FRANKLY, we are anxious to interest you in designing houses in ILCO Ripplstone, as we call Indiana Limestone used as a sawed masonry facing. Sawed into strips usually four inches thick at the quarries, this beautiful stone is broken to lengths on the job and laid up in the wall as a facing or veneer. Don't confuse this with ordinary stone. We carefully select every piece of ILCO Ripplstone so that in color, texture and sizes it harmonizes with your design. We send an expert to the job to make sure every detail is handled correctly.

We have standardized procedure on stone construction until we can assure you that the total cost of a house faced with our stone will not be over 5% to 6% more than when other facing material is used.

You realize, of course, that design is the most important element in achieving a pleasing result with Indiana Limestone used this way. Why not make your present house project a stone project? We will gladly furnish you with interesting information to aid you. Write us today. We'll also send complete information regarding this interesting new use of nature's oldest building material. Use the coupon.

Wall Units of
Atlantic Terra Cotta
Particularly Adapted for Interiors
~ Catalog on Request ~

An entirely new development—Atlantic Wall Units have every advantage of handmade Terra Cotta.

Great economy is due to the fact that Wall Units are made mechanically to standard size, with every saving attending on quantity production. Quick and easy to erect, there is great saving in labor costs.

The standard size is 8" x 16". The bond is 2, 4, 6 or 8 inches. Cove base pieces, inside and exterior miters, and bull nose, plain or modeled cap pieces, are made as required.

The entire line of Atlantic colors, hundreds in number, is open for selection.

Atlantic Wall Units are particularly useful for lining lobbies and corridors in office buildings, schools and hospitals, replacing less durable materials or materials that are far more expensive. Atlantic Wall Units complete the walls structurally and give a permanently enduring surface, clean and sanitary, that can be completely renovated at any time by washing with soap and water.

Wall Units can be used for lining garage interiors, especially the high class office building parking type of garage, subways and tunnels. They can be used for driveways of hotels (for example the driveway of the new Waldorf Astoria Hotel).

Power house interiors, dairies, bakeries and food product factories require maximum light reflection and the cleanliness of Terra Cotta Wall Units.

Atlantic Wall Units are manufactured in an entirely new way. The development is one of the greatest importance to architects, owners and builders.

In writing for catalog please specify "Wall Units."

Atlantic Terra Cotta Company
19 West 44th Street, New York

Atlanta Terra Cotta Company
Atlanta, Georgia
All the individual character of the architect's design, no matter how rhythmic the flow or modern the conception, can be faithfully reproduced in terra cotta. For symbolic figures and other forms of enrichment expressing the most cherished ideals of the American School, terra cotta is an exceptionally sympathetic material. The living, breathing spirit of the ornament is fully retained, as approved in the original model. Each unit, either in white or in full color, can be repeated without the slightest loss of feeling. Every detail is true to the creative impulse which transformed it from a lump of clay into a thing of lasting beauty.

Noise Does Not Rule...  
the Cork Decorated Office

So any modern business room can be built both for beauty and for silence.

A QUIET business office is at least 10% more efficient than one that is noisy. Much more pleasant, too. And it is especially friendly when unnecessary noise is subdued by Armstrong's Corkoustic.

Corkoustic—strong, firm cork panels—is installed on walls and ceilings primarily to absorb sound. But it also has interesting decorative possibilities. Both in color harmony and pattern the designer is limited only by his ingenuity.

Suppose you plan a directors' room. Dignity and modesty must be the keynotes, of course. So we suggest the rich, natural Corkoustic surface in blended browns. Personal taste will dictate your selection of smooth or textured surface, beveled or squared finish. Your design can also be varied with units of a wide range of sizes and shapes.

Another room may call for a modern touch of color. It might be a reception hall, an office, even your own anteroom. Here you can apply spray coats of cold water paint in stencilled design. You can create Persian, Gothic, or other artistic panels. Again you make your choice of sizes, surfaces, and finishes.

Armstrong's Corkoustic also offers high insulating efficiency. It reduces heat losses and helps to maintain uniform, comfortable temperatures. For the complete story, send for the book, "Acoustical Correction." Then our engineers will be pleased to consult with you. Armstrong Cork & Insulation Co., 902 Concord St., Lancaster, Pennsylvania.

Armstrong's
CORKOUSTIC

Sound Quieting and Acoustical Treatment for all buildings
TWENTY years ago we gave the building field a new waterproofed cement and said, "This waterproofed cement made by the Medusa Process will break down capillary attraction of the concrete or mortar and make it permanently impervious to either slow seepage of water or hydrostatic pressure."

- It was our belief that the "grinding in" of Medusa Waterproofing with cement clinker at the mill was better than using ad-mixtures on the job.
- Time has proved the "Medusa Process" right. Today, waterproofing on countless jobs where Medusa Gray Portland Cement — waterproofed — or Medusa White Portland Cement — waterproofed was used, is still giving satisfactory service. Consider this record when working out specifications for waterproofing on your next job. Send and get the latest waterproofing information and specifications in our new book entitled "How to Make Good Waterproofed Concrete."

A FORM FOR EVERY PILE—A PILE FOR EVERY PURPOSE

---

This steel shell is left on every standard RAYMOND CONCRETE PILE in the ground
For the first time in its history, structural concrete has been endowed with the property of insulating against heat and cold.

The cause—
A structure of individual trapped air cells in the Haydite aggregate, that is vitrified, fused shale, impervious and strong.

The result—
A product that resists the passage of heat and cold and which at the same time brings the weight of concrete as low as 10 lbs. per sq. ft. All this with a strength as great as sand concrete — well above all building code requirements.

Featherweight Concrete INSULATING ROOF SLABS

are providing permanent, fireproof, no-maintenance service on all kinds of buildings—public, industrial and railroad — such as the Adler Planetarium, Chicago—Alexander Gymnasium, Appleton, Wis. — Detroit Municipal Hangar—C. M. & ST. P. R. R.—Oakland Motors—Dow Chemical—and many more. "Catalog and Roof Standards" on request.

FOR OVER A QUARTER CENTURY
VALUE at your WINDOWS

isn’t THAT what you want for your window shade money?

With all the shouting that’s going on about "special features" of various window shadings, it is not always easy to remember that the one and only vital feature is... that your shades do, and keep doing, good work at your windows.

Compare a Columbia NIAGARA washable shade with any other, and you’ll see just what we mean. We’ll provide the NIAGARA shade any time.

NIAGARA does a splendid job at your windows. Its colorings are rich and even. Its texture and finish bespeak the thoroughbred. Its translucency gives a delightful effect... with no sacrifice of privacy.

Yet NIAGARA costs less than you’d guess. And its length of service is more than you’ve ever had reason to expect of a shade.*

NIAGARA doesn’t "go dead" with exposure. It keeps its shape and appearance. And it is washable... really washable... repeatedly washable.

NIAGARA, sir, is the best performer you can buy, by a wide, wide margin... and performance is what you want, isn’t it?

*NOTE: When you specify NIAGARA shades, be sure to get Columbia rollers, for it takes the world’s best roller to match NIAGARA’S service.
For homes and smaller buildings — the NEW

Kewanee steel Boiler

The Type "R" Kewanee was specially designed, engineered and built to meet the ever growing demand for a steel boiler for heating homes and smaller buildings.

All that sturdiness of material; correctness of design; and skilled care in manufacturing—which for forty years has marked Kewanee Boilers as the Leaders—will be found in Type "R."

These Features Mean Greater Boiler Value

A bigger, higher combustion chamber. More generous steam space.
A Crown Sheet that is Right-Side-Up. And: Sturdier construction of thick, high quality steel boiler plate made into one homogeneous piece which adds years to the boiler's life.
Long two-pass travel of the gases through the flues. Tapped for Excelso Water Heater.

He Took Up the Draftsman's Pencil to Battle Constipation

The daily output of a lathe operator drops. A child grows listless and inattentive as the school day drags into afternoon. An office worker slumps idly at his desk, neglecting the work before him.

The boundless energy that drove a business genius to the top rung of the ladder, slips silently away, leaving only a dull clod of a mind and body.

Yet doctors tell us that constipation is really nothing but a habit—or rather the lack of one. It is a chronic disorder, of millions, induced by irregular evacuation during youth.

The Clow Soldier of Sanitation took up the draftsman's pencil to fight this enemy of modern man and industry.

His first attack was for the coming generation. It resulted in a closet bowl, efficiently designed to make evacuation easier and more certain for school children.

For many years careless designers had been inflicting high bowls upon children in school toilet rooms.

The seat of the Clow Bowl was lowered, 2 inches closer to the floor. The position of the child is natural, with knees high and stomach muscles relaxed. Thus by making evacuation easier, regularity is made more of a habit.

Following this first bowl have come others on the same idea to help grown-ups in all walks of life. And the Soldiers of Sanitation score another important victory in their battle against uncleanness, pollution, ill-health and inefficiency.
NATIONAL Tube Company was the first manufacturer of Copper-Steel Pipe. In addition to being the pioneer in making Copper-Steel Pipe, this Company has contributed a large share of the research and experiments necessary to definitely establish the fact that a small amount of pure copper added to steel makes it more resistant to atmospheric corrosion. Nearly twenty years of observation, laboratory and field tests and actual service records are behind the development of NATIONAL Copper-Steel Pipe.

Time-tested and quality proven—backed by the experience and resources of the largest manufacturer of wrought tubular products in the world—NATIONAL Copper-Steel Pipe is the logical choice for all services in large buildings where the pipe is exposed to atmospheric corrosion due to alternate wet and dry conditions, particularly for soil, waste, vent lines and rain leaders.

To secure the benefit of the experience of pioneers in making this product, be sure to specify—

20 Years of Continuous Quality Have Kept Brasco Foremost

The tone of today's shop is determined by its front of modern design, of new metals and brilliant effects, built to withstand the action of vibration, time and the elements. Twenty years ago, Brasco pioneered in the development of quality metal store fronts, engineered for strength, safety, permanent architectural beauty. Today, these same basic principles bring to your clients the very highest value in advanced store front construction. Such quality—and at moderate price—is made possible only because Brasco ability, experience and facilities have progressed with your demands. Complete data with full-sized details and samples on all Brasco types, gladly sent on request.

A Solution to the Difficult Problems in Architectural Acoustics

While the problems in Architectural Acoustics have always been perplexing, the demand for comfortable noise levels has grown so rapidly that many architects realize, more than in the past, the need for an organization which can take full responsibility for the acoustical phases of its assignments.

Through the creation of many types of acoustical materials and methods of application and through the development of a competent staff of experts—as well as through the maintenance of skilful installation crews—the United States Gypsum Company has endeavored to make an exact science of what were once vague theories and unreliable opinions.

The result is that the United States Gypsum Company is well prepared to counsel with you on all acoustical problems. We are in a position impartially to prescribe the type of material best suited to the job, to complete the installation in accordance with the specifications and to assure the specified results.

For jobs requiring reduction or complete elimination in the transmission of noise from one room to another, the USG System of Sound Insulation and USG Insulative Doors are employed. For the absorption of noise within the room in which it is created and for the correction of acoustical conditions in auditoriums, churches, theatres, and other public buildings, Sabinite Acoustical Plaster, or Acoustone, the USG Acoustical Tile, is usually prescribed.

Acoustone is a scientific sound-absorbent—light in weight and possessing a texture that resembles travertine. It is easily and quickly installed on new or old walls and ceilings without interruption to business. Supplied in a wide variety of shades, shapes and sizes, it readily lends itself to any architectural or decorative scheme.

Samples of Acoustone, a description of its uses as well as an explanation of the cooperation which is available to you on any problem in Architectural Acoustics, will be sent upon request. Please address the United States Gypsum Company, Dept. 28N, 300 West Adams St., Chicago.
A MONUMENT TO MODERN METHODS

In Cincinnati, on a lot that originally sold for eight dollars, a fourteen million dollar structure is rearing its 47 stories upward toward the clouds.

Embodying every advance of architectural and engineering science, this magnificent building will stand as a monument to the modern progress of America.

Playing an important part in this progress—enabling the successful development of plans—is American Steel & Wire Company Wire Fabric (the steel backbone of concrete).

Recognized as the most efficient and economical means of concrete reinforcement, this product is in general use throughout the nation. An evidence of interest on your part will bring detailed information and literature.

The specifications of every office and loft building requiring 10,000 sq. ft. or more of direct radiation should call for heating "Controlled-by-the-weather" with a Webster MODERATOR System of Steam Heating. This new development is heating typical modern office and loft buildings with results which warrant investigation. For details write Warren Webster & Company, Camden, New Jersey.
EQUIPPED WITH CRITTALL WINDOWS—
THE WOODBURY COUNTY COURT HOUSE

Designed in the modern spirit, the Woodbury County Court House at Sioux City, Iowa, is an interesting example of the use of Crittall Casements in new-style architecture. In the window treatment, full advantage was taken of their straight, narrow lines and angular steel construction—with the result that the casement installation is not only striking in effect but also in complete harmony with the character of the building.

Crittall Casements can be used just as effectively with many other styles of architecture. Their simplicity of design makes their range of application practically unlimited.

Manufactured in three separate and complete lines, Crittall Casements are available in a wide variety of types and sizes. Norman and Stanwin Casements are offered in standardized units—while Universal Casements are custom-built in steel or bronze to meet the architect's own requirements.

See our complete catalog in Sweet's—pages A1131 to A1200—for specifications. Separate copies may be obtained upon request.

NATCO FITTED GLAZE VITRITILE
NOW OFFERS A NEW MEDIUM OF EXPRESSION TO ARCHITECTS

Fitted Glaze - A Pledge of Permanence

New fields of color composition, color harmony, are open with the advent of Natco Fitted Glaze Vitritile. The comprehensive line of structural units, suitable for interior or exterior walls and partitions, are painted with flame into beautiful luminous matt whites, striking blacks, and seven delightful and unique mottled effects, ranging through cream tans and cream browns.

Beautiful When Installed— the Beauty of this New Material Endures

The Natco Fitted Glaze process, scientifically developed, is a pledge of permanence. The glaze is as permanent as that on the finest English Glazed Brick—the standard of excellence in materials of this type.
NATCO Frittéd Glaze represents the successful culmination of a determined attempt to produce a glaze so permanent—so impervious—so immune to the destructive agencies of time, the elements, chemical attack, staining, checking, and crazing—that it will easily meet the most exacting requirements. The fritted glaze process is the most effective method science has devised of holding, crawling, peeling, blistering, cracking and pinholing to a microscopic minimum.

Tests and experiments early disclosed that the ordinary processes of raw mixing, spraying, and kiln-burning which are in common use were powerless to attain these ideals. Only by the scientific fritted glaze process could they be realized.

NATCO's frit is made of a number of various compounds, which are mixed, melted at 2300°, chilled and then ground to an impalpable powder. This powder represents a new and homogeneous compound, which melts at a much lower temperature. The successive coats of glaze material (sometimes as many as 7) are applied to the tile on a patented "G Mottling" machine, developed by a ceramic expert. This machine does its
SEVEN MOTTLED EFFECTS

work with absolute precision, substituting for the uncertainties of makeshift methods un­varying excellence of results. When the tile is kiln-burned, the frit causes the glaze to mature at a lower temperature; form a more intimate bond with the tile; give—because the various elements have been pre-melted, instead of merely fused, together—more uniform results; and yield a silica glaze equivalent to that on the finest English glazed brick—the accepted standard of excellence. Colors are prepared in the same pains­taking, scientific way. Instead of merely mixing a dye-powder with the glaze, Natco utilizes calcined colors; the various compounds required to produce the desired shade are blended, burned, wet-ground and the resulting powder screened, before it is added to the glaze. Color variation is thus reduced to a minimum.

The added care needed, the added expense, of the scientific Natco Fritted Glaze process is abundantly justified in the increased service, the assured satisfaction, the well-founded confidence that Natco’s product offers to the user. Fritted glaze is a triumph of the ceramic art, a pledge of permanence to you.
The architects' cry for a new brick unit will soon be answered. Natco Vitribrik, shortly to be introduced, will offer a brick twice the height of the present standard. Its face will be finished in a beautiful and permanent salt glaze, which resists all agencies of destruction. Watch for the announcement, soon to come.

Natco Fritted Glaze Vitritile
For Permanent Walls of Enduring Beauty

EXTERIOR USE

THE calcined colors and fritted glazing of Natco Fritted Glaze Vitritile are prepared by a scientific process, then are fired in, making them immune to acids, to all to the attack of the elements. The most striking effects be obtained through this material and the effect will end year after year with no decrease in attractiveness.

INTERIOR USE

Beautiful, colorful finishes, hitherto obtainable only through costly decorating, now can be built into the wall. Instead of being faced with the necessity for frequent redecorating, the owner has a wall finish that will last as long as the building itself. Dirt will not harm it, acids will not affect it. The hard fritted glaze repels dirt, is easily cleaned and kept clean.
From Noon to Dawn Oak Flooring
Keeps This Dining-room Looking Its Best

With more engagements than the season’s favorite deb, the Locust Room is dined and danced each day from noon to dawn. It is the most popular of all the private rooms in the Penn Athletic Club. And being adaptable (by means of sound-proof rolling walls) it often does duty in five ways at once. Luncheons, bridges and teas, dinners and receptions, dances and suppers are on its daily program. And it must always look its best!

That it might keep its very best foot forward, the architects specified floors of oak. This wood has a strength that counts its time in centuries and never has been known to tire of dancing. And then, its rich warm beauty is always the most becoming background for soft velvet and candlelight or crystal and smooth satin. In every sense it is a floor of quality and, like all things genuine, is sure to gain in character and grow more lovely with the years.

While this floor was chosen first for its strength and beauty, it also proved to be the most economical, both in terms of price and future up-keep. It was indeed a sound investment from every point of view. . . . If you have a problem such as faced these architects, the engineering staff of the Oak Flooring Manufacturers Association of the United States stands ready to help you in every possible way. Address, 1887 Sterick Building, Memphis, Tenn.
SOUND ISOLATION completes our Acoustical Service

Johns-Manville now offers architects a complete service covering every problem of Sound Control

The Johns-Manville Corporation announces to the Architectural Profession the addition to its acoustical service of the J-M System of Sound Isolation, formerly known as the Stevens System of Sound-proofing.

Not only does the J-M System of Sound Isolation function effectively in reducing or eliminating sound transmission through floors, ceilings or partitions but it is also of great value in the construction of antivibration platforms. Such equipment as blowers, motors, ice machines, motor generator sets and elevator machines may be isolated by the J-M System so that resulting vibrations are not transmitted through structural members to other parts of the building.

With the addition of this thoroughly tested sound isolation system it is now possible for Johns-Manville to offer a complete acoustical service. Whether your problem is acoustical correction, sound quieting within a room, or a system of sound isolation, we will be glad to work with you to provide an effective solution. Representatives of our Architectural Service Department will be glad to confer with you at your convenience.

Address Johns-Mansville, 292 Madison Avenue, New York, or at any of the other cities listed below.

SAVE ON YOUR MASONRY

BETTER masonry at less cost has made Brixment the world's largest-selling mason's cement:

[1] It costs less than the portland and lime required to make an equal amount of mortar.

[2] No soaking, no slaking. Ready to mix by hand or machine.

[3] Saves bricklayer's time because it's easier to spread and sticks to the headjoint; its unusual plasticity and convenient set help him in striking joints.

[4] Reduces labor in cleaning down the wall because it doesn't slop down over the face of the brick. Louisville Cement Co., Incorporated, Louisville, Kentucky.

CEMENT MANUFACTURERS SINCE 1830

Pouring Bronze...for Flawless Castings

Scientific foundry practice bulwarks Jenkins Valves against the blows of hard service. Metal is poured at the proper temperature to assure castings free from imperfections... Jenkins Valves are manufactured throughout to provide long-term performance characterized by definitely low upkeep... Jenkins Bros., 80 White Street, New York; 524 Atlantic Avenue, Boston; 133 North 7th Street, Philadelphia; 646 Washington Boulevard, Chicago; 1121 North San Jacinto, Houston, Texas; Jenkins Bros., Ltd., Montreal, London.
The modern builder has to plan bathrooms carefully. These days, home and apartment hunters look at that room first. They assume that the plumbing system is efficient. But they want to see for themselves that color, design, and style of fixtures are right—that fittings, down to the last detail, are in complete harmony. Mentally, at least, they may decide to buy or rent right then and there.

When you specify Kohler brass to the builder, you specify fittings built for positive, silent action—divided into three complete groups that meet every taste and pocketbook. The Octachrome series, with clear-cut octagonal lines, includes the latest and most exclusive Kohler designs. Dynamic patterns have rounded, flowing surfaces, and come at a lower price level. The Continental designs have handles and escutcheons of vitreous china, and are still more moderately priced.

Here, every ounce of brass has a purpose

Kohler brass fittings are superbly constructed. The metal is real red brass, with a high virgin copper content. The heavy plated chromium finish, easily cleaned, looks like fine silver; nickel and gold finishes are equally beautiful. No waste material takes up space on Kohler brass-ware—no little gee-gaws that add nothing to the efficiency and ease of operation. Free passageways, ample clearances, and water-tight joints, together with advanced design, make Kohler fittings unusual for their combined utility and style.

Kohler fittings ordered with Kohler fixtures mean that the fittings will fit. Kohler Company. Founded 1873. Kohler, Wis. —Shipping Point, Sheboygan, Wis.—Branches in principal cities. Look for the Kohler mark on each fixture and fitting.
A strikingly similar development traces the history of architecture—the development from piled-up blocks of stone to the vaunting skyscrapers that defiantly pierce the skylines of our modern cities.

Buildings of solid masonry soon met a limit in the upward climb made necessary by ever-increasing needs for expansion and advancing values of land. Then came Structural Steel—to create the skyscraper—to carry construction to the almost unbelievable heights to which our modern buildings rise. Steel is ready to serve you—fit and able for the march of architectural progress.
National Bonded Jacketed Square Boilers

Through the Arch to Efficiency

Through the hottest part of the flames the arched crown-sheet curves, providing an abundance of the prime heating surface essential to prime heating results. The flaming gases are drawn to the rear of the boiler—rise up into the two side flues—swirl along the long path to the front of the boiler—then swing back through the central flue to the smoke outlet. Every inch of the exceptionally long fire travel decreases fuel consumption, increases efficiency.

This boiler is designed to perform efficiently with all leading types of fuel; coal, coke, oil and gas. It can be converted on the ground to meet the individual requirements of the fuel selected. Engineering design scientifically coordinates every part to produce economical combustion and thoroughly satisfactory heating. The National Boiler Bond, furnished with each boiler, not only guarantees workmanship, materials, and design, BUT MOST IMPORTANT OF ALL SPECIFIES AND GUARANTEES BOILER PERFORMANCE.

The illustration, taken from our A.I.A. Catalogue, shows one of more than twenty ways in which Orange Extruded Aluminum Screens are fitted to existing sash.

They Solve Special Screening Problems

As In Banks and Churches

WHERE ventilators are placed high in windows of banking rooms and auditoriums Orange Extruded Aluminum Screens are permanently fly-tight and trouble free. They do not rust out nor stain the mullions or sash. They often stay up winter and summer and last indefinitely with scant attention.

For aluminum will not corrode. It gives off no discoloring salts. The frames are made of solid extruded bars, welded at the corners. They never warp and are not easily bent out of shape.

And because we have screened so many odd openings, our men know how to meet every screening problem in a practical way.

In the Home—a Dumb Waiter to carry food trays, linen, laundry, waste baskets and countless other household loads—a Fuel Lift to carry wood and coal—a Trunk Lift to carry luggage, chairs and other bulky loads—an Invalid Elevator to carry the invalid, aged or infirm from floor to floor.

In the School—a Dumb Waiter to carry books and supplies up or down, also for food and dish service in cafeteria or lunch room—a Sidewalk Elevator to lower supplies and for ash removal.

In the Bank—a Dumb Waiter to carry checks, ledgers, memos and currency—a Sidewalk Elevator for ash removal and conveyance of supplies to basement vaults.

In the Hospital—a Dumb Waiter to carry food, supplies, linen and laundry—a Hospital Elevator to carry patients between two or three different floors.

In the Restaurant—a Dumb Waiter to carry food, dishes and supplies—various types and various sizes—a Sidewalk Elevator to remove ashes or waste and receive supplies from sidewalk level.

SEDGWICK MACHINE WORKS
158 West 15th St., N. Y.
Once you have specified rust-resisting Reading 5-Point Pipe, make sure that it remains in your specifications. To substitute inferior pipe on the basis of first-price alone is to strike at the arteries of your building—to make it obsolete before its time. Over and over again, Time—That Tough Old Tester has proved that inferior pipe means higher operating cost: per year of service—constant repairs—probable replacement of the entire pipe system within a relatively short time.

Reading 5-Point Pipe, being made of the original Genuine Puddled Wrought Iron, repays its first price many times by insuring freedom from pipe replacement throughout the entire life of the building. Whatever else you cut, let this long-lasting pipe remain—the greater life-span of the building will approve your wisdom.

READING IRON COMPANY, Reading, Pennsylvania

The Economy of High Quality

The superfine, the thing built as well as men know how to build, is frequently the economical thing to buy.

It is with panic devices.

The new series genuine Type "B" Von Duprins, for example, cost somewhat more to buy. It is expensive to build as we build these devices—with the best materials we know and with every working part tremendously overstrength.

But during the life of the building, this higher first cost is far more than offset by the almost complete elimination of upkeep expense.

To secure these superlatively fine devices, specify them separately from the finishing hardware and, of course, by name. Thus you foster clean competition, since all reputable dealers can buy these devices at the same fair prices.

VONNEGUT HARDWARE CO.
Indianapolis, Ind.

Listed as Standard by Underwriters’ Laboratories
The Standard Association Symbol rolled on rail steel reinforcing bars produced by the member mills listed below, positively identifies material meeting quality requirements of specification A16-14 of the American Society for Testing Materials—a standard grade reinforcement universally recognized and having a background of twenty years successful use in the world's finest concrete structures. Architects and engineers can specify this mark as an assurance of standard certified quality.

**LIME Safeguards this Bridge!**

The effect of impermeability on the permanency of concrete structures is of even greater importance today than strength and rigidity.

The problem of water-tightness is especially serious in such structures as dams, reservoirs, aqueducts, bridges, piers and abutments. Hydrated lime used as an admixture in the Belle Isle Bridge has made this concrete structure water-tight and thus assured its permanency and safety.

Due to the unusual length of this bridge—nearly 2,200 feet—a tremendously large area of concrete must be protected from the destructive influences of water, weather and extreme temperature changes.

By the use of five pounds of hydrated lime per sack of cement a denser, richer, more uniform concrete mix was secured, which prevented separation of the aggregate during placing and eliminated honeycombing, which so often leads to disintegration of the finished concrete work and corrosion of the reinforcing.

In actual field practice it is rarely, if ever, possible to produce concrete equal to laboratory specimens, but an admixture of lime has so consistently demonstrated its value in overcoming field difficulties that it is regarded as the most efficient integral water-tightening medium for concrete.

This statement is not based upon the results of one operation but upon hundreds of concrete structures of every size and type throughout the country.

The National Lime Association has just published a booklet giving authoritative test data and practical field results with lime as an admixture in concrete.

Write today for your copy.

---

**National LIME Association**

An organization of leading lime manufacturers formed to encourage a better appreciation of the economic value of lime in all its uses.

SPECIFIED FOR USE
in Many of the Nation's Prominent Buildings

IT IS significant that G&G Ash Removal Equipment has been selected for use in many of the most important buildings in the country. Architects have through the years shown a growing preference for G&G Equipment for all types of structures where ashes must be removed from cellar to grade. Here are a few of the better known buildings served by G&G Ash Removal Equipment:

UNITED STATES CAPITOL, WASHINGTON, D.C.
INDEPENDENCE HALL, PHILADELPHIA
U.S. CHAMBER OF COMMERCE, WASHINGTON, D.C.
AMERICAN ACADEMY OF ARTS & LETTERS, NEW YORK
HOLLAND TUNNEL BLDGS. (2 HOISTS), NEW YORK
CORCORAN ART GALLERY, WASHINGTON, D.C.
MUSEUM OF THE AMERICAN INDIAN, NEW YORK
COLUMBIA PRESBYTERIAN MEDICAL CENTER, NEW YORK
BIRTHPLACE OF THEODORE ROOSEVELT, NEW YORK

1,054 schools, 612 banks, 188 Bell Telephone Buildings, use G&G Ash Removal Equipment. The list of satisfied users covers almost every building classification. Electric and hand-power models to meet varying conditions, but all noted for their outstanding economy in operation, positive safety features and extra long life. Our Engineering Department will be glad to work with you on your next project.

Catalog in Specification Data, 1930 Ed., pp. 230-231

GILLIS & GEOGHEGAN
548 West Broadway
New York, N.Y.
Once again the architects have selected Halsey Taylor Drinking Fountains to safeguard the health of Uncle Sam’s employees. Not only in the government buildings at Washington but in the majority of this city’s fine schools, Halsey Taylor Drinking Fountains are the logical specifications.

The Halsey W. Taylor Co., Warren, Ohio

Halsey Taylor Drinking Fountains

Halsey Taylor fountains are distinguished by practical, automatic stream control and two-stream projector. Water is always at uniform height regardless of pressure variation and the drinking mound is such that it is impractical for lips to touch source of supply.
Where does your job as an architect end? Is it finished when structural details are complete, or do you go further and make very definite suggestions for decoration? Many architects have decided in favor of the latter, and have won new clients and pleased old ones by so doing.

Consider the entrance hall shown here. If the architect had retired content when the walls were up, it might have suffered by inadequate decoration. By staying on the job, he made sure of a finished work that reflected nothing but credit upon his ability.

The decorative effect is based upon one of the newest Armstrong designs (Marble Inlaid No. 172). No matter what type of interior you plan, you will find some Armstrong Floor well suited to the effect you wish to create.

By specifying an Armstrong's Linoleum Floor, the architect assured himself of the client's satisfaction from a practical as well as a decorative point of view. An Armstrong Floor is easy to clean, enduring in service, and comfortable under foot.

There's a lot of usable floor information in our new file-size specification book. Sent with colorplates and samples of modern linoleum upon request. Look for us in Sweet's. Armstrong Cork Company, Floor Division, Lancaster, Pa.

