Concrete of good appearance and other desired qualities with POZZOLITH

In the construction of this outstanding municipal auditorium and coliseum — as with many other important projects built since 1932 — Pozzolith proved a valuable aid in improving cohesiveness and plasticity, to enhance the appearance of exposed concrete.

Beauty and utility with architectural concrete is but one of the advantages obtained with Pozzolith . . . key to the control of:

1. water content . . . makes possible lowest water content for a given workability.

2. entrained air . . . provides optimum air content without sacrificing other desired qualities.

3. rate of hardening . . . provides desired handling and finishing time under widely varying job conditions.

Any one of our more than 100 seasoned fieldmen will be glad to demonstrate the full benefits of Pozzolith for your project, and to advise of the availability of Pozzolith Ready Mixed Concrete through more than 1000 qualified producers.

*POZZOLITH* . . compounded from exclusive technical components including Master Builders time-tested cement-dispersing agent, modifies the kinetics of the portland cement hydration process thereby improving the quality of concrete and its control.

Pays for itself in maintenance savings!

SPECIFY

GOODYEAR
Super DeLuxe
true Vinyl

For your commercial floors - "The quality outlives the price"

EASY TO MAINTAIN! STUNNING COLORS!
It's true vinyl throughout its husky ⅛" and ⅛" gauges, and available in full 45"-wide rolls as well as tiles! It's styled to complement the best-designed buildings, and built to last, with the absolute minimum of maintenance! (Goodyear Super DeLuxe Vinyl needs no wax to protect its super-dense surface—just the usual commercial cleaning and buffing will keep it beautifully brilliant!)

Available, too, in economical Standard and DeLuxe .080-gauge material for color-coordinated walls and counter tops. As the years roll by, the true vinyl will stand as a lasting testimonial to your good judgment!

DURIRON®
CORROSION RESISTING DRAIN PIPE

The really permanent one, of course—Duriron.
It's the one specified for more than 30 years by architects
and engineers who recognize it as the perfect protection
for a quality job. Not a coating, Duriron offers
resistance to virtually all commercial acids and
corrosive solutions... throughout the entire pipe wall.
Duriron is installed by ordinary plumbing
methods and is carried in stock by leading wholesalers
everywhere. Insist on Duriron.

PANELFAB leads the way in lightweight, super strength building panels and doors

PANELFAB DOORS have a one-piece extruded .125" thickness aluminum perimeter edge, permanently bonded and roll-interlocked to aluminum facings. Wide variety of types and sizes available — reinforced for any type hardware.

PANELFAB PANELS are available with porcelain facings in 8 types — sizes up to 4' by 10'; with aluminum facings in 3 types — sizes up to 4' by 24'.

From Canada to the Caribbean... from California to Maine, Panelfab Doors and Building Panels are being specified in the latest and most modern schools, hotels, office buildings and other commercial structures.

Proven strength, impact resistance and dimensional stability are major reasons for Panelfab success. Another is finished appearance of the product. Many architects state flatly that Panelfab Doors, for example, are the most handsome metal-faced doors being made today.

We welcome the opportunity to aid the architectural profession in the selection and application of these advanced building materials. For detailed information please write us today.

Architectural supplements Tomson's Engineering. This month's column P/A Office Practice decided since publication of the book.

Chapter 9—Agreements with Owners Pennsylvania. In re Stormer's Estate, 129 Atl. 2d 627 (1956). In a declaratory judgment proceeding to determine the liability of the executors of a deceased contractor to complete performance of a contract for construction of a municipal sewer system, held that the contract was not of such a personal nature as to be discharged by death of the contractor. Said the Court, building contracts generally do not involve a peculiar skill or ability on the part of the person who is to perform them, and hence do not terminate on the death of the contractor. The formation of the contract in this case was induced by the fact that decedent made the lowest bid and not by any peculiar ability or skill.

Chapter 13—When Architect's or Engineer's Decision is not Final California—Pacific Coast Builders v. Antioch Live Oak Unified School District, 300 Pac. 2d 309 (1956). A school district architect's opinion that the contractor should bear the cost of inspection was reviewable by the Courts, notwithstanding a contract provision making the architect's determination final, where the architect's decision was based upon an obvious misinterpretation of the contract.

Chapter 20—Right to Compensation Iowa—S. D. & D. L. Cota Plastering Co. v. Moore, 77 N.W. 2d 475 (1956). In an action for foreclosure of a mechanic's lien, it was held that the evidence sustained a finding that there had been substantial compliance by the plaintiff with the agreement, under which it was to apply siding to the defendant's house, notwithstanding the defendant's contention that the coloring of the siding did not accord with the agreement. The Court stated that the rule of substantial performance is applicable to building construction or improvement contracts because the builder's material and labor cannot be returned to him; the Courts are forced to weigh, on the one hand, the harm to be done to the owner if he is forced to accept and pay for a job that is not the job he contracted for; and, on the other hand, the injustice to the builder and the unjust enrichment of the owner if trivial deviations from the contract will permit the owner to keep the fruits of the builder's efforts and material without compensation.

Miscellaneous: Liability of Architect to Surety on Contractor's Bond Mississippi—State v. Maloney, 72 So. 2d 424 (1954). An architect who, by the terms of the contract, was to require of the contractor evidence that payrolls and material bills had been paid before issuing the certificate of substantial completion, was held liable to the contractor's surety for negligence in issuing the certificate without requiring such evidence, with the result that the contractor collected retained payments and then defaulted, throwing the burden of completing the work and satisfying the claims upon the surety.
here's the economical answer to **Classroom Comfort**

**Norman Gas-Fired Schoolroom Heating and Ventilating System**

In one complete package for the individual classroom, Norman engineers have designed everything needed to assure economical and healthful classroom comfort — automatically.

And, because the Norman gas-fired, forced air heating and ventilating system is specifically designed for modern schools, it offers important advantages for new school construction and expansion programs. No separate building or extra space is needed for a central heating plant. Simplifies expansion programs — just add another Norman unit for each additional classroom.

**NORMAN COMPLETE PACKAGE PROVIDES:**
- Perimeter forced air distribution at proper angles for constant classroom comfort without draft or stale air pockets.
- Automatic operation cycles which include warm-up, daytime or occupied period, and nighttime period.
- Automatic ventilation with proper mixture of outdoor air and room air.

**NORMAN COMPLETE PACKAGE INCLUDES:**
- Automatic gas-fired, forced air central heating furnace and enclosure, pre-wired and fire-tested at factory.
- Standard length Util-i-Duct sections of sturdy furniture gauge steel, shipped ready to install. Each section includes quality adjustable perimeter diffuser . . . aluminum trim for front top edge . . . resilient gasket for back top edge. (Filler and corner sections available.)
- Electrically controlled multi-blade air damper assembly for automatic inside and outside air modulation.
- Rugged aluminum outside weather grilles and mounting frames for fresh air and combustion air openings.
- Automatic controls for complete modulation of heating and ventilation air requirements.

**OUTSIDE AIR ONLY USED FOR COMBUSTION**

Mail the coupon today for complete details and specifications.

P/A Office Practice column on mechanical and electrical design and equipment, devoted this month to heating and cooling systems using piped water.

Strange enough, it is possible for heating and cooling systems to be popular or unpopular, understood or misunderstood. Those who conduct research and endeavor to disseminate technical information find that news about mechanical improvements is very perishable. Frequently, systems are chosen on the basis of local experience or custom and without the advantage of published findings of centralized research, or the results of the experience of others on a national scale.

About a year ago, the Better Heating-Cooling Council was organized in New York to conduct a vigorous job of promoting a greater understanding of the good qualities of piped systems for heating and cooling, especially in residences. Now, fifty organizations that manufacture or install equipment for these systems participate in the work of the Council. For the first time in industry, installation contractors have joined manufacturers in promoting a technical program. The former are represented by The Mechanical Contractors Association of America and The National Association of Plumbing Contractors; both of these organizations being members of the new Council. Their influence will undoubtedly be felt in a more complete program which can include information on methods of installation as well as the selection of manufacturers' equipment. Architects can feel free to consult the Council on questions about the new systems that it promotes. Many architects believe that their professional position is better maintained when information comes from a national association instead of from a specific manufacturer or contractor.

The choice between a piped-water system and one using ducted air will, of course, be determined by the best findings concerning both processes. The Council feels that the architect should give increased consideration to the merits of piped systems and seek information which it is well prepared to give. Some of the advantages claimed are durability, suitability to the adjunct generation of domestic hot water, and a less bulky installation because of the use of pipes instead of ducts. The last-mentioned quality might seem most important in contemporary houses where heating or cooling should be delivered at perimetal glass or walls.

The system illustrated on this page (its equipment made by Vulcan Radiator Company) typifies the kind of heating-cooling that is being endorsed and promoted by the Council. It combines both processes through baseboard units. A central chiller and a central boiler circulate chilled or heated water to the convectors, where there are two additions to the conventional baseboard scheme. A trough and plumbing drain catch and dispose of condensed moisture, and an air chamber below the base cabinet distributes fresh or recirculated air to induce flow of room air over the coil fins. A central fan in the boiler room delivers this air through three-in. flexible hoses. The convector and trough are made of rust resistant materials.
"Decay and Termite Damage in Houses"

Prepared by the DIVISION OF FOREST INSECT INVESTIGATIONS, Bureau of Entomology and Plant Quarantine, Agricultural Research Administration; and the DIVISION OF FOREST PATHOLOGY, Bureau of Plant Industry, Soils, and Agricultural Engineering.

(Excerpts—Exact Quotation)

"Termites are the most destructive of the insects that attack wood in houses. They eat the interior of the wood and may cause much damage before they are detected."

"Wood damaged by termites can be easily distinguished from decayed wood. Termites honeycomb the wood with definite tunnels; these are separated by thin partitions of sound, firm wood."

"Wood decay is caused by fungi, which are plants consisting of microscopic threads... the decay fungi weaken or destroy the fiber. These cannot work fast at temperatures below 55 to 60°F., and not at all in dry wood. There is no such thing as 'dry rot'; decayed wood is often dry after it has rotted, but not while the decay is taking place."

"The decay fungi soften the wood and in the final stages cause it to shrink and crack or crumble."

Scientific multiple aluminum, by insulating against vapor and heat flow, keeps the area beyond the insulation colder and drier, thus retarding fungus growth and timber rot.

"10 Essential SAFEGUARDS AGAINST TERMITES AND DECAY" will be found in U.S. Bulletin 1993, obtainable free by sending the coupon.

General Conditions and Types of Specifications by Harry Terry*

P/A Office Practice article discussing general conditions for installation of Mechanical and Electrical work in buildings. Problems raised by “Open,” “Bidder’s Choice,” and “Base Bid” specification types are discussed: problems which also arise to some extent in other sections of specifications.

Members of New York Association of Consulting Engineers, during the past thirty years, have each prepared their own supplementary Mechanical and Electrical General Conditions to be used with American Institute of Architects General Conditions for the Construction of Buildings. During the past two years a committee of NYACE has reviewed these Conditions of its members and compiled a set of Conditions representing the combined experience of its members.

These “Conditions” apply to specifications covering all mechanical trades — such as Heating, Plumbing, Air Conditioning, and Electrical Work — specifications for which can be divided into three general classes:

1. The “Open” Specification, in which minimum standards of quality and performance are set forth, and any piece of equipment or material which complies with these minimum standards is acceptable. This type of specification is most commonly found in U. S. Government work.

2. The “Bidder’s Choice” Specification, in which three or more brands of any given piece of equipment usually are named and described, the choice being left with the bidder. This is the most common of all types of specifications in use today, particularly on public work.

3. The “Base Bid” Specification, in which the various items of equipment are concisely described, their performance defined, and the manufacturer’s name and catalog designation clearly set forth. In this type of specification the base bid includes only the articles specifically named, and if other brands of equipment are offered, they are included as an alternate proposal.

The Open Specification enables the specifying engineer to maintain complete impartiality between the various manufacturers and suppliers of equipment. This type of specification should present complete and comprehensive detail on each item. Specifications for a heating unit, for example, should include heat exchange, heating surface, entering and leaving air temperatures to establish the capacity characteristics and equally comprehensive details of the materials of the coil, the method of fabrication, the sealing of connections, as well as specific data on fins, tubes, headers, and tappings. Cabinet enclosures are similarly described. Motors required are described as to electrical characteristics, drive, speed, guards, and motor mount. Even greater detail may be set up for control apparatus.

Standard General Conditions must be written to cover all three types of specifications, and since so much choice may be left to a contractor, he must accept corresponding responsibility.

From the bidder’s point of view, a loose specification does admit bargaining between various suppliers. However, since basic plans cannot be complete in detail, indeterminate items can be specifically defined only after the selection of equipment is approved by the specifying engineer.

From the craftsman’s point of view, such a specification is most undesirable. The basic plans are necessarily lacking in detail. Detailed plans prepared by the manufacturer of the equipment are concerned only with the immediate problems of a particular piece of equipment. The foreman on the job and the clerk-of-works must fit the selected apparatus in the building without conflict between various trades.

From the owner’s point of view, the major objection is that the lack of precise definition in specifications may result in numerous “extras” which often work a severe handicap in the manner of financing.

The Bidder’s Choice Specification is an Open Specification which limits the contractor’s choice of equipment to two or three brands, predetermined as acceptable to the designer. The objections raised to an Open Specification are present in this type of a specification, but they are more limited in scope and create proportionately less of a problem to all concerned. It is true that less technical detail and description are required than with an Open Specification, but it is also true that architectural plans and layouts must be prepared with enough latitude to allow for variations in equipment.

The Base Bid Specification — where each item of equipment is clearly defined as to quality, capacity, function, and performance, and specifically identified with the manufacturer’s name, model number, catalog listing, and size designation — gives the bidder no choice of equipment under his base bid. All contractors bid on the named equipment, the only variable factors involved are quantities of miscellaneous supplies and quantities of labor. The architect and owner know exactly what will be received for a given cost. The kind or brand of equipment that will be used is not within the province of the contractor but rests jointly in the hands of the architect, engineers, and owner, where it rightfully belongs. If there are price differentials, the owner receives or pays the difference, as the case may be, if he chooses to accept alternate proposals. If the acceptance of an alternate will require design changes, extra costs on the part of other trades, or additional engineering, the costs of these changes can be established and a true evaluation can be made on the worth of an alternate proposal, prior to its acceptance by the owner.

The mechanical and electrical specifications prepared in New York City are of the three general class commented upon above, and the General Conditions for these specifications must of necessity be broad enough to apply to all three classes. Paragraph 2 of the General Conditions, therefore, frankly demands that “It is the intention of the Specifications and Drawings to call for finished work tested and ready for

General Conditions and Types of Specifications

operation . . . and that the Contractor has included the cost of all required items in his proposal, and that he will be responsible for the approved satisfactory functioning of the entire system without extra compensation.

The most vulgar objection to broad coverage specifications and General Conditions is sometimes expressed in the damning statement that such specifications contain “God Save Us All” clauses. However, any specification must be set up to protect the owner, the legitimate bidder, the supplier, the architect, and the engineer against unfair and unethical practices, including the following:

1. Failure of successful bidder to place orders promptly for the required equipment. One contractor out of twenty, instead of placing his order for equipment promptly, will indulge in shopping between the suppliers of various brands. He will play one against the other until, finally, the supplier who does obtain the order is more unfortunate than any of his competitors. First of all, he has had to cut his price to a point where he no longer has a profit. Second, his selling expense has doubled and sometimes tripled. Third, while all this shopping has been going on, time has been passing and delivery is invariably delayed. (In most cases, a manufacturer will not extend himself too much to expedite a nonprofit order.) This condition then provides a hand-made opportunity for the contractor to attempt a substitution, of course to his own advantage. If a substitution is not accepted, it’s the engineer’s responsibility to attempt justification of a job delay.

2. Increasing the engineer’s cost of doing business. The technical performance and quality of substitute brands must be checked carefully for each unit offered for consideration, in order to determine if the units proposed will meet the minimum requirements of the specifications. This work is time consuming and therefore costly. There has been nothing constructive accomplished with this byplay—for the engineer, the supplier, or the owner. As far as the contractor is concerned, job delay probably eats up any additional profit obtained through these manipulations of orders and specifications.

Another fallacious objection to tight specifications and General Conditions is that they require the bidder to accept responsibility for work for which the engineer has been paid and for which he should himself take the responsibility. This familiar objection has been advanced most strongly by wartime contractors. Their experience with the Corps of Engineers, which depended upon Renegotiation of Contracts to protect the Government from overcharging, has encouraged the practice of making a low bid and depending on extras to make the work profitable.

The failure of many architects and engineers to recognize the importance of insisting that owners be protected against such practices has resulted in a new clause in the New York City Housing Authority’s standard contract with architects. It reads as follows:

“Responsibility of Architect. The Architect shall apply to the preparation of the plans and specifications the reasonable and proper skills, judgment, and care which are customary and normal to professional architectural practice, and shall be liable to the Local Authority for damages or losses resulting from failure to apply the above reasonable and proper skills, judgment, and care.”

This clause makes it imperative that plans and specifications be such as will leave no opening for a contractor to charge the architect or engineer with accountability for errors and omissions, presumably to be paid for by the owner, without making the architect or engineer actually responsible for the cost to the owner of such errors and omissions.

Years of experience in all branches of construction show conclusively that the best contractors welcome a tight specification, provided it is enforced as rigidly as it is written. Such contractors will not deviate from or attempt to evade a well-written specification. When others do attempt to do so, the architect and engineer should be totally inflexible and insist on compliance with both the letter and intent of the contract specifications or be personally responsible for their failure to do so.
Seven Years of Trouble-Free Service
(Servicing 35-40 Trucks per Day)
with Crawford Doors

Wray-Dickinson motor truck service garage installed twelve 12' x 14' x 13½" Crawford Model SLB Garage Doors in 1948. These doors handle a heavy traffic load, with as many as 40 trucks serviced every day.

Since the final adjustment of the doors at installation time seven years ago there has never been a service call of any kind.

This fine service garage is 160' x 40' x 18' high and occupies a full half block of frontage.

An important exclusive feature of the Crawford installation is the use of a removable, light-weight, extruded aluminum mullion, or center post, between each pair of doors. With the mullion removed, an unobstructed opening two bays wide is available for easy maneuvering of big trucks and tractors. In a matter of seconds one man can easily remove any of the six mullions, without any mechanical equipment. The mullions lock securely at top and bottom, and when they are removed, doors are automatically locked open . . . can't accidentally descend.

If you have a door problem, we'll welcome your inquiry and it will get quick, intelligent attention. Architects, write for complete file of Crawford literature. Crawford Door Company, 202-20263 Hoover Road, Detroit 5, Michigan.
history of techniques

Dear Editor: I have been reading with great interest the articles by Ada Louise Huxtable. PROGRESSIVE ARCHITECTURE IN AMERICA. I congratulate her on her choice and analysis of material.

The National Trust interests itself in the preservation and maintenance of distinguished architecture of all periods, with no particular emphasis on any decade or century; at our recent annual meeting in Washington, an entire session was devoted to papers on industrial architecture, covering some aspects of the material which Mrs. Huxtable is so ably presenting in her series.

I think it is important that contemporary architects should be informed of the history of building techniques, just as it is important for antiquarians to be informed of the later developments that have taken place since the Colonial and Early Federal periods.

RICHARD H. HOWLAND, President
National Trust for Historic Preservation
Washington, D. C.

Dear Editor: At the last meeting of the Board of Directors of the Society of Architectural Historians, I had the pleasure of showing them the several projected articles for the series of historical studies you have added to PROGRESSIVE ARCHITECTURE. I was asked to convey to you the warm congratulations of the Board for instituting this series which will serve to keep alive a realization of the continuing accomplishments of the architectural profession in America.

If I had any suggestion to make, it would be to add at least one page to each article! As I have had the pleasure of observing Mrs. Huxtable in her research work at Avery Li-

brary, in preparation for these articles, I have noted how much valuable information she assembled which could not be included in the articles because of space limitation. Increasing their size, I believe, would more than correspondingly augment their significance for architects and historians.

JAMES GROTE VAN DERPOOL, President Society of Architectural Historians
New York, N. Y.

Dear Editor: Mrs. Huxtable's articles, PROGRESSIVE ARCHITECTURE IN AMERICA, are attractive and very informative. I read those in the November and December issues.

I also read the Sullivan & Berlage article in November and I also found interesting the article in the December issue, "Check Lists for Environmental Control of Houses." The opening paragraph on the disregard by architects of air conditioning reminds me of the similar situation with respect to Pullman cars that were built in the 1920's (300 to 500 per year, after the cessation of building during World War I) with no thought of air conditioning, although it was then being introduced in theaters and other public buildings. Then, in the 1930's many millions of dollars were spent on the installation of air conditioning in these cars.

Some of the control items named bring a smile. For example, "Control of Sound" (par. 7, page 128), suggests "greatest possible distance from airports and heavily traveled airlanes." My own home is in the South Shore District underneath the eastern and southeastern airlanes from Midway Airport, the largest in the world in traffic volume. I hear airplanes overhead every few minutes. They are a development of the

(Continued on page 14)
The trend to thorough equipment checkups

Stepped-up production in the plant almost always means stepped-up activity on the board. Unfortunately, there is rarely time to stop and take stock of what is happening to drafting room efficiency as the work load increases. It is often necessary to improvise with what you have, or hastily expand as the need occurs.

With the shortage of manpower obviously continuing, it is apparent that a careful, critical review of drafting methods and equipment can lead the way to greater productivity. Department heads in some companies are setting aside a specific time every year to completely analyze the drafting room. The trend is to planning additions, improvements and reorganizations during such check-up periods.

One way to pinpoint possible increases in productivity is to go, item by item, through a check-up list showing every type of product used in a modern, well-equipped drafting room. Such a list is available from the Frederick Post Company. It covers equipment and supplies from A to Z and suggests where you can make improvements.

Here are some typical examples of what you might look for during a Check-up: Cutting down waste motion by using modern drafting tables and drafting machines; eliminating time-consuming methods by using special grid-lined sketch pads, templates and other devices; reducing fatigue and increasing comfort by installing newer equipment; saving space with up-to-date files, etc.

Whatever the need, a logical, well-planned analysis of current and contemplated drafting operations is likely to unearth improvements.

Trained specialists in complete checkups

Practical assistance in making your checkup can be obtained from your POST supplier, who frequently helps make such efficiency surveys. He is experienced in all phases of drafting room operation and is a valuable source of ideas for everything from a major reorganization to producing hard-to-find supplies. Call your POST supplier and ask him about some of the techniques other companies use in surveying drafting room operations and boosting productivity. You will find his thinking a valuable addition to your own appraisals.

For more information and a POST checkup list, write to the Reader Service Division of the Frederick Post Company, 3642 N. Avondale Ave., Chicago 18, Ill.
From the "world" on down, Overly has roofed Pittsburgh's famed treasure house of antiquity—Carnegie Institute and Library. Replacement of the badly leaking old roof was necessitated by continuing, costly damage to interior finish. Overly was awarded the project because of the architect's knowledge that our guaranteed weather-tight roof and skylight system would handle the job on a permanent basis. Installed were almost four acres of Overly-Goodwin batten type aluminum roofing and puttyless skylights; skylights alone amounted to 44,500 sq. ft. An outstanding feat was the removal of 93,000 sq. ft. of original skylight and its replacement with new skylight, or deck and roofing. This was done without damage to glass ceiling lights beneath, and without interruption to building's activities. The new roof reduced load on supporting structure by 1,370,000 pounds. Aluminum is finished in attractive Alodine green, which eliminates glare and softens appearance of massive roof area. Overly's experience and financial ability to carry a job of this scope uniquely qualify us to handle roofing requirements of largest size. Get the complete Overly story into your files; write us today for catalog 16b-Ov.
some heat-absorbing glasses; namely, that the glaziers, in setting some panes of glass, did not allow proper tolerance in their bedding and fitting in the metal frame to allow for expansion. The result has been a few isolated cracked pieces of glass on the exterior. This is confined only to the heat-absorbing glass which, of course does expand, but assumes no regular or characteristic pattern. One could, therefore, not attribute this to lack of expansion in the frames and, of the many thousands of pieces of glass, the number in question might be, in one year, some six to ten pieces. The junior I's at 5 ft increments around the building are frequent enough to allow the individual frames, I suspect, a little movement.

We have now used this basic detail on several other buildings with similarly happy results, but I rather think that if we were to have a clear run of 200 ft or more, we would have to detail adequate provision for expansion.

The wall is now going through its second winter, and while this one is relatively mild, last winter was somewhat more severe and we had temperature differentials between inside and out, on many occasions, of 60° or more, which I think is a fairly good test.

JOHN B. PARKIN
Toronto, Canada

schedules in specs

Dear Editor: As a very interested reader of Ben John Small's column and one who has had the opportunity to wrestle with the problems he so informatively and wittily discusses, I am taking the liberty of writing this note.

In SPEC SMALL TALK in November 1956 P/A is mentioned the subject of the finish schedule and its inclusion in the specifications. I find this quite coincidental, as we have been trying to solve the problem of reducing the amount of work on the drawings (draftsman's time vs. a typist's) especially in view of the fact that the office I am connected with (Percival Goodman's) invariably requires quite extensive detailing.

We have gone a step further—namely put all schedules (doors, (Continued on page 20)
Youthful, lasting color for generations to come

No building material is more stimulating to creative design than Ceramic Veneer, the modern architectural terra cotta. Unmatched in versatility of form, color and texture, it fits into your plans for smart, functional schools where color is used to keynote youth, generation after generation. You have full freedom in the selection of colors and textures because Federal Seaboard custom-makes every unit, large or small—plain surfaces, sculpture, or decorative panels—to your precise specifications. Big-city grit and grime are resisted by the fire-hardened surface, which requires only simple soap-and-water washings for retention of original beauty. For interiors as well as exteriors, in schools and other public buildings, Ceramic Veneer is in a class by itself—for quality, appearance, permanence and price. Without charge we will gladly furnish construction detail, data, color samples, and advice on preliminary sketches involving use of Ceramic Veneer.
Now you can SAVE $215 per ton in base price alone!

Many designers and fabricators who are currently using Type 302 stainless can, in numerous applications, specify Type 430 straight chromium stainless and take advantage of the 10.34 cents per pound difference in base price. Some of our customers are already saving more than $215 per ton using our 430 MicroRold stainless sheet.

The steel industry estimates that 50% of all stainless sheet applications could satisfactorily employ Type 430, the least expensive of all stainless grades, as an economical and practical material. When properly applied, Type 430 has all the desirable qualities of beauty, corrosion resistance, strength, long life and low maintenance that no other material, except stainless, can offer.

We are currently producing our MicroRold Type 430 sheets up to 48” wide in thicknesses .005” to .109” with 2B or 2D finishes; and in thicknesses .010” to .109” in No. 3, 4 and 7 finishes.

Send for Your copy, "Care and Use of 430 MicroRold Stainless Steel"

Washington Steel Corporation
4-M WOODLAND AVENUE, WASHINGTON, PA.
Selecting an option in the specifications for this 180,000 square foot building, the construction company cut roof costs by thousands of dollars. By constructing 150,000 sq. ft. of the roof deck with precast insulating concrete slabs, or tiles 2' x 4' x 3", laid on bar joists spaced 4' on centers, they were able to eliminate all other insulation in that area. The "U" factor of the completed roof—a 4-ply, 20-year bonded roof—is .18 without a ceiling. Further cooling during hot weather is gained by flooding the roof with 3" of water.

The precast tiles were made by the local Permalite franchisee, Minnesota Perlite Corporation, using Permalite in a 1 to 6 mix. These tiles have a compressive strength of 400 psi, weigh less than 11 lbs./sq. ft., and take a superimposed load of 240 lbs./sq. ft., thus providing a very large safety factor. "K" factor of these tiles is .650, established by an independent testing laboratory. As the photo shows, the roof deck was laid during cold weather, and there were no delays... job completed on schedule.

Whether as precast slabs, or poured in place, lightweight, insulating, fireproof concrete mixed with Permalite as the aggregate provides important advantages, both to the building itself and to the builder's budget. For complete information, write:

The busy office employees of the Socony Mobil Oil Company don't have to search Manhattan for a comfortable place to eat. They just ride the elevator down to this spacious cafeteria in the basement of the new Socony Mobil Building. The handsome floor that contributes so much to the relaxing atmosphere is Armstrong Excelon Tile—in the softly shaded "Designers Series." Excelon was specified here for its wearing qualities, too. Durable and greaseproof, it will keep its good looks for years, even around the counters where 1,300 people are served every day.
EASE OF MAINTENANCE

No matter how much it snows, or how much slush and dirt are tracked in, the smart Excelon Tile floor of Donaldson's new department store unit in the Southdale shopping center outside Minneapolis never looks messy and unattractive. During business hours, an occasional quick mopping wipes mud and water right off the smooth surface of Excelon Tile, without leaving a trace. After hours, regular maintenance is fast and economical.

Donaldson's, Southdale, Edina, Minn.
Interior: Alvin L. Weidt & Assoc.

MINNEAPOLIS

ECONOMY

The Bond Stores are famous for quality clothing at economy prices. Bond management know the value of other kinds of economy, too. For their new Wilshire Blvd. store in Los Angeles, they wanted a fashionable floor as a background for modern merchandising displays. But because the floor area is so large, cost per square foot had to be kept down. Good looks and low cost combined to make this floor the ideal choice for this handsome interior.

Bond Clothing Store, Wilshire Boulevard, Los Angeles
Stiles and Robert Clements, Architects and Engineers
Interior: Burke, Kober and Nicolas

Armstrong Excelon Tile is a vinyl-asbestos floor that costs only a few cents more per sq. ft. than asphalt tile. A wide range of distinctive designs and colors makes Excelon Tile suitable for any interior. Exceptionally durable and dimensionally stable, it can be specified with confidence for heavy-traffic areas. The vinyl content of Excelon Tile makes it highly resistant to greases, oils and alkalis. It can be installed over any subfloor: suspended, on grade, or below grade. Because Armstrong makes all types of resilient floors, we can offer unbiased recommendations for every flooring need. For information, samples, complete specifications, design and color scheme assistance, call the Architectural-Builder Consultant in your nearest Armstrong District Office or write Armstrong Cork Company, 1504 Watson Street, Lancaster, Pennsylvania.
Inside and out... Jamison cold storage doors show quality construction

Box girder construction of highest quality boat hull plywood gives maximum strength and rigidity. Large series "50" door is shown as door and frame meet on assembly line.

Insulation—Each block of insulation is individually measured and cut to give maximum insulation efficiency.

Tight Seal is assured by carefully applied gasketing. Gasket is soft sponge rubber resistant to acids, oils and greases.

Materials and workmanship assure top efficiency in rugged service

The reason behind the reputation of the Jamison Series "50" Cold Storage Door is apparent here. Some of the most important parts and components are never seen by customers... Yet operational efficiency in all types of installations continues to prove that Jamison quality materials and precision workmanship mean superior protection and overall economy.

If you have plans for modernization or expanding, first get the story on Jamison's Series "50" Door. Write for your copy of Section 3. Jamison Cold Storage Door Co., Hagerstown, Md.

More JAMISON Doors are used by more people than any other Cold Storage Door in the world.
Top protection — 2-pole common trip Duo-Guard Pushmatics

New safety, new convenience! Now, wherever you need full protection for 220V circuits—in residential, commercial or industrial applications—BullDog’s new 2-pole common trip Duo-Guard Pushmatics® will deliver it. You’ll get all the advantages of single-pole Pushmatics—the famous 2-way Duo-Guard thermal and solenoid magnetic protection—plus simultaneous tripping action on both poles.

Simple and safe! A push of the button gives simultaneous “ON” or “OFF” operation. In event of an overload or short circuit, both poles are automatically de-energized. Specify BullDog equipment for all your electrical work—count on it to provide the safety, convenience and quality that build client satisfaction.

Cutaway view (left) shows interior of 50-amp, 2-pole common trip Duo-Guard Pushmatic. A common push button controls both poles simultaneously. These 2-pole, 120/240V AC units are available in 15-, 20-, 30-, 40- and 50-amp ratings... fit any BullDog Electri-Center®.

Let your BullDog field engineer demonstrate all the advantages of Duo-Guard Pushmatic circuit breakers and Electri-Centers. A complete range of sizes and ratings meets all applications, providing complete client satisfaction.
16 alleys wide—and not a single supporting column. Truscon's new Clerespan Steel Joists give Miracle Lanes Bowling Alley, Toledo, Ohio, clear, profitable space wall to wall.

Truscon Clerespan Joist design utilizes a Warren-type truss. Relatively shallow depth allows pleasing exterior design and saves in masonry work by reducing the required height of building walls. Clerespan's light weight allows more savings in lighter framework and footings.
TRUSCON
CLERESPAN® STEEL JOIST
LONGSPAN SERIES

Now made up to 96 feet long. Load-bearing capacity is predictable and dependable. Send coupon for Clerespan dimensions and loading tables.

Suspend a fire-resistant ceiling from Clerespan Joists by using Truscon Metal Lath, channels and plaster. When plastered, it forms a lightweight fire-resistant "membrane", wall to wall, protecting structural members from any fire below them. Truscon offers more than 40 different Metal Lath items and accessories that are accepted by all building codes. Your plastering contractor knows them.

TRUSCON
CLERESPAN® STEEL JOIST
LONGSPAN SERIES

Truscon Ferrobord® Steeldeck, welded or clipped to the top of Clerespan Joists, produces an ideal, fire-resistant roof. Ferrobord is light, easy to handle, easy to place. Long lengths span three or more purlins. It roofs large areas quickly—flat or pitched. Full-length interlocking increases strength. When laid, Ferrobord provides the perfect surface for application of insulation and built-up waterproofing. Send coupon for specifications and tables.

Provide added fire-resistance with Truscon Interior Steel Doors. And, save dollars in the process. Truscon Steel Swing or Slide Doors and Frames are easy and fast to install. There's no need for on-the-job cutting or fitting. No sanding or sealing required. Doors are prime finished at the factory, ready for one-coat finish painting. A wide variety of types and sizes—including various panel and louver choices—is available in Truscon warehouse stocks. Send coupon for details.

All flush doors may look alike... but these 9 reasons prove why America's Finest doors are Paine

These nine production photographs show the time... craftsmanship, precision, care... and highly specialized equipment required for the manufacture of Paine Rezo Doors. Backed by over a century of woodworking experience and more than nine million installations, it's no wonder architects, dealers, builders—and home owners—call Rezo Doors America's finest doors!

For information, write:

PAINELUMBER COMPANY, LTD.
ESTABLISHED 1853 • OSHKOSH, WIS.

