Smart clients are usually practical... and that's why they like MATICO ARISTOFLEX, vinyl-plastic tile — the flooring that's both smart and practical. Available in low-cost standard gauge, as well as 1/8" thicknesses, Aristoflex is ideal for almost every type of installation. Vinyl-plastic throughout (no felt backing), it can be used on, above or below grade... it resists acid, alkali, petroleum and grease... is easy to maintain... comes in 12 clear, bright colors.

Yes, when next you specify tile flooring, be sure to consider long-lasting MATICO ARISTOFLEX!

THE PRODUCTS
No commercial kitchen is more efficient than its time and money saving installations of food, kitchen, bakery and dishwashing machines. In over half-a-century of field-tested experience, Hobart products have won a name for the utmost in design, manufacturing and performance standards—for year-after-year, day-in and day-out reliability. See Hobart—clean in design and clean in performance.

THE COMPLETE LINE
Specify Hobart—and consolidate planning, purchasing and service. Plan on the added economy of attachment interchangeability among Hobart products. Choose from the greatest range of products—in a wide range of capacities and sizes for utmost efficiency.

THE GUARANTEE AND SERVICE
All products carry the long-respected Hobart guarantee—backed by the most extensive sales and service organization in the industry. Local representation is important—they’re as near as your phone.

The Hobart Manufacturing Company, Troy, Ohio.

the permanent installation is
DURIRON ACID RESISTING DRAIN PIPE

Duriron is a high silicon iron alloy with a very high resistance to
corrosion, abrasion and erosion. This resistance is present throughout
the entire pipe wall.

Installed by ordinary plumbing methods, Duriron can be counted on
to outlast the building, in most cases. Obviously, replacement and
building repairs are virtually eliminated. Bulletin PF/4 lists complete
details and standard fittings. Insist on Duriron.

Construction outlays in January and February fulfilled predictions made for 1955. Reports from U. S. Dep'ts. of Commerce and Labor estimate cost of new construction placed during first two months at $5423 millions, 13% above same period in '54. Spending of $2636 millions in February alone indicates an annual rate of $40.5 billions, as compared to $37.2 billions last year.

Private and public housing starts for first two months of 1955—178,000 units—topped last year's activity by 26%. . . . Housing Administrator Albert M. Cole predicts that high level of home building, 1.2 to 1.3 million units per year, might be sustained by demand for better living quarters for low-income groups and replacements on older homes, although current rate of new household formations is estimated at approximately 600,000 per year.

Within five years, 40% of country's housing market will be taken over by makers of prefab homes, prophesies Gen. John J. O'Brien, retiring president of Prefabricated Home Manufacturers' Institute. Activity in 1954 gained over previous year by 34% and this year an increase of 30% is expected.

In a decision of import to future city-planning and slum-clearance projects, the U. S. Supreme Court recently decided in the case of Berman v. Parker (75 "Supreme Court Reporter," p. 98) that all property within an area designated for redevelopment may be subject to condemnation, even though an individual building is, in itself, exempt from attack. Comments by Justice William O. Douglas indicate that while esthetics alone may not be sufficient grounds for condemnation, the concept of public welfare does represent values which are "spiritual as well as physical," and "esthetic as well as monetary."

NAHB plans to start construction of $2-millions Research Village In Grand Rapids, Mich., early next year. Fifty homes, open for public inspection, will be completely equipped to serve as testing ground for latest architectural ideas, building techniques, and materials.

Beaux-Arts Institute of Design announces award of its $5000 Lloyd Warren Scholarship for 18 months' study abroad to Norman L. Johnson, architectural student at University of Illinois. . . . 1955 Arnold W. Brunner Scholarship for $2400 was granted by New York Chapter AIA to Ralph E. Myers of Kansas City, Mo., for second consecutive year. Myers has been editing series of 30-minute lectures, in form of colored slides with tape-recorded commentary, entitled "ARCHITECTURE—U.S.A."

George Howe, 1887-1955

Distinguished Architect in practice 42 years, FAIA, former Supervising Architect of PBA, ex-Chairman of Yale Department of Architecture, ex-Resident Architect at American Academy in Rome, influential Chairman and Professional Advisor of national design competitions, died April 16 in Philadelphia on eve of departure for Ankara, Turkey, to help establish UNESCO School of Architecture. Architect, with William Lescaze, of Philadelphia Saving Fund Society skyscraper; partner of Robert Montgomery Brown since 1945; Chairman of Design Advisory Board for current Penn Center project.
The first three of a group of 29 lease-purchase projects for Federal buildings—in Green Bay, Wisconsin, Rock Island, Illinois, and Council Bluffs, Iowa—are scheduled to be assigned to Midwest architects early this month. But the jobs themselves, combinations of post offices and court houses or office buildings, will be scarcely distinguishable from any other sorts of Federal buildings save in the invisible aspects of financing. Architects will receive the same assignments, work with the same Public Buildings Service reviewing and supervisory officials, use the same design and engineering standards, get the same negotiated fees, as if the buildings they design were built by direct appropriation rather than with private funds for long-term lease to the government.

In selecting architects, PBS still holds that geographical location is the most important characteristic. Local boy makes good! If not, it's likely to be an architect from another nearby town of the same size—not a big-city slicker. In its first group of projects, PBS invited all architects in Green Bay and larger Wisconsin cities to indicate their interest in the job. Those interested were asked to complete new roster forms giving standard data on size of firm, experience, technical background. Selection was then made. The same procedure was followed in Iowa; but in Illinois, selection was limited to Rock Island, Peoria, Moline, and Rockford architects (eliminating Chicago). In all, 360 firms have been approached.

A fourth lease-purchase project, a court house and post office in Lake Charles, Louisiana, has been approved and a site is now being selected. Action to release another eight or ten projects, including some larger office buildings, is expected during April or May. A similar architectural selection procedure will then be initiated in each area.

The balance of the PBS project list, sent to Congress last August shortly after the program commenced, is still being held up by the Senate Public Works Committee, which must approve each building. Having already "saved" $1.3 million in the projects thus far approved, by demanding new field surveys (and having enormously increased the opportunities for political maneuver), fast action is hardly to be expected, even on projects that have been long in the course of preparation. The field surveys were made by PBS field personnel and Budget Bureau representatives (who had claimed the net-to-gross space ratios in PBS work were too high) and they covered everything: the need, site, land, values, community, and other factors, including the condition of existing buildings. Obviously little value is set on an urgent building need that awaits satisfying. Nor does it explain why the economy-minded, nonpolitical Government Services Administration which supervises PBS isn't capable of doing the job itself.

A new program like this demands closer examination, it is argued. Perhaps! The more probable reason is anxiety in Congress over a program which initiates, for the first time since 1940, public buildings activity in the executive branch of the government. These 29 building projects were sent to Congress nine months ago as a package and are subject to individual approval by committees that have jealously guarded their prerogatives in public building functions. They appear determined that the lease-purchase will not diminish legislative powers.

Whatever may turn out to be the merits of this new type of building, the architects have done well so far, in a job sense. They are directly engaged, not wrapped into the total building package as was at first proposed. Fees currently are being paid from unexpended balances of 1949 appropriations. (This is necessary because under lease-purchase procedures no money is available for building purposes until the investor has been selected by competitive bid.) But next year, architects' fees, as such, will have to be sought from Congress by PBS as a budgetary "line item," and architectural services will be more specifically discussed in appropriations committees.

PBS has a good architectural policy—in spite of the manifest waste in examining 360 architects for three jobs. It also has a very definite idea of what it wants: the architect who can do the best job for the money. This ought to go down with Congress, but the independent architect is going to be looked over more carefully than before, to see that he's a necessary part of this new kind of building.
Rolling Steel Doors

Manually, Mechanically, or Electrically Operated

If you want real protection, long life, and convenient, timesaving operation, you can’t beat the quick action of a good power-operated rolling Steel Door. No other type of door can match their compactness in operation — the vertical roll-up action of the door curtain occupies no usable space either inside or outside the opening — and, there are no overhead tracks or other obstructions to interfere with material stacking or crane handling adjacent to door openings. A quick-opening, quick-closing Mahon Power Operated Rolling Steel Door will save valuable space and valuable time in any type of opening. In addition, Mahon Rolling Steel Doors are permanent — their all-metal construction assures a lifetime of trouble-free service, and provides maximum protection against intrusion and fire. They require less maintenance, too, because, when the door is open, the interlocking steel curtain is rolled up above the opening safe from damage. When you select a Rolling Steel Door, check specifications carefully ... you will find extra-value features in Mahon doors — for instance, the galvanized steel material, from which the interlocking curtain slats are rolled, is BONDERIZED and DIP-COATED with synthetic enamel which is baked on at 350° F. prior to roll-forming. You will find other Mahon features in both design and materials that add up to a greater over-all dollar value. See Sweet’s Files for complete information, or write for Mahon Catalog G-55.

THE R. C. MAHON COMPANY

Detroit 34, Michigan • Chicago 4, Illinois • Representatives in all Principal Cities

Manufacturers of Rolling Steel Doors, Grilles, and Automatic Closing Underwriters’ Labeled Rolling Steel Doors and Fire Shutters; Insulated Metal Walls and Wall Panels; Steel Deck for Roofs, Partitions and Permanent Concrete Floor Forms.

Rolling Steel Doors, Shutters and Grilles To Meet Every Requirement

Six Mahon Power Operated Rolling Steel Doors installed in truck openings of a loading dock in the new plant of Sutherland Paper Co., Kalamazoo, Mich. Miller-Davis Company, Designers and General Contractors. A total of thirty-nine Mahon Rolling Steel Doors were installed in various types of openings in this plant.

Modular Multi-Vent panels will provide a quiet, concealed, draft-free air distribution system in the four new FORD buildings listed at the left.

The Multi-Vent story is simple...this system distributes conditioned air at low velocity by gentle pressure displacement. This unique feature not only eliminates all draft complaints but also allows complete freedom in locating or relocating moveable partitions without repositioning the outlet panels.

Multi-Vent can handle as many as 60 air changes per hour and still maintain even, draftless, low rate of room air motion.

These are only a few of the many reasons why Multi-Vent is the choice of the nation's leading office buildings, hospitals, laboratories, factories, hotels and restaurants.

Write today for new Multi-Vent Literature

multi-vent DIVISION OF

WHERE QUALITY IS TRADITIONAL

THE PYLE-NATIONAL COMPANY
1379 North Kostner Avenue, Chicago 51, Illinois
SPECIFYING on a "take-it-for-granted" basis, some architects and builders with their own hands sow the seeds of destruction inside the walls of buildings they are so proud of.

A sturdy, frame house in Pennsylvania, for example, had to be moved. But it was found that the sills had rotted away. Inside the walls was ordinary insulation and no metallic vapor barrier.

A large brick and steel apartment development in the suburbs; a huge housing project in a big city; each caused great expense to its sponsors when ordinary insulation inside walls failed to prevent excess vapor flow, excess condensation formation, resulting in peeling paint and crumbling plaster.

Reputations as well as buildings are guarded by the use of multiple accordion aluminum. Its continuous metal sheets, 500 ft. to 750 ft. long, are almost impervious to water vapor. Infiltration under flat, stapled flanges is slight.

The scientific construction of multiple layers of accordion aluminum, fiber, and air, minimizes condensation on or within this type of insulation.

Of all heat flow through structural spaces, 50% to 80% is Radiation; 7% Conduction; the rest Convection. Multiple accordion aluminum surfaces have a reflectivity of 97% for Radiation or radiant heat, and an emissivity of only 3%. The aluminum and fiber sheets retard outer and inner Convection. The alternating layers of air spaces have low density and therefore slight Conduction.

To obtain maximum, uniform-depth protection against heat loss and condensation formation, it is necessary to use the new edge-to-edge multiple aluminum*, each sheet of which stretches from joist to joist, and also all through the flanges for further vapor protection as well as permanent attachment of each sheet.

COST OF EDGE-TO-EDGE INFRA
Multiple Aluminum Insulation installed in new construction between wood joists, material and labor
Type 6-PS about 10¢ sq. ft.
Type 4-PS about 8¢ sq. ft.

Architect Harmon H. Goldstone, New York, has completed preliminary plans for a development comprising a resort hotel with detached guest rooms, a golf club, about 100 lots (one to three acres) for private ownership, and facilities for the use of hotel guests, lot owners, club members, and daily visitors. The development will be built for Laurance S. Rockefeller on an ocean-front site about 20 miles west of San Juan, Puerto Rico. O’Kelly & Mendez, San Juan, will be associated architects; Robert Trent Jones, New York, is designing the 18-hole golf course. A spectacular point of land (plan above) projecting from the center of the 4000-ft bathing beach provides an ideal site for the hotel. The main structure features a barrel-vaulted roof and a circular driveway leading up to the second floor, which will house reception and administrative facilities as well as a bar and...
lounges. An open interior stairway will descend to an outdoor dining terrace, crescent-shaped dining room, swimming pool, and cabanas. Some of the latter will be equipped for use as guest rooms.

To take advantage of the natural potential of the site, and to insure quiet and privacy (and also to facilitate future expansion), guest rooms will be decentralized as detached units. Two-story blocks (above) containing either eight or twelve rooms will permit individual access to each suite, and unobstructed view of the ocean. Cross ventilation may be controlled by louvers built into folding panels. One and two-story cottages (below) may enjoy the hotel service or be rented on a semi-housekeeping basis. These rooms, also rentable in units of two or three, will have private terraces facing the sea and walled patios on the south side. All of the hotel buildings are to be of reinforced-concrete construction. White plaster has been selected for exterior walls, for its reflective quality. Native tile and Honduran mahogany will be extensively used. As a relief from the brilliant sunlight and bright foliage the color scheme of the buildings and rooms will be subdued.

Model photo: E. Z. Marks

Progressive Architecture
new concrete

Get full 28 Day Curing for Greater Density with CEM-SEAL

Unless properly sealed, a new concrete floor has a natural tendency to deposit alkaline salts on the surface as it cures. This causes surface powdering, called "dusting" or "bloom."

CEM-SEAL acts as a cap or dam to hold moisture down below the surface. This prevents formation of the damaging salts — and it also prolongs the curing period of the concrete. The surface comes through denser, harder, more resistant to wear.

Application is simple and easy. Treat acres of floor in a short time with big sheepskin applicators. Floors can be opened to traffic in just 4 hours.

CEM-SEAL is also an ideal primer for renewing old concrete floors.

Check these CEM-SEAL advantages — never before available.

1. Goes on easy — just sweep floor and apply.
2. 1-coat quick dry application — seals moisture in the concrete.
3. Complete curing of concrete gives you a dense, uniform surface with longer life.
4. Protects floor from stains while other building trades are at work.
5. Prevents "dusting" and efflorescence.

Branches in Principal Cities
Properly implemented, the redevelopment plan by Architects Yamasaki, Stonorov, and Gruen for 142 formerly slum-ridden acres in downtown Detroit will be a model for other cities with similar problems. The sponsors feel that many families have moved to suburbs only because desirable living facilities were unavailable nearer their economic, civic, and cultural interests. This program is designed to reverse this trend and thus to restore the center of the city. The project, designed for the Citizens Redevelopment Committee, will provide 4000 living units for varied income groups, in structures ranging from one and two stories to multistory towers. Aside from concentrations of green spaces, each dwelling will have a private outdoor area. Since Detroit is dependent on private automobiles for transportation, 100% off-street parking is contemplated.
CONSOLIDATED FOODS CORPORATION'S NEW PLANT is equipped with
85 Crawford Industrial Doors—31 equipped with Electric Operators

Consolidated Foods' new plant, set in a 33 acre tract at River Grove, Ill., just west of Chicago, is a model of modern, functional design and operating efficiency. The project, which cost nearly $3,000,000, consists of two, one-story buildings. The one shown above, where automatic, mechanically-operated conveyors assemble orders and handle merchandise, houses processing and warehousing facilities of over 500,000 square feet; a department of 72,000 square feet for coffee roasting and packing and for handling teas, extracts and spices; a two-floor office of 24,000 square feet; an air-conditioned cafeteria for 650 employees; and an enclosed space for 20 railroad cars and 52 trucks.

The second unit has 44,000 square feet and is used for handling fresh fruits and vegetables and frozen food. An unique system of conveyors and automatic equipment moves merchandise from refrigerator cars and trucks to coolers and outgoing trucks.

Contributing importantly to the quick, easy, thrifty movement of merchandise are 85 exterior and interior Crawford Marvel-Lift Industrial Doors, 31 of which are electrically operated by remote control. Significantly, this entire installation, which is so vital to the smooth operation of the entire plant, cost only about 1% of the total plant cost. If you have a door problem, we'll welcome your inquiry and it will get quick, intelligent attention. Crawford Door Company, 170-20263 Hoover Road, Detroit 5, Michigan. Plants in 10 cities; Warehouses in 95 cities; Sales and Service everywhere. In Canada, F. Fentiman & Sons Ltd., Ottawa, Ontario.
The new Pacific High School provides an excellent demonstration of the versatility of Laclede Straight Chord Steel Joists and their adaptability to specific architectural requirements.

By using two single joists with cantilever extended ends on each side of a three bay roof design, the number of joists required on the project was reduced by one-third and substantial saving resulted in material, time and labor.

Other Laclede Steels, too, including Multi-Rib Reinforcing Bars and Welded Wire Fabric, were used in this modern new building.
luminous ceilings

Dear Editor: If it is not too late to recall “Luminous Ceilings—A Tool For Everyman” by Domina Eberle Spencer (December 1954 P/A), I would like to comment on the effects of indoor overhead brightness. Dr. Spencer refers chiefly to the translucent sheeting covering the entire ceiling, through which the light from incandescent or fluorescent luminaires is diffused. Such a light source, she says, allows the architect to produce a more effective environment and she states, “Lighting should be designed to provide the luminous environment most suited to human visual requirements.”

Effective is certainly the word for the dramatic luminosity of the Manufacturers Trust Company ceilings, for example, in Skidmore, Owings & Merrill’s handsome building at 43rd Street and Fifth Avenue, New York. What it is like to work all day under such uniform brightness might bring varying answers, for the psychological effect of light is surprisingly little understood. Many would justly praise the high visibility in all directions. Some might confuse tension with elation, experiencing the unrelaxed sense of being constantly on display in a bath of light.

In any case, consideration of human visual requirements covers enormous ground, going beyond the eye as a camera, to include the whole person and personality.

Dr. Spencer claims that the more light we use the better we can see. The amount, she says, is largely a matter of economics. I think this should be amended to “the more light we use correctly,” since it is not more light alone that we need, but more specific modulation of light—more of it in the places where it counts and less in between. In view of the frequent costly installations that squander wattage afield and fail to earn their keep, I wonder if economics is the main answer.

Dr. Spencer finds that “The most obvious applications for luminous ceilings are in those locations in which exacting visual tasks are performed for long periods.” She cites or recommends their use in schools, libraries, offices, operating rooms, stores, and even homes.

When all the aspects of human requirements are reconciled with the problems of installation and maintenance, it might develop that the best use for luminous plastic ceilings would be in the more transient places, like lobbies and corridors.

It has been demonstrated that serious work is accomplished more happily and efficiently when there is no distracting brightness overhead or anywhere else, and where, in lieu of pure daylight, a strong, clear, shielded light is focused directly on the work. In the field of peripheral vision restful shadows benefit both eyes and mind, which relax more easily when enjoying some reflex motion occasioned by distance accommodation and varying light intake. The sensing, perceiving apparatus tends to immobilize and tighten under monotonous stimuli—as has been painfully noted in the desert, or the Arctic snowfields, or the flat terrain of Florida. The shadows Dr. Spencer calls “unwanted” are the very ones that help keep the visual mechanism flexible and healthy. More tiring than sharp contrast is the deadly lack of it.

Agreed that the eye can not efficiently record too much contrast simultaneously (such as trying to see something when the sun interferes), and that glare is undesirable, and agreed that the eye works best “in a medium to which it has become adapted,” must the brightness ratio between luminaire and broad surrounds be maintained at the conservative 3:1? Outdoor light, which is normally so easy on the eyes, often varies 20:1, while transitions of 5:1 in outdoor expanses are hardly noticeable. A brightness contrast of 10:1 in different parts of a room can seem quite comfortable. It may also be remembered that many people find the best medium for concentration is in a light-dark ratio of 100:1, in other words at night, using a good work light, encircled by comparative darkness.

The opposite condition, an entire ceiling of light, bright enough to provide 30-50 ft-c on the centers of activity beneath, could prove somewhat shattering to concentration: everything within range vies equally for a share of the attention, and veiled glare dominates the peripheral vision. If the ceiling as luminaire is pale enough to be less aggressive, the ft-c levels may not go above 15 where the light is needed most.

This is the case in a local store and lunch counter, where a ceiling 30’ x 60’ carries ninety-eight 40-w fluorescent tubes behind a vinyl rolled-strip covering. Over the months since the last servicing, tubes have burned out and the diffusing plastic has dimmed with dust. The corrugated dropped ceiling must be rolled back, taken down, and washed every six months, and more than half the tubes replaced. This means that for about half of each interval, the lighting tends to be ineffectually spotty.

Dr. Spencer speaks of the “optimum modeling of the human face” that takes place under a luminous ceiling and she praises the “soft, transparent shadows” made by the rebound of the ceiling light from walls and other surfaces. However, the interpenetration of these pale shadows, nullifying each other, is subtly disturbing, because evolution under the sun has taught us to look for shadows going in one direction. Where they overlap and blend, the modeling is less convincing. By contrast, objects form a relation to each other. The lack of it gives an incomplete realization of depth. As for attractiveness, light originating or reflecting below the face is notoriously more flattering than light casting downward shadows.

It is my belief that where sustained close eye work must be done by artificial light, institutional rooms are served best by incandescent downlights from the ceiling or walls, lensed, lowered, or recessed to prevent glare. Where possible, as in offices and reading rooms, auxiliary portable illumination is desirable because of its flexibility for individual needs.

As for operating rooms, I think I would prefer one with a big movable spotlight (Continued on page 16)
capable of giving depth and delineation to the intricacies of the human interior! A glaring ceiling (it would have to be that bright for surgery) plus one luminous wall recommended by Dr. Spencer, might distract even a surgeon without nerves.

Nevertheless, may I say enthusiastically that the luminous ceiling deserves an interesting future as a decorative element in architecture, for exhibition halls, theater entrances, and foyers in apartments, offices, and similar places. Dr. Spencer illustrates its striking use in a store front and a showroom. Besides the vinyl- and acrylic-plastic sheetings mentioned, the choice of colorful translucent materials is wide among plastics incorporating glass fibers and other synthetics in which designs are embedded. For most, due to their susceptibility to heat, fluorescent tubing would be indicated. The use of control switches could also add variety, by darkening or coloring certain portions at will. JESSIE PHELPS KAHALES

Spring Valley, N.Y.

ROMANY TILE

SPACE ADVANTAGES

Now with direct adhesive ROMANY tile setting, tile of any color offers real space savings applicable to high cubic foot costs. Consider the difference of a total of one-half inch thickness from rough block to finished tile as opposed to approximately 1 1/4". When a long corridor is figured, this saving in cubic area amounts to an interesting item. It makes useful much space previously allotted to vertical wall areas, or it materially reduces overall cubage with less room and floor. It also offers lower cost dry wall construction where desired.

Dear Editor: Miss Kahles has made two basic mistakes. She has written about what it must be like to work under luminous ceilings, without (apparently) ever having tried it. And she has commented on the details of my paper without having read it carefully. Misunderstandings associated with the latter can be rectified by the present reply to her letter. In the former mistake, she reminds me strongly of many of my illuminating-engineer friends who reacted similarly to the idea of luminous ceilings about 10 years ago—before they had had any opportunity to experience working under them.

For example, when Miss Kahles discusses my statements on quantity she misinterprets them. I said that if the field of view is sufficiently uniform, the more light we have the better we can see. Therefore, there is no "correct" amount of light for each task and the amount of light we decide to use is largely a matter of economics. I did not say that this is true unless we design our luminous environment to satisfy the 3:1 adaptation-helios criterion. But if we do satisfy adequate-quality criteria, there is no upper limit to the amount of light we can employ with pleasure until we rival daylight.

For example, if we use the downlights suggested by Miss Kahles for "sustained close . . . work," quality criteria are violated for many lines of sight. Large quantities of light provided by downlights become intolerable to the human being who frequently views the downlights or their reflections as his eyes rove over the field of view.

But with luminous ceilings the story is entirely different, for now adequate-quality criteria can be satisfied for all lines of sight (if room reflectances are suitably chosen). To their astonishment, architects and illuminating engineers alike have discovered that it is possible to obtain the high visual acuity associated...
TEXTURED WOODS

Give homes new beauty, a new kind of appeal with Weldwood textured woods ... at a cost as low as $23 for an 8' x 12' wall!

Weldtex—patented by Weldwood. Only from Weldwood can you get the original striated paneling that started the textured wood trend; fine for natural or painted finish. Comes also in exterior grade for siding; striations assure no grain raising or checking. Thicknesses: interior 5/16", 3/4" in fir only; exterior 3/4".

Planktex combines the striations of Weldtex with alternate bands of smooth wood. Comes unfinished or completely pre-finished ready to apply. Thickness—5/16".

Sea Swirl and Surfwood look like weathered driftwood; fine for dens, playrooms, cabins; texture hides nail holes. Thickness—5/16".

V-Plank features vertical grooves that give the effect of random planking. Comes already pre-finished by skilled woodcraftsmen. Thickness—3/4".

Texture 111 siding is exterior grade fir with knots and unsanded faces; gives rough-textured, dramatic look; can be installed without sheathing. Also perfect for gable ends, soffits, carports, breezeways and fences. Thickness—3/4".

All panels available in standard 4' x 8' sheets, as well as other sizes.

Send coupon for more details or visit your Weldwood lumber dealer or any of the 82 United States Plywood showrooms in principal cities.

Concrete and Cantilever Design
Cut Costs for Modern School

Attractive, modern appearance distinguishes this fine school, completed at a cost of only 92¢ per cu. ft.—20 to 25 per cent less than the cost of other new buildings of comparable size and quality in the area.

Concrete cantilever beams at 17' 2" centers are an outstanding feature in the design. Supported on twin concrete columns that form a central corridor, they extend beyond the exterior walls of the classrooms as roof overhang. Concrete ribs between the cantilever beams carry lightweight precast concrete panels that form the roof.

In the auditorium, cantilever beams from opposite walls join at the center of the room to form a 58-ft. roof span (see drawing below). Exposed concrete masonry, used for partitions and backup throughout the structure, assures maximum fire safety, economy and durability.

Concrete construction for schools is moderate in first cost, means lower maintenance expense and extra long life. These factors add up to low annual cost—which pleases school officials and taxpayers alike.

