case where several men are spacing independently. I have known a man to lay off two adjoining spaces between windows and get one more piece of siding in one space than in the other where each space was done independently.

Staging a Building

Another thing in which often too little foresight is displayed is in staging a building. We hardly ever use portable brackets here, but 2 x 3 or 2 x 4-in. stuff for uprights and nailing ledges to the building. If a little forethought is exercised the stagings can as easily be built so that the top one will be right for putting on the cornice and starting the shingling and siding, as otherwise, yet I have seen men stage a whole house so carelessly that when it was sheathed every stage had to be rebuilt before it could be used for either cornice or siding. Also get the habit of always nailing the ledges and stays securely before they are left, otherwise they may be forgotten and a bad fall with serious injury or loss of life may result.

Sometimes we are called on to patch an old roof or to put up an addition where the roof joints below an old one, in which case the task of getting rid of nails under the shingles which are not to be removed is somewhat troublesome. A tool shaped somewhat like an old-fashioned bayonet with the blade made of a thin piece of steel like a leaf from an elliptic spring will be found useful. The sketch, Fig. 2, will explain what I mean. The notches should be made rather sharp and have a "cold chisel temper" that they may cut or pull the nails. If in putting in patches or the top course below an old roof, the shingle is shoved up to within $\frac{1}{4}$ in. of where it belongs and the nails driven close up to the butts of the course above and not too tight, the shingle can then be driven home and will draw the nail heads up under the shingle above, thus hiding them and making a much neater job.

Floor and Ceiling Joint Construction

Where the cornice plancier is of 1 x 4-in. ceiling, or in turning a corner with porch ceiling, or laying a floor border around a room, it is better to make a "zig-zag" joint, as in Fig. 3, than to mitre the boards. Such a joint will "stay put" better and is easier to make than a mitred one, which is almost sure to shrink or swell and open. I much prefer a square joint to a mitred one wherever it can be used, and in my own practice use such a joint where many prefer the mitre cut. For instance, in such places as joining base or moldings, casing around registers, where they are set in the wall, etc., I think a square joint that *stays* is much preferable to a mitred one that has opened ever so little, and it is very rarely that a mitred joint will stay in ordinary work, especially out of doors.

In years gone by every carpenter carried with

him on to the job a chest full of tools, including a supply of bead planes of various sizes, but in these days of "suit case" kits even a Stanley "55" adds materially to the workman's load. Yet it is often necessary for him, especially on repair jobs, to work a bead to match some old work, and the absence of a bead plane of the right size is a great inconvenience. Here is a simple way to overcome the difficulty that is worth knowing. Take a block and drive a large headed wood screw into the side of it till it projects the right distance to make the right sized bead, as in Fig. 4. Turn the screw till the slot presents a cutting edge, as shown, and the groove of the bead can be made with little difficulty. The sharp corner can be easily rounded off with the smoothing plane and a little application of sandpaper will show a presentable bead that will pass muster on almost any job. Of course, this is not as satisfactory as to have a regular bead plane, but it is a convenient makeshift to tide one over a hump when caught without just the necessary tool.

Doing Mill Work on the Job

Sometimes the carpenter does much of what is commonly known as "mill work" on the job, and sometimes he does cabinet work when other work is dull, or where no regular cabinet shop is near. In such cases he is sometimes required to glue up a mitred corner and finds it difficult to clamp the two pieces together while the glue is setting. Fig. 5 shows an easy way to overcome the difficulty, and is almost self-explanatory. The blocks "A" are dressed to the proper angle so that when glued on the faces will be parallel with the faces of the joint, and glued just back of the edge as shown. When the glue has set and the clamps applied the joint can be brought firmly together and held while the glue is drying, after which the blocks can easily be dressed off. If hot glue is used the blocks can be "rubbed on," but if liquid glue is used it may be necessary to tack them slightly to hold them in place till the glue sets.

Lock Joint for Mitred Corners

Fig. 6 shows a lock joint for mitred corners that I consider much superior to a plain mitre. It offers more surface for the glue and if well made will hold with some force without glue. In main newel posts and similar work clamps need only be applied one way, saving half the number otherwise required, and where the boards are a little crooked, as is almost always the case, they will straighten themselves when clamped together. The joint should be made a little open, and with a little "draw" to it as shown. Where machinery is available the joint can readily be run on the shaper or jointer, but where no such advantages are at hand planes to stick the joint can be made at small expense, and where there is much work of this kind to be done they will be a profitable investment.

Where pantry fixtures or cabinet work are made by hand, dowels are largely taking the place of the mortise and tenon, and I think that way is fully as good, being as strong as well as more quickly and easily done. Where that kind of work is done it will be found that an old bitt with the spurs filed off smooth and sharpened will work better for boring into end wood than even a new bit with the spurs

sharp. Almost every workman has several such bits thrown aside as useless from the spurs having become so worn down that they will no longer cut a smooth hole for ordinary work, but which will be found to have "renewed their youth" for this purpose if treated as above.

Also let me suggest to the inexperienced workman that in making panelled work or glass doors, that the mortises and tenons should be worked and the dowel holes bored before the stiles and rails are plowed or rebated. Where glass doors or sash are being made allow $\frac{1}{8}$ in. more than the glass size in laying out the work, and make panels $\frac{1}{16}$ or $\frac{1}{8}$ in. smaller than the surrounding frame, allowing for the groove to provide for swelling or shrinkage of the wood. Panels should never be glued in as there is almost certain to be more or less shrinkage or swelling of

since I have no intention of invading, I venture to illustrate in Fig. 7 a simple and convenient way of laying out winders where it is necessary to make a turn and there is not room enough to permit of the use of a platform, no stair-builder being employed.

Fig. 7 is the plan of such a stair. From the center e with any convenient radius strike the arc $a d c b$. From a as center with the same radius cut the arc at c , and from b as center cut it at d ; then from e through c and d draw lines as shown, which will give the position of the risers for three winders—the number most commonly used. A way by which a pattern can be made from which to cut the tread for the middle step is shown. The pattern can be made of any light stuff with one straight edge, and with care can be made accurate enough so that the tread can be cut by it to make a good

Fig. 5—A Method of Clamping Work

Fig. 6—Lock Joint for Mitered Corners

Fig. 7—Simple Method of Laying Out "Winders" in Stair Construction

Fig. 8—Method of Constructing Thresholds

More "Wrinkles" in House Building as Described By George L. McMurphy

them, and if glued they will be apt to split, thus spoiling the work.

Many times the carpenter is required to put up the rough strings for stairs, even when the finish stairs are made at the mill, or by a stair builder. Sometimes one man will put up the strings and another will finish the stairs. As the rough strings will almost always shrink a little it is usually difficult to determine from measuring the strings just what figures were used in cutting them, and as a small variation from the figures will make a considerable difference in the length of the flight, I have found it a great convenience when working after another man in such cases to have the width of risers and trends marked on the side of the rough string for the benefit of the man who may follow.

With apologies to Morris Williams, whose prov-

fit. It should be braced as shown to prevent its getting out of shape in moving from the strings to the plank. The other steps can be similarly cut.

While the custom of putting thresholds under doors has mostly gone out of use except under outside doors it is well for one to know how in case it may be desirable to do the work. My method, which I have rarely seen other workmen use, is rapid, easy, and if carefully followed, will insure a perfect job, so I venture to describe it, though it would be much easier to *show* how than to *tell* how.

Lay the threshold across the doorway against the plinth blocks, as in Fig. 8. Take a straight rule (the slide from a Starrett try-square is excellent for the purpose), place it against the face of the jamb, as shown, and mark on the threshold the line $f b$ for the cut against the jamb face. Measure the

A Dutch Colonial House on Long Island, New York

A Good Example of the Domestic Architecture of the Time of Our Forefathers—Some Details of Interest to the Builder

THOSE of our readers who are interested in colonial architecture will find much to command their attention in the layout of the suburban home which we illustrate herewith. The rambling roof with its dormer windows, the broad veranda extending entirely across the front with the pergola at the side, the swell of the dining room and the solarium with sleeping balcony above are some of the noticeable features of the design.

The foundations rest upon footings 8 in. deep and projecting 6 in. beyond the walls on both sides. The foundations are of hollow blocks 12 in. thick laid in cement mortar composed of 1 part Portland cement and 4 parts sharp sand.

The building is of frame construction, all timbers being of spruce. The sills are 4 x 6 in., the girders 6 x 6 and 8 x 8 in., the first and second floor joists 2 x 10 in., and the third floor joists 2 x 8 in., all placed 16 in. on centers, except the second floor beams over the living and dining room, which are placed 12 in. on centers, the studs 2 x 4 in., the rafters 2 x 6 in., and the floor joist of the porch deck 2 x 8 in. The sills are halved together and spiked at the corners and junction points. They are supported on Acme columns with iron caps and bases. The floor beams are doubled under partitions and around openings for stairs, chimneys, etc. All openings more than 4 ft. wide are trussed.

The exterior walls of the house are covered with $\frac{7}{8}$ x 6 in. spruce boards laid diagonally, over which is a layer of heavy building paper. This in turn is covered with $\frac{7}{8}$ x 10 in. white pine clapboards or siding exposed 9 in. to the weather.

The rafters of all sloping roofs carry 1 x 2 in. shingle strips, on which are laid 16-in. white cedar shingles, exposed 4 in. to the weather. Before laying, the shingles were dipped in Cabot's moss green shingle stain.

All outside finish is of No. 1 cypress and the porch is ceiled with strips of $\frac{7}{8}$ x 2 $\frac{1}{2}$ in. cypress. The porch columns are

of Koll's lock joint type, made by Hartmann-Sanders Company, Chicago, Ill.

The sash of double hung windows is of $\frac{3}{8}$ -in. white pine and the French windows are 1 $\frac{3}{4}$ in. rabbetted.

The plastering is of two-coat work finished with a white coat of King's Windsor cement. The bathroom and kitchen are also plastered and finished with a coating of Keene's white cement laid up in 3 x 6-in. sections to represent tile. Metal corners are used in all exposed openings.

The floors are double, the sub-floor being of $\frac{7}{8}$ x 6-in. spruce with a finish floor of parquette design in all the rooms in the first story except the kitchen and pantry. The finish floors in the rooms of the second and third stories are of $\frac{7}{8}$ x 2 $\frac{1}{2}$ in. North Carolina pine with $\frac{7}{8}$ x 2 $\frac{1}{2}$ -in. maple flooring in the kitchen and pantry. The finish of the living room, the dining room, the main hall and stairs is of first quality Tennessee chestnut, while the finish of all other rooms is of white wood with birch one-panel doors.

The floor of the bath room is of 1 $\frac{1}{8}$ -in. white vitreous hexagon tile with a 6-in. glazed tile sanitary base.

The house is wired for electricity and heat is supplied by a Richardson & Boynton hot water plant with radiators in all rooms.

VIEW OF HOUSE AS SEEN LOOKING TOWARD THE SIDE AND REAR

All exterior woodwork was given two coats of lead and oil paint and the ceilings of the porches were finished with a coat of shellac and two coats of varnish.

All second and third-story interior trim was given four coats of flat white finish and all interior birch doors were finished dull, fumed and stained a very dark mahogany.

The white cement tile of the kitchen and bath room was given one coat of Jap-a-Lac and three coats of white enamel.

All chestnut woodwork was given one coat of stain, one coat of preservative and a coat of wax. The North Carolina pine floors were given two coats of shellac and a coat of wax.

The Dutch colonial dwelling here illustrated and described was built for Albert Hagsted at Great Neck on Long Island, N. Y., in accordance with plans prepared by George J. Hardway, architect, for the McKnight Realty Company, New York City.

Production of Portland Cement in 1915

An estimate of Portland cement produced in the United States in 1915, just made by Ernest F. Burchard of the United States Geological Survey, indicate that the shipments from the mills amounted to 86,524,500 barrels, compared with 86,437,956 barrels in 1914; the production was about 85,732,000 barrels, compared with 88,230,170 barrels in 1914, and the stocks of finished cement at the mills were about 11,583,000 barrels compared with 12,893,863 barrels in 1914. The slight decrease in production and the considerable decrease in stock indicate greater caution in the industry, which in the preceding few years showed a tendency toward overproduction.

The Lehigh district, which produces nearly 30 per cent of the domestic cement, shipped 24,500,000 barrels, produced 24,860,000 barrels and stocked 3,460,000 barrels in 1915, showing increases respectively of 2.2 per cent, 1 per cent and 10.9 per cent over the corresponding totals for 1914.

New York State shipped 5,236,500 barrels, produced 5,097,000 barrels and held in stock 825,000 barrels. These figures represent decreases respectively of 4.3 per cent, 13.4 per cent and 15.1 per cent compared with 1914.

Ohio and western Pennsylvania shipped 7,400,000 barrels, produced 7,200,000 barrels and had 750,000 barrels in stock.

Michigan and northeastern Indiana shipped 5,545,000 barrels, produced 5,550,000 barrels and held stocks of 650,000 barrels.

Southern Indiana and Kentucky shipped 2,780,000 barrels, produced 2,840,000 barrels and had 490,000 barrels in stock.

The Illinois and northwest Indiana district shipped 10,825,000 barrels, produced 10,200,000 barrels and had stocks of 1,511,000 barrels.

The Pacific coast district showed shipments of 5,867,000 barrels, production of 5,712,000 barrels and had stocks of 880,000 barrels.

Cement plants in Kansas, Nebraska, Oklahoma and central Texas showed total shipments of 6,546,000 barrels, production of 6,378,000 barrels and stocks of 786,000 barrels.

In Colorado, Utah, Montana and western Texas

the shipments approximated 2,475,000 barrels, the production 2,525,000 barrels and the stocks 300,000 barrels.

The general prices averaged a few cents lower per barrel in 1915 than in 1914, although toward the end of the year they were considerably higher. The statistics show that the general volume of business was about the same as in 1915, though it was not uniformly distributed throughout the year. During the early part of the year the demand for cement was not great, and in some districts the industry was depressed during the summer by excessive rainfall, but in the last four months or more a decided change for the better has occurred both in demand and prices, so that the outlook for 1916 is brighter than for several seasons.

Building the Tower of Babel

BY NOBLE FOSTER HOGGSON

The Tower of Babel was the first building operation undertaken by man. That the enterprise was a failure is common gossip. Not that the builders aimed too high—they hoped to reach Heaven, you remember—but because of a misunderstanding. The plans and specifications seemed clear enough in the beginning, but when it came to interpreting them there was the same diversity of opinion and the same confusion that exists to-day when a building operation is begun in the ordinary method, with a responsibility divided by many antagonistic interests.

When the ark dropped anchor and moored off Mount Ararat the sons of Noah, Shem, Ham and Japhet, journeyed down the Euphrates in search of a good building site. They chose a likely looking plot on the plains of Shinar, upon which to found a city of prodigious extent, and they planned a citadel or tower of uncommon height, a skyscraper that would in fact not only scrape the sky, but pierce into very Paradise itself.

As a building operation the Tower of Babel was a failure; if the true secret were known it would evidently show that the cost of the operation exceeded the amount of the appropriation. At any rate we know that the undertaking was contrary to the design of the Infinite Wisdom, and was defeated by a miraculous confusion of tongues. The Almighty effected a separation of the three tribes by confounding their common language. Then, of course, they could not understand each other, "and they left off to build the city and were scattered abroad on the face of the earth."

It is not exactly clear whether this initial labor friction should be termed the first strike, called by a walking delegate, or whether it was not in fact a "lock out." In either event it was effective, and definitely tied up the erection of the tower. The structure was progressing satisfactorily in every way as long as the interested parties worked together in harmony, and spoke a common language. But the moment the confusion of tongues took place among the builders, nothing further could be done. All was confusion and misunderstanding. It was impossible to go on, so the work was abandoned.

The common mode of building to-day very much

A Dutch Colonial House on Long Island, N. Y.—George J. Hardway, Architect

resembles the Tower-of-Babel manner of procedure. The confusion of ideas, lack of sympathetic understanding and mutual interest, and the division of responsibility work toward disaster. Not perhaps in the sense of initial and utter failure—the impossibility of going ahead with the work at all—but ultimate failure in that such structures reared by workers who do not “speak the same language” are foredoomed to failure.

The bricks used for building in those early days were marked with inscriptions giving the names and titles and achievements of the founders and designers of the various structures. Some of the inscriptions related to chronology, grammar, astronomy and history—“a perfect encyclopedia of the science of that people.” To-day the buildings we rear should bear the impress of the character of the future occupant, the character of the designer and the builder, and embody in detail and spirit the knowledge of the different sciences just as surely as though this knowledge were inscribed on each brick and stone which goes into the building.

A modern building should combine strength, beauty, harmony, simplicity, convenience, permanence and revenue. It is only under a form of contract which places upon one concern the responsibility for the design, construction, decoration and equipment of a building that the owner can be assured of a satisfactory and harmonious outcome of his building.

The Unit of Cement Measure

In discussing the question “Why is a barrel the unit of cement measure?” a writer in a late issue of *Concrete* comments as follows:

The Standard Specifications for Portland cement, under General Conditions provide that:

A bag of cement shall contain 94 lb. of cement net, and each barrel of Portland cement four bags.

The 400-lb. barrel originated at the time when all of our Portland cement came from abroad and was actually packed in barrels. When we began to make Portland cement in this country we put it up in barrels weighing 400 lb. gross. Later, when, as a matter of package conservation, we began to put it up in sacks, we ascertained the net weight per barrel and divided it by four.

As will be seen from the specifications, the official unit of quantity is the bag or sack which must contain 94 lb. of cement. This being the standard unit of quantity as well as the unit in which nearly all cement is actually handled, why not make our prices, contracts, invoices, bills of lading, etc., read sacks or bags instead of barrels? In other words, why not price cement in cloth 35 cents per sack gross instead of \$1.40 per bbl. gross, and in paper 27½ cents per bag gross, instead of \$1.10 per bbl. gross?

In tracing a quantity of cement from the time a quotation is made until the empty sack has been returned it will be seen that the figures are frequently converted from barrels to sacks, and sacks to barrels.

A price is made and accepted. The order calls for barrels but when it is sent to the mill, barrels

are converted into sacks and sacks are loaded into the car. In making out the invoice, however, the sacks are converted into barrels but when the consignee receives the car he converts the barrels on the invoice to sacks to check out the contents of the car. When the dealer's customer buys 10 bbls. of cement his order is converted to sacks and 40 sacks are delivered, but in invoicing the material the sacks are converted into barrels and the invoice calls for 10 bbl. The customer then changes this to sacks to make it correspond with the actual delivery.

When the sacks are emptied the word “barrel” seems to get out of our vocabulary and instead of calling “four empty sacks” “one empty barrel,” the sacks are called by their right name.

Why should not prices, orders, contracts, invoices, bills of lading, etc., correspond with our goods? This change may seem quite formidable and it would involve a change in the habit of thought of some people, principally the manufacturers of cement, but against the inconvenience of a few hundred people, we will have the convenience of hundreds of thousands of engineers, architects, inspectors, dealers, contractors, bookkeepers, farmers, teamsters, etc.

Fire Retardant Shingles

A method of rendering shingles fire retarding, developed at the Forest Products Laboratory, Madison, Wis., consists essentially in treating the air-dried shingles with a solution of borax in water, says *Hardwood Record*. The shingles are then dried to about 10 per cent moisture and a second treatment with a zinc chloride solution is applied. The shingles are again dried, after which they are then ready for use.

Theoretically, the process depends upon the formation of an insoluble salt by the zinc chloride and the borax, namely, zinc borate. This salt is practically insoluble in water and when heated to a high degree fuses and coats the cell walls, rendering them fire retardant. Shingles treated in this manner and soaked in running water for two weeks still retained their fire retardant properties. When subjected to high temperature the treated shingles will burn, but without a flame, so fire will not spread from one portion of the roof to another in case fire brands fall upon it.

The chemicals required cost about 50 cents per 1000 shingles, but the solution must be applied under pressure and a comparatively expensive equipment of cylinders, pumps and tanks is required. For this reason the method is recommended only where large quantities of shingles are being treated.

The State College of Forestry at Syracuse, N. Y., in carrying on studies of wood utilization in New York finds that of the total cut of lumber in this country 11 per cent, or about eleven billion feet, is wasted yearly in sawdust. It is estimated that in New York State alone an equivalent of nearly 135,000,000 board feet of good lumber goes into sawdust every year. This amount of lumber is enough to build at least two thousand good substantial frame houses.

Some Aspects of Modern Shingling*

A Consideration of the Subject from the Viewpoint of the Workman Rather Than That of the Contractor

BY EDWARD H. CRUSSELL*

IN looking back over the years of a somewhat busy life spent in the wood-working business, one of the things that strikes the writer as being significant is the number of times he has been compelled to change his views, or ideas, concerning fundamental items of that same business.

To explain briefly and exactly what is meant by the foregoing let us take an example: In some parts of the country it is the practice, when using corner-boards in connection with siding or clapboards, to put on the corner-boards first and then to carefully cut and fit the siding in between them. In other parts they put on the siding first, letting it run out

Scores of instances of this kind might be mentioned, and in thinking them over one is led to realize the amount of time and money that may be wasted, and the opportunities that may be lost by clinging to out-of-date ideas for nothing more than sentimental reasons. "The world do move," and it is our duty to move with it. If we do not someone with less sentiment is going to cut across and get into the procession ahead of us.

The following must be the writer's apology—if any is needed—for commencing this series of articles on modern shingling, with a short consideration of wooden shingle substitutes. The mason

Some Aspects of Modern Shingling—Fig. 1, Showing Scaffold Brackets in Position on Roof

to the corner, and then nail the corner-boards over it.

To a mechanic who is used to the first method the second method appears to be the work of an amateur, and the writer well remembers his contempt for this method the first time he saw it used.

Since that time, however, his views have changed—so much so that he now thinks the second method is the only correct and logical one, and he realizes that his original preference for the other method was not because it was the better method of construction, but because it required more skill on the part of the workman.

declares for stone, the shoemaker says "there's nothing like leather," and the carpenter, when he speaks or thinks of shingles has in mind wooden ones only, leaving the consideration of all other kinds to someone else.

Wooden shingles make a satisfactory roof covering from every point but one: they are not fireproof unless treated to be fire resisting before being laid. In fact, they are directly the opposite, and on that account their use is not permitted within the fire limits of cities or towns that have building restrictions. If it is considered necessary to guard against the use of wooden shingles in places where there is fire protection, one would naturally come to the conclusion that it must be more necessary, or at

*Copyrighted 1916 by Edward H. Crussell.

any rate, more desirable, to prohibit their use in those places where fire protection is lacking.

Of course, it is generally conceded that if fire once gets a good start on a wooden house it is just as well to let it burn and clear the site, and if fire starts from within a fireproof roof is of little consequence; but in country and suburban districts, where the houses are close enough together for the wind to carry possible sparks from one to another, it surely may be considered advisable for the present-day builder to consider roofing material of a fireproof nature, especially if (as is asserted by the manufacturers and vendors of the roofing in question) the same artistic effects and durability may be secured, and at about the same cost.

Subject Considered from Standpoint of Workman

The substitute, whether of asphalt, asbestos, or metal, is fireproof, and what should be of interest to both the workman and the contractor is usually much more easily laid, being of even size, without knots, shakes or cross grain to consider; nothing to do but place them properly and drive in the nails. This series of articles is undertaken from the viewpoint of the workman, rather than that of the owner or contractor, with the idea of offering the said workman a little reliable data on a branch of his trade that has heretofore been somewhat slighted by the technical writers. A discussion of the merits of the various brands of asphalt, asbestos or metal shingles, metal tile, slate or other roof covering, would not definitely decide anything and would, moreover, be sure to lead to needless controversy. About all that the present writer can say is: all brands have certain merits, and all manufacturers put out plenty of literature describing what these merits are. The proper thing for the person interested to do is to write for the literature and from it decide for himself.*

The literature supplied will describe the method of laying, and usually offers some suggestions regarding scaffolding. The writer would mention in passing that the methods of scaffolding to be described further on for wooden shingles are not suitable for putting on asphalt or metal ones. No roof is improved by being walked upon, but the wooden shingle will stand more of this without serious damage than will the substitute.

Scaffolding for Asphalt Shingles

One of the best methods of scaffolding for asbestos or asphalt shingle work is to cut small brackets, to the pitch of the roof, from pieces of 2 x 6-in. stuff, and fasten them to the roof with strips of sheet iron or tin, as shown in Fig. 1. These brackets may be spaced about 10 ft. apart, and should have pieces of 2 x 6 or 2 x 8 laid on top of them to walk on. These pieces are left loose and may be carried up the roof onto other brackets as the work progresses. After the roof is finished the scaffold brackets are removed by severing with a pair of tin snips the metal strips, close up to the lower edge of the row of shingles.

Of course, the metal strips that hold the brackets must be so fastened to the roof that the nails in them are covered by the next course of shingles.

*NOTE.—The writer wishes to take this opportunity of thanking those advertisers in *THE BUILDING AGE* who have so promptly answered his letters of inquiry.

This will be understood from an examination of Fig. 1, where the dotted line represents the lower edge of the next course.

Some of the advertisements picture a scaffold formed of a scantling suspended by two ropes from the ridge of the building. This may perhaps be used to advantage when the roofing is in large sheets, but for that in small pieces the writer ventures to assert that the method shown in Fig. 1 is the best. A place to stack the shingles on the roof is necessary, and Fig. 1 supplies it.

These shingles, being laid much faster than wooden ones, it is better to carry them up as they are used, enough help being told off for this purpose to keep the shinglers busy. This method saves unnecessary handling and prevents the bundles being broken open before they are actually needed. Unnecessary handling does not improve the product, and letting the shingles lie around loose is calculated to result only in useless waste.

(To be continued)

Doors 700 Years Old

There was recently exhibited in New York City four door panels carved in Japan in the twelfth century, and which are said to have once adorned a Shinto shrine. The material of which they were made was Satsuma oak. The eight compartments were ornamented with Howo birds and cloud designs in relief, representing the four heavens.

Advantages of "The Building Age" as an Advertising Medium

We take pleasure in presenting herewith a photo reproduction of a cottage erected at Mosgiel, New Zealand, by McLeod & White of that place. It strikingly illustrates the far-reaching influence of

A Double Wall Concrete Cottage in New Zealand

the advertising columns of *THE BUILDING AGE*, as the cottage was erected by the use of Van Guilder hollow wall machines which the manufacturers sold by mail through their advertisement in this journal. The photograph was sent to the Van Guilder Hollow Wall Company by the contractors, when ordering a duplicate set of machines, stating that the cottage had been built by that method.

The timber industry represents 37 per cent. of the annual wealth in British Columbia.

Details for Applying Wall Board

Timely Information for the Carpenter—The Framing an Important Factor—Nails to Be Used

BY JOSEPH A. POESL

EVERY carpenter should make himself familiar with wall board and the way it is put up because it is a material which is for him to handle. Its use in house construction is rapidly increasing, and the man with wall board knowledge is the man who will be the longest employed on the job. Wall board, you know, is often called manufactured or fiber lumber. Both of these terms are entirely correct, for most wall board is merely logs of wood converted into pulp, which is subsequently built up into strong and rigid panels. These panels saw like lumber, and are applied like lumber.

The most important factor in the application of this material is the framing to which it is applied.

Fig. 1—Showing How Wall Board May Be Used Over Plaster

ceiling, can accomplish as much as three men working singly. The use of a prop, or "tee," as it is sometimes called, to hold up one end of a panel while the other is being nailed is desirable only when but one man is available, and as an aid when two men are applying very long panels. In a ceiling panel, the first nail should be in the center, the other intermediate nails should then be driven in, and after these the edge nails. Carefully and very slightly countersink the former so that the decorator may have no difficulty in filling the depressions before painting.

On the walls, one man can easily handle a panel alone unless it is of an extremely large size. Here, the first nail goes in the center of the upper edge, and the intermediate nails follow. Then, beginning at either side of the first nail, drive nails along and around the edges until they meet at the center of the bottom edge. The intermediate nails are also countersunk on the walls.

Generally, the nails on the edges of the panels are spaced at intervals of 3 in., and those in the center from 8 to 12 in. This spacing is followed almost universally, but some carpenters take the liberty of spacing the edge nails as far as 12 in. apart, and get good results. However, do not fol-

Fig. 2—Use of Door and Window Frames Made for Lath and Plaster, in Connection with Wall Board

Details for Applying Wall Board

Rigid and level studding and joists, headers and all additional framing members have much to do with the finished job—much more than if lath and plaster were to be used.

But, before you begin work on the framing, be sure to have a plan before you for arranging the panels in some harmonious and suitable manner. It is exceedingly desirable to have this plan, for the difference between good and bad paneling is the difference between good and bad looking rooms. With it you are permitted to proceed intelligently with the preparation of the studding and joists to receive the board.

Whether the ceiling or walls be covered first is immaterial. Let us, however, begin with the ceiling. Before we commence, bear in mind that two men, working together in applying wall board to a

low suit unless you have had much experience with wall board and are quite certain that you understand its peculiarities thoroughly.

The three kinds of nails used in wall board construction are: for the edges common 1½ in. flat head; and for intermediate nailing 1-in. finishing, or 1 in. floor nails. Of the latter two, the finishing nail is the more popular, but the other possesses certain advantages which should not be overlooked.

To every 150 sq. ft. of wall board figure on about 1 lb. of the flat-head nails and to every 600 sq. ft. 1 lb. of finishing, or floor nails.

Do not put on door and window casings, trim or other finishing woodwork until after the decoration of the walls has been completed. The right procedure is to decorate the walls, stain the woodwork and apply it. Then countersink the nails,

stop the depressions and put on the shellac and varnish, or whatever treatment is wanted.

A decorative strip or moulding should never be placed where there is no panel joint or where no header is in back of the panel; otherwise the board and the moulding are not likely to fit close together, and consequently will produce an unsightly crevice.

Wall Board for Remodeling Purposes

The use of wall board for remodeling and refixing purposes is tremendous; therefore it is well to know something about the method of applying it over defective plaster. If the plaster is not in such bad condition as to be almost ready to come down, just fasten the wall board directly to it, employing sufficiently long nails to penetrate the lath and hold securely. Around the casings and along the baseboard put a small moulding having a curved, or convex, surface, which will conceal the nails and finish off the joints. Fig. 1 makes this clear.

For covering brick and concrete walls, furr them with 1 by 2 in. strips in the same manner as studing and apply the board in the ordinary way.

Not infrequently, for various reasons, carpenters are confronted with the problem of using door and window frames, made for lath and plaster, in connection with wall board. A number of solutions are common besides returning them to the mill to be cut down. One is to put an equalizing strip under the outer edge of the casing to make up the difference between the thickness of lath and plaster and of wall board. Another is to have blocking take care of the difference and finish off with a suitable molding. These methods are shown in Fig. 2.

Wide Range of Uses

The wide adaptability of wall board to different methods of construction is interesting. In Fig. 3 "A" we have a method adapted to office partitions and to summer cottages for walls and ceilings. The framing is similar to ordinary construction, only the studs and joists should be dressed if a finished looking job is wanted. Method "B" is much like "A," although it is considerably less expensive from both a material and labor viewpoint. The lumber saved by "C" is the principal reason for its being, the labor being only slightly less than in ordinary work. Some, in championing this method, declare that it brings about more attractive panel effects than is ordinarily effected. Of course, it is unnecessary to have every stud rabbeted as shown; only those coming at the edges of the panels need be of this kind. If you were using 32 in. panels every other stud would be rabbeted; if 48's, every third. The others would be regular studs, made small enough to fit the panels and afford a nailing surface for the intermediate nails. In this way the paneling would not be so pronounced as in the other methods.

Considerable importance is attached to "D" because in certain parts of the country it is almost entirely supplanting the common method, due to the peculiar labor and lumber conditions prevailing there. This is true notably in the Far West. Taken all in all, it is cheaper, the claim is made. Instead of using headers the walls are furred horizontally from the top of the baseboard up every 16 in. with 1 by 2 in. strips. At the vertical edges of the panels short pieces are fitted in between the

horizontal strips so as to provide an even nailing surface. You will observe that 2 by 3 in. studs are specified in the illustration, which you might think would weaken the construction to a great extent. But the strips brace and strengthen the entire construction so as to overcome the weakening effect of the smaller studs. In the event of your trying this method bear in mind that the window and door frames must be changed in size accordingly.

Wall board construction is new and there is yet a lot to be learned before an absolutely correct method is perfected. So, when you have a wall board job be sure to acquaint yourself thoroughly with the maker's instructions for applying his product; then mix a little judgment with your knowledge of carpentry and you will be certain of satisfactory results.

National Association of Mixer Manufacturers

This association is made up of ten of the leading manufacturers of concrete mixers, and it was the rapid growth of the industry and the lack of standards that were responsible for the formation of the organization. President Capron has stated that the object of the association is to standardize the ratings of concrete mixers, to improve conditions in the field and to establish harmonious co-operation among manufacturers in the marketing of their products.

One of the first progressive moves undertaken by the members was the standardization of concrete mixer ratings, and after thorough investigation and discussion it was decided to adopt the wet batch. This action has been indorsed by the American Concrete Institute, The American Society of Engineering Contractors, The Lehigh Portland Cement Co., The Universal Portland Cement Co., The Chicago Portland Cement Co., and A. N. Talbert of the University of Illinois.

The officers are: President, H. M. Capron, president of the Marsh-Capron Mfg. Co., Chicago, Ill.; treasurer, F. C. Wilcox, Foote Concrete Machinery Co., Chicago, Ill.; secretary, Harold E. Smith, The T. L. Smith Co., Milwaukee, Wis.

The association holds meetings every month, and one took place during the Cement Show, which was held in Chicago, Feb. 12-19.

The efforts of this organization have received the hearty support of concerns and individuals interested in the welfare of the industry, and the move is evidently a step in the right direction.

By-Products of the Lumber Industry

According to official statistics, the waste in the logging industry of the United States amounts to 15 to 20 per cent of the timber cut, or about a billion and a half cubic feet of wood annually. Saw mill waste also amounts to several billion cubic feet of wood, although not all of it is absolute waste. A Bulletin on the subject of lumber by-products just issued by the Bureau of Foreign and Domestic Commerce, Department of Commerce, makes the claim that only 320 ft. of lumber is used for each 1000 ft. that stood in the forest. The Bulletin in question gives a definite idea of how far the manufacture of lumber by-products has been developed in this

country, how far it may reasonably be expected to develop in the future and just what some of the

Industry," Special Agents, Series No. 110, and copies are obtainable at 10c. each from the Su-

problems are that confront the industry. The new Bulletin is entitled "By-Products of the Lumber

perintendent of Documents, Government Printing Office, Washington, D. C.

A Four-Room Cottage for the Suburbs

A Frame Building with Exterior of Stucco Applied to Metal Lath and with Shingled Roof

WE have taken for the subject of our colored supplemental plate this month a design well adapted for execution in the suburban districts and intended to occupy a corner lot. The picture shows the appearance of the finished structure as conceived by the architect, while the drawings upon the pages which immediately follow indicate the interior arrangement of the rooms, as well as some of the more important details of construction.

All foundation walls and footings are to be of concrete, the walls to be 8 in. thick supported on footings 10 in. thick and extending 6 in. on each side of the wall above. The concrete is to be mixed in the proportions of one of cement to three of sand and five of broken stone.

The framing timbers are to be of spruce with corner posts 4 x 6 in.; girders 4 x 8 in.; plate 4 x 6 in., laid flat; floor beams 2 x 10 in., placed 16 in. on centers, and ceiling beams 2 x 6 in. placed 20 in. on centers. Both tiers of beams are to be strengthened with one row of cross bridging. The studs are to be 2 x 4 in. placed 16 in. on centers and doubled at all openings. The rafters are to be 2 x 6 in., the porch floor beams 2 x 8 in., and the porch ceiling beams 2 x 4 in., all placed 20 in. on centers.

Outside Covering of Frame

The entire exterior frame of the building is to be covered with 1 x 9 in. hemlock sheathing laid diagonally and covered with a heavy layer of Neponset building paper, upon which is to be laid 1 x 2 in. furring strips placed 16 in. on centers. To these are to be fastened metal lath, upon which stucco is to be applied. The exterior stucco is to consist of two coats, the scratch coat to be at least $\frac{1}{2}$ in. thick outside of the lath surface and to consist of one part cement, three parts sand and not more than 10 per cent lime putty. The finishing coat is to be $\frac{1}{4}$ in. thick and to consist of one part cement, two parts sharp sand and three parts pebbles for rough finish. The stucco is to be tinted a cream shade.

The roof is to be covered with red cedar shingles, exposed $5\frac{1}{2}$ in. to the weather, and before being laid should be dipped at least two-thirds their length in Cabot's creosote stain.

The chimney, which takes care of the furnace, the kitchen range and fireplace in the living room, is to have a concrete foundation and be built of brick, the three flues to be lined with vitrified flue lining. Above the roof line the chimney is to be finished with stucco.

The exterior cornice, rails, brackets, trim, etc., are to be of clear white pine.

The floors of the principal rooms are to be double, the sub-flooring to consist of 1 x 9 in. tongued and grooved hemlock, and the finish floor to be $\frac{7}{8}$ x $2\frac{1}{2}$ -in. maple. All other rooms are to be floored with $\frac{7}{8}$ x $2\frac{1}{2}$ in. Carolina pine.

The Trim

The trim for the living room is to be cypress, and that of all other rooms white wood. The feature of the living room is the large open fireplace at the center of the interior wall and between the door leading to the hall and the one giving access to the kitchen by way of the pantry. The rear portion of the living room is to be used as a dining room. The walls are paneled with plain strips of wood between which are rough plaster. All doors are to be of cypress. The ceiling is beamed.

The color scheme suggested for this room is a flat old English brown stain for the woodwork and old rose for the side walls, and for the ceiling between the beams a light cream.

All trim in the bed rooms is to be enameled and the doors stained an old English brown. The bath room trim is to be enameled white. The walls and ceilings of the bed rooms are to be treated with waterproof paint, flat finished.

The hall and living room trim is to be treated with a good wood filler, stained and varnished and finished flat. The floors are to be varnished with the exception of that in the living room, which is to receive an additional coat of wax.

The kitchen, being centrally located, is within easy reach of all parts of the house, an arrangement which will save a great many steps for the housewife. The side walls for a height of 4 ft. 6 in. are covered with waterproof cloth in tile effect. The walls above are painted with waterproof paint, light blue and the ceiling white. The pantry and the bath room are similarly finished.

The Plastering

The walls and ceilings of the rooms are to be plastered with a hard smooth finish, except in the living room which is to have a sand finish.

All sheet metal work is to be painted on both sides before being laid and all leaders are to be of galvanized iron of a neat square design.

The exterior trim of the house is to be painted three coats of white lead and linseed oil, well puttying the first coat.

The hardware is to be of a bronze plate finish and to match the lighting fixtures. The lighting is to be by electricity and the living room is to contain two drop pendants of two lights each.

Plans and Elevations of Four-Room Cottage Shown on Our Supplemental Plate

Miscellaneous Constructive Details of Four-Room Cottage Shown on Our Supplemental Plate

A good system of plumbing is to be installed with simple fixtures, using a galvanized iron enamel sink, a two-part wash tray of soapstone and a 40-gal. galvanized iron boiler over the range. The plumbing is to be of the exposed pipe type, and all rough pipes are to be painted with enamel paint. The plumbing in the bath room is also to be of the open type and the fixtures are to consist of iron enamel bath tub, a water closet with china bowl and low tank, a wash stand with a marble top, and china wash basin. All exposed pipes are to have a nickel plated finish.

The house is to be heated by hot air furnace of

such capacity as to maintain a comfortable temperature within when the thermometer registers zero outside.

There is to be a cellar under the main portion of the house to contain a large furnace and storage room.

The architect estimates the cubic content of the house to be 20,692 cu. ft. and places the estimate of cost at 14c. per cubic foot.

The cottage here shown was designed by Arthur Weindorf, architect, Long Island City, N. Y., or care of THE BUILDING AGE, 239 West Thirty-ninth Street, New York City.

Details of a Home-Made Glue Press

A Device Which the Country Carpenter, the Cabinet Maker and Even the Builder Is Likely to Find Useful

BY W. S. WILKIN

A PIECE of equipment which should be of interest to a great many builders, if not to the average carpenter, is the home-made glue press illustrated herewith. I have done a great deal of gluing in a press something similar to the one here shown, and am therefore familiar with its possibilities. Of course, it is not as good as the improved glue press of the present day, but there are not many of us who have sufficient work of that kind to do to make it profitable to purchase a new press. Many of us perhaps do not have any work at all of this kind to do, but still there are times

be glued up as shown. It is necessary to get out all the wind and dress the stuff smoothly so that the result will be something that will hold its shape. The bottom may be covered with zinc, as this will not rust and glue will not stick to it.

The size of the iron or steel blocks through which the screw operates will regulate the size of the timbers "B." The timbers must be set far enough apart to allow the block to slide back and forth loosely. It will be seen that the iron blocks have lugs on the top and bottom which hold them in place. There will be little wear on the top of "B,"

Fig. 1—Plan of the Press

Fig. 2—Front Elevation of the Press

Fig. 3—End Elevation

Details of a Home-Made Glue Press—Some of the More Important Features of Construction

when the man without one would give several dollars if he had one in his shop so that he could use it a few hours on some job.

There is lots of work for which some heavy boards and hand screws will answer the purpose when no press is available and when it will not pay to make one. The press, however, which is here shown can be built without going to much expense. The material may be some good hard wood such as oak or maple, and to make a good bottom it should

as the weight of the screws is all that it will be required to support, but when the screws are tightened they would soon cut out the bottom side unless there be a piece of scrap iron screwed on as shown at "i."

Referring to the sketches, Fig. 1 is a plan, Fig. 2 the front elevation and Fig. 3 the end elevation. The timbers "E" and "F" are cut out so that the rods may be removed when putting things into the press and then they can be slipped in and the screws

tightened up. The iron plates at "h" are cut out the same as the timbers and put on both top and bottom to keep the nut and head of the rod from cutting into the wood. The bottom "D" may be put in loose or screwed down to the piece "C." The posts "A" are gained to receive the piece "B," which is bolted up tight as shown.

It will be noticed that the rods do not help to hold up the top of the press. The post "A" must do this. Sometimes the timbers "B" and "C" are run on back and a row of screws put in on that side of the posts. This balances the press better, but it makes it larger and costs more. The carpenter might run one row of screws each side of the post and it would be just as good for narrow work. Sometimes, however, it is necessary to glue up wide material. A post could be used in front at each end and rods the rest of the way. This would probably support the top better and still be opened up in front sufficient for all purposes.

Support for the Press

The press may be leveled up on some blocks or beams, or if it is likely to be moved it can be put on heavy casters. The pieces "E" and "F" may be bolted to the cross pieces or they may be put on with lag screws, as there is no strain to pull them off, the pressure all being the other way.

The screws should not be set too far apart—not over 18 or 20 in. at the most. If the screws are too far apart they will not hold the work down tight between them. In veneering, or work like that, it is very essential that it be held down snug so as to give a satisfactory job.

In veneering or gluing up any work that is to be finished for varnish, care must be taken that the bottom of the press or the boards to be used on top have no hard pieces of glue on them, as they will press holes in the wood that will be hard to get out.

A press like this can be built any size to suit the owner. It could be long with a single row of screws or it could be built 3 or 4 ft. wide with a row of posts on each side and 3 or 4 rows of screws.

Using Jack Screws

Most any man doing jobbing work or building will have use for jack screws, and if so, he could make good use of them in a press like that here described, and at the same time the jack screws could be made to serve the double purpose of both inside and outside work, which will tend to reduce the cost of the press somewhat.

The material may be put in the press, the boards placed on top, and blocks put on top as usual, then set a jack in position, and place a good block on top of it, screwing it up against the pieces "B." If one is going to use jacks the press should be made lighter than otherwise, for the full length of the jack must set under the pieces "B."

I do not think it pays the small builder to be without a good shop, for in the winter as well as in slack times he can obtain many little odd jobs that will bring in a few dollars and will always keep him in touch with the people of the community.

I think it would be very interesting to hear from some of the other readers of THE BUILDING AGE along this line, more especially such as jobbing and building through the country.

I would say in conclusion that the sketches are drawn to scale so that the reader may have some idea of the proportion of the timbers. The bolts through the posts should be about $\frac{5}{8}$ in. and the rods in the front about $\frac{3}{4}$ in.

Building Operations in 1915 on Long Island

Each year a compilation of the new buildings erected on suburban Long Island is made by the railroad of that name, and according to the figures for 1915, now available, there were 8895 new structures put up, of which 7276 were dwellings, this being very nearly the high-water mark.

According to A. L. Langdon, traffic manager of the road in question, the buildings heretofore erected are occupied. The known preparations indicate more building during the coming year than ever before.

It is expected that in one year more the New York Connecting Railroad will be completed, which will give direct rail connection between Long Island and New England, and will add much to the advantages of Brooklyn and Queens for manufacturing and commercial purposes.

A tabulation by the railroad shows that in the last ten years 71,660 new buildings, including 62,916 dwellings, have been erected on suburban Long Island; that is, the portions lying outside of Brooklyn and Long Island City.

Concrete Grain Tanks of Unusual Construction

At the present day concrete is being used for every conceivable form of building construction, and interesting developments are constantly being brought to light, one of the latest being exemplified in two concrete grain tanks recently erected at Shreveport, La. The foundation walls are of brick and these support concrete walls which are only $2\frac{1}{2}$ in. thick. The walls are built up of curved sheets of what is known as Hy-Rib, to which the concrete is applied in the form of a plaster coat. The reinforcement consists of vertical rods placed at intervals of about 3 in. around the circumference, these rods keeping the curved sheets in perfect alignment, and where the grain pressure is heavy additional reinforcement is added to take care of the strains.

The tanks are 20 ft. in diameter and the bottom of each tank is in the form of an inverted cone, so as to permit the use of conveying machinery in emptying them. The bottom is of concrete construction about 6 in. thick. The architect for the concrete tanks was J. Y. Snyder, of Shreveport, La., and the Hy-Rib reinforcement was furnished by the Trussed Concrete Steel Company, Youngstown, Ohio.

R. P. Miller Chosen Building Expert

Rudolph P. Miller, formerly Superintendent of Buildings of the Borough of Manhattan, New York, has been retained by the Board of Aldermen as expert on buildings to assist the committee on ordinances to complete the Building Code for the city. The term of service will be six months.

It will be recalled that Mr. Miller supervised the revision of the entire Building Code, giving up his position as Superintendent of Buildings in Manhattan to undertake the work.

CORRESPONDENCE

A Department Where Those Interested Can Discuss
Trade Topics—Every Reader is Invited to Participate

A Combination Silo and Windmill Tower

From W. E. Frudden.—It may prove interesting to some of the readers to have a few particulars relating to the picture accompanying this letter, so I give them herewith. The picture shows a silo being filled with ensilage. It is a 12 x 50 ft. clay tile silo, but the cost has been reduced 50 per cent by eliminating the windmill tower which would have otherwise been necessary. It is located on a dairy farm near Campbell, Iowa, and the walls are made of special 4-in. "Adel" silo tile. The windmill is an 8-ft. Carter wheel and drives through a walking beam and triangles to

A Combination Silo and Windmill Tower

two pumps in nearly opposite directions, both of which are 150 ft. distant from the base of the silo.

The windmill tower is fastened into the concrete to special cast-iron plates, which are also utilized where any concrete foundations are used, and a reinforcing rod goes over and under these plates in the concrete. The latter is about 16 in. thick at the center of the roof of the silo and 8 in. thick at the sides or cornice, the weight being sufficient to absorb all vibration and preclude the possibility of any storm affecting the rigidity of the walls. The latter are built in the usual manner

for silos of this type, with the customary No. 3 wire in the joints.

The door frame is of the ingot iron type with a steel ladder and removable rounds in the doorway. The chute at the time the picture was taken had not been added, but has now been extended so that a door opens out of the top of the chute, which is 4 ft. higher than the roof, the door swinging outward, so that a man simply goes out of the chute onto the roof. In this way it is a great deal safer to take care of the oiling, etc., of the mill than one on top of the ordinary windmill tower.

The top of the wheel is 65 ft. It has proven successful in many respects. Few have been built this way, but it is probable that from now forward a large number of farm owners will follow suit. Silos are being built in large numbers throughout the Middle West, and many of them will follow the plan here outlined. At this time silage is being fed out of the silo, and reports are that it is an unusual fine quality feed for live stock. Silos are usually considered as being as important on the dairy farm as a deep well, and to the beef cattle industry it has come now as a first aid. Silos are towers of prosperity.

Repairing a Concrete Roof

From J. B., Wyoming, Iowa.—I would like the advice of some of the practical readers of the paper regarding a concrete roof that I put on a garage late last fall and it now leaks. At the time the work was done some of the concrete froze and the roof is now cracked in places. How can I repair it properly when warm weather comes around? Shall I have to use some other material than waterproof concrete in order to repair the damage?

Durability of Metal Lath for Exterior Work

From F. D., San Diego, Cal.—For the information of "G. R. M.," Rapidan, Minn., concerning the life of metal lath for exterior work and whose communication appeared on page 56 of the February issue of the paper, I would say that my experience in that line has demonstrated the fact that metal lath will not corrode if properly covered with cement or lime mortar even if it is not galvanized or painted. The various brands of "hard wall" or plasters made from Gypsum in which the setting is retarded by chemicals are on that account injurious to metal lath which is not painted or galvanized, and especially so if the wall is exposed to dampness.

I have seen metal lath even when it was used in interiors in such cases in three years' time so rotten that it would crumble under the touch. Lime or cement on the contrary will preserve the metal and will absolutely prevent rusting wherever it is in close contact with the lath.

Fitting and Hanging Doors

From "D. P. B.," Redford, N. Y.—Having read the articles recently published on door hanging, I have thought a few of my "wrinkles" might be helpful to those on the lower end of the ladder. I follow the practice of "G. L. McM.," Tacoma, Wash., to a considerable extent. The trestles, straight edge, two slender sticks shorter than the opening, and jack

Fitting and Hanging Doors—Side View of the "Jack"

constitute the paraphernalia. The jack is made of any convenient piece of lumber, 4 in. or 5 in. wide. A notch is made in the center and all the cuts are beveled the same way. The notch is wide enough for the thickest door, and a little wedge holds the thinner ones. I put this between the jambs about 30 in. from the floor beyond the rabbets.

If there is much to take off I use the rip saw on both edges; if not more than $\frac{1}{8}$ in. I use the straight edge on the lock jamb. If no threshold is used I cut off the top lugs on the trestles. If there is no rabbet I set in four small nails to supply one. I use a try square and bevel as I joint— $\frac{1}{8}$ in. bevel for a door $2\frac{1}{4}$ in. thick is sufficient, as that is the standard bevel on the face of locks. If the door is rather narrow a little more bevel is safe.

I fit the lock stile first in order to have more timber for the lock, and as that stile is more noticeable. When the lock stile is jointed I take the sticks and measure the opening top, bottom and center and connect these points with the straight edge. The door is dressed to the line, then set in tight; the top scribed with rule or compass and the bottom picked, the spots where the door binds being checked with the pencil. The door is then taken down, dressed if necessary, and the top fitted. This may be done on the trestles if the opening is square. The door is then set in, wedged up tight, any unsatisfactory spots noted and the butts marked, three to a door 2 ft. 6 in. x 6 ft. 6 in. and above. A butt gage is used. All the marks are deeply cut with the knife before a chisel is used. The chisel should have at least a 6-in. blade to keep one's hands out of the light, and should be of the paring tanged firmer unbeveled type. The thinner the chisel the less enlarged will be the butt mortise.

Two bit braces are necessary, Forstner bits being used to bore out the butt mortise. A little practice will enable one to regulate the depth by the eye. These bits are a joy in such grains as cypress and Oregon spruce.

Outside door thresholds here are made on the sill. In this case the bottom must be fitted before the top. I do not leave any opening round the door, just enough to freely open. When the door sets there is opening enough. I bore in with a small bit for the

screws—the center screws first—put the butts on and hang the door. If everything passes inspection the door is swung a few times and the other screws put in with the door swinging. This insures loose pins and first holes for the screws.

The lock is placed across the edge of the door, the face marked top and bottom on the corner with the knife, then across the top and bottom of the lock with a pencil. This is the boring limit. The lock is then put on both sides of the door and the knob and keyholes picked. The strike is mortised with the Forstner bit.

For the butts I gage the jamb first, measure accurately from the gage line to the shoulder of the rabbet and put this on the outside of the door with a thumb gage.

Design for Carpenter's Workbench

From Contractor, Moffittsville, N. Y.—In the November issue of the paper, "W. M. L.," Orange, N. J., asked for the design of a house carpenter's workbench and tool holder combined, the cabinet for the tools to contain portable compartments. In reply I would state that there are some of these on the market, but mostly for students. I am sending a drawing of one of my benches which the correspondent can no doubt finish to suit his needs. By rabbeting the inside of the rails he might set in a floor, put in divisions for his tills, say 6 in. high, then cover this over with matched lumber. This will give a place for tools above. The rails may be lowered some, if necessary.

This bench is of hard wood. The tenons are $\frac{3}{4}$ in. x $2\frac{1}{4}$ in. The top should be grooved half way through on the underside with a fine circle saw. It is bolted down and the tops of the bolts are plugged loosely so that the top can be taken off easily. The rear leg and center post are bored for pins to hold lumber. It is all pinned, and whatever the correspondent adds should be put on in the same way

Design for Carpenter's Work Bench

with the idea of taking it apart when storing or moving. If the correspondent will refer to page 331 of the issue of THE BUILDING AGE for July, 1913, he may obtain some ideas on tills and saw racks.

Obtaining Bevels for a Diamond Spout

From R. C. H., New Salem, N. D.—As I am about to do some millwrighting in the near future, and this being a trade in itself, I would like to ask the practical readers how to obtain the proper bevel for gaging and joining a diamond spout regardless of the angle it is run. I have no trouble at all finding top and bottom cuts, as I obtain these with a string and very thin board, marking the

pitch on the board and then setting the bevel square to mark on board. This, however, does not give the bevel for joining the boards for the spout.

This work is somewhat outside the field of carpentry, but very often a person is called upon to do odd jobs such as this, and all one can do is the

Fig. 1—Obtaining the Bevels

Fig. 2—Showing How to Cut the Hopper

Obtaining Bevels for a Diamond Spout

best he knows how. I would, however, like to know the proper way.

Note.—We have received some interesting comments on the above topic from Mr. Barry, and submit them herewith for the benefit of the correspondent above.

The manner in which the bevels for a diamond spout are obtained is shown in Fig. 1 of the sketch. The spout is laid off on the major and minor axes of an ellipse and the bevels at *a* and *b* will be the same for all four pieces. Increasing the major axis and decreasing the minor axis will vary the form of the spout.

Fig. 2 shows how to cut a hopper. The center line 18 in. in this case is the vertical height of the hopper, including the discharge. The hopper is taken as 48 in. square at the top. Take 18 on the tongue of the square and 24 on the blade and apply to the line *a b* and mark by the blade for the side.

I will give a few cuts for different hoppers, the figures being those to use on the square for right-angled hoppers with miter-joint.

Slope of Hopper	Face Cut	Edge cut
4 in. in 12	11 1/4 x 12	3 1/4 x 12
6 in. in 12	10 1/4 x 12	5 1/4 x 12
8 in. in 12	10 x 12	6 1/4 x 12
10 in. in 12	9 1/4 x 12	7 1/4 x 12
12 in. in 12	8 1/2 x 12	8 1/2 x 12

Cut by the varying figures.

The following are the figures to use on the square for right-angled hopper with butt-joint.

8 in. in 12	10 x 12	14 1/4 x 12
10 in. in 12	9 1/4 x 12	11 1/4 x 12
12 in. in 12	Same as for mitre joint	
15 in. in 12	7 1/2 x 12	6 1/4 x 12

Hanging Glass Doors

From Contractor, Mofittsville, N. Y.—According to my notion there will never be any uniformity as regards the practice of hanging glass doors. If the door is so placed that neither rain nor frost will strike it the glass may be hung according to the taste of the builder or owner. If rain will strike it, place that side out which is least impervious to rain. Whichever side is placed out may be greatly protected by careful puttying and painting at glass and moldings.

If "C. W. R.," Terre Haute, Ind., has some of the earlier files of THE BUILDING AGE he will find numerous illustrations of tool chests which may serve his purpose. I refer especially to page 80, February, 1913; page 239, May, 1913; page 284, June, 1913; page 331, July, 1913, and page 377, August, 1913.

Methods of Building Construction

From J. P. W., Lane, Kan.—I notice on page 23 of the January issue of THE BUILDING AGE the method of house building suggested by G. L. McMurphy, and as he invites suggestions from other builders, I am taking the liberty of offering a few comments. At the outset I desire to say that I began my apprenticeship under a New York builder in the fall of 1879 and learned to frame a sill just like that shown in Fig. 1 of Mr. McMurphy's drawings. With regard to a built-up sill, I changed my ideas twenty-five years ago, and in the accompanying sketch show the way I frame a box sill. I use the same size timbers for sill that I do for floor joists, and the edge sill is placed the width of the studs from the outer edge of the flat sill. The studs run clear down to the flat sill.

The floor lays over the edge sill, flush with the studs and is rat-proof. The building cannot blow away without taking the sills, joists and floor with it, as could happen with the sill of Mr. McMurphy. This method also saves the 2 x 4 which he spikes down on the sub-floor and on which he sets his studs.

Now his corner posts would be O. K. if the studs were just twice as wide as they are thick, but such is not the case here. All dimension lumber here is 3/8 in. scant in width and thickness, so

Methods of Building Construction—Making a Box Sill as Suggested by "J. P. W."

his corner would be 3 5/8 x 3 1/4 in. if made of 2 x 4-in. material.

I cannot say that I like Mr. M.'s method of second-story construction. In fact, I call it bad construction for a country where the wind blows as it does in Kansas. I should prefer the studs full length, and I even prefer the sheathing on the inside of the wall instead of outside. This should be put on horizontally and lathed diagonally flat on the sheathing with no furring between.

Roofing with the Steel Square

From D. P. Barry, Redford, N. Y.—Referring to the comments in the February issue of "G. L. McM." I would say that I did not intend to convey the idea that the rule would work only after the rafter was backed. It will apply before the rafter is

backed and even if it is not backed at all. The lines A A of Figs. 1 and 5 in the October issue are just where they ought to be. A vertical plane coinciding with the outside wall of a building would be parallel to those lines and pass through them after those rafters were placed in position on any building. If the hip be backed those two lines must be equal to each other. If not backed they may be equal or not according to who is doing the work. The vertical line A in Fig. 5 is measured

Fig. 1

Fig. 2

Roofing with the Steel Square

where a line representing the plate, upper outside edge, intersects the projection of the hip rafter on the plate. I will reproduce Fig. 5 to apply the rule, as shown in Fig. 1 of these sketches.

Assuming that A on the common rafter is 3 in., A on the hip is the first line to be drawn. For all ordinary roofs with 2 in. hip rafter A extends from S to the top corner of the rafter, or is $3\frac{1}{4}$ in. long. The line B is gaged 3 in. from S. Dress from the center of the rafter to B and go your way re-joining among mechanics for that is all there is to it. For a very steep roof make the line A $\frac{3}{8}$ in. long and B would be $\frac{3}{8}$ in. from the top edge of the rafter, or 3 in. from S.

The discussion in regard to the position of A seems to me like a tempest in a teapot. The line A is taken on each side of the hip just as it is taken on each side of the common rafter. When the hip is backed and grooved on the underside the line A will be equal to any other line taken diagonally across the hip over the outside edge of the plate. If the hip is mitered at the deck or ridge its length can be taken on the side as well as on the center.

Fig. 2 shows the underside of the hip when grooved. I am inclined to think the correspondent was forced to the expedient of beveling the plancier at the hip by my strictures, but bumped into the valley without seeing that the roof boards must be beveled in the same way in order that the fascia may not be too narrow. There are thousands of buildings erected every day to which my strictures do not apply. I have seen some jobs where the builder discovered that the center of the valley was too high and without being able to find the cause resorted to the expedient of raising the bottom end of the valley cripples above the edge of the valley rafter. This, however, only distributes but does not remove the evil.

Rafter finish consists of more than cornice. The entire rafter system is planed and chamfered, the roof boards planed and beaded and unless the valley is grooved there will be an ugly opening the entire length of the valley and for a one-half pitch roof it is more than $\frac{1}{4}$ in. wide. It is an aggravating job to get a valley level in the center with the common rafters unless it is grooved and then when grooved the measurements are taken just the same as for the hip.

It was not my intention to say I had never seen a work line used on hewed timber. The correspondent stated the work line was used on hewn rafters and such a line on them, to my mind, would be entirely useless. I said it was used to avoid working off superfluous timber. When a 10 in. timber is sized to 9 or $9\frac{1}{2}$ in. the size line is the work line. It can be used only on the housing face of posts as for braces, girders, girts, etc. Every piece of timber in a frame, except the corner and center posts, is worked from the hew line. In center posts the work line is placed on the center of the outside face.

I confess that I know nothing about timber sizing in Washington, but I do know the clapboards we get from there vary $\frac{1}{8}$ in. in thickness on the thin edge. Superfluous timber does not interfere very much with a man who knows how to frame. I measured some girders in a mill I took down a couple of years ago and found they were 17 x 22 in. in cross section by 40 ft. in length, were double braced and triple pinned; structural steel could not fit neater.

In conclusion I will say that if the hip is grooved on the underside for plancier and the valley is grooved for the roof, the boards will not slip out of place while nailing. The groove is a guide and all the work is reduced to its simplest terms.

Ash Chute for a Kitchen Range

From J. B. M. C., Brooklyn, N. Y.—In answer to "K. V." of Paterson, N. J., asking for information concerning a practical ash chute for a kitchen range, I desire to suggest the idea indicated in the accompanying sketch which has proven thoroughly practical. A cast-iron plate is placed in the bottom of the ash pit of the range which has an opening toward the front of the stove varying from 9 x 9 in. to 12 x 12 in., according to the size of the range. This opening has a cast-iron sliding cover. A hole

Ash Chute for a Kitchen Range

is cut through the floor the same size as the opening in the ashpit and directly under it. A black sheet iron sleeve is then put down in the hole and long enough to extend a little below the ceiling line of the floor above. This is secured at the top by a flange resting at the floor.

To the bottom of the sleeve is attached a round pipe of sheet iron extending down to a point a

little above the top of the ash can or barrel. At the end of this a cover is connected, which slips up and down on the outside of the pipe and also fits over the top of the can rather snugly.

When ashes are being dropped down the chute the cover is slipped over the can so as to keep the dust within, and when the ashes are to be removed the cover is slipped up and rests on catches, thus allowing the can to be moved free and clear. The pipe is usually braced from the rear wall and sometimes the pipe and can are enclosed by walls with a door in front so as to absolutely confine all dirt and dust.

"Boston" Hip Construction

From G. A., Fairbury, Ill.—Will the editor kindly advise me how to lay what is termed a "Boston hip" on slate roofs. I am called upon to do a job of slating in which the above is specified and am at a loss to know how to proceed.

Answer.—In the accompanying sketch we present a view of a portion of a hip roof showing the general arrangement of the shingles or slate as the case may be. The lower course is laid in the

"Boston" Hip Construction

usual way and then the hip shingle is put on with the upper portion cut away at the angle indicated by the dotted line. This allows the second course of shingles to form a close joint with the hip shingle. The operation is repeated for the different courses, care being taken to alternate the laps on the hip as indicated in the sketch.

Suggestions Wanted for a Store Building

From A. S. Chapin, Northern, Minn.—I am contemplating the construction next spring of a store building, and although I have been a reader of the paper since it was first published this is the first time I have come to the Correspondence Department for special information. I want to build a mixed or general store with pool room for two tables and to carry in stock flour, feed, shoes, hardware, clothing, dry goods, farming implements, furniture, etc., etc. I want a concrete basement under the front portion of the building to extend the entire width and large enough for furnace, and proper storage room. I would like to build a little wider than

24 ft., but I have the joists—lower and upper—to conform to a building 24 ft. wide.

The building is to face east and west on a corner and will have east and south fronts. No one will build south of me, as that is to face on the new State road and railroad grounds. It is a new country town just starting. The town will probably never be anything but a small place and perhaps a one-story structure will answer the purpose. The lots are 140 ft. deep.

I might mention that I want the basement to be water-tight, as water comes within 18 in. of the top of the ground.

Will some of the practical readers make suggestions as to how I can best carry out my scheme?

A Question in Floor Construction

From L. S., Dixon, Ill.—I would like to hear from some one of the readers of THE BUILDING AGE as to what they think of $\frac{3}{8}$ -in. oak flooring in a church laid over a good level sub-floor with felt between.

Removing Linseed Stains from Marble

From C. C. H., Brookville, Pa.—Will some of the practical readers of THE BUILDING AGE who have had experience tell me what will take linseed oil stains out of marble?

Illinois Board of Examiners of Architects

At the recent State Convention of Illinois Architects, a report was presented showing some of the work which had been accomplished by the State Board of Examiners of Architects. It showed that licenses had been granted to 982 architects, of which 417 are Class "A," and 565 are Class "B." It is interesting to state that Class "A" are those architects who received their licenses when the law went into effect. At the present time there are only nine more architects holding licenses in the state than the total number a year ago.

Carpenters Rebuilding Oil Rigs

Carpenters and mechanics for heavy work have been in demand of late in the California oil fields, where every effort is being made to rush the reconstruction of oil-well rigs blown down in recent storms. Enormous damage was done all over the Coalinga and Kern oil districts about the middle of January. Reconstruction was started immediately, and many rigs were rebuilt when that section was visited by another storm on Jan. 28-29, even more violent than the first. Considerably over a thousand well rigs were overturned and demolished, in addition to the destruction of large numbers of bunk-houses and other light buildings. The rush of rebuilding used up all the lumber of the sizes needed on hand in the South San Joaquin Valley, many of the yards being kept open day and night for some time, and heavy shipments were rushed down from the Oregon and Washington mills.

Competition in Workingmen's Houses

A competition in houses for workingmen involving plans, sketches, grouping and arrangement has been announced by the National Americanization Committee with the co-operation of various societies and institutes of architects and engineers. Prizes aggregating \$2,100 are divided into two groups, the first of which covers plans for the housing of workmen in industrial communities not exceeding a population of 35,000. Entries of this class include plans for: First, single family houses; second, combined family and lodging houses which will permit separation of the family from the lodgers; and third, boarding houses or community dwellings for numbers of single men or of single women.

In the second group two prizes are offered for a satisfactory substitute for the derailed freight and cattle cars now used to house construction gangs on railways.

The aim of the contest is to arouse interest in the subject of the housing of workmen in industrial communities and to produce carefully worked out and entirely practicable housing plans and standards which it will be possible for employers and workmen and communities alike to demand and insist upon.

Inquiries concerning the competition should be addressed to the National Americanization Committee, 20 West Thirty-fourth Street, New York.

The Cost of Using Steel Forms

When steel forms are leased and returned they cost 30 cents a square foot, according to Leonard C. Wason of Boston. With wood, on the average, 3 cents per superficial foot of contact is the cost when used four times. Thus it is necessary to use steel forms ten times to bring the average material cost down to that of wood. But with wood the forms are so much shaken and damaged that after three or four uses they are practically worn out and have to be replaced. Steel forms have been used more than thirteen times on one job.

"We have never used steel forms to destruction," says Mr. Wason, "although we have used them thirty times. Probably forty-five uses is a conservative estimate of their life. During this period 3 cents per square foot may be spent for upkeep, and when they are worn out the same 3 cents can be obtained from the metal as junk. If the forms are bought at 45 cents a square foot instead of leased at 30 cents the cost per use would work out finally at 1 cent, to which should be added $\frac{1}{2}$ cent for wedges and keys. This total is just half the cost of wood."

Waterproofing Backs of Wood Finish in Concrete Buildings

In connection with the wood finish of some concrete buildings on the Pacific Coast trouble was experienced by a California builder with the moisture coming out of the cement and warping the woodwork, and request was made of *The Painters' Magazine* for a formula for a paint that would waterproof the back of the wood finish

The following reply was furnished by the magazine in question:

"The very best and probably the only means to keep the wood from being affected by the moisture coming from the source mentioned is to dissolve one part by weight of paraffin wax in two parts by weight of heavy coal tar oil, also known as heavy naphtha, which is readily obtainable in your State. As paraffin wax has a melting point between 118 deg. and 130 deg. F., the solution can be made by steam heat without fire risk. It should be used fairly warm and several applications made.

"However, even by the use of this moisture-shedding preparation, you cannot guarantee to keep the wood from warping, when the walls are not entirely dry or when moisture percolates through from the exterior of the walls. Even if the walls were waterproofed on the inside by painting, the moisture coming through from the outside is apt to throw off the paint back of your wood finish."

The House of Seven Gables

This old house, which is one of the show places of Salem, Mass., and was made famous by Nathaniel Hawthorne, overlooks the harbor, with a view of Marblehead in the distance. The house faces the south. Its east end borders on Turner Street, crowding down so close to the sidewalk that the picturesque sign over the shop door swings just over the heads of the passersby. The steeply sloping roof of the ancient mansion, its sharp-pointed gables, its gray weather-beaten clapboards, the faded red of its brick chimneys all attract the visitor who journeys to this historic house.

The house was built in 1669 by John Turner, a Salem merchant. The third John Turner sold the house in 1782 to Captain Samuel Ingersoll. Mrs. Ingersoll was a Hawthorne and a cousin to Hawthorne's father. The house is a picturesque clapboard house and its many gables add interest and quaintness to its composition.

The State College of Forestry at Syracuse, N. Y., has just announced plans for the annual lumber trip which is restricted to members of the Senior Class of the College taking general forestry and which amounts to a month of study in the woods of methods of logging and saw-milling. This is an annual event looked forward to by all of the boys, as it offers unusual opportunities for learning the practical features of the lumber industry, the theoretical side of which is studied at the college in Syracuse. The trip includes a very careful analytical study of methods and efficiency secured in various logging and milling operations.

According to the Chamber of Commerce Oakland is the only city on the Pacific Coast from British Columbia to Mexico to show an increase in building operations for 1915. The average decrease in the amount of building in Pacific Coast cities for the year was 35 per cent and a fraction. Oakland, however, shows a gain for 1915 of \$327,769.24, or approximately 7 per cent over the previous year.

Design of Beams, Girders and Trusses*

A Series of Articles on the Above Subjects in Which Only Arithmetic Is Used for the Calculations

By ERNEST McCULLOUGH, C.E.

WHEN the shape of a beam resembles the shape of the bending moment diagram the stress is the same along the length. When the top and bottom of a beam are parallel the stress diminishes toward the ends. Cast iron beams therefore are generally made with a "belly" for the material can be distributed at will since the beam is cast in a mold. This effects some saving in the cost of patterns and castings. Plate girders are sometimes made in this form, a familiar example being the main girders along the under-side of railway cars. The stress equals the moment at any point divided by the depth of the beam at point.

Trussed Beams

The trussed beam shown in Fig. 59 is the most simple form of truss. One-half of a uniformly distributed load is assumed to be concentrated over the strut in the middle, so, letting $P = \frac{W}{2}$

$$M = \frac{P}{2} \times \frac{L}{2} = \frac{PL}{4}$$

Referring to Figs. 37, 38 and 39, wherein the stress is shown to be equal to the moment divided by the depth, the compressive stress in the long horizontal member is,

$$C = \frac{PL}{4} \div d = \frac{PL}{4d}$$

The length of the diagonal portion of the tie is found by the formula

$$t = \frac{\sqrt{L^2 + (2d)^2}}{2}$$

and the tensile stress in the diagonal is

$$T = \frac{Pt}{2d}$$

The compressive stress in the vertical strut depends upon the construction of the horizontal member. If it is in two pieces joined over the strut, one-half the load, P , is carried by the strut. If it is in one piece, or composed of several planks so joined that they act as one piece, the strut carries $5/8P$ when P is a single concentrated load or $5/4W$ when W is a uniformly distributed load. This value must be used for P in the above formulas.

Note in this series of articles no algebra is used. The rules are written in the modern way in the shape of formulas by using letters instead of writing in full words that are often employed. The words for which the letters stand are explained for every formula so that readers may in time understand how to read and comprehend formulas used by other writers. The actual computation is arithmetical and worked examples are given.—Editor.

*Continued from page 53 of the February issue.

When the single strutted beam carries a single concentrated load over the strut the latter carries the whole load, plus half the weight of the uniformly distributed load of the beam. The tensile and compressive stresses in the horizontal and diagonal members are found as explained above.

In Fig. 60 is shown a beam with two struts at the third points.

The bending moment for a beam carrying two equal loads, P , at a distance $= L \div 3$ from each end, is

$$M = P \times \frac{L}{3} = \frac{PL}{3}$$

The horizontal stress, $C = \frac{PL}{3d}$

The diagonal stress, $T = \frac{Pt}{d}$

The compressive stress in each strut $= P$.

When the load is uniformly distributed one-third

Fig. 59—A Single Trussed Beam

Fig. 60—Design of a Double Trussed Beam

Design of Beams, Girders and Trusses

is carried by each strut, so in the above expressions substitute $W/3$ for P .

When the horizontal member is in one piece and uniformly loaded each strut carries eleven-thirtieths of W .

The above formulas are true for any depth of truss of the single or double strut kind. The truss may be reversed so the sloping members are above and the long horizontal member is below. Then the lower member carries tension and the upper members are in compression. The methods of computation are not altered except that the vertical pieces are ties instead of struts. With the load applied at the upper end the ties carry no stress from the load but are used merely to maintain the horizontality of the lower chord. With the load

applied at the lower end each vertical carries the amount it would carry if the beam were inverted. With a double tied beam the tie serves to hold the frame together in case of a rolling load, or a load applied other than vertically, in which case it does carry stress. Diagonal counters set between the ties will take care of such stresses and the ties merely serve to hold the frame together. It is advisable to have ties many times in trusses when an analysis shows they are not stressed, in order to carry the weight of the lower chord. If the lower chord must carry all of its own weight or any load between supports, bending and shearing stresses will be set up in the lower chord in addition to the direct tensile stress. This is one reason for making all tension members of metal when possible.

Dimensions are on center lines. The tension rods should go through the ends of the compression member at the neutral axis. The plates at the ends should be normal to the direction of the tie. The area of each plate is obtained by dividing the tension in the rod by the allowable safe unit compressive stress on the end of the wood.

The area of each strut is obtained by dividing the compression in the strut by the safe unit compressive stress in the material of which it is made. The area of the end of the strut against the wood is found by dividing the compression in the strut by the allowable safe unit compressive stress across the grain of the wood.

The size of the long compression member is obtained by designing it as a column, plus the effect of bending caused by whatever load it may carry as a beam, with spans figured between end supports and vertical struts, or ties. The unit compressive stress on the end of wood may be used when the length of the member between supports does not exceed fifteen times the least thickness. For longer pieces the unit compressive stress must be reduced by an appropriate column formula.

The sizes of metal tension members are fixed by dividing the total tension by the allowable safe unit tensile stress in the metal used. If threads are cut in a rod this size must be at the root of the threads. If the rod has upset threads the full area of the rod may be used. The minimum size rod to use in any tie is $\frac{5}{8}$ -in. diameter.

The size of a tension member made of wood is obtained by dividing the total tension by the allowable safe tensile stress in the wood and adding thereto an area equal to that caused by bolt holes and seating of other truss members.

(To be continued)

Building Outlook in New York City

In its first issue for the new year, discussing the outlook for 1916 in the building trades, the *Record and Guide* presented expressions of opinions from contractors in a position to know the trend and outlook for the future. It said:

"Among the general contractors in this city there is a strong feeling of optimism in regard to the outlook for an active season in 1916. Many operations which have hung fire for a year or more are becoming active now, and the prospects for much additional work are better than they have been for a

period of years. The activity extends to all lines of the building trades and all should reap the benefit of the increased prosperity of the country at large.

"There is still a demand for high class apartments and for accommodations in loft buildings, and the erection of buildings of these types will be a prominent feature of the construction work for 1916.

"The excellent condition in financial circles and the large amounts of money made by industrial corporations during the last year have released great sums to be utilized for the construction of new buildings. If this condition continues, and there is every indication that it will, the building trades in this country, and particularly in the Metropolitan district, should enjoy one of the most prosperous years in the history of the business."

The Complete Building Show

A very large and attractive exhibit of building material, known as The Complete Building Show, was held in Cleveland, Ohio, Feb. 16 to 26. This exposition was the first of its kind ever held in this country, having been inspired by the Building Trades Exposition of London, England. The exhibit was designed to interest the architect, builder, material dealer, manufacturer and the man who might be contemplating a house of his own.

The show was educational in character and included nearly 150 exhibits, covering about every kind of material and equipment for any building from a skyscraper to a garage. The displays included iron, steel, brick, tile, wood of all kinds, cement, lime, asbestos, sheet steel, expanded metal, and devices for safety and labor saving. More than fifty lumber dealers and manufacturers united in an exhibit of woods and their uses, showing woods from all parts of the world. Makers of hollow tile showed, in completed sections of houses, the various ways in which tile may be used in building construction. Every possible use of electricity in the home was also shown.

The exhibit attracted a large number of visitors, including many from other cities. While the show was in progress the annual conventions of the National Builders Supply Association and of the National Brick Manufacturers Association were held in Cleveland, in addition to meetings of several State supply associations.

Bungalow on Roof of Office Building

Mention has been made in these columns from time to time of unique features of the roofs of some of the commercial buildings in New York City, but this novelty is not confined to the eastern Metropolis, for one of the latest developments is a bungalow or cottage on the roof of the fourteen-story Railroad and Bank Building recently completed at St. Paul, Minn. The cottage is 40 x 40 ft. in size with a living room, or rest room as it might be called, 40 x 24 ft., besides two bed rooms. The rooms are intended for meetings of directors and the bed rooms for those directors from out of town who may attend. The ground plan of the commercial building is 290 x 232 ft.

Chicago's Ninth Annual Cement Show

The Extent and Variety of the Exhibits Rendered
the Affair an Education for the Interested Visitor

THE ninth annual Cement Show, held in Chicago Feb. 12-19 inclusive, was acknowledged to be the largest and most successful exposition ever held in the interests of cement and its affiliated industries. It eclipsed its eight predecessors in every department from the character and number of exhibits, floor space occupied and the attendance of contractors and builders, architects and engineers from all parts of this country and Canada. So great was the demand on the part of the manufacturers for exhibit space that the

nized by progressive contractors and builders as an exceptional opportunity to investigate the improvements which have been made in modern equipment and products. They feel the necessity of meeting men who are cognizant of cheaper and more efficient methods of accomplishing certain results. They seek new ideas in home and farm building construction, realizing that it is only by heading the procession in their communities that they can retain their reputations as leading builders. Those who visited the show this year were not disap-

Interior View of the Chicago Coliseum During the Progress of the Cement Show

Coliseum and Annex were insufficient to accommodate them, necessitating the leasing of the First Regiment Armory, which is close to the other buildings. Not a vacant booth was to be found in these three commodious structures, a fact which in itself is conclusive evidence that manufacturers of machinery and materials consider the Cement Show the premier event of the year.

Being held at a time just preceding the opening of the building season, the Cement Show is recog-

pointed in their expectations, and they returned to their homes with the satisfaction of knowing that the time and money they spent were investments which will produce exceptional dividends in new and more desirable business during 1916.

Not alone was cement itself shown in its many ornamental and useful functions, but also in wide variety the machinery, tools and appliances where-with it is transformed into the permanent concrete structures which are seen on every hand.

CHICAGO'S NINTH ANNUAL CEMENT SHOW. ONE OF THE MANY ATTRACTIVE AND INSTRUCTIVE EXHIBITS OF CONCRETE MIXERS

Auto trucks are proving their worth in the contracting field as a successful medium for reducing hauling costs, and many manufacturers were on hand exhibiting new models, some of which were of the self-dumping type. One company which builds both mixers and barrows recognizing the need for a barrow which would make for more uniform batches as delivered to the mixer hopper included in its display a new barrow having a fixed capacity.

When City Prosecutor Harry B. Miller, representing Mayor William Hale Thompson, officially declared the exposition open on Lincoln's Birthday, Sat., Feb. 12, a flood of light revealed the Coliseum handsomely decorated and all exhibits in working order. Hundreds of American flags hung suspended from the ceiling. Concrete mixers, tampers, and other equipment were working to beat Biefield's band, which played popular and National airs throughout the day. The booths were made attractive with columns of gray and white, graced on the top with spreading ferns, and the gilded bars which separated the exhibits reflected an atmosphere of prosperity.

The signs which were nailed to the balcony of the Coliseum and Armory called to mind the wonderful progress made in the cement industry in the past thirty-five years, the manufacture of Portland cement now ranking as sixth in the list of American industries.

During that comparatively short period of time the an-

nual production has jumped from 42,000 bbl. to over 90,000,000 bbl., a truly stupendous achievement! The reason for this wonderful growth is that year after year the adaptability of concrete to the uses of mankind has become more and more generally recognized. In the cities the earth is hermetically sealed with it. On the farm, as a road surfacing material, and for thousands of other uses the slogan, "Concrete for Permanence," has a significant message which speaks for itself.

About two hundred manufacturers were present with a wide variety of equipment and materials, each occupying one or more spaces. So great was the noise caused by practical demonstrations of concrete mixers, tampers, etc.,

that each alternate half-hour was observed as a period of quiet. On various occasions the proceedings were enlivened by Biefield's Band, which played at stated intervals during each afternoon and evening.

A radical departure from former shows was found in the effort of the cement industry to demonstrate in one exhibit the achievements in the principal fields of concrete construction. To this end thirty cement companies, shipping cement within 1000 miles of Chicago, entered into an agreement for the installation of a most exhaustive educational and creative exhibition of cement ever attempted. It enabled architects to see in it the possibilities of concrete as exemplified in a bunga-

AN EXHIBIT EMBRACING A MILWAUKEE 16 PAYER WHICH WAS THE OBJECT OF MUCH COMMENT ON THE PART OF THE MANY INTERESTED VISITORS

low of the unit construction. The bungalow was designed by a leading Chicago architect. Its walls were built of Hydrostone blocks, faced both inside and out, thus eliminating all plastering work. On the exterior the finish was a combination of mica spar and white cement, while the interior decoration consisted of white cement mixed with an aggregate of verona marble flakes. A number of transparencies were shown of the Edison fire to demonstrate the fireproof qualities of concrete construction.

Beauty and utility are often combined most successfully, and some new effects in concrete wall sur-

tures as ice houses, smoke houses, milk houses, pergolas, septic tanks, and buildings for housing live stock. Small models of several types were installed on a revolving slab, showing how effectively silo forms may be used for construction work on the farm.

Another booth was set aside for practical demonstrations of the use of wooden forms in the manufacture of solid concrete blocks, with some attention being also given to the methods employed in decorative surfacing. A separate exhibit was devoted exclusively to the decorative and structural use of concrete, and many examples displayed on

Chicago's Ninth Annual Cement Show—Handsome Mantel and Fireplace Executed in Concrete

faces were shown to great advantage. Builders were also presented with examples of the best skill of the concrete products manufacturer in fence posts, blocks, tile and many other products closely associated with the building art.

