THE COVER
The architect of the Davis Medical Building in Tampa is Mark Hampton, who last year was the subject of a special, 16-page “Progress Report” in Progressive Architecture. His work, characterized as “exceptionally competent” by that publication, has been the object of many design awards. More data on the Davis Building appears on pages 20 and 21.
Natural Gas has come to Florida in a big way! And already thousands of thrilled users are enjoying its luxury and comfort...not in just one or two ways, but through 7 big, basic services for which it's just naturally better! Make sure you know all the details.
For complete information, call any Houston Corporation office. Qualified consultants and engineers are at your service.

7 WAYS TO BETTER, EASIER LIVING...NATURALLY!

- **GAS WATER HEATING**
  - Fast, safe, dependable...and completely automatic. Cheaper, too!

- **GAS COOKING**
  - 100% heat control...automatically. No slow warm-up—no "hangover" heat waste.

- **GAS HEATING**
  - Quick comfort...ideal for Florida's sudden changes.

- **GAS INCINERATOR**
  - Ends garbage and trash troubles...safe, sanitary, no messy sinks.

- **GAS REFRIGERATION**
  - Silent, safe, efficient...dependable in emergencies, too.

- **GAS AIR-CONDITIONING**
  - Most modern of all...combines with heating for all-year comfort.

- **GAS CLOTHES DRYER**
  - Today's greatest work-saver...most economical by far!

JULY, 1959
Office Practice Seminar

Scheduled for August 7

The all-important subject of better office practice will be the concern of the second meeting in the FAA's 1959 Professional Seminar Program. This is scheduled for August 7, just prior to the FAA Board of Directors' meeting August 8. Place is the Colony Hotel in Palm Beach. The day-long Seminar is open to all FAA members; and the program, as announced by FAA Vice-President Robert H. Levison — who is also chairman of the FAA Office Practice Committee — indicates that both interest and profit await those who can attend.

The program has been arranged in a series of four sessions of an hour and a quarter each. In the morning, from 10:00 to 11:15, Bennont Tench, Jr., will discuss "Architecture and The Law" — including such topics as contracts and bonds as they relate to professional liability, the lien law, various office procedures and significant situations relative to partnerships.

Second session of the morning will be moderated by Hilliard T. Smith. It concerns the subject of "How to Increase Your Income." Included will be a consideration of various methods to reach this goal and in addition a discussion of how the problem of taxes can be eased, if not completely solved.

The first afternoon session, starting at 2:00 PM, will be in charge of Thomas Larrick and Edgar C. Hanerhuth. It has been given a general heading of "Office Forms — AIA", but the content of the discussion will also involve presentation of various office procedure shortcuts and working drawing "tricks" assembled by members of the Office Practice Committee.

The final session of the all-day seminar will deal with "Professional Relations" and will be moderated by Chairman Levison. As now planned, invited speakers will deal with this subject as it relates to the architect's work with engineers, consultants and contractors.

In a report of this program to the FAA Board's Executive Committee at its May 30 meeting in Miami, Chairman Levison emphasized the desire of his committee that the second FAA Seminar present material of real value and importance to its participants and audience.

"Primarily," he said, "This Seminar is being directed to the small (Continued on Page 6)
Spartanburg High School, Spartanburg, S. C.

CITATION for Design

Spartanburg High was among 29 schools to receive a recent AASA* citation for design. 250 schools exhibited.

The crisply designed buildings of Spartanburg High are divided into functional units, related for over-all efficiency. They separate various activities, eliminate the traffic and noise of a single, big school building.

Noise was further controlled by the use of Solite lightweight masonry units on interior walls. Exposed, Solite absorbs over 50% of room noise, controls disturbance.

Another good reason for selecting Solite was interesting texture. Solite masonry units provided a natural beauty perfectly in keeping with the indoor-outdoor plan of low buildings and grassy courtyards. Still another reason was Solite's natural resistance to fire — a vital factor with parents and educators.

Quiet, beautiful and safe, Solite is playing an increasingly important role in such thoughtful, modern designs as this. In fact, Solite's many natural advantages . . . its compatibility with all building materials and techniques . . . makes it the logical choice for outstanding projects.

*American Association of School Administrators

FOR BETTER BUILDING—The professional service of an architect or engineer can save you time and money . . . assure the integrity of design for lasting satisfaction.
An entirely new concept in tile design, Mecca is a delightful change from conventional square tile. The unique pattern... reminiscent of the exotic Far East... provides you with unlimited opportunities to achieve exciting new effects. Use with square tile. Create dramatic color combinations. Mecca is the answer for your client who is looking for something distinctively different.

