**McBRIDE, NAST & COMPANY**

- Union Square, North, New York City

Robert M. McBride, President; Condé Nast, Vice-President and Treasurer; Frederick A. Leland, Secretary; John T. Ehred, Assistant Treasurer. Published monthly, 25 cents per copy; $3.00 per year. For Foreign Postage, add $1.00; Canadian, 50 cents. Entered as second-class matter at the Post-office, at New York, under act of March 3, 1879.

Copyright, 1915, McBride, Nast & Co.
Changes in grade are usually welcome factors in garden making, for terraces offer great variety in treatment, and each terrace, as shown by this picture of a New England garden, should have some individuality and distinctive interest. Prentice Sanger, landscape architect
By the back fence were clumps of iris and peonies, a jungle beloved of the cats—and of small children, too.

In Grandmother's Garden

BEING THE LAND THAT MANY OF US CANNOT GO BACK TO SEE—THE LAND WHERE THE CHILDREN PLAYED THAT WE USED TO BE, WHERE GREW THE FLOWERS THAT HAVE A PLACE IN THE HEART.

Fanny Sage Stone

By the back fence were clumps of iris and peonies, a jungle beloved of the cats—and of small children, too.

Just the sight of a sweet briar rose brought it all back to me. My thoughts had been busy with shopping lists and plans for the day, as I rode into the city on the elevated train. At one of the stations I glanced up to see a dear, little old lady taking a seat near me, and on her coat was pinned a sweet briar rose. She loved it. I knew from the way she wore it and the tender look she gave it occasionally, and when she took off her coat, how carefully she folded it that the rose might have a safe place! Then I fell to wondering where the rose grew, and soon I forgot the little, old lady and her rose and I was a child again—happy and free in Grandmother's garden.

It was there where I first knew and loved the sweet briar rose: in Grandmother's garden, the place that was really paradise to us as children.

Fortunate, indeed, is the child who has such a start in life. For, ever after there comes to her a greater love and appreciation of nature and of all out-of-door things.

Every season was interesting in that old garden. Even at Christmas time one of the most fascinating spots was the one where we knelt and pushed away the snow to peep under the protecting branches and find the blossoms of the Christ-
mas rose. We loved these flowers that bloomed defiantly in the face of the frost king, and how like conquerors we felt as we carried them in from the ice and snow! Another joy was in finding the berries on a cold, winter’s day, still clinging to the barberry bushes, the high-bush cranberries and the snow berries. No wonder the birds came often to the garden, even in winter, where they found such good things to eat.

When the March days came we watched for the first snowdrops. Brave little things! They pushed their way up through the frozen ground, each one covered with a little cap to protect it from the cold.

Then came the crocus blossoms, all in purple, white and gold: and soon, best of all, the lovely, blue scillas, with the real fragrance of spring, and the rock cress. Were ever bouquets prettier than those we made of these two flowers and took to school for our favorite teachers?

Grape hyacinths came next, and the dear little row of hepaticas that Grandmother had brought from the woods years ago sent up their sweet blossoms. They always nodded to us as we passed, and Grandmother had no rest after the first one blossomed, for then we felt the call of the woods and begged for the day when we could go and pick all we wished.

Spring was full of gladness in this garden, for there was always something coming into bloom, and we knew just where to look for the different things. Grandmother had taught us, and we grew to love the flowers almost as well as she did.

Sometimes we would go out with Grandmother in the early spring, and she would take a stick and poke carefully among the leaves to see if the different things had started to grow. Often we would find little buds just waiting for a warm day to help them burst into bloom, when they would come to us again with the same sweet fragrance and freshness.

“God does not send us strange flowers every year.
When the spring winds blow o’er the pleasant places,
The same dear things lift up the same fair faces.
The violet is here.
It all comes back; the odor, grace and hue,
Each sweet relation of its life repeated;
No blank is left, no looking for is cheated;
It is the thing we knew.”

Down by the porch in the south sunshine grew the white violets. In April the ground was white with their blossoms and their fragrance greeted even the people who were passing on the street.

We were never so much interested in the front yard, where the more formal things grew, and Grandmother never encouraged our becoming intimate with that part of the garden. We peeped through the lattice at the snowball and barberry bushes, the bleeding heart and the crown imperial lily. Sometimes we did beg permission to step in through the lattice gate to pick a few of these forbidden flowers that would help us in some of our games or in our house-
keeping plans. We found the most fascinating little rabbits in the blossoms of the bleeding heart when it was pulled apart, and the berries we just had to have for our salad, when we kept house under the apple trees. We had our favorite flowers, of course, and most of these grew in our yard—the one behind the lattice fence. Yes, the sweet briar rose grew there, and Grandmother loved it dearly. I suppose that was why it grew near the window where she always sat, with her sewing. The little, south wind bore its fragrance in to her, and perhaps a message from Grandfather, for he planted the bush there and was “partial to it,” he used to say. On Sundays, when he went down the side steps on his way to church, he always stopped to pick a sprig of the sweet briar to take with him. As he fingered the leaves in church, I used to wonder if he were saying his prayers with them, as Martha did with the heads on her rosary.

Such beautiful things grew in the “back yard!” There were larkspurs in pink and lavender, the little, old-fashioned annual larkspur that to my mind is still more desirable than the tall, cultivated kinds. There were rows of stately hollyhocks, mullein pinks with flowers of such wonderful color; the Star of Bethlehem or Johnny-go-to-bed, as we sometimes called it; Canterbury bells and foxgloves, the dear, little Johnny-jump-ups, or ladies’ delight, and the lilacs.

A great mountain ash tree grew here. Its berries strung together made lovely necklaces for us. The birds loved this tree, especially the cedar wax wings, tidy, polite, little things. Then, too, there were sunflowers, where the goldfinches feasted in the fall. A beautiful trumpet vine grew up over the side of the house. We often watched the humming birds as they came to the red trumpets on the vine and ate their fill, and we wondered, as the cuckoos flew to the bitternut tree, how they knew that the tent caterpillars were there doing harm.

A great syringa bush grew higher than the second-story windows of the house. This bush was a home for birds through all seasons. Grandmother used to say that most of the birds in migration time flew to its protecting branches, registered and rested and then went on their pilgrimages. The wood thrush and cuckoo would come to the bush and rest for hours, evidently tired and exhausted after long flights.

Two little, round beds in Grandmother’s garden were our special delight. They were made originally for Grandmother’s own girls, but were claimed by us as we grew up. We planted and cared for them, and wonderful indeed were the results. Occasionally Grandmother would take a hand in managing them. I remember a beautiful border of June pinks that grew around one bed. The other had a row of love-in-the-mist. Grandmother called it Lady-in-green. Sweet William and wall flowers grew near: columbine and veronica; and, peeping through the fence, were the sturdy flowers of the bouncing Bet.

Around the well grew the pretty, little, low flower-delicate, the yellow buttons and the striped grass. I intuitive put my hands to my ears when I see the striped grass. Never shall I forget the dreadful squeaks and shrieks that were made with it.

We felt that the bitternut tree really belonged to us, for we spent many, many happy hours in its shade, and its fruit was a never-ending source of pleasure. I wonder if little girls nowadays know the fascination and charm of the pig-nut doll! When the nut was shelled the little, pointed end made such a lovely nose, and, with a pencil or nail, we easily made holes or marks for eyes and mouth. Then, with two sticks or matches for legs that were thrust into the head of the unfortunate doll, we had a wonderful result. Marvelous dresses we made and caps and bonnets such as never were seen or heard of. As I think of it now, it seems as if all of our good times were in this garden, and everything that grew blossomed seemed to lend itself to... (Continued on page 301)
The Right Way to Grow Seed

MUCH of the success of the garden will depend upon giving the plant a good start in life. On this account the question of seed sowing is one which should receive a good deal more attention than is usually given. It will well repay any grower to study the conditions under which seeds most readily germinate and develop, and then to do his utmost to provide favorable surroundings.

There is, of course, a right and a wrong season for the sowing of every kind of seed, and such information is usually to be found on the packets. But of almost equal importance is the choosing of the right kind of weather. Dry weather, such as sooner or later comes with every spring, should be chosen for the business. No time will be gained and, in many cases, much will be lost by scattering the seeds when the soil is heavy with damp. Germination will be rapid in a light and comparatively dry soil, but it will be slow and may not take place at all on water-logged ground. Anything, like the addition of sand, which can be done to lighten the surface soil of the border will be very helpful in enabling a free growth of the little plants. Remember that the more freely the little roots can push about, the better chance will the plants have of establishing themselves. When sowing seed indoors in pots, pans or boxes, it is possible to prepare the soil very perfectly. Whatever is used as a base, a liberal allowance of sand is desirable, and the mixture should be passed through a fine sieve so that all lumps are made to disappear. A very important precaution is the sterilizing of the soil before use. Ordinary soil always contains the spores of mould, and may very well have a quantity of slugs' eggs as well. Under the shelter of a glass house these pests rapidly develop, and will play havoc with the baby plants. The danger may be prevented either by baking the soil in an iron tray over a furnace or pouring boiling water over it. In any case, the mould must be moist when it is used. Of course, in the case of pots and pans it is most important that the drainage should be in perfect order. Some gardeners half fill their pots with broken crocks before putting in the soil. Nearly all gardeners sow their seeds too thickly. An idea seems to be abroad that it is necessary to sow a great quantity of seed, on the supposition that a large number will not germinate at all. This might have been the case a generation ago, when there was a great deal of bad, and even dead, seed about. Nowadays the merchants of high standing all sell seeds which show a considerable measure of vitality; indeed, every effort is made to ensure all the seeds being alive. Thus, to sow thickly is to secure a cluster of crowded plants which, from birth, jostle one another in an endeavor to get enough light. These specimens will always be weaklings. Thin sowing, on the other hand, will result in strong plants which can be relied upon to yield the very best results. Do not sow direct from the packet. Pour a little quantity of seed, if it is

---

Large seeds are best planted singly. They can be pushed into place with stick or lead-pencil. Loss of moisture can be checked by covering seedlings with a glass. Much of the success of raising plants from seed, especially annuals, depends upon thin sowing. Use a spoon as shown.

S. Leonard Bastin
fairly small, into a spoon and then gently shake over the soil. The large seeds, which can be picked up singly, should always be sown one at a time.

Use a stick to push them down into the soil. The distance apart depends upon the size of the plants, but in any case you will be surprised at the sturdy specimens which come up after single planting.

The depth of sowing is a matter upon which there is a good deal of ignorance. Never forget that the seed is a living thing, and that if it is going to grow it must have air, as well as warmth and moisture. Thus, to bury a seed deeply is to suffocate it; countless millions of prospective plants are lost in this way. On the whole, a very good rule to observe is that seeds should be covered with soil to about their own depth. This will mean that very tiny seeds can be simply scattered on the prepared surface and then gently raked in with a handfork. In such cases it is an excellent plan to cover the bed with a sheet of newspaper until the actual germination has taken place. This plan will always be followed with great advantage in the case of minute seeds, whether indoors or out. Quite apart from the protection, it will assist a speedy germination, for the awakening of the seed always goes forward more rapidly in the dark than in the full light. Out-of-doors sheets of glass propped up on stakes may be employed to protect seeds after sowing; bell glasses or cloches will do as well. These may be helpful later on when the little plants appear, should the weather be fickle. As far as the seed is concerned, the shelter will keep away rain or hailstorms which might cut up the ground.

Where any close shade, such as a bell glass, is used, it is important to remember that germinating seeds must have air, and the confinement must not be too rigid.

In the case of seeds of moderate or large size, germination will be very much hastened if these are soaked for twenty-four hours in water before sowing. This is sometimes a useful plan in a backward season when outdoor sowing has been delayed owing to continued wet weather. At the first sign of a dry spell the seeds are soaked, and then popped into the soil, when, if the conditions are at all genial, they will come up in an amazingly short time. Any seeds which are big enough to handle and seem to be very hard may always be soaked with advantage. Some kinds, such as those of the canna or Indian Shot, rarely germinate satisfactorily unless they are soaked for days. A quicker way is to get a file and carefully cut through the outer skin. This will ensure a speedy growth. Certain kinds of seeds naturally take a long while to come up; in other cases some of the seeds germinate, and some of the same sort own at exactly the same time lag behind. This uneven germination is a feature of some plants, the most notable of which are certain kinds of primula. The writer remembers sowing a pan of the Chinese primula; about half the seeds came up within quite a short time, while the others spread their germination over two months. No one seems to know why this is the case, but the fact is mentioned to warn the grower against concluding that a lot of the seeds (Continued on page 291)
THE GARDEN ENEMIES TO LOOK OUT FOR—SPRAYING FROM APRIL ON
-FORMULAS FOR SPRAYING MIXTURES—THE MACHINES TO USE

GRACE TABOR

Photographs by the E. C. Brown Company

TWO months ago, in these pages, was considered the subject of winter spraying—taking the offensive against the outposts of the garden enemies. San José scale and the oyster scale were described then, and the work was mainly restricted to the spraying of fruit trees.

Arriving well into April, things begin to be complicated, and the spraying table must be consulted from now on. Against the apple, for instance, there is a second race of invaders due along with the hatching of the new San José scales, about the time the young leaves are unfolding. This is the codling moth—the common, unpleasant thing familiar to everybody in the “wormy” apple. Pears, quinces, pomegranates, peaches and cherries are also its victims, but it is distinctly an apple feeder, if apples are plentiful.

In a sober and inconspicuous way this moth is really a very beautiful little creature. The spread of its wings is not more than three-quarters of an inch—usually less—and it has two pairs of wings. The forward pair look like brownish-gray watered-silk, with a spot at their tips of brown inlaid with rich bronze and gold; the rear pair are sober grayish-brown, not ornamented at all, but very soft and delicate in texture and appearance.

About a week after the apple trees have opened their buds these moths emerge from the pupae—which earlier in the spring have been developed from the larvae, in which state the insects have passed the winter, wrapped in their silken cocoons and hidden in cracks and holes in the trees or in houses where apples have been stored. A few days after emergence the gray moths lay their eggs—on the leaves in the first generation or brood; on the fruit usually, in the second. In about eleven days the eggs are incubated—the time varying with the temperature—and the young larvae or “worms” of the new generation come forth, seeking at once to find a home for themselves inside the fruit just setting. Sometimes these small worms eat off the leaves before reaching the fruit, but they lose no time in making straight for the heart of the apple or pear, or whatever it may be, through the calyx end or through some irregularity in the surface. A smooth surface they cannot seem to penetrate. Naturally, once they have gone to the inside of the fruit, no poison can reach them; so it is in this early period, just after hatching, that spraying for them must be done.

Along with the codling moth comes the curculio—a snout beetle—that it was thought at one time could only be fought by jarring from the trees. Spraying with the same sort of poison used against the codling moth, however, is generally favored now.

The injury done by the curculio is also effected by the worm form of the insect, but instead of this worm being hatched outside of the fruit and entering it subsequently, the egg is laid just under the skin of the newly formed plum or peach or apple, and the insect is already safe from destruction when it hatches. This complicates the work of the gardener; for, once hatched, it proceeds to eat and grow, all under cover, until it is a great, fat, whitish worm at the very heart of the fruit. The first broods come up from their winter quarters under rubbish or leaves or the dry grass of old, sod-covered orchards about the time the trees bloom; full-grown adults, ready to eat and mate and lay immediately. Direct poison applied to the tender buds and leaves and flowers on which they appease their spring appetite will destroy many of them. Some time in April the first application of Arsenate of Lead for these two enemies is made. Just when this is done depends entirely upon...
local conditions of growth; so the gardener must simply watch his own trees, and as soon as the leaves are unfolded, get to work. It may not be until May; it may be early in April.

Waiting for the blossoms to open and mature and fall, he must note the date of the latter, and three days later make a second application. A third treatment to catch the larva of the codling moth as it is entering the newly set fruits at their bud end may be necessary when the fruit is set and careful observation reveals the presence of any more of the small worms hanging around, waiting for their chance to move in. This is usually two weeks to a month following the second use of Arsenate.

Later in the summer comes a second brood of the codling moth, resulting in much greater damage, if left to its natural devices, than the first. The spraying table gives the dates for getting after this. As the worms of this generation enter the fruits usually where they touch and rub together, impairing the skin, proper thinning of the fruit greatly aids in the work against them.

Fungi are contested with the lime-sulphur spray of early February, which cannot be used after vegetation is in leaf—nor even after the sap has begun to run, preparatory to the spring awakening. But one's troubles are by no means at an end with this particularly insidious form of pest when the February dosage is administered; for increasing warmth and the rains of summer liberate continually and favor the germination of the infinitesimal spores by which all fungous diseases spread.

As a matter of fact, these diseases are more to be dreaded in a way than insects, for they are practically incurable, and their presence is never suspected until they have established themselves. The spores, which are quite as invisible as germs, enter the leaf or plant tissue and are there protected from anything which may be applied, so that treatment must be made literally before the trouble exists.

In addition to spraying with a direct poison for codling moth and curculio late (Continued on page 294)

PLANTING FOR WORK WITH THE WHEEL-HOE—THE PROBLEM OF TOMATO TRELLISES—WEEDING VERSUS CALISTHENICS—A SECOND-YEAR SUCCESS

WARREN H. MILLER

Late in February I sneaked out into the country, attended a trapshooting contest and planted lettuce, radishes, pansies, cosmos, hollyhocks, peppers and cabbages in the hotframe. When we opened up the house early in March they were up and getting along finely. Often, during the city visit, I had given an evening to the planning of this year's garden, and the seeds for it were already ordered. It was a combination of the wheel-hoe system and the old-fashioned bed system. I had not yet learned to appreciate the wheel-hoe as a weeder, and for a busy commuter weeds are the great problem—after the soil is in shape. Not having a gardener to fight weeds, nor much time to do it yourself, some method of destroying them wholesale must be provided for, or the weeds will not leave you a single vegetable that you can call your own!

The wheel-hoe is the only tool I know of that will take out weeds wholesale, but the rows of plants must be spaced to leave room for it to work in—at least 18" apart. In other words, instead of a system of beds and paths, there is a sort of path between each row of vegetables spaced 18", instead of 9" or 12", which is more wasteful of land than the old-fashioned bed system. Now, a commuter's garden is usually short on land, but unless it is going to be long on weeds also, the wheel-hoe system is the only sensible plan. But there are certain vegetables which can be sown so thick and grow so fast that the weeds never get a look-in, notably lettuce, radishes, carrots, beets and turnips, so I decided to experiment a little with beds, leaving the main garden on the wheel-hoe system.

On each side of the central garden path I laid out beds 4 x 12 feet in area, one radish, one lettuce, one carrot, and one salsify. They all succeeded except the last, which, being a narrow-bladed plant, soon got full of weeds. For the same reason, the beds of leeks, onions and onion sets did not yield anything, for the rows of sets were too close for the wheel-hoe, and the close-sown beds of leeks and little onions for table garnish got full of weeds before those little plants ever amounted to anything. The close-sown carrot bed was a wonder for yielding basketfuls of those little, tender carrots which the French use so much in soups and stews. For full-grown carrots for winter storage, such a bed will not do, as they require about 4" in the rows and periodical visits of the wheel-hoe to discourage the weeds.

The twenty tomato vines in staggered rows of ten, three feet in the row, were well placed. These vines should always be set out in a group and in some regular formation that can be reached by a trellis system, never scattered about isolated locations unless you want to tend each one like a baby. Set them out about the fifteenth of May, never earlier, as

The garden in February of the second year, showing young peach and cherries planted from the nursery the previous October.

Early Spring: note the young trees shown above and the whole east garden in strawberries—400 plants in a plot 30 feet square, providing a family of six with enough to eat and preserve.
The garden in July showing the dahlia and phlox hedge between the fruit trees.

side of the main garden path, the increase in the strawberries making it necessary to give up the whole East Garden to them.

By the middle of March the first peas were in, the early potatoes, the outside radishes, lettuce and spinach. The first two (American Early Round Top and Mignonette) were sown on top of two beds in the East Garden and pressed into the soil with the back of a rake. From that time on Spring came with a rush, and the garden likewise. Everything budded and everything lived and thrived.

I put in nine rhubarb plants in some rich soil in front of the hotframe and built a lima bean yard of twelve hills behind it (not planted, of course, until the middle of May).

By April 1st all the peaches had little, pink flowers, quite a display for their first year. None of them set fruit or would have been allowed to. The quince was covered with pale pink flowers, looking like wild roses. It set one little quince, which the tree refused to feed, as it needed all its vitality in growing, and it soon dropped off. The pears and apples contented themselves with a heavy growth of leaves and wood: the Baldwin, which survived from the first year, growing to fourteen feet in height and two inches in trunk diameter. During April I was busy laying out and planting all the new beds. Onions, onion sets, carrots, oyster plant, second row of peas, turnips, beets and second spinach went in, row by row, as fast as the wheel-hoe could prepare the ground.

The April rains were even more continuous than the year before, but this time the garden was different. No longer were there muddy pools distributed about the garden after a heavy rain, though the surrounding woods were full of them. Raising the surface nearly a foot above the water table, as determined by the subsoil drains, had taken care of all that; the soil held no more than it would naturally, acting as a capillary sponge in dry weather, and later in the dry season my high-water table showed its advantages in the luxuriant growth of the plants when most neighboring gardens were drying up and needing a hose on them. My soil and drainage problems were over; it remained to be seen whether ten to four o’clock direct sunlight would be enough.

May was upon us before I actually realized...
it, and all the tender vegetables had to go in without delay. On
May 1st the corn went in, a shovelful of manure to each hill, 
Earth, Merriam, Country Gentleman and Golden Bantam
being the sorts selected. A few days later the first three rows
(75 feet) of string beans went in, and on May 7th I set out the
tomato plants. Get a dozen little plants seeded in a grape basket,
25 cents a basket, and transplant direct to the hills, taking out
with a narrow trowel with the earth still caked about the roots.
Twenty of these filled the allotted tomato space, and the other
four (from two baskets) I found space for in the rear border,
where they grew and luxuriated and gave endless trouble, falling
over on currants and asparagus plants. May 10th I planted the lima
beans, with a show-
eeful of manure in each hill for good measure. They
should be planted eight to a hill, eyes
down. I used pole
limas, because the
yield is very much
greater per foot of
ground than with
bush limas, and
poles were easy to
get in the sur-
rounding forest. I
left the saplings
full length and bent their

The Dorothy Perkins roses were trained up hair-pin arches over the main garden
path, making a beautiful ornamentation

An inexpensive and easily made trellis for
tomato plants

The strawberry bed now began to attract attention
for miles around. It was not only a
mass of big, dark-
green penn but a

The seaboard population was now clamoring to be set out, so,
"partner," who presides over our flowers and shrubbery, took her
pansies and hollyhocks away, and I set out 72 young
lettuce plants for heading. To get crisp, tender lettuce you want
a rich, mellow soil, for slow-growing lettuce is always tough, so
I gave it a bed alongside the eggplant, where the proportion of
manure to soil was very great.