Armstrong's Linoleum Floors

Armstrong's Linoleum Floors for every room in the house

Plain • Inlaid • Embossed • Jaspé • Printed • Linotile • and Armstrong's Cork Tile

This Armstrong Floor (Marble Inlaid 172) furnishes the keynote for the whole decorative scheme. The floor in the outer hall is plain linoleum with a special star Linoset of contrasting color.
Albert Kahn, Inc. selects Libbey-Owens-Ford Glass

The reputation for unvarying high quality that Libbey-Owens-Ford Glass enjoys is directly due to the exclusive process by which it is produced, and to the purity of its ingredients. Libbey-Owens-Ford maintains a rigid and exacting control over these two factors, to the end that Libbey-Owens-Ford Glass will always be of a higher quality, truly flat, clean and clear — with a brilliant, sparkling and enduring lustre. To achieve the utmost in window beauty always specify Libbey-Owens-Ford “A” quality glass.

Libbey-Owens-Ford Glass Company, Toledo, Ohio
Manufacturers also of highest quality Polished Plate Glass and Safety Glass for automobiles

Allegheny Ave., Phila., Pa.
Architects Adopt This Positive Method of Insuring Great Facades

THE Cowing Joint is installed in the columns and weight carrying mullions at a mortar course. Its purpose is to relieve pressure thrown on the facing material by compression of steel, temperature changes, vibration and wind stresses. Experience has proved that these severe stresses, unless relieved, will crush and break the stone, terra cotta or marble.

Where the Cowing Joint is installed at each story height the building is completely insured against cracks and spalls, the mortar joints are protected from crushing and the maintenance cost of tuck-pointing is eliminated. The facade is in no manner weakened because the Cowing Joint carries the normal weight of the facing material and compresses only enough to relieve the stress.

See "SWEETS" Catalogue
Cowing Pressure Relieving Joint Co.

Chicago, Illinois

Houses must be screened...yet the architectural beauty, so carefully planned and executed is often marred with screens.

And so unnecessarily, for Higgin Screens can scarcely be seen. They're visible only as an accentuation of the harmonies you have planned into the building. Their narrow metal frames and invisible bronze mesh admits the maximum light and air...yet not an insect can get in!

Every opening: windows, doors, porches...are given individual study by the Higgin Experts. Let the Higgin representative in your locality work with you...he knows screens as you know architecture.

Keeps Food and Dishes Hot... Dries Towels

If you wish to give clients the "last word" in modern pantry design, specify the Prometheus Electric Plate Warmer.

The Prometheus keeps food hot at a minimum cost as it is thoroughly insulated. Doors are of double construction, filled with asbestos. Space between the walls is thoroughly insulated. That also keeps the exterior cool.

Has a three-heat switch. Cannot overheat. A thermostatic cut-off can be furnished to disconnect current automatically if left on accidentally. Pilot light shows whether current is on or off.

Has a beautiful finish. Trim is heavily chromium plated and polished. Doors are vitreous porcelain when white finish is desired. Will not crack or turn yellow. Shelves are removable for cleaning.

Heating elements last indefinitely, but if accidentally damaged they can be easily and inexpensively replaced. Built in many models.

Approved by National Board of Fire Underwriters.

Write for catalog, or mail the convenient coupon.

Town State
Many things have changed since Mr. Jones' youth. Even Doorways are not what they used to be—for Standing Trim is now no longer necessary. A comparatively new method eliminates the need—a method new in principle, but proven on countless important installations.

The Kalman Steel Buck (with or without integral Jamb) permits the clean, simple lines of marble slab construction without thickening the plaster for returns. A perfect bond is provided with the other elements of the wall structure, resulting in unity of action, and eliminating plaster cracks. A definite ground and termination for plaster is obtained.

If interested in this new and attractive method of constructing doorways, we shall be pleased to send our file folder on the subject.

THE GUARANTEED WAY TO HARDEN CEMENT FLOORS

We Guarantee Every Sonneborn Job

If our inspection shows a floor is not so greatly deteriorated that a good hardening job is still possible—if Lapidolith, the original concrete floor hardener, is used—if a Sonneborn Service Crew applies Lapidolith—we guarantee such floors to remain wearproof and dust-proof for a period of years, dependent on specific conditions of use.

IN your client’s behalf you are interested in getting a concrete floor hardening job that will give long and satisfactory service. A Sonneborn job will give you such service.

But unless you insist on Sonneborn doing the hardening the chances are that low price will win the order, and at the prices that concrete floor hardening material can now be bought, there can only be one result—quick and lasting dissatisfaction.

Architects who are interested in jobs that will stand up, will realize the ultimate economy and service of intrusting hardening work to Sonneborn, who guarantee every job, and stand behind their guarantee, and always make good.

The Sonneborn Method calls for the use of Lapidolith, the original concrete floor hardener, and for the correct application of Lapidolith by a Sonneborn Service Crew trained to apply Lapidolith in the right way and in the proper amount.

We are prepared to quote a price in advance direct to the architect so there can be no misunderstanding between architect and contractor about the cost of the work. We can compete on price but do so reluctantly, because we cannot give at a low price as fine a job as that which is possible to supply at a fair price.

To get a job that will reflect credit on the architect and contractor by lasting for years, specify Lapidolith to be applied by Sonneborn under guarantee.

**It** may now almost be said that man is "burning daylight." Darkness—feared by primeval man has today been completely conquered. The torch, the candle, the oil lamp, the gas burner, the electric bulb, the ordinary lighting globe, and now Celestialite have each marked successive stages in man's struggle to conquer darkness. Another great stride forward has been taken in man's efforts to imitate the absolutely perfect light of the Sun.

Celestialite is made to transmit a light which is a very pleasing imitation of daylight. Celestialite gives a soft, but powerfully revealing light, pure white, and restful to the eyes. Under it your eyes see better, your mind and body both work more effectively because—perfect lighting stimulates both physical and mental activity.

Architects Everywhere are recognizing the advantages of Celestialite and are recommending it for houses, office buildings, schools, hospitals, chain and department stores. For further information mail the coupon.

Cast Iron Verandas
by
Smyser-Royer

Enchanting Colonial Designs

The enchanting atmosphere of colonial days is being revived in many modern homes with cast iron verandas as charming and as quaint as the originals themselves.

Almost a century's experience in producing ornamental iron work insures the authenticity of the designs by Smyser-Royer Company. Some of these designs are almost a century old. Architects and builders who are contemplating the use of cast iron verandas are cordially invited to consult Smyser-Royer Company about any phase of design or execution.

A booklet showing many veranda designs in detail will be gladly sent at your request.

VERMONT MARBLE

"A GOOD JOB"
FROM the architect to the lowliest laborer, every man that works on a building construction job knows and feels the spirit in which it was conceived. A fish-eyed foreman can take a couple of pulls at a wicked pipe and say a few words of contempt that tell the whole story. Or a stubby mason may squint appraisingly at the lines of a building and grunt, “Good Job”, and no further conversation is necessary.

This million-dollar clinic started out to be a masterpiece. Donor, architect, builder, everybody concerned aimed at perfection. Calking—effective calking—just naturally had to be done as a guarantee of permanent worth. Pecora Calking Compound was installed by the Ev-Air-Tight Pneumatic method.
Pecora Calking Compound is made by the manufacturers of Pecora Mortar Stains—the pulp mortar colors.

PECORA PAINT COMPANY,
Sedgley Avenue and Venango Street, Philadelphia.
Please tell me why a building isn’t completed until it is calked. And give me full information on Pecora Calking Compound.

Built for kitchen duty

... this lifetime sink

of Monel Metal

The custom-made Monel Metal sink illustrated is a splendid example of the advantages of this silvery Nickel alloy in kitchen sink construction. With its washing and rinsing bowls, its corrugated drain-boards, all of satin finish, heavy gauge Monel Metal, it represents the utmost in sink attractiveness, convenience and durability.

Heavy gauge Monel Metal is customarily specified for kitchen sinks because it combines modern beauty and ready cleanability with rugged wear-resistance. Strong as steel, with no coating to chip or wear off, it resists the denting and abrasion encountered in hard kitchen service. It can never rust—and it defies the corrosive attacks of food juices and cleaning compounds. A Monel Metal sink can be kept spick and span with minimum cleaning effort.

Because its crisp, silvery beauty is so perfectly in keeping with modern trends in kitchen design and appointment, leading architects are now specifying heavy gauge, satin finish Monel Metal kitchen sinks for many of the finest residences they plan. Let us send you complete information on household uses for Monel Metal.

Write for New Booklet, "Planning the Modern Kitchen".
A mark of a well-planned home

Among the important features of a home which contribute to the ease and comfort of the occupants is telephone convenience... that modern note which should be considered in the early stages of planning for a new home or remodeling an old one.

Planning in advance the provision for telephone convenience in a house makes possible the placing of conduit within the walls and floors during construction. This improves the interior appearance by concealing the telephone wiring; insures against certain kinds of interruptions in the telephone service; and provides for complete convenience by making telephone outlets available in all the important rooms. The occupants can use whichever outlets they wish, and can easily expand or rearrange the telephone service to meet their changing needs.

Your local Bell Company will gladly help you plan the telephone arrangements for new and remodeled residences. There is no charge. Just call the Business Office.
AR-KE-TEX TILE IS EASILY ADAPTED TO INTRICATE PLANS

WALL plans calling for unusual window openings of varied height or with irregular and broken areas, present no difficult problem for the application of AR-KE-TEX Tile. A conference between the architect, the contractor and an AR-KE-TEX Tile representative in advance of the starting of construction, will often speed up work and save labor and material.

AR-KE-TEX Tile is hard burned, otherwise it would not be impervious to moisture, acids, alkalis or grease. But it is not too hard to cut easily with proper tools. In fact, any type of cut which it is possible to make with a saw in any other material, can be made in AR-KE-TEX Tile right on the job.

Horizontal or vertical cuts, mitres andmortises can be made easily and quickly. Some of the cuts which are used frequently in construction work with AR-KE-TEX Tile are shown here.

AR-KE-TEX Tile representatives are prepared to advise any contractor where to secure one of several types of portable saws adapted to do satisfactory work.

COLORUNDUM

For Coloring and Armor Plating

Cement Floors
When the Floor Is Laid

What It Is
And Does

IT'S a something that does five things at the same time. Does five, each one as well done as if done by itself. It Colors, Armor Plates. Dust-Proofs. Water-Proofs. Gives a Non-Slip surface. The one material does all five with but two operations.

As for looks, the colors are full bodied and non-fading. Lime or light has no effect. Beautiful mottlings, or blended duotones can be obtained by using different colors of Colorundum in trowelling the second coat. The resulting surface is glass smooth. But contrary to the logical happening, it's also non-slip. The fused aggregates self clinched into it's surface do that at the same time they armor plate against wear.

Made in 4 Colors
Red, Brown, Green, French Grey.
One price for all four, even to the green.

"Will it do the job?" is no longer the deciding factor in the choice of acoustical treatment for courtrooms, auditoriums, offices, schools, hospitals. Acoustics have passed beyond the first stages of development. Architects know they can supply the desired sound absorption in any one of a dozen different materials.

But put the material to the final test. Is it incombustible? Easily cleaned? Durable? Can it be refinished without loss of absorption? Is it decorative? (Most important from a standpoint of design.) With Acoustex, the answer to these questions is "yes." Meeting this test, as Acoustex does, establishes it as first choice for your acoustical correction.

MURPHY FINE FINISHES
Famous for 65 years among architects, master painters, and makers of products requiring a fine finish

A beautiful and lasting varnish...

This fine bank building was finished throughout with Murphy Transparent Interior Varnish, which is standard among architects for a beautiful, lasting finish.

Murphy Transparent Interior was used on the doors of the old Waldorf-Astoria in 1893-4, when this famous hostelry was dismantled to make room for the 85-story Empire State Building, the doors, which in all these years have never been refinished, were found in perfect condition. 37 years old and still young!

There have been many experiences of this kind with Murphy Transparent Interior Varnish and they all go to show that the beautiful finish given by this varnish is enduring.

This building—the Ohio Savings Bank Building in Toledo—was designed by Messrs. Mills, Rhines, Bellman and Nordhoff, Architects. The painting contractors were Messrs. J. H. Aberst and Son.

Murphy Varnish Company — Members of the Producer's Council

NEWARK  CHICAGO  SAN FRANCISCO
MONSON ROOFING SLATE

The requirements for beauty, strength, and long life are perfectly satisfied in Monson—the finest type of unfading black slate. Mined and shipped directly from our quarries to the project, Monson is given the same careful supervision and inspection that our other slate receives. Since this splendid black slate costs little more than inferior slates to quarry and no more to apply, the architect may specify a high class roof of Monson without appreciably increasing the cost of the building.

ELECTRO-KABINET
(Eight Recessed Models)

NO BATHROOM is modern without this latest improved cabinet... already wired... four electrical fixtures all serviced from one outlet box... adds beauty to the bathroom... gives better lighted mirror and the EASY, ECONOMICAL INSTALLATION saves money. You will appreciate the convenience of installation of the Electro-Kabinet and your owner will welcome its unusual beauty and the saving in bathroom construction.

Guaranteed as to Material and Workmanship
Every Electro-Kabinet is guaranteed by the manufacturers to be free from defect in material and workmanship. Mail coupon today for illustrated literature and prices.

DEW attacks the PIPE COVERING behind every drinking water fountain

When DEW wins the fight, the pipe covering is ruined. Pipe chases must be opened and wet insulation replaced. Just some of the damages Novoid Cork Covering prevents.

WHEREVER warm air strikes a cool surface, it deposits moisture. Architects call it condensation. Gardeners call it dew. To grass and flowers it is a blessing. To the insulation on cold lines it is a constant menace.

Novoid Cork Covering insulates cold lines without fear of dew damage. Its close-structured cork body has no voids in which moisture can collect. It has none of the capillary attraction so common in fibrous materials. Outside and inside both covering and fitting jackets are coated with pure mineral rubber. Novoid Cork Covering is impervious to moisture.

The high insulating value of the cork keeps the outside of Novoid Cork Covering above the dew point. And because cork does not absorb moisture and lose its efficiency, Novoid Cork Covering is permanent. It is not subject to progressive deterioration which causes increasing line losses and gradual overloading of the refrigerating machines.

Novoid Cork Covering is made in all sizes of pipes and fittings and in thicknesses suitable for drinking water, brine and ammonia lines. For further information write to Cork Import Corporation, 345 West 40th Street, New York, N. Y.

Novoid Cork Covering FOR COLD LINES, COOLERS AND TANKS

Cold lines in the walls of your building face condensation as real as that which wet your lawn on summer nights.
Meeting the Conditions
By Meeting
the Requirements

It's not at all any concern of ours if you
incline towards cast iron or steel boilers
for any particular purpose. We make both.
So ours is an unprejudiced position. Our
only concern is, that you get the type
of Burnham boiler that best meets your require­
ments. Happily for you we make everything
from a hot water supply boiler to the big
welded steel ones.

Special circular on the welded
steel boiler now ready.

1. Burnham Round Sectional Cast Iron
Boilers—for small to medium buildings.
2. Burnham Square Sectional Cast Iron
Boilers—for small, medium to large heat­
ing requirements.
3. Burnham Welded Steel Boilers—
for jobs requiring 4,200 to 29,500 square
feet of direct radiation, at a pressure of less
than 15 pounds.

A lumber expert at your elbow to help you specify the best lumber for every building need

**GRATEFULLY** the lumber industry acknowledges a long outstanding debt to the American architect. Now, in partial payment, we place at his disposal expert assistance in the development of sound lumber specifications—
together with a practical method for securing faithful adherence to such specifications.

"Know the Lumber You Use" is a useful addition to the architect's working library. Consult it when writing lumber specifications.

To safeguard against deviations from your specifications, the National Lumber Manufacturers Association guarantees that all lumber bearing its Tree Mark symbol is exactly as marked thereon by the expert grader.

The interests of the owner are protected. The value of his property is enhanced.

Mail the coupon below and we shall send you the booklet, "Know the Lumber You Use." Additional booklets forming a valuable lumber library are also available. For a complete list of titles, check the coupon.

**National Lumber Manufacturers Association**
**Washington, D.C.**

**Offices in New York • Boston • Pittsburgh • Indianapolis • Chicago • Minneapolis**
**Kansas City • Memphis • New Orleans • San Francisco • Los Angeles**

**NINETEEN great associations affiliated with the National Association maintain supplementary information and service organizations. Guaranteed grade-marked Tree Mark lumber is available in all these species:**
- California Redwood Association, San Francisco, Calif. • Redwood
- California White & Sugar Pine Manufacturers Association, San Francisco, Calif. • California Pine, White Fir
- Hardwood Manufacturers Institute, Memphis, Tenn. • Oak, Gum, American Red Cedar, Southern and Appalachian Hardwoods
- North Carolina Pine Association, Norfolk, Va. • North Carolina Pine
- Northern Hemlock & Hardwood Manufacturers Association, Ogdensburg, Wis. • Hemlock, Maple, Birch and Northern Hardwoods
- Northern Pine Manufacturers Association, Minneapolis, Minn. • White Pine, Norway Pine

**Standard lumber bearing this Association's grade-mark available in these species.**

**Lumber shipments protected by Manufacturer's Certificate of Car Contents available in these species**

RADIATOR Attention
Banished

No longer need radiators require the attention of the room occupants. Hand-operated radiator valves are now being discarded for the more efficient automatic radiator valves—valves that let you forget the radiators. Not only do these latest devices keep the room temperature at the comfortable point at all times—they save steam and thereby keep heating costs very, very low. In fact, a Sylphon Automatic Radiator Valve will soon pay for itself in the amount of fuel saved.

Architects and engineers may write-in Sylphon Automatic Radiator Valves with the full assurance that clients will receive nothing short of miraculous performance. Our organization is behind this valve—it is built to our high standard of quality for which other Sylphon products are so well known. Write for bulletin No. RP-250.

AUTOMATIC RADIATOR VALVE

The Sylphon Automatic Radiator Valve is made in the angle and the globe valve types. The above bulletin not only describes these valves, but contains suggestions and drawings that should prove valuable to you. Write for a copy.

Announcing
A New Electric Dumbwaiter

—a development by Energy Engineers which, by its wide capacity for speed and load and its lower cost, broadens immeasurably the application of electricity to the vertical transit need.

PUSH BUTTON controlled from any floor to any other floor .... a new meaning of the word quiet in dumbwaiter operation .... a flexibility that economically permits installation for any capacity up to 300 lbs., at any practical speed desired, with the machine at top or bottom of the shaft .... but, above all, a new "over-powering" in every part which not only results in smoother operation with maximum load, but assures that smoothness for as many years as dumbwaiter service is desired.

Coupled with a new simplicity of design which makes possible its easier installation by the local contractor, you have in this new electric a dumbwaiter assuring permanent satisfaction without ordinary limitations as to use.

Complete description of this new dumbwaiter, showing the features of "over-power" and their advantages, on request.

WHEREVER A LIFT IS NEEDED
A WARM, RICH WOOD, WITH DELICATE GRAIN

... PONDOSA IS IDEAL FOR PINE PANELING

"I once heard a fellow who said you could do anything with children if you play with 'em. Pondosa Pine's like that. Sort of show it what you want an' it gets into the game with you—sawin', it cuts true an' easy; planin', it comes smooth an' even; paintin', it pretties up like a girl goin' to a party."
—From the philosophy of the boss-carpenter.

COMBINING structural, insulating and decorative values all in one, as it does, Pondosa Pine is especially suitable for knotty pine paneling. The grain is rich and delicately figured, with an infinite variety of knot arrangement. Pondosa takes a wide number of finishing treatments quickly and easily, using a minimum of material.

This good softwood is easy to keep clean, too, and actually becomes more beautiful as years pass. Up-keep charges are negligible. It lends itself, of course, to almost every architectural type... in Colonial or Georgian homes, with one or two rooms that must be faithful to the period... in houses, clubs, restaurants, public buildings and professional studios of Tudor, French, Spanish and Italian design.... With a low density cell structure, Pondosa affords natural insulation.

Used for remodeling work, Pondosa at once adds authenticity and charm. The familiar pine tree trademark, imprinted on "the pick o' the pines," is your assurance that every board has been manufactured according to the highest standards. Specify Pondosa by name. Most good lumber yards handle it. Western Pine Manufacturers Association, Portland, Oregon.
"Isn't your hardware heavier than necessary?"

Mr. Architect, ask that question of any of the thousands of users of Jamison and Stevenson Doors and you will get the same answer as I give you—"NO." The hardware has to be strong to give the right kind of service. And it has to be heavy in proportion to the strength needed. 

As a matter of fact, we offer a choice. If your conditions do not require the extra strength and protection offered by Jamison hardware, which guarantees against grief under the worst conditions, we offer you the Stevenson Door equipped with hardware as strong and serviceable as any procurable save that on the Jamison Door. Either Door is of strong construction and unequaled in service.

In the first place, Jamison and Stevenson hardware is right in principle—practically all cold storage engineers agree on that. In the second place, the strength of our hardware is largely responsible for the long records of uninterrupted service which Jamison and Stevenson Doors have established, and that means greater satisfaction and a lower cost per year for all our users.

We have had years of experience to guide us on the correct design.

Let me give you the benefit of this experience—

NEBRASKA STATE CAPITOL  
"THE SOWER"

In the memorial volume "BERTRAM CROSVENOR GOODHUE —ARCHITECT AND MASTER OF MANY ARTS." Lee Lawrie, Sculptor of "The Sower," says of Mr. Goodhue "—Enthusiastic, he always was, but while the Nebraska drawings were getting into shape, he was ablaze. For this Capitol, style is the wrong word—Creation it must be—a full, new expression at one bound. Sculpture here is not sculpture, but a branch grafted onto the architectural trunk." Hartley Burr Alexander adds "—impressions brought from many sources, enabled him when the flash came, to strike just the monumental note that is to make of the Nebraska State Capitol not only one of the most impressive structures in the world, but one of the most germane. The whole structure is like a gnomon of the plainsman's hours; it is simple as sun time and free as sun's space and is topped by the great image of "The Sower.""
WHEN WE published, in our July issue, our proposed educational document, “The Value of the Architect’s Services,” we did so in the full realization that as it stood it was imperfect. In fact, our object in printing it in the magazine was to place it before the entire architectural profession for criticism, hoping that we would get the benefit of the advice of many leading practitioners. We are pleased to say that many of them responded to our invitation and that the helpful comments they have sent us will be of inestimable value in revising the document.

On pages 753 to 756 of this issue we have printed a selection of the letters we received. We regret that space did not permit that they should all be included for they represent much serious thought on the part of architects who realize the vital necessity of educating the public to an understanding of the value of good architecture and of the architect as the instrument by which it is produced.

Curiously enough, some architects found the document in its published form to be a clear statement of the things to which they could subscribe and were willing to have it sent out to the building public without change. Others, however, felt that it should be considerably shortened by condensing it while others proposed that it be divided up into parts which could be mailed separately to prospective clients. Several men found that the tone adopted was a bit too pleading, as if we were trying too hard to justify the architect’s existence.

All of the points brought up are reasonable criticisms and with them as a basis we will proceed to make a thorough revision of the document. We suggest that architects and draftsmen take the trouble to read what has been said on pages 753 to 756, for the letters themselves contain a number of thoughts which are pertinent not only to the general problem confronting the whole profession but to the individual problems of every architectural office. Every architect should be well posted on all the available arguments he can employ in “selling” himself and his profession to a public which is lamentably indifferent to good architecture.

As a slogan, for example, we cannot better the suggestion of Mr. Pierre of Indianapolis who says, “GOOD ARCHITECTURE IS THE PRODUCT OF A GOOD ARCHITECT, A GOOD CONTRACTOR, GOOD CRAFTSMEN, USING GOOD MATERIALS.” Work on the revision of the document is now being done. The next time you see it, it will, we hope, come nearer to being satisfactory to a reasonably large proportion of the architectural profession for whose benefit it is being undertaken.
IN OUR OCTOBER ISSUE

IN AUGUST we inaugurated the practice of letting our readers know what was scheduled for publication in the following issue. It worked out pretty well, though we were hard put to it to get everything into this issue as announced and came very near having to leave some of it out to make room for news matter. We did, however, make it, and so we are going to be rash enough to give you a set-up for October. If we don’t live up to it, what with editorial vacations and such, please do not take it too hard. Remember, we’re doing our best.

FOR OUR leading article next month we have turned to the past and gone to one of the early masters of lithography for our subject. It will be remembered that several years ago we presented articles on the lithographs of David Roberts and Thomas Shotter Boys, both of whom have few peers as delineators of architecture. Now we have turned to the work of Eugene Isabey, one of the greatest artist lithographers of all time, for inspiration to present-day draftsmen. A number of his prints will be reproduced, and, since they speak eloquently for themselves, the text will be brief. We are sure that these examples of superb draftmanship and composition will surprise many of our readers who are not acquainted with Isabey’s work.

SINCE AT this time building is slack it behooves us all to consider ways and means of improving conditions and relations in the building industry which may make for economy. The slump cannot go on forever. When it does end, close cooperation between the various elements of the industry will be needed as never before to keep things going and to guard against further dull times. With this in mind we have asked John C. Hegeman, president of the Hegeman-Harris Co., one of the leading firms of builders in this country, to give you, in October, his views on the relationship that should exist between Architect and Builder. What he has to say is well worth considering, for he bases it on many years of experience working with architects on important nationally-known projects and has found that the best results are obtained for the client when architect and builder cooperate to the fullest extent.

PROFESSOR John Harbeson’s series of articles on Design in Modern Architecture has, if we are to judge from letters received from our readers, succeeded in helping to clarify in the minds of many draftsmen, designers, and students what is going on at the present day in the architectural world and what it really means. We discover from what he has to say that modern work, to be really good, must be based on the same principles of good design that underlie the good work of the past. Part 8 of his series will appear in October and will concern itself with architectural metalwork.

WITH THE October issue we bring to an end the series of delightful little stories by Rossel E. Mitchell of Washington which have been running under the general heading “Adventures of an Architect.” They have been full of the application of a simple homely straightforward philosophy to the everyday occurrences of architectural practice. Those who have read them all have not only been entertained, we venture to say, but have found therein nuggets of wisdom and common sense which could well be applied to their own practices. Those who have missed reading them might with profit go over their back issues and smile for a while with Mr. Mitchell.

MARTIN LEWIS, who has “arrived” as a painter-etcher of the contemporary scene, is represented on next issue’s frontispiece by a reproduction of one of his recent drypoints, “Building a Babylon.” This plate is a striking study in black and white of a building excavation in the heart of New York City as seen at night. By the way, we hope you have been liking this series of special frontispieces. If you grow vociferous enough about it the editors may be able to secure an appropriation sufficient to extend this feature for another year. If we don’t hear from you we will have to assume that something else had better be substituted.

OUR COLOR plates for next month include a rendering in black and colored pencil of a moderately large residence and a water color painting of the interior courtyard of Santa Maria Novella, in Florence. The rendering is by O. L. Schoeffler, a New York man, and is of interest as showing how effectively the delineator can make use of tinted or colored paper. The water color is the work of J. Olaf Olson, a painter who has achieved considerable recognition through his able handling of the medium. From the painter, who makes a much more thorough and intense study of color than the architectural delineator, the average draftsman and student can learn a great deal which will help him to improve his work.

THOSE INTERESTED in perspective will be glad to know that Ernest Irving Freese’s long awaited textbook on “Perspective Projection” is now printed, bound, and ready to be of aid to the draftsman who is striving to perfect himself in his art. By taking the vanishing point out of this difficult subject and by reducing the making of a perspective to a matter of straight projection from plan and elevation Mr. Freese has done a service which will be appreciated by many. The author states in the beginning of the volume, “It has taken two thousand years to produce this book.” We, as publishers, hope that it will be good for another two thousand! The material as it originally appeared in Pencil Points was thoroughly revised and amplified before it was made into the book.
ST. OLAVES, TOOLEY STREET
FROM A DRYPOINT BY HENRY RUSHBURY

PENCIL POINTS
September, 1930

Reproduced by courtesy of the Schwartz Galleries
ALMOST A SCORE of years ago, in those good old days when the average designer leisurely and confidently located a “crib” in Letarouilly, Mauch, or Meyer’s Handbook of Ornament—instead of frantically floundering through the latest flood of periodic cosmopolitan publications in a state of baffled bewilderment and high blood pressure—the placid small-town course of a young draftsman was abruptly and forever turned aside by that yellow peril—a telegram. With others, obedient to the kindly recommendation of Dr. Warren P. Laird, he had submitted examples of his work to a firm of architects in Montreal with the feeling and subconscious hope that it would not meet with favor. Instead came the command, “Come at once—if not sooner,” signed Francis S. Swales. This challenge, bringing about a contact for which the writer has ever been grateful, proved typical of the man.

The first impressions which that diffident newcomer to Montreal gained of Francis Swales still remain vivid. The tall, gaunt figure; the fine head, with determined jaw, softened by an “atelier” beard; and the keenly intelligent eyes, commanded instant respect. The kindly welcoming gleam from those eyes, the manly soothing voice, the frank unaffected manner restored self-confidence and inspired an affection shared by the whole office staff.

The staff that was housed in the fine old three-story stone building, which looked like a clubhouse, at 12 Beaver Hall Square, was a most interesting British-American group, made up mostly of men who had spent years with Francis Swales in Europe or the United States to which nucleus new men were being added. It recalls to mind many personalities to each of which I should like to devote a paragraph if space permitted. Eric Temple, Grosvenor, Arthur Carman, Mercil, John Taylor, “Jack” Lehti, Harry Wilkinson, Derrick, and young “Sam” Swales, brother to the power that was, are some of the names that linger vividly in the memory as belonging to outstanding individuals. Eric Temple, a grand and glorious Briton, saw just a bit farther than the rest of us—as far as 1914, to be exact. Delightful Arthur Carman, with his ubiquitous umbrella, proved not only that the English know their steel but that structural engineers can be quite human. It was more like one of the glorious guilds of the Renaissance or a Paris atelier than like an office. A squad of men would arrive from Europe or New York. A half dozen would be dispatched to a job on the Pacific Coast or elsewhere. Everything was bustling with activity.

Of the new men from the United States the writer and last, but not least, Ralph Walker finally joined the remaining numerous group. We were immediately made aware of his presence and of an institution referred to as M.I.T. The writer being a loyal Pennsylvanian, discussion naturally took place for the edification of the whole group. Even then, Walker had ideas—no matter whose. For instance, he claimed to have boiled down all known architectural plans into three parent types of which all others were variants; viz. the H plan, the U plan, and the T plan. With this formula he claimed to be able to solve all programs and planned an immediate onslaught in the major architectural competitions. Although we pointed out that, as far as architecture went, the three letters spelled “hut,” he was not deterred.

The writer claims the privilege of exemption from discussing his own foibles at this time. All of this made for a very happy group, with none happier than its patron, F. S. Swales.