Write for free booklet on concrete school design and construction, distributed only in the U. S. and Canada.

PORTLAND CEMENT ASSOCIATION
Dept. A5-25, 33 West Grand Avenue, Chicago 10, Illinois
A national organization to improve and extend the uses of Portland cement and concrete through scientific research and engineering field work
with large amounts of light without any sense of glare. A luminous ceiling does not look bright when one is working under it. I have never forgotten the reaction of one prominent architect on viewing his first luminous ceiling. "This is all very nice," he said, "but I can give you 50 ft·c with louvers and you haven't more than 10 here." To his chagrin, a light meter told him that he was then bathed in 50 lumens per sq ft. The eye is not a light meter. Once it becomes adapted it can work under luminous ceilings which provide 30, 50, 200, or even 1000 lumens per sq ft without a sense of glare. How many lamps we use above a luminous ceiling is largely a question of economics.

The 3:1 adaptation-helios criterion has also been misinterpreted. Miss Kahles says, "A brightness contrast of 10:1 in different parts of a room can seem quite comfortable." Apparently she does not realize that this is exactly what we get when we apply the 3:1 adaptation-helios criterion. The ratio of three is taken with respect to the work. Large areas may be three times as bright as the work or 1/3 as bright as the work. Thus, the ratio between the helios of floor and luminous ceiling may be as much as 9 or 10 to 1.

This criterion does not impose undesirable restrictions. It does not produce the monotony of an arctic snowfield. It allows, rather, all of the interest and variety which can be recorded on a Kodachrome film without under-exposing or over-exposing important areas.

The 3:1 criterion has been characterized as conservative. Yet Miss Kahles calls outdoor light "so easy on the eyes." If she would sometime venture outdoors with a helios meter as I have, she would find that many of the most interesting sunlit fields of view have even lower adaptation-helios ratios than required by the familiar 3:1 ratio. The interest and variety is in small details and in color. Large areas may vary in helios surprisingly little and permit the eyes to be simultaneously adapted to the entire field of view.

It is, of course, desirable to take into account the human aspects of vision. Perhaps the most important of these is the everchanging line of sight and the fact that vision is impossible without continual eye motions. Thus, there is a basic flaw in designing a lighting system for a single line of sight. The "strong, clear, shielded light... focused directly on the work" which is surrounded by deep "restful shadows" is possible at low levels of illumination but becomes utterly intolerable when the quantity of light is increased. As the eyes rove, they stray from the single position for which Miss Kahles has prescribed her downlights. If, in relaxing, her victim looks up at angle which she did not expect, he may encounter a helios ratio of a million to one. Even if he keeps his eyes down reading a glossy magazine, annoying images of her downlights are reflected into his eyes.

(Continued on page 20)
if he shifts his position or that of the magazine.

Except for the purpose of sleeping, a properly designed luminous ceiling provides a most restful luminous environment. Ordinarily the desk top and floor which form the background for the work are slightly darker than the work (perhaps by a factor of 3). The ceiling is generally slightly brighter than the work. Especially in a large room and if the work is of high reflectance, the helios ratio between work and luminous ceiling is very small. The luminous ceiling is neither aggressive nor distracting. And the continual eye motions necessary for relaxed vision are possible without encountering direct or reflected glare.

Perhaps Miss Kahles will soon be proposing luminous ceilings in many places where she does not yet consider them desirable. For she says, "As for attractiveness, light originating or reflecting below the face is notoriously more flattering than light casting downward shadows." This is just the situation we obtain if light floors are combined with luminous ceilings. (And it is, incidentally, the opposite of the ugly and confusing pattern of black shadows produced when the human face is viewed under a maze of downlights.)

I hope that next time Miss Kahles passes Fifth Avenue and 43rd Street, that she will go inside the Manufacturers Trust Company and will stay long enough to begin to experience the delight of reading, working, and living under luminous ceilings.

DOMINA EBERLE SPENCER

excellence recognized

Dear Editor: I have been advised that Robert Billsbrough Price, Architect in the City of Tacoma, has been awarded a Citation by PROGRESSIVE ARCHITECTURE in connection with a Design Awards Program. This Citation, as I understand it, is in the Public Use Category for the Tacoma Fire Station No. 17.

It is with great pleasure that we learn that the architect of our selection for this public project will be granted this recognition.

In connection with the preliminary design work and through the actual preparation of the plans, Price worked closely with the staff of the Fire Department in laying out a station which will not only be functional but also will be pleasant living quarters for the firemen. Price explored all suggestions from the Fire Department staff and this office, relative to the interior and exterior of the building, in order that the final plans might completely meet our expectations of an economical, efficient, and attractive fire station.

The other day I had occasion to visit the site, and we can now visualize the result of his excellent work.

Let me congratulate the magazine on this design award program as some measure of recognition for professional excellence.

THE MANY ECONOMIES OF

It's the "long-run-cost" that counts. Door maintenance and insurance over the years add up to a tremendous figure. That's why there's a strong trend to replace ordinary doors with Schacht STAINLESS STEEL Doors & Frames. They cost less to maintain...far less to insure—yet their price is but a trifle more.

All This and Style Too!

Interesting Data on Request

Photographic proof reveals the superiority of

**GOODYEAR ALL-VINYL**

Note GOODYEAR’s smoother, more dense surface has no large pits and voids — needs no additional protective finish!

Here are actual photographs showing wearing surfaces of Goodyear All-Vinyl and other vinyl type floorings magnified 14 times—taking the mystery out of the unrivaled performance which has made Goodyear All-Vinyl the superior product that it is.

Goodyear’s vastly superior, naturally lustrous surface is much smoother and much denser—the result of top-quality construction.

This virgin vinyl construction results in the most beautiful surface ever engineered into a resilient floor covering. The surface is so smooth and lustrous, it requires no additional “glossing” to dress it up.

And as a result, the consumer knows he’s getting the finest-quality flooring built. There’s no “after-buying letdown” when you specify Goodyear. There’s no added finish to quickly wear off—no need for it, because Goodyear has no large pits and voids! For complete information and catalog, write: Goodyear, Flooring Dept. E-8325, Akron 16, Ohio.

The quality is remembered long after the price is forgotten.

</tbody>
</table>

1. 3/4" gypsum lath covered with 1/4" of gypsum plaster with expanded perlite aggregate.
2. 3/4" gypsum lath, reinforced with 20-gauge, 1" hexagonal mesh; then covered with only 1" of gypsum plaster with expanded perlite aggregate. The use of hexagonal mesh fabric in 3/4 in. ceiling (3/4" gypsum lath; 3/4" plaster) gave almost four times the resistance obtained without, the report states.

*B. Building Materials and Structures Report 141 National Bureau of Standards
Once again Keymesh-type plaster reinforcing lath has demonstrated its ability to multiply firesafety at amazingly low cost. First, as part of a new, low-cost system for fireproofing structural steel and beams. Next, 50% greater fireproofing when added to gypsum lath and plaster ceilings of wood frame construction. Now, over twice the endurance on open web steel joist construction.

**How can Keymesh add so much at such low cost?**

Here's why! The complete coverage of this multidirectional reinforcing holds the plaster in place so it continues to fight fire until structural failure occurs. At the end of the 4 hour and 26 minute period, "no plaster had fallen". On the test without the 20-gauge hexagonal mesh "nearly all the ceiling was down".

In addition to greater fire-safety, Keymesh produces stronger ceilings; gives far more crack resistance.

Why build to burn, when it costs so little to multiply the fire resistance of buildings with lath and plaster, reinforced with Keymesh.

*Recommended and used by America's leading lathing and plastering contractors.*

**KEYSTONE STEEL & WIRE COMPANY**

HOW “RESERVE STEAM” HELPS MRS. BAIRD’S BREAD CO.
KEEP PACE WITH GROWING MARKETS

It's "full steam ahead" for growth at Mrs. Baird's Bread Co., Dallas, Texas. That's because management looked well into the future in planning the company's modern plant. Take the boilers as an example. Past experience proved that boilers with reserve capacity could economically provide sufficient power to meet the needs of expansion. Kewanee Reserve Plus Rated Boilers were installed, with 50% extra power built in for additional capacity requirements. When fluctuating loads demand more steam at once... it's there with Kewanee. When expansion calls for more steam... it's there with Kewanee. So, when you consider boilers, don't be misled by promises that a boiler delivers enough steam to meet average daily requirements. Look for reserve to assure performance beyond the call of usual duty. Consider Kewanee Boilers, rated on nominal capacity to operate at "cruising speed". You'll get greater efficiency at lower cost, plus longer boiler life. Only a boiler rated on nominal capacity can make that guarantee.

Architect & Engineer—George L. Dahl & Associates
Heating Contractor—C. Wallace Company

KEWANEE

...BOILERS PROVIDE FOR FLUCTUATING LOADS AND FUTURE EXPANSION

Here are 2 Kewanee No. 5188 Boilers installed at Mrs. Baird's Bread Co.

KEWANEE-ROSS CORPORATION, Kewanee, Illinois

YOU can depend on KEWANEE engineering.
THE MIRACLE WEDGE

Weathertight Closure . . . originated by Overhead Door Corporation in 1921, this feature is the basis of construction of every door, from the smallest residential garage door to the largest industrial door.

Vertical tracks incline away from jambs at a pitch of \( \frac{\sqrt{2}}{4} \) per door section.

End hinges with roller sleeves of progressively graduated height guide the door tightly against jambs and lintel, yet free it quickly when opening.

Built, installed and serviced by the world's largest manufacturer of doors and door operators exclusively!

For easy solution of heating problems, employee protection, traffic speed-up and lasting satisfaction under constant hard use, insist upon The "OVERHEAD DOOR," first and finest in its field. This quality door is built of wood, steel or aluminum in any size to fit the opening . . . a "custom" door at production line prices. Consult our engineering and research staff about unusual installation problems.

Equip All Doors with ELECTRIC OPERATORS and Remote Control

Electric operation from a centralized control board pays for itself in man-hours saved. It lengthens the life of the doors because they move at a steady speed proper for their size and weight, without sudden strains.

In Atlanta -- Youngstown Buckeye Conduit installed in Georgia State Office Buildings

WHY YOUNGSTOWN BUCKEYE CONDUIT IS BETTER

Youngstown is the one manufacturer who makes rigid steel conduit from ore to finished product. This enables Youngstown to control the complete manufacturing process—your insurance that each length of "Buckeye" is made of top-grade steel.

Planned and built for years to come, these modern Georgia State Office Buildings have wiring protected by Youngstown Buckeye rigid steel conduit. It was only natural that Buckeye was specified. Made of top-grade steel, Buckeye dependably guards any electrical system against such damaging elements as water, moisture, vapor, dust and dirt. Its durability makes Buckeye rigid steel conduit ideal for wiring systems that must be permanently safe.
Frank Lloyd Wright specified Colorundum floors for their warmth of color and beauty."

"Look at these photographs of our exciting new home and you can see why we just wouldn't consider drab, colorless concrete. From the first rough sketches," writes Mrs. Zimmerman, "we planned attractive, luxurious Colorundum for the patio and the service areas... especially when we found out how little it cost!"

Colorundum is the ideal solution to the problem of exposed or uncarpeted areas of plain concrete. It provides colorful, wear-resistant floors at just a fraction of the cost of tile.

Colorundum is far more resistant to traffic than ordinary concrete floors. It is a balanced formulation of nonslip aggregate (next to the diamond in hardness), water-repellent compounds, and durable colors... contains no silica, quartz, metal or sand. It is easy to keep clean, and since it contains no metal, it will not rust or stain.

Colorundum is available in eleven decorator colors.

FUEL DOLLARS AREN'T WASTED ON OUTDOOR HEATING
WHEN HERMAN NELSON DRAFTSTOP SYSTEM
COOLS THE CLASSROOM.

No school can afford open window ventilation, if it counts the cost. Fuel dollars are wasted every day of the heating season. And, in addition to this needless extravagance, the problem of the overheated classroom remains unsolved.

Herman Nelson DRAFTSTOP eliminates both the waste and worries of overheating. In fact, the major function of this system during school hours is to cool rather than heat. As sun, lights and students add to the heat load, it goes to work, automatically introducing outdoor air in sufficient quantities to keep room temperature at comfort level. And, to complete the economy picture, Herman Nelson eliminates chilling window downdrafts without the use of heat.

Why pay a premium for open windows and overheated classrooms? All the comfort features of the Herman Nelson System are yours at a saving—a saving that starts with the first day of operation and continues through the years. For complete information, see our catalog in Sweet's Architectural File, or mail coupon on adjoining page.

WASHINGTON. They cook in comfort at Pasco Senior High School, Pasco, Wash. Note cavity wall construction which permits passage of lolly column through outdoor air opening of the Unit Ventilator—another example of the flexibility in Herman Nelson design. Superintendent of Schools: Herman F. Jaeger; Architect: Victor Louis Wulff; Engineers: Kendall M. Wood & Associates.
for the Birds"

MICHIGAN. Long, low and handsome, Edmonson Elementary and Junior High School, Willow Run, Mich. Installation cost of Herman Nelson DRAFT/STOP System was materially reduced by laying piping on depressed slab in exposed perimeter trench (see inset), with unit ventilators and utility cabinets serving as cover. Superintendent of Schools: Albert C. Johnson; Business Manager: A. A. Wiensch; Architect and Engineer: W. T. Anicka; Mechanical Contractor: United Heat Engineering Co.

TENNESSEE. Strictly modern and modest in cost. The new C. T. Kirkpatrick School, Nashville, Tenn., featuring Herman Nelson DRAFT/STOP Unit Ventilators, was built at a cost of $9.60 per square foot. Superintendent of Schools: W. A. Bass; Architects: Taylor & Crabtree; Engineers: I. C. Thomason & Associates.

Even the smallest offices can be made roomier, more efficient and happier places to work. All it takes is MODERNFOLD—the door that folds completely within the door frame. That’s especially important in very small rooms, where a MODERNFOLD door can add 10% to the usable floor space. Just by eliminating old-fashioned door swing, you make room for another chair, table or file cabinet.

To workers in partitioned cubicles, a MODERNFOLD door is like a promotion. It gives them the working environment and prestige of a private office. Office managers appreciate MODERNFOLD doors for a different reason; their construction. Washable vinyl covers a double strength steel frame that operates smoothly, year after year. And MODERNFOLD offers dozens of cheery morale-boosting colors.

Your clients will marvel at the ingenious way MODERNFOLD doors magically make small offices more roomy and attractive at so little cost!

The MODERNFOLD distributor (listed under “Doors” in classified directories) will be glad to show you the Custom line. Your building supply dealer has the Spacemaster line available. Or write New Castle Products, Inc., Dept. E31, New Castle, Indiana. In Canada: New Castle Products, Ltd., Montreal 6.

Full Details in Sweet’s File
THE NEW LIBRARY AT BRADLEY UNIVERSITY, PEORIA, ILL., IS A THREE-STORY, COMPLETELY AIR-CONDITIONED, BRICK-AND-STEEL BUILDING OF CONTEMPORARY DESIGN, WITH A CAPACITY FOR 150,000 VOLUMES. TO PROTECT THE LIBRARY AND ITS CONTENTS FROM THE HAZARD OF FIRE, THE ARCHITECTS SPECIFIED FLOORS BUILT WITH OPEN-WEB STEEL JOISTS COMBINED WITH CONCRETE FLOOR SLAB AND VERMICULITE PLASTER CEILING.

THIS TYPE OF FLOOR CONSTRUCTION PROVIDES FIRE-RESISTANCE UP TO FOUR HOURS, DEPENDING ON THE THICKNESS OF THE SLAB AND THE KIND OF PLASTER USED.

THE ARCHITECTS ALSO GAINED OTHER ADVANTAGES THROUGH THE USE OF BETHLEHEM OPEN-WEB JOISTS. THE FLOORS MUST SUPPORT HEAVY LOADS OF BOOKS, AND THE STEEL JOISTS HAVE THE REQUIRED STRENGTH AND RIGIDITY WITHOUT DANGER OF WARP OR SAG, AT THE SAME TIME PROVIDING LARGE AREAS OF COLUMN-FREE SPACE, WITH CONSEQUENT FREEDOM FOR REARRANGEMENT OF STACKS AND NON-BEARING WALLS TO MEET CHANGING REQUIREMENTS.

IN ADDITION, THE USE OF STEEL JOISTS HELPED TO REDUCE BUILDING COSTS. THE JOISTS REACHED THE JOB SITE FULLY MARKED, READY FOR PLACING, AND THE INSTALLATION OF DUCTWORK FOR AIR-CONDITIONING AND OF WIRING WAS SIMPLIFIED BY RUNNING THEM THROUGH THE OPEN WEBS.

BETHLEHEM OPEN-WEB STEEL JOISTS

Surround Your Customers with the Practical Luxury of Briggs Beautyware

Statistics show that the bathroom has an ever-increasing influence on the home buyer—the finer the bath facilities, the faster the sale. Briggs has led the field in providing the building industry with the practical luxury of top quality, truly modern bath fixtures—at a realistic price.

And Briggs has set the pace in pioneering new safety, utility and ease of installation features—in the merchandising of color at popular prices—in the promotion of the second bathroom as “The New Standard for American Living.”

Read below for additional facts about Briggs leadership in engineering, manufacturing and merchandising. Join the fast growing ranks of home building leaders who surround their customers with the practical luxury of Briggs Beautyware.

BRIGGS MANUFACTURING COMPANY
300 Buhl Building • Detroit 26, Michigan

Refer to Sweet’s Catalog—Architectural File 24A, Light Construction File 9B, or A.I.A. File 29H.

Delightful distinctive design in fresh, bright colors is yours with Briggs Beautyware—at the cost of many white bath sets. Briggs craftsmen have developed new techniques in forming and finishing that provide new bonus benefits in contour, color and value. With Beautyware, two bathrooms in color can be a practical reality for a big majority of your customers.

Long-lasting quality is inherent in Beautyware design and materials. Bathtubs feature the traditional durability of the finest, heavy-gauge enameling steel, pressure-formed to exacting contours and reinforced with special rigid frame members. It is the surest blend of strength and scientific weight—with exclusive dividends in easiest handling and installation.
surfaces hard as glass are fused to every Beautyware fixture—porcelain enamel fused to steel, and high-density vitreous china. Briggs’ exclusive pioneering in manufacturing processes for beautyware bathroom fixtures has brought new achievements in super-hard fixture finishes—glistening, easy to clean, and defiant to stains, acids and fading!

Important utility features—such as the square, straight ends and the leak-proof wall flange, found on all Briggs tubs—make Beautyware the most practical as well as the most appealing choice. The architect prefers Beautyware for functional styling, the builder appreciates its practical appeal, the plumber has confidence in Briggs’ technical excellence.
Do You Consider

THESE 4 IMPORTANT FACTORS

WHEN YOU SPECIFY GLUED LAMINATED WOOD MEMBERS?

ENGINEERING reliability is a must. For your protection, our first and most important job at Rilco is dependable engineering. Our large technical staff is of proven competence . . . will cooperate with you to develop the best design for your job, suggesting economies based on long experience.

PRODUCT QUALITY Every Rilco arch, rafter, truss or beam is custom-built by experienced personnel and modern equipment to meet your specific requirements. Rigid specifications are followed using specially kilndried and graded lumber, properly mixed adhesives, proper temperature and gluing time. Quality control guards every step of the fabrication. Members arrive trimmed and drilled ready to erect.

SERVICE Our service engineers are experienced Rilco building consultants who can advise and recommend the type of member best suited for your job. Working out of our conveniently located district offices, our engineers will gladly help with any specific design problems.

DELIVERY delays cost money and create ill will. Rilco plants are strategically located for shorter hauls and complete assurance of delivery when promised.

Your reason for specifying Rilco arches, beams, rafters or trusses for your next school, church, gymnasium, store, commercial or industrial building could be any of the above. Together they add up to an important ingredient . . . integrity. For more information write:
Creative engineering experience assures true expression of your design

Kawneer has been working hand-in-hand with architects and builders for nearly 50 years in the development, engineering and production of architectural metals. The creative engineering ability (The "Kawneer Touch") coupled with years of production experience has made Kawneer the pioneer in aluminum window and spandrel products. Now, due to expanded production capacity and demand Kawneer has developed a special metal wall department. Production and engineering facilities have been organized to manufacture windows, spandrels, mullions and jambs in any metal and finish and to any design, economically and in any quantity desired, with special weather and waterproof features.

For personal assistance from Kawneer's metal wall engineers, just phone, wire or write.

In the new Texas Children’s Hospital...

Pittsburgh Glass was utilized for maximum visual freedom

In the main lobby, large areas of Pittsburgh Plate Glass help to achieve a cheerful, attractive atmosphere. The two doors and two sidelights, which make up the main entrance, are Herculite® Tempered Plate Glass—a glass that is noteworthy for its characteristics of sturdiness, strength, transparency, and endurance. Herculite has approximately four times the strength of normal plate glass of the same thickness.

Large panels of Pittsburgh Plate Glass are used to enclose the snack bar and gift shop located near the lobby on the ground floor. All the mirrors in this hospital building are made from Pittsburgh Polished Plate Glass.

Design it better with Pittsburgh Glass

This modern hospital for child care reflects in its physical arrangement the best in functional design. A simple rectangle in shape, five stories high, this building utilizes broad expanses of Pittsburgh Glass for added beauty and practicality. The use of Pittsburgh's Solex® Heat-Absorbing, Glare-Reducing Glass on the third and fourth floors of all patients' rooms is a distinct contribution to their comfort. Solex keeps rooms cooler, protects them from the intense glare from direct sunlight.

Your Sweet's Architectural File contains detailed information on all Pittsburgh Plate Glass Company products... Sections 6a, 15d, 20, 12e, 15a.

Washrooms of another notable building

finished in **Carrara Glass**

- **Carrara® Structural Glass** has many outstanding, distinctive qualities which make it first choice with important architects who are called upon to design America’s leading buildings. This is especially true when the selection of a finishing material for washroom walls, stiles and partitions is involved.

Carrara Structural Glass is all pure glass with a smooth, even surface that is highly impervious to attack by steam, water, acids and cleaning compounds. Its gleaming finish, mechanically ground and polished to a high degree of lustre, will retain its beauty indefinitely, through many years of service, countless cleanings. It cannot check, craze, stain or fade; it will not absorb odors.

Carrara Structural Glass is easy to clean and keep clean. An occasional wiping with a damp cloth keeps it fresh and sparkling. And since Carrara is made in large sections, there are fewer joint crevices to catch dust and dirt.

For more information about this versatile material —its unique beauty, its wide application possibilities, and its ten glowing colors— write Pittsburgh Plate Glass Company, Dept. 5226, 632 Fort Duquesne Boulevard, Pittsburgh 22, Pennsylvania.
Designed for carefree modern living

Breathable Naugahyde*

the finest in vinyl upholstery

Welcomed by leading decorators, Breathable U.S. Naugahyde is the first fabric truly combine beauty with ability for modern living. This entirely new concept of upholstery fabrics brings new distinction to every style period of furniture, as illustrated here. Breathable U.S. Naugahyde combines the soft luxury of woven fabric with the soil-resistant ability of vinyl.

Look for Breathable U.S. Naugahyde on fine new furniture or ask your supplier.

Breathable U.S. Naugahyde comes in a wide range of beautiful colors; in the four distinctive patterns shown in sample swatches.

UNIVERSAL STATES RUBBER COMPANY • Coated Fabrics Department, Mishawaka, Indiana
County fathers in Houston, Texas, took no chances when they were approving a $1,500,000 conditioned air system for the new $11,000,000 Harris County Court House. Barber-Colman equipment was specified throughout this modern structure, assuring finest possible end results from the sizable investment in conditioning apparatus. Air is distributed efficiently, quietly, unobtrusively, for heating, cooling, and ventilating from the Line-O-Flo and Venturi-Flo Ceiling Diffusers, and the Uni-Flo Sidewall Diffusers and Return Grilles. Not only are the results above par, but the air distribution units are easier to install, harmonize beautifully with the contemporary design, and last a lifetime with a minimum of service.

Architects: FINGER & RUSTAY. Mechanical Engineer: I. A. NAMAN. General Contractor: MANHATTAN CONSTRUCTION CO. Mechanical Contractor: CHARLES G. HEYNE AND COMPANY.

Eight-story court house, except for the jail area, is completely air conditioned. Four primary systems, located on the roof, heat, cool, ventilate, and control humidity as outside conditions require.

Line-O-Flo Ceiling Diffusers in lobby and court room areas quickly equalize temperature differential between supply and room air, preventing stratification and eliminating drafts. Combine readily with light fixtures.

Model LL Line-O-Flo is designed to receive a Day-Brite light unit, which is isolated from the air stream. Flange arrangements permit individual or continuous mounting.

Model LS Line-O-Flo, as used in Harris County Court House, provides positive control of air volume, plus uniform distribution over entire length. Individual or continuous mounting.

BLAZING THE TRAIL TO BETTER AIR DISTRIBUTION

First with widely accepted line-type air distribution

Desire of architects and engineers for continuity of design in modern architecture led Barber-Colman Company into development of Line-O-Flo air distribution equipment. These were the first successful line-type outlets on the market. Scientifically designed, rolled steel members provide rigidity. Two models are available with flange arrangements for individual, or continuous strip installation. One Line-O-Flo model is designed to receive a fluorescent light unit. Both models are dimensionally co-ordinated for use with acoustical ceilings and other building products. Either may be used for supply (with balancing dampers) or return units. Reliable performance data is available on Line-O-Flo and all other Uni-Flo products. For literature, prices, and expert engineering help, phone our nearby Field Office, or write us.

Stran-Steel® Galvanized Decking
for use with Stran-Steel Framing

Woodland Acres Shopping Center in Green's Bayou, Texas, utilizes 26-ga. Stran-Steel galvanized roof deck nailed to 9" Stran-Steel joists, on 24" centers. Built-up roof was applied over 1/2" fiber glass insulation. Architects: DUNAWAY AND JONES, Houston. Distributor: BUIE BLDG. MATERIAL CO., Houston.

STRAN-STEEL DECKING IS . . .

LIGHTWEIGHT but STRONG: Dead load savings up to 10 lbs. Total weight of this dry system, including 1" of insulation board, is less than 3 lbs. per sq. ft. Great strength-to-weight ratio assures maximum economy in materials.

ECONOMICAL: Competitive with poured-in-place decks. Galvanized coating assures long life . . . no painting is required.

EASY TO INSTALL: A 5-man crew can install up to 14,000 sq. ft. in an 8-hr. day. Insulation and built-up roofing can be applied immediately after erection. Erection is simplified by accurate fabrication and uniform pattern of decking.