It was now time for second sowings of stringless beans, third
of peas and radishes, and we were already having our first radishes
and lettuce. The weeds also began to be noticeable, so I manned
the wheel-hoe, and in half an hour had weeded that whole garden,
all but the beds, which took an hour each. All these hours (I
might add in parentheses) were snatched here and there; morn-
ings, evenings and Saturdays, before and after business hours. They
represented my physical exercise, my complaints in the
needs of the Unexercised Middle Third, which too often among
us Americans degenerates into an unearned increment around the
waist line! So long as it isn't Undeserved Excrciation of the
Backbone, I have no objection to gardening as exercise, and the
wheel-hoe has emancipated us from those sore and aching back-
bones which always overtook the Man with the Hoe in the old-
style weeding days. You put on one or both of the hoes and walk
up and down the rows of vegetables, shoving the wheel-hoe ahead of you in a
series of short pushes. Good for chest
and arm muscle development. The keen,
little hoe scrapes along, half an inch below
the surface, cutting the root of every weed
in its path. Its curved, inner face just
grazes the line of vegetables, and a cast-
iron pointer going on before lifts the vege-
table leaves out of the way of the wheel.
If your row was not planted to a line (by
eye-guess, let us say), and is seeded
crookedly, woe will be yours, for the
wheel-hoe is no respecter of aristocratic
vegetables, and cuts off plants and tares
alike. If sown to a garden line, or, better
still, by the seed-
ing attachment of
the wheel-hoe (if
you can afford it,
get one: it saves
man
back), you will
shear a straight
line, passing with-
in an inch of the
vegetable stems,
and you will have
hardly a weed to

Dahlia—The Flower that Came Back

ITS CHECKERED CAREER—METHODS OF PROPAGATION—WHERE TO PLANT IN THE GARDEN—TILLAGE AND WATERING—WINTER CARE OF ROOTS

Stephen Edsall

If you doubt that there are fads in flowers, follow the course of the wavering popularity to which the dahlia has been subjected. Once an old favorite, it fell into disfavor for a few years because of its formal and artificial-looking flowers—round and hard and stiff as a ball. It was relegated to the company of those that are considered as having a place only in the rural districts, where its popularity would seem never to have waned. Since the coming of the loose-flowered forms—the cactus and semi-cactus types, which tend toward free, fluffy chrysanthemum-like flowers—it has gained front rank in popularity once more, coming just in advance of the chrysanthemum. And there is additional reason for this return to popularity, for few cultivated plants have such a wide range of color; few are more enlivening to the garden ensemble when placed in the proper positions and planted in the proper proportions.

Though the amateur gardener may not be able to avail himself of all the methods of dahlia propagation, it is wise for him to have a speaking acquaintance with the four processes: By cut-

The Queen Queen, a seedling dahlia, exhibiting great variety in form and color, and easily a favorite for the fall.
THE FOUR MAJOR OPERATIONS OF THE MONTH—
PREPARING THE SEED BED—SOWING SEED, TRANSPLANTING, MAKING THE SEED BORDER

D. R. Edson

There is a world of difference between making a garden and "doing some gardening." In the former case you are master of the situation, and in the latter quite likely to be a slave to it. But the former course, although it may seem to involve more work at the start, is in reality much the easiest. It is largely a matter of thoroughness with the things you do in your garden during the first couple of months of the season.

There are some five or six "operations" which the gardener, large or small, must perform repeatedly for the first few weeks, on Saturday afternoons, in making the garden.

The first, after the initial handling of the soil, which was discussed in last month's issue, is:

Preparing the Seedbed.—
"Rake a piece of ground smooth and plant"—that sounds easy enough, but it depends upon how you do it.

If you do it right it is not an easy job or one quickly finished.

The importance of having the ground deeply and thoroughly dug and well broken up was discussed last month. On top of that must come thorough work with the iron rake, involving plenty of "elbow-grease," for which no satisfactory substitute has yet been discovered. When the seed leaves the packet and reaches its new home in the soil it will sprout—provided conditions are right. In Nature gardening, perhaps one seed out of a thousand may find the right conditions. But the gardener, who has voluntarily taken over Nature's job, becomes responsible. He cannot, of course, control the temperature, which is one of the factors, but he can withhold his seed until he thinks that the temperature is likely to be favorable for what he wants to grow. For the other condition, moisture, he must be, during the early stages of growth, quite responsible. And the soil to supply it must be made fine enough to pack up close and tight against the seed on all sides. A soil that is lumpy, and consequently full of small air spaces, will not do. Moreover, the soil must remain moist during the period of germination, which, for ordinary garden seeds, takes from six to twenty days. For this reason the soil, in addition to being fine, must be made compact enough to provide capillary action, by which water is drawn up to the surface from the depths below. Leaving the soil too loose, although it may have been thoroughly dug and raked fine on the surface, is one of the common causes of failure in the beginner's garden. It should seem firm beneath the foot when you tread on it.

Soil for the garden line across the freshly raked surface and mark out with your hoe handle the first row. Be sure you have your seed drill adjusted just right—unless you have used it frequently enough before to be familiar with its operations—test it out on the smooth floor. Be sure that the opening plow is set at just the right depth, and kept tight. Be sure that it is also free of weeds and rubbish—small pieces of sod or manure dragging along may catch the seed as it falls, so that it will all be

Your Saturday Afternoon Garden

VEGETABLES TO PLANT THIS MONTH

In a Medium-sized Garden. Four Plantings.

First Planting.—Cabbage, early; lettuce plants; onion sets; pea, smooth; radish; spinach; Swiss chard.

Second Planting.—Beets, plants; beets, early seed; carrots, early; cauliflower; leek, in seed border; onion, seed; radish; turnip.

Third Planting.—Cabbage, summer; cabbage, in seed border, for fall; lettuce, seed; parsnip; pea, wrinkled, two varieties; potatoes, early; salisbury.

Fourth Planting.—Beets, summer; carrots, summer; kohlrabi; lettuce, cos; onion, seedlings, Spanish varieties; pea, late; radish.

Seed Sowing.—Sow seeds of cauliflower late this month—or later—letting it follow some early crop.
dropped in one place. Be sure that the seed is dropping regularly, and clear to the ground. A lump of moist dirt at the end of the seed spout may clog it up. Do not attempt to plant when the soil is wet and sticky; very fine seed, such as lettuce or celery, may be picked up by the roller. Be careful to keep the front or drive wheel accurately on the mark at all times, even when you are looking to see how the seed is dropping.

Transplanting.—Next to seed sowing, the most important of early garden tasks is setting out the plants. Transplanting may seem to the beginner a very simple job, but most beginners, and frequently even experienced gardeners, fail to do it properly. What has been said in regard to the thorough preparation of the soil in connection with seed sowing applies equally well to the setting out of plants. While plants can be set out on a lumpy, ill-prepared surface, to get the best results, just as much care should be taken in the preliminary work as though it were expected to sow the smallest seed. The soil must be fine in order to be packed around the minute root hairs, which form again after the plant has been set out. And the soil must be fine on top to form a dust mulch, a condition in which it cannot be easily put after the plants are set out.

The plant to be set out will have been grown in flats, in pots, or directly in the soil in hotbed or cold-frame. In any case, they should be given a thorough watering at least some hours previous to the time they are set out. The flats, of course, can be loaded directly onto the wheelbarrow and taken out to the garden. The pots are not so easy to carry, and if there are any number of them, or if they have to be taken any distance, a good method is to knock the plants out of the pots and to pack them carefully into an empty flat. Wrap each ball of roots in newspaper. The plants should be sheltered as much as possible from wind and sun. For this reason a cloudy, quiet day is preferable, but in the home garden, where the number of plants to be set out is usually small, it can be done late on any Saturday afternoon. In taking plants from the flat or frame, it is best to cut them out with an old knife, as a much better ball of earth and roots can be had in this way. The rows should be marked out before any plants are taken out. It is better to have two to do the work if possible—one to drop the plants and one to set them, so that they may be got into the ground as soon as possible after being removed. There are various small hand tools which (Cont. on p. 296)
The Inviting Hall

ITS PURPOSE AND PERSONALITY—THE THREE TYPES OF HALLS—THEIR ARCHITECTURAL AND DECORATIVE TREATMENT—MAKING THE UPSTAIRS HALL ATTRACTIVE

Abbey McClure and Harold Donaldson Eberlein

The hall is the first part of the interior seen by the stranger and gives the impression of the spirit of the household and the personality of its occupants. It should be a place to pass through conveniently and ought to be pleasant enough to invite one to linger on the way.

The hall should always be inviting. It is the first part of the interior seen by the stranger and gives the first impression of the spirit of the household and the personality of its occupants. Its function is to afford ingress and egress, privacy to the rooms from those entering, and protection from draughts. It is a place to pass through conveniently, and ought to be pleasant enough to invite one to linger on the way. Needless to say, it should have an aspect of breadth and space and give no suggestion of stuffiness.

There are three general types of halls, and upon the type depends the method of architectural and decorative treatment. The hall of the first type is a commodious passage and a connecting link between the rooms. It is of convenient dimensions, of agreeable aspect, and lends itself readily to numerous phases of treatment. It is the sort of hall we find in so many of the broad, old Georgian houses, almost as wide as a room, and oftentimes running the full depth of the house, with a garden doorway at the opposite end from the front door. The stairs may form a conspicuous

In the long, narrow hall the less furniture the better. A table and one or two chairs are quite enough.
feature in the rear part of the hall or they may be in a small offset or room, so that the hall is, in effect, a long and narrow room. This spacious type of hall, usually with the stairs visible, has always been in favor since the Colonial period, and is still popular.

The hall of the second type is in reality a kind of living-room into which the house door opens directly, and is to be dealt with, for the most part, as a room. This type is especially suited to small and informal country houses or bungalows. A generous fireplace ought, if possible, to be a conspicuous feature.

The hall of the third type is merely an abbreviated and insignificant entry, or, if it is longer, a narrow rat-hole-like passageway of thoroughly unprepossessing character and not inviting as a problem to the professional or amateur decorator.

The hall of the first type is usually of such sensible and comfortable proportions and is so easily furnished that we need scarcely consider it from the architectural point of view with the object of alteration. The same thing may be said of the hall of the second type, but the hall of the third type presents serious difficulties that only heroic treatment can overcome satisfactorily. Such halls lack light and are ill-proportioned. The best thing to do is to eliminate such a hall by throwing it into an adjoining room, leaving merely such supports as may be necessary to sustain the floor joists above. No serious objection can be made to this alteration on the score of either privacy or protection from draughts. Privacy can be attained by the use of screens or by a draw curtain attached to rings sliding along a pole. When not needed the screen can be removed or the curtain drawn back, and then the hall becomes a part of the room.

The stair is the next feature to claim attention. Allusion has been made to halls, in some of the old houses, where the stair is placed in an offset and does not figure in the central hall. Sometimes this offset is closed by a door and partition, an arrangement doubtless adopted to keep what heat there was downstairs in winter.

It will be found that treads 12" broad with risers 6 3/4" high will make a delightfully comfortable stair, or the treads might be 12 1/2" broad and the risers 6" high. Whatever measurement is decided upon, it is useful, as a rule of thumb, to remember that the dimensions of the breadth of the treads and the height of the risers ought to be multiples of 75.

Second floor halls should be large enough to contain such pieces of furniture as highboys or chests of drawers that can serve both decorative and useful purposes.
Passing from the physical aspects of the treatment of halls, we come to a consideration of the several ways in which floor, walls and ceilings may be dealt with. It is not advisable to carpet the hall over its whole surface. It is much better to have either rugs or runners that can be easily taken up and cleaned, for there will necessarily be more or less dirt brought in from outdoors. When the hall is not of the second or living-room type, the flooring may often appropriately be made of tile, concrete, or even stone. We have become so accustomed to using the wooden floors that we go on laying them from force of habit. The objection will be made, of course, that tile, concrete or stone flooring is cold, but it may be answered that halls not combined with living-rooms are not intended to sit in, and therefore their coldness is not a serious drawback. On the other hand, they are subjected to more or less hard wear, especially from water and mud brought in by wet umbrellas or miry boots, and a floor of one of the last-named materials is readily cleaned and does not show the marks of wear. Flooring of this sort has been used with the most satisfactory results in a number of recently-built houses, and it is a common practice to employ it in country houses in England. It is particularly suited for the long galleries, which are long halls, and have become a somewhat popular feature in recent American country houses. The most satisfactory and sanitary flooring of this type is made of large, red quarry tiles, but tiles of other descriptions may also be used, as well as brick, concrete or stone. A flooring, tiles of irregular surface with wide concrete joints between, or random-laid stones, are open to the objection of inconvenience and dust catching.

One of the first essentials for hall walls is that they should be of sufficiently neutral character not to clash or make violent and unpleasant contrasts with the schemes of the rooms opening therefrom. In the next place they should be light enough in tone to lighten the darkness of a dark hall and to brighten an area that, in any house, is rarely as well lighted as the rooms. The walls may suitably be paneled, painted, if the plaster be sufficiently good, papered with plain and unobtrusive paper or left with the plaster sand-finished rough, which may either be tinted or left its natural hue.

Although in this instance the stairs were built open, it suggests a possible treatment for stairs that have been boxed in, a change worth considering in remodeling an old house. Whether painted, papered, paneled or sand-finished, color must be considered first. Colonial yellow, tan, fawn, light gray, light coffee color, or gray with an element of yellow in it, may be recommended. If there is enough warm light in the hall, even though narrow, other colors, such as sage green or old blue, might be used, but the first-mentioned hues are preferable. The woodwork in most cases should be white. With gray walls, however, gray woodwork is often desirable and pleasing in effect. Only in commodious halls where there is a good light will wood in natural finish be advisable or appear to the same advantage that the lighter woods display.

Tiles for flooring in a hall that also serves as living-room are a distinctly decorative asset. Rugs will dispel the chill in winter.

For paneling that is to be painted—while some hard wood is desirable—well-seasoned poplar, pine or cypress may be satisfactorily employed. Plaster walls should not be painted unless the surface of the plaster is entirely free from crocks and hair lines, otherwise the appearance of the paint will soon be spoiled by its bad backing. Paint may be either left dull or finished with a gloss. In a case of bad plaster, the walls may be covered with canvas or burlap, tightly glued on and then painted. Plain felt papers of desirable color are easy to obtain. It is worth noting that some excellent paper is to be had resembling cut Caen stone. If a glazed surface is preferred, some excellent patterns are to be found in bright-hued, glazed paper of old-fashioned pattern. Sand finish, though slightly more troublesome to apply than the ordinary white

(Continued on page 312)
IN the development of the small lot it is best to center all the attention upon one important feature. This feature should be in full sight of the house and have a close relationship to it. It should have individuality enough to perpetuate genuine pleasure in it. It should have elasticity enough to offer a chance for the expression of changing and growing interests. It should have a distinct originality which will grow in the hands of the ingenious designer directly out of some character peculiar to the site itself. These principles underlie the development of this property.

The unobtrusive, low shrubbery, still rather unconvincing in its newness, which is planted along the front of the house, conforms with the quiet character of the narrow Plymouth street overshadowed by old elm trees. The front of the house is simply good to look upon. There is nothing of particular interest or striking originality. This is left entirely to the development of the ground in back of the house. There the attention is focused upon the garden.

In the beginning it was only a deep, uninviting hollow. Now it is an oval flower garden. In May, 1913, it was an unsightly dump, an ugly hole in the ground. On the 20th of August of the same year there was a carefully arranged garden with abundant bloom and color. By July of the next year astonishing growth had sprung up. Later pictures will show still heavier growth, but these early pictures shown here convince one of the efficiency of a plan in which the work is carried on skillfully and rapidly without unnecessary readjustments of haphazard and disjointed ideas. The ordering of large-sized plants, the planting of heavy clumps for later thinning and the use of annuals for filling in bare spots gave in a few months a full-grown effect to the garden.

In May, 1913, this was an ugly hole; four months later by an almost magic transition had it been made a carefully designed, well ordered, formal garden

In May, 1913, this was an ugly hole; four months later by an almost magic transition had it been made a carefully designed, well ordered, formal garden

THE FORMAL AND INFORMAL GARDENS OF A PLYMOUTH PROPERTY—ELIZABETH LEONARD STRANG, LANDSCAPE ARCHITECT

ELSA REHMANN
In early spring this effect is gained by the careful distribution of early flowers. Daffodils skirt the outer edge of the oval, scillas and snowdrops, primulas and fritillarias are planted between the stepping stones, early pink and rose tulips and Mentensia circumcrire the circle with lavender Darwin tulips describing a wider circle around them.

A little later in the season the effect of symmetry is continued by dividing equally between the four parts masses of iris and

The house is in keeping with the quiet character of a New England street, overshadowed by old trees. Note the vine covered panels of the wall.

peer, phlox and Japanese anemones, asters and chrysanthemums. Planted in

strikingly picturesque accent in height.

In order to emphasize the short path, a balanced arrangement of flowers is quite rigidly adhered to in the borders on either side. Throughout its length English daisies and early tulips make a continuous border in early spring, to be followed by forget-me-nots. In back of them is a row of salmon-pink sweet William (Dianthus barbatus var. Newport pink), whose June flowers are replaced by the later bloom of heliotrope and pink stocks. The white and pink peonies in back of the sweet William in the nearer borders are replaced by the yellowish blush Peonia Canari farther away.

Where the circle breaks the path in two, groups of purple Japanese iris make an emphatic end to the borders; pyramidal foxgloves make tall June accents at the beginning of the path, and day lilies (Hemerocallis flava and H. thunbergii, interplanted) terminate the other end.

A balanced effect is also felt in the arrangement of the flowers on either side of the longer path. Bordered by alyssum saxatile and Arabis, Adonis and white wild geranium, Carpathian harebells, stac-tice and sedum, the edge is kept in continuous bloom. The varying greens and gray greens of the foliage add a special interest to these compact, mat-like ground covers. In back of this edging of dwarf flowers the irises, Queen of May, pallida and Purple King range from soft lilac pink, through blue to deep purple.

At the circle the symmetry is most strictly carried out. This is done to focus all the attention upon this central point and bind together the many motives of the flower design.
Four terra-cotta pots with salmon-pink geraniums are placed in the circle. The planting in the borders is arranged in a series of inscribed circles. In the first tier the early-blooming Mertensias make a complete circle with blue flowers that fade into pink. These are replaced later on by deep-purple pansies var. Emperor Williams. During July this tier is made effective by eight Oenothera Missouriensis placed at the points where the paths converge into the circle. The large, bright yellow flowers make a brilliant color note especially striking in front of the deep purple of Japanese iris in an outer circle. In the second tier Iris Purple King continues the color effect of the purple pansies. In the third tier are peonies in a deep pink and rose circle. Each peony is encircled by a dozen pink tulips, whose early flowers have disappeared by the time the peony has opened its abundant foliage. In the fourth tier are the purple Japanese iris. With them the circular treatment fades into the masses of phlox, which help to develop the oval outlines of the garden.

Special attention has been given to color in this garden. Not a single jarring color note can be found in it. Only the clearest of yellows, the softest of pinks and rose, the quietest of lavender, blues and purples and harmonizing whites are used in this elusive pattern of color, and the result is satisfactory in the extreme.

It is obvious that in such a formally arranged garden the succession of bloom is most carefully developed. Early tulips and daffodils; Darwin tulips and irises, peonies, foxgloves and sweet Williams, larkspurs and phloxes, Japanese anemones and asters, and chrysanthemum give continuous bloom. Coming into flower one after another with varying lengths to their periods of bloom they present a closely interwoven succession. Used in big masses, they form the major succession of bloom.

Complementing it is a minor succession. Bright-yellow Alyssum saxatile, pure white Arabis, blue Mertensia, pink bleeding heart, yellow Trollius make a spring medley of bright color. Columbine and yellow day lilies accompany the bloom of German iris; dictamnum and campanulas that of peonies. Purple Viola cornuta, creamy-white and pink spiraea, lavender Galium, snow-white Achillea. “The Pearl” and filmy Gypsophila, the baby’s breath, accompany the flowering of the larkspurs. Yellow Anthenis, lavender Sedum spectabilis, blue statice, and purple veronicas are in flower, while the phlox is blooming. Pink snapdragons complement the delicacy of Japanese anemones, salmon-

### NOTES AND REMARKS

Ascom.—III.—Dish and stake for flue fowers. Protect from black aster beetles.
Balsam.—Plant where individual flowers may be seen, as near paths or in foregrounds.
Begonia.—III.—Free and constant flowering. Red sorts very showy.
Bella.—II.—Very free flowering and pretty. New sorts large flowering.
California Poppy.—April. Cover lightly, thin out before crowding.
Chrysanthemum, annual.—III.—Sticky for cut flowers. Watch for aphids.
Chrysanthemun, annual.—II.—Most effective in single colors. Select young, healthy plants.
Cockspur, Catananche, Eremogone.—2 to 3 ft. Directly from seed the first year.
Larkspur, Anemone.—III.—One of the finest blue flowers for either garden or cutting.
Marigold, Gazania.—An excellent cut flower for the garden.
Petunia.—For double sorts destroy the ranking growing seedlings.
Philus Depressus.—Very free flowering. Good in solid masses or for medium-high hedges.
Poppy.—Thin out before 10ths plants get large. Make second planting.
Portulaca.—Especially good for hot, dry situations on sandy soil.
Salvia, I.—Most satisfactory of all red flowers for mass and long borders.
Verbena.—Very free flowering. Especially cheerful in the late fall garden until frost.

### FOR EDGING AND BORDERS

Alyssum, Sweet.—Most beautiful and graceful of all edging plants. Slightly spreading
Bells.—Extremely attractive, little, low-growing English daisy. Very cheerful.
Caulifoy.—Suitable for edging along walks where Alyssum is too spreading.
Chrysanthemum.—Fine, new, unique varieties. Especially desirable for long borders. Dwarf sorts good for edging.
Cynoglossum.—IV.—Most dainty and beautiful of all edging plants. Fine, new variety.
Geranium, Fuchsia, Salver.—Best edging for semi-formal bed.
Larkspur.—Most effective for airy, graceful, low edges and masses. Large-flowered, new variety.
Nasturtium, Dwarf.—III.—Free flowering, brilliant colors, best for poor soil.
Pansy.—IV.—For summer and fall bloom make spring sowing. Keep cool and moist as possible.

### FOR CUTTING

Antibrachium—I, II.—Should be in every garden. Fine, new sorts. Dwarf and tall.
Callistephus.—Very free-flowering and of quick growth.
Carnation.—I.—Very free-flowering. Last well after cutting.
Cosmos.—Large-flowered, late variety should be started early in ver or glass.
Digitalis (Foxglove).—Old favorite. Very striking. Most reliable.
Myosotis (Forget-me-not).—See the above under "edging."
Pansy, Hardy.—Color, variety and factory. Oriental, very striking.
Portulaca.—Large-flowered, scarlet flowers are scarce.