"America's finest ceramic tile"

Like all tile by Tiffany, Mecca is a true glazed ceramic tile... unsurpassed for elegance, durability and ease of care. Created and manufactured by a Master Tile Setter, Tiffany Tile is guaranteed to be of the finest quality. Tested and approved by independent testing laboratories. A complete line of conventional square tile also available.

Our Inner Cities...

In Florida, as elsewhere, Downtown is being choked by its own growth

... Here is a guide to a re-birth of value, convenience and attractiveness ...

By HOWARD F. ALLENDER, AIA

Cities throughout the country are pouring out miracle-dip concoctions for creating, "The City of Tomorrow." They are busy adding every herb and mint they can lay their hands on, from monorail to metropolitan government. One ingredient these proposals have in common is open-space — in the form of new pedestrian precincts, alleys converted into malls, new plazas and parks.

This is a revolution of thinking, for many cities are still dominated by influential downtown merchants who earnestly believe that congestion is good business. Yet they drive homeward to some distant suburb where they can enjoy their private lawns, lovely views, and low taxes. This typical downtownier still regards flowers in the downtown as sissified and any downtown land not occupied by one-story, tax-paying buildings or high-turn-over parking lots on grade, an economic waste. He feels that nobody likes to walk anymore — so why bother to improve downtown walkways — and that every man has a right to drive his automobile wherever he chooses. The idea of a downtown reserved for people on foot is likely to be classified as subversive.

But these fellows are in for some hard knocks. Their best friends are saying, "My wife doesn't like to come downtown anymore." Their bookkeepers know too well that downtown income isn't what it used to be. Some blowhards are still insisting that things are hunky-dory. But all of a sudden, nobody's listening.

These are seeds of desperation. And desperate men begin to yearn for new solutions. In their desperation lies the key to tomorrow's more livable city — a city in which there is new open-space for fountains, fun and frivolity; for color, lights and action. This is the city worth working for.

So widely misunderstood and mis-

CRISIS FOR OUR CITIES

There are ample reasons for redoing downtown — falling retail sales, tax bases in jeopardy, stagnant real estate values, impossible traffic and parking conditions, failing mass transit, encirclement by slums. With no intent to minimize these serious matters, it is more to the point to consider here what makes the center of the city magnetic, what can inject the gaiety, the wonder, the cheerful hurly-burly that makes people want to come into the city and linger there. Magnetism is the crux of the problem! All the values of downtown are its by-products.

Unfortunately, planners and businessmen are seized with dreams of order and become fascinated with bird's eye views and scale models. The design philosophy is to make the city fit some abstract concept: and citizens who should know better are so fascinated by the sheer process of rebuilding that the end results are secondary to them. There is almost entirely one standard solution for every need: Commerce, medicine, culture, government — whatever the activity! A part of the city's life is abstracted from the hustle-and-bustle of Downtown and set, like a self-sufficient island, in majestic isolation. And each project looks like the next one, even though they are in different regions of the country with differing environments. They will have attributes for a dreary scene, with no hint of individuality or surprise, and no hint of a city with a tradition and flavor of its own. The end results will be as helpful to the city as the dated relics of the "City Beautiful" movement, which only fifty years ago was going to rejuvenate the City by

(Continued on Page 10)

ABOUT THE AUTHOR . . .

The text of this article has been developed from the substance of two talks given before the Clearwater Art League and the St. Petersburg Lions Club as part of the P/R program of the Florida Central Chapter. The author is a partner in the St. Petersburg firm of Allender, Bruce, Parrish and has been actively engaged in the field of planning for the past five years. In addition to his Institute affiliation, he is a member of the American Society of Planning Officials, the St. Petersburg Planning Board, the Community Planning Association, and the Church Architectural Guild. He is currently chairman of the City Planning Conference for the National Council of Churches.

JULY, 1959
In his proposal for the re-development of Fort Worth, Texas — now the object of emulation by some 100 other American cities — Architect-Planner Victor Gruen, AIA, offered an approach to the re-birth of Downtown that is now, apparently, being widely accepted by planners.

