POZZOLITH CONCRETE

In Ultra Modern Suburban Store

TO a long and impressive list of projects built with Pozzolith Concrete now is added this beautiful \$3,000,000 suburban store.

Among the reasons why Pozzolith Concrete is being used more and more by the builders of America's leading structures, are such advantages as:

- EASIER PLACEABILITY — for lower placing costs
- MINIMIZED SEGREGATION — for better appearance
- REDUCED SHRINKAGE — for less cracking
- LOWER PERMEABILITY — for less "waterproofing" expense
- INCREASED BOND-TO-STEEL — for better construction
- GREATER DURABILITY — for longer life concrete

Pozzolith produces these and other important benefits because it disperses cement, reduces water and entrains the optimum amount of air.

Investigate the advantages of Pozzolith for *your* next job, whether an industrial plant, reservoir, hospital, bridge, tunnel or sewage treatment plant.

We'll welcome your request for further information.

CEMENT DISPERSION ALSO KEY
SUPERIORITY OF THESE
MASTER BUILDERS PRODUCT

MASTERPLATE . . .

Masterplate produces "iron-clad" concrete floors with 4-6 times longer life; also spall resistant, non-dusting, less absorbent, easy-to-clean. Non-colored and 11 colors for new floors and resurfacing.

Section of Masterplate Floor.
Note Thickness of Armored Surface

OMICRON MORTARPROOFING .

For tight brick walls. Helps overcome shrinkage in mortar joints, principal cause of leaky brickwork, by producing mortar with low water content, excellent workability and good bond strength.

Good workmanship and good bond, with "O.M.", produce tight brick walls.

KNOLL OFFICE PLANNED FURNITURE... a new comprehensive collection of desks, tables, cabinets and molded chairs, designed to provide maximum flexibility in the planning of contemporary office interiors. Illustrating the admirable versatility of this new line is the Knoll Executive Desk. A basic structural unit of metal frame and wood top, it converts into a series of co-ordinated desks with varying drawer arrangements for individual needs. Finished in plasticized, burn-proof, stain-proof walnut or birch; metal base is satin black. Wide range of sizes permits most efficient utilization of available square footage. Full information on request.

LETTER TRAY
DICTAPHONE SLIDE OUT

More Destructive than Termites

CONDENSATION WILL MAKE PAINT PEEL, PLASTER CRUMBLE, WOOD ROT, AND MASONRY AND MORTAR DETERIORATE.

Ordinary insulation in walls lets water vapor flow through, condense, accumulate and cause damage. Vapor is a gas. It flows through walls from high vapor density areas to low. Cold air can retain less vapor in suspension, and creates a low density area. Vapor pierces plaster, wood, brick, stone, asphalt, building paper, ordinary insulations. Wherever it touches a substance colder than its dew-point, it condenses.

Inside walls, within ordinary insulation, onto and within siding or sheathing, onto inner wall surfaces, vapor flows and condenses if a vapor barrier of **zero** permeability is not provided. Upon condensing, it stimulates fungi and insects which greedily break down wood and cause timber rot. It makes paint peel, plaster crumble, iron rust.

Impervious to vapor, multiple accordion aluminum is also non-condensation-forming. The slight mass of the aluminum sheet on the warm side

(1/5 oz. per sq. ft.) approximates the adjacent air's temperature (by conduction) so quickly that it can extract very little heat from it. Therefore the air can retain its vapor content in suspension, without otherwise resulting condensation.

Each aluminum sheet throws back 97% radiation on the warm side, emits but 3% on the cold. On the cold side, each aluminum sheet is slightly warmer than adjacent air, and heats it. Therefore the capacity of the air to retain vapor in suspension is slightly increased, and no dewpoint is ever reached. Nowhere on nor within multiple accordion aluminum does condensation formation occur.

The aluminum and fiber sheets block inner and outer convection. In addition, the air spaces practically eliminate conduction.

Multiple accordion aluminum is commercially available as Infra Insulation, Types 6, 4, and 4 Jr. For a complete discussion of the subject, ask us to send at our expense, Schwartz's "Simplified Physics of Vapor and Thermal Insulation," and the Government booklet, "Insulation and Weather-Proofing" (Div. Farm Bldgs. & Rural Housing).

combined sanatorium and university

under construction at Agra, Italy, on a slope that commands a superb view down across Lake Maggiore and the surrounding ranges of mountains, this is a remarkable combination of a TB sanatorium and university. The architect for the complex is Richard J. Neutra of Los Angeles; his chief collaborators are Dr. Omodeo Quaroni, Frederick Reichl, Sid H. Brisker, Edgardo Contini, and Richard Neutra.

This latter-day "magic mountain" is being built for the *Associazione Sanatorio Universitario Italiano*, from the last three of which the project derives its name of SUI. This organization, headed by leading Italian physicians, has cordial relations with the administrations of all Italian universities and is supported by the Ministry of Health of the Republic. Neutra requests that special credit be given to Dr. Omodeo Zorini, SUI's president, and Dr. Pietro Buscaglione, the secretary, for "their untiring efforts in convincing the authorities in Rome."

The incidence of TB in Italy was considerably aggravated during the war years, and the customary disposition of the afflicted was to relegate them to comparative inactivity at their homes—a lonely, frustrating existence that doctors conceded was a psychosomatic error. The impetus behind the combined sanatorium-

chapel opens to the southern terrace.

(Continued from page 23)

Lake Maggiore, as seen from the sanatorium-university site.

university is to set up a health-care facility in ideal surroundings, where the patients can stay and receive expert treatment but where they also will have an educational goal, the stimulation of friends, and the encouragement of preparing for future careers. Thus, it is hoped, the stumbling block of the institution may be turned into a stepping stone with the curative process speeded. The educational portion of the group will be a college affiliated with all Italian universities, and it will have an accredited teaching and visiting-lecturers' staff.

In the design of the project, the emphasis was to avoid an institutional aura as far as possible, with emphasis, both in concept and visually, on the cultural aspects—auditorium, lounges, music rooms, library, etc.

Each of the nine upper stories of the main block has facilities for 33 patients in either single or double rooms, with joining south-facing balconies large enough to accommodate beds, a dining room, and a living room. On the lower floors are the college classrooms, library, cultural director's suite, and main kitchen, laundry, locker rooms, and service rooms. The chapel is on the roof of the main block, with southern walls that can be fully opened to a roof terrace; also on this are two small apartments for staff members.

At the front of the group is a two-level curved element with the main entrance, lounges, smoking room, billiard room, music rooms and auditorium; as well as laboratories, medical director's offices, examination rooms, etc. At the south corner is a multi-story residence for nurses.

In dealing with his client at long distance, Neutra went into the analysis

This issue of PROGRESSIVE ARCHITECTURE, devoted to a study of the planning of shopping centers, was prepared very much in the same manner in which shopping centers are created—by team work. An architect and a real-estate economist are responsible for the basic concept. Much of the writing and the co-ordination of the material was also done by them. However, their associates have contributed materially, by writing chapters, by preparing drawings and sketches, and by taking part in round-table discussions held on many occasions over many months.

The cumulative experience of the contributors is tremendous. Since he came to New York, in 1939, Victor Gruen, architect with offices in Los Angeles, Detroit, and New York, has been active in store design. In this field he has been a pioneer; many aspects of modern store design have been introduced by him in projects which range all the way from intimate shops to department stores. Gruen early turned to shopping center design as a potentially new field of architectural expression, and in recent years he has designed many neighborhood centers, suburban centers, and regional centers. Larry Smith, real-estate economist and consultant, has a background of real-estate experience going back to 1917, as well as private business experience; working in recent years in a professional capacity as consultant for shopping center projects, for investment companies, insurance companies, department store organizations, and private investors. He is regarded as one of the outstanding authorities in the shopping center field.

what is a shopping center?

A shopping center must be more than a mere collection of stores and shops.
A shopping center must be even more than its name implies—a center for shopping.
The regional shopping center must, besides performing its commercial function, fill the vacuum created by the absence of social, cultural, and civic crystallization points in our vast suburban areas.
The centers of our big cities are shrinking, not only as far as the size of their populations is concerned, but much more in their importance to the social life of the metropolitan inhabitants.
During working hours, the downtown centers still represent great concentrations of trade, banking, and office work activities. For 40 hours a week, most of them teem with life.
But for the 128 hours a week over which the metropolite is master of his fate—the 128 hours a week which are devoted to his or her private life, those 128 hours and the many hundreds of hours a year during which holidays unchain him from his duties—the core areas of our cities are deserted and might as well not exist.

This is true for the working part of the population. For the non-working part, downtown is even less important. Our children, our youth, the aged, and the housewives are groups which together represent a majority of the population. For them, a trip “downtown” occurs sometimes only once or twice a year and even a trip into another city or country.

True, there are exceptions. Manhattan, Chicago, San Francisco, and a few other cities still have attractions of sufficient magnetic power to draw the suburbanite into the downtown area from time to time. But there, magnetism decreases as the centrifugal forces grow.

The reasons for this phenomenon are many-fold. The mass migration from the country to the city which took place in the past has now been reversed by a new, still more powerful wave of migration from the city to the suburbs.

The automobile has made this migration possible. And now the metropolite finds himself in the position of the Sorcerer's Apprentice—the spirits he conjured up he cannot exorcise. The millions of gas-driven “spirits” get into each others' way and choke the highways, roads, and parking areas.

The metropolite is willing to find his way into town in order to make a living, but he protests violently against the idea of repeating this nerve-racking routine for purposes of pleasure, relaxation, mental enrichment, or education.

This condition will exist, and become even worse, as long as the pressures to which downtown areas are exposed are not lightened, and as long as the ring of blighted and slum areas which surrounds

Nuremberg market place, from a 1599 engraving by Lorenz Strauch, shows the shops around the square under arcades; the temporary stalls in the center of the square. Commercial activity is integrated with the town center—churches, municipal buildings, and stores are together.

Credits for all illustrations on page 160.

The Greek Agora was the market place and, at the same time, center of city life. Here, in the Agora of Assos, one sees the stoa (market hall) set against the mountain, with a promenade before it. Opposite is

so many of our downtown districts is not broken. Movements are underway to do something about both slum clearance and rehabilitation sections of the Housing Act of 1949 might very well open the way to eliminate the slums which choke the downtown areas; and large regional shopping centers will absorb enough of the buying power of the suburban areas to ease traffic and parking conditions downtown.

If and when this happens, downtown will again be able to serve satisfactorily its original trade function for the size of city for which it was originally built; and in addition it will become more desirable as a principal center for social and cultural activities.

Regional shopping centers may well be regarded as satellite downtown areas, offering much of what the metropolitan centers give and adding the decisive advantage that, if they are designed correctly and scientifically, they will take care of today's needs and today's living. They will welcome the hordes of automobiles which approach them, providing easy access and ample free parking space. They will offer restfulness, safety, and esthetic values. They can become places where suburbanites will visit for a shopping trip, and also centers where they will want to congregate for many hours—both days and evenings.

The need for social and cultural activity has by no means disappeared in our times. It has been artificially stifled by the price tag attached—a price tag that spells exhaustion, loss of time, high transportation costs, and parking costs—all efforts out of proportion to the gain.

With the advent of the large shopping center there will be a new outlet for that primary human instinct to mingle with other humans—to have social meetings, to relax together, to enjoy art, music, sports, activities, the theater, films, good food, and entertainment in the company of others.

What are the requisites to the fulfillment of this function of a social and cultural center? First of all, to include, from the inception of the general plan, attributes which go beyond the commercial function.

the three-story bazaar, with storage space below. Temple, council house, and theater complete the center. In the center of the mall are temporary shopping facilities under a tent.

Great Cloth Market, Leeds, established by Edward III (1312-1377 A.D.) was another mall-type center.

Proposal by Victor Gruen for a contemporary mall, keeping the amenities and the facilities of old.

auditoriums	lecture rooms	exhibit rooms	reading rooms
theaters	restaurants of many types	club rooms	community centers
libraries	children's day nurseries	boy and girl scout dens	

Second, to take advantage of the existence of public areas—such as garden courts, malls, arcades, es, covered walkways—for relaxation and amusement. If such areas are properly planned, they will opportunities for outdoor activities. There will be greenhouses, play areas, band shells, outdoor theaters, or fashion shows, miniature zoos, outdoor shows of painting and sculpture, flower shows, picnic grounds.

Third, to realize an architectural concept and treatment which offer variety without confusion, colorful arance without garishness, gaiety without vulgarity; a concept which creates an atmosphere in which the of shopping becomes restful and fun; an architectural treatment which, by application of scientific design, nates what appears as an ugly rash on the body of our cities—the countless smoke stacks, telephone, power poles, dangling wires, air conditioning and ventilating ducts—treatment which pays design atten- o that ugly duckling of our urban civilization called “street furniture.” The myriad warning signs, posts, bus-stop signs, directional signs, hydrants, waste baskets, letter boxes—all must be redesigned, linated, and brought into a disciplined pattern.

Here, at least, is an opportunity for contemporary art to find a place as part of a new architectural pt. Here is space for sculptures, murals, fountains, mosaics on floors, and mosaics on walls.

That this is a thoroughly practical concept becomes obvious if one considers that a shopping center is a civic, cultural, and social center will develop magnetic powers to attract more people and hold them longer time than if it were only a commercial center. More people—for more hours—mean cash reg- ringing more often and for longer periods.

In the anarchistic wilderness of our cities there have existed up to now only a few cases of organized architectural development: civic centers, public parks, college campuses, industrial centers. Now a new opportunity for the creation of co-ordinated, planned, and spirited architectural units exists in the large shopping centers. This new architectural design category is different in one very important aspect from the others: it is neither publicly owned nor completely controlled by one institution.

The shopping center is a conscious and conscientious co-operative effort by many private commercial enterprises to achieve a specific purpose: more and better business. This co-operation, in order to be effective, must be enlightened and wholehearted. Individual wishes and needs must be secondary to the needs and requirements of the center as a whole. This *does not* mean subjugation of individual wishes and desires for the individual needs of the tenant stores. The design problem of the shopping center is the *co-ordination* of these needs and wishes with each other, and with the whole. Conformity, but not uniformity, must be the goal. In addition, if it is planned to integrate with the community, the new shopping center can be a boon, rather than a threat to the privacy and the stability of residential areas.

The achievement of complete co-ordination becomes the mainspring of the architect's work. It influences his work through the entire project, from the moment the search for a site starts, through the stages of site usage planning, traffic planning, merchandising of the center, to the selection of colors and materials.

In creating this new architectural design category, we will be wise to observe what has been done in the past and in other parts of the world. During many ages and in many lands, such combinations of cultural, social, and trade centers have existed. Today's shopping center has an opportunity to give us again a desirable gathering place, planned in a co-ordinated fashion, for the automobile age. In the first excitement of the industrial revolution we temporarily lost our feeling for planning, organization, and architectural beauty. The modern shopping center is a clear expression of the desire to regain these advantages, translating past experiments into forms suitable for our mechanized life.

Because shopping-center planning is in our era a young and new category, it is impossible to pass judgment or make final statements about any phase of the subject. The contributors to this issue have worked actively for many years on problems of shopping-center planning. This experience has had a sobering effect on us; we have learned enough to realize how little we know. Therefore we decided early in the discussion of this issue of PROGRESSIVE ARCHITECTURE would not be a recipe for cooking up the shopping center. It will not be a complete history of shopping centers, nor a critical review of existing or projected ones, nor a handbook of procedures. It will, rather, attempt to present and spotlight the problems involved. It will mention solutions and means that have been found practical, without any claims that they are necessarily the best ones. And, we will, we hope, provoke thinking and discussion.

Northgate, at Seattle, Washington—designed by John Graham & Co., architects and engineers—recognizes community needs by providing a children's playground with a carnival atmosphere. It fosters community pride with "the largest Christmas tree in the region," thus emphasizing the fact that commerce thrives where social gathering is made easy and pleasant.

the definitions

A shopping center is different things to different people. To the customer it means a group of stores with parking, no traffic worries, minimum walking distances, variety of merchandise, and a pleasant atmosphere in which to shop.

To the merchant it means a business location with adequate parking, tremendous drawing power, all possible customer conveniences, protection against irresponsible competition, stable rental value, efficient service facilities, flexibility in floor space, substantial and well-designed buildings, landscaping—in short, a location wherein all merchants band together to furnish services none could afford singly and, in turn, to receive sales and trade which could not be given to them singly.

Modern shopping centers are relatively new, the concepts are changing, new solutions are constantly being tried, new problems arise. There is no tradition for the auto-age regional shopping center, no set of rules, no set concepts, and a great deal of misunderstanding and misinterpretation, due mainly to the lack of a common shopping-center language. In the interest of clarifying some of the most commonly misunderstood terms, our interpretation follows:

the center

Neighborhood Shopping Center: Serves 10,000 to 20,000 people. Has a core of foods and drugs. Sells mostly convenience goods.

District or Suburban Center: Serves 20,000 to 100,000 people. Has a core of large supermarket or small department store. In addition to convenience goods, sells apparel, hardware. Adds depth to merchandise.

Regional Shopping Center: Serves a population of 100,000 or more. Has one or more major department stores as a core. Has great depth and variety in merchandise.

the building areas

Gross Area: Total floor space of all buildings in a project. This figure should be the basis for quoting building costs.

Rentable Areas: That part of gross area within buildings which is used exclusively by individual tenants,

and on which rent can be obtained, usually the difference between gross area and common areas within buildings.

Common Areas: Areas, such as the mall, corridors, tunnels, public stairs and elevators, ducts, truck routes, loading docks, public and employee rest rooms not in individual stores. These are not rentable but their maintenance charges are levied *pro rata* against tenants.

Sales Area: Rentable area minus storage space.

Service Areas: Part of common areas used for servicing, such as truck tunnels, delivery docks, access corridors, etc.

the site areas

Building Area: The ground area of the enclosed building or buildings.

Covered Area: The ground area of the enclosed buildings plus all roofed areas, such as covered walks, shelters, etc.

Road Area: The area of all main private roads not directly serving parking stalls. Road area includes all feeder roads, perimeter roads, truck roads, ramps, etc., but does not include parking aisles or public streets.

Service Yard: The area devoted to servicing the center which is not enclosed or roofed. It includes rubbish collection and disposal stations, truck-loading spaces, maintenance yards, etc.

Parking Area: All space devoted to parking, including aisles, minor walks, islands, minor landscaping, and other features incidental to parking. Parking area is sometimes subdivided into customer parking, employee parking, and overflow or reserve parking.

Reserve Area: Area undeveloped or temporarily developed, intended for future use coincident with the shopping center. Such use may be expansion of buildings, parking, or both.

parking

Parking Ratio: The relationship of parking area to gross area.

Single-Level Parking: All parking on grade and at the same level. Ordinarily this level coincides with the major shopping level.

Landscaped and Incidental Area: Major landscaped areas, such as courts, groves, park strips, and buffer areas. Incidental areas include major walks, free playgrounds, and other recreational features of the shopping center.

Site Area: The gross area of the property. Includes all space within the property lines.

Split-Level Parking: All parking on grade, but at two levels. Ordinarily used with two sales floors, each level of parking coinciding with a shopping level.

Double-Deck Parking: Two levels of parking with one level at grade, the other elevated or depressed. Used where area is insufficient for single-level parking.

One-Side Parking: Peripheral parking on one side of the building, single or split-level or double-deck.

Two-Side Parking: Parking on both sides, as used with a single-store depth. Either single, or split-level, or double-deck.

economics

Economic Analysis: The process of analyzing and interpreting all economic data relating to the shopping center, including patronage expected, volume of business, expense of operation, probable rents by stores, net income of the project, financing requirements, and economic feasibility in general.

Trade-Area Pattern: The final delineation of the boundaries of the trade area as affected by distance, arterial highways, obstructions caused by extensive land use by large institutions, golf courses, etc., and the limitations placed by relationship to rivers, railroads, and the downtown area itself.

Gross Population: The total population of the trade area.

Net Population: The population which can be expected to trade in the proposed project after discounting for distance and other factors, such as access, character of the center, nature of the population, etc., all of which can affect the degree of patronage.

Primary and Secondary Trade Areas: The primary area is the more immediate area within which the center can expect to do a substantial proportion of the volume of food and drug business. The secondary trade area is the more remote area whose patronage of the center will be largely for ap-

parel, furniture, general department store sales, etc.

Trade Habits: The existing pattern of trade, prior to the establishment of the center, that has developed over a period of years, and is influenced by the location of existing stores, including the effectiveness of leading downtown department stores.

Disposable Income: Same as Department of Commerce definition.

Consumption Expenditures: Same as Department of Commerce definition.

Retail Expenditures: The portion of disposable income which is spent in retail stores.

Gross Potential Sales: Total retail sales made to all residents in the trade area, regardless of where the purchase was made.

Net Potential Sales: Total retail sales that could be expected to be made to the net population tributary to the proposed shopping center.

Per Capita Retail Sales: Total retail sales in a given area, divided by the population of that area.

Store Integration (Pre-merchandising): Analysis of the proper relationship of stores of various categories, with the purpose of developing their highest volume of sales.

team: architect and economist

Fallacy: "The buildings are incidental; only the trade potential counts."

When Victor Gruen and Larry Smith started to work on this issue, the members of their organization were asked the question: who is more important and who, therefore, should co-ordinate all work for shopping center planning—the economist or the architect?

One of the economists answered, "The ultimate goal of the owner is to build a satisfactory financial investment—and, only incidentally, some buildings. Therefore, the economist should be in full charge."

One of the architects answered: "A poorly planned center, uninviting in appearance, erected in accordance with no matter how brilliant an economic analysis, would be a failure. Therefore, the over-all responsibility should be the architect's."

They both have a point. It is unquestionable, as the economist has stated, that the primary aim of a commercial project is realized profit. To arrive at such realization, two factors must be present: the market potential and the correct tapping device. The analyst will detect, forecast, evaluate the potential. The architect will design the most efficient organic and economically sound environment for marketing—the most effective tapping device he can achieve for the given potential.

A competently designed group of buildings located in an area of poor economic potential will be as much a failure as an oil well sunk where no oil-bearing strata exist; and no amount of architectural skill will save it. On the other hand, once the potential is established, a poor handling of the architectural environment will represent an economic waste, bring lower profits and will, in time, hasten failure against the competition.

So there is no single point where analysis can be divorced from design. Analysis without design is,

Fallacy: "The decisive factor in design is the structural system."

at best, a theoretical exercise. Design without analysis is altogether unrealistic. A building constructed on either basis alone faces intolerable risks.

Since analysis cannot be separated from design, it is useless to argue who and which is more important. Shopping-center design is teamwork and the ideal team consists of the architect who is fully aware of the needs of our economy, and who has wide knowledge of city planning and the problems of the retail trade; an economist who is fully aware of the tenets of contemporary architectural and structural design, whose experience with problems of financing, analysis of trade potentials and merchandising is great, and who has enough imagination to project into future trends his charts and statistics drawn from the past.

These two central figures of the team should be associated with a large number of teammates: structural, mechanical, and electrical engineers; traffic planners; merchandising analysts; landscape designers; leasing experts, and many more. All these team members must exhibit infinite patience, straightforward thinking, and comprehensive understanding in co-operating with each other, with the owner, with city and county authorities, financing institutions, highway commissions and, last but not least, with the tenants.

Such a team should be able to avoid the human but dangerous tendencies to overestimate the importance of certain links in the chain of analysis and design. It will never subscribe, for instance, to any of the precepts or dogmas which are illustrated here by Karl Van Leuven's cartoons. It will recognize that the process of planning a shopping center is one of fitting together, co-ordinating, revising, judging ideas, views, prejudices, statistics, and facts. The problems will stem from all the individuals involved in the design, in the financing, the up-keep, and the maintenance of the completed center. The solutions will come from teamwork, with the architect and the economist acting closely together as co-ordinators.

Fallacy: "Plenty of parking is a cure-all."

PHOTOGRAPHS of shopping centers shown on this and the following pages as well as the illustrations elsewhere in this issue, have been selected by the authors and the editors to illustrate specific points made in the articles; they are not intended to represent the best or the "most beautiful" examples that could be chosen. The pictures on these pages show admirably the value of landscaping in achieving the integration of the building and the benefit to a community that a well-planned shopping center can provide.

landscaping

Lido Shops (above), Newport Harbor, California, designed by Dwight Gibbs, architect. Entrance to the super-market is inviting because of its rich planting.

Bullock's Pasadena (left), California, Wurdeman & Becket, architects. Landscaping within parking-area dividers is both functional and attractive.

Country Center (right), Palm Springs, California, by A. Quincy Jones, architect. Landscaping and building have been planned together to draw shoppers to first- and second-floor shops.

Baldwin Hills Shopping Center, Los Angeles, California, by Robert E. Alexander, architect. This project is an excellent example of the point made by the authors in the opening section that shopping centers offer a new opportunity for unified design and planned architectural organization. It also illustrates the point (stressed later in the section on Storefronts and Signs) that the basic architectural concept must be strong—and capably handled—to achieve that unity within the competitive economy that controls merchandising. Here, show-window lines, roof lines, canopy lines, carry through a sense of scale and co-ordination, without limiting use of materials or display techniques.

unified design

"arcades"

The earliest examples and the most recent, in our own time, have made use of the age-old device of an arcade or one of its modern equivalents to protect shoppers and shelter store fronts. THE STEPS IN SHOPPING CENTER PLANNING

The planning procedure for a shopping center will go through the following stages:

1. *Economic Analysis.* Planning must start with an economic analysis of the prospective trade area, based on the seven points which are discussed in the section which follows:

2. *Decision on Site.* In most instances, the builder is already in possession of a piece of property which is considered adaptable for shopping-center purposes. If the economic study was undertaken for the purpose of selecting a shopping-center site, then the actual purchase of the property should be the next step. This subject is discussed on page 80.

3. *Preliminary Architectural Studies.* Certain architectural work should proceed before the economic analysis is complete. As soon as a site of proper location and adequate size is available, preliminary architectural studies should be undertaken simultaneously with the economic investigations such as: soil tests; study of drainage conditions; study of such site problems as contours, shape, improvements of adjoining property; preliminary engineering and traffic studies. As soon as the site is approved, the architect should proceed with land-use studies and develop a land-usage plan that is adaptable to the site and that is capable of accommodating a project that can fully exploit the potential of the trade area (see chart at right).

4. *Joint Study and Agreement upon Land-Usage and Merchandising Plan and Traffic Planning.* At this point, the land-usage plan (discussed on page 84) should be the subject of a joint study by (a) the owner, (b) the economic consultant and the architect, (c) the prospective major tenant, (d) the mortgagee or finance source. It should be modified to whatever extent necessary to bring about a meeting of the minds, at which point detailed architectural plans could proceed.