### CLIMBING VINES

Canary Bird Vine.—Unusual, bird-like flower. Cardinal Climber.—The newest and most striking annual climber. File seeds slightly before planting.
Cypress Vine.—Fern-like foliage. Star-shaped flower. Sow seed before planting.
Datura.—Large, showy flowers, varieties, great improvement. Beautiful, good scent.
Japanese Honeysuckle.—The best "temperate Ivy." Succeeds under adverse conditions. Sow seed.
Morning Glory.—Not out good, strong plants after danger of frost. Free flowering, fragrant. Sow seed.
Sweet Pea.—Try some of wonderful, new-named sorts.

### BULBS AND TUBERS

Begonia, Tuberous.—See the above.
Caladium.—Individual plants, groups of rows. Especially good for tropical effect. Very tender.
Campanula.—New orchid-flowered varieties; among the very best bedding plants.
Chrysanthemum.—Sticky for both the finest flowers.
Garden Mum.—Large, life-like, unique, beautiful blooms. Take up in fall, as with Gladioli.
Gladioli—I, II, III, VI.—Make several plantings for succession of bloom until frost. Last in June.

* Numbers refer to other groups in which plants may be classified.

#### NOTE

- A—Plants remaining the whole season.
- B—Plants maturing quickly enough to be followed by others.
- C—Usually sown or planted late enough to follow some earlier crop.
- D—Vegetables of which several sowings should be made during the season to maintain a table quality.

### REMARKS

#### PLANTS—EARLY

- Beets—Sow early; with single tooth on wheelbar; do not plant too deep.
- Cabbage—Use only a few of extra early sorts. Broccoli for out-wrongs.
- Cauliflower—Spray for green worm; tie leaves for blanching as heads form.
- Celery—Plant just to crowns; give plenty of water at all stages of growth.
- Endive—Blanch with boards or by tying when large enough to use.
- Lettuce—Set out two or three varieties for succession. Sow in seed border for plants.
- Leek—Set in shallow trench; fill in and hill up as growth is made.
- Onions—Trim back tops and roots; do not set too deeply.

#### PLANTS—LATE

- Beans, Pole—Start in paper pots; thin to one or two plants; transplant while small.
- Brussels Sprouts, Cabbage, Cauliflower—Sow in seed bed in early bed for late crop. Thin out to stand several inches apart. Cut back leaves once or twice during growth to induce formation of good, stocky plants.
- Corn—For extra early crop start in paper pots; thin to three or four plants.
- Cucumbers—Start in paper pots; thin to one or two plants. Transplant while small.
- Eggplant—Watch daily to protect from potato beetles. Plenty of water or mulch.
- Melons—Same as cucumbers. Spray early for striped beetle and wilt. Keep clean.
- Peppers—Rich soil; start in hills. Use same for eggplant.

#### SEEDS—EARLY

- Beet—Cover early planting shallow. Use thinnings for greens.
- Carrots—Make early plantings small. This before plants crowd.
- Endive—Sow when ground is moist. Thin out before plants crowd.
- Lettuce—Thin early. Sow in moist soil and shade to get stand in summer.
- Onions—Thin out at second weeding. Sow few radishes with them to mark rows.
- Parsnips—Thin out as soon as possible. Prepare soil deeply.
- Peas, Early—Smooth sorts can be planted a week or ten days earlier than wrinkled.
- Pea, main—Sow two or three varieties at a time to make succession picking.
- Radish—Seed can be sown early for best table quality.
- Spinach—Prepare soil very deeply. Thin as soon as possible.
- Squash—Keep very carefully cultivat, thin leaves for greens.
- Turnips—Sow thinly two varieties every four weeks, for best table quality.

#### SEEDS—LATE

- Beans, pole—Make first planting in lightest and driest soil available.
- Brussels Pole—Plant limas, including dwarf sorts, eyes down. Plant when soil is not wet.
- Cauliflower—Set heavy hill deeply; after 50 days give one-half hill. Sow 13 or 20 to hill.
- Cucumbers—Water—As above, but fewer seeds to hill and deeper. Scatter tobacco dust or fine ashes over hill.
- Pumpkins—Sow thinly in hill. (Winter)—No to two seeds, evenly spaced, in well-enriched, flat hills.
- Use tobacco dust or ashes freely on young plants. Hand-pick first large, black squash bugs. Thin to 2 or 3 plants a hill. Kill borers with wire or thin knife-blade.

### ROOTS AND BULBS

- Asparagus—Trench rows deeply. Enrich well with manure. Do not quite fill at planting.
- Onion sets—If of uneven size, separate before planting, using largest to be pulled green; smallest to develop new buds.
- Potato—For earlier results, sprout before planting, giving full light when sprouts start.
- Rhubarb—Plant fairly deep in enriched soil. Old clumps separated to advantage.
There is no escaping weeds and the knife is the only weapon that wagers an effective warfare on them.

UNTIL a few years back it was recognized by all that a new lawn or green could not be made, if sown with grass seed, in less than three years, and this belief is still rigidly adhered to by many. But, why did it take at least three years to make a  

lawn? For the simple reason that the grass seed was sown so  

thinly (from three to four bushels per acre) that each plant had  
to grow to its full size before the ground was covered. This slow  

process suited its time, but now the strenuous life demands quicker  

results. By a series of experiments, not only have several new  
or improved varieties of grasses been found, which tiller out over  
the ground instead of growing in tufts, as the older varieties did,  
but by judiciously increasing the amount of seed sown per acre,  
according to the fineness of the mixture, the quality of the soil,  
and the time in which the turf is required for play, a lawn or  
green can be, and has been, made with a close, uniform and even  
turf, fit for play in from about nine to twelve months from the  
time the seed was sown. I have seen lawns, greens, and entire  
golf courses grown in eight months, and not only was the turf  
strong enough for regular play, but it had the appearance and  
bottom of a good, old turf, such as is found at the seaside and in  

some famous parks; and I have actually seen a golf green turfed  
with turf only six months old. The seed was sown late in October  
and the turf was cut and laid in the following April. This was in  

England.

The method which should be employed for procuring a turf in  
the shortest possible period of time is as follows: A good time  
to commence the operation of making a new lawn is as soon as pos-  
sible after the break-up of the hot summer weather, with the in- 
tention of sowing, if possible, at the end of August, or during  
the early days of September. The soil is warm at the end of the  
summer, and an abundance of rain and dew may be expected,  
which is very beneficial to the growth of the young grass before  
the real cold weather sets in. As weeds are far more in evidence  
in the spring than they are in the autumn, it follows that the long  
start given to autumn-sown grass should make it better able to  
withstand the onslaughts of any weeds that may be lying dormant  
in the soil when they appear in the spring. For spring growing,  
prepare the ground as soon as the weather permits, and sow the  
seed as soon as weather permits.

It is good policy to allow as much time as possible to prepare  
the ground. A month or six weeks is not too much, as the sur- 
face will, to a certain extent, find its own level, which can be more  
easily corrected before than after the seed is sown. Work that is  
done in a hurry is generally badly done, as it gives no chance for  
the surface to consolidate, which is so essential for the welfare
of the young grass plants or for quick-growing weeds to show themselves and be destroyed before the grass seeds are sown. A lawn made and sown at the end of August or the beginning of September should be fit for play by the middle of the following summer; if sown in the spring it should be fit for play before the end of the summer. The making of a new lawn can be roughly divided into five operations, viz.: digging, manuring, preparing the seed-bed, seedling, and after treatment.

Dig to the depth of a spade, turn the soil well over, break up the large clods, pick out all large stones, weeds, roots, etc. Grass being a shallow-rooted plant, makes it quite unnecessary to work the soil to a greater depth, unless the old turf is to be buried; then the surface should be turned under to a depth of two spits. Work into the soil a generous quantity of manure. This is the most important operation in the making of a new lawn or green, and I cannot too strongly recommend it to be given very careful attention, because, no matter how good the soil may be, the results will be both better and quicker if it is well manured. The best general manures for digging in are fresh peat moss, stable manure, old, well-rotted short straw, and artificials. The peat moss and rotted straw manures should be spread over the surface at the rate of one load per 100 square yards, and forked or dug into the soil in such a way that the bulk of it remains within 2 ins. or 3 ins. of the surface. The artificials should be broadcasted over the surface at the rate of 2 ozs. per square yard and raked in.

Some people maintain that manure, if used, should be buried at least 6 ins. deep, while others hold that it should not be used at all, otherwise the grass will grow coarse and rank. I have proved over and over again that the closer the manure is to the surface, the better and quicker are the results, because the young grass can reach it quickly during the early period of its existence, whereas if it is buried deeply it will take months for the roots to reach it, and it often happens, especially during unfavorable sea-

sons, when grass grows very slowly, that it perishes for want of manure, in spite of the fact that plenty has been put in the ground, but out of reach. The suggestion that manure makes grass grow coarse and rank is another fallacy. If a mixture of coarse grasses is sown, a coarse turf will be produced, but if a mixture of the finest grasses is sown a turf of the finest quality will be formed.

Prepare the surface by breaking up the clods, removing large stones and all weed roots with an iron-toothed rake; then roll, rake and tread the ground until the surface becomes quite firm, true, fine, and when walked on hardly shows the imprint of the foot. It will then be ready to receive the seed. Sow the seed on the raked surface at the rate of 1 oz. per square yard, choosing a calm, dry day for the work; otherwise much of the seed may be blown away and lost; or, should the soil be wet, it will stick to the operator's boots, and in this way the level may be seriously disturbed. Divide up the ground into strips about 3 ft. wide by means of pegs and string, and divide the seed into as many equal portions as there are strips or squares; this will be found to be an easy way to ensure an even distribution of the seed. Sow the seed by hand, with the back bent, taking care to spread it as evenly as possible over the surface. The seed should now be covered to a depth not exceeding ¼ in., otherwise much of it will be lost. The most simple way to do this is to lightly rake the surface in two directions, taking care not to bury the seed too deeply. The ground should then be rolled and cross-rolled with a light roller.

Under favorable conditions the young grass should appear above the ground in about five to ten days if autumn sown, and fourteen to twenty-one days if spring sown, according to the weather. When about 1 in. high it is greatly benefited by a dressing of fertilizing fiber, malt culms, rape dust, or prepared compost. These top-dressing materials are gentle in action; they

(Continued on page 283)
Once children are interested in the care of plants and taught the rudiments of the work, they can be put in charge.

**New Use for Old Plants**

**HOW TO USE HARDY PLANTS INDOORS—TREATMENT FOR SCRAGGLY GERANIUMS—MAKING THE WINDOW-BOX SERVE A DOUBLE PURPOSE—AN EXPERIMENT WORTH TRYING**

**Luke J. Doogue**

Any suggestion that would open up possibilities of increasing the supply of flowers for the house during the early spring months should certainly be in order, and this suggestion is to use hardy plants in the house and outside of the house fully flowered, in the spring months before the frost had gone. For the inside, keep them in the window in the sun; for the outside put them in boxes, the window boxes that you use for the usual summer plants.

This is the plan. It can be carried out with a surprising degree of success. The idea of using hardy plants in the house seems so absurd to many of the admirers of these plants that they choke with indignation and reel off a thousand objections to such a proposition. Some of these same people are not aware of the fact that most of the large nurseries of the country, to meet an ever-increasing demand, are growing their hardy plants in pots so that the making of a hardy garden is not dependent on time or weather, as has been the case in the past. How often it has happened that an unlocked early spring with a burst of heat has suddenly brought everything into flower and leaf and suddenly terminated all planting operations? What tempers and plans were destroyed by such a happening? Happily, this is over. Surely, such treatment as potting hardy plants bas resulted in a better demand for them, with no damage to their good qualities.

If there is no crime in potting these plants for use in the garden, surely the dispensation could be stretched to allow some of them to get inside the house if such an entrance will tend to brighten the dull days of spring.

There is as great a need of novelty in the manner of using plants as there is in handling any other commodity, and that element of novelty is always possible if a little serious consideration is given to the subject.

A bed of geraniums planted out as they usually are is always a bed of geraniums, (Continued on page 281)
Spanish Mission style adapted to the bungalow is a tempting form for architects, and in California it has been adapted successfully, as in this instance. Every possible means of letting the sun into the house has been provided—wide windows and generous patio.

BEING A HOUSE BUILT OF MONOLITHIC REINFORCED CONCRETE, FIREPROOF AND TIME PROOF—THE CONCRETE INTERIOR FINISH—DEMOCRACY AND THE PATIO—A CENTRAL FIREPLACE AND ITS ADVANTAGES—THE POSSIBILITIES OF ADAPTING THIS STYLE OF BUILDING TO ANY LOCALITY

ALBERT MARPLE

It is not always that one sees incorporated in a home features that are suitable for either the country or the city dwelling. True, a city type of home might be built in the country, but there would be something about it that would give it the appearance of being "placed" there and of not having "grown into its surroundings." The same would be true if the country residence were placed in the city. It would seem a little out of place. The home, then, which might, with equal propriety, be placed in either the city or the country, would be of a somewhat unusual character. Such a home is the subject of this sketch. It is owned by Ridley F. Taylor, of Long Beach, California, and is located in a semi-city district known as a suburb, and even in that locality it is right "at home."

This house is a one-story structure, built along the lines of the Spanish type of architecture. It contains fifteen rooms, sun parlor and two cement porches, and cost $20,000. It is built of monolithic reinforced concrete, which is, possibly, the most substantial form of building material known.

In many minds the mistaken idea that a concrete home is an expensive luxury still exists. The initial expenditure is a little more, but when it is considered that when the concrete home is erected it is there to stay, necessitating no continual repairing, that far less fuel is necessary in winter to keep the rooms at an even temperature, and a great deal less ice is used in summer for cooling purposes; that there is no need of an excessive paint bill every two or three years, etc., it will be clearly seen that in the long run a home made of concrete is far cheaper than is the frame dwelling.

The word "monolithic" is synonymous with "one piece," so it will seem that this home is a one-piece structure. To all intents and purposes it is, although naturally it will not be expected that this entire house was placed at the one time; that is, the walls, floor and roof made by the same set or forms. That would have been as nearly impossible as anything could be. This house was, however, erected so that now that it is completed it is practically as strong as one piece of concrete.

The initial work of construction was to build the forms up to the floor level. During the process of placing the concrete in these the horizontal reinforcing rods were installed, and just as soon as there was sufficient.
Concrete in the forms to hold them the vertical rods were placed in position. After this concrete had set, the floor slab was poured. When the concrete already in place was sufficiently strong the wall forms were erected and the concrete and steel of the walls placed. The pouring of the roof slab was accomplished just as soon as the walls were strong enough to support it with safety. It will be seen that these different sections were so joined as to make practically one solid piece. The concrete brackets for the awnings over the windows were placed during the construction of the walls, having been made ten or twelve days previous. When the forms were removed the 2½-inch slabs beneath the red tiling of these awnings were set in position.

The outside walls of this home are six inches thick and of solid concrete, reinforced by ½- and ¾-inch twisted steel bars, being placed two feet on centers. The beams are reinforced by steel bars, while the roof and floor slabs are three inches in thickness and reinforced by electric welded fabric, this having Nos. 3 and 8 wires, the No. 3 wires running longitudinally of the house or the longest way of the slabs. All interior partitions are of Class A construction, built of ¾ Sharron iron channels, metal lath and plastered to a thickness of 2½ inches. It will be seen that there is nothing to decay or give way, everything being solid and substantial.

The home is of unique arrangement, the rooms being formed around a spacious, open-air patio. Fresh air and sunlight enter two sides of each of the principal rooms every sunny day. Double French doors connect the patio with the living-room, dining-room, breakfast room, kitchen, family bedroom, guest bedrooms, screen porch, plunge and dark room, making accessibility of one part of the home to another a very important feature. The patio has cement floor and walls, excepting the parts taken up by doors and windows, while the roof is of copper wire screen having ½-inch mesh. It is drained to the center, at which point it drops through a pipe into a concrete box. The roof being of concrete, no especially prepared roofing is needed. This is used as a sun parlor and a playground for the children. It is drained to the four corners of the patio, at which points the waste water enters pipes that convey it to the box.
beneath the center of the patio, whence it is carried by a 4-inch cement pipe to the street in front of the house.

The living- and dining-rooms are finished in oak, each room having a floor of 6 x 6 terra-cotta tile, brown cement border, etc. The dining-room has a leather-effect paper to a height of five feet, above which is painted in a frieze showing scenes of California. It has beamed ceiling, which is tinted, cement fireplace, buffet, etc.

The living-room is in the natural finish of the cement, so that the grain of the wood which served as the forms is plainly seen.

The doors of this house are all of the "slab" variety, being flush with the walls. In the planning of the house an effort was made to eliminate woodwork, and thus trim down the work for the housekeeper. There is no wood base, no picture moulding, no casing nor stool. Throughout the house 6-inch transoms cap the windows, and at points where there are two or three windows in a row, a single-light transom runs the entire width. Nearly all of the windows are of the casement variety. An idea original with the owner was to swing these windows outward, placing them outside the screen, thus protecting the screen from the weather. The curtains are fastened to the outside windows, coming between the glass windows and the screens and permitting the using of one long curtain across the entire width of the two or three lights. All the floors, except where otherwise stated, are of cement, and throughout the ceilings are tinted and are equipped with a 5- x 5-foot cupola above the center of the room, this having chipped-glass lights at the sides. This is supported by a cove ceiling. The furniture in all rooms matches the woodwork.

The kitchen is a cabinet affair with 4- x 4-foot cooler having cement shelves, cement sinkboard, etc., while the breakfast room is finished with Oriental paper and handwork. The sun parlor has a 7- x 16-foot art-glass roof. Upon a background of light blue is a pergola in dark brown, interlaced upon which is a rose vine bearing dark-red and pink flowers. At the center of the sun-parlor floor is a panel of 6 x 6 tile, this effect also being carried out on the front porch and the approach between the house and the sidewalk.

The most attractive feature of this many-featured living-room is the brazier. The walls here are left rough finished, the floors laid as in the dining-room, and the woodwork being eliminated to simple door and window frames.

Neither the walls nor ceilings have been decorated in any way. The brazier or fireplace in the living-room is a novel feature. Both the basin and the hood of this brazier are of hammered copper, while the screen is of copper wire. It is located a little in front of the center of the room. The occupants of the room may sit on all sides of this fireplace, the sides of the basin serving as foot-rests. An important point about this brazier is that after the fire has secured a good start the hood may be raised, the upper part of the "neck" disappearing into the ceiling, thereby permitting the occupants to see one another and talk across the fire.

Both the living- and dining-rooms have 10-foot plate-glass windows, similar windows being located on either side of the sun parlor, one facing the street, the other the patio.

The family and guest bedrooms are finished in mahogany, with cut glass doorknobs and doors with full-length bevel mirrors. The family bedroom is Glassed in, the patio becomes a room itself, impervious to the weather, an avenue of access to the various rooms.

(Continued on page 282)
If all the effectiveness of German iris would be had, they must be given a conspicuous place—and let alone. They are easily grown.

F. F. Rockwell

half closed, after the fashion of an art critic, at the beauty of the picture presented, and who never risks soaking feet in the morning dew, or gets a hand dirty or a wrist scratched in rendering some little service, perhaps unnecessary, to the garden's inmates; who has no friendships such as one may have with a quiet but dependable companion, among the nodding faces along the well-worn walks.

No one class of flowers has all the desirable points. Some of the advantages and uses of annuals and annual-like flowers were discussed in last month's article. The paramount advantage of perennials, of course, is their longevity. Instead of having to be started afresh each year or carried over, like potted plants or tender bulbs, they are planted once and for all, and one is done with the job until overcrowding or starved soil may make it necessary to replant; a condition which will not be reached for several years, and, with some varieties,
in heavy soil, is hardly ever reached. Another advantage is their great dependability. You can count on their being in the same spot and blooming at just about the same time year after year. They include, of course, some of the most beautiful of flowers and kinds which are valuable for practically every purpose—gorgeous shows in masses, bold and dainty landscape effects, cutting for bouquets, use around rock-work and naturalistic effects. But the very fact that perennials are long-lived and regular in their season of bloom makes it doubly necessary that the greatest care should be exercised in selecting them. The results of mistakes made are not for a few weeks or a season, but for years, unless one wishes to contemplate the job of un-making a perennial garden, which is much more of a job than making it.

The easiest part of this rather difficult task of selecting your perennials is to find out everything there is to be found out about any particular plant. You can get this information from any good nursery catalogue or find it in more complete and convenient form in the numerous tables which have been made up, listing and classifying these data. A complete list of perennials, without going into varieties at all, would include many scores of plants of which there is not room for even a brief description here. Some of the most dependable and satisfactory are described in the accompanying table.

In selecting perennials, the first thing to decide is when you want them to bloom. If your hardy border is on a "summer place," to which you do not come until mid-June, there is no use in wasting good money and space on flowers that bloom in April and May; and if August must see you again packing up for the city, those glories of the later summer garden, Japanese anemones and the hardy chrysanthemums, will not be for your enjoyment. On the other hand, if your garden is enjoyed during the Spring and Fall, but left to its own happy self-contemplation during a month or so while you are away at the seashore in mid-summer, you will miss the delphinium and campanulas in their glory. So, the first thing to decide in getting at your perennials is when you want them in bloom. Having settled this, you will find there is quite a list available. But there is another matter to settle in your own mind before you go any farther, and that is, how much care they are going to get after they are set out. This is a very important point. If you expect to set out your perennials and then let them take care of themselves, you will save time and disappointment in the first place by setting out only the hardiest and toughest, those capable of surviving in the struggle for existence which they will have to make. Among these are most of the native species, especially those which may be native to your own locality, and other particularly robust sorts.

A few of these are blood-root, trillium, aquilegia, lily-of-the-valley, iris, peony, dicentra, yuccas, Cardinal flower, golden glow; and, for one of the least appreciated varieties all considering the many beautiful varieties now available—the hardy asters and the native hardy lilies. If your flowers must be left to shift for themselves, your nurseryman will be glad to suggest extra hardy sorts for the conditions your garden will have to meet. Such conditions should, however, always be taken into consideration. The plants that are most tenacious, like the lily-of-the-valley, for instance, under the conditions they require, may not prove dependable in an ungenial environment. You should plan, however, to give your hardy plants, as well as your other plants, a reasonable amount of attention.