1 All lumber kiln-dried to specific, and uniform moisture content.
2 Stiles and rails securely fitted. Stiles are 11/8" instead of 11/8".
3 Hand-matched face veneers; the panels 3/4" thick—instead of 1/2".
4 A complete coating of resin glue is applied by machine.
5 Accurate assembly is assured by controlled heat and pressure.
6 Doors pass through a complete conditioning cycle in special kilns.
7 Doors are carefully belt-sanded to a cabinetmaker's finish.
8 Special doors are custom-made by experienced craftsmen.
9 Each door must be painstakingly inspected in oblique light.
Modern in design, Houston's new Bank of the Southwest uses wrought iron pipe for hot and cold water lines, vent piping, all downspouts, and drain piping from air conditioners.

Wrought Iron guards this bank's corrosive piping services

Designers seeking piping permanence for this new bank in Houston, Texas, chose wrought iron pipe.

Service records of wrought iron pipe's performance in these corrosive trouble-spots vouch for the durability of this material. Annually, wrought iron pipe's corrosion resistance results in great savings for building owners.

Such savings make wrought iron pipe low in cost, per-year-of-service.

Our booklet, Piping for Permanence, reviews a wide range of wrought iron installations which may help you in your planning and design. Write for a copy. A. M. Byers Company, Clark Building, Pittsburgh 22, Pennsylvania.

April 1957 43
National Homes, Lafayette, Indiana, specifies Styrofoam 1" thick placed horizontally around the perimeter 12" from the foundation wall of the house.

Styrofoam insulation 1" thick is then placed at an angle 12° high against the poured foundation wall.

National Homes uses Styrofoam

A new concept for construction of all masonry structures:

Styrofoam is used to eliminate dampness and cut building costs. Portland cement mortar bonds Styrofoam to the masonry—permanently, without studs. Plaster keys directly to Styrofoam surface—smoothly, without lathing. No special training or tools are needed. And the warm, dry walls keep their smooth, crack-free appearance year after year. The man who looks ahead will investigate this!
3. Next the slab is poured—and that's it! From experience National Homes finds it has protection from cold and damp for the lifetime of the house.

**for lifetime perimeter insulation**

There are good reasons why this is so. The same reasons that can help you enhance your reputation.

Styrofoam* (a Dow plastic foam) is a homogeneous insulation with a remarkable combination of properties. This rigid insulation contains millions of noninterconnecting air cells. As a result, it can't absorb water. It provides true protection against dampness and water. Its low thermal conductivity stays low. In addition, it resists rot, mold, deterioration. And having no food value, vermin and rodents won't bother it. But what makes Styrofoam even more outstanding is its unparalleled performance in such fields as low-temperature and plaster-base construction... industrial equipment... roofs, cavity walls and wall panels. This clean, odorless, lightweight insulation has many applications that are well worth your investigation. You'll find Styrofoam pays off in lifelong efficiency and economy.

*Styrofoam is a registered trademark of THE DOW CHEMICAL COMPANY

How **ANEMOSTAT**

All-Air **Constant Volume**

High Velocity units operate

Here is a vitally important advance in the field of air distribution. Anemostat All-Air High Velocity units, *with new simple automatic controls*, deliver constant volume, no matter what the fluctuations from 1:4 or 4:1 on inlet pressures of either the hot or cold valve.

Each unit is a single package including the controls and integral thermostats, if required. There is complete accessibility of all controls through removable diffusers. No access panels are required. Capacities of CONSTANT VOLUME units can be pre-set at the factory.

These Anemostat CONSTANT VOLUME units

- Assure scientific draft-free distribution of air.
- Are available in 100% induction units.
- Include Anemostat die-cast metal rocket-socket valves. More than 50,000 of these valves are in service, and not a single one has needed maintenance.

- Operate on standard 15 lb positive acting compressed air systems.

Each unit contains a micropressure regulator in the box, sensitive to .02 static pressure. This in turn operates a pneumatic motor and independently maintains by adjustment constant volume, while the wall mounted or integral thermostat controls the outlet mixture temperatures.

Write on your business letterhead for your copy of

**New Anemostat Selection Manual 60**

to Anemostat Corporation of America,
10 East 39 Street, New York 16, N.Y.

ANEMOSTAT: The pioneer of All-Air Velocity Systems
why more architects are specifying Streamline® copper tube and fittings for drainage

In designing a home, you, as an architect, consider every component with great care. That's why we'd like to point out that by specifying Streamline copper tube and solder-type fittings for drainage, you add still greater merit to your most sound architectural design. With Streamline copper tube and fittings, for example, there are no caulked joints to leak . . . no rust to impair the building's beauty and utility. In addition, compact Streamline stacks fit into standard 2" x 4" partitions . . . increasing usable house space and affording greater flexibility of design. The net result is a modern corrosion-resistant drainage system that will last for the life of the building.

It costs a little more, but the extra cost of a drainage system of copper is negligible when you compute its practical advantages.* When Streamline tube and fittings are used, it means a trouble-free future for your client's home.

Remember—the advantage of an all-copper Streamline drainage system far outweighs the small extra cost. Write today for information Kit No. 15 containing the detailed story of using copper for drainage.

MODERN DESIGN CALLS FOR COOLITE

Extensive use of Coolite glass in sidewall sash in the Thomy Lafon Elementary School, New Orleans, fits the aims of architects, Curtis & Davis, to obtain "the ultimate in scientific achievement for natural lighting . . . a truly functional architecture adapted to human values and physical needs." Coolite, glare reduced, floods classrooms with softened, glare-free light . . . absorbs up to 50% of solar heat . . . makes rooms appear larger, friendlier.

GLASS MAKES A GRACEFUL ENTRANCE

In a distinctively different doorway, made possible by the handsome Broadlite pattern, the reception hall is flooded with flattering, diffused daylighting. A rhythmic pattern, translucent Broadlite glass offers a new, dramatic decorating texture that creates a feeling of leisurely living and gracious hospitality, in either modern or traditional settings.

MODERN VISTAS ARE CREATED WITH GLASS

As advanced in design as the sleek California Zephyr seen through it, Polished Misco (Approved Fire Retardant No. 32) is used extensively in Chicago's Union Station to help protect its thousands of travelers. This rugged glass offers effective but inconspicuous protection at minimum cost in windows, doors, transoms, skylights, partitions... wherever fire and breakage protection is required.

COOLITE GLASS IS RIGHT VARIETY FOR HEINZ

Executed in a shimmering sweep of Coolite, Heat Absorbing, Glare Reducing glass, the Heinz Vinegar Plant, Pittsburgh, has been acclaimed "a brilliantly incisive piece of architecture." Here, employees see better, feel better, work better—for Coolite filters out unwanted factors in "raw" daylight... helps keep interiors cooler, more comfortable.

LONGSPANS GIVE CLEAR SPAN OF 69 FT TO NEW MILWAUKEE BANK BUILDING

This attractive new bank building is the newest Milwaukee branch of the First Wisconsin National Bank. It embodies the latest developments in modern banking facilities—plenty of parking space, drive-in windows and after-hours depositories, among others.

An outstanding feature of the new building is its 69-ft interior clear span, made possible by the use of 70-ft Bethlehem Longspan Steel Joists. The lobby and banking area, uncluttered by columns or supporting walls, is believed to have the largest clear span of any bank building in Milwaukee.

Bethlehem Longspans gave other advantages to the builders. The open webs of these steel joists simplified the installation of pipes and conduits. The joists arrived at the job site clearly marked, ready for immediate placing. And they contribute to the fire-resistant construction of the new bank, for steel joists in combination with poured floor slab and ceilings provide fire-resistance of up to four hours, depending upon the thickness of the slab and the type of plaster used.

BETHELHEM LONGSPAN STEEL JOISTS
VARI-VAC is selected for BIG heating jobs (and small ones too) to provide fuel economy . . . precise central control, even in higher ambients . . . simplicity of operation . . . minimum maintenance cost . . . ultimate in tenant comfort.

For 10 years VARI-VAC has been proved-in-use by the New York City Housing Authority . . . is installed in its earliest, in its most recent projects.

On your jobs, big and small, specify VARI-VAC, the differential vacuum heating system that automatically balances heat medium to balance with varying heat loss of building due to changing outside weather conditions.

New York City Housing Authority, "Landlord for 312,000 persons—"

VARI-VAC, nerve center for controlling heat, has been selected by the New York City Housing Authority to regulate heat for 927 buildings in 64 of its projects. These projects contain 74,761 apartments housing 283,972 tenants.
Just HOW equal is "OR EQUAL"?

Because all fluorescent lighting fixtures look good and sound good on paper, the safest way to answer the "or equal" question is to make a point-by-point comparison between the fixture that you specify and those offered as substitutes. This safeguards the architect's reputation as well as the owner's interest.

To save the architect's time and help him in his decision, every Day-Brite representative is prepared to make a table-top demonstration of the features that make Day-Brite the logical choice of architects, designers and engineers throughout the country.

Look at the fixtures, not just the pictures! Ask your Day-Brite representative for actual proof. He's listed in your classified phone directory. Send for new Architectural File material, just published.

when you specify an EDWARDS Clock System

For a school, a factory, or a hospital, you’re specifying the simplest, most dependable clock system available. Moreover you are doing away with master clocks and hourly resetting. Accuracy has been achieved through the use of the famous Telechron® motors that completely eliminate scattering and coasting. And, in case of power failure, reset action is automatic and immediate—no waiting for resetting to start on the hour as in other systems.

Keeping pace with the clock system is the simple Edwards Program instrument. No longer do you need worry about tapes, chains or other complicated devices. It will pay you to discover why you should specify the simplest, most functional clock system for schools, hospitals and factories. For information write Dept. PA-4, Edwards Company, Inc., Norwalk, Conn. (In Canada: Edwards of Canada, Ltd., Owen Sound, Ontario.)

EDWARDS Specialists in Signaling Since 1872

DESIGN • DEVELOPMENT • MANUFACTURE

Primed...for quick finish painting
No knots, splits or splinters

INSULITE PRIMED SIDING

Turn the page... read the whole story
Twelve-Inch wide Insulite Lap Siding, with 10 3/4" exposure, goes beautifully with any style or design. Half-inch thickness provides deep, beautiful shadow lines that accentuate the “long, low look” so popular in contemporary homes. Long lengths—8’, 12’ and 16’—mean less handling and waste. Vertical grooved panels on gable ends add an attractive touch. Grooved panels have shiplapped edges.

Board-and-batten design treatments made possible by Insulite Primed Siding in plain 4’x8’ panels are trim and handsome. Grooved panels, too, make strikingly distinctive sidewalks. Grooves are 3/8” wide, spaced 8” on center, and are fully prime coated for fast finish painting. Many other applications of Insulite Primed Siding include light commercial buildings, porch ceilings, and soffits.

No more paint blisters?

Flotation test apparatus in our research laboratory measures paint-blist er-resistance. Sample in foreground is wood, painted two coats. Sample at back is Insulite Primed Siding, painted one coat. Both have been subjected to the same moisture-forcing treatment. Notice how paint on one specimen has blistered and failed while paint on Insulite Primed Siding shows no blistering or damage whatever. In addition, test homes built with Insulite Primed Siding have now weathered three full years in severe northern climate; and today show no trace of paint blistering.
This is important, stimulating news for architects—a basic building material in a radically improved new form. Man-made siding that looks like wood...works like wood...in ideal architectural sizes...without imperfections!

Physical properties and application features of this new material are, in many respects, spectacular. Insulite Primed Siding is delivered in sturdy cartons...every piece flat, straight and square. It saws and nails beautifully. It is factory primed on face, edges, ends, grooves; and back primed. Finish painting is therefore fast, simple and economical. Most important of all, Insulite Siding shows an amazing resistance to paint blistering.

Lumber dealers and building contractors are now receiving complete information on this product. Retail yard stocks will soon be available everywhere. Want technical data? Write us—Insulite, Minneapolis 2, Minn.

**What it is:** Insulite Primed Siding is a machine-made wood fiber board, $\frac{1}{2}$" thick, with density of 36 lbs. per cu. ft. Has no internal grain to warp or twist; no surface grain to raise.

**Development:** Insulite Primed Siding has been developed by five years of research, pilot plant manufacture, laboratory and field testing. First test homes were built in 1954.

**Easy to saw, easy to work.** Cuts quick, clean with hand or power saw. Takes nails like wood.

**Full coverage...no scantage.** All dimensions are full and true. Grooved panels are 48\(\frac{3}{4}\)" wide, for 4' coverage with lap joint.

**Reversible weather drip edges,** on both long edges of Lap Siding, make water drip straight off, instead of flowing inward to wall.
For new construction...for modernization of any type of structure...here is continuous, crackproof coverage of any ceiling area. It is actually "continuous dry-wall" construction — with no perceptible seams — made possible by weatherproof Homasote in big sheets up to 8' x 14'...

The whole ceiling, whether one-layer, two-layer or more, literally floats — clear of all walls — free to expand or contract as a unit in either dimension.

It is hung from ceiling joists or rafters or collar beams. The supporting members need not be uniformly level at the bottom. It can be applied below old plaster ceiling.

Consider this ceiling method in any type of new construction of any size. Consider it for modernization — to lower a ceiling, to introduce indirect lighting or air-conditioning. Let us send you complete blueprint details and construction data. Kindly address your inquiry to Department D-16.
Lewin-Mathes' quality strikes a responsive accord.

Despite the large number of new customers for Lewin-Mathes Copper and Brass tube, pipe and rod in recent years, better than 90 per cent of our business comes from repeat customers. High fidelity of a rare order!

So long as we remain faithful to the highest standards of tolerance, temper and uniformity, we can expect our customers to remain loyal to Lewin-Mathes products. And as specialists—with a completely integrated plant designed specifically for the manufacture of tube, pipe and rod—it's in our own best interest to be perfectionists.

For the most fitting accompaniment to your plumbing, heating and air conditioning installations, specify...

deck insulation BOARD

compare it with any board, on any count

COMPARE FIRE HAZARDS — Rated Incombustible; Flame spread, only 20.5; smoke contribution, 0. Fesco Board's basic ingredient is Coralux perlite. Expanded and annealed at 1700°F it is incapable of burning.

COMPARE PERMANENCE — No rot, no fungus, no decay. Our basic expanded Coralux perlite ingredient is dielectric and chemically inert. It will not support organic life of any type.

COMPARE MOISTURE RESISTANCE — Only 1.5% absorption by volume @ 24 hours total immersion. Not only is the basic ingredient of Fesco impervious to moisture but the board is completely impregnated with a water repellant binder. Fesco has no capillary or wick-like attraction as do fibrous materials.

COMPARE WEIGHT — Only 9 oz. per board foot. Because expanded Coralux perlite is feather-light, Fesco Board is only half the weight of most boards.

COMPARE DIMENSIONAL STABILITY — Linear change at 100% RH at 10 days + 1/5 of 1%. Due to its low moisture absorption, and mineral composition, Fesco Board will not grow, shrink, curl.

COMPARE DURABILITY — Compression resistance is 174.8 PSI. Fesco Board is not damaged by normal installation and maintenance traffic.

COMPARE LAYING TIME — Convenient 24" x 36" size. Smaller, lighter, dimensionally stable sheets lay truer, faster.

COMPARE COST — No other board, at any price, can match Fesco Board's balanced combination of every job-required property.

MANUFACTURERS OF STAINLESS AND CARBON STEELS
The trim, low lines of the Minocqua bath have been given fresh selling appeal with the addition of a 4-inch bench rim.

Space-saving dimensions solve many problems caused by limited space available in today's homes, yet the Minocqua affords the convenience, comfort and safety of the full 5-foot length, slope end, flat bottom.

The sparkling, easy-to-clean enamel of the Minocqua—like that of all Kohler baths—is fused to a base of non-flexing iron, cast for strength and rigidity. The complete line of Kohler baths includes sizes and styles that permit various arrangements in bathrooms of any shape or size.
Skylights with domes formed from PLEXIGLAS provide efficient, balanced daylighting. Covington Elementary School, Laurenburg, N.C. Architect: Leslie Boney.

PLEXIGLAS diffusers provide high-level illumination with low surface brightness in the main banking area, and a 105-ft. high internally-lighted sign with PLEXIGLAS letters and corrugated background gives dramatic exterior identification. Citizens National Bank, Abilene, Texas. Architect: George Dahl.
Daylight Louver Panels
formed from PLEXIGLAS, for light transmission, daylight control, and weather closure in one continuous surface.

PLEXIGLAS
The Architectural Plastic

... for lighting ... signs ... skylights ... daylight-control glazing

It is the outstanding combination of properties obtained with PLEXIGLAS® acrylic plastic that accounts for the specification of this material for so many light-transmitting applications. PLEXIGLAS is—

Formable economically into domes, pans, spandrels, louvered panels, letters, sign faces, and corrugated sections.

Resistant to age, weather, sun and corrosion.

Strong, yet light in weight.

Efficient in the transmission and diffusion of light.

Clear, in transparent form, as optical glass.

The coupon below will bring you color samples and the names of sources of supply for building products and signs that incorporate PLEXIGLAS.

KNOCK ON THE GRANT FOLDING DOOR, naturally!

The Grant Folding Door alone combines the flexibility of fabric with the solidity of a 5/16” core. Designed by Paul McCobb, in cooperation with the nation’s leading Sliding Hardware manufacturer, it is the only such door that has captured both the beauty of specially designed fabric and the durability of a natural door.

- solid, 5/16” core—you can knock on it.
- finely textured vinyl fabric, laminated to core.
- sound-resistant, light-proof
- nylon carriers, aluminum track
- minimum stacking space—door stays put against jamb, without air pockets, puffiness or distortion
- nylon friction catch
- wide range of colors and sizes

Write for your copy of the Grant Reference Catalogue. Important data on Folding Doors and the full Grant line.

Outstanding single source for sliding hardware.

BETTER APPEARANCE is achieved with the help of Atlas Mortar Cement in new men's dormitories at Valparaiso University, Valparaiso, Ind. According to Masonry Foreman James S. Sedan, "This is the best mortar I have ever used—has remarkable workability and stays workable." Project architects: Hare & Hatch, New York; Contractor: Hagerman Construction Corp., Fort Wayne, Ind.

Modern masonry for modern design laid with ATLAS® MORTAR Cement

- Better mortar workability characteristics are the basis for better masonry.
- Field reports confirm that Atlas Mortar contributes to excellent workability, high yields, and weather-resistant masonry.
- Quality-controlled manufacture of Atlas Mortar promotes uniformly good performance and appearance. (Complies with ASTM and Federal Specifications.)

For further information, write Universal Atlas, 100 Park Avenue, New York 17, N.Y.
3 Penn Center: Custom Windows without the Premium of Custom Prices. Combination fixed and ventilator windows are adapted from a standard Lupton design. They're good-looking, maintenance-free, and unusually well suited for air conditioned buildings. See Section 17a/FLy in Sweet's for the full story.

Providing the modern luxury of a built-in lavatory comes easy with the Lowell. This distinctive vitreous china flat-rim model is styled for it. The modern slant-back design is both functional and handsome, lending itself ideally to convenient, attractive twin installations. It blends perfectly, installs easily, with tile as shown above, or with “plastic-covered” counter tops. Available in five Briggs Beautyware compatible colors or white, the Lowell is the “showpiece” of any modern bathroom!

**SPECIFICATIONS:** • 22” length, 18” width • Model Number B-3500 HS • Deep 17” x 10½” bowl has maximum water capacity, twin concealed front overflows • T-8808-S fitting with aerator mounted • Jiffy Pop-up Drain with removable stopper • One-piece, leakproof, stainless steel molding (B-3085) available when required.

A new design approach for New York City public schools

The critical design decision in PS 220 was to employ an aluminum window wall system rather than the conventional 12" masonry spandrel with double-hung windows.

With first costs approximately equal, the decision to use curtain walls of Alcoa® Aluminum was a good one. It permitted use of flat-slab concrete construction without additional spandrel beams. This, with set-back columns, allowed heating ducts to be routed easily without sleeves or offsets. Wind loads could be transmitted directly to floor slabs through the aluminum mullions. Moreover, entire erection procedure was simplified, with one trade responsible for all exterior skin work, including flashing and calking.

Projecting vents in this window system form a continuous ribbon, conveniently located for hand operation. Vents and fixed lights can be safely cleaned from inside.

Alcoa works closely with qualified fabricators on the engineering and design of wall systems, but does not bid on these jobs. Alcoa architectural specialists are ready to work with you in the use of aluminum in building construction. For this assistance, call your nearest Alcoa sales office. Or write Aluminum Company of America, 1890-D Alcoa Building, Pittsburgh 19, Pennsylvania.
Director of the Bureau of Construction and Michael L. Radoslovich, Chief Architect of the Bureau of Construction.

THROUGH WINDOW FIXED LOUVERS provide ventilation. Since they are made from aluminum, they will not rust, rot or warp.

(At left) DOORS and panic exits of Alcoa Aluminum are safe, durable, maintenance-free.

Your Guide to the Best in Aluminum Value

MULLIONS are first clipped to floor slabs. Preassembled sash units and aluminum panels are then inserted quickly from inside of building. Each unit is compact and light for fast, easy shipment, low-cost installation.

HANDSOME APPEARANCE combined with low maintenance, high structural strength and ease of installation make aluminum window walls a good feature for school architects to investigate.

ELECTRICAL FLEXIBILITY...
WITHIN A BUILDING BUDGET

New exclusive CECO Electro-Channel Steel Joist Construction for Underfloor Electrical Systems
Saves Time . . . Saves Weight . . . Costs Less, Too

Building planners recognize the basic fact that in this "electrical age" buildings must be wired for the future. To provide only for today's requirements is not enough. Use of electrically-operated business machines and communication equipment is constantly increasing. But the question is: How to provide for future electrical flexibility at lowest cost? Ceco meets the issue with its new Electro-Channel Open Web Steel Joists. Now, for the first time, steel joist construction can provide an integral underfloor raceway system allowing complete electrical flexibility. These joists have the same structural properties as regular Ceco Shortspan Open-Web Steel Joists. But in the Electro-Channel Joists the conventional top chord is replaced by a specially shaped hollow section which serves both as the top chord of the joist and as an underfloor distribution duct for electrical circuits. For complete information on Ceco Electro-Channel Steel Joist Construction, consult your nearest Ceco office. Approved by the Underwriters' Laboratories for use with electrical header ducts and accessories as manufactured by General Electric, National Electric Products Corporation and Walker Bros.
"CREATIVE ENGINEERING" BY CECO—with a variety of building methods and products to meet any design problem. See CECO in the early planning stage for Steel or Concrete Joist Floor Systems—the most economical Underfloor Electrification—the widest line of Steel and Aluminum Windows and Curtainwalls. All will help you accomplish your design objectives. And CECO products and services assure quality construction on a tight budget.

**FOAMGLAS®**

the cellular, stay-dry insulation

**FOAMGLAS IS VAPOR-PROOF**—Cut a 1/4" thick slice from a FOAMGLAS sample. Hold it tightly to your lips and try to blow cigarette smoke through it. The smoke won't penetrate . . . proof that FOAMGLAS is its own positive vapor barrier.

Vapor can ruin ordinary insulations . . .

Prove to yourself that FOAMGLAS is vapor-proof!

Send for a sample and test it!

Nature exerts almost constant pressure to force heat and moisture vapor through a thermal insulation. Permeable insulations absorb that vapor. Even expensive vapor barriers cannot always insure absolute protection.

Once vapor enters an insulation—and condenses there—insulating value starts to nosedive . . . because moisture conducts heat. The real cost of a permeable insulation may multiply two or three times . . . in terms of lost insulating value and the resulting increase in heating and cooling costs.

That's why it pays to specify FOAMGLAS for true insulating economy. This unique all-glass insulation is naturally immune to vapor attack. Composed of millions of sealed cells, each a separate insulating unit, FOAMGLAS repels moisture in any form . . . liquid or vapor. Its insulating efficiency can never vary, and no costly vapor barrier is needed to protect it. Prove it to yourself with the simple test illustrated above.

In a few minutes, in your own office, you can test the whole combination of properties that makes FOAMGLAS unique among insulating materials. These properties have been proved not only by rigid scientific tests, but by hundreds of actual insulating applications. Send for a free sample and complete testing directions today. Address:

Pittsburgh Corning Corporation

for sixty years,
for nearly every use,
for every good reason

Today's public preference for cheerful brightness emphasizes anew the tough, enduring, ageless beauty of Northern Hard Maple floors. What other floor, natural or synthetic, serves so many varied needs so well and so long? In the six typical areas pictured, MFMA Maple, you'll agree, is an eminently sound specification. It will serve for years with routine maintenance. Easy refinishing will bring out the "new floor" that's always waiting underneath. Available in wide variety of block patterns as well as the familiar strip. See Sweet's (Arch. 13j-MA) for full facts.

NORTHERN HARD MAPLE
BEECH AND BIRCH
Guard industrial plants against fire hazards with low-cost Fenestra* Fire Partition Panels. Made like a sandwich, with two galvanized 18-gauge steel Fenestra Panels on either side of four 1/4" layers of fire-resistant materials, this Fenestra Fire Partition is easy to assemble and erect. It can be moved to another location just as easily.

With a 21/2-hour fire rating, Fenestra Fire Partition Panels can be used to divide large open areas against fire spread, and to enclose paint rooms, inflammable storage or other hazards.

For existing plants, or for new construction, investigate Fenestra Fire Partition Panels. Your local Fenestra Representative—listed in the Yellow Pages—can give you all the details, including the results of a large-scale fire rating test conducted to ASTM standards at Ohio State University and witnessed by Factory Mutual Laboratories. Call him, today, or mail the coupon.

8 important steps required to produce FENLITE

1. Vapor Degreasing
2. Pickling
3. Rinsing
4. Liquid Fluxing
5. Oven Drying
6. Zinc Alloying
7. Passivating & Chemical Polishing
8. Final Assembling
Now!

Fenestra FENLITE process gives you new window beauty and durability

Distinctive New Fenestra™ window finish needs no painting!

Here's what you've been looking for in modern windows . . . distinctive appearance . . . lifetime corrosion resistance without painting . . . plus the strength of steel! The Fenestra FENLITE Process gives you all three of these important advantages. And it costs no more than an ordinary steel window with two-coat field painting.

Briefly, this new process protects the steel windows with an alloy-bonded lifetime zinc surface. Then, a special treatment "passivates" and chemically polishes the zinc for longer life and a bright finish.

Standard 20% salt spray tests indicate that this new treatment increases the resistance of the zinc to the start of white corrosion by 3 to 12 times. It also prepares the surface for a tight glazing compound bond and for decorative painting, if desired. Maintenance protective painting is not required!

The FENLITE Process requires precision electronic control of every step in the process. The windows must be completely submerged in one dip in each bath! Fenestra's specially designed "million-dollar" plant—the only one of its kind in America—has been adapted to produce this exclusive new finish.

FENLITE is available on all types of Fenestra Steel Windows—Architectural, Industrial and Residential. Ask your local Fenestra representative, listed in the Yellow Pages, to show you a sample. Call him, today, or mail the coupon below for complete information!

Fenestra Incorporated
PA-4, 3409 Griffin Street

Fenestra packages hollow metal door, frame and hardware units to save you up to $100 per opening with this... NEW IDEA

Look like costly custom-made doors, don't they? They're not. They're stock doors by Fenestra®—with an installed cost about $100 less per opening than you'd expect to pay!

Fenestra's new idea for saving you money on school doors is really very simple. We mass produce them on special jigs that save us expensive labor. We pass along this savings to you. We maintain large stocks of standard sizes to give you fast delivery and doors come to your building complete with frames and hardware, ready to install. You don't have to cut, fit, mortise, drill or tap a Fenestra Door. One

REIDLAND SCHOOL, Paducah (Reidland), Ky., cost less to build because 184 Fenestra 13/4" Hollow Metal Flush Doors were used. Architect: G. Tandy & Lee Potter Smith, Paducah, Ky. Contractor: Erhart-Knopf Construction Co., Inc., Louisville, Ky.
man with a screw driver can install it in minutes.
Fenestra Hollow Metal Doors swing open smoothly. They close quietly because there's a sound-deadening material inside. You save, year after year, on maintenance because Fenestra Doors can't warp, swell, tick or splinter. They last a lifetime!

Illustrated are Fenestra's 1 3/4" Entrance Doors, 1 3/4" Flush Door and the NEW 1 3/4" Fen-Air Louvered Door for air-conditioned buildings—three of the many fine doors in Fenestra's complete line. Call your Fenestra representative for detailed information or mail the coupon below.

April 1957
Fine architectural structures too soon become begrimed and unsightly unless protection against weathering is provided at the time of construction. The problem, which is mainly the repelling of water, is greatest when the exterior surface is limestone, porous brick, concrete or stucco.

Discoloration of exterior masonry usually reaches such an advanced stage that sand-blasting, or steam-cleaning, is employed to restore a look of newness to the surface. And although this process rids the surface pores of dirt, it also opens up the pores still more, so that subsequent discoloration progresses even faster than before.

The solution to the problem of discoloration lies in attacking the very root of the trouble. Discoloration is caused by rain washing down over exterior surfaces and carrying with it soot, grime and dust, depositing such material in the surface pores. When the water is repelled instead of absorbed, discoloration does not occur. But the problem is greater than would appear at first glance. It is not so much to find a colorless repellent that will repel water as it is to find a repellent that will keep on being effective over a period of years.

Truscon “Super-Por-Seal with Silicone” combines the weather resisting and water repellent features necessary to protect the finest types of construction materials. Limestone and other fine structural stones retain their natural appearance and beauty longer.

Spalling and discoloration are the common causes of unsightly appearance. A single coat of “Super-Por-Seal with Silicone” will help to maintain the dignity of appearance of fine structures for years. Absorbent types of surfaces, such as common red brick and mortar, are likewise protected against water and dirt absorption, as the surface pores are actually lined with repellent and chemical resistant “Super-Por-Seal with Silicone.”

For details and specifications write Truscon Laboratories, Dept. P-3, Detroit 11, Michigan
NEW General Electric bulletin tells . . .

HOW YOU CAN SOLVE YOUR BALLAST HEATING PROBLEMS

Send for your free copy today

You as a lighting engineer, architect, contractor, fluorescent lamp user or fixture manufacturer and we as ballast manufacturers are concerned with the basic problem of ballast heating.

Overheating drastically reduces lighting efficiency, ballast life, and results in wasted lighting dollars for everyone. G-E ballast engineers have long recognized this problem and are working constantly to design ballasts that give more uniform heat dissipation and longer operating life.

Intensive research by General Electric engineers shows that the solution involves much more than a carefully designed ballast. Surveys of heating problems indicate many other trouble spots.

Some of these are: Improper ballast application... misuse of building insulation... poor lamp maintenance... improper fixture design.

The trend to higher fluorescent lighting levels and higher-output lamp sources in industrial and commercial applications is increasing daily. This means that it is more important to you than ever before to be provided with more dependable and economical ballast operation.

In this new illustrated bulletin, “Let’s Talk About Ballast Heating,” General Electric engineers have laid the facts on the table. They carefully describe, in simple, easy-to-read language, the causes of ballast overheating, the basic heat problem, and what happens to an overheated ballast. But, most important, they tell what you can do to help prevent overheating.

To get your free copy just fill out the coupon and send it in. Your copy will be sent to you by return mail.

If you have a specific heating problem right now, why not contact your nearest General Electric ballast sales engineer? He’ll be glad to answer your questions and tell you how General Electric longer-life ballasts can help you save lighting dollars.

Progress Is Our Most Important Product

GENERAL ELECTRIC
Must a Fire Door

What about heat transmission?
Stopping flames is just one part of a fire door's job. For 500°F., heat will easily ignite many materials and cause fire to break out on the other side of a fire door even if the original flame and fire are stopped. This chart (right) proves the positive protection a Weldwood Fire Door offers against destructive, suffocating heat. This substantial margin of safety is due to Weldrok® — the exclusive incombustible core material of the Weldwood Fire Door (U.S. Pat. No. 2,593,050). Weldrok is a mineral material consisting of hydrous calcium silicates with asbestos fiber binding.

What about proven performance?
Just in the last 10 years, many thousands of Weldwood Fire Doors have been installed in all 48 states. Between them, these doors have lived through every conceivable adverse condition—fire, flood, slamming, storms, violence, and severe use. The Weldwood Fire Door always comes through! And this door is approved by Underwriters' Laboratories for all Class "B" (vertical shaft) and Class "C" (room and corridor partitions) openings. The Weldwood Fire Door is also approved by Factory Mutual Laboratories, New York City Board of Standards and Appeals, and Building Official Conference of America.

Blowtorch barrage! In laboratory tests up to 1700°F., the Weldwood Fire Door proved its superiority.

What about weight?
Weight has no part in stopping flames or heat. The Weldwood Fire Door gives vital protection from fire and heat, yet is 33% lighter than some other core fire doors. And that lighter weight means no hidden costs from sky-high shipping charges . . . simpler installation because the door is easier to handle and carry. One man can install the Weldwood Fire Door. No undue strain on hinges and door frames, either!

What about day-to-day use?
Even with bad luck, a fire is a once-in-a-lifetime event. Day-to-day performance is almost as vital. The Weldwood Fire Door — because its Weldrok core is completely inert and won't absorb water — will never warp, twist or get out of line. And that's a guarantee! Furthermore, in laboratory tests a Weldwood Fire Door was opened and closed 200,000 times. Then the same door was opened and slammed shut an additional 100,000 times. Even after this torture test, the Weldwood Fire Door still worked like new!

What about appearance?
The Weldwood Fire Door is as beautiful as it is practical. Choice hardwood veneers are a pleasure to look at, easy to maintain. Choose from regular stocks of Birch, Korina®, Mahogany, Rift Oak, Walnut or any other wood, on special order. Veneers may be picked
be only “Fireproof”? to match wood-paneled walls, if you wish. And doors are available in a complete range of sizes (up to 4’ x 7’—two sizes larger than some other doors). UL approved vision panels of 10” x 10” or 8” x 12” available.

What about construction?
Compare the construction of the Weldwood Fire Door point by point:

1. ¾” hardwood stiles treated with Class “A” fire-proofing agent. Note UL label and individually registered guarantee number on the stile for your protection.

2. Incombustible Weldrok core. A material that needs no artificial fireproofing because it is naturally unburnable and incombustible. Won’t char, deteriorate or “break down” either! This exclusive core material is dimensionally stable, strong, light in weight. Won’t warp, shrink or swell.

