Each year more and more people are appreciating the value of the porch as a living-room—a twelve-month living-room. At little expense for closing-in, furniture, decorations and plants, it can be made of great comfort throughout the winter. Willow or rattan furniture is the best to use, light sundown casement cloth at the windows, braided rugs on the floor—which preferably should be of tiles—and plants—plenty of plants.

This outdoor living-room is in a house at Radnor, Pennsylvania; other pictures of it will be found on pages 178-179.
STAKING OUT A CLAIM IN A YOUNG FOREST—DREAMS AND DISILLUSIONMENTS—THE TOOLS FOR QUICK WORK—THE MYSTERIES OF THE WATER TABLE—SUCCESS IN A WHEEL-HOE GARDEN

Warren H. Miller

Part I—Taming the Wilderness

From the beginning of things I believe I have been a born farmer, which is a very different thing from being born a farmer; for I was raised in a fine, old Colonial town where everybody owned a big place, ten to fifteen acres; gardened, lawned and hedged, every foot of it under cultivation—a very different thing from the average farm. Land was cheap in those days, and living was cheap, so that people of moderate means could easily own a big place and raise enough on it to keep a man who did the gardening, looked after the horses and carriages, etc., in return for the rent of the cottage and one-third the product of orchard and vegetable garden. Ours was one of the smallest of these places—four acres—yet, even we kept an old darkey, who lived in the cottage at the foot of the third terrace, and was given his rent and the cultivation of that terrace in return for general gardening of the place and care of our stock. My particular job was the chicken and pigeon establishment, also all our hunting dogs, besides doing part of the weeding and planting of the vegetable garden, and I look back in wonder to-day at the efficient way in which those trusts were administered, for a boy of twelve; to say nothing of the numerous side-lines of my own—rabbits, guinea pigs, an aquarium, a reptile den—Lord knows what all—white rats and mice, too, if memory serves me correctly!

Then, as I grew to manhood, came five years in Europe and fifteen years' pioneer construction work as an electrical engineer, living in rented houses on small plots of ground, so that one hardly had time to accumulate so much as a dog before new construction work necessitated moving again. But the yearning for a place of my
When preparing the raw soil for planting in a small garden, the first operation is to lay a main drain beneath where the path is to run. If the water table is right, it will be permanent

own, such as I had enjoyed as a boy, would not be stilled, and when I finally settled down, I determined that my three boys would have the same sort of big suburban place to grow up in as I did.

Alas, but the country had changed in those twenty years! In my native town, as in thousands of them like it near big cities on the Eastern seaboard, those fine old estates had all been cut up by the real estate men into little 50 x 100-ft. lots, with scarcely breathing room between the houses. Even the Governor's mansion, with its twenty acres of gardens and grounds, was now reduced to a bare two hundred square feet of land; Van Wyck house, with its noble avenue of pines, its box gardens and stately lawns—swept away utterly, not a trace of it to be found. The Kearney place—trying to look snug and respectable on fifty feet of front for all its sprawling, one-story ways: our own place—what! was this it! this big, high-gambrel roof, flanked closely by squat, "Queen Anne" cottages of nondescript architecture?—It was to weep!

After much search, I found a place 50 miles from the city, on the Atlantic coast, in a fine, hardwood forest, where a development company had put through a magnificent road system with cement sidewalks, water, gas and sewer.

Labor conditions had also changed since my early garden days. No longer could you put up a small house and get a man to live in it and garden for you for a percentage of the total and his rent. Now they want all this and wages besides, which immediately makes the country place an expensive luxury, instead of a self-sustaining property.

I foresaw that I would have to do all the gardening myself, and that, too, in the scant spare time permitted to a busy commuter; so I estimated that about an acre was all I could manage properly. And, as this acre was wild forest, which had to be cleared and tamed, I started on but one-third of it, leaving the rest in park for future years.

It's a heartrending business, this cutting down beautiful forest trees, but it has to be done if you are going to find room and sunlight for a garden and fruit trees. The diagram shows the original layout of house, barn, garden and shrubbery. We left about twenty-five forest trees on the place—four of them on the garden site—as I did not believe at the time of planning that the sun has a very different declination in winter than in summer, and I had read somewhere that the sun's declination was 20 degrees, so I concluded that the shadows of these trees would fall back of the garden on the forest. This theory the sun seemed to amply uphold—in February—for, even at mid-day, it seemed hardly over the southern horizon. As a matter of fact, in midsummer the shadows of these trees fell directly below them at high noon, robbing the plants beneath of their sunlight, and I took all of them out the next year.

I did not realize that much of my boyhood success came from excellently prepared soil, well drained, well meliorated and well fertilized. This had all been done by my elders, leaving me nothing but planting and fighting weeds to insure success. In reality, my forest soil, even after stumping, clearing of roots and adding a thin top-dressing of field soil, was as sour as untold centuries of shade and forest leaf-fall could make it.

To determine the water table height, the bottom of the drain should start a foot below soil level. Note the sub-surface water level. This seepage should be run off to avoid sogginess.

The original vegetable layout had too much of everything and not enough of anything. The plan shows the feasibility of a wheel-hoe garden.

When preparing the raw soil for planting in a small garden, the first operation is to lay a main drain beneath where the path is to run. If the water table is right, it will be permanent.
To me it looked rich and black, needing only drainage to produce a fine yield.

The first big February thaw, with its multitudinous puddles, showed me where the low spots were, and I filled most of them with furnace ashes and field soil. The garden was 35 x 75 feet, capable of feeding five people all summer with green vegetables and fruits if managed rightly. I first trenched and drained it, using about 100 feet of terra-cotta inverted U tile laid on boards in the bottom of the trench, with straw over the joints. The reason for this straw is to catch and hold the silt, which is carried along by the muddy water to the drain and dropped along the plank, thus blocking it. A great deal of it washes through the cracks in the tile joints and catches in the straw. If you put these inverted L tiles directly on the bottom of the trench without the boards underneath, your drain will soon be filled up with silt, and in a year or so you will have to dig it up again. The best material for the bottom board is pitch pine, because of its durability.

This drain carried off all surface water very efficiently, but still the garden was soggy and wet. My water table was not low enough. Now, I had read, vaguely, of water tables in agriculture papers, but I never thought of one as a hostile factor in my own garden. The water table may be defined as the prevailing height of water in the soil all over a given section of land. If too high, put your drains lower. I could not put my drain any lower, for its outlet was already at the lowest available exit from the garden, yet the water table was only about four inches below the surface of the soil. A spade thrust any lower would turn up wet, soaking, sandy loam. Now, the capillary action of soil will draw water up at least four inches above the water table, so my soil was always wet, even in bright sunlight. The only way out was to raise this water table by putting on more fill. This seemed an expensive proposition, so I decided to leave the soil as it was, in the hopes that summer would bring drier conditions.

Meanwhile I had ordered a large box of privet, apple trees, pears, peaches, cherries, berries and grapes, and they now arrived from the nursery. I chose standard apples on the corners, with dwarf Bartlett pears in between, two peaches flanking the garden gate, and two cherries along the back as fillers between the apples. These latter should go on 35-foot centers if standard, whereas dwarf trees require but 15 feet of room; but a standard tree, while it takes longer to get to bearing, will give bushels of apples to your dwarf's dozens. The same is true of pears; the dwarf will begin to bear in two years (one pear!); the third year it may have three pears on it, and the fourth, a dozen. The standard will not bear at all until the fifth year after planting, starting with a two-year, 8-foot nursery tree, but then it will give a dozen for a starter, and from that time on will beat the dwarf five to one in yield. Standard pears should set on at least 20-foot centers, but in a garden like this they will do well enough as fillers between the apples.

For selection of varieties I had no literature available, and there were no orchards near me, but in general, for light, sandy soil, Baldwin (red, winter), Early Harvest (yellow, summer), and Stayman's Winesap (red, striped, fall) are good garden selections. All peaches do well in light soils, so your choice will be mainly for a succession of ripenings throughout the peach season—Early and Late Crawford, Elberta, Ray, etc.—and in this garden I have had very good success with Governor Wood and Black Tartarian cherries. All these were two-year, 7- and 8-foot trees.

Distinction in Dining-Rooms

THE PERIODS THAT CAN BE MIXED—GENERAL RULES FOR MAKING THE ROOM A CHEERY PLACE
WHAT TO AVOID—AND A NOTE ON BREAKFAST-ROOMS

Mary H. Livingston

Photographs by Jessie Tarbox Beals

In planning a dining-room of distinction there are three points to be considered: tradition; demanding and impressing one's personality through this tradition; and suiting one's means to one's choice. It cannot be the composite of various unrelated styles, nor of the unorthodox *nouveau* art—futurist and what not new invention. We must feel conscious of a certain co-ordination in planning. Without co-ordination such a dining-room, although it be wonderfully clever and pleasing, may still lack distinction.

In a traditional room is immediately created an air, a spirit, something that responds to the background of our own experience—be this experience in a New England home, a Southern mansion, villas and cottages abroad, or it merely a result of visits to our shops. People may protest against a period room, saying: "Why should I limit my choice of furnishings to designs produced between such and such a year? It hampers my selection." Such a person does not understand what the periods are. There is not standard of scale or universality of spirit running through the periods, and hence they cannot be mingled successfully. You cannot put American Colonial with French furniture of Louis XIII, because one is light in scale and domestic in spirit; the other heavy in scale and majestically ponderous in spirit. It is not a matter of dates, this incongruity. By the consistent use of a period style, formality and restfulness, plus cheeriness, create the desirable dining-room.

To many of us, and particularly to men, dining is the high spot of the waking hours. A good dinner works the daily miracle of a man's existence. Let the dining-room have restful spaces, comfortable chairs, adequate table-room and the elimination of an over-loaded sideboard and ostentatious china. Let the walls be light in tone. Let there be enough light to eat by. Women are apt to light a table insufficiently—a soft, becoming glow from shaded candles. Men, with little or no concern for their wrinkles and graying hair, have a less impelling aesthetic sense. So, if possible, have side wall fixtures, which, with the candles, will give sufficient light. If side fixtures are not feasible,
use a center drop light with a flaring Empire shade of soft-toned silk bound with heavy fringe, toned with the color of the walls, making it as unobtrusive as possible. Have the light hung high enough so that the diner can see his vis-a-vis, but deep enough to prevent the electric bulbs from glaring into his eyes. If a central gas fixture has to be considered, use flaring white porcelain shades, and over these silk shirred shades of a warm tan or old rose. These throw the light down upon the table and give to the room a soft, pleasant glow. If preferred, candlesticks of silver or copper with shades or shields may be used on the serving-table or sideboard. In country houses there is often neither gas nor electricity, and in such a case small twin oil lamps with old-fashioned glass shades, or sconces for candles, are attractive and serviceable. The main thing to avoid is a large oil lamp in the center of the table or an electric hanging fixture with glaring green or red-glass shade. This unpleasant feature spoils more dining-rooms in the modern apartment than any other, I believe. It is almost always out of proportion and usually dwarfs the room. Why should it be tolerated when at a slight expense it can be removed and a tasteful substitute made? This matter of good lighting fixtures I have spoken of at length because it has to do so much with restfulness.

It is best to have no more furniture in the dining-room than is necessary. The table, enough chairs for family and guests, and a serving table. An open fire is pleasant, and the English habit of having a little coal fire to greet one in the morning is particularly conducive to starting the day aright. If there is a fireplace in the room, have the fire laid before the meal. In so many rooms boasting this distinctly sociable feature the fireplace is left bare and gaping, a hole of black dejection, whereas a few logs and cones on the fire dogs, or a neatly filled and highly polished grate would add much cheer and distinction to the room.

It is rather a pity that the habit of a "dining-room suite" of furniture has become so impressed upon most of us. Much more interest and originality can be created by mixing two styles of consistent design. Choose, for example, mahogany Hepplewhite chairs, a sideboard of Sheraton design, inlaid with satin wood, and a serving-table of enamel or walnut of French Louis XVI. This combination, or one equally good, does not make the dining-room "mixy;" to the contrary, it is a pleasing and restful variation.

Another practice that helps give restfulness to a room is the use of things in pairs: well-balanced panels; a pair of lighting fixtures, two candles on the serving table or mantel; a pair of old decanters on the sideboard; two consoles or serving tables.

The most inharmonious thing in a dining-room is usually the sideboard, covered with plate and china. Its appearance is usually no worse, however, than the average china closet. There is something that smacks a little of the vulgar in such display. Those who champion the china closet maintain that glass and china should be kept in the dining-room so that the mistress can keep her eye on the breakables, take account of stock each day, and thereby keep the housemaid under discipline. Wouldn't it be as easy for the mistress to investigate her pantry each morning?

All the furniture in the dining-room should occupy no more space than is absolutely necessary.
In planning, have a space reserved for the sideboard, into which it fits. Do not let it protrude into the room. Such fittings as a china closet, if one must have one, should be built in.

The foremost essential for cheeriness is exposure. If possible, have the dining-room windows face south or east, for the morning sun at breakfast helps in starting the day well. If the exposure must be west, we will find much joy in watching the sun set as we dine in the summer.

A group of windows is always preferable to scattered ones. They lend themselves better to decoration with hangings and plants, and besides, we get from a group of windows a broad, generous outlook. On the opposite side should be the fireplace, so that when the sun deserts us at our meals we can make use of his understudy. The day of the basement dining-room has passed, let us hope. To those of us not brought up in New York the idea certainly made a most unpleasant impression at first experience. The pyramidal walnut suites of our mothers' day, set as they were in a dark-toned basement dining-room, must have made eating a dismal horror. But in many city homes the dining-room is sunless, albeit it is above stairs. In this case a light, gay-flowered paper will prove charming, adding life and brightness that is lacking. In the country, light, paneled walls or plain papers are best.

The floor of the dining-room may either be stained and waxed or painted. In the center, leaving a border of about three feet, spread an Oriental or plain rug. Oriental rugs are the most accommodating things in the world; they tone in with every sort of furniture, decoration and hanging. Never use a patterned carpet in a dining-room, especially one with a scattered pattern. The floor should be kept unobtrusive.

Walls may be treated in any number of ways, but must be kept lighter in tone than the floor. Panelled walls of oak or cypress are beautiful, but in using these woods one is limited in one's choice of furniture. One successful treatment is to panel the wall in large spaces in creamy white or soft gray. Should wood paneling prove too expensive, strips of moulding fastened on the plaster and the whole covered with several coats of paint make a distinguished and at the same time an expensive wall. Either buff striped paper or plain Eltonbury paper in a warm tan makes an excellent background for mahogany furniture.

The ceiling must be toned in with the side wall, but never a dead white. Beamed ceilings are almost always too heavy and out of proportion in a small dining-room. It takes a very large dining-room to carry off a beamed ceiling and have it achieve any distinction. Delicate plaster designing may be used with success on the ceiling of a rather pretentious dining-room, but a simple, classic cornice is much better than a heavy, over-elaborated type. All these things are simply a matter of proportion.

"To break bread" presumes a certain intimacy, and it is as her dining-room is cheery or cheerless, as her meals are carefully chosen and served, meagre or overponderous, that we judge a hostess. She stands or falls with her dining-room.

The floor of the Colonial dining-room is a gracious style, and for many homes this has proved the most successful, especially as we are rather rich in heritage of old mahogany. Simplicity must be the key-note: white, paneled walls, with perhaps an old family portrait over the fireplace; and simple side fixtures of Sheffield plate silver, make a good beginning. A wonderfully decorative and (Continued on page 193)
THE PLAIN FACTS OF GLADIOLI CULTURE—THEIR THREE METHODS OF INCREASE—SUCCESSION PLANTING—THE TIME TO CUT BLOSSOMS—WINTER CARE OF CORMS

STEPHEN EDSALL

The most feasible method, then, is to buy your corms, which are cheap enough except in the finest varieties. Buy from a reputable seed house and your probability of loss and consequent disappointment will be reduced to a minimum if you follow directions. The first direction is to choose the right soil. Avoid a heavy, clay soil. They thrive in a light loam or sandy soil which is retentive of moisture, the ideal being a sod fall spaded or plowed, and then thoroughly worked over in the spring. Also avoid strong, fresh stable manure. If the soil lacks plant food, any commercial fertilizer thoroughly worked through will answer the purpose. Moreover, gladioli should have a new place every year, and always an open, sunny situation. Plant as early in the spring as the soil can be fitted, for late spring frosts do not penetrate deep enough to harm the early planted corms. If a heavy frost happens along, a light covering will forestall damage. With the first planting, do not use the largest bulbs; keep them for the second or third planting, as the larger bulbs withstand the dry heat of summer better than the smaller ones. This succession of planting, with a two weeks’ interval between, may be continued profitably as late as in the middle of June, or even as late as July 4th, but the months of August and September, being notably hot and dry, the later plantings are more likely to be less luxuriant, unless moisture is plentifully supplied. For these later plantings it is not difficult to find places, as some early vegetable has been used by this time, leaving vacant spaces in the garden. (Continued on page 196)
Mrs. John on Orcharding

THE CITY WOMAN WHO SET OUT TO UPLIFT THE COUNTRY FOLK AND FOUND THE TABLES TURNED—
A HOUSE THAT HELD HANDS WITH A WOODSHED—RECOVERING A LOST FIREPLACE—LIFE

Susana Rathbone Anthony

EDITOR'S NOTE: Readers of Home & Garden will recall both John Anthony and Mrs. John Anthony. Here is a page of confessions by the latter—a human story that will make your heart leap up if ever a longing for the country has seized you.

ANCY starting to live in the country—the New England hill country—in March! We came on the 22nd; came from a steam-heated, well-appointed city house to a bleak, desolate—looking, shivery hillside.

My grandfather used to say that you could tell how good a Christian a man was just by looking at his woodpile, so I went out to look at ours. If John had stood sponsor for it I never could have read his title clear to the skye mansions, but, luckily, I recalled that he had ordered forty cords. That was the first blow. Next came the hens. They ranged freely because the theory is that a free range is best for both orchard and hens. Unfortunately for my disposition, the hens thought the orchard was located on the front porch and on what ought to be the front lawn. John and I nearly came to "words" over them, but later, when he found how they devastated our garden and had no respect for his barn and his wagons, he decided to build a hen-yard—or rather, let the "Chicken Lady" build it!

Before we were married I had seen the house, but because of John I wore rose-colored glasses. His practical pen had discoursed so eloquently about the stability of the underpinning of huge slabs of Vermont granite, the fine way his tiresome apples kept in the cellar, the ever-running spring water and the two old fireplaces that I, too, was sure nothing else mattered.

Then, too, I had been accumulating a lot of what the country-folk discredit as "book knowledge," and I saw myself transforming not only the house interior, but "uplifting" the manners, morals and house interiors of all my neighbors. Why not? Had I not had superior home training at the hands of that efficient Christian a man? I forgot when I contemplated all this that at home we always had a servant and always the possibility of extra help across the way. Again, why not, since I had not only taken two domestic science courses, but had taught several branches of housewifely arts for nearly a decade in two of the best-known household arts schools?

For forty-six years the charm of this fireplace had been lost. I went out to look at ours. If John had stood sponsor for it I never could have read his title clear to the skye mansions, but, luckily, I recalled that he had ordered forty cords. That was the first blow. Next came the hens. They ranged freely because the theory is that a free range is best for both orchard and hens. Unfortunately for my disposition, the hens thought the orchard was located on the front porch and on what ought to be the front lawn. John and I nearly came to "words" over them, but later, when he found how they devastated our garden and had no respect for his barn and his wagons, he decided to build a hen-yard—or rather, let the "Chicken Lady" build it!

Before we were married I had seen the house, but because of John I wore rose-colored glasses. His practical pen had discoursed so eloquently about the stability of the underpinning of huge slabs of Vermont granite, the fine way his tiresome apples kept in the cellar, the ever-running spring water and the two old fireplaces that I, too, was sure nothing else mattered.

Then, too, I had been accumulating a lot of what the country-folk discredit as "book knowledge," and I saw myself transforming not only the house interior, but "uplifting" the manners, morals and house interiors of all my neighbors. Why not? Had I not had superior home training at the hands of that efficient housewife—my mother? I forgot when I contemplated all this that at home we always had a servant and always the possibility of extra help across the way. Again, why not, since I had not only taken two domestic science courses, but had taught several branches of housewifely arts for nearly a decade in two of the best-known household arts schools?

Metropolitan friends who looked a little pityingly on living in the country, even with John, said: "How much you can do for the country woman!" I disclaimed modestly, but secretly thought I could. However, it wasn't long before I found the country-folk were uplifting me! When there is only one woman to do every bit of work, it doesn't matter that she knows how to cook a delicious variety of food dietetically correct. One comes to understand why plain boiled potatoes supersede mashed and French-fried; why pie is the daily pièce-de-résistance—delectable,
“filling,” quickly and easily made and fairly inexpensive. So it goes. I haven’t yet come to white oil cloth or a red tablecloth, but I am no longer horrified by those who do!

Like most of these hill-country houses, ours is a story-and-a-half house, holding hands with the woodshed and the barn. When we came, the front of the house was painted gray, with white on the east end. On the barns and woodshed, the sides visible from the road displayed a coat of red, but the backs of all the buildings were guiltless of paint.

I have not yet ceased to wonder where the former owner put his family of eight, to say nothing of his “lairs and peanuts.” We find that our present family of four fills the house comfortably, and our Lares and Penates clamor for larger quarters. However, we feel distinctly metropolitan because we must hoist our upper-story furniture through the window. The room now our living-room had been used as kitchen, dining-room and living-room. The floor was worn hollow, splintered, and most of the yellow ocher paint had worn off. This color had been used on the baseboards, and a cold, dingy, drab paint was on the rest of the wood. An ugly, flowered paper, with a dominant note of pink, was on the walls; the ceiling was black with smoke. The cook-stove, which continually leaked ashes because of a broken casting, stood in front of the fireplace. For forty-six years the charm of this fireplace had been lost. It was boarded up and over the boards a green paper hung in tatters. The shades at the window were old and dingy, perforated like a strainer.