At this time the office buzzed with the preparation of drawings for the millions of dollars worth of building that were to be constructed for the Canadian Pacific Railway, the Dominion Government and municipalities of Canada, and projects of Sir William Van Horne in Cuba. Amid this activity, ceaselessly moved the presence of F. S. S., day and night. He was equally interested in construction, engineering, design, or mechanical equipment, and showed the faculty of a true genius in following out a conception to the last detail, no matter how large the original idea, no matter how small the detail involved. He was equally at home with the engineering staff or the design staff and his ability was respected by both.

The writer—graduate of a great architectural school...
AN AUTOMOBILE CLUB—WINNING DESIGN FOR FIRST WASHINGTON UNIVERSITY TRAVELING SCHOLARSHIP IN ARCHITECTURE
WON BY FRANCIS S. SWALES IN 1903
and fresh from worshipful contact with that great teacher of design, Paul Cret—felt he had experienced the ultimate in design criticism. Upon graduation, the architectural career seemed to promise nothing beyond slavishly pleasing the varied whims of architectural plutocrats, whose taste seemed vulgar and debased beside the master’s, or else practicing on an uninitiated public a few imitations and tricks of architectural sleight-of-hand such as the tyro uses to cover up a lack of sufficient knowledge or training.

We noted with a shock of the keenest pleasurable surprise that Francis Swales sought the same distinguished white surfaces, relieved by chastely rich grays, the same simple, firm silhouettes, and the same high-tension curves which our great teacher had taught us to appreciate. The same logical analysis of a program was observed, the same regard for circulation and the importance of position of the various elements was emphasized. Such similarity of taste seemed a marvelous coincidence. Swales displayed such a mastery of composition in design that, without sacrificing one iota of our loyalty, we fiercely determined to be worthy of one who was putting into practice those principles we had been taught. We were to learn later that this similarity of taste was no mere coincidence but the result of the happy influence of a renowned French patron, Pascal, in whose atelier at Paris both Francis Swales and Paul Cret had studied.

To Francis Swales, leisure and social success in the commercial sense meant nothing; he loved his profession too much. In practice no human effort and no expense was too much to produce a satisfactory result. No study, no set of working drawings was ever too far advanced for him to sacrifice if he discovered an idea later that would improve the solution—structurally, aesthetically, or to the economic advantage of his client. The quality of the work produced was high and the training of his assistants profited because of the research and intensive study required.

Besides his comprehensive professional knowledge, his technique in draftsmanship and water color rendering were at once the envy and despair of those about him. Rapid and sure with pen, pencil, or brush, his lines or strokes were full of fine feeling. Spontaneous preliminary freehand sketch perspectives which fall somewhere between a thumb-nail sketch and a finished rendering were his most characteristic drawings. They presented the complete composition in all its essential elements but showed no more detail than an artist like Joseph Pennell or Jules Guerin would draw in picturing a completed building. He used a 4B lead pencil in making sketches of smaller buildings and details and usually drew on sheets of ordinary writing paper. Large buildings or groups
SKETCH DESIGN FOR MORTUARY CHAPEL AND CEMETERY ENTRANCE, COLUMBUS, OHIO, 1901

SKETCH DESIGN FOR CASINO AT ALGIERS, 1904

SKETCH DESIGN FOR A RESIDENCE AT PALM BEACH, FLORIDA, 1918
were drawn on large sheets in charcoal, pencil, and water color. Mr. Swales dislikes fixatif and since un-fixed drawings in soft pencil and charcoal were sure to smudge he smudged them in the first place, with his finger, as he drew. He preferred then, and still prefers, an impression to any semblance of the photographic in representation.

The poetic quality and fiery surety of his sketch criticisms showed that he possessed the quality of a real critic—the ability to analyze and synthesize, and to express the synthesis graphically in a representation filled with the promise of efficiency and beauty. Just a few days ago, with fascination as of old, we watched his clever fingers trying to keep up with his busy, fertile mind, evolving dozens of miniature sketches of plans, elevations, sections, and perspectives possessing that elusive quality "scale" and beauty of composition.

He encouraged his office to organize an atelier in which he unselfishly devoted much of his time to criticism, placing his own valuable library at the disposal of the students. He proved his quality as a teacher since the work of his students met with success in the B.A.I.D. judgments and the spirit of the Atelier Swales ran high.

Not only were we inspired by him to study in the atelier, but he opened up undreamed-of vistas for our future development. He fired our imaginations by recounting his own experiences as a student in architecture in the United States and abroad. His life was so brimful of architectural experience, his contact with members of the profession so wide and varied, that we gained from him an intimate knowledge of those great ones who had hitherto been only names to us. He wiped away our snobbish, academic provincialism. Through him we learned that truth in art may be sought and found in many different ways; that the self-made, atelier-trained man and the college-trained man could succeed equally well in the profession, depending on their determination to equip themselves properly. Through the modest presentation of his own experiences as a scholarship winner, he evoked and nourished in us a determination to compete until
denied the privilege. His accounts of the life and the brilliant achievements of the students of the École des Beaux Arts made us feel that we must enjoy this training.

It had been a great joy to work thus for an artist—but there was a penalty attached. Gradually there dawned a feeling of complete inadequacy and a sense of the foolishness of trying to design for one so far advanced—though one who never complained at the crudities committed. At times it would have been a relief if Francis Swales had complained, but he could not bring himself to chide one who was trying. His patient, helpful criticism, never given in a peevish way or spirit of contrariness, gradually made it clear that it was necessary to start again with a new point of view—to go back to school, to regard the criticisms of the master with a new insight, to acquire if possible that supertraining felt to be so necessary.

The parting was mutually reluctant—but there was also understanding. Patient saving and the award of a scholarship made a return to school possible. The germ planted by Francis Swales, the work done in his atelier, the added training at Pennsylvania brought about the realization of a dream—training abroad. His advice and experience never ceased to be an inspiration and it is a privilege to place before the readers of PENCIL POINTS an account of his career. Two large scrapbooks containing reams of data and reproductions of drawings, published photographs of executed work, etc., provide sufficient data upon which to construct a more complete story than can be given here of a lifetime full of study, travel, work, and adventure. Nearly everything that life can offer, whether in its refinements or on the battlefront of engineering, he has been able to enjoy. Many of the items of an immense experience have appeared in the anecdotes given in his articles upon the work of other architects and artists in PENCIL POINTS—but we digress.

Francis S. Swales, born in Canada of American parents, was reared and educated in the United States. Heredity and environment formed a uniquely favorable background for the rapid development of his natural talents in the field of architecture. His father, a building contractor of the old school, kept a joinery shop in the rear of the Swales home in Buffalo. Here old white-bearded English craftsmen and artists executed fine interior woodwork from architects' drawings and details. Constant contact with these activities from infancy made the keen young Swales so familiar with the various phases of the craft that, at the age of eight years, he was quite capable of reading and interpreting all types of drawings of carpentry, joinery, and building construction. Steel was just beginning to supplant wrought iron structurally and Mr. Swales can still recall how the various members had to be colored for identification—red for wrought iron and blue for steel. As far back as he can remem-
ber, architectural magazines came to his home and he followed the usual bent of children by copying their illustrations. Probably by reason of environment his interest did not wane; his efforts were continuous and his ability to draw grew apace.

In addition, his mother's father was a consulting engineer who, because his work took him wherever railways were built, had traveled a great deal in Europe and Asia and had resided several years in Paris. His descriptions of the cities and buildings he had seen, together with his accounts of the progress of Alfred Gilbert, an uncle of Swales, in his work as a sculptor at Paris and Rome, stirred the lad's imagination. Contact with architects who visited the shop enabled him to understand that an architect was an important person and he learned that Richard M. Hunt and Richard Upjohn were "great architects." After a chance acquaintance, Mr. Hunt, by reason of his genial and impressive personality, became such a hero to the boy Swales that, in his first years as an architectural student, he became furiously jealous of the rising and overshadowing reputation of the firm of McKim, Mead, and White.

From time to time later on, he was taken out to visit buildings in course of erection and material supply yards. He was sent as a messenger to architects' offices and soon made contacts with such men as D. H. Burnham, Louis Sullivan, and Bruce Price. He thus became familiar with the various phases of the building industry.

At the ripe age of eleven, a summer vacation spent as assistant to a timekeeper and clerk of the works of a theatre building brought a job of "inking in" a drawing for an architect. This resulted in a strong disinclination to continue at school and a desire to "see America first," which he gratified. About two years later, a visit to the office of Claude Bragdon at Rochester resulted in young Swales' determination to enter upon the formal study of architecture. He took up the courses available at the Rochester Athenæum, where his first instructor was Edwin S. Gordon, working in his free time in architects' offices. The architectural course, scheduled to require four years, was completed by Swales in less than two, by no great effort, although he did lose some sleep. He received his diploma and two first prizes at the age of fifteen.

Then followed a year of further preparation through the University of Rochester's extension courses in literature, civil law, electricity, and drawing from life under the tutelage of Harvey Ellis. Meanwhile he endeavored to "put over" a project for an exposition on the islands above Niagara Fails—an idea which finally led to the Pan-American Exposition at Buffalo. Shortly after this, a commission to design some houses brought Swales to Philadelphia. He
PORTION OF RENDERING OF HOTEL VANCOUVER, VANCOUVER, B.C.—FRANCIS S. SWALES, ARCHITECT
PRELIMINARY PERSPECTIVE DRAWING BY H. C. WILKINSON, RETOUCHED BY FRANCIS S. SWALES

PENCIL POINTS
(September, 1930)
PENCIL POINTS SERIES of COLOR PLATES

This plate reproduces a portion of a carefully rendered drawing of the Hotel Vancouver, interesting particularly as being the earliest modern setback building, designed in 1911. The drawing was done in pencil on mounted Steinbach paper and rendered with watercolor. The portion reproduced measured $8\frac{3}{4}$" x 11" on the original while the whole drawing measured 34" x 26". It is seldom that we see today such care expended in drawing the detail on a building.
joined the T-Square Club—that notable group of talented men destined to furnish the profession with so many distinguished practitioners—in the year of its incorporation. He was probably its youngest member at that time, and for his initiation submitted a rendered drawing of an elaborate Gothic screen in the Church of St. Ouen, Rouen, that was remembered for many years after.

That his talents were diversified is proven by the fact that at this time he won the prize offered by the Women's Educational and Industrial Union for an essay on civic improvement. He won the Third Annual Redesigning Competition of the T-Square Club with his design for a group of banks and office buildings which was awarded a Gold Medal at the Pennsylvania Academy of Fine Arts.

During the next five or six years Swales became known throughout the country by reason of continuous prize winning in competitions.

He became known in business and railway circles by reason of his energetic efforts to induce the cities of Philadelphia and New York to plan their waterfronts and civic centers and the railways to replan their terminals. He gained increasing professional prestige because he "had the luck to be with" firms of architects who won important competitions, as their designer.

During this time he had returned to New York and had entered the atelier of Masqueray, a highly reputed French architect and critic.

The comment of Mr. Swales, on his work and experience in Masqueray's atelier, is worth recording. He states:

"I worked out and rendered only two projects and three or four sketches and I experimented with the French student fashion of design upon some successful competition work during the next three or four years. Masqueray was strong in getting his students to comprehend relationships between plan and elevation, but the popular fashions in architectural motives among the students did not appeal to my preferences. Nevertheless, I was able to use all I learned in the atelier to my own advantage, particularly the ideas enunciated by Masqueray upon space necessary in planning for proper circulation outside as well as inside the buildings, of the accessories of landscape design, and of relations of heights to areas—in other words to think of the building as determining its entourage, and in terms of solid geometry rather than in two planes. I believe every man who came in contact with Masqueray gained a great deal from his happy humor. He was sincere in his work and had an honest and admirable hatred of pose and hypocrisy. Hence his dislike of registrationists, certificates, diplomas, etc.—in short, of anything by which an architect hoisted himself without real accomplishment. When I told him that I was going to Paris, he advised me against taking the school course. 'Study the art—you can get the rest here, and too much of it!' he said."

Success in competitions brought recognition. At the age of twenty-one, Swales became chief assistant to the firm of George D. Mason and J. M. Wood, at Detroit, and a year later he was admitted to partnership with Colonel Wood who specialized in theatres. Here he designed and supervised the construction of the Temple Theatre, the first of the modern type of American theatre, with the sides of the auditorium curved and carried over in the form of an elliptical ceiling to form a deep and low proscenium in which the step-down boxes were placed. He also made a design for the Majestic Theatre in Boston, proposing a plan without steps or stairs, with the balcony and parquet entrance from ramps leading from the street to the middle of the theatre. These ideas are today regarded as the most up-to-date features of theatre planning. The following year, through the influence of Mr. George D. Mason, then President of the Michigan Chapter of the American Institute of Architects, Swales was appointed by Mayor Maybury of Detroit to design the decorations of the City Hall and streets for
PENCIL POINTS FOR SEPTEMBER, 1930

FLEETWOOD, MOUNT VERNON, NEW YORK—THE FIRST STEP ADOPTED BY THE CITY PLANNING BOARD—FRANCIS S. SWALES, CONSULTING ARCHITECT

It is interesting to note that this drawing was made by Mr. Swales, freehand in soft lead pencil without the use of vanishing points.
the celebration of the Bicentennial of the founding of the city. These designs, for execution in "staff" on wood framing, showed a new note in the architecture of that time by introducing piers and plain surfaces, breaking the horizontal lines of the entablature and omitting the classical orders. Together with their freshness and daring, these designs show the power and restraint of an able designer.

On a leave of absence (during which Colonel Wood died) Swales went to St. Louis to become Assistant to the Chief of Design of the Louisiana Purchase Exposition, who was none other than his former patron, E. L. Masqueray. His services were engaged on the design of the Transportation Building, Colonnade of States, Restaurant Pavilions, Gardens, Bridges, and Monuments.

After a busy year spent in working for Masqueray on the Exposition he left this office and became chief designer to Messrs. Eames & Young, a prominent firm of architects in St. Louis. With this firm, and in his own student work, Swales was successful in placing first in nine competitions over a period of nine months. Such pronounced success by his pupil reconciled Masqueray to losing him. As chief designer for this firm, Mr. Swales designed the changes to the services of the St. Louis Terminal Station and also the Parkview Realty Developing Project, evolved the competitive design for the West Point Military Academy, which placed second, and created the successful competitive design for the Custom House in San Francisco.

The Parkview Realty Development had almost the extent of a city, and Swales' plan of the total scheme presented the first idea of garden apartments projected for city development, and planned with all rooms outside and overlooking gardens and boulevards.

The winning design for the San Francisco Custom House again suppressed the orders and made use of plain piers or vertical surfaces separating richly bordered openings. This was the first design in an American Government competition to be successful without the application of a classical order.

Not content with the success that was crowning his efforts, Swales pursued architectural studies at night at Washington University, St. Louis. That year, for the first time, the University offered a travelling scholarship in architecture on the same terms as the Rotch Scholarship of Boston. Six problems were required and Swales made the remarkable record of placing first in each closely contested competition. An amusing incident, serving also as a sidelight on Swales' character, took place on the final competition. The head of the department informed Swales when he turned in his extension building, seasonal hotels, and country clubs. His work took him to nearly every country in Europe and his commissions extended to Africa, China, and South America. He collaborated with D. H. Burn-

FRANCIS S. SWALES, ARCHITECT
Francis S. Swales—An Appreciation

Ham & Company of Chicago on the design of Selfridge's department store in London, for which he later designed, in association with his old friend Albert D. Millar, great future extensions for Mr. Selfridge while again abroad in 1928.

An interesting sidelight on Mr. Swales' influence upon the development of the Burnham Plan of Chicago appears from some letters contained in his scrapbook, written in the large, strong handwriting of D. H. Burnham. The letters refer to some critical magazine articles written by Swales and published in London at a time when the Plan of Chicago seemed likely to die of neglect. Swales so cogently urged its value to Chicago that it was again taken up by prominent citizens and the whole lake-front plan has since either been executed or its actual completion assured.

Mr. Burnham, upon having read Swales' articles, expressed his appreciation by writing, "What you say is entirely satisfactory and confirms the impression I have formed of your own manly fairness. I did not realize that what you have to say would affect me so much as it does. It gives one a new hold on things when he finds another man sees the ends he has in view. If I deserve your praise, there is reason for renewed effort." Letters written in Mr. Burnham's own hand-writing and with familiar salutations to another man half his age are, one ventures to suppose, rather rare.

Swales also collaborated with Edwin O. Sachs of London on Lord Cromer's project for a new Grand Opera House in Cairo, Egypt, which it was intended should surpass anything in the world for magnificence.

Among Swales' clients in London was the Canadian Pacific Railway, for which he designed several exposition pavilions. These beautiful examples of his work received favorable world-wide publicity. They were awarded Grand Prix and many gold medals. In this way, the company's officials at Montreal came to know the name of Swales. The official architect of the company employed him as consultant and, during a visit to Canada in 1911, the president of the company appointed him to design the scheme of ultimate development of the Château Frontenac at Quebec, as well as a projected hotel at Glacier, B. C., and the Hotel Vancouver at Vancouver, B. C.

The Vancouver Hotel is notable as the first modern “set-back” design to be constructed and for the definite way it was designed. The scheme of grouping geometrical solids to obtain effective form is similar to Swales' design in 1903 for an Automobile Club, but, apart from that, it had no precedent in architecture. Containing the same ideas, the Hotel Vancouver was designed in 1911, five years before the Zoning Law was passed in New York which now requires new buildings of similar size to adopt the same general plan with all the courts turned towards the streets and the higher parts of the buildings set back in planes from the street lines.

Associated with W. S. Painter—who seldom visited the office—Swales was engaged upon a number of huge projects including hotels, railroad stations, ocean terminals, Government buildings, office buildings, and city plans. The World War checked the execution of several of these projects. When the United States entered the war Swales was invited to take charge of the reconstruction work in France by the Military Division of the American Red Cross. He closed his offices in Canada, returned to New York, and prepared to go, but the Russian defection which occurred soon afterwards caused a temporary abandonment of the project and its transfer to other organizations resulted. While "marking time" at New York, Swales projected the development of East 42nd Street, New York, on the big scale that has actually resulted only during the last three or four years. He also designed, during this war-time, shipyards at Quebec and on the Pacific coast. After the war, he resumed contact with some of the projects left unfinished in Europe at the outbreak of the war. Shortly after this he established his office at Park Hill, Yonkers, and took up consulting practice. He spent a year on public work for the city of Cleveland in conjunction with the City Architect and on the plans for the Civic Center and new Water Works with the Director of Law.

Since 1922 Swales has been occupied chiefly with city and harbor planning. As Consulting Architect to the Regional Plan of New York of the Russell Sage Foundation, he designed a comprehensive projected development of New York, including the architectural city planning of four specific and strategic areas of Manhattan, each of which covers several square miles.

In 1928, while at London, besides designing the future extension to the store for Mr. Selfridge, he developed city plans for areas of London. During the present year, many of his studies made for the Regional Plan have appeared in the New York newspapers. Hence, we have come to realize once more the influence of his ideas as an architect and city planner.
Not the least important of Francis Swales' activities have been his writings. While abroad, from 1905 to 1911, he wrote critical articles for the old *American Architect* entitled "Notes from Europe." These were eagerly read by many of those engaged in the profession at that time. Many of his articles have been published in the foremost architectural journals of Europe and America. By special invitation of the President and Council of the Royal Institute of British Architects, he read a paper on American Architecture before one of its meetings which aroused lively interest in England and caused the usually conservative *London Times* to discuss it in a column of news and a column of editorial comment. He took an active part in the first International Town-Planning Conference at London in 1910 where he insisted that City Planning is the province of the architect and that it will not be improved until architects are consulted before engineering work is undertaken by public authorities.

This sketchily brings up to date the record of this outstanding and tireless member of our profession. One might quote tritely on his behalf:

"Something attempted, something done,
Has earned a night's repose"—

except for the fact that he seemingly forgoes such repose. He has crammed into his life the experience of a dozen good architects and is still as young as when he started to blaze his trail of prizes. He is the exponent of a vigorous age that produced a restless, searching group of American pioneers and independents in Architecture. In the galaxy of such names as Louis Sullivan, Frank Lloyd Wright, Henry Hornbostel, Bertram Goodhue, Charles F. McKim, Harvey Wiley Corbett, Egerton Swartwout, Wilson Eyre, Louis Mullgardt, William L. Price, and others that compel admiration, the name of Francis S. Swales, is not least.

The enduring enthusiasm with which he pursued his preparation and practice, and the independence of mossy precedent and stilted convention he has ever displayed, his sound philosophy, to apply mere knowledge with reason and understanding to the varied problems of architecture, thus assuring freedom from changes in mode or taste—in short, his career—should make a healthy, inspiring example for the student and the practitioner.

To paraphrase an Eastern benediction, so that it applies professionally as well as personally—"May his shadows never grow less!"
THE GEOMETRY OF ARCHITECTURAL DRAFTING

12—LINES AKIMBO

By Ernest Irving Freese

Editor's Note:—This article, which is copyrighted, 1930, by the author, continues the series begun in August, 1929.

SHADES OF THE IMMORTALS! A Historical Romance appears upon the "boards." Geometrizing philosophers and philosophizing mathematicians climb down off their eternal pedestals in the Hall of Fame to tell us "how." The curtain rises. Entertainment becomes abruptly precipitated:

ACT 1: (Figure 108) Pythagoras-of-Samos and Euclid-of-Alexandria cut the "pi." With \( BA \) as radius, describe a circle. From \( A \) as center, revolve \( B \) to \( C \). Then \( ABC \) forms an angle of 60 degrees, and \( AC \) becomes one inscribed side of a regular hexagon. From \( C \) as center, revolve \( B \) to \( D \). Then \( ABD \) forms an angle of 120 degrees, and \( AD \) becomes one inscribed side of a regular trigon, or equilateral triangle. From \( C \) and \( D \) as centers, any radius, cross arcs at \( E \). Then \( ABE \) forms an angle of 90 degrees, and \( AF \) becomes one inscribed side of a regular tetragon, or square. Prolong \( EB \) to \( G \), and bisect \( BG \) at \( H \). From \( H \) as center, revolve \( A \) to \( I \), and from \( A \) as center, revolve \( J \) to \( K \). Then \( ABK \) forms an angle of 72 degrees, and \( AK \) becomes one inscribed side of a regular pentagon. From \( C \) as center, radius \( JB \), cross the circle at \( L \). Then \( ABL \) forms an angle of 24 degrees, and \( AL \) becomes one inscribed side of a regular decagon. Now, \( LBC \) forms an angle of 36 degrees, and \( LC \) becomes one inscribed side of a regular decagon; \( CBK \) forms an angle of 12 degrees, and \( CK \) becomes one inscribed side of a regular polygon of 30 sides; \( KBF \) forms an angle of 18 degrees, and \( KF \) becomes one inscribed side of a regular bisdecagon; while \( FBD \) forms an angle of 30 degrees, and \( FD \) becomes one inscribed side of a regular dodecagon.

ACT 2: Euclid stages the "Great Divide." From the vertex \( N \), describe an arc crossing the sides of the angle at \( M \) and \( P \). From these points as centers, any suitable radius, cross arcs at \( Q \). Then \( QRN \) bisects the angle \( MNP \). From \( M \) and \( R \) as centers, any suitable radius, cross arcs at \( S \). Then the angle \( MNT \) becomes a quarter of the angle \( MNP \). Now, if \( MP \) were the side of a regular polygon, then \( MR \) would become one side of a polygon of twice the original number of sides, and \( MT \) would become one side of a polygon of four times the original number of sides. Et cetera ad infinitum.

ACT 3: Nicomedes takes a famous "part." Let \( ABC \) be a given angle no greater than a right angle. Assume any point \( D \), on \( BC \). Through \( D \) draw \( V \),

FIGURE 109
crossing $H$ at $J$. Make $IA$ twice $BD$. From $B$, draw a series of radials, and on each of these mark off a distance from the line $V$ equal to the distance $IA$. Draw the conchoid, $AM$, through the resultant points. From $D$ draw $F$, crossing the conchoid at $G$. Then the angle $ABC$ is one third the angle $ABC$.

ACT 4: "Descartes extracts an algebraic "root"." Let $ABC$ be a given angle. From vertex $B$ draw any arc, and bisect its chord at $D$. Make $AE$ and $EF$ each equal to one quarter of $AB$. Locate any number of points, $K$, such that $FK$ equals $AJ$. Draw the parabola through the resultant points. Make $EG$ twice $AB$, and make $GH$ equal to $AD$. From $H$ as center, radius $HE$, cross the parabola at $L$. Project $L$ to $L'$, and, from $A$ as center, revolve $L'$ to $L''$ on the arc of the angle. Then the angle $ABL''$ is one third the angle $ABC$.

ACT 5: "Gauss inscribes the inscrutable." With $BA$ as radius, describe a circle. Prolong $BA$ in both directions, and draw $BD$. Make $BC$ equal one quarter of $BA$, and, from $C$ as center, revolve $D$ to $E$ and $F$. From $E$ as center, revolve $D$ to $G$, and, from $F$ as center, revolve $D$ to $H$. Make $HJ$ equal $GB$. Bisect $JD$ at $K$, and, from $K$ as center, revolve $J$ to $L$. From $L$ as center, radius $BA$, cross the circle at $M$. Then the angle $ABM$ is $1/17$th of $360$ degrees, and $AM$ becomes one inscribed side of a regular polygon of $17$ sides. . . . Curtain!!!

The show's over! The sum total of the geometric knowledge of the ages, relative to the construction of angles and polygons has been displayed. That's all of it—all that the geometrizing philosophers and the philosophizing mathematicians have to offer. And, aside from the basic Pythagorean angle of $72$ degrees, by means of which the pentagon and allied polygons are readily constructed, none of it is of any practical use in the drafting-room. The Nicomedeian principle of trisection can, however, be made practical. The famous construction by Gauss, and the analytic trisection by Descartes, are less exact in execution than pure guesswork: they are merely pictures of the mathematical solutions of highly involved quadratic and cubic equations. Moreover, all of the so-called "Euclidean" angles and polygons are directly constructible with the T-square and the triangles—by mere manipulation of the instruments. Figures 109 to 112, inclusive, present a modernized sequel to the historical romance just staged.

Figure 109, Diagram "1," shows the full range of angles and polygons inherent in the sliding instruments when referred to the T-square as a base. Furthermore, by means of this Diagram, you can see at once the setup required to yield any angle relative to any other angle. Say you need a line making an angle of $37\frac{1}{2}$ degrees with the vertical. Just look for the combination pictured at that number of degrees from ninety. This is easy, since all inherent angles are integral multiples of $7\frac{1}{2}$ degrees, and since the $75\frac{1}{2}$-degree interval is the unit division of the Diagram. In this case, then, the required line occurs 5 intervals from the vertical, and it is there seen to be a $52\frac{1}{2}$-degree oblique. Again, if a line is required to make an angle of 45 degrees with a $67\frac{1}{2}$-degree oblique, simply pick the combination removed that number of degrees, which is $6$ spaces, from the $67\frac{1}{2}$-degree angle, and it is seen to be producible merely by a shift of the original triangle. Finally, to get a perpendicular to any given oblique of the Diagram, just shift the projecting triangle so that its hypotenuse crosses the given line at right angles. Now look at Diagram "2," in which $ABC$ is a given angle—any angle, inherent or extraneous. Of course, if the given angle is an "inherent" one containing a whole number of degrees, it can at once be bisected by the instrumental combination yielding half the angle. In other cases, make $BC$ and $BD$ any equal distances, and draw the bisector $BE$ parallel with $DC$. Or, as at Diagram "3," make $BC$ any distance, and make $CD$, parallel with $BA$, the same distance. Then $BD$ bisects the angle. Or, for wide angles, the method shown at Diagram "4" can't be beat. Make $BA$ and $BC$ any equal distances, and project the bisector, $BD$, perpendicular to $AC$, as shown. At Diagram "5," an angle is quickly divided into $4$ equal parts as follows: From vertex $B$, draw an arc $AC$, and, from $A$ and $C$ as centers, same radius, draw two other arcs as shown—but don't cross them. Project $C$ to $D$, parallel with $BA$. Project $C$ to $E$, and $A$ to $F$, parallel with $BD$. Lines from $B$, through $E$, $D$ and $F$, quarter the angle.

At Figure 110, the Pythagorean principles of Euclidean geometry have been put to work in various simple and practical ways. The constructions presented in the first six Diagrams avoid the cumulative error always resultant upon the more common method of "stepping off" a given distance successively around a circumference. At Diagram "1," let $AB$ be the radius of the given circle. Draw a perpendicular to this through $A$, and make $AC$ equal half of $AB$. From $C$ as center, revolve $B$ to $D$, and, from $B$ as center, revolve $D$ to the points $E$ and $F$. From the latter points as centers, same radius, cross the circle at $H$ and $G$, respectively. Lines connecting the five points will form an inscribed pentagon. To form the circumscribed one, project the five found points through $A$ to the opposite portions of the circle and, through these other five points, draw tangents parallel to the chords formed by the first set of points, as shown. The regular five-pointed star, shown at Diagram "2," is formed by connecting alternate points of the five divisions instead of successive ones.

At Diagram "3," the line $AB$ represents one of the given side of a required pentagon. Draw an extraneous line through $B$ at a slope of $1:2$ relative to $AB$, and cross this at $C$ with a perpendicular from $A$. Make $CD$ equal $CA$, and, from $B$ and $A$ as centers, radius $BD$, draw the arcs crossing at $E$. From the same centers, $A$ and $B$, but with radius $AB$, cross the first arcs at $F$ and $G$, respectively. Incidentally, the length $AD$ is the radius of the circumscribing circle. Next, Diagram "4": Make $AC$ equal half the radius, and, from $C$ as center, revolve $B$ to $E$. From $B$ and $D$ as centers, respectively, revolve $E$ to the points $F$, $G$; $H$, and $J$. With these four points as centers, same radius, cross the circle at the four remaining points.