That there is a broad field for contractors whose transactions are mostly confined to the rural districts was effectively demonstrated in the joint exhibit, and opportunities for profitable expansion were shown in many interesting ways.

In one section, for example, a number of blue prints gave practical designs and details of a wide variety of buildings. These included such struc-

ture as ice houses, smoke houses, milk houses, pergolas, septic tanks, and buildings for housing live stock. Small models of several types were installed on a revolving slab, showing how effectively silo forms may be used for construction work on the farm. Another booth was set aside for practical demonstrations of the use of wooden forms in the manufacture of solid concrete blocks, with some attention being also given to the methods employed in decorative surfacing. A separate exhibit was devoted exclusively to the decorative and structural use of concrete, and many examples displayed on

the floor had features of exceptional interest. Still another department demonstrated the importance of using clean, graded aggregates, and it was shown conclusively that dirty materials will not make first-class concrete, either from the standpoint of strength or appearance. An attractive booth was also fitted up to demonstrate the advantages of concrete as a surfacing material for roads, streets and alleys. There were several interesting models which showed work in various stages of construction, and so forth.

Three large spaces were devoted to a display of work of many Illinois architects, consisting of

bungalows, residences, apartments and industrial buildings.

A moving-picture exhibition was also part of the Armory attractions. Through the courtesy of the Portland Cement Association, a two-reel comedy, entitled "A Concrete Romance," was run periodically every day.

Quite a number of visitors took advantage of the offer of the Universal Portland Cement Co. to visit the company's plant at Buffington, Ind. Two trips were made each day, one in the morning and the other in the afternoon, each inspection consuming one-half day.

Several important conventions were held while the Cement Show was in progress, notably those of the American Concrete Institute, the National Conference on Concrete Road Building, the American Concrete Pipe Association, the National Association of Mixer Manufacturers and the Illinois Lumber and Builders' Supply Association. A conference of building inspectors was also conducted, which was attended by inspectors of forty of the larger cities in this country. This meeting was of a most interesting character, and comprised a discussion of building codes, methods of inspection and other live topics bearing on the conduct of a modern city building department.

Antiquity of Glue and Veneering

Among the many occupations of the carpenter, that of veneering is noticed in the sculptures of Thebes as early as the time of the third Thothmes, who is supposed to be the Pharaoh of the Exodus, and the application of a piece of rare wood of a red color to a yellow plank of sycamore or other ordinary kind is clearly pointed out, says a writer in a London contemporary. In order to show that the wood is of inferior quality the workman is represented to have fixed his adze carelessly in a block of the same color while engaged in applying them together. Near him are two other men, one of whom is employed in grinding something with a stone on a slab, and the other is spreading glue with a brush. It might, perhaps, be conjectured that varnish was intended to be here represented, but the appearance of the pot on the fire, the piece of glue with its concave fracture, and the workmen before mentioned applying the two pieces of wood together, satisfactorily decides the question and attests the invention of glue over 3000 years ago.

The Need of Trained Men

The greatest need in each and every line of business in the United States to-day is trained men, is the opinion of Dr. Pratt, chief of the Bureau of Foreign and Domestic Commerce, and honorary vice-president of the Foreign Trade Council, who made an impressive address at the recent convention of the National Foreign Trade Council held in New Orleans. This need, he pointed out, is especially true in foreign trade because of two facts which must be recognized and taken into consideration in any practical plan for equipping men for foreign trade work. "We must recognize the fact that this country is not specialized in foreign trade

and hence the demand for qualified men, not having been widespread, as in the past has not aroused general interest. Another reason why we lack men trained for foreign trade is the barrier of language. Practically every European business man does an international trade and needs languages in his everyday work. The very isolation of our business, which in some ways is not to be regretted, has prevented us, and will continue to prevent us—unless we make special efforts—from overcoming the handicap of language.

"The quality which I would place first among those needed in foreign trade is resourcefulness, then adaptability. The man to make a success in foreign trade must be more than a salesman. The man whom the American concern can afford to send out of the country to develop its foreign business must be a business diplomat—one who can represent creditably his concern and who can give his firm prestige in a country where the heads of the business are personally unknown."

Tearing Down Class "A" Building

The largest Class "A" building in San Francisco thus far to be demolished to make room for a larger structure is a six-story structure adjoining the Spreckels building at Third and Market Streets, known as the Spreckels annex. The original plan was to add two stories to the old building, first raising the various floors to correspond with those of the larger structure adjoining, making it possible to throw the two together and save the space now used for elevators in the smaller building. On stripping the columns, however, it was found that an offset in one of the walls made the proposed change inadvisable, and J. R. Miller, the architect in charge, decided that it would be cheaper to wreck the old building entirely and rebuild than to make over the old structure.

Not Liable for Result of Joke

A decision recently rendered by the California Industrial Accident Commission, by which the employer is declared free from liability for the result of a practical joke played by a workman during working hours, is of considerable interest to building contractors in localities where employers' liability laws are in force. The workman claiming compensation was employed in cleaning out a kiln of the California Pottery Company of Oakland, Cal., when a fellow workman, as a joke, turned a hose on him. The water, unknown to the joker, was scalding hot, and disabled the victim for a period of forty-five days. In denying his claim, the commission decided that he did not receive his injuries from an act growing out of his employment.

Among the building improvements planned for Mount Vernon, N. Y., is a factory, 83 x 153 ft. in plan and two stories in height. It will follow regular mill construction lines and be covered with a slag and felt roof. The contract has been placed with J. W. Ferguson Company of New York City and Paterson, N. J.

Building Methods and Millwork

Some of the Old-Time Methods of the Carpenter and the Builder Contrasted with the Present

BY GEORGE E. WALSH

TIME is money for the carpenter and builder as well as for the business man, and efficiency in all construction work to-day means such a close organization of forces and workmen that a building can be put up in the least possible time without friction or interference of one set of workmen with another. In our large cities, where millions of dollars are invested in a single structure, the outlay of capital is so great that a delay of six months in finishing a building means a considerable loss of money to the investors. The most successful builders are, therefore, sought who can do a given job in a short time and turn the structure over complete to the renting agent.

The small builder and carpenter have to a certain extent adopted somewhat similar methods of building. Only recently a frame church was started and completed within three days, and a house was finished and the family ready to move in within twenty-four hours after work was commenced. These, of course, were emergency orders, and were worked out with the idea of seeing how quickly a frame structure could be put up.

To the old-fashioned carpenter and builder of fifty years ago such a performance would seem little short of the miraculous. In those early days house-building was a slow and serious undertaking. Practically everything was made on the site by the slow, laborious process of hand labor. Everything had to be cut and made by hand, from the doors and window frames to the stairs and newel posts.

A Small Library Made of Mill Stock Sizes for Windows, Doors and Porch Columns

Perhaps there are a few carpenters living and working to-day who can remember when mill-work was an unknown factor in the building situation, and it took a good carpenter the greater part of a day to make a door or a window frame. There was no place where orders could be given for the man-

ufacture of stock goods, and even the mantelpiece had to be fashioned and made by the man on the job. The building of an ordinary frame structure then required many months, and sometimes a year or two marked the limit.

We have grown more and more dependent upon

A Low-Cost Chapel Made Entirely of Regular Mill Stock Material and Giving a Very Attractive Effect

the mill for certain stock fixtures. No carpenter to-day would think of making doors and windows by hand, as they can be manufactured at the mill in one-tenth the time and at one-fourth the price. When the mills began to make stock doors, windows, newel posts and other needful things, a period of imitation set in. There was no longer individuality of construction that marked the early buildings. Each builder would, before that period, design and fashion his doors, windows, newel posts and mantelpieces to suit his own fancy, and repetition of designs was far less than when the mills began to make them.

The woodworking plants could not afford to make a great variety of stock. Only a few sizes were made and carried, and every architect and builder had to adapt his designs to fit these stocks. A mill would work up a lot of stock doors and windows during the dull months and store them away for the busy season, confident they could dispose of them. This kept the mill going the year round and tended to cheapen the cost of production.

But this had a fatal influence upon the building operations of the day. It made for uniformity and monotony of appearance. The owner of a house would find his doors and windows imitated by all his neighbors. Even his moldings and interior trim were the same as in nearly every other house.

It has only been in recent years that the mill work industry has changed and attempted to meet the pressing needs of the day. People got tired of

the sameness of construction, and there was a demand for a change. Architects began to design their own windows and doors, but when these were sent to the mills the cost was almost as great as if hand made. But the demand for new styles became imperative, and the mills had to specialize on these particular orders. New machinery was introduced, and really complicated designs were executed for those willing to pay for them.

A Change for the Better

But a more noticeable change for the better has now come about. The mills, instead of sticking to a few stock sizes and designs, have begun to take notice of changing styles and to manufacture in large lots the latest thing in mill work. They have entered upon a specializing work that is apparent in many ways. Instead of sticking to a few old stock sizes that were popular fifteen or twenty years ago, they are making and carrying in stock a great variety of the newest things.

The carpenter and builder are learning therefore to depend more and more upon the mills, and as a result they are becoming more assemblers than builders. For instance, the mill work of a modern frame structure to-day represents more in expenditure than the carpenter's work on the site. If the carpenter's bill reaches \$1,500 for the whole job, the mill work will cost \$2,000 to \$2,500.

This is in line with modern progress. The mills, with their machines, can cut and plane lumber much quicker and cheaper than carpenters can do it by hand, just as they can make doors and windows at half the price formerly required. The builder who depends upon the mill for the greater part of his stock work can construct cheaper and quicker than another who has the work performed by hand on the site. On the other hand, the mills which give most of their attention to the ordinary stock sizes, without considering the improvements being made, run a great risk that may prove costly in the end.

Improving the Quality of the Finish

Not only are the mills engaged in increasing the size and variety of their stocks, adopting new styles as fast as they become popular, but they are improving the quality of their finish. Green lumber or inferior kiln-dried stock are mostly avoided by the reputable mills, for owners and contractors will not tolerate such material. Stock material to-day is up to the standard of what is commonly called the best, and the finish is made perfect.

Take stock doors as an illustration. The best of these are veneered, with a core of pine because of its lightness and non-warping properties, but this core is not made of a solid piece of pine but of narrow strips of wood with pieces of hardwood at the edges. These pieces are fitted with tongue and groove or dovetailed, and when glued together subjected to great hydraulic pressure to secure a perfect joint.

The veneers are made from a great variety of hardwoods, and are often one-quarter of an inch thick. The best veneers are rotary cut to bring out the beautiful figure and grain, and when polished they have a finish unsurpassed by anything made entirely by hand. The greatest variety of patterns and styles of doors made with hardwood

veneers of all our known choice woods are turned out by the mills, and the architect can find among these stock veneered doors just what he needs to finish off his Colonial, Gothic, Italian or old English house. So he patronizes stock doors just because the mills have followed him in his profession and tried to meet, if not anticipate, his wants.

Stock Mantels

The same is true of the stock mantels. It was not many years ago that stock mantels were confined almost entirely to cheap houses. They were as cheap in looks as in price. The builder who was constructing a house of any pretensions had to design his own mantels or appeal to the architect to make them for him. The architects began designing strictly Colonial or old English mantels, and the mills began to realize that they would have to improve their stock or lose trade. Some of the more progressive ones employed architects to make designs for them, and a new list of stock mantels was made and other drawings were shown for immediate execution on order. With the machinery on hand it was not a difficult matter to execute an order as needed at only a slightly increased price over the regular stock.

The up-to-date woodworking mill is of the greatest help to the small builder and carpenter as well as to the big contractor. If the carpenter is depending upon his own skill and knowledge in planning and constructing a house, he may at times be at a loss just how to design a strictly Colonial or Gothic door, window or mantel. If so he has merely to go to the mill and choose from samples. These samples are strictly correct, having been designed by professionals, and the carpenter can feel that he is carrying out the lines of his order even in the smallest detail. He orders his mill work with an assurance that he is saving time and trouble, and that it will give satisfaction to the owner.

Thus even the small carpenter and the builder are becoming a good deal of "an assembler." He orders mill work more and more each year, and has less and less executed on the building site by hand. Stock sizes of molding, lumber and other pieces are ordered to suit his needs, and the waste grows less and less. The waste, if any, is at the mill, and there waste is reduced to a minimum because of the ability to use small ends and odd lots in the manufacture of other articles.

Quicker Construction

These changes in the building world make for quicker construction work, and the more the small builder imitates the big construction companies of the cities in availing himself of mill stock the more expeditiously can he put up a structure. Time counts with him, too, and he cannot afford to drag behind and cling to old methods. The builder who can put up twenty houses in a year makes a better income than the one who builds five or ten. To do this he must know how to build his house first on paper and then order from stock as much of the material as he can use, having it delivered at specified dates. Then with a sufficient force of men on hand he can put up a structure in half the time that his forefathers did.

Meeting of New York State Builders

A Well Attended Convention—Important Topics Discussed —Work of Legislative Committee—Election of Officers

THE twentieth annual convention of the New York State Association of Builders was held in the rooms of the Building Trades Employers' Association in The Builders' Exchange Building, West Thirty-third Street, New York City, on Jan. 25 and 26, there being present ninety-five delegates representing twenty different cities and twenty-four different organizations.

The first business session was held on the afternoon of Jan. 25, the delegates being called to order by President G. C. Norman of New York City, after which William Crawford, president of the Building Trades Employers' Association, extended a welcome to the delegates in behalf of his organization.

List of Delegates Present

The roll-call showed the following delegates in attendance:

Albany—W. G. SHEEHAN, JNO. DYER, P. WELCH, J. BAME, E. A. KEELER, L. STRAUSS, M. MEAD, J. J. FINN, L. J. MCCANN, W. S. HAMILL, J. F. STONE.
Amsterdam—H. C. GRIENE, C. B. MACHOLD.
Auburn—R. C. HALL.
Binghamton—H. E. FORD.
Buffalo—F. L. BEYER, J. M. CARTER, B. I. CROOKER, J. G. DAVIS, C. DIEBOLD, T. M. DYER, M. G. FARMER, H. M. FEIST, MR. FULLER, W. F. FELTON, G. J. HAGER, J. W. HENRICH, A. I. HOLLOWAY, W. G. HOUCK, D. HYMAN, G. C. SCHIERER.
Corning—M. E. GREGORY, J. W. SHEA.
Elmira—C. A. PULFORD, J. M. CUNNINGHAM, VERNE G. WELLS.
Ithaca—D. DRISCOLL, J. CAMPBELL, E. H. HULBERT.
Kingston—J. A. CAMPBELL.
Mt. Morris—C. A. FOOTE.
Mt. Vernon—J. D. LAPAGE, O. J. HAYEN, A. S. JENKS.
Olean—B. C. TAYLOR.
New York City—L. HARDING, F. YOUNGS, MR. WHITNEY, WM. CRAWFORD, F. TUTTLE, G. C. NORMAN, M. WEBB, MR. CRANE, J. O'D. WHITENACK.
Rochester—F. ELAIN, A. J. MAHON, W. A. FREIDERICH, G. A. SWAN, H. J. KARAVECK, L. S. WHITMORE, R. WILLIAMSON, C. W. LUTHER, J. W. BEINSHEIM, J. L. STEWART, C. HARPER, H. STALLMAN, H. C. PECK, W. BLAIR, F. H. PHELPS, F. GOULD, T. SWAN, J. L. FREIDERICH, J. LUTHER.
Syracuse—C. CICCARELLI, J. R. PIERCE, D. W. NICHOLSON, R. A. McHALE, E. K. FENNO, H. P. WARNER.
Schenectady—THOS. BROWN, P. H. McDERMOTT.
Utica—GEFFORY GRIFFITH.

President Norman's Report

President Norman read his annual report, which dealt with the work of the State Association as well as that done in co-operation with the National Association of Builders' Exchanges in amending and advocating the use of the new Standard Form of Contract. Following this report it was recommended that the New York State Association of Builders advise all affiliated organizations and individuals to use this Standard Form of Contract, as prepared by the American Institute of Architects in conjunction with the National Association of Builders' Exchanges.

The report of Secretary James M. Carter of Buffalo covering the general condition and finances of the Association in detail, showed a normal growth and healthy condition of the organization.

E. A. Keeler of Albany, Chairman of the General Welfare Committee, presented a report touching upon the work of the committee and the general welfare and membership of the State Association during the past year. Following this report several applications for membership were submitted.

President H. L. Lewman of the National Association of Builders' Exchanges, Louisville, Ky., was scheduled for an address on "The New Standard Form of Contract," but not being able to be present the address was read by Commissioner I. H. Scates of Baltimore.

Report of Counsel

The second business session of the convention was held from 10 a. m. to 1. 30 p. m. on Wednesday, Jan. 26. At this time the report of Counsel Eidlitz & Hulse of New York City was submitted, covering the legislative work of New York State Association of Builders during the session of the Legislature of 1915 and the session of the Constitutional Convention from April 6 to Sept. 10, 1915. During the four and one-half months of the 138th session of the State Legislature there was introduced a total of 3356 bills of which 956 passed both houses. Of these bills 197 were vetoed by the Governor. Thirty-two others were returned with the disapproval of the mayors of various cities, but two were passed over the mayors' veto. The titles and digests of all the bills introduced in the Legislature were examined by the committee and 101 bills appearing to directly affect the interests of the members of the New York State Association of Builders were examined and considered in detail. Of the bills approved several passed both houses only to be vetoed by the Governor, and others are now laws. Of the bills opposed by the Legislative Committee none was enacted into law.

Work of Legislative Committee

Robert Christie, Chairman of the Legislative Committee of the Building Trades Employers' Association of New York City, submitted a report touching on the number of bills considered by the Legislative Committee during the past year and gave the results of the committee work for the past five years. The number of bills presented was 529; those opposed were 214 and those indorsed numbered thirteen. Two were referred to the General Contractors' Association, fourteen were referred to Counsel and on sixty-five no action was taken. Altogether 418 bills were considered and action taken thereon.

The next order of business was a very comprehensive address by I. H. Scates, Commissioner of the National Association of Builders' Exchanges, who took for his topic "Work Done by and Development of the National Association."

Officers for 1916

The officers for 1916 were then elected, resulting in the following choice:

President.....M. E. Gregory, Corning
1st Vice-Pres.....E. A. Keeler, Albany
2nd Vice-Pres.....G. C. Schierer, Buffalo
Sec'y-Treas.....James M. Carter, Buffalo
Counsel.....E. F. Eidlitz, New York City

Louis Harding of New York City was reappointed Chairman of the Executive Board.

Following the business session the delegates had as their guests at a luncheon the officers of the Building Trades Employers' Association of New York City.

In the evening the delegates of the New York State Association of Builders were the guests of the Building Trades Employers' Association of New York City at their annual banquet held at the Biltmore Hotel.

Advance in Cost of Blue Prints

According to present tendencies it would seem that the price of blue-print paper and blue prints is likely to advance in the near future, due to the increase in the price of all chemicals used in the blue-print process, as well as to the heavy advance in paper. As is well known, blue-print paper is coated with an emulsion of iron and potash salts, which are combined by the action of light, and upon immersion of the paper in water the coating is precipitated on the surface of the paper in the form of Prussian blue.

According to the *New York Commercial*, red prussiate of potash, which is the form of potash used in the blue process, has been made exclusively in Germany. Before the war it sold for 19c. a pound; to-day it is practically unobtainable at \$7 per pound, or an advance of 3500 per cent. Citric acid, from which the citrates of iron and ammonium are made, has advanced 150 per cent, and oxalic acid from which the oxalates of iron are also made has advanced 1000 per cent in the same time.

Will Sell Sand by Cubic Measure

Owing to the discovery that sand sold by weight contains a large and varying amount of water, the California Superintendent of Weights and Measures is preparing to issue an order establishing the sale of sand for building purposes by cubic measure.

Changes in Lumber Rates

For several years the importation of oak lumber for finish, etc., from Japan, has been a feature at Pacific coast ports. To permit Eastern hardwood lumber to compete with the imported wood, the transcontinental railroads have announced the following reduction from Eastern common points to this coast: From Cincinnati, Detroit and Birmingham, 75c. per 100 lb. terminal and 86c. intermediate, against 80c. and 92c. respectively; from Chicago, 70c. terminal and 75c. intermediate, vs. 80c. and

86c.; from Mississippi territory, 70c. and 75c., vs. 80c. and 86c.

The coastwise steamer rate on fir lumber from Oregon and Washington mills to San Francisco, which was recently as low as \$3.25, or even \$3 per thousand feet, has quickly jumped to \$5, and is still advancing.

Framing the Trimmers for an Angle Fireplace

A piece of work which a carpenter in England was called upon to execute involved the framing of the trimmers for an open fireplace which was to occupy the corner in a sleeping room. He was somewhat in doubt as to how to cut the trimmers for this work, and in reply to the questions which he raised a brother chip suggested the method

Fig. 1—Plan of Corner of Room.

Fig. 2—Method of Framing

Framing the Trimmers for an Angle Fireplace

illustrated in the accompanying sketches. From Fig. 1, which represents a plan of the corner, it will be seen that the trimmer joist and the cross trimmer are framed square in the usual manner as indicated in Fig. 2. The joints at A, B, C, D and E are what is known as tusk tenon joints, and the one at A is keyed.

Ornamental cornices projecting over the sidewalk will be authorized by law if the Chicago City Council adopts an ordinance recommended by the committee on buildings. It provides a scale for cornice widths ranging from a 2 ft. projection from a building 12 ft. high to a cornice 5 ft. wide on the highest buildings. Hitherto all such cornices have been installed without any authority in law.

A Stucco House in Rochester, N. Y.

A Well Considered Interior with the Living Room
and the Stair Hall Among the Noticeable Features

IN carrying out the ideas of his client who wanted a house in which there should be no bay windows, but "just a plain dwelling with no nooks or cozy corners; good to look at on the outside and easy to take care of on the inside," the architect evolved the design here illustrated. It is a stucco-coated dwelling of substantial construction and embodies the arrangement clearly outlined on the floor plans which appear upon the following page, these

the house. There are two short flights with a landing half way up directly over the vestibule. A rather unusual feature in connection with the main entrance is that after passing through the vestibule the visitor ascends a flight of four steps to reach the level of the hall.

Just beyond the main hall, which is 10 ft. wide, is what might be termed a rear entry wherein are located the telephones and out of which opens a

The Stucco Residence of Mr. Louis C. Rogers in Rochester, N. Y.—Architect, Horace T. Hatton

being reproduced direct from the architect's drawings and are presented to the scale customary in *THE BUILDING AGE*; that is, 1/16 in. to the foot. A striking feature is the living room extending entirely across the end of the house and from which opens the partially enclosed porch. The hall occupies the center of the building, and instead of the main stairs rising from the rear portion of it, as is often the case, the arrangement has been reversed and they start from a point adjacent to the entrance to the living room and rise toward the front of

toilet, all as clearly indicated on the floor plan.

At the left of the hall are dining room and kitchen, communication between the two being established through a well equipped pantry measuring 6½ x 11 ft. in size. The pantry is lighted by a window, beside which is located the refrigerator so placed that it may be readily iced from a small platform outside. The kitchen sink is placed against the pantry partition with a slide in the latter opposite the drip board so that dishes may be readily passed from one room to the other.

Another one of those little conveniences which help to make the kitchen equipment complete and the quiet of the early dawn undisturbed is a milk locker in the wall between the kitchen and the rear porch. Here the milkman can place the daily supply of bottled milk, and his early delivery in no way tends to disturb the occupants of the house. Again it insures safe receipt of it by the family.

On the second floor are four sleeping rooms and a bath room, together with commodious clothes closets. The rear flight of stairs to this floor rises from a point near the door leading from the kitchen into the rear hall and the flight is continued to the attic, wherein are located the servants' quarters. The bath room is directly over the toilet on the first floor, so that the piping is concentrated. Conveniently located to the sleeping rooms and bath room is a linen closet, and just at the right of the bath room is a broom closet.

The foundations of the house are of concrete with stucco on wood lath above grade. The studs, floor joists, rafters, etc., are of the usual dimensions and in executing the work the lath were put on diagonally 4 in. apart over Neponset R.R.R. Fabric. On this, in reversed direction, were placed lath $\frac{3}{4}$ in. apart.

The first mortar coat was the usual lime mortar, filling in solid to the sheathing boards. The finishing coat was of Portland cement mortar with the sur-

marble base. The steps up to the main hall are of light Tennessee marble. The floor in the hall is of kiln run, light gray tile with a dark green border.

The stairs are white with mahogany treads, posts and rail. The living room and dining room are finished in mahogany. The hall and rooms on the second floor are finished in white enamel and the doors are mahogany.

A comfortable temperature is maintained within the building by the Brommel system of vapor heating.

Below the rear porch is a well and in the concrete floor is a removable walk-light, so that sucker rods may be removed from the well.

Second Floor Plan—Scale 1/16 In. to the Foot

First Floor Plan—Scale 1/16 In. to the Foot

A Stucco House in Rochester, N. Y.

face floated with burlap on the trowel to roughen the surface. The plaster was given two coats of Bay State Brick and Cement Coating of buff tint.

At the front entrance are cast granite steps and the base course was also cast. "Rookwood" tile in dark blue color were used in the decoration of piers and columns.

The floor of the porch is reinforced concrete with "Ruabon" Welsh quarry tile flooring.

The roof is covered with Ludowici Spanish tile, which, in combination with the stucco exterior, gives a most pleasing effect.

The vestibule has tile floor with verde-antique

The two-story cement-coated dwelling here shown is the residence of Mr. Louis C. Rogers, Highland Avenue, Rochester, N. Y., and was erected in accordance with plans prepared by Architect Horace T. Hatton, 507 Cutler Building, Rochester, N. Y.

Stairway and Elevator Inclosures

At the present time there are two types of metal lath and plaster partitions which are being used for inclosing stairways and elevators. One is the $2\frac{1}{2}$ or 3-in. thick solid plaster and metal lath partitions and the other is the 4-in. thick hollow partition. Laboratory tests and observations of behavior in actual severe fires show that the solid partition provides ample protection. Some designers, however, prefer to have the added factor of safety that is secured through the air space of the hollow partition, says a recent issue of *Expanded Metal Construction*. The supports for the partitions consist of $\frac{3}{4}$ or 1-in. steel channels securely fastened at the floor and ceiling. The lath is wired to these channels and Portland cement plaster is applied to both sides of the lath on the solid partition in successive coats until the desired thickness is obtained. In the case of the hollow type the plaster is applied to only one side of the lath. The construction is such as to make a partition that is in every way satisfactory for the purpose.

Glass in Building Construction

A Variety of Purposes for Which This Material Is Rapidly Growing in Favor in Building Operations

USE of the steel frame in building construction has made all buildings, no matter what their actual height, only one story high. Crushing strength, heretofore required of all material entering into the work, has given way to requirements in lightness and durability. Before the advent of the steel skeleton, six-story (and not to exceed eight-story) buildings were the limit; walls started from the ground of sufficient thickness to support all stories on it, gradually decreasing with the height. Now all is different; foundation beneath the steel columns bears all loads, and the height of the building governs the thickness and tensile strength of the steel. The exposed materials without and within now are being selected with a view to durability, beauty and sanitary effects combined with lightness. The greater the increase of these qualities proportionately with the decrease of weight so is the value of the materials enhanced. In factory construction, and more recently in mercantile buildings, seven-eighths of the outside walls consist of glass. The steel window sash has made it possible to have nearly light-conveying walls on all exposed sides of business buildings.

New Formula for Opal Glass

Simultaneously with the advent of the steel structure releasing the crushing strength requirements of the materials comes the new formula of opal glass. White glass, as known twenty years ago called for a batch mixture costing $3\frac{1}{2}$ c. to 6c. a lb. in the melted glass ready to use. This initial cost made white glass for building purposes impossible. Now white glass mixture is found to be satisfactorily based on feldspar and fluorspar instead of lead, arsenic and cryolith, the basis of the earlier mixture. These chemicals are found scattered in all parts of the United States in abundant quantities and at a low price, so that opal glass is now produced at $\frac{3}{4}$ c. per lb. in the melted glass. The cheap white formula opens the way for the use of glass in building materials. Henceforth this new element must be looked for in all places of building construction demanding the elements before stated.

Glass for Brick, Wainscoting, etc.

Glass brick, the impossible a generation ago, now becomes possible. Glass sheets for wainscoting, table tops, counter tops, kitchen table tops, refrigerator and the like, become possible in the discovery of this new formula. Purposes innumerable are springing up daily for the use of this glass. It can be seen at once that this new material means permanency.

The crushing strength of glass is three times that of granite, ten times that of concrete, six times that of the hardest brick, sandstone or limestone,

and different from all in that it is absolutely non-absorbent. This latter quality makes it highly sanitary. There are dozens of buildings within a short distance of every city and town that hold in the decayed sash of the windows pieces of glass that have possibly outlasted one or two buildings before it, and if not crushed by a blow will outlast any number of structures of other materials. There is nothing in building construction that absolutely endures as does the glass. A tornado will tear off the chimney, twist the porch out of position, and probably carry off the roof, but the thin sheet of glass withstands every storm. It is plain to see why the building trades have flirted with this material since building construction became one of the principal arts of man.

Glass Brick a Standard Building Material

Within the past five years glass brick has come upon the market, has been tried out in almost every conceivable test to which building material is put, and has taken its place with other building materials as a standard commodity. The old adage, "Those who live in glass houses should not throw stones," must now be packed in ice with the story of "Darius Green and His Flying Machine," for the supposedly impossible has now actually become possible, and is rapidly coming into general use.

New Publications

Practical Gilding, Bronzing, Lacquering and Glass Embossing. By Frederick Scott-Mitchell. 184 pages. Size 5 by $7\frac{1}{4}$ in. Numerous illustrations. Bound in cloth. Published by the Trade Papers Publishing Company, Ltd., London, England. Price \$1.25.

This little work deals in a practical way with the subjects indicated by the title and affords a good idea of English practice. The matter is comprised in fifteen chapters, beginning with tools and appliances and ending with a treatment of the subject of embossing on glass and glass chipping. There is an appendix dealing with lacquering metal work. The work is really a second edition of the book on the same subject published by the author in 1905, but many new illustrations have been added and the text thoroughly revised.

The magnificent national hospital at San Salvador is composed of pressed-steel plates inside and out, bolted to wrought-iron framework, and the roofing is of corrugated iron.

Brief Review of the Building Situation

Building Operations for January in 117 Cities Show
an Increase of 26.6 Per Cent Over January, 1916

THE improvement in the building situation of the country noted in our last issue has continued with gratifying results, and reports for the first month of the new year covering 117 cities indicate an amount of new work planned which is 26.6 per cent in excess of that projected in January, 1915. The extensive additions which are being made to industrial plants in various parts of the country are reflected in some measure in the larger volume of operations in the Eastern, Middle and Southern States. In January the greatest gain was in the cities of what may be designated as the Middle States, while next in order are the cities in the Southern tier.

The figures in the accompanying table show the relative amount of work planned in the leading cities of the East:

	January, 1916	January, 1915
Albany	\$114,595	\$340,290
Allentown	120,445	5,835
Altoona	4,982	22,255
Binghamton	75,700	39,219
Bayonne	125,683	38,000
Boston	4,756,229	2,408,000
Bridgeport	392,276	98,110
Brockton	50,950	48,275
Buffalo	510,000	381,000
East Orange	59,955	87,121
Elizabeth	455,088	82,314
Elie	116,171	66,509
Harrisburg	86,575	7,575
Hartford	235,978	139,265
Haverhill	25,200	15,400
Holyoke	68,400	23,850
Irvington	39,015	35,000
Jersey City	366,745	184,385
Lawrence	56,250	48,375
Manchester	50,684	19,317
Montclair	72,000	80,861
Newark	359,363	339,803
New Bedford	204,770	75,560
New Britain	53,650	35,095
New Haven	675,068	132,155
New York:		
Manhattan	4,588,950	8,164,716
Bronx	2,982,227	2,108,668
Brooklyn	3,012,343	1,624,203
Passaic	43,280	20,410
Paterson	141,788	73,895
Philadelphia	1,859,090	910,805
Pittsburgh	344,944	465,461
Portland	78,445	28,765
Quincy	79,875	59,605
Reading	11,750	5,900
Rochester	746,506	246,717
Scranton	129,475	38,170
Schenectady	57,950	327,650
Springfield	325,815	266,005
Syracuse	109,445	219,715
Trenton	132,520	36,812
Troy	207,995	100,014
Utica	77,135	109,905
Wilkes-Barre	33,850	34,643
Worcester	330,185	77,276
Woonsocket	19,975	19,500

In the thirty-six cities of the Middle States from which reports are presented, there are twenty-six showing increases and ten decreases with a resultant gain of 38 per cent over January, 1915. An immense amount of new work was planned in Chicago, the figures being almost double those for January, 1915. Other cities showing notable increases are Cleveland, Columbus, Dayton, Des Moines, Detroit, Duluth, Grand Rapids, Indianapolis, Kansas City and Milwaukee. More important among the cities showing decreases are St. Louis, St. Paul, Evansville and Saginaw.

	January, 1916	January, 1915
Akron	\$288,430	\$52,635
Cedar Rapids	48,000	44,000
Canton	71,725	31,175
Chicago	8,118,200	4,327,900
Cincinnati	445,895	451,350
Cleveland	1,600,895	1,116,080

CITIES OF THE MIDDLE STATES (Continued)

	January, 1916	January, 1915
Columbus	223,415	85,100
Davenport	27,579	26,455
Dayton	115,645	30,000
Des Moines	115,645	52,250
Detroit	1,979,410	1,217,290
Duluth	113,733	90,155
East St. Louis	5,885	23,025
Evansville	31,862	69,050
Fort Wayne	64,250	35,100
Grand Rapids	118,455	80,072
Indianapolis	392,902	266,907
Kansas City, Mo.	445,575	387,880
Kansas City, Kans.	23,530	35,690
Lincoln	53,045	70,135
Milwaukee	2,433,838	203,649
Minneapolis	586,340	485,100
Omaha	177,025	165,075
Peoria	131,500	24,100
Saginaw	4,675	133,794
St. Joseph	10,990	12,380
St. Louis	644,191	1,094,673
St. Paul	423,198	693,258
Sioux City	42,200	24,950
Springfield	92,525	69,400
Superior, Wis.	6,955	65,830
Terre Haute	22,535	2,400
Toledo	560,875	537,297
Topeka	29,110	18,270
Wichita, Kan.	34,400	32,300
Youngstown	96,345	69,367

Coming now to the tier of Southern States we find of the eighteen cities reporting that fourteen show increases and four decreases with a resultant gain of 35.33 per cent. The greatest activity as compared with a year ago was in Baltimore, Birmingham, Dallas, Memphis, Nashville, Oklahoma, Richmond and Wilmington.

CITIES OF THE SOUTHERN STATES

	January, 1916	January, 1915
Atlanta	\$130,480	\$273,796
Baltimore	767,712	575,072
Birmingham	273,611	72,178
Dallas, Tex.	771,630	140,005
Fort Worth	91,127	90,705
Huntington	41,555	18,455
Louisville	178,980	333,520
Memphis	186,800	101,953
Montgomery	57,399	40,483
Nashville	150,999	56,037
New Orleans	134,425	146,909
Norfolk, Va.	148,222	119,864
Oklahoma	103,350	18,300
Richmond	300,592	159,840
Savannah	52,000	152,750
Shreveport	54,449	46,326
Washington	738,546	470,328
Wilmington	263,768	58,084

In the extreme Western section of the country, taking those cities lying beyond Denver, six show increases and eleven decreases out of the seventeen reporting with a resultant gain of 6.6 per cent. This gain is largely accounted for in the operations in Los Angeles, Salt Lake City and Seattle. Heavy falling off in operations occurred in Portland, Sacramento, San Diego, San Francisco, Spokane and Tacoma.

CITIES OF THE EXTREME WESTERN STATES

	January, 1916	January, 1915
Berkeley, Cal	\$64,500	\$83,750
Colorado Springs	11,986	7,665
Denver	14,260	177,636
Little Rock	31,586	29,559
Los Angeles	1,678,724	860,360
Oakland	248,408	291,859
Portland	169,375	378,040
Pueblo	21,636	6,300
Sacramento	73,407	115,735
San Diego	128,554	288,895
Salt Lake City	178,262	85,650
San Francisco	947,551	1,006,043
San Jose	20,067	24,156
Seattle	413,505	408,585
Spokane	38,555	92,185
Stockton	18,222	24,040
Tacoma	33,154	59,598

Current News of Builders' Exchanges

Annual Meetings and New Officers for the Ensuing Year—Removal of Cleveland Exchange

Banquet of Quad City Builders' Exchange

AN EVENT which will long be pleasantly remembered by those present was the first annual banquet of the Quad City Builders' Exchange, held in Rock Island, Ill. There were in attendance 287 builders and their friends from the cities of Davenport, Rock Island, Moline and East Moline, which cities are represented in the organization. The toastmaster was Irving C. Norwood, secretary of the Davenport Commercial Club, and following a brief talk on "Co-operation and Organization," introduced as the principal speaker of the evening H. L. Lewman, president of the National Association of Builders' Exchanges. He took for his subject "Building Organization and Its Needs," and also dwelt at some length upon the Standard Contract Documents. The address of Mr. Lewman was closely followed and his remarks aroused a great deal of interest on the part of his hearers.

The Exchange is composed of representatives of practically all trades connected with the building industry, including general contractors, mason contractors, painters, plaster contractors, plumbers, heating contractors, tin and sheet metal workers, electricians, excavating and grading contractors, material men and dealers as associate members. The object is to make all members in the building industry in the four cities named one large family and to assist one another in their respective branches of the industry. The officers of the Exchange are as follows:

President.....A. A. Arnould, Davenport
First Vice-Pres....Edward Kunkel, Davenport
Second Vice-Pres. Archie McInnis, Rock Island
Third Vice-Pres....Axel Carlsen, Moline
Fourth Vice-Pres. G. F. Schilling, East Moline
Secretary.....Otto Bargmann, Davenport
Treasurer.....F. R. Dwend, Moline

Great interest is being manifested in the securing of additional members and we understand that from twenty-five to thirty applications are acted upon at every meeting. While the Exchange is only four months old there are at present about 200 members and the number is rapidly growing.

Annual Election of Milwaukee Exchange

What was regarded as the banner election in the history of the Builders' and Traders' Exchange of Milwaukee, Wis., occurred in January at the headquarters, 456 Broadway, when officers were chosen for the ensuing year. There were over 400 members present and everyone appeared to have a good time. The balloting resulted as follows:

President.....Burton L. Hibbard
First Vice-President.....Arthur J. Maag
Second Vice-President.....Louis Hoffman
Secretary.....Frank Spetz
Treasurer.....Anton Hennecke
Assistant Secretary.....A. E. Stein

The building outlook is regarded as most encouraging in the city and vicinity and contractors are expected to find plenty to do as soon as the season opens.

The annual meeting of the Builders' Club was held at the same time, when the following officers were chosen:

President.....William Gregory
First Vice-President.....Thomas E. Dever
Second Vice-President.....William Metzker
Secretary.....Arthur J. Maag
Treasurer.....Anton Hennecke

New Officers of Philadelphia Exchange

At the recent meeting of the Master Builders' Exchange of Philadelphia the following officials were chosen for the ensuing year:

President.....George J. Watson
First Vice-President.....J. L. Tyson
Second Vice-President.....O. W. Ketcham
Third Vice-President.....E. E. Hollenback
Treasurer.....Frank H. Reeves
Secretary.....Charles E. Smith

It is interesting to state in this connection that President Watson was re-elected by a unanimous vote, and since he has been at the head of the organization it has made remarkable progress. Every department has taken on new life, and builders are strong in their praise of the official management, for it is claimed Philadelphia will receive the benefit by reason of more modern and safer buildings, and every safeguard that can be thrown around construction work by those engaged in the building industry. The outlook for 1916 is said to be the most promising in the history of the Exchange.

Annual Meeting of Nashville Exchange

The annual meeting of The Builders' Exchange of Nashville, Tenn., was held in their quarters on the third floor of the Noel Block in January, when officers were elected for the ensuing year, as follows:

President.....J. A. Daugherty
First Vice-President.....J. W. Patrick
Second Vice-President.....J. H. Peter
Secretary-Treasurer.....Lee Parrish

Reports were presented covering the work of the Exchange during the past year, and in the evening the annual banquet took place at the Commercial Club. From the standard of attendance and enthusiasm the affair was regarded as the most successful in the history of the organization. President Daugherty was toastmaster and he arranged a number of surprises which added greatly to the enjoyment of the occasion. The program was a unique one in that there were speakers to represent all the branches of building, the architect having first place on the program and the builders' hardwareman the last. Secretary Parrish had some very interesting remarks to present on the subject, "If I Were a Builder."

New Officers of Reading Exchange

At the recent annual meeting of the Master Builders' and Contractors' Exchange, Reading, Pa., held in the rooms of the Chamber of Commerce, officers for the ensuing year were elected as follows:

President.....D. Elmer Dampman
Vice-President.....David E. Gring
Treasurer.....Daniel H. Hunter
Secretary.....Howard C. Faust

The secretary reported that most of the contractors and builders in Reading are associated with the Exchange and plans are being made to bring in all those now outside the organization.

Alameda County Builders' Exchange

The annual meeting of the Builders' Exchange of Alameda County, Cal., was held in January, the principal business accomplished being the election of direc-

tors, as follows: Frank Oates, Al. Hillman, J. P. Woods, A. Poulsen, James Pedgrift, P. N. Winlund, William Makin, O. W. Fletter, H. C. Steinbach, E. G. Hunt and O. A. Edwall. It was also decided to hold a membership meeting the first Monday of each month.

Following the business meeting at Exchange headquarters, the members went to Hotel Oakland for their annual banquet. William Makin, president of the Exchange, acted as toastmaster, and a number of speeches were made by prominent members; but the formal talks were brief, and much of the time was taken by entertainment stunts, in which a number of the members participated. The banquet committee consisted of O. W. Fletter, E. G. Hunt and Al. Poulsen.

New Officers of Hamilton Builders' Exchange

At the annual meeting of the Builders' Exchange of Hamilton, Ont., Canada, held in December, the following officers were selected for 1916:

President C. T. Pearce
First Vice-President E. Kent
Second Vice-President William Penny
Treasurer James McNeil

Following the election an interesting address on the Workmen's Compensation Act was given by Secretary J. Flower of the Provincial Builders' Exchange, who set forth very clearly the additions and amendments which have been made since the passing of the act and gave details of more amendments likely to be made in the not very distant future. A banquet was served just prior to adjournment.

Increasing Membership of Jacksonville Exchange

The Builders' and Traders' Exchange at Jacksonville, Fla., has been increasing the membership through a campaign recently inaugurated and renewed efforts are in progress to bring results along this line. A recent canvass by six teams of the Exchange resulted in adding fifty new members, and on the first of the year three additional teams were selected in the hope of increasing the number by fifty more.

An interesting feature of the work being done by the Exchange is the publication of a "Bulletin" each day. All the newspapers of the towns of Florida are taken by the Exchange and these are looked over every morning and the news of the principal work being done at various places is briefly summarized and the information presented in the "Bulletin" in question.

New Officers of Sacramento Exchange

The result of the election of officers at the meeting of the new Builders' Exchange at Sacramento, Cal., on Jan. 11 resulted in the following choice:

President F. E. Connors
Vice-President W. C. Keating
Secretary W. B. Scollen
Treasurer W. J. Brughman

At the meeting some interesting talks were made by those prominently identified with the trade, among the number being J. E. Brandon, a supervisor and building contractor of San Francisco, and W. H. George, a dealer in builders' materials in the same city. They told the members of the activities and results accomplished by the Builders' Exchange in San Francisco.

Cleveland Builders' Exchange to Move

The Builders' Exchange of Cleveland, Ohio, will move April 1 from its present quarters in the Cleveland Chamber of Commerce Building, which it has occupied for a number of years, to new quarters in the Rose Building at East Ninth Street and Prospect Avenue. This change is to be made in order to secure more room, the new quarters having more than double the floor space of the present ones. The Exchange will occupy about 15,000 sq. ft. of floor space, or about

three-fourths of the entire third floor of the Rose Building, which has been leased for five years with an option for longer periods. Two large bronze tablets will be placed on either side of the main entrance of the building bearing the words, "Builders' Exchange, Third Floor."

In connection with the new quarters the Cleveland Exchange plans the establishment of a Permanent Building Exhibit which will be one of the largest in the United States. In addition to the exhibit space will be provided for the division of floor space into private offices for members, open desk spaces, assembly rooms and other improved facilities for the members of the Exchange.

Annual Banquet of Youngstown Exchange

The members of the Builders' Exchange of Youngstown, Ohio, held their annual banquet on Tuesday evening, Feb. 8, in the banquet hall of the Y. M. C. A. The plans for the evening were in the hands of an entertainment committee consisting of W. G. Heacock, chairman; P. A. Andrews, S. A. Dalzell, D. G. Morris, T. Murray, Jr., and Gordan Phillips. There were several special entertainment features, but the event of the evening was the talk on "Importance of Organization" by H. L. Lewman of Louisville, Ky., president of the National Association of Builders' Exchanges.

New Officers of Rochester Exchange

At the annual meeting of the Builders' and Traders' Exchange of Rochester, N. Y., held Feb. 1, the following officers were elected for the ensuing year:

President F. H. Phelps
First Vice-President Clarence Wheeler
Second Vice-President J. E. Summerhays
Treasurer Henry Lampert
Secretary A. J. Mahon

There were five directors elected to serve for a period of three years.

Banquet of Omaha Exchange

The members of the Builders' Exchange of Omaha, Neb., held their annual banquet at the rooms of the Commercial Club on the evening of Feb. 1. The toastmaster of the evening was Charles E. Black, and among the speakers were Richard L. Metcalfe, who had for his subject "Building," and John Latenser, Jr., who gave an interesting talk on "The Architect and the Contractor." The feature of the entertainment program was a little sketch called "The Workhouse Ward."

Columbus Exchange Helps Newark Exchange

As a result of the recent visit to Newark, Ohio, of President R. L. Watson of the Builders' Exchange of Columbus and B. M. Freeman, Ohio Commissioner of the National Association of Builders' Exchanges, thirty-five new members were added to the Builders' Exchange of Newark. The success of this missionary trip was reported at the "Old Timers" meeting of the Columbus Builders' Exchange held on the evening of Feb. 2. The affair was largely attended and great interest was shown in the progress of the Columbus organization. At the noonday luncheon K. G. Thompson urged the co-operation of the Columbus Builders' Exchange in the movement for a city-planning commission.

One of the largest and most valuable timber trees of the country is the tulip tree, known to lumbermen as "yellow poplar." It is the only tree of its kind in the world.

Some of the architects of San Francisco are in favor of saving the Marina as the vital part of a grand water front park to keep green the memory of the Panama-Pacific Exposition.

For Roof *Beauty* and *Economy*—
Asphalt Shingles

YOU rarely find so much *beauty* and *efficiency* combined in a building material as in *Asphalt Shingles*. Especially at a *moderate cost*.

Asphalt Shingles give a distinctive touch to the outside appearance of any house on which you use them. They add \$1000.00 to the looks at no extra expense. Their rich coloring stands out in pleasing contrast to the other building material used.

Cold weather cannot harm them—they do not crack or split, and as water cannot penetrate them, they never freeze. With all these advantages to the houseowner, they can be laid so much faster than common roofs that you *save labor charges*—which puts you in a strong position to get more business.

Big, National Advertising To Help You

We are starting the building season with big advertising space in Magazines and Farm Papers, featuring *Asphalt Shingles*. This helps you to help yourself and help your *customers*. It aids you in showing them better roofing value for their money. It assists you to use this efficient, economical, handsome roofing, and secure more business.

Our free booklet, "*The Roof Distinctive*" should be in the hands of every Contractor and Builder. Send for your free copy.

The mark to always look for on packages of good Asphalt Shingles.

In all of our advertising we always refer the house owner to his Architect and Contractor about *Asphalt Shingles*.

The mark to always look for on packages of good Asphalt Shingles.

Asphalt Shingle Publicity Bureau
 854 Marquette Building ∴ ∴ CHICAGO

"I Am the Neponset Man"

"They called me that at first to jolly me.

"They didn't believe I had shingles that couldn't crack, rot, rust or rattle loose.

"But now the name Neponset is my capital. The first job where I used

NEPONSET Shingles

broke the ice for me. That one job led to a second, and the two soon became four. And so my business grew.

"Every one of these red and gray roofs here in town is mine. And many of the others, too, for I got a reputation as a roofer on account of my success with Neponset Shingles."

The same materials are used in Neponset Shingles as in the well-known Paroid Roofing, also used in Neponset Proslate, the highest grade colored ready roofing ever made. Neponset Wall Board, Neponset Waterproof Building Paper and Neponset Floor Covering are other well-known Neponset products.

We want a carpenter in your Town to be known as the "Neponset Man." Will you be the one? Send Coupon to-day for particulars.

Why Not Make Every Room Habitable?

Almost every home builder economizes somewhere. Often a room is left unfinished. In such a case you can give that extra bit of service that is so well appreciated.

Recommend that it be finished with

NEPONSET WALL BOARD

There are three finishes to choose from—all are waterproofed and prevent warping.

If you do not know Neponset Wall Board you cannot know the possibilities that lie in this substitute for lath and plaster. Let us send you a sample. Details are given in "Repairing & Building" but you should examine the board itself.

Mail your request today.

BIRD & SON, Dept. B, East Walpole, Mass.

Please send me information and samples of the Neponset Shingle and Neponset Wall Board. Also a copy of your book, "Repairing & Building." This request, I understand, does not put me under any obligation whatsoever.

Builders' Appliances and Equipment

Some Things of Special Interest to Those Having to do with the Various Branches of the Building Business

The Neville Adjustable Scaffold

ONE of the latest candidates to popular favor in the way of an adjustable scaffold for the use of masons in building chimneys is that illustrated in Fig. 1 and made by the Neville Mfg. Company, 210 North Freemont Street, Kewanee, Ill. The device consists of two pairs of brackets—one on each side of the proposed chimney. The brackets are placed

FIG. 1.—The Neville Adjustable Scaffold as It Appears Ready for Use About a Chimney

in position by hanging them over the ridge of the roof upon which they rest firmly, fitting equally well over a ridge board or metal ridge roll. The arrangement of parts is such that there is no weight on the roll itself. When in position the brackets are 6 ft. across, thus permitting of the support of a board of somewhat greater length. The brackets are made of soft steel, thus rendering it strong and durable, and the point is made that they can be used on shingle, metal, composition or slate roofs without damage to the roof. When not in use each bracket folds up compactly, occupying but little space, and is of convenient form for handling. To the workman there is a very perceptible saving of time and material both in the putting up and in the taking down of this scaffold, while to the house owner there is the saving of damage to the roof.

Finishing Southern Yellow Pine

Many of our readers will be interested in a handsome brochure containing specific directions for finishing Southern yellow pine, which has just been sent out bearing the above title by the Southern Pine Association, New Orleans, La. It is a work of twenty pages, profusely illustrated with well executed halftone engravings, of interiors for the most part, of buildings in connection with which Southern yellow pine has been used. A striking feature of the publication is a folded sheet carrying seven colored illustrations of Southern yellow pine interior finish. The examples measure $1\frac{1}{2}$ in. in width by $6\frac{1}{2}$ in. in height, thus affording an area sufficient to demonstrate in a striking manner the appearance of the wood in question when finished in the various styles shown. We understand that the directions given within the covers of the work are based on the "uniformly successful experience of the foremost American painters and structural experts. The rules given vary but little from those governing good workmanship in finishing others of the leading building woods. In their intelligent observance it will be found that Southern yellow pine not only takes and holds paint perfectly and permanently, but that no effect of richness and beauty in color and tone is beyond the

possibilities of the builder with this wood, and at a cost much less than that entailed in the employment of any other variety of anything like the same intrinsic merit."

Another feature of the work which will appeal to a great many readers is found in the directions for finishing Southern yellow pine floors. Emphasis is laid upon the necessity of care in the preliminary work and to the fact that a hard wood floor at small cost is within the reach of every house owner no matter how modest may be his domicile. Reference is also made to the use of Southern yellow pine for finish and trim in kitchens, this being due, it is claimed, not altogether to the moderate cost of that wood but to the dense even texture of the wood which becomes harder and more dense with age, thus making it particularly desirable for use where "the hot vapors of cooking might penetrate and render unsanitary more porous woods." It is further pointed out that the material takes enamel so readily and holds it so tenaciously that it is well adapted to use in kitchens so finished. The little work is one which cannot fail to prove helpful to every one interested in the interior finish of houses.

Flexible Concrete Forms

Those of our readers having to do with concrete work cannot fail to be interested in a "form" which is used for building any hollow or solid wall concrete building at a cost claimed to be much less than the ordinary expense of construction where temporary "forms" of any kind are used. The claim is made that dwelling houses, garages, factories, ice houses, etc., can be constructed through the use of this "form" at a material saving over brick, tile, cement-block or wood construction. It is referred to as simple in construction and most rapid in operation. One operator it is said can build as rapidly as three men can mix and carry concrete to the "form." There is no delay in waiting for the concrete to

FIG. 2.—View of One of the "2-E Flexible Concrete Forms"

set, as it is only necessary to spread and tamp the fresh concrete in the machine until full, then raise the lever releasing the machine from the wall, move it forward, reclamp at the wall and repeat the operation. The device is known as the "2-E Flexible Concrete Form," and is made of metal. The supporting frames are of a very rigid truss design and the arms supporting the mold boards are made of flexible spring steel and will not bend out of shape. The mold boards are of heavy gal-

vanized sheet metal and will neither bulge, warp nor get out of shape when exposed to the weather. All parts are interchangeable. A general view of the device is presented in Fig. 2, and it is made by the 2-E Flexible Concrete Forms, Eagle, Wis.

Lightning Hollow Chisel Mortiser and Relisher

A machine just placed upon the market which cannot fail to prove interesting to those having occasion to mortise sash stiles, rails and muntins as well as relishing out the tenon and cutting away that part of it

FIG. 3.—Lightning Hollow Chisel Mortiser and Relisher

that is under the mold, is the No. 384 Lightning hollow chisel mortiser and relisher, illustrated in Fig. 3, and made by the J. A. Fay & Egan Company, 221-241 West Front Street, Cincinnati, Ohio. The capacity of the machine is such as to be able to work material up to 6 x 6 in. and 3 in. deep, or by reversing through 6 in. It will carry chisels up to $\frac{3}{4}$ in. square, and any larger or irregular shaped mortise can be quickly and easily made by overlapping cuts. It has a traveling relishing table, the relishing head being carried on the same spindle with the bit for the hollow auger. At right angles to the relishing head is a borer that cuts away that portion of the tenon which is under the mold. The machine is self-contained, occupies but small floor space, requires very little power and does clean-cut and accurate work. The claim is made that it is so simple to adjust and easy to operate that a boy can run it. Those who have heretofore operated separate machines for the various kinds of work indicated cannot fail to appreciate the advantages of the combination machine here illustrated and described.

Minneapolis Branch of Cornell Wood Products Company

Those of our readers among the architects, builders and contractors doing business in the Northwest will be interested in learning that the Cornell Wood Products Company of Cornell, Wis., and Chicago, Ill., has opened offices in the National Soo Line Building, Minneapolis, Minn., in order to meet the growing demands in that section for its output. The office is in charge of W. N. Spires, who is the assistant sales manager in charge of the Northwest district, and is said to be one of the best known experts on wall board material. Mr. Spires will be assisted by a staff of men located in Minneapolis, and in addition to this the company has arranged, at considerable expense, a demonstration and showroom in connection with the Minneapolis office. This will be found of great importance to architects and builders of the Northwest, who will thus have the opportunity of becoming thoroughly familiar with the company's system and method of doing business.

A New Field for Building Contractors

Just because a man operates a coal yard does not mean that his office should be grimy and unattractive; in fact, an orderly, well kept, cleanly office has a certain sub-conscious influence on the casual visitor

or finicky customer; it suggests that the customer will get similar business-like attention and courtesy in his dealings with that concern. An interesting incident along this line occurred when a certain carpenter-contractor was making some repairs in the flooring of an Indiana coal dealer's office. The contractor suggested that for just a little additional outlay he could make over the entire office in a most attractive way.

"Don't want to spend the money—lumber is too high. Besides, people are going to buy coal just the same no matter what kind of an office I have," growled the coal dealer.

After the contractor had pointed out how he would use wall board, how little it would cost and how he could get the effect of a handsomely paneled quartered oak wall and ceiling by using grained wood Utility Board, the coal dealer grudgingly gave his consent. The result was really surprising. The fact that that coal dealer's business has increased considerably, that people are now glad to call on him at his office and that his own efficiency has improved 50 per cent may not be due entirely to the Utility Board with which his walls are paneled—but it certainly is due to the fact that his office is a better place in which to transact business.

In every locality there are similar places—offices where a little up-to-date renovating will do a world of good. Any interested contractor who wants to find out how to get this class of business need only write to the Heppes Company, 4501 Fillmore Street, Chicago, Ill., who will send full details and liberal samples of their new grained wood Utility Board.

The Loudon Special Garage Door Hanger

A form of garage door hanger which is meeting with great favor at the hands of builders and garage owners, especially those living in the suburban and rural sections of the country, is that which has been brought out by the Loudon Machinery Company, 5401 Court Street, Fairfield, Iowa, and the general appearance of which, upon a garage door, is clearly indicated in Fig. 4 of the engravings. The picture represents the inside

FIG. 4.—The Loudon Special Garage Door Hanger in Use

of the door with the swinging section open, showing the ready entrance to the garage without the necessity of opening the entire door as would ordinarily be the case. The construction is such that when the complete door is thrown open it lays flat against the inside wall of the building, and the owner's car may be driven in

(Continued on page 74)

Fiberlic

For Walls
and Ceilings

Specify Fiberlic from Basement to Garret

FROM basement to garret—in any kind of building—there isn't a single room for which you can't safely specify Fiberlic Wall Board. For instance, take the Fiberlic surfaced kitchen illustrated above.

A kitchen surfacing, to be worth its price, should be absolutely *vermin-proof*, *odorless* and *fire-resisting*. These three essentials stand out boldly in Fiberlic—the superior wall board. For that reason builders who spend their clients' money judiciously specify Fiberlic.

But Fiberlic possesses other marked advantages. It is a sound-deadener and has great strength and lasting qualities. It is more economical than lath and plaster and thoroughly sized *throughout*.

All these superiorities are due to the exclusive patented Fiberlic chemical process that treats every fiber in the board.

Send for a sample of Fiberlic and try this test: Take your sample and pull it apart. Then do the same with the ordinary wall boards. Compare them and you'll immediately detect the absence of odor in Fiberlic.

We manufacture special Fiberlic paints and stains that come in 24 different colors and shades. Ask about them.

THE FIBERLIC COMPANY, CAMDEN, N. J.

LONDON (England) BRANCH: MacAndrews & Forbes, Ltd., Finsbury Court, E. C.

"Viceroy" One-Piece Bath **KOHLER** Plate No. V-12-A
(Patent applied for)

This trade-mark—KOHLER—is on every piece of KOHLER enameled plumbing ware. It is incorporated in faint blue in the enamel at point indicated on illustration.

Enameled Plumbing Ware that is notable for its beauty and excellence

One of the characteristics of KOHLER Plumbing Ware is the beautiful whiteness of the enamel.

Its attractiveness compels attention and is an added value to the purchaser.

KOHLER enameling is in keeping with the excellent construction and uniformly high quality of our products.

KOHLER

designs are modern
and hygienic

Our designs represent twentieth century ideas in bathtubs, lavatories and sinks. The *one-piece* construction and KOHLER enamel make cleaning easy.

The KOHLER trade-mark is our guarantee of excellence.

Builders throughout the country select KOHLER Enameled Plumbing Ware because it is always of one quality—the highest.

Write for our "Viceroy" Book, describing the "Viceroy" *one-piece* built-in tub. The "Viceroy," low-priced, due to manufacturing economies, is the most popular built-in bathtub made.

within 6 in. of the wall if necessary. As a consequence the owner can build his garage so narrow that he will just have room to enter the car through the open end and still there will be room for the door to open and close. All the fittings are included in what is known as the "Original Package," and the only materials necessary in doing the work are the lumber, a saw, a hammer and a screwdriver. This hanger is such that all danger of swinging doors is avoided, and its use does not cut off and waste several feet of space in the end of the garage as does the one or two-piece inside sliding door. The hardware or fittings are furnished complete for 6-ft., 8-ft., 10-ft and 12-ft. doors according to requirements. The claim is made that the roller-bearing swivel trolleys glide along on the tracks so easily that a child can open the largest door.

New and Improved Tilting Level

There has recently been placed upon the market a new and improved tilting level which will be found of special interest to architects, contractors and builders by reason of the various features which are embodied

New and Improved Tilting Level—Fig. 5—Instrument As It Appears When Used as a Level

in its construction. Fig. 1 shows the instrument as it appears when used as a level, while Fig. 2 shows it when used as a transit. Among the chief advantages of the instrument are the drop-center construction of the cross bar with standards cast in one solid piece which obviates the necessity of attaching and detaching the standards each time it is desired to use the

FIG. 6—The Instrument When Used as a Transit

instrument as a transit. The arrangement of parts is such that it is claimed the level can be converted into a transit in ten seconds. The standards are so constructed as not to interfere in the least when the instrument is used as an ordinary level. The standards, which are cast solid on the cross bar, are made of a steel-like bronze, and are ground true, thus requiring

Gordon-Van Tine Co.

Established Half a Century

813 Federal St., Davenport, Iowa

Watertown, Minnesota
November 1st, 1915
Gordon-Van Tine Company,
Davenport, Iowa

Gentlemen:—

When I placed my first order with you people in January, I felt that I was making more or less of a gamble. You will remember that my first order was a carload of shingles and I will confess that I was worried for a while about delivery and half and made a fine profit. You can well imagine how anxious I was to see the shingles. The car came promptly and when we opened it we were all delighted—they were the best Red Cedar shingles any of us had ever seen.

Since that time, I have bought three more carloads of shingles and about 17 cars of your dimension lumber and several thousand dollars of millwork from you, and they were all just as satisfactory as were the shingles.

This last season has been the most profitable one I have ever had and it would be ungrateful for me to deny the important part your firm played in making it so. This town has never seen the equal of your dimension lumber, and with your doors, trim and interior finish, I was able to turn out really classy jobs. Considering your grades and service it is conservative for me to say that I have saved \$900.00 this season by patronizing you.

Very truly yours,
(Signed)
EMIL PALMER

Read this Contractor's Letter

The saving of \$900 that Mr. Palmer made, you, too, can make.

He added \$900 to his profits in a single season. So can you.

Read his letter. Then act on the suggestion it contains. Buy wholesale from Gordon-Van Tine!

Keep Your Men Busy This Winter at a Big Profit to You

THERE IS A BIG PROFIT TO YOU IN SELLING AND LAYING "SANTILITE COMPOSITION FLOORING" IN THE

DULL WINTER MONTHS.

As you know, "SANTILITE COMPOSITION FLOORING" is laid just like plaster 3/4 of an inch thick on any sub-floor of wood or cement—sets in 6 to 8 hours into a smooth, jointless absolutely sanitary surface without cracks to collect dirt, germs and filth—absolutely no trouble to keep clean—never grows dusty regardless of wear—extremely easy to stand and walk upon—fire will not burn it—water will not soak it—of permanent pleasing appearance—never requires painting and will last the life of the building.

"SANTILITE" is the ideal floor in the home for the kitchen, pantry, bath or any room where a sanitary, dustless floor is wanted. It is extensively used in the factory for offices, halls, lockers, toilets in the store, restaurant, cafe, public or semi-public building in areas subjected to heavy wear where a pleasing appearance, durability and absolute sanitation are required.

There are many masons, building and cement contractors who are making big profits in selling and laying "SANTILITE." It enlarges that branch of your business where there is an ever-increasing demand—every home with a wooden bathroom or kitchen floor needs it—every public place that has lots of wear must have it. You will find that there is little competition in your own locality and it is especially attractive, for it keeps your men profitably busy during the closed or Winter Season.

Write for samples, illustrated instructions for laying "SANTILITE" and our proposition to make your winter's work profitable.

SANITARY COMPOSITION FLOOR CO.

134 Plum Street, Syracuse, N. Y.

no further adjustments. Another point emphasized in connection with this instrument is that the standards are permanently fixed on the bar ready for use any time on ten seconds' notice. This prevents all possibility of the standards being either in the instrument case in the office, or misplaced somewhere so that the busy contractor cannot lay his hands on them when urgently needed. This new and improved tilting level is made by the David White Company, Inc., 421 East Water Street, Milwaukee, Wis., and a catalog which describes the level in detail besides giving illustrations, descriptions and prices of a great variety of up-to-date instruments for up-to-date contractors can be secured free of charge upon application to the company.

A New Single-Drum Builders' Hoist

A type of single-drum hoisting outfit of special interest to building-contractors throughout the country has recently been placed upon the market by the Novo Engine Company, Lansing, Mich., and in Fig. 7 we present a general view of one of the hoists. A special feature of this hoist is that the single-drum outfit can readily be converted into a double-drum hoist simply by adding the forward drum and a few extra parts. This is a decided advantage to the contractor who has use for a single-drum hoist, but at some future time may find it necessary to use a double-drum affair. He can purchase the extra drum at any time and can

Fig. 7—General View of the Novo Single Drum Builder's Hoist

readily attach it to his single-drum hoist. Still another feature is the use of Thermoid lining in connection with the brakes, which are 3 in. wide and have a maximum angle of contact. The outfits can be furnished for various speeds; also reversible and non-reversible. The base is made of heavy steel shapes with strong angle connections securely riveted together. The gears have 3-in. face and are machine-cut from solid blanks. The drum frictions are of the double cone or V-type, made of segments of hard wood turned to fit the friction groove in the drum. The drums are of 12-in. diameter, 16-in. length, and have diameter flanges 20 in., holding 1050 ft. of half-inch cable.

Something About Zinolin Zinc Paint

Among the very interesting literature which is being distributed among architects and builders by the Keystone Varnish Company, 2010 Kestona Building, Brooklyn, N. Y., is a folder relating to Zinolin "Arnold-ized" zinc paint, which it is claimed does not fade but remains glossy. It is referred to as the "Wonder paint" and is said to revolutionize outside painting while costing not more than ordinary white lead paint. Zinolin is the company's trade name for a new paint for all exterior painting. The statement is made that it does

Try This Level 10 Days—FREE

You pay no money down—don't place yourself under obligation to buy—simply get the level and use it on your own work in your own way. PUT IT TO THE TEST—laying out, squaring and leveling foundations, plumbing walls, girders, etc. At end of 10 days if you don't want to keep the level return it at our expense. Can you ask anything fairer? WRITE FOR DETAILS OF THIS GENEROUS FREE TRIAL OFFER—NOW.

(Something entirely new)

White's Improved TILTING LEVEL

*Try it Before
You Buy it*

Just what the contractor, architect and builder need. Saves its cost several times over every season. An accurate, reliable, moderate-priced instrument, with all complicated and confusing features omitted. Any contractor can master this simple and easily-used level in a short time with aid of complete 16-page instruction book accompanying each instrument. WHITE'S IMPROVED LEVELS are strong, rigid—few adjustments—built to stand hard service. Why keep on using clumsy makeshifts like the spirit-level or straight edge when this up-to-date instrument, with all latest improvements, will make your work easier, prevent costly errors and boost your reputation? FIND OUT WHAT A DIFFERENCE IT MAKES—AT OUR RISK.

Write today for free catalog showing large assortment of levels and transits and latest discount sheet.

G. & H. Barnett Company

Philadelphia, Pa.

Owned and Operated by Nicholson File Company

not contain white lead, lithophone or barytes. Another circular calls attention to the "Seven Wonders" of the company, among which mention may be made of "Litho-ite," a liquid outside white paint which can be tinted with colors and oil to make it any shade; "Prevento," a transparent liquid for rendering cement or brick surfaces above ground waterproof and keep them so for at least two years; "Poleva," a flat enamel for wet surfaces such as baths, laundries, brewery cellars or any place where there are acid fumes; "Caveco," a paint for cement inside or out, and being made up in jelly form it is stated that one coat will finish the wall or ceiling without any preparatory coat and over any other paint.

"Simplex Junior" Concrete Mixer

An economical and well built cement and mortar mixer having capacity to mix from 15 to 25 cu. yd. per day has been put on the market by the Western Manufacturing Co., Oskaloosa, Iowa, under the name "Simplex Junior," and is shown in Fig. 8. It is stated that the mixer is of such dimensions that it can be kept close to the material and near the point where the concrete is used, thus saving time in moving materials to and from the machine. It takes up but little room and can, therefore, be used in cramped places. When the hopper is mounted it is 43 in. high, thereby allowing the workmen to shovel in the ingredients in quick time. The mixer is provided with steel mixing blades, which are so arranged that twenty-one blades move the batch forward while seven blades work in the opposite direction. This action, the company claims, gives a double mix in one operation. The body of the mixing chamber

Fig. 8—"Simplex Junior" Concrete Mixer

is made of heavy sheet steel, and all gears are carried in a heavy casing which has long sandproof bearings. Each bearing is turned and bored to a true fit and is provided with a hard oil grease cup to insure proper oiling. A continuous belt runs the full length of the hoppers and feeds the materials in an even, unbroken stream, which prevents clogging and gives a steady flow of sand or cement. Both hoppers are identical, and either may be used for sand or cement. The adjustment of materials is performed by sliding gates installed at the front of the hopper, and these may be set for any amount desired, from 1 to 1 or 10 to 1. It measures and feeds the materials accurately. Every machine has a water tank of ample capacity. The trucks are of steel. The front and rear wheels are 16 in. in diameter, with oval tires and channel steel frame. The length of the axle is 36 in. The equipment is furnished with a 1½-hp. water-cooled gasoline engine, complete with dry-cell battery ignition, which is said to produce ample power for efficient mixing.

Roofing Facts and Figures

Under the above title a booklet of suggestions and interesting information for the practical carpenter and builder has been issued from the press for general distribution by the William L. Barrel Company, 8 Thomas Street, New York City. The little work not only tells about the long life of "Con-Ser-Tex" canvas roofing but also contains many valuable pointers for

WARNING

The Level we offer is the new Aloe Convertible Level, 1916 model. Don't confuse the Convertible Level with the ordinary old style Architect's Level. The only work that can be satisfactorily done with the ordinary Architect's Level is the determining of elevations. But the Convertible Level, besides its use as a level, is a modified transit and broadens the use of the level 100%. You can't afford to buy any but the Aloe Convertible Level.

HALF CENTURY REPUTATION

Spells Dollars For You

Selling the *Williamson New-Feed Underfeed Furnace* or *Boiler* means money in your till—and more money. You can guarantee the customer a saving of from $\frac{1}{4}$ to $\frac{2}{3}$ of the coal cost from the time he installs an *UNDERFEED*—and we back you. Is there a stronger trade puller than that guarantee? Think what it means to you in actual sales—advertising—consumer good will—new and better business! Not forgetting that a million dollar corporation is behind the guarantee.

WILLIAMSON CUT
NEW-FEED COAL
UNDERFEED BILLS
Furnaces and Boilers $\frac{1}{2}$ to $\frac{2}{3}$

The "*UNDERFEED*" is the big sensation of the heating world—simply because it *saves money*, is *easy to operate* and *delivers the heat*. It saves because it burns cheap or slack coal with as good results as highest grades. And the *UNDERFEED* is smokeless, sootless, clinkerless—adapted to warm air, steam, or hot water. It delivers clean, live heat all the time because it's built on

The "*Candle*" Principle. The fire is on top of the fuel, where it plays right against the radiating surfaces—not buried under a mass of smoky, half-burned coal. Turn a candle upside down and you've got a good imitation of the old fashioned top-feed. The *UNDERFEED* burns on the candle principle of an upright candle—fuel is fed from below.

A *Big Selling Success*. The *UNDERFEED* has swept the country. Over 35,000 enthusiastic users write of warmer homes with coal bills cut $\frac{1}{4}$ to $\frac{2}{3}$. Our big advertising campaigns and real sales helps are making money for live furnace men everywhere.

How You Can Cash In. Put the accent on the *IN* when you tie up to this fast-selling line. The cash comes in from the time we start to work for you and with you to sell the *UNDERFEED* in your town. Get our "*Exclusive Rights*" proposition—now—before the other fellow. Send the coupon below. It will bring you an eye-opening offer. But act today.

Business

making larger profits on repair jobs and new buildings. "*Con-Ser-Tex*," it may be stated, is a canvas roofing chemically treated to preserve the fiber from mildew and the detrimental action of the oil and paint. The claim is made that unlike most roofing fabrics it remains unaffected by the weather. It is used with great satisfaction to the owner and economy to the builder and contractor for porch and house roofs, piazza and other floors. A copy of the booklet can be secured by any reader of *THE BUILDING AGE* by sending his request to the company.

The Hill Balcony Dryer

In connection with those houses where yard room is not available for drying clothes, it is generally recognized that one of the most convenient arrangements for the purpose is a balcony dryer as shown in Fig. 9. This device is intended to be hung from piazza posts, from the side of a building, fire-escape or window balcony, the arrangement being such that when the lines are filled the dryer is swung clear of the building as shown in the illustration. The swing arms are made of steel and the dryer top is fastened open and locked to the post by a patented device which makes it impossible for it to be blown off. The castings are galvanized and the arms painted a light chrome yellow. The device is especially convenient for apartment houses,

Fig. 9—The Hill Balcony Dryer as it Appears When Ready for Use

flats, etc., and does away with the unsightly pulley lines which are a conspicuous feature of the rear areas of these buildings in the larger cities. The dryer here shown has four arms, each 5 ft. 6 in. long, holds 110 ft. of line, and is made by the Hill Dryer Company, 318 Park Avenue, Worcester, Mass.

Eureka Batch Concrete Mixer

An attractively illustrated folder setting forth in detail the merits and construction of the 5-6 Eureka batch mixer has just been issued from the press by the Eureka Machine Company, Lansing, Mich., and with representatives in the principal cities of the country. The special features of this mixer are minutely described in comprehensive specifications which occupy a double page of the folder, with a picture of the mixer in the center and having leaders pointing to the salient features. The company states that the machine has a foundation of unusual strength and compactness, that the heavy drum and load is situated over the rear end of the frame, while the power is in the front, this being referred to as a positive step in advance of mixers with the arrangement reversed. The drum rollers are built on the principle of a railroad truck, and emphasis is laid upon the fact that large drum rollers wear longer and require less power than others. The machine has a low-down, easy-charging side loader that will not clog, a counter shaft with clutches and driving pinion, an all-steel batch hopper, a self-measuring pressure water tank, a "new-way" engine for motive power and a steel housing for protecting the mechanism from

The HESS STEEL PIPELESS FURNACE

is a most decided success. Customers who are using them report surprising efficiency in producing and circulating warm air, economy in fuel, and general satisfaction.

The HESS STEEL PIPELESS FURNACE

is provided with one large register only, directly above the heater. The central part of the register is the heat outlet and warm air is delivered through it into the main room above the heater. The two ends of the register are cold air return openings, and the cold air flows through them and downward, around the outside of the furnace, to the bottom. It then ascends through the middle chambers of the heater and returns, properly heated, to the rooms.

The temperature of all rooms opening into the main room where the register is situated is kept uniform and comfortable. The upper rooms are tempered by ceiling registers.

This method is ideal for cottages, bungalows, stores, etc., but is not intended for houses where there are rooms distant from the furnace to be heated. For such houses we recommend our regular steel furnace, with separate pipes and registers.

This is a fine proposition for contractors and builders, to whom we make special terms and concessions. Write for particulars.

HESS WARMING & VENTILATING CO.
1201 Tacoma Building, Chicago

Makers also of the Hess White Steel Medicine Cabinets.

SAVING STEPS

with an

Amherst Furnace

No woman likes to run up and down the cellar stairs several times a day to tend the furnace. She doesn't have to while the Amherst is on duty. Hubby loads it morning and night, and the furnace then takes care of itself.

Here is a perfect heater, proven absolutely dependable by many years' service—a heater you can freely rely on to uphold your reputation for fair, square dealing.

Show us roughly the plans of house you're building, and we'll submit heating plan and cost. Get our catalog anyway.

Buffalo Co-operative Stove Co.

WILLIS MFG. CO., Galesburg, Illinois

dust and dirt. The policy of the company is stated to be "a good mixer at a reasonable price."

Mims Clamp for Concrete Forms

In these progressive days when concrete is so extensively used in connection with building construction of all kinds, contractors are interested in the appliances which are being brought out to facilitate this sort of work. Among the later candidates for popular favor in the way of a clamp for concrete forms is that which has been placed upon the market by J. R. Mims, Luray, Va., and the general application of which is shown in Fig. 10 of the engravings. The invention consists of a number of bars having their ends overlapping as shown in the illustration. One end of each of the bars has a series of holes so as to permit the bars to be pivoted at this end, while the other ends are provided with notches. A lock plate, provided with slots, is placed over the overlapping notched ends in such a way as to hold them firmly in position. The device is also provided with a locking lever for drawing the boards together so that there will be no cracks in the "form." The manufacturer states that in constructing columns where the clamps are used it is only necessary to get out a piece of the proper width and nail a 1 x 2 in. batten at each end, and where the columns are unusually long a batten is placed in the center to hold the boards together until the clamps can be put in place. After the clamps have been adjusted to the proper size, a lock plate is slipped into place, the locking lever is inserted in the holes at

Fig. 10—The Mims Clamp for Concrete Forms

the end where the notches are located and the clamps are drawn together until all the cracks in the boards are closed. After the columns have been filled with concrete and the "forms" are ready to be removed the bolt at the adjusting corners is taken out and the clamps released. As the bolts are made tapering they can readily be driven out. The clamps are made from cold rolled steel and are adjustable from 12 in. to 30 in. square. They are also made for larger columns when necessary. All bars are made by the same templet, thus saving time in assembling the clamps.

Convention of Branch Managers of Trussed Concrete Steel Company

The first annual convention of the branch managers of the Trussed Concrete Steel Company was held at the main plant in Youngstown, Ohio, the last week in January and was notable in many ways. Not only was every section of the country represented, but managers were present from Japan, Hawaii, South America and Porto Rico, there being fully 100 men in attendance. The general program included business sessions morning and afternoon. President Julius Kahn gave the opening address, followed by an interesting talk and discussion on "Shop Practice" by T. H. Kane, manager of the works. The noon recess was devoted to the inspection of the manufacturing operations. P. M. Louwerse, manager of the Sash Department, gave an interesting talk on "Steel Sash," and branch managers participated in the discussion which followed, telling of their experiences in various parts of the country.

The Economy of the **FEDERAL** Proves a— “very profitable investment”

That's what this prominent lumber company says comparing Federal Service with other trucks and other transportation methods they have used.

W. A. C. MILLER COMPANY
1080 Vinewood Avenue
Detroit, Mich.

Jan. 4th, 1916.

Federal Motor Truck Co.,
Detroit, Michigan.

Gentlemen:

In reply to your favor of December 31st, relative to the operation of our 1½-ton Federal motor truck, will say that this truck has given us very satisfactory results.

During the four months we have had this truck it has cost us just 30c for actual repairs.

During our busiest season our truck made an average of 6.59 miles per gallon of gasoline under an average load weight of 2550 lbs., which we consider is very low, in comparison with other trucks that we have had, and we feel that we have made a very profitable investment in the purchase of this make of truck.

Yours very truly,

FCN/GHK

W. A. C. Miller Company.

You owe it to yourself and to your firm to have us at least show you what other concerns in the lumber and building fields have saved with Federalized Transportation. Write today—

Federal Motor Truck Company

Tested by Chemists Every Hour—Day and Night

DESPITE standardization, the making of Portland Cement is—as an authority recently expressed it—“an extremely scientific proposition requiring the exercise of the greatest care and long experience. It is a scientific and chemical procedure representing the antithesis of guess-work or slipshod methods.”

Is it not well, therefore, in selecting cement that is to become the very sinew of your construction, to choose the product of a manufacturer whose present-day output represents 25 years of experience in cement making—who has made the chemist a man of real authority in all plants—who has for years followed a strict system of hourly tests to insure exact proportioning, thorough burning and grinding that will more than meet standard requirements?

Under the ALPHA system of supervision it is impossible for cement that lacks binding power to be shipped out. ALPHA CEMENT costs no more than other good Portland Cements.

Six great plants on six trunk-line railroads—capacity 25,000 barrels daily—enable us to render ALPHA service that is on a par with ALPHA quality.

Let us send you our Art Envelope No. 17, containing illustrations of distinctive concrete constructions, and a copy of the 80-page book, “ALPHA CEMENT—How to Use It.”

ALPHA PORTLAND CEMENT COMPANY,
General Offices, Easton, Pa. Branch Offices: New York, Philadelphia, Boston, Pittsburgh, Baltimore, Savannah.

Other topics discussed were "Reinforced Concrete," "Engineering Practice," "Experiences with Reinforced Concrete," "Metal Lath," "Methods of Distributors," "Kahn Mesh Reinforcement," "Concrete Pavements."

A program of entertainment had been prepared including, on the opening night, special motion pictures of Oregon views followed, by a buffet luncheon; on the next night a banquet at the Hotel Ohio, the hall being specially decorated and arranged for the occasion with special company songs and many interesting toasts, and the following evening was "Trussed Concrete Night" at the Hippodrome Theater. Curtains carried banners of welcome and the actors had been coached and poked fun at some of those in attendance. After the performance a buffet luncheon was served in the grill room in the Hotel Ohio.

Berger's Steel Cores for Concrete Floor Construction

A form of pressed steel core or tile for use in connection with concrete floor construction and one which is rapidly growing in popularity throughout the country is illustrated in Fig. 11 of the engravings. It is designed to give great strength and displacement for the least amount of weight and cost, at the same time making a great saving in concrete, reinforcing steel, centering and labor, as well as greatly reducing the dead floor load. The cores which are made in the lighter gages are for "left-in" construction while the heavier gages may be removed and used again and again indefinitely. The cores are made with 20-in. base for joists, 24-in. centers and cores with 25-in. base for concrete joists 30-in. centers. The point is made that the cores can be shipped to any part of the United States at a very low freight rate owing to the

Fig. 11—General View of Berger's Steel Core for Concrete Floor Construction

fact that one car of cores will cover an area equal to twenty cars of clay tile. The cores are made by the Berger Mfg. Company, Canton, Ohio, which will cooperate with architects, engineers and contractors, furnishing them with complete designing data that will enable them to economically lay out concrete floor construction by the use of these steel cores.