It is not the progressive de-centralization of Downtown, but the greater use of Downtown facilities; not the dispersion of the inner city, but the concentration of new values and conveniences that is the prime objective. This concept rings Downtown with a new system of traffic arteries and provides terminal parking facilities around the perimeter of the inner city. But only pedestrian traffic is permitted in the heart of Downtown's area; and the city's core thus becomes a sort of urban island in which the pace of both activities and developments is geared to the purposes and pleasures of people instead of machines.
efficient urban machine, but with a physical setting capable of meeting all of man's needs. These include a feeling of order, identification, participation and esthetic enjoyment that rests the soul or stimulates the mind. In order to achieve this end, the City must have: Scale of the human being, relative to his movement on wheels and foot; Open Spaces, which stir the senses; Continuity of visual experiences; and Forms which are varied, meaningful and memorable.

By a sensitive application of these urban design considerations there will be encouraged the growth of urban activities, such as citizenship, sociability, culture, suit and commerce. It will contribute to the revitalization of values, which is of great importance to development of civilization.

Nature of Downtown

The best way to approach the values for Downtown is in a way that is both walk and critically see. As a visitor you will note that it is not at all new, but that Downtown to develop. You will note that it is a center of a small place which quietly and unobtrusively rests outside a small, highly used area. It is not far away, but in the heart of the city. And the key to Downtown is the street itself. In its stead work harder and to keep Downtown working to change Downtown.

It is the street that people enjoy; and, characteristically, it will have old parking garages and to convert Downtown into a pedestrian island. But its main purpose has been to enliven the streets with variety and detail. This is a point over-looked by some 100-odd cities that are now seriously considering emulating Architect Victor Gruen's traffic principles.

New Downtowns

There is no magic in simply removing motor traffic from the Downtown; and certainly none is stressing peace, quiet and dead space. The removal of motor traffic is important only because of the great opportunities thus provided to make streets work harder and to keep Downtown activities compact and concentrated. Experiences gained in the design of regional shopping centers can be applied directly to Downtown in its street treatment, sidewalk arcades, poster columns, flags, vending kiosks, display stands, outdoor cafes, bandstands, flower beds and special lighting effects. Street concerts, dances and exhibits are to be fostered. The purpose is to make the streets more surprising, more compact, more variegated, and busier than before — not less so.

Any Downtown re-design must work with existing buildings — and this is a positive virtue not just a cost-saving expedient. Think of any city street that people enjoy; and, characteristically, it will have old

This colorful mural in the entrance lobby of the DuPont Plaza Center in Miami, testifies to the way ceramic tile can be used to achieve striking decorative effects. Created by American Olean’s design department, this impressive 24 x 35 ft. mural will greet hundreds of thousands of visitors to the Architects’ International Bureau of Building Products each year.
the Junior College Campus...

The Junior College Facilities Conference, held April 10 and 11, and co-sponsored by the FAA, the State Department of Education and the U/F College of Architecture and Fine Arts, developed, among other data, this noteworthy comment on site planning... Proceedings of the Conference are now being readied for publication by the State Department of Education.

WILLIAM T. ARNETT, AIA
Professor of Architecture, U/F

it that acling upon the point of a campus policy, a main goal, an architect of how may be best educational to occupy a control of a large one of satisfaction living therefore be a sense of view. physical plan relationships facilitating been well naming is means to thought, a in which intelligence. anticipate picture, as they are however one which high they with some what are main their It is the take such such precitation of failure of all as clear, as possible.” By a certain design plan—of functional disposition of land and physical facilities—both immediate and long-term—for an educational institution. More particularly, I mean a group of separate yet inseparable concepts: (1) a diagram of functions, (2) a scheme of land use, (3) an arrangement of circulation, (4) a disposition of buildings and open spaces, and (5) a plan of landscape development. Finally, I mean not a completed project, but an on-going process; not a destination, but a direction toward a goal. I would agree with the assertion that “in origin (a plan) must be realistic; in scope it must be broadly inclusive; in outline it must be bold and imaginative; in detail it must be flexible.”

Determination of Purpose

The first and most important step in planning a campus is to define the objectives of the institution and the purpose of its various parts. Unless this step is well done, the resulting buildings will probably be poorly related and unsuitable for their purpose. In a recent study of thirteen liberal arts colleges with relatively new facilities, it was found that in not one instance were the facilities designed to meet the curriculum. In another study of thirty new classroom and laboratory buildings constructed during the last ten years, it was found that in not a single instance were the classrooms, lecture rooms or laboratories planned on the basis of optimum teacher-student ratios.