5. *Detailed Architectural and Engineering Studies.* Architectural, mechanical, and engineering design should now go ahead, along with traffic planning (see page 87), land-use and site planning, utilities planning, the planning for services.

6. *Tenant Selection.* Determination of the ideal tenants for the type of center decided upon and the preparation of material for examination by those tenants.

7. *Major Department Store.* At this point, it is highly desirable to complete negotiations with the major department store tenant. The result of such negotiations will have an important bearing on the success of subsequent negotiations with other major tenants and financial institutions.

8. *Other Major Tenants.* Active lease negotiations for other major tenants can be undertaken at any point, either by the project manager in the employment of the owner, or by brokers, or by a combination of both.

9. *Financing.* Application for mortgage financing should be made during the initial stages, in order to secure assistance and guidance from these institutions. At this time, negotiations should have progressed to the point where at least a conditional financing commitment can be obtained.

10. *Public Agencies.* Approval by public agencies, such as planning commissions, zoning commission, city and county engineering staffs, and the city council will be required at different stages of the development. The actual circumstances in each case will dictate the timing.

11. *Construction.* When the above ten steps have been taken, actual construction can begin.

The time table indicates the approximate amount of time that should be allowed for various stages of work. It assumes the most favorable circumstances.

the economic study

If one were asked to point to the most important economic aspects of a shopping center, he would certainly name the following:

(a) Single ownership, which gives to the owners a measure of control not enjoyed in any other type of retail-store grouping.

(b) Co-ordinated planning, which makes it possible to plan all aspects of the center, including architectural and engineering design, economic studies, traffic, finance, etc.

(c) Complete representation of all stores and services in a single integrated area allowing for one-stop shopping.

There are many other distinguishing features of a shopping center but the above three points, in the opinion of the authors, represent the basic factors that distinguish a planned shopping center from an ordinary group of retail stores.

Two factors, characteristic of modern urban areas, tend to favor the success of regional centers:

1. *Population Growth.* One of the outstanding features of population growth during the last decade is the continued

concentration of people in large metropolitan areas and the strong tendency for that population to disperse into the suburban sections of these areas. Generally speaking, the growth of retail trade facilities has not kept pace with this growth.

2. *Existing Facilities Unsatisfactory.* The effect of the automobile is just beginning to hit us with full force. It is forcing a complete rearrangement of arterial patterns. It is forcing a redevelopment of downtown areas, and also forcing a complete redesigning of merchandising techniques. The one-stop regional shopping center appears to be one of the principal results of increased automobile use and, by comparison, existing facilities now appear to the customer to be completely inadequate and unsatisfactory. As a result, new shopping centers have not experienced too much difficulty in transferring the allegiance of customers from the use of inconvenient retail facilities to the new, streamlined shopping center.

economic dangers

In spite of the inherent advantages that tend to favor decentralization of facilities

generally, there is ample opportunity for serious mistakes on the part of the owner. Here are some of the penalties if he fails to plan his center to fit the exact requirements of his trade area:

(a) If he builds his center too large, construction costs and operating costs will blot out his rental returns. He will have a poor investment opportunity on his hands, making financing difficult if not impossible.

(b) If, on the other hand, he builds his center too small, he will be inviting competition which, if it takes the form of a competitive shopping center as is likely, will be most destructive.

(c) If he fails to diagnose accurately the character of the trade area, and therefore the character of the shopping center that should be built to serve that area, he will find himself in possession of a center that never exactly clicks; and his selection of inappropriate tenants will probably result in years of low rents before the situation can be remedied.

(d) If his stores are not skillfully arranged in order to capitalize on peculiarities of pedestrian traffic by the

agement of small shops in relation to stores, he can easily lose the top to 50% of his bonus rent potential.

) If he has not made a proper allocation of operating costs, parking maintenance, utility expenses, etc., he may be giving the burden of any increase in operating expenses that will eliminate any opportunity for surplus rent.

There are many other pitfalls in the planning of a project of this size, but those mentioned above are the most serious and, in fact, the most typical. Most shopping centers, because of weaknesses that might have been avoided in the planning process, will have to be satisfied with only 60% to 90% of the full potential of the location. The ability of the project to earn the last 10% to 40% of potential income distinguishes the well planned center from the ordinary, and the added value that comes from careful planning can easily amount to several times the cost of the planning process.

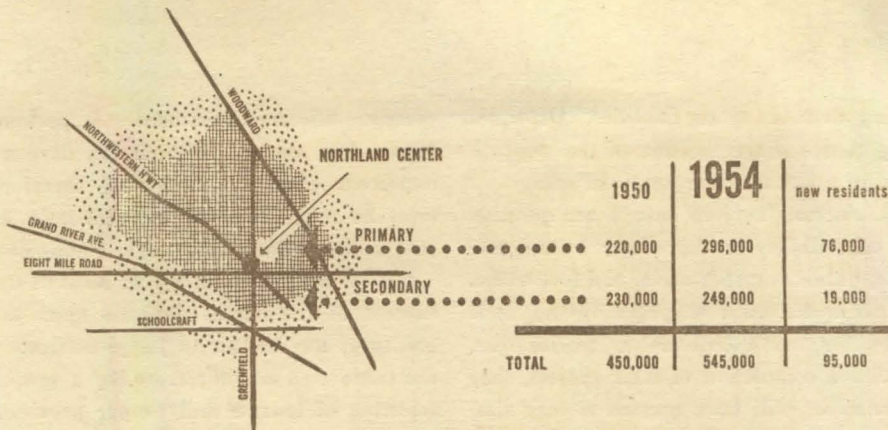

economic analysis

The beginning of the planning process is economic analysis. It must be based on seven points of study, some of which are purely market analysis, and others which call for a background of architectural and land planning with a knowledge of the relationship between these physical factors and merchandising.

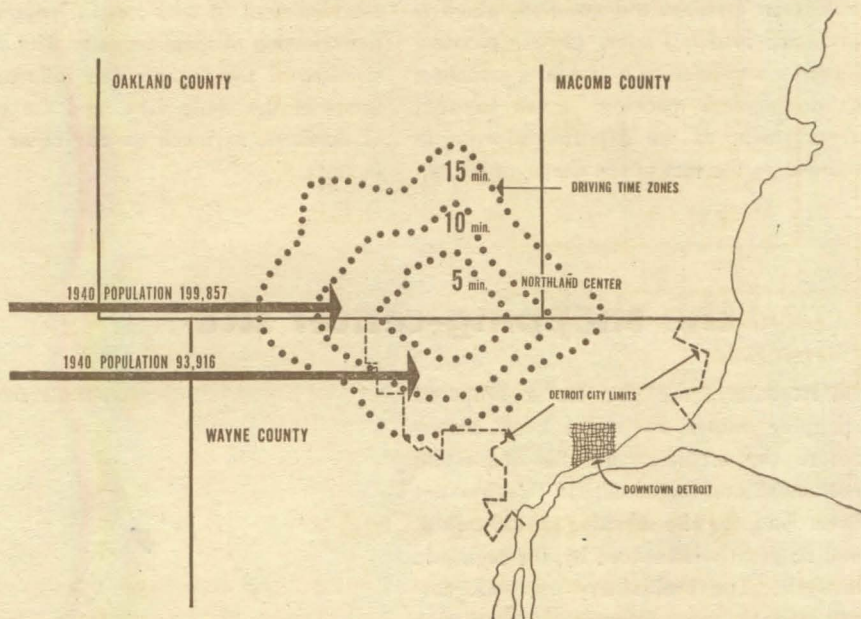

Population. Standard procedure based on the use of the Bureau of Census data, broken down by small enumeration districts, so that groups of population can be studied in relationship to physical factors. Census data must be secured for a broad area that can later be curtailed as the boundaries of the trade area is gradually evolved.

Income and Purchasing Power. This type of information still has to be secured primarily on the basis of observation in the field or through the medium of special studies. Data from the 1950 Census are readily available and, for most projects, the information is not sufficiently detailed to be adequate.

Competition. Here again it is necessary to depend on studies of the particular area since census information is rarely in a form that is capable of being adjusted for any particular trade area. Furthermore, the purpose of the study of competition in any trade area is more to define the capacity of existing facilities rather than the amount of business

Study indicating that rapid anticipated growth is greatest in the primary trade area for J. L. Hudson's Northland project near Detroit, planned by Victor Gruen Associated Architects & Engineers, with Larry Smith as economist.

Study showing that proposed Northland Center will tap rapidly growing section of city, and even more rapidly growing suburban area.

retail expenditures of trade area residents

Estimate of increasing retail expenditures due to population growth, based on statistics obtained for present per capita spending.

The nature of the competition is also important.

being done in those facilities. Of equal importance is the location of the competition in relation to the proposed site.

4. *Access.* Involved here is the question of accessibility to the center by automobile, public transportation, and foot traffic. (This is discussed on pages 87-89.) It is hard for many builders to realize that, with the completion of their project, they themselves will have created a very sizable traffic problem which should be completely visualized and planned for from the beginning.

5. *Physical Characteristics.* This is primarily an architectural question, which is discussed in detail later. Certain physical features may dictate a two-level structure or double-deck parking, or an unusual arrangement of the department store in relation to the rest of the shops, or a com-

pletely different treatment of parking areas. Any and all of these can have an important effect on sales and therefore must be regarded from the economic, as well as from the architectural standpoint.

6. *Character of the Project.* Most of the success of the center depends upon the ability of the builder to judge accurately the trade area and therefore, by a proper selection of tenants and proper provision of services, to exploit fully his merchandising potential.

7. *Tenant Selection.* There are very few things that are more important in the establishment of a successful center than the selection of ideal tenants. The aggressiveness of the tenants can influence the limits of the trade area, and the volume of business, as much as any other single factor.

It is important to recognize the basic differences that distinguish the planning a shopping center from ordinary commercial construction. Ordinarily, the construction of a single store building represents a small addition to the total retail space of the business community. In many cases, it means no addition at all, but simply a replacement. As a result, the sales activity of the new tenant brings about little or no disturbance to the existing equilibrium.

A shopping center, on the other hand, is equivalent to adding the retail space of a small city to existing facilities which, presumably, were fairly adequate up to the opening date of the new project. In such a situation, new facilities must be located, well planned, and well timed.

the shopping-center site

Unfortunately, the site for a proposed shopping center has often been chosen before the architect and the real-estate economist are consulted. If this has not been done, the site selection should follow, and be greatly influenced by, the economic analysis. The preliminary economic survey should have determined whether a demand for additional shopping facilities exists, the extent of that demand and its nature, the areas of most rapid growth, the areas of greatest future expansion, and the nature and extent of existing competitive facilities. On these findings, architect and economist will make recommendations.

From the dollar-volume estimate of demand, the architect and economist can determine in a preliminary way the store types and the approximate square footage of building necessary. Parking and traffic needs can also be determined (by methods discussed in a later section). With the number of cars and the total store area established, the architect is able to project the approximate total area required for the center, and the search for the site can begin.

What are we to look for in selecting a shopping-center site? In an effort to answer this question, the essential features and characteristics of the ideal site are listed in the order of their importance:

Accessibility. This is, in our opinion, the most important consideration for either

a district or a regional center. A shopping center is designed for the customer behind the wheel and, if free and easy access from the highways to the perimeter roadways and into the parking lots is not achieved, most of the convenience advantages the center can offer are lost. To achieve this maximum convenience, the site should be at, near, or readily accessible to at least two major highways. These highways and access roads should have considerable reserve capacity, over and above their present and projected needs, because the traffic movement to and from a regional shopping district (parking 5000 to 10,000 cars, and increasing previous traffic two or three times) will completely alter the existing traffic pattern.

When considering accessibility, it must be borne in mind that the old concept of "hot spot" location is not necessarily valid for a shopping center. If the entrances and exits to the parking lot are near a major intersection, the interference of through traffic can cause a major congestion problem.

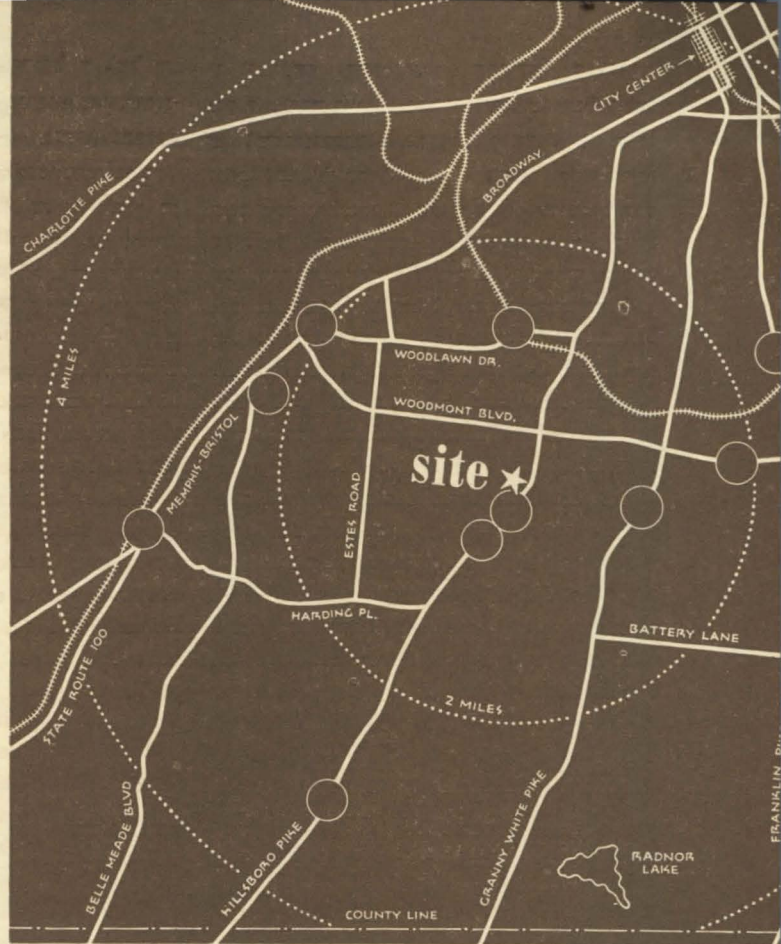

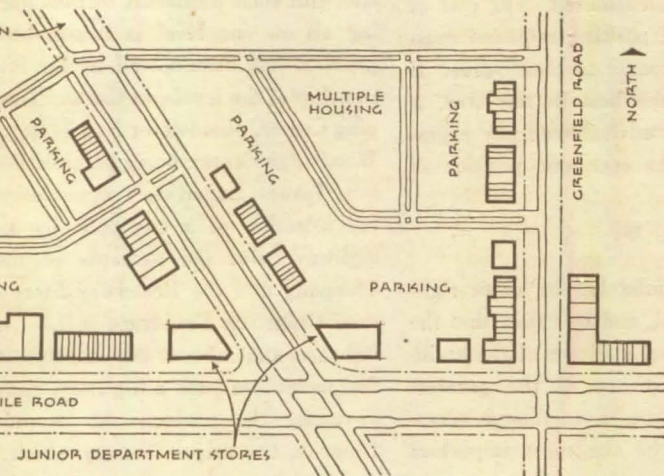

Sufficient Size. The shopping center should have not less than the minimum acreage that the architect and the economist have estimated as necessary to adequately develop the potential of the area. An incomplete shopping center invites development of competitive centers nearby and the pirating of its parking facilities by fringe promotional activities or

... all in one

Analysis of a proposed center in Tennessee by Larry Smith & Company shows the location of present retail stores. A study of their capacities will help evaluate the nature of the competition to be expected in the area of the site under consideration.

Typical uncontrolled strip commercial development: proper zoning could cure this.

... immediately surrounding it—and in a congested, disorganized, uncontrolled commercial slum.

The site under consideration should be one piece, and not divided by major or minor highways that cannot be moved or rerouted. Nor should it be divided into pieces, subject to subdivision conditions which would make replatting difficult. It should force artificial divisions or restrictions on the development of the center.

In addition to the minimum acreage required for the shopping center itself, adjacent land should be readily available around the center so that buffer zones and other uses can be introduced to protect surrounding property and prevent uneconomic development of the areas around the center. This buffer space, which should be devoted to landscaping, parkways, many non-commercial uses, or multi-level parking, will not only give the shopping center the opportunity to expand beyond the present shopping requirements but also protect the values of the residential area which now, or will in the future, surround the project.

Grading Area Possibilities. The site should have no physical characteristics that make the development of large parking areas costly. The act of parking should be simple, trouble-free, require little or no attendant direction, and cost the customer at no cost to him.

... room for expansion, buffer areas

Multi-level parking, by its very nature, is not simple nor trouble-free and, because it is more costly to provide, will have to be charged to the customer in some form or other.

... no grading complications

Nearness to Utilities. Usually the only large parcels of undeveloped land available or desirable for shopping-center projects are on the fringe of the city where water, power, and sewers are limited or non-existent. The power requirements for a shopping center are heavy and (in addition to the normal sewerage requirements) the large areas of impervious material

... near adequate utilities

necessary to provide adequate parking create a new storm drainage problem. Hence the architect must be satisfied that, if these utilities are not on hand, the program for their development is sufficiently advanced to guarantee their availability by the time construction is completed.

Favorable Zoning Conditions. In gen-

eral, sites suitable for shopping centers do not occur in areas already commercially zoned. Usually they are undeveloped farmland, ripe for residential development, or areas which have been reserved for speculative purposes and are already surrounded by well built-up, protected, residential sections. Present city planning sets aside large areas of organized space for potential commercial development but, in the past, the practice has been to zone for commerce in strip fashion along the highways or streets.

Because of the unfortunate history and experiences of extensive strip-commercial developments in residential areas, any attempts to re-zone usually encounter intense local opposition which must be met by a carefully organized educational program. The owner must be warned to weigh the political temper in the area before he embarks on an extensive program which may not be realized because of community opposition. A new zoning category for planned shopping centers is possible, and has been adopted in some instances. If it is carefully drawn, it will grant certain new rights and impose certain new restrictions.

Comparative Excellence. It is essential that the project be in an impregnable economic position; hence the site must be, from all points of view, the *best* in the entire area. It must be impossible for another project similar in size and scope, but better located, more convenient, and protected, to be introduced and, because of its improved services, to compete successfully with the center. A few minutes additional driving time, or the acquisition of another piece or two to complete the parcel, may be all that is required; but the economist and the architect must take a strong position in this matter, since the future success or failure depends largely on the center's ability to completely dominate the area.

Nearness to Homes. The site should be in or near an already established and well

developed residential area or in an area so ripe for development that, by the time the shopping center is constructed, the residential growth around the center will be well advanced. Certain types of activities necessary to make a complete and well rounded one-stop shopping center, such as drug and food stores, need for their healthy growth the day-to-day pull of neighborhood shopping requirements.

Reasonableness of Price. This factor must be carefully considered. The cost of the large areas of parking required must not be disproportionate to their value. If the site is truly the best in the area, it may sometimes be advisable to pay a premium to secure the economic position of the project.

Sometimes, unfortunately, the exact right spot can't be found, and it is then that the reports, studies, and analyses of the architect and economist are of the greatest value and importance. Even though accessibility seems to be the most important single consideration, it may be that in a particular site all of the other factors are so importantly solved and satisfied that the considerations of accessibility are secondary. The problem then becomes a mechanical one of providing the best possible scheme for the distribution of traffic that can be achieved with the limited means at the architect's disposal. Northgate, near Seattle, reaches out by secondary roads to the main highway. Framingham, near Boston, with a relatively short frontage along the major limited-access highway, provides an independent circulatory road around the entire project. At Northland, planned for Detroit, the center was pushed well back from the two major highways which intersect at one of its corners, and divided road systems were introduced within the site to tap and increase the importance of the secondary roads which surround the area.

There are many cases where the only available site has been smaller than the

economic survey indicated necessary because it was good in other ways selected by the owner. At Bayview, planned for Oakland, California, the problem of limited space was solved by split-level shopping, making space available for split-level parking. At Skokie, planned for Chicago, the problem of extensive shopping facilities on a limited site has been solved by multi-level parking.

Sometimes it is necessary to select a site with such a difficult terrain that building all on one level is impossible. This problem has been solved by the interrelationship of the levels, at Canoe Plaza Shopping Center, planned for New Jersey, and Woodridge Center, being planned for Houston, Texas. Expediency might even dictate the selection of a site split by a major highway. But the example of the Montgomery Ward Company and the Broadway Store complex near Crenshaw Boulevard in Los Angeles indicates that almost any expense is justified to reroute such a highway, either over or under the project. At Montclair, near Houston, the major freeway which bisects the property will be rerouted overhead to serve the extensive roof-deck parking area, which the irregularities of the site made necessary.

Sometimes (too often!) the architect is confronted by a site optioned or purchased by the owner without the benefit of an economic survey. In this case, the architect must insist, for his own and the owner's protection, that a proper review is undertaken by a competent economic analyst before he accepts the project and prepares any plan for the site.

In attempting to approach as close as possible to the ideal site, we feel that the architect, the economist, and the planner should always remember that the customer in the automobile is the element around which the entire concept of a shopping center has grown; that it is difficult to persuade her to drive farther if this will lead to shopping in an atmosphere of maximum convenience, effort, and uncomplicated surrounding

land usage

The site planning of a regional shopping center must be done by the architect, with the closest collaboration of the economic consultant. At each stage of its development, the site plan picks up additional attributes, solves additional problems, and creates new ones which must be solved again. The planning stage is a fluid one, and no plan can be frozen until the multi-

tude of requirements is fulfilled. Throughout the planning phase, seldom is one stage distinct from another. But, in order to clarify the planning process, the various steps leading up to the final site plan are explained separately.

The land-usage plan is actually an assignment of land to the various activities which take place in a shopping center.

The required rental area is obtained from the economic analysis; the necessary service and public areas are added to the requirement; minimum parking requirements are estimated; space is assigned to roads, landscaping; and other incidental uses. Then, working with the special characteristics which every site has, plan is blocked out to fit the land require-

Two-level merchandising (above), combined with split-level parking, allows high land coverage at a center planned by Victor Gruen architect. A roofed-over mall permits some concessions to be planned without store fronts—true “open-front” shops.

schemes are tried and discarded in search for the one meeting most of the principles of good shopping-center planning.

A store group which can be merchandised to provide the greatest interplay between stores.

Minimum walking distances, both to the parking areas to the stores and within the store group itself.

Elimination of all poor store locations, difficult or isolated parking locations. Separation of foot and auto traffic, and elimination of all service facilities to the public consciousness.

A center efficient to operate.

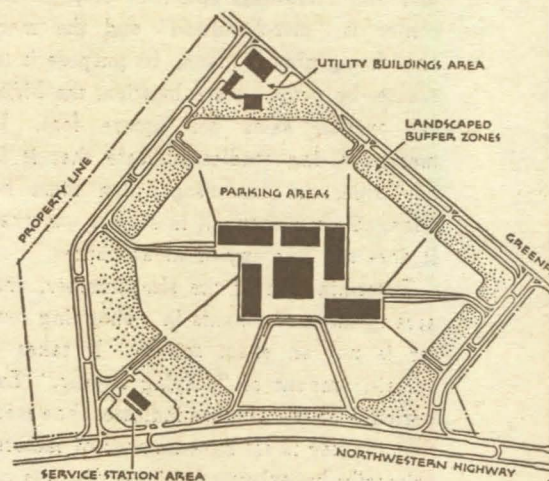

A unified building group which will make a shopping center, not an assemblage of miscellaneous stores.

And all this must be beautiful, inviting, comfortable—have a “shopping atmosphere.”

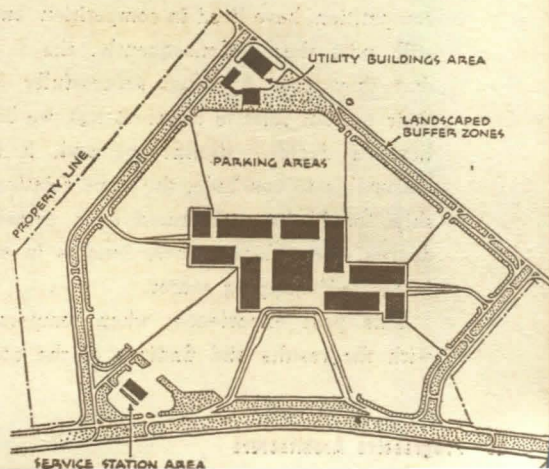

Often the land available is not sufficient to meet the ground requirement for a split-level center. In such a case, it is necessary to double-use parts of the site, with double-deck parking,

or two-level merchandising, or perhaps both. A site which requires intensive use of the land can lead to very interesting solutions, once the obstacles of double-level planning—vertical circulation and parking accessibility at each level—are solved. Two centers now on the boards required a very high coverage of the land—too high to allow single-level planning. Double-deck parking was considered and discarded in favor of two-level merchandising. Both sites were nearly level but, by grading, split-level parking was introduced, which made parking directly available to each sales level. Vertical circulation is by ramps, stairs, and escalators.

In other cases, the site is more than ample for the shopping center proper. This is true of the J. L. Hudson Northland Center where it was possible to provide adequate buffers, place land in reserve for future expansion of buildings and parking, and devote other land to high income subsidiary uses, both commercial and residential,—a city in itself with all land planned for its highest use, providing the most pleasant and efficient living, shopping, and business surroundings possible.

Northland Center, Detroit (above), is planned by Victor Gruen's firm with buffer strips which can shrink as the parking areas expand (below).

Open-air mart in Mexico City . . . elementary merchandising.

merchandising

After the economic analysis has been made and the land-usage plan developed, the center is "merchandised" and the merchandising plan is made. Its purpose is to create, by proper store location, the highest *over-all* sales per square foot. If merchandising studies indicate that it is advisable, the land-usage plan must be changed—but changed in such a way that it does not lose any of its attributes.

Determination of the size, number, and arrangement of tenants in a shopping center is not an exact science. It takes a certain amount of "playing by ear." Experience of the authors indicates, however, that the key is set by a number of factors, primarily by existing business districts on conventional street patterns. This is because existing business districts are the result of competition. They were born in competition, have lived in competition, and still exist there. Consequently, the fact that they have operated successfully in their present relative locations has, we believe, a decided significance and, it is reasonable to conclude, the same relationship should be maintained to a certain degree when placing these tenants in an integrated shopping center.