Catalog of Wire Work

One of the most attractive catalogs illustrating and describing wire work of all kinds which has come to our notice is that now being distributed to the trade by the Buffalo Wire Works Company, 446 Terrace, Buffalo, N. Y. The volume consists of 176 pages profusely illustrated with halftone and line engravings showing a few of the many uses of "Buffalo" wire cloth and the various kinds of ornamental designs the company has executed. In addition there is a number of carefully compiled tables showing the various sizes of wire, weights, sizes of opening in the different meshes and metric measurements—in fact all general information pertaining to the company's line. Attention is given to ornamental floor railings, elevator cabs and inclosures, wire baskets, folding gates, partitions, fireplace screens, lawn fences, settees, wall guards or partitions, wire bins, wickets, grills, ornamental panels and guards, etc. The company states that inasmuch as the list prices of all wire cloth have been changed it is suggested that all previous copies of catalogs now on file be destroyed, as all prices quoted after Jan. 1, 1916, will be in accordance with the list prices in the new catalog. Those of our readers who

Booklet on Economical Gas Making

Readers of THE BUILDING AGE residing in rural and suburban sections which are isolated from public gas supply for lighting purposes are likely to be interested in a booklet relating to the Tirrill "Equalizing" gas machines which has just been issued from the press by the Tirrill Gas Machine Lighting Company, 103 Park Avenue, New York City. This booklet, which is being mailed free on application to any address, gives many interesting details of this gas machine and also describes gas burners and gas appliances of all kinds for every conceivable purpose.

The International "Onepipe" Heater

One of the latest developments in the solution of the heating problem, and one in which architects, builders and house owners generally are interested, is the device illustrated in Fig. 12 of the engravings. It represents a broken view of the International "one-pipe" heater, the arrows clearly indicating the course of the air currents. The construction is such as to render the operation readily understood, and as the heater is delivered in "knocked-down" shape, all that is necessary in erecting it is to select a suitable place in the cellar, near the center of the house if possible, and follow the directions of the manufacturer. All the tools required are

Fig. 12—Broken View of the International "Onepipe" Heater

a screwdriver, a saw and a hammer. The inner casing is lined with tin and asbestos to retain the heat until it is absorbed by the air passing through. The point is made that the outer casing is always cool so the cellar will not be heated. In operation, which the manufacturer claims is positive, the warm air flows up through the center of the register, passing at once to the ceilings of the various rooms and "flooding the house with warmth." The colder air falls to the floor, then down through the outer section of the register between the outer and inner casings of the heater, and is then rewarmed and recirculated. The smaller size is designed to warm a house having from six to eight ordinary size rooms, while the larger size is intended for warming a house of eight to ten rooms. The device is made by the International Heater Company, Hickory Street, Utica, N. Y.

Millers Falls Tool Catalog

The Millers Falls Company, Millers Falls, Mass., has recently issued a new catalog, No. 35, of the Millers Falls tools. The book is well printed and illustrated on good quality of paper and shows complete lines of hand vises, drilling machines, auger handles, automatic boring tools, boring machines and augers, various kinds of drills, saws, chisel grinders, chucks, motor boxes, soldering sets and braces. At Last! A Practical Home-Study Course for

CARPENTERS

FOREMEN—SUPERINTENDENTS—CONTRACTORS
and all other men in the Building Lines

**Plan Reading, Estimating,
Architectural Drawing, Contracting, etc.**

This is a course for practical men. We send you actual blue print plans of buildings now being built or recently completed. Practical training, not book knowledge, is what you want—it's what we give. When you think of the opportunities this training offers, you will take time—right now—to mail the coupon for full information.

To Succeed In any branch of the building business you must have a complete knowledge of plans and specifications. You must be able to estimate closely the cost of material and labor. Guessing won't do—you must know. This knowledge is what makes successful foremen, superintendents and general contractors. This knowledge means money—thousands of dollars—to any builder—to you!

Your spare time is enough. You can master these subjects in your own home by this new, easy, quick method.

This elegant set of Drawing Instruments and Complete Outfit furnished FREE to our Students.

Special Trial Offer!

For only \$2 we will send you the complete set of working blue print plans for a large residence just completed in Evanston, Ill. Also the complete specifications for this job. We will also include questions concerning the plans and a complete itemized estimate showing how to figure the cost of the building down to the last penny. This is information worth many times its cost to you. Supply of plans on this offer is limited and will not last long. Send for your set today.

New Lane Garage Door Hanger

Lane Brothers Company, Poughkeepsie, N. Y., has recently placed upon the market a new garage door hanger embodying a number of features of special interest to the architect and builder. It is a well-known

New Lane Garage Door Hanger—Fig. 13—One Plan of Arranging the Doors and Showing Hanger in the Insert

fact that there are many situations constantly developing in the construction of modern garages where the plain, old-fashioned swinging or sliding door is not at all convenient even if not impossible. In such cases one or the other of several plans suggested in a "Bulletin" sent out by the company is sure to meet the required conditions. One plan is particularly adapted to private garages where a wide opening such as that required for two cars is desired and unobstructed in the center. Another plan is the reversal of that just mentioned, which brings the doors inside the building when opening. A third is a modification of the second, but keeping the doors inside the line of the sill and the jamb. This requires a hanger swivelled at the extreme edge of the door, but not projecting beyond it. A fourth plan involves an equipment which operates easily and is quite extensively used on public and private garage entrances. One side of this plan is shown in Fig. 13 of the illustrations, while Fig. 14 shows an ar-

Fig. 14—Another Arrangement Suggested for Hanging the Garage Doors

range which enables the employment of a single trackway across the front owing to the fact that the wheels set back from the door edge and do not interfere when the doors meet edge to edge at the center. This arrangement involves the use of the new style hanger and allows the door not only to set snugly against the jamb in closing, but also hangs back of the side rail against the wall when not in the open

position if sufficient length is provided in the front track for a clearance for the hanger truck.

A New Lock Striker

An adjustable lock striker that will eliminate the cutting of door casings when the door sags has been placed on the market by the Wiley Hardware Manufacturing Co., 746 First National Bank Building, Chicago, Ill. When the latch bolt is out of line the inner plate of this device may be adjusted to the proper position by the removal of the screws, so that the simple operation is the removal of the holes instead of the plates. These strikers are made in two qualities, from cold rolled steel and from solid brass in a variety of finishes. Each one is adjustable for right or left door strike. Their full length is 6 1/2 in., the size of the upper opening 3/4 x 9/16 in. and the lower opening 1 1/4 x 7/16 in.

New R-W Door Closer and Check

One of the latest additions to the Richards-Wilcox line of specialties is the door closer and check illustrated in Fig. 15. In the production of this device the old, time-tried principle in checking mechanism by the use of crank and pitman has been improved and simplified. All working parts used in the checking cylinder are made of steel drop forgings. The spring used is such that it is impossible to overwind it, while the tension can be adjusted to suit conditions by the pawl and tooth dog. The claim is made that by reason of the original construction the check is leakproof, while the liquid—

Fig. 15—New R-W Door Closer and Check

a non-freezing oil—in which the main working parts are immersed, "has high lubricating qualities." The working parts are made of gray iron, malleable iron and steel drop forging, machined to a perfect fit, and are interchangeable. No special wrenches or tools are required in assembling or winding up the spring, while a screwdriver is all that is necessary to take the check apart. The device is known as No. 643 and is made by the Richards-Wilcox Mfg. Company, Aurora, Ill.

The General Fireproofing Company, 303 Logan Avenue, Youngstown, Ohio, calls attention to the fact that the success of a stucco job depends very largely upon the lath to which the stucco is applied, and that that is the reason why builders prefer "Herringbone" rigid metal lath to other styles. This particular lath has strong, lengthwise ribs which stiffen each sheet, thus rendering it easy to work, while at the same time the rigidity saves plaster by eliminating the pockets which form in lath that sags between the studs. The company has issued a catalog relating to Herringbone lath, and a copy of it will be sent to any interested reader who may make application for it.

California Redwood Association

The California Redwood Association, 51-52 Newhall Building, San Francisco, Cal., has just been incorporated under the laws of California for the purpose among others of collecting and disseminating information and knowledge of the value and utility of Redwood timber and lumber and of the uses to which it is adapted. Most of the Redwood manufacturers have already joined the new association and have subscribed for its services. The officers are: President, Edward Selfridge, Jr.; vice-president, J. H. Holmes; secretary, A. B. Wastell. The business of the association will be carried on by several committees, the members of which will outline and direct its activities into the several channels of trade extension, grading and inspection, traffic, etc.

The Story of the Stratton Level

A booklet describing in attractive style the story of the Stratton level has just been issued from the press by the Goodell-Pratt Company, Greenfield, Mass., and a copy, we understand, will be sent free to any address upon application. The descriptive text is illustrated in a way to prove attractive, and the information contained is such as to appeal to every practical mechanic who takes pride in his "kit" of tools. The booklet is only one of many dealing with the 1500 good tools made by the company.

TRADE NOTES

The "Medusa White House" booklet has just been issued from the press and copies are being distributed by the Sandusky Portland Cement Company, Engineers' Building, Cleveland, Ohio. The little work has been prepared in a way to appeal particularly to the home builder, but the information is also of a nature to interest the architect and contractor as well. The illustrations in the booklet are such as to afford the reader some idea of the artistic beauty of "Medusa White House," which it may be remarked in passing, is durable, fireproof and sanitary. A copy of the booklet can be secured by writing to the company.

Alpha Portland Cement Company with general offices at Easton, Pa., is offering to send free to builders and others having to do with the use of concrete, a copy of its "Red Envelope No. 17," which contains illustrations of distinctive concrete constructions, also a copy of its eighty-page book, "Alpha Cement—How to Use It." The company operates six mammoth plants on six trunk-line railroads, with a capacity of 25,000 barrels of Alpha cement daily.

Triple "A" Machine Company, 302 West Grand Avenue, Chicago, Ill., states that in order to meet the demand of contractors and builders who have only a limited amount of floor surfacing to do, it has designed two new models in addition to its old standard Triple "A" Spring-Driven Floor Smoother. The new models are known as Triple "A" No. 2 and Triple "A" No. 3. These machines have been specially priced so as to place them within the reach of everyone who needs a floor surfacing machine, and interested readers can obtain full particulars by addressing the company.

A. A. Jackson Machine Company, 1766 Broadway, Denver, Col., is sending out a free booklet entitled, "Money in Polished Floors," which contains much valuable information relating to its Jackson scraping, planing and sanding machine. The outfit embodies scraper, plane, cabinet finisher, sanding, polish and waxing device. The claim is made that a job or two are sufficient to pay for the machine.

The Ideal Engine Company, formerly known as the Original Gas Engine Company, East Kalamazoo Street, Lansing, Mich., is directing the notice of contracting-

(Continued on page 94)

We Won't Let a Lansing Mixer Go Wrong

What do you mean "won't"?

We mean that we cannot afford to let a single mixer leave our shops that hasn't been perfected and thoroughly tested.

You say there is not a perfect mixer?

You are correct.

There is not a perfect mixer manufactured; neither is there a perfect automobile, nor a perfect phonograph, nor a perfect typewriter. There never will be. We all strive toward perfection, but as close as we come to it is only as close as any article comes to perfection. If there is no absolutely perfect mixer, no manufacturer can truthfully tell you your mixer troubles are over when his mixer is purchased. There will probably be more or less mixer trouble so long as mixers are used.

But,—

with some mixers you will have less trouble than with others. There are certain degrees of perfection, even if there is no perfect thing. Some manufacturers can afford (at least they think they can), to sell a cheap mixer at a low price and consider the incident closed when the sale is made. Naturally they never sell the same man twice. Mixer troubles to them are the other fellow's miseries. Not so with the Lansing Company. We will be selling mixers a year from today, five years from today, twenty years from today, and we expect to sell you, too.

The few troubles our customers have with Lansing mixers—and they are indeed few—are our troubles. We make them our troubles.

The difference in price between a Lansing guaranteed mixer and others, is slight if any. We have found the wise contractor profits from the other fellow's experiences, and the small difference in the initial cost eventually pays him interest on the complete investment.

That's the why of the Lansing.

That's the reason Lansing Mixers were used on the Sheepshead Bay Speedway; the New York Subway; the Henry Ford farms; as well as on hundreds of sidewalk jobs; small and large building jobs, etc., etc.

Made in 5, 7, 10, 12, 15 cu. ft. capacities.

builders to the Ideal "Single Line" hoists which are built in two sizes of 4 and 6 hp. The capacity of the smaller size is 900 lb. and that of the larger size 1500 lb. The hoist is mounted upon a steel skid; has a 10-in. winding drum and an extra strong brake.

The February issue of Door-R-Ways, the house organ of the Richards-Wilcox Mfg. Company, Aurora, Ill., is unusually attractive both in its printing and in the matter contained within its covers. A number of the company's specialties are referred to in a way to attract the attention of the carpenter and the builder, not to mention the hardwareman who carries on hand a stock of the company's hangers and other specialties. Accompanying the issue is an illustrated folder describing the R-W Stewart electric door opener and closer, an attachment which it is claimed will save time and money in any building where the doors must be opened and closed a number of times a day.

J. A. & W. Bird & Co., 88 Pearl Street, Boston, Mass., makes announcement of the fact that it has changed the location of its New York City offices from 66 Beaver Street to the new Equitable Building, 120 Broadway, where the company has much more commodious quarters as well as better facilities for meeting the requirements of its trade. The company also states that it has not advanced the price of "Ripolin" enamel paint, as its stock is sufficiently large to take care of practically all demands. In view of the fact that "Ripolin" is made in Holland, the company is experiencing no difficulty in obtaining the material of the same high standard as heretofore.

Lehigh Portland Cement Company makes announcement from its Chicago office that owing to its rapidly increasing business in the Northwest, and in order to give customers prompt and efficient service, it has established a sales office at Mason City, Iowa, under the supervision of J. H. Black as district sales manager. The company will still retain its office in the Security Building, Minneapolis, Minn., which will be under the supervision of J. J. Kehoe.

F. E. Myer & Bro., Ashland, Ohio, have been distributing a poster of mammoth proportions carrying a vast array of illustrations of specialties turned out by them, the goods embracing spray pumps and fittings, wind mill force pumps and hay unloading tools. The leaflets containing the calendar proper are attached to the center of the poster, the upper part of which gives an extensive birdseye view of the company's plant.

A package of illustrated circulars sent out by P. & F. Corbin, New Britain, Conn., relates to some features of the extensive lines of builders' hardware which they turn out. Reference is made to the pin tumbler cylinder locks with ball bearings, to door handles of hammered finish, to Corbin door checks and to various designs of Corbin cast-bronze hardware which is described as strikingly original in its form and elegant in effect.

Paul O. Moratz, Bloomington, Ill., is sending out a neat folder calling attention to the "Acme" brand of $\frac{3}{8}$ -in. oak flooring. Emphasis is laid upon the great improvement made in the manufacture of thin oak flooring and to the fact that the bevel tongue and groove of the "Acme" will not only withstand rough handling, but will save the carpenter a large amount of hard work, because it comes together tight and even without driving. Another claim made is that owing to the very strong lip this thin flooring will withstand the weight and moving of heavy furniture the same as thick flooring. Among the information given in the folder are directions how to figure the amount of oak floor required to cover a certain space, also standard weights of $\frac{3}{8}$ -in. oak flooring, together with an enumeration of the grades in which the "Acme" brand is made.

Fritz Foltz, head of the firm of F. Foltz & Son, architects, died Feb. 1, 1916. Mr. Foltz has been active in practice of architecture in Chicago since 1868. The

(Continued on page 96)

The ARCHER

50 Cubic Yards and More of Concrete Per Day!

Can you do better than that by the old hoe-and-box method? Can you mix more than 50 cubic yards of really good concrete in a day?

It is possible—yes—but not probable; and, surely, not profitable.

An Archer Mixer can be managed by one man. It saves the wages of five men toiling at a mixing box!

Chew this over in your mind, after which let us come to terms.

Established 1891

Ideal Cincinnatus Batch Mixers

Tried, Tested, Approved, Accepted.

It pays to use a Mixer that is dependable, one that will turn out good concrete and lots of it. The ability of Cincinnatus Mixers to mix quickly and thoroughly means profits on every job.

Built in four sizes—5, 7, 10 and 14 cu. ft. capacities (loose materials). Equipped with Wheelbarrow and Batch Hoppers, Power Side Loader or as Rear Discharge Traction Pavers.

Mixer values are measured by results. Ideal Cincinnatus Mixers give the best results.

Prices, \$197.50 and up.

Ideal Concrete Machinery Co.

1310 Monmouth Avenue

Windsor, Ont., Can.

Cincinnati, O.

business will be conducted as usual at 1760 Conway Building, with F. C. Foltz as the head.

The year book of the School of Applied Art of Battle Creek, Mich., contains in attractive shape much interesting information relative to this institution. The opportunities offered by the school are presented in forceful style and the point is made that its "original direct-dictation system of correspondence instruction brings the guidance of eminent artists" to the student in his own home. The school has been teaching successfully for sixteen years and stands to-day high in the art world.

Some interesting literature relating to the "Incinerite," which it is claimed will solve the garbage problem for people living in apartment houses, is being distributed by E. C. Stearns & Co., 400 Oneida Street, Syracuse, N. Y. The device is constructed in a very substantial manner of heavy castings, brass and sheet steel lined with asbestos and is said to be practically indestructible. The gas burner system and the formation of the grates are such that no matter how firmly the garbage may be packed in the Incinerite, the gas combustion will not be adversely affected.

We learn from the Willis Mfg. Company, Galesburg, Ill., that during the past year it has placed 1000 of its skylights in various parts of the country and that they are meeting with increasing popularity. The skylights are made with the best grade of sheet metal, strongly reinforced, and the company guarantees them not to sag. An important feature in connection with them is that no putty is required and that no tools except a hammer and a screwdriver are needed to install the skylights. In fact any carpenter can readily put them in place. Different sizes and styles are made, and in addition to the company's well-known ventilators, it also has a complete line of sheet metal building materials. A catalog which describes the company's products has been issued and can be secured on application.

S. Cheney & Son, Manlius, N. Y., are directing the attention of architects to what is known as the Zimmerman patent iron base for wood porch columns, the claim being made that the use of this base tends to prevent rotting of the columns. It is adapted for both round and square work, and a folder sent out by the concern gives directions for applying the base, also prices and other interesting information.

At the recent meeting of the stockholders of the Detroit Steel Products Company, makers of Fenestra solid steel windows, Detroit, Mich., Walter S. Russel was elected president, R. S. Drummond vice-president and J. G. Rumney secretary-treasurer and general manager.

Typewriters Distributing Syndicate, 1510-59-P Wabash Avenue, Chicago, Ill., calls attention to the fact that for the first time in history building contractors and lumbermen can obtain a standard visible typewriter with keyboard designed especially for the needs of their business, and at a price so low that it is quoted only in a confidential letter.

The Oak Flooring Bureau, 1349 Conway Building, Chicago, Ill., is distributing a circular letter giving the substance of its reply to a prominent architect of St. Louis who asked for information as to the grade and thickness of oak flooring it would recommend for a class of moderate cost residences that he is planning for investment. The bureau also inclosed a copy of its "Oak Flooring Booklet" and 1916 calendar as likely to prove of interest to him in the connection named. Copies can be obtained by any interested reader on application.

Lansing-Company, Lansing, Mich., is now making new contracts covering its concrete mixers and other specialties for 1916, and is offering the agency to reliable contractors in unoccupied territory. Those builders and dealers in contractors' equipment who may be interested in a matter of this kind should communicate with the company at once.

Most Mixing—Least Fixing

Universal Mixer, Charging Side

MARSH-CAPRON MIXERS

are furnished in all popular sizes with proper equipment to give you best possible service. The Marsh-Capron Line includes seven sizes of mixers, three sizes of pavers, and the Marsh-Capron Grouler

Universal Mixer, Discharge Side

The new Marsh-Capron Universal Mixer—the big sensation of the Chicago Cement Show—is now ready for delivery. This one-bag mixer has a capacity of 7 cu. ft. of mixed concrete, or 11 cu. ft. of loose material, as rated by the National Association of Mixer Manufacturers. It is sturdily built, compact, very roomy, easy charger—a mixer that will give you years of service, better mixed concrete, less trouble than anything of its type now on the market.

Universal Mixer, Platform Folded Up

The Charging Hopper is only 19 inches from the ground, is large, well designed and will take care of a wheelbarrow load without spilling. It is a batch-a-minute mixer with the strong reputation of the Marsh-Capron Mfg. Co. back of it, insuring **MOST MIXING WITH LEAST FIXING AT LEAST COST.**

You will be interested in the circular we will mail you on request.

Blystone Batch Mixer

For Plaster-Concrete-Mortar

A saving of \$25.00 per day was made in mixing hardwall plaster for the big Machinery Palace for the Panama Pacific Exposition.

The Cement Tile & Block Mfg. Co., of Osgood, Ohio, paid for their Blystone in three months work in their block plant.

One man slaked lime and made mortar for ten masons and had time to spare for other work on a job recently done by G. Ed Berry, of Harrisburg, Ill. Mr. Berry also says he got 10% more mortar per barrel of lime.

H. A. Farmer, St. Petersburg, Fla., recently wrote us as follows: "I am so well pleased with mixer, I want another just like it. Ship me another one as soon as possible."

Construction News

"It should be in the hands of everyone who has to do with building construction."

Over 8,000 Sold in Eight Months The New Edition of Arthur's Building Estimator

Is a modern working guide for all who figure the cost of building construction, either in detail or approximately. It gives the actual time, labor and material required on every operation in all classes of residential and municipal work, as recorded and checked by the author and other experts on thousands of jobs, finished under varying conditions, in different sections of the country. Special stress is laid on those items that are affected by varying conditions and the reasons for the difference, as found by experience, are given so the reader may profit. Many things that the estimator would not think of until too late may thus be brought to his attention in time. In preparing the 1913 edition no expense was spared to make it complete and absolutely correct. It has been thoroughly revised, and 248 pages of new material added, making a volume of 744 pages, 5x7 inches in size. Price \$3.00 delivered.

We guarantee it to be up to date and you may return it if it does not prove entirely satisfactory.

Send us copies of Arthur's
Estimator. Enclosed find \$.....

SENT FREE!

Don't take our word for it that these books will enormously increase your earning capacity. Get them into your home and shop—free—and determine their value for yourself. The books themselves, not what we say for them, must convince you that you need them, so send the coupon to-day—now—and the entire eleven volumes will come to you at once, express prepaid. If, after a full week's trial, you decide to keep them, you can buy them at half the regular price and on the easiest of easy payment plans.

Newly Revised Cyclopedia of

Architecture, Carpentry and Building

consists of ten large volumes, handsomely bound in half red morocco, gold stamped, containing 4,760 7 x 10-inch pages; 4,000 illustrations, full page plates, building plans, diagrams, etc.; hundreds of valuable tables and formulas, carefully cross indexed for quick, easy reference.

PARTIAL TABLE OF CONTENTS

Mechanical, Freehand, Perspective and Architectural Drawing, Lettering, Pen and Ink Rendering, The Orders, Superintendence, Strength of Materials, Masonry, Reinforced Concrete, Carpentry, Steel Square, Stair-Building, Hardware, Steel Construction, Roof Trusses, Practical Problems, Estimating, Contracts, Specifications, Building Law, Sanitation, Sheet Metal Work, Electric Wiring and Lighting.

Plan Book and Consulting Service FREE

We give free to every purchaser of our Cyclopedia of Architecture, Carpentry and Building, a copy of "Modern American Homes," a complete and up-to-date plan book. Contains plans and specifications for 168 structures, including excellent exterior and interior views, detailed estimates, etc. Designed by leading architects, it covers city, suburban, and country homes; bungalows; summer cottages; tent houses and camps; apartment houses; garages, and public buildings. 224 pages, 9 1/2 x 12 1/2 inches, and 426 illustrations. Printed on enameled paper and substantially bound. With this plan book in your shop you are prepared to figure on any job, no matter how large. No need for the prospective builder to consult an architect—you can offer him his choice of practically every type of home. This saving of the usual architect's fee should get you the business.

In addition we give free with each set a year's consulting membership in the American Technical Society. Through this service you have the assistance of a staff of architectural and building experts. These men are no farther from you than the nearest mail box. They stand ready to solve your perplexing problems, to offer suggestions, to point out the things you should avoid. In fact, they enable you to compete with the biggest and most experienced men in the construction field.

Send for this great combination today

We will send the complete eleven volumes to your home for seven days' free examination, express prepaid. Look them over carefully—make use of them at your work for a week—then if they fail to meet your expectations they may be returned at our expense. If you keep them send us \$2.00 within seven days and \$2.00 a month until the specially reduced price of \$24.80—regular price \$50.00—has been paid. Remember—the consulting membership and plan book are included absolutely free.

Can you afford to let \$2.00 a month—50c a week—stand between you and success? The consulting membership alone is worth many times the first cost of the books. Fill in and mail the coupon—NOW!

American Technical Society, Chicago, U.S.A.

IF IT'S

BEAVER BOARD

—IT'S THE REAL THING

INSTRUCTIONS

Right There!

Right there on the back of every panel of the *real* Beaver Board you'll find these two things:

One is the old original Beaver Board Trade-Mark.
The other is "Instruction for Use."

You can't go wrong, for they're on *every* panel.

And if they're not there it isn't Beaver Board.

Don't go by the looks. Many a man has taken poison by mistake because the bottles looked alike.

That's why we put the trade-mark on the back—to protect you from the innocent-looking wall boards that imitate Beaver Board in appearance but not in service.

You can't cover up a bulge with paint.

The defects in a piece of lumber usually show when you buy it. The defects in a poor grade of wall board show after it's on the wall.

Beaver Board is made from selected white spruce fibre and that alone. It's made from the log to the finished panel in the Beaver Board mills. It's made by experts under constant laboratory inspection. *It must be up to the Beaver Board standard before it leaves the plant.*

Surface sealed by a patented process, front and back, it resists moisture better than any other wall material and is easier to paint.

Every lumber, building material or hardware dealer doesn't handle Beaver Board. Some sell other so-called wall boards which they may honestly believe are just as good (we'll give them the benefit of the doubt). But you can't get Beaver Board service unless you get genuine trade-marked Beaver Board from a real Beaver Board dealer.

The Beaver Board Companies

United States: 601 Beaver Road, Buffalo, N. Y.
Canada: 801 Wall St., Beaverdale, Ottawa

Great Britain: 4 Southampton Row, London, W. C.

Offices and Warehouses in Principal Cities

Build for Permanent Profit

When you have a job of interior finishing, whether in a private home, office building, factory, etc., don't forget that every dollar you save for your client will be appreciated, and that his continued patronage depends on the value you put into the job.

Roberds Ideal Wall Board

will please the owner and make a satisfactory profit for you. Unlike many substitutes for lath and plaster it is not a make-shift but a substantial, time-tried interior finish. Does not shrink or warp—it's waterproof. Goes on in a truly workmanlike manner and stays where you put it. Makes a handsome, durable, permanent finish for any room or building. Made in quartered oak, mission oak, tan and gray.

Write for samples, booklets and prices.

Roberds Manufacturing Co.

101 Spencer Avenue

Marion, Ind.

Grimm's Galvanized Corrugated Wire Lathing

"Note the V"

(Pat. Applied for)

requires no furring on account of the V-shaped corrugations which are imbedded at intervals of seven inches.

This feature alone is worth considering but that's not all. It WILL NOT RUST as it is heavily galvanized with the finest grade of Western Spelter and is much easier to handle and will conform to irregular curves much better than any other form of metal or wood lath.

Walls or ceilings plastered on this lathing WILL NOT CRACK OR DROP OFF, owing to its great keying qualities, which we will explain if you will drop us a card asking for our booklet No. 61 and samples.

We also manufacture Greening's Patent Trussed Steel Wire Lathing, Buffalo Crimped Wire Concrete Reinforcing, Buffalo Wire Cloth of all kinds and Wire and Artistic Metal Work for all purposes. DROP US A LINE AT ONCE.

BUFFALO WIRE WORKS CO.

"Looks Very Good to Us"

Sykes Lath Proves It Saves Labor and Money

Letter from Century Lumber Co., Des Moines, Iowa, to Sykes Metal Lath and Roofing Co.:

"We find that our orders for Sykes Expanded Cup Lath 'Self-Furring' have been as follows:

Bought 1915	91,966 yards
Bought 1914	43,578 yards
Bought 1913	520 yards

"The purchase for 1913, as you know, was a small quantity purchased to satisfy ourselves as to the strong points which you have advertised in regard to your lath, and to see whether your material could actually be used without furring strips with perfect success.

"We were pleased to find that with Sykes Lath, without the use of furring strips, we were able to secure a wall with much less labor and expense than with the ordinary metal laths which require the use of furring strips. However, we believe that the increased demand for this product demonstrates this better than anything we might say.

"This comparison looks very good to us, and we feel repaid for the time and energy used in creating a demand for your lath.

"CENTURY LUMBER CO., Des Moines, Iowa."

Expanded Cup Lath *Self Furring*

Best for Overcoating, for Interior Work, and for Stucco Work

Saves 5 to 10 cts. a sq. yd. by saving labor and cost of furring strips. Easy to apply—can't be applied wrong.
Sykes Metal Lath is heavier than others cut from same gauge because of its wider strands.

Write for free sample and Book of "Specifications for Metal Lath"

Sykes Metal Lath and Roofing Co.
494 River Road, Warren, Ohio

Herringbone Rigid
Metal Lath Style "BB"

Success With Stucco!

Builders tell us that the success of a stucco job depends largely upon the lath beneath it. That's why they prefer metal lath to wood lath, and

Herringbone Rigid Metal Lath

to any other style. Note the illustration of Herringbone above, and you, too, will recognize its practical value.

Herringbone has strong lengthwise ribs which stiffen each sheet, and make it easy to erect and quickly plastered.

This same rigidity saves plaster by eliminating the pockets which form in lath that sags between the studs. And the flattened strands curl the plaster around into a sure and lasting key.

GF Cold Rolled Channels and GF Corner Bead are good products to use with Herringbone.

If you are not getting our little magazine, "General Fireproofing," send your name, and a copy will be mailed each month. Herringbone Catalog on request.

Utility Board

in grained wood finishes

PLAIN OAK—QUARTERED OAK—CIRCISSIAN WALNUT—MAHOGANY

"I've got something definite to show my customers when they want to know how grained wood Utility Board is going to look," writes an Illinois carpenter contractor. "I show them my own office. Most of them can hardly believe their eyes when they find that what they thought was genuine quartered oak paneling is really Utility Board."

For every kind of work

whether office or residence, public building, store, factory or garage—there's a Utility Board that will exactly suit the purpose; economical and always satisfactory.

If your stock of samples is diminishing or if you haven't complete information on the entire Utility Board subject, by all means

write for additional samples and literature today

The lasting, in-built durability of Utility Board, together with its artistic appearance, is winning new friends by the thousands. Be sure you are prepared to participate in the big increase in Utility Board business that the coming season will bring.

NOW You Can Get Great, Wide Panels of

UPSON BOARD

64 In. Wide

Overcomes Fancied Objections to Paneling

This big news should be welcomed by every carpenter who wants to get more business—and lots of it.

It is one of the most important announcements ever made by a wall board manufacturer. For 64 inch UPSON PROCESSED Board opens up many new avenues of use. It is the widest board on the market.

The giant panels give practically unbroken wall surfaces and overcome any fancied objection that some people have heretofore had to paneling.

Only two of these large 64 inch panels of Upson Processed Board are needed to cover an ordinary wall area. Where no openings occur between the usual openings, one panel will be sufficient. Or by running 64 inch Upson Board around the room at picture moulding height in combination with a freize panel, all up and down paneling is done away with. And the wall looks about as a plastered wall would look.

Dealers predict that 64 inch Upson Board will double the sale and use of wall board. Seldom has such a fine, profitable opportunity been offered to the carpenter!

This really remarkable innovation is, of course, inaugurated by the Upsons, better known as the "FIBER BOARD AUTHORITIES," who have been responsible for practically every improvement in wall board during the past five years and whose ingenuity has largely standardized the use of wall board as a staple building

material.

It is another hint that no carpenter—with fairness to himself or his trade—can overlook UPSON PROCESSED Board. For Upson Processed Board is made good to make good! It is unfair to condemn Upson Board because some wall boards have been unsatisfactory.

UPSON PROCESSED Board is made of specially selected, long, tough, pure

wood fibers which are compressed into harder, stiffer and more woodlike panels. It is free from cheap "chip" fibers with their tendency to curl, pull and twist, as well as short, punky "jack pine" fibers that make a weak, brittle, short-lived board.

64 inch Upson Board will be imitated. But remember! No inferior wall board can be successfully made in panels 64 inches wide because they will warp and twist and curl worse than ever, while the punky boards in this width will be almost impossible to handle.

Upson Board looks, feels and works like lumber. It cuts clean instead of crumbling, tearing or gumming the saw. Carpenters say that they can handle one-third more of it than other wall boards in the same time. And, of course, each UPSON panel is scientifically processed. KILN CURED like interior trim, WATERPROOFED and SURFACE FILLED.

Write today and let us send you samples for your own test. Let us show you how you can easily build up a permanent, profitable all-year-round business.

Let us prove why you can safely recommend and use Upson Board.

Don't defeat your own best interests by doubting! Get your sample now and be your own judge as to Upson quality.

The "Kno-Burn" Book is Chuck Full of "Reasons Why"

Every house you contract to build—brick, frame or stucco, calls for lath as a base for the interior plaster work.

The "Kno-Burn" book was written to convince you that the best all-around base for you to use is metal lath and the most practical all-around metal lath is

Kno-Burn *Expanded Metal Lath*

You'll admit that metal lath is logical because its lasting qualities more than balance its slightly higher cost.

We can convince you that "Kno-Burn" is worthy of your choice in every instance if you will let us lay before you its exclusive features of superiority.

Do us the favor of sending for booklet 43, the "Kno-Burn" book that contains our arguments for your business. Then, if you'll read the book, we'll get your next order.

The Stiffest, Strongest and Most Efficient Plate for Reinforcement — Berger's

RIB-TRUS

THIS remarkable Berger's Rib-Trus plate has greater tensile strength than any other similar plate on the market. Especially adapted for reinforcing thin concrete slabs for flat or arched roofs, floors, sidewalls and partitions. It serves both as a reinforcement and centering.

The vertically expanded meshes prevent, to a great extent, the soft concrete from dripping through upon materials, machinery and men on floor below.

Ribs, running throughout the length of each sheet on 6" centers, stiffen the plate and support it while the concrete is being poured. No supports are required for ordinary spans. Furnished 24" wide and standard lengths in multiples of 1 ft. to 12 ft.

For strength, permanency and all-around economy, use Berger's Rib-Trus.

The Taylor-Boggis Foundry Co., Cleveland, Ohio.
Contractors, John Gell & Son, Architects, Cleveland
Engineering Co.

These Berger Products Will Also Save You Money

Ferro-Lithic Reinforcing Plates, used extensively for reinforcing concrete slabs for flat or arched roofs, sidings of buildings, sidewalks, etc.; **Berger's Steel Cores**, for coring out concrete floors and roofs; **Multiplex Reinforcing Plates**, for heavy service floor, roof, bridge and sidewalk construction; **Expanded Metal Lath**, used on stucco walls, partitions, ceilings and every other kind of work requiring plaster; **Corner Beads**, for protecting exposed corners of plastered walls. SAVE Labor Cost—Time on Job— Painting and Staining Costs

Above all, get quality in both shingles and colors that wear a generation

- to make your customers better satisfied
- to make your work sell easier and better
- to insure profits on all work you figure

You do not have to allow for waste of shingles. You do not have to allow for time or loss in staining. We are responsible for both quality of shingles and stain desired.

"CREO-DIPT" STAINED SHINGLES

17 Grades 16, 18, 24-inch 30 Colors

Such quality in shingles is not found in the open market. We buy in enormous quantities. They are cut from live timber—no sappy wood—no stumpage—no wedge-shapes. They are dipped—not coated—in best creosote, that carries earth pig-

ments (no aniline dyes) far into the wood. Colors are ground twice in pure linseed oil. Shingles are thoroughly seasoned before we stain them and thoroughly dried before we ship them. They do not wash off or fade out in streaks.

Over thirty-five million people read the magazines in which our advertising appears in your locality. You will find clients ready to use "CREO-DIPT" Stained Shingles if you tell them you use them. Let people who pass by know that you use "CREO-DIPT" Stained Shingles on the job. It helps your reputation for quality work.

Going to Build? Remodel or Repair?

Save \$5 to \$500 on Every Order for Building Material

BUY your lumber and millwork direct. Every contractor, carpenter and builder should have our big free catalog of building material—the book of 8000 price bargains. A copy is ready and waiting for you and will be sent free, postage prepaid, at your request. *The tremendous saving* afforded by our method of supplying building material direct to the actual builder has proven a boon to thousands. Let us show you how to make more money by saving more money.

H. N. Mungus
President

Everything in Building Material

is described in this big book. It quotes low, net, rock bottom prices for lumber, flooring, roofing, doors, windows, interior trimmings, cabinet work, colonnades, porch-work, hardware, tile, paints, wallboard, metal work, plumbing and heating equipment, cement machinery, water supply outfits and thousands of building specialties. It is a handy book of information and reference that no builder can afford to be without.

Free Architect's Blue Prints

You do not need to have costly plans prepared by high-priced architects, thus adding to the cost of building, because we have had just such plans prepared for us by some of the ablest licensed architects in the country. These plans are complete in every detail and include a full set of specifications. Our FREE PLAN BOOK tells how to secure these plans without one cent of cost to you. A contractor will find this book of the utmost assistance in securing new trade because with it he can show his customers newer and better designs that may be built for less money.

Houses of Standard Construction

These buildings are of standard construction. They are built from high-grade guaranteed material with all cutting and fitting done by the carpenter on the job. They are not "ready-cut," "factory built" or freak houses in any sense of the term, but are erected as any house must be put up to secure best and most lasting results. Practical builders will readily appreciate the importance of this feature. It means more work for them and a better and less expensive building for their client.

Two Big Free Books

We want every carpenter, contractor and builder to have a copy of our big, free catalog, whether or not he is now in need of building material. It will keep him in touch with the very lowest prevailing prices and prove an invaluable guide to right buying. "Plan Book of Modern Homes" is filled from cover to cover with designs of convenient bungalows, handsome suburban residences, town houses, practical country homes and barns. Write for either or both these books today. Both are free. A postal request will bring them by return mail, or fill out the coupon below.

Gentlemen:

I got a pair of stairs from you, and the price was about \$73.00, I think, when our local mill man wanted \$150.00 for the same. I am a lover of net-priced catalogs and hate to get hold of one that is afraid to tell you what they want for their goods. Yours very truly,

J. B. FEASTER & CO., Greensburg, Ind.

Gentlemen:

The carload of lumber which I bought of you on order No. 3548 was all that I could ask. The grade was up to the standard and I saved after paying my freight and drayage, \$127.00. I certainly will keep you in mind when in the market.

Yours respectfully, F. N. CLINE, Muskegon, Mich.

Please quote BUILDING AGE when writing to advertisers

Gentlemen:

I desire to express to you my sincere thanks for the manner in which you have handled my orders, accounts, etc. I found the lumber to be of the very best quality, and the attention you gave the orders to be first-class. I am very much pleased with it all. The party for whom this building was put up was more than pleased, and I assure you that it will be a pleasure for me to turn any business your way I can.

Yours very truly, C. B. PATRICK, Burnside, Pa.

Dear Sirs:

I received order No. 10671 in good shape, and am well pleased with the goods. I saved on my order 15 to 20 per cent. Hope to be able to give you some more orders.

Yours very truly,
M. O. TERRELL, Cartersville, Ga.

Start Your Spring Buds

Plant the tiny seeds in boxes beside the kitchen window. Use every ray of the bright winter's sunshine. You can have pansies, heliotrope, verbenas, hollyhocks, tomatoes, celery, cauliflower.

All these and a host of other things may be sown early so that by the time the frost is out of the ground they will be grown plants ready to set out.

Then you will escape the drudgery of tedious "thinning out" and unnecessary weeding. Then you plant everything where it is to stay—in perfect symmetry. Your garden and grounds are well started and you get the full happiness out of every one of the out-door months.

"Indoor Gardening"

Mr. F. F. Rockwell is one of America's leading garden experts. He explains the knack of getting maximum results with the least efforts. He talks about the right tools, the right soils, the right times to plant. Everything he writes has a little touch of individuality. He suggests, as if to you, especially, little secrets you want to know in his article "Indoor Gardening," in March House & Garden, the

Spring Gardening Guide

In this number the entire subject of vegetable and flower gardening and planting the grounds is covered from A to Z. It tells what to plant in various locations and what to plant for special effects. How to make a velvety lawn, what hardy flowers you can grow, what to plant in the shady places, what fertilizers to use—the Spring Gardening Guide tells you all this—and more. It contains planting tables of vegetable and flower seeds, showing when to plant, how deep, how far apart, time of blooming and ripening—all so explicit as to make your garden an assured success.

A \$3 Investment May Save You \$300

Surely a year's subscription to House & Garden is a good investment when you consider that for \$3 you may save \$300, or even \$3,000 or more perhaps uselessly spent on furnishings that do not harmonize, on gardening which does not please, or on building which is not practical or useful.

Special Introductory Offer

You may have this excellent magazine for a whole year, twelve special numbers in all, for \$3. Or, if you subscribe now, beginning with the *Spring Gardening Guide* (March Number), you may take advantage of our six months' special introductory dollar offer, using the coupon below if you choose. Do not even write a letter. By mailing the coupon you are ASSURED of valuable suggestions, new ideas, and ENSURED against costly failures.

Gardening Information

Do you know what to plant and where to get it?

How to make your soil yield the best results? What tools are necessary to do the work with the least labor?

How to plant vegetables to get the right successions? What flowers bloom the first year—and which are perennials?

Practical information in answer to the above questions will save you costly mistakes.

Before the first robin flaunts his red breast upon your lawn, you should know when and where to buy your seed, garden implements, fertilizer and every similar item for Spring planting.

Gardening Preparedness

We have found a way to answer all your questions without obligating you—a way that will satisfactorily give you the information you desire. Without expense you can secure information on any of the subjects indicated or others that you may select—all from reliable sources.

Your Questions Answered

Look over the list below. Check the ones that interest you. More subjects will suggest themselves as you go along. As many questions as you choose, relating to all phases of gardening, building and decorating, in fact everything pertaining to the subject of house and garden and whatever associates itself with it—we will gladly answer.

Information Without Cost

This offer is without cost of any sort. It has no strings attached to it. There are no fees or remuneration now or later. It is entirely free. Our only consideration is that you are sincere in your desire for information and that you will advise us whether the service supplies your wants. It is open to all serious-minded persons who really want to know about gardening and home beautifying. If you really intend to have a garden this Spring and want to have information about how, when and what to plant, use this service and coupon below.

Send the Coupon

Enclose the coupon in an envelope or paste it on a postal. Or if you prefer you may write a letter. We will see that you are supplied with valuable information that possibly may save you many dollars—surely time and energy perhaps ill spent. This will solve your garden problem and in the end will afford you endless pleasure.

Send in the coupon to-day

Don't Lay Another Roof Until We Send You a

Winthrop Tapered Asphalt Shingle

Just ask for a sample shingle. See how tough, how pliable and how durable it is. See how it is made like a wooden shingle—thick at the butt and thin at the top. See how easy to lay it is. See what a beautiful roof it will make—red, green or slate-black. Then you will understand why owners want the Winthrop when they know about it.

Winthrop Tapered Asphalt Shingles will enable you to get most of the roofs in your town. They win out with less argument than anything you ever tried to sell, for they look better than wood shingles and they have all the protection of asphalt.

The Beckman-Dawson Company
Asphalt Shingles

Factory: Argo, Ill. 1400 Association Bldg., Chicago, Ill.

The Only Tapered Asphalt Shingle

Traditions Die Hard!

—but the “good old things” must give way to the better things.

Lath and plaster must give way and is giving way, for the more durable, stronger, stiffer, more economical and altogether more satisfactory

This is no ordinary wall board—it is a wall board in a class by itself, the *only* wall board with a center core of kiln-dried wood slats, else we would not claim it to be *better* than lath and plaster. It does not have to be paneled, but can be made into walls and ceilings smoother than lath and plaster. Can be decorated by any method—even papering—which other wall boards cannot stand.

Are you going to stick to tradition or give your customers the more modern and more satisfactory wall lining in their buildings? *Talk to us* about some of the common false notions on the subject of wall boards, and let us make clear to you just what you're overlooking.

The Compo-Board Company
5778 Lyndale Ave. No., Minneapolis, Minn.

The Answer to the Outside Painting Problem **ZINOLIN**

*Get this
for your Files*

This Leaflet

is yours for the asking. Write for it. Inform yourself about Zinolin, the “Wonder Paint.” Know why Zinolin saves you and your clients money. Know why its brilliant luster lasts indefinitely, making any building always look newly painted. Know why

ZINOLIN

the “Arnold-ized” zinc

protects better—why its dazzling whiteness cannot be duplicated in any other outside paint. Know why its colors never fade no matter how delicate the tint when colors are used. Know these things. It will take but one second—it will cost but one cent to write—and know the greatest achievement in all paint history. Then you will realize fully why you should specify and use Zinolin.

Write to-day, now; don't delay or you may forget.

Keystone Varnish Co.

N. B. Arnold, President

Makers of

Keystona—the original and justly famous, washable wall paint.

Edelvice—a superior Enamel for inside or outside use.

Floorstona—a wonderfully durable Floor Varnish.

Multiproof-Varnish—for anything, proof against everything.

Prevento—prevents Concrete and Bricks from crumbling. Absolutely waterproof.

Walter's and Cooper's Painted Tin Shingles

THE SHINGLES THAT LAST

This is the Roofer's Opportunity

We require an agent in your town; may we have the pleasure of sending you a selling proposition, the acceptance of which will put you in a way to unusual profits?

Why use high priced Galvanized Roofing?

Walter's and Cooper's Painted Tin Shingles will make a roof just as lasting and cost you about one-half as much.

A painted tin shingle to be enduring must have as its base a heavily coated sheet of roofing tin, well covered with a lasting coat of paint. This paint must be flexible and dry, tough and hard. On exposure to the sun it must not flake, chip or scale.

Walter's and Cooper's Interlocking Tin Shingles

are stamped from the best grade of roofing tin, and are individually coated by the dipping process in a bath of paint to the above specifications.

Walter's and Cooper's Painted Tin Shingle roofs put on over thirty years ago are in as good condition today as when first put on the roof. Not only are they long lasting, but they are fire, wind, snow, storm and lightning proof, and are sold under an ironclad guarantee that they are right in every way.

ROOFED WITH AMBLER ASBESTOS "CENTURY" SHINGLES

Mr. Contractor, Architect, and Builder

Do your contracts specify Ambler Asbestos "Century" Shingles? If not, here are a few facts worth considering.

We specialize in furnishing a shingle that will give complete satisfaction to the owner and the builder alike. During the past few years the average property owner has been growing to realize that a roof is an important factor in the make-up of a house. Consequently he is more and more seeing to it that he obtains a roof that is permanent, low in upkeep cost and attractive. For that reason he is no longer willing to take a chance on anything; he wants a roof that is sure to possess these qualities.

Ambler Asbestos "Century" Shingles

As a result of this increase in the property owners' ability to recognize value in their roofing investment there is a steadily growing demand for Ambler Asbestos "Century" Shingles. Every day contractors and builders are reaping the benefit of this demand. When they supply it, they know they are furnishing shingles that do

not split, crack, decay or warp. Shingles that require no paint, no repair or replacing. The shingles that give unfailing service.

If you are anxious to supply the best, you will be interested in Ambler Asbestos "Century" Shingles. May we send you information, samples and trade prices?

The Carborundum Round Combination Bench Stone

THINK of the advantage of the combination stone over the ordinary sharpening stone. The ordinary stone is made of the same grit throughout. As a result, it is not adapted to both sharpening and finishing your tool edges. The combination stone is made with one side of coarse grit and the other of fine grit. A few strokes over the coarse side take out the nicks and sharpen your tools, and the fine side gives a keen, finished edge.

And then, too, these stones are all made from Carborundum, diamond-like in its hardness and sharpness, and the very best sharpening agent known.

It can't fall

The keystone in an arch is no more securely held in place than is the stucco finish on a background of Bishopric Board. In both, the age-old and reliable principle of dovetailed construction insures security.

is built on the wisdom of ages. Dove-tailed lath, creosoted to preserve them, imbedded in asphalt-mastic, a perfect protection against vermin and dampness; backed by heavy fibre-board, through which neither sound, heat nor cold can penetrate, form a background for stucco, cement or plaster combining the oldest and most

efficient principles in building construction. It contains no metal to rust and break away from its fastenings.

Write for free samples and our book "Built on the Wisdom of Ages." It illustrates homes, apartments and buildings of all kinds using Bishopric Board. It contains scientific tests, with letters from architects, builders and users; and it gives facts and figures to prove that Bishopric Board cuts the cost twenty-five per cent.

Showing position of
cutters on mandril.

Grooves Cut with Huther Bros. Dado Head

Fit Up Your Saw Rig— With HUTHER Tools

The Dado shown on right cuts perfect grooves with or across grain and can be purchased in all widths and sizes. Fits any saw rig and is easily adjusted by adding or removing inside cutters. No screws to slip.

These tools may be returned if not satisfactory and your money refunded without question.

The Cutter Head shown at left will fit saw mandrel or shaper. Can be used with knives shown, to cut sash, moulding, window stops, treads, etc.

Drop a card for our new catalog No. 34 which shows these and other tools for the saw rig.

W.F. & JOHN BARNES CO.
71 Ruby St., Rockford, Ill.

Designed for your needs—

C. H. & E. Portable Saw Rigs

come the nearest to being what you want of any on the market

They are made by practical builders who understand the contractor's problems, and appreciate his expenses.

The C. H. & E. No. 6 Portable Saw Rig shown above is the "last word" in a combination portable woodworker. It is a complete mill in itself, all self-contained, with power "built in" and under the table—ready to operate anywhere.

It is also an excellent shop tool, and avoids the installation of separate machines for the different kinds of mill work, the installation of power, line shafts, belts, etc.

None of the attachments interfere with each other—and each attachment is driven by an endless belt, thus reducing wear to a minimum and saving power.

Four men can work on this machine at one time, with the belting so arranged that all the attachments can be brought to a standstill by shifting the power belt to the loose pulley without stopping the engine.

*Write for our catalog and special folder on this No. 6 outfit
—its many labor-saving operations—its exclusive features.*

Steel "Stitches" Every Few Inches

Columns which have staves simply glued together will surely open up. Columns which have any kind of a lock-joint are liable to open up. Columns which are glued under hydraulic pressure, where the staves are locked with a double V joint and sewed with cold rolled steel staples every few inches of their entire length *cannot* open up. And this is the way "Steel-Sewed" Columns are always made. Catalog explains the construction and shows many beautiful illustrations. Write for it.

OAK: "America's Best Flooring"

Landlords offering houses for sale or for rent recognize the value of OAK FLOORING, and that is why they emphasize OAK FLOORING in their ads in newspapers. They know that OAK FLOORING is sure to attract a better class of tenants or buyers.

Nature has given OAK FLOORING that peculiar favor that appeals to the artistic as well as the demand for the distinctive and substantial.

The lady of the house finds OAK FLOORING an elegant expression of refinement, cheerful in color and capable of friendly harmony with other furnishings.

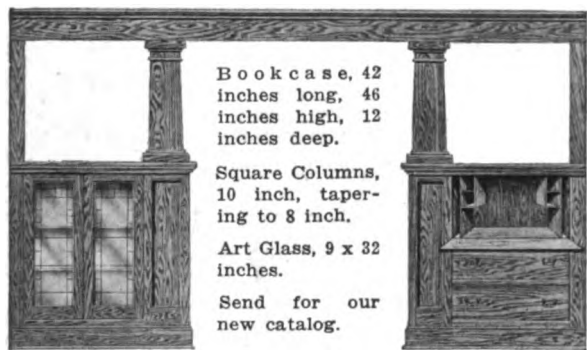

OAK FLOORING is always considered a good investment and grows old as gracefully as a Chippendale chair or a good Oriental Rug.

Every year of service makes J-M Transite Asbestos Shingles Better

The exposure to sun, rain and frost that warps, cracks and rots ordinary wooden shingles actually *toughens* J-M Transite Asbestos Shingles. Their Asbestos Fibre and Portland Cement composition grows more weather-resistant with every year of service.

J-M Transite Asbestos Shingles are absolutely fireproof, practically indestructible.

Furnished in beautifully soft colors—Indian Red, Mottled Brown and Gray. The gray shingles may be stained any color to harmonize with desired color schemes.

J-M Transite Asbestos Shingles of ¼-inch thickness are supplied with rough edges. The rough edges relieve the monotony of ordinary smooth-edge shingles and present a most artistic appearance.

They are made in several shapes and sizes, lending themselves to easy application by a number of approved methods.

J-M Transite Asbestos Shingles are Examined, Approved and Labeled by the Underwriters' Laboratories, Inc., under the direction of the National Board of Fire Underwriters. Laid American method they are given class "B" rating; laid French method they secure class "C" rating.

Norfolk, Virginia

THE BEAUTY OF YOUR HOME

is dependent as much upon the material of which it is built as upon the taste with which it is furnished.

Livable, lovable homes are built of WOOD.

And there is just one wood that, in strength, durability, workability and beauty, is suited to every requirement of homebuilding, from framework to exterior and interior finish and trim. That wood is

SOUTHERN YELLOW PINE

"The Wood of Service"

Do you fully appreciate the possibilities of even grained, workable, beautiful Southern Yellow Pine used for interior trim? It takes paints, stains and enamels perfectly, making possible any effect of richness in color or tone; and it is unsurpassed in wearing qualities.

SOUTHERN YELLOW PINE COSTS LESS

than other high grade woods because it is the most plentiful. And in connection with "cost," here is a timely hint: Do your building NOW, before prices are forced up by the enormous demand for lumber that is certain to follow the termination of war in Europe.

We have a new booklet, "Directions For Finishing Southern Yellow Pine," that tells all about its use for interiors. Also, a variety of house plans suited to every purse. These are FREE to you for the asking. Just fill out and mail the coupon.

**BEAUTY, ECONOMY, AND DURABILITY
ARE PERFECTLY COMBINED IN SOUTHERN YELLOW PINE**

Rose Inn, Crossett, Ark. Frank W. Gibb, Architect. Finished throughout in Arkansas Soft Pine.

When specifying Interior Trim for semi-public buildings, the prime considerations, of course, are attractive appearance and durability. The chosen wood must be serviceable, yet afford a satisfactory base for the desired color treatment.

IN THESE RESPECTS ARKANSAS SOFT PINE

will meet your every requirement and at the same time completely satisfy your client, whatever his taste.

This wood possesses well-balanced absorbing qualities, due to the absence of rosin or sugar. It will take applied stains evenly, definitely avoiding any tendency towards a "blotchy" appearance so often experienced in stained work, at the same time admitting of a rich looking waxed or varnished surface, which will retain its luster permanently.

Together with these advantages, Arkansas Soft Pine is readily obtainable, due to an abundant supply, and therefore at a comparatively

Moderate Cost

Believing you will gain a clearer idea of the wood by personal inspection, we will send a set of finished samples on request. Address Department R.

See that your dealer supplies you with Trade Marked Arkansas Soft Pine. He can.

"We're Not Satisfied Unless You Are"

TUCKER-RICE PORTICO
at Salem, Massachusetts.
Built in 1807 of White Pine.
Samuel McIntire, Architect.

For over one hundred years this famous portico—considered the best of the many masterpieces of Samuel McIntire, one of the greatest architectural designers America has produced—has stood exposed to the weather. It is today as perfect as the day it was completed, thanks to the enduring qualities of White Pine.

Photo by Mary H. Northend, Salem, Mass.

WE need hardly remind carpenters that in exposed mortised doors, in close-fitted mitres, or in delicately moulded, carved and columned porticos White Pine joints hold close—not for a year or a lifetime, but for centuries. For these purposes no other wood has ever been found which gives such lasting service as

WHITE PINE

Despite an impression that it is scarce there is still plenty of "Good Old White Pine," in all grades, and it can be purchased in all markets at reasonable prices, when considering its value as a structural wood.

If the lumber dealers supplying the materials for those for whom you are building are at any time unable to furnish it, we would appreciate the opportunity of being helpful to you in securing it.

A FREE MAGAZINE FOR CONTRACTORS

We are now publishing a bi-monthly architectural magazine, every issue of which will be full of valuable and helpful information for contractors and builders. If you would like this magazine, write us and we will be pleased to place your name on our mailing list.

Walls finished with Cabot's Old Virginia White
Roof finished with Cabot's Creosote Stain

"We are using the same stains on other houses with equally satisfactory results."—Herbert Folts, Architect, Indianapolis

A New Style in Country Houses

Our leading architects are now designing a new and dignified type of country-house, along fine old Colonial lines. The roof is shingled, and large shingles, in single or double courses, cover the sides. The roof shingles are stained in moss green, tile red or slate gray tones of

Cabot's Creosote Stains

and the sides with

Cabot's Old Virginia White

which is as cool and brilliant and soft as new whitewash, and as lasting as paint. The stains are rich and handsome, and the combination is harmonious and appropriate.

Cabot's Quilt

Makes houses warmer in winter and cooler in summer. The U. S. Bureau of Standards' tests proved it the most efficient heat insulator, even better than cork board. As a sound-deadener it is equally efficient.

You can get Cabot's Stains and Quilt all over the country. Send for samples and names of nearest agents.

A Cleverly Planned Syracuse Dwelling

Silver Gray Clapboards Contrast with Dark Green
Shingle Roof—Outside Walls and Ceilings Insulated

IT may be said that the architect who is truly clever in his profession is he who so develops his work as to create a harmonious whole well adapted to the purposes for which it is intended, as well as thoroughly in keeping with its immediate

housing accommodations. As individual tastes differ so must the designs of our homes vary greatly in their external treatment as well as in their interior arrangement. In this connection the clever example of domestic architecture here illustrated

View in the Living Room of the House Looking from the Hall Toward the Extension Window

environment. Primarily, of course, he must make it conform to the requirements of his patron, meeting therein individual tastes and preferences, more especially so perhaps if the work has to do with

will be found of interest. It is the conception of an architect whose desire has always been to design houses somewhat different at least from the average, while at the same time keeping well within

A Cleverly Planned Syracuse Dwelling—Elevation and Miscellaneous Constructive Details

A CLEVERLY PLANNED SYRACUSE DWELLING—THE MAIN HALL
LOOKING TOWARD THE STAIRS

In describing the local conditions influencing in some measure the design in question, the architect states that the site was sloping ground with a small knoll, the top of which was just about the center of where the house now stands. The lot sloped down on all sides, and the architect therefore fitted the house to the land, rather than graded the land to fit the house as is done in the great majority of cases. This treatment retained the natural and beautiful contour of the land, made the house to appear lower, gave better drainage and saved a large portion of the cost of grading, besides creating a far more pleasing aspect to the eye than the straight, leveled-off surroundings of many houses. The brick walk and driveway curves up from the street instead of being straight, and in this respect is a variation from the conventional approach to the average dwelling.

The color scheme of the exterior is such as to produce a pleasing combination. The wide cypress clapboards are stained a silver gray, allowing the grain to show through, while all the trim is white, forming a striking contrast with the dark green shingles of the roof. Red Pennsylvania face brick were used in the chimney as well as in the foundation above grade and porch. The brick were laid in "Dutch bond" with half-inch "rough cut flush" pure white mortar joints. All exterior hardware is finished in dull

black with special old-fashioned strap hinges and bolts.

All overhanging windows, and wherever the second story overhangs the first, are filled between joists with 4 in. of concrete. All outside walls and second floor ceilings are filled between the studs and joist with hair-insulated-quilt, making a tight double air space, thus insuring a cool house in summer and a warm one in winter.

The floor joists are of 2 x 10 in. hemlock, the studs of 2 x 4 in. pine and the rafters 2 x 8 in. The cypress clapboards are 10 in. in width and the columns are of cypress made by the Hartmann-Sanders Company. All doors are 1 $\frac{3}{4}$ in. thick.

The floors are double with deadening felt and waterproof paper between. All are of $\frac{7}{8}$ in. birch, except the living room, which is of oak, finished with two coats of shellac and then waxed. All inside painted work is five-coat work.

The floors of the bath room and the space occupied by the refrigerator are of sanitary flooring with 9 in. base, all in one piece. The walls are wainscoted with tile.

The main bath room has a built-in tub, a pedestal lavatory, china tank, horseshoe seat closet, medicine cabinet and a large towel cabinet.

The living room is finished in dark oak with rough sand float finish plaster between the beams and pilasters. An unusual feature of this room is the setting out of the windows to give the effect of the old-fashioned rooms that really had thick, massive walls. The mantel in the living room is of special design made of Caen stone cement.

The dining room is finished in yellow ivory with solid old-blue paper in the panels, rough plaster ceiling and around the panels tinted yellow ivory. The furniture and draperies are such as to match.

The kitchen walls, ceiling, woodwork and lighting fixtures are white enameled. The ironing board, which swings into a recess provided for it in the wall, is hinged and also has a hinged leg. The board swings down into position for use. An electric ironing plug with pilot light is conveniently placed.

A FRONT VIEW OF THE HOUSE SHOWING DRIVEWAY LEADING TO THE GARAGE

There is a broom closet at the right, a sliding bread board, sliding shelves and pan racks on all lower doors in the kitchen equipment. In fact, every convenience is provided to save steps and labor.

An interesting feature of the main floor arrangement is the door of the coat closet just at the right of the flight of stairs leading to the second story. This is a plain mirror door into which is fitted a French door grill, and the reflection gives the impression of another room beyond. The grill is hinged separately, thus giving an unobstructed use of the mirror when open. An idea of the effect produced may be gathered from the picture on page 23, showing a view of the staircase hall.

All woodwork of the second floor is finished in yellow ivory with the rough sand finish walls tinted, yellow ivory ceilings and dull yellow ivory fixtures.

An inspection of the floor plans shows three principal rooms on the first floor, the living room extending the entire depth of the house. The dining room and the kitchen are at the right of the hall with direct communication between, and the kitchen may be reached both from a rear porch and also from the door at grade which also leads to the cellar. On the second floor are four sleeping rooms and bath room, all compactly arranged so that there is practically not a foot of waste space. The stairs are amply lighted by the window on the broad platform half way up the main flight. In the attic is a maid's room and

a bath room fitted with modern plumbing fixtures.

The house is equipped with a Kelsey No. 24 generator complete with humidifier, thermostat and outdoor cold air intake running under the cellar floor. A complete ventilating system connects each room with the ventilator in the roof.

Another interesting feature of the house, and one which will readily be appreciated, is a sill cock on one side which furnishes cold water for sprinkling, while on the porch side it furnishes hot water for cleaning porches, windows, etc.

The driveway shown at the left of the house leads to a garage in the rear of sufficient size to contain two cars. A description will appear in a later issue.

The house here shown was erected by day labor in accordance with drawings prepared by H. L. Condé, No. 22, The Hartson, Syracuse, N. Y., who also hired the men and supervised the construction. Nothing was done by contract except the plumbing and heating.

Apple wood is the favorite material for saw handles, and some goes into so-called brier pipes.

Concrete Silos in Missouri

Some very interesting information as to the use and construction of silos is being furnished by the Missouri Experiment Station through the medium of its Bulletin, and the many facts which have been gathered by this authority are valuable to the building-contractor who may be called upon to construct silos of concrete. Reports made by 300 Missouri farmers who have silos shed much light on the subject of silo efficiency, under their farm conditions at least. Of the 300 farmers reporting 234 had silos of wooden stave construction, thirty-three of solid concrete, and twelve of concrete blocks.

Out of 100 men having some difficulty with the stave silo, thirty-eight expressed a preference for the solid concrete silo in case they should build another. Not a man, however, having a concrete silo expressed a desire for any other kind in the event that he should build again.

The average per cent of spoiled silage in silos of different kinds, as reported by correspondents

of the Experiment Station, was greater in the stave silos, the average being 3 per cent, while the average per cent of loss in the concrete and the concrete block was 2 per cent.

It is pointed out, however, that the percentage of spoiled silage is not great enough in any of the silos to be made a talking point for or against any particular kind.

A CLEVERLY PLANNED SYRACUSE DWELLING—THE SIDE AND REAR SHOWING MULTIPLICITY OF WINDOWS AND PORTICO ENTRANCE

As regards relative costs of the different kinds, the solid concrete and the concrete block silo involve a greater expenditure than the others, but the sizes of the solid concrete and the concrete block silos, considered in the Bulletin, are appreciably greater than those of the others. The average of the concrete silo was 15.4 ft. diameter and 35.1 ft. in height, while the average of the concrete block silos was 16.3 ft. diameter and 34.1 ft. in height. On the other hand, the average of the stave silos was 15.1 ft. diameter and 30.9 ft. in height. The cost per ton shows that the monolithic silo is actually cheaper than the wooden stave silo, and that the apparently expensive block silo still costs 1 per cent per ton less than the stave. These favorable figures, however, are partially offset by the fact that the average concrete silo was larger and taller than the wooden silo, and it is well known that the greater the capacity of the silo the lower the ton cost.

Canada has 23,000,000 acres in timber reserves, as compared with 187,000,000 acres in the national forests of the United States.

have to make every third course of headers of whole brick. Making them all whole brick or all bats does not change the face, and you still have English and Dutch bond.

Fig. 6 illustrates a lead on a corner having the brick numbered as they should be laid. I have a certain order for building a corner that I think produces efficient results. Rotation is for first lead on foundation; other leads are same except you eliminate No. 4 and strike each course as you lay it.

1. Lay first course to line from corner to corner.
2. Strike up these joints.

3. Lay three more courses.

4. Plumb up.

5. Strike up.

6. Lay rest of corner striking each course as you lay it.

7. Plumb.

In building a lead, try to lay the brick as level as possible. Learn to tell whether a brick is level by just looking down on it. Take special care that the first brick on the corner is not laid too tight or you will have trouble when you come to lay the rest of the wall.

A Frame Cottage at Pensacola, Fla.

Interesting Example of Southern Home Costing
Less Than \$4000—Roof of Asphalt Shingles

THE story and a half cottage is a type of dwelling popular the world over, and in the different volumes of this journal we have presented from time to time designs of this nature representing the conception of architects operating in various sections of the country. It is our privilege at this time to show an attractive cottage design recently executed in the south, and which is a fair example of this type of dwelling in a climate requiring little, if any, artificial heat outside of

covered with sheathing boards as in the colder climates, but heavy building paper is tacked to the studs and then covered with the weather boards as stated, and exposed 6 in. to the weather.

The roof is of the usual construction and covered with Vulcanite asphalt shingles, the two chimneys being of brick. The floors are double, the finish floor being of "B" grade selected pine laid in strips with 2½ in. face.

The walls and ceilings of the rooms are plas-

General View of the Finished Building—W. C. Frederic, Architect

open-grate fires to render the house comfortable.

An inspection of the halftone picture upon this page will afford the reader an idea of the appearance of the finished structure, while the floor plan shows the general layout of the interior.

The foundation walls as well as the porch enclosure and supports are of field stone while the exterior frame is covered with rough clapboards stained a chocolate brown, with the trim finished ivory white. The outside 2 x 4 in. studs are not

tered two-coat work and the walls tinted. The interior trim is finished a Mission brown.

The house here shown was erected in Pensacola, Fla., and as the climate is very mild in that section, the most important thing for the owner to consider in connection with the construction work is a water-tight roof. The architect states that it is not at all uncommon to have 60 in. of rainfall in the course of a year and this very often with the wind blowing a gale of fifty miles an hour. The

more pretentious houses have a small cellar for the reception of the heating plant, but this is not the case with those of moderate cost.

Even with the finest houses in the south there is no laundry or servants' rooms in the dwelling proper, but the servants' quarters are built in connection with the garage in a separate structure.

An inspection of the accompanying floor plan shows a living room, dining room, kitchen, two sleeping rooms and bath room compactly arranged with a sleeping porch at the rear. Communication between the dining room and kitchen is through a conveniently arranged pantry, while the refrigerator is so placed as to be iced from the outside through a door just at the left of

Main Floor Plan—Scale 1/16 In. to the Foot

A Frame Cottage at Pensacola, Fla.

the window which gives light to the storeroom.

The cottage with neat fixtures, plumbing, etc., cost \$3,898.50 and was designed by architect W. C. Frederic, Thiesen Building, Pensacola, Fla.

Building in Philadelphia

The new year is opening up with bright prospects for operative builders, and notwithstanding the increased cost of all materials entering into construction work, as well as the greater cost of labor in the building trades, the opinion prevails that 1916 is likely to establish a new record in building operations in Philadelphia. It is expected that the greater portion of dwelling house construction will be done along the Northeast Boulevard, where sites for 3000 to 4000 homes have recently been sold. Much house building will also be done in West Philadelphia, where the outlook is most encouraging.

Meeting of National Builders' Supply Association

The seventeenth annual convention of the National Builders' Supply Association was held at the Statler Hotel, Cleveland, Ohio, Feb. 17 and 18, when more than 300 delegates were in attendance. Many important matters, particularly those affecting relations between dealers and manufacturers, were discussed at length. Among other things a resolution was adopted authorizing the president to appoint a committee of three to act as an Arbitration Board in connection with the efforts of members to bring about more uniform conditions in the marketing of cement. That committee is composed of E. K. McCormack and W. B. Stewart of Chicago, and W. A. Fay of Cleveland.

Officers for the ensuing year were elected as follows:

President, James H. Allen, Lincoln, Neb.

Treasurer, John J. Voelkel, New Orleans, La.

Secretary, L. F. Desmond, 1211 Chamber of Commerce Building, Chicago, Ill.

In addition to the above officers there were thirty-one vice-presidents elected representing as many different cities of the country; also nine directors.

Los Angeles Architectural Exhibit

The Southern California Chapter of the American Institute of Architects held a most successful archi-

End of Dining Room Looking Toward the Open Fireplace—Scale 3/16 In. to the Foot

tectural exhibition at the Metropolitan Building, Los Angeles, Cal., from Feb. 15 to Mar. 4. After the opening night, for which five thousand invitations were issued, the show was open to the public, and there was a good attendance throughout the period. The exhibition was the most complete and finest display of architectural drawings, mural decorations, etc., ever shown in southern California. The show was held in a part of the hall that houses a permanent exhibit of building materials, which also received considerable attention.

Hanging Glass Doors

In the comments of "Contractor" on page 49 of the March issue the sentence next to the last should read "If rain will strike it, place that side out which is most impervious to rain."

VIEW LOOKING TOWARD THE DINING ROOM AND CAFÉ END AT THE RIGHT OF WHICH ARE THE MEN'S LOCKERS

New Home of an Eastern Country Club

A Dignified Structure in Stucco and Half-Timber Effect
Embodying Many Interesting Features of Construction

WITH the present policy of outdoor sports and especially of golf, tennis, polo, etc., nearly every community has its country club with a home on the field representing a studied conception of what is required in the way of a

building of this nature. The interior arrangement is of unusual interest owing to the diversified purposes for which it is called upon to provide, and in the example forming the basis of the present article the architect and the builder will find much to

THE OFFICE AND RECEPTION ROOM END OF THE CLUB HOUSE WITH PORTE COCHERE AT THE EXTREME LEFT

command their attention. In the exterior treatment the designing architects have cleverly carried out the English half timber effect while the location of the building itself upon a commanding eminence with the foreground sloping gently toward the tennis courts, materially contributes to the impressiveness of the design.

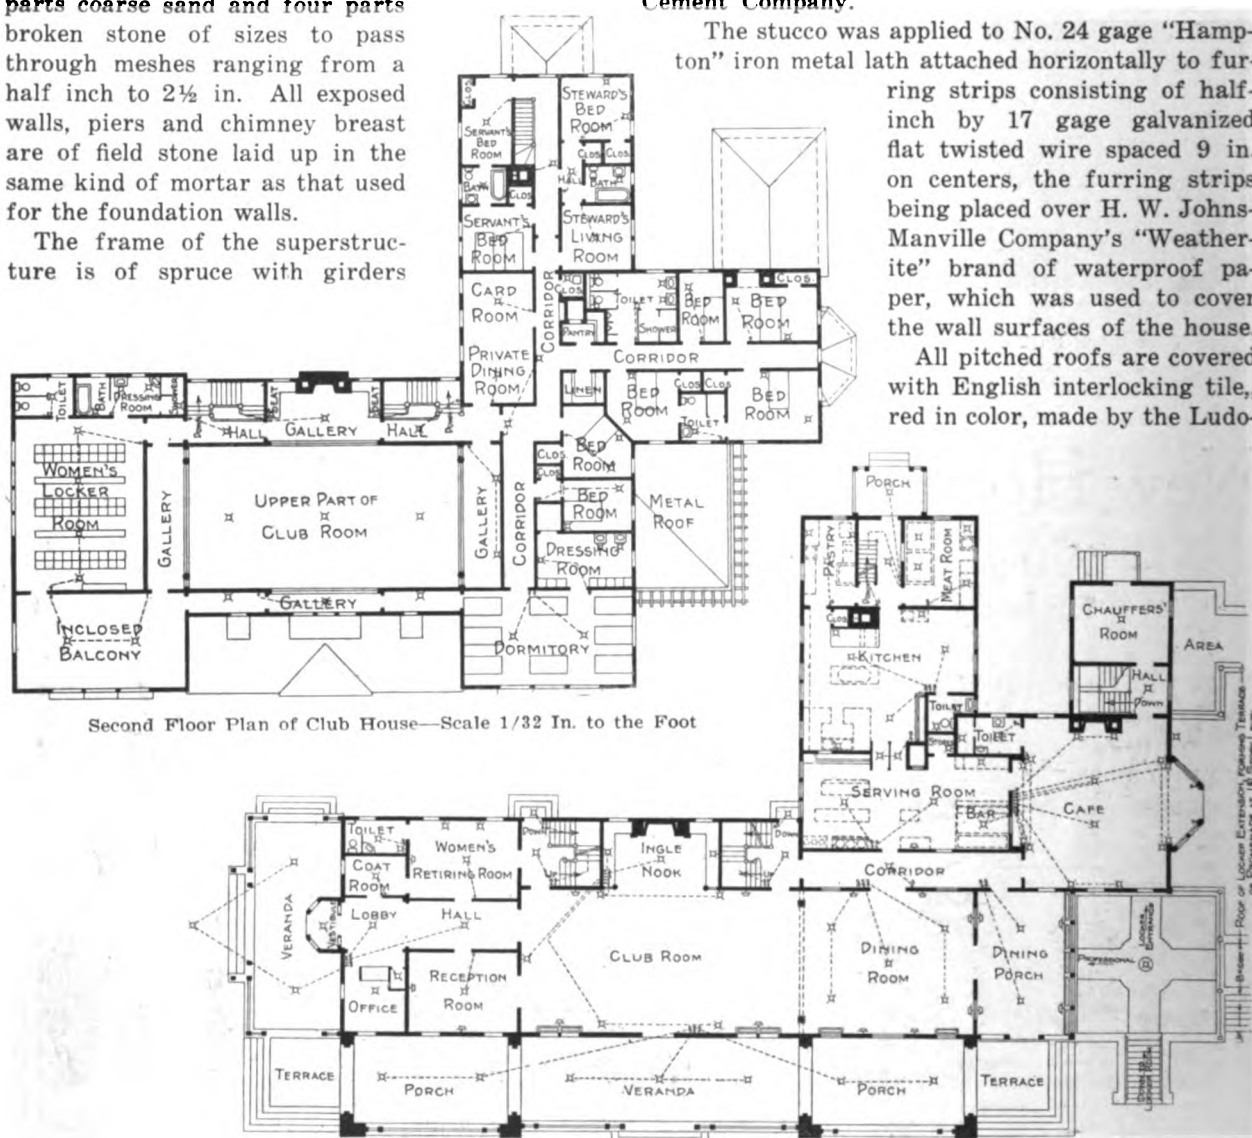

The foundation and retaining walls are of native stone laid up in mortar composed of one part Portland cement, three parts coarse sand and 10 per cent lime putty. These rest on footings of concrete composed of one part Portland cement, two parts coarse sand and four parts broken stone of sizes to pass through meshes ranging from a half inch to 2½ in. All exposed walls, piers and chimney breast are of field stone laid up in the same kind of mortar as that used for the foundation walls.

The frame of the superstructure is of spruce with girders

All exterior walls of the house including dormers, and all ceilings of open verandas and porches, are covered with stucco applied in three coats. The first coat consisted of one part Portland cement, three parts sand and not more than 10 per cent lime putty with which was mixed 4 lbs. of hair to the barrel of putty, while the second coat consisted of one part Portland cement to 2½ parts of sand. The final coat consisted of one part Portland cement and two parts white sand, this coat being mixed with Medusa waterproofing applied in strict accordance with the directions of the Sandusky Portland Cement Company.

The stucco was applied to No. 24 gage "Hampton" iron metal lath attached horizontally to furring strips consisting of half-inch by 17 gage galvanized flat twisted wire spaced 9 in. on centers, the furring strips being placed over H. W. Johns-Manville Company's "Weatherite" brand of waterproof paper, which was used to cover the wall surfaces of the house.

All pitched roofs are covered with English interlocking tile, red in color, made by the Ludo-

Second Floor Plan of Club House—Scale 1/32 In. to the Foot

having 2 x 3 in. bearing pieces spiked to the sides. The wall and partition studs are 2 x 4 in., placed 16 in. on centers and doubled at all openings. The corner posts are braced both ways at sill and plate. Where bearing partitions occur over each other the cap of the lower partition forms the sill of the one above. Fire stops are cut in between the joists at the sills on all floors and partitions between stair stringers in accordance with the Ordinances of the city.

For the wood partitions in the cellar 2 x 4 in. cypress sills were imbedded in concrete. All floor joists are bridged with 1 x 3 in. strips and bearing partitions are bridged twice in height of first story and once in height of second story with 2 x 4 in.

wici-Celadon Company. The rafters were first covered with sheathing boards over which was placed one thickness of asphalt roofing felt weighing about 40 lbs. to the square. This was then covered with the tile in question and fastened with copper nails.

At the right of the main body of the building is the stone masonry locker extension, the plan and roof of which are given herewith. The roof is formed of slabs and beams of reinforced waterproofed concrete. The reinforcement of the slabs consisted of expanded metal and the concrete was mixed in the proportion of one part cement to two parts sand and four parts pea chips.

The inside face of the stone walls in the locker rooms, professionals, and drying room are cement plastered about one in. thick, the plaster being composed of one part of Portland cement and three parts of sharp sand.

The walls of the showers in the house have a hard plastered wainscot about 6 ft. 6 in. high; the serving room, kitchen, meat and pastry rooms and toilet on the first floor have hard plastered wainscot 4 ft. 3 in. high, and the dining room, passage to cafe, entrance, vestibule, lobby, hall, office, reception room and women's retiring room have hard plaster wainscot 2 ft. 6 in. high.

The entire bottom of the building, including boiler pit and basement floor of locker extension, is covered with a base course consisting of 3 in. of a

als' room, servants', cafe and entrance doors are of gulf cypress, while all other outside doors are Western white pine. Interior doors in the second story are "Korlock" birch, veneered two-panel stock design.

The doors showing the cafe are veneered cypress of uniform color. Heavy deadening felt is laid under the top floor in the first story except in the kitchen wing, and under all other top floors is 2-ply P & B paper. The floors of the cafe connecting toilet and entrance vestibule are of tile. The top floor in the second story of the house except in staircase halls, and galleries and in the kitchen wing of the first story, is 13/16 x 2 1/4 in. face No. 1 maple.

The trim in the club room, except for doors to

Home of Worcester Country Club—View in Club Room Showing Ingle Nook at the Left and Dining Room in the Far Background

1:3:6 mixture of concrete. This in turn is covered with a finish coat 1/2-in. thick, composed of one part Portland cement and two parts sand.

The pergola roof is covered with 5-ply tar and gravel roofing, while all flat roofs are covered with a heavy layer of roofing felt and 16-oz. copper.

All exterior finish is gulf cypress, the veranda and porch posts and piers being of solid stock, planed but not sandpapered. Pergola posts and beams, except the projecting ends of the beams, are boxed, the posts being 7 3/4 in. square. The frieze and false timber work are of 7/8-in. stock and the false rafters are 2 3/4-in. thick.

All outside doors to locker extension, profession-

staircase, halls and vestibule, is plain double trim, the cornice forming the head of the trim. That in the dining room, connecting corridor, reception room, women's retiring room, hall, lobby, office and club room doors already mentioned is 7/8 x 3 3/4-in. molded casings with 7/8-in. back band in two members.

The finish in the kitchen wing of the house, the basement and the servants' quarters is North Carolina pine. The finish in cafe adjoining staircase to basement and the dining porch is of gulf cypress. The remaining finish in the first and second stories is well as main staircase to basement is common birch painted.

All stairs are built on 2 x 10 in. stringers placed 12 in. on centers. The main stairs from first to second stories have 4 x 4 in. square posts with molded cap and drop, a molded rail with ramps and casements mitering with cap and posts. The rails and posts are of red birch; the treads of maple and the balance of common birch to paint. The stairs from the cafe to the basement have maple treads with balance of finish of cypress.

The plumbing fixtures in the basement include four water closets, four lavatories, two urinals, four showers and three sinks; in the first story three water closets, three lavatories and one urinal; in the second story seven water closets, nine lavatories, two urinals, four showers, three baths and one slop sink.

The outside doors, sash, blinds, lattice and frames and masonry walls were painted two coats while all other outside finish had two coats of linseed oil stain.

The cement plastered surfaces of outside stone walls, the brick masonry walls and the plastered partitions of the locker room, professionals' and drying room, and the corridor were given three coats of paint. The first consisted of Rice's "Granolith" and the second three coats of Rice's millwright gloss.

The building here described is the new home of the Worcester Country Club and was erected in accordance with plans prepared by L. W. Briggs Company, architects, 314 Main Street, Worcester, Mass. The general contractors were E. J. Cross Company, 82 Foster Street, and the contractors for the plaster and stucco work were Faucher Brothers & Company, 58 Front Street, all of Worcester, Mass.

Some Comments on Slate Roofs

In a discussion of the subject of "Rendering Under Slate Roofs," which appeared in a recent issue of one of our London contemporaries, a participant presented the following views, which are interesting as showing a practice which prevailed in certain parts of England:

Rendering with haired mortar on the under side of slating is certainly a useful addition. If properly done it will make the roof much more equable in temperature, will prevent rattling of slates, and will prevent snow, soot and dust from being blown up under the slates and into the space between the ceiling and the roof.