We called in some painters and paperers who had been imported for a wealthy neighbor’s work. Their estimate on one room made it impossible for us to consider employing them, so we rolled up our sleeves and started in. It took about four weeks of intermittent evening work to get that doleful, drab paint covered—but, such a transformation! We hid the paper with successive coats of tan Muresco—eventually we plan to seal it with our own wood; new shades were ordered from a hitherto despised mail-order catalogue. We made mahogany sectional bookcases by applying a mahogany stain to apple boxes. A few bits of real mahogany lent an air of verity, and we feel irritated when (Continued on page 186).

At the end of the orchard is our “dream tree,” where John and I dazzle our minds with plans for the future and feast our eyes on the view of the surrounding hills.
Though it has a tendency to weedyishness and garish color, the petunia is of easy culture and profuse bloom.

Because of the long season of bloom and ease of culture, nothing is better for edging than Sweet Alyssum.

Making the seed order—the flowers to start now from seed—where to place them in the garden—how to handle the seeds before planting

F. F. Rockwell

Photographs by N. R. Graves

A garden lingerer, the cosmos is unequalled among the tall annuals for late summer.

The annuals, too, are, on the average, much more dwarf in growth and lend themselves readily for edging and foreground planting in front of taller things.

A combination border with hardy perennials in the background and with bedding plants and annuals in the foreground makes a convenient and effective way of arranging the garden, particularly on the small place, where it is advisable to avoid the “chopped-up” appearance resulting from making too many flower beds, crowded, for want of room, too close together.

There are several methods of starting the plants, depending upon the use to which they are to be put and also upon the variety. Some of them, being introductions from warmer climates, take such a long season to mature that they must be started indoors early in the season. Others which do not take kindly to transplanting and come into flower quickly are better sown where they are wanted to bloom. Still others which would bloom if sown outdoors and may be handled in that way, give much quicker results if started early so that a good part of their growth is made by the time they are set into the flower bed or border in which it is intended to have them mature. These methods may be described briefly as “Sowing in Heat,” “Sowing in the Seed Border,” and “Sowing Where They Are to Bloom.”

The first method, of course, involves more...
work than the others. It gives the earliest and most certain results. And, with a number of plants, such as cosmos, and with most of the biennials and perennials that may be grown to flower the first season, it must be used. In all cases, except where a dense edging or a tangled mass of bloom is wanted, one can get more satisfactory results by having plants to set out than by sowing seed.

Often it is not possible to start all one's flower seeds, and the next best method is to make up a little border of finely prepared soil raised somewhat from the level of the ground and in a sheltered position, where it can be readily tended and watered. In a coldframe, or against the south wall of the house or garage (where water from the eaves will not drip on it) will make a good place. It is much better to start all the seedlings in one place than to plant them all around the garden, a few here and a few there, with the idea of transplanting them later. They all need much the same care in the early stages of growth, and it not only saves a great deal of time, but it secures much better results to have them all in one place where the various operations of thinning out, watering, trimming back, and so forth, may be more expeditiously carried out.

Then, with most of your flowers started in one of these ways, things like poppies and nasturtiums, which are usually sown where they are to bloom, can be planted under the right conditions: just after a good, soaking rain, where there is a prospect of several days of warm weather, or at the beginning of a warm, rainy "spell."

By all means, make up your order for flower seeds in the garden. Take a little stroll around the place and see what needs to be planted, rather than look through the catalogue to see what there is you will like to plant. Jot down, as you look about, the conditions you will have to meet.

You can go over your place from side to side and from front to back. With your garden problems all before you on a sheet of paper, you can go over the list of flowers to be started from seed —some of which are given at the end of this article—and select those things which will best answer your own particular purposes. Get for the back fence, for instance, a packet of the red sunflowers, which, while not pure red, are distinctly different from any of the older sort, being striped, shaded and zoned with red—the flower being borne freely on tall, branching stalks. As for the neighboring hen-yard—start some Ricinus, one of the taller-growing sorts, if necessary, which will grow to a height of 8 or 10 feet; the hens will take care of that. Nothing is better for a long row of edging than Sweet Alyssum—Lilac Queen is a new variety which is equally as good as the white sort for a border. If the lawn mower must be used close to the bed something more upright will be preferable, and then one of the candytufts can be used. Or for a still more upright border the dwarf zinnias, either in mixed colors or in scarlet. Where a tall background plant is wanted, the new annual hollyhock, which will bloom freely the first year if sown early, would prove ideal. There are, of course, a number of other things which would answer this purpose—such as the taller snapdragons, or amaranthus or closia. For a partly shaded bed, where beautiful flowers are wanted, one of the many fine bedding begonias would do well—although for a situation of this kind nothing surpasses the tuberous begonias. Where a low bed of bright colors may be wanted in the full sunlight the favorite old portulacas are sure to give pleasing results. Parana, a new sort, has flowers a great deal larger than any of the older kind. Flower seeds vary greatly in size, in shape, in hardness, in the amount of heat required to get them to germinate, and in the ways which they should be handled after they are up and as they grow. But there are a few rules in regard to starting them which apply to all. Heat and moisture must be supplied, whether they are started inside or out, which will meet their individual requirements. Indoors both these things may be regulated. Outside, of course, one has to take a chance on the temperature; but it is one's own fault if he plants tender things in April and fails to obtain successful results. But, both inside and out, the amount of moisture can be regul-
We always hurried by the place, especially after dark, fearing that some dreadful thing would spring out at us from behind the great spruce trees. No house and grounds could have been more gloomy and forbidding. A high picket fence, painted brown and sand-ed, was in front of the house. The gate was really the only fascinating thing about the whole place. It was kept shut by an iron chain that was hung from the gate to a post, and on it was a heavy iron ball. This chain made a splendid swing for a little girl, and on the few occasions when I ventured into the yard the temptation to stop for just a moment and try the swing would overcome me, until I thought of the stern-faced people who might at any time fling open the big door and glare out at me. The place looked like the people within the house, and I can remember when a child, wondering if houses always looked like the people who lived in them. A straight, brick walk, almost overgrown with grass, led up to the front door of the austere, white house with high, front steps and with many grea-blinds that were always closed. Shades were drawn to most of the windows, too, so little, if any, sun ever peeped into the cold, uninviting rooms. The brick walk led one around the house to a side porch. There were a few peonies, a honeysuckle bush, a syringa and some blush roses along its edge. A forlorn old horse grazed in the yard and kept the

Near the side porch was the same syringa bush now grown 'way above the second story windows, a shower of white blossoms in June
grass from entirely overrunning the place. My big brothers used to tell us that this horse was fed on barrel hoops, as we might plainly see when we looked at his sides, and we, in our youthful simplicity, believed it.

I remember going up the side steps of this house when I was a little girl and knocking timidly at the door when I was sent there on an errand, and the greeting that I met was like everything about the place—cold and formal. The glimpse of the interior, showing plain, white walls, unpapered throughout; no pictures anywhere; no draperies; no little home touches, made me long to hurry away much faster than I had come. So the place held for its craggy arms over the eaves and onto the very roof itself.

I went often to admire this spot during my stay in Oldham. I was irresistibly drawn to it, not only because of its beauty and restfulness, but because of the fact that I was interested in seeing how much had been done to transform an ugly, uninteresting spot into a lovely one. It was so impressed upon me that I was constantly in a state of wonderment and surprise. Then, too, it was interesting and delightful to meet the ones who had transformed it and to go away with a sweet, happy memory of the place that long ago gave me an almost uncanny feeling.

Only half a block away from a noisy, dusty business street one

It was in the backyard that the clothes drier used to be, its long arms always ready for a swing. Now a bird bath stands there, and orioles and blue birds banter where the children would swing. A matrimony over the back door, too.

many years for us all a memory full of mystery, dread and fear.

Imagine my surprise when, on going back to the little town of Oldham last summer, I found this place a most attractive one and the house full of charm. The youngest son of the family had married, and, full of the right kind of sentiment, had bought the old home and made it so inviting and comfortable that I found it hard to believe it the place of long ago. Yet there was the same little brick wall, not overgrown as it used to be, but well kept in every way. There, too, was the syringa bush near the side porch, now grown 'way above the second-story windows, and a mass of white blooms when I saw it in June. The white lilac bush near the front steps was a real lilac tree, and a beautiful trumpet vine partly covered the south side of the house and ran found this fresh, attractive yard, and it was all the more attractive because of the great contrast, perhaps. A yard 76 by 120 feet; houses very near, and shops not far away, and yet the spot was full of blooming shrubs and plants; birds were singing all the day, building their nests and rearing their young in safety. There were bird houses provided, two birds' baths and many fruit-bearing trees and shrubs and the different members of the family were on the lookout constantly for enemies of the birds. Cats and English sparrows were not cordially received. In fact, an air gun was often called into action.

I am going to tell you in detail about the making over of this yard, to show any incredulous city person who feels that it cannot be done, that it is a possibility and a very successful one.
At the south of the entrance to the front yard a double-flowering plum flourished and looked like a great pink popcorn ball in season. Across the front of the yard to the south was a pretty row of Japanese barberries that met a glorious hedge forming the south boundary of the place. This hedge had been worked out with thought and care. Most of the things in it were native shrubs and trees brought from the woods and lanes near by. How they did grow, and how graceful and artistic the whole arrangement was in contour, color and grouping! There were bushes of wahoo, snowberry, dogwood, high-bush cranberry, golden elder, the lovely purple barberry, golden syringa, sumac (the cut-leaf), Tartarian honeysuckles (in white and pink), and lilacs of different colors. It was always showing blossoms or partly hidden by overhanging branches of cranberry and dogwood, was a great trunk of an oak tree, over which ran blossoming nasturtium vines. On this stump was the basin for the birds' bath, and all through the summer the birds came in numbers to drink and bathe, and no spot in the yard was more attractive.

I remember many delightful afternoons spent in this garden, yet one stands out in my memory more distinctly than any other, and it is because of the joy I had that day in watching the birds come to this bath. When I tell you of it, please remember how many people are saying things like this nowadays—"No wonder we never see birds now as we did long ago. They used to come to our yards, but they do not like the city." Then, too, please remember that this yard is less than a block from one of the

fruit of some kind, and in the fall was especially attractive to the birds, as well as to the people. The cedar waxings would come in dozens and settle down on the Tartarian honeysuckles, and when they took their flight not a red berry would be left to delight our eyes. The catbird, cuckoos and brown thrasher would come creeping in and out, feasting on the berries of the elder, and seldom did they leave without calling back a little "thank you" song. This hedge formed a graceful, irregular line along the lawn. Around one of its curves was a border of sedum—and, by the way, nothing can be prettier in such a place than this plant with its trim, stiff branches, its soft, green color and its especially attractive pink flowers in the fall. Behind this sedum grew quantities of the white snakeroot that had been brought from the woods near the river. This filled in the space completely between the sedum and the higher shrubs back of it, and its white flowers harmonized with whatever blossomed near. Close to the hedge,
The Irish terrier is a true Irishman. I do not mean a low comedian with a red wig and a stub of a clay pipe, nor a sweetly, sad, romantic tenor with nicely rouged cheeks and pumps with great silver buckles. The objection of a certain tremendously clever gentleman from Dublin that there is no typical Irishman is half truth, for the "typical Irishman" is usually a poor, lopsided creature. If drawn by a comic artist, his external features are exaggerated out of proportion. A lady novelist, on the other hand, will turn him inside out, an equally unfaithful portrait.

The terrier from Ireland is remarkably like his original master. As one of his oldest and best friends once said to me: "Shure, he's a rale bit o' the Ould Sod." Irish terrier and Irish gentleman both hide their deeper feelings and finer sensibilities under an apparently care-free exterior. The better one knows these two, the stronger their likenesses in disposition and character appear. So, after a deal of casting about, I can find no more fitting title for this, the story of the Irish terrier, than the two words "Real Irish." But one must remember what real Irish is.

The little, four-footed Irishman is the most lovable of dogs. Always happy and lively, with a devil-may-care air, he is a bit too cock-sure at times, but his heart is light as a balloon and almost as big, and he is always ready to meet anyone half way. He races through life, his head cocked on one side, his bright eyes sparkling with keen merriment, his tail gaily erect. He is ever on the alert, and he never misses a trick in the game. He may blarney, but he never begs; and he fears no man or beast. Come fair weather or foul, good luck or bad, he is always the same cheerful little chap, ever ready to share any lot with his beloved master.

This master of his is his god. Though he can never be accused of snobbishness, still his deep affection for his own family is a very different thing from his frank camaraderie with the world at large. His love is strong and sure and faithful to the very end of his life. Only the voice of his master, raised in displeasure or in discipline, can stop the gay wagging of his tail, but he is very sensitive to rebuke from those he loves. Through his heart he is tractable to training that could never be beaten into his tough little hide.

All the terriers are blessed with the happy knack of making themselves at home in any clime and under any circumstance, but in this the Irish terrier is trebly blessed. Box him up in a crate and ship him off—it makes not a bit of difference whether your destination be a ranch in Arizona or an apartment in New York—when you open up his box he will hop out, greet you with a joyous bark, make a hurried inspection of the new premises, and come back with wagging tail to tell you: "This suits me! Now, what's next on the program?"

Over and above his perfect adaptability to any surroundings, the Irish terrier can with impunity be cosmopolitan in his associations. He can hobnob with the grooms in the stables without losing those qualities that make him so delightful a companion for his mistress. He is one of those rare chaps equally at home and equally popular in the harness room and in the parlor. Moreover, he is well able to lead a varied life. He is a bully good pal for man or boy in the country. He is a fitting and proper escort for milady in town. He will hunt moles or rats or woodchucks with furious gusto from morn till night, and...
he will also lie for hours at a time on the nursery floor, mauled and pulled about by the children. He will run his legs off after a tomcat, and he will fearlessly tackle any tramp or burglar; but no one ever even thought of him as snappish or bad tempered. The Airedale is proverbially a versatile dog, but the Irishman is hardly less so. The main difference is one of pounds. The Irish terrier is not big enough to hunt grizzlies in the Rockies or lions in Africa. The Airedale is too big to be comfortable in the house or convenient in the city.

Years ago in belligerent Belfast, which was the heartstone of the breed's home, the nickname of Daredevil was bestowed on the Irish terrier. He is truly a reckless dog, who carries a chip delicately balanced on his long, sloping shoulder. His rivals have made this the basis of many a jealous shr. "The greater the truth, the greater the libel," but the Irishman, despite all his liking for an occasional mixup, is not a bad dog. True, he is a very touchy dog, quick as lightning to resent any familiarity or interference from other dogs. "To be sure," one of his Ulster friends once said to me, "He's a daredevil, but ah! he's such a dear devil, and as for a dog that won't fight when he's picked on, he's as bad as a man—worse!" This truly Hibernian reasoning is perfectly valid and sound in the case of a so thoroughly Irish terrier. One does not have to believe that John L. Sullivan is deserving of a niche in the Hall of Fame to admire a man who uses his fists to protect his person or to answer certain insults. Nor does one have to be a lover of dog fights to dislike a dog that tucks his tail between his legs and cuts for home whenever a gutter pup comes sniffing about. There is not a malicious hair in the Irish terrier's wiry jacket. He never sets out deliberately to hunt for trouble; he never "starts things" out of pure devilry; he never plays the bully or the thug. He does not scrap without an excuse, and his fights are never the deadly, grab-the-throat-and-hang-on-till-death affairs of some other dogs. Moreover, the Irishman's scrappiness has been magnified. Probably he fights no more than any other gitty, spirited dog, and, since he is amenable to reason, he will, if properly brought up, prove to be a remarkably peaceable canine citizen.

"Happy is the race," says the proverb, "that has no history," and in this may lie the secret of the Irish terrier's happy-go-lucky disposition. Gallons of good black ink have been spilled over the origin of the breed, obscuring, if anything, what was from the first a mystery. When all is written, what we know is that the breed was discovered, all ready-made, some three-quarters of a century ago in the North of Ireland. "Stonehenge," in his monumental "Book of the Dog," which in the early days was the dog fancier's vade mecum, opened the discussion by boldly declaring that the Irish terrier was nothing more nor less than the common or garden variety of terrier that flourished in the Border counties of England and Scotland about 1800, transplanted and given a national name that he did not deserve. The Daredevil's Irish friends came to his rescue, and Mr. R. J. Ridgeway capped the climax of all extravagant claims by stating that there were unmistakable references to the dog in sundry ancient Celtic manuscripts, chronicles of the Irish kings. He, however, failed dismally when the production of the aged parchments was demanded, and "Billy" Graham, whose love for the dog won for him the sobriquet of "The Irish Ambassador," very properly poked fun.
at all this balderdash by solemnly declaring that the sole and only reason the Irish terrier was not itemized in the manifest of the Ark was that Noah knew they could swim so well that it would be foolish to take a pair of them aboard.

Dog fanciers dote upon finding an ancient and honorable lineage for their favorite breed, but the terrier from Erin is quite well able to stand upon his own straight legs, thank you. However, those who feel that age is a desirable attribute for the winning disposition and his marked individualities, and all the discussions about his origin proved to be valuable advertising. But historical debates were not the only ones held on the attractive subject of the Irish terrier. His early friends wrought themselves into furies over the questions of how much white should be allowed on his chest and what should be the correct color of his toenails. Next came the cropping question—in those days the Irishman’s ears were cropped, as the Great Dane’s and the Boston terrier’s are now—but this was settled once and for all by the firm action of the club devoted to the interests of the breed. The Irish terrier can, therefore, claim justly to have initiated the cropping discussion which ended in the abolition of this custom for all breeds in England, a question that has recently been put to our own American Kennel Club, and which may soon be answered by an anti-cropping edict in this country.

The red fox terrier bugaboo, which, like the poor, is always with us, was first raised over the long, lean head of Champion Bachelor, a famous dog who made his début in 1885. Everyone who knows both the Irish and the wire fox terriers knows that the two are, speaking roughly, similar dogs. They are, however, quite distinct in type. In the first place, the Irishman is not only four or five pounds heavier, but, being lithe and racy, he is larger for his weight. He is built after the model of a thoroughbred racehorse, while the fox terrier is a cobby hackney. The greatest difference, however, is in the head and expression. The Daredevil’s head is, roughly, like a wedge; the fox terrier’s is coffin-shaped. Moreover, the correct Irish head has a definite “stop,” or dent, between the eyes; the ears are placed higher and carried more lightly; the eyes are set in at a more acute angle; the stiff hair on the muzzle is a tuft under the chin—not on the upper lips. All these seemingly trifling details result in a very great difference in expression. The fox terrier looks keen and varminty; the Irish terrier expression is alert and devil-may-care. The difference, which seems a mere technical distinction on paper, is very appreciable when one sees two typical dogs of the breeds. (Continued on page 198)
The Uses of Woodwork in Interior Decoration

CONSIDERING THE PERIOD OF ADAM—DIGNITY, DELICACY AND DRYNESS—THE STRUCTURAL ELEMENTS OF AN ADAM REPRODUCTION—THE PURELY ORNAMENTAL USE OF FURNITURE

Alfred Morton Githens

"If we have any claim to approbation, we found it on this alone: that we flatter ourselves we have been able to seize with some degree of success the beautiful spirit of antiquity, and to inform it with novelty and variety through all our numerous ways."

So Robert Adam wrote a hundred and fifty years ago. His work in general, and particularly the decoration of his rooms, seem to me close in spirit to the old Roman work. His arrangements are always of the highest dignity, his outlines pure and delicate. Dignity, Delicacy: these are the chief attributes; must we admit at times a certain dryness? His rooms are lofty, ennobling, inspiring; but conventional to the last degree, with the rigidity of a formal age.

His was the last great period of English architecture; after it came the "church warden" and all the confused abortions that culminated in the Mid-Victorian. The great cabinetmakers, Hepplewhite, Sheraton and Shearer, were his contemporaries; under his influence their furniture developed the characteristically delicate purity of outline and modeling we know so well. Robert Adam was the central figure, dominating these men and his three brothers; we see Robert Adam in the delicate classic Wedgwood figures, white on a dull blue, gray, pink or chocolate ground; for Wedgwood was a contemporary and copied Adam's architectural decoration in porcelain. This cameo-like treatment was first popularized by Adam. Nearly all his walls and ceilings show fine white decorations on a pale tinted ground, whereas his immediate predecessors, as far as I know, never colored their ceilings except for a sparing use of gold on certain parts of the ornament; on the walls they used oak or white painted wainscoting whenever they could.

He himself explains his scheme in describing his work at Kenwood:

"The grounds of the panels and friezes are colored with light tints of pink and green, so as to take off the glare of the white, so common in every ceiling till of late. This always appeared to me so cold and unfinished that I ventured this variety of grounds to relieve the ornaments, to remove the crudeness of the white and to create a harmony with the ceiling and the side walls with their hanging decorations."

Wainscoting he seldom used; nothing heavy or clumsy; such a thing as a gilt mirror-frame and window-cornice; gray, pale green or dull, yellow walls, relieving the white chair-rail, base, door frame and picture framing; ceiling, pale colors, with plaster cornice, moldings and arabesque in white, and inserted circular paintings; mahogany door, painted panels; dark wood floor with carpet of special design; all furniture of Hepplewhite or Sheraton type.

If we have any claim to approbation, we found it on this alone: that we flatter ourselves we have been able to seize with some degree of success the beautiful spirit of antiquity, and to inform it with novelty and variety through all our numerous ways.

Corner of a room after manner of Robert Adam—Mantel of white marble, colored inlay, or of white wood; gilt mirror-frame and window-corner; grey, pale green or dull, yellow walls, relieving the white chair-rail, base, door frame and picture framing; ceiling, pale colors, with plaster cornice, moldings and arabesque in white, and inserted circular paintings; mahogany door, painted panels; dark wood floor with carpet of special design; all furniture of Hepplewhite or Sheraton type.