This past experience, when tempered with the results and findings of the eco-

nomic analysis, provides the basis for establishing the size, number, and type of tenants for a shopping center.

the traffic generators

Assuming that the size and number of stores have been determined previously, the arrangement of those stores in a plan becomes first an architectural problem. The architectural design must lend itself to the arrangement of stores in such a manner as to locate "traffic generators"—which are the major department stores, food stores, and other major tenants—in such a manner as to direct the flow of traffic by the doorways of smaller tenants. The importance of creating traffic for the smaller tenants is pointed up when a study is made of the rents per square foot which can be realized from small tenants, in comparison with the larger tenants.

For instance, we know of no case in recent years where a major department store has executed a shopping-center lease to pay a percentage in excess of 4% of its sales. When that percentage rent is applied to what is considered a good merchandising job, namely sales of \$60 to \$70 per square foot of gross building area, it indicates that the maximum department store rent will be approximately \$2.50 per

square foot. For a good market in a location, a good lease with a tenant of strong credit may call for a rent of 2% on sales, and a top operator will reach a rent of from \$100 to \$150 per square foot of gross area, which indicates a maximum rent of somewhere between \$2 and \$3 per square foot.

the small shops are of equal importance

Small shops, besides paying excellent rents, add interest for the customer to the shopping center and actually contribute to higher sales by the major tenants. It is not uncommon for shops for candy, hosiery, millinery, etc., whose area requirements in most cases do not exceed 1,500 square feet per store, to earn 10% leases and, even if their sales are \$30 per square foot, they would pay as high as that paid by the major tenants. In most cases, the sales of those small shops approach \$70 or \$80 per square foot which would indicate a rental return over \$7 per square foot. Between the small stores and the big stores, the whole range of others whose importance should not be lost due to the fact that they are not so-called "name" tenants.

If the owner expects to receive a 15% to 20% rental return in his shop-

we believe he cannot overemphasize the importance of placing the small center in a location that will allow them to capitalize on the pedestrian traffic created by the major tenants. We believe it is impossible for a regional center to thrive without a major department store and other major tenants, such as variety stores, food stores, etc. The advertising effort of these large tenants which generates the customer acceptance of the center and actually establishes its status of the trade area.

Importance of balance

Therefore, our conclusion that a

center of all "big names" may be successful, but will fall short of obtaining the last 15% or 20% of revenue possible from a shopping-center development. Likewise, a center consisting of all small stores with high-rent-paying capacity might fail, due to the lack of sufficient traffic which would be provided by the larger tenants. Consequently, a proper balance is necessary between traffic generators and the high-rent-paying smaller tenants. An architectural plan capable of placing the small tenants in the path of the pedestrian traffic generated by the larger tenants is of utmost importance.

It might be taken from the above argument that the ideal center would be one

having just enough "name" traffic generators to bring customers to the center, with the rest of the project devoted to high-rent-paying small tenants. This is very far from the truth, since there is one more condition which must be fulfilled and that is completeness. In addition to traffic generators and high rent producers, there must be an adequate selection of tenants who do not, themselves, generate traffic or pay high rent but who do provide the necessary facilities to insure a complete selection of merchandise and make the center a true "one-stop" shopping center. In this category, we would include furniture stores, hardware and appliance stores, and stores for miscellaneous services.

traffic and parking

A traffic-and-parking plan must define a flow of traffic into and out of the center. It must balance parking demand with parking facilities. It must answer the requirements of land usage and merchandising. To do all these things, it must be based on a thorough analysis of the particular traffic and parking situation. Usually, there is no more controversial or politicized aspect of shopping-center planning than the matter of parking. Just as important, but generally overlooked, is the matter of *shopping-center traffic*. Together, these two functions pose the twin problems: how many parking spaces will be required for a given shopping center? and what facilities will be required to handle the flow of traffic to and from these

answers to these questions are governed by a set of factors which varies for each shopping center and most of these factors are indeterminate in the planning process. The various ratios 1:1, 2:1, 3:1 are only approximate to apply to a project of a regional shopping center and, if they were exact, they apply only to that project, leaving the traffic problem un-

al years ago, the Smith and Gruen firm decided to undertake a series of studies of existing regional centers,

hoping that a pattern of operations might exist between centers on which the operations of a proposed center might be predicted. Three such surveys were conducted of different sized centers in different locations. The number of cars in, out, and parked was tabulated each half-hour for a full shopping week. Also observed were passengers per car, truck traffic, and boundary road conditions.

The statistics were reduced to a common denominator—the number of cars performing a given operation per 1000 sq. ft. of rentable area—and curves were then constructed from the three sets of figures. These curves proved that, although shopping centers do vary in their parking and traffic requirements, there is an amazing similarity as to volumes, peak hours, and the general pattern of operations. From the three curves, it was possible to construct a mean curve, representing the operations of a hypothetical shopping center, which could be used as a norm with which to compare proposed shopping centers.

Eventually, a technique was evolved for estimating not only the parking needs, but traffic requirements as well. Whereas this technique by no means results in a down-to-the-last-car prediction, based as it is on actual operations, the chance for error is

reduced to the minimum. Mainly, such possibility of error as does exist is limited to the estimate of expected trade, and this estimate is probably the most carefully considered figure in the entire shopping-center analysis.

In order to project the figures obtained by observation to the operations of an unbuilt shopping center, a comparison must first be made. Will the proposed center do more or less business than those observed? Are the trade-area economic levels and car registrations similar? Are they comparable in size? Is public transportation of the same or similar quality? Once these questions are answered, the observed operations are adjusted up or down and applied to the proposed center. For example, assume that a regional shopping center of 800,000 sq. ft. of rental area is being planned for a medium income area, in a city with a high ratio of cars per capita. It is compared with an observed center of 650,000 sq. ft., located in a similar area, and doing a moderate volume of business.

The economic analysis indicates the proposed center has an excellent net potential—nearly 20% greater than that of the operating center. Other considerations being equal or nearly so, we judge that the proposed center will enjoy a 20%

TYPICAL "OUT" TRAFFIC

HOURS 12:30 - 9:30

volume of business per square foot of the existing one whose operations we are to replace. Armed with this estimated coverage, it is next possible to consider shopping traffic from its point of origin to its destination, and back again—incoming traffic, and outgoing traffic.

The existing center was observed to handle the weekly volume (Table 1).

The estimated 20% increase for the new 800,000 sq. ft. center results in the weekly volume (Table 2).

Since the daily over-all volumes have been estimated, in order to determine the distribution on the major access roads and the time and intensity of the traffic periods, the following analysis is made.

Origin of Trade. The number and location of expected customers and the size of the trade area, can ordinarily be obtained from the economic analysis. Factors which tend to reduce auto-borne traffic—such as walk-in trade and trade by public transit systems—should be identified and the proper deductions made from the net expected customers to arrive at the net auto-borne population. It sometimes simplifies the procedure if the various groupings of net auto-borne population are converted to percentages of the total.

Traffic Volumes. The net auto-borne traffic can now be traced to the center

over the most logical trade routes. The figures used can be either percentages of the total net trade, or these percentages can be converted to actual cars per day by applying them to the expected total cars for any given day. Traffic volumes are computed by distributing the population among the various roads and then, starting at the outer limits of the trade area, totaling them cumulatively until the site is reached.

Since there is a wide hour-to-hour variation in traffic volumes, it is next necessary to break down the daily total into hourly or half-hourly subtotals. The Smith and Gruen offices found it possible to plot the number of cars "in," cars "parked," and cars "out" from curves based on the operations of existing centers which show a definite similarity in these operations. From these charts, a "mean" curve can be constructed and then, working from the total traffic expected each day, a tabulation of the operation can be computed. Considering Friday, when approximately 18,300 cars are anticipated at the proposed center, the day's operation would be as shown (Table 3).

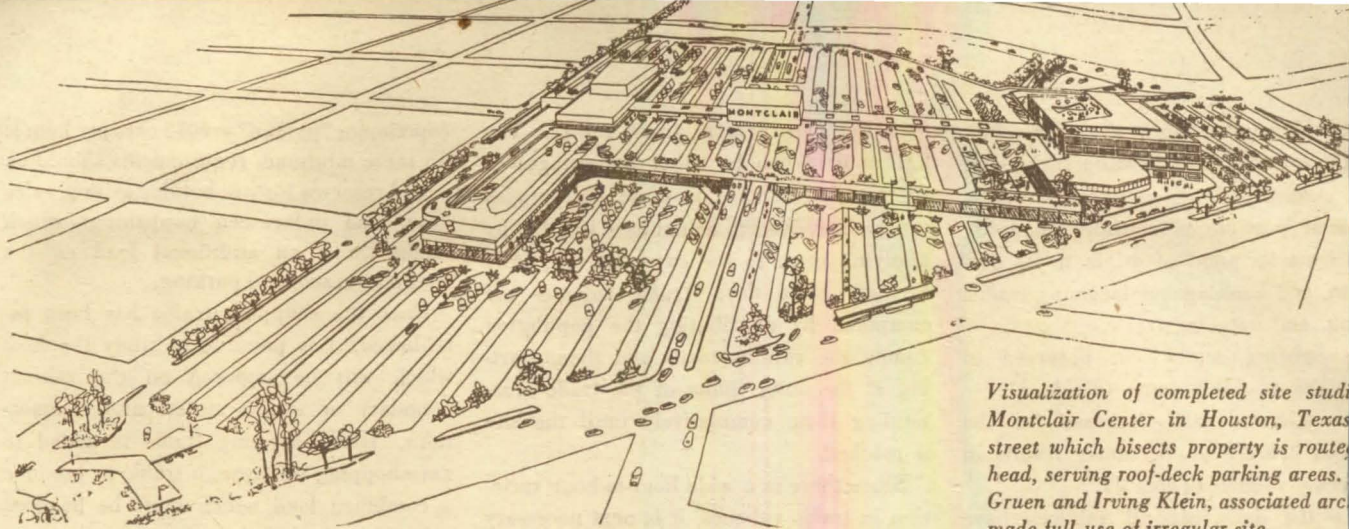

This tabulation forms the basis for establishing the required number of entrances (maximum "in" load=3412 cars per hour), exits (maximum "out" load=3596 cars per hour), and parking stalls

(maximum "parked"=4042 cars per hour). To these minimum requirements should be added reserves for pre-holiday selling, sales days, and unforeseen happenings which might throw an additional load on the shopping traffic and parking.

Once the shopping traffic has been established, it is possible to study the load which will be imposed on the critical boundary or access streets and intersections. Here shopping traffic is added to non-shopping or through traffic to produce a combined load which must be handled smoothly if the shopping center is to operate efficiently. A car count is taken of the existing traffic on all boundary roads, tabulating volumes for each half-hour of the shopping week. This is projected forward to the date the proposed center is expected to open, and adjusted for population increase, new highway facilities, etc. The shopping traffic is then broken into half-hour totals for each day and added to the non-shopping traffic, producing a combined load which the roads must be designed to handle. The boundary roads will carry the most critical loads and the locations of exits and entrances to the shopping center can have a great effect on these loads. The entrances and exits must be located as strategically as possible in order to balance the traffic flow about the center.

Visualization of completed site study for Montclair Center in Houston, Texas. Street which bisects property is routed to head, serving roof-deck parking areas. Gruen and Irving Klein, associated architects, made full use of irregular site.

the site plan

This plan is the culmination of land-usage studies, merchandising plans, and parking and traffic analyses. It is here that the refinements are made. The basic requirements have been determined and fulfilled. But, faced with the complexity of area requirements, rents, car counts, intersection studies, truck traffic, drainage conditions, tenant demands, etc., architecture though not forgotten, is sometimes

temporarily moved to the background.

The architect designing a regional shopping center faces one of the great opportunities of his day. Projects of this scale have been rare since the Renaissance and what is lacking in experience must be made up for by skill in mastering the spatial relationships, the landscaping, the walks, the vistas, the atmosphere to produce a beautiful and harmonious whole.

shopping-center type plans

Basically, there are five types of shopping-center plans. These types are often used in combination, and each has many variations.

1. *The Strip.* Most store groupings stem from this "line of stores." It is efficient and economical to place stores side by side with common end walls, a united front, and service concentrated in the rear. The strip can be adapted to neighborhood and even, at times, to district centers. But, as the size of the center increases, the advantages of the strip are outweighed by the disadvantages. It becomes too elongated, difficult to merchandise, foot traffic is diluted, and walking distances are increased.

2. *The Court.* By shaping the strip into a court or series of courts, its basic advantages are retained while new ones are added—visual distances are decreased, walking distances can be lessened, and foot traffic improved since more key store locations are created. The court is adaptable to neighborhood and district centers and, by double-use of the site, to regional centers.

3. *The Ring.* A closed court. This basic type shapes the strip into a ring and in so doing creates equal trade locations and, consequently, increases foot traffic. Walking distances are reduced since almost all retraced steps are saved. If the court in addition to the periphery is used for parking, the stores enjoy excellent contact with the parking areas. This type can be used for neighborhood and district centers, although, in this case, the inner court will not be large enough to use efficiently for parking. A regional center, however, develops sufficient diameter to devote the inner court to parking.

4. *The Mall.* The mall is essentially two strips, face to face. This simple shift in grouping has tremendous advantages which increase as the size of the center is increased. First, it is possible to double the building area with no increase in walking distances. Second, the volume of foot traffic is greatly increased. Third, more strong store locations are created. And fourth, if the center is large enough to warrant the expense of underground delivery, a single service road below the

mall will serve the stores on both sides. Inherent in the mall scheme is the possibility of covering and closing the mall for winter weather. The mall is being planned for Woodridge, in Houston, Texas—to provide air-conditioned walks, complete weather protection. The type is adaptable to any size center, from the neighborhood arcade to the important regional mall.

5. *The Cluster.* The cluster plan, which is a carefully plotted informal grouping of stores, can range in size from the "farmers' market" with a dining center at its core, to the huge regional center with a major department store for its anchor. In its small form, the cluster is akin to early bazaars and market places. At regional size, the cluster can combine four of the basic types—strip, court, ring, and mall—to produce a tightly integrated store grouping with a maximum in contact between stores. Extreme care must be taken with this plan type to maintain contact between the parking and store areas, and to avoid "lost" store locations. Although very difficult to plan, the cluster scheme has great possibilities.

wn eating place which has been boon
ther tenants.

Shoppers' World, Framingham, Massachusetts; Ketchum, Gina & Sharp, architects; Kenneth C. Welch, economic survey. Among contemporary shopping centers, this is an example of the mall-type development. In contrast to others, such as Northgate in Seattle, the principal department store is at one end of the mall, with another major store planned ultimately to close the opposite end of the mall. The planning and merchandising theory here is that for such a great development there must be two principal "pullers." Site has a rather narrow frontage; parking area surrounds the stores.

Picture above shows a busy day at Shoppers' World in rather mild weather, with the two-story pedestrian arcades open to the landscaped central mall, which is eight feet below the level of the parking space. The same arcades are shown (left) glazed against winter weather. Note the discipline in the use of signs—here the management controls size and placement, both on the outside of the arcades and on the walkways themselves (in comparison to the greater freedom suggested later on in this issue).

Owner-Architect Contracts

standard forms of agreement as issued by the A. I. A. provide basically for two types of agreement: Forms a-102 and b-102, in which a percentage of the cost of the work forms the basis of payment to the architect; and Form 103, which is based on the fee-plus-cost system.

Experience seems to indicate that the first-mentioned type of agreement, the percentage type, is not at all practical for shopping-center contracts. The reasons are many: the long pre-preliminary period and the number of people involved as consultants and tenants are among them. The fee-plus-cost system would seem, on the basis of some experience, to be much more adaptable to shopping-center design. However, even this agreement should be used only with considerable changes.

First, a special arrangement should be made for the period of exploratory work which precedes the service referred to in standard architectural projects as preliminary work. As we have attempted to explain step by step in this issue, many studies have to be made before, what are commonly referred to as, architectural preliminaries can be started—and the architect should be involved in all pre-preliminary matters. At various stages, he will be called on to present studies for leasing and financing purposes. This exploratory period may last anywhere from a few months to a few years. Only when the basic land-use plan has been agreed upon by owner, economist, and financial institution and when the main tenant or tenants have in principle agreed on the terms of a lease, can the architect start to undertake the work which is usually referred to as “preliminary.”

It seems to be obvious that, for the entire exploratory period, only a highly flexible arrangement could be practical. Victor Gruen's office uses, for this period, an arrangement by which it is reimbursed for actual drafting cost, for overhead in the form of a percentage of these drafting costs, and for other out-of-pocket expenses; it uses a fee which is expressed as a function of the drafting cost.

In such a preliminary agreement, the typical Gruen contract provides that the project can be terminated by either side on proper notice (60 or 90 days), and that neither side shall have any obligation toward the other if the project should not be executed at all, or if the owner does not desire to continue to employ the services of the architect—with the proviso that, in that case, he shall not use the architect's plans, ideas, or any part thereof.

Once the exploratory work is concluded, the A. I. A. Form 103 could well be used. However, Victor Gruen offices find the following changes and additions practical:

1. At this time, the size and nature of the project can be documented by photostats of the site plan and basic program which has been agreed upon in the exploratory stage.

2. Clear provisions concerning changes of the fee in case changes in the program should be made. (They could, for example, refer to changes in the square footage of building area, or to extra cost for changes which make completed drawings obsolete.)

3. Paragraph 3B of the agreement—which deals with sums paid to structural, mechanical, electrical, sanitary, or other engineers—should be enlarged in scope to include consultants for lighting, landscaping, graphic work, land planning, etc.

Because of the complex nature of shopping-center planning, the architectural cost is considerably higher than that for projects of similar size in the housing or office-building field. The repetitive tasks which occur in the other fields are not as prominent in shopping-center planning, and many factors which do not occur in other fields are present in shopping-center design. If it is necessary to give an estimate of architectural cost (which should never be guaranteed) or to submit a guaranteed minimum cost (which is not desirable), these facts should be borne in mind. Architectural costs, even for very large shopping center projects, should probably be estimated to run between 5% and 7% of the total construction cost.

If signs and lettering are considered a part of the total design problem, there can be a much better co-ordination without loss of merchandising appeal. An instance is the picture (right) of the Shopping Center for the Palo Alto Consumers Co-operative Society in California; Bolton White and Jack Hermann, architects.

What can happen when intentions are good but control is lacking is indicated by the sad case of real-estate signs, directional signs, and ads pasted on show windows of the shopping center in Tarzana, California (left). It was designed by the architects, Palmer & Krisel, with the restraint which the rendering (left, below) indicates.

Sketches of storefront and sign treatments, from the office of Victor Gruen, indicates what can be done within the terms of a reasonable lease arrangement such as the one outlined in the following article.

Storefronts and Signs in Shopping Centers

forces, that seem to be hostile to one another, influence shopping-center design, to pull it in different directions. There is the desire for architectural unity; there is, however, the desire for full expression of the individual character of tenant stores.

The clear victory of the second tendency is seen in the strip developments along urban roads and highways. Here stores of different depths and various heights will zigzag toward the parking area, another zigzag toward the sky. Colors and materials of neighboring stores clash violently, and signs try to outdo each other in size, garishness, and light intensity. The absurdity of the competitive effort of neighboring stores was most effectively illustrated in an old Chaplin comedy when Charlie, the store owner, caught himself in the middle between two "gorgeously" redecorated neighboring stores, saved his business by affixing a large sign on his shop front reading "Main Entrance."

It is much less easy to find examples of the uniformity of storefront treatment—at least, they are hard to find in existing shopping areas. Very often, projects which provide for the strictest stand-

ardization are started with great courage, only to experience defeat after defeat during the leasing period, the final construction period and (worst of all) during the years following the opening of the center. This is not surprising, if one remembers that a shopping center is by no means an institutional enterprise, but a voluntary cooperation of individual tenants.

Shopping centers are constitutionally organized along the lines of a federal republic: the owner, or shopping-center management, represents the federal government; the tenants, the different states. Certain laws and institutions serving the overall interest will be administered by the management; others can be, and should be, left to the tenants. In most instances, the division of authority is a pretty clear one. There is usually full agreement that the store interiors shall be individually shaped by the tenant in accordance with his needs. There is mostly agreement that parking, landscaping, utilities, general upkeep, and maintenance should be taken care of by shopping-center management. But there is one area of conflict—storefronts and signs.

Architects who have worked on store de-

sign will always stress the point that each individual store needs an individual expression on the outside. Some merchandise calls for open fronts, other products for big show windows, still others for small show windows. Some stores need vestibules or so-called arcades; others, just a straight glass wall separating exterior from interior.

There is no doubt that when each store is given the exterior treatment which best expresses its individuality and its merchandising methods, it will function best and, therefore, be of the greatest value to the shopping center as a whole. Individual storefront treatment should be encouraged, but this does not have to result in a disorganized appearance if a number of measures are taken to protect architectural unity.

One of these measures is the creation of the basic architectural elements which form part of the over-all design of the center. Uniform roof lines, parapet walls, canopies, colonnades, exposed columns, and color schemes must be strong and clearly defined. The more strongly the over-all character is stressed by architec-

tural means, the more liberal can be the policy concerning individual expression in store exteriors.

For instance, the Victor Gruen organization has used the colonnade instead of a cantilevering canopy in many cases, because it seems to offer two advantages: It provides a strong rhythmic architectural element which gives character to the shopping center itself; and, it permits the establishment of the storefront line in an area where no columns occur, so that com-

plete freedom concerning store sizes and storefront treatments is achieved.

Another measure is architectural control of tenant storefront design. This control should be anchored in the lease and should not only provide a clause requiring all plans to be approved by the owner, but should also give the tenant a clear indication of the requirements which the owner will consider desirable and on which approval or disapproval will hinge.

A similar policy should prevail concerning tenant signs. It seems to us of utmost

importance to keep tenant signs restricted to the storefront areas of the individual tenants themselves. On the other hand, the greatest freedom, within the bounds of good and sound construction, should be given to the tenant signs which are attached directly to the storefront. They should be subject to architectural control, but here the tenant should be told in the lease, not that the owner's permission is required, but also the considerations on which granting or refusal of such permission should be based.

TYPICAL LEASE CLAUSES GOVERNING ARCHITECTURAL AND CONSTRUCTION STANDARDS

General Principles. In establishing architectural and construction standards, the management is guided in this matter by the belief:

That a shopping center is basically an expression of the effort of many individuals to co-operate with each other to achieve the highest degree of service for their customers and, from this, the most profitable operation for themselves.

That this co-operation will find its clearest expression in the public services provided by the shopping center, and in the exterior appearance of the individual stores.

That the individual stores contribute most to the total visual effect of the center if they, on one hand, maintain individual expression and thus add interest, variety, and color to the total project and, on the other hand, relate harmoniously to the general character of the center and to their immediate neighbors.

That an integrated shopping center is a place to which prospective shoppers come with the express purpose and intention of shopping; therefore, the large flashy signs, loud color scheme, noisy designs, deep arcades (which are necessary in downtown areas) can be forgotten.

That the shopping center itself, by virtue of its size, public features, and general advertising value, offers each tenant the opportunity to keep his storefronts and, especially, signs simple and in good taste.

The management believes that these principles are not only in the best interest of the shopping center as a whole, but will provide the greatest benefits for the individual tenant, and that the guiding motive

in the development of the tenant storefront should be conformity, but not uniformity.

Therefore:

1. All entrance doors must be recessed in such manner that the door openings to the outside will not cross the general storefront line.

2. Arcade fronts are to be considered undesirable and unnecessary; however, if in some special cases, an arcade front shall be held necessary by the lessee, then the depth of the arcade will be limited to its width.

3. To secure a clear separation of one tenant store from the other, and to avoid possible clashing in materials and treatments, there will be a neutral strip between each store of a minimum of 12 inches in width. The center line of this neutral strip will coincide with the line defining the leased spaces.

4. To avoid areas which will not provide points of interest to pedestrian customers, blind walls more than 20 feet in length will not be permitted. The break separating blind wall areas must be of a major character, such as a glass-wall view into the store or a large-scale show window.

5. Signs should be regulated as follows:
 - a. All designs for signs shall be subject to approval by the owner.

- b. Signs shall be of substantial, easily maintainable construction and conform with all regulations of the Building Code.

- c. No sign or any part thereof shall be higher than 4 feet.

- d. The location of signs is restricted to the storefront proper.

- e. No electrical signs of the moving flashing type shall be permitted.

6. No storefront or any part thereof shall project beyond the lines described in the leased premises, with the exception that signs may project beyond the general storefront line not more than 6 inches.

7. The center provides general sun and weather protection by covered colonnades sufficient to cut the sun's rays down to a 45° angle. In certain cases, additional protection will be provided by awnings furnished by the owner and operated by the tenant. In such cases, the awnings shall carry a standard, uniform sign panel with the name of the store located beneath the awnings. Individual awnings will not be permitted; however, the installation of awnings, skirts, or interior, plastic, sun shades shall be permissible.

8. It is the desire of the management to give the tenants the greatest possible freedom in the choice of materials; however, materials must be fireproof and lend themselves to easy upkeep and maintenance and must offer a pleasant, orderly appearance.

9. It is the desire of the management to give the tenant the greatest possible freedom in the choice of colors. However:

- a. Colors must harmonize with the general color scheme of the center itself and, especially, with the columns of the colonnade.

- b. Colors must harmonize with the general color scheme of the surrounding stores. To the tenant, a general color range should be developed, with a sufficiently large selection to permit a wide latitude of individual expression.

THE SHOPPING-CENTER STRUCTURE

selection of the structural framing for a shopping-center project is affected by many factors. Some of these are constant; others, however, vary greatly in relative importance from project to project. A preliminary, general study of the problem will lead to a recommendation for one preselected system, but will help to establish the basic relationships characteristic of the project. Such a study will also indicate which of the most recent developments in structural design promises most

for development and application to shopping-center framing.

We shall list the most important factors affecting structural framing and briefly examine their influence on the selection and development of framing schemes.

size of project

A small shopping center, especially if located far from a large city, will probably be best framed by the conventional methods prevalent in the region where the center is

located. Imagination in applying such common systems as trussed rafters, open-web steel joists, or beam-and-slab concrete framing can bring entirely satisfactory results. On the other hand, a regional shopping center, located where competitive, aggressive, and experienced contracting firms are available—covering several hundred thousand square feet of floor area, and designed so that a repetition of typical elements will occur on a large scale—offers an excellent chance for an investigation of the most ad-

Figure 2—"waffle-type" flat slab designed by Edgardo Contini of Vignelli Associates, Inc., and Gruen Associated Architects & Engineers, for Northland Center.

vanced design techniques and for original developments conceived to most satisfactorily answer the requirements of the largest number of effecting factors. In such a case, the investment in design and construction experimentation will be well justified by the possible economies and advantages achieved.

location of project

Location will effect structural design in several ways. Differences in building codes (particularly the reluctance of some building departments to accept new techniques of analysis or tests, or of departing from obsolete and arbitrary restrictive rules) may penalize the use of certain materials. Climatic differences evidently bring complex and controversial influences. The supply of some materials is also effected by geographic location. The economical availability of good quality lightweight aggregate for reinforced concrete is, for one example, geographically limited for the present by the high cost of transportation for a material of such bulk. Further, established habits of local contractors have to be

accounted for. There are still several areas where precasting techniques are frowned upon as something very daring and experimental.

physical characteristics of site

These characteristics are likely to govern the selection of the foundation system. Where unusual soil conditions are encountered, site characteristics represent an important secondary factor effecting the selection of the framing for the superstructure.