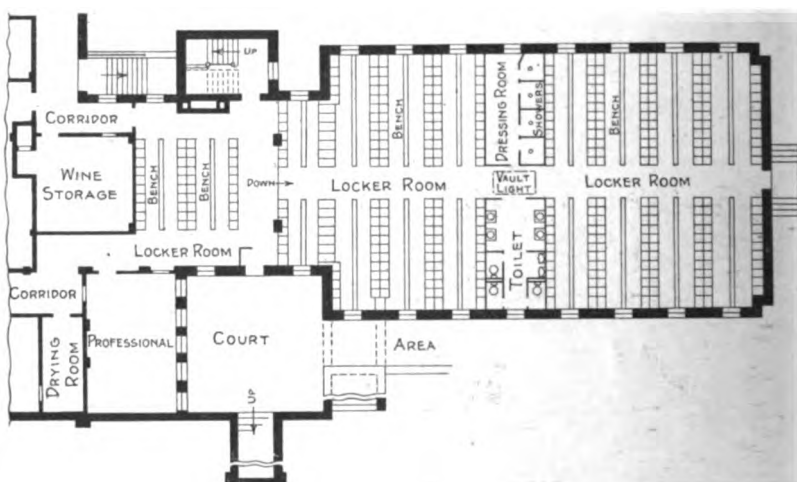

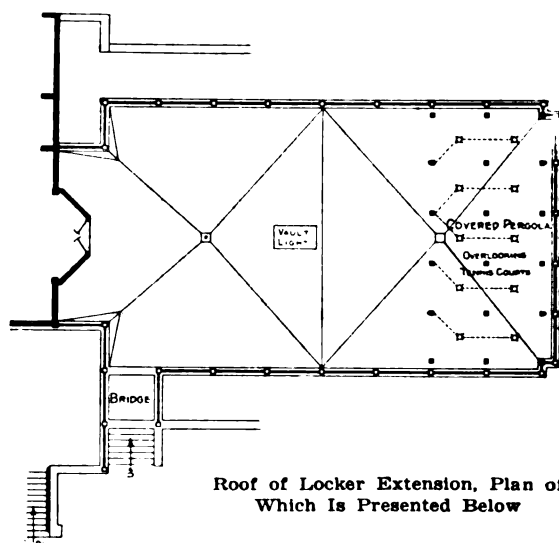

An ordinary split ceiling lath should be nailed to the rafters between the slating battens as a key for the rendering. The additional comfort of a properly rendered roof should amply repay the extra cost.

Pointing of slate roofs used to be somewhat common, also "Torching," or rendering, to the under side where exposed to the wind. The fact that both have gone out of practice is evidence of failure to accomplish any lasting usefulness. Quite recently in a mid-Sussex village I saw a remnant of outside

pointing to a slate roof which was of low pitch.

Old customs of the countryside are affectionately retained long after modern practice has proved them to be a failure.

The building employee of to-day is more or less a casual, a nomad among workmen; his predecessor was a bit of a dandy in his own estimation; rather an eligible person matrimonially. To apprentice a boy to a trade was equivalent to making a lifelong provision for the man. He was rather stiffnecked and tied to old ideas; old customs were to him the ideal of perfection; there was just the right way and wrong way for doing a job; little thought

Plan of Men's Locker Extension—Scale 1/32 In. to the Foot

New Home of the Worcester Country Club

being given to immediate circumstance or expediency; as grandfather did it, grandson followed on, often with the same old tools.

When stone followed slabs as a roofing material, mortar was useful and necessary; it was a natural sequence that joints were pointed. There is still in existence a stone heeling firm who can trace back more than one century; they use different mortar from our Sussex sort, with less water, and it stands better. When tiles were used mortar again appealed to the workmen; other localities had slate less skilfully adapted than we now see it. Here again mortar appealed to the workman, and it keyed fairly well to the rough surface. As time

passed, improved means of sawing timber, the cheap production of more suitable nails, etc., gradually brought a change, the pitch of roofs was increased, levelling up was more carefully executed, and the fact that dry heeling in place of bedding with mortar was better was demonstrated.

The old-time workmen did not lay slates so tight and snug as is now the practice; less lap was given, low pitch for cheapness was common; slates side-stretched in their courses, for some reason, often out of level, caused a side pull instead of a straight-down weathering, and wind drove under and between lap, causing wet to follow inside. Pointing for a time held it back, and as often split the slates during wet and frost.

Torching inside to joints of slates and to battens, also pointing to outside, was common, and prevented

given proper fall and lap, can be laid to weather effectively without mortar on battens. Rough boarding and felt make a more effective job where a roof is exposed to rough weather; tiled roofing will follow flowing curves as architectural features to quaint dormers, and weather effectively.

Workingmen's Houses in Chile

There has recently been commenced in Valparaiso and Vina del Mar, Chile, a large number of small houses for workingmen, the houses being of three different sizes, but all of them two stories in height. The beams, supports and roof timbers of each house are of oak, the interior walls of adobe and the exterior of brick, faced with cement. The roofing will be of galvanized corrugated iron. The interior

Home of Worcester Country Club—The Ingle Nook on First Floor with Gallery Immediately Above

wind drive. Both were sometimes adopted, each preventive was more or less supplanted by wet and helped to rot timbers; both were affected by vibration and became loose. Wind and storm strained them, repairs totally upset matters, it was at best an expensive patchwork, instead of a remedy. If pointing is necessary it is far and away cheaper to unroof and pay for proper knowledge and skill to cover again.

In the cheapest slating for sheds and wash-houses, locally called "batcher," or "badger" heeling, the slates were given the least possible lap and side spaced to the greatest possible extent. Modern practice has proved that either slate or tile, if

height of the ground floor of each house will be 10 ft. 5 in., and the upper floor 10 ft.

The houses classed as "Type A" will cost about \$2000 each, United States currency, this amount to be paid in instalments of \$417 on the signing of the contract, \$333 when the house is roofed, \$250 on its delivery and the balance in twenty-one years, with payments of \$13.33 monthly for the first 6½ years, and \$5 monthly for the balance of the period.

Houses of the "Type B" class will cost about \$2500 and the houses of the "Type C" class will cost \$2834, the same general method of payments being made as in the case of "Type A" houses, the amounts, however, being correspondingly larger.

Some Aspects of Modern Shingling

The Wooden Shingle and the Best Method of Distributing the Bundles on a Roof—Nails to Be Used

BY EDWARD H. CRUSSELL

WE come now to the wooden shingle, for which an eminent authority gives the best wood as cypress, redwood and cedar, in the order named. "It is a difference of opinion that makes horse races," and men may easily be found who will disagree with him. The present writer is of the opinion that shingles made from any of these woods will make good roofs, the lasting qualities of which will depend as much upon the manner in which the work is done as upon the kind of wood used in the shingles. In other words, he believes a good quality of cedar shingles properly applied will outlast either a cypress or redwood roof of poor workmanship.

In considering the foregoing statement the attention of the reader should be drawn to the fact that it is usually much easier to get first quality cypress or redwood than it is to get first quality cedar.

Ordinary roofing shingles, as most carpenters are aware, are of random widths, and are put up in bundles. Four inches is the understood width of a

the professional shingler ask, "What kind of bundles are they—full count, or California count?"

When estimating shingles for a given area in those parts where the two different counts are met with this difference must, of course, be taken into consideration, and the estimate made accordingly. It is easy to tell which count you are getting. A bundle of shingles is 20 in. wide, which is equal to five 4-in. shingles to the row. If the bundles have twenty-five rows on a side there are 250 shingles in the bundle. If they have only twenty rows on a side there is only 200 shingles in the bundle, and for estimating purposes one must figure five bundles to the thousand. Or, in other words, instead of ordering four thousand you must order five.

Exposure to Weather	Area Covered by 1000 Shingles	Number of Shingles Required for 100 Sq. Ft.
4 inches	111	900
4 1/2 "	125	800
4 3/4 "	133	760
5 "	138	720
5 1/2 "	153	655
6 "	166	600
6 1/2 "	181	554
7 "	194	515

Fig. 2—Table Showing Shingles Required for Various Lengths of Exposure to the Weather

Fig. 3—Opening a Bundle of Shingles Preparatory to Beginning Work

Some Aspects of Modern Shingling

shingle, and usually a bundle of shingles is equivalent to 250 shingles 4 in. wide, and four of these bundles are counted as a thousand shingles.

On the Pacific Coast, however, a bundle of redwood shingles is only equal to 200 shingles 4 in. wide, although they also count them four bundles to the thousand.† It is no uncommon thing to hear

There are different methods of estimating the number of shingles required, all of them arriving at about the same result by different ways. One of the easiest methods follows: First find the number of square inches in the exposed portion of one shingle. Divide the number of square inches in one square foot by this figure, and multiply the square feet in area of roof by the answer.

Example.—Suppose the shingles are laid 4 1/2 in. to the weather. Multiply 4 1/2 by 4 (the width of the shingle) and the answer is 18. Divide 144 (the number of inches in one square foot) by 18, and the

*Copyrighted 1916 by Edward H. Crussell.

†Since these articles were prepared by the author the California Department of Weights and Measures has notified all shingle dealers that in future shingles must be sold on a full-count basis so that hereafter five bundles instead of four will be regarded as a thousand.

answer is 8. Therefore, when shingles are laid $4\frac{1}{2}$ in. to the weather it takes 8 shingles for every square foot of roof surface.

This, of course, gives the exact number and

SOME ASPECTS OF MODERN SHINGLING. FIG. 4—PUSHING THE LOWER ROWS OF THE BUNDLE IN BETWEEN ROOF BOARDS

allows nothing for waste. With good quality shingles on a straight gable roof allowance for waste need not be more than 2 per cent, if you are careful to figure in the double rows at the eaves and the necessary overhang. On irregular shaped roofs, with hips and dormers, the allowance may need to be increased to as much as 10 per cent.

Another way to estimate shingles is to take the length of the roof in inches and divide by 4, which will give the number of shingles required for each course. Then take the length of the rafter in inches and divide it by the distance the shingles are exposed to the weather. This, when the extra course at the eaves is added, will give the number of courses required for one side of the roof. Multiplying by 2 gives the number of courses for both sides of the roof, and finally, multiplying by the number of shingles in each course gives you the total number of shingles required.

It takes just about the same number of shingles for a plain hip roof as it does for a gable, and the hip roof may be figured as a gable, allowing extra shingles for the hips if they are to be covered with what is known as "The Boston hip." In Fig. 2 is a table showing the number of shingles required for various lengths of exposure to the weather.

There is always a chance for argument regarding the kind of nails to use for shingling. Most people are agreed that cut nails are better than wire nails for this purpose, and one large association of shingle manufacturers advocates the use of copper nails. Climatic and other conditions have something to do with this subject, and a writer needs to be very sure of himself before making anything more than a general statement regarding it. As with the choice of wood, the kind of nails to be used is generally decided for the workman by the

powers that be; but for the benefit of those with whom the cut nail is such a favorite, the writer would mention an experience he once had with a shingle roof on which cut nails had been used. This roof had a good appearance, but was leaking badly, and an examination as to the cause discovered the fact that around every one of the thousands of cut nails in that roof the shingles had rusted, worn, or eaten away until there were holes in them from $\frac{1}{4}$ to $\frac{5}{8}$ in. in diameter.

The shingles, which were of redwood, had been on about fifteen years and apart from the holes were perfectly good; hardly a split in any of them and only a little worn on the exposed portions.

The foregoing is not set forth as an argument against cut nails, but merely to show that you cannot always tell. If it is left for the workman to decide he will certainly choose wire nails, because they are easier to handle and easier to drive. 4d. common and 3d. common are the kinds mostly used, though the professional shingler prefers 3d. fine. The writer has seen 2d. nails used on the lower courses of roofs so that the ends of the nails might not show through in the open cornice. Then further up the roof, where stout nails were not so

much needed, the specifications called for 4d. common and the building superintendent saw that they were used too. It requires about $3\frac{1}{2}$ lb. of 3d. or 5 lb. of 4d. wire nails to nail on 1000 shingles.

In some parts of the country, usually where the winters are severe, the roof sheathing is of tongued and grooved boards laid tight. In other parts the roof boards are squared-edged from 1 x 3 to 1 x 6 in. cross-section, and are laid

from 2 to 3 in. apart. The smaller sizes are known as shingle lath instead of roof boards. This open joint roof sheathing is certainly the best for shingle roofs because it permits them to dry out better after

FIG. 5—THE NEXT STEP IN DISTRIBUTING THE SHINGLES

FIG. 6—PUSHING THE TOPS BETWEEN THE ROOF BOARDS

rain. It is also much preferred by the shingler, because he can get about on it more easily and distribute his shingles to much better advantage.

On a close board roof he can hardly ever open more than one bundle of shingles at a time and will usually need some sort of a "jack" to hold the shingles and prevent them being blown away. On the open board roof he can open and distribute the shingles for the entire job if he is so minded and to keep them in place merely sticks the end of them between the roof boards.

Distributing the Shingles

This item of distributing the shingles is one portion of the work where the experienced worker forges ahead of the novice and although but a simple thing in itself, it has quite sufficient bearing on the cost of the shingles laid to warrant us looking closely into it before going further. Nothing is more wearing on the nerves of the man in charge than to watch an inexperienced workman open a bunch of shingles on a steep roof. Many of us have seen this performance and some of us have perhaps at some time taken part in it, so the matter need not be enlarged upon. It being better to use our space for the purpose of describing a good method than to pick out the flaws in a bad one, interesting though the latter may be.

Before distributing the shingles we must first get them onto the roof. This is usually accomplished by carrying them up a ladder, although there are conditions where a hoisting rig, with a line and single pulley, is the better way. Which ever way is decided upon, there is a chance for the man in charge to show his executive ability even in this small item. Some men can get around on a roof like a cat and others move so timidly they are always in danger of falling off. One man will hoist his bundle onto his shoulder, march up the ladder and onto the roof without missing a step or hesitating a moment. The next man will be all right until he gets to the head of the ladder and then finds it necessary to drop his bundle onto the roof before he can negotiate the crossing. It is things like this which decide whether it is better to let each man go the full distance, or to have some on the roof distributing while others are carrying them up the ladder. Each bundle of 250 will lay a patch about $5\frac{1}{2}$ ft. square, which gives a pretty accurate idea of how to space the bundles.

Carrying Up the Shingles

It is only in special cases, of course, where all hands will be required to carry up shingles. Wherever possible this work should be done by apprentices or helpers; or in the absence of them by the men best fitted for it. The good shingler would rather shingle than carry up, and the poor shingler will usually prefer to carry up because he is anxious to prove that he can do something.

The writer has heard of cases where men competing with each other have carried up four or five bundles of shingles at a load. No doubt many of my readers have heard something of the same kind. The case about to be mentioned is different, but rather unique in its way.

There were some 90,000 shingles to carry up onto the roof of a new warehouse, the eaves of which were about 14 ft. from the ground. Two helpers, who had been hired the day before, were set at this work and told how to space the bundles on the roof. The foreman was busy with other

matters, and when he returned some half hour later he found the two geniuses had decided that a bundle was too heavy to carry up the ladder, so they were opening them on the ground, taking as many as they could carry in one hand, and laying them on the roof in the required position. The roof being $1/3$ d pitch, the shingles refused to stay as placed and the appearance of that section to which they had directed their efforts can be more easily imagined than described. The foreman's description of it, and his ideas of the entire performance, as imparted to those chiefly concerned, covered the entire subject in a complete and forceful manner, but were unfortunately scarcely suitable for the present writer's purpose.

Best Method of Opening Bundles

One of the best ways of opening and distributing a bundle of shingles on an open board roof is as follows: Hold the bundle, as shown in the picture, Fig. 3; with the lower corner resting on the top edge of one of the roof boards and your knee pressing against the other end of the bundle. Now with one decisive blow of the hatchet open the bundle and at the same time push the lower rows of the bundle in between the roof boards with your knee, leaving the bundle as shown in Fig. 4. It is easy to sever the metal strip with the head of the hatchet if you know how, but it is easier yet to use an old hatchet or hand axe for this purpose and chop at the strip regardless.

To distribute the bundle, pick up a convenient full-length section of it (about one-tenth of the entire bundle) as shown in Fig. 5. Separate by bending them across the knee, put the butts together and push the tops between the roof boards, as shown in Fig. 6. The entire bundle can usually be distributed without moving the feet. It is best to open the necessary bundles first and distribute afterward. One advantage claimed for a method such as this is that the precision of the operation and the elimination of lost motion tend to a "speeding up" all along the line.

(To be continued)

Political Honors for a Prominent Builder

The members of the building fraternity of the eastern section of the country and especially of the New York State Association of Builders will be interested in learning that his Excellency Governor Whitman has appointed James M. Carter, the energetic secretary of the Association and of the Builders' Association Exchange of Buffalo to the office of State Superintendent of Prisons, succeeding John B. Riley, recently removed. While his loss to the building interests of Buffalo will be severely felt every one of his wide circle of business friends will wish him success in his new field of endeavor.

Building the Stucco-Coated House

We take this occasion to announce that the photographs from which were made the two illustrations appearing in the above-named article in the February issue were loaned the author by the Garden City Sand Company, Chicago, Ill.

Some Attractive Exhibits — at the — Complete Building Show in Cleveland, Ohio.

"Community Displays" a Prominent Feature—The General Arrangement Most Unique—Great Interest Manifested in the Wide Range of Materials

SUPPLEMENTING the brief reference in our last issue to The Complete Building Show recently held in the city of Cleveland, we present herewith pictures which afford the reader a faint idea at least of some of the attractive features. In many ways the show was different from anything heretofore attempted in this country, and was in

floor plan arrangement was decidedly out of the ordinary in that the exhibits were displayed along aisles bearing street signs, which gave the visitor the impression he was viewing a miniature city. For example, there was "Broadway in honor of New York," "Tremont Street in honor of Boston," "Pennsylvania Avenue in honor of Washington,"

A GENERAL VIEW OF THE DISPLAY OF THE SOUTHERN PINE ASSOCIATION SHOWING THE MODEL COTTAGE

a measure inspired by the well-known Building Trades Exposition of London, England. Those instrumental in promoting the affair included the Society Advocating Fire Elimination, The Builders' Exchange, the Local Chapter of the American Institute of Architects and concerns engaged in the building materials line. What might be termed the

"Broad Street in honor of Philadelphia," "Michigan Avenue in honor of Chicago" and many others, signifying the wide importance which the show was intended to cover. The picture in the upper corner of this page represents a cottage built of cedar and located at the corner of Michigan and Pennsylvania Avenues.

ONE OF THE SEVERAL MODEL HOUSES FORMING THE DISPLAY OF THE CLEVELAND BOARD OF LUMBER DEALERS

The exhibition, which lasted ten days, was notable in the fact that it in reality included displays of about everything used in the erection of a house. There were over 150 exhibitors, and their displays included hollow tile, building and paving brick, asbestos, asphalt, all types of shingles, domestic and foreign woods, cement, lime, waterproofing, water colors, metallic paints, coatings for concrete, wire cloth, electrically welded reinforcing for concrete, expanded metal, wire lath, builders' hardware, brick machines, concrete mixers, ventilating devices, paints, varnishes, etc., etc.

A section of the show which was the center of much interest contained the model of a New England cottage built of Arkansas soft pine and with paneling of Southern pine, the display being that of the Southern Pine Association. The picture presented upon the first page of this article gives the reader an idea of the display of this association, the cottage indicating the proper frame construction when using Arkansas soft pine.

The attractiveness of the displays was largely increased by providing what was known as "Community" exhibits; that is, a number of manufacturers of similar products united in making one exhibit,

which obviously was much finer than would have been the case had each manufacturer provided a separate display. There were a number of these community exhibits, one of which was that of the Cleveland Board of Lumber Dealers, showing nine model houses built on a scale of 1 in. to the foot and located on a model allotment with driveways, sidewalks, shrubbery and trees. These houses were designed to show different types of wood exterior, shingles, siding, roofs, etc., and were executed in various styles of architecture. Two were of plaster and the rest were of wood, one being a replica of Washington's home at Mount Vernon. This exhibit occupied a space at one end of the Coliseum sufficiently large to permit of as many as 100 people at a time inspecting the various features of interest.

Another lumber exhibit included a model of a modern commercial building showing what is known as "mill construction"; that is, built of heavy timber frame work, so as to make it "slow burning."

The Gum Lumber Manufacturers' Association had an interesting exhibit of red gum which can be finished in most beautiful effects, and which is used for interior trim and fine cabinet work. A view of the red gum booth is shown herewith, the design

ANOTHER OF THE MODEL HOUSES WITH THATCHED ROOF EFFECT DISPLAYED BY THE BOARD OF LUMBER DEALERS

representing the side of a room fitted with fireplace and mantel and flanked on one side by a book case. Other lumber exhibits included displays by the California Redwood Association and the Southern Cypress Manufacturers' Association. The display of the latter is shown in the picture at the bottom of the facing page. The conspicuous feature is a bungalow of clever design with pergola effect, while around the sides of the booth are panels of cypress, showing the varying effects which may be produced with the wood.

In connection with The Complete Building Show was a competition in \$3000 houses for which several cash prizes were offered. This was conducted under the auspices of the Cleveland Art Association, and something like 300 sets of plans were submitted. The names of the prize winners are announced in another part of this issue. The stucco cottage with slate roof, awarded the first prize, was on exhibition in the shape of a model made to a scale of 1 in. to the foot. In addition a full-size living room and drawing room were built from the plans and completely furnished. As part of the program a \$6000 model house was given away, the house being of brick and plaster exterior with interior trim of wood, excepting the first floor, which was finished with Berger's metal lumber. A green tile roof covered the house.

Another attractive community exhibit was of hollow tile and made by five hollow tile manufacturers of Cleveland. This also included the side of a tile wall covered with stucco. As a part of the

EXHIBITS AT THE COMPLETE BUILDING SHOW—THE RED GUM DISPLAY

display there was a new self-facing tile—a hollow tile with a wire rake surface requiring no facing whatever and made by the Ohio Clay Company.

Another community display was that of the Face Brick Manufacturers, which included an attractive bungalow with tile roof, a garden, a fence, a garden wall and pergola. About twenty different kinds of brick were shown in this exhibit, and it has been left as a permanent feature of the Coliseum. An idea of the display may be gathered from an inspection of the picture which shows a portion of

THE MODEL BUNGALOW AND BOOTH SHOWING THE DISPLAY OF SOUTHERN CYPRESS ASSOCIATION

the exhibit. In arranging the brick exhibits, the building of brick panels was practically eliminated and the brick laid up in various forms as they would appear in actual building construction. The exhibit was made by the Ohio Face Brick Manufacturers' Association in conjunction with a few brick-makers from other States.

W. C. Shires of Cleveland gave the first exhibition of his new system of pouring reinforced concrete hollow walls, floors and roofs without using falsework or forms. A continuous wire mesh takes the place of forms, and the cores are placed inside the mesh before pouring. They may be run horizontally or vertically, as conditions require, and may be round, oval or any other form or of any dimension. For ordinary work in the construction of an 8-in. wall a core 8 ft. long, 11 in. deep and

lock studs for fireproof partitions, etc. A section of the wall, floor and ceiling of a building was erected to show the use of the face steel joists and metal lath in building work.

The Sandusky Portland Cement Company had a very attractive exhibit of fountains, fences and railings made of Medusa white Portland cement.

The Cleveland Cement Users' Association in a community exhibit showed cement products, including artificial stone columns, urns and other decorative articles.

The Farr Brick Company had as its exhibit an old-fashioned Dutch kitchen with huge rafters, a capacious open fireplace and brick oven.

Not the least interesting feature of the show was a model of a poured concrete cottage worked with steel forms recently developed by the Hydraulic

EXHIBITS AT THE COMPLETE BUILDING SHOW—SECTION OF A "COMMUNITY" DISPLAY MADE BY MANUFACTURERS OF FACE BRICK

4 in. wide is used. The core is of 32-gage sheet metal and has a slit joint. The wall is poured 1 ft. at a time, one core being put in each section, making 1 in. of solid wall between the cores. The wire mesh has three wires to an inch for the wall and five wires to an inch for the floors and roofs. It is claimed that this system of pouring saves 64 per cent of the concrete, as compared with a stone wall, and that by using it a building can be erected complete at 18c. per square foot, including finishing inside and out.

H. W. Johns-Manville Company showed its line of asbestos shingles and other building products, while several of the Cleveland supply dealers had tastefully arranged exhibits of many kinds of building materials.

The Berger Manufacturing Company, Canton, Ohio, showed fireproofing building specialties, including cores for reinforced concrete floors, prong

Pressed Steel Company of Cleveland. The statement was made that with these forms a cottage 21 x 35 ft. in plan has been poured in three hours.

New York's Latest Skyscraper

Instead of erecting a thirty-two story office building, for which the company filed plans in March, 1914, the American Express Company has decided to erect on the site of its present structure in lower Broadway a fifteen-story building, the plans for which have been prepared by Redwick, Aspinwall & Tucker, 8 West Fortieth Street, New York City. The building will be for the exclusive use of the company and is expected to be ready for occupancy by Feb. 1, 1917. The contract will be executed by the Cauldwell Wingate Company, 381 Fourth Avenue, New York City.

Three Contract Clauses Construed

Necessity for Formal Claim for Time Extension— Measure of Contractor's Recovery for Destroyed Work

BY ARTHUR L. H. STREET

THE following review of two late and important court decisions will serve to illustrate the practical impossibility of so wording a building contract as to make it dispute proof and so plain as to afford no reasonable basis for litigation, especially as against unexpected circumstances such as were involved in the first-mentioned case. But the continued volume of court decisions interpreting the scope of

construction contracts should serve a useful purpose in gradually pointing the way toward the formulation of standard forms of agreement which will minimize the troublesome and expensive disputes which arise under loosely drawn contracts.

Delay Clause Interpreted

The right of a firm of contractors to an extension of time for the completion of a building, where no written claim for an extension had been given, was passed upon by the Texas Court of Civil Appeals in the cast of *Crisman & Nesbit*.

The original plans and specifications called for a girder through the building intended as a support for the ceiling joists. As the work progressed it was discovered that according to the plans one end of the girder projected into a window, and it was necessary to re-arrange the plans so as to provide a support for the girder. The superintendent for the owner consumed about two weeks in preparing new plans or details to meet the emergency, and in the litigation which followed between owner and contractors the owner refused to permit the delay charged against him, because no written claim had been filed under the following clause of the contract:

"Should the contractors be obstructed or delayed in the prosecution or completion of the work by the neglect, delay or default of any other contractors, or by any alteration which may be required in the said work, or by any damage which may happen thereto by fire, or by the unusual action of the elements, or otherwise, or by the abandonment of the work by the employees through no fault of the contractors, then there shall be an allowance of additional time beyond the date set for the completion of the work; but no allowance shall be made unless a claim is presented in writing at the time of such obstruction or delay. The superintendent shall award and certify the amount of additional time to be allowed; in which case the contractors shall be released from the payment of the stipulated damages for the additional time so certified, and no more. The contractors may appeal from such award to arbitrators constituted as provided in article third of this contract."

In holding that this section did not apply to the delay involved in this case, the court said that the purpose in requiring the contractors to give notice in writing of delays occasioned by others was to afford the owner a prompt opportunity to investigate and end same, but that the provision for written notice of delays caused by others could not be invoked by the owner in case of delays due to the

fault of the owner, except in cases "requiring alterations." Holding that no "alteration" was involved in this case, the court says:

"It [the girder] remained in the same place in the building where it was originally placed. The sole purpose of the delay was to give the owner's superintendent time within which to prepare details or plans for the building of some sort of base or foundation for the girder in or about the open space into which the original plans carried it. Delay for the purpose of adding to or curing omissions in the plans adopted for remodeling the building cannot fairly be said to be an alteration of the work already planned. The original plans were not altered, rather they were added to."

It was also decided by the court that the contractors were entitled to allowance for delay resulting from the superintendent's loss of the specifications for the windows of the building, although no written claim had been made under the clause of the contract above quoted, since that was a delay not occasioned by any alteration in the building or by the fault of other contractors.

A contract for the erection of a building contained the following clauses:

"Fifth. The owner agrees, in consideration of the performance of this agreement by the contractor, to pay or cause to be paid to the contractor, his legal representatives or assigns, the sum of \$23,100 in United States gold coin, at times and in the manner following, to wit: Seventy-five per cent (75%) of the amount completed on the first and fifteenth days of each month, the balance to be paid thirty-five days after notice of completion is filed: Provided, that when each payment or installment shall become due, and at the final completion of the work, certificates in writing shall be obtained from said architect, stating that the payment or installment is due or work completed, as the case may be, and the amount then due; and the said architect shall at said times deliver said certificates under his hand to the contractor, or in lieu of such certificate shall deliver to the contractor under his hand a just and true reason for not issuing the certificates, including a statement of the defects, if any to be remedied, to entitle the contractor to the certificate or certificates."

"Twelfth. In case the work herein provided for should, before completion, be wholly destroyed by fire, defective soil, earthquake, or other act of God, which the contractor could not have reasonably foreseen and provided for, then the loss occasioned thereby shall be sustained by the owner to the extent that he has paid installments thereon, or that may be due under the fifth clause of this contract; and the loss occasioned thereby and to be sustained by the contractor shall be for the uncompleted portion of said work upon which he may be engaged at the time of the loss, and for which no payment is yet due under the fifth clause of this contract."

When more than \$17,000 worth of work and materials had been furnished by the contractor, the whole of the partly constructed building was destroyed without his fault. Thereupon he claimed the full contract price of the work done, but the owner disclaimed liability beyond 75 per cent of the amount which had fallen due before the fire, according to the terms of clause 5 of the contract. In sustaining the contention of the owner, the California Supreme Court said:

"The payments to which the contractor was entitled while construction was in progress consisted of 75 per cent. of the value of the work completed on the 1st and 15th days of each month. The remaining 25 per cent was not due until thirty-five days after completion of the building. How, then, can it be claimed that the contractor was entitled to receive anything more than 75 per cent of the value of the work done by him? The 25 per cent, in value, of the work done, was clearly a portion of the work for which no payment was yet due under the fifth clause of the contract, and the loss of this, under the agreement, fell on the contractor."

The fire having occurred between the 15th of one month and the 1st of the next, the court held there could be no recovery for work done after the 15th.

A Suburban Cottage of Six Rooms

Foundations of Concrete with Brick Underpinning
—Walls and Roofs Are Covered with Shingles

THE interest which attaches to conveniently arranged dwellings of the cozy cottage type of architecture has moved us to present as the basis of our colored supplemental plate this month a design of this character. The cottage is of frame construction, with 10-in. concrete foundation walls resting on footings of concrete 10 in. thick and 22 in. wide, all concrete to be mixed in the proportions of one of cement to three of sand and five of broken stone. The exterior frame is to be covered with sheathing boards over which is to be placed a heavy layer of building paper, this in turn being covered with red cedar shingles laid $5\frac{1}{2}$ in. to the weather on the roof, 4 in. to the weather on porches and dormers, and 5 in. to the weather on the sidewalls. Before being laid the shingles are to be dipped in Cabot's shingle stain.

Arrangement of Rooms

The cottage has been designed to occupy a plot of ground having a frontage of 75 ft. and a depth of 100 ft. An inspection of the plans presented on the facing page shows the feature of the layout to be the living room, which occupies the entire central portion of the building, extending from front to rear and communicating at both fronts with a covered porch through casement doors. At one end of the living room is an open fireplace with red brick hearth. At the right of the living room is a passageway communicating with two sleeping rooms and bathroom, while at the left is a sleeping room and the kitchen. In the attic is a fourth sleeping room.

The living room is also intended to be used as a dining room, although in the summer months the screened porch at the rear can be used for this purpose if so desired.

The Chimney

One chimney supplies the kitchen, the living room and the furnace in the cellar. The entrance to the cellar is by means of a stairway leading directly from the kitchen. The chimney is to be built of common brick laid in a good cement mortar and the three flues to have vitrified flue lining. The chimney breast below the mantel shelf in the living room is to be covered with stucco and tile set in, as indicated in the details, with a tapestry brick base.

The cellar is located under the kitchen wing of the house, and contains the furnace and storage rooms, the floor being of concrete and the walls whitewashed.

According to the specifications of the architect,

the first floor beams are to be 2 x 10 in., placed 16 in. on centers; the second floor beams 2 x 6 in., placed 16 in. on centers; the rafters 2 x 6 in., placed 20 in. on centers. The plates and corner posts are to be 2 x 4 in., the sill 4 x 6 in. and the studs 2 x 4 in., the latter being placed 16 in. on centers. All beams are to be of spruce.

Floors and Trim

The rooms of the first story are to have double floors, with building felt placed over the sub-floor. The finish floor is to be of $\frac{7}{8}$ x $2\frac{1}{2}$ in. North Carolina comb-grain pine. The attic floor is to be $\frac{7}{8}$ x 4 in. pine.

All doors and trim are to be of cypress. The windows and door frames, as well as all outside trim, are to be of white pine.

The bedroom in the attic, as well as ceiling of cellar, is to be finished off with a good wall board.

The interior walls of the cottage are to be plastered two-coat work, with a sand finish in the living room and a hard, smooth finish in all other rooms. The walls in the living room are to be paneled off to the height of the mantel shelf with 4-in. plain strips. The plastering, having a sand finish, is to be tinted in the panels and above to the picture mold a deep golden yellow. The ceiling and plaster cornice down to the picture mold is to be a delicate warm gray. The stucco of the mantel is to be tinted a cream color and the tile is to be dark red. All living room trim is to be stained a deep rich brown with a dull finish.

The Kitchen and Bathroom

In the kitchen and bathroom the trim is to be enameled white and the walls and ceiling treated with a waterproof paint.

The bedroom trim is to be stained and the walls painted, carrying around each room a paper border which shall be in harmony with the tints selected for the walls. The ceilings are to be left white.

The living room trim and doors are to be stained and rubbed to a smooth dull finish.

The floors of the various rooms are to be filled and finished with two coats of wax and polished. The trim and doors in the bedrooms are to be stained and brought to a dull finish.

The kitchen and bathroom are to have three coats of enamel paint.

The outside trim is to be primed with lead and oil and given two coats of paint. Both sides of the sheet-metal work are to be treated with two coats of mineral paint.

The hardware throughout the house is to be of a bronze plate finish and the glass used is to be double-thick American of the best quality.

The plumbing is to be of Standard make, and all exposed pipes in the bathroom are to have a

Miscellaneous Constructive Details of the Suburban Cottage Shown on Our Supplemental Plate

nickel-plated finish. All the rough pipes exposed in the kitchen are to be painted with enamel paint. The kitchen is to contain an iron enamel sink, a two-part soapstone wash tray with removable perforated metal covers, and a 40-gal. galvanized iron hot-water boiler over the range. The bathroom is to be equipped with complete shower-bath arrangement, a water-closet with china bowl and low-down tank, and washstand with marble top and china basin. All fixtures are to be properly supplied with hot and cold water. The bathroom floor is to be covered with square tile and have a sanitary cove and base.

All rooms are to have outlets for gas fixtures, and so arranged that combination electric and gas fixtures may be used.

The down spouts shall be 3 x 3 in. square and

shall be made of corrugated galvanized iron.

It is intended that the cottage be heated by furnace installed in the cellar and of sufficient size to heat the building to 70 deg. in zero weather. All hot-air ducts are to be covered with asbestos, and all registers are to be of such a finish as to match the hardware.

The house is to be wired for electric lighting, and all rooms are to have at least two outlets.

The architect calculates the cubical content of the house at 25,197 cu. ft. and the cost at 18c. per cu. ft. He states that the estimate and specifications are based on prices, labor and materials on Long Island about 30 miles from New York City.

The architect is Arthur Weindorf, Long Island City, N. Y., or care of THE BUILDING AGE, 239 West Thirty-ninth Street, New York City.

Convention of Builders' Exchanges

National Body Meets at Baltimore—President Lewman Delivers Stirring Address—New Officers Elected

WHAT was undoubtedly the most successful meeting of builders of the country both as regards numbers and interest manifested, occurred in the city of Baltimore, Feb. 22 to 24 on the occasion of the fifth annual convention of the National Association of Builders' Exchanges. The gathering was highly representative of the building interests and the delegates in attendance numbered nearly 500. The sessions were held in the Roof Garden of the Emerson Hotel, and as fast as the members arrived they were presented with badges and copies of a handsome booklet entitled, "Baltimore of To-day," containing much information and many pictures of the city. The early arrivals among the delegates attended an informal reception given by the Baltimore Builders' Exchange and the Ladies Auxiliary Committee to the delegates and guests on the evening of Feb. 21. The reception committee, headed by James A. Marrian and A. H. Sieman as chairman and vice-chairman, also included President Herbert J. West and Secretary I. Herbert Scates of the Baltimore Builders' Exchange, and Vice-president John Trainor of the National Association.

Tuesday's Session

The first session of the convention proper was held on the morning of Feb. 22 with President H. L. Lewman in the chair. This session was largely taken up with greetings by Vice-president John Trainor of the National Association, and addresses of welcome by Secretary of State T. W. Simmons, Assistant City Solicitor B. H. McKindless and Herbert J. West, president of the local Exchange. Response was made by Ralph McLauran of San Francisco, who was warmly applauded.

The address of the morning was by R. Clipston Sturgis of Boston, a past-president of the Ameri-

can Institute of Architects. The speaker asserted that the present system of placing bids and grinding prices down to the depth of inferiority was nothing short of a blot on the reputation of honest and straightforward builders who are forced to share the disfavor resulting from a bad system. He urged a remedy whereby owner as well as builder, contractor, engineer, architect and mechanic would mutually profit. He suggested a general getting-together, which for its principal purpose would have a building-up of confidence and the abolition of internal discord. After this confidence had been brought into existence the public should be educated to the fact that there really existed honest and honorable persons in the United States who are willing to give and take a fair deal.

In bitter terms the speaker condemned petty specializing where lines are drawn and mechanics are not allowed to overstep a certain mark which bounds their province in the construction of a building. This he said, no matter what price the mechanic was paid, was unfair to him inasmuch as it necessarily hindered his education and privileges without apparent reason.

Principal among the things to be accomplished, he said, was confidence. This, once generated, would create a different spirit in the business world and would result in the realization of real Christianity—faith in fellow man, all of which he stated would work out a beautiful system of fair dealing, and was after all, the goal of the builders' exchanges of the country.

The president then appointed committees on Credentials, Constitution and By-Laws, Resolutions and Conference. President Lewman also appointed the following as assistant secretaries for the convention: C. H. Bowen, John Hauch, A. J. Mahon, C. P. Massard, Daniel Carey and O. G. Albrecht.

In the afternoon the delegates and their wives

were taken on an automobile sightseeing tour of the city, and in the evening the delegates were treated to an oyster roast at Recreation Pier.

Wednesday Morning Session

The second day's proceedings consisted very largely of the presentation of reports and discussions thereon. The event of the session was the address of President Lewman, extracts from which follow:

President Lewman's Address

Four years ago our National Association was formed for the purpose of advancing and protecting the interests of the builder. Volumes have been written upon the most desirable methods of attaining a complete and closely related system of organization, and many ingenious suggestions have been advanced. But the difficulties are very great and the factors and interests to be co-ordinated are numerous and diversified. We have reached certain definite conclusions and have developed policies with reference to the fundamental principles of organization which coincide with the views of many observant men. The general acceptance of these principles with our actual concrete achievements, and the benefits we have already derived, assure us that we are on the right road, and are progressing toward the formulation of a complete Code of Practice, the most stupendous and necessary problem with which the builder has ever grappled.

Since the dawn of civilization it has been the duty of the builder to provide habitations for mankind. In so doing, he has constantly been confronted with many serious problems. He has successfully coped with those of handicraft and construction which is evidenced by the wonderful skyscrapers and other building marvels of the age. This success has been an important element in the improvement of our country; but the wonderful development of the purely mechanical part of the builder's work has not been accompanied by a like improvement in his business customs and methods—in fact these are in many ways very crude and have only slightly advanced in the past century.

Mechanical Progress of the Builder's Work

This mechanical progress of our business is noticeable, in a variable degree, throughout the domain of the building industry, and shows the facility with which the purely structural and engineering problems have been mastered. We see the best organized companies in the world to-day in the realm of the building business. These wonderful machines work with a precision that excites the admiration and envy of all, and the men who are their leaders are capable of effective organization in any line of business. It is remarkable that this marvelous talent, which they have developed, should be coupled with, and hampered by antiquated, unfair and burdensome methods and be conducted in such an immature and rambling manner in what may be termed the commercial or business side of our vocation.

We all appreciate fully our responsibilities and obligations to our fellow men in the development of economical construction and mechanical efficiency, nevertheless our primary and fundamental purpose is to reap the value of our services for the support and comfort of ourselves and dependents. We must also appreciate the fact that the highest mechanical skill can only be reached under sound business conditions and that the development we have attained along structural lines has been achieved in spite of our stunted and neglected business growth. In the matter of erecting a steel framework, placing a difficult foundation and all the many practical propositions the builder faces from day to day, we must recognize the soundness of judgment and skill with which he handles problems that would baffle men whose capacity had not been developed along such strenuous physical lines. But notice how differently he acts when it comes to the wording of a contract, and how many important latent and implied obligations he carelessly and need-

lessly assumes. As an illustration: we permitted the architect until recently—and still in some localities—to be the final judge, without appeal, of his own acts, documents, and errors, thus waiving our rights to appeal to arbitration or the courts in case of disputes or differences. Such a condition exists in no other branch of commerce or industry in the civilized world. The courts when called upon to interpret and adjudicate such arbitrary conditions, have uniformly shown a great repugnance toward their manifest injustice having frequently called the attention of owners and builders to their oppressive and unbusinesslike character.

Business System of the Builder

The builder spends large sums of money annually under a business system which has advanced but little since the early days. The savage knew the number of beads or amount of liquor he was to receive for his furs, but the builder, when he contracts for work under the old contract documents, names a price to erect a building, leaving many of the important elements that determine its cost to be "decided as the work progresses." He often receives his pay at the "discretion of the architect" instead of at fixed times, as is customary in all other lines of business. He assumes responsibility for buildings and guarantees the integrity of heating, electrical and plumbing systems, conceived, planned and executed under the direction of another, and leaves in the owner's hands, large sums of money to make good defects for which he is in no way responsible. He agrees to execute the work with the very noticeable absence of an accurate definition as to what constitutes quality. He accepts responsibility and guarantees the soundness and capability of mechanical and engineering constructions when he has no voice in determining their materials or design. In dealing with architects and owners, how many unreasonable burdens are imposed and just claims denied for want of technical business knowledge or attention! In competition how foolishly he allows conditions of unfairness, treachery, auctioning of bids, and other well known and easily remedied evils to exist! In fact our lack of ethics in the manner of conducting competition is appalling.

A chain is only as strong as its weakest link and it will not profit us to excite the wonder and admiration of the world for our mechanical achievements if we continue to excite its amazement at our lack of business prudence. It is the weak part of any structure we hasten to strengthen. It is not the strong and fully developed part that needs prompt and careful attention. I cannot pass from this subject without saying that there is no sadder sight than that of a thoroughly capable and proficient builder coming to the end of a useful and industrious life of true public service, impoverished and dependent because of his lack of business precautions and ability to reap the financial reward of his efforts.

Code of Ethics

It is singular that such an important industry has never developed some well-defined Code of Ethics under which to conduct its business, in order to be fair to all interested parties, as have all other branches of commerce and professions. This is a serious problem, and one in which we have the most intense interest. We have two splendid examples of organization after which to pattern; the banks and financial institutions with an organization for full co-operation, providing its members with all reasonable protection, and business information, and we have the different laborers and mechanics with a nation-wide organization whose conditions are recognized in practically every section of the country. Contrast these two associations with the builders, who generally act independent and as individuals and who are proceeding under unsound and archaic commercial methods, generally failing to consider and co-operate with fellow craftsmen. As our business is conducted to-day, we meet in common centers to enter competition, ungoverned and uncontrolled by ethics and often without fair intentions, each man being a free lance, allowed without restraint, to follow his own ideas regardless of whether they are honest, fair to others, or businesslike. He is permitted to

pursue his objects and often performs deeds that of a character dangerous to business principles, unfair to owners, fellow builders, and the business community, often casting all ideas of fair dealing and business protection of himself and his calling to the four winds.

Bids are many times secured under what practically means misrepresentation and the violating of pledges either made or understood. They are invited and received under an actual or implied promise of an award to the lowest responsible bidder and then immediately rejected; resulting in practically an auction, where all ethics and fairness are ignored. To call for bids with no intention to award the work to the lowest responsible and competent bidder is fraudulent, and rejecting them and calling for new proposals upon some slight pretext or change is generally deliberate misrepresentation. Sometimes this is intended to be used as a basis for future negotiations; sometimes to favor a bidder in an endeavor to secure the work for him, and often other motives equally unfair and unbusinesslike.

We find bids that require great knowledge and expense in their preparation treated without reasonable consideration; large sums expended in competition when the work is never awarded, and no compensation given the bidders; misrepresentation and unfair means used to force down the price of a bidder and many obnoxious and inequitable actions. To stamp out these

while our vocation is apparently idly drifting and failing to give the proper attention to this important phase of our business, when as a matter of fact, we should be studying this question and be represented in its consideration and just settlement as practically all other branches of commerce are doing to-day. Of course our aims and purposes should always be to bear ourselves creditably among our fellowmen; and our thoughts, expressions and actions should be at all times made clear that we are not seeking to form an organization to restrain or throttle fair competition, but that we wish to encourage competition on equitable lines. What we seek is organization for the protection, advancement and conservation of our interests against unfair business practices and to promote stable and well-organized business institutions, in order to render good service. Our highest courts have drawn a clear line of distinction between these two types of organization prohibiting the former and encouraging the latter.

We should conduct our business in such a manner that builders' organizations in the public's mind will be synonymous with honest and fair dealing, sane and correct business principles, and for whatever tends to promote and elevate our calling. A line between this type and the unscrupulous builder should be clearly drawn before the public, and the results will soon impress us with the advantages of this Code of Ethics.

PRES. JOHN TRAINOR,
OF BALTIMORE, MD.

TREAS. GEO. C. SCHROEDER
OF GRAND RAPIDS, MICH.

SECT. I. H. SCATES
OF BALTIMORE, MD.

New Officers for 1916 of the National Association of Builders' Exchanges

practices which are harmful to the architect, the owner, and the builder, should be our aim and purpose. These and many other improprieties and irregularities that permeate the whole system of receiving bids, awarding and conducting building contracts should have immediate attention and be settled in a manner fair to all, and in this progressive age, these constitute a national question which can only be determined and brought to a finality by national consideration and co-operation. A just settlement means a new era of businesslike procedure in the conduct of building—a day to be welcomed by architects, builders, and owners and all the interests creating the owner's investment.

We have a striking illustration of the importance of this question before us. Our Federal Government for the protection of public carriers and other branches of commerce, prescribe methods, minimum rates, and other essential fundamentals in order to protect the public and to conserve the interests of all concerned. Likewise we have federal laws governing corporations, powerful companies and individuals that prevent them from destroying the weaker competitors or imposing unfair or burdensome methods on others. We find many prominent attorneys devoting their life and thought to this question; the courts of our land writing opinions on what is proper and what is improper.

I mention this to impress upon the builder the immensity and importance of this question that is receiving the thought of the greatest minds of our nation,

A proper Code of Ethics will give higher caste to our calling, and improve our members in many ways. We found the progressive and fair-minded architects, the owners and business interests of the nation with us on "Contract Reform," and I am confident they will assist in the remedy of these unfortunate disabilities and unnecessary costs imposed on building.

At the present time considerable thought, experience and expert advice are being directed to manufacturing efficiency. It is a very important problem to manufacturers that they not only consider the actual manufacturing problem but at the same time give equal thought to the questions of what is fair and unfair in representation of merchandise, sales, competition, errors, collections, etc., and many of the other elements necessary to the conduct of a fair and successful business that lie beyond the confines of actual labor and material. These are wisely handled by most all other branches of commerce through organization. Experienced business men attach a great deal of importance to these phases of their business, then why should not the builder give this commanding matter the attention and consideration it deserves.

Your interests as individuals are generally parallel and identical; however, being a compound organization, there are times when the interests of the component parts are in opposition. The resultant condition often produces a very serious situation in our organization. Discipline and well considered actions are required for

the proper conduct and settlement of these perplexing problems. A full and just consideration of the rights of all interests with fair and equitable intentions must govern and determine our policies on this very important phase of our business.

How to Avoid Possible Rupture of Relations

Unless wisdom and equity are rightly adhered to in their settlement we are likely to permit or bring about differences and possible rupture. Individuals or organized interests who are in opposition to us and who desire to arrest our progress and defeat our purposes, realize that this is our most vulnerable point of attack, consequently at times we have to contend with these antagonistic elements, which bring about dangerous internal dissensions by misrepresentation, distorting of facts and conditions, and many other irritating methods. This strategy, often not fully understood by our members, frequently causes unnecessary differences between general contractors, sub-contractors, material dealers and manufacturers. Sometimes this attempt to center our attention on internal matters of this nature has a strong and frequently successful tendency to take our attention from dangerous external matters that are vitally opposing our success. This procedure has been noticeable in certain localities, in our campaign for contract reform. Any such attempt to destroy our efficiency as a unit should be avoided and promptly eradicated. I desire to warn you to be ever alert, and guard against such disasters brought on by external force, by influence within our organization.

Building Business Prosperous

I am convinced from the information I have received from our local associations that the building business of the nation is now entering an era of prosperity never before equaled. In the execution of this volume of business that is now at our door, we should realize our duty to the public and avoid the burden of unnecessary labor and material.

It is our duty to give the public skilled and economical service. We are generally a factor and not a producer, usually providing in our price for all inherent and contingent costs—consequently the great burden of superfluous cost and loss which has always been abnormal must enter into the owner's investment.

Under the head of unnecessary loss we find exorbitant and wasteful material and labor conditions and costs, burdensome building codes, antiquated contract provisions, allowances for indefinite descriptions and provisions in specifications, disputes between various organizations and crafts, and many other extravagances. The interest accumulating yearly upon this excess investment forced upon the consumer makes this supercost a sum beyond the sphere of human comprehension, and emphasizes and brings out the necessity for strict justice in adjusting all labor and material costs and conditions. This is an obligation imposed upon us which we should properly recognize in this era of approaching prosperity.

Relationship Between Contractors and Sub-Contractors in Bidding

Regarding the question of the relationship between contractors and sub-contractors in bidding, I sincerely hope you will, in discussing and settling this question consider the rights of all, exercise diplomacy, equity and discipline, always remembering that we necessarily are a composite organization and that all its integral parts are entitled to liberality in judgment of their position and acts.

There are many serious questions that will come before this convention for consideration and determination, such as Quantity and Quality, Survey, Ethics in Bidding, Methods of Raising Funds for the Conduct of the Organization, and many other important matters. I am confident you will solve them to the best interest of all concerned.

I wish to express my appreciation of the great assistance rendered the Association and myself by J. M. Vollmer, our worthy and efficient secretary. These two years of labor by him in our behalf should be

recognized and appreciated by every member of the Association; it is seldom we find a man so devoted and interested in his work. Our success in the past two years is very largely due to his capacity and experience so loyally and industriously applied.

Secretary and General Manager in One

During the year I visited an exchange whose secretary had the title of Secretary and General Manager. I was impressed with the accuracy of this description, as our secretaries very largely contribute to the management of the Exchange. The success of the National Association is due largely to the work of the secretaries of our affiliated associations. I wish to extend the thanks on behalf of the Association and myself for their earnest endeavor to promote our interest.

The address of I. H. Scates on "Organization and Co-operation" before the Michigan builders' State meeting recently is a masterpiece that you should all read and study. His years of experience, his labor devoted to our welfare, and his keen perception are shown in this splendid article.

At the close of this convention my term of office ceases, likewise my membership in this association, as my investments and interests are no longer identified with the building business, but are involved in a manufacturing plant that requires my attention.

Classification of Architects

In retiring I desire particularly to call your attention to one matter, and I hope you will consider it very seriously, as I think this largely influences your future success. I refer to "The Classification of Architects." Though people understand there are doctors and quack doctors, lawyers and shysters, and so on through all trades and professions, yet we generally permit the people to believe that there is no distinction between architects.

This situation is unique, and is no doubt brought about by our past subserviency, and our present enforced silence and submission in localities where the new contract documents are not in use. This of course results in the builders being forced to hold themselves in awe, on account of business diplomacy, and suppress their true opinions regarding the methods of this type.

It appears to me that it is our duty to the public and ourselves to use sterner methods than those of the past year and turn the full light of publicity upon architects who refuse to use the new Documents, and who are still clinging to what Mr. Sturgis designates as "comfortable blanket clauses under which the ignorant and incompetent architect seeks to protect himself." Proper attention on our part to these self-indulgent architects will soon form a clear line of demarcation, which will be readily recognized by an owner who is about to employ an architect. We should always make clear to the public and the owners the unnecessary expense and delay this method adds to the cost of the improvement. This type should be subjected to merciless public criticism and legal regulation. The reason for such action is not far to seek. You may just as easily imagine Nero being subjected to an intelligent criticism by the sycophants surrounding his throne as to expect an architect of this class to be criticized by a building fraternity which he has the power to make or break.

This is no abstraction, but a frequent condition, and there is not one man within the sound of my voice who cannot immediately summon up instances where the ill will and the oppression of an architect of this type have been invoked by a frank criticism made without thought of malice but dictated by a sincere desire to prevent the squandering of the owner's capital.

The New Policy

I say to you that such a situation is intolerable, and unless you appreciate the truly revolutionary character of our new policy and unless you realize that the builder is placed upon a new plane of equity and dignity and that our calling has been rid of the incubus of demoralizing subserviency to this method, you will have lost the fundamental keynote of our work.

Having bound ourselves together with the strong ties of our organization and having united our experience and acquired the strength and influence as a unit necessary for guiding our deliberations, determining our policies and enforcing their execution, we should now proceed to the proper regulation of such current matters of our business as will accrue to our common benefit, without imposing any burden or hardship upon anyone, always having uppermost in our thoughts the right of all others, and never permitting personal advantage to interfere with the high aim of our calling.

The delivery of this stirring address, voicing as it did the sentiment of the very best elements in the building industry, was received with thunders of applause from the attending delegates who followed every declaration of principle with the keenest interest.

Wednesday Afternoon Session

The afternoon session was given up to reports of committees and an address by Richard Ferge of Milwaukee. One of the most interesting features of this session was the report of the Committee of the Whole covering comments of delegates as to general conditions existing in various parts of the country.

The Theater Party

In the evening the center of the stage, so to speak, was held by the "Builders' Exchange Minstrels" at Aubaugh's Theater, which was well filled with delegates and friends. The show was "put on" as one of the attractions of the Builders' Convention and the parts were played by amateurs and everyone shared in the glory. E. Claire Urban was the director, J. E. Duggen the interlocutor, Arthur P. Pierce and W. A. Marshall the ends. In the second half of the program Mr. Pierce gave a capital imitation of Bert Williams and his famous game of Pantomime Poker. During the intermission the audience amused itself by sending up toy balloons. The Indianapolis delegation distributed a headgear of Oriental appearance with "Indianapolis 1917" emblazoned thereon.

Thursday Morning Session

On Thursday the feature of the forenoon session was an address by James A. Emery of Washington, D. C., who took for his topic the establishment of an American merchant marine and made an urgent plea for the creation of a good system of carrier ships flying the American flag. Speaking extemporaneously, Mr. Emery urged the builders to study the interests of one another and to co-operate one with another, citing the fact that the building industry was the oldest of all and for that reason should be the strongest. He briefly traced its history back to the days of the first man who provided shelter for himself.

He referred also to the unsatisfactory laws and rules which existed not only in the various organizations of the country, but in every city and State. He mentioned the great number of unnecessary laws enacted in the last few years and pleaded with members of the Builders' Exchanges throughout the land to study these conditions and be guarded in what they do.

President Lewman then introduced S. B. Detwiler, representing the National Lumbermen's As-

sociation, who delivered an address on behalf of that organization, pointing out that the lumbermen were willing and anxious to establish a system of co-operation with builders with a view to giving the best service possible.

Report of Various Committees

Following this address the report of the Field Commissioner was read by Benjamin K. Nausbaum of Philadelphia. He stated that during his activities and investigation during the past year he had learned of the membership campaigns which had been inaugurated and of the many new members who had been secured by various builders' exchanges throughout the country. He suggested that a permanent information bureau be established in connection with each of the builders' exchanges affiliated with the National body.

The report of the standing committee was next submitted, and J. A. G. Baddorf of Kansas City read the report of the labor committee. He stated that during the year there had been a number of serious strikes in the building industry, but all had been settled by arbitration.

At this point of the proceedings the convention was informed of what had transpired during the executive session held the day before. The principal work was the formation of a policy governing the official publication of the association.

The committee on Quantity Survey recommended a further investigation along the line indicated and expressed the opinion that constant communication with the American Institute of Architects should be maintained throughout the year relative to the recently adopted Contract Documents.

At 1 o'clock in the afternoon the visiting ladies were entertained by the management of the Fidelity & Deposit Company, the invitations to the entertainment having been extended by former Governor Warfield.

Thursday Afternoon Session

The principal business of the afternoon session of Thursday, Feb. 24, was the election of officers and Board of Control for the ensuing year. The result of the voting was as follows:

Officers for 1917

President—John Trainor of Baltimore, Md.

First Vice-President—H. K. Cochran of Pittsburgh, Pa.

Second Vice-President—Henry Otis of Detroit, Mich.

Treasurer—George C. Schroeder of Grand Rapids, Mich.

Secretary—I. H. Scates of Baltimore, Md.

Board of Control

C. J. Kelly, New York, N. Y.; D. A. Farrell, Atlanta, Ga.; Franklin M. Harris, Philadelphia, Pa.; Harry I. Wood, Louisville, Ky.; C. A. Dubel, Sioux City, Iowa; R. L. Watson, Columbus, Ohio; C. C. Pierson, Indianapolis, Ind.; D. C. McChord, Dallas, Tex.; Ralph McLeran, San Francisco, Cal.; Henry Ferge, Sr., Milwaukee, Wis., and Perry W. Ruth, Norfolk, Va.

The newly elected officers were then installed,

after which suggestions were offered for the development and extension of the organization.

Mr. Lewman an Honorary Member

A pleasing feature of the convention was the election of retiring President H. L. Lewman to an honorary life membership in recognition of his untiring services during the two years in which he held the office of president. During this time he was able, with the assistance of Secretary J. M. Vollmer, to increase the membership of the organization 175 per cent, making it not only one of the largest commercial organizations in the world, but establishing it as a most useful vehicle for advancing the interests of all those engaged in the business of building construction.

Place of Next Convention

The contest for the place of holding the 1917 convention was most spirited, but Atlanta, Ga., was finally selected, the first ballot showing that city to have secured 197 votes, Detroit 191 and Indianapolis 168. Two or three other cities had scattering votes. The next ballot was almost as close, but finally Detroit and Indianapolis withdrew in favor of Atlanta, and a unanimous vote was recorded.

The Ball on the Roof Garden

The entertainment features of the convention were concluded on the evening of Thursday, Feb. 24, with a ball on the roof garden of the Hotel Emerson, which was a fitting climax to a succession of pleasant events, and it is hard to say whether the Baltimore hosts or their out-of-town guests had the better time.

Trip to Washington and Annapolis

On Friday, Feb. 25, the delegates and ladies to the number of about 200 were the guests of the Builders' and Manufacturers' Exchange of Washington, D. C. The trip from Baltimore was made by special train over the Baltimore & Ohio Railroad. Secretary Charles E. Welsh of the Washington Exchange was in general charge of the trip, and naturally he was a very busy person about the Hotel Emerson on the day before, gathering together as many delegates as cared to make the trip. Upon arrival in Washington the visitors were taken on an automobile tour of the city, then entertained at luncheon and afterward were received by President Wilson at the White House.

On Saturday, Feb. 26, the delegates and ladies visited historic Annapolis, and were given a reception at the Capitol by Gov. Emerson C. Harrington of Maryland. Following a luncheon at Carvel Hall there was a visit to the United States Naval Academy, and then came the return to Baltimore.

A New Fourteen Story Hotel

Plans have recently been filed in the Borough of Manhattan, New York City, for a fourteen-story apartment hotel to occupy a plot 40 x 100 ft. in West Sixty-ninth Street, and cost \$260,000. The plans by Architects Schwartz & Gross, 347 Fifth Avenue, were the first filed which comply with the new Building Code as regards light and ventilation, which went into effect March 14.

Conference of Secretaries of Builders' Exchanges

The day before the members of the National Association of Builders' Exchanges went into session the secretaries of many of the affiliated bodies held an all-day session and were the guests at luncheon of the Builders' Exchange of Baltimore. The deliberations of the body were presided over by Charles A. Bowen, the genial secretary of the Builders' and Traders' Exchange of Detroit, while A. H. Shank, the popular secretary of the Grand Rapids Exchange, acted as secretary.

The sessions were largely taken up with a discussion of a number of important phases of exchange work, and among the questions were several on "Legislation," "Labor," "National Organ," "Code of Ethics," "Committee Work," "Policy of Secretaries' Conference," "Sociability," "Co-operation, and Reciprocity," "Collection of Dues" and "The Field."

The secretaries of Exchanges in attendance at this conference included the following:

Charles A. Bowen of Detroit, Mich.
A. H. Shank of Grand Rapids, Mich.
I. H. Scates of Baltimore, Md.
C. B. Pitt, Assistant Secretary of Baltimore, Md.
Ed. Walters of the Master Builders' Association, Baltimore, Md.
Samuel B. Donnelly of New York City.
H. J. Mahon of Rochester, N. Y.
Howard Faust of Reading, Pa.
J. D. Stringer of Johnstown, Pa.
Vernon J. Dietz of Johnstown, Pa.
Henry J. Cohlgraff of Chicago, Ill.
E. M. Craig of the Building Contractors' Association, Chicago, Ill.
Charles F. Weltz of Cincinnati, Ohio.
A. A. Weingarten of Cincinnati, Ohio.
Paul J. Harvey of Youngstown, Ohio.
Frank G. Boyd of St. Louis, Mo.
J. M. Vollmer of Louisville, Ky.
Lee Parrish of Nashville, Tenn.
J. H. Snoddy of Chattanooga, Tenn.
Fred R. Stair of Knoxville, Tenn.
C. P. Massard of Des Moines, Iowa.
P. A. Bendfeldt of Richmond, Ind.
John Hauck of Indianapolis, Ind.
Oswald H. Albricht of Milwaukee, Wis.
A. V. Stein, Assistant Secretary, Milwaukee, Wis.
Benjamin K. Nusbaum of Milwaukee, Wis., Field Secretary of the National Association of Builders' Exchanges.
V. R. Gould of Omaha, Neb.
Clark Shelly of Omaha, Neb.
Philip Williams of Winston-Salem, N. C.
Dan Carey of Atlanta, Ga.
George F. Wadsworth of Norfolk, Va.
Charles E. Welsh of Washington, D. C.

Secretary Scates of the Baltimore Exchange and General Commissioner of the national body, urged the establishment of a "National Organ" and the matter was taken into convention proper with a recommendation from the conference that such a publication be launched.

North Jersey Master Builders' Association

Leading builders in Hudson County have recently formed an association, the objects being to promote the general welfare of builders and contractors. It is known as the North Jersey Master Builders' Association, with officers as follows:

President Samuel H. Rubine
Treasurer Max L. Baylene
Secretary Samuel Horwitz

Regular meetings of the association are held on the first and third Thursdays of each month.

Some Built-in Conveniences for the Modern Kitchen

Features of Household Equipment which the Carpenter and Joiner Are Often Called Upon to Construct

BY CHARLES ALMA BYERS

“A PLACE for everything, and everything in its place!” If there be any one room more than another to which the average housewife wants to apply this rule in her home, it is the kitchen. As every woman knows, it is difficult enough to keep this room “in order” when conditions are at their very best. Therefore, the kitchen should be as conveniently arranged and equipped as possible. And it is gratifying to observe that, in the modern home, wonderful progress

desirable auxiliaries, if space will permit of their being used.

Fig. 1 shows a section of ordinary cupboard and drawer space, but special attention, however, is invited to the nine small spice drawers that occupy the center of the picture. These drawers are so arranged as to occupy an almost square space at one end of the counter-shelf that here divides the cupboard space of the kitchen into an upper and a lower section. The space occupied is ap-

Fig. 1—The Nine Little Spice Drawers a Feature the Housewife Will Appreciate

Fig. 2—Open View of a Well Designed Built-in Refrigerator

Some Built-in Conveniences for the Kitchen

is, at last, being made in this direction. This is particularly true of the bungalow, for no other type of home has brought about the introduction of so many built-in conveniences.

The accompanying photographs are especially interesting as showing some of the numerous built-in features with which the kitchen may be equipped. Some of these conveniences, in design, are quite simple and ordinary and some are truly unique, but all of them will be found to constitute particularly

proximately 15 in. high by 18 in. wide, and the drawers are about 10 in. long. The sides and the bottom of each drawer are of tin, and the ends are of wood, while the knobs are glass. The drawers may be drawn entirely out if desired, so that they may be used at the work table or elsewhere. A set of such drawers for spices costs very little and are particularly convenient.

Another of the pictures Fig. 2 shows a still more desirable feature in this line—a built-in re-

frigerator. Being located in the kitchen, it is especially convenient, and, extending from the floor to the height of the ordinary door, it is unusually roomy, being nearly 36 in. wide by 20 in. deep, inside measurements. It is equipped with one large door below and a small one above, each about 6 in. thick, the center being filled with sawdust. The lower compartment is provided with three shelves, constructed of wood strips, and the upper section is used to hold the ice. The piece of ice may be inserted either through the door in the kitchen or through a small door opening onto the rear porch, and a drain for the water from the melting ice is naturally provided. An ice box of some kind is virtually a household necessity, and one of the type here shown is never in the way and is perhaps as inexpensive as any other kind, size considered. To

Some Built-in Conveniences for the Kitchen—Fig. 3—A Well-Designed Closet for Storing Cooking Utensils

make them air-tight, the doors are edged with canvas.

Fig. 3 shows a well-arranged closet for cooking and baking utensils, tins, pans, lids, etc. The interior walls are provided with numerous headless nails on which to hang the different articles, and the inside surface of the door is equipped with four well-designed racks or trays for holding the articles which cannot be hung on the nails. The closet is sufficiently roomy to hold practically all the necessary articles of this kind.

In Fig. 4 is shown a collapsible table which can be used as a work table or a dining table for the servant, and when not in use it is entirely out of the way. This one is 36 in. long by 24 in. wide. It is fastened to the wall by two hinges placed along one of its longer edges, and a hinged iron brace underneath the center enables its being raised or lowered at will. When lowered it hangs so close to the wall as to take up no room whatever. A table

of this kind can be added to the equipment of almost any kitchen, and will cost comparatively nothing. A stool of the kind here shown is, of course, a desirable adjunct thereof.

Fig. 4—A Collapsible Table of Great Convenience

In Fig. 5 of the pictures are shown three flour bins of the more common type. Each of the bins is nearly 2 ft. deep by about 1 ft. sq. at the top, inside measurements. The board which forms the back, however, is set at a slant, so that the dimensions at the bottom are approximately 12 by 3 in. The bins are fastened with a hinge at the bottom, and by pulling outward on the knob at the top they are opened to access. They are held in such manner that they can be drawn outward only far enough to expose the opening. The bins occupy the space beneath one end of the sink drain-board, and immediately above them is a disappearing bread board of the usual type.

There is shown in Fig. 6 of the pictures a combination of conveniences. Occupying wall space approximately 3 ft. wide, extending from the floor to

Fig. 5—Three Flour Bins with Disappearing Bread Board Shown Above and Partially Drawn Out

the ceiling, it would be extremely difficult to more compactly group so many very desirable features than is done in this arrangement. Placed at a height of 33 in. from the floor is a deep counter-shelf, and immediately beneath it is a bread board, 24 in. wide by 18 in. deep, which may be pushed

back when not in use. Below this disappearing board, on one side, are two flour bins, and, on the other side, are respectively an ordinary drawer di-

flour bins, or drawers, are lined with tin, curved in such manner as to make the center deeper than the front and back ends; and the door of the cabinet is equipped with a sort of shelf, near the lower edge, with a suspending brace at the edge nearer the hinges, on which rests the jar of lard, and which is swung outward from the cabinet by merely opening the door. Immediately above the counter-shelf are two shallow shelves, used for extracts and

Fig. 8—The Ironing Board of the Built-in Type

Fig. 6—A Combination of Conveniences

Fig. 7—A Draught Cooler Which Serves an Excellent Purpose as a Feature of the Kitchen Equipment

Some Built-in Conveniences for the Modern Kitchen

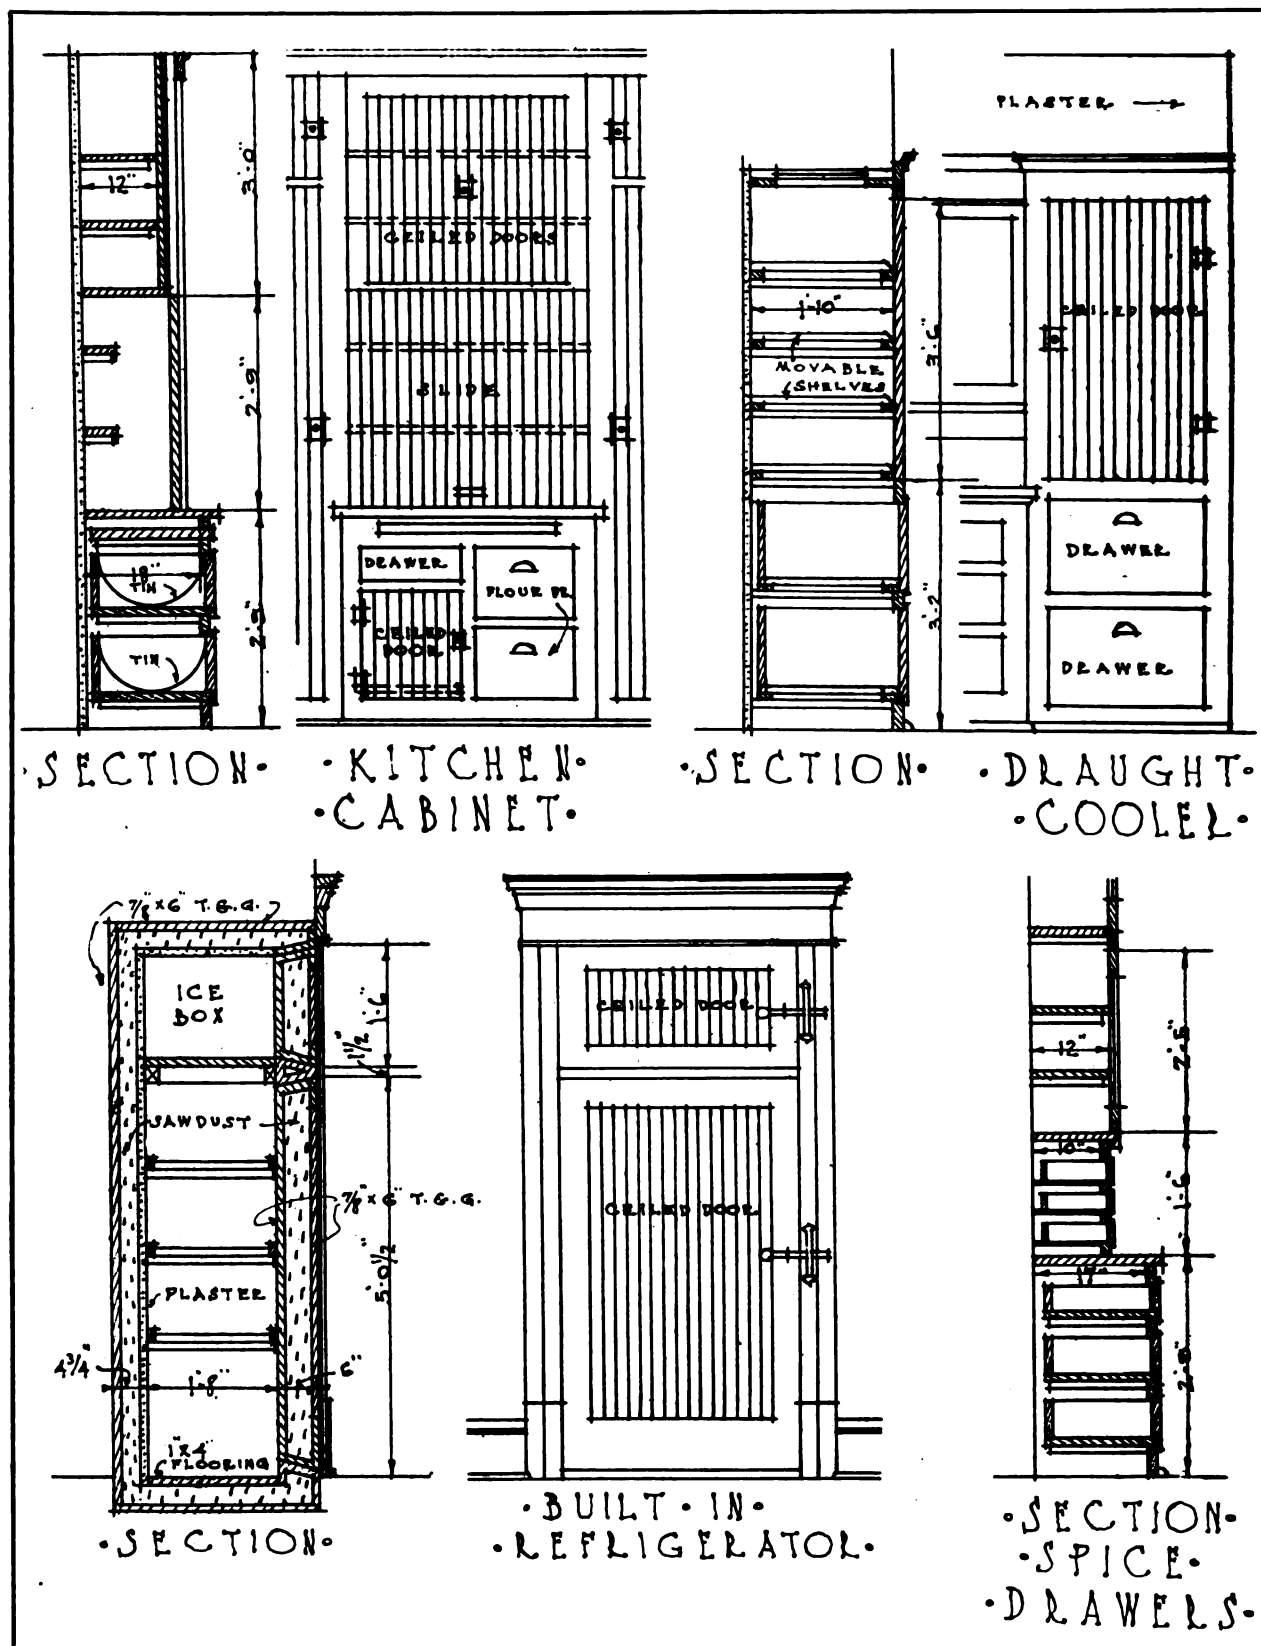

vided into spice compartments and a cabinet for lard and other things, requiring considerable space, that may be needed in cooking or baking. The

other cooking or baking ingredients, which are either exposed to view or concealed by respectively raising or lowering a sliding door, the weight of

which is counterbalanced in such manner as to cause it to remain in any position desired. And above the center portion is still another section, which is occupied by a sort of cupboard space, equipped with a pair of ordinary hinged doors.

shelf, the woman will find that nearly everything required in cooking or baking is so conveniently at hand that she will not be compelled to rise from her chair.

A draught cooler, quite indispensable as a kitchen

Some Built-in Conveniences for the Modern Kitchen—Various Details of Construction

The front surface of this section is set into the wall far enough to enable the raising of the sliding door of the middle section without causing interference. By seating herself before the counter-

feature, is shown in Fig. 7. This cooler has openings at the bottom and the top, to assure a cooling draught, but in other respects it differs quite a little from the ordinary kind. In the upper portion are

four shelves, which are constructed of wood strips instead of wire screen; and in the lower portion are two large drawers, the bottoms of which are also constructed of wood strips. These open wood frames give the maximum of stability and at the same time permit a free circulation of the draught.

If you would always have your ironing board in its proper place you will want one of the built-in kind. Fig. 8 of the accompanying illustrations shows such an arrangement. This board, which is 12 in. wide and 5 ft. long, when not in use, folds up neatly into its own special cabinet, and, by closing the door, is concealed from view. The cabinet end of the board is equipped with tiny knobs which fit into slides or grooves in the sides of the cabinet. The brace is fastened to both the board near the center and the bottom of the cabinet by hinges. The board is held stationary at a certain level by the knobs slipping into small notches in the grooves. There are several ways of designing built-in ironing boards, and others will perhaps readily suggest themselves. One common plan is to fasten the board at one end to the interior of the cabinet with hinges, and then fasten to the underneath near the other end of the board a hinged leg, which, by raising the board upward into the cabinet, folds alongside the under side of the board.

The last of the illustrations Fig. 9 shows still

another very desirable kitchen feature—a Dutch breakfast corner. These have come into considerable favor during the last few years, especially with bungalow builders, and have proven very convenient for serving the morning meal in the small home and as a dining place for the servant or for the small children in the larger home. The spaces devoted to such corners are of various dimensions. A space 5 ft. wide by about 4 ft. deep, however, will prove quite sufficient in most cases. The table in such instances will be about 3 ft. 6 in. long by about 2 ft. 6 in. in width. The seats are invariably stationary, but the table may be constructed so that it can be removed from the corner, in order that it may be temporarily used for some kitchen emergency, or so that the corner may be the more easily cleaned.

The kitchen features here suggested are practical and the cost of installing them will be found to be very little as compared with the convenience that they afford. They help very materially toward making kitchen work more pleasant and considerably lighter, and every housewife will find them a source of much delight. The ones here illustrated are merely intended as suggestions, for in making adaptations it will often be necessary to make certain changes to suit the particular kitchen in which they are to be used.

Variation in Builders' Estimates

Some of the Differences Noted in Connection with Actual Bids on Contracts for Construction Work

It is a well known fact that in the competition for work, builders' estimates frequently vary to a surprising extent, and some of the results of this competition are set forth in the Monthly Letter of Secretary Sayward of the Master Builders' Association of Boston. The following extracts cannot fail to be read with interest.

"On a bank alteration job, an alleged ambiguity in specifications led to one contractor's success. He found, after he had expended about \$100 on the job, that the architect was expecting him to do things he had not estimated to do. Inquiries easily established the fact that four other bidders had all included the items in question—the successful one had not. Owner, architect and builder each paid one-third of the cost of the error, about \$300 each. But what of the unsuccessful bidders?

"On a house some distance from Boston, about ten years ago, three bidders figuring about alike were above the price set by the owner for his expenditure. The architects, a leading firm, told him he could cut his requirements, or could get another series of bids from men doing a lower grade of work. He chose the latter alternative, and his house was built within his price.

"On a job of interior finish, some distance from Boston, three or four years ago, three Boston bidders doing a similar high grade of work were within \$1,000 of \$137,000. The work was let for \$92,000 in another city, and, even after adding on an acknowledged error of \$25,000, the successful bidder would still have been 16 per cent under the Boston men. None of the Boston men would have made over \$15,000 on the job.

"On a small job in a small town, five figures were \$9,500, \$9,300, \$9,000, \$8,900 and \$6,600. What is obviously within a few hundred dollars of the right price? The owner was delighted at the low price. Why should he have been?

"On a recent bank alteration job, with six bidders, four were eliminated after the bids were in because they were not local men. Refiguring of cuts was done by the other two, and one dropped one thousand dollars more than the value of the cuts (finding he had to do so), and although still high was awarded the job because he was a depositor in that bank, while the other was not.

"On a job in 1912, where cuts were figured, one competitor dropped five hundred dollars where twelve hundred dollars' worth of stone mason's foundation work was changed from stone to concrete in location where materials for either were easy to get. Cuts offer a splendid opportunity for one man to drop by another, and win by, in fact sub-

mitting a second figure when he surmises his first one was a little too high.

"Recently, subcontractors for painting figured so cleverly that the lowest on a job was \$650 and the highest \$2,180, with enough good men together around \$1,500 to show that probably there was the right price. Some contractors figuring would use the low figure, others not wanting to must do so, or risk their chances of winning. This element is a common feature of competitive bidding.

"In September, 1915, a reputable Boston architect of a fairly large job stated that the owner had a fixed price set for his work, and that he had purposely selected a list of bidders commonly varying widely in price and in quality of result. From them he had chosen as good a man as he could, and come within the price established; and he said that he regretted not being able to choose a better man.

Effect of Guarantee

"Two or three years ago, an owner who formerly let a contract to a bidder about 20 per cent under a group of competitors, and who was not satisfied with the results obtained, strove to mend matters upon some further work by a most stringent three-years' guarantee—the strongest document of the sort ever seen by Boston contractors who estimated the work. This document was the work of the owner, not of his architect. Here was a direct intent to make a silk purse out of a sow's ear by legal verbiage—followed, if needed, by legal procedure.

"A few years ago a hard-fought job near Boston was awarded to the contractor fourth from the bottom in a list of six bidders. Later, he was told the owner always intended him to do the work.

"Recently, on a job a few miles from Boston, the owner told one bidder that he wanted him to do his work and that he would pay a preference, but not a large one. The job went to another man, who by the use of two subcontractors, whose bids the preferred man had but did not care to use, saved more than the difference between the two figures.

"In 1915, a job near Boston had four bidders within a fifteen-hundred-dollar variation figuring around \$62,000, while a fifth was about \$50,000 and won the award. What will happen to the winner and to the work he does?

"Time is of the essence of this contract.' How often this is written! A year ago a large job was let to be completed Aug. 15, 1915. On October 1, 1915, it was nearly done. A contractor's promises for time are commonly taken in preference to an examination of his performances.

The Forfeit Clause

"Not long ago the wife of an owner told a friend about to build to put a forfeit clause into his contract, for the reason that it could always be collected, for some reason or other, and was a good way to save on a contract.

"Recently an architect asked for two bids from general contractors. With one of these the architect was in league to the extent of giving him competitor's prices in order that he might bid under them—and the other contractor knew it—and knew the owner. After the bids were in, he approached the owner thus: 'Now, Mr. Blank, I have a grudge against Smith, my competitor, and I can work it

out and show you how to make a thousand dollars if you will give me fifty dollars.' Mr. Blank agreed. 'I will go to your architect, claim I made a mistake, withdraw my bid, put in another one, one thousand dollars lower; your architect will tell his friend, who will do the same thing. You will make a thousand, and can then send me fifty.'

"On a job of plumbing worth \$750 a low bidder was awarded the work at \$475. Recently, two years later, alterations were made, and the hot and cold water piping, specified "iron-sized brass"—a good brass pipe—was found to be gilded iron.

"The above cases, excepting one or two, are typical instances of occurrences which are very common—so common that they would not be worth reciting were our readers only those familiar with building operations. The cases quoted are not garbled or exaggerated, but are normal, and are all actual happenings."

The Spirit of the Country Home

Sometimes there comes to every one of us the overwhelming desire for a home in the country. If the call is unheeded, one of the finest and most satisfying joys that life holds will have been missed.