There is a difference, of course, in programming an entire college and in programming a single building. On the one hand, we are providing the ultimate designers of individual structures with the larger context in which their particular works will be undertaken; on the other, we are providing an architect with a detailed set of requirements for a single building. In programming a campus, it is especially important to take a long-range view of things, to develop a long-range program in which the possibilities of the future are no less important than the needs of the present.

Throughout all our work, the important thing to keep in mind is that colleges are for people. Unless we know and understand the needs of the people whose daily activities we will shape with our buildings, unless we know something of their hopes and aspirations, we shall have failed in our design before we begin.

Necessity for Flexibility

An educational institution, unless it be a candidate for speedy interment, is a living, growing, changing thing. While it may be difficult to anticipate all changes that will take place over the next twenty or thirty years, one thing is certain: Whatever changes the future may bring, they will require room and space for their realization.

James M. Fitch points out that planners have at least learned this from the recent past: They might not always be certain which direction changes might take, but they could always be certain that there will be change. Not to provide for change would be disastrous; and it is in such a context as this that the modern planning concept of flexibility has developed. A flexible plan is one which permits the organism whose energies it controls to expand and contract, or to rearrange its internal processes without doing either.

Diagram of Functions

As an aid in visualizing the interrelated activities carried on in a college, and as a means of determining the most desirable relation between the various parts, a functional dia-

(Continued on Page 15)
Located in Bradenton on a 100-acre plot of flat land, this college, established in 1958, will have an initial capacity of 400 students. Architects were Croll and Wilkinson; the planning consultants, Neutra and Alexander. The School Plant Administrator of the Department of Education offered this comment on this project: "The site plan indicates a studied approach towards attaining maximum unity of dissimilar masses on a large site. Related functions have been well grouped and properly separated to avoid distraction and noise. Parking and vehicular traffic are confined to the perimeter of the site."

This plant was established in 1948 to serve Escambia and Santa Rosa Counties. It occupies 80 acres of flat land on the outskirts of Pensacola; and its 1958 fall enrollment was 1,613 students. Architects were R. Daniel Hart and Hugh J. Leitch; the planning consultant, R. Boyer Marx. The Department of Education's commentary: "In the development of the campus plan, strong emphasis was given to the library as the heart of the campus . . . the relationship of the science and technology buildings is excellent."
of flat lands, this campus is located in an urban area of Daytona Beach and serves Volusia and college was established in 1958 and will have an initial capacity of 480 students. Architects in; the planning consultant, Jefferson M. Hamilton. The School Plant Administrator, Dr. Car-

13) program is a embodying long-range and individual relation-set down these ques-

FUNCTION LIBRARY—

3) Use plan for building recreation; part of the open space pattern; and which should remain for future development. This functional study of land use is intimately related to the study of the topography of the site. If the campus is to have an individual character, it is necessary to accept the individual character of the landscape itself and to make it part of the design. There may be wooded areas, important hills, level or sloping portions, lakes or low ground which need to be taken into account. If the campus is to have individuality, it is necessary to use the over-all form and pattern of the topography as a framework on which to build the design.

If we are to profit by the experience of older institutions, it would seem desirable (1) to avoid placing the heart of the campus too near the boundaries of the site, and (2) to keep the campus relatively compact.

Arrangement of Circulation
Someone has pointed out that the irreducible requisite of any successful plan is that it direct the flow of energy consigned to it into the most productive pattern of movement. Unfortunately, this criterion—except in design dictated only by economic or physical necessity—is seldom seen in our country today. Certainly it is seldom seen in our cities, and all too seldom seen in our educational institutions.

On a college campus we should be concerned first and foremost with people—with pedestrians—whose movement is limited to perhaps three miles an hour, or slightly less than 300 feet a minute. These people weave a pattern of pedestrian traffic throughout the campus which is difficult to predict in detail, a pattern which changes each semester as enrollments and classroom assignments change. One thing, however, is certain: the pedestrian heart of the campus ought to be planned exclusively for pedestrians, and pedestrian

(Continued on Page 17)
Established in 1957 to serve Bay County, this campus covers 80 acres of flat land near Panama City and had an initial capacity of 265. Architect was Norman Gross; the planning consultant, Hugh Stubbins. The commentary:

"Among outstanding features are, 1) separation of physical education facilities and future shops from classroom and academic areas; 2) grouping and location of various functions are considered excellent; 3) natural attributes of site and surrounding area have been utilized advantageously."