He took under his charge the complete decoration of a room, designing the carpet, the window hangings, all the furniture, even the ornaments. There was nothing whatever left to chance: there could not be, with a room pitched in such a high and delicate key. A Jacobean room, with its dark oak wainscot, is of a burlier, heartier type and can assimilate many a monstrosity without being much the worse; but not so this exotic from the South, as certain manor houses in England testify, whose owners have furnished their Adam rooms without discrimination.
The furniture had its set place along the walls. Between the windows were half-round tables of inlaid or painted mahogany and other woods. They were called pier tables, as they stood against the "piers" or masses of wall between the window openings. Under the windows stood window stools. At other places against the wall were chairs and sofas. The dining-room contained a great sideboard, long and low, with wine-cooler and cellarette below, and knife-cases in the form of classic urns above. There seems occasionally to have been a center table in the dining-room. Otherwise all furniture was ranged along the walls.

For cards, the pier-tables were brought out and set back to back in pairs to form circular tables. If they were made in the familiar manner, with double-hinged top and sliding leg, a single pier-table would form the complete circle. In the dining-room several rectangular pier-tables were brought to the center and placed side by side, with a half-round pier-table at each end. This formed the dining table, or "Set of Dining Tables," as the term was then. After dinner, back to the wall they went.

There were no books, papers or odds and ends about; one or two vases or statuettes may have stood on the mantel; the books or papers were in the library. In short, the Adam room was the formal setting of a formal, dignified life: shocking at times their conversation might have been to our sense of modesty; but nevertheless the life was one of rigid convention and etiquette.

Whether such a style is suited to our free-and-easy ways, I much misdoubt. Would such a room seem ever right with chairs and tables not formally arranged? In a drawing-room, perhaps, or reception room or dining-room? One could never lounge in such a room; but, then, he cannot lounge against a Sheraton or a Hepplewhite chair-back without breaking it. Many an old lady still remembers being reproved for leaning against the back of a chair. O tempora! O mores! Perhaps rocking on the hind legs of a chair will be considered perfectly wood and before long.

But to more certain matters. The Adam style, we have said, was primarily a style of plaster decoration. For this alone it should be worth our study, for we have made little use of decorative plaster in this country. A revival of it seems just beginning. Unfortunately, "plasterwork" suggests immediately the coarse, heavy cornices and centerpieces of the Brownstone Age; "Stucco" suggests cheap, poor, sham construction. But it need not mean anything of the sort. The Greeks and Romans had the highest respect for the hard, white coating. The great Doric temples of Paestum and Agrigentum, the Ionic Temple at Bassae—all were of cut stone covered with plaster or stucco. The finish was so fine and hard that in Roman times slabs were cut from the walls and used as table-tops, and even as mirrors! Vitruvius describes it as often more beautiful and more durable than marble; but, as far as I know, where marble was used as the building material it was not covered with plaster. The temples mentioned above were made of a rougher stone.

I do not know why plaster should not be more used to-day. There is no lack of skilled Italian workmen of the highest order. It is not expensive; compared to wood-carving, for instance, far less expensive; for one mould can make many ornaments. Adam's decorations were cast in metal moulds. His predecessors, under Wren and Grinling Gibbons or their followers, had modeled directly in the soft lime-plaster on the hinged top and sliding gelatine moulds are used now. A full-sized model is made in plastic of each type of ornament; the architect or decorator criticises the model, which is altered until satisfactory. Then the clay is coated with shellac and grease, the soft gelatine poured around it, which, when it dries, is lifted away from the clay and is used again and again as a mould for the plaster.

The plaster casting is not always solid; unless very small, it is merely a thin crust of plaster of Paris reinforced with burlaps, following the outline of the mould and fastened in place on wall or ceiling with galvanized or copper wire. When very large it is sometimes braced with pieces of wood, as in the case of large cornices or the ceiling ribs of a dome.

Such a construction was abhorrent to Adam and seemed, I suppose, unsuited to the material. He preferred the bas-relief of the Appian Tombs or of Pompeii, and he heeded Vitruvius, (Continued on page 205)
An intimate spot not thirty feet square is the flower garden. Rhododendrons, box and arborvitae form the enclosure, and around the walls, sedum spectabilis, with dwarf nasturtiums between; then come tall, blue iris interspersed with golden marguerites; a third tier is composed of daffodils, lavender and white phlox; and to complete the formal effect, a Rose of Sharon is planted at each corner.

Landscape Gardening on a Small Place

BEING THE STORY OF A PATH ON A BROOKLINE PROPERTY—THE ROUND GARDEN IN THE SQUARE PLOT—GROWING A FRAME FOR A VIEW—THE CREATION OF INTEREST IN A GARDEN—PRAY, HUBBARD & WHITE, LANDSCAPE ARCHITECTS

Elsa Rehmann

This is the story of a path, because on its location depended the development of the whole property—a path on a small suburban lot, connecting the front door with the street. Such a walk is a necessity in daily use. It must be practical, dry under foot and as direct as possible. These reasons should not deprive it of interest and make it commonplace. The very fact that it is in daily use is all the more reason why it should have beauty wrought in its making. While considerations of beauty and the means of arriving at and departing from a front door are by no means the same, yet it will be found that they are not antagonistic. A solution which offers convenience can at the same time be beautiful.

The house had to be set high above the street level. To accommodate its shape to the long, narrow lot, it was built wide and shallow. For these reasons the necessity of facing the house upon an unpaved road which is only a right of way, and the impracticability of placing the entrance to the grounds on it, forced a less conventional solution than is usually possible. The direct communication with the main thoroughfare only a block away through a narrow street on the south side of the house, made it of practical importance to locate the entrance on this street. Still the problem remained of how to get from the street entrance to the front door in an interesting but direct manner.

The grounds are walled in along the whole southern side to avoid steep, grass terraces. This wall is surmounted by a white picket fence and broken in the middle by the entrance steps. One step up out of the street we stand on a small space in front of seven steps, which are closed in on both sides by the retaining walls of lawn and flower garden. Once up these steps we come...
to a little vestibule or ante-room, if we may borrow the architect’s terms. It is a little breathing space, a place pleasant to linger in. Masses of rhododendrons, with a background of cedars, face us. On the left the white gate opens into a short cut through the flower garden to the living-room; on the right, tall, feathery Retinispora pisifera specimens on either side indicate that the walk continues in that direction toward the front door. After we pass the Retinispora sentinels we make a turn, and another five steps brings us up to the house level. This turn and the shrubbery around it hide one flight of steps from the other, and the level piece of ground between breaks into two short flights what might have been one long, tiresome as well as tiring flight of steps. Once on the house level, the walk runs along the whole front of the house.

Not only is this arrangement of the walk direct and attractive in itself, but it makes possible a considerable space of unbroken lawn between the walk and the east fence.

The solution seems so simple and appropriate that all the care, labor and study put into the planning for grading, for construction of wall work and steps is entirely lost from mind. It should be so. All study should be hidden behind seemingly unstudied naturalness. Such fundamentals, to which the planting—so important in itself—is added as a decorative feature, display the ingenuity of the landscape architect and show the practicability of employing him.

The path is laid in brick. Brick pavements have a permanent decorative quality and a warm color of special value in the winter effectiveness of a garden.

At the end of the path stands a maple tree—a piece of rare good luck to have it in just that position. Such a beautifully shaped old tree has a way of imparting some of its own dignity and distinction to the house and grounds near it. Its depth of shadow lends an indescribable charm, beside providing a strong contrast of shade to the sunny lawn.

The house is well orientated in relation to the various parts of the grounds. It faces east upon the lawn. On the south side is the living-porch facing the garden; on the north side, the kitchen, and cellar doors open on a lattice-screened and brick-paved enclosure used both as laundry yard and service court. A path, which joins at right angles to the path along the front of the house, connects this court with the roadway.

This service path is bordered by heavy and continuous masses
of shrubbery composed of groups of forsythia, lilacs and rhododendrons. The rhododendrons find an appropriate place in the shade of the maple tree. Next to them are the lilacs, their heavy, plain leaves harmonizing exceptionally well in color and texture with the rhododendron foliage, which is difficult to combine with deciduous shrubs. Forsythia foliage, as well as that of lilacs, retains its good, deep green late into the fall. Together they give three monthly periods of bloom, in April, May and June. The arching branches of the forsythia mould this shrubbery with the climbing Lady Gay roses on the east fence. In front of the roses are peonies. These two give two long periods of bloom. Peonies need isolation from other flowers for complete development, and are as valuable as a shrub in foliage effectiveness.

Next to the roses are poplars for height accent; then come groups of lilacs, Deutzia lemoinei and Spiraea van Houttei. Ranged along the fence, these groups balance the shrubs on the other side of the roses in effect of height and in succession of spring bloom.

This unbroken but irregular border hides the house from the street except where glimpses of doorway or arched window are seen through the branches. It gives a delightful informality to the grounds which characterizes so many of the older and larger Brookline places. Together with the shrubbery along the house it makes a complete frame for the lawn.

Andromeda floribunda was planted along the house under the windows. It is one of the most pleasing of the dwarf evergreen shrubs. The buds of its white flowers have a curious way of appearing all winter long as if they were just ready to burst into bloom, which helps to enliven the garden during the winter months. What happened to these plants I do not know, but the unfortunate placing of box bushes spoils the continuity of the border. The

(Continued on page 190)
The air space in an egg should increase according to the scale shown here.

If it were not for incubators, someone has said, we should be paying fifty cents apiece for eggs, instead of fifty cents a dozen. It is a fact, at any rate, that the tremendous expansion of the poultry industry which the past few years has seen has been made possible in large measure by the perfection of the modern hatching machine. Not that these machines are really perfect: far from it. Yet the best of them are remarkably efficient, even in the hands of amateurs. And it does not pay to buy a second-rate incubator at any price. Price is not always the gauge, however. There are some very good machines at a moderate price. In most States it is possible to get reliable advice on the subject by applying to the State experiment station, where tests of the different machines are constantly being made.

One may buy an incubator with a capacity of but fifty eggs, or one which will care for many thousands. Much depends upon the number of eggs available at one time. If it is possible for the amateur to get out all of his chickens in one lot, he will find it a great advantage, for much extra work is involved when it is necessary to care for several broods of chicks of different ages. And yet that may not be possible with a small flock, for eggs which are to be incubated should not be kept over ten days. If his flock is a large one, even the amateur may be justified in installing a large, sectional machine, possibly one heated by a small coal stove. In most localities he can make it pay for itself by hatching eggs for other people or by selling day-old chicks.

With a large machine, an incubator house or cellar will be needed, but the average amateur will purchase a machine which can be accommodated in his house cellar. Such a cellar usually serves very well if it is properly ventilated and the air not too dry. It is very important to have an abundance of pure air, and many poultry keepers substitute a frame covered with muslin for one of the windows.

One point not to be overlooked has to do with insurance. If something goes wrong and your house burns down you will get no insurance unless a clause covering the use of an incubator has been written into your policy. It is true that the danger is very slight, and yet it is advisable to take no chances, especially as the cost is negligible. With some types the insurance charge is ten cents on each one hundred dollars; with others, twenty-five cents. The charge is always less for machines which bear the label of the Underwriters' Laboratories, Inc., showing that they have been passed by the experts of the insurance companies. Sometimes a flat rate of fifty cents a year is made, if certain conditions are complied with and the insurance offices are satisfied. It is not wise to stand the incubator close to a door which is often opened, or where sunlight will fall upon it. Sometimes close proximity to a stone wall will keep one end cooler than the other. Stand the machine perfectly level, or the heat will not be evenly distributed; and have it so placed that the thermometer may be read easily at any time. In order to maintain an even temperature from the first, the incubator should always be started several hours before the eggs are placed within it. The machine is not ready for use until the thermometer can be kept at exactly 103 degrees. It is true that the mercury will drop low in the tube immediately after the eggs are put into the machine, but, as the eggs become warmed it will return to 103, although perhaps not for half a day. This delay need not be a source of worry.

Many hatches have been lost because of imperfect thermometers. Curiously enough, too, when a thermometer goes wrong it is likely to be at a point between 100 and 105 degrees. It is only a wise precaution to have the instrument which is to be used first compared with the clinical thermometer of a physician.

The eggs must be considered, also. Eggs for hatching should be smooth, regular, of average size and strong of shell. It has been said that they should not be over ten days old, yet eggs which come from special hens or fancy stock may be set when two, or even three, weeks old, with an expectation of getting a satisfactory number of chicks. Do not put brown-shelled and white-shelled eggs in the same machine, for, as a rule, the latter will hatch first. Fresh eggs usually hatch earlier than those that have been kept a long time, and when a high temperature is maintained, hatching begins quicker than if it is run low. All these factors tend to cause a little departure from the period of twenty-one days commonly given as the length of time required for hatching hens' eggs.

Some thermometers are made to touch the eggs, while other heat by radiation. With a hanging thermometer the usual plan is to keep it at exactly 103 throughout the hatch, except that it may be allowed to run up to 104 or 105 while the chicks are breaking out of their prisons. When the contact type of thermometer is in use it is better to have the mercury register 101 degrees the first week, 102 the second and 103 the third.

After the eggs are in their chamber they need not be touched for three days, but the lamp must be filled and trimmed daily. It is well to have a regular hour for this work, in order to avoid any possibility of overlooking it. Practically the only danger which comes from the use of an incubator is the result of lamp neglect.

Hatching Chicks With A Wooden Hen

THE SIMPLE PRINCIPLES OF INCUBATION—HOW TO HANDLE THE MACHINE—THE KINDS OF EGGS—CARE OF THE YOUNG BROOD

E. I. FARRINGTON
For the amateur an incubator capable of holding seventy eggs will suffice. This type heated by an oil lamp is simple of construction and easily handled.

Between the third and eighteenth days the eggs must be turned night and morning. Roll them about gently on the tray so that each will develop thoroughly.

Test the eggs by placing them between the eye and a strong light. An infertile egg will appear clear, a dark spot, with radiating red veins, indicates life.

Test the eggs by placing them between the eye and a strong light. An infertile egg will appear clear, a dark spot, with radiating red veins, indicates life.

is needless to say that the door of the incubator should be kept closed while the eggs are being cooled.

There is no occasion for alarm if the operator happens to forget the eggs and leave them out of the machine for an hour or more, especially during the latter part of the hatch. There is lots of life in a partly formed chick, and the egg may become thoroughly cold without doing serious harm, if a little extra heat is given afterwards.

When the eighteenth day arrives, the eggs should be cooled and turned for the last time. Under normal conditions, with brown eggs in the machine, all the chickens should be out of their shells by the end of the twenty-first day. Chicks in white eggshells may emerge eighteen hours or more earlier.

As a rule, the machine will do its best work if the door of the egg chamber is not opened after the eggs have been pipped until all the chickens are out of their shells. There may be a great temptation to help some of the struggling youngsters: in fact, the novice is pretty certain to feel that he is not doing his duty unless he aids the more backward chicks in escaping from their cells. Experience shows, however, that this is a mistake. Unless a chicken is strong enough to get out of its shell unassisted it is not worth raising, and if the machine has been run properly, with an abundance of moisture, the chicks will fairly pop out of their shells, breaking in a ring around the middle. This is the desirable procedure; in point of fact, many hatches drag through several hours, often a whole day and longer.

When ducklings are hatching it may be worth while giving them a certain amount of assistance. The shells are very tough, and ducklings which I have helped into the world have seemed just as strong and lively after a few days as those which required no assistance. With chickens, though, it is better to keep the door closed until the hatch is over, although if the air inside seems very dry and the ventilation poor, the door may be kept open a crack by the
insertion of a match, which will at all times afford sufficient air.

If the incubator stands in a light spot, it is well to cover the glass with a dark cloth at hatching time. Otherwise the youngsters will crowd to the front and fall down into the nursery before they are fully dry. The temperature in the nursery may be just right for a chicken that is perfectly dry and moving around, but uncomfortably cool for a wet chick that has scarcely found its feet.

Twenty-four hours is none too long to leave the chickens in the incubator after they are out of their shells, but many poultry keepers open the door a little without changing the lamp, by which means the little fellows are gradually prepared for the shift from incubator to brooder. It is a good plan, in any case, to take out the egg tray with its accumulation of shells, leaving the chicks in the nursery. If there is no nursery, the shells may be removed and the tray left.

With a successful hatch, almost every egg in the machine on the eighteenth day should produce a chicken. There will be fewer eggs on that date, however, than when the incubator was filled, for some, and perhaps many, of them will have been tested out. This testing of the eggs is found by the amateur to be one of the most interesting features connected with hatching chickens with a wooden hen. It offers a peep into some of Nature's mysteries and helps the operator to realize the wonderful transition going on quietly within each little shell. If the eggs have white shells the first test may be made on the fifth day, but with brown-shelled eggs it is better to wait until the seventh day, as they are less transparent.

Testing is done by placing eggs between the eye and a strong light and excluding all other light. The kind of tester which comes with the average incubator is an elongated tube large enough at one end to cover both eyes and narrowing at the other end to an opening slightly smaller than an egg. The eggs are placed one by one in front of the tube and close to a fairly strong light. An infertile egg will appear perfectly clear, like any fresh egg. If the egg contains a living chick there will be a small, dark spot and little red blood vessels or veins radiating from it. A black spot without the veins indicates that the egg was fertile, but that the germ has died. An egg in which the contents are loose and mixed together is added. An egg like the latter is more likely to be found when hatching duck eggs than when eggs from hens are being incubated.

It is customary to make a second test a week after the first, as there may be more eggs with dead germs in them. All the clear eggs tested out on the fifth or seventh day may be saved and boiled for the young chickens. They are often used by bakers and sometimes are sold in the public markets. Of course, they cannot be considered fresh, but neither can they be classed as bad. An infertile egg never becomes really rotten.

The amateur sometimes finds it an excellent plan to set several hens at the time he starts his incubator. Then, when the infertile eggs have been tested out of the machine, they are replaced with those from under the hens, after the latter eggs have also been tested. In this manner it is possible to bring out a much larger number of chicks. And it may be said in passing that it always pays to test the eggs when hens are being depended upon, as well as when an incubator is in use. The hen doesn't mind, and the risk of having a bad egg broken in the nest is avoided. Also, if several hens are set at the same time, some of them can be liberated when the infertile eggs are tested out, as fewer birds will be required to cover the eggs that remain, unless, indeed, they are exceptionally fertile eggs.

When a considerable number of eggs is to be incubated a more
PERENNIAL USES FOR SASH—TRANSPLANTING SEEDLINGS—THE LOOKOUT FOR PESTS

D. R. Edson

Photographs by R. S. Lemmon

The first part of March may offer a breathing spell if you have your hotbeds made and your coldframes in shape. But before you sit down and fold your hands, check up all the things that have been mentioned in these articles during the last two months. See if you have made every possible preparation for the rush that is sure to come with the arrival of spring.

One thing, however, cannot be neglected even for a single day—the hotbed. After every snow the sash should be cleaned off unless, as seldom happens at this time of year, exceedingly cold weather ensues, when it may be left on for a day or two as a protection against the cold. On bright days, unless they be very cold and windy, ventilation should be given. As the sash may be lifted at either end or at either side, air can always be let in in such a way that the wind will not blow directly through the opening, which might chill the plants enough to injure them, or, if the wind happened to be strong, tip a sash over and give you a lot of repairing to do.

The height to which the sash may be raised will depend upon the temperature, the wind and the condition of the plants for which you are caring. For this purpose make as many notched sticks about 18 inches long as you have sash, which will hold the sash in any position desired. If you have left the mats on at night and a rain comes, be sure to hang them up where they can serve as miniature trowel.
dry out thoroughly the next day. When pulled off and thrown in a heap they will probably be frozen stiff the next time you may want to use them.

Find the time some Saturday this month to get stakes and boards, and put up a coldframe to which you can transfer any sash which may need through the season in their present position. As the warmer weather comes you will have no further use for the sash which have been over the frames that were set out to lettuce, radishes, carrots and beets, or any in which hardy plants, such as cabbage, cauliflower, beets or lettuce, may be growing, if you have not put them in flats. Instead of simply putting the glass sash from these frames aside, you should have a frame ready where they may be used a second time over cucumbers, melons, beans and similar things. For this use, the glass sash may be bought a couple of weeks sooner. Make some frames the same size as the sash and cover them with plant-protecting cloth, which costs only about thirty cents for enough to cover each frame.

During March, about four weeks after the seeds of beets, cabbage, lettuce and cauliflower have been put in, the tender things such as tomatoes, eggplant and peppers, should be started. There is little danger of getting the temperature too high until they are well up! At night, 70 degrees will not be too much if you have a place where they can be kept as warm as that, and during the day, 10 or 15 degrees higher may be given without getting it too warm. In such a temperature, of course, the soil tends to dry out very rapidly, particularly in flats; and as the weather also is much brighter than it was a month ago, you will have to be careful to see that the soil never gets dried out. It may prove fatal to the sprouting seeds. And it is even more important than it was in the case of the early seeds to have a very light, fine soil to plant them in; it can hardly be made too light and dusty.

Plants will be growing much more rapidly now than when they first came up, and care must be exercised not to let the little seedlings wait too long before transplanting. All those sown last month should be transplanted the first part of this month. So soon as the second or third true leaves begin to show they will be large enough to handle conveniently. If you intend to transplant them directly into the frame, there to grow until ready to set into the garden, the soil should be enriched with old, well-rotted manure and bone meal. Usually it is more convenient to handle them in flats, which should be at least three inches deep. Put a layer of finely pulverized manure in the bottom of each, from a half to an inch thick, and cover this with a soil which is clayey enough to have a tendency to be sticky; add some sand, and, if necessary, some leaf mould and chip dirt, but usually these will not be required, especially for the early vegetables. It is always best to do the transplanting out of the direct sunshine, and if it must be done in the open frame, it is advisable not to do it in the middle of the day should it happen to be very sunny. If the soil is at all dry, give the flats a thorough watering the day before you transplant. Immediately after transplanting give them a watering with a fine spray (not applying very much, however, if the soil was watered the day before), keep them in some place out of the sun or covered over with newspapers during the warmer hours for the few days following. Should conditions of soil and temperature be right, the roots will take hold and establish themselves very quickly in their new surroundings.