It is easy to establish a home in the country, and it matters not so much where one builds. It may be by the sea; in the wooded hills or on the plain, and in almost every instance will be found many generous gifts of nature that will serve the builder of the country home to make the house a very part of the spot on which it stands. For the form it will take there is a wide choice, says Noble Foster Hoggson. Splendid advancement has been made in the design of the country house. The fortunate seeker for a home in the country, however, is the one who finds, hidden away from the beaten track, an old homestead which may be remodelled without marring its fine simplicity, its real charm.

No fairy is needed to bring the dream of a real country home into being, when once the place has been found; no magic is brought into play. The owner need only find a designer, who is at the same time a builder, and who can put himself in the place of the owner in spirit as well as in the practical working out of the scheme. He will begin with the owner at the beginning, and take upon himself the whole responsibility, because all necessary elements work more harmoniously and co-operatively under a single direction and management. A home constructed in this way has no bickerings or misunderstandings built into it, and holds no disappointments, but on the contrary brings a sense of satisfaction that grows with the passing years.

Code of Lighting for Factories

As an aid to Public Service Commissions, State and Municipal and Industrial Commissions, Factory Boards and other bodies taking up questions of legislation as related to factory and mill lighting, the Illuminating Engineering Society has prepared a Code of Lighting for factories, mills and other work places readily available for transforming into legal orders. This code was discussed at an open meeting held in New York City on March 14.

CORRESPONDENCE

A Department Where Those Interested Can Discuss
Trade Topics—Every Reader is Invited to Participate

Defective Bracing

From Builder, Clinton County, New York.—For a long time I had been puzzled to know why good framers had one brace loose and all the others in the bent very tight. I finally discovered a mire

Defective Bracing as Described by "Builder"

hole they fell into. The sketch is drawn to point out the failure to readers who may be framing. The danger is as great in sawed as in hewed timber. Also the work line is placed on those posts for "McM's" benefit as well as for those who have never seen it in framing hewed timber.

The distances *D* and *E*, Post A, are equal; the gains are all sunk to the work line to which the tenon is sized. On post *B* the sizing and superfluous timber are on the left face; the right hand face is worked to the hew line; now if a brace is put on the right face at *F* and the run measured from the mortise as at *D*, that brace will be too short by the depth of the seat *F*.

Again, if *B* is sawed or planed timber the mortise would be the full width of the timber and if the run of the braces are taken as at *a* both braces will be short.

Now it is clear that the rise of the brace must be taken from the housing of the plate or post and the run must be measured from the work line which limits the depth of the gains even if you don't put the work line on. The post *C* is a hewed center post 10 x 10 in., but much larger; the work line is placed in the center, the tenon sized to 9 in., the bottom of each gain is 4½ in. from the center line. Most framers size the center post all from one side and get one loose brace.

Question in Floor Construction

From W. K., Highland Park, Ill.—In regard to the question of "L. S.," Dixon, Ill., concerning the use of ¾-in. oak flooring in a church laid over a

good level sub-floor with felt between I desire to offer a few comments. I have laid a considerable quantity of this in 1¾-in. and 2-in. widths with square edges and have found that it makes a very good and substantial floor. These results, however, are obtained by using quarter sawed material, exercising great care in laying the floor and then keeping it properly finished. The plain sawed material is apt to buckle badly when it becomes damp and it will warp and show cracks; therefore it is not suitable for thin floors.

From Contractor, Moffittsville, N. Y.—Regarding the query of "L. S.," Dixon, Ill., will say "Don't do it." It will be a botch job in less than a year. Flooring that thin is useless anywhere except in small rooms of dwelling houses. It will be dearer than 13/16 in. before the job is done. Get a high grade article, bored, tongued and grooved or doweled at the ends. It will cut but once in each course, and the piece cut off will start the next course. Lay crossways over the old floor and 8d finish nails or 6d flooring nails will give a good job. Use a nail-set and do not pound the lumber. A bar of soap is a useful article on the job.

Construction of a Carpenter's Tool Chest

From S. D. Gratke, Cedar Falls, Iowa.—I am sending herewith a view of my tool chest which may possibly interest some of the readers of the

Construction of a Carpenter's Tool Chest

paper and also answer the needs of "C. R. W." who made inquiry in the February issue in regard to tool chest construction. I intend to make some

improvements in my tool chest just as soon as I can obtain information as to the best means of accomplishing it.

I have tried in the construction of this box to follow the idea of "a place for everything and everything in its place." The outside dimensions of the chest are 20 x 20 x 36 in. As will be seen from the picture, saws and squares are placed in the lid or cover. The front doors hold a set of chisels, a set of auger bits and a few other tools. In the large bottom drawer are the planes while the small tools are kept in the other drawers. The two bottom drawers extend to the back of the chest, while the others run only half way back, thus giving a recess in the rear of them for larger tools. I have very nearly a full set of tools, and while the chest is not sufficient to hold all of them it is heavy enough to handle.

Shingling on the Pacific Coast

From G. L. McM., Tacoma, Wash.—While the subject of shingling is being discussed I wish to register my objection to the "calked shoe" method

Shingling on the Pacific Coast

of work, though I know that it is quite generally practised. It is a case of sacrificing quality and durability to speed. It does not add anything to the excellence or durability of a roof to have from one to a half-dozen men tramping over it with spiked shoes. When one considers that *A* shingles—the grade most commonly used—are only "6 to 2's," that is six of them only measure 2 in. in thickness, and that loggers calks are from $\frac{3}{8}$ in. to $\frac{1}{2}$ in. long one does not need a "double million magnifier" to see that there is not much left between the bottom of the calk hole and the under surface of the shingle, to say nothing of the liability of splitting shingles in walking on them. The small spurs necessary to keep a seat such as "O. K." describes, from slipping, would not materially injure the roof however.

With the use of the seat described by "O. K." in the December issue, the 2 x 4 toe holds in common use here, and the gauge on the hatchet, a roof can be shingled with speed enough to satisfy ordinary demand, and the increased quality of the roof will, in my opinion, more than make up for the trifling loss of time. If the shingles are carried up and distributed before the shingling begins, and placed one bunch every 5 or 6 ft. each

way, there will always be a bunch within easy reach of the shingler, and very little moving bunches out of the way or hunting extra bunches will be necessary and it is less work to properly distribute them in the first place than to move them about as required after the work of laying them is started. This is one of the numerous cases where the application of a little brains and foresight in planning the work in advance pays big dividends in time saved later on. More such planning would obviate the necessity of using injurious "hurry up" methods later on in order to make a profit on the job.

In inclose a sketch of the way to put on a toe hold such as I have mentioned, which is self-explanatory. It will be noticed that the shingles holding the 2 x 4 are nailed to the under side and that the toe hold is placed just below the butts of the next course of shingles, of which the shingles holding it become a part. When the shingling is completed the 2 x 4 can be raised a little and the shingles holding it sawed off even with the course, leaving the roof smooth and with no nail holes exposed to become possible leaks later on. Nothing thicker than 2 in. should be used for toe holds put on in this way, as if thicker material is used there is a tendency for it to roll under pressure of the feet and become loose with the result that a dangerous, if not fatal fall may occur. I once worked with a man who got a fall, resulting in a broken ankle that laid him up several months, from using a 4 x 4 for a toe hold. Care should be taken that the holding shingles are well nailed both to the toe hold and to the roof above. I have used this kind of a toe hold exclusively for twenty-seven years and never knew of one giving way where nothing thicker than 2-in. was used.

If shingles are nailed about $\frac{1}{2}$ in. from the edge and care is taken to break joints not less than 1 in. there will be little danger that nails will come under the joint in the course above.

Repairing a Concrete Roof

From W. K., Highland Park, Ill.—Replying to the inquiry of "J. B.," Wyoming, Iowa, in the March issue of the paper regarding a leaky garage roof, I would suggest the use of a prepared roofing cement which can be bought at almost any tin shop or hardware store. The correspondent should see to it that the cracks are clean and dry, and then work the cement well into them so that it will firmly adhere. I have used this preparation for repairing roofs, gutters, tin decks, chimneys, etc., with good results.

From Builder, Redford, N. Y.—I am thinking that "J. B.," Wyoming, Iowa, has a job hard to discuss without giving more data. I have done concreting 18 degrees below zero. If such work is troweled it will crack and scale. Freezing does not necessarily cause cracking, as it may be due to shrinkage or settling of the lumber. The first thing he must do is to get up on the roof and examine it. He should have done this before he wrote. If there are disintegration areas they must be cleaned out, well wet and plastered over with cement mortar waterproofed with 5 per cent to 10 per cent of Maltha. If everything is sound and only cracks he may fill these with "Tarvia X.," a material used to fill the cracks in cement highways.

If the cracks are large, fine sand may be mixed with the Tarvia. After the cracks are well filled, the entire roof may be given a coat of Tarvia A applied at 170 degrees F. This material adheres firmly to concrete.

Scaffold Bracket for Asphalt Shingle Roofs

From W. M. Spalding, Elmira, N. Y.—In reading the article by E. H. Crussell in the March issue of *THE BUILDING AGE* it has occurred to me that the bracket I am using for scaffolding on asphalt shingle roofs might possibly prove of interest to some of the readers of the paper. I am, therefore, sending sketches, Fig. 1 showing the bracket and Fig. 2 its application on the roof of a building.

Any blacksmith can make these brackets. We use $\frac{1}{8} \times 1\frac{1}{4}$ in. band iron. The two hooked notches or slots in the top of the bracket as shown in Fig. 1 are just large enough to work over an 8d wire nail

Fig. 1—Side View of Bracket with Plan of Upper Part Showing Slots for Nails—Scale one-quarter full size

sheathing nailed to the sill as well as the studs.

In some respects there is an advantage in using studs of the full height of both stories, and I sometimes use that method myself. It has some disadvantages, too. Our custom here is to put down the floor joists and lay the floor lining, which can more easily be cut off flush with the outside of the frame than with the edge sill shown by "J. P. W.," then the 2 x 4 is nailed down and the stud nailed to the plate while spread out on the floor in sections as long as can easily be handled. Door and window openings can be framed in at the same time if desired, but that is not usually found desirable, and the walls and bearing partitions are raised in sections. These sections can be more easily handled with studs of only one story length than with full length studs, and the saving in time more than offsets the extra 2 x 4 used for sills. The second floor joists are then placed and the second floor lining laid and the process repeated. This method gives us a smooth floor to work on, which is much more convenient and safe than loose boards laid on the joists.

Another advantage, with us, of the one-story-at-a-time method as opposed to the full-length-stud

Fig. 2—View of a Portion of a Roof Showing the Manner in Which the Scaffold Brackets Are Applied

Scaffold Bracket for Asphalt Shingle Roofs as Described by W. M. Spalding

driven down tight on the iron. When through with the scaffold a tap on the bottom end with a hammer will unhook the bracket and it can be pulled out. The nails sticking out only $\frac{1}{8}$ -in. will never give any trouble. We have used these brackets on a great many roofs and find them to be very satisfactory indeed for the purpose.

Methods of Building Construction

From G. L. McM., Tacoma, Wash.—I concede that "J. P. W.'s" method of constructing a built-up sill might make a somewhat stiffer frame than the way I mentioned, especially if the studs were spiked to the edge sill as well as the flat one, but that would seem to necessitate setting up the frame before the floor lining was laid, which would be a disadvantage. Probably no one method combines the advantages of all, with none of the defects of any, and no doubt all our methods are modified by the conditions as we find them.

I do not think there would be any appreciable danger of the sills and superstructure parting company as he suggests, especially if, as is usual here, the walls are sheathed diagonally and the

method, is that our lumber comes to us direct from the saw-mill, and often there is no appreciable pause between the mill pond and the unloading of the lumber on the job. Consequently our lumber is usually wet or green, or both, and has very little chance to dry out or season before the house is finished and occupied. It is Douglas fir, and a fir joist 2 x 12 will shrink $\frac{1}{2}$ in. in seasoning. If the framing is done as I showed, the walls will follow the shrinkage of the joists, while if full-length studs are used, and they are set on the flat piece of the sill, as "J. P. W." suggests, the base and other finish, being nailed to the studs, will part company with the floor, much to the detriment of the appearance of the completed job, especially if, as is usually the case, the shrinkage does not fully take place till the heating plant has been in full operation for some time, the painting and varnishing completed and the house occupied. I knew of one \$20,000 house in which this was the case and the floor and floor mold dropped a full half-inch away from the base.

Will "J. P. W." kindly tell us why he prefers to have his sheathing on the inside of the wall rather than the outside? I have never been able to see any good reason for that.

I wonder if "D. P. B.'s" "Oregon spruce" doors are not really made of Douglas fir? Spruce is not considered good door material here, and as it is more expensive than fir, and as I do not know of any company making doors of that material while there are many makers of fir doors hereabouts, I am rather inclined to believe that the doors are marketed under a false name.

Our Pacific Coast spruce is about half way between New England spruce and white pine for hardness; is very susceptible to changes of humidity in the atmosphere, and is much disposed to roll up or become stringy under the plane or chisel, and is hard to finish without becoming fuzzy. Fir is known in some markets as "Oregon pine."

Constructing Simple Concrete Steps

From E. Edward Kurtz, Grand Rapids, Mich.—My attention was recently drawn to the article appearing in *THE BUILDING AGE* describing a method of building simple concrete steps, but as the information there given is in some respects in conflict with my own experience, I take the liberty of

Constructing Simple Concrete Steps

offering a short description of the method which I have found satisfactory for doing work of this kind.

First—Excavate the ground to the required area; the depth may be a foot or more, depending upon the nature of the soil. Good firm soil must be reached for the foundation. It is very important to have a good foundation and good drainage, for without these the concrete is liable to settle and crack. After excavation is completed, fill the space to a depth of about 6 inches with gravel, stone, broken brick or cinders, and then tamp compactly.

Second—The next step is to build the "forms." They may be made of almost any kind of lumber, so long as it is straight and free from knot-holes and slivers. It is always best to use two-inch material, or lumber of nearly that thickness, as the "forms" need to be rigid. Poor "forms" make bad looking concrete. Stock size lumber may be used in many cases. It is always better to complete the "forms" and brace rigidly before the concrete is placed. The drawing shows how "forms" are often built.

Here, A, A, are the 12-in. treads; B, B, the 7-in. risers; C, C, the 2 x 4-in. stakes, and D, D, is No. 12 wire.

Third—Now proceed with proportioning, mixing and placing. Use a 1:2:4 mixture—that is, to one sack of cement use 2 cu. ft. of sand and 4 cu. ft.

of gravel or stone which is not over 1 in. in diameter. The quite common practice of using bank-run gravel directly is a poor one. It should first be screened and reportioned, as the correct proportion of sand and stone is rarely found in the pit. The mixing, if by hand, should be done on a watertight platform.

First mix the cement with good, clean, coarse sand until a uniform color is obtained, and then add water until the mixture is mushy. Next, add the coarse aggregate and mix thoroughly. While placing the concrete, spade or trowel along the sides next to the "forms," so as to get the larger particles away from the surface. If this is carefully done, a smooth surface will be obtained. The treads, by sufficient troweling, can be made smooth, although they should not be smooth enough to be slippery. Good practice is to put a ¾-in. of mortar, 1:2 mix, on the treads.

Good judgment must be exercised in the removal of "forms" and the curing of the concrete. During warm weather the "forms" may be removed within twenty-four to thirty hours. In cold weather they must be left on much longer, as concrete hardens very slowly when the temperature is low. In hot weather the concrete should be protected from the direct rays of the sun and kept damp for a week or ten days.

The method here given is not the only one, but if it is carefully followed, steps that are permanent and attractive may be constructed.

Framing with the Steel Square

From G. L. McM., Tacoma, Wash.—It is to be regretted that a man of Mr. Barry's ability, and no one who has read *THE BUILDING AGE* for any length of time can doubt his ability, persists in what he must know are erroneous statements, and fails to see that there is more than one way of doing most kinds of work; also that methods which are correct for one way may not be correct for another way of doing the same kind of work. The bevels of jack-rafters against hips and valleys are not the same as the bevels of hips and valleys against ridges, as every roof framer knows, and the same figures on the square will not give the correct cuts for both, else why do framing squares give different cuts for the two? Why do framers ask for the proper cuts for hips against ridges? Neither will there be any such difficulty as he contends in the matter of fascias with my methods of framing.

The whole trouble seems to arise from the fact that Mr. Barry does not understand, or will not admit, that there can be any other way of doing work than the one he has learned. I understand his method of framing roofs, and with the exception of the contention that the same cuts can be used for both jacks and hips, his directions are correct for his method, just as mine are for my method. There is a difference in the framing of both valleys and hips, depending on whether they are to be backed and grooved or not. His figures are for the former, mine for the latter. I consider it unscientific and the mark of an inferior workman to do unnecessary work that does not add to either the strength or appearance of the finished job. And

backing hips and grooving valleys, except in rare and isolated cases, is such work. Of course, if his customers want their work done that way, well and good, and if he can do his work and put in more or less unnecessary time and labor and "get by" with it, that is a matter between his customers and himself.

Referring particularly now to his strictures in the March issue, I would say that obviously his lines A A of Figs. 1 and 5 in the October issue are correct *if the hips are to be backed*, but not otherwise.

Where the hips are *not to be backed* the length of the line A, Fig. 1, October issue, must be taken on the hip *one-half the thickness of the hip back from A, Fig. 5 of the October issue*, as shown in my article in the issue for November, 1915. Where the valley is to be grooved the same allowance must be made, with this difference, that the length of the line A, Fig. 1, October issue (on the common rafter)

Fig. 1—Method of Finding Bevel for Edge of Door

Fig. 2—Side View of Trestle with Box

Fitting and Hanging Doors—Contributed by "J. C. G.," Philadelphia, Pa.

must be laid off on the valley *outside* the line A, Fig. 5, of the October issue, instead of *inside*. In other words, when the hip is *not to be backed* or when the valley is *to be grooved* the length of the line A on the hip or valley must be taken *where the edge of the hip or valley cuts the outside edge of the plate—not at the center of the hip or valley*.

It will be understood that I assume that the line A, Fig. 5, of the October issue is at the point marking the length of the hip or valley at the corner of the plates, which will mark the place the hip is cut while the valley will naturally be cut half its thickness longer.

Fitting and Hanging Doors

From J. C. G., Philadelphia, Pa.—I have read with a great deal of interest the various communications appearing in the Correspondence Department of THE BUILDING AGE, and have obtained valuable information therefrom. Having read the article recently published on fitting and hanging doors, I thought, perhaps, the method of doing this

sort of work which I use might interest the readers.

The tools and appliances are a jack for holding the door while jointing it and fitting the hinges, also a pair of trestles with a box fitted in between the legs to hold the tools, and at the same time serve as a handbox. I use a foreplane to joint the door and on hardwood doors I use a scraper plane to smooth the curly grain, a thin 2-in. butt chisel to mortise out for the butts, a gage, an automatic drill, a screw-driver and other necessary tools.

I first place the door on the trestles and measure the width of the door opening with a slide rule. I then plane or rip off the surplus wood from each stile so the door will go in the opening. I take the same amount off the top of the door that I took off the sides. I obtain the height and cut off the bottom of the door about $\frac{5}{8}$ in. from the floor.

The next step is to try the door and take off enough for clearance. The bevel I give the door is just enough to open clear of the jamb with the same joint as when the door is closed. I fit the butts on the door first and then place the door in the opening, marking the jamb for the butts. I mortise the butts on the jamb, put in one screw, hang on the door and then put in the remaining screws. If care is used in fitting the butts, the door will work well with very little adjusting.

I am sending a sketch, Fig. 1, of the way I find the correct bevel for the edge of the door, also

Fig. 3—Plan and Elevation of "Jack"

sketches, Figs. 2 and 3, of the jack and trestle.

Hanging doors and fitting locks, I think, are about the most important work in connection with a building, for to become an expert it is not so much the method used as it is practice and experience.

I fit locks very much the same way as described in a recent issue by "D. P. B.," Redford, N. Y.

"Wrinkles" in House Building

From G. L. McM., Tacoma, Wash.—I notice the printer (or my mistake) made me say in my article in the March issue that I used $\frac{1}{2}$ -in. nails for siding. Of course it should have been $1\frac{1}{2}$ in. My directions for gluing mitered joints are not so clear as could be desired, either. The blocks should, of course, be glued on and the glue allowed to dry, then the joint glued and the clamps applied. The same method can be used in making picture frames.

To be your own architect is said to be worse than to attempt to be your own lawyer.

New Publications

Theaters and Motion Picture Houses. By Arthur S. Meloy. 122 pages, size 7 x 10½ in. Illustrated with line drawings by the author. Bound in board covers. Published by Architects' Supply & Publishing Co. Price \$3.

Poor indeed is the hamlet or village at the present day that is unable to boast of at least one moving picture theater within its precinct, and with something more than 18,000 scattered throughout the country with an attendance that is figured at millions of persons daily, the observing architect and builder cannot fail to be interested in what must be regarded as the first book of designs of moving picture theaters which has yet been placed on the market. The work above referred to constitutes a practical treatise on the proper planning and construction of such buildings, and at the same time contains a vast amount of useful information including rules and data which cannot fail to prove of value to architects, builders and prospective owners. There are half-tone engravings of eight moving picture theaters scattered throughout the country and eighteen plates relating thereto, giving floor and balcony plans, sections, details, etc., all of which are of practical value. The descriptive text covers all those features concerning which the architect and builder desires information and among the tables is one giving in condensed form comparative laws of various cities. The matter is arranged with a careful regard to the requirements of the architect and builder, and considered as a whole, the work is one which should find a place in the library of every progressive architect and builder throughout the country.

Practical Perspective. By Frank Richards and Fred H. Colvin. 64 pages. Size 5 x 8 in. 64 illustrations. Published by the Norman W. Henley Publishing Company. Price, 50c.

The book, which is now in its fourth edition, is a practical treatise giving the principles of perspective written in such a way that they can be understood and applied by a mechanic. It is intended also for the manager who has to make sketches to illustrate his instructions and the draftsmen who must turn in the finished drawings. It tells how to make all kinds of mechanical drawings in isometric perspective. In doing this a brick is taken as a starter and the method is developed up to the sketching of irregular figures, such as five-pointed stars, etc. The use of isometric sketching paper by which it is possible to make a sketch in short order without using anything but a pencil is also explained.

Concrete and Reinforced Concrete. By W. L. Webb and W. H. Gibson. 240 pages. Size 4¾ x 7 in. 119 illustrations. Bound in flexible leather with gold titles. Published by American Technical Society. Price \$1.50.

This is a condensed treatise on the problems of concrete construction which cannot fail to be of interest to the building contractor having to do with concrete work, whether plain or reinforced. The

authors have endeavored to present the subject in a simple and concise manner, so that the younger element in the trade may readily absorb the principles involved. The composition and treatment of cement, sand, stone and mortar, the mixtures most commonly used, the reinforcing bars and the fireproof qualities of concrete are discussed in a way to afford accurate knowledge of their relation to the general subject in hand. The authors have taken special pains to render clear and simple the general theory of flexure in reinforced concrete, and the same is true of the design of the ordinary beam and girder type of floor. The text includes tables and diagrams by means of which designs may be made without recourse to other portions of the text. A comprehensive index, alphabetically arranged, is also a feature of the work, which is one that will be found a valuable addition to the trade library of the progressive builder.

Officers of Brick Makers Association

At the recent convention of the National Association of Brick Manufacturers the following officers for the ensuing year were elected:

President, C. J. Deckman of Cleveland.

First Vice-President, Fritz Salmen of New Orleans.

Second Vice-President, George H. Clippert of Detroit.

Third Vice-President, J. W. Robert of Clinton, Ind.

Secretary, T. A. Randall of Indianapolis.

Treasurer, J. W. Siblay of Birmingham.

It is interesting to note in this connection that Secretary Randall was elected for the thirtieth successive term.

New Officers of Concrete Mixer Makers Association

At the meeting held during the period of the Cement Show in Chicago, Ill., the National Association of Mixer Manufacturers elected the following officials to serve for the ensuing year:

President A. Cameron

Vice-president .. William A. Hart

Secretary H. E. Smith

Treasurer F. C. Wilcox

H. M. Capron was elected a member of the executive committee.

Meeting of Pennsylvania Building Material Dealers' Association

The annual convention of the Building Material Dealers' Association of eastern Pennsylvania was held at the Hotel Walton in Philadelphia on March 9, when officers for the ensuing year were chosen as follows:

President George F. Erich of Allentown

First Vice-President .. E. L. Merriman of Scranton

Second Vice-President .. Chas. A. Miller of Reading

Third Vice-President ... J. L. Tyson of Philadelphia

Fourth Vice-President .. O. W. Bennett of Sunbury

Secretary M. A. Kruder of Allentown

Treasurer Luther Keller of Scranton

Design of Beams, Girders and Trusses*

A Series of Articles on the Above Subjects in
Which Only Arithmetic Is Used for the Calculations

BY ERNEST McCULLOUGH, C.E.

A truss is a system of framework forming a skeleton beam. The top chord is in compression; the bottom chord is in tension; the web members (interior braces and ties) carry the shear. The parts must be in equilibrium, that is each push must be balanced by a pull, or a push from the opposite direction. This indicates the triangle as the perfect truss, for it cannot be changed in shape without breaking at the joints.

Trusses are of two kinds, those with parallel chords and those with non-parallel chords. The parallel chord truss will first be considered. Fig. 61 shows the development of the Pratt truss from two panels to six panels. Assume a load = 1 at the middle vertical. Half the load goes to each support so the coefficient for the two middle diagonal ties

This increased tension throws on the middle of the upper chord the added load of the end panels in addition to the load carried by the middle triangle, so the middle panels of both upper and lower chords are more heavily stressed than the end panels.

The coefficient for ad and $cd = \frac{1}{2}$. When the unit load, 1, at the next joint is at c the coefficient for $ce = \frac{1}{2} + 1 = \frac{3}{2}$, but if the load is at e the coefficient for $ae = \frac{1}{2}$. The coefficient for ef is the sum of the coefficient for dc and the unit load on the line ce . The above explanations are based on the load being on one chord only. When there are loads on both chords there should be two sets of coefficients written down and their sum used. Using the positive sign (+) to indicate compression and

Fig. 61—Development of the Pratt Truss

Fig. 62—Development of the Howe Truss

Design of Beams, Girders and Trusses

$= \frac{1}{2}$. If the load is applied at the top, 1 is the coefficient for the middle vertical, but if the load is suspended at d the coefficient = 0.

In Fig. 61 (b) two panels have been added and it is assumed the panels are loaded equally, the loads being concentrated at the joints. The end panels not only carry the reactions from the original middle triangle but their own loads in addition. The diagonal ties ef are more heavily stressed on this account than are the ties cd , the stress being tension, for the whole load is suspended at the end points f

the negative sign (—) to indicate tension the algebraic sum is meant when the stresses are opposite in kind. To check what has been stated: Note that there are three panel joints carrying equal loads, so $\frac{3}{2}$ of the total load goes to each support. If the load is uniformly distributed one-half a panel load will be concentrated at f , but this is carried directly on the supports and has no effect on the stresses in the framework.

In Fig. 61 (c) two more panels have been added. If the load is on the top chord the coefficients are as follows:

$bd = 1$	$ce = \frac{3}{2}$	$fg = \frac{5}{2}$
$cd = \frac{1}{2}$	$ef = \frac{3}{2}$	$gh = \frac{5}{2}$
If the load is on the bottom chord:		
$bd = 0$	$ae = \frac{1}{2}$	$fg = \frac{3}{2}$
$ad = \frac{1}{2}$	$ef = \frac{3}{2}$	$gh = \frac{5}{2}$

Note in this series of articles no algebra is used. The rules are written in the modern way in the shape of formulas by using letters instead of writing in full words that are often employed. The words for which the letters stand are explained for every formula so that readers may in time understand how to read and comprehend formulas used by other writers. The actual computation is arithmetical and worked examples are given.—Editor.

*Continued from page 53 of the March issue.

Merely for illustration the end panels have been completed by dotted lines. The coefficient for $hi = 6/2$ (that is, it carries the reaction). The difference, $6/2 - 5/2 = 1/2$, at h acts vertically and causes no stress in the truss. The member gi carries no load when the weights all act vertically, but in case of wind or rolling loads causing horizontal or diagonal action on the frame there will be compression on the member gi at the end where the load is applied and tension in the same member at the opposite end. When the vertical post hi is omitted the end, h , rests on the abutment and the truss is said to be suspended.

The Howe Truss

Fig. 62 shows the development of the Howe truss, which is merely the Pratt truss inverted. The verticals are in tension and the diagonals are in compression. The Pratt truss is usually the more economical and may be built of metal, or of metal and wood. The Howe truss is usually a combination of metal for tension members and wood for compression members. For maximum economy in metal trusses the compression members should be as short as possible, so the Howe truss is not well adapted for all metal construction.

Coefficients for the Howe truss are written as explained for the Pratt truss, with the stresses reversed in kind. The middle vertical, however, is opposite in character as affected by the load. That is, when the load is on the lower chord the coefficient = 1, but when it is on the upper chord the coefficient = 0. Practically, however, in the latter case the vertical does carry a portion of the weight of the lower chord in the middle panel. This is very small and the smallest sized rod used will more than take care of it.

What a Coefficient Represents

A coefficient represents the proportion of panel load carried by the member on which it is written. Coefficients are used only when all the panels carry equal loads, the truss then being symmetrically loaded. Instead of starting from the middle panel and working to the ends the coefficients may be obtained as follows: Count each panel load = 1. One-half the number of panel loads will be the reaction (expressed as fractional coefficients). From one end reaction subtract 1 successively at each panel joint and thus obtain the coefficient for each member in the following panel. The coefficient for the chord in any panel is the sum of the coefficients of the diagonals between that panel and the end support.

The weight (W) carried by each truss member is equal to the coefficient of the member multiplied by the unit panel load, P .

Let l = length of panel, center to center of verticals.

d = depth of truss, center to center of chords.

t = length of diagonal, center to center of chords.

then

$$t = \sqrt{l^2 + d^2}$$

$$\text{Stress in diagonals} = \frac{Wt}{d}$$

$$\text{Stress in chords} = \frac{Wl}{d}$$

$$\text{Stress in verticals} = W.$$

The theory of coefficients is as follows: Assuming the truss to be symmetrically loaded with uniform loading on each panel, half the load on the middle panel alternately pulls and pushes (or pushes and pulls) on all the web members until the end of the truss is reached. Each panel load, as its point of application is reached, is added and the end web member carries half the entire load on the truss. Thus the load on the web members increases from the center to the ends and the load on a chord increases from the ends to the center. The end half panel load is carried by the abutments. It causes no stress in the truss.

(To be continued)

Drainage in Ancient Roman House

In connection with the work of excavation at the Roman City of Uriconium, Wroxeter near Shrewsbury, the remains of many houses superimposed one upon another were exposed, the earlier ones of wattle and daub being similar to the half-timbered houses common in Shropshire at the present day. They dated back to between 75 and 120 A. D.

From the report given by the director of the excavation, it is learned that one large dwelling-house had rooms heated with hot air, fine mosaic pavements in different colors, and hot, tepid, and cold bathrooms. One of the most striking points about this building was the drainage system. From a large water main running down the street side channels passed through the houses, having mouths raised 7 or 8 in. above the level of the main.

There were sluice gates at intervals, so that when the water was raised in the main it flushed out the drains in the houses and carried everything away to the River Severn. This was the first time these sluice gates had been discovered in a Roman town.

Another discovery was a large structure consisting of two walls inclosing a large space. No similar building had been met with in any Roman town. It was not easy to find out its original use, but probably it was a place for bull-baiting and other amusements. The excavations proved almost conclusively that the town was abandoned about the year 393; also, they had not found any evidence that the end of the town was a massacre and that the town was burnt as was generally supposed. Some of the objects found dated as early as 50 A. D.

A country house recently completed at Douglas-ton, L. I., is of somewhat unusual plan, the idea being to give maximum of light. The building occupies a corner plot and has wings set at right angles so that the light comes into the dining room, the living room, and the master's room in three ways. The exterior walls are of stucco, brick and half timber effects.

Plans are rapidly being prepared for the erection of twenty to twenty-five houses to accommodate the steadily increasing number of employees of the Corona Typewriter Company, Inc., at Groton, N. Y.

A ROW OF COTTAGES IN CONNECTION WITH WHICH STUCCO WAS USED WITH PLEASING RESULTS IN THE EXTERIOR TREATMENT

Stucco in Building Construction

Timely Suggestions for the Builder Regarding
the Use of This Material—Kinds of Finish

By EDGAR PARKER

THERE has developed a stucco building period in this country, the architectural beauty of well-built stucco having popularized it among home-builders. The increasing demand for this construction may be laid to the general betterment of taste and to the extensive development of suburban home-building. The stucco homes already erected include some of the finest examples of the architect's and builder's art in this country, and this type of construction presents good opportunities for both the contractor and builder in developing new business.

Poorly built stucco is on the decrease because of the greater care exercised by the builder, the excellent building accessories which have been developed and the thoroughness with which specifications have been worked out. Well-built stucco has both durability and beauty; it does not need constant repairs and painting; it forms a fire-retarding wall, maintains an even house temperature and grows harder with time. Used in conjunction with fireproof roof-

ing and floors, a stucco home offers substantial fire protection.

Stucco is a mixture of Portland cement and sand, to which one part of lime is added for every ten parts of cement. The lime may either be hydrated or slaked lump lime. The advantage of using hydrated lime lies in the fact that the work of slaking or hydrating is done mechanically and there is then

no chance of unslaked material getting into the plaster. If it is impossible to obtain hydrated lime ordinary lump lime can be used, but this must be thoroughly slaked before using.

The stucco mortar is made by mixing with the cement, lime and sand enough water to form a thick paste that can be applied with a trowel. Only as much as can be used immediately is prepared,

as cement will start to set after thirty minutes. Cement mortar used after it has begun to set has been responsible for a considerable percentage of poor stucco work.

Stucco construction properly falls under two heads—stucco veneer and solid stucco. In stucco veneer the stucco is applied to a wall structure—brick, tile, concrete or frame. This can be done with both new and old structures. The renovation

A VERY ATTRACTIVE EXAMPLE OF EXTERIOR STUCCO TREATMENT

Photographs by courtesy of Atlas Portland Cement Co.

with stucco of old buildings in good condition is a common practice, the stucco being used for both decorative and strengthening purposes.

In the case of new brick, tile or cement block surfaces the stucco veneer is customarily applied directly to the material, care being taken that the surfaces have ample roughness or absorption to assure a strong bond and key with the stucco. Standard specifications prescribe that the mortar joints should not be less than $\frac{3}{8}$ in. thick and the mortar should be omitted from or raked out of the joints for at least $\frac{1}{2}$ in. back from the face to which the stucco is applied. The stucco is then forced into the joints.

Stucco Veneer Frame

Stucco veneer frame is the more common construction. In the application of the stucco the important question of the proper lath arises. The opinion of builders who have used both wood and metal lath favors metal. The tendency of wood lath to warp and expand is an unsafe element, since the stucco is subjected to uneven strains. However, stucco on wood lath has given satisfaction in many instances. Between good lath and metal lath, stucco boards apparently hold an intermediary position.

With wood lath the sheathing is nailed to the studs, then covered with sheathing paper; wood furring strips are applied and the lath put on the furring strips. The lath is applied in either single or double layers. In single layer it is placed horizontally on the furring, and in double-layer work the layers are placed diagonally to the furring in opposite directions.

The wood lath should be thoroughly saturated with water before the plaster is applied, or the moisture will be absorbed from the cement. Another method of preparing wood lath is to paint it with two coats of any of the reputable bitumen waterproof paints to which plaster adheres. After twenty-four hours, and within six days of the application of the bitumen paint, the plastering should be started.

Stucco board is a commonly used lath, where the stucco is built up against a solid wall to which it keys thoroughly. While stucco board does not expand and contract completely to meet the contraction and expansion of the stucco, the difference in coefficients of expansion is small. Stucco board costs less than metal lath. Care, however, should be exercised to avoid the cheap variety, which is unsafe. Manufactured stucco board requires no furring and comes ready for application of first coat.

Metal Lath the Best Practice

Metal lath for stucco building represents by far the soundest practice. The better varieties on the market have been carefully designed to insure durable work. Two kinds are in use—expanded metal lath and close-meshed wire lath. The expanded metal type consists of metal sheets about $\frac{1}{40}$ in. in thickness, which are slotted and expanded to form mesh of various shapes. Woven wire lath is a close-mesh wire cloth provided with wire stiffeners. Many of the metal laths are designed to be applied directly to the sheathing, and thus do away with furring. This greatly increases the speed of

erection and at the same time reduces the cost.

In applying the stucco to metal lath it should be thoroughly pushed through against the inside waterproofing so as to completely bed the metal of the lath on both sides. If furring strips are used special care should be taken to fill all voids around the furring strips and where laths lap.

Solid Stucco Construction

The use of solid stucco construction has grown with the development of superior metal lath. Solid stucco is a solid slab of Portland cement mortar 2 in. in thickness, gaged with lime, built around the metal lath, which acts very much as reinforcing bars in reinforced concrete. The strength of such a wall is evident. All wood is eliminated except the studding. This is notched into the slab $\frac{1}{2}$ in. to give bracing to the construction. The metal lath is back-plastered. The cost of solid stucco is but little more than veneer stucco, while at the same time it is more substantial and makes a fireproof wall. It is better adapted than stucco veneer for fireproof construction when used with hollow-tile floors and fireproof roofing.

It is frequently asked, how many coats of stucco should be put on? Possibly because stucco veneer was first applied to brick and stone there has been a tendency also to apply it in two coats on frame. This we believe is a serious mistake. Every effort should be made to get into stucco veneer on frame as much of the strength of solid stucco as possible; and the second or backing coat should not be used for finishing. Finishing should be left to a third coat. The first coat should be at least $\frac{3}{8}$ in. thick over the face of the lath. The backing or second coat should be $\frac{3}{8}$ in. The final coat should be $\frac{1}{4}$ in.

The Various Coats of Stucco

With solid stucco the first coat is at least $\frac{1}{2}$ in. and is back-plastered to the same amount; the backing coat is $\frac{1}{2}$ in.; the third or finishing coat should not exceed $\frac{3}{8}$ in.

The thickness of the coats and the care with which they are applied give stucco its durability. The treatment of the finishing coat gives stucco its beauty and distinction. The beauty of its surface depends upon the skill of the manipulator. Fortunately, there are a number of standard finishes which can be satisfactorily produced without great experience. An original builder of stucco will often obtain interesting results by deviating from customary finishes. It is told that on one occasion such an original finish was obtained at the suggestion of the woman whose house was being stuccoed. She advised the men to press into the stucco the leaves on a branch; this was repeated around the entire wall with striking results.

White cements have been used as a final coating to give a wide variety of finishes and colors. This feature brings an additional element into play in the beautifying of home exteriors.

The following finishes are applicable to both the gray Portland cement stucco and to white finishes. They derive their names, as will be seen, from the methods used to create the proper surface.

Smooth Troweled—The finishing coat shall be troweled smooth with a metal trowel, with as little rubbing as possible.

Stippled—The finishing coat shall be troweled smooth with a metal trowel, with as little rubbing as possible, and then be lightly patted with a brush of broomstraw to give an even, stippled surface.

Sand Floated—The finishing coat, after being brought to a smooth, even surface, shall be rubbed with a circular motion of a wood float, with the addition of a little sand to slightly roughen the surface. This floating shall be done when the mortar has partially set.

Sand Sprayed—After the finishing coat has been brought to an even surface it shall be sprayed by means of a wide, long fiber brush—a whiskbroom does very well—dipped into a creamy mixture of equal parts of cement and sand, mixed fresh every thirty minutes, and kept well stirred into the bucket by means of the whiskbroom or a paddle. This coating shall be thrown forcibly against the surface to be finished. This treatment shall be applied while the finishing coat is still moist and before it has attained its final set—that is, within three to five hours. To obtain lighter shades add hydrated lime of 5 to 15 per cent of the volume of the cement.

Splatter Dash or Rough Cast—After the finishing coat has been brought to a smooth, even surface, and before attaining final set, it shall be uniformly coated with a mixture of one part cement and two parts of sand thrown forcibly against it to produce a rough surface of uniform texture when viewed from a distance of 20 ft. Special care shall be taken to prevent the rapid drying out of this finish.

Pebble Dash—After the finishing coat has been

distributed uniformly over the surface of the final coat and may be pushed back into the mortar with a clean wood trowel, but no rubbing of the surface shall be done after the pebbles are embedded.

Exposed Aggregates—The finishing coat shall be composed of an approved, selected coarse sand,

STUCCO COTTAGE FOR THE SUPERINTENDENT OF A COUNTRY ESTATE

marble dust, granite dust or other special material, in the proportion given for finishing coats, and within twenty-four hours after being applied and troweled to an even surface shall be scrubbed with a stiff brush and water. In case the cement is too hard a solution of one part hydrochloric acid in four parts of water by volume can be used in place of water. After the aggregate particles have been uniformly exposed by scrubbing, particular care shall be taken to remove all traces of the acid by thorough spraying with a hose.

Tinted stucco is secured by the addition of coloring matter to white cements and gives a wide variation of color. In using coloring matter care should be used to select materials which will be permanent. Blacks are safe, as a rule. Ultramarine blue, if of good quality, will hold its color for a number of years, and when it begins to fade out does so evenly. It cannot be classed as a permanent color with black, brown or ochre. The following table of colors may help those contemplating the handling of stucco surfaces.

In selecting reds and browns it is safest to be guided by the table. A bright red shade will not be produced by the ordinary red oxide of iron at 3½ cents a pound. These colors are permanent if high grade.

Yellow ochres offer a wide variety of shade and quality. French ochre, if genuine, is safe to use, and with it most attractive colonial yellow and buff tones can be secured. It is best to know the name of the manufacturer in buying coloring material, and also whether the color was specially designed for coloring cement.

STUCCO IN BUILDING CONSTRUCTION—A MODERN BUNGALOW IN WHICH STUCCO PLAYS AN IMPORTANT PART

brought to a smooth, even surface, and before attaining initial set, clean round pebbles or other material as selected, not smaller than ¼ in. nor larger than ¾ in., previously wetted, shall be thrown forcibly against the mortar so as to embed themselves in the fresh mortar. They shall be

Table of Colors to Be Used in Portland Cement

Brown to reddish-brown	Metallic brown (oxide)	4	5	10
Buff colonial tint and yellow	Yellow ochre	5	5	10
Green shade	Chromium oxide	26	5	10

The renovation of old buildings by means of stucco is worth the builder's attention. Unless renovated such buildings remain eyesores and their owners are not likely to go to the expense of complete rebuilding.

In renovating the exterior of an old brick building the stucco can be applied directly to the brick. The brick should be thoroughly cleaned with a

it is decided that overcoating is practical the partitions and outside walls should be made plumb, poor weather boarding removed and furring and metal lath applied over the sheathing. It may be advisable to tear off the sheathing; the furring can then be fastened direct to the studding after bracing between the studs.

When furring is used of a depth which does not allow the space back of the lath to be entirely filled with plaster, provision should be made for extending the old window and door frames to correspond with the increased thickness of the wall. In some cases the plaster is brought over the old frames in such a way as to make an opening for a recessed window or door. When the furring is fastened to the studding it is not necessary to provide for extending the window and door frames, as the new stucco finish will be in the position of the old weather boarding.

To secure well-made stucco the builder should see that the following working details are followed. As indicated in the early part of this article, only a small quantity of plaster should be mixed at one time to avoid the use of cement which has begun to set. In all cases the various ingredients should be thoroughly mixed. Plaster-

STUCCO IN BUILDING CONSTRUCTION—ANOTHER ROW OF STUCCO TREATED COTTAGES IN A WESTERN BUILDING OPERATION

weak solution of muriatic acid before the stucco is applied. The old mortar joints should be picked out $\frac{1}{2}$ to $\frac{3}{4}$ in. from the face of the brickwork, and when the first coat is applied it is forced into these crevices and forms an excellent bond. Before applying the plaster the brick must be thoroughly saturated with water so that none will be absorbed from the plaster.

Builders sometimes prefer to use wire or expanded metal lath to keep the stucco to the brick. In such cases metal furring strips are attached to plugs driven in joints of brickwork, flush with surface, and the wire is fastened to these strips.

"Overcoating" of old frame houses, as renovating with stucco is called, requires more care than stucco veneering on brick or stone. The frame house should, of course, be gone over to determine if the framework will justify the improvement. Foundations should be examined to see if they will bear the additional weight of the stucco. Proper footings should be provided. Special attention should be paid to the studding. If

ing should start at the top and the work carried downward continuously without allowing the plaster to dry at the bottom edge. If it is impossible to work the full width of the wall at one time the break should come at some natural division of the surface, such as window or door.

Too rapid drying weakens the plaster. It should be covered with a wet canvas or the surface frequently sprayed when exposed to the sun or wind. Stucco should never be mixed or applied during freezing weather; the water will freeze before the cement has set, and the latter will not harden, nor should cement be disturbed after it has begun to set.

In the application of the various coats the first or scratch coat should be well roughened before the backing coat is applied. Each coat should be kept damp before applying the following coat to prevent absorption of water from the latter.

To obtain uniform results as to color and texture each batch of plaster must be mixed in the same proportions as the preceding one.

Prize Designs in \$3000 House Contest

List of Winners and Perspectives with Plans of First, Second and Third Prize Designs

ONE of the very interesting features in connection with the recent Complete Building Show was a competition in houses costing not to exceed \$3,000 each and conducted under the auspices of the Cleveland Art Association. It will be recalled that the exhibition in question was promoted largely in the interests of the Society for

readers of THE BUILDING AGE some idea of the class of building treated in this contest we present the designs awarded first, second and third prizes, there having been seven prizes in all.

The design awarded first prize was that submitted by Olaf William Shulgren, a member of the Buffalo Architectural Club, and whose address is

Second Floor Plan

Prize Designs in the \$3,000 House Contest—Design Awarded First Prize

Fire Elimination—an organization of materialmen formed to further the use of various fire-resisting building materials.

In the contest in question something more than 300 sets of drawings were submitted, thus demonstrating the favoring use of fire safe materials the country over. With a view to conveying to the

1314 Prudential Building, Buffalo, N. Y. The design calls for the use of stucco with a roof of green slate. In the color scheme the window and door frames are green to blend with the roof. The committee in charge of the contest referred to this design as being "a model of compactness," the feature being the elimination of the entrance from

the front of the house and the substitution of a large bay window opening on three sides instead of the conventional porch. The dining room is a part of the living room with French doors opening out on the porch. The kitchen contains all the necessities of the culinary department and the stair arrangement provides an excellent short-cut from the working section of the house to the second story.

The authors of the design awarded the second prize were S. C. Merrell and C. H. Dittmer, connected with the staff of Charles S. Schneider, a well known architect of Cleveland, Ohio. Here stucco was chosen for the exterior and the design is one well suited to the requirements of a small family.

terrace across the front with its suspended covering, its large bay window and steep roof give a suggestion of a quaint old type modernized for present use. The large hall with the combined stairway under which access is given to the kitchen are features of the first floor layout, while the two large bedrooms are features of the second floor plan. The position of the stairway is such as to receive ample light from the window at the landing half way up, while the bathroom being directly over the kitchen permits of an economical disposition of plumbing fixtures.

The author of the design awarded fourth prize was Frederick A. Harburg, 94 West One Hundred

Perspective of the Design Awarded the Second Prize in the \$3,000 House Contest

First Floor Plan

Second Floor Plan

Prize Designs in the \$3,000 House Contest—The Second Prize Design

The recessed porch and the excellent arrangement of stairs are features of the first floor plan, while the large family bedroom with commodious closets and the central hall from which all rooms upon that floor are readily accessible without waste space are features of the second story.

The third prize was awarded the design submitted by H. W. Peebles and Richard J. Hazelwood of 82 North Elizabeth Street, Detroit, Mich. This design is such as to lend itself readily to the use of stucco with dark roof and white trim. The paved

and Sixty-second Street, New York City, who chose a colonial type for his subject.

Stucco metal lath were chosen as construction materials of the exterior treatment in connection with the design awarded fifth prize which went to C. C. Tallman, 17 Dill Street, Auburn, N. Y.

The sixth prize went to Henry P. Whitworth, 155 Carylton Road, Cleveland, Ill. The house was of the cottage type and hollow tile was specified as the material for use in its wall construction. The combined stair and entrance hall with direct passage

to the kitchen showed excellent use of the limited space available. The position of the refrigerator at grade entrance avoided the necessity of entering the kitchen in order to supply it with ice.

The design awarded seventh prize was submitted by Maurice Feather, 129 Langdon Avenue, Watertown, N. Y., who evolved a house of interesting exterior. Stucco was chosen for the finish, and the

bert S. Skeel, W. R. Watterson, R. G. Hubby and H. Dercum.

Plans have just been filed by architects Timmis & Chapman for a six-story factory building to cost \$250,000, and which will take the place of three old shacks located at the corner of Frankfort and Rose Streets, New York City, in what is known as the

Perspective of the Design Awarded the Third Prize in the \$3,000 House Contest

First Floor Plan

Second Floor Plan

Prize Designs in \$3,000 House Contest—The Third Prize Design

roof lines were broken up in a way to render the design unusually effective. The placing of the enclosed porch and entrance upon opposite sides of a front wing with a single large chimney placed in the center of the building were features of the design.

The judges appointed by Abram Garfield, President of the Cleveland Chapter of the American Institute of Architects, were Charles S. Schneider, Al-

bert S. Skeel, W. R. Watterson, R. G. Hubby and H. Dercum.

We understand that arrangements have been completed for the erection of more than 100 homes in Struthers, Ohio, work to be commenced shortly after April 1 and rushed to completion. The houses will be of moderate cost, construction ranging for the most part between \$2200 and \$5000.

New Goods Seen at the Cement Show

An Array of Up-to-Date Builders' Equipment Which Was an Education in Itself

ONE year ago THE BUILDING AGE established a precedent by presenting in one article the features of the various new equipment displayed by manufacturers exhibiting at the Cement Show in Chicago, Ill. Among other reasons, it was prepared for the benefit of those who found it impossible to attend the exposition yet were intensely interested in the latest improvements brought out during the previous year. This enterprise met such hearty approval on the part of the building and contracting trades that it was decided

be found ready to help in the selection of suitable equipment for specified needs.

Several manufacturers of motor trucks were present this year to meet contractors and point out the possibilities of reducing hauling costs by using trucks in preference to horses and wagons. Though the trucks exhibited were of large capacity, principally of the 3-ton type, the salesmen distributed catalogs which contained much valuable information on light trucks having 1 and 1½-ton capacities. It was pointed out that the motor truck is capable

General View of the Armory in Which Many Interesting Exhibits Were Displayed During the Period of the Recent Cement Show in Chicago

to repeat the performance this year in the April issue, without doubt one of the most important numbers of the year, in that it precedes the opening of the building season. A close study of the contents of this article will enable those contemplating the purchase of new equipment to discriminate in their buying. On account of space limitations it is impossible to describe minutely the many features claimed by the different manufacturers, and the suggestion is therefore made that interested readers communicate direct with the makers who will

of delivering men and materials direct to the job in fast time, and numerous trips can be made during the day. Statistics were presented to illustrate the low cost of operation, and books of photographs were convincing evidence that progressive contractors in all parts of the country are finding the purchase of motor trucks a profitable investment. The following companies were represented at the show: International Motor Co., New York; Sterling Motor Truck Co., West Allis, Milwaukee, Wis.; The Garford Motor Truck Co., Lima, Ohio; The Service

Motor Truck Co., Wabash, Ind.; The Gramm-Bernstein Co., Lima, Ohio, and the Federal Motor Truck Co., Detroit, Mich.

The New Goods

One year ago we had the pleasure of describing the features of the new No. 5 batch mixer of the Eureka Machine Co., Lansing, Mich. When the company's booth in the Armory was visited in February it was learned that two larger models had been marketed during the year, the Nos. 7½ and 10. These numbers denote their respective capacities in cubic feet of unmixed material per batch. Attention is called to the substantial drum which houses properly arranged steel blades which assist in forcing the aggregate into perfect uniformity. Each machine has a drum which consists of a double cone of unequal tapers comprising only three parts, the large semi-steel conical head with gear and a slightly smaller rounded head being joined together by a shell of heavy boiler-plate steel. The mixing chamber is of the non-tilting type and is gear driven. The side loader is the pivoted type, and is provided with a clutch which is automatically released when the bucket reaches the discharge position. The batch hopper has the same capacity and opening as the drum. The water tanks are of the positive measuring type with capacities from 12 to 15 gal., operating at 125 lb. working pressure. Every machine is tested under its own power before shipment, and a complete set of tools goes with each outfit. Close fitting guards are provided over all exposed working parts. All bearings are supplied with compression grease cups, and the equipment receives two coats of paint and varnish before shipment.

The Amalgamated Roofing Company of Chicago, Ill., was another new exhibitor. The display consisted, as shown in Fig. 1 of the illustrations, of a small house

New Goods at the Cement Show—Fig. 1—The Exhibit of the Amalgamated Roofing Co.

which had its roof and sides covered with asphalt shingles of various colors. This interesting method of showing the company's products enabled the representatives to explain just how the shingles are applied and to further demonstrate how harmonious effects may be brought about. The advantages of asphalt shingles were enumerated when it was said that they are waterproof, fire-resisting, economical, in that the overhead expense is reduced to the minimum, attractive and easily applied. The company's "Nu-Tile" shingles are made in three colors—red, moss green and white—and measure 12¼ in. long by 8 in. wide. They are packed in boxes containing ¼ square each. Another product is manufactured in rolls 32 in. wide by 41½ ft. long to imitate brick siding, black lines being inlaid to indicate the brick design. Strip shingles are also made 10 and 12¼ in. wide, and some very artistic effects may be produced by the use of the company's "In-Lade" roofing of "Diamond Square," "Spanish Ripple" and "Offset Shingle" designs.

The ever-increasing and varying uses to which concrete is adapted has proved that it is the ideal building material for every purpose in that it does not deteriorate with age and exposure. A great many con-

Fig. 2—Cottage with Roof Covered with "Concretile"

tractors who visited the Armory were interested in the exhibit of the Walter Concrete Machinery Co., Saks Building, Indianapolis, Ind., which demonstrated "Concretile." It was said that this tile has been used in Europe for many years with considerable success. Its manufacture is an operation that is simple for any man used to handling concrete, and the equipment is inexpensive. "Concretile" is fireproof, storm-proof, waterproof, indestructible and easily applied. The company sells the machines for making this tile, and it is said that the average cost of manufacturing 100 sq. ft. of "Concretile," including all labor and materials, is \$2.50. In Fig. 2 of the illustrations is shown an attractive bungalow in Indianapolis roofed with this product. While the capacity of these machines is limited only by the skill of the operator, the average production varies between 35 and 50 tile per hour. The average cost of laying "Concretile" on the roof for every 100 sq. ft. does not exceed \$1.50, and complete specifications for covering all types of roofs are furnished to buyers of machines. The tile can be manufactured in variegated shades, all beautiful and rich in tone.

Visitors to Booth No. 178 in the Coliseum were greeted by Joseph Stretch of the International Concrete Construction Co., of 47 West 42nd Street, New York

Fig. 3—Broken View of Wall of a Building Showing New Method of Reinforced Concrete Construction

City, who explained a newly patented method of erecting reinforced concrete structures without the usual molds. Mr. Stretch stated that pressed steel channels

are used for studding instead of reinforcing rods, two channels back to back forming an I-stud. The foundation of any residence, bungalow, or other structure is erected in the usual manner of any suitable materials, and a steel footing strip to line, level and secure the wall in place, is anchored to the top of the foundation. The channels are cut stud length and laid out upon the ground back to back in pairs and spaced apart on two leveling planks. Furring lath cut to length is set in the channels, and gage strips are placed between the backs of the channels. Sand or loam is leveled in to the top of the furring strips, and tar paper is then laid between the studs. Lateral iron rods tie the channels and rough concrete is then filled in and faced off with a rich finishing mixture of any desired color or appearance. All door and window openings have rough frames set into the channels, ready to receive the window and door frames and trim. When the concrete has hardened, these cast reinforced wall sections are set in place and the channels secured together, forming an I-studded reinforced concrete wall, furred off for air space, ready for the inside finish. An angle steel crowning member is secured to the top of the wall ready for placing the floor joist, or in case of a one-story bungalow, to receive the plate for securing the rafters. No metal lath or stucco is plastered on. A contractor's equipment may consist of a few inexpensive gage strips and clamps for pouring belt courses. An idea of the construction is afforded by Fig. 3. Mr. Stretch demonstrated the low cost of this method of construction by showing the cost of building a small bungalow, 20 x 23 ft., at Beechwood, N. Y. The investment was \$478.14 as against a contract price of \$705. Of this sum about \$150 was spent for workmen's time and the cost of superintendence. Building materials cost \$225.38, and the rest of the cost was divided between the mason, well driver, painting, sand, gravel, cartage, reinforcing metal, lumber and freight.

Much has been said in recent years about the efficiency of the motor truck, and many contractors would undoubtedly feel justified in purchasing such

New Goods at the Cement Show—Fig. 4—Trailer, Known as a "Contractors' Special" for Motor Trucks

modern equipment if it were not for the fact that it involves such a large investment. The problem has been solved to some extent by the manufacture of trailers, and at the Cement Show the Miles Manufacturing Co. of Jackson, Mich., exhibited model 33, known as the Contractor's Special and shown in Fig. 4. This trailer has capacity to hold 1200 lb. It is of the rack style, 86 in. long and 42 in. wide, with an inside depth of 16 in. The sides and ends are removable. The wheels have 1 3/8 in. spokes and are 34 in. high, with solid rubber tires. The axle and springs are of substantial construction and the draw-bar is a heavy pole, reinforced with steel and adjustable to any height auto frame. The trailer can be instantly attached or detached from the car by removing one pin, no tools being necessary. The bracket fastens to the frame of the car, above the springs, taking advantage of the full spring action from the car and removing all vibration from the draw-bar and trailer body. The trailer is painted green.

The latest improvement in "Big-an-Little" concrete mixers, manufactured by the Yaeger Machine Co., 216 West Rich Street, Columbus, Ohio, is a new spouting outfit, and nine reasons are advanced to prove its usefulness. This equipment was designed and perfected for the purpose of eliminating all labor possible in the placing of mixed concrete in forms on such

work as foundations, piers, abutments, etc. The uses to which it may be applied are many and varied, and the savings effected are said to be considerable. By setting the mixer at the most convenient place to have the material, time is saved in loading. Speed is increased, as while one batch is being mixed the car is being dumped. The capacity of the mixer is increased as the entire batch is dumped at once in a skip car

Fig. 5—View of the New Yaeger Spouting Outfit

instead of into several wheelbarrows. Economy is effected, as no concrete is spilled—all that goes into the mixer goes into the forms. Wheeling of cement is eliminated, and only one man is required at the delivery end of the spout. The outfit may be erected in 90 min. and dismantled in 45 min. The construction of the incline car track and spouts is standardized and therefore interchangeable, and can be adapted to any job. Power to operate the skip car is taken from the auxiliary hoist on the mixer. The entire plant of hoisting and mixing is combined in the one machine and may be operated by one man. Specifications call for a mixer with loader and auxiliary hoist; 5 hp. engine; incline track of 4 in. channels in 10 ft. sections, 5 sections to a plant; adjustable legs of angle iron; skip car of 6 cu. ft. capacity, capable of automatically dumping an entire batch into the receiving hopper. The spouts are 12 ft. long and operate on pivots, swinging to any point desired. The outfit in use is shown in Fig. 5 of the illustrations.

In response to a continued demand by contractors in many parts of the country for a smaller mixer than they have been making in past years the Marsh-Capron Manufacturing Co., Lumber Exchange Building, Chicago, Ill., exhibited for the first time its new "Universal" concrete mixer as shown in Fig. 6. It has a guaranteed capacity of 7 cu. ft. of mixed concrete, of any standard formula, and is rated by the National Association of Mixer Manufacturers' Wet Batch Rating. Its loose capacity, of mixed cement, sand and stone is 11 cu. ft. The "Universal" is designed to give the greatest possible convenience in dumping wheelbarrows directly into the hopper without spilling the aggregates. The platform is 19 in. from the ground and the distance

Fig. 6—Loader Side of the "Universal" Concrete Mixer

from the mouth of the charging hopper to the platform is 10 in. The hopper is 30 in. diameter, with an opening into the drum of 26 in. diameter. The equipment has a steel frame and the drum has a shape that readily cleans itself. It has five buckets and blades of steel, securely bolted to the inside of the drum. The drum

revolves on rolled channel-iron tracks. The mixed concrete is discharged from the side of the mixer. The discharge hopper is of the apron type, and the entire batch can be emptied in a few seconds. The diameter of the discharge opening is 17 in., insuring a rapid, easy flow from the drum. The gears are made of semi-steel and the drum gear, which is similar to the well-known segmental gear, center drive of Marsh-Capron rail-track mixers, is arranged in four interchangeable parts, any of which may be replaced in case of accident. The mixer is operated by a 4 hp. gasoline engine. A wide, roomy low platform is provided, having dimensions of 5 ft. long and 4 ft. wide, and may be folded up when not in use. A friction clutch is provided between the engine and the mixer, making it easy to start the engine at any time. The approximate measurements are: Height overall, 56 in.; entire length, 7 ft. 9 in.; width overall, 5 ft. 6 in. The mixer weighs, without platform, 2500 lbs. The company states that it is built for service, for most mixing with least fixing at least cost, for convenience in charging, mixing and moving. The steel used in its construction is said to have enough weight to insure long wear without breakdowns.

The Oshkosh Manufacturing Co., Oshkosh, Wis., was one of the many companies exhibiting new concrete mixers, one of which is shown in Fig. 7. Its latest models are made in two sizes, the No. 7 with capacity to mix 5 cu. ft., and the No. 11 for 7½ cu. ft., specifications being according to the wet batch rating of the National Association of Mixer Manufacturers. The drum heads are made of heavy semi-steel and the center of heavy sheet steel, assembled with large bolts that lock all parts together as though they were one piece. All surfaces are rounded to eliminate corners in which concrete would be likely to clog. The buckets are large, being built of heavy semi-steel, and the blades are substantially constructed. These are raised from the drum to allow the water to run beneath, thus wetting the entire batch quickly and keeping the drum washed clean. On the outside, the tracks on which the trunnion wheels travel, are cast extra heavy and accurately machined to reduce friction and to insure smoothest running. The drum is revolved by means of a steel bushed roller chain. When the dry material is dumped into the drum it is thrown in among the paddles. As the drum revolves, the paddles plow it over into the buckets, which carry it up and drop it on to the inner end of the discharge chute. This throws the mix back into the paddles again and the operation is repeated. Thus the batch is split up and turned over four different ways all at once. The hopper is made of heavy steel plate, 40 in. wide, and is loaded direct from the wheelbarrow. It is situated 14½ in. above the platform with a steep pitch, so that the material runs into the drum without shoveling or pushing. The discharge side of the drum is fitted with a semi-steel guard plate to prevent slopping and to keep

New Goods at the Cement Show—Fig. 7—Loader Side of the New Oshkosh Concrete Mixer

the mixer clean. The discharge chute is turned up high on the sides and is mounted on the slop guard on a pivot, an easily operated lever at the right of the drum controlling its position. When turned up it assists in one of the mixing motions, and when turned out is at a convenient height to load a wheelbarrow without splashing. The loading platform is 4 x 3 ft.,

20 in. high, built of 1½ in. maple planks. Steel ledges are provided for runways. It seems that the company has left nothing to be desired in the construction of the frame, trunnion rollers, trucks, clutch and chains. The power is supplied by the well known Novo engine, and the larger size may be equipped with steam power if desired. For a small additional charge a power-driven hoist may be had for use in elevating concrete in the construction of silos and other structures.

In the foreground of the picture on the first page of this article will be seen the display of the T. L. Smith Company, Milwaukee, Wis., and among the features of

Fig. 8—View of New Smith Low Charging Concrete Mixer

interest were two new types of Smith equipment. One of these was a new line of low-charging mixers comprising four sizes. From an inspection of Fig. 8, which represents one of the sizes, it will be seen that the mixer is mounted on a steel truck, is readily portable and indicates the manner in which the hinged platform may be hooked up out of the way. The runway lifts off and is carried on special brackets under the truck, all as clearly shown in the picture. The rigidly cross braced steel channel truck is fitted with strong wheels and heavy steel axles, thus rendering the machine capable of withstanding hard usage to which it is likely to be subjected. One feature which commanded a great deal of attention on the part of visiting builders and contractors engaged in concrete work was the loading platform which is only 16 in. high on all sizes.

The other new machine displayed was a new type of high drum paver, one of the chief features of which is an absolute water-weighing device. When the gage is once set each succeeding batch will contain an equal amount of water by weight rather than by volume. Another important feature of this machine is the long spout swiveled chute which is pitched at an angle of 20 deg. so that the concrete will easily slide downward.

A display which was the center of interest on the part of a large number of visitors during the period of the Cement Show consisted of six low-charging concrete mixers having a capacity ranging from 3 ft. up to 16 ft. mounted on truck with gasoline engine and made by the Standard Scale and Supply Company, Pittsburgh, Pa., and with branch offices in leading cities of the country. Both the "Standard" and "SSS" types of mixers were shown, the former being equipped with folding platform which, with the low-charging open drum, the thorough mixing device, the semi-automatic discharge and simplicity of construction throughout, are special features of this low-charging design. Of the "SSS" mixers two new sizes were shown, one being the new low-priced machine having a capacity of 9 cu. ft. of unmixed materials mounted on truck and equipped with gasoline engine. This new machine has a capacity of one bag batch up to 1:3:5 mix. The other new size, also mounted on truck with housed 4-hp. gasoline engine, will take care of any one

bag batch up to 11 cu. ft. of unmixed materials. All of the machines exhibited were equipped with belt drive and floating idler, this drive having been brought out in the last year or two and being especially desirable, as the belt drive is not only simpler than friction clutch drive but absorbs all the jar from the mixer and is not carried back to interfere with the engine. An excellent picture of the company's display was presented on page 56 of the March issue of the paper.

The line of equipment made by The Knickerbocker Co., Jackson, Mich., was notably augmented during the past year by the marketing of three new concrete mixers—the Nos. 5, 7 and 8. The numbers of these machines denote their respective capacities in cubic feet of unmixed material. The company emphasizes the fact that it has been building concrete mixers since 1904, and in offering the new 1916 equipment it represents twelve years of experimenting and improving in order to present the discriminating contractor with ideal mixers. The Knickerbocker construction shown in Fig. 9 embodies an extra heavy all-steel frame and on all models a cold rolled steel shaft is used for the rear axle. In order to prevent tipping or straining the frame when a power loader or stationary batch hopper is being used, there has been provided what is known as a "fourth point suspension," constructed in the following manner: To the sill on the charging side and directly over the front axle is bolted a casting, bored and threaded, through which runs a cold rolled screw shaft. By means of a hand wheel, this shaft may be lowered to rest on the front axle. On Model 5 there is a 3 h.p. Bates & Edmonds Bull Pup gasoline engine, and on the larger sizes a choice of Ideal or Novo gas engines is offered. The mixers have a drum which has been designed and built for long, hard service. The body is of heavy steel plate, securely riveted to drum heads of solid cast semi-steel. The drum heads and tracker bands are cast in one piece, not bolted or riveted together, thus insuring rigidity and solidness that needs no adjusting or care. Five buckets and five blades, one reversed, are arranged

New Goods at the Cement Show—Fig. 9—Loader Side of New Knickerbocker Concrete Mixer

in the mixing chamber to give a quick and thorough mixing action. Four of the blades are raised from the drum to facilitate cleaning. The automatic water tank is an extremely simple affair. The volume of water is controlled by an adjustable float valve and the flow is regulated by a three-way cock. The company calls special attention to the various parts on which the wear

usually comes and commends the many features of construction to those contractors who are desirous of purchasing mixers that will stand the hardest kind of use.

A new company to be seen in the Coliseum Annex was the Brownwall Engine & Pulley Co. of Holland, Mich., and R. G. Pulver, who officiates as sales manager, dispensed information on the features of "Brown-

Fig. 10—The New "Brownwall" Engine

wall" hopper and air-cooled engines. It was said that this engine, shown in Fig. 10, is especially adapted for operating concrete mixers, twelve of the largest mixer manufacturers in this country having used it successfully. Large numbers are also sold to manufacturers of other contracting equipment and individuals who use automatic tampers, cement block outfits, etc. It does its work well on account of the simplicity in construction, light weight and compactness. Its special features are the inclosed crankcase, absence of cylinder head packing, a solid cast-iron base in which gasoline is stored, thus eliminating the galvanized-iron tank and leakage troubles, specially constructed valves that can be taken out and replaced in 10 min., and the first-class workmanship and material throughout. In the hopper cooled type the horsepower ranges from 1½ to 10 and from 1½ to 6 hp. in the air cooled models. With each equipment is given a five-year guarantee against defect in material and workmanship.

The Cellular Lath Co., 5126 North Second Street, St. Louis, Mo., made a most successful debut at the Cement Show by exhibiting "Keezon" lath, a product which is claimed to save approximately 30 per cent in the cost of labor and materials. This lath consists of a cellular structure formed of fibre board and wood, heavily coated with a creosote and damp-resisting preparation to prevent any excess moisture from affecting the lath structure in case of a rain before the roof is on the building or when plaster is applied. Numerous rigid tests of the fireproof qualities of this lath have been made with the most satisfying results, it is said. "Keezon" lath is manufactured in standard units of convenient size to handle, each unit measuring 48 x 6¼ x ¾ in. Four units cover a yard of wall and require but 48 nails to hold them securely in place. Narrow strips of wood set on edge effectively prevent warping, and give the tensile and compressive strength of the unit. The extreme rigidity thus secured makes the tying of joints wholly unnecessary, which is an economical feature. Owing to the fact that this lath contains six separate cells to the square inch, each three-eighths of an inch deep, only enough plaster to cover the surface of the lath is required to secure a perfectly keyed wall or ceiling. This requirement is said to be much cheaper when compared with wood or metal lath, resulting in reducing the amount of material used and time necessary to apply it. The company states that the seven-eighths inch ground usually left around window and door openings where wood lath is used can be reduced to five-eighths of an inch when "Keezon" lath is used, thus saving one-quarter of an inch of plaster over the entire surface. This lath may be applied directly to any flat surface, and will key perfectly without furring. It is also stated that the second coat of plaster may be applied without waiting for the first or scratch coat to dry and without moving the scaffold. On account of its extreme flexibility, it is especially adapted to curved

surfaces, and will readily conform to round columns not under 4 in. diameter. The lath is said to be especially adapted to stucco work. It is light and easily handled, can readily be cut to any size with a hatchet, and has no sharp edges to tear or cut the hands.

The prominent feature of the exhibit of the Ideal Concrete Machinery Co., 1310 Monmouth Avenue, Cincinnati, Ohio, were the "Ideal" Cincinnati concrete

New Goods at the Cement Show—Fig. 11—View of "Ideal" Cincinnati Concrete Mixer

mixers, of which the No. 7 Batch mixer, with power side loader equipment, automatic water tank, etc., is shown in Fig. 11 of the cuts. This mixer is designed to meet the requirements of the general contracting business, and although it is a very compact and convenient machine to use it is durably constructed and a machine that can be depended upon to turn out good concrete without the troubles that are incidental to operating the average cheap mixer. Cincinnati mixers are made in four sizes, having loose material capacities of 5, 7, 10 and 14 cu. ft., and are made in equipments with wheelbarrow hoppers, batch hoppers, power side loaders or for rear discharge and paving work.

The Atlas Engineering Co., Milwaukee, Wis., has a new concrete mixer, which is said to be the only one having a seamless pressed steel drum. This mixing chamber is narrow and high and has rounded edges, which keeps the batch in the center of the drum directly over the tracker wheels and gives an equal distribution of weight over the four wheels and their bearings. The drum is built of Bessemer steel with a uniform thickness throughout, a feature which is said to make this part of the equipment 500 to 1000 lb. lighter than other drums having the same capacity. It has dimensions of 28 in. wide and 39 in. high, with openings of 15 in. diameter for the loading and discharge of the material. The mixer has a capacity of 7 cu. ft. and is provided with a rapid loading skip. The chain drive is used on this mixer. The tracker wheels are built of chilled semi-steel castings with ground surfaces on which the drum revolves, assuring a smooth and true running of the drum and requiring a minimum of power. The mixer is furnished with steam, electric or gasoline engine. The top of the engine into which the water is poured in is extended through the roof of the metal housing, making it easy to fill. The housing protects the engine, tool box and battery box from dust and dirt, and may be locked for protection when the mixer is not in use. The equipment is 6 ft. 4½ in. high. Wheeling planks and a loading platform are furnished if desired, the latter extending the full length of the machine with capacity to hold from 50 to 100 bags of cement.

The ordinary charging chute is supplied with this mixer. The "Atlas" material hoist can be attached to the side of the mixer and is operated off the main drive shaft by beveled gears which reduces the speed of the hoisting drum so that its lifting power is tremendous. Thus, for a nominal charge, a contractor may have two machines in one. A batch hopper large

enough to hold one complete batch is also part of the equipment. The hopper is separated from the drum by a steel slide which makes it possible to assemble a complete batch within the hopper while the drum is mixing. The mixer is equipped with either an open top or pressure type tank, and the latter is recommended as the more desirable of the two in that a predetermined volume of water may be delivered to the batch. The discharge spout, when in a discharging position, extends nearly across the inside of the drum, thereby receiving the material from the blades as well as the buckets, discharging the entire load in 8 seconds.

The Schaefer Manufacturing Co., Berlin, Wis., occupied a large space in the Coliseum and displayed two new products—the "Berlin Six" concrete mixer and a portable woodworking machine. The former equipment has capacity for 4½ cu. ft. of mixed concrete, being of simple and durable construction. The mixing chamber is cone-shaped and has the bottom level, the top being inclined toward the discharge end. This drum is made of tank steel with cast semi-steel heads on each end. The concrete is mixed by blades which carry the material up and drops it down in another part of the drum. The company says that there are four mixing motions, which assures the contractor of using a first-class, well mixed batch. The discharge of concrete is controlled by a ring which operates a shutter. A heavy spring holds the shutter in place against the end of the drum, making it water tight, and the amount of material to be discharged can easily be controlled by the operator. The equipment has a 2½ hp. gasoline engine.

In the portable woodworking machine shown in Fig. 12 and just placed on the market, the main frame and table top form one unit, making a very rigid construction. The steel angle legs and lower steel frame are securely bolted to the table top, thus forming a complete box-like all-metal frame, no wood being used in the manufacture of the machine frame. The saw may be raised and lowered through the slot in the main frame by means of a handle and clam screw. This

adjustment can be made instantaneously, without touching the belt-tightener, as it is self-adjusting. With this method of construction the company is able to cast the main bearing in a solid yoke, making it impossible for the bearing to get out of alignment. The machine is furnished with gasoline engine,

Fig. 12—The Schaefer Portable Saw Rig

electric motor or for belting to line shafting or an independent motor or engine. The equipment consists of a band saw, mortising machine, jointer, dado head, disk sander, emery wheel, molding attachment or sticker head, boring attachment and a ripping gage.

An excellent display of mixers, among which were to be found two new models equipped with track loaders, was that of the Waterloo Cement Machinery Corporation of Waterloo, Iowa. For mixers of this capacity the company claims that this is a new departure, as heretofore only the large and expensive machines have been provided with these facilities. It is said that the track loader saves time because the travel is so short, and because, requiring much less power, it can be run faster with the same engine than the old type. As compared with old style loaders this enables the operator to handle more batches per hour, allowing the same time for mixing, or permits more time for mixing if the same number of batches per hour are handled. The truck rests on the ground, giving great rigidity to the equipment. It is hinged so as to fold back out of the way when moving the mixer, as shown in Fig. 13. It can also be extended so as to load the scoop below ground level. Models 15 and 17, having respective capacities of unmixed material of 5-6 and 7-8 cu. ft., are identical in construction and operation, with the exception of the methods of tilting. In model 15 the drum is tilted by levers because of the

New Goods at the Cement Show—Fig. 13—New Model of Waterloo Concrete Mixer

comparatively light load, while in the case of the model 17 size this is done with a hand-wheel and back gear to offset the increased weight of the load. The discharge in either case is easily controlled, and a small or large quantity of material can be discharged as required. The drums revolve at the rate of from 14 to 18 r.p.m. The drums are so constructed that the mix is visible at all times, and the blades are so arranged that the ingredients are well mixed. An important and exclusive feature of the drum is that of adjustment to different pitches, or tilts. This is to accommodate it to the desired consistency of the mix, and the change of pitch can be made in a moment by means of a simple adjustment on the hub of the tilting levers.

The C. A. Londelius & Sons Co., 847 West 63rd Street, Chicago, Ill., exhibited for the first time a contractor's portable water heater, Fig. 14, an equipment especially designed for the mixing of concrete and mortar in zero weather. The heater consists of 100 ft. of 1 in. galvanized iron pipe arranged in coils as shown in Fig. 15. It will be seen that the pipe runs around four sides of the heater and also forms the grates, on which either

a wood or coke fire may be built. This feature brings all of the exposed pipe surface in contact with the fire, thus a high rate of efficiency is assured. The pipes are enclosed in a substantial salamander, which has its corners reinforced with angle iron to insure a substantial and rigid outfit. The equipment stands about 4 ft. 6 in. high and is 24 in. square. The salamander is finished in white on the outside, and the

Figs. 14 and 15—Contractor's Portable Water Heater

cover likewise, the latter having a 6-in. opening in the center. It weighs complete approximately 250 lbs.

The Cummings Machine Co., Minster, Ohio, occupied a booth in the Armory for the purpose of demonstrating the new features in its small concrete mixer. General Manager E. C. Cummings called attention to the fact that the equipment is well adapted to the needs of both large and small contractors, and this prompted the adoption of the slogan "Get a mixer you can afford to use on every job." In Fig. 16 is shown a very compact and portable equipment—one that should appeal more especially to contractors who are often called upon to undertake work many miles from town. The mixer weighs 324 lbs. and mounted on a truck, with engine, 1000 lbs. It has a capacity of $2\frac{1}{2}$ cu. ft. of loose materials. The mixer is somewhat different in construction and operation from the majority on the market. The loading hopper is directly above the mixing chamber, and the batch is dumped by a lever at the side of the machine. The batch is thoroughly mixed by ten mixer blades, operating fifty revolutions per minute, and this is materially assisted by the patented cylindrical mixing

Fig. 16—Front View of Cummings Concrete Mixer

chamber. It will be seen that the mixer is mounted on the rear end of the truck and may be readily placed to discharge directly into forms. This method dispenses entirely with the wheeling of mixed materials. The mixer may be operated by a gasoline engine of from $1\frac{1}{2}$ to 3 hp., and when mounted on a truck occupies a space measuring 5 x 7 ft.

Concrete House of Hollow Wall Type

A Form of Construction Which Gives an Air Space Continuous in Outside Walls from Cellar to Roof

AMONG the building improvements lately carried out in one of the important cities of central New York was the hollow wall concrete house which constitutes the basis of the illustrations upon this and the page which follows. It is a two-story affair, and during the course of construction it attracted a great deal of attention, not only on the part of architects and builders who chanced to pass the scene of operations, but also the curious public, owing, no doubt, to the fact that it was the first hollow wall concrete house erected in that city. As a consequence of this, the builders

tend to reduce the coal bill seldom escapes consideration.

An examination of the floor plans on the following page shows a compact arrangement and a form of house which is economical of construction—that is, the outline is practically square, which avoids the necessity of having rooms of all sorts of irregular outline. From an open porch one enters the main hall, from which rise the main flight of stairs landing nearly in the center of the building on the second floor. The stairs are lighted at the first landing by an outside window. At the right of the

A Concrete Dwelling in Birmingham, N. Y., of the Hollow Wall Type—S. O. Lacey, Architect

doing the work secured a number of contracts from people who became interested in the development of this residence. The practical man appreciated almost at a glance that the method of hollow wall construction involved a number of very desirable features, and that it gave a house which was much warmer in winter and cooler in summer than would otherwise be the case. In connection with a private dwelling the economy of heating is always an important factor, and anything which will

main entrance and under the stairs is a coat closet. At the left of the hall is the living room, the striking feature of which is the open fireplace with bookcases at the left. Beyond the hall is the dining room, and at the left of it, reached through a commodious pantry, is the kitchen. Out of this opens a cold closet and also the stairs leading to the cellar. The sink is placed between two windows with the drainboard directly under one of them, thus affording ample light.

The outside walls of the house are composed in reality of two 4-in. concrete walls separated from each other by a continuous air space $2\frac{1}{2}$ in. wide. These walls are tied together across the air space every 2 ft. horizontally and every 9 in. in height by means of wall ties. In stuccoing the exterior walls the contractors used cement paste applied with a whiskbroom in such a way as to give a rather pleasing effect. The roof of the building is covered with unfading green slate.

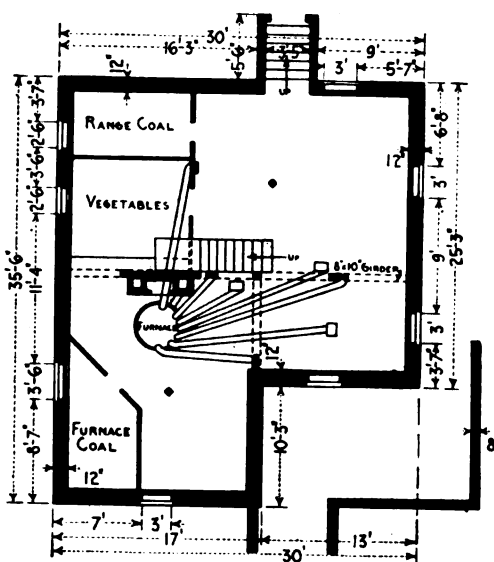

An interesting feature in connection with the interior finish is the wall decoration. The dining room, the living room, and the reception hall are glazed in imitation of leather, which gives not only a pleasing effect but also a sanitary and durable finish. The point is made by the architect that an interior decoration of this kind will last indefinitely and requires nothing except soap and water for the next ten or fifteen years. The walls of the bed rooms are finished in deli-

Foundation, Showing Position of Furnace

Main Floor

Concrete House of the Hollow Wall Type—Floor Plans—Scale $\frac{1}{16}$ Inch to the Foot

For outside trim cypress was used, treated with tobacco brown creosote stain and then wiped.

The interior woodwork of the house is of clear basswood finished in white enamel with mahogany doors throughout except in the kitchen and pantry, where they are finished in North Carolina pine. In doing the work what is known as "Chi-namel" was used with excellent results.

cate tints with "Chi-namel," dull wall finish.

The residence here shown was erected in Binghamton, N. Y., for H. C. Lawrence at a cost of about \$4,500. The plans were prepared by Architect S. O. Lacey of Binghamton, N. Y.

The system of construction used was that of the Van Guilder Hollow Wall Co., 712 Chamber of Commerce Building, Rochester, N. Y.

