From the EDITORS

The problem of preservation of historic architecture is not always confined to preventing the destruction of buildings. Occasionally the area surrounding an important structure is treated in a manner detrimental to the overall impact of the building, even though the principle structure is in no immediate danger of destruction. This is recognized as a legitimate point of concern by most modern planners and is provided for in the long overdue Landmarks Ordinance which hopefully will someday be enacted by Chicago's City Council. A current example of this problem is Chicago's Monadnock building located at Jackson and Dearborn Streets.

The only clear view the public has ever had of the Monadnock is at present—while the old courthouse is razed and before anything new has been built on the block it formerly occupied. This is to be the site, of course, of two still to be erected Federal Center buildings which were designed by Ludwig Mies van der Rohe. The first structure of the Federal Center complex now stands north and east of the Monadnock as shown in the sketch below. Mies' original proposal would have placed a twin to the first structure on the west half of the old courthouse block and the Monadnock would have faced the open court between the two structures. No such satisfactory relationship of the old and new has been achieved by the latest plan.

What is the compelling reason for locating the tall building squarely in front of the Monadnock? Mies has a square block in which to site only two buildings, the high office block and a very low lying postal building, now planned at the southeast corner of Adams and Clark. I believe that we are fully justified in suggesting that further studies be made before construction begins. This is an opportune time to undertake such an evaluation since the construction of the two remaining structures has been temporarily delayed.

The Monadnock is one of the greatest of the great buildings of the Chicago School in general and of John Wellborn Root in particular. The Federal Center will be a monument to the "new" Chicago School and a credit to Mies. Let not its crisp steel and glass facade hide the elegant profile of the Monadnock.
An interior perspective of the second project for the Childs Harold Wills house in Detroit, Michigan. This drawing demonstrates the technique used by Marion Mahony in her rendering throughout her career.

The Early Work of Marion Mahony Griffin

By David T. Van Zanten*

Mr. David T. Van Zanten is doing his doctoral work at Harvard University in the field of art history. Previously he was a University Scholar at Princeton and attended the Courtauld Institute in London. For several summers he has worked for the National Park Service doing HABS work in various areas. He has also been published by the Journal of the Society of Architectural Historians. This paper was prepared during the academic year 1965-66.

For the breadth of their interests, the sincerity with which they pursued their ideals, and the efforts they made to embody them in their architectural projects, the husband and wife design team of Marion Mahony and Walter Burley Griffin deserve a special place among the architects of the “Prairie School”. Although the influence of Frank Lloyd Wright was obvious in their earliest works, it disappeared before their move to Australia in 1914, replaced by a personal style based on non-Wrightian theories of proportion, color, and structure. Buildings were only a small part of their concern. From the first Walter concentrated on landscape design and community planning, inspired by contemporary social theories. Later both of the Griffins became active in community affairs and prominent in the Australian Anthroposophical Society.

The Griffins’ work after their marriage in 1911 - and Walter’s activity before that date - recently have been the subject of several publications.¹ Professor H. Allen Brooks’ forthcoming book will examine it further. One interesting part of the story, however, has not attracted much attention: Marion’s designs before her marriage and subsequent submersion into the Griffins’ common artistic personality. By 1911 she had been at work as an architect for seventeen years. During that period she executed a variety of projects, some of which were quite large. I would like to survey those years here.

Marion Lucy Mahony, as she relates in the unpublished biography of her husband, The Magic of America,² was born in Chicago in 1873. She was the second of the five children of an Irish-American from Cork and a woman of New England stock

² A typewritten manuscript in four copies (four volumes, eight sections). One copy dated September 30, 1949, is in the New York Historical Society and another in the Burnham Library, Chicago.
settled on the Mississippi side of Illinois. Her father died when she was about twelve years old, but her undaunted mother, principal of the Komensky Elementary School in Chicago, brought up the family and provided for their education. Marion attended the Massachusetts Institute of Technology from September 1890 to May 1894, when she became the first woman to receive the degree of Bachelor of Science in Architecture at that institution. While at M.I.T., she recalls, she demonstrated a facile touch in drawing and rendering but little aptitude for the intellectual exercises of academic eclecticism and avoided the library as much as possible. She loved the drama society and spent most of her time at that instead. Her thesis had a relatively unacademic subject, "An Artist's House and Studio".

In the summer of 1894 Marion returned to Chicago and entered the office of her cousin Dwight Perkins as a cub draftsman, helping with the Steinway Hall working drawings. A slackening of work forced Perkins to let her go a year later, and she joined Frank Lloyd Wright's office where the Heller house and the Francis apartments were on the drawing boards. Although she spent most of her time with Wright between 1895 and 1909, Marion only came in "on call" and regularly worked for other architects as well as accepting commissions on her own. She had herself listed in the Lakeside Directory of Chicago from 1898 to 1903 (under the address 281 West Adams Street) and again in 1905, 1910, and 1911. Exactly what she did during these years will probably never be established, but I have located a number of projects demonstrating a consistent approach and development. Identifying the numerous renderings and illustrations which she did on the side would surely not materially alter this picture.

Marion's earliest major independent commission was All Souls' Unitarian Church in Evanston, Illinois. In 1902 the minister, James Vila Blake, was forced to found a splinter congregation. He was a friend of the Mahony family and asked Marion to design him a small meeting house. It consists of a sunken octagonal "parlor" opening under a balcony into a rectangular gabled auditorium with exposed ceiling beams and slightly Gothic pointed windows and paneling. The stuccoed exterior is built up of clean geometric forms accentuated by simplified historical motifs (like the cavetto cornice of the parlor) and patterned ceramic tile panels.

This design was consistent with contemporary developments in *avant garde* Chicago architecture around 1900. An increasingly ordered treatment of mass composition and interior space had characterized the American "Shingle Style" in domestic design after 1885, exemplified by Bruce Price's Tuxedo Park houses of that year. This was introduced to Chicago in the late 'eighties through the work of Joseph L. Silsbee and led to a series of strongly geometricized designs like George W. Maher's A.D. Wheeler house and Frank Lloyd Wright's Bagley house, both of 1894. This development, probably combined with some European ideas like those of C.F.A. Voysey and M.H. Baillie Scott, soon produced a group of unshingled structures of even purer geometric form; for example, Robert C. Spencer's *Ladies' Home Journal*.

8 In 1902 and 1903 she gave her profession as teacher rather than architect. In 1903 and 1904 she also listed herself under the name Mahoney.

9 Blake dedicated his book *Sonnets to Mrs. Mahony* (1902) and in his *Discoveries* of 1904 dedicated a poem to Marion (no. 87).

10 The *Magic of America*, vol. IV, pp. 163-165. The original ink sketches reproduced here are attached to the New York copy.

11 A development examined in detail by Vincent Scully in his "Shingle Style" (pp. 119ff.).

12 Barry Byrne remembers that one of the few books in Wright's library was a publication of colored renderings of the works of Voysey and Scott. There are many indications of Wright's appreciation for English architectural develop-

designs of 1900-1901 and Frank Lloyd Wright's Oak Park Studio. Like Marion's All Souls' project, these buildings are characterized by clean geometric massing, open interior spaces, and simplified historical motifs.

Marion's first project for All Souls', however, did not suit the building committee who wanted "something Gothic". Thus she provided a second design which was carried out in 1903 (and demolished in 1960). This was a simple rectangular auditorium under a tall gable roof with quarry-faced masonry and pointed windows. The interior was enlivened with arched, sky-lit spaces at the entrance and altar walls as well as with delicate Wrightian lighting fixtures, planter boxes, and leaded glass. Although the building was essentially a Gothic compromise, Marion did manage to imbue it with the exotic flavor of Wright's work through her handling of the skylights with their rich patterns casting a mottled light on the clean forms below.

ments at this time; in 1900 he met C. R. Ashbee and in 1901 he delivered his talk "The Art and Craft of the Machine" filled with references to the English "Arts and Crafts" movement.

15 Published in the Western Architect, September, 1912.
Apparently resembling the first project for All Souls' was a scheme for a summer house in Hubbard Woods which Marion drew up for her family. In The Magic of America she describes it as "a long narrow oblong with octagonal rooms flanking on either side towards the front". This, she says, was immediately before Wright designed the Husser house (built in 1899), with which she compares it. The Hubbard Woods house was never built and I have been unable to locate any of the designs. Her brief description, however, indicates that she tried an even more complex play of geometric forms in the facade than she had in the first projects for All Souls' Church.

Barry Byrne remembers Marion once telling him that she designed the Catherine White double house at 1303-1307 Ridge Avenue in Evanston for Myron Hunt. Hunt opened his office in Chicago in 1897 and a photograph of the completed house (with Hunt alone cited as architect) was published in the Island Architect in November, 1899, bracketing the date of its construction. In spite of Marion's assertion of her authorship, the house is very like Hunt's contemporary designs. The boxey massing, wide level eaves, peaked roofs, and simplified details are familiar from the two Sweet houses or his own residence which he erected in Evanston at this time. Unique to the White house, however, is the complex terracing in front of the entrance porch: a geometric structure of steps, balustrades, and benches creating broad horizontals to relate the house to the ground. Also unexpected is the use of orange and red brick with brownstone trim, later to appear in Marion's D. M. Amberg house. One would suspect that Marion did some of the detailing for this house while Hunt was responsible for the general design.17

16 The Magic of America: vol. IV, p. 75b, repeated, p. 331. 17 Barry Byrne feels that Dwight Perkins' schools of 1910 show Marion's touch - especially the Karl Schutz High School with its terra cotta brick and brownstone color scheme, tall gables, and massive piers. This group of designs is unique in Perkins' oeuvre, which was generally eclectic, but Roy Lippincott, who was working with Marion from late 1909, remembers nothing about her ghosting for Perkins.

Marion's steadiest employer during these years was Frank Lloyd Wright. Barry Byrne, a co-worker in the Oak Park Studio, remembers her doing designs for furniture, leaded glass, lighting fixtures, and glass mosaics.18 But Wright's determination to take credit for all the work coming out of the office - Byrne remembers the sharp reprimands which any reference to "Miss Mahony's design" would elicit - and the presence in the Studio of men like William Drummond and Walter Burley Griffin who were also entrusted with some designing make specific examples of her work difficult to establish.19 The furniture, window, and lighting fixture designs coming out of the Studio during and after her stay there are very consistent in style; there seems to be no evidence of her having tried to assert her artistic individuality. Many claims made throughout The Magic of America concerning designs in Wright's office which were "wholly" hers or Griffin's should probably be understood as exaggerations, the result of the great resentment she later felt toward Wright who already in 1914 was accusing her husband of stylistic "highway robbery" and "sucking his eggs"20 and who later referred to him as a "draftsman who went to Australia".

The "Japanese" presentation drawings which began to be made in Wright's Studio around 1906 are definitely known to be from Marion's hand. Barry Byrne remembers that she used the technique with greater skill than anyone else in the office, but that Birch Burdette Long actually was the first to try the "trick" with Wright's coaching. This would seem logical in view of Long's love of Japanese art around 1900 and his great facility as a renderer. Therefore not even the famous "Mahony renderings" would seem to have been her original invention.

In October of 1909 Frank Lloyd Wright ran off to Europe with Mrs. Cheney and sold a part of his practice to Hermann V. von Holst who employed Marion to carry on several large commissions: von Holst (1875-1955) 21 was a friend of the "Prairie School" architects and had his office in Steinway Hall. But he was chiefly renowned for his knowledge of the orders and his skill with academic water color renderings. 22 During the academic year 1905-1906 he was Associate Professor of Architectural Design at the Armour Institute of Technology and worked on four architectural books of essentially Beaux Arts character for the American School of Correspondence headquartered there. 23 He was a great committee man and his name could be found on many art club boards.