The foregoing factors, of course, are not peculiar to shopping centers; however, they combine with the more specific ones (which follow) in effecting the final selection.

selection of column spacing

There are three primary types of buildings generally present in a large shopping center:

(1) The typical row-type building. These are one or two stories high, 100' to 150' in depth, and will accommodate tenant stores of different widths.

(2) The special-purpose-type building. Accommodating major department stores,

these may be multistory and, in general, have a compact plan shape.

(3) The supermarket-type building, usually one story high.

All of these, from a merchandising point, will benefit from complete elimination or, at least, reduction to a minimum of interior bearing supports. On the other hand, long unobstructed spans, if feasible from an engineering standpoint, undoubtedly conflict (especially for floor framing) with the primary underlying factor of construction. Cost has not previously been mentioned simply because, within the economic framework representing the presence of a shopping center, it effects no others.

At present, very large clear spans are economically feasible for roof framing. Large spans, up to 200' or 300', can be achieved by means of trusses, arches, space frames, and, more dramatically, by means of domed structures of thin concrete or structural steel framing (Figure 1). On the other hand, it is very likely that the existing concepts in department store planning are enabling great framing depths without

Figure 4—detail (left) of welded connection for columns and girders in field-welded steel frame of Robinson's Beverly Hills store.

ful space, or new structural development, such as the practical application of stressing techniques for concrete, allow an increase of economically feasible column spacing beyond the present standards. It is unquestionable that the challenge facing engineers concerned with shopping-center framing is the development of economical as well as structurally sound larger spans. In general, it has been found that merchandising layout of department-store-type buildings suggest even spacing in both directions. With concrete construction (for which many interesting optical methods of determination have recently been developed) lends itself for column spacing up to 30'. For larger spacings (or, under present restrictions, for maximum economy of reinforcing steel) concrete-type flat slabs are very satisfactory (Figure 2). Were it not for the present conditions, however, structural steel would provide a very competitive type of framing—especially with an increased use of field welding to create continuity of both vertical and horizontal members. The re-

cently completed Robinson's Store in Beverly Hills achieves a remarkably light steel framing on a 32' x 32' typical column spacing (Figure 3). In fact, it is likely that advanced structural steel design, exploiting continuity in a multi-directional way rather than as the obvious linear extension of the traditional two-way simple-span riveted framing, will soon find successful application and allow lighter framing for longer spans (Figure 4).

For the typical, row-type buildings that are sub-divided into leasable units of narrow frontage and considerable depth, it will be found preferable to minimize the number of interior supports by maintaining a longer column spacing in a transverse direction and a narrower spacing in a longitudinal direction. This solution suggests a two-way framing which, if less economical than flat-slab construction, offers another advantage—that of framing flexibility.

For the supermarket-type building, if present in the project as a separate unit, it is desirable to span the roof as a clear span, if for nothing more than to meet the demand of the supermarket operator who

often objects to having his counter layout dictated by column spacing. Wood trusses, lamella framing, or glued laminated-wood arches offer reasonably inexpensive solutions for clear-span roofs.

framing flexibility

Of all the factors effecting the selection of a structural framing method, its adaptability to alterations is perhaps the most specific consideration. Maximum flexibility is required for the typical row-type building for the following reasons: (1) not all of the space may have been leased by the time the center is under construction or completed; (2) changes of tenancy will undoubtedly occur, in time. It is often desirable to provide for future vertical expansion, rather than by the addition of new wings or buildings. In this manner, the delicately balanced plan pattern of the shopping center need not be disturbed. Thus, it becomes important that the floor framing and the roof framing, if designed for possible floor use, allow for the future openings of shafts for stairs, escalators, ducts, elevators, etc., without creating ma-

Figure 5—all-precast framing system for the J. L. Hudson Company's tenant buildings at Eastland Center, Detroit, Michigan; Victor Gruen Associated Architects & Engineers.

Figure 6—design for tenant buildings of project in Detroit (same owners, architects, and engineers as design above) which is a compromise between cast-in-place and precast elements, in order to conserve steel.

structural difficulties. Changes of this type will not occur frequently enough, however, to warrant an excessive investment to achieve absolute flexibility. An optimum compromise is to be sought; too much is known about the operational demands of shopping centers at present to require that degree of framing flexibility approaches this optimum.

In general, the demands of flexibility factor are not too taxing on structural steel design, which, by its very nature, is eminently suitable for alterations.

Reinforced concrete does impose limitations on flexibility. Flat-slab construction does not lend itself successfully to cutting of openings after construction. This limitation is unfortunate because one of the most interesting recent structural developments, the lift-slab, offers a low flexibility alternative. Two-way framing, previously considered advantageous in the selection of column spacing, is also desirable from the point of flexibility.

In the J. L. Hudson projects, which from their inception were designed for reinforced concrete framing, due to material considerations, an exhaustive study was conducted on the possibilities of precast construction. This technique seemed to present

possible economies as well as excellent qualities of flexibility. In the first project (Eastland), the framing for the typical row-type building has been detailed for all-precise construction—entirely eliminating scaffolding and formwork. The framing consists of 18" x 18" precast columns, spaced 36' on center, which support 18" wide double-cantilever girders spaced 20' on center (Figure 5). A specially designed connection detail allows for ease of erection and at the same time re-establishes a high degree of rigidity between girders and column. Spanning the girders are typical precast 4' wide channel panels of 2½" slab thickness. The two bays between the end of the girders' cantilevers are also framed with typical channel panels; however, they span in a transverse direction. With this system, it is possible to provide at any time for stair or other openings, in either direction, by simply removing one or more typical panels. An all-precise system, though offering the most satisfactory solution for such a large size project, does not achieve the highest economy of reinforced steel—the price is paid for flexibility at the expense of continuity!

For the project presently being detailed (Northland), a compromise solution was

adopted in an effort to achieve the maximum saving in steel tonnage. The framing will consist of cast-in-place, continuous, deep-ribbed pan construction throughout, except on the two interior, center bays where most of the foreseeable future openings may be located. These are framed by means of precast concrete joists, supporting a 2½" cast-in-place slab (Figure 6).

During the preliminary studies, the feasibility of using prestressed elements was investigated. It was found, however, that the high ratio of live to dead load for floor construction penalized the design of continuous elements. It was also felt that the absolute lack of flexibility of a framing system employing prestressed elements would prevent its adoption. Even if additional supports were added to such a framing system, it would be impossible to cut through a prestressed girder. It is possible, however (especially for roof framing where flexibility is not demanded), that prestressing large-size, precast units and applying the strands to the full length of the building, to minimize the cost of anchoring devices and stressing operations, may lend itself to very significant developments in the search for economical long-span framing.

fire rating factors

For department store buildings where large, undivided floor areas are demanded, Class I construction will be required for all but the smallest projects. Either reinforced concrete or fireproofed structural steel can be used. Developments in lightweight fireproofing and in lightweight aggregates for concrete topping are in favor of structural steel framing. On the other hand, the need for flexibility on store ceilings—where lighting fixtures, air-conditioning outlets, and other inserts may need relocations and additions—makes it almost mandatory to divorce the fireproofing ceiling from the finished ceiling. It may, therefore, often be more economical to adopt a basic reinforced concrete structure with finished ceiling suspended directly.

For the typical row buildings, where the total floor area can be divided into smaller units by using firewalls or separations between tenants, the selection of framing systems becomes more complex. This is because differences in fire ratings and consequent insurance costs have to be projected against differences in initial construction costs. Furthermore, the introduction of sprinklers—a reasonable enough investment—will considerably reduce the insurance cost of systems with otherwise high rates. Thus it becomes impossible to give any rule of thumb. In each case an exhaustive comparative analysis will have to be made to determine the most economical solution. It is possible that, under certain circumstances, wood framing—in the form of arches, trusses, glued-plywood-box girders for roofs used in combination with structural steel or concrete girders for floors—may well prove to offer an entirely satisfactory solution.

owner's or tenant's specific requirements

These, of course, are highly unpredictable. It has been mentioned that some supermarket tenants will not consider anything but a clear-span roof. The clear-span domed

roof over the main department store at the Framingham center has also been cited. It is unquestionably a desirable luxury to have an uncluttered area of such size within which to develop the merchandising layout. Yet, other major stores have been successfully planned on the basis of conventional open-column spacing. The conclusion: that the asset of clear span is evaluated with different factors by different tenants.

After having thus surveyed the influence of general factors on the selection of a structural system, a brief mention can be made of some specific framing problems that are characteristic of shopping center projects. It is accepted as almost mandatory that a covered pedestrian sidewalk be provided at the periphery of the store buildings. It is also very desirable to eliminate all columns from the storefront line of typical row-type buildings in order to allow for maximum flexibility in the subdivision of tenants' space and in the design of storefronts. This problem can be solved either by recessing the columns a reasonable distance inside of the store space and cantilevering the horizontal framing, or by providing colonnade columns at the outer edge of the sidewalk. Aside from architectural considerations that may influence the choice, it can be noted that the first solution, involving cantilevers of considerable span, is more appropriate where the typical interior transverse column spacing is also very wide. The second solution, on the other hand, lends itself satisfactorily to any selected column spacing.

If the shopping-center plan is developed around a covered mall, there arises the problem of how to roof (elegantly) the public promenade. The use of long-span, precast elements—possibly prestressed—having integral—glass inserts, so that natural light will not be excluded, may lead to interesting solutions.

If truck tunnels for underground service delivery are a part of the project, special

framing problems will unavoidably arise. It should be noted that often a large portion of the structure's total cost is represented by special conditions of the structure. As a thorough analysis of the typical framing system is necessary to the selection of the most satisfactory and economical structure, so ingenuity and sustained effort applied to the design and detailing of secondary elements, is needed to avoid the danger that some features of the project, otherwise very desirable, may become excessive economic burdens.

conclusions

In view of the fact that so many concepts are still at a fluid and formative stage, the creative collaboration of architect and engineer is vital in the basic design of shopping centers. Inventiveness and daring are as much bound by considerations of economic necessity as spurred by the magnitude and the extraordinary potential of the problem. The shopping center, again, to modern man, the values of the small order, well-scaled environment, the relaxed activity that were characteristic of the old-time plaza or the country market, lost in the fragmentary, unplanned, development of our time's downtown.

These same values are in the process of being reinterpreted for modern man in terms of today's economy, up-to-date technology, and contemporary living patterns. Moving as we are in this direction, we have just traveled the first steps. Tomorrow's "plaza" may well be envisioned as a great, cheerful, informal, air-conditioned space, sheltered by a light, luminous, long-span roof. Within this one space organized and interrelated—merchandise will be displayed and "shopping" will become again a most enjoyable exciting civilized experience! To make this vision into a physical and economic reality is the combined, interplaying imaginative ingenuity of architects and engineers—a challenging task.

SHOPPING-CENTER MATERIALS

Special problems introduced in the selection of materials for a shopping center are related principally to those portions of the building directly affected by tenant occupancy, which would be subject to alteration with a change of tenants. Insofar as the criteria for selecting materials are concerned—unaffected by the consideration of flexibility—they are not significantly different from those for other building types.

Familiar problems exist—some of which are becoming more important because of the special use of the buildings—and are analyzed by the same analysis that the architect customarily makes of existing conditions for any building. Cost, appearance, flexibility, size of project, adaptability for various structural systems, duration of construction, speed of erection, climatic conditions, and maintenance factors—these considerations must be recognized in varying degrees of importance for all buildings.

In shopping centers the maintenance problem, particularly of those materials exposed to contact with the public, is intensified because of the intensity of traffic developed for many hours every day. The problem, then, is to select paving and wall and column materials which require over the years a minimum of maintenance under rigorous use, while providing an agreeable, pleasant atmosphere contributing to the enjoyment of the shopping. Color and texture should be used liberally but not garishly and materials should offer a wide range of color and textural possibilities should be sought.

The selection of materials for a shopping center presents possibilities which are almost unlimited, we shall make this a study of a specific center—the J. L. Company's Northland, in Detroit—in which materials have been selected considering all of the factors previously mentioned.

Cast architectural-concrete facing has been specified for the large wall areas of the major department store as well as for the fascia on the cov-

ered walkway canopies, decorative panels in storefronts, and panels in the pavement of courts and malls. This precast architectural-concrete material was found particularly adaptable for the exterior wall panels of the department store. A sandwich panel 6" thick, consisting of two 2" layers of concrete enclosing a 2" layer of cellular glass is being used. Any desired color or texture is possible for the exterior and the interior side will be finished smooth, ready for painting. The panels are 4'-6" x 24'-0", reducing the number of troublesome joints to a minimum.

The exterior free-standing columns supporting the canopies and covered walks will be of reinforced concrete faced with a vitreous cement-enamel finish. Here, a variation of color was required in a material easily maintained and durable. The colonnade surrounding each court or mall area is in a distinctive color, identifying that area and establishing a unifying framework for the varying treatments of the storefronts which face it. The edge of the colonnade roof will be precast panel-facing throughout the center helping to knit all the elements into an integrated composition.

Splashes of bright color will be introduced into the permanent features of the court areas by ceramic-mosaic tile walls for orientation maps and directory panels in strategic locations.

In the selection of interior materials, the concept of flexibility assumes an important role, and those permitting relatively quick and economical alterations to the tenant spaces should, when practical, be selected.

It is customary for the owner to provide the tenant with finished floor, finished ceiling, and finished walls enclosing his space, in addition to the necessary stairways, toilet facilities and access directly from his space to shipping and receiving services provided for the center, whether at basement or grade level. Within this space, the tenant then provides any additional walls, curtain walls, fixtures, and any finish ma-

terials which deviate from those furnished by the owner.

A mastic-tile finish floor is the best type for the owner to provide consistent with economy, durability, and good appearance and one which many tenants will regard as acceptable without further expenditure on their part. It offers as much flexibility as is possible in a floor finish, and is easily replaced or matched to suit the changing requirements of the tenant.

Ceilings should be of acoustical tile on a suspension system designed to provide maximum adaptability to change. Recessed light fixtures and air diffusers demand this flexibility and it should be possible to provide new openings and close old ones quickly and easily.

The importance of a dry-built ceiling installation in a shopping center cannot be stressed too strongly. Constant changes are being made in fixture layout and curtain-wall location; these changes reflect themselves in new lighting, air diffuser, and sprinkler layouts. Changes in the ceiling must be made quickly and cleanly so that the merchandising operations can proceed without the mess and bother attendant when plaster is torn down, patched, and painted.

In Northland Center the owner will provide an asphalt-tile floor through the merchandised areas and a cement finish on concrete slab in storage and utility areas. The ceilings in selling areas will be a standard acoustic tile applied with mastic to rock lath on a standard metal suspension system. Since the buildings at Northland are of reinforced concrete construction, a fire-resistant ceiling is not necessary. Walls installed by the owner, separating the leased spaces, will be of gypsum-tile construction, plastered and painted. The employees' toilet rooms for each tenant (which are part of the owner's work) will have terrazzo floors, ceramic-tile walls, suspended plaster ceilings, and flush-type metal stalls. Stairs will be standard pan type with channel stringers and abrasive finished-cement treads.

Provision of a central heating and air-conditioning plant will eliminate a multitude of scattered stacks and superstructures. The single plant can be unified in design with the total. Eastland Center (below) by Victor Gruen.

SHOPPING-CENTER MECHANICAL DESIGN

The heating, ventilating, and air conditioning of a preplanned, integrated shopping center is actually one of the most challenging aspects of the project. It is challenging because the possibilities for efficiency in installation and operation, which are inherent in a co-ordinated project, can not be realized without a complete change in the traditional owner-tenant relationship and division of responsibility.

Historically, the problem of heating and air conditioning store buildings has been managed in a haphazard way largely through expediency rather than upon a logical basis. The owner generally built his building with a particular tenant in mind. It was his responsibility to provide the heating plant—the tenant provided the maintenance and operation. If a tenant wanted air conditioning, the owner sometimes, and sometimes not, provided the duct work and the enclosures or supports for the air-conditioning equipment. The compressors, the air-handling equipment, fans, evaporative condensers, etc., were supplied by the tenant. Mechanically, this wasn't too

bad a situation and it was possible to have a fairly efficient installation, if the owner and the owner got together before the installation was quite complete.

Architecturally, the results have not been so happy. The typical one-story strip development store carries a superstructure almost as impressive as the building itself. The ducts run all over the roof and the stacks, boiler flues, air intakes, evaporative condensers, or water towers are arranged in a totally haphazard and ungoverned fashion.

So long as each store in a group was to be the property of a separate owner, the only relationship between stores was a party wall; the problems of expansion, contraction, alteration, and change were considered as horrors to be faced. There was no incentive or real reason to change this not too efficient pattern.

But the preplanned regional or suburban shopping center has introduced a new set of factors. In the shopping center the typical tenant building is not a little building all strung together

one large building, sometimes 400' long, uniformly designed, condensed for maximum efficiency, and capable of being divided in many ways to suit varying requirements of a multitude of agencies. This element of being built once, and the ability to adjust to a variety of occupancy shapes and requirements suggests the possibility that the heat and air conditioning might be conceived on the same basis—that there might be advantages in cost of installation, operation, and maintenance to be achieved by placing this part of the center.

Of course, it would be possible to wait until the building was rented and, as each tenant's requirements were established, to locate the heating plant and the duct work on the traditional basis—modifying the building; adding superstructures on the roof; erecting a scattered pattern of chimneys. But the only reason for doing this would be to maintain the tradition, to follow the old pattern, without establishing whether the old pattern is right for the new type of the shopping center.

Many aspects of the old system are not compatible with the aims of the planners of the modern, integrated shopping center. Their desire is not only to make convenient shopping, but shopping that is most pleasant and attractive atmosphere possible. The integrated, preplanned building achieves order and uniformity, a disciplined shape to house the equality of each tenant as expressed in storefronts and signs. As these signs are set back from the street, surrounded by parking, and therefore visible from a distance, a disorganized array of roof elements would not enhance the appearance nor would smoke and fumes from a variety of chimneys improve the shopping atmosphere.

An alternate to this traditional, expedient approach to heating and ventilating, a preplanned building offers the opportunity to provide a central heating plant and a central air-conditioning plant of sufficient capacity to accommodate the needs of all tenants within the building. However, as the concept of the central plant departs

completely from the historical owner-tenant relationship of cost and responsibility, it must be compared carefully with standard procedures and practices so that its advantages are clearly established.

This examination and comparison should be carried out from four points of view: initial cost, operating cost, flexibility, and the effect on the architectural design.

To determine the initial cost is relatively simple. Take a typical tenant building, fill it with a theoretical occupancy of stores and: (1) design a central system with the necessary distribution lines and ducts to serve the occupancy; (2) design an individual local system for each tenant in accordance with standard practice; (3) estimate the cost of each. Our experience has indicated that the central steam plant, serving a large group of tenants is, from a capital-cost point of view, more expensive than the sum of the individual plants in spite of the multiplicity of units, stacks, etc., involved in the local units. This appears to be due largely to the special character of central equipment as compared with the mass-produced individual units; and to the complex character of a central installation as compared with the simplicity of the installation of individual units.

An examination of operating costs, however, yields very different results. The maintenance, supervision, and fuel consumption of 10 to 12 individual units total approximately twice those of a central plant serving the same number of tenants. This engineering evaluation is borne out by the experiences of industrial plants, apartment house groups, etc., which have been converted from multiple to central installations.

To date, it has been impossible to confirm these operational estimates by figures from stores or chains that operate and maintain individual units, because the common practice of lumping electrical costs, service, and maintenance into the store operation, and of using either sales or management personnel for the operation and supervision of the boiler units.

As far as flexibility is concerned, there is no question that the central plant has

advantages for the owner that the scattered individual tenant plants cannot hope to match. Changes in occupancy requirements, due to changes in merchandising activity or to the introduction of new units, can be met without structural change, and with only a minimum of mechanical alteration.

From an architectural point of view, the central system has many advantages: the elimination of a multitude of stacks, the localizing of the mechanical installation in one area, the opportunity of effective smoke control, and the simplification of framing by elimination of stacks. And for the tenants there is a distinct advantage in the actual saving of space—the area which would be occupied by boilers, fuel storage, and related equipment is released for merchandising or the processes necessary for merchandising.

For the landlord, the weighing of these four factors poses an interesting choice. The central plant costs more to install than the individual systems. The maintenance and operating expenses, which were formerly the burden of the tenant, must now be assumed by the management and distributed to the tenant on some equitable basis, such as the metering of the steam. The typical tenant has to be satisfied that the metered rate he is paying for the steam represents a lower heating cost than he would pay with an individual system. Yet there is difficulty in establishing what the tenant's cost would be with the individual plant because there are no clear records of this cost. The tenant must realize, however, that the diversion of man hours from the operation of the equipment to the actual management and selling operations of his store cannot be ignored, and that hidden maintenance and operating expenses are bound to be eliminated if shopping-center management assumes this responsibility.

The case for air conditioning is similar, but perhaps more complicated.

Air conditioning is not as simple a matter as the provision of steam. Tempered air can be produced in a number of ways. The central refrigeration and air-handling plant could easily supply the required volumes

of tempered air to all the tenants in a building. But it is difficult, from a central plant, to adjust to individual requirements in any fashion other than by increasing or decreasing the volume of air in each space. If booster coils are provided, the system immediately becomes special. Tempered air can be provided by supplying chilled water from a central refrigeration plant to zoned, air-handling equipment units, each of which will serve a limited area. The chilled water can be metered on a thermal basis, and the air-handling equipment will be operated by the individual tenant as he requires. Or the central plant could produce only condenser water, which would be piped to zoned compressor locations. There are others, but these are the basic central-plant variations.

Each of these three must be completely laid out with their related duct work, electrical installation, etc., in order to establish a fair basis of comparison. And in making the examination and comparison, again the four factors involved are: initial cost, operating cost, flexibility, and the effect on architectural design.

Initial cost can be determined by laying out individual systems in accordance with standard practice for a theoretical pattern of individual tenants, and three central system variations designed to serve them all.

Our surveys have indicated that, from a total cost point of view and considering a group of approximately 12 stores, the initial cost is almost a toss-up with the central plant, providing tempered air adjusted on a volume basis, having a slight edge.

Our examination of the projected operating costs of the four possible situations shows the central refrigeration and air-handling plant providing total tempered air to be by far the most efficient. One of the principal reasons for low-operating cost of the central plant is that, while it is no longer unusual for a typical one-store in-

stallation to require and use more than 20 tons of refrigeration, local ordinances and controls now generally require the continuous presence of a first-class engineer for any installation of 20 tons or more. This means that six to eight engineers would be required continuously if the regulations are adhered to, whereas only one engineer with a helper would be necessary at the central plant.

Here, again, cost figures on individual installations are hard to check: condenser water is generally thrown away and lumped into the water bill; electrical consumption is buried in the total; most operating stores ignore the regulation requiring a registered engineer, and the same manager who operates the steam plant fiddles with the air-conditioning unit.

There is also the problem of distributing costs. Steam consumption can be easily metered—air flow, only with difficulty. And to distribute the cost simply on a square footage basis can result in inequalities because of differing hours of operation.

In considering flexibility, there is no question that the central plant has great advantages. Changes in merchandising techniques often introduce increased lighting loads in an individual store and require brand-new or additional cooling equipment; with a central plant system, however, the extra cooling can be supplied without additional equipment. Changes in store occupancy also can be accomplished with little or no structural or mechanical problems.

Architecturally, the central plant is a boon. The superstructures are gone from the top of the building. There are no exposed ducts crawling over the roof. Intake and exhaust stacks can be centrally located and specially treated. And, for the tenant, the space advantage gained from the elimination of the individual boiler plant is re-

peated by the elimination of the space required for the compressors, condenser fans, etc., thus increasing his usable area and giving him a larger net area available for actual merchandising.

In addition to these purely theoretical considerations of cost and flexibility are limiting factors that may be dictated by facilities or conditions special to the location of the project. It is possible, even probable, that the sewer capacity available at a suburban shopping center will not be sufficient to permit total discharge of condenser water into the system. In these circumstances, evaporative coolers or cooling towers which permit recirculation may be mandatory. Or the water supply may be limited in the general area, and, for conservation reasons, the use of condenser water restricted.

Where these conditions exist, our findings have indicated that the capital cost of a central plant is considerably less than the capital costs of a series of individual units, each requiring its own water tower and evaporative condenser; further, the unutilized space lost where each tenant must satisfy these special requirements is considerable and imposes a burden on the landlord who must rent this space. (It also decreases the opportunities of profit to the landlord because this space is totally lost to him, and so must affect the percentage of payments.)

The decision on the method of handling air conditioning on an integrated basis is obviously a complicated one both for the owner and the tenant. If a central plant is introduced, a large item of capital cost, normally borne by the tenant, is completely eliminated and must be expressed as a change in the rental structure or charged to the tenant on some fair and equitable basis. Either of these alternates will be a major departure from the rental practice.

in conclusion

We—the Authors and the Editors—hope that this issue of PROGRESSIVE ARCHITECTURE has offered something helpful and useful in understanding the problems raised by that new building type, the shopping center. In conclusion, we would like to re-emphasize three points:

First, there has seriously been a desire to avoid definite “instructions” and dogmatic statements. If there is anywhere an appearance of such, it should be taken as a case study of one or more projects, rather than a general rule to be followed.

Second, interrelationships of factors are so important, especially in the economic aspects of shopping centers, that one can easily change another. For example, even the “trade area” cannot be defined except in relation to the physical design, and the selection of tenants.

Finally, the point made in the opening pages of the issue—that a modern shopping center can be a cultural and social center as well—may have been lost in the technical discussion through the study. This important aim should not be lost sight of: if it has not yet been attained in any completed center, it remains a possibility and a goal to work for.

interchangeable over-all lighting

Smithcraft's Area Illumination, a complete fluorescent system, represents an entirely flexible approach to over-all lighting. The method gives the architect, designer, and engineer full freedom in lighting design for areas of any size or shape, with a limitless choice of pattern, shielding, and intensity.