In transplanting, the plants should be put about two inches apart each way. They can be put a little closer and still make very good plants, but nothing is to be gained by crowding them. A dozen good plants will yield more, and yield it sooner, than twenty-five poor ones.

What has been said about giving fresh air and plenty of it to the crops planted in the frames applies equally well to the transplanted seedlings. Those that begin to run up tall and pinching, or the leaves of which look light-colored usually need air. If (Continued on page 187)
Though a few trees had to be destroyed and some transplanted, an old-fashioned setting, perfect for such a house, was created.

Leading off the dining-room, which is comfortably formal, is a sunny breakfast porch, curtained and glazed in winter.

With a pent roof above and trellises on either side, flanked by the little casements, the entrance has an air at once strikingly individual and invitingly formal.

The Residence of Mrs. Allen J. Smith, Radnor, Pa.

For the establishment of her residence the owner selected a property among the rolling hills of Radnor, and chose the orchard of an old farm for the setting of the house. While this cost the destruction of a few trees and the transplanting of others, the spoliation was repaid when the house was finished, for, surrounded by foliage, it immediately took on a comfortable, old-fashioned look.

Furthermore, near the orchard ran the entrance road to the old farm house, lined on each side with old trees whose leaves and branches met far overhead. The road continued past the boundary of the present property, but, by removing one tree, this road was diverted to serve the present house and garage. Its one-time direction is now gone, but, with only a new roadbed and top coating, the present approach has all the appearance of an ancient road beneath the old trees.

The problem of compromising the various demands of orientation, view and practicality in designing the house was reduced to a mini-
mum, for in this case it largely solved itself. The high road runs practically north and south, so that the length of the house naturally parallels the road, while the living-room porch, which faces the view, has a full southern exposure. With no straining, the dining-room and breakfast porch could be placed in the right location to receive the morning sun, and the living-room and the living-porch to receive the sun all day long. It is rarely that all these demands are met.

The long, paneled vestibule hall opens vistas on the living-room with its sun porch beyond; on the dining-room with its cozy little breakfast porch; and in turn on the stair hall and rear entrance. It makes a comfortable introduction or farewell to the house.

The living-room takes the full width of the house, and beneath it is the billiard room, reached by a stair from the hall.

The den or library is purposely sequestered. One never "stumbles into it." The mellow mahogany red gives a warm background for the books, and the atmosphere is inviting.

There are plenty of closets on every floor, but the big store-room in the attic is an achievement.

Consistent decorations in the living-room create a distinct atmosphere, at once rich and restrained, the heavy hangings relieving the whiteness of the woodwork and the walls.
A Practical Flower Box

The reason why many people fail with their flowers inside the house, and even in window boxes, is because the plants are not set in a receptacle that permits the thorough watering and proper drainage. Either they overwater and the soil becomes soggy, which leads to rotting of the roots, loss of plant food and consequent poor health for the plants; or else they underwater and the plants suffer from the lack of moisture. The most practical plan is to feed the water into the bottom of the box so that the roots can absorb as much moisture as they need and not be floated in a soggy soil, for roots are like the horse that you lead to the trough—they'll drink their fill and that's all.

There is being shown a box that is nothing more than a greenhouse on a small scale. It has a patented bottom which gives the plants perfect drainage, and at the same time does not leak. The water receptacle runs full length of the box and gives the roots a plentiful supply of clean water. It is made of galvanized steel, enamel dark green on outside, and will last for many years.

It can be set on the window-sill inside or hung from the window on outside, or fastened to rail on any part of the piazza. It gives the perfect drainage so necessary for the growing of plants, and at the same time will not leak or drip and damage the woodwork.

The Care of Curtains

With spring cleaning comes the necessity of caring for the curtains and draperies that have done service through the winter months and must be made ready to store away until they are needed again in the fall. All draperies should be thoroughly cleaned before being put away for the summer, for dirt and dust will not even the strongest material if allowed to remain in it for any length of time. There are several easy ways to clean the most delicate curtains, but the most satisfactory method of washing white ones is to place them in a bag made of cheese cloth or mosquito netting. Let them soak in warm, "soapy" water made with a pure, white soap for about thirty minutes; apply more soap and rub the

bag and its contents gently through the hands. Rinse in clear, warm water and again in cold water to which a little bluing has been added. Squeeze the water out with your hands; do not wring. Lacking a curtain frame, lay a clean sheet on the floor and stretch the curtains on it, pinning them at frequent intervals along the edge. Take care to pull the lace edges, if they have them, out smooth, and pin them securely to the sheet. When the curtains are dry they will look like new.

Heavy draperies should be hung on the line on a windy day and beaten as you would a carpet, but not so hard. When the loose dust is out they can be laid on the grass and the spots removed by scrubbing them with gasoline to which a small quantity of soap powder has been added. If they are badly soiled, wash them in gasoline and soap powder, rinse in clean gasoline and dry in the open air. Sprinkle powdered camphor balls between the folds of heavy draperies when packing them away for the summer, and wrap them in newspaper to avoid any danger of moths. It is said that blotting paper wet with oil of lavender is an excellent preventive of moths. If this is used it will impart a delightful perfume that will prove very pleasing when the curtains are called into service once more.

A Revival of Sconces

There are many occasions when the country dweller who cannot avail herself of the conveniences of gas or electric lighting wishes for suitable wall brackets that are at once decorative, simple and serviceable. For such needs come reproductions of Colonial tin sconces, shown in illustration here.

They consist of an oblong back that acts as a reflector and shields from the slight draught; a semi-circular base with a socket for the candle; and above, a flange bent over at a slight angle to reflect the light further. All the edges are turned to a seam over heavy wire, giving a substantial, rounded finish. There is a hole in the back by which they may be hung on the wall; the base is sufficiently solid to permit their standing upright on table or mantel.

Though painted in various colors, the most attractive is in black, with edges of green or dull orange, with the decoration on the top flange, employing the same tones. The design of these little decorations are supposed to repeat the design of the chintz used in hanging and covers in the room. Thus, one charming type is decorated with a green vase filled with vari-colored flowers, and, atilt on the edge, two yellow birds. Another is painted white and striped with green edges, and at the top a lattice basket overflowing with old-fashioned flowers. This is particularly appropriate for a Colonial bedroom. Still another striking example has a white background, black-striped edges, and on top a large bird swinging on a circular perch. It is from the futurist designs of the new chintzes that many of these sconce decorations are taken.

It must not be supposed that such sconces have only a utilitarian value. In a small hall they make by night an attractive temporary light, and by day are invariably decorative. Again, a pretty group may be made by placing on either side of a black-framed mirror striped with colors, one of these sconces with the decorations repeating the colors on the frame of the mirror.

Mostly Vanity

Each season brings forth something new in the way of furnishings that are intended to add solely to the joy and
convenience of capricious woman, and this year comes a vanity box wonderful in construction and decorative in design. The idea of the permanent vanity box—as compared with those one can carry about—is very old. The ladies of Louis XVI's time possessed intricate affairs made up from little block-printed chintzes, and from these the inspiration for the modern reproductions has been caught. The older type, however, was not always so out-and-out in its purpose: its exterior gave little promise of the contents. It looked like a calf-bound volume, delicately tooled with gold, about twelve inches long, ten wide and three high, a most learned and forbidding tome on the whole. It was placed on the library table, but les belles dames knew what lay hid within, and, unsuspected, they could prink and powder.

Nowadays we are more obvious, and the vanity boxes shown in illustration look their part. They consist of three compartments designed to hold toilet necessities; a little mirror can be raised up, two candles providing sufficient light for madam's face. Quaint and simple as are the exteriors of the boxes, their exterior decoration may be made as elaborate as one wishes. One has a dainty Perouilly design; another is along a Chinese pattern on black lacquer. The colors are rich and warm, and, whether the boxes, closed or open, they give it a great decorative value. These cases may be placed in an entrance hall of the country house or in the room where ladies place their wraps when one is not using the bedroom for that purpose; moreover, a hostess, in providing toilet material in this manner for her guests, precludes the necessity of their using hers. In a country club they would prove of excellent service, for they can be of as much use as they are beautiful.

A Tabby-Cat Chair

The past two years have seen a decided and most certainly welcome improvement in the form of furniture for children. Just as at one time children had to content themselves with sitting in the chairs of their elders, so another generation relieved the inconvenience of these little tots by making diminutive reproductions of their grownups' furniture. In recent years, however, designers have been even more thoughtful for the comfort and interests of children, finding that just as a middle-aged man prefers a wing chair, so does a child take naturally to a chair that was created especially for her age and size.

Among the many interesting pieces of furniture for children being shown in the shops is a black tabby-cat chair, reproduced here in illustration. Quite apart from its quaint attractiveness is its practicability. It sits solidly on the floor and cannot easily be rolled over because of its broad bases, or knocked over because of its well-balanced weight. The long tails of the cats curl up to form a brace for the comfortable back. The seat and back slats are painted white. As an adjunct to the child's room, and especially to the home schoolroom, the value of this chair will be appreciated both by children and parent.

Madagascar Cloth

When the bungalow, porch or den needs a touch of color do not forget the Madagascar curtain material, which comes in such vivid stripes of orange and buff, magenta and buff, in five-inch stripes, separated by fine lines of green, purple or black. The material is woven from dried Madagascar grass, which takes and keeps the brilliant colorings, and also furnishes a natural fringe as a finish. A pillow or two covered with this material, a couch cover, a table cover or curtains are guaranteed to cheer up the dreariest of rooms or the dreariest of days. The plain Madagascar cloth—buff—has the same light, springy effect that willow furniture possesses, and is, besides, a good "dirt color" for any use where brilliant stripes are not desired. Two curtains sewed together will make a very acceptable summer couch cover.

The Unusual in Table Linens

More than ever are hostesses on the search for new things that will make their tables attractive, and the shops are trying to appease this desire not only with new articles and materials, but with striking adaptations and combinations. One can tire of fine damask however costly it is, and at the present time it would seem to be used less and less. For the dinner table, a fine damask cloth is still unsurpassed, but for breakfast, luncheon, tea, supper and receptions less usual and conventional covers are in vogue.

Small squares of Russian crash with simple peasant patterns and monograms in blue or green or yellow to match the breakfast service are being used. If there are but two persons at the table, a runner may be used made of Italian linen edged on either end with heavy crochet lace of conventional design, the side edges being done in blanket stitch with the hem turned over on the right side. This makes a serviceable and unusual cover. Many old Italian covers are characterized by this blanket stitch hem. If the crochet lace is of Italian design, distinct style is given the cloth. With such a cover use for center-piece a bowl or vase of Italian pottery.

Large supper cloths can be made of this same Italian linen. Here again the blanket stitch is used on the edge, with the stitches grouped in threes. At each corner can be inserted an Italian reticella square, and around it a simple Italian design. Always keep the stitches consistently Italian. At the corners fasten a long tassel of heavy linen thread. With this cloth use oblong napkins half the width of the ordinary napkin. They are unusual and quite as serviceable as the ordinary accustomed shape, being large enough to protect the lap and not too large to prove in the road. They can be decorated by putting a small reticella square at one end.
PUT a red mark around March 1 on your calendar to remind you that you have but a month—four short weeks—left in which to get everything ready for the "spring opening" of April. When the snow drives and a northwest wind makes you turn up your coat collar and hasten to the shelter of the house, it may seem that spring is a long way off; but this is only winter's final presumptuous bluff, and maybe by afternoon, out on the sunny side of the barn the warm sunshine will trickle down the back of your neck until your coat peels off.

There may be some things left that must be done before the sap starts. Look up the suggestions given in these pages last month. If you have not already attended to this work on your own place, do it now! This will be the last chance.

Set Out Small Fruits this Spring

Unless your place is thoroughly well stocked with the various small fruits, plan now for what you will want to set out this spring. These will take up comparatively little room, and none of the garden's products are looked forward to and enjoyed more than June's strawberries and summer's blackcaps and raspberries and fall's sugary grapes. Moreover, any surplus of any of the small fruits need never be wasted. Whoever heard of too much raspberry jam or too many currant dumpings in winter? Corners, wall, house-sides, etc., may be taken advantage of for growing the small fruits if your garden space is limited. Go over your garden carefully and mark down on the garden plan you made last January just how much space you will want to devote to small fruits. Then indicate on the sketch the number of each of the various fruits—

raspberries, blackberries, dewberries, currants, grapes, strawberries and dwarf fruits, apples, pears, etc., you plan to set out. If you find you cannot get them all this year, plan for them just the same. Then get what you can, maybe one or two or a half-dozen, as the case may be, of a kind, and leave room to put in the rest next year or the year after. Five dollars or ten dollars a year judiciously laid out for two or three consecutive years will result in a fruit garden capable of supplying the average family with a generous supply. Do not allow yourself to be tempted into buying altogether wonderful new varieties of the small fruits. Good new kinds there are. But it is always safest to select only, or mostly, kinds which receive the recommendation of more than one seedsman, and which have been out at least two or three years. The best varieties of the new fall-fruiting strawberries are practical and very good, but you will probably be disappointed in the yield unless you take the precaution of removing the first crop of blossoms, which isn't such a big task on a few dozen or hundred plants. The new St. Regis "Ever-bearing" raspberry differs distinctly from the older sorts and ripens fruit in the fall on the new canes. Ranere is a sort very similar to, if not identical with, St. Regis. Among the newer strawberries, Early Ozark and Fendall are very fine early and late sorts, respectively. Among the grapes, beside the well-known standard sorts, such as Concord and Delaware, Lindley, an extra large, sweet, red, and Lockington, a delicious, juicy golden, will undoubtedly claim a place for themselves as they become better known. All the small fruits will do well in average garden soil, provided there is good drainage. As a rule, it will pay best to order first sized plants of the small fruits, as the difference in price does not amount to a great deal, and results are quicker.

Work in the Greenhouse

This month and next there are plenty of activities in the greenhouse to occupy fully all the indoor time enforced by inclement weather. If any Easter Lilies are being forced they should receive special attention from now on, being forced ahead with higher temperature and liquid manuring or held back if they seem too far ahead. The latter is seldom the case, however, and it is much better to have them a little too far advanced than lagging behind. If you have no roses growing in the greenhouse, get a few plants, dormant, from your seedsman, or out of the garden, if there are a few that you can spare, and give them a rich soil and a warm corner, with plenty of water after active growth begins. Plants of all kinds which flowered through the winter, and which have been resting for the past month or two, and plants which remain nearly dormant through the winter, such as palms, should be started into more active growth now. Re-pot where necessary, using for most things pots one or two sizes larger than those in which they have been growing. Some plants, such as palms and other fine-fibrous things, do better with a comparatively restricted root room. Azaleas should be started into

A strong-growing Manetti stock, cut ready for grafting

Too much old wood here; it should be cut back

Tying the graft rose in place on sturdy root stock
active growth from four to six weeks before Easter, depending on the varieties and the forcing conditions.

Cuttings of various kinds, including, besides those started last month, cyclamen and gloxinias, should go into pots now, and be kept in active growth until they may be put out in the frames. It is not too late yet to gain a good deal by starting your cannas, dahlias and tuberous begonias, in moss or leaf mold, and potting them up as soon as they are well started. The dahlias and cannas are not so particular about the kind of soil in which they are potted up, but for the others a very light, rich compost, containing plenty of rotted manure, fibrous material and a little sand, should be used. Cow manure, if thoroughly decomposed, is preferable to horse manure. Be careful to water only lightly until they become established.

The cuttings taken from plants in January and February will be ready for “potting off” during this month. A good, fibrous loam, with a little sand added if it is not friable enough, and enriched with bone flour, will answer for these. Don’t let the plants stay in the rooting box or bed too long; the roots shouldn’t be over half an inch at most, and half that is plenty. Put them well down in the pots and make them firm by tapping the bottom of the pot firmly against the bench before pressing the soil about them with the thumbs. Keep shaded from the sun and syringe daily for a few days after potting. The pots should be partly sunk in soil, ashes or moss, to keep them from drying out too rapidly, as they will invariably do on a bare bench bottom. Cuttings that may be wanted in some quantity, such as carnations for next fall’s plants or coleus or sweet Alyssum or salvia, for borders or masses, may be put in flats instead of potted up, and will make strong, sturdy plants for setting out if they are properly looked after.

Keep a sharp lookout for insect troubles of all kinds. Sprinkle tobacco dust around the plants. Plenty of fresh air and regular watering will go far toward preventing any trouble from such sources. The green aphid is the pest most likely to cause trouble. But even after it puts in an appearance it may be successfully got rid of by the use of nicotine in the form of a spray or fumigation. The “mealy bug” will succumb to alcohol and a small brush.

Spare the Knife and Spoil the Roses

The most important of all the jobs in the rose garden is the spring pruning. And it is one which many people neglect, either through ignorance or because they just can’t bring themselves to be so hard-hearted as to do it the way it should be done. As a general rule, I would be willing to state that the more a rose is pruned, the better! But, like most general rules, this one has a number of exceptions, even among the “garden” roses, to which it is meant to apply. The hardy sweetbrier hybrids and the hardy climbing roses of the Rambler class need very little pruning, except to cut out old or broken wood, and perhaps shorten back a too-ambitious spray or a winter-killed tip here and there. The rugosas, which grow rank and throw up too many canes, need an occasional thinning out, but no pruning in the sense in which it applies to the garden roses, the teas, hybrid-teas and hybrid perpetuals.

Before you begin the job of pruning your roses you should settle in your own mind what you want them to do for you: whether you want extra fine and large flowers, at the expense of number, and the natural, graceful appearance of the bushes; whether you would rather have a medium number of flowers of medium size, or whether you would prefer to have the bushes themselves in bloom as ornamental and full of flowers as possible, even if the individual flowers weren’t quite so large. The more severely you prune, the larger and fewer flowers you will have. For ordinary purposes the second system is probably the most satisfactory. As soon as it is safe to remove the winter mulch in the spring, and the leaf-buds begin to swell, begin with the hybrid perpetuals, which are the hardiest sorts, and cut out all but a few of the strongest canes on each plant. These should be cut back to only a few buds or eyes on each if large flowers are wanted. For general garden culture they should be cut back a half to two-thirds of their length. The teas and hybrid teas and the weaker-growing varieties of the perpetuals should be pruned even more closely. The cut should always be made above an outside eye, so that the new sprout from it will grow outward, keeping the bush to an open form.

Spring Painting Hints

It is remarkable what a difference a can of paint can make in rendering the garden presentable, even when applied by an inexperienced person. For such a one here are a few hints: wash all surfaces clean before painting; rub down all rough or cracked surfaces with both coarse and fine sandpaper; have your paint thoroughly mixed—this may seem impossible, but persistent stirring will accomplish wonders. Whenever possible, place the freshly painted article out of reach of flying dust. And don’t forget to keep your brushes in oil when they are not in use.
THE BALANCE OF ANIMATE NATURE

FACTS set down boldly have an inexplicable attraction — even disjointed facts. But when one can pick out two fact items, place them side by side, the reader is often astonished to find not only a singular relationship, but each appears the more important for that relationship. Thus, it is an astonishing fact that the annual loss to plant industries of the nation and to forests through pests ranges between ten and twenty per cent, is valued at $500,000,000, and causes an annual expenditure of between $7,000,000 and $8,000,000 for spraying machines, spraying solutions and labor.

It is also an astonishing fact that between 1840 and 1910 eleven species of valuable wild life were totally exterminated in the United States; that twenty-five others are candidates for oblivion, and that in one State alone—Ohio, which was once abundantly stocked with a great variety and a great number of game birds and mammals—fourteen species have become extinct, and eight species of valuable birds are reported to be threatened with extinction, one of them being the quail, the most valuable bird influencing the fortunes of farmers and fruit-growers of North America.

Between these two bare lines of statistics there may seem to be no relation until one considers the services of the quail. For the facts, turn to a volume by William T. Hornaday, "Wild Life Conservation in Theory and Practice"—a book that should be in every sportsman's hand.

"It is fairly beyond question that of all the birds that influence the fortunes of the farmers and fruit-growers of North America, the common quail is the most valuable!"

"It remains on the farm throughout the year. When insects are most numerous, bob-white devotes them his entire time. He destroys them during sixteen to eighteen hours of the summer day. When the insects are gone he turns his attention to the weeds that are striving to seed down the farmer's fields for another year. He consumes, as palatable food, the seeds of 129 species of weeds; and the quantity that one bird can consume in one day is almost beyond belief. The thousand seeds for one bird's daily ration is a small quantity and far below the average of what a healthy adult bird requires. To kill weeds on the farm costs money — hard cash that the farmer has earned by toil or labor of cash value which he himself bestows. Does the average farmer ever put forth any strenuous efforts to protect from pouchers and other enemies the quail that work so well and so faithfully for him? The exceptional farmer does; the average farmer does not.

"All that the average farmer thinks of the quail, even those in his own covesy, is as so much meat for his table.

"A list of the 129 species of weeds whose seeds are eaten by the bob-white looks like a botanical roguey gallery. Conspicuous in it are such old enemies as the pigweed, smartweed, beggar-tick, foxtail, burdock, barnyard grass, crab grass, ragweed and plantain. It has been calculated that if in Virginia and North Carolina there were four bob-whites to every square mile, and each bird ate one ounce of weed seeds per day from September 1 to April 30 the total amount consumed in those two States would be 1,341 tons.

"As a destroyer of insects it would seem that the common quail deserves the first place. We know of no other species whose appetite covers so wide a variety of insect food. It is known that this bird consumes 145 different species of insects, and the list includes all the notorious insect pests of the farm and orchard save the few that live and work high up beyond the reach of a bird that lives on the ground. However, the quail’s repertoir includes the coiling-moth, the garden caterpillars, flies, mosquitoes, plant-llice, cotton-boll weevil and a host of others."

All of which brings us around to the original figures given at the head of this editorial—that from ten to twenty per cent loss is caused to crops every year, loss that was unknown forty years ago, loss that man must suffer because we have prevented, through our wilful destruction of wild life, the maintenance of the balance of animate nature.