3. Handsome hardwood face veneer ½” thin. (Send coupon for complete proof why “thin” veneers are better.)

4. Solid hardwood rails, treated with Class “A” fire-proofing agent. Top rail is ½”, bottom rail 1½” to permit trimming.

5. Hardwood crossbanding. This ¼” veneer is bonded to the core with a waterproof phenolic resin glue.

All underwriter approved types of hardware are easily installed if simple directions are followed. This has been proved over years of continuous use with complete satisfaction.

What about a guarantee?
This guarantee is given in writing with every Weldwood Fire Door installation: “United States Plywood Corporation unconditionally guarantees, if properly installed, this Weldwood Fire Door against warping, twisting or manufacturing defects for the life of the installation. If any Weldwood Fire Door should fail to meet these standards, we will replace said door without charge, including all labor costs of hanging and refinishing involved.”

Typical Installation of Mohon Long Span M-Deck with Acoustical Ceiling and Troffer Lighting in Rigid Frame Construction. In installations of this type, the Long Span M-Deck Sections and the Troffer Sections serve as the Structural Roof and the Acoustical Ceiling Combined.

**ELECTRIFIED M-FLOORS**
Mohon M-Floors provide electrical availability in every square foot of floor surface—safeguard buildings against electrical obsolescence in years to come.

**CONCRETE FLOOR FORMS**
Mohon Permanent Concrete Floor Forms in various types meet virtually any requirement in concrete floor slab construction over structural steel framing.

**ACOUSTICAL and TROFFER FORMS**
Provide an Effective Acoustical Ceiling with Recessed Troffer Lighting—Serve as Permanent Forms in Concrete Joist and Slab Construction of Floors and Roofs.
as the Structural Unit, the Roof Deck and Interior Finish Material as Well

... Acoustical Treatment can also be included in the Same Package!

Mahon Long Span M-Decks are ideal for combined roof-ceiling construction in such structures as auditoriums, armories, sports arenas, churches, and other types of buildings where exposed truss or rigid frame construction is employed.

An M-Deck is a structural roof and ceiling combined... its structural sections span from wall-to-wall or from truss-to-truss, eliminating the cluttered effect of roof purlins and producing a neat, continuous, flat metal ceiling surface—all of which can be acoustically treated. If recessed lighting is desired, Mahon Troffer Sections can be included in this type of roof-ceiling construction in any ratio to meet specific lighting requirements.

Mahon M-Deck Sections and Mahon Troffer Sections are roll-formed from galvanized, structural quality steel... they are permanent and indestructible. Exposed surfaces in roof-ceiling construction can be readily painted to match or harmonize with any interior decor.

All Mahon Long Span M-Deck Sections can be furnished with bottom metal perforated and sound absorbing material inserted to provide a highly effective acoustical ceiling. Noise Reduction Coefficients range up to .85 in Mahon Sections recommended for this use.

Some of these Mahon Sections do not appear in the current Sweet’s Files. Why not have a Mahon sales engineer call and bring you up to date on new Mahon products now available for Floor, Roof, and Combined Roof-Ceiling Construction.

375 PARK AVENUE

Numerous styles of Pomeroy custom-built Enclosures enhance prestige buildings recently completed and buildings presently under construction.

The low, free-standing enclosure sketched here will soon take its place with the other ultra efficient products selected for 375 Park Avenue. We are proud to be part of this building operation that represents another example of modern architectural achievement.

S. H. POMEROY CO., INC., 25 BRUCKNER BOULEVARD, NEW YORK 54, N. Y.
Here's why Mr. L. V. Lacy, Vice President of Sordoni Construction Co., chose Gold Bond Corrugated ASBESTONE "400" for this Fast-Freight Terminal

"light weight—speedy erection—low cost—freedom from maintenance"

This Buffalo Fast-Freight Terminal for the Delaware, Lackawanna & Western Railroad Co. was built by Sordoni Construction Co. As Mr. Lacy of Sordoni Construction Co. puts it:

"Gold Bond Corrugated ASBESTONE "400" was a most practical material for the exterior walls of the warehouse, which is not heated, because of its light weight, speedy erection, low cost and freedom from maintenance." These are four of the most important points to consider when you specify building products for exterior walls or roofs.

Mr. Lacy's firm put 27,000 square feet of corrosion-resistant Corrugated ASBESTONE "400" on these sidewalls. The money that Gold Bond ASBESTONE "400" saved on the initial application was only the start. ASBESTONE "400" will save maintenance dollars every year—and it actually grows stronger with age.

Does this Fast-Freight "400" story suggest a Gold Bond® Corrugated Asbestone use to you? Wherever you use it, you're getting strength and good looks for a lengthy lifetime. For further details, write Dept. PA-47, National Gypsum Company, P. O. Box 5237-B, New Orleans, La.
Modernizing in stucco?
low-cost expansion joint
helps do the job 3 ways better

Here's a building being prepared for the application of exterior stucco. At this stage, Penmetal Expansion Joint (see arrow) had been applied to left side only.

Finished remodelling job. Arrow points to Expansion Joint in stucco. Decoratively patterned, this aperture breaks the flat wall expanse, enhances the appearance of the building.

LONGER LASTING
Stucco jobs keep their new look longer when the Penmetal Expansion Joint is applied for anti-crack protection. A specially designed ground expands and contracts with any movement of stucco. This absorbs internal stresses and strains—greatly reduces the threat of cracking.

GREATER ECONOMY
Long-run savings on maintenance justify ten times over the small initial cost of a Penmetal Expansion Joint. What's more, the joint provides a work stop—no improvising, no special-order items. Saves time and labor, too; it's a one-piece joint and ground.

BETTER LOOKING
Many architects use the Expansion Joint to enhance the appearance of buildings. They have placed it in squares, rectangles, etc., to break the monotony of drab, flat, building sides. In this way, beauty plus crack resistance is achieved.

Planning to modernize in stucco? Then plan to take advantage of the many benefits of Penmetal's expansion joint. Also used for plastered walls and ceilings. Ask for details.

PENN METAL COMPANY, INC.
General Sales Office:
40 Central Street, Boston 9, Mass.
District Sales Offices: Boston, New York,
Philadelphia, Pittsburgh, Detroit, St. Louis,
Dallas, Little Rock, Seattle, San Francisco,
Los Angeles, Parkersburg
A three-day wingding last month launched the new Philadelphia Hotel Sheraton (to be shown fully in a later issue), designed by Architects Perry, Shaw, Hepburn & Dean with Mary Morrison Kennedy, Architect and Vice-President of decorating and architecture for the Sheraton Corporation of America.

In a way, it was hard to see the hotel for the luminaries. For, in addition to attending limitless parties—a Calypso band from Bermuda; Xavier Cugat; Meyer Davis—I found myself swimming in a sea of officiadom (Mayor Richardson Dilworth, of Philadelphia); filmdom (Zsa Zsa Gabor); TV-dom (Eddie Fisher); baseballdom (Mrs. Cornelius MacGillivray); and Sheraton Hotel Corporation-dom (Ernest Henderson, President). Hostess for the formal dinner-dance (for Hungarian relief) was Mrs. Perle Mesta; and on hand were Ginger Rogers; Betsy Von Furstenberg; Martha Raye; Lefty Grove; Joe E. Brown; and Gypsy Rose Lee—to mention a few. We were once on the Steve Allen Show (Andrew Sisters); and two mornings, with Dave Garroway. The place was heaving; and it's quite a place.

Because of an unusually narrow site, the hotel has a three-story escalator-connected lobby that is elegant, colorful, and—perhaps most newsworthy—well endowed with the related arts. Carpets of the main lobby were designed by Anton Rerregier, who also did montage murals for Connie Mack Room; at the second-floor level, a full-height mosaic wall mural by Gyorgy Kepes; bordering a floating stair, joining the two levels of the main ballroom, a room-height metal-and-glass screen/sculpture by John Rhode; Lumen Winter’s murals on the walls of Town Room restaurant; Sally Swann Carr’s life-size, wood-carved figurehead for Indian Queen Tavern; and on the walls of Pennsylvania Ballroom, murals by Francis Scott Bradford.
A new hotel, department store, and underground parking garage—all units of Denver's Court House Square Development—are soon to be constructed within a short walk from the handsome Mile-High Center (foreground left) completed in 1955. Architects, as for the earlier building, are I. M. Pei & Associates for Webb & Knapp. The hotel (above) will contain 900 bedrooms and also provide ballroom and convention facilities. Its structure is to be of concrete with an exterior enclosure of precast mosaic frames serving as brise-soleil. The department store's structural frame will be of steel, using ribbed slab floors, and a skin enclosure of gold anodized aluminum panels with honeycomb core. Entrance to the store will be through a hyperbolic paraboloid concrete shell structure. The three elements, the 1200-car garage, department store, and hotel are to be interconnected underground.
Chicago citizens and groups who respect fine architecture are currently alarmed by threatened demolition of the Robie house, most famed example of Frank Lloyd Wright's early "prairie style." Chicago Theological Seminary has announced the house must go this spring to make way for a dormitory for married students, being designed by Holabird & Root. Protests from Chicago Chapter, AIA, from a Committee headed by Sculptor Milton Horn, from newspaper letter-writers, from signers of Seminary campus petitions, have been answered by Seminary President A. C. McGiffert, Jr., with statements that the site must be used, or another bought, for the new dormitory. He added that the house would be costly to restore and maintain (the Seminary bought it in 1926) and that it is not suited for use by the Seminary. Those interested contact: Samuel A. Lichtmann, President, Chicago Chapter, AIA, 53 W. Jackson Blvd., Chicago 4, Ill.

Temple U.'s New Campus Plan

Architects for the new campus development for Temple University, Philadelphia, Pennsylvania, are Nolen & Swinburne. Immediate needs are for six new buildings—Chemistry (top, center, model photo); Biology (right of Chemistry building); Physics (left of Chemistry building); School of Business (center, bottom); Teachers College and Communications Center (bottom, right). All buildings of this first phase of the development will be fully air conditioned.
**News Bulletins**

- Proposed amendment to bill before Subcommittee, H.R. 4660 (which would end lease-purchase program of Federal building and authorize expenditure of $1.5 million for new building program through 1962), has dual purpose: to centralize authority over Federal building in GSA for greatest efficiency and economy while encouraging advice and consent of each agency on design of buildings it will inhabit; to direct Commission on Fine Arts to advise and consult with GSA in establishing high standards of design, style, and ornamentation. Amendment was designed by Representatives Henry S. Reuss (Wis.), and Frank Thompson, Jr. (N.J.)

- Albert C. Martin & Associates, Los Angeles architectural-engineering firm, has established two annual grants for advanced study in architecture at University of Southern California. Unusual aspect of award is extension of firm's facilities and personnel to aid students in design solutions. First winners are: Donald R. Brown, Los Angeles; Rudy L. Veland, Fontana, Calif. . . . School of Future Essay Contest awards—contributed by School Architects Frederic P. Wiedersum Associates, Long Island, N.Y.—will send top winners Betty Bodian, New York City, and Joseph J. Berke, Newark, N.J., on all-expenses paid trips to Paris and Mexico.

- Top prize project in international U.S.A. Tomorrow Manhattan Redevelopment Competition was submitted by firm of Katz, Waisman, Blumenkranz, Stein, Weber (Architects Associated) in collaboration with team from Pratt Institute. Pratt students and faculty members captured 2nd and 3rd prizes also for schemes developed as part of thesis. Winners shown in photo (below) are: (l. to r.) Joseph M. DeChiara, Patrick S. Raspante, Sidney L. Katz, Frank Pisani, Herbert Auerbach—part of 1st Prize team; 2nd Prize team: Theodore Hinz, Paul Sanzari, Olindo Grossi, William Breger (William Bodouva and Alfred Marchesani absent); 3rd Prize team: Breger, Arthur Wrubel, Marc Feldman, Maxwell Levinson (Marc Weissman, Gerald Rosen, John Deans, Ralph Lentsch, Arnold Horn, Norman Wax absent). Winning solution (right) provides elevated crosstown highway, mid-city parking facilities, civic center, and exposition complex for fashion and industry. Areas adjacent to center were developed in parklike surroundings for commercial and housing purposes. Separation of pedestrians from motor traffic, ample thruway facilities, and parking were basic considerations.

- Summary of personal achievements at National Joint Conference on Church Architecture held in St. Louis, Feb. 26-28: Harold E. Wagoner, Philadelphia, Pa., was elected president of Church Architectural Guild of America; Guild's coveted Elbert M. Conover award was presented to Dr. William Kincaid Newman, lawyer, lecturer, and church-building executive of New York, for outstanding contributions to better church design. Guild's Architectural Awards went to: Durham, Anderson & Freed, Seattle, Wash., for design of St. Elizabeth's Episcopal Church, Burien, Wash.; Lawrence, Saunders & Cologna, New Orleans, La., for design of Gretna Methodist Church, Gretna, La.; Alfred W. Johnson and William Sargeant, San Francisco, Calif., for alteration of First Presbyterian Church, Burlingame, Calif. . . . 1957 Lloyd Warren Fellowship—awarded to winner of design competition "An International Airport"—was presented to Robert P. Burns, Jr., Roxboro, N.C. . . . Franklin Chenault Watkins, Philadelphia artist, is 1957 winner of Philadelphia Art Alliance Medal of Achievement.

- Pereira & Luckman, co-ordinating architects for contemplated $40-millions National Civic & Cultural Center in Washington, D.C., report that project is materializing rapidly while P/A's Frederick Gutheim reports from Washington that "the plan still lacks a realistic foundation in the needs of this city of 1.5 million of people, in operating considerations, and in meeting international obligations." Center—which would be constructed with funds raised by public subscription—is envisioned as multipurpose structure housing auditoriums and halls of varying sizes for banquets, balls, and conventions as well as opera, music, theater and exhibitions, Tourist Information Center, parking and dining facilities. As yet, site has not been determined.

- First skyscraper of this generation in Buffalo, N.Y.—18-story, curtain-wall structure designed by Emery Roth & Sons—will be built by Tishman Realty & Construction Company,
Inc., starting late in year... When completed in 1960, new Union Carbide & Carbon Corporation Building (below) will be tallest office building on New York's rapidly changing Park Avenue and among largest in city. Architects are Skidmore, Owings & Merrill.

- Architectural historians note: Index of Historical Architecture—selection of 300 buildings in New York City deemed worthy of preservation—represents culmination of six-year survey by Municipal Art Society and Society of Architectural Historians. Condensed copies called New York Landmarks will be sold by MAS at $2 each... James Grote Van Derpool, librarian of Avery Architectural Library, Columbia University, has announced acquisition of 56 original drawings of Saint Patrick's Cathedral, designed by Architect James Renwick, Jr. Other original drawings in collection are largely of 19th Century and include work by A. J. Davis, Richard Upjohn, Detlef Lienau, Calvin Pollard, Martin Thompson, and James Renwick, Sr... First printed book on architecture, De Re Aedificatoria, by 15th Century Architect Leon Battista Alberti, is currently on display at Robinson Hall, Harvard University, in exhibit of architectural books and drawings from 800 to 1800.

- For extensive activity in field of Industrial Design, New York City's Museum of Modern Art—represented by Museum Director Rene d'Harnoncourt—received La Rinacente's Grand International Compasso d'Oro Award for 1956 in formal ceremony held at Overseas Press Club, New York, Mar. 21.

- Jose Luis Sert, Professor of Architecture and Dean of Faculty of Design in Harvard University, was appointed to additional post as consultant for Harvard's own architectural and long-range planning problems... C. E. Silling, Architect, Charleston, W. Va., was named chairman of national committee on Modular Co-ordination, A62—which was organized under auspices of ASA... IDI officers for 1957 are: George A. Beck, President; Robert E. Redmann, Executive Vice-President; Leon Gordon Miller, Treasurer; John S. Griswold, Secretary. Architect Richard Neutra is now honorary member.

- Construction Surveyors Institute will hold 31st Anniversary Conference in Washington, D.C., May 13-15. For reservations write: G. Szmak, Executive Secretary, CSI, 101 Park Ave., New York 17, N.Y... "A New Century Beckons" will be theme of AIA Centennial Celebration Program to occur May 14-17, in Washington, D.C... Architects' Tour to Japan, headed by Kenneth M. Nishimoto, AIA Pasadena Chapter, Calif., is set for Oct. 1957. Details to be announced.

- New racetrack designs for sites in New York and Caracas, Venezuela—by architectural firm of Arthur Froelich & Associates, Beverly Hills, Calif.—reflect individual consideration of environmental demands. Multitiered Aqueduct Race-track (below) seats 21,000 persons and holds 65,000. Steel-frame structure with cantilevered trusses exposed above roof decking is sheathed in pre-cast concrete panels, brick, block masonry and serviced by 18 escalators, 10 elevators. Engineers: Stone & Webster Company. Hipodromo Nacional (above) is 52-building project including school for veterinaries, hospital, school for jockeys, dormitories, and cafeterias. Building seats 8500 and has capacity for 30,000. Multitiered concrete structure with cantilevered grandstands is topped by series of undulating thin-shell roofs. Interior walls are finished in block masonry and mosaic. To control heat and sun, enclosed areas are air conditioned while concrete grills and porcelain enamel louvers protect unshaded facades. Nine elevators and 16 escalators service project. Structural Engineer: Henry Layne; Pre-stressed Concrete Consultant: T. Y. Lin.
Building money, the housing-mortgage interest rate, the suspension of the lease-purchase program, and other Federal cuts in construction are probably the most significant items of news here this month. They all reflect the hard-money, anti-inflationary mood of the Administration. Perhaps they reflect a central policy: but it is certainly not a policy that has been formulated in a fashion that will allow people concerned with building to attack it in any effective fashion. Indeed, there is still plenty of evidence that the Administration is construction-minded. The 1958 budget contains major increases in Federal construction projects. While this is an area in which forthcoming budget cuts will probably fall heavily, it is not expected to result in any economically significant drop in building activity. Economists here are impressed with the large volume of private nonresidential building. They point out there are no pockets of unemployment in the construction field. Even if the budget is cut substantially, the total of Federal expenditures for construction will probably exceed that of 1956. Those concerned with building, except commercial housing, can probably count on continued high rates of activity. And it remains to see how much housing will actually be hurt by tight-money policies.

On the heels of the proposed new Federal office building flanking Lafayette Square along Jackson Place, discussed in this column last month, comes now a new Executive Office building to be constructed on the site now occupied by the one-time State, War & Navy Building, just west of the White House. Since the war, this building has accommodated various parts of the expanded Executive Office—the Bureau of the Budget, Office of Defense Mobilization, Council of Economic Advisers, and similar Presidential-oriented agencies. The immediate office of the President is still located in the west wing of the White House, built for that purpose, and extensively remodelled and enlarged at the time the White House itself was comprehensively reconstructed a scant half-dozen years ago. A carefully directed campaign to substantiate the need for enlarged office space for these headquarters has been under way now for some months. More recently it was intensified by the release of a management engineering report recommending the replacement of the old State Building. The climax presumably will come when an Advisory Committee on Presidential Office Space, headed by Robert V. Fleming, a Washington banker and Eisenhower crony, renders its report this June.

All this is part of a single problem, wrapped up with other questions, such as the character of the official residence of the President of the United States. It is a problem that has been repeatedly explored during the last half-century, in which executive power and the activities of the President's office, in particular, have steadily and hugely expanded. Theodore Roosevelt cleared the White House itself of office work, and constructed the first executive office wing. To it, by "the compromise of 1903," were also removed the meetings of the cabinet. Taft doubled the size of the Presidential offices. Hoover increased them again. Franklin D. Roosevelt tripled the executive-office space, largely by means of an underground extension. Truman's alterations to the White House halted this line of expansion, and commenced the great development of executive offices in the Old State building across the street. The growth of Presidential offices under President Eisenhower has strained both the offices in the White House itself, and those in the what is now called the Executive Office Building.

These changes do not imply that the White House is now chiefly a residence. The President, his family, and their immediate servants occupy hardly a single floor (about as much space as a Park Avenue apartment). The rest of the building is given over to public dining and reception rooms, museum, and "palace" functions. There is little space for "living" here—as most of us understand that term. But there is little time for "living," either! When the President is in Washington, he is confined and his time is fully absorbed. The White House social obligations have been greatly increased in recent years, and the visits of foreign chiefs-of-state and political leaders have become vastly more significant. The Eisenhower pattern of living is gradually being understood and publicly accepted, and it is going to make it easier for future Presidents to use the compact and efficient White House apartments while they are working, and to get away to their chosen spots when they can find time to relax. (I suspect this is becoming a familiar living pattern for executives more than we recognize.)

All this means the White House is becoming a ceremonial residence. But it continues a residence for all that, and that character makes its demand on what is done with Jackson Place. How it affects the design of the proposed Executive Office building is less evident. Not enough consideration has been given the architectural value of what now stands there—a building probably more reviled than any other in Washington since its construction in 1888. It may be a compendium of architectural errors, comparable only to the old Trocadero or London's Albert Hall, but it is a revealing one. Henry Adams called it "Mr. Mullet's architectural infant asylum," but the granite pile epitomized the taste of that age. Past efforts to tear it down or modernize it have founedered and, on the whole, I think we would do well to leave it stand. This does not mean that the needs of the Executive Staff should be ignored. They can be accommodated in new buildings elsewhere. If it means they are farther from the President, there are resources of improved communication and transportation to fall back upon. Everyone cannot be in the throne room.
Winners in AIA's Ninth Annual Honor Awards Competition, to be cited for fine design next month at the AIA Convention in Washington, D. C., have been announced. The Jury—Roy F. Larson, Chairman; John Knox Shear; Alden B. Dow; Philip D. Creer; and James M. Hunter—made the following citations from the 344 submitted projects:

**first honor awards**

2. Junior - Senior High School, Greenburgh, New York. Warren H. Ashley, Architect; Marchant & Minges, Engineers; Stewart M. Muller, Inc., General Contractor.

**awards of merit**

Awards of Merit will be given to:

Edward B. Page (residence, Belvedere, California); Skidmore, Owings & Merrill (Wyeth Laboratories, Radnor, Pennsylvania); Antonin Raymond & L. L. Rado (Memorial Hall for Japanese Steel Workers, Kyushu, Japan); R. B. O'Connor & W. H. Kilham, Jr.; Philip M. Chu, Associate in Charge (Tokeneke School, Darien, Connecticut); Golemon & Rolfe; Skidmore, Owings & Merrill, Consulting Architects (Medical Towers office building, Houston, Texas, June 1957 P/A); George Matsumoto (residence, Raleigh, North Carolina); John Carl Warnecke (Mark Thomas Inn additions); A. Quincy Jones & Frederick B. Emmons (residence, Los Angeles, California); Curtis & Davis (Our Lady of the Sea General Hospital, Golden Meadow, Louisiana, November 1956 P/A); A. Quincy Jones & Frederick B. Emmons (residence, Pacific Palisades, California); Stevens & Wilkinson (Rich's Department Store, Knoxville, Tennessee); A. G. Odell, Jr. (Wilson Junior High School, Charlotte, North Carolina, May 1957 P/A); Caudill, Rowlett & Scott (San Jacinto Elementary School, Liberty, Texas); and Paul Thiry (Northeast Branch Public Library, Seattle, Washington).
Financial News

by William Hurd Hillyer

Capital structure is more than ever a matter of attention for architects, now that physical structure is increasingly the result of monetary factors. Outstanding as an object of professional interest, financially, is the projected main building of The Chase Manhattan Bank in New York's Wall Street district.

First thought would indicate that the operation of financing a hundred-odd-millions banking edifice by a seven-billions bank would be just a matter of that institution's drawing a series of official checks to cover labor and materials. Time was when a bank might elect such a course; today the procedure is not so simple.

At the outset of the enterprise, Chase Manhattan found itself owning, among other parcels, two extremely valuable pieces of real estate—its banking-office building at 18 Pine Street, which it now occupies, and the structure at 11 Broad Street used by the bank for clerical overflow. The first step was to sell 18 Pine to the Chemical Corn Exchange Bank and 11 Broad to J. P. Morgan, both for undisclosed (but presumably large) sums. With part of the funds thus realized, Chase Manhattan bought the old Mutual Life building at Cedar and Nassau for $4,500,000 and proceeded to demolish it. This provided part of the land for the proposed building and plaza. As figures now stand (after a number of upward revisions) the new edifice with its $16-millions authorizing a $94 millions will go into building and plaza construction. Cost of furnishings and special facilities is estimated at $11 millions.

The whole transaction is being handled by means of a holding company, The Chase Manhattan Realty Corporation. This company is a “wholly owned subsidiary” with $5-millions authorized capital, the bank being sole stockholder. Chase’s investment in the stock of the realty corporation represents its equity in the building. As of January 31, 1957, the realty holding company borrowed $60 millions on first mortgage from the New York State Teachers Retirement Fund. The loan runs 30 years with customary amortization and bears 4% interest per annum. Under present tight money conditions, this is deemed a favorable arrangement for the bank. Since the loan is owed by the holding company it is not a direct obligation of the bank and does not appear as such on that institution’s books. What does appear is the usual item of “Bank Premises and Fixtures” which includes the 20 floors—will shoulder an $800,000 annual interest load which, taking similar situations as a criterion, it should be able easily to bear.

Inflationary pressures are less minatory than a month ago, Guaranty Trust Company of New York reveals. That institution sees the curve of over-all activity as turning downward somewhat earlier than has been generally assumed. Such a conclusion is fostered by a raise in the number of business failures, a shrinkage in new orders for machine tools, uncertain textile conditions, capital expansion cutbacks, and a further decline in new housing starts. These windstraws, however, are seen by Wall Street as pointing to readjustment rather than depression. The financial district no longer shares Government’s view that inflation is the country’s number one menace.

Tight money, nevertheless, particularly in the mortgage field, is still a problem and shows no signs of loosening. “Fanny May” (Federal National Mortgage Association) is coming to the rescue with over a billion dollars this year embracing 96,000 loans—when Congress gives her the money—but even so huge a sum, officials warn, will not assure “full liquidity” for mortgage investments.

Outlook for new school financing is sung by successful bond sales providing $14 millions for such purposes in the week ended March 8. Interest yield ranged from 2.1% for longer maturities of Yuma, Arizona.

Early estimates indicate that “gross national product” for 1957 will reach a level of $425 billions, compared with $412 billions for 1956, First National Bank in Dallas, Texas, discloses. Unless conditions change radically, this will mean a $3.5 billions increase in commercial bank loans—and continued tight money.
or real dishwashing efficiency and thorough sanitation, either the water pattern or the dishes must move. Hobart adheres strictly to this sound, proven washing and rinsing principle. In the flight-type, both the water pattern and the dishes move. You can see the complete coverage of the wash action (above). What you don't see is the continuous racking system that conveys the dishes through pre-scraping, power wash, power rinsing, final rinsing, draining and drying phases. The jet-powered wash pattern reaches every part of every dish racked in perfectly inclined position by the special stainless steel (nylon-coated) flight links. Hobart builds the only continuous racking dishwasher with all-stainless steel conveyors. A less expensive conveyor with nylon flight links is available.)

In kitchens where speed and capacity are demanded as flight-type is ideal. Sizes range from 12 to 26 feet long. Conveyor speeds from 5 to 12 feet per minute. Where volume varies, one of 50 other Hobart semi-automatic or dual-drive conveyor models will be exactly right. The smallest is two feet square. Each is designed for maximum volume in a minimum space and with minimum supervision.

As an architect, you'll readily appreciate the performance and dependability that are synonymous with the Hobart name. You'll appreciate, too, the complete flexibility of choice offered by the complete Hobart line. Check Sweet's Architectural File for complete specifications on all Hobart kitchen and dishwashing machines or send in the coupon.
Only Adlake gives these 6 basic advantages:

- No warp or rot
- Minimum air infiltration
- No painting or maintenance
- Finger tip control
- No rattle, stick or swell
- Guaranteed non-metallic weather stripping

The Adams & Westlake Company
NEW YORK  ELKHART, INDIANA  CHICAGO
Students of regional planning are agreed that the postwar phenomenon known as "the flight to the suburbs" is losing momentum, and its end is in the foreseeable future. Vacant land for single-family houses outside the cities is on the point of disappearing because of the speculations and successes of tract developers, voracious space requirements of industry, road-building programs, regional recreation areas, and other competitive demands. The disillusionment of so many families who did leave the cities in search of sunlight, fresh air, better school and civic facilities, relief from urban noise and traffic—when the very conditions they were escaping have crept up on them again—is serving to reduce the enthusiasm of those who have not yet ventured to move. Further, land prices in what were formerly rural and undeveloped suburban areas have risen immensely, the cost to tract developers has increased correspondingly, to the point where most families are being priced out of the market for new private homes. How then are the new increments of our exploding national population to be housed? Controlled multiple housing appears to be the only logical answer. Its successful attainment will to a large degree depend upon the architect's skillfulness and ingenuity. The examples on the following pages are representative of solutions within the current pattern of possibilities, from the viewpoints of design, financing, and land planning.

Since land costs within cities have always dictated high-rise and high-density housing, why are apartments a factor even more essential now than before? Most important of all, apartments are a major element of the solution to the problem of urban sprawl. City planners and redevelopment officials are realizing the political and economic importance of retaining a balanced leavening of income groups within the municipality—particularly including the middle-income families—as numerous housing units lost by slum clearance are being replaced by new housing. Finally, a large part of the population prefers apartments to private houses, and once costs bring well designed apartments within their reach through some feasible, universally available, and self-regulating mechanism of site and construction financing, the result will be overwhelming.
The four projects shown here and the completed Philadelphia apartment on the pages following are all being assisted by city, state, or federal funds. Principal objective in the planning of these buildings has been to achieve livability within the stringent design and budget limitations usually attached to subsidized multiple housing.

This project (below and right) designed for the New Brunswick, New Jersey, housing authority, will have 246 dwelling units. Service and community facilities are on the ground level. Enclosed elevator lobbies at each floor open onto exterior access galleries wide enough to be useful as fresh-air space for children and adults. Introduction of the galleries has also made cross ventilation possible for all the apartments. Decorative precast-concrete panels and sections of expanded-metal-mesh screening enclose the galleries. Alexander Merchant & Son, New Brunswick, and Turano-Gardner Associates, New York, are the Architects.

A similar solution with exterior galleries and their consequent benefits was developed for the Housing Authority of Stamford, Connecticut, with assistance from the Housing Division of the Connecticut State Department of Public Works. Here the design of the gallery is further refined by the introduction of setbacks. Large families are accommodated in duplex units on the first two floors. These units are directly accessible from the ground level and so help to lighten the elevator load. William F. R. Ballard is the Architect for this moderate rental project.
This state-aided low-rent public housing project (left and below) encompasses 2000 dwellings in four self-contained neighborhood units. Of particular interest in these high-rise structures are the extended central elevator lobbies which provide open-air spaces for community use at every floor. Exteriors of the reinforced concrete structures will be enlivened with brick of various texture and color and a gay pattern of multicolored metal panels on the protective screening of the open-air lobbies. Architects for this New York City Housing Authority project are Katz, Waisman, Blumenkranz, Stein, Weber: Architects Associated.

The same architects have designed a co-operative apartment house (below) for middle-income families, a state-aided limited profit development made possible through New York's Mitchell-Lama law. The project is noteworthy as the first to introduce prefabrication techniques into multistory housing design. The structural frame is concrete. Wall panels are of lightweight precast concrete having integral exterior and interior finish. Color is introduced at slabs and dividing walls of private balconies.
A quite limited area earmarked for housing on a site originally intended as a playground for the Philadelphia Department of Recreation dictated the height of this 16-story building. The project was designed for the Philadelphia Housing Authority, which specified provision of 120 dwelling units, community facilities for large meetings, kitchen, activity room, office for playground director, and toilets for playground users. "In the interest of economy and maximum amenity for the residents," write the architects, who are well acquainted with apartment house planning, "our approach was to provide the simplest possible form—in this instance a rectangular slab. Past experience had shown us the value of private terraces for apartment living. We felt that the extremely small maximum for room areas, imposed by public housing regulations, made the inclusion of adequate terraces even more desirable. Experience with the finished project has demonstrated the wisdom of this approach. The terraces get maximum use; they provide a safe outdoor recreational space for children and adults and effect cross ventilation for every apartment." Beyond private terraces, the architects have stressed the importance of well designed public spaces, and the introduction of color and ample sunlight. The lobby (acrosspage bottom) extends through the ground floor of the building and thus obtains natural light both from the street side and the playground. To heighten the effect of light and spaciousness, the walls are faced with three shades of pale-yellow terra-cotta tiles, the floor is gray-and-yellow terrazzo, and fluorescent lighting behind an eggcrate ceiling is employed. To counteract the effect of the small size of the rooms in the apartments, it was considered desirable to introduce large and continuous glass areas. This was achieved by using a reinforced-concrete flat-slab system, which also had the advantage of being the most economical since it provided finished floors and ceilings integral with the slabs. Columns are set back from the outer wall and slabs are cantilevered. "Not only do these cantilevered slabs reduce the moments in the interior slabs, but an obvious economy results from shortening interior slabs and reducing the number of columns. The resultant elimination of spandrel beams at the cantilevered edges also effectuated considerable economy."
Colors on the exterior of the building are two shades of warm brown—a light tan on the end walls and a chocolate brown on the spandrels of the long exterior walls. Color accents are provided by Mandarin-Red exterior doors to the terraces. In the apartments, a uniform light-beige paint was used to make the rooms appear as spacious as possible; the trim is brown. Doors and trim in service areas are dark brown; in laundry and community rooms at the ground level (across page top) they are dark green.
Because of the wind-force factor, the slabs could not be cantilevered at the end walls. "Sufficient wind-resistance," continue the architects, "even beyond structural safety requirements, is necessary for buildings with rigid partitions, to obviate cracking or crushing of the partitions resisting wind loads where the frame is too flexible. If this point is not carefully considered, excessive maintenance will result. To provide the necessary rigidity in the transverse direction, rigid frames are located in the short end walls and at the stairs and elevators (48" deep columns and 40" deep beams at the stairs, and 30" deep columns and 22" deep spandrels in the short end walls, which, with the masonry built into these walls, sufficiently increase the mass and rigidity). The wind forces are not critical in the longitudinal direction, and need no special provision." For lowest first cost, durability, and ease of maintenance, the following building materials were chosen: concrete, concrete block, brick, solid plaster for interior partitions, and steel sash. The heating system uses forced hot water regulated by outdoor-indoor thermostatic control. Lighting, except for illumination in lobby, is incandescent. Acoustical treatment, in the form of ceiling tiles, was limited to ground floor public spaces.

Architects for this apartment building were Roth & Fleisher, Philadelphia; Horace Fleisher, Landscape Architect for the playground; Severud-Elstad-Krueger, Structural Engineers; Charles S. Leopold, Mechanical Engineer; McCloskey & Co., General Contractor.