AVAILABLE: On-the-spot distributors and dealers in all major building centers . . . with trained technical personnel to assist you in design and fabricating problems and adaptations to meet local conditions.

Architectural Terra Cotta is so versatile, you'll find it specified extensively throughout schools and other public buildings. For creative planning of interiors or exteriors, it offers unequalled plasticity of form, color and texture. Architectural Terra Cotta is custom-made for high quality and close tolerances to your precise specifications. You can design in large units or small, plain surfaces or decorative sculpture. Moreover, you have an unlimited range of ceramic colors from which to choose...and their original richness and beauty can be retained indefinitely by simple soap-and-water washings. Thus, minimum maintenance is still another advantage to quality, appearance, permanence and price.

Construction detail, data, color samples, estimates, advice on preliminary sketches, will be furnished promptly without charge on Architectural Terra Cotta and Ceramic Veneer.
There's a Hoffman Trap, Valve, Pump or other specialty designed to give you better control of every steam system requirement. And, each Hoffman product is distinguished by exclusive features that assure customer satisfaction, long, care-free service. It's the COMPLETE, tested, quality line backed by a dependable, single source of supply and responsibility. Yet Hoffman Products cost no more than the ordinary kind—and pay their way with the fuel they save. To avoid delays—order now from your wholesaler of heating and plumbing supplies. Catalogs available on all items.
Write for these free data books from H. H. Robertson's technical library

1. Design and Cost Factors
   This book compares Q-Floor with other types. Based upon a typical multi-story building, the study is replete with charts and cost analyses of all structural components.

2. How to Fireproof Q-Floor and Structural Steel
   This is a description of fireproofing methods when Q-Floor is used with structural steel framing. It contains detailed drawings, typical code requirements and fire resistive ratings.

3. An Analysis of Industrial Roof Construction
   All the better-known roof types (flat, monitor, bow-string, double-pitch, high-low bay, saw tooth) are compared on the basis of weight of structural steel, volume, roofing, sash area, flashing, ventilation and daylighting.

4. Cantilevered Roofs and Canopies
   This is information on the use of long-span Q-Deck on modern buildings that call for covered walkways or overhanging roofs for weather protection. Loading conditions and structural details shown.

5. Concrete Fill on Q-Floor
   This booklet gives recommended practices for concrete fill over Q-Floor. You'll find specifications for formulation, placement and curing, plus treatises on the nature and reactions of concrete.

6. Acoustical Data on Q-Deck
   Though the fluted undersurface of Q-Deck provides some acoustical value, demand for more has led Robertson engineers to devise a new low-cost treatment. Test data and details are included.

WHAT TO LOOK FOR IN QUALITY TOILET COMPARTMENT CONSTRUCTION

One of many major differences that give you your money's worth in satisfactory service!

Porcena
(Vitreous Porcelain on Steel)

PROVED LOW IN MAINTENANCE COST BY 19 YEARS' EXPERIENCE

Genuine
PORCELAIN ENAMEL
"THE LIFETIME FINISH"

THIS MATERIAL IS
ACID RESISTING PORCELAIN ENAMEL

- Will not rust, burn, or discolor
- Does not harbor odors or germs
- As easy to clean as a China dish
- Is not harmed by household acids, fruit
- Is not permeated by miscellaneous stains or marks
- Stands up under household work surface
- Color and beauty will not fade

GUARANTEED by the manufacturer to conform with the "General Specification for Porcelain Enamel Surfaces - Acid Resistant Type JPEI: S-1021" of the Porcelain Enamel Institute, Washington, D.C.

TO CLEAN: USE DAMP CLOTH, SOAP AND WATER

MINIMUM OF MAINTENANCE - The sanitary flush surfaces of PORCENA are economically maintained. Pencil or lipstick marks are easily removed. Porcena resists cleaning caustics, uric acids, and withstands scratches and shocks, still retaining its original luster.

It is not necessary to gamble on getting long life and low maintenance cost in toilet compartments you specify. PORCENA, Sanymetal's vitreous porcelain on steel, has proved to have the lowest maintenance cost. It has been in actual use for more than 19 years, with over 2,000 actual installations.* Today the porcelain surfaces of even the oldest are as bright as new after being sponged with soap and water. Not one has faded, failed, required repair, or replacement, due to lack of durability or normal use of the material. Porcena has the hardness of glass and the natural strength of steel — it never requires refinishing.

There is nothing "experimental" or "developmental" about Sanymetal Porcena. Sanymetal originated porcelain enamel toilet compartments, and thoroughly understands how to make them uniform in durability, color and quality. Porcena is a proven product, one of many Sanymetal features. Ask your Sanymetal Representative about other features you get in Sanymetal Compartments — all of them at no extra cost.

*See Sweet's, or send for Catalog 92 describing all Sanymetal Compartments. If you wish, we will mail other advertisements in this series about quality construction features, and a list of PORCENA installations in your area.

time honored yet timeless...

Versatile Birch Plywood forms interesting block panels on walls. Maple Plywood is readily curved to make these attractive seats in Washington School—W. E. McCaughey & Associates, Park Ridge, Illinois—Architects

hpi HARDWOOD PLYWOOD

Schools and churches pose this architectural problem... once built, they must function with minimum architectural or decorative changes for years. The timeless loveliness of Hardwood Plywood wears well—in more ways than one:

• Grain in panels can be matched without risking the repetitious monotony of printed photographic substitutes.
• Unlike paper-thin surfaces, Hardwood Plywood offers a depth of beauty which means that scratches and mars are easily repaired—that maintenance is held to a minimum.
• Hardwood Plywood has superior acoustic qualities—an important consideration in churches and schools.
• Hardwood Plywood is a practical building material. It's reasonable in cost, easy to work with, easy to install, and available everywhere.

ACHIEVE DISTINCTIVE, INDIVIDUALISTIC EFFECTS

Where beauty and function are equally important goals, Hardwood Plywood fulfills the situation as nothing else can. The natural beauty combined with the unparalleled strength, stability and durability makes it a truly outstanding design medium. It's available in lovely birch, gum, mahogany, maple, oak, walnut and other popular species.

Consider these 4 Essentials in Your Store Front Plans

**STYLE** - Architectural individuality will set the store apart from its competitors. Window settings and entrances of distinctive design help to provide immediate store identification. You can accomplish this economically with complete Brasco Construction. The variety of special effects possible with our versatile stock assemblies eliminates any necessity for special fabrication.

**STRENGTH** - Today's larger glass areas require sound construction, designed, engineered and fabricated to provide ample security under all conditions of weather and traffic. This calls for Brasco's heavy duty, steel-reinforced division bars. Glass holding mechanisms for sash rails are made of stainless steel to assure greater strength and resistance to corrosion.

**SAFETY** - Brasco's deep, firm, time-tested grip on the glass is your best protection against breakage. Even the largest lights are held securely, without strain, to absorb shock, vibration and wind pressure. Special lead-covered aluminum setting blocks cushion the glass safely and prevent shifting. They will not corrode or deteriorate.

**SALES** - Sallevision™ design is an important factor in attracting both new and old customers. Brasco's low sash exposes more glass to enlarge the view of the inviting interior from the street. With smart lines and pleasing profiles, Brasco Store Fronts and Entrances add eye-catching appeal that brings buyers IN.

YOU’LL GET BETTER RESULTS WITH BRASCO

Another feature
to please
your clients!

Ceramo is protected by a glazed ceramic surface, similar to the enduring finish given fine china! And, like china, Ceramo resists stains, doesn’t fade... never needs paint or preservatives... is 100% washable! Thus Ceramo costs your clients less in the long run than ordinary sidings that can’t match its rich, deep-tone and pastel colors, or its whiter-than-white. And remember—Ceramo colors are permanent. They’re baked right into the ceramic surface!

For homes that look newer, smarter... are worth more at resale time, specify quality Carey Ceramo! It’s ideal for new homes and remodeling. Send today for your free copy of “Carey Dependable Products”—picturing Ceramo and other fine Carey products in full color! Address Dept. PA-5. Or, see A.I.A. File No. 12.

Carey COLORED CERAMO SIDING

Better products for better building since 1873
High-precision manufacturing equipment and constant laboratory checking enable us to make sure that every resilient tile we produce is straight-edged and square when it leaves the factory; efficient modern packaging keeps it that way until ready for installation. These precision-cut tiles fit together smoothly and easily for low installation costs, and minimize wastage. Uniform thickness, accuracy of cutting, trueness and clarity of color, surface smoothness, ease of maintenance and built-in durability—all of these qualities combine to make this line the world's most popular line of resilient tile floorings.

KENTILE, INC.
America's largest manufacturer of resilient floor tiles

When Individuality Counts Use

NEW MASONITE PANELGROOVE

Different—distinctive—and desirable! Offers you a vertical accent for exteriors in homes of all types, for garages, shops, and many another structure. Creates a refreshing contrast to other design treatments. Makes good-looking gable ends—quickly! Perfect for use between and around windows, on short runs, and in featured areas.

Masonite Panelgroove needs no joint treatment...edges are shiplapped to create a continuous pattern. Square-cut grooves are 3/8" wide and 4" on centers. Panels are 4' wide, 1/8" thick and up to 16' long.

When you specify Panelgroove, you will be assuring your client all the weather-defying advantages of Masonite Tempered Preswood®—plus a continuous high-styled design with great popular appeal. Sold by lumber dealers. For complete information write Masonite Corporation, Dept. PA-5, Box 777, Chicago 90, Illinois.

Ideal for the game room, recreation room, den, study or modern living room. Panelgroove goes up quickly, takes and holds any surface finish, resists all kinds of bumps, scrapes and surface hazards. Use Panelgroove for interesting, serviceable walls in public rooms, too.

Look For This Man  He Makes The Difference

MASONITE PANELGROOVE

TEMPERED PRODUCT OF MASONITE® CORPORATION

SO EASY—yet it does so much more!

Just a low-pressure spray application—or simple flushing on with a brush.
That's all it takes to keep out water for many years to come—when you apply above-grade masonry water repellent made with Linde Silicones.
But it does so much more!

OUTSIDE
As soon as it dries it is colorless. It leaves no shine. It stops rain from penetrating even when driven on 100-mile-an-hour winds. Since it puts a water-shedding surface on masonry, concrete and brick, dirt washes right down to the ground.
It lines yet it does not seal up the pores, so moisture entrapped before treatment can evaporate. Thus spalling and cracking due to freezing are halted. Efflorescence, too, is prevented.

INSIDE
The benefits really multiply. Plaster, woodwork, paint and wallpaper stay dry. Peeling and staining due to moisture penetration are banished. Decorating, maintenance and repair costs drop.
See for yourself how easy and inexpensive it is to put a lasting, invisible raincoat on homes, institutions, schools, factories, churches, office buildings. Write today for full information and a list of representative suppliers. Address Dept. B-5.

THERE ARE ALWAYS NEW USES FOR WEST COAST LUMBER

This striking “inside-outside” truss is one of the many interesting new uses of wood for home construction. Intended primarily to give a feeling of greater height in the living room, it also helps create a spacious, informal atmosphere. Outside, this truss application makes possible a post-free overhang for a protected patio and children’s play area.

For freedom of expression, specify wood . . . the economical, ever-modern building material. For dependable lumber, specify the West Coast species . . . Douglas Fir, West Coast Hemlock, Western Red Cedar and Sitka Spruce.

WEST COAST LUMBER
Douglas Fir • West Coast Hemlock
Western Red Cedar • Sitka Spruce

WALTER GORDON
Architect, AIA
Graduated from Princeton and later took his M.F.A. there. Also studied at University of Paris, and at Yale University graduate school. Has designed numerous homes, many of which have been featured in national magazines.
Brixment is waterproofed during manufacture, with the most effective air-entraining, water-repelling agent known.

The fact that Brixment is waterproofed can be demonstrated by making the crater test shown in Figure 1. Brixment's effectiveness in preventing the passage of water through the mortar can be demonstrated by making the test shown in Figure 2.

* * * *

Waterproofed Brixment gives you three practical benefits which are not available in ordinary cement-and-lime mortars:

1 **HELPS PREVENT LEAKY WALLS**

Even under pressure, water cannot readily pass through Brixment mortar. Therefore, if the face brick are back-plastered with Brixment mortar, a barrier is set up against the passage of water to the inside of the wall.

2 **GREATLY INCREASES DURABILITY**

Water cannot readily penetrate Brixment mortar. This prevents the mortar from becoming saturated — therefore helps protect it from the destructive action of freezing and thawing to which it is subjected many times each winter.

3 **HELPS PREVENT EFFLORESCENCE**

Waterproofed Brixment mortar checks the passage of water and keeps it from percolating down through the wall, dissolving salts which may be in the masonry materials, and carrying them to the surface.

*Louisville Cement Co., Louisville 2, Ky.*
Higher interest rates are foreseen by banking lookouts as springtide lifts business and construction to record levels. The first suggestion of an upswing occurred in mid-February when one of the larger New York banks raised its commercial short-term rate 1/20 of 1%. The average figure has since been inching up by minute fractions. Two reasons are given for this "creeping firmness": commercial borrowers are not paying their loans in customary seasonal amounts and the Federal Reserve System has been supplying the banks less liberally with loanable funds. Sensitive barometers, such as Treasury bills and loans by banks on Government obligations, have reflected a similar tendency. These indicators veer toward a possible tightness in municipal bonds and mortgages, sources respectively of public and private building financing.

Banking sentiment as to home mortgages took its first cautious turn this year when Homer Livingston, president of the American Bankers Association, warned against over-easy terms designed to stimulate housing starts, at the recent midwestern conference of the Mortgage Bankers Association of America. Livingston, who also heads the First National Bank of Chicago, was impressive when he declared that prosperity on the basis of "smaller and smaller" down payments coupled with "longer and longer" maturities "may not be a bargain." He advocates a change in law that will shorten maturities and provide FHA-VA down payments which are "reasonable" from the lenders' standpoint.

At the same conference Wallace Moir, president of the mortgage association, declared that "the end of the road" is in sight concerning liberalized lending. He questioned the ability of savings institutions to supply funds for 1955's estimated 1,400,000 housing starts. Moir decried both the current "100%" loan fashion and the "costly" supports Government is giving the home mortgage market to keep interest rates low. He reminded his hearers that mortgage debt on one- to four-family houses is rising ten times as rapidly as personal income. However, he admitted, whereas in 1933 the mortgage debt was 32% of the nation's total borrowings, it is now only an estimated 18% despite huge dollar increase and some 95% millions housing starts during the past decade.

The money atmosphere has gained a further feeling of "closeness" from contra-seasonal business borrowings. Instead of the usual reduction during the first quarter, bankers this year have faced an increase of demand for business funds which has pushed up loans and depleted "excess reserves." At the same time Federal Reserve operations pulled funds out of the banking system in a deliberate tightening up process.

Yet another untimely factor that has given pause to a recently freethand banking world is the circumstance that total production slid a trifle while the year was young, though it is still ahead of 1954. In like manner heavy public construction showed an unseasonal slow-up as compared with the unslackening pace of private building, but construction of all kinds is in advance of last year. The record rate of house building may breed inflation, as seen by the United States Savings & Loan League; though Housing Administration officials insist that the credit fabric is sound and the activity justified. Fears of scarce money are likewise allayed by the President of New York's Federal Reserve Bank, who infers that Reserve authorities will think twice before tightening credit.

On the sunnier side, a little-publicized semiprivate undertaking—the Voluntary Home Mortgage Credit Program—is getting under way with Uncle Sam's blessing. Its plan should make Federally insured funds more readily available at mutually agreed interest rates to a wider distribution of qualified borrowers. There is a feeling, too, among bankers themselves, that they should assume a greater proportion of lending hazard. Exhorts the president of a Virginia bank active in "term" and installment credit: "Seize the initiative, despite what small risks may be involved!"

Bankers are approaching home improvement loans in similar spirit. From a slow start some years back, these one-time small frcy are nearing an $8 billions total, with more than $1 1/2 billion outstanding and with less than 1% net average loss. Until recently such loans were Government-insured under FHA Title I, but the current banking tendency is toward self-insured home improvement financing. Net losses through the years have turned out to be less than the cost of Title I credit insurance; hence the banks find it profitable to do this type of lending without Federal aid.

One large eastern bank, for example, has had its own modernization plan for more than two decades with a rate of $6 annually per $100 on 36-month maximum maturities. During the past seven years, on a $65 millions volume, the net losses were 3/4 of 1%. In the Middle West a medium-sized banking institution reports a loss ratio of only 1/26 of 1% on its $9 millions uninsured loan aggregate since 1948. Now that so many activities are taking on modernization commitments, this uninsured loan trend should benefit all parties through substantial cuts, both in red tape and costs.

Despite shadows here and there, the general economic structure retains its stronger elements. These may be briefly listed:

1. Industrial production is recovering the ground lost earlier in the year and at last accounts was averaging some 6% higher than in '54;
2. Treasury capital is being replaced by private capital as the Federal National Mortgage Association sells the public half a billion of 2 1/2% bonds;
3. Business failures are fewer than last year after a super-seasonal increase;
4. Municipal bond absorption by institutional and banking investors continues in heavy volume with school issues particularly favored;
5. Upsurge of machine tool orders is unslackened at this writing, averaging some 17% in advance of '54 and forepacing high industrial activity;
6. Bank balances are being augmented as banks make further progress toward nationwide reduction of "float" by speeding up check collections;
7. New orders at factories are coming in faster than at this time last year, with only few exceptions. The increase is reaching 35% in some key areas;
8. Depreciation charge-offs, estimated at $15 billions during the '54 twelvemonth, plus $7 of retained earnings, are strengthening industry's cash position.

In sum, signs point to continued and profitable business progress, with construction of all kinds leading. Funds will likely continue in fair supply, though at somewhat higher rates. The bogy, if any, is in the realm of inflation rather than in that of deflationary "recession."
Do you remember the ads that used to start with "There's big money in drafting ..."? Maybe they were right. Add up the payroll in any medium-sized drafting room for just one month and you'll agree—it's big money.

There are people who say too much money is sometimes spent in the process of drafting room production; that drafting costs can be cut 10%—15%—even 50% in extreme cases—without changing the quality of product. They say, and they back up their claims with a growing history of proved results, that closer attention to principles of sound production management not only gives a firm increased profit but also frees executives from trivial detail, giving them a chance to work where they themselves are most effective.

Among the people who say this are successful architects and engineers, men who have for years faced the same problems we face every day. In analyzing their clients' problems they turned up answers to problems of their own and it is these answers they put to work—in varying degree.

It is the intention of this series of three articles to do two things: first, to explore techniques these people use to cut the cost of drafting room production, and second, to uncover where possible the principles involved. Certainly no one technique will fit every drafting room. But if, as is claimed, all human production has something in common, then the underlying principles provide fabric from which new techniques can be cut to fit.

where are the costs?
In general it is agreed that the major cost in drafting room production is the cost for drafting labor. There is not much question about it. Costs vary from office to office and from job to job within any one office but it is a rare drafting room where the total of all other operating costs equals that paid for labor. As in most production where humans are involved, labor costs far outweigh everything else.

It is small wonder then that talk of "efficiency" revolves mostly around the human element in production, and means to help humans produce more and better work. The problem is one of an insistent growth of competition among engineering and architectural firms, a competition based not on the amount of fee but on the quantity and quality of work being offered for the same fee. Unless some very successful firms are mistaken, we will see that competition grow and grow, a competition rooted in increasingly efficient methods of drafting room production.

what is efficiency?
One thing that efficiency does not mean is "working harder." It was once pointed out that "to be strenuous is to put forth greater effort: to be efficient is to put forth less effort. Efficiency brings about greater results with lessened effort; strenuousness brings about greater results with abnormally increased effort."

An example of this is a comparison of today's automobile motor with one of, say, 1910. Today's motor develops tremendously more horsepower, not from consuming more fuel (actually it burns less) but from making more efficient use of the fuel it does burn. And that seems to be the goal in increasing any operational efficiency, to increase what comes out of the machine in proportion to what goes in.

An increased efficiency, in this sense, is synonymous with increased productivity. Charles Luckman, the architect, in a speech to the Producers' Council Annual Convention, defined "productivity" this way: "Suppose you have an apple tree that produces 500 apples. You can double production by planting another tree with the same yield. That is more production. But if, through added skill, you get that first apple tree to yield 600 apples instead of 500, you have increased 'productivity.'"

So, applying it equally to automobile motors or apple trees or drafting rooms, let's take industry's definition of efficiency: "The ratio of output to input"; the ratio of what comes out of the machine in proportion to what goes in.

efficiency—and people
Yet, with all this talk about machines there is an even more important aspect of the problem to deal with: people just aren't machines.

No matter how much of the production expense is for human labor and no matter how badly we need increased production efficiency, human beings are hired to do the work and humans are a lot more complex than any machine. Machines have no wives...
by Hans W. Meier*

at home nor ambition to do better things nor interest in the future. A good machine turns out a uniform quantity day after day; speed it up and it turns out even more. But humans have good days and bad days, problems they can lick and problems that lick them, abilities to do immense things in some fields—and to draw complete blanks in others. And humans alone have the great skills and technological know-how needed to produce a set of plans and specifications.

If human labor represents the chief cost in drafting room production, and if an increased efficiency of that production is desirable, then it follows that one good technique lies in understanding why people work and what helps them to work better. Industry has poured millions of dollars and years of study into the search for answers to that problem. The entire field of “Industrial Relations” is a product of that search. Testimony of results is the productivity of American industry today.

Industry found that human efficiency could be improved if industry would make, and follow, certain broad assumptions:

1. That a job can best be done by teamwork with each member of the team carefully chosen for the special abilities needed to do his designated part of the work. From this assumption has arisen the practice of “job analysis” and the present methods of personnel selection.

2. That thorough preplanning of production will help eliminate bottlenecks, confusion, and duplication of effort. In this area have been developed the methods of time and motion study, scheduling, co-ordinating, etc., known under the general title of “production planning.”

3. That contrary to earlier beliefs, there is no “one best way” to do things and that the way must be left open for developing better methods as experience is gained in production. From this last assumption have come the studies in production management being carried out in factories and universities throughout the country.

drafting room efficiency

At the drafting room level, none of this presents anything astonishing or particularly new. Consciously or not, we tend to follow those assumptions to some extent. We choose our personnel with quite a bit of care when we can. We do have some measure of planning about our drafting projects, and we certainly are all on the lookout for new and more efficient methods of production. As far as we go, we follow those assumptions and we accept them as being “good business” if nothing else.

But the startling increases in efficiency seem to come about when those assumptions are polished up, delved into, refined in operation. When drafting room production is thoroughly preplanned on the basis of time studies of previous work, a realistic schedule can be made and maintained; a schedule which generally saves man-weeks of effort lost in poor co-ordination and in meeting hastily set “deadlines.” When personnel is carefully selected for special abilities, each person takes a place on the production “team.” When each man and his work are respected for a vital contribution to the finished job, the resulting sense of participation and responsibility does a lot to ensure top-notch performance. When the team feels a pride in itself and its firm, a loyalty based on mutual understanding and respect, an identity with the firm’s success and a confidence in their future together, then you’ll have a hard-hitting crew who will show you how fast and accurately a job can really be gotten out.

Experts point out that none of this happens by itself. Having employees does not automatically make good management any more than having a saw automatically makes a good carpenter. Yet the skills of production management are learned skills, as more and more people are discovering. The techniques seem to be those of understanding just what it is that we are trying to do, carefully dividing the labor among personnel qualified to perform it, carefully planning the work to be done, and constantly being on the alert for a more effective way to do it.

These are some of the things that have brought American industry to the productivity we know today. It is not surprising that they can be applied, and are being applied, to increase drafting room productivity as well.

Bernard Tomson  it’s the law

Periodically, this column supplements Tomson’s Architectural & Engineering Law (Reinhold, 1951) by reporting summaries of cases decided and other matters of interest occurring since the publication of his book. A number of cases meriting more than a capsule treatment will continue to be discussed more extensively.

PART III. ARCHITECT, ENGINEER, AND OWNER—THE EMPLOYMENT RELATION

Chapter 9—Agreements with Owners

The employment relation between architect or engineer and owner is entered into by a voluntary agreement between the parties; its creation and existence is governed by the general principles of contract law.

Louisiana. Besson v. Oden, 59 S. 2d, 221 (1952). Owners found it necessary to move into building on the date of its completion, and no objection was raised by the Contractor. It was held that the occupancy of the building prior to complaint regarding certain defects was not such ratification and acceptance of the Contractor’s performance as to preclude the Owners from complaining about the defects. Furthermore, the Court held that, in the absence of specific evidence by the Owner as to the cost of repairing the defective work, the Contractor was entitled to the full contract price. The Court deducted from that price the figure of $30, which the Contractor himself had testified to as the estimated cost of repairing the defects.

Mississippi. Monroe v. Kimbrough Homes, Inc., 59 S. 2d 273 (1952). Action for breach of contract was brought arising from the fact that the Contractor had made his bid and began construction on the basis of the foundation plans, without reference to floor plans which contained specifications irreconcilable with the foundation plans. The Court held that under the contract the defendant had a duty to check all plans. It further held that the Owners, in allowing the work to proceed upon the assurances by the Contractor of later adjustment, had not waived their right to damages.

Indiana. Baird v. Aluminum Seal Co., Inc., 105 N.E. 2d 825 (1952). In an action upon a note given as security for the performance of a building contract under which the plaintiff was given the right to declare forfeiture if the Builder failed to procure FHA certificates by a certain date, the Court held that, inasmuch as the plaintiff expressly waived its right to declare a forfeiture at the time it accrued, the right could not thereafter be asserted in the absence of reasonable and specific notice of intent to reassert it.

New Mexico. Staley v. New, 250 P. 2d 895 (1952). The Owner’s agent obtained plans and specifications for a radiant heating system and these were referred to in the building contract and became a part of it. The Owner could not maintain an action for breach of contract and warranty against the General Contractor and heating Subcontractor for failure of the system to heat the house adequately, inasmuch as the Contractor and Subcontractor performed the work in accordance with the plans and specifications.

Illinois. Wolters v. Venhaus, 112 N.E. 2d 747 (1953). In a suit by a Contractor to recover the balance due for construction of a house, the Owner counter-claimed for damages resulting from defective workmanship and failure to comply with plans and specifications on the part of a subcontractor. The Court held that, since the subcontractors had been paid in full on orders from the Owner, who had a right under the contract to withhold fifteen percent of the price until acceptance, the General Contractor was not liable for the default.