Von Holst’s background was impressive. He was the son of the German political scientist Hermann Eduard von Holst and a New York socialite, Annie Isabelle Hatt. Born in Freiburg, Germany, he came to America in 1891 when his father accepted a professorship at the University of Chicago. In 1893 he received a B.A. at the University of Chicago and in 1896 a B.S. in architecture from the Massachusetts Institute of Technology. His thesis was a good academic hospital design. Von Holst then returned to Chicago and entered the office of Shepley, Rutan and Coolidge. Only in 1905 did he have himself listed in the Lakeside Directory of Chicago with an address in the highly respectable Rookery Building.

Unfortunately von Holst’s drawings and office records seem to have been destroyed. He had no children or close relatives in America and no one whom I have contacted among his old friends and office force know what happened to his belongings after he and his wife died in Florida. We must thus extrapolate on the basis of published sources and drawings which Marion photographed or - in a few cases - retained possession of.

The few von Holst designs of which we have record before Marion’s arrival in the office are very ordinary and non-descript. The George A. Matchette house in Bethlehem, New Hampshire, built in 1904-1905 is in the familiar “Shingle Style”; 24 the cow barn on the Littleton, New Hampshire, estate

21 Obituary in the Chicago Tribune, October 18, 1955.
22 In 1905, 1906, and 1907 he exhibited water color sketches of European cityscapes in the Chicago Architectural Club Exhibitions.

of J. J. Glessner built in 1906-1907 is a piquant "Queen Anne" design;\textsuperscript{25} and the competition project for the Home of the Knights of Pythias at Decatur, Illinois, done in collaboration with Lorin A. Rawson about 1907 is Tudor on an academic plan.\textsuperscript{26} About 1906 von Holst met the public utilities magnate Samuel Insull (recently the subject of Forrest McDonald's \textit{Insull}) who began to pass on to him a steady stream of electric company substation designs. The first of these seems to have been that of the North Shore Electric Company on Grove Street in Evanston, a non-descript "stripped classical" structure in brick.\textsuperscript{27} When Roy Lippincott entered von Holst's office in July, 1909 substations comprised most of his work.

In 1909 von Holst moved his office to the ninth floor of Steinway Hall. With Wright's departure a few month later he inherited several commissions for "Prairie Style" houses. After helping settle things in the Oak Park Studio, Marion switched over to von Holst's office full-time and established a subdivision with a half-dozen draftsmen under her, among them Albert McArthur from Wright's Studio and Roy Lippincott, Griffin's future brother-in-law. Marion asserts in \textit{The Magic of America} that she had complete control of design in this subdivision, and after 1912 she was cited in contemporary publications as "associate". Her first concern was to carry on four Wright commissions: the David M. Amberg house in Grand Rapids, Michigan, and the E. P. Irving, Robert Mueller, and Adolph Mueller houses, all in Decatur, Illinois.

In 1901 Frank Lloyd Wright designed David M. Amberg a house to be at the corner of Logan Street and College Avenue in Grand Rapids. This was not built, but in 1909 Wright erected a house two blocks away for Meyer S. May whose wife was David Amberg's daughter. In the same year David Amberg decided to build a home on the plot he had planned to use eight years before. Mrs. Callie S. Amberg, his daughter-in-law, says that Frank Lloyd Wright was again commissioned to design the house immediately before he left for Europe\textsuperscript{28} (there is no record of the second Amberg commission at Taliesin). The house was subsequently designed and erected by Marion for von Holst and still stands, although now partitioned into five apartments\textsuperscript{29}.

\textbf{The front elevation of the Amberg house clearly indicates its excellent state of preservation and shows Marion Mahony's personal style in her designs for the planter areas and other details.}

\textbf{This north view of the David M. Amberg house in Grand Rapids, Michigan shows the building as it appears today. Photo by Allen Strass for HABS.}

The house is basically Wrightian in plan, massing, and detail. But the overly rich use of materials strikes one at once: the walls are of bright orange brick with brownstone copings broken by bays of cream stucco and dark brown wood trim. It stands on a gray concrete plinth and is covered with a red tile roof and green copper eaves. The massing is very complex - particularly around the living room.

\textsuperscript{26} \textit{Ibid.} (1908 edition): vol. II, frontispiece.
\textsuperscript{27} Photographs and drawings of many of these buildings are preserved in the files of the Commonwealth Edison Company who kindly permitted me to sift through them.
\textsuperscript{28} Letter to the author of January 12, 1966.
\textsuperscript{29} Extensively published in the \textit{Western Architect}, October, 1913. Lippincott asserts that it was entirely designed by Marion and one is inclined to agree, if only on account of the numerous esthetic mistakes Wright would have avoided.

gable - and even a bit confused in the great variety of window sizes and wall treatments. Beside this, the restricted buff brick-limestone color scheme and tight horizontal composition of Wright's May house seem very restrained. Marion tried several new ideas in the detailing: Wright's bowl-shaped planters are here replaced with complex cubic ones and ceramic tiles are set into the plaster gables and eaves continuing the pattern of the leaded glass windows within a gridwork of incised lines.

The Decatur houses form a single group along Millikin Place. Wright had completed the working drawings for the Irving house and in The Magic of America Marion claims only to have designed the "furniture, carpets, draperies, radiator screens, and glass" of the interior. All are in the contemporary style of Wright's office, although the desk-couch is a very complex design. The landscaping of the group was done by Walter Burley Griffin.

The other two Decatur houses are entirely Marion's creations, but they are chiefly remark-

30 Extensively published in the Western Architect, April, 1913. The editors credit von Holst with redesigning the exterior for brick (Wright's design was entirely stuccoed) but Marion, surprisingly enough, nowhere claims to be the author of the whole house.

31 His drawings for the layout are now in the Burnham Library.

32 In 1916 Wright included these two houses in an exhibition of his work at the Chicago Art Institute. There are

A preliminary design for the living room of the Robert Mueller house was published in Building (Sydney), October 11, 1913: p. 64a.

33 A preliminary design for the living room of the Robert Mueller house was published in Building (Sydney), October 11, 1913: p. 64a.
Von Holst also received a large commission in Detroit through Wright, the Childe Harold Wills house. Barry Byrne remembers Wright meeting Wills immediately before he fled to Europe. Although there is no record of the commission at Taliesin, the first von Holst design for Wills, dated December 1909, must have been the result of the contact Wright had established. Like the other designs just discussed, this is basically Wrightian in character, but elaborately detailed. Using the system of axially-related spaces defined by an open-work of isolated piers familiar from Wright's Martin house in Buffalo of 1904, Marion creates a very complex plan. The small number of piers and variety of spaces go beyond Wright, but perhaps lose some of the lucidity of his planning. The detailing is considerably richer and more imaginative than in the Mueller houses, especially the ceramic tile patterns around the entrance and the great fountain in the back court.

Soon after this first project had been drawn up, Roy Lippincott remembers, Wills changed the site and a new design had to be prepared. Only a single interior view from this scheme survives in a photograph in the New York copy of The Magic of America. It again is chiefly remarkable for such decorative devices as the interior fountain and the radiator screens in the heavily decorated piers. This project did not get to the working drawing stage either, Lippincott says, for Wills now ran into domestic troubles and decided not to build a house at all.

Marion's subdivision in von Holst's office also produced several designs which were not inherited Wright commissions. The largest of these is a project for an unidentified multi-storied building which is now among the Griffin drawings at the Avery Library. Lippincott thinks he remembers doing the drawing under Marion for von Holst and Barry Byrne is sure he never saw it in Griffin's
This drawing is of the Doyle house, a project which was to have been built in Rogers Park near Chicago. The architects were von Holst and Fyfe. The design was by Marion Mahony but the delineator was Roy A. Lippincott who later married Walter Burley Griffin's sister. Drawing from the Chicago Architectural Club catalog of 1913.

This illustration was done for Marion's short essay which appeared in One Hundred Bungalows in 1912.

Frank Lloyd Wright would surely not have disagreed. But when we look at the four illustrations which Marion included, we find her designing in a weak "Arts and Crafts" style. The bold rhythms

renderings on silk many of which are now in the Avery Library. After a long siege, chronicled in the delightful "Autobiography of Xantippe" in The Magic of America, she took him by storm, and they were married on the twenty-ninth of June, 1911.

With Marion's marriage we reach the limits of this survey. Two projects which she executed immediately afterwards, however, cast a good deal of light on her artistic personality. The first is a short essay entitled "The Bungalow Indoors" published as part of the book One Hundred Bungalows in 1912. Here she is principally concerned with praising the beauty of natural materials and making simple planning suggestions in the spirit of the current "Arts and Crafts" publications of Gustav Stickley. The following passage is typical:

Honesty should lead us to use materials in accordance with their nature, and calls for highly intelligent research into their qualities and possibilities. The character of many of our rougher brick demands the elimination of high polish in the finish of wood to be used in connection with them, and moreover the beauty of the wood itself should lead us to keep it as nearly natural as is compatible with necessity for protection. All the woods are beautiful and only the aristocratic antipathy for the common can account for the commonplace, vulgar habit of imitating mahogany, for example, with red gum or birch. 35

office. It is not a very effective design. Essentially it follows the system of Wright's E-Z Polish factory with the addition of a few heavy-handed mouldings and two weakly-articulated framing masses. Smaller but finer is the design for the Doyle house in Rogers Park which was exhibited in the Chicago Architectural Club in 1912. The restraints posed by such a small house seem to have forced Marion to develop a design with better order and more evenly articulated than she had in her large houses.

When Marion moved into Steinway Hall to join von Holst late in 1909, she found herself near Walter Burley Griffin who since 1907 had rented an office in the loft. What had been a friendship at the Oak Park Studio now became love, at least on Marion's side. In The Magic of America she relates: "When I encountered W.B.G. I was first swept off my feet by my delight in his achievements in my profession, then through a common bond of interests in nature and intellectual pursuits, and then with the man himself. It was by no means a case of love at first sight but it was a madness when it struck." 34 In order to pursue the imper-turbable bachelor she volunteered to join his office part time to make the beautiful series of colored

35 Published by the Building Brick Association of America, Boston, 1912: pp. 114-120.
A perspective of the Henry Ford project of 1912. This drawing was probably used to make several prints which were then rendered in color as presentation perspectives. Drawing from Northwestern University archives.

The floor plans of the Henry Ford project. The skill and refinement of some of Marion Mahony's earlier work seems strangely lacking in this project. Plans from Northwestern University archives.
and idiosyncratic forms which she had previously borrowed from Wright are entirely missing. I do not see any reason to doubt her sincerity; she was now married to a prospering architect and had no reason to do hack work. She simply enjoyed trying another style. As we have frequently noted, when she was working in Wright’s style for von Holst, she exhibited nothing more personal than a flair for decorative details. Within the general limits of the “progressive” schools, from Stickley to Wright, Marion felt free to try whatever caught her fancy.

The second project which Marion executed immediately after her marriage, a country house for Henry Ford, also demonstrates her essentially derivative and decorative approach. Ford had been buying land along the Rouge River in Dearborn for a country estate since 1908. In 1909 he erected a small bungalow there. After a few years this proved too small, and on the recommendation of Childe Harold Wills, he engaged the firm of von Holst and Fyfe to design a new mansion. Unfortunately, no written contract was drawn up. On July 15, 1913, Ford stated in a newspaper interview that he had begun to haul material for the building. The foundations of the house, a swimming pool, and a power plant were actually erected before a dispute arose between Ford and the architects resulting in a law suit and the hiring of a new architect, W. H. Van Tine of Pittsburgh. At the same time (1914) Jens Jensen was engaged to lay out the grounds.