With these matters settled, you will still have a wide field to choose from. So far the process has been one of elimination. Now it will become one of selection. In solving this problem, you should first of all consider your general garden scheme. You must picture, in your mind—if you do not want to take the trouble to do it on paper, although that is the better way—the prominent points, the high lights and shadows, so to speak, of the general plan or scheme of your place. Upon your ability to pre-visualize thus a planting effect will depend to a very great extent the efficiency of your efforts to make a beautiful place.

Among the hardy perennials are to be found many of the most striking and effective things that can be used, and the hardy border itself, particularly on a small or medium-sized place, may be the dominant feature of the whole planting arrangement.

Another thing which must be carefully thought out at first is the arrangement of the plants in regard to each other. In the mixed bed or border the taller should be kept in the background, conflicting colors should be avoided, and harmonious colors planned, and such a distribution of species and varieties that no spot will look bare at any season of the year. For this reason, a number of different plants blooming at the same time should not be placed in proximity without interspersing others which will come into bloom before or after them.

From all this it becomes evident that about the last thing you do in planning your garden of perennials is to select your plants. This may seem at first paradoxical. You would think an architect very strange, when (Continued on page 304)
The house was set in an old orchard, with the trees forming a natural avenue up to the front door. Simplicity of line characterizes the building adapting it to its setting.

**THE RESIDENCE OF GEORGE K. SMITH, AT ST. LOUIS MISSOURI**

*Roth & Stody, architects*

A wide, paved terrace and an indented doorway give approach from the orchard to the house.

By using balanced lights around the door an old practice is put to an excellent modern use.

Here are characteristics of the Colonial style—wide house-depth hallway, and the service department set in an ell by itself, leaving the living quarters a private entity.
In the lower hallway the Colonial atmosphere is well expressed, the stairs being excellently proportioned.

Full length glass doors between the living-room and the sun-room give to the first floor an airy atmosphere.

In this house is well planned what in many others is often neglected—the upstairs hallways.

With the alcove and wide spacing, there is ample room for a little work corner in the hall.

The wall, shingled in like the house and garage, connects the two, tying the group into a pleasing, congruous whole, and carrying out the single direct lines to the best advantage. Note also the small bay in the angle and the roof treatment.
Good Reproductions in Brass

Fortunately, we are lucky to recognize the beauty and utility of brass and set about reviving its use. In the scheme of artistic possibilities for the house, it has its value no less than silver and crystal, though its place is totally different. Brass candlesticks are out of key on a mahogany sideboard, where silver is at home, but they may give distinctive charm on the mantel or table of the living-room.

Many hand-wrought articles are faithful reproductions of old English pieces, just as we have the samovar copied from the Russian. The corn-poplers and chestnut roasters, which are illustrated, are hand-made copies of their English forebears. They show fidelity of workmanship in the minutest detail, which is noteworthy in this commercial age, when quick work is the rule. The designer shows his interest in ancient legend by the use of Mercury wings and the serpent to compose the handle of one of the roasters. One of the symbols also appears on the perforated cover of the roaster. There are few perforations in this cover, but usually the cover is full of piercings like the sides and bottom.

The little triangular chestnut roasters are odd looking and interesting, but one rather imagines the large, round chestnut roaster or popper serving a merry party of youngsters who have just come in from a tramp in the sharp, spring air, and gathered about the blazing fire. Just before bedtime that same happy assembly will probably lift the lovely brass toaster from its hook and over the glowing embers there will be toasted marshmallows, done to a turn, just as they were at the erstwhile college feasts. These brass toasters are wonderfully charming, some that suggest the Far East in the design of bowl and handle; others of remarkably simple, but none the less graceful, lines. And there are warming pans like them, too, which, like the toasters, are a joy whether in use or not, because they are so decorative.

Door knockers, those silent sentinels that save our nerves from slamming doors, will be welcomed when warm days tempt one to stand every door wide open. One entirely new design is the Dolphin, handsome, massive and heavy, which is illustrated, and the very opposite of this is the Colonial style, plain, but with charm, as the true Colonial always is. Between these two, the one ornate, the other severely plain, there are many designs from which to select. One that is good is a claw-foot, evidently copied from the foot of an old davenport or highboy, out of which rises a twisted rod with handle at convenient height.

Some door-knockers that are the outcome of these tragic days are reminders of Rheims. One is a miniature façade of the Rheims Cathedral, and two others are copies of gargoyles from that historic church. They may be interesting, but they are not cheerful.

The “safety-first” slogan might have been responsible for the Cape Cod fire lighter, which recalls visions of Puritan New England. It reduces fire building to a feat of magic by its working, not to mention the quaint beauty of the device. There is a ball of absorbent stone clasped to a wire handle, and this stands in kerosene, which is held in the brass container. The kerosene-soaked stone is thrust under the coal or wood, the match applied, and a quick fire is the result. No kindling or paper is needed. It is a blessing to the man who builds the furnace fire in winter and to mountain campers, who often need fires on chill summer evenings.

Let not the thought of keeping one’s brasses in order be a hindrance to their possession. Brass is more easily kept burnished and shining than silver, yet the care of silver deters no woman from owning as much sterling and fine plate as her means will allow. Our grandmothers were wont to keep their brass preserving kettles shining like virgin gold through a liberal use of vinegar and salt, which removed every particle of tarnish. Nowadays there are all sorts of metal polishes that do the work, but when none is convenient try rottenstone and oil. Any cottonseed oil product is good for this, and is inexpensive.

I admit a leaning to the use of rottenstone and oil for cleaning brass. It produces such a rich, deep golden yellow that I use it on my grandmother’s brass kettle. No, I don’t make preserves in dear grandmother’s brass kettle in this day of porcelain and aluminum. But I hold such happy memories of scraping that jam ket-

The old chestnut roasters have been faithfully reproduced even to the crevices of workmanship

Nothing more than the utilitarian strainer, fashioned after the old pattern, with a semblance of artistry

Toasters and fire irons of rich old patterns are as serviceable as they are decorative

A product of “safety first”—a fire starter, with a stone torch to soak in oil
tle and licking up every morsel of sweetness, back in a far-distant childhood, that I greatly prize the old-time utensil.

When it came into my possession I pondered a long time before I decided how I could use it. Finally an idea came. I took the kettle to a worker in brass down in Allen street, had him remove the old handle and rivet a plain drop handle on each side. Then he mounted the kettle on three plain balls, which serve as feet, and I had a jardiniere of unusual design and lineage. When once you know its history you quickly see there's no disguise attempted. It's the old-fashioned kettle, transformed, it's true, now holding something of an enhancing charm than this of the satyr and the crab. George L. Lober was the artist.

Who has not had difficulty in getting a good arrangement of handsome flowers which have straight, stiff stems such as gorgeous tulips, lovely jonquils and narcissi? A low glass flower holder, a hemisphere in shape, solves the problem. By using it stiff flowers may be displayed in a mass for table or other decoration, with each blossom standing separate and distinct. This holder is on the same principle as the small ones which hold only one or two sprays. But the spherical shape, full of places for the stems, hold and at the same time give form to the mass of blossoms.

**An Old Problem Solved**

GRANDFATHER, descending the stairs on a cold winter morning, hurried to the living-room for a glimpse of the morning paper. But it is already in the hands of other members of the family. "I just wanted to know how cold it was last night," pipes grandmother, pouring over the weather column; "but it doesn't seem to tell here." "I wish one could tell what the temperature is at night," complains sister Mary, examining her bulbs in the window box. The small brother wonders if the pond is frozen so that he can skate on it—and the man of the house falls into an amiable dispute with his helpmate as to the reliability of wearing rubbers, the question devolving upon the condition of the streets—whether frozen or not.

These domestic uncertainties would be impossible were this particular family the possessors of a regulating thermometer. For use indoors and out, its value far exceeds its price, in the mental satisfaction it gives in determining past and present temperatures. For this little instrument not only records the weather conditions (so far as the temperature goes) of the moment, but also the lowest and highest temperatures touched by the mercury in a previous given period. The mechanism of this "scientific toy" is so simple that the proverbial child can set it in action. In appearance it resembles the ordinary glass thermometer for use on a window. Instead of one tube, containing the mercury, it has two—one for registering the greatest degree of heat, the other for the greatest degree of cold. In each tube is a small bar of steel, placed above the mercury. Controlling this bar by means of a magnet (which is provided with the thermometer without extra charge) it can be moved up and down in the tube at will. For determining the lowest temperature during a cold night, for instance, one moves the steel bar—in the tube for recording cold—down to where the mercury is at that time. The thermometer is then placed outside the window, or in the conservatory, or wherever the test is to be made. As it grows colder the mercury rises (instead of dropping, as in ordinary instruments), pushing the steel upward as it does so, till the extreme point is reached. When temperature becomes warmer as morning approaches, the mercury falls, leaving the steel, however, at the point touched during the extreme cold. By a glance at the thermometer it is seen at once just exactly how cold the night has been, or, to be accurate, what has been the lowest temperature reached during the night. In the same way, one may ascertain the greatest heat of a summer day, when the mercury is supposed to make a marked rise, say in the middle of the day, when the sun is highest. This is recorded in the other tube, in which the mercury rises to the extreme of heat. The thermometer, at a moderate price, will be found indispensable to the average household, for use in the house, on the porch, or in the care of indoor plants.

**Warming Facilities for the Kitchen**

A n important problem in the kitchen is that of keeping food warm and warming dishes that are to be used on the table. This is a very simple matter in a coal kitchen. The best coal ranges are equipped with good warming shelves. Where the warming shelves are not provided, as in the case of a cheaper range, it is possible to have a tinsmith make a serviceable substitute of japanned iron, which can be placed above the stove at a convenient height. These iron shelves should have round holes cut through for ventilation, and may be supported against the wall by means of brackets.

In a gas kitchen this matter of warming-shelves presents much greater difficulty and requires more thought. With the larger gas ranges there is no longer a constant radiation of warm air which can be utilized not only for the purposes named above, but for raising bread and drying the kitchen-ware. These needs must now be provided for in some other way.

The larger gas ranges have a warming oven above the elevated baking oven, which is kept hot by the oven burner when the latter is in use. At other times the (Continued on page 312)
April, 1915

April is the gardener's month of months. In it he can do almost everything in the way of planting. Or, to put it more correctly, he may do almost everything. What he can do is limited by his time. I doubt if there ever was a gardener who, on the first of May, could look back and feel that he had done everything he would have liked to do in April. On the other hand, the temptation to start too much proves fatal to many gardeners. For beginners it is a veritable moon. The beginner does not realize that with a modern seed-drill you can plant more in thirty minutes than you can take care of, when it comes to weeding, in a day. So, when you begin your planting, especially in the vegetable garden, be sure to figure up before you begin operations—if you have not already made a garden plan, as you should have done—exactly how many of this, that, and the other you think it will require to supply your table, and don't put in more.

The vegetables that can be planted out of doors this month are: beets, carrots, corn salad, endive, kohlrabi, onions, parsnips, parsley, peas, potatoes, salsify, spinach, Swiss chard, and turnips. Plants that can be set out are cabbage, cauliflower, onions, lettuce, beets, sprouted potatoes.

Seeds to sow for plants to transplant later on: Cabbage, cauliflower, lettuce, celery, leek, endive; and asparagus, rhubarb, and sea-kale to make plants for setting in permanent beds next spring.

In the rush of your outside planting,

When roses have become scrawny, as has this dwarf rose, they should be cut back, as in the accompanying illustration.

however, do not overlook the frames in which the plants to be set out early next month are coming along. These should be repotted, and, for extra fine specimens, put into flower or paper pots. They should receive every attention in the way of watering and care. During this month, especially as the weather begins to get settled, they should be given full air and sunshine daily, the sash being removed altogether.

Work About the Grounds

Don't let your vegetable garden monopolize all of your time. In fact, during the earlier part of the month there will be many days when it will be comfortable to work outdoors, when conditions are not right for seed sowing. These should be utilized for continuing the work which was begun last month, and doing your regular spring cleaning, getting the place "licked into shape."

Carefully rake off the lawn, putting the refuse mulching away, if you do not need it in the vegetable garden, where it can be used later around gooseberries, currants, and other things benefited by a summer mulch. If there are bad spots in the lawn you can probably find a nice-looking piece of sod for patching. If not, there will probably be some florist or gardener doing work in your vicinity from whom you can get a wheelbarrow or two of sod. The small, bare spots should be raked with an iron-toothed rake and grass seed applied and patted down with the back of
the spade. Be sure, in any case, to get
the winter mulch off before the grass be-
gins to make any growth.

If roads and paths are inclined to get
grassy or weedy, now is the time to give
scuffle-hoe. Make use of the "edger" for
trimming up the roads and walks, but
do not overdo it—it is very easy to cut
back too far into the sod, making an edge
that will dry out quickly, and looks ama-
teurish.

WORK FOR A COLD DAY

It is a good scheme to plan work as
much as possible for cold days. One can
be quite comfortable chopping pea brush
or taking more or less violent exercise
with hammer and saw on a day that would
be decidedly uncomfortable for setting
out plants, and vice versa. Get your pea
brush early. If it is quite near at hand
and you expect to carry it yourself you
will find that a piece of rope fifteen feet
long will furnish a better means of trans-
portation than the wheel-barrow. You
will find that the brush is of much neater
appearance and harder to handle if you get
it long before you want to use it and
lay it in a long, narrow pile on the top
of which a few heavy fence posts or
plank are placed. These will press it out
flat, with the result that you will have
much neater-looking rows and your brush
will go farther.

Roses and climbing vines trained
against the house should always be sup-
plied with trellises that will hold them
out a foot or so from the wall. This is
better for the plants and also for the
house. Where the vine grows directly
against the wall, unless it is of brick, it
will at least disfigure it and possibly cause
decay to set in by rotting and rubbing off
the paint and by keeping out the anti-
rotting influences of air and sunshine.
The form of trellis will depend largely
upon the vine which is to be grown. If it is
a real climber, making use of tendrils or
a twisting stem, the cross pieces on the
trellis should not be very far apart, and
the trellis should be comparatively broad
and flat. For climbing roses and plants
of similar habit of growth, all that is
needed is a rugged support to which the
strong-growing canes can be fastened in
any desired position, or through which
they may be trained. Frequently, espe-
cially for the annual climbing vines,
strings are used as supports. This makes
a cheap and easy method of vine training,
but it usually breaks down before the sea-
son is over. If you must use strings, get
a heavy, brown jute or hemp, or ordinary
"hinder twine," instead of the white,
"store string" which one so often sees.
It is much stronger and infinitely better
looking.

If you haven't finished all your pruning
and tree-repairing, that will make a good
job for the colder days. One can get a
good deal of exercise digging out old
pruning wounds that have rotted back a
foot or two into the limb or trunk. Clean
out to firm, live wood, paint with creo-
sote or tar, and, any time when there is
no danger of a frosty night, fill with con-
crete.

A SPECIAL BED FOR SEEDLINGS AND
RADISHES

Beside the vegetables mentioned above,
to be started now for plants to transplant
later, a number of flower seeds give earlier
and better results when handled in this
way. Among these are asters, antirhi-
num, carnations, dianthus, kochia, petu-
nias, salpglossis, stock, verbenas and
zinnias. A small packet of each of these
will furnish a supply of nice, stocky little
plants to put in the garden, not as early
as those you would have from a green-
dhouse, but ahead of seeds sown in the or-
dinary way in the garden.

Radishes sown in the usual way in the
garden are almost always put in in too
large quantities, and are not sown fre-
cently enough. Besides this, the soil
should be especially prepared for them.
For all these reasons, it is a good plan to
make a bed in some sheltered spot for
starting these seedling plants and for
growing your radishes, where the water-
ing, the thinning, and so forth, can be
regularly attended to. A couple of short
rows may be put in regularly once a week
—say every Saturday afternoon. To
make such a bed, dig up a place some 6
feet wide and 10 feet long (the dimen-
sions can be varied according to your re-
quirements). Dig up the top soil for 4 to
6" deep, put in a layer of rough cinders
or wood ashes may be put with it, but
avoid manure—especially for the radishes.
A row of brick around this bed, set on
edge, will hold it in place and will give it
a neat appearance. The end of the bed
be devoted to radishes should receive
a very heavy dressing of lime. Cover the
ground thick: use raw, ground limestone,
unless it is some time in advance of plant-
ing, when other forms can be used.

SET OUT NEW BEDS OF ASPARAGUS,
RHUBARB AND STRAWBERRIES

April is the month, and the earlier in
April the better, to make your new plant-
ings of rhubarb, asparagus and strapera-
ries. There are a good many kinds of
asparagus listed by the seedsmen, but the
listing is about as far as the difference
goes, except for two or three varieties—
Palmetto, Barr's Mammoth and Giant
Argentine. As the asparagus bed is made
for a long time, fifteen or twenty vears,
if you take care of it, it pays to prepare
it thoroughly in the beginning. The rows
may be made 3 or 4 feet apart. After
marking them out, dig out a trench along
(Continued on page 300)

(April 1915 HOUSE AND GARDEN 273)

The trellis should be permanent if roses are to be trained on it. Plain, straight bars of iron arranged
in this fashion are simple and effective.
OF GARDENERS  

We must acknowledge in the beginning that gardening is not for everyone. Although with each recurring spring there comes to all the desire to touch and handle and be one with the soil, not to all is vouchsafed the patience that watches the plant struggle up to fruition. In the heart of everyone, it would seem, the seed of garden love has been planted. We can never cease to love a garden, albeit we may have never loved gardening. The two differ, and have to do with different spheres. The love of a garden is akin to the appreciation of anything lovely—we may look upon a flower with the same rapture that we see a picture or listen to music. The love of gardening, on the other hand, is an expression of the love of life. The two may be co-ordinated, but the presence of the one does not necessarily connote the presence of the other, for the love of a garden is a condition of being, sired by heritage and reared by education; the love of gardening, a constant state of becoming that knows no parent nor instruction.

Because of this difference, the genius gardener is a type that runs through all sorts and conditions of men—a golden thread woven in and out the varied wood of humankind.

Could one visualize all the gardeners of the world foraged together, one would see such a motley as had never before been assembled: bankers and laborers, unlettered men and scholars, sinners and saints. Charney, the prisoner of Fenestrella, whose captivity was lightened by la potera piccola, would stand beside the poor, little man of Assisi, who so loved flowers that he preached to them. Walpole would be there, and Pope and Chancer. Burns would come, and Bacon, and with them Browning, who sang “the soft, meandering Spanish name” of roses. There would be Nero and Sir Henry Wotton, Addison and Montesquieu, the Jesuit Attiret and the German Prince Pückler, Peré Huet and Dufresny, Canon Hole and Benedetto Croce and Richard Jeffries. And one would almost dare to think that Another Presence would attend (‘and they all rise up as He passes by!’)—He of whom it is said that He planted a garden eastward.

By many indications can you tell the gardener. He has a meilowness, an urbanity. He is a cosmopolitan, though of cities other than those in which men dwell, and his acquaintance is with folk of an order different from mankind. He is usually a meek man, for his comrade in work is the worm that helps him plow the soil; he is usually an industrious man, for he labors in season and out of season with things that know no respite day or night. There are triumphs in his life; he can look upon a perfect flower. There are also defeats and sorrows, for wind and winter and drought and pest are leagues against him.

In whatever walk of life you find him, the gardener will prove a man in whom is active the vital forces of poetry. He is a poet, making rhythms of color and growth, planting for succession of bloom, just as a poet sings the refrains of his triolets.

He is, moreover, a radical, as have been all great poets. By intricate and secretive ways he strives to turn aside from the paths of the accepted varieties and eternally is he seeking out the new types that will set the old at naught, ever finding new methods of plant culture that will revolutionize the old. One can never say that his life is unromantic or commonplace, for each new bud may prove a new kind, and these inexplicable vagaries of Nature lead him into new worlds and set his feet upon paths that no man has ever trod.

Revolutionary, fickle, unpredictable Nature! Only a fool or a blind man would say that you obey your own laws or ever do a thing twice in the same fashion. Every plant is a new creation, unlike those that have gone before or will come after. Every plant is the beginning of a new history. Little wonder that he who works with you as a guide leads a romantic life!

The good gardener may not be a profound philosopher, but one will have to travel a great distance before he finds a body of men and women who are more innately philosophic than gardeners. The reasons are obvious: they have ample time to think, and they consequently gather the fruits of solitude; they work with fundamental verities, such as the dust from which we are sprung. Moreover, being initiated into a life and a companionship different from that of the mercantile world, or even the world of books, they are led far afield by problems of which the average man knows little. The very fact that they can create new varieties leads them to speculate on the reasons why they can. And the deeper they delve into the universe of plant life, the more complex grow the problems. Perhaps it is awe that makes the gardener a silent man, even as that silence makes him a philosopher.

To be a questioner in the garden is no far cry from being a believer, and taken, man for man, there is more acute perception of the Divine in Nature among gardeners than in many another walk; there is more of that rich, unresting life which characterizes those to whom mystic sight and speech are as a native tongue. The Light does not shine uncomprehended in darkness when it shines in a garden. For it would seem that gardeners know the wisdom of Plato’s observation, that “the true order of going is to use the beauties of Earth as steps along which one mounts up towards for the sake of that other Beauty.”

Nature reveals little of her secret to those who only look and listen with the outward ear and eye, and the gardener, whom she takes into her confidence, soon learns that seeing and hearing in that world lie in a peculiar attitude of his whole personality, a self-forgetting attentiveness, a profound concentration, a self-dying which creates a real communion between the seer and the seen. Only under such conditions do the things of his world surrender their secrets, only under such does he enter into their lives. The true gardener, then, is a mystic. What the mystic calls the Real he finds in his garden where he perceives the Divine in Nature, where heart speaks to heart and in a tongue not understood of men.

Such is some of the true inwardness of those men and women we see grubbing in the dirt of their gardens these days. Blind are we if we perceive not the gold in the dirt upon their hands, if in their taciturn methods we read not the speech of other worlds, if in their naive words and simple pleasures we see not the light of mighty discovery and ineffable joy. Because the things of their lives are reflections of eternal things, gardening transcends wavering popularity. It is the expression of an ageless instinct. The gardener is at once a survival more ancient than the Pyramids and a creation as fresh as to-morrow’s light.
"Start your Berkey & Gay collection today"

Furniture that lives with you

Berkey & Gay Furniture lives with you—it fits naturally into your home and into your life.

It does this because, being truly studied and properly executed after the masterpieces of the periods, it has the very qualities which have made the principles of the old masters in furniture live through all the years. In our furniture the excellence of the wood is equal to the faithfulness and exactness of the workmanship—yet is most reasonable in price.