Figure 110
L, M, N, and K. At Diagram "5," the fifteen equally-spaced points of a regular pentadecagon are located in this wise: As before, make AC half the radius, and, from C as center, revolve B to D. From B as center, radius BD, cross the circle at E and F, and, from these points as centers, same radius, again cross the circle at G and H. Now project a 30-degree oblique from A to J. Then, with radius GJ, and from the already-found points as centers, cross the circle at the remaining required points K; L and M; N and P; Q and R; S and T. At Diagram "6," a right angle becomes divided into 5 equal parts in the following simple manner: From the vertex, A, as center, draw an arc of any radius, say AB, and make AC half of this radius. From C as center, revolve B to E, and, from B and D as centers, radius BE, cross the arc at F and G, respectively. From these points as centers, radius GB or FD, locate the other two points H and I, as shown. At Diagram "7," geometry once again becomes the handmaid of aesthetics. The "divine" proportions of the "golden rectangle" are established as follows: Draw AB at a slope of 1:2 relative to the given direction of the longer side, and, from any point thereon, say B, as a center, draw an arc of radius BA, as shown. Project B to C, perpendicular to AD. Then AC, prolonged as far as you like, is the diagonal of any golden rectangle that your heart desires! Diagram "8" is merely the author's mathematical analysis of the geometrical aesthetics of Diagram "7." It shows that the short side of this particular rectangle "fitters out" to be 618/1000ths of the long side, and that the angle formed between the diagonal and the long side is practically 31 degrees and 43 minutes—which said mathematicians "never did nobody no good"? Now shift to Diagram "9" and you will re-discover the fact—which was originally discovered only about 2500 years ago—that there are but three regular polygons capable of being individually grouped about a point in a plane so as to completely fill, or "pave," the adjacent space about said point—triangles, squares and hexagons. At Diagram "10" the familiar figure representing the "Pythagorean proposition" appears under the seductive title of "The Princess of Persia." The particular triad shown—the old three-four-five combination—was, however, known and used by the "rope stretching" surveyors of Egypt to lay off right-angular lines about 1500 years before Pythagoras proved conclusively that the square on the hypotenuse of any right-angled triangle is equal to the sum of the squares on the remaining sides. Wherefore, any three commensurate numbers, such as 3, 4, 5, that represent the three sides of a right-angled triangle are called Pythagorean triads. A usable few of an infinite number of these triads are tabulated at Diagram "11," while Diagram "12" shows a similar series of roof pitches wherein the length of rafter is commensurate with the rise and run. The 5-12-13 triad also makes a good stair. At Figure 111, the historically famous Nicomedean trisection has been revamped to such an extent as to result in a thoroughly practical, speedy, and accurate method of taking a third part of any angle whatsoever. For angles up to 90 degrees, proceed as in Diagram "1": Make BD any definite distance. Draw E perpendicular to BA, and draw F parallel with BA. Now align your scale with B so that GH reads twice the distance BD, and so that H comes almost, but not quite, on the line F. Indent H. In the same manner, locate and indent another point, K, on the opposite side of the line F. Then mark L, on the line, where HK crosses F. Then LB is the trisector of the given angle ABD, and the point M, where this trisector crosses any corresponding arc drawn from vertex B, will cut off a third part of such arc, as shown. Obviously, if the chord AM is now laid off from point D, the other third-division point will be located. Also, if the angle ABM now be trisected in the same manner as was ABD, then the resultant division will be one ninth of the given angle ABD. Or, by bisecting the angle ABM, a sixth part of the given angle is yielded. Thirds, sixths, and ninths of an angle are impossible to produce by any method identified with Euclidean geometry. If the given angle lies between 90 degrees and 180 degrees, it is trisected as shown at Diagram...
"2." As before, make $BD$ any definite measure. But, in this case, make $BA$ equal the same measure. Then draw $E$ between $D$ and $A$, and draw $F$ perpendicular to $E$. The process then becomes the same as at Diagram "1." If the given angle should exceed 180 degrees, the same simple method applies in the manner shown at Diagram "3." Make $BA$ any definite radius, and draw the arc $ADC$ upon which locate $D$ by a perpendicular to $AC$ through $B$. Then proceed exactly as in Diagram "2"—the same reference letters being used in all cases. Ten minutes practice with the scale will make you an expert at angle trisection. And once you "get the idea" you'll attempt no more "stepping off" by trial and tribulation. Now let's lay out a nonagon—a polygon of nine sides—another thing unheard of in Euclid's hallowed curriculum. For the first time in all time, the construction shown at Diagram "4" goes "on the boards." With the 30-degree triangle, divide the given circumscribing circle into three equal parts at the points $A, C$ and $D$. Draw $E$ as a portion of the chord $DA$, and draw $F$ perpendicular to $E$, which, in the case shown, is merely the process of drawing a horizontal and a vertical from $D$. Then take a third part of the angle $ABD$ in exactly the same manner as depicted at Diagram "2," thus fixing point $M$ on the circle. So, from $D, C$ and $A$ as centers, radius $DM$, cross the circle at the other required points $N, P$ and $Q$; $R$ and $S$. The nine required points of the nonagon have been found with accuracy and dispatch, and no accumulation of error has been made possible. Now then, in all the Diagrams of Figure 111, the conchoidal points $H$ and $K$ have, for clarity, been shown farther from the line $F$ than should actually be the case: they should be fixed as close to this line as possible, but yet not on it unless, as has heretofore been shown in Part 11 at Diagram "6" of Figure 107, the slant of the scale where it crosses the line $F$ is relatively great enough to locate the required trisection-point directly and definitely on the line $F$ in one placement. The whole object of locating the two points, $H$ and $K$ of Figure 111, slightly off the line, is to definitely locate $L$ precisely on the line. Note that the point $L$, the trisection point of the Diagrams of Figure 111, corresponds to the point $G$ of the Diagram just referred to in Part 11.

In Part 13, following, you will find a full explanation of the author's method of graphical interpolation whereby any extraneous angle whatsoever can be laid out with the triangles to such a degree of accuracy in actual execution as to render a more involved "theoretical" construction utterly inexact in comparison. For the present, I shall show you how it applies to the construction of the several "odd-agons" shown in Figure 112, herewith. The simplicity and accuracy of this method are particularly striking in Diagram "1," since the practical manner there shown of laying off the central angle subtended by one side of a heptadecagon, or polygon of 17 sides, may readily be compared with the mathematically-entertaining but wholly impractical construction arrived at by Gauss. The suggested comparison, however, smacks not of odium. I am making no reservations for a pedestal in the Corridor of Fame: I am merely showing you how to do the "impossible" with three celluloid triangles, a T-square and a drafting-scale. Now let's locate not only two points, but all seventeen—of the "heptadecagon" that made Gauss famous as a maker of history and that disqualified Webster as a maker of dictionaries. Here's "how": Draw a vertical diameter across the given circle and indent the extremities $A$ and $B$, as indicated at Diagram "1" of Figure 112. Along the inherent lines of the indicated triangles, lay off any 14 units from $C$ to $D$, and 3 of the same units from $D$.
FIGURE 113

The circular pathway, will result in a surprising and
in the stepping-off process alluded to, even a hair­
and
and
points
and
and
That beats "walking around with the dividers," for,
then, I claim that this has outdone theory
from at least one angle: the line $CE$, crossing the circle
at $F$, slices off a seventeenth part of said circle and
makes the chord $AF$ one inscribed side of one of the
polygons that disqualified Webster as a maker of dictiona­ies! Now you shall see how to locate the other
fifteen points in a way that will disqualify nobody as a
maker of polygons. You merely have to divide the
rest of the circle into sixteen parts—an even number
—which is easy, and done mainly by manipulative
bisection in one or another of the ways shown herein­
before at Figure 109. With variations to suit any par­
ticular case, the process of subdivision is of general
application, and entirely does away with the possibility
of cumulative errors. In fact, even if a slight initial
error has been made in laying off the one central angle,
the same becomes distributive rather than cumula­tive.
We're on our way—back to Diagram "1" of Figure
112—again in high gear:—Using a two-triangle slid­
ing combination, hypotenuse to hypotenuse, and draw­
ing no lines but merely indenting the projected
points on the circle, project

- $C$ to $G$, parallel with $FB$;
- $C$ to $H$, perpendicular to $GA$;
- $C$ to $J$, perpendicular to $GF$;
- $C$ to $K$, perpendicular to $GJ$;
- $C$ to $L$, perpendicular to $GH$;
- $C$ to $M$, perpendicular to $AH$;
- $C$ to $N$, perpendicular to $FJ$.

Then, with $AF$ as radius, and from centers $A$, $F$, $J$, $G$ and $H$, fix the remain­
ing required points, $K$ and $L$; and $M, N$; and $P, Q$, and $R, S$; as shown. Now you can undertake the undecagon of Diagram "3," with the following "help": Indent $D$, four units from $C$, and fix $E$, in the same precise manner, seven units from $D$. Likewise fix $F$,
collinear with $CE$. With $FA$ as radius, and $F$ and $A$
as centers, fix $G$ and $H$, and leave the instrument set
to this radius. Then, project $C$ to $J$, parallel with
$FB$; and $C$ to $K$, perpendicular to $JH$; and $C$ to $L$,
perpendicular to $JG$. Now, with the original radius,
$FA$, and from centers $L$ and $K$, locate the final points
as shown, thus completing the layout for the required
eleven sides. No doubt, with what you now know,
you will have little difficulty in getting "hep" to the
heptagon of Diagram "4." I leave it up to you—
it's so terribly easy!

Figure 113, along with TABLE 4, herewith, are
exceedingly valuable reference documents, furnishing
ready data, heretofore only partially available, for
laying out, dimensioning, or determining the areas of,
these figures. Incidentally, you'll probably wonder
how I procured the names of the last twelve polygons
listed in Table 4. Well, I guessed at the final four—
but the others are "authentic." I'll admit, however,
that it's much more comprehensive to say "24 sides"
then it is to warble "tetrabidecagon." Maybe I'm
wrong!

Example 1: Sixteen columns occur in a circular
colonnade. The radius of the circle that passes
through the center of the columns is $20'-0"$. What
is the spacing of the columns, center to center, in a
straight line? This amounts to determining the side of
a hexadecagon that can be inscribed in a circle of
$20'-0"$ radius. In other words, $R$ is given as
$20'-0"$ and it is required to determine $S$ for a poly­
gon of 16 sides. Table 4 gives $S = R \times .39018$,
which makes \( S \) equal 20' \( \times .39018 \), or 7.8036'. Now, by multiplying the decimal portion of this dimension by 12, we change .8036' to 9.6432". Then, by converting the unit scale given at Figure 88 of Part 9, it immediately becomes evident that the decimal .6432 is practically the fraction 41\(\frac{1}{4}'\). Hence, the required dimension is 7"—9.41/64". Expressed in still another way, this is the length of a chord that subtends an angle of 22\(\frac{1}{2}\) degrees, the radius of its arc being 20 feet.

**Example 2:** You have laid out an octagonal room, or tower, or dome, or an octagonal what-not, to an over-all width, say of 14"—0". What other dimensions would you mark on the plan so that a builder could lay out this octagon? Builders do not lay out polygons by inscribing them in, or circumscribing them about, circles. This works all right on the drafting-board but not on the job. Now refer to Figure 113, where six of the "regulars" are reduced to rectangular coordinates. The pictured octagon immediately informs you that the length of one of its sides is .414 of the over-all width. In this example, the length of a side thus becomes .414 \( \times 14\)", which is 5.796". But .796" is 9.55"'. And .55, by reference to the conversion scale mentioned, is seen to lie between 35/64ths and 9/16ths. Wherefore, if you decided that a 64th of an inch would be cutting it too fine—and in most cases it most certainly would be—you might mark 5"—9.9/16" on the plan as the dimension of the sides lying at right angles to each other. This would make the diagonal sides slightly less than this, but the difference would be absolutely inappreciable in framing, and would be taken care of by the rectangular system of dimensioning indicated in Figure 113. In other words, the distance which, in the octagon, is indicated as .293 would, in the case instance, become \( \frac{1}{2} \) of the difference between 14"—0" and 5"—9.9/16", or 4"—1-7/32"—which, also, is cutting it finer than practical conditions usually call for. Maybe, after all, you'd better dimension the rectangular sides as 5"—9 3/4", which would make the other dimension, just discussed, 4"—1 3/4". Take note,

---

**TABLE 4**

**DATA ON REGULAR POLYGONS UP TO 24 SIDES, INCLUSIVE**

\[ R = \text{Radius of circumscribing circle.} \]

\[ M = \text{Radius of inscribed circle, or the distance from the Middle of one side to the center of the polygon.} \]

\[ S = \text{Length of one Side.} \]

\[ A = \text{Area of the polygon.} \]

</tbody>
</table>

*For a dodecagon, only, the area also equals \( R \times R \times S \).*
however, that this adjustment to the *lucid intervals* on a "white man's rule" does not affect the accuracy of the *dimensioning*—it merely changes the polygon from a "regular" to an irregular one, but the irregularity is so very slight as to be practically inconsequential. As a matter of fact, a builder would be compelled to guess at or "estimate" anything finer than a sixteenth of an inch, so you might just as well put a dimension on the plans that he can lay off by *measurement*. Again, a crooked two-by-four, or a slack chalk-line, will make more difference in a dimension of this kind than you could ever make by dropping a few insignificant decimal places from your calculations and then converting the result to the nearest sixteenth, eighth, quarter, or half inch. Your *geometry* should most assuredly be as exact as you can make it: but your *dimensioning* should be in terms associated with a *foot rule*. The *difference* is graphically non-existent in a scale drawing, and practically negligible on the job. In certain obvious cases, of course, a dimension *must* be put down as an exact fractional or aliquot part of a total, regardless of what the fraction may be, but, ordinarily, any dimension that "splits a sixteenth" creates vociferous and ridiculing amusement among the building "fraternity." Which is as it should be!

*Example 3:* In the dodecagon bay at Diagram "1" of Figure 114, the dimension $M$ is fixed at 7'-6", and it is required to determine $S$, the length of a side, as well as the other dimensions, $A$ and $B$, for the purpose of *dimensioning the working plans*. The dodecagon, however, is not shown at Figure 113: but, looking in Table 4, you will speedily find that $S$, for a polygon of 12 sides, is equal to $M$ multiplied by .53589. Hence, since $M$, which corresponds to the radius of the *inscribed* circle, is here fixed at 7'-6", or 7.5', the indicated calculation gives $S$ as 7.5' $\times$ .53589, which is 4.019175'. By conversion, in the manner already indicated by foregoing examples, this dimension becomes 4'-15/64", but since, in this case, a sixty-fourth of an inch is practically insignificant, the dimension, $S$, is taken at 4'-1/4". Now, in general for all regular dodecagons, the distances marked as $A$, in Diagram "1," Figure 114, are each 1/12 of $S$; and $B$, therefore, becomes $M$ minus $S$, as there formulated. Hence, in the case here exemplified, the required *plan dimensions* are: $A = 2'-\frac{7}{16}$", and $B = 3'-\frac{5}{16}$", the over-all, $M$, being 7'-6".

*Example 4:* What is the area of the dodecagon bay of Example 3? You have already found the length $S$, of one side, to be 4.019175' or, practically,
4.019'. From Table 4, you then find, in the $A$-column, that the area of a polygon of 12 sides is $8 \times 8 \times 11.9615$ or, to all intents and purposes, the square of the side multiplied by 11.2. Hence, substituting the known value of $S$, the calculated area of the full polygon becomes $4.019' \times 4.019' \times 11.2$ or 180.9 square feet. But, since the bay in calculation is but half a polygon, its area would be half of this value, or 90.45 square feet. You have noticed that the decimal values of Table 4 are given to five places: you can use as many as you please, dependent upon the degree of approximation permissible in the result. Aside from the square, the areas of regular polygons, for a given length of side, can never be calculated to theoretical exactness—the arithmetic result always contains an interminable decimal. In the case just given, if the six-place value of $S$ is used rather than the curtailed value of 4.019, you'd produce a decimal reading to 12 places for the square of $S$. And if this 12-place decimal were multiplied by the 5-place decimal multiplier given in the table, namely 11.9615, the final calculation giving the required area would read to 17 decimal places: 180.86000601742959375! And this terrifying-looking result would merely be another approximation. In fact the decimal digits could march entirely off this page, strike out across the great open spaces, and become lost in the dim decimalized distance—and still the result would be an approximation! However, by using the 17-place result, you'd get closer to the "theoretical" area of that dodecagon bay by about 2½ square INCHES. Take your choice.

**Example 5:** Now suppose that regular genuine antique heptadecagons were selling at the remarkably low price of a dollar per square foot; and suppose, further, that you were willing to invest a couple of hard-earned simoleons in one of these curios—just for Gauss' sake. How long would one of its seventeen sides be? Well—its area would be two square feet: that's easy. Now look in the catalogue—Table 4—and you'll discover in the $A$-column that the area of a regular heptadecagon, antique or modern, is equal to the square of one side multiplied by 22.7355. Wherefore, it is incontrovertible that the square of one side is equal to the area divided by 22.7355. And the square root of this quotient will consequently be the length of one side. And, from the length of one side, you could easily determine the radius of the one and only circle that would just circumscribe said heptadecagon, or the radius of the one and only circle that said heptadecagon would just circumscribe. Now you do it. After that, you will then be able to prestidigitate the unknown dimensions of that octagonal lobby in the high-brow country-club club-house you are planning, so that said octagon will just use up a hundred and eighty-six square feet of no-more procurable imported Tunisian tile paving—and you will thereby qualify for the cherished cognomen of drafting-room "wizard."

**Example 6:** At Diagram "2" of Figure 114, a decorative tile wainscot cap has been carried over an arched opening in the shape of a half octadecagon—the regular cap tile being mitred to form the arch as shown. What width, $W$, of opening is required if the size of the tile used is 6" by 9" and a half-inch joint is allowed for? Here, $S$ is known, and it is first necessary to determine $M$. Inspecting Table 4, you find that $M$, for a polygon of 18 sides, is $8 \times 2.83564$. Hence, since $S$ is here 9½", $M$ becomes 9.5" $\times$ 2.83564, or 26.93" which, containing the allowance for the joints, can certainly be made 27". So, deducting 6", the width, $A$, of the tile architrave, leaves 21" as the radius $M'$ of the circle inscribed within the polygonal intrados of the arch. Wherefore, twice $M'$, which is twice 21", or 3'—6", is the required width, $W$, of the opening to accommodate the given size of tile and the desired shape of the arch. To lay out the arch, now proceed as follows: Make $CB$, on the spring line, equal 27" as above determined, to any scale. Make $BD$ equal half of $S$, or 43½", at the scale adopted. Then $CD$ equals $R$, the radius of the circumscribing circle of the extrados. The points of the arch will then lie on this circle, and the required arch-division can then be done either with the protractor—marking off 20-degree intervals each way from the crown point $O$—or, just as quickly and possibly more precisely, in the manner indicated by the drawing. In the latter case, the 30-degree triangle at once fixes $N$, a point on the arch lying on the circumscribing circle. The angle $NCP$ is then trisected at $Q$ in accordance with the method heretofore shown at Diagram "1" of Figure 111, and the remaining points then fixed with radius $NQ$, from $N$ and $P$ as centers.

**Example 7:** Diagram "3," of Figure 114, is a mere suggestion of the limitless possibilities of polygons as elements of decorative design. Suppose, in the example shown, that a double heptagon is to be used either as a repeating unit of fixed width, $W$, or as an individual panel. In either case, the corresponding height, $H$, must be determined, since it is not the same as the given width $W$. This is always the case with the "odd-agons." So, referring to Figure 113, you forthwith find that the width of a heptagon is to the height as 1 is to .975, or, which is the same proportion expressed in integers, as 40 is to 39. Hence, knowing this, the required dimension $H$ can be directly established, and, moreover, the entire heptagonal motif can be directly laid off by the system of rectangular coordinates worked out in Figure 113, without the necessity of either drawing a circle or knowing its center.

ADVENTURES OF AN ARCHITECT

11—BOOM, BOOM! CITY PLANNING IN REVERSE GEAR

By Rossel E. Mitchell

SHE WAS LARGE and smiling, of the pouter pigeon type, and Jewish. Her husband was a Jew-eler, and a fine chap too. She wished to erect a moderate-sized apartment building on her own property. "What's mine is mine, and what's his is ours!" We planned it for her, secured bids and let the contract. The builder "went busted" during the construction, and there was some delay. She admonished us that we ought to have known better than start the work on Friday! After completion, it filled rapidly and she was a satisfied client. Her husband's jewelry business appeared to prosper, although she had remarked that there was "only a living" in it.

Several years later an "Exposition" was being promoted and everybody assumed the event to be an Aladdin's lamp which only needed gentle rubbing to bring forth a magic genie, loaded with riches and prosperity. Nearly everybody fell for some get-rich-quick scheme. People who had labored a lifetime to accumulate a competence, invested their hard-earned savings in fly-by-night enterprises that never had a chance to pay.

Our amiable client showed up again. She wanted to build an "outside" hotel. Apartment houses "only" paid ten or twelve per cent, at best, and she could double her money there in a year!

I ventured to proffer some observations: "Apartments are here to stay; expositions come and go. Eight or ten per cent. is a good investment, even in cheap apartments." But my youth discounted this sage advice, besides, the speculating fever was in the air.

We planned and she built a cheap temporary hotel. To save money she omitted architect's supervision. I never saw the place, but she said later she never got 25% of her investment back. She borrowed a large sum of money and I think her husband endorsed for her. Soon after the collapse of the Exposition boom her husband lost his business and became a salesman.

Following this debacle, came the opening of the Panama Canal. Many Eastern cities looked forward to this event as another boom-producer. One day a bald and elderly gentleman with rather wild eyes and a deadly seriousness of demeanor secured an interview with me. He wanted to sell me some vacant lots, beautifully located—on his colored map—in a wonderful new section "right in the path of the inevitable development to be brought about by the completion of the Canal."

I knew the territory, but was not sure just where, in the center of which farm, these corner lots were located. Keenly observing my diffidence, not to say disinterest (they had not then learned to call it sales-resistance), he grew oratorical.

"Sir, if a man should go up over this section in a balloon, and drop greenbacks over every acre, it would not increase in value more surely than it must because of this great industrial development."

When I informed him that I, personally, had no greenbacks to drop into vacant lots, he departed for more fertile fields. At least he sold lots of lots. The last I knew the victims had either been foreclosed or still held them for re-sale. "Three moves," "tis said, "equal a fire." A town may recover from one boom, recuperate in time from two, but three in a row spell disaster.

To architects and draftsmen, an Exposition is great fun. To most investors looking for returns, they have proved great fakes. The Chicago Exposition of 1893 was an educational event of first importance to the American people. Most of the other shows, under-financed and sometimes over-sized for the community, have not only been disappointments to their promoters but actual calamities to the local citizenry.

Vast sums of money have been wasted building ephemeral exposition palaces. These funds, if expended in permanently re-vamping the public buildings of the city backing the show, would produce civic centers rivalling the best in Europe. Streets could be widened, eyesores turned into parks, beauty spots created.

A striking example of this misdirected energy and misapplied expenditure was seen in our city. This town possessed many beautiful and historic features which could have been developed and made to pay big dividends in civic character and interest to the world outside the bounds of the municipality.

One of the most interesting streets to be found in America might once have been seen here. Here was Colonial architecture at its best. Delicate and graceful porticos, approached by broad winding marble steps, each riser with a moulded nosing. Chaste wrought iron railings, windows with wide exterior trim contrasting with the deep color of the handmade brick. Brickwork of large units, laid Flemish bond, softened by time and English Ivy or Virginia Creeper. Inside were to be found the most charming mantels, reflecting the refinement of owners and builders who demanded and could produce such tasteful work. Room cornices with fine, light mouldings, broad flooring that reflected the refinement of owners and builders who demanded and could produce such tasteful work. Room cornices with fine, light mouldings, broad flooring that did not tire the eye with infinite lines, raised panel doors in scale with the surroundings, ingenious hand-wrought hardware. Some of these homes possessed the original furniture of the first owners.

To recount all the beautiful detail to be seen on that street would be almost to catalogue Colonial architecture. Some mansions dated back well into the Eighteenth Century, others the early Nineteenth, and some arrested you with delightfully dignified porticos and façades of the Greek Revival.
Sad to relate, this wealth of beautiful things was lightly held by most natives, and apparently so by the local architectural lights. Rarely did a new mansion in the growing sections evidence any feeling for the abundant local tradition. When a public library was built, it was in a crude style of French Renaissance. And when the construction of an Art Gallery came up, the most complete and beautiful Colonial mansion in the city was available, furniture and all. Was it secured? By no means! The art gallery had to be new, and grandiose, and mediocre!

As in many cities having no such fine architectural traditions, new buildings were designed in the most bizarre styles extant—but if some old treasure of Colonial days was destroyed, few lamented.

Parvenue apartments began to elbow out the old aristocracy and no one said them nay. Some years after the Exposition fever and subsequent financial chills had done their work, I visited again this old town where once were found so many charming spots, "Progress" and speculation had done their worst. Ugly shops jutted their gaping glass to the street lines. A huge bare office building in the residential section destroyed all the ancient character. Many old places had been destroyed and not one beautiful thing substituted. Uptown, the Exposition palaces had nearly all disappeared, but downtown the hideous public buildings of the era of Victorian eclipse still survived!

Change and replacement are inevitable, but why ruthlessly destroy what the past has bequeathed, in beauty that has stood the test of generations? Numberless architects today have caught up the spirit of Eighteenth Century refinement as evidenced in Colonial architecture, and are carrying it on to even greater perfection. But many a city and town has lost all individual character, and with it an invaluable asset, by failing to perpetuate its heritage of beauty and interest, left to it from an age of cultural enlightenment. Such priceless heirlooms are not replaced by erection of rectangular brick boxes of hideous height, sans form, sans beauty, sans color, sans everything but mortgages; frequently also, sans dividends!

FROM A PEN AND INK DRAWING BY FRANCIS S. SWALES

DOORHEAD—AVRAULT HOUSE, NEWPORT, RHODE ISLAND

PENCIL POINTS
This drawing, reproduced at the actual size of the original, is a good example of pen technique. It was done many years ago as part of a series Mr. Swales worked up on Colonial details.
DINAN, FRANCE

FROM A WATER COLOR SKETCH BY JOHN N. RICHARDS

PENCIL POINTS
(September, 1930)
PENCIL POINTS SERIES
of
COLOR PLATES

The water color sketch shown on this plate was made by Mr. Richards during his travels as holder of the Stewardson Memorial Scholarship of the University of Pennsylvania for 1928-1929. It measured 13" x 19" and was done on rather rough Fabriano paper. The artist makes it a practice to use as few colors as possible and his palette included, for this sketch, Cerulean Blue, French Blue, Alizarin, Burnt Sienna, Raw Sienna, and Emerald Green. The color was applied very wet with the object of producing a clear, bright effect.
FROM A DRYPOINT BY ERNEST THORNE THOMPSON
TEMPLE EMMANUEL, NEW YORK

PENCIL POINTS
This drypoint by Ernest Thorne Thompson shows one of New York's most recently completed ecclesiastical buildings, designed by Robert D. Kohn, Charles Butler, and Clarence Stein, Architects, with Mayers, Murray, and Phillip as Consulting Architects. The original print measures 10" x 12".
"The Dawn of a New Era," the panel shown on the other side of this sheet depicts the departure of the Red Men from the Genesee Valley and the entrance of the White Men, following the enactment of a treaty between the two parties, affirmed by the two figures behind the oxen. The size of the original panel is 7' x 15'.

The two smaller panels shown above were designed by Mr. Friedlander to be executed in limestone, to be placed on the main façade over windows at the left and right, respectively, of the large panel. These smaller panels each measure 4' x 4'.
BUILDING CODES require tall buildings to be so constructed as to resist a given wind pressure. These requirements generally make special bracing system necessary, but the proportions of the building and the arrangement and strength of the walls determine the extent to which special bracing must be used.

In the past, because of the prevalence of riveted construction, it has been customary to construct the wind bracing by this traditional method. Since the advent of electric arc welding, however, and because of the expense connected with field riveting, it has been a question as to whether it is good engineering practice to continue fabricating wind bracing by riveting. A comparison of the designs for these two methods of construction reveals many interesting facts.

The prevailing style of riveted wind-bracing connection is the T-type. It consists of large T's formed from I-beam sections split in two lengthwise as shown in Figure 1. These large T's are riveted at the shop to the columns by a suitable number of rivets and field riveted to the beam flanges as shown in Figures 2 and 3.

It is often possible to replace advantageously the riveted T-type wind-brace by the arc welded knee brace type shown in Figure 4. The knee braces are placed only at the intersection of the spandrel beams and wall columns, the floors being usually well able to transfer the lateral strains to the wall bracing systems.

To illustrate the point, consider the floor plan, Figure 5, of a recently built 40-story structure. The position of the riveted T-braces, detailed in Figure 1, are indicated by the crosses shown on the floor plan.
Check marks indicate the position of the exterior T-braces. The exterior braces, Figure 3, need only have one-half the strength required of the interior braces. There are, in all, 120 T-braces per floor.

Figure 6 shows the same floor plan, the arrows indicating the position of the corresponding arc welded knee braces. There are 40 knee braces per floor. For the case shown in Figures 5 and 6, each knee brace must have, and has, two and a half times the strength of each interior T-type connection and five times the strength of each exterior T-connection.

It is to be observed that the use of the arc welded knee brace does not in any way change the usual erection procedure; the steel is raised, set, bolted up temporarily and plumbed in the ordinary fashion and then riveted together by means of the beam connection angles. Only when this has been done are the knee braces placed and welded in position.

Evidently such a procedure is bound to speed up the job, not to delay it, since the riveters have less rivets to drive to obtain a well squared and plumb structure. The welder operators follow the riveters without interfering with them, and without getting in the way of the masons back of them. For purposes of comparison, Figure 7 shows a riveted knee brace connection corresponding to the arc welded connection shown in Figure 4, and of exactly the same strength.

Shop rivets cost about $4 each; field rivets 22¢ each and the large T's and fabricated connections about 6¢ per pound. Plain knee brace material and plates cost about 5¢ per pound, and welding, in the positions indicated, averages about $1.25 per lineal foot. On this basis, the cost of the 120 riveted T-brace connections per floor is $1,334; that of the corresponding 40 riveted knee braces $1,164. The cost of the 40 arc welded knee braces, including the riveted standard connection angles, is only $826 or one-third to one-fourth less than the cost of the riveted types of wind bracing. In all cases the cost of the standard or other load carrying connection is figured in the total. On tall structures the saving effected by use of arc welded wind bracing represents an amount that cannot be ignored.

A CALL FOR INFORMATION ON WATERPROOFING PRACTICE

A letter from Hugo Zichner of Buchanan, New York, reads as follows:

"Experience shows me that a common waterproofing practice prevails in New York of leaving weep holes after the waterproofing operation is finished in concrete construction to carry off excess water and I should like to ask through your columns whether this practice is not thoroughly unsound? Does not the water flowing through the weep pipes carry off the lime of the cement and consistently weaken the construction by removing from it the particular elements which are relied upon to give it strength? "

"I have run across several instances where infiltrating waters flowing out from weep pipes have reduced the concrete to a mass of rubble for which the contractor has been blamed for bad work when the cause of all the trouble lay with the weep holes.