Four drawings by Marion pertaining to this house survive in the possession of the art department at Northwestern University. They seem to be the layouts for presentation drawings of a preliminary design (the interior section differs slightly from the project shown in the other three sheets). Although these drawings do not tell us what actually was put under construction, they are of great interest in themselves.

The title block offers a hint about their date: “von Holst and Fyfe, architects, Marion M. Griffin, associate”. This was later altered by Marion to read “von Holst and Fyfe associate architects, Marion M. Griffin, designing architect”. Von Holst went into partnership with the M. I. T.-trained architect-engineer James L. Fyfe sometime in 1912, late enough that they are still listed separately in the Lakeside Directory of Chicago of that year, but early enough that drawings shown at the Chicago Architectural Club Exhibition of May, 1912, are under the corporate name. Furthermore, Ford and his family took their first extended European holiday in the summer of 1912 (from the middle of July to the beginning of September), and considering the preparations usually made for such tours one would assume that Ford did not get the serious and complex business of building a large country house underway until his return. Marion later pencilled the date 1912 on one of the Northwestern drawings, and I would be inclined to understand this as signifying late 1912.

The design shown in these drawings seems to be based on an uneasy combination of the styles of Frank Lloyd Wright and Walter Burley Griffin. To Wright Marion owes the long horizontal lines of the eaves and windows as well as the asymmetrical composition of the river front. To Walter should be credited the adoption of fireproof concrete construction - something he had been very concerned with since about 1908 - and the consequent distortion of Wright’s essentially wooden conceptions. Also Walter’s are the monotonous rhythm of the second story fenestration and the cubic, modular treatment of forms, over-scaled and built up entirely of right and forty-five degree angles. The strict adherence to a large-scale module had been the essence of Walter’s personal style beginning with a design dated 26 December, 1906 and was used in the Frank Palma house (working drawings dated from 8 March, 1911) to create a stark geometric design almost entirely free of Wrightian motifs. In the H. M. Mess house (working drawings dated 15 June, 1912) the Palma house scheme was elaborated with the forty-five degree window splays which are so conspicuous in the Ford design.

Both Griffin’s and Wright’s contributions to Marion’s Ford design, however, consist primarily of motifs and forms which she uses to achieve her

36 A. Nevins, Ford: The Times, the Man, the Company, 1954: p. 584.
37 Detroit Journal, July 12, 22, 23 and September 1, 1915. There is no mention of Frank Lloyd Wright being the intermediary between Ford and von Holst (cf. G. C. Manson, Frank Lloyd Wright to 1910, 1958: p. 213).
38 Detroit Journal, July 16, 1913.
39 This law suit unfortunately resulted in Ford’s giving all the records pertaining to the von Holst commission to the lawyers. Nor was the case of sufficient importance to be summarized in the contemporary legal reporters.
42 If the drawings were dated to the summer or spring of that year they would exhibit a precociousness in relation to Walter’s work which I think the naive planning and ill-digested borrowings do not warrant.
43 Detroit News-Tribune, July 13, 1913.
44 A design for a bungalow for Messrs. Jenkins, Lewis, and Dickinson at Hollister, California, one of Walter’s first independent commissions.
characteristically decorative ends. The plan is inconvenient and probably structurally impossible. But the detailing - in isolated passages - is magnificent. The rough masonry of the den cut into the cliff face, the airy pergola above, and the rich ceramic tilework in the spandrels reveal her touch. In the interior Griffin's stiff modular geometry is transformed into a fantastic prismatic ornamental style, entirely in terms of right and fortyfive degree angles.

Thus in this design we see Marion adopting Griffin's style, just as she had Wright's before her marriage, and developing it with her own fanciful touch. As an architect, Marion seems to have been capable only of decorative elaboration. Consistent architectural conceptualization and invention were beyond her.

What, then, was her contribution to the Griffins' common artistic personality? It has sometimes been thought that Marion had a profound influence upon Walter. But Marion's own statements in The Magic of America are very humble in this regard. She remarks in the "Autobiography of Xantippe":

And now upon coming into his (Walter's) office she (Marion) had revelation after revelation, thrill after thrill. Problems which she had seen struggled over in office after office and never solved were being solved one after another. Inspiration, the source of information, had been tapped and she watched Socrates with awe and amazement and understanding. 45

In another place she says:

During my life I was led by the passing will'o'the wisp in what I did - drawing, dancing, drama, architecture. Not so after my marriage - yes, even before, when I suggested to my friend Walt that he might find me a useful person in his office in the matter of the presentation of his work. I presently became deeply centered in the task of lending a hand in all

45 Vol. IV, p. 286.

This is a section in perspective of the project prepared for the Henry Ford house in 1912. This was done after Marion Mahony's marriage to Walter Barley Griffin. Drawing courtesy of Northwestern University archives.

the emergencies that arose. Truly I lost myself in him and found it completely satisfying. 46

Roy Lippincott, who had shifted over to the Griffins' office around 1913 (and married Walter's sister), confirms Marion's modest description of her artistic relationship with Walter:

She had an almost worshipful regard for his genius, and repeatedly expressed to me the opinion that it was far greater in basic elements than Wright's . . . She never attempted to influence his planning and it is remarkable how little change there was in any of his designs between the first little freehand sketches done on any scrap of paper or envelope; but when it came to detail and pattern she was supreme and he seldom or never suggested any alterations. The outstanding example was the ceiling of the Capitol Theatre in Melbourne. 47

Lippincott's remarks seem to agree with what our survey of Marion's early work has indicated: she was a great designer of isolated decorative details, but not an architect and planner. Walter had many interesting ideas relating to structure, landscaping, town planning, and style. It has never been proposed that Marion influenced the first three of these facets of his work, but that she also did not contribute to the essentially new and personal features of his style I think our examination of Marion's artistic personality has proven. Walter, however, always suffered from a lack of esthetic imagination in his detailing which Marion complemented. They were a true design team, each doing what the other could not, Walter providing the basic ideas and architectural framework, and Marion the decorative elaboration.

The Chicago Art Institute has a large collection of drawings such as this done by Marion Mahony Griffin. This tree study was probably done while she and her husband, Walter Burley Griffin, were living in India. Note the distinctive monogram which nearly always appeared on her drawings.
Modern American architecture seems to suffer from a prolonged, self-conscious detachment of its practitioners from their native sources. Since the 1880s architects have had continuous and direct access to the social philosophy of Louis H. Sullivan, first through his active participation in regional and national meetings, and later through his writings published by the professional press and beamed in their direction. However, considering this long period of almost exclusive "possession", it now seems doubtful whether the architectural profession ever really tried to understand the breadth or the pertinent quality of Sullivan's thoughts on which his designs were based. The title of his Kindergarten Chats, written for architects (ca. 1901-02), implies that Sullivan was acutely aware that his audience was difficult to reach. For this reason especially, sociologist Hugh Dalziel Duncan's new interpretation should be a welcome and important addition to the Sullivan literature.

The 1960s have seen—outside the profession—a widespread awakening of interest in Sullivan and his times. Two generations is the normal, predictable lapse of time for the dust to settle on activities in the recent past and for historical perspective to permit a sharpened focus. An added incentive to study the late 19th century may be that the current goal-questioning spirit recognizes the same old issues concerning society and architecture that were first identified in Chicago and the Middle West in the 1880s and 90s. Intervening time, with major wars, depressions and technological speed-up seems not to have altered but merely accentuated the basic problems: as predicted, cities have erupted—socially and physically; American architecture has survived the international style and now engages the computer; during the 1950s both the "curtain wall" and Williamsburg influence permeated to the remote corners of the country, dramatizing—if architecture is any index—a need to search again for meaningful identification of the individual with the spirit of his time and place in a democratic society.

Dewey, Veblen, Jane Addams and Sullivan were never more timely for thoughtful re-examination. Professor Duncan is well equipped for the task; he is an author who has long been concerned with interrelated fields, especially the sociology of literature and art. Culture and Democracy is by far the most comprehensive and potentially useful of the many Sullivan readers and biographical studies that have been published since Hugh Morrison's Prophet of Modern Architecture (1935). This new book complements but does not supplant the others. Except for portions of his introduction and conclusions, Duncan writes with unusual architectural insight. His greatest contribution is in extending the "Chicago School" concept beyond architecture, clarifying the unity of literature, education and the arts with social and economic theory of the time. The nature of this subject is kaleidoscopic, and he has developed a significantly wider angle from which a composite view is possible.

Duncan uses a Sullivanlike structure for his book, dividing it into nine major parts and fifty-six, bite-sized chapters. The first three parts (more than one-third of the book) present the historical background: "Search for Community", "Money as a Symbol of Life" and "The Struggle for Power in Chicago". Duncan's account of the Pullman strike, the Haymarket riots and the Hull House program is as exciting as tomorrow's news report. His analysis relates directly to architecture and planning. Against this background, the remainder of the book is devoted to the evolution and analysis of Sullivan's major themes and the Chicago School, with chapters on Dankmar Adler, John Edelmann, John W. Root, the World's Fair and Burnham's betrayal of his "benighted brethren of the West" to men trained in the international style of Europe.

Duncan depends heavily upon a tight sequence of quotations as he takes the reader along an intricate path through Sullivan's Chats, Man Search and Autobiography. Interlocutions are woven almost too deftly into the quoted selections; at times it is impossible to find Duncan's own words as he allows Sullivan's poetic phrasing to escape the customary typographical markings. Since the original texts are now available (the Autobiography in paperback edition since 1956), Duncan might have been more effective had he kept his illuminating commentary on a separate sound tract. His technique is didactic to the extreme. Some readers may be annoyed by the redundancy, and those who are chronologically unwary may get lost among numerous flashbacks. However, the careful reader will find fewer slips than might be expected in a text of more than 600 pages. The author's use of descriptive subtitles, his documentation with hundreds of footnotes, and the scholarly index contribute to the book's usefulness. The illustrations, with the exception of the decapitated Carson Pirie Scott Store, are well chosen reminders of text material, carrying their own uneven commentary.
Unfortunately, this urgently needed publication may lose some of its authority for many readers because of the author's paradoxical efforts to bring in prestigious contemporary names and specious support in his introduction. He echoes this curious unVeblenlike note emphatically in the final paragraph of the book. After one has followed the eloquent discussion of Sullivan's theory of architecture related to society, it comes as a shock to have Duncan gratuitously hand the Chicago School torch to an aloof, international master-architect who was invited to Chicago because of his distinguished work in Germany. Shades of Burnham and Hunt! It is ironical that Duncan should be caught up by his own words: "To say that art in Chicago must be disciplined by international standards of taste, or that local artists must learn by copying masterpieces made little sense to artists." Likewise, does it make sense for the author to speak of the "Legacy of Sullivan" without adequate recognition of twentieth century continuity in the Prairie School Group as well as current, torch-bearing Chicago architects as varied as George Fred Keck, Larry Perkins and Harry Weese?

Buford L. Pickens
Washington University

This is a fascinating account of the life and work of the man who designed and built the original "mission" furniture that was so popular in the early twentieth century. This same furniture quickly fell from public favor when its originator lost control of his now legendary Craftsman empire. Today interest in mission furniture is returning as collectors search it out as being genuinely representative of an important period of our culture.