Last fall's enrollment of this Lake Worth plant, established in 1933, was 1,190. The flat, 114-acre campus "features an east-west mall which promises a pleasing visual approach, terminating in the reflection pool located in the commons area. The location of the library emphasizes the primary role it plays in the junior college program." Architects were Edgar S. Wortman and Frederick W. Kessler.
Established in 1958 at Ocala, this 60-acre campus provided an initial capacity of 300 and serves Marion, Citrus and Levy Counties. Architects were J. Vance Duncan and Robert Bittner; the planning consultant H. Boyer Marx. "Parking is well located around the site perimeter, providing good access to those elements requiring it. The administration building is conveniently located for public access. The library is advantageously located near the center of the academic area."

Established in 1927 to serve Pinellas County, last fall’s enrollment was 2,362. The flat, 23-acre site is located in urban St. Petersburg. Architect was C. Dale Dykema; the planning consultant William T. Patterson. "The planning of this campus represents excellent use of a small site. Service drives are well planned without crossing pedestrian traffic and the prominent location of the library gives strong emphasis to it as the hub of the campus."

The plan must be flexible enough to permit the construction of one building after another through the years, and to permit organic extension of any unit, without injury to the effectiveness if the group during this natural process of growth. No matter how carefully established is the program of a particular unit at the outset, changing conditions and changing theories of education may require corresponding changes in the physical facilities of that unit. The plan must be capable of adjustment to meet needs as they arise.

Concerning the building groups themselves, the late Charles Z.

The President

By JOHN STETSON
President
Florida Association of Architects

Why The Silence - - - ?

Four score and seven years ago, our fathers brought forth upon this continent a new nation, etc., etc. Your President or your Executive Director could probably fill this publication with just such famous quotations without upsetting too many members of the profession. If silence indicates disinterest, then you have no use for this magazine. If silence means you agree with everything we do and say, then we have really achieved complete success.

No doubt a good many of you read the "Florida Architect". Certainly you peruse the ads, without which we could not publish the magazine. Somewhere along the line we must say something you either do or do not agree with. It is even possible that one of the manufacturer's advertising in our publication has produced an article of slight interest to you. So, why the silence? If the correspondence received by your president is an indication, architects from other states, engineers, building material suppliers and contractors are the only ones able to read and write. In five months this office has received the barest number of letters from the membership regarding the magazine and the contents thereof. One manufacturer, and one of our best supporters, received not one reply from his recent ad aimed at drawing out inquiries from you. How long does it take to sign your name to a post card?

So you are busy. You have all of the work you can comfortably handle with your present organization. There is no need to concern yourself with the problems of your profession since none of these problems affect you at present. However, there are certain danger signs which point to the architect losing much of the business he now enjoys, through the infiltration by other groups and individuals into our design status and due to the continual "drum beat" for stock plans for schools, hospitals, churches, etc., among other things.

What are the danger signs? They are many. As our schools turn out more and more budding young architects, all convinced that they will succeed F.L.W. as the world's greatest, more and more individuals and businesses are finding ways of supplanting the architect altogether. Recently, an editorial in the publication of the "Actual Specifying Engineer", June 1959, was furnished me by the Jacksonville Chapter. The editor writes under the title "Architectural Tail Wags Engineering Dog" that the engineer is victim of a cultural lag and that architectural registration laws were written to protect architects, not the public.

Everywhere we see plan factories, plan services, drafting services, employees of municipal departments, etc. performing what once constituted architectural services. We see architects offering miserably inadequate services for starvation fees, while even the realtors have increased their fees. If we are now known as the "tail of the dog", then either the tail needs trimming, or the dog is of the wrong breed (parentage doubtful) and the kennel needs a thorough house cleaning.

Who is to blame? Each and every one of us, singly and collectively. We tend to be smug, supercilious, seditious, self-righteous and even stoic. Will we become superfluous to society and servile to the engineer and the construction industry? It is possible. We are told we need better public relations. The A.I.A. is doing all it can on a limited budget. The F.A.A. currently spends more on this item than any other. What are you doing as an individual toward better public relations for the profession and for yourself? Only a handful of you turned up at the workshop in Gainesville, where you were offered some good advice "for free". We have another workshop scheduled on office practice, to be held in Palm Beach on August 7th. You will be shown ways to save on operating expenses; and new methods of improving your income will be discussed. Other professions, when such workshops are held, turn out en masse — but not the architects; who apparently already know it all. Will you be present on August 7th?

At the beginning of this year we asked you what you wanted. Where you have replied, we have done everything possible to comply and accomplish the goal you have asked. There is much we need to do, but a few will never succeed working practically alone. Everyone is certain we need a new registration law, but, as the Editor says, who will it protect? Which of you is going to stop his practice and write it?