Idaho. Puget Sound National Bank of Tacoma v. C. B. Lauch Construction Co., 245 P. 2d 800 (1952). The siding to which a Subcontractor applied paint was in a warped condition and the Subcontractor knew that the two coats of paint called for in the specifications would be insufficient, considering the poor siding and the sunny climate. Nevertheless, the Court said, “A contractor is required to follow the plans and specifications which were referred to in the specifications for a radiant heating system and these were referred to in the building contract and became a part of it. The Owner could not maintain an action for breach of contract and warranty against the General Contractor and heating Subcontractor for failure of the system to heat the house adequately, inasmuch as the Contractor and Subcontractor performed the work in accordance with the plans and specifications.

88 Progressive Architecture
"The ideal living unit, it was generally agreed, remains the one- or two-story family dwelling... Only recently have designers and builders begun to recognize the automobile and the scarcity of servants as important factors in house design. They should now be taking into account, with data which should be provided by sociologists and home economists, the problem of the adjustable, expansible, and contractable house for all phases of the cycle of family life, the desirable use of increased hours of leisure, the adjustment of television into the home and the all-purpose or play-work-creative area."*

In "the production of architecture" — P/A's theme for 1955 — no building type is more difficult to analyze than the individual house. Consider the paradoxes in practice produced by house design:

Private residential work is the largest item in the construction picture, taking almost 40 percent of the building dollar; yet it constitutes less than 5 percent of the architect's business.

Many architects feel, as E. Maxwell Fry has said, that "a house encloses most of the problems of architecture"; yet they agree with Robert Woods Kennedy that the very special requirements of individual clients make the house "the most demanding and discouraging of all specialties."

Since the house is a special problem, the "data which should be provided by sociologists and home economists," mentioned in the quotation above, is obviously needed; yet economists know that only an industrialized homebuilding industry with mass production of houses can hope to solve the housing need that is growing apace.

The architect, then, must increase his participation in a field of design that is "discouraging" and often unrewarding, if he is to fulfill his responsibilities. He must spend time finding social and technical solutions in a design category where individual designs will become proportionately less important. The fact that so many talented people practice in this field is remarkable; the manner in which they do it — their methods of production of architecture — and some outstanding current examples of the results, occupy the pages of this issue.

Berkeley, California

architect | Vernon DeMars
general contractor | Albert Hirshfield, Jr.

This engaging house for the architect's own use is one of the few private residences he has designed. DeMars, well known for his work in housing and redevelopment, is nevertheless interested in the design of the individual house as a laboratory of ideas for the more general market. He believes that vast strides have been made in the quality and design of the individual modern house, but is disturbed by the general lack of understanding of the esthetic principles governing mass-siting of the American production house. “The English have thrashed this out thoroughly for their particular problem,” states DeMars. “Compared with their study of the ‘townscape’ we have hardly started to think about it.” Though on a smaller scale than the “townscape” concept, the building complex on these pages is a lesson in fine site planning. Reminiscent of Japanese solutions, architecture and landscape have been treated as a unified theme. As a solution to this extremely steep site, and as a means of introducing the house into its setting with the least disturbance “propping the house up on stilts among the tree tops” suggested itself to the architect. “Then with terracing and modeling, to give some usable flat area and the impression of more.”

Photos: Roy Flamm
"As the design developed," relates the architect, "the similarity to a Japanese situation became more evident, and the design character was allowed to lean in that direction." The gravelled entry court with stepping stones (photo above), the "Tokonomo" post, the Shoji screens, which close off the guest bedroom, and the strict modular pattern of the big glass wall (photo of living room right) are quite literal Japanese details. However, since the house is not lived in nor furnished as a Japanese house, no attempt was made to be rigidly consistent. Exterior wall coverings are either cedar shakes or redwood boards. These have been stained dark-brown — the color of weathered redwood. Sash and doors have been painted a light gray and all exposed structural elements, barn red, a color long-lasting and pleasant in the green surroundings. Steel was originally intended for the structural frame but later changed to wood "when the idea of a cagelike framework dropping to the ground seemed to be a way to regularize and organize the design." A 4'x8' structural module has been maintained throughout, employing the post, beam, and plank system.
The dining end of the living room (above and left) is purposely low, its ceiling stained quite dark to give a sense of casuelike cosiness, in contrast to the light airiness of the two-story living room. The kitchen (below) may be closed off from the dining room by folding doors. Inside walls are covered with plywood or redwood vertical boarding. A forced warm-air system, employing 4 in. flexible ducts, was of particular design advantage in this house, in which most of the structure is exposed.
In detailing the big window in the living room (below), the architect made a special point of keeping the glass far toward the inside, thereby exposing as much of the frame on the outside as possible. “This tends to avoid the ‘wrapped in cellophane’ look and lets the structural members carry through in the design. However,” adds DeMars, “I would never propose the big window as a general solution.” Large glass areas, he feels, are appropriate only where privacy is protected, as on this site. Skylight is broken, in this case, by the large oak which filters the light through a fine lacework of foliage and also provides shade for the balcony (right), suspended in the treetop. Doors to the balcony slide on tracks to the outside, leaving a large, unobstructed opening.
This house for New England is of exceptional interest, not alone for its inherent qualities but because it was designed by a San Franciscan who is distinguished for his sensitive and practical solutions for California living. Hill went to considerable pains to isolate the basic differences in climate, terrain, natural growth, and sun conditions that affect designing for the northeast. While in California, trees such as eucalyptus and pine tend toward a regular pattern, with strongly emphasized verticals, and the live oaks, though rather bushy and ground hugging, also form regular patterns; Hill noted that the hardwoods that luxuriate on the Greenwich site make highly irregular shapes, broken by "dancing all over" masses of leaves. The land, too, is various, broken by rock outcroppings and a ravine through which a brook flows.

From these observations, Hill concluded that an appropriate scheme would be a broken, or stepped-back plan, at once echoing and taking best advantage of the site. Happily, this also made capital of the view of the brook and an old stone bridge to the southwest. As a result, all major living areas have windowed corners opening to the living terrace, which both command the favored outlook and welcome the prevailing breeze. Within the house, the stepback scheme provides a remarkable visual continuity, with a glass wall always continuing beyond the wall or pier that defines an adjoining area.

The house is wood framed, with waxed-concrete floors, in which are embedded the radiant-heating coils. Under large glass areas, continuous convector are built into the window sills, so that cold air from the glass surfaces is warmed by the rising hot air.

Hill's work to date has been almost wholly residential, though he readily admits that he would like to have more commissions in the nonresidential category. "My guess," he says, "is that residential work is the backbone and supporting type of construction of 85 percent of San Francisco offices." All in all, he reports, they make a "go of it . . .

"I enjoy tremendously the variety and personal quality of residential work. There are no two jobs alike; each site is different; each budget; each problem; to say nothing of the individuals involved. . . . I have had my own office for some seven years now, and we are doing a little over our 200th job."

Greenwich, Connecticut
The flagstoned terrace (left) is an outdoor extension of all major living areas. Exterior walls are chiefly cedar, while ceilings and roof soffits are resawn pine stained gray-gold. Steel sash are used throughout. At the entry (below) floors, both indoors and out, are flagstone, practical for winter snow, as well as serving, along with interior fireplace breasts and stone piers, to relate indoors and outdoors.

architect | Henry Hill
associate | John W. Kruse
supervising architect | Edward L. Barnes
landscaping, interiors | Henry Hill
genral contractor | Robert Chuchrow
In the superbly detailed kitchen (left), three distinct areas are provided—service area, including washing machine, cooler, and storage units (foreground); food-preparation center; and a sit-up eating counter. Through the door in the background is a glimpse of the dining room (above), which overlooks and opens to the terrace.
The master bedroom (above) is also on the view side of the house; in one corner (left of photo) is a commodious dressing area, while a special alcove is provided for sewing.

Exterior wall of the bathroom near the entry is mainly of glass; the masonry area recalls the rugged site.

Between living room (below) and dining room, a translucent-glass panel forms a partial screen.
As this site, an old orchard in the Rio Grande valley, offered little outward visual interest, the architect focused the three sections of the residence on an interior patio. This inner area provides a picturesque and very useful outdoor living space protected from the intense sun by large roof overhangs, sun screens, and strategic planting. The largest of the three building elements houses living quarters for two adults. Another unit, featuring a spacious room with a large north window, kitchenette, bath, and storage area, serves ordinarily as a studio for the owner’s wife, who is an artist. It also doubles as a self-contained unit for overnight guests. Facing away from the central patio is a maid’s apartment with its own little garden and private entrance from the driveway. A carport containing built-in storage closets along one entire wall forms the third element. The buildings are well related to each other and planned for maximum ease of circulation. The owners are particularly satisfied with the intimate relationship of the terrace to kitchen and living room. This arrangement has proved conducive to leisurely, effortless entertaining of either large or small groups of people. The combination studio-guest room has also been found to be very practical since it has all of the features and convenience of a separate apartment. A reinforced concrete slab supports the post and lintel frame. The roof is woodframed with 1" sheathing, 4-ply built-up roofing, and gravel surfacing. Walls are wood studs faced with plywood, or brick cavity walls of local hand-made sand brick, for the most part running parallel to the prevailing breeze. Carpentry work was kept as simple as possible because of the lack of skilled carpenters in this area.
West elevation (across page) is windowless except for sun-screened kitchen window. Exterior walls are of western red cedar boards and battens, and hand-made sand brick. Carport and studio unit (above) shield central patio (below) from the street to provide a completely private terrace. Large window of studio (shown in photo below) and main living quarters face this pleasant space. Terrace and adjoining rooms are well protected from the intense sun by wide roof overhangs, sun screens, and planting.

Photos: Ulric Mehler
End wall of dining room (above) is a 12" cavity wall, in which both faces are built of hand-made sand brick. Window wall is protected from sun and insects by a grid made of 2" x 12" cedar boards covered with bronze screening. A planting bed between window and screen helps to temper reflected sunrays. A second, more informal dining area, seen at far end of kitchen (left), overlooks the patio. Kitchen is planned around a central island unit containing the range. Flooring in this area is split paving brick.
Ceiling in studio (right) slopes up to large window facing north to patio. Light can be carefully controlled by vertical blinds. A screened passageway (below), forming the background to outdoor seating group, connects bedroom wing at right with kitchen and living area at left. Patio floor is paved with sand brick. Clerestory fins above are for the control of the flattened sunrays during winter mornings and afternoons.
The home of the parents of the landscape architect's wife, this house was planned from inception with the closest co-operation between architects and landscape architect. Informal living and minimum maintenance were guiding considerations throughout. While the owner enjoys a certain amount of gardening, he did not wish this to become a burden. So the areas requiring upkeep were limited and the rest of the site was left in the natural state. His wife likes doing her own cooking, but she didn't want to be shut off from visitors while preparing meals; hence, the kitchen-dining-living room-porch arrangement. All principal living areas open to the south terrace, from which one looks down a slope to a swimming pool. The room and bath at the service end of the house may be used as a study, an extra guest room, or a maid's quarters.

A preference for natural materials is evident inside and out, with natural-finish redwood on the exterior; a fireplace and chimney of native stone; and most interior walls and ceilings of vertical-grained Douglas fir. All floors are concrete, troweled with color and hardener, and copper tubing in the floor slab serves the hot-water, radiant-panel heating system.

Speaking for the architectural firm, Donn Emmons tells us that they find the residential design field "most interesting and reasonably profitable. We like to do houses and do not plan to get out of this field." Actually, the firm is busy with a great variety of different types of buildings and "at present size, we could not operate solely on residential work. But we have had a steady flow of houses going through the office, and this work can be co-ordinated readily with the other jobs."
Immediate surroundings of the house, as at the terrace entrance (right), are either planted or paved; beyond these spaces are lawn or tanbark areas; and beyond these, undisturbed meadows.

Photos acrosspage: Hallerstadt
the private house: Woodside, California

Sliding doors open the living-dining area (left) to a screened eating porch.

A large dressing room, with many closets, is an extension of the owners' bedroom (below, left). Glimpse of swimming pool in the background.

Top to bottom: an exterior light fixture; a living-room wall fixture, designed by Mike Chepoukoff; and a door handle.
A wish for privacy and a desire to take advantage of the southern sun and view were prime factors behind the planning of this home for parents and three children. A further plan determinant was the wish to provide some physical separation between adults' and children's activities.

The entrance drive, carport, and front door are all on the north, away from the view; all main living space is aligned along the two levels of the south front (above). The entrance occurs at an intermediate level, from which a half flight of stairs leads down to the main (adult) living and dining area, kitchen, and utility room; and a half flight up to the bedroom level. Two of the children's bedrooms may be opened together, by means of a folding partition, to become a daytime activity room for the young.

Structural scheming is conventional, combining wood frame and concrete block; exterior wood surfaces are 1" x 6" V-groove redwood boarding; aluminum reflective insulation assists thermal control. Sash are aluminum, both awning and casement types. The house is heated by a gas-fired, cast-iron furnace, that serves a forced hot-water system.

Little & Associates, as does many another young firm, feels that it is none too easy to make expenses on custom-house design, but that doing houses is "a pleasure, human satisfaction, the doorway to the public, and perhaps to other more lucrative, nonresidential, commissions." Little explains that the cost of designing the individual house is justified in his practice whenever he can "bring a family a richer enjoyment of life; move ahead in our own design development by using custom houses as a Design Proving Ground; use this experience toward housing design for many people (the builder house); and produce something that may give aesthetic satisfaction."
the private house: Akron, Ohio
From the entry (above), one looks both up to the bedroom-level gallery and down to the family living room (acrosspage).

A pass-through serving counter occurs between the dining area (below) and the well-equipped kitchen (right). All of these main rooms face south and enjoy the view down a slope to a wooded ravine.
Bethesda, Maryland

architects-engineers | Charles M. Goodman Associates
general contractor | Gordon H. Sears

Garage, service room, and the extension of the garden wall (above) form a delightful entrance court at the western end of the house. A corner of the main roof (acrosspage) shelters the entrance and protects the large, recreation room windows from the western sun.

Photos: Robert C. Lastman
The client, who was also general contractor for this house, required a two-car garage, service and utility rooms, kitchen, dining, and living rooms, two bedrooms, a study, and a recreation room. A simple rectangular structure houses the living quarters, with major rooms facing south onto a terrace. An entrance court is located at the western end of the house. The interior arrangement was greatly influenced by the interests of the owner's wife. An avid plant lover, her desire for interior greenery indicated a planting area as the focal point of the house, with the principal rooms centering around it. To achieve this objective, the architect has introduced a skylighted conservatory in the center of the house, with a planting strip running along the brick wall that forms one side of the room. Folding doors can be pushed aside to create one large open space in this central area. The recreation room, near these main rooms and opening into them, is semiprivate for card games, music, and intermittent guest use. Simple wood framing, in combination with old brick, has been used in the construction of this house. Footings are concrete, foundation walls of 8" cinder blocks. The floor is a 3" concrete slab surfaced for the most part with 9" x 9" oak parquet. Philadelphia Blue-stone was used as flooring for the entrance hall and conservatory; kitchen and recreation room floors are asphalt tile. Conventional stud walls are faced with 1/4" oak plywood or plaster on the inside, and 1" x 4" T & G vertical siding on the exterior. Many of the floor-to-ceiling windows have fixed glass; others are steel casements. A large skylight over the conservatory is of polished wire-glass, fixed in a wood frame with copper clips and caulked. The simple hip roof is framed with 2" x 10" rafters, 16" o.c., topped with 4-ply built-up roofing and bluestone-chip surfacing. The house is heated by hot water circulating through radiant-heating coils in floor and ceiling.
South terrace (above) is shielded from the entrance court by an extension of the recreation room wall into the garden.

View toward entrance hall (right) shows study in foreground right, glassed-in conservatory in foreground left, and living room beyond.
Conservatory, with view into study (across page) brings light, color, and a feeling of spaciousness into the interior of the house. From any part of the living room (above and right) distant view of landscape or near view of interior planting may be enjoyed. Living room and dining room (right) may be combined, or used independently when folding wood doors are closed.
This serene and beautifully landscaped house was built for a family consisting of parents, a son, and a daughter. Sited on a lot 100 ft wide and 375 ft deep, it presents a relatively closed face to the street and a completely open side to the lawn and vistas to the rear.

The plan is organized in three areas—

- the sleeping wing, with the four bedrooms sharing two baths;
- the living space, which, with its garden loggia, forms one inter-flowing living area; and
- a work zone, including kitchen, breakfast nook, and utility spaces.

Living and dining areas are separated by only the low, open fireplace of red brick; and four, 10-ft-wide, sliding glass panels can also open the space to the loggia (see selected detail, page 120).

Framing is of both wood and steel, erected on a concrete slab. Face-brick veneer, white-cedar siding, and plaster are all used for exterior wall surfacing (the designer feels that fewer materials would have produced a more effective result). Flooring consists of 9" x 9" oak blocks, stained and waxed. Sash are aluminum. The forced-air heating system has a gas-fired furnace.

About 70 percent of Ellwood's work (it's a three-man office, established in 1948) has been residential. Other categories include 15 percent apartment buildings and 15 percent commercial structures, remodeling, and miscellaneous. "There is little profit for us in residential design," he comments. In 1953, the total office gross went for ⅓ drafting; ⅓ overhead; and ⅓ profit.

He finds, "as things are today, that one must decide whether to do architecture or make money." Furthermore, he feels that "each new job must be a design improvement over any previous work. Actually, we have enough contracts signed to keep a half a dozen draftsmen busy, and we could sign enough to keep a dozen and a half busy." But he believes that the design standard can be maintained only by keeping the office small. He is researching the possibility of developing certain stock details and standardized members and parts that can reduce the cost of design—and the finished product.
On the garden side, the joining of indoors and out is about as complete as one could devise. Wood-block flooring, and extension of hearth tile come up to the truck of the full-height, aluminum windows; pebbled concrete, within wood screeds, surfaces the loggia floor and extends well beyond as a terrace, finally giving way to the greensward and garden elements. (See SELECTED DETAIL, page 120.)

Alex dePaula
A variety of built-in storage and counter units line two walls of each bedroom (left). The kitchen (below left) has three areas—food preparation (background); dining nook; and service (foreground), including an automatic washing machine. The larger of the two baths (below) contains both a shower and a tub. Exceptional countertop space is provided.
principles of solar house design

by Austin Whiller

Designing a solar house requires close cooperation between the architect, the heating engineer, and the prospective occupant; the house finally decided upon will be the result of numerous compromises by all concerned. The divergent individual tastes and needs of the occupants and the varying extent to which costs become a limiting factor combine to make inappropriate any general reference to a particular house design as being "best."

Houses which are broadly classified as solar houses may vary from those with conventional heating facilities combined with large south-facing windows to those in which the complete heating load is carried entirely by the solar-heating system. This discussion will refer primarily to those houses in which a major portion of the heating requirement, both house heating and domestic hot-water supply, is carried by the solar-heating system.

Although it is only in the past 20 years or so that solar houses have come before the public eye, it has long been recognized that logical house design could improve both comfort and functionality of the resulting enclosure. In this connection, excerpts from Xenophon's Memorabilia (III, viii 8-14) regarding the teachings of Socrates (470-399 B.C.) are pertinent:

"Again his dictum about houses... was a lesson in the art of building houses as they ought to be.

"He approached the problem thus: 'When one means to have the right sort of house, must he contrive to make it as pleasant to live in and as useful as can be?'

"And this being admitted, 'Is it pleasant,' he asked, 'to have it cool in summer and warm in winter?'

"And when they agreed with this also, 'Now in houses with a south aspect, the sun's rays penetrate into the porticoes in winter, but in summer the path of the sun is right over our heads and above the roof, so that there is shade. If, then, this is the best arrangement, we should build the south side loftier to get the winter sun and the north side lower to keep out the cold winds. To put it shortly, the house in which the owner can find a pleasant retreat at all seasons and can store his belongings safely is presumably at once the pleasantest and the most beautiful."

The foregoing is clear evidence that solar heating is not a new field in house design. We are more than 2000 years behind the times!

The mere decision to build a solar house immediately imposes severe architectural limitations in that it is necessary to combine a large south-facing solar-energy collection area, with a living space, that satisfies the functional and comfort requirements for occupancy. The extent of solar heating will have a profound effect on the design; it is a relatively simple matter to design a house which has, say, up to half its annual heating load (house heat plus domestic hot water) supplied from the sun, but the problem rapidly increases in complexity as the fractional solar heating increases toward unit value. In any event, unless an extremely large and expensive storage system is provided, it is virtually impossible to heat a house completely with solar energy, in most localities. At least once during the lifetime of the equipment it is highly probable that inclement weather will occur, of such duration that the energy-storage capacity of the system becomes exhausted, and some make-up heat will be required. Storage of summer heat for winter use has been proved uneconomical; the load factor on that part of a storage system which exceeds one, two, or three days' capacity is too low.

The two primary components of the solar-heating system are the solar collector, which is mounted in an exposed position to intercept the sun's radiation, and the insulated thermal-storage unit in which some or all of the energy collected during the day is stored for use at night or on subsequent cloudy days. Also, because of the high probability of a period of insufficient sunshine during any one heating season, it is desirable if not essential to have some means of auxiliary heating with sufficient capacity to take care of the minimum comfort requirements during the most severe weather. Finally, there is the domestic hot-water supply, which in most cases may be integrated profitably into both the solar and the auxiliary-heating systems.

An important feature of any solar house is the south window. In addition to the many esthetic advantages and good daylighting of large windows, these south windows permit direct heating of the house during the day, heating which may be quite considerable even on cloudy days. Tight-fitting draperies are necessary both to reduce night-time heat loss through the windows, as well as to serve as a radiation barrier to improve comfort at night.

While the use of a heat pump for either primary or secondary heating in conjunction with the solar-heating system (and for summer cooling) offers many interesting possibilities, it is not considered here.

the solar collector

The collector is mounted in an exposed position and oriented to intercept the sun's radiant energy most advantageously (Figure 1). The south-facing roof of the house is one good location. For optimum performance the collector should be tilted toward the equator. The actual angle of tilt will depend upon that time of the year when the most energy is required. For year-round performance when the winter energy requirement is somewhat greater than that during the summer, a tilt of from 10 to 20 degrees greater than latitude would be close to optimum. At latitudes between 40 and 45 degrees, a collector tilted toward the equator at approximately 15 degrees greater than latitude would give about 15 percent more energy during the critical winter months than a south-facing vertical collector or
a 45-degree tilt collector. Furthermore, a south-vertical collector may not collect sufficient energy in summer to heat the domestic water completely.

In localities where the water in the collector may freeze on cold winter nights, the collector must be drained whenever the sun is not shining. To avoid the use of expensive reversing valves, the storage tank must be located below the level of the collector and a pump used to circulate the water through the collector. The control must be such that the pump is switched on only when the collector is hotter by 5°F, or more, than the water in the storage tank. This, in effect, means when the sun is shining. At all other times, the water should drain from the collector through the pump back into the tank, and so eliminate the freezing danger.

The area of solar collector needed for each particular application and location is determined by use of calculating techniques reported elsewhere in the literature.\(^1,2,3,4\) As a rough guide, for domestic-water heating only, the surface area of collector (with one glass cover plate) that is required per person living in the house varies from 10 sq ft in dry, low-rainfall regions to about 25 sq ft in localities such as New England.

The solar collector consists essentially of a flat copper or aluminum plate painted black on the side facing the sun to increase its absorption or solar radiation, and insulated on the reverse side to reduce the backward heat loss. Above and parallel to the blackened plate are mounted one or more air-spaced glass

---

plates about $\frac{3}{4}$" apart. (Glass transmits short-wave solar radiation but is opaque to long-wave reradiation from the collector plate.) The energy absorbed by the blackened plate is transported to the insulated thermal-storage unit by the circulation of either water through tubes soldered to the plate (on $5\frac{1}{2}$" centers if a 0.021" copper plate is used) or air through an air space behind the plate but inside the back insulation (Figure 2).

There are no hard and fast rules for choosing between air and water as the energy-transportation fluid. Water is preferable when it is also used for storage, while air is best when the storage system is of the crushed solid type, such as a gravel bed. However, it should be noted that at the same average fluid temperature, the efficiency of a collector with air removal of energy is generally 15 to 25 percent less than with water removal of energy. For collectors with both one- and two-glass cover plates, the optimum water and air-flow rates are about 6 and 25 lb per hr per sq ft of collector area, respectively. The optimum number of glass cover plates depends on the temperature level of operation above atmospheric, and on the cost of adding each additional glass plate to the collector. As a rough guide, one cover glass is needed when the difference in temperature between the incoming fluid and the outdoor air is less than approximately 60°F; when it is between 60°F and 140°F, approximately, the use of two is optimum.

A word may be pertinent, at this time, regarding the use of concentrating devices, such as reflecting mirrors, for solar collection. The primary function of a concentrating-type solar collector is to attain temperatures higher than are possible with flat-plate collectors. Only when the temperature level of collection is greater than approximately 300°F are concentrating devices competitive with flat-plate collectors in their performance. A flat-plate collector is much simpler and less costly than one of the concentrating type and, in addition, it may be mounted in a fixed position for year-round operation. Since solar collectors operate at temperatures less than 150°F for both domestic-water heating and house heating, the flat-plate type is prescribed.

**the thermal-energy (heat) storage system**

Problems that arise in designing the storage system fall into three categories: the physical location of the system for optimum performance, the choice of storage medium, and the determination of the optimum size of storage needed for the given application.

The storage system should be located in that part of the house which is least expensive to provide, or which cannot be used for any other purpose. The attic and basement immediately come to mind. Location in the attic would require special structural support for the large mass. Also, if a self-draining water system is wanted, the storage must be below the bottom of the collector, and hence the attic is not suitable. Since in addition to the solar-storage system there is a domestic-water tank, a furnace, and oil-storage tank, some pumps, and possibly a fan, heat exchanger, and air-conditioning system—each to be enclosed within the house envelope—there are few situations where at least a partial basement will not be justified. Other suggestions for the physical layout of the storage system are shown (Figures 1 and 3).

Research at MIT has shown that combining the energy-collection and energy-storage functions (such as by placing the containers for the storage material immediately behind the glass of a south vertical collector) in order to eliminate the transportation problem and also to reduce the complexity of the system, is not feasible because the night-time heat loss from the combined system is excessive. Separation of the two functions is necessary to permit insulation of the storage system.

Materials suitable for energy storage are water and crushed solids, which store the energy as sensible heat characterized by a change in temperature, and certain chemicals which undergo a change of phase permitting storage of energy as latent heat (heat of fusion). Reliability and cost form the basis for selection of any particular material. Reliability is an important consideration with phase-change materials because supercooling and stratification, which are not always consistent in their occurrence, may at times markedly influence the performance. Cost should be evaluated on the basis of volume and should include allowance for space occupied in the house, for the cost of the material itself, and for the cost of the necessary containers and fittings. In addition, it is desirable that the energy be stored at the lowest possible temperature because of the strong dependence of collector efficiency on the temperature level of operation.