Most of the material has previously appeared in the American Life—Collector's Annual, also edited by Mr. Freeman. Regrettably the author did not take time to edit the text so as to present a better organized book, for the various chapters read like individual articles. Still, the work is original and informative. A complete index to all issues of the Craftsman magazine (1901-1916) both by author and subject makes the book particularly useful for the historian. The relationship of Stickley's work to that of others such as Elbert Hubbard and Will Bradley, and the Craftsman movement as compared to the Art Nouveau are discussed in detail.

Plate number nine from the Catherwood portfolio is the ornament over the principle doorway, Casa del Gobernador, Uxmal. Note the squared spiral motif repeated above either side of the opening.

This is a superb facsimile of the original which was published as a limited edition of 300 copies in New York and London in 1844. As many of the originals were broken and sold as individual plates, complete sets have been virtually unobtainable for many years.

It has been suggested by several writers that these drawings had a great influence on the work of Frank Lloyd Wright during the period of the Midway Gardens through the California concrete block buildings of the 1920's. Several of the plates do show the square spiral design which Wright used for his red squares during the last twenty-five years of his life. However, careful study of these plates reveals little real evidence that Wright was influenced by them.

This edition is limited to 500 copies and is handsomely boxed. The reproduction is excellent, and the soft lovely colors are beautiful. The price seems very high but to persons with an interest in Central American culture, this may be immaterial. It is not essential to those interested primarily in the development of the modern movement in architecture.
Letters to the Editors

Sirs:

Since your Volume II, No. 2, contains a review of Chicago's Famous Buildings (University of Chicago Press), I wish to point out that the editors made changes in my text (the comments on the individual buildings) without my knowledge or consent. Correction of errors and modifications for style I gladly accept; but in addition a number of changes were made which alter the sense or add ideas which I do not share. Contrary to my expectations and, I believe, to good publishing practice, I was not shown proofs. (Although this deprived me of any opportunity to protest or even to discuss these changes, I am now told that this was done merely to speed publication.) The Senior Editor of the Press has assured me that I shall have the right to make revisions in a re-printing or new edition. In the meantime I should not like the comments, as now printed, to be taken as representing my views accurately in all cases. This is especially true of Nos. 20, 45, 69, 70, etc. In Nos. 65 and 87 the entire comment was contributed by the editors. I hope it is obvious that I had nothing to do with the "Glossary".

Your reviewer has correctly called attention to some of the shortcomings of the book in general. His one remark about the comments on the individual buildings suggests that he does not distinguish between speculation and criticism or appreciation; and, in view of that, one should not speculate as to what he means by analysis. His remark shows more, in a negative manner, about his use of such terms than about the comments under review.

J. Carson Webster
Northwestern University

The above letter, reproduced in its entirety, was received from Professor Webster shortly after Volume II, Number 2 of THE PRAIRIE SCHOOL REVIEW appeared in 1965. Other commitments have prevented its being printed before now.

Dear sirs:

I received your notice that my subscription has expired. Upon glancing through past issues I feel little desire to renew. Although I appreciate the interesting articles and the fine organization, I feel that I can not indulge a school of hope that would have Louis and Frank resurrected. The ideals and concepts are living in their works and in their writings but believe it or not gentlemen, the times are changing . . . new and vital works are being accomplished. Had your Review been less intent on reviewing and taken a more alive look at what is being done by those who were greatly influenced by these two men . . . then I would have wanted to renew. Any group or person who is so dedi-

cated to the past is doomed especially when considering both Wright and Sullivan arose out of just the eclecticism you would have. Are you out to create a new "order"? Do the Masters get plopped upon the vegetables of a Corinthian column?

Kansas City, Mo.

Name withheld through editor's prudence.

In Chicago

Andrew N. Rebori, one of the last members of the old "Chicago School" architects, passed away on May 31, 1966 in Chicago. Mr. Rebori, who was 80 years of age, was employed by De Leuw Cather and Company at the time of his death.

Mr. Rebori was born in 1886 in New York City. He began work in an architect's office at age 16, later leaving to attend Massachusetts Institute of Technology. He graduated at the top of his class in 1908 and then was appointed a professor of architecture at the Armour Institute in Chicago. It was in Chicago that he became a close friend of Louis Sullivan.

Rebori wrote a number of published articles concerning his friendship with Sullivan and the architectural theories which they shared. His commissions included the 39 story LaSalle-Wacker building and the Cudahy Memorial Library at Loyola. He was a member of the AIA and was named a fellow of the Institute in 1955.

Preview

The next issue of Volume III of THE PRAIRIE SCHOOL REVIEW will be one of our largest and most significant issues to date. It will be devoted entirely to the work of Frank Lloyd Wright in Japan with photographs of all remaining structures to be included.

The text is being prepared by Robert Kostka, a long time student of things Japanese and of the Prairie School of architecture. Mr. Kostka's work will be based on his personal observations while in Japan and on correspondence with Japanese historians since his return.

To be reviewed . . .

Adolph Loos

From the EDITORS

Volume III of THE PRAIRIE SCHOOL REVIEW is underway, and we begin our third year looking to the future. Our subscription list is still small, but most subscribers are loyal when renewal time comes enabling us to plan coming issues with confidence.

THE PRAIRIE SCHOOL REVIEW was inaugurated to fill a need. In 1963 interest in our architectural heritage was growing steadily, but the major architectural periodicals were publishing very few items concerning history and the Journal of the Society of Architectural Historians too often covered the subject from an archeological point of view. Thus THE PRAIRIE SCHOOL REVIEW was born in the Spring of 1964. Our efforts were and still are aimed at making known the more recent achievements as exemplified by the development of the modern movement in architecture around the turn of the century.

It is with interest that we note that during the past few months the wide circulation architectural magazines have been offering us some competition in the field of history. The new FORUM featured Hugh Garden’s Madlener House in its first issue of last year with photos by Richard Nickel whose work has appeared in THE PRAIRIE SCHOOL REVIEW several times. The current issue of P/A (which editor Jan C. Rowan, AIA has transformed into the best of the major architectural periodicals) has an excellent article on the influence of Richardson and Sullivan in Scandinavia by our friend and contributor, Leonard Eaton. The AIA Journal recently published “In Search of John Edelmann” by Donald Egbert and Paul Sprague. The latter, of course, was the author of our most ambitious article concerning Sullivan’s Garrick Theater. As we go to press, the latest issue of the ARCHITECTURAL RECORD has arrived with a splendid folio of the Sullivan drawings formerly in Frank Lloyd Wright’s collection now held by the Avery Library. We have also noted an increased interest in historic architecture as evidenced by expanded newspaper coverage. In addition, it will soon be our privilege to participate in one of a series of television documentaries on architecture sponsored by the University of Illinois and filmed by the American Broadcasting Company.

It would be presumptuous for us to claim credit for this expanded interest in our chosen field, but it is gratifying to see; and if our efforts have helped to bring it about, THE PRAIRIE SCHOOL REVIEW is fulfilling its stated purpose.
Hugh M. G. Garden

By Bernard C. Greengard

Bernard C. Greengard, now retired, studied architecture at the Art Institute of Chicago then affiliated with Armour Institute of Technology, the predecessor of the Illinois Institute of Technology. After graduation he was employed in the office of Schmidt, Garden & Martin and later did renderings for that office as well as working for various other Chicago firms. During the preparation of these reminiscences, he has worked closely with Hugh Garden’s daughter, Sally Garden Mitchell.

At the turn of the century, following in the footsteps of Jenney, Sullivan and Root, a group of architectural designers appeared in Chicago that Carl Condit refers to as "The second generation, or the Prairie School". One of its more talented members was Hugh Garden.

During the 1890’s while still a young man, he became associated with Richard E. Schmidt, a practicing architect in Chicago since 1887. During the early years of this association, which was to last a lifetime, he contributed design for a series of buildings thereby earning the praise of contemporary critics for inventiveness and a refreshing departure from precedent. His name was then obscure, and to this day little credit has been given him as designer for much of this early work. While he later turned to a then prevailing mode of traditional design, it is his early work that is now of the greatest interest in the light of modern architecture, and on which this essay is to be concentrated.

Hugh Mackie Gorden Garden was born July 9, 1873 at Toronto, Canada, the son of a civil engineer. He attended the Bishop College school at Lennoxville, a province of Quebec. He left school at the age of 14, several years after his father died, and with his family then moved to Minneapolis. There is no doubt that he showed talent very early for drawing and an interest in the building art, for

---

2 Richard E. Schmidt (1865-1958) was born in Bavaria. He came to the United States in 1866 and received his basic education in the Chicago Public Schools. He studied architecture at M.I.T. from 1883 through 1885, leaving before graduation. He began independent practice in Chicago in the year 1887.
while still very young, he was accepted as an apprentice in the architectural office of William Channing Whitney. 3

He then came to Chicago where a new style of architecture had been developing, later to become known as the "Chicago School". 4 He worked as a draftsman in such offices as Flanders & Zimmerman, Henry Ives Cobb, and Shepley, Rutan & Coolidge. 5 Thus under competent men he gained his architectural training in what some consider to be the most efficient school, the school of experience. Formal courses in architecture, as then taught in colleges, were based upon the study of the classic orders of ancient Greece and Rome with student projects conducted along the lines of the Ecole des Beaux Arts of Paris. This may have diverted men of talent from developing any modern spirit in design. Hugh Garden lacked such academic training, and for that reason may well have been more receptive to the indigenous spirit of the Chicago School.

In the year of 1893 America experienced one of its periodic economic "busts". It was a year of financial panic, and architectural commissions were not plentiful. Office staffs were cut for the sake of economy and young draftsmen such as Hugh Garden were hardpressed to find employment. It was also the year of the great World’s Columbian Exposition in Chicago. Hugh Garden must have had plenty of time to inspect the white colonnaded buildings of the fair reflecting a dead past and to contrast these with the color and vitality of Louis Sullivan’s great transportation building. It was then that he decided to become self employed. He was a talented designer as well as clever at perspective rendering, so he set out as a free-lance designer

3 William Channing Whitney, FAIA (1851-1945) studied architecture at Harvard and at Massachusetts State College where he was graduated in 1872. He practiced independently in Minneapolis, Minnesota from 1880 until retirement in 1925.

4 Ed. Note: The exact date of Garden’s arrival in Chicago has not been determined. He is listed as an active member of the Chicago Architectural Sketch Club in their publication Sketches published in 1892. His undated initiation sketch was published in this same folio as was his drawing for the C.A.S.C. Clark Medal Competition for 1891. He also drew several of the ink advertisements included in this first publication of the Chicago Architectural Sketch Club. Sketches, C.A.S.C., 1892.

5 Ed. Note: Examination of the Exhibition catalogs of the Chicago Architectural Club (publication of these catalogs was begun in 1894) reveals that Garden did work for the following architects other than Richard E. Schmidt: Shepley, Rutan & Coolidge; William R. Gibb; A. H. Granger; Flanders & Zimmerman; Henry Ives Cobb; Howard Shaw; and Frank Lloyd Wright. He also regularly submitted designs of his own to the annual exhibitions of the Chicago Architectural Club.

and perspective artist. He made renderings for Louis Sullivan and Frank Lloyd Wright and thus came under the direct influence of these masters. 6

It was in this capacity that he first began to work with Richard E. Schmidt, who was impressed by the quality of Garden’s renderings and even more so by his ability as a designer. In 1895 he was invited to join the Schmidt organization to take charge of design. 7 At the same time he was

6 Ed. Note: We have found no documentation of renderings done by Garden for Louis Sullivan. However, Garden’s name, along with that of Charles Corwin, is shown on the rendering of the “Cheltenham Beach” project of Frank Lloyd Wright which was first published in the 1895 catalog of the Chicago Architectural Club. Exactly what Garden’s contribution was to this project is not known, although it is likely that he was the deliniator of the drawing.