Current News of Builders' Exchanges

Annual Meetings with Election of Officers for 1916—Banquets of Various Organizations

Annual Banquet of Worcester Exchange

MEMBERS of The Builders' Exchange of Worcester, Mass., held their annual banquet in the large ball-room of the Bancroft Hotel on the evening of March 7, and it was by far the best in the history of the organization. Covers were laid for 275 and only a few vacant chairs were noticeable.

President Geo. W. Kilmer presided and introduced as toastmaster F. L. Powers of the F. E. Powers Company—"what's the matter with Link? He's all right."

Among the invited guests present were the Hon. Geo. M. Wright, Mayor of Worcester; Geo. C. Halcott, Superintendent of Public Buildings; W. T. Morley, president Worcester Chamber of Commerce; W. J. Conlon, General Secretary Worcester Chamber of Commerce; J. W. Higgins, president of the Metal Trades Association; D. Tulloch, Secretary of the Metal Trades Association; ex-Senator A. S. Pinkerton, and Dr. I. N. Hollis, President of the Worcester Polytechnic Institute.

Dr. Hollis delivered a very able, interesting and instructive address, taking as his subject, "Can International Law Be Maintained Without a Navy?"

The speaker of the evening was Dr. Willard Scott of Brookline, Mass., who has no superior and few equals as an after dinner speaker. His address, thoroughly saturated with wisdom and common sense, was made doubly interesting by timely witticisms.

In September of this year the organization will celebrate its twenty-fifth anniversary as an incorporated body and preparations are already under way to make the occasion one long to be remembered. The officers for 1916 are:

President.....Geo. W. Kilmer
Vice-President.....H. C. Wilson
Treasurer.....A. P. Robbins
Secretary.....A. H. Skillings

The Builders' Exchange of San Francisco

The Builders' Exchange of San Francisco, Cal., recently held a meeting for nomination of directors for the ensuing year, and the election will be held shortly. At the meeting definite form was given to a movement that has been under way for some time, to consolidate two of the building trade organizations, as it has been felt that the functions of the Builders' Exchange and the General Contractors' Association might be better performed by one organization. The Builders' Exchange is now in excellent shape in every way, having some 500 members, no heavy liabilities, and a good sum of money in the bank, while its building has been fully paid for, and will bring a return when turned over to the owners of the lot when the lease expires. Though unpretentious, the Exchange quarters are very convenient and well located, and are used to the fullest extent by the members.

Banquet of Pittsfield Master Builders' Association

The tenth annual banquet of the Master Builders' Association of Pittsfield, Mass., was held Feb. 17 at the New American House when covers were laid for 101 members and guests. After a somewhat elaborate menu had been properly considered, the speakers of the evening were introduced in well chosen words by Frederick G. Rice, president of the association. The address of the evening was by ex-City Solicitor M. B. Warner, who in the course of his remarks touched upon

unpreparedness, pointing out that unless the Master Builders were prepared they would be unfit to meet the boom of prosperity which he regarded as rapidly approaching. Mr. Warner was followed by Librarian H. H. Ballard, who dealt largely upon the subject of the Public Library, otherwise known as the Berkshire Athenaeum and Museum. He stated that he had lived in Pittsfield as librarian for a little over twenty-eight years and regretted to state that there were many men in the city who were not aware that a public library existed. Almost every man who did pay a visit to the building expressed surprise that there were so many books on architecture, building, plumbing, interior decorating and furnishing, bricklaying, civil engineering, electricity, etc.

During the evening the Berkshire Glee Club rendered an excellent musical program.

Officers of Hartford Builders' Exchange

The Masons' and Builders' Exchange of Hartford, Conn., has recently organized with the following officers for the ensuing year:

President.....Robert H. Fox
Vice-President.....Dominick Tremonte
Secretary.....Francis Hendron
Treasurer.....Thomas Wester

The meetings are held each week in Odd Fellows Temple and at present there are thirty-five concerns represented in the membership.

Jacksonville Exchange Affiliates with Chamber of Commerce

A meeting of the members of the Builders' & Traders' Exchange of Jacksonville, Fla., was held on the afternoon of Feb. 29, when it was unanimously decided to affiliate with the Jacksonville Chamber of Commerce. The headquarters of the Exchange has been changed to the Chamber of Commerce Building.

Banquet of Lansing Exchange

The members of the Builders' & Traders' Exchange of Lansing, Mich., enjoyed their third annual banquet at the Chamber of Commerce on the evening of March 1, when nearly 125 were present. Peter Gray acted as toastmaster and his humorous remarks added greatly to the good fellowship which generally prevailed. After the many good things provided by the entertainment committee had been duly considered, Hugo Delfs gave a talk on "Fire Prevention" in connection with which he dwelt at some length on the new Building Code now in course of formulation. He was followed by Frank L. Dodge of the State Consultation and Mediation Board, who had for his subject "Lansing." He told something of the history of the city and outlined some of its future prospects. President C. S. Wilcox of the Associated Builders' Exchanges of Michigan spoke on the subject, "Why Builders' and Traders' Exchanges?" He outlined the past achievements of the State Association and emphasized the fact that self-protection was the keynote of the Association's existence.

The Exchange has been moved into its new quarters on East Michigan Avenue, and has planned to add a businessmen's luncheon, reading rooms, billiard rooms and other club features if there is enough interest displayed to warrant the expense.

Brief Review of the Building Situation

Building Operations for February in 97 Cities Show
an Increase of 17.5 Per Cent Over February, 1915

THE striking feature of the present building situation is the showing of the eastern section of the country in the planning of new work, as compared with a year ago, largely due to the heavy shrinkage reported by four out of the five boroughs of Greater New York. Not a little building work however has been held in abeyance, if not altogether abandoned, by reason of the tremendous advance in prices of all forms of structural steel, brick and other building materials, although in some cases plans have been further modified so as to use concrete. Notwithstanding this condition, however, reports from ninety-seven cities for February show an increase of 17½ per cent over the same month last year. Of the number reporting seventy-three show increases and twenty-four decreases.

Of the four sections or zones into which we have divided the country, the eastern cities show a loss of 3.15 per cent as compared with February, 1915, there being thirty-five cities reporting.

CITIES OF THE EASTERN STATES

	February, 1916	February, 1915
Albany	\$169,230	\$277,115
Allentown	192,000	85,335
Boston	4,591,000	3,587,000

St. Joseph	82,190	18,751
St. Louis	1,180,334	701,062
St. Paul	426,694	797,054
Sioux City	569,400	36,150
South Bend	177,085	17,455
Springfield	137,300	65,900
Toledo	700,781	454,607
Topeka	10,575	37,607
Wichita, Kan.	81,550	64,825
Youngstown	85,675	79,650

There are nineteen cities reporting from the southern tier of states representing a gain of 35.6 per cent in the new work planned in February, as contrasted with the same month in 1915. Important increases are found in Baltimore, Louisville, Nashville and Washington.

CITIES OF THE SOUTHERN STATES

	February, 1916	February, 1915
Atlanta	\$277,000	\$471,961
Baltimore	1,952,667	983,136
Birmingham	150,965	136,710
Chattanooga	249,570	33,110
Dallas, Tex.	216,212	324,185
Greensboro, N. C.	33,350	23,200
Louisville	941,330	319,520
Memphis	205,565	101,735
Nashville	241,306	65,705
New Orleans	116,889	97,323
Oklahoma	62,580	42,780
Richmond	372,907	259,184
Savannah	96,520	74,010
San Antonio	84,110	113,595
Selma, Ala.	10,885	5,000
Shreveport	45,046	41,576
Tampa	75,385	58,055
Washington	1,124,300	890,838
Waco, Tex.	58,480	24,951

Coming now to the extreme western section of the country, and including the territory west of Denver, the twelve cities reporting show increased planning of work, the gain over February last year being 41.56 per cent.

CITIES OF THE EXTREME WESTERN STATES

	February, 1916	February, 1915
Berkeley, Cal.	\$210,450	\$93,600
Denver	472,380	165,070
Little Rock	67,061	37,095
Los Angeles	976,378	560,697
Oakland	338,836	328,934
Portland	406,615	311,740
San Diego	164,890	95,990
Salt Lake City	243,815	147,705
San Francisco	1,356,915	807,936
Seattle	598,615	353,880
Spokane	202,660	21,725
Tacoma	63,801	56,751

For the first two months of the current year there has been a gain of something like 20 per cent in the amount of new work planned, and as the spring season opens there is every indication of a most gratifying degree of activity the country over.

Asphalt Shingles Saved This House

A toy balloon set fire to the old style roof of the house to the left. Burning sparks, falling on the roofs of the adjoining houses, set fire to each in turn until **four homes were destroyed**—the same old story that accounts for millions in fire losses.

Fire Chief Says Asphalt Shingles Stop Fires

City of Birmingham, Ala.
Office of
Chief of the Fire Department
S. A. Middleton, Chief.

WALDO BROS., 45-49 Battery March St.,
Boston, Mass.

Gentlemen:—
Replying to your favor of the 21st inst. relative to fire on North 30th St., in this city, beg to advise that the fire originated on the house adjoining the big house shown in the photograph, and was caused by a toy balloon falling on the shingle roof with the result that this house was almost totally destroyed and three adjoining houses were badly damaged.

The fact that the big house was covered with Asphalt Shingles is all that saved it from serious damage, as the side of the house was badly scorched and burned by the intense heat.

I consider that the Asphalt Shingle renders a building reasonably safe from flying sparks, and that there is very little danger of a fire communicating to a house covered with these shingles.

I would be glad if all the residences in this city were covered with Asphalt Shingles, as more than fifty per cent of the fires originate by sparks on shingle roofs, and the number of fires would be materially reduced and the danger of fire spreading would be reduced to the minimum.

Yours truly,
(Signed) S. A. MIDDLETON,
Chief Fire Dept.

The house on the right is covered with Asphalt Shingles. Its roof was showered with burning brands and sparks. But all burned out harmlessly because Asphalt Shingles are highly fire-resistant. Read the frank letter of the Fire Chief about this roofing.

Asphalt Shingles

"Destined to Roof the Nation's Homes"

will protect the homes you build in the same way.

Safeguard Your Customers With Asphalt Shingles

You are safeguarding your customers when you recommend Asphalt Shingles. You are giving their lives and property better protection from fire and you are protecting their pocket-books from a steady toll of repair expenses. Asphalt Shingles are fire-resistant, and they **stay young**, which saves upkeep costs.

Their use insures a higher standard of building material **without** greater expense, for they cost practically the same as common-place roofing.

With this fire-resistance and moderate price

you will find also a beauty that makes Asphalt Shingles decidedly better for a home than any other roofing. Many colors to choose from, each a never-fading shade, and a soft-coloring that blends with any other building materials you use.

There is a greater satisfaction for you in Asphalt Shingles. Even size, few to the square, easy to handle—these mean labor charges saved, which puts you on a better footing to get more business.

Send for books of roofing suggestions, *"The Roof Distinctive"* and *"Fire Protection."*

854 Marquette Building, CHICAGO

Gordon-Van Tine Co.'s Building Material Plant

At Davenport and Vast Lumber Yards at St. Louis

Our business with Carpenters and Contractors throughout the Nation is growing with giant strides. They have come to realize the tremendous advantages offered by the Gordon-Van Tine Company's wonderful Millwork and Building Material Plant in Davenport, where everything used in a building, from shingle nail to the finest interior wood-work, can be secured in double-quick time at a fraction of retail prices.

They have learned that our immense Lumber Yards in St. Louis can "fill the bill" in less time and for less money than retail lumber yards with their limited stocks and heavy running expenses.

We ship building material into practically every community in the United States. We have an enormous output. Our small profit comes on the big volume—the total business. The man who orders a single window or door gets exactly the same low price as the man who orders in car-loads.

We have reduced the manufacturing cost and the handling cost to an absolute minimum. We have applied the principles of scientific management to this vast Building Material enter-

prise. The goods are loaded direct from platform to car without a penny of drayage. In addition to all these facilities we have a Special Service Bureau for the benefit of Carpenters and Contractors. Expert lumbermen, practical carpenters, experienced contractors, and a staff of Architects make this department of great practical benefit to all who require such service. We invite Carpenters and Contractors wherever possible to visit our plant. We want you to inspect our facilities, to meet our men, to study our methods of business.

But whether you come to Davenport or not, you will receive the absolute best that we have in materials, price and service.

Millwork, Lumber and Roofing

25 to 50 Per Cent Below Average Retail Prices

Carpenters' and Contractors' Service Bureau

We maintain for the benefit of customers a highly efficient Service Bureau. The various departments of this Bureau is as follows:

Estimating Department

Furnishes quick, accurate estimates. Get our estimate on your next house bill.

Plan Department

We employ a staff of high-class architects. We work from your rough draft or description of proposed building—charge less than your local architect.

Advisory Service

Our experienced men will be glad to assist in solving any knotty problems that present themselves in connection with your work. Please feel free to use this service.

These are not "paper" savings but in actual dollars and cents. The most thorough investigation, the most rigid comparison, will prove these statements correct.

Quality, Prices and Service

Insure Saving and Satisfaction

All Gordon-Van Tine Millwork, Lumber and other Building Material is of the highest guaranteed quality. The prices speak for themselves. The service is yours for the asking. We have "made good" for thousands and thousands of Contractors and Carpenters in all parts of the country. A test order is all we ask. Every item listed and described in our Catalog is ready for immediate shipment. Hundreds of items in fancy doors and windows, special stair work, porch work, and interior finish which cannot be duplicated by local planing mills inside of two or three weeks are ready for quick delivery.

Send for Big, New, Color-Illustrated Building Material Catalog

The splendid Catalog contains over 5,000 bargain offers in high-grade Building Material, and is a veritable Encyclopedia of Building Information for contractors and carpenters.

The new 1916 editions of our two house plan books are now out. One is on Standard Homes—material in the standard way; the other is on Ready-Cut Houses—material cut to fit. Over 300 plans in all. Every one practical—all built many times. Costs definitely known and guaranteed to keep within our figures. Free on request. Valuable books to aggressive builders. Send for them.

Builders' Appliances and Equipment

Some Things of Special Interest to Those Having to do with the Various Branches of the Building Business

"Buttonlath" Plaster Board

The great extent to which cement stucco has come to be used all over the country has created an exceptionally big demand for wood and metal lath and substitutes therefor. The ideal concrete-appearing building is, of course, the one that is constructed of solid concrete, or at least stucco over building tile, but a structure which shall have the same appearance and at the same time cost less is frequently found desirable. It is in such cases that stucco over lath or plaster-board is made to serve, and the success of such work naturally depends largely upon the stucco's foundation, although not a little upon the quality of the plaster itself.

There has been recently placed on the market a new plaster-board, called "Buttonlath," which is not only intended for exterior purposes but for interior work as well. It is a composition board made into sheets 24 x 32

Fig. 1—Showing the Application of the Lath to the Walls and Ceiling of a Room

"Buttonlath" Plaster Board—Various Details of Interest to Architect and Builder

in. in size and $\frac{3}{8}$ in. thick. Because of its fibrous nature, it is readily nailed to the framing timbers, and it can be cut to any size with a saw or by drawing the blade of a hatchet or other sharp instrument across it and breaking over a straight edge. It is an easy matter to break joints by using half and quarter sheets. The appearance of "Buttonlath" applied to the interior of a room is shown in Fig. 1.

The important feature of this board is its mechanical keying system or bonding quality. The surface to which the plaster is applied is covered with indentations, in the center of which are set cement-composition buttons with flaring edges. These buttons are spaced, in stagger fashion, $1\frac{1}{2}$ in. apart on centers, and number 530 to

the square yard. Each of the buttons will sustain 50 lb. before breaking. The applied plaster is not only held by its grip under the edges of the buttons, but also is bound to the fibrous surface of the board by suction and adhesion.

Although there is no variation in sheet size or thickness, "Buttonlath" is really manufactured in two different grades—one for interior work, and the other for exterior purposes. The former is surfaced, on both sides, with a sort of paper pulp and the latter with a special 15-pound roofing paper. For exterior work, the board is also supposed to be covered with ordinary wire netting, of 16-gage and 2-in. mesh. This netting is nailed loosely to the surface, to act as a reinforcement for the stucco and to help in keying it to the board.

In some cases, "Buttonlath" is also used to form solid partitions, and for this purpose it may be had faced with buttons on both sides. For such construction, metal studs are used spaced 24 in. on centers and secured to the ceiling and the floor by $\frac{3}{4}$ -in. steel channels or a galvanized runner, or by drilling into the concrete and springing steel studs into place. The boards are then set in place, and secured to the steel studs by nails, as in Fig. 2, which firmly wedge the boards together and make the structure rigid. The plaster is applied to each side of the partition, which is from $1\frac{1}{2}$ to 2 in. thick.

One of the advantages of a plaster-board of this kind is that the plaster or stucco may be applied in a single coat, from $\frac{3}{4}$ to 1 in. in thickness. This means a considerable saving in time and labor. Of course, however, the finishing coat must be applied separately, but no surface need be gone over more than twice. Because of its composition, "Buttonlath" is more or less fire-retarding, is water-proof, a sound-deadener, and a heat-insulator. Since it is always rigid and affords a solid surface, the plaster is said to be less apt to crack than when metal or wood lath is used.

Although placed on the market less than a year ago, "Buttonlath" has been quite extensively used in southern California. It has been employed in the construc-

Fig. 2—Horizontal Section Through a Solid Partition

tion of residences, store buildings, apartment houses, etc. One of the most notable jobs for which it was used is the group of new high school buildings at San Bernardino, Cal., in which 360,000 sq. ft. of "Buttonlath" is used, it being employed for both exterior and interior purposes. It is manufactured by the Buttonlath Manufacturing Company, Central Building, Los Angeles, Cal.

The Hess Pipeless Furnace

Hess Warming & Ventilating Company, 1220-B Tacoma Building, Chicago, Ill., reports a very gratifying demand for its welded steel cottage furnace which was

brought out early last fall and which was illustrated and described somewhat in detail in these columns in September. The furnace is of the "pipeless" type, having a large register placed directly above it and the hot air rising through the center of this register. On each side of the hot air outlet is a cold air flue so that the cold air from the room descends to the bottom of the furnace casing and then ascends in contact with the heated surface of the furnace and escapes through the register as stated. The arrangement is such as to constitute a circulating system which rapidly changes the air in the room in which the register is placed as well as all rooms which communicate directly with that room. The heaters are sold on trial and special terms are made to contractors which enable them to handle the furnace business direct rather than through local dealers.

The "Hummer" Door Hanger and Track

One of the latest additions to the assortment of barn equipment which is manufactured in great variety by the J. E. Porter Company, Ottawa, Ill., is a new barn door hanger and track known as the "Hummer." It will be seen from Fig. 3 of the illustration that the track is made of one piece of No. 14 gage steel and is formed in such a manner as to give the maximum strength. This single piece of steel constitutes the cover and track complete, no rivets or brackets necessary, and the joint clamp is so arranged as to make a continuous track. The wheels of the hanger run in the V-shaped base of the track, the contact being with the sides of the groove rather than in it, thus reducing the point of contact to a minimum and practically eliminating friction. The appearance of the hanger in the groove is shown in Fig. 4 which represents a vertical cross-section through the door and track. The construction is self-centering, the wheels running perfectly true

Fig. 3—Broken View Showing Hanger in Position

are constructed of a series of galvanized sheet steel of No. 26 gage or cold rolled drawn through sharp straight dies. The exterior faces of the metal trim can be varnished, painted or stained to give the appearance of various kinds of wood according to requirements. This construction is referred to as fireproof as well as inexpensive and durable. It is of such a nature that it can be applied with hammer and nails—no special tools being required. The use of the material insures close fit between the trim and the walls and in plastering it makes a positive joint. The sanitary "Nu-Wa" trim and base cap has been designed primarily to reduce the cost of interior and exterior finish, and is especially adapted for use in connection with hospitals, colleges, schools, public, commercial and industrial buildings, bathing establishments, etc. The company has issued an architectural catalog giving many interesting facts concerning the advantages of the Elgin "Nu-Wa" method of construction using the metal trim and base cap both for interior and exterior finish.

Use of Mineral Wool in Architecture

The use of mineral wool for filling the outside walls of residences and the space between rafters of buildings of all kinds for the purpose of protection against heat

Fig. 4—Vertical Cross-Section Showing Hanger in the Groove

The "Hummer" Door Hanger and Track

regardless of the angle of the door. It will be seen from the picture that the door is completely protected from the weather as is also the hanger and its mechanism. The track is furnished in 6, 8 and 10 ft. lengths with all joint clamps and a lag screw every 12 in. The hanger is a steel tandem, the wheels being large and having roller bearings. The construction of the hanger is such that the wheels cannot jump the track. It is made in adjustable and non-adjustable types so as to meet varying requirements.

Elgin "Nu-Wa" Sanitary Trim

One of the latest candidates for popular favor in the way of exterior and interior trim is the product which is being brought to the attention of architects, builders and owners by the Elgin Nu-Wa Metal Trim Company, Excelsior Springs, Mo. This trim and base cap

in summer and cold in winter is rapidly growing as the merits of the material become better known. The material is also used for deadening sound and fireproofing, and as there is nothing organic in its composition to decay or become musty—being manufactured from blast furnace slag—it is well adapted for the purposes for which it is recommended. Many interesting details as to the manner in which Mineral wool can be utilized to the best advantage and illustrations showing just how the work is done are contained in an attractive pamphlet sent out by the United States Mineral Wool Company, 140 Cedar Street, New York City. Mineral wool is now made by a new and improved process and as a consequence the quality of the material is much enhanced as regards strength of texture, lightness and freedom from dross over that hitherto made. Accompanying the pamphlet is a folder telling how to keep out the heat in summer and keep

(Continued on page 88)

Fiberlic for Walls and Ceilings

What Do You Know About Wall Board?

DO you know which has the greatest elasticity, tension or sheer strength? Which reflects heat? Or which is odorless, vermin-proof, fire-resisting, etc.?

When you specify FIBERLIC Wall Board for any of its manifold uses, you can be sure that it is way ahead of ordinary wall boards in all these qualities.

All FIBERLIC tests place it in a class by itself, because it is the only chemically treated, **long-fibered** board on the market.

To the wide-awake man practicing the profession of building, we submit FIBERLIC as a material for interior finishing, more economical than lath and plaster and for very many purposes more suitable and practical.

Samples and full technical information on request. Also ask about the special FIBERLIC paints that come in 24 different colors and shades.

it in during the winter months. In other words, the matter constitutes a chapter on the insulation of dwelling houses.

Laying Shingles to Give the "Thatched" Roof Effect

Some very interesting literature bearing upon the above subject is being sent out by the Standard Stained Shingle Company, 1030 Oliver Street, North Tona-wanda, N. Y. There is an instruction sheet giving details including sections and elevations of portions of a roof together with explicit directions as to the proper method of laying "Creo-Dipt" stained shingles in order to give the wavy thatched effect to a roof. The shingles in question are furnished for this sort of work ready for instant application. The butts are sawed in the proper manner, while for dormers, valleys, hips, and gable ends, the shingles are bent with the grain, and for the eaves they are bent across the grain. The company recommends the use of "Creo-Dipt" 16-in. extra clears for the thatched effect as they lend themselves particularly to the processes required for this work, and the company points out that since the exposure is less than for ordinary roofing purposes they are more economical and better adapted. With the instruction sheet is a handsome folder entitled "Thatched Effect," which is illustrated by means of numerous half-tone engravings of attractive residences, the roofs of which have been covered with the company's stained shingles, so laid as to give the effect described. The company states that during the past four years it has made exhaustive experiments and has furnished "Creo-Dipt" stained shingles for many fine houses throughout the country for thatched roofs and with very satisfactory results. The company calls attention to the fact that its Service Department is at the disposal of architects and contractors and the suggestion is made that blue prints and specifications be sent the company for thatched roof work. The Service Department will offer suggestions as to radius, best grade and colors to use, as well as many other things which will materially aid the inquirers in producing the best and most artistic results.

A New Plasterer's Trowel

A copper-plated plastering trowel, which is referred to as a great improvement over the old-style polished steel trowels, has just been placed upon the market by

Fig. 5—General View of New Plasterer's Trowel

the Nicholls Mfg. Company, Ottumwa, Iowa, and a general view of which is presented in Fig. 5. This new trowel is so made that it will not rust and will prove very durable. It is made of the finest quality of crucible spring steel, with blades and mountings full polished and copper plated. It is substantially constructed with flexible blades, straight edges, perfect hung, light weight and secured with ten and twelve rivets.

Catalog of Sheet Metal Building Materials

There has just been issued from the press by the Willis Mfg. Company, Galesburg, Ill., a very attractive catalog of sheet metal building materials which is being distributed to those making application for it. The work is known as "Catalog No. 7," consists of 170 pages and presents numerous illustrations with descriptive text of metal windows, tin clad doors, shutters and fixtures, all bearing the underwriter's label. The point is made that these products are such that every community can use them satisfactorily for the reason that they reduce insurance charges, assist in protecting property from fires in adjoining buildings, and while

"Keystone Lock Joint Clamp"

Patent applied for

These clamps are made from high grade spring steel, with convex face and acute angled flanges, which engage corresponding grooves formed in backs of the parts to be joined together, as shown in illustration.

When driven in place, the clamps, owing to their compensating spring construction, exert a constant pressure on the edges so joined together, making a joint which remains tight under all changes of climate or temperature.

To secure the best results, specify and insist upon the use of the "Keystone Lock Joint Clamp" on all mitre trim joints.

We use the "Keystone Lock Joint Clamp" on all our erected trim without any additional cost to our Customers, giving them, as always, **MAXIMUM VALUE AT MINIMUM COST.**

they are more generally used in the larger cities they can be profitably utilized in the smallest village because the latter usually does not possess the fire fighting apparatus and night watchman service that is to be found in the more popular places. The small additional cost of fireproof windows and doors as compared with ordinary construction give the former a value that cannot be estimated in dollars and cents. The catalog also illustrates and describes skylights and ventilators, all grades of roofing and roof finishes, shows numerous styles of metal ceiling as well as gutters in standard sizes and design. The new catalog measures 8½ x 11 in. in size, and its arrangement is such as to render it a ready reference book for the builder and the sheet metal worker.

Kaustine Sewage Disposal

An attractive pamphlet of sixteen pages profusely illustrated with halftone and line engravings, all relating to the Kaustine system of sewage disposal is being sent out by the Kaustine Company, Inc., Dept. B-1, Buffalo, N. Y., and with export sales office at 116 Broad Street, New York City. The system described is well adapted to dwellings, churches, hotels, schools, factories, and in fact to all the toilet requirements of unsewered districts in village or country. The features of the scheme of sewage disposal are the Kaustine closet system and the chemical germicide and solvent, "Kaustine." A description and specifications of the outfit are presented in a way to be readily understood and the plan of installation is simple and effective. The scheme most commonly used is that described in connection with the 1915 model. It is to locate the bowl on the first floor in a shed, back porch room, lean-to, or whatever room may be provided in the house. The tank is usually buried 10 in. under ground beneath the wall of the house, and the manhole for emptying and re-charging is thus outside. With each outfit specific instructions for installation are furnished. A feature of the pamphlet in question is a number of plans of school-houses showing suggested schemes for installations.

Montross Metal Shingles

We have just received from the Montross Metal Roofing Company, 108 Erie Street, Camden, N. J., a copy of an attractive catalog of Montross metal shingles and

Fig. 6—Government Building at Baird, Cal., Roofed with Montross Metal Shingles

roofing sundries, the salient features of these specialties being set forth in a way to command the attention of the architect, the builder, the roofer and the house owner, while numerous illustrations show the appearance of the various types of shingles produced, also some of the many buildings in connection with which the goods have been used. Directions are given for applying the shingles, and in addition reference is made to metal weather boarding either painted or galvanized, rock face siding and rock face stone siding stamped in metal in a way to represent the finish indicated. Interesting in this connection is the building pictured in

Fig. 6, which represents the government residence at Baird, Cal., and which is roofed with Montross metal shingles. Supt. G. H. Lambson of the Bureau of Fisheries at Baird, states that the shingles are giving perfect satisfaction and in that climate where there are six months of hot weather without rain followed by a six months rainy season, they have proved, he states, to be much "superior to the best wood shingles." They were laid over the old wooden shingle roof and have rendered the house cool in summer and warm in winter.

New Hand Saw Files

Delta File Works, Philadelphia, Pa., are distributing among the trade an illustrated folder calling attention to the high-grade files which they are prepared to supply. In the list are three specials, known respectively as the "Carpenter Special," "Mechanic's Favorite," and "Expert's Choice." Each represents a special length, and is particularly adapted for filing hand saws. Being made of crucible steel with a deeper tooth and the correct angle that will insure the greatest efficiency, they are much longer than the usual shapes that have been used in this same cross-section or face of the file. The longer sweep of the files economizes the time of the user so that he is able to do a great deal more work in less time. The manufacturers call attention to the fact that if the goods, after fair trial, are not found satisfactory the money will be refunded.

The Neville Roofing Bracket

Carpenters and builders throughout the country are likely to be interested in a new roofing bracket covering which application has been made for a patent, and

Fig. 7—The Neville Roof Bracket

which is now being placed on the market by the Neville Mfg. Company, 210 North Fremont Street, Kewanee, Ill. The bracket is intended to support the staging on the roof while work is in progress. It can be used over either wood shingles, metal, slate, composition or roofing in rolls. The device consists of a bar of soft steel 5 ft. 6 in. long and $\frac{1}{4}$ in. thick made in the form of an arch so that the roofing may be laid under it while at its lower end it is looped to receive a 2 x 4 in. stud. The top end has a reversible hook which is designed to hook over the roof boards on an open sheathed roof. The flat end has a slot in it to hook over a 10d. or 20d. nail driven in the roof on a close-sheathed roof. The claim is made that the bracket may be used on any style of sheathing and is readily moved up as the work proceeds, thus always keeping the staging where it is most convenient to work upon. The company is sending out an illustrated circular setting forth the merits of the bracket and telling how to use it in connection with various kinds of roofs. The application of the device will readily be understood from an inspection of Fig. 7.

Lewis-Built Homes

A very attractive catalog which cannot fail to command the attention of every home-seeker in the country has just been issued from the press by the Lewis Mfg. Company, Bay City, Mich. It is a volume of 112 pages profusely illustrated with halftone engravings and plans of attractive homes, the building materials for

Try This Aloe Level 10 DAYS—FREE

Easy Monthly Payments If You Buy

Prove the superior quality of the Aloe Convertible Level by testing it out for 10 days. Use it on your every day work laying out buildings, locating foundation piers, leveling up foundations, walls and floors, aligning, shafting walls, piers, etc., for getting angles, or levels anywhere and the hundred and one other things for which you would use a level or transit. Then, if you decide to keep it, you may pay for it in easy monthly payments so small that you will scarcely feel them.

Aloe Convertible Level

is more than a mere level. It is a modified transit permitting double the range of work possible with an ordinary architect's level. Its construction is such that sights above or below the horizontal can be taken, making it the finest instrument ever offered at anywhere near the price. For taking vertical sights the instrument is provided with a special convertible bracket rigidly and permanently attached to the cross-bar thus eliminating the extra time that other instruments require for changing the telescope in position to take vertical readings. The telescope which is fitted with a permanent axis, rests in the bracket bearings and owing to our special constructed clips the instrument can be used for leveling while in this position if desired, although the bracket clips are easily and quickly released from the telescope axis when levels only are to be taken. The telescope is then set in its normal position in the wyes and you have overcome the old method of attaching and detaching the convertible bracket.

Your Own Time To Pay—No Interest

Remember, you are under no obligation whatever to keep the Aloe Convertible Level. We do not even ask you to promise to buy. But you owe it to yourself to see and try it. If it isn't all you expect you may return it at our expense. If you do keep it, you will find the small monthly payments easier than paying rent for an instrument—and at the end of a few months you will own it—absolutely. There's no red tape about this offer—we ask no embarrassing questions—everything is confidential—we charge no interest. You have practically your own time to pay.

Mail Coupon for Descriptive Circular

It explains the Aloe Convertible Level in detail and shows how easily the man without the training of the engineer or surveyor may secure the same accurate results as the expert. Send your name on coupon or postal for free copy and full particulars of our original, unique and popular selling plan.

Write for Catalog A.

Section of Sound-Proof and Fire-Proof Partition. Can be used for outside walls also.

Mineral Wool for Building

Mineral Wool has superseded all other materials used for similar building purposes because it does "a great work at little expense." A house lined with Mineral Wool has an indestructible, fire-proof and vermin-proof guard; it protects the entire household. In the winter time it keeps the cold air out, facilitating proper heating and economy in fuel. In the summer it keeps the heat out.

This material, being of fibrous, inelastic composition, acts as a deadener and muffles all sound. It is considered the best insulator material on the market, making it a perfect refrigerating machine.

Mineral Wool makes life-long friends of all its users. If you are skeptical as to its power, let us demonstrate. We can prove all claims. Write us to-day.

which can be supplied by the company for the sum stated in connection with each design. The purpose of the book or catalog is to inform those who are intending to build homes how they can do so "by a better method than was thought possible prior to the perfection of the Lewis-built ready-cut system." The business of the company is selling houses direct to the builder and so prepare the lumber as to make the erection easy, economical and satisfactory. The point is emphasized that the company does not make what are known as "portable" houses, and it requests that Lewis-built homes be not confused with such. The many advantages of the Lewis-built method are presented as well as the way in which the reader can derive the most benefit from the catalog. Reference is made to the saving in time, labor and in the cost of material together with an enumeration of what is furnished for Lewis-built homes in the way of lumber, interior and exterior mill work, paint, stain, varnish, plaster and plaster board, masonry and complete plans and instructions. The company also furnishes a photograph of the house showing how it will look when completed. The publication is known as Catalog A-6 of One Hundred Homes, and we understand that a copy of it may be secured by any prospective builder upon application to the address given.

The "Universal" Hand-Block Belt Sanding Machine

Carpenters and builders who find hand finishing an expensive operation are likely to be interested in the new "Universal" hand-block belt sander illustrated in Fig. 8, and recently placed on the market by the Berlin Machine Works, Beloit, Wis. This equipment is said to speed up

Fig. 8—The "Universal" Hand-Block Belt Sanding Machine

sanding jobs, insure a better and more uniform finish, to be an insurance against spoiled stock while adding profits and saving labor costs. The standard table is 80 in. long by 32 in. wide, and when the bases are set close up to the table the floor space occupied is about 5 x 10 ft. Where plenty of room is available the standards may be set 12 to 18 ft. apart. The machine is entirely self contained, has no complicated parts to get out of order and requires little power to operate it. One of the main features of this sander lies in its ability to handle material at great length and of exceptional thickness, as the pedestals can be spaced and the table lowered to suit requirements. Furthermore, with the pedestals set well apart an exceedingly flexible belt results, permitting manipulation to shapes of stock that a short belt could not accommodate. The work lays on the table always facing the operator as he brings the belt to the work. This enables him to see exactly what he is doing and insures the proper finish. Little effort is required to roll the table proper back and forth, as it is built very light but rigid and runs on nearly frictionless rollers. The table is raised and lowered by means of a rack and pinion at each end, giving a level rest and proper height to work for most convenient sanding. This adjustment is readily accessible from the operator's natural position, being controlled by the large center hand wheel through a worm and worm gear. The belt level is at the proper height to allow straight arm manipulation of the hand block, so that no useless effort is expended in getting the required pressure on the sand belt. This is important in eliminating strain when reaching over wide work and generally means greater output with less operative ef-

(Continued on page 96)

Architect—"Here is that job showing the new gray finishes that I've brought you over to see. It gives you an exact idea of the beautiful finishes that can be given to the woodwork of your new home."

Owner—"My, but they're fine—the best I've ever seen. How did you get them?"

Architect—"Easily answered. The Bridgeport people put out the *real* grays. I specified a coat of **Bridgeport Standard Acid Stain**, two coats of **Wonder Lac** and the result is just what you see here—certainly they're the slickest, clearest grays I ever laid eyes on."

Owner—"I happen to have some knowledge of wood finishing and I must say that I've never before seen what I called a good gray. They're all more or less of a greenish cast. How did you overcome that on this job?"

Architect—"You get a greenish cast when shellac and wax are used as a finish. There's just enough yellow in shellac to kill the delicate gray tint; but you see **Wonder Lac** is colorless, so it retains that beautiful gray tone which the stain gives to the wood."

Bridgeport Standard Gray Acid Stains are **real grays**. They give the most beautiful gray effects you ever saw.

But be sure to see that **WonderLac** is used over our acid stain—because **WonderLac**, being colorless, does not change the tint of the stains like shellac.

These new types of finishes are playing such an important part in attractive decorative effects that no architect, building contractor or home owner who desires his wood-work finished in the most artistic and practical manner can afford to neglect being fully posted about them.

We are ready to furnish sample panels and complete information.

FOR EVERLASTING CONCRETE WORK

Millions of barrels of **ALPHA**, the Hourly - Tested, Guaranteed Portland Cement, have been used by the United States Government in building fortifications, sea walls, breakwaters, big dams, etc., and by other constructors in such great works as the Galveston Sea Wall, the New York Aqueduct, the Pennsylvania Railroad Terminal in New York, and many more notable constructions where concrete is called upon to meet the severest conditions.

ALPHA

The Hourly-Tested and Guaranteed Portland Cement

long ago displaced the best imported Portland Cements. Great builders have learned that **ALPHA** on a bag means something more than 94 pounds of Portland Cement. It stands for exact proportioning of superior raw materials, exceptionally fine grinding and thorough burning. In all **ALPHA** plants the chemists are supreme. They make hourly tests, to be absolutely sure of uniformity, fineness, and strength. Their strict system of tests insures that every bag of **ALPHA** sent out will bind with an everlasting grip. "Guaranteed"—now stamped on all new **ALPHA** bags—enables you to know, whether you make your own tests or not, that the cement will more than meet the United States Government standard and every other recognized test.

Free Plans If you are about to build a garage, barn, poultry house, greenhouse, small dam, dairy house, or porch floors or steps, ask the **ALPHA** dealer in your community to secure valuable free plans for you. The **ALPHA** dealer will also be glad to give you the 80-page book, "ALPHA Cement—How to Use It," which tells how to make all the improvements illustrated here, and dozens of others as well. If you do not know the **ALPHA** dealer, write us, mentioning what you are planning to make or build. Ask for Book No. 17.

The Amherst Warm Air Furnace

The heating question is one of never-ending interest to the architect, the builder and the house owner, and they are therefore likely to find much to command their attention in a folder which has been sent out by the Buffalo Co-Operative Stove Company, Buffalo, N. Y., which illustrates and describes a new hot-air furnace known as the Amherst. In its construction the front is made entirely of cast iron in two sections, the fire and ash pit doors are large; the grate is of the triangular roller-bar pattern which is easy of operation and permits of the bars to be removed separately; the fire part section is in two parts while the combustion chamber below the radiator is made in one piece. Cup joints filled with asbestos cement are used, which it is claimed prevent leakage of air, gas and dust. The radiator is composed of heavy cast iron top and bottom rings with sides of heavy gage sheet steel. The dome is made in one piece of solid cast iron and the dust flue pipe connects the ash pit with the combustion chamber so that when shaking the grate the ash dust is drawn into the combustion chamber and then to the chimney, thus preventing its escape to the cellar. The furnace is made in three sizes and is fitted with water pan which, it is pointed out, will constantly supply the air in the house with all the moisture needed and keep it at the average summer humidity.

Mottled Asphalt Shingles

Architects and builders will be interested in learning that the Asphalt Ready Roofing Company, 9 Church Street, New York City, has just brought out a line of mottled asphalt shingles, which in view of the present tendency toward mottled roof effects, cannot fail to command widespread attention. These mottled shingles are surfaced with different quantities of red and green slate, some being half red and half green, some nearly red and others nearly green, and when the shingles are mixed together and properly laid they give to a roof tone and individuality. Although the shingles have been placed upon the market only a very short time, a number of architects have specified them and indications point to a rapidly growing popularity.

Cassens' Ideal Eaves Trough

Cassens' Ideal Eaves Trough is the subject of a little pamphlet which is being sent out by Cassens Mfg. Company, Edwardsville, Ill. It is of simple construction and is said to completely overcome the disadvantages of the old-style open gutter. Its construction is such that it cannot become clogged, neither will it fill with snow and ice. When it sleets the small opening—about 1/8-in.—is quickly closed and this prevents the bursting of the trough also of the downspout. When the ice melts the entrance opens automatically before the water from the roof reaches the gutter. The body is made in the usual semi-tubular form and the rear wall extends upward to which is attached a cover having an inclined upper face. The lower edge of the cover curves downward and terminates inside of the front wall of the trough, leaving a relatively narrow space for the entrance of the water. The claim is made that no matter how hard it rains the "Ideal" will catch all of the water. The cover can be had in 5-ft. sections and is detachable so that the gutter may be painted without removing it from the building.

The Archer "Special" Concrete Mixer

Archer Iron Works, 2440 West Thirty-fourth Place, Chicago, Ill., is sending out an attractive four-page folder printed in colors and illustrating and describing the No. 1 Archer "Special" concrete mixer. One of the striking features is the low-charging platform which is of the right height to permit the discharging hopper to catch under the front edge of the wheelbarrow tray.

(Continued on page 98)

ALWAYS ACCESSIBLE

Saves \$85 on Average Job

Here's a time-saving closet that'll enable you to bid lower—to get more of the jobs you figure on—and make more on each job.

Every man on building, road construction, sewer or other jobs wastes 10 minutes twice daily going to and from your inaccessible closet—that's 20 minutes daily, 8 1/2 hours monthly (520 minutes). 20 men 2 months on a job lose 340 hours, and even at 25c. hour waste \$85. The

Kaustine Portable Closet

is always so accessible that a man never wants to delay relief—such delays make men sluggish, deadening physical and mental effort. Kaustine, the powerful, germ-killing disinfectant makes this system odorless and sanitary.

Promote your own profits. A copy of our new, intensely interesting catalog awaits you—what's your address?

How to Haul Lumber and Building Materials Efficiently—

Your biggest problem is how to equip so as to be able to handle a large volume of construction work.

This can be accomplished by doing your hauling with a Federal Motor Truck or

FEDERAL Motor Trucks

as the case may be.

A large volume of work can then be handled because of the large territory served and the prompt service of Federal Trucks.

FEDERAL Service sells additional Federals.

For instance:—The business building service

Have us send you "Traffic News," an interesting magazine on transportation.

of truck No. 3452 sold truck No. 3555, and then still another. Loading of miscellaneous building and mill products in a very novel way permitted this truck to handle an enormous volume of business.

Write us for reports of Federals in the service of builders and contractors.

Material Co.**

48-50 Vine St., Cincinnati, O.

The man simply lifts the handles of the wheelbarrow and the charge is dumped directly into the drum. The Archer uses a half sack of cement per batch on a 1:3:6 mix or a whole sack on a 1:2:4 mix. This it is pointed out saves time, as there is no dividing a sack into small sections. The discharge spout is so arranged that the drum can be emptied in ten to fifteen seconds. The mixing is done by the bucket and blade method, the drum being equipped with six buckets and six blades—two blades being reversed—and the mixing concrete falls on the discharge spout, which when tilted back throws the material far into the drum to give a re-mixing action. The drum is provided with splash plates which it is claimed make it impossible for concrete to splash out. The mixer is readily portable and can be shifted around to any part of a job by reason of its narrow tread. One man can easily lift it at the platform end, as the wheels, engine and drum are so placed as to make a perfect balance.

Something New in Hollow Steel Doors

Architects, builders and owners generally throughout the country will be interested in a new development in connection with building construction which has to do with the standardization of hollow steel doors. This has been brought about by the Solar Metal Products Company, Columbus, Ohio, which claims by this standardization to have largely reduced the cost for the reason that a builder can purchase standard doors at a fixed price instead of securing prospects on each particular door. The trouble in the past seems to have been that hollow steel has cost too much, and this excessive cost has been, in the average case, the stumbling block when architects desired to specify hollow steel. The problem which confronted the company was to supply hollow steel doors at a fair price, and this has made possible their use in all the better class of buildings, apartment houses, schools, etc. The remedy for excessive cost and a restricted field was to establish suitable standards of size and quality. The new deal means not only lower prices, but a better product, and to the architect it means less work and more knowledge; to the contractor quick and accurate estimating with delivery on time, and to the owner the possibility in moderate priced buildings of having handsome, durable, fire-resisting doors that will neither crack, shrink, swell nor stick. The company offers a comprehensive series of standard styles ready for assembling, finish and delivery. The cost of hollow steel doors turned out under these new conditions is said to be on the average just a little more than one-half of former prices. The details and specification of Solar standard doors are covered in a convenient loose-leaf handbook, a copy of which can be secured on application.

Rodgers Automatic Stair-Door

A development in connection with two-family houses and one which enables the same space to be used for basement stairs for both of the two families in the building is the automatic stair-door to which the attention of architects and builders is being drawn by William F. Rodgers, 3552 Pine Street, St. Louis,

Philadelphia Boston St. Louis Minneapolis Des Moines Dayton

ATLAS CEMENT
The Standard by which all other makes are measured

Mo. The door consists of the five steps at the foot of the flight of stairs from the second story, and is directly over the stairs leading to the basement. The arrangement is such that the pressure of the foot against a catch plate opens the door, which can be operated either from above or below, and when the door is open one may pass up or down to the basement stairs without trouble. The stair-door is referred to as a great saver of space and can readily be installed in old or in new houses. The arrangement is such that the door in the stairs is practically invisible, the only indication of it being the very small crack which appears on either side just within the stringers.

New Upson Wall Board

The latest addition to the imposing list of improvements which the company has introduced in the wall board industry during the last five years is the new 64-in. wide board which has just been placed on the market by the Upson Company, 92 Upson Point, Lockport, N. Y. This wide panel opens up many new avenues of use which cannot fail to be appreciated by the carpenter and builder. By means of this 64-in. board, paneling is greatly minimized, giving as it does a practically unbroken wall surface. Only two 64-inch panels of Upson processed board are needed to cover an ordinary wall area, and where no openings occur between the usual openings one panel will be sufficient. Interested readers can obtain samples for their own test simply by writing to the company.

Important Purchase of Metal Lath Interests

Just as we go to press we learn that the Sykes Metal Lath & Roofing Co., Warren, Ohio, has purchased the metal lath department of the Brier Hill Steel Co., at Youngstown, formerly operated under the name of the Garry Iron & Steel Co., at Niles, Ohio, making the Sykes Metal Lath & Roofing Co. one of the largest pro-

ducers of metal lath in the country. The company will continue to operate the plant of the Garry works at Niles, in addition to its own plant at Warren.

TRADE NOTES

American Sheet & Tin Plate Company, Frick Building, Pittsburgh, Pa., has just been distributing an interesting booklet entitled, "Research on the Corrosion Resistance of Copper Steel," by D. M. Buck, Metallurgical Engineer of the company, and J. O. Handy, Director of Laboratories of the Pittsburgh Testing Laboratories. The matter has been presented in attractive shape and will be found of interest to many connected with the building industry.

The illuminated calendar which the Richards-Wilcox Mfg. Company, Aurora, Ill., sends out for March carries a panel picture of a most charming young lady entitled "Sunshine," which evidently signifies her temperament. On the back of the card is the application of the word "sunshine" to the company's business, the point being made that "as the warm rays of the sunshine bring out the luster and build up life, so do right business tactics build up trade friendship and spread wide the prestige gained by a square deal to all." The card calendar accompanies the March issue of DooR-Ways, the house organ of the company. This has, among other things, an interesting article on hanging garage doors.

Tubular Heating & Ventilating Company, 223 Cherry Street, Philadelphia, Pa., has just issued from the press an attractive catalog of forty-eight pages illustrating and describing the Forbes warm-air furnace. This heater is only 4 ft. 3 in. in height, thus readily adapting it for use in low cellars and at the same time allowing of proper pitch to the distributing pipes in order to insure the best results. Special attention is drawn to

Makers of Hand Nailing and Tacking Tools

MACK & CO.

YOU will always feel secure when you use Barton Planes and Edge Tools. The making of keen edged tools that hold their sharpness is our hobby. If your dealer won't supply you we will. There is some mighty interesting and profitable reading in "The Carpenter's Catalog" and "True Stories." Both free, of course.

Brown's Race & Platt St., Rochester, N.Y.

the radiating manifold, "a new principle in connection with heating air." The radiator is made of cast iron without joints, and is thus gas-tight. In addition to the many illustrations are several pages of testimonials from some of the many who have made use of this heater with gratifying results.

"The Shingle of the Century" is the suggestive title of an attractively illustrated folder being sent out by Bird & Son, Dept. B, East Walpole, Mass., and relating to the merits of Neponset shingles. After years of preparation the maker announces a "tremendous spring campaign on Neponset shingles," and the statement is made that last year the campaign, with the help of Neponset dealers, brought the biggest business of the makers' 120 years' existence.

The Bridgeport Wood Finishing Company, New Milford, Conn., is directing the attention of architects and owners to some new types of finishes which are playing an important part in attractive interior decoration. These include Bridgeport standard gray acid stains and WonderLac. The company makes announcement that it is ready to furnish sample panels to those who may write for them. Architectural service departments are maintained in New York, Boston, Chicago and Philadelphia.

Bird & Son, Department B, East Walpole, Mass., is distributing a folder printed in colors relating to Neponset and Proslate shingles. Emphasis is laid upon the statement that the big profits go to the Neponset dealer purchasing the makers' roofings, building papers and wall boards in mixed carload quantities. A free booklet sent out by the makers entitled, "Repairing and Building," contains the story of the various specialties of the concern.

Art Stone Company, makers of high-class concrete specialties, Waynesboro, Pa., is directing attention to the artistic effects in connection with various classes of concrete work which may be produced by the processes which it controls and licenses for the use of which are issued at stated rates. By these processes the builder or contractor may imitate marble, granite, sandstone, onyx and other natural stones and at a comparatively small cost. The company states that it has no machinery or materials to sell, but that the processes for which it grants a shop license enable the builder and contractor to greatly increase his business by improving, without appreciable cost, the products which can be turned out by his own equipment. In connection with the offer which the company makes it will mail the builder or contractor a dozen or more varied samples, and at the same time it offers its patrons, free of charge, expert service on any specialties in which they are interested or intend to take up for consideration.

Wadsworth, Howland & Co., Inc., Boston, Mass., has been favoring its friends in the trade with an advertising novelty in the shape of a *facsimile* of its Bay State trademark. This is made in two parts, each of the exact outline of the trademark, which, by the way, is a representation of a member of the original Plymouth Colony, and carries between what may be described as the front and back covers small pieces of court plaster for emergency use.

"Medusa Waterproofing" is the title of an exceedingly attractive booklet just off the press and sent out by the Sandusky Portland Cement Company, Engineers Building, Cleveland, Ohio. The advantages of Medusa waterproofing are set forth at considerable length and in a way to prove of special interest to the architect, the builder and the owner. Directions are given for using Medusa waterproofing powder in connection with concrete blocks, in mortar, plaster and stucco and as a wash. The illustrations are halftone engravings of buildings in connection with which Medusa has been used and there are numerous testimonial letters from some of the many who have practically demonstrated the merits of this waterproofing material. We understand that any reader of THE BUILDING AGE can secure a copy of this booklet by writing to the address given.

(Continued on page 104)

Sterling Wheelbarrows Are Different

—and Better, because Different.

Oil-impregnated fiber Bushings for Wheel Bearings make its wheel self-lubricating. No squeaking. No oiling-nuisance. The older the barrow the more glassy-smooth the bearing. This is one difference.

Then note the patented Braces that tie the handles to the legs. No holes bored through handles. Another important Difference.

And the reinforced channel steel legs, the method of joining wheel axle to malleable side brackets without using nuts, and a whole lot of other things are Better because—Different.

Our catalog No. 19 tells of more differences—all to your advantage if you have the sort of vision that gets the true measure of values.

Walter H. Kestin, sales manager of the concrete machinery department of the Northwestern Steel & Iron Works, Eau Claire, Wis., represented his company at the tenth annual Middle West Cement Show, held under the auspices of the Middle West Cement Users Association at Omaha, Neb., Feb. 29 to March 4. An exhibit was made of the well-known "Northwestern" line of concrete mixers and concrete tile forms. The 5-ft. mixer in particular attracted an unusual amount of attention and we understand a large number of sales were made.

Harry Louis Meacham has recently opened an office for the practice of architecture at 39 Circuit Avenue, Worcester, Mass., and is desirous of obtaining catalogs and samples from manufacturers of building materials.

A recent addition to the office force of the Willis Mfg. Company, Galesburg, Ill., is H. L. Swan, who for several years was secretary of the Rockford Mitre Box Company, Rockford, Ill.

Oak Flooring Service Bureau, Conway Building, Chicago, Ill., is distributing a unique calendar for 1916 consisting of a piece of celluloid 3½ in. high by 3¾ in. long and colored to represent a piece of oak flooring. On one side is the calendar proper and on the other is a brief statement of the use of the different grades of oak flooring.

Charles F. Lorenzen & Co., Chicago, Ill., is distributing an attractive folder printed in colors and calling attention to some of the many specialties which they are prepared to furnish. Special attention is called to mosaic tile for bath room floors, also to tile fireplaces, ceramic mosaic floor tile as well as to red quarry and promenade tile. Not the least interesting feature are several patterns for mosaic floor tiling.

H. F. Wardwell, former home office manager, was appointed general sales manager of the Fenestra Division of the Detroit Steel Products Company, Detroit, Mich., the change taking effect Feb. 1. He succeeded P. A. Smith, who recently resigned to engage in another line of business.

A new plant known as Mill No. 7 of the Universal Portland Cement Company, has been established at Duluth and will have a daily capacity of 4000 bbls.

Sterling Wheelbarrow Company, 6201 Shenners Avenue, West Allis, Wis., is directing the attention of building contractors to its line of Sterling wheelbarrows which in their construction embody many interesting features. Use is made of patented braces that tie the handles to the legs so that no holes are bored through the handles. Then there are the reinforced channel steel legs, the method of joining wheel axle to the malleable side brackets without the use of nuts, and oil-impregnated fiber bushings for the wheel bearings making the wheel self-lubricating. The claim is made that the older the barrow the more glassy-smooth becomes the bearing. The company has issued Catalog No. 19, which sets forth the merits of these wheelbarrows at considerable length, and a copy of it can be secured on application.

The February issue of *Traffic News* which is published by the Federal Motor Truck Company, Detroit, Mich., in the interest of economical transportation, contains a most interesting assortment of matter relating to the topic mentioned. The building-contractor appreciates the economy of transporting his materials and the extent to which the motor truck is used at the present day by building-contractors, lumber dealers, and others engaged in the building business is strong testimony in favor of such utilization. The motor truck has many advantages, both in summer and winter months, over the horse-and-wagon method, and this is constantly being manifested by the decreased use of the animal for these purposes.

Stanley Tools

Stanley Nail Sets

¶ Made of a high grade of tool steel. Both ends hardened and oil tempered. Specially well knurled, giving the workman a feeling of security as to "grip." ¶ The point that comes into contact with the nail is "cupped" and the edges nicely rounded. Made in a variety of sizes four inches long.

YOU Sell this Heater— The Buyer Can Install It

A new profit for contractors. Many houses in your locality can profitably use this new heater and do away with all the trouble, expense and inefficiency of stoves.

You can sell it, for new or old houses, because it is so simple that it requires no furnace expert to install it. Simply a smoke pipe, and a single register under main room, from which the furnace floods the whole house with heat. It has a strong appeal to farmers and owners of cottages and bungalows, because of its efficiency, low cost and ease of installation and operation. Does not heat cellar.

Write at once for Booklet and our Agency Proposition. It will show you an easy way to add good profits to your business, that you would not otherwise get.

“The STANDARD” Low-Charging Concrete Mixers

Low-charging is the only practical, quick, economical way of loading mixers. It is replacing other forms of loading with wonderful rapidity. Contractors everywhere—old-timers who have had experience with every style of concrete mixer—will tell you that this is the only successful improvement in mixers in many years. And it was introduced in “The STANDARD” Mixers—in which it is retained in its highest degree.

In thousands of installations “The STANDARD” is saving actually one-third in concrete costs. Figure out for yourself in dollars and cents what it means to do away entirely with complicated side loaders—expert mechanics to manipulate them—power to operate them—and expensive breakdowns and delays. You can't ignore the FACTS!

Let Your Next Mixer Be Low-Charging

And save enormously in time and money. They can be charged by shoveling into the drum direct, or by the use of wheelbarrows wheeled up a low incline of 24 inches. The materials are drawn into the center of drum by an ingenious arrangement of the charging blades, which are a part of and rotate with the drum. This is simplicity itself. An ordinary laborer can understand it. You get this all-important feature in “The STANDARD” without additional cost.

But the low-charging feature isn't the only one with “The STANDARD.” Its construction, durability, absence of unnecessary parts, light weight and inbuilt quality win it highest approval in every kind of concrete work.

Use “The STANDARD” Low-Charging and thereby you will save more time and money than you ever expected. Catalog No. 48-4 gives full facts. You should have it. Simply drop us a request.

The “SSS” Low-Charging Mixer shown at bottom of page is sold at *very low prices* and will also give you the advantage of Low Charging.

The Smith Mixerette—

A Three Foot SMITH QUALITY mixer

The Smith Mixerette is a high grade concrete mixer with a 3 cu. ft. wet mixed capacity and a low price. This light, portable, all-steel machine is a big money maker for every contractor. It has the famous Smith dust-proof casing protecting the big gear ring and driving pinion—a vertical frost-proof gas engine that furnishes ample power—three different methods of loading.

A— Gear - Lifted Loader

No over-head frame, sheaves nor hoisting cables. The skip is operated through a series of steel gears. It lifts easily and every particle is quickly emptied into drum.

B— Batch Hopper

Feed level of gated batch hopper only waist high. Steep angle of hopper sides produces rapid flow into drum. One batch can be assembled in hopper while other batch is mixing.

C— Low-Charging Platform

The Mixerette Low-Charger solves the contractor's biggest problem—"QUICK, EASY and ECONOMICAL LOADING"—The platform is only 16 inches high. It can be removed or hooked up out of the way when moving.

D—SMITH BUILDERS RIG—

This machine is the only one designed especially for a combination mixer and hoisting rig. The hoisting drum is mounted on the truck between the engine and boiler. All levers are banked for REAL ONE-MAN OPERATION. A series of clutches enables you to use engine only; engine and mixer drum without hoist; engine and hoist without the drum or all three together.

A Drum Mixer

By the Manufacturers of the
justly famous CUBE MIXERS.

Every contractor knows the Austin Cube Mixer and hopes some day to own one, but just now perhaps a sturdy mixer at a cheaper price will serve his purpose. For such men we have built

The Austin Drum Mixer

It will mix a 1-2-4 mix, and has a capacity of 60 to 80 cubic yards a day. It is operated by a 4 horsepower gasoline engine with all operations controlled from a single position.

While simple and low-priced, no sacrifice of strength or durability has been made in any part. Steel riveted plates and shapes are used throughout except racks and gears.

The drum is practically indestructible, and is operated with a combined endwise and circumferential plowing and pouring movement—the most efficient of all drum mixer mixing movements.

And the last objection to your buying a mixer has been removed with the price. You cannot beat it. It does not impose any obligation on your part to ask for our catalogues. We'll send them immediately. Use the coupon below.

Fireproof Sanitary Cow Barn,
140' x 36' x 37' high. Double
Wall Silos, 16' x 56'

The wise builder uses a Van Guilder

Van Guilder Hollow Wall Machine

Note the photographic reproduction of Mr. Hamm's postal to us.
Why not profit by his experience? He has since built six more houses, making 26 to date, all built within three years, and there is no limit to the number he can build with the same Van Guilder Hollow Wall equipment.
With this machine and a few simple attachments you can follow any set of plans, constructing hollow walls for houses, churches, schools, farm buildings, silos, etc. No matter how many angles or bays you want, you can take care of every cubic inch with this outfit.
Just notice the illustration of the hollow wall, consisting of two independent walls 2½ in. apart and tied together by metal ties. This means perfect insulation, protection from outside moisture and a comfortable house in hot or cold weather.
Why should you cut up good lumber costing good money for temporary forms for every job, when you can buy a Van Guilder Hollow Wall Machine and use it over and over again year after year? Save all the form lumber and build insulated double walls for less money. If you are interested in building concrete houses fast and well without expense for lumber to be used in the forms, read our "Book." A copy will be sent free on request.

Blystone Batch Mixer

For Plaster-Concrete-Mortar

A saving of \$25.00 per day was made in mixing hardwall plaster for the big Machinery Palace for the Panama Pacific Exposition.

The Cement Tile & Block Mfg. Co., of Osgood, Ohio, paid for their Blystone in three months work in their block plant.

One man slaked lime and made mortar for ten masons and had time to spare for other work on a job recently done by G. Ed Berry, of Harrisburg, Ill. Mr. Berry also says he got 10% more mortar per barrel of lime.

H. A. Farmer, St. Petersburg, Fla., recently wrote us as follows: "I am so well pleased with mixer, I want another just like it. Ship me another one as soon as possible."

The Answer to the Outside
Painting Problem
ZINOLIN

*Yours for
the Asking*

If Zinolin, the "Wonder Paint," were superior in only one respect to other Paints you would certainly owe it to yourself and your clients to be completely informed concerning it.

How much more important is it, then, that you should know about

ZINOLIN

the "Arnold-ized" zinc

when it possesses 9 distinct and revolutionary advantages over every other paint on the market? Here they are—

1. Permanently lasting luster.
2. A brilliant white that cannot be equaled.
3. Absolutely non-fading colors.
4. Covers 30% more surface per gal. than white lead.
5. Two coats of white hide jet black.
6. One coat always does the work of two.
7. Gives tougher, more durable coat.
8. Will not crack, peel, chalk or blister.
9. Much easier and quicker to apply.

The Leaflet tells you the whys and wherefores. Send for it to-day.

Keystone Varnish Co.

N. B. Arnold, President

Makers of

Keystona—the original and justly famous, washable wall paint.

Edelvice—a superior Enamel for inside or outside use.

Floorstona—a wonderfully durable Floor Varnish.

Multiproof-Varnish—for anything, proof against everything.

Prevento—prevents Concrete and Bricks from crumbling. Absolutely waterproof.

2011 Keystona Bldg., Brooklyn, N. Y.

Here's Wall Board That Makes Good!

At the Panama-Pacific Exposition thousands of feet of ordinary wall board were torn out because unserviceable, while the extensive UPSON BOARD installation at the San Diego Exposition proved satisfactory in every way! It's the same story everywhere!

Upson Board is made good to make good. It is as different from ordinary wall boards as oak is from hemlock. Perhaps your opinion of wall board is based on your experience with soft, soggy boards. You will revise that opinion if you make one practical trial of DEPENDABLE

UPSON-BOARD

(PROCESSED)

There has not been one complaint to the million feet used! Hundreds of carpenters are increasing their reputation and their business by installing Upson Processed Board. It means plenty of work for them every month in the year—work that the plasterers used to get.

And Upson Board means EASY work. This Board looks, feels and works like lumber. It is made only of long, tough, pure wood fibers combined and compressed under the Upson formula into wonderfully strong, hard, stiff, woodlike panels. It cuts clean—Carpenters tell us they can apply one-third more of Upson Board than of any other wall board in a day.

Each Upson Panel is SCIENTIFICALLY PROCESSED: Kiln-cured, like interior trim; waterproofed; surface-filled—saving your customers from \$5 to \$15 per 1000 square feet in painting cost over other boards. This makes it, when finished, the cheapest board.

Let us show you how much money there is in Upson Board for you and send you samples for your expert test. Write today to

THE UPSON CO.

Fibre Board Authorities

Lockport, N. Y.

The Only Tools Required

A pair of hands, a claw hammer, and some nails complete the equipment needed to finish any cellar ceiling or to convert any attic into charming rooms. Wherever there are joists or studding to which nails can be driven you have the opportunity to use

CAREY

Ceil-Board
SUPERSEDES WALLS AND CEILINGS

Contrast this clean, fast, easy work with the old method of complicated labor, with special gangs of men, tons of sand and lime, sacks of cow hair, dangerous scaffolding and days or weeks of precious time.

Carey Ceil-Board is made in three beautiful natural wood finishes: golden oak, mission oak and circassian walnut and in plain grey and tan which can be papered, painted or tinted. It means profitable employment for the carpenter every day in the year.

WHERE COMPETITION HURTS

A wise man once said, "Competition is the Life of Trade."
This is undoubtedly true with competition in *service* or *quality*.
However, with competition in *price*, it's another story.
Price competition is the death of trade—not the life of trade.

Selling Beaver Board service is distinctly a different thing from selling wallboard by the bundle. The one thing we have in mind in making and selling Beaver Board is *the finished room*. The Beaver Board we make must satisfy its users—in durability, in appearance, and in general service. Most wallboards are made to *sell* and not to *serve*. They *look* very much like Beaver Board but don't *act* like it. They frequently warp, stretch or show spots and streaks under the paint. They are there with the *price* but not with the *service*. That's where competition hurts.

The buyer is disgusted. "No more Beaver Board for me!" he says.

If he had gotten genuine Beaver Board in the first place he would have been pleased and satisfied. His friends would have been pleased and more Beaver Board business would have resulted. He bought the imitation wallboard on the Beaver Board reputation and it is the Beaver Board reputation that suffers when the substitute fails to satisfy.

That's where competition hurts.

We wouldn't mind having our wallboard competitors help supply the market which Beaver Board and Beaver Board advertising has created if they'd only give Beaver Board results. But they don't.

H. B. SHERMAN MFG. CO., Battle Creek, Mich.

YOU Can Earn \$2000 a Year

The demand for trained engineers at \$2000 to \$5000 a year becomes greater every day. Any man with engineering training can practically demand his own price. NOW—as never before—is the time to enter a profession that pays big money—a profession in which the demand for trained workers far exceeds the supply.

The **AMERICAN SCHOOL** will make you an expert engineer in a short time at small expense. Our staff of experienced engineers will give you individual instruction and advice. No previous

experience necessary. You can start in immediately to prepare yourself for one of the countless high-salaried positions always open. You run no risk—we **guarantee** you more pay.

Earn While Learning

No need to give up your present occupation. We train you at home—solely by correspondence—as we have successfully trained thousands of others in the past nineteen years. Pocket-size text books enable you to study anywhere—at any time. Papers examined and corrected only by technical experts. Most thorough correspondence instruction in America.

\$40 Drafting Outfit and Library Furnished FREE

First of all we will teach you drafting—the foundation of all engineering professions. We will give you a \$20 drafting outfit and a \$20 drafting library (4 vols.) **ABSOLUTELY FREE!** Then, after you have mastered drafting and are getting actual working experience as an engineer's draftsman, we will train you in your choice of Civil, Mechanical, Structural or Architectural Engineering. Thus, for a little more than the cost of a course in drafting alone, you get the training that enables you to fill a responsible, well-paying position as engineer. Be sure to investigate this offer if you have been thinking of enrolling in any drafting course.

248-page Engineering Book FREE

Send the coupon today for your copy of our 248-page Free Book. Tells how easy it is to become an engineer, and gives full particulars regarding the course you are most interested in. **Don't hold back because of the money.** The cost is small, and you can pay for your instruction as you progress—in small monthly installments.

Mark and mail the coupon today. This is a wonderful opportunity to get into a profession in which the possibilities for advancement are unlimited. No obligation, so mail the coupon now!

AMERICAN SCHOOL OF CORRESPONDENCE, CHICAGO, U. S. A.

Gained \$3600 Position
"The same day I received my Diploma I secured a position at \$3600 a year. My present success is due to the knowledge gained through your school."—Robert Knight, Chicago, Ill.

Now Gets \$2000 a Year
"I now have a position that pays me \$2000 a year, which I never could have obtained had it not been for your school."—Robert T. Hendrickson, Fremont, Ohio.

Salary 400 Per Cent Greater
"I am now Assistant Chief of the Engineering Department, and my present salary is 400 per cent greater than when I started the course."—Frank C. Krohn, West Allis, Wis.

It is brimful of convincing reasons why you save labor, time and expense by using

Con-Ser-Tex Canvas Roofing

It's weatherproof. It is easy to lay. It never rots or stretches. It hugs the porch or roof surface tightly. It makes a handsomer roof than wooden shingles, slate or tile and is more economical.

The scientific treatment of CON-SER-TEX makes it practically proof against deterioration. It gives lasting protection under all conditions of weather and climate.

A postal will bring our new illustrated book on "Roofing Facts and Figures" to you. Send for it before you forget. It means money to you to have the information it contains.

Self-
Sentering
Partitions

For Economical Partitions

SELF-SENTERING solid partitions in wood framed, steel framed or concrete buildings save material and labor and take much less space than other types.

SELF-SENTERING

(You'll know it by its Diamond Mesh.)

Acts as both lath and stud. Its plastered up on both sides alike to a total thickness of only 2 or 3 inches. Yet partitions are firm, fireproof and permanent.

Self-Sentering is rigid and easy to handle, economical to plaster.

Note how simply Self-Sentering partitions are adapted to wood frame as shown above.

The "Fireproofing Handbook," full of helpful designs, specifications and illustrations about fireproof building will be sent on request.

Send You a**

Winthrop Tapered Asphalt Shingle

Just ask for a sample shingle. See how tough, how pliable and how durable it is. See how it is made like a wooden shingle—thick at the butt and thin at the top. See how easy to lay it is. See what a beautiful roof it will make—red, green or slate-black. Then you will understand why owners want the Winthrop when they know about it.

Winthrop Tapered Asphalt Shingles will enable you to get most of the roofs in your town. They win out with less argument than anything you ever tried to sell, for they look better than wood shingles and they have all the protection of asphalt.

Asphalt Shingles

Factory: Argo, Ill. 1400 Association Bldg., Chicago, Ill.

The Only Tapered Asphalt Shingle

Have You Made The Mistake

of thinking that Compo-Board is the name of any composition wall board?

Have you overlooked the fact that the *genuine*

Trade-mark Reg. No. 94745

is made with a center core of kiln-dried wood slats—is the only wall board so made—and as a result of this unique patented construction possesses a strength, durability, cold, heat and moisture-resisting quality, decorative adaptability and other features that make it far more satisfactory than lath and plaster or other wall boards?

Do you know also that it *does not have to be paneled*, because it saws with such smooth edges, and is so stiff it can be papered? Thus two of the greatest objections to giving up the traditional lath and plaster are overcome.

If you would be *modern* in your ideas about building, you owe it to yourself to get acquainted with Compo-Board. Write for free sample and interesting book.

The Compo-Board Company

5778 Lyndale Ave. No., Minneapolis, Minn.

This New Asphalt Shingle
SAVES
50% to 75% in Labor
35% in Freight
38% in Nails

Here is the greatest shingle sensation of a decade!
An absolutely new, patented asphalt shingle
that is simply revolutionizing the roofing
industry.

FLEX-A-TILE Diamond Point Slab

It's the
shape of
this Flex-A-
Tile Diamond
Point Slab that
gives it its *dis-*
tinctive features.
It's the unique dia-
mond point design
that makes it possible to
lay a roof faster and with
less bother—that makes it possible to
lessen the cost of nails by 38% and
the cost of freight by 35%.

FLEX-A-TILE

Quality

Made identically by the same processes
of manufacture that we have always used
in making Flex-A-Tiles, we make these
Diamond Point Slabs in standard weight
and two colors, green and red.

Four Shingles in One

Every time you lay a Flex-A-Tile
Diamond Point Slab you lay practically
four shingles at one operation. It takes
only 112 Diamond Point Slabs to cover
100 square feet of roof. No time is lost in
chalk-lining—Diamond Point Slabs auto-
matically space and gauge themselves.

Get Full Details Now

Agency territory for the Diamond Point
Slab is now being allotted. Write for
details today. Everyone in any way in-
terested in building ought to be thor-
oughly acquainted with this new shingle.
We'll gladly send prices, sample and
literature on request.

If Cement Roads Need Expansion Joints Like These—

*Then Cement Stuccoed
Houses Should Be Treat-
ed the Same Way and
Would Look Like This—*

To overcome the buckling and cracking in a stucco
made of Portland cement or similar ingredients,
it would be necessary to use expansion joints,
just the same as in building a road made of cement.
So much greater would be the need because of the
comparative thinness of stucco. Even then you could
never be sure of avoiding breaks and cracks. But if
you use

KELLASTONE

IMPERISHABLE STUCCO

you can be **assured** that the stucco applied will be free from
the cracks, buckling, loosening and falling caused by expansion
and contraction.

This is because Kellastone does not expand or contract from
change of temperature or stress. Yet it is remarkably elastic,
and adheres so firmly to wood, brick, stone and tile that shrink-
age from window and door casings never occurs. It is weather-
proof, fireproof—everlasting. It's the only stucco that permits
you to run no chances with your reputation. Kellastone is
used by the U. S. Government and big institutions everywhere.

Kellastone Composition Flooring surpasses any
other flooring material. Resists abrasion even under great
weight, deadens noise, has no seams or cracks, never shrinks.
Lasts indefinitely. Used in factories, office buildings, hospitals
and homes, etc.

Send postal for free illustrated facts today about
Kellastone and Kellastone Composition Flooring.

Real Advantages, Check Them Up— Important to All Who Use or Buy Metal Lath

As sketch above illustrates—(1) Sykes Metal Lath is applied direct to sheathing boards over waterproof paper; (2) it insures a wall of exactly the same thickness; (3) therefore, a wall of equal expansion and contraction at every point, eliminating the danger of cracking due to uneven expansion. (4) Sykes Metal Lath being “backed up” by sheathing boards is perfectly rigid. (5) It is easy to plaster over. (6) There is no waste mortar because every particle goes to make up the required thickness of wall.

Furring strips add 5 to 10 cts. a sq. yd. to cost of building wall. There is no key between Furring Strip and this lath. At the points where Furring Strips occur the plaster is, of course, much thinner than at other places; result, uneven strength and uneven expansion, liable to cause cracking in plaster.

There is actually more mortar required to plaster a wall of given thickness using ordinary metal lath than is required if you use Sykes Metal Lath; simply because it requires more mortar to secure a key back of the ordinary lath than is necessary for Sykes Metal Lath.

Best for Stucco, for Overcoating and for Interior Plastering. For free sample and Book of Specifications write to

Sykes Metal Lath & Roofing Co., 494 River Road, Warren, Ohio

Expanded Cup Metal Lath

Self-Furring. Saves 5 to 10 cts. a sq. yd. Can't be applied wrong. Is heavier than other laths of same gauge because cut with wider strands.

Approved by U. S. Gov't for Post Office Work. Indorsed by architects.

“CREO-DIPT” STAINED SHINGLES

“My Carpenter told me that

“CREO-DIPT” Stained Shingles were the best shingles he has ever seen. He said if he had known he could get such shingles he would have put them on his own roof. He said they would last thirty years.”

Buffalo, N. Y. J. C. Moss

17 Grades

16, 18, 24-inch

30 Colors

These Shingles Are Doubly Satisfactory

First, they are more profitable to the builder and contractor because they mean 15% to 20% less for labor and time in laying. There's no waste—they come stained and bundled ready-to-lay. Every shingle is usable—never any wedge shapes or splits.

Then they make a satisfied customer for you. Their beautiful colors always please and there's no question about the uniform staining. There's no kick about any muss or odor.

Inexpensive—First, Last and Always

We are advertising in the best and biggest magazines of this country to tell people how extraordinarily fine “CREO-DIPT” Stained Shingles are—and why it's to their advantage in real money to specify this brand. You'll find it easy to sell them, so get your lumber dealer to carry three or four colors in stock to satisfy the demand for your jobs. Book of “CREO-DIPT” Homes and Samples of Colors on Wood on request.

FREE

224 page Plan Book and year's Consulting Service given absolutely FREE with every set!

This is one of the most attractive offers ever made. We give free to every purchaser of our newly revised **Cyclopedia of Architecture, Carpentry and Building**, a copy of "**Modern American Homes**," the most complete and up-to-date plan book procurable. It contains plans and specifications for 168 different structures, including excellent exterior and interior views, detailed estimates, etc. Designed by the leading architects of this country, it includes city, suburban and country homes, bungalows, summer cottages, tent houses and camps, also apartment houses, garages and various public buildings. Contains 224 pages, 9½ x 12¾ inches, and 426 illustrations. Printed on heavily enameled paper and substantially bound. With this great plan book in your shop or office you are prepared to figure on any job, no matter how large. No need for the prospective builder to consult an architect when you can offer him his choice of practically every type of the modern American home. This saving of the usual architect's fee should get you the business.

In addition to this we give free with each set a year's consulting membership in the *American Technical Society*. Through this service you have the assistance of the most expert architects, structural engineers and draftsmen in America. They are no farther from you than the nearest mail box. They stand ready to solve your perplexing problems, to offer suggestions, to point out the things you should avoid. In fact they enable you to compete with the biggest and most experienced men in the construction field.

The Newly Revised Cyclopedia of

Architecture, Carpentry,

and Building

This is the clearest, most practical and complete work ever published on the practice and possibilities of the modern building trades. It covers everything from cottage to skyscraper—from the plans to the completed structure. It includes wood, stone, steel and reinforced concrete construction; estimating and contracting; a study of the Greek and Roman orders; interior finishing and decorating; and modern house lighting and sanitation. The work of forty experts, it can be depended upon to give you the information you desire on any and every subject.

The ten large volumes are handsomely bound in half red morocco, gold stamped, and contain 4,760 7x10 inch pages; 4,000 illustrations, full page plates, building plans, diagrams, etc.; hundreds of valuable tables and formulas, carefully cross-indexed for quick, easy reference.

Send for this great combination today

That you may judge for yourself the value of the plan book and this wonderful reference work, we will send the complete eleven volumes to you for seven days' free examination, express prepaid. Look them over carefully—make use of them at your work for a week—then if they fail to meet with your expectations they may be returned at our expense. If you keep them, send us \$2.00 within seven days and \$2.00 a month until the specially reduced price of \$24.80 on the Cyclopedia has been paid. Remember—the consulting membership and plan book are included absolutely free of charge.

Can you afford to let \$2.00 a month stand between you and hundreds of dollars in increased profits? The consulting membership alone is worth many times the first cost of the books. Decide to equip your shop or office with this business getting combination. Fill in and mail the coupon—now!

As I have had no previous dealings with you, I refer you to

Kidder's Architects' and Builders' Pocket Book

The 16th revised and enlarged edition of this standard work has just been issued. Prof. Nolan and a corps of experts have rewritten the book from cover to cover and it is a veritable digest of the latest approved practice in all branches of the Building Trades.

The authors have quoted from many authentic sources as well as giving the results obtained in their own daily practice. Every item has been carefully checked and rechecked to see that it is technically correct and the aim throughout has been to present clearly and concisely and in the least possible space, all the information that is likely to be required by the architect, builder, structural engineer, draughtsman or contractor, including data for estimating the approximate cost.

This New Kidder is divided into three sections: *Part I*, which contains 90 pages, explains the practical application of arithmetic, geometry and trigonometry. This data has been carefully checked and much of the matter rearranged. *Part II*, with its 1324 pages, treats the materials of construction and strength and stability of structures. All the matter in the 28 chapters included in this section are special essays by experts. Reinforced Concrete Mill and Factory Construction is one of the new subjects given in this edition. *Part III*, contains 358 pages of miscellaneous data and much new matter has been added such as extended tables of specific gravities, weights of substances, architectural acoustics, waterproofing for foundations, the new quantity system of estimating, etc.

One of the most important changes is the recalculation of the tables and problems relating to unit stresses, especially those for the different woods. These were changed to conform to the latest engineering practice. The derivation of many of the formulas used has been explained, and numerous cross references enable the reader to use the New Kidder as a text book for

certain parts of the mechanics of materials as well as a handbook for office work. The tables of the properties of structural shapes, of safe loads for columns, beams and girders have been revised and many new tables added.

Many of the tables have been rearranged so as to read across the page instead of lengthwise as heretofore. A large number of illustrations have been added and the diagrams used from the last edition have been redrawn and some have been printed with lines of different colors to make the demonstrations clearer.

Every paragraph of the text starts with a black faced caption describing the subject matter of the paragraph the same as in Arthur's New Building Estimator. This facilitates quick reference. An elaborate cross reference index of 40 pages set in two columns is also provided. The subjects covered in every paragraph have been carefully indexed and cross-indexed so the reader will be sure to find any item he is likely to look up, at a glance.

Special Offer. We will stamp the customer's name in gold without charge on all copies of this book, ordered through us.

CONTENTS OF NEW KIDDER BY CHAPTERS

PART I—PRACTICAL ARITHMETIC, GEOMETRY AND TRIGONOMETRY (90 Pages)

Mathematics.
Weights and Measures.
The Metric System.
Conversion Tables.
Mensuration and Geometry.
Geometrical Problems.
Table of Chords.
Hip and Jack-Rafters.
Trigonometry, Formulas and Tables.

PART II—STRENGTH OF MATERIALS, CONSTRUCTION AND STABILITY OF STRUCTURES (1324 Pages)

Terms Used in Architectural Engineering.
Foundations of Buildings.
Masonry Walls. Footings for Light Buildings. Cements and Concretes.
Retaining-Walls, Breast-Walls and Vault-Walls.
Strength of Brick, Stone, Mass-Concrete and Masonry.
Forces and Moments.
Stability of Piers and Buttresses.
The Stability of Masonry Arches.
Reactions and Bending Moments for Beams.
Properties of Structural Shapes. Moment of Inertia, Moment of Resistance, Section-Modulus and Radius of Gyration.

Resistance to Tension, Properties of Iron and Steel.
Resistance to Shear. Riveted Joints. Pins and Bolts.
Bearing-Plates and Bases for Columns, Beams and Girders. Brackets on Cast-Iron Columns.
Strength of Columns, Posts and Struts.
Strength of Beams and Beam Girders.
Framing and Connecting Steel Beams.
Strength of Cast-Iron Lintels and Wooden Beams.
Strength of Built-Up, Flitched and Trussed Wooden Girders.
Stiffness and Deflection of Beams.
Strength and Stiffness of Continuous Girders.
Riveted Steel Plate and Box Girders.
Strength and Stiffness of Wooden Floors.
Wooden Mill and Warehouse-Construction.
Fireproofing of Buildings.
Reinforced-Concrete Construction.
Reinforced-Concrete Factory and Mill-Construction.
Types of Roof Trusses.
Stresses in Roof-Trusses.
Wind-Bracing for Tall Buildings.