In principle, the system consists of two sets of grids of flexible dimensions, one positioned directly above the other. The upper set of grids forms the lighting panel and contains all the electrical components. Parallel electrical housings are furnished with as many lamp holders as needed to create the desired lighting level. While the lamp spacing can vary every 3", the manufacturer believes that 12", 18", 24", and 36"-spacing will meet most demands. The

installed or completed lengths of these housings can be any dimension from 2' to 2000' or more.

The lighting panel may be fastened directly to, or suspended from, the building

structure by movable support hardware which can be adjusted by as much as 4" in each direction—a total of 8" that allows for the variations, discrepancies, and instructions found in almost every building.

air and temperature control

Vaporizing Oil Burner Wall and Floor Furnaces: complete new line provides full automatic heating for small houses; each unit equipped with electric ignition system that controls combustion and temperature without need for pilot light, eliminating extra fuel consumption. Available in models suitable for shallow pit, basement, or wall-recessed installations; units may be set safely against wood. Capacities range from 50,000 to 85,000 Btu. Iron Fireman Mfg. Co., 3170 W. 106 St., Cleveland 11, Ohio.

Power Exhauster: up-blast type, ready for installation, with exceptionally low silhouette designed to cut down danger of overturning; largest model, rated at 22,000 cfm, stands only 54" high. High-tensile, cast aluminum fan blades follow latest development in air foil design. Totally enclosed motor. Gallaher Co., 4108 Dodge St., Omaha 3, Nebr.

Automatic Heating Plant: designed for low-priced, small homes. Interchangeable unit is designed to accommodate oil or gas burners; in spite of compact size—22" square—furnace will heat, humidify, filter, and circulate warm air to every room. Rated capacity of 80,000 Btu with .75 gph oil input, and 65,000 Btu with 82,000 Btu gas input. Majestic Co., Huntington, Ind.

Model 2000 Thermobloc: gas- or oil-fired industrial heating plant, capable of 2 million Btu per hour, with normal air output of 22,000 cfm. Equipped with twin heat exchangers, four diffusers that can be rotated a full 360° to any position desired, and blower fan powered by 10 hp motor. Unit requires less floor space and head room

than most conventional space heaters. Prater-Daniel Corp., Thermobloc Div., 2 Meadow St., South Norwalk, Conn.

"Water-Saving" Air Conditioners: new line of medium-tonnage, self-contained units designed to meet most municipal regulations on water consumption and disposal; completely wired, piped, dehydrated, charged, and tested for operating conditions specified for each individual job. Produced in 15 and 20 ton capacity ranges to serve offices, super markets, banks, restaurants, and other commercial and industrial applications. Trane Co., La Crosse, Wis.

Unitaire Air Conditioner: 10 hp, self-contained unit, encased in thermally and acoustically insulated cabinet, is 91" high when top mounted, and 61" x 32" at base, making it ideal for fitting into recesses to save floor space. Two double-inlet, 12" fans deliver 4000 cu. ft. of air per minute; adaptability for heating is provided. Unit is suitable for offices, stores, and other applications calling for economical air conditioning. Westinghouse Electric Corp., 200 Readville St., Hyde Park, Boston 36, Mass.

construction

Stri-Color Shingles: asbestos-cement siding with striated, embossed surface, available in brown, gray, or green. Special "Dura-Shield" factory finish helps to repel water and resist staining. Flintkote Co., 30 Rockefeller Plaza, New York 20, N. Y.

Adjustable Welding Connector: new, adjustable clip offers 1/4" adjustment which facilitates erection of welded-steel, multiple-story building construction; is claimed to save steel, produce fabrication economies,

and speed erection. J. H. Williams, 400 Vulcan St., Buffalo 7, N. Y.

doors and windows

Full-Vision Rolling Door: rolling door now furnished with windows, 12, 20", or 24" in height and 20" in width, made of aeroplane plastic lights shaped and assembled to coil with door. Windows permit clear, unobstructed view of exterior and interior, admits light to aid in coiling truck movements; may be installed on existing rolling doors as well as in new construction. Cornell Iron Works, Inc., 36 Ave. & Long Island City, N. Y.

Marmet Window-Wall Sash: welded aluminum sash, ready to install in frame, available in single sash width and height, multiple of 3 sash wide or additional multiples of 1, 2, or 3 sash and 1, 2, or 3 sash high. Glass opening takes stock size mopane; equipped with operating hardware. Marmet Corp., Wausau, Wis.

Carrara Glass Plates: structural glass plates for doors, furnished in any size in full range of colors. Permanent finish needs no polishing; can be kept clean with damp cloth. Pittsburgh Glass Co., 632 Duquesne Way, Pittsburgh, Pa.

electrical equipment, lighting

"Grid-Light": lighting system using a grid-like arrangement of prewired clips for single-pin T12 slimline lamps, and translucent plastic shields, designed for mounting installations against flat surface of any material. System is said to improve lighting efficiency, facilitate maintenance.

important advantage of these adjustable supports is that any adjustment, sidewise or lengthwise, up or down is made *after* the erecting of the grid panel; which means that no exact

dimensioning is required when attaching the supports into a poured-concrete ceiling structure. They also have the advantage of economy, since it is only necessary to secure them at dimensions of 8' x 3' to 4'

—using about half the number of support-devices essential to the conventional suspended-lighting system.

The lower grids are designed to receive all types of shielding media and acoustical treatment. The shielding materials may be used singly, or in combination; thus, special effects can be created with eggcrate mental louvers interspersed with molded-plastic panels, glass panels, or corrugated-plastic sheets. Spotlights may be inserted at will in desirable locations. In stores, where changes of departments and different seasons call for alterations in lighting effects, the many possible variations prove particularly advantageous.

Area Illumination is entirely pre-wired and needs only to be connected to the feed wires in the same manner as an ordinary lighting fixture. The manufacturers state that this product is not custom-made. The system is completely standardized and may be ordered in the same manner as one would order steel casement windows. Smithcraft Lighting Division, Chelsea 50, Mass.

specification, and make installation Recommended for classrooms, stores, drafting rooms, and similar localities. Benjamin Electric Mfg. Co., Des Moines, Ill.

Master Stand-by Light: automatic unit equipped with glass jar rechargeable and visible ball-float hydrometer, gives emergency light instantly when power failures occur. Electrical components specially engineered for constantly emergency stand-by duty. Choice of floodlights or beam lamp heads. Unit can be used for permanent location or supplied with cord and plug for semi-portable installation. Carpenter Mfg. Co., Somerville, Mass.

Lite PBM Lighting Fixture: fully developed, luminous indirect fixture, developed by M.I.T. engineers, reduces maintenance to minimum and assures long life trouble-free operation. May be installed in individual unit or in continuous run. Available for two 40w fluorescent lamps, or one 40w and two 60w slimline lamps. Lite Lighting, Inc., 5455 Bulwer Ave., St. Louis 7, Mo.

Spot Adapter: portable spot or floodlight fixture, involving no installation except designed for use in any porcelain receptacle and with swiveling device suitable to wide variety of display for cent lighting in stores, restaurants, similar commercial interiors. Consists of housing, porcelain adapter receptacle, aluminum reflector, and concentric Silvray Lighting, Inc., Bound Brook, N.J.

Circline Fluorescent Fixture: two-lighting fixture, of hard-baked enamel,

has 8", 22w preheat type, standard-start lamp mounted inside 12", 32w instant-start lamp, both arranged so as to form concentric circles of light; decorative glass centerpiece fastened to fixture by knurled thumb nut. Suitable for applications in residential kitchens, bedrooms, hallways, bathrooms, as well as for commercial applications (small offices, waiting rooms, etc.) Sylvania Electric Products, Inc., Ipswich, Mass.

finishers and protectors

Flow Kote: rubber-based flat wall paint, easily applied, durable, thoroughly washable, is thinned with water, acts as its own primer, and resists chipping. May be applied with brush or roller-coater without causing lap marks or streaks. Du Pont Co., 350 Fifth Ave., New York 1, N.Y.

Mason-Coat 310: one-coat, oil-based paint designed for decoration and protection against moisture infiltration, is applicable to interior and exterior surfaces of concrete block, cement, brick, stucco, and similar masonry surfaces. Available in white and several tints. United Laboratories, Inc., 16801 Euclid Ave., Cleveland 12, Ohio.

insulation (thermal, acoustic)

Finger Strap: 3/4"-wide metal strapping for use in applying all types of insulation material, quickly, economically, and permanently, to ducts, pipes, tanks, and flat walls. Available in continuous coils, in thicknesses from .015 to .35, in plain steel, galvanized, stainless 430, or monel steel. A. J. Gerrard & Co., 1950 Hawthorne Ave., Melrose Park, Ill.

sanitation, water-supply drainage

Ideal Distributing Box: prefabricated, hexagonal distributing box of heavy welded steel, for sewage disposal systems; insures uniform distribution to entire drain field and is easily inspected at heart of system. When one line becomes clogged, remaining lines share load; one inlet and five outlets are sized for tight seal within standard field tile. Ideal Sanitation Co., 8052-A Montgomery Rd., Cincinnati 27, Ohio.

specialized equipment

Meteorological Equipment for Industrial Site Location: newly-developed electronic wind-speed and -direction recording system provides means of accurate investigation into meteorological conditions affecting projected plant sites so that later corrections to plant waste-discharge operating procedure can be minimized. System makes recordings from threshold below one mph up to 30 mph, on standard pen-type, strip paper recorders. Unit is energized by its own battery supply, weighs only 100 lbs. Beckman & Whitley, Inc., 1031 San Carlos Ave., San Carlos, Calif.

surfacing materials

Colorbestos: large-sized asbestos-cement sheet, in random-ribbed pattern, for exterior siding of houses, comes in 32" x 96" x 3/16", covers large areas quickly, yet is convenient size for handling. Manufactured in strong colors of red, yellow, brown, green, and three tones of gray. Johns-Manville Corp., 22 E. 40 St., New York, N.Y.

air and temperature control

1-173. June-Aire, 4-p. folder illustrating operation of completely automatic winter air-conditioning system, available for light- or heavy-oil fuel, gas, or hand- or stoker-fired coal. Components, cross-section of heater room, system designs. American Foundry & Furnace Co., Dept. CV, Bloomington, Ill.

1-174. Anemostat Air Diffusers, AIA 30-J (Selection Manual 40), 64-p. revised booklet containing full technical data on selection of proper air diffusers for air-conditioning systems; complete new section on high-pressure units for high-pressure, high velocity systems. Types, accessories, typical specifications, installation data, list prices, weights, contents table, photos, drawings. Anemostat Corporation of America, 10 E. 39 St., New York, N. Y.

1-175. How to Have a Carrier Weather-maker Home, 31-p. booklet outlining new way of planning homes, with freedom from many old technological restrictions, by means of installing air-conditioning system that cleans air, cools or heats it, and circulates it throughout house. Economic advantages, plans and other drawings, photos. Carrier Corp., 300 S. Geddes St., Syracuse, N.Y.

1-176. Chelsea Fan and Blower Catalog, AIA 30dl (400), 20-p. catalog, including loose-leaf price list on fans, blowers, packaged penthouse units, louvers, and shutters. Types, applications, dimensions, specifications, photos, diagrams. Chelsea Fan & Blower Co., Inc., Plainfield, N.J.

1-177. How to Have Comfort from Moving Air (1952), 200-p. revised and enlarged catalog providing data on heating, cooling, and ventilating equipment made by various manufacturers; includes air circulators and dehumidifiers, fans for all requirements, heating systems, oil burners, unit heaters, floor furnaces, clothes dryers, farm ventilators, etc. Illustrations, contents table, manufacturers' index. Torrington Mfg. Co., Torrington, Conn.

construction

3-145. Architectural Uses of the Stainless Steels, AIA 15-H-1. Photographic examples of architectural applications of stainless steel and basic information about properties. Availability, parts and sections, drawings. American Iron and Steel Institute, 350 Fifth Ave., New York 1, N.Y.

3-146. Macomber Steel Trusses, 20-p. catalog. Basic design data on industrial plants and commercial buildings completely built of structural-steel framing members—trusses, open-web purlins and joists, decking and siding, columns, eave struts and girts. Plant layouts, structural details drawn to scale, safe-loading tables, general information, photos. Macomber, Inc., 1925 10 St., N.E., Canton, Ohio.

3-147. Reinforced Portland Cement Stucco (1), 4-p. bulletin giving complete details and specifications for reinforced Portland cement stucco for both new and remodeling work. Photos, drawings. Metal Lath Mfrs. Assn., Engineers Bldg., Cleveland 14, Ohio.

3-148. Robinson Clay Product Co. (R-450-15), 4-p. folder. Illustrations of vitrified clay pipe, perforated clay pipe, flue lining, terrace tile, wall coping, chimney tops and bases, and septic tanks, all of clay. Sizes, dimensions, weights, diagrams, drawings. Robinson Clay Product Co., 65 W. State St., Akron 9, Ohio.

3-149. You Can Build Schools Now, 12-p. booklet, on methods of using proven clay-masonry construction in schools to reduce use of steel to absolute minimum. Typical examples, photos. Structural Clay Products Institute, 1520 18 St., N.W., Washington 6, D.C.

3-150. Specifications for Vermiculite Concrete Floors, AIA 4-E-13, 12-p. booklet. Concise data given on use of vermiculite-sand concrete as fill over structural floors, as floor slab over supports on relatively close spacing, and as slab laid on ground. Specifications for vermiculite concrete floors on ground (with and without radiant heating units) that are topped with sand concrete. Drawings. Vermiculite Institute, 208 S. La Salle St., Chicago 4, Ill.

doors and windows

4-176. Aluminum Windows for Moderately Priced Homes, 8-p. brochure. Standard types and sizes of solid-aluminum residence casements, also available as fixed windows. Brief descriptions and photos of basement windows and casement hardware; installation and assembly details. Alcasco Products, Inc., 1780 Creston, Muskegon, Mich.

4-177. Amweld, AIA 16-A, 12-p. catalog. Installation advantages of interior steel door and frame units and steel sliding closet door units. Sizes, types, construction data, photos, drawings. American Welding & Mfg. Co., Warren, Ohio.

4-178. Window Magic, 16-p. booklet, including rotating color selector, illustrating many examples of drab window areas converted into decorative wall areas by color integration of Venetian

blinds, draperies, and walls. Full photos, construction features of Venetian blinds, suggested color combinations, available colors for blinds. Levolor Laminated Inc., 391 W. Broadway, New York 1, N.Y.

4-179. Stay-Strate Door (1114-510), 4-p. folder on warp-proof, flush-veneer door with Kaylo (incombustible material) bestos fiber and hydrous calcium silicate suitable for residences, apartments, hospitals, and institutional uses. Installation details, construction data, specification tags, construction data, specification tags, installation details. U.S. Plywood Corp., 44 W. 44 St., New York, N.Y.

4-180. Flexseal, AIA 35-P-6, 4-p. folder describing flexible-type weatherstripping utilizing steel-spring assembly that seals wool felt strips tightly in place, seals window gaps and openings. Specifications, general information. U.S. Weatherstripping Inc., 463 W. 5 St., Bountiful, Utah.

4-181. Residential Aluminum Windows, 8-p. bulletin. Specifications for standard modular size casement and awning aluminum windows. Sections, details. Aluminum Laboratories, Inc., 3700 N.W. 25 St., Ft. Lauderdale, Fla.

electrical equipment, lighting

Booklet describing fluorescent and incandescent lighting fixtures designed and manufactured to meet specific home lighting requirements and to insure correct lighting for every kind of domestic seeing. Types, uses, illustrations. Also, 6-p. brochure presenting line of incandescent lamps for either close ceiling mounting or pendant suspension, designed for use with all-silver or semi-silvered bowl lamps. Modelometric data, coefficients of utilization, construction features. Silvray Lighting Co., Bound Brook, N.J.:

5-119. Silvray Components for Conditioning Recipes for the Home (LC50 4 S)

5-120. Luminaires by Silvray (50 4 S)

finishers and protectors

6-66. Busatti Adhesive Coating, 8-p. pamphlet on plaster-like ready-mixing smooth, marble-hard finish to interior surfaces; not affected by moisture, is easily washed. For use on dry interiors only. Advantages. Busatti Products, 575 Old Country Rd., Westbury, N.Y.

6-67. What's a Silicone? (SIL-1), 16-p. booklet. Detailed answers to 51 questions on practically all forms of silicone products: polishes, water repellents, protective coatings, lubricants, rubber, insulation, etc. Photos, thumb index. Dow Corning Corp., Midland, Mich.

6-68. Hydroban, 4-p. folder giving data in form of questions and answers

parent, liquid water repellent for most dry surfaces and wood surfaces; not a g, it penetrates surface and becomes al part of material. Hydroban, Inc., spect St., Brooklyn 1, N.Y.

Your Answer Book on Penta, 40-p. et. Detailed answers to 51 questions ling pentachlorophenol wood preserva- covering types of applications and ds of use. Monsanto Chemical Co., S. 2 St., St. Louis 4, Mo.

Your Floors and How to Main- Them (1000), 40-p. booklet on proper enance of commercial, industrial, and tional floors, plus listing of floor rs and cleaning equipment, finishes, vatives, etc. Table of contents, s. Multi-Clean Products, Inc., 2277 Parkway, St. Paul 1, Minn.

Rustoleum Stops Rust! (251), 16- log. Guide to various types of rust- tive coatings, floor sealers, and other tive coatings. Technical data, ap- ons, resistance qualities, drying time, samples. Rust-Oleum Corp., Evans- ll.

Insulation (thermal, acoustic)

Fissuretone and Perforated Min- Tile (5114A), 12-p. booklet describing types of acoustical tile made from al fiber, one with fissured texture, her with perforated surface; both are bustible, moisture-, rodent-, and abra- sistant. Typical application photos, absorption coefficients and specifica- of test samples. Celotex Corp., 120 Salle St., Chicago 3, Ill.

Kaylo Heat Insulation (KH3-517), booklet illustrating numerous ways in hydrous calcium silicate insulation al is used in industrial and commer- projects for temperatures as high as . Shapes and sizes, physical charac- tics, recommended thicknesses, in- n efficiencies, photos, illustrations. Illinois Glass Co., Kaylo Div., Ohio Bldg., Toledo 1, Ohio.

Insulating Sheetrock (WB55), 4- er describing fireproof gypsum wall- laminated with aluminum foil which as vapor barrier, heat reflectant, and epellent. Advantages. U.S. Gypsum 0 W. Adams St., Chicago 6, Ill.

Sanitation, water supply, drainage

New Way to Cut Man-Wasted (SP60-2123), 4-p. folder. Recom- ns for proper placement of water , based on extensive study made by t drinking-water requirements of in- l plants and offices. Sample floor table for computing payroll savings by using recommendations. General e Co., Air Conditioning Div., Bloom- N.J.

specialized equipment

19-245. P-A-X Business Telephone Sys- tem (1735), 16-p. circular describing inter- communication system, composed of stand- ard automatic equipment: required number of telephones, wiring, and switchboard (with associated power supply unit); suit- able for all types of small and large organi- zations. Switchboard models, diagrams, photos, installation data, special services. Automatic Electric Sales Corp., 1033 W. Van Buren St., Chicago, Ill.

19-246. Acousti-Booths, AIA 35-R, (A- 107), 4-p. bulletin. Full information on 4 types of floor and wall telephone booths, of steel or wood, with patented acoustical con- struction that reduces sound by 50%; suit- able for any noisy location, such as bus terminals, power stations, railway stations, hotels, airports, drug stores, etc. Construc- tion features, advantages, specifications, prices. Burgess-Manning Co., 5970 North- west Highway, Chicago 31, Ill.

19-247. Curtain and Drapery Hard- ware (15), 8-p. catalog illustrating various types of traverse equipment for curtains and draperies. Uses, typical installations, construction details and other drawings, finishes, advantages, photos. Gould-Merse- reau Co., Inc., 35 W. 44 St., New York 18, N.Y.

19-248. The Original Tubular Steel School Furniture, 30-p. booklet. Wide range of classroom chairs, desks, chair-desk

units, tables, all made with seamless, welded steel tube framing and birch seats and backs. Construction data, dimensions, schedule of sizes, details, photos. Hey- wood-Wakefield Co., Gardner, Mass.

surfacing materials

19-249a. Traffic Concrete—A Study in Specialization, 20-p. booklet outlining properties and advantages of high density, extremely hard, concrete, floor topping with maximum resistance to wear and abuse; four prepared types to meet every traffic need. Step-by-step comparison of low water ratio of material, as opposed to wet mixes, applications, photos. Flash- Stone Co., Inc., 3723 Pulaski Ave., Phila- delphia 40, Pa.

19-250. Cold Process Built-Up Roofs, 6-p. pamphlet. Specifications for cold pro- cess built-up roofs, using especially treated felt, liquid roof preservative, and plastic roof preservative, providing interlocked, all- weather roof covering. One- and two-ply application data, photos. Hallemite Mfg. Co., 2446 W. 25 St., Cleveland 13, Ohio.

19-251. Formfree Decorated Wall ★ Tile (151), 8-p. booklet. Illustra- tions of glazed mosaic tile, 6" x 6", patterned with free, flexible designs, for use as decorative panels or large, contin- uous wall surfaces. Patterns, full-color plates, typical applications. Mosaic Tile Co., Zanesville, Ohio.

NORTHGATE SHOPPING CENTER

(SEATTLE, WASHINGTON)

Air-Conditioned by **YOUNG**

Front elevation of the central Bon Marche Store. Arrows indicate location of decorative inlet grilles which provide fresh air to the "YAC" Units.

45 YOUNG "YAC" UNITS COMBINE ECONOMY OF CENTRAL PLANT HEATING WITH EFFICIENCY OF POSITIVE ZONE CONTROL

Owner: NORTHGATE COMPANY

Architects and Engineers: JOHN GRAHAM AND CO.

Mechanical Contractor: UNIVERSITY PLUMBING & HEATING CO.

A total of 45 Young Sectional-Design "YAC" Units, with a total capacity of 371,000 cfm, are used throughout the new Northgate Shopping Center, Seattle, Washington. These units are horizontal type, ceiling-suspended, and are concealed in furred ceiling spaces adjacent to areas served. Clever designing and wise selection of individual "YAC" units, has permitted positive zoned ventilation without sacrificing valuable floor or shelf space. The result is a comfortable combination of filtered, properly tempered, fresh and recirculated air blended automatically to provide maximum comfort at minimum cost.

Interior view of the largest building of the group showing outlet grilles and recirculated air inlet grille. Horizontal "YAC" Units are concealed within the ceiling.

Young sectional-design means greater ease in handling, installing, servicing . . . permits partial or complete air conditioning service from compact, economical units. Eight sizes, horizontal or vertical types, are designed for right or left hand installation. Catalog 7550 gladly sent upon request.

YOU'LL NEVER SEE THIS ON A PANELED WALL

RODDISCRAFT PLYWOOD PANELING PAYS FOR ITSELF

You have always recommended paneled walls for appearance. Today with scarce, high-cost maintenance labor, you can also recommend them on the basis of economics. The higher original cost of installing plywood is easily offset over the years by savings in costly painting, paper hanging and maintenance.

And for the life of the building, paneled walls will continue to pay dividends in savings, and in beauty that ripens with age.

Roddiscraft craftsmen control the step-by-step manufacture of Roddiscraft Plywood from veneer selection to the finished product — no shortcuts — no compromise. You can be sure when you specify Roddiscraft Plywood.

UNBELIEVABLE DURABILITY

on our hospital walls and furniture...

That's the comment frequently heard about *Kalistron* installations. When walls, doors, columns or furniture are covered with *Kalistron*, they literally defy the wear and tear of "heavy duty" service. Years after installation, the *Kalistron* is still in excellent condition... unmarred, unscratched, with practically no sign of wear.

Kalistron is different because its color is fused to underside of clear sheet of wear-resistant *Vinylite*. Since nothing can touch this under-surface, *Kalistron's* beauty stays fresh and new-looking.

Kalistron cannot chip, crack or peel; minimizes maintenance costs. Cleans easily with a damp cloth. In 28 standard colors; special colors matched.

SEND COUPON BELOW for sample of *Kalistron* and nail-file. Test *Kalistron* yourself... prove its unbelievable durability.

restaurants

By Abraham W. Geller*

There must be a reason, other than a predominance of bad cooking, why the percentage of failure in the restaurant world is higher than in any other business enterprise. One suspects that the continued reappearance of mock-Colonial and rococo settings; the inept combinations of materials, the spurious; the wide use of banal murals and garish mosaics—all help maintain this percentage. Exceptionally fine cooking will, in rare cases, draw patrons into strange surroundings. I have worked for a number of years in a Chinese restaurant esteemed by some as one of the finest in the country and where, because I know one of the owner's closest friends, I am permitted to eat in the dining room. I am thankful that this resourceful move on the part of the owner to provide space is a universal solution.

The charm of a mellowed establishment, well-maintained over the years, combined with a long tradition of good cooking, will undoubtedly draw continued patronage. Here the warm and gracious atmosphere has been carefully nurtured for many years and any accelerated aging will appear false. What then should be the approach of an owner and architect in planning a restaurant that will flourish? They can best insure their success by a contemporary solution which, if sensitively handled, will become a favored dining place of the present and future.

The experienced restaurateur is worth his weight in magazine articles on restaurant planning. An architect with a respectful ear can gather valuable fundamental information from a sagacious restaurateur on his particular methods of management and the level of standards between the ideal and the real. How important is the headwaiter's pivotal position between bar and dining areas and is a planned bottleneck at this point necessary? How much area should be given to patrons waiting at tables and how near to the bar should the space be located? What importance should be given to current standards on seating? How far can the kitchen be from the farthest table and still permit prompt service? What are the spheres of authority of the head chef, the headwaiter, the manager, the owner; and what physical provisions are to be made for carrying out their several responsibilities. All the above questions, and many others, are best answered by the restaurateur.

The owner is, of course, not infallible. He may be over-optimistic about the potential number of patrons and should be advised against building too large a restaurant (much better an over-crowded, than a sparsely filled one). Also, his desire to pack the house may lead him to crowd the dining room. I recall an owner of a chain of fine restaurants who insisted that the standard booth width be made appreciably narrower and who, wedging himself into the model booth, had to be forcibly ejected.