This balance is all a part of Nature’s scheme for having a place for everything and everything in its place. When the balance is broken someone must pay. In this instance man pays, pays heavily. And so, on our pages of HOUSE AND GARDEN you find a strange contrast—articles that give directions for spraying and articles that give directions for preserving bird life. In the former we are valiantly trying to supply a defect that the loss of the latter incurs, striving to keep up a balance that Nature, were she permitted, would gladly do. Nor is it any vicious circle, for we are American sportsmen to appreciate the situation in all its gravity they would soon find a solution. They would soon learn that to every wild bird ruthlessly killed some farm somewhere must suffer.

Only the stern restrictions of the law seem to curb the savagery of some sportsmen. But others, fortunately, are amenable to reason. A great fault lies in the fact that the reason has not been brought to their attention with sufficient force. Start with the reform leaders in embryo—start with college men. What do they know of the necessity for preserving wild life? Were the facts presented to them, doubtless the next five years would see sincere effort being made by these men to provide for proper legislation and a curbing of individual savagery.

And, as in any other reform, the problem of the preservation of wild life must start with the individual. The type of sportsman who can boast enormous bags is growing scarcer every day. We do not admire him any more than we would nowadays marvel at the prowess of an Indian boasting of the scalps hung from his belt. The game hog is a distinctly distasteful person. He represents the regrettable past. He is, moreover, a living contradiction to the banal platitudes. He has not yet learned that to every wild bird ruthlessly killed some farm somewhere must suffer.

When insect reform leaders in embryo—start with college men. What do they know of the necessity for preserving wild life? Were the facts presented to them, doubtless the next five years would see sincere effort being made by these men to provide for proper legislation and a curbing of individual savagery.

And, as in any other reform, the problem of the preservation of wild life must start with the individual. The type of sportsman who can boast enormous bags is growing scarcer every day. We do not admire him any more than we would nowadays marvel at the prowess of an Indian boasting of the scalps hung from his belt. The game hog is a distinctly distasteful person. He represents the regrettable past. He is, moreover, a living contradiction to the banal platitudes. He has not yet learned that to every wild bird ruthlessly killed some farm somewhere must suffer.

By this we do not mean to imply that there is not a legitimate use of game or that all wild life should be given a coddled existence. The relief from work and worry that a gunning trip affords is undisputed. Nor can any of us deny that a taste of game is a great relief from a steady diet of beef and mutton. But to the doors of such conservative folk cannot be laid the blame, for the slaughter of our wild fowl is necessitated by the demands of those jaded epicureans to whom even good beef and mutton are revolting. Killing for food necessity exists only in the farthest outlying districts, and yet, as Hornaday observes, fully ninety-five per cent of the men and boys who kill American game birds and mammals only as things to be killed and eaten to satisfy hunger—the viewpoint of the caveman and the savage. None of them knows what real hunger is, save by hearsay.
"Start your Berkey & Gay collection today"

Berkey & Gay Furniture never has the obviously "new" look

Berkey & Gay pieces go into your home and "belong." They have the quiet unobtrusiveness of good taste. They have the charm and beauty of correct design and treatment.

You will be as pleased with your choice years from now as today when you furnish one room or your entire home with our furniture, for it is based on the true period designs which have endured because they are right. That is why our furniture is "For Your Children's Heirlooms."

You will also be pleased to find that Berkey & Gay furniture is not extravagant in cost. Many people naturally think, because of its beauty and its reputation, that it is high priced. A visit to the store offering Berkey & Gay furniture in your locality will remove any such impression. Our furniture is generally sold at the best store in every city, as is indicated by the following firms which represent us:

- Marshall Field & Co., Chicago
- Paine Furniture Co., Boston
- Lammert Furniture Co., St. Louis
- The Sterling & Welch Co., Cleveland
- Daniels and Fisher Stores Co., Denver, Colo.
- Frederich & Nelson, Seattle

"For Your Children's Heirlooms"

This inlaid mark of honor identifies to you each Berkey & Gay piece.

For fifteen 2-cent stamps we are glad to send you our de luxe book, "Character in Furniture," a recognized authority on the periods. Other publications free. List on request.

A Little Acme Quality Paint, Enamel and Varnish and there you are

When a family moves into a new house all freshly decorated, there is a distinct uplift felt by everyone. It is just like beginning over again on a higher level of living. But we can't all move or build new houses every year, though things do grow shabby and family life gets into a rut. But everyone can occasionally put a new room in the old home, and the new room will act like a tonic. It will give a new zest, renewed pleasure in the home. New rooms can readily be put in old houses with

ACME QUALITY Paints and Finishes

There is an Acme Quality finish for every surface. Floors, baseboards, window sills, stairs and all such surfaces are made beautifully bright and new with Acme Quality Varnish. Acme Quality White Enamel is a perfect finish where white woodwork is wanted—in living rooms, dining rooms, kitchens or bathrooms, and it is just the thing for enameled odd pieces of furniture.

But first write for the Acme books—"Home Decorating" and "Acme Quality Painting Guide." These will tell you exactly what you need for any kind of surface and how to use it. We will tell you the name of the nearest Acme dealer, who will be glad to advise you on what you are planning. Acme Quality Finishes come in cans from 1/2 pint up, ready prepared to use. They are easy to use and the results are invariably delightful. The books are free for the asking. A post card will bring them.

Mr. John on Orcharding

(Continued from page 159)

some of the undiscerning consider them only make-shifts.

A warm, two-toned brown Scotch wool rug nearly covers the floor. With little outlay we have a room of charm and distinction, and the chief attraction is the big fireplace with its crane, the brick oven at one side, the funny little cupboard over one end and the few bits of Chinese crackle ware on its high, narrow shelf. Occasionally we have a merry fireplace supper with an R. F. D. beefsteak—bless the parcel post!

With the exception of twelve of my forty years I had always lived in the country. I was certain that I knew country life thoroughly; that there could be no problems which I could not cheerfully take in hand. For years I had been obliged to drive two miles to the inadequate stores of the neighboring hamlet and the station, although the railroad went within sight of my old home.

Critics of our scheme of living—and they were many—shuddered when they heard that we were to be eight miles from a railroad and four from "the store." The line-sulphur spray might be expected to cover the neighbors' fields with their crops, and every year I was sure of the geographic position of Hades. Even John's watch stopped because I didn't know how to get help. My laundry work was so badly done by Mrs. Mason that I finally attempted it myself—with disastrous results, more mental than physical.

The spraying season came to sight, and, although I didn't board the extra men, I had continuous processions of them over my kitchen floor to get water—and such looking men! The lime-sulphur spray made them look like coal diggers; the odor of sulphur was omnipresent, and for a time I was sure of the geographic position of Hades. Even John's watch stopped because of the fumes. And the clothes he wore! Probably I was ultra fastidious, but the ubiquitous dun-colored clothes of country men-folk and the drab calico of the women "got on my nerves." I had chosen my own garments with an eye to

beauty as well as utility. I carefully avoided kimono aprons until a misguided beauty as well as utility. I carefully in clothes and hair and manicuring. In the season of spraying I fell from grace. I know she can get help for her unaccustomed duties. Too, she must be willing to form new ideals of housewifery—not to be overfastidious about inevitable "tracking in." I can’t yet practice this preachment, especially on days when, as someone puts it, "I’m running a boarding house for hired men." With our growing prosperity, those days will decrease. Already we are planning to better advantage for my relief and John’s, too.

At first I felt that I couldn’t wait for things to get in order. Now I know that half the fun is in doing them by degrees, and I have ceased to feel apologetic for things which must wait. After all, it’s the looking ahead that counts.

A visit to my old home wrought the cure. I was away from John and the orchard for five endless weeks, and I found a new perspective. I had an orgy in New York—theaters, bridge, shops, Knox hats, taxicabs, automobiles, teas, tournaments—nothing availed to content me. I came home gladly, gayly, and things have smoothed out before my altered mood. It was life that I wanted—life on that hilltop with John Anthony!

There are houses made for comfort, and houses made for style; and there is also a house in California made for sunlight that you will enjoy reading about in the April House and Garden.

Your Saturday Afternoon Garden (Continued from page 177) they turn yellow without cause the trouble is likely to be in the soil or on account of too much water. When the dripping-off fungus puts in an appearance, plenty of fresh air and flour of sulphur scattered over the surface will help to check its ravages. A close temperature, a sudden shock or chill of any kind, or having the surface of the soil or the foliage wet, during the night when the temperature is likely to go down, the result of watering too late in the afternoon, are all conditions favorable to the damping-off disease. It attacks the stems of the little seedlings at the surface of the soil. It often entirely destroys a large percentage of them.

The green aphis is another pest that may cause serious trouble, as it is almost the color of the leaves, quite small, and hides in the heart of the plant or on the underside of the leaves until it becomes numerous. Left uncontrolled for only a few days it multiplies so rapidly that it may get beyond control. Any condition that is likely to weaken the growth of the

For the Interior Arkansas Soft Pine contains practically no resin or resinous oil. There is a notable absence of pitch streaks. It does not gum the carpenter tools or power tools, and it does not permit of the absorption of sufficient of the oil and pigment to bind paint firmly to the surface to which it is applied. The result is that Arkansas Soft Pine holds paint. It is easy to work and work working.

These are elemental Arkansas Soft Pine facts with which you should be familiar, because the difference between the cost of this wood and others not so good is so slight that you cannot afford to take a chance.

For Interior Woodwork there is no comparison between the value of Arkansas Soft Pine and other soft woods.

SPECIAL FOR YOU—We have a limited supply of finished samples. We will honor requests in the order received. Send for yours.

Arkansas Soft Pine Bureau

In writing to advertisers please mention HOUSE & GARDEN.
that is backward can be worked up into broad ridges for the planting of a few extra early things, like peas, planting on top of the ridge. While an emergency method of this kind may help temporarily, a thorough system of under-drainage should be put in as soon as possible—early next fall, if you cannot find time to do it now.

Before you begin digging, the manure or compost should be put on. That can be done before the ground is quite ready to dig. But it should be done only just before, and, if possible, the very day that you are going to "break up the soil." If it lies around on the surface after it has begun to decompose it loses much of its effectiveness. The best way, if the garden has to be dug by hand, is to get at it, and get it over as soon as possible. The sooner you can get it all dug, the better, even such parts of it as will not be planted until May. Besides getting the work out of the way, this saves moisture in the ground from the early spring rains, since water evaporates much more rapidly from ground that has not been worked over. Do not, however, make the mistake of spading up or plowing the ground and then leaving it that way, raking off a strip now and then only as it is needed. It should be pulverized and raked and made fine and smooth at once; this to create what is known as the "dust mulch," which is nothing more than the surface of well-prepared top soil, which, drying out very quickly to a depth of half an inch or an inch, holds the moisture in the soil below.

The deeper you can dig your garden, the better, provided you do not have to turn up the hard, lumpy sub-soil. However, a little of this mixed in will not make any difference, and where the garden is shallow from not having been dug before, a little of this raw dirt from the bottom should be turned up every year, in order that the garden may be gradually deepened. The deeper the garden, the more capacity will it have to store up plant food and water for the use of the growing crop.

If there is manure to be turned under, the soil in the bottom of each furrow must be well mixed with the soil from the next furrow that is thrown in on top. If it is dug in the usual way so that some of the manure is near the surface, this will be a constant annoyance throughout the season.

Should fertilizer be necessary, spread it on after the ground is plowed or dug, and rake it in. It will be as well in this case, however, to apply the fertilizer to each strip of the ground as you get ready to plant it. Such parts of the garden as cannot be planted until May after they are prepared will have to be raked over thoroughly before planting, in order to break the crust that may have formed and to destroy any small weeds that have sprouted.

Landscape Gardening on a Small Place

(Continued from page 172)

rhododendrons and cedars at either end of the house show how effective evergreens can be against red brick walls. Two Rose of Sharon bushes, with double pink flowers, frame the entrance porch. A new effectiveness has been given to the old, neglected Rose of Sharon by the production of many new hybrids with flowers of clear and single colors. Their upright habit accentuates the quiet formality of the entrance porch. This upright stiffness which makes it so difficult to mould them into a shrubbery border invests them, when they are so placed, with a peculiar dignity, producing an architectural balance. It is especially in contrast to these Roses of Sharon that the already-mentioned box bushes under the windows show that they are in wrong positions. They illustrate a frequent mistake in shrub planting, for they have no reason for existence except the willful caprice of the planter, who is wont to consider his material only at its own and separate value, instead of at its subordinate value as part of a well-ordered design.

The planting along the house and lawn enclosure has been given in such detail to show how full of interest a little place can be when careful attention is given to the proper arrangement of shrubs as a boundary around a lawn.

The evergreens give much winter interest to the lawn, the deciduous planting emphasizes the spring bloom. After the roses are through blooming in July, the lawn is framed by quiet greenery, and the color interest is absorbed by the flower garden.

It is a delightful little place not thirty feet square, this flower garden. We like its friendly colors, its intimacy placed close against the house, its little touches of formality and its seclusion, standing high above the street.

Part of its success is due to its enclosure. On the north side is the porch, with masses of rhododendron. On either side of the path is a box bush, and along the steps Lilies-of-the-Valley are crowded close together. On the east side is the picket fence, the curve of which follows the slope up to the house level. On the west side stands a row of arborvitae trees, now six to eight feet high, and on the south side the branches of the street trees make a heavy, green screen.

In a small garden the design wins approval through sheer simplicity. This design is based on a circular composition inscribed in a square, an old motive kept always new by variety in details. The center was the place designed for a sundial. It could have been substituted by a slender-columned bird bowl. The spreading Picea mariana there now is at its present height an acceptable central fea-

This Book Will Help You Build

“Practical Homebuilding” begins with the selection of a lot and the location of the house upon it. It discusses cellar, wall and roof construction, and describes the most approved methods for each. It contains comparative costs of frame, stucco and brick. It is profitably illustrated with photographs of attractive houses, drawings of floor plans, etc.

In addition to its general features, “Practical Homebuilding” explains why Knob-Burn Expanded Metal Lath is the logical base for stucco and plaster work.

One interested reader said that it covered the subject ”from loam to lace curtains.” We want you to have it now whether you are going to build this spring or sometime in the dim future.

Send 10c to cover cost of mailing and ask for booklet No. 379.

Specimen Trees

We are offering for spring planting a limited quantity of beautiful, large specimen coniferous trees, each tree having a growth equal to that of other similar trees, in the month of March. The selection comprises White, Alberta, Elms, Linni- dems, Pines and several varieties of Evergreens. We have just published a leaflet giving full particulars. If you are interested, write us and a copy will be sent you by return mail.

Cottage Gardens Co., Inc.
Nurseries
Queens New York
ure, but soon it will grow too large and dwarf the rest of the design. The manner in which the brick is laid on the path around the Pinus mugho emphasizes the circular composition.

To the choice of the flowers is due much of the effectiveness of this garden. The succession of bloom and color harmony creates a pleasurable perennial interest. Their symmetrical arrangement emphasizes the circular composition.

On the edge of the circular path are eight Sedum spectabilis, with dwarf narcissi, daffodils, and primroses planted in between. In back of them are planted the tall, blue Iris pallida and the golden marigold. The third tier is composed of daffodils and lavender and white phlox. Along the street wall stand, in front of the dark-green of the Arbor Vite, light-blue larkspurs raise their slender spikes in spring, and Aconitum, the monkshoods, give a similar effect in autumn. On either side of the gate a bush of low Delitzia gracilis blossoms early in the spring, and later in June two plants of yellow day lilies placed on either side of the path to the house make bright spots of color. To complete the formal effect, a white, flowering Rose of Sharon is planted at each corner.

From the time the narcissus come out in April until the phlox fades in September there is always something blooming in the garden. The middle of August, when the picture was taken, is the gala time. It is the climax of the flowering season. The Rose of Sharon, the sedum and the phlox are all blooming together in a harmony of lavender and white with a bright touch or two of yellow anemones.

It is not necessary, however, as it is not possible, to have so much bloom all the time to make the small garden effective. When I saw it in early July, with the Hemerocallis just beginning to bloom and the larkspurs in flower, the garden was quite charming, with its delicate touch of blue and gold.

When it gets too cold to sit out, the garden lies unadorned with bloom, but it has lost little of its attractiveness. The rhododendron foliage, the fragrant box bushes, the Pinus mugho, the pyramidal Arbor Vite, contrasting with the warm, red brick of the paths, provide much winter interest.

The enclosure, the architectural details, the design, the flowers, each has an important part to play. Not in their individual parts, but in their inter-related action toward effectiveness and beauty lies their value in the art of garden making.

There's a right way to grow seed and a wrong way: the right way you'll learn about in Leonard Bastin's article in the Spring Planting Number of HOUSE AND GARDEN.
NEW ENGLAND GROWN PERENNIALS

are only a branch of our business, but this department is in charge of an expert.

Our catalog "Greenhouse and Garden Plants" is a book of 76 pages devoted entirely to the best varieties and the best plants that can be produced.

Roses for the greenhouse and Roses for the garden.

Chrysanthemums whether for exhibition purposes or the Hardy border.

Bedding Plants for the garden or the window box.

These in addition to Hardy Perennials are only a few of the items.

Our Baby Grand edition of "Greenhouse and Garden Plants" may be obtained at our exhibit at the International Flower Show at the Grand Central Palace at New York, March 7 to 23.

This booklet comprises selections of the best from "Greenhouse and Garden Plants," and in addition an excellent list of the new named varieties of Delphiniums. Sent upon special request only.

Our catalog "Greenhouse and Garden Plants" is yours for a postal card.

The Old Ballard Place

(Continued from page 164)

near a hedge. Cats can, and will, creep under the shrubs, and, hidden there, will lie in wait and do much harm, as feathers near the hedge have often testified.

Peeping out from this hedge here and there were dainty little Columbines, with their graceful bells in different colors. Forget-me-nots were blue with their blossoms through the summer, and in the fall the asters along the front of the hedge were glorious. Directly in front of the house, at the north of the brick wall, were masses of bridal-wreath bushes, and a great, golden forsythia made sunny the northeast corner of the yard. Tartarian honeysuckles formed the north line to the house. All along its north foundation wall and hugging up close to it were lilies-of-the-valley and ferns.

Over the front of the house itself grew wonderful eumatis vines that were full of little white blossoms in the fall, making the air sweet with their fragrance. One of these vines grew onto and over the lilac tree at the corner of the house. This was the old front yard.

Between it and the back yard there used to be a high board fence. I was glad to miss it. The old back yard was given over to the clothes—drier, with its great, long arms, its platform and steps; to board walks and ash heaps; to the well and pump; to barn and chicken yard; to cornfield and vegetable garden. The day of the great clothes reel is past, but the memory of the joy that came as we hung to the arm of this reel while we were rapidly swung around will be ever with us. Were you ever a little girl who was compelled to play in the back yard, never stepping foot in the front yard in your play? If you were, you will understand me when I say that my first glance at this back yard when I saw it last summer made me long to be again a little girl, compelled to play only there, where there seemed to be everything to make interesting a little girl's play. A splendid apple tree grew here, and a mulberry tree full of fruit attractive to the birds. A hedge of lilac and sumac hid the back fence completely. A weedline and wild grape vine covered the south side of the house. All along its north foundation wall and hugging up close to it were lilies-of-the-valley and ferns.

MARCH, 1915
and gladioli showed their colors. There were beds, too, filled with anchusa in its pretty shades of blue; hardy larkspurs, monkshood and Sweet William, and when the fall came this garden was brilliant with asters, cactus, dahlias, chrysanthemums and zinnias.

Where the cornfield and chicken yard had been I found a beautiful lawn, at the north line of which was an occasional bush and another birds’ bath out in the sunshine away from bushes and danger. On a little trellis over the woodshed door grew the marriage vine, and the south fence—a little wire fence—was covered with the vines of woodbine and bittersweet. Loving hands and much thought had been given to the task of making this garden spot a pleasing one. Joy had come to those who did the work and to those who came to enjoy it.

No one but the German gardener looked on with a thought of criticism. He, with a wry face and a shrug of his shoulders, would say: “Oh, ya, it is good—but nolding’s to eat in dis garten! Should be, anywhere, strawberries or somedings,” and a kindly Scotch neighbor was, perhaps, of the same opinion, when he came modestly asking: “Might I be allowed to set out a few lettuce heads in the corner by the barn?”

I left Oldham and this garden late in the fall full of regret, but at the same time convinced that nothing in the way of transformation is impossible to the one who really loves and studies a garden.

Dining-Rooms of Distinction

(Continued from page 150)

unusual room may be had by using Colonial landscape paper of classic or Chinese design. This necessitates long, unbroken wall spaces. Needless to say, pictures have no place here. Sheraton dining-room chairs of shield shape back give a refined appearance and silhouette beautifully against the wall. In such a room a corner cupboard for old china looks well, or better still, a pair of such cupboards. The door of the cupboard can be made attractive by removing the top panels and filling the frame with small panes of glass, thus giving above a glimpse of the best china, whilst the lower part may be used for the less attractive.

In many dining-rooms in the country that have a northern exposure an excellent plan is to use a Colonial yellow paper with white wainscoting and trim, small-paneled windows, a cheery, old-fashioned chintz on the windows and begonias—for begonias grow beautifully in a north room. This a dismal, north room can be verted into a cheery place. A piece or two of well-polished brass helps out the effect in such a room. For the table, an
Right Now Is The Very Best Time.
To Investigate Heating Systems.
Start With THE KELSEY.

Now is the time, if ever, that a heating system's defects show up. It's the time when you can get the truth, and the whole truth about them. It's the time when you can get ready information on steam or furnace heat, with the Kelsey Warm Air Heating Heat. It's the time to go into radiator heated houses and see how "stuffy" they are; and then into one Kelsey heated and feel the delightful freshness of the air and the cozy comfort of the warmth. It's the time to talk "cool-hit-talk" and find out if you want to burn up your money and heat and time and comfort, or just want a fresh-air home. It's time to send for a Kelsey Health Heat Booklet, and find out exactly why the Kelsey is a healthizer and economizer. It's time for you to do it.

are consistent with the beauty of a home. They make your improvements permanent. Give you the protection to which all the natural laws of ownership entitle you.