Of the sensible-heat type materials, water is certainly the best on a volume basis. However, when costs are taken into account, the picture will be influenced by the cost of the materials themselves, as well as by the fact that water requires an expensive retaining tank while the others may be housed in relatively cheap enclosures. Although it is difficult to ascertain accurate figures, water probably is superior to the others on the basis of cost as well as of volume. Of the phase-change or heat-of-fusion type storage materials (such as Glauber's salt, Na$_2$SO$_4 \cdot 10$H$_2$O, and dibasic sodium phosphate, Na$_2$HPO$_4 \cdot 12$H$_2$O) none has yet been found that is reliable, relatively cheap, and sufficiently better than water in its thermal performance to warrant its use in place of water or crushed rock. For example, the above-mentioned salts would be suitable only in mechanically stirred systems (to ensure uniform composition at all times), and provided that supercooling could be prevented. Because of the potential superiority of heat...
of-fusion type materials over sensible-heat materials (primarily because operation of the solar collector is at a lower temperature and hence at a greater efficiency, and to a lesser extent because of the reduction of space needed for the storage system), much research is currently being devoted to understanding the phase-change process more fully and to finding new phase-change materials.

Accordingly, water (or, for a system with air removal of energy from the collector, crushed rock) is recommended as probably the most suitable storage material in solar-heating applications at the present time.

The size of the storage system lies for most purposes within the range of 5 to 50 lb of water (or its equivalent) per sq ft of collector, with about 20 lb being close to the optimum for house heating. A method for accurately determining the optimum size of storage for any given application using day-to-day temperature and solar-radiation data, and taking account of the unit cost of the storage system has been given in the literature.

heating the living space

The primary factor which dictates the choice of the house-heating system is the desire to operate the solar collector at the lowest possible temperature. This low-temperature characteristic of solar heating therefore limits the choice to those systems with large areas for heat transfer—namely, forced-air and panel systems. In the former the large area is provided within the storage unit in a crushed-rock system or in a heat exchanger in a water system, while in the latter it is that of the panel itself.

Panel systems have a high time lag when the source temperature is low, their installation cost is somewhat higher than that of forced-air systems, and condensation seriously restricts their use for summer cooling. Forced-air systems on the other hand have a low time lag, may be used with any kind of storage system, and are ideally suited to summer cooling or even air conditioning. In general, the forced-air system is preferable for most solar house-heating applications.

auxiliary heat supply

The choice of auxiliary-heating system depends not only on the relative prices of different fuels, but also on the expected quantity of heat to be supplied each year. For example, if the quantity of auxiliary heat is small, it may be economical to install an inexpensive, low-efficiency oil burner instead of a more efficient and hence more expensive unit. Only if the amount of auxiliary heat is extremely small will direct electric heating be economical. In this case the low initial cost of the electric heater more than offsets the high unit cost of electricity.

The size of auxiliary heater may be somewhat reduced if used in conjunction with a small storage system separate from the main solar-heat storage. This storage system would not only smooth off the peak-demand rates but would, in addition, prevent frequent switching on and off of the heater during periods of low demand. Also, time lag between the instant that heat is called for and the time when it is delivered would be eliminated—an important factor in low-temperature systems.

The method of introducing the auxiliary heat into the house requires careful attention. Under no circumstances should the auxiliary unit be used to heat the solar-storage system. Rather, the auxiliary heat should be introduced directly into the house using the existing solar-heat distributing system.

the domestic hot water

As opposed to the seasonal nature of the house-heat load, the energy required for the domestic hot-water supply is almost constant year-round. Also, whereas the annual energy usage for house heating is generally two or three times the annual energy required for the hot water, the peak-demand rates for the two are of the same order of magnitude, yet these peak demands seldom occur simultaneously. This suggests the possibility of using a single auxiliary heater for both purposes, thus avoiding duplication of equipment.

summer cooling and air conditioning

The use of summer solar heat for operation of absorption-type refrigerators or for reactivation of adsorption-type dehumidifiers is certainly possible, yet not even remotely competitive with mechanical refrigeration in cost. Other ways of using the system (which is installed primarily for winter heating) in summer are worth consideration. They involve the use of the large solar-storage system for regenerative cooling. Again, two levels of use are possible.

In the first, cold night-time air is used to reduce the temperature of the large storage mass, which then serves as a heat sink for the house during the days that follow. As would be expected, the cooling effect is not very large and in any event it is not reliable. In the second, the large storage system is used regeneratively in conjunction with a small mechanical-refrigeration unit to provide complete summer air conditioning. The merit of this arrangement lies in the fact that a ¼-ton compressor may be used in place of a conventional 3-ton unit to give complete air conditioning; the 3-ton unit would run twenty-four hours a day, cooling the large storage system when no house cooling is needed.

an integrated solar-heating summer-cooling system

A schematic layout for a solar-heated, summer air-conditioned house is shown (Figure 3). The following features should be noted:

1. The large tank is solar heated in

May 1955 125
In winter, the house thermostat energizes the solenoid valve to connect the small (furnace-heated) tank into the house-heating system only if solar heat from the large tank is insufficient to maintain comfort.

winter and mechanically cooled in summer. The small tank is heated by the furnace in winter and is solar heated in summer.

2. In winter both tanks are used for heating; in summer the large tank is used for cooling and the small tank for heating.

3. In winter the domestic water is preheated in the large tank before passing through the small tank for final heating. In summer it is by-passed around the (mechanically cooled) large tank and is heated only in the small, solar-heated tank.

4. The heat exchanger and pump are used for solar heating, auxiliary heating, and summer cooling with complete automatic control.

5. The switch-over from winter to summer and back again each year requires manual switching of only two water valves (in the collector circuit and in the domestic-water circuit); all electrical controls may be made automatic.

economic considerations

Although this article is not intended to discuss the economics of solar-house heating, a word on costs may be pertinent. Solar heating requires an initial investment over and above the usual house cost of between $3 and $5 per sq ft of installed collector surface, including the cost of the insulated storage system and of the controls. The return on this investment is in the form of an annual saving in fuel and of improved comfort in the house. Whether or not a solar-heating system is a sound economical investment thus depends on the value of the annual heat collected, which in turn depends on the climate, the local price of fuel, and upon the value of the comfort realized—a value assessed only by the occupants themselves. Here the question arises as to whether it is really necessary that solar heating should be economical, or whether its many advantages more than outweigh the small extra cost that is inevitable in northern areas of the United States at present-day fuel prices.

acknowledgement

research village: two houses

Coddington-Simms team

Now on view at Barrington, Illinois (near Chicago), are six architect-builder houses comprising the "Research Village Project" which has been sponsored by the United States Gypsum Company. Primary objective of the project was to team up outstanding talent in the architectural and building professions to (1) contribute new design and construction ideas, particularly for the project home builder, (2) create new uses for building materials, and (3) provide more livability, comfort, safety, and value for the homeowner. The sponsor's building materials were offered for study but were to be specified only if they best suited the requirements of the architect's design. The NAHB and an architectural advisory board composed of three members of the Chicago Chapter AIA collaborated with U.S.G. in selecting six architect-builder teams to meet the challenge of these objectives.

Last year, models and plans developed for the "Research Village" made up one of the most talked about exhibits at the 10th Annual Convention and Exposition of the NAHB in Chicago (March 1954 P/A). This year, literally thousands of delegates and visitors to the annual meeting took the better part of a day's time to make the bus trip to Barrington and back in order to inspect the completed model community. What they saw were six houses, very different in plan and structural concept yet presenting a handsome group appearance, built on an uneven, wooded tract of an attractive suburb.

Two of these houses are presented here. The first was designed by Architect Gilbert Coddington, of Brooks & Coddington, Columbus, Ohio; working with teammate builder Alex Simms, Dayton, Ohio; the second was designed by Architect Francis D. Lethbridge, of Keyes, Smith, Satterlee & Lethbridge, Washington, D.C., working with teammate builder Eli Luria, Arlington, Virginia. All homes were constructed by the Maxon Construction Company, Barrington.

Having been given a sloping plot, Coddington wished to take maximum advantage of the terrain by designing a split-level house—a plan that he believes will provide maximum economy in both space and use of materials. The principal part of the house, situated four ft above entrance level, consists of living, dining, kitchen, bath, and bedroom areas. Down
Figure 4—east elevation (left) shows compactness of design; lower level: 826 sq ft; upper level: 943 sq ft.

Figure 5—view from street shows lightweight concrete-block masonry (below). Pattern produced by laying alternate blocks endwise so that tongue of control joint is exposed.
six risers from the entrance are the recreation (adjacent to and level with outside terrace), study, lavatory, and utility rooms. A covered walkway, carport, and enclosed tool-storage area are at entrance level (plans acrosppage).

Lightweight, rigid-steel bents are the principal framing members for the upper level. This welded framing is made up of 10 Jr 9 rafters, 4 I 9.5 mullions, and 12 Jr 11.8 floor joists (Figure 1 and selected detail next page). The bents and floor beams, spaced five ft on center, support a roof-deck and floor construction of metal-edge gypsum planks tack welded in place. This entire framework rests on lightweight concrete-block masonry. Such a combination of steel framing and fireproof gypsum, along with masonry exterior walls, make this house practically incombustible.

This construction method suggested the use of an open-web, steel-stud system for both nonbearing exterior curtain walls and interior partitions (Figures 2 and 3). This system, more commonly specified for Class A buildings, has been employed at Research Village with much success. Although they are reported to cost no more than wood, these steel studs are dimensionally stable, incombustible, easily cut to size, and rapidly erected. Upper-level partitions which possess 40-db sound-transmission ratings are surfaced with metal lath and plaster. Insulating gypsum wallboard and plaster form the inside surfaces of the exterior curtain walls while the exterior finish is stucco applied over self-furring metal lath and fiber-board sheathing (Figure 3).

Viewed from the street (Figure 5), the storage-wall enclosure running the full length of the carport makes a novel use of metal roof decking—as sliding doors. Highly practical for outside service doors, this ribbed decking is framed by 2 x 2 x 1/4 structural-steel angles on all four sides.

Baseboard convectors heat the house.

Figures 6 and 7—outside terrace and recreation room are at same level (left acrosspage and below).

Figures 8 and 9—living room-bedroom partition is topped by sliding-glass panels (below right) and end of kitchen allows control of entrance by mother (right).

HEDRICH-BLICKING

HOUSE, U. S. Gypsum Research Village, Barrington, Ill.
Brooks & Coddington, Architects
While planning their house, one of the Lethbridge-Luria design objectives was to devise a home that would meet the needs of a family with children—a house that would provide a measure of privacy by separating the activities of various members of the family group. Another design objective was to develop an economical plan that could be expanded or reduced in size—keeping all of the rooms in proper proportion to one another. Used as a prototype plan, this scheme would allow the operative builder an opportunity to construct houses of two, three, or four bedrooms using the same basic construction system and utility core. Of the six possible variations, the plan for this house (shown next page) represents one of the larger units.

To help accomplish the foregoing, Lethbridge designed a wood-frame post-and-lintel construction system (Figure 1) with a beam and tongue-and-groove plank roof—a system which permitted the use of both hollow and solid nonbearing dry-wall interior partitions. Posts are rabbedet to receive fixed-glass, metal window units, or solid panels; lintels are continuous for the length of the house. Roof beams are built up of 2 x 10's with 2 x 8 center gussets and 2 x 4 outriggers sandwiched between them. The structural design of the roof was determined in accordance with the Chicago suburban code which requires a design live load of 20 psf and a dead load of 15.

With the exception of the kitchen sink, all plumbing is concentrated in one wall. Open-web steel studs in this nonbearing wall simplify cross connections and accommodate pipes, conduits, ducts, and other services without notching or drilling (Figure 2). Although various surface materials could have been applied to the steel studs, gypsum panels were anchored in place with special locking clips (Figure 3). Over this base layer of gypsum board, 4' x 8' panels of 5/8" thick gypsum wallboard were applied with the aid of adhesives (Figure 6). To complete the hollow-partition system, joints were covered with tape.

The sandwiched roof-beam design permitted easy erection of 1-5/8" mill-laminated gypsum-core units which are also easily cut by sawing (Figures 4 and 5); accurate fitting around service outlets...
further speeds erection time. To these core panels, regular 5/8" gypsum-wallboard panels were applied and held in place by a layer of special adhesive (Figure 6). Joints between these face layers are also finished by taping.

The east elevation clearly illustrates the extensive use of glass (Figure 7). The terrace has a barbecue pit which, indoors, is combined with a living-room fireplace. A low-pitched, built-up roof enhances the spread of this house even though it occupies an area of only 1190 sq ft. One of its most practical features is the covered walk which extends the full length of the carport to the front of the house and to the adult kitchen entrance (Figure 8). It provides an essential element to the design of the house in that it not only affords weather protection from car to doorways, but also it integrates the carport with the house. At the far right is the other kitchen entrance—for youngsters—which allows the mother traffic control.

Warm-air perimeter heating was selected as being most practical considering the design of the home and the possibility of year-round air conditioning.
stainless-steel skin for largest metal-clad building

Designers of the Chrysler Building's spiked helmet, completed in New York in 1928, were the first to make major use of stainless steel for the exterior of a skyscraper. Today, directly across the street, 750,000 lb of the same material are being used for the exterior sheathing of the world's sixth largest office structure—the new Socony-Vacuum Building. Although aluminum has become increasingly evident in tall office-building construction throughout the country, this is the first major use of stainless steel in this type of structure since the designs for the Gateway Center and Lever House projects in the early 1950s. Because of the industry's avowed desire to participate in the trend toward metal-clad buildings and because of the current availability of Type 302 stainless steel (formerly restricted for architectural construction), this material will undoubtedly be used in greater abundance during the coming years.

Type 302 stainless steel, .037" thick and containing from 17 to 19 percent chromium, 8 to 10 percent nickel, 0.2 percent manganese, and small amounts of silicon, phosphorus, and sulphur, will be applied to the Socony-Vacuum framing in the form of pier covers, spandrels, windows, frames, Mullions, and louvers (see details below right). Pier covers and spandrels, embossed with triangular shapes to provide a pattern of light and shadow, were selected after a study of over 100 panel designs. Compared with 48 psf for a 4" brick exterior wall, the weight of this skin is only 2 psf. An unrealistic section in New York City's building code was satisfied by the erection of a 4" cinder-concrete block back-up with applied insulation in lieu of a prefab spandrel system.

The skyscraper's windows, 4'-5" x 6'-3" and of continuous rectangular section, will pivot on a vertical axis to permit cleaning from inside the building. Double vinyl gaskets act as seals against wind and water on the more than 3200 window openings.

Owner: Galbreath Corporation; architects: Harrison & Abramovitz and Peterkin; general contractor: Turner Construction Company. Truscon will handle all stainless-steel fabrication.

The footnote on this page in March 1955 P/A was correct in listing both Building Check List and Streamlined Specifications Standards as Reinhold publications, but should have made it clear that only the first is available at $3.50 a copy. The Standards (Volume 1) sells at $20 a set.

Feller by the name of Marley Cole writes:

"Mr. Progressive Architect: you are playing he double Q with Tennessee quartzite or "Crab Orchard" stone business. We unimaginative and nameless rock busters down here in the quarries, trying to get out the kind of stone you call for, are having a hemorrhage. We are hereby giving you a demand invitation to come down and learn right here at the quarries what you have done to us.

"Listen, Mr. Architect, have a heart. Maybe we have got the wrong impression of you, and we know you must have the wrong impression of us—or maybe I should have said, of our stone. I am going to confess—we all say it with cuss words to ourselves, only I am going to cry it out from the heart, where it's hurting. Maybe we have got the wrong impression to come down and learn right here.

"It was not laid down there in course heights exactly and precisely and ever so neatly 1", 2-1/2", 4" and 4-1/2". No, friend. It runs 7/8", 1-1/15", 1-1/99" and just any old random face height that might fall next. Worse still, though it make you fancy-minded dreamer-uppers say an unspeakable word, this stone runs thick. It runs just any old thickness it wants to—5", 7", 9-11/47”. You name it; it's their in them hills. And the devil was never made could whittle it down to match those fancy lines you've been drawing.

"Most scandalous of all, the thicker the face of the stone the more beautiful. I mean it. The more beautiful. In an 8" height of Tennessee quartzite you get a peep at all the glorious tints and mixtures of crystal-like sandstone, gleaming and shimmering. Now you take your pencil and thin that face-height down. Slice it down to 2". Then you draw it out to some preposterous four or six feet. Make your wall face look like a lot of yardsticks laid on edge. And what have you? That's right. Lines. But, brother, lines is for brick. In a natural stone that comes in natural layers you can't show a decent grain from such a measly squint at its face. Remember the Lord showed Moses a glimpse of the Promised Land. But the Lord wasn't stingy about it. What if he had taken Moses up on some little 40-foot knob and said "Look over"? How much would Moses have seen? No, the Lord took Moses up on a great high mountain. From there he could get a decent view of all the glory and the beauty. It is just the same thing if you want people to appreciate Tennessee quartzite. You have got to let them see it. And to do that you have got to take a progressive outlook on things, sketch a jack under those pencil lines of yours and try them up high enough to allow for some decent face heights to show through!

"Sure, I know what they say. Buildings these days are running to the ranch type. Low and long. You have to draw stone lines that are correspondingly low and long. Stretched out, extenuated, attenuated, and otherwise reaching across the lawn and up in the next block. Otherwise how would the thing called a house correspond to the sleek lines of their Cadillac parked out front? Poo-poo!

"We're not sore at you, but here is what we are up against: we are up against a market that uses mostly sawed-bed stones. You specify most of your work on a sawed-bed basis. For variety's sake you toss in a few million dollars worth of Tennessee stone jobs. Automatically you draw it up in the long, sleek-line job style. When you do that, you kill two stones with one birdie. You not only rob our stone of its chance to really show itself off—in face heights, not in a face-stretching contest—but also you make it more and more impossible for us quarry men to supply the market. Most quartzite comes in heights of 3" and over. When we have to sort out the blade-thin layers and haul the really finer stone out on the sprawls pile, it puts us in the position with our neighbors the farmer. What if somebody told them the only ears of corn they could sell are their red ears? There are only two or three red ears in a bushel. The longer I think of it the madder I get! And I have been thinking of it for years now.

"Friend, come down and see for yourself what you are doing to us. There is a real and present danger that we may have to close up business, if you don't help us out!"

Fifteen beautiful Securit Interior Glass Doors grace a home in Greenville, South Carolina.

**BRIEF DATA**

- **Glass**—¾" thick. Muralex patterned on both surfaces.
- **Tempered**—three to five times stronger than untempered glass of same thickness.
- **Reversible**—can be used right or left hand.
- **Standard Sizes**—
  - 2'6" x 6'8"
  - 2'5" x 6'7½"
  - 2'8" x 6'8"
  - 2'7½" x 6'7½"
  - 3'0" x 6'8"
  - 2'11½" x 6'7½"
  - 3'0" x 7'0"
  - 2'11½" x 6'11½"

- **Closers**—when specified, the door can be shipped with a Sargent closer or prepared for use with an LCN concealed closer.

There's rare beauty in the translucence of this door

The Securit Interior Glass Door decorates rooms on both sides, giving to each some of the light and color of the other.

It's more than a door . . . it's a decorating medium. It is tempered to stand hard usage . . . transmits light without sacrificing privacy . . . never needs refinishing . . . comes complete with distinctive hardware. Its simple installation eliminates cutting, mortising, planing and painting. That saves money.

Call your L-O-F Glass Distributor or Dealer for full information. Look him up in your phone book yellow pages. Or write us.**

The now popular use of the phrase “dining area” instead of “dining room” clearly reflects the architect’s influence on contemporary living. It was Architect Edward Stone who, in the 1930s, first exposed to the public a “dining-kitchen” in an exhibition at the Metropolitan Museum of Art in New York. But though 20 years have turned the phrase into a language cliche, the dining area itself has not become a design cliche, as evidenced by the fresh and varied handling illustrated in this section.

Perhaps no other aspect of residential design demands of the architect such sensitivity to the living needs and social habits of the client. Is the family life one of formality, of “dress-for-dinner” and “coffee-in-the-drawing-room” elegance? Or is the mistress (or master) of the house a gourmet cook, who prefers to prepare the food in person without sacrificing the company of family or guests? Will the dining area serve two or four or ten? Are there servants in the home or is the electric switch the only servant? Such questions as these, when answered, determine the location of the dining area as well its plan and its furnishings.

In the five examples that we show, one dining area is actually a part of the kitchen (Gray Taylor); one is separated not at all from the living room, and by only a dividing storage unit from the kitchen (John Grace); one is separated entirely from the kitchen but flows uninterrupted from the living room (Neutra); one may be set off when desired, by a sliding wood door (Ain); and one is treated as a separate room (Miller). Each is suited to the needs of the residents—through choice of surface materials, furnishings, arrangement. Although they have in common good contemporary design thinking, each solution expresses the diversity that escapes cliche decor.
A dining area related as much to the exterior as to the interior, this room opens into the walled patio shown, and may also be opened toward a distant view seen through the glass loggia, or shut off from the loggia by a 12-foot-wide sliding wall panel of wood. Unbroken areas of glass, interesting planting, the natural textures of redwood wall and cork floor provide a stimulating background for the conventional furniture arrangement.

collaborating architects | Joseph Johnson and Alfred Day
Freedom to visit with guests or oversee children while preparing meals; reduction of maintenance problems to a minimum; and custom-designed convenience of work and storage areas resulted for the architect's wife from the planning of this dining-kitchen area for the architect's own home. Gray-painted cabinets and gray-with-white terrazzo floor warm the scheme, which is further enriched by the natural wood tones of the fir ceiling, the walnut window shades, walnut-and-marble dining table, and brass lighting fixtures.

*Photos: S. C. Valastro*
Dining area that is thoughtfully integrated with the living area, with the outdoors, and with the adjacent service wing. Sliding glass wall allows merging of the dining area with the patio. No visible divider sets off the dining corner from the living area—this is accomplished with a defining carpet and through furniture arrangement. Two walls of the dining area are unified by built-in storage units of birch, one containing a pass-through panel opening into the kitchen. When it is desirable to use the dining area to expand the living area, the architect-designed table may be lowered to coffee-table height, the dining chairs used as occasional chairs. The color scheme of “naturals” and “neutrals” serves as muted background for California sunlight and rich planting. Lighting combines concealed spotlight over dining table and continuous light troughs under roof overhang along full length of living quarters, and also over built-in buffet. Photos: Julius Shulman

Wainscot: '/2" birch plywood/ U.S. Plywood Corporation, 55 W. 44 St., New York, N.Y.

Ceiling: T & G fir, painted.

Carpet: "Deep Pile"/ off-white/ Slaxon Mills, Salem, Ore.
Separated from the living room by a gray sandstone fireplace wall, but visible through wide openings on either side, this dining area was designed to be complete in itself. It maintains the formality of the separate dining room, yet conveys warmth, comfort, and drama through the designer’s deft blending of textures and materials. Two walls are chestnut, honey in color. The glass window wall is hung with ice-blue silk. Walnut table and chairs are rich against the tone-mixture carpet. The brass ceiling fixture adds sparkle, the wall tapestry introduces added pattern interest.

Photo: Martin Linsey
Dining end of the living floor in a hillside house, the structure itself and all interior planning designed to take fullest advantage of the extraordinary setting overlooking Sausalito. “Openness” is the keynote, with the view providing color, texture, and pattern at the windows; maximum built-in storage freeing the interior of distraction; natural surface colors chosen to offset the abundant light. Storage cabinets on left divide kitchen from dining area, extend forward into living area which continues full length of the house. Flush double doors next to sun-deck door conceal a built-in bar.

No Lunch Served

One look and it is obvious that this is a financial institution. Yet the same Formica that has been so effectively used here for all "heavy traffic" surfaces is hard at work in the colorful lunch counter on the corner, the hotel down the street, the hospital, school, and thousands of homes. Formica brings long-lasting beauty with low maintenance to surfaces in nearly any surroundings. In the Formica Sunrise Line, styled by Raymond Loewy, are the high style colors and dignified wood grains to fit any fashion.

Arnold Banfield & Co. Ltd.
Oakville, Ontario.
The wall-facing design and workmanship on Donner Hall in Pittsburgh, Pennsylvania, are in keeping with high architectural standards of Carnegie Institute of Technology and those of Pittsburgh architects Mitchell & Ritchey. • Overly flat spandrel wall panels of aluminum, a new construction technique, and the absence of flashing make this new dormitory for men a prototype for several other metal-faced buildings to be erected elsewhere.

Collaborating with the architects named, Overly design engineers have reached these objectives:

1. A unit type wall with no metal passing through from exterior to interior of the building. This eliminates moisture and frost condensation inside.

2. A self-flashed wall. Special design of flanges on spandrels and mullions provides expansion joints that eliminate the necessity of flashing or caulking compounds.

3. A building facade made up of aluminum spandrel sections that present a completely level and flat finished appearance. By unique jugging and manufacturing methods, the spandrel panel surfaces are entirely free from that "pillow look"—bulges or unevenness. • We offer a design service in metal spandrel construction. And we are now fabricating and erecting various designs of formed spandrel panels in both colored and natural finished aluminum, and in stainless steel. Write us today for details of the Carnegie Tech job.

**Why not add a comprehensive Engineered Color Study to your plans?**

**Today,** nearly everyone who owns or operates an industrial, commercial or service enterprise recognizes the importance of the effect of color environment on people.

- You can often make your plans more acceptable to clients by including a detailed color program. Why not let us submit **engineered** color recommendations to go with your plans? These recommendations are based upon the principles of **COLOR DYNAMICS**, Pittsburgh's modern painting system which has demonstrated its ability to improve productive efficiency, morale and well-being in many fields.

- **We'll be glad** to make such a detailed study without cost or obligation to you. Simply call your nearest Pittsburgh Plate Glass Company branch and arrange to have one of our color experts see you at your convenience. Or mail this coupon.

Additional information on **COLOR DYNAMICS** in Sweet's Architectural File, Section 14/PL.

Extensive use of Coolite, the Heat Absorbing Glare Reducing Glass, enables the Strietman Biscuit Company to brighten this modern plant with copious quantities of natural illumination at low cost, yet keep interiors cooler, more comfortable. For Coolite's amazing ability to absorb up to 50 per cent of solar rays keeps this unnecessary and unwanted heat from work areas, lessens need for mechanical cooling. And Coolite light is comfort-conditioned as well. The glare reduced glass makes seeing easier, cuts harsh glare that causes eye fatigue and visual errors. Employees see better, feel better, work better under Coolite's cooler, better light.