"If some of your readers would analyze the water coming out of concrete construction through weep pipes, and give the benefit of their observations, the information would be most valuable to Engineers and Architects."

We will be glad to receive comments from our readers on this topic and will publish the most interesting observations for the benefit of all.
GOOD PRACTICE IN CONSTRUCTION—EAVES DETAILS—DRAWN BY PHILIP G. KNOBLOCH

PENCIL POINTS

FUNERAL WREATHS, LOCKS AND BOLTS, AND BOOTS AND SHOES ARE ADVERTISED BY THEIR SYMBOLS

TRADESMEN'S SIGNS IN FRANCE

By Samuel E. Gideon of the University of Texas

With Illustrations by Paul E. Presler

IN THE early days, in this country, tradesmen had their characteristic signs over their shops—history and old illustrations bear this out. Some still exist in the towns of old New England and the painted wooden Indian can still occasionally be seen in front of cigar stores, in the older settlements, throughout the United States, though he is rapidly becoming obsolete.

In France, these tradesmen's signs are much in evidence in the villages and smaller towns, but in the tourist thoroughfares of the larger cities they, also, are fast disappearing.

Long ago, comparatively few people could read, and it must also have been the crowded towns, winding streets, and narrow shops with overhanging upper stories that made the signs of the butcher, the baker, the candlestick maker necessary. To the uninitiated they are not always self-explanatory, because some of them are only symbols. We, on this side of the Atlantic, can usually, at a glance, recognize the nature of a shop from its window display, but in France—and Italy, too, for that matter—it is difficult to distinguish between the apothecary, the perfumer, and, except for its accompanying odors, the saloon.

Several years ago I made some purchases of old pewter. Among the pieces was a queer shaped dish whose crown hallmark interested me more than the piece itself. Frankly, I did not know the purpose of the dish and the dealer was equally ignorant, but recently in France, I learned that it was used in shaving, the place in the rim being hollowed out to fit the neck. Two of these suspended plates, bright and shiny, one on either side of the door, are the sign of the barber and hair dresser—used by barbers who shaved men's beards and curled milady's hair long before women entered the barber shops over here. A more common barber's emblem is the gilded ball with dangling horsehair tassel. Usually there are two of these, although sometimes only one is displayed. In Paris, however, I saw a whole façade dotted with them. The latter place handled barbers' supplies, as I discovered upon inquiry.

The butcher's shop is unmistakable—a gilded cow's head hangs over the entrance or forms part of an elaborate decorative scheme in the upright supports at either side of the shop. The law requires that a horse-meat butcher must advertise the fact with a horse head over the doorway, in addition to his sign "Boucherie Chevaline." Then there are numbers and numbers of the more commonplace signs, though frequently these are ornamental. The boot for the shoemaker who sometimes displays a shoe with fantastic toe; the key for the locksmith; miniature, gay striped parasols, sometimes crossed, for the umbrella mender; the watch or clock for the clocksmith or jeweler; scissors for the cutlery shop; a plug for the hatter; a glove for the glove shop; a

wheelbarrow for the hardware man; a horseshoe for the blacksmith and a palette for paints and artists' supplies. The cigar store shows a pipe and often, in addition, a conventional shaped cigar. The most ornate of all is the sign of the dealer in antiques. His shop is indicated usually by a wrought iron design in the form of a bracket, arabesque, or panel. The several shown are from shops in Fontainebleau.

There are some misleading signs too—for instance, "CONFETTI" though naturally suggesting bonbons and good things to eat, means nothing but the driest of dry goods and notions. My French being limited, "TEINTURE NETTOYAGE," toy-like, hanging signs which have for years been directing business to the shops of French tradesmen.
IN DISCUSSION OF “THE VALUE OF THE ARCHITECT’S SERVICES”

EDITOR’S NOTE:—A number of architects have, during the past month or so, expressed their opinions and offered their criticisms of our document, “The Value of the Architect’s Services,” which was published in the July, 1930, issue of PENCIL POINTS. We have not room here to present more than a few of these responses but the ones we have selected for publication will, we believe, be of interest. The criticisms received will serve as a basis for revising the document, which we propose to do, so that its eventual publication and distribution will be of benefit to the profession as a whole.

From Edward D. Pierre of Indianapolis

“Architects at large have been asked to express their opinion of Pencil Points’ efforts on Educational Publicity, and the writer respectfully submits the following thoughts with a prayer that P. P. will not become disgusted and give up the ship. It is natural to expect that a highly individualistic group such as makes up the Architectural profession should have as many varied ideas on publicity as they have on the new octagon at Washington.

“May I submit this thought, that when we buy an automobile, we are not forced to listen to a sales talk on the ‘value of the Automotive Engineers’ services.’ When we buy a dining room suite we are not bored with a discourse on the ‘value of the Furniture Designers’ services.’ Almost all we are interested in is the result, not how that result was obtained. In other words, the Building Industry has a product the same as the automotive industry. This product is ‘Architecture.’ If we will convey to the public the value of ‘Good Architecture’ over ‘Bad Architecture’ or ‘Indifferent Architecture’ we will talk in terms they will understand. A technical explanation or apology for the architect’s many years of training or the number of pounds of lead or tons of paper he uses is of no interest to them.

“This Educational campaign can be put in terms of Results by showing them the value and advantages of Good Architecture. Do not forget to tell them, however, that Good Architecture is the product of a Good Architect, a Good Contractor, Good Craftsmen using Good Materials.

“I think we lose a great point if our efforts appear to be selling the Individual rather than selling his product. Subtlety in Publicity grows as the intelligence of the public makes new advances. Let us be not apologetic to the public about the Architect and make them read a lot of stuff about his training, his ethics, his ability, his knowledge and skill, his business capacity, his consideration for the aesthetic, his knowledge of law. Let’s not talk about working drawings and pictures. Let’s talk about buildings.

“The man who builds a bungalow is not going to employ an architect because an architect was necessary to create Rheims Cathedral. The hard-headed Chairman of the Board of the American Folding Can Company is not influenced one bit by a sales talk on the Architect’s training at the Beaux Arts.

“He wants to know ‘why should I have an architect for a factory?’ He would be impatient with all the steps necessary to get 500 pounds of Blue Prints. He is concerned about the Building, and if it should be good architecture or indifferent architecture. If it is good architecture will it pay dividends? In other words, let’s talk his language. If we are convinced that his factory should be good architecture let’s itemize the advantages and tell him to them—he will understand—but don’t make him read six pages about cathedrals before he gets to the part he is interested in.

“We can convince the most practical and mercenary jury in the world that the Good Architecture pays and that it is not a luxury but a necessity.

“Now then, one of the mechanics in the Can Factory might be influenced by the atmosphere to desire a little of his own. He also wishes to know if it is practical for him to have ‘Good Architecture’ of his own. We can tell him about the pleasure of living in an organized house—about the resale value of his home when he comes to sell it, about the satisfaction of living in a thoroughbred home, one that will attract the admiration and respect of his friends—we can show him that a well-planned house (a piece of good architecture) costs no more than poor architecture, that it is an economy. We can impress on him the environment will reflect itself on his children. He doesn’t care about the architect’s problems. He is concerned about his house—whether it shall be Good Architecture or ordinary architecture without character. When he finds out that the only place to buy good architecture is from a good architect, he will find one. The Public sense of discrimination is developed in other fields, why not in Architecture.

“Manufacturers of good products increase their opportunities for selling their goods when a good architect is employed. Why then should they not inject into their advertising a line for good architecture.

“Finally to me our problem seems to be this:

1. Attract the attention of the Public to Good Architecture by building Good Architecture.
2. Arouse their interest in Good Architecture by telling them about Good Architecture.
3. Create a desire for Good Architecture by raising their standard of appreciation and power of discrimination.
4. Make the sale—by impressing on them that GOOD ARCHITECTURE IS THE PRODUCT OF A GOOD ARCHITECT, A GOOD CONTRACTOR, GOOD CRAFTSMEN, USING GOOD MATERIALS.

“Leave it to the American Institute of Architects to show them how to get a good Architect.”

From Charles Crane of New York

Office of Henry C. Pelton

“We have studied your proposed document ‘The Value of the Architect’s Services’ published in the July, 1930, number and while we feel that it is somewhat lengthy, still we realize that the subject cannot be covered too briefly.

“On the whole we believe that the document as proposed will be very useful, and as soon as published we will be glad to receive copies for distribution to prospective clients.”

From Jonathan Ring of Los Angeles

“So far as possible I have been keeping posted on this matter of advertising the architect, and am therefore aware of what Pencil Points has been doing (my subscription dates back 6 or 8 years). I have favored the movement, but have been simply unable to support it by any money subscription. Also, probably like many others, I have
been 'watchfully waiting' instead of hopping into the ring.

"But while taking no action as a member of a group, I certainly have been active as an individual in distributing what published literature I could secure, putting it in the hands of any one even remotely contemplating building.

"Always aware—vaguely, perhaps—that the architect was an unknown quantity to the majority of people, I have become increasingly aware of it, and convinced that the architects should do something about it. When the architect wouldn't tell anyone what he did, and the manufacturer didn't, and the newspapers seemed not to understand his function, is it any wonder that the public scarcely heard of this man? In the past two weeks I have had three cases where prospective builders—a church, a fraternity, and an office—contemplated having architects 'submit sketches' for the job or use a builder (contractor). To all of these I sent copies of the PENCIL POINTS article, and other printed matter, to acquaint them with facts of which they were ignorant.

"To inform the general public about the architect is a huge task and will require huge expenditures and considerable time, I am afraid, unless direct advertising methods are followed, such as continued notices in the newspapers and the common magazines. But as so many architects and the A.I.A. are not in sympathy with such publicity, and seemingly cannot be gotten to pull together, I decided some time back that the individual would have to do what the group would not. I therefore secured copies of the A.I.A. 'Functions of the Architect' and, lastly, Scribner's 'This Man the Architect' and, lastly, copies of July PENCIL POINTS article, sending these to any one contemplating building. As this matter went to people who were thinking of building, it doubtless accomplished something, but it is a huge task and will require huge expenditures and considerable time back that the individual would have to do what the group would not. I therefore secured copies of the PENCIL POINTS article, and other printed matter, to acquaint them with facts of which they were ignorant.

"I have no suggestion to make in regard to the article in PENCIL POINTS other than that it be condensed. My observation is that the people who need to be told are unlikely to read a long presentation of the facts. There is practically nothing I would want omitted from your article, but think the matter should be put into fewer words—but don't ask me to do it! Your article can be shortened. Had you thought of dividing the matter into two or perhaps three pamphlets? Who should get it? Would it be good to send it to Architects first, with a statement of cost per hundred for additional copies they might use on their mailing list? It seems to me Manufacturers, Distributors, Building Managers, and Owner Associations, Real Estate Boards, Libraries, School Boards, Loan Associations, etc., should have it; yet one issue would be like dropping a hail stone in a blast furnace to reduce the heat. That is the reason I think of dividing the matter, so as to get the value of repeated 'perception.'

"I hope you will find it advisable to proceed with the widest distribution of this work possible. I am glad you did not let any one in on it with a lot of 'drivel' about Beauty, Ethics, and indicated repulsion to manlike responsibility; expressed in terms that go over the heads of even most of the architects and mean nothing, when you trace them out in the dictionary, that could not have been expressed in one or two syllable words. Pardon if I seem hard-boiled or sarcastic, or even discourteous. I think you know what I mean. PLEASE keep away from it.

"There certainly is nothing in your effort, to which this letter refers, that makes me in the least ashamed to admit I am trying to be an Architect. Thanks for all your interest, and success to you."

FROM EDDIE I. WILLIAMS OF NEW YORK

"I have read your article on the importance of employing an Architect, and it makes a very bad impression on me. It is too long and has a begging tone, almost as though the Architect were justifying his existence.

"As one of the Architectural profession, I wish to say that I feel we owe you our deepest appreciation and our help, and I trust you will not feel that this harsh criticism is not well meant.

"My suggestion is that the first part, on Page 567, should be retained. I should then proceed with a few paragraphs, somewhat as follows:

"Any building project has two important aims—
1. The creation of an efficient, good-looking, well-built building.
2. The spending of money so that good value is received for the amount dispersed.

"There are two ways in which a building project can be accomplished. The first is between two parties, call them the Owner and the Builder. The second is between three parties, the Owner, the Architect and the Builder. In each case the operation is the same. Plans are made, estimates are procured, contracts let and work is done. In each case the Owner pays for the work that is done. In one case he may think he does not pay for all of it, but he does.

"Plans cost money. They are necessary in order that an Owner may know what he is to spend, just as much as to show him how his building will work, and how it will look. No Builder can give this service free to an Owner—none does.

"If the Owner puts himself in the hands of a Builder he goes on trial in a court in which, as plaintiff, he is opposed by a defendant who is both defendant and judge. This is no reflection upon the integrity of Builders, it is a reflection upon the judgment of Owners.

"Plans are best drawn by those who make a business of planning—Architects. Those who do so are men trained in mind to catch an Owner's ideas, put them in form on paper and to give to this form reason, efficiency, order, and good looks. The plans are then described by careful specifications. When the Owner sees on paper what he will get, he will also know approximately what it will cost, and it is then time to seek a Builder.

"The Architect submits his plans and specifications to
IN DISCUSSION OF "THE VALUE OF THE ARCHITECT'S SERVICES"

various Builders and, by the practice of competitive figuring, he tests the purchase of value of the Owner's dollars. The cost to the Owner for the plans is not added to this building figure. The Owner is actually better assured of his value and he has had the services of the trained planner. Now, when it comes to the building operation, he avails himself of the Architect's organization for checking costs, dispersing of his funds, etc.

"The article could elaborate much more briefly the Architect's function than is done in your chapter on 'What does the Architect do for you?"

"I hope these suggestions may prove constructive—it is their honest intention."

From Wilson C. Ely of Newark, New Jersey

"I want to congratulate you on our part for the wonderful contribution you made in your July issue to help the practice of Architecture. Articles such as these are certainly very beneficial to the profession and most instructive to the public.

"I think the profession owes you a vote of thanks for the stand you have taken in our behalf and for your generosity. As I wrote you before I regret that the profession has not realized the importance of helping financially with this project. Perhaps one of these days they may awaken to the necessity of doing something and if they do you can count on us for a substantial amount to help along this work."

From C. B. F. Brill of New York

"I have looked over your articles appearing on pages 563 to 588, inclusive, of your July issue, and have certain suggestions.

"They are grouped in more or less two classes. In making them I have in mind one premise, that your advertising or booklet, whatever it be, if it is to bring results, must appeal to the persons who contemplate building without an Architect. It cannot possibly do direct good with any other group. Therefore in preparing it, there should constantly be held in mind the mental attitude of these people. This entire group should be separated into classes according to the reasons why they decide to eliminate the Architect and various points presented should be aimed directly to meet the resistance of each of these classifications.

"It is my opinion that the rather aggressive way in which you constantly pound the word 'Architect' in your present draft, would distinctly irritate the largest part of this group and that they would never read through to the finish. It would become so evident to them that the matter was written from a biased point of view, that they would discount everything said.

"It seems that in many cases you perhaps overestimate the things an Architect can, and does do best. For example, under Heading No. 2, Page 571. Most competent Builders are better purchasing agents than most Architects and on this point the Owner would do well to pay his attention to the Builder. Also, no Architect can guarantee that the foundations will be solid, the cellar dry, the roof tight, that the floors will not warp and the ceiling be free from cracks. These matters are up to the Builder, for no matter how well designed, improper materials and workmanship can result in the defects mentioned and no Architect can prevent a Builder from using defective materials and workmanship if the Builder is the sort of person who intends to do so. It is a physical impossibility to check the proportions of every batch of concrete or the quality of every board which may go into a floor, etc. The Architect can force the Builder to remedy such defects after they develop, but he, himself, cannot prevent them occurring.

"For the Owner to secure the best value and result from any building project, it seems to me two things are important, first: select the proper Architect. Second: select the proper Builder. It seems to me that in your articles you should stress these two facts and prove that both are essential.

"I believe that to make your series effective you must lose sight of the fact that your main effort is to advance the interest of the Architect and concentrate upon solving the problem of the person who is going to build. Let the interests of the Architect come as a logical development of the solution of the problem facing anyone who plans to build anything.

"As to specific suggestions regarding certain points mentioned, I would note that on page 579, second column, you state that all bids are opened at the same time by the Architect, in the Owner's presence. This is seldom done, except in public work, as far as my experience goes. On page 581, the reference to large scale and full-size drawings, I would suggest that my experience has been that the best millwork concerns will not proceed without such drawings, which should be sufficient answer as to their necessity.

"In regard to reference to the cost of the Architect's services, I believe it would be a serious mistake to mention any definite percentages as you do on page 583. The percentage varies so much in different localities and with different Architects, that any such reference would probably be embarrassing to someone.

"I also believe that it would be well to put greater emphasis and to repeat the theme, from other angles, which you present in your last sentence on page 570. 'No Owner, however gifted in other ways, no Contractor, however skilled, can design and build the simplest house equal in beauty, utility, and economy to one completed under the guidance of a trained Architect.'"

From W. H. Cook of Youngstown, Ohio

"I read your proposed publicity document published in the July issue and am very much pleased with it. It should have the widest possible distribution. If funds will not permit its going any other place, it should at least be distributed to the various lumber companies who have been so active in promoting stock plans. It might help some of them to see the light of reasoning.

"I would also like to see copies available so that an architect could have them imprinted with his own name and distribute them as occasion warrants."

From William E. Frenaye, Jr. of New York

"The July, 1930, issue of Pencil Points has just come to my attention. I wish to compliment you on the straightforward, clear-thinking, fine piece of work you have done from pages 565 to 588. I want this thing to be of benefit to my firm."

From Alexander B. Trowbridge of Washington

"I have been much interested in your effort to place before the public the information which you believe the public should possess with regard to the value of an architect's service. I was one of your early contributors and sent my check quite promptly, as I wish to stand behind
PENCIL POINTS FOR SEPTEMBER, 1930

a sincere effort even though I was not wholly convinced with regard to the merits of your plan.

"I now note in the July number an elaborate literary effort, very fine from a reader's point of view but quite useless if it is not going to be read. The true test of your plan, therefore, is whether your document will be read by the public or whether it will find its way into waste baskets or dead files. I do not think the public would read a document of that kind even if you could claim that the best writing talent in the English speaking world had labored to qualify it to give legal advice. And the 'sincere effort,' as I have labeled it, is much too long and it is not educational. It merely states things in the assumption that every one will accept such statements as facts. An article to be educational must present more than your editorial dictum.

"To the average reader of your document it would seem as if the selection of any architect, who is privileged to call himself by that title, could secure to the owner all of the wonderful qualities which you state can be obtained through an architectural service. In my experience as a consulting architect I have had contact with many types, and I do not hesitate to say that sometimes an architectural firm of considerable standing in its own community can do a thing so asinine as to injure not only the firm's reputation, but the profession of architecture as well. I do not believe there is any architect that can supply all of the wonderful things that you more or less promise through the pages of your proposed booklet. While it is true that men learn through long experience how to interpret building laws, sanitary codes, fire laws, etc., they are by no means qualified to give legal advice. And the young men who have had very little contact with building departments and with the various hard-boiled officials who pass upon plans and specifications! Are they supposed to be so well informed that they can keep their clients out of legal difficulties? In brief I do not believe architects are in the habit of claiming for themselves all of the superior qualities you are claiming for them. It often happens that an architect will be talented in design and unpractical in matters of plan and construction. On the other hand it frequently occurs that an architect who is ingenious in matters of construction and economical in the use of space is not particularly gifted in the aesthetic side of his work. The interiors of his buildings prove it. Why give the public the idea that an architect is a tin god when you know that he is as fallible as any other type of professional?

"What worries me particularly in a general consideration of this question is the system which has developed whereby a young man just graduated from a school of architecture and perhaps just received as a registered architect by an official registration board is privileged to ask a fee which is fully as much as the fees asked by architects who have practiced for thirty or forty years. Does the long experience of our leading firms count for nothing? I do not wish to question the right of the young men to demand a fee of the minimum grade recommended by the Institute. I do question, however, a system which seems effectually to prevent the men of long experience from securing a larger fee than the minimum referred to. Our profession is underpaid and nothing effective is being done to better this condition.

"For a long time I have been opposed to the percentage system of determining charges. At times it is ridiculous, and frequently it is as fallible. When circumstances require that I should be paid a percentage of the cost, I find myself laughing at myself for accepting such an absurd system for I spend my life trying to help my clients reduce the costs of their projects. I am aware that this subject has many times been aired in print, but I do not recall that I have seen enough said about one feature of it. I claim that the percentage system injures the professional standing of architects in the minds of the public. If the public assumes that a boy just out of college can receive the same fee that is paid McKim, Mead & White, the public is perhaps inclined to look upon the product of those two firms as more or less equal, or, to put it differently, the public gets the idea that the work of an architect is mechanical and that one man can do it about as well as another. Obviously, the public is ignorant on that point.

"I would like to suggest an entirely different approach. I believe that the public is justified in its idea that the architects as a class are not practical when it comes to the question of costs. It is altogether too common for an owner to say, 'My building cost me a great deal more than I was told it was going to cost when the sketches were made.' This is sometimes partially offset in the owner's mind by a realization that he has secured from his architect a beautiful and perhaps worth the extra cost. But there is no question whatever that the architects have allowed a condition to develop which is exceedingly bad for the reputation of the profession as a whole.

"I should like to see you money and my money devoted to a plan for assisting the architects in the matter of preliminary estimates. Why would it not be just as well to state at the outset that the present system of arriving at a preliminary estimate is frequently only guesswork? It is true that an experienced office may hit it off quite accurately, especially when it is carrying out a project which is similar in many respects to something already constructed. But by and large I would hold that all architects would be greatly benefited if there existed a bureau or an organization whose business it would be to take a set of preliminary sketches and determine the cost very much as such matters are worked out by the quantity survey method. It is my recollection that the men who organized the quantity survey system in New York used to state that their estimates came within three or four per cent. of the final cost. If a bureau of that kind gets under way with many problems it is very likely that it would in time learn how to perform a remarkably valuable service for the architect. The architects in the meanwhile would be spoken of in a more complimentary tone than they are at present in matters connected with costs.

"I believe there is something wrong in a situation that admits of caustic, drastic criticism of books, plays, paintings and sculpture, but stops short of printed adverse criticisms of architecture. I would be glad to subscribe to a fund which would be used to defend a magazine or a newspaper in lawsuits which might crop up as a result of open criticisms of buildings. If we could find some way of publishing in the great newspapers, critical articles which would be instructive, we might accomplish just what you are aiming at.

"If my frank comments do not meet with your approval and you decide to go ahead with the issuance of your leaflet, I beg of you to put the soft pedal on those portions of the document which appear to state to laymen that if they will employ an architect all their troubles can be packed into an old kit bag. The smile, however, would be on the face of the architect."
COMPETITION FOR IMPROVED DESIGN FOR ELEVATED STEEL WATER TANKS AND THEIR SUPPORTING STRUCTURES

The officers of the Chicago Bridge & Iron Works, builders of elevated steel water tanks, are of the opinion that a considerable improvement could be made in the appearance of elevated steel tanks and their supporting structures. They believe that there are attractive architectural possibilities to be found in the natural characteristics of these structures. They have, therefore, undertaken to sponsor a competition in the hope of securing designs for a typical tank and tower from which may be developed types which will express pleasing aesthetic qualities. They offer the following prizes for the eight most interesting solutions:

1st prize $2,000.00
2nd prize 1,000.00
3rd prize 500.00
and five honorable mention prizes of $100.00 each.

Program: The form and method of procedure of this competition has been approved by the Chicago Chapter of the American Institute of Architects.

Architectural Adviser: The Chicago Bridge & Iron Works has appointed as its professional adviser in the competition, Mr. Albert M. Szwe, Architect, 430 No. Michigan Avenue, Chicago, Illinois, to prepare this program and to act as adviser in the conduct of the competition.

Competitors: Participation in the competition is open to such architects, engineers and draftsmen of the United States and Canada, as shall have made application to the Professional Adviser, by mail, on or before December 1, 1930. A list of the names of all those admitted to the competition will be mailed to each of the competitors on or before January 1, 1931. No competitor shall submit more than one design.

Jury of Award: The sponsor has appointed a Jury of Award consisting of Mr. Howard Cheney, President of the Chicago Chapter of the A.I.A., Mr. R. W. Zimmerman, Architect, of Chicago, and Mr. George T. Horton of the Chicago Bridge & Iron Works.

Authority of the Jury: The sponsor agrees that the Jury above named shall have authority to award the prizes in whatever order the Jury may consider to be the order of their merit, and that the Jury’s decision in the matter shall be final.

Examination of Designs and Award: The sponsor agrees to hang the designs in some suitable room and in an impartial manner as to arrangement and position, in order that they may be fairly judged.

The Professional Adviser will examine the designs to ascertain whether they comply with the requirements (mandatory) of this program and will report to the Jury any instance of failure to comply with same.

The Jury will carefully study the program and any modifications thereof which may have been made through communications, and will then consider all of the designs which have complied with the mandatory requirements and make the award and the classification of prize winners by secret ballot before opening the envelopes which contain the names of the competitors.

The opening of the envelopes, in what the Jury may consider the order of merit in the designs, will automatically award the prizes as heretofore enumerated.

Ownership and Use of Submitted Designs: All competitors agree, by the act of making application for participation, that their designs and drawings shall become the property of the sponsor and may be used by it without further obligation upon its part, in any way and for any purpose that it may desire in the accomplishment of the object of this competition.

Report of the Jury: The Jury will make a full report, which will state its reason for the selection of the designs and its reason for the classification of the designs placed next in order of merit, and a copy of this report, accompanied by the names of the prize winners, will be sent by the Professional Adviser to each competitor.

If, in the estimation of the Jury, no drawings have been submitted which fulfill the mandatory requirements of the program or no drawing has been submitted which contributes constructively or aesthetically to the object of this competition, the Jury may refuse to make an award of any of the eight prizes, or if no drawing has sufficient merit to be entitled to the first prize, the Jury may award to it the second prize, or the third prize, or an honorable mention, and it is hereby agreed that a decision to award any one or more, or no prizes, is wholly within the will and estimation of the Jury. However, in the event that no presentation, in the estimation of the Jury, has sufficient merit to be entitled to the award of any one of the first three prizes, all drawings shall be returned to the competitors at the expense of the Chicago Bridge & Iron Works, and further, in said event no use shall be made by the Chicago Bridge & Iron Works of any drawing or any original idea presented by such drawings.

Distribution of Prizes: The sponsor agrees to distribute its checks to the successful competitors within ten days of the judgment.

Exhibition of Drawings: No drawings will be exhibited or made public until after the award of the Jury. There will, however, be a suitable public exhibition of all of the submitted drawings under the circumstances mentioned above under “Examination of Design and Award.”

Communications (Mandatory): If any competitor desires information of any kind whatever in regard to the competition or program, he shall ask for this information by anonymous letter addressed to the Professional Adviser, and in no other way, and a copy of this letter and the answer thereto will be sent simultaneously to each competitor, but no request received after the day of January 1, 1931 will be answered.

Anonymity of Drawings (Mandatory): The drawings to be submitted shall bear no name or mark which could serve as a means of identification, nor shall any such name or mark appear upon the wrapper of the drawings, nor shall any competitor, directly or indirectly, reveal the identity of his design, or hold communication regarding the competition with the Owner, or with any member of the Jury, or with the Professional Adviser, except as provided for under the paragraph headed “Communications.”

It is understood that the act of submitting the design (Continued on page 82, Advertising Section)
WINNING DESIGN FOR "A COUNTRY ESTATE," BY RICHARD COOLIDGE MURDOCK

ROME PRIZE IN LANDSCAPE ARCHITECTURE FOR 1930

(See text opposite)
PRIZE AWARDED IN LANDSCAPE ARCHITECTURE

The American Academy in Rome has announced its annual award of a fellowship in landscape architecture. The winner of the fellowship is Richard C. Murdock of Osnining, New York. Mr. Murdock is 25 years of age and was graduated from Cornell University in 1929. During the past year he has worked in the office of Noel Chamberlin in New York City.

Honorable mentions were given to Hodge J. Hanson, of Mount Carmel, Ill., a graduate of the University of Illinois and a graduate student of landscape architecture for two years at Harvard University, and to Neil H. Parr, of Parkin, Arkansas, a graduate of Cornell University.

The fellowship carries an annual allowance of $1,550 with $500 for passage to and from Rome. Residence and studio at the Academy are provided free of charge. The term of the fellowship is three years, beginning October 1, 1930.

There were 38 entrants in the competition, and the problem called for a design for A Country Estate.

The members of the Jury of Award were Ferruccio Vitale, Chairman, Arthur F. Brickerhoff, Noel Chamberlin, Ralph E. Griswold, and Albert D. Taylor.

Mr. Murdock's winning drawings are shown opposite.

ARCHITECTURAL STUDENTS HONOR DEAN

On June 30th, the architectural students of John Huntington Polytechnic Institute tendered a dinner to Mr. Robert M. Wright, the retiring Dean of the Architectural Department. Mr. Wright has been the father of the architectural school since its organization some fifteen years ago. Previous to that time he was Massier of the Atelier of the Cleveland Architectural Club.

The dinner was attended by many of the former students who expressed their appreciation for the untiring efforts of Mr. Wright and what the Atelier has accomplished for them. These expressions of affection for their critic added greatly to the grief of the present students who sincerely regret his leaving them.

Mr. Wright was overwhelmed at the gathering of about fifty students, all his, and responded with a heartfelt talk to them of the pleasure he had derived in directing their efforts in the past, saying that it was with sincere regrets he was leaving the institution.

The guests of honor were Mr. Harry Hughes of Hicks, Hadlow, Hughes and Conrad, a former Clevelandian who contended for the Paris Prize and who worked in ateliers in Cleveland and New York with Mr. Wright. He told of the many escapades during their association in both cities. Mr. Dana Clark, designer with Walker & Weeks, also an associate instructor with Mr. Wright at the John Huntington Polytechnic Institute, gave a very fine talk on the spirit of the architectural school and included a good story about Anthony and Cleopatra.

A toast was given to the late John Huntington who founded the Polytechnic Institute. It is a school intended to further the development of students in architecture, decoration, painting and sculpture; it is purely a night school for students who find it necessary to work while studying. No students are accepted other than those employed in the arts.