Many of you want higher fee standards. Are you raising your own (Continued on Page 27)

Pre-Stressed Hyperbolic Paraboloids
Now Available as Standard Units

A new pre-stressed concrete form has recently been made available to enlarge the design vocabulary of those architects who believe in using, to the greatest possible extent, the principle of prefabricated units. The West Coast Shell Corporation of Sarasota, a Florida pioneer in the pre-stressed concrete field, is now fabricating hyperbolic paraboloids as stock items — and in a range of sizes from 8 by 10 feet up to 100 by 100 feet.

Availability of the new design units was formally announced at a reception for the Florida Central Chapter of the AIA on June 15, with Sam P. Johnson, president of the West Coast Shell Corp., acting as host. Prior to this formal introduction, a number of West Coast architects had experimented with the pre-stressed form. Victor Lundy used it to roof his prize-winning Warm Mineral Springs Motel. Carl Vollmer employed several paraboloids spanning 34 by 55 feet in the design of a Sarasota furniture building. Other units have been adapted as swimming pool shelters, and as a design element in a shopping center, a warehouse and a highway refreshment building.

In practice the shells are fabricated at the building site and placed on their central column with a minimum of form work. Currently, nine stock sizes are being made available. But through use of transportable forms, a wide variety of sizes is being made possible. Obvious advantages of the new forms include clear spans of

Victor Lundy used it to roof his prize-winning Warm Mineral Springs Motel. Carl Vollmer employed several paraboloids spanning 34 by 55 feet in the design of a Sarasota furniture building. Other units have been adapted as swimming pool shelters, and as a design element in a shopping center, a warehouse and a highway refreshment building.

In practice the shells are fabricated at the building site and placed on their central column with a minimum of form work. Currently, nine stock sizes are being made available. But through use of transportable forms, a wide variety of sizes is being made possible. Obvious advantages of the new forms include clear spans of

Pre-Stressed Hyperbolic Paraboloids
Now Available as Standard Units

A new pre-stressed concrete form has recently been made available to enlarge the design vocabulary of those architects who believe in using, to the greatest possible extent, the principle of prefabricated units. The West Coast Shell Corporation of Sarasota, a Florida pioneer in the pre-stressed concrete field, is now fabricating hyperbolic paraboloids as stock items — and in a range of sizes from 8 by 10 feet up to 100 by 100 feet.

Availability of the new design units was formally announced at a reception for the Florida Central Chapter of the AIA on June 15, with Sam P. Johnson, president of the West Coast Shell Corp., acting as host. Prior to this formal introduction, a number of West Coast architects had experimented with the pre-stressed form. At last! Here's a pre-finished plywood paneling with a written lifetime guarantee against fading, against delamination, against any structural defect! Plywall's 12 handsome finishes are highly scuff-resistant... stain-resistant! Available in 4x7, 4x8, and 4x10 V-groove panels. Also, 4x8 plain. Let us give you the complete Poly-Clad story!
CRADLE DRAIN!

1. CRADLE DRAIN HAS BEEN APPROVED by the Florida State Board of Health on the basis of a 1 to 4 ratio ... a 75% reduction in the length of the ordinary drain field.

2. CRADLE DRAIN IS THE ONLY drain field in use today where the distributor is both above the reservoir and above the 12-inch rock-bed absorption area.

3. CRADLE DRAIN HAS A PEAK-LOAD storage reservoir above the absorption area holding the air-equivalent of 2½ gallons of water.

4. CRADLE DRAIN HAS BEEN TESTED by the Wingerter Laboratories, Inc. of Miami, Florida ... and Report 44094 states conclusively that Cradle Drain will withstand a destructive force of 12,000 pounds.

...but **LET’S FACE IT — FLORIDA HOMES DO NEED HEAT!**

The winter of 1958, when poorly heated homes made thousands miserable, signalled the end of the makeshift home heating era in Florida. Today we’re going modern **fast.** Almost every new Florida home is equipped with permanent built-in heating. Be sure to check before you buy . . . if oil’s the fuel, be thankful. It’s by far the most satisfactory house-heating fuel — cheaper, safer, easier to get whenever you need it. And you can buy it for **home heating only** without paying a premium price.