Coolite can help brighten your production picture. If you are planning to expand or modernize facilities, it will pay you to find out how Coolite, Heat Absorbing and Glare Reducing Glass can increase efficiency and economy. Coolite's filtered light boosts employee morale, reduces rejects. Specify Coolite, famous Mississippi Glass.

Translucent light diffusing glass by Mississippi is available in a wide variety of patterns and surface finishes "visioneered" for any daylighting requirement. Sold by leading distributors everywhere.

With the Soss Lev-R-Latch you open a door with but a flick of a finger. There’s no more pesky knob that’s either too tight or too loose, or is forever punching holes in the wall.

MECHANICAL AND DESIGN PATENTS PENDING

SOSS Manufacturing Company
P. O. Box 38, Harper Station
Dept. 12, Detroit 13, Michigan

Soss Lev-R-Latch is a fitting companion to the world-famous Soss Invisible Hinge “The Hinge That Hides Itself.”

The Soss Hinge has no protruding hinge butt. It’s completely hidden from view when doors or lids are closed. Use it wherever you build or remodel.
House Beautiful exhibition room designed by John Hill, based on an idea first projected in 1922 by Frank Lloyd Wright.

National Concrete Masonry Association

Many new concrete masonry wall patterns are shown in the handy reference booklet, "Ideas for Wall Patterns with Concrete Masonry," which was an exceptional merit award winner in the 1954 AIA-Producers' Council Product Literature Competition. Ask your local NCMA member for your copy.

Versatile Concrete Masonry makes news with LINE • TEXTURE • COLOR

Nearly a million people saw this room at the Los Angeles County Fair, and thousands more acclaimed it at the recent Phoenix Home Show. Many of them couldn't tell you just why they liked it. But they did realize that it was beautiful, inviting, and distinctive. Yet it was built with one of the most economical, widely available, and practical of all building materials—concrete masonry.

The interesting textures, planes, lines and color of the block wall and fireplace are the principal interest in this room... adding richness and a third-dimensional sculptured quality. Yet the interesting wall patterns were created with square 8"x8" concrete block, tilted to become diamonds. This diamond, and the half-diamond, or "V," became the design motif for the entire room... echoed and re-echoed in the offset-block wall pattern, the fireplace, the furnishings, even the floor plan... proving again that you can do more with versatile concrete masonry!
Editors' Note: Items starred are particularly noteworthy, due to immediate and widespread interest in their contents, to the announcement of a new, important product, or to some other factor which makes them especially valuable.

air and temperature control

1-23. Anaconda Copper-Tube Panel Grids (C-6), 26-p. booklet containing information on preformed copper tubing for radiant-panel heating. Gives suggestions for designing radiant-heating systems in floor or ceiling; provides technical data on heat output, heat-loss factors, panel circuits, and piping requirements. Also includes material on applications of radiant heat for snow melting. Photos and layout drawings. The American Brass Co., Waterbury 28, Conn.

1-24. Heatilator Fireplace, AIA 14-5 (146), 6-p. brochure illustrating prefabricated fireplace unit, scientifically designed to insure smoke-free performance. Explains operation of unit, which circulates warm air to all corners of room and even to adjacent rooms; describes damper which seals flue tightly when fireplace is not in use. Photos show contemporary and traditional installations; specifications; information on accessories. Heatilator Inc., Syracuse 5, N. Y.

1-25. Weather Compensating Control Systems, 150-p. manual containing pamphlets and supplementary data sheets on controls for hot-water and steam heating systems. Covers basic principles of operation of each system, giving detailed material on electrical accessories and installation. Also describes fanned-tube and baseboard radiation. Photos; layout diagrams; tables. Sarcotherm Controls, Inc., Empire State Bldg., New York 1, N. Y.

1-26. What You Should Know About Modern Steam Heating, 29-p. booklet suggesting when and how to specify steam heat. Outlines physical properties of steam and control of steam heat; lists instances where steam may be used to best advantage as well as its limitations. Gives specifications checklist. Steam Heating Equipment Manufacturers Assn., 450 E. Ohio St., Chicago 11, Ill.

1-27. Uskon Radiant Heat (S-55), 8-p. bulletin describing electrically heated radiant-ceiling panels. Shows construction of panel utilizing conductive rubber—instead of wires—to give even heat over entire panel; explains installation of 1/16" thick panel with adhesives. Provides technical data on computation of required panel area. Photos; tables; specifications. U. S. Rubber Co., 1239 Ave. of Americas, New York 26, N. Y.

1-28. "Perмуheat" Baseboard Convector, AIA 30-C-1 (4554), 12-p. publication on baseboard convectors designed for use with hot-water heating systems. Gives information for design of system, including typical layouts, capacity data, roughing-in dimensions, and architectural specifications. Photos, drawings, tables. Young Radiator Co., Racine, Wis.

construction

2-34. What to Look for in a Good Translucent Building Panel, 4-p. folder prepared to aid architects in choice of translucent panels. Discusses standards involved in weight-thickness measurement, glass content, strength, light transmission, surface finish, pitch, depth, and weather resistance. Drawing. Corrulux Div., Libbey-Owens-Ford Glass Co., P. O. Box 20026, Houston 25, Tex.

2-35. Specifications for Metal Lathing and Furring, AIA 20-B-1, 20-p. guide for specification of many types of metal-lath construction. Includes information on solid or hollow partitions and fire protection of structure. Two changes from previous specifications are noted, involving reduction in spans of suspended-ceiling supports and decrease in height of partitions to insure rigidly. Diagrams of constructions. Metal Lath Manufacturers Assn., Engineers Bldg., Cleveland 14, Ohio.

2-37. Typical Designs of Timber Structures (3rd Ed.), 125-p. reference manual for architects and engineers presenting designs representative of sound wood construction. Features roof-truss designs of most common structural usage, which may be used directly or modified to suit individual requirements. Includes detailed data sheets on pitched, flat, and bowed-string trusses; contains information on timber connectors and anchors. Timber Engineering Co., 1319 18 St., N. W., Washington 6, D. C.

2-38. Wcbrib Concrete-Reinforcing Bars, 76-p. design manual explaining use of deformed-steel reinforcing bars. Gives results of tests performed and outlines advantages of deformed bars. Design data section provides all necessary information for design, including sample problems for beams, slabs, columns, and spread footings. Drawings; charts; specifications. Wcbrib Steel Corp., 120 Broadway, New York, N. Y. ($2.50)†

(Continued on page 159)
Perlite-concrete design

Building designers will find very useful this new manual on perlite concrete for roof decks, in which, for the first time is taken an authoritative and sound engineering approach to a subject of growing importance. The book contains numerous tables and diagrams of roof construction that simplify design. A looseleaf binder enables supplementary information to be added later, when available.

Perlite aggregate, formed by “popping” a siliceous volcanic rock at 1,500 F, weighs less than one-tenth as much as sand or gravel. It can be used alone as a non-structural insulation fill or mixed with portland cement and water to form a lightweight structural concrete of high insulative value. The book presents data for both types of application.

Design tables in the manual enable a designer to pick out the thickness of roof deck required for various mixes to obtain a desired overall insulation value. The compressive strength of the slab also is given, thus enabling the designer to check the thickness for load-carrying capacity.

The tables give coefficients of heat transfer (U-values) for slabs on permanent forms of various types, on metal lath and on paper-backed wire mesh. The effect of ceilings is taken into account. Accompanying drawings show details of the various types of construction.

Also included in the manual are typical specifications and recommendations for mixing, handling and testing perlite concrete, technical data for subpurlins and a discussion of commonly encountered problems, with suggestions for avoiding or correcting them.

"Engineering News-Record" 6/29/54

This Solid Engineering Information Can Save You Hours on Every Job. Don’t Delay—Write Today for Information on How to Get Your Copy of the Permalite Roof Deck Manual!
doors and windows

3-25. Andersen Tracing-Detail File, AIA 16-L, file folder containing 52 pages of detail sheets and six pamphlets on wood window units. Detail sheets cover specification data, stock sizes, and typical sections of casement, gliding, double-hung, or vent-type windows. Pamphlets give general information and photos of actual installations. Also includes booklet explaining how to eliminate condensation. Andersen Corp., Bayport, Minn.

3-26. Kramer Control Hardware, AIA 27-C-1 (BC-1), 8-p. publication on burglar-proof hardware for wood sash. Lists features of wood sash with automatic-locking hardware; describes operation of locking device with transoms, projected sash, or casement windows. Photos; diagrams; table of recommended hardware for various window sizes. The Brookman Co., Inc., 2833 Third St., San Francisco 7, Calif.

3-28. Panelfold Doors, AIA 16-M, 8-p. pamphlet showing wood accordion-fold doors. Explains operation of doors, providing details of typical head and jamb sections. Contains reproductions of standard colors and wood finishes available; includes specifications, dimensions of doors, and data on stacking space. Panelfold Doors, 4951 E. 10 Court, Hialeah, Fla.

3-29. Plyco Plastic Window Frame, 12-p. brochure illustrating plastic window frames which may be used with wood or metal sash. Features weatherstripped vent unit, fabricated with 3/16" glass panes, requiring no sash frame. Provides drawings, details, dimensions, and specifications. The Plyco Corp., Elkhart Lake, Wis.

3-30. Soss Precision Hinges (59), 36-p. notebook containing information on line of quality hinges, manufactured in wrought steel, wrought bronze, or brass. Describes different kinds of hinges and gives data on selection of proper hinge for type of door and jamb specified. Specification charts, dimensions, and drawings; material on screen-door spring hinges. Henry Soss & Co., 5716 W. 96 St., Los Angeles 45, Calif.

3-31. Soss Precision Hinges (50), 36-p. notebook containing information on line of quality hinges, manufactured in wrought steel, wrought bronze, or brass. Describes different kinds of hinges and gives data on selection of proper hinge for type of door and jamb specified. Specification charts, dimensions, and drawings; material on screen-door spring hinges. Henry Soss & Co., 5716 W. 96 St., Los Angeles 45, Calif.

New! OVERLAID* Fir Plywood SIDING GIVES YOU ALL THREE!

1. SUPERIOR PAINT BASE
2. DESIGN ADAPTABILITY
3. EXTRA DURABILITY

THE SURFACE MAKES THE DIFFERENCE!

New panels overlaid with a medium-density fused-resin fiber face—smooth, tough, durable, uniform, providing excellent "tooth" for longer-lasting paint finishes.

surfaceing materials

9-8.  Modern Ideas for an Older Home, 24-p. pamphlet illustrating how an older home can be rearranged to provide more flexible space for contemporary living. Takes sample house, showing by plan, photos, and sketches its inherent possibilities. Analyzes inadequacies in existing layout and suggests methods of solving them. Lists furniture and floor coverings used. Floor Div., Armstrong Cork Co., Lancaster, Pa.

9-9.  Gold Seal Floors and Walls (551), 148-p. catalog of patterns available in line of surfaceing materials—resilient-tile flooring, corkboard, linoleum for floors, walls, or counter tops. Provides information on adhesive used with each material; gives brief recommendations for selection of surfacing for various floor conditions. Color photos of patterns; installation specifications; instructions for estimating quantities of tile flooring. Congoleum-Nairn Inc., 195 Belgrove Dr., Kearny, N. J.

9-11.  Ideas Unlimited, 16-p. pamphlet of suggestions for use of clay tile in homes. Color photos and sketches show ideas for using tile in living areas and exteriors, in addition to customary application in kitchens or baths. Also pictured are tile floors and counter tops on built-in cabinets. The Tile Council of America, 114 E. 40 St., New York 16, N. Y.

interior furnishings

11-3.  Space-Saving Ideas, 8-p. booklet of suggestions for enclosing fold-away beds. Drawings show use in living areas and expansion attic; photos show operation of bed; dimensioned diagrams. Murphy Bed and Kitchen Co., Inc., 19 W. 44 St., New York 36, N. Y.
"UNPROTECTED" STEEL DECK

Withstands Raging Fire For 1 Hour-49 Minutes

IN HISTORY-MAKING FIRE TEST!

Monolithic Insulation Sustains Galvanized Metal Deck In Grueling Test

You know that unprotected rolled structural steel has a fire resistance of 15-20 minutes at temperatures of 1000°F-1300°F. Above is the Zonolite reinforced deck that survived 1800°F. temperatures seven times longer!

Take a good look at the New Look in Roof Construction!
The recently conducted Underwriters' Laboratories fire test in Chicago puts the spotlight on a new, revolutionary kind of "unprotected" low-cost steel deck which is 7 times safer.

Metal Deck with 3" of Reinforced Zonolite Vermiculite Concrete on Top:
1. Withstood fire and heat transfer for 1 hour and 49 minutes, while roof deck deflection remained well within design limits.
2. Withstood hose stream test following the fire.
3. Withstood ACI 24-hour double-loading test.

MAIL COUPON TODAY!
Investigate this remarkable roof system that combines insulation, maximum fire safety, and low cost. Send now for complete data on this new roof test, plus full information on Zonolite "Systems of Lightweight Construction."

Mail coupon today to:
Zonolite Company, Dept. PA-55
135 S. LaSalle St.
Chicago 3, Illinois

Please send me details of recent fire test, plus new booklet "Systems of Lightweight Construction."

BASIC BULLDOG SWITCH UNIT IS PROVED BY HUNDREDS OF INSTALLATIONS. Switch and fuse units are available in capacities of 30 to 1200 amperes. I-T-E Circuit Breakers available in capacities up to 4000 amperes. All meters, instruments and current transformers are of finest quality. All equipment listed by UL.

BULLDOG DF-50 SWITCHBOARDS GIVE YOU

Time-tested Dependability

plus modern beauty!

CUSTOM-TAILORED TO YOUR JOB AT A STANDARD PRICE!

How can we offer a custom-designed switchboard at a regular price? The answer is BullDog ingenuity! Standard circuit breakers or fusible units in a standard enclosure with the most modern of finishes are individually tailored to fit your requirements.

BullDog field engineers will consult with you as to the type, combination and arrangement of units needed for your specific application. Then you will receive a factory-built, custom-engineered switchboard that's designed for maximum protection and styled for the most modern factory or commercial building. Standardized, performance-proved components assure uniformly high quality and utmost dependability. Engineered to meet today's demands, BullDog DF-50 switchboards are so advanced they will stay modern for years.

Consult with your nearest BullDog field engineer for assistance in selecting all your electrical distribution needs. Or, write: BullDog Electric Products Company, Detroit 32, Michigan.

162 Progressive Architecture
With the use of "Duroface Foamglas," a cellular-glass insulating material combining both insulation and ceramic finish in a single unit, a completely insulated and surface-finished wall can be erected in one operation. Impact tests on the dense surface of the block show that it has about twice the impact resistance of cement-plaster finish. Face dimensions are 12" x 18" and either 3" or 4" thicknesses are available. (Above photo is of sample block and not a standard unit.) Pittsburgh Corning Corp., One Gateway Center, Pittsburgh 22, Pa.

Reflective Kimsul "18" Sheathing Blanket is being stapled to plywood sheathing (below) which will then be applied to the exterior side of wall studs. Precut sheets, 49" x 8' 3", are packaged in compressed form; builders report that labor cost of applying new blanket is negligible. Kimberly-Clark Corp., Neenah, Wis.

Thermal insulation on pipe and ducts can be protected by new-type, prefab Krene plastic cover. Cover is wrapped around insulated pipe and closed by pulling slide fastener which locks preformed edges. End joints are wrapped tightly with Krene tape. Will cover pipes from 1/2" to 32" in diameter and in lengths up to 100". Miracle Adhesives Corp., 214 E. 53 St., New York 22, N. Y.

Translucent, Bakelite, rigid-vinyl sheet formed in a diamond-shaped corrugation and printed with basic colors (left) is used in conjunction with fluorescent lamps to bring out the natural color and texture of foods, textiles, clothing, furnishings, cosmetics, decorative materials, etc. Reducing glare while maintaining natural color, these Quantalite shields permit any desired quantity of illumination without irritating occupants' eyes. Produced in shapes and sizes to fit all standard fixtures and luminous ceilings. Quantalite Inc., 101 Park Ave., New York 17, N. Y.
REVOLVING DOORS
reduce redecorating costs

Uncontrolled entrance of dust-laden outside air is reduced to an absolute minimum with "always open, always closed" revolving doors—over 97% less per in-or-out passage as compared to conventional swing doors.

OVER 600 COMPARATIVE TESTS . . .

conducted in as many different entrances, best show how revolving doors assure big savings on cleaning and redecorating costs. In all buildings but those with revolving door entrances . . . whether a one-story taxpayer or a multi-story skyscraper . . . the influx of outside air was always at least 40 times greater.

This means dust, dirt, and grime accumulate quicker—over 40 times faster by conservative estimate—swept in with drafts through swing doors. And that means money out of pocket, for more frequent painting and redecorating . . . for more counter-spoiled merchandise in retail establishments. Overhead goes down fast when revolving doors go into service!

There are many more ways revolving doors pay their cost many times over. Mail coupon for details.

HOW REVOLVING DOORS

Wethertron Heat Pumps: new line of packaged, air-source, heat pump features improved performance, lower cost, and more compact size than earlier models. Using only air and electricity for fuel, unit extracts heat from outdoors in winter, and in summer automatically reverses procedure to pump warm air from home to outdoors. Model 44C will heat or cool 6- to 8-room house; model 66C will condition 7- to 9-room home. Units measure 29" x 48" x 74". Weathertron Dept., General Electric Co., Bloomfield, N. J.

Area and Crackage Calculator: vinyl-plastic device operates similarly to slide rule, but gives readings in tabular form. Of use to architects and engineers in figuring heat losses, calculator may be employed to find areas of floors, walls, ceilings, and windows, along with lineal ft of crack. Paul S. Morton Engineering Service, 609 Bangor Rd., Lawrence, Mich.

Remote "Marvair" Air Conditioner: unit meeting need for low-cost, quiet, powerful performance also satisfies detailed requirements of FHA and VA. Conditioner may be used with any forced-air furnace and can even be connected to perimeter-heating system, providing summer air conditioning through existing perimeter ductwork. Condenser may be located as far as 60' from rest of system to utilize space in garage, attic, or basement. Three-ton unit will cool home up to 2000 sq ft in area. Marvair Div., Muncie Gear Works, Inc., Muncie, Ind.

Combination Air-Conditioning Units: new series of air conditioners for year-round temperature control are now available in 24 sizes. Suitable for new construction or existing buildings, units may be had in 2- or 3-ton capacity, air or water cooled, to be fired by gas or oil. All elements of system are housed in one cabinet of heavy-gage steel construction; outputs range from 8,500 to 130,000 Btu. Shana Mfg., Inc., 188 W. Randolph St., Chicago 1, Ill.

Percolash Air-Conditioning System: centralized heating and cooling system, operating on forced water, features individual room controls. Recessed units, measuring 17¾" x 14" x 4¾", circulate and filter air in each room at desired speed. System may be installed in any size or type of building. Percolash Ru Div., Wenteck-Alexander, Inc., Madison, N. J.

Dor-Win Frame Seal: metal casing eliminates need for heavy wood casing and trim around window or door frames. Frame seal has wide flange for nailing to studs and groove to anchor rock lath; perforated strip provides rigid ground for plaster. Fabricated of steel, electrocoated with zinc; available in standard precut lengths. Dor-Win Manufacturing Co., Chicago 15, Ill.
BURN COAL—
Save Fuel, Save Time, Save Money!

Combustioneer's Modulation automatically feeds coal and air to the fire at variable rates to meet load requirements, starting slowly, accelerating, tapering off, or stopping as the load demand changes. This levels off peaks and valleys in feeding, prevents over-firing and waste of coal!

Combustioneer Modulation can be obtained at savings up to $500 per stoker over other makes.

Furthermore, Combustioneer's agitating transmission and automatic respirator assure maximum combustion efficiency and smoke-free stacks. Heat output is always balanced with load demand.

Combustioneer Hopper and Bin-Feed Models range in capacity from 9 to 1000 lbs. per hour. They are precision made, rugged, giving long life in hard service.

Write today for Heating Manual giving complete data and specifications.
Because of its wider angle of illumination, a complete ceiling of Gotham's recessed downlites* need fewer units than any other recessed Alzak-reflector-type downlite.

*units 801, 811, 821, 831

Win Frame Seal Co., 710 W. Rocksld Rd., Cleveland 9, Ohio.

Kwik-Fit Door Frame: steel door frame is designed for installation over drywall construction. Frame allows greater economy in time and materials since only four nails are needed and there are no rough edges to be finished off. Manufactured of zinc-coated steel, benderized for good paint adhesion; available for use with 2" x 4" stud partitions and 1½" drywall, for all sizes of 1½" doors. Kewanee Mfg. Co., Kewanee, Ill.

"Filon" Plastic Panel: improvement in translucent building panels is addition of Nylon strands to glass-fiber reinforcing. Combination of fibers gives more rigidity and substantially greater strength. Produced in 20 colors, crinkled or smooth finish, 6- or 8-oz weight. Plexolite Corp., 270 Park Ave., New York 17, N. Y.

Metaset A201 Putty: compound formulated of epoxy plastic and aluminum hardens to metallic density at room temperature. Putty may be used on wood or metal surfaces for calking and patching; after hardening it may be machined, tapped, or drilled. Since no evaporative solvents are used, there is almost no shrinkage nor cracking; putty is unaffected by water, acids, or alkalies. Smooth-On Mfg. Co., Jersey City, N. J.

doors and windows
Multi-Purpose Window: versatile units may be installed as awning windows, hopper vents, or casements, in any desired combination. Windows come completely factory assembled with all sash hardware attached; when furnished as vents, inside self-storing screens are included. Two of these units satisfy FHA requirements for 10' x 12' room; window measures 44" wide x 28" high. Rolscreen Co., Pella, Iowa.

Slide-O-Ramic Aluminum Window: horizontal-sliding window units are especially suitable for housing projects and apartments. Glazed with plastic, in 2- or 3-light models, movable sash rides on stainless-steel spring-loading tracks. Units are designed for easy installation with continuous head jamb and sill fin; aluminum snap-on trim is optional. Fabricated for use with separate screens and storm sash or in triple-track style to accommodate sliding screens and storm sash. Wisco Aluminum Corp., 3945 "A" St., Detroit 16, Mich.

electrical equipment, lighting
Paralzector Louver: developed for use with recessed troffers, new louver's high "visual comfort index" is achieved by parabolic design and precision-rolled cross baffles. Aluminum baffles, providing 35° crosswise and 25° lengthwise lamp shielding, are designed for low brightness and excellent diffusion. Edwin F. Guth Co., 2615 Washington Blvd., St. Louis, Mo. (Continued on page 168)
ALL STANDARD SIZES OF REVERE SHEET, STRIP AND ROLL COPPER now come marked with gauge and temper

Effective with current production each sheet or strip of Revere Copper will be marked as to gauge and temper. All coils of Revere Copper will be marked on the outer copper wrap. Sample marking (actual size) is shown above. These markings also apply to LEADTEX, Revere's Lead-Coated Copper. The ink used for marking is water-soluble so that it is readily removed by a damp cloth or by water alone.

Now, you can be sure, at a glance, what gauge and temper copper you are getting, when you specify Revere. Also included is the Revere Seal (shown above) which identifies the manufacturing source of the copper as American. This seal and the line, "A QUALITY PRODUCT BY REVERE U.S.A." also appears on all shipping cases.

So in order to make sure that you get the gauge and temper of copper you specify, make certain the sheet, strip and roll copper you order, or use, bears the Revere stamp.
men and machines move safely over LOW-COST • LONG-LASTING A.W. SUPER-DIAMOND Rolled Steel Floor Plate

Where safety and economy are "musts"—no other floor plate can match SUPER-DIAMOND's rolled steel ruggedness and easy maintenance for so low a cost.

At every step 40 steel diamonds guard constantly against skids and slips. This non-directional pattern floor plate fabricates easily ... can be installed overnight ... gives years of dependable safety under the heaviest industrial loads.

Mail coupon for full details on this low-cost, long-lasting rolled steel floor plate.

SUPER-DIAMOND ROLLED STEEL FLOOR PLATE

insulation (thermal, acoustical)

Poly-Cell Insulation: resinous-liquid insulation, sprayed on like paint, immediately foams to 20 times original thickness. Material will adhere to almost any type of surface and simplifies insulation of irregular shapes. Building costs may be cut substantially by using spray-type vapor barrier directly on insulation. May be applied at temperatures ranging from minus 40 F to 225 F; K-factor—0.24, weight—2 lb per cu ft. Insul-Mastic Corp. of America, 1141 Oliver Bldg., Pittsburgh 22, Pa.

Fiberglas Industrial-Building Insulation: hardboard faced with glass-fiber mat provides thermal and acoustical insulation for roofs or walls. Designed for use with cement-asbestos board or metal sheets, insulation board is strong enough to span purlins without deflection. Available in 24" widths, lengths up to 96", 1" to 2 1/2" thick; K-value —0.25, noise-reduction coefficient —.75 for 1" board. Owens-Corning Fiberglas Corp., Toledo 1, Ohio.

Hot'N Cold Water Cooler: designed to eliminate time losses due to coffee breaks, new water cooler also serves water at proper temperature for making tea or instant coffee. Heating element and hot-water storage tank are fully insulated from chilled-water section. Unit measuring 43 1/2" high x 15 1/4" wide x 15 1/4" deep serves 45 to 55 cups per hr at 160 F and 120 cups per hr of drinking water at 50 F. Kelvinator Water Coolers, Columbus 13, Ohio.

ALGRIP Abrasive Rolled Steel Floor Plate—Plates—Sheets—Strip (Alloy and Special Grades)
It's so easy to build with **VIBRAPAC BLOCK**

**MODULAR SIZES make everything FIT!**

You avoid cutting and fitting, in many details of construction, when you build with VIBRAPAC Block. Their modular dimensioning coordinates with other modular building elements. Door and window openings, for instance, come out right for standard framing. No wasted time fitting door and window frames into openings. By eliminating block cutting and fitting, building costs are materially reduced.

Almost unlimited opportunities for creative architecture and structural versatility are provided by VIBRAPAC Block. Building code requirements are easily met . . . ruggedness with substantial structural loads . . . fire-safety . . . high insulation values. Write to us for name and address of nearest plant producing VIBRAPAC Block of highest quality.

PROMOTERS OF HIGH QUALITY CONCRETE MASONRY FOR MORE THAN A HALF CENTURY
a new major advancement...

Nesbitt SERIES HOT WATER

Nesbitt Syncretizers and Wind-o-line may now be combined in a forced hot water heating and ventilating system in which the Wind-o-line tubing becomes the supply and return main to the Syncretizer in a series of classrooms—thus saving on construction, equipment, and installation costs.