We are the acknowledged premier iron fence designers and builders. Blue Print, Book of Designs, Catalog, etc., sent free, if you will tell us what you have in mind. A brief description of your property will be of great assistance to us in making suggestions.

The Stewart Iron Works Co.

"The World's Greatest Iron Fence Builders"
should open onto a terrace, and there should be arched niches in the wall for rare, old Italian pottery or copper. In such a room a simply carved stone fireplace and Italian walnut furniture would give an unusual effect. Linen hangings, luscious with fruit of warm colors tone in with the soft buff of the walls. It is curious that these Italian rooms—so simple, reposeful and full of quaint, decorative charm—are not more often adapted to our American uses.

Especially would I make a plea for the long, narrow tables that are used with so much success in Italian villas. If the guests are few and favored, by placing them opposite one another they have an intimacy they cannot have across a large, circular table; and if the guests are numerous, the table may accommodate them all. Also it affords an excellent opportunity for decoration; at either end a huge bowl of flowers, a pair of those charming brass candelabra, or even the informality of a pair of early wrought iron candlesticks whose beautiful lines, one imagines some Fifteenth Century craftsman fashioned with the same loving care that he expended on a silver chalice. About the whole room is a feeling of ascetic severity.

Contrasted to this is our very modern room of enameled and decorated furniture and the omnipresent touch of black: rooms, black carpeted, gray walled with gray and black furniture; rooms of clear pure green, with a touch of strong, deep, old rose; rooms with blue walls and blue carpet and blue and gray furniture. Such rooms are clever and really charming, but they have too obvious a note, one gets merely the strong sense of color combination. They are unusual, but not always distinctive.

Such effects should be confined to the breakfast-room. There one needs toning up, and any fantasy is welcomed. You feel the spirit of play, of fun in their planning and making, and to-day the shops are tempting beyond resistance in these very modern combinations of furniture and fabrics.

A most important consideration in a breakfast-room is the outlook. There must be a good view of the weather, so to speak. In summer the breakfast-room may be little more than a porch.

In many old farm houses one finds a downstairs bedroom. In remodeling, why not convert this into a breakfast-room? Its possibilities for decoration will be a source of much delight. Gay chintz paper, sundour hangings, white enameled furniture decorated with old-fashioned bouquets, and then you have a convenient, cheerful and charming breakfast-room, an altogether desirable adjunct to your dining-room of distinction.

**STEINWAY & SONS, STEINWAY HALL**

107-109 East Fourteenth Street, New York

---

THE purchase of a Steinway for the home means the selection of the ideal piano, tone and workmanship being of first importance.

It is the price of the Steinway which makes possible its supreme musical qualities, but you will find that the Steinway costs only a trifle more than many so-called “good” pianos.

Style V, the new Upright, and Style M, the smallest Steinway Grand, offer a special advantage in price. They embody all the distinct Steinway features, but, being of a reduced size to meet the requirements of the modern home or apartment, are offered at very moderate prices.

We shall be glad to send you, free, illustrated literature, with the name of the Steinway dealer nearest you.

STEINWAY & SONS, STEINWAY HALL

Getting Results with Gladioli

(Continued from page 157)

den that can be utilized in this way. It is better to plant gladioli in beds or groups, rather than in rows, as the plants help to sustain each other.

In heavy soils the corms may be covered two inches deep and four to six inches in light soils. For massed effects, plant four to five inches apart and twice that distance if one wishes to fill in nooks or portions of the border. When the gardener plans for successive planting the earlier lot should be put in a foot apart, to admit of later settings between. A six-inch distance, however, is generally applicable.

As they grow, stake the plants, for the stalks are fragile. In conspicuous positions stakes are desirable. Those who care for garden novelties will find in the shops a variety of pretty stakes with butterfly and bird heads that add a touch of color and picturesque quiet pleasing to those who have been accustomed to the monotonous but none-the-less serviceable, old-fashioned garden stake. If these are not desirable, stakes can be driven in at regular intervals around the beds and a cord tied on them, which will help support the stalks. Some gardeners nail laths to the top of the stakes and wind on them a mesh of light string that will steady the fragile spikes against the wind.

The time to cut gladioli spikes is when the lowest blossoms open. Keep them in fresh water and cut the stems daily, and some will open one by one. With this precaution they will last over a week. Cutting the spikes will help increase the size of the bulbs—an advantage that will be appreciated next season. If the stems are allowed to dry without cutting after the flower spikes are removed strength is thrown back into the bulb—an added advantage for the next season. It is a wise plan to cut gladioli so soon as the flowers appear, for the flowers fade quickly if left on the plant—some varieties particularly. This is notably true of America—the delicate, flesh-pink variety—which will be wilted at the end of one warm day.

Like canna, elephant's ears, tuberos begonias and dahlias, gladioli must be lifted in the autumn. Late in the fall, after frosts and before freezing, the corms should be dug up, cleaned and dried in the sun for several hours. The top should be left on, or, if space is needed, kept on until completely shriveled, when the corms can be stored away in boxes about two and a half inches deep. Keep your varieties separate as much as possible. Place in a cellar where they can be undisturbed throughout the winter.

Should the gardener wish to force blooms in November and December, the process is simply done by keeping some of the corms in a cool place, thereby retarding their growth until August. Plant them in boxes of rich soil four to eight inches deep, and keep them outdoors until frost.

THE Machine For REAL Cleaning Efficiency

We have stocked this machine—The Bissell Vacuum Sweeper—because we believe its combination of the carpet sweeper and vacuum cleaner afford the solution of the cleaning problem.

In its efficiency, ease of operation and simplicity it has no superior. It is well designed and well constructed, and will maintain its exceptional cleaning ability for years.

See this machine here and let us show you what it can do.
Hatching With a Wooden Hen

(Continued from page 175)

convenient tester will be needed. A good kind consists of a device similar to a metal lamp chimney, with a light tube at one side. It may be used on an ordinary lamp, and leaves both hands free. A plan used by some poultrymen who have incubator cellars allows the eggs to be tested in daylight and without the use of a lamp. A board shutter having an opening in the center a trifle smaller than an egg is fitted into the window so tightly that all light is excluded except that which comes through the opening, and against which the eggs are held to be examined. If there be a strong light outside, as when the sun is shining brightly, the testing may be done very easily and quickly.

While making the test for fertility it is also advisable to examine the air cell at the end of the egg in order to learn whether evaporation is normal or too rapid. One of the illustrations indicates the proper size of the air chamber at the end of a week and two weeks. When the contents of the egg seem to be drying faster than it should the air chamber will be larger and the operator will know that more moisture is needed. The moisture question is one which has been the cause of much discussion, but too much moisture seems, on the whole, to be better than too little. In many machines it is provided by means of wet sand trays. With other machines pails of water may be placed under the lamp, the floors wet down or the eggs sprinkled with water at a temperature of 101. Sprinkling is often advantageous when duck eggs are hatching.

With the chicks finally out of the incubator, it is easy to understand that the machine will need a thorough cleaning and disinfecting before it is used again. The lamp burner should be boiled and a new wick inserted, after which the machine may be started on a new hatch.

From all that has been written one might suppose that the operation of a hatching machine is a complicated matter, but in point of fact it is not. Certain things are to be done in the right way and at the right time, but a first-class machine will require little attention except night and morning. Follow the maker's directions carefully, for he has doubtless spent many hours trying to anticipate every possible contingency. He wants to make it as easy as possible for his customers to get satisfactory hatches. As to the rest, the amateur who has the highest degree of success is the one who looks carefully after every detail, but otherwise leaves the machine alone. Tinkering, especially with the thermostat regulator, is foolish. After the first adjustment, the temperature may usually be regulated by increasing or lowering the lamp flame. And, finally, it must be remembered that nobody can hatch good chickens in any sort of incubator unless the eggs were laid by hens possessing strong vitality.

At Last — A Light-weight Porcelain Bath Tub

costing about the same as a good quality cast iron bath and weighing little more

Mott’s Light-Weight Porcelain Bath

marks a new era in bathroom fixtures

By reason of the reduction of several hundred pounds in weight in these baths, plumbers effect a saving in transportation and handling — and are thus able to quote you a lower price for installation.

To learn more about this remarkable advance in bathroom equipment send for Mott’s “Bathroom Book” — 112 pages. Illustrated with photographs of model rooms and suggested floor plans. Please include 4c for postage.

R. J. & J. B. Birkhead, 425 N. La Salle St.

From nose to stern he is made of tingling nerves and springy muscles

the typical Irishman has the free, open swing of a gallopping thoroughbred. He is always up on his toes, and from nose to stern he seems to be made of tingling nerves and springy muscles. No dog is more everlastingly on the alert.

In the city, in the suburbs, on the farm, the Irish terrier is a mighty good dog. He has size enough and sand enough to be useful both as a destroyer of vermin and as a guardian. At the same time he is small enough and nimble enough to be convenient in the crowded street or the four-roomed apartment. He is always good company, quick of Wit, sympathetic, and lively without being boisterous. He is intelligent, as well as clever, and he is easily taught those lessons in etiquette and obedience so necessary to his own peace and his master's pleasure.

If a friend, with his heart set on owning an Irish terrier—there are many worse ambitions—should ask my advice, I would suggest he go to a reputable kennel prepared to pay what he could afford, for a good dog is worth a good price, and one does not like to have to apologize for his four-footed companion. I would advise his getting a younger about six months old. At this age he will be over the troubles of his puppyhood, and yet young enough to be brought up in the family,

It Makes No Noise!

Why Be Embarrassed?

Why submit to the mental discomfort caused by the sound of flushing the ordinary noisy closet?

The Trenton Pottery Company

SIWELCLO

Silent Closet

operates so quietly, when properly installed, that it can't be heard outside its environment. It was designed to be silent, yet no sanitary detail has been neglected.

Even if its highly glazed surface should be accidentally chipped off, it would still be white, and impervious to grease and acids.

Architects and plumbers recommend the Siwelclo and all our other sanitary products.

Booklet R-8, "Bathrooms of Character" shows plans and designs. May we send it to you?

I would advise his getting a younger about six months old. At this age he will be over the troubles of his puppyhood, and yet young enough to be brought up in the family,
which is something to be greatly desired in the case of a house dog. I would suggest he pick out a bright, husky pup, with good, straight legs, a shortish back, small ears, dark eyes, and a red, wiry coat. Six months later his dog may have developed into a "world beater," fit to win at any bench show in the land, or he may, as the fancier says, have "gone wrong." In either event, I will wager that whether he cost twenty-five dollars or two hundred and fifty, my friend will not take a hundred per cent profit on his bargain.

Forty years ago no one dreamed of spraying. That was because Nature took care of us—her birds and mammals thrived on the pests that would otherwise have spelled ruin to crops. Since then men have thrived on the wild birds and mammals. Hence spraying is a necessity—a necessary evil, perhaps, yet a part of garden work that is vital. Read "Re-pelling the Pest Invasion," in the April HOUSE AND GARDEN.

My Suburban Garden  
(Continued from page 153)

with trunks about 1 1/4 inches in diameter. They cost 35 to 50 cents each; surely a diminutive outlay for all that future wealth and pleasure! Orchardmen always buy, one-year trees, which are mere "whips," costing about 20 cents apiece. They do this partly because of the reduced cost (which runs into money on 10,000 trees) and partly because they can head the little whips of trees themselves, and every orchardman has his own notions as to the proper height to head. For a suburban garden, the two-year tree is best, for it already has been headed at the nursery better than you could do it yourself.

Three-year trees are sold by some nurseries, but having them is a great gamble. Some of my three-year Baldwins are fourteen feet high, and must have by this time roots at least eight feet long, but if you were to dig up such a tree at the nursery your top and roots would be far out of balance, for most of the big roots will have been shorn off by the spade, and it would take years to get on its feet again, if, indeed, it lives at all. Our two-year trees came to us with a ball of roots about two feet long, and simply needed cutting to the proper height to head. For a suburban garden, the two-year tree is best, for it already has been headed at the nursery better than you could do it yourself.

Creating a New Art

At the Centennial Exhibition at Philadelphia, the exhibit of the Bell System consisted of two telephones capable of talking from one part of the room to another.

Faint as the transmission of speech then was, it became at once the marvel of all the world, causing scientists, as well as laymen, to claim with wonder.

Starting with only these feeble instruments, the Bell Company, by persistent study, incessant experimentation and the expenditure of immense sums of money, has created a new art, inventing, developing and perfecting: making improvements great and small in telephones, transmitter, lines, cables, switchboards and every other piece of apparatus and plant required for the transmission of speech.

Get Ready for the Song Birds

$1

Including 3-Hole Entrance

All In One

The "Ridgewood"

banded Bird House

Can be used with your existing bird houses. Can be hung or placed on the ground. Can be made in various sizes and colors. Order direct.

"Three-Hole" Entrance

Keeps birds with you all the year round. Great for song birds. The best copy of "How to keep birds in your yard" by C. E. White. Order direct.

White's Suet Basket

75c

Robin and Phoebe Shelf

50c

Hang It Anywhere

Fill with suet or crumbles and attract the birds that you desire. Order direct.

Get the Song Birds Food and Shelter

They Will Repay You!

Enlist for the protection of our native song and insect-eating birds. A few bird houses erected on your place will invite the birds to stop on your premises. Proper food will keep them there all the year round to protect your trees, shrubs and garden.

The birds are our best friends, as they kill our enemies—the insects who destroy plant life. Besides they please us with song and beautifully influence the children for good.

Birds need shelter and food right now. Order several of the beautiful bird houses shown here and a few suet baskets. All shipment charges prepaid. Money back if not satisfied. Address:

McCray Sanitary Refrigerators

Keep the Iceman Outside

Any McCray can be equipped with an ice water cooler and arranged with outside door for iceing from the side or rear porch. This keeps the ice man with his muddy tracks and ice dippings outside and relieves you entirely of this annoyance.

The linings are snowy white opal glass, porcelain or white enamel, as you prefer, and are easily kept clean and sanitary.

For over thirty years McCray Refrigerators have been recognized as standard, representing the finest type both in construction and efficiency. They are used in the U. S. Pure Food Laboratories, because tests proved them to best meet the exacting requirements, and in the finest residences, hotels, clubs, restaurants, public institutions, etc.

McCray Refrigerators are built in a great variety of sizes, for every requirement of residences, hotels, clubs, restaurants, delicatessen stores, groceries, coal merchants, florists, hospitals, public institutions, etc.

Planting a young nursery peach. Mound system is best. Dig a shallow hole, set in roots, trim rich soil about them, next a shovelful of manure, and top off with ordinary field soil piled up above the graft joint as shown.

rhubarb, spaced 3 feet; one of eggplant, spaced 2 feet; one of lettuce, three of peas, two of radish, two of beets, one of spinach, onions, carrots, parsley, a tomato garden of 15 plants, 100 feet of string beans, forming a garden border, and 60 feet of corn along the back fence, in front of the raspberries. With extremely rich, mel- low soil this arrangement might have given fair results by making the east garden all permanent plants; i.e., rhubarb, asparagus and strawberries, all requiring rich soil and coming up year after year uninterurbated.
You will note that it is a wheel-hoe garden, all the vegetables in long rows running north and south, no small beds and no paths except the main central and traverse paths, wide enough for a wheelbarrow or garden wagon. All my boyhood gardens were a series of small beds and had to be hand-weeded and hand-hoed. Since then the wheel-hoe has come into prominence. I got one, right off, for one can accomplish five times as much in one-fifth the time as with the old spade, hoe and rake methods. The wheel-hoe has a small plow, which turns over your soil as fast as you can push it, three cultivator hooks to break up the plow clods, two harrow rakes and two hoes, the latter for weeding. I could appreciate all those soil-preparation tools, and used them at once, but the efficiency of the hoe attachment as a weeding tool I did not realize until next year, for my rows were down too close together at first to use the hoe properly.

Planting went on merrily by simply throwing two furrows against each other with the plow and planting on the ridge (you see, I was still much afraid of that wet soil), and by the middle of May the tender vegetables were in; beans, corn, tomatoes, eggplants, and the summer came on apace.

But I had reckoned without my soil. The fruit trees and berries put forth their leaves bravely, the vegetables came up on time, and those early May days were a delight. But by June a subtle change came over the whole garden. The soil was still as black and wet as ever, in spite of three weeks of sun; the young, tender seedlings of lettuce, radishes, beets and spinach seemed to languish and stop growing. A distinct appearance of withering overtook the fruit-tree leaves; they were curling up and turning yellow, the raspberry leaves were shriveling before my eyes. An alarming blight seemed to spread over everything. At first I thought it was lack of sufficient sunlight, so I took out, furiously, the remaining forest trees over the garden. It then got direct sunlight from 10 A.M. to 4 P.M., in spite of the wall of forest trees on the east and west. Still the desolation went on; all the trees dropped their first crop of leaves and the strawberry and asparagus plants turned yellow and died. Young radishes, spinach and beets simply withered away and died after the first two leaves; the string beans (which will grow anywhere) contented themselves with two sickly yellow leaves; peas rose to about six inches high, stopped, and turned yellow.

Ah, that terrible June! I, that was one of the most successful boy gardeners of my time, saw my work as a grown man coming to nought before my eyes. It could not be the drainage entirely, for under the long, sunny, dry spell my soil was simply fresh and moist—not soggy. Could it be the soil itself—that rich, black loam that looked to be so ideal for plant
Radium Makes Things Grow

Its effect upon vegetation is very marked, producing more rapid growth and luxuriant appearance, as well as improving quality and production. Radium Brand Fertilizer (R.A.F.) is a scientific and thoroughly tested combination of Radioactive Element with fertilizer. Try a can today and see what gratifying results follow its use. One pound will fertilize 50 sq. ft. of surface.

Before being offered to the public, it has been successfully tested on 130-acre farm under direction of famous Botanists and Horticulturists; also by Phipps Conservatories, Pittsburgh, Pa., and many others in various parts of the country. These results told in our interesting free booklet, "Radium Makes Things Grow," illustrated with photographs of plant life grown with and without Radium Brand Fertilizer (R.A.F.). Write today for this booklet, and also order a sample can by mail.

Sample Can, Prepaid, 25c

Radium Brand Fertilizer is a complete and highly efficient plant food, put up in convenient and attractive packages and priced to meet a demand from you who love to grow things, in your home, garden, or farm.

Radium Fertilizer Company
203 Vanadium Bldg., Pittsburgh, Pa.

The Helpful Book

The Meehan handbook is different! It's advantage to the garden lover is not alone in the fact that it has over 100 pages, profusely illustrated. It is complete, compact and handy. Easy to find any hardy tree, plant or shrub of merit in this book.

Many new, rare and unusual plants are described and illustrated.

Collections for various purposes are so arranged that proper choice is easy. Any property of one acre or less can be planted complete from the street front to the small fruit-patch in the rear by combining these collections. It simplifies ordering.

Write today for this practical handbook. It is FREE. If you have a new un_planted property, indicate the size and conditions, and we shall have one of our practical plantmen familiar with the soil conditions in your locality forward his recommendations.

growth? One after another, five of the fruit trees died—one Baldwin, both Fall Pippins, both cherries; they put up a noble fight for life, sending out two sets of leaves with what sap they possessed, but, when I sadly dug them up—pheew! the sour stench that arose from that black, muddy mess of rotten roots! The same occurred with the raspberries—magnificent two-year Cuthbert roots—now sour and black, not even attempting to grow a fibre of new roots, killed with "wet feet" in sour soil! But the overflow berries and grapes, planted any old place about the house, were thriving mightily; so was all the privet and shrubbery in the dry soil at the front of the place. I took hope and consulted a soil expert, for I knew it was not a sunlight problem, but soil and drainage, that I had to deal with.

Said the expert: "That soil of yours, when you get it tamed, will be the most wonderful grower you ever knew. What it needs is lowering the water table about six inches, or else, what is the same thing, raising the soil about that much.

If you have a new unplanted property, indicate the size and conditions, and we shall have one of our practical plantmen familiar with the soil conditions in your locality forward his recommendations.

and two wagon loads of manure. This whole dressing was then plowed under with the wheel hoe.

The stumps of two big maples which stood side by side in the garden were next taken out, hurled, and their ashes spread over the soil. I stood aghast at the hole they left, as it was about eight feet by six and three feet deep, and I was at a loss how to fill it. However, when people want a hot frame in their garden they usually begin by digging just such a hole as I already had, so I simply filled it with two wagon loads of fresh horse manure and put up a frame 6 feet x 7 feet of 7%-inch x 12-inch yellow pine boards, and on them put two hot-frame sashes, thereby making me a hotbed out of a vexatious hole in the garden! The mill size of these sashes is 6 feet x 3 feet, and they cost $3.00 each. A headboard and footboard made up the difference between my frame and sash size, after which six inches of rich manure and field soil went in on top of the manure fill. The hot frame received two coats of white paint, and was sown to lettuce forthwith, which soon came up, and we enjoyed fresh lettuce all that winter.

This job was hardly finished when the new fruit trees arrived. I made up my mind that it was a mistake to plant such large trees as apples along the south border of the garden, because of the shade they would inevitably cast, so we decided on a line of peach trees spaced 10 feet apart, with a bed of dahlias in between each peach tree, making a solid wall dividing the garden from the rear lawn. This, with a rose arch over the garden entrance and a solid border of pansies in front of the dahlias clear across the garden, would give a pleasing effect as viewed from the rear lawn (as this latter is always a favorite camping ground for my family). So these peaches went in first; two Elbertas (a splendid fall market variety), two Crawford lates (white and juicy) and the two Crawford Earlys flanking the garden gate, which, having been planted on an ash fill, had survived from the first garden. Half way down the main garden path and ten feet apart went in two new cherries—Black Tartarian and a Governor Wood. The former we used to call "Oxhearts" when I was a boy, and the latter is an early red-and-yellow sort.