The success of the dinner to a great extent is attributed to the efforts of Harry Sharpe, Chairman of the Committee, and E. F. Horley, Toastmaster.

CARL E. HOWELL

1879-1930

CARL E. HOWELL, Architect, of the firm of Howell & Thomas, died on June 17th at Monrovia, California.

Mr. Howell had been in failing health for more than two years and had given up active work in Cleveland for the climate of New Mexico and California. He had been in California only two months.

He was a Life Member of the Museum of Art, a member of the Chamber of Commerce, the University and Midday Clubs of Cleveland, the University of Pennsylvania Club of New York, and the Athletic, Rocky Fork, and Columbus Clubs of Columbus, Ohio. He was also a member of the American Institute of Architects and the American Academy in Rome.

Mr. Howell was born in Columbus in 1879, the son of Robert and Elizabeth Howell. He was educated at Ohio State University and studied drawing at the Columbus Art School. He entered the office of Frank E. Packard at Columbus, where he obtained two or three years' office experience, followed by a course in architecture at the University of Pennsylvania. While at Pennsylvania, he won several scholarships and membership in Sigma Xi, honorary scientific fraternity. He was also awarded the John Stewardson Traveling Scholarship in Architecture and spent a year traveling in Europe. After his return, he started the practice of architecture with J. W. Thomas in Columbus, in 1908.

In addition to house architecture, outstanding examples of the work of Howell & Thomas include the Library and Auditorium Buildings for Ohio University at Athens, Ohio, East High School of Columbus, Ohio, High Schools in Lakewood and Shaker Heights, Ohio, Churches at Columbus, Canton, and Oxford, Ohio, and Y. W. C. A. Buildings at Cleveland and Zanesville.

Another branch of architecture in which the firm has received recognition is the planning and designing of newspaper buildings.
DESIGN FOR "A STATE PENITENTIARY," BY RICHARD RUSH WEIR, JR.
WINNER OF PRINCETON THESIS PRIZE FOR 1930
(See text opposite)
ARCHITECTURAL THESSES AT PRINCETON

The Annual Prize of $500.00 for the best thesis submitted during the year in the Princeton School of Architecture was awarded for 1930 to Mr. Richard Rush Weir, Jr. The prize is offered by the Princeton Architectural Association (an organization of the alumni and friends of the School) and is given to help the winner defray the expenses of a trip to Europe for travel and study.

The subject of Mr. Weir's thesis was "A State Penitentiary." The Jury felt that he had not only made a comprehensive study of the problems of penology, but that his solution was a well thought-out and comprehensive scheme which presented a step forward in the architectural expression of institutions of this sort. The social, administrative and psychological implications of his program had been carefully analyzed, and expressed in an architectural scheme of great dignity, in which the forms and arrangements were derived from the implications of the problem. The other drawings submitted included such varied and interesting programs as "A Convention Hall for the City of Havana," by Eugenio Batista; "A Modern Church," by Rudolf H. Blatter; "An Air Terminal for the City of Washington," by J. B. Corner, Jr.; "A Congress of Nations," by Kenneth S. Kassler; "An Exposition," by John T. Moss, Jr.; and "A Municipal Health Center," by John W. Perse, Jr.

In addition to awarding the prize to Mr. Weir, the Jury "highly commended" the drawings of Messrs. Batista and Kassler, and "commended" those of Messrs. Blatter and Perse.

Mr. Weir has used his prize in continuing his study at Fontainebleau this summer. This fall he will return to Princeton as an Instructor in Design. His program, which was selected and written by himself and developed under the direction of the Staff of the School, was as follows:

"A State Penitentiary"

The serious outbreaks which have occurred in various prisons throughout the country since the summer of 1929 have awakened a widespread interest in the whole problem of prison design. Experts of various kinds—penologists, psychologists, psychiatrists, prison officials—have entered the discussion and have published many suggestions for changes.

The analysis of the problem has been particularly interesting to the architect since it presents him with a very living program and one which is the result of the study of specialists. To him is left the task of examining this mass of material, and of finding an architectural solution for the many sociological principles which have been placed before him. In achieving this solution the architect must of course find a logical and studied coordination of the elements involved, but he should go even further than usual in insisting on the expression of their composition, since thereby he is giving evidence to the inmate of the inevitable organization which constitutes prison discipline.

This project has therefore as its subject a state penitentiary which shall be an architectural answer to the suggestions which have been made within the past year. The outstanding ideas which have been expressed in this connection are:

1. The maximum number of prisoners to be accommodated in any one prison should be 2000.
2. All prisoners should be classified on various physical and psychological standards and the nature of their quarters and occupations determined in accordance with these classifications.
3. Adequate industrial and recreational facilities must be provided in order to eliminate idleness.

These considerations merely pose a problem and any written discussion of how it is to be solved architecturally will accompany the drawings and will be the result of study paralleling the development of the problem, rather than a set of preconceived ideas.

In general the elements needed will be: Administration, Offices of Wardens, Visitors' Rooms, Clerical Offices; Classification, Reception of Prisoners, Offices for Classification Staff, Group Examination Rooms, Physical Examination Rooms; Cell Group, Cell Buildings, Bath Houses, Mess Halls and Kitchens, Auditorium and Chapels, School and Library; Infirmary; Guards' Quarters; Industrial Group; Farm Group, Dormitories, Farm Buildings; Services, Laundry, Storehouses, Garage, Firehouse, Power Plant, Maintenance Buildings. The site is a large state-owned tract of which a maximum of 100 acres is available for the prison proper exclusive of the farm lands.

Mr. Weir's drawings are reproduced on the opposite page.
PRIZE WINNING DESIGN FOR "A SUMMER HOTEL AND RESORT ON AN ISLAND," BY GEORGE E. FISCHER
STEEDMAN MEMORIAL FELLOWSHIP COMPETITION, WASHINGTON UNIVERSITY
(See text opposite)
STEEDMAN SCHOLARSHIP COMPETITION

Owing to certain conditions the Steedman Scholarship Competition Drawings for 1929 were not released to us for publication at the time the scholarship was awarded. Therefore we are glad to present them at this time with the announcement that Mr. Fischer, the winner, has recently left for his year of travel and study abroad.

The subject of the program of the competition was "A Summer Hotel and Resort on an Island," which required a utilitarian as well as an aesthetic solution. The Jury of Award consisted of Messrs. Henry Hornbostel, Chairman, E. J. Weber, H. A. Schwab, and Benno Janssen, Architects, of Pittsburgh. The scholarship was awarded to George Eckerson Fischer, who is the fourth Steedman Fellow. There were twelve competitors in the competition.

Mr. Fischer was born in Beardstown, Illinois, in 1907. He graduated from the High School of his home town in 1924, and entered the School of Architecture of Washington University in the fall of the same year. After the completion of the four-year course in Architecture, he graduated with final honors in June, 1928. Owing to the brilliance of his record in the undergraduate course, he was awarded a scholarship at the Massachusetts Institute of Technology in the fall of 1928. He completed the work required for the Master's Degree in Architecture, which he received in June, 1929.

During his year of residence at the Massachusetts Institute of Technology, he entered the 1929 Competition for the James Harrison Steedman Fellowship in Architecture, conducted by Washington University. In April he was awarded this much-coveted Traveling Fellowship, which provides for a stipend of $1,500 for a year of study and travel abroad. He chose to remain an additional year in St. Louis in order to acquire practical experience in the office of Mr. Beverly Nelson, Architect. He sailed for Europe on July 21st and, in compliance with the terms of the fellowship, is not expected to return until the end of the summer of 1931. He is expected to bring with him an interesting record of his travel throughout Europe in the form of sketches or measured drawings.

TAU SIGMA DELTA HONORARY FRATERNITY

Tau Sigma Delta Honorary Fraternity in Architecture and Allied Arts announces the establishment of the Kappa Chapter at the School of Architecture and the School of Landscape Architecture at the Iowa State College, Ames, Iowa. The Charter members are Prof. Allen Holmes Kimball, Head of Department of Architecture, George Oliver Beach, Leonard Wolf, Harold Ludwig Hunzinger, Gerald Irving Griffith, Ernest Clifford Ebert, Glenn E. Crippen, Walter E. Becke, C. Eldon Jones, John Merton Hall, Edouard Evart Exline, Norman Arthur Morris, and LeRoy Howard Wendt. Grand Master P. H. Elwood, Jr., Head of the School of Landscape Architecture, directed the installation of the Chapter.

GEO. A. LICHT ADDED TO STAFF OF N. Y. U.

Dean Bosance, of the Department of Architecture, New York University, announces the appointment of George A. Licht as additional critic in Design for the coming year. Mr. Licht, the winner of the first Paris Prize in 1904, is one of the most successful patrons in design in this country. He has served with the faculties of Princeton and Columbia and in addition has had for many years an atelier of his own, which has won many high awards in the Beaux-Arts Institute Competitions. The design staff of New York University now includes Burnham Hoyt, George S. Koyl, Will Rice Amon, A. G. Schweizer, and E. O. Helien.
THE ANNUAL SUMMER FROLIC will be held some time in the middle of September, exact date and place to be announced later. Same will consist of an outing during which games and sports will be indulged in, followed by a dinner in the evening. Tickets will sell at $2.50, covering all refreshments, dinner, etc. Those affiliated with the architectural profession and building trades in Northern New Jersey are invited to join us.

A program for the granting of certificates and mentions of merit for various types of buildings erected within the last year in Bergen and Passaic Counties will be announced in the Fall and same will be open to owners and architects of such structures. The program and the final selection and awards will be announced in the public press. This is undertaken to stimulate public interest and appreciation in better architecture in this vicinity.

The regular meeting date has been changed and meetings are now held on the third Thursday of every month at the Elm Chateau, 285 State Street, Hackensack, New Jersey.

WESTCHESTER COUNTY SOCIETY OF ARCHITECTS

THE SECOND ANNUAL FIELD DAY of the Westchester County Society of Architects, which was held at the Gedney Farm Golf Club on June 18th, was attended by the following members: Bruno Amato, Jas. W. Clyde, Wm. C. Halbert, Wm. H. Jones, Louis Levine, Laurence M. Loeb, John M. Paul, Howard B. Peare, Louis M. Petry, Theodore Richards, Fred E. Winter, and Charles B. Forbes.

The prize for the low net score was won by Theodore Richards and low gross by Howard B. Peare.

Hon. Jas. F. Bly was the guest of the day and gave a very interesting talk on legislation.

The Association is steadily growing, the following new members having been recently elected: Paul Cerrina, William Cane, Jos. Emmet Kelly and Frank Kronfeld.

ABOUT DESIGNS IN THE PENCIL POINTS COMPETITION

WILL MICHAEL DE RUBERTIS of Cleveland and Everett G. Nash of Chicago please communicate with the PENCIL POINTS Editorial Office at 419 Fourth Avenue, New York, giving us their new addresses in order that their designs submitted in the PENCIL POINTS COMPETITION for an Eight-room House may be returned.

Also, we should like to hear from competitors in this competition whose drawings carried the following devices: A Deep Secret, Nom de Plume, and Pen N. Ink, and any other competitors who have not as yet had their drawings returned. We are holding several unidentified designs here in the office.
This department conducts four competitions each month. A prize of $10.00 is awarded in each class as follows: Class 1, sketches or drawings in any medium; Class 2, poetry; Class 3, cartoons; Class 4, miscellaneous items not coming under the above headings. Everyone is eligible to enter material in any of these four divisions. Good Wrinkle Section: a prize of $10.00 is awarded for any suggestion as to how work in the drafting room may be facilitated. No matter how simple the scheme, if you have found it of help in making your work easier, send it in. Competitions close the fifteenth of each month so that contributions for a forthcoming issue must be received by the twelfth of the month preceding the publication date in order to be eligible for that month's competitions. Material received after the closing date is entered in the following month's competitions. The publishers reserve the right to publish any of the material, other than the prize winners, at any time, unless specifically requested not to do so by the contributor.

The prizes in our regular monthly competitions have been awarded as follows:

Class I—John Welker, New York
Class II—Thomas Pao Ho Liang, Tientsin, China
Class III—No Award
Class IV—Victor Szucs, Astoria, L. I.
Good Wrinkle—Philip S. Metcalf, Boston

The urge to conduct another Here and There Extra Special Competition has come over us. We had a request from one of our subscribers for information on gin mill designing. After days of research we have had to admit defeat—there is no authentic literature available! Thus inspired we hereby announce a competition for the design of A Gin Mill—open to all architects, draftsmen, and students. Two prizes will be awarded as follows: First Prize, $25.00; Second Prize, $15.

All drawings must be done in black and white on a sheet that will reduce to 9" x 6⅛". The Competition closes Friday, November 7th, 1930, at five o'clock. Address all entries to E. L. C, Pencil Points Press, Inc., 419 Fourth Avenue, New York.

Mr. Liang also sent us the following: "One day I strolled into a department store and a terrible smell filled my nostrils. I asked the first employee I met, 'What smells so bad here?' to which he replied, 'That's business; it's rotten.'"
A CONVENIENT ARRANGEMENT FOR BEAM CALCULATIONS
By Philip S. Metcalf, of Boston, Mass.
(Prize—Good Winkle—August Competition)

THE FOLLOWING IS a very simple and convenient method of arranging the necessary calculations involved in finding the reactions preliminary to finding the maximum bending moment in beams.

The chief advantage of this method is that the designer can see at a glance just what portion of the various loads is carried to each reaction, and each step can be automatically checked as the work proceeds. It is more foolproof than the customary method of taking moments about one end of the beam and subtracting the reaction thus found from the sum of the loads to find the other reaction.

An example is the simplest explanation. In the beam shown in the figure, multiply load "a" by its moment arm of 5 feet, divide by the span of 20 ft. and write the result of 250 lbs. under the right end of the beam as shown. Then multiply the same load by its moment arm of 15 ft., divide by the span of 20 feet and write the result of 750 lbs. under the left-hand end of the beam.

Write the load "a" which is under consideration under the middle of the beam and on the same line with the figures just previously written. The two parts of the load should total up to the original load.

Continue with the other concentrated loads in the same manner. The uniform load would of course be as follows:

For the portion carried to the left reaction:
$$\left(\frac{17 \times 1500}{5}\right) = 14,662.5 \text{ lbs.}$$

For the portion carried to the right reaction:
$$\left(\frac{17 \times 1500}{20}\right) = 10,837.5 \text{ lbs.}$$

Finally add all the loads at the left reaction together and all the loads at the right reaction together. The sum of the two reactions should equal the sum of the loads in the middle column.

ONE IS BORN EVERY DAY
Reprinted from *The Lintel* for July, 1930

The following letter from Robert W. Snyder, Architect, San Diego, has been received and noted with much interest:

Dear Mr. Robin:

Am enclosing clip from San Diego Union Development Page.

Can you beat it? It seems pretty rare to me.

Yours,

R. W. Snyder.

We disagree only in one point with Mr. Snyder; his use of the word rare. We believe raw would be more exact.

It is entitled "Home Building Hints by S. D. Architect." S. D. we imagine is an abbreviation for "Some Damn"—Certainly not for San Diego. The article is too long and idiotic to print in full but the following choice bits will serve to show why many persons are possessed with the belief that architects are the bunk.

"Generally speaking, a sideboard looks best when it is at one side of the dining room.

"If there is a pretty garden visible from the dining room it is well to have a wide group of three or four windows.

"Two doors are usually placed between the dining room and kitchen. In many cases much space can be saved by a single door.

"If the hall is 20 to 25 feet long it can be 8 to 10 feet wide in order to preserve good proportions but in small houses halls are frequently less in length in which case they may be narrower.

"Large houses should be provided with a staircase from the first to second stories.

"If there is a billiard room in the attic or basement a separate staircase is frequently desirable."

It is quite certain that such doggerel as this does more harm than good to the conscientious architect who has something worth while to contribute to his client.

BOOK PLATE BY VICTOR Szucs, OF ASTORIA, L. I.
(Prize—Class Four—August Competition)
ABOUT NINE YEARS AGO I wrote an article on paint and varnish, which no doubt some of my readers may remember. Since that time many new materials have been put on the market, and I have learned many things which I did not know at that time. Taking those facts into consideration, I feel that I can again write on that subject and tell much that was not included in my earlier article.

Despite all of the many changes and inventions, white lead and linseed oil paint are still more extensively used than any other painting medium. White lead is basic lead carbonate containing from twenty-five to thirty per cent. of lead hydrate. It is probably the oldest form of pigment known, having been mentioned in literature as early as 430 B.C., and the records seem to indicate that it was made by a process not widely different from the Old Dutch Process of the present day, which is the method now most widely used. It is produced either by the corrosion process (the Old Dutch Process), or by the precipitation process, and the paste white lead is ground with eight per cent. of linseed oil.

Sublimed white lead is basic lead sulphate and is practically nonpoisonous. It is produced by sublimation and oxidation from lead ore. It has good spreading power and good body, but has not the opacity or hiding power of white lead. Since that time many new materials have been put on the market, and I have learned many things which I did not know at that time. Taking those facts into consideration, I feel that I can again write on that subject and tell much that was not included in my earlier article.

Zinc does not work well in an acid oil, and it also requires about twice as much oil as lead. Zinc oxide mixed with white lead for exterior painting retards chalking, and tells much that was not included in my earlier article. Another pigment which has some very excellent qualities is aluminum which is mixed with either a linseed oil or a varnish vehicle. This paint is used both on wood and metals, and makes an excellent priming coat for exterior wood work on account of its moisture resisting qualities. One use for which I have specified aluminum paint and for which I will recommend it to all others who write specifications, is for a priming coat on galvanized iron work which is to be exposed to moisture.

Linseed oil is usually specified to be “raw oil,” but for special uses, particularly when used as a vehicle for red lead paint for priming metal work, “boiled linseed oil” should be specified. Boiled linseed oil dries with a distinct gloss and makes a fairly hard film over night. Boiled oil should be specified to be “genuine kettle boiled linseed oil.” The so-called “bung hole” oil is a mixture of raw linseed oil and driers made up from metallic oxides.

In addition to the pigment and vehicle the other two component parts of practically all paints are volatile thinners and driers. Volatile thinners are added to paint for the purpose of making it spread farther and for obtaining a film of the proper thickness. The standard thinner and practically the only one which should be used in high class work is turpentine.

Turpentine is distilled either from the resin of the Southern Pine, or from the wood. Gum spirits turpentine should always be specified, and as an extra precaution it should be specified to be distilled from the sap of living trees. Benzol and solvent naphtha, which are coal tar

THE SPECIFICATION DESK
A Department for the Specification Writer

PAINT AND VARNISH

By David B. Emerson
distillates, are also used as thinners, and are recommended for use in the priming coat for resinous, hard, or non-absorbent wood to aid the penetration of the paint.

Driers are compounds of lead and manganese oxides heated and then dissolved in linseed oil, and are called "oil driers." If thinned with turpentine or benzine or zinc or with a combination of both, they are called "liquid driers." Japan driers, in addition to the metallic oxides, the oil, and turpentine, contain gums or gum resins. They act as carriers of oxygen between the air and the oil, and their addition to the paint makes it dry more rapidly. An excess of drier will make paint lose its durability.

Where colors are desired, tinting colors ground in oil are added to the white pigments which have been described. For black or very dark green paints the colors are mixed with the oil without the addition of white lead or other white pigment. Colors are made from various mineral and vegetable substances, generally mineral and some are coal tar derivatives.

Flat wall paints are made up of lithopone which is a combination of zinc sulphide and barium sulphate, and China wood oil, which by the way is not made from the wood, but from the nuts of the Tung tree which grows in China. China wood oil renders the paint more durable, makes it brush much easier and makes it more moisture resisting. Where color is desired, colors ground in oil are mixed with the white paint to obtain the lighter shades and for the darker colors the pigment is ground with the lithopone.

The higher grade enamels are no longer mixed with varnish, but are composed of zinc oxide and specially treated linseed oil which has been kettle bodied and bleached. The driers are reduced to a minimum to preserve the whiteness of the enamel. This is the principle reason why high grade enamels always dry slowly. Enamels may be colored by the addition of colors ground in oil. For high grade enamels only the lighter tones are used, as only about five per cent. of colored pigment should be added to the white enamel.

Enamel undercoaters are made with a lithopone pigment and specially treated oils, principally China wood oil. In the specifying of enamels, it should always be noted that all enamel undercoaters should be the same make as the enamel which is to be used, if not the painter may use a cheaper lithopone product with more or less unsatisfactory results.

Practically all "mill whites" or industrial enamels are made up of lithopone and specially treated linseed oil. The newest development in the field of enamels is the quick drying enamels, not to be confused with the lacquers, which are a decidedly different article, although certain materials are used in the manufacture of both. These enamels under proper drying conditions dry "dust free" in a few minutes and will dry hard enough to recoat in four hours, so it is perfectly easy to apply two coats in a day and have time to spare. They are made up of lithopone with a quick drying varnish as a vehicle. These enamels dry with a gloss and may be rubbed exactly the same as the regular long oil enamels.

Varnishes are generally composed of fossil resins or gums, which are the sap of prehistoric trees, drying oils which render the varnish elastic and durable, metallic driers, which are incorporated with the oils to hasten the drying of the varnish film and volatile solvents which aid the spreading of the varnish on the work. The resins are copal, kauri, and others, and are found in Africa, New Zealand, and the East Indies. The oils are linseed oil and China wood oil. Linseed oil produces a varnish of greater elasticity, fuller body and lustre and with better flooring qualities. China wood oil is more waterproof than linseed oil, and it also causes the varnish to harden quicker than linseed oil.

Spar varnishes require linseed oil; a combination of China wood oil and linseed oil are best for floor varnishes. Varnish is produced by a cooking process. The gum is first melted, the oil which is usually preheated is added, and when the mixture is sufficiently cooled to prevent their flashing the thinners are added. This process differs very little from that described by Theophilus; a monk who wrote in the Eleventh Century. After thoroughly settling and filtering all good varnishes are allowed to age thoroughly, which is very essential for good results.

The latest development in the varnish field of which I have any knowledge is the so-called "four-hour" varnishes. These varnishes are being made by most of the leading varnish manufacturers, and are called "liquid driers." Japan driers, in addition to the metallic oxides, are reduced to a minimum to dry "dust free" in a few minutes and will dry hard in four hours. The principal difference between these varnishes and the regular slow drying varnishes, is that the four-hour varnishes are made up from synthetic or manufactured gums and China wood oil, which is both waterproof and quick drying. The synthetic gums are the ester gum which is made by a chemical combination of resin and glycerine (but its properties are entirely different than those of either rosin or glycerine), or the condensation products of phenol and formaldehyde. These varnishes dry with a gloss and can be rubbed the same as all gloss varnishes.

Dull drying varnishes are produced by a proper emulsification of varnish by the addition of somewhat less than one per cent. of water which has the physical effect of destroying the gloss of the varnish.

Now, while we are considering varnishes, let me inject a few words on shellac, which is not a true varnish but is often confused with varnishes. Shellac is a gum obtained from the lac insects which live upon the twigs of certain resinosous trees in India and other tropical countries. These insects exclude a gum-like secretion which finally covers the twigs and twigs are broken up or coarsely pulverized and then placed in hot water which melts the resinous matter and liberates the wood. This process is facilitated by kneading the melted resin. It is then taken out and dried, and afterwards washed and dried a number of times. It is then given a heat treatment, melted, and allowed to harden.

The resulting gum is in thin flakes and of a deep brownish orange color. This gum is cut with alcohol and rendered liquid in which state it is used in painting and wood finishing. Shellac should only be used for "knot stopping," that is the covering of knots and pitchy places in wood before painting, to prevent them from bleeding through the varnish, and on light-colored flooring, to prevent the floor varnish from darkening the wood. It should never be used as final finish, particularly on floors, as it turns permanently white when touched by water, is very brittle and easily shows dents and heel marks.

The newest and probably the most radical development in the paint and varnish industry, is the lacquers which have been introduced in the past few years. They are being very extensively advertised, and are being manufactured by most of the leading varnish manufacturers.
PAINT AND VARNISH.

The present day lacquers which are manufactured in this country should not be confused with the Chinese and Japanese lacquers, which are an entirely different product, as anyone who read Miss Houch's very interesting article in the August number of PENCIL POINTS will very easily understand. The basis of all present day lacquers, and the ingredient which distinguishes them from paints and varnish, is soluble nitro-cellulose. Soluble nitro-cellulose made from cotton linters (the short fibers of cotton which surround the cotton seed, which previous to about thirty-five years ago, were regarded as waste matter) treated with a mixture of nitric and sulphuric acids. Nitro-cellulose is what renders lacquers tough, elastic and durable, just as oils do in varnishes.

The next most important ingredient in lacquers is the gums and resins, which broadly speaking are much the same as those used in varnishes, and which impart the same properties to lacquers as they do to varnishes, which oils do in varnishes.

The resins used are either the fossil gums or the synthetic or manufactured gums the same as used in the quick drying varnishes. In the making of lacquers the resins, like the nitro-cellulose, are used in the form of a solution. There are numerous solvents used in the manufacture of lacquers, the principal ones used to dissolve the nitro-cellulose are either of the amylacetate (banana oil) group, some of the derivatives of glycol and anhydrous or water free alcohol which is commonly used in conjunction with the other types of solvents. The solvents for the resins are either the alcohols, such as ethyl alcohol, butyl alcohol and amyl alcohol; the coal tar products such as turpentine, Xylol and solvent naphtha, and the petroleum products such as benzine. Benzol was largely used as a solvent in the past, but having been found to be poisonous, its use was discontinued by all reputable manufacturers of lacquers.

Lacquers are made clear or colorless, or in the form of lacquer enamels, which are made by incorporating pigment with a clear lacquer.

The pigment is ground in a pebble mill, stone mill, or roller mill, in a portion of clear lacquer, and the resultant paste is then thinned with additional clear lacquer and thinner. Lacquers may be applied either by spraying or brushing. The sprayed lacquer dries quicker than the brushed lacquer but as the labor unions are bitterly opposed to spraying, it is impossible to use sprayed lacquer on any new work in the larger cities. So far as I have any information on the subject, no manufacturer of lacquers has up to the present time been able to produce a lacquer that brushes as well as a good oil varnish or enamel. Lacquers as a class are harder and tougher than varnishes or oil enamels and are generally more resistant to scratching or marring or to printing from heavy weights. Most brushing lacquers never become as hard as spraying lacquers, due to the fact that they are of necessity much slower drying. As to the question of elasticity, lacquer is much inferior to varnish. A film of lacquer is very much stronger than one of varnish, but it can not be stretched nearly as far before it breaks. For this reason lacquer is not suitable for exterior work, as the expansion and contraction of the wood, due to atmospheric changes will cause it to crack, whereas paint and varnish have sufficient elasticity to follow the changes in the wood and the film remains intact. Lacquers are made in gloss or dull drying with a semi-gloss and the gloss lacquers can be rubbed to a dull finish the same as oil varnishes and enamels.

A recent product which has been developed as a direct result of a new class of materials which is on the market, is a special paint for acoustical materials—either plaster, felt, or boards. This paint is washable and it is claimed that it does impair the porosity of the acoustical materials. It is recommended by the manufacturers of acoustical materials and works very well. The process of manufacturing being more or less secret, I am unable to tell anything about its composition, but I have an idea that it is a lithopone product.

After having discussed some of the various new materials, it may not be amiss to consider some of the old stand-bys. We all specify kalsomine and very few of us know anything about its composition, and if asked would either have to plead guilty to not knowing or else do a little equivocating. Kalsomine, according to the formula of one of New York City's leading painters and decorators, is made up of whiting which is pulverized chalk and glue with a fair amount of flaxseed added. To this mixture dry water color mixed with hot water is added to produce tone effects. The cold water and hot water paints contain practically the same ingredients mixed under improved methods.

Another of the old stand-bys which is still in use and which in my opinion gives a most pleasing texture when applied to brick is the Spanish whiting, which is what it is, a mixture of formulae for whitewash, but the government formula which is used by the United States Lighthouse Board is undoubtedly the last in use. As several of my acquaintances have asked me for this formula recently, I do not believe it will be at all out of order to give it here so that all of my readers who wish it may have it.

Slake one-half bushel of lump lime in boiling water, keeping it covered. Strain the slaked lime and add one peck of salt, dissolved in warm water, and then boil to the consistency of a thin paste. Add one-half pound of Spanish whitening, and one pound of clear glue dissolved in warm water; mix thoroughly and allow the mixture to stand for several hours. Keep the whitewash in a kettle or a portable furnace, and apply as hot as possible using a wide brush. The whitewash is improved by the addition of three pounds of powdered rice before boiling.

After having briefly described most of the outstanding materials in the paint and varnish field, I will tell the reader that to the best of my knowledge there is no sure way to judge these materials except by experience, either your own or some one's else, the latter being the better and safer if we can only profit by it.

CONCERNING A RECENT ARTICLE BY
MR. EMERSON

By L. N. Whitchcraft
District Engineer, Portland Cement Association

Editor's Note.—The following article sent to us by Mr. Whitchcraft will be of interest to those who have read Mr. Emerson's article in the July issue of PENCIL POINTS. We are always glad to hear from our readers and invite a further discussion of this important subject.

MR. EMERSON'S DISCUSSION on "Waterproofing, Damp-proofing, and Floor Hardeners," appearing in the Specification Desk Department of the July issue of PENCIL POINTS, is indeed timely and should be of interest to most specification writers. His suggestions for the surface treatment of concrete to render it waterproof are of particular value as the methods recommended are excellent expedients in overcoming the difficulties that are often encountered in the production of watertight concrete in building con-
struction where only a small proportion of the total concrete is required to be watertight.

On the other hand, many concrete structures which are required to be watertight throughout have given entirely satisfactory results without the application of surface treatments or the addition of compounds to the concrete mixture. Thorough understanding of the basic principles of concrete making and their correct application in the field are necessary to obtain the best results. Neglect of these principles can not be compensated for by the addition of other materials and the unsatisfactory results can only be corrected by the surface treatment method at a later date.

Readers may be misled by such statements as “Integral waterproofing is accomplished by adding various substances—to the concrete to fill the pores, thereby keeping out all waters” and “This method closes all the minute voids and pores in the concrete, which is all that is required to render it absolutely waterproof.” When it is realized that these minute voids and pores in concrete are formed by the evaporation and loss of the excess water above that required for the hydration of the cement it will be readily understood that these materials can not possibly fill the voids as they are added to the mixture while it is plastic and can not move into the void spaces which are not formed until after the concrete has hardened.