In this series system the water temperature at all times is related to the outdoor temperature, thus improving the individual room temperature control provided by the Syncretizer, and the protection against cold surfaces furnished by the Wind-o-line.

Telephone, wire, or write today for more information:
school mechanical system costs reduced
classroom comfort and protection increased

WIND·O·LINE SYSTEM

If you are interested in school construction costs, it will pay you to study how this latest Nesbitt development meets today’s needs and gives more for the school-building dollar.

In forced hot water applications Nesbitt Syncretizer heating and ventilating units with Wind-o-line radiation may be installed in series-loop circuits, in which the copper tubing of the Wind-o-line system serves as the only required supply and return piping for multiple-classroom groupings or entire wings.

COSTS REDUCED Savings in equipment: Smaller pipes and pumps are required because the Nesbitt System is designed to provide the needed heating capacity with water quantities of from one half to one third those required in conventional systems. Saves on both first cost and operating cost.

Savings in construction: Wind-o-line supplies Syncretizers, eliminating costly pipe trenches, mains, runouts and pipe covering in much of the building. Other piping is simplified.

Savings in installation: Mains and piping are smaller, shorter, simpler. Packaged piping within the Nesbitt Syncretizer unit ventilator reduces installation labor at the site. See above.

COMFORT INCREASED Variable water temperature control: Relating the available heat directly to outdoor temperatures improves the control of individual room temperature by the Syncretizer.

Improved cold surface protection: Because the system water temperature increases as outside temperature falls, Wind-o-line protection against cold window downdraft and bodily heat loss is continuously related to actual needs.

Off-time temperature maintenance: Without additional investment in equipment, the Nesbitt System maintains safe basic building temperatures during overnight, holiday, week-end shutdowns.

Packaged piping reduces installation cost.
(a) Crossover return tubing, expansion loop, and air vent fitting come pre-assembled and connected to the heating element.
(b) Crossover supply tubing, expansion loop, and balancing valve are furnished installed, leaving a minimum of piping at the site.

at no extra cost to you:
Nesbitt schoolroom equipment upgraded

new hardtop sunboard
Durable laminated plastic, resists cracking, chipping, and abrasion. Easy to clean. Available in five decorative colors.

new attractive colors
Nesbitt Syncretizers, Storage Cabinets, Wind-o-line, and Sill-line Radiation are now available in six harmonious colors.

new shallow wall box
A new Nesbitt air intake (2¾" deep) is suitable for either prefab panel or masonry walls. Its vertical louvers provide better elimination of air-borne water than wall boxes of conventional design. Shown below.

Made and sold by John J. Nesbitt, Inc., Philadelphia 36, Pa. — Sold also by American Blower Corporation
A noncombustible two-inch Tectum roof deck, the exposed underside painted to specifications, shelters shoppers as they purchase high value at low cost in this million dollar co-op shopping center. Customers will enjoy year round shopping comfort at less cost because of Tectum's high insulating properties. At least 70% of all harsh noises will be absorbed. For years ahead, the rest of Tectum’s nine values will contribute to safety, strength, and minimum upkeep. With an ultimate live load of 200 lbs. p.s.f., and greater stability than most building materials, Tectum weighs approximately 2 lbs. per board foot, is easily workable with hand tools, has a self-decorative texture, and is termite and fungus proof.

K.C.'s First Big

COFAR®, ROOF DECK & CORRUFORM®
Help K.C. Win 96-Day Race to Rebuild Baseball Stadium by Opening Day

Placing of Corruform precedes concrete placement in partly finished upper deck. Nearly 70,000 sq. ft. of time-saving Corruform sheets were welded to risers to form second-deck floors for the enlarged stadium.

JOB: Start Jan. 6, 1955, and rush rebuild a 17,000-seat single-deck stadium to a 34,000-seat double-deck stadium meeting American League standards by Opening Day, April 12, 1955—a period of 96 days.

SOLUTION: CORRUFORM to form floors between risers... and on back walls of press boxes; ROOF DECK over office, concourse, press boxes, back-seat row in upper deck; COFAR on ramps and office and concourse floors.
League Win!

RESULT: “We had to guarantee the American League a stadium that meets Big League specifications and have it ready to play baseball April 12. Thanks to Cofar and Corruform, we will meet the deadline and stay within our budget as well.”

J. L. Neville, Project Engineer

“We couldn’t have done it without Cofar, Roof Deck and Corruform. They’re perfect from every angle—speed of construction, strong working platform, economy. I’ve never seen construction go faster.”

Arthur Row, General Superintendent

“Each hour was important on this job. We couldn’t have done it without Cofar, Roof Deck and Corruform. They’re perfect from every angle—speed of construction, strong working platform, economy. I’ve never seen construction go faster.”

Fred Kuentz, Project Manager

Cofar for Concourse Floors. Webb-Winn-Senter speeded the casting of concrete floors by using Cofar which acts as a deck for workmen, a form for wet concrete, and as reinforcing when the slab sets.

Corruform between Risers. The 100,000 psi steel made both concrete base and working platform, kept laying crews well ahead of concreting. Hot-dip galvanized Corruform was vinyl primed for painting.

Gronco Steel Roof Deck formed concourse roof and decorative curtain wall behind upper-deck rear seats. Wide sheets meant fewer laps, greater roof strength and safety, time saved in placing and welding.

Cofar is extra-strong, cold-reduced, hot-dip galvanized steel. It makes a tight form for wet concrete, provides full positive reinforcing. Welded transverse wires give full temperature reinforcing plus mechanical anchorage between concrete and steel.

Corruform forms tight, solid base for wet concrete, gives a definite concrete saving at no sacrifice to slab design. Corruform remains in place, eliminates the nearly impossible job of stripping. Mesh laid over high-tensile steel sheets reinforces slabs.

Gronco Roof Deck is rotary-press formed steel with baked-on, rust-resistant alkyd finish. Each sheet is shaped for maximum strength and perfect nesting, covers 25 to 35 sq. ft. for fast placement, has 28 1/4” width to reduce laps to a minimum.

(Continued from page 172)

report to outline such characteristics. Presently and from time to time the re-evaluation of this list may be a worthwhile and definitive task of the AIA Committee on Education. Such statements can be of great value to Boards of Examiners in stimulating and guiding their interpretation of professional standards as these are established through the content of state examinations. They should suggest to the schools the core of the subject matter to be incorporated into the curriculum.

Despite the need felt by the schools that they must anticipate the professional thinking and practice of 10 to 20 years hence (and with this point of view of the educators I am in sympathy), they must recognize the insistent presence of those fundamentals of practice, the elements constituting competence, which characterize architectural practice over relatively long periods. These must penetrate and form the great body of content for curriculum and examinations alike.

What are these "elements which constitute professional competence"?

To many this question is academic, but to the members of State Examining Boards it is a very real problem. While the practicing architect or student of architecture may, from intellectual curiosity or for pleasure, examine the many ramifications of such a question, the Board member, consciously or subconsciously must answer it in detail. Without formally phrasing an answer he incorporates his analysis of professional attributes into the examination he prepares. As he writes or approves examination questions his response is often automatic, but automatic or carefully studied, what is of real import is that his board membership gives legal sanction to that response.

Very soon after the NCARB was organized it became evident that one task which such a national body could accomplish was to formulate a statement of the qualifications, abilities, techniques, knowledge, etc., peculiar to architecture. This was accomplished in the 1930s and has been known since as Examination Syllabus. No. 3. It has served as a guide over the years in establishing the content of the licensing examinations. In addition, it set forth in brief outline the qualifications which should be possessed by a candidate to admit him to examination, as well as a standardized grading procedure that has done much to unify examination procedure among the states.

The years leading to 1950, filled with re-evaluation in design, revolution in architectural education, and a highly stimulated confusion among the profession generally, have evolved the necessity of restating the content of Syllabus No. 3. The determination to rewrite this document was made, in the annual convention of 1950, an event concurrent with the appointment of the AIA Commission for the Survey Education and Registration. Its final preparation and publication as Syllabus 3-53 was delayed, however, in order to take advantage of the findings of the Survey Commission. Its formal adoption, which is based upon approval indi-

Fenestra* Electrifloor† has been chosen for these new office buildings, state and federal buildings, airport terminals, plant office buildings and for other major buildings all across the country.

Why Electrifloor?

First, you can install electrical, telephone or intercommunication outlets in any or every square foot of floor space . . . any time. Desks and partitions can be moved, office layout changed, or new electrical equipment installed without the trouble and expense of tearing up walls and floors for new wiring.

Second, you actually save money on construction costs, because Electrifloor is a cellular structural subfloor and electrical raceway system all in one. Its unique design combines such light weight with such great strength that structural steel and foundation costs are reduced.

Third, your building goes up faster. The clean, dry Electrifloor panels go in quickly, and, as soon as a few panels are laid and interlocked on each floor, they immediately form a flat, smooth working platform and material storage space for the contractor.

Investigate Electrifloor for your next building. To utilize all of its advantages, you should design the building around it. Get complete details, now, before you start your plans. Fenestra's nationwide sales organization will co-operate with and assist you. Write Detroit Steel Products Co., Dept. PA-5, 3409 Griffin St., Detroit 11, Michigan.

---

**Exclusive Features of ELECTRIFLOOR**

1. Big, four-inch handholes in the header ducts for easiest possible access to wire-carrying cells.
2. Capacity of cells is 2½-3 times greater than most other cellular floors, protecting against dangerous crowding of wires.
3. Flat, smooth surface saves concrete fill and provides utmost economy in preparation of finished flooring.
4. Because of the flat plate construction any depth Fenestra panel can be designed as a lateral diaphragm for resistance to wind, bomb shock and seismic loads.
5. Designed for greater strength with lighter dead weight, giving you unusual structural design economy.
Novafold
SOLID CORE PLASTIC DOORS
—space- and money-saving doors and room dividers

By saving the space a swinging door wastes, you increase the useable area of any room! The Novafold Solid Core Plastic Door provides this attractive sales feature—at a price 25 to 50% less than comparable Vinyl-covered doors.

Novafold folds to 16% of its expanded width in a flush-with-the-wall 4 3/8" stack. 4" leaves, in individual, full-length pockets in the Vinyl Plastic cover, give you a solid core door—room-to-room privacy—true accordion folding.

Smooth, silent operation is assured by self-lubricating Nylon slides. An exclusive Novafold feature is the linkage chain that gives even pleating when the unit is drawn.

Novafold is available in six colors—a wide range of sizes—affording unlimited application possibilities.

In Novafold, you have a top-quality product that is guaranteed for one year by the manufacturer against defects. This unit folds into the smallest space possible, thus increasing the useable floor and wall space.

Novafold affords the latest design features—in a wide range of size and color combinations—at a price 25 to 50% less than for doors of comparable quality.

Novafold is installed in 4 to 7 minutes. In new construction—no furring, trim or roughing is needed. There are no floor guides. With special track, Novafold is available for curved openings.

Colors: Beige, Dark Green, Chartreuse, Eggshell, Gray and Red.

May we send you color samples and specification data suggesting many applications of Novafold in the home? Please address your inquiry to Department E-8.

out of school

(Continued from page 178)

individually by the state boards, is not yet fully complete, but the acceptance has been so general that the National Council announced its replacement of the earlier document at the Boston Convention of 1954 and is urging its use by all states.

In brief, the document has been streamlined in form; the subject matter of the examinations has been regrouped; the statements of examination content have been extensively revised and re-evaluated; and the system of grading has been modified.

To understand fully the nature of the streamlining one will need to study the publication. It is hoped by the Council that its form will make the content more easily read and understood, and the intent more accurately conveyed.

The regrouping of examination subject matter provides now the following examination units:

Examination A—Academic and Practical Training
Value: 100 Points.

Examination B—Personal Audience
Value: 100 Points.

Examination C—History and Theory of Architecture
Value: 100 Points. Time: 3 hours.

Examination D—Site Planning
Value: 100 Points. Time: 5 hours.

Examination E—Architectural Design
Value: 200 Points. Time: 12 hours.

Examination F—Building Construction
Value: 100 Points. Time: 3 hours.

Examination G—Structural Design
Value: 100 Points. Time: 5 hours.

Examination H—Professional Administration
Value: 100 Points. Time: 3 hours.

Examination I—Building Equipment
Value: 100 Points. Time: 5 hours.

The examinations are not arranged into division groupings as they were previously. Each examination must be successfully passed with a grade of 75 points.

The content of the various divisions is direct and pointed.

The task now confronting the Registration Boards is to determine the effect
FOR CONCRETE FLOORS... GREATER HARDNESS, TOO!
WITH TRUSCON ART-ROC AGGREGATE

BUILT-IN COLOR! Yes, built right into the concrete, forming an integral part of it, giving you a beautifully colored floor . . . rather than plain, drab concrete. Both colors, Tile Red and Spanish Green, have depth and brilliance. Each Art-Roc color offers its own pleasing effect—Tile Red radiates warmth—Spanish Green provides a soothing, cooling motif.

BUILT-IN HARDNESS! Concrete floors protected with Art-Roc are actually twice as hard as iron, can last up to twice as long as ordinary concrete. Art-Roc floors resist many cleaners, alkalis and rust . . . as well as physical abuse.

BUILT-IN PLEASURE! Color pleases. Color sells. Color makes everyone react favorably . . . provides tremendous contrast to lackluster, plain, neutral surfaces.

AND SINCE ART-ROC is so low in cost—and so easy to apply—it's a real pleasure to use, as well as to behold!

300 PARK AVENUE, NEW YORK. Arch: Emery Roth & Sons. Contr: Uris Brothers.
Lupton Curtain-Wall, Type H. Width module, 4'-5". Structural opaque colored glass from floor to sill with clear glass above. Ventilators open out. New York building code requires a masonry back-up wall to sill height.

Welding anchor clips to the building frame, at locations established by a Lupton Engineer.

**New Lupton Simplified Curtain-Wall System**

Lupton-Engineered . . .
Lupton-Made . . . Lupton-Installed

Exterior view of building frame showing anchor clips in position. Clips provide for horizontal and vertical alignment of the curtain-wall units.
Here’s the curtain-wall you design — Lupton Manufactures — Lupton Installs

This new exterior wall system offers new flexibility of design, aesthetic appeal and decided economies.

The Lupton Curtain-Wall System uses prefabricated units and aluminum mullions, designed for varying conditions and wind loads. Completely adaptable to single-story and multi-story buildings.

The Lupton Curtain-Wall System has been engineered to overcome inherent problems in curtain-wall construction — condensation — expansion and contraction — corrosion — warping and buckling.

Through standardized factory operations the Lupton System of construction offers custom-designed units at reduced costs. The design elements and construction features incorporate Lupton’s more than 40 years experience in the production of metal windows. Now, you can specify type of fenestration, choice of wall unit materials, texture and color — and get what you specify. Your problems are simplified because Lupton Curtain-Walls are manufactured, shipped and installed by one responsible organization.

A COMPLETE SYSTEM

Lupton installation includes everything — anchor clips adjustable to assure accurate alignment — all aluminum framework — custom-built units with or without ventilating sections — thorough, complete inspection and checking every step of the way.

INSTALLATION ECONOMIES

All-season installation from within the building — maximum prefabrication, less to do on the site — simplified on-the-job storage at needed floor levels ... no ground storage. All aluminum units handle easily, go into place quickly.

For Geriatrics... Underfoot

An architect practices geriatrics when he prescribes Terrazzo. The building will indeed reach an advanced age before Terrazzo shows signs of wear! Young as a new idea, old as the building it graces, Terrazzo paves the way to aseptic cleanliness in hospitals. Wanted in surgery, wanted for the long halls, wanted wherever a smooth, unbroken surface is required, Terrazzo delivers an easy-to-clean floor that thrives on use. Installed for permanence, punishment and performance, Terrazzo provides floors, wainscots, stairs of inviting appearance and minimum upkeep. If you're building or remodeling, investigate Terrazzo. See our catalog in Sweet's. Use coupon for free AIA Kit.

of the restated principles upon current examination practice and concurrently with such review to examine critically contemporary examination procedures in the attempt to produce fairer and more accurate tests of ability. In doing this a great many more detailed questions and determinations relative to the architects' qualifications must be faced and successfully established. Nationally this project has been placed in the hands of a Committee on Examinations headed by J. Woolson Brooks of Des Moines, Iowa. Some of the material which it will be obliged to consider might be anticipated to advantage here.

Examinations A and B include the collection of basic information concerning the candidate and provide for his personal appearance before the Board.

For several years the examination on History of Architecture (Examination C), has been subject to criticism. This has been true within the Council as well as in the profession generally. The committee responsible for the formulation of the revised syllabus was very conscious of this criticism but in the end felt that there was justification for the inclusion of such a section. This was particularly true with the emphasis being shifted from rote historical fact to that of historical analysis. The subject matter is outlined in the syllabus thus:

"History and Theory of Architecture.

The development of architecture; the effect of geography, climate, and material resources; the factors of site and orientation; the influence of science and technology. The varying response to the needs and desires of the changing social pattern; the evolution of design, methods of construction, structural systems, and building equipment; the influence of tradition and law. Typical historical examples."

You will note the pointing of the above material suggests an approach quite different from the formal history examination in the History of Architecture. There remains the question of whether the above is really essential in establishing the competence of a candidate to practice architecture. The majority of the Council membership at present feel that it is.

(Continued on page 190)
NOW the luxury of clay wall tile becomes practical for even the low-budget home!

the new and modern clay tile adhesive by 3M cuts installation costs up to 20%!

Now architects can have their way in specifying durable, practical, beautiful clay tile for even low-budget installations... because CTA-11 is here! Now builders can use "dry wall," and get a clay tile job that will last a lifetime... because CTA-11 is here! Now tile contractors can set tile faster at up to 20% savings in cost, remodel without rebuilding walls... because CTA-11 is here!

CTA-11 is the new, the modern clay tile adhesive that holds clay tile fast to almost any plumb surface. It's tough, resilient, durable...resists cracks, moisture and settling...spreads neatly like butter right out of the can!

Say CTA-11 on your specification sheets. Say CTA-11 to your supply dealer. It's on his shelves right now...ready to start cutting costs for you.

To profit from the same dollar-saving advantages in setting floor tile, specify CTA-12. For the complete details on CTA-11 and -12, write today to 3M, Department 155, 417 Piquette Avenue, Detroit 2, Michigan.
The architects of Gimbel's new Milwaukee store had several problems to solve: (1) They wanted an open, spacious interior appearance. Yet, (2) they wanted individual departments to be easily distinguished — with clean partitions that could do double-duty as panels for signs and decorations, and as storage-area enclosures. (3) They wanted to screen off the massive, overhead air-conditioning and heating systems. (4) They wanted the store to be well-lit without conspicuous light sources. And finally, (5) they wanted it to be fire-safe.

They found the answer to all these design problems in the exceptional versatility of Milcor Metal Lath and accessories. Milcor Catalog No. 202 illustrates and describes the complete line of Milcor Metal Lath and accessories. Copies are available upon request.

**Metal Lath for Strength — Plaster for Beauty**
211,500 square feet of Milcor Celluflor are being erected in Baltimore's new Commercial Credit Building.

IT'S MILCOR CELLUFLOR FOR NEW COMMERCIAL CREDIT BUILDING
Baltimore's Newest — Designed by Harrison and Abramowitz and Constructed by Consolidated Engineering Company,— will have the Last Word in Electrified Sub-Floors

Milcor Celluflor, latest cellular floor development, is truly the "Floor of the Future". It meets the changing, growing need for electrical flexibility to provide for electronic office equipment and business machines. Its closely spaced raceways permit the installation of communications or power outlets at virtually any point on the floor. Furthermore, these outlets can be relocated — or new ones added — without expensive alterations.

Only Milcor Celluflor offers all these features:
- Structural strength of close cell spacing — eight steel webs every 24 inches.
- Potential electrical outlet every 6" of exposed floor.
- Unexcelled protection of Inland Ti-Co† galvanizing.
- Safe working floor for all trades during construction.
- Lower over-all building cost — wood forms, staging and shoring eliminated — faster construction — earlier occupancy.

Milcor Celluflor (with Walker electrification) has (1) closely spaced cells protected by Ti-Co galvanizing; (2) large header duct that carries wiring from distribution point to panel cell; (3) user-access units that are inset to accommodate floor covering; (4) outlet fittings for telephone and power.

We'll be happy to send further information at your request.
OQUALITY CUSTOM HOMES AND COMMERCIAL BUILDINGS!

Can be Glazed with Double Strength, Crystal, Plate, Architectural Obscure Glass, as well as Sealed Glass Units.

1. Hollow-type aluminum extrusions for maximum strength... 635-T5 alloy, minimum thickness .062".
2. Space for sliding sash to be lifted upward and into room for easy washing.
3. Hi-pile water and wear-resistant weatherstripping provides draft-free comfort—allows window to operate smoothly, quietly—eliminates rattling and whistling during windstorms.
4. Prime glass set with aluminum stops—no putty to fall out.
5. Storm window has an aluminum frame removable into room for cleaning.
6. Full half-inch air space between panes of glass for highly efficient insulation—(U factor .58).
7. 16 mesh non-rusting aluminum screen in rewirable extruded aluminum frame—will not stain. Removable from inside.
8. Storm sash is an integral built-in feature having same appearance as sealed glass units.
9. Specially designed weatherstripping seals track on which sliding sash rolls.

*Storm and prime glass readily replaceable from inside in event of breakage.

STORM SASH combines efficiency and beauty and adds greater insulation—(U factor .58). Special sizes and types are available in sizes up to 10' wide by 6' high. They are sturdy aluminum extrusions and are available in sizes up to 10' wide by 6' high. They begin where the economy project window leaves off.

50 STANDARD SIZES

MUNTIN BAR WINDOWS are available for all sizes except 2' high series.

ROLLS OPEN HORIZONTALLY—Effortless operation on grease-packed, dust-proof ball bearing rollers. No sash balances, springs, cranks or projecting hinges.

FLUSH EXTERIOR—MODERN STYLING—Clean, smooth balanced sightlines and flush exterior enhance all architectural styling motifs.
nation as a vital element in proof of competence does not relieve one of the necessity of raising certain questions which result from its inclusion. It is patently an adaptation of the "sketch problem" technique of the schools. It does, however, have a parallel in practice in the occasional client who for real and necessary purposes must set a "deadline."

If we assume the technique of the "sketch problem" to be an acceptable means of demonstrating competence, the matter of design judgment and the resulting grading, which determines the candidate's success or failure, must be faced.

Notable divergence of opinion concerning design grading occasionally is heard. Some members of Registration Boards who had their schooling prior to the 1920s were trained to recognize as basic the design philosophy attaching to the Beaux Arts tradition. They find contemporary design instruction and performance with its apparent lack of authoritative principles quite unsatisfactory.

What is a sound basis for the judgment of the Design Problem? Are board members correct in looking for "balance," "rhythm," "pleasant mass relationships," "proportion," "scale," etc., and permitting their sense of these values in a project to be influential in establishing a grade?

Is the following schedule, used recently by one state, sufficiently broad and inquisitive?

<table>

What are the values by which a candidate's competence in design may be measured—and in particular that competence which will justify granting the privilege of professional practice?

Is there justification for insisting that a candidate be able to design competently in the manner of the accepted historic
They cut exposed beam ceiling costs 19¢ per sq. ft. Edward Pitt, A.I.A., Arlington, Va. (left) and builder Arthur Pomponio were quick to recognize the growing appeal of exposed beam ceiling construction. How Insulite's new 3-in-1 product—roof deck, roof insulation and finished ceiling—helped them capitalize on this trend by offering exposed beam ceiling at far less cost, is shown in pictures at right.

Build better and save with

Send for complete information now! Actual on-the-job pictures and construction details show how to use new Insulite Roof Deck to build better for less. Write Insulite, Minneapolis 2, Minnesota.
exposed beam ceiling
2500 sq. ft. job

1. It's roof deck . . . Two by eight foot unit cuts application time as much as 45%. Only one material to handle. New Insulite Roof Deck eliminates need for separate roof boards, insulation, lath and plaster and ceiling finishing. Roof Deck can save 12 man-hours per 1,000 sq. ft. of surface compared with 2'x6' D&M roof sheathing.

2. It's insulation with vapor barrier . . . No need for other insulation. Two-inch Roof Deck is comparable to 2" wood deck plus 1" fiberboard insulation and meets heat loss requirements for roof and ceiling construction. Absorbs sound better than wood or plaster. Exclusive vapor barrier protects against condensation within the unit.

3. And finished ceiling . . . The underside of Insulite Roof Deck is finished with a white flame-resistant surface at the factory. Lay Roof Deck over pre-finished beams and ceiling is done. No need to plaster, paint, stain or wax. Reduces labor and material costs. Available in 2'x28' units, 11/2", 2" or 3" thick with or without exclusive vapor barrier.
New Quality Line. Here are smart, new fittings for the bath, lavatory and kitchen... in center-set and spread styles. They’re designed to complement the modern lines of American-Standard plumbing fixtures, and will give long, dependable service. All Quality Line fittings are finished in gleaming Chromaid for permanent beauty and easy cleaning.

New Monogram Fittings. These luxurious fittings have a rich satin chrome finish, and can be personalized with the owner’s initials. Distinctive Monogram fittings are available with clear or colored non-slip handles to blend with the bathroom color scheme.

New Bathroom Fixture. The Dentaleedge is a useful and sanitary addition to the modern bath... it helps relieve bathroom “rush-hour traffic”! This 14” x 14” dental lavatory features a flushing rim with a back-flow preventer. Styled to harmonize with other American-Standard fixtures, it is made of genuine vitreous china.

New G-6 and G-4. They’re new American-Standard gas-fired boilers that can be used with either hot water or steam systems. These boilers are compact and streamlined... drafthood and manifold are completely enclosed in a steel jacket. Service is simple because big, easy-to-remove access doors let maintenance men do their job quickly and thoroughly. These efficient boilers have A.C.A. approval. The G-6 boiler can be used singly or in battery to handle any commercial or industrial heating job. This compact boiler has a solid, one-piece cast iron base for reduced installation costs. The G-4 boiler can be used in large homes and small industrial and commercial buildings. Designed for quick, easy assembly.

forms, e.g., Greek, Gothic, Renaissance, American Colonial, etc.? Should design problems be graded solely on the grounds of plan logic, structural practicability, and conformity to the recognized principles of safety?

Are the schools in their current unwillingness to codify design principles and the consequent dependence upon personal opinion and taste providing a training that has in it the elements of esthetic soundness?

Regardless of the voiced responses to the above questions, each board must formulate its own definitive answers each time it faces the perennial crop of Examination E presentations.