Depending on the size of the project, the architect may call on the expert aid of lighting, acoustical and kitchen-planning consultants. It is the designer's task to co-ordinate and sometimes temper the recommendations. It may be wise to eschew a too-perfect sound treatment so that the result is a lively hubbub rather than an acoustical deadness, a condition to be reckoned with as much in the restaurant as in the theater or concert hall. Standard lighting recommendations of 10-foot-candle power for dining areas should be accepted with reservations. More often, a lesser intensity of lighting will produce a more cordial atmosphere and prove more flattering to the patrons.

The restaurateur and his architect may, in the near future, be challenged by higher standards, for there is in America a lively new interest in fine food and fine cooking. A continued interest in fine cuisine may result in the renaissance of more gracious manners and surroundings for dining. A restaurant may then become an integral part of our culture—a meeting place closely related to the gaiety and activity of the street, square, or park, where one can dine leisurely and repair one's spirit as well as his hunger.

Harlequin Room—Chicago, Illinois

architects

Holabird & Root & Burgee

contractor

William Koenig

This room takes its name from the mural which depicts a harlequinade, the comic episode of the 16th Century Italian commedia dell'arte. The theme is played with restraint. Only harlequin paintings by Degas, Dufy, and Picasso are further interpretations of the name.

The assignment was to design for the Harvey chain a restaurant of leisurely pace, spaciousness, and a touch of elegance. The architects have successfully fused a delicate atmosphere with the plain duties of maintenance. In happy combination here are the materials chosen for durability but sensitively contrasted for texture, kind, and color.

The vulnerable surfaces of the chairs, for instance, are covered with tough plastic, but the outer sides, which escape hard wear, are in a colorful print. For the banquettes, a textured fabric is used to contrast with the smooth plastic and cotton of the chairs. But, again, there is no sacrifice of toughness, because the choice is a closely woven fabric of hard viscose fiber, designed for heavy duty.

One of the perpetual problems of contemporary interior design is the conflict between the desire for plain surfaces and the need for stain and soil camouflage. For the carpet in this room, the architects have specified one woven with three shades of blue. The impression is one strong color but the variation minimizes stain and soil.

We like the nice transition between areas by change of ceiling height, the variety of seating, and the lighting fixtures astutely chosen to suit. Banquettes are covered in red, chairs in gray plastic and black-blue print, and carpet is dark blue. Striated plywood is painted light gray, walls and ceiling are white.

architects

George Nemeny & Abraham W. Geller

contractor

Great Eastern-Victor Corporation

The visual quality of this steak house suggests substantial food, hearty eating. The rough natural materials, the generous chairs, the glistening brass speak of the sizzling platter. These architects are practical planners, but they are showmen too. And this is important in restaurant design, where atmosphere invites as well as food. The mechanical copy of a style is dreary fare but nostalgia is human stuff. Here it is creatively employed to evoke a sense of warmth and substantialness associated with the pub.

Materials used are the kind that require little upkeep and, in fact, improve with age. The existing brick wall was peeled of plaster, tin, and paper. The opposite wall is paneled with 12"-wide Douglas fir, and the wall between dining and kitchen is warm-colored fieldstone with wide mortar joints.

Lighting is subdued and frankly meant to flatter. At the wood wall, coved lighting is directed to the arched ceiling and down on photographs of famous patrons. The floor is pegged, random-width oak. Lighting fixtures, entrance doors, and balustrade are all polished brass. The only applied colors are the brown-black paint on the burlap wall covering at entrance, blue-plastic covering for banquettes, and the red-and-white cotton curtain at the stair.

Accurate Construction Company

black-green asphalt tile

The use of few materials and a simple color scheme give a sense of largeness and calm to this quick-order restaurant. Large areas of cypress and oak make a good background for the special murals and the playful touches. Use of materials is architectural—the dramatic lighting for cakes, the choice of chimney lamps and wire chairs—with an awareness for mood and display. The old “ice cream parlor” chairs bought from second-hand shops are painted white. (One first-hand source for these sturdy reliables is included in our data listing and a photograph of the model is shown.) Because of a low budget, architects saved an existing front, the recessed lighting fixtures, and the acoustical-tile ceiling, which they painted green. Counters are comfortably wide and low—the scrubbed wood tops in effective contrast with the glossy black floor.

Two rooms were thrown open to each other as much as structural requirements would permit. Then, since this was a headquarters for smörgasbord, treated in the domestic scale and spirit associated with Scandinavia. The large room with windows on either side was respected for its rigid symmetry. A high ceiling was coved on window sides and covered with a gay-patterned paper, which is the dominating color in the room. It brings the vertical dimension into more friendly scale; also drawing attention away from the irregular walls. Oak fascias terminate the coved ceiling and are baffles for fluorescent strips that filter light above: curtains hang below. At central points, the architects mounted specially designed chandeliers. These are of black iron, capped with crisp pleated shades of Scandinavian design. Lighting can be dramatic and focal, gently diffused from the coves, or a combination of both. Alternate lighting and choice of opaque linen or open-net curtains changes the mood for day or evening dining. To relate the two rooms, carpet and wall color are one. Painted plaster walls are cocoa, carpet blue with small white squares, ceiling paper predominately orange. In the bar section, there is also some whitewashed brick and random oak. All furniture was left by previous tenant.

The versatility of MICARTA® laminated plastic surfaces helped inspire the dramatic interiors of the home exhibit in the Museum of Modern Art. The room divider and storage wall, shown below, has a light gray MICARTA top. This surface was chosen because it blends discreet beauty with the ability to withstand all the known hazards and inconvenience of household wear.

This top-quality, high-pressure laminate offers architects complete flexibility in interior planning . . . a material that won't scuff, scar, burn, stain or warp. A whole range of solid colors, pastels, patterns and wood grains for an infinite variety of applications.

MICARTA never needs refinishing, polishing, waxing or maintenance of any kind. It cleans to an inviting gleam with just a damp cloth.

You can see MICARTA at the permanent exhibit in the Architects Samples Corporation, New York City. For further information just call your nearest United States Plywood Office, fill out the coupon below, or consult your Sweet's Catalog.

Y.

Koroseal Tile "Supreme" as used in the penthouse of the Museum of Modern Art, New York. Tile is 9" x 9" x 1/8" solid vinyl plastic, with a nonporous glossy surface said to resist indentation and to be unaffected by grease, oils, and alkalis. Only an occasional coating of wax is required for maintenance. Flecked or marbelized patterns in a variety of colors/ approx. retail: \$1.35 per sq. ft./ also available are "De Luxe" and "Special," thinner gauge tiles with felt backing/ approx. retail: \$.65 and \$.25 per sq. ft., respectively/ Sloane-Blabon Corp., 295 Fifth Ave., New York, N. Y.

Associates introduced a new line of woven fabrics at the recent A.I.D. exhibit. Handsome collection combines wool, raw mohair, hemp, linen, jute, cotton, and synthetics such as nylon, plastic, Orlon, and acrylic. A wide range of textures is offered for upholstery, but includes some suitable for curtain fabric. Bold vibrant colors used, such as green with turquoise, cobalt and black, or Mexican pink wool with nylon threads, or burnt orange with plastic, or black wool with orange and stripes. All fabrics are 50" wide but may be ordered as 72" to special order. Combinations of specific colors and textures can be ordered. Retail prices: \$18.00 to

\$30.00 per yard. Eszter Haraszty, head of the Textile Division is responsible for color coordination. Evelyn Hill designed the line for Knoll Associates, 575 Madison Ave., New York, N. Y.

Nessen Studio Inc., lamp manufacturers have added a Contract Division to produce portable lamps for hotels, schools, hospitals, and other institutions. Any of the standard lamps may be ordered in quantity or adapted to suit specific needs. The use of materials other than the standard metal is now also possible. The design staff headed by Greta Von Nessen is available for consultation and special design.

Stanley Wolf heads the new Contract Division of **Nessen Studio Inc.**, 5 University Place, New York, N. Y.

The Herman Miller Furniture Company, Zeeland, Mich., has issued a new comprehensive price list illustrated with drawings of every item in the line. Complete facts and figures are systematically and clearly presented in a booklet that is a visual delight. Included is a cross reference which co-ordinates the price list with the forthcoming revised edition of "The Herman Miller Collection." The 40-page price list, 8 1/2" x 11" with cardboard cover is available to architects and designers on request.

Can we put
resilient tile floor-
ing over radiant
heating?

Of course!
I've been working
closely with the Kentile
Flooring Contractor
on all my radiant
heating jobs.

You can specify Kentile, Kencork and KenRubber* for most Radiant Heated installations

Specialized flooring problems call for specialized training and experience. And, no man is better qualified to help you solve the problem of selecting and installing specialized flooring than the Kentile Flooring Contractor. His years of working closely with architects and builders have equipped him with the precise knowledge needed to recommend the right floor every time...the one floor

that provides the longest wear at the lowest cost ...the greatest maintenance economies.

Even if your problem results from architectural design or construction methods recently developed, the Kentile Flooring Contractor is prepared to give you valuable assistance. For his name, look under FLOORS in the classified phone directory...or write Kentile, Inc., 58 2nd Ave., Brooklyn 15, N. Y.

**KenRubber should not be installed on concrete in contact with the earth.*

THESE "K" FACTORS ARE YOUR GUIDE TO THE CHOICE OF RESILIENT TILE FLOORING FOR USE OVER RADIANT HEATED CONCRETE

KENTILE	KENCORK	KENRUBBER
4.5 BTU/sq. ft./hr./°F/in. thick	0.7 BTU/sq. ft./hr./°F/in. thick	4.5 BTU/sq. ft./hr./°F/in. thick
1/8" 36 BTU/sq. ft./hr./°F	3/16" 3.7 BTU/sq. ft./hr./°F	1/8" 36 BTU/sq. ft./hr./°F
3/16" 24 BTU/sq. ft./hr./°F	5/16" 2.2 BTU/sq. ft./hr./°F	3/16" 24 BTU/sq. ft./hr./°F
	1/2" 1.4 BTU/sq. ft./hr./°F	

Based on the "K" factors at top of each table, heat transmission rates through the various thicknesses of KENTILE, KENCORK and KENRUBBER are shown. The °F means that this is the transmission rate when there is 1°F difference between the top and bottom of tile. The heat transmission rate

increases proportionately with an increase in the temperature difference between the top and bottom of the tile; e.g., with 1/8" KENTILE, heat transmission rate would be 180 BTU/sq. ft./hr. if there were 5°F difference between top and bottom of tile.

Write to the nearest office listed below for FREE Folder that summarizes research data prepared to answer your questions about the use of resilient tile flooring over radiant heating.

another **HOMASOTE FIRST** — designed to reduce the cost of building

Three years of research and field testing are back of these Nova Roller Doors

Here are the most practical roller doors yet developed. Simple to install, easy to operate, and *economical in every sense*—these high quality, hollow core doors are light, strong and warp-resistant. Gone is all the expensive, overhead hardware—always difficult to install—always noisy. Two rollers revolving on pins act as guides at the top; two vulcanized rubber rollers carry the weight of the door at the bottom—through simple floor guides. There is no floor track. All hardware except floor guides is installed at the factory. Each door—Closet or Passageway—comes complete in one carton. In 30 minutes' time one man makes the installation.

CLOSET DOORS

A closet or storage space may be one of the standard sizes—or extend the width of the room. Two or more doors enclose it entirely. Instead of exposing only part of the interior, as with a swinging door, you have full and easy access.

*Nine standard opening sizes: 32", 36", 40", 48", 56", 60", 72", 84" and 96".
Five standard heights: 6'0", 6'6", 6'8", 6'10" and 7'0".*

Revolving roller guides operate in head track; vulcanized rubber rollers run on finished floor.

Head tracks are accurately machined for perfect operation of revolving roller guides; side jamb is routed to receive the door.

Passageway door slides easily into wall pocket

Simple floor guides, installed flush with finished floor, eliminate need for floor track.

PASSAGEWAY DOORS

Each comes assembled in its wall pocket, ready to install for either plaster or dry-wall construction. *Five standard opening sizes: 2'0", 2'4", 2'6", 2'8", 3'0".*

Both Passageway and Closet Doors are hollow core flush doors, 1 $\frac{3}{8}$ " thick, regularly sold in unselected gum, paint grade and in select White Gum, and Birch, stain grade. Other faces on special order.

We urge you to write today for the full details. *Kindly include the name of your lumber dealer and address your inquiry to Department 32A.*

Sunshine's BRIGHT (without GLARE)

COOLITE GLASS Cuts Costs, Improves Efficiency in Sunshine Biscuits Plant

The heat absorbing properties of Coolite glass helps keep interiors of this modern plant cooler even at high noon. Coolite traps and absorbs much of the sun's heat rays, reduces the load on air conditioning equipment, saves on overall operating costs.

Glare Reducing Coolite also filters out annoying glare in work areas and cafeteria. The plant is flooded with softened, filtered light that cuts costly eye fatigue. Employees *feel better, work better, when they can see better.*

Approximately 10,000 window lights of Coolite, Heat Absorbing and Glare Reducing Glass are installed in this well-daylighted Sunshine Biscuits plant.

See How COOLITE Can Save Money For Your Clients

In your plans for new industrial buildings or the modernization of existing ones, it will pay you to find out how Coolite can provide increased efficiency and economy. The cool, blue-green color of Coolite adds a modern note to any exterior. Coolite's filtered light boosts employee morale, reduces rejects. See your nearby Mississippi Glass distributor today.

Translucent, light diffusing figured and wired glass by Mississippi is "visioneered" for better daylight illumination. Available in a variety of patterns and surface finishes, all scientifically designed to distribute light to best advantage.

"Sign up now, boss—it's got Honeywell Controls!"

The *best* way to assure comfort in any building is to insist on Honeywell controls

If *you* have a control problem, Honeywell can help provide the proper thermal environment for any client—anywhere—in any kind of structure.

A large staff of well-informed control engineers—in 91 different Honeywell offices across the nation—are experienced in doing just that. Or—there's a lot of literature that's yours for the asking—on the auto-

matic control of heating, ventilating and air conditioning.

So, why not *talk to Honeywell*? Why not *write to Honeywell* about *your* control problem? And why not do it *now*?

For help with any control problem talk to Honeywell

for pin-point control of heating, ventilating and air conditioning

Specify Honeywell Automatic-Reset Pneumatic Relay

Stop temperature see-sawing and lagging

This magically accurate relay, made only by Honeywell, sets new standards of performance for pneumatic temperature controls. By using it, you can give clients closer temperature control, regardless of weather variations.

This remarkable Honeywell mechanism virtually *eliminates see-sawing temperatures* because it goes to work the instant the temperature deviates from the thermostat setting.

The Reset-Relay can be installed on any graduate-acting pneumatic system where close temperature control is desirable.

Get the complete story on this exclusive Honeywell control. Call your local Honeywell office or mail coupon below.

MATCHED EQUIPMENT

These **TRANE** products furnish air conditioning results you

TRANE CentraVac . . . Hermetic Centrifugal Refrigeration Unit. Completely self-contained. For chilled water systems. Six models from 45 to 200 tons. Lightweight, vibration free. Efficient operation down to 10% of capacity, through automatic throttling controls. Power consumption very closely proportionate to load through entire range.

TRANE Climate Changers . . . basic air conditioning units, built for widest range of requirements. Combine coils, fans, humidifiers, filters, dampers. 450 to 22,000 cfm.

TRANE Evaporative Condenser . . . for condensing refrigerant in the air conditioning system where water is scarce or expensive. Cuts water consumption as much as 90%.

TRANE Multi-Zone Climate Changer . . . A single air conditioner that provides heat or cooling or both simultaneously to as many as 8 different zones.

MANUFACTURING ENGINEERS OF HEATING, VENTILATION AND AIR CONDITIONING

D MATCH THE JOB...

together to give you the want!

What air conditioning results do you want? Have you a simple cooling problem—or a complex one? Is it small or large? Does the job require only cooling or does it involve the related problems of heating and ventilating?

Regardless of the nature or scope of your next air conditioning project, the *complete* line of TRANE matched air conditioning products contains exactly the equipment needed to do a superlative job.

Consider these advantages:

1. UNDIVIDED RESPONSIBILITY The completeness of the TRANE line makes it possible to get the undivided responsibility of one manufacturer.

2. ONE SOURCE OF SUPPLY You save time by dealing with one competent specialist—the TRANE sales engineer—instead of many.

3. ONE SET OF CATALOGS From one handy and complete set of catalogs you can select all the equipment you need.

4. COMPLETE FLEXIBILITY There's a wide range of sizes and models. So flexible is the line, you can, for example, create 10 different 50-ton air conditioning systems.

TRANE Cooling Coils . . . Efficient fin-and-tube extended surface. For use with chilled water, well water, or direct expansion refrigerants.

TRANE Centrifugal Fans . . . Class I and II construction with backwardly inclined or forward-curved wheel design. Ruggedly built. Quiet operation.

TRANE Reciprocating Compressor . . . Capacities up to 50 tons. New, automatic cylinder unloading saves power through multi-step reduction.

TRANE Self-Contained Units . . . all-in-one package. 3- to 20-ton capacity. Heating coil optional. 15- and 20-ton available with built-in evaporative condenser.

TRANE UniTrane and Custom-Air Systems . . . Multi-room air conditioning. Individual room control of heating, cooling, humidifying.

Why not join the many architects, engineers and contractors who specify and install TRANE Equipment? Call or see your nearest TRANE sales engineer when you plan your next air conditioning project.

AND AIR CONDITIONING EQUIPMENT

"Off-ceiling" lighting is attractive

Creative design added spaciousness and beauty to this confined building interior with an unusually high ceiling. Modern, flexible lighting systems and more freedom in architectural design techniques are the basic ingredients.

In the Anglo California National Bank's office at Hayward, California, the architect cleverly planned a second working level to minimize the high ceiling. An off-ceiling (or suspended) lighting system became an integral part of this design. Individual working areas are more than adequately lighted (over 40 footcandles) *with good, comfortable lighting.*

Open office spaces and carefully selected decorating colors help provide "spill-over" light for the main area; a device that might be used in many office buildings where the problem is one of high ceilings and limited space.

Westinghouse Type CC, 8-foot slimline fixtures with plastic sides were selected. Low in first cost, they are economical to install and maintain, since a minimum number of fixtures are needed. This is only one of a wide variety of lighting systems designed by Westinghouse for flexibility in planning. Send for B-5254, "Lighting Sets the Stage" and see an analysis of our complete commercial line. Westinghouse Electric Corporation, P. O. Box 868, Pittsburgh 30, Pennsylvania.

HEAVY-DUTY CYLINDRICAL LOCK

The free-standing Nesbitt Syncretizer Unit Ventilator with Wind-o-line Radiation extending from both ends of it, at the sill line.

**To solve your "WALL-OF-ICE" problem...
this NESBITT THERMAL BLANKET:**

Architects who design and school officials who approve large window areas in the modern classroom may delight in their choice if *thermal comfort* has been considered.

Unit ventilators could be selected by conventional standards if thermal comfort depended alone upon the classroom air temperature. But today we know that low-temperature exposures and cold window downdrafts may remain the robbers of pupil comfort, even in classrooms with close control of room-air temperature. The practical solution to the chilling effect of window downdraft is to release heat upward over the exposure.

For conditions of large glass area and cold outdoor temperature, Nesbitt provides Wind-o-line Radiation for integration with the Syncretizer.

Wind-o-line consists of fin-and-tube radiation in a grilled wall-hung casing to extend from both ends of the ventilating unit for the full window length—and continued, if required, along cold outside walls. (Or it may be had as a component of the storage cabinets forming The Nesbitt Package.)

Wind-o-line solves the problem of heat loss logically with a heat gain where and when needed. Convected currents of warm air temper the window downdraft and divert its flow upward and above the heads of the room occupants.

Inquire further of John J. Nesbitt, Inc., Philadelphia 36, Pa.

With room-air temperature evenly maintained, downdraft from large cold windows may remain the robber of comfort.

Nesbitt Syncretizer and Wind-o-line temper the downdraft, raise it out of impression range, and improve thermal balance.

NESBITT *Syncretizer* **WITH WIND-O-LINE**

Wind-o-line Radiation may be integrated as part of The Nesbitt Package of Syncretizer and storage cabinets.

furniture characteristics

American Furniture: Queen Anne and Chippendale Periods. Joseph Downs. Macmillan Company, 60 Fifth Ave., N.Y., 1952. 401 illus. \$1.50.

Written by the outstanding authority on American decorative arts, this handsome book is a highly significant contribution to the field, that will be welcomed by everyone who takes pleasure in beautiful period pieces and architectural backgrounds for which they were made. There is probably no one better qualified nor more conversant with the subject than Joseph Downs. Before becoming curator of the recently opened Winterthur Museum, near Wilmington, Delaware, he was curator of the American Wing of the Metropolitan Museum of Art, New York, and previous to that was associated with the Philadelphia Museum of Art and the Museum of Fine Arts, Boston.

The author shows how social and economic changes in the 18th Century brought about transitions to new styles and the manner in which they were reflected in homes of the time. Here are pictured more than 400 examples of Queen Anne and Chippendale pieces from the Winterthur collection, so the reader has a wonderful opportunity to study the characteristics of the different types of furniture made in this country during that time. There is a painstaking description of each piece shown, including place of origin, approximate date of construction, maker's name and many other pertinent facts.

Not the least important in this comprehensive volume are the 10 exquisite color plates of period rooms at Winterthur, with the furniture in its authentic environment.

radioactive contamination

Control and Removal of Radioactive Contamination in Laboratories. *National Bureau of Standards Handbook 48. Government Printing Office, Washington 25, D.C. 24 pp. 15¢.*

This handbook is one of several authoritative reports on radiation hazards, prepared under the auspices of the National Committee on Radiation Protection. While it is concerned primarily with operating procedures, it also contains considerable material of value to architects planning hospital or research radio-isotope laboratories; of particular interest to the architect are the "Introduction" and the chapter on "Special Materials." The Introduction outlines the general problem of radioactive contamination and how it may be minimized. Chapter 5, "Specific Materials," gives a brief analysis of the most common surfaces in use in radio-isotope laboratories from the point of view of contamination.

CARL B. BRAUER

revised guide

Heating, Ventilating and Air Conditioning Guide, 1952. *American Society of Heating and Ventilating Engineers, 62 Worth St., New York 13, N.Y. 1520 pp., illus. \$7.50*

The newest A.S.H.V.E. Guide contains revised and increased technical data on 50 subjects related to the heating, ventilating, and air conditioning industries. Chapter arrangement is still grouped under the familiar section headings: Fundamentals; Human Reactions; Heating and Cooling Loads; Combustion and Consumption of Fuels; Systems and Equipment; Special Problems; Instruments and Codes. Names and addresses of organizations which can supply codes and standards are listed in the last section. One of the special features in the 1952 edition is the larger Catalog Data section giving detailed information and specifications on the equipment produced by 277 national manufacturers. A 32-page index simplifies the search for products and manufacturers, and a separate index is provided for both the Catalog and Technical Data sections.

**Fiat Cadet Built-in Model 19B
shown with Dolphin Door**

View showing typical construction at door opening. Notice how metal lath and plaster are secured to front stile of shower. This construction prevents plaster cracks around door opening.

A shower unit designed for Built-in installation in bathrooms . . .

At last . . . a moderately priced shower unit expressly created for recessed installation . . . the only prefabricated metal shower cabinet that provides for continuity of the bathroom wall material. By the elimination of all apparent cracks or joints it becomes an integral part of the structure rather than merely a fixture.

The result is a rich, ultra-smart, custom-built appearance. Yet, the installed cost is considerably less than that of a built-up tile shower. It makes a permanently water-tight installation, will not crack and develop leaks with settling of the building, as often occurs when mortar joints are depended upon for water-tightness.

Reversible side panels, valves can be installed on either side without drilling on the job.

Size 36" x 36" x 80"—Bonderized galvanized steel walls with baked-on synthetic white enamel—will not rust. Precast terrazzo receptor. Clean interior, no screws or projecting fastenings to mar the bright white smooth enamel finish.

a hinge that **WON'T** wear out

Stanley Full-Jeweled Ball Bearing Butt Hinge*

Here's a hinge you can specify for heavy doors, exterior doors, and doors receiving high frequency service — with complete confidence that it will last as long as the building.

The ball bearing construction of the Stanley Full-Jeweled* Hinge is designed to take lateral as well as vertical wear. With the load supported both ways on ball bearings, it is practically impossible to wear out this hinge.

Whenever there are heavy or busy doors in any building you design, you will insure your client's investment by specifying Stanley Full-Jeweled Extra Heavy Ball Bearing Butt Hinges†.

Exclusive Full-Jeweled Ball Bearing assembly consists of a movable and fixed raceway. When lateral thrust occurs, the movable raceway transmits the force directly to the bearings, which, in turn are held firmly by the fixed raceway. Thus, the weight of the door is supported both laterally and vertically on ball bearings.

† All Stanley Extra Heavy Ball Bearing Hinges are equipped with Full-Jeweled Bearings.

The most famous doors in the world swing on Stanley Hinges

out of school

by Carl Feiss

The following editorial from *The Architect's Journal* of March 6, 1952, should be read by student and teacher alike and then followed by reading (on page 296 of that issue) the letter from Tony Moore, an R.I.B.A. student, called "Theory and Practice in Education."

research into education

"Two talks followed by discussions, which were attended by architectural students last week showed that students (in London, at any rate) are becoming anxious and worried about their training and their future prospects. They have good reason to be so. The postwar building

boom on which both architects and students have staked so much has never amounted to a great deal and is now fast coming to a close. Students, on qualifying, are at last finding it difficult to get a job. The reason for worrying about their training, however, is not so obvious for those who remember the struggles to form schools, have lectures, qualification by exams, for "live" projects and for freedom to design in one's *metier*. The student of a recognized school has, on paper, got everything. He has, in fact, got too much, including title of "architect" at the end of a five-year's course with a year's practical experience. The average year school course is over-crowded and unbalanced.

"He attempts a superficial study, backed up by sparetime reading, of more separate subjects than any other profession in the world. He also attempts to apply his knowledge by designing (on paper) as many buildings in five years as he, alone, could design, detail, and supervise the construction of, in fifty years. His position, leaving school, is akin to that of Barrie's little sillies who don't know what they are—he is competent neither as an assistant nor as an architect."

"Our plea is for the formation of a school group who, now the battle for sound architectural schools is won, will look afresh at the problems of education and qualification. The R.I.B.A. is heavily overworked but the Architectural Association—that self-professed unofficial institution—has a precedent in these matters."

Architects Lundeen and Hilfinger, Bloomington, Ill., designed this modern building for the Kemp Grain Co. of Lexington, Ill. Rilco Laminated wood beams are 36' long, spaced 6½' O.C. Rilco V columns are 10' 4" high.