It is an advantage to know who sells Berkey & Gay furniture in your locality. The store offering it is usually the best, and it is so organized as to advise authoritatively on any house furnishing detail. Such firms as the following are examples of Berkey & Gay representation everywhere:

Marshall Field & Co., Chicago
Lummert Furniture Co., St. Louis
Paine Furniture Co., Boston
McAllister-Moehler, Columbus, Ohio
Sterling & Welch Co., Cleveland
Daniels & Fisher Stores Co., Denver

Berkey & Gay Furniture Co.
Factory, Executive Offices and Show Rooms
184 Monroe Avenue, Grand Rapids, Michigan
Eastern Offices and Show Rooms
113-119 West 45th Street, New York

For fifteen 2-cent stamps we will mail you "Character in Furniture," a de luxe book which is authority on the periods. Other of our publications are free. Write for the list.

My Suburban Garden
(Continued from page 248)

ripe for the table. The strawberries were something phenomenal, but there were only enough for picking three times a week. For a family of five, at least two hundred plants are needed, and three hundred is better for a surplus for winter preserving. The robins gave us a good deal of trouble and ate at least half of our berries. Either lines of rag scares or else some of those French garden windmills with looking-glass flashers on their arms are needed to scare off birds. We had a family of cats, but they did not seem to be on their job.

I had two canoes and a motor boat to paint and put into the lake, and a swim in the ocean to take every day, so that, beside from fighting weeds occasionally, garden operations in July were not very irksome. The hotframe glasses were stored away and the frame itself planted with young bush melon plants. With heat above and below, they threw mightily and set a lot of fruit, but neither here nor in the main garden did the melons do well. They rotted on the under side, while the whole fruit was still yet unripe. Next year I tried a patch of excelsior under each fruit, with good results.

July also brought a horde of plant lice on rose bushes, pear trees and grapes. These are a regular institution, as are black fleas and bugs on the potatoes, so we got after them with a brass sprayer loaded with kerosene emulsion and whale-oil soap. Also Bordeaux mixture for the fruit trees, following the regular spraying tables. It does not do to neglect these things nor to bewail your fate if the insects chew up your leaves, suck out the sap and create general havoc and desolation. A thorough spraying in a small garden like this one takes but an hour, and should be done every two weeks. The insects will tell you if it is not done often or thoroughly enough.

In August we had early corn, lima beans, plenty of little, tender carrots, young beets, turnips, stringless beans, peas and the last of the spinach. New plantings were always going on of lettuce, radishes, peas and stringless beans, of which I made a long, 75-foot border on the rear traverse path over the drain. This border yielded plenty of beans, but was a nuisance from the tendency of the bean plants to fall over into the path. It will not be repeated.

Another border, of nasturtiums on each side of the main path, was a howling success. "Partner" put it in and drew from it an endless succession of nasturtium blooms until late December. Indeed, our floral display was beginning to attract notice. The wall of dahlias had done their duty right manfully, and were now filling the gaps between the peach trees, with a topping of wonderfully variegated blooms — scarlets, maroons, lavenders, whites, yellows—a sight to behold! The
front border of pansies had been another
delight all through June, and still had
blossoms until August, though in not such
profusion.

We now had more time for the aes-
thetic features that every well-designed
garden should have—rose arches, a lath
trellis, rose and grape trellises. He who
would be a gardener must also be some-
what of a carpenter, unless he is one of
those unfortunate creatures who “have”
things done for them by the mere act of
waving a five-dollar bill about in the air.
Such rob themselves of their rightful
pleasures as much as if they hired an
Italian to run their garden for them. Both
double and single hairpin rose arches are
easy to make. You need some 3/4” x 7/8”
yellow pine stock sixteen feet long,
straight-grained and free from knots and
checks, also “dressed four sides,” a mill
term, meaning planed smooth on all sides.
Beginning at the middle of your stick, saw
cuts for 2½ feet each way three-quarters
through the wood, making a cut at every
inch. The stick will now bend readily
into an arch about three feet wide without
requiring steaming. Put the feet about a
foot into the ground and paint white or
green, according to the color scheme of
your garden. To make a double arch,
plant two hairpins about a foot apart, side
by side, and join with cross pieces at every
foot around the arch and up both sides.
These cross pieces ought to be about
twenty inches long to give a pretty over
lap, and must be screwed in place, as the
arch will not stand much nailing. We put
double arch at the garden gate and single
arches at ends of paths, etc., growing a
pair of rambler roses over each arch and
using both Dorothy Perkins and Crimson
Rambler roses.

For rose and grape trellises on the walls
of the house I used 3/4” x 1/4” yellow
pine stock, making various forms of verti-
cal and horizontal ladder trellises, up-
rights and horizontals being about two
feet six inches apart. The whole east
wall of the house is now covered with
Dorothy Perkins (pink), Crimson (red),
and Philadelphia (large red) ramblers, be-
sides four Niagara white grape vines,
which have grown twenty feet long since
planting two years ago.

We used up a lot of this square stock in
the tomato and grape trellises and for
dahlia stakes. Starting with nine dahlia
roots (a tuber like a sweet potato) the
first year, we dug up a peach basket full of
them at the end of the season, enough to
fill, by dividing the clusters of tubers, the
five 10-foot beds between the peach trees.
At the end of the next season, in the Great
December Dahlia Digging, we had over a
bushel of thet ind had to clear more land
to find a place for the “dam-dahlias”.

Now, every dahlia needs its own stake
or it will tumble over and be a disgrace at
the first severe thunderstorm, so, at ten
cents a stake, as bought from the florist’s,
the increase in our dahlias bade fair to
bankrupt the establishment. We took

Now in the Light

Goodyear tires have for years
loomed up as the biggest thing in
Tiredom. And theyloom up bigger
each year.

Last year men bought about one
Goodyear for every car in use. That
proves beyond question—does it
not?—that Goodyears average best.

Goodyear Fortified Tires have five
great features found in no other tire.
These combat these six chief troubles
in the best ways known:

Rim-Cuts Insecurity
Blowouts Punctures
Loose Treads Skidding

We spend millions of dollars to
give you these protections. One of
them—our “On-Air” cure—costs
us $450,000 yearly.

That’s why Goodyears rule. They
are super-tires. Men who adopt
them find contentment, and they stay.

Lower Prices. On February
1st we made our third great price
reduction in two years. The three
total 45 per cent.

That is largely the result of our
mammoth production. It enables us
to give you greater value than was
ever known before in a tire.

Try them, in fairness to yourself.
Any dealer will supply you.

The Goodyear Tire & Rubber Company, Akron, Ohio

refuge in stakes made from 1" mill stock, four feet long and driven into the earth a foot. My back fence cost $22 for five fifteen-foot bays, including posts and rail. It was, in effect, an open lattice, 8" x 18", with a 12" foot-board and a 4" top running-board. The posts were 4" x 4", 8 feet long, 1½ feet in the ground, and the lattice 3½" x 1½", nailed to an interior frame 1" cove molding. I wanted an ornamental background for the garden, something to grow roses on and set off my currant bushes, something to differentiate the garden from the wall of forest behind it. The photographs tell about how we succeeded. I fussed with it odd times during September and finished it in three afternoons' work, besides a number of morning hours before business.

The garden that had been a flat fizzle the year before turned out a screaming success this year, even with none of its fruit trees bearing, except a few raspberry stalks. The ro 4 o'clock sunlight was just right, indeed many people build a windbreak on the north and west sides of a garden to shut off north winds and afternoon sun, that scorching heat that wilts plants around 4 o'clock when the summer day is hottest. I had proved that my problem was a soil and drainage one; that I had plenty of sun, enough to grow anything; and a trip across the State in May and September showed that I was ahead of the average farm truck garden—few, indeed, could show corn eight feet high in mid-July! So I began to cast longing eyes at my remaining uncleared west land, and smoked many pipes in the woods on the site of the future barn and chicken house, the greenhouse that I had promised myself for twenty years, and the pergolas which would flank it, covered with Delaware and Concord grapes.

The principal trouble with my garden for this season had been that there was not enough of anything. It had turned in about $130 worth of green groceries in six months, but we had put up nothing for the winter—no preserves, no winter vegetables, no green vegetables salted down in crocks in the good, old way. I wanted more land, and before leaving for my annual hunting trip in the West, late in September I engaged a laborer to take out all the blazed trees on a strip of forest to the west, and to grub up all the roots and bushes on it.

Editor's Note—The reader who followed Mr. Miller's work in the March issue of House and Garden, and who has read this record of the second year, will learn a secret about gardening—that success is rarely attained the first season, especially by the amateur. A garden is a gilt-edge bond, but Nature doesn't pay a big dividend the first year, nor sometimes even the second, but when she pays, she pays well.
Landscape Gardening on a Small Place

(Continued from page 257)

pink annual phlox Drummondii continues to bloom late into aster time, and calendulas are still fresh when the last chrysanthemum has faded.

Succession of bloom, color harmony and arrangement are subtly interwoven. Thus analyzed it illustrates the difficulties and pleasures in designing the perfect garden. It makes clear the reason for many failures, the source of many delights in garden making.

It is as easy to enumerate the flowers planted in the garden as it is hard to describe the elusive effects that are attained. It is as simple to explain the underlying principles of the garden's composition as it is difficult to analyze its charm.

A flower garden is a transitory, evanescent thing. Without constant, patient and intelligent care the whole charm of a garden like this one, dependent on so many interrelated details, is lost in a year's time. This garden has the monthly supervision of the designer. This means not only that she can see that it is kept up to the color scheme and arrangement as she devised it; that she can foretell and forewarn lapses of bloom, winter failures and seasonal mishaps, but that she can rearrange and complete, substitute and devise new color effects in minor details which will give new interest to the garden without disturbing its old vigor and its stable, constant arrangement.

The oval is box bordered, and then girt by a ten-foot wide strip of gravel. Although the plan of the entire layout had been carefully studied beforehand, we had been, throughout the long and minute inspection of the garden, altogether unconscious of the fact that this gravel strip was the turn-around. A turn-around is so much a matter for practical consideration, a flower garden is so much a striving for an ideal, that the two seem antagonistic. The harmonizing of these two opposing factors strikes not only a clever and original note in garden composition, but shows a serious understanding of garden art.

Laundry yards are even more incongruous to flower gardens. With only a little space available, the vine-clad lattice screen and groups of Arborvite trees hide the close proximity of drying linens which, no matter how fresh and clean, are not in harmony with flower gardens.

In developing the principal feature of a place there is often a possibility of combining with it a number of secluded scenes of a special character. Attached to the side of this wide, shallow lot is a narrow strip of sloping land which lends itself to such use. Subordinated to the main garden it must still be related to it. One of its long paths is a continuation of the longer axis of the main garden. The

Smokeless Firebox Boilers

Cut Coal Costs

Q In a 21 apartment building at 51st Street and Forrestville Avenue, Chicago, a Kewanee Smokeless Firebox Boiler saves $883.20 yearly in the fuel bill—this saving being figured from the record of coal costs during two years.

Q This is the way the saving was figured:

Q The Kewanee Smokeless burned during December 1914 a daily average of 1400 pounds of coal, costing $4.50 per ton. A coal cost of $3.15 daily or $756.00 for the entire heating season of 240 days.

Q Another boiler, which was formerly used in the same building for heating 15 of the present 21 apartments, used during December 1913, 2170 pounds of coal daily, costing $4.50 per ton. A coal cost of $4.88 daily. Figuring that the other make of boiler would heat the 21 apartments at the same proportionate cost, the cost of heating the 21 apartments with the other boiler would be $0.83 daily—or $1,039.20 for the heating season of 240 days.

Q This shows a saving with the Kewanee Smokeless of $3.68 per day or $883.20 in a heating season of 240 days.

---

This attractive home at Minneapolis is faced with Hy-tex Colonials, a smooth sand-mold Brick of prevaiingly smooth, deep red color-tone, with a great variety of shadings and kiln-set marks that greatly enhance the changing beauty of the wall surface. Note the chaste and pleasing ornamental effect produced on the elevations by the soldier and row-lock courses, used not only around the entire building, but as sills and lintels in the lower story.

Hy-tex
The Standard of Quality in Brick

Your first step in connection with building should be the recognition of the all-round value of brick as a desirable and artistic building material. Almost of equal importance is the realization that Hy-tex is the one name which stands for every variety of color-tone and texture known to brick-craft, as well as for the highest quality of product and service in brick. You can find in the Hy-tex line any brick you want for any architectural purpose you choose.

You should read “Genuine Economy in Home Building” not for what it tells about the elevation of the entire building, but as sills and lintels in the lower story. Hy-tex Brick but for what it throws on its whole subject. It is profusely illustrated.

KELLY BROS., Wholesale Retailers, 243 Main Street, DANSVILLE, N. Y.
It is a place for old-fashioned plants and favorites, flowers of odd colors and curious shapes. It is a medley of color, a spot full of fragrance. Little surprises are at every turn, unexpected flowers are found in hidden corners; there are little blind paths where steps have to be retraced through flower tangles. It has absorbed in a very short time the indescribable, old-fashioned quality of the Colonial gardens, of which it was to be a freely rendered replica.

New Use for Old Plants
(Continued from page 28)

and attracts the usual notice—or lack of notice—that such planting does. But if these same plants are grown so that they attain an unusual size and an increased number of flowers, then the element of novelty creeps in and the bed is something more than just a bed of geraniums. There are dozens of hardy plants that can be used in the house. A few that might be suggested are Aquilegia, Arabis, Asperula odorata, Trollius europaeus, Veronicastrum tormentosum, phlox subulata. These are both suitable for the inside and outside. The plants should be small. If you don't happen to have a stock, grow them from seed, sowing in the early part of July and potting when of good size, and winter them in a coldframe or pit. Take them out in the spring and start them into growth at your window. If you have a coldframe, give them their start there, since they will come along tougher than if brought into the house at once.

For larger plants, such as the Campanula calycanthemus, foxgloves, Veronica spicata, anemone, Queen Charlotte, and the like, which can be used for veranda ornaments, go out into the border and dig the plants up early and put them in large pots and place them on your steps.

Large clumps of trollius, although about to come into flower, can be dug up and potted without any danger of losing them, provided a thorough soaking is given when first potted. The same is true of the campanula. They are easily grown from seed or the old plants can be dug up without trouble. A large tub of these flowers makes an attractive and unusual sight. They can be potted singly, but when massed they are more effective.

The use of hardy plants on the veranda is with the idea of succession, allowing one kind to remain while the flowers look fresh, and then substituting another and later flowering kind. By this process the season is materially lengthened.

Returning to the interior use, it would be a good idea to make a small window box about four by three deep and wide and the length of the window and arrange the different plants into these boxes. The Aquilegia, particularly, thrives under such treatment, and the plants send up masses of their wonderfully beautiful flowers, lasting for weeks.

The Agency of a United People

A striking comparison between a homogeneous country and a heterogeneous group of countries is obtained by placing over the map of the United States the map of Europe. These represent the same area—about 3,000,000 square miles—if a few of the remote provinces of Russia are omitted.

Europe has the advantage in population, with more than four times as many people as the United States; in the number of large cities, with two and a half times as many cities of over 100,000 population.

Yet the United States, a comparatively young country, has outstripped Europe in the diffusion of civilization, because of its wonderfully greater means of communication between all parts of its area. The United States not only excels in transportation facilities, but it has nearly three times as many telephones as Europe, or about eleven times as many in relation to population.

A House Made for Sunlight

(Continued from page 265)

9 feet in height. Not satisfied in using concrete and cement within the home, this

builder employed it in the construction of the

surrounding features. The well-
equipped garage and the driveway are of

this material, as are the brooder and in-
cubator houses, the chicken sheds, the

standard of the clothes-drying rack and

the fence which enclosed two rear sides of

this property. The two pretty pergolas

are also made entirely of concrete, these

being so located as to "shut off" the view

of the back yard from the streets. On

the outside of these, rose vines are grow-

ing, while on the inside are grape vines.

The result of much and careful thought

is this house. Planned right and built

right, and, being on "Spanish lines, it is

bound to be in "style" for years to come,

for that type of architecture will probably

always be appropriate in Southern Cali-

fornia.

The subject has often been discussed,

and still is a moot point, whether or not

this Spanish type of bungalow is adapt-
able to other localities. For it has even

been hinted that from the Spanish will

eventually be created the American style

of architecture. From the point of feasi-
bility, however, there is no doubt but that

for California this type is the best, the

atmosphere conspiring to enhance the ap-
pearances and the climate eliminating to

a great extent the problems of heating.

For the other sections of the country the

Spanish bungalow can be adapted, even to

the patio, and an all-year house made that,

with proper heat radiation, would make

living in it easy and comfortable. It is a

democratic style, and hence peculiarly

American.

But whatever the style of house, there

is no doubt but that its construction of

monolithic reinforced concrete is quite

adaptable to any region, and should be

given serious consideration by the pro-
spective house builder. The material is

plastic, capable of adornment and tinting,

fireproof, timeproof and damp-proof, if

properly treated. Moreover, if one com-
bines with the use of concrete the use of

steel door and window frames and sash

set flush with the wall, there is still further

eliminated the possibilities of fire, and
work is saved for those who have to keep clean and in order the insides of the house.

At all events, the reader can gain much from a close study of this "House Made for Sunlight." for here are features that can readily be adapted to houses anywhere, features that will prove their worth both in serviceableness and decorative value.

**Living Lawns**

(Continued from page 261)

do not burn the young grass, but they protect it from extremes of temperature and assist to conserve moisture. I cannot too strongly recommend the use of these top dressings, as they supply nitrogen to the young grass during the most critical period of its existence, and the effect that they have on its growth is extraordinary.

When the young grass is about 1 1/2 inches high it should be rolled with a light roller, and when about 2 inches high it is ready to be cut, which may be done either with a freely running machine, set rather high, or with scythes. It is most important to regularly mow and roll the young grass from the very start, otherwise it will grow long and thin, instead of tillering out and covering the ground. Any thin or bare places should be repaired as soon as noticed by very carefully loosening the surface soil, sowing a handful of seed, covering, and rolling in the usual manner.

—W. R. Gilbert.

Much of the success with a lawn depends, of course, on the kind of seed used, for there is just as much individuality in a plant produced from a grass seed as in the choicest plant in a greenhouse. One kind of grass seed will produce a low-growing plant while another grows high; one wants a moist situation, another a dry one; some will germinate in the shade, others will not, and so on through the list.

Kentucky Blue Grass—Fine for lawns; grows slowly but vigorously almost everywhere but on acid soil.

Red Top—Shows results more quickly than blue grass; will thrive on a sandy soil; fine in combination with blue grass.

English Rye Grass—Grows quickly and shows almost immediate results; good to combine with the slow-growing blue grass.

Various-leaved Fescue—Good for shady and moist places.

Rhode Island Bent—Has a creeping habit; good for putting-greens, sandy soils.

Creeping Bent—Creeping habit; good for sandy places and to bind banks or sloping places. Combined with Rhode Island bent for putting-greens.

Crested Dog's-tail—Forms a low and compact sward; good for slopes and shady places.

Wood Meadow Grass—Good for shady places; is very hardy.

Red Fescue—Thrives on poor soils and gravelly banks.
That Bare Spot in your lawn can be renovated by Bunyard's Invincible Grass Seed Mixtures

Made up of the finest reclained seed

BUNYARD'S "BRITISH LAWS" FORMULA

This mixture is made from a famous British formula that produces the well-known lawns as much admired.

Price: 10 lb. to 10 lb. $1.50; over 10 lb. $1.00 per lb.

BUNYARD'S PUTTING GREEN MIXTURE

Made up of grasses that will stand the wear and tear on the "greens."

Price: 10 lb. to 10 lb. $0.50; over 10 lb. $0.50 per lb.

BUNYARD'S CENTRAL PARK MIXTURE

An excellent mixture for re- seeding run-down and worn out lawns.

Price: 10 lb. to 10 lb. $1.25; over 10 lb. $1.00 per lb.

BUNYARD'S TERRACE MIXTURE

Made up of grasses that are deep-rooting and will hold the soil

Price: 10 lb. to 10 lb. $0.50; over 10 lb. $0.50 per lb.

BUNYARD'S SHADY NOOK MIXTURE

Specially prepared to grow under trees and where shade predominates.

Price: 10 lb. to 10 lb. $1.00; over 10 lb. $0.75 per lb.

Grass Seed specialists
49 W. 28th St., New York City
Between 7th & 8th Ave.

White Clover—Good for slopes; not to be recommended for a lawn.

Sheep Fescue—Sod for light, dry soils.

On banks and terraces it is preferable to use sods rather than seeding. The sods can be held in place with wooden pegs driven through them seven or eight inches into the bank. Over this work scatter some seed and give a light dressing of loam; then pound the whole to an even surface. When the bank is too steep to hold the sods pedged in this way, they should be piled upon each other horizontally, so that the ends will form the surface of the bank. This effects the double purpose of creating a permanent sward and also a depth of ten inches of loam upon which it can feed.

A lawn that has been properly made will not suffer if it is not given a yearly dressing, for it has sufficient food supply in the ground to keep it going for years.

Strange as it may seem, many good lawns have been ruined by being given a heavy application of manure year after year. When a top dressing is necessary on soil that is good, Canada hardwood ashes and bone meal will supply all the nourishment it may be washed into the soil.

The Canada hardwood ashes, as usually found in the market, contain from 1 to 5 per cent of potash, but to get the results you are looking for, the ashes should contain from 7 to 9 per cent of potash. In purchasing this fertilizer in large quantities demand a guaranteed analysis, otherwise you are liable to get something little better than what you take out of your store, and wholly useless for lawn purposes.

There are good ashes on the market, and they can be had if one goes after them vigorously enough and gives some indication of a knowledge of what good ashes are.

When it is not possible to get what you are looking for, mix moraine of potash with finely sifted loam, and spread it broadcast over the grass. This treatment is always effectual, as you are absolutely sure of getting what is necessary for the land.

Many prefer to use a top dressing of manure, regardless of conditions. It is sure to bring more or less weeds. If you decide to use it, however, get the thoroughly decomposed kind, as this means a minimum of weeds. When manure is used for a top dressing, do not get it on too thick, and do not leave it too long on the grass; in the spring it is highly efficient, clean, and produces very few weeds. It is best used at the rate of about a ton to the acre.

Nitrate of soda is a very vigorous stimulant and produces quick results. It is economical, requiring but small quantities to cover large areas. Spread broadcast, taking a high class fertilizer and add to it Radium Element in just the proper proportion and you have the ideal plant food—Radium Brand Fertilizer (RAF). Assuming according to directions and your flowers will bloom more beautifully, your vegetables will grow more, your lawn will thrive, your shrubbery will increase its foliage and bloom. Put up in handy packages for small users. One lb. will fertilize 50 sq. ft. surface, or a plot 5 ft. by 10 ft. by 4 in. deep.

Radium makes things grow.

Radium Fertilizer Company
203 Vanadium Building
Pittsburgh, Pa.

In writing always be sure to give us your dealer's name, so we can arrange for your future supply.

Radium is sold by florists, grocers, druggists, and seed and hardware dealers. If your dealer can not supply you, send us his name and 25 cents for a Sample Can (12 oz. net) RAF-1 prepaid. Also, sold as follows, prepaid:

5 lb. can... $1.75
25 lb. can... $3.75

Ship to your dealer or to us here.