7 Ed. Note: The date 1895 is at best an approximation. Office addresses given by the Chicago Architectural Club catalogs indicate that Schmidt and Garden maintained separate offices until 1899. The catalog for that year shows Schmidt, Garden and an architect named Fraenkel all at 1013 Teutonic Building. Schmidt had been listed at this address since 1896. Prior to that he and Fraenkel had both been listed at 604 Pullman Building, and in 1894 he had submitted a design with Fraenkel listed as his partner. It is interesting to note that Birch Burdette Long, another prominent renderer, was also listed at Schmidt’s address in 1898, and that he is listed as the deliniator of a drawing for the Joseph Theurer house designed by Richard Schmidt. Also, Long is listed as the deliniator for a cottage designed

Hugh Garden’s initiation sketch for the Chicago Architectural Sketch Club was published in the club’s first publication, Sketches, in 1892.
permitted to use the facilities of the office for work under his own name which he carried on in a limited way. There followed years of creative activity when his characteristic style "Gardenesque" as he called it, appeared in a series of Richard Schmidt's projects.

A considerable amount of information concerning the work he did independently during that early period can be gleaned from catalogues of the Chicago Architectural Club's annual exhibits held at the Art Institute of Chicago. The catalogue of 1898 contains an illustration of a city residence naming him and a brother, Edward G. Garden, as architects. Its design recalls that of a Venetian palazzo, similar to the style used by Henry Ives Cobb on the Michigan Avenue elevation of the Chicago Athletic Association building which apparently was influenced by John Ruskin's "The Stones of Venice". Again in the catalogue of 1901 there is a design for a theater at Marion, Indiana. Hugh Garden's name appears alone as architect, and in this design one may note the influence of Louis Sullivan and Frank Lloyd Wright. In the same catalogue a house at Highland Park is illustrated with his name as architect. This design with its projecting eaves, low lying roof lines and horizontal feeling, is typical of the "Prairie" style, as the residential work of the "Chicago School" architects has become known in recent years.

However, it was in his association with Richard E. Schmidt that Garden had his greatest opportunity to exercise his talent. Schmidt had business and administrative ability and connections which brought him numerous architectural commissions. His father and brother were prominent physicians who may have helped to introduce him into the field of hospital work for which his firm became noted.

Architectural practice is complex, and it requires teamwork to carry it on successfully. Richard Schmidt was an executive well versed in his profession, able to keep his team working together.

This sketch for a theater at Marion, Indiana was exhibited by Hugh Garden at the Chicago Architectural Club's Annual Exhibition in 1901.

At the same time, while the business and professional aspects of architectural practice are vital, he recognized that the department of design was of prime importance, though personally he was not a designer. He devoted his time to conferences with clients, correspondence, business trips and other administrative duties. The department of design he left entirely in charge of the artist of his organization, Hugh M.G. Garden.

Another exhibit at the 1901 Chicago Architectural Club's Annual Exhibition was "A House at Highland Park, Illinois, by Hugh M.G. Garden". Note the resemblance to Frank Lloyd Wright's "A Home in a Prairie Town" published in the February 1901 Ladies Home Journal.

While Hugh Garden's work during the early years of his association with Richard E. Schmidt was primarily identified with commercial buildings designed in the manner of the Chicago School of Architecture, he was also a participant in the Prairie School of design which generally concerned residential work. Along with other young men of the prairies who were designing homes at the turn of
the century, he frequently broke with European tradition.\(^1\)

As opposed to this, architects in the eastern part of the United States remained faithful to European tradition and considered their midwestern colleagues radicals. It was fortunate for American architecture that there were clients in the west who did not demand the styles of old Europe for their houses. They accepted non-traditional design, local materials and home-made fabrics appropriate for their locality. At about the same period, a secessionist movement in art, including architecture, took place in Europe known as "Art Nouveau" in France, and the "Jugend Style" in Germany. American designers of the midwest borrowed but little from these sources. They derived their inspiration chiefly from the work of Louis Sullivan and Frank Lloyd Wright. It was the latter whose early houses in Oak Park and elsewhere in the Chicago area pioneered the Prairie style.

A house of the Prairie School designed by Hugh Garden during the beginning years of the century was the L. Wolff, Jr. residence located on Chicago's north side in a section formerly the suburb of Buena Park. A good deal of space was devoted to a discussion of this house in an article by Arthur C. Davis, "The Architecture of Ideas" in the Architectural Record.\(^1\) As this writer pointed out, the design derived a good deal from Frank Lloyd Wright, and as he said, "that is as it should be, for he is the most original of the young designers of the day." One notes a very simple and rational character of exterior design, a frank treatment of materials and a purely functional placing of the openings. The critic admired the designer's handling of masses and his search for structural honesty, as well as the play of light and shade expressed in the color value of the brick and the bold shadows cast by widely overhanging roofs. Ornament was confined to the entrance framed with skillfully executed carving, detailed in Garden's typical style.\(^2\)

Another of his early house designs was the Thorne house built in 1903 at Winnetka, Illinois, one of Chicago's fashionable north shore suburbs. In its exterior, like the Wolff house, it displays bold effects of light and shade. A feature was a two story portion with double gables, projecting out to produce deep shadows. Extending from this at right angles was a one story portion with hip roof and widely projecting eaves. It was of frame construction presenting a rather gay, picturesque appearance. On the lower story, sharp mouldings framed clapboards into rectangular panels producing an interesting effect.

\(^{11}\) Many years later, Garden wrote an important essay wherein he discussed the reasons for the development of a new architecture in and around Chicago. Illinois Society of Architects, Monthly Bulletin, October, 1939, pp. 6-7. We have reprinted the entire article starting on page 19 of this issue of The Prairie School Review.

\(^{12}\) The Architectural Record, April 1904, pp. 364-368, illustrated.

\(^{13}\) Ed. Note: The basic design of the L. Wolff house cannot be unquestionably credited to Hugh Garden. In 1902 Richard Schmidt exhibited "A House in Buena Park" at the Chicago Architectural Club. The title block on this perspective states "House for Mr. L. Griffin..." In comparing this drawing with photographs of the L. Wolff house they are obviously variations of the same design. To further complicate matters, William E. Drummond was employed by Schmidt during this period, and he has been recorded by H. Allen Brooks as having remarked to Barry Byrne that he designed the Wolff house for Schmidt. "The Prairie School: The American Spirit in Midwest Residential Architecture," Northwestern University, 1957, p. 184.

\*The L. Wolff house as it appeared shortly after construction. This house is markedly like the earlier "Griffin" house exhibited by Richard Schmidt at the 1902 Chicago Architectural Club's Annual Exhibition. Photo from The Architectural Record.

\*This design for "A House in Buena Park, Chicago" for L. Griffin was exhibited by Richard E. Schmidt at the 1902 Chicago Architectural Club's Annual Exhibition. Drawing from the 1902 CAC Catalogue.
Above is the first floor plan of the Albert F. Madlener house, 1902, designed by Hugh M. G. Garden for Richard E. Schmidt. Drawing courtesy of Brenner, Danforth and Rockwell.

The celebrated Madlener house located on North State Street at Burton Place on Chicago's near north side was designed by Hugh Garden during the same period. It was of masonry construction, three stories high with a flat roof and an exterior faced with Roman brick and trimmed in buff Bedford limestone. It was a work generally regarded as a high point in Chicago's residential architecture. In plan it satisfied the owner's requirements and in its exterior displayed elegance without in any way copying the past.

The noted architectural critic, Russell Sturgis, author of "How to Judge Architecture" and frequent contributor to the architectural journals of the early twentieth century, devoted an article to it in the Architectural Record. He compared the design of the mansion with a certain Florentine palace of the day where the entrance rather stiffly centers on the windows above. There was no such symmetry at the Madlener house where the entrance and windows on the ground floor were placed as needed with a resultant gain in freedom. The Chicago house appeared to him neither grandiose nor traditional in feeling, but rather gave the impression of comfort and wholesomeness. The size and grouping of window openings, relative to the exterior wall-space, gave the design its character of sturdiness while the horizontal divisions were admirably proportioned in relation to each other. He felt, however, that something was sacrificed for exterior effect by keeping the window-heads low in the principal rooms of the first floor; higher window-heads would have provided better light. Since drapes and shades usually covered the upper parts of windows in homes, this does not appear to be

14 Russell Sturgis (1836-1909) was an architect known primarily for his writing. During the last thirty years of his life he was a regular contributor to the major architectural journals as well as the author of several books on architecture and the arts.

15 The Architectural Record, June 1905, pp. 491-498, illustrated.
The drawing at the left and the photograph above are of the Montgomery Ward building on Michigan Avenue in Chicago. It was built in 1898 and was the largest building that Hugh Garden had designed for Richard Schmidt at that time. Both from 1899 CAC Catalogue.
a very serious objection. What seems to have determined the level of the window-heads, as one notes when examining the interior, was the designer’s aim to keep them on a line with those of door openings. With the sills close to the floor line, generous glass areas were obtained, and the interior effect is pleasing.

The house was occupied by the Madlener family until the death of the original owner’s widow in 1962. After this there arose the possibility of its demolition to make way for a high-rise apartment building, the site being very desirable for that purpose. Fortunately, it was acquired instead by the Graham Foundation for the Advanced Studies in the Fine Arts as its permanent headquarters. Thus a valued landmark was saved for posterity. In 1964 the Chicago Commission on Architectural Landmarks designated the Madlener house as an official Chicago Architectural Landmark.

The residential designs which Hugh Garden did during his early years with Schmidt were only a part of his contribution to the firm. The first of Richard E. Schmidt’s important commissions in the commercial field to which Garden contributed the design was the Montgomery Ward building at the northwest corner of Michigan Avenue and Madison Street in Chicago built in 1898. It is difficult to visualize the original design from the present condition of the building. In later years under new ownership with other architects in charge, several additions and alterations completely destroyed the effectiveness of the design, much to Hugh Garden’s regret. As described in the Inland Architect & Building News, the main body of the building, 12 stories on 86 feet frontage, had a tower 40 feet square extending above it. The entire building with offices and storage space was occupied exclusively by the mail order firm. In exterior design the first three stories were of white Georgia marble, classic in treatment. Above, the material was brick and terra cotta, with soaring piers of Sullivanesque influence. In its general proportions, it was not unlike Sullivan’s Schiller Building. The top of the tower recalled the campanile in Venice, its pyramidal roof covered with gilded terra cotta panels which shone brightly in the sunlight, and at the summit was the now legendary gilded copper statue of Diana which rotated in the wind as a weather vane. The design of the building was much admired by architects of the day, and for years it was a landmark on Chicago’s Michigan Avenue.

A far cry from the above as to type, size and design was the Grommes & Ullrich warehouse at 108 West Illinois Street built in 1901. This was a four story brick building with wide windows of a type Giedion labels the “Chicago window”, a mulioned window with a large unit in the center, flanked by two narrow ventilating parts. Projecting brick courses forming patterns in the piers between the windows and horizontal projecting brick courses above and below these were the only ornamental features in this simple “Gardenesque” design.