Dramatic new designs with **RILCO** *Laminated* **BEAMS and V COLUMNS**

RILCO laminated beams and V columns LOOK expensive, so they're particularly valuable when you want a fine building at moderate cost. The richness of the wood warms and softens utilitarian structures . . . gives a luxurious, inviting atmosphere.

Yet the material cost is surprisingly low. And all members are smoothly-surfaced, precision cut and drilled for assembly hardware, to make erection fast and simple.

These custom fabricated beams and columns offer unlimited possibilities in designs of all types and costs. For information on specific installations, write for literature or see our 16-page catalog in Sweets.

RILCO

RILCO *Laminated* PRODUCTS, INC.

2517 First National Bank Building, St. Paul 1, Minnesota

I wonder what is meant by "the battle for sound architectural schools is won." It certainly isn't won here and I can't conceive of finishing in such a battle.

There is a bitter tinge to this editorial disappointment in postwar events, along with that constant frustration which seems to attend the analysis of architectural training these days. In this country, we have little cause to be unhappy about postwar building. Despite slowdowns and material shortages, the result is not too bad. We've done only fairly well in office buildings but there has been a shortage of good churches. Design trends have moved upward in the medium-sized but high-quality single house, but row houses and large apartment groups have reached a new low in quality and discernment. In fact, we have now reached a point where we are accepting as standard what less than a generation ago were considered substandards. I like some of the factories we've been designing and we've

(Continued on page 296)

Intermediates that last like photographs

... produced at low cost

A case history based on the experience of the Hyster Company, Portland, Oregon

By reproducing its engineering drawings on **Kodagraph Autopositive Paper**, the Hyster Company gets intermediates which have dense black photographic lines on a translucent, highly durable paper base. *Intermediates* which will remain intact in the files year after year... and produce sharp, legible blueprints and direct-process prints whenever needed.

And the cost is surprisingly low because Kodagraph Autopositive Paper boasts unique photographic properties which cut production costs *substantially*. It can be handled in ordinary room light... and it produces positive copies *directly*—without a negative step.

Furthermore, existing equipment can be utilized—Autopositive can be exposed in any blueprint or direct-process machine... and processed in standard photographic solutions. Hyster uses a blueprint

machine which has also been designed to produce Autopositive intermediates in a continuous flow.

How The Hyster Company Uses Autopositive

For All Print Production. Autopositive intermediates are used instead of valuable and perishable original drawings. Producing sharp, legible blueprints and direct-process prints time after time, they greatly reduce the possibility of reading errors in the shop.

For "Permanent" Files in its home office... and branches in the United States and abroad. "Photolasting" Autopositive intermediates eliminate the costly delays experienced in the past when intermediates faded, turned yellow, or became brittle.

For Drafting Room Short Cuts. Autopositive Paper is used to reclaim old and weak-lined drawings... and to duplicate standard designs which will be incorporated in new drawings. *All of which saves hours of creative drafting time.*

Kodagraph Autopositive Paper

"THE BIG NEW PLUS" in engineering drawing reproduction

Learn in detail all the ways you can use Kodagraph Autopositive Paper—the revolutionary photographic intermediate material which you, or your local blueprinter, can process quickly... *economically... at a low cost.*

(Continued from page 150)

one interesting plan for a new town, but not very exciting building to go along with it. The last five or six years have been good years—not great years—for architects in the United States.

Our British friends, although frustrated by shortages in money, men, and materials have no cause to be ashamed of the quality of their small production. In mass housing they have done some fine things. Their new town plans are way ahead of our thinking and their public buildings are, on the whole, of greater dignity and taste than what we have been turning out.

Much of the matter of spirit in today's designs rests on the quality emphasis to be found in our training systems. In the general subjects I have mentioned above, there has been little or no debate. We have no forum for discussion adequate to do justice to the merits of the issues to be discussed, or of sufficient stature to attract our attention. Debate on architectural design could be a television dream. I'll expand that idea sometime soon. I understand that one architectural educator, at least, is working on TV ideas. But I'm still going to look for great debates on architecture, on planning, and on the training for whatever systems of design, construction, and initiative develop. Perhaps the students will do it yet.

As I write this, the first issue of *LINE* magazine is on my desk. Some of you may remember that I put quite a plug in for the publication of this student architect's magazine, back in the September, 1951, *OUT OF SCHOOL*. I am happy to see the first issue and congratulate the editors on the fruition of their obviously arduous task. Frankly, I am sorry the issue does not have more meat in it, neat as it may be in format. Tony Moore's letter in *The Architect's Journal* mentioned above raises the kind of questions students should be asking, but *LINE*, in its first issue, starts with a gentle and slightly patronizing first editorial by Vi Hudnut, who was talking to boys, not men. This is followed by several high-school themes on the subject, "Why My School is Best." There are also some reproductions of student problems, without explanation, comment, or criticism.

Come on, men, get mad! Take a poke at something if you feel like it! Take a poke at me or any handy object, but get going! I want to see a student magazine that howls. You've published your first issue—now get rolling!

(Continued on page 154)

A fan for every need from HERMAN NELSON

Direct Drive Unit Blowers are available in 11 models. Wheel size from 6" to 11". Choice of speeds available in each size. These units may be mounted on floor, wall or ceiling.

Direct Drive Propeller Fans. Both small sizes for use in offices, laboratories, etc. and also heavy duty units commonly used where contaminated air cannot penetrate the totally enclosed motor. Sizes from 14" to 36". Capacities up to 12,400 c.f.m.

Belt Drive Propeller Fans. These versatile units deliver maximum amount of air effectively . . . quietly. Operate horizontally or vertically. Wheel diameters from 24" to 54". Capacities up to 36,000 c.f.m.

Centrifugal Fans for every Class I or Class II use. Equipped with statically and dynamically balanced air wheels of most advanced design. More than a hundred sizes and speeds. Extra quiet in operation.

Write for detailed information about any type Herman Nelson Fan to Dept. PA-6.

HERMAN NELSON

Division of AMERICAN AIR FILTER COMPANY,
MOLINE, ILLINOIS

A fan for every need

...FROM

**HERMAN
NELSON**

In the industrial plant shown above 43 Herman Nelson Propeller Fans insure comfort cooling for employees working at heat-producing, high speed machines.

No matter what type or size of ventilating fan you need for industrial, commercial and institutional use Herman Nelson makes it. Our designers and engineers are leaders in the fan field and in our laboratories and test rooms all the latest findings of aerodynamic science are put to work in fan design. Herman

Nelson fans are noted for low initial, operating and maintenance costs. They are designed to operate with minimum air turbulence, thus permitting the delivery of more air with less noise.

The Herman Nelson line includes Propeller Fans, Unit Blowers and Class I and II Centrifugal Fans. All Herman Nelson fans are tested and rated according to Standard Code of the National Association of Fan Manufacturers and the American Society of Heating and Ventilating Engineers.

The key superiority of Herman Nelson propeller fans is the exclusive design of the fan blade.

The blades have an "air-foil" cross section which results in greater efficiency and quieter operation. The tendency toward over-loading, common in propeller fans, is minimized by advanced Herman Nelson design. Lower initial, operating and maintenance costs are assured.

Fan blades of all Herman Nelson Propeller Fans are fabricated of aluminum and are formed by the hydraulic pressure method for extreme precision. The outer edge of each blade is flanged to increase strength and rigidity.

out of school

(Continued from page 152)

And remember what I asked last September? "What is the program for LINE? What are some of the issues and principles it hopes to develop?"

The other day, I was walking down the elm-

shaded walks of the University of Theleme, lost in the architectural nostalgias for which the university is famous. The warm June sun beat brightly on the library's ivy-covered walls and, between the buttresses, the lancet windows glowed with the pale blue of the cold cathode lights in the reading rooms behind

little leaded panes. By a flight of steps to handsome Georgian portico of what was obviously either a classroom building or dormitory I paused to question a blue-jeaned co-ed and her two drooling escorts.

"Where," I asked, "is the School of Architecture?"

"The which?" she languished, and one of her pals dropped one of her books.

"Agriculture?" the other pal asked, his gaze wandering reluctantly to me.

"What team are they on?" asked the first, palsy, having recovered his stance.

I explained gently that it was where they taught people to design buildings like those around us.

"Never heard of it," says the second wails.

"Do they actually teach things like that?"

she crooned, her eyes obviously seeing for the first time the buildings around us. "How cute!" and she giggled.

I left them to their more important affairs and plucking my long, grey beard, fixed with glittering eye one out of every three students I could corral, as I continued my search. The mystery thickened as my random sampling turned up no more than shrugged shoulders and an occasional misdirection. Finally an elderly professor told me that he was walking that way, just by chance, and would escort me to the door. As we strolled along, I asked him about the School of Architecture.

"Frankly," he said, "Although I have been on the campus 30 years, I have never visited it. I have heard that it does have a good reputation. Some of us occasionally meet the Dean at a President's reception, or at Commencement. He is said to be an excellent cook and to have traveled widely. I am an urban sociologist myself, so I would have nothing in common with architects, nor they with me. I do have a friend in engineering, who tells me that the construction courses in the architectural school are below par. I have heard, also (though this is mere hearsay, mind you), that the school is an expensive one to run, and that there is some feeling that it is a luxury which, in these days of inflation, the University can ill afford. However, I am of the old school myself and I feel that in these days of gross materialism a university should indulge itself occasionally with a few educational frivolities—

Architect:
Wm. Henry Deitrick, Inc.
Raleigh, N. C.

If it deserves fine architecture, it deserves
"The Finest Floor that Grows"

NORTHERN HARD MAPLE

- ✓ resilient
- ✓ bright
- ✓ smooth
- ✓ tight
- ✓ warm
- ✓ dry
- ✓ non-splintering
- ✓ easy cleaning
- ✓ easy re-surfacing
- ✓ dent-resistant

Today's architecture truly and admirably "brings the outdoors in." And inevitably, too, foot traffic carries in some of that same "outdoors," to make life a bit tougher for any floor. The choice of enduring MFMA-graded Northern Hard Maple, in strip, block or pattern flooring, assures a floor that will grow old very slowly and gracefully. "There's always a new floor underneath" which will forever respond to simple refinishing, after millions of footsteps may have dimmed its original genial luster. Nature does not produce a finer floor material, nor has man's ingenuity ever outdone Nature in this respect.

not always just the necessities, if you know what I mean."

I did.

"Of course," my friend the urban sociologist went on to say, "A truly educated man is always interested in architecture. Every time I go to Europe I visit the Cathedrals and

really the main reason most people travel is to see buildings, or scenery, or historic spots. I have a large collection of postal cards from my various trips abroad. Most of them are on architectural subjects and I have thought of willing them to the architectural school library, which I have heard (although this is

just a rumor), refuses to catalogue its collection by the Dewey Decimal system—and the librarian is being threatened with excommunication by the joint chiefs of staff. Under circumstances, I may will my postal cards to Harvard."

We had been walking for some time, passing at a leisurely pace from quadrangle to quadrangle. Since the fronts and backs of buildings did not match, following the tradition, I suppose, (where a Gothic facade has as its opposite, or rear, a Georgian facade), the variety of effects was stimulating if not pleasing. Turning to my companion, I asked, "Do you know whether or not the faculty of architecture designed the campus buildings?"

"Why, I don't believe so," said my friend in some surprise. "I don't think it would occur to anybody to ask them to."

We were now approaching an undistinguished and drab structure with three-story limestone pilasters flanking an entrance much too small for this frame. Before this grandiose decalcomania we paused to say good-bye.

"I can always recognize the School of Architecture at night; its lights are on later than in any other building. Sometimes I wonder why." And with these remarks we parted ways.

Seated later in the Dean's office, I mentioned my recent experience. He put his pipe in the bulging pocket of his tweed jacket and looked at me sternly.

"I would not dream," said he, "of risking the political future of the school by permitting my faculty to work on the design of university buildings. There are two dangers; first that they might get into a stylistic debate on the campus and the second that the students might question the competencies of the faculty. The perils are much too great. We rely on our reputation. Best to leave well enough alone."

"Of course, it is regrettable, to some extent that we are not better known on the campus. I can assure you that were anyone from another college of the university to visit us, we would receive a cordial welcome. Our problem, of course, is time. We are just too busy to curry friendships, which would mean very little to us. Besides, looking at it

PROTECTED ... automatically ... inconspicuously

Records show that during the next twenty-four hours fire will strike more than 1600 buildings in the United States. Among these will be 140 stores, 80 factories, 6 churches, 3 hospitals, 6 schools. A staggering daily total of property destroyed . . . far worse, when measured by lives lost.

These figures emphasize the obligation upon architects and management to provide protection against fire in hospitals, hotels, restaurants, schools, stores, offices and factories. Be sure the buildings for which you are responsible have the positive protection of a Grinnell Automatic Sprinkler System.

Call in the Grinnell engineer when your project is in the design stage. Let him show you how, with the use of these inconspicuous sprinklers, you can have this dependable protection against fire without taking away from the appearance of your carefully planned interiors.

**GRINNELL CEILING
SPRINKLER**

For offices, shops, stores, restaurants, lounges, country clubs . . . where sprinklers must be unobtrusive and blend into modern interior design. Protrudes only 1-inch below ceiling.

**GRINNELL
SIDEWALL
SPRINKLER**

Inconspicuous. Economical to install when remodeling rooms with narrow ceiling areas, such as hotel rooms and corridors.

the vantage of the student, what conceivable benefit would such contacts be to him?

"After all, the architectural school can be considered as an exclusive club. We are training professionals. Now, if our men were gotten out into the world to earn a living as an objective, it might be different. But prima facie they are designers in a profession of a high degree of specialty. It is impossible that these men, with all the charettes and everything, should fritter away useful time trying to get the university the benefit of their experience, training, and character. Yes, I use the word 'character' advisedly, as our men are, of course, of a higher type than is to be found anywhere else on the campus."

The Dean paused and looked sentimentally at a handsome photograph of Chartres on the wall. I found my gaze wandering around the office. The furniture was adequately contemporary to satisfy the demands of the students without disturbing the more conservative atmosphere. The atmosphere of decorum, proper to a Dean's dignity, was disturbed only by the tweed coat. It should at least have been a pin-stripe burlap serge.

I asked, "Haven't I heard that there is an excellent English faculty on the campus. Do they serve your school?"

"Oh, no!" cried the Dean, letting his gaze wander to another fine picture, this time of Falling Water. "We have our own English courses, exclusively for architects. After all, the boys do not need to read too much. They are designers. They should be able to read the copies of 'Mont St. Michel and Chartres' by Henry Adams and OUT OF SCHOOL in Pencil. But beyond these they should not be expected to go. An architect, it is true, should be a liberal intellectual. He should know when to enjoy art, music, and literature. But, because of the many exacting tasks confronting the profession, I believe that it is the duty of the school to teach its students the maximum amount of culture necessary for this particular profession to retain its reputation. To develop an intellectual curiosity beyond these limits would be indicative of overbreeding."

The Dean leaned back in his chair, his finger tips together, and staring through the tops of the elm trees at the tall ivory tower of Theleme, added, "We tolerate this university as a necessary adjunct to the School of Architecture. My task, to which I have devoted many years, has been to see that at no time does the university intrude on our activities. I modestly pride myself on the complete success of this undertaking."

I could not argue the point.

HOW TO KEEP CLEAR OF ERASURE "GHOSTS"

Specify Arkwright Tracing Cloth, and you'll get clean, clear, "ghost-free" blueprints no matter how often you erase the drawing.

You can re-ink razor-sharp lines on Arkwright cloth without "feathering" or "blobbing". More important, you can be sure that drawings will never become brittle, opaque or paper-frayed with age.

They're good reasons for you to remember: if your work is worth saving, put it on Arkwright Tracing Cloth. Want a sample? Write Arkwright Finishing Co., Industrial Trust Bldg., Providence, R. I.

AMERICA'S STANDARD FOR OVER 30 YEARS

Note from the drawing above and the photo below how Steeltex bonds a veneer wall together as a strong single unit and eliminates the need for standard sheathing.

500 Families Get Added Fire Protection with Steeltex for Masonry Veneer

One very good reason for specifying *Steeltex for Masonry Veneer* on the extensive row-type Oglethorpe Apartments in Atlanta, Georgia was the added fire protection it offered, according to James C. Wise, architect for the development. Said architect Wise, "A highly fire-resistant wall was achieved by the solid, steel-reinforced, mortar slab.

"Another excellent reason," said Mr. Wise, "lies in the fact that Steeltex rigidly ties the brick veneer and frame together for mutual protection against later settling and distortion. In the Oglethorpe Apartments, I have noted that there has been no plaster cracking or breakaway."

To take advantage of the stronger, safer walls Steeltex brings to your veneer construction, see our catalog data in Sweets' or write for Catalog DS132, Dept. PA, Pittsburgh Steel Products Company, Grant Building, Pittsburgh 30, Pennsylvania.

**How much does it
cost to shut down for
refinishing or repairs...?**

It doesn't happen with Facing Tile

In a broad sense, size and use of a building determine the cost of a shut-down for refinishing or redecorating walls.

There are specific factors which must be considered, too.

- There's the time lost in shutting down.
- There's the loss of efficiency from interrupting operations.
- There's the income lost from products not made or sold.
- There's the cost of labor and materials for refinishing.

These costs can be avoided by selecting Structural Clay Facing Tile for building interiors. Facing Tile builds a strong, load-bearing wall combined with a color-right finish. The wall is fireproof and will not decay or disintegrate. The finish is permanent and will not scratch, mar or fade.

Whenever you use Facing Tile, you eliminate refinishing, redecorating and repairing.

GET ALL THE DATA ON FACING TILE

For full information on Structural Clay Facing Tile, glazed or unglazed, send for free booklets, "Catalog 52-C," "The Scientific Approach to Color Specification" and "Facing Tile Construction Details." Just address your request to any Institute Member or Dept. PA-6 of our Washington or New York offices.

it's the law

by Bernard Tomson

This column has previously discussed zoning law as it applied to esthetics and related matters: (May 1950 P/A—Extent to which a municipality may limit the minimum area upon which a dwelling may be constructed; November 1950 P/A—Extent to which a municipality may restrict construction of homes that "look alike"; December 1950 P/A—Extent to which a municipality may restrict area for construction of one-family homes). The tendency has

been to incorporate in a building or zoning ordinance a rigid set of rules intended to be applicable to all building projects. Lately, an interesting variation has begun to appear. Under these zoning laws a commission, or similar body, has been set up to determine, among other things, the esthetics of a building project at the time the building project is contemplated.

An excellent example of this device is

found in New York City, where the problem of finding industrial sites has directed companies into residential areas. An additional advantage in such a site stems from the fact that a project in such an area immediately available a ready pool of labor. The difficulties inherent in placing an industrial plant in a residential area are not apparent. How New York City solved this problem is intriguing.

esthetic zoning

part I: industrial

In 1943, New York City adopted a zoning resolution permitting the erection of certain types of industrial plants in residential districts. Art. 2, Sec. 3 (10) of the resolution provides for the submission to the New York City Zoning Commission of a site plan, and general building plans showing design, location, structures and open spaces of project. The resolution listed the type of project permitted (administrative offices and industrial laboratory projects), and restricted the size of the height of buildings, the distance between buildings and required conformity to applicable laws and regulations relating to construction, operation and maintenance.*

City Planning Commission was then to consider the merits of each contemplated project individually in the light of promoting benefiting the use and value of property in the area.

Only one concern took advantage of the resolution. In August of 1943, Sylvania Electric Products, Inc. of New York made an application for the erection of a research, developmental, and administrative center in a residential zone. The project presented by Sylvania comprehended the initial utilization of two buildings then occupying the site in Long Neck, Queens, and the subsequent erection of five administration and industrial labor buildings, a garage, and club house. The site contained 28.5 acres, of which seven acres were set aside as a park area for use by the general public. The total floor area of the project was 429,104 square feet, or 36 per cent of the net area of the site. The project further provided for parking areas (approximately 500 cars) and for landscaping and developing of the entire area so as to create "a pleasing appearance to the community, an attractive setting for the buildings and a general atmosphere of a high-grade technical institute . . . The architecture will be a modern Georgian style depending upon project walls and eaves and varying roof treatment to break up otherwise long building masses. Modern

(Continued on page

structures on the plot shall be consistent with the predominantly residential character of the district. The uses provided for in subsection (10) shall in no instance include the trades, industries and uses proscribed in section 4(a) and 4(b) of this resolution.

"(b) Upon presentation to the City Planning Commission of a site plan and general building plans showing the design, location and uses of buildings, structures and spaces of a project within a residence district or in an area predominantly residential although partly lying in less restricted districts, the commission may, after public notice and hearing, and subject to appropriate conditions and safeguards, by resolution certify that the construction, operation and maintenance of such a project is consistent with the use of property in such districts and is designed to promote, enhance and benefit the value and use of such project and may, thereupon, approve such plan project. Such resolution of the City Planning Commission, together with the plan of a project shall be filed with the Secretary of the Board of Estimate within five (5) days after its adoption. Unless the Board of Estimate shall disapprove such resolution by majority vote within thirty (30) days of the date of filing, it shall thereupon

There's No Limit on Beauty

in a durable **VITACHROME FLOOR!**

In residential and commercial interiors, count on Vitachrome† Tile to always give you beauty plus service.

It offers you a choice of *especially light, bright* colors that give everybody a lift! Colors that won't fade, wear or show age because they go all the way through from the tile to surface.

Though Vitachrome can be used wherever resilient flooring is desired, it is particularly suited to food-serving areas. You'll find that it resists oils and fats, acids and even that bite into ordinary floors when food is spilled.

Vitachrome is a *cinch* to clean. Just sweep its smooth surface to remove dirt. Wash periodically, water-cleaning occasionally.

With all the hustle and bustle of modern living, Vitachrome floors show no signs of wear.

And yet how sparkingly alive they remain for entertaining . . . for parties. Their gay, smooth surfaces make even old-timers eager to trip the light fantastic again.

Oh yes, the low cost of Vitachrome! *That*, you'll like!

Get all the details about this *light, bright* flooring material from your Tile-Tex* Contractor. You'll find his name listed in the classified pages of your phone book . . . Vitachrome is one of *several* very attractive and serviceable *extra* floor coverings that are made by Tile-Tex.

*Gold Depository in
Fort Knox, Kentucky*

... more important than gold!

The most important metal today is not the tons of gold buried at Ft. Knox!

Far more important are the millions of tons of iron and steel scrap so desperately needed to make new steel. All scrap, actual and potential, needs to be gathered up and channeled to the steel producing plants-NOW, today, tomorrow and tomorrow. So long as the steel industry is called upon to produce two million and more tons of ingot steel per week, it must have one

million and more tons of scrap each week.

Steel producers are getting the iron ore, limestone and coal they need. But the scrap situation is critical and will continue to be so until inventories are built up substantially.

As a user of steel--as one interested in seeing that America's rearmament program is not too little and too late--you can do your part to see that your community and your business keep scrap moving toward the mills.

The Youngstown Sheet and Tube Company

General Offices--Youngstown 1, Ohio
Export Offices--500 Fifth Avenue, New York

MANUFACTURERS OF CARBON ALLOY AND YOLOY STEELS

The steel industry is using all its resources to produce more steel, but it needs your help and needs it now. Turn in your scrap, through your regular sources, at the earliest possible moment.

it's the law

classic entrance porticoes and varying treatment of the fenestration together with low connecting colonnades and arcades will create an intimate college campus effect, suitable to a highly restricted residential neighborhood."

The project was to contain complete facilities for research and development in lighting,

communication and electronics, as well as general administration and sales offices for the concern. Manufacturing was strictly limited and the ultimate number of employees upon completion of the project was not to exceed 2000. The City Planning Commission, after considering the merits of this application by Syl-

vania, by resolution dated September 2, 1950, approved the contemplated project.

It will be noted that the original resolution made no provision for the erection of a light industrial plant. In 1950 this was amended by the insertion of the words "and light industrial plants" into Art. 2, Sec. 3(10) of the City Charter. The Board of Aldermen dealt with the types of projects which might be erected. In November of 1950, upon the then amended resolution, The Bulova Company, Inc., filed an application for the erection of a light industrial plant in the residential area.

The Bulova project, in Jackson Heights, Queens, was prepared with the problem of aesthetics kept foremost in mind. The resolution provided for the erection of a three-story building on a site area of approximately 24 acres, a plot coverage of 15%. Sixty acres were reserved for landscaped park area for public use. The floor area of the building was to be 390,000 square feet. There were provisions for a parking area to accommodate not less than 500 cars. The entire area, including the plant building, interior roads and walks, park areas and automobile

LONG LIFE makes DURIRON THE BEST BUY IN ACIDPROOF PIPE

Duriron resists practically every industrial corrosive in use today. *This resistance is as thick as the pipe wall.* This means no leakage or costly replacement caused by corrosion damage.

The labor cost of installing Duriron is the same as that for other types of pipe—and it's a cost that will never occur again.

Physical properties and other details about Duriron Acidproof Pipe are available in free catalog PF/1. Write.

Hospital Wing, Medium Security Prison, Soledad, California; Division of Architecture, State of Calif., Archts.; M. & K. Corporation, San Francisco, Calif., Builders.

Highlights of this New Exclusive BAYLEY Product

- Safeguards against escape ● Better daylighting ● Controlled ventilation ● Large areas of clear vision ● Minimizes self injury ● Working parts concealed ● Clear glass ● GLAZ-WEDG secures glass ● Sanitary—screens removable, easy to clean ● Glass washed from inside ● Noncorrosive metals throughout ● Reduces maintenance and interference with hospital routine

73 Years of
RELIABILITY

New Bayley SAF-T-GARD Window *Scientifically Developed for Mental Hospitals*

To be known for a fine quality product is only the *first* essential. Much more is required from a truly satisfactory relationship. Full understanding of this fact is the foundation of Bayley's policy—and why Bayley has been so widely preferred for so many years by discriminating Building Designers.

Bayley's endeavor to better serve through all the building stages—from recognition of need to building occupancy—is further exemplified in the new Bayley Saf-T-Gard Window. This window is the result of Bayley's close collaboration with Doctors and officials of mental institutions. Not only does it efficiently meet the demands of modern mental hospitals but it also incorporates construction features made possible by Bayley's years of specialized window experience.

Regardless of window requirements, you too will find extra values in discussing your needs with Bayley. Write or phone.