We believe it to be the most important effect of the radium was that of improving the edible properties of the products.

Sample Can, Prepaid, 25c

800 best Dahlias

All the finest varieties to date in decorative, fancy, cactus, show, peony-flowered, col- larette, Century and pompon dahlias are described and illustrated in Herbert’s 1915 Catalog

Contains full directions on growing—any amateur can raise these fine flowers.

Enchanted Homes

Transformed by Billiards

This grand old game was once the sport of royalty alone. Yet these are days when Carom or Pocket Billiards reign supreme in mansions and cottage alike. Look about you—how home folks love the beautiful buildings of Billiards. How they prize its physical and mental benefits. How boys and girls alike play it.

Each evening in the billiard room a round of happy events. When boys were away, home drifted. Here girls develop gracefulness and charm. And billiards brings home happiness. Makes them great big-hearted little men!

Superb Brunswick Home Billiard Tables

Real Brunswick foundation tables, modified only in size and style to suit your home. Striking styles in American, English and Continental. French Empire, American Empire, and French style masterpieces in mahogany richly inlaid. Other styles include Convertible models in oak or mahogany that serve as perfect Library and Dining Tables when not in use for billiards. All Brunswick Home tables have quick-setting Monarch cushions, genuine Vermont slate bed, fast imported billiard cloth—all the most scientific playing qualities.

20 Cents a Day

Our popular purchase plan—terms so low as 20¢ a day—that you pay nothing in advance and you are privileged to try any table 30 days right in your own home. Playing Outfit Free—Balls, Cues, Rack, Markers, expert instruction booklet—How to Play, etc—all included without extra cost.

Can These Things Be Replaced?

The arm-chair, where perhaps you sit as you read this magazine—how comfortably it conforms to the curve of your back. How often you have thought of its welcoming arms as a haven at the end of a hard day—and the side-board that has been in the family for more than one generation. You can remember how you had to stand on tip-toe to reach the sugar bowl on its shelf—and the old secretary in the corner. Old friends, these. Could they ever be replaced? Is there any insurance in the world that could cover them in case of destruction by fire?

You can safeguard them as well as all the other home treasures made priceless by association—if you build your house of Natco Hollow Tile—Fireproof; damp proof; vermin proof; age proof; warmer in winter; cooler in summer.

The house built of Natco throughout—walls, partitions, floors and roof—is constructed rapidly and economically. Its cost is lower than any insurance in the world that could cover it. Its cost is almost insignificant in comparison with the value of the things it protects. Its cost is an investment that pays interest sixfold in every case in which it has been used.

Natco Hollow Tile is precisely the same material—the same Company's product—that has been used in the construction of the greatest fireproof buildings in the world. The twenty years' experience of this Company has developed a perfect form of Fireproof Construction. "Natco" stamped on every tile.

Investigate this modern form of construction before you decide upon your building specifications. A fine will bring you our new 32-page hand-book, "Fireproof Homes." Contains photographs of typical Natco residences, large and small. An invaluable guide to the prospective builder. Mailed anywhere for 10 cents (in stamps or coin).

Can These Things Be Replaced?

The garden at the seashore is usually an afterthought, but often these afterthought gardens can be a success, as you will discover in the May Issue of HOUSE AND GARDEN.

Country Houses. By Aymar Embury II. Doubleday, Page & Co. $3.00.

Every man has in his heart the vision of the house that he will build some day. A few of us are able eventually to attain that vision and see our dream crystallized into permanent fabric; as for the remainder—a plausible majority—they buy picture books of houses and go on with the dream, which is true wisdom. Such a picture book is this volume showing the work of Aymar Embury II. Though holding firm to the best traditions of the Colonial and Dutch Colonial craftsmen-builders, he has gone forward in the incorporation of exquisite detail and ingenious planning, so that his houses may be said to represent the best of American domestic architecture of the day.

Of each house are shown the plans, and exterior and interior views. The costs range from modest structures of $5,000 or $6,000 to the more elaborate country home. Several of the pictures have been reproduced in HOUSE AND GARDEN, bringing from the readers a deserved measure of interest; others are new: but all are worth the seeing and the knowing, even if one belong to that plausible majority which never attains the real house, but has to content itself with looking at pictures.
The Lawn Mower—Its Proper Selection for Various Conditions

The creation of the lawn mower was entirely due to an Englishman—Edward Budding—a native of Gloucestershire, England. He had considerable ability as a draughtsman, mechanic and inventor. It was while he was superintendent for a large woolen manufacturer in Dursley, England, that the cloth-chipping machine used in the manufacture of woolen goods suggested to him the possibility of inventing a machine for clipping grass. He successfully worked out his idea, and on October 25, 1830, was granted a patent on the first lawn mower.

A roller mower, with demountable cutter and steel-carrying wheels, adaptable to the small place

It was of a pattern now known as the "Roller" mower. A large roller is used instead of drive wheels; it operates a gear which causes the movable blades to revolve against the cutting knife and also helps to keep the lawn smooth and free from bumps.

Since that day, manufacturers have realized that different conditions required different machines, and as a result the buyer of the present time can obtain a machine peculiarly adapted to his requirements. For instance, all mowers are not suitable for terraces having an abrupt slope, and machines used on golf greens or tennis courts which are mowed daily would be unsatisfactory for the average lawn mowed weekly.

The small lawn or grass plot, so common to the private dwellings in most cities, where all that can be had are small patches of grass in the front and back yards, requires a small, light-weight mower of about 12" cut, having direct-drive internal gears, 8" wheels, four revolving blades and adjustable, split-bronze bearings. A medium-priced machine is all that is required, because it receives so little

Old English Floor Wax

There is nothing cheaper for the cottage—nothing richer for the mansion.

A good wax is the most practical preserving application your kitchen linoleum or woodwork can have. Old English Floor Wax is at the highest repute because it is made of the hard, substantial wax which not only gives the most beautiful finish but is most durable. Finish your floors with Old English—it's easy—just a rag and a can—no odor and in an hour you can use the room.

Polish your piano with Old English. It restores the lustre and protects the delicate finish of your floors. Old English makes linoleum look new and makes it last about twice as long.

Send for Free Sample of Old English Floor Wax and Book, "Beautiful Floors". It tells authoritatively about the different pictures and how to prevent "worn spots." Send 25 cents for these five Extra Size pictures on paper 10 x 12—Baby Stuart, The Angelus, Sir Galahad, Christ and the Doctors, Angel Heads. VITRALITE is used in the little homes nestling under the trees, and in the big mansions on the Avenue, because it combines richness and economy, beauty and durability.

Vitrailite is truly the Long-Life White Enamel. It will not mar, scratch, crack, peel or turn yellow, whether used inside or outside, on wood, metal or plaster, and withstands repeated washing.

There are Pratt & Lambert Varnish Products for every purpose.

But there is one that stands out pre-eminently, perhaps because it must withstand such rigorous practical tests daily, and that is "61" Floor Varnish. "61" is heel-proof, mar-proof and water-proof. It is easy to apply and hard to wear out.

The quality of P. & L. Varnish Products has always been their strongest guarantee. Our established policy is full satisfaction or money refunded.

Pratt & Lambert Varnish Products are used by motion pictures, specified by architects, and sold by paint and hardware dealers.

The large country estate requires a high-grade motor mower, such as this used on the property of John D. Rockefeller, well rolled, eliminating all unevenness. For this size lawn a 16" to 18" cut should be used, even a 20" cut would be advisable where the lawn is perfectly smooth and free from bushes and flowers. Do not use a smaller machine unless the lawn is so encumbered with flower beds and bushes that a larger machine could not easily be steered around them.

The plot over 100 feet by 100 feet requires a high-grade mower having driving wheels 10" or more in diameter and a cut of 18" to 20" and four or five blades. On large lawns, roller mowers having 18" or 20" cut with driving rollers instead of wheels are very successful, and may be used on smooth lawns with six blades, which, owing to the great speed of the revolving cutter, leaves the lawn exceptionally smooth and velvety. The rollers keep the grass moderately rolled, keeping down ant hills, etc.

The large country-estate lawn or golf course requires high-grade motor or horse mowing machines, probably both if the estate is very large and a portion of it is too hilly for the motor. The best type large motor mower, weighing about 2,300 pounds, having demountable cutter unit, described later, and seat for operator, is the ideal machine, and should be used...
Wherever practicable. They are about 8 feet long by 5 feet wide over all, the driving rollers are 27" in diameter, and the width of cut is 40". The height of the revolving cutter and the heavy weight of the roller make it all that can be desired for the finest cutting and rolling of the lawn. The high-power motor enables it to cut successfully on hills not over 20 per cent grade. These machines will do the work of three horse mowers at little more than the cost of operating one.

If the size of the lawn be such as to not warrant the purchase of a large motor mower, a small mower weighing about 1,000 pounds will accomplish wonderful results with great speed, and is so far ahead of the horse machine (having a heavier roller and obviating hoof marks when ground is soft) that it is more than worth the difference in price. It has the same width of cut as the large motor and horse mowers, namely, 40", and takes up no more room than the horse mower with the shafts removed. It cuts around shrubbery, trees, etc., with greater ease than any other mower, excepting a hand machine.

This machine speeds up to about four miles an hour, and will operate successfully on 25 per cent grades. Demountable cutter units, described later, are a very important feature of this type of machine, as is also the lawn sweeper, which can be quickly substituted in place of the cutting mechanism and easily accomplish the work of seven men with rakes.

If for some reason a horse machine is preferred, one from 30" to 40" cut having four blades if for coarse grass on uneven ground, or six blades if for fine grass where ground is fairly even, should be used. In purchasing this type of machine, be sure to obtain one having a demountable cutter unit, as it avoids the necessity of shipping the entire machine to the factory should it require adjustment. Extra cutter units may be purchased and kept on hand to insure against the possibility of the machine being put out of commission in the height of the grass-cutting season. This feature is very important and should not be overlooked. If conditions require a narrower cut than 30", a smaller horse mower commonly known as the "pony" type may be had, having a cut of 25". These can also be procured with four or six blades for general use, or nine blades for putting or bowling greens. Boots should always be worn by horses doing this work.

The "pony" horse mower described above is one of the best mowers for putting where ground is fairly even, should be used. In purchasing this type of machine, be sure to obtain one having a demountable cutter unit, with six blades, should be used. The latest types of these machines

up and bow away, grass catchers should always be used. Raking tends to injure the grass, and should be avoided unless used in the form of a lawn cleaner, which is a system of three rapidly revolving rakes that pick up all sorts of litter, leaves, etc., in addition to the grass clippings, leaving the grass standing upright and free from foreign matter. The suction created by the revolving rakes clean the lawn not unlike the vacuum cleaner does the carpet. It is easy to operate, and with one man will accomplish more and better work than four men with hand rakes.—M. B. McKibben.

The Right Way to Grow Seed
(Continued from page 243)

are dead if they do not all come up at once. Out of doors it is impossible to control the weather conditions, although by means of shelter the seedbed may be protected. Indoors the question of watering arises. It is very important to avoid soaking the soil until germination is an actual fact. The best way of all is to have the soil nicely moist at the start, and then, in the event of a fairly quick germination, no further watering will be required. A good plan is to cover the boxes, pans or pots with sheets of glass, admitting air daily. This protection prevents the soil from drying too rapidly. If, on the germination of the seed, it seems that the sowing has been too thick, it is an excellent plan to thin out at once. Of course, the half-developed plants will have to be thrown away, but it is worth while making the sacrifice, seeing that those which are left behind will be much more sturdy than would be the case if they grew for a week or two in a crowded condition.

As soon as the little plants appear on the scene plenty of light is of supreme importance. Making allowance for the shading which may be needful indoors from bright sunshine, young plants cannot be in too light a position. Without light, the green leaf cannot carry out its wonderful business of extracting the carbon from the atmosphere, but in another way a strong illumination is needful. In dark or in shady places plants tend to grow up towards a lighter position; thus they become lanky weaklings which would never yield good results. Light has a retarding effect on actual growth, and thus plants in a light position are sturdy, with strong stems and an abundance of leaves. This augurs well for the future of the plant, and all gardeners should follow the advice of the books, and put their seedlings on the top shelf of the greenhouse. Young and delicate plants will want close watching under glass, especially in the bright days of spring. The sun at these times is very powerful, and unless a certain amount of protection is given a great deal of damage will result. Sheets of paper cast over the pots or pans are the handiest, seeing that these may be ad-

justed in a moment as the need arises. As the sun gets still more powerful it is a good plan to make the paper damp. Sooner or later, in most cases, a time comes when transplanting has to be arranged. Wherever possible, whether in bed or border, it is an excellent plan to sow the seed in the position where the plant is to be. Much stronger specimens, as a rule, result from this method. In a great many cases, however, this cannot well be managed, and one is faced with the necessity of making a shift. A few hints on this point may usefully conclude this article. In the first place, always try to remove as much soil as possible with the little plant. Almost every root tip which is exposed to the air, even for a few minutes, is likely to die, and this will mean a great tax on the energies of the little plant before it can settle down in its new home. So much do some gardeners realize the importance of this point that in the case of many large seeds they sow them singly in thumb pots out of which they can be turned without serious root disturbance. A small, flat piece of wood is very useful for lifting up a little wedge of soil with the roots of the plant. It is best to do the transplanting when the soil is in rather a specially damp state, as then the earth is not so likely to fall away from the roots. Do not keep the little plants out of the soil longer than is absolutely necessary. After putting them into the fresh position press the soil gently around the stem. It is a good thing to plant rather deeply; that is, well up to the first pair of true leaves. This will encourage a stocky growth. Now and again spindly seedlings may be improved if they are put deeply down into the soil. The first few days after transplanting are always rather critical in the life of the seedlings. The chief danger is that the specimen loses moisture more rapidly through its leaves than it can make good by root absorption. At this early stage the roots are still suffering from the shock of the removal. Transpiration from foliage is checked by protecting the plants, wherever this is possible, with glass shades. Where this cannot be arranged, as might be the case in the case of doors, pieces of paper propped up with sticks could be employed to shield the plants from the hot sun. As soon as all signs of drooping are at an end the shelters must be discarded, as once the plant is established, the more light and air it has the better.

In many instances an even better plan than the use of individual thumb pots is to use one of the varieties of ingenious combination flat and paper pots that are being shown. This flat is of strong wood with an inside collapsible crating of stiff paper, dividing it into a number of square compartments, and the bottom is a sheet of galvanized steel that also serves as a carrier. When the plants are grown all one has to do is to put out the bottom sheet and each plant drops from its com-
partment with sufficient soil compact to its roots. With these potting can be done at a custom position, instead of having to get on your knees in frames. Other flats have a side piece that can be removed and the whole block of compartments pushed out on such the work table. Amateurs can make a convenient propagating frame by using one of these detachable side flats, and after planting the seed or small plants, put it in a sheltered spot in the garden. Covering it with a pane of glass of suitable size, you have a perfect little hotbed frame.

Repelling the Pest Invasion

(Continued from page 245)

in April, Bordeaux mixture must be used as a fungicide. This may be mixed with the arsenate of lead and the two applied as one spray. Indeed, it is not a bad idea always to add Bordeaux to any other spray, whatever the latter may be—save the lime-sulphur solution, which is a fungicide in itself without the addition of anything else.

May adds the plant lice or aphids, which are likely to attack anything that grows, to the armies of the invading hosts. Also, it presents for our tender consideration the pleasant, slimy slug-worm—the young of a small, inoffensive appearing saw-fly. The former are sucking insects, the same as the scales; the latter, eating or chewing insects, as all "worms" are. The life-history of each is interesting, but is perhaps not quite so important to the defender of the garden as in the cases already dealt with. Briefly, however, I may say that the aphids generally hatch in early spring, about as the buds are bursting, or a little later; these "stem-mothers," as they are called, bear young in prodigious numbers, their offspring, in turn, giving birth to succeeding generations, up to a ninth and even an eleventh, according to some observers; while others declare their belief that there are twenty generations in a year.

Fortunately, aphids are as easily killed as they are multiplied; yet be not deluded by the lime-sulphur solution, which is a fungicide in itself without the addition of anything else.

Aphids are sucking insects, as all "worms" are. The life-history of each is interesting, but is perhaps not quite so important to the defender of the garden as in the cases already dealt with. Briefly, however, I may say that the aphids generally hatch in early spring, about as the buds are bursting, or a little later; these "stem-mothers," as they are called, bear young in prodigious numbers, their offspring, in turn, giving birth to succeeding generations, up to a ninth and even an eleventh, according to some observers; while others declare their belief that there are twenty generations in a year.

Fortunately, aphids are as easily killed as they are multiplied; yet be not deluded by the lime-sulphur solution, which is a fungicide in itself without the addition of anything else.

Pyrene Fire Extinguishers are included in the lists of Approved Fire Appliances issued by the National Board of Fire Underwriters, and are inspected, tested and approved by, and bear the label of, the Underwriters' Laboratories, Inc.

Boron and Nickel-plated Pyrene Fire Extinguishers are included in the lists of Approved Fire Appliances issued by the National Board of Fire Underwriters, and are inspected, tested and approved by, and bear the label of, the Underwriters' Laboratories, Inc.

THE MOST EFFICIENT FIRE EXTINGUISHER KNOWN

has a HOME USE outweighing its BUSINESS USE, even as a human life is of more value than a factory or a business. PYRENE, recognized by fire engineers as superior on every kind of incipient fire, will protect your home against the greatest of inside perils.

See the Pyrene display in Machinery Hall at the Panama-Pacific Exposition.

OWN AT LEAST ONE

GOOD ORIENTAL RUG

Place it in your living room and give it hard service. You will notice at the end of the year that it grows better looking. Other floor coverings will come and go, but your Antique Oriental Rug lives on.

It is my aim to sell you at least one rug to make you a customer for life. I buy and sell because to do so gives me pleasure and keeps me busy. I will prepare a selection of rugs for you to look over and return, at my expense, if you possibly can.

Send for List of Rugs and Free Booklet.

clawing resistance. Proper methods of cultivation are practically the only adequate means of fighting them, where their depredations extend to grapes and fruit trees and bushes generally. They breed more freely in light soil than in heavy, consequently gardens in such soil are almost sure to be greatly troubled by them. Orchardists plan trap plants about to draw them, anything having a white or light flower being attractive to them. If it is possible to discover just where they are breeding in a given locality, the ground may be saturated with kerosene-soap emulsion with fairly satisfactory results; this, of course, chokes off the larva as it draws near the surface to pupate, and if done in May will destroy great numbers.

July and August it is the same old story carried on. Spraysing for the second brood of the coddling moth are made in each month, while the weekly precautionary treatment against fungi, and the bi-weekly treatment against fungi, and the bi-weekly

vigorous, blooming plants I believe it is decided advise. It is not a difficult task, when one is provided with the proper equipment and the ready-to-use sprays so thoroughly furnished by our friends, the dealers in things for the garden. Without much trouble spraying mixtures can be made at home. Those to use from April on should be mixed in the following proportions:

Arsenate of Lead—Three ounces crystallized arsenate of soda, 7 ounces crystallized acetate of lead, 10 gallons of water. Dissolve the crystals, each kind separately, in a small amount of water. The lead will dissolve more readily if the water is warm. Unite these, and reduce by adding the remainder of the water. A milky mixture will be the result, but straining will not be necessary if the poisons have been thoroughly dissolved and thoroughly stirred with the water. When combining with Bordeaux, use the latter in place of water, instead of clear water.

Bordeaux—One pound copper sulphate (blue vitriol or blue stone) to 1 gallon of water is the proportion for the copper sulphate stock. As much may be made as desired, keeping to this. Prepare and keep in a wooden or porcelain vessel. When needed, add milk of lime made by slaking 2 pounds of lime in 17 gallons of water, to each gallon of the copper sulphate stock. The mixture must not be made till needed, as it loses strength if united and allowed to stand.

Potassium Sulphate—Three pounds potash, 1 3/4 pounds sulphur (as finely ground), 3 ounces salt, 1 gallon water. Mix the potash, sulphur and salt together in a porcelain vessel, with a part of the water. Chemical action will make the mixture boil. Add the remainder of the water. This is the stock, to be put away and kept carefully covered. When the

Have electric light throughout your home, grounds, garage, barns and out-buildings. It is the safest, cleanest, surest and most convenient way of lighting. An effective safeguard against fire also.

The installation of a Kewanee Plant is extremely simple. All expert work is done at our factory. The plant is shipped as a complete unit, ready to run when the crate is taken off. Only two bolts and seven wires, properly tagged, have to be connected.

KEWANESE Private Utilities

like Public Utility Plants, give every city comfort to the man in the country. Work to a plan for your home power plant and get the best and longest service out of what you buy. Our Engineering Department will furnish free a layout or plan for the best arrangement of your Home Power Plant

Portable Fire Proof Garage

Kewanee Plants are made as carefully for private use as the big public generating station is constructed for public use. That is the secret of their successful and economical operation. The first cost of the Kewanee Plant is reasonable and its maintenance is but a few cents a day for the current used. It also furnishes ample current for the operation of Electric Iron, Washing Machine, Toasters, Cooking Stoves or any other household or farm appliances.

You can absolutely depend upon the Kewanee for good daily service and this is guaranteed by us. Semi-automatic switch board. Reliable amere-hour meter which tells condition of batteries. Exide Hyray storage batteries—whole plant assembled on adjustable Kewanee sub-base.

The Kewanee can be operated by the same engine that operates the pump and other household machinery so that your whole Private Utility System may be compact and complete if you install Kewanee Systems.

Vegetable Collection "A"
This contains 15 of our choicest vegetables and will be sent for $1.00

It has proved a great favorite with those planting small gardens, both because of the care taken in the selection and the price, which is considerably less than the several varieties of seeds would cost purchased separately.

1 pt. Beans, Refuge Green Pod
1 pt. Beans, Golden Wax
1 pt. Beet, Egyptian
1 pt. Cabbage, Early Wakefield
1 pt. Carrot, Half Long
1/2 pt. Corn, Early Bantam
1 pt. Cucumber, Imp. White Spine
1 pt. Leek, Best Flag
1 pt. Lettuce, Big Boston
1 pt. Onion, White Globe
1 pt. Parsley, Extra Long
1 pt. Peas, Thorburn's Extra-Early Market
1 oz. Radish, Scarlet Turnip
1 oz. Spinach, Vinday
1 pt. Turnip, Snowball

We cannot make alterations in this assortment for they are packed ready to ship. The price of one dollar includes free delivery. You will find it just what you want for your small garden. Send for it today.