PART III—USEFUL INFORMATION FOR ARCHITECTS, BUILDERS AND SUPERINTENDENTS (358 Pages)

Heating and Ventilation. Heat, Fuel,

Water, Steam and Air Chimneys.
Hydraulics, Plumbing and Drainage.
Gas and Gas-Piping.
Lighting and Illumination of Buildings.
Electric Work for Buildings.
Architectural Acoustics.
Data on Excavating.
Stonework.
Bricks and Brickwork.
Lime.
Sand and Gravel.
Lathing and Plastering.
Lumber and Carpenters' Work.
Building Papers, Building Felts and Quilts.
Paint and Varnish.
Window-Glass and Glazing.
Asphaltum.
Mineral Wool.
Structural Steel.
Estimating the Cost of Buildings.
Quantity System of Estimating.
Mail-Chutes, Elevator Installation.
Mechanical Refrigeration.
Tower-Clocks.
The Classical Orders.
Lightning-Conductors.
Vacuum-Cleaning.
Waterproofing of Foundations.
Horse-Power, Pulleys, Gears, Belting and Shafting.
Chain-Blocks.
Hoists and Hooks.
Architectural Terms Used in Law, etc.

BUILDING AGE BOOK DEPT., 239 West 39th Street, New York

Actual photograph of Keezon Lath as it looks before any plaster is applied.

Actual photograph of Keezon Lath showing first coat of plaster. Second coat can be applied without waiting for first coat to dry.

Back view of Keezon Lath after it has been plastered. Note the perfect key.

Side view of Keezon Lath after plastering. A plaster saving of about 25% is made possible by the use of Keezon.

The Greatest Improvement Ever Made in Lath Construction Places

"Made in St. Louis"

in the unique position of combining every advantage of every other lath (wood, composition or metal) and yet in addition of being very reasonable in price.

Keezon Lath is every bit as fire-resisting as metal lath. It costs less. Keezon Lath can't rust. Keezon cellular construction forms a key to which plaster clings with greater tenacity than it will to any other known form of construction. In a test made to demonstrate the holding strength of the Keezon key, water to the depth of two inches was poured on top of a Keezon ceiling and allowed to remain for twenty-four hours. At the end of that time most of the water had soaked through the plaster without causing the slightest loosening or sagging.

Another big reason why Keezon is bound to be universally used is the absolute saving in material and labor it assures—at least 30%. Coming in standard size units of 48" x 6 3/4" x 3/8", it only takes four pieces of Keezon to cover a square yard of space. Each unit is simply put in place, and where studding is sixteen inches apart but three wide staples (specially furnished for the purpose) are necessary to hold each piece firmly.

To cover a square yard with wood lath fifteen pieces are necessary and sixty nails. Figure the labor saving.

And so we continue explaining the many superior features of Keezon Lath and cover a number of pages with small type. We could explain why Keezon is unequalled as a base for stucco work; how it can be applied to flat surfaces without furring; why it can't warp or buckle; expand or contract. We want to explain these Keezon advantages to you and we do explain them in an attractive booklet we have just published. Won't you let us send you this book FREE?

Write for it now. Mail the coupon. There's no obligation whatsoever attached.

What Others Says:

Mr. Geo. F. Bergfeld, President of the Geo. F. Bergfeld Realty Company, one of the largest builders in St. Louis, writes us in part as follows:

Cellular Lath Company:

I used your Keezon Lath in the new Institutional Building for Kings Highway Presbyterian Church, and found it so satisfactory in every way that I take great pleasure in commending it to others.

(Signed) Geo. F. Bergfeld.

Mr. P. Rowan, one of the best known Plastering Contractors in St. Louis, writes in part:

After having made tests of Keezon Lath extending over a year and a half on walls, ceilings, solid wood columns, beams and channel iron partitions, I find it the most practical lath I ever used. If I were building for myself I would use Keezon Lath in preference to all others regardless of price.

(Signed) P. Rowan.

Architects, Contractors and Builders, Note!

We have a special proposition that will interest you exceedingly. Don't fail to use the coupon.

A Selected List of Reliable Books on

Carpentry and Building, Estimating and Specification Writing. The Steel Square, House and Barn Framing, Roof Construction, Stair Building, Furniture Design, and Cabinet Work

Any Carpenter, Contractor, Estimator or Building Mechanic who does not believe these books will be helpful to him, after careful inspection, may return them *within one (1) week* and his money will be refunded.

CARPENTRY AND JOINERY

Crussell's Jobbing Work for the Carpenter

Furnishes simple short-cut methods for doing such things as: constructing a work bench, building a saw horse, making and fitting doors, window frames and sashes, crating furniture and household goods, cutting doorways through partitions, making counters, desks, bookcases, drawing boards, show cases, picture frames, regular, extension and rope ladders, fences of various design, etc.

Special attention is given to labor-saving tools and equipment which the author has found so serviceable and which cannot fail to be appreciated by practical men.

The chapter on curved work and saw kerfing gives several methods of spacing kerfs for regular and irregular curves, laminated curve, curved wainscoting, cutting a moulding around a curve, bending with staves or lagging, bending a bull-nosed riser, bending by steaming, cutting diagonal panels, beveled siding or round towers, etc.

The second chapter tells how to mark and cut a doorway through a partition wall, take off the plaster and cut the lath so a 4-inch casing will cover the ragged edges of the plaster.

Contents.—Tools and Workshop Equipment; Cutting Doorway through a Partition Wall; Store counters; Making a Cash Till; A Small Bookcase; General Repairs; Taking Measurements; Making a Four-paneled Door; Window Frame Construction; Show Case Construction; Cabinet Hardware; Design and Construction of Roll Top Desk; Making a Drawing Board; Picture Framing and Kindred Subjects; Crating Furniture and Household Goods; Curved Work Saw Kerfing, etc.; Contractors' Ladders; Design and Construction of Fences; Shop Kinks; The Shop Doctor.

273 Pages. 6 x 9 in. 270 Figs. Cloth. \$1.50

Kidder's Part II—Carpenters' Work

The Ninth Edition. Revised and rewritten by Thomas Nolan.

When the building mechanic wants the best book on carpentry this is the one he gets. It covers the subject from a description of the different kinds of timber, through the quartering and sawing, framing and finishing of every kind of wood work now used in building, with special chapters on builders' hardware, patented devices used in connection with carpenters' work, heavy wood framing, and complete specifications to apply on any modern structure.

Contents.—The Building and Finishing Woods of the United States; Wood Framing; Ordinary Construction; Sheathing Frames; Sashes and Glazing; Store Front Construction; Interior Woodwork, Sashes, Frames, Trim, etc.; Outside Finish and Roofing; Builders' Hardware; Heavy Wooden Framing; Specifications, Frame Buildings, Brick Buildings, etc., Appendix; Data Relating to Strength of Materials, 50 Tables.

931 Pages. 7 x 9 in. 830 Figs. Cloth. \$6.00

Carpenter's Steel Square and Its Uses

A description of the square and explanation of its uses in obtaining the lengths and bevels of all kinds of rafters, hips, grooves, braces, brackets, purlins, collar beams and jack rafters. Also its application in obtaining the bevels and cuts for hoppers, spring mouldings, octagons, stairs, diminished stiles, etc.

111 Pages. 5 x 8 in. 70 Figs. Cloth. \$0.50

Townsend's Carpentry and Joinery

One of a series of useful guides for the young mechanic based on the course of lectures prepared by one of the leading correspondence schools.

It gives the most approved methods in American practice for the selection of lumber, framing of buildings and allied branches of carpentry construction.

The main divisions of the book are: Characteristics of natural timber and the conversion of the various species into lumber; layout and framing of building; roof construction; special framing, such as inclined and bowled floors, towers, vaults, groins, etc.

160 Pages. 6 x 9 in. 224 Figs. Cloth. \$1.50

Hicks' Builders' Guide

One of the most popular books on carpentry. Over 23,000 copies have been sold. The author knows what the mechanic wants to find in a book and he has put that information in simple and practical form. Special attention is given to framing and the geometrical measurement of roof surfaces, embracing simple methods of roof framing of various descriptions, and including an easy system of framing curved roofs.

Among the other contents of the volume is a chapter on mitering planecers, mouldings, etc., showing how to make many difficult joints.

This handy book also presents a practical system of estimating materials and labor. This section treats on figuring almost all the details of building construction, including lumber, carpenters' work, masonry, plastering, painting, etc., and gives the latest methods of getting the cost. The entire matter is arranged for ready reference.

Contents.—Points on Estimating; Linear Measure; Square Measure; Cubic Measure; Items and Quantities; List of Items and Quantities Required; Practical Rules for Estimating; Estimating Siding; Estimating Sheeting; Estimating Shingles; Estimating Studding; Estimating Floor Joists; Estimating Cornice; Estimating Corner Casings; Mistakes from Omissions; List of Items for Estimating Lumber; Geometrical Measurement of Roofs, Finding the Area of a Gable; Finding the Area of a Triangle; Plain Gable Roofs, Hip Roofs, Hip and Valley Roofs; The Circle; Finding Radius of a Circle from a Segment; To Draw a Circle Through Three Points; Polygons; Estimating Labor for Carpentry Work; Points on Estimating Labor; Table of Prices for Estimating Labor by the Square; Table of Prices for Estimating Labor by the Piece; Double Floors; Cornices; Gutters; Porches; Estimating Window Frames; Door Frames; Sliding Doors; Folding Doors; Wainscoting; Sinks; Bathrooms; Pantries; Stairs; Recapitulation of Estimates; Short Cuts in Estimating; Form of an Estimate; Principal Divisions in Estimating; Excavations; Foundations and Chimneys; Example of Estimate of Masonry; Lathing and Plastering; Painting; Hardware; List of Items for Estimating Hardware; Table of Estimating Nails; Number of Nails to the Pound; Form of Contract; Practical Methods of Construction; Making Corners; Spacing Studding; Corner Blocks; Mitering and Coping Base; Binding Sliding Doors; To Prevent Leaks in Bay Windows; Shingling Hips and Valleys; Art of Roof Framing; Bevel of Jack Rafters; Hip Roofs of Unequal Pitches; Great Circle of Jack Rafters; Complicated Roof Framing Made Easy; Hips on End of Building Out of Square; Gables of Different Pitches; Hip and Valley Roofs; An Important Point; Octagon Hip and Jack Rafters; Joining Gables; Diagonally; Curved or Moulded Roofs; Roof Framing by the Steel Square; Roof Framing Without Drawings; Rafter Table; Laying Out Rafters; Rising Rafters; Mitering Planecers, Mouldings, etc. Mitering Roof Boards and Planecers; Bevel for Hip or Valley, Index.

166 Pages. 4 1/4 x 7 in. 114 Figs. Cloth. \$1.00

Kidder's Part III—Trussed Roofs and Roof Trusses

This volume describes nearly every type of roof construction commonly met with in buildings, pointing out the advantages of different types of wooden and steel trusses for different spans and building requirements.

Contents.—Types of Wooden Trusses and the Mechanical Principles Involved; Types of Steel Trusses; Layout of Trussed Roofs; Bracing of the Roof Trusses; Open Timber Roofs and Church Roofs; Vaulted and Domed Ceilings; Octagonal and Domed Roofs; Coliseums, Armories, Train Sheds, Exposition Buildings, etc.; Computing the Purlin and Truss Loads and Supporting Forces; Stress Diagrams and Vertical Loads.

294 Pages. 7 x 9 in. 306 Figs. Cloth. \$3.00

Cassell's Carpentry and Joinery

It is a book which by its wealth of practical information is indispensable to all who are directly engaged in, or are in any way interested in the important crafts with which it deals. In nearly every instance the description of process and material, method and practice, is the direct outcome of actual experience and special investigation—that is, none of the cases dealt with are imaginary; they have all occurred in practice. Actual examples of all kinds of Carpentry and Joinery are described in clear and simple language and in careful detail until the whole art and craft of Carpentry and Joinery is plainly revealed.

567 Pages. 6 1/4 x 9 in. 1803 Figs. Cloth. \$3.00

Sent Prepaid by Building Age Book Department, 239 W. Thirty-ninth Street, New York

Hasluck's Handyman's Book of Tools, Materials and Processes

An extended treatise on all branches of amateur carpentry for those who have occasion to handle tools for practice or profit or wish to execute odd jobs and, in fact, construct almost any kind of accessory which involves the working of wood.

Contents.—Introduction. Geometrical Tools. Holding Tools. Paring and Shaving Tools. Hand Saws. Tools of Percussion and Impulse. Boring Tools. Abrading and Scraping Tools. Nails, Screws, and Glue. Timber: Its Growth, Seasoning, Conversion, Selection and Varieties. Joints. Easy Examples of Woodwork. Workshop Furniture, Fitting Locks and Hinges. Houses, Runs, and Coops for Poultry. Accessories for Yard and Garden. Gates and Rough Fencing. Trellis Work, Porches, and Summerhouses. Garden Seats. Rustic Carpentry. Sheds, Tool Houses, and Workshops. Garden Frames, Window Conservatories, and Greenhouses. Lathes, Turning and Turnery. Veneering. Office, Library, and Study Furniture. Kitchen Furniture. Hall Furniture. Bedroom Furniture. Dining Room Furniture. Drawing Room Furniture. Index.

760 Pages. 6½ x 9 in. 2545 Figs. Cloth. \$2.50

Richey's Carpenters' and Woodworkers' Reference Book

A ready reference manual to which the busy mechanic can turn to refresh his memory on any branch of his work. No complicated diagrams are given but all illustrations are plain and simple with as few lines as possible. A large amount of the data given has been reduced to tables so as to give the information at a glance.

Contents.—Short Methods of Laying Out Work; Roof Framing; Laying Out Arches, etc.; Names of Parts of Columns, Entablature, etc. Time-saving Tables; Tables of Lengths, etc., of Rafters; Tables of Cuts, etc., of Rafters; Tables of Treads and Risers; Excavation Tables, giving Contents, etc.; Miscellaneous Tables; Short Cuts and Useful Problems for Every-day Use; Shingling Hips and Valleys; Explanation of the Steel Square; Day's Work for Carpenter, etc.; Board and Timber Measure; Tables of Strength, etc., of Joist; Strength of Wooden Beams, etc.; Strength of Cast-iron Columns; Strength of Steel Beams, Channels, etc.; Strength of Various Materials Used in Construction; Weight of Various Substances and Materials; Working Strength of Building Materials; Capacity of Tanks and Cisterns; Miscellaneous Data; Various Hints and Receipts; Rules for Painting; Various Mensuration Tables; A Few Problems for the Noon-hour; Wage-tables, etc.

226 Pages. 4 x 7 in. 118 Figs. Morocco. \$1.50

Hodgson's Modern Carpentry and Joinery

This is a modern guide to handling the problems which come up daily. It has been prepared to enable the young man who has not had the opportunity of a thorough schooling to grasp all the details, and the use of bewildering formulæ and long mathematical calculations has been avoided.

The first volume is devoted to the more elementary work, and it explains how to lay out roofs, rafters, stairs, hoppers, bevels of all kinds, mitering, coping, circle work, flooring, splayed work, plain stairs and handrailing, cornicing, dovetailings and many other things the young carpenter will require to know in the performance of his regular work.

The second part is somewhat similar to Vol. I, only on more advanced lines, and is intended to follow up the progress made by a study of the first. Indeed, it is simply a continuation of the first volume, on a higher plane, and no workman having mastered the contents of one will rest satisfied until he has also mastered the contents of the second volume.

This volume contains some examples of work, with a description of the way the work is performed, and the materials employed. Many very difficult problems are here shown, and the solutions and explanations are given and fully explained. Many things that at first seem formidable to the unpracticed workman become quite easy of solution when taken up in the progressive manner in which they are given in this work.

2 Vols. 700 Pages. 5¼ x 8 in. 618 Figs. Cloth. \$2.00

Fair's Practical House Framing

A simple explanation of approved methods of laying out and erecting balloon and braced frames. **Contents:** The frame house—Sills—Joists and Studs in Balloon Framing—Floors and Joists Framing the Floor—Framing the Walls—Partitions—Framing Bay Windows and Towers—Special Forms of Sills—Principles of Bracing—Braced Frames—Fire Stops—Sheathings.

108 Pages. 5 x 7½ in. 98 Figs. Cloth. \$0.50

Fair's Hints for Carpenters

A collection of practical hints, ideas, wrinkles and suggestions giving directions for making various tools and appliances that will lessen the work of the carpenter.

144 Pages. 5 x 7½ in. 101 Figs. Cloth. \$0.50

Radford's Framing

Carpenters and builders who wish to keep posted on the approved methods of framing houses and barns will do well to add this book to their libraries. It deals with every form

of construction and explains the every-day work of the average mechanic as well as the intricate forms of framing, which may be called for at any time. The problems presented have been taken from the working drawings of well-known architects, and complete details showing each successive step are given.

A few of the principal subjects treated in this exhaustive work are: Laying out building lines, foundation, waterproofing, window and roof framing, stair building, framing for cement construction, brick veneer houses, framing for slate and tile roofing, location, drainage, and all details of heavy timber and plank frame barn construction, mill building, factories and shops, public buildings, strength of timbers, truss framing, etc.

338 Pages. 6 x 9 in. 182 Figs. Cloth. \$1.00

Hodgson's Light and Heavy Timber Framing

A practical treatise on the modern methods of executing all kinds of timber framing from the simple scantling shed or lean-to to the heavy and complicated timber bridges, centers, needling and shoring, roofing and railway work, tank frames and taper structures. Apart from the easy system of balloon framing, the work explains the methods for taking hewn timber out of "wind," hewing, counter-hewing, sizing, boxing, draw-boring, gaining, mortising, tenoning, kerfing, splicing, and all other details of framing.

Contents.—Joints in Woodwork; Framing; Classification of Timber; Classification of Fastenings; Studding; Outside Walls; Partitions; Doorways; Flooring; Laying Joists; Fireplace Trimming; Balloon Trimming; Roofing; Towers, Domical Roofs, Mansard Loop, Trussed Roofs. Sills and Joists; Bay Windows; Skeleton Framework; Cornices; Veranda Roof; Heavy Timber Framing.

305 Pages. 6 x 9 in. 420 Figs. Cloth. \$2.00

Hasluck's Cabinet Work and Joinery

Cabinet Work and Joinery is the natural outcome of and sequel to "Carpentry and Joinery," with which work it is uniform in style and price. While the chief object of that work was to explain constructive principles adopted in the related crafts of carpentry and joinery, the present purpose is to give some hundreds of examples showing further how these principles are applied in everyday practice.

The present book devotes but little space to the rudiments of cabinet work and joinery, but makes a direct and immediate appeal to the constructive instinct of the craftsman by presenting him with an extensive and varied range of designs of completed articles, accompanied by full explanatory notes. No less than two hundred and fifty different designs with details are included in this book, the illustrations numbering 2021 in all.

574 Pages. 6¼ x 9 in. 2021 Figs. Cloth. \$3.00

Maginnis' How to Frame a House

Gives reliable methods of laying out, framing and raising timber houses on the balloon principle with a complete and easily understood system of roof framing.

Contents: Balloon and Braced Frame Houses—How to Frame the Timbers for a Brick House—Framing Roofs—Rustic Carpentry and Joinery—Miscellaneous Framing—How to Move a House—Practical Information for Carpenters on Taking Measurements—Laying Flooring—Stacking Lumber—Fitting Hardware, etc.

159 Pages. 7 x 10 in. 159 Figs. Cloth. \$1.50

Dale's Arithmetic for the Carpenter and Builder

A simple and comprehensive text-book on arithmetic as used in the daily work of the carpenter and builder. Every example applies to building and the drawings which illustrate the methods of figuring problems are all carefully detailed and marked with dimensions. There are 246 different problems on figuring weights of building materials, footings, bearing power of soils, use of the steel square, cement and concrete mixtures, lumber terms and dimensions, allowance for dressing, width of lumber standard lengths, sizes of common boards and of dimension lumber, sizes of dressed finishing lumber, flooring, shingles, etc., and 100 diagrams are used to explain them. Everything is described in everyday English and anyone can understand it.

Contents.—Units of Length; Addition, Subtraction, Multiplication and Division; Fractions; Mixed Numbers; Division of Fractions and Mixed Numbers; Money; Examples with Money Quantities; Checks, Statements, Receipts, Estimates; Decimals; Examples with Decimals; Use of Rules; Rules for Pulley Sizes, Width of Belts, Use of Formulas; Percentage, Discounts, Profit, Interest, Ratio, Proportion; Examples in Cement and Concrete Mixtures; Slopes, Levers; Weights and Measures; Practical Examples; Powers, Roots, Right Triangles, Areas of Circles; Lumber Terms and Dimensions; Flooring Shingles; Builders' Geometry; Areas of Surfaces and Volumes of Solids; Use of Carpenter's Square; Use of the Carpenter's Square in Framing; Practical Examples.

228 Pages. 5 x 7 in. 109 Figs. Cloth. \$1.25

Sent Prepaid by Building Age Book Department, 239 W. Thirty-ninth Street, New York

Williams' Stair Builder's Guide

The effort in this book is to explain the tangent method of the science in its present advanced stage. The arrangement of its plan in short chapters cannot fail to be of the greatest advantage to the reader. The first chapter treats upon the constructive details of the stairway, while the four which follow are devoted exclusively to the fundamental elements of wreath rail construction.

What appears in the sixth chapter on the arrangement of risers will prove of paramount value. The remaining chapters contain examples of stairways of all descriptions, from the small straight flight to the most complex examples of cylindrical structures. Each chapter represents a complete example of a special stairway, including plan, elevation and rails. The laying out of each working detail is carefully considered and explained, accompanied by such illustrations as will render the explanation easily understood.

Contents.—Straight Flights and Platform Stairways; Sections of Prisms; Tangents; Face Moulds; Wreath Rail Bevels; Arrangement of Risers in and Around Cylinder; Straight Flight of Stairs; Flight with Winders at the Bottom; Platform and Newel Stairway; Construction of a Platform Stairway with Stretchout Curve at the Bottom; A Stairway Containing Stretchout Curve at the Bottom and a Quarter Turn Curve at Top Landing; Method of Constructing a Scroll Wreath; Second Method of Constructing a Scroll Wreath; Third Method of Constructing a Scroll Wreath; A Wreath Rail Over a 12-inch Cylinder Containing Eight Winders; A Wreath Over a Cylinder, Adjoining a Level Landing; Wreath for Stairway Containing a Curve more than a Quadrant at the Starting and a Quadrant Curve at the Intersection of Two Flights; A Wreath in Sections Over a 13½-in. Quadrant; A Wreath Over a Cylinder at the Top of a Stairway; A Wreath Over a 4-in. Cylinder Adjoining a Top Landing; The Right and the Wrong Way of Treating a Quadrant Between Two Flights; Examples of Curves Intersecting Flights and Landings; Wreaths for "Thumb-Ellipse" Plan Curves; Wreaths Over an Elliptical Plan Stairway; Rails for a Stairway Containing Complicated Plan Curves; Wreath Rail Over a Thumb Ellipse Curve, and a Quadrant Intersecting Two Flights; A Panel Soffit for a Circular Stairway; A Rail Over a 24-in. Quarter Turn, at the Bottom of a Stairway; Rail Around a Cylinder Containing 4 Risers at the Junction of a Flight and Top Landing; Designs of Stairs.

258 Pages. 6 x 9 in. 360 Figs. Cloth. \$1.50

Hodgson's Practical Uses of the Steel Square

This is one of the most popular works on the uses and applications of the square. It is complete, accurate and easily understood, the aim of the author having been to avoid confusing terms and to treat every problem in a simplified way.

This instrument has so wide an application in the solution of problems connected with the work of carpenters, joiners, cabinet makers, bricklayers, stone cutters, plasterers and others that to present a really comprehensive treatment it has been found advisable to publish the text of the work in the two above described volumes.

These volumes are one of the first requirements of the mechanical library.

The contents include some ingenious devices for laying out bevels for rafters, braces and other inclined work; also chapters on the square as a calculating machine, showing how to measure solids, surfaces, and distances—very useful to builders and estimators. Chapters on roofing and how to form them by the aid of the square. Octagon, hexagon, hip and other roofs are shown and explained, and the manner of getting the rafters and jacks given. Chapters on heavy timber framing, showing how the square is used for laying out mortises, tenons, shoulders, inclined work, angle corners and similar work are given. The work also contains a large number of diagrams, showing how the square may be used in finding bevels, angles, stair treads, and bevel cuts for hip, valley, jack and other rafters, besides methods for laying out stair strings, stair carriages and timber structure generally.

2 Vols. 600 Pages. 5½ x 8 in. Figs. Cloth. \$2.00

Odell's Hardwood Floors

A practical little book from the pen of a man who has an extended experience in the better grades of modern floor finishing. It was written to meet the increasing demand for a simple treatise on the tools required and methods of handling same to turn out an even, well-laid floor. Contains detailed information on the methods of hardwood floor laying, with hints and cautions to those who aim for best results. Treats the subject from the selection of material to waxing the finished floor, with prices and suggestions for estimates.

Contents.—Descriptions and Illustrations of Tools, with Points on Construction and Proper Care; How to Sharpen the Scraper, with Illustrations; A Talk to the Carpenter; Preliminary Points; General Directions for Laying the Floor; How to Proportion the Floor Surface; Information for the Painter; Facts About the Different Varieties of Finish; Relative Costs of Floors and Floor Finishing; A Chapter on Costs, with Many Complete Estimates, which may be used for Guidance in Figuring; The Selection of Floors in New Buildings; System an Important Factor.

50 Pages. 5 x 8 in. 13 Figs. Cloth. \$0.50

Otter's Furniture for the Craftsman

This book treats the design, construction and finish of practically all articles used in furnishing and equipping modern homes. The wide variety of work discussed is conveniently arranged in 16 intensely interesting chapters.

One chapter considers the essential tools and equipment for doing the work—other chapters describe the various kinds of furniture, as well as appropriate bathroom accessories, while the concluding chapters are devoted to finishing and upholstery. Attention is also given to the design and construction of the furniture most suitable for porches of country houses or modern mansions, as well as the furniture usually found about the grounds.

An important feature is that all of the different kinds of furniture intended for use in one room, such as Dining-room or Parlor, for example, are listed in the chapter devoted to that particular class of furniture.

And the various measurements for making each piece of furniture are given so that there will be no difficulty in following the plans and printed instructions.

In the chapter on tables and stands attention is given to selecting the material, designing and constructing fourteen different articles, including round and square tables for the dining-room and parlor, center tables, library and reading-room tables, with drawers and shelves for books, tabourets, writing tables, music stands, serving stands, etc.

Contents.—I. Influence of Antique Models on Present-day Furniture; II. Essential Tools and Equipment—Ornament on Furniture; III. Certain Furniture Forms—Value of Spare Time and Observation; IV. Tables and Stands; V. Stools and Other Useful Furniture; VI. Furniture for the Hall; VII. Sitting Room Furniture; VIII. Furniture for the Parlor; IX. The Dining-room; X. Bedroom Furniture and Conveniences; XI. Bathroom Accessories; XII. Certain Kitchen Accessories; XIII. Bookcases and Holders; XIV. Furnishings for the Porch and Grounds; XV. Finishing; XVI. Upholstery.

305 Pages. 6 x 9 in. 297 Figs. Cloth. \$1.50

Hodgson's A B C of the Steel Square

This little book contains a number of practical examples of the application of the square to hand-railing, stair-building and many of the problems which come up daily. It is claimed that this is entirely original and not taken from the larger work by the same author.

139 Pages. 4 x 6 in. 96 Figs. Cloth. \$0.50

ESTIMATING AND SPECIFICATIONS

Joslin's Estimating the Cost of Buildings

A thorough and clearly presented system for figuring the actual cost of all kinds of residential work and schools, banks, hospitals and other public buildings of moderate cost. A specially commendable feature is the arrangement of the text for home study or class use. The first chapter explains plan reading in a concise and lucid manner and then each step of the work of taking off the various quantities and items of cost is considered in its logical order, with hints and time-saving suggestions based on the author's lifelong experience in all the branches, from draftsman to consulting expert.

The special forms which the author finds indispensable in keeping accurate record of time, material and tools in his system of executing building contracts are illustrated and their use explained.

An excellent method of estimating alterations and remodeling with costs from jobs where careful records of expense were kept adds materially to the value of the book.

Contents.—PART I. READING ARCHITECT'S DRAWINGS.—Definition of Plan; Analysis of Foundation and Cellar Plans; First, Second and Attic Floor Plans; Elevations; Roofs; Black Plans and Use of Colors on Drawings.

PART II. MASONRY, IRON WORK, MARBLE WORK, METAL WORK.—Knowledge Required by the Estimator; Method of Estimating; Excavation and Ground Work; Foundation Walls, Walks, Grading; Brick Work; Stone and Terra Cotta, Ornamental and Structural Concrete Floors; Steel and Iron Work; Marble, Mosaic and Terrazzo Work; Roofing and Metal Work.

PART III. CARPENTER WORK.—Frame, Studding and Furring; Boarding and Measuring Roof Surfaces; Shingles, Clapboards and Outside Finish; Windows, Doors, Inside Finish and Floors.

PART IV. MISCELLANEOUS SUB-CONTRACTS.—Plastering; Painting; Plumbing, Gas-Piping, Electric Work, Heating; Miscellaneous Expenses, Lockers, Profits, etc.; Example of Making Approximate Costs.

PART V. ESTIMATING THE COST OF BUILDING ALTERATIONS.—Razing, Shoring, and Temporary Protection; Masonry; Carpenter Work, Plastering, Painting, Plumbing, etc.; An Interesting Example of Alteration Work.

PART VI. SYSTEM IN THE EXECUTION OF BUILDING CONTRACTS.—Steps Necessary to Start Building Alterations; Job Superintendence; Handling Work at a Distance, Timekeeping and Divided Costs.

228 Pages. 6 x 9 in. Illus. Cloth. \$1.50

ESTIMATING AND SPECIFICATIONS

Arthur's New Building Estimator

A modern working guide for all who figure the cost of building construction, either in detail or approximately.

It gives the actual time, labor and material required on every operation in all classes of residential and municipal work, as recorded and checked by the author and other experts on thousands of jobs, finished under varying conditions, in different sections of the country. Special stress is laid on those items that are affected by varying conditions and the reasons for the difference, as found by experience, are given, so the reader may profit. Every operation from the clearing of the site and excavation to the painting of the finished structure is covered in detail with time, labor and material figured chiefly in hours and quantities. It is an Estimator's Guide, based on work done, not on theory. Examples of work are presented in a systematic and clear manner, so as to give the idea at a glance. With it one may figure anything from a \$500 cottage to a \$500,000 structure.

The chapter on Reinforced Concrete work gives the actual cost, with illustrations, of all the latest types of construction by the Abenthaw, Ferro-Concrete, Trussed Concrete Steel, Hy-Rib, Hennebique and Roebbing Construction Companies, with full information as to cost of forms, quantity of material, labor required, etc.

Insurance Adjusters and Appraisers will be overjoyed at the fund of information it contains on their particular work. Besides treating all types of frame, brick, concrete and stone construction in the approximate form which they require, the author has included chapters on Square and Cubic Foot Costs, Depreciation, Physical Valuation, Equipment of Buildings, Sprinkler Systems, Comparative Costs, Ornamental Iron Work, etc. Figures are given on railroad work, grain elevators, silos, apartment houses, hotels and other classes of work not covered in any previous work.

Contents.—Part I. Approximate Estimating.—Excavating, Wood Piling, Concrete, Rubble, Cut Stone, Brickwork; Steel and Iron, Carpentry; Carpentry: Tin and Galvanized Iron, Plaster, Millwork; Millwork; Paint; Percentages; Percentages of Various kinds of Buildings; Relative Cost of Brick and Glass; Relative Cost of Brick and Frame Buildings.

Part II.—Detailed Estimating.—Excavating and Filling; Piling; Concrete; Stonework; Brickwork; Municipal Work; Fireproofing; Tile, Reinforced Concrete; Cement Stone; Plaster; Carpenter and Joiner Work; Millwork and Glass; Glass; Structural Steel and Iron; Hardware; Sheet Metal Work; Roofing; Painting; Plumbing and Gas Fitting; Heating and Lighting; Tiling; Cost of Buildings per Square and Cubic Foot; Railroad Buildings per Square and Cubic Foot; Standard Engine Houses; Standard Sizes and Grades; Odds and Ends; Hints on House Building; Cottages in Spain; Weights and Measures; Counting the Cost; Actual Cost of Reinforced Concrete; Measurement of Building Work; Comparative Costs; Cornices and Canvas Pools; Sprinkler System; Silos; Depreciation; Physical Valuation; General Principles; Physical Valuations; Details; Railroad Figures; Grain Elevators; Square Foot Costs; Approximate Cost of Wood Trusses; Short Cuts; Equipment of Buildings; Apartment Houses; Wage Tables; Ornamental Iron Work.

744 Pages. 5 x 7 in. Illus. Flexible Leather. Gilt Edges. \$3.00

Joslin's Handy Estimate Blanks

These Blanks are the greatest time and labor savers the contractor, estimator and architect can use in computing the cost of dwellings, small apartment houses, churches, schools, banks, stables, garages and municipal buildings.

They list all the items required for a modern job, including everything from excavation to painting, and are arranged so that each sub-item may be priced on the "Unit of Measure" installed complete basis or the labor and material may be figured separately.

Contents.—General Expenses; Excavation, Landscape Work; Drainage, Granolithic, etc.; Asphalt, Foundations, Piling; Cut Granite, Face Brick Work; Limestone, etc.; Interior Marble; Mosaic, Terrazzo, Tile; Brick Work, Structural T. C.; Reinforced Concrete, Metal Furring; Plastering, Lathing; Structural Steel and C. Iron; Ornamental Iron, Roofing; Metal Work, Fireproof Doors, etc.; Frame, Boards, etc.; Studding, Furring, etc.; Wall Covering; Roof Covering, Outside Finish; Outside Finish, con'd, Doors and Windows; Inside Finish; Inside Finish, con'd, Upper Floors; Misc. Carpentry, Painting; Glazing, Elec. Work, Gas Work; Plumbing; Heating; Sundry Specialties; Total Estimated Cost; Profit; Amount of Bid.

32 Pages. 7 x 10 in. Heavy Paper, 25c., \$2.50 per Dozen

Gillette's Handbook of Cost Data

The book has over 1,800 pages of actual costs taken from the private records of engineers and contractors, and so itemized and analyzed as to be of inestimable value to any person who has to do with making bids and estimates, or in checking estimates.

Contents.—Principles of Engineering Economics and Cost Keeping; Earth Excavation; Rock Excavation; Quarrying and Crushing; Roads, Pavements and Walks; Stone Masonry; Concrete and Reinforced Concrete Construction; Water Works; Sewers; Timberwork; Buildings; Railways; Bridges and Culverts; Steel and Iron Construction; Engineering and Surveys; Miscellaneous Cost Data.

1850 Pages. 4 1/4 x 7 in. Leather. \$5.00

Hicks' Estimator's Price Book and Pocket Companion

This, as its name indicates, is a guide to prices of all kinds of building materials, together with handy rules, tables and general information for the architect and builder. Almost everything required in the construction of the ordinary building has been considered together with average market prices. The items have been arranged in such a way as to enable the estimator to readily find what is wanted both in regard to size, weight and prices. The work is designed to supplement that section of "Hicks' Builders' Guide" which relates to estimating with a more comprehensive reference to prices and material and labor. Ample spaces have been left throughout the work for the insertion of local prices, memoranda, etc. It may, therefore, be used with equal advantage in any section of the country. The entire matter has been classified according to the nature of the work and it will be found of unusual interest and value to the practical estimator, contractor and builder.

The work is of a size to be readily carried in the pocket, and the 14 pages of cross reference index will be found a most convenient feature for the man in a hurry to find a specific matter.

The chapter on Carpentry gives the number of board feet and cost of framing lumber per square of 100 sq. ft., and many valuable tables, including timber measure, common and hip rafters for roofs of various pitches and with from one to eighteen feet run, the safe bearing loads of timber and yellow pine posts. Reliable data on figuring the strength and weight of materials is also given.

Contents.—Introductory; Preparing Estimates; Excavating; Stone Work; Plain Concrete; Reinforced Concrete; Concrete Cement Stone; Cellar Bottoms and Walks; Brick Work; Hollow Building Tile; Masonry Tables; Estimators' Guide; Plastering; Carpentry; Iron Work; Sheet Metal and Roofing; Plumbing; Heating and Ventilation; Electrical Work; Tile Work.

218 Pages. 4 x 6 in. 92 Tables. Cloth. \$1.00

Hodgson's Estimating Frame and Brick Houses, Barns, Factories, Stables and Outbuildings

It tells how to estimate, step by step, the cost of labor and materials, from the work of excavation for the foundation to the finishing of the building. It gives a careful analysis of each item of cost in construction, all being demonstrated in progressive order, and by means of figures and rules.

These methods of figuring costs are brought out in the clearest and simplest manner, and may be applied in estimating the cost of constructing any dwelling, stable, barn or outbuilding.

The author has endeavored to make this book so general in its scope that the builder living in any part of the United States will find it of great service in getting the actual cost of the different items in builders' work.

Contents.—Order in Estimating; The Frame Construction; Interior and Exterior Trim; Stair Work; Plastering; Painting; The Cellar; The Superstructure; Rough Lumber Required; Plastering for Brick House; External Wood Finish; Inside Finish; The Kitchen; The Conservatory; Estimating Brick Work; Estimating Cost of a Stable; Estimating a Barn; Details in Estimating; Form of Tender.

252 Pages. 5 x 7 in. 25 Figs. Cloth. \$1.00

Hicks' Specification Blanks for Frame or Brick Buildings

It pays to have definite specifications covering all details of the work when preparing your estimates. These new blanks are arranged to cover all the work apt to be called for in erecting residences, churches, schools, and other small public buildings in various sections of the country. All the user has to do is insert his sizes, quantities, etc., and cross out what he does not want. Plenty of space is left at the end of each specification for extra data.

The Carpenter's Specifications cover: Framing Lumber; Joist Spacing; Doubling; Bridging; Rough Floors; Sheathing; Roof Sheathing; Shingles; Tin Roof; Slate Roof; Other Roofs; Paper; Siding Outside Finish; Porch Finish; Frames; Windows; Special Glass; Doors; Finish Floors; Interior Finish; Thresholds; Front Stairs; Rear and Attic Stairs; Cellar Stairs; Medicine Cabinet; Pantry; Closets; Mill Work.

8 Pages. 7 x 10 in. Paper, 25c., \$2.50 per Dozen

Maginnis' How to Measure up Woodwork

This book was written so as to place in handy and concise form reliable directions to enable builders and mechanics to measure up the quantities of woodwork for brick and frame houses accurately and without hesitation.

Contents.—Measuring Window Frames and Sashes; Door Jambs, Base and Trim; How to Measure Up Wainscoting; Getting Sizes of Doors; Finding Dimensions of House Fixtures; Determining Sizes and Quantities of Portiere Screens, Transoms and Mouldings; Measuring Up Stairs, Balustrades and Handrails; Inside and Outside Blinds; How to Figure Up Rough Timber for Frame Buildings; Miscellaneous Information.

79 Pages. 4 1/4 x 7 1/2 in. 161 Figs. Cloth. \$0.50

**"BERGER'S"
Classik
STEEL CEILINGS**

Effectively and Profitably Erected in Any Building

THE building and repair season is now under way, and the contractor who recommends and installs Berger's "Classik" Steel Ceilings will build an enviable reputation for himself and profit accordingly.

These ceilings combine the characteristic graceful outlines of plastic relief with the mechanical and constructional advantages of sheet metal.

The dies, from which these ceilings are made, are reproductions of skilfully clay-moulded originals, while the stamping done on our special machines brings out the beauty of design sharp, clear and true. Each unit is rigidly inspected and guaranteed against defects, imperfect stamping, holes and breakage. Besides their unusual attractiveness, these ceilings are safe and durable. They are fire retardant, and cannot crack, chip or fall down. We have hundreds of designs to harmonize with any class or type of building—homes, theatres, churches, garages, public institutions, etc.

You Save 25% to 40%

on every job, because our improved bead and button construction makes a perfectly tight joint without tamping and calking. Thus erection is quickly and easily accomplished.

OUR new "Classik" Book D. B. is just off the press. It will help you close many contracts. Want a copy? Write.

Plaster Won't Crack

or drop off when applied to **Grimm's Galvanized Corrugated Wire Lathing**—because of its great keying qualities and the minute metal expansion and contraction area of the wires from which it is constructed.

This lathing has "V" shaped corrugations embedded at intervals of six inches, which serve to stiffen it and raise it sufficiently to allow ventilation in back of the plaster. These corrugations also eliminate the necessity of furring strips.

The fact that Grimm's Galvanized Corrugated Wire Lathing is galvanized after being woven makes it rust proof and solders each joint tightly, and the ease with which it can be applied makes it more desirable to use than any other metal lath on the market.

Have you seen our new No. 8-H catalog? If not, send for it to-day. Refer to pages 64 and 66 for full details and valuable information regarding "Buffalo" Wire Lathing and its use on up-to-date houses.—There is also other valuable information in it for you—*Send for it now.*

Absolutely Safe

The "Trouble-Saver" Building Bracket is distinctly different from other brackets on the market. This bracket has two legs to support it. These legs brace against each other at the outer end and prevent any side motion. The bracket takes hold of the studding directly, thus preventing any motion at the inner end. It is absolutely solid—no wobble at all. Your men will feel perfectly safe on this scaffold, and because of confidence they will get around faster and do more work.

**Which? 5 Minutes
or 5 Hours?**

You can erect as many "Trouble-Saver" Steel Building Brackets in 5 minutes as you can wooden brackets in 5 hours. Not one nail or bolt is used. Simply hook the steel supports around the studs and there you are. It's just as easy to take them down.

Consider it from every angle and you'll see an actual cash saving by using "Trouble-Saver" Steel Brackets. It will mean a saving on time—a saving on materials—a saving by preventing injury to your workmen—a saving by reason of your workmen having a firm, solid and safe footing.

Just fill in the attached coupon for further information and prices.

Kno-Burn

Expanded Metal Lath

Is Fireproof, Permanent and Pliable for "Movie" Theatres

The contractors for this theatre laid all the plaster over Kno-Burn Expanded Metal Lath—1800 yd. of it. They got an interior construction that complied with the strictest fire resisting requirements and at the same time could be shaped to follow the distinctive interior designs

of the architects without trouble or excessive expense in labor.

Plaster laid over "Kno-Burn" is always insurance to you of a permanent job because the mesh of "Kno-Burn" grips the plaster unfailingly and forever and because metal lath lasts.

Send for booklet No. 43 for full details about all the types of lath in the North Western line.

EAST AND WEST HILL, RESIDENCES OF WM. L. GLATFELTER AND PHILIP H. GLATFELTER, SPRING GROVE, PA.
J. A. Dempwolf, Architect

The Glatfelter Residences at York, Pa.

are proof of our claim that whenever builders of standing have had an opportunity to test BAYONNE by comparison with other prepared materials, BAYONNE Roof and Deck Cloth has been given the preference.

For veranda and piazza roofs, especially roofs with flat pitch; on decks and sun parlors; and for use on sleeping porches—where it was used exclusively on the Glatfelter Residences at York, Pa.—BAYONNE leads all metal and other prepared coverings. It is unequalled in wearing qualities, simplicity of handling, neatness of finish and economy.

BAYONNE ROOF AND DECK CLOTH

Write for Sample Book D giving prices and laying instructions. See Sweet's, Page 539.

John Boyle & Company, Inc.
New York City
112-114 Duane St. 70-72 Reade St
Branch House:
202-204 Market Street, St. Louis

BAYONNE is highest quality duck, made practically indestructible by our special process. It is laid directly on the dry boards (no "wet" setting or painting of edges in laying) and one coat of paint is sufficient for ordinary purposes. Unlike any metal covering it does not expand or contract with heat or cold, nor does it peel, crack or buckle. BAYONNE does not corrode, never leaks—and we have yet to hear of the first yard of BAYONNE to give way to the most constant wear.

SPRINGTIME IS BUILDING TIME

Soon there will be a demand in all localities for men to build new barns.

This call is welcomed by the contractor who uses *PORTER SERVICE*, since he knows he can build the new barn in double-quick time and guarantee a thoroughly modern and workmanlike job.

Consider what it means to receive authentic and practical data covering the construction, arrangement, ventilation, etc., of each individual barn. That's what *PORTER SERVICE* renders—and it's *FREE*.

The name *PORTER* is identified with that practical and durable kind of *BARN EQUIPMENT*.

For Permanency and Economy—Use Berger's Metal Building Materials

Berger's Expanded Metal Lath

Add strength and stability to a building and makes plaster go farthest. Reinforces plaster at all points, thus preventing it from cracking, breaking and falling off. The diamond-shaped meshes are small and expanded so that plaster clinches perfectly.

Berger's Corner Beads

Insure a smooth, round corner to which the plaster properly adheres. Prevent plaster from cracking or chipping at the corners, thereby eliminating patching, and doing away with old fashioned wooden mould.

Berger's Ferro-Lithic Reinforcing Plates

Are used extensively for reinforcing concrete slabs for flat or arched roofs and floors, sidings of buildings, sidewalks, etc. Plate is watertight in itself, which prevents dripping of soft cement and insures a dry roof even before concrete is applied.

Berger's Pressed Steel Cores

Reduce cost and dead load, enabling you to do this in both light and heavy long-span construction. Our standard size has a 20-inch base with flanges adapted for making concrete joints 24" on centers. We make both removable and permanent cores.

This handbook will prove valuable to all interested in reinforced concrete, as it contains illustrations, diagrams, safe load tables and complete specifications for building roofs, side-walls, partitions and floor construction with Berger economy products. Compiled by experts—yours free for the coupon.

Wire Lath

The Kind the N. Y. C. Uses

When the New York Central built the Grand Central Station, New York City, they used the best of material throughout. Wright Wire Lathing was chosen and used with notable success.

Perhaps the Grand Central Station does not come in your class of work, but we mention it to show how the country's foremost architects and builders feel about Wright Wire Lath.

It is as well adapted to the modest residence as to the biggest buildings. It is fire-proof, rust-proof and sag-proof. Easily applied. Made in three finishes—Plain, Japanned or Galvanized.

Send for our Catalog X and see how well you can use it in your walls, ceilings, partitions, and for holding stucco.

Grand Central Terminal, New York City

Wright Wire Company
Worcester Mass.

A STEEL ceiling like this, with stamped or panel patterns between beams of sheet metal or wood, is one of many we have, appropriate for residences. Others for Parlors and Bedrooms. All different from those commonly seen in commercial buildings (and we have them also).

SANITARY, INCOMBUSTIBLE

nothing better for a new building or for remodeling an old one. Catalog at your desire.

Going to Build? Remodel or Repair?

Save \$5 to \$500 on Every Order for Building Material

BUY your lumber and millwork direct. Every contractor, carpenter and builder should have our big free catalog of building material—the book of 8000 price bargains. A copy is ready and waiting for you and will be sent free, postage prepaid, at your request. The tremendous saving afforded by our method of supplying building material direct to the actual builder has proven a boon to thousands. Let us show you how to make more money by saving more money.

H. N. Munger
President

Everything in Building Material

is described in this big book. It quotes low, net, rock bottom prices for lumber, flooring, roofing, doors, windows, interior trimmings, cabinet work, colonnades, porchwork, hardware, tile, paints, wallboard, metal work, plumbing and heating equipment, cement machinery, water supply outfits and thousands of building specialties. It is a handy book of information and reference that no builder can afford to be without.

Free Architect's Blue Prints

You do not need to have costly plans prepared by high-priced architects, thus adding to the cost of building, because we have had just such plans prepared for us by some of the ablest licensed architects in the country. These plans are complete in every detail and include a full set of specifications. Our FREE PLAN BOOK tells how to secure these plans without one cent of cost to you. A contractor will find this book of the utmost assistance in securing new trade because with it he can show his customers newer and better designs that may be built for less money.

Houses of Standard Construction

These buildings are of standard construction. They are built from high-grade guaranteed material with all cutting and fitting done by the carpenter on the job. They are not "ready-cut," "factory built" or freak houses in any sense of the term, but are erected as any house must be put up to secure best and most lasting results. Practical builders will readily appreciate the importance of this feature. It means more work for them and a better and less expensive building for their client.

Two Big Free Books

We want every carpenter, contractor and builder to have a copy of our big, free catalog, whether or not he is now in need of building material. It will keep him in touch with the very lowest prevailing prices and prove an invaluable guide to right buying. "Plan Book of Modern Homes" is filled from cover to cover with designs of convenient bungalows, handsome suburban residences, town houses, practical country homes and barns. Write for either or both these books today. Both are free. A postal request will bring them by return mail, or fill out the coupon below.

Gentlemen:

I got a pair of stairs from you, and the price was about \$73.00. I think, when our local mill man wanted \$150.00 for the same. I am a lover of net-priced catalogs and hate to get hold of one that is afraid to tell you what they want for their goods. Yours very truly,
J. B. FEASTER & CO., Greensburg, Ind.

Gentlemen:

The carload of lumber which I bought of you on order No. 3548 was all that I could ask. The grade was up to the standard and I saved after paying my freight and drayage, \$127.00. I certainly will keep you in mind when in the market.
Yours respectfully, F. N. CLINE, Muskegon, Mich.

Please quote BUILDING AGE when writing to advertisers

Gentlemen:

I desire to express to you my sincere thanks for the manner in which you have handled my orders, accounts, etc. I found the lumber to be of the very best quality, and the attention you gave the orders to be first-class. I am very much pleased with it all. The party for whom this building was put up was more than pleased, and I assure you that it will be a pleasure for me to turn any business your way I can.
Yours very truly, C. B. PATRICK, Burnside, Pa.

Dear Sirs:

I received order No. 10671 in good shape, and am well pleased with the goods. I saved on my order 15 to 20 per cent. Hope to be able to give you some more orders.
Yours very truly,
M. O. TERRELL, Carterville, Ga.

A House— or a Home?

THE one is commonplace; the other discloses a sense of artistic values—a distinction that comes of information rather than of money. And the best guarantee of such distinction is to read

House & Garden

With which is incorporated American Homes & Gardens

Condé Nast - Publisher

440 Fourth Ave. New York

This newly consolidated monthly of home making, of interior decoration and furnishing, of town and country life, is published by Mr. Condé Nast, who also publishes Vogue and Vanity Fair—an earnest of the success of House & Garden.

\$1 Invested in House & Garden May Save You \$1000

The planning and furnishing of a house, the beautifying of grounds and gardens, entails expense. For \$1—a mere fraction of your loss on one ill-considered expenditure—you may secure House & Garden for six months, and carry out your plans with a certainty that results in lasting satisfaction. If you intend to spend only \$25, \$50 or \$100 this year in the beautifying of your home, it will be true economy to get all the best ideas beforehand.

A Special Offer:

House & Garden is a handsome magazine of the large-page size, with an average of 80 pages of text and pictures per issue. Its price is 25 cents a copy—\$3 a year. But if you will detach, fill in, and mail the coupon below, with \$1, you will receive

House & Garden for the next 6 months, beginning with the beautiful Spring Building Number now on the newsstands. Opposite is a list of the six issues you will receive.

Six Forthcoming Numbers:

APRIL—Spring Building Number. Architecture for the vacation home—water supply—new gardens—the sewage problem.

MAY—Summer Furnishing Number. Summer curtains and rugs—rattan and willow—the young girl's room—cool color schemes.

JUNE—Garden Furnishing Number. Living out of doors—the pergola and garden pottery—flower boxes—pools and statuary.

JULY—Small House Number. Twenty inexpensive houses—economies in fireproof houses—evergreens—the remodeled farm house.

AUGUST—Motor Number. The automobile at home on a farm—garages—motors in suburban life—community improvement.

SEPTEMBER—Autumn Furnishing Number. New decoration tendencies—bath rooms—the man's room—furniture grouping which is distinctive.

He's Proud of His Montross Metal Shingle Roof

Your customer will be proud of his Montross Metal Shingle Roof. When finished it has the appearance of slate or tile. Tests prove it will render as good service if not better than either. And the cost is considerably less.

Montross Metal Shingles have been tested out after 32 years of continual service and they have shown phenomenal durability.

They are leak, lightning and fire proof. The sun's heat in summer will not bulge them. The wildest wind cannot make them rattle. The frost, snow and ice cannot crack them.

As one of our customers puts it "they make a durable, watertight and very handsome roof which can be put up by an ordinary carpenter." You make no mistake in specifying and using Montross Metal Shingles. They give absolute satisfaction and save dollars.

Get our book "Best Roof Under the Sun." A comparison of roofing materials. It's a revelation. FREE on Request. Write for this book and our proposition TO-DAY.

Walter's and Cooper's Painted Tin Shingles

THE SHINGLES THAT LAST

This is the Roofer's Opportunity

We require an agent in your town; may we have the pleasure of sending you a selling proposition, the acceptance of which will put you in a way to unusual profits?

Why use high priced Galvanized Roofing?

Walter's and Cooper's Painted Tin Shingles will make a roof just as lasting and cost you about one-half as much.

A painted tin shingle to be enduring must have as its base a heavily coated sheet of roofing tin, well covered with a lasting coat of paint. This paint must be flexible and dry, tough and hard. On exposure to the sun it must not flake, chip or scale.

Walter's and Cooper's Interlocking Tin Shingles

are stamped from the best grade of roofing tin, and are individually coated by the dipping process in a bath of paint to the above specifications.

Walter's and Cooper's Painted Tin Shingle roofs put on over thirty years ago are in as good condition today as when first put on the roof. Not only are they long lasting, but they are fire, wind, snow, storm and lightning proof, and are sold under an ironclad guarantee that they are right in every way.

National Sheet Metal Roofing Co., 339-345 Grand Street
JERSEY CITY, N. J.

The big Edwards' Metal Shingle family is growing fast. One of our late arrivals is here shown. Look it over. Did you ever see a more handsome, novel design, or more clean cut embossing? We've christened this "Baby" after our own great state.

Edwards "Ohio" Metal Shingle

This stunning pattern is made in one size only, 14 x 20 inches. Manufactured from the best quality Worcester Grade Terne Plate, painted or "Tightcote" galvanized. Every good Edwards Shingle feature—and there's a big bunch of them, including our

famous patent interlocking device—is in the "Ohio," of which we are justly proud. *Let Us Send Samples and Agent's Proposition*—The high quality of the former will please you and the low prices will surprise you. You ought to see the "Ohio" and you ought to see it now. Act!

ROOFED WITH AMBLER ASBESTOS "CENTURY" SHINGLES

When a Good Contractor and a Wise Owner Get Together

There you are likely to find Ambler Asbestos "Century" Shingles. And the reason is simple. The owner naturally wants a roof that is permanent, attractive and low in cost of upkeep. The contractor is interested in the same things, though for a different reason. The owner demands value; the contractor desires to supply it in order to maintain his reputation in the community. They both seek shingles that will wear longer than the building; that require no paint or repairs; that can be depended upon.

Ambler Asbestos "Century" Shingles

Can you supply these shingles? There is a growing demand for them. Whether the work is on houses, school houses, churches, garages or any other structure you will be fair to yourself and the

dealer likewise if you use Ambler Asbestos "Century" Shingles.

If you have no samples we will send some together with information and prices. A line from you will bring them.

Ordinary concrete, uncoated, showing its porous character. Concrete finished with Bay State Coating, making it waterproof.

Building for Beauty

TO fully realize the possibilities of concrete and stucco, you should know the ideal effects which are get-able with

Bay State Brick and Cement Coating

This Coating overcomes the dull blue-gray of concrete. It gives a permanent finish in white or tint. It doesn't sacrifice the distinctive texture of concrete.

Also—Bay State Coating makes an absolutely weather-proof wall. Rain can't seep through the pores.

Architects and builders in all parts of the country have tested this, the original Bay State Coating. We'll be glad to pass along what they say of it. Write for booklet 19.

Or, test it yourself—we will send you a sample can of the original Bay State Coating free for the asking. Say what tint you prefer.

"HARD KNOCKS"—of Centuries

have not destroyed the principle of the dovetail or, the preserving qualities of creosote and Asphalt

Time, the great destroyer, deals "knock-out" blows to inferior building materials. The stucco finished house with any but *the best background* for stucco, cement or plaster is short-lived.

Write for our free book, "Built on the Wisdom of Ages," illustrating homes, apartments, factory and public buildings finished in stucco on Bishopric Board—containing letters from architects, builders, and users, and extracts from reports of scientific tests, also free samples of Bishopric Board.

Write today, investigate for yourself, be convinced.

is a modern combination of material and principles that centuries of actual use have proven the most efficient in building construction. The dovetailed creosoted lath *clinching* the stucco, backed by Asphalt Mastic over heavy fibre-board, absolutely weather and water proof, withstand the vibrations from storm, the extreme changes in temperature and all the hard knocks of time, more successfully than any known background for stucco made—and *it's the most economical*.

Why Don't You Get a Barnes Hand Circular Rip Saw?

Sawing by hand is "backbreaking" work—sawing with our machine prevents the aches, and requires no skill.

One man with a Barnes Hand Circular Rip Saw can easily rip (line measure) 600 feet of one inch pine in an hour, or 6,000 feet in 10 hours.

It will rip boards or planks of either soft or hard wood, of any thickness up to $3\frac{3}{4}$ inches and any width up to 19 inches.

Feeds slow or fast as desired; can be instantly set to or from the gauge to any width.

The Barnes is a money maker, and the price a money saver.

Send for Catalog of Wood Working Machinery

W. F. & Jno. Barnes Co.
71 Ruby Street, Rockford, Ill.

Just what you've been looking for! —a combination Hollow Chisel Mortiser and Relisher

An entirely self-contained hollow chisel mortiser, that will carry chisels up to $\frac{3}{4}$ " square and make any larger or irregular mortise by overlapping the cuts.

Easy and simple to operate. No pounding or jarring. Every mortise perfect. No chips left to be picked out by hand, when you put your work on

the other side. Relishes out the tenon and bores away for that part which goes under the mold after you have completed the work on the sash stiles, rails and muntins.

Every carpenter and jobbing shop should have one of these machines.

Write for Bulletin J-27

Steel "Stitches"

Every Few Inches

Columns which have staves simply glued together will surely open up. Columns which have any kind of a lock-joint are liable to open up. Columns which are glued under hydraulic pressure, where the staves are locked with a double V joint and sewed with cold rolled steel staples every few inches of their entire length *cannot* open up. And this is the way "Steel-Sewed" Columns are always made. Catalog explains the construction and shows many beautiful illustrations. Write for it.

AMERICAN COLUMN CO., Battle Creek, Mich.

OAK: "America's Best Flooring"

Landlords offering houses for sale or for rent recognize the value of OAK FLOORING, and that is why they emphasize OAK FLOORING in their ads in newspapers. They know that OAK FLOORING is sure to attract a better class of tenants or buyers.

Nature has given OAK FLOORING that peculiar favor that appeals to the artistic as well as the demand for the distinctive and substantial.

The lady of the house finds OAK FLOORING an elegant expression of refinement, cheerful in color and capable of friendly harmony with other furnishings.

OAK FLOORING is always considered a good investment and grows old as gracefully as a Chippendale chair or a good Oriental Rug.

Write for booklet, "America's Best Flooring."

THE BESSLER MOVABLE STAIRWAY

This is how it looks when in use

This photograph was taken in a bungalow. The owner wanted to use the attic for a bedroom, but was confronted with the usual stairway problem. The Bessler Movable Stairway solved it. He now has an additional bedroom without sacrificing space for a stationary stairway in the room below. The Bessler Movable Stairway is ready to solve those problems for you and help build you a reputation for progressiveness and expert knowledge of your trade.

Write us for booklet now.

CORTRIGHT METAL SHINGLES

Easy and Profitable to Lay
THERE'S satisfaction in laying Cortright Metal Shingles, because the work is comparatively easy, quick and profitable. No specially trained roofers are necessary. Your regular men can do the job, and you make a profit on a job you would otherwise have to subcontract, or have no chance to bid on. Furthermore, the recommendations of owners of Cortright roofs are always counted on to help you to get other contracts. Every Cortright roof is a stepping stone towards still another. Prices to contractors make Cortright a particularly profitable proposition. Write at once for details.
Cortright Metal Roofing Co., Philadelphia and Chicago.

Hang the Screens Yourself

It's easy to put up full length screens if you use

Kees-Gossett Hinges

They lock the screens securely, opened or closed. Use the same hinges for storm windows—enable you to ventilate rooms safely. Handy, cheap, durable—no loose parts to rust tight or get lost.

The Farmer of Today Wants Better Buildings

The farmer of today is keeping pace with the times. He realizes that he can no longer live in a shack or house his cattle in a shed. He is demanding a *real* house, built of *good lumber*—and barns equally as good.

North Carolina Pine

"The Wood Universal"

is splendidly adapted to almost every farm requirement—for homes, barns, silos, poultry-houses or dairy-houses.

It is beautiful, strong, enduring and easy to work. And its low cost proves an added factor in its suitability for farm construction.

WRITE FOR NEW FREE REFERENCE BOOK

It is filled with information on North Carolina Pine, and will prove an asset in your every-day work. Free—just drop a postal. Ask for Book B.

North Carolina Pine Association
Norfolk, Virginia

A fireproof, weatherproof roof for the residence

If your clients appreciate artistic effects they will want wood shingles. If they dread fires they will want slate. But when they consider the inflammability and short life of wood, and the great cost of slate, they will want

J-M Transite Asbestos Shingles

J-M Rough-Edge Asbestos Shingles are especially appreciated by architects and homebuilders who know their artistic attractions. And houses roofed with J-M Transite Asbestos Shingles need never fear roof-fires. These shingles, made solely of pure asbestos and Portland Cement, are absolutely fireproof. And they become tougher and more enduring with every year of exposure to weather—they *can't* deteriorate.

J-M Transite Asbestos Shingles are examined, approved and labeled by the Underwriters Laboratories, Inc., under the direction of the National Board of Fire Underwriters. Laid American method they are given Class "B" rating. Laid French method they are given Class "C" rating.

Building Age Colored Perspectives

Do You Want a Set of 27?

WE have a limited number of sets of 27 each of the beautiful three and four-color perspectives, same as those used in various issues of BUILDING AGE. There has never been an opportunity for getting such a varied collection of beautiful perspectives, and as we have no remaining copies of most of the issues of BUILDING AGE in which these appeared, and as the expense of reprinting them in color—unless in very large quantities—would be prohibitive, it is probably the last opportunity of securing a set.

We have constant inquiries from subscribers for these prints separate from those bound in the magazine. Many frame them; others use them as suggestions. While they last we will send a set for one new subscription, or for renewal of your subscription for one year from date to which it is now paid; two dollars to accompany order, or enclose a dollar bill at our risk for the set.

Address orders to—

-and now the Wedge Dowel

Manufactured under U. S. Patent No. 1,060,543

The Latest Evidence of Morgan Leadership

In addition to the features of construction which have always made Morgan supreme in the veneered door field, Morgan Doors will in the future be built exclusively with the Wedge Dowel Construction. That means additional insurance against any possible annoyance or trouble. It means

Doors That Can Never Come Apart

The Wedge Dowel made of hard wood is slit obliquely at each end as shown in illustration above. When clamped into place, the wedge formed by the slits is driven into the dowel, expanding the sharp ends and driving them into the soft White Pine core, locking stiles and rails together in a vise-like grip.

No pockets are left to gather glue at the ends of these wedge dowels. Instead the glue is forced along the dowel, thus making a perfect bond between dowel and core.

Morgan Doors are the only hard wood doors made with Wedge Dowel Construction.

Think what this improvement means to

Doors

Already safe in their leadership because of the exclusive All White Pine Core, this latest forward step in the building of Morgan Doors means even greater satisfaction for the owner, and means greater assurance to you that once a Morgan Door is properly hung it will give perfect service without the necessity of constant retrimming and rehanging.

Now more than ever Morgan Doors are the doors that safeguard your reputation as a high-class contractor.

THE INTERIOR HARDWOOD CO.

1341 BEECHER STREET
INDIANAPOLIS, INDIANA

"Roof and siding stained with Cabot's Stain. Result most satisfactory." Yours, etc., Charles A. Hoag, Architect, Pleasantville, N. Y.

Stain Your Siding

clapboards, half-timbers, trellises, sheds and fences, as well as your shingles, with

Cabot's Creosote Stains

The soft, rich colorings are incomparably nicer than paint, and they bring out the grain of the wood in beautiful shadings. The "painty" effect spoils the beauty of the wood, and paint costs twice as much. The Stains last as long as the best paint, and "grow old gracefully"; and the creosote penetrates the wood, preserving it and making it less inflammable.

Cabot's Quilt

A genuine house-warmer. It's a cushion of dead-air spaces and is 30 times warmer than building paper. Quilt will pay for itself in a short time in saving coal, to say nothing of making the house comfortable for all time. Also a complete sound-deadener.

You can get Cabot's Stains and Quilt all over the country. Send for samples and names of nearest agents.

NEW YORK, MAY, 1916

A Bungalow of Picturesque Design

An Exterior of Cypress with Roof of Cedar Shingles—"Outofsite" Beds a Feature

A DESIGN embodying a number of interesting features both from the standpoint of the architect and of the builder is the bungalow which forms the basis of the present article. The building is picturesque in its conception and treatment, while the interior arrangement is such as to invite careful study on the part of the home builder.

A commodious living room occupies a goodly portion of the front of the house, it being entered directly from the veranda which extends as far as the offset made by the den in the extreme right-hand

with the kitchen through a double swing door. The kitchen is equipped with range, cupboards, a sink which is placed under the triple window at the rear, where it has ample outside light and space for the refrigerator which is convenient to the porch entrance so that in icing it there is no necessity of passing into the kitchen proper.

The right-hand portion of the bungalow and immediately in the rear of the den has two sleeping rooms and bath room. The former are provided with commodious

The Exposed Stone Work Is Such as to Give a Rugged Appearance to This Cozy-Cottage Type of Dwelling Which Has Been Designed by Morgan Rundel, of Detroit, Mich.

corner. Beyond the living room is the dining room with a pergola entrance and beyond it is a breakfast room which communicates with the kitchen at the right. The dining room also communicates

clothes closets, while a linen closet is conveniently placed to all of the rooms.

A feature of the exterior treatment is the stonework which is laid up as rough as possible, the masons having had instructions to use as little mortar as consistent with good work and not to get any on the exposed portions of the stone. They were also instructed not to chip or break any exterior stones, the idea being to have the latter present the appearance of stones laid one upon another and all the mortar possible raked out so as to leave the surface rough. Cement mortar of natural color was used and the result was a piece of work which, when completed, was pleasing to the eye and harmonized with the rest of the building.

Floor Plan—Scale $\frac{1}{16}$ In. to the Foot

Right Side Elevation of Building—Scale $\frac{3}{32}$ In. to the Foot

A Bungalow of Picturesque Design—Plans, Elevations and Various Details of Construction

The brick foundation walls are 8 in. thick and the inside portion of the walls is white lime brick. It was thoroughly covered on the outside with cement plaster $\frac{1}{2}$ -in. thick and then given a heavy coat of waterproofing so that the cellar is perfectly dry. A 3-in. tile is used inside and out.

The exterior is almost wholly of cypress. The walls are sheathed with $\frac{7}{8}$ -in. lumber over which is placed a good grade of building paper, and this in turn covered with 6-in. cypress siding with the rough side out and stained two coats nut brown. All exterior lumber used on the building with the exception of the window and door frames is rough, thus contributing materially to the picturesque effect of the design.

The bungalow here shown embodies a number of very interesting features in connection with its interior equipment and finish. In the breakfast room is a built-in buffet and there is a large buffet in the dining room. In the den is an "outofsite" bed which permits of the den being used for a sleeping room if required, and there is another "outofsite" bed in the breakfast room. Details of these beds are presented on another page. Over the bed in the den are bookcases and there are other bookcases along the right-hand wall under the double window. The doors throughout are of the single panel variety.

The bungalow here shown is located in the aristocratic Bloomfield Highlands, near Pontiac, Mich.,

A Bungalow of Picturesque Design—View in the Dining Room Looking Toward Buffet at the Right and Double Swing Door to the Kitchen Beyond

The roof is covered with clear 5 to 2-in. Washington red cedar shingles and stained the color desired. In the present instance the butts were dipped before putting on and then given a final coat when they were on the roof. The siding was also treated in the same way.

The studs are 2 x 4 in., the joists 2 x 10 in., the rafters and lookouts 2 x 6 in., and the ceiling joist 2 x 6 and 2 x 8 in.

The floors are double, the sub-floor being of $\frac{7}{8}$ -in. hemlock and the finish floors of Southern pine with deadening felt between.

The interior woodwork of the house is yellow pine stained to give the effect of fumed oak.

The rooms and the ceilings are covered with two coats hard wall plaster.

and was built for E. P. Waldron of Detroit. It is equipped with pressure water system, electric lights, gas machine and steam heating plant, the cost complete being in the neighborhood of \$7,500.

The work was done on the percentage basis and the design was by Morgan Rundel, 982 Woodward Avenue, Detroit, Mich.

Some Comments on Woods and Stains

It is often required to imitate by means of the ordinary water stains the effect of fumed woodwork and where the so-called fumed stains cannot be used the ordinary coal-tar dye stain can be utilized provided the wood is treated before staining with a

solution of 12 gr. to 16 gr. of soda to two pints of water and is sandpapered after drying. In all wood stains the nature of the wood itself is of course of prime importance. Maple can be stained gray without any trouble, while oak will not give the proper gray color in most cases since its color tends too much toward yellow and the gray stain—after waxing, shading and matting—shows greenish.

When light gray stains are used on oak it is often noticed that they turn yellow, especially if the stain is not light-proof and if it consists in the main of coal-tar dyes. All woods stained gray with iron salts take on a brown color in time. Most stains are made with such additions as potassium chromate, copper sulphate, etc., as also many metallic salts.

Most coal-tar dyes are either mixed at the shop,

stains are also mixed from the fundamental colors. Brown colors consist, as a rule, of red, yellow and black dyes; gray colors of blue-black, yellow, a little red, and sometimes a little green. It depends on the preponderance of some color in the dye whether the final stain will have one shade or another.

If in a brown color red is in excess then the final shade will be reddish-brown. The modern greenish-brown shades similar to the fumed finish are usually mixed with green. Green deadens all colors. If too much is used, the shade will have too great a greenish hue, and red may be used to offset the green.

Coal-tar dyes may be deepened in shade by adding a little potassium chromate or a little sodium hydroxide. Most colors may be made by using the fundamentals red, yellow and blue. Since the blue

A Bungalow of Picturesque Design—View in Living Room Looking Toward Open Fireplace with a Glimpse of the Dining Room at the Right

or, which is better, bought ready mixed, says a late issue of the *Journal* of the Incorporated Clerks of Works Association, London, England. With the greater number of shades and stains now on the market making up in the workshop is unnecessary.

If the stains are mixed at the shop, care must be taken in the first place to get lightproof colors, and that these colors are as nearly alike as possible in their resistance to the influence of light. For example, if a brown stain is mixed from black, yellow and red, then the stained wood will gradually take on a much lighter shade than desirable if the red was less lightproof than the other colors.

The same thing can be observed with the products of many paint-supply houses, for their paints and

colors are, however, less lightproof than the others, they are avoided wherever possible, and other colors are substituted.

It is impossible to get exactly the same color on a wood with the same stain. A piece of woodwork will show considerable differences in shades in the various parts, a state which is not very obvious in the completed product. If the different parts were laid side by side, however, the enormous differences in stain would be at once apparent.

The reason lies, of course, in the natural difference of the wood itself. Oak, for example, shows such a difference even when taken from the same trunk that it is impossible to get a uniform shade over the entire surface. A good stain is not sup-

posed to cover the natural grain of the wood, but is presumed to show it up more clearly. The stain should stain the wood uniformly over the entire surface, but it cannot be expected to produce an absolutely uniform effect.

Often woodworker and stain manufacturer have long arguments and differences about the nature and quality of the stain, merely because the woodworker demands something of the stain which he has no right to demand. This is especially true if he is re-

the darkening of cross-grained wood or carvings by moistening the wood with water just before staining to prevent the stain from penetrating too deeply. It is true that moistening the wood prevents irregularity in final effect of stains to some extent.

All vivid stains containing many alkaline ingredients or even potassium chromate should be avoided, as they fade rapidly under the influence of light and show many drawbacks which only appear after a long time. For example, the chromate and the soda

Miscellaneous Constructive Details of a Bungalow of Picturesque Design

quired to stain two pieces of woodwork alike. He may not allow for the difference in grain and structure, and then lays the blame on the stain manufacturer.

Every experienced finisher knows that in staining veneers always remain lighter than solid wood, and that such differences must be eliminated by different manipulations. This can be done by adding a second coat of stain, using either the same stain or some oil or spirit stain. An experienced stainer can prevent

in the hydroxide destroy the shellac layer, and with very strong solutions of these chemicals yellow and gray spots appear after a time, which are hard to eliminate.

Stains from coal-tar dyes have the disadvantage of leaving the pores in the wood lighter than the rest of the wood, but this can be remedied by waxing the surface after staining. Too much wax should not be used, as then the pores become too dark and the surface of the wood a dirty brown appearance.

To Be Answered by the Architect

Some of the Many Questions Which Are Frequently Asked by the Young and Inexperienced House Builder

By W. LIVINGSTON LARNED

“WE have heard so much of ‘Rooms with Southern Exposure.’ Everybody seems to agree that they are preferable. Can’t you arrange to have all of ours that way?”

“If it’s possible, we would like to have the guest room, wherever you put it, so arranged that we can turn it into a nursery or a conservatory, or something like that, in case the guests don’t come, you know.”

“Oh, please do cut the roof up into a whole lot of funny shapes. I once saw a building like that in Venice or somewhere and I thought it did look too cute.”

“We must have a butler’s pantry. However, I’m willing to admit that until John gets more salary we shan’t be able to go to the expense of a butler. They aren’t necessary, are they, when there’s only two in the family?”

“So this is the first floor plan and this is the second? How funny! They look very much the same. You know what I mean—with rooms and things and all drawn in those peculiar straight lines. How can you ever tell them apart?”

“Oh, dear, you architects are all alike. I was just looking over the list and you’ve gone and made us buy fifteen door knobs. I don’t believe a house has that many doors. Try and be economical, now, won’t you?”

“What’s the use of storm doors on this bungalow? You know as well as I do, that we never have any very severe storms in this section of the country. I’d cross those off.”

“You have forgotten the most important thing. Why—why did you? There was to be a push button under the dining room table so that all I have to do is push and the servant comes in. It makes one’s guests so curious.”

“You only have one old-fashioned fireplace. We wanted one in each of the rooms, and perhaps two in the big living room, in case my mother comes to stay with us. And the fire-dogs—you’ve left those out entirely.”

“I was just thinking—wouldn’t it be a novel idea if you could arrange a trick hole in the wall in our room, where I could keep my sewing machine when I’m not using it—a lever or some sort of a jigger? I could work it, and the machine would disappear. No one has ever tried that.”

“Now, don’t try to fool us. I had a grandfather who was in the building business and he told me lots and lots of things. There would be room for a large closet right under the stairs. Why, you could almost build another little parlor.”

“What’s that—you call this a ‘perspective drawing’? I suppose that’s some fancy, highfalootin’ name that will make it cost about three or four times as much as it really should.”

“Couldn’t you throw in a greenhouse and a pergola and a walk down to the pigeon-house, without it costing us anything extra? It seems to me that when folks give you a whole house to draw, you could do those little things—just as a favor and to show your appreciation. It would only take you a minute.”

“In your floor plan you don’t show any tiles in the bath room. I never heard of such a thing. I might as well tell you—frankly—your plans look terribly bare to me.”

A Handsome Private Residence

One of the latest additions to what is known as “Millionaires’ Row” in New York City is the new six-story residence designed by Architect Guy Lowell, to cost \$300,000, and to be erected at the northeast corner of Fifth Avenue and Eighty-sixth Street. It will stand on a plot 50 x 100 ft. in area, will have a façade of brick and limestone in the French Renaissance style of architecture and will be ornamented with a balcony on the sixth floor. There will be a massive entrance hall of marble with a great staircase in the center and on the second floor will be a gallery, library, drawing room, and billiard room. The plans have recently been filed with the Bureau of Buildings.

A good slate should be both hard and tough. If it be too soft the nail holes soon become enlarged and the slate works loose.

Some Aspects of Modern Shingling

Scaffolds and Various Ways of Using Them — Toe-Laths and Roof Jacks

By EDWARD H. CRUSSELL

ANOTHER item to be considered in connection with our present theme is scaffolding. On a new building a scaffold is usually required when putting up the cornice, and it is best to build this scaffold at such a height that the first two or three rows of shingles may be put on from it. There are many shinglers, however, who when working on a roof of low pitch prefer to get right onto it at the start. That is, they will shingle a piece 3 or 4 ft. long from the scaffold or ladder, make themselves a small stool, climb up onto the roof and work forward from that point, preferring to sit on the roof rather than stand on the scaffold. In repair jobs the ability to work on the roof

One way of avoiding scaffold expense is to leave off several rows of roof boards about 3 ft. up from the eaves and work from inside the roof while shingling the first few courses. The writer, when a young fellow, gained some local fame by suggesting this method when reshingling the roof of an old covered bridge. The bridge was close-boarded on the sides and would have been a difficult thing to scaffold. The old-timers said, it took a kid

Fig. 6—Method of Fastening Toe Lath

Fig. 7—Side and End Elevations of Shingler's Seat

Fig. 8—Shingler's Seat as it Appears on the Roof

Some Aspects of Modern Shingling

from the commencement is something to be desired, as it enables the workman to avoid the expense of building a scaffold which can only be used for laying the first few courses. Putting up a scaffold on purpose to shingle from may generally be regarded as unnecessary expense. In many cases it would be cheaper to shingle the entire length of the building from a ladder, awkward as that method is, than to build a scaffold for that purpose alone.

with more nerve than brains to suggest that some of the roof boards be knocked off so that the first rows of shingles might be laid without a scaffold.

There are many methods of scaffolding that may be used after the roof has been started, the writer knows of one contractor who used to fasten a two-by-four on the roof with forty-penny nails. After the roof was finished and the two-by-fours removed, the holes made in the shingles by the nails were filled with plugs of wood whittled to

*Copyrighted 1916 by Edward H. Crussell.

shape, driven in and cut off flush. Can you beat it?

Scaffolds used on the roof surface are usually called toe-laths, and in modern shingling are used more for the purpose of getting about the roof easily than they are to work from. On roofs of one-quarter pitch or less no toe-laths are needed, the shingler being able to get about on this pitch of roof with nothing but his seat, or roof-jack, as some prefer to call it. On roofs of steeper pitch it is better for the average workman to use toe-laths, although the professional shingler thinks nothing of getting around on a one-third pitch roof without their aid.

Toe Lath Used for Safety

As already stated, the toe-laths are used more for safety and ease in getting about the roof than they are to work from, so we usually space them about 7 ft. apart. This makes it easy for a man to scramble from one to the other in getting up or down a roof; and if his seat should slip (an unlikely occurrence), or if he should drop his hatchet, there is less chance for someone to get hurt thereby.

In Fig. 6 is shown the common method of fastening the toe-lath. The two-by-four, or whatever is to be used, is laid on the roof and a shingle is fastened to it near each end, as shown in the upper portion of the illustration. The top of the shingle points down the roof and about 1 in. of the butt end is fastened securely to the two-by-four with several shingle nails. The two-by-four is then turned over and the upper ends of the shingles are fastened to the roof boards. The shingles should be so placed on the two-by-four as to cover a joint in the proper manner when they are turned over onto the roof and naturally take the place of a shingle in the course immediately above the toe-lath. Of course, several extra nails are driven into these shingles—the ordinary nailing not being sufficient.

A toe-lath is shown, fastened in place as it appears on the roof, in the lower portion of Fig. 6. To remove it after the roof is finished the shingles that hold it are sawn off on a line with the others in that course.

Method of Fastening Toe Lath

This method of fastening the toe-lath was used by the writer for a number of years, until the proprietor on one job objected to its use, claiming that the short shingle made a weak spot in the roof. Although not entirely agreeing with his ideas, it was thought better to humor him, if possible, and so instead of using shingles for fastening the toe-lath we used strips of galvanized iron about 2½ in. wide, put on in the same manner as the shingles but covered entirely by the following course. To remove these toe-laths the strips of iron are cut with a pair of snips close up to the covering course of shingles.

This method of fastening the toe-lath has a number of things to recommend it. One advantage is, the toe-laths may be prepared with the iron strips before they are needed, thus avoiding delay, besides which scrap pieces of material of different length and thickness may be more easily utilized.

The shingler's seat is a simple affair, made in different ways according to the ideas of the user. A common form is shown in side and end elevation in Fig. 7 and in place on the roof in Fig. 8. The

two side pieces are made from scraps of 1-in. board cut to the pitch of the roof. The top is formed of a piece about 10 in. wide and 14 in. long, or sometimes two wide shingles are placed butt to tip and used for the top of the stool. The small strip on the rear is used chiefly as a handle by which to move the stool. The workman just reaches backward and hitches the stool forward as he moves.

To prevent the stool slipping, nails are driven into the side pieces, as shown in Fig. 7. The head of the nail is left projecting about ¼ in. and is then bent over as shown. The size of the nails in Fig. 7 are somewhat exaggerated to show the method more clearly; and particular mention is made of the method because the uninitiated often try to use the points of the nails, toenailing them through the sides of the boards so that they project slightly below. This does very well when the stool is first made, but after a little use the nails either bend or are pushed back into the wood and away goes both seat and user. Toothed plates, pointed wood-screws and other devices are used to prevent these seats slipping, but the writer has always found Fig. 7 to fulfill every requirement, especially when used in conjunction with the toe-laths already mentioned.

Alternative for Toe Lath

Without the toe-lath on a steep roof the shingler needs two seats unless he uses spiked shoes, something to which the man responsible for the job will usually object. The professional shingler will argue that he has never split a shingle with his spiked shoes, which may or may not be so. In hot, dry weather it is easy enough to split the shingles by walking on them with ordinary shoes, and spiked shoes certainly do not help the matter any. When much shingling is to be done it pays to invest in a pair of rubber-soled tennis or "gym" shoes. With these you can get around on the average roof almost as well as with the spiked shoes, besides which they are easier on the roof and easier on the feet than the ordinary shoe. Anyone who has done much of it knows that walking around for several days on a roof is an entirely different matter to walking on the level.

(To be continued.)

South Dakota Master Builders' Association

A Master Builders' Association has just been organized in Watertown, S. D., with officers for the ensuing year as follows:

President.....A. A. Gray of Watertown
Vice-President.....S. W. Jonason of Aberdeen
Secretary-Treasurer...Herman Stolte of Redfield

A constitution and by-laws have been adopted and a committee on membership appointed, who at once began active operations with a view to securing a "100 per cent organization" of contractors throughout the State. The several sessions were followed by a banquet at which Col. Lee Stover was toastmaster, the hosts being the materialmen of the State. Among the prominent speakers were Eugene Young, secretary of the Builders' Exchange of Minneapolis, who gave a general talk on "Co-operation," John R. Hanten and M. A. Hockman, the latter advocating an architects' license law.