The powerhouse of the Schoenhofen Brewery at 18th Street and Canalport Avenue built in 1902 was one of Hugh Garden’s most distinguished designs. It has been designated by the Chicago Commission on Architectural Landmarks as a Chicago Architectural Landmark and is credited to Richard E. Schmidt alone, though Garden was certainly responsible for the design. It was built on an irregularly shaped lot with an acute angle at the street corner. In plan it was divided into a powerhouse section and warehouse area. In its exterior the design expressed the various functions of the building in a unified and harmonious manner. A feature is the tower, carried up above the masonry enclosure of the interior stairway and elevator shaft.

The Grommes and Ullrich building was a strictly utilitarian design in the Chicago “commercial” style. The only ornamentation was the restrained use of projecting brick courses. Photo by B. C. Greengard.

17 Frank A. Randall in his History of the Development of Building Construction in Chicago, Urbana: University of Illinois, 1949, states that the Grommes and Ullrich Building was constructed to allow for the addition of four more stories at a later time.
In the Schoenbofen Brewery Powerhouse of 1902 Garden used the "Prairie" style in a commercial building for the first time. In 1960 it was designated a Chicago Architectural Landmark.
to the required height for elevator machinery and a water storage tank. It is interesting to note that a structural system is not expressed in the design.\(^{18}\)

The Schoenhofen Brewery design was also the subject of an article by Russell Sturgis. Commenting on it the critic remarked:

\[
\ldots \text{if architecture means making a building interesting and worthy of study in its exterior, then \ldots such a building as the powerhouse of the Schoenhofen Brewery, \ldots architectural enough. No school of architecture can teach a man how to design such a building. At least if there be any school of architecture of that stamp, it should really proclaim itself \ldots its power of inspiring liberal and practical ideas in the youthful mind should be widely advertised.}\(^{19}\)
\]

No greater compliment could have been paid the designer who, as previously stated, never attended an architectural school. In Hugh Garden's background there was a natural talent for design, stimulated by the influence of Louis Sullivan and his contemporaries.

Another building designated as one of Chicago's

Architectural Landmarks is the Chapin and Gore building at 63 East Adams Street built in 1904. Designed in the office of Richard E. Schmidt, its handsome facade was the work of Hugh Garden. In an article by William Herbert entitled "An American Architecture"\(^{20}\) this building was discussed along with a number of other designs by Garden without, incidentally, any mention of the designer's name. According to this critic, the front elevation of the Chapin and Gore building was expressive of "clear functional demands", which was achieved, it might be added, in terms of beauty.

Carl Condit writes:

The frame of the Chapin and Gore Building is virtually two separate structural systems with a great difference in the bearing capacities of the individual members. Up to the third floor the frame is of massive construction designed for a floor load of 250 pounds per square foot; for the upper five stories it was designed for a 100-pound load. This difference may have suggested, or even dictated, the special treatment of the second and third stories.\(^{21}\)

\(^{19}\) Condit, *The Architectural Record*, March 1905, pp. 201-207.

\(^{20}\) The Architectural Record, February 1908, pp. 111-122.

The second and third floors were used for storage and called for smaller window openings. These were richly framed at the jambs and ornamented at the spandrels. The floors above were offices with "Chicago windows", flanked by slender brick piers. The piers were topped with terra cotta capitals of typically "Gardenesque" design. As Mrs. Sally Garden Mitchell, Hugh Garden's daughter relates, Louis Sullivan was impressed with the beauty of this design and congratulated her father on it.

Along with commercial buildings, Richard E. Schmidt and his organization became noted as specialists in hospital design. Important among these was Michael Reese Hospital, begun in 1905 with Hugh Garden responsible for its architectural design. Located on Ellis Avenue and 29th Street, it was set back from the corner to a central pavilion at 45 degrees to the street lines with two wings projecting one bay extending parallel to the streets. The center entrance was marked with projecting piers running up five stories with contrasting horizontal bands of projecting brick courses at sills and heads of windows. The design was free from the influence of traditional styles and typical of

**LEFT**: The Chapin and Gore Building. This measured drawing was prepared by the 1964 HABS Chicago Project. The building was remodeled in 1939 with the cornice and pier capitals removed. The ground floor elevation has also been extensively revised.

This is Hugh Garden's rendering of his design for the Michael Reese Hospital. This portion of the building still stands although extensive additions have been made during the hospital's expansion.

Below is a detail of the "Gardenesque" ornament above the second floor windows of the Chapin and Gore building.
One of the last designs executed by Hugh M. G. Garden under his own name was "Paper III, the Village Block Series" which was done for one of The Brickbuilder's competitions and published in the April 1905 issue. It shows a strong Sullivan influence and was a quite satisfactory solution to the problem presented. Plan and rendering from The Brickbuilder.
Garden’s early work. This hospital has since been expanded into one of the great hospital and research centers of today.

In 1906 Richard E. Schmidt was awarded the important commission of the Montgomery Ward warehouse and office building located on Chicago Avenue at the north branch of the Chicago River. This building, some 800 feet long and nine stories high, is entirely of reinforced concrete construction, including parts of the exterior walls, and is one of the first in this country to be so constructed. In plan it roughly followed the shoreline of the river, and its design was guided by structural, economic and functional considerations. It was the designer’s task to give architectural expression to its form and material. This Hugh Garden accomplished in a straightforward manner, emphasizing the horizontal feeling which the great length of the building suggests. Giedion called it "one of the few late buildings in which the spirit of the Chicago school still survives".  

The Montgomery Ward warehouse is a noteworthy example of the successful collaboration of an architectural designer and a structural engineer. Edgar Martin (1871-1931) was the structural engineer who along with Hugh Garden was associated with Richard E. Schmidt. It was at this juncture that the latter gave recognition to his associates by making them members of the firm under the name "Richard E. Schmidt, Garden & Martin". It was not until some years later that each got "equal billing" when the firm name became simply "Schmidt, Garden & Martin".

Another notable design by Hugh Garden during this period was an addition to the building of the Chicago Athletic Association, just off Michigan Avenue, facing on Madison Street. It adjoins the rear of the older building around the corner, facing Michigan Avenue which was designed by Henry Ives Cobb. Floor lines of the older building were carried through and with the kitchen located on the eighth floor, the banquet hall in the new addition was placed at the same level. The large hall called for a ceiling height twice that of the typical floors with tall window openings. These were tied with the smaller windows above to form a decorative unit. As described in a contemporary journal the entire facade expresses the club spirit, "more private than a hotel, nonetheless residential". In 1925 six stories were added with the east elevation, then exposed, rather elaborately treated.

A work in which Garden is said to have taken particular pride was the Humboldt Park boathouse. On this he collaborated with Jens Jensen, the noted landscape architect, whom he greatly admired. It was pleasantly suited to its surroundings along the lagoon in an appropriate setting of trees and shrubs. An arched pavilion is open to a terrace on the water front, and below the terrace are moorings for row boats and facilities for the attendants and for storage. On the opposite side the low pitched roof with projecting eaves gives the design a horizontal feeling close to the ground with the open arches flanked by two enclosed spaces. The material was brick with stone trim, handsomely detailed in Garden’s characteristic way.

In the year of 1911 Samuel T. Chase of Lake Forest came to Schmidt, Garden & Martin with a project for an apartment building to be built on the site of the old Chase family estate located at Sheridan Road and Belmont Avenue on Chicago’s

23 The Architectural Record, February 1908, p. 120.
north side. This developed into a block-long building of three stories plus a floor at ground level known as an "English basement", the building containing thirty luxury apartments. In the exterior design Garden here deserted his former individualistic style, turning to eighteenth century English manor houses for its model. When asked why he had given up his accustomed freedom from precedent, he replied that "Gardenesque" was avant garde and people were not ready for it. Eastern architects, such as Charles A. Platt, H. T. Lindeberg and John Russell Pope, with their mastery of traditional styles, had made their impression on popular taste in Chicago as elsewhere. Some decades were to go by before modern architecture, which had its foundations in the Chicago School, finally came into its own. In the Chase apartments however, Hugh Garden acquitted himself brilliantly. It was awarded a medal by the Chicago Chapter of the American Institute of Architects for excellence in design.

Here Hugh Garden once more chose a non-traditional style for its exterior design. Prominently located at 3301 West Franklin Boulevard on Chicago's west side, it was T-shaped in plan, contained four stories plus basement, and totaled 400,000 square feet in area, possibly the largest candy factory in the world. It developed into an impressive and monumental composition with rectangular shapes. Near the main entrance short wings built up to a massive tower, the entrance flanked with pylons topped with sculpture. The long wings of the office and factory sections were treated with projecting piers. This building marked the last of the buildings in the spirit of the Chicago School to come from the office of Schmidt, Garden & Martin. In the years that followed, the firm, later known as Schmidt, Garden & Erikson, grew into one of the largest architectural organizations in the country with hundreds of draftsmen and a variety of designers. But, as is often the case with such large firms, individuality in design was largely lost. Although the work of the firm continued to be of high quality, it did not reflect the character of the early work of Hugh Garden.

During his later years in semi-retirement, he worked in his roomy studio at his home on North State Street in a quiet section of Chicago near Lincoln Park. As his daughter writes, "he was never without a pencil or a drawing board". He produced many beautifully rendered drawings, mostly for projects that were never built. One of these was for an Episcopal Cathedral for Chicago, a favorite project of his. Working on this was to him a pleasure, quite apart from any prospect of ever building it. As he said: "There is no greater joy for a designer than designing."

As for his association with Richard E. Schmidt, it continued throughout the greater part of their long lives. According to Garden's daughter, this association was an ideal one: "Richard Schmidt had his feet firmly on the ground, father had his head in the clouds. Together they worked and loved it and they were dear friends to the last."

When he passed away at the age of 88 in October 1961, Hugh Garden could look back upon a long career as a member of a distinguished firm. But it is his work as designer during the early years of his association with Richard E. Schmidt that remains as his most significant. He never allowed baldness or monotony to characterize his work. He used ornament with restraint, a style of ornament inspired by Louis Sullivan's, yet it was his own; it was "Gardenesque". In the annals of the history of modern architecture, his name deserves to be remembered.
The Chicago School

By Hugh M. G. Garden

In this fast-moving age the "Chicago School" is almost forgotten and recent press and platform statements showing a lack of understanding of the part played by Chicago architects in the initial days of what is now variously called the "Modern Style," "Functional," "International," etc., and which now sweeps the world like an influenza epidemic, seem to justify a short review of those days following the invention of the "Skyscraper" in Chicago when Chicago architects pointed out the way for all who followed them.

The Editor of the Bulletin has asked me, as an eye-witness and participant in those activities, to undertake such a review.

There exists in the souls of all designers of buildings a restless urge to give their designs some quality of arrangement which they can recognize as "art," and this urge results in what we call architecture. Not content with mere functional building, the architect insists that his productions shall express his own conception of what is orderly, proper, and—he hopes—beautiful, or at least good to look at. In this urge he is abetted by those he builds for; for all people seem to feel the need for beauty in their habitations.

Through the ages this has resulted in some astonishing performances which at times have crystallized into what we call "styles" and their subdivisional "periods".

From time to time changes in living conditions or in methods of construction have brought about a radical and sometimes abrupt change in design with some fragments of preceding fashions lingering over to cloud the new expression. Such an abrupt change was the introduction of steel as a principle material for construction of walls, displacing solid masonry and opening up to the architect the possibility of wide-spanned openings and slender vertical supporting members. The invention of the elevator or lift as a quick and fatigue-saving means of vertical communication, added to the use of steel, made possible a vast increase in the height of buildings and a more intense use of small portions of land.

The aesthetic expression of the new construction, while swift to make its appearance, was not immediate and many of the facades of the early experimental buildings of the late seventies and eighties, although often more honest in expression of skeleton construction than many later buildings, were appallingly crude.