J. M. Thorburn & Co.
53D Barclay Street through to 54 Park Place, New York

Spraying is to be done, dilute 1 part of stock with 100 parts of water, and use. For prompt application, it is simpler to dissolve potassium sulphide (liver of sulphur from the chemists) in water, using 1/2 ounce to a gallon. This solution will not retain its strength, however, and must therefore be prepared as needed.

Soap—Two pounds whale-oil soap to 1 gallon water. Dissolve the soap in the water by heating to boiling point, and put away for stock. Dilute 1 part stock with 5 parts water for use against aphids, slugs, etc. Common laundry soap also makes an effective wash, 1/4 cake to 4 gallons water, used hot, being the proportion.

All of the above, save the last, are obtainable from first-class dealers, in forms to be depended upon and with full directions for applying. It is quite unnecessary to make them, if one prefers to buy ready mixed.

Your Saturday Afternoon Garden
(Continued from page 251)

may be made to help in the work—dibbles, transplanting trowels, the transplanting hoe, and so forth. The various kinds of plants are set at different distances, shown in any planting table (see planting table in this issue). It may be quickly done either by marking off the rows both ways and digging a small hole with hoe or trowel at each intersection, adding the compost and covering it up, making a mark with the head of the hoe to show exactly where it is, or by furrowing out the rows one way with a hoe attachment on the wheel-hoe, crossmarking, dropping the compost and covering it again with the wheel-hoe. Where several hundred plants are to be set the latter method will usually save some time. In setting the plants, get them well down into the soil, but not deep enough to cover the crowns of such things as lettuce, beets, strawberries or celery. Get them in as firmly as possible. Some planters make a practice of walking back over each row and pressing the plants in still more firmly with the feet. If the plants have to be set out in hot, bright weather it is not a difficult matter to shade each plant with a sheet of newspaper, which can be left on for two or three days.

The Seed Border.—One of the tasks which should be attended to early in your garden making—the third or fourth Saturday afternoon of this month, if you are maintaining a Saturday afternoon garden—is to start seeds of things which you will want for transplanting. This will include such plants as cabbage and cauliflower for fall use, leek, summer lettuce, late celery, and so forth. Ordinarily, this

In writing to advertisers, please mention House & Garden.
work, if it is not overlooked altogether, is done by planting the seeds of the several things here and there about the garden where space and opportunity offer. An easier way is to have a small plot devoted exclusively to this purpose, where the plants, being all in one place, can be more effectively watched. If the garden is near the house and convenient to the water supply, the seed-bed may be made up in one corner of it. An empty hotbed or cold-frame will make an ideal spot, or, if neither of these conditions is available, the seedbed may be made on the south side of a fence or wall or the side of a house or shed, which will protect it from the north, and where it can be handily managed. One of the essentials for it is good drainage: and, unless the soil is naturally dry and light enough, a few wheelbarrow loads of light loam should be added to the surface—after it is spaded up. A board set on edge along the front will hold it in place and make a neat-looking job. Such a seedbed can be managed about the same way as a frame, and the plants watched daily, protected from insects and thinned out as soon as they are large enough, and watered when necessary. By the time they are needed in the garden they will be strong, thrifty plants conveniently situated for taking out and transplanting. Very often when they are planted in the garden, and sometimes even when they are in a specially prepared seedbed, the plants are allowed to remain too close together, with the consequence that they crowd each other and grow up tall and spindling. The rows should be made from 6" to 12" apart, according to the size of the seed and the size you expect to have the plants, before shifting them to a permanent position. Another important job to be done late this month, some Saturday afternoon, about four to six weeks before it is safe to plant corn in your neighborhood, is to make use of paper pots or dirt bands to start early hills of cucumbers, melons, lima beans, and, if you wish the earliest sweet corn you ever had, some hills of this also. Dirt bands are simply paper pots without bottoms. They may be packed into a flat which will furnish the bottoms or may be placed on newspapers. The former method has many advantages, as a number at a time may be handled and carried to the field without disturbing them. The 4" or 5" size should be used. Fill with light, rich compost, water thoroughly, and after they have been drained out enough to be friable again, plant in each pot a number of seeds (about half or two-thirds as many as you would put into a hill out of doors of the variety being planted). They should be given a suitable temperature in a frame—the corn, of course, will not require as much heat as others—and protected from insects. The beans and melons should be thinned out to two or three plants a hill when well up.

GARDENLORE

We desire to call attention to
A FEW SPECIALTIES
which we believe we have in larger supply and of better quality than can generally be obtained. Our stock of large specimens
RHODODENDRONS
is unequalled. We grow only the very hardest varieties—those that have been tested and that are thoroughly dependable. We believe we have the largest stock of large specimen rhododendrons in the United States. Our plants have been grown on our own place for a dozen
years or more, so that they are thoroughly acclimated, for which reason they are preferable to newly imported plants.

We call particular attention, also, to our
EVERGREENS
of which we have a fine stock of plants which have been frequently trimmed, transplanted, and root pruned—large specimens 6 to 12 ft. high; Colorado Blue Spruce, of which we believe we have the largest stock in the United States; Juniperus Virginiana glauca, fine pyramidal specimens 4 to 8 ft. high; Juniperus Pfitzeriana, 2 to 6 ft. high; Thuya Standishii, or Sitka Arbor Vittae, fine specimens 5 to 9 ft. high; Taxus cuspidata, broad, perfect specimens 3 to 4 ft. high, etc., etc.

Also elegant plants of the following:
DOGWOODS
White-flowered—one of the most beautiful of trees. 6 to 12 ft. high; Red-flowered, 5 to 6 ft. high.
JAPANESE MAPLES
especially atropurpureum sanguineum, dissecticum—well-grown specimens 4 to 6 ft. high.
HYDRANGEAS
Otakas and new French varieties, grown in tubs and half-barrels for summer-flowering.

ROSES
We make a specialty of winter-flowering roses, particularly the new sorts that we are offering this season. Opheelia and Francis Scott Key, also other new and standard varieties.

Catalogue of "Choice Ornamental Trees and Shrubs" mailed free on application; also other Seed and Plant Lists.

The Dahlia—A Flower That Came Back

(Continued from page 249)

which case no growth will start. All the single dahlias, too, are easily raised from seed sown in the cold frame about March 1st, and when so started the period of bloom is greatly increased. By the early start thus obtained the dahlias raised from seed are particularly fine in form and color. Dormant tubers of double dahlias can be started about April 1st in a coldframe.

When the plant is dead, remove the root; and after drying it store in some cool place until time for the next planting.

The chief use of seeds is the production of new varieties. Seeds are also used by those who chiefly desire a mass of color and are not particularly desirous of finely formed blooms. If planted early enough indoors and transplanted to the open as soon as safe, fine masses of color can be secured before frost, and the roots of the more desirable kinds can be saved, and will give even better results the next season.

The dahlia flourishes best in deep, rich, moist soil, although very good results can be had on sandy soil, provided plant food and moisture are furnished. Clay should be avoided. The soil is not so important except in its ability to hold moisture during severe draughts.

Dahlias are easily destroyed by high winds unless they are given a protected position. They need plenty of air and sunlight for best results. In shaded, close, airless quarters the growth is sappy and the flowers are poorly colored. Moreover, if the best effects are to be had, they should not be planted in clumps, as their brilliance of coloring can often prove a jarring note in the garden scheme.

It is always best to broadcast the manure and plow or spade it into the soil; if the manure is not well decomposed, thorough spading is necessary. On heavy clay or gravelly soils, loose, coarse manure should always be fine and well rotted. Commercial fertilizers are also largely used, and are valuable when used in connection with manure.

Although there is a diversity of opinion as to the proper time to plant dahlias, it is always best to plant early—about two weeks before danger of frost is over. If small roots or green plants are used, do

Every Country Home Needs a
"WALROND"
Boot Wiper

THERE is nothing more disagreeable on the rainy days so common in the Spring than to have mud and dirt tracked into the house and over the floors and rugs.

An efficient boot wiper is the only means of preventing this discomfort—and the most efficient boot wiper is the "Walrond." This device combines metal scrapers with a pair of strongly bristled brushes set at the correct angle to thoroughly clean soles, sides and tops of shoes. No particle of mud or dirt can remain after a few seconds' use of the "Walrond."

It is heavily constructed and will last indefinitely. If necessary, the brushes may be renewed.

Prices of the "Walrond:"

RIPE TOMATOES

Earlier than you ever had them before

No danger from frost, cold winds or late springs when protected with The Ball Seed's Plant Forcer

The Ball Manufacturing Co.
Dept. V.
Glenville, Pa.

Makes any kind of seedling plants grow in the open garden just the same as if under hothouse sash. Clear enough to use with the L1000. Private and market gardeners talk it over in the hothouse. It's the only rep that will protect the plant from the cold damp air. A fine catalog. It's a compendium of many new and wonderful inventions for the up-to-date gardener. You'll be glad you sent for it.

The Ball Manufacturing Co.
Glenville, Pa.
not set out until later. A good rule to follow would be to plant small roots and green plants as soon as the danger from frosts is passed, and large roots about three weeks earlier.

During its early stage of development, the dahlia grows very rapidly, and should be kept thoroughly tilled. But, while deep tillage is beneficial during the early stages of development, it is almost fatal to the production of flowers if practiced after the plants come into bloom. Therefore, when the plants commence to bloom, cease deep tillage and stir the soil to the depth of one to three inches only, but stir it often, and never allow the surface to become hard and baked. This will not only prevent excessive evaporation of moisture and keep the undersoil cool and moist, but will also prevent the destruction of immense quantities of feeding roots.

As long as the roots supply more nourishment than is needed to support the plant, both the plant and the flowers increase in size and beauty; but as the supply gradually becomes exhausted the plants cease growing and the flowers become much smaller. This condition is generally called "bloomed out," but it is really "starved out," and can easily be prevented if the proper attention is given to the plants. As soon as the flowers commence to grow smaller, broadcast around each plant a small handful of pure bone meal and nitrate of soda, in proportion four parts bone to one part soda, and carefully work it into the soil.

In planting the roots or tubers, place them on their sides with the eye as near the bottom as possible; cover only two to three inches deep. As soon as the shoots appear, remove all but the strongest one, and pinch out the center of that one as soon as two or three pairs of leaves have formed, thus forcing it to branch below the level of the ground. As the plants develop, the soil is filled in gradually by subsequent hoeings. By this method the entire strength of the root and the soil is concentrated on the one shoot, causing it to grow vigorously; while the pinching back not only causes it to branch below the surface of the soil, and thus brace it against all storms, but also removes all of those imperfect, short-stemmed flowers that appear on some varieties. If the plants are pinched back low, as described, there is no danger of the branches splitting down, as the soil around them will hold them securely in place.

As soon as the plants are killed by frost, lift the roots, and, after removing all the soil possible from them, allow them to dry in the air for a few days under cover, when they should be stored in the cellar or some other cool place secure from frost and yet not warm enough to start premature growth. This gives the tops chance to die down before they are cut off, while the clinging soil falls away readily. If the cellar is very dry or is not frost-proof, put the roots in a barrel or box.

In Grandmother's Garden

(Continued from page 241)

our play. What does a city child do today without the charm of a garden? Even the “pin-a-poppo show” has passed away. One never hears of it now, but we who pasted the lovely bright flowers and leaves on paper and covered them with glass can still remember the thrill experienced when in response to the invitation “A pin, a pin, a poppy show—Give me a pin and I’ll let you know” the wonderful show was uncovered. Then followed such gasps and expressions of admiration! No, the modern child knows nothing of the real pleasure of a garden.

Of course, we must have done damage to many things in Grandmother’s garden, but if we did she was kind enough to overlook it all. She must have known that many of the morning glory buds failed to open. It was such fun to take firm hold of those pointed buds and pinch and hear them pop.

Our playhouse was out under the apple trees. Never was there more wonderful housekeeping nor more varied and original meals. The garden furnished everything, even much of our clothing and adornment when we really “dressed up” for dinner. The lilac leaves pinned together with their stems make most charming caps, belts and aprons. The flowers of the lilac were equally useful. One blossom put into another and another and lo! a lovely chain was formed from the larkspur blossoms and from the dandelion stems. The latter were always popular, since the work of making a dandelion chain was more speedily accomplished. We loved the dandelion curls and stout stems made charming caps, belts and earrings for ear rings, we felt that we were dressed for any swell occasion.

Our Grandfather always had corn in his garden—the blue, sweet corn. Whenever I see it I recall the day when Grandmother entertained a very stylish city friend. It was in the day of the bang, and when we children beheld this fashionably-dressed lady with a straight bang of blonde hair covering her forehead, we gazed in amazement at first, and then flew to Grandfather’s cornfield. The corn was just right for it, the silk the exact shade. It did not take us long to arrange it on our heads in an up-to-date bang; and at dinner we appeared a little self-conscious, perhaps, but well satisfied with the style of our hair dressing.

On our table in the playhouse, spread with a cloth made for our use, we served most remarkable meals. We had few dishes; but what of that, when leaves made adorable plates and platters and even cups in an emergency! Jack-in-the-pulpit flowers served as pitchers; little thorns from the thorn apple trees made splendid forks, and such a lot of things we found to eat!
The leaves of the sorrel and nasturtium with berries of the wild strawberry made our salad and our tea was either of mint, caraway or catnip. In cherry time a dish of the red cherries, piled high on a pie-plant leaf, served as centerpiece and dessert. The robins spoiled us when we picked the cherries and the orioles were always in the tree when it was in flower as well as in fruit. Because we loved the birds and hesitated to disturb them we really did not get as many cherries as we longed for.

Another delicacy on our table was the cheese from the hollyhocks, and we found that nothing was more decorative than a pretty green leaf piled with berries from wahoo, bittersweet, elder, Tartarian honeysuckle, mountain ash, dogwood, snowberry and the little black seeds from the tiger lilies in the fall.

Do girls to-day know that hollyhocks make lovely dolls? Turn down some of the petals, tie them, and an elaborately lady-like is the result. The foxglove and trumpet flowers exactly fitted our fingers, and we wore them often as gloves.

When the Canterbury bells were in bloom we used to watch for the bee to crawl into the bell of the flower and then pinching the end: what a thrill went through us as we felt him buzz and beat and try to force his way through the bursting side! I remember doing this once too many times, and the flowers were never again disturbed by my fingers.

The long needles of the pine made fine things to sew with, and were ever bags more adorable than those we made by pinching the tips of the needles of the live-for-ever? The queen of the meadow grew in this garden; marigolds were there and the mourning bride (the pincushion flower) and the garden heliotrope (valerian). The cats always liked to roll in this, and how they would scratch at the elder bushes!

We buried many a pet canary under the lilacs. Elaborate preparations were made for these burials, to which all of the girls were invited (not the boys, for they laughed at us). Into a pretty little thread-box, lined with ferny leaves, the bird was tenderly laid, and over and about it we tucked the sweetest flowers. Then the cover was put on and our choicest larkspur wreath was laid upon it; then the sad little procession; the digging of the grave and its covering, and we were ready for the song. Above us we heard the laughter of the marins, the glad note of the orioles and the happy flight song of the goldfinch. Wrens were chirping up the leaves of the orioles calling. In a way we resented all their songs of happiness. We loved best, that day, the little pewee and his plaintive call. We sang the same song at every burial. There was no partiality shown. Possibly the song was not at all appropriate, but these words came from sorrowing hearts.

**Salpiglossis**

(Orchid-Flowering)

as illustrated on the front cover of our Catalogue, is a favorite with those who have become acquainted with this delightful annual.

The orchid-flowering strain branches freely from the main stem, forming a spreading plant, flowering from all branches, making it invaluable for cutting.

Following are a few of the popular varieties:

It tells all about the proper method of finishing doors, windows, and floors. Also how to make your own hanging wall spaces. It will help in beautifying the home—new or old.

**Johnson's Wood Dye**

Come In! 17 beautifully illustrated colors. Makes colors with wood as artifices on bare woods. If you are interested in building we will send you a $100 Portfolio of Wood Panels, showing all popular woods finished with Johnson's Wood Dyes. Remember, Johnson's are the genuine article. All colors are Fine and Permanent.

Take this ad to your dealer—or write.

S. C. Johnson & Son, Racine, Wis.

"The Wood Finishing Authorities"
“Brother, thou wert mild and lovely, 
Gentle as a summer breeze; 
Pleasant as the air of evening, 
As it floats among the trees.”

Not remembering the words of the other verses we sang the first one over and over until we felt that due respect had been given the little bird we mourned.

In the fall great golden balls hung from the porch—fruit of the gourd vine. Nothing could have made prettier balls for our games. When the evening primroses bloomed “with a silken burst of sound” we watched them in the twilight, listening ever for the sound that we hoped to hear as the yellow petals popped open. We never heard it, and neither were we able ever to light the gas on the seed pods of the Fraxinella. Both of these things, we decided, were fables gotten up by the older people to please children.

There was a witch hazel bush, however, that always delighted us. After all else had gone, out in the garden we would find the spidery little blossoms of this bush, and never was a fall complete until we had taken into the house some of its branches. It was not the flowers that fascinated us. The heat of the room made the seed pods expand, and how the hard little black seeds would snap and shoot around the room!

Grandfather once sat reading his paper when this cannonading was going on. He finally looked up from his reading and remarked that he supposed the house was old enough now so that its walls were entirely settled, but evidently not. We children knew what made the cracking noises, but we didn’t tell.

Really, the sweetest part of Grandmother’s garden was down by the Persian lilacs. She called it her “garden of sweetness.” In it grew such fragrant blossoms. There were mignonette and violets, valley lilies, tuberoses, lemon verbena and lavender. Wall flowers bloomed there and heliotrope and sweet peas. A few plants of rose geranium were carefully tended, for Grandmother used the leaves in many ways. We often played near this garden, especially when the valley lilies were in bloom, for we loved their fragrance best of all.

Yes, a “garden is a lovesome thing, Got wot!” and the memory of such a garden was in my mind before making up your spring list.

Do you have trouble finding time for garden work? Possibly that’s because you don’t parcel out your time systematically. Glance over “How to Find Time for Garden Work,” in next month’s House and Garden.
Efficiency in the Flower Garden
(Continued from page 267)

engaged to plan a house, if he should look-through a lot of builders' catalogues and select ornamental doors, the newest wall papers, paint, lighting fixtures, plumbers' supplies, tiling, trim, finishing, and shingle stains, and having got his materials together, should then attempt to construct the houses. Of course, he goes at it the other way round. That is the attitude of mind you should try to get in garden planting.

But the contractor's job, however, is no less important than the architect's. After you have turned all these things over in your mind carefully and finally made your selection and sent in your order, it is just as important to know how to handle your plants to give them every chance of success. Many hardy perennial shrubs may be effectively used in small groups or clumps or even as individual plants, but far more often they will be used in the mixed hardy border or bed. The success you may have in growing hardy plants will depend more on anything else upon the thoroughness with which the border for them is prepared. Most of them will grow, some of them will thrive, in ordinary, good, rich, garden soil. But to make sure of success, and to make sure of the best results, the border should be trenched to a generous depth its entire length. This is particularly necessary if the soil is at all wet or heavy or is poorly drained. There is but one way of doing it properly, and that is by getting right at it and making a man-sized job of it. An hour or two of putting about with a spade or a fork, with your collar on, will accomplish little in this direction. The making of a border is a day's work for a couple of men used to handling pick and shovels—and in a very hard or stony soil, or for a generous-sized border, it may take them longer than that.

First of all, stake out the outlines of the proposed border. Then have it excavated to a depth of two or three feet, throwing all the sods and top-soil to one side and the stones and subsoil and roots to the other. Any stones or coarse gravel may be saved for drainage material. If there are not enough of these, as in most cases there will not be, coarse, cold cinders, or brick or mortar will do, and put in a layer several inches thick. Cover this with the sods removed from the surface, and replace them upside down. In place of soil a little straw or manure may be used—anything that will keep the dirt as it is thrown back in from packing down closely into the drainage layer. On top of this put a layer of compost a foot or more in depth, enough to come within six inches or so of the top of the trench. This compost may be made of garden soil, a good, heavy loam being preferable, and manure mixed about half and half with a generous sprinkling of bone through it. The top six inches or so of the trench...
TOWNSEND'S
TRIPLEX
LAWN
MOWER
(PATENT PENDING)

The Greatest Grass-Cutter on Earth, Cuts a Swath 86 Inches wide.

Drawn by one horse and operated by one man, the Triplex Mower will mow more lawn in a day than the best motor mower ever made, and cut it better and at a fraction of the cost.

Drawn by one horse and operated by one man, it will mow more lawn in a day than any three other horse drawn mowers with three horses and three men. (We guarantee this.)

Floats over the uneven ground as a ship rides the waves. One mower may be climbing a knoll, a second skimming the level and a third paring a hollow.

Does not smash the grass to earth and plaster it in the mud in springtime, neither does it crush the life out of the grass between hot rollers and hard, hot ground in summer, as does the motor mower.

Write for catalogue illustrating all types of lawn mowers with list of users. (Free)

Dreer's Dahlias

We offer and fully describe in our Garden Book this season three hundred and forty-eight of the choicest New and Standard varieties, which include all types and colors of this favorite Fall flower, every one having been carefully tested and found desirable. If you have never grown Dahlias you should begin by getting our Six "Incomparable" Dahlias for Garden Decoration, for $1.25

Or send for a copy of our Garden Book free and make your own selection.

HENRY A. DREER, Dendrificer

should be filled in with good, rich loam, rounded up well all the surface, but flat enough so that water will not run off to the edges. Allow for the setting of the soil, which will amount to two or three inches before the season is over. Both compost and soil, as they are put in the trench, should be made fairly firm with a good packing down, not hard enough to make the soil hard or lumpy.

Before you begin to set the plants, you should have a plan showing exactly where each should go. Then take a section and arrange the bed, and arrange these clumps in order ready to plant. It is better to do this rather than to begin planting one by one. Do not expose the plants to wind and sun any more than possible during the operation of plant setting. If the soil is at all dry, water may be used under each plant as it is set. But usually at this time of the year this will not be necessary. The various plants should be set slightly deeper than they have been growing before; or if they are from pots, an inch or so above the ball of earth. Plants that have been kept wrapped up and boxed and kept from the light for several days should not be immediately exposed to the strong sunlight. If they show a tendency to wilt, shade for the time being with papers, plant them as the sun begins to weaken in the afternoon. If dry weather follows and the beds require subsequent watering, before the plants become established, use a fine spray and go over the bed several times until it finally becomes thoroughly saturated. The careless use of the hose on a newly set border may do considerable damage by washing and packing the soft soil. The plants should be set in as firm as you can possibly get them. If there seems to be danger of pushing them too far down, then the soil in the bed has been left too loose.