How, then, may watertight concrete be produced? By reducing the number and size of the voids and by distributing them uniformly throughout the mass so that they can not form continuous passages for the entrance of water. A requirement of watertight concrete is the use of aggregates of low porosity each particle of which is thoroughly surrounded by cement paste which is itself watertight. Little, if any, water can pass through the particles of the silicious or calcareous materials generally used as aggregate, so that the real problem is to produce watertight paste which will actually float the aggregate particles and hold them in place until the concrete has hardened.

In the great majority of cases where unsatisfactory results are encountered, the difficulty has been confined to comparatively small areas—construction joints or fill planes being prolific sources of leakage while the porous concrete is in the area near the top of each lift. These are indications of improper bond between the layers and segregation of the materials while the concrete is still plastic. Antiquated specifications are often responsible for the latter—the 1:2:4 or leaner mixes, interpreted as field mixes, giving undersanded mixtures that are harsh and do not have proper workability. In placing such concrete, excess water is used in an attempt to overcome the harshness but with the consequent segregation indicated on so many jobs, a porous area near the top of each layer where the excess water and the fine particles of sand with dirt and other objectionable fine material have collected while the lower section of the layer is of sound, watertight concrete.
A proper design of the mixture, using the identical materials but proportioning them to give a plastic, "sticky" concrete, without exceeding the amount of mixing water found from experience and tests to be the limit for watertight concrete, would almost invariably have given good results. For ordinary construction this is about 6 gallons per sack of cement; where the sections are thin this should be further reduced to about 5 gallons, while for extra thick sections such as gravity dams and retaining walls the quantity may be increased to as much as $\frac{3}{4}$ gallons, depending on the thickness. These quantities include the surface water entering the mixture as moisture on the aggregates.

Limiting the amount of mixing water does not mean the use of a stiff mix. Proper plasticity is a requirement for proper placing and consolidation of the mass, but it should be obtained by adjustments in the aggregate proportions. The concrete should be placed in thin layers, keeping the top surface horizontal, and should be rodded and spaded. It should not be permitted to flow over long distances in the forms as segregation is almost certain to result. Continuous placing should be followed where possible. When placing is intermittent, care should be taken to bond the succeeding layers thoroughly. All laitance, dirt, and loose particles should be picked and swept off, presenting a rough, clean surface for the new concrete. Some engineers recommend a cement grout to be slushed on the surface just prior to placing the fresh concrete. A further precaution for a tight construction joint is to place a galvanized metal or copper strip in the joint, half of it extending into the lower layer and the other half into the upper layer of concrete.

Curing is an important process in the production of watertight concrete. The purpose of curing is to prevent the evaporation of water from the concrete, giving it time to unite with the cement. The products of hydration build up the internal structure of the concrete and leave less uncombined water to form pores and voids upon evaporation. Leaving the vertical forms in place is of assistance in curing. Horizontal surfaces may be covered with damp sand or burlap and kept moist by sprinkling. Covering should be placed as soon as it can be done without marring the surface. Concrete for watertight construction should be cured by keeping it moist for at least 10 days.

Failure to observe any of the above principles may result in unsatisfactory work regardless of the materials that are used. Fortunately any contractor can carry out these operations nor need they involve more expense than the slipshod method all too frequently used.
SERVICE DEPARTMENTS

THE MART. In this department we will print, free of charge, notices from readers (dealers excepted) having for sale, or desiring to purchase books, drawing instruments and other property pertaining directly to the profession or business in which most of us are engaged. Such notices will be inserted in one issue only, but there is no limit to the number of different notices pertaining to different things which any subscriber may insert.

PERSONAL NOTICES. Announcements concerning the opening of new offices for the practice of architecture, changes in architectural firms, changes of address and items of personal interest will be printed under this heading free of charge.

QUERIES AND ANSWERS. In this department we shall undertake to answer to the best of our ability all questions from our subscribers concerning the problems of the drafting room, broadly considered. Questions of design, construction, or anything else which may arise in the daily work of an architect or a draftsman, are solicited. Where such questions are of broad interest, the answers will be published in the paper. Others will be answered promptly by letter.

FREE EMPLOYMENT SERVICE. In this department we shall continue to print, free of charge, notices from architects or others requiring designers, draftsmen, specification writers, or superintendents, as well as from those seeking similar positions. Such notices will also be posted on the job bulletin board at our main office, which is accessible to all.

SPECIAL NOTICE TO ARCHITECTS LOCATED OUTSIDE OF THE UNITED STATES: Should you be interested in any building material or equipment manufactured in America, we will gladly procure and send, without charge, any information you may desire concerning it.

Notices submitted for publication in these Service Departments must reach us before the fifth of each month if they are to be inserted in the next issue. Address all communications to 419 Fourth Avenue, New York, N. Y.

THE MART

Homer V. Geib, Box 925, Lake Wales, Florida, would like to obtain the following copies of Pencil Points: July, October, and November, 1920; August, October, 1921; April, 1922; June, 1925. State prices.

S. Lagunas, B. de Irigoyen 171, Buenos Aires, Argentina, will pay 45c each for the following copies of Pencil Points: April, and September, 1928; January, April, May, July, August, and September, 1929.

TO RENT—Unusual space to sublease in well equipped New York architect's office. Address communications to Statistical Department, Pencil Points Press, Inc., 419 Fourth Avenue, New York.

The Fred. Wagner Co., 113 East Fifth Street, Cincinnati, Ohio, has the July, August, and September, 1929, issues of Pencil Points; also a few 1930 copies, of which they would like to dispose.

John H. Geerling, Blackwell-Wieland Co., 1605 Locust Street, St. Louis, Mo., would like to obtain the August, 1929, issue of Pencil Points.

McVey & Cohagen, Billings, Montana, would like to have the December, 1922, issue of Pencil Points.

F. G. Gamba, Calle 19, No. 396, Vedado, Havana, Cuba, has the following copies of Pencil Points for sale at $1.50 each, or $9.00 for the lot: July, August, and September, 1921; November, 1922; November, and December, 1923; September, 1926.

J. Kendall Hanson, 14 Orchard Street, Peabody, Mass., has the following copies of Pencil Points for sale: all of 1926, except January; 1927; 1928; and 1929.

W. E. Needham, 156 East 46th Street, New York, has for sale one K. & F. Polykase Duplex Slide Rule No. 4088-3s with leather case, brand new, price $6.00.

Stephen J. Ames, 859 Westgate Ave., St. Louis, Mo., will sell Pencil Points issues of April through August, 1930.

FREE EMPLOYMENT SERVICE ITEMS WILL BE FOUND ON PAGES 86, 88, AND 89, ADVERTISING SECTION

PERSONALS

Max Sandfield, Architect, has opened offices recently in the Milam Building, San Antonio, Texas.

M. Louis Kroman, Architect, has moved his offices from 134 No. La Salle Street, to 180 No. Michigan Avenue, Chicago, Illinois.

Frederick A. Muhlenberg, Architect, announces that S. M. Yerkes and Charles R. Muhlenberg, former associates, were admitted into full partnership and that the firm name will hereafter be Muhlenberg, Yerkes & Muhlenberg. The address will remain as before, Ganster Bldg., Reading, Penna.

A. Salmon and M. F. Adamson have become associated for the practice of Architecture under the name of Salmon & Adamson, with offices at 1536 Enquirer Building, Cincinnati, Ohio.

Marani & Lawson, Architects, announce that R. L. Morris has become a member of the firm which will now practice under the name of Marani, Lawson & Morris, Architects, 38 Bloor Street West, Toronto, Canada.

The firm of Murphy and Lehmann has been dissolved. Henry V. Murphy is continuing the practice of architecture at 208 Livingston Street, Brooklyn, N. Y. Edward A. Lehmann has opened a new office for the practice of architecture at 101 Park Avenue, New York.

James L. Gatling, Architect, has opened offices at 811 Bankers Bond Bldg., Birmingham, Alabama.

The office of Joseph Evans Sperry, 409 Calvert Bldg., Baltimore, Md., announces with regret the death of the senior member of the firm, Mr. Joseph Evans Sperry, F.A.I.A. on August 6th, 1930. The practice of architecture will be continued under the same firm name by the surviving partners, Herbert G. Crisp and James R. Edmunds, Jr.
COMPETITION FOR IMPROVED DESIGN FOR ELEVATED STEEL WATER TANKS AND THEIR SUPPORTING STRUCTURES

(Continued from page 757, Editorial Section)

shall constitute an affirmation by the competitor that he has complied with the foregoing provisions in regard to anonymity, and agrees that any violation of them invalidates his design and removes it from the competition.

With each set of drawings must be enclosed a plain, opaque, sealed envelope without any superscription or mark of any kind, same containing the name and address of the competitor. These envelopes shall be opened by the Professional Adviser after the final selection has been made, and in the presence of the Jury.

Delivery of the Drawings (Mandatory): The drawings submitted in this competition shall be securely wrapped, addressed to the Professional Adviser at 430 No. Michigan Avenue, Chicago, Illinois, in plain lettering and without any other lettering thereon, and delivered at this address not later than March 1, 1931.

The Problem: In order that the greatest possible latitude may be given to the competitors and the maximum of real public service attained, the example chosen as a basis for the designs is what may be called a typical elevated steel tank on a supporting steel structure, to serve a small city or suburban community. The physical requirements shall be as follows (Mandatory):

1. The tank shall contain 200,000 gallons, or approximately 26,700 cu. ft.
2. The top of the tank shall be not more than 110 ft. above the ground level and the low water line, or bottom of the tank shall not be less than 85 ft. above the ground level.
3. The water connection or standpipe from the tank to the ground shall be at least 5 ft. in diameter, which is the size necessary to prevent freezing.
4. All portions of the entire tank and structure must be built entirely of structural steel, but in so doing it must not contain metal work nor sheet metal, the nature of which may be perishable or short lived, either as a result of its design or the frailty of its mass.

In judging the relative merit of the designs, the Jury will be governed by the apparent permanency and commercial practicability of the structure, as well as its aesthetic qualities.

Drawings Required (Mandatory): 1. One direct elevation at \( \frac{3}{4} \)" scale and two horizontal sections or plans at \( \frac{3}{4} \)" scale taken at such points in the structure as the designer may consider best to illustrate same—all of the above on one sheet, 24" x 30". 2. One perspective drawing wherein the object is substantially the same height as the \( \frac{3}{4} \)" scale elevation above mentioned—on one sheet, size 24" x 30".

The material of the two sheets shall be uniform of suitable cardboard, or on thinner material mounted upon cardboard.

Sheet 1 shall be done in ink and may be colored or washed at the option of the competitor. Sheet 2 shall be done in ink or pencil and water-colored, and may contain such background of landscape as the competitor may see fit to employ.
Mighty, modern, adaptable steel ... it stands alone, needs no bolstering—and when unconcealed by weaker materials brings light and air and majesty to cubist mass, to lance-like tower.

Windows, which in the fledgling skyscrapers were mere slits through heavy masonry, have grown in size and number. Tomorrow, curtain walls will yield to solid-section steel windows, to sheets of glass through which even ultra-violet rays may pass.

In small as well as large structures, steel is an ally of daylight, of speed, permanence and economy. It permits the most practical design for homes, schools, apartment or mercantile houses, industrial plants and small bridges. Steel has less bulk, greater strength than any other fire-resistive material. It secures more floor space; saves building time and labor; facilitates alterations, additions, removal.

Before building anything, find out what steel can do for you. The Institute serves as a clearing house for technical and economic information on structural steel, and offers full and free co-operation in the use of such data to architects, engineers and all others interested.

The co-operative non-profit service organization of the structural steel industry of North America. Through its extensive test and research program, the Institute aims to establish the full facts regarding steel in relation to every type of construction. The Institute's many publications, covering every phase of steel construction, are available on request. Please address all inquiries to 200 Madison Avenue, New York City. Canadian address: 710 Bank of Hamilton Bldg., Toronto, Ontario. District offices in New York, Worcester, Philadelphia, Birmingham, Cleveland, Chicago, Milwaukee, St. Louis, Topeka, Dallas, San Francisco and Toronto.
PUBLICATIONS OF INTEREST TO THE SPECIFICATION WRITER

Publications mentioned here will be sent free unless otherwise noted, upon request, to readers of Pencil Points by the firm issuing them. When reviewing for these items please mention Pencil Points.

Bi-Flex—An Insulated Metal Lath.—A.I.A. File No. 37-b-1. Descriptive data and standard specifications No. 20-a and details covering the application of this new type of insulated metal lath for frame and masonry walls, partitions, and ceiling. 8½ x 11. Flash-lum Insulating Co., St. Paul, Minn.

Curt-Fans and Fan Fixtures.—A.I.A. File No. 31-f-23. Catalog No. 2, just issued, gives complete detailed information concerning this type of combined lighting and air moving equipment suitable for commercial, industrial and residential uses. Numerous standard designs are illustrated. 26 pp. The Edwin F. Goth Co., Jefferson and Washington Aves., St. Louis, Mo.

Fenestra "Fenecraft" Casements.—Attractive brochure on the line of Casemrices, window casements especially adapted for distinctive homes. Specifications, construction details, illustrations of various styles of window treatments, hardware, etc. 24 pp. Standard filing size. The Steel Plate Products Co., 2250 East Grand Boulevard, Detroit, Mich.

Bryant Wiring Devices.—Catalog No. 30 just off the press. Looseleaf document gives complete information concerning the several thousand catalog numbers listed therein. Illustrations, wiring diagrams, tables, price lists, etc. Indexed. 146 pp. Standard filing size. The Bryant Electric Co., 1421 State St., Bridgeport, Conn.

The Cryer Radiator Control Valve.—A.I.A. File No. 30-C-2. Catalog and publication describing the construction and operation of the Cryer radiator control valve for reproducing hot water effects in steam heating systems. Specifications, tests, tables of capacities, roughing-in dimensions, etc. 30 pp. Standard filing size. The Cryer Co., 1 East 43rd Street, New York, N. Y.

Electro-Kabinets and Welco Medicine Cabinets.—Illustrated folder describing these types of cabinets for the modern bathroom. Welded Products Corp., 176 and Cleveland Aves., Kansas City, Mo.

International Concealed Radiators.—A.I.A. File No. 30-c-4. Catalog No. 30. Attractive new publication describing and illustrating the international concealed radiator and enclosed steam. Complete data for architects and engineers including specifications, installation details, tables of capacities, roughing-in dimensions, etc. 16 pp. 8½ x 11. International Radiator Corp., Port Chester, N. Y.

Richmond Boilers.—A.I.A. File No. 30-c-1. New publication. No. 104, for architects and engineers covering this type of boilers for steam and hot water heating. Tables of ratings and dimensions, and other useful data on the subject. 24 pp. Richmond Radiator Co., 2114 N. 49th Street, Omaha, Neb., and Detroit, Mich.

Published by the same firm, "Richmond Tube and Wall Radiators." A.I.A. File No. 30-c-4. Publication No. 504 presents complete engineering data on this line of tube and wall radiators for steam and hot water heating as well as floor-type radiators. Typical installations, rating tables, roughing-in dimensions, etc. 4½ pp. Standard filing size. Richmond Radiator Co., 2114 N. 49th Street, Omaha, Neb., and Detroit, Mich.

How to Make Good Waterproofed Concrete.—A.I.A. File No. 4. New publication presents much useful information for architects and engineers on the subject of waterproofing concrete and mortar with special reference to Medusa gray portland cement waterproofing compound, the various types of construction, including concrete and masonry below and above grade, swimming pools, etc. Report of tests, illustrations. Indexed. 28 pp. Standard filing size. Medusa Portland Cement Co., 1902 Engineers Bldg., Cleveland, O.

Curing and Protecting Concrete Floors with Sialkraft.—A.I.A. File No. 4-c-4. Illustrated bulletin describing the use of this reinforced waterproof paper for curing and protecting concrete floors. 8½ x 11. The Sialkraft Co., 205 W. Wacker Dr., Chicago, Ill.

School Ventilating Practice—Yesterday, Today and Tomorrow.—An interesting treatise for architects and engineers dealing with the ventilation of school classrooms and other spaces where the problem of proper air conditioning arises solely through occupancy. Included are suggestions for revised ventilation systems and for the heating and ventilation of school buildings. Accompanying folder describes and illustrates the operation of a new ventilating system for such buildings. 20 pp. Standard filing size. The Herman Nelson Corporation, Moline, Ill.

Carey Built-Up Roofing and Waterproofing Specifications.—A very practical reference book for architects and specification writers containing a complete set of asbestos, felts and combination built-up roofing specifications for application over wood, concrete, gypsum, and steel decks, and waterproofing specifications for walls, floor, bridges, etc. Also includes application requirements, flashing details and descriptive of materials. Indexed. 250 pp. Standard filing size. The Philip Carey Co., Lockland, Cincinnati, Ohio.

Novoid Corkboard Insulation.—A.I.A. File No. 37-b-4. Bulletin No. 293 describes the manufacture and uses of this insulating material for the walls and roofs of residential, commercial and industrial buildings, for cold storage, etc. Specifications. 8½ x 11. Cork Import Corporation, 345 West 40th St., New York, N. Y.

Architects pay tribute to Andersen on their specification sheets

FROM drafting room to finished job, the new Andersen Master Frame is winning the architect’s critical approval.

All parts of genuine white pine; perfect mill workmanship — absolute accuracy, a type and size for your every need; steep sill slope; wide blind stop provisions. These are a few of the reasons why architects today are writing, on their specification sheets, a remarkable tribute to this new Andersen Master Frame. Remember also — Andersen’s patented noiseless pulleys are used on every frame.

We will be glad to mail your copy of our new catalog, No. 500.

Andersen Frame Corporation, Bayport, Minnesota, represented by 3,500 leading jobbers and dealers.

FOR WEATHERTIGHT INSTALLATIONS — USE ANDERSEN SPECIFICATIONS.
Position Wanted: Registered architect, twelve years in private practice and as office manager in New York City and neighboring states. Richly experienced in all phases of architectural practice. Salary $40.00 per week. Box No. 900, care of PENCIL POINTS.

Position Wanted: Architect experienced in educational and institutional buildings, with broad knowledge of planning and design, desires to make connection with first class office. Salary of secondary importance. Box No. 901, care of PENCIL POINTS.

Position Wanted: Architectural draftsman, 31 years of age, eight years' experience in New York City. Will take position out of town or city. Willing to work anywhere. Salary liveable. Box No. 902, care of PENCIL POINTS.

Willing to learn and can easily adapt himself to the system in use by concern and entirely unfamiliar with the part of the business of Airport. Salary accordingly. Best references. George Sachs, 235 East 190th Street, New York, N. Y.
A charming time-worn texture was given the walls of this and other buildings on the place of Michael Gavin, Jericho, L. I., by using cinder blocks of varying size which had been sprayed with water while still soft. These walls called for a roof that also simulated age, so Hopkins and Dentz, the architects, chose IMPERIAL Shingle Tiles. In color and texture they are amazingly faithful reproductions of tiles which have seen centuries of use.

Steelcrete Partitions—open to air and light, reducing fire and theft hazards—are especially desirable for gymnasiums, stairway and elevator enclosures, tool and pattern rooms, apartment house storage lockers and enclosures of all kinds. Strong, rigid—these modern partitions offer practical protection that is permanent.

Steelcrete Shops, located in every important center, specialize in the assembly of Steelcrete Partitions, Enclosures and Window Guards. They use our standard Steelcrete framing materials to insure quick, low cost fabrication to your exact specifications. Construction is standardized—service is nationalized. Send for your courtesy copy of the new Steelcrete Partition and Window Guard Handbook.

You need never be caught short of PARTITION TILE when you use GYPSTEEL

Freight delays and the uncertainties of railway service don’t mean a thing to you when you use Gypsteel Gypsum Partition Tile. Our fast trucks make daily deliveries from our plant at Linden, N. J. or warehouse in Newark, anywhere within the New York Metropolitan Area.

Your contractor can phone us in the morning and he’ll get Gypsteel tile that afternoon or early the next day at the very latest.

YOU CAN DEPEND ON IT!

Less Chipping and Breakage

And when the tile arrives it will not be chipped and broken as much as you have come to expect of partition tile, because the Gypsteel Partition Tile is almost three times as strong as the standard specifications call for. This great strength of Gypsteel tile minimizes chipping and breaking, saving time and expense in setting up.

Our rapid delivery service and the great strength of Gypsteel Partition Tile are two of the numerous reasons why we are supplying so much of the partition tile being used today in the Metropolitan New York Area.

YOUR first glance at Pennvernon Window Glass shows you its surprising freedom from old-time waviness, streaks and other defects so long associated with window glass. Take a sheet of it in your hands —look at it as well as through it. Its difference from ordinary glass—its new quality—new flatness and brilliance, are strikingly apparent. The test is worth your while. And samples are readily available at the warehouses of the Pittsburgh Plate Glass Company. There’s one conveniently located in every leading city.

Write for the new Pennvernon booklet, explaining and picturing the new process that makes flatter, brighter, better glass—at no higher cost. Address Pittsburgh Plate Glass Company, Grant Building, Pittsburgh, Pa.
FOUR SHAFTS OF FREIGHT ELEVATOR DOORS

IN CONSTANT USE

THE NEW First National Bank Building of Detroit represents the latest development in the design of a combined bank-and-office building. Every item of its equipment was selected with a view to permanence, design, workmanship, and the ability to withstand abuse.

The four freight elevator shafts in this 30-story building are equipped with "St. Louis Freight Elevator Doors" to accord with the high class equipment throughout the structure. Because of the constant service required, care was taken to obtain here, as elsewhere, the most rugged construction available.

These, like all St. Louis Freight Elevator Doors,

are equipped with automatic Sill-Leveling Devices which maintain level trucking surfaces between elevator and floor under all conditions. This equipment is in use in many notable commercial structures in different parts of the country.

Literature describing it in detail is at the services of architects and others interested in construction work. Special engineering cooperation is also freely at the service of the architectural profession.

The diagram above shows the materials required for a one-piece cove-base and border, and the mechanical details of assembly. The cove-stick is merely a piece of soft wood, triangular in shape, with $1\frac{1}{4}$" legs rabbeted to a concave face. This method of construction gives a neat, sanitary effect at comparatively low cost. It was developed entirely within the Bonded Floors organization and is available through Authorized Contractors of Bonded Floors.

THE pictures on this page show three steps in the installation of a one-piece border and sanitary cove-base in Sealex Linoleum. Constructing this as one unit is one of those fine points of craftsmanship that mark the difference between a good floor and a fine floor.

This one-piece border and cove-base was developed by the engineers of the Bonded Floors organization. The men best qualified to install it are the Authorized Contractors of Bonded Floors, located in principal cities throughout the country.

Everyone admits that the customary factory-made cove-base furnishes a satisfactory job. The one-piece base, border and cove, however, possesses certain definite points of superiority. It lends itself to a much greater variety of decorative effects. It makes possible a border of any width, in any weight of material and in any color—as opposed to the strictly limited assortment of effects in the factory-made cove.

Furthermore, this Bonded Floors cove-and-border is structurally sounder than the old-style type. The number of cove cross-joints is reduced. It is less expensive to construct—and can readily be installed

(See next page)
on the job by a skilled mechanic. We recommend it for commercial and business installations and particularly for schools and hospitals. Not to mention kitchens in private homes.

We have described this Bonded Floors improvement in some detail because we consider it a typical example of the progressive flooring service offered by Authorized Contractors of Bonded Floors. The ready-cut borders illustrated on the right are another service feature available through Bonded Floors contractors. These strips can be combined into a great variety of attractive border effects—without the expense and wastage of material that is inevitable when the border is cut out by hand on the job.

Still another field in which our Authorized Contractors have a distinct edge on their competitors is in designing and laying custom-made floors. Our designers have had conspicuous success in creating floors for all types of buildings. The most conservative period design and the most radical modernistic effect can be carried out with equal ease in Bonded Floors.

May we send you the names of Authorized Contractors near you?

CONGOLEUM-NAIRN INC. . . . General Office: KEARNY, N.J.

BONDED FLOORS

Bonded Floors are floors of Sealex Linoleum and Sealex Treadlite Tile, backed by a Guaranty Bond issued by the U.S. Fidelity and Guaranty Company. Authorized Contractors of Bonded Floors are located in principal cities.

(See preceding page)
ARCHITECTS and interior decorators find that Tidewater Red Cypress (Coast Type) meets every requirement of the smart, modern interior.

Its exquisitely patterned grain combines simplicity with distinction. Its mellow, glowing surface yields a charm found in no other material. And yet, Tidewater Red Cypress is comparatively inexpensive.

And versatile—this Wood Eternal can be stained or varnished, painted or waxed, charred or left in its natural state, always with beautiful effects that never go stale.

No wonder, then, more of it is used every year for panels, doors, beams and trim. No wonder more home-owners every year are enthusiastic in their approval of interiors whenever and however Tidewater Red Cypress is employed.

A Book of Interiors—sent free

Many noted architects have contributed photographs of their interesting work for this booklet, which well illustrates the beauty and unusual versatility of Tidewater Red Cypress.

For your complimentary copy, address the Southern Cypress Manufacturers' Association, Jacksonville, Florida. If your dealer is not stocked with Tidewater Red Cypress, he can get it for you quickly—or you can write direct to any of the Association Mills listed at the bottom of this page.

The architect, Mr. Harry Sternfeld of Philadelphia, Pa., employed Tidewater Red Cypress in creating this lovely interior in the home of Mr. W. N. Morice, Flowertown, Pa.

EXAMINE A BAKELITE MOLDED DOOR KNOB
AND FORM YOUR OWN OPINION

You cannot appreciate the unusual beauty and quality of Bakelite Molded door knobs, until you have actually seen and handled them. The colors are pleasing to the eye, and the smooth surface to the touch. You will immediately think of many places where they may be used appropriately. Fine appearance is but one of the advantages of Bakelite Molded door knobs. They are strong and hard, cannot be dented, and withstand long, se-
vere use. The colors are permanent and stainless. The smooth lustrous surface is lasting and does not corrode. There is no lacquer or plating to peel or rub off, and polishing is never required. These door knobs are available in colors and finishes to match mahogany and walnut, and in lustrous and dead black. They are made by the National Brass Co., Grand Rapids, Michigan, who will be glad to send you full particulars and prices.

BAKELITE CORPORATION OF CANADA, LIMITED, 163 Dufferin Street, Toronto, Ontario

BAKELITE
THE MATERIAL OF A THOUSAND USES
ASSURES SUPERIOR SERVICE

SUCCESSFUL and efficient operation of any piping system is dependent to a marked degree upon satisfactory performance of the pipe joints. For this reason the pipe joint has taken its place as a most important part of design.

The oxwelded joint is permanently tight, strong and compact. It reduces friction, leakage, radiating losses and maintenance and thus assures increased serviceability and operating efficiency. In addition to these inherent advantages of the oxwelded joint, lines constructed by oxwelding can be crowded into small space where necessary, and transmission pipes can be closely nested in tunnels.

Under Procedure Control, welded piping construction may be undertaken with the same confidence in a satisfactory result as older methods.

LARGE BUILDINGS MEAN heavy door traffic

The World’s Largest is Equipped with
RIXSON “30” FLOOR CHECKS

In the race for more and more gigantic buildings, a problem of population and traffic is involved. The larger the building, the more inhabitants it has—thus, naturally, the greater the wear and tear on the door controlling devices and floor hinges.

The choice of the Rixson “30” as the device to control heavy-duty doors in Chicago’s Merchandise Mart is significant. It climaxes this Floor Check’s reputation as standard for use on all office and public buildings. They have been installed in an imposing majority of such buildings for more than a decade.

The mechanism allows for the exorbitant demands of constant action and necessary resistance to violent winds and drafts, by use of two springs and two checks, one pair for the in-swings and the other for the out-swings.

HYGIENIC SCHOOL WARDROBES

Eliminate Cloak Rooms
—Save Space; Reduce Construction Costs

SCHOOL ARCHITECTS, the country over, have ruled that the old time Cloak Room has no place in the modern school building, and are specifying Wilson Hygienic School Wardrobes—proven best during a half century of service.

Wilson Wardrobes not only promote greater efficiency in the class room, but also offer important savings in constructing the new school building.

For instance, in a class room 29' x 22', with 12' ceiling, the substitution of a Wilson Hygienic Wardrobe for the cloakroom, represents a saving of from $120 to $187 per room.

YOU CAN POSITIVELY PREVENT
Seepage • Leaks • Efflorescence
in Masonry Walls with

CHENEY
INTERLOCKING WALL FLASHING

CHENEY INTERLOCKING WALL FLASHING is the only Ready-to-use Thru-wall Copper Flashing that runs entirely thru the masonry wall and forms a positive unbreakable key-bond in every direction within the mortar bed. It scientifically solves the problem of seepage in masonry walls and positively prevents leaks, efflorescence, disintegration of the walls, and the rusting of steel spandrels and lintels from this cause.

It does not break the bond because it is keyed both horizontally and vertically on both sides of each strip. The ends of the strips hook together to form a continuous course.

The unbreakable key-bond feature of CHENEY FLASHING is of the utmost importance in the construction of high buildings where the swaying of the structures tends to loosen coping stones and parapet walls and hurl them to the ground.

Cheney Interlocking Wall Flashing is economical in cost and application, as it requires no soldering, special fitting or loss of time. It is built into the mortar bed as the masonry progresses.

Cheney Flashing is Standard with leading Architects and Engineers and the many outstanding construction jobs throughout the country in which Cheney Flashing has been installed are sufficient proof of its merits.

A large fund of valuable information on the use of Flashing is available for Architects, Engineers, etc., without obligation. Send for descriptive literature TODAY.

THE LARGEST BANK IN THE WORLD uses *

THE Chase National Bank, New York merged recently with the Equitable Trust Company, thereby becoming the largest bank in the world, with assets of $2,800,000,000.

In the downtown offices of the Chase National Bank, 12,800 square yards of W. & J. Sloane double-waxed Battleship Linoleum are used.

More and more frequently architects' specifications call for W. & J. Sloane Linoleum, both because of its inherent quality and because of its wide range of colorful patterns.

W. & J. Sloane Linoleum is made with a natural fine-textured finish, the result of extra-processing in the grinding and mixing of raw materials and extra pressure in the calendars. It is then double-waxed at the plant by an exclusive Sloane process.

When you specify W. & J. Sloane Linoleum you assure your clients of the finest money can buy. It comes to the job double-waxed, is easy to handle and is ready for use the instant it is laid. Examine this superfine finish before you write the specifications. We will gladly send you quality samples.