This crudity was made clear to Chicago architects when Henry Hobson Richardson of Boston erected for Marshall Field the large wholesale store building (the site is now a parking lot for automobiles) in Chicago. This structure, although traditional and of solid masonry construction, was a highly original example of the regularity and simplicity of pure masonry design for which Richardson became famous. It pointed a way to all American architects toward simplicity and swept into the discard the multitude of meaningless gew-gaws that had survived from the Victorian Gothic revival that preceded it.

To Louis H. Sullivan of Chicago, it opened a new road from the strange but interesting originalities he had been perpetrating and down this path he quickly advanced to the development of the brilliant personal style for which he has become famous.

The Museum of Modern Art of New York has recorded this development in their "Exhibit of Early Modern Architecture, Chicago 1870-1910," and has established the chronology of the development with short biographies of the leading architects and illustrations of the principle structures with comment on each. To this excellent bit of work I am indebted for many of my facts which might otherwise remain controversial and from it I quote the following to make clear what is meant by the "Chicago School":

"The influence of Sullivan's style was so great that it attracted a group of young architects who formed under his leadership the Chicago School.

"The free non-traditional architecture of the Chicago School retained its vigor until about 1910 when the stylistic revivalism which had made its first striking appearance in Chicago with the World's Fair of 1893 vitiated its force."

From the same source I also quote the following:

"Sullivan led for two decades a considerable group of architects known as the Chicago School, but he alone made of the early skyscraper an aesthetic invention."

The tall commercial building was the outstanding contribution of American architects in the second half of the nineteenth century.

It emerged gradually, following a number of technical developments preceding the year 1880. These included, in the fifties, the first use of metal to replace masonry bearing walls; the introduction of elevators, making multiple stories possible; methods for fireproofing metal structural members and the development of effective pier foundations; and, to quote again from my previous source:

"Finally in Chicago, by the late eighties, the protective masonry shell came to be carried entirely by the metal framework in which Bessemer steel replaced cast and wrought iron. The skyscraper, imminent for more than a generation, thus became an actuality."

Thus the invention of the skyscraper furnished the spring from which the Chicago School flowed as the nucleus of a stream of modern art expression that flows world-wide and architecture was, I think, the first of the arts to respond to the modern urge as distinguished from traditional art.

For the Chicago School was not concerned exclusively with the designing of skyscrapers and, with the possible exception of Sullivan, its members were not especially conscious that they constituted a "School". The name, as I remember, appeared first in the architectural press of the day and may have been coined by Montgomery Schuyler or Russell Sturgis or another of the editorial writers and critics of the East. Also, the Chicago School included many men not resident in Chicago. But it was definitely Midwestern and its center was in Chicago.

In 1880 Leroy S. Buffington of Minneapolis, inspired perhaps by ideas of Viollet-le-Duc, and undoubtedly conscious of what was going on in Chicago, had dreams of metal "cloud-scrapers" and through the versatile hands of his designer, Harvey Ellis, an artist of the first rank, produced a design for a multiple story, castle-like office building in the Richardson manner which formed the basis of Buffington's claim that he was the inventor of the skyscraper. It was an effective design, as was everything that Ellis produced, but was considered a dream and went not much farther that the publication of the design.

In like manner, there were men in St. Louis, St. Paul, Indianapolis, and others in Minneapolis as well as farther west, who were quick to see the opening through which poured the light of freedom from traditional restraint.

The great flood of architectural publications, which in the succeeding years of stylistic revivalism made every architect's library a prerequisite to practice, had scarcely begun and in consequence the architects of the Chicago School, books being scarce and the money to buy them as scarce, were only too glad to forget about precedent and proceed quite naturally to make their own designs as Sullivan urged them to.

It was Sullivan who invented the slogan "Form must follow function," and the young architects
about him understood easily enough what he meant and went confidently on to create new forms as each problem demanded. And they did this without conscious thought that they were doing anything extraordinary.

The continuous horizontal window, since re-discovered in New York with much acclaim for originality, was actually produced in Chicago, not only by Sullivan (who in fact did not at first make them quite continuous but merely narrowed the dividing piers) but by several others in the ordinary course of practice, quite without thought of any epochal significance.

Thus in 1907 a factory building requiring continuous work benches under the windows was designed with continuous horizontal windows as a matter of course.

This inconspicuous structure, scarcely noticed then or now, has found an honored place in the Museum’s exhibition of significant structures with the following critical comment: "This factory has real architectural quality based only on the character of the ferro-concrete structure. At this early date a factory at once so simple and so well studied in its proportions was unique."

Mention of ferro-concrete in the above suggests that in considering the problems of the new construction, ferro-concrete, which followed rapidly on the heels of steel, is but steel in another form in most of its applications. Of the new possibilities opened to the designer by ferro-concrete in applications peculiar to itself, I shall have no space in this short story to speak. The sequence is obvious and not essential to a record of the Chicago School.

Louis Sullivan was, of course, loud in proclaiming his "New Deal" in architecture and was echoed by his immediate pupils; but the others of the Chicago School were less vociferous and I think less conscious of their importance—which is as it should be.

In the light of later days and larger undertakings, it is seen that not much of the work done prior to 1910 was important and before the assault of the wrecker and the alterer, an appalling amount of it has disappeared along with its authors. But its significance as an aesthetic expression at a time when American architecture was emerging from chaos into a definite trend remains at least in the minds of a few white-haired old gentlemen.

That large and expensive buildings growing more or less old-fashioned should be destroyed as a relief from high taxes is a phenomenon of American cities. The wiping out of the capital investment and the conversion of their sites to park-

ing lots or other taxpayers seems a strange loss of wealth, not only to their owners but to the taxing bodies that caused the destruction. At any rate, this trend, particularly in Chicago, is the cause for the disappearance of many interesting if unprofitable buildings, many of them examples of the work of the soon-to-be-forgotten Chicago School. The automobile, besides throwing all city plans out of joint, is responsible for many changes and today the old-fashioned buildings go and in their place the "parking lot" reigns supreme.

I shall not attempt to record the names of the men composing the Chicago School, except its founder, because I would almost certainly forget some of them, which would be unfair.

There is, however, one other who has played an outstanding part in this movement, because he is still living—very much so—and because of some peculiarities and antagonisms, I shall refer to as "Hamlet"—a pseudonym that will be transparent enough. It is necessary to mention him, for how can there be anything to Hamlet without HAMLET?

But this is the story of the Chicago School and the book says that, except for a few brief years while wings were sprouting, he is not to be classed with the Chicago School or with Louis Sullivan, but is one apart, alone, a great triumphant star of the first magnitude. And in truth he is a great star, a great artist, possessor of—everything; determined, too, that all shall know it, without either false or real modesty. As he strides down the aisle toward the dais, the spot-light knows instinctively which way to turn, and turns.

But he is a great artist.

Equally at home as architect, as Master surrounded by his pupils, as lecturer or debater on the platform, or as author with pen in hand, Hamlet stands alone and confident, a magnetic personality. Possessed of an erect, trim figure with good square shoulders—despite his more than sixty years—a lionine head of white hair, a vibrant voice and a nimble wit, he asks for no sympathy or affection from his brother architects and, alas, gets none or little.

But he is a great designer.

Like all great designers, great artists, he makes his design from the instinct that is within him and then invents a beautiful theory to go with and explain it. And it is certain to be a perfectly splendid theory even if you know it is an afterthought. Also he has an excellent sense of humor, can laugh at himself and so is to be forgiven a great deal of buncombe. The balance, that you feel you cannot forgive, you must for he is a great designer.
He is, of course, a supreme individualist and egoist. Ruthlessly so, for he knows no other way but his own and will admit none.

Also he is a showman. The printed page and the center of the stage are for him and, like all showmen, he requires an audience. If there be none, he will find a way to attract one and, like that other great showman, he believes that there is a prospective client born every minute.

He gets about too, as he must to keep up the supply of audiences; the Orient, Europe, are as much his stage as is his native land. Recently he has completed a group of lectures before the Royal Institute of British Architects. And, if one may judge from the reviews, he has “mowed them down” in London as he has elsewhere.

If we may judge from past performance, there will be a sharp upcurve in Britain of a certain type of design, which imitations will fall far, far short of the work of the one and only Hamlet.

In his itinerant showmanship he has perhaps made his greatest, if inadvertent, contribution to Modern Art. For he carries and sows the seed—good sound seed too—of basic honesty in design that Sullivan taught. He is a prolific and indefatigable worker. From his facile mind and pencil flows a stream of fresh and beautiful designs. Too often they have the same quality that distinguishes a certain musical composition called “The Flight of the Bumble Bee,” which serves as medium for the technical display of skill by violinists and, to my mind, establishes a new “low” as music. There is too often an insistent buzz to Hamlet’s work.

I have described a great artist, but I have not yet called him a great architect. I do so now. His influence has been tremendous and it has been, on the whole, good.

From the score of years when Sullivan dominated the architectural scene in Chicago, the heyday of the Chicago School, the sound of his words and deeds passed first to Europe and remained there to come back to us later as an echo, scarcely recognizable, of functional architecture.

It is to be remembered that until Sullivan spoke, architectural chaos and revivalism were practically world wide and that after he had spoken his message was heard in Europe, the very seat of eclectic architecture.

In Holland, in France, in Austria, in Germany, in Finland and the Scandinavian countries and in Italy, men began to discard their textbooks and dare to make their own designs. The best of them admit their debt to Sullivan and the Chicago School. But it is inevitable in any art that no artist can long endure the acknowledgment of his debt to anyone. And so we have a score of new genii who proclaim themselves the anointed sages of the great new art.

But I think that without Sullivan and the Chicago School, we would never have had that glorious “second prize” design in the competition for the building of the Chicago Tribune by Eliel Saarinen, a design that completely revolutionized architecture in America, that completely won over the winners of the Tribune competition and made them followers of the author of the second prize design, and that brought to an abrupt stop the ascendency of the stylistic revival.

Mr. Saarinen is now our fellow citizen and he too is a great architect and a great teacher, greater than Hamlet, for with him architecture comes first and its author after.

There is so much to regret!

While Europeans were taking up and nourishing the seeds that Sullivan had sown in our own country, as the Museum pamphlet states, “the free non-traditional architecture of the Chicago School retained its vigor until about 1910 when the stylistic revivalism which had made its first striking appearance in Chicago with the World’s Fair of 1893, vitiated its force.” Thus Chicago was the birthplace of the new art and the place of its temporary obscuration.

What if it had been otherwise? What if Sullivan’s influence had gone on at home as it did abroad? What if the Chicago School had not faded under the stylistic revival? I think that the intervening wasted years might have produced other good architects and certainly the grammar of modern architecture would have been vastly richer than it now is.

And certainly we would not now have a group of foreign professors of art coming over to teach us what it is all about.

But, of course, there would have been no living with Sullivan.

And as for Hamlet? Things have been just perfect for him. He could not long have borne the beatification of Sullivan and he would not have been the one great star that was never dimmed by the clouds that obscured the Chicago School.

So perhaps after all, it does not matter—much—except to a few old white-haired gentlemen who will soon go the way of their works into parking lots and be as little remembered as the Chicago School.
Robie Fund Sketches

During the summer of 1965 The Committee of Architectural Heritage at the University of Illinois at Champaign-Urbana sponsored a Frank Lloyd Wright Summer Sketch Competition for students in the Department of Architecture. The competition drawings were then used as part of a three week exhibition entitled "Frank Lloyd Wright, Vision and Legacy" held in September as a project to raise funds for the Robie House restoration program. John R. Smart served as exhibition director and Hermann G. Pundt was faculty advisor.