Building a Modern Low-Cost Bungalow of Hollow Tile Construction

Various Details Which Will Be Found of Unusual Interest to the Builder Who May Be Called Upon to Erect Fire-Proof Construction in the Smaller Places of the Country

BY EDWIN G. ZORN

MARY and John are about to embark on the matrimonial seas. They have been planning for weeks, yes months, the details of their future paradise, but there is one question which they have not as yet been able to answer to their satisfaction and which has caused them considerable anxiety—where shall we live? Mary is opposed to entering upon her duties as a housewife in a “two by four” flat, while John, who is an ambitious fellow having saved through his industry a small amount of money, would like nothing better than to build a home in which he and Mary could begin their partnership. But his capital is small and he has high ideals. He would not build a “cheap” home—he would rather rent a place than do that—yet he would build if he could find a design and construction that would give him a substantially built home with modern conveniences at a low cost.

Did they realize their ambitions—Mary and John? The accompanying illustrations of a bungalow tell the story. They did, and in so doing, have blazed the path to a well-built, low-cost home, a house such as many would like to build if they only knew it were possible with the money at their disposal. And so, in order that some may learn of this fact and that the man who can most profit by the erection of these homes—the constructor—may have something tangible to show a prospective builder of a low-cost home, the following description and plans are given.

The bungalow shown herewith was built in Hammond, Ind., a town adjoining, in fact, almost a suburb of Chicago, the architect being Karl D. Norris of East Chicago, Ind. It has masonry walls, is of attractive design, well built, fire-proof and has a well finished interior and exterior. The main part of the building, not including the porches, is 26 ft. wide and 37½ ft. long, measuring 12 ft. from the grade line to the eaves.

The foundation is composed of conduit seconds, a material that was originally intended to house telephone or telegraph wires, but which, because of

some minor defect such as a slight imperfection in the glaze or a knick out of one end, were rejected at the manufacturer's yard by the buyer's inspector. These conduits are made of fire clay, vitrified in a kiln at a high temperature and are amply strong to carry the load imposed upon them in a building of one or even two stories. They

General View of the Completed Hollow Tile Bungalow

may be obtained very cheaply and make an excellent foundation, thoroughly waterproof. These conduits, eight inches in thickness, were laid up with cement mortar on concrete footings, and upon them were placed the walls of the building which are composed of eight inch hollow clay building tile.

When finished these walls were covered with a coat of rough cast stucco which was applied directly to the surface of the tile. The exposed woodwork on the exterior of the house has been painted a rich brown, and this, together with the rough gray of

VIEW OF THE SOUTH SIDE AFTER BEING COATED WITH STUCCO

REAR VIEW OF THE HOUSE BEFORE THE STUCCO WAS APPLIED

the stucco, the green roof and the red pressed brick chimney, form a most pleasing color combination.

The interior of the house is taken up by a living room, dining room, kitchen, bath and two bedrooms. The entrance to the house is through a vestibule which has a large window in the south wall, while opposite the door is a closet for hanging coats and wraps. From the vestibule, access may be had to the living room which extends very nearly the entire width of the house. The floor of this room is oak as is also the trim, which is continuous; that is, it consists of a broad band of oak placed at the proper distance from the ceiling and extending in one seemingly continuous strip around the entire room. In a niche at the south end of the room is a built-in bookcase of oak. The plastered walls in this, as in all of the other rooms, have a sand float finish, the plaster being applied directly to the surface of the tile on all of the outside walls. The interior partitions were built of studding and wood lath. The electric light fixtures in the living room are of brass, very simple and plain, but serviceable.

A colonnade separates the living from the dining room, the most striking feature of the latter being its well-lit interior which is due to the fact that this room has a bay on the north side with three windows in it. Unlike the living room, the floors in the dining room are of white pine, but so well has the painter done his work that the difference can only be seen by the trained eye. The floors match perfectly in the doorway between both rooms. In the dining room an inverted light fixture hangs from an elliptical, imitation-beamed ceiling. The trim is of oak, the walls below the plate rail being paneled with strips of the same material.

The kitchen is separated from the dining room

by a swinging door. The floor in this, as well as the bedrooms, is of white pine, well laid and without blemish. The trim is also of pine, the wall below the chair rail being painted in ochre while above it is white. This kitchen has many conveniences, notable among which is a small door in the east wall opening onto the back porch through which the ice may be placed in the box without the necessity of the iceman coming into the kitchen. Opening onto the back porch, and immediately at the head of the stairs, may be found a built-in chamber for housing the garbage can. We hear so much about "swat-the-fly" campaigns, but here is an instance where the fly has been put to rout without the beating of drums and the blaring of trumpets. This chamber is thoroughly sanitary, being lined with white enameled sheet iron. It also has a cast-iron door which may be shut tight at all times, a most welcome provision for hot summer weather.

Next to the kitchen is the bath room, which is a surprise to all who visit this home. Considering the total cost of the building, this room is a marvel of conveniences and finish. The floor is laid in mosaic tile, while the walls are plastered, that part below the chair rail being marked off in imitation tiles. Above the chair rail, the walls are enameled white over a sand float finished plaster wall, the woodwork also being enameled white. The plumbing fixtures are modern in every respect, the most notable feature being a shower bath. In the west wall and next to the floor, is a clothes chute leading to the basement through which all soiled clothing may be thrust to a receptacle below where they will be ready for the attention of the housewife and her helper, thus eliminating many steps and the carry-

THE SOUTH SIDE OF THE HOUSE BEFORE THE EXTERIOR COATING OF STUCCO HAD BEEN APPLIED

CORNER OF THE BASEMENT SHOWING CONDUITS AND THE HOLLOW WALLS LAID UPON THEM

ing of a cumbersome basket or bag to the basement on washday.

The bedrooms, of which there are two, are located on the south side of the building. The floors are of white pine, well laid, stained and varnished. The larger bedroom has a double window while the smaller back room has one window in both its north and south walls. Between the bedrooms is located the stairway to the basement.

Nor has the basement been neglected in the planning of this model home. With a well drained cement floor, electric lights and stationary tubs it compares well with the rest of the house in convenient arrangement. Here is also located the hot-air furnace which heats the home in cold weather. A cast-iron coal chute in the east wall permits the coal to be thrown into the basement without injuring or discoloring the wall.

One of the most notable features of the exterior of the house is the spacious front porch which is

it cost only \$2,755 would have little interest for the contractor, simply because there are thousands and thousands of small homes being built of that material throughout this country for the figure named and even less. But the walls of this house are of masonry—hollow clay building tile—and this is what makes the home here shown worthy of more than a passing interest.

It is unfortunate that the merits of hollow tile are so little known among builders. While the fact that this material makes a building that is perfectly dry at all times, warm in winter and cool in summer, one that requires little or no repairs, should be of vital interest to the contractor because it makes satisfied clients, there are advantages that appeal more directly to his pocket-book than perhaps those above mentioned. Just one instance of the saving to the contractor that may be effected through the use of hollow tile is graphically illustrated in the following comparison of labor costs

Building a Modern Low-Cost Bungalow of Hollow Tile Construction—Various Constructive Details

largely built of hollow tile, thus demonstrating the flexibility of that material. This porch has cement steps and a cement floor, and is screened in for summer living. A large electric light has been placed in the ceiling which is built of siding dressed and match, beaded center and side. When finished, this ceiling was varnished.

The roof is constructed of 2 x 4 in. tie beams, spaced 16 in. apart on centers, and 2 x 6 rafters, spaced 24 in. on centers, over which was placed car siding to form a sheeting. Green composition, fire-proof shingles were then laid over this sheeting. The roof is drained with galvanized iron gutters, while flashing, valleys and ridges of the same material have been laid so as to make a thoroughly waterproof roof. A red pressed-brick chimney topped with a stone cap finishes off this part of the building.

Had this house been built of frame, the fact that

which were carefully compiled by a reliable authority.

The average mason will lay about 1500 brick in a day of eight hours, while he will lay 250 8 x 8 x 12 in. hollow tile. The latter unit being considerably larger than a brick, requires one-fifth as much mortar for laying. Figuring the cost of mason labor at \$6 per day with the assistance of a helper who divides his time between two masons, a comparison of labor costs between the two types of wall construction is as follows:

BRICK		HOLLOW TILE	
	Per Day		Per Day
Mason	\$6.00	Mason	\$6.00
One-half helper	1.80	One-half helper	1.80
Mortar	2.00	Mortar	.75
	\$9.80		\$8.55

1,500 brick will lay 75 ft. of 12-in. wall at a cost of \$9.80

250 tile will lay 125 ft. of 12-in. wall at a cost of 8.55
75 ft. of brick at \$9.80 amounts to \$.13 per foot.
125 ft. of tile at 8.55 amounts to .068 per foot.
Difference in cost of brick over tile, \$.062 per foot.

In these figures is contained the reason why the bungalow shown herewith could be built of tile for the low figure mentioned, which is nearly identical

Building a Modern Low Cost Bungalow of Hollow Tile Construction—Porch View Before Stucco Was Applied

to what this same building might have cost had it been built of frame.

The itemized bid of the successful contractor follows, and although there might have been a few extras, the owner states that the work was done for approximately the total shown below:

Masonry	\$555.00
Carpentry	900.00
Excavating	25.00
Plastering, inside	150.00
Plastering, outside (stucco)	120.00
Painting	125.00
Sheet Metal	40.00
Plumbing	275.00
Heating	150.00
Mosaic Tile	25.00
Fixtures and Hardware	150.00
Electric Wiring	40.00
Miscellaneous	200.00
Total	\$2,755.00

Another interesting fact about this house is that in building it the contractor who did the work “tackled” his first job of hollow tile and, as may be seen, turned out a very creditable piece of work. The next time he undertakes a job in which this material is used, there is no doubt but that he will finish with a larger profit and with a better piece of work, made possible by the experience gained from his first job. And so it may be seen that long experience and specially trained masons are not required for the successful performance of work involving the use of hollow tile, although in this, like in all other lines of endeavor, experience, skill and specialization make for still larger profits.

At Sacramento, Cal., the brick contractors met recently at a dinner, with D. A. Cannon as toastmaster, and after exchanging views on trade conditions, it was decided to form an organization, preliminary action being taken toward that end.

Shrinkage in Tenement House Construction

One feature of the local building situation and one which may be traceable in large measure to the high cost of structural materials is the effect upon tenement house construction as reflected in the statistics covering the first three months of the current year. During this period, according to the Tenement House Department, there were 400 apartment houses planned, costing \$14,822,000, as against 498 houses, costing \$18,124,950, in the first quarter of last year.

In the Borough of Manhattan there was a decrease of 10 per cent; in the Bronx 44 per cent, in Brooklyn 31 per cent and in Richmond 50 per cent, the Borough of Queens being the only one of the five constituting Greater New York to show a larger volume of tenement house construction than in the corresponding period a year ago.

The following compilation from the records of the Tenement House Department of tenements projected during the first quarter ending March 31, 1916, and a comparison with the first quarter of 1915, shows at a glance the current production of housings in all boroughs:

	Bldgs.	Rooms	Est. Cost
Manhattan—			
1915	50	7,200	\$5,480,500
1916	45	5,899	4,943,500
Bronx—			
1915	155	13,600	6,563,250
1916	87	8,297	4,250,000
Brooklyn—			
1915	255	13,773	5,380,200
1916	176	10,474	4,379,500
Queens—			
1915	36	1,761	688,500
1916	91	3,476	1,244,000
Richmond—			
1915	2	29	12,500
1916	1	17	28,163

The better showing of the Borough of Queens is no doubt due in large measure to the comparative low price of land and the prospects of an advance in property when the new subways are in operation.

A study of the figures above leads to the conclusion that while the drift of Manhattan is toward larger units and bulky rentals, the other boroughs

The Appearance of the Completed Cottage Looking Toward the Front Entrance Steps

are providing the housings for the masses, with whom \$25 is the average maximum monthly rental they can conveniently pay.

According to the Bureau of Statistics and Information of the New York State Department of Labor, there were fewer unemployed in February, 1916, than in any other February in the last four years, except in the year 1913.

How to Estimate Wall Board Work

Accurate Measurements Essential—Brief Specifications—Applying the Panels—Some Figures of Cost

By JOSEPH A. POESL

EVERY contractor is well aware of the customary inaccuracy of estimates in the building trade. The trouble lies mainly in the tendency to guess at quantities and measuring by the estimator. The only way to get accurate estimates is by careful measuring, for even expert builders often go amiss when they rely so absolutely upon the guesswork of which they usually feel so proud.

It is doubly essential that careful measuring and estimating be practiced in connection with wall board, due to the comparative youth of the industry itself and the lack of general knowledge of it, unlike lath and plaster. The carpenter has just about been educated to accepting the very nearly standardized method of construction which the manufacturers of wall board have been advocating for years. Only several years ago, when wall board was not so well known as it is to-day, carpenters

Fig. 1—Outline of a Dining Room

as chair rail and picture moldings. Use 2 x 2 or 2 x 4 in. hemlock for headers.

To apply panels to walls, begin at top in center of panel; put in brads and then nail edges. For ceiling, first nail should be driven in center of panel, followed by rest of brads and nails on edges.

Nail every 6 or 8 in. to intermediate studs and joists; on edges, every 3 in. and $\frac{3}{8}$ in. from edge.

For intermediate nailing, use 1 in. 16-gage brads. These to be slightly countersunk for stopping. Use $1\frac{1}{8}$ in. 16-gage flat-head nails for edges.

After decorating with any kind of good paint,

Fig. 2—The "Layout" of the Dining Room

How to Estimate Wall Board Work

looked disdainfully upon and cast aside the instructions which the manufacturers religiously furnished with every order to insure satisfaction to the user. As a result the carpenter came to grief. But what did he do? Merely condemned the board, not for a moment considering himself the real cause of the trouble.

Now, the estimator should be able to figure up the dimensions of all materials to be used in wall board work, know the cost and possess a thorough knowledge of the details of this type of construction. So, for the benefit of all those who have had little experience with wall board, I give brief specifications for wall board construction.

Studding and joists to be evenly spaced; preferably 16 in. or 24 in. on centers.

Headers must be provided wherever necessary, so that all edges of every panel can be nailed; also at top edge of baseboard and behind such moldings

cover the joints with finished decorative strips of wood. These strips should never be less in size than $\frac{3}{8}$ x $1\frac{1}{8}$ in.

Over old plaster follow above instructions, nailing directly into the plaster and lath without regard to location of studs or joists.

On brick or concrete walls, put on 1 x 2 in. hemlock furring strips in the manner of studs and headers and apply as specified in the foregoing.

Although the fundamentals of wall board construction are pretty well established, improvements are constantly being made to reduce the labor item, which is a big factor in the cost. For instance, the usual way of putting up wall board is for the carpenter to measure up a panel, cut it to fit, if necessary, and nail it to the studding of joists. There is much lost motion in this process. The bricklayer does not carry up the bricks he uses—a laborer relieves him of this necessity. He, the high-priced

mechanic, is always kept well supplied with all his requirements by the laborer—the cheap man. This means less waste motion and closer to 100 per cent efficiency.

The same applies to wall board. A first-class man should measure, lay out the work and fit the panels, while unskilled, or apprentice workmen do the cutting, nailing and other things that do not require expert workmen.

What you want to do first when you get a set of plans to figure on, is to see whether the architect has supplied plans for paneling the rooms. If not, it is necessary that you do so before an estimate can be made, for in a wall board room the panel arrangement is as vitally important as the location of doors and windows. In an article in the February issue of THE BUILDING AGE I gave suggestions for wall board paneling which would be of assistance in a case like this. It will help you to work out economical as well as attractive arrangements for the various rooms.

I will make use of the practical example, ex-

required, keeping ceiling and walls separated for convenience later on when applying the board.

Ceiling		
5—32 x 84.....	98 1/4	
5—32 x 72.....	80	
Walls		
12—32 x 72.....	192	
4—32 x 156.....	138 1/2	
1—48 x 120.....	40	
		544 sq. ft.

Most wall board is sold at about 3c. a square foot delivered, which will bring the cost of the requirements of this room to \$16.32.

The nails needed to apply this board are: 6 lb. of 1 1/8 in. flat-head nails and 1 lb. of 1 in. 16-gage brads. Both at 5c. a pound, come to 35c.

One man can put up the wall board in about five hours, figuring that an average workman can put up a trifle more than 100 sq. ft. in one hour. This, at 50c. an hour, will mean \$2.50 for the application.

Then ascertain how much molding and deco-

Fig. 3—Panel Treatment Suggested for Dining Room

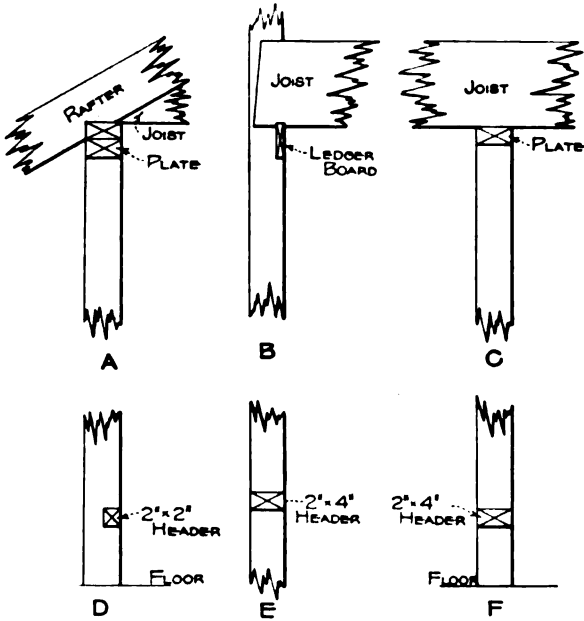

Fig. 4—Suggested Details of Wall and Partition Construction

How to Estimate Wall Board Work

plained therein as the most convenient means of showing how to estimate wall board work.

Suppose we had a dining room, as in Fig. 1, on which an estimate was desired. We first lay it out as in Fig. 2, and design a panel treatment as in Fig. 3. Observe that a plate rail and crown molding are specified in addition to the regular decorative strips.

Knowing just where each panel is to be located, we can readily ascertain how many headers will be needed, assuming the studs and joists are 16 in. on centers. One row will come at the top of the base-board and one behind the plate rail. The wall plate and ledger board will answer for a header for the crown molding. On the ceiling a row will be inserted between the joists at the ends of the room and where the two panel joints cross the room.

The labor and material cost of one 2 x 2 in. header 14 in. long is about 2 1/2 cents; and as the room takes 76, the cost of headers will come to a total of \$1.91.

We now make a list of the panels that will be

rative strips will be necessary. Of the crown molding 55 lin. ft., of the plate rail 40 lin. ft. and of the decorative strips 200 lin. ft. will be required. The first, at \$2.25 a hundred, comes to \$1.24; the second, at \$4.00, comes to \$1.60; and the last, at \$1.50, comes to \$3.00, making a total of \$6.85 for woodwork without labor.

The labor of application will figure to about \$4.60, assuming that the cost to apply crown molding is about 2c. a foot, three-member plate rail 5c. and decorative strips, 3/4c.

Recapitulating the figures we have the following:

76 headers, 2 x 2 x 14-in., complete, at 2 1/2c.....	\$1.91
544 sq. ft. of wall board at 3c.....	16.32
6 lb. 1 1/8-in. flat head nails at 5c.....	.30
1 lb. 1-in. brads at 5c.....	.05
55 lin. ft. 4-in. three-member plate rail, pine, at 4c....	1.60
40 lin. ft. 3 x 2 1/4-in. crown molding, pine, at 2 1/2c....	1.24
200 lin. ft. 3/4 x 2 1/4-in. decorative strips, pine, at 1 1/2c..	3.00
Labor:	
Wall board	2.50
Moldings	4.60
Total	\$31.42

The labor has been figured at \$4.00 a day of eight hours. Sometimes a 2 x 4 in. header is used where

it can do duty on both sides of a partition. This is at the top edge of the baseboard and where the frieze line on both sides is at the same height. When a 2 x 4 in. header is used figure the cost at 3½c. apiece. However, half of this must be given to both of the rooms on the opposite sides of the partition. This reduces the cost of each header to 1¾c., and therefore it is well to take this advantage wherever possible. In Fig. 4 is shown, at "D," the common header which is used for outside walls; for partitions where the frieze line is at different heights, or a wainscot is on the opposite side, and for ceilings, Fig. 4 also illustrates how the roof plate, partition plate or cap, and ledger board take the place of headers.

Exhibit of Arkansas Soft Pine

Regarding some of the attractive exhibits at the Complete Building Show recently held in the city of Cleveland, Ohio, and which were referred to in the April number of *THE BUILDING AGE*, we desire to state that the display shown on page 37, representing the model of a New England cottage built of Arkansas soft pine, was the individual exhibit of the Arkansas Soft Pine Bureau, and not of the Southern Pine Association, as might be inferred from the caption to the half-tone engraving. A portion of the larger cottage in the exhibit shown partially completed indicated the proper frame construction when using Arkansas soft pine. The feature of the display of the Southern Pine Association which occupied space with the Bureau was creosoted wood blocks, etc.

New Building of Interest to Sportsmen

It is expected that work will begin about the middle of May on the eleven-story building which is to occupy a plot 100 x 100 ft. on the corner of Madison Avenue and Forty-fifth Street, New York City. The plans, prepared by architects Starret & Van Vleck, call for a structure in the Italian Renaissance style of architecture and estimated to cost, when completed and ready for occupancy, in the neighborhood of \$1,000,000. The exterior will be of limestone for the first two stories, surmounted by a shaft of light colored pressed brick, with terra cotta enrichment beginning on the tenth floor.

A novel feature will be the roof, the parapet walls of which will extend upward, completely concealing the usual roof fixtures, so that from the street the appearance will be very much that of an extra story. On the roof will be a fly-casting tank and camping equipment, and adjoining the pent house will be a rendezvous for guides and sportsmen, fitted up like a lodge in the Adirondacks, with a log interior, a great stone fireplace at one end, a wide porch on the side and hickory furniture. Here hunters may meet their guides, and with the assistance of maps and other information at hand, plan their trips to the woods, the whole scheme being designed to facilitate the booking and outfitting of those bound for the wilds.

In the basement will be located one of the most unique features of this structure—sound-proof rifle

ranges. Here sportsmen may try out their rifles and pattern their shotguns. It will be possible to hold target matches in these armored ranges, constructed to admit of firing the highest power rifles with safety and without noise to those outside.

The first seven stories will be used for various sporting goods departments by a well-known concern in the city, and the storeroom on the street floor will have a 21-ft. ceiling. The floor will be of Travertine stone and the walls of limestone. In connection with the show windows many special accessories will be provided, such as running water and tanks to permit the building of mountain scenes in which live fish may be seen and marshes in which live mallards and teal. Special lighting will also be provided for the reproduction of night scenes around the campfire.

Single Inspection of Building Construction in New York City

The bill providing for single inspection of building construction in New York City was passed by the Senate and Assembly on April 12 and as it is an Administration project it is reasonably certain that it will receive the approval of Mayor Mitchell. This will end the confusion and overlapping of orders during the erection of buildings which have caused no end of expense to the real estate interests of the city and retarded in many instances the completion of important building improvements.

The new law creates a Board of Standards and Appeals, to consist of the fire commissioner, five superintendents of buildings, the fire chief, and six other members to be appointed by the mayor, consisting of an architect, a structural engineer, and a builder, each of ten years' experience, and one an architect or structural engineer of fifteen years' experience.

This board is given power to make rules and regulations, inspect buildings, and exercise with respect to buildings situated in the city of New York the same powers as are conferred upon the Industrial Commission by Chapter 719 of the Laws of 1915.

A Board of Appeals, composed of the fire chief and the six appointive members, is also created, to whom is given the right to review a decision of the Board of Appeals by a writ of certiorari.

The fire commissioner is given power to issue orders in conformity with the Building Code, Labor Law, and the rules of the Board of Standard Appeals, and to enforce all laws and ordinances in reference to the use and occupancy of buildings, except tenement houses.

The law is to become operative on October 1.

A sixteen-story office and store building has been planned for erection in West Thirty-seventh Street, New York City, the architect being William H. Gompert, 171 Madison Avenue, New York City.

The fire losses in the United States and Canada in March were, according to the *Journal of Commerce*, \$38,680,250, against \$18,786,400 in March, of last year.

Apartment House for Four Families

A Popular Style of Multiple Dwelling Having
the Appearance of a Commodious Private House

MANY of our readers are likely interested in the design and arrangement of four-family houses, and therefore the study which we illustrate herewith, but which in its external aspect has much the appearance of a large private dwelling, will command their attention. There are twenty rooms in the building, and on another page we show a half plan of the first floor clearly indicating the general arrangement, together with a half plan of the second floor. It will be seen that each family has a commodious living-room, a dining-room, a

tacks. Over the felt were placed furring strips, to which expanded metal lath was secured with 2-in. nails placed 6 in. apart. The sheets of metal lath were lapped in both directions and securely tied together by weaving wire in and out through the lapped meshes, thus making a continuous reinforced slab. All corners were wrapped with American Steel & Wire Company's fabric, lapped 4 in. over the expanded metal lath.

On this lath was applied the base coat of stucco $\frac{3}{4}$ in. thick, composed of one part Portland cement

General View of Four-Family Apartment House—Designed by Rex D. Weston, Los Angeles, Cal.

kitchen, two bedrooms and a bathroom, with a screened porch inclosing the wash trays and which may be utilized as a laundry.

The exterior walls of the building are of stucco and the latter was applied by means of what is known as the cement gun, that is, the plaster or stucco was blown on to the wall by means of compressed air; the dry cement, sand and water being mixed as they were blown from separate tubes. The exterior wall studs were first covered with 1 x 6 in. sheathing put on diagonally and then covered with 5-lb. waterproofing roofing felt lapped like siding and secured to the sheathing with large-headed

to $4\frac{1}{2}$ parts coarse, well-graded sand, and 10 per cent hydrated lime as a permanent waterproofing, all being applied by means of the compressed air gun as above stated.

The second coat was applied by hand and consisted of one part of Medusa white Portland cement, two parts of white sand and 12 per cent of hydrated lime left in as a sand finish. This stucco was kept wet for about three days to insure proper curing and bonding of both coats. We learn from the architect that it has produced a job without cracks or breaks, "thoroughly monolithic and everlasting."

The first floor joists are 2 x 8 in., the second

floor joists 2 x 10 in. and the ceiling joists 2 x 4 in., all placed 16 in. on centers.

All floor joists are covered with 1 x 6-in. surfaced sub-flooring, on which was placed a heavy layer of waterproofing felt. The finish floor of the main room is $\frac{7}{8}$ x 2 in. square, quarter sawn, tongued and grooved oak flooring, with the exception of the front and rear porches, which are covered with 1 x 4-in. tongued and grooved pine flooring. In the

The entrance to the building is prominent and gives a decorative architectural feature to the front façade. The paneled front door with glass side lights of small panes with segmental transom partakes of the colonial in style of architecture. The entrance is sufficiently recessed to form with the projection of the entablature over the columns, a protection from the elements.

The large casement windows furnish an abund-

Elevation of the Fireplace in the Living Rooms of the Four Apartments

Apartment House for Four Families—Floor Plan and Various Constructive Details

partition between the apartments on the first and second floors was placed a layer of Natural Linofelt quilted between two sheets of strong building paper and the same was laid on the second floor joist.

The rafters are covered with 1 x 6-in. surfaced sheathing laid tight and over which was placed a heavy layer of waterproofing felt. This in turn was covered with No. 1 cedar shingles laid with an exposure of $4\frac{1}{2}$ in. to the weather.

ance of light and add materially to the pleasing effects produced.

The living room at the front of the house has a Colonial fireplace opposite the entrance doorway, the design being in keeping with the surroundings. The fireplace is constructed of buff colored brick with Colonial mantel shelf. The French doors leading from the dining-room into the balcony at the side are extra large, and it is possible to convert.

the balcony into an open-air sleeping porch if so desired. Both the living and the dining-rooms have polished hardwood floors and woodwork finished in white enamel. The doors and trim are mahogany. The electric fixtures and hardware are of a silver and bronze combination, but all harmonizing with the general scheme of interior decoration.

The center of the kitchen is but a few steps from the dining-room and contains built-in cupboards, sink and breakfast nook, which is nothing more than a recess with table and seats on either side as indicated in the detail shown herewith. The drainboard of the sink is of sanitary composition. On one side of the sink is a deep cupboard for dishes and on the other side a shallow cupboard for supplies, etc. Back of the kitchen is a screened porch containing wash trays, already referred to, and

from the upper porches the rear stairway leads down, all being inclosed and separate from the apartments on the first floor.

The two large bedrooms shown at the rear are well lighted and ventilated and are finished in white enamel with paper walls and tinted ceilings.

The bathroom is finished in white enameled woodwork and smooth plaster wainscoting extending up to the top of the doors. The floor is of tile with a tile base around the room. The bathtub is built-in with tile on the front running from the rim of the tub to the floor.

The four-family house here shown was erected in accordance with drawings prepared by Rex D. Weston, 507 Chamber of Commerce Building, Los Angeles, Cal., and cost complete \$6,950, the structure having been erected during the past summer.

Bevels for Rafters and Hoppers

A Method Embracing Every Possible Condition the Carpenter Is Likely to Encounter in His Work

BY ALVA COLE, C.E.*

IN view of the discussion which has been appearing recently in the columns of this paper I present herewith a method of finding the bevels and lengths of rafters and boards for roofs and hoppers that embraces every possible condition which may come to the carpenter. The corner of the building or hopper may be square, obtuse or

based on established principles of what is known as descriptive geometry.

The several diagrams, Figs. 1 to 9, inclusive, represent the different conditions that may prevail; but only one diagram is necessary for any particular job to be done, and the conditions on that job will decide which diagram must be used. All the

Bevels for Rafters and Hoppers—Diagrams Showing Different Conditions That May Prevail

acute angle; each corner may be different from the others, and the pitch of roof or slope of hopper may be flat, medium or steep; in fact, any shape bounded by straight lines, and of any slant is easily executed. Every required length and bevel can be found easily and with accuracy, depending upon the care and skill of the man who prepares the working diagram. The same theory always applies and is

diagrams are lettered alike, and to use this method we proceed as follows:

Draw lines WAC and CS to represent the sides of a plan of building or hopper at the corner to be constructed, as at C ; which may be exactly 90 deg., or square, as in Figs. 1, 2 and 3; it may be greater than 90 deg., or obtuse, as Figs. 4, 5 and 6; or it may be less than 90 deg., or acute, as Figs. 7, 8 and 9.

Bisect the angle at C by the line CB ; then the

*Superintendent of Construction, Q. M. Corps, U. S. A., Honolulu, T. H.

angle $B C A$ is equal to the angle $B C S$. Draw $A B$ at right angle to $W C$. This line can be drawn from any point on $W C$; but, as will be seen presently, it will be best to select a point on $W C$ so that $A B$ will be exactly 12 in. in length.

Draw $B R$ at right angle to $A B$ and make it equal to the rise of the roof. If $A B$ is 12 in. in all the figures shown, then $B R$ will be 8 in. for $1/3$ pitch; 12 in. for $1/2$ pitch; 16 in. for $2/3$ pitch, and so on. Therefore, make $A B$ exactly 12 in. and $B R$ any length that may be selected to represent the rise of roof in 1 ft. of run; or the height of the side of hopper to be constructed.

Draw $A R$, which is the exact length of common and jack rafters for 1 ft. of run. Also, it is the pitch of roof, or the slope of side of hopper.

Draw $R O$ at right angle to $A R$, and extend $A B$

and accurately the length of each line in the diagram and mark it in plain figures thereon. Second, always remember that if a hip roof is inverted it will become a valley roof, and a valley roof is a hopper. Third, the various bevels required for a hip roof are exactly similar to those required for a valley roof and for a hopper. Here they are, all in a nutshell.

To frame common rafter take $A B$ on the blade of the square and $B R$ on the tongue; mark by the blade for level cut and by the tongue for the plumb cut. The level cut on hip jacks and the plumb cut on all jacks will be the same as for common rafter.

For bevel across edge of jack to fit against hip: Take $A R$ on the blade and $A C$ on the tongue; mark by blade.

To frame hip rafter (or valley), take $C B$ on the

Bevels for Rafters and Hoppers—Diagrams Showing Different Conditions That May Prevail

to O . Draw $O M$ at right angle to $B O$. Extend $C B$ to meet $O M$ at M . Make $C S$ equal to $C A$, and draw $S B$. Now $A B$ and $S B$ represent the seats of first common rafters each side of the hip rafter shown by the line $C B$.

Draw $B H$ at right angle to $C B$ and make it equal to $B R$; draw $C H$, which will be the exact length of the hip rafter for 1 ft. of run of the common rafter.

Draw $C P$ at right angle to $C B$; extend $R B$ to P ; then the line $R B P$ will be parallel to the line $W A C$, and be an extension of the projected plan of the ridge board of the roof.

Use a good steel square and proceed to lay out the work as follows: First, measure very carefully

blade and $B H$ on the tongue; mark by blade for level cut and by tongue for plumb cut. The distance between marks will be the length of hip for one foot of run of common rafter. To find the total length of hip rafter multiply the length just found by the number of feet in the entire run of the common rafter.

To find the bevel for hip to fit against side of ridge board, or to fit the "boot-jack" at top end of hip against the corner formed by the angle of ridge board, take $C H$ on the blade and $C P$ on tongue; mark by the blade. This same bevel will be required at bottom end of hip to receive the fascia nailed on ends of rafters; reversed "boot-jack."

To find the cut across face of hip rafter at the

overhang to receive the fascia board, draw Bf so that the angle BfR will represent the angle cut on lower end, or overhang, of common rafter; draw fi parallel to WAC ; draw in parallel to BH ; draw nB . Then the angle HnB cut on lower end of hip will correspond with angle RfB cut on the lower end of common rafter.

In all of the foregoing the work has been laid out on the hip rafter with square edges. If it is desired to "back" the hip rafter proceed as follows: From any convenient point on CH , as at x , draw xv at right angle CH ; through v draw de at right angle to CB . Make vt equal to vx ; draw td and te . Then the angle dte will be the shape for back of hip. Set the bevel-square to angle dtv and apply it to the side of hip timber and cut off the corner to center line of hip. For a valley rafter, cut entirely across the thickness of timber and spike two pieces together, forming a true valley, or trough; dte inverted.

To find bevel across face of roof board, take AR on the blade and AC on the tongue; mark by tongue. This is, also, the exact bevel required for a hopper.

To find bevel across edge of board, take RO on the blade and OM on the tongue; apply the square to edge of board and mark by tongue for a miter bevel; for hip or valley or hopper.

For a butt joint proceed as follows: Take RO on the blade and AC on the tongue; mark by tongue for bevel required. The long side will be the upper face of board at valley or for a hopper; while the short side will be the upper face of board at hip; or for a hopper when it is inverted; lapping over the other board.

If the dimensions for the diagram are greater than the figures on the square, then take one-half of those dimensions, as in Paragraph 19; that is, take one-half of RO on the blade and one-half of AC on tongue, and mark by tongue. The bevels should be marked on the edge of a straight board and transferred to the work by use of adjustable bevel squares, or by templates carefully made. In the case of short pieces used in hoppers it will be impossible to use the steel square applied directly to the material; but for rafters and long boards it will be convenient to do so.

The Sanitary Handling of Timber

Results of Some Investigations by the U. S. Department of Agriculture Relative to the Storage and Decay of Timber

ONE of the most important problems confronting the lumberman is the storage and marketing of his product in as sanitary a manner as possible, both to prevent direct loss to himself through deterioration and to protect the consumer against many avoidable outbreaks of rot after the timber is incorporated into buildings. The investigations of the United States Department of Agriculture during the past two years have revealed many deplorable conditions in the storage of timber and coincident with them have disclosed many serious outbreaks of rot in important structures. While many of the latter cases may be due to faulty construction, particularly to insufficient seasoning of the timber before used and to the failure to provide for sufficient ventilation in basements, the fact remains that infected timbers placed in buildings are far more likely to cause trouble than sound ones.

One Cause of Rot

Poor ventilation favors rot by not allowing the timber to come to an air-dry condition quickly enough to prevent the development of fungi.

Since decay is due to the presence of wood-rotting fungi the obvious first principle is to render conditions about the lumber yard unsuitable for the growth of the organisms. This can be accomplished by attention to the following details:

Wherever possible storage yards should be on high and dry grounds—on mineral soil rather than filled-in debris.

The most careful attention should be given to the cleaning up of the yards; also greater care should

be taken in handling piling sticks and stacking lumber. Timber should never be allowed to lie, even temporarily, in close piles on the ground or on decayed tramways.

Pile Foundations

Very often pile foundations are altogether too low or are poorly constructed, not allowing sufficient ventilation beneath the stacks. Pile foundations should consist of timbers set on concrete or brick piers or blocked up at intervals with wood to a height of at least 18 in. from the ground. Such timber as enters into their construction should be either highly durable or else treated with some wood preservative.

Sound air-dry blocking cut from many of the low-grade species of timber having a good percentage of sapwood can be given a satisfactory treatment by heating in a tank at about 200 to 220 deg. Fahr. for 4 to 6 hr., then allowing to cool in the oil. The longer horizontal timbers can be given three coats of hot creosote at 180 to 200 deg. Fahr. at intervals of 24 hr.

According to the department, timber which shows any trace of decay should never be sold or accepted for building purposes, as even dormant fungi in dry timber can often start into active growth when placed under moist, comparatively warm conditions. Architects should see to it that only well-dried timber is employed and that beams and joists are never embedded in concrete or brick without allowing for ample ventilation at the ends by "boxing." Particular attention should also be paid to ventilating close basements.

A Small Country House of Five Rooms

A Frame Building with Exterior of Stucco on Metal Lath—Roof of Cypress Shingles

WE have taken for the subject of our colored supplemental plate this month a small house designed for a plot of ground having a frontage of 40 or 50 ft. The plan is compact and contains sufficient accommodations for a family of two adults and two children.

According to the specifications of the architect all foundation walls are to be of concrete 8 in. thick, supported on footings of concrete 10 in. thick and extending 6 in. each side of the walls above. All concrete is to be mixed in the proportions of one of cement to three of sand and five of broken stones.

The Framing Timbers

The framing timbers are to be of spruce with corner posts 4 x 6 in., girders 4 x 8 in., and plate 4 x 6 in. laid flat. The first tier of floor beams are to be 2 x 10 in., the second tier 2 x 8 in., all placed 16 in. on centers and strengthened with rows of 2 x 4-in. cross bridging placed 6 ft. apart. The studs are to be 2 x 4 in., placed 16 in. on centers and doubled at all openings. The rafters of the main roof are to be 2 x 8 in., and of the dormer roof 2 x 6 in., all placed 20 in. on centers. The porch girder is to be 2 x 8 in. and the porch floor beams 2 x 6 in.

The entire exterior frame of the building is to be covered with 1 x 9-in. hemlock sheathing laid diagonally, over which is to be placed a layer of good building paper. This in turn is to receive 1 x 2-in. furring strips placed 12 in. on centers, and to these strips is to be nailed the metal lath to which the stucco is to be applied.

The Exterior Stucco

The exterior stucco is to be two-coat work, the scratch coat to be at least $\frac{1}{2}$ -in. thick outside of the lath surface and to consist of one part cement, three parts sand and not more than 10 per cent lime putty. The first coat is to be applied under pressure and must be well scratched before it sets. The finish coat is to be $\frac{1}{4}$ in. thick and consist of one part cement, two parts sharp sand and three parts of pebbles for rough finish. The stucco is to be given a cream tint.

The roof is to be covered with red cedar or cypress shingles laid with an exposure of $5\frac{1}{2}$ in. to the weather and with a heavy joint every third course. All shingles are to be dipped in shingle stain. The chimney, which takes care of the furnace, the kitchen range and the open fireplace in the living room, is to be of brick, and have three flues lined with vitrified flue lining. Above the roof line the chimney is to be finished with stucco.

The exterior cornice, rails, brackets, trim, etc., are to be of white pine.

The floors are to be double on the first tier of beams, the under-floor to be 1 x 6-in. tongued and

grooved pine, while the finish floor is to be of $\frac{3}{8}$ x $2\frac{1}{2}$ -in. comb-grain North Carolina pine in the living and dining rooms. All other rooms are to have $\frac{7}{8}$ x 4-in. North Carolina pine floors.

Interior trim throughout the house is to be cypress for the living room, the dining room and the hall, and white wood for the bed rooms. All doors are to be of cypress.

The Layout of Rooms

An examination of the floor plans on the facing page shows the entrance to be through a vestibule containing a coat closet, the vestibule connecting directly with the living room. The latter contains a large stone fireplace with seat and bookcase, and from this room rise the stairs to the second story. The dining room opens directly into the living room, but may be shut off from it if desired by means of a screen.

The kitchen is of good size and contains sink, range, hot water boiler, wash trays, closet, stairway connection to the second floor and the flight leading to the cellar. Communication with the dining room is established through a large pantry which contains closets and space for refrigerator.

A cellar extends under the entire building and contains furnace room with considerable space for storage purposes.

The sleeping rooms on the second floor are well lighted and ventilated, the latter being greatly facilitated by reason of transoms over all doors. The bed room ceiling heights are 8 ft., the head room at the lowest point being 6 ft.

Between the two bed rooms and directly over the kitchen is located the bath room, its position being such as to require only one line of plumbing. The bath room is equipped with wash basin, shower bath and water closet.

The Trim

The trim in the hall, the living room and the dining room is to be brought to a smooth finish, filled with a good wood filler and stained and varnished, the colors to be selected by the owner. All trim in the bed rooms is to be enameled and the doors left natural. The side walls of the bath room are to be enameled and the ceiling left white.

The floors are to be brought to a smooth finish, filled and varnished, the first floor to have an additional coat of wax.

The exterior trim is to be painted three coats of white lead and linseed oil, well puttying the first coat.

All sheet metal work is to be painted on both sides before it is laid, and all leaders are to be of galvanized iron of a square neat design.

A good system of plumbing is to be installed with simple fixtures, using a galvanized iron sink, a two-

LONG ISLAND CITY, N. Y.

Plans and Elevations of the Small Country House Forming Basis of the Supplemental Plate

part wash tray of soapstone or enameled iron, and a 40-gal. galvanized iron boiler over the range. All the plumbing is to be exposed and all rough pipes to be painted with enameled paint.

The plumbing in the bath room is to be of the open type with a complete shower arrangement, the water closet to have china bowl and a low tank, and the washstand to have marble top and china bowl. All exposed pipes are to have a nickel-plated finish.

The hardware is to be of a bronze plate finish and match the lighting fixtures and hot-air registers.

The lighting is to be by means of electricity and gas. The living room is to have two drop pendants

of two lights each and the dining room one drop pendant of two lights each.

The house is to be heated by hot-air system with registers in all rooms except the kitchen, the installation to be such as to properly heat the building in zero weather.

The architect computes the cubical content of the house here shown as 20,796 cu. ft. and places the unit cost at 16 cents per cubic foot.

The total figures of cost are to include the contractors' 10-per cent profit.

This small country house of five rooms has been designed by Arthur Weindrof, architect, Long Island City, N. Y., or care of THE BUILDING AGE, 239 West Thirty-ninth Street, New York City.

Fruit Storage House for the Farm

A Few Details of Construction Which the Country Builder Will Appreciate—Total Cost \$500

BY JOHN L. SHAWVER

IT is possible that some of the readers of THE BUILDING AGE may be interested in a small storage house for the farmer who grows a few hundred bushels of apples a season. In most cases farmers depend solely on small cellars for the stor-

orchard of about twelve acres, and though only a small portion of it is bearing, the question of suitable storage was becoming important. As the nearest cold storage warehouse was 28 miles distant, it was expensive to transport thereto and to pay rental

Fig. 2—Plan of Second Floor

Fig. 1—Plan of Main Floor

Fig. 4—Dividing Panel—Scale 1/4 in. to the Foot

Fig. 5—Elevation of Foot Brace

Fig. 3—Cross-Section of the Building Showing Arrangement of the Bins

Fruit Storage House for the Farm—Various Details of Arrangement

age of apples, and if they grow a hundred or five hundred bushels of the finest of winter apples they are compelled to put them on the market before it becomes dangerously cold—that is, he places them on a market flooded with fall apples or he must store them in some warehouse more or less distant from the farm on which they grew.

The storage house here illustrated was erected on the farm of the writer in 1915. This farm has an

for five to eight months. This building has solved the problem in a very satisfactory manner.

The foundation walls are of concrete and those of the superstructure are made snug and tight by means of 6-in. flooring, over which is placed a heavy layer of building paper, and this, in turn, covered with novelty siding. The doors are double and the sash double glazed.

The structure is 24 x 40 ft. in plan and two

stories and attic in height. There are two cold storage rooms, each measuring 16 x 24 ft., as shown on the plan, Fig. 1. One is divided into small bins to accommodate different varieties, each bin holding about 150 bushels. These may be subdivided by means of portable panels 4 ft. long and 50 in. high, the panels being kept in position by foot braces, which may be placed at any point desired.

Details of the panels and braces are given in Figs. 4 and 5. If the bin has been made for, say, 80 bushels, and it is found that the variety is over-running the estimate, the bin can be increased to a capacity of 90 or 100 bushels, as the case may be, by the use of the dividing panels and braces.

The other cold storage room is intended for standard varieties of winter apples such as Baldwin or Greening, which may yield several hundred or a thousand bushels. After these bins are filled, a temporary floor may be quickly laid over the partitions, as indicated in the sectional drawing, Fig. 3. The remaining space is then filled with apples in crates.

The middle room, as shown in Fig. 1, is intended for grading and packing, but may also be used for storing early winter or late autumn varieties. For the present it is used for storing the power spray trucks and the cider mill.

Layout of Second Floor

Fig. 2 shows the arrangement of the second floor, where two large storage rooms are provided for boxes, crates and barrels. Between the storage rooms is a bedroom, 16 ft. square, which is of sufficient size for two beds, a table and chairs to meet the requirements of extra help at picking time. This room may be reached by means of a stairway or by a ladder attached to the wall near the outside entrance. A balcony walk connects the two storage rooms and passes in front of the bedroom. The open space in front of the balcony is for convenience in unloading boxes, crates, etc., into the storage rooms. The attic is used for ladders and lumber.

Five ventilators are provided at each end of the building. With the outside temperature ranging from 10 deg. below zero to 70 deg. above, the temperature in the fruit rooms may be kept at 30 deg. or 40 deg. without much difficulty. About 2 in. of straw is placed on the clay floor and this has provided such ideal protection that Maiden Blush, Wealthy and Munson Sweet were kept in fine condition to January. If zero weather should be likely to continue for several days a small coal oil stove is sufficient to maintain the necessary 30 deg. in these storerooms.

Provision is made for the use of ice in warm weather by means of a shallow pan of galvanized iron, 20 x 60 in. in size, placed on the temporary floor. On this pan from one to four cakes of ice may be placed, according to requirements.

The entire cost of this building, including labor and first-class materials, was \$500, this also covering two coats of paint and lightning rods.

Probably the queerest town on earth is Universal City, Cal., for it is a make-believe city with a population of 1500, all employed in the art of making moving pictures.

San Francisco Building Material Market

Our correspondent, writing under date of April 1, says: "The general building market has improved greatly since the end of the heavy rains, and in San Francisco and many neighboring towns there is more activity in new construction than for nearly two years past. This is in spite of the postponement of a great volume of work on account of the excessive cost of many materials. Figures were recently taken for the construction of an addition to a local hospital, the bids running considerably below half a million dollars, but the lowest was \$100,000 in excess of the estimate based on costs last year, and the job was held up. This is only one example of many that might be cited.

"Structural steel fabricators have raised their prices quite sharply, but not so much as might be warranted in view of the cost of the raw material, which costs about 4 cents per lb. out of stock. Rather large shipments, however, are coming in on old contracts, and construction is proceeding much more rapidly. It looks as if this would be rather a good year for concrete, for, though bars cost nearly as much as shapes, considerable economy can be effected in the tonnage used, and prices for rock, sand and cement have not changed much. In fact, contracts have already been let for considerable important concrete work.

"The cost of galvanized sheets has come to be practically prohibitive for building, and other materials are being substituted. More lumber is being used for barns and warehouses, which will in some cases be protected by asbestos or composition; and for roofing the patent compositions, asphalt and gravel, etc., are largely replacing corrugated sheets. Metal cornice work is also materially curtailed. Such cornices, because of cheapness, as well as immunity to earthquake damage, have been very popular in San Francisco. Now there is a tendency to use more terra cotta cornices or to change the designs, reducing cornice work to a minimum.

Sale of the "Tower of Jewels"

The "Tower of Jewels," which was one of the show pieces of architecture at the Panama-Pacific Exposition in California, has been purchased by a firm of pipe dealers, the members of which are considering the means of its disposal. The high prices of steel and lumber give big value to the materials that were used in the spire. It is said that in the tower are 2,000,000 ft. of No. 1 pine lumber, which would be marketable at a good figure. In addition the tower contains 2000 tons of structural steel.

The Tower of Jewels stands 433 ft. above the ground upon a solid concrete base with a surface of 300 sq. ft., and is said to have cost \$200,000.

Utilization of Exposition Materials

The big logs from the Oregon Building at the recent Panama-Pacific Exposition, which excited much admiration, are being used in Berkeley, Cal., to construct a home for R. W. Hawley.

Timbers from the Pennsylvania Building at the Exposition will form most of the framing material for a large apartment house in Oakland.

Design of Beams, Girders and Trusses*

A Series of Articles on the Above Subjects in
Which Only Arithmetic Is Used for the Calculations

BY ERNEST McCULLOUGH, C.E.

FOR irregular and unsymmetrical loading find the reactions as for a simple beam similarly loaded with concentrated loads, and the panel joint where the maximum moment occurs is the point of zero shear. From this point the loads run up and down the web members to the ends, instead of from the center panel, as in the case of uniform and symmetrical loading. For unsymmetrically loaded trusses the weight per panel is used instead of the proportion of weight (coefficient).

A truss being merely a skeleton beam a study of the manner in which the loads go to the abutments shows that the weight on each panel is really the shear on the panel. It is thus feasible and practical to consider the truss as a beam, and from the reaction at either end subtract in succession the loads on the panel joints until the point of zero

$$\text{The compression in } ef = \frac{14.14 \times 15,000}{10} = 21,750 \text{ lb.}$$

$$\text{The compression in } dc = \frac{14.14 \times 5000}{10} = 7190 \text{ lb.}$$

With the load considered as applied on the upper chord the tension in $gf = 15,000$ lb.; the tension in $ec = 5000$ lb., and the tension in $bd = 0$. With the load considered as applied on the lower chord the tension in $gf = 25,000$ lb.; the tension in $ec = 15,000$ lb., and the tension in $bd = 5000$ lb.

The compression and tension per panel in the chords $= \frac{Wl}{d}$, therefore compression in $eg =$ tension in $fh = 25,000$ lb., for the ratio $\frac{l}{d} = \frac{10}{10} = 1$.

The compression in $de =$ tension in $cf = 25,000$

Fig. 63—Shear Method for Obtaining Stresses in Truss

Fig. 64—Shear Method for Truss with Odd Number of Panels

Design of Beams, Girders and Trusses

shear is reached. In Fig. 63 is shown a truss with the shear diagram. The shear on $gh = 25,000$ lb.; on $ef = 15,000$ lb.; on $cd = 5000$ lb., the panel load being $10,000$ lb. concentrated at the joints. The skeleton truss lies on the center lines of the members, the panel length being 10 ft. and the height 10 ft. The length of a diagonal $= 14.14$ ft., so the

$$\text{compression in } gh = \frac{14.14 \times 25,000}{10} = 35,950 \text{ lb.}$$

Note in this series of articles no algebra is used. The rules are written in the modern way in the shape of formulas by using letters instead of writing in full words that are often employed. The words for which the letters stand are explained for every formula so that readers may in time understand how to read and comprehend formulas used by other writers. The actual computation is arithmetical and worked examples are given.—Editor.

*Continued from page 63 of the April issue.

$+ 15,000 = 40,000$ lb. The tension in $bc = 25,000 + 15,000 + 5000 = 45,000$ lb.

The object of the computations being to obtain the stresses so members may be proportioned the method above given of following the loads from joint to joint and obtaining the co-efficients for uniformly and symmetrically loaded beams, or of obtaining the shear at panel joints for unsymmetrically loaded beams is adequate and simple.

It can be proven that a truss is merely a skeleton beam by finding the shear and bending moment at each joint and then dividing the bending moment by the depth obtain the stresses in the chords, the web members carrying the shear. In Fig. 63 the end reactions each equal $25,000$ lb. Then M , at f , $= 10 \times 25,000 = 250,000$ ft.-lb.

M , at g , = 0, for the top chord rests on gh .

M , at c , = $(20 \times 25,000) - (10 \times 10,000) = 40,000$ ft.-lb.

M , at e , = $10 \times 25,000 = 250,000$ ft.-lb.

M , at b , = $(30 \times 25,000) - (10 \times 10,000 + 20 \times 10,000) = 450,000$ ft.-lb.

M , at d , = $(20 \times 25,000) - (10 \times 10,000 = 400,000$ ft.-lb.

Dividing the moments by the depth:

Tension in fh = compression in eg = $\frac{250,000}{10}$
= 25,000 lbs.

Tension in cf = compression in de = $\frac{400,000}{10}$
= 40,000 lb.

Tension in bc = $\frac{450,000}{10} = 45,000$ lb.

Fig 64 shows a truss having an odd number of panels. There is no stress in the dotted cross diagonals in the middle panel except in case of wind or rolling loads, or otherwise unbalanced loading. Coefficients may readily be written for uniform and symmetrical loadings for this case, or the loads may be followed from the point of zero shear in cases of unsymmetrical loading, or the shear method may be followed.

In Fig. 65 (c) is shown a truss with a sub-vertical and sub-diagonal at each end. Such an arrange-

Design of Beams, Girders and Trusses—Fig. 65—
(a) Truss with Non-parallel Chords; (b) A Bow Girder; (c) Truss with Sub-verticals

ment involves the consideration of an additional triangle in which half the weight is added to the load at b and is then carried to a , the other half being added to the load at c . This arrangement offers no difficulty when figured by the shear method but sometimes causes trouble and confusion when an attempt is made to trace out the loads from the middle panel, or point of zero shear.

Some trusses have non-parallel chords. The shapes vary from those higher at one end, as in Fig. 65 (a) to those approaching an arch form as at Fig. 65 (b). Part of the shear is carried by the

sloping chord. When the chord stress is found by one of the preceding methods it is the horizontal stress. For a sloping chord the horizontal stress must be multiplied by the inclined length and the product divided by the panel length, the result being the axial (longitudinal) stress in the inclined member.

(To be continued)

Is a Fruit Stall a "Building"?

A case recently came up in England where a man was summoned before the authorities "for not depositing plans; also for not giving notice to erect and for the use of improper materials." The borough engineer stated that the building was a light structure supported on iron standards, fixed into a concrete floor, which supported battens, on which were laid others, and over all was placed a tarpaulin. It had a complete front of wood, with movable shutters, dividing walls on either side formed the sides, and the building was braced to one of the walls so that it should not blow down in a storm."

Plans of a temporary building in a form which the council would approve had been deposited, but the work had not been proceeded with. The defendant stated that the structure was so fragile that the whole of it could be taken down in five minutes and re-erected in a similar time. He sold fruit at the stall, and was in the habit of taking it down every Sunday and cleaning the place. The walls were there before, and all that he had added were the uprights (which were placed in sockets in the concrete) and the rafters on which the tarpaulin rested.

Counsel for both plaintiff and defendant agreed that there was no legal definition of a building and the court came to the conclusion that within the meaning of the Public Health Act this was a building and agreed to state a case.

A Hillside Dwelling Scheme

Construction is about to begin on a fireproof community residence scheme on a large lot at Green and Taylor streets, San Francisco, on the steep slope of Russian Hill. The structure will consist of sixteen residences of 5 to 12 rooms each, so arranged as to give each a good share of the marine view. Each will have its individual entrance, approached by broken flights of steps, which will be varied by terraces and pathways through gardens. An electric tram elevator will also be built through the central court. Every room, it is said, will be an outside one, and all residences will be provided with either roof gardens or balconies.

The general architecture shows influence of the Pueblo style, which is well adapted to the hillside location. The main entrance will be through a lobby, the walls and ceiling of which will be of caen stone, floors and stairways of marble and doors, etc., of bronze. Ten individual garages will be a part of the structure. The property will be owned by a corporation, the plan being to have the stockholders own the various homes in the group.

Mortars for Brick and Stone Masonry

Brief Reference to the Chief Characteristics of the Ingredients Entering into Their Composition

BY W. H. HEFELFINGER

MORTAR for any kind of masonry is composed of sand, some cementing material and water, but the proportions of these materials and kind of cementing material to use depend on the kind, quality and purpose of the masonry. A thorough knowledge of the materials used in making mortar should first be acquired if one wants to make mortar durable and at the same time economical. The principal cementing materials used are Portland cement and lime. There are several special cements used in pointing stone, which I will describe later.

Portland cements are nearly all identical in chemical analysis and will meet the required specifica-

an impurity. Some limes contain as much as 35 per cent magnesium carbonate, which, of course, makes it a poor lime. These impurities in lime do not have any chemical action on the mortar, but simply act as adulterants like water does in milk; it simply takes so much more to get the same results. Since commercial limes in different parts of the country vary from 65 per cent to 97 per cent pure, you can readily see why it is necessary to have different mixtures for different limes. Good lime should possess the following characteristics:

1. Freedom from clinkers and cinders and with only a small percentage of other impurities.
2. It should be in large lumps, free from dust.
3. It should slake very readily in water, forming a very fine, smooth paste without residue.
4. It should dissolve in soft water.
5. It should increase from $2\frac{1}{2}$ to 3 times in bulk.

Poor limes may be used for mortar for brick and stone work, but they should not be used in plaster-

*Pat for testing
Portland cement.*

Fig. 1—Glass Plate for Testing Cement — One-half Full Size

Fig. 2—Diagrams Showing How Sand Grains Should be Graded

Fig. 3—Testing Sand for Cleanliness. Sand Should Be Washed if it Contains Over 3% of Clay, Loam or Vegetable Matter

Mortar for Brick and Stone Masonry

tions of the "American Society for Testing Materials," so one is safe in using any well-known brand of Portland cement for making mortar, as long as it is in good condition and is not too old. If you care to test the cement, however, the most practical way is to make a pat of neat cement according to Fig. 1, keeping it in a moist place for twenty-four hours, then boil it for three hours. If it shows no signs of disintegration, it is all right. This is a very reliable test.

Lime differs from cement in that it is a natural product, while Portland cement is an artificial one. We have to take lime as it comes, its quality depending upon the purity of the limestone from which it is made. Lime is made by calcining limestone, which is mainly calcium carbonate and magnesium carbonate, the latter being classed as

ing. Lime should never be kept in a damp place as it absorbs moisture from the air and soon becomes useless as a building material. For best results lime should be slaked as soon as possible after it is burned. Slaked lime will keep indefinitely if kept moist. Hot mortar dries out very quickly and shrinks considerably, causing cracks in the mortar joint. It is far better to let it cool for at least twenty-four hours before using, and there is no reason why this should cost more or take more time if the work is planned ahead.

Hydrated lime, a specially slaked quicklime, is used very extensively in the United States for plastering and masonry, especially in cement lime mortar. This lime keeps well, is easy to handle and makes good strong mortar.

Sand is used in cement mortar to cheapen it and

prevent shrinkage. In lime mortar it adds strength in proportions up to three of sand to one of lime. After that, any increase of sand weakens it. Sand is an aggregation of loose, incoherent grains of crystalline structure, derived from the disintegration of rocks. It is obtained from the seashore, from beds and banks of rivers and from land deposits. Sea sand is not very desirable because the alkaline salts attract and retain moisture, which acts on certain soluble substances in the lime and brick, causing them to appear on the surface in form of white powder, commonly called whitewash, and is very noticeable on red brick work. River sand is generally composed of rounded grains and is very likely to contain clay and other impurities in form of vegetable matter, which may, however, be washed out. Pit or bank sand grains are usually angular in form and of good size, but contain considerable clay and loam, which should always be washed out before using in the best work. Marble dust, which is obtained from marble yards, is often used in laying stock brick where fine joints are necessary. Stone screenings are used in making mortar where a heavy joint is used and is obtained by screening the fine stuff from crushed rock for concrete work.

Recent Tests and Experiments

Recent tests and experiments have proven the following facts in regard to sand:

1. Sharp grains are not necessary.
2. The quality of sand is governed by the gradation of size of grains from coarse to fine.
3. Loam and clay are not always injurious; that is, a small amount of clay with coarse sand would be beneficial, especially in a poor mixture, but in fine sand would be injurious, particularly in a rich mixture.
4. Clay and loam are injurious to rich mixtures.
5. Dry sand is heavier than wet sand.
6. Coarse sand and cement make a denser mixture than fine sand and also require less water.
7. Coarse sand is heavier than fine sand with ordinary amount of moisture.
8. A sand in which the grains are graded from coarse to fine, with coarse predominating, makes the densest and strongest mortar.

When good sand is required, specifications should read as follows: Sand should be composed of grains that are hard, of crystalline structure, free from clay, loam, vegetable matter and salt. It should consist of a mixture of coarse and fine grains with the coarse grains predominating; not more than 20 per cent should pass a No. 50 sieve and not over 5 per cent a No. 100 sieve.

Fig. 2 illustrates how sand should be graded: "a" shows 200 cubic centimeters of sand that has passed $\frac{1}{4}$ -in. sieve; "b" shows the amount passed a No. 50 sieve and amount retained; "c" shows the amount that passed a No. 100 sieve and the amount retained. You will notice a slight difference in total amounts when measured separately and when measured together. That is because some of the finer grains fill the voids in the larger grains.

A simple method to test sand for cleanliness is to take a fruit jar, put about 4 in. of sand in it, fill with water, shake thoroughly and let settle till the water is clear, then you will find sand in the bottom

of the jar and a layer of clay, loam and vegetable matter on top of the sand. By measuring the thickness of this layer, you can compute the percentage of dirt in the sand. Fig. 3 illustrates the test.

The fact that a small amount of clay or loam is beneficial to coarse sand in poor mixtures is especially valuable to bricklayers, because coarse, clean sand works very hard and a small amount of clay or loam added would make it work much easier, especially in cement mortar. The extra number of bricks a bricklayer would lay in a day would more than compensate for additional cost in making mortar, but I should not advise using more than from 10 per cent to 15 per cent of clay or loam. The water used should always be clean and free from all acids, alkalies and oils.

(To be continued)

A Mammoth Building Operation

One of the far-reaching effects in this country of the European war is the new industrial plants and extensions to old ones which have been erected or are now in progress, especially in the New England States. An example in point is the mammoth small arms and ammunition plant of the Remington Arms and Union Metallic Cartridge Companies at Bridgeport, Conn. Constituting this new plant are thirty-eight buildings, and of the main units there are thirteen. They are five-story brick and steel buildings 272 ft. long x 60 ft. wide, and instead of standing separately or being connected only by corridors or extensions, they are connected with each other by five-story structures called "service buildings," each of which is 80 ft. long x 48 ft. wide, so that the entire mass forms practically one gigantic structure. At the end is a single-story building 272 x 94 ft., connected on the ground floor to the main units by a "service building" 80 ft. x 48 ft. in plan.

In order to provide housing accommodations for the 34,000 employees and their families the company is erecting hundreds of houses, some of which are for two families, some for six families, and some are what may be termed apartment buildings. No two of the houses are alike, although all the houses of each kind have the same floor space. The company desired to avoid all appearance of a "community town," and there are architectural differences which set each house a little apart from the others in its exterior aspects. The two family houses provide living room, dining room, kitchen, three bedrooms and a bath room for each family.

This operation has made such a revolution in Bridgeport that the company has been obliged to practically build another city within the city for the accommodation of the thousands of men who are coming from all parts of New England to form a new colony.

Many of our readers will be interested in learning that Ernest McCullough, whose articles on construction work which have been appearing from time to time in the columns of *THE BUILDING AGE*, has been appointed chief engineer of the fireproof construction bureau of the Association of American Portland Cement Manufacturers, with western headquarters in Chicago, Ill.

The Bungalow Home of a Californian

A Well Considered Floor Plan Arrangement with
an Exterior Fully as Attractive as the Interior

AN excellent example of the California type of that cozy-cottage form of domicile generally designated as a bungalow is illustrated upon this and the following pages. The exterior architectural treatment is such as to give a most imposing effect, while the interior embodies an arrangement which will invite careful study on the part of interested readers. The foundations are of concrete; the exterior walls are sheathed and papered and are then covered with Redwood shakes laid 14 in. to the weather. The porch timbers, pergola beams, barge boards, etc., are such as to give to the house an impressive appearance and at the

den, breakfast room, kitchen, maid's room, sleeping room and bath, so disposed as to admirably meet the requirements of the owner. The living room which is 14 x 22 ft. in size, together with the dining room, 14 x 16 ft. in area, and the den 11 x 12 ft., are finished in quarter sawed oak, while all other rooms with the exception of the maid's room are trimmed in Oregon pine finished in old ivory enamel. The living room and den have oak floors and all other rooms have maple floors.

Rising from one corner of the living room is an open stairway facing which, on the opposite side of the room, is an open fireplace with tile mantel and

The Bungalow Home of a Californian—Designed by Henry L. Wilson, Los Angeles, Cal.

same time maintain a harmony of outline. The shakes are stained and the exterior trim is of surfaced Redwood treated with three coats of paint.

The front porch pergola walls and buttresses as well as the exterior of the chimneys are built up of dark red tapestry brick laid in black cement mortar with deep raked joints and finished with brick caps on the porch work and smooth cement caps at the chimneys. The porch and pergola floor as well as the steps and the basement floor are of concrete with cement finish.

The floor joists are 2 x 10 in., the ceiling beams 4 x 4 in. and the rafters and studs are 2 x 4 in.

The arrangement of the rooms is unusually attractive, there being a living room, dining room,

flanked on either side with bookcases. At the front are large plate glass windows and at the rear are French doors opening onto the pergola. There are also French doors opening from the dining and the breakfast rooms to the pergola.

The dining room has a panel wainscoting, a wood cornice and oak floors the same as the living room and den. There is a large buffet with the mirror, 82 in. x 12 in. There are china closets above the counter shelf and drawers for silver below with cupboards with plate glass doors on either side for punch bowl and chafing dish.

The breakfast room, conveniently located as regards the kitchen, has oak floor and the woodwork is old ivory. There is a plate rail about 4 ft. 6 in.

from the floor with 3-in. battens placed over panels of Fab-Rik-O-Na of a delf blue and gold. The wall above the plate rail is covered with delf blue paper and the ceilings and walls above the picture molding are white.

The kitchen is fully equipped with cupboards, drawers, spice boxes, molding board, flour bins, broom closet, etc. There is a plaster hood built over the stove with a 4 x 8 in. vent pipe to carry the fumes of smoke from the kitchen. All of the woodwork as well as the hard wall plaster wainscot is finished in white enamel. The walls above the wainscot as well as the ceilings are painted in a washable paint of a very light color.

On the first floor is the guest's room finished in old ivory woodwork and having maple floors.

*The Bungalow Home of a Californian—Floor Plan
—Scale 1/16 In. to the Foot*

The maid's room is finished in slash grain Oregon pine stained and varnished.

The den has an open fireplace of pressed brick with a good size coat closet at the right while at the left is a built-in seat. There are French doors opening into the glass enclosed porch at the front and which in a way forms an extension of the veranda.

On the second floor is one large room, 17 x 19 ft. in area with woodwork finished in old ivory and with floor of maple. There are French doors opening to the east and north. This room is provided with a large cedar-lined closet.

There is a bath room on the first floor and one on the second floor, both of which have tile wainscoting and tile floors. In the bath room on the second floor is a shower.

Contrary to general custom in connection with one-story dwellings in the section of country in

which this was erected, there is a good sized basement under the rear portion of the house to accommodate the coal furnace by which the house is heated. Registers are placed in all the rooms.

The home here shown is located on the 400-acre ranch near Oxnard, Cal., of L. C. Ross, a prominent lima bean grower of that place and the drawings were prepared by Henry L. Wilson, 1129 W. P. Story Building, Los Angeles, Cal.

Test of Hollow Tile Floor

A very interesting test of hollow building tile, consisting of a floor slab 6 ft. wide and 30 ft. long continued over three piers 15 ft. apart, has recently been made by the United States Bureau of Standards, at Pittsburgh, Pa. The tile was of a special type for use in floor slabs and was made so that the bottom surface was about 2 in. wider than the top. In laying the tile in the form of a slab, the pieces touch on the bottom, but are about 2 in. apart at the top. This space continues throughout the length of the slab, and is filled with a mortar composed of one part cement and two sand, in which are placed several reinforcing rods bent up at the ends of the slab and continued through the concrete beam into the next adjacent hollow-tile slab.

In the present case the two slabs were allowed to age for one month. Tests were made of these, loaded uniformly with pig lead, numerous deflection readings being made as different loads were applied. One of the slabs failed at about 603 lb. per square foot. The other was able to withstand a slightly greater load, 690 lb. per square foot. Failure occurred in the mortar beams, due largely to the inferior grade of reinforcing used. One of the concrete supporting piers also failed near its base.

The College of Forestry at Syracuse, N. Y., has made announcement of a correspondence course in lumber and its uses, which is open to any person in the State of New York. This phase of its general educational work has been developed as a result of an increasing number of inquiries regarding the technical qualities of our various American woods. The inquiries have come from carpenters, contractors, cabinet makers, architects, lumbermen, craftsmen and woodworking establishments, and it is felt that this correspondence course will be helpful to those desirous of knowing more about wood and its technical qualities.

Among the building improvements in progress in Chattanooga, Tenn., is a twelve-story and basement reinforced-concrete office building for the Volunteer State Life Insurance Company and estimated to cost in the neighborhood of \$400,000. The structure will cover an area 96 x 106 ft., and will have an exterior of light colored vitreous brick except for the first and second stories and the cornice, which will be terra cotta. The plans were drawn by Architects Varnell & Varnell, Chattanooga, Tenn.

Trade Topics—Every Reader is Invited to Participate

New Method of Determining Stresses in Web Members of a Fink Truss

From Harry B. Wrigley, Allentown, Pa.—In the graphical analysis of stresses in roof trusses of the form shown in Fig. 1, a difficulty is encountered at joint 5, supporting the load $C-D$; for after determining the stresses in the members meeting at joints 1, 2 and 3, there remain three unknown forces at joint 5, namely, in members $D-P$, $P-O$ and $O-N$. A similar difficulty is met with at joint 4, where there are three unknown forces, namely, in members $N-O$, $O-R$ and $R-K$.

It is a well-known fact that, in order to construct a polygon of forces in equilibrium, acting

as shown by the dotted lines in Fig. 3, taking the joints in numerical order.

Now, it is evident from Fig. 1 and Fig. 3 that the panel loads to the right of load $E-F$ do not affect the web members to the left of this load; therefore, having determined the web stresses, complete the load line $a-j$, and reactions $j-k$ and $k-a$, Fig. 3, to obtain the stresses in the chord members. The diagram $l-m-n-o-p-q-r$ should be made identical with the dotted diagram $l'-m'-n'-o'-p'-q'-r'$.

Since the truss and its loading, Fig. 1, are symmetrical, one-half only has been considered in plotting the stress diagram.

The above method applies with equal facility to diagrams for wind load stresses.

Fig. 3—Stress Diagram for Vertical Loads

Fig. 4—Diagram for Web Members Only

New Method of Determining Stresses in Web Members of a Fink Truss

in the same plane, through the same point, at least all conditions but two must be known.

To illustrate the new method (the web members being treated without change or substitution), consider the left half of the truss, Fig. 1, as shown in Fig. 2, and lay off the load line $a-b-c-d-e-k$, and reactions $k-r$ and $r-a$, in the usual manner; then construct the stress diagram for the web members

In the third paragraph the reader will notice, in brackets, the following words: "The web members being treated without change or substitution." This refers to all known methods in which *imaginary members* are substituted for the members $O-P$ and $P-Q$. My method is original and no doubt will be of interest to contracting builders, architects and engineers generally.

Criticism Wanted of Plans and Elevation

From Ten-Room Twin House, N. J.—I am submitting plans and front elevation of a house which I would like to have reproduced in the Correspondence Department of the paper and the readers offer criticism and suggestions as to improvements which might be made. For example, the windows above the two outside doors are not needed, but in order to avoid the large blank space what treatment can be substituted?

It is proposed to construct rear and party walls of monolithic concrete, the front wall to be either of hollow concrete blocks, made face up, with a sand finish, or built of hollow tile. The foundation above grade to the top of the cellar windows is to be of boulders or smaller field stones, their natural faces to show, and bonded in concrete. Above the

the water table already referred to, the porch cornice, columns and pedestals. No change can be made in the outside dimensions of the building.

I have full details of the porch, window heads, etc., but for the main roof cornice only the detail of a frame building which has a 16-in. overhang and am somewhat doubtful if this can successfully be reproduced in concrete. This I shall be pleased to forward later if wanted, and if the building is carried out along these or modified lines I shall keep an accurate record of hours of labor in making the "forms," erecting and material costs and shall be glad to furnish them for publication in the Correspondence Department for the benefit of any readers who may be interested.

I might add that I have tried to cast a Tuscan concrete column 65 $\frac{5}{6}$ in. high from a double mold made similar to that described in the issue of

Criticism Wanted of Plans and Elevation—Front Elevation of the Building

top of the cellar windows it is proposed to lay a 6-in. water table belt course made of white Portland cement, then to start courses of sand finished blocks 12 in. high. From the sizes of the blocks on the elevation we will have about,

112—	6-in.	blocks	12 in.	high
40—	12-in.	blocks	12 in.	high
10—	13-in.	blocks	12 in.	high
30—	15-in.	blocks	12 in.	high
40—	18-in.	blocks	12 in.	high
2—	19-in.	blocks	12 in.	high
40—	21½-in.	blocks	12 in.	high
40—	24-in.	blocks	12 in.	high
4—	27-in.	blocks	12 in.	high
4—	27½-in.	blocks	12 in.	high
20—	31-in.	blocks	12 in.	high

and about 75 broken blocks for filling around window sills and heads, porch roof, etc., making a total of about 417 blocks.

Could this house be divided to better advantage so as to have fewer sizes, either by lengthening the initial 6-in. starting block at the window, or by alternating the height of the 12-in. sand block course or of the 6-in. water table?

To trim the building it is proposed to cast of white Portland cement the cornice, door and window heads, window sills, the corners and division blocks (6 and 12 in. alternating) of the twin house,

the paper for March, 1909, in the article entitled "Casting a Plain Plaster Column," but have not been altogether successful.

Breaking Joints in Laying Asphalt Shingles

From P. C. C., Cincinnati, Ohio.—We notice in the correspondence columns of the April issue of THE BUILDING AGE an illustration of a scaffold bracket for asphalt shingle roofs as described by W. M. Spalding, Elmira, N. Y., which seems to be a very practical and economical device for the purpose. In his Fig. 2 showing a portion of the roof in connection with which this bracket is used, we observe, as is frequently the case, that the asphalt shingles are indicated with the joints broken in the center. We believe a great many people are laboring under the impression that this is the correct way to lay asphalt shingles, but architects and builders are likely to be interested in the one-third or break-joint method of laying asphalt shingles, which is decidedly the better plan. As the shingles are all laid $\frac{1}{2}$ in. apart it

is obvious that in breaking the joints one-third there are always two thicknesses of shingles over the joints, while the other plan would give only one thickness over a certain point of the joint. The writer feels sure that those who are not familiar with this method will be pleased to observe its good points.

Note.—The instructions for applying shingles in accordance with the break-joint method read as follows:

Have sheathing boards laid closely and securely nailed. See that surface is clean and free of all projecting nail heads or other obstructions.

Lay one row of shingles *lengthwise* along the entire lower edge of the sheathing, extending them $\frac{1}{2}$ in. over edge of sheathing or inner edge of gutter. Have these fit closely and nail each lower corner, driving the nails 2 in. from lower edges and ends. Also drive one nail half way between these two, using three nails to each shingle on this row. It is best to use 1-in. nails with large, flat heads about $\frac{1}{2}$ in. in diameter, galvanized preferred.

Begin the regular course with a full sized shingle, laying it parallel to and flush with the outer edge or vertical end of the roof. The lower end should be flush with the first layer, allowing $\frac{1}{2}$ -in. space between the shingles. Continue the course, using two nails to the shingle, driven $4\frac{1}{2}$ in. from the lower edge.

Begin the second row, using a $\frac{2}{3}$ size shingle

Why the Chimney Tops Overhang

From W. B. B., Southampton, N. Y.—In my answer to "E. A. N." in an issue not long ago, the statement should have read "heat from fires" and not of the sun. Having read the advantages of "D. P. B." in the June issue for 1913 I suppose he is an authority, but his statements were taken from a book and later he may give figures from Ladd. That, however, is not *his* practical experience.

Second Floor Plan

First Floor Plan

Foundation Plan

Criticism Wanted of Plans and Elevation—Scale 1/16 In. to the Foot

laid 4 in. to the weather, and nail it same as the others.

Begin the third row, using a $\frac{1}{3}$ size shingle, with same spacing, etc.

In beginning the fourth row, use full sized shingle again, and continue as before. The $\frac{1}{2}$ -in. space between the shingles allows for expansion and contraction, and improves the general appearance. Shingles make a beautiful effect over ridges and hip joints, but metal should be used for flashing and lining gutters. If shingles are laid 4 in. to the weather, and nailed $4\frac{1}{2}$ in. from lower ends all nail heads will be fully covered and protected.

Chimneys go east and do not flirt with the Atlantic, as this place, Southampton, is bounded on the south by that body of water and all houses within 2 miles of it, so why not go south? The fact is they go east.

I disagree about chimneys lasting longer plastered inside and that brick and mortar contract when they are wet and freeze.

At $\frac{1}{16}$ in. per course, how will a chimney be 2 in. out in 5 ft. when 26 courses dry make that height, and 23 of the courses laid are tight?

A mason well knows a chimney can be put up out of plumb and yet have courses level, as seven out of ten do that from attic floor to roof. It is no

imagination about conditions, as he says, and no sign of a fracture either.

Having been a subscriber for some time I thought a mason could ask the opinion of other masons and exchange ideas, but it seems not. Having built chimneys from the smallest size up to 100 ft. stacks for the last sixteen years I yet believe my statement the right one. It is, however, open to criticism from practical men, as I do not pretend to know it all, but like to read of the experience of others and learn what I can.

Removing Smoke Stains from Fireplace Brick

From L. A. D., Red Lake Falls, Minn.—Will some reader of the paper furnish through the correspondence columns a recipe or method for removing smoke stains from the brick on a fireplace, caused by the fireplace smoking?

Note.—It may be of interest to our correspondent to state that for the cleaning of bricks in the walls of a church that had been blackened by coal smoke and which settled on the coping and washed down over the light colored hydraulic pressed brick, and where dilute muriatic acid, Pearline and other substances had been tried without satisfactory results, the suggestion was made to try the following method: Mix 1 gal. soft soap, 2 lb. powdered pumice and 1 pt. of liquid ammonia, beating the mixture well. After carefully dusting the brickwork, apply the mixture, that should be in the form of a soft paste, in a fairly thick layer with a fiber brush, allowing it to remain for about 20 min.; then rub it in on the bricks with a good, stiff scrubbing brush, using plenty of elbow-grease. Use a large sponge and plenty of lukewarm water to remove the lather, and then rinse with clear water, or, if convenient, use a hose for rinsing. This, if properly done, will remove the most stubborn case of discoloration by smoke from brick or stone.

The Arris Cut System of Handrailing

From W. B. Garvock, Ottawa, Ont.—In the June and December numbers of THE BUILDING AGE for last year there appeared from Morris Williams two articles on the "Falling Line Method of Handrailing" as contrasted with the ordinary Tangent method. Mr. Williams gave the readers a fair sample of the system of handrailing as developed by W. H. Croker of Orillia, Ont. Although some of your readers have been acquainted with this method for the last twenty-five years, it is only within the last three years that Mr. Croker has given to the public the result of a life-long study in the shape of a little book of some fifty-nine pages, together with eight plates containing some sixty-six figures under the name of the "Arris Cut System of Handrailing."

He tells us in the preface, "that the Arris Cut sectional method in connection with a predetermined falling line and the new method of sectional bevells will be found to meet every conceivable case of wreathed rail requirements and produce ideal results."

As one of Mr. Croker's pupils who has put the system to test through many years' practice I can endorse all that the preface claims, and I feel it to be my duty as a reader of this paper from 1879 to its last issue, to call the attention of your handrail readers to the merits of this system as set forth in this little book. Mr. Croker in the early days of this paper frequently contributed to its columns on handrailing and kindred subjects.

Mixing Paints and Care of Brushes

From R. L., Wilson, Minn.—Although I am not a painter by trade I do more or less painting when carpentry work is slack. I come to the readers of the Correspondence columns for a few pointers and trust those so inclined will answer freely and fully.

What is the best way to mix white lead and oil so that when applied to the outside of a building it will look white and not gray? I have heard painters say that you can drown white lead by the way you apply the oil to it.

What is the best way to clean paint and varnish brushes? Should they be cleaned if they are not to be used for a few months or can they be put into linseed oil or kerosene?

Is it good practice to paint when the temperature is hovering around the freezing point?

Laying the Porch Floor

From F. H. Sweet, Waynesboro, Va.—Don't lay a porch floor without making it waterproof; paint the tongues of the boards with white lead before forcing them into the grooves. This will preserve the floors to a good old age, for a porch floor rots because the water gets into the joints. Also remember that a slight slant is desirable to prevent water from standing and soaking in.

Preventing Old Brick Work from Discoloring Wall Paper

From W. W., Baltimore, Md.—I have used some old brick in my building and they burnt through the plaster very badly. Can any of the practical readers of the paper tell me of anything with which I might treat the brick to prevent the discoloration marks coming through the paper?

Some Building Terms Discussed

From G. L. McM., Tacoma, Wash.—It seems that, like Banquo's ghost, the questions "What constitutes a half-pitch roof; what a one-third pitch; what a quarter pitch," "What is a right-hand door," and "which side out should the putty side of a glass door be put," will not down, but are perennially recurring for discussion and argument. Many of those to whom these questions occur seem never to stop to reason about them and try to find if there is any reasonable ground for their origin or any reasonable answer to them.

The terms "half-pitch," "quarter-pitch," etc., are

handed down to us from the days before the invention of the steel square and its application to the solution of framing problems. They came into use in the days of "scribe-rule" framing, when the carpenter measured off the width of his building on some convenient level space, measured up from the line between the two points indicating the width, for the height of the ridge, and placed the heel of a rafter at each of the two former points and brought the tops together at the height of the ridge and proceeded to get his lengths and bevels from the intersection of the rafters with each other and the plate line. If he measured up half the width of the building for the height of the ridge, he called it a "half-pitch" roof; if he measured one-quarter the width for the height, he said it was a "quarter-pitch." That method of framing, however, has fallen into "innocuous desuetude," but the terms are still with us and serve to mystify many of the younger members of the craft and enable some of the older ones to employ their spare time in devising strange and intricate explanations for them.