The scarcity of desirable sites for residential development, the price of land in highly developed urban areas, and constantly rising construction costs have practically excluded any privately financed multiple housing except luxury apartments. To secure the necessarily high rentals, these buildings must now include "extras" such as swimming pools, gardens, clubrooms, facilities for maid and food service—all beyond the traditional range of apartment-house amenities. Though both of the luxury buildings shown here are to be built in California, they are characteristic of conditions prevailing across the country.

The proposed Beverly Towers, a 22-story co-operative apartment project, will be located on a two-acre site in Beverly Hills. All apartments will be planned to meet the individual requirements of prospective owner-tenants. Glass panels or solid walls with an exterior facing of marble may be placed at any point within the stainless-steel grid which supports these exterior-wall materials. Three basement levels will provide shelter for two cars per family and 200 sq ft of fireproof storage space per apartment. In addition, owner-tenants will have available a 20' x 40' swimming pool, cabanas, a landscaped terrace, several ground floor shops, and a private club on the top floor. Of particular structural interest is the lift-slab construction, the first use of this system for so high a building. Economies resulting from the selection of lift-slab construction amount to $250,000 and a saving in construction time of four months. Moreover, owing to the elimination of the usual heavy beams, the architects were able to secure two extra floors and yet remain within stipulated height limitations. Pereira & Luckman were the Architects.

Model photo: Erwin Lang
Fundamental considerations in the design of this apartment building to be erected in Oakland, California, were view, privacy, spaciousness, and maximum flexibility of living areas. The curved form suggested by the irregular shape of the site affords a maximum of view frontage with a minimum of circulation. Each apartment looks over the surrounding parks and Lake Merritt; those on the higher floors view San Francisco Bay as well. Privacy for each unit is assured and space was left in back of the building for a garden. Fifteen prototype apartments have been developed to give prospective buyers a large selection from which to choose. If preferred, open space of any size may be purchased and subdivided to suit the particular requirements. A furred ceiling above the line of baths and kitchens will carry horizontal pipe runs, making it possible to vary the location and number of plumbing fixtures. "The main façade," write the architects, "has been treated as a random-patterned mosaic of glass and porcelain-enamedled panels in modular frames, thus providing flexibility in elevation as well as in plan." A two-level garage, each level directly accessible from the exterior provides off-street parking for all owner-members of the co-operative. Architects are Confer & Willis; D. W. Anderson, Associate Architect.
"Sprawling suburbia, remote sites, and staff problems," write the architects, "have produced a situation where it is more economical for the wealthier, older couples with grown-up children to rent a comparatively expensive apartment in the city than retain their old homes in the suburbs." This building, the first of its kind to be erected in the post-war period, has since set a precedent for many such large luxury apartment houses in the city. Its site is a hillside left by the receding waters of Lake Ontario. The plan scheme, a compromise between the original design of two separate buildings linked by a glass foyer, now places the 75-room residential hotel in one leg of the Z-shaped structure, with apartments in the other two wings. Two lobbies are therefore provided on the ground floor (plan below); one with reception desk and parcel storage for the use of the hotel guests (acrosspage bottom), the other for the occupants of the apartments. A restaurant below the lobby floor of the hotel affords indoor seating for 250 persons as well as a broad, cantilevered terrace (foreground acrosspage top) for outdoor dining. Parking for all residents is provided in a three-level parking garage directly opposite the entrance driveway. Apartments are for the most part oriented toward the com-
apartment houses: luxury
manding view of the city and the lake to the south—only a few face west. **Rooms are of generous dimensions** and all of the one- to five-bedroom units have their **private outdoor areas**. Balconies are cantilevered 7'-0" from the column line and enclosed by translucent balustrades. These are of wired, cast glass—a material well suited for this purpose since it contributes a feeling of maximum security, is easily maintained, allows the sun to penetrate, yet provides an excellent wind break. The structural frame is of reinforced concrete—floors being of 5"-thick flat-plate construction. Exterior walls are faced with brick, interior walls with plaster. Finished floors are wood block on concrete. Casement-type windows have steel frames; fixed panels use 1/4" plate glass. Heat is supplied through built-in convectors from a forced hot-water high-pressure system. Provision has been made for fully recessed, individual air conditioners concealed from view on the exterior of the building by the balconies.

Architects for this Toronto apartment were Page & Steele, Toronto; Peter Dickinson was Partner-in-Charge-of-Design; Edwin Kay, Landscape Design; Hooper & Yolles, Structural Engineers; J. A. Norton, Mechanical Engineer; Roxborough Electric, Electrical Engineers; L. S. Yolles, General Contractor.

April 1957 119
An extraordinary legal device called "Horizontal Property Law," in existence in many South American and European countries, made possible this huge co-operative in Cuba. "Under this law," states Dr. Nestor Moreno, one of the attorneys instrumental in carrying out the enabling legal arrangements, "each apartment unit becomes an individually and completely owned parcel of real property inscribed in the land registry. The proprietor, beyond owning his own unit, is joint owner of the common facilities, such as land, lobbies, stairs, elevators, swimming pool, and other similar adjuncts. According to this statute, the building can be planned to house apartments, offices, stores, or other space utilization. Any combination may be arranged, but it must be clearly delineated in the planning stages." In contrast to the U.S. co-operative system under which "ownership" means owning stock in a building corporation and under which an apartment, as only part of an entity, cannot be independently mortgaged or sold, the horizontal-property law permits individual long-term financing and unhampered sale. Dr. Moreno feels that a similar system would provide the necessary stimulus to U.S. apartment house construction and open the way to badly needed middle-income housing in urban centers. Slum clearance, he suggests, could with this system be conducted by private interests and would no longer depend on governmental action. The introduction of the horizontal-property law would also present new opportunities to architects, ranging from large-scale planning to the detailed design of individual units.

"Edificio Focsa" (shown on these pages) covers an entire block in the Vedado section of Havana. The
Havana, Cuba

site is near the seashore and close to transportation and hotel facilities. In addition to the 373 apartments within this huge structure, other occupants include TV studios, shops, offices, and parking areas in the four stories below the grade level, as well as a bankers' club with independent entrance and separate elevators located in the five-story tower structure, "Twenty different models," state the architects, "all containing the same number of apartments, distributed among one to eight blocks and from 10 to 30 stories in heights, were compared for appearance, view, privacy, cost of building, and maintenance." The single structure finally selected, now completed and in use, covers barely 22% of the site and incorporates many design innovations. Most ingenious is the solution of one special requirement: the separation of services from the owners' areas. This has been achieved by providing three elevator halls for every four floors. Two of the three halls are for the apartment owners, one for service. "Completely separate entrances, elevators, halls, and stairs," write the designers, "make it physically impossible for servants and delivery personnel to meet the owners. This system provides two other advantages. In reducing by half the number of owners' elevators otherwise required, the number of servants' elevators to one fourth, the cost of elevators is considerably diminished both for installation and operation. And by making the ceiling height of the halls 2'-6" lower than that of the apartments, access to light, view, and cross ventilation is provided through the rear façade of the wings. With such a device, 45% of this façade is free of obstruction from the halls." Garbage is collected through the service halls, at night, and carried by special elevator to a storage silo.
For stability, rigidity, and low cost, reinforced concrete was chosen as the structural material. Horizontal and vertical elements in the structure, as well as the building’s plan and its own weight provide the necessary rigidity. Bearing walls serve also as partitions between apartment units. Windows are the glass-jalousy type, tested to withstand hurricane conditions and driving rains.

Responsible for the design and construction of this building were: Architects Ernesto Gómez Sampera & Martín Domínguez; Civil Engineer Bartolomé Bestard; Manuel Padrón—all members of the firm Proyectos Obras y Construcciones, S. A. Consultants were: Structural Engineers Sáenz-Cancio-Martín; Electrical Engineer Fernando Meneses; Mechanical Engineer Gustavo Bequer.

Materials & Methods

construction

Structure: foundation, frame, floors, and roof; reinforced concrete—Lone Star Cement Corporation; reinforcement—Internationale Crediet Handels-Vereeniging, Rotterdam; walls: concrete block—POCSA, Havana; roof: tower curtain walls; porcelain-enamel panels—Tealite Inc.

Roof Surfacing: thin concrete slabs over slag; slabs covered with Calendrite—George M. Callender & Company, London; solid roofing asphalt—Texas Company.

Roof Drainage: gutters & downspouts: lead; asbestos cement—Perdix, Havana; iron—San Jose, Havana.

Doors: interior: wood veneer; spiral core—Constructor Cubana de Placard, Havana; entrance: sliding aluminum and glass doors—Sioux Metal Products; automatic door operators—The Stanley Works.

equipment

Lighting Fixtures: living area—Lamparas Ouesada, Havana; lobby area—POCSA, Havana.

Designs for new apartment buildings are reflecting a growing inclination among tenants to expect air conditioning. In the past several years, window units have dotted the façades of countless apartment houses. Very effective and still the most inexpensive and adaptable method of adding this facility to modern living in existing structures, window units are now being produced in phenomenal quantities. One brochure refers to 52 manufacturers and over 300 models; consumer information is given on 36 characteristics of these units. This movement has not been without its problems. The installation of units in all major rooms of an existing apartment building can add 30 percent or more to the electrical load.

Very few existing houses, not planned for air conditioning, can make this addition without serious or dangerous overload.

This trend in power increase for air conditioners and other electrical devices has given rise recently to the founding of the National Adequate Wiring Bureau whose surveys have revealed fantastically inadequate conditions in wiring. It is safe to say that almost all existing apartment houses need major increases in wiring before window units may be added in all apartments.

The question arises whether proposed buildings should be planned for window units, or for a more integral scheme. Functionally, the window unit encroaches on the natural use of the window and is not always architecturally attractive either within or outside the building (Figures 1, 2A, and 3). The use of wall units (Figures 1, 2B, and 4) has solved a good many problems for the apartment-house owner. They are self-sufficient, requiring only an electrical connection and an outside grill. The electrical connection is best placed in a concealed position and assigned specifically to the unit. Major rooms often have a large glass area or several windows together. Thus the cooling device can be placed below one window and conventional heating units below the others. In a recently completed apartment building at 35 Park Avenue, New York, designed by Architects Sylvan & Robert L. Bien, conditioner cabinets and convector cabinets were made to match.

John Campagna, representing the owning corporation, reports good experience with these wall units, which were manufactured by Amic (Figures 4 and 5). This method places control of room temperature in the hands of the tenant—and this appears to be the trend of most new systems. Unlike central systems (Figure 10), room units may be turned off when the tenant is out, thus saving him electrical expense. The central system would have to keep operating for all apartments and this unnecessarily high expense would be
Figure 2A—Window unit, method A. This type may project in or out, or be flush. Ratings are usually \( \frac{1}{2}, \frac{3}{4}, \) 1, and sometimes 1\( \frac{3}{4} \) hp.

Figure 2B—Wall unit, method B. Section indicates usual location of equipment. Air rates for one hp model in cfm: room, 350; outside for condenser cooling, 500; intake for ventilation, 160; exhaust for smoke and odor removal, 160. Weight about 190 lb.

Data: courtesy Amic

Figure 2C—Cabinet with self-contained cooling unit and integral heating, method C. In order to add heating element in form of a—convector, or b—finned coils above the evaporator coils, the unit is raised off the floor and served by steam-heating runouts concealed behind a continuation of the cabinet. This falsework may be partially adapted to bookshelves. Cooling process is the same as in B.
charged to the tenant. Campagna finds that repairs can be made on wall units in less than the full time of one mechanic. Service contracts for this function are also possible. Two special controls are suggested: one prevents the conditioner from operating inadvertently in freezing weather, thus precluding freeze-ups; the other prevents the heating and cooling from operating at the same time. Manufacturers active in the production of wall units are Lewyt, Amic, General Electric, and Chrysler.

Because heating units also require space below windows, a number of manufacturers have combined heating and cooling functions, using interconnecting controls. The principles involved are illustrated (Figure 2C). Hot water or steam can be circulated through convectors or finned coils placed in the same air stream as the cooling coil. Sometimes the location of runouts requires that the cabinet extend to the nearest exterior column. As in all air-cooled systems, a large outside grill is needed. The first application of this kind of climate control to apartment houses is now being installed at 136 East 56th Street, New York, for which Emery Roth & Sons were the architects. Samuel Rudin, project owner, states that this system allows the tenant full control and makes possible heating, cooling, dehumidification, air exhaust, and fresh air intake for ventilation. American-Standard units (Figure 5) are supplied with steam from a conventional vacuum system served by two boilers in the basement. Register and controls are on top of the cabinets, which are elevated above the floor. Easy cleaning below, clean appearance for the front of cabinet, effective routing of air to the glass surface, and ease of access to controls are claimed as advantages.

Another example of the preceding method will be found in the new Harrison Park Apartments, East Orange, New Jersey, designed by Architect Romolo Bottelli, Jr. There, the use of Carrier units

Figure 3—window unit, method A. Flush-front room air conditioner measures 15½" deep and 17" high. Has five control settings to provide combinations of cooling, ventilation, exhaust, dehumidification, and filtering. Three-quarter ton model has current consumption of only 7.5 amps. Figure 4—through-the-wall unit, method B. Adjustments include variable cooling, control of outdoor ventilating air, and possibility of exhaust. Only required connection is electricity. Photo: courtesy Amic
Figure 5—Outside grill for a through-the-wall unit (exterior part of installation shown in Figure 4) represents kind of grill necessary for any air-cooled conditioner using method A, B, or C.

Figure 6—Cabinet unit elevated above floor and adapted to heating, method C. Hexagonal unions at right of installation are for steam connections. When swung back in position, compressor, condenser, and condenser fan are in the wall. Cabinet section, protruding in room, houses cooling coil, heating coil, circulating fan, and controls.

Figure 7—Method C. Short duct, only 5½" high and 24½" wide, is only connection required to outside. Fits under windows with stools as low as 23½". Cools, ventilates, exhausts, dehumidifies, filters, and heats.

Figure 8—Heating and cooling medium from central source, method D. Over-all depth of this unit is only 9". Recirculating air intake is concealed in toe space. Access to controls is in top panel of cabinet.
at windows (Figure 7) includes heating by means of circulated hot water, centrally heated in the building. These units also condition the air with all of the usual control and air-handling possibilities. Special attention has been given to the conditioning of the halls and lobby. A separate central system with duct distribution cools and dehumidifies air for delivery to the halls, placing them under a slight pressure. This pressure, maintained with warmed air in winter, causes a slight flow of air into the apartment, effectively preventing odors and humidity from drifting into the halls. Everyone familiar with the stuffiness and typical odor of interior halls of apartment buildings, will appreciate this feature. Kitchens and baths are exhausted directly outdoors to assure further the directional flow of air from hall to apartment, to kitchen or bath, and then outdoors.

A great reduction in the size of the outside grill can be made if, instead of using the air cooling principle, a central chiller is used supplying chilled water to the cabinets at each window (Figure 9). At 10 East End Avenue, New York, such a system is supplied with hot water by two boilers in the basement. At the same location, there is a central chiller of 400-ton capacity, disposing its heat to a cooling tower. Lobbies are conditioned by Trane units similar to those in rooms, but of a type concealed in furred ceilings. The cabinet units are somewhat simpler in this method. There is no need for compressor, condenser coil, or condenser fan. This makes for less maintenance in the apartment and puts equipment in a centralized location. The employment of an operating engineer is, of course, required. A single-finned coil at the cabinet utilizes either hot water or chilled water; both are supplied by the management at correct temperatures for the ratings of the units (Figure 8). Baths and kitchens are exhausted separately, to the roof. Plumbing drains are necessary to dispose of the condensation collected in dehumidifying room air. Runouts collect at a drainage stack next to the water pipes (hot or cold depending on the season) at the nearest column. It may be seen that coils and water distribution pipes double for both warm and chilled water, permitting considerable economy over other types of central systems. Fresh-air admixture and exhaust ventilation are taken care of through an outside grill, which is small because it does not have to handle the additional air for condenser cooling. Controls are just as sensitive in this method as in others, in spite of a remote source of chilling, because variable speed fans make it possible to increase or reduce the cooling to be pulled off the coils. Three rates are available in this particular system. Architect for 10 East End Avenue was H. I. Feldman; owner and builder, Stanley R. Broff.

Conventional central cooling schemes (Figure 10) have not been commonly used in apartments. In seeking reasons why they are less used in apartment houses than in office buildings, one might

Figure 9—cabinet housing a fan and finned coils which use either hot or chilled water from central source, method D. Schematic drawing shows essential connections. Central cooling reduces outside grill to size only large enough for ventilating air.

Data: courtesy Trane

D
list a number of possible reasons. Ceiling heights are usually greater in offices and suspended ceilings hide ductwork without serious loss of headroom. Costs of installing and maintaining the central equipment of this system are undoubtedly higher than in other schemes. All supply ducts must be protected against vapor condensation. In some buildings, air conditioning may be optional for tenants and this is difficult with ducted air. Controlling each apartment is not easy without expensive devices such as motorized dampers and special tempering coils. Shutting off the air flow to a number of apartments seriously disturbs the balance of air flow to remaining apartments, because a group of apartments is commonly supplied by a central fan of fixed output. Finally, control of the system is in the jurisdiction of the owner's staff, a situation that can be just one more item for tenant and owner to disagree over.

The proper selection of conditioners and integral heating coils for output is an engineering problem. In spite of their adjustability, they cannot be moved into the room and used like a TV set. Small units of \( \frac{1}{2} \) and \( \frac{3}{4} \) hp have not been used widely in apartment houses. Many houses use one hp in living rooms and \( \frac{3}{4} \) hp in bedrooms. Horsepower and tonnage are about numerically equal, so that these numbers may be read as tons. Tonnages up to \( 1 \frac{1}{2} \) and even \( 2 \frac{1}{2} \) have been used in living rooms. Kitchens and baths are cooled by air from adjacent rooms flowing to their exhaust fans. Adjacent heating coils for a room usually produce heat in a range from 3000 to 18,000 Btu per hr. They should be sized just as carefully as radiators or convector are always sized for residential use.

Comparison of cost and other qualities is difficult since there is no distinct separation between "good" and "bad" methods. Obviously, the choice depends on the kind of tenancy, ownership, and location. In absolute cost the several systems probably follow the sequence in which they have been described here, window units being least and central air conditioning most; each case, however, must be individually considered. Intangible costs such as the effect on other parts of the structure and comparative maintenance rates must be carefully studied. In any case, air conditioning brings a distinct increase in power load and maintenance responsibility which must be considered thoroughly. Offering the tenant an option of choice or rejection of air conditioning is usually difficult and needs special study. Not unimportant is the interpretation of the equipment as "real property" or "chattels." Integral units would probably be the former and could be offered for inclusion in mortgage valuation. Window units might, under certain circumstances, fall into the latter category and not be included. Substituting fixed glass for operable windows has not been as universal as might appear. Emergency shutdown of the system or optional disuse in a given apartment might make normal window arrangements highly desirable.
There is much more to this extraordinary house than a first glance reveals. The program itself was exceptional: a home and work place for a couple in their 60's with varied interests—one is a painter and writer, the other is a violinist who also keeps in close touch with business. Jointly, they concern themselves with the graphic and plastic arts and own an extensive collection of paintings and sculpture.

Translated into terms of plan requirements, this meant the need for separate work spaces where each could receive visitors independently, and design of the entire house for optimum display of the art collection. To complicate the problem of providing the desired privacy, the site is an in-town corner lot with busy bordering streets.

To solve the latter problem, fenced gardens, adjoining all main rooms, both screen against the streets and provide inviting outdoor extensions of interior areas. The husband's and wife's workrooms are at opposite ends of the house. Eleven-ft-high ceilings, with bayed window elements concentrated and arranged vertically, leave as much interior wall space as is feasible for the hanging of paintings.

Structure is wood frame, with cedar shingles on the exterior, vertical painted redwood or plaster on interior walls; doors are flush veneer. A hot-water ceiling-panel system heats the house. Decorator was Beth Armstrong; General Contractor, Jacks & Irvine.
The entrance passage (above) borders the south living garden; obscured-glass screen at left shields the bedroom garden. The bayed window occurs in the living room (below), where walls are of painted, vertically applied 1"x6" flush-joint redwood.

Photos: Roger Sturtevant
The two main bedrooms open to their own fenced garden (right). Except for the pair of glazed doors in each major room, all window areas are of fixed glass, and ventilation is achieved through louvered vents, with concealed, drop-in panels.

Assisting the gallery aspect of the house is an unusually wide hallway (below), lighted from overhead plastic skylights.
bridgehead to "Brazilia"

This skeleton Capital—consisting of a Government Palace, a Presidential Residence, an Hotel, and a Chapel—will serve as provisional headquarters for the Brazilian President while the new Capital is being built. Situated in the State of Goyas, near the site of "Brazilia," the group of buildings will later become the nucleus of a tourist center in the new Capital, with the Presidential Residence to be used as a sort of Blair House for distinguished visitors. Ground was broken last January by President Kubitschek; buildings scheduled for occupancy in 1958.

The Government Palace, in the center of the group, will be between a spacious esplanade, suitable for State functions, and an artificial lake. Raised a full story height from the ground, it is to be entered from a broad ramp. Offices for the President and his staff, conference rooms for Cabinet meetings, and halls for State Receptions will occupy one and a half floors of the rectangular building, which is planned approximately 200'x300' in area. The roof will be given over to a garden, with some sheltered lounging facilities. The long main façades of the building will be accented by abstract "caryatids," each an integral part of the reinforced-concrete frame. Well to the right of the Palace will be the Presidential Residence, all on one floor and planned around formal and private patios. The Hotel (to the left) is to be seven stories high and will house Presidential assistants and other administrative personnel. A Chapel, in the lower right-hand corner of the esplanade, completes the scheme.

Architect: Oscar Niemeyer
The Government Palace (acrosspage and below right), showing the sculptured columns facing the esplanade. The semi-cylindrical structure at right of the access ramp is a Presidential Tribune. Photos: Flavio Dann.
Sketches for the Chapel (left and below) indicate a plan that is reminiscent of the nautilus shell. The building's sculptural form will add visual interest to the esplanade.

The architecture of the 20th Century owes one of its lasting debts to engineering of the 19th Century. While the Victorians sought the meaning of building in ornament and style, we find it today in structure and form. Their engineers, more often than their architects, were the form-givers; and in such utilitarian structures as James Eads' St. Louis Bridge, Victorian engineering-architecture reached its most expressive and influential level.

The Eads Bridge was much more than a gateway to the West and a link in the railroad conquest of the Continent. A steel-arch bridge of unprecedented span, it was the most daring and original structure of its kind in its day. The design was unique, the material was new, and the methods were unproved. The vision and courage of a pioneer like Eads are hard to grasp after history has accepted his hard-won progress. In this bridge, Eads employed practices many years ahead of his time: the use of hollow, tubular-steel chord members in the first such span ever built almost entirely of steel; the introduction to the United States of the pneumatic-caisson method of founding piers and abutments, with improvements and at depths never before attempted; the analysis and solution of new problems of stress and erection; and the initiation of requirements for structural steel for which no standards yet existed. So novel was the undertaking, that every piece of Andrew Carnegie's steel used in the bridge had to be individually checked—the source of spectacular disputes between Carnegie and Eads. With all of this, Eads also created a work of art. The St. Louis Bridge has survived the test of time in its engineering and in its esthetics, both of which remain outstandingly satisfactory today.

No description of the bridge could tell the story of its innovations better than an account of its erection. Three arches of 502 feet, 520 feet, and 502 feet were constructed, with piers and abutments of stone, at a cost of about $6.5 million. Because of the dangerous, shifting quality of the Mississippi river bed, Eads understood that only the use of pneumatic caissons sunk to bedrock, 95 feet below the surface, would make a firm foundation possible. The difficulties and disasters encountered during the sinking and building of the piers and abutments (1869-1871) sound like the plot of a dime novel. The men were icebound in winter; a tornado struck in spring. Working inside the caissons, in unknown and untested conditions, was extremely hazardous. Oil lamps gave off heavy, sooty smoke, candles burned rapidly, and if fire started, the compressed air made it almost impossible to extinguish. But the most mysterious and dreadful effect was the new "caisson disease"—still little known or understood—which claimed the lives of a dozen men, while a floating hospital under the supervision of Eads' personal physician was in permanent attendance.

The problems of the superstructure were equally great. An explosion wrecked the steel-rolling mill, delaying production. It seemed impossible to produce parts to meet Eads' rigid specifications. The steel staves took months to make in acceptable and uniform quality; a year passed before the material for the anchor bolts was satisfactory; more than six months went by in unsuccessful attempts to make the brace bars; and a total of two and a half years was spent trying to roll steel couplings for the tubes, with wrought iron finally substituted as a compromise.

The climax of the drama was reached with the joining of the arches. These were cantilevered from the piers to meet in mid-span with the structure self-supporting as the work progressed—the first practical use of this method on a large scale. A loan of a half-million dollars depended on closing the first span by September 19, 1873. Unseasonably warm weather caused such expansion of the metal that it was impossible to insert the connecting tubes as planned. Even the dramatic application of an "ice poultice" failed. Finally, an adjustable tube was used, shortened before insertion and then screwed out again to the proper length. On September 17, the span was successfully closed. The other two spans followed and the roadways were finished shortly after. The bridge was officially opened on July 4, 1874, its bold and graceful arches marking one more milestone in the progress of American building.

Suggestions and information from John A. Kouwenhoven and Missouri Historical Society are gratefully acknowledged.
office building

location | Silsbee, Texas
architects | George Pierce—Abel B. Pierce
associate-in-charge | E. J. Goodwin, Jr.
This efficient office building for Kirby Lumber Company has won a remarkable number of design distinctions. First recognized with an Award Citation in P/A's Second Annual Design Awards Program, it later received Medal of Honor in the Houston Chapter, AIA, Honor Awards Program and also Honor Award in Texas Society of Architects' "Architecture 1956" exhibition.

Designed to serve management, accounting, engineering, and personnel departments, it adjoins the lumber mill. Organized around a landscaped courtyard, it has three approaches—the main entrance, to the north; a covered walk, to the rear, connecting with covered parking space; and a protected series of outdoor aisles (toward the mill and employees' parking area) where employees line up to receive their paychecks. Special requirements included a drafting room and map-conference room for the Forestry Department, and a business-conference room. For details of entrance canopy, see SELECTED DETAIL. East and west walls of the steel-framed building are largely of hollow brick masonry; north and south walls consist of glazed aluminum grids with porcelain-enamed steel panels. The roof is a flat, concrete, lift slab. Acoustical plaster or tile is used on ceilings; flooring is vinyl-asbestos tile. The air-conditioned building is heated by forced-circulation hot water. H. E. Bovay, Jr. was Consulting Engineer; W. S. Bellows Construction Company, General Contractor.
Exceptional natural light and a sense of spaciousness are afforded by the central, planted courtyard (below and across page). Artificial lighting is fluorescent, in recessed, surface mounted, or 4'x4' pendant, louvered fixtures. A covered walk (left) leads from the office building back to a covered parking dock (above left).

aluminum stressed-skin dome

Early this year an all-aluminum stressed-skin dome—the first structure of its kind ever built—was erected on the island of Hawaii. This dome, designed by engineers of the Product Development Department of the Kaiser Aluminum & Chemical Corporation, was built especially for use as an auditorium—for conventions and entertainment purposes at Kaiser's Hawaiian Village Hotel.

Its design involves the creation of a spherical structure through the use of diamond-shaped aluminum panels geometrically arranged and bolted together at contiguous edges to form a rigid shell. Each panel is curved inward and its short diagonal length is strengthened by the addition of an aluminum strut. Panels and struts, when combined, make a unit of great strength; 575 of these were geometrically grouped to form a dome having a floor diameter of 145 ft and a height of 49 ft 6 in.

Buckminster Fuller's fundamental work with geodesic structures unquestionably provided the inspiration for this structural concept. In this design, however, both the skin and the struts work concurrently to carry load and to resist wind forces; each assumes approximately 50 percent of the responsibility. Although without interior support, this clear-span structure can withstand loads of over 100 psf. Structural tests indicate that the dome can stand up under wind pressures twice greater than those caused by a hurricane.

erection procedure

A portable mast, made of structural steel and 96 ft tall, was set up in the center of the dome's concrete foundation. Around this mast was assembled a section of panels which, when the dome was completed, constituted the uppermost portion of the dome. This section was first lifted a sufficient height off the ground to allow another perimeter of panels to be installed. This larger section was in turn lifted, a third set of panels installed, and so on until all panels were in place.

The dome was then anchored to 25 concrete piers spaced around the circumference of the floor. Anchorage was accomplished through the use of aluminum struts, each of which has a pin-end connection at its concrete pier to allow for a three-in. change in diameter—the regular expansion and contraction of the metal dome.

After aluminum sheet was sheared into diamond-shaped panels, a press brake was used to make 12 bends (six from either end) in each unit. Appearance of panels before flanges were formed at edges (left).

Delivered to job site, panels were removed from trucks and assembled into proper categories (below and right).
Castings of various shapes were used on the inside of the dome to join the diamond-shaped panels together where their corners converged. These were fastened to the panels with Huckbolt fasteners, special aluminum bolts which provide a permanent high-strength union. The same type of bolt was used to fasten the panels together along their edges.

A synthetic-rubber compound sealing material was used to calk the cracks between the panels and to make the dome waterproof. A 50-sq ft cover protected opening was left at the top of the dome to aid ventilation. This opening has a permanent cover, made up of five diamond-shaped panels, which is raised three in. above the dome itself.

The precision with which the dome was designed and constructed is indicated by the fact that the complete dome "settled" only 3/4 in. after all rigging had been cut loose.

Actual erection time (hoisting and installation) required but 20 working hours by a crew of 38 men. Anchorage, removal of mast and rigging, and weatherproofing were completed within a few days after erection.

fabrication

Panels, struts, and castings were fabricated at a Kaiser plant near San Francisco and then shipped to the job site. Templets were used to assure precise drilling of bolt holes in the 0.081 in.—slightly less than 1/16 in.—aluminum sheet of the panels. After drilling, sheets were sheared into diamond-shaped panels of 10 basic sizes. Their lengths—long
diagonal—vary from 106 in. to 150 in.; widths range from 65 in. to 82 in. Each panel has a total of 12 bends, six from either end, made by press break—which give curvature to the unit in addition to an interesting pattern. Around the edge of each is a 3⅜ in. flange for the purpose of bolting panels together; bolt holes are spaced six in. on center. To facilitate erection, each panel was color coded by a small dab of paint to denote its proportions.

Gage of struts is 0.156 in.—slightly more than ⅛ in. Each strut is U-shaped and is two in. wide and 3⅛ in. deep. Lengths vary from 62 in. to 79 in.—three in. less than the width of the panel.

cost

According to Kaiser Aluminum's engineers, an aluminum stressed-skin dome is lower in cost than conventional structures built for the same purpose. Factors such as size, location, and use naturally will affect the cost of future domes; however, it is estimated that the cost to erect elsewhere the same shell as at Hawaii Village would be approximately $4.00 or less per sq ft.

occupancy

This dome will serve as a completely equipped auditorium with a seating capacity of over 1800. Structures of this type, however, have many other uses—some of which are aircraft hangars, sports
arenas, field houses, convention halls, and so on. It is reported that Mayor Morrison of New Orleans has expressed keen interest in the possibility of having such a dome structure with a capacity of 17,000 people to be erected as a sports arena in a community-center type of development that his city is planning.

Bolt, Beranek & Newman, Cambridge, Massachusetts, have been retained as acoustical consultants for the Kaiser Dome. Their preliminary report indicates that the dome presents no unusual acoustical problems and that the curved panels provide better acoustics than a smooth spherical surface. Acoustical material will be applied to only one-third of the interior surface and will be placed directly on the panels, thereby retaining their geometric pattern.

The dome was erected by Terminal Steel Company, Honolulu, T. H., under supervision of Kaiser Aluminum’s engineers.

Calking operation required 40 gal of synthetic-rubber compound, a special sealant used to weatherproof the dome (below).

Pin-end connection at base of strut allows dome to expand and contract three in. in a day. Tip of base panel extends into track to prevent rotary movement of dome (right).

Individual panel is added to dome (above left). Worker at top is lining up holes with star-shaped gusset casting, beneath panels, and driving drift pin to hold panel in place until bolted.

Star-shaped gusset castings were used where six panels converged (above center). Dome contains 175 of these castings which are 16½ in. in diameter.

One of 1150 hub castings used where three panels are joined (above right).
Chemical sensibility is primitive; the most lowly of animals possess it—long before they develop brain, nervous system, eyes, ears, nose, or mouth. When the paramecium encounters water that is chemically contaminated, he dodges it just as if he had bumped into an obstacle. In 1883, W. H. Pollock observed that sea-anemones rapidly and beautifully expand if a little meat juice is added to their water. It might be taste or it might be smell, but in such primitive creatures we can only be sure that their behavior is changed by chemicals introduced into their environment. As we rise through the different classes of animal life, we find that there is a gradual but immense development of the chemical senses, characterized by the following features:

1. Reduction of the sensitive area. Whereas protozoa are apparently sensitive over their entire body, man can taste only with the tongue and less delicately with parts of the palate. Furthermore, he can smell only with two small interior surfaces—each about two sq cm in area—on either side of the nose. The change from whole body sensitivity to local sensitivity can be followed through most of its stages in different kinds of living animals.

2. Sensations become progressively more sharply defined. As we ascend the scale we find that in moths, ants, and bees, taste and smell are both highly developed and distinct; the original chemical sense has differentiated. In man, taste and smell are separate sensations and are stimulated in different but narrowly restricted areas of the body.

G. H. Parker has pointed out that in man the two surfaces sensitive to smell are anatomically invertebrate in character, since they resemble the skin of the sea-anemone. It is as if we preserve to this day a trace of our sea-inhabiting invertebrate ancestors.

For man, the act of smelling is a simple enough process. To experience smell, it is necessary that particles—perhaps molecules—of the odorant material be present in the air that he breathes. In normal breathing, the main airstream passes through the nose but not the olfactory receptor surfaces high up in the nose.
1—the sense of smell

Eddy currents are formed, however, and some of these swirl to the olfactory receptors. When smell is faintly sensed, the immediate reaction is to sniff in order to increase the intensity of the smell and to savor it to the full. W. Ogle has shown that the mechanism of the sniff forces air higher through the nose where it freely contacts the olfactory receptors. Those receptors contain the ends of a large number of nerve fibers, and as soon as the area is stimulated by contact with odorous air, tiny discontinuous electric currents pass along the nerve fibers—first to the olfactory bulb and then to the cortex or surface of the brain. What happens then is so far conjectural. These electrical impulses are not dissimilar in character, whether they are started by the sight of a light, by the sound of a violin, or by the smell of a rose. The ultimate sensation is determined by the location of that part of the brain that is stimulated.