Along the west border of the driveway I put in two Kieffer pears and a Champion Quince. Kieffer does splendidly all over South Jersey, a rich, juicy pear, larger than Bartlett. Mine grew to be ten feet high their first year.

All these trees and shrubs were planted mound style; that is, a shallow hole in the soil, good, rich earth packed tight about the roots, next a shovelful of manure, and finally a mound of garden soil piled up to cover the graft joint onto the root.
We wish to call your particular attention at this time of year to our cottage furniture, suitable for shore and country homes.

It is no exaggeration to state that Leavens Cottage Furniture is a distinct type, recognized at once and appreciated by the discriminating.

We have an unlimited stock to select from and in addition, you have the choice of a large variety of finishes to conform to the individual taste or harmonize with the interior surroundings we offer.

Shipments carefully made, insuring safe delivery. Send for complete set No. 4, over 200 illustrations and color chart. You will find possibilities and suggestions for every room in your house.

For Beautiful Interiors

Most every style of interior trim and design or exterior architecture can be harmoniously matched by the great variety of correct and dignified designs of

MORGAN

It is not necessary to go to the expense or suffer the delay of "specially made" doors for a building of any kind or size. Specify MORGAN DOORS and you will experience a satisfaction that you have rarely enjoyed.

Every genuine MORGAN DOOR is stamped "MORGAN" on the top rail as a guarantee of a perfect door and for identification at the building.

Send for our handsome Suggestion Book of Interiors. "The Door is Half the House." It will help in building and remodeling.

THE STORRS & HARRISON CO., Box 427, Palenville, N.

Trees put in late October start considerable root building before the hard frosts reach them in December, and in the spring they get time to make a lot of root-growth before the sap rises in April and the buds begin to come out. Trees put in as late as the middle of May may succeed, but it's a toss-up, for the leaves begin to demand sap before the roots can get a start to supply it, and all the sap dormant in the root and trunk is soon exhausted. After dropping its first leaves, it will still grow another set, and then if sap is not forthcoming from the roots the tree will inevitably die.

I was very uneasy about planting any more trees along the back border of the garden, though that is theoretically the ideal place for them. This was the lowest ground in my particular garden and everything had died there the first year, even the hardy privet hedge. The new fill, however, had raised this nearly a foot above the main traverse drain, but still I feared the overhanging branches of the forest trees shutting out the direct sunlight at high noon. Two Early Harvest yellow apples had survived here, however, and were getting along slowly, having been planted on high spots, so I decided to risk a row of ten currant berries (Industry), all of which did well the succeeding summer. Here also, next to the drain, I decided to put the new asparagus plants, of which I had ordered fifty three-year roots to replace the hundred two-year roots which had all died. Asparagus must have a permanent bed of its own, in rich, dry soil not likely to be disturbed by annual plantings of vegetables, so where could they be better put than in the rear border of the garden, in front of the currant bushes and behind the main drain? The old location in the east garden I foresaw would be soon wanted by the new strawberry runners, of which we would have at least 300 to find room for the next fall. No almanac or catalogue that I have found speaks of asparagus roots, though they tell you how far apart and what kind of soil to put them in. The thing to do is to dig a trench about a foot deep and two feet wide and set the plants in well-rotted manure in two rows, 18 inches apart in the rows, "staggering" the rows; that is, one row ahead of the other nine inches. Fill back the trench soil so as to cover the tops of the roots about four inches. Two years later, when you begin to use the shoots for the table, build a blanching mound over them of loose loam a foot high, and cut the shoots off sideways through this mound with an asparagus knife.

Editor's Note.—This is the first of a series of four articles that Mr. Miller has written on his garden. The next appears in April—"Slave of a Wheel-hoe"—a fascinating story of garden work.

The Uses of Woodwork in Interior Decoration

(Continued from page 169)

who, writing in the Age of Augustus Cesar, warned against the affectation of heavy plaster cornices, lest they fall. But Adam did not use the Lime-Stucco of the Ancients, but a sort of deal Plaster of Paris, mixed with fibre and glue to hold it together—a poor material, one would think.

It might be interesting to digress somewhat on this general subject. Lime, Plaster, Stucco, Mortar, Plaster of Paris, Cement, Concrete—these names are generally used so loosely and incorrectly that it is difficult to make oneself understood in writing about them. The other day a chime, unsplashed time, about distilling concrete houses. I completely misunderstood him, rather stupidly, I confess, but, as I disliked what I understood by "concrete house" did not matter. Of course, he meant a house with a facing of cement and sand, generally called a "stuccoed" house, or a "rough-cast" house; structurally its walls might be of hollow tile or wood-frame and wire lath, or brick, or anything else. He did not refer to the construction. I thought he meant a house with walls built of concrete, the sort of a house that Edison has so glowingly recommended, cast in one piece—walls, floors, roof and all, in one day, in a series of iron molds—or the house built of great concrete slabs, that the Sage Foundation first tried at Forest Hills Park, and discarded later, preferring houses of other material.

This is merely a case in point; let us examine what these terms generally are understood to mean by architect or builder. There are only three active materials involved—Lime, Plaster of Paris, Cement. Each is obtained by roasting or calcining rock; each is mixed with sand and water before using, and all harden in what seems at first a more or less similar way. As to their differences, here they are:

Lime: Made from roasting Marble, Calcite, Limestone, Chalk, Oyster Shells, which, chemically, are all Calcium Carbonate, or CaCO₃, differing among themselves only in their form of crystallization. By this process Carbonic Acid Gas, or "CO₂," is driven from the stone and leaves the pure white material we call Quicklime, unsplashed lime, or, chemically, Carbonic Oxide or CaO.

Quicklime longs for its old companions: its hands are outstretched; leave it alone, exposed to the air, and quietly, unobtrusively, it seizes every molecule of Carbonic Gas that comes near, and before we are aware of a change, behold our sack of Quicklime has become crumbling, air-slaked Lime! Of no more use is it for building; it might be used as a fertilizer or to make an indifferent, poor whitewash.
Asters and Dahlias

It is our aim to grow and have grown for us only the very best and Highest Grade Seed—both flower and vegetable—that experienced growers can produce.

FRANKLIN PARK LAWN SEED

The original formula that has made our Boston Parks famous. It is made up of all recleaned seeds of known vitality, is quick to germinate, is free from weed seeds, it starts at once.

but for little else. Put it in a pail of water and it sinks, inert, to the bottom like a white mud; such molecules which have not found their Carbonic Acid mates will accept the water instead, and there is a certain amount of bubbling.

For Quicklime has also a strong affinity for water, and changes to Calcium Hydroxide with enthusiasm, with great bubbling and heat, with steam arising and a vast to-do.

This Calcium Hydroxide, or Hydrated Lime or Slaked Lime (not Air-slaked Lime) or Line Putty, or "Fine Stuff," is what is used in building. Mixed with sand it formed the early mortar generally used throughout Northern Europe and the United States until Portland Cement was developed in the last century.

The slaked-lime and sand, too, mixed with cattle hair and called "Coarse Stuff," is used for the first coats of the common inside plastering of houses; formerly it was used for the finishing coat, too, though without the hair. Its disadvantages are its slowness to dry and the difficulty of slaking the Quicklime; for, notwithstanding its violent bubbling and steaming when water is poured on, there always are a few particles which resist the water, which prefer their single state and will not unite, despite the Italian with his hoe. Time alone seems to solve the difficulty; all architectural specifications call for the lime to be slaked "at least three weeks before using," or sometimes "three months:" the old Romans, Pliny tells us, had a civil law by which it had to be kept for three years before anyone could use it! The longer it slakes, the better it becomes.

On the wall it dries out and "sets" in a day or two; but a very slow change begins which is not completed for hundreds of years, perhaps—the divorcing of the water and substitution of such Carbonic Acid Gas as it can absorb from the air, when it has returned to its original form and is actually artificial limestone, very hard and strong.

Plaster of Paris is the next to consider. It is formed by roasting Gypsum or Alabaster, which are chemically Calcium Sulphate + Water. The roasting drives off part of the water, leaving the fine powder we know as Plaster of Paris. Mix it with water and part of the water is absorbed; it quickly hardens into its original chemical state, though it never gets as hard as the Gypsum it was made from, nor as hard as Lime does. It swells slightly as it "sets," so fills moulds well. Therefore it is the material always used for cast decorations.

It does not stand the weather as lime will; rain disintegrates it, so it is not used out-of-doors. Mixed with slaked lime, however, it sets slowly, taking hours, instead of minutes, and is used for the last coat of inside house-plastering. Formerly

only lime was used, as we said before: Plaster of Paris is a comparatively recent discovery—or rediscovery—since the interiors of some of the earliest Egyptian tombs were coated with this material.

Cement is the last of the three. It is somewhat like lime, but much more complicated chemically. Until a very few years ago—in the eighteen hundreds—it was produced by calcining (roasting) a volcanic or a sedimentary rock which naturally contained the proper ingredients: this cement is known as Roman, Pozzolanic, Rosendale; now the best of our cement, and by far the most of it, is produced by calcining an artificial mixture of the proper ingredients; there is nothing left to chance; we are sure of our product, which is stronger than the old natural cement; we call it Portland Cement.

Cement does not need to dry out in order to set, but a little water will cause it to set anywhere, under any condition; under water, as well as in the air; so, like Plaster of Paris, it must be wet only immediately before use; if it once starts to set and the "set" is broken, it will never be strong again. There is no need for this; it takes several hours for the Initial "Set," not several minutes, like Plaster of Paris. However, it is sometimes mixed with lime in the same way, to retard the setting. If the final set has once started, the cement must not be disturbed, or it is not fit to use again; therefore, no wet cement can be kept in good condition over night for use in the morning; though I find that the smaller and irresponsible Italian contractors are prone to attempt it, breaking up the leftover material and mixing it with a little new. Its hardening power has gone, though, and it is not much better than so much sand.

Sand does not take a chemically active part with either Lime or Cement; it merely dilutes the material, and, if in proper proportions, it makes the hardened material less apt to shrink and crack. Cement particularly has a superabundance of strength; it would be wasteful to build a wall of cement and sand alone, so small stones or clean cinders are mixed with the cement and sand, and this triple mixture is Concrete.

As to the terms Mortar, Stucco or Plaster, they do not describe special materials, but indicate where the materials are used: though the word "Plaster" is sometimes carelessly used as an abbreviation of "Plaster of Paris," and is misleading.

Mortar is the material that fastens stones or bricks together in a building; it may be Lime Mortar, lime and sand, or Cement Mortar, cement and sand.

Plaster, or Plastering, is the wall and ceiling covering. A room may be plastered with lime and sand, with Plaster of Paris, lime and sand, or with cement and sand; a house may be plastered outside with Lime and Sand, or with Cement and Sand; or, in the case of old houses in the

Efficiency in the Flower Garden—II

(Continued from page 161)

be just right. It must be a soil that will absorb and hold a great deal of water. It must also be fine and light, so that the sprouting seeds may push up through it readily. Decomposed sod, or garden loam with as much fibrous matter in it as possible; leaf mold, or chip-dirt or coconut fibre, and sand or very finely sifted coal ashes, are the ingredients required. Mix the loam and leaf mold in equal portions and add as much of the sand as is needed to "cut" the mixture thoroughly, making it so that when a handful of it is squeezed up into a ball it will crumble apart under the touch of the finger when released. After these things are mixed together run them through a sieve—an ash-sifter will answer the purpose, if you haven't one especially for your garden work. While flower-pots are sometimes used for starting seeds in, it is exceedingly difficult to keep the soil in them at an even degree of moisture, and results are likely to be unsatisfactory. Seed-pans, which are made for the purpose and are inexpensive,
are much better. If you have to use a pot, take a comparatively large one, and, after filling it about a third full, place a small pot in the center of it and fill the prepared soil around this, leaving it empty. Sow the seeds on the surface of the soil between the two pots and apply water through the inside pot, which is plugged at the bottom. Or the soil may be put in the small pot and the space between the pots stuffed with moss, which is kept evenly moist. In either case the water passes slowly through the porous sides of the smaller pot, keeping the soil moist without getting it wet. A light of glass over the pots, raised slightly at one side to admit air, will also help to conserve the moisture. While this method is good for very fine seed, like that of begonias or petunias, small, shallow wooden boxes, which may vary in size from a cigar box to a cracker-box “flat,” may be used with more convenience and as much success for the majority of the flower seeds.

A number of different sorts may be started together in the same box, but be careful to tag each one as you plant it. Do not cover the seeds too deep. Very fine seeds should be merely pressed into the moist soil with a brick or piece of flat board, and covered with a thin layer of cocoanut fibre or sifted moss to shade the little sprouts until they begin to bury themselves in the soil. The small flower seeds should be covered an eighth to a fourth of an inch deep—the old rule is two to three times their diameter when sown inside, and three to four times when sown outdoors. Larger things, such as sweet peas, should be covered from a quarter to half an inch deep. Very hard seeds, such as moonflowers, canna and musa (banana), should be carefully filed or cut through and soaked a day or two in tepid water before planting.

Seed-beds made for flowers in a cold-frame or outdoors in some sheltered spot should be carefully drained, preferably by having a layer of coal ashes two or three inches thick put down, and the three or four inches of surface soil should be prepared as above. A little bed only a few feet square will serve for starting a great many plants. The rows of most sorts may be made as close as three or four inches, if it is intended to transplant the seedlings. If one expects to thin them out and grow them where sown until ready for changing to the garden, they should be allowed more room.

In sowing flowers in the open where they are to bloom, every possible care should be taken to provide a fresh, finely pulverized seed bed. A liberal dressing of manure or fertilizer should be added to it before the seed is put in. Among the best of the flowers which may be started from seed to flower the first year are: African daisy, allamanda, ageratum, antirrhinum, asters, balsam, begonia, calliopsis, canna, candytuft, mat-
The Unusual in Table Linen

(Continued from page 181)

The edges finished with a narrow hem, as was the tablecloth. Such a set is inexpensive and easy to make, since it is all done with a coarse thread.

Cross-stitch cloths and napkins are always attractive, especially when the pattern is compact and the stitches small. They go especially well in Colonial dining-rooms.

In the shops are being shown hand-woven linens from Russia decorated with red designs set in bands. They prove serviceable for tea or the light supper.

The conventional pink and blue flowered china requires a damask of smooth texture, so, in the event of our luncheon or breakfast sets not being of a sturdy make and design, it is advisable to keep to the ordinary damask. Among the attractive damask covers is one blocked in yellow and white, others have blue borders. These are especially appropriate for tea in summer on the porch. Little weights attached to the corners will prevent the wind from curling them up or blowing them away.

For a reception, a filet or open-work cloth laid over a colored silk damask gives a rich effect. Especially luxurious is it when the damask is yellow, the china gold, and white and gilt candlesticks are used. Which is another way of saying that color is more and more being used in table linen.

A Solution of Cold-Frame Inconveniences

When the calendar and the annual crop of horticultural catalogs announce that spring is really not so far away as it seems, the soils-and-seeds enthusiast without a greenhouse is prone to long for something between a hotbed and an open air. There are flats to be prepared and soil to be dried and pulverized and weights attached to the corners will prevent the wind from curling them up or blowing them away.

For a reception, a filet or open-work cloth laid over a colored silk damask gives a rich effect. Especially luxurious is it when the damask is yellow, the china gold, and white and gilt candlesticks are used. Which is another way of saying that color is more and more being used in table linen.

A Solution of Cold-Frame Inconveniences

When the calendar and the annual crop of horticultural catalogs announce that spring is really not so far away as it seems, the soils-and-seeds enthusiast without a greenhouse is prone to long for something between a hotbed and an open air. There are flats to be prepared and soil to be dried and pulverized and weights attached to the corners will prevent the wind from curling them up or blowing them away.

with many of the advantages of the former, most of the latter's, and some of its own thrown in for good measure. It is the de luxe edition of the conventional frame, wherein one crouches in cramped attitudes and fear lest the seedlings be nipped by the cold before the sash can be replaced; it does its work efficiently and it is inexpensive to build.

The chief requirements for the construction of such a place are a perpendicular out-building wall with a southern exposure, four or five standard hotbed sashes, some 2 x 4 joists and rough boards, and a roll of tar paper to cover the roof and ends. The photographs show the general plan of construction, which can be varied to meet individual requirements. In this particular case the beds are level with the outside ground, for the entrance doorway connects with an out-building whose floor is sunk four feet below the surface, but there is no reason why they should not be built up to conform to other situations. The beds should not be more than ten inches from the glass at its lower end, for the nearer they are the better will the plants grow and the more easily they may be ventilated. For ventilating, the sashes are simply lifted from the cleats at the lower end and slid the required distance down their runways, thus leaving openings at the top. This must be carefully attended to, for though the temperature will run high during the middle of a sunny day, the ground itself remains quite cold and the plants will damp off quickly.
Dreer's Roses
For the Garden

STRONG, two-year-old, pot-grown Rose Plants that will give a full crop of flowers this season, is one of our most important specialties. In our Garden Book this season we offer and describe over two hundred of the choicest varieties, including the latest introductions of the world's most famous Hybridisers.

Special: The "Dreer Dozen" Hybrid-Tea Roses, a collection of high-grade sorts that always do well—for $5.00.

Or, send for a copy of the Garden Book free, and make your own selection.

Early Plants Make the Profitable Garden

And you can have neither unless you use hot-bed接种

Sunlight Double Glass Sash make the earliest and strongest plants at the least cost of money and

The sashes are set at an acute angle to catch the sun's rays

without proper air. Regular greenhouse benches instead of the solid beds would lessen this contrast of soil and air tem-

The sunken pathway is a great conven-
ience, for it does away with tiresome stoop-
ing over the beds. The work-bench at the
back, too, is invaluable as a place to pre-
pare the flats; their seed can be thoroughly
pulverized and mixed without danger from
the wind; and, surrounded by a delight-
fully warm atmosphere, one can work all
day in comfort. By April first it is safe
to plant lima beans, squash, melon and
cucumber seed in small pots set in flats.

Most of these would rot or burst in the
hotbed, but at least two weeks can be
gained, especially with the squash, by start-
ing them in the glass-front room.

Quite contrary to what one would ex-
pect, this near-greenhouse is not good for
transplanting from the hotbed. In the
spring it is a workroom and cold-frame
rather than a forcing-house, for plants ac-

Farr's
Hardy
Plant
Specialties

Edition 1915-16

tells of the favorite plants that make the hardy garden an endless joy from the earliest days of spring to the time when the plants must be covered for their winter sleep. It is a book—rather than a mere catalogue—describing in an extremely interesting way the habits, the form, the likes and dislikes of my favorite perennial plants, with notes about the time of blooming and colors of the flowers. There are many illustrations of my Irises, Peonies, Delphiniums, Aquilegias, hardy Chrysanthemums, with twelve full page plates in natural colors, (reproduced from Lumiere plates) just as the flowers grew here at Wyomissing.

Over Five Hundred Varieties of Peonies

are accurately described, the text having been prepared from my own field notes. The book includes the Irises as well as the Peonies, classifying and describing the hundreds of varieties and telling how and where to grow them. Other favorite hardy plants described are the Phloxes, Asters, Poppies, a choice selection of Roses together with a unique collection of the new and rare Lilacs.

This Book is for You

if you write for it. I trust that it will be an inspiration to you, as its predecessors have been to others who love the many hardy plants that are a never-failing source of delight, making the hardy garden a place of recreation and rest.

BERTRAND H. FARR, 106 Garfield Ave., Wyomissing, Penna.

Rose-Growing—A Delight

Do you know the joy of looking each day for new blooms, to watch them open and grow into splendor, to feel as if they were almost human and begging your care and love? Plant a garden of C. & J. Roses and you'll learn this delight. Ours are the aristocrats of the rose world—selected for their great beauty, and hardiness, and are guaranteed to grow and bloom. With all the varieties in commerce, they constitute a wide range in color, size and growing habits for all climates. 400 Roses—Nature's Best 101 of them are winners, and we have marked them with a * in our 1915 Rose Guide — making ordering easy and safe. The Rose Guide is a beauty —contains 85 instructive illustrations, 19 in color—42 pages of interesting descriptions. It's free, and we send Art Rose Poster Stamps, if you mention House & Garden.

EVERGREENS

Rox B Tarrytown, N. Y

ROSEDALE NURSERIES

offer our choice English mixtures suitable for our climate at usual prices. These mixtures have the season's crop. Despite the limited imports, we will grow them. This guide will be treasured by rose lovers—The Dingee & Coward Co., Box 374 West Grove, Pa. Published, it is the most educational work on rose culture for 1915—Free. It is only in southern climates where still waters seldom, and running waters never, freeze, that the water hyacinth becomes an evil. In Florida and Louisiana untrammeled growth would be granting a complete monopoly. Impenetrable masses of heavy, green growth would render the passage of small craft impossible, and even the progress of strong and well-equipped vessels over deep waters would be impeded.

Neither in Florida nor Louisiana are these conditions allowed to prevail. Over ten years ago the wild growth of the plant was condemned. Active measures were adopted for its extermination. Harvey's Canal and Bayou Saint John, in New Orleans, and the Saint John's River, in Florida, are prominent examples of its obstruction and the manner in which it crippled fisheries.

All ordinary remedial agents failed; the plant continued a crying evil. The Government gave efficient aid. Liberal reward was offered for the discovery of some destructive agent. Nothing did more than temporarily check growth. The many chemicals, mechanical devices and modes proposed for the purpose fill a book if enumerated. Some were applied to the water and some directly to the top growth and crown of the roots. Entomologists sought for insect foes, poisonous to plants. Destructive bacteria did, for a time, materially lessen the growth; it inspired more reasonable hope than any other agent.