W. & J. SLOANE
DOUBLE-WAXED LINOLEUM

This Service Free to Architects

We maintain a service department to assist architects in planning or specifying linoleum floors. This service is at your disposal without charge. Write for copy of Architects Data Book and ask for a representative to call if you wish advice on specific problems. Address: Architects Service Department, W. & J. Sloane, 577 Fifth Avenue, New York City.
Colors that Satisfy the most Critical Thickness that Affords Comfort and Wearing Quality

COUNTRY CLUBS subject the architect to exacting requirements, particularly the interior finish and floors which receive critical inspection by the membership.

The Rubber Tiling of New York Belting and Packing Co. has proved to the satisfaction of architects, who have specified it for club floors, that it is not only the ideal flooring for such installations, but the safest. Being three-eighths of an inch thick, the rubber tile affords more foot comfort, greater strength and longer life. It lays perfectly smooth. The harmonious colors are an integral part of this flooring—running clear through and cannot fade or wear off.

Twelve rich colors may be combined in an endless variety of designs and harmonies which will satisfy the most exacting requirements.

"On with the show"
—electricity answers its cue

BACK of dimmed footlights a white figure flashes gracefully through the movements of an intricate dance to the accompaniment of soft music and ever-changing light. In perfect accord with each changing mood, soft hues of amber, green, and red sweep across the stage. A hundred shadings of color to match a hundred shades of feeling—controlled by a single throw of a switch. "The show is on"—and electricity—through Westinghouse Multi-Pre-Set Switchboards—has answered its cue.

Westinghouse Theater Switchboards control lighting in the Atlantic City Auditorium, Fox Theater in San Francisco, at the Barcelona Exposition in far off Spain as well as in many other famous theaters and buildings. C. 1702, which can be obtained from the nearest Westinghouse office, explains these switchboards and gives typical specifications.

Service, prompt and efficient, by a coast-to-coast chain of well-equipped shops

LIONOIL
SEALS
CEMENT SURFACES—BINDS
COLOR COATS

BERRY BROTHERS' Lionoil—amber-clear and secret-processed—seals the pores of cement—waterproofs and literally "welds on" succeeding color coats. It forms a tough, elastic, durable surface that "holds out" the colors—saves paint and cuts finishing costs.

Lionoil is economical—easy to apply—can be brushed or sprayed on. It covers about 600 square feet per gallon—dries dust-free in two hours and hard over night.

Here's a remarkable finish of a thousand uses. It is an excellent first coater on almost any surface—provides firm "roots" for other paints. On plaster, cement, metal, fabric, floors, walls, roofs, wood and brick it protects and preserves.

You'll appreciate Lionoil's wide range of usefulness. Specify this remarkable finish for difficult jobs—always demand it as a bond coat on cement. Write our Architectural Department for complete information.

PENCIL POINTS FOR SEPTEMBER, 1930

IN OFFICE STRUCTURES
PARTICULARLY

Veneer-Steel sound-proof doors on partitions of marble, structural glass, etc., have found great acceptance in office structures. The hinge used is the famous Hart & Hutchinson ball-bearing gravity type—proved insurance of trouble-proof performance.

DEPENDABILITY HAS BEEN PROVED

Veneer-Steel Partitions for toilets, showers, dressing rooms—for ward screens and dwarf partitions in hospitals—have thoroughly established their dependability. Here are partitions that will stand up against rough use, time, hot and cold water, and excessive temperature changes.

Veneer-Steel Partitions and Doors are rust-proofed, noiseless, non-absorbent and flush-type. They are built of galvanized sheets overlaid on a fibre core and cemented thereto with all edges soldered. All posts and wall attachments are sherardized inside and out after fabrication.

Hardware solid white brass buffed bright or pressed brass chromium plated. Because Veneer-Steel Doors and Partitions are solder sealed they are impervious to moisture and cannot absorb or retain odors. Standard finishes for Veneer-Steel Partitions and Doors are olive green and grey. Special finishes and wood grains can also be supplied.

CONCERNING GALVANIZING

W. T. Flanders of the Malleable Iron Fittings Co. says in his book:
“GALVANIZING and TINNING”

It has not yet been discovered how to regenerate steel. Until such a discovery is made we are compelled to resort to embalming.

“The metallic method of embalming consists of coating the steel with some other metal, and zinc is without doubt, the best protective coating for iron and steel.”

Veneer-steel Partitions and Doors are galvanized.

FACTORY—NEW BRITAIN, CONN. ... AGENTS IN OTHER PRINCIPAL CITIES
LOOK into the majority of today’s commodities—and the base material of which they are made will generally be found to be steel. Whether the use be great or small—in the air, or on land or sea—there is scarcely a piece of construction or fabrication which does not contain some steel. Symbols are therefore placed on better steel as signs of quality, dependability and durability; as an assurance of Service. For service to humanity is, after all, the only valid reason for the existence of any industry.

American Sheets offer efficient and economical service on a plane with product quality—the kind that makes friends and keeps them. Supplied in Black and Galvanized Sheets, Special Sheets, Tin and Terne Plates for all known purposes; also Keystone Copper Steel Products for uses requiring maximum rust-resistance.
antique reproductions & adaptations

The base of this Secretary is from the Louvre, and the top from a piece in the Lemoine-Carbon Collection. It is part of a Charlotte Provincial French Group of 16 pieces in Beech.

We Co-operate with Architects

We will be glad to work closely with you in the furnishing of homes, clubs, hotels and other buildings which you design. Charlotte furniture is historically correct, and is distinguished by a high quality of hand craftsmanship and finishes which closely resemble antiques in their coloring and aged appearance. The scope of our line is suggested by the list of periods and woods below. Inquiries are invited.

The Whitest Glass made for Windows

Lustraglass Flat-Drawn

Clearer, flatter, more lustrous... truly a remarkable product. Lustraglass transmits a substantial amount of the shorter ultra-violet rays of sunlight of a wave length of 313 mu. It costs no more than ordinary window glass and is the whitest of all glass made for windows as evidenced by the unretouched photo shown at the left.

This is an "edge on" view of four stock samples of the leading and best known makes of glass... The second from the left (the white one) is Lustraglass... you can make this test yourself... The superiority of Lustraglass is obvious... Its marked freedom from color alone is sufficient reason for its use in better buildings.

*Send for Lustraglass Booklet A-430 and Specification Sheet and see complete table of transmission. Write today.

American Window Glass Co.

Farmers Bank Bldg.
Alcoa Aluminum Window Sills
were used in the Central Union Bank, Evansville, Indiana
-Alcoa Aluminum Spandrels, of course

In designing the Central Union Bank, the architects, Messrs. McGuire and Shook, were mindful of the example set by the largest metropolitan buildings. They specified window sills of Alcoa Aluminum. These sills are of extruded aluminum. 112 of them, each 4 ft. 6 in. long, have a total weight of approximately 819\(\frac{1}{2}\) lbs. They also used Alcoa Aluminum spandrels—a practice that is rapidly becoming standard with most architects.

By using these Alcoa Aluminum sills and 112 Alcoa Aluminum spandrels 4 ft. 8 in. x 4 ft. 4 in., weighing approximately 10,784 lbs.—the architects lifted about 25,000 lbs. of surplus dead-weight from the face of this bank building. And they saved money.

In the matter of first cost, Alcoa Aluminum building materials can be bought at prices that compare very favorably with the prices of the same products made of other metals. But Alcoa Aluminum weighs only \(\frac{1}{3}\) as much as old-fashioned metals. It costs you far less to ship, truck and erect. In addition, it does not require painting. It can be high-lighted. It cannot rust—weather will not make it streak adjoining surfaces.

Our nearest office will gladly send a representative to talk with you about the many architectural uses of Alcoa Aluminum. ALUMINUM COMPANY of AMERICA; 2406 Oliver Building, PITTSBURGH, PENNSYLVANIA.

SPECIFICATIONS

"These Aluminum Spandrels and Sills shall be made of Alcoa No. 43 alloy, having a silicon content of 5%. The average tensile strength shall be 17,000 lbs. per sq. inch and the average elongation of 5% in two inches. The weight shall not exceed 0.097 pounds per cubic inch. The surface shall be free from imperfections and in all respects equal to sample submitted."

These Alcoa Aluminum spandrels are 4 ft. 8 in. by 4 ft. 4 in. 112 of them weigh approximately 10,784 lbs.

Where Construction Speed Was Imperative — All Wood Floors in London Terrace are Finished by The

MINWAX METHOD

In the world's largest apartment house development, where the speed of erection was outstandingly important, Minwax Flat Finish was successfully used. This new, Quick Drying form of the Minwax Method makes it possible to have lustrous, beautifully finished floors well within the limits of the most rapid construction program.

The significance of this fact lies in its manner of selection. For over two years, Mandell & Co. have used the Minwax Method in other operations. Their decision to use it here was based on actual satisfactory experience. It was also recommended by Builders Wood Flooring Company, the flooring contractors, based on their use of it in several important contracts.

Today it stands, proven by time, as a material perfectly adapted to modern requirements. It is applied to any natural wood, floor or trim, either in colorless or pre-colored form... It penetrates deeply into the wood, filling the pores with a tough protective gum and depositing on the surface sufficient mineral wax to allow of an easily produced lustrous polish. This finish in no way hides the natural beauty of the wood, is simple to maintain, and actually improves with use and age.

We have prepared a pamphlet that describes Minwax Flat Finish and the Minwax Method of wood finish in detail. You are welcome to a copy.

All exterior walls above grade are protected with Minwax Dampproofing and Spandrel Waterproofing

Evans "Vanishing Door" Wardrobe Class A-A, without jams or trim

HERE is an ideal school class-room wardrobe, low in cost yet meeting every demand of the most exacting. This wardrobe is made for plaster ends, backs and ceilings; no jams nor trim being required. When so desired blackboards can be furnished for the doors, giving a continuous black-board surface.

The "Vanishing Door" hinges on which the doors are hung are made with double pivoted arms and swing the doors back into the wardrobe entirely out of the way. There are no noisy tracks nor rollers to stick or bind, nor intricate mechanism to get out of order. These hinges are guaranteed to last as long as the building.

All wardrobes are furnished complete in the knockdown, with all woodwork cut to size, and only need to be nailed in place. The hinges are easier to put on than common butt hinges. The entire cost of installation is small.

Many types of school wardrobes are fully illustrated, described and detailed in Catalog "K." This catalog is of A. I. A. file size and can be had for the asking.

W. L. EVANS
Washington, Indiana, U. S. A.
VANISHING DOOR WARDROBES

DEPENDABLE INCINERATION

FLUE-FED Incineration differs from most household utilities in that it is built-in—an integral part of the building. Just as it is doubtful economy to use inferior materials in building construction, so is it unsatisfactory to install incineration of doubtful performance.

The few extra dollars that Kernerator costs assures a lifetime of satisfaction. It buys the most advanced design. It secures the benefit of years of experience in incinerator manufacture and entitles you to a guarantee that means something, because it is backed by a financially strong, well managed organization.

You specify continued satisfaction when you specify Kernerator.

Sizes to heat water for one family or one hundred
By using Alcoa Aluminum, which weighs on \( \frac{3}{8} \) as much as other materials commonly used, the weight of the City Bank-Farmers Trust Building is being reduced many tons without the expenditure of a penny extra. This great weight saving both reduces the cost of shipping, trucking and hauling, and speeds up work on the job.

Over 1,000 spandrels will be used; casement windows—more than 100 of them—on the second and third floors—thousands of feet of handrail—all of these will be made of the light, strong Allo of Alcoa Aluminum.

On this building six different decorative ornaments are being used on one spandrel base. Where ventilation was desired behind the spandrel, the vent has been cast in the base and the ornament placed to cover it.

Both the Architect and Builder have found Alcoa Aluminum a most helpful material for many architectural purposes. It is easily worked. It can be wrought, drawn or extruded. It can be cast accurately to any design. No design is too intricate. It can be readily fitted in place either on the exterior face of the structure or on the interior.
Ornaments and Spandrels
300,000 lbs. at no extra cost,
Farmers Trust Building, N.Y.C.

Alcoa Aluminum does not rust. It will not streak adjoining surfaces; never requires painting. Pleasing effects are obtained by deplating and high-lighting certain portions of the surface by polishing.

Our nearest office will gladly give you complete information on the many ways in which Alcoa Aluminum is being used as a building material. Let our representative advise with you on the use of Alcoa Aluminum for any specific architectural purpose you may have in mind. Address ALUMINUM COMPANY of AMERICA; 406 Liver Building, PITTSBURGH, PENNSYLVANIA.

Specifications of these Spandrels and Ornaments

“These Aluminum Spandrels and Ornaments shall be made of Alcoa No. 43 alloy, having a silicon content of 5%. The average tensile strength shall be 17,000 lbs. per sq. inch and the average elongation 5% in two inches. The weight shall not exceed .097 pounds per cubic inch. The surface shall be free from imperfections and in all respects equal to sample submitted.”

Alcoa Aluminum Spandrel Ornament—21¼ in. x 21¾ in. —9 in. across bottom. Weighs 13 lbs.
Steel Toofing tile is beautiful, requires lighter supporting members, has low maintenance cost, and is complete protection against flying sparks and brands.

Steel Lath would have prevented this

A WAKENED to the smell of smoke! The mad scramble to arouse the family! A dash to the bedroom door... driven back... the hall and stairs a seething mass of flames... a paragraph in the next day's paper tells the story.

Approximately 7,000 people lose their lives in residential fires each year. It is estimated that at least 50% of these tragedies could be eliminated if architects, builders and owners would insist upon fire safe means of egress.

Steel lath protected walls and stairways are preventing such tragedies. Underwriters' Laboratory tests have definitely proved that steel lath covered with 3/4" of plaster on both sides of an ordinary stud partition, will resist the hottest flames for one hour—time enough to save lives—time enough for the fire department to arrive.

If steel lath had only this one advantage it would be well worth its slight additional cost. But when it is considered that this product prevents plaster cracks and lath streaks—protects the expensive interior decorations, its use becomes a real economy.

Steel Building Products for Practically Every Need

Check them off—steel lath, steel joists, steel doors, steel trim, steel wall tile, medicine cabinets, laundry trays, steel radiator enclosures—these and many others mark the modern building. Each brings a definite saving of time, money, labor, space, weight or fire loss...

If you desire full information on any steel building products—write Trade Research Division, National Association of Flat Rolled Steel Manufacturers, Terminal Tower Building, Cleveland, Ohio.

Save with Steel LATH
Today every building can have MODERN HEATING

Without Radiators

—since Trane engineering and production brought the price of concealed heat down to the level of old-fashioned radiators

Have you been waiting for concealed heat to prove itself?
Have you been specifying cast iron because you thought concealed heat was an expensive luxury few owners would approve?
Then consider these facts—
During the first seven months of 1930 more Trane Concealed Heaters were installed than during any twelve months in heating history.
These heaters were installed in every type of building, old as well as new—large and small office buildings, apartments, hotels, hospitals, public buildings, stores, schools, large and small homes.
This amazing vote of public confidence was made and is being made during a year when building budgets are cut to the bone.
Trane's triumphant record in spite of a general recession is possible only because of Trane's superior product and Trane's revolutionary low price. Trane Concealed Heaters are so well designed, they offer so many exclusive advantages, that orders came in ever increasing numbers. To fill these orders Trane developed volume production. Volume production cut production costs. Trane passed these savings on to the trade and the general public.
For the first time in history, Concealed Heat ceased to be a millionaire's luxury. It sold—as it sells today—in the price range of old-fashioned cast iron radiators.
Thousands of installations prove the heating efficiency, the absolute dependability of Trane Concealed Heat. Thousands of satisfied owners are enjoying the benefits of Trane Concealed Heat installed at an unprecedented low cost.
The new day in heating, prophesied when Trane reduced concealed heater prices, has emphatically arrived.
Send the coupon today for complete description of Trane Concealed Heat, and full set of architectural details.

55 Distributor Warehouses Assure You Immediate Service
A slightly higher first cost is true economy in unsupervised parts of school buildings.

Method of joining partitions and back slabs.

Alberene construction stands the gaff.

The carelessness and rough usage to which shower and toilet rooms in schools are subjected makes it imperative that partitions be durable. Any attempts at economy through the use of materials which are cheaper and which cannot be fabricated properly for the purpose, reacts unfavorably by increasing upkeep costs.

Alberene Stone aside from its proven methods of construction (rigidity and permanent waterproofness of joints) is selected by architects because it is easy to clean and keep sanitary. Considered from every angle it is the most economical form of partition.

A Bulletin containing details and specifications is available. May we send you a copy? Alberene Stone Company, 153 West 23rd Street, New York. Branches: Boston; Chicago; Newark, N.J.; Washington, D.C.; Cleveland; Pittsburgh; Richmond; Philadelphia; Rochester. Quarries and Mills at Schuyler, Va.

New Birks Building, Montreal, P. Q.
IN this classic building, every facility and comfort has been provided to make the course of study more enjoyable, more beneficial and valuable to the student. Everything is the best...including the air! Stuffy, dusty rooms would be as much out of place as obsolete equipment and textbooks.

Libraries, laboratories and lecture rooms are free from the slow anaesthetic of bad air. Pure, invigorating air is continually circulating...noiselessly, without drafts. It's drawn in from outdoors, filtered clean, tempered to comfort-able warmth when needed, and then passed gently into the rooms...

...by Sturtevant Unit Heater-Ventilators. The units blend in quietly with the appointments. And the vents are concealed...nothing detracts from the dignity of the exterior.

Sturtevant Unit Heater-Ventilators are adaptable to an endless variety of installations in schools, churches, institutions, office buildings, etc. You will be interested in our Catalog 361. Our nearest office will send you one...for the asking.

In the Original Home of the Skyscraper

THE FIRST SKYSCRAPER was built in Chicago. They are still building them there. A few recent additions to the skyline are illustrated here, and these buildings, like the more prominent buildings in most cities, are all "Bryant Equipped." Whether for office buildings, hotels, homes, commercial buildings, factories, schools, hospitals......those architects and engineers who specify and insist upon the use of "Bryant Superior Wiring Devices," know that their own interests and reputations are fully protected through protecting the interests of their clients.

Have you received your copy of our new Catalog No. 30?

A simple and exact method of making Perspective Drawings. This work is an elaboration of the articles, on the same subject, which appeared serially in Pencil Points.

CONTENTS
1 Straight Line Figures 4 Enlargements and Reductions, Domes, Foregrounds, and Interiors
2 Curved Line Figures 5 The Author's Drafting Room Method
3 Expedients 6 Supplemental Illustrations

PRICE $1.50

THE PENCIL POINTS PRESS
419 Fourth Avenue New York
STATE HOUSE, AUGUSTA, MAINE

This imposing and beautiful building is the scene of extensive public activity. To protect the floors permanently against constant wear—to insure utmost sanitation and quietness—1000 sq. yards of Blabon’s Brown Battleship Linoleum have been installed. This makes a mighty important addition to the long list of public buildings which have selected Blabon’s as the finest in linoleum floors.
**The FAMED DURER SELF PORTRAIT —A MARS Rendering**

Surpassing ADJECTIVES!

IN QUALITY AND PERFORMANCE, Mars Drawing Pencils far surpass all of the adjectives generally used to describe pencil perfection.

A trial is the only way you can discover the difference—the revelation in precision and performance—accorded by these remarkable pencils which are made in old Nurnberg, hard by the home of Albrecht Durer, that medieval master of draughtsmanship, by pencil-workers, influenced not by the enormity of modern production, but by guild craftsmanship of centuries and the traditions of forebears of pencil-makers before them.

Carried in stock by the better class of stationers, art and blueprint shops. Sample 15c, if your dealer cannot supply you.

DRAWING WITH PEN AND INK

by

Arthur L. Guptill

Author of "Sketching and Rendering in Pencil"

With an Introduction by Franklin Booth

LIKE its companion book, "Sketching and Rendering in Pencil," this book is based partly on lectures and instruction given by the author in his classes and partly on his experience as a professional illustrator and as an architectural renderer.

The volume offers much of value to everyone, whether novice or adept, who is interested in the art of drawing with pen and ink. The chapters follow the work of the student from the beginning with instructions and suggestions about pens, ink, drawing paper, rulers, erasers, etc., up to the final chapters treating of special matters. An attempt has been made to preserve the unity of each chapter so if read by itself it will have a complete meaning, thus making the book valuable as a reference.

The book aims to offer practical instruction in the art of pen drawing, rather than a statement of facts concerning its history or a discussion of the relative merits of the works of its followers.

419 Fourth Avenue New York City, N. Y.
The building of fine switchboards and cooperating in the engineering of them has been an activity for nearly a half century, bringing to unquestioned leadership in this work.

For instance, a great many government buildings have selected equipment, a mark of approval important to commercial buildings in selecting theirs. Either live, deadface or remote control switchboards for all purposes are capably built by FA.

Send for estimates or talk to an FA man near you. A country-wide service of experienced men await your call.

Quiet and Quieting resilient floor at WLW

Quiet because it absorbs shock; quieting because it deadens sound. . . . Stedman Reinforced Rubber Tile was chosen for the floors in the several studios of WLW, Cincinnati, because it provides a noiseless floor; because it is smooth, foot-sure, easy to move about on; because it is wear-resisting and sanitary; and because it provides 27 effective color types with which any decorative treatment can be achieved.

. . . Will you accept the book and color charts, complimentary?

STEDMAN RUBBER FLOORING COMPANY, South Braintree, Mass.

Stedman Reinforced Rubber Tile

*REINFORCED in the Stedman Process minute cotton filaments, uniting with the rubber under high pressure and heat, are responsible for its unusual resistance to wear and distention, its lasting resilience and smooth impervious surface—characterized by color veinings of remarkable fineness and beauty.

Station WLW, Cincinnati, Crowley Radio Corporation One of several studios containing in all more than 7,000 square feet of Stedman Tile. This floor is laid with Walnut Paisley and Black Gold Paisley.
DRAW... SKETCH... PAINT...

All with ONE pencil
the MONGOL colored indelible

STRENGTH, almost unheard of in a colored pencil. Sharpens to a needle point. Economical—lasts about three times as long as an ordinary colored pencil. Thirteen different colors. For water colors—just shade in with the pencil and wash with brush. That’s how you “paint with pencils.”

Send for the new Artists’ Portfolio
Contains six colored reproductions of originals done with the Mongol Colored Indelible Pencil and six black-and-white drawings done with Eberhard Faber drawing pencils.

EBERHARD FABER

Dealer’s Name
KNOCK A HOME-RUN with a golf-club

Even Babe Ruth couldn't knock home runs without the right equipment.

And a heating plant cannot be expected to do its best without the right kind of accessories.

So give your customers the better value of In-Airid Air Valves. In-Airid is the only air valve

— that is inside the section and beautifies the radiator.
— that must be installed by a steam fitter.
— that cannot be stolen or tampered with.
— that vents all the air from modern steam radiators.

In-Airid is just one item of a complete line of heating accessories which improve any heating job—old or new. Among these are:

- In-Airid Air Valves
  - (No. 1 for Steam)
  - (No. 2 for Vacuum)
- Airid Air Valves
  - (No. 500 for Steam)
  - (No. 510 Vac-Airid for Vacuum)
- Arco Packless Valves
  - (No. 999 for Steam)
  - (No. 901 for Water)
- Arco Damper Regulators
  - (No. 800 for Water)
  - (No. 905 for Steam)
- Arco Vent Valves
  - (for mains and risers)

Year in, year out, the "KOH-I-NOOR" DRAWING PENCIL maintains unchanged the scientifically accurate lead that made this pencil famous.

This stability of excellence—this persistence of perfection—give a sense of security to "KOH-I-NOOR" users worth many times over the little extra the "KOH-I-NOOR" may cost.

And when with this quality you consider its unmatched smoothness, its precise grading and its ability to wear—then your estimate of the "KOH-I-NOOR" will approximate its value. Then you will have joined the legion that acclaims it as "The Perfect Pencil."

How to secure the Ideal Flooring effect for every type of Building

The floor is the basis of every interior decorative scheme. The effect produced by the material covering the floor can enhance the beauty of the interior or depreciate it. Hit or miss selection of the flooring material, designs, colors and arrangements is obviously dangerous. Good taste alone is not sufficient in itself to determine effectively the ideal type of floor to use.

Architects and builders can now assure themselves IN ADVANCE that their selection of a particular floor effect will result in a perfectly harmonious interior.

How to Get Expert Advice on Your Floor Problems

There are selected “U. S.” Flooring Representatives in every large trading center who will gladly discuss with you means of securing the ideal flooring effect for your particular requirements.

He will submit to you the proper flooring design and color scheme that will harmonize with your interior. He will take into consideration the right tonal value of the floor in relation to the walls and ceiling, whether the floor should be light or dark, the pattern subdued or prominent, the color warm or cool.

For further information, or for the name of the “U. S.” Authorized Representative in your locality, please write to United States Rubber Company, Suite 9114, 1790 Broadway, New York City.

LIGHT HOUSE
ON BELLE ISLE, NEAR DETROIT
Albert Kahn, Architect

The inscription at the base reads:
WILLIAM LIVINGSTONE

This light house is erected by the Lake Carriers Association and the citizens of Detroit to honor the memory of William Livingstone, President, Lake Carriers Association, 1902—1925, and throughout his active life one of the most prominent and public spirited citizens of Detroit.
1844—1925

LIGHT HOUSE

This is the only light house under U. S. Government supervision built of marble. The architect and the donors were unwilling to permit any but a time tried material to be used for this project. Although Georgia Marble had never been used for a light house, it had been used for fountains, statues exposed to the weather, memorials, mausoleums, and hundreds of monumental public buildings and commercial buildings from Porto Rico to Canada, and coast to coast. Past performance gives ample assurance that Georgia Marble withstands punishing weather changes.

THE GEORGIA MARBLE CO. • TATE • GEORGIA
NEW YORK  ATLANTA  CHICAGO  DALLAS  CLEVELAND
The joint board of directors of the C. Pande-Mata­wan Tile Co. have announced the formation of a new selling company, the Pande­Matawan Tile Co., the sales of wall and floor tile produced by these two manufacturers of the new Pande-Matawan Tile Co. are: Atlantic, N. J., Boston, Mass., Denver, Colo., W. A. Warden, Jr., Assistant to President; C. F. Ellert, Secretary; W. D. Hall, Vice President; A. W. Eschbach, President; A. W. Chamberlain, Vice President; C. F. Ellert, Secretary. This new company is operating on a twenty-hour-a-day type of heater has been so great that the demand for its heaters.

A new Monel metal finish, designated as No. 8, especially adaptable to kitchen sinks, has been developed by the Huntington Steel Casting Company. This new finish, which is named, is made by an improved process, which is presently as good as any finish as announced by the manufacturer of the standard, and it is usually white, and perfectly flat, being almost entirely free from the green­ish cast characteristic of the usual finish. The production of a new ultra­violet glass to sell at ordinary window glass prices has just been announced by the American Window Glass Company, Pittsburgh, Pa. Lustraglass, as the name is known, is made by an improved process, which is presently as good as any finish as the high reflectivity of the full finish.

The joint board of directors of the C. Pande­Matawan Tile Co. have announced the formation of the Pande-Matawan Tile Co., the sales of wall and floor tile produced by these two manufacturers of the new company is operating on a twenty-hour-a-day type of heater has been so great during the past year that it has been obligated to build a new manufacturing unit. The company is operating on a twenty-four-hour-a-day two-shift basis, with 150 men to meet the demand for its heaters.

The news of the sudden passing on Aug. 2nd of Charles F. Geisler, co­president of the Gleason-Tileout Glass Co., came as a shock to his many friends in the trade. He was seventy years old and a native of Weymouth, Mass. At the time of his death he had sold his interest in the major business of the company to his son, Elliott F. Geisler, in the Elliott F. Geisler Mfg. Co. When the Gleason-Tileout Glass Co. was formed he became vice­president. The late Charles F. Geisler was a past president of the Greater Boston Chamber of Commerce and was a member of the board of directors of the Greater Boston Chamber of Commerce and the board of trustees of the Massachusetts Institute of Technology.

This Metal Trim Appeals Instantly
... to Architect ... Builder ... Owner

The metal molding makes a precise, neat trim around window and door openings. It may be finished in the same tone as the walls ... giving a harmonious finish and adding a distinctive touch to the room. The expanded metal wings key the plaster right up to the casing ... and the patented Milcor lock and clip anchors the assembly to the wood frame so it's there to stay. The Milcor one-piece mitre makes a perfect corner joint. Architects appreciate the beauty and permanence of Milcor Expansion Metal Casing ... Builders like its ease of application ... and owners enthuse over the fact that here is a metal trim from which the plaster will not pull away. Send for a sample section ... and complete information.

Milcor Products
Milcor Steel Company
(formerly Milwaukee Corrugating Co., Milwaukee, Wis., and The Eller Mfg. Co., Canton, Ohio)
Main Offices: 1403 Burnham Street, Milwaukee, Wis.

Plants at Milwaukee, Wis., Canton, Ohio, La Crosse, Wis., Chicago, Ill., and Kansas City, Mo.
Sales Offices: New York, 418 Pershing Square Building; Boston, Mass., 725 Little Building; Atlanta, Ga., 207 Rosa Allen Building; Minneapolis, Minn., 612 Builders Exchange Building; Little Rock, Ark., 104 W. Markham Street

Save with Steel: Copperillness

[Image of Milcor Expansion Corner Bead]

Milcor Expansion Corner Bead assures perfectly true lines and curves as well as permanent beauty. The wings of expanded metal key the plaster right up to the head. No hunting for nail holes ... erection is fast and low in cost. Milcor corners will stand unusual abuse.

[Image of Stay-Rib Metal Lath]

Scratching in and doubling up can be done from one scaffold with Milcor Stay-Rib Metal Lath. Perfect plastering can be done, with a saving in labor and material. All paints Stay-Rib is heat-treated and re-annealed after forming.
Here is no compromise with SAFETY

Elevator equipment is either safe or unsafe. There is no middle ground. There must be no remote possibility of failure. R-W equipment provides 100% safety. Interlocks on all floors are simultaneously controlled by one master switch. Every door in the entire shaft must be closed to permit movement of the car. The master switch is gravity operated—no springs or chains to give trouble. Easy maintenance is another exclusive feature. Power trouble is located instantly!

Casualty insurance companies have granted 10% reduction in the premium on liability risks covering elevator door openings when this R-W equipment is used.

Other savings are enjoyed with R-W equipment. For example, rental space saved with R-W closers can pay the whole original cost in one year. Single type closers require no space behind doors; two and three speed types need only one-half inch clearance. Compare this with 5 to 7½ inches needed by other equipment!

Every elevator door requirement is met by R-W equipment: Hangers, closers, checks, interlocks, electric operation, and SIGNAL SYSTEMS OF ALL MODERN TYPES.

Catalog No. 44 is a revelation in modern elevator door engineering. Send for it.