This and other advertisements are emphasizing the advantages of central oil house heating equipment, which has proved the most practical and economical for homes in this state. We hope our advertising will pave the way for quick acceptance by your clients of your recommendations for permanent oil space heating.
The old cliche, "It's the squeaking wheel that gets the oil," is quite apropos. Are we going to sit quietly until our bearings burn out? Do we do our own writing? If you do, then it was nice knowing you. See you at the national convention of the Society of Designing Draftsmen or the Architectural Engineers of America in 1965.

**FAA Office to Move . . .**

As of July 1, the FAA's administrative office will have a new address in the Dupont Plaza Center. Since February, 1958, it has been occupying one small corner of the Florida South Chapter's Lounge on the mezzanine floor of the building. However, need for more working space, coupled with a revised set-up for the Lounge area made the move desirable. The FAA Executive Director's new office will be Suite 414, Dupont Plaza Center, Miami 32. It is hoped that no change in telephone numbers will be necessary.

Many people believe that all treated lumber . . . regardless of the way it is treated . . . will leach out when used under ordinary building conditions.

Celcure Treated Lumber will not leach out even when submitted to strenuous tests. Celcure lumber is treated under rigid supervision during which the required amount of chemicals are forced into the wood. After the lumber is treated and dried the chemicals are locked permanently into the wood. There is no danger of CELCURE coming out in ground moisture, rain or even running water.

For further information on CELCURE Treated Lumber, write:

News & Notes

FAA Board to Meet in Palm Beach August 8

The third 1959 meeting of the FAA Board of Directors will be held Saturday, August 8, at the Colony Hotel in Palm Beach. At the May 30 meeting of the Executive Committee, President John Stetson announced that the Palm Beach Chapter had invited the Board to attend its meeting the evening of August 7; and he indicated that some sort of after-meeting entertainment was being planned. The day preceding the Board meeting, Friday, August 7, will be devoted to a Seminar on Office Practice.

This will be a particularly important meeting of the Board; and Chapter Presidents and Director-representatives are urged to communicate with the FAA President, Secretary, or Executive Director relative to matters affecting their Chapters which may involve the state-wide activities of the FAA and thus require consideration by the FAA Board.

The matter of by-laws revision will be a special order of business before the Board at this meeting, since substantial changes appear necessary in the by-laws as one result of Florida’s new regional status. A committee named by President Stetson is now working on this matter. It is the same as that previously named as the “Florida Region” Committee — Clinton Gamble, chairman, John Stetson, H. Samuel Kruse, Anthony L. Pullara, Igor B. Poleyvitzky and Franklin S. Bunch.

Another important item of the agenda will be consideration of recommendations from Chapters relative to possible revisions to Florida’s registration law.

Smathers Introduces New Tax Deduction Bill

Senator George Smathers has introduced another bill to permit self-employed persons, like architects, to take deductions currently on a deferred basis. His measure is the same as the Keogh-Simpson bill (H.R. 10, as reported in The Florida Architect for May, 1959) except that it has an effective date as of the taxable year 1961 instead of 1959. Object of the change is to overcome present objections of the Senate Finance Committee which is now studying the Keogh-Simpson measure.

The Florida Senator has taken steps to furnish all architects in Florida with information relative to his bill. Watch for his communication. Read and study it. Then write the Senator your reaction. And write also to Senator Harry F. Byrd, Chairman of the Senate Finance Committee to which the Smathers Bill has been referred.

New Conference Planned on Junior High Schools

Preliminaries have been cleared for setting up another school planning conference under the joint sponsorship of the FAA, the State Department of Education and the U/F College of Architecture and Fine Arts. The Conference would be specifically focussed on junior high schools and would be designed to clarify application of new planning standards which have emerged from a number of recent research activities. Currently the Conference is planned as a three-day session tentatively scheduled for September 24, 25 and 26.

State Board Grants

56 New Registrations at Mid-Year Meeting

The State Board of Architecture, through its Secretary, Morton T. Ironmonger, has announced that 56 new registrations to practice have been granted since the Board’s January meeting. Only 18 of these represent registration on the basis of written (Junior) examination. Included in this category were: John P. Lynch, Ft. Lauderdale; Larry N. Justice, Thomas T. Mayo, Jr., Lester N. Merwin, and John Allan Rudolph, St. Petersburg; Howard B. Bochairy, Norman E. Wash, Jacksonville; James C. Chapman, Jr., John B. Langley, Winter Park; Jack R. Jones, Leesburg; Edward L. Meadows, Tallahassee; Robert C. Peacock, West Palm Beach; John B. Gosman, Palm Beach; John J. Jetton, Sarasota; Sherman T. Wheeler, Fort Myers; Frank E. Sanchez, Jr., North Miami; Harold E. Seckinger, Miami; and Harvey J. Einrich, Miami Beach.