The great majority of people can smell the same smells, usually at about the same dilution, and for the most part they like and dislike the same smells. When coffee is being made in the kitchen, its aroma is clearly noticeable in the bedrooms. Is there any chemical test that would respond to the quantities of furfuryl mercaptan, diacetyl, and acetylpropionyl present in the bedroom air? There is not, but the ordinary person detects them effortlessly. Some people, who use sense of smell every day as a part of their work, can confidently detect differences of five percent in the strength (concentration) of an odor. We should recognize that we have in our noses a finer chemical detector and discriminator than any evolved by the best chemist.

Two primary needs of man, as of every other animal—nutrition and reproduction—were both at one time served by smell. Our way of life has altered and we smell our way neither to the butcher’s nor to the altar. Despite our neglect of it, the sense of smell still lives strong within

Researchers make odor comparison tests to determine effectiveness of odor counteractant using a multistimulator olfactometer.

Test of various types of deodorizing and air freshening equipment. Technician checks spray head used for large volumes of air such as found in industrial exhaust systems.
us and sometimes it gives us a sharp reminder. We all know of some scent that takes us back to a childhood scene.

Smell has a third function: one of warning. To smell a bad smell is an extremely painful experience and the act of withdrawal is as quick and certain as if the hand had been burned or the foot bitten. People who tamper with warning systems are inviting all sorts of trouble. If the warning signal were eliminated, but not the condition that gave rise to this strangled warning, then dangerous situations might follow. This is a consideration to be borne in mind when we consider methods that are available for deodorization.

What can account for likes and dislikes? Most people like the smell of flowers, most like the smell of a mild cheese; however, let that cheese odor appear in an egg and they will detest it. The smell of onions on a steak may be pleasant, but the same smell on the breath of a companion may be horrible. The truth is that the brain does more than take information from the ends of the receptors and give a straight report on it; it minimizes some of the evidence, exaggerates other parts, lines it up with previous experience, takes a dozen other factors into account and finally comes out with the answer “I like” or “I dislike.”

Deodorants of many kinds have been in common use for a long time. Earth is one of the best—certainly the most plentiful—and it was probably its liberal use as such that made early days of civilization at all tolerable. As soon as the nomadic stage was passed, and particularly as soon as people began to live in large groups, troublesome odor problems must have arisen.

Chemical deodorants and disinfectants have become more and more widely used. Formalin is used for swabbing hospitals while oxidizing agents such as the permanaganates, the hypochlorites, and hydrogen peroxide have become household commodities. All such agents are intended for direct application to the source of the malodor. When the source is known and when it is accessible and can be treated without harm by an oxidizing agent or disinfectant-type deodorant, such agents are extremely effective. Their attack on the malodor is directed at the source; there is, though, one disadvantage from which most contact deodorants suffer—they are strongly odorous themselves.

We have become so familiar with them and have associated them for so long with the clean, fresh smell of aseptic condition, that many people have come not to be offended by them. Nowadays, powerful bactericides that have only a light odor are available and these may be expected to replace gradually the strong smelling disinfectants that have been used in the past.

Quite a variety of chemicals have been used for deodorizing. Some of them are primarily bactericides. For example, formaldehyde used for swabbing is a most effective deodorant. The ease of preservation of protein specimens in formalin is a sure indication that it inhibits bacterial action. It is to be found in some air fresheners, too, but its inclusion in these seems to be undesirable.

Sometimes metallic salts are used for deodorant action. Aluminum chloride has been used to remove the taste and odor from petroleum stock material which is to be used medicinally. Aluminum salts are widely used too for antiperspiration creams, although the main function of aluminum chloride or aluminum sulphate in these is to prevent sweating.

Chlorophyll is one of the most interesting recruits to the ranks of deodorants. Although it possesses powerful anti-odorant properties, the mechanism or mechanisms, whereby it exercises these properties are not yet fully understood. Although smells are fleeting and elusive, there is one way of catching them and holding them for future reference, That is by absorption. Most odorants either in solution or in vapor form can be absorbed onto the surface of active carbon or silica gel or alumina.

In preceding paragraphs, the destruction of odors by materials or contact deodorants has been discussed. There are, though, many odors that are less easily treated. It is not appropriate to pour some disinfectant on the cooking cabbage, nor to freshen the air by spraying disinfectant in a lounge in which a lot of people have been drinking and smoking. Devices which have been prepared to meet this need are known as space deodorants. In the main, they comprise the wick and spray types for house use, and fan blowers, spraying, and atomizing equipment for industrial, restaurant, institutional kitchen, etc., uses.

When the way in which air fresheners work is discussed, three ways likely to be put forward are: by masking, by anesthetization, and by odor pairing. The third—odor pairing—has much more to commend it: air fresheners of this type consist of a large number of odorant chemicals, which have been chosen so that one of them will “pair” or neutralize any bad smell. For any one of a large number of malodors, there will be a neutralizing “pair” for it in the fresher. Oil of juniper and cologne water, for example, neutralize the smell of camphor. Other examples of these are: cedarwood and rubber; rubber and wax; wax and balsam of Tolu; paraffin and rubber.

While the wick bottle is adequate for an ordinary living room, kitchen, hall, or bathroom, something larger is required for large rooms such as restaurants, cocktail bars, etc. For the latter, another method which has made good headway in the United States is an air fresher that may suitably be in the form of a firm gel in the air-conditioning system.
2--application of the Airkem method

The primary reason that outside air is introduced into air-conditioning systems is to dilute disagreeable odors. Contrary to popular opinion, outdoor air is not free—it must be cleaned, cooled or heated, and have moisture added or removed. Since thousands of cubic feet of treated air are forced through the exhaust outlets of air-conditioning systems, use of outside air should be as carefully considered as power, materials, labor, or any other expense.

Outside air entering an air-conditioning system costs approximately $200/1000 cfm/yr to condition. In the process of being circulated this air comes in contact with minute traces of odor—in ducts, on clothes of occupants, on furniture, and elsewhere. Despite the most rigorous cleaning methods, sufficient odors may be present to become offensive. As soon as an odor concentration of one or two ppm has been reached, it becomes necessary to exhaust it, unless a counteractant such as Airkem is introduced to combat the malodor. Airkem is a liquid complex of a group of materials, including essential oils and the chlorophyll complex as commercially extracted from green plant material. When this liquid is evaporated, its vapors are introduced into the supply air-stream of the air-conditioning system.

Several types of evaporating or dispensing equipment have been developed to utilize effectively this liquid complex with the many types and sizes of air-conditioning systems in current use. One piece of equipment, especially designed for attachment to packaged air-conditioning units, (say 1 1/2, 3, and 5 tons) has no motor or moving parts and does not interfere with the regular operation of the air conditioning. Efficient evaporative surface and damper control permits a metered amount of the liquid to be vaporized and circulated throughout the space treated by the air-conditioning equipment. A continuous flow of room air enters the unit through adjustable louvers and is then drawn over the vaporizing surface. A reservoir and a wick-floating device keep the wicking surface supplied with fresh emulsion at all times and surface evaporation permits it to enter the air in a vapor state. This air stream is drawn into the air-conditioning unit and thoroughly dispersed in the recirculated odorous room air by a centrifugal fan. Treated conditioned air is then distributed throughout the area by fan action of the air-conditioning unit. Amount of air to be treated may be controlled by adjustment arm; capacity of the reservoir is 1 1/2 gal. Under normal usage the unit will require only routine servicing and liquid replacement once each month.

For air-conditioned spaces requiring up to 20 tons, a larger system is available consisting of three principal components: vaporizer cabinet, pump and storage unit, and controlling device (Figure 1). The vaporizer cabinet, a square metal box that holds a balsa evaporating cartridge (in effect a wood-wicking surface), is mounted on the outside wall of an air-conditioning system in which a small opening has been cut. This component permits air to be drawn off the evaporating surface, since air movement is treated by suction from the air-conditioning system fan. By this method the liquid complex is introduced into the air-conditioning system's makeup chamber, or plenum chamber. The procedure is automatic as long as the air-conditioning fans operate. A pump-tube assembly, mounted on the storage tank, is activated by a solenoid to supply the odor counteractant to the vaporizer. Whenever an electric impulse is delivered to this unit, it pumps a measured amount of odor counteractant up a supply tube which sprays it on the balsa evaporating cartridge. The resultant vapor is drawn into the air stream by the suction created by the air-conditioning system fan. The controller is a timing device which delivers an electric impulse activating the pumping assembly. By the simple expedient of increasing or decreasing the frequency of this action, by manually setting the controller, one can introduce any predetermined amount of vapor into an air-conditioning system. Thus, if a building engineer or superintendent suddenly finds he requires more odor counteractant—to eliminate the odor of paint, for example—he can step up the controller setting to effect the necessary odor counteraction. Conversely, he can decrease or completely turn off this process when it is not required. By the addition of a time clock one can further mechanize this procedure by scheduling odor counteraction during peak odor levels. A good example of this would be a restaurant which would require odor counteraction and air freshening principally during meal hours. By setting the time clock to co-ordinate with these peak odor hours, this entire process becomes fully automatic.

The Airkem method works by odor counteraction or odor neutralization (as described in Part I of this article). When most odors are combined in groups of two or more, their individual characteristics are no longer as readily distinguished by the olfactory receptors in the nose. Frequently the combined perception effect is a significantly lower odor level than that of each of the constituent odors in the mixture. In other words, mixtures of odors can be controlled to result in a diminishing of the total odor intensity and perception. This may be analogous to a situation in which a disc with red, yellow, and blue stripes, when rapidly spun, appears only as gray. All colors are still present, but in combination they are counteracted, neutralized, or eliminated and the eye sees only a gray or "colored" disc. This same principle oper-

**Savings in operating costs**

To condition 1000 cfm outdoor air per year, the costs are:

- **Power**—\(\frac{1}{2}\) tons \(\times\) \(\frac{1}{2}\) load \(\times\) 10 hrs \(\times\) 120 days \(\times\) 24 \(\times\) 1 kw ................. $ 30.00
- **Fuel**—\(\frac{1}{2}\) gal/hr \(\times\) 14 hrs \(\times\) 215 days \(\times\) 11 gal ................. $ 165.00
- **Water pumping, air circulating, and miscellaneous operating** ................. $ 20.00

\[\text{Total Cost} = 30.00 + 165.00 + 20.00 = 215.00\]

Cost of Airkem for one year on basis of 1000 cfm reduction in outside air (varies with the rate of odor generation in the particular space).

- $75.00 to $125.00
- $90.00 to $140.00

The initial cost of equipment to accomplish the saving indicated above will vary between $150 and $350, depending on the size of the air-conditioning system.

ates entirely independent of and is unrelated to masking, anesthetization, and fatigue.

In addition to counteracting odors, this method performs another definite function by adding a note of freshness to indoor air. Just as tap water, placed for a period of time in a glass becomes stale and vitiated, so does air become stale after it has been allowed to stay indoors. Airkem adds ingredients which are associated with outdoor freshness; such materials, including the chlorophyll complex, are put into the air in minute quantities. Thus unpleasant odors are counteracted and a note of freshness is introduced to the recirculated air. Odors tend to be absorbed on surfaces generally—especially on carpets, drapes, walls, and the coils and duct surfaces of air-conditioning systems. The deodorant vapors also go to these surfaces and apparently have the ability to displace the odorous molecules.

When properly installed, there is no objectionable deposit of deodorant on the air-conditioning surfaces. The vapor does not tend to condense out and most of the active ingredients become a true molecular dispersion. Madison Square Garden, in New York, has vaporized thousands of gallons of deodorant into its air-conditioning system over a period of five years and yet no deposit of Airkem has been detected on the duct linings. This is an unusual test because the concentration put through these ducts to take care of circuses, rodeos, horse shows, etc., exceeds by many times that used in conventional air-conditioning systems. Tobacco-smoke odor is unlike most of the other occupancy odors. Freshly formed smoke may be fairly agreeable to many persons. Once the solid smoke particles have separated out and been deposited on rugs, draperies, ducts, and cooling coil surfaces, however, they undergo further chemical changes which make them most obnoxious.

In some systems the air-conditioning load for heating and cooling the outside air may be as high as 30 to 50 percent of the total load. Hence, the air-conditioning system which reduces its outdoor intake to a minimum approaches the most economical use, and requires less installed...

Tonnage and heating equipment. Savings of from 10 to 35 percent of the total heating and cooling costs can be realized by reclaiming some of the conditioned air which will otherwise be wasted. The possible reductions in the cost of operating air-conditioning equipment will, in most cases, more than offset the cost of the liquid complex and result in a further net reduction in the heating and cooling costs.

One gallon of the liquid costs from $6.00 to $7.25 depending on the quantities purchased; one gallon, however, is sufficient to treat 30,000,000 cu ft of malodorous air. The possible savings that may be considered typical for a wide section of the U.S. are indicated (Table I).

How Do You Specify and Approve Paint Material?
by Harold J. Rosen

This column was inaugurated on the premise that we could furnish the architect and the specifications writer with the latest authoritative information on materials and methods to be used in the writing of architectural specifications. In this issue, however, I propose to turn the tables and ask you, architect or specifications writer, for information.

The question is simply this: How do you specify and approve paint materials? This is a loaded question; so before you leap to a quick reply permit me to bring you up to date on several methods that are used today, but which are not entirely satisfactory.

In previous years, before the advent of alkyd emulsions, latex paints, polyvinyl acetates, acrylics (and perhaps others by the time this article gets into print), about all we had to deal with in specifying paints was a lead-and-oil paint. Many specifications of that era spelled out the exact proportions to be used in formulating paints. For example, for a primer on exterior wood, one might specify as follows:

<table>
<thead>
<tr>
<th>Material</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>White lead</td>
<td>100 pounds</td>
</tr>
<tr>
<td>Raw linseed oil</td>
<td>7.9 gallons</td>
</tr>
<tr>
<td>Drier</td>
<td>½ pint</td>
</tr>
</tbody>
</table>

For a finish coat on exterior wood, the specification might read as follows:

<table>
<thead>
<tr>
<th>Material</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>White lead</td>
<td>100 pounds</td>
</tr>
<tr>
<td>Raw linseed oil</td>
<td>3 gallons</td>
</tr>
<tr>
<td>Drier</td>
<td>½ pint</td>
</tr>
</tbody>
</table>

Then to insure that you were getting what you specified, you watched the painter measure out and mix the ingredients on the job.

However, the paint industry has come a long way since the days of lead and oil paints, and the architect and specifications writer have not been able to keep pace with these developments. The formulation of paints is a science today, and one must possess a knowledge of chemistry to understand its ramifications.

The paint manufacturers are constantly improving their products through research, and even today's brand changes as new resins, solvents, and plasticizers are discovered.

How then does the specifications writer specify these new paints and approve them? If he specifies Manufacturers A, B, and C (or equal) and the contractor submits Manufacturer D, how does he determine that Manufacturer D is "or equal"? For that matter, how can he equate Manufacturers A, B, and C in the same specifications?

In public work, a specifications writer might use Federal-Specifications paints as criteria, but if these paints are not tested in accordance with these specifications how does he know what he is getting? If you cannot afford to test the paints in accordance with these Federal Specifications and will therefore accept affidavits, you are again on shaky ground because the affidavits are not always attested to by the proper people. Most manufacturers make their own standard brands and only make paint in accordance with Federal Specifications when large quantities are involved. So if your project requires a small amount of paint, it may be difficult to get Federal-Specifications paints manufactured.

In institutional work, where purchasing agents buy paint for maintenance purposes, some have tried to develop specifications based on washability of the paints. The awards on paint materials are made not necessarily on low bids but on the basis of longevity of the paints based on the number of washings as against the price.

We cannot close our specifications to a limited few manufacturers. It may be that we have personal knowledge that some manufacturer's paint materials are unacceptable, and we may specifically exclude these, or veto them if they are submitted. But there are so many manufacturers of paint that one cannot possibly know them all and arbitrarily disapprove of a paint bearing the name of an unknown manufacturer, unless one has specific information. Yet, how can you approve the brand offered?

Recently a paint-specifications guide entitled "A Modern Guide to Paint Specifications," prepared by the Painting and Decorating Contractors of America, came to my attention. The very problem which I have posed here is unanswered in this guide. While a comprehensive specification on painting has been developed, the paragraph on paint materials is left to the Architect.

For example, on materials, this specifications guide reads as follows:

"Recommendation of specific material for fulfilling the intention of the Architect is not considered a function of these recommendations. This data should be obtained by the Architect from the Paint Manufacturers who generously supply any and all necessary information on this subject."

The foreword to this particular painting guide states that "no proprietary brands of materials have been stipulated in the preparation of these specifications." I do not wish to single out these specifications as an example, but I believe that had a satisfactory system been developed, it would have been incorporated in that guide.

Inasmuch as apparently there is no satisfactory method of specifying and approving paint materials, I am putting the question to you. How do you specify and approve paint materials? We propose to put the question to leading architectural firms, paint manufacturers, and other interested parties. Perhaps if we all put our heads together we can be instrumental in formulating a policy on the specifying and approving of paint materials. We plan to publish the results of this inquiry in this column at a later date.

with Formica on walls in Hotels and Motels

Formica surfaced furniture is still basic for all types of institutional use. But a newer Formica development is causing architects, decorators, contractors and operators to take a long look. It's the dollars and sense story of how attractive Formica wall surfaces cut maintenance, increase economy.

Every inch of wall area in this picture is Formica that was applied on-the-job with our new Fast Dry contact adhesive. There are many ways Formica can be applied to walls in full sheets, random width strips or pieces of all shapes and sizes.

Formica has a new Custom Design Service for providing suggestions for layout of any sizable wall area. Your local Formica representative will be glad to discuss this new service with you.

Full “how-to-do-it” information on applying Formica to walls is included in a new booklet “Vertical Surfaces.” It's yours for the asking. Write for form #670.

FORMICA CORPORATION, Subsidiary of 4604-7 Spring Grove Avenue, Cincinnati 32, Ohio.

In Canada: Arnold Banfield & Co., Ltd., Oakville, Ontario

Customers buy Formica because it is a brand name they know and trust.

DEMAND THIS CERTIFICATION

We protect this faith in our product by certifying every sheet with a wash-off Formica marking. It is for your protection and guarantee that you are getting genuine Beauty Bonded Formica.

Seeing is believing. If this wash-off identification is not on the surface, it's not FORMICA.
New Merchandise Mart showroom of Laverne, Inc., displays the firm's textiles, wall coverings, and furniture in a handsome interior designed by Estelle and Eurene Laverne. Elements combine to achieve a quality of light: white-on-white canvas "Patina" wall covering, glass partitions, white overall carpeting. Thirty-three-foot "Marbalia" mural, monumental Piranesi mural, and a wall of sliding fabric panels, luminously back-lit, dramatize the chiaroscuro effect. (See p. 166 for more Market News.)

Louise Sloane retail shops

Sharply contrasted in concept and in execution, yet unified in their purpose—to serve the retail customer—are the two New York shops that we show on the following pages. Designers Hansen & Thuesen created for Hotaling's News Agency a crisp, vividly colorful showcase that calls out to the passerby to enter and browse among the foreign-language newspapers, magazines, and books for sale within. Designer Finn Juhl, in remodeling the first floor of Georg Jensen, Inc., devised a richly subtle background for the hundreds of pieces of silverware, porcelain, and allied accessories that gleam and glitter throughout the space. Both shops reflect their respective designers' sensitivity to the emotional quality of the merchandise on display: Hansen & Thuesen choosing bold geometric lines, brilliant lighting, and such frankly contemporary materials as steel, Micarta, and Plexiglas to convey the excitement of news from foreign lands; while Juhl selects the patina of rare woods, gentle curves, soft diffused lighting, and floating ceiling panels of velvety fabric to emphasize the elegant character of Jensen's wares. Yet each shop design has been thought through functionally and practically. In the Hansen & Thuesen shop, the fixture units (see SELECTED DETAIL) are designed for maximum display in minimum space, and arranged both for self-service customer ease and watchful visibility by the sales attendant. The Juhl design provides necessary flexibility for frequently changing display requirements through a free-standing shelving system supported overhead by a suspended wood grid.
Contributing to the international atmosphere: world maps showing the time in major capitals, colorful blown-up names of publications in many languages. Unobstructed street window affords full view from the outside. Horizontal grid 10" below ceiling conceals wiring, carries signs, ties together vertical metal poles.

designer | Finn Juhl

**data**

**Color Plan:** Dominant color is the teak wood, used for display tables, backgrounds, and overhead grid. In free-standing and wall-hung cases, panels are of lacquered, Black Bog Oak and Japanese Bast, all in natural finish. Walls are painted off-white, flooring is black and white, ceiling fabric panels are white.

**cabinetwork, lighting**
All designed by Finn Juhl.
Cabinetwork: executed by Bovirke, Copenhagen, Denmark.
Lighting: Louie Poulsen & Co. A/S, Copenhagen, Denmark.

**fabrics**
Ceiling Panels: fireproofed white cotton cover, Maharam Fabrics Corp., 130 W. 46 St., New York, N. Y.

**flooring**
Floor: vinyl-tile/ Robbins Floor Products, Inc., Tuscumbia, Ala.

Overhead grill of teak, carried to ceiling by metal straps, provides support for flexible display units as well as for snap-on accent lights which may be moved about at will. Display units have interchangeable wood panels attached to metal uprights, bracket-supported glass shelves.

Chicago Market Survey

The consistently increasing work of the architect in areas of interior design has electrified the atmosphere of the Chicago home-furnishings market, with "the importance of the architect as interior designer" a topic for panel discussions, humorously pointed dramatic sketches, and focal point of much manufacturers' sales literature. Furniture, floor-and-wall covering, and appliance suppliers are deeply conscious of the desirability of the architect-customer, and are slanting their design and selling efforts to appeal to the architect market.

Outstanding example of a supplier's provision for both the esthetic and practical needs of the customer is Amtico's effective new showroom, designed by Paul MacAlister & Associates in the Merchandise Mart. In a compact 33x18-ft space, the designer has managed to show six different, installed, sample floors; the company's entire diversified assortment of patterns, grades, and colors; and has devised a "Color Scheme Planner" for presenting co-ordinated color schemes. The Planner is composed of three revolving triangular columns, each face carrying eleven separate color schemes, permitting a total of 99 color schemes, to be read from top to bottom. Along one wall, a wing-form display of small samples is specially lighted to avoid hilation and to permit true reading of color.

The Upholstery Leather Group's 1957 exhibit introduces both a new upholstery leather, and a lightweight leather suitable for draperies, curtains, shades, folding doors. In its fourteen room settings by members of the American Institute of Decorators, markedly architectural use of leather has been made—in an acoustical ceiling, as a wall covering, for a room divider, for screens, as facing for a storage-wall (see acrosspage).
Stationary screen, framed in white metal, uses four leather panels ranging from light beige to chocolate brown, stands against a wall of white pecky cypress. Adjacent wall is gold-colored burlap, chair in vermilion leather, vermilion Venini hanging light. Setting designed by Marius Perrin; furniture by Erwin-Lambeth Furniture Co., Thomasville, N. C.

Prize-winning architectural design in 1956 competition, acoustical ceiling by Dave Zeese, combines five shades of leather woven with 1-inch wooden dowels. Setting designed by William Pahlmann; furniture by Jens Risom Designs, Inc., New York, N. Y.

Oiled-walnut beams frame leather in two tones of yellow and white, and in gold, for ceiling and shade wall. Chairs are competition designs, the pair in oiled walnut with brass ferrules designed by Kwok Wai Lau; the turquoise-lacquered chair with sculptured back and seat molded in one piece of leather designed by Robert B. J. Biggins. Antique Persian brass piece serves both as cocktail table and lighting fixture. Setting designed by Marian Heuer; furniture by S. J. Campbell Co., Chicago, Ill.

Leather window shades, in mustard yellow and gray, have cut-out snowflake motif (competition design by Betty Cooke). Floor cushions, armless chair, and console table are all leather-covered, in yellow, grey, white, kumquat. Floor is V-joint ebony, walls are by Murals, Inc., Jamaican-weave covering in white. Setting designed by John Wisner; furniture by Arch Gordon Company, Chicago, Ill.
Occasional Chair: designed by Edward J. Wormley/ of laminated natural ash, formed of "X" members/ round, down-filled, back cushion over cane back/ retail: $440, cover furnished/ Dunbar Furniture Co., Berne, Ind.

Bel Canto Chair: designed by J. Gordon Perlmutter/ floating seat, leather-upholstered in sculptured walnut frame/ Shearman Brothers Co., Jamestown, N. Y.

Low Round Table: designed by Charles Eames/ white plastic top, gray vinyl edge, base and shaft of black-lacquered steel tubing, top of star-shaped base of polished aluminum/ 16" high, 36" diam./ Herman Miller Furniture Co., Zeeland, Mich.

Side Chair: designed by Gio Ponti/ walnut frame in fluid, unbroken line, slim seat and back upholstery/ M. Singer & Sons, New York, N. Y.
Two Grand Old Names in Lighting

Announce the New

Guth

Incandescent Lighting Catalog

"Mr. Holophane" says—
"Glad to have you aboard, Ed. My colleagues tell me your new catalog will prove to be most valuable for Architects and Engineers. Congratulations!"

CHARLES FRANCK,
President
The Holophane Company
New York 17, N. Y.

"Mr. Guth" says—
"Thank you, Mr. Franck. Our Engineers have had a hey-day with your grand lens-line. The new catalog appears to be a most helpful lighting tool."

EDWIN F. GUTH, SR.
The Edwin F. Guth Co.
St. Louis 3, Mo.

THE NEW GUTH CATALOG features 8 special indexed sections to completely cover the entire new Brascolite line of incandescent fixtures: square and round recessed units with Holophane Controlenses*, surface and suspended fixtures, night lights, bed lights, gym lights, etc. Complete with photograph of each fixture, plus specifications, dimensional drawings (drawn to scale for easy reproduction), coefficients of utilization, light curves, installation information and other technical data.

Also a special 12 page section including complete Lumen and Point-by-Point Charts, features of Guth quality design and construction, as well as description of the famous ALZAK Lifetime Aluminum Finishing Process.

Write on your letterhead for your complimentary copy of this new catalog today.

THE EDWIN F. GUTH CO., ST. LOUIS 3, MO.
5 miles of GoldSeal Floors exclusively for Maine State Office

Aerial view of the new Maine State Office Building with the Capitol building at the rear.
More than 148,000 square feet of Gold Seal Veltone® ⅜" Inlaid Linoleum has been specified and installed in the new Maine State Office Building at Augusta, Maine.

Originated by Gold Seal, "Veltone" provides an attractive, long-wearing, all-over decoration for use in all public buildings, schools, hospitals, offices, etc. Veltone's excellent resiliency provides quiet and comfort under foot. The unique design of this Inlaid Linoleum literally hides foot marks...it's exceptionally easy to clean and keep clean because of its density and surface smoothness. This ease of maintenance naturally reduces the expense of building service and upkeep. For those who prefer the modern textured look in Inlaid Linoleum, Gold Seal offers Sequin®—⅜" thick—with all the advantages of "Veltone."

Gold Seal Vinylbest® Tile and Gold Seal Asphalt Tile were also used in special areas such as the food and photo laboratories.

Send for Free Technical Data Book—"Why Resilient Floors"—containing 36 pages of information to help you specify the correct resilient floor for any type of commercial, institutional or residential building. Address Architects' Service Department, Gold Seal Floors and Walls, Congoleum-Nairn Inc., Kearny, N. J.

Provide your clients with the finest in flooring—specify Gold Seal.
The tremendous growth in popularity of glass-wall construction and the use of sliding glass doors has created a demand for these doors in a wider variety of types, sizes, and materials. Among the few major firms in this country manufacturing both steel and aluminum frames, Arcadia Metal Products offers three basic lines of sliding doors in stock and custom sizes. Full information for architects on these lines is presented in the new Arcadia Sliding Door Catalog.

In addition to conventional sliding doors, the catalog features custom models to permit greater mobility, wider openings, pocket installations, and use with post-and-beam construction. Details, specifications, and tables of stock sizes for each line—single and double-glazed standard aluminum, standard steel, and heavy-duty aluminum doors—are grouped for easy reference. Photos show outstanding features including double-seal wool-pile weatherstripping at head section, jambs, interlocking, and sill; contemporary-styled hardware. Installation details are provided in final section. Example shown on cover was designed by Cliff May with architects Higgins & Root for the Lane Publishing Company, Menlo Park, Calif.

**Construction**

Typical Lumber Designs, AIA 19-B, 16-p. 1957 edition of handbook listing large variety of lumber designs using Tees structural connections. Designs range from basic types of trussed rafters and heavy roof trusses to highway structures and farm buildings. Provides: data on spans, depths, spacings, and loads; descriptions; outline drawings; instructions for ordering complete information on any design listed. Request from: Timber Engineering Co., 1319 18 St., N.W., Washington 6, D. C.

270. Steel Joist Bridging, AIA 13-G, 16-p. synopsis of tests made on short-span open-web joists to determine most effective type of bridging. Presents charts compiled from results of three series of tests along with observations and conclusions. Drawings, diagrams, and photos illustrate report. Steel Joist Institute, Dupont Circle Bldg., 1346 Connecticut Ave., N.W., Washington 6, D. C.

271. Fireplaces of Stone, AIA 22-A-2, 22-p. publication showing examples of stone fireplaces for homes selected by Building Stone Institute. Photos indicate wide range of stone types used in fireplaces designed for contemporary or traditional surroundings. Building Stone Institute, 1696 Summer St., Stamford, Conn.

272. Milcor Metal Trim, AIA 20-B-1, 26-p. catalog illustrating types of interior steel trim for various installations. Features standard wall units for window openings—consisting of head and jamb sections, window stools, and convextor enclosure panels; gives full data and installation details. Includes sections on plastered-in and clipped-on bases, picture molds, fillet molds, and blackboard trim. Provides installation details for each unit. Photos, specifications, dimensions. Inland Steel Products Co., 4143 W. Burnham St., Milwaukee 1, Wis.

274. Micro-Match Flooring, 4-p. folder containing information on pre-sanded oak strip flooring supplied in long uniform lengths and double-widths to eliminate problem of matching odd pieces. Color photos show precision tongue and groove connections of strips that form integral finished floor over conventional subflooring, concrete slabs, or joists. Illustrates two available oak grades. Specifications. Miller Brothers Co., Inc., Johnson City, Tenn.
installed with transoms or sidelights. Photos show designs of standard hardware for panic exits, residential doors, and doors in public buildings. Specifications, charts, drawings. Dusing and Hunt, Inc., Dept. P, Lake St., Leroy, N.Y.

**electrical equipment, lighting**

485. Interior Lighting Design Data, 52-p. manual intended as basic reference book for architects and engineers designing interior lighting installations. Describes footcandle levels required for such seeing tasks as drafting, bookkeeping, and machine operating; levels are assigned to specific interior areas of all conceivable types from armories and airplanes to textile mills. Also, suggests methods of calculating light quantities as well as selecting lighting systems, maintenance factors, and locations for luminaires. Provides tabulated textbook data on room indexes and coefficients of utilization in addition to series of charts that facilitate computations. Westinghouse Lamp Div., Bloomfield, N. J.

486. Milcor Cellulor, 16-p. booklet containing information on cellular steel subfloor which serves as both electrical duct system and lateral reinforcement in concrete slab construction. Lists advantages in economy and flexibility; provides formulas, charts, and tables for determining proper gage and form of steel sections for different loads, spans, and bearing requirements. Construction details show typical applications at critical points. Drawings, specifications. Inland Steel Products Co., 4139 W. Burnham St., Milwaukee 1, Wis.

488. Modular Lighting Systems, AIA-11-F, 12-p. pamphlet discussing features of modular ceiling lighting systems and pendant lighting units. Describes and illustrates systems designed to coordinate acryllic diffusers, suspended acoustical baffles, sprinklers, air diffusers, and movable partitions. Photos show actual installations; drawings explain assemblies. Catalog section shows variety of pendant lamp designs; includes engineering data. The Wakefield Co., Vermilion, Ohio.

**finishers and protectors**

521. Stop Rust, 32-p. four-color booklet with sample charts showing wide range of available colors for rust-preventive coatings used in industrial applications. Discusses advantages of use and physical characteristics of primers, long and short oil coatings, machinery finishes, and special heat-resistant, chemical-resistant coatings as well as sealers and floor coatings. Gives instructions for mixing, thinning, and application. Rust-Oleum Corp., Evanston, Ill.

641. Shock and Vibration Control, 4-p. report reviewing basic principles of vibration isolation and shock absorption, with suggestions for their practical application. Classifies vibrations according to origin, which may be directly from machine or indirectly through foundations and walls. Provides formulas and graphs for determining individual problems. T. R. Finn & Co., Inc., 200 Central Ave., Hawthorne, N. J.

**insulation (thermal, acoustical)**

642. Styrofoam Insulation, AIA 37-B, 16-p. folder enclosing separate detail sheets which illustrate variety of applications for polystyrene, plastic-insulation. Clearly drawn details show rigid-type material used to insulate wood and metal windows, masonry-wall door opening, perimeter heating ducts, slabs and foundation walls. Also includes listing of thermal, physical, and water-resistant properties; specification sheet; ordering data. The Dow Chemical Co., Midland, Mich.

643. Perforated Metal Sheets for Sound Control, 6-p. nontechnical bulletin describing application of perforated-metal sheets for acoustical treatment of ceilings, walls, and enclosures. Isometric drawings show panels of perforated metal and sound-absorbent blankets supported by aluminum-grid ceiling system or fixed to wall with metal-molding caps and spring clips. Illustrates variety of three-dimensional patterns that strengthen sheet material and suggest exciting design possibilities. Diamond Mfg. Co., Wyoming, Pa.

(Continued on page 174)
specialized equipment

854. Steel Kitchens, 20-p., catalog containing information on a wide variety of model sinks, cabinets, and special sink equipment. Features titanium-porcelain, acid-resisting steel sink and cabinet combinations; base cabinets; cabinets with lighting; corner cabinets; nicarta covered sink tops; double faucets with aerator and automatic diverter sprayer. Eljer Div. of The Murray Corporation of America, Three Gateway Center, Pittsburgh 22, Pa.

855. Curtis Kitchens, 24-p. catalog illustrating range of wood cabinets and closets for designing attractive contemporary kitchens. Illustrates several complete kitchens stressing color variety in natural wood or painted effects. Shows selection of storage units with pull-out trays, swinging doors, and spinning shelves as well as storage walls and island units. Scale outline drawing of wall and base cabinets facilitate kitchen planning. Photos. Curtis Companies Service Bureau, Clinton, Iowa.