Not long ago, Bayou Barataria and Bayou des Allemands, in Louisiana, were so densely overgrown that important lumber manufacturing plants had to suspend operations until a clearance could be made in order to get the logs through. The Government has expended private business interests quite recently by two vessels specially fitted and equipped for clearing these bayous of the plants. They use a combination of chemicals, which appears to be only of temporary benefit. The two vessels endeavor to cover the entire surface of the bayous with sufficient regularity to keep pace with the rapid growth, so that traffic can proceed; the engineers say there is but little hope of extermination. There is an expressed determination to increase the hyacinth fleet for more extensive operations upon infected waters. One simple method of uprooting and destroying the hyacinth is employed in Bayou St. Johns, which is a very important body of water connecting New Orleans and Lake Ponchartrain. It consists of small boats with long-handled rakes, operated by boatmen, who tear up roots and top growth constantly at all seasons as fast as growth advances. From margin to center these boats push their way through the overgrown waters.
ATTRACTION FENCES and GATES
For Country and Suburban Houses

A WELL built fence adds to the appearance of any country place, protects your lawns and gardens from romping, heedless children and keeps out the neighbor's dog. To be a permanent source of satisfaction and not a source of trouble and expense it must be properly made.

ANCHOR POST FENCES have a record of over twenty years of satisfactory service. The Anchor Post construction insures permanently correct alignment. The stability is unaffected by frost and thaw and it remains erect and true year after year. All parts are heavily galvanized to prevent rust.

Our catalogue shows a wide variety of fences and gates and we will gladly mail you a copy.

$150,000 FIRE AT CEDAR ACRES
11 Years at Cedar Acres
GLADIOLI EXCLUSIVELY
1639 varieties under cultivation last year, and our catalogue lists a selection of the best of these—giving you the benefit of our experience.

A Letter from Mr. Tracy to the Readers of House & Garden:

My Friend:

Before the smoke had blown away after the big fire at Cedar Acres, on the morning of November 2nd, we were busy making plans for continuing the business.

Though the many expressions of sympathy which have come to us, we are given the courage to start over again. We have the advantage, this time of all our past experience and the knowledge of Gladiolus culture that three years have given us.

One of the greatest features of our loss was the destruction of all mailing lists, orders placed through the summer, and, in fact, all office records.

If you or your friends are interested in Gladiolus we would be very glad to receive names and addresses, if only on a postal card, so that we may send our new catalogue.

With thanks to you for all your past courtesies both to Mrs. Tracy and myself, I am,

Sincerely yours,

(Signed)

B. Hammond Tracy

For years I have devoted all my time and thought to improving the Gladiolus and raising better bulbs. It is both my business and my pleasure to answer any questions in regard to the "Garden" or its culture, the best varieties, etc.

B. Hammond Tracy, Cedar Acres, Wenham, Mass.

As Waterproof as a Duck's Back

That's the way Bay State Brick and Cement Coating keeps exterior walls of concrete or stucco. One coat absolutely overcomes the tendency of cement to absorb water—it prevents disintegration.

Bay State Brick and Cement Coating gives a uniform color—no blotched appearance. For interior decoration it is unequalled, being light-reflecting, damp-proof, fire-retarding and easily cleaned.

Our free Booklet 2 contains some ideas that will be of immense help to the man who's planning to build of concrete, stucco or brick. Send for it—it's free.

Thirty Years in the Manchu Capital
In and Around Moukden in Peace and War

By DR. DOUGALD CHRISTIE

Dr. Christie, who is one of the quiet heroes of peace, went to Moukden in 1882 as a medical missionary. His intimate knowledge of Manchus of the capital and province gives authority to his vivid pictures of the Chino-Japanese War, the Russo-Japanese War and the Boxer Rebellion.

McBRIDE, NAST & CO., PUBLISHERS
UNION SQUARE, NEW YORK
When dry, paper in the usual manner. Paper is stripped off by damping it with water until the paper will come off without difficulty. Give the walls a thorough rinsing down with clean water, so as to get rid of all old paste and size. It is desirable to wash the walls with an antiseptic, such as carbolic acid. It may be difficult to remove varnished paper from plastered walls, especially if the paper is a good one and has received several coats of good varnish and is thoroughly hard. Hot lime and soda or potash will remove a recently varnished paper without much trouble, and the soda, if properly washed off the walls before repapering, cannot show through the new paper. To remove old varnished paper from walls, a solution of 2 ozs. borax to 1 pint of water, applied hot, is generally recommended. There are certain ready-prepared solutions which will be of invaluable aid to the paper-hanger when he is engaged in stripping old paper, but there are also certain other preparations which are not only useless, but actually harmful. It is never a good plan, not even in so simple an operation as stripping old wall paper, to use cheap solvents.—Practical Decorator.

Suttertly Weed in the Home

A garden should lack the butterfly weed, the most gorgeous of all our yellow wild flowers. Old plants can be divided and will grow if a portion of the root be taken up with each piece, or plants can be raised from seed. The pronged sprays of brilliant orange-colored flowers make goldenrod and “Susans” look cheap. All the nature books in our collection unite in the praise of their beauty. One says: "Of this family, no member is more satisfying to the color-craving eye than the butterfly weed, whose vivid flower-clusters flame from the dry, sandy meadows with such luxuriance of growth as to seem almost tropical. Even in the tropics one hardly sees anything more brilliant than the great masses of color made by these flowers along some of our New England railways in July." Another: "Bright, orange-colored flowers which are exceedingly showy and allow the plant to be distinguished at a great distance. In this country it is seldom seen in gardens, but there is no flower of its color capable of producing a more brilliant effect." A third: "Intensely brilliant clusters of this most ornamental of all native milkweeds set dry fields ablaze with color. Above them butterflies hover... Surely here is a butterfly flower, if ever there was one, and such are rare." Not one of these descriptions oversteps the facts, and the wonder of wonders is that this plant is so little regarded in this country, when it would be such an addition to any home garden, small or large. Its ornamental

LET US LANDSCAPE AND BEAUTIFY YOUR GROUNDS

Add beauty and value to your property. Landscaping is an art, and when properly done grows and gets more beautiful every year. Add hundreds of dollars' worth of value to your property in a few hours. Let us landscape your grounds, let fail to get there because they did not. Ask us to send you our illustrated catalogue, "Landscaping and Beautifying Gardens," together with particulars of our fine stock of deciduous and evergreen shrubs, hardy perennials and annuals, bedding plants, and our wonderful varieties of Hardy Phlox. We are the very best. Our assortment of Evergreens, Shrubs, Trees, or Turfs is extensive and you should have our list, please ask for it.

Fairfax Roses Bloom Quickly

There are few greater delights than a flourishing rose garden, bright and fragrant with many blooms.

You can have just such a garden this year if you plant Fairfax Roses. They are hardy plants that have been propagated under natural conditions and wintered out of doors. They will bloom freely this summer in any climate—big, glorious blooms of unrivaled beauty and perfume.

Send for my 1915 Rose Book

It is free and tells you how to grow roses successfully as well as describing and illustrating the many different kinds of the famous Fairfax hardy Roses and other outdoor plants with which you can make your garden bright this summer.

Just to Make You Acquainted

With our beautiful magazine TRAVEL—to place you on speaking terms with all the strange peoples of the earth—we will be glad to make you a special offer. It will take you on a pictorial tour around the world, and issue to you a passport good in every country. There is only one safe way to travel this year, and that is through the broad pages of TRAVEL.

Each month this beautiful periodical will come to your home filled with glowing pictures and vivid stories. It will take you over the battle-fields of Europe, show you the ruined cathedrals and belaguered cities, and by swift transition point out to you the scenic beauties of some savage land, or reveal the many interesting scenes of our own country. TRAVEL is at once a delight and a liberal education.

Will You Join Our Spring Tour?

The coming months promise some unusually interesting trips. There will be timely visits to European cities, and equally timely jaunts to the Pacific coast where two great expositions beckon. This year TRAVEL is all the more a necessity, now that so many lanes of foreign communication are closed. With this sparkling magazine on your table you are still a citizen of the world.

BOOK OF WAR FACTS FREE

We have recently issued a timely little book entitled "The German War Machine"—written by a famous former spy of the Kaiser. To all who take advantage of this offer we will be glad to send a copy of this book free.

Pin a Dollar Bill to This SPECIAL TRIP TICKET

Return this ticket to the publisher with $1 and you will get six numbers of TRAVEL, beginning with the beautiful March number, and in addition a copy of "The German War Machine.""x

ALEXANDER'S QUALITY DAHLIAS

The true species is the hardest Rhododendron known in America.

Several thousand of this brilliantly colored Rhododendron are offered in car lots at a great reduction to clear land. They are heavy nursery-grown clumps, well-budded from 1 to 5 feet in height. Also R. MAXI-
MUM and KALMIA LATIFOLIA the beautiful Mountain Laurel grown in the Carolina Mountains.

Send for Special List and Prices.

3 Men Out of 4 Over 35 Have Chosen the Wrong Vocation

That's where failure lies—failure or weary endurance of hated labor. How is a man to know what he can do best? His own optimism or pessimism colors his judgment, perhaps. You are trying to make money through business you ought to be writing a book. Perhaps you are tied down to a desk when you ought to be out of doors, or your talents lie in the diplomatic handling of other men. Perhaps you are teaching when you were born to be a business man. Stop wasting time going in the wrong direction. Take advantage of the talents that are in you. Learn to make an unbiased judgment.

Science of Character Analysis

21 Practical Lessons by Mail. Illustrated

The information in these lessons has never been published before in any form. Here you get no theories—no repetitions—but a clean-cut presentation of the principles underlying human character, with so many photographs, diagrams, and charts that you can apply the principles rapidly and accurately. I will teach you the Science of Character Analysis by mail—in your own home, in your own time. When you have studied carefully these 21 lessons you will be able to read the characteristic of any human being, and to understand the way in which he expresses the various psychological characteristics. If you are a good judge of men this course will make you a better one. If you think you are a poor judge, this course will make you good one.

JAMES VICK'S SONS Rochester, N. Y.

NATIONAL FIRE PROOFING COMPANY

Dr. Katherine M. H. Blackford

Is eminently qualified to formulate and teach these new sciences, having had the advantage of thorough scientific knowledge, and practical experience, in this and other fields. She has been retained by many distinguished men, not only as a teacher, but as a problem solver, and as an expert in the solution of any problem connected with human psychology.

This Course Will Teach You

How to judge all people from their outward appearance.

How to know what your child is and what you are best fitted to do with him.

How to judge the mentality of your child's playmates.

How to read the secrets that men reveal in eyes and face and hands.

How to judge the inclinations of your children.

To know when to use patience or force.

To know when to use color or logic.

To know when to give in or take the victory.

To know when to get your case across.

To know when to put you in the wrong.

FOR THE BEGINNING HOUSEKEEPER AND THE BACHELOR GIRL

The Small Family Cook Book

By MARY D. PRETLOW

This new cookery book for the beginning housekeeper and for everyone who has to cater to two or three persons will quickly find its way to the kitchen reference shelf of every small family. It solves the difficulties imposed by the average cook book of reducing the quantities prescribed, to the limits required and at the same time retaining the essential piquancy of the recipe.

This book is fascinating in its suggestions and menus for afternoon teas, informal breakfasts, luncheons and congenial foregatherings of bachelor girls in which the author reveals many delightful "subtleties" and inventions of her own and of the private recipe books of Southerners of Virginia

With decorations by Rhoda Chase and Charles Guichard. 12mo. 75 cents net. Postage 8 cents.

McBRIDE, NAST & CO., Publishers, 31 Union Square North, New York

House Centipede Useful, but Disagreeable

The house centipede, although disagreeable in appearance, feeds on small cockroaches, the typhoid fly and other still more disagreeable insects, and, therefore, would not seem altogether an undesirable visitor in one's house. However, as one of the Department of Agriculture's entomologists says in a recent Farmers' Bulletin dealing with this insect: "Its uncanny appearance is hardly calculated to inspire confidence, and it will unquestionably bite in self-defense, although very few cases of its having bitten any human being are on record." It does not feed on household goods and woolens, although many housewives hold this belief.

The house centipede is a Southern species, its natural home being in the latitude of Texas, but it has slowly spread northward, and, having reached New York and Massachusetts about thirty years ago, it is now very common in these States and extends westward well beyond the Mississippi. It is a very delicate creature and almost impossible to catch, having a worm-like body about an inch long of a grayish-yellow color. The name "centipede" is misleading, as it does not possess a hundred legs, but no more than thirty, although the speed at which it travels across the floor does not give the ordinary observer sufficient time to count them. Its head is armed with a pair of very long, slender "feelers." The bulletin advises the housekeeper who feels that the centipede has become a pest in her house to use fresh pyrethrum powder near bathrooms, closets, cellars, conservatories and store-rooms where it may hide itself. The suggestion is also given that all moist places should be kept free from any objects, such as flower pots, mops, or dirty rags behind which the insect may conceal itself.

It is very questionable whether the centipede would ever, unprovoked, attack any human being or other large animal, still if it is pressed with the bare hand or foot, or is caught between sheets in beds it will probably bite, and a few cases on record show that severe swelling and pain may result, for the insect belongs to a poisonous group of centipedes. The wound can hardly be called dangerous, however, and prompt dressing with ammonia is recommended to alleviate the disagreeable symptoms. The centipede is in one respect like a spider, in that it springs after its prey and is very rapacious. Trained observers have noticed that in capturing a moth it has been observed to keep its numerous long legs vibrating with incredible swiftness, giving the appearance of a hazy spot surrounding the fluttering moth.
Economy in Garden Space

WHETHER we are hobbyists or serious, matter-of-fact gardeners, we have learned that, if we are to get more than cost out of our gardens, it is unwise to grow any vegetable really unsuited to the location.

While we may succeed with the standard varieties, some of us have to leave out more exacting sorts because the garden soil is too dry or too wet or too light. The fact is, that, in some instances, a kind of garden annex in another place where a few rows of vegetables, unfavored in the main garden, may be grown is a necessity.

Still, one can greatly improve unfavorable soil conditions by using plenty of humus in the form of compost or of cover crops upon light, poor soil by occasionally giving a coat of lime to heavy, sour soil or by spreading sand upon a clayey garden spot and working it through with the plow.

An economical garden scheme for a tract having definite portions of light and heavy soil, as well as moist spots, calls for a classification of vegetables according to their requirements.

The soil should be as fertile as good manuring can make it. The distinctions in soil, as made in this classification, relate to its natural composition as to the predominance of sand or clay and its moisture capacity, sandy soil being light and clayey soil heavy.

Class A—Light, rich soil (sandy):
- Okra
- Asparagus
- Early varieties of sweet corn
- Sweet potatoes
- Endive or chicory
- Turnips
- Squash
- Beans—bush
- Musk melon
- Watermelons
- Tomatoes
- Pole beans
- Celery
- Spinach
- Radish
- Eggplant
- Beets
- Peas
- Carrots

Class B—Heavier soil (well-drained):
- Irish potatoes
- Cabbage, brussels sprouts
- Kohl-rabi
- Rhubarb
- Bush beans
- Later plantings of peas
- Lettuce (cutter of)
- Onions and leeks

Class C—Moist soil (not wet nor clayey):
- Cauliflower (cool, moist location)
- Cucumber (warm, moist location)
- Parsnip
- Pepper (warm, moist)
- Cresses (cool, moist location)
- Head lettuce (cool)

MOTHERHOOD WITHOUT SUFFERING
The Truth About Twilight Sleep
By HANNA RION (Mrs. Ver Beck)

In this message to mothers by an American mother, Mrs. Ver Beck presents with authority and deep human interest and conclusive evidence of a personal investigation of the Freiburg method of painless childbirth.

While the book is written with simplicity and directness for the great mother-public, its authoritative scientific foundation and the careful evidence of the medical and clinical reports will make it of great interest to the general practitioner.

Book of War Facts Free

We have recently issued a timely little book entitled “The German War Machine”—written by a famous former spy of the Kaiser. To all who take advantage of this offer we will be glad to send a copy of this book free.

April Poultry Work

What most disturbs the poultry-keeper’s peace of mind at this time of year is the broody hen. Even among the Leghorns, Anconas and other supposedly non-sitting breeds, broody individuals are often to be found, and sometimes they are aggravatingly persistent. In former days it was considered the proper thing to dunk the broody hen in a pail of cold water or to starve her or to treat her in some equally inhuman fashion, as though she were a criminal in feathers. We have learned better now.

The poultryman’s object is to get the hen into laying trim again as soon as possible, and therefore she should have extra good care. She should be given a crumbly mash every day, with the addition of a few table scraps, if any are available, together with cracked corn and plenty of water. She must be removed from the nest, however, and put where she cannot sit comfortably. A small pen or coop without nests and with no litter on the floor is a good place for the broody hen, and if an active cockerel can be put with them, they will soon be broken up. Many poultry houses are equipped with a coop having slatted sides and bottom and which

Paris Shows Spring Fashions

The great French couturiers, unmindful of the war that rocks the world around them, have been holding their regular Spring openings. All through the winter Vogue's splendid staff of Paris correspondents are gathering for your benefit everything authoritative and new.

With the great European fashion journals cut off, with all ordinary sources of fashion news interrupted, Vogue has become more clearly than ever the absolute authority on what is to be worn by the well-dressed American woman.

And remember that Vogue comes not once a month, like the ordinary magazines, but twice each month, bringing thereby not only the very latest fashion news but twice as much of it.

Never has Vogue's unique value been so universally recognized as in the past six months of uncertainty. And this value reaches its very highest point in these few weeks, when everyone is asking, "What shall we wear this Spring?"

To answer this very important question, don't fail to consult Vogue's Spring Fashions Number and the great series of special fashion numbers that follow it.

$2' Invested in Vogue
*a tiny fraction of your loss on one ill-chosen gown.
will save you $200

The gown you buy and never wear is the really expensive gown! Hats, suits, negligees, that just miss being exactly what you want are the ones that cost more than you can afford.

Why take chances again this season of confusion when simply by sending in the coupon below and paying $2—an insignificant portion of your loss on a single ill-chosen hat or gown—you can insure the correctness of your whole Spring and Summer wardrobe?

Before spending a single penny on clothes, before even planning your Spring wardrobe, consult Vogue's great Spring fashion numbers. Beginning with the Spring Fashion's Number—

You will receive these 12 numbers of Vogue

The Bride of the Sun

By GASTON LEROUX

Author of "The Mystery of the Yellow Room."

The action of Gaston Leroux's latest story takes place in the mountain fastnesses of modern Peru where the hill tribes are said to continue mysterious religious rites of their ancient ancestors, the Incas. They worship the sun and offer up a human sacrifice every ten years, with awe-inspiring ceremonies. Their choice for a sacrifice is the most beautiful girl of the surrounding country, who is rescued from a living death by an old family servant.

First Aid for the Poisoned Dog

JUST about every once in so often, in the average suburban community, the dog poisoner wakes up some night, dons his clothes and his most deceptive expression and surreptitiously scatters bits of "loaded" meat and suffering in accord with his despicable character. No dog is safe from him. Mongrel and blue-ribbon winner may find pieces of the deadly stuff, bolt them and die in agony before the vet. can be called in.

It is with first-aid remedies, designed to save the victim's life by tiding him over that critical period from the time he crawls, whimpering, into the house until professional services can be obtained, that the following paragraphs have to deal.

Arsenic and strychnine are the poisons most commonly used by the dog-hater. Phosphorus is also to be considered, for it is the chief deadly ingredient in many rat poisons, and so can be easily obtained every time by peering at the standing in the community. Even when intended for its legitimate purpose—vermin destruction—it sometimes happens that a dog will get hold of it and suffer accordingly.

Considered arsenic poisoning first, the symptoms to be expected are heat and tenderness of the abdomen, quickly followed by frothy vomiting and thirst. The dog's breathing is heavy and labored, and in a little while he will have convulsions. The thing to do, as in all poison cases, is to get the stuff out of his stomach as soon as possible. For this, the best temporary remedy is an emetic of milk, magnesia and oil, or flour and water. It should be given in good quantity as soon as possible after the cause of the trouble is suspected. If the first dose does not have immediate effect, give another, for time is precious.

Strychnine symptoms are quite different from those of arsenic. The dog yelps and whimpers with pain, jerks his head, froths at the mouth, and, as the poison takes greater effect, his legs twitch curiously. These indications will be followed by arching of the back and occasional convulsions. Give him a powerful emetic and hope for the best until the doctor comes.

Phosphorus causes frequent vomiting and purging, heat and tenderness of the throat and stomach, and convulsions. Give an emetic and follow it with frequent doses of magnesia or chalk dissolved in water.

It must not be supposed that every case of poisoning can be treated successfully by the above methods. The remedies are efficacious as far as they go, and in the majority of cases they serve their purpose, but when the poison has had time thoroughly to work into the dog's system, it is a toss-up whether or not he can be saved. The veterinary, or, lacking one near by, a druggist, should be reached with all possible speed, for a few minutes' delay often means the difference between a live dog and a dead one.—R. S. Lemmon.
The Best Phloxes

In several hundred Phloxes tested in our trial grounds we have found the following varieties are among the very best. Except where noted we can furnish good strong plants at 15 cents each, $1.50 per dozen, $10.00 per 100. When selection of varieties is left entirely to us we will supply good plants, in a good assortment at $1.00 per dozen, $7.00 per 100.

Elizabeth Campbell. This is the best Phlox introduced in recent years, and is destined to become very popular. Very bright salmon-pink, with lighter shading and dark red eye; very beautiful. 25 cents each, $2.50 per dozen.

Rynstron. A splendid improvement on Panthone, color not unlike that of Paul Neyron rose; fine for massing. A magnificent variety and one of the best of the new Phloxes. 25 cents each, $2.50 per dozen.

Athias. Tall; best salmon.

Beranger. Rosy white, suffused gray, very delicate shade, lovely.

Champs Elysees. Fine, rich purple crimson.

Edelweiss. Bright purple rose, light center; enormous flower.

Frau Antoine Buchner. The finest white yet introduced; largest trusses and individual flower. Dwarf - 25 cents each.

We have the largest, finest and most comprehensive stock of Hardy Plants in America, including three hundred varieties of the choicest Peonies, and also the largest collection of Japanese Iris in the world, and an unsurpassed collection of named Phloxes. Our illustrated catalogue, describing these and hundreds of other Hardy Plants, Trees, Rhododendrons, Azaleas and Shrubs will be sent on request.