The border already established, and individual plants or clumps about the ground should come in for their share of attention in the general spring "cleaning up." Beds that are still in good condition should be forked up after the winter mulch has been taken off and a dressing of manure and bone meal worked into the ground around and between the plants as thoroughly as possible. This should be done quite early, before new root growth and activity begin. Root pruning, even though quite severe, while the plants are semi-dormant, will, with most things, do little or no injury. Around lilies, bulbs, iris and other things out of the ordinary root formation one must be reasonably careful. Hardy plants that have begun to crowd, either in clumps by themselves or in the mixed border, can be taken up, divided and replanted and shifted to other positions. If you need more plants than you have, each clump or crown will usually make from three to six good plants. If your garden is already well supplied, take one or two of the best pieces or "crowns" from each plant and dispose of the others to your less fortunate friends.
**Gives a Grecian Touch of Beauty to Concrete**

Artistic effects in concrete and stucco are made possible by the use of Bay State Brick and Cement Coating in white or in color. This coating enables you to paint out the dull blue-gray of cement without losing the texture of the material.

**BAY STATE Brick and Cement COATING**

also means absolutely waterproof walls. And waterproof walls mean dry interiors.

It is equally desirable for interior finish of bungalows, factories, office and other buildings of heavy design.

*Our booklet 2 tells what this coating is and gives the experience of home builders. Send for it—it's free. Ask for color card.*

More Seed-Sowing

By the time the March seed-sowing is over and one draws a long breath, April is here, and more seed must be planted whether one wishes to do so or not.

First come the asters. The tribe has so increased that it is most difficult to decide which of the lovely varieties one would rather have, since it is not possible for most of us to plant them as Wordsworth saw the daffodils and Mrs. Elly has the asters ten thousand to a summer.

Because mid-summer blossoms are rather scarce in the South, the early varieties are desirable, and, of these, the best are the “Queen of the Market” varieties in pink, white and lavender. The blossoming time of these is later in the South than in the North and East, where it is not so warm, but they may be counted on for August blossom. The Crego Giant Asters furnish the handsomest blooms of all, and come in September, while the real fall blossoms of the Late-Branching kinds should by all means be planted. If space is limited, white for the early varieties, lavender for the mid-season, and pink for the late bloom, would give color variety as well as succession in bloom. They should be planted in the open where they are to flower, and thinned out, if necessary, later on.

Seed of white and blue ageratum sown now in the open will make masses of color from late summer until frost. They are largely planted in the gardens of those who leave their homes in summer and seem to welcome the owners on their return as heartily as if they had received unremitting care.

When there is room in the background, along walls or fences, or boundaries, for masses of tall flowers, Cosmos and Dahlias should be planted. The new varieties of Cosmos, early Large-flowering, Lady Lenox, and Mammoth Perfection, are offered by all reliable dealers, and should give fine results, both for flowers in quantity for cutting and for masses in the borders.

There are many varieties of Dahlias, in single and double, in frilled and quilled, mammoth and dwarf, which come to bloom in the fall from seed sown in the open this month. They are like the “prize-boxes” which allured in childhood days, you never know what you are to get until blossoming time. This is fatal to a color scheme, but flowers are usually growing fewer about the time the dahlias bloom, and among the brilliant green tones of the foliage they do make bright clouds of color among the more somber tones of autumn.

The most important: seed-sowing of
Don't expose your family to draughts, cold and dampness.

FRIENDLY RUSSIA

By Denis Garstin
With Introduction by H. G. Wells

Mr. Garstin in these intimate well-observed sketches of rural villa, cottage and town life pictures for us the extraordinary kindliness, peacefulness and friendliness of Russians at home.

McBRIDE, NAST & CO. : New York City
April is that of the perennials, which germinate only while cool days and cooler nights are felt. The seed-bed should be prepared in a partially shaded situation in an unobtrusive part of the garden. The soil should be porous, rich and deep, and the seed sown in rows, clearly marked as to variety and color.

By the middle of August the plants may be transplanted into the places where they are to remain permanently, or else they may be removed to temporary quarters to wait for final transplanting after the summer flowers are cleaned out and the borders enriched for the winter bloom.

This sounds a little romantic, but, as I write this in mid-February, the Delphiniums are showing color in their buds, the Digitalis have flower spikes several feet tall, the Campanulas are beginning to send out their new leaf stalks, Platycodons are growing, Wallflowers are budding, and Aquilegias are strong and vigorous, getting ready for April bloom. From April seed-sowing to spring bloom of the next year seems a long time to wait, but these perennials' bridge so beautifully the gap between the real winter flowers and the annuals, which cannot be counted on until late spring or early summer, that, if for this reason only, they should be in every garden. But they are in themselves so daintily exquisite, so pure in color, with heavenly blues rivaling richest orange, with golden yellow facing clear amethysts, with tall flower spikes in the border back, and dainty masses of snow in the foreground, that they should be planted wherever there is a garden, a gardener-taker and a garden-lover.

As to the varieties to be planted, there is not such a wide range of choice as in most of the annuals. Of the Aquilegias, the Caerleia, the Rocky Mountain Columbine, the Crysanthem, golden-yellow, and the Nivea grandiflora are the most attractive and beautiful. The red tones are often not pure in color and do not mix well with the clear blues, and for this reason the above-mentioned ones are preferable. The Campanula hybrids are grown by many with satisfactory results.

The lovely Campanulas in both dark and light blues, in white, and a delicate rose, are so delightful in the garden, such a bright spot of color in the shadows of the garden picture that no one should fail to plant them. Both the Campanula Medium, the single Canterbury Bells and the Calycanthemum, the Cup and Saucer variety, are strong and vigorous, get flowers are cleaned out and the borders enriched for the winter bloom.

If you expect to buy a piano or player piano it will pay you to get the beautiful Golden Anniversary Booklet that we send without charge. It will help you to avoid disappointing purchases and waste of money. Detach the coupon printed below and mail it today.

Send $2 for this everlasting birdhouse

Made of genuine Wheatley Pottery in beautiful rustic effects, Imperishable, weatherproof, cheaper in the end than wood. Attached in a jiffy; never requires further attention. Scientifically constructed to attract birds. You never regret giving your feathered friends a home.

**Beautiful Wheatley Bird Bath**
Give to your garden or lawn a touch of old Italy in this lovely piece of old ivory tint pottery. Home made, scientific in design, and scientifically constructed to attract birds. You will be satisfied with your purchase. Satisfaction guaranteed or your money back.

**The Wheatley Pottery**
2427 Reading Road, Cincinnati, O.

**GROWN ON NEW LAND**
Strawberry plants, growing conditions, and directions for planting. If you have a garden, you’ll want to know the secret of maintaining your electric car. Ask for this valuable information. 

**‘DOMES OF SILENCE’**
Make your furniture glide. Save rugs, carpets, floors and your furniture. Look for the name inside. Domes of Silence Company, 12 State St., New York.

**Wheatley Pottery**

---

**YOUR GARDEN**
Will never be a disappointment if you plant and work it with tools like these—the operator walks upright, the seeder walks accurately in drills or hills and with the cultivator points, side boxes and plows you can do more in one hour than in a whole day the old way. Result, a much better garden and more pleasure in it.

**IRON AGE Garden Tools**
give you a large line to choose from.

The Goodrich Tire, like the trained athlete, is all brawn and muscle—no fat

IT was their only "come-back." They had to say that, in stripping down prices to the point where they were fair to dealer and consumer and left no room for injurious price-cutting tactics, we had stripped our tires of some quality, too.

THE Goodrich Tire, like the trained athlete, is all brawn and muscle—no fat. It represents an achievement—the ability to cut out the extra costs of manufacture, the extra costs of labor, of extra, needless material, and to give you the best, long-mileage, high-standard tire in the world. There are padded tires as well as padded price lists. Don't pay for padding.

Now don't forget this—we are talking in the main about Goodrich Safety Tread Tires, for they represent ninety per cent of our factory output for results.

Furthermore, while we have put the padded prices on smooth tread tires on the run, the evil of padded prices on non-skid tires still is in evidence, as shown in table below:

How France is Governed

In response to widespread demand, this new edition of President Poincaré's vigorous and authoritative book has been prepared especially for the students of history and politics, for the traveler and all the lovers of things French.

"Indispensable to the student of politics."—N. Y. Times.

"For the American reader anxious to obtain a good working knowledge of the complex machinery which supplies the motive power of the French Government, M. Poincaré's book has much of value that "Bryce's American Commonwealth" had for Englishmen."—N. Y. Sun.

high, do not try to bring it down by a border; carry the picture moulding, if there be one, all the way up to the cornice or angle between the ceiling and walls.

Floor coverings in any hall, of whatever type, should be quiet and neutral in tone. The furnishing of the hall is an exceedingly important matter. Let simplicity be the guiding principle in the choice and disposition of furniture and the adornment of the walls. In the long, narrow hall, the less furniture the better. It will be quite enough if there is a table (for a card salver) and candlesticks—the Victorian hat rack of whatever species should be absolutely taboo—and a chair against the wall at either end of the table. Above the table may be hung a mirror, a suitable picture or girandole, flanked by sconces, which will give the necessary decorative distinction and will be quite enough to furnish the hall for all practical purposes. Put the card salver and a couple of candlesticks or acceptable Oriental vases, mounted on teakwood stands, or some simple but elegant similar bit of bric-a-brac on the table. If a table is not placed against the wall, a chest may be used instead. In the well-lighted long gallery traversing the face or rear of the house, a sort of long hallway adopted from English models and now much in favor, one may appropriately range a great deal of furniture along both sides. In the hall of ordinary width, of course, there is a great deal of possibility to introduce other appropriate pieces of furniture, such as chests, chairs, lowboys or highboys, sofas, mirrors—in fact, any piece of furniture that stands against the wall and may add to the decorative attractiveness of the hallway. It is important, however, to see that not too many objects are placed in the hall, so that it will be crowded or lacking in the aspect of roominess. Hats, coats and umbrellas should always be kept out of sight and a place should be provided for them in a closet conveniently accessible.

Let the wall ornaments be exceedingly few but well chosen. Do not make the hallway a picture gallery or hang anything there that may detract from the air of elegant simplicity. It will be well to study effective groupings of furniture for a broad hall, such as a table with a pair of candlesticks, a table or lowboy with a pair of candlesticks and a china bowl upon it, and above it a mirror or girandole or hanging sconces. Such furniture grouping needs careful thought to make it thoroughly effective.

In living-room hallways there are almost always suitable opportunities for building in locker seats or settle and window seats. Oftentimes this arrangement can be effected in conjunction with the construction of bookcases. In halls of this description a great deal of paneling can be done in connection with the built-in furniture and the balusters of the stairway with excellent results.

The Water Supply for Suburban Homes

The suburban dweller, or often the family living in the small cities and towns, is confronted with the problem of a water supply. The majority of cases are difficult to solve, because of the supply being hard water. Hard water of itself for many purposes is all that can be desired. But there are limitations to its use, and among the important uses to which it cannot be put are those of bathing, washing and cleansing. As these are important factors of daily living, and as they center about the sanitary and hygienic possibilities of the home, it becomes a topic of magnitude and one that should be solved wherever possible.

Water is hard for several reasons, primarily because of the presence of soluble and insoluble solids of lime, magnesia, iron and some forms of aluminum. These solids are divided into two distinct classes. The first is that which is soluble in water itself, and the second, that which is only soluable when carried down and is present in the water. To make this clear, we find that the sulphates, chlorides of lime, magnesia, iron and aluminum are solids that are detrimental to the water; inasmuch as they constitute its hardness. Then, all but the latter minerals are held in solution as bicarbonate.

These are present also where the carbon dioxide gas exists. Now, the condition of the water that we know as hardness is made possible from the fact that the water in passing from its source penetrates through these various formations, and by its very action takes up some portions of these minerals.

We all understand that with but few exceptions cistern (soft water) is not fit for drinking purposes. Even then there is a feeling that it is not pure, and there are many times more than an idle notion present to substantiate it. If we can make the hard water pure by a simple process, and if we can also make the hard water soft, and also insure its purity, there is little left to be desired. Even if we have a supply of cistern water on hand we desire that it be clean and free from the impurities that could become a menace to our health. It is a fact that the body absorbs at least some portion of the impurities in the water where such are present, to a marked degree, a danger not always apparent.

Even where the cisterns are cleaned out frequently there is danger from the use of this water. But many times this is not done and the danger is thereby increased. Stagnant water is full of germ life that is a health menace. There is a simple process now that insures pure and soft water. This cannot be done by the addition of powders or other means that have been in vogue for years. There must be a more powerful means for the removal of these elements.

To do this there have been devised plants that can be purchased and installed...
THE ultimate value of a trade-mark, and of the advertising of a trade-mark, depend absolutely upon the merit of the goods which bear the trade-mark. Therefore you may depend upon it that when a manufacturer brands his goods, thereby identifying them, and then advertises their identity, he is going to put merit into them. He knows that if he doesn't, his first sales will be his last. The consumer may buy the first time on advertising, but he buys the next time on satisfaction or not at all.

The trade-mark makes it as easy to avoid the unsatisfactory as to re-purchase the satisfactory. Therefore the presumption of excellence is always in favor of the trade-marked, nationally advertised goods as against the unbranded article of uncertain origin. The trade-mark of the known, established manufacturer is for your protection as well as his. In fact it is only because the trade-mark protects you that it is profitable to him. Trade-marks and national advertising are the two greatest public servants in business today. Their whole tendency is to raise qualities and standardize them, while reducing prices and stabilizing them.

Poultry Work for May

THE first of this month is not too late to buy day-old chicks, especially those of the smaller breeds, like the Leghorns and the Anconas. Even Plymouth Rocks and Rhode Isolocks may be hatched into laying in November if they are grown rapidly. This is a good month to hatch bantams, which are much in favor among fanciers. It is hard to raise bantams in cold weather, but easy when the weather becomes settled and warm.

From now on turkey hens may be allowed to sit on their own eggs. Young turkeys must have shade on warm days and should be kept confined in the morning so long as the grass is wet. Duck eggs run very fertile this month, and it is not too late to hatch Indian Runners, which will lay early the coming year. For a month or two previously to Easter duck eggs sell for from ten to fifteen cents more than hen eggs. When duck eggs are being set it should be remembered that twenty-eight days are required to incubate them.

Before the incubator is put away after the last hatch, it should be thoroughly cleaned and disinfected. It is a good plan to let it stand for a few hours where the sun can flood the egg chamber.

Wireless brooders can be used to advantage at this season. When outdoor brooders are used for very young chickens they should be set under trees or protected from the sun's rays by some artificial means. Otherwise it will be difficult to maintain an even temperature in the hover. If an electric current is available, the new electric brooders will be found exceedingly convenient, reducing the work of management to a minimum. Usually it is possible to get special rates on a heating basis.

It is useless to keep any male birds at a reasonable figure. There are several of these systems, the varying price being due to the amount of water desired every twenty-four hours. There is a double tank that receives the water in its natural state, and after passing through the first, or receiving tank, is permitted to flow into the storage tank, ready for use.

The supply of soft water is drawn from the bottom of the tank, where there has been provided a quartz filter, thus insuring an added purification after the water has been softened. What is known as the precipitating tank is supplied with a funnel bottom containing a flush-out valve. The treated water passes through the center reaction tube of this tank and the residue is permitted to pass into a pan or any other outlet. One can see at a glance the mineral substances that have made the water both hard and impure. There is an automatic feed-box and a regulating mechanism that controls the supply of chemicals to be consumed in making the water ready for use.

WARFIELD WEBB.

A New Volume in the HOUSE & GARDEN Making Book Series

MAKING WALLS AND CEILINGS
By H. D. EBERLEIN
Author of "House Furnishing and Decoration," etc.

Mr. Eberlein has contributed a new volume to the "Making Series" which discusses all types of ceilings employed in the best American examples of home architecture. He describes the various kinds of wall treatment, including all the various modifications of paneled, plastered, rough plaster walls, pseudo paneeling and lattice work.

Size 4½x6½ inches. 50 cents net. Postage 10 cents.

around after the breeding season is over, unless, to be sure, they are good enough to carry over to the next season. It is advisable, also, to sell off whatever old hens may be left as fast as they stop laying, and sometimes it is just as well to get rid of the younger birds from now on when they become persistently broody.

Hawks, rats, skunks and marauding cats do a great amount of damage at this season. When the chickens are on range the hawks are likely to get many of them, and light-colored chickens are more often the victims than those which have darker feathers. It is a help to have piles of brush to which the chickens can flee when danger threatens, and if a few guinea hens are kept on the place they will be certain to give warning when hawks appear. When carefully shut up at night the chickens are safe from skunks and a brooder house may be made rat-proof by means of a vermin-proof door. Thieving cats are a great nuisance in many sections and hard to deal with. Usually the right kind of dog will secure immunity, but occasionally it is necessary to trap the cats.

If there is plenty of grass the chicks will need no other green ration early in the season, but after a time the grass will become too tough for them. Lettuce and other garden produce may be fed, but probably there is nothing better to grow, especially for the poultry, than dwarf Essex rape. It is ready in a few weeks from planting, and if only the leaves are broken off the plants will continually renew themselves. A spring planting and another in July will give green food all summer. Rape seed may be sown broadcast, but it is better to grow the plants in rows and to keep them cultivated. Tall Scotch kale planted now will give an abundance of greens in late fall, long after the frost has cut down everything else in the garden.

It is poor policy to keep chicks of different ages together or to let chickens and ducks run in the same yard. The big chickens will crowd their weaker brothers and sister and the ducks will foul the drinking water. Of course, it does not matter much if flocks are mixed when there is plenty of range, provided that the smaller and weaker birds are allowed to

HOW TO BUILD, STAIN AND PRESERVE ALL TYPES OF FLOORS

Making Floors by ABBOTT McCLURE
Author of "Making Built-In Furniture," etc.
A New Volume in the "Making" Series

The book describes and illustrates by half-tone pictures and diagrams the construction of parquet floors and composition floors; the proper staining of the wood to harmonize with the decorative scheme, the adaptation of cement floors to special requirements, waterproofing the bathroom floor and other special problems.

Size 4½ x 6½ inches. 50 cents net. Postage, 5 cents

McBRIDE, NAST & CO., Publishers, Union Square North, NEW YORK

In writing to advertisers please mention House & Garden.

obtain their share of the grain. This can be arranged for by making a coop with slatted sides, the slats being placed too close together to admit the larger members of the flock. If fed in this shelter the less robust youngsters will be able to eat in peace.

There is a distinct advantage in housing the chickens in small lots after they leave the brooders. They are sure to pile up in the corners, and if there are many birds, those at the bottom of the pile are pretty certain to suffer.

It is necessary to repeat previous warnings about the coming of the ubiquitous chicken louse. These pests multiply with astonishing rapidity. In the course of a few weeks one pair will have increased to thousands, unless something is done to keep them in check. Whitewash and kerosene and lice powder serve useful purposes, but nothing is so economical of time and labor or so effective as a good prepared lice paint used freely on perches and coops and in the nest boxes. Applied once a month it practically means freedom from the invasions of the red mites, which often appear at this season in countless numbers and which, if unchecked, spell sure disaster.

As eggs are plentiful and cheap at this season, it behooves the thrifty housewife to preserve a considerable number in anticipation of the lean days sure to come in early winter. Undoubtedly the best preservative is sodium silicate, commonly called water glass, and obtainable at any drug store. It should be used at the rate of one part to nine of water. Probably the best receptacle is a stone or earthenware crock, which should be set in a cool cellar. The eggs should not be over three or four days old, and it is desirable, although by no means necessary, to have them sterile. When they are in the crock those at the top should be about two inches under the surface. A gallon of water glass, costing 50 cents, will be sufficient for 60 or 70 dozen eggs, and will keep them remarkably fresh and good for six months or longer.

For the Intending Dog Buyer

In buying a dog, the first point to be decided is, of course, the breed. Look about and pick up all information possible concerning the different standard types; learn the peculiarities of each and how they will or will not fit in with your particular tastes and requirements. When you have found a kind that you think will suit, get in touch with one or more reliable breeders (most of the best breeders advertise quite extensively, and so can be readily located), and see what they have to offer.

If possible, arrange to see the dog before definitely closing for him. Look him over for such possible defects as deafness, poor eyesight, canker of the ear, etc. He should (and will, if you go to a breeder
who has a reputation to maintain) be sound and in good health. Notice his disposition, too, for a dog should "fit" his owner as comfortably as if he were a pair of shoes or a hat.

If you cannot see the dog before buying, and consequently have to make the purchase by correspondence, write the breeder fully as to what you want. State the desired age, sex, approximate price and purpose in regard to the last item, it will be well to remember that dogs may be divided roughly into three classes: working dogs, such as terriers, to be used for hunting, etc., bench-show dogs, and general companions.

The matter of age is deserving of considerable thought. Fully matured dogs are apt to be set in their ways and do not become as attached to a new home and master as do younger ones. Very young puppies, on the other hand, are subject to various minor disorders which often cause considerable worry and trouble. Where the purchaser is more or less experienced in raising young puppies, and has time and facilities for it, I might advise his getting a seven- or eight-weeks' old pup, because such a one will be less expensive and his character may be more readily molded along desired lines. For the average person, however, a pup of seven or eight months old will generally prove the most satisfactory investment.

When it comes to price, there is little to be said except that good, well-bred dogs cost real money and are worth it. "Blood tells," whether it flows in the veins of a man, horse, or dog, and when a supposed-to-be good dog is offered you at a very low price, look out. It is better to pay twenty-five or thirty dollars for a sound, well-bred pup of eight months and know what you are getting than to pick up a misrepresented "bargain" for one-fifth as much.

In considering the question of the purpose to which your unbought dog will be put, we may pass over the "work" classes as being too obvious to need further explanation, and turn to the bench show and companion types. Oftentimes these two overlap to a considerable extent, for many a ribbon winner of some standard breed is as fine an all-round dog as could be desired. A pup that comes of show stock is usually more expensive than his shortpedigreed cousin, but providing the breeding points have not been carried so far as to impair his vitality or intellect, he is worth the extra money, even to the person who never expects to enter him for competition. There is a certain satisfaction in owning a dog whose appearance will pass muster in any company.

Avoid the stranger who offers you a handsome dog at a low figure. Five times out of ten the dog has been stolen, and the other five times he has some serious defect. The place to buy dogs is from the people who breed them for sale, for such persons must live up to their established reputations for square, honest dealings, and they are available in case your dog should prove unsatisfactory in any way.

Buy from the dealer, by all means.
As Waterproof as a Duck’s Back
That’s the way Bay State Brick and Cement Coating keeps exterior walls of concrete or stucco. One coat absolutely overcomes the tendency of cement to absorb water—it prevents disintegration.

Bay State Brick and Cement Coating
gives a uniform color—no blotched appearance. For interior decoration it is unequaled, being light-reflecting, damp-proof, fire-retarding and easily cleaned.

Our free Booklet 2 contains some ideas that will be of immense help to the man who’s planning to build of concrete, stucco or brick. Send for it—it’s free.