856. Methods for Plant Layout, 44-p., catalog showing materials and methods for making plant layouts or scale models without preliminary drafting. Describes two-dimensional system using grid sheets, templates, and tapes to create layout from which blueprints are made in usual manner. Drawings show available replicas of piping sections with brass-pin connections; pumps; compressors; ladders and stairs; laboratory furniture; refinery equipment and even scale figures for building miniature assembly lines and fully equipped model plants to facilitate visualization. F. Ward Harman Associates, Halesite, Long Island, N. Y.

Inexpensive acoustical treatment can be attractive, too!

Study this picture. This room is sound-conditioned with the wonder-material of the acoustical industry—Forestone fissured woodfiber acoustical tile. You'll notice that there are no mechanical-appearing holes drilled all over the ceiling. Forestone catches noise in its hundreds of beautifully-formed fissures instead. Yet, because it is made of woodfiber, Forestone costs no more than popular thicknesses of perforated tile.

Forestone is available in 12" x 12" and 24" x 24" tiles; as ceiling board to fit 24" x 24" and 24" x 48" exposed grid suspension systems; and in 12" x 23¾" tiles for exposed Z and T suspension systems, with access to utilities.

Now, Forestone is also available in center-scored 12" x 24" tiles with tongue-and-groove joints, flanged for easy stapling or nailing.

When planning your next building, if beauty and economy are important, specify Forestone. For further information call your nearest Simpson Certified Acoustical Contractor today. (See contractors listed on opposite page.)
METAL CURTAIN WALL

the creative building tool

Commercial building built of 3 central core units enclosed in metal curtain wall. Apartment buildings use curtain wall recessed in balcony enclosures. End walls of anodized aluminum panels. Design by Ray Stuermer, A.I.A.
KAWNEER a single source for a complete metal wall system

analysis, engineering, fabrication, installation

ANALYSIS AND ENGINEERING—Kawneer engineers will translate your architectural metal wall design in terms of factory fabricated units that will speed erection of your building, and assure client satisfaction. You gain the know-how Kawneer has accumulated through 50 years of architectural metals experience.

FABRICATION—Kawneer has extensive fabricating facilities available for application to your job. These modern facilities and production techniques allow Kawneer to give the most effective execution to your metal wall requirements...regardless of the blend of expression and function you may have in your design. Porcelain faced aluminum, stainless steel, colored Alumilite finished aluminum, insulated mullions for condensation and heat control, operating or fixed sash...whatever you demand, Kawneer can supply in its metal wall system.

INSTALLATION—Kawneer metal wall contracts are usually direct subcontracts with architect, general contractor or owner. This places complete responsibility for fabrication and erection with one responsible firm. This responsibility allows tight control over anchoring devices, sealing methods and materials, and expansion provisions...control that assures you and your client complete satisfaction. Since Kawneer has this control, an effective and adequate guarantee is provided at no extra cost.

IF YOU ARE PLANNING construction that calls for metal wall, any Kawneer district office or the home office in Niles, Michigan, will be pleased to discuss the advantages and characteristics of Kawneer’s complete metal wall system with you.

Guarantee Mutual Life Co., Omaha, Nebraska.
Architect: Leo A. Daly Co.
Contractor: Peter Kiewit Sons' Co.

April 1957
reactors available to industrial, educational, and research organizations. Cutaway drawings show features of: highly flexible swimming pool reactor; heavy-water reactor for large-volume projects; nuclear test reactor for precision industrial process experiments. Provides diagrams showing internal mechanisms; tables of reactor characteristics; full descriptions. General Electric, Apparatus Sales Division, Schenectady 5, N. Y.

Compound Diffraction Projector, 24-p. handbook offering complete data on public address loudspeaker system operating on diffraction principle. Analyzes limitations of commonly used sound equipment; gives thorough description of components, performance, and application of system utilizing two coaxial horns for high-quality projection of voice and music. Outlines method for making sound surveys; discusses public address requirements for auditoriums, stadiums, and large interior rooms, with reference to basic acoustical principles. Text is illustrated with numerous diagrams, graphs, and photos. Includes architect’s specifications. Electro-Voice, 404 Carroll St., Buchanan, Mich. 35p

surfacing materials

955. Chalkboards for Schools, 8-p. publication exhibiting line of chalkboards, corkboards, and aluminum frames for schoolrooms. Introduces plastic-faced, curved chalkboard designed to reduce eye fatigue, arm strain, and glare. Also shows porcelain-enamel surface chalkboard which won’t chip, warp, break, or shatter. Offers tabulated data on various board compositions. Full size details for recessed or surface-mounted boards and aluminum trim. Photos, specifications. New York Standard Blackboard Co., Inc., 225 Broadway, New York 7, N. Y.

956. Marlite Wall and Ceiling Panels, AIA 23-L (15551), 8-p. bulletin illustrating plastic-finished interior surfacing material. Shows panels in solid colors, with tile scoring, in eight wood finishes, and in five marble patterns; gives description and dimensions for each type. Also includes data on T&C hollow-core paneling available in solid colors and wood finishes. Marsh Wall Products, Inc., Dover, Ohio.

Mahogany Grain Patterns, 32-p. booklet illustrating 40 varieties of mahogany veneer in natural color reproductions. Gives detailed description and standard plate numbers useful for specification and selection. Data covers origin and development of various configurations; includes a glossary of pertinent terms. Special sections show effects obtained by matching pieces. Available only on direct order from Mahogany Assoc., Inc., 666 Lake Shore Drive, Chicago 11, Ill. $1.

interior furnishings

66. Post Furniture for the Drafting Room, 16-p. bulletin on wood and steel furnishings for architectural offices. Shows standard sections for inter-locking, built-up filing cabinets; also illustrates tracing files, drafting tables, and chairs. Dimensions and description for each piece of equipment. Frederick Post Co., 3650 N. Avondale Ave., Chicago 90, Ill.

Dunbar Book of Contemporary Furniture, 208-p. catalog of Edward Wormley’s contemporary furniture designs has been issued in handsome book form. Photos in black and white as well as imaginative color plates display capacious sofas with sculptured wood supports; chairs for all occasions—openwork, wood-cradled desk chairs, plump lounge chairs, long-legged side chairs; flip-top, drop-leaf, expandable tables in myriad forms; cabinets doubling as bars, bookcases, or room dividers. Ordering data is tabulated in final section with pictorial recapitulation of items. Request directly from Dunbar Furniture Corp. of Indiana, Berne, Ind. $12.50.

NEW RECORDS: Center, DEPT. OF DEFENSE

1,340,000 sq. ft. of floor space functionally planned

The architects spent months of patient study and intensive research and planning. The result is a highly integrated structure, with modern conveniences and appointments throughout.

Halsey Taylor drinking water equipment was specified to afford cool water for all employees. The Halsey W. Taylor Co., Warren, Ohio.

* Cooler shown has mechanical dual controls, stainless steel top. Wall Fountain shown, as well as cooler, is typical of complete Halsey Taylor line.
VITROLUX®
A COLOR-FUSED, HEAT-STRENGTHENED
POLISHED PLATE GLASS for curtain walls and
other facing applications

Enduring, True-Toned Colors. Vitreous color is fused to
the back surface of clear plate glass. The rich, true color is
transmitted to the surface undiminished, unchanged.

Practical, Low-Cost Maintenance. The polished glass
surface is non-porous, non-absorbing—practically self-cleaning.
Offers high resistance to corrosion and weathering.

For colorful buildings of distinctive character, VITROLUX
is the answer.
VITROLUX is made of heat-strengthened polished plate glass.
Vitreous color, fire-fused to the back surface, becomes an
integral part of the glass. The VITROLUX color is sunfast,
enduring—offers the same natural resistance to weathering,
crazing and checking inherent in quality glass.
Many curtain wall manufacturers offer framing systems into
which VITROLUX is installed much the same as glazing with
plate glass. Because VITROLUX is heat-strengthened, all
edgework, pattern cutting or drilling of holes must be done
at the factory before fabrication.

Dimensions—Thickness: $\frac{3}{8}''$ plus $\frac{3}{4}''$ minus $\frac{1}{2}''$.
Standard maximum size is $48'' \times 84''$. Maximum size for
special orders is $60'' \times 84''$.
Ask your L.O.F Distributor for descriptive folder (he’s
listed under “Glass” in phone book yellow pages), or write
Libbey-Owens-Ford Glass Company, 608 Madison Avenue,
Toledo 3, Ohio.

Your visiting facts and figures department

Your Kewanee man

Your mechanical equipment specifications can only be as good as the information behind them. Knowing this, your Kewanee man is data-conscious. He keeps you armed with boiler facts and figures...sees that you have an up-to-date catalog...is fast to supply specific information you request.

He can intelligently assume this responsibility because he is a qualified boiler specialist. He knows boiler problems—and answers—from years of experience. Also, he maintains close contact with engineering experts at Kewanee Boiler Division—can keep you abreast of latest applications in the field.

His competence keeps pace with the famed performance of Kewanee Boilers themselves—dependable, efficient models from residential 70,000 Btu units to industrial boilers carrying a 651 h.p. rating. And he is quickly available from a nearby Kewanee Branch Office in the coast-to-coast network.

AMERICAN-STANDARD, KEWANEE BOILER DIVISION, 101 Franklin Street, Kewanee, Illinois.

Singly and in battery Kewanee Type C Steel Boilers have won a reputation for high capacity and efficiency—within a minimum floor space—since introduction in 1928.
For column-to-column treatment, trim wall-hung units with standard prefabricated enclosures, accessories and shelving are "tailored" to fit building modules.

For a clean, continuous appearance, two well-proportioned Weathermaster base units separated by a filler piece look good, make future partitioning easy.

For pleasing corner assemblies, a wall-hung Modular Weathermaster unit with prefabricated cabinet and run-out enclosure is both attractive and economical.

For floor-fed services, a pedestal arrangement attractively conceals air and water risers. This method of distribution eliminates the need for furred-in risers.

For harmony with custom interiors, a decorative furred-in arrangement with base unit, inlet panel and discharge grille matches any interior treatment.

For modern, all-glass buildings, a "foot-high" column-to-column arrangement is extremely flexible and blends well with modern architecture and furnishings.
Heat Pump Weathermaker: new packaged heat pump for year-round residential and commercial air conditioning is designed to cut initial and operating costs as well as reduce required floor area. Pump, utilizing outdoor air or water as heat source, can be installed in attic, basement, or closet. Two-piece unit with exterior-mounted air intake eliminates interior ductwork normally used to supply air for heat production. Air-source heat pump may deliver nearly 3 units of heat energy per electrical work unit; using water, pump may deliver as much as 5, 6, or 7 units. Heat pumps now available in 5-hp models will eventually appear in other popular sizes. Carrier Corp., Syracuse 1, N. Y.

Electric Radiator: completely automatic electric steam convector is said to combine advantages of electric heater and ordinary steam radiator: eliminates fan noise, air blast, and dried, burned, or overheated air; requires no liquid or exposed heating element. Radiators, housed in baked-enamel shell, are equipped with thermostat and pilot light. Six models for free-standing or recessed installation are available, ranging in size from 16" x 20" to 64" x 24". All units are 6" deep and operate on 230v; capacities range from 650w to 3000w. Spartan Electric Radiator Corp., 52-55 74 St. Maspeth 78, N. Y.

Airtherm Air Conditioner: in new buildings, multiroom central-system air-conditioning unit provides individual-room control of heating and cooling without ductwork; in old buildings, unit is adaptable to existing wet-heat systems. New units feature: quiet operation; one-piece front panel for recessed installation; single-unit motor and fan assembly. Concealed or cabinet-type models installed at floor or ceiling are available in four series ranging from ½-ton to 2-ton capacity, at 160 to 600 cfm. Airtherm Mfg. Co., 745 S. Spring St., St. Louis, Mo.

Ray-O-Lite Panels: translucent reinforced plastic panel awnings and patio coverings are engineered to provide louvered ventilation and soft diffused light. Shatterproof, weatherproof panels do not require painting and are available in 10 integral colors. Panels may be utilized by simple aluminum frame to complement contemporary-styled homes. Ray-O-Lite Corporation of America, 316 Peachtree St., N. E., Atlanta, Ga.

Bi-Folding Door Hardware: new hardware sets for bi-folding wood wardrobe doors permit center-hinged panels to fold together against jamb, giving full access to interior. Hardware sets consist of nylon pivots and guides; heavy-gage adjustable steel brackets; header guide track. Packaged sets for two- and four-door openings can be used on doors from ½" to 1¾" thick. The Stanley Works, New Britain, Conn.

Sprayed Stipple-Texture: new ready-to-use multipurpose latex paint with micronized silica particles is especially formulated for stippling or texturing wall surfaces in single paint application. Paint is also recommended for hiding minor surface imperfections and filling masonry block pores. Applied by brush or roller, new paint provides durable base for finish coats. Product is available in eight color shades. The Glidden Co., Cleveland, Ohio.

Acoustical Sidewall Panels: for industrial sound control problems, long-strand woodfiber sidewall panels mounted inside or outside framing girts are claimed to have inherent sound-absorbing properties. Non-combustible panels interlock in vertical tongue-and-groove connection. Panels (Continued on page 190)
MODERN DOOR CONTROL BY LCN

Fir plywood roof deck helps save $3,300.00

To eliminate 2 x 4 blocking, metal "H" clips were used at unsupported panel edges. Two clips were used for each span. (Clips were responsible for approx. $20 per M of savings; see table above).

**ALTERNATE COST DATA**

Summary of installed costs per M sq. ft. Based on actual suppliers' quotations and time records where available and on Walker's Estimator's Handbook where not:

1. As built, with clips, eliminating blocking at panel edges. Includes cost of new plywood and 50% of initial cost of exterior plywood salvaged from forms.......... $169*

2. Estimated cost as built but using all new sheathing with no salvage from concrete forms........... $187

3. Estimated cost all new sheathing with 2 x 4 blocking at panel edges $206

4. Estimated cost 2 x 6 T & G decking $291

*160.00 per M "as built" cost represents $122.00 per M savings over estimated cost of 2 x 6 T & G decking. On this basis, savings on entire job total $3,300.00.
An excellent example of how fir plywood roof decking sharply cuts costs as well as provides markedly superior construction is this new U-shaped, 1-story reinforced concrete school.

The contractor estimates ¾" fir plywood saved a total of $3,300.00 on the job; $2,800.00 in actual installed cost, plus an additional $500.00 by amortizing costs of some of the panels previously used for forms. A total of 27,000 sq. ft. were used on the job. Design calculations by the architects show plywood superior in resisting racking forces such as wind loads and earthquakes.

Although many home builders have found thick plywood over wide rafter spacing saves money, this is one of the first detailed cost analyses for a larger building. The idea points the way to new opportunities for reducing costs on commercial and industrial buildings as well as schools.

Fir Plywood means quality construction

For your files: A new portfolio assembly of basic plywood design and application data for schools, homes, commercial buildings. Includes detailed information about job described above.

5 ways Fir Plywood builds better schools

1. Strong, rigid, easy-to-apply wall and roof sheathing.

2. Smart, durable siding, soffits and exterior trim.

3. Attractive, damage-resistant paneling and wainscoting.

4. Good-looking wardrobes and storage lockers.

5. Inexpensive, easy-to-build screens, movable partitions.
feature textured surface and shadowline groove at edges. Compressed 2" or 3" panels are 30" wide and from 4' to 10' high. Tectum Corp., 105 S. Sixth St, Newark, Ohio.

Deltafilm: pure polyethylene film for permanent moisture vapor protection in building construction is lightweight, rot-proof, crackproof, and easy to apply. Film is applicable to windows, crawl space, windbreaks, and on-grade slabs; when used under slabs, film is laid over sand base to protect from ground projections; joints are sealed by folding butted edges. Product is said to withstand effects of extreme temperatures. Protective film, furnished in variety of thicknesses, is also recommended for use over sub-flooring to seal dust out and on sidewalls to keep

STRATEGIC DESIGN FURNITURE

In our age when men of science are so badly needed, and in our land where individuals fortunately choose their own professions, it is most important that science teaching is not a sterile world of laborious formulae—but a fascinating world where exciting new facts await discovery.

Now, the very design of the science room must create enthusiasm. The atmosphere must be right, with emphasis on science. Truly, the new line of laboratory furniture by Sjöström of Philadelphia can help create an atmosphere which encourages students to appreciate, to like, and to stay with the sciences. Write for descriptive literature.

new line of laboratory furniture by Sjöström of Philadelphia can help create an atmosphere which encourages students to appreciate, to like, and to stay with the sciences. Write for descriptive literature.

Vacuum Cleaning System: central built-in vacuum cleaning system (above) with motor and tank-type receptacle installed in garage, does away with laborious maneuvering of bulky equipment. Pneumatic 2" aluminum tubing extends under floor or overhead to desired locations and emerges at floor or low-wall inlet sockets (above, inset). Advantages of system include: elimination of operating noise and dust recirculation; powerful, stationary, central-service motor; central receptacle—16" diameter, 27½" height—requires less frequent emptying. Two available models have capacity ratings of ½ hp, 90 cfm; 1½ hp, 120 cfm. Sequoia Mfg. Co., 1090 Brittan Ave., San Carlos, Calif.

Roll-A-Way Bleachers: with new, powered gymnasium bleachers, opening and closing of 10, 15, 20, or more row-sections is rapid and single-handed operation. Basic component is compact mobile electric power unit (above). To operate unit, custodian fits extended gripper arm into opening under front row; this engages attachment bar under bleacher section; action begins with touch of handle switch. Operator need only guide unit from section to section and direct action. Pneumatic tires on power roller protect gym floor. Bleachers may also be operated by hand. Universal Bleacher Co., Champaign, Ill.
you know you're right when you specify by DFPA* grade-trademarks

factory-inspected, laboratory-tested
To qualify for DFPA grade-trademarks, manufacturers must pass rigid and continuous inspection of current plywood production. In addition to these on-the-spot mill checks by DFPA quality supervisors, thousands of samples undergo scientific testing in DFPA laboratories. Use of grade-trademarks may be withdrawn if quality is not satisfactory.

right grade, right quality for every job
DFPA grade-trademarks are specification guides to the right grade for a specific job. Only genuine DFPA quality-tested panels bear DFPA registered grade-trademarks. There are imitations. Don't be misled!

Be sure you can tell the difference.
Send for the DFPA Quality Story—a portfolio of grade-use data and a step-by-step description of the DFPA quality control program. Write Douglas Fir Plywood Association, Tacoma 2, Washington. (Offer good USA only)

*DFPA stands for Douglas Fir Plywood Association, Tacoma 2, Washington—a non-profit industry organization devoted to product research, promotion and quality maintenance.
If You Have a Large Warehouse
To Design and Early Occupancy
and Cost Are Important Factors...

FROM A DESIGN STANDPOINT: V-LOK Interlocking Steel Framing meets all design variables, collateral material attachment and design adaptability requirements of the Structural Engineer.

FROM ERECTION STANDPOINT: The positive interlocking of structural members (without bolts, rivets or welding) not only produces a more rigid frame but reduces man hours to a record low not possible with any other type of construction.

FROM THE COST STANDPOINT: A building erected, ready for occupancy months earlier because the steel frame is up and the roof on in a matter of days or weeks, proves its economy to any Builder in one V-LOK job. Let us prove it.

the search for pleasingness

The discussion below is drawn from a provocative book, While Architecture Lasts: Proposals for a Revival and a Code of Criticism of Modern Architecture, being written by Robin Boyd, Australian architect, author, and critic who was first brought to attention of P/A readers as editor of the student leaflet, Smudges, with which professionals of his country were bombarded several years ago.

In his first book (Chapter II), Vitruvius defined good architectural arrangement as the disposition in their just and proper places of all the parts of the building, and the elegance or pleasing effect of the whole. Pleasing Effect then became the slogan emblazoned on the banner wherever the Classical tradition was carried. To realize this universal property of pleasingness the ancients sought a Golden Rule, the vital touch of nature's design, the key to a perception unlocking the innermost secrets of the design of the universe. Characteristically they began the search on the surface of the human body, believing that the secret of the design of its form would be the key to all creation.

Vitruvius started methodically at the navel, noting it to be the natural central point: "If a man be placed flat on his back with his hands and feet extended, and a pair of compasses centered at his navel, the fingers and toes of his two hands and feet will touch the circumference of a circle described therefrom." (Book 2, Chapter I.) He also explained that a square may be discovered in the body, for a man's arm-stretch "will be found to be the same" as his height.

This picture of the man in the circle has pleased many generations. Somehow, it seems evidence of our importance in the scheme of things, suggesting at least a comforting niche for our mortal frames in the cosmic pattern, if not positive proof of our being made in God's image. In his study of the Renaissance, Rudolph Wittkower disagreed with Scott's theory of empathy, of the humanist's simple aim to please the eye. On the contrary, he pictured the age in earnest search of a mathematical and harmonic integration of architecture in the cosmos. The Vitruvian Man "seemed to reveal a deep and fundamental truth about man and the world," he said, "and its importance for Renaissance architects can hardly be over-estimated. The image haunted their imagination." (Architectural Principles in the Age of Humanism, Part IV.)

The artists of the Renaissance delighted in illustrating the concept. Leonardo's famous diagram is the most thorough. His man has a body fixed in the center of a superimposed circle and square. Man's limbs are shown in two positions, with legs spread easily and arms raised in a V to touch the circle, and with feet together and arms stretched wide to touch the square. Other artists pictured the Vitruvian figure differently. In 1511, Fra Giocondo, the first to publish a drawing, had Man's arms horizontal and his legs comparatively close together. Cesariano's edition of Vitruvius (1521) spread Man's legs into an acrobatic split. Francesco Giorgi (1525) had to bend his Man's arms to contain them within a circle which had suddenly contracted, for some reason not suggested by Vitruvius, until it almost touched his head. Notwithstanding the different postures, all these universal men were contained precisely within the perfect geometric form of a circle. This is not remarkable since artists can adjust posture and proportions at will. All the men in the pictures are proportioned differently, as indeed are men in life, and the artists could just as well have turned their pens to prove that man bore a striking resemblance to a triangle, or a tree—which may be a more convincing hypothesis. But the circle attracts because it is the most obvious basis of cosmic geometry, and a circular container adds dignity to our physical form. It reminds us that, however vulnerable and ungainly our body may be in comparison with the forms of some of our four-footed co-inhabitants of the world, it alone when spread-eagled can fit inside the shape of the universe. Nevertheless, if we were cats we would fill the Vitruvian circle much more snugly—and in our sleep.

Vitruvius scrutinized his fellow men more closely to find further evidence of harmonic pattern. He was delighted to discover that their frames carried a network of mathematical division; "The human body is so designed by nature," he wrote (Book 3, Chapter I).
the search for pleasingness

"that the face from the chin to the top of the forehead and the lowest roots of the hair, is a tenth part of the whole height; the open hand from the wrist to the tip of the middle finger is just the same, the head from the chin to the crown is an eighth, and with the neck and shoulder from the top of the breast to the lowest roots of the hair is a sixth . . ." and so on. Furthermore the face is a veritable graph: "The distance from the bottom of the chin to the underside of the nostrils is one third of it, the nose from the underside of the nostrils to a line between the eyebrows is the same; from there to the lowest roots of the hair is also a third comprising the forehead. . . . The other members too have their own symmetrical proportions."

It is difficult to believe that such wishful thinking ever could have commanded a sizeable body of artistic thought. If the proportions stated for the body or the face were exact, everyone would look alike. If they were intended only as approximate, then they mean nothing as a rule for design, since it is the subtle little differences in proportion which express major differences of character in the human design. And if the ancients were not considering ordinary mortals but only an ideal, a perfect human, a God, then who among the artists are we to follow? Where is the perfectly proportioned human on which we can base our proportions of building? No doubt he is an athlete—tall, trim, and bronzed, poised against the blue sky of ancient Greece—or perhaps a modern Olympic competitor, Western (of course) Caucasian, and all that, and male. The Vitruvian figures were always male, sometimes aggressively so.

A variety of nerves and muscles is required beneath beautiful building exterior. No matter how creative the architectural design, there can be no destiny of usefulness for the proposed structure until the electrical system, which gives life, has been carefully planned.

Detailing electrical apparatus into harmony with the rest of the building need not be a chore. Westinghouse has applied years of experience and engineering skill to simplifying and standardizing components of commercial and industrial electrical systems. Electrical specifications can be written around the "circle W" with confidence.

A fine example of a building with visual beauty plus "down" functional beauty is the Occidental Life Insurance Company of North Carolina Building at Raleigh. Some of the features are pictured on succeeding pages.

YOU CAN BE SURE...IF IT'S Westinghouse
The belief that the elusive "perfect" human body holds a secret of universal proportional beauty was carried high through the Renaissance and appears triumphant again today in the . . . figure with which Le Corbusier embellishes his measuring stick, Le Modu­lor. Le Corbusier proposed Le Modulor, after World War II, as a method of standardizing and "harmonizing" dimensions of all manufactured goods while reducing the obstacle created by the irreconcilable metric and foot-and-inch systems, which are now splitting the world. It takes the form of a graduated scale, a useful tool for draftsmen, and is based not on the repetition of even units—inch upon inch—but on a logarithmic progression of lengths. Starting at a basic dimension of 2.26 meters, the intervals diminish in steps of even proportion towards zero, and in the other direction (beyond the length of the tool) enlarge in the same progression toward infinity.

The basic dimension of 2.26 meters was selected by Le Corbusier as being the height of a man standing with one arm raised. He proposed this as a standard dimension for the ceiling-height of rooms, a measurement based on the human being rather than the arbitrary inch or meter. The man whose arm is raised is taken to be six feet tall. In earlier experiments with Le Modulor, Le Corbusier recounts that he and his collaborators had adopted a human height of 1.75 meters, but this was not proving satisfactory in some of the practical details of conversion to feet and inches. Then one draftsman suggested: "Isn't that rather a French height? Have you never noticed that in English detective novels, the good-looking men, such as the policemen, are always six feet tall?" (The Modulor, Harvard University Press, 1954). So they amended the basic measurement to 1.8288 meters (6 feet) and this solved their problem!

Le Corbusier was not prepared to leave his measuring stick at the utilitarian level. Having selected rationally, if not very scientifically, a basic dimension keyed to human scale, he diverted to the mystic "mathematics of the human body, gracious, elegant and firm." In the body he expected to find, as the Ancients did, "the source of that harmony which moves us: beauty." On the measuring instrument he drew in his familiar easy scrawl the outline of a man—the English policeman, presumably—with one enormous hand raised above his head to the 2.26 meter line. He discovered that the figure could be divided vertically into sections of pleasing mutual relationship. He used the navel, not as a socket for the point of a pair of compasses, but to mark one of the decisive points of the human body's occupation of space. As he shows it, the policeman's navel is conveniently situated half way between his toes and raised fingers. This central position of the navel, as
the search for pleasingness

noted by Vitruvius, may apply universally to athlete, policeman, giant, or pigmy; because all proposals of this sort avoid specifying whether the raised arm should be stretched or bent, and any differences may be adjusted at the elbow.

Le Corbusier then took three "decisive" dimensions from the figure of his policeman, measuring from ground to the navel, to the top of the head and to the raised fingertips, and from these three he developed the entire system of Le Modulor. By combining two simple mathematical progressions, a range of dimensions was obtained from 2.26 meters (basic ceiling height) descending in decreasing steps to the smallest measurable size. It was intended that a tape so graduated should be at hand on every drafting-board, eventually supplanting the foot or centimeter rules. It could eliminate arbitrariness in the subdivisions of building. The architect or draftsman, after being led by functional requirements to an approximate dimension for any detail—for instance, the height of a sill—would consult the tape and select the nearest Modulor size. Now, because all Modulor sizes are linked in a progression, all the dimensions of the building would be linked or "harmonized" to each other and to human scale. While Le Corbusier was careful to explain that this measuring-tape did not relieve the artist of any responsibility, while he reserved for the artist the right to make a "personal interpretation" of the proportions which it suggests, still he claimed that Le Modulor would help a draftsman to select the most pleasing proportions not only for the parts of architecture, but indeed for sculpture or paint-
ing as well. He was naturally delighted when Albert Einstein wrote: “It is a scale of proportions which makes the bad difficult and the good easy.” Durisol Inc., a company in New York, undertook in 1947 to market Le Modulor as “a scale for harmonic measurement of space,” and Le Corbusier saw himself entering the country of numbers, “passée la porte des miracles.”

Anyone else is entitled to select other key features of the human frame—for example, the joints: knees, pelvis, and shoulders—and claim for them more decisive roles in the body’s occupation of space than that enjoyed by the immobile navel. A different scale could thus be drawn up from the relative positions of these features, no less logically related to the body. Someone else may prefer to base a system on the proportions of the width of a policeman to his height. A dozen different systems of proportioning could be devised on the results of a brief run over a human body with a tape measure. But of all the possible points of reference and combinations of dimensions, Le Corbusier was led by his practiced artist’s eye direct to the one set of proportions which accorded to the Classical designer’s Golden Rule; he selected a division approximating the mathematician’s extreme-and-mean ratio, the traditional conception of perfection in proportion, the Golden Section.

If the rational movement in architecture cannot accept any mystical connection between the figure of a man and a Divine System of Proportion, it is nonetheless as impressed by mathematicians as any esthetician of antiquity. In Architectural Principles in the Age of Humanism, Professor Wittkower went some way toward presenting a disenchanted post-war generation of architectural students with a creed. Many saw a new direction for a Functionalism that had lost its way, as they followed him through the historic progression of the idea that architecture, in the company of the musical scale, may reach through a system of mathematical ratio finally to the being of God Himself. Wittkower traced the growth of number symbolism and mysticism from the Pythagorean conceptions (for example: “Three is the first number because it has beginning, middle, and end. It is divine as the symbol of the Trinity”) through Plato’s suggestion that cosmic order may be contained, and the harmony of the world expressed, in a pyramidal lambda of the figures 1, 2, 3, 4, 8, 9, 27 (“The ratios between these numbers contain not only all the musical consonances but also the inaudible music of the heavens and the structure of the human soul.”) Renaissance architects, practical men, converted the heritage of harmonic theories into workaday techniques. They modified the strict Classical modular system and developed new codes. Palladio in the mid-16th Century gave a general rule to harmonic

Lighting in modern buildings is more than a functional accessory to construction. The Occidental Building is a typical example of the effectiveness with which Westinghouse fluorescent lighting is applied as an integral part of architectural beauty. With no sacrifice of efficiency, the recessed troffers become a part of the pattern of perfection designed into the architecture of this effectively lighted reception room.

the search for pleasingness

proportions for the height of rooms in relation to their width and length. "A wall [was] seen as a unit which contains certain harmonic potentialities," reports Wittkower. "The lowest sub-units, into which the whole unit can be broken up, are the consonant intervals of the musical scale, the cosmic validity of which was not doubted."

Gradually the search for a key to the cosmic harmony was abandoned, but the belief in the existence of a universal beauty and a science of proportions lingered on into the middle of the 18th Century. Then a new tide of rationalism engulfed it with the cold water of the ideas that architecture and music are not comparable since they communicate with the mind through different organs, and that architecture and mathematics operate on different levels: note how a building's apparent proportions change as the observer moves about. The effects of proportion depend on the association of ideas, not an abstract reason, and are relative to the beholder, his nature, his time, and his place. Thus Burke, Kames, Hogarth, Knight, and others argued in the 18th and 19th Centuries, and in the 20th a leader of the modern movement restated the most obvious objection to all Golden Rules: "Beauty is relative because men are different," said Piet Mondrian, a painter for whom an utmost delicacy of proportioning in lines, spaces, and solids constituted the very means of expression. "Attachment to a merely conventional conception of beauty hinders a true vision . . ." (Plastic Art and Pure Plastic Art. Wittenborn, New York, 1945).

For two centuries, then, bridging across generations of the picturesque, the romantic, the worldly, and deep into the revolution of the functional, the thought of universal harmony lay dormant. Men with all kinds of conflicting artistic approaches could agree at least on one principle: whatever the style, art was a task for artists and not for mathematicians; it was an understanding between an artist and an observer; it was in the eye that received a satisfying message.

But the closed door of the mathematician's study slowly regained its fascination for the architect. Everything he saw through the keyhole, as the 20th Century developed, suggested analogies with the problems of his own creative work. When the mathematician advanced in his studies of three-dimensional geometry, the designer saw new prospects in plastic forms; and when the mathematician directed his attention to a fourth dimension, the architect would scarcely contain himself. Hence the worldwide enchantment of the title which Siegfried Giedion attached to his famous account of the origins of the modern movement: Space, Time and Architecture.

For Economical,
Many architects still respond today to an old magic and look to their profession for somewhat more than creative satisfaction. The polite apathy which the ordinary cultivated layman extends to architecture is counterbalanced by a high intensity of feeling on a certain, thin, professional stratum from which architecture is viewed not simply as the ultimate art of man—for this much is self-evident—but also as dazzling light now shaded by ignorance, a saviour of mankind's soul—not to mention his body. On the day when all building accords to the cosmic harmony, all men will live in order and peace of mind. The secret of the harmony escapes us temporarily, but who can deny that the Greeks were close to it on the Acropolis?

Thus the search for inspiration in numbers is revived, if on a somewhat less emotional plane, and linked now to the technological demand for an international module to reconcile the metric and foot-and-inch systems and to facilitate the prefabrication and international exchange of parts. High-level meetings of professional men and technicians in Italy and England have discussed the physical details while estheticians re-examine the complex arithmetic which the Greeks brought to perfection in the Parthenon. The geometry of the medieval mason is drawn out into the daylight. Even Chartres Cathedral's asymmetrical façade is found probably to be following a mathematical “melody” of dimensions based on an octagonal whorl in the Gothic section and a modular scale in the Romanesque part (On the Proportions of the South Tower of Chartres Cathedral, Ernst Levy. Humanities No. 20, MIT. 1956).

Le Corbusier was never alone in his experiments with Le Modulor. Once again he was leading his profession, this time in the revival of a concept and an argument which had been discredited for two centuries: the concept of an objective system of beauty which may be applied to all men's construction. But what made his invention profoundly significant as an architectural development in the middle of the 20th Century was that it returned, beyond the numbers to the dawn of philosophy to try to find some sort of mystical link for the system with the proportions of the body, some hint of divine inspiration. The sheer reaction of these suggestions coming from one of the spiritual leaders of 20th Century architecture might have been expected to take the rational movement's breath away. Instead, thousands of Le Corbusier's disciples round the world began to play with Le Modulor and claimed to see some part of the miracle which the inventor himself all but experienced. Some criticism was made at the time of inherent difficulties in the practical application of the scale but there was no sign of shock; only a movement which had retained its rational principles would have been shocked.