Those granted registration on the
A poured roof deck or fill of Perlite Insulating Concrete is one of the most efficient and inexpensive means you can specify for reducing interior heat loads. For example, "U" factors of a 1:6 mix ratio range from .200 to .098 — depending on the type of construction and the thickness of roof fill used.

This high insulating effectiveness makes possible a substantial reduction in air-conditioning costs. With lessened heat loads, smaller units, less tonnage and power are required — and economies like these are often greater than the costs of the Florilite Perlite insulating fills that produced them.

In addition... Perlite concrete is lightweight — about one-fifth the weight of standard concrete. So its use makes possible construction economies, too — thus still further reducing the cost of using one of the most versatile and effective materials in building...
Instant Hot Water

HOT WATER
NEW from bryant

You save this space

All You Need - When You Need It - Economically and INSTANTLY!

- 20 year warranty
- Lower initial cost than conventional systems
- Two-temperature water
- Ends expensive replacement costs of tanks, boilers, etc.
- Low operating costs
- Monthly leasing plan available

Perfect for ... Hotels ... Motels ... Restaurants ... Laundries ... Institutions ... Industrial use.

The Inner City...

(Continued from Page 11)

buildings mixed with new. This mixture is one of Downtown's greatest advantages, for Downtown streets need high-yield, middling-yield, low-yield and no-yield enterprises. The intimate restaurant or good steak house, the art store, the university club, the fine tailor, even the book stores and antique stores — it is these kinds of enterprises to which old buildings are so congenial.

Without a mixture on our streets, our Downtowns would be superficially standardized. But old buildings and large cities are especially suited to the small, specialized enterprise which must draw on supplies and skills outside itself. Its market is so selective that it must have exposure to tens of thousands of people. The chief magnet of the Downtown is the enormous collection of small elements, where people can see them, at street level.

The Citizen's Role

The citizen doesn't have to be a planner or architect to ask the right questions in the interest of his city: How can new buildings capitalize on the City's unique qualities? Does the City have a waterfront that can be exploited, or an unusual topography? How can the City tie in new buildings with old ones, so that each complements the other and reinforces the quality of continuity a city should have?

The ultimate expert on such questions can be the citizen. What is needed is an observant eye, curiosity about people and a willingness to walk. He should walk not only the streets of his own city, but the streets of every city he visits. He will understand his own city a little better—and perhaps steal a few ideas.

There is a wonderful challenge! Rarely before has the citizen had such an opportunity to re-shape his city, and to make it the kind of city he likes and that others will like too. Citizens can decide what end-results they want—and then adapt the rebuilding machinery to suit them. If new laws are needed, they can agitate to get them.

Designing a dream city is easy. Re-building a living one takes imagination. It takes the desire of the citizen as well as the three-dimen-sional concepts of the Architect. Collaboratively it can be accomplished.

ELECTRIC WATER HEATER

Cleanest • Simplest • Safest • Cheapest • Coolest
Can be installed anywhere—no vents or flues needed

• In FPL-served areas, unit sales of Electric Water Heaters last year were 6\(\frac{1}{2}\) times the national average.

• Selling aids and factual data available through any FPL office.
Featherock introduces exciting new departures in architectural, and landscape design for the creative architect. Weighing one eighth the weight of normal rock, Featherock has a unique structure, enabling ease of application, and maximum latitudes in creating decorative arrangements. Used as wall facing, Featherock can be easily formed or fitted to any size or shape by the simple use of chisel, bit or saw. Available in grey or charcoal, Featherock combines strength and durability with a natural beauty.
At this year's FAA Convention the spotlight will be on Design — and the theme suggests a program, now taking shape, that will explore the ways in which the art in architecture is molding the life of the community, the neighborhood, the family and the individual . . . The Jacksonville Chapter will be the Sponsoring Host; and its members invite your interest, your presence and your participation . . . Better mark your calendar now for November 12, 13 and 14 at Jacksonville . . .

Convention headquarters will be the brand new Robert Meyer Hotel in downtown Jacksonville. Convention rates will be moderate. Full program details will be sent you in plenty of time to assure the comfortable accommodations you will want . . . When you receive them, act promptly, for the Convention program promises a heavy attendance — and reservations are always and necessarily limited. . . .