Examination F—Building Construction embodying the content of the old examination E—Materials and of Examination H—Supervision is described in the syllabus as follows:

"The use of materials and methods of construction. The selection of appropriate materials and knowledge of how they are combined for use under given conditions, considering their practicality and durability, also the factors of safety, economy, and architectural expression. Supervision of construction, detection and correction of defects; sequence of construction operations."

It is evident that the above anticipates the inclusion of knowledge of construction processes and methods beyond the content of the two earlier examinations. This may permit a board to supplement the examination on Structural Design, and it is reported that it is so done in some states.

We have state and federal laws to protect the citizen against fraudulent advertising, inaccurate weights and measures, contamination of food, and even to protect businessmen against each other in the fair trade protective legislation. Can we not logically expect public support in an attempt to protect citizens against financial loss resulting from bad judgment in the selection and purchase of building materials and methods?

Should not this area, including much of the practical knowledge of the construction process and its proper supervision, be one for which the candidate re-

(Continued on page 193)
With home buyers demanding plenty of handy storage space, every day more and more architects and builders are specifying Glide-All Sliding Doors. Why?

For these simple reasons: Glide-All Doors make it possible to have floor-to-ceiling, wall-to-wall expansive wardrobes, huge closets tucked in corners of small rooms, full-length, full-height hallway storage space, large entrance-way guest closets in confined quarters, and in many other waste-space areas. Glide-All Doors save construction time and dollars, too...they're installed quickly, adjusted easily to fit the opening, decorated with the wall, and they give a life-time of trouble-free performance.

With Glide-All Sliding Doors in your plans you're sure to meet the popular demand for ample storage space...and save time and money. They are available in standard 8' and 6'8" heights, flush or recessed panel models, overhead or bottom roller types...and in special sizes for unusual jobs.

Write for complete details, specifications and prices.

Glide-All Doors are produced in 6 modern plants across the Nation...available from distributors throughout United States and Canada.

For complete information write plant nearest you.

CORNING PATTERN No. 70
Lightweight . . . Low-Brightness Lens Panel

You use Corning Pattern No. 70 to deliver maximum light in the useful zone with low brightness in the glare zone.

A pattern of hexagonal prisms on one surface controls the light. These prisms bend light rays downward creating more useful illumination. Light in the near horizontal angles is reduced so that surface brightness of the panel is low at normal viewing angles.

Result is a distribution of emitted light in a pattern of even illumination on the working surface.

Lightweight—just 1.75 pounds to the square foot. You can get panels up to 100 inches long—for one-piece fixtures that eliminate dust- and light-leaking seams. Water-white crystal, dimensionally stable glass. Won't warp, fade, discolor, or show age. Has no dust-attracting static charge. Cleans easily.

Recommended for luminous elements, troffers and fixtures in schools, banks, offices—wherever you want low brightness.

For free information about this interesting and useful lighting-ware, please use the coupon.

new backgrounds for business
in Suntile ceramics

Suntile Satinized Ceramics offer you a fresh, practical design medium for business interiors. The smaller sizes* and pleasing colors of porcelain and natural clay tile permit you to produce an almost endless variety of patterns and textures. Delivered mounted on large sheets of back-up material, Suntile Satinized Ceramics are quickly installed. They will stand up equally well in walls or floors—indoors or out. Use them wherever you need a finish that is both handsome and easily maintained.

SPECIAL DESIGN SERVICE

Our staff of trained ceramic artists, headed by Harry J. Macke, is always prepared to assist you with tile design or layout problems—at no obligation. Write us for full information on this service. Address Dept. PA-55.

(Continued from page 198)

ceives his training primarily in the three years as an “Architect-in-Training”?

That the material outlined in this examination is logical subject matter for examination appears to be generally accepted, but the manner of its application differs somewhat with the individual boards.

Examination G — Structural Design reads as follows:

“The knowledge of various structural systems; when, how, and why each would be used; the determination of safe and efficient sizes of structural elements and arrangements of combinations of such elements as slabs, beams, girders, trusses, columns, walls, foundations, and footings, designed in various materials by either graphical or mathematical analysis.”

Those familiar with the old NCARB syllabus will immediately observe the omission of the “Truss Design” as a separate examination. Statics is included as a part of the larger division.

Some members of the NCARB have expressed the opinion that the revised publication allocates insufficient time to Structural Design. Attention is called, however, to the possibility of examining some aspects of Structural Design under Building Construction.

Widely varied opinions are found nationally on the extent to which the architect should be capable of determining, computing, and detailing the structural design of the buildings for which he assumes responsibility.

Should an architect be capable of designing in detail all structural systems currently in use, including the more complicated forms such as the rigid-frame, long-span members requiring the use of moment distribution calculation, the more intricate requirements created by horizontal forces of wind and earthquakes, etc? Should he be examined in detail on his competence to so design?

Should an architect have a basic understanding of the forms listed above sufficient to do such design in an emergency and to criticize intelligently and check design produced by others or to set up with confidence the designs of buildings which must use the above listed structural forms? (Knowing member sizes,
The key to safe comfortable showers in the fabulous Beverly Hilton 
Thermostatically controlled shower baths

Why Famous Guests in The Beverly Hilton Hotel will enjoy the best, worry-free showers they ever had:

- Shower temperature always remains constant wherever bather wants it regardless of pressure or temperature changes in water supply lines.
- There is no danger of accidents caused by slipping and falling while trying to dodge an unexpected shot of hot or cold water.
- Failure of cold water supply instantly and completely shuts off the shower.
- No danger of scalding caused by "dead ends" in water supply lines. Powers thermostatic safety limit prevents delivery above 115°F.

Consult Powers on Shower Planning.

For engineering data on thermostatic control for all types of baths call your nearest Powers office or write us direct.
- Service available, if required, in chief cities in U.S.A., Canada and Mexico.

Powers Control Saves Water

No time or water is wasted by bather having to get out from under shower due to fluctuating temperature. Water conservation alone helps pay back its cost.

THE POWERS REGULATOR COMPANY
SKOKIE, ILLINOIS | Offices in chief cities in U.S.A., Canada and Mexico

Over 60 years of Automatic Temperature and Humidity Control.
The selection of a roof drain, at first appearing to be a simple matter... may become a difficult, complex and time-consuming problem because of the particular roof conditions or requirements.

- Will a water insulated roof be required for air conditioning or cooling condenser water?
- Will the roof be sloped?
- Will the drains require adjustment to meet changes in thickness of roofing materials?
- Will the roof be used for traffic or open-deck auto parking?
- Will the roof drains be required to take care of excessive rainfall or cloudburst?

On many jobs it becomes a question of just how much time you can spend to determine the right drain for the purpose?

To facilitate the selection of the proper roof drain for a specific purpose, Josam offers the check list below. This shows the great variety of features available only in JOSAM drains and illustrates those features on the next page.

After you have determined the features you need, your selection from the JOSAM line of hundreds of different types of roof drains and accessories, will give you a specially designed drain to meet your type of installation.

Or... a much quicker method of selecting roof drains is to ask the JOSAM representative in your territory. From his years of experience and his personal knowledge of the Josam line, he can quickly recommend the correct features for your needs, because JOSAM makes a roof drain for every need!

This service is yours for the asking. It costs you nothing, so why take less than the best when the best costs no more? Call JOSAM for all your plumbing drainage needs... and you'll get your job done right... to your satisfaction!

MULTI-PURPOSE WINDOWS

Pella®

MULTI-PURPOSE WINDOWS
Go the limit on window arrangements...
yet stay within the limit of cost

You can create an infinite number of arrangements with PELLA MULTI-PURPOSE WINDOWS. Use these units as casements, hopper vents or awning windows. Employ them in ribbons or stacked. Utilize many possible combinations of ventilating and fixed units. The wide range of stock sizes, all compatibly proportioned, allow arrangements unlimited! Yet for all this versatility, PELLA MULTI-PURPOSE WINDOWS are truly low in cost.

PELLA MULTI-PURPOSE WINDOWS combine into interesting, practical arrangements for homes, schools and commercial buildings. They come completely factory-assembled, with all sash hardware attached. And the frame is flat on all sides for quick, easy installation.

Clients appreciate PELLA’S work-saving features too. In fact, with no other window can you give a client so much at so low a cost. Investigate today. See the PELLA catalog in Sweet’s Architectural File. Or mail coupon for free literature.

It's Easy to Specify the Exact Drain for the Job!

(Continued from page 205)

necessary bracing provisions, and such other detail as may influence general building design?) Should he be so examined on a reasonable working knowledge of these forms?

Should an architect's competence be limited to simple members in steel, wood and concrete, including simple footings, columns, beams, and light loaded trusses up to 60' or 75' span, and the parallel knowledge of riveted and welded joints, etc.? Should the examination confine itself to problems involving these simple structural members?

Should the architect's competence in structural design be purely perfunctory, and the design eliminated from registration examination?

Many of the members of the National Council are of the opinion that in the schools and the examinations too little stress is laid upon structural design competence. Their reasoning generally follows this process:

Structure is increasingly determinative in the establishment of contemporary form. Such structure is the outgrowth to a great degree of the application of new materials and processes. Then, how can contemporary design in any sense be alienated from structure? And, how can the designer be really free to establish form unless he is thoroughly acquainted with the detailed structural design process? Does not the establishment of form without consideration for structural design integrity lead to irresponsibility on the one hand, or to the forcing of structure to a predetermined appearance, which is basically the criticism leveled at the design prevalent at the turn of the century and immediately thereafter.

It is recognized that many architectural offices do their structural design as a separate engineering department or in a consultant's office, but is the fact that practice is so conducted proper justification for relieving the architectural candidate of the necessity for proving his competence in structural design or the schools of their responsibility to teach structures?

"THINNESS CONTROL"

provides Strip Quality in SHEET Sizes

Remarkable uniformity of gauge in MicroRold Stainless Sheets up to 36" wide.

The "Thinness Control" used in manufacture of light gauge MicroRold Stainless Sheets assures you of the same dimensional accuracy as in strip stainless. Specified gauge thicknesses may be rolled in sheet sizes with tolerances as low as 3% average (plus or minus) as compared to the A.I.S.I. allowable of plus or minus 10%. This results not only in weight savings but also in fabricating economies.

Regular use of MicroRold Sheet can give you more stainless area per ton or the equivalent area with lesser weight.

MicroRold Stainless Steel Sheets are available up to 36" wide and in gauges from .005 in commercial grades, finishes and temper.

Washington Steel Corporation
Washington, Pennsylvania

See for yourself why you don't replace seats in Dunham Traps

A glance at this photograph quickly tells the entire story. Dunham's flat valve disc closes flush against the trap seat. Since Dunham's flat disc does not fit into the seat... isn't tapered or conical... there's less chance for erosion, wear or wire-drawing.

Dunham Radiator Traps always assure easy passage of air, water and foreign matter. No clogging. Extra-large, non-clogging seat opening is unrestricted by any guide. There are no bellows to stick, no field adjustments to make.

Steam Specialties are our specialty... and have been since we perfected the first commercially successful thermostatic trap over 50 years ago. Next time you need anything at all in the steam specialties line, do as so many have done for so long—Depend on Dunham for all your needs.

Refrigerators Are Flexible

Whatever the Application
We Have a Refrigerator to Fit!

It makes no difference what size, shape, or application you specify, KOCH can provide the refrigerator you need . . . usually from the standard KOCH line. Numerous variations are available on standard refrigerators, including the exclusive "Koch Food File", front opening or pass-through door arrangement, solid or triple-glazed doors, and choice of finest quality porcelain or stainless steel finish. KOCH does not use sheet aluminum. We have a range of sizes from 18 to 98 cubic feet, in remote and self-contained models. You will find KOCH modern in engineering and design, but old-fashioned in our respect for quality of materials and workmanship.

When you specify refrigerators, specify KOCH

KOCH Refrigerators, Inc., 401 Funston Road, Kansas City, Kansas
Professor Raskin's book, an important and rewarding one, is defined by the author as "an inquiry into the psycho-physiological considerations involved in architecture."

This inquiry was begun, as I remember it, by Alberti but it is continued by Raskin in the light of those new understandings of ourselves and of the world around us which are generated by the new science called General Semantics. Because, as a consequence of this science, we find ourselves in a new universe where long-standing problems are suddenly capable of solution, where "much that had been mysterious (is) a mystery no longer," we ought, says Raskin, to re-examine our art in the hope that its problems and its mysteries may be as happily resolved.

If the reader will pass through this somewhat formidable gate, raised by the author in the first chapters of his book, he will be pleasantly surprised to find that architecture remains precisely what it has always been: a problem and a mystery. He will find also in Raskin a most engaging guide and companion on a voyage of exploration through that enchanted realm: a voyage which, although it takes one along familiar paths, is so enriched with refreshing valuations and evocative comparisons, and with insight and wit, as to make architecture even for a tired educator an exciting experience and a renewal of faith. Students entering that realm for the first time could scarcely have a better mentor.

Architecture, writes Raskin, is an art of expression. Architecture originates in the idea and feeling of an architect; becomes, through a process inaccessible to the intelligence, inherent in a pattern of space and structure; and is revealed, by a process equally enigmatical, to those observers who are, by the grace of God, receptive to architectural idea and feeling. Thus the meaning of architecture lies—at its beginning and end and "all the way through"—in human behavior.

In the light of these definitions, Professor Raskin re-examines the well-tried expedients of architectural design lifting each in turn from the stale air of the Academy, where they exist as the means of objective harmony and integration, into the more rarified air of the neuro-semantic and neuro-linguistic issues. Unity, proportion, scale, rhythm—all the stock concepts in the designer's arsenal of concepts—are brought out of their mothballs, set free from any taint of tradition, and given a new life and dimension. But Raskin does not suggest that these abstractions are the keys to great architecture. They remain crutches for (Continued on page 224)
Where beauty and economy are factors...

The answer is

Simpson
Forestone

FISSURED WOODFIBER
ACOUSTICAL TILE

For the first time
...a fissured tile at economical cost

Stores, bars, restaurants, hotels and other institutions serving the public must control noise through sound conditioning... but they must also present an attractive appearance. Before Simpson created Forestone there were only two choices among materials that are readily maintained: the rigid, mechanical pattern of perforated tile, or beautiful—but costly—fissured mineral tile. Forestone offers the beauty of fissuring, with woodfiber economy. Investigate this exclusive Simpson product today.

Originated by Simpson Logging Company - Shelton, Washington

AVAILABLE ONLY FROM SIMPSON CERTIFIED ACOUSTICAL CONTRACTORS LISTED AT LEFT

Simpson Logging Co., 1004 White Bldg., Seattle 1, Wash.

When Armour Fertilizer Works, of Atlanta, Ga., decided to build a new fertilizer plant in East St. Louis, they wanted to be in business in a hurry. Gold Bond Corrugated Asbestone helped make this possible.

This material enabled them, with the use of four standard steel sections, to roof and side the entire area as one building on a single concrete slab. Within a few weeks, after the foundations and floors were completed, the building was ready for occupancy! 76,500 sq. ft. of Asbestone were used on this job. The Armour Fertilizer Works are also using it on their plant in North Kansas City, Mo.

The rock-like surfaces of Asbestone are sturdy, incombustible and weather resistant. And, Gold Bond Corrugated Asbestone is highly economical compared to old style, high cost walls! Investigate Gold Bond "400" Asbestone for your next job.

timely advice

This manual for owners and operators of motor courts and highway hotels is well organized, clearly written, and illustrated with plans, diagrams, and sample operating accounts. It offers advice on all of the problems which might be expected to arise, including selection of a site, land use, and the practical problems of furnishing and operation. The particularly complete exposition of financial problems should prove valuable to architects and builders undertaking work in this field.

...plus

Wise birds will send for the full story on this line of brand-new building products **today**.
Windows with eyebrows provide glareless daylighting with eye-resting views

Concrete canopies over Ceco Windows provide adequate diffused daylight for visual acuity and eliminate glare.

Architects create a laboratory as rugged as the Rockies — choose Ceco-Meyer Concrete Joist Construction for rigidity ... for resistance to wind loads and seismic forces ... for economy

Architects Pereira & Luckman achieved a unique design when they made forthright use of standard products in creating the Radio Propagation Laboratory, U. S. Bureau of Standards, Boulder, Colorado. With the majestic Rocky Mountains as a backdrop, it was fitting that aesthetics be combined with ruggedness, in a functional, fire-safe structure. Imagination accomplishes the unusual in window treatment. Ceco Steel Architectural Projected Windows are positioned in the openings to obtain best diffusion of daylight. Concrete canopies eliminate glare. Clear glass allows occupants to rest their eyes by focusing on distant views. Window types provide optimum ventilation.

Concrete joist construction was chosen as the best framing method for the building. Less concrete and steel were used than in other monolithic concrete constructions. Reduced deadweight permitted lighter columns and footings. The contractor selected Ceco-Meyer Adjustable-Type Steelforms for the job. The Boulder Radio Propagation Laboratory is another example of Ceco’s performance on the architect-engineer-contractor-supplier team. Ceco offers you similar structural engineering and window product services, including erection ... for your next building project. Consult nearest Ceco office or Sweet’s files.

CECO STEEL PRODUCTS CORPORATION
Offices, warehouses and fabricating plants in principal cities. General Offices:
5601 West 26th Street, Chicago 50, Illinois
Typical arrangement of Ceco-Meyer Adjustable-Type Steelforms, showing simplicity of erection. Proper joist depth is obtained by nailing through selected holes into the soffit form.

Abundant daylight is provided by window arrangement in clerestory and at work level. Clerestory windows are mechanically operated. Concrete joist ceiling was formed with Ceco-Meyer Steelforms.

Concrete Joist Construction was also used in the roof of the open walkway.
HOPE’S STEEL WINDOW WALLS were used extensively on the north and south elevations of this modern one-story school. Floor-to-ceiling pressed metal frames contain insulated steel panels, intermediate projected ventilating sash and large glass panes as required.

The use of Hope’s Window Walls helps keep construction costs down by providing an economical, flexible, rapidly erected system of enclosure with cost-saving factors in both construction and maintenance. Write for catalog No. 134-PA.

New LUXTROL Light Control requires no complex wiring as an ordinary wallswitch!

A turn of the dial shows your prospects how DIFFERENT a home can be!

Here's a new, easy, practical way to set your homes apart from competition... to make them beautifully, profitably different.

It's an entirely new concept in home light control. New LUXTROL Light Control!

LUXTROL brings to homes, for the very first time, light that is truly controlled. Light that glides from dark to bright, bright to dark, at the turn of a dial.

Gone are old-fashioned "on-off" switches. Gone is "all-or-nothing" lighting.

In living room or TV room, bedroom or nursery, dining room, bar or den, LUXTROL offers your prospects the perfect level of light for every occasion, every activity, every mood.

LUXTROL is a soundly engineered autotransformer-type unit with brush and winding in constant contact. It has both fuse and thermal overload protection. It controls not only incandescent lighting but fluorescent and cold-cathode too. It operates smoothly, silently, safely, is approved by Underwriters' Laboratories.

Best of all, LUXTROL is priced surprisingly low and requires no complex wiring. It replaces ordinary wall-switches, is just as easy to incorporate in your designs, just as easy to install.

We invite you to arrange a personal LUXTROL demonstration. Simply call Western Union Operator 25 in your own city and ask for the name of your LUXTROL distributor.

THE SUPERIOR ELECTRIC COMPANY
4065 Domers Ave., Bristol, Conn.

Reinhold Books that work for you

How to plan for more living space and new beauty — with even greater economy

A treasury of 100 architect-designed houses from $5,000 to $20,000

QUALITY BUDGET HOUSES

By KATHERINE MORROW FORD, Architectural Consultant, and THOMAS H. CREIGHTON, Editor, Progressive Architecture

How to obtain the best value from a limited budget, with the most in quality, is the vital message of this amazing book. Each of the practical and beautiful houses featured is described from the viewpoint of what today's home-buyer wants to know.

You can safely hand this book to your clients for the complete and down-to-earth information they need in what may be the biggest single purchase of a lifetime. Every aspect is covered, from economizing on the land bought, to increasing resale value.

224 pages 350 photos and plans $4.95

85 Best U. S. Houses: Designs, Plans, Pictures, Special Problems

THE AMERICAN HOUSE TODAY

By KATHERINE MORROW FORD and THOMAS H. CREIGHTON

Each house in this exceptional and inspiring volume is unique in some way. Here are special program requirements of houses for small, large, or growing families: for the bachelor; vacation houses, houses built for city or country, for flat land or hill site; etc. Text and more than 500 illustrations cover every reason-why of building a house anywhere. The most beautiful and detailed book on homes ever published.

235 pages Profusely illustrated $7.95

The whole picture of housing design— from simplest to most complex aspect

HOUSING DESIGN

By EUGENE HENRY KLABER

The designs of over 125 outstanding architects are shown in photographs and scale drawings. These point out the standards essential to successful room layout, apartment floor planning, building design, and site orientation. The author's eminent career as architect, town planner, and housing consultant in both private practice and government service gives him the broad experience needed to cover such an amazing range of topics.

250 pages Over 200 illustrations $8.50

Modern planning that cuts costs with space-saving magic!

DESIGNS FOR LIVING

By KATHERINE MORROW FORD and THOMAS H. CREIGHTON

Shows how thrilled homeowners and their architects or interior design specialists solved the problems your clients face. Every page features ideas that save both space and costs; ideas you can apply now — or show to your clients to illustrate your own suggestions. No detail — interior or exterior — from garden gate to rooftop, is overlooked. Includes full pages in gorgeous color.

216 pages Hundreds of page-dominating illustrations, $5.95 room and floor plans.

Gives the much-needed definitions pointing the difference between the architect-designed house and others...

THE HOUSE AND THE ART OF ITS DESIGN

By ROBERT WOODS KENNEDY

Brings you a complete review of the architect-designed house — its conception and design scheme as determined by the needs and activities of its inhabitants. Skillfully analyzes the demands of the inhabitants on a house, and shows how these demands are translated into a house plan that reflects the ultimate in beauty as well as in technical advantage. A well-known authority in the socio-psychological aspect of house design, the author presents his material in a strikingly informative and often humorous style.

May 1955 247
There has been a great deal of advice given to architects recently on the subject of public speaking. This is an important ability to develop; being able to fascinate an audience in the cause of architecture is an art any civic-minded practitioner should learn and practice. However, the little private speech—made directly to one potential client—is also important, and on this I find no current literature or suggested outlines. Here are a few recommendations of points that might be elaborated.

If you have a small office: “Nothing can take the place of a small, cohesive group, whose interests are directed entirely on your problem. We are not a plan factory. We give personal attention to every detail.”

If you have a large office: “We have the benefit of a comprehensive, efficient organization, large enough to include trained specialists in every branch of design, research, documentation, and construction.”

If you are a specialist: “Obviously, only a man who has made a specialized study of your problem over many years, a man who is a recognized authority in his field, can do justice to your project.”

If you are a general practitioner: “We will approach your job with a fresh point of view. We have no preconceived or fixed ideas, resulting from a sureness that we know it all. Only a man who has designed many types of buildings has this unbiased approach.”

To a conservative client: “We don't believe in self-promotion, or such things as brochures. We suggest you visit our completed work, which speaks for itself.”

To a progressive client: “You will naturally want to support the architects in our own community, where there is just as fine a talent as you could find anywhere in the United States.”

To an out-of-town client: “You would not be fair to yourself if you limited your search for an architect to your own locality, and its few practitioners.”

If you have a brochure: “You can see that we have put together data on work we have done, for your convenience and reference.”

If you have no brochure: “We don't believe in self-promotion, or such things as brochures. We suggest you visit our completed work, which speaks for itself.”

If you feel sure of the job: “Now I don't want you to make a quick decision; be sure you have canvassed the field before you decide to retain us.”

If you have tough competition: “It usually doesn't pay to shop around for an architect. It's better to decide these things on a purely objective basis.”

If you've had work published: “Of course this doesn't mean anything, but I thought you'd like to see this copy of...”

If you haven't been published: “Thank God I'm not one of the 'pets' of the magazines. I'm interested in down-to-earth construction—not theory.”

I have at hand a copy of the Annual Report of the Department of Public Works, The City of New York. It is a book of 135 pages, well illustrated. The first illustration is a picture of the Hon. Robert F. W. Wagner, Mayor of the City. The second illustration is a picture of Frederick H. Zumwuhlen, P.E., R.A., Commissioner of the Department. Both very handsome gentlemen. There then follow pictures of the openings of a branch library, a health center, and several other projects. Various city officials are in these pictures, and Commissioner Zumwuhlen appears sometimes with his hat on, sometimes bareheaded. Very handsome both ways! Then there is a small picture of Albert B. Bauer, R.A., Director of the Division of Buildings in the Department.

Finally, on page 17, pictures of buildings begin. I noticed a number of very distinguished structures, designed by architects with whom I am familiar. For example: Bellevue Nurses' School and Residence, by Litchfield, La Pierre & Associates, and the Coney Island Hospital, by Architects Associated.

I happen to know who designed these projects because of information which I already had, from one source or another.

However, there are many other buildings illustrated in the book whose architects I cannot identify. The reason that I can't is a simple but a maddening one: this report from Commissioner Zumwuhlen, P.E., R.A. (and AIA, incidentally) to Mayor Wagner does not mention the names of any of the private architects or engineering firms who designed these beautiful structures for the citizens of New York.

One difficulty in objective criticism of architecture is the need to be objective. It seems to me that every time we publish a building that I have visited under pleasant circumstances I find myself being sentimentally pleased that we are publishing it, and being unreasonably annoyed at whatever carping criticisms my editorial colleagues propose. So what if the fireplace wall in that house has a slightly awkward proportion? Don't I know from my own experience that it has a warm, comfortable perspective when the fire is lighted and the talk is good? Who cares if this entry hall looks too small on the plan? Don't I know that it leads to a delightful, intimate house in which friendly people lead a relaxed life?

Of course this is a completely indefensible point of view. I should always draw myself up short when I am having a very good time and say, "But is this really good architecture? Would it take good pictures? As published material, would it be useful, instructive and illuminating to a large proportion of P/A's readers? Or am I just being a sentimental old fool?"

It isn't just houses I'm talking about, either. When I visit a school, walk into a bright, gay kindergarten room where a "show me" class is going on, and have a cute little girl come over to me with her pet rabbit to show me what she's showing the class that day — I should, of course, not let myself be distracted from the orientation of the room, the footlamberts provided at the "task," or the ingenuity of the structural system.

It's very important to visit the jobs we're going to publish. It's necessary, in good reporting, to see how these jobs work in actuality. But it's also a good thing that we have checks and balances in the form of hard-boiled, critical editorial meetings. Any one Editor, we've discovered, is likely to become an old softy about some of the buildings he's seen.