The drawings were juried and the first place sketch was awarded a copy of The House Beautiful by Frank Lloyd Wright and William C. Gannett. After the awards were presented, the sketches were sold at auction for the benefit of Robie House.

The exhibit was an excellent example of what can be done with a minimum budget, imagination and dedication. It was designed in a manner reminiscent of Mies van der Rohe's Barcelona Pavilion and included Wright-designed furniture from several sources, drawings, leaded windows, a superb model of the Robie House and several fragments of ornament. Several hundred dollars were raised and contributed to the Robie House Fund.

The first place sketch by Mike Plantz is of the Gregor Affleck house in Bloomfield Hills, Michigan.

A window from the Dana house in Springfield, Illinois was the model for this drawing which earned second prize for Charles Zacker.
**Book Reviews**

The *Wendingen* edition of 1923, as the Dutch monograph on Frank Lloyd Wright is often called, has always been, along with the more famous Wasmuth publications of 1910 and 1911, among the most important yet more rare items in the Wright bibliography. Now it is available in a splendid new edition.

*Wendingen,* which means a turn in the sense of a new direction, was the title of the Dutch periodical published between 1918 and 1931 by the architect and critic H. Th. Wijdeveld. The journal served as spokesman for the Amsterdam School, a group of expressionist designers who were near contemporaries of the de Stijl group of Rotterdam. On two separate occasions *Wendingen* devoted its pages to Frank Lloyd Wright. First, a single issue was published in 1921, entitled "Lloyd: Wright," with a text by H. P. Berlage and with twenty illustrations. A special edition of this issue was bound in hinged hard covers on which appeared (extending over front and back) a four color lithograph especially designed by Lissitzky. The spine was tied with straw. This handsome book is so rare as to be all but unknown. It is missing from most Wright bibliographies and, in the Lissitzky bound version, the reviewer has seen no other copy than his own.

The second occasion when *Wendingen* published the work of Wright was in 1925-26. At that time seven special numbers of the magazine were devoted to him and these were issued either in seven separate parts each bound in identical (except for the Roman numerals I through VII) heavy paper covers of red, black and white design (with spines tied with straw), or in book form. The book, with the same format and contents as the seven single numbers, is the better known version of this publication. It was bound in tan cloth over hinged boards with the words Frank Lloyd Wright stamped in gold on the spine. It is this publication which has been reissued.

The new edition, although not a facsimile, is very similar to the original. The editor, Ben Raeburn, has obviously made every effort to retain the character of the original while making only those changes which will add to the readers' convenience and pleasure. The format, binding, and double-fold pages are the same. However the paper is slightly thicker and more glassy and the inking is heavier. This results in a stronger, more bold impression which loses the subtle, Oriental character of the original.

The most remarkable and commendable variation from the original is the improved quality of illustrations. Often fuzzy or even smudgy in the original publication, they are at least as good and in many instances better in the Horizon edition. This is a real achievement. Eleven plates, according to the "A Note to this Edition," have been substituted with improved views, and to this list should be added plates 7 and 153 (top) which are also new and plate 66 which has been severely cropped.

At the back of the book a list of "Dates of the Buildings Shown" has been appended (misprint under Lowes House: read 1922 for 1912), and this is a most welcome addition. Over two-thirds of the designs illustrated represent the period from 1911 to 1922, thus offering the most extensive coverage of these years available in any publication.

The text, in spite of the galaxy of authors, is probably less important than the illustrations. Many of the articles were previously published in various magazines. Wright's two articles "In the Cause of Architecture" are reprints from 1908 and 1914, although his "In the Cause of Architecture, the Third Dimension" of 1925 is not. Both of Louis Sullivan's articles about the Imperial Hotel are reprints, as are H. P. Berlage's and J. J. P. Oud's. The latter's contribution is perhaps the most interesting, especially for his discussion of cubism and architecture. Lewis Mumford, Robert Mallet-Stevens, and Erich Mendelsohn are also represented. An introduction by Mrs. Frank Lloyd Wright has been added at the beginning.

In sum, one cannot but speak in praise of this new edition of *The Life-Work of the American Architect, Frank Lloyd Wright.* It is a publication of high quality which does honor to its predecessor of 1925.

H. Allen Brooks
University of Toronto

The architecture of California is, for the most part, representative of the *avant-garde* in the buildings of the United States. This is particularly true of residential work. The buildings illustrated in this book are examples of the best contemporary architecture of the past thirty years with emphasis being placed on the more recent designs.

California, with its mountains, forests, coastline and splendid varied weather has long been an area of architectural inovation. The work of the brothers Greene during the first decade of the present cen-
encyclopaedia and that of Bernard Maybeck and Irving Gill later on led the way to modern California architecture as we know it today. Unfortunately, the present volume does not include the work of these pioneers, but the designs of the twenty-nine offices that are included are all in debt to the work of these predecessors in some degree.

Frank Lloyd Wright is represented only by his Walker house at Carmel. It is a fine small house, but what of the work Wright did during the twenties in California? The Hanna house of 1937 is far more significant historically than the Walker house and his textile block houses certainly deserve some mention. Architects Aaron Green and Mark Mills, both products of Taliesin, get more space than the master which in this case is appropriate. Their work deserves close attention and will probably get it as their buildings become more well known. John Lautner's work is also covered extensively being most notable in its great variety of imaginative designs.

The greatest space is given to the dean of California's modern architects, Richard J. Neutra. His work includes the Heath house built in 1927 at Griffith Park, Los Angeles, through the Edgar J. Kaufmann house at Palm Springs and the Rados house in San Diego which also adorns the book's dust jacket.

The gardens portion of the book has been somewhat neglected with only two major firms represented. This can be excused if one considers that architecture in California must take its surroundings into consideration even more than elsewhere and therefore nearly every building illustrated has been carefully studied from this point of view.

This book is beautifully produced with careful attention to detail including superb page layout, excellent typography and good paper. Text is held to a minimum with over two thirds of the book being plans and photographs. Our only regret is that the author did not see fit to include the men who started it all.

W. R. H.

Only the first 25 pages of this volume are devoted to historic architecture. Only two paragraphs cover the work of Puerto Rico's only architect of the "Prairie School", Antonin Nechodema.

The remainder of the book is largely illustrations of contemporary architecture. It constitutes a well balanced presentation of what is being built in Puerto Rico today.

This "first encyclopedia of modern architecture" might be better titled "An Encyclopedia of Modern Architects". Over 1000 individual names are included comprising perhaps nine of every ten entries. The names are heavily weighted in favor of European architects with the "International" group leading all others. This probably is a result of there being only six North Americans included in the list of thirty one author contributors.

Editor Wolfgang Pehnt has written an excellent though brief introduction discussing the period from 1850 through the present day. It is this era that is covered by the main body of the encyclopaedia with the greatest attention devoted to the Bauhaus years and to the last decade or so. In attempting to be absolutely current, a few names are included which may fall by the wayside when the much needed comprehensive encyclopedia of modern architecture is written. At the same time, a number of the lesser known but important figures in the development of the modern movement are conspicuous by their absence. William Drummond is not mentioned, Hugh Garden is included only as part of the firm of Schmidt, Garden and Martin, and Walter Burley Griffin is completely omitted.

Historians will find it often unsatisfactory for research because of these and other reasons. As a layman's reference work it will be quite useful, answering many questions that often come forward in architectural discussions of a casual nature. The alphabetical arrangement is good and cross references are helpful. Nearly every major entry includes its own bibliography which in some cases will prove extremely useful. The selected bibliography at the end of the book is less comprehensive than it should be, and one wonders why it was included in such a minimum fashion. Typography and layout are good; however the quality of reproduction of photographs is poor. This is probably due to the use of the offset process on a dull surfaced paper.

This book, the first of its kind since Russell Sturgis edited his three volume Dictionary of Architecture and Building in 1901 does serve to remind us that modern architecture is growing more complex every year, and that the time has come for someone to edit and publish an extensive reference work which will include in depth discussions on the many facets of modern architecture. The present volume is not enough.

In Chicago

Ralph Fletcher Seymour was the victim of an automobile accident on January 1, 1966. He would have been 90 years old in March of this year. Mr. Seymour had been a permanent personage in Chicago art circles for over fifty years, and was particularly noted for the unusual, handcrafted books he designed and published.

Some of Seymour’s publications are now in the collector’s category. For example, he did at least five publications for the late Frank Lloyd Wright. He published the English translation of *Angefahrene Bauten und Entwürfe* in 1911, and he published two titles by Ellen Key which Wright and Mrs. Borthwick translated from the Swedish. These little known works were *The Morality of Woman and Love and Ethics*, both published in 1911. The first was in enough demand to require a second edition in the same year. In 1912 Seymour published *The Japanese Print* by Frank Lloyd Wright. This was done in three editions. The first was rejected by Wright and all but 50 copies were destroyed. The second and third were both done from the same new plates but the second was on heavy handmade Japanese vellum while the third was on delicate handmade Japanese rice paper. Both were bound in boards covered with ordinary brown paper and printed with a flying bird motif of Wright’s design in green ink along with the title. Later the same motif was used on the cover of the catalog of an exhibit of *Antique Colour Prints From the Collection of Frank Lloyd Wright* held at the Fine Arts Building in the fall of 1917 and again on the cover of the Auction catalog printed for the sale of Wright’s prints in New York in 1927. No record of who printed these catalogues is available, but they may also have been done by Seymour. The final item we know to have been done by Seymour for Frank Lloyd Wright was a small paper cover booklet *Experimenting With Human Lives*. This was distributed by the Fine Art Society at Olive Hill in Hollywood, California, but Seymour did the graphics and printing in 1923.

Mr. Seymour also claimed Louis Sullivan among his friends and was to have printed his *A System of Architectural Ornament* until the American Institute of Architects decided to underwrite the publication of that venture and bring it out over their own imprint.

As a founding member of the Cliff Dwellers Club in Chicago, Mr. Seymour knew nearly all of those men who made Chicago the great architectural center that it was and still is. The publications that he did for Wright and others contributed to that greatness. He will be missed but remembered for many years to come.

Letter to the Editors

Gentlemen:

In some cleaning out that we are doing we have come upon a stock of a few sheets of the original edition of *A System of Architectural Ornament*. This is the sheet that has plates two and three on it. Although the outside sheets are quite dirty, I imagine that there might be between 60 and 70 that are quite presentable.

It has occurred to me that possibly some people would like to get copies of even one original sheet, particularly for framing purposes. I doubt if we could handle this ourselves, but I thought that you with your specialized clientele might possibly be interested. Any proceeds, of course, we would add to the Sullivan Scholarship Fund.

Sincerely yours,
George E. Pettengill, Hon. AIA
Librarian, The Octagon

Editor's Note: We are happy to accept Mr. Pettengill's suggestion. He has forwarded the sheets to us, and they will be distributed on a first come, first serve basis. The plates are printed on opposite sides of the same sheet in such a manner as to permit their being divided and framed separately. The price is $2.50 per sheet in advance.

The Second Quarter of Volume III of THE PRAIRIE SCHOOL REVIEW will be primarily concerned with the work of Marion Mahony. This talented designer, perhaps best known for her work in Frank Lloyd Wright's Oak Park studio, later became Mrs. Walter Burley Griffin. The author is David T. Van Zanten of Harvard University.

We appreciate receiving comments and recommendations in the form of letters to the editors. When of general interest and space permits, we are happy to publish such letters. We are particularly interested in previously unpublished and little known works of the "Prairie" architects.