All-Purpose Lighting...**SPECIFY WESTINGHOUSE**

Modern lighting with Westinghouse fluorescents is as natural as daylight. Actually more efficient, too, because it can be controlled to provide balanced intensity and minimum power requirement. An added advantage to the architect is a natural compatibility with building design, as in the Occidental Life Insurance Building. Further advantages are found in Westinghouse lighting data available to simplify the detail work, and Westinghouse specialists who are ready to help you.

**YOU CAN BE SURE...IF IT'S Westinghouse**

**LC Fluorescent Fixture**

Colorful harmony can be added by the use of Carousel fluorescent fixtures—another Westinghouse first. A variety of colors can be blended into the visual beauty of the lighted area by the use of the new sea-mist green and sun-tan brown Carousel fixtures.

the search for pleasingness

The Golden Mean, Golden Cut, or Divine Proportion, which were revived from near oblivion by Le Modulor, are the artist's quasi-mathematical terms for one of the geometrical propositions which has fascinated many men who have gone in stumbling search of a rhythm of creation. The Pythagorean mathematicians, who sought a rational explanation for the phenomenon of beauty in the 6th Century B.C., and decided that the circle was the most beautiful figure and the sphere the most beautiful form, first solved the problem of devising a mathematical basis for the perfect visual proportioning of parts. They discovered how to divide a line into two parts, the ratio of the smaller to the greater being the same as the ratio of the greater to the whole line (roughly .618 to 1). As the Pythagoreans discovered, this proposition leads to absorbingly interesting mathematical consequences. For instance, if the length of the smaller section of the divided line is marked on the larger section, again an extreme and mean ratio is created, for the offset that remains bears the same ratio to the original small section as the small does to the large, and as the large to the whole. This process may be repeated again and again but the end of the line—zero—will never be reached, for the parts of the Golden Proportion are incommensurable, which adds to their

fascination and to the aura of mysticism surrounding them for twenty-six centuries. Artists saw in the phenomenon a Golden Rule of proportions for building, sculpture, and painting. Plato saw in it a clue to the secrets of creation, and Aristotle saw, in the balanced tension of the long and short parts, an analogy for a code of ethics. Developing from the divided line, the esthetic theory of the Golden Section goes on to state that a rectangle formed of the two parts of the linear division is a plane shape of absolute beauty; a solid rectilinear body based on the proportion is one of the forms of absolute beauty; and a building sub-divided in accordance with it will be a building of perfection.

The rule may, in fact, be traced through the proportions of many famous paintings and buildings, and its “objective beauty” is occasionally “proved” by art instructors in simple experiments. If a group of people is asked to select the most pleasing shapes from a range of different lines and rectangles, one is fairly safe in calculating on the majority selecting the figures which approximate to the proportions of the Golden Section. An experiment even so simple as this supplies substantial evidence supporting the idea of a mathematical formula for beauty. Here, clearly, is the basis of a system of scientific determination of the most popular, satisfying shapes and sub-divisions, and eventually an architect might be able to apply this to all the openings

the search for pleasingness

and appurtenances of his buildings.

At the highest pitch of enthusiasm the Golden Section suggests the possibility that the eye can recognize here a microcosm of universal harmony, that the human being somehow senses the progression from zero to infinity of further ratios implicit in the single given ratio, and that somewhere beyond the reach of our present knowledge an understanding of the all-pervading pattern of creation flickers in the soul.

At a lower pitch of excitement, the psychoanalyst interprets the mystique of it as a comparatively simple psychological trick. Even when conscientiously applied to the parts of a building, the mathematical simplicity of the proportions of the Golden Section are never obvious. The conscious eye finds nothing offensive yet can find in the lines no apparent mathematical law, but meanwhile the subconscious has perceived the precision hidden in the form relationships and its secret goading of the surface mind is the seat of the fascination.

At the most prosaic level the "universal beauty" of the Golden Section may be explained flatly as a matter of compromise. Any pure mathematical form or simple mathematical system is approved by the eye because it is a decisive statement. A line cut in the middle satisfies because there is nothing woolly about the even
balance of the halves. In a line cut in the golden proportion of .618 to 1 the ratio of the parts is more subtle, but the statement is still clear, for if the cut is moved close to one end of the line, it reduces the shorter section to an inconsequential tag. And if it is not moved far enough from the center the indecision is disturbing; perhaps the draftsman's hand slipped as he was about to make a central cut! A position in which the cut is far enough from the center to be clearly no slip of the pen and far enough from the end to give the short section sufficient strength of its own, is the point at which the eye finds a satisfyingly definite statement; this is approximately the point of the Golden Cut. It may not always agree exactly with the mathematician's calculation, but in practice the eye cannot judge with any accuracy the parts of a building seen in perspective. The arithmetical Golden Progression may be converted for everyday use from decimals to found figures (say 3, 5, 8, 13, etc.) and a Board Room may be cut to this pattern with every confidence in its ultimate pleasingness. It will seem neither constrictingly narrow nor oppressively low, and a building on the same pattern will be neither too thin nor too squat. The Golden Mean means neither too much nor too little, but moderation, the comforting average; everything to rest the eye and nothing to concern the mind.

If these are the qualities desired of all buildings
FOR DENSE, TIGHT, NON-SHRINKING, ODORLESS, NON-TOXIC JOINTS...

INHIBIT BACTERIA GROWTH...

HYDROMENT JOINTS ARE HIGHLY RESISTANT TO WEAR AND ABRASION. THEY PROTECT THE VULNERABLE PORTIONS OF BRICK AND TILE WALLS & FLOORS.

Comparatively expensive in initial cost brick and tile floors and walls should not be installed without adequate thought given to the vulnerable 5% joint area.

Ordinary Portland cement grouting is unsatisfactory for this purpose.

H.J.F. (HYDROMENT JOINT FILLER) floors, installed at slight additional cost, assure a lasting service area that resists corrosive action and abuse so prevalent in many industries today.

We'll gladly send you a list of satisfied users in all fields of endeavor.

the search for pleasingness

irrespective of their site, environment, function, and meaning to society, then the Golden Mean should dictate the proportions of everything man makes and *Le Modu­lor* should be on every drawing board. But Le Corbusier cannot believe that these qualities are desirable in all buildings, for his own have the expressive range to be expected from a master who can control tons of concrete as few men can control a tube of paint. The Golden Proportion can be discovered in most of his buildings only if they and credulity are stretched to breaking point—and they will relate to almost anything when thus extended. On the other hand, they may be sensed like a grid of invisible wires between one's eyes and most of Le Corbusier's paintings, contributing to the singular monotony of his work along this sideline.

Contradicting nearly everything that has gone before, Le Corbusier concluded his first book on *Le Modu­lor* with a caution: "Any door that offers an escape is dangerous," and by quoting Kahnweiler's comment on the Cubist movement (including Le Corbusier's architecture): "Every one of these artists has attempted to create works of art which have as strong an autonomous existence as possible, to produce objects whose unity is ensured by the force of their rhythm and in which the
parts are subordinated to the whole. To each of these objects, fruits of their emotion, they intend by its uniqueness to guarantee complete autonomy. Could Le Corbusier have discovered a more devastating condemnation of Le Modulor's pretentions to universal proportioning? How can a work of art have an autonomous existence while it is pulling its forelock to some inviolable rule of proportion? Le Corbusier makes this apparent contradiction because he sees the dimensions on his measuring stick not as an architectural scale like a foot-rule, but more as a musical scale on which the designer may play freely. But surely language is working some mischief here. Le Corbusier's interpretation of playing freely on Le Modulor is to ignore it altogether, to change the key whenever it offers no dimension applicable to a practical task in hand—for instance, in the height of an ordinary doorway. This is the traditional way with systems of architectural proportions. "The artist is always present beside the geometer," said Viollet-le-Duc, "and will be able to bend the formulas when necessary." (Dictionnaire Raisonné de l'Architecture Française du Xle au XVle Siècle: "Proportion," "...l'artiste est toujours présent à côté du géomètre, et sait, au besoin, faire fléchir les formules.") Now, just what—one may ask in Heaven's name—is bent geometry? It is certainly not geometry, probably it is not the best art, and it can hardly be the way to the stars.

THOUSANDS OF ADMINISTRATORS
SELECT
TELKEE SYSTEMS . . .

Because Telkee handles the complex situation in schools which must have positive key control.

How Telkee Works: Keys are indexed three ways: by description of item locked, by hook number, by lock number. Cross Index, then, shows where every key is. No more lost keys, less duplicate key expense, guaranteed key control. With Cross Index hidden, keys have maximum security even if cabinet is forced open.

Free Booklet Available: Obtain complete facts on Telkee Systems today without obligation.

A SUBSIDIARY OF SUNROC CORPORATION, GLEN RIDGE, PA.

Planning a commercial or industrial electrical system is a teamwork project. A Westinghouse electrical construction specialist can be of service to your planning team.

He'll talk Westinghouse, of course, but you can make him prove every point to your advantage.

The specific case history and product references on preceding pages cover only part of the line. Fact is that everything needed for any job can be specified in the "circle W" brand. When you draw up specifications on that basis, you write a fine insurance policy for long-term satisfaction of your valued clients.

Westinghouse Electric Corporation, P. O. Box 868, Pittsburgh 30, Pa.

YOU CAN BE SURE...IF IT'S Westinghouse

April 1957  205
More than ten years have passed since the architects designed this building... one of the earliest "Window Wall" installations in the United States. At the time, when Hope's Window Wall construction was adopted, we pointed out the labor-saving advantages of its installation and confidently predicted that upkeep expense would be low. That has proven to be the case. The total Window Wall area in the building group is more than four times that illustrated in the photograph; the location is in a severe climate; yet the maintenance is less troublesome and expensive than for comparable, conventional masonry and window construction.

The great increase in the use of Window Wall construction by architects is sufficient evidence that it offers economies in original building cost and that its esthetic effects and benefits to building interiors are pleasing to owners.

Hope's engineering and planning assistance can be of great help to you and is always available when you have in mind a building with an interesting window problem. Write for Catalog 152PA for your files.
New 240-Unit Pittsburgh apartment gets "Sunshine Warmth" with ANACONDA pre-formed Copper Tube PANEL GRIDS

The ease of installing PG's® was a big factor in adding radiant panel heating to the long list of modern comfort and convenience features in the new Kenmawr Apartments in Pittsburgh.

John O'Farrell, partner of Steel City Piping Co., Pittsburgh, heating contractor on the project, suggested a radiant heating system because of his previous experience with Anaconda Panel Grids. He knew that the savings provided by these ready-to-install copper tube grids make the installation cost competitive with other heating systems. And he felt strongly that the "sunshine warmth" of radiant heat would be an important feature in attracting and holding tenants.

Each of the 240 apartments has "customized" control of temperature. Each has its own radiant heating system served by a main supply line. A motorized valve, actuated by the apartment's thermostat, controls the flow from supply line to the panel circuits.

Why PG's save time and money. Anaconda Panel Grids are machine-formed radiant heating coils containing 50 feet of Type L Copper Tube, conveniently packaged, ready to install. They lie flat against the ceiling construction so that plaster is applied easily and evenly. They are easily extended by hand to the center-to-center spacing required. Each grid has one tube end expanded for solder connection in series without fittings. PG's are available in two nominal tube sizes, ⅜" for ceiling installations and ½" for floor panels.

Write for Publication C-6 which gives the full story, including engineering and layout data. Address: The American Brass Co., Waterbury 20, Conn. In Canada: Anaconda American Brass Ltd., New Toronto, Ont.
The right atmosphere
calls for quality air conditioning
"custom" controlled

Today, remodeling or new construction should certainly include air conditioning. Year-round control of interior air temperature results in a comfortable atmosphere that increases workers' efficiency, health, and customer good will.

To give your clients maximum benefit from an air conditioning system, it should be efficiently controlled with the control system "tailored" to the specific needs and individual spaces of a building. This assures the right atmosphere in every individual room, passageway and lobby.

A good example of efficient Honeywell "custom" controlled air conditioning is the Shannon Memorial Hospital. Recently remodeled, it is now completely air conditioned. All patients' rooms have individual Honeywell thermostats so that a comfortable room temperature can always be maintained for occupants. Temperatures in other rooms of the building—offices, operating rooms, pediatric wards—can be independently controlled to maintain the comfort level suited to the specific room activity.

Your clients need Honeywell "custom" control to protect their investment in air conditioning equipment. With Honeywell control, an air conditioning system will operate as it should—effectively and economically.

To learn how Honeywell custom control can help bring the right atmosphere to any building, new or existing, call your local Honeywell office, or write Minneapolis-Honeywell, Dept. PA-4-146, Minneapolis, Minnesota.

Honeywell Master Control System cuts operating cost

Central supervision of year-round indoor environment in the Shannon Memorial Hospital is provided by this Supervisory DataCenter control panel. By coordinating and centralizing all controls, it allows one man at one location to supervise comfort throughout the building, and to monitor and control operating equipment in the air conditioning system. It adds efficiency, prevents expensive equipment breakdowns and reduces demands on maintenance personnel's time. In this manner the Supervisory DataCenter does much to cut the cost of air conditioning, and at the same time to make it more effective. Only Honeywell has the experience and the complete control line to provide an installation that so effectively ties in all types of control, so well adapts to any building.

Honeywell
First in Controls

Nowhere is accurate temperature control more imperative than in the nursery. It is maintained precisely by the Honeywell individual room thermostat. And Honeywell bedside thermostats installed in every patient-room give convalescents fingertip control of their own comfort.

As important as economy is, price alone doesn’t sell the building committee. The wide acceptance of Rilco laminated-wood members in church and other construction is due to the warmth, beauty and decorative values offered as well as the savings.

And Rilco members allow the architect full freedom of expression without the stifling impact of increasing costs. These reasons plus ease of handling, speed of erection and precise engineering are more and more influencing the design of school and church structures. For full information on how you can use Rilco laminated-wood members price- and beauty-wise write

Adviser to Architects

He's Jno. Worner, Sr., A.H.C., and he has spent more than 50 years helping architects.

Long ago, architects learned they could place full confidence in Mr. Worner's hardware specifications; ever since, they've looked to him for estimating, detailing and servicing builders' hardware.

And well they might!

For Mr. Worner has made Hardware his lifelong study. Of course, there are other qualities, too — integrity, knowledge, good taste, imagination and common sense, to name a few.

Of such qualities is the average Hardware Consultant made. As a member of the American Society of Architectural Hardware Consultants, he's a distinguished representative of a highly respected profession.

Call in a Hardware Consultant on your next job. No one knows hardware better.

505 Crane Bathrooms
new Americana

Twin Countess lavatories fit in a counter-top only 16 inches deep, yet give big basin convenience. Crane bathtub allows tiling of apron to match floor or wall. Water closet is Crane Santon.

Designer & Architect: Morris Lapidus & Leo Kornblath, Miami & New York
General Contractor: Taylor Construction Co., Miami, Florida
Mechanical Contractor: Markowitz Bros., Inc., Miami, Florida
What's the newest trend in hotel bathrooms? Make them big. Make them beautiful. Provide plenty of facilities including twin lavatories. Even throw in a second bathroom for the larger suites.

That's exactly what Miami's new luxury hotel Americana did. Altogether, 505 bathrooms were used for the hotel's 475 rental units. And for all the bathrooms Crane fixtures were chosen.

Why Crane?
Well, because architects who use Crane like their up-to-the-minute Henry Dreyfuss designs. They like the wide selection of fixtures and fittings available from just one source. They prefer famous easy acting, easily maintained and beautifully designed Crane Dial-ese Trim. And they like the way Crane fixtures are engineered so they last for years at a minimum maintenance cost. All good reasons for choosing Crane.

If you need any information or details on Crane's wide line of fixtures, just call your Crane Branch or Crane Wholesaler. They'll be glad to help you in any way they can.

number of actually executed works. Some years ago, Neutra already had developed his basic philosophy in his *Survival through Design*, when he emphasized the physiological and psychological conditions of human existence from which the architect must develop his design—a concept which he probably sometimes exaggerated. The present book—text in English and in German—combines many excellent photographs of Neutra's main works with explanatory captions and a thorough interpretation of his theoretical thinking. The humanist will be gratified by the humaneness of his approach, in contrast to the intellectual dogmatism of Le Corbusier. And the layman will discover that the employment of large glass planes, roof slabs, and cantilever constructions does not automatically mean a "modernistic" expression of the already slightly antiquated "functionalism" of the Twenties. On the contrary, the livability of Neutra's houses is based on his desire to speak to all our senses, from the visual to the kinesthetic, to the totality of conscious living. Not to press the life of people into a form, preordained by the architect, but to create for them spaces, forms, and colors which allow free and relaxed expressions of individual desires—that seems to Neutra the basis of architectural creation.

Each of the more than twenty houses reproduced in this book from many angles and with details, shows from the very beginning the human freedom of the individual who does not try to conform anxiously to the materialistic slogans of a mechanized period. Even the choice of material is dictated by this tendency—although he continuously employs truly new constructions and materials. Typical and not accidental is his abundant use of water in the synthesis of house, garden, and landscape. Considering this attitude toward the surrounding nature—always the touch-stone of a really great architect—one could perhaps say that Wright, in his more brutal structures, tries to emulate the "organic" forms of the landscape; while Neutra opens the spaciousness of his houses toward nature, and adapts them to given natural conditions, but demonstrates by their lines that they are man-made, developed out of an unique human equilibrium of imagination and thought. The emphasis on simple clarity of exactly limited and very definite forms does not contradict fluidity and tactful, humble subordination to nature.

Certainly the self-reliance of the Californian architect, who never in his work became a mere "regional-
“Home buyers want concealed telephone wiring”

— says Mr. Russ Ketchum, Builder, of Van Nuys, California

“Here’s why home buyers want concealed telephone wiring,” says Mr. Ketchum. “They want telephone outlets located as conveniently as electrical outlets, and they want the finished beauty of their rooms preserved, too.

“I’m in business to give people what they want in homes, and today that means concealed telephone wiring along with the many other built-in, ready-to-work conveniences that people look for. I put concealed wiring and telephone outlets in every home I build. It’s good business. It’s a sales feature I wouldn’t be without.”

Your nearest Bell Telephone business office will help you with concealed wiring plans. For details on home telephone wiring, see Sweet’s Light Construction File, 81/Be. For commercial installations, Sweet’s Architectural File, 32a/Be.

Ceramics

Exciting abstract patterns—subtle color harmonies—interesting textural effects—wide design flexibility—

These are just some of the features of this new crop of contemporary stock patterns in Suntile inspired Ceramics, designed by the well-known ceramic mural artist, Max Spivak. They permit you to take full advantage of both the decorative and practical characteristics of Suntile—a relatively modest budget.

Each of the nine basic motifs is made up of 1" unglazed tile mounted on regular 2' x 1' sets for quick installation. Only a few of the many design possibilities offered by this group are suggested here.

Because only rugged, natural clay and porcelain Suntile are used, these patterns are equally serviceable in walls, floors or counter tops—indoors and out.

For guaranteed installation, call your Authorized Suntile Dealer. His name is listed in the lower pages of your phone book.

Larger glazed areas will become more desirable with \textit{American Lustragray*}

By reducing glare, a deterrent to comfort and efficiency, \textit{American Lustragray} provides a greater field for design expression. Functionally, it enables progressive architects to specify larger amounts of glass per installation on any building exposure—for office buildings, banks, schools, hospitals, apartment houses, homes, etc.

As a bonus benefit, \textit{American Lustragray}—while not classified as a heat absorbing glass—provides a significant reduction in the transmission of solar energy.

True economy comes from \textit{Lustragray} features: moderate first cost; non-fading; no special installation handling; shades and blinds optional.

For technical literature on \textit{Lustragray}, write our Architectural Consulting Department today.

Wind hits a screaming 130 m.p.h.
Rain whips out in a 12-inch-per-hour deluge. The curtain wall unit shudders, bends under this man-made blast... but doesn't leak. WEATHERBAN Brand Curtain Wall Sealer seals its seams.
The purpose of this torturing, simulated weather test? To prove the weather-tightness of this WEATHERBAN sealed curtain wall, even under the lash of hurricane fury.

This new curtain wall sealer is a two-part polysulfide rubber-based compound. It cures chemically without shrinkage into a durable, solid rubber seal. It stretches, compresses with wall movement, adheres strongly to glass, stone and metal.

Here's why WEATHERBAN Sealer is being picked to seal new buildings... why it's being chosen also to repair leaks in older buildings originally sealed with conventional sealers.

SEE WHAT WEATHERBAN SEALER OFFERS YOU!

ist," explains the far-reaching influence on all those who see in the modern movement more than a pattern and combination of new forms which—in contrast to those of the past—only the development of new techniques and the employment of new materials could make possible today.

His approach asks for a greater and more intrinsic originality than the usual indulgence in glass, stainless steel, and rectangularity which by so many amateurs is considered as the decisive symptom of "modernism."

The layout and technically excellent illustrations of the book correspond to the importance of this very worthwhile publication of the work of one of our best architects. PAUL ZUCKER

personality and performance

A career of promise, when snuffed out at an early stage, has all the elements of tragedy.

Gordon Drake's active career was short—seven years—but long enough to show how tragic a loss to architecture was its sudden ending. His work was little in volume; but it was great in design importance, as the illustrations demonstrate.

An appreciative introduction by P/A's George Sanderson capably sets the spirit of the book. Written appreciations by two other friends of this reviewer are also included: these features convince him that the personality, philosophy, and performance of Gordon Drake merit whatever permanence and continuance this fine book may inspire.

LAWRENCE E. MAWN

urban design and theory
The Nature of Cities. L. Hilberseimer. Paul Theobald & Company, 5 N. Wabash Ave., Chicago 2, Ill., 1955. 286 pp., illus., $8.75

At some point in his latest book, Professor Hilberseimer comes out against the Roman practice of rebuilding cities by imposing from above a rigid system of street design, with little regard either to the physical topography or to the social traditions of the community. In the first part of The Nature of Cities, which is a scholarly critique of city patterns from the past, he decries that "dominating form concept to which everything must be subordinated." Yet this is precisely what he calls for in the more sensational third part of his book. Here he repeats and elaborates on the schemes he launched in his book The New (Continued on page 224)

21st century city

The shallow, plastic-faced, Geodesic dome makes this city of the future look strange to 20th century eyes. But designer Philip H. Seligson has combined practical economics with creative thinking in committing his concept to paper. Industries are located at the outer circumference of the city; discharge their smoke through stacks that pierce the dome. Central air conditioning controls the temperature—winter or summer the climate is perfect. Instead of building their own four weather walls and roof, insulating them, heating and cooling them, people can build their walls merely as grilles and curtains.

No matter which of today’s ideas become reality, it will be as important tomorrow as it is today to use the best of tools when pencil and paper translate a dream into a project. And then, as now, there will be no finer tool than Mars—from sketch to working drawing.

Mars has long been the standard of professionals. To the famous line of Mars-Technico push-button holders and leads, Mars-Lumograph pencils, and Tradition-Aquarell painting pencils, have recently been added these new products: the Mars Pockct-Technico for field use; the efficient Mars lead sharpener and “Draftsman’s” Pencil Sharpener with the adjustable point-length feature; and—last but not least—the Mars-Lumochrom, the new colored drafting pencil which offers revolutionary drafting advantages. The fact that it blueprints perfectly is just one of its many important features.

City, which appeared more than a decade ago. In the earlier work, he outlined ingenious plans for the rebuilding of New York and London, for an unnamed “European industrial city” (and, very specifically, for Chicago) by means of skilfully rendered sketches showing beautiful, orderly, but strictly regimented patterns of industry, residence, and transportation lines. Drawn on background maps indicating no topographical features other than rivers or waterfronts, they appear to impose on living cities of today a form concept as dominating as the Roman schemes he so effectively criticizes in the historical section of his present book.

On close examination, The Nature of Cities is in many ways an improvement on the earlier book, but it carries over the more serious weaknesses of that work. Reviews of The New City that appeared in the planning and architectural periodicals of 1945 seem to have escaped Professor Hilberseimer’s notice entirely. Nor has he—as far as one can discover from the present book—profited by the experience shared by planners here and abroad in the postwar period. One must, therefore, regrettably (since he is obviously a serious, well intentioned, and learned student of architecture and planning) conclude that he has spent the intervening years in that Ivory Tower whose inhabitants are so vulnerable to the malicious, cynical jibes of that Arch-Antiplanner Moses and his like.

Stimulating as Professor Hilberseimer’s theories are, and interesting reading as his arguments may be, they tend to do more harm in the long run to the achievement of concrete results in civic design by the active practicing architects and planners who try to improve our cities within the framework of feasible procedure, than they could pos...
This heavy-duty cylindrical lock line has earned a schoolwide reputation for being rough-resistant...a point to consider when specifying doorware for any type of institutional or commercial building.

A close check of Stilemaker construction will reveal the advantages of such features as...a full 5/8" throw permanently lubricated latch bolt; concealed knob retainers; long knob shank bearing for knob rigidity and many others. In split level homes, new Beauty-Line Windows blend perfectly to match architectural design—no matter what elevation you're planning.

In schools and light commercial buildings new Beauty-Line Windows adapt to any exterior elevation, admit plenty of light and ventilation.
Andersen announces a new idea in wood window beauty, the Beauty-Line Window, designed for a variety of architectural styles in homes, schools and commercial buildings.

Now in a single unit you can specify a window with fixed upper sash over an awning style lower ventilating sash. Andersen's exclusive design features an exceptionally narrow meeting rail to bring trim, narrow lines, minimum interference with vision.

Economies effected in this design mean a lower overall cost per square foot of glass area. And Beauty-Line is available in seven sizes, forms mullions or triples.

In addition, the Beauty-Line comes completely assembled and packaged. Optional features include double glazings, insulating glass, aluminum frame screens, choice of operating hardware. All wood parts are treated against moisture, decay and termites. They last as long as the house.

You can get full details and specifications on new Andersen Beauty-Line Wood Window Units to suit your building plans by writing directly to Andersen Corporation.

Eljer's new high-style line of quality brass fittings!

Quality Plumbing Fixtures Deserve Quality Fittings! From the moment they were introduced, early this year, Eljer's new line of brass fittings have won overwhelming acceptance. These fittings have brought a completely new styling concept to the plumbing industry. And they can add unique beauty to fixtures in the projects you plan. Here's what they offer:

- Sleek, sculptured styling!
- Compact, functional design; easy to clean!
- Completely renewable for easy maintenance!
- Traditional Eljer quality!
- Thoroughly tested mechanical efficiency!
- Heavy, long-lasting chrome plating!
- Made in modern plant devoted solely to brass!

An Eljer representative will gladly give you the facts on new Eljer fittings, fixtures and all-steel kitchens. Write Eljer Division of The Murray Corporation of America, Three Gateway Center, Pittsburgh 22, Pa.

New Brass Line Backed by Eljer's Colorful National Advertising! This striking new brass line is featured in Eljer's national advertising and is gaining widespread acceptance among millions of users.

*ELJER - the only name you need to know in plumbing fixtures*
Designing, fabricating and erecting curtain wall systems is a highly specialized type of construction that involves many intricate problems for architect, contractor and fabricator.

How to take care of expansion and contraction,—how to keep the building weathertight at all times,—when and where flashings are necessary,—how to integrate windows into wall panels,—how to design trouble-free horizontal and vertical joints, etc., are all problems that demand the attention of experienced experts.

As a result of our pioneering efforts in the field of curtain wall and our 10 years of practical experience on more than 40 individual jobs (including the United Nations Bldg., Lever House, House of Seagram and the new M.I.T. Compton Laboratories shown below) we at General Bronze have learned the answers to these and many other problems that are bound to arise.

If you are thinking of curtain walls, in terms of aluminum, bronze or stainless steel, either complete skin or grid system, we offer you the benefit of our experience working with all types of buildings, all types of materials—experience that can help eliminate many headaches for you and save time and money for your clients. Call in the General Bronze representative today. He is anxious to serve you. Our catalogs are filed in Sweets.
Positive Door Control is a MUST where there's heavy traffic

**use DOR-O-MATIC CONCEALED IN FLOOR**

**Manual Door Controls**

Precision-built DOR-O-MATIC door controls are at work in thousands of buildings from coast to coast... providing vital positive door control under even the heaviest traffic conditions. Designed for long service and complete adaptability to contemporary design and function, there are 31 models to choose from... one for every type door in any kind of building. Write for detailed information.

sibly do good by engaging the attention of a few sympathetic readers. For, in *The Nature of Cities*, Professor Hilberseimer carries into much further detail the sketch plans for Chicago which he previously published in *The New City*, updating them, perhaps, but apparently having learned nothing from the criticisms that had been made of them a decade ago. He blandly applies the same drastic conversion technique to St. Paul, Washington, and other large cities, as well as to selected medium- and smaller-sized cities such as Elkhorn, Wisconsin, and Rockford, Illinois. It is difficult to understand why the public-relations department of the Illinois Institute of Technology, where Professor Hilberseimer directs the teaching of planning, should think that these far-fetched schemes for Chicago and other existing communities, had to be featured as the selling-point of the new book in the release which they circulated on publication of *The Nature of Cities*. The Chicago plan, even as abstracted in the release, must inevitably be described as "wacky," "long-haired," or, at best, as "star-gazing" by those who go no further than the release or the dust jacket; or even by those who read only that section of the book itself.

To single out for attention his Chicago scheme, therefore, does a distinct disservice to Professor Hilberseimer, since the book is really a great deal more than that. Divided into three main sections, the first two—"Origin, Growth and Decline" (of cities) and "Pattern and Form"—constitute an excellent, well-documented and illustrated history of city planning. This is a mine of information, full of ideas, and a critical review of urbanism through the ages as seen by an enlightened 20th Century mind. The range is enormous, the illustrations, many taken from old engravings, plans and photographs, are unusual and pro-
vocative. (One could wish, however, that recent photographs, wherever used, were more effective as pictures: dramatic compositions like those of G. E. Kidder Smith, for example, instead of being merely symbols or keys, so to speak, whereby the reader can recall scenes already familiar to him and to which he must then apply further mental effort to relate them to the argument of the text.)

It is in the third section of the book, "Planning Problems," in which the present state of our cities is examined and his ten-year-old theories re-expounded, that Professor Hilberseimer goes sadly astray. It is really too bad, since his basic analysis is correct, his design technique is firm, and his means of expression is convincing; but like so many of the gifted Europeans who have settled here in the last two decades to teach or to practice, he fails to come to grips with the basic financial, political, and social realities of the present day. These realities apply not only to the North American scene, but to the European and to the South American as well—in fact to any community where the deeply rooted and well established processes of western democratic financial, political, and social processes are in motion. Only under new forms of government, building on untouched terrain (as are emerging in Asia, Asia Minor, and in Africa), could the beautiful, serene, and formal concepts of Professor Hilberseimer be carried to fruition. Prof. Alexander Klein, imbued with similar idealistic didacticism, when laying out our new towns on the deserts of Israel, may be able to prescribe successfully patterns not unlike Professor Hilberseimer's. They would, however, be neither applicable nor acceptable in the reconstruction of European, and the "renewal" of American, cities.

SARGENT BUILDERS' HARDWARE
"... sign of long-lasting construction"
How to Specify More Strength and Protection into Masonry Walls

Here's 2-point assurance that masonry block walls will keep the appearance and strength you design into them.

These Carter-Waters materials control and protect against the pressures and strains that generally contribute to wall cracks and separations.

Exclusive "Deep-Grip" swedging produces squared edges where mortar can seat to provide maximum tight bond.

BLOK-MESH gives highest resistance to cracks from pressures and shrinkage.

Made of 100-year extruded rubber, BLOK-JOINT is used with any standard metal window sash block. No building paper or mortar fill needed. Allows for expansion and contraction, yet maintains a firm, solid, weather-tight joint.

Other Applications:

BLOK-MESH Swedged Reinforcing

BLOK-JOINT For Control Joints

WRITE TODAY for Free BLOK-JOINT sample and literature on Carter-Waters 2-point better masonry block wall design.

WAL-LOK FOR THE CRITICAL LIGHTING PROFESSIONAL

Modular Sightron, in 4' and 8' modules, creates an unbroken line of light for office, school and hospital corridors and utility areas. Complete specifications on request.

LIGHTOLIER
ARCHITECTURAL LIGHTING
JERSEY CITY 5, NEW JERSEY

WAL-LOK IS A NECESSITY

To minimize shrinkage cracks.
To withstand side pressure.
To increase wall strength.
To reduce cracks caused by foundation failures.

WITH ARCHITECTS and BUILDERS because WAL-LOK was first . . .

To use research for product improvement.
To deform without impairing tensile strength.
To use projecting Cross Bars — 4 mortar locks at every weld.
To comply with National Bureau of Standards Recommendations.
To furnish galvanized Cross Bars.
To furnish 12' lengths in 300' bundles — fewer splices, less scrap, lower cost.
To manufacture 8 Gauge Super Standard.
To insure complete mortar bondage.

Make WAL-LOK first on your list. Write today for descriptive brochure packed with facts.
Behind a wall of redwood...

there is privacy and seclusion, even in today's world of shrinking property lines.

reviews

(Continued from page 231)

Applied to some far-off setting, or regarded as pure abstractions, unrelated to the here and now, Professor Hilberseimer’s urban patterns appear not only rational but also fascinating and delightful. I regret, therefore, that I must bring in a report which may seem unappreciative of a work of such obviously excellent intentions and of such brilliant, imaginative ingenuity. I cannot conclude without making some comparisons with personalities, living and dead. Le Corbusier’s Ville Radieuse gathers dust in Algiers as it does in Paris; and the late Martin Wagner’s “solution” for Beacon Hill, like the Goodman brothers’ for Manhattan, can never be taken seriously. The late Eliel Saarinen and Richard Neutra, on the other hand, have written books which to many of us seem vague and far-fetched if taken literally as proposals for new ways of living, but we know that the dynamic constructions each of them has created in the course of his architectural practice are such positive contributions to our USAnian scene that much can be forgiven them in the way of theorizing when they sit down to write. The late Werner Hegemann, who was not an architect or planner by profession but an historian and a journalist, gave us many works that are unsurpassed, both in English and in German, on architecture, urbanism, and civic design (and I compliment Professor Hilberseimer by comparing the historical parts of his book with Hegemann’s Civic Art). But at the same time, Hegemann participated actively, with his feet right down on the ground, in the day-by-day fight for better housing and more beautiful cities. Working closely with civic groups, attending committee hearings and official sessions, he never disdained to talk the language and understand the motivations of the bureaucrat, the politician, the realtor,

TUFCOR® offers permanent firesafe roof construction at low cost

**EASY TO PLACE.** Galvanized corrugated Tufcor sheets arrive at the job site conveniently bundled and pre-cut to fit structural framing. No measuring or cutting is required. Three men can easily place and weld 5000 to 7500 sq. ft. of Tufcor in a single day. Low dead load of the finished Tufcor roof system (4 to 6 psf less than most types of roof construction) offers pronounced savings in the structural steel requirements.