See Bayley in Sweet's. Complete catalogs on Aluminum Windows, 17a/BA; Steel Windows, 17b/BAL; SAF-T-GARD Hospital Detention Window, 17b/BAY.

area was to be landscaped, developed and maintained, "in such a way as to create a suitable and attractive appearance." The application further stated that the three-story building would be used as central headquarters and plant for Bulova Watch Company. More specifically the activities would include admin-

istration and sales officers, advertising, personnel administration, product research and development, general engineering, quality control and metallurgic development, production of watch parts, assembly of watch movements, shipping, and the production of tools and dies for watch parts manufacturing. This light manu-

facturing would be permitted under amended resolution. It was also estimated the number of employees to be accommodated on this project would not exceed 2000. There were also provisions for the building of new streets, the widening of existing streets and the deeding of these to the city.

The City Planning Commission, in its resolution approving the Bulova application on December 27, 1950, stated:

"The Commission was impressed by the community Campus plan, but the effectuation of any such plan is not practical at this time because of the numerous interests and agencies involved. It is obvious that the proposed project would require expenditures far in excess of the sums now available for such purposes. However, development of the Bulova project would not preclude the subsequent use of other facilities in the vicinity for public purposes. It appears that the Bulova project could be integrated with a larger community plan without adversely affecting the over-all objectives of the latter. The Commission is hopeful that, as practical, schools, parks and other facilities in this area may be provided in conformity with such an integrated plan."

The results of these two projects alone are listed as follows:

1. New York City gathered increased revenue by their real estate tax on the greater valuation of these two large projects, compared to lower assessed residences.
2. Employment was provided for residents of neighboring communities close to their homes.
3. The City was given a large area for parks—the Bulova site provides playground, swimming pool, comfort station, basketball and football fields available to the public.

registered, often give little thought to the problem until they need registration in a state. What is needed is continuous action on the part of every architect to the end that registration procedures will be improved. Registration laws will be strengthened and not weakened, and that such laws be enforced.

An encouraging sign has been the increasing number of architects who are not members of registration boards, who have attended meetings of the N.C.A.R.B. Possibly a seminar in registration should have a place on the convention program.

In general, I agree heartily with T. J. O'Connell. Among the flaws in the new Georgia law are (1) requiring only one member of an architectural firm to qualify, (2) providing for the acceptance of "a diploma... from an architectural... school... in lieu of the examination" and (3) no specific provision for enforcement.

the intelligent way

Dear Editor: Only a short time ago architects seemed to focus indifference, individualism, independence and pure cussedness on the suggestion at group effort for group action, but lately I am greatly encouraged. I watch various architectural groups at work and note the fruits of their labor.

They stood off bureaucracy in Maryland last year, in Virginia this year. They are about to win a national battle on fees with the AIA, services, long-drawn though the engagement has been. They even begin to impinge on the PHA with NAHO to appreciate us. Small groups are stirring of some research matters and beginning to take form. All these items are of unsurpassed public relations value. As architects learn to respect and guard their

professional values they will gain, and deserve, more public appreciation. May lessons hard learned stay with us.

Bernard Tomson strikes at the heart of our professional troubles in seeking to develop, common to all states, the public values in-

herent in adequate registration laws. I hope his article stirs a real urgency among architects everywhere to demand a united front through national A.I.A. guidance, and to work unceasingly to bring this about. Its accomplishment would be the finest public relations

gesture the profession could ever hope to make. It is the intelligent way to a public appreciation of the architect's contribution.

More power to Bernard Tomson and his colleagues for adequate registration laws common to all states.

more than a law

Dear Editor: It is certainly time to attempt to get some reasonable uniformity in registration legislation. However, more than a "statute" law is needed. The whole examination procedure in states with strong laws and no required "internship" period needs re-examination.

Among the questions that should be considered are:

1. The reasonableness of the requirement of three years of experience in New York or some other states before any part of the examination may be attempted. The experience period is completely without contact with any professional or public agency.

2. The justification for examining in subjects as the history of architecture. No one has yet convinced me that a knowledge of the history of architecture designed what building in 16th Century France has any reasonable relationship to the protection of the public health, safety, moral and general welfare in 20th Century America.

3. The examination in design, as given in some states, lends itself to subjective evaluation on the part of the examining board. The end result can be that the design judgment criteria have little to do with the protection of persons and property.

THOMAS W. MACKESY,
College of Architecture
Cornell University

agrees wholeheartedly

Dear Editor: My comments relative to Bernard Tomson's article are: I agree wholeheartedly with his premise that some uniform legislation should be advocated for the entire profession. You are probably aware that the Institute of Professional Surveyors and Architects, Education and Registration, has one section of their report devoted to registration.

Blo-Fan
and
Pry-Lites

For Beauty

For Utility

For Easy Maintenance

No kitchen is complete or modern without a Blo-Fan electric exhaust ventilator. Its patented blade combines the volume of a breeze fan with the power of a blower. Its attractive grille is removable *without tools* and the motor assembly merely lifts out for easy cleaning. A Pry-Lite modern recessed lighting fixture completes the picture.

Easy to clean or relamp, Pry-Lites have snap-on fronts. No screws, no hinges, no nuts—and no tools needed. Pry-Lites (1000 series) have a built-in pull box, adjustable mounting straps that eliminate framing-in time, a plaster flange which fits any finish, and they are U.L. approved for any standard building wire.

In the bath . . . Pry-Lites and Blo-Fan go together—Pry-Lite recessed lights give perfect illumination without glare—and elimination of offensive odors and steam-streaked walls is assured with a Blo-Fan exhaust ventilator.

(Continued from page 174)

Having attended but one of the many sessions of this commission, I am, however, aware that the members recognize the worth of a uniform licensing law; but also realize that states' rights and many local conditions, together with local interests are working against such over-all simplification.

I am also very familiar with many cases and problems that come before the Board of Directors of the Institute relative to our inadequate licensing laws. The fact that all 48 states now have laws means a step in the right direction, but a step which will have to be supplemented over the years to get the proper teeth incor-

porated, as was only recently done in the state of Georgia. Even when such a good act put into force, there are always groups of individuals making an effort to weaken purpose, as is the case in Tennessee at the moment.

To be very practical about the whole matter I feel that all groups with the interest of the profession at heart, including our Board of Directors, should keep up a constant pressure within the states and nationally to consummate some sort of a uniform registration law. This will take time but it is none too soon to initiate a pressure of this type.

The futility of working with local legislative groups, who usually are satisfying local interests and pressures, has been the chief stumbling block in the past, but by the proper public relations, with emphasis placed on the safety, health and welfare of the public, more than on the resulting interests of the architectural profession, would ultimately bring about such a progressive and all-inclusive registration law.

I have heard Bernard Tomson speak before Institute groups and I compliment you both for the excellent job he does.

KENNETH E. WISCHMEYER
First Vice President, A.I.A.
St. Louis, Mo.

national pattern wanted

Dear Editor: I am wondering if you and Bernard Tomson are aware of the activities of the National Council of Architectural Registration Boards. This organization now has under study the unification of state registration laws. They meet each year during the A.I.A. Convention and will meet this year in New York, Sunday and Monday prior to the Convention. I understand the committee is working and will probably report on their activities along the line of Tomson's suggestions.

There is no question but what there is a need for some unification. I find in my visits to various chapters in my region that it is one of the topics most discussed with emphasis is set up for use in securing local legislation which would be strengthened by a national pattern. I also find that there is a hesitancy on the part of state groups to ask their respective legislatures to make drastic changes

appeasement chant

Dear Editor: My office has just delivered complete Contract Documents to the Public Housing Administration for three Housing Projects in Fresno County, and, being an interested witness to all the strenuous effort of satisfying a well known host of requirements, my verse has recapitulated in rhyme her impression of the operation, which is enclosed.

I thought it might strike a responsive chord in some of the readers of your good magazine.

JOHN P. MILLER

Architect

Fresno, Cal.

public housing

So much confusion in the air
Little men run now here now there
Catching plurals, commas, quotes,
Thrashing windmills, nanny goats.
When at last the dust will settle,
Tempers calmed and eyes half shut 'til
Slowly they become aware
Of something growing over there . . .
A spreading out—a pushing higher
And here and there a rubbish fire,
By light of which one just makes out
The flow of living space throughout
Soon to be filled with living things,
Flowers, trees, a bird that sings.
People too will soon rush in
With crates and boxes, children,—gin,
Leaving dirt and dark behind
For fresh paint, sun, venetian blind.

For this, dear sirs, is what evolves
From taxes, red tape, dedication
Of Housing Projects across the nation.

the guest speaks

Dear Editor: Having designed a half dozen resort hotels in the last three years, I read with avid interest the section devoted to INTERIOR DESIGN DATA which concerns itself with resort hotel rooms (April 1952 P/A). Since I spent some time in the Caribe Hilton and other hotels similar to El Panama, I was most interested in seeing what was said about the design of these hotels. Never having learned the gentle art of polite criticism, I am afraid that what I have to say will seem like rather bold statements. I intend no criticism of the architects and their views, but I do feel that something should be said about this subject lest other architects absorb everything in this section as gospel truth. Paraphrasing the wrenching outcry of Hamlet, I cannot help

b Beautiful terrazzo

An aristocrat that works in supermarkets

Does a Terrazzo floor in a supermarket surprise you? It shouldn't, because not only is Terrazzo beautiful, but also its low annual cost prompts the choice.

The designer reasoned: heavy foot-traffic grinds the life and beauty out of most market floors. Terrazzo floors are known for long service life. They require virtually no maintenance and are easy to clean. What's more, Terrazzo stays beautiful throughout its long, long life. All this made "dollars and sense" to management... and also made Food Fair Market floors, such as the one above, an important part of their attractive interiors.

Terrazzo offers the architect a spectrum of color, unlimited design possibilities. Made with a true white cement, like Atlas White, any desired color and shading can be produced. In short, Terrazzo gives *practical* beauty for commercial-building floors or any other.

For more information see SWEET'S Catalog, Section 4g/Uni and 13f/Un, or write Atlas White Bureau, Universal Atlas Cement Company (United States Steel Corporation Subsidiary), 100 Park Avenue, New York 17, N. Y.

say of your report on "Resort Hotel Rooms
"something is rotten in Denmark."

It is amazing to me to find in this issue of P/A, an article by Mitzi Solomon which she holds forth for such things as "the fantastic—the need for the personal thumbprint—the enigmatic symbol—and delicious joke of the frankly fake." In short this is a clarion call to bring back some of those things which appeal to the eye, the heart and the soul rather than to the cold, esthetic mind. On the other hand, I find Suzanne Sekey saying quite the opposite in her text on the Caribe Hilton, citing "... meticulous considerations of easy housekeeping and durability. Tables and cabinets have plaques to be impervious to burns and stains. Furniture supports are high off the floor to clear mops and brooms."

I do not see this as an argument between the sensitive classicist and the intellectual modernist. What I have to say is not the cry of the classicist, the yearning for the good old days. Although trained in the traditional school, my very first commission was executed in a groping, stumbling contemporary manner over 25 years ago. In all these years, I have never taken a commission in which the client insisted on the period styling. I can look back to publications in the architectural magazine of my work in the modern manner as late as 1928. Whatever may be said about my work, one thing cannot be gainsaid: that I have attempted in my own particular way to work in the contemporary idiom. But in all my work, I have always felt that I was designing for the average person and not the steely-eyed, icy-minded intellectual. Shops and hotels are meant to appeal to and to serve the average American. I have attempted to introduce color and interest and excitement which appeals to the eye and heart. Whether I succeeded or not is another matter. I must cry out against accepting hotel rooms as designed by Messrs. Warren, Leeds and Stone as those which have gained popular acceptance.

Without intending any offense, I should like to enumerate some of the things I have found which I think need to be spoken of. The meticulously designed rooms so easy on brushes on mops, are not easy on people. During my stay at the Caribe Hilton, my wife, who happened to have a touch of claustrophobia, woke up one night in a state of extreme nervous up-

(Continued from page 180)

She felt that the room and the furniture were closing in on her. To avert hysteria, I went out on the terrace while I reasoned with her to see why this sense of claustrophobia had taken such complete control of her. She could not explain in particular, except that she could not spend another night in the room. (The truth of the matter is that she checked out the next day.) After a few phenobarbitals, she finally dozed off, but could sleep no more that night. Lying there in that efficient room, I too, began to get a vague sense of unrest. It was not claustrophobia. It was a feeling that here I was on a vacation in the tropics and my reaction was that I was being locked up in a hospital or a prison. Farfetched, you will say. Not lying on a sofa bed with a vista of efficient metal supporting functional modern furniture. There were no soft lines—nothing that human emotion could find pleasure in. A sleepy mind in an environment like this immediately forms associations and if you will look carefully at the photographs of these rooms, as I have looked at the room itself, you may also understand the feeling that it is efficiency and mechanicalness such as this, that the average person would associate with hospitals and public institutions. A lone reaction, you say. Oh, no. After this disquieting experience at the Cambridge Hilton, I made it my business to interrogate people who had stayed there and 75% of the time the reaction was the same as mine. The room gave people a vague feeling of unrest, dissatisfaction and I know of one case where a couple checked out four o'clock in the morning because the woman refused to stay in the room any longer.

The sofa-bed or daybed arrangement has been spoken of as "the coming thing" in hotel rooms. I have attempted to introduce this type of furniture arrangement in the resort hotels I have done in Florida. And, in each case, none of these rooms have been furnished because the average guest prefers a bedroom arrangement. I have tried arguing with my clients but one cannot argue against good business. In Florida, at any rate, a living-bedroom arrangement is a drug on the market. If I indulge in personal tastes, I am getting tired of checking into a hotel that has this arrangement and deciding with my wife whether we would sleep head to head, feet to feet, head to feet, or what have you. I am old-fashioned

keeps heat in, cold out!

COOLER IN SUMMER
...because it opens
widest...scoops air in
and up...luxurious ven-
tilation, but no drafts!

PERFORMANCE FACT

of aluminum awning-type windows

Every day, more and more architects and contractors are turning toward aluminum type windows. These newer, more windows are being specified for all construction, including factories, commercial buildings, apartments, hotels, schools, and homes. Over a period of years, the awning-type window has been subjected to rigid and exhaustive tests to determine performance characteristics and operating under every known weather condition. Research has been carried on by the leading manufacturers in cooperation with leading architects.

the "open" window

One important advantage in favor of the aluminum awning-type window is that it can remain "open" to provide ventilation and air circulation even when it is raining. The slanting sash is the answer. One aluminum awning window, the Ludman Auto-Lok, goes even farther in this respect. The bottom sash of an Auto-Lok window is designed to remain open, while the upper sashes are closed and automatically locked. This feature allows for night ventilation and limited ventilation in inclement weather.

better ventilation...easier to clean

Because of their outward projection, aluminum awning windows provide the possibility of attaining 100% ventilation. Not all awning windows can be opened nearly 90 degrees (almost straight out). The degree of their opening can be predicted by checking the manufacturer's specifications. In their wide-open position awning windows can be cleaned from the inside. This important maintenance factor cannot be estimated. However, the basic design of a window must be checked. For, on these types, where vents are pivoted on a point, the top vent cannot be cleaned inside. The Ludman Auto-Lok window can be cleaned completely...all from the inside, sash, too. This feature is accomplished by Ludman's uniquely designed operating mechanism in which the hinge points of the top sash are moved down with the mechanism when the window is opened to provide a convenient 6 inches of clearance between the top sash and the window frame.

air infiltration

Paradoxically, the use of aluminum windows has for many years been criticized because of their generally unsatisfactory performance on the score of tight closure and prevention of air infiltration. Yet, today, the tightest closing window ever made is an aluminum awning window.

LUDMAN LEADS THE WORLD IN WINDOW ENGINEERING

This unit is Auto-Lok, developed by Ludman Corporation after many years of research. Tight closing performance is made possible by patented hardware, a self-locking device which automatically seals the window tight when closed. Auto-Lok hardware provides a closure which is tighter than the popular established standards for casement windows and projected windows. Pittsburgh Testing Laboratory tests reveal that air infiltration through a standard, assembly type window amounts to only 0.095 cubic feet per minute . . . a degree of weather-tightness heretofore thought impossible in any window. Though the Auto-Lok locking action is competitive with Ludman, other manufacturers are beginning to use a vinyl plastic weatherstripping material similar to that which Ludman uses to weatherstrip the Auto-Lok unit.

Simple operation

"One-hand" operation of aluminum awning-type windows is another feature that is very well liked . . . and, in many instances, one of the important deciding factors in the selection of windows. For example, this feature is important to hospitals, where busy nurses with a free hand can still open or close the window with their free hand . . . saving time and effort.

Each individual manufacturer utilizes a different type of operator to actuate the window opening hardware. Usually they have large torque boxes to generate the great amount of torque required to actuate the torque bar window mechanism. Because of their size they extend far beyond the face of the window sill into the room. They have removable cranks and extension arms. A study of the operating hardware of all aluminum awning-type windows reveals the fact that Ludman, maker of the Auto-Lok Window, has the most efficient mechanism from the standpoint of easy operation and trouble-free service. The automatic, self-locking principle of the patented Auto-Lok operating device eliminates the strain required to force the hinges in and out to pull individual sash in tight against the frame. In fact, the Auto-Lok mechanism is perfectly balanced and requires so little effort that a child can operate the windows.

Ideal window for any installation . . . in any climate

Aluminum awning-type window is practical from every standpoint. Installations all over the world in all climatic extremes, have proven their reliability. Their attractive horizontal lines make them entirely adaptable to all types of architectural design from cottage to skyscraper. Their rapidly growing acceptance is having a profound influence on architectural designs because their clean horizontal lines fit admirably with modern architectural styles.

Seals itself shut like a refrigerator

THE FIRST WINDOW TO *Answer* EVERY PERFORMANCE REQUIREMENT

Read this check list for opening sash . . .

- | | |
|---|--|
| ✓ | AMOUNT AND QUALITY OF VENTILATION? AUTO-LOK checks: 100% ventilation, draft-free! Vents open almost 90°, entering air is scooped in and up. |
| ✓ | POSSIBILITY OF VENTILATION CONTROL? AUTO-LOK checks: You make your own weather! Perfect control in all positions from a slight crack of one vent to full opening of all vents. |
| ✓ | IS THE WINDOW EASILY OPERATED? AUTO-LOK checks: Friction-free, precision balanced "no wear" operation. Fingertip control with roto-type operator...no interference with screens, drapes or blinds. AUTO-LOK windows never stick. |
| ✓ | WEATHER PROTECTION WHEN WINDOW IS OPEN? AUTO-LOK checks: Awning-type design provides the luxury of healthful, refreshing ventilation even when it's raining. |
| ✓ | WEATHER-TIGHTNESS WHEN WINDOW IS CLOSED? AUTO-LOK checks: AUTO-LOK is the tightest closing window ever made! Closes many times tighter than any other window. Patented self-locking device plus elastomeric vinyl weatherstripping automatically seals window tight and isolates weather to a degree heretofore believed impossible. |
| ✓ | WHAT OBSTRUCTIONS TO VIEW (RAILS AND MUNTINS)? AUTO-LOK checks: Extremely narrow yet extra strong rails and muntins are made possible through the use of adeptly engineered extruded aluminum sections. |
| ✓ | FIRST COST? AUTO-LOK checks: Initial cost compares favorably with competing products providing many less advantages. You cannot buy better window performance at any price. |
| ✓ | MAINTENANCE COSTS? AUTO-LOK checks: Simplified operation eliminates wearing parts. No periodic adjustments necessary. Ludman engineering leadership combines the best in design, materials and workmanship to produce a window that will give no-wear operational ease with a minimum of maintenance. |
| ✓ | CAN ALL WINDOW GLASS BE CLEANED FROM INSIDE? AUTO-LOK checks: Window can be completely, comfortably and easily cleaned entirely from inside, including top vent, too. No gadgets to disengage. |
| ✓ | HOW DOES THE WINDOW FIT IN WITH PLANS FOR SCREENS, STORM SASH, BLINDS, ETC.? AUTO-LOK checks: Interchangeable inside screens and storm sash can be placed or removed easily...just flip the clips, no tools required. |

THE WINDOW THAT SETS A NEW STANDARD FOR WINDOW PERFORMANCE

**WIDE RANGE OF STOCK SIZES
AND ARCHITECTURAL TYPES TO
FIT EVERY REQUIREMENT...**

The design of AUTO-LOK Aluminum Windows and the development of their patented, self-locking operating device, are the results of years of research by men who know windows and window problems. The materials that go into the manufacture of AUTO-LOK are the finest produced. The exacting workmanship is your final guarantee of windows that will meet the broadest specifications. Many features to spare!

Only **Auto-Lok** *gives you*

AUTOMATIC LOCKING
PATENTED

ALL THESE FEATURES...

FRESH AIR WHILE IT'S RAINING

No more running to close windows...rain can't enter through slanting sash!

WARMER IN WINTER...

Seals itself shut like the door of your refrigerator...keeps heat in...cold out!

COOLER IN SUMMER...

Opens widest...scoops air inward and upward...luxurious ventilation, but no drafts!

PRACTICAL BEAUTY...

Narrow horizontal lines and graceful tilt of sash in every open position add distinction to any home...lend themselves to a wider variety of architectural arrangements.

EASIEST TO CLEAN...

Nothing to lift out...no sash to remove...no gadgets to disengage. Simply open wide and clean all glass from the inside...top sash, too!

INTERCHANGEABLE SCREENS AND STORM SASH...

Can be handled all from inside. Just flip the clip. No tools required. Reduce work to an hour!

FRESH AIR NITE-VENT...

Bottom sash opens slightly for night ventilation, while sash remain securely closed...fresh air circulation even in bad weather, too!

FINGER-TIP CONTROL...

Operates for a lifetime. Perfectly balanced, friction-free mechanism operates window at the touch of a finger. No adjustment ever necessary...never rattles!

CONCEALED HARDWARE

No unsafe, unsightly mechanism exposed to collection of dust. Compact roto-type operating handle does not interfere with drapes, blinds, etc.

DESIGN

with Sylvania's New Industrial Fixtures

Announcing 222 New Industrial Fluorescent Fixtures at an amazingly new low cost. All are engineered to meet every lighting need in any type plant for any level of illumination. Customers make additional savings since new design also cuts maintenance costs.

Reasons for Sylvania's flexibility and lower cost

Simplified designing is the basic reason for the success of this new line. With one skillfully engineered reflector and two top housings, Sylvania lighting experts have developed 6 interlocking "family" groups of 24 standard fixtures each. These, with optional variations, making up 222 different types, offer a variety and flexibility never before possible.

And, because this line requires comparatively few different parts, die costs and assembly costs are held way down. These savings are now passed along to you in lower prices.

You'll want all the facts about this splendid new fixture line. The coupon brings you new folder and data sheets for your file.

Expert interior designs need expert interpretations . . . so for your lighting requirements, see the man who displays this Qualified Lighting Contractor emblem.

enough to want to retire in a more conventional position.

Those wonderful tile floors—so clean, so efficient. But if anyone moves a piece of furniture, 10 rooms down, the squeal of the furniture leg on the tile is enough to rouse you out of the deepest slumber and send

shivers down your spine. It was one of the most uncomfortable sounds that I had to live with while in this type of hotel. But that's not all! In one of my stays, a young lady (I assumed she was young although I never saw her) had a way of returning to her room at about three o'clock in the morning. The lady

in question wore high heels and the sound of high heels tapping along those lovely floors, from closet to dressing table, from dressing table to bathroom, from bathroom to dressing table, until finally she was ready to retire, was another thing that kept us awake every night. Her nocturnal habits and her high heels are something I will never forget, and I think of clean efficient tile floors.

And now to talk of "Nature's own cooling system." Ah, yes! The tradewinds—wonderful—much better than draughty air conditioning, but—how can you get air and off light and sound! I have tried and I cannot find the answer. If you kept the jalousies on the hallway side open, then at approximately eight o'clock in the morning the staff came to work; housemen and maids with their buckets and pails and their stories of how they spent the previous evening. Sound travels unhindered through the jalousies and, aided and abetted by smooth walls and tile floors, even a whisper could be heard. Try and sleep! Close the jalousies you will say—well, no sound—but no air. Try that in the tropics. That's not the answer. On the outside windows, the rooms are usually and considerably furnished with a drape over the jalousies, but you cannot draw the drapery, because you cut off the flow of air through the room, so you leave the drapes open when you retire at night. At five or six o'clock in the morning, the sun "comes up like thunder" and floods the room with light. Some people, of course, can sleep in spite of noise and light. I, for one, cannot. So I get up and close and draw the drapes to shut out the brilliant tropical morning. Do I go back to sleep? No. Within 10 minutes I am lying in a pool of perspiration. No breeze and you really suffer!

I did not mean and do not mean criticisms to be harsh or offensive. If I do not sound quite politic, then you will have to attribute it to the fact, as I said before, that I have never learned the gentle art of criticism but the facts do remain. I think that architects should be made to live in their own homes and find that some of those things that looked so good in photographs and so good in text are actually detrimental expedients which should not be encouraged and promulgated.

DE LUXE
(swirl
marbleizing)

Only Armstrong's Asphalt Tile offers you this choice

STANDARD
(directional
grain)

Now you can specify Armstrong quality in two types of asphalt tile graining. The swirl marbleizing of Armstrong's De Luxe Asphalt Tile creates beautiful allover floor effects that cannot be achieved with any other type of graining. This tile also has superior strength and flexibility. Exclusive manufacturing processes interlock fibers and binders in two directions for greater strength, much as alternating the grain adds strength to plywood. The swirl marbleizing of Armstrong's De Luxe Asphalt Tile also speeds installation because it doesn't require twisting and turning to match grains.

For decorative effects requiring floors with direc-

tional graining, the Armstrong Line now includes Standard Asphalt Tile. You can design floors to suit any decorative scheme in which a straight-grained asphalt tile is preferred. Where price is the most important factor, Armstrong's Standard Asphalt Tile offers Armstrong quality at minimum cost.

Armstrong's De Luxe Greaseproof Asphalt Tile is available with swirl marbleizing. Armstrong's Standard Grease-Resistant Asphalt Tile is made with directional graining. For samples and complete specifications, write Armstrong Cork Company, 8906 State Street, Lancaster, Pennsylvania.

pleased and satisfied

Dear Editor: I admire your magazine and appreciate all that you are doing. I study every issue from front to back. However, because of my intensive reading of the P/A and of my other periodicals, not to mention my social activities and studies, I find I get further behind in my reading, and magazines are crowding my desk, my files, and my book case.

It was my intention to let my subscription lapse and get up to date and then at that time consider renewing. I just glanced through the January issue to see what was doing and how and was pleased and quite satisfied with the issue. In fact, I decided that I couldn't afford to miss any of the forthcoming issues. I know I can't show my enthusiasm any better than to renew my subscription.

ALBERT H. TEBBS