**STRUCTURAL DECK.** After tough-temper Tufcor sheets—80,000 psi and stronger—are welded in place, they help stiffen framing, provide an immediate work platform for trades. Tufcor easily withstands normal construction abuse.

**EFFECTIVE INSULATION.** Because insulating concrete is inert, it is one of the most permanent, desirable types of roof insulation. Thickness of concrete fill placed on Tufcor can be varied to obtain desired insulation.

**BUILT-UP ROOF.** Rigidity and firmness of the Tufcor system provide a firm base for built-up roof, add years to the life of this roof, lower maintenance cost. Fast construction means faster profits from occupancy.

**VAPOR BARRIER.** Water vapor can't penetrate Tufcor. Sheets stay dry, maintain insulating properties, cut fuel bills. Firesafe Tufcor roofs need fewer sprinklers. Insurance savings, alone, often pay for the entire roof deck in 10 years!

and the banker, to say nothing of the architect who cannot afford to lose his client!

Taking this approach, far-sighted solutions offered in the technical field of urbanism by a teacher or a writer stand a better chance of being both applicable and acceptable. We hope Professor Hilbersheimer will be with us for many years to come and that his next book will contribute as much to the solutions of current problems as The Nature of Cities adds to the literature of urbanistic history. We hope, too, that he will join with the rank and file of practicing civic designers who believe that "the art of the possible" is a goal worth their efforts.

ROBERT C. WEINBERG

COLOR IN INDUSTRY

Selling Color to People. Faber Birren. University Books, Inc., 404 Fourth Ave., New York, N. Y., 1956. 219 pp., illus., $7.50

One of the outstanding color consultants in the country, the author has written fourteen books on color as well as more than 300 articles on the subject. Here, in his fifteenth book, he discusses the importance of color economically. He feels—and rightly so—that color is becoming "big business" in the United States; and as its power and influence increase, there is a vital need for a better understanding of it and just how it can be used for profit. Color has become one of the chief wants in the life of the American public and thus constitutes an important influence in the advertising, the selling, the styling, and the packaging of consumer goods.

In his approach to the subject, Birren wisely avoids the commonplace subject of color theory and, rather, makes a direct and dynamic approach to color as it applies to industry. This approach necessitates

☐ Architect ☐ Builder Other
Washrooms of another notable building finished in Carrara® Glass

NEW ENGLAND MUTUAL LIFE INSURANCE COMPANY
Boston, Massachusetts, is the location for the home office of this large insurance firm. The building was designed by Architects Cram & Ferguson, Boston, Mass. The contractor was Turner Construction Co., New York, N. Y.

Among leading American architects, Carrara Structural Glass is often first choice for use on washroom walls and partitions. This beautiful and practical material, with its smooth, polished finish and its smart, attractive colors, fits right in with modern washroom design. Carrara Glass can be luxurious or dignified or simple—or all three—as the architect's specifications require.

But Carrara's beauty is more than skin deep—it is an inherent part of this all-glass material—and as such it cannot fade or change with the years. The smooth finish of Carrara Glass discourages the collection of dust and dirt. It is highly impervious to attack by steam, water, acids and cleaning compounds, and will not craze, crack, stain or check. An occasional wiping with a damp cloth keeps Carrara clean and sparkling.

For more information on Carrara Structural Glass, write Pittsburgh Plate Glass Company, Dept. 7205, 632 Fort Duquesne Blvd., Pittsburgh 22, Pennsylvania.
Seventeen thousand square feet of smoothness

Robbins Hard Maple Floor in Skateland Roller Rink, Memphis, Tenn.
Installer: Dellinger Floor Co., Memphis.

BRING THE CROWDS TO SKATELAND

This Robbins Hard Maple Floor is a major drawing card at Memphis' Skateland, the largest roller rink in the Mid-South. Its beautiful smoothness, uniform resiliency and tight-grained splinter resistance offer the finest skating surface possible. And the amazing part of it is — this hard maple floor will still have all these remarkable features after years of abuse by thousands of speeding skates.

Robbins approved floor contractors are specialists in skating rink installations. Their long experience in this field can help you with specifications and correct installation procedure. And they'll be glad to fully explain why Robbins Hard Maple floors are chosen for the nation's finest skating rinks, gymnasiums, classrooms, workshops and plants. For the name of your nearest authorized installer, write Robbins Flooring Company, Reed City, Michigan. Attn: Dept. PA-457

For an extra assurance of long life, Robbins floors are now available Dri-Vac treated with Woodlife for protection against moisture absorption, swelling, shrinking, checking, cupping and grain raising as well as termite and fungi attack.

a first-hand knowledge of mass human psychology, marketing, and research. Being responsible for the styling of consumer goods for many of the nation's top industries and conducting one of the foremost color research agencies in the field, the author possesses the special skill and experience in supplying that knowledge.

This is throughout an especially useful book since it answers so many of the problems that anyone using color in a commercial way is confronted with. It has been written for business executives, sales managers and salesmen, advertising men and research specialists. No doubt many people in those categories realize and appreciate the value of color as a selling tool today, but this authoritative work affords worthwhile and practical guidance on many of the fine points of color use. Such guidance will help industry in serving the public better and surely business can profit accordingly.

Of special interest in this well designed and illustrated book is the chapter on color television because of its potentialities on the current business scene. The author has devoted special research to this use of color, not from the technical point of view of the process, but from the human side. FRANK A. WRENCH

in plumbing drainage... it costs no more for the... VERY BEST

A Backwater and Sewer Valve which provides complete, positive protection against backwater from heavy rains, floods and inadequate sewer carry-off. The scientifically engineered flap valve permits normal drainage to the sewer, but closes instantly... and tightly at the slightest backflow from the sewer.

series 1170-T BACKWATER VALVE

- Every home and every building needs to be safeguarded against the ravages of backwater—especially since ordinary insurance does not provide for this contingency. JOSAM Backwater Valves positively prevent water and sewage backing up through drain lines. Once installed, JOSAM Backwater Valves stay on guard for the life of the building. There is no need to take chances on backwater damage that can be caused by heavy rains or floods, when it costs so little to provide the very best, most complete protection. In plumbing drainage, you use the best when you use JOSAM! It costs less in the “long run”!

Here's what Best Foods learned from experience:

The makers of Hellmann's Mayonnaise first used Styrofoam* (a Dow plastic foam) in 1952. That was to insulate egg-storage rooms. The results have been so satisfactory that when Best Foods planned a new unit for making salad oil, Styrofoam was specified for 40° insulation in the winterizing cells (see illustration). When you specify easy-to-install Styrofoam for low-temperature structures or refrigerated equipment, you are ahead with the unique combination of superior properties found only in Styrofoam (see chart). For complete information, write THE DOW CHEMICAL COMPANY, Midland, Michigan—Plastics Sales Dept. PL1714M.

*Styrofoam is a registered trademark of The Dow Chemical Company

For a flexible, low-cost luminous ceiling...

Now— you can relight existing buildings with modern, luminous ceilings easily—inexpensively. Simply use Mult-A-Frame to suspend fixtures from ceilings. The only tools required are a saw and wrench. No special skilled labor is needed. An installation is far quicker and less expensive than with "ordinary" materials. The result—a double saving for your customers from labor time and materials cost.

Here's how it's done:  1 Attach small Mult-A-Frame channel (No. 3161) to old ceiling with power actuated fastener toggle bolts. 2 Locate Mult-A-Frame spring nut (No. FX 200) in desired position. Insert hanger rod through fitting (No. F 1004) and tighten with jamb nut. Serrations and keyed fittings hold firmly until you're ready for final tightening. Use any standard conduit, or hanger rod, as drop to fixture. 3 The Mult-A-Frame fitting (No. FX 43) clamps around 4 1\(\frac{1}{2}\) sq. channel (No. 6161) and attaches to the fixture using T-bolt (No. MF-1574). Fixture supports can be placed at any interval both at ceiling and atop the fixture for complete flexibility of installation. 6 Next step is to hang ceiling from Mult-A-Frame channel with Mult-A-Frame fitting (No. FX 75). Any strap, rod, or wires can be used with this fitting for ceiling support.

For complete information on Mult-A-Frame's many uses in the electrical field, write today for your copy of the Electrical-Mechanical Catalog.

Busy—but not noisy...

because Johns-Manville Acoustical Panels reduce disturbing noise

In new buildings or old, business, industry and institutions depend on modern acoustical materials to achieve maximum efficiency. Johns-Manville offers a choice of highly efficient sound-absorbing materials for every need:

**J-M Sanacoustic® Panels** — perforated metal panels backed with a fireproof, highly sound-absorbent element. The sanitary, white baked-enamel finish is easy to clean, may be repainted.

**J-M Fibretone® Panels** are available in Uniform, Random, and Variety-drilled patterns. Hundreds of small holes act as "noise traps." Panels are factory-painted white, need no further treatment. Also available with a flame-resistant finish.

**J-M Permacoustic® Panels** — combine maximum efficiency with handsome fissured surface. Made of mineral wool to meet all fire-safety requirements.

Send for your free copy of the new brochure entitled "Sound Control." Write today to Johns-Manville, Box 158, Department PA, New York 16, New York. In Canada, write 565 Lakeshore Road East, Port Credit, Ontario.

See "MEET THE PRESS" on NBC-TV, sponsored on alternate Sundays by Johns-Manville

DESIGNED FOR MOISTURE AREAS

The SIMPLEX all-aluminum flush panel acoustical ceiling.

1. It smothers noise in kitchens, serving areas, swimming pools, etc. with an 85% Noise Reduction Coefficient.

2. Because of its completely aluminum construction, including suspension, trim and ceiling panels, it lasts indefinitely, never rusts. The permanent aluminum finishes, mill-waxed and anodized, never crack, peel or become permanently dulled.

3. The SIMPLEX aluminum acoustical ceiling requires less maintenance than any other acoustical ceiling designed for moisture areas. Permanent finishes need not be repainted, dead flat ceiling has no crevices to collect dirt and make cleaning difficult.

SIMPLEX anodized ceilings have received approval for use in Y.M.C.A. swimming pool areas.

Send today to SIMPLEX Ceiling Corp., 552 W. 52 St., N. Y. 19, N. Y. for AIA booklet containing photographs, details and full specifications.

Lower over-all costs and design flexibility were the major factors which influenced architects Shaw, Metz & Dolio in their selection of reinforced concrete for the imposing new Florsheim Shoe Company factory and headquarters offices in downtown Chicago.

On many other important industrial projects and buildings from coast to coast, reinforced concrete is also providing better structures for less money. It is a flexible medium, inherently firesafe, and highly resistant to wind, shock, and quake. Furthermore, reinforced concrete buildings start quicker . . . are completed sooner because all necessary materials and labor are readily available from local sources. On your next job, design for beauty plus economy . . . design for reinforced concrete.
NOW!

LOXIT MIRACLE ADJUSTABLE
CHALKBOARD SETTING SYSTEM
USING LOXIT PREFABRICATED
CHALKBOARDS AND TACKBOARDS

Eases Classroom Shortages
by Giving Classrooms
Greater Flexibility!

With rapidly changing school room conditions and uses, the new Loxit Miracle Adjustable Chalkboard-Tackboard Setting System provides for the rapid and economical changing of chalkboard and tackboard heights above the floor to meet all student requirements from KINDERGARTEN TO COLLEGE. It is practical, safe, economical, easy to install and easy to use. Carpenters or maintenance men can change the heights of chalkboards—quickly, easily, effortlessly—when the Loxit Miracle Adjustable Chalkboard-Tackboard Setting System is used.

Write today for literature and samples.

LOXIT SYSTEMS, INC.
1217 W. WASHINGTON BOULEVARD, CHICAGO 7, ILLINOIS
Modernfold’s superior construction assures a life-time of service and like-new appearance

For saving space in homes, businesses and institutions, MODERNFOLD doors are the overwhelming choice of architects.

How many other folding doors have a double-strength, all-steel frame and wipe-clean vinyl covering? Where else is your choice of colors, finishes, sizes, hardware, switches and tracks so complete or attractive? Where else can you find a folding door of such quality that its application possibilities are almost limitless? Choose from four complete lines. Only MODERNFOLD, among all folding doors, can serve your needs so well! You'll find out why, in detail, when you refer to Sweet's Catalogue.

When you have problems in dividing space, why not check your MODERNFOLD distributor? He's listed under "Doors" in classified telephone directories. You'll find him always ready to assist, in new construction or remodeling.

This Modern Building Has Life-time Wiring Protection--Thanks to 

YOUNGSTOWN “BUCKEYE” CONDUIT

Fifth and Boston Corporation's strikingly beautiful First National Building at Tulsa, Oklahoma, utilizes quality-controlled Youngstown “Buckeye” Black Enameled Full Weight Rigid Steel Conduit exclusively, for protection of its all-important electrical wiring system.

Nationally-known building owners, leading contractors and progressive architects realize that electrical systems that don't function safely and efficiently are definitely a bad investment. So to guard against this costly condition they specify Youngstown “Buckeye” Conduit for its long, trouble-free service life.

“Buckeye” Conduit is easy to fabricate on the job—easy to fish wires through—and thoroughly corrosion-resistant to damaging elements such as water, moisture, vapor, dust and dirt.

Leading distributors in every industrial and electrical market are ready to serve you quickly from their ample stocks. They're as near as your phone—why not call today?

Standard-threaded rigid steel conduit is the only wiring system approved today by the National Electrical Code as moisture-, vapor-, dust- and explosion-proof for use in hazardous locations and occupancies.

Effective Lighting + Sound Conditioning + Striking Beauty with Modern Ceiling Treatment

Here is an outstanding example of a “combination” ceiling treatment. It makes this three-way contribution to an interior: 1. Highly-efficient sound conditioning to arrest noise. 2. Soft, diffused lighting. 3. An attractive contribution to the modern decor. Acousti-Celotex Sound Conditioning Tile and Acousti-Lux Translucent Panels provide a compatible blending of light- and sound-conditioning in an integrated ceiling of unusual beauty. From planning and designing stage right through to the job's finish, Acousti-Celotex Distributors will cooperate with you... to achieve the utmost in practical and beautiful ceiling integration.

FOR COMPLETE DETAILS on Acousti-Celotex Sound Conditioning Tile and Acousti-Lux Translucent Panels, write to The Celotex Corporation, Dept. C-47, 120 S. La Salle St., Chicago 3, Illinois.
You can offer your clients authentic American colors...

for siding

and for trim...

Some house showing trim painted with Cabot's DOUBLE-WHITE

Cabot's colorful, long-lasting
HOUSE & TRIM PAINTS (COLLOPAKES) ®

Cabot's House and Trim Paints will give your clients years of beauty and enduring satisfaction. They can choose from a wide range of unique, authentic American colors from old favorites to popular pastels! And most important, in Cabot's Paints, unlike ordinary paints, the oil and pigment, combined by the patented Collopaiking Process, stay together, bound firmly to the wood. Only Cabot's Paints offer these other advantages:

- fresh, lively, non-fading colors
- porcelain-smooth finish — no brush marks
- excellent hiding power
- lasting gloss
- tough, flexible, long-wearing film

A quality product from Cabot Laboratories ...manufacturing chemists since 1877

picked by professionals

Reach for a Venus drawing pencil...and get the clearer, consistent, precision line blueprint and drafting work demands. The lead in all 17 degrees of Venus drawing pencils is homogenized by the exclusive Venus Colloidal Process. Result: sharper prints...smudge-free tracings. Clean erasures are easy to make.

And because Pressure-Proofing seals the lead to the wood along its entire length, the Venus is stronger, holds a needle point longer. See why Venus sets the standard for fine drawing pencils. Also try Venus Refill drawing lead that fits all holders.

SEND FOR the Venus Technical Test Kit. State degree wanted—also choice of pencil or refill lead.

VENUS drawing pencils

The SURE WINNER
at Sportsman's Park...

Cooling with minimum installation time and cost is a sure thing—with Airtemp "packaged" air conditioning. It can be used with or without ductwork...to cool either single areas, or multi-story complete buildings, like the Sportsman's Park clubhouse.

Another example of how Airtemp's complete line—286 models, biggest selection of any manufacturer—helps American business and industry solve cooling problems with models specifically suited to particular requirements—at standard-model cost! And all engineered by Chrysler.

PHONE your nearby Airtemp contractor. He's in the Yellow Pages. Or—write to Airtemp Construction Division, Chrysler Corporation, Dayton 1, Ohio.

Outside-mounted Airtemp units—1 60-ton Model 2660, and 2 40-ton Models 2640—silently and unseen cool the 160,000 cubic foot clubhouse. Evaporative condensers totally eliminate need for cooling towers, drastically reducing installation and maintenance expense.
situations open

ARCHITECTS, GRADUATES & DRAFTSMEN—midwestern office specializing in school design. Excellent opportunities for professional experience. Group hospitalization and other benefits. Please submit complete personal information including training, experience, marital status, military status and recent photo or snapshot. Box 472, PROGRESSIVE ARCHITECTURE.

ARCHITECTURAL DESIGNER-DRAFTSMAN—who can carry through from preliminaries to final. Opportunity given to meet with clients and contractors according to ability. Small well established office in small Pennsylvania university town. Write, giving complete background, professional experience and starting salary expected. Malcolm A. Clinger, Architect, Buffalo Road at Matlack Avenue, Lewisburg, Pennsylvania.

ARCHITECTURAL-DIS-DRAFT PERSONNEL—small office—medium sized commercial semi-public, original work. Experience and background important; initiative necessary. Salary and responsibility compatible with ability. Written initial application preferred—confidential. L. L. Fischer, Architect, 541 Nassau Street, Princeton, N. J.

ARCHITECTURAL DESIGNERS AND DRAFTSMEN—progressive organization of architects and engineers requires additional qualified men to carry out diverse programs. We are presently engaged in the design of institutional, educational, industrial and governmental buildings. We offer top salaries, an unlimited opportunity for career development, full employment, benefits and long-term employment. To arrange personal interview, send brief outline of education and experience to Box 475, PROGRESSIVE ARCHITECTURE.

ARCHITECTURAL DRAFTSMAN—immediate opening for experienced draftsman in established architectural office. Pleasant working conditions in small air conditioned office located in central New Jersey. State age, qualifications, experience, availability, salary expected, etc. Box 474, PROGRESSIVE ARCHITECTURE.

ARCHITECTURAL DRAFTSMAN—experienced in church work, small office with chance for partnership. State experience, age and salary desired. W. E. Tolfort, 4143 Monroe Street, Toledo, Ohio.

ARCHITECTURAL OR STRUCTURAL ENGINEER—excellent opportunity to assume a responsible position with a growing, progressive engineering firm designing all types of building frames, foundations and shell structures. Applicant should have experience in reinforced-concrete and structural steel design and details. State salary desired. Ib Falk Jorgensen, Consulting Structural Engineer, 924 Broadway, Denver, Colorado.

EXPERIENCED ARCHITECTURAL DRAFTSMEN—wanted by firm of excellent reputation in rapidly growing southwestern U. S. A. Work includes government and institutional buildings, commercial and industrial buildings, residences and churches. Three years practical experience essential, college degree not essential. Stage age, education, experience, marital status and starting salary, also send recent photo or snapshot. Louis G. Hesselton, AIA, Architect, 213 Fourth SW or P. O. Box 893, Albuquerque, New Mexico.

YOUNG ARCHITECT OR ARCHITURAL DRAFTSMAN—excellent opportunity for permanent affiliation with progressive architectural firm, specializing in contemporary architecture. Prefer college men with some experience. Good pay, eventual partnership or associateship. Desires aggressive, intelligent man with a fine education and experience, stating salary requirements and availability, also send a recent photograph or snapshot and references. Jan Ruhtenberg, Registered Architect, A.I.A., 235 Mesa Road, Colorado Springs, Colo.

WANTED FOR ARCHITECT'S OFFICE—architect job administrator, spec writer, shop drawing checker, experienced in all phases of active architect's office. Good salary, additional benefits, nice environment. Write experience to: Fulmer and Bowers, Architects, 541 Nassau Street, Princeton, N. J.

situations wanted

ARCHITECT—35, A.I.A. Registered New Jersey. Broad experience in all phases of office work, specification writing, client-contractor relations, commercial and institutional buildings. Desires administrative position with progressive engineering firm. Free to travel and relocate. Box 475, PROGRESSIVE ARCHITECTURE.

ARCHITECT—A.I.A., age 34, family, registered in two eastern states. Now practicing as partner, desires position of responsibility with contemporary firm in new locality. Ten years diversified experience, all phases. Prefer Maryland, Virginia, North Carolina or Florida. Box 476, PROGRESSIVE ARCHITECTURE.

ARCHITECT—29, married, B.Arch degree, registered by examination in two states. Three years diversified experience in residential, institutional and commercial projects. Client-contractor contacts, design through supervision. Desire immediate relocation with firm doing contemporary work with opportunity for associateship or partnership. Will consider foreign position. Box 477, PROGRESSIVE ARCHITECTURE.

ARCHITECT—32, university graduate, AIA school medal plus other awards. NCARB. Six years diversified experience in architectural office, including client contact, design, working drawings, and office and job supervision. Seeks position with responsibility and future. Box 478, PROGRESSIVE ARCHITECTURE.

ARCHITECTURAL ENGINEER—with 25 years experience in structural design of large industrial and institutional projects in reinforced concrete or steel, seeks similar responsible position with progressive office in the Southwest. Box 479, PROGRESSIVE ARCHITECTURE.

ARCHITECT—registered, 36, 12 years experience handling all phases of work. Desires position as office supervisor and coordinator. Progressive firm in West, can arrange interview. Box 480, PROGRESSIVE ARCHITECTURE.

ARCHITECT—studied civil engineering, holds B.Arch degree, N.C.A.R.B. certificate, nine years experience (five in organization and design) would like to team up with individual or group interested in forming the nucleus of a highly imaginative and aggressive organization. Am willing to relocate anywhere. Box 481, PROGRESSIVE ARCHITECTURE.

COST ENGINEER—professional, wide experience, will prepare complete budget estimates from outline plans on any kind of work, equipment and mechanical items. Box 482, PROGRESSIVE ARCHITECTURE.
Hydrocide* S-X COLORLESS gives exterior walls of this new hospital positive water-repellency

Sonneborn silicone-base product—one of the first developed in its field—also helps check efflorescence on brick and masonry walls.

The exterior brick and masonry walls of the new Providence Hospital have been treated with surface-penetrating Hydrocide S-X Colorless to make them water-repellent. This also minimizes the effects of weathering. It discourages the adhesion of dirt and grime, preserves the original beauty, color and texture of exterior brick and masonry.

Before you specify or buy any water-repellent, consider these facts:

Hydrocide S-X Colorless was one of the first in its field. It has had the benefit of longer research and performance testing under all climatic conditions.

Hydrocide S-X Colorless is the silicone-base water-repellent created out of complete collaboration between the primary silicone producers and Sonneborn's intimate masonry waterproofing knowledge.

Sonneborn issued the first performance specifications ever drafted for a silicone-base water-repellent; this specification has served as the model for the industry.

Thus, Hydrocide S-X Colorless started with "plus" advantages—and continuous research has maintained these advantages over the years.

Hydrocide S-X Colorless has been used on many millions of sq. ft. of brick, concrete, block and stucco surfaces. This confirms its eminently satisfactory performance.

Since 1903 manufacturers of quality building products.
Naugatuck LATICRETE

Rubber-bearing flexible concrete

Repair it... prevent it... with LATICRETE

Concrete corrosion like this is all too familiar to maintenance men in plants where acids, alkalies, sugars and other chemicals are used. LATICRETE® provides an easy, inexpensive way to repair it... and to prevent it!

This unique combination of portland cement, inert fillers and natural rubber latex exhibits excellent resistance to most chemicals. And because it bonds so tightly and permanently to almost any substance, a LATICRETE surface as thin as a quarter of an inch, applied over old concrete, effects a permanent repair... or provides a whole new floor surface that is non-porous, nondusting, not slippery either wet or dry, easy on the feet and which flexes with building movement.

On new construction, architects and builders can save money by specifying LATICRETE in place of chemical-resistant tile. Use it also to secure maximum bonding in the bedding and pointing of glass blocks, tile and brick... to waterproof basements and tunnels... to weatherproof cinder and concrete block exteriors. Write for the 8-page LATICRETE bulletin for facts you should know about this unique material of many uses.

TRADE-WIND
OVEN VENTILATOR

Salem Antique Copper Hood

Here's the remarkable new Trade-Wind Oven Ventilator for both built-in gas and electric units.

Engineered with more than adequate suction to remove the blast of oven heat, odors and greasy air each time the door is opened... and to keep the kitchen comfortably cool as long as the oven is in use. In addition to a handy on/off switch, the ventilator is equipped with automatic thermostat control for complete protection.

This beautifully designed unit is another quality first from Trade-Wind. It combines the finest style... super performance... and easy installation.

YOU GET MORE WITH TRADE-WIND

Stationary Copper or Stainless Steel Hood
Suspended Acoustical Ceilings

Stay TRUE and LEVEL With

GOLD BOND Nail-Tite Steel Furring!

Gold Bond's Nail-Tite Channel System helps you plan for strong, sturdy construction when you're thinking of a suspended acoustical ceiling. It's the sound basis for a sound ceiling, and here's why:

1. It won't warp or twist — it's steel! Ceilings won't buckle from dampness or age.
2. It's stronger than many other "furring strip" methods — steel grips the beams or trusses...and steel grips the sheathing nails, too.
3. It can't burn — it's steel! Your ceiling is supported by incombustible steel Nail-Tite Channels and Nail-Tite Hanger Clips.

The Gold Bond® Nail-Tite Channel System can be suspended from or attached to steel trusses and beams, wood joists, or other structural media. Nail-Tite Channels are erected at right angles to carrying channels and secured to them by Nail-Tite Hanger Clips. Gypsum board is nailed directly to the Channels. Acoustical tiles are then cemented to the boards.

NOTE: Nail-Tite Channels feature a wide throat for easy insertion of annular nails. The channel's wide top provides good bearing surface to 1½" channel, too.

For further information, write National Gypsum Company, Dept. PA-47, Buffalo 2, New York.

Another sound idea from

Gold Bond

Doesn't Warp — Doesn't Twist — Stronger Than Wood Furring — Incombustible

115 mph rainstorm—didn't leak a drop...

During a torrential rainstorm in Kansas City last summer, winds reached 115 MPH, yet the newly completed Ware window-walls in the TWA terminal building didn't leak a drop—thus proving their weathertightness in the best possible manner.

Weathertightness—and simplified installation—are two of the key features of Ware's complete series of window-walls which are now available.

Our experienced engineering department is at your service to meet your specific needs. Why not send us the requirements for your next job, today? Write Dept. PA-4.

Ware Laboratories, Inc., 3700 N.W. 25th St., Miami, Florida
Important Wiring gets Permanent Protection with SHERARDUCT

RIGID STEEL CONDUIT

Specify National Electric Sherarduct and you safeguard electrical wiring against corrosion for all time.

NE's Sherardizing process of dry galvanizing under heat actually alloys corrosion resistant zinc with the steel walls of the conduit. Threads are machined before galvanizing so that the entire length of the conduit receives a uniform protective zinc coating from end to end.

On the job Sherarduct helps cut construction costs. A slick inside coating of Shera-enamel makes fishing and wire pulling easy. The gradual heating and cooling of the Sherardizing process anneals the steel conduit . . . develops the ductility needed for efficient bending and working.

On the next conduit installation remember — Sherardizing is Galvanizing at its best—Sherarduct is Galvanized conduit at its best.

Architectural Practice—Revised Edition
by Clinton H. Cowgill and Ben John Small
This comprehensive book covers the professional, business, and
legal aspects of architectural practice. Commissions for profes-
sional services are traced in minutest detail from the day the client
arrives to the last payment for work performed. The social and
economic implications of contemporary practice are translated in
terms of ready-to-use forms, guides, advice, graphic illustrations,
and the like. Accounting procedures, bookkeeping systems,
almost every procedural form an architect requires for his prac-
tice, agreements of every nature, specifications, insurance and
bond requirements are all presented in orderly sequence.

DESIGN FREEDOM

plus lifetime protection against Termites and Decay

Wolmanized®

PRESSURE-TREATED LUMBER

Now—build with the design freedom of wood anywhere, in any manner. Just be sure that the wooden members of the structure in close contact with the ground or masonry are made of Wolmanized® pressure-treated lumber.

Wolmanized lumber is used just as any untreated lumber. The difference is in results. Wolmanized lumber gives positive protection against termite and rot damage; it is clean, paintable, non-corrosive, glueable.

And because Wolmanized lumber has built-in protection from decay it should be specified where these conditions exist: process moisture, condensation, high humidity, water contact.

The HOW and WHY of Wolmanized lumber and many suggestions for residential, commercial and institutional uses are covered in this 16-page handbook. Write for a copy.

Wolman Preservative Dept., Koppers Company, Inc.
1452 Koppers Building
Pittsburgh 19, Pa.

The remodeled gymnasium of the Army Chemical Center, Edgewater, Maryland, is typical of the practical use for Wolmanized lumber. The gym's rotted, wartime sub-flooring was replaced with Wolmanized lumber to provide solid, even support for 30 years or more.

Lighting in the Museum of Contemporary Crafts represents a happy solution to the demanding requirements of exhibit-space. One of the reasons for its success is the Gotham Monopoint-Control unit used throughout this area.

Perhaps this unit is the answer to a lighting problem for you. For data, write: Gotham Lighting Corporation

37-01 Thirty-first Street, Long Island City 1, New York
Last weekend I made a quick trip down to Tampa, Florida, to help the Florida Central AIA Chapter celebrate the hundredth birthday of AIA. In making notes on what one does say about "a new century beckons," I found myself thinking that in the period immediately ahead two attitudes within the profession are going to be important. One is that continuing experiment and serious moves toward further progress must be encouraged. It is certainly clear, as contemporary scientists such as Norbert Wiener keep reminding us, that progress doesn't come automatically; it comes as a conscious move against nature's normal tendency toward disintegration, chaos, and sameness.

The other necessary intra-professional attitude, it seems to me, is one of serious, constructive criticism of current work. Progress through experimentation comes only when results of the experiments are critically evaluated. There must be further moves in this direction (I think the P/A Design Awards Case-Study Seminars are one, and I hope you all agree when they are published) both by the press and by the profession.

Many people are thinking—and writing—about the subject of architectural criticism, even though there is little of it carried out. I have just read two manuscripts; both attempt to assist critical understanding of architecture. One, as yet unpublished, is by Robin Boyd, an Australian; the other, just off the press in the United States, is by Bruno Zevi, an Italian.

I find Bruno Zevi's book* (which will be reviewed in our regular Reviews pages by someone more competent than I to discuss his historical analyses) both stimulating and disturbing. Stimulating (even, I would say, very important required reading) because of its emphasis on space as the definition of architecture—a consideration we are all too apt to depreciate, minimize, or ignore completely in our preoccupation with forms and volumes. Disturbing because his thesis—that interior space, considered in all its aspects of what it is and what it does, is "the most exact definition of architecture that can be given today"—does not entirely check out, even in his own analysis and considering his own selected examples. He has to make too many qualifications, it seems to me, to justify such an absolute basis for a system of interpretation which has to, as he says any interpretation must, "demonstrate its effectiveness in illustrating every work . . ."

After arguing for space as the "protagonist of architecture," Zevi devotes a chapter to problems of representation of space (assuming that an interested person, student or not, cannot see every building in which he is interested) and raises some interesting problems regarding indications of the volume and shape and continuity of spatial concepts, by plans, sections, flat elevations. A chapter analyzing, briefly, historic stages of architectural development on the basis of space use, I found most interesting and fresh (although some historians I have discussed the book with quibble at some of his interpretations of historic fact). With his admitted preoccupation with spatial interpretations—the flat statement, in fact, that "no work, lacking interior space, can be considered architecture"—Zevi has to classify some past examples as great sculpture, rather than architecture. The Greek temple, with "an internal space which was never developed creatively, because it had no social function," must be considered, under the architecture-is-interior-space concept, as "a horrible example of non-architecture" and "a giant piece of sculpture," albeit a work of "human genius."

At the other extreme of chronological history, Zevi's thesis needs further elaboration. The contemporary skyscraper is illustrated—presumably as architecture—but there is no attempt to describe it by its definition of interior space—slices of space cut up arbitrarily to answer many tenants' needs. In fact I felt, after the illuminating discussions of Renaissance and Baroque space concepts, that the brief analysis of contemporary treatments of space was quite inadequate. However, the fact that the many trends and subtrends in the current contemporary work are not studied from the space-treatment point of view doesn't mean that this could not be done—or wouldn't be a fascinating study. In fact, Zevi ends his book with a strong argument for a new, complete history of architecture based on this method.

It is the section of the book dealing with various methods of interpreting architecture that most interested me. A study of the literature of criticism leads him to break critical systems into three currently accepted types: those dealing with content (political, scientific, technical, and so on); those which are basically physiological and psychological (symbols, interpretations, empathy); and the formalistic ones (laws, rules, and principles of design). All of them, Zevi feels, neglect space, even though a physiopsychologist such as Geoffrey Scott (whom he quotes at great length) did discuss space, and even avowed that "To enclose a space is the object of building; when we build, we do but detach a convenient quantity of space, seclude it and protect it, and all architecture springs from that necessity."

Zevi carries that conviction to its logical end: "spatial interpretation . . . is a super-interpretation, or, if you wish, an underlying-interpretation." It does not compete with other methods of understanding buildings; it supplements them. "Interpretations of space may be political, social, scientific, technical, physio-psychological, musical and geometrical, or formalistic."

In other words, Zevi's original argument that architecture is interior space comes down, finally, to an insistence that space considerations plus others must be studied. As a matter of fact, exterior space is admitted, in parts of the book devoted to urbanism, to be an important partner with interior space in the evaluation of the space content of a city, and of the part exteriors of buildings play in this larger understanding of architecture in urban design.

To return to my original point that we need better evaluation of experiment and progress, I believe that this book is an important and timely reminder that the volumes and forms which catch our eye are a means rather than an end—that the content of architecture, the purpose of architecture, are the factors that somehow the viewers and users of buildings must be made to appreciate.
